Уважаемые Дамы и Господа,

Это нераспечатываемая версия публикации, представляющая собой Англо-Английский и Англо-Русский толковый словарь банковских, биологических, биржевых, ботанических, бухгалтерских, генетических, грузоперевозочных, зерновых, инвестиционных, карантинных, компьютерных, металлургических, нефтегазовых, политических, статистических, страховых, таможенных, текстильных, химических, хлопковых, экономических и энергетических терминов, а также терминов авторского права, деревообработки, единиц измерений, смазывания, технического и фундаментального анализа, Интернета и прочего. В нём также представлена расшифровка сокращений и обозначений и их последующее толкование. В общем это книга для сотрудников компаний, осуществляющих внешнеэкономическую деятельность. В поисках точного сопоставления и соответствия Англоязычного термина Русскоязычному приходится просматривать массу специализированных энциклопедий и словарей, конвенций, кодексов, законов, правил и стандартов, различных форм документов, в которых также можно встретить соответствующие термины и их толкование. Приходится также общаться со специалистами из различных отраслей с тем, чтобы определиться с Русскоязычным жаргонным термином, который соответствовал бы Англоязычному слэнгу, также встречающемуся в данном толковом словаре. Все те Русскоязычные термины, являющиеся соответствием Англоязычным, которые выделены голубым цветом, нуждаются в сверке, доработке или корректировке. Без привлечения специалистов из соответствующих отраслей экономики делать это очень сложно. Начиная с 1991, то есть после развала Советского Союза в продаже появилась масса Англо-Русских толковых и обычных словарей, где Русскоязычная терминология трактовалась и трактуется авторами как им заблагорассудилось и без всяких консультаций со специалистами соответствующих отраслей экономики. Раньше (при Союзе) любой проект закона ‘спускался на места’, где специалисты из той или иной отрасли хозяйства, чьи интересы затрагивал проект этого закона, дорабатывали его. В результате все формулировки, включая и терминологию, были отточены в принимаемых законах до совершенства. Сейчас же такая практика отсутствует, и это приводит к появлению в современных законах натуральной отсебятины, замешанной на полупрофессиональном жаргоне. В своём толковом словаре мне не хотелось бы допускать таких же ошибок и вводить в оборот несуразные термины и выражения, которые звучат порой из уст некоторых наших ‘новейших’ экономистов, деловых людей, журналистов и политических деятелей.

Ряд моих знакомых специалистов из различных отраслей экономики по мере возможности помогают мне прямо или косвенно в подборе, доработке и корректировке Русскоязычной терминологии. Среди них:- Владимир Ксенофонтович АБРОСИМОВ, Флюр Фаритович АХМЕДЬЯНОВ, Пэтра БОКХАН (Petra BOCKHAHN), Валерий Евгеньевич БУЛЫГИН, Татьяна Яковлевна БУХТОЯРОВА, Елена Фёдоровна ДЕНИСОВА, Ойбек Хужамуратович КИМСАНБАЕВ, Елена Сергеевна КОКУРИНА, Лидия Александровна КОЧЕРГИНА, Иван Иванович КУЗЬМИН, Олег Германович МАННОВ, Игорь Васильевич МАСЛЁНКИН, Алексей Юрьевич МАТРОХИН, Наталия МЕЛЬНИКОВА НИЛЬССОН (Natalia MELNIKOVA NILSSON), Виктор Валентинович ПАВЛОВ, Михаэль РАЙХЭЛЬ (Michael REICHEL), Ольга Николаевна РЫБАКОВА, Галина Васильевна САМСОНЯН, Олег Александрович ТВОРОГОВ, Валерий Евгеньевич УСТЮГИН, Борис Александрович ФАКТОР, Галина Михайловна ФИШЕР, Евгений Михайлович ХАРТУКОВ, Сергей Станиславович ЧУМАКОВ, Наби Каюмович ШАДИЕВ, Валерий Львович ЯХОНИН и другие. Я выражаю им свою благодарность и искреннюю признательность за оказанную и оказываемую помощь в подготовке данного словаря. Персональную благодарность выражаю Александру Валерьевичу ЗДОРИКОВУ. Несмотря на свою постоянную занятость, он находит и уделяет мне время для оказания помощи в создании этого толкового словаря. Если бы ни его участие, то словарь и ряд разделов книги не продвинулись бы так быстро и так глубоко. Но, к сожалению, и у перечисленных мною людей не всегда находится достаточно времени, возможностей и тех специфических знаний, необходимых для соответствующей правки. В силу того, что данная публикация размещается в Интернете в бесплатном режиме пользования, предполагаю, что она может попасть и в руки к специалистам. Если Вы и есть такой специалист, и обнаружили в ней какие-то неточности или готовы оказать содействие и предоставить более правильную в профессиональном плане Русскоязычную формулировку термина, то я буду весьма признателен, если Вы сможете направить мне соответствующую информацию по электронной почте (адрес указан ниже).

В книге в качестве других разделов будут представлены статистические данные о производстве и потреблении хлопкового волокна, а также о структуре мирового хлопкового сообщества и практике ведения бизнеса с этим родом сырья, включая всё то, что связано с заключением и исполнением форвардных контрактов, с тонкостями финансовых расчётов, страхования и грузоперевозок, независимой инспекции качества и хранения на так называемых таможенных складах; второй раздел книги посвящён биржевым операциям с фьючерсами и опционами на фьючерсы на хлопок, практике хэдьжирования реальных сделок с хлопком, а также фундаментальному и техническому анализу биржевых рынков сырья на примере хлопкового; последний раздел книги будет содержать информацию о качественных характеристиках хлопкового волокна и методах их определения в различных регионах мира.

Эта публикация, а также две другие размещены на сайте крупного Российского поставщика сырья и продукции текстильной промышленности по адресу:- http://www.primtex.ru/ в разделе ‘О компании’ в самом низу страницы. Их можно также скачать, воспользовавшись приводимыми ниже ссылками:-

Посвящается памяти родителей

GLOSSARY OF TERMS
ТОЛКОВЫЙ СЛОВАРЬ ТЕРМИНОВ

As in any industry there are key terms with specific meaning unique to its participants. The following list of terms and abbreviations is not meant to be all-inclusive. It is meant to provide the reader with basic understanding of such terminology. This list is constantly being updated. However, if you have any suggestions as to what definitions you would like to see here, please contact somebody of The Invar Group. This glossary is designed as an aid in understanding terms that are widely used in the chemical, computer, cotton, energy, equities, grains, Internet, investments, oil and gas, securities, textile industries and exchange trading, and also in the accounting, banking, biology, botany, copyright, customs, economy, finance, fundamental analysis, genetics, insurance, intellectual property, licensing, metallurgy, politics, quarantine, statistics, technical analysis, transport, units of measurements, woodworking, etc, and does not constitute a legal or official definition or meaning or interpretation on any of the listed items. These explanations were collected from many sources to help you understand these segments of the world economics. In practice, terminology can differ across firms and across market segments. /

Поскольку в любой отрасли существуют ключевые термины со специфическим пониманием, уникальным для её участников, постольку читателю предоставляется возможность найти в данном словаре базовое понимание такой терминологии. Приводимый ниже перечень терминов и сокращений не предполагает того, что в него включены абсолютно все такие термины и сокращения, и он постоянно пополняется. Тем не менее, если у Вас имеются какие-либо предложения по толкованиям, которые Вы хотели бы увидеть в нём, пожалуйста, связывайтесь с кем-нибудь из The Invar Group. Этот толковый словарь разработан в качестве поддержки в понимании терминов, которые широко используются в зерновой, инвестиционной, компьютерной, металлургической, нефтегазовой, текстильной, химической, хлопковой, энергетической, отраслях, в индустрии ценных бумаг и биржевой торговле, а также в авторском праве, банковской деятельности, биологии, ботанике, бухгалтерском учёте, генетике, деревообработке, единицах измерений, инвестиционной деятельности, Интернете, карантине, лицензировании, политике, статистике, страховании, таможенной деятельности, техническом анализе, транспортировке, финансах, фундаментальном анализе, экономике, в сфере интеллектуальной собственности и прочем, и, при этом, в нём нет состава юридического или официального определения (дефиниции) или значения или интерпретации любых из приведённых терминов. Эти разъяснения были собраны из многочисленных источников с тем, чтобы помочь Вам понять эти сегменты мировой экономики. На практике, терминология может иметь свои отличия как среди отдельных фирм, так и среди отдельных сегментов рынка.

1/F NOISE = ШУМ 1/ЭФ. – 1/F Noise:- in Rescaled Range (R/S) Analysis, an anti-persistent time series reverses itself more often than a random series would. If the system had been up in the previous period, it is more likely that it will be down in the next period and vice versa. Also called Pink Noise. See also Anti-Persistence. Rescaled Range (R/S) Analysis is the analysis developed by Harold Edwin Hurst (1880–1978; British hydrologist) to determine long-memory effects and fractional Brownian motion. Rescaled range analysis measures how the distance covered by a particle increases as we look at longer and longer time scales. For Brownian motion, the distance covered increases with the square root of time. A series which increases at a different rate is not random. / (Harold Edwin Hurst).

1P = PROVEN

1PL = FIRST PARTY LOGISTIC MODEL

1Q12 = FIRST QUARTER OF 2012

2/2 TWILL WEAVE = ПЕРЕПЛЕТЕНИЕ САРЖЕВОЕ 2/2 – 2/2 Twill Weave or Two-And-Two Twill Weave:- the twill is used where tightly woven fabric with high density is required. The twill weave is characterized by a diagonal rib or twill line. The warp yarn floats over at least two consecutive picks, permitting more yarns per unit area.

2D = TWO–DIMENSIONAL

2–D BAR CODE = ШТРИХОВОЙ КОД 2–ДИ. (или ШТРИХКОД 2–ДИ.) – 2-D Bar Code:- The PDF 1000 style barcode is used to store up to 1 800 characters of text. Designed to allow more information to be stored and retrieved electronically; it has not achieved wide use.

2D SEISMIC SURVEY = СЕЙСМИЧЕСКОЕ ИЗЫСКАНИЕ 2И (или СЕЙСМИЧЕСКАЯ РАЗВЕДКА 2И, или СЕЙСМОРАЗВЕДКА 2И) – 2D Seismic Survey is a study of strata formation using a system of sensors and explosive devices to obtain a two-dimensional strata model. In 2D exploration, sensors are placed along certain lines (sections) and the study is carried out along the depth of the

section. / Сейсмическое Изыскание (Сейсморазведка) в формате 2И это изучение строения пласта с помощью системы датчиков и взрывных устройств, направленное на получение двумерной модели залежей. Сокращение 2И предполагает под собой 2 измерения; может называться также 2М, означая двухмерное. При сейсмическом изыскании в формате 2И датчики расмещаются вдоль определённых линий (разрезов), и исследования проводятся по глубине данного разреза. Сейсмическая Разведка или Сейсморазведка, группа методов разведочной геофизики, основанная на наблюдении процессов распространения искусственно возбуждаемых упругих волн. Используется для изучения строения земной коры, поисков и подготовки к разведочному бурению нефтеносных структур и другого. Сейсмическая Разведка или Сейсморазведка – методы разведочной геофизики, основанные на изучении особенностей распространения в земной коре упругих (главным образом продольных) волн, возбуждаемых взрывами (в неглубоких скважинах) или ударными и вибрационными генераторами. Применяется для изучения строения земной коры, поисков и подготовки к разведочному бурению нефтегазоносных структур и другого. Виды сейсмической разведки различаются по родам используемых волн (отражённых, преломлённых и других), условиям проведения сейсмической разведки (морская, полевая, скважинная – сейсмокаротаж) и другим признакам. Сейсмическая Разведка или Сейсморазведка:- методы разведочной геофизики, основанные на изучении особенностей распространения упругих (сейсмических) волн в земной коре, с целью исследования её геологического строения. Для сейсмической разведки применяют методы отражённых и преломлённых волн и пьезоэлектрического эффекта. Применение отражённых сейсмических волн предложено Американским учёным Рэдьжинэлдом Абри Фэсэндэном (Reginald Aubrey Fessenden; 1866–1932) в 1913, независимо Советским инженером Владимиром Сергеевичем Воюцким в 1923, но вследствие значительных технических трудностей впервые реализовано в 1928–30. Простейший вариант использования преломлённых волн по Людгэ Минтропу (Ludger Mintrop; Немецкий геофизик; 1880–1956) (1919) применялся с 1922–23; в современном виде предложен в 1939 Советским геофизиком Григорием Александровичем Гамбурцевым (1903–1955). Применение пьезоэлектрического эффекта предложено Советским геофизиком Михаилом Павловичем Воларовичем (1900–1987) и другими. Основные методы сейсмической разведки:- Метод Отражённых Волн (МОВ) и Метод Преломлённых Волн (МПВ), использующих различие упругих свойств и плотности горных пород. (i) При МОВ возбуждённая взрывом или механическим воздействием сейсмическая волна, распространяясь во все стороны от него, последовательно достигает нескольких отражающих границ. На каждой из них возникает отражённая волна, которая возвращается к поверхности Земли, где фиксируется приборами. МОВ позволяет одновременно изучать геологическое строение на глубинах от 0.1–0.2 до 7–10 километров (км) и определять глубины сейсмических границ с точностью до 1–2%, обнаруживая при этом небольшие угловые несогласия, зоны выклинивания и участки смены фаций. МОВ – наиболее точный и детальный метод изучения осадочных толщ, используемый главным образом при поисках нефти и газа, а также при изучении некоторых рудных месторождений и региональных геологических исследованиях. (ii) МПВ основывается на наблюдении волн, которые, преломившись в слое, отличающемся повышенной скоростью распространения сейсмических волн, проходят в этом слое значительную часть пути и после повторного преломления возвращаются к поверхности Земли. Пользуясь МПВ, можно определять положение и форму поверхности одного или нескольких таких слоёв и скорости в них на глубинах от нескольких м до десятков км. К сейсмической разведке относится также Пьезоэлектрический Метод (ПЭМ), в котором особенности распространения упругих волн изучают, наблюдая возбуждаемое ими (при воздействии на пегматиты и некоторые горные породы) электромагнитное поле, возникающее вследствие пьезоэлектрического эффекта. ПЭМ позволяет обнаруживать породы, обладающие этим эффектом в значительной степени. В сейсмической разведке применяют преимущественно Продольные Волны, скорость которых в горных породах от 0.4–0.5 до 7–8 км/сек. Поперечные Волны применяют редко ввиду трудности их возбуждения; скорости поперечных волн от 0.1 до 5 км/сек. Частоты регистрируемых колебаний, возбуждаемых сейсмическими волнами, составляют от 3–5 Гц при глубинных исследованиях и до 150–250 Гц при изучении небольших глубин. Сейсмическую разведку проводят вдоль профилей, на которых через определённые интервалы располагают источники и приёмники колебаний. В качестве источников колебаний используют взрывы зарядов в неглубоких (первые десятки м) скважинах; применяют также вибрационные или ударные передвижные установки. При каждом положении источника колебаний замеры на профиле производят сейсмоприёмниками, в которых механические колебания почвы преобразуются, в электрические; последние по соединительным линиям (косам) или по радио транслируются в передвижную сейсморазведочную станцию. Колебания, приходящие от каждого приёмника, усиливают, преобразовывают, записывают и получают полевую магнитную сейсмограмму; распределение времени пробега волны на профиле позволяет судить о путях её распространения, физическом типе и некоторых других особенностях. Геологическую информацию из сейсмограмм извлекают обработкой на ЭВМ, в результате которой получают сейсмогеологические разрезы, отображающие положение сейсмических границ вдоль профиля, выраженное или во времени прихода сейсмических волн, или в глубинах. На основании разрезов составляют карты изохрон или изогипс. Для правильного геологического истолкования материалов сейсмической разведки важно возможно более полное знание скоростей распространения волн в разрезе; сведения о скоростях волн могут быть получены из данных МОВ и отчасти МПВ и в особенности из данных детальных сейсмических наблюдений в глубоких скважинах. Несмотря на высокую стоимость, сейсмическая разведка является наиболее распространённым среди геофизических методов. Сейсмическую разведку применяют для решения задач структурной геологии чаще всего с целью поисков структур, благоприятных для скопления в них залежей нефти или газа и подготовки их к разведочному бурению, а также для прогнозирования наличия в них залежей нефти или газа. Данные, получаемые при детальных наблюдениях, в особенности МОВ, являются основой для обоснования места заложения глубоких разведочных скважин на нефть и газ. В сложных геологических условиях, при изучении глубоко залегающих структур и наличии сильных помех, для повышения глубинности и надёжности данных сейсмической разведки её сочетают со структурным бурением, проводя дополнительные сейсмические наблюдения в глубоких скважинах. Поиск и разведка нефти и газа ведутся также с помощью морской сейсмической разведки. Сейсмическую разведку применяют для изучения структуры рудных полей, обнаружения и прослеживания крупных разломов, определения формы коренных пород под наносами. Посредством ПЭМ обнаруживают и локализуют пегматитовые тела и кварцевые жилы. Методы сейсмической разведки позволяют изучать некоторые инженерные свойства грунтов в массиве, а также определять положение водоупоров и уровня грунтовых вод. Для повышения геологической и экономической эффективности геологоразведочных работ сейсмической разведки, особенно при региональных исследованиях, применяют в комплексе с другими геофизическими методами гравиметрической разведки, магнитной разведки и электрической разведки, что обеспечивает большую надёжность геологических прогнозов. Сейсмическая разведка позволяет изучать региональное глубинное строение земной коры вплоть до Мохоровичича поверхности, для чего применяют глубинное сейсмическое зондирование.

2H = SECOND HALF

2P = POLLUTION PREVENTION PLANS OR PROGRAM

2P = PROVEN PLUS PROBABLE

2PL = SECOND PARTY LOGISTIC MODEL

2–WAY MATCHING = 2–СТОРОННИЙ ПОДБОР – 2-Way Matching is the comparison of relevant voucher to purchase order.

3/4 FOLD YARN = ПРЯЖА, СЛОЖЕННАЯ В 3/4 – 3/4 Fold Yarn is the yarn containing 3 or 4 fold yarn. Spinning defect. 3/4 Fold Yarn is the yarn containing 3/4 fold yarn. Ply. Winding m/c. is more responsible for this type of fault. When one yarn breaks and joins to neighbours end. This may happen to parallel winding, two for one (TFO), and auto-winding m/cs. If conveyor belt of particular auto-winding block is not in working order and yarn from the ejected ring cops just pass and winds with the other running end and finally at ply winding made 3 fold yarn. Also, if stop motions of ply winding is not working properly. Higher package diameter causes slip of coil generates such type of faults. / Порок или Дефект прядения.

3D = THREE–DIMENSIONAL

3D SEISMIC SURVEY = СЕЙСМИЧЕСКОЕ ИЗЫСКАНИЕ 3И (или СЕЙСМИЧЕСКОЕ ИЗЫСКАНИЕ 3М, или СЕЙСМИЧЕСКАЯ РАЗВЕДКА 3И, или СЕЙСМОРАЗВЕДКА 3И) – 3D Seismic Survey is a study of strata formation using a system of sensors and explosive devices to obtain a three-dimensional strata model. In 3D exploration, the sensors are placed over the surface of the relevant area. This is one of the most accurate geophysical techniques, but requires major IT resources and other equipment and expenses. Therefore oil and gas companies usually carry out 2D seismic in order to ascertain which zones are most deserving of 3D studies. / Сейсмическое Изыскание (Сейсморазведка) в формате 3И или 3М это изучение строения пласта с помощью системы датчиков и взрывных устройств, направленное на получение трёхмерной модели залежей. Сокращение 3И предполагает под собой 3 измерения может называться также 3М, означая трёхмерное. При сейсмическом изыскании в формате 3И датчики размещаются по поверхности соответствующей области исследования. Это одна из самых точных геофизических техник, однако она требует значительных ресурсов вычислительной техники, а также иного оборудования и расходов. Исходя из этого нефтегазовые компании, как правило, проводят сейсмическую разведку в двумерном формате с тем, чтобы по её результатам выделить зоны для более детального обследования с помощью съёмки 3И. Сейсмическая Разведка или Сейсморазведка, группа методов разведочной геофизики, основанная на наблюдении процессов распространения искусственно возбуждаемых упругих волн. Используется для изучения строения земной коры, поисков и подготовки к разведочному бурению нефтеносных структур и другого. Сейсмическая Разведка или Сейсморазведка – методы разведочной геофизики, основанные на изучении особенностей распространения в земной коре упругих (главным образом продольных) волн, возбуждаемых взрывами (в неглубоких скважинах) или ударными и вибрационными генераторами. Применяется для изучения строения земной коры, поисков и подготовки к разведочному бурению нефтегазоносных структур и другого. 3PL = THIRD PARTY LOGISTICS

3–WAY MATCHING = 3–СТОРОННИЙ ПОДБОР – 3-Way Matching is the comparison of relevant voucher, purchase order, and receiver.

3XL = XXXL = EXTRA EXTRA EXTRA LARGE

4 C's OF CREDIT = 4 СИ. КРЕДИТА – 4 C's Of Credit are the four primary considerations that will affect a lender's decision to approve or decline your loan application. Known as the 4 C's Of Credit:- (1) Capacity – what is your ability to repay the loan? Do you have a job or another income source? Do you have other debts? (2) Character – will you repay the loan? Have you used credit before? Do you pay your bills on time? (3) Collateral – if you fail to repay your loan, is there something of value that you agree to forfeit? For example, if you are buying your first car, it could be used as collateral to insure that you will repay the loan. If you default, you lose your car. (4) Capital (accumulation) – what are you worth? Do you have other assets, such as a savings account, car, or certificate of deposit that could be used to repay the debt?

4D = FOUR–DIMENSIONAL

4D = TETRACHLORODIBENZO–(P)–DIOXIN

4F = TETRACHLORODIBENZOFURAN

4G = 4ДЬЖИ. – 4G is the industry term for fourth generation wireless mobile communications networks.

4PL = FOURTH PARTY LOGISTICS

4 SIEVE = СИТО № 4 – In the Rice industry of the United States, 4 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.062 5 (4/64) inch in diameter, 1/8 inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 4 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.062 5 (4/64) дюйма, с расстоянием от центра до центра этих отверстий в 1/8 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим.

4–4–5 CALENDAR = КАЛЕНДАРЬ 4–4–5 – 4–4–5 Calendar, in budgeting and accounting, is the breakdown of each month into weeks by counting the number of times Friday occurs within each month, e.g., Jan = 4 weeks, Feb = 4 weeks, Mar = 5 weeks, Apr = 4 weeks, May = 4 weeks, Jun = 5 weeks, etc. to total 52 weeks in a 12 month period. Every third month, Friday will occur 5 times. All other months, Friday will occur 4 times. In the months where Friday occurs 5 times, it is considered a 5 week month. Whereas, the 4 Friday months will be considered as 4 week months.

5D = PENTACHLORODIBENZO–(P)–DIOXIN

5F = PENTACHLORODIBENZOFURAN

5PL = FIFTH PARTY LOGISTIC

5 PLATE = РЕШЕТО № 5 – In the Rice industry of the United States, 5 Plate is a laminated metal plate 0.142–inch thick, with a top lamina, 0.051-inch thick, perforated with rows of round holes 0.078 1 (5/64) inch in diameter, 5/32 inch from center to center, with each row staggered in relation to the adjacent rows, and a bottom lamina 0.091-inch thick, without perforations. / на решётах. Решето – рабочая часть сельскохозяйственных машин, предназначенная для разделения зерна, семян, клубней картофеля и другого по размерам на фракции. Решёта бывают штампованные, проволочные (плетёные или тканые) и роликовые. На решётах с

круглыми отверстиями зерновой материал разделяют по ширине зёрен, а на решётах с продолговатыми отверстиями – по толщине. Решёта крепят в решётных станах. При колебаниях стана сортируемый материал движется по решётам, мелкие семена и примеси проходят через отверстия, а крупные идут сходом. Полотна:- № 1 – 15 (сито с отверстиями диаметром 1.5 мм); № 2А – 22·20 (сито с продолговатыми отверстиями размером 2.2·20 мм). Решётный Стан – многоярусный, он предназначен для исследования процесса сепарации зерновых материалов по интенсивности просеивания, а также служит для очистки зерна по обычной схеме работы решёт путём разделения материала на две фракции – ‘сход’ и ‘проход’. Рассев, машина для разделения продуктов измельчения зерна с помощью плоских сит, совершающих круговое поступательное движение в горизонтальной плоскости. Рассевы получили распространение в конце XIX века; в России их производство было начато в 1888. Основными частями являются механизм привода и набор сит, установленных в корпусе. Рассевы различаются по числу корпусов (одно- и двухкорпусные), по роду привода (кривошипные и самобалансирующиеся), по числу ‘приёмов’ – секций, в которых можно одновременно сепарировать различные смеси. Сепарируемая смесь перемещается по расположенным одно под другим горизонтальным (иногда слегка наклонным) ситам, просеивается и образует несколько (обычно 3–6) фракций, отличающихся крупностью частиц. Рассевы применяются в основном при производстве муки и крупы. Рассев:- просеивание продукта происходит под собственным весом, при движении продукта по горизонтально натянутому ситу, за счёт инерции продукта, при совершении рассевом круговых движений в горизонтальной плоскости. Рассев является классическим просеивающим устройством, применяемым на мельницах и, если это рассев пакетного типа, то он полностью обеспечивает необходимое качество разделения продуктов на фракции, отсутствие подсоров в готовой продукции и высокое качество муки:- (i) продукты размола перемещаются по поверхности сит в рассеве тонким слоем и при движении, просеиваются сквозь сито под собственным весом; (ii) наличие в рассеве необходимого количества сит с разным размером позволяет более тщательно вести отбор продуктов размола и отправлять их на выбой или дальнейший размол, если фракция не просеялась. Величина размера ячейки сита должна соответствовать требованиям по крупности получаемого продукта, и чем больше номенклатура сит в просеивающем устройстве, тем качественнее произведётся просеивание. В рассеве количество сит разного размера составляет 15 видов, это значит, что при проходе через несколько сит, продукты размола, во-первых, насыщаются кислородом (важно при производстве мучных изделий), а во-вторых, просеиваются качественнее. Не просеявшиеся частицы ещё раз уйдут на станок вальцовый для домола; (iii) ещё более важна площадь просеивающей поверхности, чем она больше, тем лучше и качественнее будет мука. Это преимущество полностью реализованы в рассеве пакетного типа. Его просеивающая поверхность (26.1 м^2) больше, чем у всех других рассевов. Большая просеивающая поверхность позволяет пропустить через сито и тщательно просеять большой объём продукта; (iv) в процессе работы сита не забиваются продуктами размола; (v) рассев может работать без остановки в течение года и более, не требуя замены сит, так как продукт в рассеве просеивается естественным путём и движется самотёком, оказывая минимальное абразивное воздействие на поверхность сит; (vi) замена сита в ячейке рамки рассева производится в течение 35–40 минут, это не требует большого опыта и квалификации, так как натяжка производится только в горизонтальной плоскости. Замена сит на всех рамках рассева займёт от 14 до 22 часов, это потребуется произвести раз в год или реже, но точно не каждую неделю; (vii) при необходимости можно изменить технологическую схему рассева для изменения соотношение процентов выхода муки различных сортов; (viii) пакетная конструкция рассева имеет свои значительные преимущества. Важным моментом является отсутствие подсоров в просеивающем устройстве, предотвращение порывов сит и прохода сквозь сито более крупных фракций (происходит зачастую при принудительном просеивании). Эти проблемы есть у рассевов шкафного типа, вымольных машин при порыве сита, в рассеве проблем с подсором нет вообще. (ix) рассевные мельницы не требуют устройства специальных фундаментов. Вибрация и инерция вращающегося рассева гасятся за счёт высокоточной хорошо просчитанной балансировки механизма привода рассева. Для установки мельницы не требуется фундамент, достаточно ровной и устойчивой поверхности, на которую они устанавливаются. Наиболее эффективным устройством для просеивания продуктов размола на мельницах являются рассевы пакетного типа, применённые на мельницах ‘Мукомол’. Такой рассев позволяет тщательно разобрать продукт по фракциям после каждой из стадий размола, обеспечивает отсутствие подсоров и качество получаемой муки. Рассев представляет собой двухкорпусную конструкцию, в каждом корпусе которого уложены друг на друга двенадцать деревянных рамок. Все рамки скреплены между собой специальными вертикальными ‘стяжками’ для обеспечения прочности всей конструкции и избежания попадания подсоров в муку – в этом также помогает то, что рассев изготавливается вручную и подгонка рамок друг к другу осуществляется с точностью до мельчайших шероховатостей. Благодаря этому обеспечивается отсутствие порывов сит и подсоров. Всего в рассеве – 24 рамки, на каждую рамку натянуто от одного до трёх сит различающихся размерами отверстий, снизу сита очищаются самоходными инерционными резиновыми очистителями. Просеивающая поверхность рассева мельницы составляет 26.1 м^2. В мельницах за счёт такой большой площади просеивающей поверхности сит в рассеве увеличена пропускная способность, что делает отбор продуктов размола более тщательным и даёт высокое качество муки. На мельницах, также за счёт этого, создан потенциал для увеличения производительности мельницы. У мельницы её можно увеличить с 20 до 25 тонн в сутки (при сортовом помоле) и до 30 тонн (на общем помоле). Качество муки при этом не ухудшается. Всё это положительно сказывается на снижении себестоимости продукции и повышении эффективности производства. В процессе работы конструкция рассева приводится в непрерывное круговое движение в горизонтальной плоскости с помощью балансирного механизма. Преимущество данного типа рассева заключается в том, что полностью исключается подсор, то есть гарантируется чистота получаемого продукта. Эта проблема есть у рассевов шкафного типа и у вымольных машин при порыве сита (при использовании машин в качестве основного просеивающего устройства) и прохода сквозь него более крупных фракций – это также происходит при принудительном просеивании в пневмоцентробежных рассеивателях. Наиболее качественными показателями получаемой продукции и проценту выхода обладают вальцовые рассевные мельницы. Именно рассевные мельницы позволили достичь высокой производительности при переработке зерна, а получаемая на них продукция отличается качеством и удовлетворяет всем требованиям ГОСТа.

5 SIEVE = СИТО № 5 – In the Rice industry of the United States, 5 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.078 1 (5/64) inch in diameter, 5/32 inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 5 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.078 1 (5/64) дюйма, с расстоянием от центра до центра этих отверстий в 5/32 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим. Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

6D = HEXACHLORODIBENZO–(P)–DIOXIN

6F = HEXACHLORODIBENZOFURAN

6 PLATE = РЕШЕТО № 6 – In the Rice industry of the United States, 6 Plate is a laminated metal plate 0.142-inch thick, with a top lamina 0.051-inch thick, perforated with rows of round holes 0.093 8 (6/64) inch in diameter, 5/32 inch from center to center, with each row staggered in relation to the adjacent rows, and a bottom lamina 0.091-inch thick, without perforations. / на решётах (или деках). Решето – рабочая часть сельскохозяйственных машин, предназначенная для разделения зерна, семян, клубней картофеля и другого по размерам на фракции. Решёта бывают штампованные, проволочные (плетёные или тканые) и роликовые. На решётах с круглыми отверстиями зерновой материал разделяют по ширине зёрен, а на решётах с продолговатыми отверстиями – по толщине. Решёта крепят в решётных станах. При колебаниях стана сортируемый материал движется по решётам, мелкие семена и примеси проходят через отверстия, а крупные идут сходом.

6 SIEVE = СИТО № 6 – In the Rice industry of the United States, 6 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.093 8 (6/64) inch in diameter, 5/32 inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 6 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.093 8 (6/64) дюйма, с расстоянием от центра до центра этих отверстий в 5/32 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим. Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

7D = HEPTACHLORODIBENZO–(P)–DIOXIN

7F = HEPTACHLORODIBENZOFURAN

8D = OCTACHLORODIBENZO–(P)–DIOXIN

8F = OCTACHLORODIBENZOFURAN

8K REPORT = ОТЧЁТ ПО ФОРМЕ 8КЕЙ. – In the United States, 8-K Report is a document required by the Securities and Exchange Commission (SEC) to announce certain significant changes in a public company, such as a merger or acquisition, a name or address change, bankruptcy, change of auditors, or any other information which a potential investor ought to know about. / В Соединённых Штатах Америки Отчёт по Форме 8-Кей является документом, требуемым Комиссией по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении), для анонсирования определённых существенных изменений в компании открытого типа (публичной компании), таких как слияние или поглощение, изменение названия или адреса, банкротство, смена аудиторов или любая другая информация, которую следовало бы знать потенциальному инвестору.

10K REPORT = ОТЧЁТ ПО ФОРМЕ 10КЕЙ. – In the United States, 10-K Report is the audited annual report that most reporting companies file with the Securities and Exchange Commission (SEC). It provides a comprehensive overview of the registrant's business. The report must be filed within 90 days after the end of the company's fiscal year. 10-K Report is an official document filed annually by a publicly traded company with the SEC that includes similar information that is within a prospectus or annual report, but also provides additional updated financial information on corporate activities. The 10K Report provides in-depth information on a company's products, market segment, competitors, customers, management and legal proceedings. The US Securities And Exchange Commission (SEC) requires all publicly traded companies to file the 10K on an annual basis. 10-K is an annual report required by the US Securities and Exchange Commission (SEC) each year. Provides a comprehensive overview of a company's state of business. Must be filed within 90 days after fiscal year-end. A 10-K report is filed quarterly. / В Соединённых Штатах Америки Отчёт по Форме 10-Кей. является аудированным ежегодным отчётом, для Комиссии по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

10Q = THANK YOU

10Q REPORT = ОТЧЁТ ПО ФОРМЕ 10КЬЮ. – In the United States, 10-Q Report is a report filed quarterly to the Securities and Exchange Commission (SEC) by most reporting companies. It includes unaudited financial statements and provides a continuing view of the company's financial position during the year. The report must be filed for each of the first three fiscal quarters of the company's fiscal year and is due within 45 days of the close of the quarter. The 10Q Report delivers a detailed analysis of a firm's quarterly earnings results. The US Securities And Exchange Commission (SEC) requires all publicly traded companies to file the 10Q on a quarterly basis. 10-Q is a quarterly financial report required to be filed with the SEC by public companies. The financial statements inside the quarterly report are not required to be audited by the SEC. However, the financial statements often provide information on a company's quarterly earnings, management discussion and analysis of financial condition. 10-Q is a quarterly report required by the US Securities and Exchange Commission (SEC) each quarter. Provides a comprehensive overview of a company's state of business. / В Соединённых Штатах Америки Отчёт по Форме 10-Кью. является ежеквартальным отчётом, заполняемым большинством отчитывающихся компаний перед Комиссией по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Он состоит из неаудированной отчётности и обеспечивает непрерывный взгляд на финансовое состояние компании в течение года. Этот отчёт должен заполняться по каждому из трёх фискальных кварталов фискального года компании и предоставляться в течение 45 дней после окончания квартала. Отчёт по Форме 10-Кью. предоставляет подробный анализ поквартальных результатов заработков фирмы. Комиссия США по Ценным Бумагам и Биржам требует, чтобы все публично торгуемые компании (открытые акционерные общества) заполняли такой отчёт на квартальной основе. Финансовый отчёт, требуемый Комиссией США по Ценным Бумагам и Биржам к заполнению на поквартальной основе публичными компаниями. Комиссия не выдвигает требования к аудиту финансовой отчётности внутри этого поквартального отчёта. Однако, финансовая отчётность часто обеспечивает информацией о поквартальных заработках компании, дискуссиях управления и анализе финансового положения.

10% GUIDELINE = ДИРЕКТИВА О 10% – 10% Guideline:- the standard analysts' principle that funded debt over 10% of the assessed valuation of taxable property for a municipality is excessive.

12B–1 FEES = 12БИ.–1 ВОЗНАГРАЖДЕНИЯ – 12B–1 Fees:- the percent of a mutual fund's assets used to defray marketing and distribution expenses. The amount of the fee is stated in the fund's prospectus. The US Securities and Exchange Commission (SEC) has recently proposed that 12B-1 fees in excess of 0.25% be classed as a load. A true no load fund has neither a sales charge nor a 12b-1 fee.

12B–1 FUNDS = 12БИ.–1 ФОНДЫ – 12B–1 Funds are the mutual funds that do not charge an up-front or back-end commission, but instead take out up to 1.25% of average daily fund assets each year to cover the costs of selling and marketing shares, an arrangement allowed by the SEC's Rule 12B-1 (passed in 1980). The US Securities and Exchange Commission (SEC).

13TH PERIOD = 13–Й ПЕРИОД – 13th Period:- in the fiscal year is the period used for fiscal year-end adjusting entries (periods 1–12 being the months in the fiscal year).

15 MINUTE RULE = ПРАВИЛО 15 МИНУТ – 15 Minute Rule is a timekeeping method used as a semi-official delay prior to ending or beginning an activity. For example:- (a) only waiting for a tardy college instructor for 15 minutes prior to the class being terminated; or (b) putting a 15 minute hands-off delay before impulsively eating a candy when dieting.

19C3 STOCK = АКЦИЯ 19СИ.3 – In the United States, 19C3 Stock is a stock listed on a national securities exchange after April 26, 1979, that is exempt from the Securities and Exchange Commission rule that prohibits exchange members from participating in off-board trading.

20% CUSHION RULE = ПРАВИЛО ПОДУШКИ В 20% – 20% Cushion Rule is a rule of thumb for municipal bonds. Under the rule, the revenue a municipal bond raises should exceed the proposed budget of the project the bond intends to fund by at least 20%. This allows the bond to account for unforeseen expenses. Following a cushion rule is especially important because municipal bonds are ultimately financed by taxpayer money. 20% Cushion Rule is the guideline that revenues from facilities financed by municipal bonds should exceed the operating budget plus maintenance costs and debt service by at least 20% to allow for unforeseen expenses.

21/2 SIEVE = СИТО № 21/2 – In the Rice industry of the United States, 21/2 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.039 1 (21/2/64) inch in diameter, 0.075-inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 21/2 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.039 1 (21/2/64) дюйма, с расстоянием от центра до центра этих отверстий в 0.075 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим. Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

25% RULE = ПРАВИЛО О 25% – 25% Rule is the guidelines that bonded debt over 25% of a municipality's annual budget is excessive.

26 USCA = THE UNITED STATES CODE ANNOTATED:- TITLE 26

30 SIEVE = СИТО № 30 – In the Rice industry of the United States, 30 Sieve is a woven wire cloth sieve having 0.023 4-inch openings, with a wire diameter of 0.015 3 inch, and meeting the specifications of American Society for Testing and Materials Designation E-11-61, prescribed in the US Federal Grain Inspection Service (FGIS) instructions. / Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

33/50 = ENVIRONMENTAL PROTECTION AGENCY (EPA) PROJECT INVITING MANUFACTURERS TO MAKE REDUCTIONS

46 CFR = THE CODE OF FEDERAL REGULATIONS:- TITLE 46

48–HOUR RULE = ПРАВИЛО 48 ЧАСА – 48-Hour Rule:- the Public Securities Association (PSA) Uniform Practices requirement that all pool information in a to be announced (TBA) transaction be communicated by the seller to the buyer before 03 pm EST on the business day 48 hours prior to the agreed-upon trade date.

49 USC = THE UNITED STATES CODE:- TITLE 49

51/2 SIEVE = СИТО № 51/2 – In the Rice industry of the United States, 51/2 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.085 9 (51/2/64) inch in diameter, 9/64 inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 51/2 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.085 9 (51/2/64) дюйма, с расстоянием от центра до центра этих отверстий в 9/64 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим. Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

61/2 SIEVE = СИТО № 61/2 – In the Rice industry of the United States, 61/2 Sieve is a metal sieve 0.032-inch thick, perforated with rows of round holes 0.101 6 (61/2/64) inch in diameter, 5/32 inch from center to center, with each row staggered in relation to the adjacent rows. / В рисовой индустрии Соединённых Штатов Америки по Ситом № 61/2 понимается металлическое сито толщиной в 0.032 дюйма, перфорированное рядами круглых отверстий диаметром 0.101 6 (61/2/64) дюйма, с расстоянием от центра до центра этих отверстий в 5/32 дюйма, причём каждый ряд располагается в шахматном порядке по отношению к примыкающим. Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают сита плоские (вибрационные, качающиеся) и барабанные (вращающиеся). Применяются главным образом при грохочении и в мукомольном производстве.

80–20 RULE = ПРАВИЛО О 80–20 – 80–20 Rule (Pareto Principle/Law) is a general rule of thumb in business that says that 20% of the items produce 80% of the activity, while 20% of the product line produces 80% of the sales, 20% of the customers generate 80% of the complaints, and so on. In evaluating any business situation, look for the small group which produces the major portion of the transactions you are concerned with. This rule is not exactly accurate, but it reflects a general truth, nothing is evenly distributed.

144 STOCK = АКЦИЯ 144 – In the United States, 144 Stock:- used in the context of general equities. Restricted stock.

401(K) PLAN = ПЛАН 401(КЕЙ.) – 401(K) plan is a tax-deferred investment and savings plan that serves as a personal retirement fund for employees. 401(K) Plan is a retirement plan in the United States that allows qualified employees to contribute money from their paychecks into a tax-sheltered account. Under section 401(K) of the Internal Revenue Code, a deferred compensation plan set up by an employer so that employees can set aside money for retirement on a pre-tax basis. Employers may match a percentage of the amount that employees contribute to the plan. Contributions by both employees and employers, as well as investment earnings and interest, are not taxed until the employee withdraws the money; if the employee withdraws the money before retirement age, he or she pays an early withdrawal penalty tax. Currently, employees are allowed to annually contribute up to 15 percent of their salary but no more than USD11 000 (USD12 000 for people 50 or older). Many employers now offer these deferred compensation plans in lieu of or in addition to pensions. / План 401(Кей.):- предлагаемая работникам альтернативная пенсионная программа. Вместо получения наличных средств, подлежащих обложению налогом, в виде компенсационных выплат и бонусов работник может перечислять средства счёта с отсроченным налогом. Суммы, которые перечисляются на такие счета, не могут превышать 9 000 Долларов в

год (размер взноса ежегодно пересматривается Службой Внутренних Доходов (СВД; Internal Revenue Service (IRS)) – налоговым управлением США с учётом инфляции). Многие компании, стимулируя своих работников для участия в такой программе, могут делать дополнительные отчисления в программу, размер которых может составлять от 10 до 100% перечисляемых работником сумм. Все отчисления, произведённые работниками и работодателями, могут быть инвестированы в несколько взаимных фондов, инвестирующих в акции или облигации, гарантированные инвестиционные контракты (guaranteed investment contract), фонды денежного рынка и акции компании. Работники контролируют размещение средств и могут перемещать деньги, по крайней мере, раз в год, а в некоторых случаях и ежедневно. При изъятии средств из программы 401(Кей.) до достижения работником 59.5 лет, за исключением случаев смерти, инвалидности, увольнения или других чрезвычайных обстоятельств, взимается налоговая пеня в размере 10%. Со средств, снятых работником после достижения им 59.5 лет, взимается обычный налог в год изъятия средств. Высокооплачиваемые работники имеют определённые ограничения на участие в программе. В последние годы программа 401(Кей.) приобретает всё большую популярность и во многих случаях вытесняет традиционные пенсионные программы с гарантированными фиксированными выплатами после установленной выслуги лет, платежи по которой производятся работодателем (defined benefit pension plans). Работники отдают предпочтение программе 401(Кей.), поскольку она позволяет снизить их налоговые обязательства в год осуществления взносов и отсрочить выплату налогов до выхода на пенсию. Работодатели предпочитают эту программу, потому что она менее дорогая, чем традиционные пенсионные программы, и позволяет перенести ответственность за размещение средств на самих работников. Эту программу называют также Соглашением Об Отсрочке Платежей (СООП; Cash Or Deffered Arrangement (CODA)) или Планом Сокращения Выдаваемой На Руки Заработной Платы (Salary Reduction Plan).

403 (B) = 403 (БИ.) – In the United States, under section 403(b) of Internal Revenue Code, 403(b) plan is a tax-advantaged retirement savings plan for public education organizations, cooperative hospital service organizations, and some non-profit employers. Tax treatment is similar to that of 401(K) plan. / План 403 (Би.) (403 (b) Plan):- вид индивидуального пенсионного счёта (individual retirement account (IRA)), описанный в разделе 403(Би.) Кодекса Внутренних Доходов (Internal Revenue Code) – налогового кодекса в США, который позволяет служащим неприбыльных организаций откладывать средства, налог с которых уплачивается только после снятия средств со счёта (с отложенным платежом налогов – tax-deferred).

940 FORM = ФОРМА 940 – 940 Form is the US Internal Revenue Service (IRS) Employer's Annual Payroll Tax form.

941 FORM = ФОРМА 941 – 941 Form is the US Internal Revenue Service (IRS) Employer's Federal Quarterly Payroll Tax form.

1040 FORM = ФОРМА 1040 – 1040 Form is the standard individual tax return form of the US Internal Revenue Service (IRS). A 1040 Form is the standard Internal Revenue Service (IRS) form that individuals use to file their annual income tax returns. The form contains sections that require taxpayers to disclose their financial income status for the year in order to ascertain whether additional taxes are owed or whether the taxpayer is due for a tax refund. 1040 forms need to be filed with the IRS by April 15. Also known as the 'US Individual Income Tax Return' or the 'Long Form'. While the 1040 form is composed of only a couple of pages, taxpayers may need to fill out extra sections called Schedules. For example, if a taxpayer received dividends that totaled more than USD1 500, he or she will need to fill out Schedule B, which is the section for reporting interest and ordinary dividends. There are several variations of the 1040 depending on your individual tax situation. For example, taxpayers that possess very simple taxation circumstances can fill out the Form 1040EZ, which is a less comprehensive form. Form 1040, US Individual Income Tax Return:- annual income tax return filed by citizens or residents of the United States. Individuals can file this form who have varied incomes and would like to take various deductions.

1042S = 1042ЭС. – 1042S is a tax form provided to foreign owners of American securities to report the dividend or interest earnings for the calendar year.

1099 = 1099 – 1099 is a statement sent to the US Internal Revenue Service (IRS) and taxpayers by the payers of dividends and interest and by issuers of taxable original issue discount securities. 1099:- a series of tax forms provided to taxpayers by financial institutions to report income to the Internal Revenue Service. There are four types of 1099 forms:- (i) 1099B – Reports the proceeds from the sale or the exchange of securities; (ii) 1099DIV – Reports dividend income; (iii) 1099INT – Reports interest income; and (iv) 1099OID – Reports income from an Original Issue Discount.

1099 B = 1099 БИ. – 1099 B is the tax statement used for reporting proceeds resulting from the sale, redemption or liquidation of shares.

1099 DIV = 1099 ДИВ – 1099 DIV is the tax statement used for reporting dividends paid to registered shareholders. Form 1099-DIV is a form sent to investors by investment fund companies. The form is a record of all taxable capital gains and dividends paid to an investor, including those that have been re-invested in a given taxation year. The amounts stated on the form represent the amounts that fund companies are attributing to each investor's investment return for the year and reporting to the US Internal Revenue Service (IRS). Investors use Form 1099-DIV to help report income received from investments on their tax return each year. Form 1099-DIV reports the ordinary dividends, total capital gains, qualified dividends, non-taxable distributions, federal income tax withheld, foreign tax paid and foreign source income from each investment account held by a fund company. Forms are not sent to investors who received or re-invested a total of less than USD10 per fund. Form 1099-DIV, Dividends and Distributions:- this form is used by banks and other financial institutions to report dividends and other distributions to taxpayers and to the IRS. Form 1099-DIV, Dividends and Distributions, reports dividend income you received from your investments. If you received dividend income during the tax year, your broker or financial institution should send you this form (or a substitute or consolidated statement) by February 01 of the following year. As with any 1099 form, keep it with your tax records.

1099 FORM = ФОРМА 1099 – In the United States, 1099 Form is a statement sent to the US Internal Revenue Service (IRS) and taxpayers by the payers of dividends and interest and by issuers of taxable original issue discount securities.

1099 VENDOR = 1099 ПОСТАВЩИК (или 1099 РАЗРАБОТЧИК) – A 1099 Vendor is a designation, or flag, listed in each of the records in the vendor master file that is part of an accounting software package. If you designate a supplier as a 1099 vendor, the system will print a Form 1099 for the supplier as part of the 1099 batch processing that follows the end of the calendar year. The company then sends the resulting 1099 form to the supplier, which the supplier should use for tax filing purposes. The software should not print a Form 1099 for any supplier for which the company has issued cumulative payments for the full calendar year of less than USD600. You send a copy of this report to the Internal Revenue Service (IRS). The intent of the 1099 vendor designation is to ensure that suppliers report the correct amount of income to the IRS for income tax reporting purposes. You should apply the 1099 vendor designation to any supplier that has the following characteristics (this is a partial list):- (i) professional services fees; (ii) commissions paid to non-employees; (iii) fees paid to independent contractors; (iv) taxable fringe benefits for non-employees; (v) director's fees; (vi) fish purchased for cash; and (vii) golden parachute payments. Generally, this designation is for a supplier entity that is not a corporation. The best practice for designating a 1099 vendor is to have all suppliers fill out and submit a Form W-9, Request for

Taxpayer Identification Number and Certification, before paying them. You can then infer from the Form W-9 what the proper designation should be. It is also a good practice to have the Form W-9 updated on an annual basis, so that you continue to have the most recent mailing address on file for each supplier. Doing so always warns you of any organizational changes in a supplier; this is useful for updating the 1099 flag in the accounting software. See also Vendor. / в хозяйском файле разработчика, .

▲ = UP = СОВЕРШЕНА – Print; up on the ticker tape, confirming that the trade has been executed. / Печатный символ в виде треугольника вершиной вверх на тиккерной ленте, подтверждающий исполнение сделки.

- A -

A = A – A:- Latin prefix:- not, negative, without, lacking. / Приставка А в переводе с Латинского и Греческого языков означает Без или Не или Отрицательный.

A = ЭЙ. – (1) A is the fifth letter of a NASDAQ® stock symbol specifying Class A shares. / Эй. (А) – пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что .

(2) A:- redness-greenness coordinate in certain transformed color spaces (Hunter L,a,b or CIELAB), generally used as the difference in 'a' between a specimen and a standard reference color. If 'a' is positive, there is more redness than greenness; if 'a' is negative, there is more greenness than redness. It is normally used with b as part of the chromaticity or chromaticity color difference.

A = ALPHA

A = ALSO EXTRA OR EXTRAS

AAA = AUTOMATED AIRLIFT ANALYSIS

AAA+ BANK = БАНК AAA+ (или БАНК С РЭЙТИНЬГОМ AAA+) – AAA+ Bank:- banks are rated according to their credit worthiness by Intervest Bancsshares Corporation (IBCA), Moodys Investor Service Ltd and Standard & Poors. The only AAA bank in the US is JP Morgan. / Интёвэст Бэньксщэаз Корпорэйшэн (Intervest Bancsshares Corporation (Ай.Би.Си.Эй. (IBCA)), Мудиз Инвэстоз Сёвис Лимитид (Moodys Investor Service Ltd) и Стэндод Энд Поз (Standard & Poors). В США банком с рэйтиньгом AAA является лишь Дьжей.Пи. Моргэн (JP Morgan).

AAAA = ALWAYS ACCESSIBLE ALWAYS AFLOAT

AAA–CPA = AMERICAN ASSOCIATION OF ATTORNEY–CERTIFIED PUBLIC ACCOUNTANTS

AAACU = ASIAN ASSOCIATION OF AGRICULTURAL COLLEGES AND UNIVERSITIES

AAAE = ASIAN ASSOCIATION OF AGRICULTURAL ENGINEERS

AAAS = AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

AAASA = ASSOCIATION FOR THE ADVANCEMENT OF AGRICULTURAL SCIENCES IN AFRICA

AAATDC = ASSOCIATION FOR THE ADVANCEMENT OF APPROPRIATE TECHNOLOGY FOR DEVELOPING COUNTRIES

AAC = ADVANCED AERA CONCEPTS

AACC = AMERICAN ASSOCIATION OF CEREAL CHEMISTS

AACSB = AMERICAN ASSEMBLY OF COLLEGIATE SCHOOLS OF BUSINESS

AADC = APPROACH AND DEPARTURE CONTROL

AADT = AVERAGE ANNUAL DAILY TRAFFIC

AAF = ARMY AIRFIELD

AAFI = ASSOCIATED ACCOUNTING FIRMS INTERNATIONAL

AAHCPA = AMERICAN ASSOCIATION OF HISPANIC CPAs

AAI = ARRIVAL AIRCRAFT INTERVAL

AAIA = AIRPORT AND AIRWAY IMPROVEMENT ACT

AAII = AMERICAN ASSOCIATION OF INDIVIDUAL INVESTORS

AAL = AMERICAN AIRLINES

AALPS = AUTOMATED AIR LOAD PLANNING SYSTEM

AAMA = AMERICAN AUTOMOBILE MANUFACTURERS ASSOCIATION

AAMVA = AMERICAN ASSOCIATION OF MOTOR VEHICLE ADMINISTRATORS

AAN = AIR AMBULANCE NETWORK

AAOSA = ALWAYS AFLOAT OR SAFE AGROUND

AAP = ADVANCED AUTOMATION PROGRAM

AAPA = AMERICAN ASSOCIATION OF PORT AUTHORITIES

AAPA = ASSOCIATION OF ASIA–PACIFIC AIRLINES

AAR = AGAINST ALL RISKS

AAR = AIRPORT ACCEPTANCE RATE

AAR = ASSOCIATION OF AMERICAN RAILROADS

AARA = AMSTERDAM–ANTWERP–ROTTERDAM AREA

AARD = AGENCY FOR AGRICULTURAL RESEARCH AND DEVELOPMENT

AAS = ADVANCED AUTOMATION SYSTEM

AAS = AIRPORT ADVISORY SERVICE

AASE = AFRICAN ASSOCIATION OF SCIENCE EDITORS

AASHTO = AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

AAT = ACCELERATED AGING TREATMENT

AAT = ASSOCIATION OF ACCOUNTING TECHNICIANS

AATCC = AMERICAN ASSOCIATION OF TEXTILE CHEMISTS AND COLORISTS

AA TRANSACTION = AGAINST ACTUAL TRANSACTION

AAU = AMENDMENT TO ALLEGE USE

AAU = ASSAM AGRICULTURAL UNIVERSITY

AAWDT = ANNUAL AVERAGE WEEKDAY TRAFFIC

AB = A/B = AKTIEBOLAG

ABA = ABSCISIC ACID ANALOGUE

ABA = ACCREDITED BUSINESS ACCOUNTANT

ABA = ACCREDITED BUSINESS ADVISOR

ABA = AMERICAN BAR ASSOCIATION

ABA = AMERICAN BUS ASSOCIATION

ABA # = AMERICAN BANKERS ASSOCIATION NUMBER

АВА = АБА (или КРЕСТЬЯНСКОЕ СУКНО) – Aba is a fabric woven from the hair of Camels or Goats. A loose sleeveless outer garment worn as traditional dress by men in the Middle East.

АВАСА = АБАКА – (1) The plant that yields Abaca. Abaca, Musa textilis (from Spanish 'Abacá' for Musa textilis) is a Species of Banana native to the Philippines, grown widely as well in Borneo and Sumatra. It is sometimes referred to as 'BacBac'. The plant is of great economic importance, being harvested for its fiber, once generally called Manila Hemp, extracted from the leaf sheath around the trunk. On average, the plant grows about 20 feet (6 meters) tall. The fiber was originally used for making twines and ropes as well as the Manila envelope; now most abaca is pulped and used in a variety of paper-like products including filter paper and banknotes. It is classified as a hard fiber, along with coir, henequin and sisal. The plant's name is sometimes spelled Abaka. Abaca was first cultivated on a large scale in Sumatra in 1925 under the Dutch, who had observed its cultivation in the Philippines for cordage since the XIX century, followed up by plantings in Central America sponsored by the US Department of Agriculture. Commercial planting began in 1930 in British North Borneo; with the commencement of World War II, the supply from the Philippines was eliminated by the Japanese. Other common names for Abaca or Manila Hemp include 'Cebu Hemp' and 'Davao Hemp'. Abaca is a bananalike plant native to the Philippines and having broad leaves with long stalks. Abaca:- The Plant:- Also called Manila Hemp, Abaca is extracted from the leaf sheath around the trunk of the Abaca plant (Musa Textilis), a close relative of the Banana, native to the Philippines and widely distributed in the humid tropics. Harvesting Abaca is laborious. Each stalk must be cut into strips which are scraped to remove the pulp. The fibers are then washed and dried. The Fiber:- Abaca is a leaf fiber, composed of long slim cells that form part of the leaf's supporting structure. Lignin content is a high 15%. Abaca is prized for its great mechanical strength, buoyancy, resistance to saltwater damage, and long fiber length – up to 3 meters. The best grades of Abaca are fine, lustrous, light beige in colour and very strong. Abaca:- Once a favoured source of rope for ship's rigging, Abaca shows promise as an energy-saving replacement for glass fibers in automobiles. Uses Of Abaca:- During the XIX century Abaca was widely used for ships' rigging, and pulped to make sturdy manila envelopes. Today, it is still used to make ropes, twines, fishing lines and nets, as well as coarse cloth for sacking. There is also a flourishing niche market for Abaca clothing, curtains, screens and furnishings. Paper made from Abaca pulp is used in stencil papers, cigarette filter papers, tea-bags and sausage skins, and also in currency paper (Japan's Yen banknotes contain up to 30% Abaca).

Mercedes Benz has used a mixture of polypropylene thermoplastic and Abaca yarn in automobile body parts. Production of Abaca fiber uses an estimated 60% less energy than production of glassfiber. Producers:- The world's leading Abaca producer is the Philippines, where the plant is cultivated on 130 000 ha by some 90 000 small farmers. While the crop is also cultivated in other Southeast Asian countries, the Philippines' closest rival is Ecuador, where Abaca is grown on large estates and production is increasingly mechanized. Production And Trade:- In 2007, the Philippines produced about 60 000 tons of Abaca fiber, while Ecuador produced 10 000 tons. World production is valued at around USD30 million a year. Almost all Abaca produced is exported, mainly to Europe, Japan and the USA. Exports from the Philippines are increasingly in the form of pulp rather than raw fiber. Abaca is a Philippine plant having leafstalks that yield Manila hemp used for rope and paper etc. / Виды (Species). Абака или Текстильный Банан – многолетнее травянистое растение рода банан. Родина – Филиппинские Острова. Культивируется в тропиках.

(2) Abaca is one of the strongest of the hard fibers, commercially known as Manila Hemp. Abaca is obtained from the leafstalks of a member of the banana family. The plant resembles the fruiting banana, but is a bit shorter in stature, bears small inedible fruits, and has leaves that stand more erect than those of the banana, and that are slightly narrower, more pointed, and 5–7 ft (1.5–2 m) long. The plant was domesticated long ago in the southern Philippines. Abaca prefers a warm climate with year-round rainfall, high humidity, and absence of strong winds. Soils must always be moist but the plant does not tolerate waterlogging. Abaca grows best on alluvial soils in the southern Philippines and northern Borneo below 1 500 ft (450 m) elevation. The plant is best propagated by rootstalk suckers. There are about 75 varieties grown in the Philippines, grouped into seven categories, each of which varies slightly in height, length, and quality and yield of fiber. The fiber ranges 6–14 ft (1.8–4.2 m) in strand length, is lustrous, and varies from white to dull yellow. As one of the longest and strongest plant fibers, resistant to fresh and salt water, abaca is favored for marine hawsers and other high-strength ropes. Abaca is also used in sackings, mattings, strong papers, and handicraft art goods. Abaca is affected by several diseases, of which the chief are bunchy top, mosaic, and wilt. Bunchy top is caused by a virus spread by the banana aphid (Pentalonia nigronervosa). Mosaic is also caused by a virus spread by aphids (chiefly Rhopalosiphum Nymphaeae and Aphis Gossypii). Abaca wilt is caused by a soil or water-borne fungus, chiefly attacking plant roots. Abaca is a hemp like fiber used for cordage grown in the Philippine Islands. Abaca is a naturally occurring fiber found in the stem of the abaca plant. A member of the Banana family, Musa Textilis. The fiber is also called Manila Hemp, and is used extensively in the manufacture of marine cordage, abrasive backing papers, tea bags, and other products requiring high tensile strength. / Мозаичность или Крапчатость или Пёстрая Гниль (Mosaic). Банановая Тля (Banana Aphid). Хлопковая Тля (Aphis Gossypii). Абака является тем же самым, что Манильская Пенька. Абака – волокно, получаемое из влагалищ листьев тропического растения Абака. Из этого волокна изготовляют морские канаты, верёвки, рыболовные сети и прочее.

ABAFT = В КОРМОВОЙ ЧАСТИ – Abaft is a point beyond the midpoint of a ship's length, towards the rear or stern. / Точка за срединой судна, по направлению к задней части или корме.

ABANDON = АБАНДОН (или ОТКАЗАТЬСЯ) – (1) Abandon:- to withdraw from a premium deal by paying a penalty or premium agreed upon in advance. / Под Абандоном, от Французского слова Abandon, означающее Оставление или Отказ (от чего-то) или Уход (от ...), понимается выход из сделки с премией посредством оплаты предварительно согласованного штрафа или премии.

(2) Abandon:- in option trading, to elect not to exercise or offset a long option position. / В торговле опционами, принятие решения не исполнять опцион или не зачитывать ранее открытую позицию покупки опциона.

(3) Abandon is a proceeding wherein a shipper/consignee seeks authority to abandon all or parts of their cargo.

(4) Abandon:- in insurance, unreasonable failure to continue activities necessary to produce agricultural commodities or allowable income, performing activities so insignificant as to provide no benefit to the agricultural commodities produced on the farm, or failure to harvest or market in a timely manner. A relinquishing of ownership of lost or damaged property by the insured to the insurer so that a total loss may be claimed. Abandonment is prohibited in most other types of property insurance. / Под Абандоном в морском страховании отказ страхователя от своих прав на застрахованное имущество (судно, груз) в пользу страховщика с целью получения от него полной страховой суммы. Под Абандоном, от Французского слова Abandon, означающее Отказ, понимается отказ лица, застраховавшего имущество (страхователя), от своих прав на это имущество и передача этих прав страховщику с целью получения от него полной страховой суммы. Как правило, страхователь-владелец прибегает к абандону в случаях пропажи или гибели своего имущества или его повреждения в такой степени, что восстановление представляется нецелесообразным. Применяется в морских перевозках страхователем судна либо товара.

ABANDONED BABY = БРОШЕННЫЙ МЛАДЕНЕЦ (или ОТКАЗНОЕ ДИТЯ) – In visual analysis, Abandoned Baby is a rare reversal pattern characterized by a gap followed by a Doji, which is then followed by another gap in the opposite direction. The shadows on the Doji must completely gap below or above the shadows of the first and third day. / В техническом анализе биржевых рынков, редкая модель разворота, характеризуемая отрывом, следующим перед появлением Додзи (Doji), за которым следует ещё один отрыв, но в противоположном направлении. И верхняя и нижняя тени, то есть максимум и минимум этого Додзи должны находиться в полном отрыве от предыдущего и последующего минимумов.

ABANDONMENT = ОТКАЗ – (1) Abandonment:- to make a decision that allows an option to expire unexercised. / Принятие решения, которое позволит опциону быть неисполненным при прекращении признания опциона.

(2) Abandonment is the cession by the insured to the insurer of the remains of his property, and rights relating to it, when a constructive total loss is claimed. To hand over all rights, title or possession of property voluntarily on an asset. The voluntary relinquishment of rights of ownership or another form of interest (an easement) by failure to use the property over an extended period of time. abstract of title A summary of the public records relating to the title to a particular piece of land. An attorney or title insurance company reviews an abstract of title to determine whether there are any title defects which must be cleared before a buyer can purchase clear, marketable, and insurable title. Giving up the proprietary rights in insured property to the underwriter in exchange for payment of a constructive total loss. Abandonment is a term that applies to property and signifies both a relinquishing of it and the letting go of all legal rights to it, as well, with the intent to claim a total loss. Abandonment of property to an insurance company is something insureds are expressly prohibited from doing in most property polices. / до того как покупатель сможет закупить . Отказ страхователя (лица, застраховавшего имущество) от своих прав собственности на имущество и передача этих прав страховщику (страховой компании) с целью получения от него полной страховой суммы. Как правило, страхователь использует такой отказ в случае пропажи или гибели своего имущества или его повреждения в такой степени, что его восстановление представляется нецелесообразным. О своём решении страхователь должен направить страховщику Уведомление об Отказе (Notice of Abandonment). Абандон:- заявление страхователя страховщику на отказ от своих прав на застрахованное имущество. Заявление должно быть сделано в течение 6 месяцев с момента возникновения оснований; оно может быть односторонним и не нуждается в подтверждении страховщика. В силу абандона к страховщику переходят все права на застрахованное

имущество. Если абандон принят страховщиком, и страховая сумма выплачена им, а объект страхования в конечном итоге окажется непогибшим, то страхователь должен возвратить страховщику выплаченную им сумму и вступить в права владения таким имуществом.

(3) The term Abandonment has a multitude of uses, legal and extra-legal. Abandonment, in law, is the relinquishment or renunciation of an interest, claim, privilege, possession, or right, especially with the intent of never again resuming or reasserting it. Such intentional action may take the form of a discontinuance or a waiver. This broad meaning has a number of applications in different branches of law. In common law jurisdictions, both common law abandonment and statutory abandonment of property may be recognized. Common law abandonment may be generally defined as 'the relinquishment of a right (in property) by the owner thereof without any regard to future possession by himself or any other person, and with the intention to foresake or desert the right ...' or as 'the voluntary relinquishment of a thing by its owner with the intention of terminating his ownership, and without (the intention of) vesting ownership in any other person; the giving up of a thing absolutely, without reference to any particular person or purpose...'. By contrast, an example of statutory abandonment (albeit in a common law jurisdiction) is the abandonment by a bankruptcy trustee under 11 USC § 554. In Scots law, failure to assert a legal right in a way that implies abandonment of that property is called Taciturnity. / Добровольная уступка титула собственности, всех прав или претензий на собственность, которые законно принадлежат её владельцу. Например, отказанной собственностью могут быть акции, облигации или средства взаимных инвестиционных фондов, содержащиеся на брокерских счетах фирмы, которая в течение нескольких лет не может определить законного владельца этого имущества. Если от собственности отказались в установленном порядке, то она может перейти штату по законам о выморочном имуществе (the laws of escheat). Помимо финансовых активов, объектами отказа могут быть и другие виды собственности, например патенты, изобретения, права аренды, товарные знаки, контрактные и авторские права.

(4) Abandonment:- a patent application becomes abandoned for failure to file a complete and proper reply as the condition of the application may require within the time period provided under 37 CFR § 1.134 and § 1.136 unless an Office (the United States Patent and Trademark Office (USPTO)) action indicates otherwise. Abandonment may be either of the invention or of an application. An abandoned application, in accordance with 37 CFR §§ 1.135 and 1.138, is one which is removed from the Office docket of pending applications.

(5) Abandonment:- a trademark application that has been declared abandoned is 'dead' and no longer pending. Abandonment occurs under several circumstances. The most common reason is when the United States Patent and Trademark Office (USPTO) does not receive a response to an Office Action letter from an applicant within 6 months from the date the Office action letter was mailed. Another instance is when the USPTO does not receive a Statement of Use (or request for an extension of time to file a statement of use) from an applicant within 6 months from the issuance of a Notice of Allowance). Applications abandoned for failure to respond to an Office Action or a Notice of Allowance can be revived or reinstated in certain circumstances.

ABANDONMENT CLAUSE = ОГОВОРКА ОБ ОТКАЗЕ – Abandonment Clause:- if salvaging or rehabilitating a ship or cargo following a marine loss costs more than the goods are worth, the loss is said to be constructively total. Under such conditions, the ocean marine policy permits the insured to abandon the damaged ship or cargo to the insurer and make a claim for the entire value. In this case, the salvage belongs to the insurer, who may dispose of it in any way. Abandonment is not permitted in other forms of property insurance.

ABATEMENT = УБАВКА (или УБАВЛЕНИЕ, или УМЕНЬШЕНИЕ) – (1) Abatement, or Rebate, in the United Kingdom (1850's), is the name sometimes given to a discount allowed for prompt payment; it is also sometimes used to express the deduction that is occasionally made at the custom-house from the duties chargeable upon such goods as are damaged, and for loss in warehouses. This allowance is regulated by the act 3 & 4 Will. 4. c. 52 § 32. No abatement is made from the duties charged on coffee, currants, figs, guinea-grains, lemons, opium, oranges, raisins, pepper, tobacco, and wine. See also Rebate.

(2) Abatement is a discount allowed for damage or overcharge in the payment of a bill. / Под Убавкой или Убавлением понимается дисконт, предоставляемый за нарушение или повышенный сбор при оплате векселя.

(3) Abatement in pleading, a legal defense to civil and criminal actions based purely on procedural and technical issues involving the death of parties.

(4) Abatement:- in general, is the reduction or lessening. In law, it is the termination or suspension of a lawsuit. For example, an abatement of taxes is a tax decrease or rebate.

ABAXIAL = АБАКСИАЛЬНОЕ – Abaxial:- facing away from the main axis, e.g., lower surface of a leaf. / Приставка Аб (Ab) в переводе с Латинского языка означает От. Абаксиальный – расположенный лицом от основной оси, например, нижняя поверхность листа. Абаксиальный:- (i) направленный от оси; или (ii) расположенный на верхней поверхности (листа).

ABC = ACTIVITY BASED COSTING

ABC ACCOUNTING = ACTIVITY BASED COST ACCOUNTING

ABC ANALYSIS = АНАЛИЗ ЭЙ.БИ.СИ. – ABC Analysis is a classification of items in an inventory according to importance defined in terms of criteria such as sales volume and purchase volume. / Классификация строк баланса в статье баланса 'материально-производственные запасы' (inventory) в соответствии с определяемой степенью важности исходя из таких критериев, как объём продаж и объём закупок.

ABC CLASSIFICATION = КЛАССИФИКАЦИЯ ЭЙ.БИ.СИ. – ABC Classification is a strategy for classifying inventory or parts within a warehouse or system. Typically fastest movers are categorized as A items, though classification can be based on other factors as well such as margin.

ABC CORRECTION = КОРРЕКЦИЯ ЭЙ.БИ.СИ. (или ТИПИЧНАЯ КОРРЕКЦИЯ) – In visual analysis, a move counter to the prevailing trend that unfolds in a three wave move such as up-down-up, or down-up-down. A-B-C is a term borrowed from Elliot Wave terminology that denotes a three-wave corrective pattern that is often found in the middle of a trend. Waves A, B and C are often of the same magnitude in both price and time, and the pattern tends to have the appearance of a zigzag. / В техническом анализе биржевых рынков движение, противодействующее основной тенденции, которое выражается на графике в виде трёхволнового движения, например вверх-вниз-вверх или вниз-вверх-вниз.

AB–DLO = RESEARCH INSTITUTE FOR AGROBIOLOGY AND SOIL FERTILITY

ABI = AUTOMATED BROKER INTERFACE

AB INITIO = АБ ИНИТИО (или С НАЧАЛА) – Ab Initio:- Latin for From the Beginning. / В переводе с Латинского языка – С Начала.

ABIOTIC = АБИОТИЧЕСКОЕ (или НЕЖИВОЕ, или НЕЖИЗНЕННОЕ) – Abiotic:- of non-living environmental factors (precipitation, temperature, wind) that affect living members of an ecosystem. / Абиотическое (от Греческих А, означающая отрицательную приставку, и Biōtikós, означающее Живой или Жизненный):- о неживых факторах внешней неорганической среды (выпадение осадков, температура, ветер), которые оказывают воздействие на живущих участников экосистемы.

ABLA = AMERICAN BUSINESS LAW ASSOCIATION

ABLE–BODIED SEAMAN = МАТРОС С ХОРОШЕЙ МОРСКОЙ ВЫУЧКОЙ (или ГОДНЫЙ МАТРОС, или МАТРОС 1–ГО КЛАССА) – Able-Bodied (AB) Seamen (deck department (unlicensed)):- stands watch, during which he steers the vessel, stands lookout, assist the mate on watch and makes rounds of the ship to insure that all is in order. Also ties up and unties the vessel to and from the dock and maintains the equipment on deck. Able-Bodied Seaman (AB):- in legal terms, a 'seaman' contributes to the mission of a vessel toward which s/he has an employment relationship. A member of the deck crew who is able to perform all the duties of an experienced seaman; certificated by examination; must have three years sea service. Also known as AB, or Able Seaman. / Член палубной команды, который в состоянии выполнять все обязанности опытного матроса; сертифицируется посредством сдачи экзаменов; ходивший по морям не менее трёх лет. Известен также как Умелый Матрос (Able Seaman) или Эй.Би. (AB).

ABM = ACITVITY BASED MANAGEMENT

ABNJ = AREAS BEYOND NATIONAL JURISDICTION

ABNORMAL CRIMP = НЕНОРМАЛЬНАЯ ГОФРИРОВКА – Abnormal Crimp:- a relative term for crimp that is either too low or too high in frequency and/or amplitude or that has been put into the fiber with improper angular characteristics.

ABNORMAL GROWTH = НЕНОРМАЛЬНЫЙ РОСТ – Abnormal Growth is a growth that deviates from the normal type or form due to various environmental factors such as disease, pests, soil condition, humidity, temperature, etc.

ABO = ACCUMULATED BENEFIT OBLIGATION

ABOARD = НА БОРТУ – A term Aboard:- referring to cargo being put, or laden, onto a means of conveyance. / Термин На Борту относится к грузу, размещённому или погруженному на транпортное средство.

ABORTIVE = АБОРТИВНОЕ (или НЕДОРАЗВИТОЕ) – Abortive:- development arrested while incomplete or imperfect. / задержанный в развитии .

ABOVE DECK = НА ПАЛУБЕ – Above Deck:- on the deck. / На палубе.

ABOVE PAR = ВЫШЕ НОМИНАЛА – Above Par:- a share that has a market value above its nominal value. / Акция, которая имеет рыночную стоимость выше своей номинальной стоимости.

ABOVE THE LINE = СВЕРХ ЛИМИТА (или ВЫШЕ ЧЕРТЫ) – (1) Above The Line:- transactions in the production, current and capital accounts which are above the Net lending (+) / Net borrowing (financial surplus or deficit) line in the presentation used in the economic accounts. The financial transactions account is below the line in this presentation. Above The Line:- in accounting, denotes revenue and expense items that enter fully and directly into the calculation of periodic net income, in contrast to below the line items that affect capital accounts directly and net income only indirectly. / Транзакции в производстве, .

(2) Above The Line:- for the individual, is a term derived from a solid bold line on Form 1040 and 1040A above the line for adjusted gross income. Items above the line prior to coming to adjusted gross income, for example, can include:- IRA contributions, half of the self-employment tax, self-employed health insurance deduction, Keogh retirement plan and self-employed SEP deduction, penalty on early withdrawal of savings, and alimony paid. A taxpayer can take deductions above the line and still claim the standard deduction.

ABOVE THE MARKET = ВЫШЕ РЫНКА – Above The Market:- a limit order to buy or sell a security for a specified price that is higher than the current market price. If the market does not reach the specified price, the order will go unfilled. / В биржевой торговле распоряжение с ограничением на покупку или продажу ценной бумаги по указываемой цене, которая выше текущей рыночной цены. Если рынок не достигнет указываемой цены, то распоряжение не будет исполнено.

ABRADED YARN = ОБОДРАННАЯ ПРЯЖА (или ИСТЁРТАЯ ПРЯЖА, или ВОРСОВАННАЯ ПРЯЖА, или ПОТЁРТАЯ ПРЯЖА) – Abraded Yarn:- a filament yarn in which filaments have been cut or broken to create hairiness (fibrillation) to simulate the surface character of spun yarns. Abraded yarns are usually plied or twisted with other yarns before use. See also Hispiduluous. Abraded Yarn is a two-ply combination yarn. One is an abraded ply, the other is filament viscose rayon. / филаментная (комплексная) пряжа (filament yarn).

ABRASION = АБРАЗИЯ (или ИСТИРАНИЕ) – (1) Abrasion:- a general wearing away of a surface by constant scratching, usually due to the presence of foreign matter such as dirt, grit, or metallic particles in the lubricant. It may also cause a break down of the material (such as the tooth surfaces of gears). Lack of proper lubrication may result in abrasion. / материала (такого как поверхности зубьев передач). Под Абразией, от Латинского слова Abrasio, означающее Сбривание или Соскабливание, понимается процесс разрушения волнами или прибоем берегов морей, озёр и водохранилищ. Абразия, разрушение волнами и прибоем берегов морей, озёр и крупных водохранилищ. Интенсивность абразии зависит от степени волнового воздействия, то есть от бурности водоёма. Важнейшим условием, предопределяющим абразионное развитие берега, является относительно крутой угол исходного откоса (больше 0.01) прибрежной части дна моря или озера. Абразия создаёт на берегах абразионную террасу, или бенч, и абразионный уступ, или клиф. Образующиеся при этом в результате разрушения горных пород песок, гравий, галька могут вовлекаться в процессы перемещения наносов и служить материалом для образования береговых аккумулятивных форм. Часть материала сносится волнами и течениями к подножию абразионного подводного склона, образуя здесь прислонённую аккумулятивную террасу. По мере расширения абразионной террасы абразия постепенно затухает (так как расширяется полоса мелководья, на преодоление которой расходуется энергия волн) и при поступлении наносов может смениться аккумуляцией. На склонах искусственных водохранилищ, уклоны которых в прошлом формировались иными, не абразионными факторами, темп абразии особенно высок – до десятка метров в год.

(2) Abrasion is the physical destruction of fibers, yarns, and fabrics, resulting from the rubbing of a textile surface over another surface. Textile materials can be unserviceable because of several different factors and one of the most important causes is abrasion. Abrasion occurs during wearing, using, cleaning or washing process and this may distort the fabric, cause fibers or yarns to be pulled out or remove fiber ends from the surface. Abrasion ultimately results in the loss of performance characteristics, such as strength, but it also affects the appearance of the fabric. Most Abrasion Tests depend on applying energy to the fabrics and measuring their response to it.

The manner of transferring the energy from machine to the fabric is different for different machines, but the basic principles are the same. There are three types of abrasion in terms of occurrence:- flat, edge and flex abrasion. Therefore different abrasion test methods have been described by the abrasion type, the test head movement or testing device setup. The differences among the procedures include the type of equipment, abradant (the material that rubs against the specimen), material used (including woven, nonwoven, and knit apparel fabrics, household fabrics, industrial fabrics, and floor coverings) and assessment method. In all of the test methods, the tested specimen is rubbed in a particular manner against an abradant which may be a fabric, or a emery sheet for either a certain amount of time for a certain number of strokes or cycles. Abrasion is a serious problem for home textiles like as carpets and upholstery fabrics, socks and technical textiles as well. Yarn abrasion is another important subject that should be considered during processing. Flat Abrasion occurs when flat objects is rubbed to a flat material. Flat resistance tends to be good for most materials because the force of rubbing is distributed over a wide area. However for many products flat abrasion resistance is assumed to occur when the curve is gradual or the bend is shallow such as what occurs in a shirt or jacket as it bends across the back of the wearer or on the seat of an upholstered chair. Martindale Tester, Taber Abraser, Uniform Abrasion Tester are the instruments working on the flat abrasion mechanism. In Martindale abrasion resistance tester, circular specimens are abraded under known pressure against a standard fabric. Abrasion resistance is measured by subjecting the specimen to rubbing motion in the form of a geometric figure, denoted Lissojous motion, that is, a straight line, which becomes a gradually widening elipse, until it forms another straight line in the opposite direction and traces the same figure again under known conditions of pressure and abrasive action (ASTM D 4966). The advantage of the Martindale abrasion test is that the fabric sample gets abrasion in all directions. Stress develops along the fiber from the force acting transverse to the fiber axis as a result of surface friction; the magnitude of surface friction developed is directly related to the harshness of standard worsted fabric abradant. Specimens are circular of either 38 mm or 140 mm in diameter. Normally the abradant is silicon carbide paper or woven worsted wool of which the specifications are given in Table 2, mounted over felt. Polyurethane foam disk is placed under the specimen for fabric having a mass/unit area less than 500 g/m^2. The small test specimen is sitting on the large abradant and then cycled backwards and forwards. If assessment of appearance change needs to be carried out, then larger test pieces (140 mm in diameter) are required. The roles are reversed and the abradant is placed in the holder with the specimen as the base platform. A force of either 9 (for apparel fabrics) or 12 kPa (for upholstery and technical fabrics) is applied to the top of the specimen to hold it against the abradant. The standard abradant should be replaced at the start of each test and after 50 000 cycles if the test is to be continued beyond this number. The rotary latform double head method (Taber abrader) can be used for most fabrics. The specimen is abraded using rotary rubbing action under controlled conditions of pressure and abrasive action, and subjected to multidirectional abrasion using a rotary rubbing action. Abrasive heads of rubber based compound simulate mild and harsh abrasion. The test specimen, mounted on a turntable platform, turns on a vertical axis, against the sliding rotation of two abrading wheels. The fabric is subjected to the wear action by two abrasive wheels pressing onto a rotating sample. The wheels are arranged at diametrically opposite sides of the sample so that they are rotated in the opposite direction by the rotation of the sample. One abrading wheel rubs the specimen outward toward the periphery and the other, inward toward the center. The resulting abrasion marks form a pattern of crossed arcs over an area of approximately 30 cm^2. Load adjustment for varying the load of the abrader wheels on the specimen is possible (ASTM D 3884). In ASTM D 4158, the uniform abrasion testing machine is used. In the apparatus, a specimen is mounted in a holder and abraded uniformly in all directions in the plane and about every point of the surface of the specimen. The Uniform Abrasion Tester, consists of the abradant mounted at the lower end of a shaft, weights placed on the upper end of the shaft to produce constant pressure between abradant and specimen throughout the test, lever and cam for raising and lowering the abradant, shaft, and weights. Essentially, the surface of the abradant lies in a plane parallel to the surface supporting the specimen and presses upon the specimen. The abradant and specimen rotate in the same direction at very nearly but not quite the same angular velocity (250 rpm) on noncoaxial axes which are parallel to within 0.002 5 mm (0.000 1 in). The small difference in speed is to permit each part of the specimen to come in contact with a different part of the abradant at each rotation. Each rotation is equivalent to one cycle (ASTM D 4158). Flex Abrasion is the most common abrasion type to which a textile product is subjected. In flex abrasion the material is bent or flexed during rubbing. Flex abrasion occurs in apparel, furnishings and industrial products. Very little of the surface of most products is completely flat during usage, therefore flex abrasion tests may reflect the usage conditions more. Oscillatory cylinder, inflated diaphgram abrasion tester, flex abrasion testing machine are the instruments working on flex abrasion mechanism. In ASTM D 4157 oscillatory cylinder method, abrasion resistance is measured by subjecting the specimen to unidirectional rubbing action under known condition of pressure, tension, and abrasive action. During the test fabric is pulled tight in a frame and held stationary. Oscillating Cylinder Section, equipped with edge clamps to permit mounting of a sheet of abrasive material over its surface, capable of oscillating through an arc. Individual test specimens cut from the warp and weft directions are then rubbed back and forth using an ACT approved #10 cotton duck fabric as the abradant. The procedure often is used for upholstery, leather and other materials (ASTM D 4157). In inflated diaphgram method, a specimen is abraded by rubbing either unidirectionally or multidirectionally against an abradant having specified surface characteristics. A specimen is held in a fixed position and supported by an inflated rubber diaphragm which is held under constant pressure. The abradant is mounted upon a plate, which is rigidly supported by a double-lever assembly to provide for free movement in a direction perpendicular to the plane of the reciprocating specimen clamp. The abradant plate assembly should be well balanced to maintain a vertical pressure equivalent to a mass of 0 to 2.2 kg (0 to 5 lb) by means of dead weights (ASTM D 3886). In ASTM D 3885, abrasion resistance is measured by subjecting the specimen to unidirectional reciprocal folding and rubbing over a specific bar under specified conditions of pressure, tension, and abrasive action by Flex Abrasion Testing Machine. This test method is useful for pretreating material for subsequent testing for strength or barrier performance. The pressure and tension used is varied, depending on the mass and nature of the material and the end-use application. Testing machine consist of Balanced Head and Flex Block Assembly that has two parallel, smooth plates. The balanced head is rigidly supported by a double lever assembly to provide free movement in a direction perpendicular to the plate of the flex block. A positioning device is provided to position the flexing bar and yoke assembly while loading the specimen such that the edge of the flexing bar is parallel to the fold of the specimen during the test (ASTM D 3885). In Edge Abrasion the material is folded back on itself while it is being abraded. In products, pleats, folds, cording, cuffs, collars, hems, pocket flaps are most subject to edge abrasion. Most products show damage along edges before damage elsewhere in the product becomes apparent because the force is concentrated on a small portion of the material. So the edge abrasion is a harsh measure of fabric's resistance to wear. The accelerator abrasion tester has an action that is quite different from most other abrasion testers. In the test a free fabric specimen is driven by a rotor inside a circular chamber lined with an abrasive cloth. The specimen suffers abrasion by rubbing against itself as well as the liner. In AATCC 93 method, each specimen is subjected to flexing, rubbing, shock, compression and other mechanical forces while the specimen is tumbling. Abrasion is produced thorough the specimen by rubbing of yarn against yarn, fiber against fiber, surface again surface and surface against abradant (AATCC 93). Abrasion is the wearing away of fiber by rubbing away. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). протирание или притирка (rubbing) волокна . от Латинского слова Abrasio, означающее Соскабливание, понимается . Под Износом понимается изменение размеров, формы, массы или состояния поверхности изделия вследствие разрушения (изнашивания) поверхностного слоя изделия при трении. Износ изделий – деталей машин, элементов строительных

конструкций, частей одежды и другого – зависит от условий трения и свойств материала изделия. Различают абразивный, кавитационный, контактно-усталостный и другие виды износа. Износ приводит к снижению качества изделий и их ценности.

(3) Abrasion (Fabric Shielding Gaskets (FSG)):- any type of abrasion from roll or any parts of machine. Finishing defect. Abrasion:- rubbing, scraping off or scuffing of the surface of a fabric. Some permanent press finishes lessen abrasion resistance. Draperies that are frequently in use should be made of abrasion resistant fabrics. / Порок или Дефект заключительной отделки. трение или натирание или ссучивание (rubbing), скобление или соскрябывание (scraping off) или трепание (scuffing).

ABRASION MARK = ОТМЕТИНА ОТ ИСТИРАНИЯ (или ОТМЕТИНА ОТ АБРАЗИИ) – Abrasion Mark:- a place in the fabric where the surface has been damaged due to friction or abnormally weakened by any operation through which it has been passed. Abrasion Mark:- an area where a fabric has been damaged by friction. Synonym:- Chafe Mark. Abrasion Mark; chafe mark:- an area of localized wear characterized by excessive surface hairiness or denuded fiber. Note:- this defect is often caused by chafing or oblique impact with a hard or rough surface. / Под Истёртым Местом понимается местный порок в виде разворсованного или разрушенного места. Следы Истирания; Истёртое Место (abrasion mark; chafe mark):- порок ткани в виде разворсованного или разрушенного места. Примечание:- этот порок часто вызывается потёртостью или воздействием твёрдой или грубой поверхности.

ABRASION RESISTANCE = СОПРОТИВЛЕНИЕ ИСТИРАНИЮ (или ИЗНОСОСТОЙКОСТЬ, или ИЗНОСОУСТОЙЧИВОСТЬ, или СОПРОТИВЛЕНИЕ ИЗНОСУ) – Abrasion Resistance is the degree by which a fabric is able to withstand loss of appearance through surface wear, rubbing, chafing, and other frictional actions. Abrasion Resistance is the ability of a fiber or fabric to withstand surface wear and rubbing. / протирание или притирка (rubbing). Под Износостойкостью или Износоустойчивостью понимается сопротивление материалов, деталей машин и других трущихся изделий изнашиванию. Износостойкость оценивается при эксплуатации или во время испытаний на стенде по длительности работы материалов или изделий до заранее заданного или предельного значения износа. Оценивается также по убыли массы детали за время её работы. Увеличению износостойкости изделий способствуют их конструктивное усовершенствование (компенсация износа, его равномерное распределение по поверхности и так далее), создание условий снижающих трение деталей (применение смазки, улучшение свойств смазочных материалов, защита от абразивного воздействия и тому подобное).

ABRASIVE WEAR = АБРАЗИВНЫЙ ИЗНОС – Abrasive Wear (or Cutting Wear):- comes about when hard surface asperities or hard particles that have embedded themselves into a soft surface and plough grooves into the opposing harder surface, e.g., a journal. See also Wear. / Под Абразивным Износом понимается механический износ материала в результате режущего или царапающего действия твёрдых тел или твёрдых частиц. Под Износом понимается изменение размеров, формы, массы или состояния поверхности изделия вследствие разрушения (изнашивания) поверхностного слоя изделия при трении. Износ изделий – деталей машин, элементов строительных конструкций, частей одежды и другого – зависит от условий трения и свойств материала изделия. Различают абразивный, кавитационный, контактно-усталостный и другие виды износа. Износ приводит к снижению качества изделий и их ценности.

ABS = ACRYLONITRILE BUTADIENE STYRENE

ABS = ACTIVE BARRIER SYSTEM

ABS = AMERICAN BUREAU OF SHIPPING

ABS = ANTILOCK BRAKING SYSTEM

ABS = ASSET–BACKED SECURITIES

ABS = AUTOMATED BOND SYSTEM

ABS = AUTOMATIC BLOCK SIGNAL

ABSCISE = ОТДЕЛЯТЬ (или АМПУТИРОВАТЬ, или ОТРЕЗАТЬ, или ОТСЕКАТЬ) – Abscise:- to cut off. Hence abscission, the normal separation of a leaf, fruit, or flower from a plant. / опадение или сбрасывание (abscission) листьев. Под Абсциссой, от Латинского слова Abscissa, означающее Отрезанная, понимается .

ABSCISIC ACID = АБСЦИЗОВАЯ КИСЛОТА – Abscisic Acid is a plant hormone that induces abscission of leaves, dormancy and other adaptations to poor growing conditions. / Под Абсцизовой Кислотой понимается гормон растений, регулирующий процессы увядания, опадения листьев, покоя. Тормозит рост растений. По химической природе изопреноид.

ABSCISSION = АБСЦИССИЯ (или XX) – Abscission:- xxxxx. See also Boll Shedding, Shed, and Shed Square.

ABSCISSION LAYER = АБСЦИССИОННЫЙ СЛОЙ – Abscission Layer (syn. Point of Disarticulation, and Point of Spikelet Separation) is a layer of cells related to the separation of a plant part, such as a leaf or fruit, from the plant. Structural changes (dissolution) in the abscission layer precede separation. In Rice, the thickness of the abscission layer between the spikelet and the pedicel is reported to be associated with the ease of shedding in certain varieties.

ABSCISSION ZONE = ЗОНА АБСЦИССИИ (или XX) – Abscission Zone is an area at the base of a leaf petiole or peduncle of a square or boll where the structure separates from the mother plant during abscission. The abscission zone, site or layer consists of a transverse layer of specialized cells in which the cell walls loosen and the cells expand to initiate the abscission process.

ABSOLUTE ADVANTAGE = АБСОЛЮТНОЕ ПРЕИМУЩЕСТВО (или БЕЗУСЛОВНОЕ ПРЕИМУЩЕСТВО) – Absolute Advantage is the ability of an economic actor (an individual, a household or a firm) to produce some particular good or service with a smaller total input of economic resources (labor, capital, land, etc) per unit of output than other economic actors. In analyzing the theory of trade and economic specialization, it is important to distinguish absolute from comparative advantage, since it is comparative advantage that determines the potential welfare gains from specialization and trade, and not absolute advantage. A person, company or country has an absolute advantage if its output per unit of input of all goods and services produced is higher than that of another person, company or country. / Лицо, компания или страна имеет абсолютное или безусловное преимущество, если выработка (или выход) его(её) продукции на единицу всех вошедших израсходованных товаров и услуг выше, чем у других лиц, компаний или стран.

ABSOLUTE BREADTH INDEX = ИНДЕКС ПО АБСОЛЮТНОМУ РАСХОЖДЕНИЮ – Developed by Norman Fosback, the Absolute Breadth Index (ABI) is equal to the absolute value of the difference between the advancing issues and the declining issues. It shows how much activity and volatility is taking place on the New York Stock Exchange while totally ignoring the price direction. / В техническом анализе биржевых рынков .

ABSOLUTE DATA = АБСОЛЮТНЫЕ ДАННЫЕ – Absolute Data:- color measurement data presented without comparison of the sample to a standard or calculated color difference.

ABSOLUTE FILTRATION RATING = АБСОЛЮТНЫЙ РЭЙТИНЬГ ФИЛЬТРАЦИИ – Absolute Filtration Rating:- the diameter of the largest hard spherical particle that will pass through a filter under specified test conditions. This is an indication of the largest opening in the filter elements. See also Filtration, and Nominal Filtration Rating. An Absolute Filtration Rating can only be applied to a filter that the end user can actually determine the size of the largest pore. Such a filter can be integrity tested using a nondestructive test method and the data can be used to determine the actual size of the largest pore. Absolute ratings can only be applied to membrane filters due to the requirement of a definable pore. If a filter manufacturer applies an absolute rating to a filter, they should be able to provide the user with a non-destructive test protocol that will allow the user to verify the absolute rating.

ABSOLUTE PLATING EFFICIENCY = АБСОЛЮТНАЯ ЭФФЕКТИВНОСТЬ ТОЧНОГО ВЫСЕВА – Absolute Plating Efficiency:- the number of individual cells that give rise to colonies relative to the number of cells plated; expressed in percentage.

ABSOLUTE PRESSURE = АБСОЛЮТНОЕ ДАВЛЕНИЕ – Absolute Pressure is the sum of atmospheric and gage pressure. / Под Абсолютным Давлением понимается сумма атмосферного и манометрического давления.

ABSOLUTE PRICE OSCILLATOR = ОСЦИЛЛЯТОР АБСОЛЮТНОЙ ЦЕНЫ – In technical analysis, Absolute Price Oscillator (APO) is an indicator based on the difference between two exponential moving averages, and is expressed in absolute terms. The Absolute Price Oscillator is calculated by subtracting the longer Exponential Moving Average (EMA) from the shorter EMA. Also known as the MACD Indicator. / В техническом анализе биржевых рынков . Известен также как Индикатор МЭКДИ (MACD Indicator).

ABSOLUTE RETURN FUNDS = ФОНДЫ БЕЗУСЛОВНОЙ ОТДАЧИ – Absolute Return Funds (including Hedge Funds) aim to deliver returns in both rising and falling markets. The investment techniques adopted may be different to methods employed by traditional fund managers as the funds have greater scope to use derivatives, short positions, and exotic securities.

ABSOLUTE VISCOSITY = АБСОЛЮТНАЯ ВЯЗКОСТЬ – Absolute Viscosity is a term used interchangeably with viscosity to distinguish it from either Kinematic Viscosity or Commercial Viscosity. Absolute viscosity is the ratio of shear stress to shear rate. It is a fluid's internal resistance to flow. The common unit of absolute viscosity is the Poise. Absolute viscosity divided by fluid density equals kinematic viscosity. It is occasionally referred to as Dynamic Viscosity. Absolute viscosity and kinematic viscosity are expressed in fundamental units. Commercial viscosity such as Saybolt viscosity is expressed in arbitrary units of time, usually seconds. See also Dynamic Viscosity, and Viscosity. / Абсолютная Вязкость – термин, который взаимозаменяемо используется с вязкостью, чтобы отличать её от Кинематической Вязкости или Коммерческой Вязкости. Абсолютная вязкость представляет собой отношение напряжения сдвига (shear stress) к ставке сдвига (shear rate). Это внутреннее сопротивление жидкости потоку. Единицей измерения абсолютной вязкости является внесистемная величина измерения Пуаз (П) (Poise (P)) и её производная – сантиПуаз (сП). Абсолютная вязкость, поделённая на плотность жидкости (fluid density), составляет Кинематическую Вязкость (Kinematic Viscosity). Изредка её называют Динамической Вязкостью (Dynamic Viscosity). Абсолютная вязкость и кинематическая вязкость выражаются в основных единицах (fundamental units). Коммерческая Вязкость, такая как Вязкость по Сэйболту (Saybolt Viscosity) выражается в произвольных единицах (arbitrary units) времени, обычно в универсальных секундах Сэйболта. Смотрите также Динамическая Вязкость (Dynamic Viscosity), и Вязкость (Viscosity). Динамическая Вязкость, то же, что и Вязкость. Динамическая Вязкость (Dynamic Viscosity) η (входит в виде коэффициента пропорциональности в формулу Закона Ньютона), единицей которой в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) является Паскаль-секунда (Па·с), в Англоязычных странах для обозначения динамической вязкости и в Системах Единиц СГС (системы единиц физических величин lmt (где l – длина, m – масса, t – время), в которых приняты три основные единицы:- сантиметр (см) – единица длины, грамм (г) – единица массы и секунда (с) – единица времени; отсюда и название системы по первым буквам названий этих трёх единиц) использовалась устаревшая и более не подлежащая применению единица измерения Пуаз (П (P); на Французском Poise, от имени Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). 1 П = 0.1 Па·с. Чаще использовалась дольная единица – сантиПуаз (сП); 1 сП = 1 мПа·с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Пауз (П), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений системы СИ.

ABSORB = АБСОРБИРОВАТЬ (или ПОГЛОЩАТЬ, или ВПИТЫВАТЬ) – Absorb:- to take in by chemical or molecular action or use as nourishment in the physiological processes of the plant.

ABSORBANCE = ПОГЛОТИМОСТЬ (или (СПЕКТРАЛЬНАЯ) ПОГЛОЩАТЕЛЬНАЯ СПОСОБНОСТЬ) – Absorbance:- the ability of a substance to transform radiant energy into a different form, usually with a resulting rise in temperature. Mathematically, absorbance is the negative logarithm to the base 10 of transmittance.

ABSORBED DOSE = ПОГЛОЩЁННАЯ ДОЗА – Absorbed Dose is a quantity of radiating energy (in Gray) absorbed per unit of mass of a specified target. See also Gray. / (в Грэях). Смотрите также Грэй (Gray).

ABSORBENCY = ПОГЛОЩАЕМОСТЬ (или ПОГЛОЩАЮЩАЯ СПОСОБНОСТЬ) – Absorbency is the ability of one material to take up another material. Absorbency is the ability of a fiber or fabric to absorb moisture. Absorbency is the ability of a fabric to take in moisture. Absorbency is a very important property, which effects many other characteristics such as skin comfort, static build-up, shrinkage, stain removal, water repellency, and wrinkle recovery. / , удаление потёков или разводов, .

ABSORBENT FILTER = АБСОРБЦИОННЫЙ ФИЛЬТР (или ПОГЛОЩАЮЩИЙ ФИЛЬТР) – Absorbent Filter is a filter medium that holds contaminant by mechanical means. See also Filter.

ABSORBENT FINISH = ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА, ПОВЫШАЮЩАЯ ВЛАГОПОГЛОЩАЕМОСТЬ – Absorbent Finish is a chemical treatment of fabrics to improve their absorption.

ABSORPTION = АБСОРБЦИЯ (или ПОГЛОЩЕНИЕ, или ВПИТЫВАНИЕ) – (1) Absorption:- the assimilation of one material into another; in petroleum refining, the use of an absorptive liquid to selectively remove components from a process stream. Adsorption refers to the collecting of molecules by the external surface or internal surface (walls of capillaries or crevices) of solids or by the surface of liquids. Absorption, with which it is often confused, refers to processes in which a substance penetrates into the actual interior of crystals, of blocks of amorphous solids, or of liquids. Sometimes the word sorption is used to indicate the process of the taking up of a gas or liquid by a solid without specifying whether the process is adsorption or absorption. A term Absorption refers to the taking up of gases or vapors by liquids and/or solids where the gas or vapor fully penetrates the liquid or solid (adsorption is limited to the surface). See also Adsorption. Absorption:- (1) penetration of one substance into the mass of another. (2) Decrease in directional transmittance of incident radiation (such as light), resulting in a modification or conversion of the absorbed energy, into heat, for example. Light incident on a specimen may be partially reflected, partially transmitted, or partially absorbed. Absorption is the process

by which a herbicide passes from one system into another, e.g., from the soil solution into a plant root cell or from the leaf surface into the leaf cells. / Абсорбция относится к поглощению газов или паров жидкими веществами и/или твёрдыми веществами. Газ или пар полностью проникает в жидкое или твёрдое вещество (адсорбция ограничивается поверхностью). Смотрите также Адсорбция (Adsorption). Под Абсорбцией понимается:- (1) Поглощение (Сорбция) веществ из смеси газов жидкостью. В отличие от Адсорбции абсорбция происходит во всём объёме Поглотителя (Абсорбента). Абсорбцию применяют в различных отраслях химической промышленности, в системах жизнеобеспечения космических кораблей и другом. (2) Поглощение электромагнитного излучения или звука при прохождении через вещество. Под Абсорбцией, от Латинского слова Absorptio, в свою очередь от Absorbeo, означающее Поглощаю, понимается поглощение вещества из газовой или жидкой среды всей массой другого вещества (Абсорбента). Абсорбция газа жидкостью осуществляется в Абсорберах (Скрубберах), имеющих развитую поверхность соприкосновения абсорбента с поглощающим веществом. Этот процесс применяют в различных отраслях химической промышленности, в системах жизнеобеспечения космических кораблей и другом. Под Окклюзией, от средневекового Латинского слова Occlusio, означающее Запирание или Скрывание, от Латинского слова Occludo, означающее Закрываю или Запираю, понимается поглощение газов различными твёрдыми веществами. При окклюзии, в отличие от Адсорбции, газы распределяются по всему объёму поглотителя. В этом смысле окклюзия подобна абсорбции – растворению газов в жидкости. Окклюдированный газ даёт с металлами твёрдый раствор; иногда часть поглощаемого газа образует с металлами химические соединения (гидриды, нитриды и так далее). Абсорбция, поглощение веществ из газовой смеси жидкостями. В технике абсорбцией обычно пользуются для извлечения из газовой смеси какого-либо компонента. Поглощение, точнее извлечение из жидкости какого-либо компонента жидкостью ранее также называлось Абсорбцией; ныне такой процесс именуют Экстракцией. При абсорбции абсорбент поглощает всем своим объёмом. Скорость абсорбции зависит от того, насколько концентрация поглощаемого газа в газовой смеси превосходит концентрацию этого компонента над раствором. Если концентрация растворяемого компонента в газовой смеси меньше его концентрации над жидкостью, растворяемый компонент выделяется из раствора (смотрите Десорбция). Абсорбция часто сопровождается химическим взаимодействием поглощаемого вещества с поглотителем (смотрите Хемосорбция). Абсорбция улучшается с повышением давления и понижением температуры. На абсорбции основаны многие важнейшие промышленные процессы, например, производство азотной, соляной и серной кислот (поглощение водой газообразных двуокиси азота, хлористого водорода и серного ангидрида), производство соды (абсорбция углекислого газа), очистка отходящих промышленных газов от вредных примесей (сероводорода, сернистого ангидрида, окиси углерода, углекислого газа и других), извлечение углеводородных газов и примесей (например, так называемых Газового Бензина, Газов Крекинга и Пиролиза), а также выделение индивидуальных углеводородов. Абсорбцию осуществляют на абсорбционных установках, основным аппаратом в которых служит Абсорбер.

(2) Absorption is the process of gases or liquids being taken up into the pores of a fiber, yarn, or fabric.

(3) Absorption is the process by which a substance passes from one system into another, e.g., from the soil solution into a plant's root cell or from the leaf surface into the leaf cells.

ABSORPTION = ПОГЛОЩЕНИЕ (или АБСОРБЦИЯ) – Absorption:- one carrier assumes the charges of another without any increase in charges to the shipper. Acceptance by the carrier of a portion of a joint rate or charge which is less than the amount which it would receive for the service in the absence of such joint rate or charge (aircargo). The assumption that the carrier will cover extraordinary or other special charges without increasing the price to the shipper. Absorption is the assumption by the carrier of switching or other special charges without increasing the rate to the shipper. / экстраординарные или иные особые сборы без увеличения цены для отправителя. В перевозках авиационных грузов, .

ABSORPTION = ПОТРЕБЛЕНИЕ (или АБСОРБЦИЯ) – Absorption is investment and consumption purchases by households, businesses and governments, both domestic and imported. When absorption exceeds production, the excess is country's current account deficit. / Под Потреблением (Абсорбцией) понимается вложение денежных средств и закупки для последующего употребления, осуществлённые домовладениями, бизнесом и правительством, причём как продукции местного происхождения, так и завезённой. В тех случаях, когда потребление превышает производство, возникающий излишек определяет дефицит текущего счёта страны.

ABSORPTION TINTING STRENGTH = СИЛА АБСОРБЦИИ (или ПОГЛОЩЕНИЯ, или ВПИТЫВАНИЯ, или ВСАСЫВАНИЯ) ПОДЦВЕТКИ (или ПОДКРАСКИ, или ПОДКРАШИВАНИЯ, или ТУШЕВАНИЯ, или ОКРАШИВАНИЯ) – Absorption Tinting Strength:- relative change in the absorption properties of a standard white material when a specified amount of an absorbing colorant, black or chromatic is added to it.

ABSS = AUTOMATED BIOTECHNOLOGY SEQUENCE SEARCH

ABSTRACT OF THE DISCLOSURE = РЕЗЮМЕ ОБНАРУЖЕНИЯ – In the US patent law, Abstract Of The Disclosure:- a concise statement of the technical disclosure including that which is new in the art to which the invention pertains.

ABT = ABOUT

AbTF = AID BY TRADE FOUNDATION

ABUNDANCE = ИЗБЫТОК – Abundance:- plentiful supply of an economic good. The opposite of Scarcity. Taken literally, this definition would apply only to goods existing outside the market economy, because any good which has a price (a value of exchange) is scarce to a certain extent. Some goods may appear to be abundant because they are free, when in fact they are becoming scarce:- for example, onstreet parking in congested areas where pay parking is not available. If a good has a price, it is not abundant in the strict sense, but the opposite is not always true. / Избыточное предложение товара или услуги. В противоположность Недостатку (Scarcity). В буквальном смысле этот термин относится только к тем товарам, которые существуют вне рыночной экономики, поскольку любой товар, имеющий цену (меновую стоимость), в некоторой степени находится в недостатке. Внешне некоторые товары могут казаться избыточными, поскольку они бесплатны, тогда как на самом деле их недостаточно; например, уличная парковка в перегруженных зонах, где нет платных автостоянок. Если товар имеет стоимость, то он не может быть в избытке в строгом понимании этого слова, но обратное утверждение не всегда правильно.

ABUSIVE DRAW = ВВОДЯЩАЯ В ЗАБЛУЖДЕНИЕ ЗАПИСЬ (или ВЫПИСКА, или ВЫБОРКА, или ИЗЪЯТИЕ) – Abusive Draw:- drawing on a standby letter of credit/demand guarantee when no violation of the underlying contract has occurred. / Надпись на резервном аккредитиве/гарантии по требованию, вследствие которой .

ABWA = AMERICAN BUSINESS WOMEN'S ASSOCIATION

ABYC = AMERICAN BOAT AND YACHT COUNCIL

AC = ADVISORY CIRCULAR

AC = A/C = AIRCRAFT

AC = AIRCRAFT COMMANDER

AC = AIR CONTROLLER

AC = AIRFRAME CHANGE

AC = ALCOHOL CONCENTRATION

AC = ALTERNATING CURRENT

AC = AMYLOSE CONTENT

AC = ANTHER CULTURE

AC = ASPHALT CONCRETE

ACA = ACCREDITATION COUNCIL FOR ACCOUNTANCY

ACAIS = AIR CARRIER ACTIVITY INFORMATION SYSTEM

ACALA COTTON = ХЛОПЧАТНИК ЭКАЛА (или ХЛОПЧАТНИК АКАЛА) – Acala Cotton is a Variety of Cotton introduced into the United States from Mexico. The staple length is 1-1/16 inches or better. / Хлопчатник Экала или Хлопчатник Акала – Разновидность Хлопчатника, ввезённая в Соединённые Штаты Америки из Мексики. Длина штапелька его волокна составляет 1-1/16 дюйма или более.

ACANTHOCARPA = АКАНТОКАРПА (или КОЛЮЧЕПЛОДНОЕ) – Acanthocarpa:- bearing spiny fruit. Also Echinocarpa. / колючий плод (или плод, покрытый иглами). Также Эхиноплодное (Echinocarpa). , от Греческого слова Acantha, означающее Колючка или Шип, .

ACANTHODES = АКАНТОДЭС (или КОЛЮЧЕЕ) – Acanthodes (Greek:- Acantha = Thorn):- full of thorns or spines. / (= Шип) полный шипов или колючек. , от Греческого слова Acantha, означающее Колючка или Шип, .

ACARICIDE = АКАРИЦИД – Acaricide is a pesticide that kills mites and ticks. Miticides (also called Acaricides) – kill mites that feed on plants and animals. / Митициды (Miticides), именуемые также Акарициды (Acaricides), от Греческого слова Ákari, означающее Клещ, и Латинского слова Caedo, означающее Убиваю, химические препараты для борьбы с растительноядными, амбарными Клещами – паразитами домашних животных и птиц. Эти препараты подразделяются на:- акарициды контактного действия (Акартан, Акрекс, Кельтан, Неорон, Омайт, Пликтран, Сера Молотая, Тедион и ИСО) и системные акарициды внутрирастительного действия (Антио, Карбофос, Фозалон, Фосфамид). Системные акарициды, кроме Клещей, уничтожают Медяниц, Тлей, Трипсов и других. Против амбарных Клещей в качестве акарицидов применяют Метилбромид, Хлорпикрин и другие вещества. В хлопководстве акарициды применяют для борьбы с паутинными Клещами. Под Акарицидами понимаются химические препараты из группы пестицидов для уничтожения Клещей, вредных для сельскохозяйственных растений и животных.

ACARS = AUTOMATIC COMMUNICATIONS ADDRESSING AND REPORTING SYSTEM

ACAS = AIRBORNE COLLISION AVOIDANCE SYSTEM

ACASTD = ADVISORY COMMITTEE ON THE APPLICATION OF SCIENCE AND TECHNOLOGY TO DEVELOPMENT

ACAT = ACCREDITATION COUNCIL FOR ACCOUNTANCY AND TAXATION

ACAT = AUTOMATED CUSTOMER ACCOUNT TRANSFER

ACATS = AUTOMATED CUSTOMER ACCOUNT TRANSFER SERVICE

ACAULESCENT = БЕССТЕБЕЛЬНОЕ – Acaulescent:- without a visible stem. / Бесстебельное:- без видимого стебля.

ACB = ADJUSTED COST BASE

ACC = AIR CENTER COMMANDER

ACC = AIRCRAFT COMMANDER

ACC = AREA CONTROL CENTER

ACCC = AREA CONTROL COMPUTER COMPLEX

ACCELERANT = УСКОРИТЕЛЬ (или КАТАЛИЗАТОР) – Accelerant:- a chemical used to speed up chemical or other processes. For example, accelerants are used in dyeing triacetate and polyester fabrics.

ACCELERATED DEPRECIATION = УСКОРЕННОЕ ОБЕСЦЕНЕНИЕ (или УСКОРЕННЫЙ (ФИЗИЧЕСКИЙ) ИЗНОС) – Accelerated Depreciation is any method of depreciation used for accounting or income tax purposes that allows greater deductions in the earlier years of the life of an asset. The straight-line depreciation method spreads the cost evenly over the life of an asset. On the other hand, a method of accelerated depreciation like the double declining balance (DDB) allows you to deduct far more in the first years after purchase. Accelerated Depreciation is a method that records greater depreciation than straight-line depreciation in the early years and less depreciation than straight-line in the later years of an asset's holding period. Accelerated Depreciation is a depreciation method which allows faster write-offs than the straight line method. These methods provide a greater tax shield effect than straight line depreciation, and so companies with large tax burdens might like to use accelerated depreciation methods, even if it reduces the income shown on financial statement. Accelerated depreciation methods are popular for writing-off equipment that might be replaced before the end of its useful life since the equipment might be obsolete, e.g., computers. One example of an accelerated depreciation method is the Modified Accelerated Cost Recovery System (MACRS). Accelerated Depreciation is a method of calculating depreciation with larger amounts in the first year(s). / Ускоренная Амортизация:- методы, одобренные Службой Внутренних Доходов США (Internal Revenue Service, IRS), используются при амортизации средств производства, введённых в эксплуатацию до 1980, то есть когда согласно Закону о Налогах для Стимулирования Экономического Возрождения они стали применяться для амортизации (depreciation) затрат, – до того, как система ускоренной амортизации (accelerated cost recovery system, ACRS) стала обязательной. Подобные методы направлены на более быстрое возвращение затрат и более раннее получение

налоговых льгот, чем традиционная обычная (линейная) амортизация (straight line depreciation). Они охватывали амортизацию методом двойного снижения остатка (баланса) (double-declining balance method, DDE), теперь используемым для амортизации некоторых классов собственности, определённых в ACRS и методом списания по сумме годов (sum-of-the-years digits method).

ACCELERATED SUPPLY = УСКОРЕННОЕ СНАБЖЕНИЕ – Accelerated Supply:- gold sold to the market before it is physically produced – generally created by producer hedging or finance transactions. Accelerated Supply:- gold reaching the market through mine hedging and finance transactions before it is physically produced – generally created by producer hedging or finance transactions.

ACCELERATION = АКСЕЛЕРАЦИЯ (или УСКОРЕНИЕ) – Acceleration is an increasing rate of change in prices either up or down. / В техническом анализе биржевых рынков, увеличение скорости изменения цен в сторону повышения или понижения.

ACCELERATION CLAUSE = ОГОВОРКА О ДОСРОЧНОМ ПОГАШЕНИИ (или ОГОВОРКА ОБ УСКОРЕНИИ) – Acceleration Clause is a term in a loan agreement that requires the borrower to pay off the loan immediately under certain conditions. Acceleration Clauses are terms in loan agreements that require the borrower to pay off the loan immediately if certain conditions are met. For example, most home mortgages have an acceleration clause that is triggered if the borrower misses too many payments. Acceleration clauses most often appear in mortgages, both residential and commercial. They also appear in some leases. When a lender invokes an acceleration clause, the borrower must immediately pay the unpaid balance of the loan's principal, as well as any interest that accumulated before the lender invoked the acceleration clause. The borrower does not, however, have to pay the full amount of interest that would have come due had the loan been paid off normally. For example, most loans allow the borrower to accelerate the loan and pay off the loan early in a single lump sum to avoid paying interest for the remainder of the loan's term. Few acceleration clauses trigger automatically. Instead, after the conditions in the clause occur, the lender may choose whether or not to invoke the clause. Where a lender gains the right to invoke an acceleration clause due to a borrower's default, the lender may lose that right if the borrower corrects his or her default before the lender actually invokes the clause. In cases involving defaults for failing to make timely payments, tender is usually just as effective as actual payment at preventing the lender from invoking an acceleration clause. Some mortgages have clauses that allow acceleration if the borrower sells or transfers the mortgaged property. These clauses are intended to protect the lender's security interest in the mortgaged property. Accordingly, some of these 'due-on-sale' and 'due-on-transfer' clauses only allow acceleration if the sale or transfer would impair the lender's security interest, or if the borrower fails to get the lender's consent in advance. These types of clauses may not be triggered if property ownership transfers because the borrower died and the property passed to his heirs. Due-on-sale and due-on-transfer clauses are regulated by the federal Garn-St. Germain Depository Institutions Act of 1982. 12 USC § 1701j-3(b)(1). The act only affects mortgages of real property. Parties may waive their rights to invoke acceleration clauses by either express agreement or by inducing others to detrimentally rely on their behavior. Home mortgages' acceleration clauses are designed to trigger in situations where the mortgagee might want to foreclose on the mortgage. This allows the mortgagee to attempt to recover the entire unpaid value of the mortgage, not just the value of a few missed payments. In some jurisdictions, borrowers in this situation may undo mortgagees' invocation of acceleration clauses and avoid foreclosure by making-up past-due payments and compensating the mortgagee for some or all of the costs associated with the borrower's default. In most of these jurisdictions, the key idea is that the borrower must put the mortgagor in the position it would have been in but for the borrower's default. Home mortgages often include acceleration clauses that are triggered by failure to make regular payments, attempts to sell or transfer the land, failure to pay property taxes, failure to maintain proper insurance on the property, and failure to make payments on a separate mortgage on the same property. Acceleration Clause is a stipulation in a loan contract stating that the entire balance becomes due immediately if other contract conditions are not met. Acceleration Clause is a contract provision that allows a lender to require a borrower to repay all or part of an outstanding loan if certain requirements are not met. An acceleration clause outlines the reasons that the lender can demand loan repayment. Also known as Acceleration Covenant. For example, a borrower who fails to make a payment or who breaks a covenant may be required to pay the lender the balance on a loan. In this case, the borrower is considered in breach of contract. Acceleration clauses are most commonly found in mortgage and real estate loans. Since these loans tend to be so large, the clause helps protect the lender from the risk of borrower default. / Оговорка о Досрочном Погашении является одним из положений контракта о предоставлении ссуды. Она гласит, что весь остаток ссуды становится должным к немедленному погашению, если прочие условия контракта не исполняются. Условие ускоренного платежа по ссуде:- пункт, представленный в соглашении о выпуске облигаций, контракте на предоставление ипотечного займа и иных контрактах о том, что непогашенный остаток подлежит выплате в том случае, если будет иметь место неисполнение обязательств. Подобные неисполнения обязательств включают неспособность выплатить проценты, основную сумму займа или внести платежи в фонд будущего погашения долга, неплатёжеспособность, а также неуплату налогов на собственность, под которую предоставлен ипотечный заём.

ACCELERATION OF SHIPMENT = ПЕРЕГРУЗКА ГРУЗА (или УСКОРЕНИЕ ГРУЗА) – Acceleration Of Shipment:- negative and positive accelerations are dynamic, mechanical stresses which occur in two main types during the transportation of goods:- (i) regular acceleration forces; and (ii) irregular acceleration forces. Regular acceleration forces primarily occur in maritime transport. Acceleration of up to one g (g = 9.81 m/s^2) and, in extreme cases, even more, may occur due to rolling and pitching in rough seas. Such regular acceleration forces have an impact on the effort involved in load securing. Irregular acceleration forces occur during cornering or when a train passes over switches, during braking, starting up, hoisting and lowering. Such acceleration forces are not generally repeated, but they may occur several times at varying intensities during transport. These are the typical stresses of land transport and transport, handling and storage operations. / прокатка (rolling).

ACCENT/NOVELTY YARNS = АКЦЕНТНАЯ/ФАСОННАЯ (или НОВШЕСКАЯ) ПРЯЖА – Accent/Novelty Yarns:- these yarns are very very fine and are not intended to be used by themselves; they are intended to be knit with another yarn and will provide additional color and texture to a finished fabric. They do possibly change the gauge of your fabric, so a swatch is recommended whenever you are going to use an accent yarn to make the necessary adjustment to your needle size.

ACCEPTABLE IDENTIFICATION OF GOODS AND SERVICES MANUAL = РУКОВОДСТВО ПО ПРИЕМЛЕМОЙ ИДЕНТИФИКАЦИИ ТОВАРОВ И УСЛУГ – The Acceptable Identification Of Goods And Services Manual lists numerous examples of identifications of goods and services that are acceptable to the United States Patent and Trademark Office (USPTO) for inclusion in trademark applications and registrations. The manual is not exhaustive and is meant as a guide to aid applicants and their attorneys in formulating acceptable identifications of goods and/or services.

ACCEPTANCE = АКЦЕПТ – (1) Acceptance:- a time draft (or bill of exchange) which the drawee (the payer) has accepted and is unconditionally obligated to pay at maturity. The draft must be presented first for acceptance – the drawee becomes the acceptor – then for payment. The word accepted and the date and place of payment must be written on the face of the draft. Acceptance of a bill of exchange is an engagement to pay it according to the terms. This engagement is usually made by writing the word 'accepted' across the face of the bill. Acceptance is a drawee's promise to pay either a Time Draft or Sight Draft. Normally, the acceptor signs his/her

name after writing ‘accepted’ (or some other words indicating acceptance) on the bill along with the date. That ‘acceptance’ effectively makes the bill a promissory note, i.e. the acceptor is the maker and the drawer is the endorser. The drawee’s act in receiving a draft and thus entering into the obligation to pay its value at maturity. Formal act whereby the drawee of a bill of exchange expressly guarantees the amount of an obligation by the due date. In a bill of exchange, the drawer orders the drawee to pay a stated sum of money to a third party, the payee. By acceptance of the note, the drawee assumes the obligation and agrees to make payment by the due date, thereby accepting the terms and conditions of the note. The note issued by the payee of an acceptance is therefore guaranteed by two debtors who are jointly and severally liable for payment, since the drawee’s acceptance is in addition to the drawer’s obligation. A time draft or bill of exchange on which the drawee has written the word ‘accepted’ over his signature. Acceptance also refers to the action of accepting a bill of exchange for payment. In practice, the term Acceptance is used in two different ways:- (i) drawn bill of exchange which has been accepted by the drawee (the principal debtor). The instructions to pay are thereby joined by an obligation to pay on the part of the drawee. A drawn bill of exchange which has still not been accepted is known as a Draft. A distinction is drawn between various kinds of acceptance:- simple and full acceptance, partial acceptance (drawee only undertakes to pay part of the amount stated in the bill of exchange) and acceptance guarantee (additional guarantee by a third party). (ii) Written declaration of acceptance by the drawee. / Формальное действие, посредством которого трассат переводного векселя прямо гарантирует оплату суммы обязательства в надлежащую (причитающуюся) дату. Переводным векселем трассант инструктирует трассата оплатить указанную сумму денежных средств третьему лицу, именуемому получателем. Акцептом векселя трассат принимает на себя обязательство о своём согласии произвести платёж к соответствующей дате, и тем самым, принимая порядки и условия этого векселя. Таким образом, вексель, выписанный получателем акцепта гарантируется двумя дебиторами, которые вместе и по отдельности ответственны за оплату, поскольку акцепт трассата является дополнением обязательства трассанта. Акцепт векселя заключается в принятии на себя плательщиком по переводному векселю обязательства оплатить вексель в срок. Плательщик может акцептовать вексель полностью или в части вексельной суммы, однако он не может вносить какие-либо изменения в содержание переводного векселя. Внесение таких изменений равносильно отказу в Акцепте. Отказ в акцепте или платеже должен быть удостоверен протестом векселя. Акцепт – письменное подтверждение согласия трассата оплатить переводный вексель по наступлении срока его оплаты. Молчаливый Акцепт; ‘Положительный’ Акцепт. Акцепт:- при акцептной форме расчётов поставщик выставляет платёжное поручение на причитающиеся ему от потребителя или заказчика суммы за отпущенную продукцию или оказанные услуги и передаёт обслуживающему его банку платёжное требование вместе со счётом-фактурой и документом, свидетельствующим об отправке продукции потребителю или заказчику. Банк, обслуживающий поставщика, направляет это платёжное требование и счёт-фактуру в банк, обслуживающий потребителя или заказчика. Если плательщик акцептует платёжное требование, то обслуживающий его банк по наступлении срока платежа списывает причитающуюся сумму со счёта плательщика и переводит её на счёт поставщика. Акцепт – одна из форм безналичных расчётов между организациями. Смотрите также Акцептная Форма Расчётов. Акцептная Форма Расчётов, в бывшем Союзе Советских Социалистических Республик (СССР), а также в других социалистических странах одна из основных форм безналичных расчётов между хозяйственными организациями за отгруженные или отпущенные товаро-материальные ценности, оказанные услуги и выполненные работы. С 1935 в СССР осуществляется посредством Инкассо платёжных требований. Сущность акцептной формы расчётов с применением инкассо сводится к следующему. Поставщик (подрядчик), отгрузив продукцию или оказав услуги покупателю (заказчику), выписывает на него счёт (товарно-транспортную накладную) и платёжное требование, содержащее необходимые расчётные реквизиты, в том числе ссылку на договор и признаки, удостоверяющие товарное происхождение документа. Расчёты по авансам, рекламациям или претензиям платёжными требованиями не производятся. Платёжное требование сдаётся в банк, обслуживающий поставщика, на инкассо. Банк берёт на себя организацию документооборота по получению платежа от покупателя:- пересылает платёжные требования в банк, обслуживающий покупателя; перечисляет сумму инкассированного платежа на счёт поставщика; извещает поставщика о причинах неполной и несвоевременной оплаты. До получения платежа от покупателя банк предоставляет поставщику кредит, возмещающий затраты по отгруженной продукции в пределах её плановой себестоимости. Банк покупателя предъявляет полученное платёжное требование к оплате со счёта покупателя. Оплата производится с акцепта покупателя. На акцепт покупателю даётся определённое время (обычно 3 рабочих дня), в течение которого он должен определить своё отношение к предъявленному требованию. По данным платёжного требования и счетов поставщика покупатель проверяет соответствие поставки условиям договора, правильность цен, арифметических подсчётов и тому подобное. При нарушении условий договора или законодательства о поставках покупателю предоставляется право полностью или частично отказаться от акцепта и оплаты платёжного требования. Банк проверяет мотивировку отказа от акцепта и соответственно уменьшает сумму платежа. Мотивы, по которым банк принимает отказ от акцепта, регламентируются действующим законодательством, инструкциями банка и условиями договора между сторонами. При наступлении срока оплаты сумма платёжного требования списывается со счёта покупателя и перечисляется на счёт поставщика. Если на счёте покупателя нет средств и ему не может быть предоставлен кредит на оплату платёжного требования, то последнее приобретает силу исполнительного документа, сумма которого взыскивается со счёта покупателя в порядке установленной законом очерёдности платежей. За просрочку платежа с покупателя взыскивается пеня в пользу поставщика – как правило, в размере 0.03% от суммы платежа за каждый день просрочки. В зависимости от порядка оформления различают Положительный и Отрицательный Акцепты. При Положительном Акцепте оплата платёжного требования производится только при письменном согласии плательщика. При Отрицательном Акцепте платёжное требование считается акцептованным, если в течение установленного срока от плательщика не поступит отказа от акцепта. В первые годы после введения в СССР акцептной формы расчётов (1931) применялся только положительный акцепт. С введением отрицательного акцепта (1936) сфера применения положительного акцепта сокращается, а с 1958 он сохраняется лишь в расчётах с сельсоветами и общественными организациями. Отрицательный акцепт по времени заявления может быть Предварительным или Последующим Акептом. При предварительном акцепте срок платежа устанавливается по окончании срока акцепта. При последующем акцепте платёж производится с поступлением платёжного требования в банк покупателя; при этом покупатель в течение срока акцепта может заявить отказ. Сумма принятого банком последующего отказа от акцепта немедленно восстанавливается на счёте плательщика и направляется в банк поставщика для взыскания со счёта последнего в бесспорном порядке. Расчёты по акцептной форме расчётов с последующим акцептом применяются с 1955. Они содействуют ускорению кругооборота средств у поставщиков. К 1960 с последующим акцептом оплачивалось 45% суммы платёжных требований, а в 1968 оплачивалось 78.8%. В 1967 последующий акцепт был распространён на основную массу иногородних расчётов (ранее он применялся преимущественно в одногородних расчётах). Эти расчёты стали целесообразными вследствие относительно небольшого размера суммы заявляемых отказов от акцепта, в 1968 составлявшей около 2% платёжного оборота по акцептной форме расчётов. Расчёты с предварительным акцептом постепенно сокращались и к 1969 сохранялись в основном в хозяйственных отношениях с бюджетными, внешнеторговыми, подрядными и проектными организациями, а также с колхозами, то есть в тех случаях, когда в силу особенностей самих хозяйственных операций или правового статута участников расчётов более целесообразно осуществлять контроль платёжного требования до его фактической оплаты. Эти расчёты могут применяться и

к поставщикам, систематически нарушающим условия договоров. Расчёты в порядке инкассо платёжных требований осуществляются в некоторых случаях в безакцептном порядке, при котором плательщик не имеет права заявить банку отказ от акцепта. Такой порядок применяется, как правило, в расчётах за услуги, объём которых измеряется специальными приборами или не нуждается в измерении, а тарифы оплаты заранее фиксированы (электро- и теплоэнергия, газ, вода, телефон, коммунальные услуги и тому подобные), а также в расчётах по взысканию уплаченных сумм за товары, оказавшиеся при приёмке их недоброкачественными, некомплектными или нестандартными. При акцептной форме расчётов осуществляется контроль банка и хозяйственных организаций за соблюдением сторонами договорной и расчётной дисциплины. С поставщика может быть взыскан банком штраф (5%) за предъявление платёжного требования без реальной отгрузки товаров (так называемое Бестоварное Платёжное Требование). Продукция, от оплаты которой покупатель отказался, поступает к нему на ответственное хранение, и за её использование без оплаты покупатель подвергается штрафу. За систематическую задержку платежей или за неоднократную поставку недоброкачественных товаров соответствующая сторона может быть лишена другой стороной на определённый срок права применять акцептную форму расчётов. Порядок расчётов по акцептной форме расчётов определяется инструкциями банка по безналичным расчётам. В целях ускорения документооборота по акцептной форме расчётов в определённых случаях допускается перечисление платежа по телеграфу (при расчётах на значительные суммы и длительном сроке почтового пробега документов). Акцептная форма расчётов остаётся преимущественной формой иногородних расчётов, так как приспособлена к обеспечению планового движения материальных ценностей и денежных средств, а также удобна для сторон, поскольку банк имеет возможность в процессе осуществления расчётов по этой форме защищать интересы каждой из них. Из одногородних расчётов акцептная форма расчётов постепенно вытесняется более простыми формами – платёжными поручениями, чеками из лимитированных и нелимитированных книжек. В учитываемом Госбанком платёжном обороте за товары и услуги удельный вес акцептной формы расчётов снизился с 77.0% (1961) до 60.6% (1968), что объясняется внедрением расчётов Платёжными Поручениями и Чеками, а также плановыми платежами. Акцепт:- в общем значении – соглашение, заключаемое в случае, когда трассат (drawee) срочного переводного векселя (time draft) пишет слово ‘принято’ (‘акцептовано’), подписывается и ставит дату платежа. Трассат становится акцептантом (acceptor), несущим ответственность за выплату средств по векселю по наступлении срока платежа. Также бумаги, выпускаемые и реализуемые компаниями финансирования продаж, такими, как Акцептная Корпорация Дьженерэл Мотоз (General Motors Acceptance Corporation). Банковский Акцепт:- переводный вексель, акцептованный банком, на который он выставлен, – обычное средство осуществления платежей в привоза-вывозных (или импортно-экспортных) сделках и источник финансирования, широко используемый в международной торговле. Имея за собой кредитную поддержку банка, банковский акцепт выступает как инструмент денежного рынка (money market). Обязательства, принимаемые на себя банком, называются обязательствами по акцепту (acceptance liability). Торговый Акцепт:- срочный переводный вексель, выписанный продавцом товара на покупателя, который становится акцептантом, то есть по существу, форма кредита покупателю. Под Акцептом, от Латинского слова Acceptus, означающее Принятый, понимается обязательство (подтверждение согласия) плательщика оплатить в установленный срок переводный вексель (тратту), выставленный на оплату счёт, удовлетворить другие требования об оплате. Акцепт оформляется в форме надписи ‘Акцептовано’ на платёжном требовании и подписью. Когда говорят, что документ акцептован, это означает, что есть согласие плательщика (банка) на его оплату. Акцептом называют также согласие одной из договаривающихся сторон на заключение договора по предложению (оферте) другой стороны.

(2) Acceptance is the formal act of agreeing to an offer to enter into a legally binding agreement. / Акцепт – согласие на предложение вступить в договор на условиях, указанных в этом предложении (оферте). Акцепт – документально зафиксированный акт согласия на предложение вступить в какое-то юридически оформленное соглашение на условиях, указанных в этом предложении (оферте). Акцепт, в гражданском праве согласие с предложением (Офертой) другой стороны, влекущее за собой правовые последствия. По законодательству большинства государств акцепт является одной из стадий заключения договора и представляет собой выражение воли лица, безоговорочно согласного заключить договор на условиях, предложенных другой стороной. Акцепт, содержащий какие-либо дополнительные условия, считается новой офертой. Согласие признаётся акцептом, если оно получено стороной, сделавшей предложение в течение срока, указанного в этом предложении, либо в течение срока, необходимого для немедленного ответа. Акцепт может быть выражен устно, письменно, путём совершения действий, из которых явствует согласие стороны на заключение договора (так называемые Конклюдентные Действия). К числу таких действий относятся и действия, составляющие содержание обязательства должника:- вместо ответа об акцепте должник приступает к передаче товара, выполнению работ и тому подобному. В случаях, указанных в законе, акцепт может быть выражен молчанием. Так, по Советскому праву при заключении договора поставки между социалистическими организациями молчание покупателя в течение более чем 10 дней признаётся акцептом. По получении акцепта в ответ на оферту договор считается заключённым. В буржуазном праве существуют две системы, по-разному трактующие этот вопрос. В странах континентальной Европы (Франция, Федеративная Республика Германия (ФРГ), Италия) действует так называемая система получения, то есть договор считается заключённым в момент получения акцепта Оферентом. В Англии, Соединённых Штатах Америки (США), Японии и ряде других стран применяется так называемая Система Отсылки, или ‘Теория Почтового Ящика’ (Mail-Box Theory), согласно которой договор считается заключённым с момента отсылки акцепта. В законодательстве социалистических стран (Венгерской Народной Республики (ВНР), Германской Демократической Республики (ГДР), Польской Народной Республики (ПНР), Союза Советских Социалистических Республик (СССР), Чехословацкой Социалистической Республики (ЧССР)) при заключении хозяйственных договоров акцептом признаётся принятие проекта договора. При этом, если стороны не достигли соглашения по некоторым условиям договора, предложение одной стороны считается акцептованным другой, если последняя выразила согласие по основным условиям договора:- например, в ГДР – о предмете, качестве, цене (Закон О Договорной Системе В Социалистическом Хозяйстве от 25 Февраля 1965 (с. 15, Gesetzblatt der DDR, 1965, 1, № 7), в ЧССР – о предмете и сроке (Хозяйственный Кодекс ЧССР, § 153). В социалистическом праве предложение о заключении хозяйственного договора обычно подлежит обязательному акцепту, если предложение основано на плановом акте или ином предписании компетентного органа, обязательном для обеих сторон договора. В таких случаях несогласие с условиями проекта договора является основанием не для отказа от него, а для возбуждения преддоговорного спора. Законом устанавливается, как правило, срок для акцепта:- 15 дней в ВНР, 2–3 недели в ГДР, 10 дней в СССР, 1 месяц в ЧССР. Если акцепт не последовал в указанный в законе срок, оферент имеет право отказаться от своего предложения либо обратиться в арбитраж с иском о понуждении заключить договор. В этом случае отказ от акцепта признаётся обоснованным, если заключение договора нарушает интересы народного хозяйства или поставщик не в состоянии выполнить этот договор (смотрите Постановление Венгерского Революционного Рабоче-Крестьянского Правительства О Договоре Поставки, § 6).

(3) Broadly speaking, Acceptance is any agreement to purchase goods under specified terms. / В широком смысле слова, под Акцептом понимается любое согласие закупить товары на оговорённых условиях, то есть согласие заключить контракт на тех условиях, которые прописаны в оферте (предложении).

ACCEPTANCE CREDIT = АКЦЕПТНЫЙ КРЕДИТ – Acceptance Credit:- way of financing a sale to a foreign buyer in which a commercial bank or merchant bank provides credit to the foreign creditworthy importer, who can draw a bill of exchange against the credit. The bank charges a commission to the seller (exporter). / иностранному покупателю. Акцептные Кредиты, кредиты, предоставляемые банками в форме Акцепта Переводных Векселей (Тратт), выставляемых на банки экспортёрами и импортёрами. Акцептные кредиты являются одной из форм кредитования внешней торговли. При реализации товара в кредит экспортёры заинтересованы в акцепте векселя крупным банком. Такой вексель в любое время может быть учтён или продан. При акцептном кредите формально кредит предоставляет экспортёр, но, в отличие от коммерческого кредита, Акцептантом векселя (тратты) выступает банк. Выдавая акцепт, банк не предоставляет кредита и не вкладывает в акцептную операцию своих средств, но обязуется оплатить тратту при наступлении срока платежа. В тех случаях, когда экспортёры требуют платежа наличными, проводятся операции рефинансирования, то есть банк импортёра акцептует тратту, выставленную на него импортёром, учитывает её и уплачивает экспортёру наличными деньгами. До 1-й Мировой Войны 1914–18 господствующее положение на акцептном рынке занимали Английские банки. После 1-й Мировой Войны роль Лондона на мировом рынке акцептов падает. После 2-й Мировой Войны 1939–45 основная часть акцептных кредитов выдаётся банками Лондона, Парижа, Нью-Йорка. Стоимость акцептных кредитов слагается из двух элементов:- комиссии за акцепт, составляющей 1–1.5%, и учётной ставки, которая обычно ниже ставки по учёту коммерческих тратт. На рынке акцептов обращаются краткосрочные – 3-месячные и 6-месячные тратты. Кредит, предоставляемый банком в форме акцепта переводных векселей (тратт), выставляемых на банки их клиентами. Акцептный Кредит:- кредит, предоставляемый банком в форме акцепта тратт, выставляемых банку экспортёрами. Отличием акцептного кредита от коммерческого является то, что акцептантом тратты выступает солидный банк, который не предоставляет кредита и не вкладывает в акцептную операцию своих средств, но обязуется оплатить тратту при наступлении срока платежа, то есть формально кредит предоставляется экспортёром.

ACCEPTANCE OF GOODS = ПРИЁМКА ТОВАРОВ – Acceptance Of Goods is the process of receiving a consignment from a consignor, usually against the issue of a receipt. As from this moment and on this place the carrier's responsibility for the consignment begins. The process of receiving a consignment from a shipper, usually against the issue of a receipt (B/L), when the carrier's responsibility for the consignment begins.

ACCEPTING BANK = АКЦЕПТУЮЩИЙ БАНК – Accepting Bank is a bank or other financial institution that endorses a time draft or sight for immediate payment. / Банк или иное финансовое учреждение, которое индоссирует срочную тратту или предъявляет требование о немедленной оплате. Акцептующий Банк – банк, который акцептует переводный вексель или тратту.

ACCEPTING DEVICE = АКЦЕПТУЮЩЕЕ УСТРОЙСТВО – Accepting Device is a device designed to:- (i) identify the relevant electronic purse; (ii) authenticate the electronic purse application; (iii) store securely the transaction or incrementation of its own balance by the transaction amount and, optionally, store the transaction information; and (iv) transfer securely the stored information to the acquiring technical operator.

ACCEPTOR = АКЦЕПТОР (или АКЦЕПТАНТ) – (1) Acceptor is a party accepting a financial transaction card for the provision of goods or services, or cash. Person who accepts either the terms of a contract, or a bill of exchange. When a bill of exchange is accepted, the drawee becomes the acceptor. / Под Акцептором или Акцептантом, от Латинского слова Acceptor, означающее Принимающий, понимается лицо, акцептующее либо порядки контракта, либо вексель. Когда вексель акцептован, трассат становится акцептантом. Акцептор:- физическое или юридическое лицо, принявшее на себя обязательство оплатить вексель, счёт.

(2) Acceptor is the person or business that accepts the cheque as payments for goods or services. / Под Акцептантом понимается лицо или предприятие, которое акцептует чек в качестве оплаты за товары или услуги.

ACCESS = AMERICAN COMPUTERIZED COMMODITY EXCHANGE SYSTEM AND SERVICES

ACCESS = ДОСТУП – Access is the ability to gain entry to a database or other digital information. / Возможность получить доступ к базе данных или иной информации, представленной в цифровом виде.

ACCESSIBILITY = ДОСТУПНОСТЬ – Accessibility is a carrier's ability to provide service between an origin and a destination. / Способность перевозчика предоставить услуги на всём пути транспортировки от пункта отправки до пункта назначения.

ACCESSION = ВСТУПЛЕНИЕ (или ЗАЧИСЛЕНИЕ) – Accession is:- (1) an addition (of a variety or strain) to a national or other register of varieties obtained by field collection or exchange. (2) A variety, strain, or population registered at a research center and worth conserving.

ACCESSION LIST = СПИСОК ВСТУПЛЕНИЯ – Accession List is a reference list of a collection of cultivars, germplasm, or breeding lines that are stored or maintained.

ACCESSION NUMBER = НОМЕР ВСТУПЛЕНИЯ – Accession Number is the identification number assigned to an accession.

ACCESSORIAL = СОПУТСТВУЮЩЕЕ – Accessorial:- a supplemental activity or material, outside normal handling and storage, that is billable in accordance with the client's contract.

ACCESSORIAL CHARGES = СОПУТСТВУЮЩИЕ СБОРЫ – Accessorial Charges are charges made for additional, special or supplemental services, normally over and above the line haul services. Charges that are applied to the base tariff rate or base contract rate, e.g., bunkers, container, currency, destination/delivery. Accessorial Charge is the amount charged to the client for providing accessorial service or materials. / Сборы сверх базовой тарифной ставки или базовой контрактной ставки, покрывающие, например, использование котельного топлива, контейнеров, иностранной валюты, особых мест назначения/поставки.

ACCESSORIAL SERVICE = СОПУТСТВУЮЩАЯ УСЛУГА – Accessorial Service is a service rendered by a carrier in addition to a transportation service, such as assorting, heating, packing, pre-cooling, storage, substitution of tonnage, etc. / Услуга, предоставляемая перевозчиком в дополнение к основной услуге по транспортировке груза. К таким услугам относятся:- сортировка (assorting), предварительное охлаждение (pre-cooling), прогрев (heating), субституция тоннажа (substitution of tonnage), упаковывание (packing), хранение (storage) и так далее.

ACCESSORY GUARANTEE = ГАРАНТИЯ СОУЧАСТНИКА – An Accessory Guarantee is dependent on the underlying contract, and the guarantor is entitled to invoke the defences which the principal may have against the beneficiary. In case of a dispute, the latter must prove his rights emanating from the underlying transaction. The bank has the same rights to object to a claim as the principal, and the bank is only obliged to pay upon presentation of either a court decision or an arbitrational settlement justifying the claim, or the principal's written approval of the claim. See also Non-Accessory Guarantee.

ACCIDENT = АКЦИДЕНТ (или НЕСЧАСТНЫЙ СЛУЧАЙ) – (1) Accident includes continuous or repeated exposure to the same conditions resulting in public liability which the insured neither expected nor intended. Occurrence in a sequence of events that produces unintended injury, death or property damage. Accident refers to the event, not the result of the event. Accident is an unexpected fortuitous event, unforeseen and unintended, not under the control of an insured and resulting in a loss. / Под Несчастным Случаем, от Латинского слова Accidentia (Акциденция), означающее Случай или Случайность, понимается внезапное случайное событие, непредвиденное и непреднамеренное, неподконтрольное застрахованному лицу и результатом которого становится возникновение ущерба. финансовая защита от последствий несчастного случая (НС). Акцидент – неожиданное событие. Акцидент:- то, что случается с кем-то или с чем-то (от Латинского слова Accidere, означающее Падать На Что-либо). Акцидент как случающееся следует отличать от субъекта (субстанции), с которым он случается, сущности, без которой субъект не может существовать, наконец, от специфических или постоянных свойств, присутствующих в субъекте всегда, а не возникающих в результате случайности. Например, тот факт, что человек сидит, это акцидент (он мог бы лежать или стоять и при этом оставаться человеком). То, что он человек, – это его сущность. То, что он наделён разумом, способен заниматься политикой или смеяться, – его свойства. Вот почему древнегреческий философ Эпикур (Epicurus; 342/341 до Нашей Эры – 271/270 до Нашей Эры) говорит, что время есть акцидент акцидентов – ведь всё, что случается (например, факт сидения), имеет некую продолжительность во времени. И наоборот, настоящее есть свойство бытия, как бытие есть сущность настоящего. Из этого вытекает, что всё в мире акцидентально, в том числе свойства, сущности, субстанции, поскольку всё это имеет место во времени. Бытие случайно, становление необходимо – значит, существует только история. Акцидент:- означает случайное, не существенное свойство вещи; акцидентальный – то же, что случайный в противоположность эссенциальному, существенному. Ввиду этого в философии акцидент противополагается существу (субстанции) и означает происшедшие от процесса случайности, свойства и назначения которых не принадлежат к постоянному, неизменному составу свойств существа и могут поэтому в нём отсутствовать или изменяться, не препятствуя тому, чтобы существо (вещь сама по себе) не переставало быть тем, чем оно есть.

(2) Accident is an occurrence involving a commercial motor vehicle operating on a public road which results in one of the following: a fatality; bodily injury to a person, who as a result of the injury, immediately receives medical treatment away from the scene of the accident; or one or more motor vehicles incurring disabling damage as a result of the accident, requiring the vehicle to be transported away from the scene by a tow truck or other vehicle. It does not include:- an occurrence involving only boarding and alighting from a stationary motor vehicle; an occurrence involving only the loading or unloading of cargo; or an occurrence in the course of the operation of a passenger car or a multipurpose passenger vehicle, as defined in 49 CFR 571.3 (49 CFR is short for the Code of Federal Regulations:- Title 49), by a motor carrier and is not transporting passengers for hire or hazardous materials of a type and quantity that require the motor vehicle to be marked or placarded in accordance with 49 CFR 177.823. An incident involving a moving vehicle. Includes collisions with a vehicle, object, or person (except suicides) and derailment/left roadway.

(3) In a gas industry, an Accident is:- (i) An event that involves the release of gas from a pipeline or of liquefied natural gas or gas from an LNG facility resulting in a death, or personal injury necessitating in-patient hospitalization; or estimated property damage, including cost of gas lost, of the operator or others, or both, of USD50 000.00 or more; (ii) an event that results in an emergency shutdown of an LNG facility; and (iii) an event that is significant, in the judgment of the operator, even though it did not meet the criteria of (i) or (ii).

ACCIDENT FREQUENCY = ЧАСТОТА НЕСЧАСТНЫХ СЛУЧАЕВ – Accident Frequency is the number of times an accident occurs. Used in predicting losses upon which premiums are based. / Под Частотой Несчастных Случаев понимается количество случающихся несчастных случаев определённого рода. Используется для предварительной оценки возможных убытков при расчёте страховых премий.

ACCIDENT INSURANCE = СТРАХОВАНИЕ ОТ НЕСЧАСТНОГО СЛУЧАЯ (или СТРАХОВАНИЕ ОТ НЕСЧАСТНЫХ СЛУЧАЕВ) – Accident Insurance is an insurance of individuals or groups against economic risks in the event of death or temporary or permanent disability by accident. A branch of non-life insurance. / Страхование индивидуумов или групп от экономических рисков в случае смерти или временной или постоянной нетрудоспособности, вызванной проявлением несчастного случая. Оно является одним из направлений страхования, не связанного со страхованием жизни. финансовая защита от последствий несчастного случая (НС).

ACCIDENT YEAR = ГОД НАСТУПЛЕНИЯ СТРАХОВОГО СЛУЧАЯ (или ГОД НАСТУПЛЕНИЯ НЕСЧАСТНОГО СЛУЧАЯ) – The Accident Year ratio is calculated as expenses and incurred losses (paid and reserves) for claims occurring in the year as a proportion of net premiums earned during the year. It excludes movements during the calendar year on claims, expenses and premium estimates for previous years. The calendar or accounting year in which a loss occurs. / Календарный или отчётный год, в который возникает убыток.

ACC/INC = ACCIDENT/INCIDENT

ACCLIMATION/ACCLIMATIZATION = АККЛИМАЦИЯ/АККЛИМАТИЗАЦИЯ – Acclimation/Acclimatization:- adjustment or adaptation of an individual to a different climate or environment. / Под Акклиматизацией, от Латинской приставки Ad, означающее Для или К, и Греческого слова Klima, означающее Наклон (земной поверхности к солнечным лучам), понимается приспособление животных организмов к новым условиям существования, к новым биоценозам. Акклиматизация бывает природной (миграции животных, перенос семян растений животными в новые места и тому подобное) и искусственной (после интродукции животных и растений). Акклиматизирующие организмы могут в новых условиях давать жизнеспособное потомство. Применительно к человеку акклиматизация – приспособление к новым климатическим условиям. Акклиматизация – процесс успешного производства жизнеспособного потомства иноземными видами в новом месте обитания с вероятностью длительного выживания. Акклиматизация Иноземного Вида путём успешного размножения в месте обитания в зоне, в которую он проник. Акклиматизация – процесс, а не результат. Таким образом предполагается, что одна отдельно взятая размножающаяся генерация организма может рассматриваться как акклиматизация, если имеется вероятность длительного выживания потомства (иначе должна стоять запятая после слова ‘обитания’). Не ясно, насколько понятие ‘потомство’ применимо к организмам, которые размножаются вегетативным путём (многие растения, большинство грибов, другие микроорганизмы). При использовании понятия ‘обоснование’. Имеется в виду выживание вида в целом. Даже рост долгоживущих особей до момента зрелости может считаться обоснованием в течение обозримого будущего (например, плантации не местного растения). Акклиматизация:- процесс успешного производства жизнеспособного потомства иноземными видами в новом месте обитания с вероятностью длительного выживания. (Примечания:- (1) Акклиматизация – процесс, а не результат. Таким образом предполагается, что одна отдельно взятая размножающаяся генерация организма может рассматриваться как акклиматизация, если имеется вероятность длительного выживания потомства (иначе должна стоять запятая после слова ‘Обитания’). Данное определение не выражает концепцию МККЗР об ‘обосновании в течение обозримого будущего’. (2) Не ясно, насколько понятие ‘Потомство’ применимо к организмам, которые размножаются вегетативным путём (многие растения,

большинство грибов, другие микроорганизмы). При использовании понятия ‘Обоснование’, Международная Конвенция по Карантину и Защите Растений (МККЗР) избегает вопроса размножения или репродукции особей в целом. Имеется в виду выживание вида в целом. Даже рост долгоживущих особей до момента зрелости может считаться обоснованием в течение обозримого будущего (например, плантации не местного растения). (3) Акклиматизация иноземного вида путём успешного размножения в месте обитания в зоне, в которую он проник). Акклиматизация – обоснование на длительный период времени в обозримом будущем популяции вредного организма в зоне после его проникновения в неё. Акклиматизация (агента биологической борьбы) – обоснование популяции агента биологической борьбы в зоне после его ввоза в неё на длительный период времени в обозримом будущем.

ACCOMMODATION TRADING = АККОМОДАЦИОННАЯ ТОРГОВЛЯ (или ПОСОБНИЧЕСКАЯ ТОРГОВЛЯ) – Accommodation Trading is a non-competitive trading entered into by a trader, usually to assist another with illegal trades. / Неконкурентная торговля, осуществляемая торговцем, как правило, для оказания поддержки другому торговцу в его противозаконных сделках. Под Аккомодацией, от Латинского слова Accomodation, означающее Приноровление или Приспособление, .

ACCOMPANIED TRANSPORT = ПЕРЕВОЗКА В СОПРОВОЖДЕНИИ – Accompanied Transport is the transport of complete road vehicles by another means of transport, e.g., train or ferry, accompanied by the driver. / Перевозка дорожного транспортного средства в собранном виде иным средством перевозки, например, поездом или паромом, в сопровождении водителя дорожного транспортного средства.

ACCORD EUROPÉEN RELATIF AU TRANSPORT INTERNATIONAL DES MARCHANDISES DANGEREUSES PAR ROUTE = АКОРД ЭРОПЕЭНН РЭЛЯТИФ О ТРАНСПОР ЭТЭРНАСЬЁНАЛЬ ДЭ МАРШАНДИЗ ДАНЖЁРЁЗ ПАР РУТ (или ЕВРОПЕЙСКОЕ СОГЛАШЕНИЕ, КАСАЮЩЕЕСЯ МЕЖДУНАРОДНОЙ ПЕРЕВОЗКИ ОПАСНЫХ ТОВАРОВ ПО АВТОДОРОГАМ) – In French:- Accord Européen Relatif au Transport International des Marchandises Dangereuses par Route (ADR)):- detailed provisions re-issued every two years by the United Nations Economic Commission for Europe. See also European Agreement Concerning the International Carriage of Dangerous Goods by Road. / Акорд Эропеэнн Рэлятиф о Транспор Этэрнасьёналь дэ Маршандиз Данжёрёз пар Рут (сокращённо – А.Дэ.Эр.).

ACCORDION SHADES = АККОРДЕОННЫЕ ТЕНИ (или ГАРМОШЕЧНЫЕ ТЕНИ) – Accordion Shades are the shades made of accordion pleats sharply creased at regular intervals horizontally across their width. Accordion shades take up relatively little room when drawn up to uncover the window.

ACCOUNT = СЧЁТ – Account is a formal record that represents, in words, money or other unit of measurement, certain resources, claims to such resources, transactions or other events that result in changes to those resources and claims. Continuously updated record of transactions. Interest rates, charges, credit and withdrawal limits and additional facilities will differ according to account type. In the context of bookkeeping, refers to the ledger pages upon which various assets, liabilities, income and expenses are represented. In the context of investment banking, refers to the status of securities sold and owned or the relationship between parties to an underwriting syndicate. In the context of securities, the relationship between a client and a broker/dealer firm allowing the firm’s employee to be the client’s buying and selling agent. Account is the detailed record of a particular asset, liability, owners’ equity, revenue or expense. / В контексте бухгалтерского учёта этот термин относится к главной книге по учёту представленных активов, обязательств, доходов и расходов. В контексте инвестиционного банковского обслуживания этот термин относится к статусу проданных и находящихся во владении ценных бумаг или взаимоотношениям между сторонами, образующими андерайтинговый синдикат. В контексте ценных бумаг, этот термин отражает взаимоотношения между клиентом и брокерской/дилерской фирмой, позволяющие сотруднику фирмы выступать от имени клиента в качестве агента по покупкам и продажам. Счёт:- в общем значении:- (i) контрактные взаимоотношения между покупателем и продавцом, в соответствии с которыми платёж производится в последующем времени. Используются также термины ‘открытый счет’ (open account) или ‘кредит по открытому счету’ (charge account), в зависимости от того, заключён ли контракт в коммерческих целях или для обслуживания потребительских покупок; (ii) хронологическая запись сделок в соответствии с контрактом, периодически представляемая банком клиенту в выписках с банковского счёта. (2) Банковское дело:- договорённость, заключенная на конкретное имя, обычно подтверждаемая депозитом средств, которые затем могут сниматься со счёта. Существуют счета ‘по требованию’, срочные, открываемые родителями для детей, совместные счета нескольких лиц, находящиеся в доверительном управлении, корпорационные, специальные и обычные текущие счета. Административные обязанности по ведению счетов исполняет специальное лицо, ответственное за операции по счёту (account officer). (3) Бухгалтерский учёт:- активы, обязательства, доходы и расходы, представленные на отдельных страницах главной книги учёта, в которую в хронологическом порядке заносятся изменения показателей статей дебета и кредита, например наличных средств, дебиторской задолженности, накопленных процентов, продаж, вознаграждения администрации и тому подобные. Система записи, проверки и отчётности по этой информации называется бухгалтерским учётом. Лица, занимающиеся бухгалтерским учётом, называются Бухгалтерами (Accountants). (4) Инвестиционные банковские операции:- финансовые и контрактные взаимоотношения между сторонами по поводу совместной покупки ценных бумаг для их размещения среди инвесторов, а также определения статуса ценных бумаг, находящихся в их владении и реализуемых на рынке. (5) Ценные бумаги:- взаимоотношение между брокерско-дилерской компанией и её клиентом, при котором компания через своих зарегистрированных представителей действует в качестве агента по покупке и продаже ценных бумаг и осуществляет соответствующий управленческий контроль.

ACCOUNTABILITY = ВОЗМОЖНОСТЬ УЧЁТА – Accountability:- the legal and political obligation of an independent institution to properly explain and justify its decisions to the citizens and their elected representatives, thereby making it responsible for fulfilling its objectives. The European Central Bank (ECB) is accountable to the European citizens and, more formally, to the European Parliament.

ACCOUNTABILITY SYSTEM = СИСТЕМА С ВОЗМОЖНОСТЬЮ УЧЁТА – Accountability System is a system established to maintain the credibility of PPQ’s (short for the Plant Protection and Quarantine) entire export program, to deter forgeries and control public misuse of the export certificates.

ACCOUNTANT = БУХГАЛТЕР – Accountant is an individual who measures and reports economic events to help managers, investors, tax authorities and others in making smart financial decisions. In the United States, CPAs (Certified Public Accountants) are qualified accountants who have passed the Uniform Certified Public Accountant Examination and have met additional state education and experience requirements.

ACCOUNTANT’S OPINION = ЗАКЛЮЧЕНИЕ БУХГАЛТЕРА – Accountant’s Opinion is a statement signed by an independent accountant outlining his or her opinion regarding the quality of information contained in a company’s financial reports and records. An accountant’s opinion statement can either be qualified or unqualified. When the opinion is qualified, the accountant is questioning the accounting principles and/or scope of the information provided. An unqualified opinion is given when the accountant sees that the given

information in the financial statements is sound. In other words, an unqualified opinion is desirable whereas a qualified opinion is not. The subject of accountant independence became an important issue in the wake of the demise of such corporate giants as Enron and WorldCom in the early 2000's. Because Enron and WorldCom were large companies, they represented a substantial portion of their accounting firms' revenues. This lead to the speculation that the accountants could not provide truly independent opinions for these giant companies, who provided the accountants with extremely lucrative contracts but also might have terminated these contracts if undesirable accounting opinions were issued. Accountant's Opinion is a letter preceding a financial report, written and signed by an independent accountant, which describes the scope of the statement and presents an opinion on the quality of the data presented. Also known as Accountant's Letter. Accountant's Opinion is a signed statement regarding the financial status of an entity from an independent public accountant after examination of that entities records and accounts. See also Auditor's Report. / Смотрите также Отчёт Аудитора (Auditor's Report). Заключение Бухгалтера – отчёт, подписанный независимым бухгалтером экспертом, имеющим право ревизии баланса и бухгалтерских книг. В нём указывается объём проверки бухгалтерских книг и отчётности организации. Поскольку финансовая отчётность в значительной степени отражает собственные оценки организации, мнение бухгалтера эксперта особенно важно для заимодавца или инвестора. В зависимости от объёма аудита и уверенности аудитора в достоверности информации, отзыв может представлять окончательное заключение по результатам ревизии или квалифицированное заключение. Квалифицированное заключение, хотя и необязательно являющееся негативным, требует расследования. Употребляется также термин Сертификат Аудитора или Свидетельство Аудитора (Auditor's Certificate).

ACCOUNTANT'S REPORT = БУХГАЛТЕРСКИЙ ОТЧЁТ (или ОТЧЁТ БУХГАЛТЕРА) – Accountant's Report is a formal document that communicates an independent accountant's:- (i) expression of limited assurance on financial statements as a result of performing inquiry and analytic procedures (Review Report); (ii) results of procedures performed (Agreed-Upon Procedures Report); (iii) non-expression of opinion or any form of assurance on a presentation in the form of financial statements information that is the representation of management (Compilation Report); or (iv) an opinion on an assertion made by management in accordance with the Statements on Standards for Attestation Engagements (Attestation Report). An accountant's report does not result from the performance of an audit. See also Auditor's Report. / (i) выражение ограниченного заверения по финансовым отчётам .

ACCOUNT BASE = БАЗА СЧЕТОВ – Account Base is a list of all accounts in a sales region.

ACCOUNT EXECUTIVE = ИСПОЛНИТЕЛЬ ПО СЧЁТУ (или ДЕЛОПРОИЗВОДИТЕЛЬ) – Account Executive:- this term refers a person who has primary responsibility for an account, whether it be for an individual or corporate client. It is used often in the advertising and public relations business, but can also be used in financial services businesses. An account executive may have a team of people or may be a sole operator. In a brokerage firm, for example, it may be the primary broker for an individual client or for a corporate client. It is that broker who must know the client, for example. The term implies decision-making authority over the firm's activities with that client. Account Executive is the agent of a commission house who serves customers/traders by entering their commodity futures and options orders, reporting trade executions, advising on trading strategies, etc. / Исполнитель по Счёту – служащий брокерской фирмы, работающий с клиентами. Имеет легальные полномочия агента (agent). Каждый исполнитель по счёту должен пройти определённый тест и быть зарегистрирован в Национальной Ассоциации Дилеров по Ценным Бумагам (National Association of Securities Dealers, NASD) до получения распоряжений от клиентов. Его также называют Зарегистрированным Представителем (Registered Representative).

ACCOUNT IDENTIFICATION CODE = КОД ИДЕНТИФИКАЦИИ СЧЁТА (или КОД ОТОЖДЕСТВЛЕНИЯ СЧЁТА, или КОД ОПОЗНАВАНИЯ СЧЁТА) – Account Identification Code is a code uniquely identifying an account held at a financial institution. / Код Идентификации Счёта – это код, в единственном роде идентифицирующий счёт, удерживаемый в финансовом учреждении.

ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ (или ВЕДЕНИЕ БУХГАЛТЕРСКОГО УЧЁТА) – Accountancy, or Accounting, is the production of information about an enterprise and the transmission of that information from those who have it to those who need it. The communication is generally in the form of financial statements that show in money terms the economic resources under the control of management; the art lies in selecting the information that is relevant to the user and is representationally faithful. The principles of accountancy are applied to business entities in three divisions of practical art, named accounting, bookkeeping, and auditing. The American Institute of Certified Public Accountants (AICPA) defines accountancy as '... the art of recording, classifying, and summarizing in a significant manner and in terms of money ...' transactions and events that are at least partly financial in character, and interpreting the results. Accounting is thousands of years old; the earliest accounting records, which date back more than 7 000 years, were found in Mesopotamia (Assyrians). The people of that time relied on primitive accounting methods to record the growth of crops and herds. Accounting evolved, improving over the years and advancing as business advanced. Early accounts served mainly to assist the memory of the businessperson and the audience for the account was the proprietor or record keeper alone. Cruder forms of accounting were inadequate for the problems created by a business entity involving multiple investors, so double-entry bookkeeping first emerged in northern Italy in the XIV century, where trading ventures began to require more capital than a single individual was able to invest. The development of joint stock companies created wider audiences for accounts, as investors without firsthand knowledge of their operations relied on accounts to provide the requisite information. This development resulted in a split of accounting systems for internal (i.e. management accounting) and external (i.e. financial accounting) purposes, and subsequently also in accounting and disclosure regulations and a growing need for independent attestation of external accounts by auditors. Today, accounting is called 'The Language Of Business' because it is the vehicle for reporting financial information about a business entity to many different groups of people. Accounting that concentrates on reporting to people inside the business entity is called Management Accounting and is used to provide information to employees, managers, owner-managers and auditors. Management accounting is concerned primarily with providing a basis for making management or operating decisions. Accounting that provides information to people outside the business entity is called Financial Accounting and provides information to present and potential shareholders, creditors such as banks or vendors, financial analysts, economists, and government agencies. Because these users have different needs, the presentation of financial accounts is very structured and subject to many more rules than management accounting. The body of rules that governs financial accounting in a given jurisdiction is called Generally Accepted Accounting Principles, or GAAP. Other rules include International Financial Reporting Standards, or IFRS, or US GAAP. The basic accounting equation is assets = liabilities + equity. This is the Statement of Financial Position (It is the new name of Balance Sheet according to IFRS). The foundation for the balance sheet begins with the income statement, which is revenues – expenses = net income or net loss. This is followed by the retained earnings statement, which is beginning retained earnings + net income + additional capital (capital contribution) – dividends/drawings = ending retained earnings. The word 'Accountant' is derived from the French word Compter, which took its origin from the Latin word Computare. The word was formerly written in English as 'Accomptant', but in process of time the word, which was always pronounced by dropping the 'p', became gradually changed both in pronunciation and in orthography to its present form. Accounting is a recording and reporting of financial transactions, including the origination of the transaction, its recognition, processing, and summarization in the financial statements. Accounting is a practice and body of knowledge concerned primarily with (i) methods for recording transactions, (ii) keeping financial records, (iii) performing internal audits, (iv) reporting and analyzing financial information to the management, and

(v) advising on taxation matters. It is a systematic process of identifying, recording, measuring, classifying, verifying, summarizing, interpreting and communicating financial information. It reveals profit or loss for a given period, and the value and nature of a firm's assets, liabilities and owners' equity. Accounting provides information on the (i) resources available to a firm, (ii) the means employed to finance those resources, and (iii) the results achieved through their use. Accounting is primarily a system of measurement and reporting of economic events based upon the accounting equation for the purpose of decision making. Generally, when someone says 'accounting' they are referring to the department, activity or individuals involved in the application of the accounting equation. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ACCOUNTING COST BREAKEVEN SELLING PRICE = XX ЦЕНА – Accounting Cost Breakeven Selling Price is the price needed to recover all costs except the opportunity costs (cost for using the producer's labor and capital) associated with producing the commodity. See also Breakeven Selling Price; Cash Flow Breakeven Selling Price; and Economic Cost Breakeven Selling Price.

ACCOUNTING FOR GOVERNMENT GRANTS AND DISCLOSURE OF GOVERNMENT ASSISTANCE = БУХГАЛТЕРСКИЙ УЧЁТ ПРАВИТЕЛЬСТВЕННЫХ ГРАНТОВ И РАСКРЫТИЕ ПРАВИТЕЛЬСТВЕННОГО СОДЕЙСТВИЯ (или БУХГАЛТЕРСКИЙ УЧЁТ ГОСУДАРСТВЕННЫХ ГРАНТОВ И РАСКРЫТИЕ ГОСУДАРСТВЕННОГО СОДЕЙСТВИЯ) – IAS 20 (short for International Accounting Standard No. 20) – Accounting for Government Grants and Disclosure of Government Assistance – This Standard shall be applied in accounting for, and in the disclosure of, government grants and in the disclosure of other forms of government assistance. Government grants are assistance by government in the form of transfers of resources to an entity in return for past or future compliance with certain conditions relating to the operating activities of the entity. They exclude those forms of government assistance which cannot reasonably have a value placed upon them and transactions with government which cannot be distinguished from the normal trading transactions of the entity. Government assistance is action by government designed to provide an economic benefit specific to an entity or range of entities qualifying under certain criteria. Government assistance for the purpose of this Standard does not include benefits provided only indirectly through action affecting general trading conditions, such as the provision of infrastructure in development areas or the imposition of trading constraints on competitors. In this Standard, government assistance does not include the provision of infrastructure by improvement to the general transport and communication network and the supply of improved facilities such as irrigation or water reticulation which is available on an ongoing indeterminate basis for the benefit of an entire local community. A government grant may take the form of a transfer of a non-monetary asset, such as land or other resources, for the use of the entity. In these circumstances it is usual to assess the fair value of the non-monetary asset and to account for both grant and asset at that fair value. Government grants, including non-monetary grants at fair value, shall not be recognised until there is reasonable assurance that:- (a) the entity will comply with the conditions attaching to them; and (b) the grants will be received. Government grants shall be recognised as income over the periods necessary to match them with the related costs which they are intended to compensate, on a systematic basis. A government grant that becomes receivable as compensation for expenses or losses already incurred or for the purpose of giving immediate financial support to the entity with no future related costs shall be recognised as income of the period in which it becomes receivable. Grants related to assets are government grants whose primary condition is that an entity qualifying for them should purchase, construct or otherwise acquire long-term assets. Subsidiary conditions may also be attached restricting the type or location of the assets or the periods during which they are to be acquired or held. Government grants related to assets, including non-monetary grants at fair value, shall be presented in the balance sheet either by setting up the grant as deferred income or by deducting the grant in arriving at the carrying amount of the asset. Grants related to income are government grants other than those related to assets. Grants related to income are sometimes presented as a credit in the income statement, either separately or under a general heading such as 'Other income'; alternatively, they are deducted in reporting the related expense. A government grant that becomes repayable shall be accounted for as a revision to an accounting estimate (see IAS 8 Accounting Policies, Changes in Accounting Estimates and Errors). Repayment of a grant related to income shall be applied first against any unamortised deferred credit set up in respect of the grant. To the extent that the repayment exceeds any such deferred credit, or where no deferred credit exists, the repayment shall be recognised immediately as an expense. Repayment of a grant related to an asset shall be recorded by increasing the carrying amount of the asset or reducing the deferred income balance by the amount repayable. The cumulative additional depreciation that would have been recognised to date as an expense in the absence of the grant shall be recognised immediately as an expense. The following matters shall be disclosed:- (a) the accounting policy adopted for government grants, including the methods of presentation adopted in the financial statements; (b) the nature and extent of government grants recognised in the financial statements and an indication of other forms of government assistance from which the entity has directly benefited; and (c) unfulfilled conditions and other contingencies attaching to government assistance that has been recognised. / МСБУ 20 (сокращение для Международного Стандарта Бухгалтерского Учёта № 20) – . выплата (repayment) . (смотрите МСБУ 8 Политики Ведения Бухгалтерского Учёта, Изменения в Оценках Бухгалтерского Учёта и Ошибки) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ACCOUNTING POLICIES, CHANGES IN ACCOUNTING ESTIMATES AND ERRORS = УЧЁТНЫЕ ПОЛИТИКИ, ИЗМЕНЕНИЯ В УЧЁТНЫХ ОЦЕНКАХ И ОШИБКИ (или ПОЛИТИКИ ВЕДЕНИЯ БУХГАЛТЕРСКОГО УЧЁТА, ИЗМЕНЕНИЯ В ОЦЕНКАХ БУХГАЛТЕРСКОГО УЧЁТА И ОШИБКИ) – IAS 8 (short for International Accounting Standard No. 8) – Accounting Policies, Changes in Accounting Estimates and Errors – the objective of this Standard is to prescribe the criteria for selecting and changing accounting policies, together with the accounting treatment and disclosure of changes in accounting policies, changes in accounting estimates and corrections of errors. The Standard is intended to enhance the relevance and reliability of an entity's financial statements, and the comparability of those financial statements over time and with the financial statements of other entities. Accounting policies:- Accounting policies are the specific principles, bases, conventions, rules and practices applied by an entity in preparing and presenting financial statements. When a Standard or an Interpretation specifically applies to a transaction, other event or condition, the accounting policy or policies applied to that item shall be determined by applying the Standard or Interpretation and considering any relevant Implementation Guidance issued by the IASB (short for the International Accounting Standards Board) for the Standard or Interpretation. In the absence of a Standard or an Interpretation that specifically applies to a transaction, other event or condition, management shall use its judgement in developing and applying an accounting policy that results in information that is relevant and reliable. In making the judgement management shall refer to, and consider the applicability of, the following sources in descending order:- (a) the requirements and guidance in Standards and Interpretations dealing with similar and related issues; and (b) the definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the Framework. An entity shall select and apply its accounting policies consistently for similar transactions, other events and conditions, unless a Standard or an Interpretation specifically requires or permits categorisation of items for which different policies may be appropriate. If a Standard or an Interpretation requires or permits such categorisation, an appropriate accounting policy shall be selected and applied consistently to each category. An entity shall change an accounting policy only if the change:- (a) is required by a Standard or an Interpretation; or (b) results in the financial statements providing reliable and more relevant information about the effects of transactions, other events or conditions on the entity's financial position, financial performance or cash flows. An entity shall account for a change in accounting policy resulting from the initial application of a Standard or an Interpretation in accordance with the specific transitional provisions, if

any, in that Standard or Interpretation. When an entity changes an accounting policy upon initial application of a Standard or an Interpretation that does not include specific transitional provisions applying to that change, or changes an accounting policy voluntarily, it shall apply the change retrospectively. However, a change in accounting policy shall be applied retrospectively except to the extent that it is impracticable to determine either the period-specific effects or the cumulative effect of the change. Change in accounting estimate:- the use of reasonable estimates is an essential part of the preparation of financial statements and does not undermine their reliability. A change in accounting estimate is an adjustment of the carrying amount of an asset or a liability, or the amount of the periodic consumption of an asset, that results from the assessment of the present status of, and expected future benefits and obligations associated with, assets and liabilities. Changes in accounting estimates result from new information or new developments and, accordingly, are not corrections of errors. The effect of a change in an accounting estimate, shall be recognised prospectively by including it in profit or loss in:- (a) the period of the change, if the change affects that period only; or (b) the period of the change and future periods, if the change affects both. Prior period errors:- prior period errors are omissions from, and misstatements in, the entity's financial statements for one or more prior periods arising from a failure to use, or misuse of, reliable information that:- (a) was available when financial statements for those periods were authorised for issue; and (b) could reasonably be expected to have been obtained and taken into account in the preparation and presentation of those financial statements. Such errors include the effects of mathematical mistakes, mistakes in applying accounting policies, oversights or misinterpretations of facts, and fraud. Except to the extent that it is impracticable to determine either the period-specific effects or the cumulative effect of the error, an entity shall correct material prior period errors retrospectively in the first set of financial statements authorised for issue after their discovery by:- (a) restating the comparative amounts for the prior period(s) presented in which the error occurred; or (b) if the error occurred before the earliest prior period presented, restating the opening balances of assets, liabilities and equity for the earliest prior period presented. Omissions or misstatements of items are material if they could, individually or collectively, influence the economic decisions of users taken on the basis of the financial statements. / МСБУ 8 (сокращение для Международного Стандарта Бухгалтерского Учёта № 8) – Учётные Политики, Изменения в Учётных Оценках и Ошибки или Политики Ведения Бухгалтерского Учёта, Изменения в Оценках Бухгалтерского Учёта и Ошибки (IAS 8 (short for International Accounting Standard No. 8) – Accounting Policies, Changes in Accounting Estimates and Errors) – этот стандарт определяет порядок внесения корректировок в содержание бухгалтерской отчётности в связи с изменением учётных оценок или по причине выявления ошибок, допущенных в предыдущих отчётных периодах. при подготовке и представлении финансовых отчётов.

ACCOUNTING POLICY = УЧЁТНАЯ ПОЛИТИКА (или ПОЛИТИКА ВЕДЕНИЯ БУХГАЛТЕРСКОГО УЧЁТА) – Accounting Policies are the specific principles, bases, conventions, rules and practices applied by an entity in preparing and presenting financial statements. When an IFRS (short for the International Financial Reporting Standards) specifically applies to a transaction, other event or condition, the accounting policy or policies applied to that item shall be determined by applying the IFRS and considering any relevant Implementation Guidance issued by the IASB (short for the International Accounting Standards Board) for the IFRS. In the absence of a Standard or an Interpretation that specifically applies to a transaction, other event or condition, management shall use its judgement in developing and applying an accounting policy that results in information that is relevant and reliable. In making the judgement management shall refer to, and consider the applicability of, the following sources in descending order:- (a) the requirements and guidance in IFRSs dealing with similar and related issues; and (b) the definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the Framework. An entity shall select and apply its accounting policies consistently for similar transactions, other events and conditions, unless an IFRS specifically requires or permits categorisation of items for which different policies may be appropriate. If an IFRS requires or permits such categorisation, an appropriate accounting policy shall be selected and applied consistently to each category. An entity shall change an accounting policy only if the change:- (a) is required by an IFRS; or (b) results in the financial statements providing reliable and more relevant information about the effects of transactions, other events or conditions on the entity's financial position, financial performance or cash flows. An entity shall account for a change in accounting policy resulting from the initial application of an IFRS in accordance with the specific transitional provisions, if any, in that IFRS. When an entity changes an accounting policy upon initial application of an IFRS that does not include specific transitional provisions applying to that change, or changes an accounting policy voluntarily, it shall apply the change retrospectively. However, a change in accounting policy shall be applied retrospectively except to the extent that it is impracticable to determine either the period-specific effects or the cumulative effect of the change. The specific principles, bases, conventions, rules, and practices applied by a reporting entity in preparing and presenting its financial statements. / при подготовке и представлении финансовых отчётов. Специфические принципы, основы, конвенции, правила, и практики, применимые отчитывающимся лицом в подготовке и предоставлении своих финансовых отчётов.

ACCOUNTING PRINCIPLES BOARD = ПАЛАТА ПО ПРИНЦИПАМ ВЕДЕНИЯ БУХГАЛТЕРСКОГО УЧЁТА – Accounting Principles Board (APB) is a senior technical committee of the American Institute of Certified Public Accountants (AICPA) which issued pronouncements on accounting principles from 1959–73. The APB was replaced by the Financial Accounting Standards Board (FASB). / Палата по Принципам Бухгалтерского Учёта (ППБУ) – орган Американского Института Сертифицированных Публичных Бухгалтеров (American Institute of Certified Public Accountants (AICPA)), который разработал в 1959–73 принципы бухгалтерского учёта, включавшие многие из общепринятых допущений в основных принципах бухгалтерского учёта (Generally Accepted Accounting Principles) США.

ACCOUNTING REGULATORY COMMITTEE = РЕГУЛЯТОРНЫЙ КОМИТЕТ ПО ВЕДЕНИЮ БУХГАЛТЕРСКОГО УЧЁТА – Accounting Regulatory Committee (ARC), established by the International Accounting Standards (IAS) regulation, that operates at the political level under established EU rules for decision-making by regulatory committees. The Committee, chaired by the Commission and composed of representatives of the Member States, decides whether to endorse IAS on the basis of Commission proposals.

ACCOUNTING STANDARDS = СТАНДАРТЫ ВЕДЕНИЯ БУХГАЛТЕРСКОГО УЧЁТА – Accounting Standards are authoritative statements of how particular types of transaction and other events should be reflected in financial statements.

ACCOUNT MANAGEMENT PROFILE SYSTEM = СИСТЕМА ПРОФИЛЬНОГО УПРАВЛЕНИЯ СЧЁТОМ – Account Management Profile System provides access to information helpful to the NYSE® staff in managing day-to-day relationships with listed companies, member firms, and institutions. / Обеспечивает доступ к информации полезной персоналу НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) в координации ежедневных взаимоотношений с перечисленными компаниями, фирмами членами и другими учреждениями.

ACCOUNT NUMBER = НОМЕР СЧЁТА – Account Number:- in banking, bank and account identifier(s) of the account to be credited or debited.

ACCOUNT OWNER = ХОЗЯИН СЧЁТА – Account Owner is an institution for which an account is serviced at another institution (account servicing institution). The account owner will often refer to the account as a nostro, or due from, account. / Учреждение, счёт которого обслуживается в другом учреждении (учреждении, обслуживающем счёт). Владелец Счёта будет часто ссылаться на этот счёт как на счёт ностро, или исходя из этого, как на счёт.

ACCOUNT PARTY = СТОРОНА ПО РАСЧЁТУ (или БЕНЕФИЦИАР) – Account Party is a party for whom a letter of credit is opened. Account Party and Applicant are generally synonymous, but sometimes one party will agree with the issuing bank to make all payments under a letter of credit showing the name of another party (often two affiliated companies). Banks may refer to one of these parties as the applicant and the other as the account party, but there is no consistency among banks regarding which is which.

ACCOUNT PROFILE = ПРОФИЛЬ СЧЁТА – Account Profile is a projection of an account's upcoming volume along with such account's shipping requirements.

ACCOUNT RECEIVABLE DAYS = ДНИ СЧЕТОВ К ПОЛУЧЕНИЮ (или ДНИ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ) – Account Receivable Days measure the average time it takes for customers to pay the company. Therefore, it measures how efficiently the company collects money. Speedier debt collection means that there is less money tied up in customer debts and, all other things being equal, a higher level of profitability. Account Receivable Days vary from industry to industry. However, a typical level is 70 to 80 days.

ACCOUNT RELATIONSHIP = ВЗАИМООТНОШЕНИЯ ПО СЧЁТУ (или РАСЧЁТНЫЕ ВЗАИМООТНОШЕНИЯ) – Account Relationship is the relationship between two parties arising from the holding of at least one account between them. / Взаимоотношения между двумя сторонами, вытекающие вследствие удерживания ими по крайней мере одного счёта.

ACCOUNTS DUE = ACCOUNTS PAYABLE

ACCOUNT SERVICING INSTITUTION = УЧРЕЖДЕНИЕ, ОБСЛУЖИВАЮЩЕЕ СЧЁТ (или ОРГАНИЗАЦИЯ, ОБСЛУЖИВАЮЩАЯ СЧЁТ) – Account Servicing Institution is an institution that is the depository for an account for another institution (account owner). The account servicing institution will often refer to the account as a vostro, or due to, account.

ACCOUNT SERVICING INSTITUTION'S REFERENCE = ССЫЛКА УЧРЕЖДЕНИЯ, ОБСЛУЖИВАЮЩЕГО СЧЁТ – Account Servicing Institution's Reference:- in a SWIFT message, a reference assigned by the account servicing institution to identify the transaction. This is the reference to which the account owner refers in cases of inquiry to that financial institution. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ACCOUNTS PAYABLE = КРЕДИТОРСКАЯ ЗАДОЛЖЕННОСТЬ (или СЧЕТА К ОПЛАТЕ) – Accounts Payable consist of financial transactions awaiting settlement, relating to short-term payables (typically payable within three days or less) where transactions have been effected but cash has not yet been transferred. This includes assets that have been purchased and liabilities that have been repurchased. Accounts Payable are company's unpaid bills for goods and services that it received. Accounts payable and accounts receivable are two sides of the same transaction. One firm's account receivable is another's account payable. An account receivable is the vendor's uncollected invoice for goods or services rendered; an account payable is the customer's unpaid bill for goods or services received. Money (debts or amounts) a company owes for services and supplies. For example, a record company would list as accounts payable the bill from a company that supplied the raw material for making compact disks. See also Payables, and Receivables. Also known as Creditors in the United Kingdom. Account Payable is an amount owed to a creditor for delivered goods or completed services. Accounts Payable:- indebtedness of a company to its suppliers for goods or services purchased that have been purchased and which must be paid for within one year (more typically paid within 30–90 days). This shows as a current liability on the company's balance sheet. Accounts Payable (AP) are trade accounts of businesses representing obligations to pay for goods and services received. / Деньги (долги или суммы), которые компания должна заплатить за оказанные услуги или выполненные поставки товарной продукции. Например, записывающая компания причислит счёт компании, поставившей сырьё для производства компакт дисков, в разряд кредиторской задолженности. Смотрите также Дебиторская Задолженность (Receivables), и Кредиторская Задолженность (Payables). Известна также как Кредиторы (Creditors) в Соединённом Королевстве. В бухгалтерском учёте под Кредиторской Задолженностью понимаются денежные средства компании или организации, подлежащие уплате соответствующим физическим или юридическим лицам. Различают нормальную (законную) и просроченную кредиторскую задолженность. Счета к Оплате или Кредиторская Задолженность – суммы задолженности кредитору по открытому счёту за предоставленные товары и услуги. Аналитики оценивают отношение счетов к оплате к объёму покупок как критерий оценки качества ежедневного финансового управления.

ACCOUNTS PAYABLE TO SALES = КРЕДИТОРСКАЯ ЗАДОЛЖЕННОСТЬ К ПРОДАЖАМ (или СЧЕТА К ОПЛАТЕ К ПРОДАЖАМ) – Accounts Payable To Sales measures the speed with which a company pays vendors relative to sales. Numbers higher than typical industry ratios suggest that the company is using suppliers assets (cash owed) to fund operations.

ACCOUNTS RECEIVABLE = СЧЕТА К ПОЛУЧЕНИЮ (или ДЕБИТОРСКАЯ ЗАДОЛЖЕННОСТЬ) – Accounts Receivable:- amounts owed to a company by its customers for goods or services supplied to those customers which must be paid for within one year (more typically collected within 30–90 days). This shows as a current asset on the company's balance sheet. Accounts Receivable is an asset reflecting money due to the company from customers as a result of delivered sales. In accounting, this account subgroup includes amounts owed on open account from private persons, firms, or corporations for goods and services furnished by a governmental unit during its normal course of business. It does include amounts due from other funds of the state which are quasi-external in character. Account Receivable is a claim against a debtor for an uncollected amount, generally from a completed transaction of sales or services rendered. Accounts Receivables are the uncollected bills for goods and services that a company has shipped or rendered. Since most businesses do not operate on a cash sales basis, accounts receivable are usually a large and important part of a firm's current assets. Amounts owed to an entity as a result of the sale of goods or services. Amounts due to a business entity which were charged by a customer for goods purchased or services performed. In the entity's balance sheet, accounts receivable are the counterpart of accounts payable owed by the party (or parties) responsible for paying the charge. Like accounts payable, accounts receivable are analyzed as a function of their due date, i.e. the date on which the charge is payable. Accounts receivable are included under current assets in the creditor's balance sheet. Whenever an account receivable from a customer is determined to be uncollectible, it is written off against an allowance (or provision) for uncollectible or doubtful accounts. See also Payables, and Receivables. Also known as Debtors in the United Kingdom. Accounts Receivable is the total value of money owed to the company by its customers for past sales. In the balance sheet, Accounts Receivable are recorded at net realizable value after consideration of an allowance for doubtful accounts. Accounts Receivable is a current asset representing money due for services performed or merchandise sold on credit. / Суммы, причитающиеся хозяйствующему юридическому лицу, которые были начислены заказчику за закупленные им товары или оказанные ему услуги этим юридическим лицом. В балансовом отчёте этого юридического лица, дебиторская задолженность служит противопоставлением кредиторской задолженности, иными словами, теми средствами, которые причитаются к оплате стороной (или сторонами) по выставленным счетам. Как и кредиторская задолженность, дебиторская задолженность рассматривается в качестве назначения к своей надлежащей (причитающейся) дате, то есть дате оплаты счетов. Дебиторская задолженность включается в разряд текущих активов в

балансовом отчёте кредитора. Когда дебиторская задолженность заказчика считается невосполнимой, она списывается за счёт отчисления (или обеспечения), выделенного на невосполнимые или сомнительные счета. Смотрите также Дебиторская Задолженность (Receivables), Кредиторская Задолженность (Payables). Известна также как Дебиторы (Debtors) в Соединённом Королевстве. В бухгалтерском учёте под Дебиторской Задолженностью понимается сумма долгов, причитающихся предприятию или хозяйствующему субъекту от физических и юридических лиц в итоге хозяйственных взаимоотношений с ними. Своевременное взыскание дебиторской задолженности является одним из важных средств обеспечения благоприятного финансового состояния предприятия. По истечении сроков исковой давности дебиторская задолженность списывается в убыток. Под Дебиторской Задолженностью понимается сумма долгов, причитающихся предприятию, организации или учреждению от юридических или физических лиц в итоге хозяйственных взаимоотношений с ними. Источником покрытия дебиторской задолженности являются отвлечённые из оборота собственные средства. В условиях бывшей социалистической экономики по характеру образования дебиторская задолженность подразделялась на задолженность, обусловленную нормальным процессом хозяйственной деятельности, и задолженность, связанную с нарушением финансово-сметной и расчётно-платёжной дисциплины, а также с нарушением социалистической законности. К первому виду дебиторской задолженности относились авансы, выданные поставщикам по условиям договора (за газ, электроэнергию, услуги автотранспорта и связи, по закупке некоторых материалов); неотоваренная часть плановых и предварительных платежей; задолженность подотчётных лиц (по выданным авансам) в пределах сроков, установленных для сдачи отчётов; задолженность съёмщиков жилых помещений по квартплате за последний месяц и тому подобное. Второй вид дебиторской задолженности охватывал долги по недостачам, растратам и хищениям; признанные ответчиками или присуждённые арбитражем претензии; вызванные несоответствием количества или качества товаров (или услуг) установленному ассортименту, и другие виды просроченной дебиторской здолженности. По экономическому содержанию дебиторской задолженностью являлись:- задолженность покупателей за отгруженные товары и сданные работы, не оплаченные в срок, а также за товары, документы по которым не переданы в банк на инкассо в обеспечение ссуд; превышение задолженности рабочих и служащих по ссудам, полученным на индивидуальное жилищное строительство и на приобретение товаров в кредит, над банковскими ссудами, выданными на эти цели, и другое. Суммы дебиторской задолженности, по которым истекли сроки исковой давности, с разрешения руководителя предприятия или организации списывались в убыток с сообщением об этом вышестоящему органу. Лица, виновные в пропуске сроков исковой давности, несли ответственность. Счета к Получению или Дебиторская Задолженность – суммы, которые должно получить коммерческое предприятие за товары и услуги, проданные по открытому счёту. Ключевой фактор в анализе ликвидности компании – её способность выполнить текущие обязательства без привлечения дополнительных доходов.

ACCOUNTS RECEIVABLE DAYS = ДНИ СЧЕТОВ К ПОЛУЧЕНИЮ (или ДНИ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ) – Accounts Receivable Days (A/R Days) is the number of days that a customer invoice is outstanding before it is collected. The point of the measurement is to determine the effectiveness of a company's credit and collection efforts in allowing credit to reputable customers, as well as its ability to collect cash from them. See also Accounts Receivable/Sales. Accounts Receivable Days is an accounting concept related to Accounts Receivable. It is the length of time it takes to clear all Accounts Receivable, or how long it takes to receive the money for goods it sells. This is useful for determining how efficient the company is at receiving whatever short-term payments it is owed. The formula for Accounts Receivable Days is:- (Accounts Receivable / Revenue) x Number of Days In Year. For the purpose of this calculation, it is usually assumed that there are 360 days in the year (4 quarters of 90 days). Accounts Receivable Days is often found on a financial statement projection model. Interestingly, a report on the technology company Apple recently stated that Apple gets paid for its products before it actually has to pay for them. In practice, this means that Apple's Accounts Receivable (AR) Days is lower than its Accounts Payable (AP) Days. This ratio is important because it means Apple can effectively ramp up production to the very maximum level of consumer demand and will never be limited by cash flow (not that it would be anyway with USD100bn in the bank). Most companies are not in this situation so in order to avoid having production constrained by free cash, it is desirable to minimise the difference between AR Days and AP days. This concept can be slightly counterintuitive at times so an example is provided below to illustrate the principals. Imagine there is a company that only sells chairs and has USD100 in the bank. Each chair costs USD10 to produce and retails for USD20. The company has a contract with its suppliers saying it will pay for materials 15 days after delivery but on average, its customers do not pay for products until 30 days (1 month free credit deal or similar) after purchase. So what does this imply? Again for simplicity, we assume that the company receives the materials, converts them into a chair and sells the chair all within 1 day. So on day 1, the company takes delivery of materials for 10 chairs and sells all 10 to consumers and still has USD100 in the bank. On day 16, it has to pay the supplier this USD100 and will have USD0 in the bank until day 31 where it receives USD200 for the parts. This means that from day 16 until day 31, the company has no money and cannot produce so maximum profit per month is USD100. If the company were to reduce the time that consumers had to pay to less than the time in which it had to pay the supplier, it would get paid before it had to pay up meaning it could produce endlessly and never run out of cash. Now no company uses its entire cash reserves to order stock so the idea falls down a bit here, but the principal still applies. In Apple's case, consumers pay for their products within 18 days but Apple does not have to pay suppliers for 83 days which implies they have money coming in roughly 4.5x faster than going out (this would be if they sold products for what it cost to purchase which they do not, in reality their income flow would be 9x faster or greater than their expenditure).

ACCOUNTS RECEIVABLE ENTRIES PAYMENTS = ПЛАТЕЖИ ПРОВОДОК ПО ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ – In the United States, a term Accounts Receivable Entries (ARC) Payments means consumer checks received at a lockbox or drop-off location that are converted to automated clearinghouse (ACH) payments for processing.

ACCOUNTS RECEIVABLE/SALES = СЧЕТА К ПОЛУЧЕНИЮ/ПРОДАЖИ (или ДЕБИТОРСКАЯ ЗАДОЛЖЕННОСТЬ/ПРОДАЖИ) – Accounts Receivable/Sales is the value of accounts receivable expressed in terms of sales income. It is usually expressed in terms of days of sales (by dividing the total value of account receivable by the average sales income per day). Note:- this measure may also be called Account Receivable Days.

ACCOUNTS RECEIVABLE TURNOVER = ОБОРОТ СЧЕТОВ К ПОЛУЧЕНИЮ (или ОБОРОТ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ) – Accounts Receivable Turnover is the sales divided by the accounts receivable and so shows the average number of times the accounts receivable are collected each year. Accounts Receivable Turnover is the ratio of net credit sales to average accounts receivable, which is a measure of how quickly customers pay their bills.

ACCOUNT STATEMENT = ВЫПИСКА ПО СЧЁТУ – Account Statement is a periodic summary of account activity with a beginning date and an ending date. The most commonly known are checking account statements, usually provided monthly, and brokerage account statements, which are provided monthly or quarterly. Monthly credit card bills are also considered account statements. Account statements refer to almost any official summary of an account, wherever the account is held. Insurance companies may provide account statements summarizing paid-in cash values, for example. Account statements should be scrutinized for accuracy, and historical statements are critical for budgeting. Account Statement is a summary in writing of all account transactions within a given

period. Depending on the type of account, interest is calculated on a monthly to yearly basis. Can be requested online via Telebanking. Account Statement is a record of transactions and their effect on account balances over a specified period of time, for a given account. A bank account statement lists the debits and credits that took place over the relevant time period, while a brokerage account statement lists the long positions and short positions, purchases and sales, and other transactions. / Заключение в письменной форме обо всех операциях, проведённых по счёту за данный период времени. В зависимости от типа счёта, проценты рассчитываются на месячной или годовой основе. Может быть затребована в режиме реального времени посредством предоставляемого Дистанционного Банковского Обслуживания (или Банковского Обслуживания на Отдалении или Тэлибэнькин (Telebanking)) – электронного банковского обслуживаниия. Выписка по Счёту:- в общем значении – любая запись сделок и результатов на балансе счетов на оплату сделанных покупок или баланса по открытому счёту в течение указанного периода времени. Банковские операции:- краткая сводка всех оплаченных чеков, зафиксированных в депозитах, и итоговый баланс за определённый период времени. Другое название – банковская выписка или выписка банка (bank statement). Ценные бумаги:- (i) выписка, в которой подытоживаются все сделки и указывается состояние счёта в брокерско-дилерской фирме, включая обязательства по срочным сделкам при 'длинных' и 'коротких' продажах. Подобные выписки могут быть ежеквартальными, но, если счета активные, выписки делаются ежемесячно; (ii) опционное соглашение (option agreement), которое требуется в том случае, если открыт опционный счёт.

ACCOUNT WITH INSTITUTION = СЧЁТ В УЧРЕЖДЕНИИ – Account With Institution is a field name in a SWIFT message, the financial institution at which the 'Ordering Party' requests the 'Beneficiary' to be paid. / Название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), финансовое учреждение, от которого 'Инструктирующая Сторона' ('Распорядитель') требует осуществления оплаты 'бенефициару'. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ACCREDITATION = АККРЕДИТАЦИЯ (или АККРЕДИТОВАНИЕ) – Accreditation is official recognition of proficiency resulting in the approval and authority to perform specific tasks or provide specific services in full or partial support of fulfilling official obligations. / В международном праве под Аккредитованием, от Латинского слова Accredo, означающее Доверяю, понимается процедура назначения дипломированного представителя (или постоянного представителя государства при какой-либо международной организации).

ACCREDITATION COUNCIL FOR ACCOUNTANCY AND TAXATION = АККРЕДИТАЦИОННЫЙ СОВЕТ ПО БУХГАЛТЕРСКОМУ УЧЁТУ И НАЛОГООБЛОЖЕНИЮ – Accreditation Council for Accountancy and Taxation (ACAT) is a national organization established in 1973 as a non-profit independent testing, accrediting and monitoring organization. The Council seeks to identify professionals in independent practice who specialize in providing financial, accounting and taxation services to individuals and small to mid-size businesses. Professionals receive accreditation through examination and/or coursework and maintain accreditation through commitment to a significant program of continuing professional education and adherence to the Council's Code of Ethics and Rules of Professional Conduct.

ACCREDITED BUSINESS ACCOUNTANT = АККРЕДИТОВАННЫЙ ДЕЛОВОЙ БУХГАЛТЕР – Accredited Business Accountant (ABA) or Accredited Business Advisor (ABA), in the US, is a national credential conferred by Accreditation Council for Accountancy and Taxation to professionals who specialize in supporting the financial needs of individuals and small to medium sized businesses. ABA is the only nationally recognized alternative to the Certified Public Accountant (CPA). Most accredited individuals do not perform audits. Generally, they are small business owners themselves. In addition to general accounting work, CPAs are also heavily schooled in performing audits; however, only a small fraction of America's businesses require an audit. In general, a CPA has majored in accounting, passed the CPA examination and is licensed to perform audits. An ABA has majored in accounting, passed the ABA comprehensive examination and in most states is not licensed to perform audits.

ACCREDITED DERIVATIVES ADVISER = АККРЕДИТОВАННЫЙ СОВЕТНИК ПО ПРОИЗВОДНЫМ ИНСТРУМЕНТАМ (или АККРЕДИТОВАННЫЙ СОВЕТНИК ПО ДЕРИВАТИВАМ) – Accredited Derivatives Adviser:- persons who have been accredited by the Australian Securities Exchange (ASX) to advise or make a recommendation (including a recommendation in a research report) to clients in relation to ASX derivative products other than futures and futures options, i.e. warrants and all DTP (short for the Derivatives Trading Platform) products other than futures or futures options. / , то есть .

ACCREDITED FUTURES ADVISER = АККРЕДИТОВАННЫЙ СОВЕТНИК ПО ФЬЮЧЕРСАМ – Accredited Futures Adviser:- persons who have been accredited by the Australian Securities Exchange (ASX) to advise or make a recommendation (including a recommendation in a research report) to clients in relation to ASX futures and futures options.

ACCREDITED INVESTOR = АККРЕДИТОВАННЫЙ ИНВЕСТОР (или АККРЕДИТОВАННЫЙ ВКЛАДЧИК) – In Canada, a term Accredited Investor generally refers to a sophisticated, reasonably wealthy person who can invest in companies without requiring a prospectus from said company. The exact definition will vary among countries and regulators. In Canada and the US it is an individual whose net worth, or joint net worth with a spouse, exceeds CAD1 000 000 (excluding one's principal residence); or whose individual income exceeds CAD200 000/yr. In the United States, an 'Accredited Investor' as defined in Regulation D under the Securities Act of 1933. It includes entities such as banks, insurance companies, registered investment companies; those charitable organizations, corporations, or partnerships that have assets exceeding USD5 million; certain employee benefits plans; and natural persons who are directors, executive officers, or general partners of the company selling the securities or who meet certain income or net worth requirements. Term used by the US Securities And Exchange Commission (SEC) in Regulation D of private placements. Concept:- although 35 is the upper limit of persons who may purchase a private placement, accredited investors are not included in this number. General definition of accredited investors:- institutional type accounts and persons of wealth (persons with a net worth of USD1 million or more, persons with annual income of USD200 000.00 or more, persons who purchase USD150 000.00 or more of the offering and this does not represent more than 20% of their net worth). / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении) который может закупить . Аккредитованный Инвестор, в соответствии с Предписанием Ди (Regulation D) Комиссии по Ценным Бумагам и Биржам (Securities and Exchange Commission (SEC)) частное товарищество с ограниченной ответственностью (private limited partnership) использует аккредитованных инвесторов для привлечения более крупных сумм капитала, чем могут внести 35 участников товарищества (предельное число членов такого товарищества по закону). Аккредитованным инвестором может быть состоятельный инвестор, который не входит в число 35 человек, вкладывающих деньги в частное товарищество с ограниченной ответственностью, имеет чистый капитал по меньшей мере в 1 миллион Долларов США или ежегодный доход не менее 200 000 Долларов и вносит в сделку как минимум 150 000 Долларов при том, что этот вклад не составляет более 20% его состояния.

ACCRESCENT = РАЗРАСТАЮЩЕЕСЯ – Accrescent:- continuing to increase in size after maturity or flowering, especially of floral parts.

ACCRETIVE = РАЗРАСТАЮЩЕЕСЯ (или НАБЕЖАВШЕЕ, или АККРЕЦИОННОЕ) – Accretive:- this usually refers to earnings that result from an acquisition of a business that add to the earnings per share as opposed to losses that would dilute earnings per share. As a general rule, an accretive merger or acquisition occurs when the P/E ratio of the acquiring firm is greater than that of the target firm. A 'dilutive acquisition' is the opposite of an 'accretive acquisition'.

ACCRUAL ACCOUNTING METHOD = МЕТОД УЧЁТА ПО НАЧИСЛЕНИЮ – Accrual Accounting Method is an accounting method that is used to measure operational efficiency and profitability versus the Cash Method which measures how much you're spending to meet business needs. In Accrual accounting, income and expenses are reported on the Income Statement as they are earned or invoice, although they have probably not been collected or paid as yet. Accrual Accounting is an accounting method which measures the performance of a company by recognizing financial transactions (purchases and sales) regardless of when the actual cash transactions occur.

ACCRUAL BASIS = МЕТОД НАЧИСЛЕНИЯ (или БАЗИС ДЛЯ НАЧИСЛЕНИЯ) – In the United States, Accrual Basis is a method of accounting that recognizes revenue when earned, rather than when collected. Expenses are recognized when incurred rather than when paid. Accrual Basis of Accounting is wherein revenue and expenses are recorded in the period in which they are earned or incurred regardless of whether cash is received or disbursed in that period. This is the accounting basis that generally is required to be used in order to conform to generally accepted accounting principles (GAAP) in preparing financial statements for external users. Accrual Basis is a method of accounting in which each item is entered as it is earned or incurred regardless of when actual payments are received or made. Accrual Basis is a method of accounting that reflects expenses incurred and income earned for Income Tax purposes for any one year. Taxpayers who use the accrual method must include in their taxable income any money that they have the right to receive as payment for services, once it has been earned. Any expenses that they may take as deductions when computing taxable income must be due at the time the deduction is taken. For example, suppose a surgeon performed a tonsillectomy in October 2012, and on December 31, 2012, he received a bill for carpeting installed in the waiting room of his office. He was paid the surgical fee on January 03, 2013, the same day he paid for the carpeting. The surgical fee will be included in his taxable income for 2012, the year in which he earned it, regardless of the fact that he was not paid until the following year. His expenses for the carpeting can be deducted from his 2012 income because once he received the bill, he was bound to pay it. The fact that he did not pay for the carpeting until the following year does not prevent him from taking the deduction in 2012. The accrual method of accounting differs from the cash basis method, which treats income as only that which is actually received, and expense as only that which is actually paid out. If the cash method were used in the above example, the payment of the surgical fee would be included as income for the 2013 tax year, the year in which it was received by the surgeon. The surgeon could deduct the cost of the carpeting only when he actually paid for it in 2013, although it had been installed in 2012. Unearned income, such as interest or rent, is generally taxed in the year in which it is received, regardless of the accounting method that the taxpayer uses. / Метод Начисления – метод бухгалтерского учёта, при котором доходы и расходы учитываются в момент совершения сделки, хотя поставки товаров могут быть ещё не осуществлены или реально не оплачены. Альтернативным методом является принцип бухгалтерского учёта на основе наличности (cash basis).

ACCRUAL BOND = ОБЛИГАЦИЯ НАЧИСЛЕНИЯ – Accrual Bond is a bond that does not pay periodic interest payments. Instead, interest is added to the principal balance of the bond and is either paid at maturity or, at some point, the bond begins to pay both principal and interest based on the accrued principal and interest to that point. When the bond begins to pay both principal and interest based on the accrued principal and interest at that point, this is known as a Z Tranche and is common in collateralized mortgage obligations (CMOs). In a CMO that includes a Z tranche, the interest payments that otherwise would be paid to the Z-tranche holder are used to pay down the principal of another tranche. After that tranche is paid off, the Z tranche begins to pay down based on the original principal of the tranche plus the accrued interest. Similar to a zero-coupon bond, an accrual bond or Z tranche has limited or no reinvestment risk. However, accrual bonds, by definition, have a longer duration than bonds with the same maturity that make regular interest or principal and interest payments. As such, accrual bonds are subject to greater interest rate risk than bonds that make periodic payments over their entire terms. Deferred coupon tranche of a collateralized mortgage obligation (CMO). An Accrual Bond receives cash payments of neither principal nor interest until all tranches preceding it are retired. In effect, an accrual bond is a deferred interest obligation, resembling a zero coupon bond prior to the time that the preceding tranches are retired, except that accrual bonds carry an explicit coupon rate. The accrual bond then receives cash payments representing interest and principal on the accrued amount outstanding. Accrual bonds are purchased most frequently by investors who require the greatest degree of protection against reinvestment and call risk, or who seek the greater price leverage afforded by these classes. Also known as Z Bond. An Accrual Bond is more commonly referred to as a Zero Coupon Bond. It is a type of bond where interest is added to the principal balance due to the bondholder at maturity and not paid out in cash. The bond is sold at a discount to its maturity value based on a financial calculation that will yield a specific amount. Savings bonds are a popular form of the accrual bond or zero coupon bond. One of the biggest dangers of the accrual bond or zero coupon bond is phantom income. Even though you receive no income in cash each year, you are still required to pay taxes on the interest that was credited to the value of your bond. If you have a good sized fixed income portfolio with several hundred thousand dollars invested in accrual bonds, you could find yourself owing taxes that you cannot pay. Accrual Bond is a bond that pays no coupons, is sold at a deep discount to its face value, and matures at its face value. An accrual bond has the important advantage of being free from reinvestment risk, though the downside is that there is no opportunity to enjoy the effects of a rise in market interest rates. Also, such bonds tend to be very sensitive to changes in interest rates, since there are no coupon payments to reduce the impact of interest rate changes. In addition, markets for zero-coupon bonds are relatively illiquid. Under US tax law, the imputed interest on a zero-coupon bond is taxable as it accrues, even though there is no cash flow. Also called Zero-Coupon Bond. / Облигация Начисления – долгосрочная ипотечная облигация с отсрочкой выплаты дивидендов. Облигации, по которым не осуществляется периодических выплат процентов, а вместо этого проценты накапливаются и выплачиваются при наступлении срока погашения облигации. Такие облигации также называются Бескупонными Облигациями (Zero-Coupon Bonds).

ACCRUALS AND DEFERRALS = НАЧИСЛЕНИЯ И ОТСРОЧКИ – Accruals And Deferrals:- adjusting entries made to allocate accrued (or deferred) expenses (or revenue) to the accounting period in which they are incurred (or earned). See also Accrued Expenses, Accrued Revenue, Deferred Charge, Deferred Income, and Prepaid Expense. / начисленных (или отложенных) расходов (или доходов) .

ACCRUALS BASIS = МЕТОД НАЧИСЛЕНИЙ (или БАЗИС ДЛЯ НАЧИСЛЕНИЙ) – In the United Kingdom, a method of recording transactions to relate them to the period when the exchange of ownership of the goods, services or financial asset applies. For example, value added tax accrues when the expenditure to which it relates takes place, but Customs and Excise receive the cash

some time later. The difference between accruals and cash results in the creation of an asset and liability in the financial accounts, shown as amounts receivable or payable. See also Cash Basis. / Смотрите также Кассовый Метод (Cash Basis).

ACCRUAL–TYPE SAVINGS SECURITY = СБЕРЕГАТЕЛЬНАЯ ЦЕННАЯ БУМАГА НАЧИСЛЯЕМОГО ТИПА – In the United States, Accrual-Type Savings Security is a savings bond or note having a redemption value (see Current redemption value) that increases periodically (typically, either every six months or monthly) as interest is added to the security's issue price (principal). Interest accrues on such a bond or note and becomes a part of the redemption value (principal + interest), which is paid when the bond or note is cashed. Series I/E/EE bonds, savings notes, retirement plan bonds, and individual retirement bonds are the currently outstanding accrual-type securities. Series A through Series D bonds as well as Series F and J bonds, all matured, were also accrual-type securities. Also referred to as an Appreciation-Type Security.

ACCRUED EXPENDITURES = НАЧИСЛЕННЫЕ РАСХОДЫ – Accrued Expenditures are the charges incurred by the recipient during a given period requiring the provision of funds for:- (1) goods and other tangible property received; (2) services performed by employees, contractors, subrecipients, and other payees, and (3) other amounts becoming owed under programs for which no current services or performance are required.

ACCRUED EXPENSES = НАЧИСЛЕННЫЕ РАСХОДЫ – Is a current liability and represents an amount relating to the period unpaid at the end of that period. Accrued Expenses is a concept similar to prepaid expenses. It refers to expenses that have been recognized for accounting purposes but have not yet been billed or paid. With the matching of revenue and expenses under accrual accounting, costs are recognized as expenses for a period if they are directly tied to goods or services delivered during that period or are general expenses for the period. When such a cost is recognized as expense in a period but has not yet been billed or paid, there is an associated liability for that expense item. Interest payments are a good example of accrued expenses. Some debt contracts require interest payments every quarter or 6 months, but the firm is incurring an interest payment obligation each month. The interest obligation will be deducted as an expense each month. This interest expense is not paid monthly but builds up, or accrues, as an obligation to be paid at a future date. Accrued expenses can also be viewed as the opposite of prepaid expenses. For prepaid expenses, a firm generates an asset by paying for expenses in advance of their 'use'. With accrued expenses, a firm creates a liability by 'using' an expense before it has been billed or paid. Expenses incurred at the end of the reporting period but not yet paid. Accrued expenses are listed under current liabilities in the balance sheet. Also known as Accrued Liabilities. / строка баланса (item). Расходы, понесённые в конце отчётного периода, но остающиеся пока что неоплаченными. Начисленные расходы заносятся в краткосрочные обязательства в бухгалтерском балансе (балансовом отчёте). Известны также как Накопленные Обязательства (Accrued Liabilities).

ACCRUED INCOME = НАЧИСЛЕННЫЙ ДОХОД – Accrued Income is the earnings during a given period which are a source of funds resulting from (1) services performed by the recipient; (2) goods and other tangible property delivered to purchasers; and (3) amounts becoming owed to the recipient for which no current services or performance are required by the recipient.

ACCRUED INTEREST = НАЧИСЛЕННЫЙ ПРОЦЕНТ – Accrued Interest is an interest that has been earned but not received or recorded. Accrued Interest:- applies to the situation of a fixed interest security when you are between coupon dates. It represents the interest accrued, but not yet paid, since the last coupon date. If, at today's date, the last coupon date was 56 days ago and the number of days between the last coupon date and the next is 180 days and on the next coupon date a coupon of £3 will be paid then the accrued interest to-day will be (£3 x 56) / 180 = £0.933 3. If the stock has gone xd then the accrued interest is negative and is equal to the negative of the interest that will accrue between today's date and the next coupon date so that if there are 4 days to go from to-day to the next coupon date and 180 days between coupon dates the accrued interest is (–3 x 4) / 180 or –£.0667. Interest payments accrued since the last interest due date up to a specified date prior to the next due date. The amount of interest that has been earned since the last interest payment date. When a bond trades, the buyer pays the seller the accrued interest – a pro rata portion of the next interest payment, which will be paid to the buyer of the bond. The interest due on a bond since the last interest payment was made. The buyer of the bond pays the market price plus accrued interest. For debt securities, interest that has accumulated since the last coupon date which the buyer of a fixed-income security must pay to the seller. The interest earned between the most recent interest payment and the present date but not yet paid to the lender. Accrued Interest is:- (1) a term used to describe an accrual accounting method when interest that is either payable or receivable has been recognized, but not yet paid or received. Accrued interest occurs as a result of the difference in timing of cash flows and the measurement of these cash flows. For example, accrued interest receivable occurs when interest on an outstanding receivable has been earned by the company, but has not yet been received. A loan to a customer for goods sold would result in interest being charged on the loan. If the loan is extended on October 01 and the lending company's year ends on December 31, there will be two months of accrued interest receivable recorded as interest revenue in the company's financial statements for the year. (2) The interest that has accumulated on a bond since the last interest payment up to, but not including, the settlement date. Accrued interest is added to the contract price of a bond transaction. Accrued interest is that which has been earned since the last coupon payment. Because the bond hasn't expired or the next payment is not yet due, the owner of the bond hasn't officially received the money. If he or she sells the bond, accrued interest is added to the sale price. / надлежащей (причитающейся) даты . Процент, начисленный к оплате по облигации с момента последней выплаты процентов. Покупатель облигации оплачивает рыночную стоимость и начисленные проценты. Проценты, начисленные с момента самой последней выплаты процентов и по настоящую дату, но ещё не выплаченные ссудодателю. Начисленные или Набежавшие Проценты – проценты, которые накопились за время между последним платежом и продажей облигаций или иных ценных бумаг с фиксированным доходом. На момент продажи покупатель платит продавцу цену облигации плюс начисленные проценты, рассчитываемые умножением ставки выплаты по купону на количество дней, которое прошло с момента последнего платежа. Начисленные проценты также используются в товариществах с ограниченной ответственностью (limited partnership), вкладывающих средства в недвижимость, когда продавец здания получает единую сумму наличными в момент продажи и предоставляет вторичный ипотечный займ на оставшуюся сумму. В том случае, если доход от сдачи здания в аренду не покрывает выплат по ипотечному займу, продавец соглашается на накопление процентов до тех пор, пока здание не будет продано кому-либо ещё. Сделки с начислением процентов были ограничены в США налоговым законодательством в 1984.

ACCRUED INTEREST PAPER = БУМАГА С НАЧИСЛЕННЫМИ ПРОЦЕНТАМИ – Accrued Interest Paper is a security which is issued at face value but which does not bear regular interest; however, in addition to the capital sum, the repayment amount includes interest and compound interest. Repayment is usually made after an agreed fixed term. The interest rate is determined on the date of issue. A typical accrued interest paper is the Federal Savings Note Type B (Bundesschatzbrief Typ B) in Germany. The opposite of accrued interest paper is Interest Discount Paper.

ACCRUED REVENUE = НАЧИСЛЕННАЯ ВЫРУЧКА – Accrued Revenue:- money which has been earned but not received as of the end of the reporting period. Accrued revenue is listed under current assets in the balance sheet. Also known as Accrued Assets, and Accrued Income. / Деньги, которые были заработаны, но не получены на конец отчётного периода. Начисленная выручка

указывается в балансовом отчёте под текущими активами. Известна также как Начисленные Активы (Accrued Assets), и Начисленный Доход (Accrued Income).

ACCRUED VACATION PAY = НАЧИСЛЕННАЯ ОПЛАТА ОТПУСКА (или НАБЕЖАВШИЕ ОТПУСКНЫЕ) – Accrued Vacation Pay is the amount of vacation time that an employee has earned as per a company's employee benefit policy, but which has not yet been used or paid. This is a liability for the employer. The following discussion of accounting for accrued vacation pay can also be applied to holiday pay. The calculation of accrued vacation pay for each employee is:- (i) calculate the amount of vacation time earned through the beginning of the accounting period. This should be a roll-forward balance from the preceding period. This information can be maintained in a database or electronic spreadsheet; (ii) add the number of hours earned in the current accounting period; (iii) subtract the number of vacation hours used in the current period; (iv) multiply the ending number of accrued vacation hours by the employee's hourly wage to arrive at the correct accrual that should be on the company's books; and (v) if the amount already accrued for the employee from the preceding period is lower than the correct accrual, then record the difference as an addition to the accrued liability. If the amount already accrued from the preceding period is higher than the correct accrual, then record the difference as a reduction of the accrued liability. Example of Accrued Vacation Pay:- for example, there is already an existing accrued balance of 40 hours of unused vacation time for Fred Smith on the books of ABC International. In the most recent month that has just ended, Fred accrued an additional five hours of vacation time (since he is entitled to 60 hours of accrued vacation time per year, and 60 / 12 = five hours per month). He also used three hours of vacation time during the month. This means that, as of the end of the month, ABC should have accrued a total of 42 hours of vacation time for him (40 hours existing balance + 5 hours additional accrual – 3 hours used). Fred is paid USD30 per hour, so his total vacation accrual should be USD1 260 (42 hours x USD30/hour). The beginning balance for him is USD1 200 (40 hours x USD30/hour), so ABC accrues an additional USD60 of vacation liability. Use it or Lose it Policy:- What if a company has a 'use it or lose it' policy? This means that employees must use their vacation time by a certain date (such as the end of the year), and can only carry forward a small number of hours (if any) into the next year. One issue is that this policy may be illegal, since vacation is an earned benefit that cannot be taken away (which depends on the law in each state). If this policy is considered to be legal, then it is acceptable to reduce the accrual as of the date when employees are supposed to have used their accrued vacation, thereby reflecting the reduced liability to the company as represented by the number of vacation hours that employees have lost. Pay Raise Effects:- What if an employee receives a pay raise? Then you need to increase the amount of his entire vacation accrual by the incremental amount of the pay raise. This is because, if the employee were to leave the company and be paid all of his unused vacation pay, he would be paid at his most recent pay rate. If a company awards pay raises to all employees during the same time period in each year, this can result in a sudden jump in the vacation expense accrual. Sabbatical Effects:- There may be situations where a sabbatical leave is granted so that an employee can perform public service or research that benefits the employer in some manner. In this situation, the compensation paid to the employee is not related to prior services rendered, and so should not be accrued in advance. In the more likely event that a sabbatical is based on prior services rendered, the employer should accrue the cost of the sabbatical during the required service period. / Фрэд Смис (Fred Smith).

ACCUMBENT = ПРИЖАТОЕ (или ПРИЛЕГАЮЩЕЕ) – Accumbent:- of a pair of cotyledons curving back towards the hypocotyl so that their edges are turned towards the hypocotyl. / пары котиледонов (семядолей) гипокотиль (подсемядольное колено).

ACCUMULATED DEPRECIATION = АККУМУЛИРОВАННОЕ ОБЕСЦЕНЕНИЕ (или НАКОПЛЕННЫЙ ИЗНОС, или АККУМУЛИРОВАННЫЕ (или НАКАПЛИВАЕМЫЕ) ОТЧИСЛЕНИЯ НА ИЗНОС) – The aggregate, at a given point of time, of the depreciation charges relating to a fixed asset made against revenue during the useful life of the fixed asset for the purpose of allocating the depreciable costs of the asset to the revenues the asset generates; when deducted from the historical cost or revalued amount of an asset it yields the book value. Accumulated Depreciation is a total depreciation pertaining to an asset or group of assets from the time the assets were placed in services until the date of the financial statement or tax return. This total is the contra account to the related asset account. Accumulated Depreciation on non-financial assets means total reduction in value of non-financial assets at the end of the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage etc.

ACCUMULATION = АККУМУЛЯЦИЯ (или НАРАЩИВАНИЕ) – Accumulation is the act of buying more shares of a security without causing the price to increase significantly. After a decline, a stock may start to base and trade sideways for an extended period. While this base builds, well-informed traders and investors may seek to establish or increase existing long positions. In that case, the stock is said to have come under accumulation. Accumulation is:- (1) an individual investor's cash contributions to invest in securities over a period of time in order to build a portfolio of desired value. Dividends and capital gains are also reinvested during this process. When an individual investor is attempting to build up the value of a portfolio, he or she is said to be accumulating wealth. The reinvestment of profits over the course of the investment time horizon can greatly boost the pace of accumulation through the benefits of compounding. (2) An institutional investor's purchase of a large number of shares in a public company over an extended period of time. Large investors and financial institutions are limited in their ability to move in and out of securities because they deal with large numbers of shares that would drive the price of a security up if ordered all at once. In order to buy their intended number of shares, institutional investors spread their accumulation of shares over a period of time. (3) The retention of company profits in corporate finance for reinvestment in business operations, as opposed to the payout of earnings as dividends to shareholders. As opposed to paying dividends out to investors, accumulation of earnings within the corporation boosts business expansion and growth and may produce extra value for shareholders in the long run. / Под Аккумуляцией, от Латинского слова Accumulatio, означающее Накопление или Собирание В Кучу, понимается:- (i) процесс накопления на земной поверхности рыхлых минеральных и органических осадков. Различают вулканическую и осадочную аккумуляцию. (ii) Аккумуляция капитала. Аккумуляция или Накопление:- (i) в финансировании корпораций:- прибыль, которая не выплачивается в качестве дивидендов, а добавляется к основному капиталу компании. (ii) В инвестициях:- приобретение большого числа акций без негативного воздействия на цены. Подобное накопление акций может занять несколько недель или месяцев. Взаимные фонды, регулярное вложение фиксированных сумм или реинвестирование прибыли для наращивания капиталовложений.

ACCUMULATION DISTRIBUTION LINE = ЛИНИЯ НАРАСТАНИЯ ЗАТУХАНИЯ – Accumulation Distribution is one of the group of money flow indicators. It measures the commitment of bulls and bears, giving advance warning of trend changes. In technical analysis, a momentum indicator that relates price changes with volume. It relates the closing price to the range of prices (High – Low). The closer the close is to the high, the more volume is added to the cumulative total. / В техническом анализе биржевых рынков, индикатор момента .

ACCUMULATION RISK = РИСК НАРАСТАНИЯ (или РИСК НАКАПЛИВАНИЯ) – Accumulation Risk is the risk that arises when a large number of individual risks are correlated such that a single event will affect many or all of these risks. / Риск, который возникает в моменты, когда большое количество отдельных рисков взаимосвязаны таким образом, что проявление хотя бы одного из них, может вызвать проявление многих или всех этих рисков.

ACCUMULATOR = АККУМУЛЯТОР – Accumulator is a container in which fluid is stored under pressure as a source of fluid power. / Под Аккумулятором, от Латинского слова Accumulator, означающее Собиратель, от Accumulo, означающее Накопляю или Собираю, понимается устройство для накопления энергии с целью её последующего использования. В зависимости от вида накапливаемой энергии различают Гидравлические Аккумуляторы, Инерционные Аккумуляторы, Пневматические Аккумуляторы, Тепловые Аккумуляторы и Электрические Аккумуляторы. Аккумулятор, устройство для накопления энергии с целью её последующего использования. В зависимости от вида накапливаемой энергии различают аккумуляторы:- электрические, гидравлические, тепловые, инерционные. Электрический Аккумулятор служит для накопления электрической энергии путём превращения её в химическую с обратным преобразованием по мере надобности; химический источник электрического тока многоразового пользования, работоспособность которого может быть восстановлена путём заряда, то есть пропусканием тока в направлении, обратном направлению тока при разряде (смотрите Химические Источники Тока). Первые опыты по созданию электрических аккумуляторов были проведены в начале XIX века Русским физиком экспериментатором, электротехником самоучкой Василием Владимировичем Петровым (1761–1834) и Немецким химиком, физиком и философом Йоханом Вильхэльмом Рита (Johann Wilhelm Ritter; 1776–1810). Особенно большой вклад в изучение свойств, разработку и совершенствование конструкций аккумуляторов внесли Русские учёные Эмилий Христианович Ленц (1804–1865), Дмитрий Александрович Лачинов (1842–1902), Евгений Павлович Тверитинов (1850–1920), Николай Николаевич Бенардос (1842–1905), Павел Николаевич Яблочков (1847–1894), Михаил Петрович Авенариус (1835–1895), Английский физик Сэр Вильэм Робэт Гроув (Sir William Robert Grove; 1811–1896), Французский физик и изобретатель Гясто Плятэ (Gaston Planté; 1834–1889) и многие другие (в мировой практике только по свинцовому аккумулятору к 1937 было зарегистрировано 20 000 патентов). В 1900 Американский изобретатель и предприниматель Томэс Алвэ Эдэсэн (Thomas Alva Edison; 1847–1931) изобрёл аккумулятор щелочного типа, получивший широкое распространение. Электрический аккумулятор состоит из 2 электродов, погруженных в раствор электролита; разность потенциалов электродов – электродвижущая сила (эдс) аккумулятора. Преобразование химической энергии в электрическую происходит при наличии замкнутой электрической цепи на основе химической (токообразующей) реакции. Наиболее распространённые электрические аккумуляторы, в соответствии с электрохимической схемой, делятся на свинцовые (кислотные), кадмиево-никелевые, железо-никелевые (щелочные), серебряно-цинковые и серебряно-кадмиевые. Аккумулятор характеризуется сроком службы, то есть числом возможных циклов заряд-разряд, допустимым без значительного падения характеристик; электрическим зарядом (распространён термин ‘Ёмкость’), то есть количеством электричества в Кулонах (Кл), килокулонах (кк) или в Ампер-часах (А-ч), которое он может отдать при разряде; средним напряжением в Вольтах (В), во время заряда и разряда; удельной энергией в Джоулях (Дж), килоДжоулях (кДж) или Ватт-часов (Вт-ч), снимаемой при разряде с 1 килограмм (кг) массы или 1 кубического дециметра ($дм^3$) объёма; отдачей по энергии (коэффициент полезного действия (кпд)) (1 Ампер-час (А-ч) = 3 600 Кл; 1 Ватт-час (Вт-ч) = 3 600 Джоулей (Дж)). Область применения аккумуляторов I группы – автомобильный транспорт (смотрите Электрооборудование Транспортных Машин), авиация, связь. Например, стартерные аккумуляторные батареи типа 6СТ-68 ЭМС или 6ТСТ-120ЭМС, стационарные аккумуляторы типа СН-1, СН-3 и другие в закрытом исполнении для работы на электрических станциях, телеграфных и телефонных узлах связи. Аккумуляторы II группы используют в авиации, средствах связи, на электротранспортных машинах, в космических аппаратах и для питания переносной аппаратуры. Например, тяговые аккумуляторы ТНЖ-3ООВМ применяют на электропогрузчиках и электроштабелерах; герметичные кадмиево-никелевые аккумуляторы типа КНГМ-10Д – для шахтных светильников; КНГ-1Д – для протезов с биоэлектрическим управлением; КНГЦ-3Д, дисковые аккумуляторы и батареи типа Д-0.06; Д-0.1; Д-0.25 и 7Д-0.1 – для питания малогабаритных радиоприёмников, электрических фонарей, слуховых аппаратов, фотовспышек и так далее. Аккумуляторы III и IV групп применяют в авиации, средствах связи, киносъёмочной аппаратуре и тому подобном. Гидравлический Аккумулятор служит для выравнивания давления и расхода жидкости или газа в гидравлических установках. Различают грузовые и воздушные аккумуляторы, поршневые и беспоршневые аккумуляторы. Гидравлические аккумуляторы используют в системах с резко переменным расходом жидкости или газа. В периоды уменьшения потребления аккумулятор накапливает жидкость (газ), поступающую от насосов (или компрессоров), и отдаёт её в моменты наибольших расходов. Аккумулятор состоит из резервуара, обычно цилиндрической формы, со свободно перемещающимся внутри поршнем. В резервуар подаётся жидкость под давлением, которое удерживается постоянным благодаря внешнему воздействию на поршень груза либо воздуха из подключённой пневмосети. В беспоршневых аккумуляторах давление поддерживается постоянным за счёт давления в пневмосети, непосредственно соединённой с резервуаром аккумулятора, причём давление воздуха равно давлению жидкости. Разновидность гидравлического аккумулятора – пневматический аккумулятор для уменьшения колебаний давления сжатого воздуха в пневматической сети. Применяют в крупных пневматических сетях, на ветроэлектростанциях и тому подобном. Представляет собой резервуар, включённый в воздуховод и снабжённый предохранительным клапаном. Клапан регулируют на заданное предельное давление. Тепловой Аккумулятор служит для накопления тепловой энергии с целью выравнивания тепловой и силовой нагрузок и устранения перебоев в снабжении паром и энергией промышленных установок (смотрите Котёл-Аккумулятор). Инерционный Аккумулятор – движущееся тело, количество движения которого значительно превышает количество движения внешних сил, воздействующих на это тело. Наиболее широко в качестве инерционного аккумулятора применяют вращающийся маховик (например, инерционный двигатель, получивший распространение в детских игрушках).

ACCUMULATOR TANK = АККУМУЛЯТОРНЫЙ БАК (или БАК НАКОПИТЕЛЬ, или НАКОПИТЕЛЬНЫЙ БАК) – Accumulator Tank is the large, well insulated hot water tank. Accumulators are plumbed in to take heat directly from the boiler, they then have a secondary heating coil to take heat for heat and hot water to the rest of the system. This has the effect of decoupling heat demand from heat production, allowing the boiler to operate at best efficiency and to accept interruptions to the heat supply. It also allows some lee-way in the specification of the boiler, as the accumulator is able to smooth some of the peaks and troughs in demand.

ACCURACY = ТОЧНОСТЬ (или ПРАВИЛЬНОСТЬ, или ТЩАТЕЛЬНОСТЬ, или МЕТКОСТЬ) – Accuracy:- the closeness of agreement between a test result and an accepted reference value (often used as a color instrument specification).

ACDO = AIR CARRIER DISTRICT OFFICE

ACD SERVICE = ENGINEERING, RESEARCH AND DEVELOPMENT SERVICE

ACE = AIRPORT CAPACITY ENHANCEMENT

ACE = AMERICAN COMMODITY EXCHANGE

ACE = AREA CONTROL ERROR

ACEA = ASSOCIATION DES CONSTRUCTEURS EUROPÉENS D’AUTOMOBILES = EUROPEAN AUTOMOBILE MANUFACTURERS ASSOCIATION

ACEID = ASIAN CENTRE OF EDUCATIONAL INNOVATION FOR DEVELOPMENT

ACEP = AGRICULTURAL CONSERVATION EASEMENT PROGRAM

ACEP = APPROVED CONTINUOUS EXAMINATION PROGRAM

ACES = ADVANCE COMPUTERIZED EXECUTION SYSTEM

ACETATE FIBER = АЦЕТАТНОЕ ВОЛОКНО – Acetate:- purified cellulose from wood pulp or cotton linters mixed with glacial acetic acid, acetic anhydride and a catalyst. Aged 20 hours (partial hydrolysis occurs). Precipitated as acid-resin flakes; flakes dissolved in acetone. Solution is filtered. Spinning solution extruded in column of warm air. Solvent recovered. Filaments are stretched and wound onto beams, cones or bobbins and are ready for use. Can be used for items such as blouses, dresses, upholstery, diapers and cigarette filters. Resistant to mold, mildew, shrinking and stretching. Can usually be washed or dry-cleaned. Acetate is a manufactured fiber that uses cellulose refined from cotton and/or wood pulp. Characteristics:- fast drying, wrinkle- and shrinkage-resistant, crisp or soft depending on end use, luxurious in appearance. Acetate Fiber is a manufactured fiber in which the fiber-forming substance is cellulose acetate. Acetate is manufactured by treating purified cellulose refined from cotton linters and/or wood pulp with acetic anhydride in the presence of a catalyst. The resultant product, cellulose acetate flake, is precipitated, purified, dried, and dissolved in acetone to prepare the spinning solution. After filtration, the highly viscous solution is extruded through spinnerets into a column of warm air in which the acetone is evaporated, leaving solid continuous filaments of cellulose acetate. The evaporated acetone is recovered using a solvent recovery system to prepare additional spinning solution. The cellulose acetate fibers are intermingled and wound onto a bobbin or shippable metier cheese package, ready for use without further chemical processing. In the manufacture of staple fiber, the filaments from numerous spinnerets are combined into tow form, crimped, cut to the required length, and packaged in bales. Acetate fibers are environmentally friendly. Characteristics:- acetate fabrics are breathable, luxurious in appearance, fast-drying, wrinkle and shrinkage resistant, crisp or soft in hand depending upon the end use. The end uses of acetate include women's and men's sportswear, evening wear, lingerie, dresses, blouses, robes, coats, other apparel, linings, draperies, bedspreads, upholstery, ribbons, formed fabrics, and filtration products. See also Triacetate Fiber. Acetate is a manufactured fiber formed by a compound of cellulose, refined from cotton linters and/or wood pulp, and acedic acid that has been extruded through a spinneret and then hardened. Acetate is a cellulose acetate fiber in which less than 92%, but at least 74%, of the hydroxyl groups are acetylated. Examples of chemical formulae:- secondary cellulose acetate:- $–(–C_6H_7O_2–(OX)_3–)_n–$; where X = H or CH_3CO and the degree of esterification is at least 2.22 but less than 2.76. Alphabetic code – CA; and relevant commercial allowance – 9.00. See also Cellulose Acetate. Acetate is a synthetic material with high-sheen and non-cling properties. Frequently used as a inner garment lining and in womens undergarments. Acetate Fibers:- acetate filament yarns are referred to as 'Fibers of Beauty', because they have luster and tactile feeling as silk fibers. The quantity of production in Japan is not so large, but in the USA, a large quantities of acetate filament yarns are used for apparel manufacturing. Acetate filament yarns are same as rayon fibers in those points that pulp is used as main raw material. However acetic acid is reacted chemically, thus, acetate filament yarns have characteristics of both vegetable fibers and synthetic fibers. Acetate fibers are frequently used for women's dresses and exhibits their beauty in the form of women's formal wear, suits, coats or knitwear. Acetate (staple tow) is used for almost all cigarette filters. Triacetate fibers are fibers to which more acetic acid is combined than to acetate fibers. End-Uses:- (i) for clothing:- Women's Formal Wear, Women's Nightgown, Coats, Printed One-piece, Accessories for Japanese Dresses, Neckties, Blouses, Sweaters, Scarves, etc; (ii) for home furnishings and beddings:- Blankets, Bedclothes, Fabrics for Curtains, etc; and (iii) fot other uses:- Umbrellas, Cigarette Filters, etc. Features:- (i) Specific gravity of acetate/triacetate fibers is lighter than that of cotton, viscose, cupram-monium rayon fibers and is nearly equal to that of wool fibers. Acetate/triacetate fibers have bulky fabric hand and rich feeling. (ii) Filament yarns have luster and tactile feeling as silk fibers. In addition, they have an excellent color development. (iii) Acetate/triacetate fibers have optimal moisture absorption, warmth retention and elasticitty. (iv) Acetate/triacetate fibers are used for pleat skirts thanks to the thermo-plasticity. Care Instructions:- care should be taken to use chemical solvents such as acetone and thinner in stain removal, because acetate/triacetate fibers may be dissolved in these solvents. See also Triacetate Fiber. Acetate is an organic and chemical fiber. Acetate is a blend of cellulose and acetic acid that has been hardened. Solution and spun-dyed acetates are colorfast against sunlight, perspiration, and air pollution. Acetate is often used for luxurious fabrics because its appearance is similar to silk. It is mixed occasionally with other fibers to give additional gloss and lower the cost. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Ацетаты, от Латинского слова Acetum, означающее Уксус, – сложные эфиры уксусной кислоты или её соли. Эфиры CH_3COOR – бесцветные летучие жидкости, многие из которых обладают запахом цветов или фруктов; соли $(CH_3COO)_nM$ – кристаллические продукты, применяемые для приготовления катализаторов и сиккативов (R – органический радикал, M – металл, n – его степень окисления). Эфиры применяют как душистые вещества в парфюмерии и пищевой промышленности, для синтеза полимеров (например, винилацетат), как растворители, в производстве киноплёнки, соли – как протравы при крашении тканей и другого. Ацетатное Волокно – искусственное волокно, формуемое из растворов ацетатов целлюлозы. Мягкое, эластичное, приятное на ощупь, мало сминается, пропускает ультрафиолетовые (УФ) лучи, устойчивое к микроорганизмам. Недостатки:- невысокая прочность (разрушается в концентрированных кислотах и растворах щёлочей), низкая термо- и износостойкость, значительная электризуемость. Ацетатное волокно выпускается в виде текстильной нити. Применяется главным образом в производстве изделий народного потребления, например, белья, галстуков, трикотажных изделий, подкладочных и других тканей, сигаретных фильтров. Ацетатные волокна с непрерывным каналом в центре используют для разделения растворов методами обратного осмоса и ультрафильтрации. Мировое производство (1984) около 570 000 тонн. Смотрите также Триацетатное Волокно (Triacetate Fiber). Ацетатные Волокна – один из основных видов искусственных волокон; получают из ацетилцеллюлозы. В зависимости от типа исходного сырья различают триацетатное волокно (из триацетилцеллюлозы) и собственно ацетатные волокна (из частично омыленной, так называемой вторичной, ацетилцеллюлозы). Ацетатные волокна формуют из растворов ацетилцеллюлозы в органических растворителях (триацетилцеллюлозу – в смеси метиленхлорида и спирта, вторичную ацетилцеллюлозу – в ацетоне), обычно по так называемому сухому методу. По этому методу получают филаментные нити, так называемый ацетатный шёлк. При получении ацетатного штапельного волокна формование ведут по сухому или мокрому методу. Ацетатные волокна вдвое превосходят вискозные и медноаммиачные волокна по эластичности; поэтому ткани из них отличаются пониженной сминаемостью. Кроме того, ацетатные волокна приятны на ощупь, мягки, обладают способностью пропускать ультрафиолетовые лучи. Окрашиваются ацетатные волокна только специальными типами красителей, которые непригодны для большинства других волокон. Это даёт возможность получать разнообразные колористические эффекты на изделиях из смеси ацетатных волокон и волокон других типов. Триацетатное волокно характеризуется более низкой гигроскопичностью, но большей эластичностью и меньшей сминаемостью, чем изделия из ацетатных волокон. При 65%-ной относительной влажности триацетатное волокно сорбирует 2.5–3% влаги, а ацетатное 6–7%. Прочность при разрыве ацетатных волокон невысока (разрывная длина 11–13 км). Потеря прочности при испытании в мокром состоянии для ацетатных волокон составляет 40–45%, а для триацетатного 15–20%. Ацетатные волокна характеризуются недостаточно высокой термостабильностью:- выше 160–170 °C изменяется форма изделий из этого волокна, при 210 °C начинается его термический распад. Поэтому изделия из ацетатных волокон можно гладить только через влажную ткань. Ацетатные волокна малоустойчивы к действию даже разбавленных растворов щёлочей. К недостаткам изделий из ацетатных волокон относятся также низкая устойчивость к истиранию и высокая электризуемость.

Для устранения этих недостатков используют методы химической модификации ацетилцеллюлозы. Основные области применения ацетатных волокон – изготовление изделий широкого потребления (верхней одежды, дамского нижнего белья, подкладочных и плательных тканей). Ацетатное штапельное волокно применяют для частичной замены шерсти при изготовлении тонких сукон и некоторых трикотажных изделий. Использование ацетатных волокон позволяет снижать сминаемость изделий. Триацетатные гидрофобные нити применяют как электроизоляционный материал. Производство ацетатных волокон до 1957 года бурно развивалось благодаря безвредности и простоте производства, ценным свойствам этих волокон, а также дешевизне исходного сырья. В дальнейшем развитие производства ацетатных волокон замедлилось в связи с появлением новых ценных типов синтетических волокон. В 1967 мировой выпуск ацетатных волокон составил 397 000 тонн (6.4% от общего производства химических волокон). Ацетатные Волокна представляют собой сложные эфиры целлюлозы и уксусной кислоты. Сырьём для получения этих волокон является облагороженная древесина или хлопковый пух. Целлюлозу растворяют в смеси уксусного ангидрида, уксусной и серной кислоты. Полученный триацетат частично омыляют, растворяют в смеси ацетона и спирта и продавливают через фильтры. Формуют волокно сухим способом (в потоке горячего воздуха). По строению ацетатные волокна напоминают вискозные, однако имеют более округлые контуры. Прочность волокон в сухом состоянии ниже, чем у вискозы (13–15 кгс/мм^2), однако потеря прочности в мокром состоянии ниже – 30–40%. Волокно упруго, мало сминается, имеет красивый внешний вид, мягко, устойчиво к действию света, микроорганизмов, не повреждается молью. Гигроскопичность ацетатных волокон 6–7%. Недостатками этого волокна являются невысокая устойчивость к истиранию, низкая термостойкость (80–90 °C), плохая окрашиваемость, а также электризуемость. Поскольку ацетатные волокна имеют низкую теплопроводность, их применяют в производстве тёплого белья.

ACETATE RAYON AND ESTRON = АЦЕТАТНЫЙ РЭЙОН И ЭСТРОН (или АЦЕТАТНАЯ ГИДРАТЦЕЛЛЮЛОЗА И ЭСТРОН) – Acetate Rayon and Estron:- the terms ‘Acetate Rayon’ and ‘Acetate’ have been generally used by the trade to describe textile fibers made of acetic acid esters of cellulose, distinguishing them from the regenerated cellulose types commonly known as ‘Viscose’ and ‘Cuprammonium’ Rayons. The American Society for Testing Materials has retained in the tentative category the term ‘Estron’ to describe all textile fibers made of esters of cellulose (such as cellulose acetate) to distinguish them from the other types of man-made fibers. Since the term ‘Estron’ has not been accepted to any great extent by yarn producers, weavers, finishers, and converters, the better known terms of ‘Cellulose Acetate Rayon’ or ‘Acetate’ are used in this text.

ACETATE/SPANDEX = АЦЕТАТ/СПЭНДЭКС (или АЦЕТАТ/СПАНДЕКС) – Acetate/Spandex:- stretchy, high sheen knit frequently used in womens outer garments. Extremely durable and washable, more so than some plain acetate fabrics.

ACETIC ACID = УКСУСНАЯ КИСЛОТА – Acetic Acid, CH_3COOH, is an organic acid; also called (rarely) Ethanoic Acid. Glacial acetic acid (GAA) is commonly sold for industrial purposes. It is almost pure acetic acid (that is, it contains almost no water), pungent smelling and flammable. It is called ‘Glacial’ because it will freeze at around 17 °C. Concentrated solutions of acetic acid are dangerous, and must be handled with care. Acetic acid is used in many dyeing processes. It is much less expensive than vinegar where large amounts are required. Often a 56% solution (in water) is called for. Acetic acid is a weak acid (see acid, weak – this does not mean ‘mild’). Acetic Acid is an organic acid (CH_3COOH) widely used in textile applications. It is used in textile wet processing, dyeing and printing, and in the manufacture of cellulose acetate and cellulose triacetate. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Под Уксусной Кислотой, CH_3COOH, понимается бесцветная жидкость с резким запахом. Для безводной, так называемой ‘ледяной’, кислоты $t_{пл}$ 16.75 °C, $t_{кип}$ 118.1 °C. Получают окислением ацетальдегида и другими методами, пищевую уксусную кислоту – уксуснокислым брожением спиртовых жидкостей. Применяют в пищевой промышленности, для получения лекарственных и душистых веществ, хлоруксусных кислот, как растворитель, например, в производстве ацетата целлюлозы. Соли уксусной кислоты – пигменты, протравы при крашении, катализаторы.

ACETIC ANHYDRIDE = УКСУСНЫЙ АНГИДРИД – Acetic Anhydride:- anhydrous acetic acid, $(CH_3CO)_2O$. It is used in the acetylation process in the manufacture of cellulose acetate. / безводное (anhydrous). ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Под Уксусным Ангидридом, $(CH_3CO)_2O$, понимается бесцветная жидкость с резким запахом, $t_{кип}$ 139.9 °C. Применяют для ацилирования, например, в производстве ацетилцеллюлозы, душистых и лекарственных веществ.

ACETONE = АЦЕТОН – Acetone:- dimethyl ketone (CH_3COCH_3). One of the most powerful organic solvents. Acetone dissolves secondary cellulose acetate and other derivatives of cellulose. It is miscible with water and has a low boiling point (55–56 °C). / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Под Ацетоном или Диметилкетоном, CH_3COCH_3, понимается бесцветная жидкость, $t_{кип}$ 56.2 °C. Сырьё для синтеза многих важных химических продуктов; растворитель, например, в производстве лаков, взрывчатых и лекарственных веществ.

ACETONE RECOVERY = ВОССТАНОВЛЕНИЕ АЦЕТОНА – Acetone Recovery is a process for reclaiming the acetone solvent from acetate fiber or plastics manufacture. Usually the recovery process consists of adsorption by activated carbon and re-distillation.

ACETYL = АЦЕТИЛ – Acetyl:- the radical (CH_3CO-) of acetic acid. In organic chemistry, Acetyl is a functional group, the acyl with chemical formula $COCH_3$. It is sometimes represented by the symbol Ac (not to be confused with the element actinium). The acetyl group contains a methyl group single-bonded to a carbonyl. The carbonyl center of an acyl radical has one nonbonded electron with which it forms a chemical bond to the remainder R of the molecule. In the International Union of Pure and Applied Chemistry (IUPAC) nomenclature, acetyl is called Ethanoyl, although this term is rarely heard. The acetyl moiety is a component of many organic compounds, including the neurotransmitter acetylcholine, acetyl-CoA, acetylcysteine, and the analgesics acetaminophen and acetylsalicylic acid (better known as Aspirin).

ACETYLATION = АЦЕТИЛИРОВАНИЕ – Acetylation is a chemical reaction whereby the acetyl radical is introduced into a compound, as in the conversion of cellulose to cellulose acetate. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Под Ацетилированием понимается введение в молекулы органических и неорганических соединений ацильной группы (ацила) – остатка карбоновой кислоты – ацетила ($CH_3C(O)$).

ACETYL VALUE = АЦЕТИЛЬНОЕ ЧИСЛО – Acetyl Value is a measure of the degree of esterification or combination of acetyl radicals with cellulose in acetate or triacetate products. Acetyl Value is the milligrams of potassium hydroxide (KOH) required to neutralize the acetic acid produced by the hydrolysis of 1 g of acetylated fat; a measure of the hydroxy acids present in glycerides; notably high in castor oil. / Ацетильное Число, показатель, характеризующий содержание свободных гидроксильных групп (–OH) в жирах, маслах и воске. Для определения ацетильного числа вещество ацетилируют и затем подвергают омылению едким кали. Ацетильное число выражается числом мг едкого кали, израсходованного для нейтрализации уксусной кислоты, освобождающейся при омылении 1 г ацетилированного продукта. Ацетильное число характеризует качество и сорт жиров и масел.

ACF = AREA CONTROL FACILITY

ACFTD = AIR CLEANER FINE TEST DUST

ACH = AUSTRALIAN CLEARING HOUSE (PTY LTD)

ACH = AUTOMATED CLEARING HOUSE

ACHENE = СЕМЯНКА – Achene is a small, dry, indehiscent fruit developing from a simple ovary with the seed distinct from the pericarp (fruit wall) which is generally attached to the seed at a single point. A naked seed. Achene is a small, dry fruit with one seed. / маленький, сухой, невскрывающийся плод, развивающийся из простой завязи (ovary) из перикарпия (околоплодника). Под Семянкой понимается односемянный нераскрывающийся плод растений с околоплодником, большей частью кожистым, не срастающимся с семенем. Например, у подсолнечника, сафлора. Семянка (Achenium), односемянный невскрывающийся плод покрытосеменных растений, образованный двумя плодолистиками с нижней завязью и имеющий сухой кожистый околоплодник (у Сложноцветных, Ворсянковых). На семянке нередко развиваются крыловидные выросты, хохолки, крючочки и другие образования, способствующие их распространению. Семянка Ворсянковых опадает с обёрточкой из сросшихся прицветников, у некоторых сложноцветных (Дурнишник, Мордовник) – вместе с обёрткой корзинки. Иногда семянкой ошибочно называют орешки, ценобии и другие типы плодов.

ACHLOROPHYLLOUS = БЕСХЛОРОФИЛЛЬНОЕ – Achlorophyllous:- lacking chlorophyll.

ACHP = ADVISORY COMMITTEE ON HIGHWAY POLICY

ACHROMATIC = АХРОМАТИЧЕСКОЕ (или БЕСЦВЕТНОЕ, или ЛИШЁННОЕ ОКРАСКИ) – Achromatic:- (1) for primary light sources, the computed chromaticity of the equal-energy spectrum; (2) for surface colors, the color of a whitish light, serving as the illuminant, to which adaptation has taken place in the visual system of the observer; and (3) perceived as having no hue, that is, as white, gray, or black.

ACI = AIRPORTS COUNCIL INTERNATIONAL

ACIAR = AUSTRALIAN CENTRE FOR INTERNATIONAL AGRICULTURAL RESEARCH

ACICULAR = ИГОЛЬЧАТОЕ – Acicular:- needle shaped, applied to an elongated tapering structure with a circular of eliptical cross section. / Игольчатое – игловидное, .

ACICULAR LEAF = ИГОЛЬЧАТЫЙ ЛИСТ – Acicular Leaf:- needle-shaped; several times longer than wide; ending sharply at the apex.

ACID = КИСЛОТА – Acid:- in a restricted sense, any substance containing hydrogen in combination with a nonmetal or nonmetallic radical and capable of producing hydrogen ions in solution. Acid is a chemical that will produce a pH of less than 7 in water solution. Many acids are used in dyeing. They include acetic acid, citric acid, formic acid, hydrochloric acid and sulfuric acid. Several other compounds, such as sodium bisulfate and ammonium sulfate form acids in solution through hydrolysis. When making solutions of acids or when diluting concentrated acids, always add the acid to water, never the other way around. This is because some acids produce a great deal of heat when they mix with water – so much that a small amount of water added to a large amount of acid may actually boil and cause extremely dangerous spattering. See also Base, Strong Acid, and Weak Acid. / уксусная кислота (acetic acid), лимонная кислота (citric acid), муравьиная кислота (formic acid). Смотрите также Основание (Base), Сильная Кислота (Strong Acid), и Слабая Кислота (Weak Acid). Под Кислотами понимается класс химических соединений. Обычно кислотой называют вещества, содержащие водород и диссоциирующие в воде с образованием ионов H^+ (точнее, ионов гидроксония H_3O^+). Присутствие этих ионов обусловливает характерный острый вкус кислоты и их способность изменять окраску химических индикаторов. По числу отщепляющихся ионов H^+ различают:- Одноосновные Кислоты (например, азотная HNO_3, соляная HCl); Двухосновные Кислоты (серная H_2SO_4); и Трёхосновные Кислоты (ортофосфорная H_3PO_4). Сильными Кислотами считают такие кислоты, которые в разбавленных водных растворах полностью диссоциированы (HCl, HNO_3, H_2SO_4). Слабыми Кислотами считают такие кислоты, которые в разбавленных водных растворах диссоциированы лишь в незначительной степени (угольная H_2CO_3). Водород, входящий в состав кислоты, способен замещаться металлами с образованием солей. Многие кислоты широко применяют в технике, медицине, быту, например, азотная или серная или соляная или уксусная кислоты. Определённая кислотность или основность среды – важнейшее условие протекания многих химических и биохимических процессов. По современной теории кислот и оснований к кислотам относится более широкий круг соединений, в частности и такие, которые не содержат водорода. Кислоты, химические соединения, содержащие водород, способный замещаться металлом с образованием солей, и диссоциирующие при растворении в воде с образованием ионов H^+ (протонов) или, точнее, ионов гидроксония H_3O^+. По современным представлениям, к кислотам относятся также некоторые соединения, не содержащие водорода (подробнее смотрите Кислоты и Основания). Кислоты и Основания, классы химических соединений. Обычно Кислотами называют вещества, содержащие водород (HCl, HNO_3, H_2SO_4, CH_3COOH и так далее) и диссоциирующие в воде с образованием ионов H^+ (точнее, ионов гидроксония H_3O^+). Присутствие этих ионов обусловливает характерный острый вкус водных растворов кислот, а также их способность изменять окраску химических индикаторов. По числу отщепляющихся протонов различают одноосновные кислоты (например, азотная HNO_3, соляная HCl, уксусная CH_3COOH), двухосновные кислоты (серная H_2SO_4, угольная H_2CO_3), трёхосновные кислоты (ортофосфорная H_3PO_4). Чем больше ионов гидроксония присутствует в водном растворе кислоты, то есть чем выше степень диссоциации последней, тем кислота сильнее. Кислоты, полностью диссоциированные в разбавленных растворах, называют Сильными Кислотами. К Слабым Кислотам относятся кислоты с константой ионизации (характеризующей степень диссоциации кислоты в растворе, например, при 25 °C) ниже 10^{-5} (уксусная $1.8\cdot10^{-5}$, синильная $7.9\cdot10^{-10}$). Диссоциация многоосновных кислот происходит в несколько ступеней, каждая из которых имеет свою константу ионизации. Например, константа ионизации H_3PO_4 на H^+ и $H_2PO^-_4$ $7\cdot10^{-3}$, $H_2PO_4^-$ на H^+ и HPO_4^{2-} $8\cdot10^{-8}$, HPO_4^{2-} на H^+ и PO_4^{3-} $4.8\cdot10^{-13}$. Об органических кислотах смотрите также Карбоновые Кислоты. Основаниями обычно называют вещества, содержащие гидроксильную группу OH (KOH, NaOH, $Ca(OH)_2$ и другие) и способные диссоциировать в водном растворе с образованием гидроксильных ионов OH^-. Большинство оснований нерастворимо в воде. Растворимые в воде основания называют Щёлочами. Присутствием ионов OH^- и объясняется характерный щелочной вкус растворов щёлочей, а также их способность изменять окраску индикаторов. Основания с 1, 2, 3 гидроксильными группами называются соответственно одно-, двух-, трёхкислотными. Не полностью диссоциирующие при растворении в воде основания называются, как и кислоты, Слабыми Основаниями. К Сильным Основаниям относятся гидроокиси калия KOH, натрия NaOH, бария $Ba(OH)_3$. О принципах установления названий кислот и оснований смотрите Номенклатура Неорганических Соединений. Понятия Кислоты и Основания возникли ещё на заре развития химии. В 1778 Французский химик Отуан Лёро дё Лявуази (Antoine Laurent de Lavoisier; 1743–1794) попытался объяснить особенности свойств кислот содержанием кислорода. Несостоятельность такого мнения стала очевидной, когда оказалось, что многие кислородсодержащие вещества (окислы металлов, щёлочи, соли и другие) не проявляют кислотных свойств, а ряд типичных кислот (соляная, синильная, плавиковая и

другие), как показали Британский химик, физик и геолог Сэр Хамфри Дэйви (Sir Humphry Davy; 1778–1829) (в 1810) и Французский физик и химик Жозэф Люи Гей-Люсакъ (Joseph Louis Gay-Lussac; 1778–1850) (в 1814), не содержат кислорода. Шведский химик и минералог Ёнс Якоп Барсэлиос (Jöns Jakob Berzelius; 1779–1848) (в 1812–19) видел причину кислотных и основных свойств в электрической природе окислов:- электроотрицательные окислы неметаллов (и некоторых металлов – хрома, марганца) он считал кислотами, а электроположительные окислы металлов – основаниями. В 1814 Хамфри Дэйви предложил признать носителем кислотных свойств водород, входящий в состав всех известных тогда соединений, обладающих кислотными свойствами, а Немецкий химик Юстус Фрайхе фон Либихь (Justus Freiherr von Liebig; 1803–1873) (в 1833) внёс существенное уточнение, что кислотные свойства вещества обусловлены не всеми содержащимися в нём атомами водорода, а лишь теми из них, которые могут замещаться металлом с образованием солей. После появления (в 1884–87) теории электролитической диссоциации Шведского физика и химика Свантэ Огюста Ареаньюса (Svante August Arrhenius; 1859–1927) Кислотами стали называть соединения, при диссоциации которых в водном растворе образуются ионы водорода H^+, а Основаниями – соединения, диссоциирующие с отщеплением иона гидроксила OH^-. По мере развития теории растворов стало ясно, что важную роль в процессе электролитической диссоциации веществ играет взаимодействие как самих веществ, так и продуктов их диссоциации с растворителем. Было выяснено также, что ион H^+ не может находиться в растворе в свободном виде:- вследствие очень высокой плотности заряда он прочно соединяется с молекулами растворителя (сольватируется) и реально существует в виде сольватного иона, в водных растворах – иона гидроксония, который и является носителем кислотных свойств. Определение понятий Кислота и Основание на основе теории электролитической диссоциации часто вполне достаточно для практических целей. Однако, как было установлено уже давно, многие соединения, проявляющие типичные свойства кислоты и основания, не содержат ни водорода ни групп OH. Кроме того, одно и то же вещество нередко в одних реакциях ведёт себя как кислота, а в других – как основание (смотрите Амфотерность). Способность вещества реагировать как кислота или основание является, таким образом, не абсолютным свойством этого вещества, а выражается в конкретных химических реакциях, относимых к классу кислотно-основных. В таких реакциях одно из взаимодействующих веществ играет роль кислоты по отношению к другому веществу, играющему роль основания. Итак, способность вещества реагировать в качестве кислоты или основания является его функциональной характеристикой. Было предпринято множество попыток разработать единую теорию, которая позволила бы, с учётом указанных обстоятельств, однозначно относить данное вещество к классу кислот или оснований. Однако до сих пор единого критерия для этого не найдено. Наиболее распространены две концепции – Датского физико-химика Йохэнэса Николяуса Бронстэда (Johannes Nicolaus Brønsted; 1879–1947) и Американского физико-химика Гилбёрта Ньютэна Люиса (Gilbert Newton Lewis; 1875–1946) (в 1923). Бронстэд относит к классу кислот водородсодержащие вещества, отдающие при реакциях положительные ионы водорода – протоны (так называемые Протонные, или Бронстэдовские, Кислоты), а к классу оснований – вещества, присоединяющие протоны. Функции кислот и оснований, по Бронстэду, могут выполнять как нейтральные молекулы, так и ионы. Химическая реакция, при которой происходит передача протона от кислоты к основанию:- $AH + B^- \hat{U} A^- + BH$ (где AH – кислота, а B^- – основание), называется Кислотно-Основной, или Протолитической Реакцией. Поскольку протолитические реакции обратимы, причём в обратной реакции, так же как и в прямой, происходит передача протона, продукты прямой реакции также выполняют друг по отношению к другу функцию кислоты и основания (так называемые Сопряжённые Кислоты и Основания), то есть BH – кислота, а A^- – основание. Например, в реакции:- $H_2SO_4 + H_2O \hat{U} HSO^-_4 + H_3O^+$ кислотами являются H_2SO_4, и H_3O^+, а HSO^-_4 и H_2O – основания. Концепция Бронстэда даёт чёткий критерий для отнесения химических реакций к типу кислотно-основных, позволяет выражать в количественной форме основные характеристики протолитических равновесий и расположить водородсодержащие вещества в ряд по возрастанию их способности отдавать протон, то есть по их кислотности. Эти достоинства теории протолитических равновесий обусловили её предсказательную силу и обеспечили широкое использование Бронстэдовских представлений в химической практике. В то же время концепции Бронстэда свойственна ограниченность, выражающаяся в том, что, связывая кислотные свойства вещества с наличием в его составе водорода, она всё же оставляет в стороне большое число веществ кислотного характера, не содержащих водорода. К таким веществам, получившим в химии название Апротонных, или Люисовских, Кислот, относятся электронно-ненасыщенные соединения, например, галогениды бора, алюминия и олова, окислы некоторых металлов и так далее. Согласно концепции Люиса, восполняющей в какой-то степени вышеуказанный пробел, Кислотой называют вещество, присоединяющее при химической реакции пару электронов, а Основанием – вещество, отдающее пару электронов. Результатом является восполнение электронной ненасыщенности молекулы кислоты за счёт электронов основания, а также возникновения нового соединения (соли) с устойчивой электронной оболочкой (в частности, октетом) и донорно-акцепторной связью. Важная особенность кислотно-основных реакций, по Люису, состоит в обобществлении электронной пары основания. Этим они отличаются от окислительно-восстановительных реакций, в ходе которых молекулы окислителя полностью отбирают по одному или несколько электронов у молекул восстановителя; никаких обобществлённых орбит при этом не возникает. В отличие от Бронстэда, Люис связывает кислотно-основные свойства не с наличием определённых химических элементов (в частности, водорода), а исключительно со строением внешних электронных оболочек атомов. В то же время между обеими концепциями имеется внутренняя связь, основанная на том, что для иона H^+, так же как и для Люисовских кислот, характерно сильное сродство к электронной паре. Кроме двух рассмотренных концепций кислот и оснований, известны некоторые другие, которые не получили, однако, столь широкого распространения. Как Бронстэдовская, так и Люисовская теории кислот и оснований широко применяются на практике. Изменение кислотности или основности среды часто используют с целью увеличения скорости реакций и изменения механизма взаимодействия. В этом состоит сущность кислотно-основного катализа, широко используемого в химической промышленности; при этом важно, что Бронстэдовские и Люисовские кислоты оказывают во многих случаях сходное каталитическое действие. Широкое применение получили кислотно-основные процессы в химической промышленности (гидролиз, нейтрализация, травление металлов и так далее). Многие кислоты (серная, азотная, соляная, ортофосфорная и другие) и щёлочи (едкое кали (или едкий калий), едкий натр и другие) являются основными продуктами химического производства и используются в качестве исходных веществ в важнейших отраслях химической промышленности. Многообразные – структурные и динамические – функции кислоты и основания выполняют в живых организмах, принимая участие во многих биохимических процессах. Как правило, эти процессы очень чувствительны к кислотности или основности среды (смотрите Водородный Показатель, Кислотно-Щелочное Равновесие). Направленное воздействие кислот и оснований используется в медицине. Так, разбавленные растворы соляной кислоты употребляются для усиления секреции желудка, борной – для дезинфицирующих и вяжущих полосканий и так далее. В то же время при попадании в организм концентрированных кислот и оснований возможны сильные ожоги внутренних органов, падение сердечной деятельности и так далее, приводящие в ряде случаев к гибели организма.

ACID DONOR = КИСЛОТНЫЙ ДОНОР – Acid Donor is a compound that hydrolyzes or breaks down to yield acid In a number of dyeing and printing processes, primarily with acid dyes, there are advantages to starting with a bath or print paste that is pH neutral or only slightly acid, but that will become more strongly acid as boiling or steaming progresses. Acid donors, such as ammonium sulfate or ammonium tartrate are often used for this purpose. / Кислотный Донор. загустка (print paste).

ACID–DYEABLE VARIANTS = КИСЛОТО–ОКРАШИВАЕМЫЕ ВАРИАНТЫ – Acid-Dyeable Variants are the polymers modified chemically to make them receptive to acid dyes.

ACID DYES = КИСЛОТНЫЕ КРАСИТЕЛИ – Acid Dyes are typically applied in acidic conditions, but the pH range used varies depending on the type of acid dye. The greater the affinity of the dyestuff for the fiber, the more the hydrophobic interaction must be repressed by applying the dye at higher pH. Therefore level-dyeing colorants are applied under strongly acidic conditions (1–3% formic acid) in the presence of sulphate ions (5–10% sodium sulphate) to assist migration and levelling. HCOOH and HSO_{4-} compete with the sulphonated dyes acting as levelling agents. As a result, other levelling agents are not generally required and the rate of dye uptake is controlled initially by increasing the temperature of the dye bath slowly (1 °C/min) and then extending the time at the boil to allow the dye to migrate from areas of high initial uptake. Fast acid dyes (also known as Half-Milling Dyes or Perspiration-Fast Dyes) exhibit superior fastness properties to level-dyeing acid dyes, while retaining some of the migration properties. Application is from a moderately acidic dye bath (1–3% acetic acid) in the presence of sodium sulphate (5–10%) and levelling agent to assist migration. Acid milling dyes (including 1:2 metal-complex dyes mentioned later) have good affinity for the fiber and do not migrate well at the boil. They are therefore applied at more neutral pH (5–7.5 with acetic acid) in the presence of sodium acetate (2 g/l) or ammonium sulphate (4%) and levelling agent (1–2%). Sodium sulphate is usually avoided as it has little effect on migration and can promote uneven dye adsorption. Levelling agents play an important role in acid dyeing. A number of non-ionic, cationic, anionic and amphoteric surfactants belong to this category. Acid Dyes is a class of dyes used on wool, other animal fibers, and some manufactured fibers. Acid dyes are seldom used on cotton or linen since this process requires a mordant. Acid dyes are widely used on nylon when high washfastness is required. In some cases, even higher washfastness can be obtained by aftertreatment with fixatives. Acid Dyes, e.g., carmoisine, red acid dye. These contain an acidic group and have a natural affinity for protein fibers and nylon, which contain basic groups with which the dyes combine. Applied from an acidic solution, the dyes are subdivided into groups according to the degree of acidity required. Those which are applied from the weakest acid solution have the strongest affinity and have the best fastness to washing and similar treatments. They are known as Acid Milling Dyes. The others, which are applied from stronger acid solutions, are known as Levelling Dyes, since their poorer fastness permits level dyeings to be readily obtained. Acid Dye is a dye which is applied to protein fabric or fiber from an acid dye solutions. It can be used on nylon, wool and other animal protein fibers, silk, acrylic, polypropylene and blends. It is fairly colorfast to light and laundering. See also Dyes. Acid Dye is a large class of dyes that are applied from acidic solutions to polyamide fibers. These synthetic dyes are used for wool, silk and nylon. They are typically applied in a bath that may range from strongly acid to neutral, and usually at temperatures approaching boiling. Bonding between the dye and fiber can be complex. Some form ionic bonds between basic groups of the fiber and acid groups of the dye, but other bond types occur. There are a great many acid dyes, in a number of major sub-groups, with a wide variety of properties. Included are ‘washfast acid dyes’, ‘milling dyes’, ‘supermilling dyes’, ‘leveling acid dyes’, ‘1:1 premetallized dyes’, ‘2:1 premetallized dyes’ and others (the premetallized dyes are sometimes regarded as being in a class of their own, apart from acid dyes). The distinction between some of the groups is often vague. Acid dyes range from poor to excellent colorfastness, and from dull tones to brilliant shades. The choice of sub-group is often a compromise among the characteristics of colorfastness, leveling properties and shade availability. Acid dyes may not perform well in mixtures, even with dyes from the same general class, so care is required in selection. / муравьиная кислота (formic acid). стойкость (fastness). ионные связи (ionic bonds) между . Найлан^{T3} (Nylon^{TM}). Кислотные Красители – водорастворимые органические красители (азокрасители, антрахиноновые и другие), содержащие в молекуле кислотные группы, главным образом сульфо- – SO_3H или карбоксильные, и диссоциирующие с образованием окрашивающего аниона. Образуют окраски различных цветов; некоторые из них устойчивы к мокрым обработкам и свету. Применяются для крашения шерсти, натурального шёлка, полиамидных волокон, кожи, шубной овчины, древесины и другого.

ACID EQUIVALENT = КИСЛОТНЫЙ ЭКВИВАЛЕНТ – Acid Equivalent (AE) is the portion of pesticide that is theoretically converted into acid.

ACIDIC = КИСЛОЕ – Acidic is a term describing a material having a pH of less than 7.0 in water.

ACIDITY = КИСЛОТНОСТЬ – Acidity:- in lubricants, acidity denotes the presence of acid-type constituents whose concentration is usually defined in terms of total acid number. The constituents vary in nature and may or may not markedly influence the behavior of the lubricant. See also Acid.

ACID NUMBER = КИСЛОТНОЕ ЧИСЛО – Acid Number:- the quantity of base, expressed in milligrams of potassium hydroxide, that is required to neutralize the acidic constituents in 1 g of sample. See also Acid.

ACID RAIN = КИСЛОТНЫЙ ДОЖДЬ – Also called Acid Precipitation or Acid Deposition, Acid Rain is precipitation containing harmful amounts of nitric and sulfuric acids formed primarily by nitrogen oxides and sulfur oxides released into the atmosphere when fossil fuels are burned. It can be wet precipitation (rain, snow, or fog) or dry precipitation (absorbed gaseous and particulate matter, aerosol particles or dust). Acid rain has a pH below 5.6. Normal rain has a pH of about 5.6, which is slightly acidic. The term pH is a measure of acidity or alkalinity and ranges from 0 to 14. A pH measurement of 7 is regarded as neutral. Measurements below 7 indicate increased acidity, while those above indicate increased alkalinity. / Щёлочность (Alkalinity).

ACID RECOVERY = ВОССТАНОВЛЕНИЕ КИСЛОТЫ – Acid Recovery is a reclamation process in chemical processing in which acid is extracted from a raw material, by-product, or waste product. In the manufacture of cellulose acetate, acetic acid is a major by-product. Acid recovery consists of combining all wash water containing appreciable acetic acid and concentrating it to obtain glacial acetic acid. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate).

ACID RESISTANCE = КИСЛОТОСТОЙКОСТЬ (или КИСЛОТОУПОРНОСТЬ) – Acid Resistance is the property of withstanding contact or treatment with any acids normally encountered in use. The type of acid should be stated, i.e. organic or inorganic. / Под Кислотостойкостью или Кислотоупорностью понимается способность материалов противостоять разрушающему действию кислот. Кислотостойкость зависит от природы анионов, концентрации и температуры кислот и так далее. Снижается с повышением температуры.

ACID SLUDGE = КИСЛЫЙ ГУДРОН (или КИСЛОТНЫЙ ОТСТОЙ, или КИСЛОТНЫЙ ОСАДОК, или КИСЛОТНЫЙ ШЛАМ) – Acid Sludge:- the residue left after treating petroleum oil with sulfuric acid for the removal of impurities. It is a black, viscous substance containing the spent acid and impurities. Acid Sludge (also referred to Acid Tar) is one of the main type of oil refining industry waste. It is formed by the purification of petroleum products, apparatuses and tanks by concentrated sulfuric acid. Refinery acid sludge is highly viscous tar-like mass that contains heavy hydrocarbons, sulfuric acid and water. The sludge is accumulated in special ponds close to major refineries. These ponds are designed only for temporary storage of hazardous waste, where it is dragged on for decades. The further existence of acid ponds will lead to environmental disaster, so in recent years around the world it is being actively seeking for effective solutions to neutralize the acid tars and restoration of disturbed lands. See also Sludge. / Кислые Гудроны – один из основных отходов нефтеперерабатывающей промышленности. Они образуются при очистке нефтепродуктов, аппаратов и

резервуаров концентрированной серной кислотой. Представляют собой высокотоксичные вязкие смолоподобные массы, которые содержат тяжёлые углеводороды, серную кислоту и воду.

ACID SOIL = КИСЛАЯ ПОЧВА – Acid Soil is a soil with a pH value of less than 7.0; for practical purposes, soils with pH below 6.6.

ACID SULFATE SOIL = КИСЛАЯ СУЛЬФАТНАЯ ПОЧВА (или СУЛЬФАТНО–КИСЛАЯ ПОЧВА) – Acid Sulfate Soil is a soil with a pH value of less than 4.0 when air-dried; contains a high amount of sulfate and yellow jarosite mottles. Abnormal growth of plants in this soil is due to (i) toxicity from aluminum, iron, and hydrogen sulfide; and (ii) phosphorus deficiency.

ACID–TEST RATIO = СООТНОШЕНИЕ ЛАКМУСОВАЯ БУМАЖКА (или КОЭФФИЦИЕНТ КРИТИЧЕСКОЙ ОЦЕНКИ ЛИКВИДНОСТИ) – Ratio of short-term assets (current assets minus inventories) to current liabilities. One of the main liquidity ratios. Also known as Liquidity Ratio or Quick Ratio (because it gives a quick assessment of the company's financial state). Acid-Test Ratio is a ratio of a company's assets (not including stock) to its current liabilities. Acid Test Ratio is similar to current ratio but considered a more reliable measurement of liquidity as it deducts inventory, which is much slower to liquidate. Also known as Quick Ratio.

ACID TREATING = КИСЛОТНАЯ ОБРАБОТКА (или ОБРАБОТКА КИСЛОТОЙ, или КИСЛОВКА) – Acid Treating is a refining process in which unfinished petroleum products, such as gasoline, kerosene, and lubricating oil stocks, are contacted with sulfuric acid to improve their color, odor, and other properties. See also Acid.

ACID VALUE = КИСЛОТНОЕ ЧИСЛО – The Acid Value specifies how many milligrams of potassium hydroxide (KOH) are necessary to neutralize the free fatty acids in a single gram of fat. / Кислотное Число – кислотность раствора в единицах нормальности.

ACIFORM = ИГЛОВИДНОЕ – Aciform:- acicular (Latin, Acus = Needle; Forma = Shape). / Игловидное – игольчатое.

ACIP = AIRPORT CAPITAL IMPROVEMENT PROGRAM

ACK = POSITIVE ACKNOWLEDGEMENT

ACKNOWLEDGEMENT OF RECEIPT = КВИТАНЦИЯ О ПОЛУЧЕНИИ (или ПОДТВЕРЖДЕНИЕ ПОЛУЧЕНИЯ) – Acknowledgement Of Receipt is a notification relating to the receipt of, e.g., goods, messages, documents or funds. / Уведомление, касающееся получения, например, товаров, сообщений, документов или фондов.

ACLS = AUTOMATIC CARRIER LANDING SYSTEM

ACLT = ACTUAL CALCULATED LANDING TIME

ACMA = ASSOCIATE CHARTERED MANAGEMENT ACCOUNTANT

ACMG = AIR CARGO MANAGEMENT GROUP

ACMI = AIRCRAFT, CREW, MAINTENANCE, AND INSURANCE

ACO = AUTHORIZED CERTIFICATION OFFICIAL

ACP = AFRICAN, CARIBBEAN, AND PACIFIC GROUP OF STATES

ACP = ALTERNATIVE COMPLIANCE PROGRAM

ACPC = ASSOCIATION OF COFFEE PRODUCING COUNTRIES

ACQUIRED CHARACTERS = ПРИОБРЕТАЕМЫЕ СВОЙСТВА – Acquired Characters:- phenotypic (see also Phenotype) changes produced on a plant by the environment during the plant's development. Such characters (defined) are uninheritable.

ACQUIRER = ЭКВАЙРЁ (или ЭКВАЙРЁР, или АКВИЗИТОР) – Acquirer is a financial institution (or its agent, usually a card scheme), which acquires from the card acceptor the data relating to the transaction, and initiates that data into an interchange system.

(2) Acquirer is an entity providing transaction clearance services for the content provider. The entity and its supporting infrastructure are used synonymously.

ACQUIRING = КАРТОЧНО–РАСЧЁТНОЕ ОБСЛУЖИВАНИЕ (или ЭКВАЙРИНЬ, или ЭКВАЙРИНГ) – Acquiring is the process by which ordering customers make payments to beneficiaries using the International Payment Instruction (IPI).

ACQUIRING BANK = БАНК, ОКАЗЫВАЮЩИЙ КАРТОЧНО–РАСЧЁТНОЕ ОБСЛУЖИВАНИЕ – Acquiring Bank is a registered member of a card association such as Visa, MasterCard or American Express that provides businesses and individuals with the ability to accept credit, debit and prepaid cards as payment for goods or services. An acquiring bank is named for the role it plays in credit card processing. Acquiring banks accept or acquire credit card transactions from banks that issue credit cards to consumers, called Issuing Banks. An acquiring bank maintains a merchant account for each business it services. A merchant account is an open line of credit that allows the acquiring bank to accept transactions on behalf of a business and deposit funds from sales into the business' deposit account (typically a checking account). Acquiring banks assume the risk associated with the transactions they process. If a business becomes insolvent and unable to fund a reversal, refund, or chargeback, the business' acquiring bank must provide the funds to make every cardholder whole. Examples of large acquiring banks include Wells Fargo, HSBC, Chase, Bank of America, and BankcorpSouth. We have also included a Visa's posted list of acquiring banks in the resource section below. What's the difference between an acquiring bank and a credit card processor? The term Credit Card Processor literally refers to a company that submits bankcard transaction information to a card association computer network (Visa, MasterCard, etc) where it is then routed among acquiring and issuing banks. An acquiring bank supplies the financial backing to support the risk of merchant processing and to fund merchants for sales. For example, a company that is licensed by a registered member of a card association may process its own transaction, and in effect be a credit card processor, but it is not an acquiring bank. See also Acquirer. / Эйч.Эс.Би.Си. (HSBC), Чэйс (Chase), Бэньк оф Амэрика (Bank of America). Виза (Visa), МэстчёКард (MasterCard) или Амэрикэн Экспрэс (American Express).

ACQUIRING TECHNICAL OPERATOR = ТЕХНИЧЕСКИЙ ОПЕРАТОР КАРТОЧНО–РАСЧЁТНОГО ОБСЛУЖИВАНИЯ – Acquiring Technical Operator is an organization, which collects and possibly aggregates transactions from several Purchase Devices for delivery to one or more Purse Providers. / Устройства Закупки .

ACQUISCENCE = МОЛЧАЛИВОЕ СОГЛАСИЕ – When a bill of lading is accepted or signed by a shipper or shipper's agent without protest, the shipper is said to acquiesce to the terms, giving a silent form of consent. / Когда коносамент акцептован или подписан грузоотправителем или его агентом без заявления протеста, данный грузоотправитель или его агент подтверждает своим молчанием факт согласия с условиями коносамента.

ACQUISITION = АКВИЗИЦИЯ (или ПОГЛОЩЕНИЕ) – Acquisition:- gaining possession of a thing, service or right, by cash or other means. Generic term covering all forms of acquisition of another business entity, such as consolidation, merger, purchase of assets with payment in cash or stock. Acquisition is obtaining control of another corporation by purchasing all or a majority of its outstanding shares, or by purchasing its assets. Acquisitions, which include mergers and takeovers, are a part of business strategy involving the combination of two or more businesses, with or without the cooperation of all parties. Once a rare occurrence, these maneuvers became a typical part of doing business on a large scale in the XX century (though the peak came earlier, in the XIX century's Great Merger Movement). Mergers and acquisitions advisory firms have even developed sometimes calling themselves transition advisors although most such guidance is still provided by traditional investment banks. Mergers and acquisitions (or M&A) are more often referred to collectively than not, but are not synonymous. They simply involve many of the same complications and concerns. Further, many mergers are in actuality acquisitions, but termed mergers in order for the acquired company to save face, a condition frequently included in the written agreement. On the other hand, a hostile takeover, when the purchased company resists being acquired, is never called a Merger. At least half of acquisition attempts fail, though companies may try repeatedly, and failed attempts can still leave the attempted acquisitor with significant control of the target company. When NASDAQ® abandoned its efforts to acquire the London Stock Exchange (LSE), it sold off the shares of stock it had acquired nearly a third of the LSE to the Borse Dubai, a stock exchange holding company of the United Arab Emirates. Advisory:- when a financial adviser says he is 'in mergers and acquisitions', he usually means he is in corporate advisory, either with an investment bank or with a specialty advisory firm. M&A is the bread and butter of corporate advisory, but the field includes other maneuvers and transactions, such as the privatization of a public company, the spin-off of a portion of a company into a new business, and the management of joint ventures between businesses. The advisers included in such transactions include legal advisers and financial advisers retained by both sides and looking out for the best interests of their respective clients; financiers who arrange funding and attend to other financial concerns of the transaction; and third-party experts, such as consultants specializing in the industry, intellectual property valuation advisors, public relations firms, and so on. The larger the companies involved, the more advisers will generally be called upon, but at a minimum each company will retain legal services, and nearly always at least one financial adviser. Investment banks like JP Morgan, Goldman Sachs, Morgan Stanley, and Deutsche Bank AG offer corporate advisory services around the world, and dozens of other investment banks operate regionally or nationally. The strength of an investment bank is its tendency to have fingers in so many pies, a sort of department store of corporate financial services, and although the 2007–08 economic crisis has demonstrated the way in which this becomes a vulnerability, it renders an investment bank's M&A advice no less useful. But since the end of the XX century, more and more firms have launched offering corporate advisory services exclusively, and have especially been engaged by businesses concerned about investment banks' potential conflicts of interest. Most such firms are run by senior executives who have left investment banks and have considerable experience, networking contacts, and professional relationships in the financial industry. They are sometimes hired to supplement the advice of an investment bank rather than to substitute for it. Corporate advisory firms tend to be smaller, and to operate in a smaller area, than investment banks; in Europe they are in a sense the descendants of the merchant banks like Lazard and Rothschild (both of which continue to offer corporate advisory services). Major corporate advisory firms operating multinationally include Evercore Partners (which advised AT&T on its BellSouth acquisition and managed the separation of Viacom and CBS Corporation) and Greenhill & Co. (in the aftermath of the 2008 credit crisis, one of the few remaining independent investment banks operating on Wall Street), both of them based in New York with operations in Europe and Tokyo. Valuation:- One of the services offered by advisory firms and investment banks, engaged when considering an acquisition, is business valuation. There are various ways to value a business, and particular methods or information may be more or less valuable in different industries. 'Value' itself is not always a straightforward thing, and can be talked about in terms of fair market value (the price an asset would sell for between informed parties on the current market), fair value (largely similar, a term especially used in Generally Accepted Accounting Principles and legal contexts), an intrinsic value, a more subjective measurement that implicitly perceives a flaw or temporariness in the fair market value. Public companies are in general easier to value than private ones, because the law and their accountability to shareholders has required them to keep financial records that adhere to a certain standard and are audited regularly. Even well-managed private companies may not do so, particularly smaller ones. Further, while it is in the best interest of public companies to emphasize their profits, it is in the best interest of private companies to minimize them to some degree, for the sake of taxes, and financial records will reflect this. Assets of both companies will probably have their original cost and value recorded, rather than their current market values, and valuing the company will thus require reexamining those assets. The discounted cash flows method of business valuation values assets not according to their cost or their resale value, but their projected cash flows, discounted to the present value. An immature bond that will be worth USD20 when it matures is in the present worth less than that, for instance, but nevertheless more than its original cost. The amount by which that future cash flow value is discounted is the discount rate, expressed as a percentage. The example of the bond is a more clear cut case than most of those faced by the advisors valuing a business:- the risk and predictability of return of a bond is very simple compared to that of a restaurant, for instance, or a patent, or a piece of real estate. Two different advisors may come to different conclusions about the discounted cash flow value of an asset, and presenting their reasoning to the prospective buyer is part of the process of considering an acquisition, especially if the acquisition itself will in any way impact that cash flow. The guideline companies method of business valuation is a benchmark-based method similar to determining the value of an asset like a car or house:- the company is compared to other similar companies that have been acquired, with multiples calculated based on differences in areas like price to earnings ratio. This has become a more useful method as acquisitions have themselves become more common, as the number of available benchmarks has increased, in some industries more than others. Intellectual property, like patents and proprietary processes, are especially difficult to value objectively. Various models have been developed, and there are firms that specialize in the valuation of intellectual property, a specialty that has developed principally since the 1990s. In the United States, the most prominent firms in this subfield are Crais Management Group in New Orleans, Ocean Tomo in Chicago, and Intellectual Ventures in Seattle, all of which have supported the treatment of intellectual property as a security like class of asset, one that could be bought and sold on an exchange, which would strengthen the reliability of intellectual property valuation thanks to the efficiency of the bid/ask system. Valuing a business generally requires that business's cooperation, especially if it is a privatelyowned company. It is standard for both parties to sign a non-disclosure agreement, though the targeted business could still be at a competitive disadvantage should the other business opt not to go ahead with the acquisition. The valuation report includes an account of the current economic conditions at the time of the valuation date, generally derived from the Federal Reserve's Beige Book and state and industry publications, followed by a detailed financial analysis that discusses both the current situation and past trends of growth and decline. Data is reported in such a way as to make comparison to other businesses in the industry as easy and accurate as possible, and certain other adjustments are made to the report as circumstances demand: nonoperating assets (which are assumed to be excluded from the hypothetical sale, such as excess cash) are eliminated from the balance sheet, non-recurring items are adjusted so as not to skew the results of the analysis, and the data of private companies is sometimes adjusted to make it comparable to that of public companies. Executives of private companies often earn a higher salary than those of public companies, for instance. There are three major business valuation societies in the United States:- the American Society of Appraisers, the Institute of Business Appraisers, and the National Association of Certified Valuation Analysts. Each publishes a set of Business Valuation Standards for its accredited members to follow. Common among them are certain

minimum requirements for the scope and contents of business valuation reports; the proscription against the appraiser's fee being contingent on the value of the business appraised; and a requirement of full disclosure of the institutions and individuals participating in the valuation report. Financing:- financing an acquisition is another consideration. If called simply 'An Acquisition', the transaction was probably financed with cash, the simple purchase of a smaller company by a larger one; because businesses do not like to restrict their cash flow if they can help it, this is most common when the size discrepancy between the two companies is greatest, i.e. a global corporation acquiring a local independent business and bringing it into the fold. Money can also be raised through bonds or loans from a bank, and it is common to finance an acquisition through some combination of these things. Leveraged Buyouts:- a leveraged buyout (LBO) is a special type of acquisition, differentiated by the way it is financed. The acquisition buyout of another company is financed by loans (leverage), using the assets of the target company as the collateral. The prevalence of junk bonds in the 1980s was due to the number of high-risk leveraged buyouts financed by bond issuance. Over the course of that decade, over USD250 billion of leveraged buyouts were made by 'corporate raiders' who acquired a total of 2 000 companies. An early famous example was the Gibson Greetings acquisition, in which a greeting card company was acquired in 1982 for USD80 million, only USD1 million of which was contributed by the acquiring group; the other USD79 million was easily paid back 16 months later when the company went public with an initial public offering (IPO) of USD290 million. It was the sort of success story that launched a thousand ships, at the start of a decade that would soon become known for its bottom line attitude and glorification of greed. The raider label was as likely to be used by businessmen as the media, as these investors would often or often enough to feed the perception embark on a hostile takeover of a company, strip its assets, lay off its employees, and restructure the remains, as much like a virus or group of convert or die missionaries as like the Vikings and pirates the label invoked. The 1987 Oliver Stone movie Wall Street combines aspects of investors like Carl Icahn and Michael Milken into the corporate raider Gordon Gekko, played by Michael Douglas; his 'greed is good' speech, in turn, was inspired by an address by arbitrageur Ivan Boesky, whose defense of greed in 1986 summarized and polarized much of the decade. Gekko's plans to acquire an airline he promises to restructure, but intends only to liquidate by selling it off piecemeal, are likewise emblematic of much of the corporate raiding activity of the time, even to the choice of an airline as his target. Icahn was best known for his 1985 hostile takeover of Trans World Airlines (TWA) and subsequent reduction of wages and benefits, liquidation of assets, and sale of profitable gates to other competing airlines, while relocating the corporate offices to a building he owned in Westchester County. The LBO boom peaked with the takeover of RJR Nabisco in 1989, a buyout that cost USD31.1 billion USD109 a share, after a prolonged bidding war involving (in one capacity or another) Morgan Stanley, Goldman Sachs, Salomon Brothers, and Merrill Lynch, the most prominent investment banks of the era. When adjusted for inflation, no buyout has been larger, and it was the last of its kind for the era; buyouts slowed, and even the RJR Nabisco deal had to be recapitalized a year later. Milken's firm, Drexel Burnham Lambert, had raised the largest amount of money for the decade's flurry of buyouts, leading the way in the securitization of high yield debt, for which Milken was called 'The Junk Bond King'. The era symbolically ended shortly after the RJR Nabisco deal, when the firm pleaded no contest to six federal felony charges related to stock manipulation and misdeeds, paying a USD650 million fine, the largest ever paid for securities violations. Milken left the firm when he was indicted individually on 98 charges of racketeering and securities fraud (insider trading), for which he was eventually sentenced to ten years in prison. Drexel Burnham Lambert declared bankruptcy less than a year later. The XXI century saw a rebirth of leveraged buyouts, as lending standards became lax, interest rates declined, and the Sarbanes-Oxley Act altered the regulations affecting public companies. Though no buyout equaled RJR Nabisco's when adjusted for inflation, there were more multibillion-Dollar buyouts, totalling significantly more money, in the first decade of the XXI century than in the 1980s. 2006 alone saw 654 companies bought for USD375 billion. The high yield debt market enabling this was affected by the subprime mortgage crisis that rippled across the other sectors of the economy in 2007–08; no bankruptcy or indictment was needed to end the boom this time, just general economic malaise and its attendant risk aversion. Many of the buyouts of this recent wave were funded with 'cov-lite' loans covenant light loans, loans with fewer clauses in their agreements protecting the rights of the lender, something more and more banks offered at a time when it was a borrowers' market and lenders had to compete for attention. Management Buyouts:- it is a mistake to conflate leveraged buyouts with the corporate raiding associated with the 1980s; even most buyouts in that decade did not result in negligent handling or opportunistic dismantling of the acquired companies. Management Buyouts (MBOs), for instance, are leveraged buyouts instigated by the management of a company, when those managers want to take control of the company usually, but not always, in order to take the company private. The reasons for this vary, but often management may have a plan for the company that is not going to return a profit to the shareholders quickly, or involves a risk shareholders are not willing to take. The problem with MBOs when they become a common corporate maneuver is the temptation that is presented for mismanagement: Corporate officers planning an MBO will have to raise less money to buy out the company if they can reduce its worth first. Takeovers:- the 1980s made hostile takeover such a common phrase that it can be easy to forget there is any other sort. While it is true that a friendly takeover is more likely to be referred to as an Acquisition, this is simply a matter of labeling. A hostile takeover is any acquisition performed without the cooperation of the company which can mean that the company actively resisted the acquisition (by rejecting initial offers) or can simply mean that its cooperation was not sought. There are different strategies of hostile takeovers, from gathering up enough stock to own a controlling stake in the company to persuading existing shareholders to vote the current management out in favor of managers who will approve the takeover. Hostile takeovers are riskier, insofar as without the cooperation of the targeted company, the business valuation will be less wellinformed, and potentially inaccurate. A reverse takeover is one in which a private company acquires a public company without taking it private in other words, the private company bypasses the usual process of going public by buying and merging with a public company, which can turn it public in weeks rather than the year or more that a standard IPO usually takes. US Airways, for instance, was acquired by America West Airlines, putting the company in the hands of US Airways' creditors, with the goal of rescuing it from bankruptcy. Mergers:- In a merger, two companies join to form a larger company. There is usually a new name and brand identity for the resulting company, but not always. Mergers may be horizontal involving companies that produce similar products in an industry, such as Pepsi and Coca-Cola or vertical, involving two companies involved with different stages of production of the same good or service, like a movie studio and a television network. Conglomerate mergers involve companies from completely separate industries. Mergers can raise a lot of antitrust red flags, and the busiest period of merger activity in the United States contributed to the speed with which antitrust legislation was adopted. The 'great merger movement' took place from 1895 to 1905, a period during which there was a significant national trend toward moving operations and consciousness from the regional level to the national level. For instance, during this same Progressive Era which historian Robert Wiebe has called the organizational period the country's major nationwide professional guilds (such as the American Medical Association and American Legal Association) developed, as did its national labor unions, several of its religious organizations, and a great many of its media organizations. There was a general and pronounced trend since the end of the Civil War to treat institutions in the United States as American institutions first, Alabaman and Iowan and Pennsylvanian institutions second, an attitude adopted so successfully that it is taken for granted a century later. In business, the effect of this trend was for more companies to want to operate nationally rather than in a single state or region. State laws sometimes made this difficult, and trusts were created in order to create legal entities which could then own or merge with smaller regional entities, which would then all be operated uniformly. Hardware stores in 30 states, for instance, could merge into a nationwide hardware chain. That is not to say that the motivation of the great merger movement was simply to participate in the spirit of cultural change that presided over the day. Economic concerns were

foremost. The Panic of 1893 had driven demand and prices down, and mergers allowed costs to come down in order to keep profits stable, or on the increase. When those costs came down because of vertical or horizontal integration, all was well. But when the mergers resembled a form of collusion, with companies joining together in order to keep prices high by removing the need to compete, that is when antitrust legislation had to be enacted in order to limit the circumstances in which mergers could occur, and set out the sorts of companies that, in plain English, are not allowed to exist under American law companies that represent such a large part of their industry that the industry is rendered noncompetitive. As an illustration of just how much merging was occurring, in 1900 right in the middle of this period the value of firms involved in mergers that year was equal to 20 percent of the country's gross domestic product. By contrast, in an ordinary year, it is closer to 5 percent or less. Acquiring control of one corporation by another. In unfriendly takeover attempts, the potential buying company may offer a price well above current market values, new securities and other inducements to stockholders. The management of the subject company might ask for a better price or try to join up with a third company. See also Merger and Proxy. / Ротшильд. Дьжей.Пи. Моргэн (JP Morgan), Голдмэн Сэкс (Goldman Sachs), Моргэн Стэнли (Morgan Stanley), Дойчэ Банк А.Ге. (Deutsche Bank AG). Мёрл Лынч (Merrill Lynch). НЭЗДЭК® (NASDAQ®). скупить активы с оплатой наличными или акциями. Установление контроля одной корпорации над другой. При попытках силового захвата компания, выступающая в роли потенциального покупателя может предложить акционерам цену более высокую по сравнению с текущей рыночной ценой, а также новые ценные бумаги и всевозможные приманки. Управляющий персонал подконтрольной компании может потребовать для себя более выгодных условий или попытаться объединиться с третьей компанией. Смотрите также Слияние (Merger) и Доверенность (Proxy). Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо. Аквизиция или Поглощение – получение одной компанией контрольного пакета акций другой компании. Инвесторы всегда ищут компании, которые могут быть приобретены, поскольку те, кто хочет приобрести такие компании, часто готовы заплатить выше рыночной стоимости акций, необходимых для полного приобретения. Аквизиция, от Латинского слова Acquisitio, означающее Приобретаю, – скупка одним лицом или группой лиц контрольного пакета акций; переход контроля над фирмой от одной группы акционеров к другой. Аквизиция или Поглощение:- (1) привлечение аквизитором новых клиентов страховой или транспортной компании; (2) скупка одним лицом или группой лиц всех акций компании, означающая приобретение предприятия. Если аквизиция производится без согласия на то руководителей и работников (акционеров) компании, то её называют Враждебной Аквизицией.

ACQUISITION ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ АКВИЗИЦИИ (или БУХГАЛТЕРСКИЙ УЧЁТ ПОГЛОЩЕНИЯ) – In the United Kingdom, Acquisition Accounting is a procedure adopted in preparation of the consolidated financial statement of an acquiring and the acquired firm. The purchase price of the acquired firm is allocated between its net tangible and intangible assets (such as copyrights, patents, trademarks) on the basis of their fair market value. Any resulting difference (acquisition adjustment) is allocated to goodwill. Also known as Purchase Accounting in the United States. / Закупочная цена . Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

ACQUISITION COSTS = АКВИЗИЦИОННЫЕ ЗАТРАТЫ (или ЗАТРАТЫ ПО ПОГЛОЩЕНИЮ) – (1) All acquisition-related costs (e.g., finder's fees, advisory, legal, accounting, valuation and other professional or consulting fees) are to be recognised as period expenses and generally written-off rather than added to goodwill (as previously). Costs incurred to issue debt or equity securities will continue to be recognised in accordance with the Standards on financial instruments. This change reflects the Board's move to focus on what is given to the vendor as consideration, rather than on what is spent to achieve the acquisition. The costs that an insurer incurs to sell, underwrite, and initiate new insurance contracts. Acquisition Cost is:- (1) the cost that a company recognizes on its books for property or equipment after adjusting for discounts, incentives, closing costs and other necessary expenditures, but before sales taxes. Acquisition costs recognize more realistic costs on a company's financial statements. The acquisition cost of property and equipment recognizes any discounts or additional costs that the company will experience. (2) The cost of a business to acquire a new customer. The company recognizes costs, including marketing and incentives, to introduce new customers to the company's products and services. The customer acquisition cost is calculated by dividing total acquisition costs by total new customers over a set period of time. Also known as Cost Of Acquisition. Customer acquisition costs are also important for companies to measure, as it aids in planning future capital allocations to things like marketing budgets and sales discounts. The company should also look at customer loyalty and whether the company will be able to retain customers easily. / Аквизиционные Затраты или Затраты по Поглощению:- (i) в финансах:- все расходы (цена покупки плюс все издержки завершения сделки (closing costs)), которые будут понесены при приобретении компании, покупке недвижимости или иной собственности. (ii) В инвестициях:- сбор с продаж (sales charge) акций взаимного инвестиционного фонда (load/unit), которые продаются с надбавкой, или же первоначальная цена ценных бумаг плюс комиссия брокера.

(2) Acquisition Costs, comprising commission and other costs related to the acquisition of new insurance contracts are deferred to the extent that they are attributable to premiums unearned at the balance sheet date. That portion of an insurance premium which represents the cost of obtaining the insurance business:- it includes the intermediaries' commission, the company's sales expense, and other related expenses. / Та часть страховой премии, которая представляет собой расходы на поддержание данного страхового бизнеса:- они включают в себя комиссионные посредников, затраты самой компании по продажам, и прочие сопутствующие затраты.

ACQUITTANCE = РАСПИСКА В ПОЛУЧЕНИИ ИСПОЛНЕНИЯ ПО ОБЯЗАТЕЛЬСТВУ (или ПОГАШЕНИЕ ДОЛГА, или ОСВОБОЖДЕНИЕ ОТ ОБЯЗАТЕЛЬСТВ) – Acquittance is a written receipt in full, in discharge from all claims. / Письменная расписка о полном исполнении обязательств, оплате по всем требованиям (претензиям).

ACR = ACCOUNTS RECEIVABLE

ACRE = AVERAGE CROP REVENUE ELECTION

ACRE = АКР – Acre is a measure of land area equal to 43 560 square feet, 4 840 square yards or 160 square rods (Metric:- 4 046.873 square meters). One square mile equals 640 acres. Abbreviation:- AC or A. A unit of area used for measuring real estate in English-speaking countries. 'Acre', an Old English word meaning a field, is derived from the Latin Ager and Greek Agros, also meaning a field. The acre was originally defined as the area that could be plowed in a day by a yoke of oxen. It was in use in England at least as early as the VIII century, and by the end of the IX century it was generally understood to be the area of a field one Furlong (40 Rods or 10 Chains) long by 4 rods (or 1 chain) wide. Thus an acre is 10 square chains, 160 square rods, 43 560 square feet or 4 840 square yards. There are exactly 640 acres in a square mile. In metric countries the unit corresponding to the acre is the hectare, which is 10 000 square meters (the area of a square 100 meters on each side). One acre is equal to 0.404 687 3 hectare. Among traditional European land area units, the acre is typical in being defined as a day's work but unusual in not being visualized as the area of a square. Similar units include the French Journal, north German and Dutch Morgen, south German and Swiss Juchart, Austrian Joch, and Czech Jitro. / от Латинского слова Агэр (Ager) и Греческого слова Агрос (Agros). Обозначение:- . единицы включают Французский Журналь (Journal), Датский Морхэн (Morgen), Южно-Немецкий и Швейцарский Юхарт (Juchart), Австрийский Ёх

(Joch) и Чешский Йитро (Jitro). Единица площади в в Британской Империальной Системе мер. 1 Акр = 4 840 квадратным ярдам = 1/640 квадратной мили = 4 046.873 квадратным метрам ($м^2$) = 0.404 687 3 гектара (га). Акр, земельная мера, применяемая в ряде стран, использующих Английскую систему мер (Великобритания, США, Канада, Австралия и другие). 1 акр = 4 840 кв.ярдам = 4 046.86 $м^2$.

ACREAGE ALLOTMENT = РАСПРЕДЕЛЕНИЕ (ПОСЕВНЫХ) ПЛОЩАДЕЙ В АКРАХ – In the United States, Acreage Allotment is an individual farm's share of the national acreage that the Secretary of Agriculture determines is needed to produce sufficient supplies of a particular crop. The farm's share is based on its previous production. Acreage Allotment is an individual farm's share, based on its production history, of the national acreage considered desirable as a means of adjusting supplies of a particular crop to national needs. Allotments were historically used with marketing quotas, which ended with the establishment of voluntaru cotton programs in the early 1970's. The Food and Agriculture Act of 1977 ended the historical allotments and bases that dated back to the 1950's and 1960's. The program acreage used for payment purposes since 1978 have been based on recent plantings.

ACREAGE REDUCTION PROGRAM = ПРОГРАММА СОКРАЩЕНИЯ (ПОСЕВНЫХ) ПЛОЩАДЕЙ В АКРАХ – In the United States, Acreage Reduction Program is a voluntary land retirement system in which farmers must idle a portion of their base acreage of Wheat, feed grains, upland and extra-long staple (ELS) Cotton, or Rice. The base is the average of the acreage planted for harvest and considered to be planted for harvest during a specified preceding period. The latter includes any acreage not planted because of acreage reduction and diversion programs during a period specified by law. Farmers are not given a direct payment for acreage reduction program (ARP) participation, although they must participate to be eligible for benefits like Commodity Credit Corporation (CCC) loans and deficiency payments. Participating producers are sometimes offered the option of idling additional land under a paid diversion program, which gives them a specific payment for each idled acre. See also Paid Land Diversion.

ACRILAN® = ЭКРИЛЭН® (или АКРИЛАН®) – Acrilan® is a registered trademark for an acrylonitrile-vinyl acetate copolymer fiber that is commonly used in textiles. Acrilan® was first produced in 1949 by Chemstrand Corporation (headquartered in Decatur, AL (State of Alabama)). After slight changes in the formulation and manufacturing procedures, Acrilan® was commercially manufactured in 1954. It is an acrylic fiber copolymerized with less than 15% vinyl acetate groups. Acrilans are noted for softness, strength and wrinkle-resistant properties. Acrilan® is used for clothing, carpets, drapes, upholstery and laminates. Properties:- (i) soluble in dimethyl sulfoxide, ethylene carbonate, and nitriles; (ii) insoluble in ethanol, acetone, benzene, carbon tetrachloride, and ligroin. Acrilan® is a trademark used for an acrylic fiber. Acrilan® is an acrylic fiber or fabric, characterized by strength, softness, and crease-resistance and used for clothing, upholstery, carpets, etc. Acrilan® is a brand name for an acrylic fiber used in textiles, characterized chiefly by softness, strength, and wrinkle-resistant properties.

ACROSS THE GRAIN = ПОПЕРЁК ВОЛОКОН – Across The Grain:- the cross-section that is the result of cutting a tree trunk perpendicular to its length. As opposed to 'With The Grain'.

ACRS = ACCELERATED COST RECOVERY SYSTEM

ACRYLIC = АКРИЛ – Acrylic:- with reference to textiles, a synthetic polymer fiber made from acrylonitrile compounds. Acrylic is probably the most popular synthetic fiber for yarns for hand knitting. It is also used for fleece clothing. Modacrylic is acrylic that contains other monomers to alter some properties, such as flame retardancy. Acrylic is normally dyed with basic dyes. The process requires care get level results and to avoid damage to the fiber. Acrylic is a synthetic resin used extensively for exterior latex paints and some high quality interior latex paints. Acrylic is a synthetic fiber composed of linear macromolecules having in the chain at least 85% by mass of acrylonitrile repeating units. Alphabetic code – PAN; and relevant commercial allowance – 2.00. Acrylic is a synthetic polymer fiber that is supple, comfortable and similar to wool. It is lightweight and dries quickly; very sensitive to heat. Acrylic is the generic name of fibers made from acrylic granulate, which comes from coal, air, water, petroleum, and limestone. The quota of acrylonitrile units has to be at least 85% for a fiber to be called Acrylic. Acrylic is light in weight for the warmth it gives and is very popular for blankets or as a substitute for wool. / Полиакрилонитрил, $[–CH_2CH(CN)–]_n$, синтетический полимер, продукт полимеризации акрилонитрила. Твёрдое вещество белого цвета. Плотность 1 140–1 170 кг/$м^3$, размягчается при 220–230 °С. Стоек к действию обычных растворителей, жиров; не изменяет свойств в атмосферных условиях; растворяется в диметилформамиде, диметилацетамиде, этиленкарбонате, концентрированных водных растворах некоторых солей и в концентрированных азотной и серной кислотах. Применяется главным образом для формования акрилового (полиакрилонитрильного) волокна.

ACRYLIC–CELLULOSE FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ АКРИЛОВОГО И ЦЕЛЛЮЛОЗНОГО ВОЛОКОН – Acrylic-Cellulose Fiber Blends Dyeing:- polyacrylonitrile-cellulose (PAC-cellulose) blends are used for household textiles (drapery and table linen) and imitation fur ('peluche', in which the pile consists of PAC fibers and the back is made of cotton). The percentage of PAC in the mixtures varies between 30 and 80%. PAC can be dyed with cationic or disperse dyes, while direct, vat or reactive dyes can be used for the cellulose component. The following methods are the most commonly used for dyeing this blend:- (i) continuous dyeing with cationic and direct dyes according to the pad-steam process (to avoid precipitation of cationic and anionic dyes present in the pad liquor at relatively high concentration, combination of anionic and non-ionic surfactants are added to the solution); and (ii) batch dyeing (usually according to the one-bath, two-steps method) with cationic and vat dyes or with cationic and reactive dyes. / непрерывное крашение (continuous dyeing).

ACRYLIC FIBER = АКРИЛОВОЕ ВОЛОКНО – Acrylic Fiber is a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of acrylonitrile units $(–CH_2CH(CN)–)_n$. Acrylic fibers are produced by two basic methods of spinning (extrusion), dry and wet. In the dry spinning method, material to be spun is dissolved is a solvent. After extrusion through the spinneret, the solvent is evaporated, producing continuous filaments which later may be cut into staple, if desired. In wet spinning, the spinning solution is extruded into a liquid coagulating bath to form filaments, which are drawn, dried, and processed. Characteristics:- because acrylic fibers are thermoplastic, fabrics may be heat-set for wrinkle resistance and to provide permanency to pleats. Acrylic fabrics have low moisture absorbency and dry relatively quickly. In general, acrylic fibers are resistant to the degrading effects of ultraviolet rays in sunlight and to a wide range of chemicals and fumes. They provide warmth in fabrics that are lightweight, soft, and resilient. Acrylic fibers have relatively poor flame resistance compared with other fibers. Some acrylic fabrics, particularly knit types, approximate the hand of fine wool. Because of the composition and cross section of the fiber, fabrics made therefrom have a high bulk to weight ratio. This is further enhanced with the so-called 'High Bulk' spun yarns. End uses of acrylic fibers include floor coverings, blankets, and apparel uses such as suitings, pile fabrics, coats, collars, linings, dresses, and shirts. Generic name for a synthetic fiber consisting of at least 85% of acrylonitrile units. Acrylic Fiber is a manufactured fiber derived from polyacrylonitrile. Its major properties include a soft, wool-like hand, machine washable and dryable, excellent color retention. Solution-dyed versions have excellent resistance to sunlight and chlorine degradation. Acrylic Fiber is a manufactured fiber made from long-chain synthetic polymers. Characteristics:- wrinkle resistance; low moisture absorbency and quick-drying; provides warmth yet lightweight, soft and resilient. Acrylic Fibers:- so called PAC Fibers are hydrophobic and contain anionic groups in the molecule. As a result, they can be dyed with disperse and cationic dyes. With the introduction of cationic co-monomers in the polymer, the fiber can

also be dyed with acid dyes. Batch dyeing is commonly applied for cable or stock (package dyeing), yarn in hank form or packages and for fabric. Piece dyeing can be performed on beam, overflow, paddle (for knitwear, ready-made bath sets), or drum (socks). Stock, cable and top can be also dyed on special machine, using the pad-steam process, preferably with pressurised steam to obtain short fixing times. Piece goods, especially upholstery material (velour), are also dyed according to the pad-steam process, but in this case fixing is carried out with saturated steam. This implies longer fixing times, which means that rapidly diffusing cationic dyes and dye solvents are required. (i) Disperse dyes are used to produce light to medium-deep shades. The dyeing techniques correspond to those used on polyester fibers. However, dyeing can be performed at temperatures < 100 °C without carriers. Furthermore, due to the good migration properties of disperse dyes, levelling agents are not required. (ii) Cationic dyes:- typical recipes used in batch dyeing include an electrolyte (sodium acetate or sodium sulphate), acetic acid, a non-ionic dispersant and a retarding agent. Dyeing is conducted by controlling the temperature in the optimum range for the treated fiber. Finally the bath is cooled down and the material is rinsed and submitted to after-treatment. Continuous processes commonly applied are:- (i) pad-steam process (fixation with pressurised steam at more than 100 °C) – this process has the advantage of reducing fixing time. Pad liquor typically contains a steam-resistant cationic dye, acetic acid and a dye solvent; and (ii) pad-steam process (fixation with saturated steam at 100–102 °C) – this process requires a longer fixing time. Rapidly diffusing cationic dyes and dye solvents, which exhibit a carrier effect, are required. When dyeing with basic dyes, special levelling agents (also called Retarding Agents) are widely used to control the absorption rate of the colorant on the fiber, thus improving level dyeing. Acrylic Fiber is a quick-drying synthetic textile fiber made by polymerization of acrylonitrile usually with other monomers. Acrylic Fibers have characteristics most similar to those of wool fibers. They are soft and light fibers having light and warm tactile feeling to the human skin. Acrylic fibers are widely used, making the most of their characteristics, for knitted products such as sweater and jersey; bedding textiles such as blankets and Pile sheets; and carpets for home-uses. In addition, rag animals and western wigs are the products making use of acrylic fibers. Acrylic fibers are manufactured in a wide variety of characteristics such as those lustered, delustered, with soft tactile feeling, and with rigid tactile feeling. There are many other types of acrylic modified fibers such as animal-like fibers with oval cross-section, thermal resistant fibers, anti-pilling fibers, antibacterial and deodorant fibers, and anti-static fibers. Acrylic fibers are manufactured in staple fibers, almost with a wet spinning process. However some fibers are manufactured with a dry spinning process. Such dry spun fibers have different fabric hand from that of wet spun fibers and are developing in a variety of new end-uses. Light/soft feeling, a characteristic among features of acrylic fibers, is referred to as Bulkiness. Bulky spun yarns, difficult to spin other fibers, are available. A variety of yarns blended with other types of fibers such as cotton and wool fibers are manufactured to make use of characteristics of each type of fibers. Filament yarns of acrylic fibers are also available. Since the filament yarns have luster and tactile feeling, they are used for silk-like knitted products. In addition, they are used for accessories for Japanese dresses and the field of silk products thanks to the non-yellowing. For information, acrylic fibers include acrylic fibers themselves and modacrylic fibers. Those fibers which contain (not less than 85%) acrylonitrile molecule as main component are ‘acrylic’ fibers. On the other hand, those fibers which contain 35–85% acrylonitrile molecule are ‘modacrylic’ fibers. Since modacrylic fibers are copolymerized with vinyl chloride or vinylidene chloride, they are flame retardant. They are used for curtains and wigs. End-Uses:- (i) For clothing:- Sweaters, Women’s and Children’s Wear, Sports Wear, Socks, Knitted Underwear, Pajamas, Gloves, etc. (ii) For home furnishings and bedding:- Carpets, A Variety of Rugs, Upholstery, Cushions, Blankets, Pile Sheets, etc. (iii) For industrial uses:- Felts for Paper Making, Filter Cloth, Alternative Asbestos, Tents, Sheet, etc. (iv) For other uses:- Rag Doll, Toys, Auxiliary Tapes for Bags, Braids, Cloth for Bags, Wigs, etc. Features:- (i) lighter than wool fibers, and fabric hand with bulkiness; (ii) superior in warm retention, light and warm; (iii) superior in elastic recovery, and resistant to crease; (iv) excellent in color development and can be dyed in desired color; (v) little affected by sunlight; (vi) resistant to chemicals and cannot be attacked by molds and insects; and (vii) thermoplastic. Care Instructions:- in the laundering of knitted products, care should be taken not to deform the shape. In particular, wash bulky knitted products with hands, fully squeeze with bath towel, and screen dry in a well ventilated place. Thus the bulky knitted products dry fast without deformation. If the products is directly ironed at a high temperature, the product may damage its fabric hand or may shrink with heating. The products should be ironed with a floating steam iron to restore the shape. Since products of acrylic fibers are particularly sensitive to heat, avoid to use a tumble dryer (hot air dryer). To iron the products, iron with an iron cloth at a low temperature. Acrylic Fibers are synthetic fibers made from a polymer (polyacrylonitrile) with an average molecular weight of ~100 000, about 1 900 monomer units. To be called Acrylic in the United States, the polymer must contain at least 85% acrylonitrile monomer. Typical comonomers are vinyl acetate or methyl acrylate. DuPont created the first acrylic fibers in 1941 and trademarked them under the name Orlon. Acrylic is also called Acrilan Fabric. As it resembles silk, it is also called Artificial Silk. / высокообъёмное (high bulk). Экструзия или Выдавливание (Extrusion). Общее название для синтетического волокна, состоящего, по крайней мере, из 85% акрилонитрильных составляющих. Известно также как Акрилонитрильное Волокно (Acrylonitrile Fiber). То же, что Полиакрилонитрильное Волокно (Polyacrylonitrile Fiber). Акриловое Волокно или Полиакрилонитрильное Волокно – синтетическое волокно, получаемое формованием из растворов полиакрилонитрила или сополимеров, содержащих в макромолекуле более 85% акрилонитрила. Атмосферо- и плесенестойко, по механическим свойствам близко к шерсти (превосходит в этом отношении другие химические волокна). Устойчиво к сильным кислотам, растворам щёлочей средних концентраций, органическим растворителям, применяемым для чистки одежды (ацетон, бензин, дихлорэтан и другие), разрушается в феноле, формалине, м-крезоле. Применяется в производстве верхнего трикотажа, ковров, искусственного меха, одёжных, обивочных и фильтровальных тканей; в смеси с хлопком и вискозным волокном – для изготовления гардин, брезентов. Торговые названия:- Акрилан, Вольпрюла (в бывшей Германской Демократической Республике (ГДР)), Дралон (в Германии), Кашмилон (в Японии), Куртел (в Великобритании), Нитрон (в бывшем Союзе Советских Социалистических Республик (СССР)), Орлан (в Соединённых Штатах Америки (США)) и другие. Мировое производство (в 1980) около 2 000 000 тонн.

ACRYLIC RESIN = АКРИЛОВАЯ РЕЗИНА (или АКРИЛОВАЯ СМОЛА) – Acrylic Resin is a polymer of acrylonitrile, used in the production of manufactured fibers, as a fabric finish and as a size.

ACRYLIC–WOOL FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ АКРИЛОВОГО ВОЛОКНА И ШЕРСТИ – Acrylic-Wool Fiber Blends Dyeing:- among synthetic fibers, PAC fibers are the most suitable for obtaining blends with wool that keep a wool-like character. This makes this blend widely used, especially for knitwear and household textiles. The blending ratio of PAC to wool varies from 20:80 to 80:20. Metal-complex, acid and reactive dyes are the dyestuffs typically used for the wool part, while PAC is dyed with cationic dyes. Cationic dyes stain wool fiber. As a matter of fact cationic dyes attach first to wool and then migrate to PAC fiber at higher temperature. Even if well-reserving dyes are selected, dyeing must be conducted for a sufficiently long time (from 60 to 90 minutes) in order to obtain good wool reserve. PAC-wool blends can be dyed using the following exhaustion methods:- (i) one-bath one-step; (ii) one-bath two-step; and (iii) two-bath. The first one allows shorter dyeing times and lower consumption of water. However, it is not always applicable because the simultaneous presence in the dye bath of anionic and cationic compounds can produce the precipitation of the formed adducts on the fiber. Precipitation can be prevented using dispersing agents and selecting adequate dyes. When dyeing with the one-bath, two-step method the use of reserve agents is not necessary. In fact, wool absorbs the cationic dye and slowly releases it, acting as a retarding agent (exerting a retardant effect on PAC).

ACRYLONITRILE = АКРИЛОНИТРИЛ – Acrylonitrile is the chemical composition from which acrylic fiber is made. It results from the reaction of ethylene oxide and hydrocyanic acid. Acrylonitrile is a colorless, volatile, flammable liquid (CH_2=CHCN) used as a raw material in the manufacture of acrylic polymers and fibers. Acrylonitrile or AN means acrylonitrile monomer, chemical formula CH_2=CH-CN. Liquid AN means AN monomer in liquid form, and liquid or semiliquid polymer intermediates, including slurries, suspensions, emulsions, and solutions, produced during the polymerization of AN. / Акрилонитрил, нитрил акриловой кислоты, CH_2=CH-CN, бесцветная жидкость с характерным запахом, $t_{кип}$ 77.3 °C. Легко полимеризуется. Сырьё в производстве полиакрилонитрила, бутадиен-нитрильных каучуков, АБС-пластика, цианэтилцеллюлозы и других сополимеров.

ACRYLONITRILE BUTADIENE STYRENE = АКРИЛОНИТРИЛЬНЫЙ БУТАДИЕНОВЫЙ СТИРОЛ – Acrylonitrile Butadiene Styrene (ABS or A.B.S.) is a plastic. ABS plastic pipe is an alternative to PVC pipe for use in shibori. / Акрилонитрильный Бутадиеновый Стирол (АБС (ABS)).

ACS = AUTOMATED COMMERCIAL SYSTEM

ACSEP = AIRCRAFT CERTIFICATION SYSTEMS EVALUATION PROGRAM

ACSN = ASIAN CROPPING SYSTEMS NETWORK

ACSSP = AIR CARRIER STANDARD SECURITY PROGRAM

ACTINOMORPHIC = АКТИНОМОРФНЫЙ –Most flowers are actinomorphic (Star Shaped, and Radial), meaning they can be divided into symmetrical halves by more than one longitudinal plane passing through the axis, much as a pie can be cut into several equal and identical pieces. In these flowers, the petals are usually similar in shape, size, and color. Such flowers are also called Radially Symmetrical or Regular Flowers. Examples of actinomorphic flowers are the lily (Lilium, Liliaceae) and the buttercup (Ranunculus, Ranunculaceae). Actinomorphic:- of flowers that can be divided into symmetrical halves by cutting across any diameter. Actinomorphic flowers are a basal angiosperm character; zygomorphic flowers are a derived character that has evolved many times. Some familiar and seemingly actinomorphic flowers, such as those of daisies and dandelions (Asteraceae), are actually clusters of tiny zygomorphic flowers arranged into a radially symmetric inflorescence. Zygomorphic said of a flower which can be bisected only in one plane in similar halves. Zygomorphic (Yoke Shaped, and Bilateral) flowers can be divided by only a single plane into two mirror-image halves, much like a yoke or a person's face. Examples are orchids and the flowers of most members of the Lamiales (e.g., Scrophulariaceae and Gesneriaceae). Zygomorphic flowers generally have petals of two more different shapes, sizes, and colors. Least commonly, flowers may be asymmetrical; they cannot be divided into two identical or mirror-image halves on any plane. Such flowers are typical of most members of the Zingiberales, such as cannas and various gingers. In most cases, different kinds of floral symmetry are linked to particular pollinators. Relating to a flower that can be divided into equal halves along only one line; bilaterally symmetrical. The flowers of the iris and the snapdragon are zygomorphic. Compare Actinomorphic. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. базальный (или нижний или основной) покрытосемянной характер. такие как цветки Маргариток и Одуванчиков, . примерами актиноморфных цветков служат Лилия (Lily) и Лютик (Buttercup). Цветки Касатика (Iris) и Львиного Зева или Водосбора Обыкновенного (Snapdragon) являются зигоморфными. такие как и различные Полыни (или Имбири). В большинстве случаев, различные виды цветковой симметрии связаны с отдельными опылителями. Актиноморфный Цветок, от Греческих слов Aktis, означающее Луч, и Morphē, означающее Форма, цветок с лучевой симметрией, имеющий не менее двух плоскостей симметрии, например, у Вишни, Мака. Зигоморфный Цветок, цветок, через ось которого можно провести только одну плоскость симметрии, например, у Бобовых, Губоцветных, Орхидных. В отличие от актиноморфного цветка, имеющего не менее двух плоскостей симметрии, например, у Вишни или Мака.

ACTINOMYCETES = АКТИНОМИЦЕТЫ (или ЛУЧИСТЫЕ ГРИБЫ) – Actinomycetes:- (1) Bacteria with branching filaments. (2) A nontaxonomic term applied to a group of organisms with characteristics intermediate between the Simple Bacteria and the True Fungi. / Бактерия с ветвящимися нитями. (2) . Под Актиномицетами понимается Порядок Бактерий, образующих ветвящиеся клетки, или гифы. К актиномицетам относят собственно актиномицеты, микобактерии, стрептомицеты и другие. Распространены в почве, водоёмах, в воздухе и на растительных остатках; некоторые – паразиты животных, человека (вызывают болезни – актиномикоз, дифтерию, туберкулёз и прочее) и растений. Виды, образующие антибиотики (главным образом стрептомицеты), пигменты, витамины и тому подобные, используются в микробиологической промышленности.

ACTION MESSAGE = СООБЩЕНИЕ О ДЕЙСТВИИ – Action Message is an alert that a software system generates to inform the controller of a situation requiring his or her attention.

ACTION THRESHOLD = КРИТИЧЕСКИЙ ПОРОГ (или ПОРОГ ВОЗДЕЙСТВИЯ) – Action Threshold is a number of pest Insects in the field that will require control. / Количество Насекомых вредителей в поле, которое требует воздействия.

ACTION STRETCH = РАСТЯГИВАНИЕ ОТ ДЕЙСТВИЙ – Action Stretch is a term applied to fabrics and garments that give and recover in both the lengthwise and the widthwise directions. Action stretch is ideal for tight-fitting garments such as ski pants.

ACTIVATED ALUMINA = АКТИВИРОВАННЫЙ ОКСИД АЛЮМИНИЯ (или АКТИВИРОВАННАЯ ОКИСЬ АЛЮМИНИЯ) – Activated Alumina:- a highly porous material produced from dehydroxylated aluminium hydroxide. Is used as a desiccant and as a filtering medium. / Используется в качестве десиканта и фильтрующей среды.

ACTIVATED CARBON = АКТИВИРОВАННЫЙ УГЛЕРОД (или АКТИВИРОВАННЫЙ УГОЛЬ, или АКТИВНЫЙ УГОЛЬ) – Activated Carbon is a charcoal, mostly of vegetable origin, of high adsorptive capacity. It is used for decolorizing liquids and other adsorption purifications. Usually made by carbonization and chemical activation. / Под Активированным Углем понимается то же, что активный уголь – пористое тело, получаемое из ископаемых или древесных углей удалением смолистых веществ, а также обугливанием полимеров. Используют как адсорбент в противогазах, вакуумной технике, медицине и как носитель катализаторов.

ACTIVE ABSORPTION = АКТИВНАЯ АБСОРБЦИЯ (или АКТИВНОЕ ПОГЛОЩЕНИЕ) – Active Absorption is a movement of ions and water into the plant root as a result of metabolic processes by the root, frequently against an activity gradient. / в корень растения как результат метаболических процессов . Под Абсорбцией, от Латинского слова Absorptio в свою очередь от Absorbeo, означающее Поглощаю, понимается поглощение вещества из газовой или жидкой среды всей массой другого вещества (абсорбента). Абсорбция газа жидкостью осуществляется в абсорберах (скрубберах), имеющих развитую поверхность соприкосновения абсорбента с поглощающим веществом. Этот процесс применяют в различных отраслях химической промышленности, в системах жизнеобеспечения космических кораблей и другом.

ACTIVE BEHAVIOR = АКТИВНОЕ ПОВЕДЕНИЕ – Active Behavior:- applies to goods that have an active influence on other goods and their environment.

ACTIVE CHEMICAL PRODUCTS = АКТИВНЫЕ ХИМИЧЕСКИЕ ПРОДУКТЫ – Active Chemical Products in the context of Oeko-Tex Standard 100 are all preparations that are incorporated into the fiber material or are applied in a later processing step to the textile product. Special requirements for the use of this kind of products exist for biological active products and flame retardant products. See also Biological Active Products, Flame Retardant Products, and Oeko-Tex Standard 100.

ACTIVE COLLECTION = АКТИВНАЯ КОЛЛЕКЦИЯ (или АКТИВНОЕ СКОПЛЕНИЕ, или АКТИВНЫЙ СБОР) – Active Collection is a breeder's term for a collection of germplasm that is used often and is maintained live.

ACTIVE INGREDIENT = АКТИВНЫЙ ИНГРЕДИЕНТ – Active Ingredient (AI) is the potent portion of a compound (such as fertilizer, insecticide, fungicide or herbicide applied on the soil or plant) used as basis to estimate the chemical effect. Useful for comparing the strength or toxicity of chemicals. Active Ingredient is the biologically active part of the chemical present in a herbicide formulation primarily responsible for its phytotoxity and which is identified as the active ingredient on the product label.

ACTIVE LOAD MANAGEMENT = УПРАВЛЕНИЕ АКТИВНОЙ НАГРУЗКОЙ – Active Load Management (ALM):- retail customer load that can be interrupted at the request of PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC). Such a PJM request is considered an emergency action and is implemented prior to a voltage reduction. ALM derives an ALM credit in the accounted-forobligation. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

ACTIVELY MANAGED = АКТИВНО УПРАВЛЯЕМЫЙ – Actively Managed:- where the fund manager has the discretion to select the securities in a fund and looks for opportunities to buy and sell to increase its performance. / Такой фонд, управляющий которым имеет право на своё усмотрение выбирать ценные бумаги для фонда, а также изыскивать благоприятные возможности для покупки или продажи с целью увеличения отдачи.

ACTIVE MONTH = АКТИВНЫЙ МЕСЯЦ – In the commodity markets, Active Month is the nearest base contract month that is not the current delivery month. The base months for each commodity futures are defined by each individual contract. / На биржевых рынках сырья к активному месяцу относится фьючерсный контракт с ближайшим базовым месяцем поставки, не являющимся при этом текущим месяцем поставки по данному контракту. Базовые месяцы по каждому конкретному фьючерсу на сырьё определяются в спецификации на данный фьючерсный контракт. Следует отметить, что для некоторых видов сырья биржи фьючерсов предусматривают все календарные месяцы года в качестве месяца поставки, например, для фьючерсного контракта на нефть, а для каких-то видов сырья – лишь некоторые месяцы года, например, для хлопкового волокна (Март, Май, Июль, Октябрь и Декабрь). С чем связано последнее толком не могут объяснить даже специалисты соответствующих бирж, ссылаясь на то, что так уж сложилось со временем. Хотя есть и предположение, что данные месяцы устоялись в качестве месяцев поставки в силу того, что именно в эти месяцы задолго до появления фьючерсных контрактов, торговцы соответствующим сырьём организовывали торговые ярмарки. Кроме того, у некоторых фьючерсных контрактов, например, на золото, серебро или хлопок, каким-то месяцам поставки присущ огромный интерес со стороны торговцев и, стало быть, фьючерсы с данными месяцами поставки обладают высокой ликвидностью, а к каким-то месяцам поставки торговцы вообще не проявляют никакого внимания, и ликвидность у этих месяцев практически нулевая.

ACTIVE POWER = АКТИВНАЯ МОЩНОСТЬ – In an electrical circuit, the Active Power P is the real power transmitted to loads such as motors, lamps, heaters, computers …. The electrical active power is transformed into mechanical power, heat or light. In a circuit where the applied root mean square (r.m.s.) voltage is V_{RMS} and the circulating r.m.s. current is I_{RMS}, the apparent power S is the product V_{RMS} x I_{RMS}. The apparent power is then the basis for electrical equipment rating. One piece of equipment (transformer, cable, switch …) must be designed in relation to the r.m.s. values of voltage and current. Active Power:- in an AC distribution system, the maximum active power is transmitted to a load when voltage and current are undistorted and in phase. See also Real Power. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность. Под Активной Мощностью понимается среднее за период значение мощности переменного тока; характеризует среднюю скорость преобразования электромагнитной энергии в другие формы (механическую, световую, тепловую и так далее). Измеряется в Ваттах. Для синусоидального тока равна произведению действующих (эффективных) значений тока I и напряжения U на косинус угла сдвига фаз между ними:- $P = I \cdot U \cdot \cos \varphi$.

ACTIVE STOCK = АКТИВНЫЕ ЗАПАСЫ (или ДЕЙСТВУЮЩИЕ ЗАПАСЫ) – Active Stock:- goods in active pick locations and ready for order filling.

ACTIVE VEGETATIVE STAGE = АКТИВНАЯ ВЕГЕТАТИВНАЯ СТАДИЯ – Active Vegetative Stage is the growth stage of plants when there is rapid development of leaves, tillers, branches, or stems.

ACTIVITY BASED COST ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ ЗАТРАТ, ОСНОВАННЫХ НА ДЕЯТЕЛЬНОСТИ – Activity Based Cost (ABC) Accounting is an accrual-based accounting method for determining unit-based costs of delivering services by allocating the costs to budgetary resources; it measures the performance and costs related to a specific activity or function.

ACTIVITY BASED COSTING = ЦЕНООБРАЗОВАНИЕ НА ОСНОВЕ ФАКТИЧЕСКИХ ЗАТРАТ – Activity Based Costing (ABC) is a method of cost management that identifies business activities performed, accumulates costs associated with these activities, and uses various cost drivers to trace costs of activities to the products. Activity Based Costing (ABC) is an accounting system that measures the cost and performance of specific activities performed within an organization. For example, an ABC approach might measure the cost incurred by the accounts receivable department in handling calls for billing errors, whereas the traditional accounting approach ignores the activity and measures the cost of the accounts receivable department as a percentage of revenue.

ACTIVITY BASED MANAGEMENT = УПРАВЛЕНИЕ, ОСНОВАННОЕ НА ДЕЯТЕЛЬНОСТИ – Activity Based Management (ABM) is a management methodology that combines ABC (Activity Based Cost) with business process analysis techniques to run, improve and measure performance for a business or organization.

ACTIVITY–COST ANALYSIS = АНАЛИЗ СТОИМОСТИ, СВЯЗАННЫЙ С ВИДОМ ДЕЯТЕЛЬНОСТИ – Activity-Cost Analysis:- assigning costs to the various value-creating activities of a business.

ACT OF GOD = ДЕЙСТВИЕ БОГА (или ДЕЙСТВИЕ НЕПРЕОДОЛИМОЙ СИЛЫ) – Act Of God is an inevitable event occurring without the intervention of man, such as flood, tempest, or death, operating in case of certain contracts, such as those of insurers and carriers. An extraordinary force of nature (such as a severe flood or earthquake) that experience, prescience or care cannot reasonably foresee or prevent. Act Of God is an act or accidents beyond human control, such as floods, earthquakes, lightning or hurricanes, usually referred to as 'Force Majeure'. A calamity beyond human control which happens to property – lightning, for example. Damage done by an Act of God would not be the responsibility of a bailee, although he/she might be responsible for many other calamities. Acts of God are excluded by the usual bill of lading and, to the extent not specifically assumed, by insurance policies. A flood, an earthquake or other accident or event that is without any human intervention and that could not have been prevented by reasonable care or foresight, but is the result of natural causes. A snowstorm is an Act of God; driving in one is an act of man. Also known as Force Majeure. / Экстраординарная сила природы (такая как . Смотрите также Форс Мажор (Force Majeure), Вис Майор (Vis Major). Форс-Мажор (от Французского слова Force Majeure). Смотрите Непреодолимая Сила. Непреодолимая Сила (на Латинском языке Vis Major, на Французском языке Force Majeure), в гражданском праве – обстоятельство, освобождающее от ответственности. Под непреодолимой силой понимается чрезвычайное событие, вредные последствия которого не могло предотвратить лицо, обязанное это сделать. К таким событиям относятся стихийные бедствия (например, землетрясения, наводнения), общественные явления (например, война). Будучи непредотвратимой, непреодолимая сила обладает тем не менее относительным характером:- событие, непреодолимое в одних условиях, может стать преодолимым в других. Как правило, непреодолимая сила освобождает от имущественной ответственности, если именно непреодолимая сила – причина правонарушения и отсутствует вина обязанного лица. В некоторых случаях правонарушитель несёт имущественную ответственность даже при наличии непреодолимой силы (например, согласно Статьи 101 Воздушного Кодекса СССР). Непреодолимая сила является также основанием приостановления срока течения исковой давности.

ACT OF MAN = ДЕЙСТВИЕ ЧЕЛОВЕКА (или ЧЕЛОВЕЧЕСКИЙ ФАКТОР) – Act Of Man:- in water transportation, the deliberate sacrifice of cargo to make the vessel safe for the remaining cargo. / При перевозке по воде, нарочитое (умышленное) пожертвование грузом с целью придания судну возможности безопасно доставить оставшийся груз.

ACTS = AMERICAN COALITION FOR TRAFFIC SAFETY, INC.

ACTUAL CASH VALUE = ФАКТИЧЕСКАЯ НАЛИЧНАЯ СТОИМОСТЬ – Actual Cash Value is the sum of money required to pay for damages or lost property, computed on the basis of replacement value less its depreciation by obsolescence or general wear. / Денежная сумма, требуемая для оплаты в счёт погашения за повреждения или гибель имущества, рассчитываемая на основе стоимости замещения за вычетом суммы обесценения или физического износа данного имущества вследствие морального (устаревания) или общего износа (снашивания).

ACTUAL FINAL CONSUMPTION = ФАКТИЧЕСКОЕ КОНЕЧНОЕ ПОТРЕБЛЕНИЕ (или АКТУАЛЬНОЕ КОНЕЧНОЕ ПОТРЕБЛЕНИЕ) – Actual Final Consumption is the value of goods consumed by a sector but not necessarily purchased by that sector. See also Final Consumption Expenditure, and Intermediate Consumption. / Стоимость товаров, потребляемых сектором, но необязательно закупленных данным сектором. Смотрите также (Final Consumption Expenditure), и (Intermediate Consumption).

ACTUAL PEAK LOAD REDUCTIONS = ФАКТИЧЕСКИЕ СНИЖЕНИЯ ПИКОВОЙ НАГРУЗКИ (или АКТУАЛЬНЫЕ СНИЖЕНИЯ ПИКОВОЙ НАГРУЗКИ) – Actual Peak Load Reductions:- the actual reduction in annual peak load (measured in kilowatts) achieved by consumers that participate in a utility Demand-Side Management (DSM) program. It reflects the real changes in the demand for electricity resulting from a utility DSM program that is in effect at the same time the utility experiences its annual peak load, as opposed to the installed peak load reduction capability, i.e. Potential Peak Load Reduction. It should account for the regular cycling of energy efficient units during the period of annual peak load.

ACTUALS = АКТУАЛЬНОЕ СЫРЬЁ (или ДЕЙСТВИТЕЛЬНОЕ СЫРЬЁ, или РЕАЛЬНОЕ СЫРЬЁ, или ФАКТИЧЕСКОЕ СЫРЬЁ) – Actuals are the physical commodity that underlies a futures contract or is traded in the physical market. This is the homogeneous commodity that is the basis for trade, either through the physical market or a derivative contract such as oil, corn or gold. Actuals are traded in either the physical market or the futures market. In the physical market, two parties enter into a private agreement to exchange the commodity for cash or another commodity, and delivery almost always occurs. In the futures market, two parties enter into an exchange-traded contract in which one party agrees to deliver a set quantity and quality of the underlying commodity while the other party agrees to purchase the commodity. In this case, delivery is not certain and parties can sell their positions before delivery. Actuals:- the physical commodities that are being traded. Actuals:- the physical or cash commodity bought and sold in the spot market, as distinguished from a futures contract. See also Cash, Cash Commodity, Spot Commodity. / Актуальное Сырьё – физическое или наличное сырьё, покупаемое и продаваемое на рынке товаров и сырья с безотлагательной поставкой, и отличающееся от предполагаемого по фьючерсным контрактам сырья. Смотрите также Наличность (Cash), Кассовое или Наличное Сырьё (Cash Commodity), Наличное Сырьё Для Безотлагательной Поставки (Spot Commodity). Реальное сырьё – любая имеющаяся в наличии товарно-сырьевая продукция, например золото, соевые бобы или свиные туши. Результатом торговых сделок с реальным сырьём является поставка товарно-сырьевой продукции покупателю по истечении срока контракта. Противоположностью этому являются торговые операции с индексными опционами на товарно-сырьевую продукцию, когда по истечении срока контракта реальная товарно-сырьевая продукция не поставляется, а проводится компенсация наличными. Однако и в торговых операциях с реальным сырьём большая часть фьючерсных и опционных контрактов закрывается до истечения срока контракта, поэтому в результате поставка не производится.

ACTUAL SETTLEMENT = ФАКТИЧЕСКИЙ РАСЧЁТ (или АКТУАЛЬНЫЙ РАСЧЁТ) – Actual Settlement is a settlement that occurs when the seller has received the proceeds and the buyer has received the securities. See also Contractual Settlement in which a trade settles regardless of whether these events occur. / Расчёт, который возникает в тех случаях, когда продавец получил вырученные суммы, а покупатель получил ценные бумаги. Смотрите также Контрактный Расчёт или Расчёт По Договору (Contractual Settlement), при котором расчёт по купле-продаже осуществляется независимо от того, что свершились данные события или нет.

ACTUAL TOTAL LOSS = ДЕЙСТВИТЕЛЬНОЕ ПОЛНОЕ ИСТРЕБЛЕНИЕ (или ДЕЙСТВИТЕЛЬНАЯ ТОТАЛЬНАЯ ГИБЕЛЬ) – Actual Total Loss occurs when:- (i) the insured property is completely destroyed; or (ii) the insured or assured is irretrievably deprived of the insured property; or (iii) cargo changes in character so that it is no longer the thing that was insured, e.g., cement becomes concrete; or (iv) a ship is posted missing at Lloyd's, in which case both the ship and its cargo are deemed to be an actual total loss. There is an Actual Total Loss (a) where the subject-matter of insurance is completely destroyed; (b) where it ceases to be a thing of the kind insured; or (c) where the insured is irretrievably deprived of it. This term derives from section 57 of the Marine Insurance Act 1906 (MIA) and refers to situations in marine insurance where:- (a) the subject matter of the insurance is destroyed; (b) the subject matter of the insurance is so damaged as to be no longer be capable of still being described as the thing insured; or (c) the insured is deprived of

the subject matter of the insurance forever. Section 58 of the MIA adds that where there is no news of a missing ship then after a reasonable period an actual loss may be presumed.

ACTUAL VOYAGE NUMBER = ДЕЙСТВИТЕЛЬНЫЙ НОМЕР РЕЙСА – Actual Voyage Number is a code for identification purposes of the voyage and vessel which actually transports the container/cargo. / Код, используемый с целью идентификации рейса и судна, которое действительно перевозит контейнер/груз.

ACTUARY = АКТУАРИЙ – Actuary is an individual member of one of the Full Member associations of the International Actuarial Association (IAA; headquartered in Ottawa, Canada) who, according to the applicable rules of professional conduct of the Member Association of which the actuary is a member, is qualified to practice under International Financial Reporting Standards (IFRS) in the applicable jurisdiction. / Отдельный участник одной из ассоциаций, обладающих полноправным членством в Международной Актуарной Ассоциации (МАА; штабквартира расположена в Оттаве, Канада), который . Актуарий – это профессионал в области подсчёта финансовых результатов непредвиденных событий. Профессия актуария требует чёткого понимания стохастической природы страхования, рисков, свойственных активам и использования статистических моделей. Эти навыки, как правило, используются в определении премий и технического обеспечения страховых продуктов, используя комбинацию дисконтных денежных потоков и вероятность. Актуарий – лицо, профессионально обученное математическим аспектам страхования, таким, как расчёт премий, обязательств по полису и других величин. Актуарий выполняет следующие функции:- (i) оценка финансовых результатов и непредвиденных событий относительно стохастической природы страховых процессов; (ii) оценка потенциального риска, свойственного активам и пассивам, используя статистические и стохастические модели; и (iii) определение премий и технического обеспечения страховых продуктов, используя дисконтные денежные потоки и вероятность. Актуарий – математик, работающий в страховой компании над расчётами страховых премий, резервов, дивидендов, ставок страхования, пенсий, рентных выплат с учётом факторов риска на основе таблиц, отражающих практический опыт. Эти таблицы обобщают как историю претензий к данной компании, так и сведения обо всей страховой индустрии и общие статистические показатели.

ACTUATOR = ПРИВОД – Actuator is a device used to convert fluid energy into mechanical motion. See also Gear. / Под Приводом понимается устройство, используемое для преобразования энергии жидкости в механическое движение. Привод, энергосиловое устройство, приводящее в движение машину или механизм. Привод состоит обычно из источника энергии, передаточного механизма и аппаратуры управления. Источником энергии служит двигатель (тепловой, электрический, пневматический, гидравлический и другой) или устройство, отдающее заранее накопленную механическую энергию (пружинный, инерционный, гиревой механизм и другое). В некоторых случаях привод осуществляется за счёт мускульной силы (например, в ручных лебёдках, в некоторых счётных, бытовых и других механизмах и машинах – арифмометрах, швейных машинах, велосипедах). По характеру распределения энергии различают групповой, индивидуальный и многодвигательный привод. В групповом приводе движение от одного двигателя передаётся группе рабочих машин или механизмов через одну или несколько трансмиссий. Вследствие технического несовершенства групповой привод почти полностью вытеснен индивидуальным приводом, в котором каждая рабочая машина имеет собственный двигатель с передачей. Такой привод позволяет работать при наиболее выгодной частоте вращения, производить быстрый пуск машины и торможение, осуществлять Реверсирование. В многодвигательном приводе отдельные рабочие органы машины приводятся в движение самостоятельным двигателем через свою систему передач. Такой привод позволяет получать компактную конструкцию машины, применять автоматическое управление; он используется в сложных металлорежущих станках, прокатных станах, подъёмно-транспортных машинах и другом. По назначению приводы машин разделяют на стационарный привод, то есть установленный неподвижно на раме или фундаменте; передвижной привод, используемый на движущихся рабочих машинах; транспортный привод, применяемый для различных транспортных средств. В качестве стационарного привода наиболее распространён электропривод, в котором источником механической энергии является электродвигатель; на передвижных рабочих и транспортных машинах используются главным образом тепловые двигатели с непосредственной механической или электрической передачей. В производстве применяются также гидропривод машин и пневматический привод, в котором энергия вырабатываемого компрессором сжатого воздуха преобразуется в механическую энергию пневмодвигателями. Развитие различных систем приводов связано с созданием и совершенствованием двигателей. Уже первые паровые машины (Шотландского изобретателя, инженера-механика и химика Дьжеймза Вота (или Уатта; James Watt; 1736–1819), Русского изобретателя Ивана Ивановича Ползунова (1728–1766) и других) потребовали применения передач и механизмов управления, которые в комплексе с паровым двигателем позволили получить экономичный, постоянно действующий источник механической энергии, не зависящий от природных условий. В процессе дальнейшего развития приводов были созданы паровые и гидравлические турбины и двигатели внутреннего сгорания. С конца XIX – начала XX веков эти двигатели, объединённые с системами механических передач, стали основным типом приводов транспортных и рабочих машин – автомобилей, самолётов, тракторов, экскаваторов и других. В начале XX века в приводах машин производственного назначения широкое применение получили электрические двигатели (сначала постоянного тока, а затем трёхфазные асинхронные двигатели, имеющие высокий кпд, надёжные в эксплуатации, экономичные). Переход к обслуживанию машин (особенно станков, кузнечно-прессового и другого оборудования) индивидуальным и многодвигательным приводом дал возможность располагать рабочие машины в необходимой последовательности и подготовить условия для развития в промышленности массового производства. Объединение электропривода с машиной-орудием позволило создать станки-автоматы, а затем автоматические системы машин (смотрите Автоматическая Линия) и перейти к управлению производством с помощью средств вычислительной техники. Электропривод получил также широкое применение в коммунальном и бытовом обслуживании (швейные, стиральные, кухонные машины, электробритвы и так далее). В приводах транспортных машин ведущая роль сохраняется за двигателями внутреннего сгорания (в автомобилях, тепловозах, теплоходах), газовыми турбинами (в самолётах, газотурбовозах), ядерными силовыми установками (на подводных лодках, ледоколах, военных кораблях). В начале 1970-х около 80% суммарной мощности всех существующих двигателей приходилось на долю транспортных. Для обеспечения сложных по режиму условий работы используются комбинированные приводы, например, паровые турбины устанавливаются совместно с тепловыми двигателями или газовыми турбинами, гидропривод комбинируется с электроприводом и так далее (гидроэлектропривод, газотурбогидропривод и другие). Мощность привода определяется возможностями применённого в нём двигателя. Диапазон мощностей приводов современных машин очень широк:- от десятков МегаВатт (МВт) (приводы гребных винтов, мощных насосов, вентиляторов аэрогидродинамических труб) до долей Вт (микропривод электрических часов). Использование передаточных механизмов в приводах машин обусловлено рядом конструктивно-эксплуатационных факторов:- по условиям компоновки, габаритов, техники безопасности двигатель не всегда можно непосредственно соединить с исполнительным механизмом; требуемые скорости машины обычно не совпадают с оптимальной частотой вращения двигателя; в большинстве технологических и транспортных машин необходимо обеспечить регулирование скоростей и возможность работы с большими моментами при малых скоростях (регулирование же скорости двигателя не всегда возможно и экономично); двигатели предназначены главным образом для равномерного вращательного

движения, а рабочие органы машин осуществляют часто поступательное, винтовое и другие виды движений, а также движение с заданным законом изменения скоростей и так далее. В приводах машин Передачи выполняют с постоянным или регулируемым Передаточным Отношением. Наиболее часто в приводах используются:- механизмы, сохраняющие постоянное передаточное отношение, – редукторы и мультипликаторы (соответственно понижающие и повышающие частоту вращения); коробки передач (скоростей), позволяющие ступенчато изменять частоту вращения; вариаторы, обеспечивающие бесступенчатое регулирование числа оборотов и оптимальный скоростной режим; различные открытые передачи (ремённые, цепные, зубчатые и другие). Привод механизмов дистанционного управления и контроля (в автомобилях, тракторах, мотоциклах) осуществляется с помощью гибких валов. Кроме механических передач, в приводах машин используются электрические, гидравлические и другие передачи. Применяется также так называемый Встроенный Привод, целиком смонтированный в рабочем органе машины (электробарабаны ленточных конвейеров и грузоподъёмных машин, приводные ролики роликовых конвейеров, мотор-колёса мощных автомобилей). Аппаратура управления приводами служит для пуска, остановки, изменения направления вращения, регулирования скорости, торможения, защиты двигателей и механизмов машин от перегрузок и повреждений, блокировки отдельных механизмов и так далее. Системы управления приводов могут быть ручными, полуавтоматическими и автоматическими. При ручной системе все операции управления осуществляются аппаратами, непосредственно воздействующими на силовую цепь двигателя (рубильники, контроллеры, реостаты и другие) или на систему его питания, зажигания и так далее. При полуавтоматическом управлении непосредственное воздействие оказывается на специальные командоаппараты (кнопки, педали, командо-контроллеры, путевые и конечные выключатели и другие). Контакты командоаппаратов включены в маломощные вспомогательные цепи реле и контакторов, которые, в свою очередь, переключают силовые цепи двигателей без непосредственного участия человека. При автоматическом управлении начальный импульс для включения привода посылается механическим или электрическим реле или иными аппаратами (датчиками). В дальнейшем автоматическая работа системы поддерживается и контролируется электрическими, механическими, гидравлическими или другими аппаратами (регуляторами, распределителями, фото- и термоэлементами, логическими, программными, телевизионными устройствами и так далее). Автоматизация управления приводом позволяет осуществлять регулирование скорости при заданной программе в функции пути, времени или нагрузки, регулирование ускорения и замедления, перераспределение нагрузки между приводами, точную остановку или реверс всех или отдельных приводов, защиту от перегрузки, разноса, неправильного начального положения и тому подобного. Применение автоматизации (даже частичной) увеличивает надёжность и точность работы привода, повышает производительность машин в целом, позволяет управлять приводом на расстоянии. В ряде случаев автоматизация привода диктуется условиями безопасности труда (нежелательностью пребывания людей в токсичной или пыльной среде, при работе с радиоактивными материалами и тому подобным). Автоматизация управления приводом даёт возможность перейти от индивидуального управления рабочими машинами к автоматическому управлению производственными агрегатами участками, цехами (смотрите Автоматизация Производства).

ACU = ASIAN CURRENCY UNIT

ACULEATE = АКУЛЭАТЭ (или ШИПОВИДНОЕ) – Aculeate:- armed with prickles. / шипами (или колючками).

ACUMINATE = ОСТРОКОНЕЧНОЕ – Acuminate:- with a long pointed structure formed by abrupt narrowing at an apex. Acuminate:- gradually tapering to a sharp, prolonged point, e.g., Rice leaves. / апекс (или верхушка).

ACUTE = ОСТРОЕ (или ЗАОСТРЁННОЕ) – Acute:- ending in a sharp point, forming an angle of less than 90 degrees. / .

ACUTE RODENTICIDE = ОСТРЫЙ РОДЕНТИЦИД (или РОДЕНТИЦИД ОСТРОГО ДЕЙСТВИЯ) – Acute Rodenticide is a poison for rodents that acts swiftly and causes death shortly after ingestion. An example is zinc phosphide. / Острый Родентицид или Родентицид Острого Действия – яд для грызунов, который действует стремительно и приводит к смерти после проглатывания. Родентициды, от Латинских слов Rodentia, означающее Грызуны, и Caedo, означающее Убиваю, одна из групп зооцидов. Родентициды – это средства, ограничивающие размножение и сокращающие численность мышеподобных грызунов. Проводимые истребительные мероприятия подразделяются на четыре способа:- (i) химический, построен на употреблении отравленных приманок и газообразных препаратов; (ii) физический, базируется на использовании механических орудий отлова и уничтожения; (iii) биологический, задействует природных врагов крыс и мышей – кошек, собак, птиц; и (iv) бактериологический, сформирован на применении различных вирусов и микробов. На сегодняшний день химический способ борьбы с использованием современных родентицидов, является самым действенным способом. Родентициды уничтожают вредителей при проникновении в желудочно-кишечный тракт или при вдыхании в лёгкие. Отравляющие вещества добавляются в состав сухих и влажных приманок – тесто в фильтр-пакетах, парафинированные брикеты, зерновые смеси, гранулы, порошки, пасты, растворы. При одноразовом поедании таких приманок грызун получает смертельную дозу яда. Отравление наступает не молниеносно, а на протяжении нескольких суток или недели. Животные не связывают симптомы отравления с едой и не передают информацию сородичам о том, что она отравлена. Наиболее безопасны и эффективны корма обработанные антикоагулянтами второго поколения, активным веществом в которых является бродифакум и бромадиалон. Эти вещества понижают свертывание крови и деформируют стенки кровеносных сосудов паразитов. При работе с родентицидами необходимо строго соблюдать правила безопасности и чётко следовать инструкциям по их применению, так как многие средства являются высокотоксичными для человека и домашних животных.

ACUTIFOLIA = АКУТИФОЛИА (или ОСТРОЛИСТНОЕ) – Acutifolia:- with pointed leaves. / Акутифолиа:- с острыми или заострёнными листьями.

ACV = ACTUAL CASH VALUE

ACVAFS = AMERICAN COUNCIL OF VOLUNTARY AGENCIES FOR FOREIGN SERVICE

AD = ADDITIONAL DECLARATION

AD = AIR DRY

AD = ANDORRA

A–D = ADVANCE–DECLINE LINE

ADA = AMERICANS WITH DISABILITIES ACT (OF 1990)

ADA = AVIATION DATA AND ANALYSIS SYSTEM

ADAB = AGRICULTURAL DEVELOPMENT AGENCIES IN BANGLADESH

A/DACG = ARRIVAL/DEPARTURE AIRFIELD CONTROL GROUP

ADAP = AIRPORT DEVELOPMENT AID PROGRAM

ADAPT = АДАПТИРОВАТЬСЯ (или ПРИСПОСАБЛИВАТЬСЯ) – Adapt:- to fit or adjust to a particular environment or a set of specific climatic conditions through a change in the plant's growth and development.

ADAPTATION = АДАПТАЦИЯ – Adaptation is the process of becoming suited to new or different environmental conditions or for particular functions. / Под Адаптацией, от позднелатинского слова Adaptatio, означающее Приспособление, понимается:- (1) в биологии – совокупность морфофизиологических, поведенческих, популяционных и других особенностей биологического вида, обеспечивающая возможность специфического образа жизни особей в определённых условиях внешней среды. Адаптацией называют и сам процесс выработки приспособлений. (2) В физиологии и медицине обозначает также процесс привыкания. Под Адаптацией, понимается процесс приспособления системы к условиям внешней и внутренней среды. А иногда называют и результат такого приспособления к некоторому фактору среды. Адаптация:- приспособление экономической системы и её отдельных субъектов, работников к изменяющимся условиям внешней среды, производства, труда, обмена, жизни. Например, при переходе от централизованной экономики к рыночной необходима адаптация предприятий и их работников к рыночной среде и к рыночным отношениям.

ADAPTIBILITY = АДАПТИВНОСТЬ (или ПРИСПОСОБЛЯЕМОСТЬ) – Adaptability is the ability to adapt to different environments by modifications in physiological responses.

ADAPTIVENESS = АДАПТИВНОСТЬ (или ПРИСПОСОБЛЯЕМОСТЬ) – Adaptiveness is a degree of being adapted to a certain environment or environments.

ADAPTIVE RADIATION = АДАПТИВНАЯ РАДИАЦИЯ – Adaptive Radiation is the diversification of a species under different, local environmental pressures to which it becomes adapted, eventually leading to the emergence of new species. / виды (species).

ADAPTIVE RESEARCH = АДАПТИВНОЕ ИССЛЕДОВАНИЕ – Adaptive Research is a research conducted to validate, modify, or calibrate a new technology to specific soil, climate, socioeconomic, or environmental characteristics of a given area.

ADAS = AWOS DATA ACQUISITION SYSTEM

ADAXIAL = АДАКСИАЛЬНОЕ – Adaxial:- nearest to or facing towards the main axis, e.g., upper surface of a leaf. Adaxial:- upper. The side toward the axis. Ventral. / Адаксиальное – вблизи к или расположенное лицом к основной оси, например, верхняя поверхность листа. Вентральное (или брюшное). Приставка Ad в переводе с Латинского языка означает На или Около или При.

ADB = ADJUSTED DEBIT BALANCE

ADB = ASIAN DEVELOPMENT BANK

ADC = AGRICULTURAL DEVELOPMENT COUNCIL

ADCOM = ADDRESSE COMMISSION

ADDED VALUE = ДОБАВЛЕННАЯ СТОИМОСТЬ – Added Value is the value attributed to products, and services as the result of a particular process, e.g., production process, storage, transport. / Добавленная Стоимость – стоимость, прибавляемая к товарам и услугам, возникшая в результате какого-то конкретного процесса, например, производственного процесса, хранения, транспортировки.

ADDENDUM = ДОПОЛНЕНИЕ (или АДДЭНДУМ) – Addendum is an additional clause or terms in a contract. Addendum is a supplement or appendix attached to a document (bill of exchange, deed, registered share) which can be used for endorsements. / Под Аддэндумом, от Латинского слова Addere, означающее Дополнять или Прибавлять, или Дополнением понимаются дополнительная статья или порядки в контракте (договоре). Приложение или аппендикс, прикреплённые или приложенные к документу (векселю, акту, именной акции), которые могут быть использованы для индоссаментов. Аддэндум:- (1) дополнение к договору, которое конкретизирует или изменяет часть условий. (2) В мореплавании дополнение к чартеру, в которое вносятся новые условия или поправки. (3) Письменное дополнение к уже заключенному договору страхования, где содержатся изменения ранее оговорённых условий. (4) Письменное дополнение к диспаше, составленной диспашером. Составляется при наличии ошибки в расчётах по общей аварии; аддэндум является составной частью диспаши. Аддэндум или Дополнение:- дополнение к договору, в частности, чартера или фрахта, изменяющее или восполняющее те или иные условия договора.

ADDITIONAL DECLARATION = ДОПОЛНИТЕЛЬНАЯ ДЕКЛАРАЦИЯ – Additional Declaration is a statement that is required by an importing country to be entered on an export certificate and which provides specific additional information on a consignment in relation to regulated pests.

ADDITIONAL INSURED = ДОПОЛНИТЕЛЬНЫЙ СТРАХОВАТЕЛЬ – Additional Insured is a person or firm or corporation other than the named insured on a policy or mortgage company named in a mortgagee clause, who is protected against loss by the terms of the policy or mortgage company named in the mortgage clause.

ADDITIONAL PAID–IN CAPITAL = ДОПОЛНИТЕЛЬНЫЙ ОПЛАЧИВАЕМЫЙ КАПИТАЛ – Additional Paid-In Capital:- for example, common stock issue, par value USD0.01 per share; authorized 40 000 000 shares; and issued 23 305 000 shares = USD233 305.00. This line means that company is legally authorized to sell up to 40 million shares of common stock, but had issued only 23.305 million of these shares as of 2009-June-30. With a par value of USD.01, the total par value of the issued shares is USD233 305.00. However, firms do not sell their stock at par value. Instead, they receive a higher amount of money when their stock is sold to shareholders. This difference between the actual funds raised from stock sales and the listed par value is shown on the balance sheet as Additional Paid-in Capital. For company, additional paid-in capital is USD110 198 695.00. The total amount that company raised from its stock sales is USD110 432 000.00, the sum of par value and additional paid-in capital. Additional Paid-in Capital includes the excess of amounts paid in over par or stated value and paid-in capital from treasury stock. Additional Paid in Capital is amounts paid for stock in excess of its par value or stated value. Also, other amounts paid by stockholders and charged to equity accounts other than capital stock.

ADDITIONAL PAID–IN CAPITAL RELATING TO PROCEEDS OF SALE OF STOCK IN EXCESS OF PAR VALUE = ДОПОЛНИТЕЛЬНЫЙ ОПЛАЧИВАЕМЫЙ КАПИТАЛ, СВЯЗАННЫЙ С ПОСТУПЛЕНИЯМИ ОТ ПРОДАЖИ УСТАВНОГО КАПИТАЛА СВЕРХ НАРИЦАТЕЛЬНОЙ СТОИМОСТИ – In the United States, . Additional Paid-In Capital is a capital contributed to a corporation by investors on top of the par value of capital stock. In other words, the money that a company gets from potential investors in addition to the stated value of the stock. Also called Contributed Capital or Paid-In Capital. Paid-in Surplus is the price paid by investors per share at issue minus the par value per share, times the number of shares issued. Also known as Additional Paid-In Capital. Paid-In Capital is a section of stockholders' equity that shows:- (i) amount of stock a corporation has issued; (ii) the premiums

or discounts that have resulted from selling stock (paid-in capital in excess of par or stated value); (iii) stock received from donations; and (iv) the resale of treasury stock. Stockholders' equity consists of paid-in or contributed capital and retained earnings. Capital contributed in excess of par value is an amount paid for stock above its stated par value, as shown in the owner's equity section of a balance sheet. Additional Paid-In Capital is an excess received from stockholders over par value or stated value of the stock issued; also called Contributed Capital In Excess Of Par. For example, if 1 000 shares of USD10.00 par value common stock is issued at a price of USD12.00 per share, the additional paid-in capital is USD2 000.00 (1 000 shares x USD2.00). Additional paid-in capital is shown in the stockholders' equity section of the balance sheet. Paid in Surplus is capital that is brought in by investors in return for stock. It is not capital that is generated as a result of the operation of the company. Also referred to as Contributed Capital or Paid in Capital. Paid-in Surplus is the price paid by investors per share at issue minus the par value per share, times the number of shares issued. Also known as Additional Paid-in Capital. Paid-in Surplus is the amount received by a corporation for its stock in excess of the par or stated value. Paid-in Surplus represents the difference on the sale of a new issue of stocks to stockholders between the actual price obtained and the nominal stock price. Additional (Paid-In) Capital Contributions of corporate stockholders credited to accounts other than capital stock; sources:- an excess over par or stated value received from the sale or exchange of capital stock, an excess of par or stated value of capital stock reacquired over the amount paid therefore, or an excess from recapitalization; often displayed on the balance sheet as a separate item or in combination with par or stated value and designated paid-in capital, known also as paid-in surplus. Also known as Share Premium Account in the United Kingdom. Paid-in Capital is a capital contributed by the stockholders (shareholders) as distinct from the capital reserves generated by the firm as profits (earnings). Paid-in Surplus is the US term for Share Premium. / как самостоятельная строка баланса (item).

ADDITIONAL PREMIUM = ДОПОЛНИТЕЛЬНАЯ ПРЕМИЯ – Additional Premium is a premium payable by the insured as a result of a change in policy cover or declaration adjustment to reflect increased exposure or sums insured.

ADDITION POLYMERIZATION = АДДИЦИОННАЯ ПОЛИМЕРИЗАЦИЯ (или АДДИТИВНАЯ ПОЛИМЕРИЗАЦИЯ) – Addition Polymerization is a reaction yielding a polymer in which the molecular formula of the repeating unit is identical with that of the monomer. The molecular weight of a polymer so formed is a simple sum of the molecular weight of the combined monomer units. Combination occurs by means of rearrangement of the chemical bonds.

ADDITIVE = ПРИСАДКА – (1) Additive is a chemical substance added to a petroleum product to impart or improve certain properties. Common petroleum product additives are:- antifoam agent, anti-wear additive, corrosion inhibitor, demulsifier, detergent, dispersant, emulsifier, extreme pressure (EP) additive, oiliness agent, oxidation inhibitor, pour point depressant, rust inhibitor, tackiness agent, viscosity index (VI) improver. Additive is a compound mixed to the base oil in order to modify its properties or performance. Additives:- substances added to other substances in order to modify their properties in a particular manner or to improve processing. Lube additives:- Antioxidants, Antiwear Agents, Corrosion Inhibitors, Detergents, Dispersants, Extreme Pressure Additives, Foam Control Agents, Pour Point Depressants, Viscosity Index Improvers, and others. Key manufacturers:- Lubrizol Corporation, Afton Chemical Corporation, Infineum International Limited, Chevron Oronite Company LLC, Croda International PLC, BASF SE, Chemtura Corporation, Kings Industries, Inc., BRB International BV, Vanderbilt Chemicals, LLC, plus CSW Industrials Inc., Abitec Corporation, Wynn's Belgium BVBA, Adeka Corporation, Archoil, Inc., Multisol Ltd., PMC Biogenix, Inc., Nyco SA, Dog Deutsche Oelfabrik Gesellschaft Fr Chemische Erzeugnisse Mbh & Co. KG, Akzo Nobel NV, and Tianhe Chemicals Chemicals Group Ltd, Additiv-Chemie Luers GmbH, Dow Chemical Company, International Petroleum Products And Additives Company LLC (IPAC), Miracema-Nuodex Industria Quimica Ltda., Produits Chimiques Auxiliaires et de Synthese SA (PCAS), Sanyo Chemical Industries, Ltd., Evonik Industries AG, Lanxess AG, Total Additives and Special Fuels, Jinzhou Kangtai Lubricant Additives Co., Ltd., Wuxi South Petroleum Additives Co., Ltd., Jinzhou Runda Chemical Co., Ltd., and MidContinental Chemical Company, Inc.. Additive is a substance added to an oil product in order to improve its properties. Additives:- In summary, an engine oil has to perform ten basic functions. To carry out these functions, the base oil must be refined to a very high level and then compounded with specially selected chemical additives. Skillful selection of additives, blended together with Petro-Canada's HT Severely Hydrotreated base oils results in engine oils of outstanding performance. Detergents:- These chemicals, usually metallo-organic based, are designed to control deposits and keep engine components clean. They are able to clean up existing deposits in the engine, as well as disperse insoluble matter into the oil. Detergents control contamination resulting from high temperature operation. Over-based detergents also neutralize acidic contaminants from fuel sulfur, engine exhaust, oil oxidation and/or nitration. Dispersants:- These are usually ashless organic chemicals, which control contamination from low temperature operation. Both detergents and dispersants attach themselves to contaminant particles, such as soot or varnish and hold them in suspension, preventing sludge and deposit formation. The suspended particles, together with their additive carrier, are so small that they can pass harmlessly between moving surfaces and through oil filters. This contamination is removed from the engine when the oil is changed. Oxidation Inhibitors:- These agents reduce oxygen attack on the lubricant base oil to a minimum. Petro-Canada's HT Severely Hydrotreated base oils have a superior response to these additives compared to Solvent Refined base oils. This results in an engine oil with high resistance to oil thickening and the build-up of corrosive acids, hence maintaining good oil flow properties and resistance to bearing corrosion. Corrosion And Rust Inhibitors:- Acids are produced by the combustion process and when an engine oil degrades with use. Unless rendered harmless by the engine oil, these acids can cause rapid deterioration of engine components. Corrosion inhibitors protect non-ferrous metals by coating them and forming a barrier between the parts and their environment. Rust Inhibitors protect iron/steel surfaces from oxygen attack, by forming a similar protective screen as mentioned above. Parts such as hydraulic lifters, push rods, etc are prone to this type of corrosion. Anti-Wear Agents:- These agents prevent wear due to seizure or scuffing of rubbing surfaces. Compounds such as zinc dialkyl-dithiophosphate (ZDDP) break down at microscopic hot spots and form a chemical film which eliminates metal-to-metal contact before it grows. Thus scuffing, galling and seizure are prevented. Foam Depressants:- Detergent and dispersant additives can facilitate aeration of an oil, which leads to foaming. This can reduce the lubricating ability of an oil and even interfere with oil pumping. Incorporation of a foam depressant controls this tendency by reducing surface tension to speed up the collapse of foam. Viscosity Index (VI) Improvers:- VI improvers are long chain polymers that can coil and uncoil in response to changes in temperature. They improve an oil's ability to resist changes in viscosity with temperature (i.e. improve its viscosity index). At low temperatures they coil up into tight balls which do not significantly increase the oil's resistance to flow (viscosity). However, at high temperatures, they uncoil into long chains which interweave and increase the oil's viscosity. VI improvers must resist breakdown due to shear and high temperatures to ensure a long lasting effect. Pour Point Depressants:- Base oils in API Groups I, II and III contain hydrocarbons that tend to crystallize into waxy materials at low temperatures. Incorporation of a chemical which reduces the size/rate of wax crystal formation can give an oil better low temperature fluidity, hence a lower pour point. Petro-Canada's HT Severely Hydrotreated base oils have a minimum of waxy materials, so they have superior response to these additives compared to Solvent Refined base oils. Friction Modifiers:- Some oils contain friction-modifying chemicals, which can reduce the fuel consumption of an engine. These chemicals form a chemical or physically bonded film that reduces the friction between the lubricated engine parts. Additives:- specialty chemicals incorporated into fuels and lubricants that enhance the performance of the finished product. / Xxxxx Корпорэйшэн (Lubrizol Corporation), Xxxxx Корпорэйшэн (Afton Chemical Corporation), Xxxxx Лимитид (Infineum International Limited), Xxxxx Кампэни Эл.Эл.Си. (MidContinental Chemical Company, Inc.). , противоизносная присадка, , присадка для сверхвысокого давления, . Под Присадками понимаются вещества, добавляемые (обычно в количествах 0.05–0.1%) к топливам, минеральным и синтетическим маслам для улучшения их эксплуатационных свойств. К присадкам относятся, например, антидетонаторы, антиокислители, ингибиторы коррозии и другие. Присадки К Смазочным Материалам – вещества, добавляемые к смазочным материалам для улучшения или сохранения на длительный срок их эксплуатационных свойств. В зависимости от выполняемых функций присадки к смазочным материалам делятся на загущающие, повышающие вязкость и улучшающие вязкостно-температурные свойства смазочных материалов; улучшающие смазывающие свойства – снижающие износ трущихся поверхностей (противоизносные присадки), предупреждающие их заедание и задир (противозадирные), уменьшающие силу трения (антифрикционные) и другие; повышающие стойкость против окисления (антиокислительные); защищающие металл от химической (противокоррозионные) и электрохимической (защитные) коррозии; предупреждающие образование на металле углеродистых отложений (моющие и диспергирующие присадки) и другие. Присадки, вещества, добавляемые в малых количествах к топливам и техническим маслам для повышения их эксплуатационных характеристик. Содержание присадок в жидких топливах и маслах обычно не превышает сотых или десятых долей % по массе (лишь некоторые присадки применяются в концентрациях до 1–2% и более). Присадки к топливам улучшают процессы сгорания, способствуют сохранению начальных свойств топлива при хранении, транспортировке и использовании, снижают вредное воздействие топлива на механизмы и аппаратуру, облегчают применение топлива при низких температурах и так далее. Наибольшее применение получили антидетонаторы (например, тетраэтилсвинец) – вещества, снижающие детонацию моторных топлив; широко используются также антиокислители (параоксидифениламин, альфа-нафтол и другие), химические ингибиторы, модификаторы, дезактиваторы металла, стабилизаторы, противонагарные и другие присадки. Присадки к нефтяным маслам и синтетическим маслам по назначению разделяются на следующие группы:- (i) вязкостные, повышающие вязкость и улучшающие вязкостно-температурные свойства; (ii) депрессорные, понижающие температуру застывания масел; (iii) антиокислительные, предохраняющие масла от окисления кислородом воздуха; (iv) противокоррозионные, снижающие разрушение металла под действием агрессивной среды; (v) противоизносные и противозадирные, улучшающие смазочные свойства масел; (vi) противопенные; (vii) моющие, препятствующие образованию на деталях механизмов твёрдых отложений; (viii) многофункциональные, повышающие сразу несколько эксплуатационных характеристик масла. В качестве присадок к маслам используются углеводородные и элементоорганические соединения разных типов и классов, в том числе низкомолекулярные поверхностно-активные вещества и полимеры. Смотрите также Присадки в металлургии. Присадки К Топливу – вещества, добавляемые к жидким топливам (бензинам, авиационному керосину, дизельному и котельному топливу) для улучшения их эксплуатационных свойств. Известны и широко используются следующие типы присадок к топливу:- антидетонаторы, антиокислители, моющие, противообледенительные, противоизносные, повышающие цетановое число, ингибиторы коррозии, деактиваторы металлов, противодымные и другие. В зависимости от качества базового топлива, функциональных свойств и эффективности присадок к топливу сочетания их в товарном продукте различны, при этом содержание присадок к топливу составляет обычно сотые – десятые доли % по массе (некоторые присадки – до 2% и более). Присадки, улучшающие качество базового масла, можно разделить на следующие группы:- (i) повышающие вязкость и индекс вязкости – модификаторы вязкости; (ii) понижающие температуру текучести – депрессоры; (iii) ингибиторы коррозии и ржавления; (iv) детергенты и диспергенты; (v) эмульгаторы; (vi) противопенные присадки; (vii) ингибиторы окисления масляной основы; (viii) дезактиваторы металлов; (ix) противоизносные (AW) и противозадирные (EP) присадки; и (x) модификаторы трения (MT (FM)). В зависимости от назначения смазочного материала в его состав могут входить только некоторые присадки из приведённого списка. Присадки К Смазочным Материалам:- входящие в состав смазочных материалов улучшающие добавки (присадки) призваны защищать трущиеся металлические поверхности (например, ингибиторы коррозии и ржавления), а также повышать качество базового масла. Присадки можно подразделить на:- (i) присадки, улучшающие свойства базового масла (например, улучшающие индекс вязкости); (ii) присадки, придающие новые свойства (например, детергенты и диспергенты); и (iii) присадки, предотвращающие потерю маслом эксплуатационных свойств при использовании (например, ингибиторы окисления). Вязкостные Присадки (Модификаторы Вязкости):- увеличивают вязкость масла и улучшают его вязкостно-температурные свойства (индекс вязкости). Добавленные к маслу, они увеличиваются в объёме при высоких температурах (набухают) и таким образом препятствуют уменьшению вязкости масла с повышением температуры. Следствием стабилизации вязкости в широком температурном интервале является рост индекса вязкости. В качестве модификаторов вязкости используются полимеры (полиалкилметакрилаты, полиизобутилены, полидиены, сополимеры диенстирольные, сополимеры этиленпропиленовые) с высокими молекулярными массами. Подобные присадки входят в состав всесезонных моторных, трансмиссионных и гидравлических масел. Депрессоры:- низкомолекулярные полимеры (полиметакрилаты и полиакрилаты) применяются в качестве присадок, понижающих температуру потери текучести смазочных масел (депрессоров). Введённые в масло депрессорные присадки предотвращают образование кристаллической сетки присутствующих в масле насыщенных углеводородов, что приводит к сохранению его текучести при низких температурах. Депрессоры входят в состав моторных, трансмиссионных, гидравлических и других масел, предназначенных для работы при низких температурах. Детергенты И Диспергенты:- наибольшую группу присадок, придающих маслу новые свойства, составляют детергенты и диспергенты (моющие и диспергирующие присадки). Они удерживают осадок и продукты износа элементов трения в масле в диспергированном состоянии. В результате добавления этих присадок в состав смазочного материала при его эксплуатации достигается эффект 'чистый двигатель – грязное масло'. В качестве детергентов используются сульфонаты и феноляты кальция или магния. Диспергенты являются имидопроизводными янтарной кислоты. Присадки этого типа входят в состав моторных и специальных индустриальных масел. Противопенные Присадки:- присутствие в масле детергентов и диспергентов может приводить к излишнему вспениванию масла, что негативно влияет на качество смазки. Это приводит к необходимости использования противопенных присадок, задача которых – уменьшение поверхностного натяжения между воздушными пузырьками и маслом, благодаря чему пузырьки быстро лопаются. В качестве противопенных присадок используют, в основном, силиконовые полимеры. Противопенные присадки – это единственный тип присадок, присутствующих в масле в

диспергированном состоянии. Антиоксиданты:- главной функцией ингибиторов окисления (антиокислительных присадок, антиоксидантов) является ограничение нежелательного процесса окисления работающего масла под воздействием атмосферного кислорода. Окислению способствуют высокие температуры и возможное каталитическое действие металлической поверхности трения. Действие антиокислительных присадок основано на разложении сильных окислителей (гидроперекисей и перекисных радикалов) на неактивные соединения в ходе реакции обрыва кинетической цепи. По механизму действия ингибиторы окисления можно разделить на три группы:- (i) присадки, разрывающие кинетическую цепь процессов, происходящих при Окислении; (ii) присадки, разлагающие образовавшиеся в результате превращений пероксиды; и (iii) деактиваторы металлов. К первой группе относятся соединения, являющиеся производными ароматических аминов и фенолов, ко второй – сульфиды, фосфорсодержащие соединения (например, диалкил дитиофосфат цинка) и дитиокарбаматы. Антиоксиданты это наиболее дорогостоящая группа присадок, их присутствие влияет на продление времени эксплуатации смазочного материала, поэтому они входят в состав всех масел повышенного качества. Дезактиваторы Металлов:- окисление углеводородов катализируют ионы металлов (особенно активны Cu и Co), механизм окисления состоит в разложении гидроперекисей на активные свободные радикалы (перекисные радикалы и углеводородные алкокси-радикалы), что ускоряет разветвление цепи окислительных превращений и расход ингибиторов окисления. Дезактиваторы металлов (некоторые соединения серы, диамины) – это присадки, обладающие способностью образовывать комплексные связи с металлами, и таким образом нейтрализовать их каталитические свойства. Ингибиторы Коррозии И Ржавления:- ингибиторы коррозии и ржавления (антикоррозионные и противоржавейные присадки) защищают металлические поверхности, находящиеся в контакте с металлом, от коррозионного действия кислых продуктов – загрязнений смазочного масла. Предотвращение коррозионных изменений достигается путём образования на их поверхности защитных плёнок (вследствие адсорбции и хемосорбции). Ингибиторы коррозии – это соединения, в структуре которых присутствует полярная функциональная группа и длинная углеродная цепь (органические кислоты, сложные эфиры, амины). В настоящее время ингибиторы коррозии и ржавления входят в состав всех масел повышенного качества. Маслянистые Присадки:- маслянистые присадки применяются для минимизации износа трущихся поверхностей и предотвращения их заедания. Это достигается путём введения в базовое масло веществ, обладающих, как правило, способностью к физической адсорбции или хемосорбции на поверхностях трения во время работы смазочного материала. В дальнейшем эти соединения могут вступать в реакции с металлической поверхностью трения или создавать слой защитной плёнки, которая образуется в результате реакции на поверхностях трения. В качестве маслянистых присадок используются соединения, содержащие атомы серы, хлора, фосфора или кислорода, причём, ввиду вредного влияния хлора на природную среду, эта группа присадок постепенно утрачивает промышленное значение. К соединениям серы, находящим практическое применение в качестве маслянистых присадок, относятся индивидуальные сернистые соединения (сульфиды и дисульфиды, ксантогенаты, тиокарбонаты и дитиокарбаматы), сульфитированные смеси или масла, образованные путём растворения элементарной серы в горячем масле (сульфитированное рапсовое, пальмовое масла). Наиболее универсальными присадками являются серофосфорные соединения, которые в большинстве случаев являются производными тиокислот фосфора (V). По функциям маслянистые присадки обычно подразделяют на:- (i) противозадирные (EP); (ii) противоизносные (AW); и (iii) модификаторы трения (MT (FM)). Назначение противозадирных присадок – предотвращение схватывания элементов трения, которое может наступить в момент появления экстремально больших нагрузок. В качестве EP-присадок могут использоваться органические серосодержащие соединения, серо- и хлорсодержащие соединения, серо- и фосфорсодержащие соединения. Вторую группу маслянистых присадок составляют противоизносные присадки (AW). Их задача – уменьшение изнашивания поверхностей трения при умеренных нагрузках, когда пенетрация слоя смазочного материала невелика. К наиболее популярным противоизносным присадкам относятся дитиофосфаты металлов. Третью группу маслянистых присадок составляют модификаторы трения (MT (FM)). Они уменьшают трение за счёт увеличения толщины масляного слоя путём физической адсорбции на металле или действия макромолекул присадки. Эти присадки наиболее эффективны, когда их концентрация значительна при не очень больших нагрузках на узел трения. Не все из представленных типов присадок входят в состав каждого типа смазочного масла. При составлении рецептуры масла в его состав включаются только те присадки, которые усиливают нужные функции данного смазочного масла.

(2) Chemicals which are added to coatings in small amounts to alter the physical or chemical properties of the finish. For example, certain additives can reduce the drying time of alkyd (oil-based) finishes.

(3) Additive is a supplementary material combined with a base material to provide special properties. For example, pigments are used as dope additives to give color in mass dyeing.

(4) Additive:- xxxxx. / Присадки (в металлургии), материалы, вводимые в жидкий металл с целью изменения состава и свойств металла или шлака. Различают присадки:- (i) шлакообразующие (известь, плавиковый шпат, боксит и их комбинации или заменители), (ii) науглероживающие (молотый кокс, чугун, карбиды металлов), (iii) окислительные (руда, окалина, окислы металлов), (iv) легирующие (ферросплавы, лигатуры, технически чистые химические элементы). Присадки вводят в плавильный агрегат, ковш или изложницу.

ADDITIVE COLOR MIXTURE = АДДИТИВНАЯ СМЕСЬ ЦВЕТОВ (или СМЕСЬ АДДИТИВНЫХ ЦВЕТОВ, или АДДИТИВНАЯ ЦВЕТОВАЯ СМЕСЬ) – Additive Color Mixture:- superposition or other nondestructive combination of lights of different perceived colors. / Под Аддитивным, от Латинского слова Additivus, означающее Прибавляемый или Придаточный, понимается .

ADDITIVE EFFECTS OF GENES = АДДИТИВНЫЕ ЭФФЕКТЫ ГЕНОВ (или ЭФФЕКТЫ СУММИРОВАНИЯ ГЕНОВ) – Additive Effects of Genes are the effects produced by the sum of more than one pair of genes to improve desirable characters or suppress undesirable characters of a plant. / свойства (characters) . Под Аддитивным, от Латинского слова Additivus, означающее Прибавляемый или Придаточный, понимается .

ADDITIVE GENES = АДДИТИВНЫЕ ГЕНЫ – Additive Genes are the genes that have no dominance and the effect of each gene can be added to the phenotype.

ADDITIVE LEVEL = УРОВЕНЬ ПРИСАДОК (или АДДИТИВНЫЙ УРОВЕНЬ) – Additive Level:- the total percentage of all additives in an oil. Expressed in % of mass (weight) or % of volume. / Под Аддитивным, от Латинского слова Additivus, означающее Прибавляемый, .

ADDITIVE STABILITY = СТАБИЛЬНОСТЬ ПРИСАДОК (или АДДИТИВНАЯ СТАБИЛЬНОСТЬ) – Additive Stability is the ability of additives in the fluid to resist changes in their performance during storage or use. / Под Аддитивным, от Латинского слова Additivus, означающее Прибавляемый, .

ADDM = AUTOMATED DOCUMENTATION DEVELOPMENT AND MAINTENANCE

ADD–ON METHOD = МЕТОД ДОБАВКИ – Add-On Method is a method of paying interest where the interest is added onto the principal at maturity or interest payment dates. / Метод оплаты процентов, когда проценты добавлены к основному инструменту при его погашении или на дату оплаты процентов.

ADD–ONS = НАДБАВКИ – (1) Add-Ons are the additional charges above ocean freight, or just additional charges. / Дополнительные расходы сверх океанской провозной платы или океанского фрахта или просто дополнительные расходы.

(2) In insurance, Add Ons are additional coverages to a basic policy. / В страховании, дополнительные покрытия к базовому полису.

ADDRESS = АДРЕС – Address:- a method of precisely describing a physical location. The SWIFT system permits three formats:- ISO Bank Identification Code (which includes registered SWIFT addresses); name and address; or simply place (when the institution itself is implied by other parts of the message). / В целом под Адресом понимается цифро-буквенный или цифровой код, определяющий местоположение. Метод точного описания физического местоположения. Система Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) разрешает три формата:- Код Идентификации Банка по системе Международной Организации по Стандартизации (МОС) (ISO Bank Identification Code); название и адрес; или просто место (когда само учреждение подразумевается другими частями данного сообщения). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ADDRESSED VALUE PAYMENT = АДРЕСОВАННЫЙ ДЛЯ ОПЛАТЫ СТОИМОСТИ – Addressed Value Payment:- if you hold deliverable warrants but do not exercise them before or at expiry you may be entitled to a cash payment, often called an Assessed Value Payment (AVP).

ADDRESS SUPPORTING ORGANIZATION = ОРГАНИЗАЦИЯ ПОДДЕРЖКИ АДРЕСОВ – The Address Supporting Organization (ASO) advises the Internet Corporation for Assigned Names and Numbers (ICANN) Board of Directors on policy issues relating to the allocation and management of Internet Protocol (IP) addresses. The ASO selects two Directors for the ICANN Board. / Организация Поддержки Адресов (ОПА (ASO)) консультирует Правление Корпорации Интернета по Распределению Имён и Номеров (КИРИН) по вопросам политики в отношении выделения адресов Интернет Протокола (IP-адресов) и управления этими адресами. ОПА выбирает двух директоров в состав Правления КИРИН.

ADEA = AGE DISCRIMINATION IN EMPLOYMENT ACT (OF 1967)

ADENOSINE–5'–DIPHOSPHATE = АДЕНОЗИН–5'–ДИФОСФАТ – Adenosine-5'-Diphosphate (ADP), a complex sugar-phosphorus compound formed as a result of expenditure of energy and the loss of a phosphate group from the energy-rich ATP (adenosine triphosphate) compounds. / Под Аденозиндифосфатом (АДФ) понимается нуклеотид, образованный аденозином и 2 остатками фосфорной кислоты. Участвует в энергетическом обмене во всех живых организмах.

ADENOSINE TRIPHOSPHATE = АДЕНОЗИН ТРИФОСФАТ – Adenosine Triphosphate (ATP), a nucleotide consisting of adenine, ribose sugar, and three phosphate groups; the major source of usable chemical energy in metabolism. On hydrolysis, ATP loses one phosphate to become adenosine diphosphate (ADP), releasing usable energy. / Под Аденозинтрифосфатом (АТФ) понимается нуклеотид, образованный аденозином и 3 остатками фосфорной кислоты. Во всех живых организмах выполняет роль универсального аккумулятора и переносчика энергии. Под действием специальных ферментов концевые фосфатные группы отщепляются с освобождением энергии, которая идёт на мышечное сокращение, синтетические и другие процессы жизнедеятельности. Препараты аденозинтрифосфата применяют при спазмах сосудов, мышечной дистрофии.

ADF = AFTER DEDUCTING FREIGHT

ADF = AUTOMATIC DIRECTION FINDER

ADHEREND = АДГЕРЕНТ (или ПРИКЛЕЕННАЯ ДЕТАЛЬ) – Adherend:- a body that is held to another body, usually by an adhesive.

ADHESION = АДГЕЗИЯ (или ПРИЛИПАНИЕ) – (1) Adhesion of two dissmiilar parts touching each other but easily separated and not fused or grown together. The force that holds different materials together at their interface and resists separation into two layers. Adhesion is the property denoting the ability of a material to resist delamination or separation into two or more layers. / Под Адгезией, от Латинского слова Adhaesio, означающее Прилипание, понимается сцепление поверхностей разнородных тел, иными словами, слипание разнородных твёрдых и жидких тел (фаз), соприкасающихся своими поверхностями. Адгезия обусловлена межмолекулярным взаимодействием, ионной или металлической связью. Она широко используется в технике. Благодаря адгезии возможны склеивание, сварка и паяние деталей с целью соединения. Кроме того, она активно используется при лужении и нанесении гальванических и лакокрасочных покрытий, и образовании поверхностных плёнок, например, оксидных. Адгезия, слипание поверхностей двух разнородных твёрдых или жидких тел. Пример адгезии – прилипание капелек воды к стеклу. Адгезия обусловлена теми же причинами, что и Адсорбция. Количественно адгезия характеризуется удельной работой, затрачиваемой на разделение тел. Эта работа рассчитывается на единицу площади соприкасающихся поверхностей и зависит от того, как производится их разделение:- сдвигом вдоль поверхности раздела или отрывом в направлении, перпендикулярном поверхности. Адгезия иногда оказывается больше, чем Когезия, характеризующая силу сцепления частиц внутри данного тела. В этом случае разрыв происходит когезионно – внутри наименее прочного из соприкасающихся тел. Адгезия твёрдых тел с неровной поверхностью обычно невелика, так как они фактически соприкасаются только отдельными выступающими участками своих поверхностей. Адгезия жидкости и твёрдого тела и двух несмешивающихся жидкостей достигает предельно высокого значения вследствие полного контакта по всей площади соприкосновения. При покрытии твёрдого тела полимером в текучем состоянии последний проникает в углубления и поры. После отвердевания полимера возникает связь, иногда называемая Механической Адгезией. В этом случае для отрыва полимерной плёнки необходимо преодолеть когезию в затвердевшем полимере. Для достижения предельной адгезии твёрдые тела соединяют в пластическом или эластичном состоянии под давлением, например, при склеивании резиновым клеем или при холодной сварке металлов. Прочная адгезия достигается также при образовании новой твёрдой фазы на поверхности раздела, например, в случае гальванических покрытий, или при возникновении поверхностных химических соединений (окисные, сульфидные и другие плёнки). Адгезия полимеров происходит лучше в том случае, если макромолекулы полярны и имеют большое число химически активных функциональных групп. Для улучшения адгезии в состав клея или плёнкообразующего полимера вводят активные добавки, молекулы которых одним концом прочно связываются с плёнкой, другим – с подложкой, образуя ориентированный адсорбционный слой. При контакте двух объёмов одного и того же полимера может произойти Автогезия (Самослипание), когда имеет место диффузия макромолекул или их участков из одного объёма в другой. При этом прочность связи со временем увеличивается, стремясь к пределу – Когезионной Прочности. Явление адгезии имеет место при сварке,

паянии, лужении, склеивании, при изготовлении фотоматериалов, а также при нанесении лакокрасочных полимерных покрытий, предохраняющих металлические детали от коррозии; причинами нарушения адгезии в последнем случае являются напряжения, возникающие вследствие усадки плёнки, а также различие коэффициентов теплового расширения плёнки и металла. Адгезия не только является условием образования высококачественного покрытия, связующего сварного или клеевого шва, но также и вызывает повышенный износ трущихся деталей. Для устранения адгезии вводят слой смазки, препятствующий контакту поверхностей.

(2) Adhesion, in tyre fabrics, is the force required to separate a textile material or steel cord from rubber or other elastomer by a definite prescribed method.

(3) Adhesion is the union between a coating film and the material with which it is in contact. The latter may be another film of paint (intercoat adhesion) or any other material such as wood. / Соединение покрывающей плёнки с материалом, с которым она находится в контакте. В последствии может быть нанесена краска (адгезия между покрытиями) или любой другой материал, такой как древесина.

(4) Adhesion is the property of a lubricant that causes it to cling or adhere to a solid surface.

ADHESION PROMOTERS = ОБЕСПЕЧИТЕЛИ АДГЕЗИИ – Adhesion Promoters are the products used to treat the smooth fiber-face of closely constructed base fabric to provide a chemical bonding site for subsequent coating. This step is done because it is difficult to get good coating adhesion via strikethrough and mechanical bonding in closely constructed fabrics. Products containing the isocyanate group are the most widely used promoters. See also Dip Treating.

ADHESIVE = АДГЕЗИВ (или СВЯЗУЮЩЕЕ) – (1) In textiles, Adhesives are materials which cause fibers, yarns, or fabrics to stick together or to other materials. Adhesives are an essential part of the manufacturing process for a variety of apparel applications ranging from applying labels, decorative trim and waterproofing tapes to innovative solutions like stitchless garment construction. / Под Адгезивом или Связующим, от Латинского слова Adhaesio, означающее Прилипание, понимается композиция на основе органических или неорганических веществ, способных соединять (склеивать) различные материалы – бумагу, древесину, керамику, кожу, металлы, пластмассы, резину, стекло, ткани. Действие обусловлено образованием прочной адгезионной связи между клеевой прослойкой и соединяемыми поверхностями (на прочность клеевого шва влияют также когезия клеевого слоя и поверхностей). Основой органического клея служат главным образом синтетические олигомеры и полимеры (феноло-формальдегидные, эпоксидные, полиэфирные смолы, полиамиды, полиимиды, полиуретаны, кремнийорганические полимеры, каучуки и другие), образующие клеевую плёнку в результате затвердевания при охлаждении (термопластичные клеи), отверждения (термореактивные клеи) или вулканизации (резиновые клеи); этим процессам иногда предшествует улетучивание растворителя. К неорганическим клеям относят алюмофосфатные, керамические (основа – оксиды магния, алюминия, кремния, щелочных металлов), силикатные (основа – калиевое или натриевое жидкое стекло), металлические (основа – жидкий металл, например, ртуть). По физическому состоянию клеи могут быть жидкими (растворы, эмульсии, суспензии) или твёрдыми (плёнки, прутки, гранулы, порошки); последние используют в виде расплава или наносят на нагретые поверхности.

(2) Adhesive is a substance capable of holding materials together by surface attachment. It is a general term and includes cements, mucilage, paste, and glue.

ADHESIVE ACTIVATED YARNS = АДГЕЗИВНАЯ АКТИВНАЯ ПРЯЖА – Adhesive Activated Yarns are the yarns treated by the fiber manufacturer to promote better adhesion to another material such as rubber and/or to allow easier processing.

ADHESIVE FAILURE = АДГЕЗИОННОЕ РАЗРУШЕНИЕ (или РАЗРУШЕНИЕ КЛЕЕВОГО СОЕДИНЕНИЯ) – Adhesive Failure:- rupture of an adhesive bond such that the separation appears to be at the adhesive-adherend interface.

ADHESIVE MIGRATION = МИГРАЦИЯ СВЯЗУЮЩЕГО – Adhesive Migration:- in nonwovens, the movement of adhesive together with its carrier solvent in a fabric during drying, giving it a non-uniform distribution within the web, usually increasing to the outer layers.

ADHESIVE STRENGTH = ПРОЧНОСТЬ АДГЕЗИИ (или ПРОЧНОСТЬ КЛЕЕВОГО СОЕДИНЕНИЯ) – Adhesive Strength is the strength of the bond between an adhesive and an adherend. Air-Bubble Void Air entrapment within and between the plies of reinforcement or within a bondline or encapsulated area; localized, and non-interconnected.

ADHESIVE WEAR = АДГЕЗИВНЫЙ ИЗНОС (или ИЗНОС ПРИ ЗАЕДАНИИ) – Adhesive Wear:- is often referred to as Galling, Scuffing, Scoring, or Seizing. It happens when sliding surfaces contact one another, causing fragments to be pulled from one surface and to adhere to the other. See also Wear. / Износ При Заедании – износ в результате схватывания, глубинного вырывания материала, переноса его с одной поверхности трения на другую и воздействия возникших неровностей на сопряжённую поверхность. Адгезивный Износ:- (1) износ, обусловленный переносом материала с одной поверхности на другую во время относительного движения благодаря процессу сварки в твёрдой фазе. Частицы, которые удалены с одной поверхности – временно или постоянно, присоединяются к другой поверхности. (2) Износ, благодаря ограниченному сцеплению между контактирующими твёрдыми поверхностями, приводящий к переносу металла между поверхностями или потерей металла из любой поверхности. Сравните с Абразивным Износом (Abrasive Wear).

AD HOC = АД ХОК – Ad Hoc:- legislative committees appointed for special, temporary purposes, such as to investigate a problem before the government prepares legislation on the subject. A special committee. The term comes from a Latin term meaning ‘to this’ and refers to a committee formed for a particular purpose. Ad Hoc:- in Latin For This Purpose, or To This, or For This. An ad hoc committee, for example, is created with a unique and specific purpose or task and once it has studied and reported on a matter, it is disbanded. / В переводе с Латинского языка, К Этому; Только Для Данного Случая/Цели; Особенно Для Этого; Кстати. Для Этой Цели, или К Этому; К Тому или Для Этого; До Того; До Той Степени; Для Этого; Применительно К Этому; Для Данного Случая; Специально Для Этого Случая; и Для Определённого Случая.

ADI = AFTER DATE OF INVOICE

ADI = AIRCRAFT DE–ICE AND INHIBITOR

ADIPIC ACID = АДИПИНОВАЯ КИСЛОТА – Adipic Acid is 1,4-butanedicarboxylic acid ($COOH(CH_2)_4COOH$). It is used in the polymerization reaction to form nylon 66 polymers and in the manufacture of polyurethane foams. / Найлан (Nylon). Под Адипиновой Кислотой, $HOOC(CH_2)_4COOH$, понимаются бесцветные кристаллы, $t_{пл}$ 149–150 °C. Сырьё в производстве полиамидов, пластификаторов, смазочных масел.

ADIS = ADVANCED DRIVER INFORMATION SYSTEM

ADIZ = AIR DEFENSE IDENTIFICATION ZONE

ADJECTIVE DYE = АДЪЕКТИВНЫЙ КРАСИТЕЛЬ (или ПРОТРАВНЫЙ КРАСИТЕЛЬ) – Adjective Dyes, or Mordant Dyes, require some sort of substance, (usually a metal salt) to prevent the color from washing or light-bleaching out. Most natural dyes are adjective dyes, and do require the application of a mordant (the metal salt) solution to the fibers at some point in the dyeing process. Aluminum and iron salts were the most common traditional mordants, with copper, tin and chrome coming into use much later. In rural areas where these metals were not widely available, plants were also used as mordants, especially those that have a natural ability to extract such minerals from the earth, such as club moss. Most ancient and medieval dyers mordanted their yarns and fabrics before dyeing them. Alum and Iron were used as mordants in Egypt, India and Assyria from early times, as there are many alum deposits in the Mediterranean region. Medieval dyers used alum, copper and iron as mordants, and cream of tartar and common salt were used as to assist in the dyeing process. Adjective Dye is a dye which requires the use of mordants. See also Natural Dyes. Adjective Dyes are those dyes that require use of a mordant to bind the color to the fiber. / Под Протравными Красителями понимаются органические красители (азокрасители, антрахиноновые и другие), которые образуют на волокне прочные нерастворимые комплексы при взаимодействии со вспомогательными веществами крашения – протравами, содержащими ионы тяжёлых металлов (главным образом Cr^{3+}, Fe^{3+}). Применяются для крашения шерсти, реже – натурального шёлка и хлопка (окраски устойчивы к любым воздействиям). Многие синтетические органические пигменты, в особенности азопигменты являются производными водорастворимых красителей. При производстве пигментов, эти красители вводятся в специальные связующие, в результате чего пигмент не теряет своих свойств после его ввода в конечный продукт. Стойкость, кроме того, особенно важна при взаимодействии пигмента с волокнами целлюлозы, основным составляющим холста, бумаги и хлопчатобумажной одежды. Сам по себе органический краситель теряет свои свойства при соприкосновении с целлюлозой, поэтому при производстве органических пигментов также добавляется адъективный краситель, являющийся агентом между красителем и волокнами целлюлозы.

ADJUST = ПЕРЕОЦЕНИВАТЬ – Adjust:- to correct share prices when there are changes in capital structures; in particular, when subscription rights are reduced or in the case of stock splits or reverse splits. / Корректировать цены акций в момент изменений в структурах капитала; в частности, при уменьшении прав подписки или в случае дробления капитала или объединения капитала.

ADJUSTABLE–RATE MORTGAGE = ЗАКЛАДНАЯ С ПЕРЕОЦЕНИВАЕМОЙ СТАВКОЙ – Adjustable-Rate Mortgage (ARM) is a type of mortgage in which the interest rate paid on the outstanding balance varies according to a specific benchmark. The initial interest rate is normally fixed for a period of time after which it is reset periodically, often every month. The interest rate paid by the borrower will be based on a benchmark plus an additional spread, called an ARM Margin. An adjustable rate mortgage is also known as a Variable-Rate Mortgage or a Floating-Rate Mortgage. Both 2/28 and 3/27 mortgages are examples of ARMs. A 2/28 mortgage's initial interest rate is fixed for a period of two years and then resets to a floating rate for the remaining 28 years of the mortgage. A 3/27 mortgage is typically the same as a 2/28 mortgage, except that the interest rate is fixed for three years and then floats for the remaining 27 years of the mortgage. A mortgage that does not have a fixed interest rate. The rate changes during the life of the loan based on movements in an index rate, such as the rate for Treasury securities or the Cost of Funds Index. In the United States, an Adjustable-Rate Mortgage (ARM) differs from a fixed-rate mortgage in many ways. With a fixed-rate mortgage, the interest rate stays the same during the life of the loan. With an ARM, the interest rate changes periodically, usually in relation to an index, and payments may go up or down accordingly. Shopping for a mortgage is not as simple as it used to be. To compare two ARMs with each other or to compare an ARM with a fixed-rate mortgage, you need to know about indexes, margins, discounts, caps on rates and payments, negative amortization, payment options, and recasting (recalculating) your loan. You need to consider the maximum amount your monthly payment could increase. Most important, you need to know what might happen to your monthly mortgage payment in relation to your future ability to afford higher payments. Lenders generally charge lower initial interest rates for ARMs than for fixed-rate mortgages. At first, this makes the ARM easier on your pocketbook than a fixed-rate mortgage for the same loan amount. Moreover, your ARM could be less expensive over a long period than a fixed-rate mortgage, for example, if interest rates remain steady or move lower. The initial rate and payment amount on an ARM will remain in effect for a limited period of time – ranging from just 1 month to 5 years or more. For some ARMs, the initial rate and payment can vary greatly from the rates and payments later in the loan term. Even if interest rates are stable, your rates and payments could change a lot. If lenders or brokers quote the initial rate and payment on a loan, ask them for the annual percentage rate (APR). If the APR is significantly higher than the initial rate, then it is likely that your rate and payments will be a lot higher when the loan adjusts, even if general interest rates remain the same. With most ARMs, the interest rate and monthly payment change every month, quarter, year, 3 years, or 5 years. The period between rate changes is called the Adjustment Period. For example, a loan with an adjustment period of 1 year is called a 1-Year ARM, and the interest rate and payment can change once every year; a loan with a 3-year adjustment period is called a 3-Year ARM. The interest rate on an ARM is made up of two parts:- the index and the margin. The index is a measure of interest rates generally, and the margin is an extra amount that the lender adds. Your payments will be affected by any caps, or limits, on how high or low your rate can go. If the index rate moves up, so does your interest rate in most circumstances, and you will probably have to make higher monthly payments. On the other hand, if the index rate goes down, your monthly payment could go down. Not all ARMs adjust downward, however – be sure to read the information for the loan you are considering. Lenders base ARM rates on a variety of indexes. Among the most common indexes are the rates on 1-year constant-maturity Treasury (CMT) securities, the Cost of Funds Index (COFI), and the London Interbank Offered Rate (LIBOR). A few lenders use their own cost of funds as an index, rather than using other indexes. You should ask what index will be used, how it has fluctuated in the past, and where it is published – you can find a lot of this information in major newspapers and on the Internet. To determine the interest rate on an ARM, lenders add a few percentage points to the index rate, called the Margin. The amount of the margin may differ from one lender to another, but it is usually constant over the life of the loan. The fully indexed rate is equal to the margin plus the index. If the initial rate on the loan is less than the fully indexed rate, it is called a Discounted Index Rate. Some lenders base the amount of the margin on your credit record – the better your credit, the lower the margin they add – and the lower the interest you will have to pay on your mortgage. In comparing ARMs, look at both the index and margin for each program. An interest-rate cap places a limit on the amount your interest rate can increase. Interest caps come in two versions:- (i) periodic adjustment caps, which limit the amount the interest rate can adjust up or down from one adjustment period to the next after the first adjustment; and (ii) lifetime caps, which limit the interest-rate increase over the life of the loan. By law, virtually all ARMs must have a lifetime cap. A drop in interest rates does not always lead to a drop in your monthly payments. With some ARMs that have interest-rate caps, the cap may hold your rate and payment below what it would have been if the change in the index rate had been fully applied. The increase in the interest that was not imposed because of the rate cap might carry over to future rate adjustments. This is called Carryover. So at the next adjustment date, your payment might increase even though the index rate has stayed the same or declined. Types of ARMs:- (i) hybrid ARMs; (ii) interest-only ARMs; and (iii) payment-option ARMs. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR). В Соединённых Штатах Америки Закладная с Переоцениваемой Ставкой (ЗПС; Adjustable-Rate Mortgage (ARM)) многим отличается от закладной с фиксированной ставкой (fixed-rate mortgage). Закладная с Переоцениваемой

Ставкой (ЗПС; Adjustable-Rate Mortgage (ARM)) – ипотечный заём с переоцениваемой ставкой процента. Соглашение об ипотечном займе между финансовой организацией и покупателем недвижимости, фиксирующее определённую переоценку ставки процента по займу через регулярные промежутки времени (каждый год, либо каждые три или пять лет). Размер выплат ипотечного займа привязывается к некоторому индексу, находящемуся вне сферы контроля банка или ссудосберегательной ассоциации, например к ставке процента по Казначейским облигациям США или к среднему по стране показателю процентных ставок по ипотечным кредитам. В обмен на некоторый риск, связанный с возможным ростом процентных ставок, заёмщик получает более низкую процентную ставку, чем если бы он брал ипотечный заём с фиксированной ставкой на тот же срок. Владельцам домов, обеспокоенным резким ростом процентных ставок, следует, вероятно, выбирать ипотечный заём с фиксированной ставкой процента, в то время как тем, кто считает, что процентные ставки вырастут умеренно, останутся стабильными или понизятся, следует выбрать ипотечный заём с переоцениваемой ставкой процента. Критики ипотечных займов с переоцениваемой ставкой процента утверждают, что такие займы провоцируют молодых покупателей недвижимости брать на себя потенциально опасные для них обязательства. Назвается также Закладной С Изменяемой Ставкой (ЗИС; Variable Rate Mortgage (VRM)), которую не следует путать с Закладной С Дифференцированными Платежами (Graduated Payment Mortgage), которые предполагают ежемесячные выплаты, растущие с ростом доходов заёмщика.

ADJUSTABLE STANCHION = ПОДГОНЯЕМАЯ СТОЙКА – Adjustable Stanchion:- these are collapsible stanchions that can be inserted and locked in place or unlocked and folded down. Stanchions are suitable for providing tight fitting lateral load securing for many types of load. / складные стойки, которые могут быть установлены и закреплены в месте или раскреплены и уложены вниз. Стойки . Неподвижное звено механизма называют Стойкой. латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона.

ADJUSTED FUTURES PRICE = ПЕРЕОЦЕНЕННАЯ ЦЕНА ФЬЮЧЕРСА – Adjusted Futures Price is the cash-price equivalent reflected in the current futures price. This is calculated by taking the futures price times the conversion factor for the particular financial instrument (e.g., bond or note) being delivered. / Эквивалент цены наличного товара, отражённый в текущей цене фьючерса. Он подсчитывается путём умножения цены фьючерса на коэффициент конверсии для конкретного финансового инструмента (например, облигации или ноты), который должен быть поставлен.

ADJUSTED SPOT PRICE = ПЕРЕОЦЕНЕННАЯ НАЛИЧНАЯ ЦЕНА (ПЕРЕОЦЕНЕННАЯ ЦЕНА ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ) – Adjusted Spot Price means the spot price adjusted to reflect any lack of data for base quality to make the adjusted spot price comparable to a spot price assuming the base quality. If base quality spot price data are not available, spot prices for other qualities will be used and adjusted by the average difference between base quality spot prices and those for other qualities over the available observations during the previous 12 months.

ADJUSTED WORLD PRICE = ПЕРЕОЦЕНЕННАЯ МИРОВАЯ ЦЕНА – The Adjusted World Price (AWP) is the prevailing world market price for Upland Cotton adjusted to the United States. The AWP is a weekly price series that began in 1986 and is calculated and published by the United States Department of Agricultural (USDA) each Thursday. The AWP is equal to the Northern Europe price (an average of the five lowest priced growths for Middling 1-3/32 inch cotton, CIF Northern Europe) adjusted to average US quality and location. In addition, the AWP may be adjusted downward under certain conditions. The AWP for individual qualities is determined by applying the schedule of loan premiums and discounts and location differentials. An additional coarse count adjustment (CCA) may be applicable for Cotton with a staple length of 1-1/32 inches or shorter and for certain specific lower grades with a staple length of 1-1/16 inches and longer. The AWP and CCA are announced for the subsequent week. The AWP is important in determining loan repayment rates, loan deficiency payments, marketing loan gains, and, in conjunction with other price relationships, is considered for US Upland Cotton competitiveness. In the cotton industry of the United States, the result of using a formula that adjusts the world price of Cotton to US prices. Adjusted World Price (AWP) is the USDA's estimated world price adjusted for US quality and location. The loan differential between qualities 31-3-35 and base quality 41-4-34 is subtracted from the prevailing world price (average of 5 lowest Far East quotes). Additionally, average transportation costs are subtracted from the world price. For certain higher qualities, the Secretary shall further reduce the AWP to reflect differences between premiums in the US market and international markets (fine count adjustment). / В индустрии хлопка в США, результат использования формулы, которая переоценивает мировую цену хлопка в зависимости от цен в США.

ADJUSTER = ПЕРЕОЦЕНЩИК (или КОМИССАР, или ДИСПАШЕР, или АДЖАСТЕР) – Adjuster is a person who investigates claims on behalf of insurers. See also Loss Adjuster. Adjuster is an individual representing the insurance company and acting for the company in working on agreements as to the amount of a loss and the liability of the company in same. / Лицо, представляющее страховую компанию и действующий в её интересах при разработке соглашений, таких как соглашений о сумме убытка и ответственности компании по данному убытку. Диспашер составляет диспашу с расчётом убытков по авариям.

ADJUSTMENT PREMIUM = ПЕРЕОЦЕНЕННАЯ ПРЕМИЯ (или ПРЕМИЯ ПОСЛЕ ПЕРЕОЦЕНКИ) – Adjustment Premium is an additional or return premium that is payable in relation to a deposit premium depending on the performance of an insurance or reinsurance contract.

ADJUSTMENTS TO OPTIONS CONTRACTS = ПЕРЕОЦЕНКИ ПО ОПЦИОННЫМ КОНТРАКТАМ – Adjustments To Options Contracts are the adjustments which are made when certain events occur that may affect the underlying securities. Examples of adjustments include changing the number of shares per contract and/or the exercise price of options in the event of a new issue or a reorganization of capital by the issuer of the underlying securities.

ADL = AERONAUTICAL DATA–LINK

AD LINE = ADVANCE DECLINE LINE

ADLY = ARRIVAL DELAY

ADM = ADMIRALTY

ADMEASUREMENT = ГЛАВНЫЕ РАЗМЕРЕНИЯ – A term Admeasurement refers to the method of calculating gross tonnage of ships or vessels. Admeasurement:- the confirmed or official dimensions of a ship. Admeasurement of a ship is a measurement made to ascertain its tonnage. / Утверждённые или официальные Главные Размерения судна представляют собой линейные размеры судна. Теоретические главные размерения судна:- (i) длина между носовым и кормовым перпендикулярами, измеряемая на уровне грузовой ватерлинии; (ii) ширина, измеряемая по корпусу в середине длины на том же уровне между наружными кромками шпангоутов; (iii) высота борта, равная расстоянию по вертикали между внутренними поверхностями палубного настила и горизонтального киля; (iv) осадка (теоретическая, расчётная), измеряемая от грузовой ватерлинии до верха горизонтального киля. Габаритные главные размерения судна соответствуют линейным размерам судна по их максимальной протяжённости в том или ином направлении с учётом выступающих частей, наделок и тому подобного. Например, габаритная

длина – расстояние в горизонтальной плоскости между крайними точками оконечностей с учётом постоянно выступающих частей (наделки, привальный брус, рули и тому подобное).

ADMINISTERED ESTATE = АДМИНИСТРИРУЕМОЕ СОСТОЯНИЕ (или АДМИНИСТРИРУЕМОЕ ИМУЩЕСТВО) – In the United States, Administered Estate:- this term refers to the estate of a decedent, which is being formally administered through court proceedings that typically involve the appointment of a legal representative, such as an administrator or executor. In other words, the court is supervising the settlement of the estate. An Administered Estate is supervised by the court and is one for which Estate a legal representative has been appointed.

ADMINISTRATION COSTS = ЗАТРАТЫ НА АДМИНИСТРАЦИЮ (или ИЗДЕРЖКИ НА АДМИНИСТРАЦИЮ) – Administration Costs are the total of all the office costs such as telephones, clerical costs, office heating etc.

ADMINISTRATION/SALES (%) = АДМИНИСТРАЦИЯ/ПРОДАЖИ (%) – Administration/Sales (%) is the administration costs expressed as a percentage of the value of sales.

ADMINISTRATIVE DISSOLUTION = ПРЕКРАЩЕНИЕ ДЕЯТЕЛЬНОСТИ В АДМИНИСТРАТИВНОМ ПОРЯДКЕ – In the United States, Administrative Dissolution is an involuntary dissolution of a corporation by an act of the Secretary of State or similar state authority, caused by the corporation's failure to comply with certain statutory requirements; especially the failure to file an annual report, to pay franchise taxes or maintain a valid Registered Agent. See also Dissolution, Involuntary Dissolution, Judicial Dissolution, and Voluntary Dissolution. / Смотрите также Прекращение Деятельности (Dissolution), Прекращение Деятельности В Добровольном Порядке (Voluntary Dissolution), Прекращение Деятельности В Принудительном Порядке (Involuntary Dissolution), и Прекращение Деятельности В Судебном Порядке (Judicial Dissolution).

ADMINISTRATIVE INSTRUCTIONS = АДМИНИСТРАТИВНЫЕ ИНСТРУКЦИИ – Administrative Instructions set out the provisions and requirements in relation to the filing and processing of the international (patent) application under the Patent Cooperation Treaty (PCT; concluded in 1970) and are established by the Director General of the World Intellectual Property Organization (WIPO).

ADMINISTRATIVE LAW JUDGE = СУДЬЯ ПО АДМИНИСТРАТИВНЫМ ДЕЛАМ – Administrative Law Judge is a representative of a government commission or agency vested with power to administer oaths, examine witnesses, take testimony, and conduct hearings of cases submitted to, or initiated by, that agency. Also known as Hearing Examiner. / Представитель правительственной комиссии или ведомства, наделённый полномочиями принимать присяги, допрашивать свидетелей, снимать показания, и вести слушание по делам, переданным на рассмотрение или возбуждённых тем же ведомством. Известен также как Заслушивающий Дознаватель (Hearing Examiner).

ADMINISTRATIVE WORKSTATION = АДМИНИСТРАТИВНАЯ РАБОЧАЯ СТАНЦИЯ – Administrative Workstation is a NYMEX ACCESS® workstation through which exchange clearing members monitor all activity in accounts they carry and set limits on their customers' accounts through the Trade Limit Monitoring System. / Административная Рабочая Станция – рабочая станци НАЙМЭКС АКСЭС®, через которую клиринговые члены биржи .

ADMINISTRATOR = АДМИНИСТРАТОР – A court usually appoints an Administrator when a person dies without leaving a will. In most jurisdictions, courts are required by statute to name the spouse of the decedent as administrator. Where no spouse is involved, administration is usually assigned to the next of kin, such as parents, brothers and sisters, nieces and nephews, or cousins. Special laws, called Statutes of Descent and Distribution, determine the next of kin who are entitled to serve as administrators. Administrator is a person appointed by a court to administer (or otherwise settle) the estate of a deceased person. / Администратор – назначенное судом физическое лицо или банк, в обязанности которого входит осуществление решений суда в отношении наследства до тех пор, пока оно не будет полностью распределено между всеми наследниками. Администратор назначается судом в том случае, если покойный не оставил завещания либо не указал исполнителя завещания, а также в том случае, когда указанный исполнитель воли умершего не может или не желает выполнять эту функцию. Если исполнителем завещания назначается женщина, используется термин Administratrix. В общем значении:- лицо, занимающееся в фирме организационными вопросами. Администратор – синоним Управляющему (Manager).

ADMIRALTY = АДМИРАЛТЕЙСКИЙ – A term Admiralty refers to marine matters such as an Admiralty Court. / Относится к вопросам и действиям, связанным с морем, например, Адмиралтейский Суд.

ADMIRALTY COURT = АДМИРАЛТЕЙСКИЙ СУД – Admiralty Court is a court of law that deals with matters pertaining to the sea. Admiralty Court is a court having jurisdiction over maritime questions pertaining to ocean transport, including contracts, charters, collisions, and cargo damages.

ADMISSION TEMPORAIRE ROULETTE CERTIFICATE = АДМИСЬЁН ТЭМПОРЭР РУЛЕТТ СЭРТИФИКАТ (или СВИДЕТЕЛЬСТВО О ВРЕМЕННОМ ДОПУСКЕ АВТОТРАНСПОРТОМ) – An Admission Temporaire Roulette Certificate (ATR Certificate (in French)) or Temporary Admission on Wheels Certificate is a certificate for the movement of industrial products entitled to preferential duty rates for export to and Turkey under the terms of the Customs Union between the European Union (EU) and Turkey. The purpose of ATR certificates is to declare that the exported goods are manufactured in or have free circulation status within the EU. Alongside its existing export documentation services, Turkish British Chamber of Commerce and Industry is now authorised to endorse and issue ATR Certificates on behalf of HM Revenue and Customs. See also Movement Certificate. ATR Certificate is used for entitlement to preferential, usually zero, import duty rates, for exports between the United Kingdom to Turkey. Temporary Admission on Wheels – certificates used to indicate that goods are entitled to preferential rates of duty in Turkey. / что вывозимые товары изготовлены .

ADMISSION TEMPORAIRE – TEMPORARY ADMISSION CARNET = АДМИСЬЁН ТЭМПОРЭР – ТЕМПОРЭРИ ЭДМИШЭН КАРНЭ (или КНИЖКА ВРЕМЕННОГО ДОПУСКА) – The ATA is a system allowing the free movement of goods across frontiers and their temporary admission into a Customs territory with relief from duties and taxes. The goods are covered by a single document known as the ATA Carnet that is secured by an international guarantee system. The term 'ATA' is a combination of the initial letters of the French words 'Admission Temporaire' and the English words 'Temporary Admission'. Thanks to this system, the international business community enjoys considerable simplification of Customs formalities. No import duties or taxes are collected for the temporary importation of goods covered by the system since internationally valid security has been established by the national associations issuing the ATA carnets. These national associations are approved by Customs and are affiliated to an international guaranteeing chain administered by the International Bureau of Chambers of Commerce (IBCC). The ATA carnet is now the document most widely used by the business community for international operations involving temporary admission of goods. The ATA carnet system was developed in response to the needs of various types of business to move their products to trade fairs or international exhibitions, as samples to potential buyers, or simply as their own professional equipment. These goods must be able to be easily and rapidly transported across frontiers. As a result, the Customs Co-operation Council (now the World Customs Organization) adopted the

Customs Convention on the ATA Carnet for the Temporary Admission of Goods (ATA Convention) on 1961-December-06. In addition a number of other international Conventions for the specific types of goods were established. An international customs document for temporary importation and exportation of goods (excluding means of transport), regulated under the terms of the ATA Convention or Istanbul Convention. An ATA Carnet (Admission Temporaire – Temporary Admission) is a standard international Customs document to be used as the Customs documents for temporarily admitted goods, e.g., an import declaration form, export declaration from, re-importation certificate, transit document controlling exports from one Customs House to the other Customs House. It is designed for incorporating international guarantee required for imports granted temporary duty free admission under the ATA Convention. ATA Carnets are used for a wide variety of goods coming into Thailand temporarily. The ATA carnets will only be accepted for goods being temporarily imported under the Conventions listed below, which have been acceded to by Thailand:- (1) The International Convention to Facilitate the Importation of Commercial Samples and Advertising Materials; (2) The Customs Convention on the Temporary Importation of Professional Equipment (1952); (3) The Customs Convention Concerning Facilities for the Importation of Goods for Display or Used at the Exhibitions, Fairs, Meetings or Similar Events (1961); and (4) The Customs Convention on the Importation of Scientific Equipment (1968). The ATA Carnet allows goods to be temporarily imported into Thailand without payment of duty or taxes if the goods are entitled for admission under the provisions of the international agreements that Thailand has acceded to. The duty and taxes are payable if the goods are not exported within the approved period. Carnets are Merchandise Passports. They are international customs documents that simplify customs procedures for the temporary importation of various types of goods. In the United States, two types are issued:- ATA and TECRO/AIT Carnets. ATA Carnets ease the temporary importation of commercial samples (CS), professional equipment (PE), and goods for exhibitions and fairs (EF). They facilitate international business by avoiding extensive customs procedures, eliminating payment of duties and value-added taxes (minimum 20% in Europe, 27% in China), and replacing the purchase of temporary import bonds. TECRO/AIT Carnets, used between the United States and Taiwan only, appear similar to, and serve the same function as the ATA Carnet. TECRO/AIT Carnets result from a bilateral agreement between the US and Taiwan, covering only commercial samples (CS), and professional equipment (PE). Merchandise entering countries in addition to Taiwan may also be accompanied by an ATA Carnet. Are Customs documents for the temporary importation of certain goods (commercial samples and advertising films, goods for international exhibitions, certain types of professional equipment) where there is a clear intention that they will be re-exported in the same condition in which they were imported. The ATA carnets replace normal import and export procedures for qualifying goods subject to a sufficient guarantee or cash deposit being lodged with the issuer of the carnet to cover any possible Customs claims in the event of misuse of the document. The scheme is administered by the International Chamber of Commerce (ICC) based in Paris which authorize national Chambers of Commerce to issue the documents on its behalf. Also known as Passport For Goods in the United Kingdom. See also Carnet De Passages En Douane, and Transports Internationaux Routiers Carnet. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. , например, . Смотрите также Карнэ Дё Пассаж Ан Дуан или Книжка Допусков В Таможне (Carnet De Passages En Douane), и Транспор Этэрнасьёно Рутэр Карнэ или Книжка Международной Дорожной Перевозки (Transports Internationaux Routiers Carnet). и замена закупки гарантии временного ввоза. привоз (importation) и вывоз (exportation).

ADMITTED = ПРИЗНАНО (или ПРЕДУСМОТРЕНО, или ПРИНЯТО) – A term Admitted means that in certain countries a local policy should be issued. Non-admitted is the opposite situation. Most countries are non-admitted, i.e. their insurance laws and regulation do not require a local policy. / означает то, что в некоторых странах должен быть выдан местный полис. , то есть их законы и предписания о страховании не требуют местного полиса.

ADMITTED REINSURANCE = ПРИЗНАВАЕМОЕ ПЕРЕСТРАХОВАНИЕ – Admitted Reinsurance:- a company is ‘admitted’ when it has been licensed and accepted by appropriate insurance governmental authorities of a state or country. In determining its financial condition a ceding insurer is allowed to take credit for the unearned premiums and unpaid claims on the risks reinsured if the reinsurance is placed in an admitted reinsurance company.

ADNATE = ПРИКАСАЮЩЕЕСЯ (или ПРИРОСШЕЕ, или СРАЩЁННОЕ, или СБЛИЖЕННОЕ) – Adnate:- of unlike parts growing closely together, attached or fused. / прикасающиеся или сливающиеся. Приставка Ad в переводе с Латинского языка означает На или Около или При.

ADP = ADENOSINE–5’–DIPHOSPHATE

ADP = ALTERNATIVE DELIVERY PROCEDURE

ADP = AUTOMATED DATA PROCESSING

ADPC = AREA UNDER DISEASE PROGRESS CURVE

ADPRESSED = ПРИЖАТОЕ – Adpressed:- lying close to another organ, but not fused to it. / , но не слившееся с ним. Приставка Ad в переводе с Латинского языка означает На или Около или При.

ADR = ACCORD EUROPÉEN RELATIF AU TRANSPORT INTERNATIONAL DES MARCHANDISES DANGEREUSES PAR ROUTE = EUROPEAN AGREEMENT CONCERNING THE INTERNATIONAL CARRIAGE OF DANGEROUS GOODS BY ROAD

ADR = AMERICAN DEPOSITORY RECEIPT

ADR = ARTICLES DANGEREUX DE ROUTE

ADR = AUTOMATED DEMAND RESOLUTION

ADR = AUTOMATIC DIVIDEND REINVESTMENT

ADRAO = ASSOCIATION POUR LE DEVELOPPEMENT DE LA RIZICULTURE EN AFRIQUE DE L’OUEST

ADRS = ASSET DEPRECIATION RANGE SYSTEM

ADS = AIR–DRIED SOIL

ADS = AMERICAN DEPOSITORY SHARE

ADS = APPLICATION DATA SHEET

ADS = AUTOMATIC DEPENDENT SURVEILLANCE

ADSCR = AVERAGE DEBT SERVICE COVERAGE RATIO

ADSIM = AIRFIELD DELAY SIMULATION MODEL

ADSORBENT FILTER = АДСОРБЕНТНЫЙ ФИЛЬТР – Adsorbent Filter is a filter medium primarily intended to hold soluble and insoluble contaminants on its surface by molecular adhesion. See also Filter. / Смотрите также Фильтр (Filter).

ADSORPTION = АДСОРБЦИЯ – Adsorption:- adhesion of the molecules of gases, liquids, or dissolved substances to a solid surface, resulting in relatively high concentration of the molecules at the place of contact, e.g., the plating out of an anti-wear additive on metal surfaces. Adsorption is the capability of all solid substances to attract to their surfaces molecules of gases or solutions with which they are in contact. Solids that are used to adsorb gases or dissolved substances are called Adsorbents; the adsorbed molecules are usually referred to collectively as the Adsorbate. An example of an excellent adsorbent is the charcoal used in gas masks to remove poisons or impurities from a stream of air. Adsorption can be either physical or chemical in nature. Physical adsorption resembles the condensation of gases to liquids and depends on the physical, or van der Waals (relatively weak electric forces that attract neutral molecules to one another in gases, in liquefied and solidified gases, and in almost all organic liquids and solids. The forces are named for the Dutch physicist Johannes Diderik van der Waals (1837–1923), who in 1873 first postulated these intermolecular forces in developing a theory to account for the properties of real gases), force of attraction between the solid adsorbent and the adsorbate molecules. There is no chemical specificity in physical adsorption, any gas tending to be adsorbed on any solid if the temperature is sufficiently low or the pressure of the gas sufficiently high. In chemical adsorption, gases are held to a solid surface by chemical forces that are specific for each surface and each gas. Chemical adsorption occurs usually at higher temperatures than those at which physical adsorption occurs; furthermore, chemical adsorption is ordinarily a slower process than physical adsorption and, like most chemical reactions, frequently involves an energy of activation. The uptake of gases, vapor or dissolved substances (this is limited to the surface of solid objects). See also Absorption. Adsorption is:- (1) the taking up of molecules or ions at a surface, including exchangeable cations and anions on soil particles. (2) The sticking of a liquid, or gaseous or dissolved substance to a solid, resulting in higher concentration of the substance. Adsorption is the attraction of gases, liquids, or solids to surface areas of textile fibers, yarns, fabrics, or any material. Adsorption is the process by which a herbicide associates with a surface, e.g., a soil colloidal surface. / Нидерландский физик Йоханэс Дидэрик фон дэр Валс (Johannes Diderik van der Waals; 1837–1923). поглощение твёрдыми веществами. Слово Адсорбция возникло путём совмещения двух Латинских слов Ad, означающее На или При, и Sorbeo, означающее Поглощаю. Под адсорбцией понимается поглощение (сорбция) веществ из растворов или газов на поверхности твёрдого тела или жидкости. Адсорбируемое вещество называется Адсорбатом, а тело, на котором происходит адсорбция, – Адсорбентом. Адсорбентами служат синтетические и природные тела с высокоразвитой поверхностью. Твёрдые адсорбенты – активированный уголь (или активный уголь), силикагель, алюмогель, природные активные глины. Адсорбцию применяют для очистки воды, газов (например, воздуха в противогазе), при крашении тканей, в вакуумной технике и другом. Явление адсорбции используют в хроматографии. Под Адсорбцией понимается поглощение (сорбция) веществ из газовой или жидкой среды, называемой Адсорбатом, поверхностным слоем твёрдого тела или жидкости, называемых Адсорбентами. Адсорбентами служат синтетические и природные тела с высокоразвитой поверхностью. Они, как правило, имеют большую удельную поверхность – до нескольких сотен $м^2$/г. К твёрдым адсорбентам относятся активный уголь, алюмогель, силикагель и природные активные глины. Адсорбцию осуществляют в специальных аппаратах – адсорберах и применяют в промышленности для осушки газов, очистки органических жидкостей и воды, улавливания ценных или вредных отходов производства, при крашении тканей, в вакуумной технике и в другом. Под Окклюзией, от средневекового Латинского слова Occlusio, означающее Запирание или Скрывание, от Латинского слова Occludo, означающее Закрываю или Запираю, понимается поглощение газов различными твёрдыми веществами. При окклюзии, в отличие от Адсорбции, газы распределяются по всему объёму поглотителя. В этом смысле окклюзия подобна абсорбции – растворению газов в жидкости. Окклюдированный газ даёт с металлами твёрдый раствор; иногда часть поглощаемого газа образует с металлами химические соединения (гидриды, нитриды и так далее). Адсорбция, поглощение какого-либо вещества из газообразной среды или раствора поверхностным слоем жидкости или твёрдого тела. Например, если поместить в водный раствор уксусной кислоты кусочек угля, то произойдёт адсорбция – количество кислоты в растворе уменьшится, молекулы кислоты сконцентрируются на поверхности угля. Адсорбция и Абсорбция – поглощение в объёме тела, объединяются общим термином Сорбция. Явление адсорбции стало изучаться со 2-й половины XVIII века (Шведский химик Каль Вильхэльм Шэеле (Carl Wilhelm Scheele; 1742–1786), в 1773), хотя несомненно, что в практической деятельности человечества адсорбция использовалась с незапамятных времён. Учение об адсорбции является частью более общей теории многокомпонентных гетерогенных систем, основы которой заложены Американским физиком, химиком, математиком и механиком Дьжосайя Вилардом Гибзом (Josiah Willard Gibbs; 1839–1903) (в 1876). Явление адсорбции тесно связано с особыми свойствами вещества в поверхностном слое, например, молекулы, лежащие на поверхности раздела фаз жидкость-пар, втягиваются внутрь жидкости, так как испытывают большее притяжение со стороны молекул, находящихся в объёме жидкости, чем со стороны молекул пара, концентрация которых во много раз меньше концентрации жидкости. Это внутреннее притяжение заставляет поверхность сокращаться и количественно характеризуется Поверхностным Натяжением. По той же причине молекулы какого-либо другого вещества, оказавшиеся вблизи поверхности, притянутся к ней и произойдёт адсорбция. После адсорбции внутреннее притяжение частично компенсируется притяжением со стороны адсорбционного слоя и поверхностное натяжение уменьшается. Гибз вывел формулу, связывающую значение адсорбции с изменением поверхностного натяжения. Те вещества, адсорбция которых сильно уменьшает поверхностное натяжение, принято называть Поверхностно-Активными Веществами. Вещество, на поверхности которого происходит адсорбция, называется Адсорбентом, а поглощаемое из объёмной фазы – Адсорбатом. В зависимости от характера взаимодействия между молекулой адсорбата и адсорбентом адсорбцию принято подразделять на Физическую Адсорбцию и Хемосорбцию. Менее прочная физическая адсорбция не сопровождается существенными изменениями молекул адсорбата. Она обусловлена силами межмолекулярного взаимодействия, которые связывают молекулы в жидкостях и некоторых кристаллах и проявляются в поведении сильно сжатых газов. При хемосорбции молекулы адсорбата и адсорбента образуют химические соединения. Часто адсорбция обусловлена и физическими и химическими силами, поэтому не существует чёткой границы между физической адсорбцией и хемосорбцией. Физически адсорбированные молекулы более или менее свободно перемещаются по поверхности, при этом их свойства часто аналогичны свойствам очень тонкого слоя газа, так называемого двухмерного газа. Они могут собираться группами, образуя слой двухмерной жидкости или двухмерного твёрдого тела. Адсорбированные молекулы рано или поздно покидают поверхность – десорбируются. Время, в течение которого молекула находится на поверхности, называется Временем Адсорбции. Времена адсорбции могут колебаться в очень широких пределах. Скоростью Адсорбция (соответственно Скоростью Десорбции) называется количество молекул, адсорбирующихся (или десорбирующихся) за единицу времени, оба значения величин относят к единице поверхности или массы адсорбента. Скорость хемосорбции, как и скорость любого химического процесса, чаще всего увеличивается с повышением температуры (так называемая Активированная Адсорбция, смотрите Хемосорбция). Если скорости адсорбции и десорбции равны друг другу, то говорят, что установилось Адсорбционное Равновесие. В состоянии равновесия количество адсорбированных молекул остаётся постоянным сколь угодно долго, если неизменны внешние условия (давление, температура и другие). Адсорбированные молекулы не только совершают движение вдоль поверхности адсорбента, но и колеблются, то приближаясь к поверхности, то удаляясь от неё. Чем выше температура, тем интенсивнее

колебательное движение, а стало быть, больше вероятность того, что в процессе таких колебаний связь молекулы с поверхностью будет разорвана и молекула десорбируется. Благодаря этому с ростом температуры уменьшается время адсорбции и равновесное количество адсорбированных молекул. С ростом концентрации или давления адсорбата в объёме увеличивается частота попаданий молекул адсорбата на поверхность адсорбента; пропорционально ей возрастает скорость адсорбции и увеличивается равновесное количество адсорбированных молекул. Кривые зависимости равновесной адсорбции от концентрации или давления адсорбата при постоянной температуре называются Изотермами Адсорбции. Если адсорбат покрывает поверхность слоем толщиной в одну молекулу, адсорбция называется Мономолекулярной Адсорбцией. Простейшая изотерма мономолекулярной адсорбции представляет собой прямую линию, выходящую из начала координат, где на оси абсцисс отложено давление адсорбата P, а на оси ординат степень заполнения поверхности Q, то есть доля поверхности, покрытая адсорбированными молекулами. Это – так называемая Изотерма Генри:- Q = kP. Коэффициент пропорциональности k зависит главным образом от температуры и характера взаимодействия адсорбент-адсорбат. Уравнение Генри справедливо при очень низких степенях заполнения для однородной поверхности. По мере увеличения степени заполнения всё большую роль начинает играть взаимодействие между адсорбированными молекулами и интенсивность их поверхностной подвижности. Если молекулы адсорбата притягиваются друг к другу, то каждая вновь адсорбирующаяся молекула будет испытывать притяжение и адсорбата и молекул, адсорбированных ранее. Поэтому, по мере заполнения поверхности, силы, удерживающие адсорбированную молекулу, будут увеличиваться и условия для адсорбции будут всё более и более благоприятными. В этом случае с ростом давления кривая изотермы всё круче и круче идёт вверх. Однако по мере заполнения поверхности вновь адсорбирующимися молекулами становится всё труднее найти свободное (не занятое другими молекулами адсорбата) место на поверхности. Поэтому с увеличением давления рост адсорбции замедляется и степень покрытия стремится к постоянному значению, равному единице. Если действуют оба эти фактора, то получаются вогнуто-выпуклые изотермы. Выпуклые изотермы часто описывают Уравнением Ленгмюра:- Θ = αP / (1 + αP). Здесь α – адсорбционный коэффициент, аналогичный по физическому смыслу константе Генри k. Уравнение Ленгмюра справедливо для Мономолекулярной Адсорбции на однородной поверхности, если можно пренебречь притяжением молекул адсорбата между собой и их подвижностью вдоль поверхности. При дальнейшем увеличении давления происходит заполнение второго, третьего и так далее слоёв, то есть имеет место Полимолекулярная Адсорбция. Если адсорбент имеет узкие поры и смачивается адсорбатом (смотрите Смачивание), то в порах может произойти конденсация при давлениях более низких, чем давление насыщенного пара адсорбата. Это явление называется Капиллярной Конденсацией. Поверхность твёрдых адсорбентов чаще всего неоднородна по адсорбционным свойствам:- одни участки поверхности адсорбируют лучше, другие – хуже. При малых давлениях преобладает адсорбция на наиболее активных участках поверхности, с увеличением давления заполняются менее активные участки. Однако, строго говоря, адсорбция происходит одновременно на всей поверхности, и получаемая на опыте изотерма представляет собой сумму изотерм, каждая из которых соответствует определённому типу поверхности. Благодаря этому экспериментальные изотермы мономолекулярной адсорбции могут существенно отличаться от других кривых изотерм. Почти всегда процесс адсорбции сопровождается выделением тепла, называемой Теплотой Адсорбции. Хотя теплота адсорбции не является единственным фактором, характеризующим прочность адсорбции, однако чаще всего чем прочнее адсорбция, тем больше её теплота. Теплота хемосорбции обычно составляет несколько десятков ккал/моль, теплота физической адсорбции редко превосходит 10 ккал/моль (40 кДж/моль). По мере заполнения неоднородной поверхности теплота адсорбции обычно уменьшается. При переходе в область полимолекулярной адсорбции теплота адсорбции понижается до величины, близкой к теплоте конденсации адсорбата. Адсорбция играет важную роль при теплообмене между газообразными, жидкими и твёрдыми телами. Например, молекулы газа, адсорбируясь на горячей поверхности, приобретают энергию, соответствующую температуре поверхности, и после десорбции сообщают эту энергию другим молекулам газа, нагревая его. Это не единственный, но важный механизм теплообмена. Адсорбция – один из решающих факторов в стабилизации коллоидных систем (смотрите Дисперсные Системы, Коагуляция, Мицелла) и одна из важнейших стадий реакций в гетерогенных системах, в частности в гетерогенном катализе (смотрите Катализ, Топохимические Реакции). В биологических системах адсорбция – первая стадия поглощения субмикроскопическими коллоидными структурами, органеллами, клетками и тканями различных веществ из окружающей среды, функционирование биологических мембран, первые этапы взаимодействия ферментов с субстратом, защитные реакции против токсичных веществ, процессы всасывания – всё это связано с адсорбцией. Многие адсорбенты (активный уголь, каолин, иониты и другие) служат противоядиями, поглощая и удаляя из организма попавшие в желудочно-кишечный тракт вредные вещества. Адсорбция применяется для разделения газовых и жидких смесей, для осушки и очистки газов и жидкостей (например, очистки воздуха в противогазах). Одним из древнейших применений адсорбции является очистка вина. В науке и технике приобрёл большое значение хроматографический метод анализа, основанный на различной способности компонентов анализируемой смеси к адсорбции (смотрите Хроматография). Адсорбцию используют также для получения и очистки биологически активных веществ – витаминов, ферментов, гормонов, антибиотиков и других. При крашении тканей, в полиграфической промышленности имеют дело с адсорбцией молекул красителей. При производстве полимеров наполнителями служат адсорбенты. В вакуумной технике адсорбция на стенках откачиваемой аппаратуры замедляет скорость откачки и ухудшает вакуум, однако, с другой стороны, действие различных сорбционных насосов основано на явлении адсорбции. В радиоэлектронной промышленности адсорбция используется для стабилизации электрических свойств полупроводниковых приборов. Вообще во всех явлениях и процессах, где существенны поверхностные свойства, адсорбция играет важную роль.

ADSORPTION DELAY = ЗАДЕРЖКА АДСОРБЦИИ – Adsorption Delay:- delayed take up of water vapor by the cargo. In the Container Handbook, this refers exclusively to water vapor and describes the fact that during the day the water vapor is given off by the cargo to the air in the container (desorption) faster than the cooling of the container air is introduces water vapor to the cargo (adsorption). The water vapor condenses on the walls of the container thus leading to damage. / Слово Адсорбция возникло путём совмещения двух Латинских слов Ad, означающее На или При, и Sorbeo, означающее Поглощаю. Под Адсорбцией понимается поглощение (сорбция) веществ из газовой или жидкой среды, называемой адсорбатом, поверхностным слоем твёрдого тела или жидкости, называемых адсорбентами. Адсорбентами служат синтетические и природные тела с высокоразвитой поверхностью. Они, как правило, имеют большую удельную поверхность – до нескольких сотен $м^2$/г. К твёрдым адсорбентам относятся активный уголь, алюмогель, силикагель и природные активные глины. Адсорбцию осуществляют в специальных аппаратах – адсорберах и применяют в промышленности для осушки газов, очистки органических жидкостей и воды, улавливания ценных или вредных отходов производства, при крашении тканей, в вакуумной технике и в другом.

ADSORPTION ISOTHERMS = ИЗОТЕРМЫ АДСОРБЦИИ – Adsorption Isotherms:- as used in the Container Handbook:- graphical representation of the uptake of water vapor by a substance at a specified temperature. For product information purposes, the sorption isotherms are usually taken for a temperature of 20 °C. / Под Изотермами, от Греческих слов Isos, означающее Одинаковый, Подобный или Равный, и Thérmē, означающее Тепло, понимаются линии, изображающие на диаграмме состояния

равновесный изотермический процесс. Слово Адсорбция возникло путём совмещения двух Латинских слов Ad, означающее На или При, и Sorbeo, означающее Поглощаю. Под Адсорбцией понимается поглощение (сорбция) веществ из газовой или жидкой среды, называемой адсорбатом, поверхностным слоем твёрдого тела или жидкости, называемых адсорбентами. Адсорбентами служат синтетические и природные тела с высокоразвитой поверхностью. Они, как правило, имеют большую удельную поверхность – до нескольких сотен $м^2$/г. К твёрдым адсорбентам относятся активный уголь, алюмогель, силикагель и природные активные глины. Адсорбцию осуществляют в специальных аппаратах – адсорберах и применяют в промышленности для осушки газов, очистки органических жидкостей и воды, улавливания ценных или вредных отходов производства, при крашении тканей, в вакуумной технике и в другом.

ADSORPTIVE FILTRATION = АДСОРБЦИОННАЯ ФИЛЬТРАЦИЯ (или АДСОРБИРУЮЩАЯ ФИЛЬТРАЦИЯ) – Adsorptive Filtration:- the attraction to, and retention of particles in, a filter medium by electrostatic forces, or by molecular attraction between the particles and the medium. See also Filtration. / Фильтрация через адсорбирующий слой.

ADT = AVERAGE DAILY TRAFFIC

ADTN = ADMINISTRATIVE DATA TRANSMISSION NETWORK

ADTR = AVERAGE DAY TRUE RANGE

ADULT = ВЗРОСЛОЕ (или ВЗРОСЛАЯ ОСОБЬ) – (1) Adult is the mature stage. (2) In Entomology, Adult is the mature stage of an insect which occurs after the nymphal or pupal stages. Adult insects usually have wings and mature sexual organs.

ADULTICIDE = АДУЛЬТИЦИД – Adulticide is a chemical, usually an insecticide, that is targeted toward the adult stage. / Адультицид – инсектицид, поражающий взрослых Насекомых, исключая личинки. Если он убивает яйца, то это – овицид, если личинок – лярвицид, если имаго – адультицид.

ADULT PLANT RESISTANCE = УСТОЙЧИВОСТЬ ВЗРОСЛОГО РАСТЕНИЯ (или РЕЗИСТЕНТНОСТЬ ВЗРОСЛОГО РАСТЕНИЯ) – Adult Plant Resistance is a resistance manifested mainly in maturing plants and less apparent in the seedling stage.

AD VALŌREM = АД ВАЛЁРЭМ (или ПО СТОИМОСТИ) – (1) Ad Valōrem is a term from Latin meaning, According To Value. Ad Valōrem:- any charge, tax, or duty that is applied as a percentage of value. Ad Valorem is a charge levied on persons or organizations based on the value of transaction. It is normally a given percentage of the price at the retail or manufacturing stage and is a common form of sales tax; e.g., Federal excise tax on new trucks and trailers. An ad valōrem duty is an import duty based on the value of an article as defined in the customs law of a particular country, rather than on weight or volume. A percentage of that value is charged, for example, 5% ad valōrem. Literally, (from Latin) According To The Value (not according to weight or units). Expression used to denote tariffs and duties that are based on the value of goods. Ad Valōrem tariffs differ from specific tariffs, which are based on a given physical quantity (i.e. number of units, weight), but not on value. / Ад Валёрэм, в переводе с Латинского ‘По Стоимости’ (а не по весу или количеству мест). Выражение используется для определения тарифов и пошлин, основанных на стоимости товара. Тарифы Ад Валёрэм или ценностные тарифы отличаются от специализированных тарифов, основанных на непосредственном количестве (то есть количестве мест, весе) тем, что имеют увязку к стоимости. Ад Валёрэм или По Стоимости – способ определения таможенных тарифов или налогов на товары или собственность. Например, расчёт таможенной пошлина Ад Валёрэм основан на заявленной стоимости импортируемого товара, а не на его весе или количестве. В городе Энглвуд (Штат Нью Джерси, США), налог на имущество взимается Ад Валёрэм, то есть на основе оценки стоимости объектов собственности, а не на основе их размеров. Ад Валорем:- (1) способ расчёта оплаты при перевозке ценных грузов; или (2) метод расчёта таможенных пошлин, которые привязаны к цене товара.

(2) For example, if a bill of lading shows a value for the cargo being carried, an Ad Valōrem charge will be levied. This charge is required because the insurance liability of the carrier increases. This charge may be a levied as a percentage of the value that has been shown. A freight rate set at a certain percentage of the value of an article is known as an Ad Valōrem Rate. In proportion to the value:- When applied to certain freight or customs duties levied on goods, property, etc set as a percentage of their value. When a shipper desires to be covered for a valuation in excess of that allowed by the carrier’s regular Bill of Lading, freight is assessed based on cargo value. Ad Valorem is a freight rate set at a certain percentage of the value of an article.

AD VALŌREM DUTIES = ПОШЛИНЫ АД ВАЛЁРЭМ (или ПОШЛИНЫ ПО СТОИМОСТИ) – Ad Valorem Duties are duties that are a fixed percentage of the price of the imported good. While conceptually straightforward, the administration of ad valorem duties may be complex, reflecting the practical difficulties in establishing the value of imported goods. An ad valorem duty, or tariff, is in contrast to the specific tariff, which is a flat rate tariff that is independent of the value of the import. Ad valorem duties, unlike specific tariffs, are flexible and adjust to changes in the price or the value of the import good. If the ad valorem tariff rate is 5 percent and the import price is USD100, the tariff revenue would be USD5. If the import price increases to USD150, then the per unit tariff revenue would be USD7.50. With an initial specific tariff of USD5 and an import price of USD100, the ad valorem tariff and the specific tariff are equivalent. However, once the import price increases to USD150, the specific tariff of USD5 translates into a tariff rate of 3.3 percent. This reduces the level of protection that domestic producers receive from the tariff structure. The ad valorem duty regime not only maintains the level of protection that domestic producers receive, it also increases the per unit import tariff revenue that the government receives when import prices are increasing. Ad valorem tariffs are therefore preferable to specific tariffs because they better achieve two of the primary aims of tariffs namely, protecting domestic firms and rising tariff revenues. Administration of ad valorem tariffs requires two factors:- the first is the ad valorem tariff rate and the second is the value of the import good. Key to answering the first question is the appropriate tariff classification for the import. Tariff classification may be critical as a change in classification may either lower or raise the ad valorem tariff rate. This is the first step in the customs valuation process. The second step in this process is determining the value of the import good. The value of the import good may be affected by the method used to determine the value of import goods. There are three import valuation methods that are frequently used:- Free Along Price (FAS) the price in the foreign market; Free on Board (FOB) the price in the foreign market plus the cost of loading the good onto transportation at its port of origin; and Cost, Insurance, and Freight (CIF) the cost in the foreign market plus insurance and freight costs incurred in delivering the good to its final destination port. In applying ad valorem tariff rates, the United States has traditionally used FOB valuations while European countries have traditionally used CIF valuations. Determining the import valuation basis does not fully resolve the question of correct import valuation. One further difficulty is that the price of the import good in the foreign market, which affects import prices independently of the valuation method used, may constantly change. This variability in the foreign market price complicates the task of establishing the value of the import good. With ad valorem tariffs, the tariff rate and import value jointly determine the import duties that are payable. Companies, therefore, have an incentive to shop custom classifications in order to reduce the tariff rate, and to under-invoice their imports in order to reduce the tariff rate. These incentives further complicate the process of administering ad valorem tariffs.

AD VALŌREM EQUIVALENT = ЭКВИВАЛЕНТ АД ВАЛЁРЭМ (или ЦЕННОСТНЫЙ ЭКВИВАЛЕНТ, или ЭКВИВАЛЕНТ ПО СТОИМОСТИ) – The Ad Valōrem Equivalent (AVE) is the equivalent in an ad valorem form of a tariff originally expressed as a specific or mixed duty. Expressing all tariffs in their AVE form was considered a nacassary step because of the tariff reduction option (the so-called Tiered Approach) adopted in the context of the round (Spring 2005) of WTO talks and the Doha Development Agenda (DDA). But, experts and negotiators are still discussing which of the different methodologies should be used to convert specific and mixed tariffs into their ad valorem equivalent. Each has very different and very significant implications for the negotiations. To convert a specific tariff into its AVE should, in principle, be simple:- it is enough to divide the tariff by the import unit value. For example, if the EU buyer imports 1 kg of cheese for which the import unit value is EUR28.00, and the specific tariff is EUR7.00/kg, the ad valorem equivalent is 25% of the import price. However, this apparent simplicity can be complicated by several factors, the most fundamental of which is the price used to make the conversion. Import unit value calculated on the basis of the world imports is often much lower than that recorded for EU imports. This is because if an AVE is calculated by dividing the tariff by the aggregate world price, it will result in a much higher figure than an AVE calculated by dividing the tariff by the high EU import price. Ad Valorem is a set percentage of the value of dutiable goods determined by the price at the port of shipment and calculated for duty assessment.

AD VALOREM TARIFF = ТАРИФ АД ВАЛЁРЭМ (или ТАРИФ ПО СТОИМОСТИ) – Ad Valorem Tariff is a tariff expressed as a percentage of the value of the goods cleared through customs.

AD VALŌREM TAX RATE = НАЛОГОВАЯ СТАВКА АД ВАЛЁРЭМ (или ЦЕННОСТНАЯ НАЛОГОВАЯ СТАВКА, или СТАВКА НАЛОГА ПО СТОИМОСТИ) – The Ad Valōrem Tax Rate is the percentage applied to a tax base to determine the amount of tax payable. / Налоговая Ставка Ад Валёрэм или Ценностная Налоговая Ставка или Ставка Налога По Стоимости представляет собой процент, применяемый к налоговой базе, для определения суммы уплачиваемого налога.

ADVANCE = ADVANCED DRIVER AND VEHICLE ADVISORY NAVIGATION CONCEPT

ADVANCE = АВАНС – Advance is a part-payment for work contracted made ahead of total payment, before the goods or services contracted for have been rendered. Sometimes, if payment depends on sales, the advance is set against those sales. See also Earnest Money. Payment of money before legally due. The term connotes an expectation that the sum will be repaid from identified receipts or in the short term, or applied to a definite act (such as an advance against salary). An Advance Payment, or simply an Advance, is the part of a contractually due sum that is paid or received in advance for goods or services, while the balance included in the invoice will only follow the delivery. It is called a Prepaid Expense in accrual accounting for the entity issuing the advance. Advance is:- (1) an increase in the interest rates, or in the market price of a commodity, good, property, or security; and (2) alternative term for Advance Payment. Advance is defined as a movement forward or an improvement. Advance, implies money paid before goods are delivered, or upon consignment. It is usual with merchants to advance from a half to two thirds of the value of goods consigned to them, on being required, on their receiving invoice, bill of lading, orders to insure them from sea risk, etc. / Выплата средств до обязательного срока оплаты. Этот термин выражает ожидание того, что сумма будет восполнена из определённых поступлений или в короткий срок, или направлена на определённое действие (такое как выдача аванса в счёт заработной платы). Под Авансом, от Французского слова Avance, понимается денежная сумма или иная имущественная ценность, выданная в счёт предстоящих платежей по договору одним контрагентом другому. В отличие от Задатка аванс не является способом обеспечения обязательства по договору. Смотрите также Задаток (Earnest Money). Аванс – деньги, выданные работнику до того, как они ему потребуются или он их заработает. Аванс на командировочные расходы выдаётся заранее, чтобы работник мог воспользоваться деньгами во время предстоящей деловой поездки. Авансовая выплата по заработной плате помогает работнику покрыть расходы на жизненные нужды до получения основной суммы заработной платы. (2) В индустрии ценных бумаг:- повышение, авансирование. Увеличение цены акций, облигаций, товаров или других активов. Это слово часто можно услышать, когда говорят об изменении индексов, составляемых на основе котировок, например:- Сегодня Индекс от Дау Дьжонз повысился (advanced) на 15 пунктов. (3) В торговле:- задаток, кредит, ссуда. Авансовый платёж за товары или услуги, которые будут поставлены в будущем. Например, подрядчики требуют задаток (аванс) от будущих домовладельцев, на оплату приобретаемых ими строительных материалов. Аванс – предварительная выплата заказчиком определённой денежной суммы в счёт предстоящих платежей за поставленные ему товары, выполняемые для него работы, услуги. Обычно в виде аванса выплачивается часть будущей суммы оплаты, составляющая 10–40% её общего объёма. Аванс представляет форму предоплаты, призванную заинтересовать исполнителя, гарантировать получение денег со стороны заказчика, возместить предстоящие расходы со стороны исполнителей. В случае расторжения договора аванс подлежит полному или частичному возврату. Распространённые формы аванса:- выдача работнику заранее части заработной платы, предоставление денежных сумм командированному перед выездом в командировку. Аванс засчитывается как часть оплаты при окончательном расчёте заказчика с исполнителями.

ADVANCE = ОПЕРЕЖЕНИЕ (или ПРЕДВАРЕНИЕ) – Advance:- a container loaded aboard vessel that was booked to a later vessel. To move cargo up line to a vessel leaving sooner than the one booked. See also Roll. / Контейнер, погруженный на борт судна, который изначально был забронирован под более позднее судно. Помещать груз внутрь линии судна, отбывающего ранее другого судна, которое предоставляло бронь под данный груз. Смотрите также Перенос (Roll).

ADVANCE AGAINST COLLECTION = АВАНС ПРОТИВ ИНКАССО – Advance Against Collection is a short-term loan that a bank makes to an exporter, secured by what the exporter is owed by an importer. The bank may collect these funds from the importer directly. If the importer does not make payment, the bank retrieves the advanced against collection loan from the exporter. Advance Against Collection is a short term loan credited to seller upon acceptance of the draft by the buyer. Advance Against Collection is a short term bank-loan advanced to a seller/exporter against his or her time-draft accepted by a buyer/importer. The loan amount is deducted by the bank when payment is received from the buyer/importer, otherwise it is recovered from the seller/exporter. Advance Against Collection is a bank loan that is short term given to an exporter or seller. It is paid when the buyer pays for the shipment. The bank can take their money out at that point. If this does not occur the seller is responsible to pay. / Краткосрочный займ, предоставленный продавцу, при акцепте тратты покупателем.

ADVANCE AGAINST DOCUMENTS = АВАНС ПРОТИВ ДОКУМЕНТОВ (или АВАНС ПОД ДОКУМЕНТЫ) – Advance Against Documents is a payment made by a buyer prior to the delivery of shipping documents. Advance Against Documents is a short term loan advanced against documents of title (such as shipping documents) as a type of acceptance credit. / Аванс Против Документов:- платёж, произведённый покупателем до поставки отгрузочных сопроводительных документов.

ADVANCE AND PROGRESS PAYMENTS = АВАНС И ПОСЛЕДУЮЩИЕ ПЛАТЕЖИ – Advance And Progress Payments are the payments made for goods in advance of completion and delivery of the goods. Also referred to as Stage Payments.

ADVANCE ARRANGEMENT = ПРЕДВАРИТЕЛЬНАЯ ДОГОВОРЁННОСТЬ – Advance Arrangement is an agreement between the shipper and the carrier, concerning contacts between those parties prior to tendering the consignment.

ADVANCED AMOUNT = АВАНСИРОВАННАЯ СУММА – Advanced Amount is a quantity of cash or cash equivalents expressed in a monetary amount given to a driver to cover expenses during a trip. / Количество денежных средств или их эквивалентов, выраженное в виде денежной суммы, переданное водителю для покрытия расходов в процессе поездки. Авансированные Средства – денежные средства, выданные или выделенные под выполнение заранее поставленных задач, для достижения определённых целей.

ADVANCED CHARGE = АВАНСИРОВАННЫЙ СБОР – An Advanced Charge is the amount of freight or other charge on a shipment advanced by one transportation line to another, or to the shipper to be collected from the consignee. Transportation charge advanced by one carrier to another to be collected by the later carrier from the consignor or consignee.

ADVANCED COMPOSITE = ПЕРЕДОВОЙ (или ПРОДВИНУТЫЙ) КОМПОЗИТ – Advanced Composite is a polymer, resin, or other matrix-material system in which reinforcement is accomplished via high-strength, high-modulus materials in continuous filament form or is discontinuous form such as staple fibers, fibrets, and in-situ dispersions. See also Composite.

ADVANCE DECLINE LINE = ЛИНИЯ ПОВЫШЕНИЯ ПОНИЖЕНИЯ (или ЛИНИЯ ПРИРОСТА ПРОСАДКИ) – One of the most widely used indicators to measure the breadth of a stock market advance or decline. The AD line tracks the net difference between advancing and declining issues. It is usually compared to a market average where divergence from that average would be an early indication of a possible trend reversal. The Advance-Decline Line is the most cited and least understood of all market indicators. The most commonly cited A-D Line is simply a running total of the daily advances minus declines for the NYSE®; however, an A-D Line can be calculated for any market index for which daily advancing and declining issues are reported. The resulting A-D Line is a measure of 'breadth', a common term applied to advance-decline indicators. The A-D Line is compared to its related market index to see if price and breadth are moving together. / В техническом анализе биржевых рынков . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Соотношение Повышения Понижения (ПП или П–П) – отношение числа акций, котировки которых поднялись, и количества акций, котировки которых упали, в течение определённого периода времени. Отражает общее направление динамики рынка. Считается, что рынок растёт, если число акций, котировки которых поднялись, превышает число акций, котировки которых упали в данный торговый день. Рынок падает, если спад котировок превышает подъём. Наклон кривой подъёма-спада (кривой A-D) графически показывает, каким будет наступающий период на рынке – периодом подъёма или периодом спада.

ADVANCE DECLINE RATIO = СООТНОШЕНИЕ ПОВЫШЕНИЕ ПОНИЖЕНИЕ (или СООТНОШЕНИЕ ПРИРОСТ ПРОСАДКА) – Advance Decline Ratio is the ratio of advancing issues over declining issues. Taking the moving average of the Advance Decline (AD) ratio will smooth it so it can be used as an overbought and oversold indicator. / В техническом анализе биржевых рынков .

ADVANCED GENERATION = ПЕРЕДОВАЯ (или ПРОДВИНУТАЯ, или ПОСЛЕДУЮЩАЯ) ГЕНЕРАЦИЯ (или ПЕРЕДОВОЕ (или ПРОДВИНУТОЕ, или ПОСЛЕДУЮЩЕЕ) ПОКОЛЕНИЕ) – Advanced Generation is a generation later than the fourth or fifth after crossing. In general, most of the major genes are fixed at the advanced generation.

ADVANCED INTERLINE = ПРЕДВАРИТЕЛЬНАЯ ПРОМЕЖУТОЧНАЯ ЛИНИЯ – Advanced Interline:- an interline carrier that picks up cargo from the shipper and delivers it to another carrier for shipment to the consignee.

ADVANCED MULTIHULL DESIGN = УСОВЕРШЕНСТВОВАННЫЙ МНОГОКОРПУСНЫЙ ДИЗАЙН (или ПЕРЕДОВОЙ МНОГОКОРПУСНЫЙ ДИЗАЙН) – Advanced Multihull Design (AMD) is a description of vessel with more than one hull – catamaran or trimaran. / Под Многокорпусным Судном понимается плавучее сооружение, состоящее из двух (катамаран), трёх (тримаран) или более водоизмещающих корпусов, жёстко связанных между собой в надводной части либо общей надстройкой, либо соединительным мостом, либо балочными или ферменными связями. Большая удельная площадь палуб, отличная остойчивость многокорпусного судна открывают возможность для их использования в качестве пассажирских судов, паромов, научно-исследовательских, промысловых, буровых судов, плавучих кранов и платформ.

ADVANCED SHIPMENT NOTICE = ПРЕДВАРИТЕЛЬНОЕ УВЕДОМЛЕНИЕ ОБ ОТГРУЗКЕ – Advanced Shipment Notice is a list transmitted to a customer or consignor designating items shipped. May also include expected time of arrival. / Переданный заказчику или грузополучателю список отгруженных позиций. Может также содержать предполагаемое время прибытия.

ADVANCE FREIGHT = ФРАХТ ПОД АВАНС – Advance Freight refers to payment of bill of lading freight in advance. Advance freight can be partial payment or full payment of the bill of lading freight given in advance. The air and ocean freight charges are paid at the port of origin or loading. It is not refundable even if the shipment fails to arrive at its destination. Ordinary freight and chartered freight may be paid in advance either before the delivery of cargo or commencement of charter party. It qualifies as advance freight if it is not repayable in case of loss. It is not the ship owner but the party who paid the freight in advance who should insure the advance freight. Partial payment of the bill of lading freight in advance; in other respects is the same as guaranteed freight. Also known as Prepared Freight. See also Prepaid Freight. / Частичная предварительная оплата фрахта по коносаменту; в прочих аспектах это относится к тому же, что и Гарантированный Фрахт (Guaranteed Freight). Известен также как Подготовленный Фрахт (Prepared Freight).

ADVANCE NOTICE = УВЕДОМЛЕНИЕ ОБ АВАНСЕ – Advance Notice is the notification provided by the creditor to the debtor of the amount, and in some National Direct Debit Schemes, of the date on which the debit is to be collected. The notice can be provided as a separate piece of information, or via inclusion in a regular statement of account, bill, or invoice. / Уведомление, .

ADVANCE NOTE = ВЕДОМОСТЬ ОБ АВАНСАХ (или ВЕДОМОСТЬ О ЗАРАБОТНОЙ ПЛАТЕ, или ПЛАТЁЖНАЯ ВЕДОМОСТЬ) – Advance Note is a draft on a shipowner for wages, given to a seaman on signing Articles of Agreement and redeemable after the ship has sailed with the seaman on board.

ADVANCE PAYMENT = АВАНСОВЫЙ ПЛАТЁЖ (или ПРЕДОПЛАТА) – Advance Payment:- funds given by the buyer of goods to the seller prior to shipment, often just a percentage of the value of the goods with the remainder paid after shipment. / Денежные средства, предоставленные покупателем продавцу товаров перед их отгрузкой, часто проявляется в форме процента от общей стоимости товаров, а остаток, оплачивается после отгрузки. Авансовый Платёж:- внесение денежных средств, осуществление платежа в счёт оплаты товаров, работ, услуг до их получения или выполнения. Это одна из форм вложений в дело, включается в активы фирмы, предоставившей аванс.

ADVANCE PAYMENT BOND = ОБЯЗАТЕЛЬСТВО ВОЗВРАТА АВАНСОВОГО ПЛАТЕЖА – Advance Payment Bond is a company's guarantee (usually through its bankers) that any advance payment will be refunded to a customer if the company cannot deliver the goods or services contracted for. Bond, guarantee, or standby letter of credit given by a seller receiving an advance payment to the buyer to assure that the funds will be returned if goods are never shipped. Also known as Advance Payment Guarantee.

ADVANCE PAYMENT GUARANTEE = ГАРАНТИЯ ВОЗВРАТА АВАНСОВОГО ПЛАТЕЖА – Advance Payment Guarantee is used in import-export business, but also in domestic commercial business, trade and industry. Its purpose is to secure any claims by the

buyer on the seller for reimbursement of the buyer's advance payment on the contract price before delivery of the goods (or advance payment of the full contract price) – in the event that the seller has failed to meet his or her contractual delivery obligations in full. Guarantee amount is the amount of the instalment or advance payment. Term is up to delivery of the goods plus, e.g., 15 days. If a documentary credit was opened in connection with the underlying transaction and advised by bank, the following clause may be included in the guarantee if the shipping documents are submitted to the bank:- 'Our guarantee will be automatically reduced by … per cent of the invoice value with each part-shipment made by … (supplier). Evidence of delivery is deemed to have been provided once … (supplier) has submitted the proper documents to the bank … under documentary credit no. …'. Also known as Advance Payment Bond. Advance Payment Guarantee supports an obligation to account for an advance payment made by the beneficiary to the principal/applicant. Banks recommend that an advance payment guarantee contain a clause that the guarantee is inoperative until the advance payment has been received by the principal/applicant, as well as a clause allowing for reductions of the guarantee amount. Advance Payment Guarantee is used where the applicant calls for the provision of a sum of money at an early stage of the contract. The beneficiary can recover the amount paid in advance, or a part thereof, if the applicant fails to fulfil their underlying contractual obligations. It may provide for pro rata reductions to the guarantee amount on presentation of certain documents or on a specified date or dates. Duration of the guarantee will depend on the underlying contract, but many run up to the anticipated date of the final delivery, plus a grace period to allow the beneficiary to make demand in the event of non-performance of the obligations covered by the guarantee. / Гарантия Возврата Авансового Платежа – обязательство банка, выданное по приказу продавца, получающего аванс от покупателя, вернуть аванс покупателю в случае невыполнения продавцом своих обязательств по поставке.

ADVANCE SHIPPING NOTICE = ЗАБЛАГОВРЕМЕННОЕ (или ПРЕДВАРИТЕЛЬНОЕ) УВЕДОМЛЕНИЕ ОБ ОТГРУЗКЕ – An Advance Shipping Notice (ASN) is received from the client to inform Logistics Depot, LLC (LD) of the contents of an inbound shipment prior to its arrival. The ASN is referred to in the LD Warehouse Management System as an 'In-transit', i.e. on its way. An ASN can be communicated by telephone, fax, email or the electronic data interchange (EDI). It should include product detail and preferably also includes inbound vehicle information (trailer number, railcar number, etc). The advance shipping notification provides details on the products being shipped such as roll or carton ID numbers.

ADVANCING = ПОВЫШЕНИЕ (или РОСТ) – Advancing is a market stage of a stock that is characterized by an uptrend with subsequently higher highs and higher lows. / Временной период на фондовом рынке, который характеризуется тенденцией роста, когда каждый последующий максимум и минимум цены становятся всё более высокими.

ADVANCING–DECLINING ISSUES = ИТОГИ ПОВЫШЕНИЯ–ПОНИЖЕНИЯ (или ИТОГИ РОСТА–ПАДЕНИЯ) – The Advancing-Declining (A/D) Issues is a market momentum indicator which shows the difference between stocks listed on the New York Stock Exchange (NYSE®) that advanced in price minus those that declined. As of this writing, about 2 500 issues trade each day on the NYSE®. The difference between the number of advancing and declining issues is the foundation of many market breadth indicators. These indicators include the Advance/Decline Line, Advance/Decline Ratio, Absolute Breadth Index, Breadth Thrust, McClellan Oscillator and Summation Index. Indicators that use advancing and declining issues in their calculations are called Market Breadth Indicators. Interpretation:- the Advancing-Declining Issues indicator shows the difference between the number of advancing issues and the number of declining issues. Plotted by itself, this indicator is helpful to determine daily market strength. Strong up days generally show readings of more than +1 000. Very weak days have readings of less than –1 000. I prefer to plot a 5-to-40 day exponential moving average of the Advancing-Declining Issues rather than the daily values themselves. The moving average creates an excellent short-term overbought/oversold indicator. Both the Overbought/Oversold indicator and the McClellan Oscillator are created using moving averages of advancing minus declining issues. Example:- the following chart shows the DJIA and a 40-day moving average of the Advancing-Declining Issues indicator. I drew 'buy' arrows when the moving average rose above –50 and 'sell' arrows when it fell below 125. Normally, I would use 100, but the strong up-trend during this period caused the indicator to have an upward bias. Calculation:- the Advancing-Declining Issues is calculated simply by subtracting the number of declining issues from the number of advancing issues, i.e.:- Advancing Issues – Declining Issues. The following table shows the calculation of the Advancing-Declining Issues (in the following format:- Date – Advancing – Declining – A/D):- (i) 02/15/94 – 1 198 – 882 – 316; (ii) 02/16/94 – 1 183 – 965 – 218; (iii) 02/17/94 – 882 – 1 251 – –369; (iv) 02/18/94 – 706 – 1411 – –705; and (v) 02/22/94 – 1 139 – 1003 – 136. Advancing-Declining Issues or Advancing/Declining Issues:- a market momentum indicator using the advancing issues and the declining issues. It subtracts the declining issues from the advancing ones and is usually smoothed to make it a good overbought oversold indicator. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). В техническом анализе биржевых рынков, индикатор Итоги Повышения-Понижения (или Итоги Роста-Падения) является индикатором момента рынка, использующим итоги повышения и итоги понижения цен на соответствующем рынке. Он вычитает результаты понижения из результатов повышения и обычно сглажен, что делает его хорошим индикатором перекупленности или перепроданности.

ADVENTITIOUS = ПРИДАТОЧНОЕ – Adventitious:- arising in an irregular or unusual position such as roots arising other than from the radicle or primary root system; adventitious buds forming along a stem, generally in response to an injury. Not in the usual place.

ADVENTITIOUS PROP ROOTS = ПРИДАТОЧНЫЕ ХОДУЛЬНЫЕ КОРНИ (или ПРИДАТОЧНЫЕ СТОЛБОВИДНЫЕ КОРНИ) – Adventitious Prop Roots are roots formed at the higher nodes above the soil surface. / Придаточные Ходульные Корни – корни, сформированные на более высоких узлах над поверхностью суши.

ADVENTITIOUS ROOTS = ПРИДАТОЧНЫЕ КОРНИ – Adventitious Roots are roots developing from the part of a plant other than roots, which are formed from nodes of the plant. After 10–20 days of growth, all roots of the rice plant are adventitious roots. / придаточные корни. Придаточные Корни:- специальные корни, которые возникают на надземных органах и придают растению стабильность.

ADVENTURE = АВАНТЮРА – (1) Adventure is a shipment of goods on shipper's own account. A bill of adventure is a document signed by the master of the ship that carries goods at owner' risk. / Приключение; похождение. Огрузка товаров за собственный счёт отправителя. Коносамент авантюры – документ, подписанный хозяином (капитаном) судна, которое перевозит товары на риск самого их собственника (владельца).

(2) Adventure is the exposure of property to risk at sea. Commercial or financial risk. / Подвергание имущества риску на море. Коммерческий или финансовый риск. Рискованное, сомнительное предприятие, рассчитанное на случайный успех.

ADVERSE EXCURSION = НЕБЛАГОПРИЯТНАЯ ЭКСКУРСИЯ (или НЕБЛАГОПРИЯТНОЕ РАЗВИТИЕ СИТУАЦИИ) – Adverse Excursion:- the loss attributable to price movement against the position in any single trade.

ADVERSE OPINION = НЕБЛАГОПРИЯТНОЕ МНЕНИЕ – Adverse Opinion is a professional opinion made by an auditor indicating that a company's financial statements are misrepresented, misstated, and do not accurately reflect its financial performance and health. Adverse opinions are usually given after an auditor's report, which can be internal or independent of the company. Adverse opinions are not a good thing for companies because it implies wrongdoing. An adverse opinion is a red flag for investors and can have

major negative effects on stock prices. Auditors will usually give a red flag if the financial statements are significantly different from generally accepted accounting principals (GAAP). Adverse Opinion is an expression of an opinion in an auditor's report which states that financial statements do not fairly present the financial position, results of operations and cash flows in conformity with Generally Accepted Accounting Principles (GAAP). An Adverse Opinion is a report that is rendered by an accounting professional after examining the accounting statements and records of a business or other entity, if the records and statements are found to not be in compliance with recognized accounting standards. The issuance of this type of financial statements opinion is considered extremely serious, and is only done when the lack of documentation and verifiable accounting is so pervasive that there is no way to reconcile the conflicting records. In some countries, the rendering of an adverse opinion audit can lead to investigation by regulatory authorities, especially when the organization is structured as a for-profit entity. A certified public accountant may issue an adverse opinion after conducting an audit of an organization's accounting records. The purpose of the audit is to make sure that all resources of the entity are properly accounted for in the accounting books, and thus eliminate any question about the proper use of those resources. When the certified public accountant (CPA) finds irregularities in the way transactions are documented, or in how expenditures are accounted for, he or she will normally seek to identify if the problem is simply incorrect posting of various line items, or if there was a deliberate attempt to falsify the financial records. The former situation can normally be resolved in a short period of time, but the latter may require that the CPA issue a negative financial statements opinion, thus paving the way for regulatory agencies to investigate the matter in more detail. In the event that an adverse opinion is issued, the organization normally has a period of time to bring the financial accounting into compliance with generally accepted accounting principles, sometimes referred to as GAAP. At the end of that grace period, a second audit takes place. If the results of that second audit show that the organization has brought its accounting into compliance with prevailing accounting standards, the adverse opinion can be reversed, and the books are certified as complete and in proper order. A business or other entity can avoid the rendering on an adverse opinion by making sure that all financial records are kept in proper order. This means maintaining the backup documentation that serves as the evidence for each entry made into the accounting books. By keeping the accounts payable and receivable up to date and accurate, it is much easier to supply an auditor with everything he or she needs to evaluate the financial record keeping of the organization, and render a favorable opinion that attests to the accuracy of the accounting. / Неблагоприятное Мнение или Заключение – заключение независимой аудиторской компании о том, что финансовая отчётность фирмы неточно отражает её текущее финансовое положение или результаты её деятельности. Неблагоприятное заключение это более жёсткая оценка, чем квалифицированное заключение (qualified opinion), в котором только отдельные пункты вызывают беспокойство аудиторов. Инвесторы должны быть предельно осторожными, рассматривая вопросы об инвестировании средств в компанию, о деятельности которой аудиторы выдали неблагоприятное заключение.

ADVERSE SELECTION = НЕБЛАГОПРИЯТНЫЙ ОТБОР – Adverse Selection is:- (1) the tendency of those in dangerous jobs or high risk lifestyles to get life insurance. In order to fight adverse selection, insurance companies try to reduce exposure to large claims by limiting coverage or raising premiums. (2) A situation where sellers have information that buyers don't (or vice versa) about some aspect of product quality. Adverse Selection is a selection against the insurance company; the tendency of more poor risks to buy and maintain insurance than good risks. Adverse Selection is a term used primarily in insurance although it is useful for other industries, as well. It refers to a situation in which the buyer or seller of a product knows something about the product quality or condition that the other party does not know, allowing them to have a better estimate of what the true cost of the product should be. In the case of life and health insurance policies, for instance, adverse selection means that insurance is going to be more expensive than it should be for those who are healthy and responsible, and less expensive than it should be for those who are unhealthy and likely to need medical attention. The insurance company cannot possibly know the individual factors that determine every single person's health file, so insurance rates are overpriced to good risk and underpriced to bad risk. If not managed properly, adverse selection can result in a 'book' of insurance business of extremely bad policies that will cost the company substantial sums of money and, in some cases, drive it out of business. / Негативный Отбор – тенденция покупать страхование в случае наличия реальных рисков. Страховые компании обычно повышают ставки премии для носителей рисков или ограничивают страховую сумму для них, так как среднестатистические расчётные риски не отражают реального положения дел для таких людей, например, страхование серьёзно больных людей явно не может быть эффективным, если брать расчётный риск болезни или смерти для среднестатистического гражданина. Неблагоприятный Выбор – склонность людей при заключении соответствующих договоров страхования скрывать реальную информацию о себе. Например, люди, у которых имеются какие-то проблемы со здоровьем, хотят купить полис страхования здоровья, а люди, которые должны поехать в опасное место, например, в зону военных действий, хотят застраховать свою жизнь на как можно большую сумму. Компании, чьи рабочие должны трудиться в опасных условиях, хотят застраховать их от несчастного случая на производстве и потери трудоспособности. В качестве мер против неблагоприятного выбора страхуемого лица, страховые компании пытаются сократить свои потенциальные потери от выплат по таким договорам страхования путём повышения размера страховых взносов либо ограничением суммы выплаты по полису для обращающихся за страхованием.

ADVICE = АВИЗО (или ИЗВЕЩЕНИЕ) – (1) Advice is the official notice regarding a business's transactions with a bank, i.e. advice of fate, advice of payment, credit advice, etc. Advice, is usually given by one merchant or banker to another by letter, informing him of the bills or drafts drawn on him, with all particulars of date, or sight, the sum, to whom made payable, etc. Where bills appear for acceptance or payment, they are frequently refused to be honoured for want of advice. It is also necessary to give advice, as it prevents forgeries:- if a merchant accept or pay a bill for the honour of any other person, he is bound to advise him thereof, and this should always be done under an act of honour by a notary public. / Авизо или Извещение – официальное уведомление о финансовых операциях предприятия, осуществлённых банком, например, авизо об участи, авизо платежа, кредитовое авизо и так далее. Авизо – извещение, направляемое банком его клиенту или банку корреспонденту; кредитовое авизо – сообщение о зачислении средств на счёт (кредитовании), дебетовое авизо – сообщение о списании средств со счёта (дебетовании).

(2) Advice is a message where the sender notifies the receiver of an activity that has been taken, requiring no approval but requiring a response. / Извещением признаётся сообщение от отправителя, которое уведомляет получателя о предпринятых действиях. Оно не требует одобрения, но требует ответа. Под Авизо понимается извещение об изменениях в состоянии взаимных расчётов, направляемое одним контрагентом другому.

ADVICE NOTE = НОТА ИЗВЕЩЕНИЯ – Advice Note is a notice from a supplier giving details of goods ordered or delivered. It either accompanies or precedes the shipment, and precedes the invoice. See also Delivery Note. A written piece of information, e.g., about the status of the goods. / , например, .

ADVICE OF LETTER OF CREDIT = ИЗВЕЩЕНИЕ ОБ АККРЕДИТИВЕ – Advice Of Letter Of Credit (L/C) means the notification of the received L/C or its amendments to the beneficiary by the bank. Features:- the product can help the beneficiary (exporter) under the L/C timely receive the L/C or its amendments verified of their genuineness. Target Customers:- beneficiary under L/C. Application Qualifications:- (i) the applicant shall hold a business license of legal person that has passed the annual inspection or other valid

certificates which fully prove its legal operation and scope of business; and (ii) the applicant shall have the qualification to engage in import and export trade. Process:- (i) after the bank receives the foreign L/C or its amendments, it will verify its genuineness by checking the speciman/stamp or test keys; and (ii) the bank will notify the beneficiary the L/C or its amendments, advise the beneficiary of potential risks in the L/C terms.

ADVICE OF SHIPMENT = ИЗВЕЩЕНИЕ ОБ ОТГРУЗКЕ – Advice Of Shipment is a notice sent to a local or foreign buyer advising that shipment has gone forward and containing details of packing, routing, etc. A copy of the invoice is often enclosed and, if desired, a copy of the bill of lading. / Уведомление, направленное местному или иностранному покупателю, извещающее его о том, что отгрузка состоялась, и содержащее сведения об упаковке, маршруте и так далее. К этому извещению достаточно часто прилагается копия счёта-фактуры, а в случаях необходимости – и копия коносамента.

ADVISING BANK = АВИЗУЮЩИЙ БАНК (или ИЗВЕЩАЮЩИЙ БАНК) – Advising Bank is a bank where a shipper negotiates documents or where documents are first presented, usually at country of origin. Also, often referred to as the Negotiating Bank. Bank in an exporter's country, which deals with letters of credit from a foreign bank, that tells the exporter when such credit has been opened with the foreign bank. The bank that advises the credit at the request of the issuing bank. A bank operating in the seller's country, that handles letters of credit in behalf of a foreign bank. Advising Bank is a bank operating in the exporter's country that handles letters of credit for a foreign bank by notifying the exporter that the credit has been opened in his favor. Advising Bank is a domestic bank which handles letters of credit for a foreign bank by notifying the exporter that the credit has been opened in his favor, fully informing him of the conditions and terms without responsibility on the part of the bank. An Advising Bank, usually a foreign correspondent bank of the issuing bank will advise the beneficiary. Generally, the beneficiary would want to use a local bank to insure that the letter of credit is valid. In addition, the advising bank would be responsible for sending the documents to the issuing bank. The advising bank has no other obligation under the letter of credit. If the issuing bank does not pay the beneficiary, the advising bank is not obligated to pay. / иностранный банк. Авизующий Банк – банк, авизующий аккредитив бенефициару без обязательств со своей стороны.

ADVISORY = СОВЕЩАТЕЛЬНОЕ (или КОНСУЛЬТАТИВНОЕ) – Advisory:- of or pertaining to giving information and especially a warning.

ADVISORY BOARD OF DIRECTORS = СОВЕЩАТЕЛЬНЫЙ СОВЕТ ДИРЕКТОРОВ (или КОНСУЛЬТАТИВНЫЙ СОВЕТ ДИРЕКТОРОВ) – In the United States, an Advisory Board Of Directors are individuals appointed to advise an elected board of directors. This board is not bound by the duties imposed upon elected board members, and the corporation is not required to follow their recommendations.

ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ) – An Advisory Committee is a formal advisory body made up of representatives from the Internet community to advise the Internet Corporation for Assigned Names and Numbers (ICANN) on a particular issue or policy area. Several are mandated by the ICANN Bylaws and others may be created as needed. Advisory committees have no legal authority to act for ICANN, but report their findings and make recommendations to the ICANN Board. / Совещательный Комитет или Консультативный Комитет – официальный консультативный орган, состоящий из представителей Интернет сообщества и предназначенный для консультирования Корпорации Интернета по Распределению Имён и Номеров (КИРИН) по конкретным вопросам или в области разработки политики. Некоторые члены комитета назначаются в соответствии с Уставом КИРИН, другие могут назначаться по необходимости. Консультативный комитет не имеет полномочий действовать от лица КИРИН, но может докладывать о своих результатах и давать рекомендации Правлению КИРИН.

ADWARE = РЕКЛАМНАЯ ПРОГРАММА (или ХХ) – Adware (from the Advertising-Supported Software) is any software application that plays, displays, or downloads advertising content to a user's computer. Typical features are pop-up windows or banners, changes to home page and search engine settings in the web browser, and so forth. Some adware is installed with the computer-user's permission:- for example, during the installation of a legitimate application with which the adware is bundled. This is the case with various dubious toolbars. The Anti-spyware Coallition defines Adware as a type of advertising display software that delivers advertising content potentially in a manner or context that may be unexpected and unwanted by users.

ADX = AVERAGE DIRECTIONAL MOVEMENT INDEX

AE = ACCOUNT EXECUTIVE

AE = UNITED ARAB EMIRATES

AEA = ASSOCIATION OF EUROPEAN AIRLINES

AED = UNITED ARAB EMIRATES DIRHAM

AEG = AIRCRAFT EVALUATION GROUP

AENEA = АЭНЭА (или БРОНЗОВОЕ) – Aenea (-us, -um):- bronze colored.

AERATE = АЭРИРОВАТЬ (или НАСЫЩАТЬ ВОЗДУХОМ) – Aerate:- to impregnate with a gas, usually air.

AERATION = АЭРАЦИЯ – (1) Aeration is the state of air being suspended in a liquid such as a lubricant or hydraulic fluid. Aeration (also called Aerification) is the process by which air is circulated through, mixed with or dissolved in a liquid or substance. Aeration is a well established water treatment mass transfer process that has been used to remove volatile gases from or to add oxygen to water supplies. / Под Аэрацией, от Греческого слова Aer, означающее Воздух, понимается искусственное насыщение различных сред воздухом для окисления содержащихся в них органических веществ. Применяется, например, для очистки питьевой и сточных вод. Аэрация воды насыщение воды кислородом воздуха. Аэрация воды производится:- в очистных водопроводных сооружениях с целью удаления из воды гидроокиси железа, свободной углекислоты и сероводорода, что существенно улучшает её качество; в сооружениях биологической очистки сточных вод (аэротенках, аэрофильтрах, биофильтрах) для обеспечения жизнедеятельности микроорганизмов (аэробных бактерий), осуществляющих процесс минерализации растворённых в сточных водах органических веществ и других загрязнений.

(2) The Aeration and Ventilation of multi-storey buildings where the air has to travel long distances or buildings requiring superior air quality can frequently only be achieved using ventilators. With mechanical aeration and ventilation systems it is extremely important that the volume of air actually required is determined with the utmost precision. The motto is:- as much air as is required, right where it is really needed. This is the only way to reduce energy costs to an absolute minimum. / Под Аэрацией, от Греческого слова Aer, означающее Воздух, понимается регулируемый естественный воздухообмен в промышленных зданиях. Осуществляется через проёмы (окна) в стенах зданий и вентиляционные фонари за счёт разности плотностей наружного и внутреннего воздуха. Используется главным образом в так называемых горячих цехах (кузнечных, литейных и так далее). Аэрация зданий,

организованный естественный воздухообмен, осуществляемый за счёт разности плотностей наружного и внутреннего воздуха и воздействия ветра на стены и покрытия здания. Аэрация зданий применяется в промышленных зданиях и цехах (кузнечных, литейных, прокатных и тому подобных) со значительными избытками тепла, она позволяет осуществлять воздухообмены, достигающие миллионов кубических метров в час ($м^3$/ч), без затраты энергии на перемещение воздуха. При аэрации зданий наружный воздух поступает в помещение без подогрева через окна (проёмы) в нижней части здания и вытесняет тёплый и загрязнённый воздух через проёмы или аэрационные фонари в верхней части здания. В холодный период года, во избежание простудных заболеваний, для притока воздуха открывают проёмы на высоте не менее 4 метров (м) от пола. Для того чтобы ветер не нарушал работу вытяжных аэрационных фонарей, их делают незадуваемыми, устанавливая перед ними ветроотбойные щиты. Створки окон и фонарей снабжаются механическими устройствами для регулирования. Смотрите также Вентиляция.

(3) Aeration is the process of passing air currents through a grain stream. This process is used to remove objectionable odors or to preserve grain quality by reducing its temperature or moisture content. / В зерновой отрасли хозяйства под Аэрацией, от Греческого слова Aer, означающее Воздух, понимается процесс подачи потоков воздуха сквозь поток зерна. Этот процесс используется с целью удаления неприятных запахов или для сохранения качества зерна посредством снижения его температуры или содержания влаги.

(4) Soil Aeration is phenomenon of rapid exchange of oxygen and carbon dioxide between the soil pore space and the atmosphere, in order to prevent the deficiency of oxygen and/or toxicity of carbon dioxide in the soil air. The well aerated soil contains enough oxygen for respiration of roots and aerobic microbes and for oxidation reaction to proceed at optimum rate. Causes of Poor Aeration:- Compact soils of finer textures suffer from poor aeration. Cultivation (working-the soil when crops are growing) of soil prevents it. Water logging is another important cause of poor aeration especially in the case of soils of finer texture. The gaseous exchange between the soil air and the atmosphere may not be rapid enough to remove carbon dioxide from the soil air and to supply oxygen to the growing roots. This may happen if an excessive amount of readily decomposable organic matter has been added to the soil. Mechanism of Gaseous Exchange:- The exchange of gases between the soil air and the atmosphere takes place mainly by the following two mechanisms:- (i) Mass flow:- Gases may move in a mass in the soil or out of it. The soil temperature is higher than the atmospheric temperature at midday when the soil gases expand and move out of the soil pore space into the atmosphere. The soil is cooler than the atmosphere during right when the atmosphere. The soil is cooler than the atmosphere during night when the atmospheric gases enter the soil. When the atmospheric pressure is increased, volumes of gases present in the soil are decreased and therefore atmospheric gases enter the soil. Rain water displaces soil gases in the pore space and also carries gases dissolved in it to the soil. Rain fall usually account for 1/12 to $1/16^{th}$ of the normal soil aeration. Variations in temperature and pressure between the soil and at the atmosphere play an insignificant role in soil aeration. (ii) Diffusion:- Most of the gaseous interchange between the soil and the atmosphere takes place by diffusion. Diffusion is the process by which each gas tends to move in the space occupied by another as determined by the partial pressure of each gas. The partial pressure of a gas is the pressure which the gas would exert if it were present alone in the volume which has been occupied by the mixture of gases. The atmosphere contains higher amounts of oxygen than the pore spaces of soils which contain more carbon dioxide than the atmosphere. So the partial pressure of oxygen is higher in the atmosphere than in the soil pore space and the partial pressure of carbon dioxide is higher in soil pore spaces than in the atmosphere even though the total pressure in the atmosphere and the soil pore spaces may be the same. So oxygen moves in the soil and carbon dioxide moves out of the soil. Aeration Status of Soils:- It can be determined in the three ways, i.e.:- (i) Percentage oxygen and carbon dioxide content of the soil, (ii) Oxygen diffusion rate, and (iii) The oxidation reduction potential (Redox potential). (i) Percentage composition of soil air:- The average inorganic soil contains about eight times more carbon dioxide and a little less oxygen than the atmosphere as shown below:- Average Composition of Soil Air an Atmosphere:- (i) Nitorgen:- Atmosphere – 79.00% by Vol and Soil – 79.15% by Vol; (ii) Oxygen:- Atmosphere – 20.97% by Vol and Soil – 20.60% by Vol; and Carbon Dioxide:- Atmosphere – 0.03% by Vol and Soil – 0.25% by Vol. Well aggregated soils contain enough macrospores to keep the soil aerated for proper growth and functioning of roots and micro-organisms. After a heavy rain, the macrospores are filled up with water but the soil may still contain some quantity of air dissolved in water. So micro-organisms can grow for a short time only, after which the soil must be drained so that the macrospores are re-filled with air. (ii) Oxygen Diffusion Rate (ODR):- It determines the rate at which the oxygen should be supplied to the soil when it is being continuously used for the respiration of roots and soil micro-organisms. The growth of roots of most crops ceases when the oxygen diffusion rate decreases to about $20 \cdot 10^{-8}$ gm./sq. cm/min. It should be above $40 \cdot 10^{-8}$ gm./sq.cm/min. for good growth of most crops. (iii) Oxidation-reduction potential of soil. The oxidation potential of chemical systems including soil is a measure of the tendency of the oxidation reaction to occur in that system, including soils. This means that the system is in a reduced condition. Highly reduced soils have a high oxidation potential of +0.50 Volts. The reduction potential of a chemical system including soil is a measure of the tendency of the reduction reaction to occur in that system. This means that the system is an oxidized condition. Reduction Potential or Redox Potential (Eh) is the opposite in sign to the oxidation potential. So a highly reduced soil which has a tendency to be oxidized has a Reduction Potential or Redox Potential (Eh) of –0.50 Volts. Well drained and aerated soils which are highly oxidized usually have a redox potential of +0.50 Volts. The value of the Redox Potential increases when the oxygen content of soils decreases. Factors Affecting Soil Aeration:- (i) Soil organic matter:- When organic matter is added to the soil, it is readily decomposed by the soil micro-organisms to liberate the carbon dioxide content of the soil air. (ii) Since the top soil contains much more macrospore space than the subsoil, the opportunity for gaseous exchange is more in top soil than in the sub soil. Hence the oxygen content of the top soil is greater than that of the sub soil. (iii) Soil moisture:- The macrospores are filled up with water immediately after heavy rain when the oxygen content falls to near zero. When the soil is artificially drained again, the macrospores are filled up with air and the oxygen content of the soil increases. Importance of Soil Aeration:- Soil aeration affects the availability of some nutrients elements to plant roots. Manganese and iron occurs in the well aerated soil in their higher valent forms (Mn^{++++}, Mn^{+++}, Fe^{+++}) and in poorly aerated soils in their lower valent forms (Mn^{++}, Fe^{++}). They are available to plants only in their lower valent forms. Crops suffer from manganese toxicity if an excessive amount of manganese occurs in the soil in the soluble form. Manganese toxicity to plant roots, under this circumstance, may be corrected either by making the soil more aerated by tilling the soil and improving drainage of the soil or by increasing the soil pH by applying lime to the soil. When iron and manganese are in short supply to the soil, then the soil may be subjected to anaerobic condition by applying readily decomposable organic matter to it. Carbon dioxide would be produced from the decomposition of organic matter to make the soil relatively more anaerobic when manganese and iron will be reduced from their respective higher Volant (Mn^{++++}, Mn^{+++}, Fe^{+++}) forms to their respective lower valent form (Mn^{++}, Fe^{++}), i.e. divalent forms and would be available to plant roots. Ferric phosphate would be reduced to ferrous phosphate. Carbon dioxide produced from the decomposition of organic matter reacts with water to form carbonic acid which slowly dissolves insoluble phosphate. So the availability of phosphates (would be increased to the plant roots. Sulphur occurs as sulphate in well aerated soil. Plant roots assimilate sulphate. Sulphate is reduced to sulphide in poorly aerated (water logged) soils. Hydrogen sulphide is toxic to plant a root which suffers from it in water logged soil. Organic matter is decomposed by aerobic bacteria in well aerated soil when complex organic nitrogen and phosphorus compounds are decomposed to their respective simple inorganic compounds which plant roots readily assimilate symbiotic and non-

symbiotic nitrogen fixation takes place only in well aerated soils. Nitrates are reduced to oxides of nitrogen and nitrogen gases in poorly aerated soils. These gases escape to the atmosphere, long light coloured roots develop in well aerated soils. Root hairs develop best under well aerated condition. Roots get thicker, shorter and darker in anaerobic soils that also retard the development of root hairs. Poor aeration causes abnormal development of roots, e.g., abnormal shaped sugar beet and carrot roots have been found in poorly aerated soils. Nutrient absorption is an energy consuming process. Energy is available from respiration is expended in absorbing nutrient ions from the soil. Hence nutrient absorption is retarded in poorly aerated soils. If an excessive amount of readily decomposable organic matter has been added to the soil, then it would decompose to evolve high amounts of carbon dioxide to the soil. Consequently root growth and germination of seeds would be adversely affected. Some crops become infested with pathogens in poorly aerated soils. The incidence of will disease caused by the Fungus (Fusarium Sp.) has been attributed to poor aeration. Citrus and suffers from die-back in poorly aerated soils have also reviewed the works of some investigators who have observed that poorly aerated soils (waterlogged soils) has an effect on the pathogenicity of root infesting Fungi. Aeration involves perforating the soil with small holes to allow air, water and nutrients to penetrate the grass roots. This helps the roots grow deeply and produce a stronger, more vigorous lawn. The main reason for aerating is to alleviate soil compaction. Compacted soils have too many solid particles in a certain volume or space, which prevents proper circulation of air, water and nutrients within the soil. Excess lawn thatch or heavy organic debris buried under the grass surface can also starve the roots from these essential elements. / Аэрация почвы, газообмен почвенного воздуха с атмосферным. Аэрация почвы необходима для успешного роста и развития растений. При аэрации почвы происходит обогащение почвенного воздуха кислородом, а приземного надпочвенного – углекислотой. Смотрите также Почва.

AERA TRAFFIC CONTROL = AUTOMATED EN ROUTE AIR TRAFFIC CONTROL

AERCC = AGRICULTURAL ECONOMICS RESEARCH COUNCIL OF CANADA

AERENCHYMA = АЭРЕНХИМА – Aerenchyma:- the lysigenous intercellular spaces in the parenchyma layer forming a system of air passages which ramifies through the leaves, stems, and roots of a rice plant. / листья, стебли, и корни растения Риса. Под Аэренхимой, от Греческих слов Aer, означающее Воздух, и Enchyma, означающее Наполнение, здесь – Ткань, понимается воздухоносная ткань, рыхлая ткань растений, состоящая из тонкостенных паренхимных клеток, образующих перемычки между большими воздушными полостями. Аэренхима в узком смысле – ткань, возникающая при делении клеток пробкового камбия (смотрите Феллоген), в широком смысле – всякая ткань подобного строения. Аэренхима характерна для растений, плавающих на поверхности воды или погруженных в воду (смотрите Гидрофиты). Большие межклеточные пространства аэренхимы, заполненные воздухом, обеспечивают растению плавучесть и создают запас кислорода и углекислого газа, необходимых растению для его жизнедеятельности.

AERIAL = ВОЗДУШНОЕ – Aerial:- occurring above ground or water.

AERIAL BRANCHING AT NODES = ВОЗДУШНОЕ ВЕТВЛЕНИЕ (или РАЗВЕТВЛЕНИЕ) НА УЗЛАХ (или КОЛЕНАХ) – Aerial Branching at Nodes (Br):- new shoots which develop at nodes high on the culm following the cutting of panicles.

AERIAL ROOT = ВОЗДУШНЫЙ КОРЕНЬ (или НАДЗЕМНЫЙ КОРЕНЬ, или ПНЕВМАТОФОР) – Aerial Root is a root arising above ground, often from an axil. Provides a means for the plant to absorb moisture from the air. Aaerial roots are roots that grow above the ground from the nodes. / , часто из пазухи (axil). Под Пневматофорами понимаются надземные (воздушные) корни некоторых тропических деревьев, например, мангровых. Снабжают воздухом подземные части растений, растущих на бедных кислородом заболоченных почвах или по берегам морей в зоне прилива. Воздушные Корни:- корни, которые растут из стебля выше уровня земли. Такие растения, как филодендроны, используют их для лазания и для абсорбции влаги и элементов питания.

AERIAL TILLERS = ВОЗДУШНЫЕ ПОБЕГИ – Aerial Tillers are the tillers that grow above the ground level.

AEROBE = АЭРОБ – Aerobe:- (Greek:- Aer = Air) microorganisms that require atmospheric oxygen. / Под Аэробами понимаются аэробные организмы, которые получают энергию для жизнедеятельности в результате окислительных процессов с участием атмосферного кислорода. Аэробы – почти все животные и растения, многие микроорганизмы. Облигатные, или строгие, аэробы развиваются только в присутствии кислорода (например, уксуснокислые бактерии); факультативные, или условные, аэробы – и при незначительной его концентрации (например, дрожжи).

AEROBIC = АЭРОБНОЕ – Aerobic:- growing only in the presence of molecular oxygen. Having molecular oxygen as part of the environment.

AEROBIC DIGESTION = АЭРОБНОЕ ПЕРЕВАРИВАНИЕ (или АЭРОБНОЕ УСВОЕНИЕ, или АЭРОБНОЕ ПЕРЕГНИВАНИЕ) – Aerobic Digestion is the partial biological decomposition of suspended organic matter in waste water or sewage under aerated conditions.

AEROBIC RESPIRATION = АЭРОБНОЕ ДЫХАНИЕ (или АЭРОБНАЯ РЕСПИРАЦИЯ) – Aerobic Respiration:- (Greek:- Aer = Air) is metabolic process of goods of vegetable origin, during which glucose and atmospheric oxygen are consumed by respiration processes to form carbon dioxide, water vapor and heat.

AERONAUTICS = АЭРОНАВТИКА – Aeronautics means the science and art of flight. / Под Аэронавтикой понимается то же, что Воздухоплавание – летание на аппаратах легче воздуха (аэростатах). В начале развития авиации термин Воздухоплавание обозначал также и летание на аппаратах тяжелее воздуха (планёрах, самолётах).

AEROPONICS = АЭРОПОНИКА – Aeroponics is a technique in growing plants wherein the plants derive their nutrients and water from a mist of air and aqueous solution that come in contact with the roots. / в контакт с корнями. Под Аэропоникой, от Греческих слов Aer, означающее Воздух, и Pónos, означающее Работа, или Возделываемой Культурой понимается выращивание растений без почвы во влажном воздухе. Корни периодически опрыскивают питательным раствором. Применяют в теплицах, оранжереях, на космических кораблях и прочем.

AEROQUIP SYSTEM = СИСТЕМА НАВЕСНОГО ОБОРУДОВАНИЯ – Special accessories in a container consisting of among others the attachment rails on the inside walls to provide facilities for lashing and separation of the cargo.

AEROSPACE INDUSTRIES ASSOCIATION, INC. = АССОЦИАЦИЯ АЭРОКОСМИЧЕСКИХ ОТРАСЛЕЙ, ИНК. – The Aerospace Industries Association represents the nation's leading manufacturers and suppliers of civil, military, and business aircraft, helicopters, unmanned aerial systems, space systems, aircraft engines, missiles, materiel, and related components, equipment, services, and information technology. The Association, originally known as the Aeronautical Chamber of Commerce (ACCA), was founded in 1919 with a charter membership of 100 'to foster, advance, promulgate and promote:- aeronautics, and 'generally, to do every act and thing

which may be necessary and proper for the advancement' of American aviation. Early members included such aviation pioneers as Orville Wright and Glen H. Curtiss, as well as representatives of major aircraft manufacturing units in the United States. The ACCA's predecessor, the Aircraft Manufacturers' Association formed in 1917, was originally devoted to technical issues, public education, and business problems facing the industry. After entering World War I, the United States immediately realized the important role of aircraft in warfare. The Aircraft Manufacturers' Association was enlisted to address specific problems associated with war-time production. The association drew up a cross-licensing agreement to allow manufacturers to have unrestrained use of airplane patents in order to produce airplanes for the government's war effort. The organization, later named the Manufacturers' Aircraft Association (MAA), continued to unify the air industry and engage in public education endeavors. The MAA was later dissolved, and in 1919, the newly formed ACCA stepped in to promote civil aviation. During World War II, the ACCA carried on limited functions for the industry while manufacturers focused on the war effort through East and West Coast Aircraft War Production Councils. These councils coordinated industry support with the War Planning Board and the military services. Following the war, ACCA was reorganized to concentrate on the industry's trade and commercial interests, and it became, for the first time, a trade association. Its name was appropriately changed to, 'Aircraft Industries Association of America, Inc.' (AIA). In 1959, the Aircraft Industries Association officially changed its name to 'Aerospace Industries Association, Inc.' to recognize an evolving industry that was now embracing the new frontier of space. Xxxxxx. The Aerospace Industries Association of America, Inc. (AIAA) or now the Aerospace Industries Association (AIA), founded in 1919 only a few years after the birth of flight, is the premier trade association representing the nation's major aerospace and defense manufacturers. Based in Arlington, VA, AIA is led by a Board of Governors that meets twice a year and consists of senior representatives (generally chief executive officers) of member companies, and an Executive Committee that meets more frequently. A hallmark of AIA is that it receives its policy guidance from the direct involvement of CEO-level officers of the country's major aerospace companies. The government frequently seeks advice from AIA on issues, and AIA provides a forum for government and industry representatives to exchange views and resolve problems on non-competitive matters related to the aerospace industry. Today, more than 300 major aerospace and defense companies and their suppliers are members of the association, embodying every high-technology manufacturing segment of the US aerospace and defense industry from commercial aviation and avionics, to manned and unmanned defense systems, to space technologies and satellite communications. AIA member company representatives sit on various councils and committees in these areas and, supported by AIA staff, formulate industry positions on specific issues for approval by the Executive Committee and the Board of Governors. The association concentrates on issues covering civil aviation, space, national security, international and procurement & finance. In addition the association has offices for Communications, Legislative Affairs, and Membership Services, the Supplier Management Council, the Team America Rocketry Challenge and the Aerospace Research Center. Headquartered in Arlington, VA, the United States. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

AERUGINOSA = АЭРУГИНОСА (или ПОКРЫТОЕ МЕДНОЙ РЖАВЧИНОЙ) – The species name Aeruginosa is a Latin word meaning Copper Rust, as seen with the oxidized copper patina on the Statue of Liberty. Aeruginosa (-us, -um) – deep green with blue color. / густо-зелёное с синевой.

AESTHETICS = ЭСТЕТИКА – Aesthetics, also spelled Esthetics, the philosophical study of beauty and taste. It is closely related to the philosophy of art, which is concerned with the nature of art and the concepts in terms of which individual works of art are interpreted and evaluated. To provide more than a general definition of the subject matter of aesthetics is immensely difficult. Indeed, it could be said that self-definition has been the major task of modern aesthetics. We are acquainted with an interesting and puzzling realm of experience:- the realm of the beautiful, the ugly, the sublime, and the elegant; of taste, criticism, and fine art; and of contemplation, sensuous enjoyment, and charm. In all these phenomena we believe that similar principles are operative and that similar interests are engaged. If we are mistaken in this impression, we will have to dismiss such ideas as beauty and taste as having only peripheral philosophical interest. Alternatively, if our impression is correct and philosophy corroborates it, we will have discovered the basis for a philosophical aesthetics. This article seeks to clarify the nature of modern aesthetics and to delineate its underlying principles and concerns. Although the article focuses on Western aesthetic thought and its development, it surveys some of the seminal features of Marxist and Eastern aesthetics. The Nature And Scope Of Aesthethcs:- Aesthetics is broader in scope than the philosophy of art, which comprises one of its branches. It deals not only with the nature and value of the arts but also with those responses to natural objects that find expression in the language of the beautiful and the ugly. A problem is encountered at the outset, however, for terms such as beautiful and ugly seem too vague in their application and too subjective in their meaning to divide the world successfully into those things that do, and those that do not, exemplify them. Almost anything might be seen as beautiful by someone or from some point of view, and different people apply the word to quite disparate objects for reasons that often seem to have little or nothing in common. It may be that there is some single underlying belief that motivates all of their judgments. It may also be, however, that the term Beautiful has no sense except as the expression of an attitude, which is in turn attached by different people to quite different states of affairs. Moreover, in spite of the emphasis laid by philosophers on the terms Beautiful and Ugly, it is far from evident that they are the most important or the most useful either in the discussion and criticism of art or in the description of that which appeals to us in nature. To convey what is significant in a poem, we might describe it as ironic, moving, expressive, balanced, and harmonious. Likewise, in characterizing a favourite stretch of countryside, we may prefer to describe it as peaceful, soft, atmospheric, harsh, and evocative, rather than beautiful. The least that should be said is that beautiful belongs to a class of terms from which it has been chosen as much for convenience' sake as for any sense that it captures what is distinctive of the class. At the same time, there seems to be no clear way of delimiting the class in question – not at least in advance of theory. Aesthetics must therefore cast its net more widely than the study either of beauty or of other aesthetic concepts if it is to discover the principles whereby it is to be defined. We are at once returned, therefore, to the vexing question of our subject matter:- What should a philosopher study in order to understand such ideas as beauty and taste? Three Approaches To Aesthetics:- Three broad approaches have been proposed in answer to that question, each intuitively reasonable:- (1) The study of the aesthetic concepts, or, more specifically, the analysis of the 'language of criticism', in which particular judgments are singled out and their logic and justification displayed. In his famous treatise On The Sublime And Beautiful (1757), Edmund Burke attempted to draw a distinction between two aesthetic concepts and, by studying the qualities that they denoted, to analyze the separate human attitudes that are directed toward them. Burke's distinction between the sublime and the beautiful was extremely influential, reflecting as it did the prevailing style of contemporary criticism. In more recent times, philosophers have tended to concentrate on the concepts of modern literary theory – namely, those such as representation, expression, form, style, and sentimentality. The study invariably has a dual purpose: to show how (if at all) these descriptions might be justified and to show what is distinctive in the human experiences that are expressed in them. (2) A philosophical study of certain states of mind – responses, attitudes, emotions – that are held to be involved in aesthetic experience. Thus, in the seminal work of modern aesthetics Kritik Der Urteilskraft (1790; The Critique of Judgment), Immanuel Kant located the distinctive features of the aesthetic in the faculty of 'judgment', whereby we take up a certain stance toward objects, separating them from our scientific interests and our practical concerns. The key to the aesthetic realm lies therefore in a certain 'disinterested' attitude, which we may assume toward any object and which can be expressed in many contrasting ways. More recently, philosophers – distrustful of Kant's theory of the faculties – have

tried to express the notions of an ‘aesthetic attitude’ and ‘aesthetic experience’ in other ways, relying upon developments in philosophical psychology that owe much to G.W.F. Hegel, the phenomenologists, and Ludwig Wittgenstein (more precisely, the Wittgenstein of the Philosophical Investigations (1953)). In considering these theories (some of which are discussed below), a crucial distinction must be borne in mind: that between philosophy of mind and empirical psychology. Philosophy is not a science, because it does not investigate the causes of phenomena. It is an a priori or conceptual investigation, the underlying concern of which is to identify rather than to explain. In effect, the aim of the philosopher is to give the broadest possible description of the things themselves, so as to show how we must understand them and how we ought to value them. The two most prominent current philosophical methods – phenomenology and conceptual analysis – tend to regard this aim as distinct from, and (at least in part) prior to, the aim of science. For how can we begin to explain what we have yet to identify? While there have been empirical studies of aesthetic experience (exercises in the psychology of beauty), these form no part of aesthetics as considered in this article. Indeed, the remarkable paucity of their conclusions may reasonably be attributed to their attempt to provide a theory of phenomena that have yet to be properly defined. (3) The philosophical study of the aesthetic object. This approach reflects the view that the problems of aesthetics exist primarily because the world contains a special class of objects toward which we react selectively and which we describe in aesthetic terms. The usual class singled out as prime aesthetic objects is that comprising works of art. All other aesthetic objects (landscapes, faces, Objets Trouvés, and the like) tend to be included in this class only because, and to the extent that, they can be seen as art (or so it is claimed). If we adopt such an approach, then there ceases to be a real distinction between aesthetics and the philosophy of art; and aesthetic concepts and aesthetic experience deserve their names through being, respectively, the concepts required in understanding works of art and the experience provoked by confronting them. Thus Hegel, perhaps the major philosophical influence on modern aesthetics, considered the main task of aesthetics to reside in the study of the various forms of art and of the spiritual content peculiar to each. Much of recent aesthetics has been similarly focused on artistic problems, and it could be said that it is now orthodox to consider aesthetics entirely through the study of art. The third approach to aesthetics does not require this concentration upon art. Even someone who considered art to be no more than one manifestation of aesthetic value – perhaps even a comparatively insignificant manifestation – may believe that the first concern of aesthetics is to study the objects of aesthetic experience and to find in them the true distinguishing features of the aesthetic realm. Unless we restrict the domain of aesthetic objects, however, it becomes extremely difficult to maintain that they have anything significant in common beyond the fact of inspiring a similar interest. This means that we should be compelled to adopt the second approach to aesthetics after all. And there seems no more plausible way of restricting the domain of aesthetic objects than through the concept of art. The three approaches may lead to incompatible results. Alternatively, they may be in harmony. Once again, it can only be at the end point of our philosophy that we shall be able to decide. Initially, it must be assumed that the three approaches may differ substantially, or merely in emphasis, and thus that each question in aesthetics has a tripartite form. The Aesthetic Object:- The third approach to aesthetics begins with a class of aesthetic objects and attempts thereafter to show the significance of that class to those who selectively respond to it. The term Aesthetic Object, however, is ambiguous, and, depending on its interpretation, may suggest two separate programs of philosophical aesthetics. The expression may denote either the ‘intentional’ or the ‘material’ object of aesthetic experience. This distinction, a legacy of the Scholastic philosophers of the Middle Ages, has played a major role in recent phenomenology. It may be briefly characterized as follows:- When people respond to object O, their response depends upon a conception of O that may, in fact, be erroneous. O is then the material object of their response, while their conception defines the intentional object. (The term Intentional comes from the Latin Intendere, ‘To Aim’.) To cite an example:- A person is frightened by a white cloth flapping in a darkened hall, taking it for a ghost. Here, the material object of the fear is the cloth, while the intentional object is a ghost. A philosophical discussion of fear may be presented as a discussion of things feared, but, if so, the phrase denotes the class of intentional objects of fear and not the (infinitely varied and infinitely disordered) class of material objects. In an important sense, the intentional object is part of a state of mind, whereas the material object always has independent (and objective) existence. If the expression Aesthetic Object is, therefore, taken in its intentional construction, the study of the aesthetic object becomes the study not of an independently existing class of things but of the aesthetic experience itself. It is in this sense that the term occurs in the writings of phenomenologists (e.g., Mikel Dufrenne, La Phénoménologie De L’Expérience Esthétique (1953; The Phenomenology of Aesthetic Experience), and Roman Ingarden, Das literarische Kunstwerk (1931; The Literary Work of Art)) whose studies of the aesthetic object exemplify not the third but the second of the approaches considered above. Which of those two approaches should be adopted? We can already see one reason for adopting the approach that puts the aesthetic experience first and examines the aesthetic object primarily as the intentional object of that experience. It is, after all, to experience that we must turn if we are to understand the value of the aesthetic realm – our reason for engaging with it, studying it, and adding to it. Until we understand that value, we will not know why we ought to construct such a concept as the aesthetic, still less why we should erect a whole branch of philosophy devoted to its study. A further reason also suggests itself for rejecting the approach to aesthetics that sees it merely as the philosophy of art, because art, and the institutions that sustain it, are mutable and perhaps inessential features of the human condition. While we classify together such separate art forms as poetry, the novel, music, drama, painting, sculpture, and architecture, our disposition to do so is as much the consequence of philosophical theory as its premise. Would other people at other times and in other conditions have countenanced such a classification or seen its point? And if so, would they have been motivated by similar purposes, similar observations, and similar beliefs? We might reasonably be skeptical, for while there have been many attempts to find something in common – if only a ‘family resemblance’ – between the various currently accepted art forms, they have all been both contentious in themselves and of little aesthetic interest. Considered materially (i.e. without reference to the experiences that we direct to them), the arts seem to have little in common except for those properties that are either too uninteresting to deserve philosophical scrutiny (the property, for example, of being artifacts) or else too vast and vague to be independently intelligible. Consider the theory of Clive Bell (Art, 1914) that art is distinguished by its character as ‘significant form’. Initially attractive, the suggestion crumbles at once before the skeptic. When is form ‘significant’? The only answer to be extracted from Bell is this:- ‘when it is art’. In effect, the theory reduces to a tautology. In any normal understanding of the words, a traffic warden is a significant form, at least to the motorist who is about to receive a ticket. Thus, to explain Bell’s meaning, it is necessary to restrict the term Significant to the significance (whatever that is) of art. Moreover, it is of the greatest philosophical importance to attend not only to the resemblances between the art forms but also to their differences. It is true that almost anything can be seen from some point of view as beautiful. At the same time, however, our experience of beauty crucially depends upon a knowledge of the object in which beauty is seen. It is absurd to suppose that I could present you with an object that might be a stone, a sculpture, a box, a fruit, or an animal, and expect you to tell me whether it is beautiful before knowing what it is. In general, we may say – in opposition to a certain tradition in aesthetics that finds expression in Kant’s theory – that our sense of beauty is always dependent upon a conception of the object in the way that our sense of the beauty of the human figure is dependent upon a conception of that figure. Features that we should regard as beautiful in a horse – developed haunches, curved back, and so on – we should regard as ugly in a human being, and those aesthetic judgments would be determined by our conception of what humans and horses generally are, how they move, and what they achieve through their movements. In a similar way, features that are beautiful in a sculpture may not be beautiful in a work of architecture, where an idea of function seems to govern our perceptions. In every case, our perception of the beauty of a work of art requires us to be aware of the distinctive character of each art form and to put out of mind, as largely irrelevant to our concerns, the overarching category of art to which all supposedly

belong. But if that is so, it is difficult to see how we could cast light upon the realm of aesthetic interest by studying the concept of art. Whether or not that concept is a recent invention, it is certainly a recent obsession. Medieval and Renaissance philosophers who approached the problems of beauty and taste – e.g., St. Thomas Aquinas, Peter Abelard, and even Leon Battista Alberti – often wrote of beauty without reference to art, taking as their principal example the human face and body. The distinctively modern approach to aesthetics began to take shape during the XVIII century, with the writings on art of Jean-Jacques Rousseau, Charles Batteux, and Johann Winckelmann and the theories of taste proposed by the 3rd earl of Shaftesbury, Francis Hutcheson, Lord Kames (Henry Home), and Archibald Alison. This approach materialized not only because of a growing interest in fine art as a uniquely human phenomenon but also because of the awakening of feelings toward nature, which marked the dawn of the Romantic movement. In Kant's aesthetics, indeed, nature has pride of place as offering the only examples of what he calls 'Free Beauty' – i.e. beauty that can be appreciated without the intermediary of any polluting concept. Art, for Kant, was not merely one among many objects of aesthetic interest. It was also fatally flawed in its dependence upon intellectual understanding. Even without taking that extreme position, it is difficult to accept that the fragile and historically determined concept of art can bear the weight of a full aesthetic theory. Leaving aside the case of natural beauty, we must still recognize the existence of a host of human activities (dress, decoration, manners, ornament) in which taste is of the essence and yet which seems totally removed from the world of fine art. It has been common, following the lead of Batteux, to make a distinction between the fine arts and the useful arts and to accommodate the activities just referred to under the latter description, but it is clear that this is no more than a gesture and that the points of similarity between the art of the dressmaker and that of the composer are of significance only because of a similarity in the interests that these arts are meant to satisfy. The Aesthetic Recipient:- Whichever approach we take, however, there is an all-important question upon the answer to which the course of aesthetics depends:- the question of the recipient. Only beings of a certain kind have aesthetic interests and aesthetic experience, produce and appreciate art, employ such concepts as those of beauty, expression, and form. What is it that gives these beings access to this realm? The question is at least as old as Plato but received its most important modern exposition in the philosophy of Kant, who argued, first, that it is only rational beings who can exercise judgment – the faculty of aesthetic interest – and, second, that until exercised in aesthetic judgment rationality is incomplete. It is worth pausing to examine these two claims. Rational beings are those, like us, whose thought and conduct are guided by reason, who deliberate about what to believe and what to do, and who affect each other's beliefs and actions through argument and persuasion. Kant argued that reason has both a theoretical and a practical employment and that rational beings find both their conduct and their thought inspired and limited by reason. The guiding law of rational conduct is that of morality, enshrined in the categorical imperative, which enjoins us to act only on that maxim which we can at the same time will as a universal law. By virtue of practical reason, rational beings see themselves and others of their kind as subject to an order that is not that of nature:- they live responsive to the law of reason and see themselves as potential members of a 'kingdom of ends' wherein the demands of reason are satisfied. Moreover, they look upon every rational being – themselves included – as made sacrosanct by reason and by the morality that stems from it. Rational beings, they recognize, must be treated always as ends in themselves, as having intrinsic value, and never as mere objects to be disposed of according to purposes that are not their own. The capacity to see things as intrinsically valuable, irreplaceable, or ends in themselves is one of the important gifts of reason. But it is not exercised only practically or only in our dealings with other reasoning beings. It may also be exercised contemplatively toward nature as a whole. In this case, practical considerations are held in abeyance, and we stand back from nature and look on it with a disinterested concern. Such an attitude is not only peculiar to rational beings but also necessary to them. Without it, they have only an impoverished grasp of their own significance and of their relation to the world in which they are situated through their thoughts and actions. This disinterested contemplation and the experiences that arise from it acquaint us, according to Kant, with the ultimate harmony that exists between the world and our faculties. They therefore provide the guarantee, both of practical reasoning and of the understanding, by intimating to us directly that the world answers to our purposes and corresponds to our beliefs. Disinterested contemplation forms, for Kant, the core of aesthetic experience and the ground of the judgment of beauty. He thus concludes:- (1) that only rational beings have aesthetic experience, (2) that every rational being needs aesthetic experience and is significantly incomplete without it, and (3) that aesthetic experience stands in fundamental proximity to moral judgment and is integral to our nature as moral beings. Modern philosophers have sometimes followed Kant, sometimes ignored him. Rarely, however, have they set out to show that aesthetic experience is more widely distributed than the human race. What could it mean to say of a cow, for example, that in staring at a landscape it is moved by the sentiment of beauty? What in a cow's behaviour or mental composition could manifest such a feeling? While a cow may be uninterested, it cannot surely be disinterested, in the manner of a rational being for whom disinterest is the most passionate form of interest. It is in pondering such considerations that one comes to realize just how deeply embedded in human nature is the aesthetic impulse and how impossible it is to separate this impulse from the complex mental life that distinguishes human beings from beasts. This condition must be borne in mind by any philosopher seeking to confront the all-important question of the relation between the aesthetic and the moral. The Aesthetic Experience:- Such considerations point toward the aforementioned approach that begins with the aesthetic experience as the most likely to capture the full range of aesthetic phenomena without begging the important philosophical questions about their nature. Can we then single out a faculty, an attitude, a mode of judgment, or a form of experience that is distinctively aesthetic? And if so, can we attribute to it the significance that would make this philosophical enterprise both important in itself and relevant to the many questions posed by beauty, criticism, and art? Taking their cue from Kant, many philosophers have defended the idea of an aesthetic attitude as one divorced from practical concerns, a kind of 'distancing', or standing back, as it were, from ordinary involvement. The classic statement of this position is Edward Bullough's ''Psychical Distance' as a Factor in Art and an Aesthetic Principle', an essay published in the British Journal of Psychology in 1912. While there is certainly something of interest to be said along those lines, it cannot be the whole story. Just what kind of distance is envisaged? Are lovers distanced from their beloved? If not, by what right do they call their beloved beautiful? Does distance imply a lack of practical involvement? If such is the case, how can we ever take up an aesthetic attitude to those things that have a purpose for us – things such as a dress, building, or decoration? But if these are not aesthetic, have we not paid a rather high price for our definition of this word – the price of detaching it from the phenomena that it was designed to identify? Kant's own formulation was more satisfactory. He described recipients of aesthetic experience not as distanced but as disinterested, meaning that recipients do not treat the object of enjoyment either as a vehicle for curiosity or as a means to an end. They contemplate the object as it is in itself and 'apart from all interest'. In a similar spirit, Arthur Schopenhauer argued that people could regard anything aesthetically so long as they regarded it in independence of their will – that is, irrespective of any use to which they might put it. Regarding it thus, people could come to see the idea that the object expressed, and in this knowledge consists aesthetic appreciation (Die Welt Als Wille Und Vorstellung (1819; The World as Will and Idea)). Of a piece with such a view is the popular theory of art as a kind of 'play' activity, in which creation and appreciation are divorced from the normal urgencies of existence and surrendered to leisure. 'With the agreeable, the good, the perfect', wrote Friedrich Schiller, 'man is merely in earnest, but with beauty he plays' (Briefe Über Die Ästhetische Erziehung Des Menschen (1794–95; Letters on the Aesthetic Education of Man)). Such thoughts have already been encountered. The problem is to give them philosophical precision. They have recurred in modern philosophy in a variety of forms – for example, in the theory that the aesthetic object is always considered for its own sake, or as a unique individual rather than a member of a class. Those particular formulations have caused some philosophers to treat aesthetic objects as though they were endowed with a peculiar metaphysical

status. Alternatively, it is sometimes argued that the aesthetic experience has an intuitive character, as opposed to the conceptual character of scientific thought or the instrumental character of practical understanding. The simplest way of summarizing this approach to aesthetics is in terms of two fundamental propositions:- (1) The aesthetic object is an object of sensory experience and enjoyed as such:- it is heard, seen, or (in the limiting case) imagined in sensory form. (2) The aesthetic object is at the same time contemplated:- its appearance is a matter of intrinsic interest and studied not merely as an object of sensory pleasure but also as the repository of significance and value. The first of these propositions explains the word Aesthetic, which was initially used in this connection by the Leibnizian philosopher Alexander Baumgarten in Meditationes Philosophicae de Nonnullis ad Poema Pertinentibus (1735; Reflections On Poetry). Baumgarten borrowed the Greek term for sensory perception (Aisthēsis) in order to denote a realm of concrete knowledge (the realm, as he saw it, of poetry), in which a content is communicated in sensory form. The second proposition is, in essence, the foundation of taste. It describes the motive of our attempt to discriminate rationally between those objects that are worthy of contemplative attention and those that are not. Almost all of the aesthetic theories of post-Kantian idealism depend upon those two propositions and try to explain the peculiarities of aesthetic experience and aesthetic judgment in terms of the synthesis of the sensory and the intellectual that they imply – the synthesis summarized in Hegel's theory of art as 'the sensuous embodiment of the Idea'. Neither proposition is particularly clear. Throughout the discussions of Kant and his immediate following, the 'sensory' is assimilated to the 'concrete', the 'individual', the 'particular', and the 'determinate', while the 'intellectual' is assimilated to the 'abstract', the 'universal', the 'general', and the 'indeterminate' – assimilations that would nowadays be regarded with extreme suspicion. Nevertheless, subsequent theories have repeatedly returned to the idea that aesthetic experience involves a special synthesis of intellectual and sensory components and that both its peculiarities and its value are to be derived from such a synthesis. The idea at once gives rise to paradoxes. The most important was noticed by Kant, who called it the antinomy of taste. As an exercise of reason, he argued, aesthetic experience must inevitably tend toward a reasoned choice and therefore must formulate itself as a judgment. Aesthetic judgment, however, seems to be in conflict with itself. It cannot be at the same time aesthetic (an expression of sensory enjoyment) and also a judgment (claiming universal assent). Yet all rational beings, by virtue of their rationality, seem disposed to make these judgments. On the one hand, they feel pleasure in some object, and this pleasure is immediate – not based, according to Kant, in any conceptualization or in any inquiry into cause, purpose, or constitution. On the other hand, they express their pleasure in the form of a judgment, speaking 'as if beauty were a quality of the object' and so representing their pleasure as objectively valid. But how can this be so? The pleasure is immediate, based in no reasoning or analysis. So what permits this demand for universal agreement? However we approach the idea of beauty, we find this paradox emerging. Our ideas, feelings, and judgments are called aesthetic precisely because of their direct relation to sensory enjoyment. Hence, one cannot judge the beauty of an object that one has never encountered. Scientific judgments, like practical principles, can be received 'secondhand'. I can, for example, take you as my authority for the truths of physics or for the utility of railways. But I cannot take you as my authority for the merits of Leonardo or Mozart if I have not seen or heard works by either artist. It would seem to follow from this that there can be no rules or principles of aesthetic judgment, since I must feel the pleasure immediately in the perception of the object and cannot be talked into it by any grounds of proof. It is always experience, and never conceptual thought, that gives the right to aesthetic judgment, so that anything that alters the experience of an object alters its aesthetic significance as well. As Kant put it, aesthetic judgment is 'free from concepts', and beauty itself is not a concept. Such a conclusion, however, seems to be inconsistent with the fact that aesthetic judgment is a form of judgment. When I describe something as beautiful, I do not mean merely that it pleases me:- I am speaking about it, not about myself, and, if challenged, I try to find reasons for my view. I do not explain my feeling but give grounds for it by pointing to features of its object. Any search for reasons has the 'universalizing' character of rationality:- I am in effect saying that others, insofar as they are rational, ought to feel exactly the same delight as I feel. Being disinterested, I have put aside my interests, and with them everything that makes my judgment relative to me. But, if that is so, then 'the judgment of taste is based on concepts, for otherwise there could be no room even for contention in the matter, or for the claim to the necessary agreement of others'. In short, the expression Aesthetic Judgment seems to be a contradiction in terms, denying in the first term precisely that reference to rational considerations that it affirms in the second. This paradox, which we have expressed in Kant's language, is not peculiar to the philosophy of Kant. On the contrary, it is encountered in one form or another by every philosopher or critic who takes aesthetic experience seriously and who therefore recognizes the tension between the sensory and the intellectual constraints upon it. On the one hand, aesthetic experience is rooted in the immediate sensory enjoyment of its object through an act of perception. On the other, it seems to reach beyond enjoyment toward a meaning that is addressed to our reasoning powers and that seeks judgment from them. Thus criticism, the reasoned justification of aesthetic judgment, is an inevitable upshot of aesthetic experience. Yet, critical reasons can never be merely intellectual; they always contain a reference to the way in which an object is perceived. Relationship Between Form And Content:- Two related paradoxes also emerge from the same basic conception of the aesthetic experience. The first was given extended consideration by Hegel, who argued, in his Vorlesungen Über Die Aesthetik (1832; 'Lectures on Aesthetics'; Eng. trans. Aesthetics:- Lectures on Fine Art), roughly as follows:- Our sensuous appreciation of art concentrates upon the given 'appearance' – the 'form'. It is this that holds our attention and that gives to the work of art its peculiar individuality. Because it addresses itself to our sensory appreciation, the work of art is essentially concrete, to be understood by an act of perception rather than by a process of discursive thought. At the same time, our understanding of the work of art is in part intellectual; we seek in it a conceptual content, which it presents to us in the form of an idea. One purpose of critical interpretation is to expound this idea in discursive form – to give the equivalent of the content of the work of art in another, nonsensuous idiom. But criticism can never succeed in this task, for by separating the content from the particular form, it abolishes its individuality. The content presented then ceases to be the exact content of that work of art. In losing its individuality, the content loses its aesthetic reality; it thus ceases to be a reason for attending to the particular work of art that first attracted our critical attention. It cannot be this that we saw in the original work and that explained its power over us. For this content, displayed in the discursive idiom of the critical intellect, is no more than a husk, a discarded relic of a meaning that eluded us in the act of seizing it. If the content is to be the true object of aesthetic interest, it must remain wedded to its individuality:- it cannot be detached from its 'sensuous embodiment' without being detached from itself. Content is, therefore, inseparable from form and form in turn inseparable from content. (It is the form that it is only by virtue of the content that it embodies.) Hegel's argument is the archetype of many, all aimed at showing that it is both necessary to distinguish form from content and also impossible to do so. This paradox may be resolved by rejecting either of its premises, but, as with Kant's antinomy, neither premise seems dispensable. To suppose that content and form are inseparable is, in effect, to dismiss both ideas as illusory, since no two works of art can then share either a content or a form – the form being definitive of each work's individuality. In this case, no one could ever justify an interest in a work of art by reference to its meaning. The intensity of aesthetic interest becomes a puzzling, and ultimately inexplicable, feature of our mental life. If, on the other hand, we insist that content and form are separable, we shall never be able to find, through a study of content, the reason for attending to the particular work of art that intrigues us. Every work of art stands proxy for its paraphrase. An impassable gap then opens between aesthetic experience and its ground, and the claim that aesthetic experience is intrinsically valuable is thrown in doubt. A related paradox is sometimes referred to as the 'heresy of paraphrase', the words being those of the American literary critic Cleanth Brooks (The Well Wrought Urn, 1949). The heresy is that of assuming that the meaning of a work of art (particularly of poetry) can be paraphrased. According to Brooks, who here followed an argument of Benedetto Croce, the meaning of a poem consists precisely in what is not

translatable. Poetic meaning is bound up with the particular disposition of the words – their sound, rhythm, and arrangement – in short, with the 'sensory embodiment' provided by the poem itself. To alter that embodiment is to produce either another poem (and therefore another meaning) or something that is not a work of art at all, and which therefore lacks completely the kind of meaning for which works of art are valued. Hence no poetry is translatable, and critics cannot do better than to point to the objective features of the poem that most seem to them to be worthy of attention. Yet that result too is paradoxical, for what do critics see in those objective features and how are their recommendations to be supported? Why should we attend to poetry at all if nothing can be said about its virtues save only 'Look!'? Why look at a poem rather than an advertisement, a mirror, or a blade of grass? Everything becomes equally worthy of attention, since nothing can be said that will justify attention to anything. The Role Of imagination:- Such paradoxes suggest the need for a more extensive theory of the mind than has been so far assumed. We have referred somewhat loosely to the sensory and intellectual components of human experience but have said little about the possible relations and dependencies that exist between them. Perhaps, therefore, the paradoxes result only from our impoverished description of the human mind and are not intrinsic to the subject matter of aesthetic interest. Many modern philosophers have at this point felt the need to invoke imagination, either as a distinct mental 'faculty' (Kant) or as a distinctive mental operation by virtue of which thought and experience may be united. For empiricist philosophers (such as David Hume, Joseph Addison, Archibald Alison, and Lord Kames), imagination involves a kind of 'associative' process, whereby experiences evoke ideas, and so become united with them. For Kant and Hegel, imagination is not associative but constitutive – part of the nature of the experience that expresses it. Once again it is useful to begin from Kant, who distinguished two uses of the imagination:- the first in ordinary thought and perception, the second in aesthetic experience. When I look before me and see a book, my experience, according to Kant, embodies a 'synthesis'. It contains two elements:- the 'intuition' presented to the senses and the 'concept' ('book'), contributed by the understanding. The two elements are synthesized by an act of the imagination that constitutes them as a single experience – the experience of seeing a book. Here imagination remains bound by the concepts of the understanding, which is to say that how I see the world depends upon my disposition to form determinate beliefs about it – in this case, the belief that there is a book before me. In aesthetic experience, however, imagination is free from concepts and engages in a kind of free play. This free play of the imagination enables me to bring concepts to bear on an experience that is, in itself, free from concepts. Thus there are two separate ways in which the content of experience is provided:- one in ordinary perception, the other in aesthetic experience. In both cases the operative factor, in holding thought and sensation together, is the imagination. Whether such theories can cast light on the mysterious unity between the intellectual and the sensory that we observe in aesthetic experience remains doubtful. The argument for saying that there is a single process of imagination involved in all perception, imagery, and remembering seems to consist only in the premise (undoubtedly true) that in these mental processes thought and experience are often inseparable. But to suppose therefore that there is some one 'faculty' involved in forging the connection between them is to fail to take seriously the fact that they are inseparable. Nevertheless, even if we find this general invocation of imagination, as the 'synthesizing force' within perception, vacuous or unilluminating, we may yet feel that the imagination has some special role to play in aesthetic experience and that the reference to imagination has some special value in explaining the precise way in which a content and an experience become 'fused' (to use George Santayana's term). Whether or not Kant was right to refer to a free play of imagination in aesthetic experience, there certainly seems to be a peculiarly creative imagination that human beings may exercise and upon which aesthetic experience calls. It is an exercise of creative imagination to see a face in a picture, since that involves seeing in defiance of judgment – seeing what one knows not to be there. It is not in the same sense an imaginative act to see a face in something that one also judges to be a face. This creative capacity is what Jean-Paul Sartre is referring to in L'Imaginaire:- Psychologie Phénoménologique De l'Imagination (1940; 'The Imaginary:- The Phenomenological Psychology of the Imagination'; Eng. trans. The Psychology of Imagination) when he describes imagining as "'the positing of an object as a nothingness' – as not being. In memory and perception we take our experience 'for real'. In imagination we contribute a content that has no reality beyond our disposition to 'see' it, and it is clear that this added content is frequently summoned by art when, for example, we see the face in a picture or hear the emotion in a piece of music. Recent work in aesthetics, to some extent inspired by the seminal writings of Sartre and Wittgenstein, has devoted considerable attention to the study of creative imagination. The hope has been to provide the extra ingredient in aesthetic experience that bridges the gap between the sensory and the intellectual and at the same time shows the relation between aesthetic experience and the experience of everyday life – an enterprise that is in turn of the first importance for any study that seeks to describe the moral significance of beauty. Consider, for example, the spectators at a performance of William Shakespeare's King Lear. They see before them an actor who, by speaking certain lines and making certain gestures, earns his bread. But that is not all that they see. They also see a hoary king, cast down by age, pride, and weakness, who rages against the depravity of humankind. Yet the spectators know that, in a crucial sense, there is no such king before them. It is intellectual understanding, not psychical distance, that prevents them from stepping onto the stage to offer their assistance. They know that the scene they enjoy is one that they invent, albeit under the overwhelming compulsion induced by the actor and his lines. The spectators are being shown something that is outside the normal commerce of theoretical and practical understanding, and they are responding to a scene that bears no spatial, temporal, or causal relation to their own experience. Their response is quintessentially aesthetic. For what interest could they have in this scene other than an interest in it for its own sake, for what it is in itself? At the same time, what it is in itself involves what it shows in general. In imaginatively conjuring this scene, the spectators draw upon a wealth of experience, which is brought to mind and, as it were, condensed for them into the imaginative perception of the play. (Hence, Aristotle believed that poetry is more general than history, since its concreteness is not that of real events but rather that of imaginary episodes constructed so as to typify human destiny in exemplary form.) Such an exercise of the imagination clearly has much to tell us about the nature of aesthetic experience. Whether or not it could found a theory of the 'missing link' between sensory enjoyment and intellectual understanding, it at least provides a paradigm of the relation between aesthetic experience and the experience of everyday life. The former is an imaginative reconstruction of the latter, which becomes interesting for its own sake precisely because – however realistic – it is not real. Emotion, Response, And Enjoyment:- It is natural to suppose that a spectator's response to King Lear is at least in part emotional and that emotion plays a crucial role both in the enjoyment of art and in establishing the value of art. Moreover, it is not only art that stirs our emotions in the act of aesthetic attention:- the same is or may be true of natural beauty, whether that of a face or of a landscape. These things hold our attention partly because they address themselves to our feelings and call forth a response which we value both for itself and for the consolation that we may attain through it. Thus we find an important philosophical tradition according to which the distinctive character of aesthetic experience is to be found in distinctively 'aesthetic' emotions. This tradition has ancient origins. Plato banished the poets from his ideal republic partly because of their capacity to arouse futile and destructive emotions, and, in his answer to Plato, Aristotle argued that poetry, in particular tragic poetry, was valuable precisely because of its emotional effect. This idea enabled Aristotle to pose one of the most puzzling problems in aesthetics – the problem of tragedy – and to offer a solution. How can I willingly offer myself to witness scenes of terror and destruction? And how can I be said to enjoy the result, set store by it, or accord to it a positive value? Aristotle's answer is brief. He explains that by evoking pity and fear a tragedy also 'purges' those emotions, and that is what we enjoy and value:- Tragedy, then, is an imitation of an action that is serious, complete, and of a certain magnitude; in language embellished with each kind of artistic ornament, the several kinds being found in separate parts of the play; in the form of action, not of narrative; through pity and fear effecting the proper purgation of these emotions. Aristotle implies that this purgation (Katharsis) is not unpleasant to us precisely

because the fictional and formalized nature of the action sets it at a distance from us. We can allow ourselves to feel what we normally shun to feel precisely because no one is really threatened (or at least no one real is threatened). Attractive though that explanation may seem, it immediately encounters a serious philosophical problem. It is a plausible tenet of philosophical psychology that emotions are founded on beliefs:- fear on the belief that one is threatened, pity on the belief that someone is miserable, jealousy on the belief that one has a rival, and so forth. In the nature of things, however, these beliefs do not exist in the theatre. Confronted by fiction, I am relieved precisely of the pressure of belief, and it is this condition that permits the Aristotelian Katharsis. How, then, can I be said to experience pity and fear when the beliefs requisite to those very emotions are not present? More generally, how can my responses to the fictions presented by works of art share the structure of my everyday emotions, and how can they impart to those emotions a new meaning, force, or resolution? Various answers have been proposed to that question. Samuel Taylor Coleridge, for example, argued that our response to drama is characterized by a 'willing suspension of disbelief', and thus involves the very same ingredient of belief that is essential to everyday emotion (Biographia Literaria, 1817). Coleridge's phrase, however, is consciously paradoxical. Belief is characterized precisely by the fact that it lies outside the will:- I can command you to imagine something but not to believe it. For this reason, a suspension of disbelief that is achieved 'willingly' is at best a highly dubious example of belief. In fact, the description seems to imply, not belief, but rather imagination, thus returning us to our problem of the relation between emotions directed to reality and those directed to merely imaginary scenes. This is part of a much larger problem – namely, that of the relation between aesthetic and everyday experience. Two extreme positions serve to illustrate this problem. According to one, art and nature appeal primarily to our emotions:- they awaken within us feelings of sympathy, or emotional associations, which are both pleasant in themselves and also instructive. We are made familiar with emotional possibilities, and, through this imaginative exercise, our responses to the world become illuminated and refined. This view, which provides an immediate and satisfying theory of the value of aesthetic experience, has been espoused in some form or other by many of the classical British empiricists (Shaftesbury, Hume, Addison, Lord Kames, Alison, and Burke, to cite only a few). It is also related to the critical theories of writers such as Coleridge, Matthew Arnold, and F.R. Leavis, whose criticism would make little or no sense without the supposition that works of art have the power to correct and corrupt our emotions. According to the opposite view, aesthetic interest, because it focuses on an object for its own sake, can involve no interest in 'affect'. To be interested in a work of art for the sake of emotion is to be interested in it as a means and, therefore, not aesthetically. In other words, true aesthetic interest is autonomous, standing outside the current of ordinary human feeling – an attitude of pure contemplation or pure 'intuition' that isolates its object from the stream of common events and perceives it in its uniqueness, detached, unexplained, and inexplicable. This position has been taken in modern times by Benedetto Croce and, following him, by R.G. Collingwood, whose resolute defense of the autonomy of aesthetic experience was also associated with a theory of the autonomy of art. Art is not only seen as an end in itself but it is an end in itself, in a profound and significant sense that distinguishes art from all its false substitutes (and, in particular, from craft, which for Collingwood is not an end but merely a means). Between those two poles, a variety of intermediate positions might be adopted. It is clear, in any case, that many questions have been begged by both sides. The aesthetic of sympathy, as Croce called it, has enormous difficulties in describing the emotions that are awakened in aesthetic experience, particularly the emotions that we are supposed to feel in response to such abstract arts as music. With what am I sympathizing when I listen to a string quartet or a symphony? What emotion do I feel? Moreover, the position encounters all the difficulties already noted in forging a link between the imaginary and the real. The aesthetic of autonomy, as we may call it, encounters complementary difficulties and, in particular, the difficulty of showing why we should value either aesthetic experience itself or the art that is its characteristic object. Moreover, it assumes that whenever I take an emotional interest in something, I am interested in it for the sake of emotion, a false inference that would imply equally that lovers are interested only in their love or angry people only in their anger. Collingwood thus dismisses 'amusement art', on the spurious ground that to be interested in a work of art for the sake of amusement is to be interested not in the work but only in the amusement that it inspires. That is to say, it is to treat the work as a means to feeling rather than as an end in itself. Such a conclusion is entirely unwarranted. Amusement is, in fact, a species of interest in something for its own sake:- I laugh not for the sake of laughter but for the sake of the joke. While I may be interested in an object for the sake of the emotion that it arouses, the case is peculiar – the case, in fact, of sentimentality, often dismissed by moralists as a spiritual corruption and equally by critics as a corruption of the aims of art. The difficulties for both views are brought out by a fundamental aesthetic category:- that of enjoyment. Whatever the ultimate value of aesthetic experience, we pursue it in the first instance for enjoyment's sake. Aesthetic experience includes, as its central instance, a certain kind of pleasure. But what kind of pleasure? While our emotions and sympathies are sometimes pleasurable, this is by no means their essential feature; they may equally be painful or neutral. How then does the aesthetic of sympathy explain the pleasure that we take, and must take, in the object of aesthetic experience? And how does the aesthetic of autonomy avoid the conclusion that all such pleasure is a violation of its strict requirement that we should be interested in the aesthetic object for its own sake alone? Neither theory seems to be equipped, as it stands, either to describe this pleasure or to show its place in the appreciation of art. The Work Of Art:- As the above discussion illustrates, it is impossible to advance far into the theory of aesthetic experience without encountering the specific problems posed by the experience of art. Whether or not we think of art as the central or defining example of the aesthetic object, there is no doubt that it provides the most distinctive illustration both of the elusive nature and the importance of aesthetic interest. With the increasing attention paid to art in a corrupted world where little else is commonly held to be spiritually significant, it is not surprising that the philosophy of art has increasingly begun to displace the philosophy of natural beauty from the central position accorded to the latter by the philosophers and critics of the XVIII century. Nor is this shift in emphasis to be regretted, for the existence of art as a major human institution reminds us of the need for a theory that will attribute more to aesthetic experience than enjoyment and that will explain the profundity of the impressions that we receive from beauty – impressions that may provide both meaning and solace to those who experience them. It is thus worth reviewing some of the special problems in the philosophy of art that have most influenced contemporary aesthetics. Understanding Art:- The use of the concept of understanding in describing the appreciation of art marks out an interesting distinction between art and natural beauty. People may understand or fail to understand T.S. Eliot's Four Quartets, Michelangelo's David, or Beethoven's Ninth Symphony, but they cannot understand or fail to understand the Highlands of Scotland, even when they find them beautiful or ugly. Understanding seems to be a prerequisite to the full experience of art, and this has suggested to many critics and philosophers that art is not so much an object of sensory experience as an instrument of knowledge. In particular, art seems to have the power both to represent reality and to express emotion, and some argue that it is through appreciating the properties of representation and expression that we recognize the meaning of art. At least, it might be supposed that if we speak of understanding art, it is because we think of art as having content, something that must be understood by the appropriate audience. The most popular approach to this concept of understanding is through a theory of art as a form of symbolism. But what is meant by this? Is such symbolism one thing or many? Is it a matter of evocation or convention, of personal response or linguistic rule? And what does art symbolize – ideas, feelings, objects, or states of affairs? Representation And Expression In Art:- Various theories have been proposed in answer to these questions, the most popular being that the forms of art are similar to language and are to be understood as language is understood, in terms of conventions and semantic rules. A few examples of contemporary theories that have described art in this way include Ernst Cassirer's philosophy of symbolic forms; Susanne K. Langer's theory of presentational symbols; the works on semiology and semiotics, largely inspired by the writings of Roland Barthes, that were fashionable in continental Europe; and the

semantic theory of art developed by Nelson Goodman. It seems important to review some of the arguments that have been employed both for and against the overall conception of art that such theories share. In favour of the view, it is undeniable that many works of art are about the world in somewhat the way that language may be about the world. This is evident in the case of literature (which is itself an instance of natural language). It is no less evident in the case of painting. A portrait stands to its sitter in a relation that is not unlike that which obtains between a description and the thing described. Even if the majority of pictures are of, or about, entirely imaginary people, scenes, and episodes, this is no different from the case of literature, in which language is used to describe purely imaginary subjects. This relation between a work of art and its subject, captured in the word About, is sometimes called Representation – a term that owes its currency in aesthetics to Croce and Collingwood, who used it to draw the familiar contrast between representation and expression. The concept of expression is variously analyzed. Its principal function in modern aesthetics, however, is to describe those aspects and dimensions of artistic meaning that seem not to fall within the bounds of representation, either because they involve no clear reference to an independent subject matter or because the connection between the subject and the artistic form is too close and inextricable to admit description in the terms appropriate to representation. Therefore, it is widely recognized that abstract (i.e. nonrepresentational) art forms – music, abstract painting, architecture – may yet contain meaningful utterances, and most frequently philosophers and critics use terms such as expression in order to describe these elusive meanings. Music, in particular, is often said to be an expression of emotion and to gain much of its significance from that. Expression in such a case is unlike representation, according to many philosophers, in that it involves no descriptive component. An expression of grief does not describe grief but rather presents it, as it might be presented by a face or a gesture. Expression must be distinguished from evocation. To say that a piece of music expresses melancholy is not to say that it evokes (arouses) melancholy. To describe a piece of music as expressive of melancholy is to give a reason for listening to it; to describe it as arousing melancholy is to give a reason for avoiding it. (Music that is utterly blank expresses nothing, but it may arouse melancholy.) Expression, where it exists, is integral to the aesthetic character and merit of whatever possesses it. For similar reasons, expression must not be confused with association, in spite of the reliance on the confusion by many XVIII-century empiricists. The distinction between representation and expression is one of the most important conceptual devices in contemporary philosophy of art. Croce, who introduced it, sought to dismiss representation as aesthetically irrelevant and to elevate expression into the single, true aesthetic function. The first, he argued, is descriptive, or conceptual, concerned with classifying objects according to their common properties, and so done to satisfy our curiosity. The second, by contrast, is intuitive, concerned with presenting its subject matter (an 'intuition') in its immediate concrete reality, so that we see it as it is in itself. In understanding expression, our attitude passes from mere curiosity to that immediate awareness of the concrete particular that is the core of aesthetic experience. Symbolism In Art:- Later philosophers have been content merely to distinguish representation and expression as different modes of artistic meaning, characterized perhaps by different formal or semantic properties. Nelson Goodman of the United States is one such philosopher. His Languages Of Art (1968) was the first work of analytical philosophy to produce a distinct and systematic theory of art. Goodman's theory has attracted considerable attention, the more so in that it is an extension of a general philosophical perspective, expounded in works of great rigour and finesse, that embraces the entire realm of logic, metaphysics, and the philosophy of science. Goodman, like many others, seeks the nature of art in symbolism and the nature of symbolism in a general theory of signs. (This second part of Goodman's aim is what Ferdinand de Saussure called Semiology, the general science of signs (Cours De Linguistique Générale, 1916; Course of General Linguistics)). The theory derives from the uncompromising nominalism expounded in Goodman's earlier works, a nominalism developed under the influence of two other American philosophers, the German-born Rudolf Carnap and W.V.O. Quine, but also showing certain affinities with the later philosophy of Wittgenstein. According to Goodman's general theory of signs, the relation between signs and the world can be described, like any relation, in terms of its formal structure, the objects related, and its genealogy. But, apart from that formal and factual analysis, there is nothing to be said. Words are labels that we attach to things, but the attempt to justify that practice merely repeats it:- in using words, it presupposes precisely the justification that it aims to provide. A corollary of this view is that relations of identical logical structure and identical genealogy between relevantly similar terms are really one and the same relation. Thus, if we assume that paintings, like words, are signs, then portraits stand to their subjects in the same relation as proper names to the objects denoted by them. (This is the substance of Goodman's proof that representation is a species of denotation.) We should not worry if that leads us to no new understanding of the relation (e.g., if it leads to no procedure for decoding the painted sign), for Goodman believes the search for such a procedure is incoherent. The meaning of a sign is simply given, along with the artistic practice that creates it. Goodman proceeds to generalize his theory of symbolism, using the word Reference to express the relation between word and thing. (We might well characterize this relation as labelling.) Denotation is the special case of reference exemplified by proper names and portraits – a case in which a symbol labels one individual. When a single label picks out many things, then we have not a name but a predicate. Sometimes the process of labelling goes both ways. A color sample is a sign for the color it possesses – say, the color red. It therefore refers to the label red, which in turn refers back to the sample. In this case, the predicate red and the sample mutually label each other. Goodman calls this relation exemplification and analyzes expression as a special case of it – namely, the case where the exemplification of a predicate proceeds by metaphor. For example, a piece of music may refer to sadness; it may also be metaphorically sad. In this case, Goodman argues, we may speak of the music as expressing sadness. The economy and elegance of Goodman's theory are matched by its extreme inscrutability. On the surface it seems to provide direct and intelligible answers to all the major problems of art. What is art? A system of symbols. What is representation? Denotation. What is expression? A kind of reference. What is the value of art? It symbolizes (displays) reality. What is the distinction between art and science? A distinction between symbol systems but not between the matters they display. Yet, at each point we feel at a loss to know what we are learning about art in being told that it is essentially symbolic. In this respect, Goodman's theory is similar to many semantic theories of art: it proves that expression, for example, describes a symbolic relation only by giving a theory of symbolism that is so general as to include almost every human artifact. It becomes impossible to extract from the result a procedure of interpretation – a way of understanding a work of art in terms of its alleged symbolic function. In particular, we cannot extend to the discussion of art those theories that show how we understand language in terms of its peculiar syntactic and semantic structure, for such theories always seem to rely precisely on what is peculiar to language and what distinguishes language from, say, music, painting, and architecture. A similar result can be found in an earlier theory upon which Goodman's is to some extent modelled – the one proposed by Langer in her Philosophy In A New Key (1942) and Feeling and Form (1953). She argues that works of art symbolize states of mind ('feelings'), but that the relation is not to be explained in terms of any rule of reference such as operates in language. Works of art are, Langer says, 'presentational symbols' whose relation to their objects is purely morphological. The symbol and its object are related by virtue of the fact that they possess the same 'Logical Form'. It follows that what the symbol expresses cannot be restated in words; words present the 'logical form' not of individuals but rather of the properties and relations that characterize them. (Here again is the familiar view that art presents the individuality of its subject matter and is therefore not conceptual or descriptive.) With such a view we can no longer explain why we say that a work of art expresses a feeling and not that the feeling expresses the work, for the relation of expression, explained in these morphological terms, is clearly symmetrical. Moreover, like other semantic theories, Langer's analysis provides no procedure for interpretation, nothing that would give application to the claim that in understanding a work of art we understand it as a symbol. Notwithstanding these difficulties for semantic theories of art, most philosophers remain convinced that the three categories of

representation, expression, and understanding are all-important in making sense of our experience of art. They have become increasingly persuaded, however, with Croce and Collingwood, that the differences between representation and expression are more important than the similarities. In particular, while representation may be secured by semantic rules (as in language itself), there cannot be rules for the production of artistic expression. To think otherwise is to imagine that the difference between a Mozart and a Salieri is merely a difference of skill. Expression occurs in art only where there is expressiveness, and expressiveness is a kind of success to be measured by the response of the audience rather than by the grammar of the work. This response crucially involves understanding, and no theory of expression that is not also a theory of how expression is understood can be persuasive. Form:- Expression and representation form part of the content of a work of art. Nonetheless, it is not only content that is understood (or misunderstood) by the attentive recipient. There is also form, by which term we may denote all those features of a work of art that compose its unity and individuality as an object of sensory experience. Consider Music:- In most cases, when listeners complain that they do not understand a work of music, they mean not that they have failed to grasp its expressive content but that the work has failed to cohere for them as a single and satisfying object of experience. They may put the point (somewhat misleadingly) by saying that they have failed to grasp the language or logic of the composition they heard. What matters, however, is that the appreciation of music (as of the other arts) depends upon the perception of certain 'unities' and upon feeling the inherent order and reasonableness in a sequence (in this case, a sequence of tones). It is this perception of order that is fundamental to understanding art, whether abstract or representational, and that to many philosophers and critics has seemed more basic than the understanding of content. When Clive Bell wrote of art as 'significant form', he really meant to defend the view, first, that form is the essence of art and, second, that form must be understood and therefore understandable (i.e. significant). Other philosophers have espoused one or another version of formalism, according to which the distinguishing feature of art – the one that determines our interest in it – is form. Part answers part, and each feature aims to bear some cogent relation to the whole. It is such facts as these that compel our aesthetic attention. The study of form must involve the study of our perception of form. A considerable amount of work on this subject has been inspired by the theories of the Gestalt psychologists Max Wertheimer, Wolfgang Köhler, and Kurt Koffka, whose semiempirical, semiphilosophical researches into the perception of form and pattern seem to make direct contact with many of the more puzzling features of our experience of art. The influence of the Gestalt psychologists is also apparent in works of visual aesthetics; e.g., Rudolf Arnheim's Art And Visual Perception (1954), which explores the significance for our understanding of pictures of such well-known Gestalt phenomena as the figure-ground relationship and the perception of completed wholes. Fruitful though this emphasis on the 'good Gestalt' has been, it cannot claim to have covered in its entirety the immensely complex subject of artistic form. For one thing, the theories and observations of the Gestalt psychologists, while evidently illuminating when applied to music and painting, can be applied to our experience of literature only artificially and inconclusively. Furthermore, it is impossible either to subsume all formal features of music and literature under the idea of a Gestalt or to demonstrate why, when so subsumed, the emotional effect and aesthetic value of form is made intelligible. Too much of aesthetic importance is left unconsidered by the study of the Gestalt, so that formalist critics and philosophers have begun to look elsewhere for an answer to the questions that concern them. One recurring idea is that the operative feature determining our perception of form is 'structure', the underlying, concealed formula according to which a work of art is constructed. This idea has had considerable influence in two areas, music theory and literary criticism, the former through the Austrian music theorist Heinrich Schenker and the latter through the Russian formalists and the structuralist linguists of Prague and Paris. Schenker tried to show, in Der Freie Satz (1935; Free Composition), that musical form can be understood as generated out of musical cells, deep structures that are expanded in ways that create a web of significant relationships, including a background and a foreground of musical movement. Certain structuralist critics, notably Tzvetan Todorov and Roland Barthes, have tried to perceive the unity of works of literature in terms of a similar development of literary units, often described tendentiously as 'codes' but perhaps better understood as themes. These units are successively varied and transposed in ways that make the whole work into a logical derivation from its parts. Against this approach it has been argued that in neither case does structural analysis succeed in making contact with the real source of artistic unity. This unity lies within the aesthetic experience itself and so cannot be understood as a structural feature of the work of art. Once again the temptation has been to enshrine in a body of rules what lies essentially beyond the reach of rules:- a unity of experience that cannot be predicted but only achieved. Structuralist aesthetics has therefore come under increasing criticism, not only for its pedantry but also for its failure to make genuine contact with the works of art to which it is applied. In general, the study of artistic form remains highly controversial and fraught with obstacles that have yet to be overcome. This area of the theory of art remains difficult and inaccessible equally to the critic and the philosopher, both of whom have therefore tended to turn their attention to less intractable problems. The Ontology Of Art:- One such problem is that of the ontological status of the work of art. Suppose that sitting on a desk before A is David Copperfield. Is David Copperfield therefore identical with this book that A can touch and see? Certainly not, for another David Copperfield lies on B's desk, and a single work of art cannot be identical with two distinct physical things. The obvious conclusion is that David Copperfield, the novel, is identical with no physical thing. It is not a physical object, any more than is a piece of music, which is clearly distinct from all its performances. Perhaps the same is true of paintings. For could not paintings be, in principle at least, exactly reproduced? And does not that possibility show the painting to be distinct from any particular embodiment in this or that area of painted canvas? With a little stretching, the same thought experiment might be extended to architecture, though the conclusion inevitably becomes increasingly controversial. The problem of the nature of the work of art is by no means new. Such an argument, however, gives it a pronounced contemporary flavour, so that both phenomenologists and analytical philosophers have been much exercised by it, often taking as their starting point the clearly untenable theory of Croce. According to Croce, the work of art does not consist in a physical event or object but rather in a mental 'intuition', which is grasped by the audience in the act of aesthetic understanding. The unsatisfactory nature of this theory, sometimes called the 'ideal' theory of art, becomes apparent as soon as we ask how we would identify the intuition with which any given work of art is supposedly identical. Clearly, we can identify it only in and through a performance, a book, a score, or a canvas. These objects give us the intuition that cannot exist independently of them. (Otherwise we should have to say that the world contains an uncountable number of great works of art whose only defect is that they have never been transcribed.) Clearly then, the physical embodiment of the work – in sounds, language, scores, or other inscriptions – is more fundamentally a part of it (of its 'essence') than the ideal theory represents it to be. What then is the work of art, and what is its relation to the objects in which it is embodied? These questions have been discussed by Richard Wollheim in Art and Its Objects (1968), and again by Goodman in Languages of Art (see above). Wollheim argues that works of art are 'types' and their embodiments 'tokens'. The distinction here derives from the American philosopher and logician C.S. Peirce, who argued that the letter a, for example, is neither identical with any particular token of it (such as the one just written) nor distinct from the class of such tokens. Peirce therefore calls a a type (i.e. a formula for producing tokens). Wollheim's theory is open to various objections. For example, works of architecture are not, as things stand, tokens of types but physical objects, and to make them into types by endlessly reproducing them would be to destroy their aesthetic character. To identify an object in terms of a process that destroys its character is not in any evident sense to identify it. The theory, moreover, seems to be unable to distinguish a musical performance containing a wrong note from a performance of a new work of music containing precisely that note as part of its type. Goodman's theory is more technical and displaces the question of the nature of art in favour of that of the nature of an inscription: Just what is it for a particular set of marks to identify a work of art? Other philosophers have concentrated on the question of identity:- What makes this work of art the same as that one? Some argue, for

example, that works of art have a distinct criterion of identity, one that reflects the peculiar nature and demands of aesthetic interest. Others dismiss the search for a criterion of identity as both aesthetically insignificant and illusory in itself. Still others, notably the phenomenologist Roman Ingarden, argue that the work of art exists on several levels, being identical not with physical appearance but with totality of interpretations that secure the various formal and semantic levels that are contained in it. Questions that so obviously lend themselves to the procedures of modern philosophy have naturally commanded considerable attention. But whether they are aesthetically significant is disputed, and some philosophers go so far as to dismiss all questions of ontology and identity of art as peripheral to the subject matter of aesthetics. The same could not be said, however, of the question of the value of art, which, while less discussed, is evidently of the first importance. The Value Of Art:- Theories of the value of art are of two kinds, which we may call extrinsic and intrinsic. The first regards art and the appreciation of art as means to some recognized moral good, while the second regards them as valuable not instrumentally but as ends in themselves. It is characteristic of extrinsic theories to locate the value of art in its effects on the person who appreciates it. Art is held to be a form of education, perhaps an education of the emotions. In this case, it becomes an open question whether there might not be some more effective means to the same result. Alternatively, one may attribute a negative value to art, as Plato did in his Republic, arguing that art has a corrupting or diseducative effect on those exposed to it. The extrinsic approach, adopted in modern times by Leo Tolstoy in Chto Takoye Iskusstvo? (1896; What Is Art?), has seldom seemed wholly satisfactory. Philosophers have constantly sought for a value in aesthetic experience that is unique to it and which, therefore, could not be obtained from any other source. The extreme version of this intrinsic approach is that associated with Walter Pater, Oscar Wilde, and the French symbolists and summarized in the slogan ‘art for art’s sake’. Such thinkers and writers believe that art is not only an end in itself but also a sufficient justification of itself. They also hold that in order to understand art as it should be understood, it is necessary to put aside all interests other than an interest in the work itself. Between those two extreme views there lies, once again, a host of intermediate positions. We believe, for example, that works of art must be appreciated for their own sake but that, in the act of appreciation, we gain from them something that is of independent value. Thus a joke is laughed at for its own sake, even though there is an independent value in laughter, which lightens our lives by taking us momentarily outside ourselves. Why should not something similar be said of works of art, many of which aspire to be amusing in just the way that good jokes are? The analogy with laughter – which, in some views, is itself a species of aesthetic interest – introduces a concept without which there can be no serious discussion of the value of art:- the concept of taste. If I am amused, it is for a reason, and this reason lies in the object of my amusement. We thus begin to think in terms of a distinction between good and bad reasons for laughter. Amusement at the wrong things may seem to us to show corruption of mind, cruelty, or bad taste, and, when it does so, we speak of the object as not truly amusing and feel that we have reason on our side. Similarly, we regard some works of art as worthy of our attention and others as not. In articulating this judgment, we use all of the diverse and confusing vocabulary of moral appraisal; works of art, like people, are condemned for their sentimentality, coarseness, vulgarity, cruelty, or self-indulgence and equally praised for their warmth, compassion, nobility, sensitivity, and truthfulness. (The same may apply to the object of natural beauty.) Clearly, if aesthetic interest has a positive value, it is only when motivated by good taste; it is only interest in appropriate objects that can be said to be good for us. All discussion of the value of art tends, therefore, to turn from the outset in the direction of criticism:- Can there be genuine critical evaluation of art, a genuine distinction between that which deserves our attention and that which does not? (And, once again, the question may be extended to objects of natural beauty.) Taste, Criticism, And Judgment:- All aesthetic experience, whether of art or nature, seems to be informed by and dependent upon an exercise of taste. We choose the object of aesthetic experience, and often do so carefully and deliberately. Moreover, we are judged by our choices, not only of works of art but also of color schemes, dresses, and garden ornaments, just as we are judged by our manners and our sense of humour. By our taste we betray ourselves – not merely a small part of ourselves but the whole. Yet, the relation between taste and morality is by no means straightforward. There seems, in fact, to be a puzzling question as to the precise nature of the relation between aesthetic and moral values and between the good taste that discerns the first and the good conduct that responds to the second. If there is no relation, the enormous amount of human energy that is invested in art and criticism may begin to seem rather pointless. If the relation is too close, however, the result is an intolerable moral elitism that makes refinement the sole standard of acceptable conduct, as, for example, the elitism depicted by Villiers de L’Isle-Adam in Axel, by J.K. Huysmans in À Rebours, and by Oscar Wilde in The Picture of Dorian Gray. The aesthete is one who puts aesthetic values above all others and who seeks for a morality that conforms to them. In contrast, the philistine (or at least one kind of philistine) puts moral values above all others and rejects any aesthetics that does not conform to them. But both the aesthete and the philistine fail to see that the relation between the aesthetic and the moral is not one of priority; each informs and is informed by the other, without taking precedence and without dictating the choice that belongs within the other’s sphere. Contemporary aesthetics has been less disposed to discuss the idea of taste than that of criticism. But clearly, the two ideas are so closely related that anything said about the one has a direct bearing on the other. In both cases, the approach has been the first of those outlined at the beginning of this article:- the approach that starts with a study of the concepts and modes of argument employed in discussing beauty and tries to grasp the distinctive problems of aesthetics through a study of the logical and ideological puzzles to which these concepts and arguments give rise. Philosophers often distinguish between two kinds of critical discussion – the interpretative and the evaluative – and two classes of concepts corresponding to them. In describing an object of natural beauty or a work of art, we may use a host of so-called aesthetic terms, terms that seem to have a particular role when used in this context and which articulate an aesthetic impression. Among such terms we may notice affective terms – moving, frightening, disturbing; terms denoting emotional qualities – sad, lively, mournful, wistful; and terms denoting the expressive or representational content of a work of art, its formal features, and its overall artistic genre – comic, tragic, ironic. Some of these terms can be applied meaningfully only to works of art; others may be applied to the whole of nature in order to articulate an aesthetic experience. The examination of their logic has had an increasingly important role in analytical aesthetics. Frank N. Sibley, for example, argued that such terms are used in aesthetic judgment in a peculiar way, without conditions (i.e. without a reasoned basis), and in order to describe aesthetic properties that are discernible only by the exercise of taste. This sophisticated reminder of Kant’s theory that aesthetic judgment is free from concepts has been criticized as creating too great a gap between the language of criticism and the language of everyday life. But it is of considerable interest in itself in attempting to revive a conception of taste that was highly influential in XVIII-century aesthetics. As noted above, taste is, according to this conception, a faculty not of evaluation but of perception. In aesthetics, however, evaluative judgments are inescapable. Theories avoiding the implication that taste is a form of discrimination, which naturally ranks its objects according to their merit, are peculiarly unsatisfying, not the least because they have so little bearing on the practice of criticism or the reasons that lead us to assign such overwhelming importance to art. What then of the concepts employed in aesthetic evaluation? Burke introduced a famous distinction between two kinds of aesthetic judgment corresponding to two orders of aesthetic experience:- the judgment of the beautiful and that of the sublime. The judgment of beauty has its origin in our social feelings, particularly in our feelings toward the other sex, and in our hope for a consolation through love and desire. The judgment of the sublime has its origin in our feelings toward nature, and in our intimation of our ultimate solitude and fragility in a world that is not of our own devising and that remains resistant to our demands. In Burke’s words,:- Whatever is fitted in any sort to excite the ideas of pain, and danger, that is to say, whatever is in any sort terrible, or is conversant about terrible objects, or operates in a manner analogous to terror, is a source of the sublime; that is, it is productive of the strongest emotion which the mind is capable of feeling. Burke’s distinction emerges as part of a natural philosophy of beauty:- an

attempt to give the origins of our sentiments rather than to explain the logic of the judgments that convey them. In Kant, the distinction is recast as a distinction between two categories of aesthetic experience and two separate values that attach to it. Sometimes when we sense the harmony between nature and our faculties, we are impressed by the purposiveness and intelligibility of everything that surrounds us. This is the sentiment of beauty. At other times, overcome by the infinite greatness of the world, we renounce the attempt to understand and control it. This is the sentiment of the sublime. In confronting the sublime, the mind is 'incited to abandon sensibility' – to reach over to that transcendental view of things that shows to us the immanence of a supersensible realm and our destiny as subjects of a divine order. Thus, from the presentiment of the sublime, Kant extracts the ultimate ground of his faith in a Supreme Being, and this is for him the most important value that aesthetic experience can convey. The distinction between the sublime and the beautiful is now less frequently made than at the time of Burke and Kant. Nevertheless, it is undeniable that aesthetic judgment exists in many contrasting forms, of both praise and condemnation. A philosopher who sought to account for the idea of beauty without attending to those of the elegant, the refined, the great, the delicate, the intelligent, the profound, and the lovely would be unlikely to provide us with much understanding of the nature and function of criticism. There may be, however, something that these judgments have in common which might be used in order to cast light on all of them. Kant certainly would have thought so, since he argued that all such judgments share the distinctive features of taste revealed in his antinomy. In other words, they are all grounded in an immediate ('subjective') experience while at the same time being 'universal' – i.e. held forth as valid for all rational beings irrespective of their particular interests and desires. Thus, critics try to justify their aesthetic judgments, seeking reasons that will persuade others to see what the critics regard as elegant or beautiful in a similar light. Could there be a genuine critical procedure devoted to that enterprise of providing objective grounds for subjective preferences? This question is integrally connected to another that we have already discussed:- the question of the value of aesthetic experience. If aesthetic experience is valueless, or if it has no more value than attaches to idle enjoyment, then it becomes implausible to insist on the existence of objective evaluation. Modern considerations of this exceedingly difficult question tend to concentrate on the criticism of art and on the role of critics of art. What are critics doing when they discuss a work of art, what do they look for, and with what purpose? It might be said that critics should first of all study the artist's intention, since this will show the real meaning of the artwork, the real content that the artist is trying to communicate. The American critics W.K. Wimsatt and Monroe C. Beardsley, however, argued that there is a fallacy (the so-called Intentional Fallacy) involved in this approach. What is to be interpreted is the work of art itself, not the intentions of the artist, which are hidden from us and no subject for our concern. If judgment is to be aesthetic, it must concern itself with the given object, and the meanings that we attribute to the object are those that we see in it, whatever the artist intended. The existence of an intentional fallacy has been doubted. Some argue, for example, that Wimsatt and Beardsley make too sharp a distinction between an intention and the act that expresses it, assuming the intention to be a kind of private mental episode forever hidden from an observer rather than a revealed order in the work itself. But when critics refer to the artistic intention, it is not clear whether they mean anything more than the general purposiveness of the work of art, which can be interpreted by critics without supposing there to be some intention beyond that of producing the precise work before them. (Indeed, in Kant's view, there can be purposiveness without purpose, and this phenomenon provides the central object of aesthetic interest, whether in art or in nature.) The dispute here is tortuous and obscure. Nevertheless, the move away from intentionalism, as it is called, has been regarded as imperative by most modern critics, who tend to see the role of criticism in either one of two ways:- (1) criticism is devoted to the study and interpretation of the aesthetic object rather than of the artist or the recipient, and (2) criticism is devoted to the articulation of a response to the work of art and to the justification of a particular way of seeing it. Underlying both these conceptions is the fashionable preoccupation with art as the principal object of critical judgment. Nevertheless, in suggesting that the choice which lies before the critic is between the aesthetic object and the experience that it arouses, the two views ensure that the artist is kept hidden. As a consequence, it is not difficult to adapt them to a wider view of aesthetic judgment and aesthetic experience – to a view that makes room for natural beauty and for the aesthetics of everyday life, as it is manifested in dress, manners, decoration, and the other useful arts. It might be thought that only the first of the two conceptions can give rise to an objective critical procedure, since it alone requires that criticism focus on an object whose existence and nature is independent of the critic. The most important contemporary defense of an objective criticism, that of the British literary critic F.R. Leavis, relied heavily on the second idea, however. In a celebrated controversy with his American counterpart, René Wellek, Leavis argued that it is precisely because criticism is devoted to the individual response that it may achieve objectivity. Although there may be objectivity in the scientific explanation of the aesthetic object – i.e. in the classification and description of its typology, structure, and semiotic status – this is not, according to Leavis, the kind of objectivity that matters, for it will never lead to a value judgment and will therefore never amount to an objective criticism. Value judgments arise out of, and are validated by, the direct confrontation in experience between the critical intelligence and the aesthetic object, the first being informed by a moral awareness that provides the only possible ground for objective evaluation. If criticism were confined to the study of nature, it would look very peculiar. It is only because of the development of artistic and decorative traditions that the habit of aesthetic judgment becomes established. Accordingly, contemporary attempts to provide a defense of aesthetic judgment concentrate almost exclusively on the criticism of art and endeavour to find principles whereby the separate works of art may be ordered according to their merit, or at least characterized in evaluative terms. Leavis's 'objective' criticism is expressly confined to the evaluation of literary works taken from a single tradition. The reason for this narrowness can be put paradoxically as follows:- criticism can be objective only when it is based in subjectivity. Criticism is the justification of a response, and such justification requires a frame of reference that both critics and their readers can readily recognize. The successful communication and justification of a response are possible only by reference to the canon of works accepted within a common culture. The canonical works – what Matthew Arnold called the Touchstones of Criticism – provide the context of relevant comparisons, without which no amount of detailed analysis could convey the quality of the individual work. Critical reasoning is an attempt to place works of art in relation to one another, so that the perceived greatness of the one will provide the standard of measurement for the other. At the same time, the individual quality of feeling in each work must be elicited and discussed exactly as we might discuss the quality of feeling in everyday life, praising it for its intensity, exactness, and generosity, and criticizing it for its sentimentality, obscurity, or lack of seriousness. All of the moral categories that we apply to human feeling and character we may therefore apply equally to art, and the basis of an objective criticism will be no different from the basis (whatever it might be) for an objective morality. The value of art, on this account, resides partly in the fact that it gives exemplary expression to human feeling and character, and so enables us to measure our own lives and aspirations against their imaginary counterparts. These ideas are vague and have been frequently criticized for their moralistic overtones as well as for the seeming narrowness of their application. Even if they apply to the criticism of literature, what do we say about the criticism of music, of architecture, of dress and decor, of natural beauty? In the nonliterary arts much criticism is directed first to form, style, and workmanship and only secondly to the moral content of the works under consideration. There are exceptions to this rule, and once again the principal exception is English – namely, John Ruskin's profoundly moralized criticism of architecture. Nevertheless, the extreme difficulty experienced in extending the Leavisite procedures of practical criticism (in which the reader's response becomes the principal focus of critical attention) to the nonliterary arts has given sustenance to the view that this 'moralized' criticism is really only one kind of criticism and not necessarily the most widely applicable or the most important. If such is the case, it cannot really claim to have discovered a basis for the objective exercise of taste. The Development Of Western Aesthetics:- The Contributions Of The Ancient Greeks:- The two greatest Greek philosophers, Plato and Aristotle, shared a sense of the importance

of aesthetics, and both regarded music, poetry, architecture, and drama as fundamental institutions within the body politic. Plato notoriously recommends the banning of poets and painters from his ideal republic and in the course of his argument provides an extended theory of imitation (mimesis), along with spurious reasons for thinking that imitation derogates both from the laws of morality and from the rational cognition of the world. Much of Aristotle's extended and diverse reply to Plato is concerned with rehabilitating imitation as the foundation of moral education (Ethica Nicomachea), as the origin of a necessary Katharsis (Poetica), and as the instrument – through music, dance, and poetry – of character formation (Politica). Plato's more mystical writings, notably the Timaeus, contain hints of another approach to aesthetics, one based on the Pythagorean theory of the cosmos that exerted a decisive influence on the Neoplatonists. Through the writings of St. Augustine, Boethius, and Macrobius, the Pythagorean cosmology and its associated aesthetic of harmony were passed on to the thinkers of the Middle Ages. The Aristotelian theory of imitation and the concern with the expressive and emotionally educative aspect of aesthetic experience were not truly influential until the XVII century. At that time much attention was also paid to another classical work, the Hellenistic treatise on the sublime ascribed to Longinus, which is perhaps the most interesting and extended piece of antique literary criticism to have been passed on to the modern world. Medieval Aesthetics:- St. Thomas Aquinas devoted certain passages of his Summa Theologiae (c. 1266–73) to the study of beauty. To his thinking, humankind's interest in beauty is of sensuous origin, but it is the prerogative of those senses that are capable of 'contemplation' – namely, the eye and the ear. Aquinas defines beauty in Aristotelian terms as that which pleases solely in the contemplation of it and recognizes three prerequisites of beauty:- perfection, appropriate proportion, and clarity. Aquinas' position typifies the approach to aesthetics adopted by the Scholastics. More widely diffused among medieval thinkers was the Neoplatonist theory, in which beauty is seen as a kind of divine order conforming to mathematical laws:- the laws of number, which are also the laws of harmony. Music, poetry, and architecture all exhibit the same conformity to a cosmic order, and, in experiencing their beauty, we are really experiencing the same order in ourselves and resonating to it as one string to another. This theory, expounded in treatises on music by St. Augustine and Boethius, is consciously invoked by Dante in his Convivio (c. 1304–07; The Banquet). In this piece, generally considered one of the first sustained works of literary criticism in the modern manner, the poet analyzes the four levels of meaning contained in his own poems. The Neoplatonist emphasis on number and harmony dominated aesthetics during the early Renaissance as well and was reaffirmed by Leon Alberti in his great treatise on architecture, De Re Aedificatoria (1452; Ten Books on Architecture). Alberti also advanced a definition of beauty, which he called Concinnitas, taking his terminology from Cicero. Beauty is for Alberti such an order and arrangement of the parts of an object that nothing can be altered except for the worse. This kind of definition can hardly stand alone as a basis for aesthetics, for what does the word worse mean? The obvious answer, 'less beautiful', at once reduces the definition to circularity. The Origins Of Modern Aesthetics:- Francis Bacon wrote essays on beauty and deformity, but he confined his remarks to the human figure. René Descartes produced a treatise on music, although it contains little that would be recognized as aesthetics in the modern sense. During the first decades of modern philosophy, aesthetics flourished, not in the works of the great philosophers, but in the writings of such minor figures as Baltasar Gracián, Jean de La Bruyère (who began the study of taste that was to dominate aesthetics for a century), and Georges-Louis Leclerc, comte de Buffon. It was not until the end of the XVII century that the distinctive concerns of modern aesthetics were established. At that time, taste, imagination, natural beauty, and imitation came to be recognized as the central topics in aesthetics. In Britain the principal influences were the 3rd Earl of Shaftesbury and his disciples Francis Hutcheson and Joseph Addison. Shaftesbury, a follower of the political and educational philosopher John Locke, did more than any of his contemporaries to establish ethics and aesthetics as central areas of philosophical inquiry. As a naturalist, he believed that the fundamental principles of morals and taste could be established by due attention to human nature, our sentiments being so ordered that certain things naturally please us and are naturally conducive to our good (Characteristiks of Men, Manners, Opinions, Times, 1711). Taste is a kind of balanced discernment, whereby a person recognizes that which is congenial to his sentiments and therefore an object of pleasurable contemplation. Following Locke, Shaftesbury laid much emphasis on the association of ideas as a fundamental component in aesthetic experience and the crucial bridge from the sphere of contemplation to the sphere of action. Addison adopted this position in a series of influential essays, 'The Pleasures of the Imagination' in The Spectator (1712). He defended the theory that imaginative association is the fundamental component in our experience of art, architecture, and nature, and is the true explanation of their value to us. Francis Hutcheson was perhaps the first to place the problem of aesthetic judgment among the central questions of epistemology:- How can we know that something is beautiful? What guides our judgment and what validates it? His answer was decidedly Empiricist in tone: aesthetic judgments are perceptual and take their authority from a sense that is common to all who make them. In An Inquiry into the Original of our Ideas of Beauty and Virtue (1725), Hutcheson explained:- 'The origin of our perceptions of beauty and harmony is justly called a 'sense' because it involves no intellectual element, no reflection on principles and causes'. The Significance Of Baumgarten's Work:- Such a statement would have been vigorously repudiated by Hutcheson's contemporary Alexander Baumgarten, who, in his aforementioned Reflections on Poetry, introduced the term aesthetic in its distinctively modern sense. Baumgarten was a pupil of Christian Wolff, the Rationalist philosopher who had created the orthodox philosophy of the German Enlightenment by building the metaphysical ideas of Gottfried Wilhelm Leibniz into a system. He was thus heir to a tradition that dismissed the senses and the imagination as incapable of providing a genuine cognition of their objects and standing always to be corrected (and replaced) by rational reflection. Baumgarten, however, argued that poetry is surely cognitive:- it provides insight into the world of a kind that could be conveyed in no other way. At the same time, poetic insights are perceptual ('aesthetic') and hence imbued with the distinctive character of sensory and imaginative experience. According to Baumgarten, the ideas conveyed by poetry are 'clear and confused', as opposed to the 'clear and distinct' ideas of reason in the sense that they had been described by Descartes and the XVII-century Rationalists. Baumgarten held that the aesthetic value of a poem resides in the relative preponderance of clarity over confusion. Accordingly, his theory of the value of art was ultimately cognitive. It was some decades before Baumgarten's coinage became philosophical currency. But there is no doubt that his treatise, for all its pedantry and outmoded philosophical method, deserves its reputation as the founding work of modern aesthetics. Major Concerns Of XVIII-Century Aesthetics:- The development of aesthetics between the work of Baumgarten and that of Immanuel Kant, who had been influenced by Baumgarten's writings, was complex and diverse, drawing inspiration from virtually every realm of human inquiry. Yet, throughout this period certain topics repeatedly received focal attention in discussions pertaining to aesthetic questions. One such topic was the faculty of taste, the analysis of which remained the common point among German, French, and English writers. Taste was seen either as a sense (Hutcheson), as a peculiar kind of emotionally inspired discrimination (Hume), or as a part of refined good manners (Voltaire). In an important essay entitled 'Of the Standard of Taste' (in Four Dissertations, 1757), Hume, following Voltaire in the Encyclopédie, raised the question of the basis of aesthetic judgment and argued that 'it is natural for us to seek a standard of taste; a rule by which the various sentiments of men may be reconciled; at least, a decision afforded, confirming one sentiment, and condemning another'. But where is this standard of taste to be found? Hume recommends an ideal of the man of taste, whose discriminations are unclouded by an emotional distemper and informed by a 'delicacy of imagination ... requisite to convey a sensibility of ... finer emotions'. For, Hume argues, there is a great resemblance between 'mental' and 'bodily' taste – between the taste exercised in aesthetic discrimination and that exercised in the appreciation of food and drink, which can equally be deformed by some abnormal condition of the subject. Hume proceeded to lay down various procedures for the education of taste and for the proper conduct of critical judgment. His discussion, notwithstanding its skeptical undercurrent, has proved lastingly influential on the English schools of criticism, as well as

on the preferred Anglo-Saxon approach to the questions of aesthetics. A second major concern of XVIII-century writers was the role of imagination. Addison's essays were seminal, but discussion of imagination remained largely confined to the associative theories of Locke and his followers until Hume gave to the imagination a fundamental role in the generation of commonsense beliefs. Kant attempted to describe the imagination as a distinctive faculty, active in the generation of scientific judgment as well as aesthetic pleasure. Between them, Hume and Kant laid the ground for the Romantic writers on art:- Johann Gottfried von Herder, Friedrich Schiller, Friedrich Schelling, and Novalis (pseudonym of Friedrich Leopold, Freiherr von Hardenberg) in Germany, and Samuel Taylor Coleridge and William Wordsworth in England. For such writers, imagination was to be the distinctive feature both of aesthetic activity and of all true insight into the human condition. Meanwhile, Lord Kames and Archibald Alison had each provided full accounts of the role of association in the formation and justification of critical judgment. Alison, in particular, recognized the inadequacies of the traditional Empiricist approach to imaginative association and provided a theory as to how the feelings aroused by a work of art or a scene of natural beauty may become part of its appearance – qualities of the object as much as of the subject (Essays on the Nature and Principles of Taste (1790)). The concept of imitation, introduced into the discussion of art by Plato and Aristotle, was fundamental to the XVIII-century philosophy of art. Imitation is a vague term, frequently used to cover both representation and expression in the modern sense. The thesis that imitation is the common and distinguishing feature of the arts was put forward by James Harris in Three Treatises (1744) and subsequently made famous by Charles Batteux in a book entitled Les Beaux Arts Réduits À Un Même Principe (1746; 'The Fine Arts Reduced to a Single Principle'). This diffuse and ill-argued work contains the first modern attempt to give a systematic theory of art and aesthetic judgment that will show the unity of the phenomena and their common importance. 'The laws of taste', Batteux argued, 'have nothing but the imitation of beautiful nature as their object'; from which it follows that the arts, which are addressed to taste, must imitate nature. The distinction between the fine and useful arts (recast by Collingwood as the distinction between art and craft) stems from Batteux. Still another characteristic of XVIII-century aesthetics was the concern with the distinction between the sublime and the beautiful. Burke's famous work, On the Sublime and Beautiful, has already been discussed. Its influence was felt throughout late XVIII-century aesthetics. For example, it inspired one of Kant's first publications, an essay on the sublime. Treatises on beauty were common, one of the most famous being The Analysis of Beauty (1753) by the painter William Hogarth, which introduces the theory that beauty is achieved through the 'serpentine line'. The view that art is expression emerged during the 1700s. Rousseau put forth the theory of the arts as forms of emotional expression in an essay dealing with the origin of languages. This theory, regarded as providing the best possible explanation of the power of music, was widely adopted. Treatises on musical expression proliferated during the late XVIII century. One illustrative example is James Beattie's Essay on Poetry and Music as They Affect the Mind (1776), in which the author rejects the view of music as a representational (imitative) art form and argues that expression is the true source of musical excellence. Another example is provided by Denis Diderot in his didactic novel Le Neveu de Rameau (1761–74; Rameau's Nephew and Other Works). The theory of expression was inherited by the German Romantics, especially by Schelling, Schiller, and Herder. It was, furthermore, developed in a novel direction by the Italian philosopher Giambattista Vico in his Scienza Nuova (1725–44; New Science). Vico integrated art into a comprehensive theory of the development and decline of civilization. According to him, the cyclical movement of culture is achieved partly by a process of successive expression, through language and art, of the 'myths' that give insight into surrounding social conditions. Kant, Schiller, and Hegel:- As previously noted, Kant's The Critique of Judgment introduced the first full account of aesthetic experience as a distinct exercise of rational mentality. The principal ingredients of Kant's work are the following:- the antinomy of taste, the emphasis on the free play of the imagination, the theory of aesthetic experience as both free from concepts and disinterested, the view that the central object of aesthetic interest is not art but nature, and the description of the moral and spiritual significance of aesthetic experience, which opens to us a transcendental point of view of the world of nature and enables us to see the world as purposive, but without purpose. In that perception, observes Kant, lies the deepest intimation of our nature and of our ultimate relation to a 'supersensible' realm. Schiller's Briefe Über Die Ästhetische Erziehung Des Menschen (1795; On the Aesthetic Education of Man), inspired by Kant, develops further the theory of the disinterested character of the aesthetic. Schiller argues that through this disinterested quality aesthetic experience becomes the true vehicle of moral and political education, providing human beings both with the self-identity that is their fulfillment and with the institutions that enable them to flourish:- 'What is man before beauty cajoles from him a delight in things for their own sake, or the serenity of form tempers the savagery of life? A monotonous round of ends, a constant vacillation of judgment; self-seeking, and yet without a self; lawless, yet without freedom; a slave, and yet to no rule'. Schiller's Briefe exerted a profound influence on Hegel's philosophy in general and on his Vorlesungen Über Die Aesthetik in particular. In discussions of remarkable range and imaginative power, Hegel introduces the distinctively modern conception of art as a request for self-realization, an evolving discovery of forms that give sensuous embodiment to the spirit by articulating in concrete form its inner tensions and resolutions. For Hegel, the arts are arranged in both historical and intellectual sequence, from architecture (in which Geist ('Spirit') is only half articulate and given purely symbolic expression), through sculpture and painting, to music and thence to poetry, which is the true art of the Romantics. Finally, all art is destined to be superseded by philosophy, in which the spirit achieves final articulation as Idea. The stages of art were identified by Hegel with various stages of historical development. In each art form a particular Zeitgeist (i.e. spirit of the time) finds expression, and the necessary transition from one art form to its successor is part of a larger historical transformation in which all civilization is engaged. The incidental discussions of Hegel's Vorlesungen introduce most of the themes of contemporary philosophy of art, though in the peculiar language of Hegelian Idealism. XIX-century Idealist aesthetics can reasonably be described as a series of footnotes to Hegel, who was, however, less original than he pretended. Many of the individual thoughts and theories in his lectures on aesthetics were taken from the contemporary literature of German Romanticism (in particular, the writings of Herder, Jean Paul (pseudonym of Johann Paul Friedrich Richter) and Novalis) and from the works of German critics and art historians (notably G.E. Lessing and Johann Winckelmann) who had forged the link between modern conceptions of art and the art of antiquity. The influence of Hegel was, therefore, the influence of German Romanticism as a whole, and it is not surprising that the few who escaped it lost their audience in doing so. Post-Hegelian Aesthetics:- Little of XIX-century aesthetics after Hegel has proved of lasting interest. Perhaps the most important exception is the controversial literature surrounding Richard Wagner, particularly the attack on the expressive theory of music launched by Wagner's critic Eduard Hanslick in his Vom Musikalisch-Schönen (1854; On the Beautiful in Music). With this work modern musical aesthetics was born, and all the assumptions made by Batteux and Hegel concerning the unity (or unity in diversity) of the arts were thrown in doubt. The most impressive work on aesthetics of the late 1800s was George Santayana's The Sense of Beauty (1896), which shows a welcome move away from the XIX-century obsession with art toward more fundamental issues in the philosophy of mind. Santayana argues against Kant's theory of the disinterested and universal quality of aesthetic interest, and defends the view that pleasure is the central aesthetic category, beauty being 'pleasure regarded as the quality of a thing'. All human functions and experiences may contribute to the sense of beauty, which has two broad categories of object:- form and expression. In his theory of expression Santayana again takes up the problem raised by the theory of the association of ideas, and argues that in aesthetic pleasure the associative process achieves a kind of fusion between the response aroused and the object which arouses it, and that this is the fundamental experience of expression. Expressionism:- After Kant and Hegel, the most important influence on modern aesthetics has been Croce. His oft-cited Estetica Come Scienza Dell' Espressione E Linguistica Generale (1902; Aesthetic as Science of Expression and General Linguistics, or Aesthetic) presents, in a rather novel idiom, some of the important insights underlying the

theories of his predecessors. In this work, Croce distinguishes concept from intuition:- the latter is a kind of acquaintance with the individuality of an object, while the former is an instrument of classification. Art is to be understood first as expression and second as intuition. The distinction between representation and expression is ultimately identical with that between concept and intuition. The peculiarities of aesthetic interest are really peculiarities of intuition:- this explains the problem of form and content and gives the meaning of the idea that the object of aesthetic interest is interesting for its own sake and not as a means to an end. Croce conceived his expressionism as providing the philosophical justification for the artistic revolutions of the XIX century and, in particular, for the Impressionist style of painting, in which representation gives way to the attempt to convey experience directly onto the canvas. His extreme view of the autonomy of art led him to dismiss all attempts to describe art as a form of representation or to establish direct connections between the content of art and the content of scientific theories. Croce's disciple R.G. Collingwood (Principles of Art, 1938) was similarly dismissive of representation and similarly concerned with presenting a theory of art that would justify the revolutionary practice of his contemporaries (in this case, the post-Symbolist poetry of T.S. Eliot's The Waste Land). As pointed out earlier, Collingwood distinguishes craft, which is a means to an end, from art, which is an end in itself. But since art is also, for Collingwood, expression, expression too must be an end in itself. It cannot be construed as the giving of form to independently identifiable states of mind. The feeling must reside in the form itself and be obtainable exclusively in that form. If it were otherwise, art would be simply another kind of craft – the craft of giving expression to preexisting and independently identifiable states of mind. Therefore, like Croce, Collingwood opposes expression in art to description:- expression gives us the particularity and not the generality of states of mind. Collingwood sets his aesthetics within the context of a theory of the imagination, in which he shows the influence of the British Empiricists as well as of the Idealist metaphysicians who had influenced Croce. A similar attempt to unite the theory of art with a philosophy of the imagination had been made by the French philosopher Alain in his Système Des Beaux-Arts (1920, revised 1926; 'System of the Fine Arts'), a work that is distinguished by its detailed attention to dress, fashion, manners, and the useful arts, and by its idea of the artist as artisan d'abord. Along with John Dewey's Art As Experience (1934), in which aesthetic experience is presented as integral to the organic completion of human nature, these works provide the culminating expression of a now defunct view of aesthetics as central to the understanding not of art alone but of the human condition as well. Marxist Aesthetics:- Many attempts have been made to develop a specifically Marxist aesthetics, one that would incorporate the Marxian theory of history and class consciousness and the critique of bourgeois ideology, so as to generate principles of analysis and evaluation and show the place of art in the theory and practice of revolution. William Morris in England and Georgy V. Plekhanov in Russia both attempted to unite Marx's social criticism with a conception of the nature of artistic labour. Plekhanov's Iskusstvo I Obshchestvennaya Zhizn (1912; Art and Social Life) is a kind of synthesis of early Marxist thought and attempts to recast the practices of art and criticism in a revolutionary mold. The ideology of 'art for art's sake', Plekhanov argues, develops only in conditions of social decline when artist and recipient are in 'hopeless disaccord with the social environment in which they live'. Drawing on Kant and Schiller, Plekhanov presents a theory of the origins of art in play; play, however, must not be understood in isolation. It is indissolubly linked to labor, of which it is the complementary opposite. An art of play will be the 'free' art of the revolution, of humankind returned to social harmony, but only because play and labour will then be reunited and transcended. In place of their opposition will be a harmonious whole in which art is continuous with labor. The aesthetic theories of the Russian Revolution owe something to Plekhanov; something to the school of Formalist criticism, typified by the proto-Structuralist M. Bakhtin; and something to the anti-aesthetic propaganda of the Russian Constructivists, who believed in an art expressive of human dominion over raw materials – an art that would be destructive of all existing patterns of subordination. The official approach of the Soviets to art, however, was typified, first, by the persecution of all those who expressed adherence to those theories, and, second, by the adoption under Stalin of Socialist Realism (the view that art is dedicated to the 'realistic' representation of proletarian values and proletarian life) as the sole legitimate basis for artistic practice. Subsequent Marxist thinking about art was largely influenced by two major central European thinkers:- Walter Benjamin and György Lukács. Both were exponents of Marxist humanism who saw the important contribution of Marxian theory to aesthetics in the analysis of the condition of labour and in the critique of the alienated and 'reified' consciousness of human beings under capitalism. Benjamin's collection of essays Das Kunstwerk im Zeitalter seiner technischen Reproduzierbarkeit (1936; The Work of Art in the Age of Mechanical Reproduction) attempts to describe the changed experience of art in the modern world and sees the rise of Fascism and mass society as the culmination of a process of debasement, whereby art ceases to be a means of instruction and becomes instead a mere gratification, a matter of taste alone. 'Communism responds by politicizing art' – that is, by making art into the instrument by which the false consciousness of the masses is to be overthrown. Lukács developed a multifaceted approach to literary criticism in which the historical condition of society and the reality of class consciousness are singled out as the ideological agenda of works of literature and the major source of their appeal. This position is set forth in such works as Die Theorie des Romans (1920; The Theory of the Novel). Neither Lukács nor Benjamin produced a coherent aesthetics as defined in this article, although each was immensely influential on the practice of modern literary criticism whether Marxist or not in its ultimate inspiration. Eastern Aesthetics:- India:- The disparagement of the sensory realm as mere illusion ('the veil of Maya'), characteristic of much Indian religion, went hand in hand with a philosophy of embodiment (Karma), which gave a distinctive role to art both as an instrument of worship and as an earthly delight. The legends of the great god Krishna abound in exaggerated fantasies of erotic and physical power; the art of the temples testifies to a sensuality that belies the mystical gestures of renunciation which form the commonplaces of Hindu morality. In providing theories of such art and of the natural beauty that it celebrates, Indian philosophers have relied heavily on the concept of aesthetic flavour, or rasa, a kind of contemplative abstraction in which the inwardness of human feelings irradiates the surrounding world of embodied forms. The theory of rasa is attributed to Bharata, a sage-priest who may have lived about AD 500. It was developed by the rhetorician and philosopher Abhinavagupta (c. AD 1000), who applied it to all varieties of theatre and poetry. The principal human feelings, according to Bharata, are delight, laughter, sorrow, anger, fear, disgust, heroism, and astonishment, all of which may be recast in contemplative form as the various rasas:- erotic, comic, pathetic, furious, terrible, odious, marvellous, and quietistic. These rasas comprise the components of aesthetic experience. The power to taste rasa is a reward for merit in some previous existence. China:- Confucius (551–479 BC) emphasized the role of aesthetic enjoyment in moral and political education, and, like his near contemporary Plato, was suspicious of the power of art to awaken frenzied and distracted feelings. Music must be stately and dignified, contributing to the inner harmony that is the foundation of good behaviour, and all art is at its noblest when incorporated into the rituals and traditions that enforce the stability and order of social life. Lao-tzu, the legendary founder of Taoism, was even more puritanical. He condemned all art as a blinding of the eye, a deafening of the ear, and a cloying of the palate. Later Taoists were more lenient, however, encouraging a freer, more intuitive approach both to works of art and to nature. The philosophy of beauty presented in their works and in the writings of the Ch'an (Zen) Buddhists who succeeded them is seldom articulate, being confined to epigrams and short commentaries that remain opaque to the uninitiated. The same epigrammatic style and the same fervent puritanism can be discerned in the writings of Mao Tse-tung, who initiated in the Cultural Revolution the most successful war against beauty that has been waged in modern history. Japan:- The practice of literary commentary and aesthetic discussion was extensively developed in Japan and is exemplified at its most engaging in the great novel Genji Monogatari (c. 1000; Tale of Genji), written by Murasaki Shikibu, lady-in-waiting to the Empress. Centuries of commentary on this novel, as well as on the court literature that it inspired, on the Nō and puppet plays, and on the lyrical verses of the haiku poets, led to the establishment of an aesthetics of supreme refinement. Many of the concepts of this form of aesthetics were

drawn from the writings of Zeami Motokiyo (1363–1443), a playwright and actor-manager. Zeami argued that the value of art is to be found in Yūgen (Mystery and Depth) and that the artist must follow the rule of Sōō (Consonance), according to which every object, gesture, and expression has to be appropriate to its context. The domination of aesthetic scruples over Japanese life has, as its culminating instance, the tea ceremony – a marvel of constrained social ballet – to the study of which whole lives have been devoted. Associated with this triumph of manners is an art of mood and evocation, in which significance is found in the small, concentrated gesture, the sudden revelation of transcendent meaning in what is most ordinary and unassuming. In the late XVIII century Motoori Norinaga, a leading literary scholar, summed up the essence of Japanese art and literature as the expression of a touching intimation of transience, which he captured in the famous phrase Mono No Aware, meaning roughly 'The Sensitivity To The Sadness Of Things'. Other aesthetic qualities emphasized by classical scholars and critics are En (Charming), Okashi (Amusing), and Sabi (Having The Beauty Of Old, Faded, Worn, or Lovely Things). In all such aesthetic categories, we can sense the resonance of the Taoist and Buddhist ideas of renunciation. Aestetics or Esthetics:- in textiles, properties perceived by touch and sight, such as the hand, color, luster, drape, and texture of fabrics or garments. / Под Эстетикой, от Греческого слова Aisthētikós, означающее Чувственный или Чувствующий, понимается философская наука, изучающая сферу эстетического как специфического проявления ценностного отношения между человеком и миром и область художественной деятельности людей. Как особая дисциплина вычленяется в XVIII веке у Немецкого философа-идеалиста Алэксандра Готлиба Баумгартэна (Alexander Gottlieb Baumgarten; 1714–62), введшего самый термин 'Эстетика' для обозначения 'науки о чувственном знании' – низшей теории познания, дополняющей логику; у Немецкого философа Иммануила Канта (Immanuel Kant; 1724–1804) эстетика – наука о 'правилах чувственности вообще'. Наряду с этим в Немецкой классической эстетике XVIII – начала XIX веков развивается понимание эстетики как философии искусства, закрепляющееся у Гэорга Вильгэльма Фриэдрихя Хэгэля (Georg Wilhelm Friedrich Hegel; 1770–1831). Основной проблемой философоэстетической мысли древности, средневековья и в значительной мере нового времени была проблема прекрасного. Эстетика, философская наука, изучающая два взаимосвязанных круга явлений:- сферу эстетического как специфическое проявление ценностного отношения человека к миру и сферу художественной деятельности людей. Соотношение этих разделов эстетики менялось на протяжении её истории и понимается неодинаково – от попыток сведения эстетики к 'философии прекрасного' до её трактовки как 'философии искусства'; не раз предлагалось расчленить эстетику на несколько самостоятельных научных дисциплин – на теорию эстетических ценностей, теорию эстетического восприятия, общую теорию искусства, однако опыт показывал, что эстетические ценности реального мира и художественное его освоение связаны столь тесно, что разорвать их изучение практически невозможно. Это нередко порождало другую крайность – отождествление художественной деятельности и эстетической активности человека, взаимоотношение между которыми в действительности достаточно сложно. Таким образом, оба основных раздела эстетики, будучи органически взаимосвязаны, обладают относительной самостоятельностью. В первом из них рассматриваются такие вопросы, как природа и своеобразие эстетического в системе ценностных отношений; закономерности дифференциации эстетических ценностей, выступающих в множестве конкретных модификаций (прекрасное и безобразное, возвышенное и низменное, трагическое и комическое и тому подобное); диалектическая связь эстетической ценности и эстетической оценки, эстетического восприятия и эстетически ориентированной практики; значение эстетической активности человека в социальной и индивидуальной жизни, в разных областях культуры; взаимосвязь эстетического и художественного в разных сферах их проявления – в практической деятельности и в созерцании, в воспитании и образовании людей. Второй раздел эстетики как науки, посвящённый специальному анализу художественной деятельности, включает изучение её возникновения в филогенезе и онтогенезе; её структурного и функционального своеобразия в ряду других форм человеческой деятельности, её места в культуре; связи процесса художественного творчества, структуры воплощающих его произведений искусства и характера их восприятия человеком; законов, порождающих разнообразие конкретных форм художественной деятельности (видов, родов, жанров искусства) и её исторических модификаций (направлений, стилей, методов); особенностей современного этапа художественного развития общества и исторических перспектив развития искусства. Вместе с тем эстетика никогда не ограничивалась одним только изучением закономерностей эстетического и художественного освоения человеком мира, но так или иначе направляла это освоение, вырабатывая определённые критерии эстетической оценки и программы художественной деятельности. Этот момент нормативности имел то больший, то меньший удельный вес в эстетике (сравните, например, нормативную эстетику классицизма и антинормативную эстетику романтизма), однако так или иначе научно-познавательные функции эстетики всегда переплетаются с её ценностно-ориентирующими, идеологическими функциями. Длительный исторический процесс становления и развития эстетической мысли направлялся рядом обусловливавших его факторов:- идеологическими и социально-психологическими позициями различных классов и общественных групп, которые эстетика выражает и теоретически обосновывает; особенностями изменяющегося предмета изучения – эстетической культуры и художественной практики; характером философских учений, из которых вырастали или на которые опирались эстетические теории; позициями смежных наук (искусствоведения и литературоведения, психологии, социологии и других). Эстетическая мысль зародилась в глубочайшей древности в мифологическом сознании доклассового общества. Анализ мифов разных народов показывает, как запечатлевались в них первоначальные представления людей о происхождении различных искусств, об их роли в жизни человека, о связи искусства и красоты (например, древнегреческий миф об Аполлоне Мусагете и предводительствуемых им Музах). Однако история эстетики в собственном смысле началась лишь с формированием научно-теоретической мысли. На первом этапе своего развития, который продлился в Европе до середины XVIII века, эстетика не была ещё самостоятельной научной дисциплиной и не имела даже собственного названия. В античности, например, эстетическая проблематика разрабатывалась, с одной стороны, в философских сочинениях (пифагорейцами, Сократом, Платоном, Аристотелем), а с другой – в трактатах, посвященных теории разных видов искусства (например, в трактатах Поликлета, Горгия, Витрувия, Горация). Это не помешало, однако, тому, что многие глубокие идеи античных мыслителей получили основополагающее значение для всего последующего развития Европейской эстетической мысли (развитие эстетики на Востоке шло специфическими путями, лишь временами соприкасаясь с развитием Европейской эстетики). Христианская эстетика средневековья обосновывала спиритуалистическое понимание эстетических явлений и трактовала структуру искусства в символическом духе (Августин, Фома Аквинский и другие). Только в эпоху Возрождения эстетическая мысль освободилась из теологического плена и стала светской, гуманистической и реалистически-ориентированной. Но при этом стали ослабевать связи эстетики с философией, которая непосредственно опиралась теперь на естественнонаучное знание и не испытывала глубокого интереса к эстетико-художественным проблемам. Такой интерес проявлялся, однако, представителями художественной практики, поскольку радикальная перестройка творческого метода требовала теоретического обоснования. Соответственно разработка эстетической проблематики сосредоточивается в эту эпоху в искусствоведческих трактатах, авторами которых были крупнейшие художники (Л.Б. Альберта, Леонардо да Винчи, А. Дюрер и другие) и теоретики различных видов искусства. В XVII – 1-й половине XVIII веков проблемы сущности красоты и природы искусства продолжают обсуждаться в трактатах по теории отдельных его видов (Никола Буало-Депрео (N. Boi-leau-Despréaux; 1636–1711), Шарль Сорель (C. Sorel; 1602–1674), Михаил Васильевич Ломоносов (1711–1765) и другие) или в работах художественно-критического жанра (Иоганн Якоб Бодмер (Bodmer; 1698–1783) и И. Брейтингер, Дени Дидро (Diderot; 1713–

1784) и другие). Художественно-практическая ориентация эстетики приводила к выдвижению на первый план вопросов, связанных с теоретическим обоснованием и защитой того или иного метода творчества, стиля, направления – маньеризма, классицизма, барокко, реализма. При этом столкновение различных эстетических программ (например, борьба Дидро и Г.Э. Лессинга за реализм, полемика сторонников классицизма и барокко в Италии и Испании) отчётливо выражало борьбу идеологий. Идеология Просвещения придала особую остроту и размах процессу теоретического осмысления новых путей развития искусства, породив во всех Европейских странах сильное, хотя и весьма разнородное по философским и художественным пристрастиям, движение, именуемое ‘просветительской эстетикой’ (Дидро и Ж.Ж. Руссо во Франции, Лессинг и И.И. Винкельман в Германии, А. Шефтсбери и Г. Хом в Великобритании и другие). Активизация интереса к искусству, его возможностям в становлении миросозерцания человека вела к сопоставлению разных видов художественного творчества (Жан Батист Дюбо (Dubos; 1670–1742), Дж. Харрис и другие), а затем к формированию представления о единстве всех ‘изящных искусств’ (Шарль Баттё (Batteux; 1713–1780), Мозес Мендельсон (Mendelssohn; 1729–1786)). С этим была связана постановка проблемы вкуса, который рассматривался как специфический психический механизм, способный воспринимать и оценивать красоту и плоды художественного творчества. В этом пункте навстречу искусствоведческой мысли двигалась философия, которая стала всё более активно включать эстетическую проблематику в сферу исследования (трактаты Дж. Вико, К.А. Гельвеция, Вольтера, Д. Юма, Эдмунда Бёрка (Burke; 1729–1797)). В середине XVIII века Немецкий философ-идеалист Алэксандр Готлиб Баумгартэн (Alexander Gottlieb Baumgarten; 1714–62), последователь также Немецкого мыслителя Г.В. Лейбница, доказал необходимость выделения посвященного этому кругу вопросов самостоятельного раздела философии наряду с этикой и логикой. Баумгартен назвал его ‘Эстетикой’, то есть ‘теорией чувственного познания’; разработка её вылилась в создание цельного и связного учения о прекрасном и об искусстве, поскольку красота была определена Баумгартеном как ‘совершенство чувственного познания’, а искусство – как воплощение красоты. Так начался второй этап истории эстетики, характеризовавшийся её превращением в самостоятельный раздел философии, необходимый последней для полноты объяснения культуры, человеческой деятельности, социальной истории. По пути, намеченному Баумгартеном, пошли крупнейшие представители Немецкой философии и художественной культуры – Иммануил Кант (Immanuel Kant; 1724–1804), И.Г. Гердер, Ф. Шиллер, И.В. Гёте, Ф.В. Шеллинг, Гэорг Вильгэльм Фриэдрихь Хэгэль (Georg Wilhelm Friedrich Hegel; 1770–1831). Правда, в начале XIX века романтическое движение, обогатив эстетику открытием многих закономерностей искусства, недоступных рационалистически-метафизическому сознанию просветителей, своей антирационалистической направленностью подрывало основы эстетики как систематической научной теории. Однако Гегель, восстановив в правах возможности разума и раскрыв перед ним диалектический путь познания, преодолел эти опасные для научной эстетики тенденции и построил грандиозную эстетическую концепцию, в которой теоретический анализ был органически соединён с исторической точкой зрения на художественную деятельность человека, её развитие и её место в культуре. Тем самым Гегель завершил идущий от Баумгартена этап развития эстетики как раздела энциклопедически всеобъемлющего философского знания, покоившегося на идеалистическом мировоззрении. Начавшийся после этого третий этап истории эстетики характеризуется острой борьбой различных методологических и идеологических ориентаций. В идеологическом плане эта борьба выразилась в поляризации трёх основных направлений эстетической мысли XIX–XX веков. Буржуазная эстетика разнообразными способами обосновывала эстетизм и принципы ‘чистого искусства’, 'искусства для искусства’ (от ‘парнасцев’ и школы К. Фидлера до Х. Ортеги-и-Гасета и Х. Рида). Демократическая эстетика выступала и в форме утопически-социалистических теорий (от П. Прудона до Л.Н. Толстого), и в революционно-демократической концепции Русских мыслителей (В.Г. Белинского и А.И. Герцена, Н.Г. Чернышевского и Н.А. Добролюбова), но в обоих случаях защищала принципы реалистического искусства, тесно связанного с реальной жизнью общества и критического по отношению к буржуазной действительности. Пролетарская социалистическая эстетика была разработана Карлом Марксом, Фридрихом Энгельсом и Владимиром Ильичом Лениным, в развитие её существенный вклад внесли Ф. Меринг, П. Лафарг, Г.В. Плеханов, А.В. Луначарский, А. Грамши, Д. Лукач и многие другие представители Марксизма-Ленинизма в разных странах мира. В философско-методологическом плане разнообразие путей развития эстетической мысли в XIX–XX веках порождалось её опорой на различные философские учения – те или иные формы объективного идеализма (Ф.Т. Фишер, В.С. Соловьев) и субъективного идеализма (А. Бретон), позитивизма (Г. Спенсер, И. Тэн, Дж. Дьюи) и интуитивизма (Б. Кроче, А. Бергсон), антропологического материализма (Фейербахианская эстетика и эстетика Русских революционных демократов), феноменологии (Н. Гартман, Р. Ингарден, М. Дюфрен), экзистенциализма (Ж.П. Сартр, М. Хайдеггер). Другой аспект дифференциации эстетических учений данной эпохи выразился в стремлении связать эстетику с той или иной конкретной наукой; так рождались психологическая эстетика (Г. Фехнер, Т. Липпс), физиологическая эстетика (А. Грапт-Аллен, В.В. Велямович), психоаналитическая эстетика (З. Фрейд, Ж. Лакан), социологическая эстетика (М. Гюйо, Ш. Лало), искусствоведческая эстетика (Э. Ганслик, Х. Зедльмайр), семиотическая эстетика (Ч. Моррис, У. Эко), кибернетическая и информационная эстетика (А. Моль, М. Бензе), математическая эстетика (Дж. Биркгоф). Наконец, эстетические учения XIX–XX веков различаются по тому, какое конкретное направление художественного творчества они теоретически обосновывают – критический реализм (О. Бальзак, Русские революционные демократы), натурализм (Э. Золя), символизм (Вяч. Иванов, А. Белый), абстракционизм (В. Кандинский). Принципиальное отличие Марксистской эстетики от всех направлений эстетической мысли XIX–XX веков обусловлено прежде всего тем, что она вырастает на философском фундаменте диалектического и исторического материализма и выступает как теоретическая платформа социалистического реализма, в разработке которой приняли активное участие наряду с классиками Марксизма-Ленинизма и теоретиками искусства крупнейшие представители художественной практики (Максим Горький и С.М. Эйзенштейн, Б. Брехт и И. Бехер, Л. Арагон, Р. Роке и другие). Современная Марксистско-Ленинская эстетика завоёвывает всё больший авторитет во всём мире, а в социалистических странах служит теоретической основой строительства художественной культуры и работы по эстетическому воспитанию трудящихся масс. Решая эти задачи, Марксистско-Ленинская эстетика совершенствуется на протяжении всей своей истории, растёт вместе с научной мыслью, философией, современным искусством, борется против догматических и ревизионистских извращений, овладевает комплексным и системным подходами, которые помогают преодолевать любые односторонности в трактовке эстетических проблем. И хотя многие из этих проблем ещё не получили однозначного решения и вызывают острые теоретические дискуссии (например, соотношение природного и социального в сфере эстетических ценностей, основные социальные функции искусства, природа реализма и тому подобное), основные контуры Марксистской эстетической теории прослеживаются сегодня с достаточной определённостью. Её исходным положением является признание практической человеческой деятельности основой эстетического отношения человека к миру. В общественном труде формируется неизвестная животным способность человека созидать и ‘по законам красоты’ (смотрите Карл Маркс, в кн. Карл Маркс и Фридрих Энгельс, Соч., 2 Изд., Т. 42, С. 94) ко всему подходить с эстетической мерой. В результате человек начинает находить в мире – в общественной жизни и в природе – разнообразные эстетические ценности:- красоту и величие, гармонию и драматизм, трагизм и комизм. Таким образом, сфера действия эстетических закономерностей, эстетических принципов и критериев выходит далеко за пределы искусства; это означает, что эстетическая активность человека в социалистическом обществе не может ограничиваться художественной деятельностью, но должна распространяться на все без исключения

области жизни. Соответственно этому и эстетическое воспитание не может сводиться к художественному воспитанию – воспитанию отношения человека к искусству или же к его воспитанию средствами искусства, но должно органически включаться во все формы воспитания:- трудовое, нравственное, политическое, физическое и тому подобное, ибо только при этом условии возможно формирование целостной, гармонической, всесторонне развитой личности. Марксистско-Ленинская эстетика показывает, что в решении этой задачи особую роль играет искусство, поскольку оно объединяет эстетическое, нравственное и другие виды воздействия на человека, то есть формирует человека целостно, а не односторонне. Эстетическая наука приходит к такому выводу, исследуя исторический процесс возникновения и развития художественной деятельности, её структуру и социальные функции. Художественная деятельность порождается потребностями наследования культуры, накопления опыта человеческой жизни и его передачи от поколения к поколению и от общества к личности. Дополняя и целенаправленно расширяя реальный опыт индивида, искусство оказывается мощным средством духовного формирования каждого нового члена общества, его приобщения к ценностям, нормам, идеалам, накопленным культурой и отвечающим потребностям данного общественного уклада, данного класса, этнической группы, социальной среды. Тем самым в искусстве диалектически соединяется общечеловеческое, исторически изменчивое, национальное, классовое, личностное. Эта диалектика фиксируется в выработанной Марксистско-Ленинской эстетикой системе социально-эстетических координат, в которых описывается каждое отдельное художественное явление – историческая конкретность, национальное своеобразие, классовость, народность, партийность, уникальность. Основная социальная функция искусства обусловливает структуру художественного способа отражения действительности. Он именуется в эстетике художественно-образным. Художественный образ является мельчайшей и неразложимой ‘клеточкой’ художественной ‘ткани’, в которой запечатлеваются все основные особенности искусства:- художественный образ есть форма познания действительности и одновременно её оценки, выражающей отношение художника к миру; в художественном образе сливаются воедино объективное и субъективное, материальное и духовное, внешнее и внутреннее; будучи отражением реальности, художественный образ является и её преображением, так как он должен запечатлеть единство объекта и субъекта и потому не может быть простой копией своего жизненного прообраза; наконец, передавая людям то, что художник хочет сказать о мире и о себе, художественный образ выступает одновременно и как определённое (поэтическое, идейно-эстетическое) значение и как несущий это значение специфический знак. Такая уникальная структура художественной ‘ткани’ сближает искусство в одном отношении с наукой, в другом – с моралью, в третьем – с продуктами технического творчества, в четвёртом – с языком, позволяя искусству при всём этом сохранять суверенность, поскольку оно оказывается носителем специфической информации, недоступной всем остальным формам общественного сознания. Поэтому взаимоотношения искусства и других способов освоения человеком мира оказываются основанными на диалектике взаимного сближения и взаимного отталкивания, конкретные формы которой обусловливаются различными общественно-историческими и классово-идеологическими потребностями; в одном случае искусство сближается с религией и отталкивается от науки, в другом, напротив, рассматривается как способ познания, родственный науке и враждебный религии, в третьем – противопоставляется всем остальным видам внеэстетической, утилитарной деятельности и уподобляется игре, и так далее. Марксистско-Ленинская эстетика ориентирует художественное творчество в социалистическом обществе на диалектическое разрешение данного противоречия, то есть на всемерное укрепление его связей с идеологией, наукой, техникой, спортом, различными средствами коммуникации и одновременно на утверждение его специфических художественных, поэтических, эстетических качеств. Поскольку искусство охватывает множество видов, родов, жанров, общие принципы художественно-образной структуры преломляются в каждом из них по-своему. Соответственно каждый конкретный способ художественной деятельности имеет особое содержание и особую форму, что обусловливает его своеобразные возможности воздействия на человека и специфическое место в художественной культуре. Вот почему в разных историко-культурных ситуациях литература, музыка, театр, живопись играли неодинаковую роль в духовной жизни общества, и точно так же различный удельный вес на разных этапах художественного развития имели эпический, лирический, драматический роды художественного творчества, равно как и жанры романа и повести, поэмы и симфонии, исторической картины и натюрморта. Эстетическая теория склонна была всякий раз абсолютизировать современное ей конкретное взаимоотношение искусств, в результате чего какой-либо один вид, род, жанр искусства возвеличивался за счет других и воспринимался как некая ‘идеальная модель’ художественного творчества, способная будто бы наиболее полно и ярко представить самую его сущность. Подобный односторонний подход успешно преодолевается в Марксистской эстетической науке, все более последовательно проводящей идею принципиального равноправия всех видов, родов и жанров искусства и в то же время выявляющей причины, по которым каждый из них выдвигается на первый план в ту или иную историческую эпоху. В результате эстетика получает возможность выявлять общие законы искусства, лежащие в основе всех его конкретных форм, затем морфологические законы перехода общего в особенное и индивидуальное и, наконец, исторические законы неравномерного развития видов, родов, жанров искусства. Эстетическая наука делает свои теоретические выводы и обобщения, опираясь на разносторонние исследования искусства в искусствоведческих науках, а также в психологии, социологии, семиотике, кибернетике; при этом эстетика не растворяется ни в одной из наук и сохраняет свой философский характер, который и позволяет ей строить целостную теоретическую модель художественной деятельности. Последняя может рассматриваться при этом как специфическая система, состоящая из трех звеньев – художественного творчества, художественных произведений и художественного восприятия. Их связь является особой формой общения, существенно отличающейся от научной, деловой, технической коммуникации, так как произведение искусства ориентировано на его восприятие человеком как личностью со всем её уникальным жизненным опытом, строем сознания и складом чувств, ассоциативным фондом, неповторимым духовным миром и требует поэтому активного сотворчества воспринимающего, его душевного соучастия, глубинного переживания и личностной интерпретации. Поскольку же социологический подход к художественной деятельности устанавливает конкретную социальную детерминированность духовного мира всех личностей, участвующих в ‘художественном диалоге’ – личности художника, личности исполнителя (актёра или музыканта), личности героя художественного произведения, личности читателя, слушателя, зрителя, – постольку воздействие искусства на человеческие души оказывается формой общественного воспитания личности, инструментом её социализации. Соответственно современная художественная жизнь раскрывается эстетической наукой как специфическая сфера проявления общих социально-исторических коллизий эпохи, борьбы двух противоположных общественных систем, буржуазной и коммунистической идеологий. Огромное практическое значение имеет разрабатываемая Марксистско-Ленинской эстетикой теория социалистического реализма. Она призвана направить творческую деятельность по пути, отвечающему интересам формирования человека коммунистического общества – всесторонне и гармонически развитого, носителя высокой гражданственности и нравственного благородства, политической сознательности и убеждённости, социальной активности и душевной чуткости. Поскольку важнейший принцип социалистического общества – единство общенародных интересов, идеалов, устремлений и неповторимости каждой личности, постольку в искусстве социалистического реализма единые позиции творческого метода служат предпосылкой богатства художественных стилей, а народность и партийность искусства органически связаны со свободой творчества.

AESTIVATION = ЛЕТОВАНИЕ (или ЛЕТНЯЯ СПЯЧКА) – Aestivation is the inactive or dormant state of a larva during summer.

AESTIVATION = ЭСТИВАЦИЯ (или ПОЧКОСЛОЖЕНИЕ) – Aestivation or Estivation is a spending the summer months in a dormant state. / в состоянии покоя. (i) Почкосложение листьев в почке или лепестков в цветочной почке. (ii) Состояние покоя растений в летний период. (iii) Летняя спячка. Под Эстивацией, от Латинского слова Aestas, означающее Лето, понимается так называемая 'летняя спячка'. Эстивацией можно назвать сонное, неактивное состояние некоторых животных при наступлении засухи, когда становится невозможным добывать пищу и воду. Так поступают улитки во время засухи, а также некоторые виды сусликов, которые в самые жаркие месяцы прячутся в свои подземные убежища, оставаясь там вялыми и неподвижными. Позднелатинское слово Aestivat-, past participle of Aestivare from Aestivus, . (in the sense 'pass the summer'):- from Latin Aestivat-, from Aestivare 'Spend the Summer', from Aestus 'Heat'.

AEX = AMSTERDAM EXCHANGE

AEX = AUTOMATED EXECUTION

AEZ = AGROECOLOGICAL ZONE

AF = AFGHANISTAN

AF = AIRWAY FACILITIES

AFA = AFGHAN AFGHANI

AFB = AIR FORCE BASE

AFB = AXIAL FLOW BLOWER

AFC = AUTOMATIC FARE COLLECTION

AFD = AIRPORT FACILITY DIRECTORY

AFE = AUTHORITY FOR EXPENDITURE

AFE = AUTHORIZATION FOR EXPENDITURE

AFE = AVERAGE FUNDS EMPLOYED

AFF = AFFINIS

AFFIDAVIT = АФФИДЕВИТ (или ЭФИДЭЙВИТ) – Affidavit is a written declaration on oath. A letter, statement or form that has been notarized (sworn). Sworn or affirmed written statement to authenticate a claim, especially in securities trading, e.g., regarding the origin and ownership of securities. In foreign taxation, tax declaration made under oath by the owner of foreign marketable securities residing abroad to avoid double taxation on income from coupons payable in their country of origin. In Latin:- Il Affirma. An Affidavit is voluntarily made without any cross-examination of the affiant and, therefore, is not the same as a deposition, a record of an examination of a witness or a party made either voluntarily or pursuant to a subpoena, as if the party were testifying in court under cross-examination. A pleading – a request to a court to exercise its judicial power in favor of a party that contains allegations or conclusions of facts that are not necessarily verified – differs from an affidavit, which states facts under oath. An affidavit is based upon either the personal knowledge of the affiant or his or her information and belief. Personal knowledge is the recognition of particular facts by either direct observation or experience. Information and belief is what the affiant feels he or she can state as true, although not based on firsthand knowledge. The Affiant is any person having the intellectual capacity to take an oath or make an affirmation and who has knowledge of the facts that are in dispute may make an affidavit. There is no age requirement for an affiant. As long as a person is old enough to understand the facts and the significance of the oath or affirmation he or she makes, the affidavit is valid. A criminal conviction does not make a person incapable of making an affidavit, but an adjudication of Incompetency does. Someone familiar with the matters in question may make an affidavit on behalf of another, but that person's authority to do so must be clear. A guardian may make an affidavit for a minor or insane person incapable of doing so. An attorney may make an affidavit for a client if it is impossible for the client to do so. When necessary to the performance of duties, a Personal Representative, agent, or corporate officer or partner may execute an affidavit that indicates the capacity in which the affiant acts. A court cannot force a person to make an affidavit, since, by definition, an affidavit is a voluntary statement. The Taker of the Affidavit:- any public officer authorized by law to administer oaths and affirmations – such as city recorders, court clerks, notaries, county clerks, commissioners of deeds, and court commissioners – may take affidavits. Justices of the peace and magistrates are sometimes authorized to take affidavits. Unless restricted by state law, judges may take affidavits involving controversies before them. An officer cannot take affidavits outside of the particular jurisdiction in which he or she exercises authority. The source of this authority must appear at the bottom of the affidavit. A notary, for example, would indicate the county in which he or she is commissioned and the expiration date of the commission. An official seal is not essential to the validity of the affidavit but may be placed on it by the proper official. The Oath or Affirmation:- unless otherwise provided by statute, an oath is essential to an affidavit. The statement of the affiant does not become an affidavit unless the proper official administers the oath. When religious convictions prevent the affiant from taking an oath, he or she may affirm that the statements in the affidavit are true. Contents:- there is no standard form or language to be used in an affidavit as long as the facts contained within it are stated clearly and definitely. Unnecessary language or legal arguments should not appear. Clerical and grammatical errors, while to be avoided, are inconsequential. The affidavit usually must contain the address of the affiant and the date that the statement was made, in addition to the affiant's signature or mark. Where the affidavit has been made is also noted. When an affidavit is based on the affiant's information and belief, it must state the source of the affiant's information and the grounds for the affiant's belief in the accuracy of such information. This permits the court to draw its own conclusions about the information in the affidavit. An affiant is strictly responsible for the truth and accuracy of the contents of the affidavit. If false statements are made, the affiant can be prosecuted for perjury. Functions:- affidavits are used in business and in judicial and administrative proceedings:- (i) Business Generally Affidavits are used in business whenever an official statement that others might rely upon is needed. Statements of the financial stability of a corporation, the pedigree of animals, and the financial conditions of a person applying for credit are examples of affidavits used in the commercial world. (ii) Judicial Proceedings Affidavits serve as evidence in civil actions and criminal prosecutions in certain instances. They are considered a very weak type of evidence because they are not taken in court, and the affiant is not subject to cross-examination. Their use is usually restricted to times when no better evidence can be offered. If a witness who has made an affidavit is not available to testify at a trial, his or her affidavit may be admitted as evidence. If the witness is present, his or her affidavit is inadmissible except when used to impeach the witness's testimony, or to help the witness with past recollection of facts. Affidavits are also used as evidence in ex parte proceedings such as a hearing for the issuance of a Temporary Restraining Order or an order to show cause. The expeditious nature of such proceedings is considered to substantially outweigh the weak Probative value of the affidavits. In addition, there is normally a subsequent opportunity in the course of litigation for the opposing party to refute the affidavits or cross-examine the affiants. An affidavit based on the knowledge of the affiant is accorded more weight than one based on information and belief. When

admissible, affidavits are not conclusive evidence of the facts stated therein. (iii) Administrative Proceedings Affidavits are frequently used in administrative and Quasi-Judicial proceedings as evidence when no objection is made to their admission and there is an opportunity for cross-examination. / Декларация в письменной форме под присягой. Письмо, заявление или форма, которая была нотариально заверена (под присягой). Заявление в письменной форме, сделанное под присягой или в торжественной обстановке, с целью аутентификации заявления, особенно в торговле ценными бумагами, например, касающееся происхождения и владения ценными бумагами. В иностранном налогообложении, налоговая декларация, заполненная владельцем иностранных ценных бумаг, проживающим за рубежом, под присягой с целью избежать двойного налогообложения доходов от оплаты купонов в стране происхождения этих ценных бумаг. На Латинском языке – Ил Аффирма (Il Affirma). Под Аффидевитом понимаются:- (i) юридически заверенный документ, например Сертификат Происхождения или принадлежности ценной бумаги. (ii) В Англосаксонском праве – письменное показание под присягой или на основании торжественного заявления перед уполномоченным должностным лицом, например, государственным нотариусом. Ответственный Свидетель (Affiant – лицо, дающее аффидевит) не подвергается опросу или интервьюированию по документу со стороны поверенных лиц; это – просто заявление ответственного свидетеля.

AFFILIATE = АФФИЛЯТ – Affiliate is a type of inter-company relationship in which one of the companies owns less than a majority of the other company's stock, or a type of inter-company relationship in which at least two different companies are subsidiaries of a larger company. For example, let's say BIG Corp. owns 40% of MID Corp.'s common stock and 75% of TINY Corp. In this case, MID Corp. and BIG Corp. have an affiliate relationship, and TINY Corp. is BIG Corp.'s subsidiary. However, note that for the purposes of filing consolidated tax returns, IRS regulations state that a parent company must possess at least 80% of a company's voting stock in order to be considered affiliated. Affiliate is a company that controls, or is controlled by another company, or is one of two or more commonly controlled companies. An Affiliate is a business enterprise located in one country which is directly or indirectly owned or controlled by a person of another country to the extent of 10 percent or more of its voting securities for an incorporated business enterprise or an equivalent interest for an unincorporated business enterprise, including a branch. For outward investment, the affiliate is referred to as a Foreign Affiliate; for inward investment, it is referred to as a 'US Affiliate'. Also known as Related Party. / Би.Ай.Дьжи. Корп. (BIG Corp.). Известен также как Связанная Сторона (Related Party). Дочерняя Компания или Аффилированная Компания (Affiliate):- в общем значении, одна из двух объединённых компаний, если она имеет меньшую часть акций с правом голоса другой компании, или когда обе компании являются филиалом третьей компании. Дочерним предприятием (subsidiary) является компания, более 50% акций с правом голоса которой принадлежат другой компании, называемой головной, или материнской (parent company). Дочернее предприятие всегда, по определению, является дочерним обществом, но в случае, если головная компания контролирует большинство акций с правом голоса, предпочтительным является термин 'Дочернее Предприятие'. Термин 'аффилированная компания' используется тогда, когда отношения между компаниями не относятся к типу 'головная компания – дочернее предприятие', а имеют скорее характер косвенного подчинения. В разных источниках может встретиться разное толкование данного термина, например, в соответствии с Актом о Банковском Обслуживании от 1933 (Banking Act of 1933):- любая организация, которой владеет или управляет банк в силу того, что её акции принадлежат банку или его акционерам, а также организация, управляющие работники которой входят в число директоров банка. Служба Внутренних Доходов США (Internal Revenue Service), совместное заполнение налоговых деклараций осуществляется объединением компаний, в котором головная компания (или иная объединяющая их компания) владеет по меньшей мере 80% акций. Комиссия по Торговле Между Штатами, Счёт 706 (Interstate Commerce Commission, Account 706; the Interstate Commerce Commission was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations):- (i) счёт, контролируемый компанией, о бухгалтерской отчётности которой идёт речь, самостоятельно или совместно с иными компаниями в рамках соглашения о совместной деятельности; (ii) счёт, контролирующий компанию, о бухгалтерской отчётности которой идёт речь, самостоятельно или совместно с иными компаниями в рамках соглашения о совместной деятельности. Акт об Инвестиционных Компаниях (Investment Company Act):- компания, в которой более 5% принадлежащих акционерам ценных бумаг с правом голоса находятся в прямом или непрямом владении другой компании.

AFFILIATED COMPANY = АФФИЛИРОВАННАЯ КОМПАНИЯ (или ВЗАИМОСВЯЗАННАЯ КОМПАНИЯ) – Affiliated Company is a company, or other organization related through common ownership, common control of management or owners, or through some other control mechanism, such as a long-term lease.

AFFILIATED FIRM = АФФИЛИРОВАННАЯ ФИРМА (или ВЗАИМОСВЯЗАННАЯ ФИРМА) – Affiliated Firm:- this term means, with respect to a firm, any firm which controls, is controlled by or is under common control with such firm. The term Control means the power to direct or cause the direction of the management or policies of a firm, whether through ownership of securities, by contract or otherwise.

AFFILIATED FOREIGN GROUP = АФФИЛИРОВАННАЯ ИНОСТРАННАЯ ГРУППА (или ВЗАИМОСВЯЗАННАЯ ИНОСТРАННАЯ ГРУППА) – An Affiliated Foreign Group means (i) the foreign parent, (ii) any foreign person, proceeding up the foreign parent's ownership chain, which owns more than 50 percent of the person below it up to and including that person which is not owned more than 50 percent by another foreign person, and (iii) any foreign person, proceeding down the ownership chain(s) of each of these members, which is owned more than 50 percent by the person above it.

AFFILIATED ISLAND = АФФИЛИРОВАННЫЙ ОСТРОВ (или ВЗАИМОСВЯЗАННЫЙ ОСТРОВ) – Affiliated Island is an island associated with the United States but not fully integrated as a State, i.e. American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the US Virgin Islands. Affiliated islands are insular areas monitored by the US Department of the Interior.

AFFILIATED PERSON = АФФИЛИРОВАННОЕ ЛИЦО (или ВЗАИМОСВЯЗАННОЕ ЛИЦО) – Affiliated Person is a person who is in a position to influence a firm's management decisions. Affiliated persons usually include directors, officers, owners of more than 10% of the firm's outstanding stock, and family members or close associates of these groups. Also called Control Person. Control Person is an important person in a corporation. Control persons include senior managers, members of the board of directors, and officers such as the Chief Executive Officer (CEO) and the Chief Financial Officer (CFO). Control persons are able to use both their authority and their influence to make decisions on the corporation's activities. A control person is also called an Affiliated Person. Affiliated Person means an individual who is in a position to influence the actions of a corporation. This includes people such as directors, executives, and owners. Depending on the context, an affiliated person might be referred to simply as an Affiliate. Affiliated Person is a person who is able to exert influence on a corporation, often as a result of minority ownership. / Аффилированное Лицо – лицо, имеющее возможность оказывать прямое влияние на деятельность корпорации. В число таких лиц входят лица, владеющие более 10% акций с правом голоса, директоры, старшие управляющие корпорации, а также те руководящие сотрудники, чьё положение позволяет им оказывать влияние на перечисленных лиц, например, члены их семей и иные близко с ними связанные люди. Иногда употребляется синоним термина – 'контролирующее лицо' (control person).

AFFILIATE INSTITUTION = АФФИЛИРОВАННОЕ УЧРЕЖДЕНИЕ (или АФФИЛИРОВАННЫЙ ИНСТИТУТ, или ВЗАИМОСВЯЗАННОЕ УЧРЕЖДЕНИЕ) – For SWIFT purposes, Affiliate Institution is a financial institution sharing, with one or more other financial institutions, some aspects of common ownership and control. If these financial institutions have ISO Bank Identification Codes, they may have the same or different bank codes. / В отношении того, что связано с Сообществом по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) это может относиться к участию финансового учреждения в одном или более других финансовых учреждениях, некоторым аспектам общего владения и контроля. Если эти финансовые учреждения имеют Банковский Идентификационный Код по системе МОС (ISO Bank Identification Codes), то они могут иметь как тот же самый, так и отличающийся банковский код. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

AFFINIS = АФФИНИС (или АФИННОЕ, или РОДСТВЕННОЕ, или ВЗАИМОСВЯЗАННОЕ) – Affinis:- Aff. is an abbreviation of Affinis = Close To, or Similar To, or Related To, as a descriptor of unresolved taxa. / нерешённых или нерешительных таксонов (taxa). Под Афинным, от Латинского слова Affinis, означающее Родственный, понимается .

AFFINITY = СРОДСТВО – Affinity is an attraction between two items; in dyeing affinity essentially means the preferential attraction of the dye for the fiber rather than for the solution of the dyebath. A dye with high affinity readily leaves the dye solution of dispersion to attach to the to the fiber being dyed. This does not necessarily imply that the attachment of the dye to the fiber is strong. Technically, affinity is expressed in terms of energy. It is determined under standardized conditions, so it is incorrect to say that affinity is altered by auxiliary chemicals or the like. See also Substantivity. Affinity is a chemical attraction; the tendency of two elements or substances to unite or combine, such as fiber and dyestuff. / Сродство. Смотрите также Субстантивность (Substantivity).

AFFIRMATION/CONFIRMATION PROCESS = ПРОЦЕСС ПОДАЧИ/ПОДТВЕРЖДЕНИЯ – The transmission of messages among broker-dealers, institutional investors, and custodian banks regarding the terms of a trade executed for an institutional investor. The Depository Trust Corporation's Institutional Delivery (ID) system is an example of an affirmation/confirmation. See also Matching, and Qualified Vendor. / , от Латинского слова Affirmo, означающее Утверждаю, .

AFFREIGHTMENT = ФРАХТОВАНИЕ – Affreightment is a contract to carry goods by ship. Charter-parties and bills of lading are contracts of affreightment. Carriage of goods by sea. See also Contract Of Affreightment. Contract of Affreightment is an agreement by an ocean carrier to provide cargo space on a vessel at a specified time and for a specified price to accommodate an exporter or importer who then becomes liable for payment even though he is later unable to make the shipment. / Транспортировка товаров по морю. Смотрите также Договор Фрахтования (Contract Of Affreightment). Под Фрахтованием понимается заключение договоров на международные перевозки грузов или пассажиров.

AFGHAN = АФГАНКА – Afghan is a blanket or shawl of colored wool knitted or crocheted in strips or squares.

AFI OCEAN REGION = AFRICAN INDIA OCEAN REGION

AFLATOXINS = АФЛАТОКСИНЫ – Aflatoxins:- short form of Aspergillus – flavus – toxin. A mycotoxin (mold toxin) that is produced by the fungus Aspergillus – flavus among others. / Под Афлатоксинами понимаются ядовитые вещества (производные кумаринов), вырабатываемые плесневыми грибами, главным образом Аспергиллами. Оказывают токсическое воздействие на печень млекопитающих, птиц, рыб; потенциальные канцерогены. В ряде стран проводится проверка продуктов на отсутствие в них афлатоксинов.

AFL–CIO = AMERICAN FEDERATION OF LABOR – CONGRESS OF INDUSTRIAL ORGANIZATIONS

AFLP = AMPLIFICATION FRAGMENT LENGTH POLYMORPHISM

AFM = AMMAN FINANCIAL MARKET

AFNETA = ALLEY FARMING NETWORK FOR TROPICAL AFRICA

AFP = AGENCE FRANCE PRESSE

AFRA = AVERAGE FREIGHT RATE ASSESSMENT

AFRAMAX = ЭФРЭМЭКС – Aframax:- tankers in the 75 000–120 000 dwt size range. AFRA is Average Freight Rate Assessment. Aframax ships are traditionally employed on a wide variety of short and medium-haul crude oil trades. / Танкеры дедвейтом (полной грузоподъёмностью) в диапазоне 75 000–120 000 тонн. ЭФРЭ (AFRA) означает Оценка Средней Ставки Фрахта (Average Freight Rate Assessment). Суда категории Эфрэмэкс традиционно используются в широком спектре сделок для транспортировки нефти на короткие и средние расстояния.

A–FRAME = РАМА В ФОРМЕ БУКВЫ А – A-Frame is a frame shaped like the letter 'A' used to transport sheet loads, similar to the type of frame used when transporting panes of glass.

AFRICAN, CARIBBEAN, AND PACIFIC GROUP OF STATES = ГРУППА АФРИКАНСКИХ, КАРИБСКИХ И ТИХООКЕАНСКИХ ГОСУДАРСТВ – African, Caribbean, and Pacific (ACP) Group of States is an organisation created by the Georgetown Agreement in 1975. It is composed of 79 African, Caribbean and Pacific states, with all of them, save Cuba, signatories to the Cotonou Agreement, also known as the 'ACP-EC Partnership Agreement' which binds them to the European Union. There are 48 countries from Sub-Saharan Africa, 16 from the Caribbean and 15 from the Pacific. The ACP Group's main objectives are:- (i) sustainable development of its Member-States and their gradual integration into the global economy, which entails making poverty reduction a matter of priority and establishing a new, fairer, and more equitable world order; (ii) coordination of the activities of the ACP Group in the framework of the implementation of ACP-EC Partnership Agreements; (iii) consolidation of unity and solidarity among ACP States, as well as understanding among their peoples; and (iv) establishment and consolidation of peace and stability in a free and democratic society. List of ACP Countries:- Angola, Antigua and Barbuda, Belize, Cape Verde, Comoros, Bahamas, Barbados, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Congo (Brazzaville), Congo (Kinshasa), Cook Islands, Côte d'Ivoire, Cuba, Djibouti, Dominica, Dominican Republic, Eritrea, Ethiopia, Fiji, Gabon, Gambia, Ghana, Grenada, Republic of Guinea, Guinea-Bissau, Equatorial Guinea, Guyana, Haiti, Jamaica, Kenya, Kiribati, Lesotho, Liberia, Madagascar, Malawi, Mali, Marshall Islands, Mauritania, Mauritius, Micronesia, Mozambique, Namibia, Nauru, Niger, Nigeria, Niue, Palau, Papua New Guinea, Rwanda, St. Kitts and Nevis, St. Lucia, St. Vincent and the Grenadines, Solomon Islands, Samoa, São Tomé and Príncipe, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, Sudan, Suriname, Swaziland, Tanzania, Timor Leste, Togo, Tonga, Trinidad and Tobago, Tuvalu, Uganda, Vanuatu, Zambia, and Zimbabwe. The ACP Secretariat is responsible for the administrative management of the ACP Group. It assists the Group's decision-making and advisory organs in carrying out their work. The ACP Secretariat's headquarters is located in Brussels (Belgium). It is headed by an Executive Secretary-General who is responsible for implementing the Group's international policy, as well as directing and coordinating its cooperation policy. The Secretariat, under the direction of the ACP Group's policy-making organs

(Summit of ACP Heads of State and Government, Council of Ministers, Committee of Ambassadors), is responsible for:- (i) carrying out the tasks assigned it by the Summit of ACP Heads of State and Government, Council of Ministers, Committee of Ambassadors and the ACP Parliamentary Assembly; (ii) contributing to the implementation of the decisions of these organs; (iii) monitoring the implementation of the ACP-EU Partnership Agreement; (iv) assisting the ACP organs and joint institutions created in the framework of the ACP-EU Partnership Agreements; and (v) acting on proposals from the Committee of Ambassadors, the Council of Ministers determines the structure of the ACP Secretariat and lays down its Staff Regulations. The Secretary-General is responsible for recruiting staff for the ACP Secretariat, an exercise which is based solely on the competence of the candidates. Nevertheless, the Secretary-General ensures, as much as possible, that a balance is maintained among the different ACP regions, as reflected in the recruitment statistics. The Council of Ministers determines the ACP Secretariat's financial regulations and approves its budget. Each ACP State contributes to financing the budget in conformity with the provisions laid down by the Council of Ministers. Headquartered in Brussels, Belgium. African, Caribbean and Pacific countries with agricultural preferences in the EU. WTO members (58):- Angola, Antigua and Barbuda, Barbados, Belize, Benin, Botswana, Burkina Faso, Burundi, Côte d'Ivoire, Cameroon, Cape Verde, Central African Republic, Chad, Congo, Cuba, Democratic Republic of the Congo, Djibouti, Dominica, Dominican Republic, Fiji, Gabon, Gambia, Ghana, Grenada, Guinea, Guinea-Bissau, Guyana, Haiti, Jamaica, Kenya, Lesotho, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Papua New Guinea, Rwanda, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Senegal, Sierra Leone, Solomon Islands, South Africa, Suriname, Swaziland, Tanzania, Togo, Tonga, Trinidad and Tobago, Uganda, Zambia, Zimbabwe. WTO observers (10):- Bahamas, Comoros, Equatorial Guinea, Ethiopia, Liberia, Samoa, São Tomé and Príncipe, Seychelles, Sudan, Vanuatu. Not WTO members or observers (11):- Cook Islands, Eritrea, Kiribati, Marshall Islands, Micronesia, Federated States of, Nauru, Niue, Palau, Somalia, Timor-Leste, Tuvalu.

AFRICAN FRANC ZONE = ЗОНА АФРИКАНСКОГО ФРАНКА – The name given to the Francophone cotton producing states of Western and Central Africa. They include, in order of prominence with regard to raw cotton production, Benin, Burkina Faso, Cameroon, Chad, Côte D'Ivoire and Mali. All have a common currency, the CFA Franc, which is linked to the French Franc. / В международной индустрии хлопка название Зона Африканского Франка относится к Франкоязычным странам Западной и Центральной Африки, производящим хлопок. В их число (из разряда более менее крупных производителей) входят Бенин, Буркина Фасо, Камерун, Кот Д'Ивуар, Мали и Чад. Все эти страны имеют одну общую валюту Сэ.Эф.А. Франк (CFA Franc), который был увязан по своей стоимости с использовавшимся тогда во Франции Французским Франком (French Franc).

AFRICAN GROUP = АФРИКАНСКАЯ ГРУППА – The African Group has 54 members (28% of all UN members), and is thus the largest regional group by number of member states. It is the only regional group that has a territory that coincides with the traditional continent of which its name originates. The African Group has 3 seats on the Security Council, all non-permanent. The Group also has 14 seats on the United Nations Economic and Social Council and 13 seats on the United Nations Human Rights Council. In the rotation of the post of the President of the United Nations General Assembly, the group is eligible for having its nationals elected to this post in years ending with 4 and 9; most recently, Ali Treki of Libya was elected to this position in 2009. Member states of the African Group, as of July 2011:- Algeria, Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, Comoros, Republic of the Congo, Côte d'Ivoire, Democratic Republic of the Congo, Djibouti, Egypt, Equatorial Guinea, Eritrea, Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Libya, Madagascar, Malawi, Mali, Mauritania, Mauritius, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, São Tomé and Príncipe, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Togo, Tunisia, Uganda, Tanzania, Zambia, and Zimbabwe. African Group is the African members of the WTO. WTO members (41):- Angola, Benin, Botswana, Burkina Faso, Burundi, Côte d'Ivoire, Cameroon, Cape Verde, Central African Republic, Chad, Congo, Djibouti, Egypt, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Madagascar, Malawi, Mali, Mauritania, Mauritius, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, Senegal, Sierra Leone, South Africa, Swaziland, Tanzania, Togo, Tunisia, Uganda, Zambia, Zimbabwe. / Африканская Группа – это группа, состоящая из Африканских стран членов ВТО.

THE AFRICAN NETWORK INFORMATION CENTER = АФРИКАНСКИЙ СЕТЕВОЙ ИНФОРМАЦИОННЫЙ ЦЕНТР – The African Network Information Center (AfriNIC) is a Regional Internet Registry (RIR), and is a non-profit membership organization responsible for the administration and registration of Internet Protocol (IP) addresses in the Africa region. / Африканский Сетевой Информационный Центр (АфриСИЦ (AfriNIC)) – Региональный Интернет-Реестр (RIR, РИР), некоммерческая организация с открытым членством, ответственная за администрирование и регистрацию адресов Интернет Протокола (IP-адресов) в Африканском регионе.

AFRICAN RICE = АФРИКАНСКИЙ РИС – A term African Rice refers only to the cultivated Oryza Glaberrima. / Термин Африканский Рис относится только лишь к культивируемому виду Ориза Глабэррима (Oryza Glaberrima).

AFRICAN RICE GALL MIDGE = АФРИКАНСКАЯ РИСОВАЯ ГАЛЛИЦА – African Rice Gall Midge (AfRGM):- General Information:- (i) The African Rice Gall Midge (AfRGM), Orseolia Oryzivora Harris and Gagne (Diptera:- Cecidomyiidae) is a serious insect pest of rainfed and irrigated lowland Rice in Africa. (ii) It is a bud/stalk borer and larval feeding causes severe damage to Rice during the vegetative stages (seedling to panicle initiation). Symptoms:- (i) the larvae attack the growing point of Rice tillers and cause the leaf sheath tissues to form a tube-like structure called a 'Silver Shoot Gall' that resembles an onion leaf; (ii) early gall infestation results in stunting, bushy appearance of the Rice plant, with as many as 50 small tillers per hill; and (iii) galls cannot be pulled out of the Rice tillers unlike deadhearts caused by stemborers. Causes of AfRGM outbreaks:- (i) changes in weather (high rainfall, excessive cloud cover and humidity):- outbreaks tend to occur in years that are wetter than usual; (ii) staggered planting:- wide range of planting dates increases the risk of AfRGM outbreaks. Late-planted fields are usually at higher risk; (iii) planting of new high-yielding AfRGM-susceptible varieties:- fertilizer-responsive improved varieties though high-yielding are generally more susceptible to AfRGM than the traditional land-races they are replacing; (iv) increased use of fertilizer, which – with the adoption of improved varieties – has been a major aspect of Rice intensification in West Africa, might have contributed to increased AfRGM infestation; and (v) presence of alternative host plants. Control:- (i) early and synchronized planting:- Rice fields planted early are less likely to suffer serious damage than those planted late; (ii) destruction of alternative host plants such as Rice ratoons, volunteers and Oryza Longistaminata; (iii) fertilizer use:- moderate levels of fertiliser (e.g., 60 kg/ha) should be used and applied in split doses; (iv) movement of seedlings should be discouraged as such seedlings can be infested by AfRGM in the nursery; (v) plant spacing:- close spacing should be discouraged because it provides a suitable micro-environment for the survival of the exposed life stages of AfRGM; (vi) the gregarious endoparasitoid Platygaster Diplosisae and the solitary ectoparasitoid Aprostocetus Procerae are the most important wasps attacking AfRGM; (vii) the combination of growing gall midge tolerant Varieties with Paspalum Scrobiculatum management at the edge of rice fields had significantly increased farmers' yields because the Paspalum conserve asso; and (viii) habitat manipulation with Paspalum Scrobiculatum management at the edge of rice fields had significantly increased the carry-over of parasitoids from Paspalum gall midge (Orseolia Bonzii) to AfRGM, such as dry-season cultivation to encourage Paspalum Scrobiculatum abundance early in the wet season. / Под Галлицами понимается Семейство Насекомых Отряда Двукрылых. Длиной 1–5 миллиметров (мм). Около 4 000 Видов, в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 500. Личинки ряда Видов

развиваются в тканях растений, вызывая образование галлов (отсюда название). Некоторые, например, Гессенская Муха, вредят культурным растениям и лесу.

AFRICAN SWINE FEVER = АФРИКАНСКАЯ СВИНАЯ ЛИХОРАДКА – African Swine Fever (ASF) is a highly contagious hemorrhagic disease of Pigs, Warthogs, European wild Boar and American wild Pigs. It is not a human health threat. The organism that causes ASF is a DNA Virus of the Asfarviridae Family. African Swine Fever (ASF) is a highly contagious hemorrhagic disease of Pigs, Warthogs, European wild Boar and American wild Pigs. All age groups are equally susceptible. With high virulence forms of the Virus, ASF is characterized by high fever, loss of appetite, haemorrhages in the skin and internal organs, and death in 2–10 days on average. Mortality rates may be as high as 100%. The organism which causes ASF is a DNA Virus of the Asfarviridae Family. ASF is a disease listed in the World Organisation for Animal Health (OIE) Terrestrial Animal Health Code and must be reported to the OIE Terrestrial Animal Health Code. Where is the disease found? ASF is generally prevalent and endemic in countries of sub-Saharan Africa. In Europe ASF remains endemic only in Sardinia (Italy). Outbreaks have occurred outside of Africa including the outbreaks in Georgia in 2007, the first ever report of ASF in that part of Europe, and in some Caribbean countries. How is ASF transmitted and spread? The Warthog can serve as a natural reservoir of the Virus without sign of disease. Spread from this reservoir is via the soft tick Ornithodoros moubata. The tick will ingest the virus when taking a blood meal and then pass it on when feeding on susceptible Animals. The Virus is found in all body fluids and tissues of infected domestic Pigs. Pigs usually become infected by direct contact with infected Pigs or by ingestion of garbage containing unprocessed infected Pig meat or Pig meat products. All processing procedures do not inactivate the African swine fever Virus. Biting flies and ticks, contaminated premises, vehicles, equipment or clothing can also spread the Virus to susceptible Animals. What is the public health risk associated with this disease? ASF is not a human health threat. What are the clinical signs of ASF? The severity and distribution of the lesions also vary according to virulence of the Virus. Severe cases of the disease are characterized by high fever and death in 2–10 days on average. The mortality rate can be as high as 100%. Other clinical signs may include loss of appetite, depression, redness of the skin of the ears, abdomen, and legs, respiratory distress, vomiting, bleeding from the nose or rectum and sometimes diarrhoea. Abortion may be the first event seen in an outbreak. Moderately virulent forms of the virus produce less intense symptoms though mortality can still range from 30–70%. Chronic disease symptoms include loss of weight, intermittent fever, respiratory signs, chronic skin ulcers and arthritis. More information on the disease can be found in the OIE Technical Disease Card www.oie.int/en/animalhealth-in-the-world/technical-disease-cards/. How is the disease diagnosed? ASF may be suspected based on clinical signs and confirmation must be made through prescribed laboratory tests, particularly to differentiate this disease from Classical Swine Fever (CSF) (OIE Terrestrial Animal Health Code, and OIE Manual of Diagnostic Tests and Vaccines for Terrestrial Animals). What is being done to prevent or control this disease? Prevention And Control Measures:- There is no published treatment or vaccine for ASF. Prevention in countries free of the disease depends on stringent import policies, ensuring that neither infected live Pigs nor pork products are introduced into areas free of ASF. This includes ensuring proper disposal of waste food from aircraft, ships or vehicles coming from infected countries. In endemic areas, it is difficult to eliminate the natural reservoir in Warthogs; however, control of the soft tick vectors is important in preventing the disease. It is also important to ensure that meat from Warthogs or infected Animals is not fed to susceptible Pigs. All successful eradication programs have involved the rapid diagnosis, slaughter and disposal of all animals on infected premises, thorough cleaning and disinfection, disinsectisation, movement controls and surveillance. Key Facts:- (i) Outbreaks of ASF in 2007 in Georgia were the first reported occurrences of the disease in this part of Europe. (ii) Severe epidemics occurred in Brazil (1978–1981) and Haiti (1978–1984). (iii) African swine fever appeared in 1960 in Spain, Portugal and Sardinia. The disease was eradicated from Portugal in 1993 and Spain in 1995, but remains enzootic in Sardinia. (iv) Limited outbreaks occurred in Belgium (1985) and the Netherlands (1986) and were successfully eradicated.

AFRICAN UNION = АФРИКАНСКИЙ СОЮЗ – The advent of the African Union (AU) can be described as an event of great magnitude in the institutional evolution of the continent. On 1999-September-09, the Heads of State and Government of the Organisation of African Unity (OAU) issued a Declaration (the Sirte Declaration) calling for the establishment of an African Union, with a view, inter alia, to accelerating the process of integration in the continent to enable it play its rightful role in the global economy while addressing multifaceted social, economic and political problems compounded as they are by certain negative aspects of globalization. The main objectives of the OAU were, inter alia, to rid the continent of the remaining vestiges of colonization and apartheid; to promote unity and solidarity among African States; to coordinate and intensify cooperation for development; to safeguard the sovereignty and territorial integrity of Member States and to promote international cooperation within the framework of the United Nations. Indeed, as a continental organization the OAU provided an effective forum that enabled all Member States to adopt coordinated positions on matters of common concern to the continent in international fora and defend the interests of Africa effectively. Through the OAU Coordinating Committee for the Liberation of Africa, the Continent worked and spoke as one with undivided determination in forging an international consensus in support of the liberation struggle and the fight against apartheid. The Organization of African Unity (OAU) initiatives paved the way for the birth of AU. In July 1999, the Assembly decided to convene an extraordinary session to expedite the process of economic and political integration in the continent. Headquartered in Addis Ababa, Ethiopia. See also Organization of African Unity. The vision of the African Union is that of:- ‘An integrated, prosperous and peaceful Africa, driven by its own citizens and representing a dynamic force in global arena’. This vision of a new, forwardlooking, dynamic and integrated Africa will be fully realized through relentless struggle on several fronts and as a long-term endeavour. The African Union has shifted focus from supporting liberation movements in the erstwhile African territories under colonialism and apartheid, as envisaged by the OAU since 1963 and the Constitutive Act, to an organization spear-heading Africa’s development and integration. The Objectives of the AU:- (i) to achieve greater unity and solidarity between the African countries and the peoples of Africa; (ii) to defend the sovereignty, territorial integrity and independence of its Member States; (iii) to accelerate the political and socio-economic integration of the continent; (iv) to promote and defend African common positions on issues of interest to the continent and its peoples; (v) to encourage international cooperation, taking due account of the Charter of the United Nations and the Universal Declaration of Human Rights; (vi) to promote peace, security, and stability on the continent; (vii) to promote democratic principles and institutions, popular participation and good governance; (viii) to promote and protect human and peoples’ rights in accordance with the African Charter on Human and Peoples’ Rights and other relevant human rights instruments; (ix) to establish the necessary conditions which enable the continent to play its rightful role in the global economy and in international negotiations; (x) to promote sustainable development at the economic, social and cultural levels as well as the integration of African economies; (xi) to promote co-operation in all fields of human activity to raise the living standards of African peoples; (xii) to coordinate and harmonize the policies between the existing and future Regional Economic Communities for the gradual attainment of the objectives of the Union; (xiii) to advance the development of the continent by promoting research in all fields, in particular in science and technology; and (xiv) to work with relevant international partners in the eradication of preventable diseases and the promotion of good health on the continent. The Organs of the AU:- (i) The Assembly:- composed of Heads of State and Government or their duly accredited representatives. The Assembly of Heads of State and Government is the supreme organ of the Union. (ii) The Executive Council:- composed of Ministers or Authorities designated by the Governments of Members States. The Executive Council is responsible to the Assembly. (iii) The AU Commission:- composed of the Chairperson, the Deputy Chairperson, eight Commissioners and Staff members; Each Commissioner shall be responsible for a portfolio. The Commission is the key organ

playing a central role in the day-to-day management of the African Union. Among others, it represents the Union and defends its interests; elaborates draft common positions of the Union; prepares strategic plans and studies for the consideration of the Executive Council; elaborates, promotes, coordinates and harmonizes the programmes and policies of the Union with those of the RECs; ensures the mainstreaming of gender in all programmes and activities of the Union. (iv) The Permanent Representatives' Committee:- composed of Permanent Representatives of Member States accredited to the Union. The Permanent Representatives Committee is charged with the responsibility of preparing the work of the Executive Council. (v) Peace and Security Council (PSC):- by decision AHG/Dec 160 (xxxvii) of the Summit of Lusaka, July 2001, a decision was made for the creation within the African Union of the Peace and Security Council. The Protocol establishing the PSC is in the process of ratification. (vi) Pan-African Parliament:- a Pan-African Parliament, and organ to ensure the full participation of African peoples in governance, development and economic integration of the Continent. The protocol relating to the composition, powers, functions and organization of the Pan-African Parliament has been signed by Member States and is in the process of ratification. (vii) ECOSOCC:- The Economic, Social and Cultural Council, an advisory organ composed of different social and professional groups of the Member States of the Union. The statutes determining the functions, powers, composition and organization of the Economic, Social and Cultural Council have been prepared and will be submitted to Maputo Summit. (viii) The Court of Justice:- a Court of Justice of the Union shall be established. The statutes defining the composition and functions of the Court of Justice have been prepared and will be submitted to the Assembly in Maputo. (ix) The Specialized Technical Committees:- the following Specialized Technical Committees are meant to address sectoral issues and are at Ministerial Level:- (a) The Committee on Rural Economy and Agricultural Matters; (b) The Committee on Monetary and Financial Affairs; (c) The Committee on Trade, Customs and Immigration Matters; (d) The Committee on Industry, Science and Technology, Energy, Natural Resources and Environment; (e) The Committee on Transport, Communications and Tourism; (f) The Committee on Health, Labour and Social Affairs; and (g) The Committee on Education, Culture and Human Resources. (x) The Financial Institutions:- (a) The African Central bank; (b) The African Monetary Fund; and (c) The African Investment Bank. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ковка или штамповка (forging).

AFRINIC = THE AFRICAN NETWORK INFORMATION CENTER

AFSPS = ARRIVAL FIRST SEA PILOT STATION

AFSS = AUTOMATED FLIGHT SERVICE STATION

AFT = КОРМА – (1) Aft:- at or near the stern (back end) or rear position of the vessel. The rear of a vessel. In, near, or toward the stern of the vessel. / Под Кормой понимается задняя оконечность судна. По очертаниям верхней части различают корму обыкновенную (эллиптическую), крейсерскую (с большим погружением), транцевую (с плоским срезом). Корма с незамкнутым ахтерштевнем называется открытой. На некоторых речных судах корма образует над гребными винтами свод, улучшающий условия их работы, – так называемая тоннельная корма.

(2) Movement toward the stern (back end) of a ship.

AFTER–BALANCE–DATE EVENTS = СОБЫТИЯ ПОСЛЕ ОТЧЁТНОЙ ДАТЫ (или СОБЫТИЯ ПОСЛЕ ДАТЫ СДАЧИ БАЛАНСА) – After-Balance-Date Events are the significant circumstances that occur or information that becomes available between the end of the accounting period (Reporting Date) and the time of approval of the financial statements. Also known as Events Occurring After Reporting Date, or Post Balance Sheet Events. / Проявляющиеся существенные обстоятельства или становящаяся доступной информация между концом отчётного периода (Датой Отчёта) и временем, отводимым на утверждение финансовых отчётов. Известны также как События, Происходящие После Отчётной Даты (Events Occurring After Reporting Date), или События После Сдачи Бухгалтерского Баланса (Post Balance Sheet Events).

AFTER DATE = ПОСЛЕ ДАТЫ – After Date is a phrase indicating that the date of maturity of a draft or other negotiable instrument is fixed by the date on which it was drawn. The date of maturity does not, therefore, depend on acceptance by the drawee.

AFTERGLOW = ВЕЧЕРНЯЯ ЗАРЯ – Afterglow:- the flameless, glowing combustion of certain solid materials that occurs after the removal of an external source of ignition or after the cessation of combustion of the material.

AFTER HOURS TRADING = ТОРГОВЛЯ ВО ВНЕРАБОЧЕЕ ВРЕМЯ – After Hours Trading is the practice of buying and selling securities during a period of time when the major markets are officially closed. Once reserved for institutional investors, individual investors may now participate. Stocks are traded after hours on ECNs, which match buyers and seller with a computer system in order to execute trades. Trading that takes place outside of normal trading hours. These are then reported to the Exchange Authorities the following day. Investors may trade in the After Hours Market (04:00–06:30 pm ET) on The NASDAQ® Stock Market. Participation by Market Makers and Electronic Communications Networks (ECNs) is strictly voluntary and as a result may offer less liquidity and inferior prices. Stock prices may also move more quickly in this environment. Trading after regular trading hours on the major exchanges. Any trade posting, adjusting, or changes made by specialists or member firm after the official close of the market. / НЭЗДЭК® (NASDAQ®). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Осуществление сделок с активами по закрытии биржевой сессии. Ранее таким видом торговли с помощью специальных компьютерных систем занимались, главным образом, Институциональные Торговцы. Сейчас многие брокеры, работающие в Интернете в режиме реального времени, предлагают доступ к торговле во внерабочее время широкому кругу инвесторов и торговцев. Заключение Сделок или Торговля во Внерабочее Время – сделки по акциям и облигациям, заключённые после официального закрытия фондовых бирж, то есть тогда, когда уже объявлено о доходах (убытках) компаний или об установлении контроля над определённой компанией. Следовательно, цена акций может резко подняться или упасть от уровня цены на момент закрытия биржи. Некоторые брокерские фирмы специализируются на сделках внебиржевого рынка после закрытия организованных бирж.

AFTER SIGHT = ПОСЛЕ ПРЕДЪЯВЛЕНИЯ – After Sight is a phrase indicating that payment on a draft or other negotiable instrument is due a specified number of days after presentation of the draft to the drawee or payee. / Фраза, указывающая на то, что платёж по тратте или иному отчуждаемому (негоциируемому или оборотному) инструменту должен быть произведён через указанное количество дней после предъявления этой тратты индоссату или получателю платежа.

AFTERTREATMENT = ОЖИВКА – Aftertreatment is any treatment done after fabric production. In dyeing, it refers to treating dyed material in ways to improve properties; in nonwovens, it refers to finishing processes carried out after a web has been formed and bonded. Examples are embossing, creping, softening, printing, and dyeing. / Оживка – очищение и оживление цвета после крашения.

AFUDC = ACCUMULATED FUNDS USED DURING CONSTRUCTION

AFUDC = ALLOWANCE FOR FUNDS USED DURING CONSTRUCTION

AFV = ALTERNATIVE–FUEL VEHICLE

AFV = ARMORED FAMILY OF VEHICLES

AFZ = AUTO–FREE ZONE

AG = AGRICULTURAL

A/G = AIR–TO–GROUND

AG = AKTIENGESELLSCHAFT

AG = ANASTOMOSIS GROUP

AG = ANTIGUA AND BARBUDA

AG = ARABIAN GULF

AGA = AMERICAN GAS ASSOCIATION

AGAINST ACTUAL TRANSACTION = ТРАНЗАКЦИЯ (С ФЬЮЧЕРСОМ) ПРОТИВ ФАКТИЧЕСКОЙ (или ОПЕРАЦИЯ (С ФЬЮЧЕРСОМ) ПРОТИВ ФАКТИЧЕСКОЙ) – Against Actual Transaction is the transaction in which there is an exchange of futures contracts for the cash commodity. This type of trade fixes the price of a physical trade deal in the futures market. See also Exchange For Physicals. / Транзакция или операция, в которой происходит увязка цены фьючерсного контракта на какое-то сырьё к цене контракта на данное реальное сырьё. Этот тип сделки предусматривает фиксацию цены фактической сделки с сырьём на фьючерсном рынке. Смотрите также Обмен на Реальное Сырьё (Exchange For Physicals).

AGAR = АГАР – Agar is a mucilage derived from a seaweed. It forms a gel with water. It is used to solidify culture media on which microorganisms are grown. / Под Агаром или Агар-Агаром понимается смесь двух кислых полисахаридов, содержащихся в клеточных стенках красных водорослей. Растворяется в горячей воде, при охлаждении образует плотный студень. Применяется в кондитерской промышленности, в биологии как основа питательных сред для выращивания клеток и микроорганизмов.

AGC = AUTOMATIC GENERATION CONTROL

AGCD = ADMINISTRATION GÉNÉRALE DE LA COOPÉRATION AU DÉVELOPPEMENT DE BELGIQUE

AGDP = AGRICULTURAL GROSS DOMESTIC PRODUCTS

AGED RICE = СТАРЫЙ РИС (или ПЕРЕДЕРЖАННЫЙ РИС, или ДАВНИЙ РИС) – Aged Rice is a Rice that is kept at least 4 months after harvest. Expands more on cooking and less sticky than cooked, freshly harvested Rice.

AGEING = СТАРЕНИЕ (или ВЗРОСЛЕНИЕ) – Ageing is:- (1) a deterioration of textile or other materials caused by gradual oxidation during storage and/or exposure to light. (2) The oxidation stage of alkali-cellulose in the manufacture of viscose rayon from bleached wood pulp. (3) Originally, a process in which printed fabric was exposed to a hot, moist atmosphere. Presently, the term is applied to the treatment of printed fabric in moist steam in the absence of air. Ageing is also used for the development of certain colors in dyeing, e.g., aniline black. / Щёлочь (Alkali). Под Старением понимается изменение эксплуатационных характеристик изделия в течение времени его использования или хранения. Примечание:- старение вызывается сочетанием нескольких факторов, таких как:- (i) процессы ухода (чистки, стирки) или дезинфекции; (ii) воздействие видимого и/или ультрафиолетового излучения; (iii) воздействие высоких или низких температур, перепада температур; (iv) воздействие химических факторов, в том числе влажности; (v) воздействие биологических факторов, например, бактерии, грибки, насекомые или другие паразиты; (vi) механическое воздействие, истирание, изгиб, давление, растяжение; (vii) воздействие загрязнения:- грязь, масло, брызги расплавленного металла и так далее; и (viii) износ.

AGENCY = АГЕНТСТВО – Agency is an organization working on behalf of a principal. Company whom represents/acts on behalf of another entity. A term Agency means:- (1) an organization, company, or bureau that provides a particular service, e.g., a welfare agency; (2) a government bureau or administrative division; (3) a company having a franchise to represent another; (4) the duty or function of an agent; (5) the place of business of an agent; and (6) a means of exerting power or influence; instrumentality. / Под Агентством понимается:- (i) местное отделение какого-либо учреждения; или (ii) название некоторых информационных, посреднических и тому подобных учреждений, например, новостное агентство, телеграфное агентство или транспортное агентство. Агентство:- (1) представительное учреждение, представительство, отделение более крупного учреждения, предприятия, фирмы, ведающее их делами в данном регионе и выполняющее определённый круг их поручений. Например, фирма может иметь агентство, способствующее распространению и продаже её продукции. (2) Учреждение, выполняющее определённую государственную, общественную, социальную функцию. В качестве примера можно назвать агентства по охране прав потребителей, рекламные агентства, творческие агентства. Агентство, в общем значении:- взаимоотношения между двумя сторонами, из которых одна является принципалом, а вторая – агентом, представляющим принципала в сделках с третьей стороной. В финансах:- определённый тип счетов в трастовых организациях, с которыми индивидуумы, обычно служащие этих организаций, оперируют от имени клиентов. Агентские услуги корпорациям связаны с покупкой и продажей акций. Банки также действуют в качестве агентов для частных лиц. В правительственном плане:- ценные бумаги, выпущенные спонсируемыми государством корпорациями. На ценные бумаги агентств не распространяется требование о регистрации Комиссией по Ценным Бумагам и Биржам (КЦББ; Securities and Exchange Commission (SEC)). В инвестициях:- покупка или продажа по счету клиента или принятие риска в интересах клиента. Как правило, агент или брокер действует в качестве посредника между покупателем продавцом, не принимая финансовый риск на себя лично или на свою компанию и взимая комиссионные за эту услугу.

AGENCY AGREEMENT = АГЕНТСКОЕ СОГЛАШЕНИЕ – Agency Agreement is an agreement whereby the ocean carrier appoints the carrier agent and defines the specific duties and areas of responsibility of that agent. / Соглашение посредством которого океанский перевозчик назначает агента перевозчика и определяет конкретные обязанности и области ответственности такого агента. В Гражданском Праве Великобритании, США и ряда других государств под Агентским Соглашением понимается то же, что в странах континентальной Европы Договоры Поручения и Договоры Комиссии. Агент – физическое или юридическое лицо, гражданин или организация, выступающие в роли доверенного лица, посредника, уполномоченного совершать определённый круг действий от имени другого лица (принципала), по поручению и в интересах этого лица. В экономических операциях в качестве агентов выступают брокеры, маклеры, дилеры, комиссионеры.

AGENCY BONDS = ОБЛИГАЦИИ АГЕНТСТВ – Agency Bond is a bond issued by a government agency. These bonds are not fully guaranteed in the same way as US Treasury and municipal bonds. These bonds do not include those issued by the US Treasury or municipalities. They include such agencies as Fannie Mae, Freddie Mac, Sallie Mae and the Federal Home Loan Banks. Agency Bond is a debt security issued by a government-sponsored enterprise such as Fannie Mae or Freddie Mac, designed to resemble a US Treasury bond. / Долговая ценная бумага, выпущенная предприятием, спонсируемым государством, таким как Фэни Мэй (Fannie Mae) или Фрэди Мэк (Freddie Mac), предназначенная для сходства с облигациями Казначейства США.

AGENCY COMMISSION CLAUSE = ОГОВОРКА ОБ АГЕНТСКОЙ КОМИССИИ – Agency Commission Clause is a clause in the standard hull clauses (1983) whereby no claim will be admitted under the policy to remunerate the assured for expense incurred, or time expended, in obtaining information or providing documents to support his claim. / за понесённые расходы, или .

AGENCY COSTS = АГЕНТСКИЕ ЗАТРАТЫ (или АГЕНТСКИЕ РАСХОДЫ) – Agency Costs are the costs associated with slack effort by employees and the costs of administrative controls designed to deter slack effort.

AGENCY FEE = АГЕНТСКОЕ ВОЗНАГРАЖДЕНИЕ – (1) Agency Fee is a fee paid each year to an agent for managing a loan. It is also termed a Facility Fee. / обеспечение/поддержка (facility). Агентское Вознаграждение – плата агенту за выполняемые им посреднические агентские услуги, осуществляемая фирмой, лицом, нанявшим агента (принципалом). Размер агентского вознаграждения зависит от выполняемых агентом поручений. Вознаграждение торговых агентов назначается обычно в процентах от выручки за проданный товар или услугу.

(2) Agency Fee is a fee charged to the ship by the ship's agent, representing payment for services while the ship was in port. Also known as Attendance Fee. Agency Fee is a fee payable by a shipowner or ship operator to an agent.

AGENCY LOCATION CODE = КОД МЕСТОНАХОЖДЕНИЯ АГЕНТСТВА – In the United States, the Agency Location Code (ALC) is an eight (8) digit code assigned to US government agencies by the Department of Treasury.

AGENCY NOTES = НОТЫ АГЕНТСТВ (или БИЛЕТЫ АГЕНТСТВ) – Agency Note is a debt security issued by a government-sponsored enterprise such as Fannie Mae or Freddie Mac, designed to resemble a US Treasury note. / Долговая ценная бумага, выпущенная предприятием, спонсируемым государством, таким как Фэни Мэй (Fannie Mae) или Фрэди Мэк (Freddie Mac), предназначенная для сходства с облигациями Казначейства США.

AGENCY TARIFF = АГЕНТСКИЙ ТАРИФ – Agency Tariff is a tariff issued by a publishing agent for one or more transportation lines. A tariff published by an agent on behalf of several carriers. / Тариф, публикуемый агентом от имени нескольких перевозчиков.

AGENT = АГЕНТ – (1) Agent is anyone who is authorized to act on the behalf of another. A corporation acts only through its agents; therefore, it is important to define what actions an agent is authorized to perform. Agent is a party performing specific functions on behalf of another party. One that acts for, or in the place of, another by authority from him, e.g., a (business) representative, emissary, or official of a government. A person authorized to transact business for and in the name of another. Agent is a person authorized to transact business for and in the name of another person or company. Types of agent are:- brokers, commission merchants, resident buyers, sales agents, and manufacturer's representatives. Agent is a person or organization authorized to act for or on behalf of another person or organization. Legally dependent businessman who is authorized by a third party (the principal) to act on that party's behalf, to act as intermediary or to conclude business transactions. / и представители изготовителя. Под Агентом, от Латинского слова Agens, родительный падеж Agentis, означающее Действующий, понимается лицо, действующее по поручению кого-либо. Им может быть также представитель организации, учреждения и тому подобного, выполняющий поручения, уполномоченный. Как правило, Агент не покупает и не продаёт товары за свой счёт, а лишь получает комиссию от их продажи от лица продавца. Агенты не владеют продаваемыми товарами, и риск за возможные убытки лежит на компании – принципале, которую представляет этот агент. Агенты не имеют права устанавливать продажные цены или условия продажи, или обязывать принципала к контракту. Смотрите также Дистрибутор (Distributor). Агент – физическое или юридическое лицо, гражданин или организация, выступающие в роли доверенного лица, посредника, уполномоченного совершать определённый круг действий от имени другого лица (принципала), по поручению и в интересах этого лица. В экономических операциях в качестве агентов выступают брокеры, маклеры, дилеры, комиссионеры. Агент – частное лицо, уполномоченное клиентом (principal – принципалом) действовать от имени последнего в сделках с третьей стороной. Часто в качестве агентов частных лиц выступают банки, которые уполномочивают своих работников действовать от имени принципалов. Агенты имеют три основных признака:- (i) действуют от имени принципала и контролируются принципалом; (ii) не имеют права собственности на имущество принципала; и (iii) обязаны исполнять указания принципала. Агент:- физическое или юридическое лицо, гражданин или организация, уполномоченные другим лицом (принципалом) действовать от его имени, производить определённый круг действий от имени другого лица (принципала), по поручению и в интересах этого лица, не являясь при этом его служащим. Агентами являются брокеры, маклеры, дилеры, комиссионеры. Благодаря деятельности агентов можно значительно расширить объём и номенклатуру операций, продаж, без значительного роста расходов. Агенты могут быть генеральными (general agents) или специальными (special agents). Генеральный агент имеет право вести все дела принципала, разрешённые соглашением, либо действовать в интересах принципала, занимаясь обычной профессиональной деятельностью. Специальный агент выполняет только определённые действия, не затрагивающие профессиональные обязанности агента.

(2) Agent is an abbreviation for Freight Agent.

(3) In shipping, an Agent is a corporate body with which the company has an agreement to perform particular functions on behalf of the company at an agreed payment. An agent is either part of the company network or an independent body. Agent is a person, association or corporation authorized to publish and file rates and provisions for a carrier's account in tariffs published in the agent's name. In shipping, an Agent is a corporate body with which carrier has an agreement to perform particular functions on behalf of carrier at an agreed payment. An agent is either part of the carrier network or an independent body. The following functions and responsibilities may apply to the activities of an agent:- (i) Sales:- marketing, acquisition of cargo, issuing quotations, concluding contracts in coordination with carrier. In essence the agent is the first point of entry into the carrier organization for a shipper. (ii) Bookings:- booking of cargo in accordance with allotments assigned to the agent for a certain voyage by carrier; (iii) Documentation:- responsible for timeliness and correctness of all documentation required, regarding the carriage of cargo; (iv) Handling:- taking care of all procedures connected with physical handling of cargo; (v) Equipment Control:- managing of all equipment stock in a particular area; (vi) Issuing:- authorized to sign and issue Bills of Lading and other transport documents; (vii) Collecting:- authorized to collect freight and charges on behalf of carrier; (viii) Delivery:- the agent who releases the cargo and is responsible for its delivery to the consignee; (ix) Handling of Cargo Claims:- handling of cargo claims as per agency contract; and (x) Husbanding:- handling non cargo related operations of a vessel as instructed by the master, owner or charterer. / хозяином (капитаном), .

(4) In insurance, an Agent is a someone who acts for another person (the principal) usually for reward. There are four main classes of agent that may be involved in the underwriting of insurance and reinsurance risks by Lloyd's underwriters:- members' agents, managing agents, brokers and coverholders. In addition, there are Lloyd's agents which are independent businesses that provide surveys and loss adjusting services to managing agents, insurance companies and others on a worldwide basis. Further in some situations one underwriter may act as the agent of other underwriters. Agent is one who introduces a business to an insurer for commission, but can continue to act as an intermediary between the insurers and the insured.

(5) Agent is an individual who meets the eligibility requirements set forth in 7 CFR 353.6 (7 CFR is short for the Code of Federal Regulations:- Title 7), and who is designated by USDA-APHIS-PPQ (short for the United States Department of Agriculture – Animal and Plant Health Inspection Service – Plant Protection and Quarantine) to conduct phytosanitary field inspections of seed crops to serve as a basis for the issuance of export certificates. Agents may conduct phytosanitary field inspections of seed crops in cooperation with and on behalf of those State plant regulatory agencies electing to use agents and maintaining a Memorandum of Understanding (MOU) with USDA-APHIS-PPQ in accordance with the regulations. The MOU must state that agents shall be used in accordance with the regulations in 7 CFR 353. Agents are not authorized to issue export certificates, but are only authorized to conduct the field inspections of seed crops required as a basis for determining phytosanitary condition prior to the issuance of an export certificate for the crops.

(6) In the US patent law, an Agent (may be referred to as a Practitioner or Representative) is one who is not an attorney but is authorized to act for or in place of the applicant(s) before the Office of the United States Patent and Trademark Office (USPTO), that is, an individual who is registered to practice before the Office.

AGENT FOR SERVICE OF PROCESS = АГЕНТ ПО ОБСЛУЖИВАНИЮ ПОВЕСТОК – In the United States, an Agent For Service Of Process is an agent, required to be appointed by a corporation, whose authority is limited to receiving process issued against the corporation. Also known as a Registered Agent, or Resident Agent.

AGER = ЗРЕЛЬНИК (или ВЗРОСЛИТЕЛЬ) – Ager is a steam chamber used for ageing printed or padded material. / Ускоритель процесса искусственного старения.

AGFLATION = АГФЛЯЦИЯ – Agflation, is a relatively new term coined by analysts at Merrill Lynch in 2007. Back then rising demand for agricultural products started driving up prices. Agflation is simply a combining of the words Agriculture as in 'Agricultural Commodities' and the word Inflation. Inflation is commonly used to mean an increase in prices (although it originally meant an increase in the money supply which eventually resulted in an increase in prices). So agflation is simply an increase in the prices of agricultural products. But agflation is not the result of an increase in the money supply like typical inflation, but rather it is simply a result of supply and demand factors. In 2000, the world wide population was 6 057 000 000 and by the end of 2010 it had increased to 6 900 000 000 or an increase of 843 million. With 843 million more mouths to feed you would expect food prices to increase but during the first five years (through 2005) that had not happened. In the year 2000, the Economist magazine's Commodity Price Index of global food prices was set to equal 100. Five years later the index stood at slightly under 100 a net change over five years of zero (actually a slight decline). As the world population increases the long-term demand for food supplies also increases but as long as the supply of food increases proportionally the price can be expected to remain relatively level as this example shows. So what happened since 2005 to drive the price of food up 135% over the following five years? Typically you would expect demand for food to be based on consumption, i.e. people eating it, but a major factor in the 2007–08 spike in food prices was a wholesale conversion of food to fuel. But in 2005 The 'US Energy Policy Act' mandated an increase in the use of 'renewable' fuels which caused an increase in demand for grains to be converted to fuel (ethanol). Basically the government mandated that in addition to eating our food, we should also burn it. Then the 'Renewable Fuels, Consumer Protection and Energy Efficiency Act of 2007' mandated another increase in the use of ethanol and this drastically increased the demand for Corn. You can see the spike in prices in 2008 which was met by farmers increasing production of Corn and by the end of 2008 prices were 'only' up 25% over 2005 prices. But a variety of factors including the coldest winter in 50 years in food growing places like Mexico have combined to drive prices back up again. This is similar to the spike in oil prices due to hurricane Katrina shutting down oil wells and refineries in the Gulf. In that case it was a sudden decrease in supply that drove up prices. With agflation it is a 'one – two punch', a sudden increase in demand (2008) due to legislation followed by a sudden decrease in supply due to the weather.

AGFS = AVIATION GRIDDED FORECAST SYSTEM

AGGLOMERATION = АГЛОМЕРАЦИЯ (или АГЛОМЕРАЦИОННЫЙ ПРОЦЕСС) – (1) Agglomeration:- a net advantage a company gains by sharing a common location with other companies.

(2) Agglomeration is the potential of the system for particle attraction and adhesion. The Agglomeration is a process which uses fine particles, added with binders or other products to form pellets, briquettes or nodules (sinter). This process is mainly used to produce iron ore pellets which supply the blast furnaces. The performance of a pelletizing circuit requires physical processes such as regrinding, hydroclassification, screening, mixing and usage of balling discs or drums to form the pellets. The quality of the end product is also influenced by the addition of specific additives and their methods of addition. Agglomeration is the fusing of fine feed material into larger chunks that can be fed into a blast furnace or retort, eliminating the problem of losing the fine feed in the hot air blast. Agglomeration of ore fines (fine particles) is accomplished by sintering or pelletizing. In the sintering process, fuel, water, air, and heat are used to fuse the ore fine into a porous mass. In pelletizing, moistened fine is formed into small pellets in the presence of limestone flux and then fired. Agglomeration is a lump formation. / , просеивание (screening), . шлифование (grinding) . В металлургии под Агломерацией или Агломерационным Процессом понимается термический способ окускования мелких рудных материалов, чаще всего рудной шихты (колошниковой пыли, пылевидных руд, рудной мелочи и концентратов), посредством спекания для улучшения их металлургических свойств. Обычно она осуществляется путём сжигания мелкого топлива в самом материале за счёт непрерывного прососа воздуха. Достаточно часто в агломерационную шихту вводят флюсы (известняк). Окускование в процессе агломерации происходит главным образом в результате образования жидких легкоплавких химических соединений, связывающих при остывании отдельные зёрна в куски. Агломерацию осуществляют преимущественно на агломерационных машинах ленточного типа, представляющих собой непрерывную цепь спекательных тележек с решётчатым дном. Продуктом агломерации является Агломерат, используемый в качестве основного сырья для чёрной и цветной металлургии. Агломерат (от Латинского слова Agglomero, означающее Накопляю или Присоединяю) – спечённые в куски мелкие материалы, главным образом концентраты обогащения руд и пылевидные руды. Агломерат = Окатыш. Агломерация в металлургии, термический процесс окускования мелких материалов (руды, рудных концентратов, содержащих металлы отходов и других), являющихся составными частями металлургической шихты, путём их спекания с целью придания формы и свойств (химического состава, структуры), необходимых для плавки. Спекание происходит непосредственным слипанием отдельных нагретых частиц шихты при поверхностном их размягчении либо в результате образования легкоплавких соединений, связывающих частицы при остывании агломерируемого продукта. Тепло, необходимое для спекания, получается от горения углеродистого топлива,

прибавляемого к агломерируемому материалу, либо от окисления сульфидов, если агломерации подвергаются сернистые рудные концентраты. На практике агломерация чаще всего осуществляется на колосниковых решётках, с просасыванием воздуха сверху вниз сквозь лежащую на решётке шихту. При этом происходит последовательное горение топлива в лежащих один под другим её слоях. Шихта должна быть максимально однородной. Для равномерного окисления горючего в процессе спекания и получения прочного и пористого агломерата соответствующего химического состава требуется, чтобы шихта обладала необходимой газопроницаемостью, что зависит в первую очередь от размера зёрен и степени начального увлажнения. Основные исходные материалы агломерации:- мелкая сырая руда (8–10 мм) и её концентрат, а также топливо (коксовая и антрацитовая мелочь до 3 мм), флюс (известняк и доломит до 3 мм), в отдельных случаях – мелкие отходы (колошниковая пыль, окалина и другие). Конечный продукт – Агломерат. Более 95% агломерата используется в чёрной металлургии; в цветной металлургии агломерат применяется в алюминиевом, никелевом и свинцовом производствах. Промышленное производство агломерата было освоено в начале XX века в США. Агломерация включает:- подготовку шихты (дозировка отдельных компонентов, смешивание, увлажнение и окомкование), спекание подготовленной шихты на агломерационных машинах, обработку горячего спека (дробление, рассев с удалением кусков до 5–10 мм, охлаждение до 100 °С, сортировка). Процесс спекания тесно связан с работой узлов и агрегатов, обеспечивающих подготовку сырых материалов для агломерации. Поэтому первостепенное значение имеет стабилизация основных входных параметров процесса (усреднение и дозировка материалов, химический состав, влажность и так далее), которые открывают пути к комплексной автоматизации агломерационного процесса. Агломерация осуществляется на агломерационных фабриках, в состав которых входят склады для усреднения и хранения запасов шихтовых материалов, приёмные бункера, отделения для измельчения кокса и известняка (иногда и обжига известняка), шихтовое, спекательное и обработки готового агломерата. На современных агломерационных фабриках приём сырья, дозировка и подготовка шихты, укладка её на агломерационные машины, а также обработка готового агломерата полностью механизированы и в значительной степени автоматизированы. Руда, концентрат, колошниковая пыль, а также другие добавки, не требующие дробления, подаются в шихтовое отделение из приёмных бункеров или со склада конвейерами. Коксовая мелочь и известняки поступают в отделение измельчения, а затем в шихтовое отделение. Сюда же направляется возврат (мелочь, отсеянная от готового агломерата). Шихтовое отделение оборудовано бункерами, ёмкость которых обеспечивает работу агломерационных машин а течение 8–10 часов. Из шихтовых бункеров заданные количества каждого из компонентов шихты дозировочными питателями выдаются на сборный конвейер, который передаёт шихту в барабаны первичного смешивания и затем в бункера шихты агломерационных машин, расположенные в спекательном отделении. Перед загрузкой на агломерационную машину шихта подвергается вторичному смешиванию, увлажнению и частичному окатыванию в окомковательных барабанах. При разгрузке с машины агломерат дробится и сортируется с удалением из него мелочи (возврата), вновь используемой в шихте. Затем агломерат охлаждается и сортируется. Отходящие газы через газовый тракт и газоочистительное устройство отсасываются эксгаустером и через дымовую трубу удаляются в атмосферу. Агломерационные машины – основное технологическое оборудование для агломерации в металлургии. Распространена агломерационная машина ленточного типа, представляющая собой непрерывную цепь движущихся спекательных тележек (палет) с днищами в виде колосниковой решётки. Тележка проходит под питателем, которым на неё укладывается шихта слоем 250–400 мм, а затем под зажигательным горном, где твёрдое топливо, содержащееся в поверхностной зоне спекаемого слоя, зажигается. Эксгаустером через слой сверху вниз просасывается воздух (80–100 кубических метров в минуту ($м^3$/мин) на 1 квадратный метр ($м^2$) площади спекания), и зона горения (толщиной 15–20 мм) перемещается вниз по слою со скоростью 20–40 мм/мин. В зоне горения твёрдого топлива при t 1 200–1 500 °С значительная часть шихты плавится. По мере перемещения зоны горения вниз полурасплавленная масса вышележащей части слоя застывает, образуя спекшийся пирог агломерата (Спек). Газы, отходящие из зоны горения, подсушивают и нагревают нижележащие слои шихты, из которой удаляются гигроскопическая и гидратная вода, углекислый газ и прочие летучие, а также сера, мышьяк и другие вредные примеси. В бывшем Союзе Советских Социалистических Республик (СССР) работали самые крупные в мире агломерационные машины с площадью спекания 312 $м^2$ при ширине 4 метра (м), их удельная (часовая) производительность на единицу площади (1 $м^2$) спекания 1–2 тонны (т), а годовая – 2–3 миллиона т агломерата. Мировое производство железорудного агломерата составляло около 330 миллионов т (в 1967), в бывшем СССР – 128 миллионов т (в 1968).

(3) Agglomeration is a cluster of particles or fibers.

(4) Agglomeration:- xxxxx. / Агломерация в микробиологии, образование микроорганизмами скоплений (кучек) в жидкостях или тканях вследствие изменения физических или химических свойств микробных клеток (под воздействием иммунных тел и других)..

AGGREGATA = АГРЕГИРОВАННОЕ (или НАГРОМОЖДЁННОЕ, или СКУЧЕННОЕ, или СГРУППИРОВАННОЕ, или СОВОКУПНОЕ) – Aggregata:- clustered. / гроздящееся.

AGGREGATE = XX – Aggregate (in electricity) is a combination of buses (interconnection points) or bus prices.

AGGREGATED SHIPMENTS = СОВОКУПНЫЕ (или СБОРНЫЕ, или АГРЕГАТНЫЕ) ГРУЗОВЫЕ ОТПРАВКИ – Aggregated Shipments are numerous shipments from different shippers delivered to one consignee, that are consolidated and treated as a single consignment.

AGGREGATE EXCESS OF LOSS REINSURANCE = ПЕРЕСТРАХОВАНИЕ СОВОКУПНОГО ЭКСЦЕДЕНТА УБЫТКОВ – Aggregate Excess Of Loss Reinsurance:- a form of excess of loss reinsurance in which the excess and the limit of liability are expressed as annual aggregate amounts.

AGGREGATE EXERCISE PRICE = СОВОКУПНАЯ (или СУММАРНАЯ, или АГРЕГАТНАЯ) ЦЕНА ИСПОЛНЕНИЯ – Aggregate Exercise Price is the strike price of a put or call option multiplied by its contract size. Aggregate exercise prices are used to determine the dollar amount required should the option be exercised. For example, if options on ABC co. have a contract size of 100 shares and a strike price of USD10, then the aggregate exercise price will be USD1 000 (USD10 x 100 shares). In the case of a bond option, the exercise price is multiplied by the face value of the underlying bond. Aggregate Exercise Price is a term in security options:- the exercise (strike) price times the number of securities involved in the contract. For example, a call is purchased at USD50.00 for 100 shares. The aggregate exercise price is USD5 000.00 (USD50.00 x 100). Exception:- Government National Mortgage Association (GNMA) options and T-Bill, T-Bond, and T-Note options, in which the aggregate exercise price is the strike price times the face value of the underlying contract. Aggregate Exercise Price is the exercise price of an option that the holder actually pays or is paid (depending on the nature of the option). The aggregate exercise price is calculated by taking the exercise price per unit and multiplying by the number of units specified in the contract. For example, if an option holder has a call for 1 000 shares of a stock for a USD35 exercise price, the aggregate exercise price will be USD35 000. Aggregate Exercise Price is the exercise price multiplied by the number of shares in a put or call contract. The option premium is excluded in the aggregate exercise price. In the case of options traded on debt

instruments, the aggregate exercise price is the exercise price of the underlying security multiplied by its face value. / Термин, используемый в торговле опционами на ценные бумаги. Она определяется как умножение цены исполнения (сходной цены) на число ценных бумаг, вовлечённых в контракт. Например, опцион на покупку, приобретённый по USD50.00 для 100 акций. Совокупная (или суммарная) цена исполнения составляет USD5 000.00 (USD50.00 x 100). Исключение:- Опционы Правительственной Национальной Ассоциации по Закладным (ПНА3) и Опционы на Казначейские Векселя, Облигации и Ноты, у которых совокупная (или суммарная) цена определяется как значение сходной цены, умноженной на лицевую стоимость соответствующего контракта. Совокупная Цена Исполнения, в торговле опционами на акции:- число акций в контракте на покупку или продаж (обычно 100), умноженное на цену исполнения (exercise price). Цена опциона называется премией (premium) и не включается в совокупную цену исполнения. Например, Июльский опцион на покупку 100 акций XYZ по цене 70 Долларов будет иметь совокупную цену исполнения, равную 100 (число акций) штукам, умноженным на 70 Долларов (цена за акцию), то есть 7 000 Долларов, если он будет исполнен до или по наступлении срока истечения контракта в Июле. В опционах по долговым ценным бумагам, включая и передаточные закладные (pass-throughs) Государственной Национальной Ассоциации по Закладным (Government National Mortgage Association (GNMA)), казначейским обязательствам, казначейским векселям, казначейским облигациям и определённым муниципальным облигациям, совокупная цена исполнения определяется умножением лицевой стоимости (face value) соответствующих ценных бумаг на цену исполнения. Например, совокупная цена 90%-ного опциона на продажу Декабрьских Казначейских Облигаций с лицевой стоимостью в 100 000 Долларов будет составлять 90 000 Долларов, если контракт будет осуществлён до или по наступлении срока истечения контракта в Декабре.

AGGREGATE LIMIT OF INDEMNITY = СОВОКУПНЫЙ ЛИМИТ ВОЗМЕЩЕНИЯ (или СОВОКУПНЫЙ ЛИМИТ КОМПЕНСАЦИИ) – Aggregate Limit Of Indemnity is the maximum amount an insurer will pay under a policy in respect of all accumulated claims arising within a specified period of insurance.

AGGREGATE RISK = СОВОКУПНЫЙ РИСК – Aggregate Risk:- size of exposure of a bank to a single customer for both spot and forward contracts.

AGGREGATE TENDER RATE = СОВОКУПНАЯ ТЕНДЕРНАЯ СТАВКА – Aggregate Tender Rate is a reduced rate offered to a shipper who tenders two or more class-related shipments at one time and one place.

AGGREGATION = СОВОКУПЛЕНИЕ (или АГРЕГАЦИЯ) – (1) Aggregation is the process whereby the values of the individual transactions, in a given collection or group of collections, are accumulated and transmitted in a set of total amounts. No details of the individual transactions that make up the total are provided. / , от Латинского слова Aggrego, означающее Присоединяю, понимается .

(2) Aggregation is the principle under which all futures positions owned or controlled by one trader (or group of traders acting in concert) are combined to determine reporting status and compliance with speculative position limits.

AGI = ANNUAL GROSS INCOME

AGIO = АЖИО (или ЛАЖ, или ПРЕМИЯ) – Agio is a term used almost exclusively in Europe. Difference in value payable for exchanging one kind of currency or bill of exchange for another. This general definition includes the various meanings of the word, which applies to money, banking, and speculation on bills of exchange and securities. In all three cases, it denotes a difference (premium or discount) between the value of the currency held and its purchasing power. Also known as Currency Premium, or Discount. Difference in the value between currencies. Also used to describe percentage charges for conversion from paper money into cash, or from a weak into a strong currency. Agio, a term used to express the difference, in point of value, between metallic and paper money; or between one sort of metallic money and another. / превышение цены . установленного номинала. разницу (премию или скидку) в стоимости удерживаемой валюты и её покупательской способностью. Известна также как Валютная Премия (Currency Premium), и Скидка или Дисконт (Discount). Слово Ажио или Лаж было заимствовано из Итальянского языка (Aggio). Оно означает превышение рыночной цены векселей и других ценных бумаг, а также курсов валют и цены золота над установленным номиналом. Лаж или Ажио, от Французского слова L'Agio, от Итальянского слова L'Aggio, отклонение в сторону превышения рыночной 'цены' золота, выраженной в бумажных деньгах, по сравнению с количеством бумажных денежных знаков, номинально представляющих данное количество золота. Лаж обычно исчисляется в процентах. Лаж обозначает также отклонение в сторону превышения рыночного курса денежных знаков, векселей и других ценных бумаг от их нарицательной стоимости. Отклонение в сторону уменьшения – Дисажио. Ажио:- (1) разница, обычно превышение, с которой продаются на бирже ценности (денежные знаки, акции, векселя, облигации) по сравнению с их нарицательной стоимостью; (2) повышение курса акций на биржах третьих стран по сравнению с курсом на национальных биржах; (3) в операциях с золотыми монетами:- разница между стоимостью металла и биржевой стоимостью монеты. Ажио соответствует также понятию Лаж.

AGIOTAGE = АЖИОТАЖ – Agiotage is a term used almost exclusively in Europe. Operations intended to artificially increase or decrease the price of a stock, commodity or currency to make a quick profit. Originally, the term agiotage was synonymous with speculation and denoted a means of deriving gains from the agio, i.e. the art of predicting upward or downward fluctuations in stocks or currencies and of profiting from accurate forecast. See also Currency Speculation. / Термин, используемый практически только в Европе. , то есть флуктуации (колебания) ценных бумаг или валют и . Под Ажиотажем, от Французского слова Agiotage, означающее Возбуждение, понимается рыночная горячка, обусловленная резкими изменениями конъюнктуры, спроса и предложения, цен товаров или сырья, курса ценных бумаг, валютного курса. Возникает в связи с возможностью получения быстрой и большой прибыли, а также возникновения значительных потерь.

AGITATE = ВЗБАЛТЫВАТЬ – Agitate:- to stir or to mix, as in the case of a dyebath or solution.

AGL = ABOVE GROUND LEVEL

AGLET = ЭГЛЭТ (или ПИСТОНЧИК ШНУРКА) – Aglet or Aiglet is the little plastic or metal cladding on the end of shoelaces that keeps the twine from unraveling. The word comes from the Latin word Acus which means Needle. In times past, aglets were usually made of metal though some were glass or stone. / Эглэт или по-Французски Эгли (Aiglet) .

AGLINET = AGRICULTURAL LIBRARIES NETWORK

AGM = ANNUAL GENERAL MEETING

AGMA = AMERICAN GEAR MANUFACTURERS ASSOCIATION

AGMA LUBRICANT NUMBERS = ЧИСЛА СМАЗОК ПО ААИП – The American Gear Manufacturers Association (AGMA) Lubricant Numbers:- AGMA specification covering gear lubricants. The viscosity ranges of the AGMA numbers (or grades) conform to the

International Standards Organization (ISO) viscosity classification system (see ISO viscosity classification system). See also Lubricant. / Американская Ассоциация Изготовителей (Зубчатых) Передач (ААИП).

AGPET = AGRICULTURAL PROCESS ENGINEERING AND TECHNOLOGY

AGRARIAN SYSTEM = АГРАРНАЯ СИСТЕМА – Agrarian System is a historically constituted and durable mode of exploitation of the environment; a technical system adapted to the bioclimatic conditions of a given area and which complies with its social conditions and needs at that moment.

AGREED VALUATION = СОГЛАСОВАННАЯ СТОИМОСТНАЯ ОЦЕНКА (или СОГЛАСОВАННАЯ ОЦЕНКА СТОИМОСТИ) – Agreed Valuation:- the value of a shipment agreed upon in order to secure a specific freight rate. / Стоимость партии груза, согласованная в соответствии с обоснованием определённой ставки провозной платы.

AGREED VALUE POLICY = ПОЛИС С СОГЛАСОВАННОЙ СТОИМОСТНОЙ ОЦЕНКОЙ – Agreed Value Policy:- an insurance contract under which the insurer agrees to pay the insured a stated amount in the event of the total loss of the property insured without any adjustment for depreciation or appreciation.

AGREED WEIGHT = СОГЛАСОВАННЫЙ ВЕС – Agreed Weight is the weight prescribed by agreement between carrier and shipper for goods shipped in certain packages or in a certain number. / Вес, предусмотренный соглашением между перевозчиком и грузоотправителем для отгружаемых товаров в какой-то упаковке или в каком-то количестве.

AGREEMENT = СОГЛАШЕНИЕ – Agreement is a verbal or written contract between two or more parties to explain the way they intend to act in respect of each other. An understanding between two or more parties that is often embodied in a legally binding, written contract.

AGREEMENT CORPORATION = КОРПОРАЦИЯ, ДЕЙСТВУЮЩАЯ ПО СОГЛАШЕНИЮ – In the United States, Agreement Corporation is a corporation chartered by a state to engage in international banking:- so named because the corporation enters into an 'agreement' with the Fed's Board of Governors that it will limit its activities to those permitted and Edge Act Corporation. / Корпорация по Акту Эджа.

THE AGREEMENT ON TEXTILES AND CLOTHING = СОГЛАШЕНИЕ О ТЕКСТИЛЕ И ОДЕЖДЕ – Done at Marrakesh, Morocco. Date enacted:- 1994-April-15. In force:- 1995-January-01. The Agreement on Textiles and Clothing (ATC), which embodied the results of the negotiations on textiles and clothing conducted under the Uruguay Round of multilateral trade talks. The ATC provides for the phasing out of Multi-Fibre Arrangement (MFA) quotas between January 1995 and December 2004. The Agreement on Textiles and Clothing (ATC) and all restrictions thereunder terminated on 2005-January-01. The expiry of the ten-year transition period of ATC implementation means that trade in textile and clothing products is no longer subject to quotas under a special regime outside normal WTO/GATT rules but is now governed by the general rules and disciplines embodied in the multilateral trading system. The Multi Fibre Arrangement (MFA, also known as the Agreement on Textile and Clothing (ATC)) governed the world trade in textiles and garments from 1974 through 2004, imposing quotas on the amount developing countries could export to developed countries. It expired on 2005-January-01. The MFA was introduced in 1974 as a short-term measure intended to allow developed countries to adjust to imports from the developing world. Developing countries have a natural advantage in textile production because it is labor intensive and they have low labor costs. According to a World Bank/International Monetary Fund (IMF) study, the system has cost the developing world 27 million jobs and USD40 billion a year in lost exports. However, the Arrangement was not negative for all developing countries. For example the European Union (EU) imposed no restrictions or duties on imports from the very poorest countries, such as Bangladesh, leading to a massive expansion of the industry there. At the General Agreement on Tariffs and Trade (GATT) Uruguay Round, it was decided to bring the textile trade under the jurisdiction of the World Trade Organization. The Agreement on Textiles and Clothing provided for the gradual dismantling of the quotas that existed under the MFA. This process was completed on 2005-January-01. However, large tariffs remain in place on many textile products. Bangladesh was expected to suffer the most from the ending of the MFA, as it was expected to face more competition, particularly from China. However, this was not the case. It turns out that even in the face of other economic giants, Bangladesh's labor is 'cheaper than anywhere else in the world'. While some smaller factories were documented making pay cuts and layoffs, most downsizing was essentially speculative – the orders for goods kept coming even after the MFA expired. In fact, Bangladesh's exports increased in value by about USD500 million in 2006. However, poorer countries within the developed world, such as Greece and Portugal, are expected to lose out. During early 2005, textile and clothing exports from China to the West grew by 100% or more in many items, leading the US and EU to cite China's WTO accession agreement allowing them to restrict the rate of growth to 7.5% per year until 2008. In June, China agreed with the EU to limit the rate to 10% for 3 years. No such agreement was reached with the US, which imposed its own import growth quotas of 7.5% instead. When the EU announced their new quotas to replace the lapsed MFA, Chinese manufacturers accelerated their shipping of the goods intended for the European market. This used up a full year's quota almost immediately. As a result, 75 million items of imported Chinese garments were held in European ports in August 2005. A diplomatic resolution was reached at the beginning of September 2005 during Tony Blair's visit to China, putting an end to a situation the UK press had dubbed 'Bra Wars'. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона.

AGREEMENT ON THE TRANSPORT OF PERISHABLES = СОГЛАШЕНИЕ О ПЕРЕВОЗКЕ СКОРОПОРТЯЩИХСЯ ГРУЗОВ – Agreement on the Transport of Perishables (ATP agreement) is an agreement on the International Carriage of Perishable Food stuffs and on the special equipment to be used for such carriage. It is referred to as the ATP Agreement (after its French initials Agreement Transport Perishable) and was drawn up by the Inland Transport Committee of the United Nations Economic Committee for Europe in 1970–71. It is illegal to transport perishable food stuffs across an international boundary between countries that are signatories to the agreement unless the vehicle has an ATP certificate. Agreement on the International Carriage of Perishable Foodstuffs and on the Special Equipment to be Used for such Carriage (ATP) Geneva, 1970-September-01. Entry into force:- 1976-November-21. Agreement on the Transport of Perishables (ATP agreement) is an Agreement on the International Carriage of Perishable Foodstuffs and on the special equipment to be used for such carriage (Agreement on the Transport of Perishables). The UN agreement for the cross-border transportation of foodstuffs. Russian Federation signed on 1971-September-10. / Российская Федерация подписала данное соглашение 10 Сентября 1971.

AGRICOLA = AGRICULTURAL ON–LINE ACCESS

AGRICULTURAL COMMODITIES = СЕЛЬСКОХОЗЯЙСТВЕННЫЕ РОДА СЫРЬЯ (или АГРИКУЛЬТУРНЫЕ РОДА СЫРЬЯ) – Under the Commodity Exchange Act (CEA) as amended by the Commodity Futures Modernization Act of 2000 (CFMA), the category of Agricultural Commodities is used in the definition of 'Exempt Commodity', the term 'Agricultural Commodity' is not defined. Logically, it refers to the list of agricultural commodities traditionally within the jurisdiction of the CEA under section 1a of the Act. It is unclear, however, whether or not the term encompasses any additional agricultural commodities. Generally, the regulatory framework for the

futures markets for agricultural commodities was not altered by the CFMA. / Сельскохозяйственное Сырьё или Агрикультурное Сырьё (устаревший термин).

AGRICULTURAL COMMODITIES INDEX = ИНДЕКС ПО СЕЛЬСКОХОЗЯЙСТВЕННЫМ РОДАМ СЫРЬЯ – Agricultural Commodities Index is a weighted average of the important agricultural commodity contracts as complied by Goldman Sachs. Commodities used include Cocoa, Coffee, Corn, Cotton, Orange Juice, Red Wheat, Soybeans, Sugar, and Wheat. / Голдмэн Сэкс (Goldman Sachs).

AGRICULTURAL LIME = СЕЛЬСКОХОЗЯЙСТВЕННАЯ ИЗВЕСТЬ – Agricultural Lime is a soil amendment consisting principally of calcium carbonate but including magnesium carbonate and perhaps other materials. This is used to furnish calcium and magnesium as elements for the growth of plants and to neutralize soil acidity. / используется для известкования почв.

AGRICULTURAL MARKETING SERVICE = СЛУЖБА СЕЛЬСКОХОЗЯЙСТВЕННОГО МАРКЕТИНГА – Agricultural Marketing Service (AMS) is an agency of the United States Department of Agriculture (USDA). This agency, for example, performs the classing of cotton samples for certification as deliverable against futures contracts. The AMS is located at:- 3275 Appling Road, Memphis, TN 38133, Phone:- +1-901-3843000. Agricultural Marketing Service (AMS) is the US Federal agency that is responsible for inspecting, grading, classing, standardizing, regulating, sampling, testing, and reporting market news for specific agricultural and food commodities. USDA-APHIS-PPQ (short for the United States Department of Agriculture – Animal and Plant Health Inspection Service – Plant Protection and Quarantine) approves Agricultural Marketing Service inspection certificates as a basis for issuing PPQ Form 577 (short for the Plant Protection and Quarantine Form 577) for certain commodities.

AGRICULTURAL PRODUCTION SYSTEM = СИСТЕМА СЕЛЬСКОХОЗЯЙСТВЕННОГО ПРОИЗВОДСТВА – Agricultural Production System is the whole structured set of plants, animals, and activities selected by a farmer for his production unit to achieve its goals. It is a global system that is finalized by farmer socioeconomic objectives and related management strategy.

AGRICULTURAL PROGRAM = СЕЛЬСКОХОЗЯЙСТВЕННАЯ ПРОГРАММА – Agricultural Program:- in the United States, government activities aimed at accomplishing a certain result. Such activities include agricultural price support loans, purchases and payments, commodity storage, transportation, exports, and acreage reduction. / Сельскохозяйственная Программа:- в Соединённых Штатах Америки виды деятельности правительства, направленные на достижение определённого результата. Такие виды деятельности включают займы по поддержке сельскохозяйственных цен, закупки и платежи, хранение сырья, транспортировка, вывоз (или экспорт), и сокращение площадей в акрах.

AGRICULTURAL SEED = СЕЛЬСКОХОЗЯЙСТВЕННОЕ СЕМЯ – Agricultural Seed is specific varieties of grass, forage, and field crop seed that are used for seeding purposes in the United States. / Сельскохозяйственное Семя – специфические разновидности злаковых трав, фуража, и семя полевых культур, которые используются в посевных целях в Соединённых Штатах Америки.

AGRICULTURAL STABILIZATION AND CONSERVATION SERVICE = СЛУЖБА СТАБИЛИЗАЦИИ И СОХРАНЕНИЯ СЕЛЬСКОГО ХОЗЯЙСТВА (или СЛУЖБА СТАБИЛИЗАЦИИ СЕЛЬСКОГО ХОЗЯЙСТВА И СОХРАНЕНИЯ СЕЛЬСКОХОЗЯЙСТВЕННЫХ РЕСУРСОВ) – In the United States, the Agricultural Stabilization and Conservation Service (ASCS) is an agency of the USDA (short for the United States Department of Agriculture) that carries out several principal farm commodity programs from appropriated funds, including Commodity Credit Corporation program activities. Headquartered in Washington, DC, the United States. Agricultural Stabilization and Conservation Service (ASCS) was an agency of the United States Department of Agriculture. It administered programs concerning farm products and agricultural conservation. It granted loans to farmers; purchased farm products from farmers and processors; administered land allotment and marketing quota programs; shared the cost of resource conservation and environmental protection measures with farmers and ranchers; and supervised civil defense activities relating to food. It also managed the inventories of the Commodity Credit Corporation. The ASCS was established in 1961. In 1994, the ASCS was merged with other Agriculture agencies to create the Farm Service Agency. / Служба Стабилизации и Сохранения Сельского Хозяйства (Agricultural Stabilization and Conservation Service).

AGRICULTURAL TRADE OPTION MERCHANT = ТОРГОВЕЦ ОПЦИОНАМИ НА СЕЛЬСКОХОЗЯЙСТВЕННОЕ СЫРЬЁ – Agricultural Trade Option Merchant:- any person that is in the business of soliciting or entering option transactions involving an enumerated agricultural commodity that are not conducted or executed on or subject to the rules of an exchange.

AGRICULTURE = СЕЛЬСКОЕ ХОЗЯЙСТВО – IAS 41 (short for International Accounting Standard No. 41) Agriculture – The objective of this Standard is to prescribe the accounting treatment and disclosures related to agricultural activity. 'Agricultural Activity' is the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets. 'Biological Transformation' comprises the processes of growth, degeneration, production, and procreation that cause qualitative or quantitative changes in a biological asset. A 'Biological Asset' is a living animal or plant. 'Agricultural Produce' is the harvested product of the entity's biological assets. 'Harvest' is the detachment of produce from a biological asset or the cessation of a biological asset's life processes. IAS 41 prescribes, among other things, the accounting treatment for biological assets during the period of growth, degeneration, production, and procreation, and for the initial measurement of agricultural produce at the point of harvest. It requires measurement at fair value less costs to sell from initial recognition of biological assets up to the point of harvest, other than when fair value cannot be measured reliably on initial recognition. This Standard is applied to agricultural produce, which is the harvested product of the entity's biological assets, only at the point of harvest. Thereafter, IAS 2 Inventories or another applicable Standard is applied. Accordingly, this Standard does not deal with the processing of agricultural produce after harvest; for example, the processing of grapes into wine by a vintner who has grown the grapes. 'Fair Value' is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. Costs to sell include commissions to brokers and dealers, levies by regulatory agencies and commodity exchanges, and transfer taxes and duties. Costs to sell exclude transport and other costs necessary to get assets to a market. Such transport and other costs are deducted in determining fair value (that is, fair value is a market price less transport and other costs necessary to get an asset to a market). IAS 41 requires that a change in fair value less costs to sell of a biological asset be included in profit or loss for the period in which it arises. In agricultural activity, a change in physical attributes of a living animal or plant directly enhances or diminishes economic benefits to the entity. IAS 41 does not establish any new principles for land related to agricultural activity. Instead, an entity follows IAS 16 Property, Plant and Equipment or IAS 40 Investment Property, depending on which standard is appropriate in the circumstances. IAS 16 requires land to be measured either at its cost less any accumulated impairment losses, or at a revalued amount. IAS 40 requires land that is investment property to be measured at its fair value, or cost less any accumulated impairment losses. Biological assets that are physically attached to land (for example, trees in a plantation forest) are measured at their fair value less costs to sell separately from the land. IAS 41 requires that an unconditional government grant related to a biological asset measured at its fair value less costs to sell to be recognised in profit or loss when, and only when, the government grant becomes receivable. If a government grant is conditional, including when a government grant requires an entity not to engage in specified

agricultural activity, an entity should recognise the government grant in profit or loss when, and only when, the conditions attaching to the government grant are met. If a government grant relates to a biological asset measured at its cost less any accumulated depreciation and any accumulated impairment losses, IAS 20 Accounting for Government Grants and Disclosure of Government Assistance is applied. / МСБУ 41 (сокращение для Международного Стандарта Бухгалтерского Учёта № 41) – .

AGRICULTURE = СЕЛЬСКОЕ ХОЗЯЙСТВО (или АГРОКУЛЬТУРА, или АГРИКУЛЬТУРА) – Agriculture is the practice of cultivation, farming, tillage and horticulture; plant and animal production. Agriculture is the science of farming plants and raising animals. / Под Сельским Хозяйством понимается одна из главных отраслей материального производства; возделывание сельскохозяйственных культур и разведение сельскохозяйственных животных для получения продукции растениеводства и животноводства. Сельское хозяйство включает также различные виды первичной переработки растительных и животных продуктов. В ряде стран к сельскому хозяйству относят лесное хозяйство. Под Агрокультурой или Агрикультурой, от Латинского слова Agricultura, означающее Земледелие или Полеводство, понимается совокупность мер по повышению культуры земледелия.

AGRIS = АГРИС – AGRIS is the International System for Agricultural Science and Technology providing access to bibliographic information on agricultural science and technology. AGRIS started in 1975 by the Food and Agriculture Organization (FAO) of the United Nations, to serve users from both developed and developing countries, to enable access to available knowledge in agriculture, science and technology. As a global public multilingual bibliographic database for agricultural science and technology, AGRIS collects and uses agricultural bibliographic data enabling you to retrieve a wealth of research and technical information resources on agriculture worldwide. AGRIS facilitates access to publications, journal articles, monographs, book chapters, and grey literature – including unpublished science and technical reports, theses, dissertations and conference papers. Currently, AGRIS is an international collaboration and partnership of a network of more than 400 data providers from up to 145 countries. Xxxxx. AGRIS:- your link to worldwide agricultural information. AGRIS puts the world of agricultural research and information at your fingertips. The International System for Agricultural Science and Technology (AGRIS) is a multilingual bibliographic database that connects users directly to a rich collection of research and worldwide technical information on food and agriculture. Maintained by the Food and Agriculture Organization of the United Nations (FAO), AGRIS has been serving users from developed and developing countries through facilitating access to knowledge in agriculture, science and technology since 1975. It offers 9 649 214 bibliographic records produced by more than 400 data providers (research centers, academic institutions, publishers, governmental bodies, development programmes, international and national organizations) from 144 countries. More than 400 000 agricultural and research professionals worldwide access AGRIS resources each month. While AGRIS is predominantly a bibliographic database, it also provides full text links to about 2 million of its records. AGRIS facilitates access to publications, journal articles, monographs, book chapters, and grey literature – includeing unpublished science and technical reports, theses, dissertations and conference papers in the area of agriculture and related sciences. Most of the AGRIS records are indexed by AGROVOC (the FAO multilingual Thesaurus). AGROVOC is widely used in specialized libraries as well as digital libraries and repositories to index content and for the purpose of text mining. It is also used as a specialized tagging resource for knowledge and content organization by FAO and other third-party stakeholders. New AGROVOC keywords can be suggested if needed, by sending an email to agrovoc@fao.org. Headquartered in Rome, Italy. Xxxxx. What Is AGRIS? AGRIS (International System for Agricultural Science and Technology) is one of the World's leading public information service that provides access to a rich collection of publications and information about agriculture, science and technology. The database is comprised of structured bibliographic records in the areas of food, agriculture, environmental science and related social sciences. More than 20% of these records direct the user to the full text on the web. The database is maintained by the Food and Agriculture Organization of the United Nations (FAO) and its content is provided by more than 400 participating institutions from 144 countries. Who Uses AGRIS? AGRIS is used by whoever is interested to find literature about food, agriculture, environmental science and related social sciences. The known user groups include students, scientists, librarians, researchers, publishers and policy makers. Searches are usually performed via the AGRIS search engine. In most cases, AGRIS is used to find literature in pursuit of an academic endeavor, research and background studies for policy makers. It is also used to obtain an overview of what has been published in a certain domain. What Subjects Are Covered By AGRIS? AGRIS covers agriculture as defined by FAO – this includes broader aspects of agriculture covering forestry, fisheries, animal sciences, nutrition, climate change, natural resources, land and water. Most AGRIS records are indexed by AGROVOC (the FAO multilingual Thesaurus). AGROVOC is widely used in specialized libraries as well as digital libraries and repositories to index content and for the purpose of text mining. Which Types Of Publications Are Indexed By AGRIS? AGRIS collects a variety of published articles and grey literature. The most common content types available include bibliographies, books, book chapters, conference papers, journal articles, theses and many others. Most of the records are journal articles. In Which Languages Are Literature Available In AGRIS? AGRIS collects literature, in theory, in all the 29 languages covered by AGROVOC. Currently, AGRIS contains literature in:- English, Spanish, French, Italian, German, Japanese, Thai, Chinese, Russian, Portuguese, Arabic, Korean, and Farsi. Even if most AGRIS records are in English, the system uses AGROVOC to translate the user's query in all languages available in AGROVOC. How Can I Perform Searches In AGRIS? The AGRIS search engine allows users to perform sophisticated searches using keywords from the AGROVOC thesaurus, specific journal titles or names of countries, institutions, and authors. The number of search results can be narrowed down with several filters that can be found of the left side of the search results list. There is also an option to carry out advanced searches using the 'Get Advanced Search' where more options to filter the results are available. How Can I Perform Advanced Searches In AGRIS? The advanced search can be accessed on the AGRIS search interface in two areas – on the AGRIS homepage under the main search bar and in the upper right corner in the list of search results. The advanced search allows you to search records filtered by data providers, language of records, content types, range of publication dates and records that contains explicit links to full text articles. Does AGRIS Provide Access To Full Text Articles? AGRIS is predominantly a bibliographic database that provides citations and that does not store full text articles. In about 20% of cases, an AGRIS record does provide an access link to the full text (only if the article is freely available online). In this case, you will see a clickable icon next to 'Access the full text', displayed on the right side of the screen. Otherwise this section will indicate that the full text is not available. Which Options Do I Have If AGRIS Does Not Provide Access To The Full Text? All AGRIS records provide metadata that shows the source of the record. Please contact the data provider directly in order to get access to the full text of the record. AGRIS cannot provide access to records that do not already include full text links. How Can I Save Individual Records? AGRIS allows you to save the metadata of individual records in three formats:- AGRIS AP, RIS or Endnote xml. Once you have clicked on a record, you can find these options on the right side of the screen. It is currently not possible to save the list of search results. Is AGRIS An OAI-PMH Compliant Repository? AGRIS is not an OAI-PMH compliant repository. However the AGRIS team is working on the option to share AGRIS upon request that will be available soon. Is AGRIS An Open Access Repository? AGRIS is a bibliographic database that provides citations in the areas of food, agriculture, environmental science and related social sciences. In some cases AGRIS records provide access to the full text of openly available resources that are freely accessible online. The metadata of AGRIS records are licensed under the international Creative Commons Attribution License (CC-BY IGO 3.0). How To Become An AGRIS Data Provider? You can contribute to AGRIS either as an institutional repository, journal publisher or as an aggregator. An institutional

repository is a collection of bibliographic metadata created within a university or a research institution while an aggregator may gather metadata collections from many different institutional repositories. It is important that the most important keywords that describe your data collection are related to food, nutrition, agriculture, forestry, fishery, environmental or other related sciences and are included in the AGROVOC thesaurus. Please send an email to agris@fao.org if your data collection meets these requisites and carefully read the instructions provided in the section 'How does it work for Contributors'. / АГРОВОК (AGROVOC).

AGROCLIMATIC = АГРОКЛИМАТИЧЕСКОЕ – Agroclimatic:- relating to the relationship between crop adaptation and climate.

AGROECOLOGICAL ZONES = АГРОЭКОЛОГИЧЕСКИЕ ЗОНЫ – Agroecological Zones are geographical mapping units based on climatic conditions and land forms that determine relatively homogeneous crop growing environments.

AGROECONOMICS = АГРОЭКОНОМИКА – Agroeconomics is the economics of agriculture.

AGRONOMIC CHARACTERS = АГРОНОМИЧЕСКИЕ СВОЙСТВА – Agronomic Characters are the plant characters related to crop production usually observed during plant growth, e.g., height, maturity, tiller number, panicle size, yield and quality factors.

AGRONOMY = АГРОНОМИЯ – Agronomy is:- (1) science of agriculture that deals with all aspects of field crop production and soil management; and (2) an applied ecological science. / Под Агрономией, от Греческих слов Agrós, означающее Поле, и Nómos, означающее Закон, понимается комплекс наук о возделывании сельскохозяйственных культур. Агрономические правила и наставления были известны в Древнем Египте, Древней Греции, Китае, Индии, Древнем Риме. С конца XVIII века совершенствовались системы земледелия, разрабатывались теории питания растений, методы семеноводства, защиты растений от болезней и вредителей. Со второй половины XIX века в составе агрономии развиваются земледелие, растениеводство, агрохимия, почвоведение, зоотехния. Большие заслуги в становлении агрономии принадлежат Русскому писателю и естествоиспытателю Андрею Тимофеевичу Болотову (1738–1833), Русскому агроному Ивану Михайловичу Комову (1750–92), Немецкому агроному Альбрэхту Даниэлю Тэеру (Thaer; 1752–1828), Немецкому химику Юстусу Либиху (Liebig; 1803–73), Русскому агроному Александру Васильевичу Советову (1826–1901), Русскому естествоиспытателю Василию Васильевичу Докучаеву (1846–1903), Русскому почвоведу Василию Робертовичу Вильямсу (1863–1939), Русскому естествоиспытателю Климу Аркадиевичу Тимирязеву (1843–1920), Русскому агрохимику Дмитрию Николаевичу Прянишникову (1865–1948), Русскому биологу и селекционеру Ивану Владимировичу Мичурину (1855–1935), Русскому селекционеру Николаю Ивановичу Вавилову (1887–1943) и другим. Основные разделы современной агрономии:- земледелие, агрохимия, агрофизика, растениеводство, селекция, семеноведение, фитопатология, сельскохозяйственная энтомология, сельскохозяйственная мелиорация.

AGROUND = НА ГРУНТ (или НА МЕЛЬ) – Aground:- touching or fast to the bottom. For example, on 2010-October-07 a dry-cargo freighter under the Russian flag, 'Sail Queen', has run aground in the Aegean Sea off the Turkish coast. The crew has steered the vessel towards a sandbank. The ship was damaged when scraping the seabed of a strait between local islands. The impact caused leakage that the crew was unable to fix. The vessel is currently in shallow waters, with none of its 16-strong crew reported injured. The 'Sail Queen' was transporting steel products from Turkey to Rostov on Don in Southern Russia. Ship Grounding is a marine accident has various types and one such type is ship grounding. The depth of sea varies from port to port. Not all the ports can allow ships of all sizes to enter. Bigger a ship, higher the difficulty in docking it to a port. For, e.g., take New York, one of the busiest port has such a low draft that VLCCs (short for the Very Large Crude Carriers) and ships with higher tonnage cannot enter the port. Sometimes even if the port is capable of receiving large vessels with higher draft, unnoticeable silt and mud gets accumulated near the ports, reducing the draft. Thus a ship with higher draft when enters such port gets stranded due to the chocked draft. Grounding is also caused due to rotational tides. There are many ports around the world that allow ships to enter only during high tides due to the problem of draft. An unpredictable change in tides, when the ship is docked at a port, can lead to grounding of the ship. Impact on the ship:- ship grounding leads tp the impact of the bottom part of a ship onto the ocean bed, resulting in damage to the ship structure. A ship grounding can be of two types:- (i) soft grounding and (ii) wallop grounding. A soft grounding does not lead to adverse effects on a ship. But this doesn't mean it has to be completely neglected. Proper inspection needs to be made as soon as the ship reaches the nearest port. In case there is a doubt about the condition of the ship, it should be prevented from sailing till a thorough inspection is not carried out by the experts or a classification society. On the contrary, wallop grounding can lead to heavy damage to the hull and submerged part of the ship.This might lead to serious cracks in the ship structure, resulting in water ingress followed by serious damage of the ship's structural integrity and causing major instability. A heavy impact can induce atypical structural stresses and heavy loads on the ship, which can lead to a major accident. Sometimes due to wallop grounding, the ship might completely lose its balance and become unstable, leading to ship capsize. Effects of Grounding:- if the grounding has resulted into a major marine accident, it can have outstanding adverse effects on both – the ship and the environment. Apart from the damage to the ship, grounding causes following effects:- (i) if grounding has lead to a crack in the cargo hold of the ship (e.g., tankers), the cargo might find a way into the sea leading to heavy marine pollution and thus causing detrimental effects on the environment and marine life; (ii) if the situation becomes grave and uncontrollable, it might lead to loss of human life; (iii) the coastal areas near the accident area will be drastically affected by the leaked cargo; and (iv) heavy financial loss will be incurred by the ship owner and communities near the accident area. What leads to grounding? Human error has been the cause of most of the grounding accidents in the past. An insufficient or improper information of the port or the navigational water ways has be the main cause of grounding accidents. Sheer maneuvering negligence and improper retaliations at the time of grounding has been the root cause of major accidents. Depending on the way the ship was being maneuvered before it was grounded will decide how the ship will be stranded after the grounding. Sometimes unknown rocks and coral reefs in the navigational waters have also been the result for grounding. Grounding events in the past have caused heavy damage to the coral reefs. / Соприкосновение с грунтом или прочное усаживание на грунт. Сесть На Мель – (про судно, корабль) застрять на мелком участке реки или моря.

AGT = AUTOMATED GUIDEWAY TRANSIT

AGV = AUTOMATIC GUIDED VEHICLE

AGVS = AUTOMATED GUIDED VEHICLE SYSTEM

AGW = ALL GOING WELL

AHAR = ADVANCED HIGHWAY ADVISORY RADIO

A–H1N1 = А.–АШ.1ЭН.1 (или ЭЙ.–ЭЙЧ.1ЭН.1) – A-H1N1:- this is an influenza virus that had never been identified as a cause of infections in people before the current H1N1 pandemic. Genetic analyses of this virus have shown that it originated from animal influenza viruses and is unrelated to the human seasonal H1N1 viruses that have been in general circulation among people since 1977.

AHIP = ARMY HELICOPTER IMPROVEMENT PROGRAM

AHS = AUTOMATED HIGHWAY SYSTEM

AHU RICE = РИС АХУ – Ahu Rice is an early Rice similar to 'Aus'; grown in Assam, India.

A/I = ACCIDENT/INCIDENT

AI = ACTIVE INGREDIENT

AI = ALL INCLUSIVE

AI = AMNESTY INTERNATIONAL

AI = ANGUILLA

AIA = AEROSPACE INDUSTRIES ASSOCIATION, INC.

AIBA = AGRICULTURAL INFORMATION BANK FOR ASIA

AIBD = ASSOCIATION OF INTERNATIONAL BOND DEALERS

AICARP = ALL INDIA COORDINATED AGRONOMIC RESEARCH PROJECT

AICC = AUTOMATED INTELLIGENT CRUISE CONTROL

AICORP = ALL INDIA COORDINATED OILSEEDS RESEARCH PROJECT

AICPA = AMERICAN INSTITUTE OF CERTIFIED PUBLIC ACCOUNTANTS

AICRIP = ALL INDIA COORDINATED RICE IMPROVEMENT PROJECT

AICSMSP = ALL INDIA COORDINATED SCHEME OF MICRONUTRIENTS IN SOILS AND PLANTS

AID = AGENCY FOR INTERNATIONAL DEVELOPMENT

AIDAB = AUSTRALIAN INTERNATIONAL DEVELOPMENT ASSISTANCE BUREAU

AIDS TO NAVIGATION = НАВИГАЦИОННОЕ ОБОРУДОВАНИЕ (или СРЕДСТВА, СПОСОБСТВУЮЩИЕ НАВИГАЦИИ) – Aids To Navigation:- artificial objects to supplement natural objects indicating safe and unsafe waters. / Искусственные объекты, используемые в дополнение к натуральным объектам, указывающие безопасные и опасные воды.

AIEDP = ASIAN INSTITUTE FOR ECONOMIC DEVELOPMENT AND PLANNING

AIFSS = AUTOMATED INTERNATIONAL FLIGHT SERVICE STATION

AIFST = AUSTRALIAN INSTITUTE OF FOOD SCIENCE AND TECHNOLOGY

AIG = AIRBUS INDUSTRIES GROUP

AIGUILLETTE = ЭГВИЙЕТ (или АКСЕЛЬБАНТ, или ШНУРОК) – Aiguillette is an aglet; specifically, a shoulder cord worn by designated military aides. / .

AIM = AERONAUTICAL INFORMATION MANUAL

AIM = ALTERNATIVE INVESTMENT MARKET

AIM = AMERICAN INSTITUTE FOR MANAGEMENT

AIMS = AMERICAN INSTITUTE OF MERCHANT SHIPPING

AIP = AERONAUTICAL INFORMATION PUBLICATION

AIP = AIRPORT IMPROVEMENT PROGRAM

AIPA = AMERICAN INVENTORS PROTECTION ACT OF 1999

AIPC = ASSOCIATION INTERNATIONALE DES PALAIS DE CONGRES

AIPLA = AMERICAN INTELLECTUAL PROPERTY LAW ASSOCIATION

AIPPI = ASSOCIATION INTERNATIONALE POUR LA PROTECTION DE LA PROPRIÉTÉ INTELLECTUELLE

AIR AMBULANCE COMPANY = КОМПАНИЯ АВИАЦИОННОЙ СКОРОЙ ПОМОЩИ – An Air Ambulance Company conducts and operates advanced air ambulance aircraft. Quite frequently the Air Ambulance company is also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medevacs or jet rescue /Air ICU (intensive care unit). These air ambulance configured aircraft have a removable stretcher and advance life support equipment. The Air Ambulance Company uses critical care trained staff to provide the care needed during the Air Ambulance Company's transfer. Air Ambulance Network, which since 1971 has been Air Ambulance Company, is a leader in the air ambulance industry. They have performed the most trips worldwide, Air Ambulances to more countries then any air ambulance company worldwide.

AIR AMBULANCE NETWORK = РАБОЧАЯ СЕТЬ АВИАЦИОННОЙ СКОРОЙ ПОМОЩИ – Air Ambulance Network (AAN) provides a variety of Advanced Air Ambulance Transportation Services from Critical Care Medflights to elective Air Medical Transport. Services offered include; Private Air Ambulances, including a wide range of aircraft from twin propeller to commerical jet airliners and everything in between. Aircrafts are equipped as flying mobile Jet ICU's Intensive Care Units (ICU) and are capable of care for the most basic patient to the Critical Care patient. All aircrafts are equipped with the most sophisticated advanced life support equipment to include; Zoll M Series 12 lead Cardiac monitor-defibrillator, full compliment of Advanced Cardiac Life Support (ACLS) drugs and all critical care medications and state of the art LTV 1200 series transport ventilator. Select aircraft are capable of being equipped with specialized equipment like Intra-Aortic Balloon Pump (IABP) and Neonate incubators and our baby pod. Air Ambulance Network can provide a wide range of worldwide air ambulance services that are customized to the patients' medical requirement and financial considerations. An Air Ambulance or Air Medical Transport:- this type of airplane is a specially modified aircraft that is used for the Medical Air Transportation of critically ill or injured patients. There are many types of air ambulance aircraft that can be used. We primarily operate within the civilian area of Medical Air Transportation. Our vast network of Air Medical Transportation providers has allowed us to

perform thousands of Air Medical Transports around the world in more than one hundred different countries, making us a leader in the Air Ambulance Industry for the past 39 years. Air Ambulance Network (AAN) provides seamless bedside to bedside service including private air ambulance, Commercial Medical Escort (CME) and International Commercial Stretcher Service. Services:- (i) Advanced Cardiac Life Support; (ii) Critical Care; and (iii) Basic Life Support. Staff:- (i) Highest rated Pilots; (ii) Critical Care Registered Nurse; and (iii) Critical Care Paramedic or Respiratory Therapist (On some flights a doctor or physician is required). Service Areas:- Air Ambulance Network has bases all over the world and the best response and service. Headquartered in Tarpon Springs, FL, the United States.

AIR AMBULANCE SERVICE = СЛУЖБА АВИАЦИОННОЙ СКОРОЙ ПОМОЩИ – Air Ambulance Service describes the type of air ambulance service an air ambulance company conducts. Quite frequently the Air Ambulance Service is also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Angel Medflights, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medevacs or jet rescue/Air ICU (intensive care unit). Air Ambulance Service providers offer patients a medically configured aircraft having a removable stretcher and advance life support equipment on board. The Air Ambulance Service provides critical care trained medical staff to provide the care needed. Air Ambulance Network, has been providing air ambulance service worldwide since 1971 and is a leader of air ambulance service providers. They have performed the most trips worldwide, offering air ambulance service to more countries then any other air ambulance service.

AIR AMBULANCE SERVICES = УСЛУГИ АВИАЦИОННОЙ СКОРОЙ ПОМОЩИ – Air Ambulance Services are services performed by Air Ambulance Network using fixed wing aircraft as a vehicle to transport sick or injured people with medical needs through the air. These air ambulance services can be an air ambulance or a medical escort service, both of these air ambulance services are offered by Air Ambulance Network. Air Ambulance Services are used when patients need to be transported over long distances more quickly than ground ambulances. Air Ambulance Network uses fixed wing aircraft that are fully equipped with all necessary medical equipment for complete patient care. Air Ambulance Services through Air Ambulance Network's fixed wing aircraft are staffed with critical care certified paramedics, nurses, doctors, respiratory therapists, or a combination of healthcare providers, based on the needs of the patient. Air Ambulance Network has been providing air ambulance services since 1971.

AIRAT = AFRICAN IRRIGATED RICE ADVANCED TRIAL

AIRBAG = ВОЗДУШНАЯ ПОДУШКА БЕЗОПАСНОСТИ – (1) Air Bag is an automatically inflating bag in front of riders in an automobile to protect them from pitching forward in an accident. End use for manufactured textile fibers.

(2) Airbag is an inflatable bag used to fill empty space on a load of product to keep the product from shifting. Airbags can be positioned in the gaps between the cargo in order to achieve a tight fit during loading.

AIR BLEEDER = ВОЗДУШНЫЙ КРАН (или ВОЗДУШНЫЙ ПРЕДОХРАНИТЕЛЬНЫЙ КЛАПАН) – Air Bleeder is a device for removal of air from a hydraulic fluid line.

AIR BREATHER = ВОЗДУШНЫЙ САПУН – Air Breather is a device permitting air movement between atmosphere and the component in/on which it is installed. / Сапун, устройство для соединения внутренней полости картеров механизмов с атмосферой. Сапун предотвращает повышение давления во внутренней полости картера и связанное с этим выдавливание масла через неплотности соединения картера, а также не допускает подсасывания пыли во внутреннюю полость картера. Для очистки воздуха, поступающего через сапун, устанавливают фильтр.

AIR BRUSHING = XX (или АЭРОГРАФИЯ, или АЭРОГРАФНАЯ ПЕЧАТЬ) – Air Brushing:- blowing color on a fabric or paper with a mechanized pneumatic brush. / Аэрографная Печать – способ печатания тканей разбрызгиванием красок с помощью сжатого воздуха и пульверизатора.

AIR CARGO = АВИАЦИОННЫЙ ГРУЗ – Air Cargo is a freight that is moved by air transportation. / Фрахт, перевозимый с помощью воздушной транспортировки.

AIR CARGO AGENT = АГЕНТ ПО АВИАЦИОННОМУ ГРУЗУ – Air Cargo Agent is an agent appointed by an airline to solicit and process international airfreight shipments.

AIR CARGO CONTAINERS = АВИАЦИОННЫЕ ГРУЗОВЫЕ КОНТЕЙНЕРЫ – Air Cargo Containers are the containers designed to conform to the inside of an aircraft. There are many shapes and sizes of containers. Aircargo containers fall into three categories:- (i) aircargo pallets, (ii) lower deck containers, and (iii) box type containers. / Авиационные Грузовые Контейнеры разработаны таким образом, чтобы достаточно плотно входить и находиться внутри салона, отсека или фюзеляжа самолёта. Они предназначены для перевозки авиационных грузов и с этой целью бывают разной формы и размеров. Авиационные Грузовые Контейнеры подразделяются на три категории:- (i) авиационные грузовые поддоны (aircargo pallets), (ii) контейнеры для нижней палубы (lower deck containers), и (iii) контейнеры коробочного типа (box type containers).

AIR CARRIER = АВИАЦИОННЫЙ ПЕРЕВОЗЧИК (или ВОЗДУШНЫЙ ПЕРЕВОЗЧИК) – In the United States (US) the Air Carrier means the US citizen undertaking by any means, directly or indirectly, to provide air transportation. An enterprise that offers transportation service via air – airline. / Предприятие – авиалиния, которая предлагает услуги по воздушной транпортировке.

AIR CLEANER FINE TEST DUST = ТОНКОДИСПЕРСНАЯ ПЫЛЬ ДЛЯ ИСПЫТАНИЯ ВОЗДУХООЧИСТИТЕЛЯ – Air Cleaner Fine Test Dust (ACFTD) is a test contaminant used to assess both filters and the contaminant sensitivity of all types of tribological mechanisms.

AIR COMMERCE = ВОЗДУШНАЯ КОММЕРЦИЯ – Air Commerce means foreign air commerce, interstate air commerce, the transportation of mail by aircraft, the operation of aircraft within the limits of a Federal airway, or the operation of aircraft that directly affects, or may endanger safety in, foreign or interstate air commerce.

AIR CONDITIONING = КОНДИЦИОНИРОВАНИЕ ВОЗДУХА – Air Conditioning is:- (1) a chemical process for sealing short, fuzzy fibers into a yarn. Fabrics made from air-conditioned yarns are porous. Because they allow more air circulation, these fabrics are also cooler. (2) Control of temperature and/or humidity in work or living space.

AIR CONTAINER = АВИАЦИОННЫЙ КОНТЕЙНЕР – Air Container is any unit load device, primarily intended for transport by air, having an internal volume of 1 cubic meter or more, incorporating restraint provisions compatible with an aircraft restraint system, and an entirely flush base bottom to allow handling on rollerbed cargo handling systems. / Авиационные Контейнеры (АК) типоразмера 1АК, 2АК и 3АК. Загрузочный люк контейнера должен иметь быстродействующие запоры. Контейнеры должны иметь плоское основание, обеспечивающее перемещение его по транспортировочному оборудованию самолётов и наземных средств механизации. Они должны иметь боковые и торцовые (по полёту) пазы для швартовки на самолёте, а также угловые фитинги для подъёма, перемещения и крепления на наземных транспортных средствах. Крышка контейнера, крыша контейнера,

дверной проём на задней стенке, двустворчатая дверь, запорное устроуство и рукоятки дверей, карманы для сопроводительной документации. Универсальный Авиационный Контейнер (УАК). Многоцелевые Авиационные Контейнеры.

AIR COVERED YARN = ПОКРЫТАЯ ВОЗДУХОМ ПРЯЖА – Air-Covered Yarn is an elastic yarn with bare and twistless elastane (or other elastic) core covered by one or more relatively inelastic cover yarns mingled together by an air stream with the core entwined by the filaments with randomly distributed interlacing points.

AIRCRAFT = ВОЗДУШНОЕ СУДНО – Aircraft means any contrivance invented, used, or designed to navigate, or fly in, the air.

AIRCRAFT, CREW, MAINTENANCE, AND INSURANCE = ВОЗДУШНОЕ СУДНО, ЭКИПАЖ, СОДЕРЖАНИЕ, И СТРАХОВАНИЕ – Aircraft, crew, maintenance, and insurance (ACMI):- package (or wet) lease of an airplane. The package includes the airplane, crew, maintenance, and insurance but excludes fuel.

AIRCRAFT ENGINE = ДВИГАТЕЛЬ ВОЗДУШНОГО СУДНА – Aircraft Engine means an engine used, or intended to be used, to propel an aircraft, including a part, appurtenance, and accessory of the engine, except a propeller.

AIRCRAFT OWNERS AND PILOTS ASSOCIATION = АССОЦИАЦИЯ СОБСТВЕННИКОВ ВОЗДУШНЫХ СУДОВ И ПИЛОТОВ – The Aircraft Owners and Pilots Association (AOPA) is a not-for-profit individual membership association, effectively serves the interests and needs of its members as aircraft owners and pilots and establishes, maintains, and articulates positions of leadership to promote the economy, safety, utility, and popularity of flight in general aviation aircraft. The Aircraft Owners and Pilots Association, a not-for-profit organization dedicated to general aviation, was incorporated on 1939-May-15. From the start, AOPA has fought to keep general aviation fun, safe, and affordable. Growth in the early years was slow, but by mid-1995, membership in AOPA had reached about 335 000. Today's robust and growing AOPA is a far cry from the earliest years. As part of a deal struck with Ziff-Davis Publishing Company even before incorporation, AOPA would have a special section in each month's Popular Aviation, the predecessor of Flying magazine, to communicate with its members. Ziff-Davis drove a hard bargain, however, with a clause that threatened cancellation of the deal if AOPA membership didn't reach 2 500 in the first year. As AOPA looks back on its first 70 years, and ahead to the next century, AOPA remains at the heart of general aviation, representing a record 414 000 members (in 2011) – more than any other aviation organization in the world. We will continue to work at the international, federal, state, and local levels to advance general aviation's cause, and continue to help pilots stay safe and get the most out of their flying. Headquartered in Frederick, State of Maryland (MD), the United States. / Xxxxx Паблишинь Кампэни (Ziff-Davis Publishing Company).

AIRD = ASIAN INSTITUTE FOR RURAL DEVELOPMENT

AIR DRY = ЕСТЕСТВЕННАЯ СУШКА (или СУШКА НА ВОЗДУХЕ) – Air Dry is a process of drying or seasoning lumber naturally by exposure to air.

AIR ENTANGLED YARN = СПУТАННАЯ ВОЗДУХОМ ПРЯЖА – Air Entangled Yarn is made from continuous filaments of polyester that are entangled as they pass through a high pressure air jet. This yarn is then twisted, dyed, and wound on cones with lubricant. Number of knots per 1 m (for air-entangled yarn), min 100. Air Entangled Threads are made from continuous filaments of polyester that are entangled as they pass through a high pressure air jet. This yarn is then twisted, dyed, and wound on cones with lubricant. Air entangled threads are used in everything from quilting mattresses to sewing heavy denim jeans. A&E (short for the American & Efird LLC, a name of the US company) Brands include:- Magic®, Magic HP®, Signature®, and Signature® Plus. See also Compacted Yarn.

AIR ENTRAINMENT = ВОЗДУХОВОВЛЕЧЕНИЕ (или ЗАБОР ВОЗДУХА, или ЗАСАСЫВАНИЕ ВОЗДУХА, или ПОДСОС ВОЗДУХА) – Air Entrainment:- the incorporation of air in the form of bubbles as a dispersed phase in the bulk liquid. Air may be entrained in a liquid through mechanical means and/or by release of dissolved air due to a sudden change in environment. The presence of entrained air is usually readily apparent from the appearance of the liquid (i.e. bubbly, opaque, etc) while dissolved air can only be determined by analysts.

AIR FORMING = ФОРМИРОВАНИЕ ВОЗДУХОМ – Air Forming is a process in which air is used to separate and move fibers to fashion a web such as the Kroyer® process for short fibers, usually of wood pulp; or the Rando-Webber® process for staple-length fibers. / Xxxxx (Kroyer®); или Xxxxx (Rando-Webber®).

AIR FREIGHT = ВОЗДУШНЫЙ ФРАХТ (или ВОЗДУШНЫЙ ГРУЗ) – Air Freight (in air transport):- goods shipped that do not include mail.

AIR FREIGHT FORWARDER = ВОЗДУШНЫЙ ЭКСПЕДИТОР ГРУЗА (или АВИАЦИОННЫЙ ГРУЗОВОЙ ЭКСПЕДИТОР) – Air Freight Forwarder is a non-asset based firm that negotiates low shipping rates with airlines, then takes orders at a higher rate in order to make a profit using the airline's assets to move the product.

AIR–GAP SOLENOID = СОЛЕНОИД С ВОЗДУШНЫМ ЗАЗОРОМ – Air-Gap Solenoid is a solenoid that is sealed to prevent leakage of the liquid indo the plunger cavity. / Под Соленоидом, от Греческих слов Solen, означающее Трубка, и Eidos, означающее Вид, понимается катушка индуктивности обычно в виде намотанного на цилиндрическую поверхность изолированного проводника, по которому течёт электрический ток. В средней части внутренней полости соленоида, длина которого значительно больше диаметра, магнитное поле направлено параллельно оси соленоида и однородно, причём его напряжённость пропорциональна силе тока и (приближённо) числу витков. Внешнее магнитное поле соленоида подобно полю стержневого магнита. Соленоид с железным сердечником во внутренней полости представляет собой электромагнит.

AIR INTERMINGLED YARN = ПНЕВМОСОЕДИНЁННАЯ ПРЯЖА – Air Intermingled Yarn is now commonly used to prevent some problems in subsequent weaving and knitting processes. In recent years, with the development of various types of long fibers, and composite fibers thereof, air intermingled yarn is being used to produce irregular knitted fabrics, and air intermingling is now an established technique for processing yarn. Convention intermingling process have suffered from the following problems:- (i) conventional air intermingled yarn is interlaced yarn produced from filaments, and has very little bulk and a hard feel; and (ii) conventional air intermingled yarn does not have a natural irregular feel, and is not very comfortable to the wearer. '1/f fluctuation' is defined as a power spectrum, with a frequency component f, and proportional to 1/f, where k is approximately 1, and is defined as a power spectrum which is similar to the above. The 1/f fluctuation provide a comfortable feeling to humans; the reason being that the variations in the basic rhythm of the human body have a 1/f spectrum. From another perspective, the human body eventually tires of a constant stimulation from the same source, but conversely, the body feels uncomfortable if the stimulations were to change too suddenly; therefore a 1/f fluctuation is a fluctuation of the right proportion between these two extremes. In the air intermingling machine, intermingling is imparted to the yarn by signals having a 1/f fluctuation, wherein the degree of intermingling of the yarn vanes with a 1/f fluctuation provides a natural, comfortable feel. Also known as Interlaced Yarn. Intermingling is:- (i) Use of air jets to create turbulence to entangle the filaments of continuous filaments yarns, without forming loops, after extrusion. Provides dimensional stability and cohesion for further processing but is not of itself a texturing process. It is compatible with high-speed spin-drawing and high-speed

take-up. When compared with twisting processes, it also permits increased take-up package size. (ii) Combining two or more yarns via an intermingling jet. Can be used to get special effect yarns, i.e. mixing dye variants to get heather effects upon subsequent dyeing. / Экструзия или Выдавливание (Extrusion).

AIR JET LOOM = ВОЗДУХОСТРУЙНЫЙ ТКАЦКИЙ СТАНОК (или ПНЕВМОСТРУЙНЫЙ ТКАЦКИЙ СТАНОК, или ПНЕВМАТИЧЕСКИЙ ТКАЦКИЙ СТАНОК) – Air Jet Loom:- weft insertion by means of air jet has made a major breakthrough in the early 1970s and its importance is increasing further because of its ability to weave a wide range of fabrics at a very high speed weft insertion rate of about 2 000 mpm. The first attempt to use a compressed air steam instead of shuttle is made by Brooks in 1914. Scope of Air Jet Loom:- (i) To insert the weft threads here used compressed air; (ii) Not suitable for the coarser count or heavier fabric; (iii) The timing of jet activity should be controlled in such a way that the main nozzle is supplied with compressed air from the beginning of the weft insertion phase and the relay nozzles also receive compressed air; and (iv) High maintenances is needed. Features of Air Jet Loom:- (1) Air jet weaving machine is high speed machine having good quality; (2) For instance on a weaving machine having a speed of 600 rpm the weaving cycle is 100 m/s; (3) Cam control valves have the advantages of high speed precision of action whilst the electrically controlled solenoid valves permit easy setting; and (4) Finer count of yarn is used as the weft thread to produce fency type of fabric. Advantages of Air Jet Loom Over Conventional Loom:- (i) The conventional loom requires shuttle or shuttle like substance to insert the weft yarn, comparatively in air jet loom there is no need to any kind of shuttle instead of shuttle here the compressed air force is used; (ii) In the conventional loom the pick insertion rate is very low compare to the air jet loom; (iii) The weft stop motion is machine controlled over the differ from conventional loom; (iv) In conventional loom the mechanical or hand shuttle reach the weft thread to the fell of the cloth, but in air jet through air force this is done, here uniform let up, take up, uniform picking, uniform bet up is possible; and (v) It has the automatic weft repair device. Disadvantages:- (i) Short or buckle pick; (ii) Loose pick; (iii) Snarling; (iv) Excess dynamic pressure; (v) Weft stop problem; (vi) Tip problem; (vii) Timing of shed may not be proper; (viii) Too high or too low main nozzle pressure; and (ix) Left side warp yarn is loose. Suggestions:- Air jet loom has some disadvantages like as floating the yarn into wrong direction. To get the better result these main disadvantages must be reduced. See also Water Jet Loom. Air Jet Loom is a loom in which the weft yarn is propelled through the shed by means of a jet of air. A shuttleless loom capable of very high speeds that uses an air jet to propel the filling yarn through the shed. A loom using a jet of air to carry the yarn through the shed. In Air Jet Weaving Machines weft is accelerated and taken through the shed by the flow impedance between the flowing air and the weft. Air jet weaving machines belong to the set of intermittent-operation weaving machines. The energy resulting from air pressure directed from the central air tank to the weaving machine changes into kinetic energy in the nozzle, which accelerates and delivers the weft in the air channels differently shaped by machine types. The air leaving the nozzle mixes with the still air, it disperses, and the speed of the axis of the flow drops quickly as it moves away from the nozzle; therefore, in order to reach bigger reed width, the air speed must be kept up in the line of the weft course. Three different systems have mainly been used on commercial air jet weaving machines:- (i) single nozzle with confusor guides; (ii) multiple nozzles with guides; and (iii) multiple (relay) nozzles with tunnel reed. Svaty (former Czechoslovakia) patented the confusor drop wires to guide the air in 1949, which resulted in a wide spread of air jet weaving machines marked P. In 1979 the Nissan company started to use plastic confusor air guides closing at the top. Since the 1980s weaving machines with tunnel reeds and relay nozzles have been the focus of developments. On type P air jet weaving machines, the local transonics speed of the air exiting the nozzle speeds up the weft to v = 30–40 ms^{-1}. By maintaining the velocity of the air jet along the reed width, high weft insertion speeds may be reached. Toyota Industries develops and manufacturers air jet looms, which insert the weft yarn using air. We provide our customers all over the world with state-of-the-art weaving machinery that excels in speedy and reliable performance. The application of the Air Jet Loom is widespread in the textile industry because of its high productivity, convenient controllability, high filling insertion rate, low noise and low vibration levels. Air stream in confusor guides can be classified into two types. A weft yarn ejected with high speed air flow is given the drag force caused by friction between the weft yarn and the air flow. Air Jet Loom is a type of loom without shuttles. Method of inserting weft yarn:- a jet of air is used to insert the weft yarn. Characteristics:- High speed operation is possible. At present this is the most popular type of loom and its functions are excellent overall. / Бесчелночный ткацкий станок, приспособленный к очень высоким скоростям, который использует . Пневматические Ткацкие Станки:- уточная нить прокладывается в зеве струёй воздуха из главного сопла и эстафетных сопел, вмонтированных в конструкцию профильного бёрда или в отдельный элемент – конфузор. Батан как таковой отсутствует, бёрдо крепится на магистральную ёмкость распределения сжатого воздуха для эстафетных сопел. Главного вала нет, различные элементы станка приводятся в работу сервомоторами через контролируемые центральной ЭВМ частотные инверторы. Основные производители в мире (по убыванию доли рынка):- Тойота Индэстриз (Toyota Industries; Япония), Цудакома (Tsudakoma; Япония), Пиканоль Эн.Вэй. (Picanol NV; Бельгия), Донйе Ге.эм.бе.Ха. (Dornier GmbH; Германия), Проматэк (Promatech; Италия).

AIR JET METHOD = ВОЗДУХОСТРУЙНЫЙ МЕТОД (или ПНЕВМАТИЧЕСКИЙ МЕТОД, или ПНЕВМОСТРУЙНЫЙ МЕТОД, или МЕТОД НАГНЕТАНИЯ ВОЗДУХОМ) – Air Jet Method:- in this method of texturing, yarn is led through the turbulent region of an air jet at a rate faster than it is drawn off on the far side of the jet. In the jet, the yarn structure is opened, loops are formed, and the structure is closed again. Some loops are locked inside and others are locked on the surface of the yarn. An example of this method is the Taslan process. See also Core-Bulked Yarn, Entangled Yarn, and Textured Yarn.

AIR JET SPINNING = ВОЗДУХОСТРУЙНОЕ ПРЯДЕНИЕ (или ПНЕВМОСТРУЙНОЕ ПРЯДЕНИЕ, или ПНЕВМАТИЧЕСКОЕ ПРЯДЕНИЕ – Air Jet Spinning is a spinning system in which yarn is made by wrapping fibers around a core stream of fibers with compressed air. In this process, the fibers are drafted to appropriate sliver size, then fed to the air jet chambers where they are twisted, first in one direction, then in the reverse direction in a second chamber. They are stabilized after each twisting operation.

AIR JET TEXTURING = ВОЗДУХОСТРУЙНОЕ ТЕКСТУРИРОВАНИЕ (или ПНЕВМОСТРУЙНОЕ ТЕКСТУРИРОВАНИЕ, или ПНЕВМАТИЧЕСКОЕ ТЕКСТУРИРОВАНИЕ) – Air Jet Texturing is used with a single type of yarn or with a blend of filament yarns. In the latter case fancy yarn mixtures are obtained. This method of texturing is carried out by feeding a wet yarn or a dry yarn plus a small amount of water into a high-speed jet of air. Yarns textured in such a process contain a large number of very fine filaments, however, increasing the probability of entanglement. See also Texturing. / филаментная (комплексная) пряжа (filament yarn).

AIR–LAID NONWOVENS = НЕТКАНЫЕ МАТЕРИАЛЫ, СБИТЫЕ ВОЗДУХОМ – Air-Laid Nonwovens are the fabrics made by an air-forming process. The fibers are distributed by air currents to give a random orientation within the web and a fabric with isotropic properties.

AIR LINE PILOTS ASSOCIATION, INT'L = АССОЦИАЦИЯ ПИЛОТОВ АВИАЛИНИЙ, ИНТ'Л – The Air Line Pilots Association, International (ALPA) is the largest airline pilot union in the world and represents nearly 53 000 pilots at 38 US and Canadian airlines. Founded in 1931, the Association is chartered by the AFL-CIO and the Canadian Labour Congress. Known internationally as US-ALPA, it is a member of the International Federation of Air Line Pilot Associations. ALPA provides three critical services to its members:- (i) Airline Safety and Security:- ALPA's founders chose 'Schedule with Safety' as their motto, and that theme remains

central to the union's work today. Over its history, ALPA has been a part of nearly every significant safety improvement in the airline industry. The Association has helped to make airline travel the safest mode of transportation in human history. More than 600 working airline pilots volunteer to serve on the local and national safety and security committees that help guide the Association's work. The union's aeronautics engineers and safety and security experts provide unparalleled independent analysis on emerging airline safety and security issues, as well as federal and industrial policies. ALPA is routinely granted 'interested party' status in most major airline accidents, which means that ALPA accident investigators assist the National Transportation Safety Board and the Transportation Safety Board of Canada during on-site investigations and participate in associated public hearings. The union's commitment to unbiased, fact-based evaluation of airline safety and security issues has won the Association an unrivaled reputation for excellence throughout the airline industry. (ii) Representation:- over the decades, ALPA pilot groups have negotiated scores of contracts with hundreds of airlines. Today, ALPA staff offers its members the finest financial analysis available, in-depth knowledge of the Railway Labor Act (the legislation that governs airline pilot contracts), and the legal experience to defend pilot contracts. By leveraging the combined resources of all union members, ALPA is able to bring unmatched expertise to bear on matters affecting its members' salary, benefits, and working conditions. (iii) Advocacy:- ALPA's staff and pilot volunteers consistently represent pilots' views to all airline industry decision-makers, including Congress, Parliament, the White House, and federal agencies. In Washington, DC and Ottawa, ONT, ALPA lobbyists successfully promote legislation that helps pilots and work to stop policies that harm pilot interests. National officers and pilot representatives are routinely called on to give their expert opinion before legislative committees and other influential governmental bodies. At all levels of ALPA, pilots make decisions through the democratic process. All decisions start with our pilot groups. Each pilot group consists of all the pilots at a given airline. Pilot groups exercise considerable autonomy in governing their own internal affairs, such as negotiating contracts, enforcing those contracts, and discussing issues of concern with their companies. Members of each ALPA carrier are represented by their Local Council Status Representatives, who make up each pilot group's Master Executive Council (MEC). Each pilot group consists of one or more Local Councils, which generally correspond with the pilots' major domiciles. These Local Council Status Representatives sit on ALPA's Board of Directors, the Association's highest governing body. The Local Council Representatives elect the officers of the MEC, the chairmen of which comprise ALPA's Executive Board. ALPA's Executive Council, which bears fiduciary responsibility for the Association, includes both elected Executive Vice Presidents and the National Officers. ALPA's National Officers, the President, the First-Vice President, the Vice-President-Administration/Secretary, the Vice-President-Finance/Treasurer, guide the Association's work from its Washington, DC headquarters and nearby Herndon, VA offices. Headquartered in Washington, DC, the United States.

AIRMAN = АВИАТОР – Airman means an individual:- (i) in command, or as pilot, mechanic, or member of the crew, who navigates aircraft when under way; (ii) except to the extent the Administrator of the Federal Aviation Administration may provide otherwise for individuals employed outside the United States, who is directly in charge of inspecting, maintaining, overhauling, or repairing aircraft, aircraft engines, propellers, or appliances; or (iii) who serves as an aircraft dispatcher or air traffic control-tower operator.

AIR MEDICAL ESCORT SERVICE = СЛУЖБА АВИАЦИОННОГО МЕДИЦИНСКОГО СОПРОВОЖДЕНИЯ – Air Escort Medical Service Patients are transported on a Commercial Airlines with a critically trained medical staff. These patients must have Commercial Airlines approved medical staff for the medical escort during the trip. All Air Ambulance Networks air staff are licensed and approved by the Airlines. Air Escort Medical Service is available Worldwide for all International and Domestic Air carriers Air Ambulance Network provides a Critical Care Registered Nurse (CCRN) or Critical Care Paramedic (CCEMTP) that will fly with the air escort in First or Business Class on a commercial airliner, providing comfort and room for medical care. Air Ambulance Network has been providing Air Medical Escort Services for over 38 years and is approved by all Commercial Airlines. Providing Basic Life Support (BLS) and some limited Advanced Life Support (ALS) to include monitoring, oxygen, suction, hygiene care, administration of medications and some advanced Air Ambulance procedures on-board during the flight.

AIR MEDICAL TRANSPORT = АВИАЦИОННЫЙ МЕДИЦИНСКИЙ ТРАНСПОРТ (или ВОЗДУШНЫЙ МЕДИЦИНСКИЙ ТРАНСПОРТ) – An Air Ambulance or Air Medical Transport describes the type of transport a company provides. Air medical transport companies specialize in providing air ambulance service. They must be specifically licensed to provide air medical transports. Air medical transport companies use an array of business size aircraft in providing air medical transports, such as twin engine, turbo prop and jet aircraft. For most long distance medical transports, a jet is used. Typically, the Lear Jet is the workhorse of air medical transport companies. Air Ambulance Network has been providing air medical transport services since 1971. Air Ambulance Network is one of the first air medical transport providers and has led the industry ever since it inception. Today, Air Ambulance Network is a leader in the air medical transport industry.

AIRMET INFORMATION = AIRMAN'S METEOROLOGICAL INFORMATION

AIR MOTOR = АВИАМОТОР (или ВОЗДУШНЫЙ МОТОР, или АВИАДВИГАТЕЛЬ, или АВИАЦИОННЫЙ ДВИГАТЕЛЬ) – Air Motor is a device which converts compressed gas into mechanical force and motion. It usually provides rotary mechanical motion. / Авиационный Двигатель, тепловой двигатель для приведения в движение летательных аппаратов (самолётов, вертолётов, дирижаблей и других). К авиационным двигателям предъявляются весьма высокие требования:- максимальная мощность (или тяга) в агрегате при минимальной массе, относимой к единице мощности (тяги), и минимальных габаритных размерах (особенно площади поперечного сечения, от которой зависит лобовое сопротивление); минимальный расход горючего и смазки на единицу мощности (тяги); надёжность, длительность и простота эксплуатации при дешевизне производства. Процесс развития авиационных двигателей проходил несколько стадий. Первым авиационным двигателем был паровой двигатель на самолёте Русского исследователя и изобретателя, морского офицера Александра Фёдоровича Можайского (1825–1890) (в 1885). Последующие авиационные двигатели во всех странах конструировались на основе поршневого двигателя внутреннего сгорания. Основными факторами, обусловившими развитие авиационных двигателей, были необходимость увеличения скорости и грузоподъёмности самолёта, требования к которым росли довольно быстро. В качестве базового был выбран бензиновый двигатель как наиболее лёгкий. Его совершенствование велось, с одной стороны, путём всемерного облегчения всех деталей за счёт применения высокопрочных материалов и форсирования рабочего процесса (для чего была разработана конструкция нагнетателя для наддува двигателя), а с другой стороны, повышением коэффициента полезного действия (кпд) воздушного винта (для чего к двигателю, частота вращения которого всё увеличивалась, присоединяли редуктор, снижавший частоту вращения винта для обеспечения максимального кпд). К 1940-м поршневые авиационные двигатели достигли предела своих возможностей на пути дальнейшего повышения скорости самолёта встал звуковой барьер, для преодоления которого потребовалось резкое увеличение мощности авиационного двигателя. Такой скачок стал возможным в результате перехода к газовой турбине и реактивному двигателю. Различные типы и классы самолётов требуют различных авиационных двигателей как по мощности, так и по принципу создания тяги. Поэтому существующие авиационные двигатели подразделяются на (i) винтовые, создаюшие тягу вращением воздушного винта, (ii) реактивные, в которых тяга возникает в результате истечения с большой скоростью рабочих газов из реактивного сопла. (iii) Комбинированные – турбовинтовые двигатели (ТВД) – основная тяга создаётся воздушным винтом, а довольно значительная

дополнительная тяга (8–12%) – за счёт истечения продуктов сгорания. Поршневые авиационные двигатели лучших типов, достигшие высокой степени совершенства, обеспечивали скорость до 750 километров в час (км/ч). Более высоких скоростей они не могли создать вследствие большой удельной массы (массы, приходящейся на единицу мощности) и необходимости в воздушном винте, кпд которого уменьшается с увеличением скорости полёта. Поршневые авиационные двигатели устанавливаются на самолётах с невысокими скоростями полёта, соответственно 0.2–0.5 Маха (М) (где М – М-Число или Число Маха; названо по имени Австрийского физика Эрнста Вальдфрида Ёзэфа Венцэля Маха (Ernst Waldfried Josef Wenzel Mach; 1838–1916)), то есть 200–500 км/ч, а также на вертолётах, турбовинтовые авиационные двигатели – на самолётах при скоростях полёта соответствующих 0.5–0.8 М, то есть 500–800 км/ч и на вертолётах. Первые турбореактивные двигатели (ТРД), появившиеся в конце Великой Отечественной Войны (1941-Июнь-22–1945-Май-09), позволили увеличить скорость до 960 км/ч. Удельная масса поршневых авиационных двигателей составляет 540–680 граммов на килоВатт г/кВт (400–500 граммов на метрическую лошадиную силу г/л.с.); турбовинтовых авиационных двигателей 140–400 г/кВт (100–300 г/л.с.); если отнести массу не к единице мощности, а к единице тяги, создаваемой воздушным винтом, то удельная масса будет меняться при изменении скорости полёта вследствие изменения кпд винта, в то время как удельная масса турбореактивного двигателя в пределах скоростей до 750 км/ч практически остаётся постоянной. Это и делает турбореактивный авиационный двигатель наиболее выгодным при больших скоростях полёта. В 1965–67 появились весьма лёгкие турбореактивные авиационные двигатели для самолётов вертикального взлёта и посадки (СВВП). Их удельная масса находится в пределах 6–7 г/н. На основе ТРД и ТВД разработаны так называемые Двухконтурные Турбореактивные Двигатели (ДТРД). Их особенностью является создание двух реактивных потоков:- одного внутреннего, или центрального, из высокотемпературных продуктов сгорания, поступающих в реактивное сопло из газовой турбины, и второго, концентрически окружающего первый и состоящего из воздуха, который прогоняется компрессором второго контура. Двухконтурные ТРД применяются на самолётах с дозвуковыми скоростями; благодаря малому расходу топлива они могут успешно конкурировать как с обычными ТРД, так и с ТВД. Тяга ТРД при сверхзвуковых скоростях полёта возрастает. Удельную массу турбореактивных авиационных двигателей за период 1939–67 удалось существенно снизить. Схемы турбореактивных авиационных двигателей для дозвуковых и сверхзвуковых самолётов различны. При сверхзвуковых скоростях полёта температура воздуха и газа в турбореактивных авиационных двигателях весьма велика. Воздухозаборник, обеспечивающий наибольшее использование скоростного напора воздуха с минимальными потерями, необходимо выполнять с регулируемыми размерами и изменяемой формой. Для увеличения тяги авиационного двигателя применяют Форсажную Камеру. При этом реактивное сопло выполняют также с регулируемыми размерами и формой. Авиационный двигатель представляет собой автоматическую систему, которая позволяет освободить лётчика от управления двигателем в полёте. Автоматически поддерживаются на заданном уровне давление топлива, температура газов перед турбиной и другие параметры, независимо от высоты полёта. Дальнейшее развитие авиационных двигателей предусматривает следующие основные направления, на которых концентрируются главные усилия конструкторов в разных странах, разрабатывающих авиационные двигатели:- обеспечение высоких скоростей и больших высот полёта, а также непрерывное повышение грузоподъёмности самолёта, что требует создания авиационных двигателей, развивающих большую тягу с наименьшим расходом топлива, с малой удельной массой и большим ресурсом работы (то есть длительностью периода работы двигателя между ремонтами, выражаемого обычно в часах). Для этого приходится повышать температуру газа перед турбиной, что ведёт к применению охлаждаемых сопловых и рабочих лопаток. С другой стороны, стремятся снизить расход энергии во всех элементах авиационного двигателя, для чего требуется повышение коэффициента полезного действия (КПД) компрессоров, турбин, форсажных камер и тому подобного. Повысить температуру газов можно применением жаропрочных материалов (ниобий, молибден) для лопаток турбины и других деталей, соприкасающихся с высокотемпературными газами. Снижения удельной массы можно достигнуть использованием материалов с низкой плотностью (титановые, бериллиевые сплавы). На крупные пассажирские и транспортные самолёты целесообразно устанавливать двухконтурные авиационные двигатели с форсажной камерой, обеспечивающие большой диапазон скоростей полёта, и двухконтурные авиационные двигатели со степенью двухконтурности (то есть соотношением температуры первого и второго контуров) 6–8 для получения больших значений тяги при высокой экономичности.

AIR NAVIGATION FACILITY = СИСТЕМА ВОЗДУШНОЙ (или АВИАЦИОННОЙ) НАВИГАЦИИ – Air Navigation Facility means a facility used, available for use, or designed for use, in aid of air navigation, including:- (i) a landing area; (ii) a light; (iii) apparatus or equipment for distributing weather information, signaling, radio-directional finding, or radio or other electromagnetic communication; and (iv) another structure or mechanism for guiding or controlling flight in the air or the landing and takeoff of aircraft.

AIRNET = AIRPORT NETWORK SIMULATION MODEL

AIR/OIL SYSTEMS = СИСТЕМЫ ВОЗДУХ/МАСЛО – Air/Oil Systems:- a lubrication system in which small measured quantities of oil are introduced into an air/oil mixing device which is connected to a lube line that terminates at a bearing, or other lubrication point. The air velocity transports the oil along the interior walls of the lube line to the point of application. These systems provide positive air pressure within the bearing housing to prevent the ingress of contaminants, provide cooling air flow to the bearing, and perform the lubrication function with a continuous flow of minute amounts of oil. / подшипник .

AIRON = AFRICAN IRRIGATED RICE OBSERVATIONAL NURSERY

AIR PERMEABILITY = ВОЗДУХОПРОНИЦАЕМОСТЬ – Air Permeability is the porosity or the ease with which air passes through material. Air permeability determines such factors as the wind resistance of sailcloth, the air resistance of parachute cloth, and the efficacy of various types of air filters. It also influences the warmth or coolness of a fabric. Air Permeability is the porosity of a fabric as estimated by the ease with which air passes through it. Air permeability measures the warmth of blankets, the air resistance of parachute cloth, the wind resistance of sailcloth, etc as measured on standard testing equipment. / пористость или рыхлость (porosity). Воздухопроницаемость – способность материалов и конструкций пропускать воздух под влиянием перепада давления воздуха. Во многих областях материального производства воздухопроницаемость материала является одним из важнейших параметров, так как определяет свойства конечного продукта (например, при производстве одежды, обуви, упаковочных и строительных материалов). Воздухопроницаемость – важнейшая характеристика гигиеничности материалов для одежды. Она имеет важное значение для регулирования газового состава, влажности и температуры пододежного пространства. Воздухопроницаемость в значительной мере определяет области использования различных текстильных материалов. Например, ткани для летней одежды, особенно из химических волокон, имеющие низкую гигроскопичность, должны обладать более высокой воздухопроницаемостью по сравнению с материалами, используемыми для изготовления демисезонных и зимних изделий. Для зимней одежды требуются ткани с малой воздухопроницаемостью. Воздухопроницаемость текстильных материалов зависит от пористости, количества и величины открытых пор, толщины тканей и других факторов. Для трикотажных полотен характерна большая воздухопроницаемость, так как петельное строение трикотажа создаёт большее количество сквозных пор. Но трикотажные полотна, ткани с начёсом и холстопрошивные нетканые полотна, где сквозные поры не велики или практически отсутствуют, обладают незначительной

воздухопроницаемостью, которая зависит от толщины и общей пористости этих материалов. Единицы измерения воздухопроницаемости – $м^3$ /$м^2$·ч (кубический метр на квадратный метр в час) и $дм^3$/$м^2$·с (кубический дециметр на квадратный метр в секунду).

AIRPLANE FABRIC = САМОЛЁТНАЯ ТКАНЬ (или ТКАНЬ ДЛЯ ВОЗДУШНЫХ СУДОВ) – Airplane Fabric is a plain, tightly woven, water-repellent fabric traditionally made of mercerized cotton. During World War I, the fabric was treated with a cellulose acetate dope and used to cover the wings, tail, and fuselage of airplanes. Today, similar fabrics made from nylon or polyester/cotton blends are used in rainwear and sportswear. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Найлан (Nylon).

AIRPORT = АЭРОПОРТ (или ВОЗДУШНЫЙ ПОРТ) – Airport means a landing area used regularly by aircraft for receiving or discharging passengers or cargo. / Под Аэропортом или Воздушным Портом понимается транспортное предприятие, состоящее из аэровокзала, аэродрома и другого и обеспечивающее регулярные перевозки пассажиров, грузов, почты средствами авиации. Наиболее крупные аэропорты имеют несколько аэровокзалов, например, аэропорты Орли (Париж, Франция) или Шереметьево (Москва, Россия) и другие.

AIRPSS = AFRICAN IRRIGATED RICE PRELIMINARY SCREENING SET

AIR–SUPPORTED ROOF = СВОД (или КРЫША, или ВЕРХ), ПОДДЕРЖИВАЕМЫЙ ВОЗДУХОМ – Air-Supported Roof is a fabric-based roofing system that is supported and held in place by air pressure.

AIR TAXI = ВОЗДУШНОЕ ТАКСИ (или АВИА ТАКСИ) – Air Taxi is an exempt for-hire air carrier that will fly anywhere on demand; air taxis are restricted to a maximum payload and passenger capacity per plane. / нанимаемый воздушный перевозчик, .

AIR TEXTURED YARN = ТЕКСТУРИРОВАННАЯ ВОЗДУХОМ ПРЯЖА – Air Textured Yarn is a textured filament yarn obtained by overfeeding filament yarn into a turbulent stream of air. / филаментная (комплексная) пряжа (filament yarn).

AIR TRAFFIC CONTROL ASSOCIATION = АССОЦИАЦИЯ ПО КОНТРОЛЮ ВОЗДУШНОГО ДВИЖЕНИЯ – The Air Traffic Control Association (ATCA):- established in Washington, DC, the United States in 1956 by a group of air traffic controllers, the Air Traffic Control Association has been from the outset dedicated to progress in the science of air traffic control and the preservation of a safe flight environment. It provides a forum in which those concerned can address the myriad issues inherent to the development of viable air traffic control systems and aviation infrastructures, and the ever increasing demands on the global navigable airspace environment. Those in the aviation community; the providers of air traffic control, system architects, manufacturers, suppliers, system operators and users join together in ATCA to share their collective experience and knowledge, and efforts in pursuit of common goals. ATCA is unique in representing the broad spectrum of civil-military cooperation typical of global flying activities. Its Annual Technical Meetings and Exhibits feature North America's largest and most diverse display of aviation related technology. These events are attended by thousands of civilian and military members and representatives from around the world. ATCA also sponsors Technical Conferences and Symposia annually in Europe, the Pacific Rim and Latin America. ATCA's Civil Military Air Traffic Management Summit known as CMAC™ attracts Civil and Military Aviation leaders from around the world. Beginning in 2009 this will be held annually. The ATCA publications, The Journal of Air Traffic Control, Conference Technical 'Proceedings', the Air Traffic Control Quarterly and the ATCA Bulletin, are prominent sources for the latest news and achievements in the field. ATCA is a non-profit, non-government, professional organization. Membership is open to all who share a common interest in promoting and encouraging the advancement of aviation and air traffic control. The governing body is composed of representatives from all segments of the aviation community. The Air Traffic Control Association (ATCA):- established in Washington, DC in 1956 by a group of air traffic controllers, the Air Traffic Control Association has been from the outset dedicated to progress in the science of air traffic control and the preservation of a safe flight environment. It provides a forum where those concerned can address the issues inherent to the development of viable air traffic control systems and aviation infrastructures, and the ever increasing demands on the global navigable airspace environment. Those in the aviation community; the providers of air traffic control, system architects, manufacturers, suppliers, system operators and users join together in ATCA to share their collective experience and knowledge, and efforts in pursuit of common goals. Headquartered in Alexandria, State of Virginia, the United States. ATCA Objectives:- as an independent, non-profit organization, ATCA is dedicated to the following objectives:- (i) promoting, maintaining and enhancing the stature and well being of the Air Traffic Control profession and the aviation community; and (ii) developing and disseminating knowledge of the control of air traffic in all its phases and applications. Encouraging intelligent and honorable cooperation between all persons, parties and agencies interested in and concerned with the promotion and advancement of aviation and, in particular, the field of air traffic control. ATCA Goals:- (i) to serve as the forum for discussing issues and exchanging ideas on all matters pertaining to global airspace systems and flight safety; (ii) to serve as a catalyst to bring together those who use, develop, operate, maintain, supervise and manage the airspace systems of the world; (iii) to continue a public relations effort through participation in and with the media and aviation related associations telling the story of the evolution of air traffic control systems and ATC to the community, its classrooms, civic organizations, airports, etc; (iv) to increase the level of operational and technical expertise within the Association through continued membership recruitment efforts; (v) to promote the development and world-wide deployment of modern air traffic control technology and services; (vi) to support R&D (research and development) activities leading to continued progress in the safety, efficiency and capacity of the aviation environment; (vii) to focus attention on the needs of users of air traffic control systems and to ensure these needs are fully understood, considered and accommodated in future air traffic control systems development; (viii) to attract, encourage and help sponsor the development of young people to enter the air traffic control profession; and (ix) to respect the professional dignity of all persons and organizations interested in air traffic control, and to actively foster the involvement of women, minorities, the handicapped and disadvantaged in ATCA and aviation in general.

AIR TRAFFIC CONTROL SYSTEM = СИСТЕМА КОНТРОЛЯ ВОЗДУШНОГО ДВИЖЕНИЯ – Air Traffic Control System means the combination of elements used to safely and efficiently monitor, direct, control, and guide aircraft in the United States and United States-assigned airspace, including:- (i) allocated electromagnetic spectrum and physical, real, personal, and intellectual property assets making up facilities, equipment, and systems employed to detect, track, and guide aircraft movement; (ii) laws, regulations, orders, directives, agreements, and licenses; (iii) published procedures that explain required actions, activities, and techniques used to ensure adequate aircraft separation; and (iv) trained personnel with specific technical capabilities to satisfy the operational, engineering, management, and planning requirements for air traffic control.

AIR TRANSPORTATION = ВОЗДУШНАЯ ТРАНСПОРТИРОВКА (или ВОЗДУШНАЯ ПЕРЕВОЗКА) – Air Transportation means foreign air transportation, interstate air transportation, or the transportation of mail by aircraft.

AIR WAYBILL = ГРУЗОВАЯ АВИАНАКЛАДНАЯ (или АВИАЦИОННАЯ НАКЛАДНАЯ) – Air Waybill (AWB) is the document which covers transport by air. It is issued by the carrier, whether an airline or a freight forwarder, as a non-negotiable document serving as a receipt to the consignor for the goods, and containing the conditions of transport. It also shows the details of the consignee so that they can be contacted on arrival of the goods. (i) HAWB is a House AWB issued by a freight forwarder acting as a carrier. (ii) MAWB is the

term used for the AWB issued on airline's stationery to a freight forwarder for all of the goods covered by one or more House AWBs on the one flight going from one loading airport to one destination airport. The Air Waybill like the sea way bill consists of three original parts. It allows airline and customs authorities to keep a record of the goods being shipped as well as proving evidence of a contractual agreement between the shipper and the carrier. It is not a document of title and is non-negotiable. An Air Waybill (AWB) is a contract between the shipper and airline that states the terms and conditions of transportation. There are two types of air waybills used for the international transportation of air cargo:- (i) the Airline Air Waybill, with preprinted issuing carrier identification; and (ii) the Neutral Air Waybill without preprinted identification of the issuing carrier in any form and used by other bodies than air carriers. The IATA Cargo Services Conference (CSC) is responsible for the development and maintenance of Air Waybill specifications and standards:- (i) resolution 600a provides the governing rules on the use of air waybill, technical specifications, completion instructions, distribution of copies and applicable conditions when transmitting air waybill information electronically; and (ii) resolutions 600b and 600b(II) provide the guidelines for the Conditions of Contract and notices included in the air waybill. Air Waybill or Airwaybill or AWB is a document made out by or on behalf of the carrier confirming receipt of goods by carrier and evidencing contract between shipper and carrier for the carriage of goods. Air Waybill is a bill of lading which covers both domestic and international flights transporting goods to a specified destination. Technically, it is a nonnegotiable instrument of air transport which serves as a receipt for the shipper, indicating that the carrier has accepted the goods listed therein and obligates itself to carry the consignment to the airport of destination according to specified conditions. Air Waybill is a consignment note covering the carriage of goods by airfreight. / порядки и условия транспортировки. для международной перевозки авиационных грузов:- (i) . Авианакладная – документ, выписываемый грузоотправителем или его агентом экспедитором при сдаче груза и подтверждающий наличие договора между грузоотправителем и перевозчиком о перевозке грузов по авиалиниям перевозчика. Авианакладная заполняется в трёх оригиналах, имеющих равную силу; первый экземпляр носит пометку 'для перевозчика'; второй экземпляр носит пометку 'для получателя' и следует с товаром; третий экземпляр подписывается перевозчиком и возвращается грузоотправителю после того, как товар принят. Авианакладная не является ни товарораспорядительным, ни передаточным документом. Она выполняет лишь функцию доказательства заключения договора перевозки, принятия товаров к перевозке и условий перевозки. Груз выдаётся указанному в ней получателю. Авиагрузовая Накладная:- договор воздушной перевозки груза. Заполняется отправителем и вручается перевозчику одновременно с передачей груза к перевозке. Составляется в трёх оригинальных экземплярах. Первый подписывается отправителем и остаётся у перевозчика, второй – отправителем и перевозчиком и следует с грузом до получателя, третий подписывается перевозчиком и следует с грузом к получателю.

AIS = AUTOMATED INFORMATION SYSTEM

AIS = AUTOMATIC IDENTIFICATION SYSTEM

AIT = ALLIANCE INTERNATIONALE DE TOURISME

AIT = ASIAN INSTITUTE OF TECHNOLOGY

AIT = AUTOMATED INFORMATION TRANSFER

AIV = AVIATION IMPACT VARIABLE

AJOUR = АЖУРНОЕ – Ajour:- an openwork design for lace or embroidery with the pattern scattered.

AJOUR LACE = АЖУРНОЕ КРУЖЕВО – Ajour Lace is an open lace design with the pattern scattered on the ground.

AKA = ALSO KNOWN AS

AKHA SPINDLE = АКХА ВЕРЕТЕНО – Akha Spindle is a spindle from Southeast Asia. The Akha spindle has a cane shaft about 8–10 inches long with a hook carved on one end. Centered on the shaft is a whorl 2–2.5 inches in diameter. Akha Spindle is a lightweight, supported spindle. The Akha tribes are a native men and women from the hills of northern Thailand. They are known for their colorful headsets and brightly decorated hand-woven cloth. Traditionally the ladies of the tribes spin nearby cotton with handmade spindles, dye the thread into bright colors, and weave a tightly threaded cloth on hand looms. Akha women do a substantial quantity of the work in the village, including tending the fields. Commonly the fields are about a twenty minute walk from the village, and they use their time well, spinning yarn as they go. The traditional Akha spindle is made of nearby hardwood which is cured underground for months just before forming. This spindle has a long shaft, and a tiny round whorl placed in the center of the shaft. It is a extremely lightweight spindle, regularly under a half ounce. This spindle can spin rather fast and is ideal for cotton which has a short thin fiber that would break under the weight of a heavier spindle. The Akha spindle can be spun with tremendous speeds both for the reason that of its light weight, and because of the balance designed by having the whorl placed in the middle of the spindle. The Akha females are happily sassy and full of life. They wear brief skirts which make them look superb and creates a great open spot on their thigh which they use to toss the spindle in a provocative manner as they walk. A nice small ball of yarn can be spun each day. Following coming house from the fields they toss their new ball into a basket to be woven into yarn throughout the winter. The center whorl drop spindles are the rarest types of drop spindle and are usually region specific spindles. For instance the Akha Spindle which is used in Tibet. There is also the Turkish drop spindle as well as the Navajo drop spindle.

AKTIEBOLAG = АКЦИЭБУЛЯГЬ (или АКЦИОНЕРНОЕ ОБЩЕСТВО) – Aktiebolag (AB) is the Swedish term for Limited Company or Corporation. When used in company names, it is abbreviated AB (in Sweden), Ab (in Finland), or A/B (for some older companies), roughly equivalent to the abbreviations Ltd and PLC. The State authority responsible for registration of aktiebolag in Sweden is called Bolagsverket (the Swedish Companies Registration Office). In Sweden, all Aktiebolag are divided into two categories:- (i) Private Limited Companies and (ii) Public Limited Companies. The name of a private limited company may not contain the word Publikt (Public) and the name of a public limited company may not contain the word Privat or Pvt (Private). A public limited company (Publikt Aktiebolag) is legally denoted as AB (Publ) in Sweden or Abp in Finland. A Swedish public limited company must have a minimum share capital of 500 000 Swedish Kronor and its shares can be offered to the general public on the stock market. The suffix (Publ) is sometimes omitted in texts of an informal nature, but according to the Swedish Companies Registration Office, 'the name of a public limited company must be mentioned with the term (publ) after the business name in the articles of association and elsewhere', unless it is clearly understood from the company's business name that the company is a public limited company. For a private limited company in Sweden (Privat Aktiebolag), the minimum share capital is 50 000 Swedish Kronor. The main Swedish statutes regulating limited companies are The Companies Act (Aktiebolagslagen (ABL) 2005:551) and The Limited Companies Ordinance (Aktiebolagsförordningen 2005:559). The law provisions in ABL stipulate that parent companies and subsidiaries are separate legal persons and legal entities. The term Aktiebolag is also used in Finland Swedish, alongside the Finnish Osakeyhtiö (OY); the choice and ordering of terms tends to indicate the company's primary working language.

AKTIENGESELLSCHAFT = АКЦИЭНГЭЗЭЛЬШАФТ (или ОТКРЫТОЕ АКЦИОНЕРНОЕ ОБЩЕСТВО, или ПУБЛИЧНОЕ АКЦИОНЕРНОЕ ОБЩЕСТВО) – In Austria, Aktiengesellschaft (AG):- Minimum capital EUR70 000.00. In Germany:- Minimum capital

EUR50 000.00. Equivalent of a Public Limited Company (PLC) in Austria, Germany and Switzerland. Abbreviation:- AG. In Switzerland, Aktiengesellschaft (AG). Abbreviation AG is equal to PLC in the United Kingdom, or Inc. in the United States of America. Minimum share capital CHF100 000.00. Bearer or registered shares, of a par value of min. CHF0.01 each. Details of shareholders generally not publicly available (except for main shareholders and management shares of publicly listed companies). / Эквивалент Публичной Компании с Ограниченной Ответственностью (ПКОО) или Открытого Акционерного Общества (ОАО) в Австрии, Германии и Швейцарии. Обозначение:- А.Ге. (AG).

AL = ALBANIA

AL = APPROACH & LANDING

AL = ARRIVAL LOCATOR

ALAC = AT–LARGE ADVISORY COMMITTEE

A LA CRIÉE = А ЛЯ КРИЕ (или ОТКРЫТОЕ ОГЛАШЕНИЕ, или ОТКРЫТОЕ ВЫКРИКИВАНИЕ) – A La Criée:- in French, Open Outcry; auction, public sale where items are sold to the highest bidder. / Выражение А Ля Крие (A La Criée) в переводе с Французского языка означает Открытое Оглашение или Открытое Выкрикивание – метод, относящийся к сделке, часто использовавшийся ранее на биржевых рынках или срочных рынках. Речь шла о продаже или покупке посредством непрерывного выкрикивания цен во весь голос до тех пор, пока не будет заключена сделка.

ALAR = КРЫЛОВИДНОЕ (или ПАЗУШНОЕ) – Alar:- (i) wing-shaped, wing-like; (ii) in the fork or axil; (iii) cells in basal angles of the leaf; and (iv) growth regulating chemical sprayed on fruit trees. / (i) крылообразное, типа крыла; (ii) в вилочке или пазухе; (iii) клетки в базальных углах листа; и (iv) произрастание, регулирующее химически опрыскивание фруктовых деревьев.

ALASKA NORTH SLOPE = СЕВЕРНЫЙ СКЛОН АЛЯСКИНСКОГО ХРЕБТА – In the US oil industry, Alaska North Slope crude oil. / В нефтяной отрасли США, нефть, добываемая на Северном Склоне Аляскинского Хребта.

ALATE = КРЫЛАТОЕ – Alate:- with wings or wing-like appendages. / Крылатое:- с крыльями или крыловидными придатками.

ALATUS = АЛАТУС (или КРЫЛАТОЕ) – Alatus (-a, -um):- with wings or wing-like appendages. / Крылатое:- с крыльями или крыловидными придатками.

ALB = АЛЬБА (или СТИХАРЬ) – Alb is a full-length white linen ecclesiastical vestment with long sleeves that is gathered at the waist with a cincture.

ALBA = АЛЬБА (или БЕЛОЕ) – Alba:- white. / белое.

ALBATROSS = АЛЬБАТРОС – Albatross is a soft, lightweight wool or wool blend fabric in a plain weave with a napped, fleecy surface that resembles in texture, the breast of the albatross. It is usually light-colored and is used in negligees, infants' wear, etc.

ALBEGAL® SET = АЛЬБЕГАЛЬ® НАБОР – Albegal® SET is a three-product mix that aids in leveling, to get a smooth solid color. Albegal SET:- this amber viscous liquid is a surfactant designed to be used with the Lanaset® dyes, it is a retarder/leveler to encourage level dyeing. It also improves the compatibility of the dyes, and promotes migration and exhaustion. Use 2% WOF (short for the Weight Of Fiber) for silk, too much will interfere with the processing. You can change the amount used to get the effect that you want. This will foam up like most surfactants. Buy it with the dyes. Lanaset® dyes are manufactured by Ciba Specialty Chemicals (part of the merger agreement of 1997 between Ciba Geigy and Sandoz was that the former's industrial chemicals business would be spun off as a separate business, leading to the formation of Ciba Specialty Chemicals PLC, Manchester, the United Kingdom) and first became available to the small scale dyer in the USA in the 1980's. They are sulphonated 2:1 metallized acid dyes that are applied under acid conditions, a pH of 4.5–5.0. There is little chance for damage to the silk at this pH, which is ideal for silk. The silk comes out of Lanaset® dye baths soft and lustrous. The Lanasets have very good wash- and light-fastness. They have excellent exhaustion, 96%, and all the colors tend to exhaust at the same rate, a real advantage when dyeing a mixed color. Albegal® SET is a leveling agent used to help achieve an even color by slowing the rate at which dye molecules attach to the fiber which aids in dye exhaustion. It also helps the dye penetrate the fiber strands. Used at 1% Weight Of Fiber (WOF x 0.01) to be dyed. Albegal® SET:- liquid dyeing assistant used in conjunction with the Sabraset/Lanaset® Dyes. To be added to the dye bath to obtain level shades. In the late 1980s Lanaset® dyes were concurrently sold as Telana Dyes by Cerulean Blue (a company no longer in business). Today they are sold as either Lanaset® or Sabraset dyes, both are names for the same dye product. Lanaset® dyes produce jewel like colors on protein fibers with results that have excellent light fastness and wash fastness. Lanaset dyes are unique in that they are a combination of woo fiber reactive and acid dyes. They are safe and easy to use. The dye powders are non-toxic and the dye bath is as acidic as salad dressing. The home dyer's approach to dyeing with Lanaset® dyes can be very simple. Yet, if desired, a more technical approach may be used. If repeatable colors are preferred, follow the technical method being as precise as you feel necessary. Sabraset is the name PRO Chemical & Dye in the US uses for the same dye. Lanaset® is the manufacturer's name. Albegal® was registered on 1993-August-17 as a trade mark of Ciba-Geigy AG, Basel, Switzerland; but from 2011-September-15 the owner of the trade mark is Huntsman Advanced Materials (Switzerland) GmbH, Basel, Switzerland, and a representative is Isler & Pedrazzini AG, Zürich, Switzerland. / Альбегаль® ЗЭТ (Albegal® SET). С красителями Ляназэт® (Lanaset®), . изготавливаются компанией Сиба Спэшэлти Кэмиколз (Ciba Specialty Chemicals) Сиба Гайги (Ciba Geigy) и Зандос (Sandoz) Сиба Спэшэлти Кэмиколз Пи.Эл.Си. (Ciba Specialty Chemicals PLC), Манчестер, Соединённое Королевство. Забраззт/Ляназэт® (Sabraset/Lanaset®). Название Альбегаль® (Albegal®) было зарегистрировано 1993-August-17 в качестве товарного знака компании Сиба Гайги А.Ге. (Ciba-Geigy AG), Базэль, Швейцария; но с 2011-September-15 владельцем этого товарного знака стала компания Хантсмэн Эдвэнст Мэтириэлз (Свитсэлэнд) Ге.эм.бе.Ха. (Huntsman Advanced Materials (Switzerland) GmbH), Базэль, Швейцария, а её представителем является Исля Унд Пэдрацини А.Ге. (Isler & Pedrazzini AG), Цюрих, Швейцария.

ALBIC HORIZON = АЛЬБИЧЕСКИЙ ГОРИЗОНТ – Albic Horizon is a soil horizon from which clay and iron oxide have been removed.

ALBIFLORA = АЛЬБИФЛОРА (или БЕЛОЦВЕТКОВОЕ, или С БЕЛЫМИ ЦВЕТКАМИ) – Albiflora:- with white flowers. / с белыми цветками.

ALBINO = АЛЬБИНОС – Albino is a plant that lacks chlorophyll and turns white; a deficiency in normal pigment. / Под Альбинизмом, от Латинского слова Albus, означающее Белый, понимается врождённое отсутствие пигментации кожи, волос, радужной оболочки глаз у человека и животных; у растений – отсутствие зелёной окраски. Организм, лишённый окраски, называют Альбиносом.

ALBO = АЛЬБО (или БЕЛО) – Albo – White – as a prefix in a compound word. Hence:- Albo-Aurea – white and gold; Albo-Marginata – with white edges or margins; Albo-Maculata – with white spots; Albo-Striata – with white stripes or striations; and Albo-Vittata – with lengthwise white stripes. / Под Альбо, от позднелатинского слова Albedo, означающее Белизна, понимается .

ALC = AGENCY LOCATION CODE

ALEE = ПОД ВЕТРОМ – Alee:- to the leeward side (away from the wind). / В морском деле, на подветренную сторону (в сторону от ветра).

ALENÇON LACE = АЛАНСОНСКОЕ КРУЖЕВО – Alençon Lace is a delicate needlepoint lace having a solid design outlined with twisted yarn on a background of hexagonal mesh. Also called Point d'Alençon. Alençon Lace or Point d'Alençon is a needle lace that originated in Alençon, France. It is sometimes called the 'Queen of Lace'. Lace making began in Alençon during the XVI century and the local industry was rapidly expanded during the reign of Louis XIV by Jean-Baptiste Colbert, who established a Royal Workshop in the town to produce lace in the Venetian style in 1665. The purpose of establishing this workshop was to reduce the French court's dependence on expensive foreign imports. The local lacemakers soon modified the Venetian technique and Alençon emerged as a unique style around 1675.

ALEURONE LAYER = АЛЕЙРОНОВЫЙ СЛОЙ – Aleurone Layer is:- (1) the peripheral layer of endosperm of the grain beneath the seed coat which envelops the endosperm and contains oil and protein. (2) It is a layer of high-protein cells surrounding the storage cells of the endosperm. Its function is to secrete hydrolytic enzymes for digesting food reserves in the endosperm. Aleurone Layer is the peripheral layer of the endosperm, containing oil and protein but no starch. / У Риса под Алейроновым Слоем, от Греческого слова Áleuron, означающее Мука, понимается периферийный слой эндосперма, содержащий масло и белок, но не крахмал.

ALF = ACCELERATED LOAD FACILITY

ALGAE = АЛЬГИ (или ВОДОРОСЛИ) – Algae are simple plants in the Division Protista, consisting of single cells to multicellular organisms, arranged in colonies or as filaments, and containing photosynthetic pigments. Many common algae are green because their cells contain chlorophyll. / в Отделе Протист (Одноклеточных Организмов (Division Protista)), или как нити (гифы), и содержащие фотосинтетические пигменты. Под Альгэ, множественное число от Латинского слова Алга или Альга (Alga), означающее Водоросль или Морская Трава, понимаются . Под Водорослями понимается группа низших водных растений, обычно содержащих хлорофилл и вырабатывающих органические вещества в процессе фотосинтеза. Тело водорослей – таллом, не имеющий настоящих корней, стеблей и листьев, от долей микрона до 60 метров. Неклеточные, одноклеточные, многоклеточные, колониальные организмы. Размножение бесполое, вегетативное и половое. Отделы (или типы) Водорослей:- бурые, диатомовые, жёлтозелёные, зелёные, золотистые, красные и другие. Около 30 000 Видов. Синезелёные Водоросли чаще рассматривают как Цианобактерии и относят к Дробянкам. Водоросли – основные продуценты органического вещества в пресных водоёмах и морях. Входят в состав планктона и бентоса. Некоторые съедобны, например, Ламинария или Порфира, другие – сырьё для получения кормовой массы, агара, каррагена, иода и другого (многие из них – объект аквакультуры). Ряд Водорослей испытывают как компоненты биокомплексов, входящих в систему жизнеобеспечения космических кораблей. Некоторые одноклеточные водоросли в симбиозе с грибами образуют лишайники.

ALGAECIDE = АЛЬГИЦИД – Algaecide:- kills Algae. / Под Альгицидами, от Латинских слов Алга или Альга (Alga), означающее Водоросль или Морская Трава, и Caedo, означающее Убиваю, понимаются химические вещества, предназначенные для уничтожения водорослей в оросительных каналах, рисовых чеках (участках) и тому подобном. В качестве альгицидов наиболее широко применяют медный купорос.

ALGINATE = АЛЬГИНАТ – Alginate or Algin is an extract of seaweed used as a thickener. 'Sodium alginate' is used in textile printing pastes, and sometimes to thicken dye solutions for direct application. It is a preferred thickener for reactive dyes because it does not react with, and therefore use up, the dye. It comes in a number of variations that have somewhat different properties. 'Low viscosity' types are appropriate for reducing migration of wet dye solutions for fine line work, while 'high viscosity' are more suitable for making printing pastes. It can form gels at low pH or very high pH, so it is not suitable for some print paste formulations. / загустка (print paste).

ALGINATE FIBER = АЛЬГИНАТНОЕ ВОЛОКНО (или ВОЛОКНО АЛЬГИНАТА) – Alginate Fiber is a fiber formed from a metallic salt (normally calcium) of alginic acid, which is a natural polymer occurring in seaweed. Alginate fiber is soluble in water. Alginate is a fiber obtained from the metal salts of alginic acid. Alphabetic code – ALG; and relevant commercial allowance – 20.00 (refers to European Union Directives on Textile Labelling). / , которая содержится в натуральном полимере, образующемся в морских водорослях. Альгинатное Волокно – волокно из солей альгиновой кислоты.

ALGORITHM = АЛГОРИТМ (или АЛГОРИФМ) – Algorithm is a specified mathematical process for computation. / Под Алгоритмом или Алгорифмом, от Латинского слова Algorithmi, означающее транслитерацию Арабского имени аль-Хорезми Среднеазиатского математика IX века, понимается одно из основных понятий математики и кибернетики. Под этим термином подразумевается способ или программа решения вычислительных и других задач (управления, планирования, учёта). Он точно предписывает, как и в какой последовательности получить результат, однозначно определяемый исходными данными. Алгоритм – одно из основных понятий математики и кибернетики. В вычислительной технике для описания алгоритма используются различные языки программирования. Алгоритм оформляется в виде текста, описывающего последовательность операций (шагов) вычислительного процесса, набора математических формул или же блок-схемы с необходимыми пояснениями. Процесс выполнения алгоритма называется Алгоритмическим Процессом. Под Алгоритмом понимается точное описание способа решения задачи (выполнения математических расчётов, проектирования технических объектов, проведения научных исследований и так далее), устанавливающее какие операции (работы) и в какой последовательности выполнять, чтобы получить результат, однозначно определяемый исходными данными. Процесс выполнения алгоритма называется алгоритмическим процессом.

ALIEN GENE = ЧУЖОЙ ГЕН – Alien Gene is a gene transferred to the cultivated species from another related or unrelated species.

A LINE = ЛИНИЯ А – A Line:- the male sterile parent involving cytoplasmic or cytoplasmic genetic male sterility developed to produce hybrid seed. It is also known as a Cytoplasmic Male Sterile Line. / Известна также как Цитоплазматическая Линия Мужской Стерильности или Цитоплазменная Линия Мужской Бесплодности (Cytoplasmic Male Sterile Line). В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

A–LINE = A–ЛИНИЯ – A-Line is a dress or skirt that is formed into the shape of an A, tight fitting at the waist and open at the bottom. This flattering silhouette is easy and comfortable to wear. It flares gently away from the body creating a soft, A-line shape. Fit for any body.

ALIQUOT = АЛИКВОТНОЕ – Aliquot:- a small part or portion of a given amount (such as 5 ml out of 100 ml solution). Aliquot is a small representative sample taken from a gold bar for assay to determine its fine gold content. Aliquot is a small representative sample taken from a precious metals bar for assay to determine its fine precious metals content.

ALK = ALKALINITY

ALKALI = ЩЁЛОЧЬ – Alkali:- any substance having basic (as opposed to acidic) properties. In a restricted sense it is applied to the hydroxides of ammonium, lithium, potassium and sodium. Alkaline materials in lubricating oils neutralize acids to prevent acidic and corrosive wear in internal combustion engines. Alkali is a subclass of base, though often used to refer to any base. Partly because the term 'Basic' is often rather confusing, 'Alkaline' is often used to refer to solutions that are basic – having pH greater than 7. / и коррозионный износ в . Щёлочь (Alkali) – это подкласс основания, . Щелочное (Alkaline). Под Щёлочами понимаются гидроксиды щелочных и щелочноземельных металлов. Растворы щёлочи окрашивают лакмус в синий цвет, фенолфталеин – в красный. Типичные щёлочи – гидроксид натрия NaOH и гидроксид калия KOH – оказывают разъедающее действие на многие соприкасающиеся с ними материалы (отсюда их устаревшее название 'Едкие' Щёлочи). Щёлочи, растворимые в воде основания. Водные растворы щёлочей характеризуются высокой концентрацией гидроксильных ионов OH^-. К щёлочам относятся гидроокиси щелочных металлов, щелочноземельных металлов и аммония. Большинство щёлочей – твёрдые белые весьма гигроскопичные вещества. Растворение их в воде сопровождается выделением большого количества теплоты. Растворы щёлочей изменяют цвет кислотно-щелочных химических индикаторов. Наиболее сильными, так называемыми Едкими Щёлочами, являются гидроокиси щелочных металлов (например, NaOH, KOH), более Слабыми Щёлочами – гидроокиси щелочноземельных металлов (например, $Ca(OH)_2$, $Ba(OH)_2$) и аммония. К щёлочам иногда относят соли сильных оснований и слабых кислот (смотрите Кислоты И Основания), водные растворы которых имеют щелочную реакцию, например, гидросульфиды NaSH и KSH, карбонаты Na_2CO_3 и K_2CO_3, гидрокарбонат $NaHCO_3$, буру $Na_2B_4O_7$ и другие. Щёлочи широко применяются в лабораторной практике и промышленности (смотрите Гидроокись Аммония, Гидроокись Калия, Гидроокись Кальция, и Гидроокись Натрия).

ALKALINE = ЩЕЛОЧНОЕ – Alkaline is a term used to describe a material having a pH greater than 7.0 in water. / Щелочное .

ALKALINE SOIL = ЩЕЛОЧНАЯ ПОЧВА – Alkaline Soil is a soil with a pH value higher than 7.0; $CaCO_3$ in the upper horizon from a few percent to 95%. / Щелочная Почва – это почва с .

ALKALINITY = ЩЁЛОЧНОСТЬ – Alkalinity is the quality, state, or degree of being alkaline. / Щёлочность Щелочное (Alkaline).

ALKALI SOIL = СОЛОНЦОВАЯ ПОЧВА (или СОЛОНЦЕВАТАЯ ПОЧВА, или СОЛОНЕЦ) – Alkali Soil is a soil containing sufficient exchangeable sodium to adversely affect crop production. Its sodium adsorption ratio is greater than 15 and pH is > 8.5. / Солонцовая Почва – почва с высокой степенью щёлочности (pH > 8.5) и с большой изменчивостью содержания натрия.

ALKALI SPREADING VALUE = ПОКАЗАТЕЛЬ ПРОНИКНОВЕНИЯ ЩЁЛОЧИ (или ЗНАЧЕНИЕ РАСПРОСТРАНЕНИЯ ЩЁЛОЧИ) – Alkali Spreading Value is the degree of spreading of six grains of milled Rice in 10 ml 1.7% KOH for 23 h at room temperature or 30 °C using a seven-point score (7 = completely spread, and 1 = no reaction). Gelatinization temperature of starch is estimated based on spreading value:- low (6–7); intermediate (4–5); intermediate-high (3); and high (1–2). Alkali Spreading Value means rate of disintegration of the starch from white Rice or white glutinous Rice kernels after being soaked in 1.7% potassium hydroxide solution for 23 hours at 30 °C temperature. / Щёлочь (Alkali).

ALKALOID = АЛКАЛОИД – Alkaloid is a complex cyclic organic plant metabolites, usually containing nitrogen, with a bitter taste and marked physiological activity on animals. Many of the 7 000 known alkaloids are basic (alkaline). Their function may be to protect the plant from non-adapted herbivores, either by virtue of their unpleasant taste or their toxicity. Examples include atropine, caffeine, cocaine, colchicine, mescaline, morphine, nicotine, quinine, strychnine. / Щелочное (Alkaline). Под Алкалоидами, от позднелатинского слова Alcali, означающее Щёлочь, и Греческого слова Éidos, означающее Вид, понимается обширная группа азотсодержащих циклических соединений главным образом растительного происхождения. Все алкалоиды – азотистые основания, которые классифицируются по химическому строению (преимущественно по входящим в их структуры гетероциклам – индолу, пиридину, хинолину и другим), а также в зависимости от источника выделения. Известно около 10 000 алкалоидов; особенно богаты ими растения из семейства бобовых, лютиковых, маковых, маревых, паслёновых, сложноцветных. Алкалоиды оказывают физиологическое действие на организм животных и человека, преимущественно на нервную систему, благодаря чему применяются в медицине (алкалоиды спорыньи, атропин, кинин, кокаин, кофеин, морфин, никотин, стрихнин, эфедрин и другие) и в сельском хозяйстве (колхицин) для борьбы с вредителями. Биологическая роль алкалоидов в растениях окончательно не установлена; их образование и превращения в клетках тесно связаны с обменом аминокислот. Алкалоиды могут защищать растения от поедания животными, служить формой хранения органического азота в тканях и другое. Многие алкалоиды получены химическим синтезом. Алкалоиды, азотсодержащие органические соединения преимущественно растительного происхождения, обладающие свойствами оснований. Алкалоиды – физиологически активные соединения. Открытие алкалоидов в растениях имело большое значение, так как ещё в начале XIX века считали, что растительные вещества, в отличие от веществ животного происхождения, не содержат азота. Первыми были открыты алкалоиды опия (1803) в виде смеси кристаллических веществ, из которых в 1806 выделили индивидуальный алкалоид – морфин. В XIX веке были открыты также стрихнин, хинин, кофеин, атропин, эфедрин и другие. К 1960-м стало известно уже более 1 000 алкалоидов как природных, так и полученных синтетическим путём. Большинство алкалоидов – бесцветные кристаллические вещества, по химической природе представляющие собой гетероциклические соединения с атомами азота в цикле. Простейшие алкалоиды содержат до 10 атомов углерода, наиболее сложные – более 50. Алкалоиды образуют кристаллические соли с кислотами, например, с серной, соляной, салициловой, щавелевой и другими; этот процесс используется для их выделения и очистки. Установление строения алкалоида – часто очень сложная задача, для решения которой обычно определяют природу групп, содержащих атомы кислорода и азота, а также расщепляют молекулу алкалоида до осколков уже известного строения. Правильность представлений о строении подтверждается синтезом. В определении строения алкалоидов достигнуты большие успехи. Установлена структура таких сложных веществ, как морфин, стрихнин, резерпин, предложены возможные формулы строения аконитина и родственных ему алкалоидов. Большое разнообразие строения алкалоидов затрудняет их классификацию. Чаще всего основным признаком при классификации является строение азотсодержащей части молекулы алкалоида (например, производные пирролидина, пиридина, хинолина, индола и так далее). Вещества неустановленного строения классифицируют по систематическому принципу, объединяя в одну группу все алкалоиды, выделенные из близких растений. Во флоре земного шара алкалоиды распространены неравномерно:- в одних

Семействах (Маковые, Паслёновые, Лютиковые, Бобовые и тому подобные) они содержатся во многих видах растений, в других алкалоиды пока не обнаружены. В одном и том же растении обычно встречается несколько алкалоидов, близких по строению, число которых может доходить до 15–20 (Опийный Мак, кора Хинного Дерева) и меняться в зависимости от условий произрастания растения. Содержание алкалоидов колеблется от долей процента до нескольких процентов. Алкалоидоносность растений определяется характером почвы и её агротехнической обработкой, высотой местности над уровнем моря, водным режимом, продолжительностью дня, интенсивностью Солнечной радиации и другими факторами. Алкалоиды участвуют в химических реакциях обмена растительного организма. Так, в созревающих семенах Табака наблюдается постепенное исчезновение никотина параллельно с накоплением белка. Из высушенного измельчённого растительного сырья выделяют смесь алкалоидов экстракцией разбавленными кислотами или спиртами. В некоторых случаях растительный материал обрабатывают смесью водного раствора щёлочи и бензола, дихлорэтана или другими не смешивающимися с водой органическими растворителями. Для разделения смеси алкалоидов прибегают к различным приёмам:- дробной кристаллизации солей, хроматографированию и другому. Для производства различных тонизирующих и наркотизирующих препаратов (из Табака, Чая, Кофе и других), действие которых зависит от присутствия в них алкалоидов, созданы специальные отрасли сельского хозяйства и промышленности. Ряд алкалоидов, например, кофеин, теобромин, эфедрин, ареколин, получают синтетически. В некоторых случаях выделенные природные алкалоиды превращают в более эффективные лекарственные средства. В промышленности синтезируются близкие по строению к алкалоидам эффективные синтетические лекарственные средства, например, новокаин (вместо кокаина), акрихин (вместо хинина) и другие. Большинство алкалоидов – ценные лекарственные препараты; многие из них сильнейшие яды. Некоторые алкалоиды обладают избирательным действием на различные отделы нервной системы, сосуды, мышцы и так далее. Например, стрихнин и кофеин возбуждают центральную нервную систему, морфин и скополамин действуют на неё успокаивающе; пилокарпин усиливает выделения желёз (противоположное действие оказывает атропин); хинин убивает малярийных плазмодиев; апоморфин вызывает рвоту; теобромин оказывает мочегонное действие; адреналин повышает кровяное давление и так далее. Алкалоиды оказывают действие либо на причину заболевания (например, хинин при малярии), либо только устраняют отдельные симптомы болезни (например, морфин, опий как снотворные и болеутоляющие, кофеин как возбуждающее). В медицине используют алкалоиды в чистом виде (кодеин), их соли (хлористоводородный хинин) и производные (апоморфин). Кроме того, алкалоиды применяют в сельском хозяйстве как инсектициды.

ALKYDS = АЛКИДНЫЕ (или АЛКИДНЫЕ ЛАКИ) – Alkyds are the oil based coatings used in a wide variety of protective coatings, such as floor and deck paint enamels, wall and trim paints, stains, and varnishes. / Основанные на масле покрытия, используемые в широкой разновидности защитных покрытий, такие как половые и deck красочные эмали, стеновые и отделочные краски, протравы (морилки) и олифы. Под Алкидными Лаками понимаются растворы алкидных смол (часто из смесей с карбамидными смолами, нитратом целлюлозы (нитроцеллюлозы) или с другими полимерами) в органических растворителях. Образуют антикоррозионные и атмосферостойкие покрытия. Применяются для защиты дерева и металла. Эмалевые краски и грунтовки на основе алкидных лаков используются для отделки средств транспорта, сельскохозяйственных машин и так далее. Наиболее распространённый вид лакокрасочной продукции. Смотрите также Алкидные Смолы.

ALKYLATION = АЛКИЛИРОВАНИЕ – Alkylation is a refining process for chemically combining isobutene with olefinic hydrocarbons (e.g., butylenes, propylene) through the control of temperature and pressure in the presence of an acid catalyst, usually sulphuric acid or hydrofluoric acid. The product, alkylate (an isoparaffin) has a high octane value and is blended into motor and aviation gasoline to improve the antiknock value of the fuel. Alkylation is a process for obtaining high-octane gasoline components by interaction of isobutane and olefin hydrocarbons. Alkylation is the introduction of an alkyl radical into an organic molecule. / , например, . изобутен с углеводородными олефинами (бутилен, пропилен) кислотный катализ, как правило серная кислота или фтористоводородная кислота. алкилат (изопарафин). Алкилирование это процесс получения высокооктановых компонентов бензинов в результате взаимодействия изобутана и олефиновых углеводородов. Под Алкилированием понимается введение в молекулы органических и неорганических соединений алкила, например, метила CH_3 – метилирование, этила C_2H_5 – этилирование. Данный процесс используется, например, в нефтехимической отрасли промышленности для получения высокооктанового топлива, поверхностно-активных веществ, антиокислителей и инсектицидов. Алкилирование, введение в различные химические соединения алкильных групп (смотрите Алкилы). Алкилирование производят алкилгалогенидами (например, C_2H_5Cl), эфирами неорганических кислот (например, диметилсульфатом $(CH_3O)_2SO_2$), олефинами, например, этиленом, и другими. Так, бензол с этиленом в присутствии $AlCl_3$ образует этилбензол:- C_6H_6 + CH2 = CH_2®$C_6H_5CH_2CH_3$. Алкилирование применяют в технике для получения высокооктанового топлива (изооктана и другого), гомологов бензола (кумола, этил-бензола и так далее) и многих других соединений.

ALL = ALBANIAN LEK

ALL–CARGO AIR TRANSPORTATION = ВОЗДУШНАЯ ТРАНСПОРТИРОВКА ВСЕХ ГРУЗОВ – All-Cargo Air Transportation means the transportation by aircraft in interstate air transportation of only property or only mail, or both.

ALL–CARGO CARRIER = ВСЕЦЕЛО ПЕРЕВОЗЧИК ГРУЗОВ (или УНИВЕРСАЛЬНЫЙ ГРУЗОПЕРЕВОЗЧИК, или ПЕРЕВОЗЧИК ВСЕХ ВИДОВ ГРУЗА) – All-Cargo Carrier is an air carrier that transports cargo only. All-cargo air carriers have a maximum certificated take off weight of more than 45 500 kg. / Авиаперевозчик, занимающийся только лишь перевозкой грузов.

ALLEGATION OF USE = ХОДАТАЙСТВО ОБ ИСПОЛЬЗОВАНИИ (или ЗАЯВЛЕНИЕ НА ИСПОЛЬЗОВАНИЕ, или ОБРАЩЕНИЕ НА ИСПОЛЬЗОВАНИЕ) – In the US patent law, Allegation Of Use is a sworn statement signed by the applicant or a person authorized to sign on behalf of the applicant attesting to use of the mark in commerce. The allegation of use must include one specimen showing use of the mark in commerce for each class of goods/services included in the application, and the required fee. If filed before the examining attorney approves the mark for publication, the allegation of use is also called an Amendment to Allege Use. If filed after issuance of the Notice of Allowance, the allegation of use is also called a Statement of Use. The Amendment to Allege Use and the Statement of Use include the same information, and differ only as to the time when filed. The applicant may not file either an Amendment to Allege Use or a Statement of Use between the date the examining attorney approves the mark for publication and the date of issuance of the notice of allowance. / В патентном праве, заявление, подписанное заявителем под присягой или лицом, уполномоченным подписывать от имени заявителя, удостоверяющее просьбу об использовании знака в коммерции. Заявление на использование должно содержать один образец, показывающий использование знака в коммерции для каждой категории товаров/услуг, включённой в это заявление, и требуемое вознаграждение. Если оно заполнено и подано до одобрения проверяющим поверенным, то оно может также называться Изменение к Заявленному или Утверждённому Использованию. Если оно заполнено и подано после выдачи Уведомления о Разрешении, то оно может также называться Заявлением или Обращением на Использование. Изменение к Заявленному или Утверждённому Использованию и Заявление или Обращение на Использование содержат одну и туже информацию, и отличаются только временем подачи. Заявитель

может не заполнять ни Изменение к Заявленному или Утверждённому Использованию, ни Заявление или Обращение на Использование, с даты одобрения проверяющим поверенным знака для публикации до даты выдачи Уведомления о Разрешении.

ALLELE = АЛЛЕЛЬ (или АЛЛЕЛОМОРФА) – Allele is one of several possible mutational forms of a gene at a given genetic locus. One diploid individual can have a maximum of two forms (alleles), but there may be several alternate alleles in the Species. / . Под Аллелями, от Греческого слова Allēlōn, означающее Друг Друга или Взаимно, или Аллеломорфами понимаются различные формы одного и того же гена, расположенные в одинаковых участках (локусах) гомологичных (парных) хромосом; определяют варианты развития одного и того же признака. В нормальной диплоидной клетке может присутствовать не более двух аллелей одновременно. Аллель или Аллеломорфа – одно из возможных структурных состояний гена; определяет вариант развития одного и того же признака организма. Возникает при любом изменении структуры гена в результате мутаций или за счёт внутригенных рекомбинаций (возможное число аллелей каждого гена практически неисчислимо). Наличием аллельных генов обусловлены фенотипические различия среди особей. Аллели, наследственные задатки (гены), расположенные в одинаковых участках гомологичных (парных) хромосом и определяющие направление развития одного и того же признака. Термин введён Датским учёным Вильхэльмом Людви Йоэнсэном (Wilhelm Ludvig Johannsen; 1857–1927) в 1909 вместо предложенного Английским генетиком Вилъйэмом Бэйтсэном (William Bateson; 1861–1926) в 1902 аллеломорфы. Каждый ген может находиться по крайней мере в двух аллельных состояниях (определяемых его структурой), одно из которых обычно обеспечивает максимальное развитие признака – доминантная Аллель (смотрите Доминантность), другое приводит к частичной или полной утрате его проявления или к изменению в его проявлении – рецессивная аллель (смотрите Рецессивность). Например, у растений доминантная аллель обусловливает появление окрашенных цветков, а рецессивная – неокрашенных; у человека ген, контролирующий цвет глаз, присутствует у кареглазых в виде доминантной аллели (одной или пары), у голубоглазых – в виде только рецессивных аллелей. Гены, относящиеся к одной аллельной группе, обозначают одной буквой:- прописной для доминантной аллели, строчной – для рецессивной аллели (например, B и b). В каждой из гомологичных хромосом может располагаться лишь одна аллель данного гена. Так как у диплоидных организмов (смотрите Диплоид) имеются по две хромосомы каждого типа (гомологичные хромосомы), то в клетках тела этих организмов присутствуют по две аллели каждого гена. При образовании половых клеток в каждую попадает лишь одна аллель вместе с одной из хромосом. При оплодотворении – слиянии половых клеток – парность хромосом, а следовательно, и аллель восстанавливается. Доминантные и рецессивные аллели могут присутствовать в состоянии гомозиготности (BB или bb) или гетерозиготности (Bb). Если ген встречается в нескольких (более двух) различных состояниях, то он образует серию множественных аллелей (смотрите Наследственность).

ALLELEMORPH = АЛЛЕЛОМОРФ – Allelemorph:- in Mendelian inheritance, a pair of alternative forms of a gene in which one may be dominant and the other recessive. / Аллеломорф – один из генов, определяющих развитие того или иного признака. Под Аллеломорфами, от Греческих слов Allēlōn, означающее Взаимно, и Morphē, означающее Вид, понимается то же, что Аллели.

ALLELISM = АЛЛЕЛИЗМ (или АЛЛЕЛОМОРФИЗМ) – Allelism is the relationship between alleles in different parents. When the alleles of two parents belong to the same gene (locus), they are allelic; otherwise, non-allelic. / Аллелизм или Аллеломорфизм, явление парности (в некоторых случаях множественности) альтернативных (взаимоисключающих) признаков организма (например, жёлтая и зелёная окраска семян Гороха), обусловленное влиянием на их развитие аллельных генов (смотрите Аллели). Аллеломорфизм, то же, что Аллелизм.

ALLELISM TEST (COMPLEMENTATION TEST) = ТЕСТ НА АЛЛЕЛИЗМ (КОМПЛЕМЕНТАЦИОННЫЙ ТЕСТ) – Allelism Test (Complementation Test) is a test for determining whether changes occurred in the same gene so that complementation between genes is possible. / Комплементационный Тест на Аллелизм – генетический метод, позволяющий проверять, являются ли независимые мутации аллельными, или они затронули разные гены. Если при скрещивании двух мутантных особей образуется потомство дикого (нормального) типа, с генотипом т1 +/+ т2, то данные мутации являются неаллельными. Синоним – Транс-Тест.

ALLELOCHEMICALS = АЛЛЕЛОХИМИКАТЫ – Allelochemicals are nonnutritional substances produced by a plant that affect the behavior, growth, health, or physiology of another plant or insect.

ALLELOPATHIC = АЛЛЕЛОПАТИЧЕСКОЕ – Allelopathic:- the adverse effect on the growth of plants or microorganisms caused by the action of chemicals produced by other living or decaying plants. / растущих или гниющих или загнивающих растений.

ALLELOPATHY = АЛЛЕЛОПАТИЯ – (1) Allelopathy:- toxic metabolites are produced during the breakdown of residues of some weed and crop plants. Cotton stand establishment may be affected if cotton is planted into areas where such plants have been recently incorporated. Symptoms include patchy stand establishment and slow seedling growth as well as poor, impaired or distorted root development. Legume crops and medics as well as sorghum have been implicated. It has been suggested that legume residues should be incorporated at least two weeks prior to planting cotton. Allelopathy is the phenomenon of suppressing the growth of one plant species by another through the release of a toxic substance. / токсичные метаболиты. Под Аллелопатией, от Греческих слов Allēlōn, означающее Взаимно, и Páthos, означающее Страдание, понимается взаимное влияние растений друг на друга (замедление роста, цветения и так далее) в результате выделения ими в окружающую среду различных органических веществ (антибиотиков, фитонцидов и других). Известны 4 группы таких веществ. Вещества двух групп образуются микроорганизмами; это – антибиотики, подавляющие жизнедеятельность других микроорганизмов, и маразмины (вещества завядания), действующие на высшие растения. Вещества двух других групп выделяются высшими растениями – это фитонциды, подавляющие жизнедеятельность микроорганизмов, и колины, тормозящие развитие высших растений. Иногда наблюдается положительное влияние растений друг на друга, что особенно важно в агрофитоценозах. Явление аллелопатии необходимо учитывать при возделывании сельскохозяйственных растений (севообороты, подбор культур для смешанных посевов и другое). Под Аллелопатией понимается взаимные влияния растений и микроорганизмов в сообществах посредством выделения во внешнюю среду физиологически активных веществ. В одних случаях эти вещества оказывают угнетающее (ингибирующее) действие, в других – стимулирующее. Так, выделяемые некоторыми микроорганизмами антибиотики угнетают другие микроорганизмы, а маразмины вызывают завядание высших растений. Высшие растения продуцируют фитонциды, угнетающие жизнедеятельность микроорганизмов, и колины, тормозящие развитие других высших растений. Аллелопатия – один из факторов, регулирующих отношения растений в фитоценозе, в том числе агрофитоценозе, поэтому явление аллелопатия необходимо учитывать при создании смешанных посевов и введении севооборотов. Понятие Аллелопатия (Взаимовлияние) находится на стыке разных научных дисциплин. Объяснение его даёт возможность понять тайные причины смены растительных ассоциаций, разобраться в процессах утомления почвы, подавлять биологическими методами сорняки, определить составы смешанных и уплотнительных посевов. Носителями аллелопатического действия являются активные вещества, называемые колинами. Их химическая природа очень разнообразна и непостоянна даже у одного растения. А в

самом широком понимании аллелопатия – это круговорот физиологически активных веществ (колинов). Они играют роль регуляторов внутренних и внешних взаимоотношений, формирующих, развивающих и сменяющих растительный покров в биоценозе. В зависимости от условий аллелопатия может играть незначительную роль, но иногда и решающую. Роль эту нельзя определить однозначно (как большую или малую), так как взаимовлияния возникают позднее, чем взаимоотношения, основанные на соревновании за условия жизни. Под Аллелопатией, от Греческих слов Allēlōn, означающее Взаимно, и Pathe, означающее Влияние или Патия, понимается взаимное влияние растений друг на друга в результате выделения ими различных веществ. Известны 4 группы таких веществ. Вещества двух групп образуются микроорганизмами; это – антибиотики, подавляющие жизнедеятельность других микроорганизмов, и маразмины (вещества завядания), действующие на высшие растения. Вещества двух других групп выделяются высшими растениями – это фитонциды, подавляющие жизнедеятельность микроорганизмов, и колины, тормозящие развитие высших растений. Первоначально аллелопатию считали исключительно отрицательным взаимодействием растений. Позднее было установлено и положительное взаимодействие растений. Аллелопатия осуществляется посредством прижизненного обмена корневыми выделениями в почве, листовыми (летучие эфирные масла) – в окружающем воздухе и путём накопления в почве токсинов, образующихся при перегнивании остатков корней и опада листьев. Наибольшей аллелопатичной активностью обладают фенольные соединения, содержащиесяся в листьях многих растений и освобождающиеся в результате разложения опада. Они вызывают так называемое Почвоутомление (‘отравляют’ почву разлагающиеся листья Каштана, Ореха, хвоя Сосны и Ели и другое). Некоторые растения (ясень, лох) обладают очень высокой аллелопатичной активностью, поэтому не образуют одновидовых насаждений. Растения с высокой аллелопатичной активностью (Дуб, Бук, многие хвойные) создают вокруг себя защитные зоны. У этих растений происходит угнетение собственного подроста из-за накопления токсичных веществ, в результате чего вид вытесняет сам себя. Многие аллелопатически активные вещества обладают также антимикробным (фитонцидным) действием, обеспечивая иммунитет растений к грибным инфекциям, а также способствуя очищению воздуха (в молодых сосновых, можжевеловых и других хвойных лесах – практически стерильный воздух). Учитывая аллелопатическую активность лесных пород, целесообразно обеспечивать их чередование. При подборе растений для декоративных и смешанных лесных посадок необходимо учитывать возможный характер их аллелопатических взаимоотношений.

(2) In Greek:- Allelon = Mutual; and Pathe = Influence. The mutual influence of goods of vegetable origin when stored together, caused as a result of gaseous metabolic products, for example, ethylene or carbon dioxide. / Термин Аллелопатия был образован от сочетания двух Греческих слов Allelon, означающее Взаимно, и Pathe, означающее Влияние или Патия. Аллелопатия означает взаимное влияние растений друг на друга в результате выделения ими в окружающую среду различных органических веществ, например, антибиотиков, фитоциндов и других. Такое взаимное влияние приводит к замедлению роста, цветения и так далее.

ALLIANCE INTERNATIONALE DE TOURISME = АЛЬЯНС ЭТЭРНАСЬЁНАЛЬ ДЁ ТУРИСМ (или МЕЖДУНАРОДНЫЙ АЛЬЯНС ПО ТУРИЗМУ) – Alliance Internationale De Tourisme:- xxxxx. See also International Touring Alliance. / Смотрите также Международный Альянс по Туризму (International Touring Alliance).

ALLIANCE OF AUTOMOBILE MANUFACTURERS = АЛЬЯНС ИЗГОТОВИТЕЛЕЙ АВТОМОБИЛЕЙ – The Alliance Of Automobile Manufacturers is an association of 12 vehicle manufacturers including BMW Group, Chrysler Group LLC, Ford Motor Company, General Motors Company, Jaguar Land Rover, Mazda, Mercedes-Benz USA, Mitsubishi Motors, Porsche, Toyota, Volkswagen Group of America and Volvo Cars North America. The Alliance of Automobile Manufacturers (Auto Alliance) is the voice for a united auto industry. We are committed to developing and implementing constructive solutions to public policy challenges that promote sustainable mobility and benefit society in the areas of environment, energy and motor vehicle safety. The Alliance of Automobile Manufacturers, the leading advocacy group for the auto industry, represents 77% of all car and light truck sales in the United States, including the BMW Group, Chrysler Group LLC, Ford Motor Company, General Motors Corporation, Jaguar Land Rover, Mazda, Mercedes-Benz USA, Mitsubishi Motors, Porsche, Toyota, Volkswagen Group of America and Volvo Cars North America. Headquartered in Washington, DC, the Alliance also has offices in Sacramento, California and Detroit, Michigan. Our Vision:- a united industry committed to enriching society through sustainable mobility. Our Goals:- (i) leadership:- to develop and implement policies that enable the introduction of new technologies needed to support sustainable mobility; (ii) public image:- to be the trusted source of proactive and positive innovation and public policy benefiting society in areas of environment, energy and motor vehicle safety; (iii) relationships:- to initiate and leverage consensus-oriented dialogue with industry, federal and state governments, and other stakeholders to address shared objectives, domestically and internationally; and (iv) respected source:- to be the credible resource for technical and science-based analysis enhancing motor vehicle safety, environment and energy issues with a global perspective. When the Alliance of Automobile Manufacturers was established in 1999, its founders envisioned a new breed of trade association for the industry. They wanted an association representing broader membership to reflect the global nature of the industry. Founders also envisioned a new type of association, one that was highly focused on discrete issues, with a lean and responsive organization. Founding members included:- DaimlerChrysler, Ford, GM, Nissan, Toyota, and Volkswagen (Regular); and BMW, Mazda, and Volvo (Associate). The Alliance provides a forum to address common industry-specific issues in the areas of environment and energy, safety and harmonization, and commercial issues. The Alliance’s original charter excludes trade issues, as well as other non-industry specific issues that would be addressed by larger groups such as the National Association of Manufacturers. The Alliance was formed in part as a recognition of the global nature of today’s marketplace and was meant to represent both US and foreign-based companies. Directly prior to the formation of the Alliance there were two associations representing auto manufacturers’ interests in the US:- the American Automobile Manufacturers Association (AAMA), whose members were Chrysler, Ford, and GM; and the Association of International Automobile Manufacturers (AIAM), whose members include non-US based companies. / Дьженерэл Мотоз (General Motors).

ALLIGATOR SPREAD = АЛЛИГАТОРСКАЯ КУРСОВАЯ РАЗНИЦА (или АЛЛИГАТОРСКИЙ СПРЭД) – An Alligator Spread refers to a financial position (a unique combination of put and call options) that is unprofitable because of the high commission it generates. This phenomenon is called an Alligator Spread because the position is said to ‘eat alive’ whatever profit the investor makes from the position. This spread is only seen with financial advisors or brokers that work on a commission basis. The unprofitability of the position is not necessarily caused by market effects but by the commission of the intermediary brokering the transaction. The unique blend of put and call options that help to set up an alligator spread can result in commission that can be so high that most of any realized profits end up going to the broker and the investor realizes next to nothing from the deal. For example, if the executed position makes a profit of USD2 000.00, the commission might be between USD1 000.00 and USD1 500.00, thereby wiping out the profit and netting the investor next to nothing. It is very possible for a broker to intentionally arrange a put and call option combination that results in an alligator spread, but for the most part, an alligator spread happens randomly. One way of dealing with an alligator spread is for the investor to look at the commission schedule for the broker or financial advisor and be aware of the commission levels for certain put and call positions. Another way of trying to prevent alligator spreads is for the investor and the broker to pay careful attention to the

sequence of call and put options being paired and what the consequences or possible results of the pairing will be. Profit made on an option that is instantly snapped up by the broker as commission, leaving nothing for the investor. Alligator Spread is an unprofitable spread that occurs as a result of large commissions charged on the transaction, regardless of favorable market movements. An alligator spread is usually used in the options market to describe a collection of put and call options that may not be profitable. Pricing models and a more efficient market can help reduce the traditional spread on a security, but it is commissions that create the alligator spread, not market inefficiencies. The commissions are dependent on a transaction's brokers. Investors should check the commission schedules carefully to avoid having their profits devoured by the alligator spread. / Прибыль, образовавшаяся по опциону, которую мгновенно прихватил брокер в качестве комиссии, оставив ни с чем инвестора. и взаиморасчёт или сведение (netting) . Аллигаторский Спрэд – спрэд по опционам, который буквально съедает инвестора живьём из-за высоких комиссионных расходов. Термин описывает ситуацию, в которой брокер организует такую комбинацию опционов на покупку и продажу, что комиссионные практически исключают прибыль инвестора, даже при благоприятной конъюнктуре.

ALL IN = ВСЁ ВКЛЮЧЕНО – All-In:- All Inclusive. The total price to move cargo from origin to destination, inclusive of all charges. / Итоговая цена по перевозке груза от места происхождения до места назначения, содержащая в себе все расходы. Всё Включено, в андеррайтинге – сокращение от all included - всё включено, означающее для эмитента процентную ставку после выплаты комиссионных и всех связанных с ними расходов.

ALLISION = СТОЛКНОВЕНИЕ – Allision is the running of one vessel against another. It is distinguished from collision in this, that the latter means the running of two vessels against each other; this latter term is frequently used for allision. The act of striking or collision of a moving vessel against a stationary object. Allision is the act of dashing against or striking upon; it is often used to describe the action of one boat hitting against another, or of the sea dashing against a boat. The word is commonly used in place of 'collision' to distinguish that one of the objects was fixed. / Акт столкновения или врезания двигающегося судна со стационарным объектом.

ALLOCATED ACCOUNT = СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ (или ЛИЦЕВОЙ СЧЁТ, или АССИГНОВАННЫЙ СЧЁТ, или ВЫДЕЛЕННЫЙ СЧЁТ, или ОБЛИЧЁННЫЙ СЧЁТ) – Allocated Accounts:- these accounts are opened when a customer requires metal to be physically segregated and needs a detailed list of weights and assays. The client has full title to the metal in the account, with the dealer holding it on the client's behalf as a custodian. Clients' holdings are identified in a weight list of bars showing the unique bar number, gross weight, the assay or fineness of each bar and its fine weight. Credits or debits to the holding will be effected by physical movements of bars to or from the client's physical holding. An account in which the client's metal is physically identified as his; he becomes a secured creditor of the holding bank. See also Bullion Account, and Unallocated Account. Allocated Account is an account in which the client's metal is individually identified as his, and physically segregated from all the other gold in the vault; in the event of a default by the holding bank, the investor becomes a secured creditor. These accounts are opened when a customer requires metal to be physically segregated and needs a detailed list of weights and assays. Allocated Accounts are accounts held by dealers in clients' names on which are maintained balances of uniquely identifiable bars, plates or ingots of metal 'allocated' to a specific customer and segregated from other metal held in the vault. The client has full title to this metal with the dealer holding it on the client's behalf as custodian. To avoid any doubt, metal in an allocated account does not form part of a precious metal dealer's assets. Insurance for allocated metal can be arranged by the client or by the precious metal dealer. Clients' holdings will be identified in a weight list of bars, plates or ingots showing the unique bar, plate or ingot number, gross weight, the assay or fineness of each bar, plate and ingot and, in the case of gold, its fine weight. Credits or debits to the holding will be effected by segregation of bars, plates or ingots to or from the client's segregated holding. An allocated account cannot, by definition, be overdrawn. See also Metal Account; and Unallocated Account. / Смотрите также Металлический Счёт (Metal Account); и Обезличенный Счёт (Unallocated Account). Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

ALLOCATED INVENTORY = РАСПРЕДЕЛЁННЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или РАСПРЕДЕЛЁННЫЕ СКЛАДСКИЕ ЗАПАСЫ, или РАСПРЕДЕЛЁННЫЕ СКЛАДСКИЕ ОСТАТКИ) – Allocated Inventory is an inventory that is reserved for a specific order, customer, promotional event or other purpose and is not to be used for standard order fulfillment purposes. Once allocated, this stock is no longer available as usable inventory for new orders. A sophisticated WMS (Warehouse Management System) will offer a variety of ways to indicate a reserved or on hold status for specified inventory.

ALLOCATION = ВЫДЕЛЕНИЕ – (1) Allocation:- the division of things into shares or portions. In economics, the term refers primarily to the 'allocation of resources', the process by which economic resources get allotted (apportioned, assigned) to their particular uses for directly or indirectly satisfying human wants. The allocation process in a particular society's economy is the process by which the three fundamental economic questions get answered in that society:- (i) what goods and services are produced (and in what quantities)? (ii) By which of the various available technological means and recipes are each of these goods and services to be produced from the available land, labor and capital? (iii) For whom are each of these goods and services produced? (Which specific individuals get to use/consume each unit of each good or service produced?) Thus one may speak of 'market allocation' of resources, 'forcible allocation' of resources, 'governmental allocation' of resources, 'traditional' (or 'customary') allocation of resources and so on, depending upon the kinds of social processes and incentives by which various sorts of scarce resources are allocated in the particular society under consideration. If an issue is oversubscribed, the underwriting bank allocates the securities in consultation with the issuer. This is done either by lottery or according to an allocation formula. The allocation formula generally gives priority to certain target groups preferred by the issuer.

(2) Allocation:- in the underwriting, after the subscription period, full or proportional allocation (allotment) of the securities subscribed.

(3) Allocation:- in the stock exchange, proportionately reduced allocation of securities if supply and demand cannot be matched at a certain price.

(4) Allocation:- assignment of available spaces to a specific sales office for marketing requirements and/or to a shipper. The process of allocating space on a particular vessel (or vessels) to a certain organizational unit. Allocation is the process of assigning activities, costs or facilities, e.g., space to a certain organizational units. / , например, .

ALLOCATION = ВЫДЕЛЕНИЕ (или РАЗМЕЩЕНИЕ, или ОТНЕСЕНИЕ) – Allocation:- inventory is allocated to a specific order.

ALLOCATION = ПРОВОДКА (или ОТНЕСЕНИЕ) – Allocation:- in accounting, the recording of an entry or transaction (inflow or outflow of funds) to the accounting period and to the account, department or function to which it is attributable.

ALLOCATION COMMITTEE = КОМИТЕТ ПО ВЫДЕЛЕНИЮ – Allocation Committee allocates stocks and options under board-granted authority. Members are selected from among the specialists, nonspecialist floor members, and allied members serving on allocation panel.

ALLOCATION REVIEW COMMITTEE = КОМИТЕТ ПО ОБЗОРУ ВЫДЕЛЕНИЙ – Convened from time to time, the Allocation Review Committee (ARC; of the NYSE®) reviews and makes recommendations to the Quality of Markets Committee with respect to the exchange's policies and procedures for the allocation of listing securities to specialist units. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

ALLOGAMOUS = АЛЛОГАМНОЕ (или ПЕРЕКРЁСТНО ОПЫЛЯЕМОЕ) – Allogamous:- capable of cross fertilization or having cross-fertilizing nature. / Под Аллогамным, от Греческих слов Állos, означающее Другой, и Gámos, означающее Брак, .

ALLOGAMY = АЛЛОГАМИЯ (или ПЕРЕКРЁСТНОЕ ОПЫЛЕНИЕ) – Allogamy is a cross fertilization; opposite of autogamy. / Под Аллогамией, от Греческих слов Állos, означающее Другой, и Gámos, означающее Брак, понимается .

ALLOMONE = АЛЛОМОН – Allomone is an allelochemical that causes negative effects on the recipient organism. / , от Греческого слова Állos, означающее Другой, и . Алломон – вещество, выделяемое организмом для привлечения или отпугивания организмов другого вида.

ALLONGE = АЛЛОНЖ – Allonge is a sheet of paper attached to a bill of exchange for the purpose of documenting endorsements. The need for an allonge arises due to the lack of space on the bill itself for additional endorsements. Because a bill of exchange is transferable through endorsement, it may be exchanged among so many parties that these parties don't all fit on the bill. In this case, a separate piece of paper – the allonge – is attached to the bill, acting as a legal extension of the document. Slip attached to a bill of exchange that provides extra space for the noting of endorsements. Allonges were most useful when bills of exchange moved freely from one holder to another, but now are less common. Attachment, prolongation of registered securities. Allonges must be firmly attached to the main certificate and be stamped on the connection in such a way as to ensure that a separation can been seen. / Аллонж:- прикреплённый к векселю добавочный лист, на котором совершаются передаточные надписи (индоссамент), если на оборотной стороне векселя они не умещаются. Первую передаточную надпись на алонже принято делать так, чтобы она начиналась на векселе, а заканчивалась на алонже. На нём также может быть совершён аваль.

ALLOPLOID/ALLOPOLYPLOID = АЛЛОПЛОИД/АЛЛОПОЛИПЛОИД – Alloploid/Allopolyploid is a polyploid containing genetically different sets of chromosomes from two or more species, e.g., O. minuta with BBCC genomes is an allopolyploid. / Под Аллополиплоидией, от Греческого слова Állos, означающее Другой, Polýploos, означающее Многократный, и Éidos, означающее Вид, понимается наследственное изменение в клетках растений, реже животных, заключающееся в кратном увеличении числа наборов хромосом при межвидовых или межродовых скрещиваниях. Встречается в природе и может быть получена целенаправленно (ржано-пшеничные, капустно-редечные гибриды). Имеет важное значение в процессах видообразования у растений.

ALL ORDINARIES ACCUMULATION INDEX = ИНДЕКС ПО НАКОПЛЕНИЮ ПО ВСЕМ ОБЫКНОВЕННЫМ АКЦИЯМ – In Australian sharemarket, takes into account both capital appreciation and dividends as a return on the companies in the All Ordinaries index. All Ordinaries Accumulation Index is a measure of the change in the prices of stock on the Australian Stock Exchange, based on the Australian All Ordinaries Index, but assuming that all dividends are reinvested. The All Ordinaries Accumulation Index has been adopted as the benchmark to measure total investment performance and is largely used to compare the performance of professionally managed funds. The All Ordinaries Index, which consists of over 250 stocks that account for approximately 90% of the total market capitalisation, summarises the movement in share values resulting from equity trading on the ASX. This is achieved by following changes in the market capitalisation of each company. This in turn is calculated by multiplying the number of quoted shares by their market price, including a respective weighting factor. The All Ordinaries Accumulation Index takes the measurement of the trend of price movements one step further by incorporating the dividends paid, so a benchmark for total investment performance (before tax) can be calculated. Over time, the Accumulation Index will rise faster (or fall less) than the equivalent share price index because dividends paid by companies are taken into account.

ALL ORDINARIES INDEX = ИНДЕКС ПО ВСЕМ ОБЫКНОВЕННЫМ АКЦИЯМ – Established in January 1980, the All Ordinaries or All Ordinaries Index (known colloquially as the All Ords) is the oldest stock index in Australia, so called because it contains nearly all ordinary (or common) stock listed on the Australian Securities Exchange (ASX). Its creation coincided with the establishment in September 1987 of the then Australian Stock Exchange (now ASX following a merger with the Sydney Futures Exchange in July 2006) from six separate state based exchanges in the capital cities of Sydney, Melbourne, Brisbane, Perth, Adelaide, and Hobart. Like all market indexes, the All Ordinaries is a summary measure of the movement of stock values that result when stock in companies held by individual and corporate stockholders trade on the ASX. It is useful as an indicator of overall share market performance and current trends. It also provides a performance benchmark for invested funds, a record of market cycles, and an indicator of stock market reactions to economic events. As a market index, the All Ordinaries is helpful in the construction of asset pricing models, like the capital asset pricing model (CAPM), where the All Ordinaries serves as the market factor and is used to calculate beta (the sensitivity of a stock's return to market or systematic or nondiversifiable forces). Daily data on the All Ordinaries for these purposes is available since 1980; movements before 1980 have been recalculated using changes in the older state-based indices (mostly the Sydney Stock Exchange). Reconstructed daily observations for the All Ordinaries from January 1958 and backdated monthly data from October 1882 are now available. When established, the All Ordinaries had a base index of 500 28 years later in December 2007 the All Ordinaries was at 6 421, meaning that it had increased more than twelvefold in nominal terms (that is, not accounting for inflation). This represents an arithmetic return of 1 184 percent and a compound annual return of 9.54 percent. On 2007-November-01, the All Ordinaries hit a record high of 6 873. However, on 2008-January-22, the All Ordinaries plunged 408.9 points (7.26 percent) to 5 222, its fourth-worst day on record and worst performance since 1987-October-29, when it fell 7.52 percent. Since then, it has partially recovered, and as of 2008-June-06, stands at 5 633. On 2000-April-03, the ASX reconstituted the All Ordinaries from a pool of 229–330 stocks to include the 500 largest companies. Prior to this change, to be included in the All Ordinaries portfolio used for calculating the index a company needed to have a market value of at least 0.2 percent of all domestic equities quoted on the ASX and maintain an average turnover of at least 0.5 percent of its quoted shares each month. The new index now accounts for about 99 percent (up from 90 percent) of the ASX's total market capitalization. This change coincided with the introduction of new benchmark indexes managed by Standard and Poor's (S&P), including the S&P/ASX 300 (i.e. the 300 largest companies listed on the ASX), S&P/ASX 200, S&P/ASX 100, S&P/ASX 50, S&P/ASX 20, and the S&P/ASX Small Ordinaries (i.e. small and mediumsized companies). The importance of the All Ordinaries has diminished with the introduction of the new S&P/ASX indexes. The All Ordinaries is a market-weighted (or capitalization weighted) index where stocks are included in the index according to the total market value of their outstanding shares. As a result, the impact of a stock's price change is proportional to the company's overall market value, which is the share price times the number of shares outstanding. Stocks in companies with a larger market capitalization will then exert a proportionally greater influence on the market index. Most stock indexes today are market-weighted; they include the S&P 500 and the Dow Jones Wilshire 5000 in the United States, the Financial Times Stock Exchange (FTSE) 100 in the United Kingdom, and the Tokyo stock Price IndeX (TOPIX) in Japan. Some other indexes are price-weighted where each stock makes up a fraction of the index proportional to its price. This means that stocks are included in proportions based on their quoted prices. Accordingly, higherpriced stock will exert the most impact on the index.

Examples of price weighted indexes include the Dow Jones Industrial Average (DJIA) in the United States and Japan's Nikkei 225. In terms of calculation, the All Ordinaries represents the aggregate market value of the ASX. The aggregate market value is the sum of the market values (the number of shares on issue multiplied by the current price per share) of all companies included in the All Ordinaries portfolio. Today's movement in the index is then calculated by multiplying yesterday's index by the ratio of today's to yesterday's aggregate market values. Updates to the companies included in the All Ordinaries portfolio are made throughout the month when there are changes in the portfolio companies, including delistings, additions, capital reconstructions, and additions through dividend reinvestment plans and bonus and rights issues. These changes affect the number of shares on issue for each company and mean that the portfolio needs modification to maintain consistency. The main limitation of the All Ordinaries is that it is a price index: it only includes movements in stock prices. However, investors accrue returns not only through price changes, but also through the receipt of dividends; hence, the All Ordinaries understates the total return to the investor. To resolve this, an All Ordinaries Accumulation Index is available that includes the effects of dividend receipts in its computation by assuming that dividends are reinvested to earn the same returns as the stock already held. The index is made up of the weighted share prices of about 500 of the largest Australian companies. Established by the Austarlian Stock Exchange at 500 points in January 1980, it is the predominant measure of the overall performance of the Australian sharemarket. The companies are weighted according to their size in terms of market capitalization (total market value of a company's shares). / 225 от Никкэй (Nikkei 225). Стэндод энд Поз (Standard & Poor's). Дау Дьжонз Вилшир (Dow Jones Wilshire). Индекс по Всем Обыкновенным Акциям – главный индекс по Австралийским акциям; рассчитывается на основе курсов наиболее активно обращающихся акций 280 компаний или большинства капитальных акций (включая акции иностранных компаний), зарегистрированных на Австралийской Фондовой Бирже (АФБ; Australia Stock Exchange (ASX)). Индекс строится на основе 23 подиндексов, представляющих индексы акций компаний различных отраслей, и обобщает движение рыночных цен путём последовательных изменений совокупных рыночных оценок компаний, чьи акции котируются на бирже.

ALL ORDS = ALL ORDINARIES INDEX

ALL OR NONE ORDER = РАСПОРЯЖЕНИЕ 'ВСЁ ИЛИ НИЧЕГО' – All or None (AON) Order is a type of order issued to a broker by a customer to fill the order completely or not at all. There are no partial transactions. An order which must be filled in its entirety or not at all. / Всё или Ничего (ВИН) в инвестиционных банковских операциях:- все ценные бумаги, продаваемые биржевым брокером, считаются действительными и проданными только тогда, когда в установленный срок удаётся реализовать весь выпуск, в ином случае эмитент имеет право аннулировать весь выпуск. В ценных бумагах:- распоряжение о покупке или продаже ценных бумаг, подразумевающий, что распоряжение должно быть исполнено полностью либо не исполнено вовсе.

ALL OTHER PERILS & MISFORTUNES = ВСЕ ИНЫЕ УГРОЗЫ И НЕПРИЯТНОСТИ – All Other Perils & Misfortunes:- phrase in cargo insurance policy meaning perils of the same nature as those described specifically in the perils clause. / Фраза в полисе страхования груза, означающая риски того же свойства, как и те, что подробно описаны в оговорке о рисках.

ALLOTMENT = РАЗМЕЩЕНИЕ – (1) Allotment is an allocation of securities apportioned to the individual subscriber in the case of oversubscribed issues. If more applications for subscription are received than securities available, the individual allotments are reduced accordingly. / Размещение или Выделение – число акций, выделенное каждому участнику инвестиционного банковского синдиката, образованного для размещения нового займа. Участников такого займа называют подписчиками (subscribers или allottees). Ответственность подписчиков устанавливается в специальном документе (allotment notice), уведомляющем подписчика о числе выданных ему ценных бумаг. Такой документ обычно готовит управляющий синдиката (syndicate manager).

(2) Allotment:- a share of the capacity of a vessel assigned to a certain party, e.g., a carrier or an agent, for the purpose of the booking of cargo for one or several specific voyages. / Доля вместимости судна, выделенная определённой стороне, например, перевозчику или агенту с целью бронирования места под перевозку груза в одном или нескольких специфических рейсах.

ALLOTMENT OF SHARES = РАЗМЕЩЕНИЕ АКЦИЙ – Allotment Of Shares:- when a company issues shares by publishing a prospectus and inviting applications, allotment is the assignment of shares to each applicant. In cases where the issue is oversubscribed, shares are allotted in proportion to the quantity requested and so applicants do not always receive the number of shares they originally requested. The allocation of shares in a company by the directors, following an application or offer to take up the shares. Decisions as to the persons to whom shares are allotted, and the number allotted to each, are at the discretion of the directors, subject to compliance with the Corporations Law. If an issue of shares is oversubscribed, i.e. the number of shares applied for exceeds the number available for issue, the excess must be eliminated either by rejecting some applications altogether, or by reducing the number of shares allotted to some or all of the applicants. / , то есть .

ALLOTTED SHARES = РАЗМЕЩЁННЫЕ АКЦИИ – In the United Kingdom, Allotted Shares are shares distributed by allotment to new shareholders (allottees). The shares form part of the allotted share capital. Also known as Issued Shares in the United States.

ALLOVER = ДЕКОРАЦИЯ (или ФРАГМЕНТИРОВАННЫЙ РИСУНОК) – Allover is an embroidered, printed, or lace fabric with a design covering most of the surface (allover the surface).

ALLOVER LACE = ДЕКОРАЦИОННОЕ КРУЖЕВО – Allover Lace is a lace in which the pattern covers the entire fabric, rather than being isolated on one section of background net.

ALLOWABLE CLAIM = УДОВЛЕТВОРЯЕМАЯ (или РАЗРЕШЁННАЯ, или ДОПУСТИМАЯ) ПРЕТЕНЗИЯ – Allowable Claim:- this term means a claim for losses arising from (i) any order or transaction for the purchase, sale, exercise or expiration of an exchange futures contract or exchange option or (ii) any cash market transaction which is part of, or directly connected with, any transaction. An allowable claim shall not include legal or other incidental expenses incurred in connection with any such losses or with the events giving rise to any such losses. / или иные побочные расходы, понесённые в связи с любыми .

ALLOWANCE = ОТЧИСЛЕНИЕ (или УСТУПКА) – (1) In accounting, Allowance is:- (i) tax-free amount (such as traveling allowance) subtracted from an income to arrive at taxable income. See also Deduction. (ii) Amount paid to employees as part of their salary package, or to defray their out of pocket expenses incurred on behalf of the firm. (iii) Amount deducted from an invoice as an incentive for a large order, or to compensate the buyer for an expense or mistake. In accounting, allowance is a 'contra account' meaning a credit balance account that goes with account receivables in the current assets section of the balance sheet. Also known as Provisions in the United Kingdom. / расходы, понесённые от имени фирмы.

(2) Allowance is funds allocated periodically for a stated purpose, such as a per diem. Allowance is a sum set aside for an occurrence that may or may not come to pass. For example, funds earmarked for expenses associated with potential bad weather. / расходы, ассоциированные с потенциальной непогодой.

(3) Allowance is a discount, especially one offered as a result of specific circumstances. The discounts (premiums) allowed the buyer for the grades or locations of a commodity lower (higher) than the par or basis grade or location specified in the futures contract. Also known as Differentials. / Скидки (надбавки), предлагаемые покупателю в случае, когда сорт сырья ниже (выше) нарицательного или базового сорта, или в случае различия в месте нахождения сырья, определённом фьючерсным контрактом. Известны также как Дифференциалы (Differentials). Уступка – скидка с цены товара, которую предоставляет перевозчику отправитель товаров для покрытия расходов на потери и порчу продукции при перевозке.

ALLOWANCE FOR BAD AND DOUBTFUL ACCOUNTS RECEIVABLE = ОТЧИСЛЕНИЕ НА БЕЗНАДЁЖНУЮ И СОМНИТЕЛЬНУЮ ДЕБИТОРСКУЮ ЗАДОЛЖЕННОСТЬ – Accounts Receivable is Money owed by customers (individuals or corporations) to another entity in exchange for goods or services that have been delivered or used, but not yet paid for. Receivables usually come in the form of operating lines of credit and are usually due within a relatively short time period, ranging from a few days to a year. On a public company's balance sheet, accounts receivable is often recorded as an asset because this represents a legal obligation for the customer to remit cash for its short-term debts. In the United States, . Accounts Receivable, if a company has receivables, this means it has made a sale but has yet to collect the money from the purchaser. Most companies operate by allowing some portion of their sales to be on credit. These type of sales are usually made to frequent or special customers who are invoiced periodically, and allows them to avoid the hassle of physically making payments as each transaction occurs. In other words, this is when a customer gives a company an IOU for goods or services already received or rendered. When a company owes debts to its suppliers or other parties, these are known as Accounts Payable. Allowance for Doubtful Accounts is an estimated amount of bad debts, to be subtracted from a balance sheet's accounts receivable. Allowance for Doubtful Accounts is an estimation made by a company and documented on its balance sheet for receivables that might go uncollected. It is standard practice for a company to have funds set aside for money that cannot be collected. Allowance for doubtful accounts receivable should be deducted from accounts receivable. In accounting, Allowance for Doubtful Accounts, this account subgroup reflects that portion of accounts receivable estimated not to be collectible. Allowance for Doubtful Accounts is a balance-sheet account established to offset expected bad debts. If a firm has made a sufficient provision in its allowance for doubtful accounts, reported earnings will not be penalized by bad debts when the bad debts occur. If uncollectible accounts are larger than expected, however, the firm will have to increase the size of the account and reduce reported income. Also called Allowance For Bad Debts, Reserve For Bad Debts. Allowance for Bad Debt is an account established to record a subtraction from accounts receivable, to allow for those accounts that will not be paid. The allowance recognizes bad debt expenses, which must be matched against current revenues. An entity could record this simply as a percent of the revenues, or it can assess a different percentage based on the age of the debt or financial strength of the debtor. Traditionally, this accrual was made at the end of the year, so the bad debt expense only showed up in the annual statements and the allowance for doubtful accounts fell during the year as it absorbed write-offs, then jumped at the end of the year when the new assessment was made. The allowance would be adjusted if, at any time, either the allowance exceeded the outstanding accounts receivable, or the allowance went negative/debit. Also known as Provision For Doubtful Debts in the United Kingdom. Allowance method is an accounting method in which a provision is made for estimated bad debts in an accounting period by setting aside a certain percentage of total sales revenue. Any excess or shortfall of this amount (as against the actual uncollectible amount) is adjusted in the following accounting period. It is one of the two such methods; the other is called Direct Write Off Method.

ALLOWANCE FOR FUNDS USED DURING CONSTRUCTION = ОТЧИСЛЕНИЕ ПО ФОНДАМ, ИСПОЛЬЗУЕМЫМ В ТЕЧЕНИЕ СТРОИТЕЛЬСТВА – Allowance for Funds Used During Construction (AFUDC) is a noncash item representing the estimated composite interest costs of debt and a return on equity funds used to finance construction. The allowance is capitalized in the property accounts and included in income.

ALLOY = СПЛАВ – An Alloy is simply a mixture of metals melted together to form a new metal with characteristics distinct from those of the metals from which it is made. Alloy is a solid or liquid mixture of two or more metals; or of one or more metals with certain nonmetallic elements formed by fusing the components. Alloy is a mixture of two or more chemical elements, including at least one metals. In the ase of gold, it is mixed with a baser metal or metals to lower the purity, influence the color or add durability. Alloy is a mixture of two or more chemical elements, including at least one metal. In the case of gold, it is mixed with a baser metal or metals to lower the purity, influence the color or add durability. / Под Сплавами понимаются тела, образовавшиеся в результате затвердевания расплавов, состоящих из двух или нескольких компонентов (химически индивидуальных веществ). Металлические сплавы могут состоять либо только из металлов (например, латунь – сплав меди и цинка), либо из металлов с небольшим содержанием неметаллов (например, чугун и сталь – сплав железа с углеродом). Неметаллические сплавы состоят из неметаллических веществ, например, естественные силикаты (базальт, гнейс, гранит) и искусственные силикаты (стекло, шлаки), сплавы солей и органических веществ. Металлические Сплавы – макроскопические однородные системы, состоящие из двух или более металлов (реже металлов и неметаллов), с характерными металлическими свойствами. В широком смысле сплавами называют любые однородные системы, получаемые сплавлением металлов, неметаллов, оксидов, органических веществ и так далее.

ALLOYING = ЛЕГИРОВАНИЕ (или СПЛАВЛЕНИЕ, или ЛЕГИРУЮЩЕЕ) – Alloying:- almost all metals are used as alloys – that is, mixtures of several elements – because these have properties superior to pure metals. Alloying is done for many reasons, typically to increase strength, increase corrosion resistance, or reduce costs. Processes:- in most cases, alloys are mixed from commercially pure elements. Mixing is relatively easy in the liquid state but slow and difficult in the solid state, so that most alloys are made by melting the base metal – for instance, iron, aluminum, or copper – and then adding the alloying agents. Care must be taken to avoid contamination, and in fact purification is often carried out at the same time, since this is also done more easily in the liquid state. Examples can be found in steelmaking, including the desulfurizing of liquid blast-furnace iron in a ladle, the decarburization of the iron during its conversion to steel, the removal of oxygen from the liquid steel in a vacuum degasser, and finally the addition of tiny amounts of alloying agents to bring the steel to the desired composition. The largest tonnages of alloys are melted in air, with the slag being used to protect the metal from oxidation. However, a large and increasing amount is melted and poured entirely in a vacuum chamber. This allows close control of the composition and minimizes oxidation. Most of the alloying elements needed are placed in the initial charge, and melting is done with electricity, either by induction heating or by arc melting. Induction melting is conducted in a crucible, while in arc melting the melted droplets drip from the arc onto a water-cooled pedestal and are immediately solidified. Sometimes an inhomogeneous, composite structure is desired, as in cemented tungsten carbide cutting tools. In such cases, the alloy is not melted but is made by powder metallurgical techniques. Metallurgy:- Increasing Strength:- the most common reason for alloying is to increase the strength of a metal. This requires that barriers to slip be distributed uniformly throughout the crystalline grains. On the finest scale, this is done by dissolving alloying agents in the metal matrix (a procedure known as Solid Solution Hardening). The atoms of the alloying metals may substitute for matrix atoms on regular sites (in which case they are known as Substitutional Elements), or, if they are appreciably smaller than the matrix atoms, they may take up places between regular sites (where they are called Interstitial Elements). The next coarser type of barrier to slip is a fine, solute-rich precipitate with dimensions of only tens or hundreds of atomic

diameters. These particles are formed by heat treatment. The metal is heated to a temperature at which the solute-rich phase dissolves (e.g., 5 percent copper in aluminum at 540 °C (1 000 °F)), and then it is rapidly cooled to avoid precipitation. The next step is to form a fine precipitate throughout the sample by aging at an elevated temperature that is well below the temperature used for the initial dissolution. In metals that undergo transformations from one crystal structure to another on heating (e.g., iron or titanium), the difference in solute solubility between the high- and low-temperature phases is often utilized. For example, in the low-alloy steels used for tools and gears, carbon forms the hardening precipitate. Carbon is much more soluble in the high-temperature fcc phase (gamma iron, also called Austenite) than in the low-temperature bcc phase (alpha iron, or ferrite). The other alloying elements added (e.g., chromium, nickel, and molybdenum) retard the transformation of austenite on cooling, so that the fcc-to-bcc transformation occurs at a low temperature by a sudden, shear transformation; this allows no time for carbon precipitation and makes the steel harder. A final reheating tends to coarsen the precipitate and thereby increase ductility; this is commonly called Tempering. An array of barriers on the same scale as precipitation hardening can be created by plastically deforming the metal at room temperature. This is often done in a cold-working operation such as rolling, forging, or drawing. The deformation occurs through the generation and motion of line defects, called Dislocations, on slip planes spaced only a few hundred atom diameters apart. When slip occurs on different planes, the intersecting dislocations form tangles that inhibit further slip on those planes. Such strain hardening can double or triple the yield stress of a metal. Increasing Corrosion Resistance:- alloys can have much better high-temperature oxidation resistance than pure metals. The alloying elements most commonly used for this purpose are chromium and aluminum, both of which form an adherent film of stable oxide on the surface that protects the metal from further oxidation. Eleven percent or more chromium is added to iron to create a stainless steel, while 10 to 15 percent chromium and 3 to 5 percent aluminum are commonly added to the nickel- or cobalt-based superalloys used in the highest-temperature components of jet engines. Inhibiting the corrosion of alloys in water is more varied and complex than inhibiting high-temperature oxidation. Nevertheless, one of the most common techniques is to add alloying elements that inhibit the corrosion. Reducing Costs:- gold and silver used in jewelry and coins are alloyed with other metals to increase strength and reduce cost. Sterling silver contains 7.5 percent base metal, commonly copper. The fraction of gold in gold jewelry is designated in karats, with 24-karat being pure gold and 18-karat being 75 percent gold by weight. In coins, alloys with the look and density of silver are commonly substituted for silver; for instance, all US coins that appear to be made of silver actually have a surface layer of 75 percent copper and 25 percent nickel. Lowering Melting Points:- alloying can also be done to lower the melting point of a metal. For example, adding lead to tin lowers the melting point of the tin-rich alloy, and adding tin to lead lowers the melting point of the lead-rich alloy. A 62-percent-tin 38-percent-lead alloy, which is called the Eutectic Composition, has the lowest melting point of all, much lower than that of either metal. Eutectic lead-tin alloys are used for soldering. / Легирование (Alloying). прокатка (rolling), ковка или штамповка (forging), или волочение или протяжка или раскатка или вытяжка (drawing). осадок (precipitate). коррозионная стойкость или стойкость к коррозии (corrosion resistance). Закалка или Упрочнение (Hardening).

ALLOZYME = АЛЛОЗИМ – Allozymes are allelic variants of enzymes encoded by structural genes. Enzymes are proteins consisting of amino acids, some of which are electrically charged. As a result, enzymes have a net electric charge, depending on the stretch of amino acids comprising the protein. When a mutation in the DNA results in an amino acid being replaced, the net electric charge of the protein may be modified, and the overall shape (conformation) of the molecule can change. Because changes in electric charge and conformation can affect the migration rate of proteins in an electric field, allelic variation can be detected by gel electrophoresis and subsequent enzyme-specific stains. Usually two, or sometimes even more loci can be distinguished for an enzyme and these are termed isoloci. Therefore, allozyme variation is often also referred to as Isozyme Variation. Strengths:- the strength of allozymes is simplicity. Because allozyme analysis does not require DNA extraction or the availability of sequence information, primers or probes, they are quick and easy to use. Some species, however, can require considerable optimization of techniques for certain enzymes. Simple analytical procedures, allow some allozymes to be applied at relatively low costs, depending on the enzyme staining reagents used. Allozymes are codominant markers that have high reproducibility. Zymograms (the banding pattern of isozymes) can be readily interpreted in terms of loci and alleles, or they may require segregation analysis of progeny of known parental crosses for interpretation. Sometimes, however, zymograms present complex banding profiles arising from polyploidy or duplicated genes and the formation of intergenic heterodimers, which may complicate interpretation. Weaknesses:- ith identical electrophoretic mobility (co-migration) may not be homologous for distantly related germplasm. In addition, their selective neutrality may be in question. Furthermore, often allozymes are considered molecular markers since they represent enzyme variants, and enzymes are molecules. However, allozymes are in fact phenotypic markers, and as such they may be affected by environmental conditions. For example, the banding profile obtained for a particular allozyme marker may change depending on the type of tissue used for the analysis (e.g., root vs. leaf). This is because a gene that is being expressed in one tissue might not be expressed in other tissues. On the contrary, molecular markers, because they are based on differences in the DNA sequence, are not environmentally influenced, which means that the same banding profiles can be expected at all times for the same genotype. Applications:- allozymes have been applied in many population genetics studies, including measurements of outcrossing rates, (sub)population structure and population divergence. Allozymes are particularly useful at the level of conspecific populations and closely related species, and are therefore useful to study diversity in crops and their relatives. They have been used, often in concert with other markers, for fingerprinting purposes, and diversity studies, to study interspecific relationships, the mode of genetic inheritance, and allelic frequencies in germplasm collections over serial increase cycles in germplasm banks, and to identify parents in hybrids. Allozyme is any one of a number of different structural forms of the same enzyme coded for by a different allele. See also Isozyme. / , от Греческого слова Állos, означающее Другой, и . Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

ALL RISK CLAUSE = ОГОВОРКА О ВСЕХ РИСКАХ – All Risk Clause is a property insurance policy provision that provides reimbursement under any condition not specifically excluded within the policy. The clause is often included for shippers and cargo carriers. Also called All-Peril Insurance. All Risk Clause:- an insurance policy that covers all possible claims not specifically excluded. All risk insurance is found only in property insurance. Homeowners insurance in sometimes all risk insurance. If one's homeowners insurance is an all risk policy and his/her house burns down, the insurance policy covers it unless the agreement states categorically that it will not cover destruction by fire. All risk insurance is usually quite expensive. All Risk Clause:- an insurance provision that all loss or damage to goods is insured except that of inherent vice (self-caused). All risks has a special meaning.This does not mean that the policy covers every kind of risk. In order to recover under this clause, the risk must be fortuitous or accidental in nature and or resulting from an external cause. In other words, the proximate cause of the damage must be from without, not from within. Damage or loss which is inevitable or foreseeable would not come within the definition of All Risks. / Оговорка О Всех Рисках – условие в полисе страхования грузов о предоставлении широкого страхования, покрывающее почти все риски потерь, вызванных любой причиной кроме производственного брака перевозимого товара и некоторых других.

ALL RISK INSURANCE = СТРАХОВАНИЕ ОТ ВСЕХ РИСКОВ – All Risks Insurance is a type of insurance coverage that can exclude only risks that have been specifically outlined in the contract. 'All Risks' means that any risk that the contract does not specifically omit is automatically covered. For example, if an all-risks homeowner's policy does not expressly exclude flood coverage, then the house will be covered in the event of flood damage. This type of policy is found only in the property-casualty market. All-risks

insurance is obviously the most comprehensive type of coverage available. It is therefore priced proportionately higher than other types of policies, and the cost of this type of insurance should be measured against the probability of a claim. This type of insurance offers the shipper the broadest coverage available, covering against all losses that may occur in transit. All Risk Insurance is an insurance against loss or damage to property arising from any fortuitous cause, except such as may be specifically excluded. All Risk Insurance is a marine cargo insurance which covers most perils except strikes, riots, civil unrest, capture, war, seizure, civil war, piracy, loss of market, and inherent vice. / Этот тип страхования предлагает отправителю доступное самое широкое покрытие, покрывающее все убытки, которые могут возникнуть в транзите. Страхование От Всех Рисков – вид имущественного страхования, при котором страховое покрытие распространяется на все виды рисков, за исключением специально оговорённых в страховом полисе; распространённая форма страхования грузов.

ALL RISKS = ВСЕ РИСКИ – All Risks:- a property insurance which covers any accidental loss or damage that is not specifically excluded under the policy. All Risk Coverage – broadest kind of standard coverage but excludes damage caused by war, strikes or riots (civil commotions). All Risks is an insurance term used in cargo insurance which means that the policy covers the insured property for loss caused by any fortuity. The policy does not cover inevitable loss. In practice, such a policy always specifies certain risks that are excluded from cover. The term is often mis-used by hull insurance practitioners to denote a 'full terms' hull and machinery policy.

ALL–TERRAIN VEHICLE ASSOCIATION = АССОЦИАЦИЯ ВСЕДОРОЖНЫХ ТРАНСПОРТНЫХ СРЕДСТВ – The All-Terrain Vehicle Association (ATVA):- How would you feel if your health insurance stopped every time you got on your ATV? Or you were outlawed from trails on millions of acres of public land? Or there was a ban on anyone under 16 riding an ATV? Or you were banned from riding on your own land? By taking on these and other serious issues, the All-Terrain Vehicle Association is waging a battle on your behalf every day. The ATVA is an arm of the 265 000-member American Motorcyclist Association (AMA), which is the world's most powerful voice for motorcyclists. The ATVA is dedicated to increasing members' enjoyment of riding and owning ATVs by serving as a source of authoritative information about where and how to ride, products, events, and racing, and by protecting and promoting the rights of all ATV riders. The ATVA is your best shot at doing something about bad laws. In conjunction with the governmental relations experts at the AMA, the ATVA ferrets out bad laws and fights them on the front lines in regulatory offices, state capitols and Congress. But we need your help. By joining the ATVA, you add your voice to the vital cause of protecting the future of ATVing. And when it comes to convincing politicians and bureaucrats that ATVs are important, nothing speaks louder than numbers. If you hunt, fish or just enjoy the outdoors from the seat of your ATV, there's a good chance you ride on public land, either in public riding areas, or in places that help you reach private land you've gotten permission to enjoy. Whether the land in question is a state gameland, an off-highway-vehicle area, federal forest land, or controlled by the federal Bureau of Land Management, there are officials who must regularly approve the use of ATVs on the lands under their control. If they change their minds, ATVs aren't allowed. The ATVA, again working with the AMA, monitors the current status of riding areas across the country, keeping track of where decision-makers are in their ongoing reviews of what will be allowed on public lands. We weigh in on your side, making sure that ATV and motorcycle use remain high priorities in the minds of regulators. Again, joining the ATVA adds to your clout when dealing with those regulators, and it helps us be more effective in opening new riding areas and keeping existing ones open. Headquartered in Pickerington, OH (States of Ohio), the United States.

ALLUVIAL = АЛЛЮВИАЛЬНОЕ – Alluvial:- pertaining to alluvium; a clayey, silty, sandy, or gravely material deposited by a stream or other bodies of running water. / Под Аллювиальным, от Латинского слова Alluvio, означающее Нанос, понимается то, что относится к аллювию; .

ALLUVIAL FAN = АЛЛЮВИАЛЬНЫЙ КОНУС ВЫНОСА (или СУХАЯ ДЕЛЬТА) – Alluvial Fan is a fan or cone-shaped mass of sand and gravel deposited by a stream where it emerges from a narrow valley and spreads on to a plain or wide valley. / , от Латинского слова Alluvio, означающее Нанос, понимается . Под Конусом Выноса понимается форма рельефа, образованная скоплением обломочных пород (гальки, гравия, песка), вынесенных горными реками на предгорную равнину или в более плоскую широкую долину. Под Дельтой понимается низменность в низовьях крупных рек, впадающих в мелководные участки моря или озера, образованная речными отложениями. Прорезана сетью рукавов и протоков. Название Дельта происходит от заглавной буквы Греческого алфавита Δ (Дельта), по сходству с которой оно было дано в древности треугольной Дельте Нила.

ALLUVIAL SOIL = АЛЛЮВИАЛЬНАЯ ПОЧВА – Alluvial Soil is a soil that has been deposited by any form of running water. / Почва, которая была нанесена любыми формами проточной воды. Под Аллювиальной Почвой, от Латинского слова Alluvio, означающее Нанос, понимается то же, что Пойменная Почва, то есть типы почв, образующиеся на аллювиальных отложениях в поймах рек. Характеризуется высокой биогенностью, слоистостью, интенсивностью почвообразовательного процесса, наличием погребённых гумусовых горизонтов. Очень разнообразны по водному и тепловому режимам, строению почвенного профиля и свойствам. Подразделяются на 3 группы:- (1) Дерновые (типы – аллювиальные дерновые кислые, аллювиальные дерновые насыщенные, аллювиальные дерново-опустынивающие карбонатные) пойменные почвы образуются под злаково-разнотравными лугами и светлыми лесами на прирусловых валах и гривах, в условиях кратковременного увлажнения паводковыми и дождевыми водами. Отличаются лёгким гранулометрическим составом, бедны органическим веществом (содержание гумуса в верхнем горизонте в основном 1–2%, редко до 8%) и основаниями. (2) Луговые (типы – аллювиальные луговые кислые, аллювиальные луговые насыщенные, аллювиальные луговые карбонатные) – формируются под разнотравно-злаковой растительностью в центральной части поймы, в условиях поверхностного устойчивого увлажнения паводковыми и грунтовыми водами. Характерезуются значительным накоплением гумуса (до 12–14% в верхнем горизонте), зернистой структурой, оглеением нижних горизонтов, гидрогенными новообразованиями (марганцево-железистыми и другими). (3) Болотные (типы – аллювиальные лугово-болотные, аллювиальные болотные иловато-перегнойно-глеевые, аллювиальные болотные иловато-торфяные) – развиваются в притеррасной части поймы (травяные и ольшаниковые болота), на пониженных элементах рельефа (впадины и другие), в условиях паводкового и устойчивого избыточного атмосферно-грунтового увлажнения, заторфованы, заилены, в поймах степной, полупустынной и пустынной зон засолены. Пойменные почвы встречаются в разных природных зонах, плодородны. Их используют как луговые угодья, после распашки для выращивания овощных, кормовых и других культур, Риса. Нуждаются в мелиорации (осушение, орошение, известкование).

ALLUVIUM = АЛЛЮВИЙ (или АЛЛЮВИАЛЬНЫЕ ОТЛОЖЕНИЯ) – Alluvium is a mineral material (sand, silt, and clay) deposited by rivers. / Под Аллювием, от Латинского слова Alluvio, означающее Нанос или Намыв, или Аллювиальными Отложениями понимаются отложения постоянных и временных водных потоков (рек, ручьёв), состоящие из обломочного материала различной степени окатанности и сортировки (галечник, гравий, песок, суглинок, глина). Аллювий или Аллювиальные Отложения:- (1) отложения русловых водных потоков (рек, ручьев), слагающие поймы и террасы речных долин и играющие важнейшую роль в строении большинства континентальных осадочных формаций. В аллювии равнинных рек закономерно сочетаются:- русловой аллювий, отлагающийся в смещающемся русле потока (косослоистые пески и гравий), пойменный

аллювий, накапливающийся поверх руслового во время половодий (главным образом супеси и суглинки), и старичный аллювий, осаждающийся в старицах (главным образом богатые органическим веществом супеси и суглинки). Состав и строение аллювия существенно изменяются в зависимости от размера и водного режима потока, рельефа водосбора и слагающих его горных пород. Например, в аллювии горных рек господствует валунно-галечный русловой аллювий, а ручьи, текущие по оврагам и балкам, отлагают плохо сортированный аллювий, в котором трудно разграничить русловой, пойменный и другие виды аллювия. В древних осадочных толщах аллювий обычно сцементирован и сложен твёрдыми обломочными породами – конгломератами, песчаниками, аргиллитами и прочим. С русловым аллювием связаны россыпи золота, платины и других полезных минералов, а также месторождения строительных песков и гравия. (2) В зарубежной литературе Аллювием часто называют всякие отложения текучих вод, включая пролювий и делювий. (3) Устаревшее название всех новейших континентальных отложений, образовавшихся в послеледниковое время (Голоцен); в этом смысле термин Аллювий употребляется иногда лишь в Немецкой литературе.

ALL WATER = ВСЁ ПО ВОДЕ – All-Water:- service rendered by carriers on a port-to-port basis; cargo moving via ocean carrier only. When a shipment is transported from its origin to its destination solely by water transportation. Term used when the transportation is completely by water. / Термин, используемый для обозначения транспортировки груза только лишь по воде (водным транспортом).

ALM = ACTIVE LOAD MANAGEMENT

ALMEN EP LUBRICANT TESTER = ПРИБОР ОЛМЕНА (или АЛЬМЕНА) ДЛЯ СМАЗОК ДЛЯ СВД – Almen Extreme Pressure (EP) Lubricant Tester is a journal bearing machine used for determining the load-carrying capacity or EP properties of gear lubricants. / разработчик Дьжон Оу. Олмен (или Альмен; John O. Almen). для смазок для сверхвысокого давления – машина с опорным подшипником или радиальным подшипником, используемая для определения или свойств СВД смазок для (зубчатых) передач.

ALNOT = ALERT NOTICE

ALOE LACE = АЛОЙНОЕ КРУЖЕВО – Aloe Lace is a bobbin or tatted lace made from aloe plant (i.e. Agave) fibers.

ALOFT = НАВЕРХУ (или НАВЕРХ) – Aloft:- above the upper deck (above). / В морском деле .

ALOHA SHIRT = АЛОХАВСКАЯ РУБАШКА – Aloha Shirt is the Hawaiian shirt. / Алохавская Рубашка – Гавайская рубашка.

ALONGSIDE = ПО БОРТУ (или ВДОЛЬ БОРТА) – Alongside is a phrase referring to the side of a ship or vessel. Goods to be delivered 'alongside' are to be placed on the dock, lighter or barge within reach of the transport ship's tackle so that they can be loaded aboard the ship. Goods are delivered to the port of embarkation, but without loading fees. Alongside:- side to side.

ALONGSIDE VESSEL = ПО БОРТУ СУДНА (или ВДОЛЬ БОРТА СУДНА) – Alongside Vessel:- delivery of cargo on the wharf, berth or lighter under the ship's tackle, for direct loading into the ship.

ALP = AIRPORT LAYOUT PLAN

ALP = AMPLICON LENGTH POLYMORPHISM

ALPA = AIR LINE PILOTS ASSOCIATION, INT'L

ALPACA = АЛЬПАКА – (1) Alpaca is a specialty hair fiber from the Alpaca, a member of the South American Llama Family. It is softer, finer, more lustrous and stronger than Sheep's wool, but in relatively short supply. Fibers are prized for their strength, durability and beauty. Alpaca is a long, fine hair from Alpaca Sheep. Alpaca:- true Alpaca is a hair fiber form the Alpaca Animal, a member of the Llama Family of the South American Andes Mountains. Also imitated in wool, wool and Alpaca, rayon, mohair and rayon or Cotton and a Cotton warp and Alpaca filling also synthetics, e.g., orlon. Fine, silk-like, soft, light weight and warm. Has much lustre and aresembles mohair. If guard hairs are used it is inclined to be boardy. It is strong and durable. True Alpaca is expensive so often combined with other fibers or imitated by other fibers, e.g., orlon. Alpaca is a natural hair fiber obtained from the Alpaca Sheep, a domesticated member of the Llama Family. The fiber is most commonly used in fabrics for dresses, suits, coats, and sweaters. The Alpaca is a domesticated member of the Llama Family, the so called 'South American Camel'. Alpaca fabric is one of the luxury fabrics for its silky, soft and fairly lightweight attributes. Today, the term Alpaca is also used for fabrics made from a blend including some wools that have a similar appearance to true Alpaca. Alpaca is a lustrous and silky natural fiber. While similar to sheep's wool, it is warmer, not prickly and hypoallergenic. Its glossiness makes it somewhat similar to hair; it is used to make items like coats and blankets. Alpaca:- The Animal:- A domesticated member of the South American Camelid Family, the Alpaca (Lama Pacos) numbers 3 million head worldwide. Around 80% are found in the Andes, but sizeable herds (totalling around 200 000 animals) have been established in North America, Australia and New Zealand. Shorn annually, an Alpaca produces about 3 kg of fiber. Alpaca Fiber:- soft and dense, or lustrous and silky, alpaca is used to make high-end luxury fabrics and outdoor sports clothing. Alpaca fiber is partly hollow, from 20 to 70 microns in diameter and comes in 22 natural colors. It is light, stronger than sheep's wool, and provides excellent insulation. Huacayo Alpacas produce soft, dense, short fibers, while the fleece of the rarer Suri is lustrous, silky and straight. Alpaca blends well with wool, mohair and silk. Uses Of Alpaca:- Of the South American Camelids, the Alpaca is the only one whose fleece is used in any quantity for spinning yarns for fashion applications. The primary end use is knitwear, but it is also woven into cloth for clothing, accessories – such as shawls and stoles – and rugs. The premium Alpaca fiber is Cria, shorn from young animals and considered lighter, warmer and softer than cashmere. To widen use of Alpaca fiber, some textile manufacturers blend it with wool, cotton and silk for both knitwear and woven cloth. There is also a growing market for outdoor sports clothing made from Alpaca thanks to its lighter weight and better insulation during cold weather. Producers:- Alpacas, usually in herds of less than 50 animals, are the main source of income for an estimated 120 000 families in the highlands of Peru (above), Bolivia and Chile. There is limited scope to expand Alpaca production in the Andes, due to lack of grazing land. Herds in North America and Australasia are expanding by almost 20% a year, and could soon become significant world suppliers. Production And Trade:- Annual output of Alpaca wool in Peru, the main producer, is estmated at around 6 500 tons. Around 80% is shipped as fleece to textile makers (chiefly in China, Germany and Italy), earning export income of around USD50 million a year. The main purchaser of Alpaca fiber, China, has begun importing Alpacas to create a domestic fiber industry. Peru's Alpaca herders, or Alpaqueros, raise their animals in one of the world's most isolated regions, the grasslands of the Andean plateau, at altitudes above 3 500 meters. But they know that the fine fleece of their Alpacas fetches high prices on world markets:- Peru's annual production of some 6 500 tons of Alpaca fiber earns around USD50 million in export income. Only a fraction of that returns to the estimated 65 000 alpaquero families. Between the producers and large processing plants in the lowland city of Arequipa is a long chain of intermediaries. Small-scale traders collect the raw fiber directly from producers, then sell it to larger traders or processors' agents. Traders do link producers with processors, but – in the words of one report – they are 'capturing an excessive proportion of the value in the chain'. That marketing system is blamed for a steady decline in the quality and value of Peru's Alpaca

fiber. Since intermediaries prefer to purchase by weight, and offer no premium for quality, herders have no incentive to produce higher quality fiber. Result:- at a time when international markets favour fine, light fibers such as mohair and cashmere, less than 10 percent of Peru's Alpaca output in 2007 was classed as 'top quality'. Meanwhile, Alpaca farms in Australia and New Zealand are emerging as strong competitors, thanks to their breeding programmes, processing technology, quality standards and investment in research. Toward A National Strategy:- To help Peru regain lost export market share while improving the livelihoods of its alpaqueros, a recent initiative of the Food and Agriculture Organization of the United Nations (FAO) brought together government representatives, Alpaca producers, fiber processors and other stakeholders. After initial tension – producers complained about prices, processors criticized the quality of their fleece – consensus emerged at regional consultations on the need to improve quality throughout the sector. Next came a series of national workshops that developed Peru's first Camelid Development Strategy. Adopted in May 2006, the strategy recognizes Alpaca fiber as a 'flagship product' of Peru and calls for strengthening producer organizations, promoting investment, developing product and processing standards, and improving research and extension services. The strategy's adoption has been followed by action. With assistance from France and Oxfam, UK, the national producers' association established a center in Puno to train farmers in selecting alpaca for better-quality fleece, and launched a breeding programme that lends out high-quality males. To break the hold of intermediaries, a network of collection centers has been set up to allow producers to bulk-up production, grade their fiber, and sell it on the open market through auctions. The centers are encouraged to use quality standards developed by the Ministry of Agriculture and the processing industry. FAO reports that many producers have taken advantage of the system, although most fibre collection remains in the hands of traders. 'The benefits of this new way of doing business need to be made more widely known', FAO says, 'so more alpaqueros can enjoy premium prices for higher quality fiber'. Policies That Benefit The Poor:- FAO's assistance to Peru's Alpaca sector was provided by its Pro-Poor Livestock Policy Initiative (PPLPI), a programme aimed at helping countries formulate policies and make institutional changes needed to benefit low-income livestock producers. Consensus Shaky:- But consensus on the right approach to reviving Peru's Alpaca sector may be shaky. In 2008, the Peruvian Government decided to break up a national camelid development agency that had been a key partner in FAO's initiative, and the new quality standards have not been widely implemented owing to disputes over their application and arbitration. The global economic downturn is another dark cloud. In 2007, processing companies offered producers very low prices, claiming reduced demand from China. Prices in 2008 were no better. 'Inevitably the cycle will turn', FAO says. 'When that happens, much will depend on the willingness of government and industry to act on the central understanding reached during the strategy process:- that fiber quality is the key to unlocking the sector's potential'. / Альпака – домашнее Парнокопытное Животное Рода Лам; гибрид Гуанако и Викуньи. Разводят в высокогорном поясе Боливии и Перу. Ценная шерсть.

(2) Alpaca is a fabric from Alpaca fibers or blends, (originally a cotton cloth with Alpaca filling) that is used for dresses, coats, suits, and sweaters. It is also used as a pile lining for jackets and coats. The term has been incorrectly used to describe a rayon fabric. / Альпака – ткань из волокна или смеси Альпака, (изначально ткань из хлопка с уточной нитью из Альпака), которая используется для платьев, пальто, костюмов и свитеров. Она также используется в качестве ворсовой подкладки для жакетов, курток и пальто. Этот термин ошибочно использовался для описания ткани из гидратцеллюлозного (вискозного) волокна. Альпака – торговое название ткани полотняного переплетения с хлопчатобумажной основой и утком из блестящего искусственного шёлка. Альпака – тонкая плотная шёлковая ткань с гладким матовым фоном и блестящим рисунком в виде цветов или геометрических фигур. Применяют для подкладки и как платьевую ткань.

ALPACA STITCH = СТЕЖОК АЛЬПАКА (или ПЕТЛЯ АЛЬПАКА, или ВЯЗКА ПЕТЕЛЬ АЛЬПАКА) – Alpaca Stitch is a 1 x 1 purl-links stitch that is knit so that the courses run vertically instead of horizontally as the fabric comes off the knitting machine. A garment made with an alpaca stitch is not always 100% Alpaca; it can be made of other natural or manufactured fibers. / вязальная машина (knitting machine).

ALPHA = АЛЬФА – (1) Alpha is a measure of the residual risk that an investor takes for investing in a fund rather than a market index. It represents the difference between a mutual fund's actual performance and the performance that would be expected based on the level of risk taken by the fund's manager. If a fund produced the expected return for the level of risk assumed, the fund would have an Alpha of zero. A positive Alpha indicates the manager produced a return greater than expected for the risk taken. A negative Alpha indicates the manager has not adequately rewarded investors for the risk taken. Yield indicator. If the average return on a security or portfolio is larger than its expected return, the Alpha is positive. If the average return is smaller than expected, the Alpha is negative. See also Beta. In securities, Alpha is the measurement of returns from an investment in excess of market returns. It represents the amount expected from fundamental causes, e.g., the growth rate in earnings per share. This contrasts with Beta, which is a measure of risk or volatility. / Под Альфой (прописная – A, строчная – α) понимается первая буква Греческого алфавита. В переносном смысле выражение Альфа и Омега означает начало и конец; основа, суть. Альфа:- (1) Коэффициент, показывающий, какая часть отдачи (return) от инвестиций возникает от специфического (нерыночного) риска. Другими словами, Альфа – это математическая оценка величины дохода, ожидаемого исходя из внутренней стоимости (inherent values) инвестиций, которая зависит, например, от темпов роста дохода в расчёте на одну акцию. Этот доход отличается от дохода, получаемого вследствие лихорадочности (volatility) курса акций, которая оценивается с помощью коэффициента Бета (Beta). Например, Альфа в 1.25 означает, что за год цена акции может возрасти на 25%, когда Отдача и Бета этой акции будут равны нулю. Капиталовложения, цена которых ниже их Альфы, являются недооцененными (under-valuated) и рассматриваются как вложения с хорошими перспективами роста. Что же касается взаимных инвестиционных фондов (mutual fund), то их коэффициент Альфа измеряет соотношение между эффективностью деятельности фонда и его Бетой в течение трёхлетнего периода. (2) На Лондонской Фондовой Бирже, которая теперь называется Международной Фондовой Биржей Соединённого Королевства и Ирландской Республики (МФБ; International Stock Exchange of the United Kingdom and Republic of Ireland (ISE)), термин Alpha Stocks (Акции Альфа) применяется по отношению к акциям крупнейших компаний, которые наиболее активно обращаются на рынке. Этот термин был введён согласно системе классификации, принятой после 'Большого Взрыва' (Big Bang) в Октябре 1986, а с Января 1991 он используется в системе классификации 'нормальный размер рынка' (normal market size, NMS).

(2) Alpha (pronunciation:- AL-fah) or A is international nautical signal flag meaning:- I have a diver down; keep well clear at slow speed. With three numerals, radius within which divers are working. Meaning:- diver below (when stationary); I am undergoing a speed trial. International Meaning:- I have a diver down; keep well clear at slow speed. With three numerals, azimuth or bearing.

ALPHA–CAPTURE = АЛЬФА–ДОБЫЧА – Alpha refers to that part of a stock's risk and return that is attributable to the stock individually, as opposed to the overall market. Alpha-capture is a spread trade between a stock futures contract and a stock index futures contract. Also referred to as Company-Specific Trading. / Альфа относится к той части риска и дохода ценной бумаги, который присущ только ей, а не всему рынку в целом. Альфа-добыча это разница в сделке между ценой фьючерсного контракта на акцию и ценой фьючерсного контракта на фондовый индекс. Также применимо к Торговле Акциями Отдельной Компании (Company-Specific Trading).

ALPHA CELLULOSE = АЛЬФА ЦЕЛЛЮЛОЗА – Alpha Cellulose is one of three forms of cellulose. Alpha cellulose has the highest degree of polymerization and is the chief constituent of paper pulp and chemical dissolving-grade pulp. See also Beta Cellulose, and Gamma Cellulose. Alpha Cellulose is the major component of wood and paper pulp. It is separated from the other components by soaking the pulp in a 17.5% solution of Sodium hydroxide. The pure white, alpha cellulose is insoluble and can be filtered and washed prior to use in the production of paper or cellulosic polymers. / Смотрите также Бета Целлюлоза (Beta Cellulose), и Гамма Целлюлоза (Gamma Cellulose). Альфа Целлюлоза – условное обозначение части целлюлозы, не растворяющейся при 20 °C в 18% растворе едкого натра в течение одного часа.

ALPINA = АЛЬПИНА – Alpina:- (i) from an Alpine habitat; and (ii) of a dwarf growth habit. / ; и (ii) о карликовом габитусе роста.

ALPINE = АЛЬПИЙСКОЕ – Alpine:- occurring above the tree line on very high and cold mountains.

ALRESS = AFRICAN LOWLAND RICE EVALUATION AND SCREENING SET

ALS = APPROACH LIGHTING SYSTEM

ALSF = APPROACH LIGHTING SYSTEM WITH SEQUENCED FLASHING LIGHTS

ALSF–I = APPROACH LIGHTING SYSTEM WITH SEQUENCED FLASHING LIGHTS IN ILS CAT–I CONFIGURATION

ALSF–II = APPROACH LIGHTING SYSTEM WITH SEQUENCED FLASHING LIGHTS IN ILS CAT–I MODIFICATION

ALSIMAG® = ЭЛСИМЭГ® – Alsimag® is a registered trademark of American Lava Corporation for ceramic materials. These materials are used in guides and discs on textile processing machines and fiber manufacturing equipment. / Амэрикэн Лава Корпорэйшэн (American Lava Corporation).

ALSIP = APPROACH LIGHTING SYSTEM IMPROVEMENT PROGRAM

ALT = ALTERNATIVE TRADING SYSTEM

ALTERNARIA = АЛЬТЕРНАРИОЗ – Alternaria:- early blight is caused by the Fungus, Alternaria Solani, which survives in infected leaf or stem. Pears are also readily killed by Cotton root rot. Any of various Fungi in the Genus Alternaria, many of which cause plant diseases, chiefly blights and leaf spots. Alternaria:- a Genus of Fungi Imperfecti of the form-class Hyphomycetes, form-family Dematiaceae; it has dark-colored conidia and somewhat resembles Trichophyton. It causes several diseases of plants and is a common allergen in human bronchial asthma; it occasionally causes alternariosis of the skin or lung. A leaf spotting fungal disease which can prematurely defoliate Cotton, usually occurring on stressed plants late in season. / Под Альтернариозом понимается болезнь растений, вызываемая паразитическими Грибами. Особенно вредоносен альтернариоз Капусты. На листьях тёмные пятна, в пределах которых ткань отмирает. Альтернариоз – болезнь, сопровождаемая появлением тёмных пятен, в пределах которых отмирает ткань листа, вызываемая Грибом и способная преждевременно лишить Хлопчатник листьев. Обычно возникает на растениях в предуборочную пору в конце сезона. Альтернариоз (Alternariosis или Alternaria или Alternaria Blight):- грибная болезнь растений, в том числе и Хлопчатника. Возбудителем болезни является сапрофитный Гриб Альтэрнариа Тэнуис Нээс (Alternaria Tenuis Nees). Он живёт в почве на растительных остатках Хлопчатника, с которых начинает переселяться на поражённые макроспориозом отмершие ткани листа, прицветники и коробочки. Болезнь проявляется в том, что на створках коробочек и дольках коробочек Хлопчатника возникает бархатистый налёт тёмно-оливкового цвета. Поражённые болезнью мумифицированные дольки Хлопчатника не распушаются и загнивают; волокно в поражённых коробочках Хлопчатника приобретает тёмно-серый цвет, а на вид становится как бы задымлённым. Со временем спороношения Гриба полностью разрушают волоконца Хлопчатника. Болезнь чаще всего встречается у разновидностей тонковолокнистого Хлопчатника; однако и на загущенных посевах средневолокнистого Хлопчатника, а также при повышенной влажности из-за грузных поздних поливов ей подвергаются раскрытые коробочки нижнего и среднего ярусов растения. Переносчиками болезни являются заражённые семена, орудия труда, насекомые вредители (например, Паутинный Клещ, Хлопковая Совка, Тли), поливная вода и ветер. Альтернариоз Хлопчатника встречается не во всех хлопковозделывающих странах, однако в зонах возделывания Хлопчатника в странах бывшего Союза Советских Социалистических Республик (СССР) была распространена повсеместно. Альтернариоз снижает урожайность данной культуры, например, при поражении 10% растений урожайность снижается на 3 центнера с одного гектара (ц/га); существенно ухудшает технологические свойства хлопкового волокна; и семена Хлопчатника теряют масличность и всхожесть. В качестве основных мер борьбы с этой болезнью служат уборка растительных остатков, зяблевая пахота, предпосевные поливы в зимний период (в странах Северного хлопкового пояса), протравливание семенного материала химическими препаратами, оптимальные сроки сева, должная борьба с вредителями и опрыскивание растения химическими препаратами.

ALTERNARIA LEAF SPOT = ПЯТНИСТОСТЬ ЛИСТЬЕВ, ВЫЗВАННАЯ АЛЬТЕРНАРИОЗОМ – Alternaria Leaf Spot is favored by humid wet conditions. The pathogen is carried over on infected Cotton residues from the previous season. Spots on cotyledons, leaves and bracts vary from 1 to 10 mm in diameter and may be brown to gray/brown, sometimes with dark brown or purple margins, and sometimes with obvious concentric zones. Symptoms should be most severe on lower leaves and least severe on upper leaves, unless leaves are affected by premature senescence. Plants with a heavy fruit load and Pima Cotton are more susceptible. Affected leaves turn yellow and defoliate prematurely. See also Pima Cotton. / Пятна на семядолях (cotyledons), листьях (leaves) и прицветничках (bracts) различаются от 1 до 10 мм в диаметре и могут быть от бурых до серобурых, иногда .

ALTERNATE = ОЧЕРЕДНОЕ – Alternate:- springing one leaf per node at different levels of the stem. Alternate:- of leaves or other parts, not opposite or whorled, but placed singly at different heights on the stem. See also Leaf. Leaves may be arranged on the stem in a variety of ways. The place on the stem from where the leaves grow is called a Node and the part between the nodes is the Internode. If only one leaf arises at a node the leaves are said to be Alternate, if there are two leaves they are Opposite and if there are more than two they are Whorled. / Очередное:- о расположении листьев или частей цветка или иных органов, и не супротивное или мутовчатое, а размещённое по-одному на различных высотах стебля. Смотрите также Лист (Leaf). Листорасположение – расположение листьев на стебле. По мере роста стебля, листья располагаются на нём в определённом порядке, который обусловливает оптимальный доступ к свету. В сущности, листья появляются на стебле по спирали, по либо против часовой стрелки, под определённым углом расхождения. Очередным называется расположение листьев на стебле по одному поочерёдно. Такой вид расположения листьев можно встретить у Берёзы либо Дуба. Последовательное – листья располагаются по одному на каждом узле. Такое расположение листьев у Берёзы, Дуба, Липы.

ALTERNATE HOST = АЛЬТЕРНАТНЫЙ ХОЗЯИН (или ОЧЕРЕДНОЙ ХОЗЯИН, или ОДИН ИЗ ДВУХ РАЗНЫХ ХОЗЯЕВ) – Alternate Host is an individual or plant other than the main or preferred host upon which a parasite (or its spores, eggs, larvae, etc) or a disease organism (pathogen) could live. / , от Латинского слова Alter, означающее Один Из Двух, . (или его споры, яйца, гусеницы и тому подобное) или .

ALTERNATING CURRENT = ПЕРЕМЕННЫЙ ТОК – Alternating Current is an electrical current which reverses direction repeatedly due to a change in voltage which occurs at the same frequency. Often abbreviated AC or ac. See also Direct Current. / Под Переменным Током понимается электрический ток, периодически изменяющийся по силе и направлению. В широком смысле переменный ток – всякий ток, изменяющийся во времени; в узком – периодический ток, среднее за период значение которого равно нулю. С использованием переменного тока связан основной способ передачи электроэнергии вследствие относительной простоты его преобразования (выпрямления, изменения частоты, трансформации). Наиболее часто применяется синусоидальный переменный ток. В электроэнергетике бывшего СССР и настоящей России используют одно- и трёхфазный синусоидальный переменный ток стандартной частоты 50 Герц (Гц), в США – 60 Гц. Переменный ток более высокой частоты применяется в радиотехнике, электроавтоматике и другом.

ALTERNATING TWIST = ЧЕРЕДУЮЩАЯСЯ КРУТКА – Alternating Twist is a texturing procedure in which S and Z twist are alternately inserted in the yarn by means of a special heating arrangement. Alternating Twist:- a yarn in which the twist alternates between S-type and Z-type along the length of the yarn. Sometimes called False Twist.

ALTERNATIVE DELIVERY PROCEDURE = ПРОЦЕДУРА АЛЬТЕРНАТИВНОЙ ПОСТАВКИ – Alternative Delivery Procedure is a provision of a futures contract that allows buyers and sellers to make and take delivery under terms or conditions that differ from those prescribed in the contract. An Alternative Delivery Procedure (ADP) may occur at any time during the delivery period, once long and short futures positions have been matched for the purpose of delivery. A contract delivery method permitting the buyer and the seller, by agreement, to settle their delivery commitment independently of the exchange. / Метод контрактной поставки, разрешающий покупателю и продавцу посредством соглашения утверждать их обязательства по поставке независимо от биржи.

ALTERNATIVE MOTOR FUELS ACT = АКТ ОБ АЛЬТЕРНАТИВНЫХ МОТОРНЫХ ТОПЛИВАХ – The Alternative Motor Fuels Act of 1988 is a law that gives incentives to motor vehicle companies to create more fuel-efficient vehicles. Since its inception, newer fuel standards and laws have been established. However, this act was one of the first to investigate alternative fuels. The Act requested that the Secretary of State study the fuel efficiency of alternative fuels such as alcohol, natural gas or dual energy vehicles. The bill also established a line of credit for car companies to build cars using alternative fuels, specifically ethanol-based fuels. The bill also established the government commission called the Interagency Commission on Alternative Motor Fuels. The Commission was supposed to conduct studies on alternative fuels and inform the Congress its results in 1992. The commission reported on the promises of ethanol- and methanol-based fuels and argued for more public transportation infrastructure. Consumers did not see the full result of this plan since ethanol-based gas had little distribution in the United States. Only in 2005, when the Renewable Fuels Standard passed, did ethanol stations and E85 fuel – gasoline mixed with 5 to 10 percent ethanol – pop up across the country. Currently, 15 percent of the gasoline sold in the United States is E85 fuel. The Alternative Motor Fuels Act of 1988 (AMFA):- investigated future alternative fuels and invested in ethanol; sponsor:- Sen Rockefeller, John D., IV; introduced on 1987-July-21; on 1988-October-14 became Public Law No. 100-494. Alternative Motor Fuels Act of 1988 – Amends the Energy Policy and Conservation Act to direct the Secretary of Energy to ensure that beginning in FY 1990 the maximum practicable number of Federal passenger automobiles and light duty trucks be:- (i) alcohol-powered vehicles; (ii) dual energy vehicles; (iii) natural gas-powered vehicles; or (iv) natural gas dual energy vehicles. Directs the Secretary to conduct a study regarding such vehicles' performance, fuel economy, safety, and maintenance costs. Directs the Secretary to report to the Congress the results of a feasibility study concerning the disposal of such alternative-fueled Federal vehicles. Provides for alcohol fuel to be made available to the public at locations where the Federal vehicles are fueled. States that appropriations for Federal vehicle acquisition shall apply only to that portion of the cost of alcohol-powered (or dual energy) vehicles which exceeds the cost of comparable conventional fueled vehicles. Provides that:- (i) such vehicles shall not be counted in any average fuel economy calculation of the Federal passenger automobile fleet acquired in any fiscal year; and (ii) the incremental cost of such vehicles over the cost of comparable conventional fueled vehicles shall not be applied to any calculation regarding the maximum cost of individual Federal vehicles. Authorizes appropriations for FY 1990 through 1993 for such alternative-fueled vehicles. Requires the Secretary to establish a commercial application program to study alcohol and natural gas fuel use in heavy duty trucks. Authorizes appropriations for such program for FY 1990 through 1992. Directs the Secretary (in cooperation with Federal agencies regulating motor vehicles for safety and environmental purposes) to assist State and local governmental agencies in testing the environmental and safety aspects of alcohol and natural-gas powered buses in urban settings. Authorizes appropriations for FY 1990 through 1992. Establishes the Interagency Commission on Alternative Motor Fuels to develop and coordinate efforts to implement a national alternative motor fuels policy. Requires the Commission chairperson to establish a United States Alternative Fuels Council to report to the Commission about alternative motor fuels matters. Requires the Commission to submit interim reports to the Congress and a final report no later than 1992-September-30. Terminates the Commission and the Council upon submission of its final report. Directs the Secretary to study and report to the Congress regarding the cost and practicability of methanol plants. Requires the Administrator of the Environmental Protection Agency to submit to specified congressional committees biennial reports on a comprehensive analysis of the air quality, global climate change, and other environmental impacts associated with the use of alternative motor fuels under this Act. Requires the reports to include extended reasonable forecasts of environmental effects. Authorizes appropriations. Precludes the voiding of any guaranty or warranty with respect to any federally acquired passenger automobile or light-duty truck after 1989-October-01, on the grounds that such vehicle is operated with nonstandard fuels. Amends the Motor Vehicle Information and Cost Savings Act to set forth fuel efficiency standards for:- (i) alcohol-powered automobiles; (ii) dual energy automobiles; (iii) natural gas-powered automobiles; and (iv) natural gas dual energy automobiles. Prescribes guidelines for calculation of the fuel economy of alternative-fueled vehicles at increasing rates for model years 1993 through 2004. Expands the definition of 'automobile' to include vehicles powered by alcohol or natural gas. Requires the Secretary of Transportation to report to the Congress the results of a study regarding the need to promulgate additional or amended regulations to stimulate the introduction of electric vehicles into commerce. Sets forth fuel economy labeling guidelines for alcohol or natural gas powered automobiles, and dual energy or natural gas dual energy automobiles. Requires the Secretary of Energy to report to certain congressional committees on whether the fuel economy prescriptions and the amendments made by this Act are likely to increase residential energy costs significantly. / сохранение (conservation). Дьжон Дэвид Рокэфэлё (John David Rockefeller).

ALTERNATIVE RATES = АЛЬТЕРНАТИВНЫЕ СТАВКИ – Alternative Rates:- privilege to use the rate producing the lowest charge.

ALTERNATIVE TRADING SYSTEMS = АЛЬТЕРНАТИВНЫЕ ТОРГОВЫЕ СИСТЕМЫ – Alternative Trading Systems are non-traditional, computerised trading systems that compete with or supplement dealer markets and traditional exchanges. These private trading systems; facilitate electronic trading in millions of shares of public issues every day, but do not provide a listing service. Electronic Communications Networks (ECNs) are alternative trading systems; however, not all ATSs are ECNs. A privately operated computerized system that performs many of the functions of a stock exchange by centralizing and matching buy and sell orders and providing post-trade information. Also known as Proprietary Electronic Trading Systems (PETS). Alternative Trading System (ATS) is a trading system that is not regulated as an exchange, but is a venue for matching the buy and sell orders of its subscribers. Alternative trading systems are gaining popularity around the world and account for much of the liquidity found in publicly traded issues.

Regulation ATS was introduced by the SEC in 1998 and is designed to protect investors and resolve any concerns arising from this type of trading system. Regulation ATS requires stricter record keeping and demands more intensive reporting on issues such as transparency once the system reaches more than 5% of the trading volume for any given security. Many alternative trading systems are specifically designed to match buyers and sellers who trade in very large quantities (primarily professional traders and investors). Also, institutions will often use an ATS to find counterparties for transactions, instead of trading large blocks of shares on the normal exchange, a practice that can skew the market price in a particular direction, depending on a particular share's market capitalization and trading volume. Examples of alternative trading systems include, but are not limited to, electronic communication networks (ECNs), crossing networks and call markets. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Альтернативные Торговые Системы являются наиболее динамично развивающимся средством электронной торговли. Они являются местом проведения электронных рыночных торгов, или предоставляют условия для сведения вместе покупателей и продавцов различных активов или осуществляют в отношении этих активов иные функции, традиционно выполняемые биржей, и обеспечивают своим пользователям доступ к информации и торгам на различных площадках через специальное программное обеспечение. В сравнении с брокерами, работающими в Интернете в режиме реального времени, работа альтернативных торговых систем отличается большей оперативностью и надёжностью в том, что касается приёма, обработки и исполнения распоряжений пользователей.

ALTERNATOR = АЛЬТЕРНАТОР (или (СИНХРОННЫЙ) ГЕНЕРАТОР, или ГЕНЕРАТОР (ПЕРЕМЕННОГО ТОКА)) – Alternator is an electric generator designed to produce alternating current. Usually consists of rotating parts which created the changing magnetic field to produce the alternating current. / Под Генератором, от Латинского слова Generator, означающее Производитель, понимается устройство, аппарат, машина, производящие какие-либо продукты (например, ацетиленовый генератор, газогенератор, льдогенератор, парогенератор), вырабатывающие электрическую энергию (например, электромашинный, магнитогидродинамический, термоэмиссионный генераторы) либо создающие электрические, электромагнитные, световые или звуковые сигналы – колебания, импульсы (например, квантовый, ламповый, магнетронный, ультразвуковой генераторы, и генератор радиосигналов).

ALTRV = ALTITUDE RESERVATION

ALUM = КВАСЦЫ – Alum is a term for a variety of chemicals, with a lot of potential for confusion. There are several compounds that are called Alum. One is aluminum potassium sulfate – pickling alum. Others include aluminum sulfate (the alum most used in textile arts, and used in municipal water filtration plants), aluminum ammonium sulfate (ammonia alum), chromium potassium sulfate (chrome alum), and more. Some alums are used as mordants in dyeing, primarily with natural (plant extract) dyes. Aluminum sulfate is often used in marbling. Alum is a hydrated double-sulfate of alumina potassium. A commonly used mordant. / глинозёма или оксида алюминия (alumina) калия (potassium). Алюминия Калия Сульфат (Aluminum Potassium Sulfate). Сульфат Алюминия или Сернокислый Алюминий (Aluminum Sulfate). Под Квасцами понимаются кристаллогидраты двойных сульфатов. Хорошо растворимы в горячей воде. Применяют в качестве протравы для протравливания тканей при крашении, например, ализарин окрашивает ткань, обработанную железными квасцами, в фиолетовый цвет; алюмокалиевые квасцы $KAl(SO_4)_2 \cdot 12H_2O$ как дубящее средство для выделки кожи; в бумажной промышленности для пропитывания бумаги; как вяжущее и антисептическое средство в медицине; и в фотографии.

ALUMINIUM = АЛЮМИНИЙ – Aluminum (spelled Aluminium in most English-speaking countries outside of North America); chemical symbol Al. Aluminum is included here because many pots are made of aluminum. In general, aluminum is not appropriate for dyeing vessels. It is attacked by both acids and bases, and explosive hydrogen is liberated in the process. Also watch out for aluminum rivets used to hold the handles on some stainless steel pots. Aluminium or Aluminum is a silvery and ductile member of the poor metal group of chemical elements. It has the symbol Al and atomic number 13. Aluminium is found primarily in bauxite ore and is remarkable for its ability to resist corrosion (due to the phenomenon of passivation) and its light weight. The metal is used in many industries to manufacture a large variety of products and is very important to the world economy. Structural components made from aluminium and its alloys are vital to the aerospace industry and very important in other areas of transportation and building. Aluminium is a soft, lightweight metal with normally a dull silvery appearance caused by a thin layer of oxidation that forms quickly when the metal is exposed to air. Aluminium oxide has a higher melting point than pure aluminium. Aluminium is nontoxic (as the metal), nonmagnetic, and nonsparking. It has a tensile strength of about 49 MegaPascals (MPa) in a pure state and 400 MPa as an alloy. Aluminium is about one-third as dense as steel or copper; it is malleable, ductile, and easily machined and cast. It has excellent corrosion resistance and durability because of the protective oxide layer. / Металл, используемый во многих отраслях для изготовления . коррозионная стойкость или стойкость к коррозии (corrosion resistance) и . Алюминий, от Латинского слова Aluminium, является химическим элементом III группы периодической системы Менделеева. Ему был придан символ Al. Он имеет атомный номер 13 и атомную массу 26.981 54. Серебристо-белый металл, лёгкий (2.7 г/см^3), пластичный, ковкий, устойчивый против коррозии, с высокой электропроводностью, плотность 2 699 кг/м^3, температура плавления $t_{пл}$ 660 °C. Химически активен, на воздухе покрывается защитной оксидной плёнкой. По распространённости в природе занимает третье место среди элементов и первое место среди металлов (8.8% от массы земной коры), по практическому использованию – 2 место (после железа). Известно несколько сотен минералов алюминия, среди которых:- алуниты, алюмосиликаты, бокситы и другие. Главным носителем алюминия выступают широко распространённые в природе (около 1/2 массы земной коры) алюминосиликаты, к которым относятся глины, полевые шпаты, слюды. Основной источник получения – алуниты, бокситы, нефелин-апатитовые руды. Получают алюминий электролизом раствора оксида алюминия (глинозёма) Al_2O_3 в расплавленном криолите Na_3AlF_6 при температуре 950 °C. Алюминий и алюминиевые сплавы используются в авиастроении, алюминотермии, машиностроении, металлургии (легирующая добавка), пищевой промышленности (тара, упаковка, фольга), строительстве (конструкционный материал, преимущественно в виде сплавов с другими металлами), электронике, электротехнике (заменитель меди при изготовлении кабелей и другое) и в других отраслях и секторах экономики. Расширяется применение композиционных материалов с матрицей из алюминия. Алюминий является одной из самых распространённых легирующих добавок в сплавах на основе железа, магния, меди, титана и других. Главная часть термита – порошкообразной смеси алюминия с железной окалиной, используемого в расплавленном состоянии для термитной сварки крупных механических деталей. Многие металлы в технике получают методом алюминотермии. Широко применяют и различные соединения алюминия. Так, алюминиевые квасцы издавна использовались как протрава при крашении тканей и для дубления кож.

ALUMINUM ALLOY = АЛЮМИНИЕВЫЙ СПЛАВ – Aluminum Alloy:- white particles which indicate wear of aluminum component such as a casing wall. / износ . Под Алюминиевыми Сплавами понимаются сплавы на основе алюминия с добавками меди, магния, цинка, кремния, марганца, лития, кадмия, циркония, хрома и других элементов. Алюминиевые сплавы обладают высокими механическими свойствами и малой плотностью, высокой электро- и теплопроводностью, хорошей коррозионной стойкостью. Применяются в авиастроении, во многих отраслях машиностроения, в строительстве, в производстве бытовых предметов. По способам производства алюминиевые сплавы можно разделить на деформируемые, литейные и спечённые.

По объёму производства и применения занимают второе место после чёрных металлов. Алюминиевые Сплавы, сплавы на основе алюминия. Первые алюминиевые сплавы были получены в 1850-х; они представляли собой сплав алюминия с кремнием и характеризовались невысокими прочностью и коррозионной стойкостью. Длительной время Si считали вредной примесью в Алюминиевых сплавах. К 1907 в Соединённых Штатах Америки (США) получили развитие сплавы Al–Cu (литейные с 8% Cu и деформируемые с 4% Cu). В 1910 в Англии были предложены тройные сплавы Al–Cu–Mn в виде отливок, а двумя годами позднее – алюминиевые сплавы с 10–14% Zn и 2–3% Cu. Поворотным моментом в развитии алюминиевых сплавов явились работы Немецкого инженера-металлурга Альфреда Вильма (Alfred Wilm; 1869–1937) (1903–11), который обнаружил так называемое старение алюминиевых сплавов (смотрите Старение Металлов), приводящее к резкому улучшению их свойств (главным образом прочностных). Этот улучшенный алюминиевый сплавы был назван Дуралюмином (Duralumin или Duraluminium). В бывшем Союзе Советских Социалистических Республик (СССР) Ю.Г. Музалевским и С.М. Вороновым был разработан Советский вариант дуралюмина – так называемый Кольчугалюминий. В 1921 в США Алэдар Пэкс (или Пач; Aladar Pacz) опубликовал метод модификации сплава Al–Si введением микроскопических доз Na, что привело к значительному улучшению свойств сплавов Al–Si и их широкому распространению. Исходя из механизма старения алюминиевых сплавов, в последующие годы велись усиленные поиски химических соединений, способных упрочнить Al. Разрабатывались новые системы алюминиевых сплавов:- коррозионностойкие, декоративные и электротехнические Al–Mg–Si; самые прочные Al–Mg–Si–Cu, Al–Zn–Mg и Al–Zn–Mg–Cu; наиболее жаропрочные Al–Cu–Mn и Al–Cu–Li; лёгкие и высокомодульные Al–Be–Mg и Al–Li–Mg. Основные достоинства алюминиевых сплавов:- малая плотность, высокая электро- и теплопроводность, коррозионная стойкость, высокая удельная прочность. По способу производства изделий алюминиевые сплавы можно разделить на 2 основные группы:- (i) деформируемые (в том числе спечённые алюминиевые сплавы) для изготовления полуфабрикатов (листов, плит, профилей, труб, поковок, проволоки) путём деформации (прокатки, ковки и так далее) и (ii) литейные – для фасонных отливок. Деформируемые алюминиевые сплавы по объёму производства составляют около 80% (США, 1967). Полуфабрикаты получают из слитков простой формы – круглых, плоских, полых, – отливка которых вызывает относительно меньшие трудности. Химический состав деформируемых алюминиевых сплавов определяется главным образом необходимостью получения оптимального комплекса механических, физических, коррозионных свойств. Для них характерна структура твёрдого раствора с наибольшим содержанием эвтектики. Деформируемые алюминиевые сплавы принадлежат к различным группам.

ALUMINUM POTASSIUM SULFATE = АЛЮМИНИЯ КАЛИЯ СУЛЬФАТ – Aluminum Potassium Sulfate is ‘pickling’ alum; $AlK(SO_4)_2$. This is the alum available from the grocery store. / Алюминия Калия Сульфат .

ALUMINUM SULFATE = СУЛЬФАТ АЛЮМИНИЯ (или СЕРНОКИСЛЫЙ АЛЮМИНИЙ) – Aluminum Sulfate, $Al_2(SO_4)_3$, is an ‘alum’. Aluminum sulfate is used in marbling with fabric paints. It will hydrolyze to become quite acid, which will destroy cellulosic fibers if given sufficient time, so it must be applied shortly before use, and rinsed out thoroughly afterwards. / Сульфат Алюминия или Сернокислый Алюминий .

ALVEOLATE = ЯЧЕИСТОЕ – Alveolate:- of a surface or structure shaped like a honeycomb, e.g., pollen or seed surface. / Ячеистое:- о поверхности или структуре в форме как у медовой соты, например, поверхность пыльцы или семя.

ALWAYS AFLOAT = ВСЕГДА НА ПЛАВУ – Always Afloat (AA):- in some ports the ship aground when approaching, or at berth.

AM = ACCOUNTING MANAGEMENT

AM = ACCOUNT MANAGER

AM = AFTER MARKET

AM = AMPLITUDE MODULATION

AM = ARMENIA

AM = ASSET MANAGEMENT

AM = AUDIT MANAGER

AMA = AMERICAN MANAGEMENT ASSOCIATION

AMA = AMERICAN MOTORCYCLIST ASSOCIATION

AMA = ASSET MANAGEMENT ACCOUNT

AMALGAM = АМАЛЬГАМА – Amalgam is a mixture with mercury and silver, gold, copper or another metal, known since classical times. A major use is in dentistry. / Под Амальгамой, от позднелатинского слова Amalgama, означающее буквально Сплав, через Арабский от Греческого слова Málagma, означающее Мягкая Подкладка, понимается сплав ртути с другим металлом. Получают электролизом соли металла со ртутным катодом, взаимодействием металла со ртутью. Амальгаму применяют при извлечении благородных и некоторых цветных металлов в цветной металлургии (амальгамация) из руд и концентратов, как восстановитель, рабочее тело термометров, для золочения металлов, в производстве зеркал.

AMAN RICE = РИС АМАН – Aman Rice is a term used in Bangladesh and East India for lowland Rice grown in the wet season during June to November. The dominant food crop of Bangladesh is Rice, accounting for about 75 percent of agricultural land use (and 28 percent of GDP). Rice production increased every year in the 1980s (through 1987) except FY 1981, but the annual increases have generally been modest, barely keeping pace with the population. Rice production exceeded 15 million tons for the first time in FY 1986. In the mid-1980s, Bangladesh was the fourth largest Rice producer in the world, but its productivity was low compared with other Asian countries, such as Malaysia and Indonesia. It is currently the world’s sixth-largest producer. Highyield varieties of seed, application of fertilizer, and irrigation have increased yields, although these inputs also raise the cost of production and chiefly benefit the richer cultivators. The cultivation of Rice in Bangladesh varies according to seasonal changes in the water supply. The largest harvest is Aman, occurring in November and December and accounting for more than half of annual production. Some Rice for the Aman harvest is sown in the spring through the broadcast method, matures during the summer rains, and is harvested in the fall. The higher yielding method involves starting the seeds in special beds and transplanting during the summer monsoon. The second harvest is Aus, involving traditional strains but more often including high-yielding, dwarf varieties. Rice for the Aus harvest is sown in March or April, benefits from April and May rains, matures during in the summer rain, and is harvested during the summer. With the increasing use of irrigation, there has been a growing focus on another Rice-growing season extending during the dry season from October to March. The production of this Boro Rice, including high-yield varieties, expanded rapidly until the mid-1980s, when production leveled off at just below 4 million tons. Where irrigation is feasible, it is normal for fields throughout Bangladesh to produce Rice for two harvests

annually. Between Rice-growing seasons, farmers will do everything possible to prevent the land from lying fallow and will grow vegetables, peanuts, pulses, or oilseeds if water and fertilizer are available. See also Aus Rice.

AMARANTHINE = АМАРАНТОВОЕ (или ПУРПУРНОЕ) – Amaranthine:- the color of amaranth, i.e. red. / цвет Амаранта (сорное растение, то же, что Щирица).

AMASS = AIRPORT MOVEMENT AREA SAFETY SYSTEM

A_{MAX} = $A_{МАКС}$ – A_{max} is maximum photosynthetic rate or maximum rate of photosynthesis.

AMBAC = AMERICAN MUNICIPAL BOND ASSURANCE CORPORATION

AMBER = ЯНТАРНЫЙ – Amber:- a variable color averaging a dark orange yellow.

AMBIENT AIR = ОКРУЖАЮЩИЙ ВОЗДУХ – Ambient Air is an air that reflects surrounding environmental conditions.

AMBIENT CONDITIONS = ОКРУЖАЮЩИЕ УСЛОВИЯ – Ambient Conditions:- common, prevailing, and uncontrolled atmospheric and weather conditions in a room or place. A test described as 'conducted at ambient conditions' was performed at whatever conditions were prevailing at that time on that day. See also Atmospheric Conditions.

AMBIENT TEMPERATURE = ТЕМПЕРАТУРА ОКРУЖАЮЩЕЙ СРЕДЫ – Ambient Temperature is a temperature of the area or atmosphere around a process, not the operating temperature of the process itself. Ambient Temperature is the surrounding temperature. Ambient Temperature is the temperature of a surrounding body. The ambient temperature of a container is the atmospheric temperature to which it is exposed. / Температура Окружающей Среды – термин, который обращается к температуре в комнате, или температуре, которая окружает объект при обсуждении. Температуры окружающей среды играют главную роль в личном комфорте, так же как функцию многих типов машин и оборудования, и различные методы могут использоваться, чтобы управлять температурой окружающей среды. Обычно, способы управления разработаны, чтобы держать температурную конюшню, поскольку температурные колебания могут вызвать дискомфорт. В смысле температуры комнаты температура окружающей среды под влиянием многих факторов, включая погоду снаружи, качество изоляции в комнате, какой или кто в комнате, и использовании нагревания и систем охлаждения. Например, комната с большим количеством компьютеров будет тепла из-за высокой температуры, произведённой компьютерами, и у комнаты, полной людей или других млекопитающих, также будет тёплая температура окружающей среды в результате тепла тела. Температура окружающей среды может также быть затронута влажностью, с влажными условиями, чувствующими себя более тёплой большинству людей.

AMC = AIR MOBILITY COMMAND

AMC = AMERICAN MARITIME CONGRESS

AMCC = ARTCC MAINTENANCE CONTROL CENTER

AMD = ADVANCED MULTIHULL DESIGN

AMD = AMENDED

AMD = ARMENIAN DRAM

AMDP = AGRICULTURAL MECHANIZATION DEVELOPMENT PROGRAM

AMENDED = ПОПРАВЛЕНО (или ПОПРАВОЧНОЕ) – Amended (AMD):- change to a document or clause – normally initialed and dated to show all parties accepted and approved the Amendment. / Изменение к документу или статье – обычно парафированное и датированное чтобы показать всех сторон, акцептовавших и одобривших данную Поправку. Под Парафированием, от Французского слова Paraphe, означающее Сокращённая Подпись или Росчерк, понимается предварительное подписание международного договора инициалами уполномоченных.

AMENDED BILL OF LADING = ПОПРАВОЧНЫЙ КОНОСАМЕНТ – An Amended Bill Of Lading is a bill of lading with updates or revisions. The updated document does not alter the amount of money for the content or financial status. Some items that could change on an amended bill of lading may include dates of delivery and quantity of products. This is not the same as a corrected bill of lading. Amended Bill of Lading (B/L) is a bill of lading requiring updates that do not change financial status. This is slightly different from corrected B/L.

AMENDMENT = ПОПРАВКА – Amendment is an addition to, deletion from, or a change of existing provisions of the articles of incorporation of a domestic corporation. An addition to the terms of an agreement. See also Modification. / Поправка – добавление к, удаление из, или изменение существующих положений учредительного договора местной корпорации. Поправка:- добавление к порядкам соглашения. Смотрите также Модификация (Modification). Поправка – дополнение или изменение в юридическом документе. При правильном оформлении поправка сохраняет полную юридическую силу оригинального документа.

AMENDMENT TO ALLEGE USE = ПОПРАВКА К ПРЕДПИСАННОМУ ИСПОЛЬЗОВАНИЮ – Amendment to Allege Use (AAU) is a sworn statement signed by the applicant or a person authorized to sign on behalf of the applicant attesting to use of the mark in commerce. With the AAU, the owner must submit one specimen showing use of the mark in commerce for each class of goods/services included in the application, and the required fee. AAUs must be filed before the date the examining attorney approves the mark for publication in the Official Gazette. You should check the status of the application before filing the AAU to make sure that is timely. An AAU filed after the mark is approved for publication but before a notice of allowance has been issued (during the 'blackout period') is untimely and cannot be accepted.

AMENSALISM = АМЕНСАЛИЗМ – Amensalism is an interaction between two organisms in which one organism is suppressed by toxins produced by the second. See also Commensalism. / Под Аменсализмом, от Греческого слова A, означающее Отрицательную Частицу, и Латинского слова Mensa, означающее Стол или Трапеза, понимается форма взаимоотношений между организмами, полезная для одного вида, но вредная для другого. Например, обитающие в норах Сусликов и Кротов 'квартиранты' (Клещи, Блохи и другие) могут служить источником распространения среди грызунов инфекционных заболеваний; 'нахлебники' хищника могут навлечь на него врага или затруднить охоту (например, Вороны, подбирающие остатки трапезы Волка, своим криком привлекают внимание охотника). Чётко отграничить аменсализм от других форм взаимоотношений между организмами не всегда возможно (смотрите Межвидовые Взаимоотношения). Чтобы определить пользу или вред от сосуществования организмов, необходимо учитывать сложный комплекс условий среды. Сравните Комменсализм (Commensalism). Аменсализм – тип межвидовых взаимоотношений, при котором в совместной среде обитания один вид подавляет существование другого вида, не испытывая противодействия. Аменсализм – это такие биотические

отношения, при которых происходит торможение роста одного вида (аменсала) продуктами выделения другого. Эти отношения обычно относят к прямой конкуренции и называют антибиозом. Наиболее хорошо они изучены у растений, которые применяют различные ядовитые вещества в борьбе с конкурентами за ресурсы, и это явление называют аллелопатия. Аменсализм весьма распространён в водной среде. Например, сине-зелёные водоросли, вызывая цветение воды, тем самым отравляют водную фауну, а иногда даже скот, который приходит на водопой. Аналогичные 'способности' проявляют и другие водоросли. Они выделяют пептиды, хинон, антибиотики и другие вещества, которые ядовиты даже в малых дозах.

AMERICAN ASSOCIATION OF INDIVIDUAL INVESTORS = АМЕРИКАНСКАЯ АССОЦИАЦИЯ ИНДИВИДУАЛЬНЫХ ИНВЕСТОРОВ – The American Association of Individual Investors (AAII) is a totally independent nonprofit association that arms individual investors with the education and tools they need to build wealth. From stock investing to financial planning and retirement funding, AAII covers all your needs. James Cloonan, Ph.D., founded AAII in 1978 because he firmly believed that individual investors armed with effective investment education materials and a bit of dedication could outperform the popular market averages. Over thirty years later, the 150 000 members of AAII report investment returns that are consistently higher than those of the stock market as a whole. Further reinforcing Dr. Cloonan's point, AAII's Shadow Stock and Mutual Fund Portfolios (real portfolios used to teach members about investing) have had lower risk scores and better returns than the S&P 500 for the last 10 years. According to Cloonan, 'AAII's purpose is to assist individuals in becoming effective managers of their own assets through programs of education, information and research'. Headquartered in Chicago, IL, the US. The American Association of Individual Investors is a nonprofit organization with about 150 000 members whose purpose is to educate individual investors regarding stock market portolios, financial planning, and retirement accounts. AAII 'assists individuals in becoming effective managers of their own assets through programs of education, information and research'. The organization markets itself as an unbiased source of investment information because of its not-for-profit status. / Дьжеймз Клунэн (James Cloonan, Ph.D.,). Американская Ассоциация Индивидуальных Инвесторов – расположенная в Чикаго некоммерческая организация, созданная для обучения индивидуальных инвесторов. Печатает материалы и проводит семинары по различным направлениям финансовых инвестиций. Кроме того, ассоциация выпускает бюллетень Computerized Investing, в котором даёт оценку компьютерным программам анализа инвестиций.

AMERICAN ASSOCIATION OF MOTOR VEHICLE ADMINISTRATORS = АМЕРИКАНСКАЯ АССОЦИАЦИЯ АДМИНИСТРАТОРОВ МОТОРНЫХ ТРАНСПОРТНЫХ СРЕДСТВ – The American Association of Motor Vehicle Administrators (AAMVA) is a tax-exempt, nonprofit organization developing model programs in motor vehicle administration, law enforcement and highway safety. The association also serves as an information clearinghouse in these areas, and acts as the international spokesman for these interests. Founded in 1933, AAMVA represents the state and provincial officials in the United States and Canada who administer and enforce motor vehicle laws. AAMVA's programs encourage uniformity and reciprocity among the states and provinces. The association also serves as a liaison with other levels of government and the private sector. Its development and research activities provide guidelines for more effective public service. AAMVA's membership includes associations, organizations and businesses that share an interest in the association's goals. AAMVA is the parent to one subsidiary, International Registration Plan, Inc. (IRP, Inc.; Lake Ridge, VA, USA). AAMVA also has four regions incorporated under its umbrella. The organization came into existence in 1933 with the idea of standardizing driver's licensing and traffic laws. In more recent years, AAMVA has pushed very hard for the one driver, one license, one record concept as found in the Driver License Compact and the newly created Driver License Agreement, especially since the events of 2001-September-11. Headquartered in Arlington, VA, the US. Mission:- as the community of motor vehicle and law enforcement agencies in North America, AAMVA will represent member interests in a variety of forums. AAMVA will be recognized as the leading authority for driver and vehicle licensing, and administration and related enforcement. AAMVA will engage motor vehicle and law enforcement agencies and the private sector to advance driver license, vehicle title, motor carrier, highway safety, security, identification and enforcement practice. Vision:- a future where motor vehicle and law enforcement agencies advance public safety and security by:- (i) lowering highway fatalities and injuries; (ii) reducing vehicle theft and fraud; and (iii) improving identification security.

AMERICAN ASSOCIATION OF PORT AUTHORITIES = АМЕРИКАНСКАЯ АССОЦИАЦИЯ ПОРТОВЫХ ВЛАСТЕЙ – American Association of Port Authorities (AAPA) is the alliance of leading ports in the Western Hemisphere (and namely:- ports of Canada, the Caribbean, Latin America and the United States), protects and advances the common interests of its diverse members as they connect their communities with the global transportation system. The Association will attain its mission through four goals:- (i) Representation and Advocacy:- advocate governmental policies that strengthen and expand opportunities for member ports; (ii) Professional Development and Education:- advance professionalism in all facets of port management and operations; (iii) Relationship-Building:- promote information-sharing and relationship-building opportunities for all members; and (iv) Public Awareness:- achieve greater understanding of the essential role and economic value of ports. Headquartered in Alexandria, VA, the US. AAPA was founded in 1912 at a New York City conference of public port officials from 11 US ports. The meeting was called to exchange ideas relative to port organization, to promote the exchange of information and the development of uniform methods of administration and possibly to provide for some permanent organization between the principal port authorities. Within three years, members of the National Association of Port Authorities voted to extend membership eligibility to ports throughout the Western Hemisphere and accordingly renamed it the American Association of Port Authorities. By 1914, AAPA welcomed its first Canadian member; in 1921 the first Latin American port member joined and in 1949 the first Caribbean port member joined the Association. The Association was incorporated on 1930-March-24. In 1947 AAPA established permanent offices in Washington, DC and in 1949 the Association hired its first full-time executive director. AAPA remained headquartered in Washington, DC until 1984 when it moved to its current location in Alexandria, State of Virginia, the United States. / Портовые Власти:- по законодательству России о торговом мореплавании соответствующие администрации морских портов, осуществляющие административно-властные и другие возложенные на них Правительством РФ полномочия.

AMERICAN AUTOMOBILE ASSOCIATION = АМЕРИКАНСКАЯ АВТОМОБИЛЬНАЯ АССОЦИАЦИЯ – The American Automobile Association, Inc. (AAA) is a federation of affiliated automobile clubs. Each AAA club is an independent, not-for-profit organization, chartered and incorporated in its own state and controlled by its own Board of Directors. In order to be affiliated with AAA, each club agrees to provide certain standard services to its own members, as well as members of other AAA clubs. The individual club owns the territory in which it resides, and membership is based on residence. Exact dues and services will vary slightly between clubs. AAA is pleased to extend reciprocal benefits – including maps and TourBook® guides – to members of bonafide international clubs while traveling in the United States. We invite you to visit any one of our more than 900 AAA club offices after your arrival and, on presentation of a valid membership card, AAA will provide travel materials and touring information. AAA office addresses can be found in all telephone directories. In the meantime, we recommend you contact your home club, as we provide our international affiliated clubs the opportunity to purchase AAA publications for advance distribution to their members prior to departure. AAA is unable to ship travel publications directly to our international affiliate members. When you think of AAA, you probably think of maps and directions and emergency roadside assistance, some of our top services. But did you know that AAA offers many services to help with your travel planning. Book air, hotels, and car rentals; find cruises and discount travel; get travel directions; search online maps; speak to a helpful

trip advisor; or get point-to-point driving directions-all from AAA. If you need help getting insurance or a car loan, AAA has you covered, too. AAA (pronounced 'triple A'), formerly known as the American Automobile Association, is a federation of 51 independently operated motor clubs throughout North America. AAA is a not-for-profit member service organization with more than 51 million members. AAA provides services to its members such as travel, automotive, insurance, financial, and discounts. Its national headquarters are in Heathrow, State of Florida, the United States. The American Automobile Association (the AAA or Triple-A) was founded on 1902-March-04, in Chicago, State of Illinois, when, in response to a lack of roads and highways suitable for automobiles, nine motor clubs with a total of 1 500 members banded together to form the Triple-A. Those individual motor clubs were the Chicago Automobile Club, Automobile Club of America, Automobile Club of New Jersey, Long Island Automobile Club, Rhode Island Automobile Club, Philadelphia Automobile Club, Princeton University Automobile Club, Automobile Club of Utica, and Grand Rapids Automobile Club. The first AAA road maps were published in 1905, and AAA began printing hotel guides in 1917. Triple-A began its School Safety Patrol Program in 1920, the first of the association's driver safety programs. The AAA Foundation for Traffic Safety, which conducts studies on motorist safety, was established as a separate entity in 1947. / Бронируйте места у авиалиний, комнаты в гостиницах, автомобили; .

AMERICAN AUTOMOBILE MANUFACTURERS ASSOCIATION = АМЕРИКАНСКАЯ АССОЦИАЦИЯ ИЗГОТОВИТЕЛЕЙ АВТОМОБИЛЕЙ – The American Automobile Manufacturers Association (AAMA) was formed in 1992 and ceased operation in December 1998. Its focus included trade and all other issues of interest to its members. It also devoted a good part of its resources to technical programs, which were generally housed in its Detroit office. At its peak, AAMA had a staff of about 130. The Association of International Automobile Manufacturers (AIAM) still is in operation. The auto industry has been represented by an association since 1903. Over time, as the industry changed, the average numbers of members have decreased from over 130 to less than 20. For the decades preceding the formation of AAMA, the main association representing the industry was Motor Vehicle Manufacturers Association (MVMA), which was open to light- and heavy-duty vehicle manufacturers with vehicle assembly plants in the United States. The American Automobile Manufacturers Association (AAMA) has now been merged into the international Alliance of Automobile Manufacturers.

AMERICAN BANKERS ASSOCIATION NUMBER = НОМЕР АМЕРИКАНСКОЙ АССОЦИАЦИИ БАНКИРОВ – American Bankers Association (ABA) Number – often referred to as the 'Transit Routing Number', is the nine (9) digit electronic address of a financial institution. The ABA number is encoded in the MICR (Magnetic Ink Character Recognition) line of all checks, and is assigned to each financial institution and each branch office of that financial institution.

AMERICAN BOAT AND YACHT COUNCIL = АМЕРИКАНСКИЙ СОВЕТ ПО ЛОДКАМ (или КАТЕРАМ) И ЯХТАМ – The American Boat and Yacht Council (ABYC) began in 1954 as a non-profit organization to develop safety standards for the design, construction, repair and maintenance of recreational boats. The mission of ABYC is to improve boating safety and reduce the number of injuries and fatalities that occur as a result of improper design or maintenance. ABYC's approximately 4 000 members (in 2011) include boat builders, boat yards, yacht brokers, marinas, service technicians, surveyors, retail marine stores, marine insurance companies, equipment manufacturers and boat owners. Both nationally and internationally, ABYC is the acknowledged authority that provides uniform standards to enhance marine manufacturing, maintenance, service and safety. In addition to writing uniform technical standards for the entire marine industry, ABYC has become a leader in education for marine industry professionals, technicians and boat owners by offering seminars, workshops, webinars, marine technician certification training and standards accreditation as well as numerous educational publications. In order to mitigate boating accidents and increase the value of recreational boating, it is hoped that more marine professionals and boat owners will become committed to ABYC's mission to protect the public from unsafe boating through the research, development and education of marine industry standards. By requesting that ABYC Standards be adhered to by all who own, operate, build or repair boats, the quality of the boating experience will be enhanced and costly and dangerous mistakes will be substantially reduced. Headquartered in Annapolis, MD, the United States.

AMERICAN BUREAU OF SHIPPING = АМЕРИКАНСКОЕ БЮРО ПО СУДОХОДСТВУ – American Bureau of Shipping (ABS) is a US-based private classification, or standards setting society for merchant ships and other marine systems. US classification society which certifies seagoing vessels for compliance to standardized rules regarding construction and maintenance. The mission of ABS is to serve the public interest as well as the needs of our clients by promoting the security of life, property and the natural environment primarily through the development and verification of standards for the design, construction and operational maintenance of marine-related facilities. From its foundation in 1862, promoting maritime safety has been the core commitment of ABS. Today, we strive to be the most efficient provider of marine and offshore classification services. We are achieving that goal through the innovative thinking, enthusiasm and professionalism of our staff. At ABS, setting standards of excellence in marine and offshore classification is more than a motto – it is the way we conduct business. The responsibility of the classification society is to verify that marine vessels and offshore structures comply with Rules that the society has established for design, construction and periodic survey. The classification process includes:- (i) the development of standards, known as Rules; (ii) technical plan review and design analysis; (iii) surveys during construction; (iv) source inspection of materials, equipment and machinery; (v) acceptance by the Classification Committee; (vi) subsequent periodic surveys for maintenance of class; and (vii) survey of damage, repairs and modifications. Offering Practical Solutions:- ABS recognizes that the classification world is changing with more emphasis on complex structures, life cycle management, unified standards and safety equivalencies. At ABS, we are dedicated to providing leadership in the development of new technologies intended to improve the safety standards for the marine and offshore industries. ABS headquartered in Houston, State of Texas, the United States.

AMERICAN COALITION FOR TRAFFIC SAFETY, INC. = АМЕРИКАНСКАЯ КОАЛИЦИЯ ПО БЕЗОПАСНОСТИ ДОРОЖНОГО ДВИЖЕНИЯ, ИНК. – The automotive American Coalition For Traffic Safety, Inc. (ACTS) in Arlington, VA is a private company categorized under Professional Organizations. Current estimates show this company has an annual revenue of 12 000 and employs a staff of approximately 2. Companies like Automotive Coalition For Traffic Safety, Inc. usually offer:- Professional Review Organization, It Professional Organizations, Bianco Professional Association, Kentucky State Police Professional Association and University Professional Association.

AMERICAN COMMODITY EXCHANGE = АМЕРИКАНСКАЯ БИРЖА СЫРЬЯ (или АМЕРИКАНСКАЯ СЫРЬЕВАЯ БИРЖА) – American Commodity Exchange (ACE) was founded in 1978 and traded futures on the Government National Mortgage Association (GNMA) certificates and US Treasury instruments. The last futures trades were in July 1981. The exchange closed in 1981 under an agreement whereby ACE members were offered membership in the New York Futures Exchange (NYFE).

AMERICAN DEPOSITARY RECEIPT = РАСПИСКА АМЕРИКАНСКОГО ДЕПОЗИТАРИЯ – American Depositary Receipts (ADRs) allow foreign equities to be traded on US stock exchanges; in fact, this is how the stock of most foreign companies trades in US stock markets. ADRs are issued by US depositary banks, and each one represents one or more shares of a foreign stock, or a fraction of a share. When you own an ADR, you have the right to obtain the foreign equity it represents, although most US investors find it easier to

own the ADR. For example, let's say that shares of CanCorp (a fictitious Canadian company) sell on the Toronto Stock Exchange for CAD5.75 (USD5.00). A US bank buys a number of shares and sells ADRs at a ratio of 2:1. Therefore, each ADR represents two shares of CanCorp and thus should sell for USD10.00. ADRs are held in the vaults of the US banks that issue them, although the shares they represent are actually held in the home country of the foreign-based corporation by a representative of the US depositary bank. ADRs simplify the process of exchanging foreign shares:- since it is only the receipts that are traded, investors do not need to worry about any exchange rate differences or the need to open special brokerage accounts. Furthermore, ADRs entitle investors to all dividends and capital gains. Depositary Receipts are negotiable certificates that represent a non-US company's publicly traded equity or debt. Depositary Receipts are legal, US securities that trade freely on a major exchange or in the over-the-counter (OTC) market in US Dollars, pay dividends or interest in Dollars, and settle, clear and transfer according to standard US practices. The Depositary Receipt evidences the home market security which trades in a foreign country and it is custodised with a local bank, called the Custodian. Also known as an ADR. A depositary receipt is a negotiable certificate that usually represents a foreign company's publicly traded equity or debt. Depositary Receipts are created when a broker purchases the company's shares on the home stock market and delivers them to the depositary's local custodian bank, which then instructs the depositary bank to issue Depository Receipts. Depository Receipts may trade freely, just like any other security, either on an exchange or in the over-the-counter market. Also known as GDRs (Global Depository Receipts). ADRs trade just like normal stocks on various US stock exchanges. Their performance usually parallels that of the parent company on its domestic exchange. Negotiable registered certificate issued on the US market and evidencing title to non-US equity paper. American Depository Receipts (ADRs) are registered with the Securities And Exchange Commission (SEC) and quoted in US Dollars. Holders of ADRs essentially enjoy the same ownership and membership rights as shareholders. A security issued by a US commercial bank in place of the foreign shares held in trust by that bank, thereby facilitating the trading of foreign shares in US markets. The American Depository Receipt (ADR) is a US Dollar denominated negotiable certificate that represents shares listed on an overseas stock exchange that is traded in the United States. ADRs are issued in the United States by a depository bank that owns the underlying foreign shares and holds them in custody in their country of origin. The issuing bank establishes a ratio of ADRs per each foreign share, ranging from a fraction of one foreign share to a multiple. The price of an ADR reflects the price of the underlying foreign stock adjusted for the exchange rate and the set ratio of ADRs per foreign share. Dividends on ADRs are paid in US Dollars. The first ADR was issued in 1927 by JP Morgan to allow American investors to invest in United Kingdom shares that were required to remain physically in the country. Subsequently their use has grown dramatically to include Global Depository Receipts (GDRs) that trade in two or more countries outside the issuer's home market. In 2008 there were more than 2 000 depository receipt programs totaling USD1.5 trillion in market capitalization. International diversification and the prospect of higher returns drive US investor interest in foreign shares. ADRs provide a more convenient and less costly means to invest abroad than buying directly in foreign markets, especially for the retail investor. The US investor relies on the depository bank to handle overseas trading and account settlement as well as foreign currency conversion into US Dollars, as the US investor in ADRs is exposed to exchange rate risk. Another possible benefit to investors is greater legal protection with securities issued and traded in the United States. For overseas issuers, ADRs provide effective access to US equity markets, the largest in the world. They increase and diversify the issuer's shareholder base and expand the market for its shares. Several recent studies conclude that cross-listing in the United States increases the liquidity of the issuer's shares. Trading of a foreign corporation's shares in the United States can also increase international awareness of the firm's name. Beyond these benefits, some types of ADRs also allow issuers to raise capital in the United States. There are several types of ADRs that are distinguishable by their intent, whether solely to expand trading in a firm's shares or to raise capital, and the exchange listing and US Securities and Exchange Commission (SEC) compliance requirements. Level I ADRs are the most basic type. They permit a foreign issuer to have its shares traded in the United States. However, they are not listed on a US exchange and, as a result, need not comply with the reporting standards of an exchange. They trade in the Overthe-Counter (OTC) market via the OTC Bulletin Board or Pink Sheets. They have the least rigorous reporting requirements from the SEC. Their intent is to increase the market for the issuer's shares in the United States. Level II ADRs are listed on a US national exchange, such as the New York Stock Exchange, American Stock Exchange® (AMEX®), or NASDAQ®, and, thus, are subject to listing requirements of the individual exchange as well as greater SEC compliance requirements. The chief benefit of a Level II program is that listing on a national exchange expands the firm's coverage and visibility in US equity markets. Finally, in addition to the benefits of a Level II program, Level III ADRs allow a foreign firm to raise capital in the United States by issuing new shares in an initial public offering (IPO), which entails stricter SEC compliance requirements but provides even greater exposure in US capital markets. Rule 144(a) ADRs or restricted ADRs (RADRs) also allow foreign firms to raise capital in the United States through private placements to 'qualified institutional buyers' as defined under the SEC's Rule 144(a). RADRs are less expensive and require less reporting than do Level III ADRs, but they are less liquid than publicly listed shares. Another distinction between ADRs is between unsponsored and sponsored certificates. The former are issued by the depository bank without the involvement of the overseas issuer. Unsponsored ADRs are restricted to OTC trading and have become increasingly rare. American Depositary Receipts (ADRs) are the depositary receipts held by the overseas branch of an American bank. American Depositary Receipt (ADR):- negotiable share certificates issued by US banks for non-US shares deposited with them. An ADR can be issued for one or several shares or for a fraction of a share. ADRs are traded on stock exchanges in place of the original shares and are quoted in Dollars. They serve to simplify transactions in foreign securities in the United States. The ADR can be traded on a US stock exchange without the stock corporation having to complete the SEC's full listing procedure which would otherwise be necessary for a quotation. / АМЭКС® (AMEX®). Дьжей.Пи. Моргэн (JP Morgan). НЭЗДЭК® (NASDAQ®) . Ценная бумага, выпущенная Американским коммерческим банком в замен акций иностранной компании, находящихся в доверительном управлении у этого банка, тем самым содействующая торговле иностранными акциями на рынках США. Розовые Листки (Pink Sheets). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). брокер закупает акции данной компании на местном фондовом рынке и поставляет их в . Расписка Американского Депозитария (РАД (ADR)) – расписка на акции иностранных корпораций, которые находятся в хранилище банка США. За их владельцами сохраняются права на получение дивидендов и прироста стоимости акций. Вместо покупки акций иностранных компаний на зарубежных рынках Американцы могут покупать акции США в форме РАД. РАД эмитируются на сотни акций из множества стран.

AMERICAN DEPOSITARY SHARE = АКЦИЯ АМЕРИКАНСКОГО ДЕПОЗИТАРИЯ – ADR stands for American Depositary Receipt and ADS for American Depositary Share. An ADR is a receipt given by an American bank to an American shareholder denoting the shares of a non-American company owned by him, and which entitle the shareholder to take all dividends and any capital gains in Dollars. The ADR tells how many ADS's the shareholder owns. Metso ADS's can be traded on the over-the-counter markets in the United States. One ADS corresponds to one share. The Bank of New York Mellon Corporation acts as the depository for Metso ADS's. An American Depositary Share is a US Dollar-denominated equity share of a foreign-based company available for purchase on an American stock exchange. American Depositary Shares (ADSs) are issued by depository banks in the US under agreement with the issuing foreign company; the entire issuance is called an American Depositary Receipt (ADR) and the individual shares are referred to as ADSs. Depending on the level of compliance with US securities regulations the foreign company wishes to follow, the company may either list its shares over-the-counter (OTC) with low reporting requirements or on a major exchange like the NYSE® or NASDAQ®.

Listings on the latter exchanges generally require the same level of reporting as domestic companies, and also require adherence to GAAP accounting rules. An American Depositary Share (ADS), on the other hand, is the actual underlying share that the ADR represents. In other words, the ADS is the actual share trading, while the ADR represents a bundle of ADSs. For example, if a US investor wanted to invest in CanCorp, the investor would need to go to her broker and purchase a number of ADRs that equal to the amount of CanCorp shares that she wants. In this case, the ADRs are the receipts that the investor has to purchase, whereas the ADSs represent the underlying shares (CanCorp) in which she invested. Foreign companies that choose to offer shares on US exchanges gain the advantage of a wider investor base, which can also lower costs of future capital. For US investors, ADSs offer the opportunity to invest in foreign companies without dealing with currency conversions and other cross-border administrative hoops. Even though ADSs represent real claims to foreign shares (and could be converted if the investor wished to do so), there is currency risk involved in holding them. Fluctuations in the currency exchange rate between the USD and the foreign currency will affect the price of shares as well as any income payments, which must be converted into US Dollars. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). За Бэньк оф Нью Йорк Мэлэн Корпорэйшэн (The Bank of New York Mellon Corporation). НЭЗДЭК® (NASDAQ®). Акция Американского Депозитария (ААД (ADS)) – акции, выпускаемые под депозитные договора. Последние представляют собой обеспечение обыкновенных акций, которые обращаются на внутреннем рынке эмитента. Термины ADR (American Depositary Receipt) и ADS обычно воспринимаются как взаимозаменяемые. Но в техническом анализе ADS – это финансовый инструмент, который действительно обращается на рынке, а ADR – это только сертификат, свидетельствующий о праве владения некоторым количеством ADS.

AMERICAN–EGYPTIAN COTTON = АМЕРИКАНО–ЕГИПЕТСКИЙ ХЛОПЧАТНИК – The United States Department of Agriculture (USDA) sponsored the development of American-Egyptian Cotton, first commercially grown in 1912, in response to the demands of American mills for a fiber competitive in quality and price with Egyptian Cotton coming into this country at a rate in excess of 100 000 bales yearly at the start of the XX century. At that time Sea Island, the existing American extra-long staple (ELS) Cotton, was highly priced in comparison with Egyptian Cotton and much in demand from foreign mills. By 1919 Sea Island production was less than 7 000 bales and subsequently went out of production. American-Egyptian extra-long staple Cotton, with a volume of less than one per cent of the total Cotton crop of the United States, has served as a highly strategic commodity since the first commercial harvest of 375 bales in the Salt River, Yuma, and Imperial valleys of the Southwest 1912. Today this variety is the sole extra-long staple Cotton produced in volume in the nation. Since 1939 production has been confined to Arizona, the Trans-Pecos section of Texas near El Paso, and the Mesilla Valley of New Mexico. Pima Cotton, the accepted generic term for all American-Egyptian Cottons, has proven of great strategic value in both world wars and the Korean campaign. In World War I, just as it was coming into existence under the guidance of the Federal Department of Agriculture, the Nationts tire and rubber companies turned to Pima Cotton when Sea Island was failing and Egyptian imports restricted. The extra-long staple was essential to the logistics of war where high tensile strength is most needed. Pima was used in the production of airplanes, barrage balloon coth, machine gun belts, parachute webbing, as well as providing the carcass strength for tires in the worldrs first motorized war. In World War II and the Korean conflict, the war department placed heavy demands on Pima Cotton planters to grow more extra-long staple. Incentive programs to induce greater production were sponsored, and above-market prices established. In times of national need, extra-long staple production reached its highest peaks of cultivation. Production:- A Pattern Of Peaks And Valleys:- the early history of Pima Cotton was largely confined to Arizona. The first experimental farms were located at Yuma and at Sacaton on the Gila Indian reservation of the Pima Indian tribe. The Sacaton farm served as the foremost extra-long staple breeding and experimental area for fifty years, and it was here that the American-Egyptian varieties were developed for commercial use. Until 1939 ninety-seven per cent of all American-Egyptian Cotton marketed was grown in Arizona. From 1922 to 1939, Arizona was the only state in the union which grew this extra-staple variety. The story of the propagation of Pima Cotton, from the breeding and acclimatization program first centered at Yuma in 1902 to its greatest period of stability in the years since 1950, has been one of hills and valleys in production and feast and famine in the market place. Every decade has had its period of crisis. After the initial 1912 commerical crop of 375 bales grown by seventy-five farmers in the Salt River, Yuma, and Imperial valleys of the Southwest, the United States Department of Agriculture, represented by a committee of Southwestern Cotton culture appointed in 1910, recommended that the Yuma and Imperial valleys grow the Durango long-staple upland and the production and the cultivation of American-Egyptian extra-long staple be carried on exclusively in the Salt River valley in Central Arizona. Until 1922, Pima Cotton was almost the only variety grown in the Salt River Valley. (In 1912 and 1913 and the years 1918 and 1920, inclusive, Pima was the only Cotton grown in Maricopa county; in the other years up to 1922 there were small plantings of upland also.) The first five years of the new Pima industry, 1912–16, were years of moderate production increases and fluctuating prices varying from USD78 per bale (1914) to USD210 per bale (1916). The largest crop in this period was 6 187 bales in 1914. These years were devoted to the problems of establishing a new industry. Gins had to be set up, financing of crops arranged, grades and classification by government officials established to provide basis for sale, labor trained, farmers organized to maintain purity of seed, transportation and fair freight rates negotiated, and links made with brokers and mills in the eastern markets in order to sell the new product to the best advantage. The next four years, 1917–20, was a period of boom and bust during which prices reached as high as USD1.32 per pound in 1919 and dropped to as low as twenty cents a pound the following year, a development which brought disaster to the growers and the industry generally. The 1917 acreage more than quadrupled that of 1916 (from 7 300 acres to 35 400); the 1918 plantings more than doubled the preceding year (78 860); 1919 showed a moderate increase (to 87 700 acres), and in 1920 more acres were sown to Pima Cotton (243 000) than has ever been cultivated in a single year since. The 1920 crop of 92 561 bales was more than double the 1919 crop of 40 437 bales but it brought in almost USD4 000 000 less cash. The 1919 crop sold at an average of USD456 per bale and the 1920 harvest was marketed for USD156 a bale, USD300 per bale less, with seed income included. Not until 1942 was Arizona's revenue from all Cottons to reach the 1919 level of cash return. The 1920 Cotton market crash accentuated the problems of the Pima undertaking. Cotton was anathema to the farmers who had plowed up good alfalfa land and sold their dairy herds to make big profits in extra-long staple fibre production. The nation's big tire companies, responsible for the all-too-rapid expansion of the industry in the boom years, had made immense capital outlays for land, new gins and all the facilities needed to grow Cotton in a hurry. New production was financed and a ready-made market provided by the rubber-makers until 1920 when record Egyptian Cotton imports and a post-war depression combined to drop the bottom from prices. Within a few years, the new low-pressure tire was introduced, and the extra-long staple was found too expensive to use. The tire companies themselves were caught with ruinous commitments for Cotton they did not need, a situation that brought them to a financial crisis. There were bank failures in Arizona in 1921; deposits fell off USD12 500 000 in a single year. Nobody was happy about Cotton in these years. Salt River Valley Invaded By Upland Variety Cottons:- the liquidation of the 1920 Pima crop took several years. The largest United States importation of Egyptian Cotton in all history was recorded for the year 1919. After the armistice of November 11, 1918, a total of 485 004 bales of Nile-grown Cotton attracted by high prices was dumped on the American market. The domestic crop of extra-long staple found itself in competition with this heavy foreign import at a time when its own market was disrupted. In 1921, the United States upland crop was the smallest since 1895 due to the infestation of the Boll Weevil in the Southern Cotton states. (The 1921 upland crop was 7 945 000 bales; the preceding year it was 13 932 000 bales. In 1926 a new high crop of 17 978 000 bales of upland was harvested.) The upland price went up to twenty-five cents per pound at Phoenix as of December 01, 1922, where-as the Pima prices held at thirty-two cents. The closeness of

these prices induced many Salt River valley growers to feel that there was more money in the upland, and in 1923, for the first time since the American-Egyptian extra-long staple was introduced into the valley in 1912, more acres were planted to the upland Varieties (45 000 acres) than to Pima (40 000). The December 01, 1923 prices narrowed to only five cents a pound (upland, thirty-five cents; Pima, forty cents), and as a consequence Maricopa county growers planted 122 000 acres to upland in 1924, and only 8 000 acres to Pima. (The Cotton Committee compared net acre returns in Maricopa county for six years 1922–27 and found that in four of the six years the Pima crops were most profitable. In 1922 and 1923, the high upland prices gave this variety the price advantage over Pima, USD13.82 and USD33.86 per acre, respectively. In the successive years 1924–27, the Pima acreage earnings exceeded the upland by USD54.97, USD14.99, USD37.29, and USD27.36, respectively. Higher picking and ginning costs for Pima were considered in the comparison.) In the next three years, 1924–26, world production of upland reached new highs of approximately 16 000 000 bales a year, and upland prices dropped from thirty-five cents in 1923 to fourteen cents in 1926. In the same period Pima prices held close to forty cents a pound. In 1927, more acres were planted to Pima (44 000) than to upland Varieties (39 185) in Maricopa county, first home of the Pima. This is the final year Pima maintained a supremacy in acreage in the Salt River Valley. The ideal of the one-variety community was lost, never to be regained. Formation Of Pima Association To Meet Problems Of 1920's:- the abandonment of the 'one-variety community' in the Salt River valley opened new problems to the incipient extra-long staple industry. Two types of gins – the roller for Pima and the saw for upland – had to be operated by the ginners. The purity of the seed was jeopardized by the two varieties planted in the same area. Contaminated seed destroyed the uniformity of the Pima fiber and lowered the cash return on the market. In June 1921, the Pima Cotton Growers' Association was organized to bring soundness and vitality to the Pima undertaking after the demoralizing crash of 1920. The association successfully undertook the orderly liquidation of 65 000 bales still unsold from the 1920 crop, secured a credit of USD1 200 000 from the war finance corporation to finance the 1921 plantings (only one-half of this was used because of mortgages already pledged), secured lower ginning prices, lower interest rates on loans, lower rates on stored Cotton, and higher prices for its certified seed. (Dwight B. Heard, President of the Arizona Pima Cotton Growers' Association for three years, 1921–23, testified in behalf of the association at the 1921 tariff hearing. In the emergency tariff act of 1921, a seven-cent duty was placed on extra-long staple, 1-3/8 inches and over, effective from May 28, 1921, to September 21, 1922.) On March 15, 1922, the association launched The Associated Arizona Producer as the official organ of the Pima growers, the forerunner of the present Arizona Farmer-Rancher, well-known farm paper published at Phoenix. In September, 1922, the Salt River Valley Water Users' Association and the Maricopa County Farm Bureau joined the Pima growers in publishing The Producer, and by March 1923 eight additional cooperatives were in the partnership. The magazine continued under cooperative ownership, primarily the Water Users' Association, until August 15, 1933, when it passed to private control. (Charles M. Morgan, Secretary of the Pima association, was editor of The Producer from March to July 1922. He was succeeded by Fred F. McLeod who served until October 15, 1923. T.A. Hayden served as editor until July 01, 1924, when Charles M. Morgan, the first editor, again took over the job. He served a year to be succeeded again by Hayden. On March 15, 1929, Ernest Douglas became the editor and has continued to be affiliated with the publication since. On August 15, 1933, ownership passed from the Salt River Valley Water Users' Association to Editor Douglas and W.S. Powers, then the advertising manager. In 1939, publication name was changed to Arizona Farmer-Ranchman, and is now (in 1960) owned by Arizona Farmer, Inc., with Douglas as editor. Burridge D. Butler, publisher of Prairie Farmer and owner of radio station WLS, Chicago, Illinois, bought into the firm in 1940.) The publication has been a great asset to Arizona agriculture as a medium dedicated to raising the standards of farm production. On June 01, 1923, the official paper of the Pima Cotton Growers' Association announced the purchase by the association of a one-fourth interest in the Mutual Oil & Cotton Company which in turn bought the holdings (gins, oil mills, and transportation facilities) of the Firestone RubberCompany and the Southwest Cotton Company (Goodyear subsidiary). This gave the association gin facilities at Phoenix, Chandler, Tempe, Glendale, and Peoria, and favorable arrangements with experienced management of the Mutual Company. The transaction involved an investment of USD680 000 and was hailed by the association paper as 'the longest forward step ever taken by the Salt River Valley' since the association started. (Arizona Farmer-Producer, June 15, 1923.) In the early years of the 1920's there was resistance to growing any variety other than Pima in the Salt River valley. Upland, plantings on the Mesa experimental farm were protested in 1922. The Pima Cotton Growers' Association reflected this attitude by refuting a statement appearing in a prominent textile journal in 1925 that 'a very large percentage of short or medium upland staple was to be planted in Arizona', and inferring that the Pima industry is doomed. The association spokesman regretted the circulation of the rumor as unfortunate because many fine goods mills were well pleased with Pima and to have the impression broadcast that there would not be a continuous supply would be 'calamitous'. (The paper cited that the Salt River valley maintained the policy of a onevariety community, and only a very few acres of short Cotton were planted by farmers who failed to get a stand of Pima because of the cold spring. The valley growers planted 77 000 acres to Pima in 1922. 'In other parts of Arizona, notably the Yuma district, the Florence-Casa Grande district, and the outskirts of the Salt River valley district, there will be planted a multiplicty of shorter varieties. But this does not affect the fundamentals of the Pima industry', the Cotton magazine stated.) The first break in the association determination to deal exclusively with Pima Cotton came in September 1922 when the short staple growers of the Yuma district were invited into membership. On January 01, 1923, the directors of the association stated they were 'trying to keep an open mind relative to the advisability of growing one kind of Cotton or another' but recommended pure seed whatever the choice. A month later the association advertised the sale of two kinds of Acala, Hartsville, and Durango upland seeds as well as Pima, prefacing the price quotations with this statement:- 'Your association is entirely neutral as regards the variety of seed you may require'. The Arizona Pima Cotton Growers' Association became a marketing agency for all types of Cottons and all kinds of seeds. In the speculative era of the late 1920's the association suffered heavy losses from which it did not survive. In November 1930 the formation of a new cooperative, Arizona Cooperative Cotton Growers, was announced. This group joined in contract with Anderson, Clayton & Co. and its Phoenix subsidiary, the Western Cotton Producers' Association. The agreement covered ginning, sale of lint and seed, and a division of profits up to five Dollars a bale on lint and ten Dollars a ton on cottonseed. The peaks and valleys of Pima production continued in the two decades of 1930–39 and 1940–49. In the depression years of 1932 and 1933, less than 10 000 bales were ginned each year. The average annual production for the 1930–39 decade was 16 995 bales. In 1937, Pima Cotton consumption in the domestic mills was only 6 164 bales, the lowest in eighteen years. New Mexico and Texas planters joined Arizona in the three World War II years, 1941–42–43, to increase production to a yearly average of 64 639 bales in response to urgent pleas of the War Mobilization Board for more extralong staple for defense needs. The next six years, 1944–49, saw Pima production sink to its lowest levels in history. The annual crop for these years in the three states averaged only 4 585 bales. The all-time low came in 1947 when the total extra-long staple Cotton crop was 1 205 bales:- Arizona, 163 bales; New Mexico, 101; and Texas, 941. Pima Cotton as an industry was close to extinction in 1947. Higher Production, Consumption Exports Since 1950:- since 1950, Pima production has been the most stable in its history. The crop has never dropped below 40 000 bales in any year and a new record for a single year's production, previously set by the 1920 crop, was established in 1952 with an all-time volume for a single year of 95 000 bales, apportioned:- Arizona, 43 800 bales; Texas, 32 400; New Mexico, 18 100; California, 700. The events of the 1950 decade opened up a new era in the extra-long staple Cotton industry in the Southwest. Production has been the highest and most consistent in Pima history, larger by 250 000 bales than any previous decade since the first commercial crop of 1912. Not only had an all-time record production for one year been established (95 000 in 1952) but in two years (1956–57) for the first time since Pima production started, the spinning mills of the United States used more Pima Cotton than the

imported Egyptian or the Peruvian extra-long staples. (In 1956–57 United States mills consumed 110 594 bales of extra-long staple:- Pima, 61 per cent (67 013 bales); Egyptian, 25 per cent (20 010 bales); Peruvian, 14 per cent (15 571 bales). In the eleven-month period, August 31, 1957 to July 01, 1958, United States mills consumed 91 594 bales in this proportion:- Pima, 45 per cent (40 819 bales); Egyptian 38 per cent (34 429 bales); Peruvian, 17 per cent (16 346 bales).) Almost phenomenal when compared with previous records is the volume of export attained by Pima Cotton in the 1950 decade. In the twenty-five year period, 1931 to 1955, approximately 9 000 bales of American-Egyptian Cotton had gone into the export trade. In the next four years, 1955–58 inclusive, more than 110 000 bales of Pima Cotton was shipped to foreign countries. High-Yielding Pima S-1 Stimulus To Extra-Long Staple Industry:- record production figures, increased consumption of United States mills, the domestic-grown extra-long staple Cotton and the rise of Pima to an export crop, was the result of the development of the new extra-long staple variety, Pima S-1. Dr. Walker E. Bryan, plant-breeder on the staff of the University of Arizona since 1916, created this superior quality, high-yielding variety after a score of years involving a complicated cross of Peruvian Tanquis, Pima, Sea Island, and Stoneland upland varieties. (University of Arizona, College of Agriculture, 46th Annual Report For Year Ending June 30, 1935 reports a Pima-Tanquis cross made by Doctor Bryan. The Tanquis seed was furnished by Dr. T.H. Kearney. The Tanquis had a lint percentage of about 38 per cent as compared with Pima's 28 per cent. Bryan reported 145 fourth generation plants being grown in 1935 to make further studies. No Egyptian Cotton seed was used in the development of Pima S-1. Farmers inspecting the new variety in experimental fields at university farm dubbed the plantings 'Dwarf Pima' because of its comparative size to earlier varieties.) The new Pima S-1 became generally available in Arizona in 1954 and was used to plant nearly all of the 44 000 acres allotted to extra-long staple in 1955 under the government's acreage control. The advent of Pima S-1 with its high-yield potential competed with upland for grower favor and revitalized the extra-long staple industry. In the thirty-eight years of American-Egyptian growth history in Arizona prior to 1950, only in four years had acreage yield exceeded 300 pounds of lint (1939, 1946, 1948 and 1949) with the top yield 346 pounds in 1946. From 1954 to 1957 inclusive, Pima S-l averaged 651 pounds of lint to the acre in Arizona. Compared with previous four-year periods, this was more than double the 1946–49 acre yield of Amsak and SXP varieties (314 pounds) and 176 per cent above the Pima 32 yields of 1950–53 (369 pounds), the American-Egyptian varieties in major use in the years specified. (Average acreage yields of lint Tor Arizona, New Mexico, and Texas combined for these years:- 1946–49, 392 pounds; 1950–53, 352 pounds, 1954–57, 539 pounds.) Development Of New Markets By SuPima Association of America:- added to the favorable developments of the mid-1950's (high volume of production, greatly increased exports, higher rate of consumption in domestic mills, and more lint fiber to the acre than ever before), the industry's status was augmented by the incorporation of the SuPima Association of America following a meeting of extra-long staple growers of Arizona, New Mexico, and Texas, held at Phoenix in July 1954. The growers were concerned about the end use of their product. The miliary stockpile absorbed the crops of 1951 and 1952 and the Commodity Credit Corporation acquired almost the entire 1953 crop and eighty-four per cent of the 1954 crop. In the three years, 1952–54, American mills used more than ninety per cent imported foreign Cotton and less than ten per cent domestic Cotton. The reason for this disparity was plainly evident:- The price of American-Egyptian Cotton at the New England mills was excessively higher than the delivered imports. In the six months prior to the Phoenix meeting, the price for Pima Cotton (January-June 1954) at the mills held at eighty-three cents per pound (No. 2, 1-1/2 inch) and the Egyptian government delivered a comparable grade (fully good to extra, good staple) to American mills at prices (six-month average, 61.83 cents a pound) more than twenty-one cents a pound below the American product. Faced with the fact that the government loan level had priced Pima out of the market and the government must eventually cease to buy the bulk of the domestic crop, the SuPima association undertook to make its product competitive by asking Congress to lower the existing price support from ninety per cent of parity to seventy-five per cent. The growers were convinced that they could make a profit at the lower price by planting Bryan's high-yielding Pima S-1. As a result of the reduction in support levels (a potential loss of fifty-three dollars per bale for growers), in all but two months of 1956 Pima mill prices were from a few cents to as much as twelve cents a pound under Egyptian extra-long imports. With the price competitive, the SuPima association launched a selling-campaign which, aided by the Soviet-Egyptian arms deal and the Suez crisis, resulted in 1956, for the first time since Pima production started, in a greater use of domestic extra-long staple Cotton in American mills than all imported varieties, and in 1957 more than either Egyptian or Peruvian imports. The mill consumption and an export business of 110 000 bales in three years, 1954–57, reduced the inventory of the Commodity Credit Corporation from 99 714 bales from the 1954 crop to 1 579 bales after the 1956 harvest. With demand at high level, SuPima association secured by law release of 50 000 bales of military stockpile extralong varieties to prevent runaway prices which might again price Pima Cotton out of the market. The government had placed extra-long staple under acreage and marketing control in 1954 and because of the favorable 1956 Pima market authorized higher production levels for 1957 (76 600 bales) and 1958 (79 000 bales). This more than doubled the quotas for 1955 (the minimum 30 000 bales) and for 1956 (35 300 bales). The SuPima plan for getting the domestic extra-long staple into trade channels met with gratifying success. The first converter (Hope Skillman, a specialist in American Cottons) made a sheer chiffon called Breeze from Pima lint and Adele Simpson, one the nation's top designers, in October 1955 showed SuPima-Skiliman chiffon in her cruise-line display. The first national advertisement, featuring the Simpson creations, was run in December 1955. This ad, in four colors, won three national awards and was the first of many to run in the nation's high-style magazines:- such as Harper's, Bazaar, Vogue, The New Yorker, Women's Wear Daily, and Town and Country. Printers' Ink, a magazine devoted to advertising, selling and marketing, reported in February 1957 that SuPima's continuing efforts to interest various converters in the extralong staple of the Southwest met 'with dramatic success':- Thirty-five fabrics – ranging from sheer chiffons and voiles to broadcloths, woven novelties and knits – are now manufactured by sixteen different mills and converters. Designers, too, have jumped on the SuPima bandwagon, and such names as Cassini, Estevez, Leser, and McCardell are featured in the association's advertising. Until March 1957, Pima Cotton prices at the New England mills were below Egyptian imports, but commencing in April foreign extra-long staple Cotton began to sell below the domestic product and by May 1958 the spread was more than fourteen cents a pound. Lower Quotas On Foreign Imports Rejected:- The SuPima association growers were convinced that no matter how low the domestic extra long staple was priced that the Egyptian government and other countries could and would under-price the domestic Cotton in order to firm their currency with 'hard' American Dollars. The association tried to maintain a competitive position by seeking further reduction in price support from seventy-five per cent to sixty-five per cent (which is the 1960 ratio) of parity, but even with this drop the price gap was fifteen cents a pound. Inasmuch as the Egyptian government set the delivered prices in the New England market, the SuPima officials determined that the only means of preserving newly-established markets rested with the United States government, which held the industry under acreage and marketing controls. The federal Department of Agriculture, at the request of the SuPima association, asked for a hearing before the Tariff Commission and recommended that import quotas, in effect since 1939, be reduced by fifty-two per cent. (The hearing was held under a provision of the 1938 Agricultural Adjustment Act (Section 22) in which Congress authorized the President on recommendation of the Tariff Commission to cut imports of commodities when such imports interfered with the program set up in the act. The agricultural department cited five programs dealing with domestic extra-long staple Cotton which, the Department charged, the foreign imports were impeding. These were:- (1) A price support program; (2) An acreage allotment and a marketing quota program; (3) Export disposal program; (4) In the Soil Bank Act, and (5) A crop insurance program. The minority Tariff Commission report asserted that it was not in the purview of commission functions to weigh the appropriateness of the programs or their administration, since this was under continuing review by the Congress. It was the commission's function to determine only if imports interfered with the USDA program.) The State Department

opposed the reduction because of the expressed fear that the reduction 'would strike a heavy blow to the Dollar income earned, particularly by Egypt, in selling its Cotton to the American market' (Arizona Star, April 29, 1959). The commission by a three-to-two vote refused to recommend the change asked. The decision was a severe blow to the domestic growers who envisioned the loss of their newly-won outlets to a foreign product, profiting from the association's merchandising program without sharing the cost. The surplus problem, which had all but disappeared after the 1956 crop, was again a depressing effect on the domestic industry. The Commodity Credit Corporation, which had cleared stocks on hand to 1 579 bales after the 1956 crop, had an inventory of 77 500 bales after the 1957 crop, including the unsold 40 000 bales released from the military stockpile (and 230 000 bales which still remained in the strategic stockpile). The SuPima association appealed to Congress to freeze the acreage and marketing quotas for 1960, which otherwise would be lowered to the minimum 30 000 bales by the formula then provided. Congress responded with a law, effective for 1960 only, stipulating that the 1960 quota could not be lowered more than ten per cent of the average of the previous four years. Under this law, the reduction was eight per cent. The association also secured the inclusion of extra-long staple as an exportable commodity which could be sold in foreign countries under public law 480 with payment 'in kind' or 'soft' currencies. Support Of National Cotton Council To Pima Industry:- The United States Department of Agriculture has assured Pima Cotton growers that support will be given the industry to obtain a future hearing before the Tariff Commission because, as Assistant Secretary Clarence L. Miller wrote, 'we believe that interference of imports with the departments program continues'. (Arizona Farmer, January 16, 1960. Quotations are from a letter received from Assistant Secretary Miller to Albert Oshrin at Tucson, Vice President of the SuPima association, dated December 18, 1959. Secretary of Agriculture Ezra Taft Benson in April 1955 said of the SuPima association merchandising program:- 'This compaign to build markets through improved quality, modern promotion techniques and competitive prices is in keeping the the best American traditions'.) The secretary added:- 'We will keep the extra-long staple Cotton situation under review, and we hope the producers will continue their highly commendable effort to expand its use'. This the SuPima association has pledged itself to do. Although the extra-long staple growers had the all-out support of the Department of Agriculture, the Department of State has declared the industry 'expendable' and recommended that the extra-long staple growers 'grow vegetables'. (Arizona Star, February 25, 1959, p. 16. Tim Malone, called the biggest extra-long staple grower in Arizona (Farmer, January 05, 1952, p. 3) did, in 1944, after Pima growers were discontented with treatment received at the hands of the government in the World War II buying program, desert Pima Cotton for vegetables. (Farmer, 'Onward and Upward with Tim Malone', October 06, 1946, p. 11). His case was typical of the industry. He came to Arizona, in 1925, produced Pima Cotton yielding more than short staple, and was declared 'Pima Cotton King' in 1935 by winning a University of Arizona-sponsored high-yield contest. In 1939, he had 3 000 acres in Pima but was interested in vegetables. When the government pleaded in 1942 to produce Pima for military use he grew 1 500 SXP acres In 1944, there were only two Pima growers in the Glendale area:- Malone had 600 acres, the other 200. The next seven years, he did so well in vegetables he said he wanted to forget his Pima past. Yet again, at the call of the Office of Defense Mobilization, he planted 800 acres of Pima 32 in 1951. Labor was the problem in 1952 even as it was in 1942. After the 1952 harvest, Malone said:- 'I'll plant no more long staple until assured of harvest labor'.) The SuPima association has now set their sights on a long-range program, outlined and given endorsement at the 1960 convention of the National Cotton Council held at Dallas, Texas, in February. This program seeks to:- (a) Establish and maintain extra-long staple production in the United States on a permanent and sound basis with a minimum of 64 776 acres; (b) Maintain consistent and satisfactory quality of Cotton; (c) Assure continuing availability of supply, including adequate working stocks; and (d) Maintain a reasonable price relationship to world prices for comparable qualities. The National Cotton Council agreed at this convention to join the SuPima association and the American Cotton Manufacturers Institute in a special study to make the proposed program effective. Efforts to establish and maintain a domestic extra-long staple Cotton industry on a stabilized basis has been a continuing struggle ever since Kearney went to Yuma in 1902 to undertake the propagation of an extra-long staple to meet the competition of a foreign product. The successes were outstanding but not enduring. J. Clyde Wilson of Buckeye, Arizona, reported to the SuPimafs fifth annual convention in Phoenix in March 1959, that the domestic extra-long staple situation was 'desperate but not hopeless'. The decade of 1950 had brought much in the way of accomplishment even though it was ended on a pessimistic note. New records of production, domestic consumption, volume of export trade, and acreage yield had been made. The new Pima S-1 met all the severest quality tests against foreign imports. An aggressive and well-financed growers' association of some 3 000 members (SuPima) was organized to meet the problems, of which Wilson, retiring in 1959 as SuPima President, said there were more than ought to be. Two of the biggest problems were still unsolved and interrelated:- (1) Foreign-government under-selling Pima Cotton prices in the New England market and (2) more and more domestic Cotton into government warehouses, contributing to excessive surpluses and carryovers. Stabilization in production, if not in price, had been met during the 1950's. The volume of production for the ten years, 1950–59, reached a total of 636 000 bales, an average of 63 600 bales a year, more than double that of any previous decade. (USDA Agricultural Marketing Service, Cotton and Cottonseed (Statistical Bulletin 164, June 1955, updated) table 38, p. 41. Production for decades prior to 1950 in gross weight bales of 500 pounds:- 1912–19 – 107 300; 1920–29 – 315 700; 1930–39 – 171 700; 1940–49 – 253 400.) One of the complaints in the early history of domestic extra-long staple Cotton growing was that manufacturers could not be assured of a continuing supply. Growers have proven that they are now in position to supply all domestic demands, in peace and war. American-Egyptian Cotton is a Cotton grown in the irrigated sections of the Southwest (in the United States) ... Developed from Egyptian seed ... Of high grade and having a staple length of 1% to 1-5/8 inches. The largest imports of Sudanese Cotton into the United States took place in the years 1941 and 1942, World War II years when a domestic incentive program was sponsored by the war mobilization board, and in 1947 when the American-Egyptian production was so low that the death knell of its existence was tolled by many in the industry. (Only 1 100 bales of Pima was grown in the three southwest states in 1947:- 100 bales in Arizona, 900 bales in Texas, and 100 bales in New Mexico.) In these three years, (1941–1942–1947), United States imported 11.7 per cent of the total Cotton exports from Sudan, and only 200 bales in one other year (1946) during 1940–49. Coincidentally, imports (in the US) of Egyptian Cotton continued to rise from 100 000 bales in 1900 to 183 786 bales in 1911 and 175 835 bales in 1912. After ten years of research and acclimatization, the first commercial American-Egyptian Cotton crop was grown in 1912, a harvest of 375 bales from plantings by seventy-five farmers in the Salt River, Yuma, and Imperial valleys of the Southwest. After 1918, Sea Island ceased to be important in the extra-long staple market. In the statistical history of the Sea Island Cotton industry in the United States from 1865 to 1912, three states grew an average of 55 266 bales a year:- Georgia, 25 678; Florida, 20 242; South Carolina, 9 346. The average price paid over this period was twenty-one cents per pound. The average upland price from 1880 to 1912, inclusive was 10.17 cents per pound. In the years 1902–12, Sea Island prices averaged 24.41 cents per pound; upland, of comparative grades, 11.035 cents per pound. Egyptian Cotton averaged 18.8 cents on the American market in these years. South Carolina Sea Island commanded a price of 29.07 cents, a premium over returns to the other extra-long staple growing states:- Florida, 22.35 cents; Georgia, 21.8 cents per pound. In the first thirteen years of the XX century, 1900–12, Sea Island crops averaged 90 690 bales. In the next decade, 1913–22, the yearly average had dropped to 55 068. In the next ten years, 1923–32, an average of only 117 bales were grown each year. There was an attempted revival in the years 1937 to 1941, and in this five-year period production averaged 3 792 bales annually. In 1942, 918 bales were grown and in 1943, 374. In the next four years thirty-nine bales was the highest volume and since 1949 no production of Sea Island is recorded. Sea Island Cotton (in 1960) is still produced in limited quantities in Puerto Rico and on some of the islands of the British West Indies. Expansion is restricted in these areas because of limited acreage on these small islands and the need for available

lands to produce food crops. Upland Sold As Sea Island:- the Boll Weevil had reduced the yearly production of Sea Island Cotton in the United States from 92 619 bales in 1917 to 6 916 bales in 1919, and it appeared that the industry was doomed. Omitting the year 1927 when 179 bales were grown, the Sea Island crop from 1924 to 1934 averaged less than eighteen bales a year, from a low of seven in 1929 to a high of twenty-six in 1931. The Bureau of Plant Industry of the United States Department of Agriculture developed, starting in 1912, an extra-long staple upland variety, called the Meade Cotton, producing a fiber mostly 1-5/8 inches but varying from 1-7/16 to 1-3/4 inches of fine texture similar to the Sea Island. So closely did the Meade fiber resemble the Sea Island that only experts could distinguish between the two. The Meade matured two to three weeks earlier, gave a higher production of both lint and seed, and could be picked more easily than the Sea Island. Experimental production started in 1916 and department officials looked to Meade as a possible substitute for the rapidly diminishing Sea Island Cotton. Three generations of progenies had been grown and a superior stock separated before the unexpected death of Meade in 1916. The Meade variety was originally bred in northeastern Texas, at Clarksville, but proved to be well-adapted to the districts of southern Georgia and northern Florida where the Sea Island was grown. In 1916 small experimental plantings of the Meade Cotton were made on the Sea Islands of South Carolina and the following year extended to Sea Island districts of Georgia. There were reports of individual successes with Meade, resulting in numerous requests to the department of agriculture for seed of the new variety. In 1918 sufficient seed had been developed to permit the department to make arrangements with selected growers to plant from five to seventy-five acres under an agreement aimed to prevent crossing with other varieties. (Meade plantings were to be in isolated fields at least 300 yards from any other kind of Cotton; or if this was not practicable, fifty or sixty rows of Corn was to be grown between the Meade plantings and that of any other variety.) The department was to receive one-third of the seed grown while the farmer retained the lint and the remaining two-thirds of the seed for his own use or to sell to neighbors. This was an effort to establish one variety community production of Meade Cotton and maintain adequate supplies of seed. An inspection of these plantings in June revealed that the precautions had not been too well observed and as a consequence not more than 250 acres of the Meade plantings of 1918 had been free of contamination with other varieties. Meade growers were unable to get the cooperation of ginners, a condition which restricted the supply of seed for 1919 plantings. (Only the early Meade crops received careful attention before the Sea Island harvest came to the gins. To assure seed purity gins would have to be thoroughly cleaned before Meade Cotton could be ginned after Sea Island. Sea Island ginners objected to Meade Cotton because of the large size of the seed which would not pass through the grids as rapidly as Sea Island, thus slowing down the process.) About 3 000 acres were planted to Meade Cotton in 1919, of which not more than 500 acres were isolated sufficiently to avoid possible hybridization with other varieties planted in nearby fields. In 1920 many bales of Meade were marketed as Sea Island and accepted on the market without question, whereas the total production of Meade approximated 2 000 bales, not including what sold as Sea Island. Spinning tests showed the practicability of using Meade Cotton in place of the Sea Island in the manufacture of thread and fibers of special quality. Since the good Meade Cotton was sold as Sea Island, Meade as a variety never gained the reputation it merited. In the rush of expansion, there was much planting of mixed seed and the inevitable production of irregular fiber, so sharply discounted in the market, that even good Meade became difficult to sell. Failed as Sea Island Substitute Consequently, the early successes of the Meade variety were turned to failures, almost before it had been able to prove its worth. Two scientists of the federal department of agriculture laid the demise of the Meade variety to these factors:- The failure to establish the production of Meade Cotton as a substitute for Sea Island was largely the result of the persistent planting of Sea Island and short Cotton in the same localities with the Meade. The growers did not appreciate the necessity of complete isolation of the fields and separate ginning of the Cotton to maintain the purity of the seed stocks and uniformity of the fiber. Careless ginning methods, with consequent mixing of the seed and the crossing of the plants in the field, made it impossible to secure stocks of seed and maintain the uniformity of the fiber required by manufacturers. The subsequent marketing of mixed irregular fiber under the name of Meade Cotton brought the variety into disrepute among the spinners as well as among the buyers and so increased the difficulties of marketing that farmers were discouraged from planting it. Both Sea Island and the Meade Cotton continued to be grown in limited quantities, but seed problems and the ever-encroachment of short staple into the extra-long staple areas throttled attempts at expansion or revival. Since the extra-long staple requires roller gin equipment, the maintenance of two sets of gin equipment was added expense. Many of the roller gins in the former Sea Island districts were dismantled and some moved to Arizona to care for the extra-long staple crops there. See also Extra Long Staple Cotton, Pima Cotton, Supima®, and Upland Cotton. Xxxxx. Pioneering A New Industry:- the high quality of Egyptian Cotton was recognized by the United States Department of Agriculture as early as 1867. The department reports of 1867 and 1871 contain the results of more than fifty trials in all the states then producing Cotton, from North Carolina to Texas to Alabama. The crop required too long a season from planting to maturity and, except in one or two instances in Southern Louisiana, was found generally unsatisfactory. As a consequence, there were no further experiments during the next twenty years. From 1892 to 1894 the department again imported Egyptian seed which was sent to all Cotton-growing states for testing at experiment stations and private plantations. Failures were reported in almost every case; growers were so discouraged that they did not bother to save the seed for further trials. (W.H. Wentworth in San Patricio County in Southern Texas obtained only seventy-five pounds of seed Cotton from three acres but noting its superior quality carried his planting to the sixth generation (1899). The acclimatization improved the stand but as a lone producer he gave up; the volume was too small to command a market.) Fairchild and Lathrop Egyptian Cotton Seed Reaches The Southwest:- The year 1898 marked the beginning of scientific Cotton breeding in the United States. That year Dr. Herbert J. Webber started Cotton breeding for the United States Department of Agriculture, making Egyptian Cotton an important item of study. Prior to 1898, limited Cotton breeding had been done at several state experiment stations but, lacking coordination and continuity, little of permanent value resulted. Webber's first attempts at producing an Egyptian-type Cotton on American soil were made in the humid section of the United States, particularly in South Carolina and Texas. He concluded that Egyptian varieties could not be profitably grown anywhere in the main Cotton belt and he so informed the Southern Cotton Spinners' Association at its 1903 convention. L.H. Dewey, in charge of fiber investigations, in 1901 and 1902 received numerous reports of trial plantings which confirmed that little success could be expected from Egyptian Cottons in the humid portion of the Cotton belt. (Dewey reported an excellent quality of fiber but small yields due to the shortness of the season which prevented many bolls from ripening. There was also delay in the spring by wet weather and killing frosts took place so early in the fall as to prevent full harvest.) In 1901 and 1902, Egyptian seed reached Arizona and California, coming from shipments sent from Cairo by David G. Fairchild and Barbour Lathrop, a Chicago philanthropist and world traveler with whom Fairchild had been associated since 1895 as an assistant in botanical researches. (Who's Who in America, 1903–05, p. 468, gives five expeditions made by Lathrop and Fairchild:- To Dutch East Indies, 1895; to South Sea Islands, Siam, Australia, and New Zealand, 1896–97; to West Indies, South America, Egypt, Ceylon, Dutch East Indies and New Guinea, 1898–1900; to Japan, China, Ceylon and Persian Bulf, 1901–02; Africa, 1903.) In 1898, Fairchild organized the Office of Foreign Seed and Plant Introduction and served as its head, except for leaves of absence on special expeditions with Lathrop, until his retirement in 1928. The importation of a large amount of Egyptian Cotton seed was noted by the agricultural department in its 1900 report:- Through the generosity of Hon. Barbour Lathorp of Chicago, the Department of Agriculture has been made the recipient of a large collection of seeds and plants ... the result of an exploring expedition which lasted from December 1898 to September 1900. He was accompanied by Mr. D.G. Fairchild, formerly special agent in charge of this department. This expedition procured over 450 separate items of seeds and plants. ... One of the most promising importations of the year has been the Jannovitch Cotton, secured in Egypt by Messrs. Lathrop and Fairchild. About 2 000 pounds of seed have been placed among some 1,100

experimenters in the Cotton states. Fairchild, in a book published in 1938, placed the price of Jannovich seed, then a new Egyptian variety, at twenty Dollars a pound, and as a consequence he had decided to send only small samples to the United States. Larger shipments were prompted by the apparent generosity credited to Lathrop by the Department of Agriculture. Fairchild said the increased volume of seed resulted from a conversation between the two:- I described the Cotton situation and told him of the samples I was sending to Washington. After a moment he said quite simply '... if you think it is such a good thing, why don't you send more of it?' ... Mr. Lathrop persuaded me to send two bushels of each variety, which was fortunate as, unbeknownst to me, my old friend Webber had begun his cotton-breeding experiments. Some of the seed was sent to Arizona and California and from it grew the first Cotton of that section, drawing attention to the possibility of Egyptian Cotton culture in the Southwest. Three years later (1902), I photographed Doctor A.J. Chandler standing beside his Cotton Plants grown in Arizona from the Egyptian seed. During the next quarter of a century, T.H. Kearney, O.F. Cook, Swingle and Webber all spent much time in the improvement of the Egyptian Cotton, and Chandler, Arizona is now (1938) the center of a large cotton-growing district? (David G. Fairchild, The World is My Garden (New York; Scribner's, 1938), pp 141-142. The photo of Doctor Chandler referred to above appears on p. 140-B. On pp 205-07 the author writes:- 'I had no real conception of the enormous amount of careful pioneer work and Plant-breeding investigations which would be necessary before an Egyptian Cotton industry was established around Chandler. Nor could I foresee how much the working out of this problem would absorb the lives of my friends – Cook, Kearney, Scofield and others – leading them into the field of genetics, a new branch of science'.) Through a series of accidents the original selections from the imported Jannovich Variety were lost. The Mit Afifi Variety became the parental stock of the first domestic extra-long staple Cotton Varieties of the Southwest. McClatchie Experiments At Phoenix Farm In 1901:- Prior to 1902, two other plantings of Egyptian seed in the Southwest are of record, in addition to the Chandler fields cited by Fairchild. One was located at the territorial experiment farm, affiliated with the University of Arizona, two miles northwest of Phoenix, and directed by Professor A.J. McClatchie, the superintendent. The other was in the Imperial Valley, California, on land where Calexico now stands. Doctor H.J. Webber, who started the Plant breeding program in the Department of Agriculture, directed the Calexico planting, in cooperation with T.H. Kearney. The Egyptian Cotton experiment at the Phoenix farm was undertaken in the spring of 1901 using three Varieties:- Abassi, Mit Afifi, and Jannovich. The crop was ginned on a roller gin at Audobohn Park, Louisiana, through the kind-nexx of Director Stubbs of the Louisiana experiment station. The experiment continued in 1902, but Professor McClatchie announced that there would be no further plantings the following year, inasmuch as the culture had been continued long enough to establish the main facts as to Varieties and methods. He found that growing on a sufficient volume for results to be practical required a large amount of labor. The plantings by Doctor Webber in the Imperial Valley may have antedated the Egyptian Cotton seedings at Chandler and the Phoenix territorial farm station, although it is probable they were contemporary sowings notwithstanding this claim:- In 1900 Webber grew about three acres of Mit Afifi in the Imperial Valley, California, on land where Calexico now stands. This was the first year water was turned into the irrigation canal and the Cotton was the first grown in this valley. A number of selections were made from this patch, which marked the real beginning of the American-Egyptian Cotton industry in this country. As of April 01, 1907, Doctor Webber resigned from the department to accept a post at Cornell University at Ithaca, New York, and Doctor Thomas H. Kearney, who had been associated with him from the start of the plant-breeding program, was given complete charge of that phase of the work in the Southwest. His earliest reference to plantings at Calexico was a crop of outstanding Jannovich grown there in 1902 and in 1903. In 1904, Mit Afifi and Jannovich Egyptian Varieties were planted only at Carlsbad, New Mexico, and Yuma, Arizona. Of the three Egyptian Cotton experiments undertaken before 1902, none were carried through to commercial production, but all proved that the Southwest was the most favorable area for development. Doctor Chandler gave up his experiments because of the difficulty in finding the help needed to cultivate, harvest and market the crop properly. McClatchie had reported in detail on two years of experiment with the crop, following directions laid down by Professor Foaden, an Egyptian authority. McClatchie conveyed information on how and in what amounts water was applied and the results from various methods of irrigation, valuable data for future planters. (A.J. McClatchie, 'Irrigation at the Arizona Experiment Station Farm', Report of Irrigation Investigations, 1901, (Office of Experiment Stations Bulletin 11:- 1902), p. 100. Cotton grown from Mit Afifi seed planted by McClatchie was tested at the Lowell, Massachusetts textile school and, compared with imported Mit Afifi, showed four per cent less waste and furnished thread fourteen per cent stronger.) Full development of the extra-long staple Cotton industry in the Southwest, however, passed to other persons. Foremost of these was Doctor Thomas Henry Kearney, who gave most of his adult life to the development of American varieties of Egyptian Cotton. Before his retirement on June 30, 1944, he had propagated four distinct varieties, each better than its predecessor. The Department of Agriculture in announcing Doctor Kearneyrs retirement referred to him as 'the plant scientist whose research was the basis of the American-Egyptian Cotton industry'. (In 1920 the University of Arizona bestowed upon Kearney the honorary degree of Doctor of Laws as the originator of the Pima variety of extra-long staple which in 1919 'was worth to the State of Arizona no less than twenty millions of Dollars', according to Dean Working of the College of Agriculture who introduced him to the assembly. A native of Cincinnati, Ohio, Kearney began work in the USDA when he was twenty years old. One of his achievements, best known to botanists, was the preparation in collaboration with Robert H. Peebles, an associate at Sacaton, of 'Flowering Plants and Ferns in Arizona', an authoritative book listing the plants of the state. This was first published by USDA in 1942. A second edition was published by the University of California in 1952. Moving to San Francisco after his retirement in 1944, Kearney became honorary curator and a research associate with the California Academy of Scientists. He died in a San Francisco hospital in October 1956 at the age of 82 years.) Yuma Cotton Experiment Center In 1902:- Starting in 1902, the Bureau of Plant Industry intensified experimentation with Egyptian Cotton, doing the concentrated study at Yuma, Arizona, as the area where successful growth was most likely. (USDA 1907 Yearbook, p. 322. A tract of six acres of land belonging to the Reclamation Service was made available to the Bureau of Plant Industry and ten acres on the Yuma mesa, about sixty feet above the Colorado River, was leased. Cotton, with other fruit and forage crops, were tested on all three areas. In 1909 experimental plantings were located near the Village of Somerton, about fourteen miles south of Yuma. In 1910 most of the work was transferred to a 150-acre experimental farm situated on the California side of the Colorado, near Bard, about seven miles above the town of Yuma. After 1907, Sacaton, located on the Gila Indian reservation in Central Arizona, became the chief center for Cotton experiment.) This region was selected after Kearney and Thomas H. Means of the Bureau of Soils had visited Egypt and made a detailed survey of the climate, soils, irrigation methods, and growing conditions along the Nile River. For the next five years, Yuma was the center of testing with minor plantings and preliminary tests in other areas. In 1907, land was acquired on the Gila Indian reservation near Sacaton, some thirty miles south of Phoenix, through agreement with the Indian affairs office of the Interior Department. For fifty years Sacaton was the locale of extra-long staple Cotton experimentation in the United States and the home of development for all the American-Egyptian Varieties. Since 1957 federal, state and University of Arizona personnel have cooperated in Cotton experimentation at the new Cotton center at Phoenix, largely financed by the Arizona Cotton Planting Seed Distributors, a farmers' cooperative. Preliminary experiments made by Webber and Kearney in 1902 in the Southwest included:- the Mit Afifi variety at San Antonio and Barstow, Texas, and Carlsbad, New Mexico; the Jannovich Variety at Barstow, Carlsbad, Yuma, and Calexico, California. In addition Webber supervised trial plots planted to the Mit Afifi at Hartsville, South Carolina, and at Houston and Brownsville, Texas, with the Jannovich variety at Denison, Texas, and with the Asmuni at Danville and Waco, Texas. Fourteen samples, representing each variety from each locality where grown in 1902, were submitted to seven American Cotton buyers, and a buyer at Alexandria, Egypt. The Jannovich grown at Calexico (about sixty miles west of Yuma) was most highly commended by all of these experts. In 1903 the Mit Afifi and Jannovich

were planted at Barstow, Carlsbad, Yuma, and Calexico, one area in each of four states:- Texas, New Mexico, Arizona, and California, respectively. In 1904 and 1905, the extra-long staple experiments were continued only at Carlsbad and Yuma. In 1905, high spring floods wiped out the plantings at Yuma, leaving Carlsbad as the only location where acclimatized seed of the Egyptian Varieties survived. A large number of selections were made from the Carlsbad nurseries and transferred to Yuma where experiments were centered in 1906 and 1907. It was the Carlsbad acclimatized Mit Afifi that became the parent stock of the new American-Egyptian varieties. Appraisal Of 1907 Yuma Crop By Twenty-Two Cotton Experts:- Small samples of Arizona-grown Egyptian Cotton grown in 1907 were placed with twenty-two American buyers and spinners of extra-long staple Cotton for testing and comparison with imported stock. Those examining these samples were practically unanimous in expressing the belief that the Arizona-grown product could be satisfactorily substituted for similar grades of imported Egyptian Cotton. The average length of the fiber grown at Yuma in 1907 was one and one-half inches and the strength, luster, fineness, and color were good. During the first years of experiment the plants had made an excessive growth of wood and relatively few bolls sprouted, and these ripened late and did not open properly. In the season of 1906 and 1907 the size of the plants diminished in size and the average number of bolls greatly increased; the bolls ripened earlier and opened wider, making picking much easier. The Mit Afifi yield at Yuma for 1907 went almost two bales to the acre on the experimental plots. A five-acre field yielded 3 300 pounds of Cotton seed to the acre, with a lint percentage of thirty estimated. The federal Department of Agriculture reported in 1907 that 'gratifying progress has been made in this work 'acclimatization', Egyptian Cotton of the Mit Afifi variety having been grown under irrigation at Yuma, Arizona Arizona ...'. (Ibid., p. 61. Excessive vegetation growth was a problem cited by McClatchie in his 1901–02 experiments with Egyptian Cotton, noting in his irrigation report that part of the field was too rank and some of it lodged. This is evident, also, in the Fairchild picture of Doctor Chandler and his Cotton field taken in 1902, reproduced on page 241. An Arizona writer (Mc-Clintock in Arizona Producer, March 01, 1933) reports a field near Buckeye, Arizona, planted to the experimental Yuma in 1908, grew plants twelve feet high; stepladders were used for picking. This was one reason why the Yuma seed was not placed with farmers commercially until 1912.) After receiving the appraisals of the twenty-two American buyers and mills from small specimens of the 1907 crop, samples of 200 pounds each were sent to three American mills using large quantities of imported Egyptian Cotton, requesting that spinning tests be made. The sum of the opinions were decidedly favorable to the Arizona-grown Cotton, and resulted in this conclusion:- It is ... no longer a question whether a good grade of Cotton of this type can be produced in the Southwestern states. The problem that remains to be worked out is whether the economic conditions of the region will justify farmers in undertaking the growing of any kind of Cotton. In view of the 1907 results, the possibility of establishing an Egyptian Cotton culture on a commercial scale in the irrigated valleys of the Southwest received increased consideration. Officials estimated that with new reclamation projects under way as authorized under the Newlands Act of 1902, there would soon be 600 000 acres of land under ditch in the Yuma, Salt, Imperial, and Gila Valleys, and that if one-fifth of this acreage could be used to grow Egyptian Cotton, production would equal annual imports from Egypt. (The 1908 imports of Egyptian Cotton were 136 900 bales, valued at USD12 627 206). Forty Acres Planted in 1908 Experiments In 1908 about forty acres were planted to Egyptian Cotton, the largest acreage yet attempted. Five acres were grown on the reclamation experimental farm at Yuma where trials had been conducted since 1902, but the largest planting (nineteen acres) was made on the Pima Indian reservation at Sacaton under a cooperative arrangement between the Agricultural Department and the Indian Affairs Office of the Department of the Interior. Two acres were seeded at the Indian school farm at Phoenix, and about four acres put in by individual farmers, chiefly in the Gila valley, west of Phoenix. The year 1908 was not a favorable crop year and only twelve bales of extra-long staple were harvested. In the main, however, the 1908 experiments were considered favorable, but further experimental work was deemed a necessity before seed could be safely distributed to farmers for commercial use. In the early autumn of 1908, Orator F. Cook, Argyle McLachlan, and Roland Meade, Bureau of Industry scientists, spent several weeks at Yuma and Sacaton, studying the variations of the Egyptian plantings in the process of acclimatization. John A. Walker, an expert classifier of Egyptian Cotton, supervised the baling of the twelve bales harvested, taking care to get uniformity in each bale. At Yuma, with a five-year history of acclimatization, the acre yield was higher (604 pounds of lint) and the quality superior (19.1 per cent graded one and two), than Cotton grown on the reservation. The nineteen acres at Sacaton averaged slightly over a half bale to the acre (263 pounds) and the best quality graded three (thirty-six per cent) and most fell into grade four (sixty per cent). The report prepared by Messrs. Cook, MeLachlan, and Meade after their studies at Yuma and Sacaton in the fall of 1908, technical in nature, cited four causes of diversification in growth, arising from different physiological factors:- (1) hybridization, (2) incomplete acclimatization, (3) differences in physical environment, and (4) variations in the same plant. In 1906 and 1907 several plots of Upland Cotton were grown alongside the Egyptian-type plantings at Yuma to test their productiveness and general adaptability in comparison with one another. The report summary laid down a principle which was to receive increasing emphasis in succeeding years:- ... considerations make it evident that Upland Cotton must either be excluded from regions where Egyptian Cotton is grown, or local sources of supply of pure, acclimatized seed must be established and very carefully guarded from contact with Upland Cotton if commercial cultures of Egyptian Cotton are to be permanently maintained in Arizona and the neighboring states. (O.F. Cook, Argyle McLachlan, and Rowland M. Meade, A Study of Diversity in Egyptian Cotton (USDA Bureau of Plant Industry, Bulletin 15b, July 24, 1909), p. 54. Cook continued his interest in the development of the American-Egyptian Cotton industry and was a leader in promoting the idea of one-variety communities for Cotton. McLachlan transferred his interests to the Durango crop in the Imperial valley. Meade developed the high quality Meade Cotton which promised to replace Sea Island until hybridization with uplands destroyed its potentialities.) The 1908 experiments resulted in the identification for the first time of three American-Egyptian Varieties, distinct from the parent Mit Afifi, originally grown at the Carlsbad nursery and transplanted to Yuma in 1906 after 1905 floodwaters of the Colorado had wiped out the Yuma test plots. The new varieties carried Arizona names taken from the locales of their inception:- Yuma, Somerton, and Gila. The Yuma became the first American-Egyptian Variety to be grown commercially. The Somerton was discarded because of excessive growth of vegetative branches. The Gila, bred at Sacaton by E.W. Hudson, superintendent of the Gila Indian reservation farm, was preserved and used exclusively for plantings on the Indian reservation. (Thomas H. Kearney, 'Mutation in Egyptian Cotton', USDA Journal of Agricultural Research, (II, 1, July 15, 1914) pp 294-295. From the 1908 progeny row of the Gila, a half acre was planted in 1910, gradually increased until 1913 when 200 acres of the variety were grown on the Pima and Maricopa Indian reservations, where its production was confined.) The birth of the Yuma variety was related by Doctor Kearney before a luncheon club at Tucson on June 04, 1920, two days after he had received the honorary degree of Doctor of Laws from the University of Arizona for his work in developing the Pima Cotton industry in Arizona:- ... in 1908 a progeny row was grown from a plant which had been selected the year preceding. The plants in this row proved to be very different from the Mit Afifi, and decidedly superior in productiveness, earliness, and length and quality of the fiber. It was soon recognized that a new variety had been developed which was altogether distinct from the parent Mit Afifi, and the new variety was christened 'Yuma'. ... It was grown on a field scale, improved cultural methods worked out, and the fiber was tested by eastern manufacturers. The Department of Agriculture was at last convinced that an American-Egyptian Cotton suitable for commercial production was at hand. In 1909, four and a half acres at Somerton in Yuma valley and ten acres at Sacaton were planted to the new Yuma variety. To test the domesticated seed in other localities, small plantings were made at four different places in the Imperial valley and at Glendale, California. Uniformly favorable reports were received on samples of the Somerton and Sacaton fiber submitted to a number of buyers and spinners. (Thomas H. Kearney, Breeding New Types of Egyptian Cotton (USDA Bureau of Plant Industry, Bulletin 200, December 23, 1910), pp 8-9. Imported

seed of the principal varieties of Egypt were also grown at Somerton and Sacaton in 1909 and none equalled the acclimatized stocks in fruitfulness or in quality of lint. Imported Egyptian seed received during southwest experiments was found contaminated by Hindi Cotton, an undesirable type with a short, weak fiber. In 1910, O.F. Cook went to Egypt to make study of this unfortunate condition.) Committee On Southwestern Cotton Culture Appointed In 1910:- A complexity of problems involved the establishment of a new agricultural enterprise in a region thinly populated, lacking facilities for processing, and remote from established markets. Initially the cooperation in developing a new industry in the Southwest was on an informal basis. Kearney had applied himself to the task of plantbreeding and had opened a new nursery in 1909 at Sacaton in addition to planting field acreage there. While at Yuma he was associated in experiments with William A Peterson, superintendent of the reclamation experiment farms in that area. At Sacaton he was joined by E.W. Hudson, farm superintendent at the Indian experiment station, who later played a major role in establishing the extra-long staple Pima Cotton industry in the Salt River Valley, its exclusive home for many years. Cook, Meade, Scofield, and McLachlan had been called in for special surveys. The early experiments at Yuma and Sacaton had convinced the Department of Agriculture that extra-long staple Cotton could be profitably grown in the irrigated valleys of the Southwest. Facilities for continued plantbreeding and the propagation of pure seed were provided on two well-equipped farms at Bard and Sacaton by 1910, but other problems had to be met if successful production was to be realized. Accordingly, in 1910 the chief of the Bureau of Plant Industry appointed a 'Committee on Southwest Cotton Culture' to coordinate the program. The original committee consisted of Carl S. Scofield as chairman. Orator F. Cook, Walter T. Swingle and Kearney. Soon afterward Charles J. Brand, chief of the Bureau of Markets, and Fred Taylor, cotton technologist, and later Doctor K.F. Kellerman, associate chief of the Plant Industry Bureau, became committee members. J.G. Martin, working under Brand, introduced methods of classing and grading the nejw product. Kellerman succeeded Scofield as chairman when the latter went abroad to investigate possible foreign markets for an American-grown extra-long staple Cotton. Functioning in close harmony, each committee member was authorized to assume responsibility beyond his own field. In charge of western irrigation agriculture, Scofield maintained cooperation with the Bureau of Reclamation but also investigated market conditions here and abroad. Swingle, physiologist in charge of crop and breeding investigations, was in charge of the Sacaton work in cooperation with the Indian Affairs Bureau, including recruitment of Indian labor for picking Cotton. Cook conducted investigations of the factors involved in the acclimatization program and took the lead in urging the one-variety community plan for the Salt River Valley. Kearney had charge of the breeding work with Egyptian Cotton and the investigation of the effect of alkali and other soil conditions upon the crop. Brand became a member of the committee in 1912 when the problem of marketing the first commercial crop was critical and assumed control of investigations in classing, marketing and transportation, with Fred Taylor in immediate charge. 1912 Crop Of Extra-Long Staple Cotton:- 375 Bales:- At the close of the 1911 season, experiments had reached a stage which justified the trial of American-Egyptian Yuma on a small scale by farmers of the Salt River Valley in Arizona and Imperial County in California. Accordingly, in the spring of 1912 about seventy-five farmers received seed from Sacaton and Bard. Thirty-two farmers in the Salt River Valley planted 303 acres; twentynine and a half acres were planted on Indian land at Sacaton. In the Colorado river valley north of Yuma, in the vicinity of Bard, nineteen farmers planted forty-four acres. In the California Imperial Valley, twenty-five farmers planted 122 acres; in addition, twenty boys directed by Walter E. Packard of the California experiment station each planted a half acre. Near Hechicera, Mexico, South of the Imperial valley, was one field of thirty acres. About 480 acres came through to harvest. From this acreage, 375 bales of 500 pounds each were picked and ginned. Of the total bales, 262 were in the Salt River Valley, seventeen in the vicinity of Bard, and ninety-six in the Imperial Valley. The experiment farms at Sacaton and Bard produced twenty-four bales, not included in the above. The average lint per acre was 400 pounds. In the Salt River Valley a large portion of the seed from the 1912 crop was reserved or sold for planting in 1913. In the Imperial Valley most of the seed was sold to an oil mill at fifteen Dollars per ton, indicating a lack of interest in further production. Carl S. Scofield, chairman of the Southwestern Cotton Committee, drew this conclusion from the 1912 crop:- The results of the season's work on Egyptain Cotton in the Southwest appear to warrant a material increase in the acreage devoted to that crop. It would appear that farmers, particularly in the Salt River Valley, will be justified in a further trial of the crop and on a much larger scale ... In the Imperial Valley the size of the land holdings and the labor supply are such that it appears desirable for the farmers of that community to specialize in a big-boiled and hence easily picked variety of long-staple Upland Cotton, such as Durango, rather than an Egyptian. In the Salt River Valley, however, conditions appear to be more favorable for the development of a cotton industry on the basis of the Egyptain type. There the land-holdings are generally smaller, the labor supply more abundant, and it has been demonstrated that fiber of very high quality and value can be produced. (The reason land-holdings were smaller in the Salt River Valley was a stipulation in the reclamation project of Roosevelt dam that no-one could own more than 160 acres. Indian labor, trained at Sacaton, was available to Salt River valley farmers.) Following the advice of the Committee on Southwestern Cotton Culture, the Imperial and Yuma Valleys gave preference to the Durango long-staple upland and the growers of the Salt River Valley, in proximity to the Sacaton farm, gave close cooperation to plans to expand the extra-long staple industry in Central Arizona. Before the industry could be established in the Salt River Valley, many important steps had to be taken:- A larger number and more efficient ginning facilities would be needed and an oil mill built to dispose of the seed, which made up about two-thirds of the bulk crop. Uniform market grades would have to be established and maintained from season to season. Storage warehouses to hold the crop for advantageous sale must be erected, enabling the grower to borrow against the stored cotton while waiting a favorable market. Precautions against insect damage were necessary. Of supreme importance was the maintenance of an adequate supply of pure seed of high-yielding and uniform variety. The Department of Agriculture, in its 1912 yearbook, reported that the crop, under research conditions, gave promise of supplying the demand for extra-long staple fiber. Thread makers of Europe were in America) inquiring about future supplies, the department reported, concluding:- 'The market waits for the scientist to do his work'. In 1912 American spinners imported 175 835 bales of Egyptian Cotton; in 1913, 191 075 bales. Atha Pioneers Crop Near Phoenix:- Herbert B. Atha, a newcomer from New Jersey, pioneered the Egyptian cotton industry in the Phoenix area. In 1911, he planted five acres on his farm, 'Esperanza', seven miles northwest of Phoenix in the vicinity of Glendale. Yuma seed secured from Hudson at the Sacaton farm was planted as directed. The crop of raw cotton was hauled to Sacaton for ginning. He had consulted with friends in New Jersey associated with the American Thread and Clark Thread companies as to the desirability of the extra-long staple. He sold Us one bale crop to the Clark company for USD100. In 1912, Atha was the largest grower of extra-long staple in the Southwest. His harvest of 120 bales was the season's record. This crop was too large to haul to Sacaton as he had in 1911 so he set up a two-stand gin in a shed on his ranch where he also ginned twenty bales grown by Indians at Gila Crossing. In 1913, Atha incorporated and assumed management of the Arizona Egyptian Cotton Company. He built an eightstand gin and an oil mill in Phoenix, locating the plant on a spur of the Arizona Eastern railroad. The installation included an office and five buildings, equipped with the latest mechanical devices. Lint, seed, oil, linters, and oil cake were all processed mechanically. Growers' cooperatives operated ginning plants for the Mesa-Tempe and Chandler areas but Atha had the only oil and cake-making plant by 1914. The one-variety Cotton community plan had strong support from Atha. Citing the 1913 crops of the Salt River valley, growing extra-long staple Yuma, and Imperial valley, growing ordinary long-staple, American-Egyptian producers netted ten Dollars more per acre under his analysis. Short Cotton was often in surplus in the United States whereas domestic extra-long staple production was always less than the country consumed and consequently was assured of a strong market, he reasoned. He reported shipping 800 bales of Yuma to the American Thread Company in 1913, stating that this one company could easily have absorbed the total Salt River valley crop of 2 200 bales. Growers Organize Cooperatives:-

Community cooperation was needed to secure labor, arrange financing for crops, and to provide a continuous supply of pure seed. Grade and staple standards had to be set to facilitate marketing. Because the American Thread Company had been a willing consumer of the yield from experimental crops, the matter of marketing had only received minor attention prior to 1912. Farmers in the Salt River Valley were familiar with Egyptian Cotton experiments at Sacaton and had consulted Superintendent Hudson about the commercial outlook and the methods of growing the crop. In the spring of 1912 about thirty farmers in the Mesa area formed an association to undertake production. The next year growers near Tempe and Chandler formed similar groups. In 1914, these three local cooperatives formed the Salt River Valley Egyptian Cotton Growers' Association, still maintaining their individual organizations. The central group was planned to function as the marketing agency for the three local units and as the source of pure seed for the entire valley. The local associations built gins and arranged financing for their membership as needed. Growers of Tempe-Scottsdale organized in 1914 to increase their plantings from 300 acres in 1913 to 3 000 in 1914. The Tempe Exchange built a ten-stand roller gin and installed a compressor to reduce the size of the bales for economical shipping. Clinging to the precept that American-Egyptian Cotton could only be grown successfully where no other variety is grown, the Salt River valley had no upland in 1912 and 1913. During the next four years, 1914–17, there were small plantings of the upland Mebane. Only Pima was grown in the Salt River Valley from 1917 to 1921. (Mebane acreage during years upland grown:- 1914, 2 000; 1915, 300; 1916, 1 000; 1917, 260.) Cotton Leading Industry Of Salt River Valley By l917:- In 1917 the production of Pima Cotton ceased to be a sideline and became the leading industry of the Salt River Valley. This was the first year Arizona Cotton production merited attention in the statistics of the Bureau of Agricultural Economics of the Department of Agriculture. The volume and value of Pima crops during the first six years and approximate per bale price for each year illustrates the effect of a fluctuating market. The 1914 crop was the largest prior to 1917 but brought the lowest bale price. The bale return for the 1914 harvest of Pima Cotton (USD86.19) was discouraging to growers and resulted in lower acreages for 1915 and 1916 than was planted in 1914. The war declarations of August 1914 precipitated sharp declines in all Cotton prices. Upland growers took more severe losses on their 1914 crop than did Pima Cotton growers. (USDA 1915 Yearbook, pp 12-13. The declaration of war on August 01, l914, brought the fear that the big United States exports of cotton would be stopped or curtailed. The August 01 price of 12.5 cents per pound dropped almost half to 6.3 cents by November 01. Cotton exchanges were closed until December. The nationTs 1914 crop, fourteen per cent above 1913 in volume, was valued at USD283 million less, a decline of over forty per cent. The Pima market survived the crisis comparatively better.) The extra-long staple Cotton came to sharper attention and greater popularity with growers in 1916 due to the prices commanded by this variety in 1916. The bale return for the season (USD233.53) was almost double that of the previous year (USD118.40). The 1917 Pima Cotton acreage of 27 000 more than doubled to 69 000 in 1918, then increased to 82 000 in 1919, and 182 000 in 1920 in Maricopa county, which represented three-fourths of all the irrigated land in the Salt River Valley. A total of 243 000 acres was planted to Pima in 1920:- 200 000 in Arizona and 43 000 in California. Never since has so much acreage been planted to Pima Cotton, although improvement of varieties, aided by modern technics of of farming, brought higher yields per acre in 1952, during the Korean war. (The 1920 acre yield was almost the lowest since production started:- 189 pounds; the 1952 acre yield of the American-Egyptian Pima 32 was 425 pounds. The total acreage for the 1952 harvest was 108 200 compared to 1920's 243 000. The volume for these years:- 1920, 91 700 bales; 1952, 95 000.) Bringing American-Egyptian Cotton to its high state of production in less than a decade after the first commercial crop of 1912 was a near phenomenon involving numerous problems attendant on a new enterprise in an area thinly populated, with limited facilities of production, and growers with no past experience. The industry literally started 'from scratch'. Because war temporarily diut off foreign imports, the demand for extra-long staple production was unexpectedly heavy in the early years of the new industry. The problems of the infant industry, in its first five years, included recruitment of adequate labor, setting up standards of grade for marketing, classifying by staple length, marketing and transporting to the regions of consumption, and continually guarding the purity of seed to protect the future of the new enterprise. Problems Of Infant Pima Cotton Industry:- even at the time that the Yuma variety of American-Egyptian Cotton proved to have the qualities needed for successful commercial production, the industry was far from established. Seventy-five farmers spread over a wide area had grown 375 bales of the extra-long staple in 1912, and it was believed to be a favorable cash crop for the Salt River Valley where the greatest success had been attained. The Southwest Cotton Committee had determined acreage returns were high and the fiber would not deteriorate in value because of the necessary long haul to markets on the eastern seaboard. Yet for production to reach its highest potential, a sufficiently large acreage would be needed to pay for the installation of machinery for ginning, baling, and compressing equipment. Volume would be necessary to earn car-lot transportation rates. (J.G. Martin, The Handling and Marketing of the Arizona-Egyptian Cotton in the Salt River Valley (USDA Office of Markets and Rural Organization:- November 26, 1915), p. 12. In January 1914, a Boston broker received a ten-bale trial order from a Fall River, Mass., mill and passed it on to the Salt River Valley Growers Association. The order was filled from a consignment to Liverpool previously sent there, saving USD15 per bale (USD3 per hundredweight; USD150 saving on the ten bales) and delivery effected sooner than if shipped from Mesa. The car-lot rate Mesa to Galveston in 1914 was 95¢ per hundredweight; the local rate was USD2.50; to which must be added water rates to New England. The consignment to Liverpool, a car-lot, from Mesa to Galveston by freight and trans-ocean, and back to New England, cost USD1.63 per hundredweight.) Pima Indians Provide Labor For Picking Cotton:- the Committee of Southwestern Cotton Culture from the beginning of experimentation recognized that the high cost of picking the Egyptian-type Cotton would be one of the difficulties to surmount. Bolls were smaller than in the upland and it was important, if quality lint was to be produced, to pick cleanly, avoiding trash and pieces of extraneous matter. Hand labor was neither abundant nor cheap. (Based on the 1910 census, there were less than two persons (1.8) to every square mile of Arizona's area; state's 1910 population was 204 354. In 1908, Kearney and Peterson (USDA Bulletin 128, p. 57) expressed the belief that the best chance of establishing the industry in the region was 'on the basis of two to five acres for each farm, the farmerfs family supplying most of the labor needed'.) Growers of the Salt River Valley had to pay two Dollars per 100 pounds for picking seed cotton while the prevailing rate in the Imperial Valley was one Dollar for the larger-boiled cotton. Yet in spite of labor scarcity, the problem of picking the extra-long staple was successfully met by a community of effort in the early years of production. The committee selected to develop the industry had interested the Pima Indians near Sacaton not only in growing Cotton for themselves but also in aiding white settlers in picking the crop. Papago Indians in southern Arizona also became pickers. In 1913 about USD20 000 and in 1914 about USD37 500 were paid to the Pima and Papago tribes as wages for picking Cotton in the Salt River Valley. These earnings were augmented by crops grown on reservation lands, bringing total Indian earnings from Cotton to USD40 000 in 1913 and USD50 000 in 1914. It was estimated that in the 1914–15 season a total of USD150 000 was paid out in wages to Cotton pickers. Oklahoma-Texas Pickers For 1913 Crop:- the ten-fold increase of acreage in 1913 over the preceding year brought concern to growers that it would be impossible to secure competent pickers. The Salt River Valley Egyptian Cotton Growers' Association began a campaign of letter-writing and newspaper advertising in Oklahoma and West Texas. Because drought had lowered the 1913 crop in these areas, more than 300 growers emigrated to Arizona by October, 1913, in response to the letters and advertising. There was a lasting effect in this campaign:- 'Many of these new citizens of Arizona will make permanent homes here. A number came early with sufficient funds to carry them for a year, rented farm lands on shares, and have raised a crop that is proving profitable to both tenants and landlords'. Caution against large planting was early stressed. Harry Welch of the Phoenix Board of Trade, warned against largescale operation until the problem of labor was settled. He commended the ten- to forty-acre farm, cultivated and cropped by the owner and his family, 'as the means to progress and prosperity. Labor problems at best, were provocative, and as acreage and volume

increased became more so. In the first years the Salt River Valley Egyptian Cotton Association in cooperation with the Southwestern Cotton Committee was able to get the Cotton picked by the white settlers from Texas and Oklahoma, Mexicans, and Indians from the Pima and Papago reservations. Later, labor problems were assumed by the Arizona Cotton Growers' Association, formed especially for that purpose. A large part of the crop in 1913 and 1914 near Mesa and Tempe was picked by Indians trained at Sacaton. The Indians were slow but good pickers, not concerned with high wages at the expense of quality. As a consequent, the Mesa and Tempe Cotton rated high in tests conducted by the Bureau of Markets in these years. (J.G. Martin, Handling and Marketing Arizona-Egyptian Cotton in Salt River Valley, (USDA Bulletin 311, November 26, 1915 p. 21 E.W. Hudson, superintendent of the Sacaton farm, commended Indian laborers:- 'The most important supply of labor for Cotton picking in Arizona is afforded by Papago and Pima Indians ... 5 000 to 7 000 in these tribes who promise by virtue of their industry, patience and honesty to play a most important part in establishing the cotton industry'. (USDA Farmers Bulletin 577, March 14, 1914, p. 8).) Classing And Grading Program In 1913:- no standards for staple or grade existed for the Arizona-Egyptian Cotton at the time of the first crop of 1912. Commencing in the fall of 1913 the Cotton section of the Federal Bureau of Markets at the request of the Southwestern Cotton Committee undertook an intensive study of the new industry, including the condition of the Cotton in the field, method of picking, handling, storage on the farms, ginning processes, and the loading into cars for shipment to eastern markets. Grades were determined by the amount of leaf, hulls, and foreign matter in the bale, the color and silkiness of the lint cotton, and the amount of boll stain and dead cotton. The staple was based on length, strength and uniformity of the fiber. Grades were classified as fancy, extra, choice, standard, and medium. Three staples were established based on comparisons with equivalent varieties of Egyptian Cotton:- (1) Sacaton equal in length to the best imported Sakellaridis; (2) River equivalent to the best Jannovitch; and (3) Valley equal to the best Mit Afifi. (Ibid., p. 9, The New Bedford, Mass., fine goods mills called the Sacaton staple 1-7/16 to 1-1/2 inches; River, 1-3/8 to 1-7/16 inches; Valley, 1-1/4 to 1-5/16 (now the established length of ordinary long staple).) This comparison was subsequently approved by eastern mills, brokers throughout New England, by merchants in England, France, and Germany and by the chairman of the arbitration committee of the Liverpool Cotton Association. The 1913 tests were run at the gins at Mesa, Chandler, and Glendale, and in 1914 at Mesa and Tempe because the Chandler gin had passed to private ownership, and the Glendale association planted short staple and changed its equipment to the saw gin instead of the roller gin required for extra-long staple Cotton. The highest grades and staples were grown in the Mesa area. In the two years, of the 2 647 bales graded and classified, 1 475 graded Sacaton, 1 147 River and only twenty-five below extra-long (the Valley staple). In 1913, 317 bales were classified at Chandler:- Sacaton, 70; River, 169; Valley, 78. Only 108 bales cleared the Glendale gin:- Sacaton, 14; River, 82; Valley, 12. The 1 237 bales classified at Mesa were:- Sacaton, 892; River, 326; and Valley, 19. The tests for 1914, confined to Mesa and Tempe, were:- Mesa, of a total of 1 410 bales:- Sacaton, 583; River, 821; Valley, 6. Tempe, of total of 1 285 bales ginned:- Sacaton, 493; River, 784; Valley, 8. The class standard was not met, however, on 123 of the Tempe bales of these staple lengths:- Sacaton, 7; River, 115; Valley, 1; and 74 Mesa bales stapling:- Sacaton, 10; River, 60; Valley, 4. The classing and grading was an essential to market stabilization and uniform pricing. On the basis of the two years of testing, some of the largest cotton firms, spinners and exporters, indicated that the quality, staple and characteristics of the new American-Egyptian Yuma was such that a permanent market should result. (Ibid., p. 16. In 1916 and 1917 the Cotton branch of the Bureau of Markets conducted similar investigations because the new Pima variety, a longer and lighter-colored fiber, required new standards of grade and staple.) 1915 Crop In Mill Tests At New Bedford, Massachusetts:- Arizona's extra-long staple production having shown a remarkable increase in the first three years of commercial growth (in 1912, 280 bales; 1913, 2 200 bales; 1914, 6 187 bales), it was considered important to gather facts on its spinning qualities. Accordingly, in summer of 1915 tests were run at the New Bedford (Massachusetts) Textile School under the direction of Fred Taylor, federal cotton technologist. Different grades of the Arizona-Egyptian Cotton were compared to each other and with the Egyptian Sakellaridis and Sea Island Cottons. The characteristics as to spinning qualities included tests on waste, tensile strength, bleaching, mercerization, dyeing and finishing. Comparisons of grade, staple, and price also were made. These conclusions were announced as a result of the most thorough of tests:- ... our domestic Cottons are equal to, and in most respects superior to, imported cottons. ... Laboratory tests indicated that after bleaching, dyeing, and mercerizing, the Arizona-Egyptian and Sea Island Cottons were practically equal to each other and were slightly superior to Sakellaridis in their bleaching and mercerizing properties; and in tensile strength the advantage was slightly in favor of Sea Island and Sakellaridis. As to spinning qualities, the tests showed no superiority of any one over another. In Cottons under test, Arizona-Egyptian was found considerably less wasty than Sea Island, which was considerably less than Sakellaridis. Samples of the tested cotton were sent to brokers of good standing for evidence of value, and the market price as of the day submitted did not vary more than a half-cent per pound for the Arizona-Egyptian, Sea Island, and Sakellaridis. Although the Southwestern Cotton Committee had succeeded in developing a Cotton of superior qualities, equal to any extra-long staple, the marketing of this product presented many new problems. Manufacturers experimenting with the Arizona-Egyptian Cotton had found it less wasty and were satisfied that it could be substituted satisfactorily for most purposes for uses served by imports. (Ibid., p. 7. Cotton listed as waste is not actually lost to the spinner; the greater part is reworked in the making of a cheaper class of merchandise.) But they were hesitant to make a change in a profitable business. The lower percentage waste was of little concern to the converter and the consumer. When placing contracts, the converter was familiar with Sea Island and Egyptian Cottons from long experience and usually specified one or both of these varieties. Mills were not inclined to adjust machinery to a new product with no assurance of a continued ample supply. Dorman Experience In Marketing New Product:- the 1913 crop of Arizona-Egyptian Cotton totaled 2 135 bales. Its sale was the first test in the marketing field of any sizeable quantity inasmuch as the first commercial crop of 1912 was only 375 (280 in Arizona) bales. Fifteen bales from the 1909 experimental crop were sold in March 1910 under bids at thirty-one cents and thirteen bales from the 1910 crop were sold in April 1911 for twenty-eight cents. The prevailing prices for upland in these months were fourteen to fifteen cents. The American Thread Company made the purchases. In 1913 the Southwestern Cotton Committee, made up of agricultural department personnel, was invited to meet with members of the Arkwright Club of Boston, an organization of the leading spinners of New England. Types of American-Egyptian Cotton were shown and the qualities of the Cotton and other phases of the industry were discussed. The committee reported that members of the club were favorably impressed with the new extra-long staple crop of Arizona. In January 1914, the Salt River Valley Egyptian Cotton Growersr Association, collaborating with the Southwestern Cotton Committee, sent W.S. Dorman, President of the association and the Mesa Cotton Exchange, to New York, Boston, Providence, and other consumer areas of Egyptian Cotton. Carl S. Scofield, former Chairman of the federal cotton committee, had previously investigated the European markets, and it was planned that Dorman would also go to England, France, and Germany to introduce the new American extralong staple. The war declarations of August 1914, however, forced cancellation of the projected voyage. The Dorman trip revealed the problems involved in presenting a new product. The Mesa Cotton Exchange president found that practically no one in the Cotton centers of the world had heard of Arizona-Egyptian Cotton except the American Thread Company of New York, buyers of the first-grown experimental crops. He commended this company as among the most careful of buyers in New England, but American Thread could use only a portion of the 1913 crop. He had expected, 'in the natural course of events', that when Arizona-grown Egyptian Cotton production reached 2 000 to 2 500 bales, staple cotton buyers should have been attracted to Arizona 'because of a natural demand for this superior cotton'. Among other things, Dorman learned on his eastern trip that women's fashions had dealt the Cotton industry a hard blow in 1913 by making five yards of material do what formerly required ten to twelve yards of fine fabric. Good mills were compelled to buy cheap cotton to make cheaper goods because of a financial depression. Uncertainty of tariff

measure, Arizona's inaccessibility to established markets, and high freight rates were given as other handicaps to the growers of the Southwest. Dorman expressed the belief that the marketing of the Arizona-Egyptian Cotton crops in the Salt River Valley had been seriously overlooked prior to 1914. He compared Arizona's situation in the cotton market to a merchant who places his wares in an inaccessible corner of a warehouse out of sight of probable customers – not a good sales promotion. Given authority to sell the 1913 crop or to make the best possible arrangements possible for all Cotton belonging to the cooperative exchanges of the Salt River Valley, Dorman found the best price was that obtained on the Liverpool market for a consignment of fifty bales which sold in competition with Egyptian varieties at twenty-three and a half cents. The top price received on the home market was twenty-two cents. One hundred and fifty bales were sold outright at twenty-one and a half cents and the balance of the Mesa Cotton was consigned to responsible brokers. On March 14, 1914, George H. MacFadden & Brothers of Providence, Rhode Island, handling the bulk of the consigned cotton, wired the Mesa exchange:- 'Have disposed of several additional trial orders since our last report. Do not expect to have any difficulty in placing every bale. Glad to note the increase in acreage as think a market can be found for every bale grown in the valley'. Dorman returned from his eastern marketing foray with the sincere conviction that Arizona had a superior product not fully appreciated by the home growers to whom he expressed these views:- 'After one has seen scores of expert cotton classers examine Arizona-Egyptian Cotton and listened to their comments without hearing a discouraging remark, after the one concern which has tried it thoroughly in their mills and want all they can use of it and have only words of praise to offer; after it has sold in England, the great staple cotton market of the world, for one cent above Sakellaridis which Variety is regarded as the very best of Egypt's production, it is fair to assume that this Cotton has real merit. On this point there can be no doubt. Arizona-Egyptian is among the finest Cotton that is grown in the world, and is really less appreciated by the residents and growers of this valley than in any place on earth. Marketing Under 1914 War Conditions:- if the year 1913 encountered abnormal conditons because women used less material for their dresses and the cotton market was a bit in the doldrums, the year 1914 was to add to the abnormality with a war of world-wide scope which European powers declared in August 1914. The war declaration sent upland cotton prices plunging downward. The price to farmers on August 01, 1914, was 12.4 cents per pound; by November 01, it had dropped almost one-half to 6.3 cents per pound. The 1913 average return to producers was 12.5 cents per pound; the 1914 return averaged 7.3 cents per pound. In view of the situation in the upland cotton market in 1914, the growers of Arizona-Egyptian fared comparatively well. In late August 1914, after the war declaration, the Salt River Valley Egyptian Cotton Growers' Association sold 200 bales at prices equivalent to sales of similar grades the year previous:- 22 cents for extra, 21 cents for choice, and 19-1/2 cents for standard grade. On September 10, 1914, eastern brokers agreed to take 500 bales on consignment, advancing 15 cents on extra, 14 cents on choice, 13-1/2 cents on standard, and 12 cents on medium, FOB Mesa. On September 15, a second sale of 200 bales of standard was sold at a slight decline from the August sale, and another 200 bales at one-cent lower. On September 19, 1914, a second consignment of 1 000 bales was arranged with Eastern brokers. A few days later this consignment was converted to an outright sale at approximately four cents less for each grade than was paid in the first sale. Later, a further compromise was necessary when rains limited the delivery of choice and higher grades and a consignment of 100 bales arranged on December 30, 1914, was applied to this sale at a price of 15 cents FOB Eastern points. The Salt River valley growers encountered new hazards in late 1914:- the elements and foreign imports. The October rainfall was the heaviest the valley had known in years and a slow, light rain began on December 17 and continued until December 28. When it seemed that shipping was safe from Egypt to England and from England to the United States, an influx of low-priced Cotton from Egypt was unleashed. This grew to a pre-war peak of 350 000 bales in 1915. In spite of unfavorable conditions, the market for extra-long staple continued fairly steady, but the Arizona association, unable to supply demands, was forced to limit orders because of inability to guarantee delivery of the higher grades. The new industry had not provided protection of its crop against excessive rains and did not realize what a loss in value resulted. Brokers reported difficulty in selling grades of medium or lower. Later in the season the local exchange at Tempe sold for the central association 100 bales below the medium grade at fourteen cents FOB Phoenix, and fifty bales of Mesa 'rain Cotton' and smaller amounts brought 15-1/2 cents at Eastern points. The 1914 crop was marketed under unfavorable conditions at fairly good prices at a time when the industry as a whole was demoralized by a war that disrupted normal channels of trade. Although all the 1914 crop found a market, even the rain-soaked crops, the declining prices discouraged acreage expansion for 1915. Only 2 600 acres, one-fifth the 12 500 acres of the previous year, were planted to Egyptian-type Cotton in 1915. The Southwestern Cotton Committee viewed the acreage shrinkage as advantageous. The too-rapid expansion of 1914 had taxed the resources of the growers' association in providing pure seed, and 1915 was viewed as a time to recoup and continue on a firm basis. There were no new problems in marketing the 1 095 bales grown in 1915. The market had strengthened and growers received an average of thirty Dollars per bale above the 1914 returns. (The University of Arizona College of Agriculture, 27th Annual Report, year ending June 30, 1916, reported:- 'Egyptian Cotton this year has yielded a handsome profit on the new station farm between Mesa and Tempe ...' (p. 243).) Cotton Brokerage Firm At Tempe In 1916:- the year 1916 witnessed the location of an Eastern cotton broker's agency at the source of Arizona-Egyptian Cotton. E.A. Shaw & Co., a Boston brokerage firm, opened an office at Tempe to buy cotton directly from farmers and ginners for its mill customer in the Southeastern and the New England states. The Shaw company became specialists in extra-long staple Cotton and have been consistent promoters of the industry in the Southwest. Of some 250 bales of the new Pima variety, brought into production in 1916, Shaw bought 179 bales for test purposes, distributing Kearney's new variety to mills on the Eastern seaboard. The new Pima sold up to 58 cents per pound ginyard while the Yuma brought only 27 cents to 50 cents per pound. (E.A. Shaw & Co., American-Egyptian Cottons, (Boston:- May 1950), p. 6. In 1933 W.K. Shaw, Jr., planted 3 500 pounds of seed furnished by the Sacaton field station under special contract which was the first commercial crop of the SXP variety. SXP (Sakellaridis crossed with Pima) was whiter and produced stronger ply yarn than Pima and by 1941 had replaced the Pima. In 1942 the SXP production was 73 808 bales grown in Arizona, Texas, and New Mexico. During World War II the government controlled production and restricted its use to military textiles and sewing thread.) American-Egyptian production in the Salt River valley in 1916 was 3 311 bales, three times the crop of 1915 but about half the 1914 harvest. The 1916 prices started at 30 cents per pound, rose rapidly to 47 cents, and by November reached 53 cents. By fall, the high prices and rumors of large land purchases to grow Egyptian Cotton presaged an impending expansion in the industry. After 1916, the marketing problems appeared to have been solved. The market had finally come to the home of American-Egyptian production. In the next few years, attention centered on growing every possible bale of the extra-long staple to supply eager buyers. Ginning And Storage Standards:- a distinctive feature of the extra-long staple industry is that roller gins must be used to preserve the fine texture and stength. Because output is about half that of the saw gin used for upland, higher gin costs result. (Stewart and Cotton Committee, op. cit., table IV, p. 30. The cotton committee set the price of roller ginning at 90 cents per hundred pounds and saw ginning at 45 cents per hundred pounds in determining costs in Maricopa county, 1922–27.) The Callaway Textile Dictionary gives this discription of the roller gin:- 'A type of gin based on the principle of the ancient Churka gin. The modern roller gin is small and simple in construction; the essential parts consist of a roller covered with rough leather, and a knife set so that its edge is parallel to the roller and barely touching it. The locks of seed cotton are fed to the roller, the lint clings to its rough surface and passes under the knife where it is stripped from the seed which cannot pass under the knife. Considered better than a saw gin for long staple Cotton as it does not cut the fibers; however, the production is low'. (W.L. Carmichael, George E. Linton, Isaac Price, Callaway Textile Dictionary (LaGrange, Georgia, Callaway Mills; 1947) p. 298. The saw gin is defined as:- 'A type of cotton gin in which fibers are pulled away from the seed by the action of rapidly revolving saws. ... This type is used for

most American Cotton'. As of 1959, there were 121 saw gins and seventeen roller gins in Arizona.) With the start of the extra-long staple industry in the Southwest, new phases of ginning problems were encountered. Several types of gins were employed in the different ginning establishments of the Salt River valley with various kinds of cleaning and handling devices, some carried over from saw gins with which many of the operators had their previous experience. The diversity of mechanical equipment resulted in different appearances of the ginned product, depending on how it was handled in the process. The essential uniformity acquired by careful seed selection, though present, appeared to be lost because treatment in ginning was not uniform. (In the first edition of The Producer, published March 15, 1922, the Arizona Pima Cotton Growers, on the front cover of their official paper, indicted itself for faulty ginning in these words:- 'Pima Cotton ... has always reached the delivery point at mills in a disgraceful condition, with bagging badly torn, bands missing, and ragged ...') Federal Cotton investigators checking the progress of the new industry in 1915 noted these shortcomings:- lack of storage facilities, exposing seed and ginned Cotton to rains with resultant spoilage and loss of grade; faulty ginning permitting crushed seed in the Cotton; insufficient covering of baled Cotton, lack of side strips and head coverings. One gin used second-hand sugar bags as a wrapper which was found too light in weight, rotted easily, and afforded little protection. The industry was undertaken prior to the days of general motorized transportation. The majority of farmers lived far from the gins, and it was costly for them to haul a fraction of a wagonload there. Without storage capacity or seed-cotton houses, the cotton was piled on the ground, exposed to heat, heavy dews, and rains. After loaded with cotton, the wagon stood in the field, the barnyard, and the gin, subject to further exposure. Damp or wet cotton produced a curly and matted condition, lowering grades materially. New Pima Variety In 1916:- the strengthening of prices for American-Egyptian Cotton in 1915 and an aroused interest among growers as to its possibilities furthered plans for close cooperation among growers, the Southwestern Cotton Committee, the University of Arizona College of Agriculture, and the Salt River Valley Cotton Growers' Association. E.W. Hudson, who had been in the forefront of the extra-long staple program in the Salt River Valley since the opening of the Sacaton farm in 1907–08, joined the university extension service, planning to devote full time to visiting growers and holding public meetings, advising and issuing material on methods of planting, growing and harvesting the crop. In 1910, Kearney discovered a plant of the Yuma Variety at Sacaton which had distinctly better fiber than the general run and from this was propagated the new Pima Variety which became the main Species grown from 1919 to 1939. The name 'Pima' became the accepted generic term for all Southwest-grown extra-long staple Cottons during the twenty years of its predominance and ever since. Compared with the Yuma, which it replaced, the Pima 'was much less limby, had better fruiting branches, the bolls were of different shape and plumper, and the fiber was, longer, silkier, and lighter colored. Field tests had shown that the Pima was thoroughly stable and uniform after repeated field and spinning tests, and that it was more productive and earlier maturing than the Yuma, and the lint grew at least one-eighth longer than the earlier Variety. A 1916 problem was how to substitute the new Pima for the Yuma Variety, already in commercial production, without mixing the seed of the two Varieties. The transition was undertaken through the well-organized association of growers of the Salt River Valley, using the modern gin facilities of the Tempe Exchange, built in 1914 by extra-long staple growers. The exceedingly great care taken to maintain seed purity was related by Kearney:- '... in 1916 several members of the exchange whose ranches adjoined, planted a few hundred acres with Pima seed, in fields which were considered sufficiently isolated from the nearest Yuma Cotton. The Pima Cotton thus produced was ginned in special runs, the gins having been thoroughly cleaned beforehand, and the seed carefully stored in sealed sacks. Several thousand acres in a compact body were planted with this Pima seed in 1917, and in 1918 the supply was sufficient to plant almost the entire acreage of the American-Egyptian Cotton. The replacement was completed in 1919, when the Yuma variety practically disappeared from commercial production. This year 1920, it is estimated that about 225 000 acres of irrigated land in Arizona and California have been planted to Pima Cotton. Tire Company Forced To Grow Own Cotton:- first signs of an incipient boom in the extra-long staple became evident in late 1916. The January 1917 issue of Arizona State Magazine described a growing tenseness:- 'During the last three months the Salt River Valley has lived in a state of ecstasy over the promised realities of the cotton industry. ... Rumors have been current for two or three months of large corporations leasing or buying lands for Cotton growing, and guarantees of high prices to those who would contract to market their crops ... The Arizona Magazine is now pleased to make announcement of a specific fact which is a beginning of this realization and is an incident of no mean importance ... To the non-resident reader only, it is necessary to say that this land will be made productive only through irrigation; and likewise, to both the home and distant reader, it is added that the means of irrigation will be the pumping plant ...' The specific fact revealed by the state paper was that the Goodyear Tire & Rubber Corporation of Akron, Ohio, had purchased two tracts of Arizona desert land, 8 000 acres of Doctor Chandler land lying twenty-seven miles southwest of Phoenix (called Goodyear, later Ocatilla), and the Beardsley 'pumping proposition' tract and some adjoining land totalling 16 000 acres, eighteen miles west of Phoenix (first called Litchfield ranch and later the site of the attractive town, Litchfield Park) (Ibid. Joseph R. Lofthus, formerly living in the Imperial valley and for the preceding two years general manager of Chandler Improvement Company, Chandler, Arizona, and a resident of Phoenix, handled the transaction. Most of the land originally had been acquired from the public domain by scrip. Aside from the large Beardsley tract, the private holdings of some fifty private owners were involved. Average sale price was reported to be twenty-seven Dollars an acre. Some portions had been cropped two or three years but most was desert 'unknown to the plow'.) The corporation hurried to plant 1 500 acres to Egyptian-type Cotton in the 1917 season. The coming of the Goodyear company to Arizona to grow extra-long staple brought a new era to the industry and hastened its development. Many of the early problems – market outlets, efficient gins, adequate storage facilities, importation of labor, money to grow crops – seemed to be met all at once by the tire company that came to Arizona to buy cotton and found it necessary to grow it also. The shortcomings and problems so evident in the early history of the industry ceased to exist with the application of the capital and 'know-how' of big business', forced to grow vitally-needed cotton when local growers were unable to supply the required volume. 1917–20 — 'Boom And Bust' Years For Pima Industry:- The manager of the Cotton and Fabric Division of the Goodyear Tire & Rubber Company wrote in a 1920 edition of The Textile World Journal:- 'From a textile man's point of view, there must be something very amusing in the general acceptance to the terms 'rubber tire' and 'rubber belting' and 'rubber hose'. A very large part of the material in these 'rubber' articles is cotton. In fact, in some ways it might be considered that the articles were made from cotton with a protective coating of rubber. ... If we estimate five and a quarter pounds of cotton on the average in each tire, it would require something like 400 000 bales net for this year. Inasmuch as tire fabric has to be of extra-long staple ...'. Harvey S. Firestone, founder of the Firestone Rubber Company, in 1917 cited as the rubber industry's weak point:- 'Its dependence on foreign sources for its raw material. Britain placed a virtual embargo on Egyptian Cotton during World War I. American tire makers desperately needed Egypt' extra-long staple and called this hindrance a 'rankling situation'. In the first two war years (crop years ended July 31) of 1914–15 and 1915–16, over 600 000 bales of Egyptian Cotton came into the United States, imports averaging 301 585 bales each year. In the next three years, 1916–17–18, Egyptian imports averaged 138 130 bales annually. (US Tariff Commission, Report 85 (Washington:- 1935), Section V. table 1, p. 109. Egyptian Cotton imports in World War I years, the crop year ending July 31:- 1914–15, 252 373 bales; 1915–16, 350 796; 1916–17, 199 892, 1917–18, 114 580; 1918–19, 100 006. The 1915–16 import was second only to the 1919–20 importation of 485 004 bales, a flood of extra-long staple so intense that Pima Cotton was inundated to ruinous price levels.) When the extra-long staple was most needed, Egyptian imports fell off for two reasons:- (I) Britain controlled production along the Nile and had priority for her own war needs, and (2) after Germany declared unrestricted submarine warfare in February 1916, Allied ship losses were so high that space was available only for munitions and war supplies. This closed the Egyptian Cotton market to ordinary industrial uses in America. Domestic mills were already consuming the available supply

of Sea Island Cotton. In the first thirteen years of this century, 1900–12, Sea Island crops averaged 90 690 bales. The 1911 harvest of 119 293 bales was the record high of its history. The next crop of volume was in 1916 when demand and top prices rung up the second highest year of its all-time production, 117 559 bales. Government experts predicted, however, that Sea Island was on the way out, due to boll weevil infestation and deterioration in fiber. In 1919, the crop was only 6 916 bales, and in subsequent years became almost non-existent. Peru, the only country other than Egypt growing extra-long staple Cotton during World War I, increased its exports to the United States in these years. The volume received from Peru compared to Egyptian imports, however, was insignificant. Whereas over 600 000 bales came in from the Nile, Peru shipped American mills only 21 262 bales of cotton in 1914–15 and 1915–16, an average of 10 631 bales a year. By 1919–20, the Peruvian imports received in the United States reached 63 426 bales, a record high which, added to the already heavy importation of 485 000 bales from Egypt, combined to ruin the domestic price by harvest time of the 1920 crop. Other wartime years Peruvian imports were well over normal receipts but could only be helpful in the crisis. (US Tariff Commission, op. cit., Section V, table 1, p. 109. Imports of Peruvian Cotton in other war years; 1916–17, 11 069 bales; 1917–18, 19 692; 1918–19, 25 230.) Tire Companies Seek New Cotton Source:- American-Egyptian Cotton was just in its birth-pangs when the textile industry, most particularly the tire makers, called for all-out expansion to meet the emergency. The 1915 crop was only 1,095 bales and the 1916 harvest was but 3 331 bales. This, to an industry with bulging war-time orders, was a mere bagatelle, but it had potentialities for which tire men came to the Salt River valley in hopes of developing. (Hugh Allen, The House of Goodyear, (Cleveland:- 1949), p. 50. The extent to which war influenced business volume is shown in the increase in Goodyear sales from USD36 490 651 in 1914–15 to USD168 914 982 by 1918–19. Tire production of 1915 was 2 500 000; by 1917, 6 000 000. (p. 107).) Paul W. Litchfield, Goodyear factory manager, came out to Arizona in the summer of 1916, offered ranchers ‘a handsome guaranteed price’ to grow more Cotton, but failed to get favorable response. So, driven by circumstances, the company bought 24 000 acres of desert land, and by super-human effort planted acres sufficient to reap a harvest of 1 500 bales of its own in the 1917 crop. (Qlbid., p. 153. The crop relieved the shortage at Akron, the author wrote, and came in time to get in on the rising prices.) Other companies, Firestone, Fisk, and Dunlop, came into the market, setting off a boom in extra-long staple Cotton growing. By 1917 the tire companies were in a mood not only to finance growers with loans but to buy all available Cotton at guaranteed prices. As a result, a considerable portion of the 1917 crop was sold under contract prior to harvest. Some contracts were executed in the early spring prior to planting and others as the season progressed, calling for delivery at picking time at prices ranging from thirty to fifty cents a pound. Unsold Cotton at picking time opened at about fifty-three cents, rose rapidly to fifty-eight cents, then to seventy-five cents. By December 01, a few Pima bales were sold at eighty cents a pound. (J.H. Collins, A Study of the Marketing Condtions in the Salt River Valley, Arizona (UA College of Agriculture Experiment Station, Bulletin 85, March 01, 1918), p. 31. Goodyear and Firestone financed new growers with loans, guaranteeing specified prices on delivery. The other companies sent in buyers, bidding up prices to get a share of the crop.) Although the bulk of the 1917 crop was grown in the Salt River Valley (29 000 acres of 35 400 in Pima Cotton), 4 200 acres of extra-long staple Cotton were planted in the Yuma reclamation project (Arizona and California) and 200 acres in the Imperial Valley of California. Of the total 1917 crop of 15 966 bales, 13 000 was of the Yuma variety and 2,966 bales of the new Pima. The new variety, developed by Kearney from a single plant found at Sacaton in 1910, was characterized by a finer, lighter-colored, and longer fiber, having an average staple of 1–11/16 inches, and sold at two to six cents a pound above the Yuma. (The first commercial crop of the new Pima, grown in 1916, was 253 bales. E.A. Shaw & Co., Boston Cotton brokers, bought 179 bales of this crop and distributed the new variety among mills on the eastern seaboard for testing. Shaw opened a branch at Tempe in 1916. Prices paid for Pima were as high as fifty-eight cents a pound at ginyard while Yuma was bringing twenty-seven cents to fifty cents a pound. E.A. Shaw & Co., Inc., American-Egyptian Cottons (Boston:- 1950), p. 6.) Because of its distinctive qualities, the Bureau of Markets of the United States Department of Agriculture sent in Cotton experts to establish new grades. By December 01, 1917, these experts, working at gins in the Salt River Valley, had inspected 1 000 bales of the new Pima crop. New Gins, Buying Stations In 1917:- The Southwest Cotton Company, incorporated as a subsidiary of the Goodyear Tire and Rubber Company to handle their newly-launched cotton venture, erected eight cottonginning plants in Maricopa County in 1917. These were located on their plantations and at Glendale, Phoenix, Tolleson, Tempe, Mesa, and Chandler. (Supra, Chap. V, p. 8 . Dwight B. Heard, prominent Arizona Pima Cotton grower, wrote in the Textile World Journal (Nov. 22, 1919, p. 175); ‘An average gin stand under good conditions turns out about one bale every ten hours’.) A cotton-buying department, named Sarival, after the first letters in Salt River Valley, was also opened at Phoenix in 1917. In 1920 this was transferred to the company ranch at Litchfield Park to assist growers in cultural methods to produce more and better Cotton, and to cooperate with the United States Department of Agriculture and the University of Arizona in the production of pure planting seed. B.B. McCall, a Florida ginner, and E.G. Attaway, a former Oklahoma-Texas Cotton grower, built a modern roller-type gin at Mesa in 1917, having a capacity of sixty bales a day. Business was conducted under the firm name of Arizona Cotton Ginning and Manufacturing Company. This mill replaced the first large gin built in the valley by the Mesa Exchange which had burned to the ground at the start of the 1917 season due to an explosion in its boiler room. The McCall-Attaway Company also built a ten-stand gin at Tempe. Later these plants were sold to the Firestone Rubber Company. In 1923, after the rubber companies no longer had extensive use for the domestic extra-long staple Cotton, ownership was acquired by the Mutual Cotton and Oil Company. Herbert B. Atha, pioneer of the Pima industry in the Phoenix area, incorporated under the name Arizona Egyptian Cotton Company, also expanded activities in 1917. To supply his Phoenix plant, he opened buying stations, with scales and warehouses, at Laveen, Mesa, Gilbert, Chandler, Glendale, Peoria, Cashion, and Buckeye. The central gin had direct rail connections with all these stations, except Laveen. The 1917 lint output of the Atha mill was destined for American Thread Company’s mills at Williamantic, Connecticut, and Holyoke, Massachusetts, for the manufacture of ‘Star’ brand thread. Atha had an order for 8 000 bales from the thread company. He further anticipated an output of 3 200 tons of an oil cake under the trade name of ‘Kapco’, and the manufacture of lard substitutes and soap. The oil was sent to Los Angeles, California, where the manufacturing process was completed. Atha boasted of the harvest of the 1917 crop in words of optimism, tinged with a flavor of the bpom to come in the next few years:- Arizona Egyptian Cotton is making good beyond all expectation. The yield is above the average, and the quality above the standard commonly used to determine values by cotton buyers ... indicate in positive terms that prosperity is with us. With twelve per cent of the Cotton picked and the big spring-toothed gins running full time; with pickers pouring in from everywhere to get some easy money ... the streets of Phoenix are beginning to look like the ‘days of old, the days of gold’. The Cotton exchange at Tempe, established by growers in 1914, was the prime commercial center for Salt River Valley extra-long staple Cotton transactions, aside from those completed directly which became the predominate manner of sale in 1917. The United States Department of Agriculture located its grading and classifying office at Tempe, first to establish grades for the Yuma variety and in 1917 to provide the sales basis for the new Pima Cotton. The exchange had an eight-stand gin, but maintenance of a pure seed supply was one of its most important functions. The task of converting the plantings from the Yuma to the new Pima variety without cross-breeding or contamination was a major accomplishment of the Tempe Cotton Exchange at a time when acreage was rapidly expanding. The new Pima Cotton was more productive, had larger bolls, a longer fiber, and better lint quality than its parent Yuma. Kearney, working at the Sacaton farm, had developed sufficient seed to plant a few hundred acres by 1916. By 1918, working through the Tempe Exchange, practically the entire Salt River Valley acreage was planted to the new Pima variety. (Collins, op. cit., In 1917 the Tempe Exchange, cooperating with the federal department of agriculture, released seed to farmers south of Tempe who planted 6 700 acres. Every grower executed a contract designed to continue control of the seed by the Exchange. The agreement

provided that the Exchange must approve the land and be given the right to enter upon it at any time to see that it had been properly prepared and seeded and during the growing season, working with the USDA, fields could be rogued and plants and parts of crop destroyed, at the growers expense, if need be. The Exchange retained unconditional ownership of the seed, the grower receiving only oil-mill prices in payment. This unusual contract placed absolute control of the new Pima in the hands of Exchange and proved an effective instrument in preserving the improved qualities of the new variety. The complete contract appears in this work..) The 16 000 bales of American-Egyptian Cotton grown in 1917, both fiber and seed, sold at unprecendentedly high prices. This was the year extra-long staple Cotton ceased to be a sideline and became one of the leading industries of the Salt River Valley (13 358 bales). The per bale return for the entire crop averaged in excess of USD343. This represented soaring profits, stimulating new acreage in Arizona and California. The 7 300 acres devoted to extra-long staple in 1916, exclusively in the Salt River Valley, exploded to 243 000 in the two states by 1920:- 200 000 in Arizona (180 000 in the Salt River Valley) and 43 000 in California. In the first five years of commercial production (1912–16), crops totaled 13 123 bales valued at USD1 717 560. In the next four years, 1917–20, 185 151 bales of Pima Cotton valued at over USD50 000 000 was produced. The United States Department of Agriculture gives this record of the 'boom' years, including 1916 since its bale yield was USD115 over the 1915 average bale return. 1919:- Year Of Optimum Prices:- In 1918, the planting of American-Egyptian Cotton spread into still newer areas. Of the 78 600 acres planted, 72 000 were in Arizona and 6 600 in California. In addition to the 69 000 acres in the Salt River Valley, Pima Cotton was planted in the Imperial and San Joaquin Valleys of California, in several localities around Yuma, at Parker on the Mohave Indian reservation, at Casa Grande and Florence, and in the Santa Cruz Valley near Tucson. The United States Department of Agriculture warned that this widespread expansion had strained the Pima seed supply and cautioned against misrepresentations in seed sales. (USDA 1918 Yearbook, p. 687. Egyptian Cotton acreage for 1917 is given at 36 000 (33 000 in Arizona, 3 000 in California), and 1918 acreage at 80 000 (75 000 in Arizona, 5 000 in California).) The returns from Cotton sent land values and rentals in the Salt River valley to new high levels. Land formerly renting for ten dollars an acre went up to thirty Dollars and was considered a good investment at the higher price. The use of wells beyond the Salt River Project increased as rough lands were levelled for deep-well irrigation. The sole problem was to grow as much American-Egyptian Cotton as possible; not enough was being grown to supply the demand. With tire and thread companies bidding for supplies, the War Department appeared as a probable heavy consumer by buying 200 bales of Pima to test for use in aeroplane wings, paying seventy-three cents on the Tempe market in early 1918. (Leopold A. Chambliss, 'Growing Cotton in the West', World's Work, March 20, 1920, p. 508. The author states a British R-34 plane required fabric that would clothe 10 000 persons. The war had brought a shortage of over eleven million bales of cotton. The reclamation projects of the Southwest were expected to meet the emergency.) The 1919 extra-long staple crop was almost entirely grown in Arizona. California had only 1 500 acres of the 88 500 acres planted to Pima. Of the approximate 40 000 bales produced, 37 986 bales were grown in the Salt River Valley. Californians grew only 675 bales. This is the year prices hit a fantastic figure. Sarival, the Goodyear subsidiary, paid as much as USD1.25 per pound or USD625 a bale. The average bale return for the entire crop was USD406. The 1920 'Long-Staple Cotton Craze':- Stirred by the boom prices of the 1919 crop, the 'long-staple Cotton craze' struck with full impact in 1920. The 1919 plantings of 88 500 acres were almost tripled to 243 000 acres, an all-time high acreage planting. The Arizona acreage was 200 000, California 43 000. Three-fourths of the irrigated land in the Salt River valley (180 000 acres) were planted to Pima Cotton in 1920. This was almost 100 000 acres more than the 83 000 acres sown in 1919. Yuma County, which had favored Durango Cotton in the early experiments, joined the Pima parade, increasing its Cotton acreage from 11 000 in 1917 to 27 000 in 1920. The Pinal county agent reported that 8 000–9 000 acres would be planted to cotton there in 1920 whereas only 2 500 acres had been in the crop the year before. Pima County had only 150 acres in Cotton in 1918 and 1 100 in 1919. This was extended to 4 000 in 1920. (R.N. Davis, History of Dairying in Arizona (US Agricultural Experiment Station:- June 1958 pp 6–9. The author's figures for county acreage ate used above. Outside Salt River valley, both Pima and short staple Cotton acreage increased. The 1919 Arizona Cotton crop approximated 60 000 bales (40 000 Pima; 20 000 upland). The 1920 crop of all cottons was 103 000 bales:- 82 041 Pima; 20 959 upland, valued at USD22 053 101, lint and cottonseed.) The Santa Cruz valley, located between Tucson and Nogales, was not much in the cotton news of earlier days, but in the spring of 1920 a national farm magazine pictured this area as a part 'in an epic movement that has had all south central Arizona with excitement for many months'. From the account given, one company claimed that in two months 250 men had bought Cotton land in its irrigation project and 'Tucson storekeepers say twice that many have settled in the valley since the last load of Cotton went into the gin last month'. The author used colorful language in depicting these events:- '... the rush into the Santa Cruz valley for Cotton lands – fat alluvial bottoms which will produce the prized long-staple Cotton that has made gold mines in the Salt River valley up around the Roosevelt dam. Like a gold rush on Nome's beach or Leadville's great silver rush, the lure of long-staple Cotton has operated in the Santa Cruz. ... Egyptian Cotton ... at the dizzy price of ninety-seven and a half cents a pound ... the pioneers cleaned upward of USD250 to the acre. Immediately word ... flew all through the west; prune ranchers in the Idaho irrigation district heard it; solid hog and hay farmers away off in Nebraska and Iowa caught the magic whisper, sold out and took the first train to Tucson. The rush was on. They came – they are still coming – from the Cotton lands of Oklahoma; from the Imperial valley ... Cotton growers of the Salt River valley saw the chance to sell their lands at top figures and come down to the Santa Cruz to pick up new prospects at one-third that figure. Men who never saw Cotton grow in their lives ... brought their bankroll, their younsters and their household goods down to find the foot of the rainbow. (Richard Wells, 'White Gold', The Country Gentleman (Philadelphia, Pa., April 17, 1920), pp 3–4.) The Santa Cruz valley did not become an important cotton-growing area although the potential existed. A development corporation, called Tucson Farms Company, had small success with its initial promotion and was taken over in 1918 by a new manager, F.W. Taylor. With the assistance of University of Arizona experts, 150 acres were planted to Pima Cotton and a forty-bale crop realized. The company expanded in 1919, built a gin, and planted 1 100 acres, which provided, in the author's words, 'tremendous profits' for the company and others in the valley. Land prices were low compared to those of the Salt River valley, causing some owners there to sell at supposedly big profits and join the rush to Santa Cruz valley. Cotton Forces Decline in Dairying For many years prior to 1919, Alfalfa was the most important crop in the Salt River valley, ranging from one-half to a third of the total cropped acreage. The year 1920 saw the low-point of production with only one-eighth of the land under cultivation in Alfalfa. The plight of the dairy and alfalfa farmer, faced with high-priced land for rental, inflated wartime feed prices, and high labor costs, was given editorial sympathy in March 1919:- 'The Salt River valley farmer has his problems. One of them is how to make a choice of crops where there are so many alluring opportunities. ... The alfalfa and dairy interests in the past have been the financial salvation of this section ... and have had a sorry time of it for a couple of years. All have sweat blood and some have lost money. ... the milk producer and the land owner have yielded to the siren song of cotton and much good dairy stock has gone to the block. ... We know men who were broke five years ago that now are actually rich, and they owe it all to Cotton ...'. During 1920 the University of Arizona agricultural extension service found it difficult to interest Maricopa county farmers in dairying. To advocate anything but Pima Cotton was like 'a voice crying in the wilderness'. B.G. Webster, Manager of the Maricopa creamery, estimated that the number of dairy cows of producing age in Maricopa county dropped from 65 000 in 1917 to 6 000 in 1920. The situation was pictured this way:- 'Everyone was excited about Cotton; some of the merchants purchased farms and became absentee Pima Cotton growers. The local banks encouraged the farmers to grow Cotton and readily financed the efficient Cotton growers. Irrigated land doubled and tripled in price, and became too expensive for dairying. A combination of high priced land, low cream prices, and excitement over Cotton resulted in a rapid reduction in the number of dairy cows in the valley. Business Optimism Of 1920:-

Overlooking what was happening to the dairy and Alfalfa area of farming in Maricopa county, high optimism prevailed in 1920 in business circles over the prosperity and future prospects Pima Cotton brought to the Salt River valley, center of the industry. The Phoenix Chamber of Commerce advertised:- 'Surrounding Phoenix on every side are farming lands, the richest in America. Here long-staple Cotton, sells for USD1.25 a pound, is grown and reaches its highest state of perfection'. The Mesa Commercial Club's advertisement was in a similar vein:- 'Mesa, Arizona:- In the heart of the Salt River valley where Pima Cotton, the best long-staple in the world, is grown and selling for USD1.25 a pound ...'. The Florence Chamber of Commerce expressed it this way:- 'Cotton is king - Pima long-staple – the highest priced Cotton in the world – forty acres will make you independent'. The Phoenix Chamber engaged in the hazardous pastime of counting the profits of the 1920 crop before the harvest, and missed the mark by some USD30 000 000:- Maricopa county, of which Phoenix is the county seat, is putting in 185 000 acres of this Cotton now. This will mean by the close of 1920 USD46 250 000 or USD5 781 250 a month, USD192 768 a day, or USD8 032 an hour coming into Phoenix and its valley. (As cited in Arizona State Magazine, May 1920, p. 4. Figures were based on USD1 a pound price and a half bale to the acre yield although the chamber stated, 'this Cotton now commands USD1.25 a pound and many producers raise a bale and more to the acre'. The advertisements referred to above were printed in the same edition:- Mesa, p. 11; Florence, p. 20; Phoenix, p. 24.) Even the Bureau of Plant Industry, in its annual report for 1920, broke from its traditional conservatism by prophesying that the 1920 crop, approximating 250 000 acres in Arizona and California, had wa prospective value of from USD50 000 000 to USD100 000 000'. The estimate was based on 1919 prices. The bureau cited the confidence in the future of the extra-long staple Cotton industry as manifested in the decision of the Goodyear Tire and Rubber Company to erect a cotton mill connected with a large tire manufacturing plant in Los Angeles. This was the first industrial plant of its kind to be built in Western United States. The cost of about USD20 000 000 represented an amount of capital which the company had already invested 'in the production of Pima Cotton'. (USDA Annual Reports, 1920, pp 162–163. Allen, op. cit., pp 351–52. Goodyear operated its Los Angeles cotton mill until 1938 when it was dismantled and parts sent to Brazil.) 1920:- Year of Cotton Disaster:- The 1920 season did, indeed, appear auspicious for the Pima Cotton grower. In the spring manufacturers offered a minimum price of sixty cents a pound and some contracts had been made at eighty cents. However, the phenomenal expansion which reached the apex of the pyramid in 1920 had many weak spots which became apparent with the harvest of the 1920 crop. For example, the acreage increase in the Salt River Valley from 83 000 acres in 1919 to 180 000 acres in 1920 enveloped much land not adaptable to Cotton because of soil conditions and grass and weed infestations. Desert land irrigation was and is an expensive process. Labor costs were high. Large sums of borrowed money were involved, from banks and federal farm loans, and machinery bought on time, adding to overhead costs. The county agricultural agent estimated that the cost to produce Pima cotton in Maricopa county in 1920 was about sixty-five cents a pound. (Dayis, op. cit., p. 7. The Phoenix Chamber of Commerce estimated the cost to produce an acre of Pima Cotton at eighty-three Dollars an acre, (fn. 25), presumably based on 1919 costs. The yield averaged 229 pounds of lint to the acre that year, placing their estimated cost just above thirty-six cents a pound.) The year 1920, contrary to the spring outlook, proved to be a year of disaster for the Pima Cotton industry. Cotton was indicted because of the 1920 collapse as responsible for the only serious setback agriculture has suffered since agriculture began to amount to something in Arizona. Hot only were many growers wiped out, but the financial structure of the area was weakened and business generally depressed. The tire companies, with large Arizona investments to get Pima Cotton, also suffered severe losses, were forced into refinancing programs, and passed dividends. The fundamental cause of the disaster was, of course, the sudden price decline due to international events. The war was over. Defense orders for military supplies were canceled. The Egyptian supply which had been under restraint during the war now was unleashed on the American market in the greatest import torrent in history. A total of 485 000 bales of the Egyptian stock flooded the American market. A post-war depression limited purchaser buying power, and high quality Cotton felt a shrinking market. Pima Cotton sold as high as USD1.35 in 1919 and growers expected USD1.50 Cotton by 1920. Instead, the record-breaking crop of 92 561 bales became a 'white-elephant' commodity, requiring several years to liquidate. Professor R.N. Davis of the University of Arizona College of Agriculture, in writing a history of the dairy industry upon his retirement in 1958, stated that the price of the 1920 Pima Cotton crop 'instead of being USD1.50 per pound was twenty-eight cents, and demand was limited at this price'. The situation was crucial to farmers but went deeper in his assessment:- Harvest time, 1920, found the farmers in a serious economic condition. They could not meet their obligations at the banks and the farm machinery dealers nor pay on their federal loan. In addition to the Cotton growers and merchants, the farmers who sold their farms on payments were also in trouble financially. A number of the farmers who had sold their farms at high prices for what they considered good cash payments had their farms returned to them in a few years later with delinquent mortgage payments, several years' taxes in arrears, the farms in a bad state of repair and alfalfa replaced by Cotton stalks. Figuratively speaking, business in the county was on its back. Banks and others who held mortgages did not dare foreclose because the security was not worth the mortgage. Some of the banks failed. A large number of farms were taken over by the more fortunate farmers by assuming the federal loan and taxes. Consolidation of farms brought about a material reduction in the rural population. According to the Encyclopedia Britannica, the actual farm population in the state decreased from 90 560 in 1920 to 71 954 in 1925. Maricopa, Pima, Pinal, and Yuma counties all had a reduction in rural population during that period. Decline Of Pima Cotton Acreage:- Cotton became anathema to the dairy, cattle, and Alfalfa farmers after the crash of 1920, and by 1922, except for 100 acres in California, the Salt River valley again became the sole area of production. When Coolidge dam opened up new irrigated acres in 1929, some Pima Cotton was planted in Pinal county and other counties as well. New Mexico and the El Paso region of Texas have since 1939 planted extra-long staple Cotton. As farmers in the Salt River valley took up the task of replanting 50 000 acres to Alfalfa and replacing 30 000 dairy cows, Pima Cotton acreage in the Salt River valley grew less:- 73 600 in 1921; 77 000 in 1922. With limited Alfalfa acreage, cattle reeders paid 'dizzy prices' for hay. Alfalfa costs went up; cattle prices went down. Unless you enjoy strong language, one writer stated, don't ask the cattlemen of Arizona what they think of Cotton. Cotton, however, was in Arizona to stay. When upland prices were high in 1924, Salt River growers put in 122 000 acres and cut their Pima cotton plantings to only 8 000 acres. Not until 1942, however, did the cash income from Cotton in Arizona exceed what Pima growers of the state received from the 1919 harvest. That Pima survived as an important cash crop is evidenced in the fact that almost half (forty-eight per cent) of the 1942 total money income from all cottons in Arizona came from the Pima plantings. (Chap. V, p. 4, fn. 6. Because 1942 was a war year when Pima Cotton growth expanded at the request of the War Mobilization Board, the comparison favors the extra-long staple variety.) The year 1920 was long remembered for the great failure of the Cotton market, 'a disaster to the Salt River valley of which seventy-five per cent was in Cotton, and the accompanying widespread financial depression. C.W. Steele, Secretary of the Arizona Dairy Association, an admitted victim of the 'cotton craze', swore:- 'Never again will Cotton be planted to the exclusion of all other Crops'. Dan F. Collett, Secretary of the Mesa Commercial Club, boasted at a Cotton carnival held in Mesa in October 1920 that three gins in his city the previous year did an export business of approximately USD5 000 000, all Pima Cotton, asserting:- 'No other is grown nor will be allowed in this valley'. Governor Thomas F. Campbell, speaking at the celebration, estimated that Cotton 'means a gross income to the farmers of this valley of something over USD40 000 000', adding that Mesa was the center of at least half of the Cotton acreage of the state. In September 1921, after the crash, Collett indulged in some postmortems:- Nearly everybody concedes that farmers made a mistake when they forsook well-tried and successful diversified farming for the exclusive raising of Cotton. All would have gone well if the demand and price had kept up to the standard of 1919 ... Another thing that added to the woe of the Cotton raiser was the fact that many got the 'get-rich-quick' idea into their heads. Not content with the acreage they had, they plunged into the buying of land, more

than they could properly till and decidedly more than they could reasonably pay for. ... Smaller farms and better farming will be the rule of the future. Generally, the expressions were aimed to bolster confidence in the Pima Cotton industry and the Salt River Valley, such as made by Charles M. Morgan, spokesman for the American-Egyptian Cotton Growers' Association:- No thinking man interested in the future prosperity of the Salt River Valley should allow the unfortunate conditions of business in general and of the Cotton market in particular for the past two months to shake his confidence in the Cotton industry of Arizona, even for a moment. Every student of the industry realizes that we have here in Arizona, the finest Cotton producing area in the world ... the only district in the world growing only one kind of cotton – the finest grown ... . A writer for Sunset Magazine, in summarizing the aftermath, took the optimistic view that, unlike the South, Cotton was not a matter of life and death to Arizonans:- 'Ten years ago they grew no cotton at all and did well. They do not need Cotton now. The spree is over. The paper profits have vanished, but the deep soil, the brilliant sun and the water are still there'. Although four years' profits vanished in three months, he found that the Copper State was still smiling, secure in the knowledge that the worst was over, that bedrock had been reached and dented, that there was but one way to go and that was – up. Conditions could only improve. History proved this assessment to be sound. Goodyear Arizona Cotton Venture:- The Goodyear Tire & Rubber Company of Akron, Ohio, according to an estimate of a bureau in the United States Department of Agriculture, invested USD20 000 000 in developing the Pima Cotton industry in Arizona. The Southwest Cotton Company (changed to Goodyear Farms, Inc., in 1943) was set up as a Goodyear subsidiary to carry on the Cotton-producing enterprise. (Goodyear Tire & Rubber Company, The Story of Goodyear Farms, (Akron, Ohio:- November 1953), pp 7–20. The Southwest Cotton Company was originally capitalized at USD1 000 000, then was increased to USD5 000 000 and later to USD15 000 000. Besides growing Cotton, the Southwest Company was the purchasing agent for Goodyear needs. In the nine years Goodyear was in the market, the company bought 79 405 bales of Pima Cotton which represented 28.5 per cent of the total Salt River valley crop. It loaned money to growers to produce the crop, at one time advancing as much as USD1 475 000. To process the Cotton, eighteen roller gin plants were built in the producing area. It ultimately came into possession of 38 000 acres of Arizona desert land, which it reduced to 16 000 acres in 1943. Mules were used to clear the land at the start, with 1 200 in use during 1917–19; ten years later mules numbered 200 with 36 tractors doing most of the plowing and cultivating. The company built 158 miles of new roads, 118 miles of electric transmission lines, 42 miles of telephone lines, 80 miles of concrete and unlined ditches, and now has 70 wells from which water is pumped at the rate of 1 928 gallons a minute.) The year 1920 started out more auspiciously for Goodyear than any in its history. The Arizona cotton venture was making USD1 000 000 profit annually. Earnings on common stock, including stock dividends, had averaged better than fifty per cent for the twelve years prior to 1920. The company was looking forward to immense profits in 1920 because the year was started with orders on the books which indicated a sales volume of a million Dollars for every working day of the year (USD300 000 000), a pace set in March 1920 when sales were USD20 000 000. At the start of 1920, Goodyear paid its biggest dividend in history (USD6 971 584). By the end of the year the company was on the verge of bankruptcy. By November 1920 sales were down to USD4 500 000 (1919 sales were USD168 000 000). Arizona Pima Cotton, which had admittedly contributed to Goodyear's record profits, became a major problem in the time of crisis. At the start of 1920, Cotton was considered such a money-maker by the company that it added 11 000 acres additional Arizona desert land (the Marinette ranch) and had plans to extend plantings into Mexico. During the year, however, between planting and harvesting time, raw Cotton crashed from one dollar a pound and more to twenty cents a pound. The company had commitments to buy Pima Cotton, no longer needed, for sixty cents a pound. (Ibid., p. 195. Litchfield wrote that Goodyear could pay Arfzona growers only forty Dollars in cash on each USD100 of its Cotton commitments, giving sixty Dollar certificates payable at USD86.20 at a later date.) 1920:- Refinancing Program:- In November 1920, Goodyear executed a revolving loan of USD25 000 000 with Goldman Sachs, a New York banking firm, pledging materials and stock as security, and permitted trustees to take charge. The company mortgaged its Arizona holdings for USD1 000 000. Before the year was out, however, it was apparent that new financing was needed. Dillon, Read & Company, then new in the investment field, sponsored a reorganization, effective only if creditors would agree on a program to liquidate bills and to provide ample working capital. By May 21, 1921, the reorganization had become effective. Three trustees, with authority to name a majority of the board of directors assumed the management of the company, and retained control until 1927. (Litchfield, op. cit., pp 195–197. In the reorganization, Frank A. and Charles Seiberling, company founders, and W.E. Palmer, treasurer, resigned, and Edward G. Wilmer, Milwaukee lawyer and financier, became president of the company. Control of the company was vested in Clarence Dillon, representing bondholders; Owen D. Young of General Electric, merchandise creditors, and John Sherwin, Cleveland banker, the holders of debentures. Each trustee received USD10 000 in management stock. Securities issued were USD27 500 000 in debenture bonds, USD30 000 000 in prior preference stock, and USD30 000 000 in bonds, issued at 90, callable at 110, and to pay eight per cent and be taken by Dillon, Read providing other issues were subscribed.) Goodyear escaped bankruptcy, but at a high price in the opinion of stockholders who instituted a law suit which mitigaged some of the terms but left the basic settlement unchanged. Since the company received only 90 cents on the Dollar and had to pay it back at USD1.20 or USD1.10 on the Dollar and pay eight per cent interest, Litchfield wrote:- 'Boiled down, we were in effect borrowing USD87 000 000 at fourteen per cent interest'. In the seven months of negotiations, Litchfield acknowledged that in the strain 'my hair turned from a chestnut brown to be almost white as it is today (1954)'. Litchfield was elected Goodyear president in 1926. The Arizona Goodyear plantation survived the 1921 reorganization although it was showing losses up to USD100 000 a year and more. The new directors taking over control in 1921 proposed its sale as a losing proposition. Litchfield, who had negotiated Goodyear's coming to Arizona, fought the liquidation and the Southwest Cotton Company remained active to go on to bigger things in Arizona. Effect Of 1920 Cotton Crisis On Firestone:- The Goodyear Company reported a loss of USD4 549 073 for 1921 and for the first time since 1904, no dividends were declared. No dividends were paid in 1922, either. (Ibid., appendix three, p. 336. The only loss year other than 1921 since 1903 was 1932, when USD850 394 loss was reported.) The Firestone Company had also invested heavily in Cotton facilities in Arizona, but not in land to grow Cotton as did the Goodyear Company. Firestone had money problems in 1920, also, but escaped refinancing as Harvey S. Firestone, the company president, informed Harry Chandler, Arizona Cotton grower, in a letter written December 27, 1924:- 'It was only the confidence of a few of my friends in the banking business that saved the company from refinancing such as was done by other Targe companies. ...'. (Alfred Lief, The Firestone Story (New York:- McGraw-Hills, 1951), p. 51. General Motors, also hit in the 1920–21 depression, was taken over by the Duponts, W.C. Durant resigning as president. Litchfield (op. cit., p. 194) wrote:- 'We had no such friends to help us out ... no one banking house who felt us as its responsibility. Seiberling, like Henry Ford and many other midwest industrialists, distrusted Wall Street'.) Firestone, however, was forced to pass dividends in two years, 1922 and 1923, the only years missed since the 1905 start. Profits in 1920 were USD9 396 912; in 1921, USD949 354. The dividends paid on common stock in 1920 amounted to USD3 607 685; in 1921, USD543 860. Then followed two non-dividend years. Vanishing earnings in the Firestone company were rooted in cotton, in part. The company president had gone to the British Isles to spend the summer of 1920 but hurried back in mid-year to lend his hand in stifling the serious set-backs his company was experiencing. This is the gist of the cabled information he received while in England:- The whole picture of the national economy was undergoing an alarming change ... Farm prices cracked. ... The country was in a depression. ... Notes to pay off rubber and Cotton purchases were falling due ... Material kept arriving on contracts that had been signed for record amounts ... Inventories were already excessively large ... Cotton and rubber prices had crashed ... Inventories and commitments were worth fifty cents on the Dollar ... The incoming raw material, unwanted and high priced, must be checked. Firestonets experience with the British embargo on Egyptian Cotton imports made him an advocate of

the cultivation of this type of crop in the United States to mend what he called the rubber industry's weakest point:- its dependence on foreign sources for raw material. This was the basic reason prompting the United States Department of Agriculture to send scientists to the Southwest in 1902, to breed an Egyptian-type Cotton. In 1923, the Firestone company liquidated its Arizona cotton-gin holdings, receiving USD360 000 in the transaction. Goodyear did the same (receiving USD320 000) except that facilities on its Litchfield Park plantation were retained. That Goodyear did not leave Arizona after the purpose of coming to the state had been accomplished proved a boon to the state's economy. Both agriculture and industry profited. (Arizona' part in Goodyear's business life developed to a peak in World War II when a huge aircraft plant, employing 7 500 persons, was built near Litchfield Park. An aluminum plant was erected nearby and a company airresearch project in Phoenix employed an additional 1 000. Luke Field, set up to train single-seater fighters, was located near Litchfield Park and Goodyear turned over its swank resort hotel, Wigwam, to house personnel in training there. The resort, one of Arizona's first 'dude' ranches, had eighteen wickiups of three to six beds each. Built in 1930, Wigwam was complete with golf course, swimming pool, and riding facilities. A Goodyear Wingfoot plant, equipped to mass produce cement igloo homes over an inflated balloon, was opened at Litchfidd Park, serving to relieve the war-time housing shortage in the region.) That the company stayed on even while losing money and was no longer in need of extra-long staple Cotton was notable in itself. Even more colorful was the company's coming in the first place, intending only to buy cotton and then being forced into growing it. This story, unique in American business, merits a place in the history of Pima Cotton. 24 000-Acre Purchase In 1916:- Paul W. Litchfield, in 1916 a Goodyear Vice President and factory manager, was the central figure in the company's Cotton gamble. He came to Arizona in mid-summer 1916, tried to interest ranchers in raising Cotton needed at Akron, and offered a handsome, guaranteed price for all they could grow, but had little success. In September, however, Litchfield executed a contract with T.E. McDevitt of Yuma, under which the latter agreed to lease 10 000 acres from Doctor A.J. Chandler, owner of the famed San Marcos hotel at Chandler, clear the land, plant Cotton, and sell it to Goodyear at a specified price. McDevitt took the contract to his lawyer, E.F. Parker of Pasadena, California, to get his opinion on its soundness. Parker, after thorough investigation, told McDevitt he was in danger of losing everything he had under the contract terms. McDevitt balked on going ahead, and in desperation Litchfield asked his board of directors to take over the proposal, advising them that a suit to enforce the contract would bankrupt McDevitt and no Cotton would be grown. The board accepted Litchfield's advice and Goodyear Tire & Rubber Company went into the business of growing extra-long staple on an extensive scale. Top Talent Employed To Grow Cotton:- Goodyear's decision to grow Cotton to keep its Akron rubber plant operating at full capacity brought recruitment of 'the best counsel available'. Joseph R. Lofthus of Phoenix, formerly of the Imperial valley and the preceding two years general manager of the Chandler (Arizona) Improvement Company, bought much of the land for the rubber company. Two undeveloped tracts of desert, 16 000 acres along the Agua Fria river and 8 000 acres near Chandler, were acquired. The firm of Quinton, Code & Hill was engaged to do the engineering and serve as consultants on construction. Litchfield thought them most competent:- 'Code knew more than anyone in the Southwest about underground water levels, and Hill had built the Roosevelt dam ...'. (Ibid. Because land ownership in the Salt River project, irrigated by water from Roosevelt dam, was restricted to 160 acres for individual or company, all Goodyear land except 160 acres had to be irrigated from deep wells. The 1917 water level was high, requiring drilling from 150 to 300 feet; water rose close to the surface; maximum lift was about 100 feet. (Allen, op. cit., p. 153.)) Shattuck & Nimmo, contractors who had built Roosevelt dam, were hired to prepare the ground for the first Cotton crop of 1917, after which they sold their equipment to the Southwest Cotton Company to permit the Goodyear subsidiary to do its own work. The headquarters of Shattuck & Nimmo was at Bakersfield, California, and their equipment included 1 100 head of stock, mostly mules. C.H. Waterhouse, president of the Tempe-Scottsdale Cotton Exchange and experienced planter, was a superintendent on the project. Associated in this work was John P. Conduit, who had previously handled 30 000 acres of Cotton in Mexico for an English syndicate. To direct the planting, Goodyear retained E.W. Hudson, superintendent of the Sacaton station during the development of American-Egyptian varieties there and the foremost authority on extra-long staple growing in the Salt River valley. The man selected by Litchfield as general manager of the project was Edward F. Parker, the Pasadena lawyer who had advised a client he had a money-losing contract with Goodyear. Parker, as vice president of the Southwest Cotton Company, continued as manager for five years, primarily as an expert on finances. McDevitt, the client, became president of the Phoenix Cotton Oil Company, a profitable enterprise using the by-products of the Cotton grown in the Salt River valley. The company was later sold to the Goodyear interests, after which McDevitt served as president of the California Cotton Oil Company. Parker, addressing the Phoenix Rotary club in July 1917, expounded on the monies spent and to be spent by the Southwest Cotton Company in the Phoenix vicinity in 1917:- USD1 500 000 in the first seven months at the rate of USD7 000 per day, to be increased to USD10 000 per day in September, and USD15 000 a day in October. Activites in progress included construction of five gins in Salt River valley, enlargement of the company oil mill with a new executive office adjoining, and the building of two towns, then called Cotton City and Agua Fria. It was planned that each town would contain warehouses, machine shops, garages, store buildings, offices, and have the facilities of any normal town, such as pool halls, theater, church, school, hospital, and so on. (Edward F. Parker, 'Some Cotton Patch', Arizona State Magazine, (Phoenix:- August 1917), p. 8. Cotton City, on the Chandler ranch, later became Goodyear and still later Ocatilla. Auga Fria became the beautiful town of Litchfield Park.) Parker, in the spring of 1918, reported that in the first year of business the Southwest Cotton Company had purchased 'something in excess of USD3 000 000 of growers' Cotton. This would approximate one-half of the value of all Cotton grown in the Salt River valley in 1917. In the nine years Goodyear continued in the extralong staple market, Southwest Cotton Company bought 79 405 bales of Cotton, which represented 28.5 per cent 19 of the total Salt River valley crop. To absorb some of the cotton commitments made in the record 1920 crop for which it was paying growers more than the open-market price, Goodyear purchased a Cotton mill at New Bedford, Massachusetts in 1924, and made its own fabric, as it had done in Los Angeles since 1920. The company paid Arizona growers USD40 in cash on each USD100 of its 1920 commitments, giving USD60 certificates redeemable at USD86.20 payable at a later date in final settlement. Goodyear's McMicken Pima Cotton Booster:- The balloon type tire, using ordinary long-staple and 'Peeler' Cottons of the Mississippi delta, came into production in 1923. The extra-long staple continued to be used in heavy-duty truck and bus tires, wherever high tensile strength was needed. (Joe H. McClure, Market Outlets for Cotton, (USDA PMA research Report 25, September 1952), p. 69. Uhtil 1923, extra-long staple Cotton was used exclusively for tire fabric. Prior to 1937 cotton was the only fiber used in tires. In 1947, 850 000 bales of Cotton went into tire production which then constituted the greatest volume for any single industrial use. Since 1937 rayon, and later nylon, has gained in use for tire cords.) The Southwest Cotton Company (Goodyear Farms after 1943) continued to serve the Pima industry even after the company's need for the crop no longer existed. The vast acreage of the Litchfield Park ranch afforded essential isolation in developing new varieties and was used by scientists of Sacaton and the University of Arizona extension service. Kenneth McMicken, cousin of Litchfield, was associated with extra-long staple Cotton-growing since joining the Goodyear venture in 1918. In 1919, he went to Egypt to study production methods and in 1928 he spent six months in Peru, where extra-long staple Cotton is grown in volume. When the purity of Pima seed was threatened in the Salt River valley after Pima's low acreage in 1924 and widespread upland plantings, McMicken planted 1 200 acres to Pima Cotton on the Litchfield ranch in 1926 from seed the Tempe exchange had stored from the purest Pima seed of the 1918–19 crop, thus permitting 44 000 acres to be grown from seed of this crop in 1927. McMicken's service to agriculture, particularly the Cotton industry, won him wide recognition and acclaim. The maintenance of seed purity was a prime concern with him during his forty-one years of work at Litchfield Park. In 1933 he was elected president of the Arizona Pure Seed Association. Appointed in 1934 to the Arizona Commission of Agriculture and

Horticulture, an agency charged with control of crop Insect Pests and Plant diseases, he continued in this service until his death on April 05, 1959, the final sixteen years as the commission chairman. He served on state agricultural boards mobilizing Arizona's resources in World War II and the Korean conflict, and was one of a national committee called to Washington to represent the nation's Cotton growers in arriving at a policy of action on boll weevil control. Cotton-breeding and research activities centered at Sacaton for fifty years were transferred to a new Cotton center built in 1956 near Phoenix on 275 acres of land purchased by the Arizona Cotton Planting Seed Distributors in 1954 for USD168 864. The association retained ten acres for an office building for itself and the Arizona Cotton Growers' Association and gave the remainder to the University of Arizona. McMicken was the one and only president of the seed distributors association from its incorporation on June 28, 1949, until his death. The association was organized to 'multiply and distribute pure Cotton seed for planting purposes'. (Statement of organization, aims, and functions of Arizona Cotton Planting Seed Distributors prepared by Dr. Scott Hathorn, economist in Department of Agricultural Economics, University of Arizona, September 1949.) During his lifetime, McMicken received numerous honors for his work in behalf of agriculture. In 1938 the Future Farmers paid tribute to him for aiding its program. In 1952, Governor Howard Pyle presented him with a plaque as 'The Man of the Year in Arizona Agriculture' on behalf of the Future Farmers at a luncheon sponsored by the Arizona and Maricopa county farm bureau federations. At the 1959 annual meeting of the seed distributors association, a large print of McMicken was presented to the head of the University of Arizona experiment stations and accepted for display in an appropriate place of honor on the campus. For his work as chairman of the Ague Fria soil conservation district which secured a flood control dam protecting 274 square miles damaged by floods in 1951, the project was named McMicken Dam in his honor. (The flood control structure protects Luke Air Base, Goodyear aircraft plant, Avondale, Litchfield Park, and part of the Beardsley area.) As a conservationist, leader, farmer, and man of progress, McMicken stands alone as the 'patriarch of Arizona agriculture'. These were expressions of tribute on his death. Editor Ernest Douglas of The Arizona Farmer-Ranchman summed up the role of McMicken and Litchfield, the man who brought Goodyear to Arizona, in these words:- 'Yes, Paul Litchfield of blessed memory supplied the capital and perhaps the original vision; but Ken McMicken supplied the know-how and dogged perseverance that made Goodyear Farms the outstanding success it has been from the start – a success financially, artistically and scientifically. (Arizona Farmer-Ranchman, April 25, 1959, p. 8. Goodyear's Litchfield (op. cit., pp 162–163, 324) recounted a profitable transaction in Cotton land, involving himself and E.W. Hudson, made on his first visit to Arizona in 1916. As the two were travelling about trying to interest ranchers to grow Cotton for Goodyear, Hudson pointed out a half section of land near Tempe, nine miles east of Phoenix. Hudson advised Litchfield the land was good, close enough to river to build a canal to irrigate it but rough and impossible to cultivate, adding:- 'I can't afford to put in graders and scrapers. I work for a government salary. But if you will take it over and clear it, I would like an option to buy half of it back from you later'. When Goodyear went into the business of growing Cotton, Litchfield said he sold his land (to whom, he did not say, but presumably to Hudson) and used the proceeds to build La Loma, the name of his show-place home built later on 160 acres of land near Litchfield Park, Arizona. He said the La Loma land cost him fifty Dollars an acre.) The Marketing Of Pima Cotton:- After the disastrous price decline following the harvest of 1920, enthusiasm for Pima Cotton was lessened. Those who were in the business for a quick profit sought greener fields. Agriculturists at Sacaton and University of Arizona and some growers of the Salt River Valley still believed Pima Cotton was a special product worth preserving. California and Texas growers went back to growing upland. Actually, the California growers had poor luck in the venture into extra-long staple growing. When the price was highest in 1919, their crop was only 675 bales. In 1920 they put in 43 000 acres to Pima Cotton and, because the lint yield was a pitifully small 107 pounds to the acre, the harvest was an unprofitable 9 650 bales of low-priced Cotton. They reported a 100-acre planting in 1922 and were generally out of the Pima industry thereafter until 500 acres were planted in 1950. Production of Pima Cotton in Texas during the World War I was not sufficient to be recorded in the Cotton statistics, but the United States Department of Agriculture in a news release dated May 14, 1921, found it necessary to repeat a warning made in 1911 that the Egyptian-type Cotton was not adapted to Texas conditions. The warning came as a result of complaints from growers who planted their land from a carload of Pima seed shipped into Texas for the 1920 season. (Since 1940 the Trans-Pecos region near El Paso has produced a high quality Pima Cotton.) The immediate problem facing the Pima growers in 1921 was to find a market for the huge 1920 crop of 92 561 bales (73 837 in Maricopa County, Arizona) at a time when Eastern mills were flooded with a record 485 000 bales of Egyptian Cotton imported in 1920. Other problems arose later, such as keeping Pima seed pure when surrounded with a large planting of short Cotton as occurred in 1924 (122 000 acres of upland and 8 000 of Pima) in the Salt River Valley. New extra-long staple Cotton varieties, with higher yields, were needed to make Pima a profitable industry. Arizona Pima Cotton Growers Association:- The Arizona Pima Cotton Growers' Association was organized in the summer of 1921. Sixty-five thousand bales of unsold Pima Cotton at that time hung like the sword of Damocles over the market. Cotton produced at a cost of sixty cents a pound had to be sold for half and occasionally a third of that price. About 7 000 bales were sold at public auction. The new association, however, attempted to achieve a more orderly liquidation. To avoid 'dumping' the surplus of 1920 crop on the market as distress stock, warehouse storage in the Salt River valley was procured, and a trainload of Pima Cotton was shipped to New Bedford, Massachusetts, for storage. These acts relieved the local congestion and provided, as well, a 'spot' supply of Pima Cotton near the mills. ('Returns from Cotton-Spinning Experiment', Arizona Producer, November 01, 1924, relates one unique attempt to use up the 1920 surplus stock of Pima cotton in a transaction not a part of the Pima Cotton Growers' Association business. This account dealt with the final returns of a consignment of 870 bales of 1920 Pima Cotton shipped to Czechoslovakia in 1921. Under the plan, Arizona growers would be paid for the Cotton from sales of fabric manufactured by a Czech mill. The plan failed, according to Department of Commerce investigators, because Pima growers were unable to guarantee a minimum annual balage and, lacking this assurance, the spinners refused to go to the expense of adjusting machinery to care for a single shipment. Only fifty-five bales were actually made into cloth. The remainder was sold over a period of two years, some being shipped back and sold on the Boston market. Final settlement thirty months after shipment was less than the local market would have paid in 1921, according to officials of the Arizona Pima Cotton Growers' Association.) Warehouses in Phoenix and New Bedford both qualified under the United States Warehouse Act, which permitted the transfer of stored Cotton from Arizona to Massachusetts by the exchange of warehouse receipts without refinancing. By providing bond, the association was licensed to loan money to members on stored cotton from USD1 200 000 credit given to the association from the War Finance Corporation, assuring 1921 crop financing for growers if needed. (Only half of the authorized credit was used because many growers had already mortgaged their crop to the limit.) Within a year, the 1920 surplus was greatly reduced. In the liquidation process some Pima Cotton was consigned to Liverpool to compete with Egyptian varieties. A year after the association started. Secretary James reported a total of 15 424 (7 825 unsold) bales of Pima Cotton on hand in the gin yards, warehouses and fields of the Salt River valley and 2 516 unsold bales in storage, including 632 bales in Phoenix, at other places. This presented a comparatively healthy situation as compared to the preceding year when 65 000 bales were reported held in the valley. (Manager James' report of July 1922 holdings of Pima Cotton indicated that the bulk of the total carry-over of 15 524 bales in the Salt River valley was from the 1920 crop. Ginyards reported 9 108 bales of the 1920 vintage and 3 805 from the 1921 harvest. An additional 2 516 unsold bales were reported in bonded storage warehouses:- 1 614 bales in New Bedford, Massachusetts, with three companies (New Bedford, 1 482 bales; Stewart Bros., 32, and Clark-Payson, 100), and 632 bales with the Arizona Storage and Distributing Company, Phoenix.) The New Bedford Storage Warehouse Company, in a July 1922 bulletin, commended the Arizona Pima Cotton Growers' Association for its sound marketing policy which had extended the use of Pima Cotton into areas never before reached:- The feature of the month has been the marked

swing into Arizona-Egyptian or Pima Cotton by many of the mills normally using long-staple peelers. Many had never before tried Pima and some were still experimenting with it for the first time, but in the aggregate there are probably twice as many mills using Pima cotton as compared with a year ago. ... Pima growers have shown great tenacity and courage in holding their Cotton until such time as there was sufficient demand for it to bring a fair market price ... not insisting upon figures high enough to bring Egyptian Sakellaridis in direct competition on equal terms, but preferring ... to get more mills into the habit of using Pima by making it available at an attractive figure compared to any other long staple Cotton. (Arizona Producer, November 01, 1922, p. 1.) The New Bedford bulletin reported that Pima Cotton prices ranged on the Boston market from thirty-two to thirty-eight cents while Egyptian Sakellaridis of good grade was selling from forty to forty-five cents a pound. The seven-cent tariff, in effect only from May 21, 1921, to September 21, 1922, was a factor in holding the Egyptian import Cotton above the price for the domestic product. Sapiro Cooperative Marketing Plan Adopted By Arizona Association:- The Arizona Pima Cotton Growers' Association was formed under the authority of an act passed by the 1921 Arizona legislature as a purely cooperative, non-stock non-profit organization. Only actual Cotton growers were accepted for membership, each with one vote. (Dwight B. Heard of Phoenix was the first President of the association, refusing re-election in 1924 after three years of service. In 1921 he attended a world Cotton conference at Liverpool and Manchester, England, and appeared at congressional hearings at Washington dealing with the emergency tariff law of 1921 which placed a seven-cent import duty on extra-long staple (1-3/8 inches and over) from May 21, 1921, to September 21, 1922. While in Washington he invited Eugene Meyers, head of the War Finance Corporation, to come to Arizona to look into the association's activities which resulted in release of USD1 200 000 credit upon which growers could borrow. He also visited several mills in the East to urge the use of Pima Cotton. Charles M. Morgan was the first association secretary, serving until he became editor of The Associated Arizona Producer, launched by the association in March 1922. P.M. James, association manager, then combined his duties to include the office of secretary-treasurer at a USD4 200 salary. James R. Ray, with fourteen years' experience with Sea Island Cotton in Georgia and Florida, was hired to classify Pima Cotton (salary USD3 600). To promote uniformity and a possible better price, he sorted crops into lots of fifty with each lot as near in grade and staple as possible. The association also employed an expert gin inspector who visited all gins twice a week in a campaign to raise the quality of work above previous standards. With 952 members enrolled in the first year the association reported a volume of USD1 787 200 the first year. These facts appeared in a report made by George Butterworth, USDA Cotton expert, sent to Arizona to help maintain the quality of Pima Cotton. His report was printed in The Producer editions of March 15 and April 01, 1922.) The Arizona cooperative act was patterned on the Sapiro plan similar to laws since adopted by some forty states, which spell out certain procedures and privileges under which the producer would have some control over the marketing of his crop. Aaron Sapiro, San Francisco lawyer who sponsored the plan named after him, came to Phoenix to help in the formation of the Arizona Pima Cotton Growers' Association, G. Harold Powell, General Manager of the highly successful California Fruit Growers' Exchange, was also consulted (and aided in setting up the Arizona Pima Cotton cooperative.) The key feature of the plan was an iron-clad contract binding the grower to deliver his crop to the association for marketing for a stipulated number of years (five years in Arizona). The Pima Cotton Growers' Association membership was confined to the Salt River valley and to Pima Cotton growers in the initial years, but was opened in 1922 to include Yuma Valley upland growers. The Arizona association differed from most marketing groups in that seed was sold also. In order to secure control of the seed, the policy of buying Cotton in the seed was adopted. Believing that local buyers were paying too little for cotton-seed, a contract for the sale of 3 000 tons of association seed was negotiated with an outside mill, giving the organization average Texas prices at FOB valley points. This forced the local market from USD12.50 to USD20 a ton (later dropping to USD16). Fred J. Elliott, attorney for the association, cited other benefits the organization secured for growers:- Almost immediately the association, following an interview with the president of the Goodyear company, obtained a reduction in the ginning rate from USD24 per bale to USD15, and seed prices were raised to USD25. Insurance rates were cut almost in half. Instead of storing Cotton in the gin yards it was stored in bonded warehouses at about one-half the gin-yard rate. (Fred J. Elliott, 'Arizona's Big Co-op', Producer. October 01, 1929. When the association was organized and several years thereafter, Elliott was the association attorney; in 1929, he was a Vice President.) C.O. Moser, Secretary of the American Cotton Exchange, told Pima Cotton growers in June 1922 that the Sapiro marketing plan was 'sure-fire' and that there had been no failures of cooperatives since Sapiro established the fundamentals in 1913. However, the Pima Cotton Growers' Association soon encountered violations among members, and the first of a series of actions against 'contract jumpers' was instituted on October 07, 1922. The suit sought to restrain the member 'from disposing of any Cotton produced or acquired by or for him' and asked judgment for USD6 000 as damages and also the cost of the action. The revolt developed seriously when on July 21, 1924, some 100 dissident members in a mass meeting held at Mesa demanded cancellation of their contracts and distribution of their share of accumulated reserve. These demands were rejected, but on October 01, 1924, the association announced that the dissolution movement was ended ('amicably settled') by the expulsion of certain members, who had given up their rights in the property and reserves of the association. The association surrender on the compulsory phase of the marketing contract virtually ended the Sapiro-model cooperative upland in Arizona as it pertained to Cotton. The association opened its facilities to members and nonmembers alike under liberalized contracts. Pima Cotton became a minor role in the association business despite its title. In 1924–25, the association handled 8 864 bales of upland and 884 bales of extra-long staple; in 1925–26, 16 346 bales of short staple and 4 902 of Pima Cotton. The business followed the variety diversion trend existing among Salt River valley growers. Adequate Financing For Growers:- The Pima Cotton Growers' Association, acting through its subsidiary, Arizona Cotton Processing Company, purchased a one-fourth interest in the Mutual Cotton & Oil Company, which in turn bought the Goodyear and Firestone Cotton mills and gins in 1923. In 1921 the War Finance Corporation advanced USD1 200 000 in credit and in 1922 Eastern banks made money available to growers through association efforts. In April 1925, the Arizona Agricultural Credit Corporation, with USD80 000 capital advanced by the Mutual company, was formed, permitting USD400 000 to be loaned to Cotton growers through the Intermediate Credit Bank of Berkeley, California. Under a marketing agreement with the Arizona Processing company, the association announced on December 01, 1926, that it could advance seventy-five per cent of the market value of Cotton to growers and store the Cotton in a fireproof warehouse in Phoenix. The storage plant was equipped with a sprinkling system to secure lowest possible insurance rates. Under this plan, Cotton was placed in pools of even-running grades and staples and held for a favorable market. (Arizona Producer, November 01, 1927. K.D. Hellwarth, President of the Arizona Pima Cotton Growers' Association, cited these facts in a report of association activities.) The Arizona Pima Cotton Growers' Association qualified as a strong cooperative but came to an end in less than a decade. Its accomplishments were momentous but having no control over the market, the association fell victim to the price declines of the farm depression given emphasis in the stock market crash of October 1929. After that, a new theory of voluntary control as a way to bring greater returns to growers was in the ascendancy:- cut acreage, grow less, decrease supolies, and prices will rise. (At a 1930 conference of agricultural county agents of Arizona held at the call of P.H. Ross, director of the University of Arizona Agricultural Extension Service, Harry A. Stewart of Maricopa county was reported by The Producer 'as the hero of the day when he was able to report a prospective decrease of 40 000 acres from last year's mark of 145 000'. In 1933, Arizona Cotton growers plowed up 21 321.48 acres for which they received USD250 309 in cash and options on 13 334 bales of surplus Cotton which if sold above six cents a pound would result in additional apportionment. Cotton acres plowed up by counties were:- Yuma, 1 944.33; Graham, 2 052.90; Pinal, 7 786.25; Maricopa, 9 538. ('Arizona Does Her Part', Arizona Producer. August 01, 1933, p. 1). Pima Cotton was exempt under the Bankhead Act which later established acreage controls over upland Cottons. Conflicting opinions as to whether

upland growers could grow the Pima variety over and above allotments on upland kept growers in a quandary much of the time. One ruling which disturbed growers stipulated that the staple-length of over 1-1/2 inches had to be proven at the expense of the grower before plantings outside the allotment would be permitted; when proven, then the upland would be increased to the extent of acreage planted to extra-long staple. In tests of the previous five years only 3.7 per cent of all Pima Cotton grown was under 1-1/2 inches. Growers thought the rule unfair, and Kenneth McMicken and Walter Smith were selected to secure revision of the rule which eventually prevailed. ('Grief for Pima Growers', Arizona Producer. August 01, 1934, p. 1.) George W. Barr of the University of Arizona Department of Agricultural Economics in a 1944 trip to Washington was able to secure USD300 000 additional funds for Pima Cotton growers under the 1942–43 government purchase programs by securing a new interpretation on price level.) In 1930, Anderson, Clayton & Co., world's largest Cotton ginner, compressor, grower, and broker, through its subsidiary. Western Cotton Producing Company of Phoenix, contracted with Arizona Cooperative Cotton Growers as a new marketing organization under which fifty per cent of sale profits, up to five Dollars per bale on lint and ten Dollars per ton on cotton-seed, would be shared with the grower. (Producer. November 15, 1930, p. 1. Growers agreed:- (l) To gin cotton with Western if charges were as low as open charges in district; (2) To sell seed if price was equal to above-board price of district; (3) To sell lint to Anderson, Clayton if price was as high as offered by other buyers at the same time. Pima Cotton was not a factor in the agreement.) Ginning and Compressing Pima Cotton from 1917 to 1920 primarily served the rubber industry; eighty-five per cent of production went into this area of consumption. By 1932–33, 23.3 per cent of the Pima crop went into tire fabrics, 11.9 per cent into sewing thread, 60.7 per cent into fine cloths, and 4.1 per cent into other uses. In the transition to new uses, Pima growers found the spinners more critical of the condition of fiber received at mills. The Arizona Pima Cotton Growers' Association, through its official paper, campaigned vigorously for improvement. (Producer. March 15, 1922, first edition of the association's official paper, pictured Pima and Egyptian Cotton bales on its front cover over this caption:- 'Pima Cotton ... has always reached the delivery point at the mills in a disgraceful condition, with bagging badly torn, bands missing, and in some cases ragged ...'.) Horace H. Willis, Cotton specialist for the United States Department of Agriculture, made a tour of New England mills in late 1922, to find out if the faults mills complained about could be corrected. (Horace H. Willis, Utilization of Pima Cotton (USDA Bulletin 1184, November 1923), p. 18. The author found the careless compressing done by railroads at Oklahoma and Texas points en route was undermining Pima's popularity in competition with the well-baled Egyptian imports.) Some of the mill complaints of the ragged condition in which Pima Cotton was received was due to the job done by railroad compression plants of Oklahoma and Texas to conserve shipping space. This condition was corrected in 1925, insofar as Arizona Cotton was concerned, by the construction of a modern compressor at Phoenix by Arizona Compressing & Warehouse Company. (Arizona Producer, August 15, 1925, p. 1. The plant covered two and a half blocks, had the 'last word' in modern installation with a normal eight-hour-day capacity of 1 000 bales a day (two bales a minute); employed 125 men in season.) Phoenix became thereafter the concentration point for Cotton grown within 100 miles of the state's capital city. In addition to its other facilities, the plant qualified as a federal bonded warehouse under the public warehouse act administered by the United States Department of Agriculture. Receipts issued by the company for stored Cotton were accepted as collateral for loans at all banks, including the federal reserve bank. With the establishment of the Pima industry in the Salt River valley, a diversity of gins and methods were employed. Some gins formerly had been used in Sea Island areas of the Southeast. Various kinds of cleaning and handling devices were attached, some carried over from saw gins with which many operators had their previous experience. The diversity of mechanical equipment resulted in different appearances in the lint, depending upon how it was handled in the ginning process. Actually, seeming lack of uniformity was more apparent than real. This was the conclusion of James S. Townsend, a man of long experience with roller-ginning in South Carolina, after a tour of mills and an inspection of Arizona gins, reported in 1925:- In reality, the select Pima variety is much more uniform than any of the seed stocks that were secured from Egypt, and the varied appearance of the bales has been due to the mechanical condition of the Cotton produced by the methods employed in the different ginning establishments. Townsend spent several months checking roller gins in Salt River valley and was able to effect many improvements in the quality of fiber produced. In 1928 there were eighteen Pima gins in the valley with 'stands' varying from one to twelve with a total combined capacity of 330 bales per day. A single 'stand' ginned one bale of Pima Cotton per day. Practically all Pima Cotton was consumed in American mills, the bulk in New England and remainder in Southeastern states and some in California. In the early days of the industry, Arizona Cotton was shipped to Galveston, Texas, and thence by water to New England or designated destination. By 1928, almost all Pima Cotton both for domestic and foreign use was routed through California. (Ibid., p. 17. Shaw wrote:- 'As shipments via the Texas ports cost considerably more than via California ports and as the Texas port facilities are insufficient for handling shipments as speedily as those of California, almost all Pima both for export and United States consumption is routed through California'. Now Texas ports are used, especially for Pima Cotton. In a comprehensive survey undertaken in 1959 by representatives of Arizona and New Mexico universities, the advantages of Texas ports are noted.) In a survey of Cotton marketing in the irrigated Southwest for 1935–36, it was found that 90.3 per cent of all Arizona Cotton was shipped through the Los Angeles port. The remainder, probably Pima Cotton (9.7 per cent) was routed to domestic mills in the southeastern states (7.1 per cent) and Northeastern states (2.5 per cent). The same survey reported that after 1931 no cooperative marketing organizations were located in Arizona. Several cooperatively-owned gins were limited to ginning only. (Wright and Kennedy, op. cit., table 39, p. 70. According to the survey about fifty-three per cent of Arizona Cotton production was shipped to Phoenix for concentration and compression. Almost forty per cent was shipped flat (not compressed) to Los Angeles harbor for compressing. Arizona Cotton made up forty-four per cent of total Cotton receipts at Los Angeles. About sixty per cent of these shipments went to the Orient, principally Japan which then provided the principal market for Arizona's upland production.) Houston and Galveston, Texas, are now concentration points for extra-long staple Cottons, according to the latest marketing survey reported in July 1959. Current marketing procedures follow this pattern according to the information gathered:- Seventy-seven per cent of the buyers interviewed purchased Pima S-1 direct from farmers. Some buyers also made a high proportion of their Pima S-1 purchases from finance companies which had financed the growers' operations or from seasonal pools. ... After the buyer purchased the Cotton from the grower he stored it locally until carload lots were available for shipment either to domestic or foreign mills. ... Galveston and Houston are excellent for concentrating Pima S-1 because it can be moved either to domestic or foreign mills from there and the Cotton is moisture conditioned to environments similar to those of the mills where located. (Carl R. Hall and Charles A. Wilmot, Marketing Pima S-1 Cotton, July 1959. The authors are agricultural economists, serving with the New Mexico (Hall) and Arizona (Wilmot) agricultural experiment stations. The study was sponsored by these two college agencies and the USDA Agricultural Marketing Service.) Marketing During World War II:- Following Pearl Harbor (December 07, 1941), the government turned to American-Egyptian Cotton growers of the southwest to provide some of the sinews of war. The uncertainty of Egypt remaining in Allied hands and finding sufficient shipping space even if she did had users of extra-long staple worried. On February 05, 1942, a 1942 goal of 150 000 acres of Pima Cotton was announced as well as a government purchase program. 'On March 14, the goal was raised to 300 000 acres ... and more, if the seed supply permits' and the support prices were raised. The plantings totaled 192 900 acres in the three Pima-growing states, and the harvest of 73 808 running bales was second only to that grown in 1920. The 1943 goal was reduced to 160 000 acres; the harvest, 59 600 bales. World War II introduced a new phase of marketing insofar as Pima Cotton was concerned. For the first time, extra-long staple became a basic crop and as such became eligible for loans and price supports which heretofore had been extended only to the upland varieties. Under the 1942 purchase program, the government first offered thirty-three cents a pound, net weight, for grade No. 2 1-1/2-inch staple with differentials for other

qualities as specified. When a higher goal was announced the supoort price was raised to thirty-eight cents a pound, and later again raised to 42.75 cents and finally to 43.25 cents. These prices seem low as compared with stockpile purchase rates for 1951–52 when the government paid USD1.05 and USD1.07 for extra-long staple Cotton. During the 1942 picking season, the free market prices generally exceeded the government purchase prices and only 5 572 bales of the 74 000-bale crop were sold to the Commodity Corporation. (Ibid., p. 5. McLure, op. cit., p. 37. reported that the government purchase programs of 1942 and 1943 and the loan programs on crops of 1944 through 1948 were not high enough to relation to that for other cottons to cause farmers to plant larger acreages of the American-Egyptian Cotton.) Growers were unhappy with the defense program as administered in 1942, and a general exodus from growing extra-long staple Cotton came in the second half of the 1940 decade. The principle discontent was centered on the government's unfilled promise to provide labor to harvest the fiber for which the war defense board had asked be grown. (Much bitter feeling was engendered during the 1942 labor difficulties. The War Man-Power Commission and growers disagreed violently on the type of contract for Mexican braceros. There was an attempt to recruit pickers from Japanese evacuees in camps at Sacaton and Parker which proved disappointing. The army sent in troops for guard duty. The Farmer (November 07, 1942) reported that three companies of colored soldiers were guarding 160 Japanese pickers, and called for the soldiers camped at Papago Park and Fort Huachuca to pick the Cotton. Papago Indians were finally used effectively and 'victory labor volunteer groups' made up of gray-haired men and women, little children, students, merchants, big business executives, housewives did part-time work. In Graham county, high schools at Solomonville, Safford, Thatcher, Pima, and Fort Thomas permitted students to be absent two afternoons a week to pick Cotton. Their earnings up to November 20 was reparted 'at least USD40 000'. (Farmer-Producer. December 05, 1942, p. 1.) As World War II neared its end, German and Italian prisoners-of-war quartered at a large camp near Florence, Arizona, were helpful in picking Arizona's Cotton. They worked under contract arrangements between the army and the grower.) Much of the 1942 Pima Cotton crop remained unpicked and because of late picking resulting damage lowered grades. As a consequence, many growers let the Cotton seed itself and reaped 'stub' Cotton in 1943. In 1943-44, the price ratio for Pima Cotton was 2.4 times over ordinary long-staple prices. By 1946–47, the price ratio was down to 1.3 times, which contributed to the near-extinction status of the extra-long staple crop in the late 1940's. Pure Seed And Breeding Programs Of Pima Cotton:- Breeding Cotton is a science based upon genetics. Profound as this term sounds, Walker E. Bryan, University of Arizona plant breeder, insists that the process is simple. Only two things are necessary:- (1) Selection of the plant and (2) control of the pollination. Plants are selected by a field inspection of growing Cotton and such as show promise of high quality and yield are set aside and the seed used for progeny planting the following year. Plants which appear to be satisfactory in this selection might prove otherwise in progeny cultivation; if this is the case, they are discarded. Progeny plants which continue to show desired characteristics are preserved year after year for further testing until a superior Variety, worthy of commercial growth, has been established. Controlling the pollination means, first, that only the desired pollens are permitted to be transmitted from one plant to another. The breeder takes the pollen from such growings as have the desirable characteristics he wishes established in a new Variety and mixes them in the pod of other plants. (Technically, the pollen from the anther of one plant is transferred to a stigma in a flower of a different plant.) Secondly, pollination must not be permitted from any unwanted source. The preventative lies in carrying on breeding programs in areas well isolated from fields of any other cotton growth. Wind and Insects (particularly Bees) will transmit Cotton pollen in fields close together. Plant selection requires knowledge of Cotton's properties. For example, in the fall of 1959, Bryan personally inspected 9 000 plants in the Cotton nursery area maintained by the University of Arizona, called the Casa Grande farm near the railroad overpass on the northwest edge of Tucson. From this group, 400 plants were selected which appeared to him to have good potential character. The seed from each of these plants is planted the following year in progeny rows. There are then 400 rows from which selections will be made for next succeeding year. Only by this process can the future of the industry be protected and progress. The principal objectives in the Pima Cotton breeding program have been high production of lint fiber (to stay in competition with upland for yield, in relationship to acreage), early maturity (to avoid possible weather damage of late seasons), adaptability to mechanical harvesting (to cut down harvesting costs), improvement in fiber quality (to meet spinners' demands), and resistance to disease and Insect injury. Value Of Pima S-1 Boon To Growers:- Breeding new Varieties is a lengthy process. In the case of Pima S-1, thirteen years elapsed from the first crossing in 1934 until a single plant selection was made in 1947, giving rise to the Variety now in general use among extra-long staple Cotton growers of the Southwest. After three years of testing at the University of Arizona experiment farm at Tucson, the Bryan selection was transferred to the United States agricultural seed station at Sacaton for further testing and seed increase. Pima S-1 originated as a single plant selection from four widely-different Varieties, each of which possessed some desirable quality the breeder sough to incorporate in a single new variety. The breeding stock included the original Pima, Stoneville 4 (upland), Sea Island (later type, with low plant), and Tanquis, grown in Peru, South America. Characteristics used as a basis of selection were low plant, productiveness, large well-opened bolls, medium length of lint, and high lint percentage. The single plant resulting was the product of six basic crosses between the original Varieties and selected plants within the crosses, each of which had one or more desirable characteristics. In four years of testing (1950–53), Sacaton found Pima S-1 the highest-producing variety of any extra-long staple Cotton ever grown in Arizona. This conclusion was confirmed by Robert H. Peebles, station superintendent, who himself had only recently developed Pima 32, hailed as a Variety of exceptional high production. In tests made in four different areas, Pima S-1 out-yielded Pima 32 from sixty pounds to 235 pounds of lint to the acre. The average lint production of Pima S-1 over Pima 32 in these four points was 128 pounds to the acre or a 22.3 per cent increase. Pima S-1 had almost a five per cent higher lint ratio (34.2 per cent) over Pima 32 (29.6 per cent). The new Variety also promised an adaptability to machine picking. (Troy Mullins, Competitive Position of American-Egyptian Cotton (New Mexico Agricultural Station, October 1955), p. 5. About sixty per cent of farmers interviewed in Graham county, Arizona, in 1954 said some of their Pima Cotton was harvested by machine. Field and grade loss were balanced by saving in labor costs.) In comparative tests on quality conducted in eleven mills in 1954 by the National Cotton Council, Pima S-1 was cited in nine categories as superior to both Pima 32 and the imported Egyptian Karnak variety. (John J. Brown and others of Southern Research Laboratory, New Orleans, Louisiana, 'Evaluation of Yarn Properties and Processing Performance of Pima S-1 Cotton', Textile Research Journal, May 1955, pp 413–414. Comparing with Pima 32 and Karnak, tests found Pima S-1:- (1) Equal to the others in general processing efficiency; (2) Nepped less than either of others; (3) Consistently made stronger yarn than Karnak for a given twist and equalled Pima 32 in strength; (4) For given draft, made yarns stronger than the others; (5) Made consistently more uniform yarns than either; (6) Had seventeen per cent more elongation than yarns produced by the others; (7) In double-creeled roving was stronger and more uniform; (8) Made two-ply yarns showing same percentage gain in strength as others, and (9) Response to mercerizing and to subsequent dyeing slightly better than the other Cottons.) Pima Cotton acreage yield had remained static up to 1945 (less than 250 pounds an acre). Upland yield had showed a gradual increase. After Pima S-1 was given to growers for the 1954 crop, acre yield apparent in tests continued to show remarkable increase over earlier Varieties. The development of Pima S-1 has placed the industry on a basis where price and quality competition with foreign imports and synthetics has become possible. Consumption and exports since the advent of Pima S-1 have reached proportions never before attained. Under a program instituted by SuPima Association of America, Pima mill consumption, averaging 720 bales a month in 1954, was increased to 2 390 bales monthly in 1955, and 5 585 bales each month in 1956. For the first time since the industry was started in 1912, United States mills in 1956–57 consumed more Pima Cotton (sixty-one per cent) than imported Egyptian (twenty-five per cent). The success of Pima S-1 is the culmination of long experience and close cooperation among breeders, growers, pure seed associations, and marketing

groups. In 1912, at the time the first commercial crop was grown by seventy-five farmers in the Southwest, O.F. Cook warned:- 'With the usual neglect of selection, crossing of Varieties in the field, and a mixture of seed in public gins, the uniformity of stock is usually lost before it has been out of the breeders' hands for more than two or three years'. This prediction was proven true, especially in 1924 when Salt River Valley Cotton growers almost abandoned the Pima industry. Survival of the industry rested with the growers who formed associations to receive the seed from the breeder and who placed the new Varieties into production in ways designed to maintain its good qualities. This work was centered at Sacaton until 1957, when it was transferred to the new University of Arizona Cotton Research Center near Phoenix. Honors Accorded Pima Cotton Breeders:- In the history of Pima Cotton development, three breeders were recognized for their outstanding service to the industry. The University of Arizona accorded Thomas H. Kearney an honorary LL.D. (Doctor of Laws) degree in 1920 and Robert H. Peebles an honorary B.S. (Bachelor of Science) degree in 1955. The Alabama Polytechnical Institute of Auburn, Alabama, awarded Walker E. Bryan, a 1911 graduate and native Alabaman, an honorary D.Sc. (Doctor of Science) degree in 1956. All of these honors were accorded because of work accomplished in the field of Pima Cotton. Kearney, the pioneer in the industry, developed four varieties of American-Egyptian Cotton, each one better than its predecessor, and brought out new facts useful in the science of genetics. More than 100 important publications and articles in scientific and trade journals record the results of Doctor Kearney's works. (Statement of USDA Agricultural Research Administration in letter circulated for trade use under date of June 09, 1944. Kearney retired in 1944 after 50 years service in USDA and died in 1956 at the age of eightytwo years in a San Francisco hospital.) Extra-long staple Varieties produced from Kearney breeding stock and the years grown included the original Yuma (1912–17), Pima (1916–40), SXP (1934–49), and Earlipima which had only limited growth but was used by Peebles in producing his best variety, Pima 32. (Brown and Ware, op. cit., p. 71. Yuma was produced from Egyptian Mit Afifi and Pima was developed from Yuma. SXP resulted from several crosses of Pima with Egyptian Sakel, from seed brought to Sacaton in 1914 by American Thread Company. Earlipima came from a backcross of SXP stock with Pima.) Kearney's first experiments, starting in 1902, were conducted on the farms of the Yuma Reclamation Bureau in cooperation with W.E. Peterson, station superintendent, who collaborated on some of the first reports. After the 1905 spring floods had wiped out the experimental plantings, breeding activities two years later were transferred to the Gila Indian Reservation in central Arizona. Here Kearney worked with E.W. Hudson, superintendent of the Sacaton station farm until 1916. (E.W. Hudson bred the Gila extra-long staple variety while at Sacaton, used but a few years exclusively on Arizona Indian reservations. His liaison work with farmers of the Salt River Valley while he was superintendent at Sacaton, a time when Cotton-growing as an industry in Arizona was in its swaddling clothes, served as a sound basis for subsequent expansion. The University of Arizona extension service had arranged for his full-time service to work among extra-long staple growers starting in 1916, the same year the Goodyear company moved into Arizona and engaged him to supervise seed selection and planting on some of the 24 000 acres of desert land bought that year by the Southwest Cotton Company. By 1918, Hudson was a 'large planter in his own right'. (McClintock, op. cit., p. 7). He is now primarily a cattle farmer with extensive holdings in California's Imperial valley, although he continues to have his home near Tempe.) S.H. Hastings succeeded Hudson until 1920 when he joined the Southwest Cotton Company. Later Hastings returned to the Department of Agriculture. Chalmers J. King, superintendent from 1920 until his death at Sacaton in 1945, contributed greatly to the Pima industry in seed programs and public speeches. (Arizona Producer. February 01, 1926, p. 3. Sample quotation from a King speech:- 'Growing of upland might be developed into a highly scientific industry in this region Balt River valley but 50 million acres in the South can be put to the same uses as our few thousand acres and we rise or fall with a population of millions that has never become notably prosperous during sixty years of Cotton growing'.) His successor was Robert H. Peebles, a close associate of Kearney. Peebles continued residence at Sacaton from 1924 until his death there in 1956. He trained in Plant breeding under George J. Harrison. (George J. Harrison was an extra-long staple Cotton breeder at Sacaton from 1920 to 1934 and did much work with Kearney on the SXP variety, which came into commercial use in 1934, the year he was transferred to Shatter field station in California. In his new assignment, from a single plant selected from an Acala 1517 field in 1939, he developed Acala 4-42, an upland 'said to be the finest short staple in the United States'. (Arizona Farmer, March 15, 1958, p. 28). The first increase seed was grown in 1945 and by 1950 was practically the only variety grown in California. The relatively rapid and complete replacement is possible under the 1925 one-variety Cotton community law passed by the California legislature in 1925 which provided that one and only one variety could be planted thereafter in Riverside and Cotton-growing counties of the San Joaquin valley. The effectiveness of the law was proven by the 1954 plantings:- 99 per cent of Californians 907 000 Cotton acres were planted to Harrison's Acala 4-42. The same year, only 81 per cent of Arizona's 416 000 Cotton acres was planted to the state's No. 1 Variety, Pressleyrs Acala 44. Two other Varieties made up Californians remaining one per cent, whereas Arizona had seven others named and more lumped as 'all other' among Varieties in the 19 per cent (80 000 acres) not planted to Acala 44. (Harry Bates Brown and Jacob Osborn Ware, Cotton, McGraw-Hill, New York:- 1958, p. 56). Harrison now serves as consultant and director of fiber research for Calcot, Ltd., a marketing cooperative which reported handling 24 per cent of California's Cotton crop and 12 per cent of Arizona's Cotton harvest of 1956–57. (Arizona Farmer, July 20, 1957, p. 35). Harrison has been awarded the farm bureau distinguished service award and was cited by the California legislature for his service to agriculture. (Arizona Farmer, March 15, 1958, p. 1.)) When Harrison was transferred to Shatter, California, in 1934, Peebles took charge of the Sacaton extra-long staple breeding program at Sacaton, and was personally responsible for two American-Egyptian varieties:- Amsak, in limited production from 1944 to 1949, and Pima 32, an excellent variety, grown from 1949 to 1959. (USDA Information Service (L.E. Childers letter, October 23, 1957) states:- 'Amsak, released in 1943, ... was accepted by mills for having fiber spinning quality equivalent to the best Cottons imported from Egypt. Pima 32, released in 1949, ... had spinning properties equal to Amsak and gave yields 20–25 per cent over the best American-Egyptian Varieties grown previously'.) The unique part of Peeble's career is that although he lacked a formal education he became an outstanding Plant breeder and scientist. (Ibid., Peebles graduated from Hollywood high school , Los Angeles, and attended U.C.L.A. one year (1920–21) after service in World War I. He was preparing to accept a promotion which would have taken him to the agricultural center at Beltsville, Maryland, when he died unexpectedly at Sacaton in 1956. William Waddles, who had been at Sacaton intermittently since 1939, was given charge of the USDA extra-long staple breeding program, until he was given a Beltsville promotion in 1957. Dr. Carl Feaster is now the extra-long staple Cotton breeder for the USDA at the Cotton center.) He worked closely with Kearney and Harrison. Peebles and Kearney collaborated in a study of Arizona flora and jointly published a monumental work, 'Flowering Plants and Ferns of Arizona', released in 1942 by the United States Department of Agriculture with Peebles as junior, author. A second edition was published in 1952 by the University of California. In addition to breeding two commercial varieties of Pima Cotton himself, Peebles recognized the merits of Bryan's Pima S-1 and supervised the testing of the new variety in the field, in the fiber laboratory, and in the mills, and multiplied the planting seed as rapidly as possible, saving one year in the process by taking progeny increase to Iguala, Mexico, in the winter of 1950. Peebles was widely commended for his work in developing Pima S-1 in which he 'demonstrated his ability as a leader working with federal and state workers, mill men, and farmers to bring out this outstanding new variety in the shortest possible time'. Walker E. Bryan came to the University of Arizona in 1916 and was associated with Elias H. Pressley in the plant breeding department of the College of Agriculture. Bryan specialized in extra-long staple breeding and Pressley in upland. Both men developed Varieties in major use in Arizona at the present time. Of the 416 000 acres planted to upland by Arizona growers in 1954, 81 per cent (336 000 acres) were planted to Pressley's Acala 44. (fn. 11). In 1959, extra-long staple plantings in Arizona, New Mexico and Texas totalled 76 200 acres; 75 000 of these acres were in Bryan's Pima S-1 variety. The citation given

Bryan by the Alabama Polytechnic Institute read in part:- ... he pioneered new methods and made significant contributions to the modern science of plant breeding; who received national recognition for developing the long-staple, Pima S-1 Cotton that has outyielded commercial Pima varieties by twenty-two per cent, that has opened to Southwestern growers new markets once dominated by foreigng-rown long staple Cotton, and that has added several million Dollars annually to growers' incomes; and a scholarly, well-informed scientist who has devoted his life to envisioning and pioneering new techniques and to training promising young men as future plant breeders. (USDA Agricultural Research Service, News Letter. June 26, 1956. Mitchell Landers, speaking as an officer of SuPima association in October 1955, said:- 'Of course, the entire program in behalf of our long-staple Cotton would have been impossible but for the development of Pima S-1 by Dr. Walker E. Bryan at the University of Arizona'. (Farmer. October 29, 1955, p. 41).) Pima Cotton Pure Seed Associations:- Keeping Pima Cotton seed in the pure state received from breeders was relatively simple up to 1922 because the Salt River Valley was virtually a one-variety Cotton community. When valley growers planted 122 000 acres to upland Cotton and only 8 000 to the Pima variety in 1924, the industry was seriously threatened. Roguing and inspection of extra-long staple Cotton fields had been a practice in the Salt River Valley since 1913, and up to 1924 was managed by the Tempe Cotton Exchange. The task became too great for the exchange after the large upland plantings of 1924. So a new organization, the Maricopa County Farm Bureau Pure Seed Association, was set up by growers, ginners, and buyers to protect the seed. Dividing the valley into ten regions and subdividing into school districts, inspectors visited 641 farms between July 20 and September 19, 1925, certified 456 as satisfactory, rejected 168 as failing to meet required standards, and had seventeen farms still in process of inspection. In all, inspectors from the Sacaton field station and university farm schools carefully examined over 33 000 acres of Pima Cotton plantings in a two-month period, issued certificates of approval to 23 169 acres and rejected almost 10 000 Maricopa county acres as lacking prescribed cleanliness. (Arizona Producer. October 01, 1925, p. 6. The process of roguing takes place when the Cotton Plant is in blossom. Growers did their own roguing, weeding out inferior and diseased plants and all hybrids or upland growth, after which experts checked the fields for certification. About 3 000 acres in the valley were not put to the inspection test, primarily because growers failed to rogue their fields. Inspection was done without cost to the grower. Certificates signed by inspectors assured buyers that the Cotton came from rogued fields, 'in an endeavor to maintain a pure and unmixed strain of Pima Cotton'.) In the opinion of Kearney, few Pima Cotton fields in 1925 were sufficiently isolated from other Cotton to make the seed safe for planting. To assure the ultimate in seed purity for the 1927 plantings, Pima Cotton seed, grown in the Tempe pure-seed district in 1918 and 1920 and since stored in sealed sacks, was used in 1926 to secure the seed purity of the 1927 crop. By an arrangement with the Southwest Cotton Company, this good seed was planted on the Litchfield ranch at least a mile distant from the nearest short staple crop. The company agreed to pick and gin the crop under conditions preventing any mixing of seed. The pure seed project carried out at the Litchfield Park farm, in cooperation with the Western Cotton Oil Company of Phoenix, made available for 1927 plantings 300 tons of absolutely pure Pima planting seed, sufficient to put about 20 000 acres into crop. The Maricopa County Farm Bureau Pure Seed Association found it necessary to supplement this supply with a crop from 1 200 additional acres, inspected by federal Department of Agriculture and University authorities, to provide an additional 300 tons of seed. Pima Cotton plantings in the Salt River Valley reached 44 000 acres in 1927, the largest acreage since 1922, and for the final time exceeded upland plantings (39 185 acres). By re-establishing the seed purity in the 1927 crop, the Pima industry survived one of its most serious crises. (T.H. Kearney, 'Pure Pima Seed for 1927:- Arizona Producer. August 01, 1926, p. 6, and Harry A. Stewart, 'Sufficient Pima Seed to Plant 30 000 to 40 000 Acres', Arizona Producer. December 15, 1926, p. 6. The Litchfield ranch Pima plantings in 1926 totalled 1,858 acres:- 680 acres in 1918 seed, 698 acres in 1920 seed, and 480 acres (for lint only) as a buffer crop planted with 1924 seed. All fields were rogued and inspected in July. The fields planted to 1918 and 1920 seed were found free from contamination whereas 747 off-type Plants were pulled from the field planted with 1924 seed. Inspections were made by Harry A. Stewart, county agent; J.B. Duerson, assistant county agent; Prof. W.E. Bryan and F.L. Smith of the University of Arizona, and the following from Sacaton field station:- G.O. Belden, F.M. Eaton H.J. Fulton, G.J. Harrison, C.J. King, H.F. Loomis, R.H. Peebles, and L. Towle.). Seed for the 1928 crop was also produced at the Litchfield ranch by the Southwest Cotton Company under similar roguing and inspection, using the 1918 and 1920 Pima seed 'which made it absolutely pure and free from any admixture'. The bulk of the seed for the 1927 and 1928 crops was sold through the Tempe Cotton Exchange under provisions approved by the pure seed association. By 1930, ninety per cent of the Pima Cotton crop was certified by the Maricopa county seed association, indicating seed purity was well protected. The Salt River Valley planted 62 400 acres in Pima in 1929 (82 700 in upland). Pima county grew 3 200 acres and Pinal county 1 400 acres, bringing Arizona's total extra-long staple Cotton plantings to 67 000 for the year. The Pima industry, in 1924 down to 8 000 acres and seed purity threatened, was within five years, that is by 1929, again comparatively well established. Growers' associations have continued to give seed purity first consideration. (Numerous surveys to determine the relative merits of upland varieties as opposed to Pima Cotton were made in Maricopa county from 1922 to 1930. The University of Arizona extension service prepared comparative acreage and returns in 1923 and 1924 (UA Timely Hints Nos. 145 and 150). Three comprehensive surveys were completed (1) by T.H. Kearney for the years 1922–26; (2) by a committee of fourteen representing all phases of the industry of which Harry A. Stewart was secretary as part of a complete appraisal of the agricultural resources of the Salt River Valley, and (3) by C.J. King and H.F. Loomis of the Sacaton field station, covering the years from 1924 to 1930, inclusive. All of these surveys reached the same conclusion:- the Pima Cotton grower received the higher cash returns from his plantings than the upland grower in all years except 1922 and 1923. The name of Maricopa County Farm Bureau Pure Seed Association was changed to Arizona Pure Seed Association in 1933 and Kenneth R. McMicken succeeded Walter R. Strong, President since 1925. Harry Stewart continued as secretary until 1936. In 1937 the association was consolidated with Arizona Crop Improvement Association with R.L. Matlock, University of Arizona agronomist, as secretary.) The Arizona Cotton Planting Seed Distributors, organized in 1949, is now well established and rendering Cotton growers excellent seed stocks. Sacaton, for fifty years the center of extra-long staple Cotton, was abandoned in 1956 in favor of a new and modern research center. The new pure seed association in 1954 bought 275 acres of land between Phoenix and Tempe (on Broadway between 40th and 48th streets) and donated the site, except for ten acres, to the University of Arizona for use as a Cotton research center, formally opened at a dedication program on December 06, 1956. (Arizona Cotton Planting Seed Distributors paid USD168 864 for the Broadway land and at the time of the dedication reported total expenditures for the center by the cooperative at USD205 000. The Arizona legislature appropriated USD132 000 for the necessary buildings, and the cooperative supplemented this with USD32 000 to finish a building to provide a meeting place and library. Both the distributors and Arizona Cotton Growers' Association maintain offices at the center on the ten-acre reserved plot. The distributors have given unstinted support to the extralong staple seed programs. In 1952, McMicken announced that distributors had 1 300 acres devoted to Pima 32 seed development; 100 acres of parent stock, 400 acres of foundation, and 800 acres of registered stock. At the same time plans for speeding up supplies of Pima S-1 seed were revealed, which brought this high-yielding variety into production a year earlier than normally possible. Foundation seed of Pima S-1 was taken to Iguala, Mexico, a tropical area in which United States cotton interests have an experimental farm, and here the foundation stock was developed during the 1950–51 winter and brought to Arizona in time for distribution to growers af certified seed. This program enabled most of the 1954 crop to be planted to Pima S-1 and put new vitality into the extralong staple industry. (V.R. Cardozier, Growing Cotton, published by McGraw-Hill in 1957, p. 53, has a picture of R.H. Peebles, Sacaton scientist, inspecting Pima S-1 experimental plants at Iguala.) The distributors have financed numerous research fellowships. The 1958 budget included USD14 778 for research to the University of Arizona and

USD9 984 to USDA. The distributors financed a Cotton mill and laboratory tour undertaken by Dr. Carl Feaster and Dr. Warner D. Fisher, Cotton breeders at the center, in which special attention was given treatment of Pima S-1 at the mills.) The new center has continued the research activities which had been concentrated at Sacaton since 1907. Facilities include laboratory and equipment, valued at USD50 000, originally used at Sacaton, a field gin, machine shop, storage sheds, offices, and superintendent's residence. The cooperative is the source of extra-long staple cotton seed not only for Arizona growers but the Pima-growing areas of New Mexico and Texas, also. (Kenneth B. McMicken was one of the original incorporators and president of the seed distributors until his death in April 1959. Other incorporating directors were Dan W. Clarke, H.S. Miller, Cecil Collerette, J. Clyde Wilson, J.D. Lee, and Elwood H. Smith. Ed S. McSweeney, secretary of the Arizona Cotton Growers' Association, managed the new organization the first year and was succeeded by Wilbur Wuertz, Maricopa county agricultural agent, who served until 1956 when he became a Pinal county Cotton grower. Since November 1956, Robert Shuler, previously at Sacaton, has been the manager. An advisory board, made up of representatives of federal and state departments of agriculture. University of Arizona Experiment Station, Arizona Farm Bureau, and the ginning industry, assists the board in dealing with Cotton problems. The association has kept Doctor Bryan on full-pay status at the University by paying the difference gap he received under retirement.) Breeding extra-long staple Cotton is a continuing process both by the United States Department of Agriculture at the Phoenix Cotton center and the University of Arizona on its experiment farms. The Arizona Cotton Planting Seed Distributors are equipped to develop the breeder seed under conditions that protects the seed purity. After fifty years of experience gained at Sacaton station, aided by growers who have maintained production through hazards attending production in multiple-variety areas, Pima Cotton still survives as an important cash crop for the Southwest. Stabilization Of Pima Cotton Industry:- Maricopa County (Salt River Valley) has produced half (714 282 bales) of all Pima Cotton grown in the United States (1 416 128 bales) since the crop was introduced commercially in 1912 up to and including 1958. Over this period, Arizona production (1 039 985 bales) has been almost three-fourths (73.5 per cent) of the nation's total American-Egyptian Cotton crop. Production in all other states, 1912–58, and the portion, of the total volume of all Pima Cotton grown in the United States has been:- Texas, 227 400 bales (16 per cent), New Mexico, 128 100 (9 per cent), and California, 21 543 bales (1.5 per cent). Only Arizona growers have maintained continuous production since 1912. Most of California's production (17 743 bales) was grown prior to 1922, thereafter no Pima Cotton was produced in that state until 1950. Only since 1940 has extra-long staple been grown in Texas and New Mexico. From 1912 to 1937, the span of the first twenty-five years of the Pima Cotton industry, Arizona produced ninety-seven per cent of the total Pima crop and California the remainder. Maricopa County grew 96.5 per cent (509 820 bales) of all Arizona Pima Cotton production (528 300 bales) in this twenty-five year period. Other counties produced the following amounts:- Pinal, 12 080 bales; Pima 6 050 bales; Yuma, 350 bales. (USDA Agricultural Marketing Service, Phoenix, Arizona, supplied data for Arizona production. However, the break-down by counties was not complete prior to 1930 except for Maricopa County. Bale production for Pinal, Pima and Yuma counties were reached arbitrarily by estimating lint yield at 200 pounds and multiplying by known acreage.) Since 1912 Maricopa County was the foremost producer of Pima Cotton except for a period of ten years when other counties of Arizona produced a larger volume. During the years 1940–43, when national defense needs called for larger crops of Pima Cotton, Pinal county grew 77 770 bales, 30 000 bales more than Pima Cotton crops of Maricopa county (47 450) in these four years. During 1944–49, Graham County produced seventy-six per cent (13 710 bales) of all Pima Cotton grown in Arizona (18 008 bales). In 1947 the Salt River Valley (Maricopa county) grew twelve bales of Pima Cotton, Pinal county harvested nine bales, Pima county two bales, and aside from Graham county which produced 140 bales, no other Pima Cotton was grown in Arizona. The State's total yield of 163 bales prompted prediction of the extinction of the industry. (UA Arizona Agriculture. 1947 (Arizona Experiment Station Bulletin 206, February 1947), p. 10:- 'American-Egyptian Cotton has ceased to be an important crop in Arizona'. The 56th Annual Report (UA College of Agriculture), p. 17:- 'The chapter covering thirty years when American-Egyptian Cotton was an important crop is now ended'.) In the 1950's revival, Maricopa County regained its leading position in Pima Cotton production and Graham County has replaced Pinal in second place in volume. Stability Of The 1950 Decade:- Based on production and cash return to growers since 1950, the Pima Cotton industry has enjoyed its most consistent period of stability. In Arizona, production has totalled 276 060 bales for the nine years, 1950–58. For this crop, growers have received USD95 824 000. Cotton growers of the Mesilla valley in New Mexico and the Trans-Pecos region of Texas planted Pima Cotton because the extra-long staple variety had greater tolerance for verticilium wilt than the uplands grown in the same area. The speculative possibility that Pima Cotton would be in special demand at high prices due to the war threats of 1939 and 1940 was also a consideration. New Mexico growers planted 100 acres in 1939 and up to 1952 had produced 69 300 bales, receiving a total of USD23 149 000. Texas growers planted their first crop, 1 300 acres in 1940, and up to 1952 harvested 110 700 bales of Pima Cotton, valued at USD43 334 000. During the period, 1939–52, about which statistical data is available for New Mexico and Texas plantings, per bale cash return for these states has far surpassed that of Arizona growers. Texas is first with USD391 per bale; New Mexico, second, with USD334 per bale; and the Arizona bale return for the same period was only USD273. The higher returns for the newer areas is due to the better grade of product marketed. This is evident in a report of the 1952 Pima Cotton harvest in which only 9.8 per cent of Arizona's crop graded No. 1 whereas 42.2 per cent of New Mexico's and 45.4 per cent of Texas' harvest were marketed in the highest grade. The stability of the Pima Cotton industry since 1950, if such it can be called, is tenuous in that production and marketing has been dependent on inconstant factors beyond control. For many years, American-Egyptian Cotton was planted by growers only to use Cotton lands taken out of production by upland acreage allotments. This position accounted, to a large degree, for the increase of Pima Cotton plantings in Arizona, New Mexico, and Texas from the low 5 700 acres in 1949 to the high 104 600 acres in 1950. The military stockpile purchase program of 1951 and 1952 absorbed most of the Pima Cotton harvests in these years, and the Commodity Credit Corporation loans took the bulk of the 1953 and 1954 crops. The 1955 Soviet-Egyptian arms deal and the 1956 French-British-Israel attack on the Suez Canal resulted in American mills using more Pima Cotton than extra-long imports in 1956 and 1957. More than 110 000 bales of Pima Cotton were exported in the years 1955–58. These two events had never happened before in the history of the Pima Cotton industry. American spinning mills base consideration of Pima Cotton purchases on (l) supply, (2) quality, and (3) price. Short supply occurred in 1924 when Arizona growers produced only 4 374 bales of Pima Cotton, and from 1944 to 1949 when the industry was near extinction. These were years when mills asked the Tariff Commission to authorize supplementary imports from foreign sources. Other years, when the domestic price was above that of similar Cotton in the world market, mills made their purchases in the most favorable price market. An executive of Coats & Clark, Inc., one of the nation's largest users of extra-long staple Cotton, expressed this view on the price situation in 1957:- With the support price the past few years for Pima Cotton as high as it was and is, it made it prohibitive to buy any sizeable amount of this American growth. As a typical example, this year (1957) it has been possible to buy certain Egyptian Cottons at thirteen to fourteen cents a pound below comparable grades and staples of Pima S-1 ... It is hoped that the Pima crop can be built up in sufficient quantity to meet the demands of the American spinners and at the same time sell it at the world market price regardless of what that may be. (F.H. Field, vice president of Coats & Clark, Inc., in letter to writer dated December 16, 1957. Fields cited that over the years his company has run many tests and used sizeable quantities of the old Pima, Amsak, Pima 32 and the current growth of Bryan's Pima S-1. He wrote:- 'The price for American-Egyptian Cotton in the past has been quite unstable. As an example, a few years ago I endeavored to purchase 5 000 bales of Pima 32. The price started at sixty-three cents a pound and by the time 1 700 bales had been secured the price had risen to eighty-seven cents which meant that the balance of our requirements had to be covered by Egyptian Cotton'.) The spokesman for Coats & Clark evinced a great desire to use Pima cotton exclusively for

certain phases of their work ‘providing everything is equal’, asserting ‘it would be a great assistance to us to buy cotton around the calendar instead of having a quota constantly over our heads’. Percy Howe, President of the American Thread Company, told extra-long staple growners at the 1955 convention of the National Cotton Council that users would rather use the domestic than the imported product. Pima Cotton growers have proven since 1950 that they are capable of growing an adequate supply of prime quality extra-long staple stock, fulfilling two of the requisites of the domestic market (supply and quality), but have found price stabilization beyond their powers. Egyptian Karnak, for example, sold within four cents a pound of Mexican Cotton at the beginning of 1959 whereas it was 39 cents higher in 1956–57 and 16 cents higher in 1957–58. In January 1957, Egyptian Karnak was priced at 81.98 cents per pound on the Liverpool market at the same time Pima Cotton sold at Phoenix for 65.85. In January 1959, Karnak was 34.02 cents and Pima 58.10 cents on these same markets. (International Cotton Advisory Committee, Report on Extra-Long Staple Cotton (Doc. 14, XVIII, Washington; May 1959), p. 31. President J. Clyde Wilson told the 1959 convention of the SuPima Association how hopeless price control was:- ‘Regardless of where domestic Cotton is priced, the Egyptians cut just far enough under to get the business. This is purely political competition and has nothing to do with costs of production or other expenses. Colonel Nasser, the Egyptian dictator, must have American Dollars to shore up his country’s shaky economy. So cotton is sold to exports at the equivalent of eighty cents a pound in Egyptian money. The exporters sell in America for what they can get, take their dollars home, trade them on the black market for Egyptian pounds, settle with their government and make a profit’. Arizona Farmer, March 14, 1959, p. 30.) In short, Pima Cotton has been caught in a price squeeze manipulation involving the United Arab Republic. The Nasser regime, in control of that nationts economy, has made possible a flexibility in prices for export by frequent changes in regulations affecting foreign exchange. From time to time premiums up to twenty-five per cent or more have been granted for payment in desired currencies. Varying percentages of the foreign currency involved are sometimes permitted to be withheld under agreements which do not require that all proceeds be turned into the exchange authorities. In addition, there have been barter transactions in which certain goods are exchanged for Cotton. Such deals have been made with France, the United Kingdom and other countries. SuPima Proposed Solution:- Lower Import Quota:- With diminishing hope of making Pima Cotton competitive on a strictly price basis, SuPima officials believe stabilization can come only when growers of the Southwest can have an assured portion of the home market each year at prices commensurate with the cost of production. This can be attained by reducing the volume of foreign extra-long staple Cotton now permitted entry under the import quota system, now approximating 80 000 bales annually. (The USDA has consistently supported this theory and asked the Tariff Commission to reduce extra-long staple imports by 52.2 per cent at a hearing before the Tariff Commission held on April 28, 1959. The State Department opposed the reduction and by a three-to-two vote, the commission rejected the reduction proposal. The import quota as now in effect allows approximately 80 000 bales extra-long staple Cotton entry annually. The USDA proposal would have reduced the volume to 39 826 bales a year. Although the Tariff Commission refused to make any reduction recommendation to the President, the USDA insists the matter is under constant review and will be presented at a suitable time in the future.) Import quotas on Cotton, as originally adopted in 1939, included both ordinary and extra-long staple with no distinction as to what volume was permitted each variety. The first quota assignment allotted 95.2 per cent of the total to Egyptian cotton and 4.5 per cent to Peruvian. In July 1942 these country quotas were replaced by a global quota of the same volume. Not until July 07, 1958, were quotas subdivided:- 79 181 bales, extra-long staple; 12 131 ordinary longstaple; and 3 000 Peruvian Tanquis. (US Tariff Commission (July 1959), op. cit., table 1b, p. 44. The change came after Mexican long-staple used most (49 108 bales) of the 1957–58 import quota, holding Egyptian imports to 28 665, and Peruvian to 13 540 bales.) Three supplemental quotas were authorized at the. request of American mills (June 14, 1947; July 20, 1948, and October 20, 1950), authorizing 97 188 bales above quotas to be imported. This was the period when the domestic Pima had its lowest production. In the stockpiling program of 1951 and 1952, the United States bought 65 000 bales of foreign Cotton entered under the import quota and 117 600 bales of foreign Cotton never applied to any quota. The Agricultural Adjustment Act of 1938 authorized the President of the United States to impose Cotton import quotas whenever it was found that the domestic program was being interfered with by imports. Fifteen months after the first import quota was established, the quota was suspended on cotton stapling 1-11/16 inches or longer. Proposed as a defense measure the suspension remained in effect until May 28, 1956, and in the interim, thousands of bales of extra-long staple came into the United States over and above the established quota. (US Tariff Commission (Report 161). p. 22. Commissioner Edgar B. Brossard, in a minority opinion, granting mills a supplemental extra-long staple Cotton quota in 1948, said of the exemption of staples of 1-11/16 and over:- ‘It is high time that this defense-era expedient ... be reconsidered since the occasion ... has ceased to exist’.) The volume of extra-long staple Cotton which came into the United States under preferential treatment accorded to cotton stapling 1-11/16 inches and over has never been recorded, except for the period from September 20 to December 31, 1947, when the Tariff Commission found 20 000 bales had entered quota-free in less than four months. A further indication of large Peruvian imports (Peruvian Pima is longer than either Egyptian or American-Egyptian extra-long staple (US Tariff Commission July 1959, op. cit., p. 25. wrote:- ‘Pima Cotton grown in Peru is generally longer than the Egyptian or American-Egyptian extra-long staple Cottons. It is, however, less strong and for that reason less suitable for manufacture of sewing thread. It is used in the production of fine shirtings and dress goods because it takes a beautiful luster when mercerized’.)) was the increase from only 3 200 bales during 1930–39 to 204 000 bales the fallowing decade, 1940–49. In 1940–49, only 70 648 bales of Peruvian Cotton imports were charged against the quota. The mill requests for supplemental imports all came during the period when the domestic Pima Cotton crop was in its lowest period of production, 1944–49. The complete elimination of imports was asked but no such action was taken. (Dr. George W. Barr of the University of Arizona Department of Agricultural Economics apoeared at the 1947 and 1948 hearings to represent Arizona Pima Cotton growers. Prior to the 1950 National Cotton Council Convention, a day-long conference of growers (Cecil Collerete and Keith Taylor of Arizona. Jake Sweet of New Mexico, and Robert Hoover of El Paso) was held with mill men (John Clark of Clark & Coats, Percy Howe of Americai Thread, and R.S. Dickson of American Yarn & Processing Company.). R.H. Peebles of Sacaton was present as advisor. The growers agreed to approve larger imports of Egyptian Cotton after threats of a swing to synthetics. Growers were told when and if the Southwest is able to fill needs, the mills may be customers. (Farmer, February 18, 1950, p. 5).) The viewpoint of the Pima Cotton industry was covered in a minority report prepared by Commissioner Edgar B. Brossard following the 1948 Tariff Commission hearing. He pointed out that the original import of approximately 95 000 bales was excessive because it was based on two years of the preceding decade when imports were largest. (Since the quotas were not filled in the first six years, this statement seemed well-founded). Furthermore, removal of Cotton stapling 1-11/16 inches and over from quota restriction increased the original quota by several million pounds. The reduction of the tariff from seven cents to 3.5 cents further favored foreign imports. The net and accumulative effects of these acts brought on the price decline of the late 1940’s which discouraged the production of domestic extra-long staple Cottons. Unless the domestic industry was revived, Brossard warned, ‘it might be disastrous in war-time for the United States to be dependent for its supplies of this strategic and critical Cotton on Egypt ...’. With the domestic crop in low supply in 1947–48, Egyptian Cotton was selling as high as USD1.02 a pound. Wills were feeling the price squeeze from abroad and were looking to domestic growers for supplies. In March 1948, W.K. Shaw, Jr., of the E.A. Shaw & Company of Boston, wired his Phoenix office that he had several inquiries from New England and Southern mills as to whether the Pima SXP would be available in the coming year Brossard stated, as his opinion, that taxes added to Egyptian stocks would bring the delivered price to United States mills even higher under the extra-long staple monopoly enjoyed by the Egyptian government:- There are large stocks of extra-long staple Cotton in Egypt, but most of these stocks are owned and controlled by the Egyptian government. In other words, at present there

is practically an Egyptian government monopoly of extra-long staple Cotton. The monopoly controls sales and charges prices at 'what the traffic will bear'. At this very moment the prices of Egyptian extra-long staple Cotton are about USD1 a pound in Egypt. In addition the government recently (April 12, 1948) imposed an export tax ... would make the price USD1.10 a pound delivered in the United States. This is a fair demonstration of what may confront the United States when domestic production of extra-long staple Cotton is destroyed and domestic mills become dependent on a supply of the Egyptian government. (US Tariff Commission, Report 161. pp 19–20.) The Supima Association bases its case for import quota reduction on the same premise and, with the support of the United States Department of Agriculture, is asking as a means to stabilization to provide a set portion of domestic needs. Mill operators have been advised that if allotments are forced below 65 000 acres, roller gins will go out of business 'and the already tiny industry will fade away'. (Arizona Farmer. April 09, 1960, p. 57. J. Clyde Wilson of Buckeye, Arizona, who retired as SuPima President in 1959, testified at the April 1959 Tariff Commission hearing that the 1958 Pima Cotton crop of Arizona was valued at USD12 000 000 and the investment of roller gins used only for Pima Cotton was USD5 000 000. Wilson cited the plight of Graham county's Safford Valley if crop allotments of 1958 had been reduced to the minimum as appeared probably then:- Six thousand of the 12 000 population look to the Pima Cotton industry for livelihood. The proposed quota reduction would mean an economic loss of USD2 407 133 to Safford Valley alone.) Growers maintaining Pima Cotton enthusiasm in Arizona during the 1930fs were the 'Cotton Kings' selected in competition during the years 1932–39, except for 1936. The University of Arizona extension service, under the direction of Howard N. Watehpaugh, sponsored the Pima Cotton High-Yield Club from which the 'kings' were chosen on the basis of yield of Pima Cotton. The winners were (Year – Cotton King - Lint Pounds Per Acre):- 1932 – Walter L. Smith – 379; 1933 – Dr. T.S. Bishop – 510; 1934 – Tim Malone – 553.7; 1935 – Don Smith – 485; 1937 – Blanton Dick – 573 (SXP); 1938 – H.S. Miller – 573; 1939 – Sam Joy – 728. Summary And Review:- The American-Egyptian Pima extra-long staple Cotton came into existence because of the demand by manufacturers at the turn of the century that the United States Department of Agriculture develop a Cotton product competitive in price and quality with Egyptian Cotton. The Cotton grown on the Nile around 1900 was coming into the United States at a rate exceeding 100 000 bales every year and increasing in volume and popularity with American spinners. Since the United States grew more Cotton of all kinds than the rest of the world combined (three times as much in 1891), the increasing dependence on Egyptian Cotton for supplies of a high-quality, high tensile strength variety was a matter of concern to the domestic industry. In 1900 Egyptian extra-long staple Cotton was rated between the American Sea Island and upland shorter-staple varieties in terms of staple length and price. Manufacturers in the United States preferred the imported variety because it was found adaptable to mercerizing and under processing it attained a high finish resembling silk. The Nile product had clearness, luster and a capacity for taking dyes, which permitted it to be mixed with silk, sateen, India linens, and goods with a brilliant surface. Egyptian Cotton was used in sewing thread, fabrics for insulation, bicycle and automobile tires, mail bags, high pressure hose, and similar articles requiring high tensile strength. The Sea Island variety supplied these qualities also but it was in high export demand and more costly than the Egyptian Cotton. Repeated attempts, starting as early as 1867, to grow Egyptian Cotton in the normal cotton belt of the South had failed, primarily because of the shortness of the growing season. The United States Department of Agriculture found that weather, water, and soil conditions of the delta of the Nile river were more nearly duplicated in the area near the mouth of the Colorado river in the American Southwest. Accordingly, serious research and experiment was concentrated in the Yuma, Arizona, region starting in 1902. Some Egyptian seed, received from an 1899 expedition made by David Fairchild and Barbour Lathrop, had been planted in Arizona by Dr. A.J. Chandler on his Mesa ranch and at the territorial experiment farm at Phoenix by Pros. A.J. McClatchie in 1901. These plantings proved that Egyptian varieties could mature in the drier and hotter irrigated areas (a season of longer growing in the Southwest). Rank vegatation and numerous other impediments precluded any commercial use of these early experimental plantings. It remained for Dr. Thomas H. Kearney and a dedicated group of scientists of the United States Department of Agriculture to bring an American variety of Egyptian-type Cotton into commercial use for the first time in 1912. The new American-Egyptian variety was scarcely in production but a few years when the folly of complete dependence on a foreign power for the raw materials needed by American industry was proven. World War I, declared in 1914, had by 1916 restricted the amount of Egyptian Cotton which could be imported. The domestic supply of Sea Island Cotton was curtailed in this same period by the boll weevil and a deterioration of its quality by hybridization due to proximity to shortstaple varieties, and by 1919 production was down to less than 7 000 bales. The spinning industry found itself desperately in need of raw cotton of the extra-long staple strength to keep in production. This applied particularly to the rubber and tire industry. In 1916 Goodyear Tire & Rubber company sent Paul W. Litchfield to Arizona to investigate the new American-Egyptian Cotton just aborning. He tried to stimulate production by offering ranchers a guaranteed price but failed to secure an adequate volume. T.E. McDevitt of Yuma agreed to grow Cotton for Goodyear but advised by a Pasadena lawyer, E.F. Parker, that he would not make a million Dollars and might lose everything he had, the contract was voided and in desperation was taken over by Goodyear. The company bought 24 000 acres of Arizona desert land and grew its own Cotton. Subsequent events provided a saga of 'big-business' methods applied to cotton growing; the employment of the top talent in construction, engineering, water development, and the setting off ofa 'long-staple Cotton craze' that drove Alfalfa growing and dairying into the background, while growers enjoyed prosperity from the high-priced Pima Cotton crops of 1917–19. In 1920, more land (243 000 acres) was planted to Pima Cotton than has ever occurred since. Between planting and harvesting time, extra-long staple prices dropped from USD1.00 a pound and more to twenty cents a pound, and part of the 92 000-bale bumper crop remained unsold for several years. The scientists of the Department of Agriculture who had developed Yuma, the first variety of Pima Cotton, through ten years of acclimitization and breeding at Yuma and Sacaton laid down as a fundamental of the industry's success that all other varieties must be excluded from the planting region. The Salt River Valley had been selected as a onevariety community and was so maintained until 1922. High upland prices the next year almost drove the Pima Cotton industry out in 1924 when 122 000 acres were planted to the short staple and only 8 000 to extra-long staple. This destroyed the one-variety plan and threatened Pima Cotton qaulity because of mixture of varieties. By 1927 the Pima industry had passed the severe crisis through the use of seed which had been sealed from crops when only extra-long-staple Cotton was grown in the Salt River Valley, That the industry survived is due to the agriculturists of the United States field station at Sacaton, and the College of Agriculture of the University of Arizona, the Southwest Cotton Company, the Maricopa County and Arizona pure seed associations, and more recently the Arizona Cotton Planting Seed Distributors, Arizona Cotton Growers' Association, the SuPima Association of America, and the National Cotton Council. The names of Kearney, Peebles, and Bryan will be forever enshrined in the hearts of Pima Cotton growers because of the constant improvement of verieties produced over the years. In some ways, Pima Cotton has been treated as the stepchild of the fiber industry. Up until World War II when the logistics of war called for greater production from Pima growers, the extra-long staple Cotton had been excluded from loan benefits given upland varieties by 'new-deal' legislation. In these years Pima came to favor for acres taken out of production by short-staple control. This provided an effective cushion for growers not permitted to employ their land for upland crops. Not until 1952 was legislation passed giving Pima growers support prices as well as acreage control. This became effective in 1954. Tariff and import quotas, imposed respectively in 1930 and 1939, were intended primarily to promote the extra-long staple industry. In both instances, however, ordinary long-staple, always in surplus and in export, was lumped with the extra-long staple, minimizing the good these acts proposed. The seven-cent tariff of 1930 was reduced by half in 1942 and to one-fourth on Cotton stapling 1-11/16 inches. What benefit to the Pima Cotton industry accrued by the tariff was watered down in these reductions of import duties. Likewise, the import quota had wide loopholes which reacted against the Pima cotton trade. Within fifteen months after the original quota was established, Cotton with

a staple 1-11/16 inches and over was admitted quota-free. This opened the gates to large unknown volumes of foreign extra-long staple Cottons. The original quota, as charged by a member of the tariff commission, was based high originally and since the quotas remained unfilled the first six years, this charge appears supported. When Pima Cotton was on the verge of extinction, mills asked for and received supplemental quotas in three years (1947, 1948, 1950). Egyptian Cotton sold for over USD1 a pound in some of these years. Pima Cotton production has become sufficiently ample to care for domestic needs due to the high-yield Pima S-1. From 1955 to 1958, the price has been competitive due to price-support reductions and the merchandising campaign of the SuPima Association after 1954. Prices of Egyptian Cotton (largely controlled by the government through currency manipulation) after 1957 dipped to extreme lows. As a consequence, domestic mill consumption of Pima Cotton (higher in 1956–57 and 1957–58 than Egyptian Cotton) is again suffering from the competition of foreign imports on a price basis. (The 1958–59 prices of comparative grades:- Pima at Phoenix, 58.14 cents a pound; Karnak at Liverpool, 35.70 cents a pound). Currently, the SuPima Association believes the American extra-long staple Cotton industry must have a protected market to survive. With the support of the federal Department of Agriculture, the Tariff Commission was asked to recommend to the President that import quotas be reduced 52.2 per cent, permitting Southwest Pima Cotton growers to supply a larger portion of domestic needs. The State Department has opposed the reduction. The Tariff Commission, after a hearing held in April 1959, by a three-to-two vote decided against the growers. The Department of Agriculture is convinced of the justice of the growers' plea and has assured officers of the SuPima Association that the question will be reopened. The SuPima Association has the support of the National Cotton Council in forming a long-term program with stabilization of the industry an objective. This includes a floor of 65 000 acres (1960 allotment 64 776 acres) for Pima Cotton. The association and the American Cotton Manufacturers Institute have jointly financed for 1960 a study of extra-long staple Cotton potential in the market. This study is being made by Dr. Thomas Stanback of New York University. Several Washington conferences revealed that knowledge of end uses and reliable figures on consumption are incomplete. Annual consumption has approximated 110 000 bales but since the import-quota-free cotton of 1-11/16 inches and over may not have been included in statistics and has been cut off since May, 1956, the belief prevails that there is a market of 150 000 bales annually open to Pima and imported Cottons. The SuPima merchandising campaign has opened many new outlets since 1954, also. The current study is expected to reveal a basis for normal expansion of the domestic industry in coming years without dependence on government price supports. After almost fifty years of research and production, starting at Yuma in 1902, the Pima Cotton industry is capable of growing all the extra-long staple Cotton required by mills in the United States. Growers are organized to produce quantities required. The Pima S-1, in production since 1954, is admittedly the best domestic extra-long staple ever grown and its high acreage yield makes it a profitable crop for growers. Most mills concede Pima S-1 high quality but are influenced by price in their purchases. They have long used Egyptian Cotton, know its qualities, and will buy the foreign product when the market is attractive. The Pima industry survived despite the seed crisis of 1924–27, and the near-extinction following World War II. The immediate problems seem acute, too. However, an awareness of the importance of a domestic extra-long staple Cotton industry seems well imbedded, except perhaps with the State Department. Mills must recognize that they would pay dearly for extra-long imports if no domestic source was available. They profit by keeping foreign and domestic industries in competition and insist that the domestic variety is wanted – but not at prices much beyond those of imports. The business-like aporoach to industry problems by the SuPima Association augurs well for the future of the Pima Cotton industry. What to do with the 230 000 bales of extralong staple (mostly foreign Cotton) remaining in the military stockpile and declared non-essential in 1957 remains a problem. Its existence is symbolic of the role and importance Pima Cotton has played in national defense and may in the future. As to Arizona, Pima Cotton was the harbinger of the state's present national standing in the fiber industry. Since 1947, Cotton has been Arizona's foremost agricultural crop. (The 1956 crop was valued at USD165 000 000; livestock in second place was USD74 000 000). (Arizona Agriculture 1957 (UA College of Agriculture Bulletin 281), p. 5. The 1959 Cotton crop was valued at USD150 000 000; livestock, in second place, USD97 000 000.) The state ranks fifth among all states in volume of production (behind Texas, Mississippi, Arkansas, and California). In 1953, Cotton production in Arizona went over a million bales (most was produced in Maricopa County, 448 770 bales, and Pinal, 370 000 bales). In six successive years, 1949–54, the acre-yield of Cotton in Arizona topped every Cotton-growing state in the union. The pioneers who braved the heat and the winds of the desert at the start of the XX century built well. / Найлэн (Nylon). Мид (Meade). Ричод. Кони (Kearney). Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945).

AMERICAN GAS ASSOCIATION = АМЕРИКАНСКАЯ ГАЗОВАЯ АССОЦИАЦИЯ – The American Gas Association (AGA), founded in 1918, represents 199 local energy companies that deliver clean natural gas throughout the United States. There are more than 70 million residential, commercial and industrial natural gas customers in the United States, of which 91 percent – more than 64 million customers – receive their gas from AGA members. Today, natural gas meets almost one-fourth of the United States' energy needs. Vision Statement:- AGA's vision is to provide clear value to our membership and serve as the indispensible voice, and facilitator, on its behalf in promoting the safe, reliable and cost effective delivery of natural gas to the more than 64 million customers in the American homes and businesses that our membership serves. Mission Statement:- the American Gas Association represents companies delivering natural gas to customers to help meet their energy needs. AGA members are committed to delivering natural gas safely, reliably, cost-effectively and in an environmentally responsible way. AGA advocates the interests of its members and their customers, and provides information and services promoting efficient demand and supply growth, and operational excellence, in the safe, reliable and efficient delivery of natural gas. To further this mission, AGA:- (i) focuses on the advocacy of natural gas issues that are priorities for the membership and that are achievable in a cost-effective way; (ii) promotes growth in the efficient use of natural gas on behalf of natural gas utilities, and the customers the industry serves, by emphasizing before a variety of audiences the attributes of natural gas as a clean, abundant, efficient and secure energy source that is recognized as part of the solution to the nation's environmental and energy efficiency goals; (iii) encourages, facilitates and assists members in sharing information designed to achieve operational excellence by improving their safety, security, reliability, efficiency, environmental and other performance metrics; (iv) assists members in managing and responding to customer energy needs, regulatory trends, natural gas markets, capital markets and emerging technologies; facilitates the identification of, and advocates for, regulatory constructs and business models that provide members the opportunity to remain financially viable, while allowing them to grow; (v) collects, analyzes and disseminates information on a timely basis to opinion leaders, policy makers and the public about the benefits provided by energy utilities and the natural gas industry; (vi) encourages the identification, development, commercialization, demonstration and regulatory acceptance of end-use technologies that will allow natural gas applications to successfully compete in the marketplace; and (vii) delivers measurable value to AGA members. Headquartered in Washington, DC, the United States. Major natural gas industry trade association. American Gas Association conducts technical research and helps create standards for equipment and products involved in every facet of the natural gas industry. It also compiles statistics which are considered industry standards. The AGA represents 185 local natural gas utilities that deliver gas to nearly 50 million homes and business in all 50 US states. Additionally, AGA provides services to member natural gas pipelines, marketers, gatherers, international gas companies and a variety of industry associates. AGA acts as a clearinghouse for gas energy information, as a catalyst in technical and energy policy matters and as a voice for its members.

AMERICAN GEAR MANUFACTURERS ASSOCIATION = АМЕРИКАНСКАЯ АССОЦИАЦИЯ ИЗГОТОВИТЕЛЕЙ (ЗУБЧАТЫХ) ПЕРЕДАЧ – American Gear Manufacturers Association (AGMA) is an organization serving the gear industry. Headquartered in

Alexandria, VA, the United States. See also Gear. AGMA Mission Statement:- AGMA is the global network for technical standards, education, and business information for manufacturers, suppliers, and users of mechanical power transmission components. AGMA Origins:- The American Gear Manufacturers Association is a voluntary association of companies, consultants, and academicians with a direct interest in the design, manufacture, and application of gears, couplings and related power transmission components and equipment. Founded in 1916, AGMA is a member- and market-driven organization, conducting programs and providing services to the gear industry and its customers. AGMA member companies currently number more than 495. They include gear manufacturers from the United States, Mexico, and Canada, as well as gearing interests from more than 30 countries around the world. AGMA is accredited by the American National Standards Institute to write all US standards on gearing. AGMA is also the Secretariat (Chairman) for Technical Committee 60 of the International Organization for Standardization (ISO). TC 60 is the committee responsible for developing all international gearing standards. In addition to the holding the position of Secretariat, AGMA convenes (chairs) the active ISO Working Groups related to gear inspection and testing. AGMA began on the cutting edge of new technologies. In 1916, a new gear market was emerging. It emphasized quiet operation, particularly for timing gears in the automotive industry. Gear manufacturers were exploring various materials – but lacked technical standards for non-metallic gearing. AGMA was born when R.D. Nuttall Company brought together several gear manufacturers to discuss developing such standards. The first AGMA members included Cincinnati Gear Company, Earle Gear and Machine Company, Horsburgh and Scott Company, Newark Gear Cutting Machine Company, R.D. Nuttall Company, Philadelphia Gear Works, Pittsburgh Gear and Machine Company, Simonds Manufacturing Company and Van Dorn Dutton Company. They established an executive committee, which drew up a constitution and elected officers. They planned AGMA's first Annual Meeting, held in Pittsburgh May 14–15, 1917. Today, AGMA is still on the cutting edge. The association includes about 495 of the world's top gearing companies across more than 30 nations. The association is managed by a Board of Directors and Executive Committee Officers. Members also serve on Business Management Committees and Technical Committees. A full-time staff of 12 association professionals is headquartered in Alexandria, VA. As in its beginnings, AGMA continues to literally set the standard. Its open standards development process is tailored to the global marketplace. But AGMA also offers much more. You are invited to look through our website to learn about AGMA's many events and training opportunities, publications, industry news, products and much more. / Ар.Ди. Натчол Кампэни (R.D. Nuttall Company). Синсинэти Гио Кампэни (Cincinnati Gear Company), Эал Гио энд Мэшин Кампэни (Earle Gear and Machine Company), Хосбёг энд Скат Кампэни (Horsburgh and Scott Company), Ньюок Гио Катин Мэшин Кампэни (Newark Gear Cutting Machine Company), Ар.Ди. AMERICAN INSTITUTE OF CERTIFIED PUBLIC ACCOUNTANTS = АМЕРИКАНСКИЙ ИНСТИТУТ СЕРТИФИЦИРОВАННЫХ ПУБЛИЧНЫХ БУХГАЛТЕРОВ (или АМЕРИКАНСКИЙ ИНСТИТУТ ДИПЛОМИРОВАННЫХ ПУБЛИЧНЫХ БУХГАЛТЕРОВ) – The American Institute of Certified Public Accountants (AICPA) is the world's largest association representing the accounting profession, with nearly 370 000 members in 128 countries. AICPA members represent many areas of practice, including business and industry, public practice, government, education and consulting; membership is also available to accounting students and CPA candidates. The AICPA sets ethical standards for the profession and US auditing standards for audits of private companies, non-profit organizations, federal, state and local governments. It develops and grades the Uniform CPA Examination. Founded in 1887, the AICPA represents the CPA profession nationally regarding rule-making and standard-setting, and serves as an advocate before legislative bodies, public interest groups and other professional organizations. The AICPA develops standards for audits of private companies and other services by CPAs; provides educational guidance materials to its members; develops and grades the Uniform CPA Examination; and monitors and enforces compliance with the profession's technical and ethical standards. The AICPA's founding established accountancy as a profession distinguished by rigorous educational requirements, high professional standards, a strict code of professional ethics, a licensing status and a commitment to serving the public interest. The AICPA's mission is to provide members with the resources, information and leadership that enable them to provide valuable services in the highest professional manner to benefit the public, employers and clients. In fulfilling its mission, the AICPA works with state CPA organizations and gives priority to those areas where public reliance on CPA skills is most significant. History of the AICPA:- The American Institute of Certified Public Accountants (AICPA) and its predecessors have a history dating back to 1887, when the American Association of Public Accountants (AAPA) was formed. In 1916, the American Association was succeeded by the Institute of Public Accountants, when there was a membership of 1 150. The name was changed to the American Institute of Accountants in 1917 and remained so until 1957, when it changed to its current name of the American Institute of Certified Public Accountants. The American Society of Certified Public Accountants was formed in 1921 and acted as a federation of state societies. The Society was merged into the Institute in 1936 and, at that time, the Institute agreed to restrict its future members to CPAs. History of Committees:- the use of committees began even before the AAPA was formed in 1887. At the first meeting of what would become the AAPA on 1886-December-22, those present authorized the appointment of a committee to draft rules and regulations. In addition to this first preliminary committee, the first Bylaws of the AAPA in 1897 established three committees:- (i) Finance and Audit Committee; (ii) Committee on Elections, Qualifications and Examinations; and (iii) the Committee on Bylaws. The number of committees grew continually over the years. In the 1940s there were 34 committees. By 1960 there were 89, and by 1970, the number had grown to 109. In 1999 the nearly 120 existing committees underwent a re-organization with approximately half of the standing committees being replaced with a volunteer group model that placed an increased emphasis on the use of task forces. The increased use of task forces allowed for more targeted efforts with the task forces being given a specific assignment then disbanding upon completion of that assignment. Also, in 1999 the first tracking and management of task forces began. Collectively, more than 2 000 volunteers contribute to the AICPA's fulfilling its mission. AICPA Service Center is located in Durham, NC, the United States. The American Institute of Certified Public Accountants (AICPA) is the national, professional organization for all Certified Public Accountants (CPA). Its mission is to provide members with the resources, information, and leadership that enable them to provide valuable services in the highest professional manner to benefit the public as well as employers and clients. In fulfilling its mission, the AICPA works with state CPA organizations and gives priority to those areas where public reliance on CPA skills is most significant.

AMERICAN INSTITUTE OF MERCHANT SHIPPING = АМЕРИКАНСКИЙ ИНСТИТУТ КОММЕРЧЕСКОГО СУДОХОДСТВА – The American Institute of Merchant Shipping (AIMS) has been the trade group representing companies owing US-flag vessels, principally tankers and dry cargo ships and sometimes liner companies as well. As US-flag steamship companies declined in the 1960s, the need to pool their dwindling resources behind one trade organization convinced executives to create AIMS out of the merger of the American Merchant Marine Institute (AMMI), the Committee of American Steamship Lines (CASL), and the Pacific American Steamship Association (PASA). The key to success was to forge a common maritime police among the disparate groups, and for that purpose AIMS was divided into a Liner Council, a Tanker Council, and Dry Cargo and Coastal Council; each group had ample opportunity to formulate within its own council its views, which supposedly were then reconciled into a common policy by the executive board of AIMS. Cooperation was the rule during the initial years, but in 1977 the liner operators felt frustrated because AIMS was not lobbying

Congress hard enough for subsidies. In January 1978 the Liner Council bolted AIMS and created its own organization, the Council of American-flag Ship Operators (CASO), in effect a revival of the earlier CASL. To facilitate consultation om points of mutual interest, during many years CASO and AIMS occupied nearby floors in the same office building, but formal cooperation was impossible because of the differing nature of their membership. The membership of AIMS in 1978 consisted of twenty-three companies owning oil and gas tankers, dry bulk vessels, and chemical carriers. After the collapse of the United Shipowners Of America (USA) in 1990, all but one of its member companies joined AIMS. Headquartered in Washington, DC, the United States. The American Institute of Merchant Shipping (AIMS), now the Chamber of Shipping of America (CSA) which represents (in 2011) 33 US based companies that either own, operate or charter oceangoing tankers, container ships, dry bulk vessels engaged in both the domestic and international trades and companies that maintain a commercial interest in the operation of such oceangoing vessels. Current members include companies that own or operate US flag or foreign-flag ships. A company owning or operating only foreign-flag tonnage must have an office in the United States to qualify for membership). In March 1992:- AIMS is a national trade association representing 25 US-flag carriers which own or operate approximately twelve million deadweight tons of tankers, dry bulk carriers, containerships, and other oceangoing vessels engaged in the domestic and international trades of the United States. AIMS represented a majority of US-flag tanker and liner tonnage.

AMERICAN MOTORCYCLIST ASSOCIATION = АМЕРИКАНСКАЯ АССОЦИАЦИЯ МОТОЦИКЛИСТОВ – The American Motorcyclist Association (AMA):- from the street to the track to the trail, millions of Americans enjoy motorcycling. Some ride to work every day. Others ride for pleasure on weekends. Many ride off-road, or journey to places near and far. Still more seek the thrill of competition. Since 1924, the AMA has protected the future of motorcycling and promoted the motorcycle lifestyle. AMA members come from all walks of life, and they navigate many different routes on their journey to the same destination:- freedom on two wheels. As the world's largest motorcycling organization, the AMA advocates for motorcyclists' interests in the halls of local, state and federal government, the committees of international governing organizations, and the court of public opinion. Through member clubs, promoters and partners, the AMA sanctions more motorsports competition and motorcycle recreational events than any other organization in the world. Through its Motorcycle Hall of Fame, the AMA preserves the heritage of motorcycling for future generations. AMA members receive money saving discounts from dozens of well-known suppliers of motorcycle services, gear and apparel, bike rental, transport, hotel stays and more. The AMA is everything motorcycle. The mission of the American Motorcyclist Association is to promote the motorcycling lifestyle and protect the future of motorcycling. The formation of the FAM can be traced to the New York Motorcycle Club, whose members in early 1903 saw the need for a national motorcyclist organization and assembled a committee to study the interest level in such an organization. Further momentum for the creation of this organization was provided by the enactment of a New York City law requiring registration of motorcycles as motor vehicles. On 1903-September-07, the FAM was officially formed during a meeting of 93 enthusiasts at a clubhouse in Brooklyn. The meeting was chaired by George H. Perry, and one notable attendee was George M. Hendee of the Indian Motocycle Company, who brought 109 membership pledges from the New England area. A constitution was drawn up, and officers appointed, with R.G. Betts of New York as president. Article I, section 2 of the constitution of the newly created FAM stated:- 'Its objects shall be to encourage the use of motorcycles and to promote the general interests of motorcycling; to ascertain, defend and protect the rights of motorcyclists; to facilitate touring; to assist in the good roads movement; and to advise and assist in the regulation of motorcycle racing and other competition in which motorcycles engage'. The constitution also recorded annual membership dues of USD2.00, and named several committees, including: Membership; Legal Action; Competition; Roads, Touring and Hotels; and Transportation and Facilities. During its 16-year existence, the FAM developed competition rules and rider classifications, dealt with restrictive ordinances in cities like Chicago and Tacoma, Washington, and wrestled with funding and membership concerns. The FAM listed 8 247 members in 1915, but with World War I draining potential members, the organization went out of business in 1919. Headquartered in Pickerington, OH (State of Ohio), the United States.

AMERICAN NATIONAL STANDARDS INSTITUTE = АМЕРИКАНСКИЙ ИНСТИТУТ НАЦИОНАЛЬНЫХ СТАНДАРТОВ – As the voice of the US standards and conformity assessment system, the American National Standards Institute (ANSI) empowers its members and constituents to strengthen the US marketplace position in the global economy while helping to assure the safety and health of consumers and the protection of the environment. The Institute oversees the creation, promulgation and use of thousands of norms and guidelines that directly impact businesses in nearly every sector:- from acoustical devices to construction equipment, from dairy and livestock production to energy distribution, and many more. ANSI is also actively engaged in accrediting programs that assess conformance to standards – including globally-recognized cross-sector programs such as the ISO 9000 (quality) and ISO 14000 (environmental) management systems. Mission:- to enhance both the global competitiveness of US business and the US quality of life by promoting and facilitating voluntary consensus standards and conformity assessment systems, and safeguarding their integrity. Founded:- 1918-October-19. Legal Status:- A 501(c)3 private, not-for-profit organization. Headquartered in Washington, DC, the United States. The American National Standards Institute is a private organization that coordinates and/or approves some US standards, particularly those related to the electrical industry. Abbreviated ANSI. The American National Standards Institute (ANSI) was founded in 1918 to coordinate national standards in the United States. ANSI is the central body responsible for the identification of a single consistent set of voluntary standards called American National Standards. ANSI provides an open forum for the identification of standards requirements, development of plans to meet those requirements, and agreement on standards. ANSI itself does not develop standards. In 1979 ANSI chartered a new committee, which in now known as Accredited Standards Committee (ASC) X12 Electronic Data Interchange, to develop uniform standards for electronic interchange of business transactions. ANSI is a national Federation of standards developers.

AMERICAN OPTION = АМЕРИКАНСКИЙ ОПЦИОН – American Option is a type of option contract which allows the holder to exercise at any time up to and including the expiry date. Most options listed on the Australian Secirities Exchange (ASX) are American Style. See also European Option. An option that can be exercised at any time prior to or on the expiration date. See also Asian Option, and European Option. American Option is an option that can be exercised on any day before its expiry. / Тип опционного контракта, который позволяет его держателю исполнить его в любое время до или на дату истечения срока. Большинство опционов, находящихся в котировочном списке Австралийской Биржи Ценных Бумаг (АБЦБ), работают в Американском Стиле. Американский Опцион – опцион, который может быть исполнен в любое время до или на дату прекращения признания или дату экспирации, а проще говоря, дату истечения срока действия опциона. Смотрите также Азиатский Опцион (Asian Option) и Европейский Опцион (European Option).

AMERICAN PETROLEUM INSTITUTE = АМЕРИКАНСКИЙ ИНСТИТУТ НЕФТИ – The American Petroleum Institute (API) is the major national trade association representing the entire petroleum industry:- exploration and production, transportation, refining and marketing. With headquarters in Washington, DC, and petroleum councils in 33 states, it is a forum for all parts of the oil and natural gas industry to pursue priority public policy objectives and advance the interests of the industry. The primary US oil industry trade association, based in Washington, District of Columbia, USA. The American Petroleum Institute (API) conducts research and sets technical standards for industry equipment and products from wellhead to retail outlet. It also compiles statistics which are regarded as

industry benchmarks. The American Petroleum Institute (API) is the only national trade association that represents all aspects of America's oil and natural gas industry. Our nearly 400 corporate members, from the largest major oil company to the smallest of independents, come from all segments of the industry. They are producers, refiners, suppliers, pipeline operators and marine transporters, as well as service and supply companies that support all segments of the industry. Although our focus is primarily domestic, in recent years our work has expanded to include a growing international dimension, and today API is recognized around the world for its broad range of programs:- (i) Advocacy:- we speak for the petroleum industry to the public, Congress and the Executive Branch, state governments and the media. We negotiate with regulatory agencies, represent the industry in legal proceedings, participate in coalitions and work in partnership with other associations to achieve our members' public policy goals. (ii) Research and Statistics:- API conducts or sponsors research ranging from economic analyses to toxicological testing. And we collect, maintain and publish statistics and data on all aspects of US industry operations, including supply and demand for various products, imports and exports, drilling activities and costs, and well completions. This data provides timely indicators of industry trends. API's Weekly Statistical Bulletin is the most recognized publication, widely reported by the media. (iii) Standards:- for more than 75 years, API has led the development of petroleum and petrochemical equipment and operating standards. These represent the industry's collective wisdom on everything from drill bits to environmental protection and embrace proven, sound engineering and operating practices and safe, interchangeable equipment and materials. API maintains more than 500 standards and recommended practices. Many have been incorporated into state and federal regulations; and increasingly, they're also being adopted by the International Organization for Standardization, a global federation of more than 100 standards groups. (iv) Certification:- each day, the oil and natural gas industry depends on equipment to produce, refine and distribute its products. The equipment used is some of the most technologically advanced available in the search for oil and gas and allows the industry to operate in an environmentally safe manner. Designed for manufacturers of production, drilling, and refinery equipment, the API Monogram Program verifies that manufacturers are operating in compliance with industry standards. API also provides quality, environmental, and occupational health and safety management systems certification through APIQR. This service is accredited by the ANAB (ANSI-ASQ National Accreditation Board) for ISO 9001 and ISO 14001. ANSI (short for the American National Standards Institute) is a national federation of standards developers. Let APIQR's industry expertise certify your organization to API Spec Q1, ISO/TS 29001 and OHS 18001. API also certifies inspectors of industry equipment through our Individual Certification Programs, designed to recognize working professionals who are knowledgeable of industry inspection codes and are performing their jobs in accordance with those codes. Through our Witnessing Programs, API provides knowledgeable and experienced witnesses to observe critical material and equipment testing and verification. API's Training Provider Certification Program provides third-party certification for a variety of oil and gas industry training courses, further ensuring that any training provided meets industry needs. In helping to improve industry safety, API has a way for service station owners to make sure their contractors have been trained to industry safety standards. API WorkSafe™ is a service station contractor safety qualification program that identifies personnel who have received training for and passed on-line standardized exams covering the latest service station industry safety practices. For consumers, API provides the API's Engine Oil Licensing and Certification System (EOLCS). It is a voluntary licensing and certification program that authorizes engine oil marketers who meet specified requirements to use the API Engine Oil Quality Marks. These emblems go directly on each container of oil that retains the certification for and is there to help consumers identify quality engine oils for their gasoline- and diesel-powered vehicles. (v) Education:- API organizes seminars, workshops, conferences and symposia on public policy issues. Through API University, we provide training materials to help people in the oil and natural gas business meet regulatory requirements and industry standards. To prepare the next generation of Americans to make informed decisions or pursue careers in our industry, we work with the National Science Teachers Association and other educational groups to impart scientific literacy and develop critical thinking skills in the classroom. Resources developed specifically for teachers and students include Energy & Society, a multi-disciplinary K-8 curriculum program, and www.classroom-energy.org, informative and interactive educational resources in one easy-to-use location. API's history:- The American Petroleum Institute traces its beginning to World War I, when Congress and the domestic oil and natural gas industry worked together to help the war effort. At the time, the industry included the companies created in 1911 after the court-imposed dissolution of Standard Oil and the 'independents'. These were companies that had been 'independent' of Standard Oil. They had no experience working together, but they agreed to work with the government to ensure that vital petroleum supplies were rapidly and efficiently deployed to the armed forces. The National Petroleum War Service Committee, which oversaw this effort, was initially formed under the US Chamber of Commerce and subsequently as a quasi-governmental body. After the war, momentum began to build to form a national association that could represent the entire industry in the postwar years. The industry's efforts to supply fuel during World War I not only highlighted the importance of the industry to the country but also its obligation to the public, as the original charter shows. The American Petroleum Institute was established on 1919-March-20:- (i) to afford a means of cooperation with the government in all matters of national concern; (ii) to foster foreign and domestic trade in American petroleum products; (iii) to promote in general the interests of the petroleum industry in all its branches; and (iv) to promote the mutual improvement of its members and the study of the arts and sciences connected with the oil and natural gas industry. API offices were established in New York City, and the organization focused its efforts in several specific areas. The first effort was to develop an authoritative program of collecting industry statistics. As early as 1920, API began to issue weekly statistics, beginning first with crude oil production. The report, which was shared with both the government and the press, was later expanded to include crude oil and product stocks, refinery runs and other data. API statistics remain one of the most credible sources of industry data and they are used worldwide. The second effort was the standardization of oil field equipment. During World War I, drilling delays resulted from shortages of equipment at the drill site, and the industry attempted to overcome that problem by pooling equipment. The program reportedly failed because there was no uniformity of pipe sizes, threads and coupling. Thus, the new association took up the challenge of developing industry-wide standards and the first standards were published in 1924. Today, API maintains more than 500 standards and recommended practices covering all segments of the oil and gas industry to promote the use of safe, interchangeable equipment and proven and sound engineering practices. The third major area of activity was taxation. Initially the efforts included working with the Treasury Department and congressional committees to develop an orderly, logical and easily administered way to tax oil assets. In the 1930s, these efforts extended to working state governments. Both the federal and state governments tax highways fuels to fund the building of roads, and the industry supported tougher laws against tax evasion. This led to the formation of the API state petroleum council network. API now has offices in 21 state capitals and represents members in 33 states, all east of the Rocky Mountains. In late 1969, API made the decision to move its offices to Washington, DC where we remain today. With 400 corporate members, we are one of the country's largest national trade associations, and the only one that represents all aspects of America's oil and natural gas industry. American Petroleum Institute (API) is a trade association of petroleum producers, refiners, marketers, and transporters, organized for the advancement of the petroleum industry by conducting research, gathering and disseminating information, and maintaining cooperation between government and the industry on all matters of mutual interest. The American Petroleum Institute (API) is the only national trade association that represents all aspects of America's oil and natural gas industry. Our more than 625 corporate members, from the largest major oil company to the smallest of independents, come from all segments of the industry. They are producers, refiners, suppliers, marketers, pipeline operators and marine transporters, as well as service and supply companies that support all segments of the industry. Although our focus is primarily

domestic, in recent years our work has expanded to include a growing international dimension, and today API is recognized around the world for its broad range of programs. Mission:- API's mission is to promote safety across the industry globally and to influence public policy in support of a strong, viable US oil and natural gas industry. Advocacy:- we speak for the oil and natural gas industry to the public, Congress and the Executive Branch, state governments and the media. We negotiate with regulatory agencies, represent the industry in legal proceedings, participate in coalitions and work in partnership with other associations to achieve our members' public policy goals. Research & Statistics:- API conducts or sponsors research ranging from economic analyses to toxicological testing. And we collect, maintain and publish statistics and data on all aspects of US industry operations, including supply and demand for various products, imports and exports, drilling activities and costs, and well completions. This data provides timely indicators of industry trends. API's Weekly Statistical Bulletin is the most recognized publication, widely reported by the media. Standards:- for more than 85 years, API has led the development of petroleum and petrochemical equipment and operating standards. These represent the industry's collective wisdom on everything from drill bits to environmental protection and embrace proven, sound engineering and operating practices and safe, interchangeable equipment and materials. API maintains 685 standards and recommended practices. Many have been incorporated into state and federal regulations; and increasingly, they're also being adopted by the International Organization for Standardization, a global federation of more than 100 standards groups. Certification:- each day, the oil and natural gas industry depends on equipment to produce, refine and distribute its products. The equipment used is some of the most technologically advanced available in the search for oil and gas and allows the industry to operate in an environmentally safe manner. Designed for manufacturers of production, drilling, and refinery equipment, the API Monogram Program verifies that manufacturers are operating in compliance with industry standards. API also provides quality, environmental, and occupational health and safety management systems certification through APIQR. This service is accredited by the ANAB (ANSI-ASQ National Accreditation Board) for ISO 9001 and ISO 14001. Let APIQR's industry expertise certify your organization to API Spec Q1, OHS 18001. API also certifies inspectors of industry equipment through our Individual Certification Programs, designed to recognize working professionals who are knowledgeable of industry inspection codes and are performing their jobs in accordance with those codes. Through our Witnessing Programs, API provides knowledgeable and experienced witnesses to observe critical material and equipment testing and verification. API's Training Provider Certification Program provides third-party certification for a variety of oil and gas industry training courses, further ensuring that any training provided meets industry needs. In helping to improve industry safety, API has a way for service station owners to make sure their contractors have been trained to industry safety standards. API WorkSafe™ is a service station contractor safety qualification program that identifies personnel who have received training for and passed on-line standardized exams covering the latest service station industry safety practices. For consumers, API provides the API's Engine Oil Licensing and Certification System (EOLCS). It is a voluntary licensing and certification program that authorizes engine oil marketers who meet specified requirements to use the API Engine Oil Quality Marks. These emblems go directly on each container of oil that retains the certification for and is there to help consumers identify quality engine oils for their gasoline- and diesel-powered vehicles. Events & Training:- API organizes seminars, workshops, conferences and symposia on public policy issues. Through API University, we provide training materials to help people in the oil and natural gas business meet regulatory requirements and industry standards. API headquartered in Washington, DC, the United States. / Американский Институт Нефти (АИН) – крупная национальная торговая ассоциация, представляющая всю нефтяную отрасль:- разведку и добычу, транспортировку, перегонку и торговлю. Штабквартира расположена в Вашингтоне, Округ Колумбия (ОК), Соединённые Штаты Америки, а нефтяные советы – ещё в 33 штатах. АИН служит форумом для всех составляющих нефтегазовой отрасли в отношении достижения industry to pursue priority public policy objectives and advance the interests of the industry.

AMERICAN PIMA COTTON = АМЕРИКАНСКИЙ ХЛОПЧАТНИК ПИМА – American Pima Cotton is an extra-long staple Cotton formerly known as American-Egyptian Cotton in the United States, grown chiefly in the irrigated valleys of Arizona, New Mexico, and West Texas. Represents only 2 percent of the US Cotton crop. Used chiefly for thread and high-value fabrics and apparel. This type of Cotton came into existence as the Sea Island Cotton was becoming extinct in the United States. See also Pima Cotton. / Американский Хлопчатник Пима – это Хлопчатник со сверхдлинным штапельком, известный ранее в США как Американо-Египетский Хлопчатник и выращиваемый главным образом в долинах Аризоны, Нью Мэксико и Западного Техаса. Составляет лишь 2 процента от всего возделываемого в США Хлопчатника. В основе своей он используется для производства ниток и высоко ценных тканей и швейных изделий. Этот тип Хлопчатника появился на свет как Хлопчатник с Морских Островов (Sea Island Cotton), но данное название не прижилось за ним.

AMERICAN REGISTRY FOR INTERNET NUMBERS = АМЕРИКАНСКИЙ РЕЕСТР ДЛЯ НОМЕРОВ ИНТЕРНЕТА – American Registry for Internet Numbers (ARIN) is a Regional Internet Registry (RIR), and is a non-profit membership organization established for the purpose of the administration and registration of Internet number resources – including Internet Protocol (IP) addresses and Autonomous System Numbers – in Canada, many Caribbean and North Atlantic islands, and the United States. ARIN also develops consensus-based policies and facilitates the advancement of the Internet through information and educational outreach. / Американский Реестр Для Номеров Интернета (АРНИ (ARIN)) – Региональный Интернет Реестр (РИР (RIR)), некоммерческая организация с открытым членством, ответственная за администрирование и регистрацию адресов Интернет Протокола (IP-адресов) в Северной Америке, большинства стран Карибских и Северо-Атлантических островов, и Соединённых Штатов Америки.

AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION = АМЕРИКАНСКАЯ АССОЦИАЦИЯ СТРОИТЕЛЕЙ ДОРОГ И ТРАНСПОРТНЫХ КОММУНИКАЦИЙ – The American Road and Transportation Builders Association (ARTBA):- ARTBA's mission is simple:- we are a federation whose primary goal is to aggressively grow and protect transportation infrastructure investment to meet the public and business demand for safe and efficient travel. In support of this mission, ARTBA also provides programs and services designed to give its 5 000+ public and private sector members a global competitive edge. ARTBA's core values and principles-defined and reflected in the association's governance, management, policies and program of work-include:- integrity and the highest ethical standards, visionary leadership that always focuses on the future, an 'action-oriented' approach and intelligent risk taking. Headquartered in Washington, DC, the United States. Established in 1902 at the Cadillac Hotel in New York City, ARTBA is the oldest and most respected national transportation construction-related association. ARTBA founder Horatio Earle, a Michigan public official, was the first to articulate the need for a federally-built network of Interstate highways. Earle called it the 'Capital Connecting Government Highway System' which he said, would 'connect every state capital with each other and the Nation's Capital-Washington, DC'. Earle's vision was achieved in 1956 when President Eisenhower signed the law authorizing the construction of the Interstate Highway System and creation of the Highway Trust Fund to pay for it. ARTBA members designed, built and continue to maintain the Interstate system, along with the rest of the nation's transportation network. / Созданная в 1902 в Гостинице Кадилак в Нью Йоркском Сити, .

AMERICAN RUST STANDARDS = АМЕРИКАНСКИЕ СТАНДАРТЫ НА РЖАВЧИНУ – The American Rust Standards are used to classify corrosion damage. The American Rust Standard is recognized worldwide and widely used. It is often used in reports produced

by surveyors. Title:- the American Rust Standard Guide is a guide for grading hot rolled steel by surface condition. Author:- American Institute for Steel Classification, 1968.

AMERICAN SELLING PRICE = АМЕРИКАНСКАЯ ЦЕНА ПРОДАЖИ – American Selling Price:- Method of estimating the value of certain products imported into the United States. The American selling price is one of many US customs regulations used to determine the value of foreign products to calculate import duties, such as ad valorem tariffs, based on the price of competitive American products, rather than on the invoice price or on the manufacturer's production costs. / или производственных затратах изготовителя.

AMERICAN SOCIETY FOR TESTING AND MATERIALS = АМЕРИКАНСКОЕ ОБЩЕСТВО ПО ИСПЫТАНИЯМ И МАТЕРИАЛАМ – The American Society for Testing and Materials (ASTM) is a society for developing standards for materials and test methods. ASTM International, formerly known as the American Society for Testing and Materials (ASTM), is a globally recognized leader in the development and delivery of international voluntary consensus standards. Today (2011), some 12 000 ASTM standards are used around the world to improve product quality, enhance safety, facilitate market access and trade, and build consumer confidence. ASTM's leadership in international standards development is driven by the contributions of its members:- more than 30 000 of the world's top technical experts and business professionals representing 135 countries. Working in an open and transparent process and using ASTM's advanced electronic infrastructure, ASTM members deliver the test methods, specifications, guides and practices that support industries and governments worldwide. ASTM was formed in 1898 by chemists and engineers from the Pennsylvania Railroad. At the time of its establishment, the organization was known as the American Section of the International Association for Testing and Materials. Charles B. Dudley, Ph.D., a chemist with the Pennsylvania Railroad, was the driving force behind the formation of the Society. In 2001, the Society became known as ASTM International. ASTM International standards are the tools of customer satisfaction and competiveness for companies across a wide range of markets. Through 141 technical standards-writing committees, ASTM serves diverse industries ranging from metals to construction, petroleum to consumer products, and many more. When new industries look to advance the growth of cutting-edge technologies, such as nanotechnology and additive manufacturing, many of them come together under the ASTM International umbrella to achieve their standardization goals. In the arena of global commerce, ASTM International standards are the passports to a successful trading strategy. High quality, market-relevant ASTM standards, developed in accordance with the guiding principles of the World Trade Organization, fuel trade by opening new markets and creating new trading partners for enterprises everywhere. From Fortune 500 leaders to emerging startups, ASTM standards help level the playing field so that businesses of all sizes can better compete in the global economy. ASTM International standards are developed in accordance with the guiding principles of the World Trade Organization for the development of international standards:- coherence, consensus, development dimension, effectiveness, impartiality, openness, relevance and transparency. ASTM International welcomes and encourages participation from around the world in the development of its standards. ASTM's open consensus process, using advanced Internet-based standards development tools, ensures worldwide access for all interested individuals. Beyond its leadership in the area of standards development, ASTM International offers technical training programs for industry and government, as well as proficiency testing, interlaboratory crosscheck programs and newly initiated certification programs, which support manufacturers, users, researchers and laboratories worldwide. ASTM International world headquarters are located in West Conshohocken, PA. The Society also has offices in Beijing, China, and Mexico City, Mexico. Headquartered in West Conshohocken, PA, the United States. Grade and quality specifications for different commodities are determined by the American Society for Testing and Materials (ASTM) in test methods. / Чарлз Би. Дадли (Charles B. Dudley). Сортность и качественные характеристики различных товаров определяются Американским Обществом по Испытаниям и Материалам (АОИМ) путём тестирования.

AMERICAN SOCIETY OF LUBRICATION ENGINEERS = АМЕРИКАНСКОЕ ОБЩЕСТВО ИНЖЕНЕРОВ ПО СМАЗЫВАНИЮ – American Society of Lubrication Engineers (ASLE):- changed now to Society of Tribologist and Lubrication Engineers (STLE). See also Lubrication. / Американское Общество Инженеров по Смазыванию (АОИС) в настоящее время изменило название на Общество Трибологистов и Инженеров по Смазыванию (ОТИС; Society of Tribologist and Lubrication Engineers (STLE)). Смотрите также Смазывание (Lubrication).

AMERICAN STOCK EXCHANGE® = АМЕРИКАНСКАЯ ФОНДОВАЯ БИРЖА® – Founded over 100 years ago, the American Stock Exchange® (AMEX®) is a large US national securities exchange on which securities are listed. The AMEX® has lower size and value listing requirements than the NYSE®. Also known as Curb Exchange, or Little Board. The American Stock Exchange® (AMEX®) is the second-largest stock exchange in the US, after the New York Stock Exchange® (NYSE®). In general, the listing rules are a little more lenient than those of the NYSE®, and thus the AMEX® has a larger representation of stocks and bonds issued by smaller companies than the NYSE®. Some index options and interest rate options trading also occurs on the AMEX®. The AMEX® started as an alternative to the NYSE®. It originated when brokers began meeting on the curb outside the NYSE® in order to trade stocks that failed to meet the Big Board's stringent listing requirements, but the AMEX® now has its own trading floor. In 1998 the parent company of the NASDAQ® purchased the AMEX® and combined their markets, although the two continued to operate separately. In 2008, the exchange was purchased by NYSE Euronext, integrated with the Alternext European small-cap exchange, and the exchange was renamed NYSE Alternext US also called The Curb. The second largest stock exchange in New York, located in the financial district of New York City. NYSE Euronext (NYX), the world's leading and most diverse exchange group, completed its acquisition of the American Stock Exchange® (Amex®), becoming the third-largest US options marketplace and enhancing the company's leadership in ETFs, cash equities, closed-end funds and structured products. As a result, NYSE Euronext has begun to integrate http://www.amex.com content and data into the http://www.nyse.com website. Effective the close of business, Friday, 2009-January-16, http://www.amex.com will be phased out. NYSE® Amex® Equities, formerly known as the American Stock Exchange® (AMEX®) is an American stock exchange situated in New York. AMEX® was a mutual organization, owned by its members. Until 1953, it was known as the New York Curb Exchange. On 2008-January-17, NYSE Euronext announced it would acquire the American Stock Exchange® for USD260 million in stock. On 2008-October-01, NYSE Euronext completed acquisition of the American Stock Exchange®. Before the closing of the acquisition, NYSE Euronext announced that the Exchange would be integrated with the Alternext European small-cap exchange and renamed the NYSE Alternext US. In March 2009, NYSE Alternext US was changed to NYSE Amex Equities. In the early XIX century, many new enterprises sprang up in the railroad and construction industries. The New York Exchange Board had then mandated an organization to have a minimum of 100 stocks in order to trade in their exchange. Many of these new companies could not meet such requirements to be listed on the Board. A group of non-member brokers catered to the needs of these companies as they traded their stocks outside the registered exchanges. These brokers came to be known as the Curbstone Brokers, as they conducted their auctions out in the street. hese brokers often traded stocks that were speculative in nature. With the discovery of oil in the later half of XIX century, even oil stocks entered into the curb market. By 1865, following the Civil War, stocks in small industrial companies, such as iron and steel, textiles and chemicals were first sold by curbstone brokers. Efforts to organize and standardize the market started early in the XX century under Emanuel S. Mendels. In 1908, the New York Curb Market Agency was established, to codify trading practices. In 1911, the curbstone brokers came to be known as the New York Curb Market, which then had a formal constitution with brokerage and listing standards. After several years of outdoor trading, the curbstone brokers moved indoors in 1921 to a building on Greenwich

Street in Lower Manhattan. In 1929, the New York Curb Market changed its name to the New York Curb Exchange. Within no time, the Curb Exchange became the leading international stock market, listing more foreign issues than all other US securities markets combined. In 1953 the Curb Exchange was renamed the American Stock Exchange®. Paul Kolton was named as President of the exchange in 1971, making him the first person to be selected from within the exchange to serve as its leader, succeeding Ralph S. Saul, who announced his resignation in March 1971. In November 1972 Kolton was named as the exchange's first CEO and the first salaried top executive of the exchange. Kolton opposed the idea of a merger with the Big Board while he headed the exchange saying that 'two independent, viable exchanges are much more likely to be responsive to new pressures and public needs than a single institution'. Kolton announced in July 1977 that he would be leaving his position at the American Exchange in November of that year. The American Stock Exchange® (AMEX®) merged with the New York Stock Exchange (NYSE Euronext) on 2008-October-01. Post merger, the Amex® equities business was branded 'NYSE Alternext US'. As part of the re-branding exercise, NYSE Alternext US was re-branded as NYSE Amex Equities. On 2008-December-01, the Curb Exchange building at 86 Trinity Place was closed, and the Amex Equities trading floor was moved to the NYSE® trading floor at 11 Wall Street. / Эс. (Emanuel S. Mendels). Пол (Paul Kolton). Эс. (Ralph S. Saul). Вторая крупнейшая биржа в Нью Йорке, расположенная в финансовом районе Нью Йорк Сити. АМЭКС® (AMEX®) . НЭЗДЭК® (NASDAQ®) . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) . Американская Фондовая Биржа® – одна из наиболее популярных фондовых бирж мира, которая на сегодняшний день является второй по величине для США. Свою историю биржа АМЭКС® (AMEX®) начала ещё в начале XX века, в 1911, когда из компании торговцев акциями в Нью Йорке, которые промышляли на городских бульварах и авеню, выросла ассоциация New York Curb Market Association, ставшая прародительницей современной American Stock Exchange®. Однако своё теперешнее название American Stock Exchange® (AMEX®) биржа получила не так давно – в 1953 и уже в последующие годы активно меняла образ Американских фондовых бирж, привнося свои изменения, на которые потом ровнялись конкуренты. Так, в 1980-х, которые, прямо скажем, были далеко не лучшими для фондовых бирж, АМЭКС® повысила уровень биржевой маржи, чтобы обеспечить новый механизм гарантий. Кроме того, был введён новый максимальный лимит на допустимое падение цен на акции до закрытия торгов на бирже, чтобы обезопасить компании от разорения и не давать рынку поддаваться панике. В 1990-х фондовая биржа American Stock Exchange® первой в мире ввела электронную систему торгов с использованием беспроводных терминалов. Это было по истине историческое событие и неоценимый вклад, который во многом изменил подход к различным биржевым торгам на многие годы. Были у АМЭКС® и сложные времена, когда в 1998 её приобрела биржа НЭЗДЭК® (NASDAQ®). Однако и этот период был преодолён – акционеры American Stock Exchange® в 2004 выкупили её. Случались и моменты сильного спада – с появлением NASDAQ® Американская Фондовая Биржа® ощутила серьёзный отток компаний, буквально заморозивший её развитие на 10 лет. Спасла АМЭКС® активизация торговли гособлигациями, фьючерсами, опционами и другими деривативами, а также размещение иностранных компаний в листинге биржи. Сейчас же на Американской Фондовой Бирже® совершается порядка 10% всего объёма сделок с акциями, она устроена в форме аукциона. Особенностью American Stock Exchange® является тот факт, что на ней представлены в основном акции среднего и малого бизнеса, то есть развивающихся фирм. Это связано с достаточно лояльными условиями для включения компании в листинг в отличие от Нью Йоркской Фондовой Биржи® (NYSE®). AMEX® публикует два своих основных фондовых индекса:- (i) Индекс по Основному Рынку От АМЭКС (AMEX® Major Market Index), который является простым средним цен на акции 20 ведущих компаний биржи; и (ii) Индекс По Рыночной Стоимости От АМЭКС® (AMEX® Market Value Index), который рассчитывается как взвешенный по рыночной стоимости всех акций, входящих в листинг биржи. Американская Фондовая Биржа (АФБ или АМЭКС® (AMEX®)) – фондовая биржа, занимающая в США второе (после Нью Йоркской) место по объёму торговли. Расположенная в Нью Йорке на Trinity Place 86, в нижней части Манхэттена, AMEX® до 1921 называлась Curb Exchange ('Уличная Биржа'), и до сих пор её иногда называют Curb (Узда или Подгубник). Акции и облигации, обращающиеся на AMEX®, в основном принадлежат мелким и средним компаниям, в то время как ценные бумаги крупных компаний, как правило, обращаются на Нью Йоркской Фондовой Бирже (НЙФБ®; New York Stock Exchange (NYSE®)). В частности, на AMEX® обращаются бумаги большинства нефтяных и газовых компаний. На AMEX® также происходит торговля опционами на акции, обращающиеся на Нью Йоркской Фондовой Бирже, и некоторые акции внеучётного рынка (over the counter). В последние годы на бирже стали осуществляться операции со многими производными инструментами. Кроме того, на ней обращается больше иностранных акций, чем на любой другой фондовой бирже США. Торги происходят с 09:30 до 16:00 ежедневно, кроме Субботы и Воскресенья.

AMERICAN–STYLE OPTION = ОПЦИОН В АМЕРИКАНСКОМ СТИЛЕ – American-Style Option is call or put option which can be exercised at any time during its term. The opposite of the American option is the European-Style Option. American-Style Option is an option which can be exercised at any stage during its life, at or before expiration date. / Опцион в Американском Стиле – опцион на покупку или продажу, который может быть исполнен в любой момент времени, пока действителен сам этот опцион, то есть либо до даты, либо на саму дату прекращения признания этого опциона. В настоящее время большая часть торгуемых на биржах США опционов являются Американскими по своему стилю исполнения. Смотрите также Опцион В Европейском Стиле (European-Style Option).

AMERICAN UPLAND COTTON = АМЕРИКАНСКИЙ НАГОРНЫЙ ХЛОПЧАТНИК (или АМЕРИКАНСКИЙ ХЛОПЧАТНИК С ВОЗВЫШЕННОСТЕЙ) – American Upland Cotton:- currently representing the bulk of the world crop, American Upland fiber runs between 3/4" and 1-1/4". See also Upland Cotton. / Американский Нагорный Хлопчатник или Американский Хлопчатник с Вызвышенностей в настоящее время представляет существенную долю всего мирового урожая Хлопчатника. Длина получаемого из него волокна составляет диапазон от 3/4" до 1-1/4" (" – обозначение дюйма). Смотрите также Нагорный Хлопчатник или Хлопчатник С Возвышенностей (Upland Cotton).

AMERICAN WILD RICE = АМЕРИКАНСКИЙ ДИКИЙ РИС – American Wild Rice is not a species of Rice. It is a wild grass found in the USA with grains similar to those of Rice. Its scientific name is Zizania Aquatica.

AMERICAN WIRE GAUGE = АМЕРИКАНСКИЙ КАЛИБР ДЛЯ ПРОВОЛОК (или АМЕРИКАНСКИЙ СОРТАМЕНТ ПРОВОДОВ) – American Wire Gauge (AWG) is a standard measure which represents the size of wire. The larger the number, the smaller the wire.

AMETHYST = АМЕТИСТОВОЕ – Amethyst:- a variable color averaging a mod purple. Yes, it is also the birth stone for the month of February (I think the entire month, but don't quote me on that ...).

AMETHYSTINA = АМЕТИСТОВОЕ (или АМЭТИСТИНА) – Amethystina:- violet. / Аметистовое:- фиолетовое.

AMEX® = AMERICAN STOCK EXCHANGE®

AMEX® COMPOSITE INDEX = СВОДНЫЙ ИНДЕКС ОТ АМЭКС® – AMEX® Composite Index is a weighted index of the stocks listed on the American Stock Exchange®. The market capitalization of each company is used to construct the index. NYSE Amex Composite Index is an index made up of stocks that represent the NYSE Amex equities market. The NYSE Amex Composite Index is a market capitalization-weighted index, so the weight of each stock depends on the price of the shares and how many are outstanding. The index is used to quickly judge the overall movement of the NYSE Amex equities market. It was previously known as the American

Stock Exchange® (Amex®) Composite Index and can be found under the symbol XAX. NYSE Euronext acquired the American Stock Exchange on October 01, 2008, and branded it as NYSE Alternext US, which was then changed to the NYSE Amex Equities in 2009. It is primarily an equity market for emerging growth companies. / АМЭКС® (AMEX®). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

AMEX® INDEX OPTIONS = ОПЦИОНЫ НА ИНДЕКС ОТ АМЭКС® – The American Stock Exchange® (AMEX®) trades put and call options based on a number of sector, industry and international indices. These indices cannot be bought or sold like stocks, their price movements are simply used for trading options. / АМЭКС® (AMEX®).

AMFA = ALTERNATIVE MOTOR FUELS ACT

AMIC = ASIAN MASS COMMUNICATION RESEARCH AND INFORMATION CENTRE

AMICE = АМИКЭ (или АМИКТ, или ПАЛИЙ, или АМИС) – Amice:- a liturgical vestment made of an oblong piece of cloth usually of white linen and worn about the neck and shoulders and partly under the alb. By the way, if you do not know what an 'alb' is, you can find it in this glossary. / от Латинского слова Амикэ (Amice).

AMIDSHIPS = ПОСРЕДИНЕ СУДНА (или МЕТАЦЕНТР) – Amidships:- in or towards the middle of a ship in regard to length or breadth (center of). In or toward the center of the ship. Generally speaking, the word Amidships means in the middle portion of a vessel. / Под Метацентром судна понимается точка, от положения которой зависит устойчивость равновесия (остойчивость) плавающего тела. При равновесии на плавающее тело, кроме силы тяжести P, приложенной в центре тяжести (ЦТ) тела, действует ещё выталкивающая сила A, линия действия которой проходит через так называемый центр водоизмещения (ЦВ) – центр тяжести массы жидкости в объёме погруженной части тела. В наиболее важном для практики случае, когда плавающее тело имеет продольную плоскость симметрии, точка пересечения этой плоскости с линией действия выталкивающей силы и называется метацентром. При наклонах тела положение метацентра меняется. Плавающее тело будет остойчивым, если самый низший из метацентров (иногда только его и называют метацентром) будет лежать выше центра тяжести тела. Возвышение метацентра над центром тяжести называют метацентрической высотой и является мерой остойчивости тела.

AMINE END GROUP = ГРУППА С АМИНОВЫМ ОКОНЧАНИЕМ – Amine End Group is the terminating ($–NH_2$) group of a nylon polymer chain. Amine end groups provide dye sites for polyamides. / Найлан (Nylon).

AMINO ACID = АМИНОКИСЛОТА – Amino Acid is a substance with both basic and acidic properties synthesized by plants and animals; considered the building blocks of proteins. / Под Аминокислотами понимается класс органических соединений, содержащих карбоксильные ($–COOH$) и аминогруппы ($–NH_2$); обладают свойствами и кислот, и оснований. Участвуют в обмене азотистых веществ всех организмов (исходные соединения при биосинтезе гормонов, витаминов, медиаторов, пигментов, пуриновых и пиримидиновых оснований, алкалоидов и других). Природных аминокислот свыше 150. Около 20 важнейших аминокислот служат мономерными звеньями, из которых построены все белки (порядок исключения аминокислот в них определяется генетическим кодом). Большинство микроорганизмов и растения синтезируют необходимые им аминокислоты; животные и человек не способны к образованию так называемых незаменимых аминокислот, получаемых с пищей. Освоен промышленный синтез (химический и микробиологический) ряда аминокислот, используемых для обогащения пищи, кормов, как исходные продукты для производства полиамидов, красителей и лекарственных препаратов.

AMIS = AGRICULTURAL MARKET INFORMATION SYSTEM

AMMONIA = АММИАК – Ammonia is a gas, NH_3; often used to refer to a solution of ammonia in water, called Aqua Ammonia or Ammonium Hydroxide (NH_4OH). Ammonium hydroxide is sometimes used for pH control, mostly where the desired pH is only moderately basic. It is used in some stripping processes for acid dyes and in rinses for reactive dyes on wool. Ammonia vapors are very irritating, and solutions should be handled carefully. Ammonia is an alkaline liquid used in natural dyeing. / Гидроокись Аммиака или Нашатырный Спирт (Ammonium Hydroxide). Щелочное (Alkaline). Под Аммиаком (NH_3), от Латинского словосочетания (Sal) Ammoniacus, означающее буквально Амонова Соль, или так называемым Нашатырём (NH_4Cl), который получали близ храма Бога Амона в Египте, понимается бесцветный газ с резким удушливым запахом. Плотность (в кг/м^3) газообразного 0.771 4, жидкого 681.4; $t_{кип}$ – 33.35 ºC, $t_{пл}$ – 77.7 ºC; при давлении $9 \cdot 10^5$ Па сжижается при комнатной температуре. Аммиак хорошо растворим в воде с образованием гидроксида аммония (NH_4OH); раствор аммиака в воде называют Нашатырным Спиртом. Аммиак получают каталитическим синтезом из азота и водорода в присутствии катализаторов при повышенном давлении; применяют для производства азотной кислоты, аммониевых солей, мочевины, синильной кислоты, соды, удобрений (4/5 производимого аммиака), в технологии редких и радиоактивных металлов, для осаждения гидроксидов; водные растворы аммиака используются как жидкие удобрения; жидкий аммиак благодаря большой теплоте испарения служит рабочим веществом холодильных машин, а также высококонцентрированным удобрением. Взрывоопасен. Токсичен.

AMMONIA VOLATILIZATION = УЛЕТУЧИВАНИЕ АММИАКА – Ammonia Volatilization is the escape of nitrogen from the soil or floodwater as ammonia gas; causes loss of urea and the ammonium form of nitrogen fertilizer from floodwater or saturated soil surfaces.

AMMONIUM HYDROXIDE = ГИДРООКИСЬ АММИАКА (или НАШАТЫРНЫЙ СПИРТ) – Ammonium Hydroxide:- this term is used to refer to a solution of ammonia in water, called Aqua Ammonia or Ammonium Hydroxide (NH_4OH). Ammonium hydroxide is sometimes used for pH control, mostly where the desired pH is only moderately basic. / Гидроокись Аммиака или Нашатырный Спирт.

AMMONIUM SULFATE = СУЛЬФАТ АММОНИЯ – Ammonium Sulfate ($(NH_4)_2SO_4$) is a solid chemical that is used most commonly with acid dyes and 2:1 premetallized dyes. It decomposes through hydrolysis as the bath temperature rises, slowly releasing acid. This helps produce level results:- at the start of dyeing the pH of the bath will be near neutral and will drop as dyeing progresses. Neutral conditions favor leveling, while more strongly acid conditions favor good exhaustion. Ammonium Sulfate is a mild acid-forming salt used with acid dyes. Used to insure levelness for light to medium shades. / Сульфат Аммония ($(NH_4)_2SO_4$) – средний сульфат, широко применяемый как азотное удобрение.

AMNESTY INTERNATIONAL = МЕЖДУНАРОДНАЯ АМНИСТИЯ – Amnesty International (commonly known as Amnesty and AI) is a non-governmental organisation focused on human rights with over 3 million members and supporters around the world. The objective of the organisation is 'to conduct research and generate action to prevent and end grave abuses of human rights, and to demand justice for those whose rights have been violated'. Amnesty International was founded in London in 1961, following the publication of the article 'The Forgotten Prisoners' in The Observer 28 May 1961, by the lawyer Peter Benenson. Amnesty draws attention to human rights abuses and campaigns for compliance with international laws and standards. It works to mobilise public opinion to put pressure on governments that let abuse take place. The organisation was awarded the 1977 Nobel Peace Prize for its 'campaign against torture', and the United Nations Prize in the Field of Human Rights in 1978. In the field of international human rights organisations,

Amnesty has the longest history and broadest name recognition, and ‘is believed by many to set standards for the movement as a whole’. 1960s:- Amnesty International was founded in London in July 1961 by English labour lawyer Peter Benenson. According to his own account, he was travelling in the London Underground on 19 November 1960, when he read of two Portuguese students from Coimbra who had been sentenced to seven years of imprisonment in Portugal for allegedly ‘having drunk a toast to liberty’. Researchers have never traced the alleged newspaper article in question. In 1960, Portugal was ruled by the Estado Novo government of António de Oliveira Salazar. The government was authoritarian in nature and strongly anti-communist, supressing enemies of the state as anti-Portuguese. In his significant newspaper article ‘The Forgotten Prisoners’, Benenson later described his reaction as follows:- ‘Open your newspaper any day of the week and you will find a story from somewhere of someone being imprisoned, tortured or executed because his opinions or religion are unacceptable to his government ... The newspaper reader feels a sickening sense of impotence. Yet if these feelings of disgust could be united into common action, something effective could be done’. Benenson worked with friend Eric Baker. Baker was a member of the Religious Society of Friends who had been involved in funding the British Campaign for Nuclear Disarmament as well as becoming head of Quaker Peace and Social Witness, and in his memoirs Benenson described him as ‘a partner in the launching of the project’. In consultation with other writers, academics and lawyers and, in particular, Alec Digges, they wrote via Louis Blom-Cooper to David Astor, editor of The Observer newspaper, who, on 28 May 1961, published Benenson’s article ‘The Forgotten Prisoners’. The article brought the reader’s attention to those ‘imprisoned, tortured or executed because his opinions or religion are unacceptable to his government’ or, put another way, to violations, by governments, of articles 18 and 19 of the Universal Declaration of Human Rights (UDHR). The article described these violations occurring, on a global scale, in the context of restrictions to press freedom, to political oppositions, to timely public trial before impartial courts, and to asylum. It marked the launch of ‘Appeal for Amnesty, 1961’, the aim of which was to mobilise public opinion, quickly and widely, in defence of these individuals, whom Benenson named ‘Prisoners of Conscience’. The ‘Appeal for Amnesty’ was reprinted by a large number of international newspapers. In the same year Benenson had a book published, Persecution 1961, which detailed the cases of nine prisoners of conscience investigated and compiled by Benenson and Baker (Maurice Adin, Ashton Jones, Agostinho Neto, Patrick Duncan, Olga Ivinskaya, Luis Taruc, Constantin Noica, Antonio Amat and Hu Feng). In July 1961 the leadership had decided that the appeal would form the basis of a permanent organisation, Amnesty, with the first meeting taking place in London. Benenson ensured that all three major political parties were represented, enlisting Members of Parliament from the Labour Party, the Conservative Party, and the Liberal Party. On 30 September 1962, it was officially named ‘Amnesty International’. Between the ‘Appeal for Amnesty, 1961’ and September 1962 the organisation had been known simply as ‘Amnesty’. What started as a short appeal soon became a permanent international movement working to protect those imprisoned for non-violent expression of their views and to secure worldwide recognition of Articles 18 and 19 of the UDHR. From the very beginning, research and campaigning were present in Amnesty International’s work. A library was established for information about prisoners of conscience and a network of local groups, called ‘THREES’ groups, was started. Each group worked on behalf of three prisoners, one from each of the then three main ideological regions of the world:- communist, capitalist and developing. By the mid-1960s Amnesty International’s global presence was growing and an International Secretariat and International Executive Committee were established to manage Amnesty International’s national organisations, called ‘Sections’, which had appeared in several countries. The international movement was starting to agree on its core principles and techniques. For example, the issue of whether or not to adopt prisoners who had advocated violence, like Nelson Mandela, brought unanimous agreement that it could not give the name of ‘Prisoner of Conscience’ to such prisoners. Aside from the work of the library and groups, Amnesty International’s activities were expanding to helping prisoners’ families, sending observers to trials, making representations to governments, and finding asylum or overseas employment for prisoners. Its activity and influence were also increasing within intergovernmental organisations; it would be awarded consultative status by the United Nations, the Council of Europe and UNESCO before the decade ended. 1970s:- leading Amnesty International in the 1970s were key figureheads Seán MacBride and Martin Ennals. While continuing to work for prisoners of conscience, Amnesty International’s purview widened to include ‘fair trial’ and opposition to long detention without trial (UDHR Article 9), and especially to the torture of prisoners (UDHR Article 5). Amnesty International believed that the reasons underlying torture of prisoners by governments, were either to acquire and obtain information or to quell opposition by the use of terror, or both. Also of concern was the export of more sophisticated torture methods, equipment and teaching by the superpowers to ‘client states’, for example by the United States through some activities of the CIA. Amnesty International drew together reports from countries where torture allegations seemed most persistent and organised an international conference on torture. It sought to influence public opinion in order to put pressure on national governments by organising a campaign for the ‘Abolition of Torture’ which ran for several years. Amnesty International’s membership increased from 15 000 in 1969 to 200 000 by 1979. This growth in resources enabled an expansion of its program, ‘outside of the prison walls’, to include work on ‘disappearances’, the death penalty and the rights of refugees. A new technique, the ‘Urgent Action’, aimed at mobilising the membership into action rapidly was pioneered. The first was issued on 19 March 1973, on behalf of Luiz Basilio Rossi, a Brazilian academic, arrested for political reasons. At the intergovernmental level Amnesty International pressed for application of the UN’s Standard Minimum Rules for the Treatment of Prisoners and of existing humanitarian conventions; to secure ratifications of the two UN Covenants on Human Rights in 1976); and was instrumental in obtaining additional instruments and provisions forbidding its practice. Consultative status was granted at the Inter-American Commission on Human Rights in 1972. In 1976 Amnesty’s British Section started a series of fund-raising events that came to be known as The Secret Policeman’s Balls series. They were staged in London initially as comedy galas featuring what the Daily Telegraph called ‘the crème de la crème of the British comedy world’ including members of comedy troupe Monty Python, and later expanded to also include performances by leading rock musicians. The series was created and developed by Monty Python alumnus John Cleese and entertainment industry executive Martin Lewis working closely with Amnesty staff members Peter Luff (Assistant Director of Amnesty 1974–78) and subsequently with Peter Walker (Amnesty Fund-Raising Officer 1978–82). Cleese, Lewis and Luff worked together on the first two shows (1976 and 1977). Cleese, Lewis and Walker worked together on the 1979 and 1981 shows, the first to carry what the Daily Telegraph described as the ‘rather brilliantly re-christened’ Secret Policeman’s Ball title. The organisation was awarded the 1977 Nobel Peace Prize for its ‘campaign against torture’ and the United Nations Prize in the Field of Human Rights in 1978. 1980s:- By 1980 Amnesty International was drawing more criticism from governments. The USSR alleged that Amnesty International conducted espionage, the Moroccan government denounced it as a defender of lawbreakers, and the Argentine government banned Amnesty International’s 1983 annual report. Throughout the 1980s, Amnesty International continued to campaign against torture, and on behalf of prisoners of conscience. New issues emerged, including extrajudicial killings, military, security and police transfers, political killings; and disappearances. Towards the end of the decade, the growing number of refugees worldwide was a very visible area of Amnesty International’s concern. While many of the world’s refugees of the time had been displaced by war and famine, in adherence to its mandate, Amnesty International concentrated on those forced to flee because of the human rights violations it was seeking to prevent. It argued that rather than focusing on new restrictions on entry for asylum-seekers, governments were to address the human rights violations which were forcing people into exile. Apart from a second campaign on torture during the first half of the decade, two major musical events occurred, designed to increase awareness of Amnesty and of human rights (particularly among younger generations) during the mid- to late-1980s. The 1986 Conspiracy of Hope tour, which played five concerts in the US, and culminated in a daylong show, featuring some thirty-odd acts at Giants Stadium, and the 1988 Human Rights Now! world tour.

Human Rights Now!, which was timed to coincide with the 40th anniversary of the United Nations' Universal Declaration of Human Rights (UDHR), played a series of concerts on five continents over six weeks. Both tours featured some of the most famous musicians and bands of the day. 1990s:- throughout the 1990s, Amnesty International continued to grow, to a membership of over 3 million in over 150 countries and territories, led by Senegalese Secretary General Pierre Sané. Amnesty continued to work on a wide range of issues and world events. For example, South African groups joined in 1992 and hosted a visit by Pierre Sané to meet with the apartheid government to press for an investigation into allegations of police abuse, an end to arms sales to the African Great Lakes region and the abolition of the death penalty. In particular, Amnesty International brought attention to violations committed on specific groups, including refugees, racial/ethnic/religious minorities, women and those executed or on Death Row. The death penalty report When the state kills (ISBN 978-0-691-10261-0) and the 'Human Rights are Women's Rights' campaign were key actions for the latter two issues. During the 1990s, Amnesty International was forced to react to human rights violations occurring in the context of a proliferation of armed conflict in Angola, East Timor, the Persian Gulf, Rwanda, and the former Yugoslavia. Amnesty International took no position on whether to support or oppose external military interventions in these armed conflicts. It did not (and does not) reject the use of force, even lethal force, or ask those engaged to lay down their arms. Instead, it questioned the motives behind external intervention and selectivity of international action in relation to the strategic interests of those sending troops. It argued that action should be taken to prevent human rights problems becoming human rights catastrophes, and that both intervention and inaction represented a failure of the international community. In 1995, when AI wanted to promote how Shell Oil Company was involved with the execution of an environmental and human rights activist Ken Saro-Wiwa in Nigeria, it was stopped. Newspapers and advertising companies refused to run AI's ads because Shell Oil was a customer of theirs as well. Shell's main argument was that it was drilling oil in a country that already violated human rights and had no way to enforce human rights policies. To combat the buzz that AI was trying to create, it immediately publicized how Shell was helping to improve overall life in Nigeria. Salil Shetty, the director of Amnesty, said, 'Social media re-energises the idea of the global citizen'. James M. Russell notes how the drive for profit from private media sources conflicts with the stories that AI wants to be heard. Amnesty International was proactive in pushing for recognition of the universality of human rights. The campaign 'Get Up, Sign Up' marked 50 years of the UDHR. Thirteen million pledges were collected in support, and the Decl music concert was held in Paris on 10 December 1998 (Human Rights Day). At the intergovernmental level, Amnesty International argued in favour of creating an United Nations High Commissioner for Human Rights (established 1993) and an International Criminal Court (established 2002). After his arrest in London in 1998 by the Metropolitan Police, Amnesty International became involved in the legal battle of Senator Pinochet, a former Chilean President, who sought to avoid extradition to Spain to face charges. Lord Hoffman had an indirect connection with Amnesty International, and this led to an important test for the appearance of bias in legal proceedings in UK law. There was a suit against the decision to release Senator Pinochet, taken by the then British Home Secretary Mr Jack Straw, before that decision had actually been taken, in an attempt to prevent the release of Senator Pinochet. The English High Court refused the application and Senator Pinochet was released and returned to Chile. This legal challenge was a novel attempt to use legal process to challenge a decision before it was taken and could be seen as hard to reconcile with the rule of law, as it was predicated on a presumption that the Home Secretary had erred in law whatever the reasons were for the decision. 2000s:- after 2000, Amnesty International's agenda turned to the challenges arising from globalisation and the reaction to the 11 September 2001 attacks in the United States. The issue of globalisation provoked a major shift in Amnesty International policy, as the scope of its work was widened to include economic, social and cultural rights, an area that it had declined to work on in the past. Amnesty International felt this shift was important, not just to give credence to its principle of the indivisibility of rights, but because of what it saw as the growing power of companies and the undermining of many nation states as a result of globalisation. In the aftermath of the 11 September attacks, the new Amnesty International Secretary General, Irene Khan, reported that a senior government official had said to Amnesty International delegates:- 'Your role collapsed with the collapse of the Twin Towers in New York'. In the years following the attacks, some believe that the gains made by human rights organisations over previous decades had possibly been eroded. Amnesty International argued that human rights were the basis for the security of all, not a barrier to it. Criticism came directly from the George Walker Bush administration and The Washington Post, when Khan, in 2005, likened the US government's detention facility at Guantanamo Bay, Cuba, to a Soviet Gulag. During the first half of the new decade, Amnesty International turned its attention to violence against women, controls on the world arms trade, concerns surrounding the effectiveness of the UN, and ending torture. With its membership close to two million by 2005, Amnesty continued to work for prisoners of conscience. In 2007, AI's executive committee decided to support access to abortion 'within reasonable gestational limits ... for women in cases of rape, incest or violence, or where the pregnancy jeopardizes a mother's life or health'. Amnesty International reported, concerning the Iraq War, on 17 March 2008, that despite claims the security situation in Iraq has improved in recent months, the human rights situation is disastrous, after the start of the war five years ago in 2003. In 2008 Amnesty International launched a mobile donating campaign in the United States, which allows supporters to make USD5 micro-donations by sending a text message to the short code 90999 with the keyword RIGHTS. Amnesty International's mobile fund raising campaign was created in partnership with Mgive and the Mobile Giving Foundation. In 2009 Amnesty International accused Israel and the Palestinian Hamas movement of committing war crimes during Israel's January offensive in Gaza, called Operation Cast Lead, that resulted in the deaths of more than 1 400 Palestinians and 13 Israelis. The 117-page Amnesty report charged Israeli forces with killing hundreds of civilians and wanton destruction of thousands of homes. Amnesty found evidence of Palestinian militants using human shields to stop Israeli attacks. A subsequent United Nations Fact Finding Mission on the Gaza Conflict was carried out; Amnesty stated that its findings were consistent with those of Amnesty's own field investigation, and called on the UN to act promptly to implement the mission's recommendations. 2010s:- in February 2010, Amnesty suspended Gita Sahgal, its gender unit head, after she criticised Amnesty for its links with Moazzam Begg, Director of a campaign group called Cageprisoners. She had called the links 'a gross error of judgment' that risked Amnesty's reputation on human rights, and said it was wrong to ally with 'Britain's most famous supporter of the Taliban'. Amnesty responded that Sahgal was not suspended 'for raising these issues internally ... (Begg) speaks about his own views ..., not Amnesty International's'. Among those who spoke up for Saghal were Salman Rushdie ('Amnesty ... has done its reputation incalculable damage.... It looks very much as if Amnesty's leadership is suffering from a kind of moral bankruptcy, and has lost the ability to distinguish right from wrong'), Member of Parliament Denis MacShane, Joan Smith, Christopher Hitchens, Martin Bright, Melanie Phillips, and Nick Cohen. In February 2011, Amnesty requested that Swiss authorities start a criminal investigation of former US President George W. Bush and arrest him. In July 2011, Amnesty International celebrated its 50 years with an animated short film directed by Carlos Lascano, produced by Eallin Motion Art and Dreamlife Studio, with music by Academy Award winner Hans Zimmer and nominee Lorne Balfe. The film shows that the fight for humanity is not yet over. Principles:- a vital part of AI's mandate is the so-called 'Violence Clause'. It sets prisoners of conscience apart from the other categories of prisoners on whose behalf the movement works. If a prisoner is serving a sentence imposed, after a fair trial, for activities involving violence, AI will not ask the government to release the prisoner. AI does not judge whether recourse to violence is justified or not. However, AI does not oppose the political use of violence in itself since The Universal Declaration of Human Rights, in its preamble, foresees situations in which people could 'be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression'. AI neither supports nor condemns the resort to violence by political opposition groups in itself, just as AI neither supports nor condemns a government policy of using military force in fighting against armed opposition movements. However, AI supports minimum humane

standards that should be respected by governments and armed opposition groups alike. When an opposition group tortures or kills its captives, takes hostages, or commits deliberate and arbitrary killings, AI condemns these abuses. Funding:- Amnesty International is financed largely by fees and donations from its worldwide membership. It says that it does not accept donations from governments or governmental organisations. According to the AI website, 'these personal and unaffiliated donations allow AI to maintain full independence from any and all governments, political ideologies, economic interests or religions. We neither seek nor accept any funds for human rights research from governments or political parties and we accept support only from businesses that have been carefully vetted. By way of ethical fundraising leading to donations from individuals, we are able to stand firm and unwavering in our defence of universal and indivisible human rights'. However, AI did receive grants from the UK Department for International Development, the European Commission, the United States State Department, and other governments. In November 2012, the Amnesty staff in London went on strike to protest work conditions and financial issues with the organisation. Gerald Steinberg, of NGO Monitor said, 'They really are in trouble. They've been in crisis for a number of years'. Charitable Status:- in the UK Amnesty International has two principal arms, Amnesty International UK and Amnesty International Charity Ltd. Both are UK-based organisations but only the latter is a charity. Criticism:- criticism of Amnesty International includes claims of excessive pay for management, underprotection of overseas staff, associating with organisations with a dubious record on human rights protection, selection bias, ideological/foreign policy bias against either non-Western countries or Western-supported countries, criticism of Amnesty's policies relating to abortion, and assertion that 'defensive jihad' is not antithetical to human rights. Governments who have criticised Amnesty include those of Canada, Israel, Iran, Saudi Arabia, the Democratic Republic of the Congo, the People's Republic of China, Vietnam, Russia and the United States, for what they assert is one-sided reporting or a failure to treat threats to security as a mitigating factor. The actions of these governments – and of other governments critical of Amnesty International – have been the subject of human rights concerns voiced by Amnesty. As of February 2011, Amnesty is engaged in a dispute with the British union Unite over Amnesty allegedly attempting to de-recognize some of its foreign-based workers' rights. Amnesty International is a global movement of more than 3 million supporters, members and activists in over 150 countries and territories who campaign to end grave abuses of human rights. Our vision is for every person to enjoy all the rights enshrined in the Universal Declaration of Human Rights and other international human rights standards. We are independent of any government, political ideology, economic interest or religion, and are funded mainly by our membership and public donations. After more than 50 years of groundbreaking achievements, Amnesty International is now embarking on a major process of evolution, to adapt to the dramatic changes in the world we operate in, and to increase the impact of our human rights work. We are introducing a new, global way of working – with a distributed centre and Regional Hubs of research, campaigns and communications – because we owe it to the people we work for to be the most effective force for freedom and justice that we can, globally. As we develop this process – in line with the long-held desire of our international membership – we will post regular blogs, articles, stories and personal accounts to explain what is happening, and why it is important to those on the human rights front line. Come with us on our journey by reading our blogs here, and then help us make a real difference to people's lives by becoming a member or supporter of Amnesty International. Xxxxx. About Amnesty International:- until every person can enjoy all of their rights, we will continue our efforts. We will not stop until everyone can live in dignity; until every person's voice can be heard; until no one is tortured or executed. Our members are the cornerstone of these efforts. They take up human rights issues through letter-writing, online and offline campaigning, demonstrations, vigils and direct lobbying of those with power and influence. Locally, nationally and globally, we join together to mobilize public pressure and show international solidarity. Together, we make a difference. United Against Injustice:- at the heart of Amnesty International is this idea: that we are at our most powerful when we stand together for human rights. We work together in many different ways, so that all our supporters can be involved, wherever they live and whatever their age, background or skills. Our movement is driven by our members, supporters, our more than 1 800 staff members and hundreds of volunteers around the world. Together we campaign to:- (i) defend freedom of expression; (ii) protect women's rights; (iii) abolish the death penalty; (iv) demand justice for crimes against humanity; and (v) demand corporate accountability where companies have abused people's rights. Campaigning can change lives – of the survivors of human rights abuses, of the human rights activists, even of the abusers. Donate now, and you can help us keep up the pressure, changing minds and changing lives. Independent And Democratic:- we are democratic and self-governing – every member has a say in deciding what we do and how we do it. Amnesty International is:- (i) independent of any government, political ideology, economic interest or religion; and (ii) financially autonomous, thanks to the generous support of donations from individual members and supporters. We do not support or oppose any government or political system and neither do we necessarily support or oppose the views of those whose rights we seek to protect. Xxxxx. The History of Amnesty International:- Amnesty International began with one man's outrage and his courage to do something about it. After learning of two Portuguese students imprisoned for raising a toast to freedom in 1961, British lawyer Peter Benenson published an article, 'The Forgotten Prisoners' in the Observer newspaper. That article launched the 'Appeal for Amnesty 1961', a worldwide campaign that provoked a remarkable response. Reprinted in newspapers across the world, his call to action resonated with the values and aspirations of people everywhere. This was the genesis of Amnesty International. 1961:- British lawyer Peter Benenson launches a worldwide campaign, 'Appeal for Amnesty 1961', with the publication of an article in the Observer newspaper. The article, 'The Forgotten Prisoners', is written after he learns of two Portuguese students who were imprisoned for raising a toast to freedom. Reprinted in newspapers across the world, his appeal marks the beginning of Amnesty International. The first international meeting is held in July, with delegates from Belgium, the UK, France, Germany, Ireland, Switzerland and the USA. They decide to establish 'a permanent international movement in defence of freedom of opinion and religion'. A small office and library, staffed by volunteers, opens in Peter Benenson's chambers in Mitre Court, London. The 'Threes Network' is established, through which each Amnesty International group adopts three prisoners from contrasting geographical and political areas, emphasizing the impartiality of the group's work. On Human Rights Day, 10 December, the first Amnesty International candle – which would become the organization's iconic symbol – is lit in the church of St-Martin-in-the-Fields, London. 1962:- in January, the first research trip is undertaken, to Ghana. This is followed by visits to Czechoslovakia (on behalf of prisoner of conscience Archbishop Josef Beran), Portugal and East Germany. The Prisoner of Conscience Fund is established to provide relief to prisoners and their families. Amnesty International's first annual report gives details of activities so far:- 210 prisoners of conscience have been adopted by 70 groups in seven countries; 1 200 cases are documented in the Prisoners of Conscience Library. An observer is sent to attend the trial of Nelson Mandela. Amnesty International groups are started in Australia, Belgium, Denmark, Greece, Ireland, Norway, Sweden, and the USA. At a conference in Belgium, all the groups decide to set up a permanent organization that will be known as 'Amnesty International'. A new section is set up in Ireland. 1963:- Sean MacBride, Irish human rights advocate, is elected Chair of Amnesty International's newly established International Executive Committee, the organization's most senior governing body. The International Council meeting takes place in Konigswinter, West Germany. Amnesty International now comprises 350 groups. The two-year total includes 770 prisoners adopted and 140 released. The International Secretariat (the Amnesty International headquarters) is established in London. A Research Bureau, consisting of volunteers, is established to prepare background papers on political imprisonment in individual countries. Ukrainian Archbishop Josyf Slipyi, who was sent 7 000 cards by Amnesty International members, is released from prison in Siberia. 1964:- at an International Council meeting in Canterbury, UK, Amnesty International debates and rejects the proposal to recognize as prisoners of conscience people who use or advocate the use of force in opposing oppressive regimes. This means people like Nelson Mandela are not recognized as prisoners of conscience,

although campaigns continue against the inhumane conditions of his imprisonment. At the same meeting, Peter Benenson, who had been secretary to the International Executive Committee, is named President of Amnesty International. The first iconic Amnesty International candle design is unveiled. A three-year total of 1 367 prisoners have been adopted and 329 released. There are now 360 Amnesty International groups in 14 countries. New sections are established in Denmark, Israel, Norway and Sweden. The UN grants Amnesty International consultative status. 1965:- Amnesty International issues its first reports – on prison conditions in East Germany, Paraguay, Portugal, Rhodesia, South Africa and Romania – and sponsors a resolution at the UN to suspend and finally abolish the death penalty for peacetime political offences. The monthly Postcards for Prisoners campaign starts. 1966:- following resistance in the USA to military service in Vietnam, Amnesty International gives prisoner of conscience status to all who refuse to fight in wars. Peter Benenson gives up his day-to-day involvement with Amnesty International and Eric Baker takes over the running of the organization. There are now 1 500 prisoners adopted, and 1 000 released since Amnesty International was founded. New sections are established in India and the USA. 1967:- fearing that intervention could jeopardize a prisoner's chance of release, Amnesty International refrains from adopting prisoners of conscience in China. There are 550 groups in 18 countries, and Amnesty International is working for nearly 2 000 prisoners in 63 countries – 293 prisoners have been released. New sections are established in Finland and New Zealand. The International Secretariat moves to offices in Turnagain Lane, London. 1968:- Amnesty International announces its opposition to the death penalty for political prisoners. The first Prisoner of Conscience Week is observed in November. Martin Ennals is appointed Secretary General. 1969:- in January, UNESCO grants Amnesty International consultative status as the organization reaches another milestone – 2 000 prisoners of conscience released. The International Convention on the Elimination of All Forms of Racial Discrimination is adopted. 1970:- there are now 850 groups in 27 countries; 520 prisoners are released during the year. 1971:- Amnesty International's 10th anniversary receives widespread publicity in international press, radio and television, in a year when 700 prisoners are released. New sections are established in Bangladesh, Mexico and South Korea. 'When the first letter came it was like something from another planet' – Marina Aidova, speaking to Amnesty International in 2006 about the letter-writing campaign to release her father, Slava Aidov. A prisoner of conscience, Slava Aidov was arrested in 1966 for attempting to obtain a printing press and printing leaflets denouncing the Soviet regime. He was released in 1971. After the fall of the Berlin Wall in 1989, Marina Aidova went to Newbury in the UK to visit the couple who had sent her father his first postcard in prison. 1972:- Amnesty International launches its first worldwide campaign for the abolition of torture. 1973:- the first full Urgent Action is issued, on behalf of Professor Luiz Basilio Rossi, a Brazilian who was arrested for political reasons. Luiz himself believed that Amnesty International's appeals were crucial:- 'I knew that my case had become public, I knew they could no longer kill me. Then the pressure on me decreased and conditions improved'. The new regime in Chile agrees to allow a three-person Amnesty International visit for an on-the-spot probe into allegations of massive violations of human rights. Amnesty International holds its World Conference for the Abolition of Torture in Paris. The conference produces a large number of recommendations and proposals for future action. The UN unanimously approves the Amnesty International-inspired resolution formally denouncing torture. 1974:- Amnesty International's Sean McBride, Chair of the International Executive Committee, is awarded the Nobel Peace Prize in recognition of his lifelong work for human rights. On the first anniversary of Chile's military coup, Amnesty International publishes a report exposing political oppression, executions and torture under the regime of President Augusto Pinochet. Mümtaz Soysal of Turkey becomes the first former prisoner of conscience to be elected to the International Executive Committee. 1975:- the UN unanimously adopts a Declaration on Torture, as campaigned for by Amnesty International. There are now 1 592 groups in 33 countries and more than 70 000 members in 65 countries. 1976:- A worldwide campaign against torture in Uruguay is launched. In November, Amnesty International lists 167 trade unionists as imprisoned in 16 countries. The first Secret Policeman's Ball fundraising event in London features John Cleese and Monty Python, Peter Cook and other comedians. The series continues in later years with musicians such as Peter Gabriel, Duran Duran, Mark Knopfler, Bob Geldolf, Eric Clapton and Phil Collins, paving the way for benefits such as Live Aid. The International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights enter into force. Together they are known as the International Bill of Rights. 1977:- Amnesty International is awarded the Nobel Peace Prize for 'having contributed to securing the ground for freedom, for justice, and thereby also for peace in the world'. The Stockholm Conference calls on all governments to 'bring about the immediate and total abolition of the death penalty'. This year's major campaign is for prisoners of conscience. Joan Miró, Elisabeth Frink, Alexander Calder and Roland Torper are among the artists who create posters for the campaign. 1978:- Amnesty International wins the UN Human Rights Prize for 'outstanding contributions in the field of human rights'. 1979:- Amnesty International starts working against political killings. Amnesty International publishes a list of 2 665 cases of people known to have disappeared in Argentina following Jorge Videla's military coup. This is the first time that Amnesty International has dealt with such a huge number of cases on one country. 1980:- Amnesty International launches the first campaign against the death penalty. Thomas Hammarberg is appointed Secretary General. 1981:- Amnesty International launches its Disappearance campaign. It now numbers over 250 000 members, subscribers and supporters in more than 150 countries or territories. A candle-lighting ceremony is held in London to mark Amnesty International's 20th anniversary. 1982:- on 10 December, Human Rights Day, Amnesty International launches an appeal for a universal amnesty for all prisoners of conscience and collects more than 1 million signatures to deliver to the UN. Amnesty International condemns and opposes laws and practices of apartheid, and reaffirms its opposition to inhumane treatment of people because of their sexuality. 1983:- Amnesty International launches a campaign against political killings and disappearances. 1984:- Amnesty International launches a second campaign against torture, which includes a 12-point plan for the abolition of torture. 1985:- Amnesty International publishes its first educational pack:- Teaching and Learning about Human Rights. The International Council meeting in Helsinki, Finland, decides to broaden Amnesty International's Statute to include work for refugees. There are now more than half a million members, supporters and subscribers. 1986:- Amnesty International marks its 25th anniversary with Voices for Freedom, an anthology reflecting the lives of people who fought for human rights and for whom the organization has worked. Amnesty International USA launches the Conspiracy of Hope concert tour with U2, Fela Kuti, Sting, Peter Gabriel, Lou Reed, the Neville Brothers and others. Ian Martin is appointed Secretary General. 'My father, Fela Kuti, was released from prison (in Nigeria) in 1986 after Amnesty International took him on as a prisoner of conscience. So I am one of the thousands of people whose life has been directly affected by Amnesty's work. Please support Amnesty by taking action for those whose freedom of expression has been taken away from them'. – Message from Fela Kuti's son Femi to the audience at the opening of the show 'Fela!' in London, UK. 1987:- Amnesty International launches a report stating that the death penalty in the USA is racially biased, arbitrary and violates treaties such as the Second Optional Protocol to the International Covenant on Civil and Political Rights. The Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment enters into force. 1988:- the Human Rights Now! tour begins in London to commemorate the 40th anniversary of the Universal Declaration of Human Rights. Artists include Bruce Springsteen, Tracy Chapman, Youssou N'dour and Sting. The tour visits 19 cities in 15 countries in Africa, the Americas, Asia and Europe and is viewed by millions when broadcast on Human Rights Day. As a direct result, Amnesty International membership rises in many countries. A new section is established in Tunisia. 1989:- Amnesty International launches a new campaign against the death penalty with a major report, When the state kills: The death penalty v. human rights. 1990:- Amnesty International's Urgent Action on torture and extrajudicial executions in Brazil receives an immediate response from President Fernando Collor, who says 'We cannot and will not again be a country citied as violent'. There are 700 000 members in 150 countries and more than 6 000 volunteer groups in 70 countries. New sections are founded

in Sierra Leone and Hungary. 1991:- on Amnesty International's 30th anniversary it broadens its scope to cover work on abuses by armed groups, hostage-taking and people imprisoned for their sexual orientation. After political change in eastern and central Europe, more than 40 Amnesty International groups are set up in every country of the region. New sections are founded in Argentina, Mauritius and the Philippines. 'In Mikuyu prison where I was, no letters were allowed, no newspapers were allowed, no radio was allowed ... For some strange reason somebody in Holland sent me a postcard. And for some strange reason that postcard arrived ... the postcard said in Dutch, 'greetings from Holland''. – Jack Mapanje, who was detained by the Malawian authorities from 1987 to 1991 for writing poetry critical of President Kamuzu Banda's government. He was released following intense public pressure from around the world. 1992:- Amnesty International calls for an end to centuries of human rights abuses against Indigenous people. Membership passes the 1 million mark, with 6 000 local groups in over 70 countries. Pierre Sané is appointed Secretary General. A new section is established in Algeria. 1993:- Amnesty International launches The Lives Behind the Lies, an international campaign on political killings, disappearances and extrajudicial executions. Amnesty International activists demonstrate at the UN World Conference on Human Rights in Vienna, and display Urgent Actions from around the world. Vera Chirwa, Africa's longest-serving prisoner of conscience, is released after more than 11 years in prison. Convicted of treason on fabricated charges, she was abducted from Zambia by Malawian agents in 1981. 'Every day of freedom is like a miracle to me. If it had not been for Amnesty International, I would not be standing before you today', she says. 1994:- Amnesty International launches a major campaign on women's rights, Human Rights are Women's Rights, and a worldwide campaign against disappearances and political killings. A new section is established in Benin. 1995:- Amnesty International launches the campaign Stop the Torture Trade. 1996:- Amnesty International campaigns for a permanent International Criminal Court, which was later adopted by the UN General Assembly in July 1998. Prescription for Change, a campaign on the role of health professionals in exposing human rights violations, is launched. 1997:- Amnesty International launches Respect Refugees!, an international campaign for refugees' rights. Analysis of executions of prisoners in the USA shows that a black person convicted of killlings a white person is 15 times more likely to be executed than a black person convicted of killing a black person. 1998:- Amnesty International launches the 'Get Up, Sign Up!' campaign to mark the 50th anniversary of the Universal Declaration of Human Rights, collecting 13 million pledges of support. The Rome Statute of the International Criminal Court is adopted in July. A concert is held in Paris on Human Rights Day featuring Bruce Springsteen, Tracey Chapman, Youssou N'Dour, Peter Gabriel and others, with special appearances by the Dalai Lama and international human rights activists. 1999:- Amnesty International broadens its scope to work on the impact of economic relations on human rights; empowering human rights defenders; campaigning against impunity; enhancing work to protect refugees; and strengthening grassroots activism. The Optional Protocol to the Convention on the Elimination of all Forms of Discrimination against Women is adopted, meaning the Committee on the Elimination of Discrimination against Women can receive and consider complaints from individuals or groups. Amnesty International and five other international NGOs launch the Coalition to Stop the Use of Child Soldiers. 2000:- Amnesty International launches Stamp Out Torture, its third campaign against torture. This is Amnesty International's first digital campaign, winning The Revolution Awards 2001, for 'best use of email'. 2001:- in its 40th anniversary year, Amnesty International changes its Statute to incorporate economic, social and cultural rights, thus committing itself to advance both the universality and indivisibility of all human rights enshrined in the Universal Declaration of Human Rights. Amnesty International has covered more than 47 000 cases – only 2 000 are still open. Irene Khan is appointed Secretary General. The International Council meeting is held in Dakar, Senegal. 2002:- Amnesty International is granted access to Myanmar for the first time after years of requests, and to Sudan for the first time in 19 years. The organization visits Israel and the Occupied Territories and reports evidence of war crimes in the West Bank city of Jenin. The Optional Protocol to the Convention on the Rights of the Child on the involvement of children in armed conflict is adopted (the Convention on the Rights of the Child itself having been adopted in 1959). The 60th ratification of the Rome Statute paves the way for the International Criminal Court to come into force on 01 July 2002. Work begins to combat torture used in the US-led 'war on terror'. 2003:- Amnesty International, Oxfam and the International Action Network on Small Arms (IANSA) launch the global Control Arms campaign to demand an international arms trade treaty. Amnesty International is allowed to visit Iraq for the first time in 20 years. Amnesty International's Ambassador of Conscience Award is established; the first one goes to Vaclav Havel, former President of the Czech Republic. 2004:- the global Stop Violence Against Women campaign is launched. At the International AIDS Conference in Bangkok, Thailand, Amnesty International calls for respect for the human rights of those living with HIV/AIDS. 2005:- Amnesty International is the world's largest independent human rights organization with over 2 million members and many more supporters worldwide. In the age of the 'war on terror', the campaign against torture has a specific aim, to 'counter terror with justice'. Amnesty International launches the Make Some Noise campaign – music, celebration and action in support of its work. Yoko Ono gives Amnesty International the recording rights to Imagine and John Lennon's entire solo songbook. Peter Benenson, Amnesty International's founder, dies aged 83. 2006:- Amnesty International's report, Partners in crime: Europe's role in US renditions, details the involvement of European states in US flights used to secretly seize and imprison terror suspects without due process. Amnesty International launches an emergency campaign to highlight the situation in Sudan's Darfur region, calling for a robust peacekeeping response from the UN. The millionth person to post a picture of himself on the Control Arms Million Faces web petition calling for an Arms Trade Treaty presents the petition to UN Secretary-General Kofi Annan. A further quarter of a million people sign the petition before the year is out. Amnesty International and its partners in the Control Arms campaign achieve a major victory when the UN votes overwhelmingly to start work towards an International Arms Trade Treaty. 2007:- Amnesty International launches a global petition calling on Sudan's government to protect civilians in Darfur, and produces a CD, Make Some Noise:- The Campaign to Save Darfur, featuring 30 internationally known musicians to mobilize support. Following intense campaigning by Amnesty International and its partners in the World Coalition Against the Death Penalty, the UN adopts the first-ever resolution calling for a global moratorium on the use of the death penalty. Nelson Mandela accepts the Ambassador of Conscience Award and congratulates Amnesty International for making the struggle against poverty its focus for the coming years. Amnesty International organizes worldwide protests against five years of unlawful detentions in Guantánamo Bay. 'I owe my life to Amnesty International. Now I am dedicating that life to campaigning against the death penalty and raising awareness about human rights'. – Hafez Ibrahim of Yemen, who received a stay of execution in 2007 after an Urgent Action appeal by Amnesty International. He was later pardoned and released, and studied law at Sana's University. 2008:- the Beijing Olympics campaign provides an opportunity to review China's human rights record and assess China's progress at the end of the year. The campaign includes specific requests to free Hu Jia, a prisoner of conscience and winner of European Parliament's Sakharov Prize. It also calls for China to reduce the number of capital crimes and to publish the number of executions each year. Amnesty International's global campaign for girls' education is launched on International Women's Day. The Stop Violence Against Women campaign starts 16 days of activism across the world. Amnesty International marks the 60th anniversary of the Universal Declaration of Human Rights with a series of events and publication culminating in a global 'Fire Up' celebration on Human Rights Day (10 December). 2009:- Amnesty International launches the Demand Dignity campaign, focusing on maternal mortality, slums, corporate accountability and making rights law. The organization calls on the multinational Shell to end the abuses resulting from its oil operations in the Niger Delta in Nigeria. Campaign themes are based on the Millennium Development Goals of 2000, and show how far the targets are from completion. As part of the Demand Dignity campaign, Amnesty International organizes a caravan across Sierra Leone with activists, musicians and a drama group to engage with local communities, including in rural areas, about the high level of maternal mortality in the country. The campaign takes hold in Sierra Leone and across the world, and leads to

the government introducing policies for free maternal health care. Prisoner of conscience Daw Aung San Suu Kyi of Myanmar receives the Ambassadors of Conscience Award. Amnesty International is now a global movement of more than 2.2 million people in over 150 countries. 2010:- in a landmark victory for Indigenous rights and corporate accountability, the Indian government rejects plans by multinational corporation Vedanta to mine bauxite in the Niyamgiri Hills, eastern India. The decision follows years of campaigning by the Dongria Kondh and other Indigenous communities who described the proposed mining project as a threat to their very existence. Amnesty International's damning report, Don't mine us out of existence, forms the basis for this decision. Aung San Suu Kyi, Myanmar's best-known prisoner of conscience, is released from house arrest in November. Salil Shetty is appointed Secretary General. There are now more than 3 million members in over 150 countries. 'For me, knowing that all of the Amnesty supporters were out there, mentioning his name, collecting signatures, holding up posters and simply thinking about him, was a great strength to help me carry on. you made a difference'. – Ronnate Tissainayagam, wife of Sri Lankan journalist and prisoner of conscience J.S. Tissainayagam who was freed in June 2010 following a sustained letter-writing campaign by Amnesty International members. 2011:- Amnesty International researchers visit countries in the Middle East and North Africa to document the repression of pro-democracy protest and make concrete proposals for human rights change. Amnesty International launches its 50th anniversary celebrations with a toast to freedom, recalling the defining moment of its inception. Global actions run throughout the year focusing on the death penalty, freedom of expression, reproductive rights, international justice and stopping corporate abuse. / Щел Оил Кампэни (Shell Oil Company). Алыгзэндё (Alexander). Ханс Цимма (Hans Zimmer). , от Латинского слова Affirmo, означающее Утверждаю, . Дьжеймз (James). Дьжодьж Вокё Бош (George Walker Bush; 1946–). В 1961 году Британский адвокат Питё Бененсон возмутился, узнав о двух Португальских студентах, брошенных в тюрьму за то, что провозгласили тост за свободу, и опубликовал статью 'Забытые узники' в газете 'The Observer'. Его статья дала старт всемирной кампании под названием 'Апелляция Об Амнистии-1961' (Appeal for Amnesty-1961) и получила исключительный отклик. Эту статью перепечатали газеты всего мира, а призыв отозвался повсюду в сердцах людей, разделяющих те же ценности и стремления. Так зародилась Amnesty International. 1961–1971:- первая свеча Amnesty International, ставшая знаменитой эмблемой организации, впервые зажглась в 1961 в Лондоне. Она олицетворяет надежду Питёра Бененсона на то, что Amnesty International осветит самые мрачные уголки планеты, где скрытно и безнаказанно нарушаются права человека. Идея возникла у Бененсона благодаря пословице:- 'Лучше зажечь свечу, чем проклинать темноту'. Движение Amnesty International началось с небольшой группы добровольцев в Лондоне под руководством Питёра Бененсона. В первое же десятилетие оно выросло до 18 национальных секций и более 850 групп в 27 с лишним странах мира. Это время не прошло даром. Спустя лишь год после своего зарождения движение послало первые исследовательские группы в Гану, Чехословакию, Португалию и ГДР, а его наблюдатель присутствовал на судебном процессе по делу Нельсона Манделлы. Amnesty International быстро получила международное признание. В 1964 организации был присвоен консультативный статус при ООН, а спустя год – при Совете Европы. К 1965 AI занялась делами более 1 300 узников. Всего через два года организация работала над делами почти 2 000 узников в 63 странах мира. Этих людей, брошенных в тюрьму исключительно за свои убеждения, Amnesty International назвала узниками совести. В 1966 руководство организацией принял Эрик Бейкер, а в 1968 его сменил Мартин Энналз, заняв новый пост генерального секретаря. К 1969 движению был присвоен консультативный статус при Организации Объединённых Наций по вопросам образования, науки и культуры (ЮНЕСКО). В том же году Amnesty international сообщила об освобождении 2 000 узников совести. Движение опубликовало свои первые доклады о положении с правами человека в Португалии, ЮАР и Румынии. 1972–1981:- следующее десятилетие стало периодом бурного роста. Расширилось влияние организации и сфера её деятельности. К концу 1981 она насчитывала 250 000 членов, подписчиков и сторонников в более чем 150 странах и территориальных образованиях. В 1973 была опубликована первая акция срочной помощи. Создана сеть срочной помощи, участники которой в разных странах мира быстро подключаются, чтобы помочь тем, кому грозит неминуемая опасность, либо когда возникает опасная ситуация в сфере прав человека. К 1981 было опубликовано 317 акций срочной помощи в поддержку тысяч узников в более чем 60 странах мира. В этот период создано 19 новых национальных секций, и направлены исследовательские миссии в 23 страны. Были начаты первые всемирные кампании с призывом искоренить пытки и положить конец смертной казни во всём мире. К 1980 пост генерального секретаря занял Томас Хаммарберг. К тому времени в Международном секретариате в Лондоне работало 150 оплачиваемых сотрудников, а движение включало в себя 39 национальных секций и 2 200 групп. В 1976 Британская секция провела первый 'Бал Тайного Полицейского' (Secret Policeman's Ball), изменив подход Amnesty International к работе с художниками и артистами. Это чрезвычайно популярное музыкально-юмористическое шоу стало первым из многих успешных благотворительных бенефисов, прошедших в разных странах мира. Благодаря этому мероприятию Amnesty International начала сотрудничать с огромным количеством известных комедийных актёров, музыкантов и исполнителей, таких как Питё Габриэл, 'Дюран Дюран', Марк Кнопфлер, Боб Гелдолф, Эрик Клэптон, Фил Коллинз, Питё Кук, Дьжон Клиз и 'Монти Пайтон'. В последующие годы Amnesty International продолжила сотрудничество с ними. Amnesty International продолжала получать международное признание. В 1972 организации присвоен консультативный статус при Межамериканской комиссии по правам человека Организации Американских государств. В 1974 Комитет Американских ветеранов присудил организации мемориальную премию имени Дага Хаммаршельда. В 1977 организация удостоилась Нобелевской премии за 'вклад в обеспечение торжества свободы, правосудия и мира во всём мире'. В 1978 её наградили премией ООН в области прав человека за 'выдающийся вклад в защиту прав человека'. 1982–1991:- в это десятилетие обстановка на международной арене значительно изменилась с распадом СССР и провозглашением независимости в странах Средней и Восточной Европы. Как следствие, в регионе было создано более 40 групп Amnesty International. AI опубликовала призыв к всеобщей амнистии всех узников совести. Петицию подписали более двух миллионов человек, и документ был представлен в ООН. В это же время началась вторая кампания за искоренение пыток. В 1985 на заседании Международного комитета в Хельсинки Amnesty International приняла решение изменить свой устав, включив в сферу своей деятельности улучшение положения беженцев. Кроме того, движение приступило к работе по образованию в области прав человека, опубликовав свою первую подборку учебных материалов в 1985. В 1986 году Иан Мартин сменил Томаса Хаммарберга на посту генерального секретаря. В этот период Amnesty International продолжала расти:- число сторонников, членов и активистов выросло с около 250 000 в 151 стране мира в 1981 году до (приблизительно) 700 000 человек к 1990 году, включая более 6 000 волонтёрских групп в 70 странах. Было создано ещё 17 секций. В 1991 в своё 30-летие Amnesty International вновь расширила свою сферу деятельности. Организация приняла новый мандат и обязалась укреплять все права, провозглашённые во Всеобщей декларации прав человека. Благодаря успешному сотрудничеству с известными комедийными актёрами, музыкантами и исполнителями, AI устроила два больших концертных турне:- рок-тур 'Заговор Надежды' (Conspiracy of Hope) в 1986 и 'Даёшь Права Человека!' (Human Rights Now!) в 1988-м. В концертном турне 'Заговор Надежды' участвовали 'U2', Стинг, Питё Габриэл, Брайан Эдамс, Лу Рид, 'Neville Brothers' и другие. Концерты в рамках турне 'Даёшь права человека!' состоялись в 19 городах 15 стран мира. Помимо многих других, в них участвовали Стинг и Брюс Спрингстен. Концерты турне 'Даёшь Права Человека!' прошли в Лондоне, Париже, Будапеште, Турине, Барселоне, Сан-Хосе (Коста-Рика), Торонто, Монреале, Филадельфии, Лос-Анжелесе, Окленде, Токио, Нью-Дели, Афинах, Хараре, Абиджане, Сан-Паоло, Мендосе (Аргентина) и Буэнос-Айресе. Благодаря этим мероприятиям Amnesty International не только

стала широко известна общественности и повысила осведомлённость о правах человека в целом, но и приобрела огромное количество новых членов во многих странах. 1992–2001:- в следующее десятилетие Amnesty International начала целый ряд больших международных кампаний, в том числе против политических убийств, исчезновений и внесудебных казней; за права женщин; кампании под названием ‘Нет торговле на пытках!’ и призывала создать постоянно-действующий Международный уголовный суд. Кроме того, организация проводила кампании, посвящённые роли медицинских работников в изобличении нарушений прав человека, положению беженцев, борьбе с использованием противопехотных мин, детей-солдат и торговле стрелковым оружием. В этот период в организации сменились два генеральный секретаря – Пьер Сане, принявший руководство организацией в 1992, и Айрин Кан, занявшей этот пост в 2001. В 1992 общее число членов, сторонников и подписчиков Amnesty International превысило миллион и продолжало расти, достигнув 1.8 миллиона человек к 1999. Ключевые вехи в работе Amnesty International пришлись на конец 1990-х, когда в 1997 Генеральный Секретарь впервые привлёк внимание Совета Безопасности ООН к проблемам в области прав человека, беспокоящим организацию. В 1998 году Генеральная Ассамблея ООН приняла Римский Статут Международного Уголовного Суда. Организация долго добивалась этого. Кроме того, в 1998 Amnesty International отметила 50-летие Всеобщей декларации прав человека кампанией ‘Вставай и подпиши!’. В ходе этой кампании удалось собрать 13 миллионов подписей, которые были представлены Генеральному секретарю ООН Кофи Аннану. Тем самым организация продемонстрировала волю общественности, требовавшей всеобщего признания и соблюдения положений декларации. И вновь совместно с известными артистами Amnesty International организовала большой концерт в Париже в День прав человека в 1998. В нём участвовали группы Radiohead, Asian Dub Foundation, Брюс Спрингстен, Трейси Чапман, Аланис Мориссетт, Юссу Н’Дур и Питер Габриэл, а почётными участниками стали далай-лама и другие активисты международного правозащитного движения. Концерт был призван повысить осведомлённость о правах человека и о работе Amnesty International. В 1999 руководящий орган организации – Международный Совет – согласился вновь расширить сферу деятельности, включив туда влияние экономических отношений на права человека, усиление влияния правозащитников, борьбу с безнаказанностью, активизацию работы по защите беженцев. В 2001 Amnesty International отмечала своё 40-летие, и область деятельности организации снова расширилась. Изменив устав, движение дополнило свои цели и задачи работой по экономическим, социальным и культурным правам. Таким образом, организация обязалась пропагандировать всеобщность и неделимость всех прав человека, провозглашённых во Всеобщей декларации. После событий 11 Сентября 2001 в США Amnesty International безоговорочно осудила целенаправленные удары по гражданским лицам и трагическую гибель людей в Нью Йорке. В ходе расследований в рамках ‘войны с терроризмом’, приведших к помещению под стражу многих сотен людей, движение решительно добивалось соблюдения стандартов в области прав человека. Оно требовало в полной мере соблюдать права лиц, оказавшихся под следствием – как в рамках законодательства США, так и международных стандартов. 2002–11:- после многих лет настойчивых просьб, адресованных правительствам Мьянмы, Судана и Ирака, организации наконец разрешили посетить эти страны. Эти успехи свидетельствуют об упорстве AI в кампаниях за соблюдение стандартов в области прав человека. В 2002 Amnesty International впервые удалось посетить Мьянму, а в Судан – впервые за 19 лет. В следующим году организация направила исследовательскую миссию в Ирак, впервые за 20 лет. В следующее десятилетие Amnesty International не прекращала расширять сферу работы по правам человека, а членский состав организации продолжал расти. К 2011 число сторонников, членов и акивистов движения превысило три миллиона человек. Amnesty International учредила премию ‘Посол Совести’. Первая премия была присуждена Вацлаву Гавелу, бывшему узнику совести (2003). Позже её получили Мэри Робинсон и Хильда Моралес Трухильо (2004), U2 и управляющий группы Пол Макгиннес (2005), Нельсон Мандела (2006), Питё Габриэл (2008) и Аун Сан Су Чжи (2009). В 2009 началась всемирная кампания ‘За достойное отношение!’. Таким образом, Amnesty International расширила сферу деятельности, включив борьбу с несправедливостью и социальной изоляцией, жертвы которых оказались в капкане нищеты и порочном круге лишений. Цель кампании ‘За достойное отношение!’ – дать возможность живущим в нищете людям влиять на решения, затрагивающие их жизнь. Сосредоточившись на таких проблемах, как материнская смертность, трущобы, корпоративная ответственность и узаконивание ряда прав, Amnesty International приступила к работе по вопросам, близким Салилу Шетти, занявшему пост генерального секретаря в 2010. В это десятилетие движение организовало кампании по контролю за распространением стрелкового оружия. Рассказывая о девушках, которых преследуют и убивают в Мексике, Amnesty International обратила внимание мира на насилие над женщинами. Организация продолжала выступать в защиту лиц, подвергшихся пыткам в ходе ‘войны с терроризмом’. Amnesty International привлекала внимание к укоренившейся безнаказанности нарушений прав человека в России и потребовала соблюдать права больных СПИДом и ВИЧ-инфицированных. Проведена большая работа для придания широкой огласке вопиющего положения с правами человека в Суданском регионе Дарфур. В 2005 Йоко Оно ещё раз продемонстрировала приверженность правам человека, щедро предоставив Amnesty International права на запись сольного сборника песен Дьжона Леннона, включая песню ‘Imagine’ (‘Представьте себе’). В то же время Йоко Оно и Amnesty International сотрудничали с более чем 30 музыкантами мирового уровня в рамках кампании ‘Пошумим за права человека’. В центре внимания кампании – сбор подписей под глобальной петицией суданскому правительству с требованием защитить права человека и мирное население Дарфура. Помимо прочего, в рамках кампании выпущен специально записанный музыкальный диск. К 2007 от его продаж выручено 2.5 миллиона Долларов США, которые пошли на защиту прав человека. В числе прочих важных кампаний последних десяти лет организация боролась с повсеместными нарушениями прав коренных народностей. Её работа включала поддержку коренной общины донгрия кондх в нагорье Ньямгири (Штат Орисса, Восточная Индия). Удалось помешать горнодобывающей компании ‘Венданта’ выселить эту общину с её исконных земель. Amnesty International исполнилось 50 лет. В этот момент мы оглядываемся на то, как многого удалось добиться людям, сплочённым общим делом. Но это также время подумать о том, что ещё предстоит сделать. Пятьдесят лет спустя мир кардинально изменился. Однако настоятельная необходимость в тесной сплочённости людей для защиты прав человека – где бы они ни находились – остаётся актуальной, как никогда. Международная Амнистия – всемирное движение людей, выступающих за соблюдение общепризнанных прав каждого человека. Возмущённые нарушениями прав человека, наши сторонники, однако, не теряют надежды изменить мир к лучшему. Поэтому мы стремимся улучшить положение с правами человека посредством скоординированных действий и международной солидарности. Наша организация насчитывает свыше 3.2 миллионов членов и сторонников в более чем 150 странах и регионах. Мы направляем их действия, чтобы добиться справедливости по обширному кругу острых проблем. Вы можете помочь изменить ситуацию к лучшему, став членом или сторонником Amnesty International. Международная Амнистия – всемирное движение людей, выступающих за защиту и соблюдение общепризнанных прав каждого человека. Мы убеждены, что с нарушениями прав человека, где бы они ни происходили, должны бороться люди всего мира. И поэтому, испытывая негодование по поводу нарушений прав человека, но не теряя надежды изменить мир к лучшему, мы стремимся улучшить жизнь людей посредством скоординированных действий и международной солидарности. Миссия Международной Амнистии состоит в проведении исследований и принятии мер, направленных на предотвращение и искоренение грубых нарушений прав человека. Мы добиваемся справедливости для тех, чьи права оказались нарушены. Наши члены и сторонники оказывают влияние на правительства, политические органы, корпорации и межправительственные группы. Присоединиться к

Международной Амнистии:- для решения вопросов, связанных с правами человека, активисты мобилизуют общественное мнение при помощи массовых демонстраций, пикетирования и прямого лоббирования, а также проводят кампании в Интернете и за его пределами. Кампании в Защиту Тех, Кто Нуждается в Помощи:- все наши кампании основаны на том, что каждый человек способен оказать поддержку тем, кто нуждается в помощи и защите. Работая с людьми и для людей со всего мира, мы боремся за то, чтобы каждый мог пользоваться всеми правами, провозглашёнными во Всеобщей декларации прав человека. Мы проводим исследования и акции, направленные на предупреждение и пресечение грубых нарушений этих прав, и добиваемся, чтобы правительства и другие органы, облечённые властью, соблюдали законность. Поэтому всегда, когда мы можем добиться перемен, мы действуем как на международном, так и на местном уровне. К примеру, сейчас (Май 2013) мы боремся за то, чтобы:- (i) остановить насилие над женщинами; (ii) защитить права и достоинство тех, кто оказался за чертой бедности; (iii) добиться отмены смертной казни; (iv) воспрепятствовать пыткам и вернуть борьбу с терроризмом в правовое поле; (v) освободить узников совести; (vi) защитить права беженцев и мигрантов; и (vii) поставить международную торговлю обычным оружием под контроль. Тысячи членов Международной Амнистии участвуют в акциях срочной помощи и посылают письма в защиту людей, которым в настоящий момент грозит опасность. Привлечение общественного внимания через СМИ и Интернет помогает донести наши обращения на многих языках до миллионов людей. Участие в кампаниях может изменить жизнь людей:- жертв и пострадавших от нарушений прав человека, правозащитников и даже виновников преступлений. Независимая и Демократичная:- чтобы обеспечить свою независимость, мы прибегаем к целому ряду мер. Мы:- (i) не зависим от каких-либо правительств, политических идеологий, экономических интересов или религиозных вероучений; (ii) придерживаемся принципов демократии и самоуправления; и (iii) находимся на полном самофинансировании, благодаря пожертвованиям членов и сторонников организации. Мы не поддерживаем и не находимся в оппозиции ни к одной из политических систем и ни к одному из национальных правительств. Кроме того, мы не обязательно разделяем или осуждаем взгляды жертв/пострадавших или правозащитников, чьи права мы стремимся отстаивать. 1948:- Генеральная Ассамблея Организации Объединённых Наций приняла Всеобщую декларацию прав человека. 1951:- принята Конвенция о статусе беженцев. 1961:- Питер Бененсон начал кампанию Апеляция Об Амнистии (Appeal for Amnesty), опубликовав в газете Observer статью Забытые Узники, которую впоследствии перепечатали газеты разных стран. Так началась история Amnesty International. 1963:- в Лондоне учреждён Международный секретариат Amnesty International — штабквартира организации. 1964:- ООН присвоила Amnesty International консультативный статус. 1965:- принята Международная конвенция о ликвидации всех форм расовой дискриминации. 1966:- приняты Международный пакт о гражданских и политических правах и Международный пакт об экономических, социальных и культурных правах. Принят Факультативный протокол к Международному пакту о гражданских и политических правах, уполномочивший Комитет по правам человека принимать и рассматривать жалобы частных лиц. 1967:- принят Протокол, касающийся статуса беженцев; данный документ обеспечил защиту прав беженцев во всём мире. 1972:- Amnesty International инициировала свою первую всемирную кампанию против пыток. 1973:- после кампании, проведённой Amnesty International, Генеральная Ассамблея ООН приняла первую в истории резолюцию (Резолюцию № 3059), которая официально осудила пытки. 1975:- Генеральная Ассамблея ООН единогласно приняла Декларацию о защите всех лиц от пыток и других жестоких, бесчеловечных или унижающих достоинство видов обращения и наказания (чего и добивалась Amnesty International). 1977:- Amnesty International стала лауреатом Нобелевской премии мира за ‘вклад в обеспечение торжества свободы, правосудия и мира во всём мире’. Amnesty International провела конференцию, в результате которой была принята Стокгольмская декларация, призывавшая правительства всех стран ‘стремиться к немедленной и полной отмене смертной казни’. 1978:- Amnesty International награждена премией ООН в области прав человека за ‘выдающийся вклад в защиту прав человека’. 1979:- принята Конвенция о ликвидации всех форм дискриминации в отношении женщин. 1980:- создана Рабочая группа по насильственным или недобровольным исчезновениям – первая специализированная структура ООН. Amnesty International инициировала свою первую кампанию против смертной казни. 1983:- в День прав человека ООН получила свыше миллиона подписей под всемирным воззванием к всеобщей амнистии для всех узников совести. 1984:- принята Конвенция против пыток и других жестоких, бесчеловечных или унижающих достоинство видов обращения и наказания. Принят свод правил ‘Меры, гарантирующие защиту прав тех, кто приговорён к смертной казни’. 1988:- принят Свод принципов защиты всех лиц, подвергаемых задержанию или заключению в какой бы то ни было форме. 1989:- принята Конвенция о правах ребёнка. Принят Второй Факультативный протокол к Международному пакту о гражданских и политических правах, направленный на отмену смертной казни; одновременно с этим Amnesty International начала свою вторую кампанию против смертной казни. 1990:- принята Международная Конвенция о защите прав всех трудящихся-мигрантов и членов их семей. Приняты Основные принципы применения силы и огнестрельного оружия должностными лицами по поддержанию правопорядка. 1993:- на Всемирной Конференции по правам человека принята Венская декларация и программа действий, в которой указывалось, что ‘все права человека универсальны, неделимы, взаимозависимы и взаимосвязаны’. После активных усилий Amnesty International учреждено Управление Верховного комиссара ООН по правам человека. 1995:- на Четвёртой Всемирной Конференции ООН по положению женщин принята Пекинская декларация и платформа действий, в которой указывалось, что ‘права женщин являются правами человека’. 1997:- Генеральный Секретарь Amnesty International впервые привлёк внимание Совета Безопасности ООН к проблемам прав человека по ‘формуле Аррии’. 1998:- после активных усилий Amnesty International принят Римский статут Международного уголовного суда. Генеральная Ассамблея ООН приняла Декларацию о праве и обязанности отдельных лиц, групп и органов общества поощрять и защищать общепризнанные права человека и основные свободы (Декларация о правозащитниках). 1999:- принят Факультативный протокол к Конвенции о ликвидации всех форм дискриминации в отношении женщин, который позволил Комитету по ликвидации дискриминации в отношении женщин принимать и рассматривать сообщения, направляемые от имени отдельных лиц или групп. Amnesty International инициировала всемирную кампанию по предотвращению распространения лёгкого и стрелкового оружия. 2000:- принят Факультативный протокол к Конвенции о правах ребёнка, касающийся участия детей в вооружённых конфликтах. Принят Факультативный протокол к Конвенции о правах ребёнка, касающийся торговли детьми, детской проституции и детской порнографии. В результате активных усилий со стороны Amnesty International и женских организаций Советом Безопасности ООН принята Резолюция 1325 ‘Женщины, мир и безопасность’, ознаменовавшая собой судьбоносное решение о признании важной роли женщин в урегулировании конфликтов и миростроительстве. Amnesty International запустила третью по счёту кампанию против пыток. 2001:- Айрин Кан была назначена генеральным секретарём Amnesty International. В год своего 40-летия Amnesty International внесла изменения в свой Устав с тем, чтобы миссия организация включала в себя борьбу за экономические, социальные и культурные права. Таким образом, организация взяла на себя обязательство продвигать идею всеобщности и неделимости человеческих прав, закреплённых во Всеобщей декларации прав человека. 2002:- принят Факультативный протокол к Конвенции против пыток и других жестоких, бесчеловечных или унижающих достоинство видов обращения и наказания. Учреждён Международный уголовный суд с официальной штаб-квартирой в Гааге. ООН приняла Факультативный протокол к Конвенции о правах ребёнка, касающийся участия детей в вооруженных конфликтах (сама Конвенция о правах ребёнка была принята в 1959). Состоялась 60-я ратификация Римского Статута, благодаря чему договор об учреждении Международного уголовного суда

вступил в силу 01 Июля 2002. Amnesty International начала в Российской Федерации кампанию по борьбе с повсеместными нарушениями прав человека, совершавшимися в атмосфере безнаказанности. 2003:- Amnesty International, группа организаций Oxfam и Международная сеть по борьбе с распространением стрелкового оружия (IANSA) запустили международную кампанию 'Оружие под контроль!'. 2004:- Amnesty International начала кампанию 'Остановим насилие над женщинами!'. 2005:- приняты Основные принципы и руководящие положения, касающиеся права на правовую защиту и возмещение ущерба для жертв грубых нарушений международных норм в области прав человека и серьёзных нарушений международного гуманитарного права. Amnesty International приступила к кампании Make Some Noise, которая объединила в себе музыку, публичные мероприятия и акции в поддержку деятельности Amnesty International. Йоко Оно пожертвовала Amnesty International права на запись песни Imagine и все сольные произведения Дьжона Леннона. В своём докладе Cruel. Inhuman. Degrades us all – Stop torture and ill-treatment in the 'war on terror' ('Жестоко. Бесчеловечно. Унижает нас всех – остановите пытки и жестокое обращение в рамках 'войны с терроризмом'') Amnesty International оспорила заявления о том, что перед лицом террористической угрозы государства могут пренебрегать ранее согласованными нормами в области прав человека. 2006:- принята Международная конвенция для защиты всех лиц от насильственных исчезновений. Приняты Конвенция о правах инвалидов и Факультативный протокол к ней. Учреждён Совет ООН по правам человека, заменивший собой Комиссию по правам человека. Значительной победой Amnesty International и её партнёров по кампании 'Оружие – под контроль!' стало голосование в ООН, на котором подавляющим большинством было принято решение начать работу над договором. В докладе Amnesty International Partners in crime:- Europe's role in US renditions ('Соучастники преступления:- роль Европы в Американской программе выдач') говорится о причастности европейских стран к Американским рейсам, использовавшимся для тайного захвата и взятия под стражу подозреваемых в терроризме, и осуществлявшимся в нарушение действующих процедур. Миллионный по счёту человек разместил свою фотографию и оставил свою подпись под Интернет-петицией 'Миллион лиц', подготовленной в рамках кампании 'Оружие – под контроль!' с целью добиться заключения договора о торговле оружием. Сама же петиция была вручена Генеральному секретарю ООН Кофи Аннану. До конца года под петицией подписались ещё четверть миллиона человек. 2007:- Генеральная Ассамблея приняла Декларацию ООН о правах коренных народов. После активной кампании Amnesty International и её партнёров по Всемирной коалиции против смертной казни Генеральная Ассамблея впервые в истории приняла резолюцию, призывающую к введению всемирного моратория на смертную казнь. Amnesty International начала сбор подписей по всему миру под призывом к правительству Судана защитить мирных жителей Дарфура, а также выпустила компакт-диск Make Some Noise:- The Campaign to Save Darfur с записями 30 музыкантов с мировым именем, которые таким образом выразили свою поддержку. Число активистов, сторонников и подписчиков Amnesty International превысило 2.2 миллиона человек. Это люди из более чем 150 стран и территориальных образований по всему миру. 2008:- 10 Декабря Генеральная Ассамблея приняла Факультативный протокол к Международному пакту об экономических, социальных и культурных правах, который позволит Комитету принимать и рассматривать жалобы от имени групп людей и частных лиц. 2010:- завершилась кампания 'Остановим насилие над женщинами!' и стартовала новая большая кампания 'За достойное отношение!', цель которой – укрепление социальных, экономических и культурных прав людей, особенно наиболее уязвимых и бедных слоёв населения, борьба с нищетой. Салил Шетти стал новым генеральным секретарём Amnesty International. Число активистов, сторонников и подписчиков Amnesty International превысило 2.8 миллиона человек.

AMO = AMERICAN MARITIME OFFICERS

AMORPHOUS = АМОРФНОЕ – Amorphous:- noncrystalline, lacking regular geometrical shape. Used to describe certain regions in polymers. Amorphous:- without shape, without a fixed form. / Под Аморфным, от Греческого слова Ámorphos, означающее Бесформенное, понимается.

AMORTISED COST = АМОРТИЗИРОВАННАЯ СТОИМОСТЬ – The Amortised Cost or Amortized Cost of a financial asset or financial liability is the amount at which the financial asset or financial liability is measured at initial recognition minus principal repayments, plus or minus the cumulative amortization using the effective interest method of any difference between that initial amount and the maturity amount, and minus any reduction (directly or through the use of an allowance account) for impairment or uncollectability. / за вычетом основных выплат (principal repayments).

AMORTISING LOANS = АМОРТИЗИРУЮЩИЕ ССУДЫ – Amortising Loans:- fully amortising loans consist of a series of periodic instalments over a fixed period. The instalments include a portion of principal repayment, plus interest and fees over the loan tenor. Such loans may be secured upon an object, such as a vehicle, or may be unsecured and advanced for a variety of consumer purposes.

AMORTIZATION = АМОРТИЗАЦИЯ (или ПОГАШЕНИЕ) – (1) Amortization is a gradual reduction of a debt by means of equal periodic payments sufficient to meet current interest and liquidate the debt at maturity. The paying off of debt in regular installments over a period of time. Amortization is:- (1) the paying off of debt in regular installments over a period of time. (2) The deduction of capital expenses over a specific period of time (usually over the asset's life). More specifically, this method measures the consumption of the value of intangible assets, such as a patent or a copyright. Suppose XYZ Biotech spent USD30 million Dollars on a piece of medical equipment and that the patent on the equipment lasts 15 years, this would mean that USD2 million would be recorded each year as an amortization expense. While amortization and depreciation are often used interchangeably, technically this is an incorrect practice because amortization refers to intangible assets and depreciation refers to tangible assets. Amortization can be calculated easily using most modern financial calculators, spreadsheet software packages such as Microsoft Excel, or amortization charts and tables. The process of fully paying off indebtedness by installments of principal and earned interest over a definite time. A term Amortization refers to the reduction in a liability over time, e.g., 'amortizing' a loan by regular monthly payments against that loan. / Амортизация:- (1) постепенное снашивание фондов (оборудования, зданий, сооружений) и перенесение их стоимости по частям на вырабатываемую продукцию (смотрите Амортизация Основных Фондов). (2) Уменьшение ценности имущества, обложенного налогом (на сумму капитализированного налога). (3) Амортизация в технике (от Французского слова Amortir, означающее Ослаблять или Смягчать) поглощение (смягчение) ударов (смотрите Амортизатор). Амортизация основных фондов, объективный экономический процесс переноса стоимости основных фондов по мере их износа на производимый с их помощью продукт или на услуги. Необходимость амортизации вытекает из особенностей участия основных фондов в процессе воспроизводства:- они функционируют в течение ряда производственных циклов, сохраняя свою натуральную форму. В каждой единице нового продукта воплощается часть стоимости основных фондов, пропорциональная их снашиванию. Различают механический, тепловой, усталостный, коррозийный и другие виды материального, или физического, износа основных фондов, порождаемого их активной работой, физико-химическими процессами, связанными с производством, и чрезвычайными обстоятельствами (стихийные бедствия). Стоимостный Износ, или снижение первоначальной стоимости основных фондов, происходит по мере их материального износа. Однако он может иметь место и независимо от материального износа, в результате так называемого Морального Износа основных фондов. Стоимостный износ основных

фондов сопровождается образованием фонда возмещения, который называется Амортизационным Фондом. Если основные фонды выбывают из строя в силу чрезвычайных обстоятельств, то их износ не сопровождается амортизацией. Основные фонды непроизводственного назначения (жилые дома, клубы, школы, больницы и другие) в ходе эксплуатации постепенно изнашиваются, но не переносят свою стоимость на продукт, поскольку здесь никакого продукта не производится. Амортизация не начисляется на основные фонды, находящиеся по решению соответствующих государственных органов в консервации, поскольку они не участвуют в процессе производства и, следовательно, их стоимость не может быть перенесена на продукцию или услуги. Вместе с тем амортизация на полное восстановление отчисляется на основные фонды, которые находятся в запасе (резерве), поскольку последний необходим для процесса производства. В бывшем Союзе Советских Социалистических Республик (СССР) амортизация не начислялась на объекты, которые имеют стоимость ниже установленного лимита (50 Рублей за единицу) или срок службы менее 1 года. Они зачислялись в состав оборотных средств, что облегчало режим их приобретения и учёта. Не включались в состав амортизируемых основные фонды организаций, финансируемых за счёт бюджета. Амортизационный фонд создаётся путём ежемесячных амортизационных отчислений, которые производятся по установленным нормам. Для большинства основных фондов годовые нормы амортизации определяются в процентах к их стоимости. По основным фондам отраслей горнодобывающей промышленности (угольной, сланцевой, горнорудной, по добыче редких, драгоценных металлов и нерудных ископаемых), срок службы которых зависит от времени отработки запасов полезных ископаемых и которые после отработки не могут быть использованы без капитального переоборудования в других целях, нормы амортизации на полное возмещение установлены в Рублях на 1 тонну (т) извлекаемых запасов. Нормы амортизации на капитальный ремонт по автомобильному транспорту (за исключением специальных автомобилей – пожарных, санитарных и так далее) исчислены в процентах от стоимости машин на 1 000 километров (км) пробега. Общую норму амортизации (на полное восстановление и капитальный ремонт) в % к стоимости основных фондов определяют по формуле:- $Н_а = ((П_с + К_р + М – Л)\cdot100) / (Т\cdot П_с)$, где $Н_а$ – годовая норма амортизационных отчислений (в %), $П_с$ – первоначальная стоимость данного объекта, $К_р$ – стоимость его капитального ремонта на протяжении всего срока службы, М – стоимость его модернизации на протяжении всего срока службы (определяется только для оборудования и транспортных средств), Л – ликвидационная стоимость, Т – срок службы данного объекта. Поскольку первоначальная стоимость перестаёт со временем отвечать условиям воспроизводства, проводятся переоценки основных фондов по восстановительной стоимости. Первая генеральная переоценка старых фондов промышленности бывшего СССР была проведена в 1925, вторая – в 1959. В связи с изменением оптовых цен на 01 Июля 1967, с появлением новых, более эффективных видов основных фондов, вновь усилилось расхождение между первоначальной оценкой основных фондов и существующими условиями их воспроизводства. Советское правительство приняло решение провести новую переоценку основных фондов хозрасчётных государственных, кооперативных и общественных предприятий и организаций по состоянию на 01 Января 1971, а совхозов, колхозов и других предприятий и организаций на 01 Января 1972. Затраты на капитальный ремонт включают замену или восстановление изношенных базовых деталей, узлов, конструктивных элементов в связи с их более быстрым снашиванием по сравнению с объектом в целом. При определении суммарных затрат на капитальный ремонт за весь срок службы объекта учитываются продолжительность межремонтных циклов и стоимость каждого ремонта в течение экономически целесообразного периода его использования. Модернизация оборудования и транспортных средств, в отличие от капитального ремонта, представляет собой их техническое совершенствование, которое приводит к повышению их производительности. При этом за счёт амортизации покрывают затраты, связанные с ускоренной заменой отдельных деталей и узлов вследствие их технико-экономического старения, установкой приспособлений и контрольно-регулирующих приборов к машинам и агрегатам и тому подобным. Затраты на переустройство системы машин, производимые при реконструкции предприятий, цехов или отдельных объектов, на установку поточных линий, конвейеров, внедрение новых технологических процессов финансируются не из амортизационного фонда, а за счёт централизованных капиталовложений. Ликвидационную стоимость рассчитывают как разность между выручкой от реализации изношенного имущества и затратами на его демонтаж. Сроки службы основных фондов определяют на экономически целесообразный период их эксплуатации, который называется Амортизационным Периодом. При расчёте этого периода учитывают темпы технического прогресса, масштабы внедрения новых основных фондов, возможности преодоления морального износа путём модернизации и тому подобное. Нормы амортизации бывают:- дифференцированные по видам основных фондов для предприятий, средние по предприятиям и отраслям. Дифференцированные нормы необходимы для начисления амортизации по отдельным видам основных фондов, определения эффективности конкретных объектов новой техники, расчёта себестоимости отдельных изделий. Средние нормы амортизации можно исчислить на основе дифференцированных норм амортизации и стоимостной структуры основных фондов как средневзвешенные величины. Они могут использоваться при планировании амортизационных отчислений в целом по предприятию, министерству и для других целей. До 1938 в промышленности бывшего СССР действовали дифференцированные нормы амортизации, установленные в 1930. Постановлением Совета Народных Комиссаров СССР от 08 Января 1938 были введены средние нормы амортизации по Наркоматам. Экономическое значение этих норм состояло в том, что они выделяли определённую долю амортизационного фонда на капитальный ремонт. В дальнейшем средние нормы амортизации уточнялись в 1949, 1951 и 1955. Уточнения сводились в основном к изменению нормы амортизации на капитальный ремонт при сохранении средней нормы амортизации по министерству (ведомству). Последнее распределяло установленные для него нормы по своим главкам, а главки – по предприятиям с учётом состава их основных фондов и дифференцированных норм амортизации 1930. Принимались во внимание планируемые затраты на капитальный ремонт, освоение выделенных средств за прошлые годы и другие факторы. В 1961 Советом Министров СССР было принято постановление о новых нормах амортизации, которые были введены в действие с 01 Января 1963. Они едины для всех отраслей народного хозяйства, обязательны для применения всеми государственными хозрасчётными предприятиями и организациями независимо от их ведомственной подчинённости. Особые условия работы основных фондов в отдельных отраслях и предприятиях (например, влияние агрессивной среды и тому подобного) учитываются с помощью специальных коэффициентов. В целях точного исчисления амортизационных сумм нормы дифференцированы по широкому кругу основных фондов. Важнейшая особенность действующих норм состоит в том, что они полнее учитывают моральный износ оборудования. Это нашло отражение в сокращении сроков службы соответствующих основных фондов и увеличении затрат на модернизацию отдельных машин и агрегатов, включённых в состав норм амортизации на капитальный ремонт. Нормы амортизации на капитальный ремонт включают также затраты на средний ремонт, который осуществляется реже 1 раза в год и по своей экономической природе не отличается от капитального. До 1963 затраты на такой ремонт финансировались как затраты на текущий ремонт. Всё это обусловило увеличение новых норм амортизации. В связи с предстоящей переоценкой основных фондов, изменением всех факторов, влияющих на уровень амортизации, Советское правительство приняло решение об уточнении действующих норм амортизационных отчислений. Для определения годового размера амортизационного фонда, включаемого в баланс доходов и расходов предприятия, помимо норм амортизации, необходимо знать среднегодовую стоимость амортизируемых основных фондов, которую определяют по формуле:- $С_{ср} = С_н + ((В\cdot К) / 12) – ((В_1(12 – К_1)) / 12)$, где $С_{ср}$ – среднегодовая стоимость основных фондов, $С_н$ – стоимость основных фондов на начало

планируемого года, В – стоимость основных фондов, вводимых в действие в планируемом году, К – количество месяцев их функционирования, $В_1$ – стоимость основных фондов, выбывающих в планируемом году, $К_1$ – количество месяцев их функционирования. Амортизационные отчисления относят на себестоимость продукции. Их подразделяют на 2 части:- отчисления, предназначенные для полного возмещения основных фондов (реновации), и отчисления, предназначенные для их частичного восстановления (капитального ремонта и модернизации). До экономической реформы (1965–66) отчисления на реновацию направлялись на финансирование централизованных капиталовложений предприятия или министерства. Отчисления на капитальный ремонт сохранялись за предприятиями, однако допускалось их безвозвратное изъятие у предприятий, где эти средства в течение планируемого года превышали потребности в капитальном ремонте, и передача их предприятиям, где объём капитального ремонта превышал наличные ресурсы. Новая система планирования и экономического стимулирования предусматривает, что значительная доля амортизации на реновацию закрепляется за предприятиями как источник финансирования нецентрализованных капитальных вложений. Перераспределение отчислений на капитальный ремонт ограничено:- максимум составляет 10%, если они превышают текущие потребности в капитальном ремонте у предприятий, где намечается изъятие. Амортизационный фонд на капитальный ремонт разрешено расходовать на приобретение новых фондов, когда это выгоднее, чем ремонтировать старые. Амортизация при социализме обеспечивает возмещение стоимости выбывающих основных фондов. Она отражает износ основных фондов и используется в целях правильного исчисления совокупного общественного продукта и финансовых ресурсов, направляемых на капитальные вложения, капитальный ремонт и модернизацию. Амортизация имеет значение для расчёта себестоимости продукции, цен, эффективности капитальных вложений, стимулирования рационального использования основных фондов, укрепления хозяйственного расчёта. В условиях капиталистического производства амортизационный фонд предназначается для восстановления основного капитала. Чтобы преуменьшить реальные размеры прибыли, капиталисты нередко умышленно отчисляют в амортизационный фонд суммы, значительно превышающие действительный износ, занижая фактический доход, подлежащий налогообложению. Этому способствуют чрезмерно высокие нормы и льготные методы начисления амортизации, допускаемые в капиталистических странах. Особенно широкое развитие эти привилегии получили в условиях государственно-монополистического капитализма, который предоставляет право ускоренной амортизации мощным капиталистическим монополиям, связанным прежде всего с развитием военного производства. Таким образом, амортизация при капитализме становится дополнительным средством обогащения капиталистов, перераспределения национального дохода в их пользу.

(2) Amortization is a process of allocating acquisition cost or other value of assets either to periods as expenses or period costs, or to inventory accounts as product costs. The term is normally used in conjunction with non-physical assets. Contrast Depreciation. In accounting, a gradual reduction in the book value of goodwill and other intangibles. Accounting for expenses or charges as applicable rather than as paid. Includes such practices as depreciation, depletion, write-off of intangibles, prepaid expenses and deferred charges. See also Depreciation, and Write-Off. In accounting, Amortization is the systematic writing off of an account or asset over its estimated life (depreciation). / Под Амортизацией основных фондов от средневекового Латинского слова Amortisatio, означающее Погашение, понимается постепенное перенесение по частям стоимости основных фондов по мере их физического и морального износа на производимый продукт. В каждой единице нового продукта воплощается часть стоимости основных фондов, пропорциональная их снашиванию. Суммы амортизации включаются в издержки производства (себестоимость продукции) в виде амортизационных отчислений. В бухгалтерском учёте постепенное перенесение стоимости средств труда по мере их физического и морального износа на производимый продукт. Переносимая стоимость в денежной форме аккумулируется в амортизационном фонде. Амортизация – процедура бухгалтерского учёта, посредством которой первоначальная стоимость нематериальных активов или активов, имеющих ограниченный срок эксплуатации, постепенно сокращается путём периодических списаний. В отношении основных средств используется термин depreciation (обесценение или износ), а для невосстанавливаемых активов (природных ресурсов) – depletion (истощение). Оба термина, в сущности, означают то же, что и ‘амортизация’. Большинство компаний следуют консервативной практике списания, амортизируя нематериальные активы (intangible assets), такие, как репутация (goodwill). Обычной практикой также является амортизация любых превышений номинальной стоимости при приобретении привилегированных акций или облигаций. Целью амортизации является учёт выкупной стоимости актива. Амортизацией также называется сокращение задолженности путём периодической выплаты процентов и возврата части долга в объёмах, достаточных для того, чтобы погасить кредит в срок. Скидки и начисления на консолидированный долг амортизируются путём списаний в соответствии с установленной схемой. Обычные списания производятся систематически, но любую сумму оставшихся скидок или начислений можно в любой момент отнести на прибыль или убыток. Такие операции должны отмечаться в годовом отчёте компании.

(3) In banking, the redemption of a loan by periodic payments of principal and interest.

AMOS = AMERICAN MARITIME OFFICERS SERVICE

AMOS = AMERICAN STOCK EXCHANGE® OPTIONS SWITCHING SYSTEM

AMP = AMPERE

AMPACITY = ЁМКОСТЬ В АМПЕРАХ – Ampacity is a portmanteau for ampere capacity defined by National Electrical Safety Codes, in some North American countries. Ampacity is defined as the maximum amount of electrical current a conductor or device can carry before sustaining immediate or progressive deterioration. Also described as current rating or current-carrying capacity, ampacity is the RMS (short for the root mean square) electric current which a device or conductor can continuously carry while remaining within its temperature rating. The ampacity of a conductor depends on:- (i) its insulation temperature rating; (ii) the electrical resistance of the conductor material; (iii) frequency of the current, in the case of alternating current; (iv) ability to dissipate heat, which depends on conductor geometry and its surroundings; and (v) ambient temperature. All common electrical conductors have some resistance to the flow of electricity. Electric current flowing through them causes voltage drop and power dissipation, which heats conductors. Copper or aluminum can conduct a large amount of current without damage, but long before conductor damage, insulation would, typically, be damaged by the resultant heat. The ampacity for a conductor is based on physical and electrical properties of the material and construction of the conductor and of its insulation, ambient temperature, and environmental conditions adjacent to the conductor. Having a large overall surface area can dissipate heat well if the environment can absorb the heat. In cables different conditions govern, and installation regulations normally specify that the most severe condition along the run will govern each cable conductor's rating. Cables run in wet or oily locations may carry a lower temperature rating than in a dry installation. Derating is necessary for multiple cables in close proximity. When multiple cables are in close proximity, each contributes heat to the others and diminishes the amount of external cooling affecting the individual cable conductors. The overall ampacity of insulated cable conductors in a bundle of more than three cables must also be derated, whether in a raceway or cable. Usually the derating factor is tabulated in a nation’s wiring regulations. Depending on the type of insulating material, common maximum allowable temperatures at the surface of the conductor are 60, 75, and 90 °C, often with an ambient air temperature of 30 °C. In the United States, 105 °C is allowed with ambient of 40 °C, for

larger power cables, especially those operating at more than 2 kV. Likewise, specific insulations are rated 150, 200, or 250 °C. The allowed current in a conductor generally needs to be decreased (derated) when conductors are in a grouping or cable, enclosed in conduit, or an enclosure restricting heat dissipation, e.g., the United States National Electric Code, Table 310-16, specifies that up to three 8 AWG (short for the American Wire Gauge, also known as the Brown & Sharpe wire gauge, is a standardized wire gauge system used since 1857 predominantly in the United States and Canada for the diameters of round, solid, nonferrous, electrically conducting wire) copper wires having a common insulating material (THWN (short for the Thermoplastic Heat and Water-resistant Nylon-coated) in a raceway, cable, or direct burial has an ampacity of 50 A when the ambient air is 30 °C, the conductor surface temperature allowed to be 75 °C. A single insulated conductor in free air has 70 A rating. Ampacity rating is normally for continuous current, and short periods of overcurrent occur without harm in most cabling systems. The acceptable magnitude and duration of overcurrent is a more complex topic than ampacity. When designing an electrical system, one will normally need to know the current rating for the following:- (i) wires; (ii) Printed Circuit Board traces, where included; (iii) fuses; (iv) circuit breakers; and (v) all or nearly all components used. Some devices are limited by power rating, and when this power rating occurs below their current limit, it is not necessary to know the current limit to design a system. A common example of this is lightbulb holders. Ampacity is the maximum continuous current that a conductor can carry without overheating above its temperature rating. / Найлан (Nylon).

AMPD = AVERAGE MILES DRIVEN PER DAY

AM PEAK PERIOD = ПИКОВЫЙ ПЕРИОД ДП – AM Peak Period is the period in the morning when additional services are provided to handle higher passenger volumes. The period begins when normal, scheduled headways are reduced and ends when headways return to normal. See also PM Peak Period. / Пиковый Период ДП (До Полудня) это утренний период, когда дополнительные услуги .

AMPERE = АМПЕР – Ampere is the unit of electric current in the Système International d'Unités (SI), used by both scientists and technologists. Since 1948 the Ampere has been defined as the constant current which, if maintained in two straight parallel conductors of infinite length of negligible circular cross section and placed one meter apart in a vacuum, would produce between these conductors a force equal to $2 \cdot 10^{-7}$ Newton per meter of length. Named for the XIX century French physicist André-Marie Ampère (born January 22, 1775, Lyon, France and died June 10, 1836, Marseille, France), it represents a flow of one Coulomb of electricity per second. A flow of one Ampere is produced in a resistance of one Ohm by a potential difference of one Volt. Ampere is the unit of measurement of electrical current produced in a circuit by 1 Volt acting through a resistance of 1 Ohm. Ampere is the electric current produced by one Volt applied across a resistance of one Ohm. It is also equal to the flow of one Coulomb per second. Named after French physicist Andre M. Ampère 1836. / , она представляет собой поток одного кулона электричества в одну секунду. Кулон . Ампер В Международной Системе Единиц, официально зарегистрированной под Франкоязычным названием Лё Систэм Этэрнасьёналь д'Юните (Эс.И. или, как её уже устоялось называть в России, СИ), под Ампером понимается:- (i) единица силы электрического тока в СИ. Обозначение:- А. 1 А равен силе неизменяющегося тока, который при прохождении по двум параллельным прямолинейным проводникам бесконечной длины и ничтожно малой площади круглого сечения, расположенным на расстоянии 1 метр (м) один от другого в вакууме, вызвал бы на участке проводника длиной 1 м силу взаимодействия, равную $2 \cdot 10^{-7}$ Ньютона (Н). (ii) Единица магнитодвижущей силы в СИ. Старое наименование Ампер-виток. 1 А равен магнитодвижущей силе вдоль замкнутого контура, сцепленного с контуром постоянного тока силой 1 А. (iii) Единица разности магнитных потенциалов в СИ. Была названа в честь Французского физика Андре-Мари Ампэр (André-Marie Ampère; родился 22 Января 1775 в Лионе, Франция и скончался 10 Июня 1836 в Марселе (Marseille), Франция).

AMPERE–HOUR = АМПЕР–ЧАС – Ampere-Hour is the flow of electricity equal to one Ampere for one hour. Commonly used to rate the capacity of batteries. / Под Ампер-Час понимается внесистемная единица электрического заряда или количества электричества. Один Ампер-Час равен количеству электричества, проходящего через поперечное сечение проводника при токе силой 1 Ампер (А) за время 1 час (ч). Обозначение:- А·ч. 1 А·ч = 3 600 Кл = 3.6 кКл. Обычно в А·ч выражают электрический заряд аккумуляторов.

AMPHIBIOUS = АМФИБИЙНОЕ – Amphibious:- able to grow in both water and on land or growing with part of the plant in water or mud and part in the air. / Под Амфибийным, от Греческого слова Amphibios, означающее Ведущий Двойной Образ Жизни, понимается .

AMPHIDIPLOID = АМФИДИПЛОИД (или АМФИДИПЛОИДНОЕ) – Amphidiploid is:- (1) said of plants resulting from a cross between two different species and having the total chromosome complement of the parent species. (2) Name given to allopolyploids which are produced when different genomes are combined through interspecific hybridization. / Под Амфидиплоидом, от Греческих слов Amphi, означающее С Обеих Сторон, Diplóos, означающее Двойной, и Éidos, означающее Вид, или Аллотетраплоидом понимается гибридный организм, полученный скрещиванием 2 разных видов (или родов) растений или животных; в его клетках сочетаются полные диплоидные наборы хромосом обоих видов (или родов). Частный случай аллополиплоидии. Пример амфидиплоида – ржано-пшеничный гибрид (Тритикале).

AMPLICON = АМПЛИКОН – Amplicon is a DNA region defined by two opposing primer amplification sites.

AMPLIFICATION FRAGMENT LENGTH POLYMORPHISM = ПОЛИМОРФИЗМ АМПЛИФИКАЦИОННЫХ ДЛИН ФРАГМЕНТА – Amplification Fragment Length Polymorphism (AFLP):- a variant DNA amplification product of different size produced by DNA amplification fingerprinting (DAF), Polymerase Chain Reaction (PCR), or Random Amplified Polymorphic DNA (RAPD) technique.

AMPS = ACCOUNT MANAGEMENT PROFILE SYSTEM

AMPS = AUCTION MARKET PREFERRED STOCK

AMS = AERONAUTICAL MATERIAL SPECIFICATION

AMS = AGGREGATE MEASUREMENT OF SUPPORT

AMS = AGRICULTURAL MARKETING SERVICE

AMS = AUTOMATED MANIFEST SYSTEM

AMSS = AERONAUTICAL MOBILE SATELLITE SERVICE

AMSTERDAM–ROTTERDAM–ANTWERP = АМСТЕРДАМ–РОТТЕРДАМ–АНТВЕРПЕН – ARA is an abbreviation for Amsterdam/Rotterdam/Antwerp. These three European ports form a key oil trading area. Crude Oil from the North Sea, Africa and the Middle East is refined into oil products and distributed throughout northwest Europe and down the Rhine into central Europe. This phrase and its abbreviation ARA are commonly used in shipping to designate discharge or loading at one of these three ports. Amsterdam-Rotterdam-Antwerp (ARA) area – a port and refining area in the Belgian-Dutch region. A cargo or barge of a refined

product traded on a cost, insurance and freight (CIF) ARA basis means that ports within this area are covered in the cost. A cargo traded on a free-on-board (FOB) ARA basis means the oil can come from any of these ports. / Это словосочетание и его обозначение АРА (ARA) обычно используются в судоходстве для обозначения пункта разгрузки или погрузки, находящегося в одном из этих трёх портов.

AMTEC = AGRICULTURAL MACHINERY TESTING AND EVALUATION CENTER

AMTID = APPLICATION OF MODERN TECHNOLOGY TO INTERNATIONAL DEVELOPMENT

AMV = AGGREGATE MARKET VALUE

AMVER = AUTOMATED MUTUAL ASSISTANCE VESSEL RESCUE SYSTEM

AMY = AMYLOSE

AMYLASE = АМИЛАЗА – Amylase is an enzyme that catalyzes the breakdown of starch. Use of amylase enzymes is now the industrially-preferred way of removing starch sizing from textiles. The reaction with the enzyme essentially converts starch to water-soluble sugar. Unfortunately, amylase enzyme is difficult for the textile artist to obtain. Amylase is the enzyme responsible for catalyzing the breakdown of starch into sugars; may be active in one of two forms:- a-amylase and b-amylase. / Под Амилазами понимаются ферменты класса гидролаз, катализирующие гидролитическое расщепление полисахаридов (гликогена, крахмала и других) у всех живых организмов. Участвуют в процессе пищеварения у человека и животных. Используются в спиртовой промышленности и хлебопечении, а также при производстве глюкозы. Амилазы, ферменты, катализирующие гидролиз крахмала, гликогена и родственных им полисахаридов путём расщепления глюкозидных связей между 1-м и 4-м атомами углерода. Различают три типа амилазы:- (i) a-амилаза встречается у животных, растений и микроорганизмов, в реакциях с её участием образуются главным образом декстрины; (ii) b-амилаза типична для высших растений, катализирует образование мальтозы и крупномолекулярных декстринов; (iii) Глюкоамилаза содержится в крови животных, плесневых Грибах, Бактериях и других, катализирует образование глюкозы и декстринов. Обычно гидролиз полисахаридов происходит при одновременном участии разных амилаз. Осахаривание крахмала под влиянием вытяжки из проросших семян Ячменя (ферментативное действие амилазы) впервые описал Русский академик Немецкого происхождения Константин Сигизмундович Кирхгоф (или Готлиб Константин Зигисмунд Кирьхьхоф; Gottlieb Sigismund Konstantin Kirchhoff; 1764–1833) в 1814. Неочищенный комплекс амилаз, выделенный из солодовой вытяжки Французскими учёными Осэльмом Пайа (Anselme Payen; 1795–1871) и Жо-Фросуа Пэрсоз (Jean-François Persoz; 1805–1868) в 1833, – диастаз был первым ферментным препаратом. Некоторые амилазы уже получены в кристаллическом виде. Амилазы специфичны у разных видов организмов. Физиологическая роль их состоит в мобилизации запасов полисахаридов в клетках (например, при прорастании семян). Велико значение их в процессе пищеварения:- амилазы содержатся в слюне и соке поджелудочной железы человека и животных. Микроорганизмы потребляют крахмал, выделяя в среду амилаз. Для осахаривания крахмалистых заторов в спиртовой промышленности и в хлебопечении применяется a-амилаза, получаемая из плесневых Грибов и Бактерий; при производстве глюкозы из крахмала используются препараты глюкоамилазы.

AMYLOPECTIN = АМИЛОПЕКТИН – Amylopectin is:- (1) a component of starch that has a high molecular weight, long-branched chain structures, and does not tend to gel in aqueous solutions. (2) A type of starch molecule composed of long-branched chains of glucose units (a polysaccharide). (3) The major and branched fraction of starch, a glucose polymer with 5 000–19 000 glucose units and mean chain length of 18–22 glucose units. This fraction contributes directly to gel consistency and has a long linear chain fraction in high amylose starch. Amylopectin is a starch made up of long branched chains of a-D-glucopyranose (which is quite similar to glucose, $C_6H_{12}O_6$). / Под Амилопектином понимается разветвлённый полисахарид, образованный остатками глюкозы. Входит в состав крахмала (обычно 70–90%). В так называемых восковидных сортах Кукурузы, Риса, Ячменя крахмал состоит только из амилопектина. Раствор амилопектина окрашивается иодом в красно-фиолетовый цвет.

AMYLOSE = АМИЛОЗА – Amylose:- (1) in cereal endosperm, it is the starch fraction of molecules or residues made up of glucose units, straight short chains (see also Nonwaxy Endosperm). (2) The essentially linear fraction of starch, a polymer of glucose (dextrose) with up to 1 000 glucose units. It gives a blue complex with iodine and contributes directly to cooked Rice hardness. It is measured colorimetrically by its blue complex with iodine in acetate buffer. Amylose means a kind of starch fraction in rice kernels. When cooked, the texture of the Rice kernels varies according to the content of amylose. Amylose is a starch made of long unbranched chains a-D-glucopyranose (which is quite similar to glucose, $C_6H_{12}O_6$; the 'a' should be the Greek letter alpha, but that character may not appear properly on all computers). / твёрдость (hardness). Под Амилозой понимается линейный полисахарид, образованный остатками глюкозы. Входит в состав крахмала (обычно 10–30%). Раствор амилозы окрашивается иодом в синий цвет. Под Амилозой понимается разновидность фракций крахмала в рисовой зерновке. При варке риса, текстура рисовой зерновки различается друг от друга в зависимости от содержания амилозы.

AMYLOSE CONTENT = СОДЕРЖИМОЕ АМИЛОЗЫ – Amylose Content is the value representing the starch fraction of milled rice, or the amount of starch in the grain that determines its eating and cooking quality. Low-amylose rice varieties are moist, sticky, and glossy after cooking. Rice with a high amylose content cooks dry and fluffy. Amylose Content:- starch makes up about 90% of the dry matter content of milled Rice. Starch is a polymer of glucose and amylose is a linear polymer of glucose. The amylose content of starches usually ranges from 15 to 35%. High amylose content Rice shows high volume expansion (not necessarily elongation) and high degree of flakiness. High amylose grains cook dry, are less tender, and become hard upon cooling. In contrast, low-amylose Rice cooks moist and sticky. Intermediate amylose Rice are preferred in most rice-growing areas of the world, except where low-amylose Japonicas are grown. Based on amylose content, milled Rice is classified in 'amylose groups', as follows:- (i) waxy (1–2% amylose); (ii) very low amylose content (2–9% amylose); (iii) low amylose content (10–20% amylose); (iv) intermediate amylose content (20–25% amylose); and (v) high amylose content (25–33% amylose). Amylose content of milled Rice is determined by using the colorimetric iodine assay index method.

AN = ACRYLONITRILE

A/N = ARRIVAL NOTICE

AN = NETHERLANDS ANTILLES

ANAEROBE = АНАЭРОБ – Anaerobe (Greek:- An = Without, and Aer = Air) is a microorganism that survives without atmospheric oxygen. / Под Анаэробами (или Анаэробными Организмами) понимаются организмы, способные жить в отсутствии атмосферного кислорода; некоторые виды бактерий, дрожжей, простейших, червей. Энергию для жизнедеятельности получают, окисляя органические, реже неорганические вещества без участия свободного кислорода или используя энергию света (например, пурпурные бактерии). Облигатные, или строгие, анаэробы развиваются только в отсутствии кислорода

(например, клостридии); факультативные, или условные, анаэробы – и в его присутствии (например, кишечная палочка, ресничные инфузории). Широко распространены в почве, воде, в донных отложениях.

ANAEROBIC = АНАЭРОБНОЕ – Anaerobic:- the absence of molecular oxygen.

ANAEROBIC HOLDING SYSTEM = АНАЭРОБНАЯ СИСТЕМА УДЕРЖАНИЯ – Anaerobic Holding System is a closed storage unit for partial digestion of liquid organic wastes in the absence of oxygen.

ANAEROBIC RESPIRATION = АНАЭРОБНАЯ РЕСПИРАЦИЯ (или АНАЭРОБНОЕ ДЫХАНИЕ) – Anaerobic respiration:- (Greek:- An = Without; and Aer = Air) occurs with goods of vegetable origin if the permitted carbon dioxide content is exceeded.

ANALOG = АНАЛОГОВОЕ – Analog:- a measuring or display methodology which uses continuously varying physical parameters. In contrast, digital represents information in discrete binary form using only zeros and ones. / Под Аналоговым, от Греческого слова Analogos, означающее Соответствующий, понимается . непрерывно изменяющиеся физические величины. В контрасте с Цифровым, представляющим информацию в .

ANALYSIS CERTIFICATE = СВИДЕТЕЛЬСТВО ОБ АНАЛИЗЕ (или СВИДЕТЕЛЬСТВО О ПРОВЕДЕНИИ АНАЛИЗА, или СЕРТИФИКАТ АНАЛИЗА) – Analysis Certificate:- this certificate must be obtained for any goods for which the importing country requires an analysis as proof of quality, composition, etc. / Под Анализом, от Греческого слова Analysis, означающее Разложение, в самом общем значении понимаются процессы мысленного или фактического разложения целого на составные части.

ANALYSIS OF COVARIANCE = АНАЛИЗ КОВАРИАНСЫ (или АНАЛИЗ СОПРЯЖЁННОГО ИЗМЕНЕНИЯ) – Analysis Of Covariance is the simultaneous analysis of the sums of squares and cross-products of two or more variables. It uses the concepts of both analysis of variance and of regression. It is applicable only if there exists a concomitant variable (called Covariate) which can not be controlled but is closely related to the variable of interest.

ANALYSIS OF VARIANCE = АНАЛИЗ ВАРИАНСЫ (или АНАЛИЗ ДИСПЕРСИИ) – Analysis Of Variance (ANOVA or ANOV) is:- (1) A statistical procedure that allows subdivision of the total variation among experimental units into known sources of variation and provides a measure for each source. (2) The statistical analysis that tests the significance of variable sources.

ANALYSIS OF VARIANCE = АНАЛИЗ ПРОТИВОРЕЧИЙ (или РАСХОЖДЕНИЙ) – Analysis Of Variance is a technique used to improve the analysis over regression techniques. It can be used for identifying relationships between predictor and criterion variables, whether the predictor variables are quantitative or qualitative in nature.

ANALYST = АНАЛИТИК – Analyst is a person with expertise in evaluating financial instruments; the analyst performs investment research and makes recommendations to institutional and retail investors to buy, sell, or hold. Most analysts specialize in a single industry or business sector. Person who undertakes analysis. Analyst is a person who evaluates and interprets public company financial statements. / Аналитик – сотрудник брокерской фирмы, трастового отделения банка или группы взаимного фонда, анализирующий положение большого числа компаний и дающий рекомендации относительно покупки или продажи ценных бумаг конкретных компаний и промышленных групп. Большинство аналитиков специализируется на компаниях одной отрасли, но некоторые собирают информацию о любой интересующей их компании, невзирая на сферы её деятельности. Аналитик может пользоваться значительным влиянием и, следовательно, воздействовать своими рекомендациями на цены акций компании. Аналитик:- специалист, работник фирмы, банка, владеющий методикой экономического анализа, проводящий такой анализ.

ANALYTICAL FERROGRAPHY = АНАЛИТИЧЕСКАЯ ФЕРРОГРАФИЯ (или АНАЛИТИЧЕСКАЯ МАГНИТОГРАФИЯ) – Analytical Ferrography:- the magnetic precipitation and subsequent analysis of wear debris from a fluid sample This approach involves passing a volume of fluid over a chemically treated microscope slide which is supported over a magnetic field. Permanent magnets are arranged in such a way as to create a varying field strength over the length of the substrate. This varying strength causes wear debris to precipitate in a distribution with respect to size and mass over the Ferrogram. Once rinsed and fixed to the substrate, this debris deposit serves as an excellent media for optical analysis of the composite wear particulates. See also Ferrography. / остатки (debris) износа . Феррография – то же, что Магнитография.

ANALYTICAL PROCEDURES = АНАЛИТИЧЕСКИЕ ПРОЦЕДУРЫ – Analytical Procedures are substantive tests of financial information which examine relationships among data as a means of obtaining evidence. Such procedures include:- (i) comparison of financial information with information of comparable prior periods; (ii) comparison of financial information with anticipated results, e.g., forecasts; (iii) study of relationships between elements of financial information that should conform to predictable patterns based on the entity's experience; and (iv) comparison of financial information with industry norms.

ANAPHASE = АНАФАЗА – Anaphase is the stage of cell division (mitosis and meiosis) in which the chromosome halves move toward the opposite poles of the spindle. / Под Анафазой, от Греческих слов Aná, означающее Вверх, и Phásis, означающее Появление, понимается стадия клеточного деления, следующая за метафазой; характеризуется расхождением хромосом к полюсам клетки.

ANASTOMOSE = АНАСТОМОЗИРОВАТЬ – Anastomose:- to join together, e.g., veins. Anastomosis is a union of a hypha or vessel with another resulting in exchange of their contents. Fusion of hyphal cells of fungi involving the cell wall or cytoplasm. / слияние относящихся к гифам клеток грибов, . Под Анастомозом, от Греческого слова Anastómōsis, означающее Выход или Отверстие, понимается соустье:- (i) у животных и человека побочная ветвь (канал), соединяющая сосуды, нервы, выводные протоки, полные органы; искусственный анастомоз накладывают оперативным путём; (ii) у высших растений соединение проводящих пучков в листьях, узлах стеблей и других структурах; и (iii) у грибов соединение или срастание сообщающихся между собой гиф грибницы.

ANASTOMOSIS GROUP = АНАСТОМОЗНАЯ ГРУППА (или ГРУППА С АНАСТОМОЗОМ) – Anastomosis Group:- a sub-grouping of a fungal species based on the ability of closely related isolates to exchange nuclear material via the fusion of fungal strands (anastomosis). The seedling disease pathogen, Rhizoctonia solanine is divided into anastomosis groups – AG4 affects cotton while AG8 affects Wheat. / Подгруппирование видов (species) грибов, основанное на . тяжей грибницы (анастомоз). Ризоктониозный соланин. У грибов под Анастомозом, от Греческого слова Anastómōsis, означающее Выход, Отверстие или Соустье, понимается соединение или срастание сообщающихся между собой гиф грибницы.

ANATOMY = АНАТОМИЯ – Anatomy is a study of the internal structure of living beings. / Под Анатомией, от Греческого слова Anatomē, означающее Рассечение, понимается наука о строении (преимущественно внутреннем) организма, раздел морфологии. Различают анатомию животных и анатомию растений. Самостоятельными являются анатомия человека (с её основными разделами – нормальной анатомией и патологической анатомией) и сравнительная анатомия животных.

Основоположники анатомии животных и человека в античный период – древнегреческий философ и учёный Аристотель (384–322 до Нашей Эры), древнеримский врач Клавдий Гален (Claudius Galenus; около 130 – около 200), современной анатомии – естествоиспытатель Андреас Везалий (Andreas Vesalius; 1514–64) и Английский врач Вильэм Хави (William Harvey; 1578–1657).

ANATROPOUS = АНАТРОПНОЕ (или ВЫВЕРНУТОЕ) – Anatropous:- descriptive of an ovule in which the body is bent backward along the funiculus and adnate to it.

ANB = AIDS TO NAVIGATION BOAT

ANCHORAGE = ЯКОРНОЕ МЕСТО – Anchorage is a site where a ship drops anchor. / Местоположение, где происходит постановка судна на якорь. Под Рейдом, от Голландского слова Reede, понимается водный район у берега, используемый для якорной стоянки или перегрузки судов. Рейдом называется также внешняя часть акватории порта. Рейды – участки акватории, защищённые от сильного волнения, где суда могут стоять на якорях в ожидании разрешения на подход к причалам или на выход из порта. При отсутствии в порту глубоководных причалов, на рейдах также производят перегрузочные операции, для чего используют вспомогательные мелкосидящие суда – лихтеры и баржи.

ANCILLARY GUARANTEE = ГАРАНТИЯ СОУЧАСТНИКА – Ancillary Guarantee is a type of guarantee where the guarantor joins with one of the parties to the contract and agrees to fulfill that party's obligations if necessary, effectively co-signing the contract. As opposed to an independent or demand guarantee, under an ancillary guarantee the guarantor also acquires rights under the contract and may resort to terms in the contract to dispute claims against the guarantee. Also called a Contract Guarantee. Although banks in the United States are generally prohibited by law from issuing ancillary guarantees, banks in other countries are not. US banks instead issue demand guarantees or standby letters of credit.

ANCILLARY REVENUE = ВСПОМОГАТЕЛЬНАЯ ВЫРУЧКА – In oil and gas industry, Ancillary Revenue is a revenue from a retail outlet which is other than from gasoline or diesel, such as convenience stores or car wash sales. Ancillary revenue helps to pay outlet and marketer operating costs, and is considered to contribute to lower petroleum margins. / В нефтегазовой отрасли, выручка от пункта розничной продажи, в которую не включается выручка от реализации бензина или дизельного топлива. К такой выручке относится выручка от продаж сопутствующих товаров или от оказания услуги по мойке автомобилей. Вспомогательная выручка помогает оплачивать расходы, понесённые данным пунктом продажи, и операционные расходы сбытовика. Она рассматривается в качестве способствующей снижению маржи от переработки нефти.

ANCILLARY SERVICE AREA = АРЕАЛ ВСПОМОГАТЕЛЬНОЙ СЛУЖБЫ – Ancillary Service Area:- a defined market service area for ancillary services including regulation and spinning.

ANCILLARY SERVICES = ВСПОМОГАТЕЛЬНЫЕ СЛУЖБЫ – Ancillary Services are those services necessary to support the transmission of energy from resources to loads while maintaining reliable operation of the Transmission Provider's transmission system in accordance with Good Utility Practice. Ancillary Service:- those services necessary to support the transmission of capacity and energy from resources to loads while, in accordance with good utility practice, maintaining reliable operation of the transmission provider's transmission system.

AND = ASSOCIATE ADMINISTRATOR FOR NAS DEVELOPMENT

ANDREWS' PITCHFORK = ВИЛЫ ЭНДРЮЗА – Andrews' Pitchfork:- those who have studied Alan H. Andrews' trading techniques in depth know that he taught ways to anticipate a change in market sentiment – a change that often results in a price move that catches many traders by surprise. Andrews' best-known technique is Andrews' Pitchfork, found on most charting software programs. Andrews' pitchfork consists of three parallel lines identifying recent trends. Two of the lines form what appear to be prongs, while the third forms a handle, thus, the 'pitchfork' descriptor. The lines are drawn across support and resistance pivots that identify recent trends. A question often arises regarding pivot selection for Andrews' pitchfork – that is, identifying what three sets of pivots would be the best to use in any given situation. Here is how Andrews addressed that question:- 'Usually, it seems best to start with the most recent three alternate pivots of the time frame you are interested in. That will give you the current view. But don't stop there, because any three alternate pivots can be used, and no matter which set is chosen, each resulting pitchfork will add something to the outlook as it tells its own story'. One part of the pitchfork story is the price failure rule. The logic for this technique is grounded in one of Andrews' best-known quotes. 'Someone once remarked that most traders spend a good deal of their time following the markets to see what prices are doing', he said at a trading seminar. 'I suggest they would be better off if they spent more time observing what prices are not doing'. The price failure rule is a core Andrews technique that deals directly with what prices are not doing. It comes into play when prices don't reach the median line, or the middle line of the pitchfork. Before we look at the technique, let's first consider the broader interpretation of price action vs. the median line. Price magnet:- the median line technique is Andrews' best-known work. Indeed, it is the basis for the Andrews' pitchfork method itself. The primary feature, according to Andrews, is the high probability that prices will reach a median line and then reverse. That aspect is pretty well known among users. Less known is that the Andrews' pitchfork offers a great deal more than that. The discovery of this phenomenon prompted Andrews to develop complementary techniques that would help confirm the outlook of trade positions already on the books, or alert him to a potential shift in market sentiment as prices interacted with the median line. The price failure rule is one of those techniques. To deal with those times when prices change direction before reaching the median line, Andrews developed a special method called the Price Failure Rule. It is an easy-to-use procedure that prepares the trader for a trend change when new buying or selling interest appears to be surfacing in a stock or commodity. The rule relates to Andrews' comment regarding the importance of observing what prices are not doing – in this case, not continuing to press on until the median line is reached. Failure to reach the median line raises a couple of interesting side issues:- One, market sentiment is more than likely changing; and two, it is not unusual to see a large counter-move take place following a price failure. Note:- often, when price fails to each the median line, it can move strongly in the opposite direction. That outlook would have been less clear, however, when prices reversed and, in so doing, penetrated the upper parallel line of the pitchfork. That was a warning that a price failure was likely and called for Hagopian's Rule, a trendline adaptation Andrews named after one of his early students. Hagopian's Rule:- here's how Andrews described the rule:- 'When prices reverse trend before reaching a line at which probability indicates such a reversal could start, proper action may be taken in buying or selling when prices cross a trendline they were moving along before reversing'. In 'New direction' the pitchfork median line is 'the line at which probability indicates such a reversal could start'. The 'trendline they were moving along before reversing' is the Hagopian line. In this example, the Hagopian line is a downward trendline that was drawn across two previous highs. It slopes away from the median line, which is the preferred arrangement, according to Andrews. In the example, a buy signal was given when prices broke through the Hagopian line, completing the setup for the price failure rule. Traders looking for additional trade signal confirmation ought to find that their favorite technical indicator studies merge quite well with this Andrews technique. Oscillator divergence is one such study that can tie in effectively. For example, on the August 2011 soybean meal chart shown in 'Confirming the turn', the stochastic oscillator formed a bullish reversal divergence pattern in October and November 2010.

Prices were in an uptrend, making higher lows during that time, while the stochastic oscillator generated a pair of lower lows, thereby forming a reverse divergence pattern. An Andrews' pitchfork was drawn following the formation of that divergence pattern, and price action indicated that prices might not make it to the median line. That probability was confirmed after prices moved outside the upper pitchfork parallel line and subsequently penetrated the Hagopian line, showing there was a high probability that soymeal meal prices would resume the uptrend. The July 2011 Cotton futures chart shown in 'Resuming the trend' uses a set of studies comparable to the August soymeal chart, with moving average convergence-divergence substituted for stochastics. The combined studies of oscillator divergence, the Andrews' price failure rule and the Hagopian line technique all served to alert the trader that July cotton prices were setting the stage to resume the uptrend. Price movement holds key:- the Andrews' pitchfork comes to the forefront as a formidable price analysis tool. It simply is hard to beat. Its underlying power comes from the clues that are generated by the price movement itself – clues that surface as prices interact with the pitchfork lines. The test is to recognize those clues, one of which leads to the price failure rule. Developed by Alan Andrews, this concept that uses three parallel lines drawn from three points that analyst selects. The points selected to begin the pitchfork are usually three consecutive major peaks or troughs. The three parallel lines extending out to the right are used as normal support and resistance points. / В техническом анализе биржевых рынков, Вилы Эндрюза относятся к концепции, разработанной Алэном Эйч. Эндрюзом (Alan H. Andrews), которая использует три параллельные линии, проведённые из трёх точек, которые выбирает аналитик. Точки, выбираемые для прорисовки данных 'вил' обычно являются тремя последовательными значительными пиками или провалами. Три параллельные линии, идущие на графике изменения цены вправо, используются в качестве обычных точек поддержки и сопротивления.

ANDROGENESIS = АНДРОГЕНЕЗ – Androgenesis is the development of a haploid individual from a pollen grain or microspore. / или микроспора. / Под Андрогенезом, от Греческих слов Anēr, родительный падеж Andrós, означающее Мужчина, и Génesis, означающее Возникновение или Происхождение, или Мужским Партеногенезом понимается развитие яйца (после проникновения в него сперматозоида) только с мужским ядром. Наблюдается обычно в случае гибели женского ядра до оплодотворения.

ANEMOPHILOUS = АНЕМОФИЛЬНОЕ (или ВЕТРООПЫЛЯЕМОЕ) – Anemophilous:- wind pollinated. / Анемофильное – опыляемое ветром. Под Анемофилией, от Греческих слов Ánemos, означающее Ветер, и Philéō, означающее Люблю, понимается перекрёстное опыление растений с помощью ветра, например, у берёзы, злаков.

ANESTHETIZE = АНЕСТЕЗИРОВАТЬ (или ДАВАТЬ НАРКОЗ, или ОБЕЗБОЛИВАТЬ) – Anesthetize:- to immobilize. / иммобилизировать или сковать. , от Греческого слова Anaishesia, означающее Потеря Чувствительности, .

ANEUPLOID = АНЭУПЛОИД (или АНЭУПЛОИДНОЕ) – Aneuploid is an individual with a chromosome number that is not an exact multiple of the haploid chromosome complement. / Под Анеуплоидией, от Греческих слов An, означающее отрицательная частица, Éu, означающее Вполне, Plóos, означающее Кратный, и Éidos, означающее Вид, понимается наследственное изменение, при котором клетки организма содержат число хромосом, не кратное основному набору:- он уменьшен на 1 (моносомия), реже 2 (нуллисомия) или увеличен на 1 или несколько хромосом. Анеуплоидия – причина ряда хромосомных болезней человека.

ANG = AIR NATIONAL GUARD

ANG = NETHERLANDS ANTILLES GUILDER

ANGELS = АНГЕЛЫ – Angels or Angel Investors are successful entrepreneurs who are willing to invest some of their gains in new ventures. They typically also act as mentors to the founding entrepreneurs. What differentiates angels from other investors is that (i) they invest their own money (not other peoples' money which they manage), and (ii) they have been an entrepreneur themselves.

ANGIOSPERM = ПОКРЫТОСЕМЕННОЕ (или ЦВЕТКОВОЕ, или АНГИОСПЕРМ) – Angiosperm, any member of the more than 300 000 species of flowering plants (Division Anthophyta), the largest and most diverse group within the Kingdom Plantae. Angiosperms represent approximately 80 percent of all the known green plants now living. The angiosperms are vascular seed plants in which the ovule (egg) is fertilized and develops into a seed in an enclosed hollow ovary. The ovary itself is usually enclosed in a flower, that part of the angiospermous plant that contains the male or female reproductive organs or both. Fruits are derived from the maturing floral organs of the angiospermous plant and are therefore characteristic of angiosperms. By contrast, in gymnosperms (e.g., conifers), the other large group of vascular seed plants, the seeds do not develop enclosed within an ovary but are usually borne exposed on the surfaces of reproductive structures, such as cones, that originally produced the spores. Unlike such nonvascular plants as the bryophytes, in which all cells in the plant body participate in every function necessary to support, nourish, and extend the plant body (e.g., nutrition, photosynthesis, and cell division), angiosperms have evolved specialized cells and tissues that carry out these functions and have further evolved specialized vascular tissues that translocate the water and nutrients to all areas of the plant body. The specialization of the plant body, which has evolved as an adaptation to a principally terrestrial habitat, includes extensive root systems that anchor the plant and absorb water and minerals from the soil; a stem that supports the growing plant body; and leaves, which are the principal sites of photosynthesis for most angiospermous plants. Another significant evolutionary advancement over the nonvascular and the more primitive vascular plants is the presence of localized regions for plant growth, called Meristems and Cambia, which extend the length and width of the plant body, respectively. Except under certain conditions, these regions are the only areas in which cell division takes place in the plant body, although cell differentiation continues to occur over the life of the plant. The angiosperms dominate the Earth's surface and vegetation in more environments, particularly terrestrial habitats, than any other group of plants. As a result, angiosperms are the most important ultimate source of food for birds and mammals, including humans. In addition, the flowering plants are the most economically important group of green plants, serving as a source of pharmaceuticals, fiber products, timber, ornamentals, and other commercial products. Although in the past the taxonomy of the angiosperms was somewhat controversial, a consensus began to develop among plant taxonomists toward the end of the XX century. The angiosperms came to be considered a group at the division level (comparable to the phylum level in animal classification systems) called Magnoliophyta. Throughout this article the Orders or Families are given, usually parenthetically, following the vernacular or scientific name of a Plant. Following taxonomic conventions, genera and Species are italicized. The higher taxa are readily identified by their suffixes:- Families end in -aceae, Orders in -ales, Subclasses in -idae, and Classes in -opsida. For a comparison of angiosperms with the other major groups of Plants, see Plant, Bryophyte, Fern, Lower Vascular Plant, and Gymnosperm. Angiosperm is a flowering Plant. One of a group of Plants whose seeds are enclosed in a mature ovary (fruit). Angiosperm (meaning covered seed) is a flowering Plant with ovules (seeds) enclosed in an ovary (fruit). Angiosperms developed about 100 million years ago (late Jurassic) and have become the dominant type of terrestrial Plant, represented by at least 250 000 Species, including both monocotyledons (e.g., Agave) and dicotyledons (e.g., Cactaceae). / 300 000 Видов цветущих Растений (Отдел Антофитов). смотрите Растение (Plant), Бриофит (Bryophyte), Папоротник (Fern), Голосемянное (Gymnosperm), и Низшее Сосудистое Растение (Lower Vascular Plant). Ангиосперм:- цветущее растение. Одна из групп Растений, семена которых скрыты в зрелой завязи (плоде). Под Ангиоспермом, от Греческих слов Angéion, означающее Сосуд, и Spérma, родительный падеж Spérmatos, означающее Семя,

понимается . Под Цветковыми или Покрытосеменными Растениями понимается Отдел Высших Растений. Семязачатки погружены в ткани завязи, из которой после оплодотворения развивается плод с заключёнными в нём семенами (отсюда второе название). Характерно также наличие настоящего цветка и двойное оплодотворение. Около 250 000 Видов, по всему земному шару. Два класса – однодольные и двудольные. Играют большую роль в жизни человека, снабжая продуктами питания, строительными материалами, сырьём для промышленности (текстильной, мебельной, фармацевтической и других).

ANGLE OF ILLUMINATION = УГОЛ ОСВЕЩЕНИЯ – Angle Of Illumination is the angle between the specimen normal and the illuminator axis.

ANGLE OF VIEW = УГОЛ ЗРЕНИЯ (или УГОЛ ОБЗОРА, или УГОЛ ПОЛЯ ИЗОБРАЖЕНИЯ) – Angle Of View is the angle between the normal to the surface of the specimen and the axis of the receiver.

ANGLE–PLY LAMINATE = СЛОИСТЫЙ МАТЕРИАЛ С УКЛАДКОЙ СЛОЁВ ПОД УГЛОМ ДРУГ К ДРУГУ – Angle-Ply Laminate is a laminate formed with fibers of adjacent plies oriented at alternating angles, e.g., $[\theta, -\theta]_n$.

ANGORA = АНГОРА – Angora is the hair of the Angora Goat. Also known as Angora Mohair. Angora may also apply to the fur of the Angora Rabbit. However, according to the US Federal Trade Commission (FTC), any apparel containing Angora Rabbit hair must be labeled as 'Angora Rabbit hair' on the garment. The hair of the Angora Goat. The long, fine fibers are so smooth and soft that they must be combined with other fibers in weaving. Angora (Goat):- soft long hair of the Angora goat, often called Mohair. The goat is native to Anatolia in the Angora province of Turkey but is extensively raised today in Texas by western ranchers. / Ангорская порода Коз, от Ангора – древнее название Анкары (нынешняя столица Турции), шёрстная. Выведена в древности. Шерсть полутонкая, белая, с блеском, длиной 20–25 сантиметров (см). Настриг с козлов 5–7 килограмм (кг), с маток 3–4 кг. В настоящее время разводят в Турции, США, странах Африки, в Австралии и странах бывшего СССР.

(2) Angora is the hair of the Angora Rabbit. The fine, lightweight hair is warm, and it is often blended with wool to decrease price and to obtain novelty effects in weaving. In the United States by law, the fiber must be described as Angora Rabbit hair. Angora is downy soft, fluffy hair that is plucked or sheared from the Angora Rabbits. This is a slippery, flyaway fiber is usually blended with wool or other fibers to make it easier to spin and to reduce the cost. Angora (also Mohair):- on the one hand this term is used for fabrics made of hair of the Angora Rabbit. On the other hand it is also used for fabrics made of the wool of the Angora Goat. To set the record straight, the Wool Labeling Law requires that a fabric has to be marked as 'Angora Rabbit Hair' rather than 'Angora' or 'Angora Wool'. Fabrics made of the long and soft fur of the Angora Goat are called 'Mohair'. Angora (Rabbit):- hair from the Angora Rabbit. Often blended and mixed with wool to lower the price of the finished article or to obtain fancy or novelty effects. Angora:- The Animal:- The Angora is a variety of the Old World domestic Rabbit (Oryctolagus Cuniculus) with a special characteristic:- the active phase of hair growth is double that of normal Rabbits. The Angora is intensively farmed in hutches, often in semi-darkness, and its hair is removed usually every three months. An adult Angora produces up to 1.5 kg of fiber per year. The Fiber:- The silky white hair of the Angora is a hollow fiber classed as wool. With a diameter of 14–16 microns, it is one of the silkest animal fibers. Angora wool is very soft to the touch, thanks to the low relief of its cuticle scales. The hairs are light, absorb water well and are easily dyed. Premium wool is taken from the back and upper sides of the Rabbit. Angora:- Fine, silky and exceptionally soft to the touch, the wool of the Angora Rabbit is used in high quality knitwear. Uses Of Angora:- Light but warm, Angora wool is used mainly in knitted clothes, such as pullovers, scarves, socks and gloves, producing a moderate 'fluffing' effect. Angora fabric is ideal for thermal clothing and for people suffering from arthritis and wool allergies. Garments made of 100% Angora wool are considered too warm and the fibers are too fine to provide density. It is therefore usually blended with other fibers, such as wool to improve its processing performance, elasticity and wearability. French Angora products usually contain up to 20% sheep's wool. Producers:- Until the 1960s, France was the leading producer of Angora wool. Since then it has been overtaken by China, where Angora farms count more than 50 million Rabbits. Other Angora producers are Argentina, Chile, Czech Republic and Hungary. Production And Trade:- Annual production of Angora is estimated at 2 500 to 3 000 tons a year, with about 90% of the the supply produced in China. Although China currently exports about half of its production to processors in Europe, Japan and the Republic of Korea, it is also developing a domestic processing industry.

ANGORA GOAT = АНГОРСКАЯ КОЗА (или КОЗА АНГОРСКОЙ ПОРОДЫ) – Angora Goat is the Goat that produces 'Mohair'. / Ангорская порода Коз, от Ангора – древнее название Анкары (нынешняя столица Турции), шёрстная. Выведена в древности. Шерсть полутонкая, белая, с блеском, длиной 20–25 сантиметров (см). Настриг с Козлов 5–7 килограмм (кг), с маток 3–4 кг. В настоящее время разводят в Турции, США, странах Африки, в Австралии и странах бывшего СССР.

ANGOUMOIS GRAIN MOTH = АНГУМУАЙСКАЯ ЗЕРНОВАЯ МОЛЬ – Angoumois Grain Moth (Sitatroga Cerealella (Olivier)):- Eggs are laid on or the near grain. The white larvae bore into the kernels of the grain and feed on the inside. When the larvae mature they eat their way to the outer portion of the grain, leaving only a thin layer of the outer seed coat intact. Pupation takes place just under the seed coat. When the adult emerges from the grain, it pushes aside the thin layer of seed coat leaving a small trap door covering its exit point from the kernel. They infest only the surface layer of bulk-stored grain, as adults are unable to penetrate deeply. / Ангумуайская Зерновая Моль (Sitatroga Cerealella (Olivier)):- систематическое положение:- Отряд Чешуекрылые, Семейство Выемчатокрылые Моли (Gelechiidae). Распространена в Южных регионах, где повреждает в поле Зерновые культуры в период созревания, в зернохранилищах – повсеместно. Предпочитает яровую Пшеницу, Ячмень и Кукурузу. Бабочка в размахе крыльев до 19 миллиметров (мм); передние крылья серовато-жёлтые блестящие, задние – светло-серые с широкой бахромой. Гусеница длиной до 8 мм, соломенно-жёлтая. Самка откладывает до 150 яиц в поле – на колосья и початки Кукурузы, в зернохранилищах – на поверхность зерна по одному или группами. Отродившиеся гусеницы внедряются в зерновку, питаются её содержимым, здесь же окукливаются. Развитие вредителя возможно при температуре воздуха 15–36 °C. В оптимальных условиях (при температуре 28–30 °C) поколение развивается за 29–35 дней. Гусеницы весьма чувствительны к низким температурам:- при 0 °C они погибают через 25 дней, а при –5 °C – через 9 дней. За год даёт до восьми поколений.

ANGRAKHA = АНГРАХА – Angrakha is a long robe with an assymetrical opening in the chest area reching down the knees worn by males in India.

ANGULAR LEAF SPOT = УГЛОВАТАЯ ПЯТНИСТОСТЬ ЛИСТЬЕВ – Name given to the foliar phase of the disease bacterial blight. See also Bacterial Blight, and Blackarm. / Название, данное лиственной фазе болезни бактериоза. Смотрите также Бактериоз (Bacterial Blight), и Гоммоз (Blackarm).

ANGUSTATA = УЗКОРОСЛОЕ (или СУЖЕННОЕ У ОСНОВАНИЯ) – The specific name Angustata is derived from the Latin for 'narrowed', as this plant has very long narrow leaves. Angustata:- with a narrow stem. / .

ANGUSTIFOLIA = АНГУСТИФОЛИА (или УЗКОЛИСТНОЕ) – Angustifolia:- with narrow leaves.

ANHYDRIDE = АНГИДРИД – Anhydride is a compound formed by abstraction of water, usually from an acid. Example:- acetic anhydride, which is used in converting cellulose to cellulose acetate. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate).

Под Ангидридами понимаются химические соединения, производные неорганических и органических кислот, образующиеся при их дегидратации. Например, SO_3 – ангидрид серной, $(CH_3CO)_2O$ – ангидрид уксусной кислот.

ANHYDROUS = БЕЗВОДНОЕ – Anhydrous:- devoid of water. Anhydrous:- without water. Many 'dry' chemicals may contain some water as part of the crystal structure. Although this can often be compensated for in making up formulas, it is often more convenient to use chemicals that contain no water, that is, that are anhydrous. Many dry chemicals are hygroscopic. See also Hydration Number. / Безводное . Смотрите также Число Гидратации (Hydration Number).

ANICS = ALASKAN NICS

ANIDEX FIBER = ВОЛОКНО ЭНИДЭКС (или ВОЛОКНО АНИДЕКС) – Anidex is a trade name of a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 50% by weight of one or more esters of a monohydric alcohol and acrylic acid, (CH_2=CH–COOH).

ANILINE = АНИЛИН – Aniline, C_6H_7N; also called Aniline Oil, Benzeneamine, Aminobenzene. Aniline used to be a very commonly used chemical in the synthesis of dyes. Sometimes the term 'aniline dye' is used as something of a catch-all term for synthetic dyes, though very few dyes still in production are actually aniline derivatives. Because of toxicity, aniline has been replaced with other compounds for most dye synthesis. / Под Анилином или Аминобензолом или Фениламином, от Французского слова Aniline, через Португальское слова Anil, от Арабского слова Аннил, означающее Индиго (впервые Анилин был получен из индиго), понимается $C_6H_5NH_2$, вязкая бесцветная жидкость, темнеющая на свету и воздухе; $t_{кип}$ 184.4 °C. Применяется в производстве красителей, фармацевтических препаратов, взрывчатых веществ (ВВ), полимеров, синтетических смол, ускорителей вулканизации каучука и так далее.

ANILINE DYES = АНИЛИНОВЫЕ КРАСИТЕЛИ – Aniline Dyes is a class of synthetic, organic dyes originally obtained from aniline (coal tars),and were the first synthetic dyes. Today the term is used with reference to any synthetic organic dyes and pigments, in contrast to animal or vegetable coloring materials, and synthetic inorganic pigments. Aniline dyes are classified according to their degree of brightness or their light fastness. Also called Coal Tar Dyes. Aniline Dyes are dyes derived chemically from aniline or other coal tar derivatives. See also Dyes. / стойкость (fastness). Анилиновый (Чёрный) Краситель – краситель, который образуется в результате окисления анилина непосредственно на волокне в кислой среде. Таким способом окрашивают хлопок, шерсть, мех. Окислением анилина получают также пигмент глубоко-чёрный, используемый для крашения пластмасс, при изготовлении копировальной бумаги, лент для пишущих машин и так далее.

ANILINE POINT = АНИЛИНОВАЯ ТОЧКА – Aniline Point is the minimum temperature for complete miscibility of equal volumes of aniline and the sample under test ASTM (short for the American Society for Testing and Materials) Method D611. A product of high aniline point will be low in aromatics and naphthenes and, therefore, high in paraffins. Aniline point is often specified for spray oils, cleaning solvents, and thinners, where effectiveness depends upon aromatic content. In conjunction with the American Petroleum Institute (API) gravity, the aniline point may be used to calculate the net heat of combustion for aviation fuels. / Американское Общество по Испытаниям и Материалам (АОИМ). Анилиновая Точка – критическая температура растворения нефтепродуктов в анилине.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE = СЛУЖБА ПО ИНСПЕКЦИИ ЗДОРОВЬЯ ЖИВОТНЫХ И РАСТЕНИЙ – The Animal and Plant Health Inspection Service (APHIS) is a multi-faceted Agency with a broad mission area that includes protecting and promoting US agricultural health, regulating genetically engineered organisms, administering the Animal Welfare Act and carrying out wildlife damage management activities. These efforts support the overall mission of USDA, which is to protect and promote food, agriculture, natural resources and related issues. To protect agricultural health, APHIS is on the job 24 hours a day, 7 days a week working to defend America's animal and plant resources from agricultural pests and diseases. For example, if the Mediterranean fruit fly and Asian longhorned beetle, two major agricultural pests, were left unchecked, they would result in several billions of dollars in production and marketing losses annually. Similarly, if foot-and-mouth disease or highly pathogenic avian influenza were to become established in the United States, foreign trading partners could invoke trade restrictions and producers would suffer devastating losses. In the event that a pest or disease of concern is detected, APHIS implements emergency protocols and partners with affected States to quickly manage or eradicate the outbreak. This aggressive approach has enabled APHIS to successfully prevent and respond to potential pest and disease threats to US agriculture. To promote the health of US agriculture in the international trade arena, APHIS develops and advances science-based standards with trading partners to ensure America's agricultural exports, worth more than USD50 billion annually, are protected from unjustified restrictions. In response to needs expressed by the American people and Congress, APHIS' mission has expanded over the years to include such issues as wildlife damage and disease management; regulation of genetically engineered crops and animal welfare; and protection of public health and safety as well as natural resources that are vulnerable to invasive pests and pathogens. While carrying out its diverse protection responsibilities, APHIS makes every effort to address the needs of all stakeholders involved in the US agricultural sector. Strategic Plan:- the APHIS Strategic Plan outlines the goals, objectives, and performance measures that set the direction of APHIS' work. By keeping this plan in mind as work is done and decisions are made, APHIS can be certain to carry out its mission. History:- established in 1972, the Animal and Plant Health Inspection Service (APHIS) is a relatively new Agency, but much of the important work that falls under its mission today has been the responsibility of the US Department of Agriculture (USDA) for more than 100 years. In fact, for most of the XX century, the early animal and plant health bureaus within USDA operated independently of one another. The creation of APHIS consolidated these functions. In the years since, the Agency has continued to expand its mission in order protect and preserve American agriculture. The foundation for APHIS was built in 1883 when USDA's Commissioner established the Veterinary Division, the Department's first regulatory program. One year later, the Veterinary Division became the Bureau of Animal Industry (BAI). Congress created the Bureau to promote livestock disease research, enforce animal import regulations, and regulate the interstate movement of animals. In the years to follow, positions were created within BAI to support inspection activities at US ports of entry. Regulatory activities to protect US crops began three decades later with the 1912 Plant Quarantine Act and the establishment of the Federal Horticultural Board to enforce the act. The Federal Horticultural Board was separated into various plant health bureaus in 1928. In 1953 the functions of the BAI and the various plant health bureaus became part of USDA's Agricultural Research Service (ARS). Under the ARS structure, plant and livestock responsibilities were located in either the research or regulatory division, depending on the nature of the activity. Congress passed The Animal Welfare Act (AWA) in 1966 to provide for the regulation of warm blooded animals used in research, bred for commercial sale, exhibited to the public, or commercially transported. The law requires minimum standards of animal care to be established and enforced. Today, APHIS' Animal Care program enforces the provisions of the AWA and the Horse Protection Act, which was passed by Congress in 1970. In 1971, the animal and plant regulatory functions were separated from ARS to become an entity known as the Animal and Plant Health Services (APHS) and in 1972 the meat and poultry inspection divisions of the Consumer and Marketing Service (later known as the Agricultural Marketing Service) were added to APHS (putting the 'I' into APHIS). This organizational realignment was intended to group functions that rely on similar professional disciplines together in one Agency. In 1977, however, the

Food Safety and Quality Service was established and took responsibility for meat and poultry inspections. Today, that Agency is known as USDA's Food Safety and Inspection Service. Within the APHIS structure, animal quarantine inspection activities at ports of entry were transferred from the Veterinary Services (VS) division to the Plant Protection division in 1974. As a result, the Plant Protection Division became Plant Protection and Quarantine (PPQ). In 2002 the majority of port inspection activities were transferred to the newly formed Department of Homeland Security's Customs and Border Protection. APHIS entered the Biotechnology era in 1985 when the Secretary of Agriculture designated APHIS as the agency responsible for regulating biotechnology-derived products that affect animal and plant health. In 1987 the Biotechnology and Environmental Coordination staff was established in order to perform this function within the Plant Protection and Quarantine program. In 2002, APHIS created the Biotechnology Regulatory Services program to place increased emphasis on our regulatory responsibilities for biotechnology. In 1985 Congress also transferred the Animal Damage Control (ADC) program from the US Department of the Interior's US Fish and Wildlife Service to APHIS, where it was later renamed Wildlife Services. This transfer enlarged the Agency, while adding a new facet of agricultural protection to the APHIS mission. In 1987 APHIS' international programs staff (within PPQ and VS) was given Foreign Service status, thereby increasing the influence of our personnel in the international arena. International programs staff from PPQ and VS were eventually combined to become the International Services (IS) program in APHIS. Today, IS is responsible for facilitating international trade and promoting international safeguarding. APHIS' ability to protect animal and plant health was further strengthened by the passage of the 2000 Plant Protection Act and the 2002 Animal Health Protection Act. Both laws consolidated and modernized previous animal and plant health statutes, giving APHIS more tools for safeguarding agriculture and responding to pest and disease threats. While APHIS' mission has remained essentially the same since its creation, the scope of agricultural issues the Agency oversees has grown exponentially. APHIS remains steadfast in its efforts to prevent the introduction of foreign pests and diseases and promote the health of US agriculture. The Agency's experienced cadre of scientists, veterinarians, biologists and other professionals will continue to offer innovative solutions to meet the agricultural challenges of the XXI century. Headquartered in Washington, DC, and Riverdale, MD, the United States.

ANIMAL DISEASES = БОЛЕЗНИ ЖИВОТНЫХ – Animal Diseases are diseases which are caused by bacteria, viruses, protozoa or fungi and may be transmitted to animals and humans.

ANIMAL FIBERS = ВОЛОКНА ЖИВОТНОГО ПРОИСХОЖДЕНИЯ – Animal Fibers are protein-based hair, fur, and cocoon materials taken from animals. Typical animal fibers include:- wool, mohair, llama, alpaca, cashmere, camel and vicuna and cocoon material (silk). See also Natural Fibers. Animal Fibers include wool, hair and secretions, such as silk. Animal Fibers are fibers of animal origin such as wool, alpaca, camel hair, and silk.

ANIMAL GOODS = ТОВАРЫ ЖИВОТНОВОДСТВА (или ПРОДУКТЫ ЖИВОТНОВОДСТВА) – Animal Goods are goods of animal origin. / Товары Животноводства – товары животного происхождения.

ANION = АНИОН – Anion is a negatively charged ion. Many chemicals used in textile processing are described as anionic. This means that when the chemical ionizes in solution, the ion that is 'functional' has a negative electrical charge. Most dyes are anionic. Surfactants, including some used as fabric softeners, may be anionic (others are cationic or non-ionic). See also Cation. / Под Анионом, от Греческого слова Aniōn, означающее буквально Идущий Вверх, понимается отрицательно заряженный ион; при электролизе растворов, содержащих ионы. Анион движется к положительному электроду – аноду. Смотрите также Катион (Cation).

ANISOMERIC GENES = НЕИЗОМЕРИЧЕСКИЕ ГЕНЫ (или НЕРАВНОЧЛЕННЫЕ ГЕНЫ) – Anisomeric Genes are the several genes that have one-directional and unequal effects. Their expressivity and heritability are intermediate between those of major genes and polygenes.

ANISOTROPIC = АНИЗОТРОПИЧЕСКОЕ – Anisotropic:- not having the same physical properties in every direction. In the plane of a fabric, it is related to a non-random distribution of fibers. / , от Греческих слов Ánisos, означающее Неравный, и Trópos, означающее Направление, .

ANKLE STRAP = С РЕМЕШКОМ (или ЗАВЯЗКАМИ) НА ЛОДЫЖКАХ – Ankle Strap is a type of shoe. This shoe style has a strap that encircles the ankle and is attached at the back. / Ankle = Лодыжка.

ANKLET = ШАРОВАРЫ – Anklet is a short sock reaching slightly above the ankle.

ANNATTO = АННАТО – Annatto (E160b) is a water and alcohol-soluble yellow-red dye made from the pulp surrounding the seeds in pods of the tropical American achiote tree Bixa orellana. Annatto is used as a natural food coloring (confectionary, cheese, margarine, smoked fish, custard powder, Caribbean cuisine) and as a fabric or leather dye. South American tribes used the brick-red triangular seeds for body paint and lipstick. / семена в бобах тропического Американского дерева Ачиотэ или Биксы Американской (Bixa Orellana). Южно-Американские племена использовали . Аннато – красный краситель растительного происхождения. Аннато:- Естественный неброский цвет варёного мяса, по сложившимся традициям, к сожалению, не особо привлекает большинство потребителей в продукции мясной индустрии. Потому в мясной промышленности широко применяются ингредиенты для восстановления и коррекции цвета мясных продуктов. Мясная промышленность потребляет 15% (в денежном выражении, по состоянию на 2009) производимых во всем мире натуральных красителей. Очень широко в мясной промышленности используется натуральный жёлто-оранжевый краситель Аннато (E160b). Краситель относится к группе каротиноидов. Водорастворимая форма Аннато (пигмент норбиксин) имеет способность образовывать прочные комплексы с белками. Благодаря этой способности Аннато хорошо подходит для окраски оболочек (как натуральной черевы, так и белкозиновой). Для получения рыжего или яркого красно-коричневого оттенка следует внести 50–100 грамм красителя на 10 литров воды (дозировка указана для красителя с концентрацией пигмента около 1%). Подготовленную оболочку необходимо погрузить в приготовленный раствор на 2–3 часа и более в зависимости от желаемой интенсивности окрашивания. Краситель растворяют в холодной мягкой воде, и мясные изделия погружают в раствор на 2–5 минут до получения необходимой окраски. Для окрашивания копчёностей этот краситель также иногда комбинируют с натуральным коричневым красителем Карамель, причем из четырёх её видов в мясной промышленности используют только E150c и E150d. Наиболее подходящим для сочетания с Аннато типом Карамели и по оттенку и с технологической точки зрения является E150c. Если необходимо придать копчёностям несколько более яркий оранжевый оттенок, к Аннато прибавляют немного Кармина. Аннато применяют при производстве следующих мясопродуктов:- (i) варёные колбасные изделия в натуральной оболочке, колбасы высшего, первого и второго сортов; сосиски высшего и первого сортов; сардельки высшего, первого и второго сортов; (ii) продукты из свинины и говядины варёные, копчёно-варёные, копчёно-запечёные; и (iii) продукты из мяса кур запечённые и копчёно-варёные. В литературе можно встретить информацию, что Аннато обладает антисептическими и гипотоническими свойствами. Для получения золотисто-жёлтого оттенка Аннато иногда смешивают с натуральным красителем Куркумином (Турмерик) (E100).

ANNEALING = ОТЖИГ (или ЗАКАЛКА) – Annealing is a formation of fully or partially double-stranded DNA molecules from complimentary single-stranded molecules. / формирование полностью или частично молекул двунитевой или двухцепочечной ДНК.

ANNEX F = ПРИЛОЖЕНИЕ ЭФ. – In the United States, Annex F:- written specifications of the application-body document type definition (EFS' filename is application-body.dtd) agreed to by the United States Patent and Trademark Office (USPTO), the World Intellectual Property Organization (WIPO), the European Patent Office (EPO), and the Japan Patent Office (JPO).

ANNIVERSARY BILLING = ЮБИЛЕЙНОЕ ВЫСТАВЛЕНИЕ СЧЁТА – Anniversary Billing is a method of billing where the client is billed for one month of storage once inventory is received. If this product remains in inventory, it will be billed an additional monthly charge each month on the anniversary of its arrival.

ANNOUNCEMENT DATE = ДАТА АНОНСИРОВАНИЯ (или ДАТА ОБЪЯВЛЕНИЯ) – Announcement Date is the date on which a company first publicly announces an impending stock split. / Дата, на которую компания впервые публично анонсирует предстоящее дробление капитала.

ANNUAL = ОДНОЛЕТНИК (или ОДНОЛЕТНЕЕ) – Annual is a plant that naturally completes its life cycle, from seed to seed, in one year. Annual:- (i) yearly; (ii) used for plants which complete their life cycle (seed to seed production and death) in 1 year or less. Annual is a plant which completes its life cycle within one year after germination. / , от Латинского слова Annus, означающее Год, . Под Однолетними Растениями или Однолетниками понимаются травы, жизненный цикл которых (от семени до семени и полного отмирания особи) завершается в течение года. Однолетние растения, развитие которых завершается в несколько недель, называют Эфемерами. Яровые однолетние растения прорастают Весной и отмирают до наступления Зимы (продолжительность их жизненного цикла от 1–2 до 4–5 месяцев. К ним относятся яровые хлеба (Овёс, Пшеница, Рожь, Ячмень), Горох, Гречиха, Лён и многие Сорняки – Куколь, Лебеда, Белая Марь, Овсюг. Озимые однолетние растения, осеменяясь Осенью, сразу же прорастают, образуют прикорневую розетку листьев, зимуют под снегом, а Весной отрастают, затем цветут, плодоносят и к Осени отмирают (их развитие, хотя и длится менее одного года, захватывает два вегетационного периода). К ним помимо озимых Пшеницы и Ржи относятся многие Сорняки – Василёк, Ржаной Костёр, Пастушья Сумка, Ярутка и другие. Под Однолетниками понимаются растения, проходящие свой жизненный цикл в течение одного вегетационного периода (обычно за 2–5 месяцев):- Гречиха, Лён, Просо, яровая Пшеница и другие. Особенно быстро развивающиеся однолетники называются Эфемерами. Однолетник:- растение, живущее только один год.

ANNUAL CHARTS = ГОДОВЫЕ ГРАФИКИ (или ЕЖЕГОДНЫЕ ГРАФИКИ) – Annual Charts:- graphical representation of price where the time interval is one year for each bar or candle. Also known as Yearly Charts. / Графическое отображение цены, где временным интервалом для каждого штриха или свечи служит один год. Известны также как Погодовые Графики (Yearly Charts).

ANNUAL DIVIDEND RATE = ГОДОВАЯ СТАВКА ДИВИДЕНДА – Annual Dividend Rate:- dividend, or portion of a company's profit paid to shareholders, divided by the number of common shares outstanding (usually a weighted average of the number of shares outstanding over the reporting period). / Дивиденд или часть прибыли компании, выплачиваемые акционерам, делённые на число обыкновенных акций ().

ANNUAL EFFECTS = ЕЖЕГОДНЫЕ ЭФФЕКТЫ (или ГОДОВЫЕ ЭФФЕКТЫ) – Annual Effects:- the total effects in energy use (measured in MegaWatthours) and peak load (measured in kiloWatts) caused by all participants in the Demand-Side Management (DSM) programs that are in effect during a given year. It includes new and existing participants in existing programs (those implemented in prior years that are in place during the given year) and all participants in new programs (those implemented during the given year). The effects of new participants in existing programs and all participants in new programs should be based on their start-up dates (i.e. if participants enter a program in July, only the effects from July to December should be reported). If start-up dates are unknown and cannot be reasonably estimated, the effects can be annualized (i.e. assume the participants were initiated into the program on January 01 of the given year). The Annual Effects should consider the useful life of efficiency measures, by accounting for building demolition, equipment degradation and attrition.

ANNUAL GENERAL MEETING = ГОДОВОЕ ОБЩЕЕ СОБРАНИЕ (или ЕЖЕГОДНОЕ ОБЩЕЕ СОБРАНИЕ) – Annual General Meeting is an annual meeting of shareholders required by law where directors inform shareholders of company performance and future prospects. Shareholders vote on board elections and significant company issues. Shareholders' meeting, required by law to be held yearly by every public company. An Annual General Meeting (AGM) is normally used to discuss the annual report and accounts, to announce dividends and to elect auditors and directors. This is often the only opportunity the shareholders have to air their views.

ANNUAL GROWTH RINGS = ГОДИЧНЫЕ КОЛЬЦА ПРИРОСТА – Annual Growth Rings:- the layer of wood growth added each growing season to the diameter of the tree. In the temperate zone the annual growth rings of many species such as oaks and pines are readily distinguished because of differences in the cells formed during the early and late parts of the seasons. / виды (species). У растений под Годичными Кольцами понимаются слои прироста древесины, образованные камбием в результате сезонной периодичности его деятельности. Годичные кольца роста хорошо видны на спиле ствола дерева. Они позволяют определить возраст растений, климаты прошлого и прогнозировать их, а также устанавливать возраст археологических находок.

ANNUAL INVENTORY = ГОДОВАЯ ИНВЕНТАРИЗАЦИЯ (или ЕЖЕГОДНЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ, или ЕЖЕГОДНЫЕ СКЛАДСКИЕ ЗАПАСЫ) – Annual Inventory:- physical count of all product in the warehouse done on a yearly basis.

ANNUALIZED = В ГОДОВОМ ИСЧИСЛЕНИИ – Annualized:- the translation of periods of less than a year into an annual rate for comparative purposes. To annualize quarterly figures, user multiply them by four. The process of converting a number to an annual value, if less than a year's data is available for a specific calculation. It is generally done to correctly compare ratios which are usually based on annual performance, such as Inventory Turn Rate and Gross Margin Return On Inventory (GMROI). / .

ANNUALIZED RETURN = ОТДАЧА ПО ГОДУ (или ОТДАЧА ЗА ГОД, или ОТДАЧА В ГОДОВОМ ИСЧИСЛЕНИИ) – Annualized Return is the return or profit, expressed on an annual basis, the writer of the option contract receives for buying the shares and writing that particular contract. See also Buy and Write.

ANNUAL MEETING = ГОДОВОЕ СОБРАНИЕ (или ЕЖЕГОДНОЕ СОБРАНИЕ) – An Annual General Meeting (commonly abbreviated as AGM, also known as the Annual Meeting) is a meeting that official bodies, and associations involving the general public (including companies with shareholders), are often required by law (or the constitution, charter, by-laws etc governing the body) to hold. An AGM is held every year to elect the board of directors and inform their members of previous and future activities. It is an opportunity for the shareholders and partners to receive copies of the company's accounts as well as reviewing fiscal information for the past year and asking any questions regarding the directions the business will take in the future. Public companies in the United States:- every

state requires public companies incorporated within it to hold an annual general meeting of shareholders to elect the Board of Directors and transact other business that requires shareholder approval. Notice of the annual general meeting must be in writing and is subject to a minimum notice period that varies by state. In 2007, the Securities and Exchange Commission voted to require all public companies to make their annual meeting materials available online. The final rules required compliance by large accelerated filers beginning on January 01, 2008, and by all other filers beginning on January 01, 2009. The 'e-proxy' rules allow two methods for companies to deliver their proxy materials, the 'notice only' option or the 'full set' option. Under the notice only option, the company must post all of its proxy materials on a publicly accessible website at the time of their mailing. Private companies in Great Britain:- in Great Britain it became optional with effect from 01 October 2007 for any private company to hold an AGM, unless its articles of association specifically require it to do so. Attending the general meeting:- (i) President or Chairman (who chairs the meeting); (ii) Secretary (who prepares the minutes); and (iii) Recount clerk (who reviews the stock ledger). Annual Meeting is a yearly meeting of shareholders at which directors are elected and other general business of the corporation is conducted. / Годовое или Ежегодное Собрание – собрание, происходящее раз в год, на котором управляющие компании отчитываются перед акционерами о результатах работы за год, а также избирается совет директоров на следующий год. Высший исполнительный работник обычно рассказывает о перспективах компании на будущий год и вместе со старшими исполнительными работниками отвечает на вопросы акционеров. Акционеры могут также потребовать провести голосование по резолюции о политике компании с участием всех, кто владеет акциями компании. Акционеры, которые не могут присутствовать на ежегодном собрании, имеют возможность участвовать в выборах директоров и принятии резолюции с помощью специальной доверенности (proxy), рассылаемой в установленном законом порядке всем зарегистрированным акционерам.

ANNUAL PERCENTAGE RATE = ГОДОВАЯ ПРОЦЕНТНАЯ СТАВКА – Annual Percentage Rate (APR) is a measure of the cost of credit, expressed as a yearly rate. It includes interest as well as points, broker fees, and certain other credit charges that you are required to pay. Because all lenders follow the same rules when calculating the APR, it provides you with a good basis for comparing the cost of loans, including mortgages, over the term of the loan. Annual Percentage Rate (APR) is the cost of credit on a yearly basis expressed as a percentage. The cost of credit, expressed as a yearly rate. For closed-end credit, such as car loans or mortgages, the APR includes the interest rate, points, broker fees, and other credit charges that the borrower is required to pay. An APR, or an equivalent rate, is not used in leasing agreements. / Годовая Процентная Ставка (ГПС (APR)):- стоимость кредита для клиента выражается в виде простой годовой процентной ставки. Согласно Федеральному Акту о Достоверности Информации в Кредитовании (Truth in Lending Act) в любом соглашении о предоставлении потребительского займа годовая процентная ставка должна указываться прописным закрытым шрифтом.

ANNUAL REPORT = ГОДОВОЙ ОТЧЁТ (или ЕЖЕГОДНЫЙ ОТЧЁТ) – Annual Reports:- all companies, public or private, are generally required to produce an annual report for their shareholders. Private companies have more flexibility in this regard and the report requirement may be waived or diminished as deemed by its owners. Public companies are required, by law, to produce annual reports and quarterly reports on their operations AND file these so that they can be accessed by shareholders as well as the general public (among which there may be future shareholders). At a minimum, these reports must contain complete financial statements (Income, Balance Sheet, Cash Flow) and various management discussions. In Canada, all public company documents can be readily accessed on the internet through SEDAR at www.sedar.com. The US equivalent is EDGAR, i.e. http://www.edgar-online.com. Annual Report is a required annual filing in a state, usually listing directors, officers and financial information. Also, an annual statement of business and affairs furnished by a corporation to its shareholders. Annual Report is a popular term for the yearly report made by a company to its stockholders. The US Federal law requires all registered corporations to make such reports. They usually contain a balance sheet, an income statement, a list of changes in retained earnings, and how income of the corporation was used. The formal financial statement issued yearly by a publicly owned corporation. The report shows assets, liabilities, revenues, expenses and earnings. The report also shows the company's financial condition at the close of the business year and other basic information of interest to shareholders. An Annual Report is an audited corporate document that details the business activity and financial status of a publicly held company over the previous year. The US Securities And Exchange Commission (SEC) requires all public companies to distribute an annual report to shareholders at the end of each fiscal year. Each report contains the three main financial statements:- The Income Statement, Cash Flow Statement and Balance Sheet as well as a host of other company-related data. Although the annual report provides a variety of important financial data, investors can find much more detailed annual and quarterly analysis in the 10K and the 10Q reports. The SEC requires all publicly traded companies to file the 10K and the 10Q on an annual and quarterly basis, respectively. Annual Report is a report to the stockholders of a company which includes the company's annual, audited balance sheet and related statements of earnings, stockholders' or owners' equity and cash flows, as well as other financial and business information. In the context of the Australian sharemarket, the Annual Report is a financial report or statement issued by a publicly listed company to its shareholders. The annual report contains a statement of financial performance, a statement of financial position, a statement of cash flow, as well as notice of the Annual General Meeting (AGM) and business resolutions to be discussed. / :- Отчёт о Прибылях и Убытках (Income Statement), Отчёт о Движении Денежных Средств (Cash Flow Statement) и Бухгалтерский Баланс (Balance Sheet). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Годовой Отчёт или Ежегодный Отчёт – отчёт совета директоров об организационно-финансовом состоянии корпорации, который должен распространяться среди акционеров согласно правилам Комиссии по Ценным Бумагам и Биржам (Securities And Exchange Commission). В отчёт включаются описание операций компании, а также балансовая ведомость и отчёт о поступлениях. Более подробная версия ежегодного отчёта, называемая 10-К, с детализированной финансовой информацией может быть представлена по требованию акционера секретарём компании.

ANNUAL RINGS = ГОДИЧНЫЕ КОЛЬЦА – Annual Rings are layers of wood laid down each year by the vascular cambium of woody plants, typically in trees. During the season of active growth in the vascular cambium, xylem cells are being added to the circumference of the xylem tissue. At the start of the growing season the cells grow fast and are large, but as the season progresses towards the dormant period fewer smaller cells are produced and growth eventually stops as the plant becomes dormant. The difference in size of the xylem cells laid down at the start and later in the growing season forms a line within the wood marking the boundary of an annual ring. The size of the xylem cells is also affected by the growing conditions. Hence changes in the width of annual rings can indicate changes in the climate. / У растений под Годичными Кольцами понимаются слои прироста древесины, образованные камбием в результате сезонной периодичности его деятельности. Видны на спиле ствола дерева. Позволяют определять возраст растений, климаты прошлого и прогнозировать их, а также устанавливать возраст археологических находок.

ANNUAL TRANSMISSION COSTS = ЕЖЕГОДНЫЕ ЗАТРАТЫ НА ПЕРЕДАЧУ (или ЕЖЕГОДНЫЕ ИЗДЕРЖКИ НА ПЕРЕДАЧУ) – Annual Transmission Costs are the total annual cost of the Transmission System shall be the amount specified in Schedule 1 until amended by the Transmission Provider or modified by the Commission.

ANNUAL YIELD = ГОДОВАЯ ДОХОДНОСТЬ (или ЕЖЕГОДНАЯ ДОХОДНОСТЬ, или ДОХОДНОСТЬ ПО ГОДУ, или ДОХОДНОСТЬ ЗА ГОД, или ДОХОДНОСТЬ В ГОДОВОМ ИСЧИСЛЕНИИ) – Annual Yield represents the dividend return from an

investment. It is calculated by dividing the dividend per share by the share price, converted to a percentage. Yield = (Dividend Per Share / Last Market Price) x 100. Also known as Dividend Yield.

ANNUITY = АННУИТЕТ (или ЕЖЕГОДНЫЙ ПЛАТЁЖ) – Annuity is a series of equal payments made at regular intervals, with interest compounded at a specified rate. An Annuity is a series of identical fixed payments to be made for a specified number of years. Annuities are investment structures that defer taxes on earnings within the account. Once the annuitant reaches age 59.5, distributions can be taken, but it is not required. When distributions are taken, earnings are added to annual income for tax purposes, while the principal is tax-free since contributions are after-tax Dollars. Many types of annuities are available. Annuities come in three basic flavors:- fixed, variable and indexed. Before you can choose what annuity is best for you, you must establish the purpose of the investment. An investor who wants growth, is comfortable with market fluctuations and has the time frame to withstand market ups and downs should look at variable annuities. Investors seeking to preserve assets with no fluctuations to the principal are drawn to the guaranteed returns of fixed annuities. Indexed annuities are a hybrid of fixed and variable annuities in which there is a minimum guarantee when the market is down but higher growth potentials when the market is up. Insurance companies offer deferred annuities, therefore, the security of your investment lies in the financial strength of the insurance company selling the annuity. This is especially true for fixed annuities with which investors are seeking conservative returns while protecting principal assets. Though not always considered as important with variable annuities, it is still a top consideration since you want the guarantee that distributions will be paid on time and to the appropriate value when you need the money. Insurance companies are rated by third-party rating companies such as Moody's and Standard and Poor's. These companies look at the financial strength of the underlying investments in the company as well as the ability for the company to pay an unusually high amount of benefits in any one period without being financially devastated. Look for A, AA or AAA grades, designating top-rated companies. After sitting down with an investment adviser, you decided an annuity was a great fit for you. Once you sign the paperwork and pay the initial payments, you are issued an annuity contract. Every state insurance commissioner requires investors receive a time period to review the contract to decide if the terms and conditions are acceptable. This is called a Free-Look Period because there is no penalty for canceling the annuity and getting your money back during this time. Go through the annuity to confirm how many years the annuity is for, called the Surrender Period. Make sure you understand how the fees in the surrender period affect your money if you withdraw money before the period is over. Look for any riders or waivers that allow you to access money quicker and penalty-free under special circumstances, such as disability or the need for long-term care. Ask the financial adviser any questions you have before the free look period expires, usually anywhere from 10 to 30 days. Annuity is series of payments, usually payable at specified time intervals. Annuity is a low-risk interest-bearing investment vehicle most suitable for retirement savings. Annuities are comparable to certificate of deposits (CDs) issued by banks, however annuities are lower risk and more liquid. In addition, annuities are tax-deferred and for the most part, offer higher returns than other investment vehicles such as bonds, CDs, and money market accounts. Identification:- oftentimes, investors that want a guaranteed income stream during retirement buy annuities. An annuity requires an initial deposit ranging anywhere from USD5 000.00 to USD1 million, known as the Premium. This premium locks in a return of 3 percent to 10 percent. Therefore, a 10 percent annuity locks in a 10 percent return on the premium. Generally, annuities offer tax sheltering by reducing your taxable income for the current year. In addition, any earnings from the annuity grow tax-free until you begin to receive payouts. Types:- there are two distribution models for an annuity:- immediate or deferred. An immediate distribution annuity immediately begins issuing monthly payments. These payments are either fixed or variable depending on what terms you agree to. Immediate annuities are usually set up to last your whole life and are generally based on a large initial deposit from something like lottery winnings. The deferred distribution model is set up to allow an investor to contribute and accumulate money over your working life for retirement purposes. The money is able to grow tax-free during the maturity period and until you choose to take distribution of the annuity. Features:- annuities have several features unique to this investment medium. There is a higher guaranteed rate of return than most other comparable investment vehicles. In addition, annuities provide tax sheltering. There are no taxes paid on the money until withdrawals begin. Another popular feature of annuities is the secure principal. Generally, there is no chance that the investor's principal will be lost. This is an attractive feature to low-risk investors and those saving for retirement. Annuities offer a lifetime income option, and payments can be set up to pay out over the remainder of your life, once withdrawals begin. Finally, many annuities offer a bailout provision, which protects against interest rate fluctuations. Advantages:- an important advantage of annuities is they are very low-risk. Money will only be lost if the insurance company goes bankrupt and your investment is more than state annuity guaranty limits. In addition, annuities are ideal for retirement income because of the guaranteed monthly retirement checks. The annuity contract locks your rate for a specified time, and solid returns with rates between 3 percent to 10 percent are common depending on maturity periods. Another unique feature of annuities is the investor is able to withdraw a limited amount of money annually without penalty. Disadvantages:- there are a few disadvantages associated with annuities. Since annuities are structured to be long-term investments, early withdrawal penalties are significant from both the US Internal Revenue Service (IRS) and the holding insurance company. There is a 10 percent tax penalty charged by the IRS for withdrawal before the age of 59 ½. The insurance company will also charge you a penalty for any withdrawals over the allowed yearly allotment. Finally, once the money is distributed it is taxed as ordinary income not capital gains. Annuity is a sum of annual interest and redemption payments. In the case of annuity redemption, this amount is constant over the entire life of the loan, with the capital redemption component increasing annually in line with the reduced interest payment. / Мудиз Инвэстоз Сёвис Лимитид (Moody's Investor Service Ltd) . Стэндод энд Поз (Standard & Poor's). Аннуитет это серия тождественных фиксированных платежей, которые должны быть произведены за указываемое количество лет. если порядки и условия . Аннуитет – один из видов контрактов страховых компаний, гарантирующий выплату фиксированных или варьирующих (переменных) сумм ренты (пенсии) (variable annuity) в некоторый период времени в будущем, обычно по достижении клиентом пенсионного возраста. Выплаты фиксированных сумм (fixed annuity) происходят регулярно, меняется только способ выплат. При варьирующих (переменных) суммах выплаты основаны на гарантированном числе пунктов; стоимость одного пункта и сумма выплат зависят от оценки базовых вложений. Капитал, вложенный в контракт на получение ренты (пенсии), пользуется отсрочкой налогообложения (tax deferred). Ключевыми соображениями при покупке контракта на получение ренты (пенсии) являются репутация страховой компании, прибыль, которую она выплачивала в прошлом, а также уровень выплат и комиссионных, уплачиваемых продавцам. Аннуитет, от Латинского слова Annuitas, означающее Ежегодный Платёж:- (1) один из видов срочного государственного займа, по которому ежегодно выплачиваются проценты и погашается часть суммы; (2) равные друг другу денежные платежи, выплачиваемые через определённые промежутки времени в счёт погашения полученного кредита, займа и процентов по нему.

ANNULAR = ПЕРСТНЕВОЕ (или КОЛЬЦЕВОЕ, или КОЛЬЦЕОБРАЗНОЕ) – Annular:- ring-like.

ANNULAR NAIL = КОЛЬЦЕОБРАЗНЫЙ ГВОЗДЬ – Annular Nail:- pallet nail with annular (circular ring) threads rolled onto the shank.

ANNULATE = ОКОЛЬЦОВАННОЕ (или ЗАКОЛЬЦОВАННОЕ, или КОЛЬЦЕОБРАЗНОЕ, или КОЛЬЧАТОЕ, или С КОЛЬЦАМИ) – Annulate:- ringed or banded.

ANODES = АНОДЫ – Anodes are positively polarized electrodes in an electrolytic cell; copper content about 99.5%. / Под Анодом, от Греческого слова Ánodos, означающее Восхождение или Движение Вверх, понимается электрод радио- или электротехнического прибора, устройства (например, электровакуумного прибора, гальванического элемента, электролитической ванны), характеризующийся тем, что движение электронов (во внешней цепи) направлено от него (к катоду). В электролитической ванне, электронных и других приборах анод соединяется с положительным полюсом источника электрического тока.

ANODE SLIMES = АНОДНЫЕ ШЛАМЫ – Anode Slimes are a product of the copper tankhouse which settles on the bottom of an electrolytic cell as the copper anodes dissolve and which also adheres to the remains of the anodes. The precious and non-soluble components of the anode are enriched in the anode slimes, e.g., silver, gold, selenium, lead. / Под Шламом, от Немецкого слова Schlamm, означающее буквально Грязь, понимается в том числе и порошкообразный продукт, содержащий обычно благородные металлы, выпадающие в осадок при электролизе меди, цинка и других металлов.

ANOMALY SWITCH = АНОМАЛЬНОЕ ПЕРЕКЛЮЧЕНИЕ – Anomaly Switch is a technique used in the active management of a bond portfolio. Anomaly switching involves moving between stocks with similar volatility, thereby taking advantage of temporary anomalies in price.

ANORAK = АНОРАК (или XX) – Anorak:- (chiefly British) parkaanorak; (chiefly British) parka. / Куртка с капюшоном.

ANP = AGÊNCIA NACIONAL DO PETRÓLEO, GÁS NATURAL E BIOCOMBUSTíVEIS = NATIONAL AGENCY OF PETROLEUM, NATURAL GAS AND BIOFUELS

ANPRM = ADVANCE NOTICE OF PROPOSED RULEMAKING

ANR = AVERAGE NOT READY

ANR = AVERAGE NUMBER OF RUNS

ANS = ALASKA NORTH SLOPE

ANSI = AMERICAN NATIONAL STANDARDS INSTITUTE

ANSI X12 = ЭЙ.ЭН.ЭС.АЙ. ЭКС.12 – ANSI (American National Standards Institute) X.12 is the official name of the standard. Textual references are also made using the terms US ANSI X.12, X12, and ANSI X12. It is a standard which has been adopted by the American National Standards Institute, a private, non-profit organization responsible for the development and approval of voluntary consensus standards in the United States. It's membership is comprised of over 1 000 companies and organizations. ANSI ASC X.12 (short for the ANSI Accredited Standards Committee X.12) is composed of government and industry members from North America. It was chartered in 1979 by ANSI to develop uniform standards for electronic data interchange documents. This committee has a long history and continues to reach for new milestones in its history. By 1997, it is expected to align itself with EDIFACT, United Nations Electronic Data Interchange for Administration, Commerce, and Transport. Many recognizable names are on the ASC X.12 800 name membership list including 3M, Xerox, Pillsbury/Grandmet, and Texaco. The ASC X.12 body comes together three times each year to develop and maintain standards. They recently met in June of 1996, but have not posted minutes of the meeting yet on the web site http://www.disa.org. Proposed standards are approved through a consensus process before a standard or a change to a standard is approved and registered with ANSI. The ASC X.12 Standards that have been designated as American National Standards are Version 3 published in March 1992 and Version 2 published in 1986. The most current release is Release 3060 priced at USD215.00 for members and USD415.00 for non-members. Since 1979, this standard has been updated and changed. These changes have been described using terms like versions, releases, and subreleases. ANSI X.12 is a large standard with over 200 transaction sets attached to it. Each of these transaction sets supports a business function such as warehousing, insurance, purchasing, and finance. The Federal Government of the United States has endorsed the use of the ANSI X.12 standards for Electronic Commerce/Electronic Data Interchange with the government. This selection was made because so many in private industry in the United States were already in compliance with ANSI rules for standards development. The government felt that it was investing in a mature and tested methodology and that would result in potential for quick implementation and a large trading partner base in the United States. The gradual alignment of ANSI X.12 with EDIFACT in 1997 is forecasted to help everyone benefit from a single global EDI standard. ANSI ASC X.12 is supported by the Data Interchange Standards Association, Inc. (DISA), a not-for-profit corporation which manages the ASC X.12 membership, balloting processes, standards development and maintenance, publications, and communications with ANSI. DISA can be reached at 703-5487005. The web site maintained by DISA is at http://www.disa.org. The entire membership list can be found there along with the product catalog. The problem addressed by this standard involves the transmission of a business document. Transaction sets were devised that become the electronic equivalent of a business document. The user encloses transactions sets in electronic envelopes, and ships the documents to the intended receiver. If the message is to be received in the way the sender intends, the computers must communicate accurately using a number of components to facilitate the communication. The standard addresses a syntax or set of rules for structuring the data, a data element directory, a code directory, a segment directory, and a message directory. At an overview level, we can say that all documents within the standard are based on the same agreed format, using similar structures and labels. The transaction sets provide the details for a number of different documents. A transaction set is equivalent to documents such as a purchase order, an invoice, or a shipping notice. Within the transaction set, the data elements and data segments are defined. It becomes more detailed from there. The standard has been implemented by a wide variety of vendors and is used by a variety of industries. Some of the transaction set names illustrate the variety:- 130 Student Educational Record (Transcript); 151 Electronic Filing of Tax Return Data Acknowledgment; 170 Revenue Receipts Statement; 186 Laboratory Reporting; 213 Motor Carrier Shipment Status Inquiry; 269 Application for Mortgage Insurance Benefits; 272 Property and Casualty Loss Notification; 324 Vessel Stow Plan (Ocean); 360 Tariff Information (Ocean); 421 Estimated Time of Arrival and Car Scheduling; 440 Shipment Weights; 840 Request for Quotation; 850 Purchase Order; 860 Purchase Order Change; 870 Order Status Report. Another type of ANSI ASC X.12 standard is the control and foundation standard. A sampling of these are listed:- (i) X12.3 Data Element Dictionary; (ii) X12.5 Interchange Control Structure; (iii) X12.6 Application Control Structure; (iv) X.12.22 Segment Directory; and (v) X12.58 Security Structures. The value of this standard translates in to saved Dollars and quicker more accurate transactions for the trading partners who are using the standard for electronic exchange of these documents in the course of doing business with one another. A closely related standard is EDIFACT. It is felt by some that EDIFACT is becoming the foremost international EDI standard. The encouraging fact is that ANSI ASC X.12 and EDIFACT appear to be working together to reach alignment. At the end of 1995, ASC X.12 balloted its members with regard to migration to EDIFACT and the result was a vote favorable toward the migration. Some feel that most US companies will opt to implement the requirements of both standards until such time as a migration strategy is developed to assist companies in migrating to whatever is developed out of the 1997 planned alignment effort. Others feel that the length of time required to get thousands of people involved in the process of standards development can be totally avoided by using the Internet for finding trading partners and doing business with them using the strength of Internet mail transport protocols and either public or private

security features. Other proprietary EDI communities include ODETTE, Organization for Data Exchange Through Tele-transmission in Europe; SWIFT, Society for Worldwide Interbank Financial Telecommunications; and TDI, Trade Data Interchange. Where the Standard is Available in Full Text and Cost:- I did not locate the full text of the standard on a Web site. I did locate the order information at the Data Interchange Standards Association web site. DISA is located at 1800 Diagonal Road, Suite 200, Alexandria, Virginia 22314. Orders are phoned to 1-888-3632334 or a PDF Order Form can be used. The ASC X12 Standards that have been designated as American National Standards are Version 3 published in March 1992 and Version 2 published in 1986. The cost of the 1992 product is USD175.00 for members and USD335.00 for non-members. The most current release is Release 3060 priced at USD215.00 for members and USD415.00 for non-members. Numerous choices are given in the product catalog for ordering the format you can best use. CD-ROM and diskettes along with paper are available. Prices vary. ANSI X12 is a standard for inter-industry electronic interchange of business transactions. ASC X12 (also known as ANSI ASC X12) is the official designation of the US national standards body for the development and maintenance of Electronic Data Interchange (EDI) standards. The group was founded in 1979, and is an accredited standards committee under the American National Standards Institute (ANSI). The acronym stands for 'American National Standards Institute Accredited Standards Committee X12', with the designation of X12 being a sequential designator assigned by ANSI at the time of accreditation with no other significance. ASC X12 has sponsored more than 315 X12-based EDI standards and a growing collection of X12 XML schemas for health care, insurance, government, transportation, finance, and many other industries. ASC X12's membership includes 3 000+ standards experts representing over 350 companies from multiple business domains. The Accredited Standards Committee (ASC) X12, chartered by the American National Standards Institute in 1979, develops electronic data interchange (EDI) standards and related documents for national and global markets. With more than 315 X12 EDI standards and a growing collection of X12 XML schemas, ASC X12 enhances business processes, reduces costs and expands organizational reach. ASC X12's diverse member base includes 3 000+ standards experts representing over 340 companies from multiple business domains, including communications, finance, government, insurance, supply chain and transportation. The ANSI Standard X.12 is quite complete and defines 10s of 1 000s of separate codes used in 1 000's of data elements used in 100s of data segments to form dozens of transaction sets for practically any transaction, acknowledgement, confirmation, enquiry, or update required in commerce. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ANSWERBACK = ОТЗЫВ – Answerback:- code name of a telex subscriber, printed automatically by the telex machine at the start and finish of every SWIFT message. Answerbacks are unique to the individual user and are used to identify the Receiver. / Кодовое название телексного подписчика, автоматически печатаемое телексным аппаратом в начале и конце каждого сообщения Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). Отзывы уникальны для каждого конкретного пользователя и используются с целью идентификации Получателя. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ANTAGONISM = АНТАГОНИЗМ – Antagonism:- in plant nutrition, the interference of one element with the absorption or utilization of an essential nutrient by plants. / Под Антагонизмом, от Греческого слова Antagōnisma, означающее Борьба или Спор, понимается противоречие, характеризующееся непримиримой борьбой враждебных сил, тенденций. В обществе антагонизм между противоположными классами разрешается в результате классовой борьбы, переворота.

ANTAGONIST = АНТАГОНИСТ – Antagonist is an organism (usually pathogen) which does no significant damage to the host but its colonization of the host protects the host from significant subsequent damage by a pest. / В анатомии и физиологии под Антагонистами, от Греческого слова Antagōnisma, означающее Борьба или Спор, понимаются мышцы, действующие одновременно (или поочерёдно) в двух противоположных направлениях, например, мышцы – сгибатели и разгибатели конечностей; противостоящие друг другу зубы верхней и нижней челюстей.

ANTAGONISTIC SYMBIOSIS = АНТАГОНИСТИЧЕСКИЙ СИМБИОЗ – Antagonistic Symbiosis is a symbiotic association which is destructive to one of the symbionts or partners involved in the association. / Под Симбиозом, от Греческого слова Symbiōsis, означающее Сожительство, понимаются формы существования двух организмов разных видов, включая паразитизм (антагонистический симбиоз). Часто симбиоз взаимовыгоден для обоих симбионтов (мутуалистический симбиоз):- например, симбиоз между раком-отшельником и актинией, между животными (человеком) и микроорганизмами, образующими нормальную кишечную флору, и тому подобным.

ANTEAPICAL = АНТЭАПИКАЛЬНОЕ (или ПРЕДВЕРХУШЕЧНОЕ) – Anteapical:- just near the apex. / Под Антэапикальным, от Латинских слов Ante, означающее Перёд, и Apex, означающее Верхушка, понимается .

ANTENNA = АНТЕННА (или УСИК, или СЯЖОК) – Antenna (insects) is a movable segmented appendage occurring in pairs on the head of an insect. / Под Антенной, от Латинского слова Antenna, означающее Мачта или Рей, или Усиком или Сяжком понимается многочленистый подвижный головной придаток у Членистоногих, исключая Паукообразных. У большинства – орган чувств.

ANTENNAL BASE = ОСНОВАНИЕ АНТЕННЫ (или ОСНОВАНИЕ УСИКА, или ОСНОВАНИЕ СЯЖКА) – Antennal Base is a fixed area around the point of origin of the antenna.

ANTENODAL = АНТЭНОДАЛЬНЫЙ (или ПРЕДУЗЛОВОЙ) – Antenodal:- any area before or preceding a node in an insect's wing.

ANTHAM = ANTWERP–HAMBURG RANGE

ANTHER = ПЫЛЬНИК – Anther is the male part of a flower producing pollen, usually on a filament. Anther and filament together are described as a stamen. Anther is the saclike structure of the male part (stamen) of a flower in which the pollen is formed. Anthers normally have two lobes or cavities that dehisce at anthesis and allow the pollen to disperse. / Пыльник – мужской орган цветка, производящий пыльцу, обычно на тычиночной нити. Пыльник и тычиночная нить описываются как тычинка. Пыльник – структура типа мешочка мужского органа (тычинки (stamen)) цветка, в которой . Под Пыльником понимается часть тычинки, в которой образуется пыльца. У цветковых растений обычно четырёхгнёздный. Гнездо пыльника – микроспорангий, или пыльцевой мешок.

ANTHER/MICROSPORE CULTURE = КУЛЬТУРА ПЫЛЬНИКОВ/МИКРОСПОР – Anther/Microspore Culture:- in vitro culture of anthers or microspores which allows the production of homozygous diploid (doubled haploid) plants. / пыльников (anthers) или микроспор.

ANTHERIDIUM = АНТЕРИДИЙ – Antheridium (pl. antheridia) is the structure on the pteridophyte (fern) prothallus that produces the mobile male gametes. / Антеридий (Антеридии (Antheridia)) структура на птиридофитном (папоротникообразном) проталлиуме (заростке), которая производит мобильные мужские гаметы. Под Антеридием, от Греческого слова Anthērós, означающее

Цветущий, понимается мужской орган полового размножения у Водорослей, Грибов, Мхов и Папоротникообразных. В антеридие развиваются сперматозоиды.

ANTHESIS = ЦВЕТЕНИЕ – Anthesis is the action or period of opening of a flower; the period of pollination, specifically the time when the stigma is ready to receive the dispersed pollen and fertilization takes place. Anthesis is the action of opening a flower or period of time during which a flower is open. Anthesis is a developmental stage of a flower associated with shedding of pollen. See also White Flower.

ANTHOCYANIN = АНТОЦИАНИН – Anthocyanin are pink, purple, violet or blue water-soluble pigments coloring leaves, flowers and other parts. These pigments are sensitive to acidity or alkalinity (pH) turning red in acid and blue in alkali. Anthocyanins and betalains never occur in the same plant. Structure of anthocyanin. Anthocyanin is any of a class of soluble glycoside pigments that are responsible for most of the blue to red colors in leaves, flowers, and other plant parts. / Щёлочность (Alkalinity). Щёлочь (Alkali). Антоцианы, красящие вещества (пигменты) растений красного, синего и фиолетового цветов. Растворены в клеточном соке; наряду с другими пигментами определяют окраску плодов, цветков, листьев.

ANTHRACITE = АНТРАЦИТ – Anthracite is the highest rank of coal. It has a carbon content of over 87% on a dry ash-free basis. Anthracite coal generally has the highest heating value per ton on a mineral matter free basis. It is often subdivided into semi-anthracite, anthracite and meta-anthracite on the basis of carbon content. Anthracite is often referred to as 'Hard Coal'; however this is a layman's term and has little to do with the hardness of the rock. Hard coal, found deep in the earth. It burns very hot, with little flame. It usually has a heating value of 12 000–15 000 British thermal units (Btus) per pound. Anthracite is a hard, black lustrous coal, often referred to as Hard Coal, containing a high percentage of fixed carbon and low percentage of volatile matter. / твёрдость (hardness) . Твёрдый уголь, извлечённый из-под земли. При сгорании выделяет много тепла и небольшое пламя. Обычно он имеет теплоотдачу в 12 000–15 000 Британских единиц теплоты (Бет) с фунта. Ископаемый уголь высшей стадии углефикации, обладающий плотностью 1 500–1 700 кг/м^3 и теплотой сгорания 33.9–34.8 МДж/кг. Антрацит в своей горючей массе содержит до 9% летучих веществ и 93.5–97% углерода. По своим характеристикам он относится к высококачественному энергетическому топливу, но может также использоваться при производстве карбидов, электродов и прочего. Основные месторождения антрацита находятся в Китае, России и США. Под Антрацитом, от Греческого слова Anthrakitis, понимается каменный уголь высшей степени углефикации с теплотой сгорания горючей массы 33.9–34.3 МДж/кг. Очень плотный, блестящий, чёрного цвета. Выход летучих веществ до 9%; содержание углерода 94–97%; объём выхода летучих веществ – менее 0.22 м^3/кг. Не спекается. Антрацит используют как высокосортное энергетическое топливо, а также для изготовления электродов, производства карбидов, литейного термоантрацита. Антрацит с максимальным содержанием углерода и минимальным выходом летучих веществ электропроводен и называется суперантрацитом.

ANTHRACNOSE = АНТРАКНОЗ – Anthracnose:- Generally found in the eastern part of the United States, anthracnose is caused by Fungi in the Genus Colletotrichum, a common group of plant pathogens that are responsible for diseases on many plant Species. Infected plants develop dark, water soaked lesions on stems, leaves or fruit. The centers of these lesions often become covered with pink, gelatinous masses of spores especially during moist, warm weather. Anthracnose can reduce a beautiful harvest into rotted waste in just a few days. The fungal disease overwinters in and on seeds, soil and garden debris. Cool wet weather promotes its development, and the optimum temperature for continued growth of the spores is between 75–85 °F. Moisture is required for development and germination of the Fungus as well as for infection of the plant. It is spread by wind, rain, insects and garden tools. Treatment:- (i) Choose resistant plant varieties when possible and use western grown seeds which have not been exposed to the disease. (ii) If this fungal problem is common, do not save your own seed from plantings. (iii) To avoid spreading the disease, keep out of gardens when plants are wet and make sure to disinfect all garden tools (one part bleach to 4 parts water) after use. (iv) Do not compost infected leaves, fruit or stems and thoroughly clean up garden areas in the fall, after harvest, to reduce over wintering sites for the fungal spores. (v) Safely treat most fungal and bacterial diseases with Serenade Garden®. This broad spectrum bio-fungicide uses a patented strain of Bacillus Subtilis that is registered for organic use. Best of all, Serenade Garden® is completely non-toxic to honey bees and beneficial insects. (vi) Liquid copper sprays and sulfur powders should be applied weekly, starting when foliage begins to develop in the early spring and continuing throughout the growing season. Spray early in the day, and avoid applications during hot weather. Seeds may also be treated prior to planting. (vii) Neem oil spray is an organic, multi-purpose fungicide/insecticide/miticide that kills eggs, larvae and adult stages of insects as well as prevents fungal attack on plants. Apply early, at the first sign of spring budding, every 7–14 days as a preventative measure or on a 7-day schedule until existing problems are eliminated. / Антракноз (Anthracnose; от Греческого слова Anthrax, означающее Уголь):- грибная болезнь растений, включая Хлопчатник. Наряду с Хлопчатником болезнь поражает, например, Бахчевые, Виноград, Зернобобовые, Кофе или Цитрусовые, вызывая у них пятнистость различных органов. Чаще всего поражаются Растения, которые были ослаблены внешними неблагоприятными факторами и имеющие какие-то механические повреждения. Возбудителем болезни Хлопчатника является Гриб Colletotrichum Gossypii Southworth (Класс Deuteromycetes, Порядок Melan-coniales), споры которого могут распространяться Насекомыми, ветром и каплями дождя. Гриб поражает всю надземную часть растения на разных стадиях его развития. Симптомы антракноза проявляются с разной интенсивностью поражения в течение всей вегетации. Переносчиками болезни являются заражённые семена и растительные остатки; вследствие чего наиболее сильно страдают всходы растений. На этой стадии развития Хлопчатника у основания стебля, на коричневой шейке, появляется красновато-коричневое пятно, постепенно охватывающее весь стебель, и вследствие чего приводящее к пожелтению, полеганию и гибели растения. Большая часть проростков гибнет ещё до выхода на поверхность почвы. Сравнительно часто гибнут и только что взошедшие растения. В случае с семядольной формой антракноза, как правило, на концах или в середине листьев растения появляются мелкие красновато-коричневые пятна неправильной округлой формы, вызывающие отмирание листьев. Форме заболевания стеблей и листьев взрослых растений Хлопчатника подвержены только ослабленные кусты. Наиболее серьёзно болезнь поражает коробочки Хлопчатника. Самыми ранними признаками их заболевания являются мелкие, круглые, вдавленные тёмно-коричневые или пурпурные пятна на створках коробочек. Проникая внутрь коробочек, заболевание вызывает сначала изменение цвета волоконец на тёмно-коричневый (побуревший) и нормальных серовато-зелёных семян на желтоватый или коричневый, а затем семена становятся щуплыми (зародыш в них не развивается), происходит склеивание волоконец и общее загнивание массы. Антракноз Хлопчатника встречался в странах Азии, Центральной и Южной Америк, Африки, Европы, Океании и Австралии; в хлопковозводящих странах бывшего Союза Советских Социалистических Республик (СССР) болезнь отсутствовала и относилась к числу карантинных объектов. В качестве основных мер борьбы с этой болезнью служат карантин и фитопатологическая экспертиза завозимых в страну из-за рубежа семян Хлопчатника. При вторичной инфекции предписано применение многократных опрыскиваний растений Бордоской жидкостью или другими медьсодержащими химическими препаратами.

ANTHRAQUIC = АНТРАКУИК – Anthraquic:- pertaining to an aquic soil moisture regime induced by human action such as bunding and leveling of land, or irrigation.

ANTHRAQUINONE DYES = АНТРАХИНОНОВЫЕ КРАСИТЕЛИ – Anthraquinone Dyes are dyes that have anthraquinone as their base and the carbonyl group (>C=O) as the chromophore. Anthraquinone-based dyes are found in most of the synthetic dye classes. See also Dyes. / хромофор (chromophore). Антрахиноновые Красители отличаются яркостью и прочностью окрасок и используются для крашения шерсти, шёлка, приготовления красок. Антрахиноновые Красители – производные антрахинона, отличающиеся высокой химической стойкостью, светопрочностью, устойчивостью к мокрым обработкам, яркостью окраски. Применяются для крашения в различные цвета синтетических и других волокон, а также в полиграфии, лакокрасочной и резиновой промышленности.

ANTHRAX = СИБИРСКАЯ ЯЗВА – Anthrax is an infectious disease caused by bacteria called Bacillus Anthracis. Infection in humans most often involves the skin, the gastrointestinal tract, or the lungs. Alternative Names:- Woolsorter's disease, Ragpicker's disease, Cutaneous anthrax, and Gastrointestinal anthrax. Causes, incidence, and risk factors:- Anthrax commonly affects hoofed animals such as sheep and goats, but humans who come into contact with the infected animals can get sick from anthrax, too. In the past, the people who were most at risk for anthrax included farm workers, veterinarians, and tannery and wool workers. There are three main routes of anthrax infection:- (i) cutaneous anthrax occurs when anthrax touches a cut or scrape on the skin; (ii) inhalation anthrax develops when anthrax spores enter the lungs through the respiratory tract; and (iii) gastrointestinal anthrax occurs when someone eats anthrax-tainted meat. Anthrax may be used as a biological weapon or for bioterrorism. In 2001, anthrax sent through the US Postal Service infected 22 people; 7 survivors had confirmed cutaneous anthrax disease. While at least 17 nations are believed to have a biological weapons program, it is unknown how many nations or groups are working with anthrax. Most bioterrorism experts have concluded that it is difficult to use anthrax effectively as a weapon on a large scale. Anthrax is a notifiable febrile disease caused by the Anthrax bacillus. Anthrax is a disease known as 'Woolsorters Disease'. Mohair, Camel's hair, Alpaca, and Cashmere most liable to carry infection. Both men and animals subject to this infectious disease, which develops a virulent ulcer and high fever. It localizes in the skin or lungs and sometimes in the intestines. Not always fatal. When confined to skin alone, a cure is usually effected. Anthrax is a highly dangerous, infectious disease cased by Bacillus anthracis. In humans, a form of this disease is commonly called 'Wool Sorter's Disease'. It may be contracted, most likely through skin abrasion from handling fleeces from infected animals. / истирание кожи . Сибирская Язва – острая инфекционная болезнь животных и человека, вызываемая бациллой Сибирской язвы. Симптомы:- септицемия, поражения кишечника (кишечная форма), кожи (карбункулёзная форма), лёгких. Заражение:- людей – от больных животных, при вскрытии трупов, разделке туш, через воду, почву, продукты животноводства; животных – чаще на пастбище.

ANTHROPOGENIC INFLUENCE = АНТРОПОГЕННОЕ ВОЗДЕЙСТВИЕ – Anthropogenic Influence is an influence caused by human activity. / Под Антропогенезом, от Греческих слов Anthropos, означающее Человек, и Genesis, означающее Происхождение, понимается .

ANTI–BACTERIAL (ANTI–MICROBAL) = ПРОТИВОБАКТЕРИАЛЬНАЯ (ПРОТИВОМИКРОБНАЯ) – Anti-Bacterial (Anti-Microbial):- a fabric that has been chemically treated or a fiber that is created by incorporating the anti-bacterial chemical agent into the fiber formula, making the finished fiber or fabric resistant to, or inhibiting the growth of micro-organisms.

ANTIBACTERIAL FINISH = ПРОТИВОБАКТЕРИАЛЬНАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Antibacterial Finish is a treatment of a textile material to make it resistant to, or to retard growth of, bacteria.

ANTIBIOSIS = АНТИБИОЗ – Antibiosis is the antagonistic association between two organisms producing detrimental effects on one of them. It could also mean an association between one organism and a metabolic product of another. / Под Антибиозом, от Греческих слов Anti, означающее Против, и Bios, означающее Жизнь, понимается .

ANTIBIOTIC = АНТИБИОТИК – Antibiotic is a chemical substance produced by certain microorganisms that retards or inhibits the growth of other microorganisms. Substance that acts to destroy or inhibit the growth of a microbe, e.g., bacteria or fungi. Antibiotic is a substance that destroys or inhibits the growth of bacteria and other microorganisms. Sir Alexander Fleming (06 August 1881 – 11 March 1955) was a Scottish biologist and pharmacologist. / Под Антибиотиками, от Греческих слов Anti, означающее Против, и Bios, означающее Жизнь, понимаются органические вещества, образуемые микроорганизмами и обладающие способностью убивать микробов (или препятствовать их росту). Антибиотиками называются также антибактериальные вещества, извлекаемые из растительных и животных клеток. Антибиотики используются как лекарственные препараты для подавления бактерий, микроскопических грибов, некоторых вирусов и простейших, поражающих человека, животных и растения. Получены также противоопухолевые антибиотики (рубомицин и другие). Первый эффективный антибиотик (пенициллин) был открыт в 1929 Шотландским микробиологом и фармакологом, лауреатом Нобелевской Премии (1945) Сэром Алыкзэндёром Флэмингом (Alexander Fleming; 06 August 1881 – 11 March 1955), который установил, что один из видов плесневого гриба выделяет антибактериальное вещество. Широко вошли в медицинскую практику с 1940-х (времён Второй Мировой Войны). В результате длительного применения антибиотиков возможно появление устойчивых к ним форм патогенных микроорганизмов. Антибиотики применяют также в сельском хозяйстве, пищевой и микробиологической промышленности, в биологических исследованиях. В промышленности получают микробиологическим и химическим синтезом.

ANTIBODY = АНТИТЕЛО – Antibody is a protein produced in a warm-blooded animal in reaction to an injected foreign antigen and capable of reacting to that antigen. / Под Антителами понимаются глобулярные белки (иммуноглобулины) плазмы крови человека и теплокровных животных, обладающие способностью специфически связываться с антигенами. Взаимодействуя с микроорганизмами, препятствуют их размножению или нейтрализуют выделяемые ими токсичные вещества. При некоторых патологических состояниях в организме появляются антитела к собственным антигенам, что вызывает повреждение различных органов. Реакции антител с антигеном применяют для диагностики различных болезней, идентификации микроорганизмов и некоторых веществ.

ANTICHLOR = АНТИХЛОР – Antichlor is a chemical used to neutralize chlorine bleach. It can be very difficult to completely rinse chlorine bleach out of fabric. The residual bleach can interfere with subsequent dyeing, or can eventually damage the fiber. A rinse in a solution of antichlor, most commonly sodium bisulfite, will quickly neutralize the bleach. Hydrogen peroxide also functions to neutralize chlorine bleach. A thorough rinse is required after using antichlor. All of the common antichlor compounds essentially convert free chlorine bleaching agents to hydrochloric acid. If enough acid is produced, it can cause liberation of free chlorine gas, which can be hazardous and is certainly very irritating. Sodium carbonate added to the antichlor rinse will neutralized the acid. Acid rinses, such as vinegar in water, should not be used to stop chlorine bleaching. For neutralization of chlorine in water used to make up dye baths, sodium thiosulfate is the preferred antichlor agent. Antichlor is a chemical, such as sodium thiosulfate, used to remove excess chlorine after bleaching. / хлорный отбеливатель (chlorine bleach). Антихлор – серноватистонатриевая соль и кислая сернистонатриевая соль.

ANTICHLOR CONCENTRATE = ПРОТИВОХЛОРНЫЙ КОНЦЕНТРАТ (или КОНЦЕНТРАТ АНТИХЛОРА) – Antichlor Concentrate is a sodium bisulfite compound used to neutralize residual chlorine when removing color with hypochlorite bleach. Antichlor is a chemical, such as sodium thiosulfate, used to remove excess chlorine after bleaching.

ANTI–DILUTION RIGHT = ПРАВО ПРОТИВ РАЗВОДНЕНИЯ – Anti-Dilution Right:- such a right gives a shareholder the right to acquire shares in subsequent share offerings such that the shareholder's percentage ownership does not get diluted (i.e. decreased) as a result of the issuance of more shares.

ANTIDOTE = АНТИДОТ (или ПРОТИВОЯДИЕ) – Antidote is a remedy to counteract the toxic effects of a pesticide, e.g., atropine sulfate for carbamate and phosphate poisoning. / Под Антидотом, от Греческого слова Antidoton, означающее буквально Даваемое Против, или Противоядием понимается лекарственное средство, предназначенное для обезвреживания попавших в организм ядов.

ANTIDUMPING DUTY = АНТИДЕМПИНГОВАЯ ПОШЛИНА – Antidumping Duty is a tariff imposed to discourage sale of foreign goods in a market at low prices which would be detrimental to local manufacturers. Customs duties imposed on imports from specific countries in addition to the normal or preferential duty; such duties can be introduced where the export price is below the normal value, provided such imports cause or threaten to cause material injury to Community producers of like products. / местным изготовителям. Антидемпинговая Пошлина применяется в случаях ввоза на таможенную территорию данной страны товаров по цене более низкой, чем их нормальная стоимость в данный момент в стране вывоза, если такой ввоз может нанести ущерб отечественным товаропроизводителям или препятствует организации или расширению производства подобных товаров.

ANTIFELTING AGENTS = ПРОТИВОСВОЙЛАЧИВАЮЩИЕ АГЕНТЫ – Antifelting Agents are the products that prevent or minimize matting and compaction of textile materials.

ANTI FOAM ADDITIVE = ПРОТИВОВСПЕНИВАЮЩАЯ ПРИСАДКА – Anti Foam Additive is an additive to reduce the foaming of petroleum products. Can be silicone to destroy the surface bubbles or polymer to reduce the count of small internal bubbles. See also Additive.

ANTI–FOAM AGENT = ПЕНОГАСИТЕЛЬ (или АНТИПЕННОЕ ВЕЩЕСТВО, или ПЕНОУНИЧТОЖАЮЩИЙ АГЕНТ) – Anti-Foam Agent is one of two types of additives used to reduce foaming in petroleum products:- silicone oil to break up large surface bubbles, and various kinds of polymers that decrease the amount of small bubbles entrained in the oils. Antifoaming Agent is an additive that minimizes the formation of bubbles within or on the surface of a liquid by reducing the forces that support the bubble's structure. / образование пузырей внутри или на поверхности .

ANTIFOAMING AGENT = ПРОТИВОВСПЕНИВАЮЩИЙ АГЕНТ (или АГЕНТ, ПРЕДУПРЕЖДАЮЩИЙ ПЕНООБРАЗОВАНИЕ) – Antifoaming Agent is an additive that minimizes the formation of bubbles within or on the surface of a liquid by reducing the forces that support the bubble's structure. / образование пузырей внутри или на поверхности .

ANTI–FRICTION BEARING = АНТИФРИКЦИОННЫЙ ПОДШИПНИК (или ПОДШИПНИК КАЧЕНИЯ) – Anti-Friction Bearing:- a rolling contact type bearing in which the rotating or moving member is supported or guided by means of ball or roller elements. Does not mean without friction. See also Bearing. / Подшипник Качения, опора вращающейся части механизма или машины, работающая в условиях преобладающего трения качения, обычно состоящая из внутреннего и наружного колец, тел качения и сепаратора, разделяющего тела качения и направляющего их движение. По форме тел качения подшипники качения могут быть шариковыми и роликовыми с различной формой роликов. На наружной поверхности внутреннего кольца и внутренней поверхности наружного выполняются дорожки качения, геометрическая форма которых зависит от применяемых в данном подшипнике тел качения. Иногда в целях уменьшения радиальных габаритов применяют подшипники качения без одного из колец, дорожка качения при этом выполняется непосредственно на валу или на поверхности корпусной детали. Некоторые подшипники качения (например, игольчатые) могут не иметь сепаратора. Такие подшипники качения отличаются большим числом тел качения, а следовательно, и большей грузоподъёмностью. Предельная частота вращения бессепараторных подшипников ниже из-за повышенных моментов трения. По направлению действия воспринимаемой нагрузки подшипники качения разделяют на четыре группы:- радиальные – предназначены для восприятия только радиальных (например, роликоподшипники с игольчатыми роликами) или радиальных и ограниченных осевых нагрузок (например, шарикоподшипники радиальные однорядные); радиально-упорные – для восприятия комбинированных, то есть радиальных и осевых, нагрузок (например, подшипники с коническими роликами); упорно-радиальные – для восприятия в основном осевых и незначительных радиальных нагрузок (имеют ограниченное применение); упорные – для восприятия только осевых нагрузок. Подшипники качения могут иметь один или несколько рядов тел качения и различную конструкцию. По комплексу признаков подшипники качения разделяются на типы. Кроме подшипников качения основных типов, существуют их конструктивные разновидности (например, (а) с канавкой на наружном кольце, (б) с одной защитной шайбой, (в) с двухсторонним уплотнением, (г) с однобортовым внутренним кольцом и с плоским упорным кольцом, (д) с коническим отверстием, (е) на закрепительной втулке, (ж) сдвоенные, и (з) с разъёмным внутренним кольцом). Радиально-упорные шарикоподшипники изготавливают с различными номинальными углами контакта (обычно 12, 26, 36°). С увеличением угла контакта возрастают осевая жёсткость и способность воспринимать осевые нагрузки, но снижаются радиальная жёсткость и быстроходность. При установке радиально-упорных сдвоенных подшипников качения повышаются грузоподъёмность и жёсткость опоры, а также точность вращения вала. Шарикоподшипники с разъёмным внутренним или наружным кольцом воспринимают осевые нагрузки любого направления и точно фиксируют осевое положение валов. Конструкция подшипников качения может отличаться в зависимости от способа крепления (на валу или в корпусе). Так, подшипники качения, предназначенные для крепления на конических шейках валов, имеют конусное отверстие. Сферические подшипники качения на закрепительных втулках устанавливают на гладких (без бортов) участках валов. Наружные кольца радиальных шарикоподшипников иногда выполняют с канавкой под установочную шайбу, применение которой упрощает осевое крепление в корпусе. Кольца и тела качения изготавливают из высокоуглеродистых закаливаемых до высокой твёрдости, реже из малоуглеродистых цементуемых сталей. Наиболее распространены хромистые стали ШХ15. В некоторых случаях для подшипников качения применяют нержавеющие или теплостойкие стали. Сепараторы подшипников качения массовых серий изготавливают из малоуглеродистой стали, реже из нержавеющей стали и латуни (штамповкой из ленты или листов). Для изготовления массивных сепараторов подшипников качения, предназначенных для работы при высоких скоростях, используют латунь, магниевый чугун, бронзу, дюралюмин, графитизированную сталь, текстолит, а также другие пластмассы. Точность изготовления подшипников качения регламентирована классами:- 0 (нормальный); 6; 5; 4; 2 (в порядке повышения точности). Во всех странах принят единый стандарт на габариты подшипников качения. Для маркировки подшипников качения применяют цифровые обозначения, 1-я и 2-я цифры (считая справа) для подшипников качения с внутренним диаметром от 20 до 495 мм соответствуют этому диаметру, делённому на 5. 3-я и 7-я цифры для диаметров выше 9 мм обозначают серию наружных диаметров и ширин. Стандартами предусмотрены сверхлёгкие, особолёгкие, лёгкие, средние и тяжёлые серии подшипников по диаметрам; узкие, нормальные,

широкие и особоширокие серии – по ширинам. Основное распространение имеют лёгкие узкие (обозначаются цифрой 2 на 3-м месте и 0 на 7-м месте) и средние узкие серии (3 на 3-м месте и 0 на 7-м). 4-я цифра обозначает тип подшипника (0 – радиальный шариковый; 1 – радиальный шариковый двухрядный сферический; 2 – радиальный с короткими цилиндрическими роликами; 3 – радиальный роликовый двухрядный сферический; 4 – радиальный роликовый с длинными цилиндрическими роликами или игольчатый; 5 – радиальный роликовый с витыми роликами; 6 – радиально-упорный шариковый; 7 – роликовый конический; 8 – упорный шариковый; 9 – упорный роликовый), 5-я и 6-я цифры обозначают конструктивные особенности подшипника. В условном обозначении подшипников качения нули левее последней значащей цифры не указываются. Класс точности маркируется слева от условного обозначения через тире. Подшипники качения, отличающиеся от стандартных конструкцией, материалами, технологией, термообработкой, отмечаются дополнительными знаками. Изготовление подшипников качения в заводских условиях было начато в 1883 в Германии. В бывшем СССР выпускались подшипники с внутренними диаметрами от долей мм до 1 345 мм и массой от долей грамма до 4 т. Подшипники качения применяют в различных машинах и приборах, в которых они работают в широком диапазоне частот вращения (до 200 000 об/мин) при температурах до 1 000 °C; созданы шарикоподшипники, способные работать в глубоком вакууме. Широкое применение подшипников качения обусловлено рядом их преимуществ по сравнению с подшипниками скольжения:- меньшим моментом сопротивления вращению, особенно в начале движения, а также при малых и средних частотах вращения; большей несущей способностью на единицу ширины подшипника; полной взаимозаменяемостью; простотой эксплуатации; меньшим расходом смазочных материалов и цветных металлов; более низкими требованиями к материалам и термообработке валов. К недостаткам подшипников качения относятся:- ограниченный ресурс, особенно при больших скоростях; большое рассеивание сроков службы; высокая стоимость при мелкосерийном и индивидуальном производстве; большие радиальные габариты; меньшая способность демпфировать вибрации и удары, чем у подшипников скольжения. Энергетические потери в подшипниках качения представляют собой результат сложного физического процесса. Момент сопротивления определяется одновременным действием ряда явлений:- проскальзыванием тел качения по площадкам контакта и гнёздам сепаратора, потерями на внутреннее трение в материале контактирующих тел (упругий гистерезис), скольжением массивного сепаратора по центрирующим бортам колец, сопротивлением смазки и внешней среды. Момент сопротивления можно приближённо определять, используя условное понятие о приведённом безразмерном коэффициенте трения f_{np}:- $M = 0.5\ P \times f_{np} \times d$, где P – нагрузка на подшипник; d – диаметр отверстия в подшипнике. Величина f_{np} = 0.001 5–0.02 (меньшие значения принимают для шарикоподшипников, работающих при радиальных нагрузках и жидкой смазке). Для смазки подшипников качения применяют различные смазочные материалы:- жидкие масла, пластичные смазки и в особых случаях твёрдые материалы. Наиболее благоприятные условия для работы подшипников качения обеспечивают жидкие масла, для которых характерны такие признаки, как стабильность при работе, сравнительно небольшое сопротивление вращению, способность хорошо отводить тепло, очищать подшипники от продуктов износа. Пластичные смазки лучше, чем жидкие масла, защищают поверхности от коррозии, для удержания их в узле не требуется сложных уплотнений. Подшипники качения рассчитывают на долговечность (ресурс) по динамической грузоподъёмности и на статическую грузоподъёмность. Методы расчёта в бывшем СССР были стандартизированы и соответствовали рекомендациям СЭВ и ИСО (Международной Организации по Стандартизации). Под долговечностью подшипника качения понимается расчётный срок службы, выраженный числом оборотов или числом часов работы, в течение которых не менее 90% из данной группы подшипников при одинаковых условиях должны отработать без появления признаков усталости металла (выкрашивания). Связь между расчётным ресурсом в миллионах оборотов (L) или в часах (L_h) и эквивалентной динамической нагрузкой (P) устанавливается эмпирическими зависимостями:- $L = (C / P)^{\alpha}$ миллионов оборотов; $L_h = 10^6 L / 60n$, где C – динамическая грузоподъёмность подшипника, постоянная радиальная или осевая (для упорных и упорно-радиальных подшипников качения) нагрузка, которую группа идентичных подшипников качения при неподвижном наружном кольце сможет выдержать в течение расчётного срока службы в 1 миллион оборотов вращающегося внутреннего кольца; P – эквивалентная динамическая нагрузка, постоянная радиальная или осевая (для упорных и упорно-радиальных) нагрузка, которая при приложении её к подшипникам качения с вращающимся внутренним и неподвижным наружным кольцом обеспечит такой же расчётный срок службы, как и при действительных условиях нагружения и вращения (значение P определяется по формулам, в которых комбинированная нагрузка приводится к радиальной или осевой, эквивалентной по своему разрушающему действию); α – показатель степени, равный 3 для шарикоподшипников и 3.33 для роликоподшипников; n – частота вращения в об/мин. По статической нагрузке подбирают или проверяют подшипники качения, воспринимающие внешнюю нагрузку в неподвижном состоянии или при вращении с частотой не более 1 об/мин. Под статической грузоподъёмностью (C_0) принято понимать такую нагрузку на подшипник качения, от действия которой в наиболее нагруженной зоне контакта возникает общая остаточная деформация тел качения и колец, не превышающая 0.000 1 диаметра тела качения. Значения динамической и статической грузоподъёмности в кгс (Н) указывают в каталогах для каждого типоразмера подшипника. По мере повышения качества подшипников качения эти значения увеличиваются. Значительное повышение долговечности подшипников качения возможно, например, в результате совершенствования технологии, применения электрошлакового, вакуумно-дугового и двойного (электрошлакового и вакуумно-дугового) переплавов сталей. Под Антифрикционными Подшипниками, от Греческого слова Anti, означающее Против, и Латинского слова Frictio, означающее Трение, понимаются .

ANTIFUNGAL = ПРОТИВОГРИБКОВОЕ – Antifungal:- inhibits or kills fungi.

ANTIGEN = АНТИГЕН – Antigen is a foreign protein and occasionally complex lipids, carbohydrates, and some nucleic acids, which upon injection into a warm-blooded animal, induce the production of antibodies. / Под Антигенами, от Греческих слов Anti..., означающее Против, и Génos, означающее Происхождение или Рождение, понимаются высокомолекулярные коллоидные вещества, которые при введении в организм животных и человека вызывают образование специфических реагирующих с ними антител. Непременным условием антигенности является отличие антигенов от веществ, имеющихся в норме в организме реципиента. К антигенам относятся прежде всего чужеродные белки, некоторые полисахариды (большей частью бактериального происхождения), комплексы белков с разнообразными химическими соединениями. Антигены бывают корпускулярные (например, взвеси Бактерий), дающие с антителами реакцию агглютинации (склеивания), и растворимые (например, токсины), дающие реакцию преципитации (осаждения). Низкомолекулярные, простые белки, такие, как желатина, не являются антигенами, яичный и сывороточный альбумины (молекулярная масса 40 000–70 000) имеют меньшую антигенность, чем гамма-глобулины и другие белки с большей молекулярной массой (>160 000). Липиды и углеводы, не обладающие антигенными свойствами и приобретающие их в соединении с белками, называются Гаптенами. Можно искусственно синтезировать антигены, соединяя те или иные химические вещества с белком. В антигенах содержатся два компонента:- высокомолекулярное вещество, являющееся проводником антигенного раздражения (большей частью это белок), и небелковая группа, структура которой определяет специфичность данного антигена. Эти группы называются детерминантными (или факторами специфичности); они расположены на поверхности антигенов и могут быть отделены от коллоидного носителя. При некоторых патологических состояниях (например, гемолитической анемии) собственные белки

организма приобретают антигенные свойства, то есть становятся аутоантигенами. Так как белки имеют индивидуальную специфичность (смотрите Генетический Код), то белки одного животного являются антигенами для другого животного того же вида (и зоантигены). Именно поэтому при пересадке тканей возникают реакции, связанные с тканевой несовместимостью (кроме случаев пересадки тканей от одного однояйцевого близнеца другому). Смотрите также статью Иммунитет и литературу при ней. Под Антигенами, от Греческих слов Anti, означающее Против, и Génos, означающее Происхождение или Род, понимаются вещества, несущие признаки генетической чужеродности и при введении в организм вызывающие специфический иммунный ответ. Способны специфически связываться с антителами. Свойствами антигенов обладают органы, ткани, клетки и жидкости всех живых организмов. Различия по антигенам между особями одного вида обусловливают отторжение тканей при трансплантации, иммунохимическое разделение крови на группы; могут быть использованы в судебной медицине (исключение отцовства). Под Антигенами понимаются вещества, которые воспринимаются организмом как чужеродные и вызывают специфический имунный ответ; способны взаимодействовать с продуктами этого ответа – антителами. Антигенными свойствами обладают макромолекулярные компоненты всех живых организмов. Антигены могут быть общими для всех особей определённого вида (Видовые Антигены) или только для части особей того же вида (Групповые Антигены). Иммуногенность антигенов и форма иммунного ответа, которую они вызывают (образование антител, клеточный иммунитет, аллергия или толерантность), зависят от степени чужеродности антигенов, химической природы, дозы и формы введения и многих других факторов. Распознавание чужеродных антигенов (бактериальных, вирусных, грибных и других), отличие ‘несвоего’ от ‘своего’ – универсальное свойство живых организмов, необходимое для поддержания их целостности, без которой невозможно выживание. Определение видовой или групповой принадлежности антигенов используется в диагностике инфекционных заболеваний сельскохозяйственных животных (например, бруцеллёза), при переливании крови. Идентификация, выделение и синтез защитных антигенов – главная задача при разработке вакцин и сывороток.

ANTIKNOCK = АНТИДЕТОНАТОР – Antiknock:- the resistance to detonation in spark-ignition or compression-ignition internal combustion engines. The antiknock value is measured in terms of octane for gasoline engines and of cetane number for diesel fuels. / Под Антидетонатором понимается вещество, добавляемое в небольшом количестве (менее 1%) к моторным топливам для повышения октанового числа и, тем самым, уменьшения детонации (чрезмерно быстрого сгорания топливной смеси) в двигателях внутреннего сгорания. Основным антидетонатором являлся тетраэтилсвинец (ТЭС; $Pb(C_2H_5)_4$) – ядовитая бесцветная маслянистая, легко воспламеняемая и горючая жидкость. Антидетонатор – присадка (металлоорганического или органического соединения) к моторному топливу, повышающая его октановое число и способствующая бездетонационному сгоранию топлива в цилиндрах карбюраторного двигателя. Наиболее распространённым антидетонатором являлся тетраэтилсвинец (ТЭС), примешиваемый к бензину в виде этиловой жидкости (смеси ТЭС с этилбромидом, дибромэтаном и прочим) в объёме 1–3 мл на 1 кг. Моторные топлива с антидетонатором обладают повышенной активностью.

ANTIMACASSAR = НАКИДКА (или САЛФЕТОЧКА) – Antimacassar is a piece of cloth originally pinned to the back of a chair to protect the upholstery from hair oil (macassar). Today, although antimacassars are still available, changes in hair grooming and the development of fairly easy-to-clean upholstery fabrics have made their purpose primarily decorative.

ANTI–MIGRANT = АНТИМИГРАНТ (или ПРОТИВОМИГРИРУЮЩЕЕ ВЕЩЕСТВО) – Anti-Migrant is an additive used in dye or pigment mixtures to prevent undesired movement or spreading of the wet dye on fabric. Anti-migrants are used in thickened dye solutions or dye pastes used for printing fabric so that the printed pattern will retain sharply defined edges. Sodium alginate is often used for this purpose for art processes. Antimigrants are also used in commercial pad-batch dyeing to prevent uneven shading across the width of the fabric.

ANTIOXIDANT = АНТИОКСИДАНТ (или АНТИОКИСЛИТЕЛЬ, или ПРОТИВООКИСЛИТЕЛЬ) – Anti-Oxidants:- prolong the induction period of a base oil in the presence of oxidizing conditions and catalyst metals at elevated temperatures. The additive is consumed and degradation products increase not only with increasing and sustained temperature, but also with increases in mechanical agitation or turbulence and contamination. Antioxidant is a substance to retard deterioration (of fiber, fabrics, finishes, etc) resulting from reaction with oxygen. / Под Антиоксидантами или Антиокислителями понимаются природные или синтетические вещества, способные тормозить или предотвращать окислительные процессы, приводящие к старению полимеров, осмолению топлив, прогорканию жиров и так далее. Антиоксиданты обрывают цепную реакцию окисления в результате взаимодействия с образующимися активными радикалами или (и) промежуточными соединениями, например, гидропероксидами. Распространённые антиоксиданты – вторичные ароматические амины, фенолы, некоторые фосфорорганические соединения, органические сульфиды. Под Антиоксидантами или Антиокислителями или Ингибиторами Окисления, от Греческих слов Anti, означающее Против, и Oxýs, означающее Кислый, понимаются природные или синтетические вещества, замедляющие или предотвращающие окисление органических соединений. Антиокислители – необходимые компоненты всех клеток и тканей организма животных, предохраняющие биологические субстраты от самопроизвольного окисления. Антиокислители применяют для стабилизации жировых веществ и других легкоокисляющихся компонентов корма (каротина, ксантофила и других), а также жиров животного и растительного происхождения, для замедления окисления топлив и старения полимеров, предотвращения порчи пищевых продуктов. Например, в корма для животных антиокислители (этоксихинолин, бутилгидрокситолуол, бутилоксианизал, производные галловой и аскорбиновой кислот, токоферола) вводят в концентрации 0.01–0.5%. Антиоксиданты, то же, что Антиокислители. Антиокислители или Антиоксиданты или Ингибиторы Окисления, природные или синтетические вещества, способные тормозить окисление органических соединений. Окисление углеводородов, спиртов, кислот, жиров и другого кислородом воздуха представляет собой цепной процесс (смотрите Цепные Реакции). Цепи превращений осуществляются с участием активных свободных радикалов – перекисных (RO_2), алкоксильных (RO), алкильных (R). Для реакций окисления характерно увеличение скорости в ходе превращения (Автокатализ). Это связано с образованием свободных радикалов при распаде промежуточных продуктов – гидроперекисей и других. Механизм действия наиболее распространённых антиокислителей (ароматические амины, фенолы, нафтолы и другие) состоит в обрыве реакционных цепей:- молекулы антиокислителей взаимодействуют с активными радикалами с образованием малоактивных радикалов. Окисление замедляется также в присутствии веществ, разрушающих гидроперекиси (диалкилсульфиды и другие). Роль таких антиокислителей состоит в уменьшении скорости образования свободных радикалов. Эффективные антиокислители, будучи добавлены в небольшом количестве (0.01–0.001%), уменьшают скорость окисления, поэтому в течение некоторого периода времени (период торможения, индукции) продукты окисления не обнаруживаются. В практике торможения окислительных процессов большое значение имеет явление Синергизма, состоящего во взаимном усилении эффективности действия антиокислителей в их смеси либо в присутствии веществ, не являющихся антиокислителями. Антиокислители широко применяют на практике. Окислительные процессы приводят к порче ценных пищевых продуктов (прогорканию жиров, разрушению витаминов), потере механической прочности и изменению цвета полимеров (каучук, пластмассы, волокно), осмолению топлива, образованию кислот и шлама в турбинных и трансформаторных маслах и другому. Для увеличения стойкости пищевых продуктов, содержащих жиры и витамины,

используют природные антиокислители – токоферолы (витамины Е), нордигидрогваяретовую кислоту и другое – и синтетические антиокислители – пропиловый и додециловый эфиры галловой кислоты, бутилокситолуол (ионол) и другие. Осмоление топлив резко замедляется при добавлении незначительных количеств антиокислителей (0.1% и менее); к таким антиокислителям относятся параоксидифениламин, альфа-нафтол, различные фракции древесной смолы и другие. К смазочным маслам и консистентным смазкам добавляют следующие антиокислители (1–3%):- параоксидифениламин, ионол, трибутилфосфат, диалкилдитиофосфат цинка (или бария), диалкилфенилдитиофосфат цинка и другие.

ANTIQUE LACE = АНТИЧНОЕ КРУЖЕВО – Antique Lace is a heavy lace made on a square knotted net with designs darned onto the net. Machine-made antique lace is often used for curtains. See also Embroidery.

ANTIQUE SATIN = АНТИЧНЫЙ АТЛАС – Antique Satin is a satin-weave fabric which is normally used for draperies. Both sides may be used. The face is a classic lustrous satin.

ANTIQUE TAFFETA = АНТИЧНАЯ ТАФТА – Antique Taffeta:- as it was originally a pure silk fabric nowadays normally contains a mixture of polyester and silk (predominantly dupion silk). Often yarn-dyed with two colors to give it an iridescent effect. Connected to:- Shantung.

ANTI–REBATING CERTIFICATION = ПРОТИВОУСТУПОЧНАЯ СЕРТИФИКАЦИЯ – Anti-Rebating Certification is a document signed by shipping companies and filed with the US Federal Maritime Commission and in ocean tariffs attesting that rebates are not allowed and will not be paid by such company. The US Federal Maritime Commission is waiving the requirement for chief executive officers of common carriers and other entities to file by 1998-December-31, a written certification that the firm has a policy against rebating that was recently promulgated to each owner, officer and employee of the firm, with details of the firm's efforts to prevent illegal rebating and that the firm will cooperate with the commission efforts to end illegal rebating. This action is being taken to alleviate the filing burden on the public and the collection burden on the commission, in light of changes made by the Ocean Shipping Reform Act of 1998 (OSRA) which removes the filing requirement on 1999-May-01, when OSRA becomes effective.

ANTI–REDEPOSITION AGENT = ПРОТИВООСАЖДАЮЩИЙ АГЕНТ – Anti-Redeposition Agents:- they help keep soils from redepositing onto clothing in the wash water after they have been removed. Anti-redeposition agents are water-soluble and typically are negatively charged. The most commonly used anti-redeposition agent is carboxymethyl-cellulose (CMC). Carboxymethylcellulose is a polymer derived from natural cellulose. Unlike cellulose, CMC is highly water-soluble. CMC is used in some of our laundry detergents at low levels (0.5–1%). It is a dispersion polymer and helps keeping soil dispersed in the wash water, thereby preventing it from re-depositing onto the fabrics being laundered. / карбоксиметил-целлюлоза .

ANTISENSE = АНТИСМЫСЛОВОЕ (или ПРОТИВОЧУВСТВЕННОЕ) – Antisense:- strand of DNA or RNA complementary to the sense strand of a gene. Sense and antisense strands anneal in vivo and cause inactivation of the gene's expression.

ANTISERUM = АНТИСЫВОРОТКА (или ИМУННАЯ СЫВОРОТКА) – Antiserum is the blood serum of a warm-blooded animal that contains antibodies.

ANTISOILING PROPERTIES = СВОЙСТВА ПРОТИВ ЗАПАЧКИВАНИЯ – Antisoiling Properties are the properties of textile materials whereby they resist deposition of dirt and stains. / и разводы (или потёки).

ANTI–SLIP INSERTS = ПРОТИВОСКОЛЬЗЯЩИЕ ВСТАВКИ (или ПРОТИВОСКОЛЬЗЯЩИЕ ВКЛАДЫШИ) – Anti-Slip Inserts:- xxxxx. / Противоскользящие Вставки или Противоскользящие Вкладыши (Anti-Slip Inserts):- несколько вставок или лента для увеличения силы трения между поддоном, грузом и погрузочно-разгрузочным устройством.

ANTISTAINING PROPERTIES = СВОЙСТВА ПРОТИВ ПЯТЕН – Antistaining Properties:- the ability of a textile to resist the deposition of oil- or water-borne stains. / разводы (или потёки).

ANTI–STATIC = АНТИСТАТИЧЕСКОЕ – Anti-Static:- can be either a fiber or fabric that does not allow the build-up of static electricity to occur when the fiber or fabric experiences friction or rubbing. / протирание или притирка (rubbing). Антистатическое:- понижающее статическую электризацию материалов вследствие повышения их электрической проводимости.

ANTISTATIC ADDITIVE = АНТИСТАТИЧЕСКАЯ ПРИСАДКА (или ПРИСАДКА АНТИСТАТИК) – Antistatic Additive is an additive that increases the conductivity of a hydrocarbon fuel to hasten the dissipation of electrostatic charges during high-speed dispensing, thereby reducing the fire/explosion hazard. See also Additive. / Присадка, снижающая статический заряд. Антистатические Присадки значительно повышают электропроводность топлив и тем самым способствуют очень быстрой релаксации зарядов статического электричества. При этом величина образующегося заряда и склонность топлива к электризации при добавлении антистатических присадок не только не уменьшаются, но иногда даже увеличиваются. Электропроводность углеводородных топлив может увеличиваться при добавлении многих соединений, однако не все они применимы в качестве антистатических присадок из-за несоответствия других свойств требованиям эксплуатации.

ANTISTATIC AGENT = АНТИСТАТИЧЕСКИЙ АГЕНТ (или АГЕНТ АНТИСТАТИК) – Antistatic Agent is a reagent capable of preventing, reducing, or dissipating static electrical charges that may be produced on textile materials. / Под Антистатиками понимаются поверхностно-активные вещества, порошки металлов, сажа и другие вещества, понижающие статическую электризацию химических волокон, пластмасс, резин. Действие основано главным образом на повышении электрической проводимости материала, обусловливающий утечку заряда. Антистатики вводят в состав материалов при их переработке или наносят в виде растворов или эмульсий на поверхность изделий. Антистатический Агент:- многие производители изделий из полимеров сталкиваются с проблемой накопления на их поверхности статического электричества. В настоящее время существует технология, позволяющая эффективно и экономично решать эту проблему. Это возможно благодаря использованию суперконцентрата антистатического агента. Величина электрического заряда твёрдого вещества (количество зарядов, которое оно может принять и удержать) зависит от состояния поверхности, химических свойств, удельного сопротивления поверхности (устойчивости поверхности к рассеиванию электрических зарядов) и от относительной влажности окружающей среды. Величина заряда обратно пропорциональна относительной влажности и прямо пропорциональна удельному сопротивлению поверхности. В соответствии со своей химической природой, большинство пластиков – мощные изоляторы. Однако их общий недостаток в том, что из-за изолирующих свойств полимеры аккумулируют статическое электричество, которое не может быстро рассеиваться по причине низкой удельной проводимости поверхности (иными словами – высокого удельного сопротивления). В плане использования конечных продуктов, склонных к накоплению статического электричества, могут возникать серьёзные и даже опасные ситуации, такие, как:- обильное загрязнение поверхности; возникновение разрядов (изделие 'бьётся током'); производственные задержки, связанные с необходимостью отделять один слой плёнки/листа от другого; образование искры с возможным последующим воспламенением накопившейся на поверхности пыли. Возможны контрмеры по подавлению статической зарядки. Это увеличение относительной влажности

среды; возрастание удельной проводимости воздуха; возрастание удельной проводимости поверхности. Добиваться возрастания удельной проводимости поверхности призваны антистатические агенты. Привнесённые в полимер, они либо проникают в его структуру (действуют изнутри), либо распределяются по его поверхности (действуют извне). Роль антистатического агента заключается в том, чтобы решать проблемы, связанные со статическим электричеством, такие, как:- взаимное притяжение противоположно заряженных частиц, влекущее за собой притяжение и накопление пыли на поверхности; взаимное отталкивание одинаково заряженных частиц, влекущее за собой появление на готовой продукции ‘капель’ полимера и появление линий на плёнке при её производстве; электрические разряды; опасность возгорания и взрывоопасность. Агенты:- Антистатический Агент – это внесённая внутрь полимера перед или во время последней ступени переработки активная добавка, влияющая на свойства поверхности. Эта добавка имеет характер межфазной активности и, мигрируя, аккумулируется на поверхности конечного изделия. Молекула этого агента состоит из гидрофилика, имеющего по своему составу сходство с водой, и гидрофобика, также сходного с водой. Гидрофобик придаёт совместимость с полимером и помогает молекуле закрепиться на поверхности, в то время как гидрофилик вступает в реакцию с атмосферными молекулами воды и формирует проводящий слой, который рассеивает электрические заряды. Итак, статическая заряженность пластика может быть минимизирована увеличением удельной проводимости поверхности. В идеальной ситуации заряды статического электричества рассеиваются быстрее, чем успевают накопиться. Активные молекулы межфазного действия аккумулируются на поверхности и, посредством гидрофобика, вытягиваются цепочкой, а посредством гидрофилика образуют поверхностный слой, абсорбирующий воду. Водяной слой, толщина которого зависит от атмосферной влажности, образуется на поверхности и увеличивает проводимость. Это объясняет, почему с уменьшением влажности воздуха (увеличением его сухости) уменьшается проводимость поверхности, и, следовательно, возрастает накопление статического электричества. Использование антистатика в нормальной концентрации позволяет снизить удельное сопротивление поверхности с 1 014–1 016 Ом до 108–1 010 Ом. Для аккумуляции молекул на поверхность полимера и построения там их слоя, антистатик должен мигрировать из внутренней структуры изделия во время или после процесса производства. В зависимости от типа полимера, его плотности и типа производства антистатический агент помогает снизить удельное сопротивление поверхности полимера более или менее эффективно. Агент быстро мигрирует на поверхность изделия, образуя на ней плёнку, толщина которой, в зависимости от системы, может состоять из одного или нескольких молекулярных слоёв. Процесс распределения по поверхности может занять несколько дней. Различия в кристаллической структуре и, следовательно, в плотности оказывают решающее влияние на миграцию агента-антистатика. Процесс миграции происходит быстрее в плёнках высокого давления (менее кристаллизированы), чем в плёнках низкого давления (более кристаллизированы). Условия работы:- эффективность работы агента-антистатика зависит от условий переработки. При компрессии или литье под давлением, например, эффект появляется незамедлительно, в то время как при выдуве плёнки требуется некоторое время для достижения такого же эффекта. Миграция антистатика не мешает внесению других ингредиентов с целостной структурой. Скользящая добавка или ускоритель экструзии имеют тенденцию повышать миграцию, в то время как наполнители или пигменты её снижают. Также важна продолжительность эффективности антистатика. Уменьшение защиты от накопления статического электричества может быть вызвано только тем, что молекулы агента-антистатика перемещают с поверхности полимера, например, при его чистке, но дефицит молекул на поверхности проходит спустя некоторое время:- защитный слой восстанавливается за счёт внутренних запасов. Для сохранения длительной эффективности важна и температура хранения. Высокая температура хранения снижает миграционные способности агента и, следовательно, сокращает период его эффективности. Когда поверхность полимера, содержащего антистатический агент, тщательно промыта, высокий уровень защиты, достигнутый вначале, снижается так, что можно считать, что полимер антистатика не содержит. Правда, спустя несколько часов или несколько дней, за счёт внутренних ресурсов этот уровень восстанавливается, так как антистатический агент постепенно мигрирует изнутри полимера на его поверхность. Количество необходимого для этого времени зависит от плотности полимера и других факторов. Суть процесса заключается в восстановлении постепенно утрачиваемого защитного слоя. Суперконцентраты антистатического агента приобрести несложно, ведь Российский рынок поставщиков суперконцентратов постоянно расширяется.

ANTISTATIC PROPERTIES = АНТИСТАТИЧЕСКИЕ СВОЙСТВА – Antistatic Properties:- the ability of a textile material to disperse an electrostatic charge and to prevent the build up of static electricity.

ANTITRUST EXEMPTION = АНТИТРЕСТОВСКОЕ ОСВОБОЖДЕНИЕ – The immunity from prosecution under the Sherman Act (passed 1890-July-02), granted to steamship companies in 1916, in recognition of the special services and value American Flag merchant vessels provide in the defense of the country in time of war. / В Соединённых Штатах Америки Акт Шёрмэна, принятый 02 Июля 1890 (по имени автора законопроекта – Дьжона Шёмэна – Сенатора от Штата Огайо (US Senator John Sherman of Ohio)) является законом, официально предусматривающим ограничение деятельности трестов и монополий. Когда-то он использовался для борьбы с рабочими организациями, рассматривавшимися в качестве организаций трестовского типа, и стачечным движением.

ANTIWEAR ADDITIVE = ПРОТИВОИЗНОСНАЯ ПРИСАДКА – Antiwear Additive:- improve the service life of tribological elements operating in the boundary lubrication regime. Antiwear compounds (for example, Zinc Dialkyldithiophosphate (ZDDP) and Tricresyl Phosphate (TCP)) start decomposing at 90 degrees to 100 degrees C and even at a lower temperature if water (25 to 50 ppm) is present. See also Additive. Anti-Wear Additive is an additive that creates a thin layer with good adhesive properties in order to prevent metal-to-metal contact at high-load spots.

ANTIXENOSIS = АНТИКСЕНОЗ – Antixenosis is a term proposed in 1978 by Marcos Kogan (Professor) and Eldon F. Ortman to replace nonpreference. It conveys the idea that the plant is avoided as a bad host. A property of the plant that makes it not attractive to some feeding or ovipositing insects. The term Antixenosis resistance was developed by Marcos Kogan and Eldon Ortman (1978) to more accurately describe the nonpreference reaction of arthropods to a resistant plant, and to complement the terminology for antibiosis resistance to arthropods. / Профессор Маркос Коган (Marcos Kogan) и Илдэн Эф. Ортмэн (Eldon F. Ortman).

ANY QUANTITIES = ЛЮБЫЕ КОЛИЧЕСТВА – Any Quantity (AQ) is a rating that applies to an item regardless of weight. Any Quantities (AQ), usually refers to a rating that applies to an article regardless of weight or size or quantity. / Таксирование, которое применяется к изделию независимо от его веса. Любые Количества (ЛК (AQ)), обычно относится к таксированию (решению вопроса об уровне ставки), которое применяется к изделиям независимо от их веса или размера или количества.

AO = AIR OBSERVER

AO = ANGOLA

AO = AVIATION OFFICER

AOA = AIR OPERATIONS AREA

AOAC = ASSOCIATION OF ANALYTICAL COMMUNITIES = ASSOCIATION OF OFFICIAL AGRICULTURAL CHEMISTS

AOC = AERONAUTICAL OPERATIONAL CONTROL

AOC = AIR OPERATIONS CENTER

AOCM = AIRCRAFT OUT OF COMMISSION FOR PARTS

AOD = AVIATION OFFICER OF THE DAY

AOF = ABSOLUTE OPEN FLOW

AON = ALL OR NONE ORDER

AOP = ADJUSTED OPERATING PROFIT

AOP = ANNUAL OPERATIONS PLAN

AOPA = AIRCRAFT OWNERS AND PILOTS ASSOCIATION

AOPL = ASSOCIATION OF OIL PIPE LINES

AOR = ANGOLAN REAJUSTADO KWANZA

AOS = AUTOMATED ODER SYSTEM

AOX = ADSORBABLE ORGANIC HALOGENS

AP = ACCOUNTS PAYABLE

AP = ASSOCIATED PERSON

AP = ASSOCIATED PRESS

APAC = ASIA PACIFIC ADVISORY COMMITTEE

APAU = ANDHRA PRADESH AGRICULTURAL UNIVERSITY

APB = ACCOUNTING PRINCIPLES BOARD

APB 29 = ACCOUNTING PRINCIPLES BOARD OPINION NO. 29

APC = AIR PROJECT COORDINATOR

APC = AUTOMATIC PASSENGER COUNTER

APCFFT = ASIAN AND PACIFIC COUNCIL FOOD AND FERTILIZER TECHNOLOGY CENTER

APEC = ASIA–PACIFIC ECONOMIC CO–OPERATION

APEDA = AGRICULTURAL AND PROCESSED FOOD PRODUCTS EXPORT DEVELOPMENT AUTHORITY

APEID = ASIAN PROGRAMME OF EDUCATIONAL INNOVATON FOR DEVELOPMENT

APERTURE = АПЕРТУРА – Aperture is the measurement opening in a typical reflection color instrument. The size of the aperture determines the size and type of sample that can be measured.

APEX = АПЭКС (или АПЕКС, или ВЕРХУШКА) – Apex is the top part of a plant or structure, the growing point. / Под Апексом, от Латинского слова Apex, означающее Верхушка, понимается конус нарастания – точка роста, верхушка побега и корня растений, состоящая из клеток образовательной ткани (меристемы). Конус нарастания обеспечивает формирование первичных тканей и органов и их рост.

APF = AFLOAT PREPOSITIONING FORCE

APG = ARABIAN PERSIAN GULF

APHICIDE = АФИЦИД – Aphicide is an insecticide that is active against aphids. / Под Афицидами, от Латинских слов Aphis, означающее Тля, и Caedo, означающее Убиваю, понимаются химические вещества, предназначенные для борьбы с тлями. В качестве афицидов используют инсектициды общего назначения, а также специфические препараты, например, Пиримор.

APHID = ТЛЯ – Aphids:- Pest type:- Insect; crops affected:- Barley, Oats, Wheat, Cotton, Cereals; scientific name:- Rhopalosiphum Padi, Rhopalosiphum Maidis, Sitobion Avenae; Pest Order:- Homoptera. Damage:- Aphids damage the host plant by sucking the plant juices; damaging roots, stems, leaves or the fruit causing abnormal growth, wilting or flower drop. Some Species inject toxins into the host, which cause discoloration and spotting. Some Species carry and transmit viruses, e.g., Barley yellow dwarf disease. Life Cycle:- most pest aphids overwinter as eggs on various plants, not necessarily crops. Life cycles may involve more than one host plant. In the spring, females emerge from eggs and give birth to live young. These remain wingless or become winged for dispersal. A new generation is produced every 3 to 4 weeks. In the fall, males are produced and mated females lay overwintering eggs. Most species of grain aphids migrate each year on southerly winds. Aphids use their piercing-sucking mouthparts to feed on plant sap, generally little damage is done from a few Aphids per plant. Since it takes several Aphids per plant for significant damage, there is usually time to detect them and make a management decision. In large numbers, the EGA can shrivel the developing grain. Aphids can also transmit barley yellow dwarf virus (BYDV); and in this case, a single aphid can infect and stunt several plants. In turn, those infected plants can provide the virus to other Aphids and quickly increase the disease level. Control Measures:- cool, moist conditions favor aphid development and fields should be inspected following a period of this type of weather. Make several counts throughout the fields prior to heading. Counts should be at least 50 paces apart and observations should be made well into the center of the field. Carefully examine 20 stems in each of five areas of the field. Examining at least 100 stems per field. Consult your extension service for threshold levels. Lady beetles, syrphid fly larvae, green lacewing larvae (Aphid lions) and parasitic wasps are natural predators of aphids. An important cotton pest, often requiring chemical control late in the season. / Одни из наиболее вредоносных хлопковых паразитов, часто требующие обработки химикатами на конечной стадии созревания растения. Насекомое тля питается соком растений. Тли или Тлёвые, Подотряд Насекомых Отряда Равнокрылых. Длина – 0.5–6 миллиметров (мм). Насчитывается свыше 2 500 Видов. Распространены главным образом в умеренном поясе Северного полушария. Живут колониями на растениях. Многие Тлёвые являются опасными вредителями, а некоторые являются переносчиками ряда вирусных заболеваний растений. Сахаристые испражнения Тлей (падь) привлекает муравьёв, которые охраняют Тлей. Тли (Aphidinea), Надсемейство

растительноядных Насекомых из Отряда Равнокрылых. Длина тела от 0.5 миллиметров (мм) до 6 мм. У крылатых Тлей 2 пары одинаковых крыльев с редкой сетью жилок. Ротовые органы колюще-сосущие. Превращение неполное. Покровы тела тонкие, часто покрыты пушком или восковым налётом. Тли питаются соками хвойных и покрытосеменных растений, реже Папоротников. Уколы многих видов могут вызвать уродливые разрастания растительных тканей (галлы), а также их скручивание, утолщение, сморщивание, изгибание; угнетают рост растений. Многие виды Тлей обладают чёткой избирательностью в отношении вида растения-хозяина и частей растения. Тли делят на 12 Семейств, включающих около 2 500 Видов. Распространены преимущественно в умеренных широтах; в тропиках и в высоких широтах их численность и видовое разнообразие гораздо ниже. В бывшем Союзе Советских Социалистических Республик (СССР) известно более 800 видов. Тли живут густыми или рассеянными колониями; дают до 20 поколений в год. Цикл их развития часто усложнён. Для Тлей характерен партеногенез, яйце- и живорождение, наличие поколений с различным соотношением полов; самцы у некоторых видов редки или отсутствуют; многим видам свойственно чередование поколений крылатых и бескрылых форм; в течение цикла наблюдается переход с одного растения-хозяина (первичный хозяин) на другое (вторичный), что напоминает смену хозяина у паразитов. Такие разнодомные Тли зимуют, как правило, на первичном хозяине:- оплодотворённые самки откладывают зимующие яйца; весной из них выходят бескрылые самки-основательницы, которые дают крылатое потомство; крылатые самки, называющиеся мигрантами, перелетают на вторичного хозяина, где развивается ряд партеногенетических поколений. Родившиеся затем разнополые особи (самцы и самки) перелетают на первичного хозяина. У некоторых видов разнодомных Тлей первичные хозяева исчезли в период оледенения, и Тли сохранились лишь на вторичных (анолоциклические, или неполноциклые, формы). У растений – первичных хозяев Тли используют преимущественно надземные части, а у вторичных – часто и корни. Многие Тли – серьёзные вредители культурных растений (например, Бахчевая, Гороховая, Капустная Тли, Филлоксера Виноградная, Яблонные Тли, Свекловичная, Персиковая, Черёмухо-Овсяная). Из галлов Тли на Фисташке и Сумахе добывают ценные красители и дубильные вещества. Жидкие испражнения Тлей (‘медвяная роса’) богаты сахарами и привлекают Муравьёв, которые слизывают их и охраняют Тлей. Среди Тлей имеются специальные мирмекофильные (смотрите Мирмекофилия) формы, обитающие в муравейниках. Выделения Тлей собираются также Пчёлами как падевый мёд. Тли – обширная группа сосущих насекомых с неполным превращением. В теплицах на Томате чаще всего встречаются обыкновенная картофельная, большая картофельная и персиковая зелёная, или оранжерейная. Без Полового Поколения:- у Тли, вредящей в теплицах, неполный цикл развития – нет полового поколения. Размножаются тли в основном живорождением, то есть крылатые и бескрылые девственные самки. В открытом грунте большинство видов Тли, вредящих на Томате, размножаются таким же образом, а перезимовывают на сорняках. Тем не менее некоторые виды, например, Оранжерейная Тля, способны образовывать половое поколение и перезимовывают на персике в стадии яйца (полноциклый вид). Персиковая Зелёная, или Оранжерейная, Тля (Myzus Persicae):- данный вид Тли чаще других встречаются на рассматриваемой культуре закрытого грунта. Питаться предпочитает на молодых листьях или побегах. В результате листья желтеют, бутоны перестают распускаться, цветки опадают. Листья покрываются сахаристыми выделениями, благоприятными для образования сажистых грибов. Данный вид Тли переносит множество различных вирусов. В теплицах чаще развивается от личинки первого возраста (личинка I далее личинка II, личинка III, личинка IV и бескрылая самка) до бескрылой самки. Крылатые самки появляются тогда, когда численность колонии Тли становится слишком большой для нормального существования на данном растении или же растение становится малоценным с питательной точки зрения для колонии Тли (схема развития:- личинка I, личинка II, нимфа I, нимфа II и крылатая самка). Бескрылая самка имеет овально-яйцевидное тело жёлто-зелёного, светло-зелёного или же розоватого цвета. Как правило, длина тела составляет 1.5–2.5 мм. Внешние особенности Тли во многом зависят от питания. Например, на Баклажане персиковая Тля достигает своих наибольших размеров, а на Томате этот же вид при тех же условиях в два раза мельче. Оптимальная температура для развития персиковой тли – 25 °C. Но она легко переносит низкие температуры, вплоть до недолговременных отрицательных. Насекомое начинает размножаться при температуре выше 5 °C. Продолжительность жизни самки при низких температурах (5–10 °C) – около 50 суток. Период преимагинального развития при этом составляет около 25 суток. При увеличении светового дня и высокой плотности вредителя в популяции увеличивается доля крылатых самок. Они разлетаются по теплице, поселяясь на нижней стороне листьев. В начале формирования колонии на листьях незаметны симптомы повреждений. Это важная особенность персиковой Тли, её необходимо учитывать и проводить тщательные обследования растений. Зачастую колонии Тли становятся заметны только при значительном возрастании их численности. На одном и том же растении одновременно могут находиться несколько видов Тли. Для более эффективной борьбы с Тлёй стоит определить видовой состав и в зависимости от этого строить защиту растений. Энтомофаги Для Контроля Тли:- Божья Коровка (Adalia Bipunctata), Златоглазка (Chrysoperla Carnea), Наездники Афидиус Колемани (Aphidius Colemani) и Афидиус Эрви (Aphidius Ervi), Галлица Афидимиза (Aphidoletes Aphidimyza), Мухи-Журчалки (Syrphidae).

APHIS = ANIMAL AND PLANT HEALTH INSPECTION SERVICE

APHIS GOSSYPII = АФИС ГОССИПИ (или ХЛОПКОВАЯ ТЛЯ) – Aphis Gossypii:- Preferred Scientific Name:- Aphis Gossypii. Preferred Common Name:- Cotton Aphid. Adults and Nymphs:- Aphis Gossypii can range in colour from yellow to very dark (almost black) green. The smaller yellow form occurs during warmer summer conditions. The green form is larger and occurs during cooler spring and autumn temperatures, and uncrowded conditions. Adult:- Aphis Gossypii is a small aphid. Adults range from just under 1–1.5 mm in body length, minimum diameter just over 0.34 mm. Summary of Invasiveness:- Aphis Gossypii is small, adaptable, easily spread, with a rapid reproductive rate, and the ability to cause serious plant injury in isolated communities. The biggest ecosystem level threat might be its ability to transmit plant viruses. While these traits might qualify this insect as an invasive threat, it has already colonized most parts of the world. This aphid is not in the Invasive Global Species Database as an invasive pest. However, it is registered in the Invasive species database of the United States Department of Agriculture. It is unclear if entry into this database indicates an official classification of this aphid as ‘Invasive’, or if its presence is entirely because it is not native to North America. Notes on Taxonomy and Nomenclature:- because of the great variability in the appearance of Aphis Gossypii and the number of plants it attacks, it has over 40 synonyms. Smith and Parron (1978) have compiled a comprehensive list. Blackman and Eastop (1984) provide taxonomic keys for Aphis Gossypii on several different crops. There have been several biotype designations used for Aphis Gossypii. However, it should be treated as a single exceptionally variable species, until meaningful and standardized quantification of the diversity within the species can be undertaken. Although Aphis Gossypii has been reported from many hosts, individual clones do not have the ability to feed on all reported hosts. Taxonomically, Aphis Gossypii is difficult to separate from Aphis Frangulae. Strogani (1984) summarizes information about the Aphis Frangulae group available at that time. He regarded Gossypii as a sub-species of Aphis Frangulae. Description:- Blackman and Eastop (1984) suggest that the following characteristics can be used to attempt to identify Aphis Gossypii. The cornicles or siphunculi are uniformly sclerotized from tip to base, and darkly pigmented. They are longer than the cauda and gradually taper towards the apex with a small dilation there. The dorsal abdominal segments are uniformly sclerotized and unpigmented. Aphis Gossypii reared near the colour transition temperature (see later in this section) often have a blotchy appearance with some parts greenish and other parts more yellow. The cauda usually have 4–7 hairs and are paler than the

cornicles. The metafemoral hairs are all shorter than the basal width of the metafemur. Stidulatory apparatus is absent. The antennal tubercles are weakly developed. The terminal process is more than twice the length of the last antennal segment, but less than 3.5 times as long. The rostrum has a blunt apex and the terminal rostral segment shorter than cauda and under 1.5 times the length of the second metatarsal segment. Aphis Gossypii is a small Aphid. Adults range from just under 1–1.5 mm in body length. The minimum diameter is just over 0.34 mm. This is indicated by the fact that a screen with a mesh diameter of under 0.34 mm is able to exclude Aphis Gossypii. Cornicle length distinguishes separate instars of Aphis Gossypii reared under fluctuating temperatures. There is considerable overlap between instars, but none between nymphs and adults. Other characteristics combined can provide greater separation between instars especially under constant temperatures. First-instar nymphs are distinguished by having 4 antennal segments, whereas second-instar nymphs have 5 segments. Differences between second- and third-instar nymphs are fairly small, but at constant temperatures they can be distinguished using a combination of characteristics. Third-instar nymphs have no setae on the margin of the genital plate, whereas fourth-instar nymphs have such setae. Second-instar nymphs with developing wings appear to have shoulders, third-instar nymphs have small wing pads, and the developing wings are prominent on fourth-instar nymphs. The occurrence of the following A. gossypii stages have been described in Japan:- fundatrix, fundatrigeniae, alienicola, gynoparae, oviparous female, alate and apterous male, hibernating viviparae, virgin androparae, androparae, heteroparae and androgynoparae. There are also individuals with partly developed wings from nearly apterous to nearly functionally winged. Miyazaki (1987), Moran (1992) and Blackman (1994) have defined the life stages of Aphis Gossypii. The following stages have been described for Aphis Gossypii in Iran: alate and apterous viviparae. Aphis Gossypii can range in color from yellow to very dark (almost black) green. The smaller yellow form occurs during warmer summer conditions. The green form is larger and occurs during cooler spring and autumn temperatures, and uncrowded conditions. Color morphs are able to produce progeny of another color morph. Host plant can also influence aphid color. Wall (1933) reported that green morphs produce more alate offspring than do yellow morphs. However, his observation could be the result of crowding, as the green form also produced more total offspring. The use of a proper key is highly recommended and the aphids should be examined by an expert for confirmation. Distribution:- Aphis Gossypii is distributed worldwide. It is a pest in very cold climates on crops grown in greenhouses. History of Introduction and Spread:- it is impossible to identify the history of introduction. An alternative is to use publication date as an indication of when the pest became serious enough to justify research. There are problems with this approach, but few rational alternatives. Please see the reference dates in the country locality. Hosts/Species Affected:- in the Aphis Frangulae group to which Aphis Gossypii belongs, the primary (winter) hosts belong to the Rhamnaceae; Aphis Gossypii is an exception as it can also overwinter on a number of plants in other families. Typically, the overwintering host is the plant where eggs are laid and the aphid completes a sexual reproductive phase. In Japan, Aphis Gossypii lays eggs on Citrus (Rutaceae), Hibiscus Syriacus (Malvaceae), Rhamnus Dahuricus (Rhamnaceae), Celastrus Orbiculatus (Celastraceae) and Rubia Cordifolia (Rubiaceae). In the USA it lays eggs on Hibiscus Syriacus and Catalpa Bignonioides (Bignoniaceae). In China it lays eggs on Zanthoxylum Simulans (Rutaceae), Rhamnus Sp. (Rhamnaceae) and Punica Granatum (Lythraceae). The host range of Aphis Gossypii (over 92 Plant Families) includes food and fibre crops, ornamentals and flowers. Ebert and Cartwright (1997) have compiled a list of hosts by Plant Family, and a list of all Plant Families that contain at least one potential host. The host list in this Compendium is a list of crops where Aphis Gossypii is able to feed and reproduce. The list of non-crop plants that can serve as hosts is more extensive. Primary host crops are ones where the aphid can cause plant mortality through direct damage and vectors one or more viruses worldwide. Secondary host crops are ones where the aphid is not a global problem, or where it either does not cause much direct damage or is not a vector. Symptoms:- the initial symptom of Aphis Gossypii attack is a yellowing of the leaves. As Aphids become more numerous, leaves become puckered, and curled. As populations continue to rise, aphids move to younger leaves, stems and flowers (sepals mostly). Plants become covered with a black sooty mould which grows on the honeydew excreted by the aphid. Plants also become stunted and (particularly in the cucurbits) the stems become twisted. At very high densities, Aphis Gossypii is able to kill its host. These symptoms are not unique to Aphis Gossypii. Aphis Gossypii will attack most parts of the plant if population density is high enough. Exceptions include direct feeding on mature reproductive structures (fruits, berries, nuts) and feeding on roots. However, even though there is no direct damage to these structures, a general decline in plant health will affect the proper development of these tissues. Host Utilization:- Aphis Gossypii reproduction is mostly asexual with either alate or apterous females. In warmer environments, Aphis Gossypii exhibits an anholocyclic life cycle, while in cooler areas it exhibits either a heteroecious or autoecious holocyclic life cycle. The heteroecious cycle involves a migration from a winter host to a summer host in the spring and a return to a winter host in the autumn for laying eggs. Population Growth:- reproductive rates in Aphis Gossypii are reported in two ways; net reproductive rate which is an interaction between birth rate and survival rate, and birth rate as measured in nymphs produced per day per Aphid. Net reproductive rate has been estimated for Aphis Gossypii on many hosts:- squashes (Cucurbita pepo), citrus (Citrus unshiu), pumpkins, Veronica persica, taro and cucumbers. Significant differences were found in birth rates of Aphis Gossypii reared on cotton, watermelons and groundnuts. Significant differences were also found in its reproductive potential on cotton, watermelons, sesame and aubergines. Another study reported that development time was shortest on cotton, longest on melons, with development rate on watermelons lying somewhere between. In contrast, one paper reported no significant differences in birth rate for Aphis Gossypii reared on okra, aubergines and chillis. Aphis Gossypii takes 5.2 days to reach maturity on cotton at 28 °C. The optimal temperature for reproduction is 20–25 °C when the aphid can produce an average of 2.8 nymphs per day (in the USA). Alate Production:- there are two forces proposed as triggers for alate production in Aphis Gossypii:- nutritional factors and crowding. However, research to date has not conclusively identified the relative importance of nutrition versus crowding in alate formation in Aphis Gossypii. Nutritional stress has been examined by removing Aphids from their host for some period of time and then returning them to their host. This treatment was applied to adults and nymphs on cotton for 6–8-hour periods each day. Starved nymphs from apterous parents resulted in 13% alates versus 0.4% from unstarved nymphs. However, starvation of nymphs from alate parents resulted in no increase in alate formation. A similar result was also reported for starved parents, where starved apterous parents produced more alate progeny than well-fed apterous parents (23% versus 2%, respectively) and there was no increase in alate formation by starved alate parents. The effect of starvation was also detectable in progeny from aphids starved as nymphs but fed normally as adults. However, this might be a crowding response if Aphis Gossypii interprets physical contact with the brush (used to remove the aphid from the plant) as contact with other aphids. Nutritional factors from other sources can affect Aphis Gossypii development. In considering the possible role of aphid-borne plant viruses, the survival of the virus is dependent on having an efficient aphid vector, and the most efficient vector is alate. Therefore one might expect that a virus would promote conditions favouring alate production in the Aphid. Alate production in the melon aphid-courgette-Zucchini yellow mosaic virus system appeared to increase on infected plants. Unfortunately, virus-infected plants also had more Aphids. Blua (1991) and Blua and Perring (1992a) decided that nutritional factors are the cause for increased alate production. To further support the argument that the cause might be nutritional, it has been shown that aphid infestations on Solanum Integrifolium changes peroxidase, esterase and protein content of the plant in proportion to the level of infestation. This shows a change in plant nutrient content associated with aphid density which might form a chemical link between nutrition and alate production. More work in this area is required. Crowding effects have been shown for Aphis Gossypii on Cotton. One study examined crowding using leaf disks with a single apterous aphid which was removed following reproduction. The resulting colonies contained 1–7 nymphs. From 52 colonies with 1–2 nymphs, no alates were produced. From 41

colonies with 3–4 nymphs, less than 10% of the colony became alate. However, of 29 colonies with 5–7 nymphs, over 30% of the total number of aphids became alate. This experiment was repeated as part of the control for another experiment. Two possibly significant differences were apparent: alate production only occurred in colonies with four or more nymphs, and colonies with 5–7 nymphs only produced 12% alates. The observation that solitary individuals never develop alates was reported earlier for the melon aphid. Additional factors which influence alate production include crowding of parents, the type of parent (apterous or alate), and the possible effects of light and temperature. Abiotic Environment:- temperature is one of the most important abiotic factors affecting the life cycle of Aphis Gossypii. A lower developmental threshold for Aphis Gossypii was estimated at 7.34 °C on squash in Taiwan. Development thresholds have also been estimated for Aphis Gossypii on cucumbers as 5.8 °C from birth to age of first reproduction, but the development threshold for the nymphal stages was 6.9 °C. A study of Aphis Gossypii on Veronica persica estimated a developmental threshold of 10.47 °C for the teneral preflight period. An upper limit to Aphis Gossypii survival of 35 °C was reported on squashes in Saudi Arabia, but it also survives in okra fields where the daytime temperature exceeds 45 °C. Temperature is also thought to be responsible for some strains of Aphis Gossypii being holocyclic whereas others are anholocyclic. A hypothesis that eggs will be produced in locations where the average temperature during November does not exceed 13 °C has been proposed . Light intensity and day length are also important in the reproductive capacity of Aphis Gossypii. Increasing daylength increases reproductive rate. The effect of light intensity is unclear, and higher intensity increased reproduction between 800 and 8 000 Lux, while it decreased reproduction between 54 and 550 Lux. Behaviour:- Flight:- flight is the beginning of the dispersal phase in the Aphis Gossypii life cycle. It begins with the preflight period (from moult to flight) which lasted from 1 to 31 hours with most activity 10–24 hours after moult from colonies reared on Veronica persica. The teneral preflight period increased from 10 to over 70 hours with decreasing temperatures from 28 to 12 °C. Adults flew from about sunrise to early afternoon, but a few individuals continued to fly after dark. With first light at 06:00 h, and last light at 19:30 h, no flight was detected from 23:00 h to 07:00 h. Considering that the time of moulting is independent of time of day, the most common duration of the teneral preflight period is explained by adult inactivity after dark. In laboratory colonies, the flight period lasted from 1 to 4 days. Older colonies produced fewer alates that flew for 1 day and more that flew for 2 days. Aphids flew from one to several (about 5) times each day, with the first flight always longer than the others. Alates larviposited after flight, and flew again when the number of embryos with pigmented eyes per ovariole decreased. Alates that flew longer had a shorter reproductive period and produced fewer total progeny. Reports indicate that alates will not produce offspring on leaves with existing colonies. Migration:- in Côte d'Ivoire, dispersal from savannah to cotton fields was examined for Aphis Gossypii from data collected using pan traps. The data showed that most aphids settled at field margins, although there was some settlement in the field. Pan traps at ground level caught more Aphis Gossypii than traps further from the ground and most aphids were caught no more than 1 m from the soil surface (the closer to the surface, the more aphids were caught). Host Plant:- orientation to host plants was significant at 6 hours after wing development, but was highly significant after 24 hours. Alates were able to distinguish between different plants; Cucurbita pepo and Thunbergia laurifolia were attractive, and were common hosts for Aphis Gossypii in Cuba. The occasional host Hibiscus Rosa-Sinensis was neither attractive nor repellent, and the non-host plant Lantana camara was repellent. (Lantana camara found in locations other than Cuba has been recorded as a summer host of Aphis Gossypii. This apparent contradiction is due to differences in aphid populations found in differing geographical areas.) Egg Laying:- Egg laying on Hibiscus Syriacus occurred mostly between the leaf scar and the twig near where the buds would emerge in spring. Some eggs were also laid at the branching point of twigs. However, from the wandering behaviour of the oviparous Aphis Gossypii females, it appears that they searched for protected places to lay eggs rather than for specific parts of the plant. Viral Interactions:- the most important impact Aphis Gossypii has on world agriculture is through its ability to transmit plant viruses. Aphis Gossypii is a vector for the following viruses:- Alfalfa mosaic virus; Bean common mosaic virus; Calotropis ringspot mosaic virus; Carnation mottle virus; Cauliflower mosaic virus; Chinese yam necrotic mosaic virus; Citrus tristeza virus; Citrus woody gall vrus; Commelina mosaic virus; Cowpea (aphid-borne) mosaic virus; Cucumber mosaic virus; Garlic mosaic virus; Greengram mosaic virus; Infectious chlorosis of banana; Leaf crinkle of sunflower; Lily symptomless virus; Muskmelon yellow stunt virus; Onion yellow dwarf virus; Papaya ringspot virus; Passionfruit Sri Lankan mottle virus; Pepper veinal mottle virus; Potato leafroll virus; Potato virus Y; Solanum trovum mosaic virus; Sri Lankan passionfruit mottle virus; Sugarcane mosaic virus; Sweet Potato feathery mottle virus; Turnip mosaic virus; Watermelon mosaic 1 virus; Watermelon mosaic 2 virus; Yam mosaic virus; Sunflower yellow blotch virus; Yellow vein mosaic virus; Zucchini yellow mosaic virus. Aphis Gossypii on okra infected with Yellow-vein mosaic virus did not reproduce as fast as those on healthy okra. Aphis Gossypii on courgette plants infected with Zucchini yellow mosaic virus spent more time probing and less time feeding than those on healthy plants. Furthermore, prior to feeding, aphids on infected plants spent more time in forming the salivary sheath. Notes on Natural Enemies:- few aphid natural enemies are host specific, rather they are attracted to aphids in particular habitats. Thus, the important natural enemies attacking particular aphid pests on crops tend to vary according to the crop, the circumstances in which it is grown and the climate. This is particularly true of aphid pests attacking a range of different crops over large geographical areas. For example, many aphid parasitoids are members of species complexes, morphologically very similar but with different host preferences and geographical distributions. The natural enemies listed here are only a selection of Species that have been listed as important and should not be considered as definitive. Predators:- the 'problem' with many predators is that they may only lay their eggs in the presence of sufficient aphids to ensure the survival of the larvae to maturity, and by then the damage may have been done. Non-specific predators with good searching ability that are active early in the year, such as Carabidae and Staphylinidae, are important when aphid numbers are low. The predators of Aphis Gossypii include a number of species in the Coccinellidae, Syrphidae, Chrysopidae, Hemerobiidae, and many small spiders. Although reports suggests that the predators will attack all life stages, there is no record of predators attacking the egg. The effectiveness of predators is highly variable, depending on the availability of alternative prey, host plant and environmental factors. The effect of alternative prey was reported for Chrysoperla rufilabris which preferred Heliothis virescens larvae to aphids, but preferred aphids to Heliothis virescens eggs. The presence of Aphis Gossypii was shown to decrease predation on Heliothis virescens eggs by Hippodamnia Convergens, Chrysoperla Carnea and Orius Insidiosus. The lacewing, Chrysoperla carnea, was able to cause an overall reduction in Aphid abundance when caged on field-grown cotton in California, USA. Added to this system were several hemipteran generalist predators (Geocoris Spp., Nabis Spp. and Zelus Spp.) which feed on Aphis Gossypii, lacewing, and each other. All of these predators reduced aphid populations, though none were as effective as C. Carnea. However, all of the hemipterans also reduced lacewing survival which resulted in an increased number of Aphids. Furthermore, the reduction in the ability of lacewings to control aphid populations was increased with increasing size of the other predators. Syrphid flies have shown potential in controlling aphid populations under greenhouse conditions. However, colonization by the syrphid was decreased on older plants, and older larvae would not transfer from young plants to more mature plants. The suggested cause for the latter effect was leaf pubescence. Parasites:- the most common parasites of Aphis Gossypii are insects in the Hymenoptera. Additional parasites include members of the Diptera and some mites. While these parasites are able to parasitize all life stages except eggs, they prefer later instars. Changes in parasitism based on age structure of Aphis Gossypii populations feeding on cotton were reported for the parasites Trioxys Spp. and Aphelinus Spp; these parasites rarely parasitized first- and second-instar Aphids. Thus, the percentage of parasitism increased as the proportion of older Aphids increased. This has survival value for both the parasite and Aphis Gossypii because Aphids which are parasitized as older nymphs or as adults have a chance to reproduce. Aphids parasitized by Aphidius colemani had a fecundity of 0.5–1.3 nymphs/female

when parasitized in the fourth-instar, and 10.5–13.3 when parasitized as adults. Aphids which survived an attack had lower fecundity but equal longevity relative to Aphids that were not attacked. There has been little study of the effect of mites on Aphis Gossypii. Studies of Allothrombium pulvinum are limited to the mite's distribution in the field. Pathogens:- the most important Aphis Gossypii pathogens discovered to date are all fungi. All Aphis Gossypii life stages may be attacked. The two best-studied pathogens are Neozygites fresenii and Verticillium lecanii. Several other fungal pathogens have also been reported:- Arthrobotrys Sp., Erynia Aphidis and Erynia Delphacis. N. Fresenii takes 3, 4, 5–6 and 6–8 days to develop at temperatures of 30, 25, 20 and 15 °C, respectively. Furthermore, at 35 °C it did not kill Aphids. N. fresenii was able to produce up to 9 835 conidia from a single aphid. The number of conidia was correlated with Aphid size, but it has been suggested that handling or storage properties of larger Aphids could explain this observation. N. Fresenii can be a major cause of Aphid mortality in Cotton grown in the Texas/Arkansas area of the USA. It has a distinct diurnal periodicity in spore discharge, with greatest activity occurring between the hours of 01:00 and 05:00 with almost no activity between 09:00 and 24:00 h. It has not been reared on artificial media, but Steinkraus et al. (1993) reported on propagation in an Aphis Gossypii colony and the longevity of N. Fresenii in cold storage. V. Lecanii is an important source of mortality for aphids under greenhouse conditions, but there are no reports of its impact on Aphis Gossypii under field conditions. Its effectiveness is emphasized by its use as an aphicide in commercial greenhouses in the UK. Its success in this capacity is partly due to the ability of V. Lecanii to grow in artificial media. As one might expect, different strains of V. Lecanii show different growth rates and different levels of pathogenicity. Temperatures above 35 °C and humidity below 85% inhibit conidial discharge from Aphis Gossypii cadavers. During the infection process, primary conidia germinate and form capilliconidia. This process is so sensitive to humidity that at 95% RH and 25 °C, 90% of the primary conidia will germinate, whereas at 89% RH only 19% will germinate. Means of Movement and Dispersal:- Natural Dispersal:- long distance dispersal is by wind. Aerial sampling may be suitable for predicting future aphid abundance, but was not suitable for predicting existing populations. Aphis Gossypii was collected at 150 m in India, and it was concluded that this dispersal of Aphis Gossypii was over tens or hundreds of kilometers. Impact:- Introduction:- Aphis Gossypii is extremely polyphagous and very damaging to many economically important crops, including cotton, aubergine, citrus, coffee, melon, okra, peppers, potato, squash and sesame. It is a major pest of cotton and cucurbits. Aphis Gossypii has a worldwide distribution, although in arctic regions it is mostly confined to glasshouses. It is particularly abundant in the tropics. Economic damage due to Aphis Gossypii is by direct feeding, the excretion of honeydew and virus transmission. Damage to Cotton, okra and certain cucurbits occurs when large populations of Aphids build up, feed on the crops and excrete honeydew. However, its biggest overall economic impact is as a vector of pathogenic plant viruses in over two dozen crops. There is little quantitative information on exact crop losses. In cotton, for example, Aphis Gossypii is only one of many crop pests. Monetary losses to this pest are substantial and are a result of crop loss and crop quality reduction, and the expense of pesticides. Direct Damage:- Aphis Gossypii causes direct feeding damage to cotton, okra and some other crops, by sucking the sap directly from the phloem, causing the removal of nutrients. The drain on plant nutritional resources can be considerable. Adverse physiological responses of plants to direct feeding can also occur. The undersides of young leaves are preferred, but the entire plant may be covered when populations are large. Infested leaves curl downwards and may appear wrinkled or reddened. Heavy infestations can result in wilting. Young plants often have reduced or stunted growth, and may sometimes be killed. Aphis Gossypii is the principal aphid attacking cotton, on which it is an early through mid-season pest; although damaging late season infestations can occur, especially if broad-spectrum insecticides have reduced natural enemy populations. In the USA, Aphis Gossypii caused more insect-related damage to cotton than any other pest in 1991. Of 13 million acres harvested, around 10 million acres were classified as infested with aphids, resulting in losses of over 360 000 bales. Losses in Texas alone were around 333 000 bales, representing a yield loss of approximately 6%. Yield reductions of over 100 pounds of lint per acre are not uncommon. In a study of late season aphids, also in Texas, one part of a field was treated to keep aphid populations below 50/leaf, while the other part had Aphid densities greater than 50/leaf. In 1992, Aphid populations that exceeded 50/leaf for 3 weeks, and 100/leaf for 2 weeks significantly reduced cotton plant height. The higher Aphid levels reduced lint yield by 16% in 1992 and 24% in 1993, with a 14% and 25% reduction in seed yield, respectively. None of the Cotton quality parameters measured were affected. Differences in gross returns between low Aphid plots and high Aphid plots in the 2 years were USD65.32 and USD99.69 per acre. In the USA, the movement onto Cotton from noncultivated host plants was an important factor determining Aphis Gossypii infestation; this movement was gradual and ongoing from the time Cotton seedlings emerged. In California, USA, seed yield was reduced by 0.21 lbs seed per Aphid-day for Cotton planted early in the season. However, there was no yield loss in Cotton planted later, even though Aphid infestation levels were similar. Yield losses were due to a 13.8% decrease in the number of bolls, and a 5.7% decrease in boll size. The impact of a Pest complex on upland Cotton in India was calculated in four regions. Aphids, mainly Aphis Gossypii, were more numerous on plants in treatment, compared with control, plots in all cases. Insecticides (soil treatment and regular spraying) resulted in yield (kg/ha) increases between 58.4 and 75.1%. In economic terms, taking into account the cost of plant protection and the net income from the cotton, an additional income of between 4 340 and 6 115 Rupees/ha was obtained from the pest control treatments. In another Indian study, yield losses in cotton due to sucking pests were between 20.90 and 26.30%, with a glabrous hybrid giving consistently higher yields than a hairy hybrid. Reductions in cotton yield due to sucking pests by 16.2 to 55.6% have been reported in studies from Russia and Brazil. In cotton in Zambia, Aphis Gossypii damage caused up to 80% yield loss, while a survey of that country's farmers ranked it as the most serious cotton pest. In China, Aphis Gossypii infestations are most serious in the seedling stage, particularly in the Northern Cotton zone. In one study, Cotton seedlings (3 leaves or less) were more sensitive to infestations, while damage on older plants was lower, in part due to compensatory growth effects when precipitation was sufficient. Seedlings were stunted, with a decreased leaf area index and reduced root system development, while the time to squaring was delayed. A damage index, used to establish thresholds for spraying, resulted in adequate control with a 50% reduction in insecticides. In Australia, a prototype IPM system maintained cotton yields, while reducing insecticide usage by around 40 to 50%. In Spain, Aphis Gossypii is capable of causing 55% yield loss in clementines (Citrus clementina). Mendoza et al. (2001) provided an estimate of the economic injury level (EIL) and the environmental EIL. The EIL for Aphis Gossypii was 271 aphids/m^2; however, this figure will change with the cost of control, the sale price, and yield loss due to the aphid change. Direct feeding damage by Aphis Gossypii on Cotton is related to plant growth stage and level of aphid infestation. Aphid populations increase rapidly with favourable climatic conditions and plant nutritional quality. Levels of damage are influenced by the presence of natural enemies and biological control, pesticide efficacy, the presence of pesticide resistance in Aphids, and compensatory growth in plants. The planting date was the most important variable, in a multiple regression analysis, affecting aphid density in dryland cotton in Texas, USA. Optimum temperature for population growth is around 20–25 °C. Light intensity and daylength significantly influence rate of population increase, while heavy rain can directly reduce populations by washing them off leaves. Natural enemies are important in many areas in preventing secondary pest outbreaks. Reduction of natural enemies by insecticides therefore might exacerbate aphid attack by removing this natural control. In a Chinese study, for example, chemical control of the pest complex during the early season led to increased damage to cotton by Aphis Gossypii during the mid and late season. In predator exclusion experiments in the USA, large decreases in cotton lint yield were observed in caged plots compared with uncaged plots where natural enemies could control Aphid numbers. Fibre quality was also reduced by high Aphid numbers in predator exclusion cages. The reduction in natural enemies resulting in greater aphid abundance was also found in Egyptian Cotton fields. The relationship between infestation, nitrogen application and Cotton yield was investigated in a study in the Philippines. The more nitrogen

applied, the greater was the infestation by Aphis Gossypii, but this was outweighed by the increased yields obtained due to nitrogen fertilizer applications. In okra, Aphis Gossypii, along with a jassid bug (Amrasca biguttula biguttula), reduced total yield by 19% in a study in Bangalore, India. Aphis Gossypii causes most damage at the seedling stage in okra, with feeding reducing the vigour of plants. Indirect damage:- Honeydew:- losses due to honeydew, excreted by feeding Aphis Gossypii, can be considerable. Honeydew interferes with leaf transpiration, and acts as a substrate for fungi, including sooty moulds (Capnodium), which blacken leaves and reduce photosynthetic efficiency. Honeydew can also act as an attractant to other crop pests, and insects such as bees, wasps and ants, that may provide protection for the aphids from their natural enemies. The presence of honeydew contaminates cotton lint, reducing its quality and economic value. The presence of honeydew on fruit crops can significantly reduce their marketability. Virus Transmission:- Aphis Gossypii transmits over 50 plant viruses, including non-persistent viruses of Beans and Peas, Crucifers, Celery, Cowpea, Cucurbits, Dahlia, Lettuce, Onion, Papaya, Peppers, Soyabeans, Strawberry, Sweet Potato, Tobacco and Tulips. In Cotton, it transmits Cotton anthocyanosis virus, Cotton curliness virus, Cotton blue disease, Cotton leaf roll and purple wilt. In addition to Cotton anthocyanosis, Lily rosette, Lily symptomless and Pea enation mosaic virus, are all transmitted in a persistent manner (Blackman and Eastop, 2000). On the majority of crops it attacks, the ability of Aphis Gossypii to act as a vector of plant viruses can result in significant economic losses (Ebert and Cartwright, 1997). Aphis Gossypii is an important vector of Papaya ringspot virus, transmitting both the P (PRSV-P) and W (PRSV-W) strains. The former is a disease of papaya, whereas PRSV-W, also called Watermelon Mosaic Virus 1 (WMV-1), infects cucurbits and watermelon. Aphis Gossypii also transmits Watermelon mosaic virus 2 (WMV-2), Zucchini yellow mosaic virus (ZYMV) and Celery mosaic virus (CeMV). These potyviruses are transmitted in a non-persistent manner. Aphis Gossypii is the most important vector of Cucumber mosaic virus (CMV) in cucurbits. CMV has one of the widest host ranges of any plant virus. It can be acquired in 5–10 seconds and be transmitted in less than 1 minute. The ability of CMV to be transmitted declines after about 2 minutes and is usually lost within 2 hours (Francki et al., 1985). Citrus tristeza virus (CTV) is transmitted in a non- or semi-persistent manner by Aphis Gossypii; the virus remains infectious for 24 hours, and is specific to plants in the Rutaceae. Aphis Gossypii is the only known vector of the virus causing cotton blue disease in Africa. In field trials in the Central African Republic, yield losses due to Aphis Gossypii and cotton blue disease were significantly reduced with insecticide treatments. A combination of organophosphorus and pyrethroid insecticides was recommended for control. In Chad, all Cotton varieties were found to be susceptible to cotton blue disease, except one with a small degree of tolerance. Cotton blue disease decreased the length of fibers by about 2.5%, compared with uninfested controls, although other quality characteristics were unaffected. Environmental Impact:- there are no documented cases of a negative environmental impact from Aphis Gossypii. Impact:- Biodiversity:- there are no documented cases where Aphis Gossypii has had a negative impact on biodiversity. Although the Aphid is certainly in national parks and other protected areas, no negative impacts from these invasions have been documented. One of the biggest problems in gaining such documentation is that Aphis Gossypii is already present, so we cannot get data about pre-aphid conditions. Furthermore, this is a small insect and it is difficult to exclude it from even small tracts of land, so getting an aphid-free zone to compare to an infested area is also problematic. Social Impact:- Aphis Gossypii is a serious agricultural pest because it reduces yields, reduces produce shelf life, and reduces the aesthetic appeal of contaminated produce. It reduces the aesthetic quality of produce mostly through contamination with honeydew and associated sooty moulds, and through transmission of viruses. Although there are no current regulations governing transportation of this aphid, there may be such regulations governing transport of infected plant products. Detection and Inspection:- Field and Nursery:- in addition to looking for symptoms on the host plant (chlorosis, distortion) one should look for the presence of sticky surfaces indicative of aphid feeding on upper leaves, and the sooty moulds which often grow on the honeydew. Aphis Gossypii is often attended by ants. A small group of ants walking on the foliage may often be associated with the presence of aphids. All of these symptoms are general indications of homopteran (aphid, whitefly, mealybug, etc) feeding and are not unique to Aphis Gossypii. Position on Plants:- on aubergines in India, Aphis Gossypii settled on older mature leaves. It moved to younger tissues only when population pressure forced it to; thus aphid populations were always greatest on the older leaves. On cantaloupes (Cucumis melo) in the USA, Aphis Gossypii was most abundant on the basal portion of vines. On cotton in the USA, it was most abundant in the middle canopy, followed by the upper canopy. However, this pattern may be a result of high aphid mortality from a fungal pathogen in the lower canopy rather than a result of aphid behaviour. Post-Harvest:- in general, Aphis Gossypii is not usually a post-harvest pest. However, damage done in the field can cause post-harvest problems. Such damage frequently occurs due to contamination with honeydew. Prevention can only occur prior to harvest. One possible situation where Aphis Gossypii could be a post-harvest pest is in the cut flowers industry. The symptoms to look for would be identical to those for the whole plant. Similarities to Other Species/Conditions:- the effects on the host plant are not unique to Aphis Gossypii. The presence of sooty mould is a general indication of the presence of a homopteran (aphid, leaf hopper, plant hopper, whitefly, etc). Taxonomically Aphis Gossypii is difficult to separate from Aphis Frangulae. Prevention and Control:- Biological Control:- despite a number of experimental studies on the natural enemies of Aphis Gossypii (see Natural Enemies), there are few records available of biological control being practised in the field. One successful study using biological control was in Egypt. Two field releases of Chrysoperla carnea at a ratio of 1:5 (predator:aphid) eliminated the aphid in 12 days, whereas it took a single release of Coccinella undecimpunctata at a ratio of 1:50 to get 99.7% control in okra. Cultural Control:- Potts and Gunadi (1991) reported a decrease in Aphis Gossypii populations in potatoes that are intercropped with Allium cepa or Allium sativum. To achieve the reduction, the onions had to be planted within 0.75 m of potato plants. However, intercropping poses a problem when the minor crop harbours a disease of the primary crop. Such a system has been documented in Taiwan where bananas were interplanted with cucumbers (an alternative host for Banana mosaic virus). A similar effect also occurs when alternative hosts (of aphid and virus) are in neighbouring fields. In cotton, an unusual approach was to top the plants after boll opening. This removed the top leaves where aphids fed, and thereby reduced contamination of bolls below these leaves. Topping was done by hand, using a pruning knife to remove the terminal spray of each plant. Host-Plant Resistance:- Glabrate cotton supported fewer aphids than more pubescent cotton. However, pubescence has the opposite effect on Aphis Gossypii feeding on muskmelons. Greater trichome density resulted in fewer aphids and less virus disease in ashgourd, Benincasa hispida. Many crops have some level of physiological resistance to Aphis Gossypii that can be classified into one of three categories: tolerance, antixenosis or antibiosis. The causes for resistance were examined extensively in muskmelons and cucumbers. Resistance has also been documented in okra; Gossypium hirsutum and Gossypium arboreum; Antigastra catalunalis; Citrullus lanatus; Solanum melongena; Dendranthema morifolium x D. indicum and Colocasia esculenta. While host plant resistance is easily classified into three categories, the cause-effect relationships are not often clear because studies focus on one part (toxicity) and ignore other aspects that may be correlated (genetically linked, or correlated within the study plants but without a genetic basis). Susceptibility to Aphis Gossypii was attributed to high protein and high amino acid content of cucumber cultivars. Differences in trichome density and differences in toxins were not measured. Likewise, in studies of host-plant resistance, nutritional suitability was not usually measured. In melons, resistance is conferred by the Vat gene. The cause of the resistance appears to be due to a modified phloem sealing physiology that reduces the quantity of sap an aphid can extract from each feeding site. Furthermore, the phloem they do get has reduced total protein. A novel approach to pest management has been the idea of eliciting natural defences in plants using mechanical wounding, infection, or sprays of elicitors. Jasmonic acid applied to cotton plants in California, USA, reduced survival and decreased the number of progeny per leaf. A similar experiment was done in China, where cotton plants were physically wounded, and some wounds were infected with a bacterium (Pseudomona gladioli D-2251). Wounded

plants had fewer aphids and it was less likely that wounded plants would be infested. Infestation frequency and aphid abundance on infested plants was further reduced if the bacterium was present. The phenomenon is widespread, and occurs naturally. A similar study was conducted on cucumber with infection by Cladosporium cucumerinum, but without physically damaging the plants. In this system Aphis Gossypii was unaffected by the presence or absence of the fungus, whereas damage from another fungal pathogen was reduced. Wind induced mechanical stress can increase peroxidase activity in cucumber, and with at least 12 days of wind stress can result in detectable reductions in aphid populations. However, Moran also found that this mechanical stress can increase pathogen susceptibility. The opposite of host plant defence would be induced susceptibility. For example, cotton plants fertilized with high nitrogen are better hosts for Aphis Gossypii, and this results in greater damage. Chemical Control:- a wide array of chemicals have been used to control Aphis Gossypii but there is a persistent problem with resistance development. In a few cases, chemical treatments have resulted in more damage than would have occurred without the treatment. The mechanism for this effect is not known, but contributing factors include the removal of beneficial organisms (predators and parasites), stimulation of aphid reproduction, and changes in plant physiology due to the application of the chemical. Resistance development has been a problem associated with the following insecticides:- Acephate; Alpha-cypermethrin; Bifenthrin:- 19 times more resistant at LD50 in Australia; Chlorpyrifos; Carbaryl:- 31 times more resistant at LD50 in Japan; Chlorpyrifos; Cyhalothrin; Cypermethrin; Deltamethrin:- 19 times more resistant at LD50 in Australia; Demeton; Diazinon:; Dimethoate:- in China, Greece, Peru, UK, Zimbabwe; Esfenvalerate; Fenitrothon:- 16 times more resistant at LD50 in Japan; Fenpropathrin; Fenvalerate:- 29 000 times more resistant at LD50 in China; Imidacloprid:- 8 times more resistant at LD50 in China; Lambda-cyhalothrin:- 28 times more resistant at LD50 in Australia; Malathion:- 27 times more resistant at LD50 in Japan; Oxydeprofos; Permethrin:- in China, Greece, UK; Phoxim:- in China; Pirimcarb:- 1 700 times more resistant at LD50 in Australia, China, Greece, Peru, UK, Zimbabwe, Italy (insensitive at all concentrations tested); Profenofos:- 6 times more resistant at LD50 in Australia; Sulprophos; y-BHC. Pesticide Susceptibility:- Aphids reared on different plants show different levels of susceptibility to insecticides. Aphis Gossypii has manifested several mechanisms for resistance:- enzymatic differences, target insensitivity, and modifications to the cuticle. However, studies in this area suffer from an inability to differentiate between phenotypic plasticity versus differences in aphid genotype as selected by host plant. Resistance to fenvalerate was increased 29 000 after 16 generations of selection in a strain reared on cotton or cucumber, and resistance to imidacloprid was increased 8.1 fold in 12 generations in a greenhouse environment. There was cross resistance to fenvalerate in aphids exposed to imidacloprid, but aphids exposed to fenvalerate did not show a cross resistance to imidacloprid. Resistance to fenvalerate was greater in aphids on cotton, but there did not appear to be a host plant difference in resistance levels to imidacloprid. Host-plant-mediated susceptibility for malathion, ethyl parathion, dimethoate and carbaryl was reported for Aphis Gossypii reared on six cucurbitaceous hosts. Aphis Gossypii on cucumbers were consistently less susceptible to all insecticides relative to aphids from the original culture on bottle gourds (Lagenaria siceraria). Other than this, there was no consistency in the level of resistance and host plant. Toxicity rank of pesticides changed depending on host plant. Aphis Gossypii colonies feeding on watermelons (in comparison with cotton) showed differences in pesticide susceptibility between bifenthrin, chlorpyrifos and dimethoate. There can be an interaction between host-plant resistance and pesticide resistance in Aphis Gossypii. In some cases, pesticide resistance in Aphis Gossypii was correlated with different aliesterase levels in aphids on different host plants. Aphids reared on melons or cucumbers showed elevated aliesterase levels relative to aphids from aubergines or potatoes. Aphis Gossypii with high aliesterase activity maintained original levels of aliesterase activity even when moved to solanaceous crops, and aphids with low aliesterase activity maintained low levels when moved to cucurbitaceous crops. This represents a difference between two strains of Aphis Gossypii correlated with a difference in host plant, and is clearly not host induced. Significant differences in esterase patterns and esterase quantity have been reported, and differences with insecticide resistance and host-plant preference have been correlated. While mixed function oxidases may play a role in detoxification reactions, the esterases and carboxylesterases showed more conspicuous differences between susceptible and resistant aphid strains. The biological cost of resistance for an organophosphate-resistant aphid feeding on cotton has been examined. Over the first few days resistant alate Aphis Gossypii produced more progeny, but over the life span of the adult there was no significant difference. However, the reproductive rate during the first few reproductive events are the most influential in determining population growth rate. Peroxidase levels in salivary glands, sheath material and salivary excretions of Aphis Gossypii might play some role in detoxifying systemic insecticides. For this reason, the role of salivary gland enzymes in detoxification has been examined as a possible defence. While the peroxidases were effective in detoxifying hordenine and gossypol, the role of these enzymes in the natural habitat of Aphis Gossypii is not clear. Aphis Gossypii also acquires resistance through target site insensitivity and through increased production of the affected enzymes. Acetylcholinesterase (AChE) insensitivity was shown in Aphis Gossypii resistant to organophosphate and carbamate insecticides. Furthermore, activity level of AChE has been correlated with pirimicarb resistance. For two clones this resistance was shown to be specific to pirimicarb. These clones were 800 times more resistant than the susceptible clone, but no more than 22 times more resistant to six organophosphates, six carbamates and two pyrethroids. The mechanism was linked to AChE with higher catalytic activity and lower affinity to pirimicarb in the resistant clones. Cuticular differences as well as AChE insensitivity played a role in insecticide resistance in paraoxon. Life stage is another factor affecting the susceptibility of Aphis Gossypii to insecticides. Alate adults on cotton were more resistant than apterous adults to chlorpyrifos and biphenate. Factors which may result in pest resurgence (other than a reduction in natural enemies) have been examined. Cotton fields treated with sulprophos had elevated numbers of Aphis Gossypii, but the cotton plants in these fields had significantly elevated levels of threonine and essential amino acids. Cotton plants treated with dimethoate had larger aphids, but treated plants had lower sugar content, lower nitrogen content, lower carbohydrate to nitrogen ratio, and higher amino acid content. Although altered plant physiology may account for Aphis Gossypii resurgence in some cases, it is not the only cause. Direct applications of deltamethrin and carbaryl stimulated the reproductive rate of Aphis Gossypii. Some of this effect was due to elevated feeding levels at certain doses of deltamethrin. Elevated Aphis Gossypii populations have been reported following pesticide applications but the causes were not examined. Sub-lethal effects:- Imidacloprid was observed to stimulate the production of alates in the USA. While six times as many alates were produced in imidacloprid treated plots, these aphids had significantly reduced fecundity. Integrated Pest Management (IPM):- major IPM programmes have been developed for Aphis Gossypii in cotton. There are computer-based systems under development in Australia, Sudan, USA, Zambia and other countries. Transgenic plants are used to manage other pests in crops where Aphis Gossypii occurs. In China, it was shown that Aphis Gossypii develops resistance to Bt, and Bt+CpTI transgenic cottons, and after only three generations, the aphids had longer reproductive duration, greater survival, and greater maximum potential fecundity than similar aphids on non-transgenic cotton cultivars (Liu et al., 2005). Economic Threshold Levels:- despite the lack of quantitative data on exact yield reductions caused by Aphis Gossypii, there are a number of reports on the control action threshold. In Sudan on Cotton, this level was 30% infestation of the plants during the first 2 months of the season. Using a damage index, a rating of 250 for seedling Cotton with fewer than three leaves, and a rating of 350–400 for larger plants was recommended for treating Cotton in China. In Spain, the economic injury level (EIL) in Clementines (Citrus Clementina) and the environmental EIL was estimated. The EIL for Aphis Gossypii was 271 Aphids/m^2; however, this figure will change with the cost of control, the sale price, and yield loss due to the Aphid change. / Хлопковые Тли, Насекомые Семейства Настоящих Тлей Отряда Равнокрылых, повреждающие Хлопчатник. Наиболее вредоносна Бахчевая, или Хлопковая, Тля (Aphis Gossypii). Бескрылые самки (самцы отсутствуют) с яйцевидным телом, длиной 1.25–2.1 миллиметра (мм), жёлтой или зелёной окраски, соковые

трубочки чёрные. После перезимовки питаются сорняками. При температуре около 12 °C начинают размножаться, отрождая 20–60 личинок, которые через 10–15 суток (сут) превращаются во взрослых особей. В начале лета появляются крылатые самки, перелетающие на посевы Хлопчатника, Клещевины, Бахчевых и других сельскохозяйственных культур. Насекомые высасывают сок из листьев, которые скручиваются и засыхают; растения замедляют рост и уменьшают плодообразование вследствие углеводного голодания. Осенью вредитель склеивает и загрязняет волокно, способствуя развитию на нём сапрофитных грибов. Хлопчатник повреждают также Люцерновая, или Акациевая, Тля (Aphis Laburni), Большая Хлопковая Тля (Acyrthosiphon Gossypii). Хлопковые Тли распространены в районах хлопководства; в бывшем Союзе Советских Социалистических Республик (СССР) – в основном в Средней Азии и Казахстане. Меры борьбы:- уничтожение сорняков, уборка растительных остатков, обработка Хлопчатника инсектицидами – сайфосом, карбофосом и другими.

API = AMERICAN PETROLEUM INSTITUTE

APIC = ADDITIONAL PAID–IN–CAPITAL

APICAL = АПИКАЛЬНОЕ – Apical is located at the tip or highest point. See also Basal. / Под Апикальным, от Латинского слова Apex, означающее Верхушка, понимается верхушечное, расположенное на верхушке или принадлежащее к ней, обращённое кверху, например, апикальный побег у растений. Смотрите также Базальное (Basal).

APICAL DOMINANCE = АПИКАЛЬНОЕ ДОМИНИРОВАНИЕ – Apical Dominance:- inhibition of lateral bud development along a shoot by the terminal bud or growing point. Apical dominance (the phenomenon known in plants) underlies pathological morphogenetic processes occurring in animals and human in oncogenesis and senescence. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. Апикальное Доминирование – преимущественное развитие верхушечной почки, замедляющей рост боковых почек и растущей быстрее, чем последние. Апикальное доминирование (явление, известное у растений) лежит в основе патологических морфогенетических процессов, происходящих у животных и человека при онкогенезе и при старении. Апикальное Доминирование – свойство преобладающего роста побегов из верхушечной и ближайших к ней почек. Апикальное доминирование проявляется в пределах дерева и каждой ветви. Ослабляется по мере отклонения ветви к горизонтальному положению, с увеличением общей длины и возраста дерева.

APICAL MERISTEM = АПИКАЛЬНАЯ МЕРИСТЕМА – Apical Meristem is the un-differentiated tissue at the tip of a shoot or root, that by division produces the precursors of the differentiated tissues, including vegetative, reproductive or floral organs. / Под Апикальным, от Латинского слова Apex, означающее Верхушка, понимается верхушечное, расположенное на верхушке или принадлежащее к ней, обращённое кверху, например, апикальный побег у растений. Под Меристемой, от Греческого слова Meristós, означающее Делимый, понимается ткань растений, в течение всей жизни сохраняющая способность к образованию новых клеток. За счёт меристемы растения растут, образуют новые органы (листья, стебли, корни, цветки). Из производных меристемы образуются постоянные ткани растений (покровные, проводящие и другие).

APICULATE = КОРОТКООСТРОКОНЕЧНОЕ – Apiculate:- ending in a short-pointed tip.

APICULUS = АПИКУЛЮС – Apiculus is the extending tip of the lemma or palea. The two apiculi may be distinguished as lemmal apiculus and paleal apiculus. Apiculus is a small extension of the lemma or palea. / или плёнка. У базидиальных грибов Апикулюс – это короткий тупой клювовидный выступ на одном из концов грибной споры, с помощью которого она прикрепляется к стеригме – выросту на базидии. На другом конце споры обычно расположена ростковая пора, через которую происходит её прорастание. Апикулюс, с помощью которого споры прикрепляются к стеригме, размещён поближе к брюшной стороне споры. У почти всех видов грибов на конце споры, противоположном апикулюсу, находится спора прорастания.

API ENGINE SERVICE CATEGORIES = КАТЕГОРИИ ОБСЛУЖИВАНИЯ ДВИГАТЕЛЕЙ ПО АИН – The American Petroleum Institute (API) Engine Service Categories:- gasoline and diesel engine oil quality levels established jointly by API, Society of Automotive Engineers (SAE), and American Society for Testing and Materials (ASTM), and sometimes called SAE or API/SAE categories; formerly called API Engine Service Classifications. / Сообщество Автотракторных Инженеров (САИ), и Американское Общество по Испытаниям и Материалам (АОИМ).

API GRAVITY = ТЯЖЕСТЬ ПО АИН (или ВЕС ПО АИН, или ПЛОТНОСТЬ ПО АИН) – The American Petroleum Institute (API) Gravity is a gravity scale established by the American Petroleum Institute (API) and in general use in the petroleum industry, the unit being called The API Degree. This unit is defined in terms of specific gravity as follows:- Sp.Gr.(@60°F) = 141.5 / (Degrees API + 131.5) or Degrees API = [141.5 / Sp.Gr.(@60°F)] – 131.5. See also Gravity (2). The American Petroleum Institute Gravity, or API Gravity, is a measure of how heavy or light a petroleum liquid is compared to water. If its API gravity is greater than 10, it is lighter and floats on water; if less than 10, it is heavier and sinks. API gravity is thus an inverse measure of the relative density of a petroleum liquid and the density of water, but it is used to compare the relative densities of petroleum liquids. For example, if one petroleum liquid floats on another and is therefore less dense, it has a greater API gravity. Although mathematically, API gravity has no units (see the formula:- API Gravity = ((141.5 / Specific Gravity) – 131.5), it is nevertheless referred to as being in ‘degrees’. API gravity is gradated in degrees on a hydrometer instrument. The API scale was designed so that most values would fall between 10 and 70 API gravity degrees. In the oil industry, quantities of crude oil are often measured in metric tons. One can calculate the approximate number of barrels per metric ton for a given crude oil based on its API gravity:- Barrels of Crude Oil per Metric Ton = 1 / (((141.5 / (API Gravity +131.5)) x 0.159). So, for example, a metric ton of West Texas Intermediate (39.6° API) would contain about 7.6 barrels. To derive the API gravity from the density, the density is first measured using either the hydrometer, detailed in ASTM D1298 or with the oscillating U-tube method detailed in ASTM D4052. Density adjustments at different temperatures, corrections for soda-lime glass expansion and contraction and meniscus corrections for opaque oils are detailed in the Petroleum Measurement Tables, details of usage specified in ASTM D1250. The specific gravity is then calculated from the formula below:- Specific Gravity Oil = ρ_{oil} / ρ_{H2O}. Generally speaking, oil with an API gravity between 40 and 45 commands the highest prices. Above 45 degrees the molecular chains become shorter and less valuable to refineries. Crude oil is classified as light, medium or heavy, according to its measured API gravity:- (i) Light Crude Oil is defined as having an API gravity higher than 31.1 °API (less than 870 kg/m^3); (ii) Medium Oil is defined as having an API gravity between 22.3 °API and 31.1 °API (870 to 920 kg/m^3); (iii) Heavy Oil is defined as having an API gravity below 22.3 °API (920 to 1 000 kg/m^3); and (iv) Extra Heavy Oil is defined with API gravity below 10.0 °API (greater than 1 000 kg/m^3). Not all parties use the same grading. The United States Geological Survey uses slightly different definitions. Crude oil with API gravity less than 10 °API is referred to as extra heavy oil or bitumen. Bitumen derived from the oil sands deposits in the Alberta, Canada area has an API gravity of around 8 °API. It is ‘upgraded’ to an API gravity of 31 °API to 33 °API, and the upgraded oil is known as Synthetic Crude. See also Gravity. API (American Petroleum Institute) Gravity, or weight per unit of volume, is an arbitrary measurement of the relative density of crude oils. It also serves as an approximate measure of their value as the higher the API gravity number, also known as Degrees API, the richer the yield in high value refined oil products such as gasoline. Crudes with an API gravity of more than 30 are said to be light crudes, those with a number of less than 20 are said to be heavy crudes. Heavy crudes produce a greater proportion of lower priced oil products such

as fuel oil. API Gravity:- an arbitrary scale expressing the gravity or density of liquid petroleum products devised jointly by the American Petroleum Institute (API) and the National Bureau of Standards. The measuring scale is calibrated in terms of degrees API. Oil with the least specific gravity has the highest API gravity. The formula for determining API Gravity is:- API Gravity = (141.5 / Specific Gravity at 60 degrees Fahrenheit) – 131.5. Gravity (weight per unit volume) of oils as measured by the American Petroleum Institute (API) scale whereby:- API Gravity = (141.5 / Specific Gravity at 60 °F) – 131.5. API stands for the American Petroleum Institute, which is the major United States trade association for the oil and natural gas industry. The API represents about 400 corporations in the petroleum industry and helps to set standards for production, refinement, and distribution of petroleum products. They also advocate on behalf of the industry. One of the most important standards that the API has set is the method used for measuring the density of petroleum. This standard is called the API Gravity. Specific Gravity is a ratio of the density of one substance to the density of a reference substance, usually water. The API Gravity is nothing more than the standard specific gravity used by the oil industry, which compares the density of oil to that of water through a calculation designed to ensure consistency in measurement. Less dense oil or 'light oil' is preferable to more dense oil as it contains greater quantities of hydrocarbons that can be converted to gasoline. Petroleum is less dense that water and in 1916, the US government instituted the Baumé scale as the standard measure for any liquid less dense than water. This, in most cases, applies to oil. The value used in this scale was 141.5 (see calculation below), but subsequent testing showed that, due to error, the actual value should be 140. The government changed the scale to 140 to correct the issue, but the use of 141.5 had become so entrenched in the oil industry that the API decided to create the API gravity scale using the old value of 141.5. API gravity is calculated using the specific gravity of an oil, which is nothing more than the ratio of its density to that of water (density of the oil/density of water). Specific gravity for API calculations is always determined at 60 degrees Fahrenheit. API gravity is found as follows:- API Gravity = (141.5 / Specific Gravity) – 131.5. Though API values do not have units, they are often referred to as degrees. So the API gravity of West Texas Intermediate is said to be 39.6 degrees. API gravity moves inversely to density, which means the denser an oil is, the lower its API gravity will be. An API of 10 is equivalent to water, which means any oil with an API above 10 will float on water while any with an API below 10 will sink. The API gravity is used to classify oils as light, medium, heavy, or extra heavy. As the 'weight' of an oil is the largest determinant of its market value, API gravity is exceptionally important. The API values for each 'weight' are as follows:- (i) Light – API > 31.1; (ii) Medium – API between 22.3 and 31.1; (iii) Heavy – API < 22.3; and (iv) Extra Heavy – API < 10.0. These are only rough valuations as the exact demarcation in API gravity between light and heavy oil changes depending on the region from which oil came. The fluctuation as to what constitutes light crude in a given region is the result of commodity trading in oil. Because density is a measure of weight per volume, API can be used to calculate how many barrels of crude can be extracted from a metric ton of a given oil. A metric ton of West Texas Intermediate, with an API of 39.6, will produce 7.6 barrels (at 42 gallons each). The calculation is:- Barrels Per Metric Ton = 1 / [(141.5 / (API + 131.5) x 0.159]. / Американское Сообщество по Испытанию Материалов (АСИМ). Плотность в градусах (вес на единицу объёма) или удельный вес нефтепродуктов по шкале определения Американского Института Нефти (АИН), согласно которой данная плотность определяется по формуле:- Плотность по АИН = (141.5 / Относительная Плотность при температуре 60° по Фаренгейту (15.6 °C)) – 131.5. Произвольная шкала, выражающая плотность (вес) жидких нефтепродуктов, разработанная совместно Американским Институтом Нефти (АИН) и Национальным Бюро по Стандартам. Измерительная шкала калибруется в градусах АИН. Нефть с наименьшим удельным весом (плотностью) имеет наибольшую плотность по АИН. Формула для определения плотности АИН:- Плотность АИН = (141.5/удельный вес при 60 градусах по Фаренгейту (15.6 °C)) – 131.5. Плотность – одна из основных физических характеристик вещества, равная отношению массы dm малого элемента вещества объёмом dV к этому объёму:- $\rho = dm / dV$. Единица плотности в Международной Системе Единиц СИ – кг/м^3. Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды.

APL = AIRPORT LIGHTS

APM = ALL PILOTS MEETING

APM = AUTOMATED PEOPLE MOVER

APMS = AUTOMATED PERFORMANCE MEASUREMENT SYSTEM

APMS = AUTOMATED PROJECT MANAGEMENT SYSTEM

APNIC = THE ASIA PACIFIC NETWORK INFORMATION CENTRE

APO = ABSOLUTE PRICE OSCILLATOR

APOD = AERIAL PORT OF DEBARKATION

APOE = AERIAL PORT OF EMBARKATION

APOMIXIS = АПОМИКСИС – Apomixis is an asexual method of reproduction in which the seed develops without the union of egg and sperm. The resulting embryos have the same genetic constitution as that of the seed parent. / Под Апомиксисом, от Греческих слов Apó, означающее Без или Из или От, и Mixis, означающее Смешение, понимаются различные способы бесполого размножения животных и растений; в более узком значении – образование зародыша без оплодотворения. Например, партеногенез и апогамия – разновидности апомиксиса.

APOPHYSIS = АПОФИЗА – Apophysis is an offshoot or projecting part. / Под Апофизой, от Греческого слова Apóphysis, означающее Отросток или Побег, понимается жилоподобное ответвление от магматического тела, связь с которым можно непосредственно проследить.

APOSPORY = АПОСПОРИЯ – Apospory is a form of apomixis in which the embryo develops from the somatic cells of the nucellus.

APOSTILLE = АПОСТИЙ (или АПОСТИЛЬ) – Apostille is a French word which means a certification. It is commonly used in English to refer to the legalization of a document for international use under the terms of the 1961 Hague Convention Abolishing the Requirement for Legalisation for Foreign Public Documents. A document which has been certified with a conformant apostille is accepted for legal use in all the nations that have signed the Hague Convention. Apostille is an official document required to authenticate signatures to a document that are not signed in the presence of the notary public in Mexico. In the United States, the Secretary Of State issues the apostille where the person signing resides. Apostille:- Certification. An apostille (French word meaning Notation) is a standard certification provided under The Hague Conference on Private International Law:- 1961 Convention Abolishing the Requirement of Legislation for Foreign Public Documents for the purpose of authenticating documents for use in foreign countries. An apostille is a form of authentication accepted in countries which have signed the 1961 Hague Convention. This Convention abolished the requirement of diplomatic and consular legalization for public documents originating in one Convention country and intended for use in another. An apostille is often needed in adoptions, extraditions, and certain business transactions. The apostille is

formatted in numbered fields that allow data to be understood by the receiving country regardless of the official language of the issuing country. With the apostille, the document is entitled to recognition in the country of intended use, and no further authentication or legalization by the embassy or consulate of the foreign country where the document is to be used is required. Apostille is a method of certifying a document for use in another country pursuant to the 1961 Hague Convention. With this certification by apostille, a document is entitled to recognition in the country of intended use, and no certification or legalization by the embassy or consulate of the foreign country where the document is to be used is required. The Hague Convention and Apostille:- the 1961 Hague Convention stipulates that signatory countries (including both Austria and the United Kingdom) agrees to mutually recognize each other's 'public documents'. In other words, such documents need no prior legalization by an Embassy or Consulate of the other country. Yet, all these public documents must be authenticated by an Apostille. An apostille is an internationally recognized form of notarization and ensures that public documents issued in one country will be recognized as valid in another country. The sole function of the apostille is to certify the authenticity of the signature on the document in question; the capacity in which the person signing the document acted; and the identity of any stamp or seal affixed to the document. The apostille either must be attached as an annex to the official document or placed on the document itself by means of a stamp. An apostille is solely issued upon request. Who issues an apostille? In Austria, for example, an apostille is issued by:- (i) the Federal Ministry for European and International Affairs; (ii) the Presidents of any Civil Court of First Instances; and (iii) the Governors or Governments of the Federal Provinces. In the UK an apostille is issued by the Foreign and Commonwealth Office. / В России в некоторых сферах деятельности этот термин был заимствован из Французского языка и утвердился как Апостиль, хотя правильно произносится как Апостий. Апостиль, от Французского слова Apostille, специальный знак, проставляющийся на официальных документах некоммерческого характера, исходящих от учреждений и организаций стран-участниц Гаагской Конвенции об Отмене Требований Легализации Иностранных Официальных Документов от 1961. Апостиль удостоверяет подписи, качество, в котором выступало лицо, подписавшее документ, а также, в отдельных случаях, подлинность штампа или печати, скрепляющих документ. Апостиль не требует дальнейшего заверения или легализации документа и признаётся официальными органами всех государств-участников Конвенции. Апостиль может не использоваться, если существуют правовые основания, отменяющие или упрощающие легализацию документа.

APOTHECIA = АПОТЕЦИЯ – Apothecia is a cup-shaped spore-bearing structure produced by some fungi. The apothecia of the pathogen that causes Sclerotinia boll rot of cotton are small (5–8 mm across), 'golf tee'-like structures that grow at the soil surface out of buried fungal survival structures called Sclerotia. / Открытое плодовое тело ряда сумчатых грибов и лишайников.

APOTHECIUM = АПОТЕЦИЙ – Apothecium is a cup-shaped fruiting body produced by some lichens and fungi. / некоторыми лишайниками и грибами. Под Апотецием, от Греческого слова Apothēkion, означающее Кладовая, понимается открытое плодовое тело ряда сумчатых грибов и лишайников.

APPA = AGRONOMY, PLANT PHYSIOLOGY, AND AGROECOLOGY DIVISION

APPAREL = ОДЕЖДА – Apparel is a term used in distribution/transport of clothing for a single piece of clothing, a garment. See also Garment. Clothing, especially outer garments; attire. Apparel:- Middle English Appareil, from Old French Apareil = Preparation, from Apareillier = To Prepare, possibly from Vulgar Latin Appariculāre, from Latin Apparāre, from Parāre = To Prepare. Something that covers or adorns, esp outer garments or clothing. (1) Apparel:- clothing in general; 'she was refined in her choice of apparel'; 'he always bought his clothes at the same store'; 'fastidious about his dress'. (2) To Apparel:- to provide with clothes or put clothes on; 'Parents must feed and dress their child'. Apparel:- personal attire; clothing; clothes; garments; fashions; things one wears to cover thy naked body. / Термин, используемый в распределении/перевозке одежды для обозначения одной единицы одежды, швейной продукции.

APPAREL = ОСНАСТКА (или СНАРЯЖЕНИЕ, или ШКИПЕРСКОЕ ИМУЩЕСТВО) – Apparel is a vessel's outfit, such as rigging, anchor and life boats. / Снаряжение судна, такое как такелаж, якорь и спасательные шлюпки. Оснастка судна – система снастей, то есть весь стоячий и бегучий такелаж на судне.

APPAREL WHOLESALERS = ОПТОВЫЕ ПРОДАВЦЫ ОДЕЖДЫ – Apparel Wholesalers are companies that sell clothing and fashion accessories to retailers. Typically, the wholesalers purchase apparel from factories and then re-sell the product to the stores. Wholesalers usually provide design direction and the factories follow the specifications set forth by the wholesaler.

APPAREL WOOL = ШЕРСТЬ НА ТКАНИ ДЛЯ ОДЕЖДЫ – Apparel Wool:- all wools that are manufactured into cloth for use as clothing.

APPARENT DEMAND = ЯВНЫЙ СПРОС (или ОЧЕВИДНОЕ ПОТРЕБЛЕНИЕ, или КАЖУЩИЙСЯ СПРОС) – In some energy reviews, Apparent Demand is an estimate of domestic demand (as opposed to counting barrels whose actual delivery has been reported and documented). Calculation varies by country. For example, in China, apparent demand is defined as refinery output plus net product imports (with some adjustments for considerations such as smuggling). In the former Soviet Union (FSU), apparent demand is equal to crude production minus net exports of crude and products. / выработка (output).

APPARENT DENSITY = КАЖУЩАЯСЯ ПЛОТНОСТЬ (или НАСЫПНАЯ ПЛОТНОСТЬ, или ОЧЕВИДНАЯ ПЛОТНОСТЬ, или ЯВНАЯ ПЛОТНОСТЬ, или ВЫЯВЛЕННАЯ ПЛОТНОСТЬ, или МНИМАЯ ПЛОТНОСТЬ) – (1) Apparent Density is defined as the ratio between the mass of a dry specimen and its apparent volume, i.e. the volume limited by the external surface of the specimen including any voids. It is, therefore, measured in kilograms per cubic meter. The apparent density (ρb) is expressed by the following equations:- ρb = (md / ms – mh) x ρw (kg/m^3); where:- md is the mass of the dry specimen (g); ms is the mass of the saturated specimen in air (g); mh is the mass of the saturated specimen in water (g); and ρw is the density of water (kg/m^3). Apparent Density is a density of lumber including hollow space. / Плотность пиломатериалов, то есть отношение массы к объёму, зависит в первую очередь от породы дерева, его влажности, места произрастания. Она не постоянна даже в разных участках ствола. По показателям плотности породы деревьев условно подразделяются на три основные группы. Малая плотность, то есть до 540 кг/м^3, присуща Сосне, Ели, Пихте, Тополю, Кедру, Липе, Ольхе и Иве. От 550 до 740 кг/м^3, то есть средней плотностью отличаются Тис, Лиственница, Берёза, Вяз, Дуб, Бук, Груша, Яблоня, Клён, Ясень. И наконец, представителями высокой плотности, то есть 750 кг/м^3 и выше, являются Граб, Акация белая, Самшит, Рябина, Кизил. Показатель плотности важен при выборе пиломатериалов, так как от него зависит прочность материала. Плотность древесины меняется в пределах и годичных слоёв. К примеру, более ранний слой позднему уступает в прочности в 2–3 раза. Показатель плотности увеличивается с повышением влажности.

(2) Apparent Density is the weight per unit volume of a metal powder, in contrast to the weight per unit volume of the individual particles. Apparent Density is the mass per unit volume of loose material. Also called Bulk Density. Provides a measure of the 'fluffiness' of a material in its supplied form. Material is poured through a specified funnel into a cylinder of known volume. Excess material is scraped off the top of the cylinder with a straightedge and the cylinder is weighed. Apparent density is calculated as the mass of material divided by the volume of the cylinder. / Насыпная Плотность – вес на единицу объема металлического порошка.

APPARENT GOOD ORDER = БЕЗ ВНЕШНИХ ПОВРЕЖДЕНИЙ (или ЗАКАЗ, КАЖУЩИЙСЯ ХОРОШИМ) – When freight appears to be free of damage so far as a general survey can determine.

APPARENT POWER = КАЖУЩАЯСЯ МОЩНОСТЬ – Apparent Power is the mathematical product of voltage and current on ac systems. Since voltage and current may not be in phase on ac systems, the apparent power thus calculated may not equal the real power, but may actually exceed it. Reactive loads (inductance and/or capacitance) on ac systems will cause the apparent power to be larger than the real power. / Под Кажущейся Мощностью понимается то же, что Полная Мощность. Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность. Мгновенная электрическая Мощность равна произведению мгновенных значений напряжения и силы тока.

APPARENT VISCOSITY = КАЖУЩАЯСЯ ВЯЗКОСТЬ (или СТРУКТУРНАЯ ВЯЗКОСТЬ, или ПСЕВДОПЛАСТИЧНОСТЬ) – Apparent Viscosity:- the ratio of shear stress to rate of shear of a non-Newtonian fluid such as lubricating grease, or a multi-grade oil, calculated from Poiseuille's equation and measured in Poises. The apparent viscosity changes with changing rates of shear and temperature and must, therefore, be reported as the value at a given shear rate and temperature (ASTM Method D 1092). American Society for Testing and Materials (ASTM). See also Viscosity. / Американское Общество по Испытаниям и Материалам (АОИМ). Динамическая Вязкость (Dynamic Viscosity) η (входит в виде коэффициента пропорциональности в формулу Закона Ньютона), единицей которой в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) является Паскаль-секунда (Па·с), в Англоязычных странах для обозначения динамической вязкости и в Системах Единиц СГС (системы единиц физических величин lmt (где l – длина, m – масса, t – время), в которых приняты три основные единицы:- сантиметр (см) – единица длины, грамм (г) – единица массы и секунда (с) – единица времени; отсюда и название системы по первым буквам названий этих трёх единиц) использовалась устаревшая и более не подлежащая применению единица измерения Пуаз (П (P); на Французском Poise, от имени Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). 1 П = 0.1 Па·с. Чаще использовалась дольная единица – сантиПуаз (сП); 1 сП = 1 мПа·с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Пауз (П), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений системы СИ. Структурная Вязкость, вязкость, связанная с возникновением структуры в жидкости и зависящая от градиента скорости течения. Структурная вязкость характерна для дисперсных систем (в том числе коллоидных растворов) и растворов высокополимеров. Возникновение структурной вязкости в перечисленных системах обусловлено тем, что при течении 'структурированной' жидкости работа внешних сил затрачивается не только на преодоление истинной (Ньютоновской) вязкости, но и на разрушение структуры, переориентацию вытянутых частиц в потоке и тому подобное. Структурная вязкость играет большую роль при перекачивании дисперсных систем (например, пульпы при углублении фарватера рек) и жидких полимеров по трубопроводам, течении их в аппаратах химических производств и тому подобного. Термин Структурная Вязкость ввёл в 1925 Русский и Немецкий физик и химик, учёный Вильхэльм Фридрихь Оствальд (Wilhelm Friedrich Ostwald; 1853–1932).

AP–PCR = ARBITRARILY PRIMED POLYMERASE CHAIN REACTION

APPEAL = АПЕЛЛЯЦИЯ (или ОБЖАЛОВАНИЕ) – (1) Appeal is the act by which a person (natural or legal) who is directly affected by a decision or omission of the Customs authorities and who deems himself to be aggrieved thereby seeks redress before a competent authority. Appeal in Customs matters is dealt with in Annex H.1 to the Kyoto Convention. / В данном случае под Апелляцией понимается обжалование какого-либо постановления в высшую инстанцию, которая имеет право пересмотреть дело по существу.

(2) In law, an Appeal is a process for requesting a formal change to an official decision. The specific procedures for appealing, including even whether there is a right of appeal from a particular type of decision, can vary greatly from country to country. Even within a jurisdiction, the nature of an appeal can vary greatly depending on the type of case. An appellate court is a court that hears cases on appeal from another court. Depending on the particular legal rules that apply to each circumstance, a party to a court case who is unhappy with the result might be able to challenge that result in an appellate court on specific grounds. These grounds typically could include errors of law, fact, or procedure (in the United States, due process). In different jurisdictions, appellate courts are also called Appeals Courts, Courts Of Appeals, Superior Courts, or Supreme Courts. A party who files an appeal is called an Appellant, Plaintiff in Error, Petitioner or Pursuer, and a party on the other side is called a Respondent (in most common-law countries), Defendant in Error, Appellee (in the United States) or Defender (under Scots law). A cross-appeal is an appeal brought by the respondent. For example, suppose at trial the judge found for the plaintiff and ordered the defendant to pay USD50 000. If the defendant files an appeal arguing that he should not have to pay any money, then the plaintiff might file a cross-appeal arguing that the defendant should have to pay USD200 000 instead of USD50 000. The appellant is the party who, having lost part or all their claim in a lower court decision, is appealing to a higher court to have their case reconsidered. This is usually done on the basis that the lower court judge erred in the application of law, but it may also be possible to appeal on the basis of court misconduct, or that a finding of fact was entirely unreasonable to make on the evidence. The appellant in the new case can be either the plaintiff (or claimant), defendant, third-party intervenor, or respondent (appellee) from the lower case, depending on who was the losing party. The winning party from the lower court, however, is now the respondent. In unusual cases the appellant can be the victor in the court below, but still appeal. For example, in Doyle v Olby (Ironmongers) Ltd (1969) 2 QB 158, the claimant appealed (successfully) on the basis that, although he won in the court below, the lower court had applied the wrong measure of damages and he had not been fully recompensated. An appellee is the party to an appeal in which the lower court judgment was in its favor. The appellee is required to respond to the petition, oral arguments, and legal briefs of the appellant. In general, the appellee takes the procedural posture that the lower court's decision should be affirmed. An appeal as of right is one that is guaranteed by statute or some underlying constitutional or legal principle. The appellate court cannot refuse to listen to the appeal. An appeal by leave or permission requires the appellant to obtain leave to appeal; in such a situation either or both of the lower court and the appellate court may have the discretion to grant or refuse the appellant's demand to appeal the lower court's decision. A good example of this is the US Supreme Court, in which review in most cases is available only if the Court exercises its discretion and grants a writ of certiorari. In contrast, appeal as of rights to the Supreme Court of Canada are

available, for example, in criminal cases where there is dissent on a point of law in a provincial court of appeal. In tort, equity, or other civil matters either party to a previous case may file an appeal. In criminal matters, however, the state or prosecution generally has no appeal as of right. And due to the double jeopardy principle, in the United States the state or prosecution may never appeal a jury or bench verdict of acquittal. But in some jurisdictions, the state or prosecution may appeal as of right from a trial court's dismissal of an indictment in whole or in part or from a trial court's granting of a defendant's suppression motion. Likewise, in some jurisdictions, the state or prosecution may appeal an issue of law by leave from the trial court and/or the appellate court. The ability of the prosecution to appeal a decision in favor of a defendant varies significantly internationally. All parties must present grounds to appeal, or it will not be heard. By convention in some law reports, the appellant is named first. This can mean that where it is the defendant who appeals, the name of the case in the law reports reverses (in some cases twice) as the appeals work their way up the court hierarchy. This is not always true, however. In the United States federal courts, the parties' names always stay in the same order as the lower court when an appeal is taken to the circuit courts of appeals, and are re-ordered only if the appeal reaches the United States Supreme Court. / , от Латинского слова Affirmo, означающее Утверждаю, . В ряде государств под Апелляцией понимается обжалование судебных приговоров и решений, не вступивших в законную силу. Апелляционный Суд заново исследует имеющиеся в деле и вновь представленные доказательства и либо утверждает обжалованное решение, либо выносит новое. В праве стран, некогда являвшихся республиками бывшего Советского Союза, единой формой обжалования судебных решений, не вступивших в законную силу, являлась Кассация от позднелатинского Cassatio, означавшего Отмену или Уничтожение. В юридическом аспекте Апелляция и Кассация со стороны выглядят одинаково – по сути, это обжалование в вышестоящем суде судебного решения, не вступившего в законную силу. А в чём же между ними разница? Если не вдаваться во все юридические тонкости процессуального производства, то главное отличие между апелляцией и кассацией заключается в том, что после апелляционной жалобы дело пересматривается и в результате выносится новое решение (например, новый приговор, который, к слову, может оказаться как оправдательным, так и ужесточающим наказание), тогда как после удовлетворения кассационной жалобы обжалуемое решение может быть лишь отменено, признано незаконным или необоснованным, без вынесения нового. В принципе, чтобы понимать эту разницу, можно быть не юристом, а лингвистом – слова говорят сами за себя. Кассация через Французское слово Cassation, означающее буквально Аннулирование или Отмена, происходит от средневекового Латинского слова Cassare, означающее Отменять. 'Осудили невинную, и я желал бы кассировать дело и перенести его в высшую инстанцию' (Лев Толстой). Апелляция же происходит от Латинского слова Appellātus, причастия прошедшего времени от глагола Appellare, означающее Взывать или Обращаться (к кому-либо) или Просить или Молить (кого-либо). Кстати, следует предостеречь от ошибки использования глагола 'апеллировать' вместо 'оперировать' в выражениях типа апеллировать фактами. Апеллировать можно к чему-то, но не чем-то. 'Наш долг взять власть в свои руки, как бы безнадёжно положение ни было. Пусть мы погибнем, мы будем апеллировать к истории и выполним свой долг' (Анатолий Луначарский). Апелляция это вторая судебная инстанция, а кассация третья.

(3) In the US trademark law, an Appeal:- an applicant who wants to contest a final refusal from an examining attorney may file an appeal to the Trademark Trial and Appeal Board. An appeal is taken by filing a Notice of Appeal and paying the appeal fee within six months of the mailing date of the action from which the appeal is taken.

APPEARANCE = НАРУЖНЫЙ ВИД (или ВНЕШНИЙ ВИД, или ИЗОБРАЖЕНИЕ, или ОФОРМЛЕНИЕ, или ПОЯВЛЕНИЕ, или ВИДИМОСТЬ, или ОБЛИК) – Appearance:- manifestation of the nature of objects and materials through visual attributes such as size, shape, color, texture, glossiness, transparency, opacity, etc.

APPEARANCE OF A CRACK OR MIS ALIGNMENT IN TRANSFER PRINTED FABRIC = ПОЯВЛЕНИЕ (или НАЛИЧИЕ) ТРЕЩИНЫ ИЛИ НЕСОВПАДЕНИЕ (или НЕТОЧНОЕ СОВМЕЩЕНИЕ, или РАЗРЕГУЛИРОВКА, или РАЗЪЮСТИРОВКА, или СМЕЩЕНИЕ) НА ТКАНИ ПЕРЕВОДНОГО ПЕЧАТАНИЯ – Appearance Of A Crack Or Mis Alignment In Transfer Printed Fabric:- Possible Cause:- due to incomplete transfer of the design in the first attempt as the paper was removed while the fabric was still hot, the operator tried to adjust the remaining bit on the fabric. This lead to improper alignment. The defect in this case is minor. The operator was lucky to have registered the design fairly well. Printing defect.

APPENDAGE = ПРИДАТОК (или ОТРОСТОК) – Appendage is any external outgrowth of a plant that does not have any apparent essential function.

APPLIANCE = УСТРОЙСТВО – Appliance means an instrument, equipment, apparatus, a part, an appurtenance, or an accessory used, capable of being used, or intended to be used, in operating or controlling aircraft in flight, including a parachute, communication equipment, and another mechanism installed in or attached to aircraft during flight, and not a part of an aircraft, aircraft engine, or propeller.

APPLICANT = ЗАЯВИТЕЛЬ – In the US patent law, an Applicant is an inventor or joint inventors who are applying for a patent on their own invention, or the person mentioned in 37 CFR 1.42, 1.43 or 1.47 who is applying for a patent in place of the inventor.

APPLICATION = ЗАЯВЛЕНИЕ – (1) Application is a signed statement by a prospective insured client which becomes a part of the insurance contract. / В страховании, Заявление, подписанное будущим застрахованным клиентом, которое становится частью страхового контракта. В России может быть известно как Заявление о Страховании или Страховая Декларация.

(2) In the US patent law, an Application is an application for patent filed under 35 USC 111(a) that includes all types of patent applications (i.e. utility, design, plant, and reissue) except provisional applications. The nonprovisional application establishes the filing date and initiates the examination process. A nonprovisional utility patent application must include a specification, including a claim or claims; drawings, when necessary; an oath or declaration; and the prescribed filing fee. / чертёж (drawing).

(3) In the US trademark law, an Application is a document by which a person requests a federal trademark registration. To receive a filing date, an application must include (1) the applicant's name, (2) a name and address for correspondence, (3) a clear drawing of the mark sought to be registered, (4) a list of the goods or services, and (5) the application filing fee.

APPLICATION FOR INSPECTION AND CERTIFICATION OF DOMESTIC PLANTS AND PLANT PRODUCTS FOR EXPORT = ЗАЯВЛЕНИЕ НА ИНСПЕКЦИЮ И СЕРТИФИКАЦИЮ ДОМАШНИХ РАСТЕНИЙ И ПРОДУКТОВ ИЗ РАСТЕНИЙ ДЛЯ ВЫВОЗА (или ЗАЯВЛЕНИЕ НА ИНСПЕКЦИЮ И СЕРТИФИКАЦИЮ ДОМАШНИХ РАСТЕНИЙ И ПРОДУКТОВ ИЗ РАСТЕНИЙ ДЛЯ ЭКСПОРТА) – Application For Inspection And Certification Of Domestic Plants And Plant Products For Export is the official form, PPQ Form 572 (short for the Plant Protection and Quarantine Form 572), that provides the information needed to complete an export certificate and serves as a worksheet for the Authorized Certification Official conducting the inspection.

APPLICATION IDENTIFIER = ИДЕНТИФИКАТОР ПРИЛОЖЕНИЯ – Application Identifier:- a numeric prefix to a GS1-128 code (formerly known as UCC-128 code or EAN-128 code or UCC/EAN-128 code; UCC is short for the Uniform Code Council; and EAN is short for the European Article Number; the European Article Numbering Association (EAN International) designed in 1977 a compatible

system for use in Europe; The UCC EAN System was established by Uniform Code Council in 1973) that defines the encoded data to follow. These are generally used as secondary codes to provide information not included in standard UPC (short for the US Universal Product Code) numbering, such as product dates, weights and lot/batch numbers. It may also identify a UCC serial shipping container code.

APPLICATION NUMBER = НОМЕР ЗАЯВЛЕНИЯ – In the US patent law, the Application Number is the unique number assigned to a patent application when it is filed. The application number includes a two digit series code and a six digit serial number.

APPLICATION RATE = НОРМА ВНЕСЕНИЯ – Application Rate is the amount of fertilizer, insecticide, or herbicide applied per unit area or volume in experiments or commercial production.

APPLICATION SERVICE PROVIDER = ОБЕСПЕЧИТЕЛЬ УСЛУГ ПО ПРИЛОЖЕНИЮ – Application Service Provider (ASP) is an online outsourcer or hosting service for applications, letting Net market makers rent instead of buying applications and services such as auctions, exchanges and catalog aggregation. Many application vendors are moving to a hosting model, but ASPs are often application-agnostic, plugging a feature of one application into a marketplace when appropriate and using another feature from another vendor elsewhere.

APPLICATION WINDOW = ОКНО ПРИМЕНЕНИЯ – Application Window is the specific crop or weed growth stage to which a herbicide can be applied.

APPLIED RESEARCH = УПОТРЕБЛЯЕМОЕ (или ПРИМЕНЯЕМОЕ) ИССЛЕДОВАНИЕ – Applied Research is a research in which results can be used immediately by the farmer and can be applied to the peculiar problems of a country or a region.

APPLIQUÉ = АППЛИКАЦИЯ (или АППЛИКЕ) – Appliqué is a decorative technique in which a smaller ornament or device is applied to another surface. A separate piece of décor added to the primary piece in order to add magnitude and consistency to a fabric. Appliqué is a design made separately and then sewn on a cloth or garment. / Аппликe – изделия, у которых кусочки ткани нашиты на другую ткань и отличающиеся надлежащим эффектом. Под Аппликацией, от Латинского слова Applicatio, означающее Прикладывание, понимается создание художественных изображений наклеиванием, нашиванием на ткань или бумагу разноцветных кусочков какого-либо материала; изображение, узор, созданные таким образом.

APPRAISAL = ОЦЕНКА – Appraisal:- when financing a home, lenders will require that a homeowner have an independent appraisal ordered on the property. Appraisals are important as they are independent assessments of a property's value. If you are paying more for a home than it is worth, it will take longer to build equity in the home, and it becomes a higher risk to a lender in the event of default. When purchasing a home, it's important to understand the appraisal process, the fee for an appraisal and why this is important. History:- prior to appraisals becoming part of the home-buying process, home sellers could place whatever value they wanted on a property based on their own assessment of what they thought their home was worth. There was no accountability for pricing, other than home sellers trying to fetch the highest price possible for their property and maximize their profit. High home prices became commonplace. However, as more and more homeowners were defaulting on mortgages and facing foreclosure, banks were losing more and more money in homes that were financed for more than what they were worth. At this point, the appraisal process became important in the home-financing process to protect the interest of banks and home buyers, which also creates stability in a down market. Significance:- appraisals are more of an art than a science. The appraisal is made up of several elements:- comparable properties in the immediate area that are currently for sale, comparable properties in the immediate area that have sold in the last three to six months, and any notable improvements to a property being appraised that would add to or detract from its value. The most important element among these are properties that have been sold in an immediate area over the past three to six months, as this determines the market value on a property, or what the buying public is willing to pay to live in a certain area. The market value of a property is the determining factor of what a house is actually worth. Function:- the function of an appraisal is to verify factors about the property in relation to improvements and square footage. From there, the appraiser will research properties most similar to the subject property being appraised in relation to square footage and improvements. Values of properties are assessed on a price per square foot basis, so it is important these measurements be accurate and up to date in order to obtain an accurate assessment. Should a home appraise for less than what a buyer is offering to pay for it, the buyer is not obligated to purchase the home unless the seller drops the price of the home, or unless the buyer is willing to front the difference of the appraisal and sales price in cash at closing. Cost:- appraisal fees vary based on the size and price of a property. A typical appraisal fee is around USD350 to USD500, which can either be paid at closing or prior to closing, depending on lender requirements. This fee is usually paid by the buyer of a property as a condition of approval from their lender in order to obtain a home loan. Misconceptions:- many home buyers believe that having an appraisal come back for less than what they have offered to pay for the house will guarantee them a lower sales price by forcing the seller to lower the price of the property to meet the terms of the appraisal. However, sellers are not obligated to lower the sales price in this situation, just as the buyer doesn't have an obligation to buy the property if the appraisal is less. Most commonly in this situation, a new appraisal will be ordered by the seller, in which case, the property value will typically wind up being closer to what they are asking for a sales price. If it does not, and the seller refuses to lower the sales price, the buyer can either pay the difference of the appraisal and sales price in cash, or walk away from the home. Appraisal is a survey of property made for determining its insurable value or the amount of loss sustained.

APPRAISAL FEE = ВОЗНАГРАЖДЕНИЕ ЗА ОЦЕНКУ (или СБОР ЗА ОЦЕНКУ) – Appraisal Fee is the charge for estimating the value of property offered as security. The Appraisal Fee pays for somebody to do an appraisal on your home. An appraisal is an investigation into the value of your home. The appraiser gives the lender an idea of how much your home is worth. In case you default on your loan and the lender has to take possession of it, they want to know that they can sell it without losing too much money. Examples:- an average appraisal fee is about USD325. / Вознаграждение или Сбор за Оценку – комиссия, взимаемая экспертом за оценку (но не определение) рыночной стоимости имущества. Оценка – это мнение о стоимости, которое обычно требуется, когда недвижимость продаётся, финансируется, конфискуется (или на неё налагается арест), облагается налогом, страхуется или делится. Например, оценка произведения искусства для Службы Внутренних Доходов США (Internal Revenue Service (IRS)), когда произведение дарится с благотворительной целью, может отличаться от оценки, которую произведение получило бы, если бы его хотели продать на аукционе. Таким же образом оценка недвижимости в целях её страхования может отличаться от её же оценки для определения величины налога на имущество. Комиссия за оценку обычно представляет собой фиксированную сумму, хотя в некоторых случаях может быть назначена и в размере определённого процента от оцененной стоимости имущества.

APPRAISEMENT = ОЦЕНКА – Appraisement is a determination of the dutiable value of imported merchandise by a proper customs official who follows procedures outlined in their country's tariff, such as the US Tariff Act of 1930.

APPRAISER'S STORES = ЗАПАСЫ ПО ДАННЫМ ОЦЕНЩИКА – Appraiser's Stores are the warehouse or public stores to which samples of imported goods are taken to be inspected, analyzed, weighed, etc by examiners or appraisers.

APPRECIATION = ПОВЫШЕНИЕ – Appreciation is an increase in the value or price. Increase in value. In accounting, increase in the market value of an asset. In foreign exchange, rise in the price of a currency on the foreign exchange market (the reverse of exchange depreciation). Currency appreciation differs from revaluation, which results from a decision by the issuing government and produces a new exchange rate. In the context of property insurance an increase in value of the property insured. Contrast with Depreciation. / Повышение – увеличение стоимости активов, таких, как акции, облигации, товарно-сырьевая продукция или недвижимость.

APPRESSED = ПРИЖАТОЕ (или ПРИЛЕГАЮЩЕЕ, или СДАВЛЕННОЕ) – Appressed:- turned upwards and lying closely, flat against something, e.g., spines of some cacti. / , например, шипы некоторых Кактусовых.

APPRESSORIUM = АПРЕССОРИЙ – Appressorium is the swollen tip of a hypha or germ tube that facilitates attachment and penetration of the host tissue by the fungus pathogen.

APPROVAL CERTIFICATE = СВИДЕТЕЛЬСТВО О ДОПУЩЕНИИ – TIR Convention of 14 November 1975. Approval Certificate of a road vehicle for the transport of goods under Customs seal. When the authority which has granted the approval deems it necessary, photographs or diagrams authenticated by the authority shall be attached to the approval certificate. The number of those documents shall be inserted by the competent authority, under item No. 6 (number of annexes) of the certificate. The certificate shall be kept on the road vehicle. This must be the original of the certificate, not, however, a photocopy. Road vehicles shall be produced every two years, for the purposes of inspection and of renewal of approval where appropriate, to the competent authorities of the country in which the vehicle is registered or, in the case of unregistered vehicles, of the country in which the owner or user is resident. If a road vehicle no longer complies with the technical conditions prescribed for its approval, it shall, before it can be used for transport of goods under cover of TIR Carnets, be restored to the condition which had justified its approval so as to comply again with the said technical conditions. If the essential characteristics of a road vehicle are changed, the vehicle shall cease to be covered by the approval and shall be reapproved by the competent authority before it can be used for the transport of goods under cover of TIR Carnets. Also known as Certificate Of Approval.

APPROVAL – DOCUMENTS SENT ON = ОДОБРЕНИЕ (или САНКЦИОНИРОВАНИЕ) – ДОКУМЕНТЫ ОТПРАВЛЕНЫ – Approval – Documents Sent On:- treatment of letter of credit (L/C) documents wherein the negotiating bank does not certify that the documents meet the requirements of the L/C, but rather forwards the documents to the issuing bank with a request that it examine the documents, obtain waiver of any discrepancies, and pay, or, in the case of time drafts, accept the drafts, if drawn on them, or authorize acceptance by the drawee bank.

APPROVED CARRIERS = УТВЕРЖДЁННЫЕ ПЕРЕВОЗЧИКИ (или ДОПУЩЕННЫЕ ПЕРЕВОЗЧИКИ) – Approved Carriers are the armored carriers approved by the exchange for the transportation of gold, palladium, and platinum. / Вооружённые перевозчики на бронированных транспортных средствах, утверждённые биржей для транспортировки золота, палладия и платины.

APPROVED CONTINUOUS EXAMINATION PROGRAM = ДОПУЩЕННАЯ (или УТВЕРЖДЁННАЯ, или ОДОБРЕННАЯ) ПРОГРАММА ПОСТОЯННОЙ ЭКЗАМЕНАЦИИ (или ДОСМОТРА) – An agreement between the owners of the equipment and the responsible governmental body to allow continuous examination of the equipment, e.g., containers. / Соглашение между хозяевами оборудования и ответственным правительственным органом, позволяющее постоянную экзаменацию оборудования, например, контейнеров.

APPROVED DELIVERY FACILITY = ДОПУЩЕННАЯ ДЛЯ ПОСТАВКИ СТРУКТУРА – Approved Delivery Facility is any bank, stockyard, mill, store, warehouse, plant, elevator or any other institution that is authorized by the exchange for delivery of commodities tendered on futures contracts. / Любой банк, грузовой двор, фабрика, магазин, склад, завод, элеватор или любая другая организация, уполномоченная биржей для поставки различных типов сырья, поданных для участия в конкурсе по фьючерсным контрактам.

APPROVED NAME = УТВЕРЖДЁННОЕ НАЗВАНИЕ (или ОДОБРЕННОЕ НАЗВАНИЕ) – Approved Name is approved names of countries are referenced in the Export Certification Project (EXCERPT) and must be used when completing export certificates. Approved names are also published in the International Standard, ISO 3166.

APPROVED TESTING METHODS = УТВЕРЖДЁННЫЕ (или ДОПУЩЕННЫЕ, или ОДОБРЕННЫЕ) МЕТОДЫ ИСПЫТАНИЙ – Approved Testing Methods:- as relates to potatoes, bioassay, serodiagnostic, or other testing methods including but not limited to, gel electrophoresis and molecular hybridization, using methods which have been approved by the Certification Section of the Potato Association of America.

APPS = THE ACT TO PREVENT POLLUTION FROM SHIPS

APPURTENANCE LIEN = ПРИДАТОЧНОЕ (или ПРЕИМУЩЕСТВЕННОЕ, или АКЦЕССОРНОЕ) ПРАВО УДЕРЖАНИЯ – Appurtenance Lien is a lien on real property which encumbers the land and all movables on it needed to fulfil the purpose of that property. To avoid subsequent disputes, the pledgor must as a rule submit a list of appurtenances to the land register office. See also Mortgage Loan.

APR = ANNUAL PERCENTAGE RATE

APRICOT = АБРИКОСОВОЕ – Apricot is a variable color averaging a mod orange.

APRON = ПЕРЕДНИК (или ФАРТУК) – Apron is a garment of cloth, plastic, or leather tied around the waist and used to protect clothing or adorn a costume.

APRON = ПОРОГ (или ХХ) – Apron is the area outside the dock door which is used by delivery vehicles to park or position for loading and unloading. The Apron is specifically designed to a depth that will allow trailer floors to fit with the warehouse floor in a way that facilitates loading and unloading.

APRON MARK = ОТМЕТИНА ОТ ФАРТУКА – Apron Mark (synonym:- Decating Mark, and Leader Mark) is a crease mark or impression extending across the cloth near the beginning or end of a piece due to the thickness of the fabric leader seam. See also Decating Mark. / Смотрите также Отметина От Декатировки (Decating Mark).

APS = AGRICULTURAL PRODUCTION SYSTEM

APS = AIRWAY PLANNING STANDARD

APS = ARRIVAL PILOT STATION

APS = AUCTION PREFERRED STOCK

APT = ACCELERATED PAVEMENT TESTING

APT = ARBITRAGE PRICING THEORY

APT = AUTOMATED PIT TRADING

APTS = ADVANCED PUBLIC TRANSPORTATION SYSTEM

APV = ADJUSTED PRESENT VALUE

APY = ANNUAL PERCENTAGE YIELD

AQ = ANTARCTICA

AQ = ANY QUANTITY

AQI = AGRICULTURE QUARANTINE INSPECTION

AQL = ACCEPTANCE QUALITY LIMIT

AQP = ADVANCED QUALIFICATION PROGRAM

AQUA = АКВА (или ВОДА, или ВОДНОЕ) – Aqua:- a light greenish blue.

AQUACULTURE = АКВАКУЛЬТУРА – Aquaculture:- the farming of aquatic organisms including fish, molluscs, crustaceans and aquatic plants, etc. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding and protection from predators. Farming also implies individual or corporate ownership of the stock being cultivated. For statistical purposes, aquatic organisms that are harvested by an individual or corporate body that has owned them throughout their rearing period contribute to aquaculture, while aquatic organisms that are exploitable by the public as a common property resource, with or without appropriate licenses, are the harvest of capture fisheries.

AQUAMARINE = АКВАМАРИНОВОЕ – Aquamarine:- a pale blue to light greenish blue. / зеленовато-голубое.

AQUATIC = ВОДНОЕ (или ВОДЯНОЕ) – Aquatic:- growing in water. / Водное:- растущее в воде.

AQUATIC BED = ВОДНЫЙ ПЛАСТ – Aquatic Bed:- areas of shallow permanent water dominated by plants that grow on or below the surface of the water.

AQUATIC PLANT = ВОДНОЕ РАСТЕНИЕ (или ВОДЯНОЕ РАСТЕНИЕ) – Aquatic Plant is a plant that grows and develops in standing water and provides sufficient aeration to the parts under water.

AQUEOUS DECONTAMINATION = ВОДНАЯ ОЧИСТКА ОТ ЗАГРЯЗНЕНИЙ (или ВОДЯНАЯ ОЧИСТКА ОТ ЗАГРЯЗНЕНИЙ) – Aqueous Decontamination:- removal of a chemical or biological hazard with a water-base solution.

AQUIC = ГИДРОМОРФНЫЙ – Aquic:- pertaining to a soil moisture regime characterized by water saturation of the soil at all depths for a least a few weeks every year.

AQUIFER = ВОДОНОСНЫЙ СЛОЙ (или ВОДОНОСНЫЙ ГОРИЗОНТ) – Aquifer is a geological formation of permeable material that can store, transmit and supply water to a well or spring.

AQUORIZEM = АКУОРИЗЭМ – Aquorizem:- soil characterized by a distinct accumulation horizon of iron oxide and manganese oxide below the traffic pan, formed as result of wetland Rice cultivation.

AR = ABSORPTION RATIO

AR = ACCOUNTS RECEIVABLE

AR = ALL RISKS

AR = ARGENTINA

AR = AUTO–REGRESSIVE

ARA = ACETYLENE–REDUCING ACTIVITY

ARA = AMERICAN RADIO ASSOCIATION

ARA = AMSTERDAM–ROTTERDAM–ANTWERP

ARABIAN GULF = ПЕРСИДСКИЙ ЗАЛИВ (или АРАВИЙСКИЙ ЗАЛИВ) – This phrase and its abbreviation AG are current in some sectors of the oil industry, especially the tanker world, as a designator for the Persian Gulf, which is the correct name in international law for the body of water bordered by Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the UAE. Note that there is a Gulf of Arabia which is not the same piece of sea as the Persian Gulf. / Этот термин и соответствующее обозначение (ПЗ или АЗ) в настоящее время распространён в отдельных секторах нефтяной отрасли, особенно на рынке танкеров. Он обозначает Персидский Залив – именно это название принято в международном праве для водного пространства, ограниченного территориями ОАЭ, Саудовской Аравии, Катара, Кувейта, Ирака и Ирана. Следует отметить, что существует также Аравийское Море – этим названием обозначается водное пространство, отличное от Персидского Залива. Персидский Залив находится на северо-западе Индийского Океана у берегов Азии. На востоке через Ормузский Пролив и Оманский Залив соединяется с Аравийским Морем. Площадь 240 000 квадратных километров, глубина до 115 метров. В Персидский Залив впадает Река Шатт-эль-Араб. У берегов много островов. На шельфе Персидского Залива располагаются крупные месторождения нефти. Рыболовство и добыча жемчуга. Основные порты:- Фао, Басра (Ирак), Абадан, Бендер-Шахпур (Иран), Эль-Кувейт (Кувейт), Рас-Таннура (Саудовская Аравия), Манама (Бахрейн), Умм-Саид (Катар).

ARABICA COFFEE BEANS = ЗЁРНА КОФЕ АРАБИКА – Coffea Arabica is a species of Coffea originally indigenous to the mountains of Yemen in the Arabian Peninsula, hence its name, and also from the southwestern highlands of Ethiopia and southeastern Sudan. It is also known as the ‘Coffee Shrub of Arabia’, ‘Mountain Coffee’ or ‘Arabica Coffee’. Coffea Arabica is believed to be the first species of Coffee to be cultivated, being grown in southwest Arabia for well over 1 000 years. It is said to produce better Coffee than the other major commercially grown Coffee species, Coffea Canephora (robusta), but tastes vary. Coffee Arabica contains less caffeine than any other commercially cultivated species of Coffee. Wild plants grow to between 9 and 12 m tall, and have an open branching system; the leaves are opposite, simple elliptic-ovate to oblong, 6–12 cm long and 4–8 cm broad, glossy dark green. The flowers are white, 10–15 mm in diameter and grow in axillary clusters. The fruit is a drupe (though commonly called a ‘Berry’) 10–15 mm in

diameter, maturing bright red to purple and typically contains two seeds (the Coffee 'bean'). Originally found in the southwestern highlands of Ethiopia, Coffea Arabica is now rare there in its native state, and many populations appear to be mixed native and planted trees. It is common there as an understorey shrub. It has also been recovered from the Boma Plateau in southeastern Sudan. Coffee Arabica is also found on Mount Marsabit in northern Kenya, but it is unclear whether this is a truly native or naturalised occurrence. Coffee Arabica takes about seven years to mature fully, and does best with 1.0–1.5 meters (about 40–59 inches) of rain, evenly distributed throughout the year. It is usually cultivated between 1 300 and 1 500 m altitude, but there are plantations as low as sea level and as high as 2 800 m. The plant can tolerate low temperatures, but not frost, and it does best when the temperature hovers around 20 °C (68 °F). Commercial cultivars mostly only grow to about 5 m, and are frequently trimmed as low as 2 m to facilitate harvesting. Unlike Coffea canephora, Coffee Arabica prefers to be grown in light shade. Two to four years after planting, Coffee Arabica produces small, white and highly fragrant flowers. The sweet fragrance resembles the sweet smell of jasmine flowers. When flowers open on sunny days, this results in the greatest numbers of berries. This can be a curse, however, as Coffee plants tend to produce too many berries; this can lead to an inferior harvest and even damage yield in the following years, as the plant will favor the ripening of berries to the detriment of its own health. On well kept plantations, this is prevented by pruning the tree. The flowers themselves only last a few days, leaving behind only the thick dark green leaves. The berries then begin to appear. These are as dark green as the foliage, until they begin to ripen, at first to yellow and then light red and finally darkening to a glossy deep red. At this point they are called 'Cherries' and are ready for picking. The berries are oblong and about 1 cm long. Inferior Coffee results from picking them too early or too late, so many are picked by hand to be able to better select them, as they do not all ripen at the same time. They are sometimes shaken off the tree onto mats, which means that ripe and unripe berries are collected together. The trees are difficult to cultivate and each tree can produce anywhere from 0.5–5.0 kg of dried beans, depending on the tree's individual character and the climate that season. The real prize of this cash crop are the beans inside. Each berry holds two locules containing the beans. The Coffee beans are actually two seeds within the fruit, there is sometimes a third seed or one seed, a peaberry in the fruits at tips of the branches. These seeds are covered in two membranes, the outer one is called the 'Parchment Coat' and the inner one is called the 'Silver Skin'. On Java Island, trees are planted at all times of the year and are harvested year round. In parts of Brazil, however, the trees have a season and are harvested only in winter. The plants are vulnerable to damage in poor growing conditions (cold, low pH soil) and are also more vulnerable to pests than the Coffee Robusta plant. Gourmet Coffees are almost exclusively high-quality mild varieties of Arabica Coffee, such as Colombian Coffee. Arabica Coffee production in Indonesia began in 1699. Indonesian Coffees, such as Sumatran and Java, are known for heavy body and low acidity. This makes them ideal for blending with the higher acidity Coffees from Central America and East Africa. In Hawaii, Coffee was formerly more widely grown than at present, and it persists after cultivation in many areas. In some valleys, it is a highly invasive weed. According to legend, human cultivation of Coffee began after goats in Ethiopia were seen mounting each other after eating the leaves and fruits of the Coffee tree. However, in Ethiopia there are still some locales where people drink a tisane made from the leaves of the Coffee tree. The first written record of Coffee made from roasted Coffee beans comes from Arabian scholars who wrote that it was useful in prolonging their working hours. The Arab innovation in Yemen of making a brew from roasted beans, spread first among the Egyptians and Turks, and later on found its way around the world. There is an Ethiopian Coffea Arabica that naturally contains very little caffeine. Maria Bernadete Silvarolla, a researcher of Instituto Agronomico de Campinas (IAC), published findings in the journal Nature about these strains of Coffee Arabica plants. While beans of normal Coffee Arabica plants contain 12 milligrams of caffeine per gram of dry mass, these newly found mutants contain only 0.76 milligrams of caffeine per gram, but with all the taste of normal Coffee. Arabica Coffee Beans are mild in flavor and contain less caffeine than other varieties. High quality blends consist of 100% Arabica beans. Countries that produce Arabica beans include Brazil, India, Colombia, Venezuela, Ecuador, Peru, Bolivia, Paraguay, Guyana, Suriname, French Guiana, Mexico, Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, Panama, Cuba, Haiti, Dominican Republic, Puerto Rico, Jamaica, Hawaii, Yemen, Ethiopia, Kenya, Tanzania, Mozambique, Zimbabwe, Zambia, and Papua New Guinea. Arabica Coffee futures are traded under ticker symbol KC at the NYMEX® and ICE®. The contract prices physical delivery of exchange-grade green beans, from one of 19 countries of origin in a licensed warehouse to one of several ports in the US and Europe:- New York District, New Orleans, Houston, Miami, Bremen/Hamburg (Germany), Antwerp (Belgium), Barcelona (Spain).

ARAB LEAGUE = АРАБСКАЯ ЛИГА – The League Of Arab States, commonly called the Arab League. See also League Of Arab States. / Арабская Лига была основана в Марте 1945 с целью защиты суверинитета её членов. Руководящим органом лиги является Совет Лиги. В 1984 членами лиги состояли:- Алжир, Бахрейн, Джибути, Иордания, Ирак, Йеменская Арабская Республика, Катар, Кувейт, Ливан, Ливия, Мавритания, Марокко, Народная Демократическая Республика Йемен, Объединённые Арабские Эмираты, Организация Освобождения Палестины, Оман, Саудовская Аравия, Сирия, Сомали, Судан, Тунис. Членство Египта в Арабской Лиге было приостановлено в 1979. В 1979 штабквартира лиги располагалась в Тунисе. Известна также как Лига Арабских Государств (ЛАГ; League Of Arab States (LAS)).

ARACHNE MACHINE = МАШИНА АРАХНЕ – The Arachne Machine, the best known unit for stitch bonding, operates much like a warp-knitting machine. Fibrous web is fed into the machine, and stitches are made by a series of needles placed about eight millimeters apart, giving the web longitudinal strength; lateral strength is provided by the fiber interactions. The products are attractive for many purposes and can be improved by treatment with polyester resins to increase their wear resistance and with thermosetting precondensates to reduce their tendency to pill (e.g., to form small tangles). A new device attached to the Arachne machine permits introduction of weft ends at every single course, making color effects possible. Araloop machines yield loop-pile fabric suitable for towels and floor coverings. Arachne (in Greek:- Spider):- in Greek mythology, the daughter of Idmon of Colophon in Lydia, a dyer in purple. Arachne was a weaver who acquired such skill in her art that she ventured to challenge Athena, goddess of war, handicraft, and practical reason. Athena wove a tapestry depicting the gods in majesty, while that of Arachne showed their amorous adventures. Enraged at the perfection of her rival's work (or, alternatively, offended by its subject matter), Athena tore it to pieces, and in despair Arachne hanged herself. But the goddess out of pity loosened the rope, which became a cobweb; Arachne herself was changed into a spider, whence the name of the zoological class to which spiders belong, Arachnida. Ovid's Metamorphoses is the chief source of the myth. A Czechoslovakian Arachne Stitch-Bonding Machine achieves high production rates with low pile costs, employing a fibrous web stitched on the knitting principle with yarns drawn from beams. A German Malipol Machine uses knitting principles to bind pile to a backing fabric, although a later model uses unknitted weft threads instead of backing. Production rates for knitting are higher than for traditional looms but do not reach the high speeds of modern tufting. The quality of the materials used and the finished carpet are much like that of the middle range of traditional carpets. No spectacular growth, however, in the sales of such carpets has occurred, since there are currently limitations in design, although development work is progressing. Several methods use the principle of bonding fibers, fibrous webs, or yarns with various adhesives. The technique imposes design limitations, but the less complicated pile forming method results in high production rates. The needle loom principle involves a fibrous lap attached to a base fabric, and another method forms a lap into a loop pile sheet and sticks it to a base fabric. A special finishing operation can convert the loops into cut pile. A German device projects positively charged fibers toward a negative pole; the fibers are then stuck to an adhesive-coated backing fabric. A Czechoslovakian technique makes double, or face-to-face, carpet by looping and bonding a fibrous web to two backing

fabrics; the full layer is then cut into two separate carpets. A French machine cuts fibers from a sheet and then binds them to a fabric backing, with electrostatic means used to keep the fibers vertical. Arachne Machine is a machine for producing loop-bonded nonwovens. The fabric is formed by knitting a series of warp yarns through a fiber web processed on a card. See also Bonding, and Stitch Bonding. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. В производстве нетканых материалов вязально-прошивным способом, Машина Арахне вырабатывает холстопровязанные полотна. Машина является завершающей частью чёсально-вязального агрегата, состоящего из чёсальной машины, преобразователя прочёса и холстопровязывающей машины. Вязально-Прошивная Машина Арахне, производимая в бывшей Чехословакии, позволяет вырабатывать различный ассортимент нетканых полотен с поверхностной плотностью до 700 г/м^2. Производительность этих машин составляет от 30 до 200 м/ч. Машины Арахне выпускаются 5, 10 и 12.5 классов. Холст подаётся питающим конвейером между подвижными платинами и неподвижными (отбойными) платинами, расположенными почти вертикально и перпендикулярно к провязывающим иглам, на которые ушковинами прокладываются провязывающие нити, подаваемые с навоев через нитеразделяющую рамку и огибающие скала. Готовое полотно направляется валиками и наматывается в рулон с помощью валиков. Особенность конструкции машины состоит в том, что гребёнки с ушковинами расположены почти в горизонтальной плоскости, причём крючки пазовых игл обращены вниз, а навои расположены в передней части машины, что облегчает её обслуживание.

ARACHNOID = АРАХНОИД – Arachnoid is cobweb-like, with soft entangled hair. / паутинная оболочка. , от Греческого слова Aráchne, означающее Паук, .

ARAG RANGE = AMSTERDAM–ROTTERDAM–ANTWERP–GHENT RANGE

ARAMID FIBER = АРАМИДНОЕ ВОЛОКНО – Aramid Fiber is a manufactured fiber in which the fiber-forming material is a long chain synthetic polyamide having at least 85% of its amide linkages (–NH–CO–) attached directly to two aromatic rings. Aramid fibers exhibit low flammability, high strength, and high modulus. Fabrics made from aramid fibers maintain their integrity at high temperatures, such fabrics are used extensively in hot-air filters. Aramids are also found in protective clothing, ropes and cables, and tire cord. Aramid is a synthetic fiber composed of linear macromolecules made up of aromatic groups joined by amide or imide linkages, at least 85% of the amide or imide linkages being joined directly to two aromatic rings and the number of imide linkage, if the latter are present, not exceeding the number of aramide linkages. Alphabetic code – AR; and relevant commercial allowance – STD 7.00/HM 3.5 (European Union Directives on Textile Labelling indicate 8.00). Aramid is a manufactured fiber in which the fiber-forming substance is a long chain of synthetic polyamide in which at least 85% of the amide linkages are attached directly to two aromatic rings. Aramid fabrics are very strong and are resistant to high temperatures and extreme external forces. Aramid fabrics are used in thermally protective clothing, i.e. coveralls, jackets, gloves, shirts, pants. The US Federal Trade Commission (FTC) Definition:- Aramid is a manufactured fiber in which the fiber-forming substance is a long-chain synthetic polyamide in that is at least 85% of the amide linkages are attached directly to two aromatic rings. Aramid Fiber is the yellowish material fuselages are made of, or reinforced with. I personally try to avoid using it because of the fuzzing you get when trying to sand exposed material. It has the benefit of being rather good at sustaining impacts (cf. bullet proof vests and body armour) and is therefore ideal for fuselages. It is no where near as brittle as either glass or carbon fiber. It's the lightest so far of the materials with a density of ~1.45 g/cm^3. It's also often known as Aramid Fiber. The type used for models is Kevlar 49 – different types such as Kevlar 29 and Twaron have different properties. Physical Properties of Aramid Fibers:- aramids – Kevlar® (is a registered trademark of the E.I. DuPont du Nemours) and Twaron® (is a registered trademark of Teijin Twaron USA, Inc.):- (1) High Strength:- aramid fibers are 43% lighter than E-glass fibers, with a density of 1.44 g/cc compared to 2.55 g/cc. Aramids are twice as strong as E-glass, ten times as strong as Aluminum and approach the strength of carbon fiber on a specific tensile strength basis. (2) Dimensional Stability:- aramids display excellent dimensional stability, with a slightly negative coefficient of thermal expansion (–2.4 µm/°C). (3) Chemical Resistance:- aramids show minimal to no embrittlement and strength loss at temperatures as low as –320 °F. Aramids do not melt or combust, but will carbonize at approximately 800 °F. Aramid is a chemical man-made fiber. A class of aromatic polyamide fiber that differs from nylon's polyamide fiber. Aramid Fibers formed from a special glass both in filament yarns and staple fibers. Staple fibers are used for architecture, vehicles, shipping, space ships, refrigerators, etc, as sound-, heat-insulating materials and heat reserving materials. By contrast, because filament yarn can be woven, filament yarns are used for electric insulating material or flame retardant curtains as well as plastic reinforcement materials as staple fibers. End-Uses:- Lamp Shade, Curtains, Insulators and Heat-Insulating Materials for TV, Washing Machines, Refrigerators, Reinforced Plastic (Pipes, Sport Cars, Motor Boats, Skis, Fishing Rods, Bath Tubs, Septic Tanks, etc), Building Materials, etc. Features:- (i) high tensile strength, excellent resistance to heat, and flame retardancy; (ii) excellent heat- and electric-insulating; (iii) no water absorption; and (iv) very resistant to acid and other chemical agents. Non-attackable by molds and insects. / Кэвла® или Кевлар® (Kevlar®). Тэйджин (Teijin). Найлан (Nylon).

ARAN = AUTOMATIC ROAD ANALYZER

ARB = ARBITRAGEUR

ARB BIZ = ARBITRAGE BUSINESS

ARBITRAGE = АРБИТРАЖИРОВАНИЕ (или АРБИТРАЖ) – Arbitrage is the simultaneous purchase of commodities in one market and sale in the same or different market. Arbitrage is profiting from a discrepancy in prices. Arbitrage is a transaction entailing the risk-free exploitation of differences between the prices of or interest rates on identical assets at different trading centers at any given point in time by purchasing in markets with low prices and selling in markets with high prices. Depending on the type of asset traded, a distinction is drawn between foreign exchange, specie, securities, bill, precious metals and commodities arbitrage. The simultaneous buying and selling of the same or equivalent securities in different but related markets. Arbitrage is the buying of foreign exchange, securities, or commodities in one market and the simultaneous selling in another market, in terms of a third market. By this manipulation a profit is made because of the difference in the rates of exchange or in the prices of securities or commodities involved. The simultaneous buying and selling of the same commodity or foreign exchange in two or more markets in order to take advantage of price differentials. Arbitrage is the purchase of physicals or futures in one market against the sale of physicals or futures in another market in order to exploit price differentials between these markets. In moving physicals oil between markets, the price differential has to be large enough to cover freight, insurance, volumetric loss and other handling charges. When this condition is met, the 'arbitrage window' is said to be open. The act of purchasing securities on one market for immediate resale on another in order to profit from a price discrepancy. Profits taken in the securities of companies about to be bought by other companies. The practice of switching short-term funds from one investment or one market to another in order to exploit price or yield differentials. An arbitrage flow of funds will take place between two financial centers if the difference in their rates of interest is greater than the cost of hedging against the currency exchange risk. Cash-and-carry arbitraging refers to the buying of an instrument on the spot market and its simultaneous sale on the futures market. The simultaneous purchase of one commodity against the sale of another in order to profit from fluctuations in the usual price relationships. Variations include the simultaneous purchase and sale of different delivery months of the same

commodity; of the same delivery month, but different grades of the same commodity; and of different commodities. A technique employed to take advantage of differences in price. If, for example, ABC stock can be bought in New York for USD10.00 a share and sold in London at USD10.50. An arbitrage may also involve the purchase of rights to subscribe to a security, or the purchase of convertible security – and the sale at or about the same time of the security obtainable through exercise of the rights or of the security obtainable through conversion. Arbitrage opportunities usually surface after a Takeover Offer. See also Convertible, Rights. Simultaneous purchase of cash commodities or futures in one market against the sale of cash commodities or futures in a different market, to profit from a discrepancy in prices. In some definitions, arbitrage refers only to riskless transactions in which the entire investment is made with borrowed funds. Arbitrage is the process whereby traders profit from price discrepancies between markets. Certain conditions must be met for arbitrage to occur. The profit opportunity must be a riskless one, meaning that the transactions (buying in one market and selling in the other) must occur as near to simultaneously as possible, and the prices at which the asset is traded are both known with certainty at the time of the trade. If these conditions are met, the trader will gain the profit without tying up any capital. Arbitrage activities contribute to the 'law of one price', a fundamental economic assumption that an efficient market will ensure at any time only one price prevails for a particular asset. Arbitrage drives prices together and is implicit within the concept of a perfect market (another way of describing the 'law of one price'). Buying increases demand for the cheaper asset forcing its price up, while the higher price in the other market falls as the cheaper asset is introduced into the supply to that market. The English word arbitrage is derived from the French arbiter, meaning to umpire or referee and so, by extension, to resolve differences. Traders who perform these activities are arbitrageurs. In immature markets, opportunities for arbitrage will be greater than in mature markets with widespread access to information. In practice, all trading activity involves transaction costs, even if only very small. For arbitrage profits, any transaction costs must be less than the difference between the two anomalous prices and known at the time of the trade. The profit will be the net value of the price differences less transaction costs. Examples of transaction costs might be dealing charges, or transaction taxes. There is rarely such a thing as an entirely riskless transaction. Even computerized trades of currencies, for example, will involve a transaction delay, even if only a matter of seconds, during which the opportunity may disappear. Arbitrage is not speculation. Speculators take risks and expose themselves to changes in price of the assets in which they take a position. Their objective is profit but they are prepared to risk losses to make gains. Speculators back their own judgment and may misjudge the direction markets take. Arbitrageurs take a certain profit from temporary market price anomalies and in doing so will remove those anomalies. Some arbitrageurs are occasional opportunists, but others engage in the process full time. In efficient markets profits on arbitrage may appear to be small relative to the value of the transaction, but when adjusted to an equivalent annual return and taking into account the riskless nature of the profit, the return may be high. Many financial institutions conduct arbitrage operations on a regular basis. The scale of their operations means that a high volume of operations compensates for the low margins. By conducting their own inhouse dealing operations scale economies minimize their transaction costs. In the real economy, firms may practice price discrimination by segmenting buyers and charging different prices according to their different price elasticities of demand. Arbitrage may not be possible between the price segments because of barriers between them. For example, the recipient of a discount price could not sell at a smaller discount to the normal price to make a profit because of the supplier's customer identity conditions. Thus a student could not sell a discount travel ticket to a full-fare-paying customer who had no student identification. The principle of arbitrage is central to many important ideas in economics and financial theory. For example, arbitrage provides the logic for the 'purchasing power parity' theory of international exchange rates. If prices in different countries are experiencing different rates of inflation, then exchange rates will alter to restore price parity. The Economist newspaper publishes a 'Big Mac Index' based on the international price of hamburgers that identifies overor undervaluation of currencies based on this limited purchasing power comparison. Although the theory is inadequate as a full explanation of exchange rate movement, it sheds light on the importance of international price differences for the long-term path of a currency's value. 'Interest rate parity' theory holds that the difference between future and spot (current) exchange rates reflects the differential between interest rates in the countries of the two currencies. Thus the practice of covered interest arbitrage seeks to take advantage of differences in interest rates in different countries while hedging (covering) the exchange rate exposure (risk of change) involved in dealing in a foreign currency. In the foreign exchange market, triangular arbitrage is a trading technique that exploits pricing anomalies between three currencies in different markets. In markets for forward contracts (where two parties agree to a sale/purchase of a commodity or financial asset at some definite point in the future at an agreed price), the process of arbitrage ensures there is no difference between the current price of the asset and the forward price after allowing for the passage of time. In financial theory, the Modigliani and Miller propositions hold that all firms with the same potential earnings should sell at the same price, regardless of their capital structure, through arbitrage in the stock market. 'Arbitrage pricing theory' has developed in recent years in an attempt to more accurately calculate the cost of capital for firms and their true value. The term arbitrageur has been applied to entrepreneurs involved in the business of buying and selling companies or parts of companies and seeking a profit from perceived anomalies between the stock-market valuation of a company and the underlying value of the business. Regulatory arbitrage is the exploitation of variations in market regulations between countries. A strategy involving the simultaneous purchase and sale of identical or equivalent commodity futures contracts or other instruments across two or more markets in order to benefit from a discrepancy in their price relationship. In a theoretical efficient market, there is a lack of opportunity for profitable arbitrage. See also Spread. Arbitrage is the practice of taking advantage of a price difference between two or more markets. It can yield a profit generated by the difference between the market prices. In commodity markets, if the difference in price between the futures and spot prices exceeds the actual cost to carry of the commodity, speculators will have the opportunity for a risk-free profit through arbitrage. Speculators will buy the undervalued cash market commodity and sell the overvalued futures contract of the commodity. This will be done until the spread between prices in both markets equals the cost to carry. Arbitrage in this fashion is very uncommon. Arbitrage is a simultaneous buying and selling of the same asset in different markets in order to capitalize on variations in price between those markets. (i) Locational Arbitrage is very prevalent in the physical trading world. Raw crude, refined products, coal, metals, grains or any other commodity are transported from markets with abundant supply to markets in deficit. One recent location arbitrage occurred in the global high-sulfur fuel oil (HSFO) markets when large physical trading firms purchased fuel oil in the Antwerp-Rotterdam-Amsterdam (ARA) complex and shipped it to the Singapore market, which was experiencing increased demand at the time. The ARA-Singapore HSFO arbitrage caused dislocations that in turn created other opportunities for those who were watching. The increased demand for HSFO in ARA sent the price premium to better quality, low sulfur fuel oil (LSFO) in other hubs around the globe. The LSFO market in New York specifically was suffering from oversupply and lackluster demand, a combination never bullish for prices. The LS/HS spread between New York and ARA is an example of (ii) a Grade Arbitrage where the underlying qualities of the product imply a price relationship than can become distorted because of localized supply and demand factors. Crude oils typically are defined by gravity, measuring density and sulfur content, an element that decreases the value of crude oil because of the increased cost of removing it. The gravities of WTI and Brent are 39–40 and 38, respectively. The sulfur content of WTI and Brent are 0.24% and 0.37%, respectively. Both gravity and sulfur content are dynamic and will fluctuate over time as a given stream or blend of crude oils changes in origin, reservoir depth and quality. Crudes that are low in sulfur are considered 'sweet', while high sulfur crudes are termed 'sour'. High gravities (>39) are considered light while low gravities (<25) are considered heavy; midrange are considered intermediate or medium (see 'Inside crude', right. Crude oils are defined by gravity, measuring density and sulfur content. The lower the sulfur content

the better, as it costs less to remove it. WTI has higher density and lower sulfur content, making it more attractive than Brent.). The sulfur content and gravities of crude oil imply a price relationship similar to that of fuel oil. Coupled with this inherent implied value, relative premiums and discounts also are influenced by regional supply and demand factors, product seasonality, refinery margins and run rates, geopolitics, tonnage capacity and many other variables. This year has seen unprecedented uncertainty and turmoil in the global crude oil markets. Libya declared force majeure from its Es Sider (As Sidr), Ras Lanuf, Zueitina and El Brega ports covering the country's crude and product exports. Crude exports are down roughly 90% from 2011 levels according to Reuters analysis and labor issues continue to affect one of the most important grades entering the Mediterranean. On August 26, the Libyan military declared they will 'strike and destroy … any oil tanker' attempting to load cargo that was not under contractual agreement with the national oil company. The military 'coup' in Egypt has brought the Suez Canal into play. While traffic flows through the canal have been uninhibited so far, the prospect remains that the canal may close temporarily or indefinitely. Closing the canal would alter tanker trade routes, requiring tankers to take the longer West-bound route around the Cape of Good Hope, thus extending their time in transit and decreasing available capacity on the market. The canal has closed before and is within the realm of closing again. Tensions in Syria and by proxy, Iran, could potentially bring the Strait of Hormuz back into flux as well. History has proven Iran both capable and willing to attack commercial freight and mine traffic lanes in the Persian Gulf and the extremely vulnerable and narrow Strait of Hormuz. Moving beyond hypotheticals, medium sour Kirkuk flow into the Mediterranean via the Kirkuk-Ceyhan pipeline continues to be the victim of constant bombing and sabotage by local militants. There have been seven attacks on the pipeline to date in 2013. Middle East and North African crude grades likely will remain constrained going into the end of the year. In the North and Baltic seas, medium sour Russian Urals continues to flow through Primorsk, Ust-Luga and Novorossiysk. Primorsk likely will see decreasing export volumes as the 'ice premium' begins to set in, making lifting from the port less attractive than its southern neighbor Ust-Luga. Through the summer and fall however, the former Soviet Union is taking full advantage of the current fear in the market and has increased export volumes in September from Primorsk and Ust-Luga by 25% and 32% over August loading programs, respectively. Comparatively, September exports from the Baltic port of Novorossiysk are up only 9.1% from August, according to Bloomberg data. The continued loss of Libyan grades on the market has caused medium sour and light sweet supplies in the Mediterranean to tighten moving into the fourth quarter. The temporary disruption opened the arbitrage of North Sea Urals cargoes to make their way into the Mediterranean for French and Italian delivery (see 'Here's the upside', page 25). Urals into the Mediterranean via Novorossiysk is at further risk according to recent statements from Rosneft. The Russian state-owned giant has hinted that they are open to reversing the Baku-Novorossiysk pipeline and leaving the crude in Azerbaijan for refining. Azerbaijan's state energy company, SOCAR, has been in talks with Rosneft to reverse the flow of oil five million tons per year, roughly 38 million barrels, allowing SOCAR to refine the crude domestically. According to August press reports, Russian pipeline monopoly Transneft may not approve the deal; however, Urals supply, particularly to the Mediterranean, remains uncertain. Trading opportunities in the global crude oil and product markets should continue as volatility on the world's crude oils rises from yearly lows into the balance of the 2013. The loss of Libya's light sweet has caused differentials of other light sweets such as Azerbaijan's Azeri Light, Nigeria's Qua Iboe and Bonny Light to trade up relative to Brent (see 'Crude continued higher?' right. Global instability should continue to cause volatility as well as higher crude prices for the foreseeable future. One of the best trading firms in the world, Glencore, noted in its 2011 IPO prospectus that highly volatile periods are great for arbitrage, but flat price environments can reduce dislocation, thus arbitrage opportunities.). The continued disruption in light sweet supply has weighed heavily on margins as the products largely have not yet followed suit. Without a rise in margins, Platts suggests the differentials will not necessarily fall; however, they should not rise much further. Refiners in the ARA complex are large buyers of Libyan crude and these issues will bring their weight to bear on the Northwest Europe product markets in the coming months. We anticipate short-term volatility to rise off multi-month lows going into the fourth quarter. The issues surrounding Kirkuk, Urals and Es Sider will continue to have tertiary effects on other crudes and products at hubs around the globe. Additionally, geopolitical posturing by major crude exporters in the face of the Syrian conflict only will compound global volatility as the UN Security Council is unlikely to approve international intervention following the recent sarin gas attacks (see 'Got volatility?' above. Short-term volatility likely will rise off multi-month lows going into the fourth quarter, and with the Syria equation, everything gets more rocky from here.). The fourth quarter is likely to be choppy. Buckle up. Arbitrage is the purchase/sale of a contract on a market and the simultaneous taking of an equal and opposite position, usually on another market, to profit from discrepancies in the price and/or currencies involved. Arbitrage:- this entails the buying and selling (of a commodity, stock, derivative, etc) in different markets in order to make a profit as a result of a price differential. For example buying a stock listed on the Toronto Stock Exchange and simultaneously selling the same stock on the NASDAQ® if, after taking currency exchange into account, the net selling price on NASDAQ® is slightly higher than the net buying price on Toronto. Another example occurs when a takeover bid is made for a company and it is trading below the value of the bid. This presents an arbitrage opportunity for speculators. Arbitrage is the simultaneous buying and selling of two economically equivalent but differently priced portfolios so as to make risk-free profits at no net cost a free lunch. / Блумбёг Эл.Пи. (Bloomberg LP). Ройтас (Reuters). НЭЗДЭК® (NASDAQ®). колебания. Акт скупки ценных бумаг . Деятельность, направленная на получение прибыли и осуществляемая путём закупок товаров, ценных бумаг, валют или индексов по низкой цене на одном рынке и одновременной перепродажи по более высокой цене на других рынках. Арбитражирование существует благодаря наличию различных цен на данные активы на различных рынках. Если цены на эти активы выравниваются, устанавливается равновесие цен между рынками и возможность арбитражирования снижается до нулевой. В соответствии с некоторыми определениями, арбитражирование относится только к безрисковым операциям, в которых инвестирование полностью осуществляется за счёт заёмных средств. Арбитражирование – получение прибыли на разнице в ценах на одни и те же ценные бумаги, валюту или товарно-сырьевую продукцию, торговля которыми ведётся на двух и более рынках. Например, арбитражер (arbitrageur) покупает контракт на золото на рынке в Нью Йорке и одновременно продаёт контракт на золото на Чикагском рынке, получая на этом прибыль, поскольку в этот момент цены на этих двух рынках различны, (цена продажи арбитражера выше цены покупки). Индексное арбитражирование (index arbitrage) использует разницу между ценами на фьючерсные контракты на фондовые индексы (stock index futures) и на сами акции. Используя существующую в данный момент разницу в цене на разных рынках, арбитражеры способствуют более эффективной торговле на этих рынках. Арбитраж:- создание безрисковой прибыли посредством использования разницы курсов на различных рынках. Многие продукты, включая валюты, торгуются одновременно на большом количестве рынков по всему миру. Иногда цена одного и того же продукта различна на разных рынках, и эта разница может быть использована для получения свободной от риска прибыли. Информация о ценовых различиях используется путём покупки и продажи одновременно на двух рынках. Можно покупать и продавать иностранные валюты, ценные бумаги или предметы потребления. Иногда арбитражная прибыль может быть получена даже в пределах одного и того же рынка (страны), на котором присутствуют различные маркет мэйкеры. Арбитраж:- одновременная покупка и продажа одинаковых или сходных финансовых инструментов или фьючерсных контрактов на сырьё, которая производится с целью получения прибыли за счёт расхождения цен. Арбитражные операции могут осуществляться на одном или нескольких рынках. Риск в ходе арбитражных операций возникает, когда перестают действовать исторические соотношения цен, которые, как предполагалось, будут сохраняться, или когда не происходят ожидаемые события (например, уже объявленное поглощение или слияние). Арбитражирование – деятельность, направленная на получение прибыли и осуществляемая путём

закупок товаров, благ, ресурсов по низкой цене на одном рынке и перепродажи по более высокой цене на других рынках. Арбитражирование существует благодаря наличию разных цен на один и тот же товар на различных рынках. Если цены на товар выравниваются, устанавливается равновесие цен между рынками, возможности арбитражирования снижаются до нулевых. В чистом виде арбитражирование чаще всего встречается, присутствует на рынках сельскохозяйственной продукции, цветных металлов и ценных бумаг. Примером арбитражирования может служить международная торговля товарами при наличии сравнительных преимуществ у торгующих стран.

ARBITRAGE POSITION = АРБИТРАЖНАЯ ПОЗИЦИЯ (или ПОЗИЦИЯ ПО АРБИТРАЖИРОВАНИЮ, или ПОЗИЦИЯ ПО АРБИТРАЖУ) – Arbitrage Position:- this term means (i) an exchange futures contract in one delivery month for an account which is offset by a Futures Contract for the same commodity in the same or a different delivery month for such account which is executed on or subject to the rules of the London International Financial Futures and Options Exchange (LIFFE); and (ii) an exchange option, a futures contract to sell or purchase the same commodity as the underlying futures contract for such exchange option, which is executed on or subject to the rules of the LIFFE. / Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)) продать или закупить такое же сырьё .

ARBITRAGEUR = АРБИТРАЖЁР – Arbitrageur is a type of investor who attempts to profit from price inefficiencies in the market by making simultaneous trades that offset each other and capturing risk-free profits. An arbitrageur would, for example, seek out price discrepancies between stocks listed on more than one exchange, and buy the undervalued shares on one exchange while short selling the same number of overvalued shares on another exchange, thus capturing risk-free profits as the prices on the two exchanges converge. Arbitrageurs are typically very experienced investors since arbitrage opportunities are difficult to find and require relatively fast trading. Arbitrageurs also play an important role in the operation of capital markets, as their efforts in exploiting price inefficiencies keep prices more accurate than they otherwise would be. Arbitrageur is an individual who may, for example, simultaneously purchase ABC stock at USD10.00 in New York, USA and sell the same amount at USD10.50 in London, the United Kingdom, making a profit of USD0.50 a share, less expenses. Also known as Arbitrager. See also Arbitrage. / Индивид, который может, например, одновременно закупить акцию АБВ по USD10.00 (10.00 Долларов США) в Нью Йорке, США и продать её же по USD10.50 в Лондоне, Соединённое Королевство, получив при этом прибыль в размере USD0.50 за акцию и за вычетом расходов. Известен также как Арбитражёр (Arbitrager). Смотрите также Арбитражирование (Arbitrage). Арбитражёр – лицо или фирма, участвующая в арбитражировании (arbitrage). Арбитражёры получают прибыль, когда какие-то ценные бумаги или товары продаются по разным ценам на двух или более рынках. Те, кто участвуют в рискованном арбитражировании (risk arbitrage), рассчитывают на прибыль от покупки акций компаний, которые объявлены объектами поглощения (takeover) или являются потенциальными объектами поглощения.

ARBITRARILY PRIMED POLYMERASE CHAIN REACTION = XX ЦЕПНАЯ РЕАКЦИЯ ПОЛИМЕРАЗЫ – Arbitrarily Primed Polymerase Chain Reaction (AP-PCR) is single primer amplification method developed by Welsh and McClelland. Usually large single primers of 20–30 nucleotides are annealed to target DNA then amplified by PCR under nonstringent conditions for two cycles. Then stringency (i.e. temperature) is increased. Products are separated by polyacrylamide gel electrophoresis and autoradiography. / .

ARBITRARY = АРБИТРАРИЙ (или АБИТЧРЭРИ) – (1) Arbitrary is a fixed amount which a transportation line agrees to accept in a dividing joint rate. / Фиксированная сумма, которую транспортная линия согласна акцептовать при разделении солидарной/совместной ставки.

(2) Arbitrary is a stated amount over a fixed rate to one point to make a rate to another point. A fixed amount added to or deducted from one station to make a rate from another station. A fixed amount added to or deducted from a rate to one station to make a rate to another station.

(3) Arbitrary is an allowance added to an employee's rate of pay in additional to regular wages, based on provisions included in the union contract.

(4) Arbitrary:- (i) subject to individual will or judgment without restriction; contingent solely upon one's discretion:- an arbitrary decision. In Latin:- to judge. Arbitrary:- decided by a judge or arbiter rather than by a law or statute. Arbitrary:- having unlimited power; uncontrolled or unrestricted by law; despotic; tyrannical:- an arbitrary government. Arbitrary:- capricious; unreasonable; unsupported:- an arbitrary demand for payment.

ARBITRARY MARKS = СЛУЧАЙНЫЕ ЗНАКИ – Comprise words that are in common linguistic use but, when used to identify particular goods or services, do not suggest or describe a significant ingredient, quality or characteristic of the goods or services, e.g., APPLE for computers, or OLD CROW for whiskey. Arbitrary Marks are words, symbols, and devices that are in common use but, when used on the goods of the trademark owner, neither describe nor suggest the quality of those goods. Examples of arbitrary marks include ARROW for liqueurs, APPLE for computers, and CAMEL for cigarettes. Like suggestive marks, arbitrary marks are inherently distinctive and secondary meaning need not be proven. The most distinctive marks are fanciful marks. / Случайные Знаки составляют слова, которые используются в языке, но когда применяются для идентификации конкретного товара или услуги, то не предлагают описание и не раскрывают саму суть, качество или параметры данного товара или услуги, например, ЭПЛ (APPLE) для компьютеров, или ОЛД КРОУ (OLD CROW) для виски.

ARBITRATION = АРБИТРАЖ (или АРБИТРСТВО) – Arbitration is a settlement of a dispute by an independent person, whose decision is to be accepted by both parties. It is an alternative to legal action. The submitting of matters of controversy to judgment by persons selected by all parties to the dispute. Arbitration is a procedure of settling disputes between parties in the court system, or by association's person or persons chosen or agreed to by them. A process for settling disputes between parties by any association is less structured than court proceedings. Method of settling disputes where a neutral third party mediates differences. Arbitration is normally binding on all parties. Generally considered a genre of dispute resolution, Arbitration is a proceeding used to obviate the litigation process. Arbitration seeks to expedite the resolution of disputes in an uncomplicated and inexpensive manner prior to the filing of a lawsuit. An impartial, private third party an arbitrator hears the parties' dispute and makes a final determination that typically binds the parties. Litigation, by contrast, involves a lawsuit and, while also a method used to resolve disputes between parties, for the most part, tends to be lengthy and expensive. There are many benefits associated with arbitration; however, agreeing to submit to arbitration requires one to relinquish his or her right of access to the courts. Still, arbitration has been used more frequently throughout the past decade. In theory, any contractual agreement may result in a disagreement. Businesses around the world understand that, many times, disputes are inevitable. Generally, disputes can be resolved in several different ways:- litigation, mediation, conciliation, and arbitration. Arbitration and mediation are cost effective alternatives to litigation. Arbitration is the submission of a dispute to one or more impartial persons for a final and binding decision. This is known as an Award, which is made in writing and, generally, is final. Usually, awards bind the parties involved. Non binding arbitration is conducted similarly to binding arbitration, except that when the arbitrator issues the

award after the hearing, it is not binding on the parties, who do not give up their right to a jury trial. In that case, the arbitrator's award is merely an advisory opinion. Many cases go to settlement or binding arbitration after this phase. Alternatively, the parties may choose to go to trial. By contrast, mandatory arbitration, also known as Court Ordered Arbitration, is a judicial mandate intended to resolve pending court cases, utilizing informal rules of evidence and procedure in an advisory arbitration process ordered by the court at an early stage of a lawsuit. The availability of this process, in large part, depends upon local, state laws or court procedures. Mediation is a process in which an impartial third party facilitates communication and negotiation and, therefore, promotes voluntary settlements by the parties themselves. This process can be effective for resolving disputes prior to arbitration or litigation. Arbitration, however, offers parties a decisive legal outcome to their dispute without the expense and inconvenience of court proceedings and attorney fees. Businesses and government departments even courts themselves have used arbitration programs to resolve disputes, and there is widespread satisfaction with the process. Because the arbitrator renders a final decision upon hearing both parties' arguments, arbitration is considered to be adjudicatory, not advisory. Similar to litigation, arbitration has a so-called Appeals Process. In other words, an arbitrator's decision can be challenged under very limited circumstances only, for example, if you can demonstrate an arbitrator was biased; therefore, parties are not always bound by the award. This process is somewhat of a misnomer, however. For the most part, arbitration is considered a binding, adjudicatory process. Providers of alternative dispute resolution services address areas such as employment, intellectual property, consumer, healthcare, financial services, technology, construction, and international trade conflicts. The largest provider in the United States is the American Arbitration Association (AAA); it plays a vital role in resolving complex matters, especially in such volatile industries as construction. The plans, specifications, site conditions, disciplines involved, construction methods, and goals in each construction project vary. Today's projects, for example, are more intricate, the technology more advanced, and the trades working on them more specialized. Identifying and establishing systems to manage potential business disagreements on construction projects can help parties avoid delays and resolve disputes that could threaten an entire project. Arbitration Agreements:- arbitration agreements are essentially of two types:- (i) a future-dispute arbitration agreement, commonly referred to as an Arbitration Clause, which is contained in a broader contract between the parties and anticipates arbitration procedures to follow, should a dispute arise under the broader contract; and (ii) a present-dispute arbitration agreement, known as a Submission Agreement, which counsel for the parties craft when the parties desire to arbitrate a dispute, but where there is no pre-existing contract clause. Arbitration can take place only if both parties have agreed to it, unless of course, the proceeding is courtordered. For this reason, the parties are obligated to accept the terms of settlement, regardless of whether it is unfavorable. If the parties do not agree in advance to follow the arbitrator's final decision, but merely agree to consider it, the process is termed conciliation. Additionally, parties are able to choose important elements such as the applicable law, language, and venue of the arbitration. In this vein, neither party enjoys home court advantage. Parties may insert arbitration clauses into contracts to resolve future disputes. An existing dispute can be referred to arbitration by means of a submission agreement between the parties. In contrast to other forms of dispute resolution, specifically mediation, a party cannot unilaterally withdraw from the proceeding. Within the two main types of arbitration agreements, parties must agree on the terms of arbitration. Terms agreed upon may be as narrow or as broad as the parties desire. For instance, the parties can agree in advance to the parameters within which the arbitrator may render his or her award. If the award is lower than the specified low, the defendant will pay the agreed-upon low figure; but, if the award is higher than the specified high, the plaintiff will accept the agreed-upon high. If, however, the award falls between the high and low, the parties agree to be bound by the arbitrator's decision. The parties' terms may include a form of binding arbitration wherein each of the parties chooses one number only, and the arbitrator may select only one of the figures as the award. Whether to reveal the figure to the arbitrator is another decision the parties must make. In some instances, the parties exchange their own determination of that value of the case, but the figures are not revealed to the arbitrator. Subsequently, the arbitrator assigns a value to the case and the parties agree to accept the high or low figure closest to the arbitrator's value. History:- historically, arbitration was practiced by the Greek city states, and in the Middle Ages high ecclesiastical authorities were called upon to settle controversies. In the first part of the XX century, some countries the United States and France began passing laws that sanctioned and even promoted the use of private adjudication as an alternative to what was perceived to be inefficient court systems. The growth of international trade however, brought greater sophistication to arbitration. As trade grew, so did the practice of arbitration. Ultimately, this led to the creation of international arbitration as a means for resolving disputes under international commercial contracts. Since then, great advances have been made, notably the establishment of the Permanent Court of Arbitration. Functions analogous to arbitration were performed by the Permanent Court of International Justice under the League of Nations:- functions that belong to the International Court of Justice. Today, many treaties contain clauses providing for arbitration or conciliation of disputes. The most notable of these is the Charter of the United Nations. The last decade has seen an unprecedented increase in professional liability claims, including those brought by businesses and individuals against accounting firms. Typically, those disputes were resolved by litigation that, in more than 90 percent of the cases, results in a settlement. Increasingly, the international business community is using arbitration to resolve commercial disputes arising in the global marketplace. Supportive laws are in place in many countries that provide a favorable climate for the enforcement of arbitration clauses. International commercial arbitration awards are recognized by national courts in most parts of the world. Arbitration is popular in international trade as a means of dispute resolution because, among other methods used to resolve disputes, it often is easier to enforce an arbitration award in a foreign country than it is to enforce a judgment of the court. In disputes arising out of a contract, the parties involved may either go to court or appoint someone (an arbitrator) to settle the dispute. The agreement to go to arbitration does not preclude either of the parties taking legal proceedings if it desires. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Арбитраж относится к способу разрешения споров, при котором стороны обращаются к арбитрам (третейским судьям), избираемым самими сторонами или назначаемым по их соглашению либо в порядке, установленном законом. Арбитраж или Арбитрство – альтернатива возбуждению судебного процесса при разрешении споров между брокерами и их клиентами, а также между брокерскими фирмами. Традиционно в соглашения о ведении брокерами счетов клиентов включается положение о предварительном арбитраже до перенесения спора в суд, что обеспечивает разрешение споров объективной третьей стороной и предотвращает судебные разбирательства. В 1989 Комиссия по Ценным Бумагам и Биржам (КЦББ; Securities and Exchange Commision (SEC)) потребовала, чтобы брокеры чётко указывали, включаются ли в соглашение подобные положения, запретила любые ограничения права клиентов на подачу в суд по проводу арбитражных претензий и жёстко ограничила стандарты, которым должны соответствовать третейские судьи. Под Арбитражем, от Французского слова Arbitrage, понимается:- (1) способ разрешения споров посредством обращения спорящих сторон к независимым арбитрам, выполняющим роль судей-экспертов. Арбитры либо избираются самими спорящими, либо назначаются по взаимному согласию, либо назначаются в порядке, установленном законом. (2) Государственный орган, учреждённый для разрешения имущественных споров между предприятиями, организациями, учреждениями, а также исков в связи с невыполнением договоров.

ARBITRATION CLAUSE = АРБИТРАЖНАЯ ОГОВОРКА – Arbitration Clause is a standard clause to be included in the contracts of exporters and importers, as suggested by the American Arbitration Association. It states that any controversy or claim will be settled by arbitration in accordance with the rules of the American Arbitration Association. In reinsurance, Arbitration Clause:- language providing a means of resolving differences between the reinsurer and the reinsured without litigation. Usually, each party appoints an arbiter. The

two thus appointed select a third arbiter, or umpire, and a majority decision of the three becomes binding on the parties to the arbitration proceedings.

ARBN = AFRICAN RICE BLAST NURSERY

ARBN = ASIAN RICE BIOTECHNOLOGY NETWORK

ARBORESCENT = ДРЕВОВИДНОЕ – Arborescent:- tree-like in size and growth habit. / Древовидное:- как дерево в размере и габитусе роста.

ARBORIO RICE = РИС АРБОРИО – Arborio Rice is a large, bold Rice with a characteristic white dot at the center of the grain. By the way of length/width ratio and starch characteristics, it is classified as a medium grain Rice. Typically used in risotto, this Rice develops a creamy texture around a chewy center and has exceptional ability to absorb flavors.

ARBS = ARBITRAGEURS

ARC = ACCOUNTING REGULATORY COMMITTEE

ARC = AGRICULTURAL RESEARCH CENTER

ARC = AGRICULTURAL RESEARCH COUNCIL

ARC = AGRICULTURAL RESOURCES CENTER

ARC = AGRICULTURE RISK COVERAGE

ARC = ALLOCATION REVIEW COMMITTEE

ARCH = AUTO–REGRESSIVE CONDITIONAL HETEROSKEDASTICITY

ARCHEGONIUM = АРХЕГОНИЙ – Archegonium (pl. archegonia):- the structure on the pteridophyte (fern) prothallus that produces the sessile female gametes. / Под Архегонием, от Греческих слов Archē, означающее Начало, и Gonē, означающее Рождение, понимается женский орган полового размножения у голосеменных, моховидных, папоротниковидных, плауновидных и хвощевидных. Обычно колбовидной формы; в расширенной части – яйцеклетка.

ARCHIVE COPY = АРХИВНЫЙ ЭКЗЕМПЛЯР (или АРХИВНАЯ КОПИЯ) – Archive Copy is a copy of a work intended to be preserved permanently.

ARCTIC = АРКТИЧЕСКОЕ – Arctic:- a rubber overshoe reaching to the ankle or above. / (высокая) резиновая обувь с тканевой подкладкой на пряжках или застёжке молнии.

ARDA = AID RESEARCH AND DEVELOPMENT ABSTRACTS = THE UNITED STATES AGENCY FOR INTERNATIONAL DEVELOPMENT (USAID) RESEARCH AND DEVELOPMENT ABSTRACTS

ARDIL = АРДИЛ – Ardil:- made of the protein in peanuts. Produced in England. A type of azlon. / Ардил – искусственное волокно из белка земляного ореха.

ARE = АР – Abbreviation:- a. Are is the unit of area equal to 100 square meters. The word is pronounced the same as Air. Being the area of a square 10 meters on each side, the are is a little large for measuring areas indoors and a little small for measuring areas outdoors. As a result, the are is not used as often as its multiple, the hectare (ha). One are is approximately 1 076.391 square feet, 119.599 square yards, or 0.024 71 acre. / Единица площади в Метрической системе мер. Обозначение:- . 1 ар = 100 квадратных метров ($м^2$) = 0.01 га. Под Аром, от Французского слова Are от Латинского слова Area, означающее Площадь, понимается внесистемная единица площади, равная 0.01 га или 100 $м^2$. Обозначение:- а.

AREA = АРЕАЛ (или ПРОСТРАНСТВО) – Area is an officially defined country, part of a country or all or parts of several countries. / Под Ареалом, от Латинского слова Area, означающее Площадь или Пространство, понимается область распространения на земной поверхности каких-либо явлений, тех или иных видов (родов, семейств и так далее) животных и растений, полезных ископаемых и тому подобного. На географических картах ареал передаётся путём ограничения его линиями разного цвета и рисунка, окраской, штриховкой и другими приёмами.

AREA CONTROL ERROR = XX – Area Control Error (ACE) is a real-time metric used by PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) operators to measure the imbalance between load and generation. ACE is the instantaneous MW (MegaWatt) imbalance between generation and load plus net interchange. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

AREA GAP = ПРОСТРАНСТВЕННЫЙ РАЗРЫВ – Area Gap is a price gap on a futures chart that rests within an established trading range. These have little significance and are normally filled in quickly. / В техническом анализе биржевых рынков, ценовой разрыв на графике цены фьючерса который располагается внутри установленного торгового диапазона. Он не имеет особой значимости и обычно быстро заполняется.

AREAL WEIGHT = ПОВЕРХНОСТНЫЙ ВЕС – Areal Weight is the weight of fiber per unit area (width x length) of tape or fabric. Typically expressed in either g/m^2 or oz/yd^2.

AREA OFF HIRE LEASE = ПЛОЩАДКА СДАЧИ В ЛИЗИНГ – Area Off Hire Lease is a geographical area where a leased container becomes off hire.

AREA OFF HIRE SUBLEASE = ПЛОЩАДКА СДАЧИ В СУБЛИЗИНГ – Area Off Hire Sublease is a geographical area where a subleased container becomes off hire.

AREA OF LOW PEST PREVALENCE = АРЕАЛ НИЗКОЙ РАСПРОСТРАНЁННОСТИ ВРЕДИТЕЛЯ – Area Of Low Pest Prevalence is an area, whether all of a country, part of a country, or all or parts of several countries, as identified by the competent authorities, in which a specific pest occurs at low levels and which is subject to effective surveillance, control or eradication measures. / Ареалом Низкой Распространённости Вредителя является ареал (область), будь-то всей территории страны или её части, или всех нескольких стран целиком или их частей, который идентифицирован компетентными органами, в котором специфический вредитель имеет низкий уровень численности, и в котором в этом отношении принимаются эффективные меры по надзору, борьбе или его искоренению.

AREA OF REPAIR = РЕМОНТНАЯ ПЛОЩАДКА (или УЧАСТОК РЕМОНТА) – Area Of Repair is a geographical area where a container is under repair.

AREA ON HIRE LEASE = УЧАСТОК ПО ПРОКАТУ – Area On Hire Lease is a geographical area where a leased container becomes on hire.

AREA ON HIRE SUBLEASE = УЧАСТОК ПО СУБЛИЗИНГУ – Area On Hire Sublease is a geographical area where a subleased container becomes on hire.

AREA PATTERN = ПЛОЩАДНАЯ МОДЕЛЬ – Area Pattern is a pattern of sideways price movement that follows a stalled uptrend or downtrend of a stock or commodity. Some of these patterns (triangles, flags, wedges, etc) have good predictive value. / В техническом анализе биржевых рынков, .

AREEO = AGRICULTURAL RESEARCH, EDUCATION, EXTENSION ORGANIZATION

AREOLATE = АРЕОЛИРОВАННОЕ – Areolate:- marked out into small spaces, reticulate. / размеченное на малые пространства, по типу сетки.

AREOLE = АРЕОЛА – Areole is a modified side-shoot growing in the leaf axil, typically as a felted or multi-spined cushion, unique to the Cactaceae. From this point, spines, flower buds, stems, roots or offsets may arise. In most species, the areole is located on the tubercles or ribs. The areole is constructed so that breaking spines off the plant does not injure the underlying tissue. / вырост в пазухе листа, типично как слившееся или . для Кактусовых (Cactaceae). , стебли, корни или . Ареола; Паренхима листа. Ареола:- небольшое углубление или бугорок на стеблях Кактусов, которое несёт колючки и волоски.

ARF = AIRPORT RESERVATION FUNCTION

ARF = AMERICAN RETAIL FEDERATION

ARFF = AIRCRAFT RESCUE & FIRE FIGHTING

ARFSN = ASIAN RICE FARMING SYSTEMS NETWORK

ARG = AUTO RADIOGRAM

ARGENT = СЕРЕБРИСТОЕ – Argent:- the heraldic color silver or white.

ARGENTATUS = АРГЭНТАТУС (или ПОСЕРЕБРЁННОЕ) – Argentatus (-a -um):- silvered.

ARGENTEO = СЕРЕБРЯНО– (или СЕРЕБРИСТО–) – Argenteo – silver – as part of a compound word.

ARGENTEUS = АРГЭНТЭУС (или СЕРЕБРЯНОЕ, или СЕРЕБРИСТОЕ) – Argenteus (-a -um):- silvery.

ARGENTINUS = АРГЭНТИНУС (или АРГЕНТИНСКОЕ) – Argentinus (-a -um):- from Argentina.

ARGILLIC HORIZON = АРГИКОВЫЙ ГОРИЗОНТ (или АРГИЛЛИЧЕСКИЙ ГОРИЗОНТ) – Argillic Horizon is a soil horizon enriched by clay that has moved downward. / , от Греческого слова Árgillos, означающее Глина, понимается .

ARGUS MEDIA LTD = АРГАС МИДИА ЭЛ.ТИ.ДИ. – Argus Media Ltd (formerly known as Petroleum Argus Ltd) is a leading independent provider of price information, market data and business intelligence for the global petroleum, natural gas, electricity and coal industries. Argus Media Ltd is a privately held UK-registered company, owned by the family of its founder and its senior staff. Established in 1970, Argus has more than 200 employees worldwide. Argus' headquarters are in London (the United Kingdom), with major offices in Moscow, Washington, Houston, Singapore, Tokyo and Beijing as well as employees in other key locations including Dubai, Germany, France, Nigeria, Venezuela, Argentina and Chile. Argus publishes comprehensive information about energy, transport and emissions in multiple formats to suit individual requirements. Argus was founded in 1970 with the launch of the weekly Europ-Oil Prices, which changed its name in 1984 to Weekly Petroleum Argus. Argus was the first company to publish a daily report on the emerging spot market in 1979. The original daily report was called Petroleum Argus, and over the past 20 years it has evolved into a series of daily market reports spanning natural gas, products, LPG, crude, coal and emissions. The original Petroleum Argus market report became two separate reports in 1984 – Argus Crude and Argus European Products. In 1986, Petroleum Argus began international coverage of the products markets, with Argus Asia-Pacific Products (edited from Singapore) and Argus US Products (edited from Houston). Argus Atlantic Products followed, a compilation of Argus European and Argus US ProductsIn 1986, Petroleum Argus began international coverage of the products markets, with Argus Asia-Pacific Products (edited from Singapore) and Argus US Products (edited from Houston). Argus Atlantic Products followed, a compilation of Argus European and Argus US Products. In 1993, the Argus International LPG report was successfully launched, filling an important gap in daily market information for liquefied petroleum gas. In 1995, the Argus European Natural Gas report began the company's coverage of the natural gas market. And in the same year, the Argus CIS Report was launched – a Russian language composite report for readers in Russian-speaking countries. In 1998, the Argus Asphalt report and the Argus Latin Markets report were launched. In 1999, the Argus European Electricity report was launched to meet the demand for high-quality information on Europe's deregulating power markets. In July 2000, Energy Argus acquired the assets of Fieldston Publications, which included titles covering the coal, emissions and rail industries. 2001 saw the launch of several new market reports, including Argus NGL Americas, Argus Petroleum Coke and Argus Coal Daily International. Argus European Emissions Markets began publication in 2005 and Argus Freight was added in 2006. Over the last 30 years, Argus has continued to expand the industries it covers through its analytical newsletters. Argus Global Markets and Argus Gas Connections were launched in 1997, joining the established Weekly Petroleum Argus, Argus Fundamentals, Argus LPG World and Argus FSU Energy. Argus LatAm Energy was launched in early 1998. Argus Neftetransport (Russian language) was launched in 2001. Also launched in 2001 were Argus Power Europe, and Argus Asia Gas and Power. In 2002, Argus Media launched Argus Nefte Transport (an English language monthly newsletter on FSU oil transportation) and Argus Global Emissions (a monthly newsletter on greenhouse gas trading). Argus Global LNG, a monthly publication focusing on the international market for liquefied natural gas, began at the beginning of 2005. Argus Media is owned by its employees and the family of its founder, Jan Nasmyth. After war service in the British Army, Jan Nasmyth worked as a civil servant in the UK Treasury, was a journalist, a Shell Mex/BP employee and was involved with the UN's energy resources project. From his experience in the energy industry, he concluded that oil markets and prices were inadequately reported, and founded Argus to fill the gap. See also Platts, and S&P Global Platts. / Щел Мэкс/Би.Пи. (Shell Mex/BP). Аргас Мидиа Эл.ти.ди. Дьжен Насмис (Jan Nasmyth).

ARGYLE = АРГАЙЛ (или АРГИЛ) – Argyle is a pattern consisting of diamond shapes of different colors knit in a fabric. Argyle is a sock knit in an argyle pattern, namely varicolored diamonds on a solid background color.

ARI = AGRARIAN REFORM INSTITUTE

ARI = AGRICULTURAL RESEARCH INSTITUTE

ARI = AGRICULTURAL RESEARCH INSTITUTE AND AGRICULTURAL BOARD

ARIDIC = АРИДИЧЕСКИЙ – Aridic:- a soil moisture regime that limits plant growth during much of the growing season. / от Греческого слова Aridus, означающее Сухой, понимается .

ARIL = АРИЛЛУС (или ПРИСЕМЯННИК) – Aril is an outer covering of the seed arising from the stalk of the ovule or below the hilum, the pulpy inner pod. Aril is an outer covering, or sometimes merely an appendage, of a seed formed from the funicle. May be hard, waxy or pulpy. Aril is a special covering of certain seeds that commonly develops from the seed stalk. It is often a bright-colored fleshy envelope, as in such woody plants as the yews and nutmeg and in members of the arrowroot family, the genus Oxalis, and the castor bean. Animals are attracted to arils and eat the seeds, dispersing them in their wastes. In the castor bean, the aril is spongy and absorbs water during germination. The aril of nutmeg is the source of the spice known as Mace. / вырост (appendage), семени, формируемого из семяножки. Может быть твёрдым, восковым или мякотным. Под Ариллусом понимается мясистый вырост на семени некоторых растений; разновидность Присемянника. Под Присемянником понимается вырост на семени растений, чаще сочный, мясистый. У Кувшинки, Тиса и других. Привлекает муравьёв, птиц, что способствует распространению семян. Иногда присемянник (так называемый Ариллус) участвует в образовании мякоти плода, например, у Смородины.

ARIN = AMERICAN REGISTRY FOR INTERNET NUMBERS

ARISTA = ОСТЬ – Arista is an awn or bristle. / Ость – ость или щетинка. Под Остью понимается:- (i) у растений (многих злаков) – тонкий, заострённый, длинный, иногда колючий или перистый отросток на цветковой или (реже) колосовой чешуе; или (ii) у животных – длинные и прямые волосы, тонкие у основания и утолщённые у вершины; верхний ярус волосяного покрова (шерсти) у млекопитающих животных. На уровне нижней половины ости находится Подшёрсток.

ARISTATE = ОСТИСТОЕ (или ЩЕТИНКОНОСНОЕ) – Aristate:- with an awn or bristle. / с – остью или щетинкой.

ARITHMETIC INDEX = АРИФМЕТИЧЕСКИЙ ИНДЕКС – Arithmetic Index is an index constructed as the (weighted) arithmetic average of the prices of the constituent investments. The prices are often weighted and the average is usually multiplied by a factor chosen to give a convenient starting value for the index. The factor is periodically altered so as to maintain a continuous index value when it is necessary to alter the constituents or the weights.

ARITHMETIC (LINEAR) SCALING = АРИФМЕТИЧЕСКОЕ (ЛИНЕЙНОЕ) МАСШТАБИРОВАНИЕ – On an Arithmetic (Linear) Scale chart, the spacing between each point on the vertical scale is identical. Thus the vertical distance between 10 and 20 is the same as the vertical distance between 90 and 100.

ARIZONA COTTON = АРИЗОНСКИЙ ХЛОПЧАТНИК – Arizona Cotton is a Cotton grown in Arizona (State in the United States of America), principally American-Egyptian types. See also American-Egyptian Cotton.

ARM = ADJUSTABLE–RATE MORTGAGE

ARMBAND = XX (или НАРУКАВНАЯ ПОВЯЗКА) – Armband is a band usually worn around the upper part of a sleeve for identification or in mourning.

ARMLET = НАРУКАВНИК (или БРАСЛЕТ, или ПОВЯЗКА, или ЗАПЯСТЬЕ, или XX) – Armlet:- a band, as of cloth or metal, worn around the upper arm.

ARMOR = БРОНЯ (или ЗАЩИТА, или XX) – Armor:- defensive covering for the body, generally made of metal, used in combat. Usually thought of as armor worn in medieval times. Bullet proof clothing can be considered as modern day armor.

ARMS INDEX = ИНДЕКС ОТ АМЗА – Arms Index is a market indicator showing the ratio between the average volume of declining stocks and the average volume of advancing stocks. Generally, a rising Trading Index (TRIN) is bearish and a falling TRIN is bullish. Also known as TRIN. The purpose of the TRIN (also called the ARMS Index after its inventor, Richard Arms) is to express the relationship of volume in advancing issues to volume in declining issues. When the market is rising we want to see more volume going into advancing issues than declining issues. When this doesn't happen, negative divergences occur. The opposite is true in declining markets. A chart of the index will display points where the market is oversold and overbought as well as divergences between the market and the TRIN. / В техническом анализе биржевых рынков . Индекс от Амза:- более известен как TRIN (от Trading Index) – Индекс по Торговле. Показатель технического анализа, названный по имени автора издательства (Ваггоп) – Ричода Амза (Richard Arms). Используется для определения динамики цен в течение дня.

ARMURE = АРМЮР (или МЕЛКОУЗОРЧАТОЕ ПЕРЕПЛЕТЕНИЕ) – Armure:- a fiber can be of cotton, silk, wool, rayon, synthetics, and blends. Plain, twill, or rib, background often has a small design either Jacquard or dobby made with warp floats on surface giving a raised effect. Design is often in two colors and raised. The name was derived from original fabric which was woven with a small interlaced design of chain armor and used for military equipment during the Crusades. / Жакяр (Jacquard).

ARMY DUCK = АРМЕЙСКИЙ БРЕЗЕНТ (или АРМЕЙСКАЯ ПАРУСИНА, или АРМЕЙСКОЕ ГРУБОЕ ПОЛОТНО) – Army Duck:- compactly woven fabrics whose weight ranges from 7 to 12 ounces per yard, based on a width of 28.5 inches. They are of the same type as wide or number ducks but have finer yarns, higher textures, and are usually lighter in weight. Army ducks are made in 72-, 81-, and 90-inch width for the laundry trade. When piece-dyed in summer colors they are called Sailcloth. In the gray-goods condition, the fabric is used for folding chairs, hammocks laundry bags, linings, shoe uppers and tool kits. Finishers used are bleached, printed painted – awning atripe, starched, sulphur, and mineral-dyed, waterproofed. In the finished state, the fabric is used for aprons, awnings, coats, hammocks, looseleaf book covers, overalls, pap tents, slacks, tents, tropical clothing, wading pools, washable uniforms, water buckets, and work pants. When dyed khaki or olive drab, the fabric is used for army cots, gun and instrument covers, knapsacks, leggings, tarpaulins, and tents. See also Canvas, Duck, and Number Duck. / широких брюк (slacks).

ARMYWORM = ПОХОДНЫЙ ЧЕРВЬ (или РАТНЫЙ ЧЕРВЬ) – Armyworm is the larva of the Family Noctuidae which often travels in large populations from field to field. The Armyworm moths are ash to light brown, with mottled forewings that have irregular white or light gray spots near the extreme tip or with two pale semicircular spots in the middle. Adults migrate from the grassy areas or upland crops to ricefields and deposit their eggs. The larvae move in armies and may eat entire Rice plants. / бабочки Походных Червей до светлокоричневого цвета, с крапчатыми передними крыльями, которые имеют вблизи экстремального острия или с двумя . Гусеницы некоторых Насекомых, образующие крупные подвижные скопления.

ARO = AIRPORT RESERVATION OFFICE

AROE = ADJUSTED RETURN ON EQUITY

AROMA = APOMAT – Aroma is a distinct smell or odor.

AROMATIC = АРОМАТИЧЕСКОЕ (или АРОМАТНОЕ, или ДУШИСТОЕ) – Aromatic:- with a resinous, spicy or distinctive smell. / (i) Ароматический. (ii) Соединение ароматического ряда. (ii) Растение с пряным запахом.

AROMATIC BROWN RICE FOR PROCESSING = АРОМАТИЧНЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – Aromatic Brown Rice For Processing shall be special varieties of Rice (Oryza Sativa L. scented) that have a distinctive and characteristic aroma, e.g., Basmati and Jasmine Rice. / риса посевного (Oryza Sativa L. scented).

AROMATIC MILLED RICE = АРОМАТИЧНЫЙ ОБРУШЕННЫЙ РИС – Aromatic Milled Rice shall be special varieties of Rice (Oryza Sativa L. scented) that have a distinctive and characteristic aroma, e.g., Basmati and Jasmine Rice. / риса посевного (Oryza Sativa).

AROMATIC POLYAMIDES = АРОМАТИЧЕСКИЕ ПОЛИАМИДЫ – Aromatic Polyamides is one of the earliest engineering polymers used for fiber production was polyamide (PA) or Nylon™, first introduced in the 1940's. Polyamide, e.g., PA 66, is formed through a condensation reaction of a dioic acid and a diamine, forming a series of aliphatic carbon chains separated by amide linkages. In the 1960's, Kwolek et al. at DuPont discovered a new industry by replacing the aliphatic carbon chains with aromatic 6-carbon rings. The resulting molecule is stabilized by electron sharing between adjacent carbon rings through the amide bonds. The carbon rings thus remain co-planar, and the molecule thus formed resembles a rigid rod or ribbon. When a group of these molecules is in the liquid state, adjacent molecules are attracted and tend to stack, like 2x4's at a lumber yard, to form crystalline domains within the polymer. The resulting highly crystalline polymers show the familiar attributes of liquid crystal polymers (LCPs) – increased strength, rigidity, and thermal stability. See also Aromatic Polyesters, and Polyamide. / Найлан (Nylon™).

AROMATIC POLYESTERS = АРОМАТИЧЕСКИЕ (СЛОЖНЫЕ) ПОЛИЭФИРЫ – Aromatic Polyesters:- polyethylene terephthalate (PET) is another common polymer used for fiber production. This polymer is semi-crystalline, formed from an aromatic dioic acid and ethylene glycol. However, in this case the ethylene group is not resonance-stabilized, i.e. there is no electron sharing across this bond. Therefore there is a perfect swivel in the molecule, and much less propensity to form rigid rod molecules and thereby crystals when in the liquid state. The first wholly aromatic polyester was Vectra™ polymer developed by Celanese in the 1980's, and commercialized as Vectran™ fiber in the early 1990's. This polymer was a polyester analogue to the aramids. Here the ethylene was replaced with naphthalene, a double ring structure. Thus a planar molecule was once again established, thereby increasing the strength, modulus, and thermal stability compared with standard PET. Melt spinning enhances the physical properties of thermotropic LCP's, by aligning the crystalline domains during the high-shear spinning process. Vectran™ LCP is an aromatic polyester (ar-ester) just as aramid fibers are aromatic polyamides. However, because Vectran™ is based on polyester chemistry rather than polyamide, it retains the advantages of PET over Nylon™, e.g., higher strength, better dimensional stability, and near-zero moisture regain. Aramid fibers however are much more stable to very high temperatures such as in direct flame applications. See also Aromatic Polyamides, and Polyester. / Найлан (Nylon™). Полиэтилентерефталат (ПЭТ; polyethylene terephthalate (PET)). влагопоглощательная способность (moisture regain).

AROMATIC RICE = АРОМАТИЧНЫЙ РИС – Grain type of Aromatic Rice is classified into three types according to milling process as below:- (i) paddy aromatic Rice; (ii) brown aromatic Rice; and (iii) white aromatic Rice and white glutinous aromatic Rice. Aromatic Rice is classified into four groups as below:- (i) soft non-glutinous aromatic Rice is the Rice which its white Rice starch contains low content of amylose (13% up to less than 20% by weight at 14% moisture content) and its alkali spreading value is in the range of 6 to 7. Its grains, when cooked, are soft and rather sticky texture; (ii) loose non-glutinous aromatic Rice is the Rice which its white Rice starch contains intermediate content of amylase (20% up to less than 25% by weight at 14% moisture content). Its grains, when cooked, are loose and rather soft texture; (iii) hard non-glutinous aromatic Rice is the Rice which its white Rice starch contains high content of amylose (at least 25% by weight at 14% moisture content). Its grains, when cooked, are loose and hard texture; and (iv) glutinous aromatic Rice is the Rice which its alkali spreading value is in the range 6 to 7. It grains, when steam cooked, are glutinous and stick together. Aromatic Rices have a flavor and aroma similar to that of roasted nuts or popcorn. The natural compound that gives aromatic rice the characteristic aroma and flavor is present in all Rice, but in the aromatic varieties it is present in much higher concentrations. The most popular domestically grown aromatic Rices include:- Della which cooks dry, separate and fluffy; Jasmine which cooks more moist and tends to cling together; and Basmati which cooks into very long, slender grains which are dry, separate and fluffy. Aromatic Rice characteristics:- flavor and aroma like roasted nuts/popcorn. Applications:- (i) packaged rice mixes; and (ii) specialty/gourmet products. / Щёлочь (Alkali).

AROMATICS = АРОМАТИЧЕСКИЕ СОЕДИНЕНИЯ (или АРЕНЫ) – Aromatics:- derived from, or characterized by, the presence of the benzene ring. Aromatics are a class of unsaturated cyclic hydrocarbons such as benzene, toluene and xylene produced within refineries. / Класс ненасыщенных циклических углеводородов, таких как бензол, толуол и ксилол, произведённых на предприятиях очистки. Под Ароматическими Соединениями, от Греческого слова Aroma (Aromatos), означающее Благовоние, понимаются органические соединения, содержащие в молекуле один или несколько циклов из шести атомов углерода, соединённых между собой чередующимися простыми и двойными связями (в классической структурной формуле, например, Антрацен, Бензол, Нафталин). Название связано с тем, что первые найденные представители ароматических соединений имели приятный запах. Все атомы углерода в цикле образуют единую ароматическую (сопряжённую) систему, обусловливающую специфические химические свойства ароматических соединений; например, в отличие от ненасыщенных соединений с открытой цепью. Ароматические соединения легче вступают в реакции замещения, чем в реакции присоединения, сохраняя при этом ароматическую систему. Свойствами ароматических соединений обладают и некоторые гетероциклические соединения, например, пиридин, а также ряд других химических соединений. Основными источниками ароматических соединений являются продукты нефтепереработки и каменноугольная смола. Арены это ароматические углеводороды, содержащие одно или несколько бензольных колец, в том числе конденсированных. К аренам относятся:- антрацен, бензол, нафталин, толуол, и фенантрен. К Ароматическим Соединениям относятся углеводороды (антрацен, бензол, нафталин и другие) и их производные (анилин, бензойная кислота, фенол и другие), содержащие в молекуле циклы, так называемые бензольные ядра, из 6 атомов углерода. К ароматическим системам относят также, так называемые небензоидные соединения (например, азулен), гетероциклические соединения (пиридин, тиофен, фуран и другие). Название соединений связано с тем, что первые открытые представители ароматических соединений обладали приятным запахом. Основными источниками ароматических соединений являются продукты нефтепереработки и каменно-угольная смола. Ароматические Соединения, класс органических циклических соединений, все атомы которых участвуют в образовании единой сопряжённой системы; p-электроны такой системы образуют устойчивую, то есть замкнутую, электронную оболочку. Название Ароматические Соединения закрепилось вследствие того, что первые открытые и изученные представители этого класса веществ обладали приятным запахом. Простейшее ароматические соединения – бензол (I). К ароматическим соединениям относятся также нафталин (II), антрацен (III), фенантрен (IV) и другие соединения, содержащие конденсированные бензольные кольца, а также различные их производные. Выделение ароматических соединений в особый

класс органических соединений обусловлено рядом соображений. Бензол C_6H_6, содержащий формально 3 двойные связи, должен обладать свойствами сильно ненасыщенного соединения; между тем бензол и другие ароматические соединения не изменяются при действии перманганата калия на холоду, не присоединяют тотчас же бром, как это наблюдается в случае олефинов, содержащих двойные связи. Для ароматических соединенией характерна лёгкость замещения атомов водорода, связанных с атомами углерода в бензольном кольце, при действии различных электрофильных реагентов (смотрите Нуклеофильные И Электрофильные Реагенты). Так, при действии азотной кислоты на бензол образуется нитробензол:- $C_6H_6 + HNO_3$ ® $C_6H_5NO_2 + H_2O$. Аналогичные процессы электрофильного замещения происходят и при сульфировании, галогенировании, ацетилировании ароматических соединенией, которые при этом ведут себя скорее как насыщенные, чем как ненасыщенные соединения. Следует, однако, иметь в виду, что лёгкость реакций замещения и затруднённость реакций присоединения к ароматическим соединениям носят лишь количественный характер; в определённых условиях бензол присоединяет три молекулы хлора с образованием гексахлорциклогексана $C_6H_6Cl_6$; гидрирование нафталина ведёт к присоединению пяти молекул водорода с образованием декалина. Ароматические соединения очень устойчивы; образуются из других классов соединений в жёстких условиях. Так, бензол можно получить из ацетилена при 650 °C в присутствии активного угля; бензол образуется также при дегидрировании (‘ароматизации’) циклогексана (V). Заместители в ароматических соединениях приобретают особые свойства. Например, фенолы обладают более кислыми свойствами, чем спирты, а нитрофенолы в этом отношении приближаются к карбоновым кислотам. Ароматические амины значительно более слабые основания, чем алифатические; для ароматических аминов, например, анилина. $C_6H_5NH_2$, характерна реакция с азотистой кислотой – диазотирование, приводящая к диазосоединениям, широко применяемым в производстве красителей. Ароматические соединения чрезвычайно многочисленны и имеют большое практическое значение. Так, ароматические нитросоединения, сульфокислоты, фенолы, амины являются полупродуктами синтеза многих красителей, лекарственных веществ; фенолы, стирол, терефталевую кислоту используют для синтеза полимеров; из толуола получают взрывчатое вещество тротил и так далее. Характерные особенности этого класса соединений могут быть объяснены тем, что ароматические соединения на самом деле не содержат чередующихся простых и кратных связей; все связи в бензоле равноценны и совершенно выравнены; расстояния между атомами углерода в бензоле (1.4 Å) промежуточны между значениями межатомных расстояний в случае простой (1.54 Å) двойной (1.34 Å) связей. Поэтому строение бензола теперь предпочитают изображать необычной формулой. Для бензола и других ароматических соединенией характерно, что все p-электроны образуют устойчивую ‘замкнутую’ электронную оболочку. Позже было найдено, что сходными с ароматическими соединениями свойствами обладают и многие другие ‘небензоидные’ соединения. В первую очередь следует назвать ненасыщенные пятичленные гетероциклические соединения типа фурана, тиофена, пиррола. Ароматическими свойствами обладают и шестичленные гетероциклические соединения типа пиридина. Известны небензоидные ароматические соединения, скелет которых состоит только из атомов углерода; к их числу относятся такие стабильные органические ионы, как катион тропилия (VI), анион циклопентадиенила (VII), биполярные соединения типа азуленов (VIII) и другие. Ароматическими свойствами обладают и некоторые неорганические соединения, например, боразол (IX), фосфонитрилхлорид (X). Ароматичность бензоидных и небензоидных соединений, проявляющаяся в способности вступать в реакции электрофильного замещения, соответствует ряду:- анион VII > пиррол > бензол ® пиридин > тропилий; способность к реакциям нуклеофильного замещения изменяется в обратном порядке. Ароматические углеводороды, органические соединения, состоящие из углерода и водорода и содержащие бензольные ядра. Простейшие и наиболее важные представители ароматических углеводородов – бензол (I) и его гомологи:- метилбензол, или толуол (II), диметилбензол, или ксилол, и так далее. К ароматическим углеводородам относятся также производные бензола с ненасыщенными боковыми цепями, например, стирол (III). Известно много ароматических углеводородов с несколькими бензольными ядрами в молекуле, например, дифенилметан (IV), дифенил $C_6H_5–C_6H_5$, в котором оба бензольных ядра непосредственно связаны между собой; в нафталине (V) оба цикла имеют 2 общих атома углерода; такие углеводороды называются Ароматическими Углеводородами С Конденсированными Ядрами. Основным источником получения ароматических углеводородов служат продукты коксования каменного угля. Из 1 тонны (т) каменно-угольной смолы можно в среднем выделить:- 3.5 килограммов (кг) бензола, 1.5 кг толуола, 2 кг нафталина. Большое значение имеет производство ароматических углеводородов из нефтяных углеводородов жирного ряда (смотрите Ароматизация Нефтепродуктов). Для некоторых ароматических углеводородов имеют практическое значение чисто синтетические методы. Так, из бензола и этилена производят этилбензол, дегидрирование которого приводит к стиролу. По химическим свойствам ароматические углеводороды резко отличаются от ненасыщенных алициклических соединений; их выделяют в самостоятельный большой класс органических соединений (смотрите Ароматические Соединения). При действии серной кислоты, азотной кислоты, галогенов и других реагентов в ароматических углеводородах замещаются атомы водорода и образуются ароматические сульфокислоты, нитросоединения, галогенбензолы и так далее. Эти соединения служат промежуточными продуктами в производстве красителей, лекарственных средств и других. Стирол легко образует практически важный полимер – полистирол. При окислении нафталина образуется фталевая кислота o-$C_6H_4(COOH)_2$, служащая исходным продуктом в производстве многих красителей, глифталевых смол, фенолфталеина.

AROON OSCILLATOR = ОСЦИЛЛЯТОР АРУНА – Aroon Oscillator is a trend-following indicator that uses aspects of the Aroon indicator (‘Aroon up’ and ‘Aroon down’) to gauge the strength of a current trend and the likelihood that it will continue. The Aroon oscillator is calculated by subtracting Aroon down from Aroon up. Readings above zero indicate that an uptrend is present, while readings below zero indicate that a downtrend is present. Aroon up and Aroon down are the two components that comprise the Aroon indicator. The notion is that an asset is trending up when a stock is trading near the high of its range. Aroon up is used to measure the strength of the uptrend, while Aroon down is used to measure the strength of the downtrend. Many traders will watch for a cross above the zero line to suggest the beginning of a new uptrend. Conversely, a cross below zero would indicate the start of a downtrend. Readings near zero suggest that a security may be trending sideways and that this period of consolidation could continue. In technical analysis, an indicator system that can be used to determine whether or not a stock is trending and the strength of its trend. The Aroon Oscillator signals an upward trend (Aroon Up) when it rises above zero and a downward trend (Aroon Down) when it falls below zero. The farther away the oscillator is from the zero line, the stronger the trend. The Aroon Oscillator oscillate between –100 and +100 with zero as the center crossover line. Developed by Tushar Chande in 1995, Aroon is an indicator system that determines whether a stock is trending or not and how strong the trend is. ‘Aroon’ means ‘Dawn’s Early Light’ in Sanskrit. Chande chose this name because the indicators are designed to reveal the beginning of a new trend. The Aroon indicators measure the number of periods since price recorded an x-day high or low. There are two separate indicators:- Aroon-Up and Aroon-Down. A 25-day Aroon-Up measures the number of days since a 25-day high. A 25-day Aroon-Down measures the number of days since a 25-day low. In this sense, the Aroon indicators are quite different from typical momentum oscillators, which focus on price relative to time. Aroon is unique because it focuses on time relative to price. Chartists can use the Aroon indicators to spot emerging trends, identify consolidations, define correction periods and anticipate reversals. Calculation:- the Aroon indicators are shown in percentage terms and fluctuate between 0 and 100. Aroon-Up is based on price highs, while Aroon-Down is based on price lows. These two indicators are plotted side-by-side for easy comparison. The default parameter setting in Sharpcharts is 25 and the example below is based on 25 days. (i) Aroon-Up = ((25 –

Days Since 25-day High) / 25) x 100. (ii) Aroon-Down = ((25 – Days Since 25-day Low) / 25) x 100. Aroon declines as the elapsed time between a new high or low increases. 50 is the cut off point. Because 12.5 days marks the exact middle, a reading of exactly 50 is impossible on a daily chart. It is possible with other timeframes. On daily charts, Aroon is either below 50 (48) or above 50 (52). A reading above 50 means a new high or low was recorded within the last 12 days or less. This is the most recent half of the look-back period. A reading below 50 means a new high or low was recorded within the last 13 days or more ((25–13) / 25 x 100 = 48). This is the latter half of the look-back period. The table below shows the range of values for 25-day Aroon-Up and 25-day Aroon-Down. Interpretation:- the Aroon indicators fluctuate above/below a centerline (50) and are bound between 0 and 100. These three levels are important for interpretation. At its most basic, the bulls have the edge when Aroon-Up is above 50 and Aroon-Down is below 50. This indicates a greater propensity for new x-day highs than lows. The converse is true for a downtrend. The bears have the edge when Aroon-Up is below 50 and Aroon-Down is above 50. A surge to 100 indicates that a trend may be emerging. This can be confirmed with a decline in the other Aroon indicator. For example, a move to 100 in Aroon-Up combined with a decline below 30 in Aroon-Down shows upside strength. Consistently high readings mean prices are regularly hitting new highs or new lows for the specified period. Prices are moving consistently higher when Aroon-Up remains in the 70–100 range for an extended period. Conversely, consistently low readings indicate that prices are seldom hitting new highs or lows. Prices are NOT moving lower when Aroon-Down remains in the 0–30 range for an extended period. This does not mean prices are moving higher though. For that we need to check Aroon-Up. New Trend Emerging:- there are three stages to an emerging trend signal. First, the Aroon lines will cross. Second, the Aroon lines will cross above/below 50. Third, one of the Aroon lines will reach 100. For example, the first stage of an uptrend signal is when Aroon-Up moves above Aroon-Down. This shows new highs becoming more recent than new lows. Keep in mind that Aroon measures the time elapsed, not the price. The second stage is when Aroon-Up moves above 50 and Aroon-Down moves below 50. The third stage is when Aroon-Up reaches 100 and Aroon-Down remains at relatively low levels. The first and second stages do not always occur in that order. Sometimes Aroon-Up will break above 50 and then above Aroon-Down. Reverse engineering the uptrend stages will give you the emerging downtrend signal. Aroon-Down breaks above Aroon-Up, breaks above 50 and reaches 100. The chart above shows CSX Corp. (CSX) with weekly bars and 25-week Aroon. First, notice that the downtrend began weakening as Aroon-Down declined below 50 at the end of 2007 (far left). The first stage of an uptrend was signaled when Aroon-Up moved above Aroon-Down in early 2008 (first orange circle). Aroon-Up continued above 50 and hit 100 as Aroon-Down remained at relatively low levels. Notice how Aroon-Up remained near 100 as the advance continued. This emerging uptrend signal lasted until September 2008 when Aroon-Down broke above Aroon-Up, exceeded 50 and surged to 100 (second orange circle). Notice how Aroon-Down remained near 100 as the downtrend extended. The third trend on this chart was signaled when Aroon-Up surged to 100 in June 2009 and remained above 50 for over a year (third orange circle). Also notice that Aroon-Down remained below 50 for over a year. Consolidation Period:- the Aroon indicators signal a consolidation when both are below 50 and/or both are moving lower with parallel lines. It makes sense that consistent readings below 50 are indicative of flat trading. For 25-day Aroon, readings below 50 mean a 25-day high or low has not been recorded in 13 or more days. Prices are clearly flat when not recording new highs or new lows. Similarly, a consolidation is usually forming when both Aroon-Up and Aroon-Down move lower in parallel fashion and the distance between the two lines is quite small. This narrow parallel decline indicates that some sort of trading range is forming. The first Aroon indicator to break above 50 and hit 100 will trigger the next signal. Conclusions:- Aroon-Up and Aroon-Down are complementary indicators that measure the elapsed time between new x-day highs and lows, respectively. They are shown together so chartists can easily identify the stronger of the two and determine the trend bias. A surge in Aroon-Up combined with a decline in Aroon-Down signals the emergence of an uptrend. Conversely, a surge in Aroon-Down combined with a decline in Aroon-Up signals the start of a downtrend. A consolidation is present when both move lower in parallel fashion or when both remain at low levels (below 30). Chartists can use the Aroon indicators to determine if a security is trending or trading flat and then use other indicators to generate appropriate signals. For example, chartists might use a momentum oscillator to identify oversold levels when 25-week Aroon indicates that the long-term trend is up. / В техническом анализе биржевых рынков . Си.Эс.Экс. Корп. (CSX Corp.).

ARP = ACCOUNTING RATE OF RETURN

ARP = ACREAGE REDUCTION PROGRAM

ARP = AERONAUTICAL RECOMMENDED PRACTICE

ARP = AIRPORT REFERENCE POINT

ARPA = ADVANCED RESEARCH PROJECTS AGENCY

ARPS = ADJUSTABLE–RATE PREFERRED STOCK

ARPS = AUCTION RATE PREFERRED STOCK

ARPSD = ANNUAL RATE PLUS STOCK DIVIDEND

ARPU = AVERAGE REVENUE PER USER

ARR = AUCTION REVENUE RIGHT

ARR = AVERAGE RATE OF RETURN

ARRANGER = УСТРОИТЕЛЬ – Arranger is a manager of a consortium in loan syndications and securities issues. The arranger is responsible for documentation and the placement mechanism. He can be compared with the lead manager of an international bond issue.

ARREST = АРЕСТ – Arrest is the detention of a vessel and/or other property until the purpose of the arrest has been fulfilled. / Задержание судна и/или иного имущества до тех пор, пока не будет удовлетворена цель данного ареста. Под Арестом, от позднелатинского слова Arrestum, означающее Постановление или Суд, понимается принудительное задержание и помещение в тюрьму. С странах, бывших республиках Советского Союза, арест применяется в качестве наиболее строгой меры пресечения и выражается в форме заключения под стражу. Предусмотрены также кратковременное лишение свободы по постановлению судьи за некоторые виды административных правонарушений и кратковременное задержание лиц, подозреваемых в совершении преступления.

ARRHENIUS EQUATION = УРАВНЕНИЕ АРРЭНИУСА (или УРАВНЕНИЕ АРРЕНИУСА) – Arrhenius Equation is an equation describing the dependency of reaction speed on temperature. A simplified rule of thumb for transportation purposes is that when the temperature is lowered by 10 °C, degradation processes are reduced to between half and a third, i.e. the storage life can be doubled or even trebled by lowering the temperature by 10 °C. Svante August Arrhenius (19 February 1859 at Vik, Sweden – 02 October 1927 at Stockholm, Sweden). / Свантэ Аугуст Аррэниус (Svante August Arrhenius; родился 19 Февраля 1859 в Вике (Vik), Швеция – умер

02 Октября 1927 в Стокгольме, Швеция), Шведский учёный один из основателей физической химии; лауреат Нобелевской Премии в 1903. Уравнение Аррениуса в химической кинетике.

ARRIVAL DRAFT = ТРАТТА ПО ПРИБЫТИИ – Arrival Draft is a modified sight draft not requiring payment until after the arrival of the goods at the port of destination.

ARRIVAL NOTICE = УВЕДОМЛЕНИЕ О ПРИБЫТИИ – Arrival Notice (A/N) is a documentation that notifies consignee of arrival information and freight charges due. Form produced by carrier for advanced notification to consignee of cargo arrival. Arrival notice (A/N) is a notice, furnished to consignee, of the arrival of freight. Documentation that notifies the consignee of arrival information for the goods and the freight charges due to be paid in exchange for the goods. A notification by carrier of ship's arrival to the consignee, the Notify Party, and – when applicable – the Also Notify Party. These parties in interest are listed in blocks 3, 4 and 10, respectively, of the Bill of Lading. This notice, which advises consignees that cargoes have arrived, is issued by railroads, airlines and maritime services. The notice also identifies the shipment and can serve as the freight bill. / Уведомление перевозчиком о прибытии судна .

ARRIVAL NOTIFICATION FORM = ФОРМА НОТИФИКАЦИИ О ПРИБЫТИИ (или ФОРМА УВЕДОМЛЕНИЯ О ПРИБЫТИИ) – Arrival Notification Form is a document which advises a consignee or a container operator that goods or containers have arrived at the port of discharge. / Документ, извещающий консигнатора (получателя) или контейнерного оператора о том, что товары или контейнеры в данный момент прибыли в порт разгрузки.

ARROBA = АРРОБА (или АРРОВА) – Arroba (@) is a traditional unit of weight in Spain and Portugal, equal to 1/4 quintal. However, the Spanish and Portuguese quintals are of different sizes. In Spain, the arroba equals 25.36 pounds or 11.50 kilograms; arrobas of very similar sizes were established in the Spanish speaking countries of Latin America. In Portugal and Brazil, the arroba traditionally equals 32.38 pounds or 14.69 kilograms, but in recent years this has been metrized to be exactly 15 kilograms. The arroba has also been used as a metric unit equal to exactly 15 kilograms. The name of the unit comes from Ar Rub', Arabic for the quarter. The @ sign (as abbreviation) has been used in Spanish as a symbol for the arroba since the XVI century at least. / Арроба – традиционная мера веса в Испании (произносится как Арроба или Аррова) и Португалии (произносится как Аробэ), равная 1/4 квинтала. Однако, Испанские и Португальские квинталы имеют разные значения. В Испании арроба равна 25.36 фунтам или 11.50 килограммам; весьма схожие по значениям арробы были установлены в Испаноязычных странах Латинской Америки. В Португалии и Бразилии арроба традиционно была равна 32.38 фунтам или 14.69 килограммам, но в последние годы в связи с практически повсеместным переходом к Метрической Системе единиц значение арробы в килограммах было округлено до 15 килограмм. Арроба использовалась как метрическая единица, равная 15 килограммам. Название этой меры произошло от Арабского слова Ар Руб, имеющего дословное значение четверть. Значок @ (в качестве обозначения) использовался в Испании как символ для обозначения арробы, по крайней мере, с XVI столетия.

ARS = ARGENTINIAN PESO

ARS = AVERAGE RECTIFIED SLOPE

ARSA = AIRPORT RADAR SERVICE AREA

ARSI = AUTOMATED ROADSIDE SAFETY INSPECTION

ARSR = AIR ROUTE SURVEILLANCE RADAR

ARS/USDA = AGRICULTURAL RESEARCH SERVICE/UNITED STATES DEPARTMENT OF AGRICULTURE

ART = AIR RESERVE TECHNICIAN

ARTBA = AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION

ARTCC = AIR ROUTE TRAFFIC CONTROL CENTER

ARTESIAN WATER = АРТЕЗИАНСКАЯ ВОДА – Artesian Water is a groundwater confined under hydrostatic pressure. / Под Артезианскими Водами, от Латинского названия Artesium Французской провинции Артуа (Artois), где эти воды издавна использовались, понимаются подземные воды, заключённые в водоносных пластах горных пород между водоупорными слоями. Обычно встречаются в пределах определённых геологических структур (впадин, мульд и других), образуя артезианские бассейны или склоны. При вскрытии буровыми скважинами артезианские воды поднимаются выше кровли водоносного пласта, иногда фонтанируют.

ARTHROPOD = АРТРОПОД (или ЧЛЕНИСТОНОГОЕ) – Arthropods:- any member of phylum Arthropoda having segmented body, thick exoskeleton that is shed from time to time, a number of jointed appendages, i.e. legs, antennae, cerci, etc, and a nervous system with double ventral cord. Arthropod is animals in the Arthropoda, a phylum consisting of animals with jointed limbs, e.g., the Insecta (insect) and Arachnida (mites and spiders). / Под Артроподами или Членистоногими понимаются самый многочисленный тип животных. По различным оценкам – от 1 до 3 миллионов видов. Наиболее процветающая в биологическом отношении группа. Тело сегментированное, с хитиновым покровом; конечности членистые. Органы чувств хорошо развиты. Обитают в воде, в воздухе, на поверхности земли и в почве. Свободноживущие и паразитические формы. Среди членистоногих многие полезны, есть и вредные. 4 подтипа:- (i) жабродышащие; (ii) трахейно-дышащие (включая насекомых); (iii) трилобитообразные (ископаемые) и (iv) хелицеровые. Наиболее распространённые:- бабочка, бокоплав, жаброног, жук, клоп, краб, креветка, кузнечик, мечехвост, морская уточка, морской паук, морской таракан (равноногий рак), муха, оса, птицеед (паук), рак-богомол, речной рак, сколопендра, скорпион, стрекоза и другие.

ARTIC = ARTICULATED LORRY

ARTICLES DANGEREUX DE ROUTE = УСТАВ О ТРАНСПОРТИРОВКЕ ОПАСНЫХ ГРУЗОВ (или ПОЛОЖЕНИЯ О ТРАНСПОРТИРОВКЕ ОПАСНЫХ ГРУЗОВ) – Articles Dangereux de Route (ADR) is an European agreement concerning the international carriage of dangerous goods by road was done at Geneva on 30 September 1957 under the auspices of the United Nations Economic Commission for Europe, and it entered into force on 29 January 1968. The Agreement itself was amended by the Protocol amending article 14 (3) done at New York on 21 August 1975, which entered into force on 19 April 1985. The Agreement itself is short and simple. The key article is the second, which say that apart from some excessively dangerous goods, other dangerous goods may be carried internationally in road vehicles subject to compliance with:- (i) the conditions laid down in Annex A for the goods in question, in particular as regards their packaging and labelling; and (ii) the conditions laid down in Annex B, in particular as regards the construction, equipment and operation of the vehicle carrying the goods in question. Annexes A and B have been regularly amended and updated since the entry into force of ADR. Consequently to the amendments for entry into force on 01 January 2013, a revised consolidated version has been published as document ECE/TRANS/215, Vol. I and II ('ADR 2011'). The structure is consistent

with that of the United Nations Recommendations on the Transport of Dangerous Goods, Model Regulations, the International Maritime Dangerous Goods Code (of the International Maritime Organization), the Technical Instructions for the Safe Transport of Dangerous Goods by Air (of the International Civil Aviation Organization) and the Regulations concerning the International Carriage of Dangerous Goods by Rail (of the Intergovernmental Organisation for International Carriage by Rail). The lay-out is as follows:- (i) Annex A:- General provisions and provisions concerning dangerous articles and substances; (ii) Part 1:- General provisions; (iii) Part 2:- Classification; (iv) Part 3:- Dangerous goods list, special provisions and exemptions related to limited and excepted quantities; (v) Part 4:- Packing and tank provisions; (vi) Part 5:- Consignment procedures; (vii) Part 6:- Requirements for the construction and testing of packagings, intermediate bulk containers (IBCs), large packagings and tanks; (viii) Part 7:- Provisions concerning the conditions of carriage, loading, unloading and handling; (ix) Annex B:- Provisions concerning transport equipment and transport operations; (x) Part 8:- Requirements for vehicle crews, equipment, operation and documentation; and (xi) Part 9:- Requirements concerning the construction and approval of vehicles. Applicability of ADR 2011:- notwithstanding the transitional measures provided for in ADR 2011, which allow compliance with certain requirements contained in previous editions, the editions of ADR published by the United Nations which may be used for compliance are as follows:- (i) until 30 June 2013:- 2011 edition (ECE/TRANS/215, Vol. I and II), and corrigenda 1 and 2; and (ii) as from 01 January 2013:- 2013 edition (ECE/TRANS/225, Vol. I and II). / Европейское соглашение, касающееся международной дорожной перевозки опасных грузов, было подписано в Женеве, Швейцария 30 Сентября 1957.

ARTICLES OF AGREEMENT = ПОЛОЖЕНИЯ СОГЛАШЕНИЯ – The document containing all particulars relating to the terms of agreement between the master of the vessel and the crew. Sometimes called Shipping Articles or Ship's Articles. / Документ содержащий в себе все сведения, касающиеся порядков соглашения между хозяином (капитаном) судна и экипажем. Иногда называются Положениями о Судовождении (Shipping Articles), или Уставом Судна (Ship's Articles).

ARTICLES OF ASSOCIATION = ПОЛОЖЕНИЯ ОБ АССОЦИАЦИИ (или УСТАВ) – In the United Kingdom, these were formerly the rules adopted by a company when it formed that governed the company's internal affairs and other matters affecting the shareholders and the company. These matters are now dealt with in the company constitution. Also known as Bylaws in the United States. / Под Уставом понимается свод правил, регулирующих деятельность компании, её взаимоотношения с другими лицами, её права и обязанности в определённой сфере хозяйственной деятельности. Устав:- (1) свод правил, регулирующих организацию и порядок деятельности в какой-либо определённой сфере отношений или какого-либо государственного органа, предприятия, учреждения, например, в бывшем Союзе Советских Социалистических Республик (СССР) действовали Устав Железных Дорог СССР, Устав Средней Общеобразовательной Школы. Уставы регулировали также деятельность Вооружённых Сил СССР (смотрите Воинские Уставы). Общие уставы утверждались, как правило, высшими органами государственной власти СССР, уставы отдельных учреждений и организаций – соответствующими министерствами и ведомствами. Уставы имели общественные организации (добровольные спортивные общества, творческие союзы, дачно-строительные и жилищно-строительные кооперативы и другие). (2) Уставы имеются у большинства международных организаций в качестве основных актов, определяющих задачи, принципы образования и деятельности данной организации (например, Устав Объединённых Наций (или Организации Объединённых Наций (ООН)).

ARTICLES OF INCORPORATION = ПОЛОЖЕНИЯ ОБ ИНКОРПОРАЦИИ (или УЧРЕДИТЕЛЬНЫЙ ДОГОВОР) – In the United States, the Articles of Incorporation are the document that creates a corporation when filed with the state. The Articles cover basic matters such as the name of the corporation, its corporate purpose, and its agent for service of process among other matters. For section 501(c)(3) applicants, the organizing document must comply with the organizational exemption test. Therefore, special attention must be given to the language of the organizing document. For example, for a trust to qualify under section 501(c)(3) of the Code, its organizing document must contain certain language. See IRS (short for the US Internal Revenue Service) Publication 557, which contains the suggested language, and consult with an attorney experienced in these matters. In the United States, Articles of Incorporation is the title of the document filed in many states to create a corporation. Also known as Certificate Of Incorporation, or Corporate Charter. / Положения об Инкорпорации или Учредительный Договор – документ, представляемый в соответствующее агентство конкретного штата США лицами, учреждающими корпорацию. После того как устав утверждён, штат выдает регистрационное свидетельство (Сертификат об Инкорпорации (Certificate of Incorporation)). Эти два документа составляют официальный устав корпорации (charter), который подтверждает законность её существования. В устав включаются название корпорации, цель её создания, число уполномоченных акций, а также список директоров и их имена. Возможности корпорации ограничены законами штата и положениями официального устава. Правила внутреннего управления корпорацией (bylaws) устанавливаются лицами, организующими корпорацию.

ARTICLES OF ORGANIZATION = ПОЛОЖЕНИЯ ОБ ОРГАНИЗАЦИИ – In the United States, Articles Of Organization is the title of the document filed in many states to register a limited liability company (LLC) with the state. Also known as Articles Of Formation.

ARTICULATE = СУСТАВНОЕ (или ЧЛЕНИСТОЕ, или СОЧЛЕНЁННОЕ, или СУСТАВЧАТОЕ) – Articulate:- jointed or with points of apparent separation, usually marked by a swelling, line or sudden change in color. Hence:- Articulata - with joints.

ARTICULATED LORRY = ГРУЗОВИК В СЦЕПКЕ (или СОЧЛЕНЁННЫЙ ГРУЗОВИК, или 'ПАРОВОЗ') – Trucks that have a tractor unit and trailer. Also known as Semi-Trailer Truck in Ireland, New Zealand and the United Kingdom, and Articulated Truck in the United States. / Грузовики, которые состоят и из тянущего средства (тягача) и прицепа. Известны также как XXXXX (Semi-Trailer Truck) в Ирландии, Новой Зеландии и Соединённом Королевстве, и как XXXXX (Articulated Truck) в Соединённых Штатах Америки.

ARTICULATED TRAIN = АВТОМОБИЛЬНЫЙ ПОЕЗД (или АВТОПОЕЗД) – An Articulated Train is a combination of an articulated truck and one or more trailers, i.e. truck tractor plus semitrailer plus trailer. German road traffic licensing regulations (StVZO) forbids combinations of this type. Section 32a states explicitly that no trailers are to be towed behind articulated trucks. Also known as Double Train. / , то есть . Под Автомобильным Поездом или Автопоездом понимается бортовой автомобиль или специальный тягач с одним или несколькими прицепами либо полуприцепом, присоединяемыми тягово-сцепными или опорно-сцепными устройствами и имеющими общую с автомобилем тормозную систему. Прицепы и полуприцепы в составе автопоезда могут иметь ведущие (активные) мосты с гидравлическим, механическим или электрическим приводом от силового агрегата автомобиля.

ARTICULATED TRUCK = ГРУЗОВИК В СЦЕПКЕ (или СОЧЛЕНЁННЫЙ ГРУЗОВИК, или 'ПАРОВОЗ') – An Articulated Truck is a combination of a truck tractor and a semitrailer. In the United States, a semi-trailer truck. Also known as Articulated Lorry in Ireland, New Zealand and the United Kingdom.

ARTIFICIAL DAYLIGHT = ИСКУССТВЕННЫЙ ДНЕВНОЙ СВЕТ – Artificial Daylight is a term loosely applied to light sources, frequently equipped with filters, which are claimed to reproduce the color and spectral distribution of daylight. A more specific definition of the light source is to be preferred.

ARTIFICIAL DIET = ИСКУССТВЕННАЯ ДИЕТА (или ИСКУССТВЕННЫЙ РАЦИОН) – Artificial Diet is a food source, other than the natural host plant, consisting of amounts of various components which are mixed and provided to insects in the rearing program. The diet may be holidic (chemically pure), meridic (one or more chemically undefined materials such as Wheat germ), or xenic (host plant materials plus supplemental nutrients). / Под Диетой, от Греческого слова Diaita, означающее Образ Жизни, понимается специально подобранный по количеству, химическому составу, калорийности (энергетической ценности) и кулинарной обработке рацион, а также режим питания.

ARTIFICIALLY PROPAGATED = ИСКУССТВЕННО РАЗВОДИМОЕ (или ИСКУССТВЕННО РАСПРОСТРАНЯЕМОЕ) – Artificially Propagated:- parties of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) recommend that artificially propagated only applies to plants grown by man from seeds, cuttings, callus tissue, spores, or other propagules under controlled conditions. The artificially propagated stock must be established and maintained in a manner not detrimental to the survival of the species in the wild, and managed in a manner designed to maintain the artificially propagated stock indefinitely.

ARTIFICIAL MANURE = ИСКУССТВЕННОЕ УДОБРЕНИЕ (или ИСКУССТВЕННЫЙ НАВОЗ) – Artificial Manure is any form of nutrient source that is not of natural origin. / Под Навозом понимается органическое удобрение из твёрдых и частично жидких экскрементов животных обычно в смеси с подстилочным (солома, торф) материалом. Применяют на разных почвах (особенно эффективен в нечернозёмной зоне) под различные сельскохозяйственные культуры (наиболее отзывчивы Капуста, Картофель, Конопля, Кукуруза, Огурец и другие). Содержит азот, калий, фосфор и микроэлементы. Используется также для приготовления теплично-парниковых почвосмесей, в компостах и как биотопливо. Под Удобрениями или Туками (от туки) понимаются органические и минеральные вещества, содержащие элементы питания растений. Удобрения вносят в почву, их раствором опрыскивают растения, обрабатывают семена. При правильном применении улучшают питательный, водный, воздушный и тепловой режимы почвы, её агрономические свойства, повышают урожай и его качество. План использования органических удобрений и минеральных удобрений, то есть система удобрений, состоит из основного (вносят под вспашку, обычно осенью), предпосевного (перед посевом под культивацию) и припосевного (вместе с семенами в борозды или лунки) удобрения, подкормок.

ARTIFICIAL MEDIUM = ИСКУССТВЕННАЯ СРЕДА – Artificial Medium is a substance having an agar base with different chemicals or other constituents developed to replace the normal food or diet in rearing insects or pathogens.

ARTIFICIAL PRICE = ИСКУССТВЕННАЯ ЦЕНА – Artificial Price is a futures price that has been affected by a manipulation and is thus higher or lower than it would have been if it reflected the forces of supply and demand. / Цена фьючерса, которая стала таковой вследствие воздействия на неё манипуляции, и в связи с чем явно более высокая или более низкая, нежели могла бы быть в случае своего формирования за счёт воздействия на неё фундаментальных факторов, то есть спроса и предложения.

ARTIFICIAL TURF = ИСКУССТВЕННЫЙ ДЁРН (или ИСКУССТВЕННАЯ ДЕРНИНА) – Atrificial Turf is a manufactured carpet having the appearance of grass. Used to replace grass in sports arenas, yards, etc. See also Recreational Surfaces.

ARTIFICIAL TWEEN DECK = ИСКУССТВЕННЫЙ ТВИНДЕК – Artificial Tween Deck (ATD) is forty feet long, eight feet wide, one foot thick steel platform with hardwood flooring. Equipped with ten bullrings for securing oversized, heavy lift or wheeled cargo. / Один из типов контейнеров, представляющий собой сорокафутовую в длину, однафутовую в ширину толстую стальную платформу с напольным покрытием из твёрдого дерева, которая оборудована десятью крепёжными кольцами для крепления превышающих габариты, тяжеловесных или колёсных грузов.

(2) Tween Deck is any space between two continuous decks in the hull of a vessel, as between a shelter deck and a freeboard deck. / Твиндек – межпалубное пространство на судне. В твиндеках располагают грузовые помещения, пассажирские каюты и так далее.

ARTIS SYSTEM = THE AUSTRIAN REAL–TIME INTERBANK SETTLEMENT SYSTEM

ART LINEN = ЛЬНЯНАЯ ПРОДУКЦИЯ ДЛЯ РУКОДЕЛИЯ (или ПОЛОТНО ДЛЯ ВЫШИВАНИЯ) – Art Linen is a plain-weave, softly finished fabric used either bleached or unbleached as a base fabric for needlework. Art Linen:- linen. Plain weave. It is woven with even threads that are especially good for embroidery. It is very easy to 'draw' the yarns for drawn thread work. Comes bleached, or colored. Has a soft finish.

ARTP = AFRICAN RICE TESTING PROGRAM

ARTS = ADVANCED RURAL TRANSPORTATION SYSTEMS

ARTS = AUTOMATED RADAR TERMINAL SYSTEM

ARZ = AUTO–RESTRICTED ZONE

AS = AGRARIAN SYSTEM

A/S = ALONGSIDE

AS = AMERICAN SAMOA

AS = AMMONIUM SULFATE

AS = ANAEROBIC SEEDER

ASA = AMERICAN SOCIETY OF AGRONOMY

ASA = ANCILLARY SERVICE AREA

ASAE = AMERICAN SOCIETY OF AGRICULTURAL ENGINEERS

ASAM = AUTOMATED SEARCH AND MATCH

ASAP = AS SOON AS POSSIBLE

ASAS = AVIATION SAFETY ANALYSIS SYSTEM

AS AT DATE = КАК НА ДАТУ – As At Date:- a date upon which the relevant information is recorded. / Дата, на которую записана соответствующая информация.

ASB = ACCOUNTING STANDARDS BOARD

ASBA = AMERICAN SHIPBROKERS ASSOCIATION

ASBESTOS = АСБЕСТ (или ГОРНЫЙ ЛЁН) – Asbestos is a nonmetallic mineral fiber, which is nonflammable. The fiber is woven into fabrics and used for theater curtains and industrial uses where flame-resistant materials are needed. Asbestos is a mineral fiber that is nonmetallic. Its greatest virtue is that it is nonflammable. It is used in combination with other fibers for theater curtains and in industrial clothing where flameproofing is essential. Asbestos is often used to make ironing board covers and potholders. / Под Асбестом, от Греческого слова Ásbestos, означающее Неугасимый, или Горным Льном понимается обобщённое название минералов класса силикатов (групп серпентина и амфибола), образующих тонковолокнистые агрегаты. Наибольшее значение имеет хризотил-асбест. Огнестойкие ($t_{пл}$ около 1 500 °С), щелоче- и кислотоупорные, нетеплопроводные, диэлектрики. Наполнители пластмасс, асбестоцементов, материал для огнестойких и теплоизоляционных изделий. Главные месторождения:- Баженовское и Ак-Довуракское (в бывшем Союзе Советских Социалистических Республик (СССР)), Дьжефри (Канада), Шабани (Зимбабве). Мировые запасы асбеста в 1980 (без учёта тогдашних социалистических стран) составляли около 77 миллионов тонн. Асбест – минеральное текстильное волокно – применяют для выработки пряжи, служащей для производства технических (негорючих, фильтровальных и других) тканей.

ASC = ACCOUNTING STANDARDS COMMITTEE

ASC = AUSTRALIAN SECURITIES COMMISSION

ASCA = ASSOCIATION FOR SCIENTIFIC COOPERATION IN ASIA

ASCE = AMERICAN SOCIETY OF CIVIL ENGINEERS

ASCENDING = ВОСХОДЯЩЕЕ – Ascending:- growing upwards.

ASCENDING TREND CHANNEL = КАНАЛ ВОСХОДЯЩЕЙ ТЕНДЕНЦИИ – In visual analysis, an ascending line that connects the bottoms of the down waves and is parallel to a Trendline. The ascending channel line and the trendline form borders on an uptrend. / В техническом анализе биржевых рынков .

ASCENDING TRIANGLE = ВОСХОДЯЩИЙ ТРЕУГОЛЬНИК – In visual analysis, a sideways price pattern between two converging trendlines in which the lower line is rising while the upper line is flat. This is generally a bullish pattern. A formation on a bar or candle chart that is similar to a right triangle, but where the hypotenuse points in the direction of the prevailing trend, in this case, higher. The breakout is expected to be in the direction of the trend (higher) which would be through the flat side of the triangle. / На штриховом или свечном графиках технического анализа биржевых рынков Восходящий Треугольник представляет собой фигуру, аналогичную прямоугольному треугольнику, но в котором гипотенуза указывает на направление преобладающей тенденции, в данном случае – на повышение. Предполагается, что пробой произойдёт в направлении тенденции (на повышение) сквозь боковую сторону этого треугольника.

ASCENDING WEDGE = ВОСХОДЯЩИЙ КЛИН – In visual analysis, a narrowing of price movement within a trend higher that resembles a triangle, except both trendlines that form the boundary of the formation are pointing higher. This is considered a reversal pattern when prices break below the lower boundary line. / На штриховом или свечном графиках технического анализа биржевых рынков восходящий клин представляет собой фигуру в виде сужения диапазона изменения цены при тенденции на повышение, в целом напоминающее треугольник, за исключением того, что обе линии тенденции, образующие границы этой фигуры, направлены вверх. Восходящий клин рассматривается в качестве модели разворота, когда цены падают вниз, прорывая нижнюю линию границы.

ASCI = AMERICAN STANDARD CODE FOR INFORMATION INTERCHANGE

ASCLEPIUS = АСКЛЕПИЙ – Asclepius – (in Latin:- Aesculapius) – the ancient Greek mythical god of healing from whom the name of the family Asclepiadaceae is derived. The Asclepiadaceae have recently been subsumed under Apocynaceae. / (на Латинском языке – Эскулапиус или Эскулап (Aesculapius)). Асклепий, в Греческой мифологии бог врачевания, даже воскрешавший мёртвых. Ему соответствует Римский бог Эскулап.

ASCOCHYTA BLIGHT = АСКОХИТОЗ – Ascochyta Blight is a fungal disease that attacks the leaflets, stems, petioles, pods, and seeds of lentil. Heavily infected seeds usually are characterized by a half-moon shaped, light to reddish or reddish brown spot on the edge of the seed. Occasionally it appears as a brown spot on the cheek of the seed. / Аскохитоз это грибковая болезнь, которая поражает листочки, стебли, черешки листьев, бобы, и семена чечевицы. Серьёзно инфицированные семена характеризуются наличием от светло- до красноватых или красно-бурых пятен в форме полумесяца, расположенных по бокам семени. Время от времени он проявляется в форме бурого пятна на боках семени. Побеги засыхают, стебли ломаются (у бобовых) и размочаливаются (у льна). Под Аскохитозами понимаются болезни растений, вызываемые Грибами Рода Ascochyta. Поражаются Зернобобовые, многолетние Бобовые травы и другие культуры. В зоне хлопкосеяния распространены аскохитозы, вызывающие заболевания Гороха, Люцерны, Маша, Нута, Сои и других (Хлопчатник не болеет). Вызывают отмирание стеблей, черешков, прилистников и листьев. Наибольшее развитие аскохитозов наблюдается на люцерне 2–3-го года жизни, что приводит к массовому засыханию и отмиранию отрастающих молодых побегов. Иногда первый укос полностью теряется или становится сильно изреженным. Поражаются обычно первые 3–5 междоузлий, на стеблях образуются удлинённые тёмные опоясывающие вдавленные пятна; на листьях появляется характерная аскохитозная пятнистость:- мелкая тёмная, крупная тёмно-коричневая, вызывающая деформацию листа; тёмно-коричневая с разрывами по жилкам; крупная светло-коричневая и белая. Споры созревают в плодовых телах – пикнидах – на мёртвых, засохших стеблях и листьях; зимуют на поражённых растительных остатках, стерне, диких люцернах, которые становятся источником заражения. Весенние дожди и завышенные поливные нормы особенно благоприятны для развития болезни. К мерам борьбы относятся:- уборка растительных остатков, сжигание стерни; очистка окрестностей от дикой Люцерны; агротехника (осенняя перепашка семенных люцерников, раннее весеннее боронование и так далее); досрочные укосы заражённой люцерны; протравливание семян (норма препарата ТМТД – 2 кг/т).

ASCOMYCETE = АСКОМИЦЕТЫ (или СУМЧАТЫЕ ГРИБЫ) – Ascomycete is a large group of fungi including yeasts, milldews and truffles, with hyphae divided by septa and producing spores sexually within a typically cylindrical membrane forming a spore case or sac (ascus). Ascomycetes is a group of fungi producing their sexual spores within asci. / , включающая дрожжи, и трюфели, с гифами, разделёнными и спорангий или споровую сумку (аск). их половые споры внутри спороносного слоя . Под Аскомицетами или Сумчатыми Грибами понимается класс настоящих грибов с многоклеточным мицелием и органами спороношения – сумками (асками). 30 000 видов. Порядки – плектасковые, перисporиевые и другие, а также группы порядков – дискомицеты, пиреномицеты. Сапрофиты (в почве на растительных остатках, пищевых продуктах и тому подобном) и паразиты растений (возбудители мучнистой росы, плесеней), животных и человека (например, возбудители микозов). Многие

сумчатые грибы в симбиозе с водорослями образуют лишайники. Некоторые сумчатые грибы съедобны (Сморчки, Трюфели), бесполые стадии других (например, пеницилл) используют в сыроварении, производстве антибиотиков и тому подобного.

ASCOSPORES = АСКОСПОРЫ (или СУМЧАТЫЕ СПОРЫ) – Ascospores are the sexual spores produced by a particular group of fungi. The ascospores produced in apothecia are forcibly ejected and then dispersed by wind. Ascospore is a sexually produced spore borne in an ascus. / спора.

ASCOT = АСКЭТ (или XX) – Ascot is a broad neck scarf that is looped under the chin. Ascot is a thin scarf worn by men that is folded into a loop under the chin. Origin:- Ascot Heath, racetrack near Ascot, England.

ASCP = AVIATION SYSTEM CAPACITY PLAN

ASCS = AGRICULTURAL STABILIZATION AND CONSERVATION SERVICE

ASCUS = АСК (или СУМКА) – Ascus is a saclike cell of a hypha in which meiosis occurs and which contains the ascospores, usually eight. / Под Аском или Сумкой понимается орган полового спороношения сумчатых грибов (аскомицетов), внутри которого развиваются аскоспоры. Образуется на грибнице из зиготы или в плодовом теле на концах гиф.

ASD = AIRCRAFT SITUATION DISPLAY

ASDA = ACCELERATE – STOP DISTANCE AVAILABLE

ASDE = AIRPORT SURFACE DETECTION EQUIPMENT

ASE = AMERICAN STOCK EXCHANGE

ASE = ATHENS STOCK EXCHANGE

ASE = AUTOMATED SPEED ENFORCEMENT

ASEAN = ASSOCIATION OF SOUTHEAST ASIAN NATIONS

ASEXUAL = БЕСПОЛОЕ (или АСЕКСУАЛЬНОЕ) – Asexual:- without the involvement of fertilization, propagation by division or the production of bulbils, offsets or stolons. / , разведение или распространение (propagation) , или столонов (stolons). Приставка А в переводе с Латинского и Греческого языков означает Без или Не или Отрицательный.

ASEXUAL REPRODUCTION = БЕСПОЛАЯ РЕПРОДУКЦИЯ (или БЕСПОЛОЕ РАЗМНОЖЕНИЕ) – Asexual Reproduction is a reproduction that does not involve fertilization or the fusion of sexually dissimilar gametes. / Под Бесполым Размножением понимается размножение организмов, характеризующееся отсутствием полового процесса и происходящее без участия половых клеток. Осуществляется путём шизогонии, в форме вегетативного размножения, а также с помощью специальных образований – спор и другого. Бесполое размножение обычно чередуется с половым размножением.

ASEXUAL SPORES = БЕСПОЛЫЕ СПОРЫ (или ВЕГЕТАТИВНЫЕ СПОРЫ) – Asexual Spores are the spores produced vegetatively, i.e. without sex. The spores and the parent organism are genetically identical.

ASF = AFRICAN SWINE FEVER

AS FREIGHTED = КАК ЗАФРАХТОВАНО – As Freighted:- all cargoes freighted on same unit; W/M or WORM (short for the Weight or Measurement).

ASH = ЗОЛА – Ash is a measure of the amount of inorganic material in lubricating oil. Determined by burning the oil and weighing the residue. Results expressed as percent by weight. Ash:- metallic residue formed due to the high temperature in the combustion chamber or on other engine parts. Ash is the non-combustible, mineral content of biomass. During combustion bottom ash is the ash that is left behind in, or under the grate or combustion region, or at the bottom of a gasifier. Fly ash consists of very small particles of ash that are carried out of the system along with the flue gases. Both types of ash can potentially be spread on the land as a soil conditioner, to help return the mineral content to the soil, however owing to the potentially very high concentration of minerals it is important that this is done with caution. In particular, if there is the potential presence of heavy metals or arsenic in ash as a result of accumulation from soil or air, or from wood treatment, it must be checked before the ash is used in this way. Alternatively, ash may be used in the manufacture of construction blocks and cement. Ash that melts or fuses is known as Slag or Clinker. Ash:- impurities consisting of silica, iron, alumina, and other noncombustible matter that are contained in coal. Ash increases the weight of coal, adds to the cost of handling, and can affect its burning characteristics. Ash content is measured as a percent by weight of coal on an 'as received' or a 'dry' (moisture-free, usually part of a laboratory analysis) basis. / :- примеси, состоящие из . известна как Шлак или Окалина или Нагар (Slag) или Клинкер или Шлак или Окалина (Clinker). Под Золой понимается несгораемый остаток (в виде пыли), образующийся из минеральных примесей топлива при полном его сгорании. По химическому составу зола состоит из оксидов Al_2O_3, CaO, Fe_2O_3, MgO, SiO_2 и других. Зола уменьшает теплоту сгорания топлива, снижает интенсивность теплообмена вследствие загрязнения поверхностей нагрева, может вызвать абразивный износ труб котельного агрегата и его дымососов, загрязняет воздушный бассейн городов. Для улавливания и удаления золы создают специальные устройства (золоуловители). Золу используют в промышленности стройматериалов для производства некоторых видов бетона, в сельском хозяйстве – как удобрение. Из золы некоторых углей добывают редкие и рассеянные элементы, например, Галлий (Ga) и Германий (Ge). Зола, несгорающий остаток, образующийся из минеральных примесей топлива при полном его сгорании. Содержание золы в каменных и бурых углях находится в пределах примерно от 1 до 45% и более, в горючих сланцах – от 50 до 80%, в топливном торфе – от 2 до 30%, в дровах – обычно менее 1%, в растительном топливе других видов – от 3 до 5%, в мазуте – чаще до 0.15%, но иногда выше. Верхний предел содержания минеральных примесей определяется технической возможностью и экономической целесообразностью использования данного ископаемого в качестве топлива. Присутствие золы снижает относительное содержание горючих составных частей в топливе. При сжигании топлива некоторое количество тепла теряется вместе с золой. В котлоагрегатах расплавленная зола оседает на трубах топочных экранов, ширм и других элементов в виде спекшегося шлака. Отложения золы на поверхностях нагрева препятствуют передаче тепла от топочных газов к воде или пару и увеличивают аэродинамическое сопротивление котла. Летучая зола истирает котельные трубы и дымососы, при удалении с дымовыми газами зола загрязняет атмосферу. В промышленности строительных материалов зола используется для производства некоторых видов бетона. Из золы некоторых углей добывают редкие и рассеянные элементы, например, германий и галлий. В сельском хозяйстве золу широко применяют как удобрение, содержащее калий в форме поташа (K_2CO_3), легкорастворимого в воде и доступного растениям соединения. В золе находятся и другие минеральные вещества, необходимые растениям, – фосфор, кальций, магний, сера, бор, марганец и другие макро- и микроэлементы. Высокое содержание углекислого кальция в золе сланцев и торфа позволяет использовать её для снижения кислотности почв. Вносят золу во все почвы, под все культуры, но наиболее целесообразно удобрять ею Табак, Картофель,

Гречиху, Бобовые, Лён, плодовые культуры. Золу вносят под вспашку, при перекопке почвы под кронами деревьев (4–15 центнеров на гектар (ц/га)), при посадке Картофеля, рассады Капусты и Томатов (3–5 ц/га), используют её для подкормки лугов, пропашных и зерновых культур (3–5 ц/га). Золу нельзя смешивать с органическими и аммиачными удобрениями (во избежание потерь аммиака), а также с суперфосфатом и другими водорастворимыми фосфорными удобрениями (вызывает ретроградацию, чем понижает усвояемость фосфатов растениями).

ASH CONTENT = ЗОЛЬНОСТЬ (или СОДЕРЖАНИЕ ЗОЛЬНЫХ ВЕЩЕСТВ) – Ash Content:- the waste product left from burning wood pellets. One of the major indicators of wood pellet quality, ash is measured as a percentage of weight. The lower the ash content, the less cleaning and maintenance you'll likely have to perform on your stove. Premium hardwood pellets have less than 1.0% ash, and premium softwood pellets typically have less than 0.5% ash.

ASHEN = МЕРТВЕННО–БЛЕДНОЕ (или ПЕПЕЛЬНОЕ, или ХХ) – Ashen:- resembling ashes (as in color).

ASIA = AVIATION SECURITY IMPROVEMENT ACT OF 1990

ASIAN CURRENCY UNIT = АЗИАТСКАЯ ЕДИНИЦА ВАЛЮТЫ – The Asian Development Bank (ADB) said on 2005-December-19 it would soon launch a theoretical currency unit – The Asian Currency Unit (ACU) – based on a basket of 13 Asian currencies as a yardstick to measure variations in currency values. The ACU will be based on the currencies of the 13 member countries (Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, The Philippines, Singapore, Thailand and Vietnam) of the Association of Southeast Asian Nations (ASEAN) plus Japan, China and South Korea. The relative value of each currency in the basket will be based on the gross domestic product and trade volume of the nation using the currency, as well as its international tradability. The currencies of Japan, China and South Korea are likely to be of greater value in the basket. The ACU is modeled on the European Currency Unit, a floating exchange rate that was adopted in 1979 when the European Monetary System was launched. It was replaced by the Euro in January 1999. The release of the ACU should be the first step toward an integrated Asian currency. The Asian Development Bank (ADB) said on 2005-December-19 it will soon launch a theoretical currency unit comprising a basket of Asian currencies – akin to Europe's Ecu, which evolved into the Euro – to promote regional cooperation. / Виртуально с Марта 2006 для 13 стран.

ASIAN OPTION = АЗИАТСКИЙ ОПЦИОН – Asian Option is an option where the strike price is not fixed in advance, but is determined, for example, on the basis of the mean market prices of the underlying over a specific period. An exotic option whose payoff depends on the average price of the underlying asset during some portion of the life of the option. Asian Options or Average Price Options are options for which the outcome is reliant not only on whether or not the option is in-the-money at expiry, but also depends on the average price of the underlying throughout the option life. See also American Option, and European Option. / Экзотический опцион, окупаемость которого зависит от усреднённой цены соответствующего актива в течение некоторого промежутка жизни данного опциона.

ASIAN RICE = АЗИАТСКИЙ РИС – Asian Rice (Oryza sativa L.) is the cultivated Rice believed to have originated in Asia.

ASIAN–STYLE OPTION = ОПЦИОН В АЗИАТСКОМ СТИЛЕ – Asian-Style Option is an option which, if it expires in-the-money, is automatically settled on the basis of the difference between the strike price and the average price of the underlying asset in a given period prior to expiration.

ASIA PACIFIC ADVISORY COMMITTEE = АЗИАТСКО–ТИХООКЕАНСКИЙ СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ (или АЗИАТСКО–ТИХООКЕАНСКИЙ КОНСУЛЬТАТИВНЫЙ КОМИТЕТ) – Asia Pacific Advisory Committee (APAC) to the Board of Directors of the New York Stock Exchange advises on matters involving international capital markets and the views and concerns of the business and financial communities of the countries represented.

ASIA–PACIFIC ECONOMIC CO–OPERATION = АЗИАТСКО–ТИХООКЕАНСКОЕ ЭКОНОМИЧЕСКОЕ СОТРУДНИЧЕСТВО – The Asia-Pacific Economic Co-operation, known also under the acronym of APEC, is an international forum created in 1989 in order to enhance commercial and economic cooperation in the Asia-Pacific region by facilitating economic development, trading exchanges, and investments. APEC's members now include 21 countries of the Pacific Rim:- the United States, Australia, Japan, Mexico, Peru, Malaysia, Brunei, Russia, Vietnam, Singapore, Thailand, Indonesia, Hong Kong, Papua New Guinea, New Zealand, the Philippines, Taiwan, Republic of Korea, People's Republic of China, Canada, and Chile. They are usually referred to as 'Member Economies'. APEC's main goals, first set in 1994 at the Bogor (Indonesia) meeting, can be summed up as follows:- promotion of free and open trade in the Asia-Pacific area; facilitation of trading exchanges by the elimination of trade, tariff, and other types of barriers that make difficult economic exchanges across the Pacific; reduction of the costs of business transactions by improving access to trade information; improvement of business facilitations in order to help economic operators conduct business more efficiently; expansion of the Asia-Pacific import-export economy by providing cheaper goods and services and more employment opportunities; and enhancement of technical cooperation. Additionally APEC works toward the creation of an international space for the safe and effective movement of goods, services, and people across its member states through policy alignment on the one hand and economic and technical cooperation on the other. APEC activities are planned and implemented with the consensual agreement of economic leaders and ministers of its member economies. During the meetings in which the representatives of each member state participate, the guidelines of APEC's activities are outlined. Member economies' representatives meet throughout the year to program future cooperation in the Asia-Pacific region and further already agreed-upon projects. The inaugural meeting of APEC was promoted by and held in Australia in January 1989. It was the then Australian prime minister who launched the idea to implement more efficient cooperation in the AsiaPacific area. However, when APEC began it was only an informal forum for the ministers of 12 states of the Asia-Pacific region. The first APEC Economic Leaders' Meeting took place in 1993 at Blake Island in the United States under the presidency of Bill Clinton. The meeting of the member economies' leaders held in 2007 (in Sydney, Australia), put new issues at the top of APEC's agenda, including climate change, energy security, and clean development. Participants in the meeting also emphasized the Asia-Pacific's vulnerability to natural disasters, recognizing the need for protecting the region from environmental risks. Additional economic integration in the area was also discussed, and new agreements were negotiated to further reduce trade barriers, and institutional and noninstitutional impediments to investments. The enlargement of APEC with the possible entry of more members as a tool to strengthen it was considered as well. The issue of membership, which is particularly important, will be discussed again in 2010. APEC is financed by contributions of member economies, and the annual budget is used for developing projects and sustaining the activities of the secretariat located in Singapore. Japan is the only member that until now has provided additional funds for specific projects related to trade liberalization. Unlike other international organizations, APEC works on the basis of nonbinding commitments. There are, in fact, no treaty obligations for its members, and commitments are undertaken on a purely voluntary basis. The fact that there are nonbinding agreements, and the enforcement of any decision depends upon the voluntary commitment of each member, impinges upon APEC's practical efficiency as well as on its real capacity to achieve specific goals. Asia Pacific Economic Cooperation (APEC) is an informal grouping of Asia Pacific countries that provides a forum for Ministerial level discussion of a broad range of economic issues. APEC includes the six ASEAN (Association of Southeast Asian Nations) countries (Brunei, Indonesia, Malaysia,

Philippines, Singapore and Thailand), plus:- Australia, Canada, China, Hong Kong, Japan, South Korea, Taiwan and the United States. APEC is an intergovernmental grouping operating on the basis of non-binding commitments, open dialogue and equal respect for the views of all participants. It was established in 1989 to further enhance economic growth and prosperity for the region and to strengthen the Asia-Pacific community. APEC's 21 Member Economies are:- Australia, Brunei Darussalam, Canada, Chile, People's Republic of China, Hong Kong (Special Administrative Region of the People's Republic of China), Indonesia, Japan, Republic of Korea, Malaysia, Mexico, New Zealand, Papua New Guinea, Peru, The Republic of the Philippines, The Russian Federation, Singapore, Chinese Taipei, Thailand, the United States of America, and Vietnam. Since its inception, APEC has worked to reduce tariffs and other trade barriers across the Asia-Pacific region, creating efficient domestic economies and dramatically increasing exports. Key to achieving APEC's vision are what are referred to as the 'Bogor Goals' of free and open trade and investment in the Asia-Pacific by 2010 for industrialised economies and 2020 for developing economies. These goals were adopted by Leaders at their 1994 meeting in Bogor, Indonesia. APEC's energy issues are the responsibilities of the Energy Working Group (EWG), one of its 11 working groups. The development and maintenance of the APEC Energy Database is assigned to EWG's Expert Group on Energy Data and Analysis (EGEDA) who has appointed the Energy Data and Modeling Center (EDMC) of the Institute of Energy Economics, Japan (IEEJ) as Coordinating Agency. One of the objectives of EGEDA is to collect monthly oil data of the APEC economies in support of Joint Oil Data Initiative. Headquartered in Tokyo, Japan. Asia-Pacific Economic Co-operation (APEC) is a forum for 21 Pacific-rim member economies that seeks to promote open trade and practical economic co-operation throughout the Asia-Pacific region. Co-operation is based on three pillars: trade and investment liberalization, business facilitation, and economic and technical co-operation. The primary goal is to support sustainable economic growth and prosperity in the region. Established in 1989, membership comprises Australia; Brunei Darussalam; Canada; Chile; People's Republic of China; Hong Kong, China; Indonesia; Japan; Republic of Korea; Malaysia; Mexico; New Zealand; Papua New Guinea; Peru; Philippines; Russian Federation; Singapore; Chinese Taipei; Thailand; United States; and Vietnam. / Бил Клынтчэн (Bill Clinton). Азиатско-Тихоокеанское Экономическое Сотрудничество (АТЭС) является неформальным объединением. Штабквартира находится в Токио, Япония.

THE ASIA PACIFIC NETWORK INFORMATION CENTRE = АЗИАТСКО–ТИХООКЕАНСКИЙ СЕТЕВОЙ ИНФОРМАЦИОННЫЙ ЦЕНТР – The Asia Pacific Network Information Centre (APNIC) is a Regional Internet Registry (RIR), and is a non-profit membership organization responsible for the administration and registration of Internet Protocol (IP) addresses in the Asia-Pacific region, including Japan, Korea, China, and Australia. / Азиатско-Тихоокеанский Сетевой Информационный Центр (АТСИЦ (APNIC)) – Региональный Интернет Реестр (RIR, РИР), некоммерческая организация с открытым членством, ответственная за администрирование и регистрацию адресов Интернет Протокола (IP-адресов) в Азиатско-Тихоокеанском регионе, включая Японию, Корею, Китай и Австралию.

ASIC = AUSTRALIAN SECURITIES AND INVESTMENT COMMISSION

ASK = ПРЕДЛОЖЕНИЕ НА ПРОДАЖУ – In securities trading, this term is generally understood to mean the quoted price at which a market participant is prepared to sell a security. The opposite is Bid. If no sale takes place at this price, the letter 'B' (stands for 'Brief' = ask) is placed after the price. The security was offered for sale, but found no buyers at the quoted price. Price at which assets are offered for sale. The opposite of Bid. Ask is a price at which a market participant is prepared to sell a security. The price that the market maker guarantees to fill a buy order. A buy order placed at the market will usually be filled at the current asking (offer) price. The Ask Price is usually greater than the Bid Price. The price at which a market maker is willing to sell an asset, or/and an expression indicating a desire to sell a commodity, security, currency or index at a given price. Also known as Offer, and Asked Price. Ask is the price a dealer or seller asks for a commodity. See also Offer. / Цена, по которой участник рынка желает продать актив или/и устойчивое выражение, обозначающее намерение продать товар, ценную бумагу, валюту или индекс по данной цене. Известно также как Оферта (Offer), Предлагаемая Цена Продажи или Цена Предложения На Продажу (Asked Price).

ASKEWED OR BIAS = ИСКРИВЛЁННОЕ (или КОСОЕ, или СМЕЩЁННОЕ) ИЛИ СКОШЕННОСТЬ (или СМЕЩЁННОСТЬ, или УГОЛ КРОЙКИ ПО ОТНОШЕНИЮ К КРОМКЕ) – Askewed or Bias:- condition where filling yarns are not square with warp yarns on woven fabrics or where courses are not square with wale lines on knits. / уточные пряжи .

ASK RATE = ПРЕДЛАГАЕМЫЙ КУРС ПРОДАЖИ (или КУРС ПРЕДЛОЖЕНИЯ НА ПРОДАЖУ) – Ask Rate is the rate at which an asset is offered for sale (as in bid/ask spread). / Ставка, по которой актив предлагается для продажи (например, в курсовой разнице спроса/предложения).

ASL = ABOVE SEA LEVEL

ASLAR = AIRCRAFT SURGE LAUNCH AND RECOVERY

ASLE = AMERICAN SOCIETY OF LUBRICATION ENGINEERS

ASM = AVAILABLE SEAT MILE

ASME = AMERICAN SOCIETY OF MECHANICAL ENGINEERS

ASN = ADVANCED SHIPMENT NOTICE

ASN = ADVANCE SHIPPING NOTICE

ASO = ADDRESS SUPPORTING ORGANIZATION

ASOS = AUTOMATED SURFACE OBSERVATION SYSTEM

ASP = APPLICATION SERVICE PROVIDER

ASP = ARRIVAL SEQUENCING PROGRAM

ASP = AVIATION SAFETY PROGRAM

ASPECT RATIO = СООТНОШЕНИЕ С АСПЕКТОМ (или СО СТОРОНОЙ) – Aspect Ratio is:- (1) the ratio of length to diameter of a fiber or yarn bundle. (2) In tire production, the ratio of the height of the tire to its width. (3) In a rectangular structure, the ratio of the longer dimension to the shorter. / , от Латинского слова Aspectus, означающее Вид, понимается . (3) В окантованной структуре, соотношение более длинного размера к более короткому.

ASPERA = АСПЭРА (или ШЕРОХОВАТОЕ, или НЕРОВНОЕ) – Aspera:- rough to the touch.

ASPERGILLOSIS = АСПЕРГИЛЛЁЗ – Aspergillos:- xxxxx. Aspergillosis is an infection caused by Aspergillus, a common mold (a type of Fungus) that lives indoors and outdoors. Most people breathe in Aspergillus spores every day without getting sick. However, people with weakened immune systems or lung diseases are at a higher risk of developing health problems due to Aspergillus. The types of

health problems caused by Aspergillus include allergic reactions, lung infections, and infections in other organs. Aspergillosis is a disease caused by a Fungus (or mold) called Aspergillus. The fungus is very common in both indoors and outdoors. Most people breathe in the spores of the fungus every day without being affected. But some people get the disease. It usually occurs in people with lung diseases or weakened immune systems. There are different kinds of aspergillosis. One kind is allergic bronchopulmonary aspergillosis (also called ABPA). Symptoms of ABPA include wheezing and coughing. ABPA can affect healthy people but it is most common in people with asthma or cystic fibrosis. Another kind is invasive aspergillosis, which damages tissues in the body. It usually affects the lungs. Sometimes it can also cause infection in other organs and spread throughout the body. It affects people who have immune system problems, such as people who have had a transplant, are taking high doses of steroids, or getting chemotherapy for some cancers. Your doctor might do a variety of tests to make the diagnosis, including a chest x-ray, CT scan of the lungs, and an examination of tissues for signs of the fungus. Treatment is with antifungal drugs. If you have ABPA, you may also take steroids. / Аспергиллёз (Aspergillosis):- инфекционная болезнь коробочек Хлопчатника. Возбудитель болезни – патогенный Гриб из Рода Аспергилл – Aspergillus Niger V. Tiegh. Аспергиллёз поражает чаще всего повреждённые насекомыми вредителями плодоорганы растения Хлопчатника на всех стадиях его развития. Возбудитель болезни проникает внутрь коробочки и повреждает волоконца Хлопчатника, которое начинает загнивать, приобретая при этом грязно-серый или коричневый окрас. На волоконцах и створках внутри коробочек в виде чёрных пылящих дерновинок образуются конидии Гриба. Поражённые болезнью коробочки засыхают и опадают. В зонах возделывания Хлопчатника аспергиллёз встречается повсеместно, особенно в местах неглубокого залегания грунтовых вод, на загущенных и полегших посевах Хлопчатника, а также при выполнении грузных поздних поливов. Болезнь распространяется насекомыми, ветром, водой, орудиями труда и другим. Сам же возбудитель болезни сохраняется в почве и на растительных остатках. В качестве основных мер борьбы с аспергиллёзом служат уборка растительных остатков, севооборот, подъём зяби, борьба с вредителями и полеганием растений, исключение поздних поливов.

ASPERITIES = НЕРОВНОСТИ (или ШЕРОХОВАТОСТИ) – Asperities:- microscopic projections on metal surfaces resulting from normal surface-finishing processes. Interference between opposing asperities in sliding or rolling applications is a source of friction, and can lead to metal welding and scoring. Ideally, the lubricating film between two moving surfaces should be thicker than the combined height of the opposing asperities. / Шероховатость поверхности, совокупность неровностей, образующих микрорельеф поверхности детали. Возникает главным образом вследствие пластической деформации поверхностного слоя заготовки при её обработке из-за неровностей режущих кромок инструмента, трения, вырывания частиц материала с поверхности заготовки, вибрации заготовки и инструмента и тому подобного. Шероховатость поверхности – важный показатель в технической характеристике изделия, влияющий на эксплуатационные свойства деталей и узлов машин – износостойкость трущихся поверхностей, усталостную прочность, коррозионную устойчивость, сохранение натяга при неподвижных посадках и тому подобное. Требования к шероховатости поверхности устанавливают, исходя из функционального назначения поверхностей деталей и их конструктивных особенностей. В современном производстве длительное время применяли систему, характеризующую чистоту поверхности с соответствующими ей классами; новая система (введена с 01 Января 1975) отменяет использовавшиеся ранее Классы Чистоты. Расширенный комплекс параметров новой системы способствует установлению обоснованных требований для поверхностей различного эксплуатационного назначения. При определении числовых значений шероховатости поверхности отсчёт производят от единой базы, за которую принята средняя линия профиля т. Измерения производят в пределах базовой длины l, то есть длины участка поверхности, выбранного для измерения шероховатости поверхности без учёта других видов неровностей (например, волнистости), имеющих шаг более l. Числовые значения базовой длины выбирают из ряда:- 0.01; 0.03; 0.08; 0.25; 0.8; 2.5; 8; 25 миллиметров (мм). Количественно шероховатость поверхности оценивают следующими основными параметрами (одним или несколькими):- средним арифметическим отклонением профиля R_a, высотой неровностей профиля по 10 точкам R_z, наибольшей высотой неровностей профиля R_{max}, средним шагом неровностей S_m, средним шагом неровностей по вершинам S, относительной опорной длиной профиля t_p. Числовые значения параметров шероховатости, типы направлений неровностей поверхностей (параллельное, перпендикулярное, кругообразное и другие) установлены стандартом. Выбор параметров шероховатости поверхности зависит от конструкции деталей и функционального назначения их поверхностей. Например, для трущихся поверхностей ответственных деталей устанавливают допустимые значения R_a (или R_z), R_{max}, t_p и направление неровностей; для поверхностей циклически нагруженных ответственных деталей – R_{max}, S_m и S и тому подобное. Требования к шероховатости поверхности указывают числовым значением (или диапазоном значений) одного или нескольких параметров и базовой длиной. Для неответственных поверхностей шероховатость поверхности определяется требованиями технической эстетики, коррозионной стойкости и технологией изготовления. В бывшем СССР стандартом были установлены 14 классов шероховатость поверхности:- 1–3-й классы обеспечивают обдирочной обработкой (точением, фрезерованием, строганием); 4–6-й классы – получистовой обработкой; 7–9-й классы – чистовой обработкой (шлифованием, тонким точением, протягиванием, развёртыванием и тому подобным); 10–14-й классы – доводочной обработкой (такие, как притирка, суперфиниш, хонингование и другие). Классы шероховатости с 6-го по 14-й разделяются на разряды а, б, в. В классах 1–5, 13 и 14-й не применяют параметр R_a, а в классах 6–12 – параметр R_z, что вызвано необходимостью однозначного определения класса шероховатости поверхности при различных методах контроля. В отличие от применявшихся до 1975 обозначений классов чистоты на чертежах (равносторонний треугольник с добавлением к нему номера класса, например Ñ3 или Ñ7), шероховатость поверхности обозначают знаком Ö с указанием над ним числового значения (в мкм) одного из выбранных параметров шероховатости. Значение Ra указывают только числом, а другие параметры – с символом, например, $R_z3{,}2$. Указанное числовое значение ограничивает наибольшую шероховатость поверхности по параметрам R_a или R_z. Поверхности в состоянии поставки или обработанные без снятия стружки обозначают символом ∀, а при обработке со снятием стружки – ▽. Начальная шероховатость поверхности, которую детали получают после их изготовления и сборки, изменяется в процессе приработки. Получающаяся после приработки (при трении качения, трении скольжения и других) шероховатость поверхности, обеспечивающая минимальный износ и сохраняющаяся в ходе длительной эксплуатации машин, называется Оптимальной Шероховатостью. Параметры оптимальной шероховатости поверхности зависят от конструкции и материала трущихся деталей, качества смазки и других условий работы. Для измерения шероховатости поверхности обычно применяют следующие методы:- контактный – щуповыми приборами (профилометрами и профилографами) и бесконтактный – оптическими приборами. В машиностроении часто используют визуальный метод, сравнивая контролируемую поверхность с поверхностью образца или детали, шероховатость поверхности которой аттестована.

ASPHALT = АСФАЛЬТ – Asphalt is a dark-brown-to-black cement-like material containing bitumens as the predominant constituents obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products:- cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts. / Под Асфальтом, от Греческого слова Ásphaltos, означающее Горная Смола, понимается смесь битумов (50–60% в природном асфальте и 13–60% в искусственном) с минеральными веществами-наполнителями (известняком, песчаником и другими.

Применяют в смеси с песком, гравием, щебнем для устройства дорог, как кровельный, гидро- и электроизоляцинный материал, для приготовления замазок, клеёв, лаков и другого. Асфальт – строительный вяжущий материал. Различают:- (i) природный асфальт, который встречается сравнительно редко, и (ii) искусственный. В строительстве используют главным образом искусственный асфальт. Асфальт обычно называют асфальтовой мастикой или асфальтовым вяжущим, – смесь 13–60% нефтяного битума с известняковым порошком. Её применяют как приклеивающий и гидроизоляционный материал, а также в смеси с песком, гравием или щебнем при получении асфальтобетона, используемого для устройства покрытий автомобильных дорог, полов промышленных зданий, кровельных покрытий и другого.

ASPHALT OVERLAY FABRICS = ТКАНИ ДЛЯ АСФАЛЬТОВЫХ ПОКРЫТИЙ – Asphalt Overlay Fabrics:- the fabric in a fabric overlay is a non-woven, petroleum-based geotextile fabric which is field saturated with an asphalt cement tack coat. When placed between pavement layers, the fabric becomes an integral part of the pavement, forming a barrier to water seepage and absorbing stresses to reduce reflective and fatigue cracking of the new asphalt surface layer. When widespread surface cracking develops on aging pavement, an asphalt fabric overlay is a reliable alternative to costly excavation and replacement of the cracked and deteriorated asphalt. Most cracked and distressed surfaces arise from surface water seeping through untreated cracks in the pavement. When water enters the base of the pavement, the base material can become compromised, leading to further cracking. High traffic volumes and vehicles carrying heavy loads (garbage trucks and delivery trucks can be especially damaging) can also lead to excessive surface cracking. Simply attempting to seal or applying a skin patch to these heavily damaged areas will provide only a temporary solution as the existing cracks will quickly reflect through the new surface. Although reflective cracking cannot be completely eliminated, the use of a fabric overlay significantly slows the reflective cracking process by forming a moisture resistant barrier that prevents water from passing through cracks, joints, and the pavement itself, preserving the structural integrity of the base. In addition, the fabric forms a shock absorbtion layer in the asphalt. This greatly reduces tensile stresses within the pavement, resulting in a dramatic increase in the life of the asphalt overlay. The process for applying an asphalt fabric overlay begins by cleaning the existing surface of dust, dirt, vegetation, and moisture. Low areas are filled with hot-mixed asphalt and large cracks are sealed to maximize the performance of the fabric. Hot oil is applied to the surface, followed by the placement of the fabric. Hot-mixed asphalt is then installed over the fabric and compacted. During the paving process, the heat and pressure from the compaction of the hot asphalt cause the oil to soak through the fabric. This creates a waterproof membrane that effectively adheres to both the new and old asphalt pavements. Long-term field evaluations have shown that the proper use of paving fabrics in asphalt overlays can increase pavement life up to 50%. Utilizing asphalt fabric overlays will reduce maintenance costs and improve the effectiveness of your pavement management system without the need to completely remove and replace your existing pavement. Asphalt Overlay Fabrics:- fabric systems installed between the old and new asphalt layers during pavement resurfacing. The fabric absorbs the tack coat sprayed on the old surface thus forming a permanent moisture barrier to protect the subgrade from strength loss due to water intrusion. The fabric system also helps retard reflective cracking by serving as a flexible layer to diffuse stress. An Asphalt Overlay Geotextile, or Paving Fabric, is designed to hold asphaltic cement tack coat and withstand the extreme temperatures associated with paving. It functions by creating a moisture barrier between the old asphalt layer and the overlay, decreasing introduction of water into the base, reducing the effects of reflective cracking and aiding in the flexibility of the pavement. Benefits:- (i) Reduces Reflective Cracking; (ii) Aides in Pavement Flexibility; (iii) Substantially Decreases Water Intrusion; and (iv) 40 Year Documented History. The Role of Water:- the American Association of State Highway and Transportation Officials (AASHTO) lists the number one cause of pavement deterioration as water beneath the pavement. A pavement saturated 10% of the time will see its lifespan decrease by 50%. According to AASHTO, upwards of 75% of water striking pavement passes through the asphalt to the base. In addition, a 1/8” crack in the surface of the asphalt will allow 97% of water striking that area of the pavement to pass through to the base. Paving fabrics boast a 40 year documented history of increasing the life span and improving the overall performance of pavements. The main reason for the success of paving fabrics is because they substantially decrease water intrusion through the asphalt. The nonwoven paving geotextile, combined with the tack coat and aided by pressure from the asphalt overlay, creates an asphalt saturated waterproofing and stress reducing interlayer. Paving fabrics reduce, but do not eliminate reflective cracking. However, in the instances where a crack reflects through from the original pavement, the paving geotextile system remains in tact as a waterproof membrane, preventing water from passing through. Finally, paving systems need to remain flexible. Research has also shown that pavement systems utilizing a paving geotextile will flex 2–3 times more than pavements without a fabric before succumbing to failure from fatigue. Paving fabrics have proven effective under both AC overlays and chip seals. See also Geotextile.

ASPP = AMERICAN SOCIETY OF PLANT PHYSIOLOGY

ASPW = ANY SAFE PORT IN THE WORLD

ASQP = AIRLINE SERVICE QUALITY PERFORMANCE

ASR = AIRPORT SURVEILLANCE RADAR

ASRB = ACCOUNTING STANDARDS REVIEW BOARD

ASRS = AUTOMATED STORAGE AND RETRIEVAL SYSTEM

ASRS = AVIATION SAFETY REPORTING SYSTEM

ASS = ACID SULFATE SOILS

ASSAILING THIEVES = ГРАБЕЖИ (или КРАЖИ С НАСИЛИЕМ) – Assailing Thieves:- forcible taking of a shipment rather than mysterious disappearance or pilferage. Forcible taking of property but not sneak thievery. / Насильственный захват имущества, но не путём воровства. В уголовном праве под Грабежами понимается открытое похищение имущества без насилия или с насилием, не опасным для жизни и здоровья.

ASSAY = ПРОБИРОВАНИЕ (или ОПРОБИРОВАНИЕ) – Assay is a testing of a metal or ore to determine the proportion of precious metal in contains. Assay most often applies to metals used in coinage, and to gold and silver. Metals assayed are stamped with a hallmark or an assay mark. To test a metal or an oil for purity or quality. Assay is the determination of the precious metal content of an alloy, either using a direct method (where the actual precious metal content is measured) or an indirect, instrumental method (usually based on spectrographic analysis) in which the levels of impurities are measured and the precious metal content is calculated by difference. For gold, the main direct method is fire assay, also known as Cupellation or Gravimetric Analysis. Assay is the testing and evaluation of a metal to determine its fineness or purity. There are often minimum standards that must be met. / в которых уровни примесей измеряются . Купелирование (Cupellation). Протестировать металл или нефть на чистоту или качество. Пробирование – проверка металла на чистоту для подтверждения того, что он удовлетворяет стандартам торговли на товарно-сырьевой бирже. Например, слиток очищенного золота весом в 100 Тройских унций должен иметь оценку чистоты не менее 995, прежде чем биржа КОМЭКС® (COMEX® (Commodity Exchange, Inc.)) разрешит использовать его для выполнения

обязательств по контракту на золото. Под Пробой благородных металлов, от Немецкого слова Probe, от Латинского слова Probo, означающее Испытываю или Оцениваю, понимается, количественное содержание золота, серебра, платины или палладия в лигатурном сплаве (смотрите Лигатура), из которого изготовляются ювелирные изделия, зубопротезные диски, монеты, медали и другое. В большинстве стран принята Метрическая Система обозначения Проб; в бывшем Союзе Советских Социалистических Республик (СССР) она была введена 15 Ноября 1927. По этой системе проба обозначается числом частей благородного металла в 1 000 частях (по массе) лигатурного сплава. По Каратной Системе, принятой в Соединённых Штатах Америки (США), Великобритании и Швейцарии, 1 000-я проба металла соответствует 24 условным единицам, называемым Каратами. До 1927 в России существовала Золотниковая Система обозначения проб (на основе Русского фунта, содержащего 96 золотников), по которой проба выражалась весовым количеством металла в 96 единицах сплава. Пробы сплавов благородных металлов, из которых разрешается изготовлять ювелирные и другие изделия, устанавливаются законодательным путём. Проба гарантируется государством, для чего изделия обязательно проходят пробирный контроль (опробование и анализ) и на них накладываются оттиски пробирных клейм (смотрите Пробирный Анализ). Слитки благородных металлов клеймятся пробой, определённой в сплаве. Не подлежат клеймению ордена, наградные медали и монеты, хотя проба их сплавов строго регламентирована и контролируется. Контроль за пробами сплавов и изделий и клеймение в бывшем СССР выполнялись инспекциями пробирного надзора. В странах, где установлен государственный пробирный надзор, торговля изделиями из благородных металлов без оттисков пробирных клейм запрещена, а подделка пробирного клейма преследуется законом. Для клеймения изделий применяются пробирные клейма разнообразных форм и рисунков. Рисунок клейма (обычно эмблема страны, города и тому подобное) сочетается с цифрами пробы (например, Великобритания) или с условными цифрами 1, 2 и так далее, где каждая цифра соответствует определённой пробе (например, Австрия, Аргентина, Болгария, Венгрия, Камерун, Италия, Нидерланды, Польша, Румыния, Чехословакия, Югославия, Португалия, Мексика); иероглифами (Египет, Тунис, Турция). Иногда проба обозначает клеймо только в виде цифр метрической пробы (Монголия). В бывшем СССР пробирное клеймо состояло из 3 элементов:- эмблемы (серп и молот на фоне пятиконечной звезды); трёхзначных цифр метрической пробы; шифра (в виде буквы), закреплённого за определённой инспекцией пробирного надзора. Клеймение ювелирно-бытовых изделий известно со средних веков (например, в Англии и Италии с XV века, во Франции с XVI века). В ряде стран клеймение введено в XX веке (например, в Канаде с 1913, Австралии с 1923). В некоторых странах ювелирно-бытовые изделия из благородных металлов хотя и клеймятся (чаще самими фирмами-производителями изделий), но контроль за пробами со стороны государства не обязателен или слабый (например, Австралия, Бельгия, Дания, Италия, Канада, Мальта, США, ФРГ, Швейцария, Швеция). В России государственное клеймение изделий узаконено:- серебряных – в 1613, золотых – в 1700; в бывшем СССР:- платиновых – в 1927, палладиевых – в 1956. В мире существуют метрическая, каратная и Русская системы проб золота. Наиболее популярны из них две – метрическая и каратная, а самая распространённая – метрическая система проб. Согласно Британской каратной системе, которая используется также в США, Швейцарии и некоторых других странах, 1 карат равен одной двадцать четвертой части массы сплава. Соответственно, 24-каратное золото (24K) является чистым, без каких-либо примесей, а, например, 18-каратное золото (18K) означает содержание в сплаве 18 частей золота и 6 частей примесей. В ювелирной промышленности применяются пробы в 9, 10, 14, 18 и 24 карата. В России в 1711 была введена Золотниковая система проб для серебряных сплавов и в 1733 – для золотых. Создана она была на основе Русского фунта, содержащего 96 золотников. По этой системе проба выражалась весовым количеством золота в 96 единицах сплава. Соответственно, чистый драгоценный металл соответствовал 96-й пробе. В конце XIX – начале XX веков для золотых изделий законными пробами были:- 94, 92, 82, 72 и 56. В 1927 в связи с переходом бывшего СССР на метрическую систему проб все изделия, которые имели золотниковую пробу, при поступлении в продажу были переклеймены на метрические пробы. Новая Российская система отличалась от Британской и была аналогична принятой в Германии. Так в России чистота золота стала определяться пробой, которая варьируется от 0 до 1000 и показывает содержание золота в тысячных долях (промилле). Золото 999.99-й пробы бывает в слитках и считается ‘практически чистым’. Такое золото очень дорого в получении и употребляется только в химии. Сегодня большинство стран пользуется метрической (самой точной) системой проб. В ней 1000-я проба – наивысшая, и, соответственно, клеймение происходит трёхзначным числом. Современной Российской системе, например, 23-каратное золото соответствует 958 пробе, 18-каратное золото – 750-й пробе, 14-каратное – 585-й пробе, 12-каратное – 500 пробе, 9 каратное – 375-я пробе. Чтобы перевести каратную пробу в метрическую нужно каратную пробу разделить на 0.024. Для перевода метрической пробы в каратную следует метрическую умножить на 0.024. Общепринятыми в нашей стране считаются пять проб золотых ювелирных сплавов:- 375, 500, 585, 750, 958:- (i) 375 проба – это сплав, содержащий 38% золота (основные компоненты – серебро и медь), имеющий цветовую гамму от жёлтого до красного, тускнеющий на воздухе из-за образования сульфида серебра (Ag_2S); (ii) 500 проба – сплав, содержащий 50.5% золота (основные компоненты – серебро и медь), низколитейный; (iii) 585 проба – сплав, содержащий 59% золота (основные компоненты – серебро, медь, палладий, никель), твёрдый, прочный, устойчивый на воздухе, широко применяется для изготовления ювелирных украшений; (iv) 750 проба – сплав, содержащий 75.5% золота (основные компоненты – серебро, платина, медь, палладий, никель), имеющий цветовую гамму от зелёного через ярко-жёлтый до розового и красного, твёрдый, прочный, хорошо подвержен обработке и полировке, широко применяется для изготовления ювелирных украшений, часто используется в филигранных работах; и (v) 958 проба – сплав, содержащий до 96.3% чистого золота, редко используемый в связи с мягкостью, с ненасыщенностью цвета. Все золотые сплавы выше 750 пробы не тускнеют на воздухе. Чистое золото (1000-й пробы) из-за своей мягкости и ломкости в производстве ювелирных изделий не используется. В ход обычно идут сплавы четырёх проб:- 958, 750, 585, 375. Золотой сплав самой высокой пробы 958-й, обычно, используется в художественных промыслах, и из него создаются произведения искусства. Золото пробы 900 (в Англии – 916) идёт в большинстве стран для чеканки. 900-я проба используется в стоматологии. Наиболее часто при изготовлении ювелирных изделий используют золото 585-й пробы. Украшения, изготовленные из сплавов ниже 375-й пробы, не считаются ювелирными (это бижутерия). Во всех странах мира количество золота в сплавах контролируется государством, а в некоторых также и корпорациями ювелиров, клейма которых чрезвычайно разнообразны и сложны. Например, в Голландии допускается полная свобода делать золотые и серебряные изделия произвольной пробы. В России содержание драгоценного металла в сплаве контролируется государством и регламентируется постановлением Правительства РФ от 18 Июня 1999 № 643 ‘О порядке опробирования и клеймения изделий из драгоценных металлов’. Изделия из драгметаллов, изготовленные на Российской территории, а также импортированные для продажи, должны быть заклеймены государственным пробирным клеймом и соответствовать Российским пробам. В РФ для ювелирных изделий установлены пробы благородных металлов:- 375, 500, 583, 750 и 958 – для золота; 750, 800, 875, 916, 925 и 960 – для серебра; 950 – для платины; 500 и 850 – для палладия. ГОСТ 6835-85 предусматривает 40 золотых сплавов восемнадцати проб, имея в виду их различное назначение. Процедура опробования и клеймения осуществляется Российской Государственной Пробирной Палатой при Министерстве Финансов Российской Федерации. За соответствием золотых проб следит Федеральный Пробирный Надзор. В Турции, Египте, Греции, в республиках Южной Америки и Соединённых Штатах правительственного контроля над золотыми и серебряными изделиями не существует. Российские ювелиры говорят, что, например, 90% золота из

Турции не ‘держит’ пробу. Поэтому, несмотря на то, что на Турецком золотом изделии стоит 585 проба, её считали как 500. Однако, в последнее время Турецкому пробированию золота вообще не доверяют. Дело в том, что в ‘бутиках’ этой страны можно выбрать понравившуюся золотую вещицу без маркировки, а уже потом попросить поставить на колечко или серьги желаемую пробу. Продавец тут же при заказчике с помощью специальной машинки проставит хоть 585, хоть 750, да хоть 958 пробу золота. Как уже говорилось выше, проба – это также и государственный знак в виде клейма, стоящий на золотых изделиях и подтверждающий количество чистого золота в данном сплаве. Как правило, он состоит из числа, обозначающего пробу и рисунка (символа или надписи). Для клеймения в различных странах применяются пробирные клейма, имеющие разнообразные форы и рисунки. Так, например, в Беларуси на клейме имеется изображение зубра.

ASSAYER = ПРОБИРОВЩИК (или ЛАБОРАНТ) – Assayer is a tester of precious metals to determine their purity.

ASSAYING = ПРОБИРОВАНИЕ (или ОПРОБИРОВАНИЕ) – Assaying is the process by which fineness is determined. The purity of silver, platinum and palladium articles is often quoted in the form of fineness – for instance, sterling silver is 925 fine. On the other hand, the fineness of gold jewellery is usually expressed in carats (parts of fine gold per 24). Eighteen-carat jewellery is therefore 750 fine in bullion market terms. See also Assay. / Пробирование – проверка металла на чистоту для подтверждения того, что он удовлетворяет стандартам торговли на товарно-сырьевой бирже. Например, слиток очищенного золота весом в 100 Тройских унций должен иметь оценку чистоты не менее 995, прежде чем биржа КОМЭКС® (COMEX® (Commodity Exchange, Inc.)) разрешит использовать его для выполнения обязательств по контракту на золото. Пробирный Надзор, государственный контроль за соответствием ювелирно-бытовых изделий из драгоценных металлов (золота, серебра, платины и палладия) узаконенным пробам, с тем чтобы не допустить продажи изделий из неблагородных или низкопробных металлов под видом благородных и полнопробных, а также избежать фальсификации пробирных клейм на изделиях. В большинстве стран установлены обязательный пробирный надзор, осуществляемый государством, и обязательное клеймение изделий из благородных металлов пробирными учреждениями. В бывшем Союзе Советских Социалистических Республик (СССР) функции пробирного надзора осуществлялись Министерством Финансов СССР через инспекции пробирного надзора. Пробирная Пошлина (от Немецкого слова Probieren, означающее Испытывать или Пробовать), вид денежного сбора, взимаемого государственными органами пробирного надзора за опробование, анализы и клеймение ювелирно-бытовых изделий из драгоценных металлов. В СССР за пробирные работы взималась плата по таксе, установленной Министерством Финансов СССР, размер её зависил от массы изделия. Пробирный Анализ или Пробирное Искусство, методы количественного определения содержания металлов, главным образом благородных, в рудах, различных продуктах металлургического производства, отходах, сплавах, изделиях и другом (смотрите Проба). Методы пробирного анализа были известны за 2 000 лет до Нашей Эры в Египте, а позже в Вавилонии, Греции, Риме и использовались в связи с добычей и торговым обращением золота. Развитию пробирного анализа в России содействовали реформы Петра I (расширение торговли, увеличение объёма чеканки золотых и серебряных монет, развитие добычи золота и серебра). Вклад в совершенствование пробирного анализа внесли работы Михаила Васильевича Ломоносова (1711–1765) и Дмитрия Ивановича Менделеева (1834–1907), а также Советских учёных Николая Константиновича Пшеницына (1891–1961), О.Е. Звягинцева, Владимира Яковлевича Мостовича (1880–1935), В.Г. Агеенкова, Игоря Николаевича Плаксина (1900–1967) и других. Методы пробирного анализа точны и позволяют определять, например, содержание золота в рудах до 0.1–0.05 грамма на тонну (г/т); это даёт возможность использовать его в качестве контрольного и арбитражного методов. По данным пробирного анализа рассчитывают содержание благородных металлов в залежах полезных ископаемых, осуществляют контроль за технологией извлечения, аффинажа, гальванического покрытия и тому подобного, ведут учёт расходования благородных металлов, выпускают ювелирно-бытовые изделия определённых проб и другое. Пробирный анализ выполняют пирометаллургическим (смотрите Пирометаллургия) и химическим методами. К пирометаллургическим методам относят тигельную и шерберную плавки, а также купелирование. Тигельная плавка применяется для анализа руд и продуктов их переработки с содержанием благородных металлов от десятых долей г до десятков и более г в 1 т исходного продукта; требуют взятия для анализа навески 25–100 г. Шерберная плавка применяется как дополнительная операция при анализе руд и продуктов их переработки и как самостоятельный метод анализа рудных продуктов с богатым содержанием благородных металлов (сотни г золота или платины и килограммов (кг) серебра в 1 т продукта); требуют взятия для анализа навески менее 5 г. Купеляция в муфеле – операция при тигельной и шерберной плавках и самостоятельный метод анализа сплавов, слитков, полуфабрикатов, изделий. Химические методы пробирного анализа применяются для всех материалов, содержащих благородные металлы, за исключением продуктов, указанных для тигельной плавки. Иногда химические методы пробирного анализа используются в сочетании с пирометаллургическими. Из химических методов пробирный анализ получил распространение экспресс-способ определения пробы ювелирно-бытовых изделий без нарушения их целостности – опробование на пробирном камне. На поверхность пробирного камня наносят испытуемым изделием однородно-плотную полоску (черту) 10–12 миллиметров (мм) длиной и 2–3 мм шириной. Рядом с промежутком 0.5–1 мм наносят такую же полоску пробирной иглой с заведомо известной пробой, подходящей к пробе испытуемого изделия, а для золота – и одинаковой по цвету. Нанесённые полоски смачивают соответствующим пробирным реактивом и наблюдают за его действием в течение нескольких секунд (сек). По окончании реакции реактив осторожно снимают с камня фильтровальной бумагой и сравнивают действие реактива на полосках. По степени интенсивности окраски пятна на полоске от изделия и окраски пятна на полоске от иглы судят о пробе изделия из благородного металла. Пробирный Камень, слабометаморфизированный, тонкозернистый, углистый, кремнистый сланец в виде чёрного бруска, на котором по цвету черты испытуемого благородного металла определяют его пробу. Основные Требования К Пробирному Камню:- твёрдость по минералогической шкале 4.7–6.5; содержание С 8–23%; примеси не более 2% (Al, Fe, Ca, Mn, S, Na, Cl и другие). Пробирный камень должен быть без трещин и не реагировать с неорганическими кислотами и их смесями. В бывшем Союзе Советских Социалистических Республик (СССР) горные породы, отвечающие требованиям пробирных камней, под названием Шунгит встречались на Урале, в устье Реки Чёрная Арагви (близ Тбилиси, Грузия), в карьере ‘Усовая Гора’ (Карельская АССР). Богатые месторождения кремнистых сланцев за рубежом расположены на территории древнего государства Лидия (на Западе Малой Азии), в связи с чем порода приобрела название ‘Лидийский Камень’. Разработана технология изготовления искусственных пробирных камней (спеканием или плавкой заранее подготовленной шихты определённого состава). Однако эти камни по своим качествам уступают высокосортным природным пробирным камням. Пробирные Иглы, эталонные пластинки из определённых сплавов благородных металлов, предназначенные для определения пробы на пробирном камне. Пробирные иглы изготавливается из того благородного металла, для опробования которого она предназначается. Выпускавшиеся в бывшем СССР пробирные иглы содержали благородного металла (в %):- золотые – 37.5; 50.0; 58.3; 75.0; 95.8, серебряные – 75.0; 80.0; 87.5; 91.6; 92.5; 96.0, платиновые – 95, палладиевые – 50 и 85. В состав лигатуры игл также входили:- золотых – в основном Ag и Cu, реже – Ni, Zn, Pd и другие; серебряных и платиновых – только Cu, палладиевых – Ag и Ni. Например, золотые пробирные иглы 583-й пробы изготовлялись 15 номеров различных по составу лигатуры и цвету, где № 1 содержал 41.7% Ag и не содержал Cu, а № 15 содержал 41.7% Cu, но не содержал Ag (промежуточные иглы с № 2 по № 14 содержали Ag в убывающих, а Cu – в

возрастающих пропорциональных количествах). Пробирные иглы для определения пробы зубопротезных дисков содержали 90.0% Au, 4.0% Ag и 6.0% Cu. Пробирные Реактивы, реактивы для определения пробы ювелирно-бытовых изделий и сплавов из благородных металлов на пробирном камне. Для опробования золотых изделий применяют растворы хлорида золота и кислотные реактивы; серебряных изделий – растворы нитрата серебра. Опробование платины производится кислотным реактивом или растворами иодида калия, соляной и азотной кислоты. Для определения пробы палладия используют реактив иодида калия. Смотрите также Пробирный Анализ.

ASSAY MARK = МАРКА ПРОБИРОВАНИЯ (или МАРКА ОПРОБИРОВАНИЯ) – Assay Mark is the stamp by an assayer on a bar or piece of precious metal to guarantee its fineness.

ASSAY OFFICE = КОНТОРА ПО ПРОБИРОВАНИЮ (или КОНТОРА ПО ОПРОБИРОВАНИЮ) – Assay Office is an official or statutory organization controlling the testing of precious metals within a country.

ASSC = ACCOUNTING STANDARDS STEERING COMMITTEE

ASSEMBLED YARN = СОБРАННАЯ (или СБОРНАЯ) ПРЯЖА – Assembled Yarn:- two or more yarns which are wound side by side on to same package, but without twisting around each other, are called Assembled Yarns. See also Multiple Wound Yarn. Assembled Yarns and twisted yarns are processed by assembling multiple numbers of yarns and twisting them, which adds various functional uses and characteristics to the yarns such as added texture and improved thermal insulation as well as enhanced strength and water repellency. Muratec's (Murata Machinery, Ltd; Fushimi-ku, Kyoto, Japan) twisters are highly efficient two-for-one twisters that twist a yarn twice while a spindle makes one full revolution. Our delivery record of more than 5 million spindles, is the largest share in the world, and proves the trust of our customers in our twisters. / (Muratec's (Murata Machinery, Ltd;).

ASSEMBLY = СБОРКА – Assembly is the stage of production in which components are put together into an end product appropriate to the process concerned. / Стадия производства, в которой компоненты соединяются воедино для формирования конечного продукта, соответствующего данному процессу.

ASSEMBLY AREA = СБОРОЧНАЯ ПЛОЩАДКА – Assembly Area is a location in the warehouse where products and loads are collected and combined.

ASSENTED BONDS = СОГЛАСОВАННЫЕ ОБЛИГАЦИИ – Assented Bonds is an American expression for bonds whose owners have agreed to reduced interest payments or a reduced repayment of principal on the basis of a reorganization or rescheduling plan. / Американское выражение в отношении облигаций, владельцы которых договорились на уменьшенные процентные платежи или платежи процентов (interest payments), или уменьшенную выплату основной суммы на основе реорганизации или плана реструктуризации.

ASSESSMENT = ИСЧИСЛЕНИЕ (или ОТЧИСЛЕНИЕ, или НАЧИСЛЕНИЕ, или ОБЛОЖЕНИЕ, или ОЦЕНКА) – (1) Assessment is an act of calculating value, e.g., Income Tax assessment. / Действие по калькулированию стоимости, например, при исчислении Налога на Доход (Income Tax). Под Исчислением понимается выражение в каком-нибудь числе, количестве; например, доходы исчисляются миллионами Рублей.

(2) Assessment is the imposition of antidumping duties on imported merchandise. / Обложение антидемпинговыми пошлинами привозимой (или импортируемой) товарной продукции.

ASSESSOR = АСЕССОР (или ИСЧИСЛЯЮЩИЙ, или ОЦЕНЩИК) – Assessor is a person who officially estimates the value of goods for the purpose of apportioning the sum payable in the settlement of claims. Assessor is:- (i) an official who evaluates property for taxation; or (ii) an assistant to a judge or magistrate, usually selected for special knowledge in a particular area. Assessor:- Assessors Mission Statement:- to discover, identify, value and assess all taxable real and personal property in order to produce the secured and unsecured assessment rolls. To fairly and accurately apply exemptions, exclusions and to defend valuations and assessments before the Assessment Appeals Board. What We Do – Assessors Responsibilities:- (i) has the responsibility for discovering and assessing all property within the County as required by law; (ii) must produce and deliver an assessment roll by July 01 each year. The assessment roll becomes the base upon which local property taxes are levied, collected and distributed to the cities, County and special districts to fund government services; (iii) values real property; (iv) audits entities doing business in the County and values all taxable personal property; (v) establishes and maintains a set of 4 900 maps for assessment purposes, delineating every parcel of land in the County. These parcel maps serve as the basis for the assessment of all real property in Santa Barbara County and are continuously updated to reflect new subdivisions and surveys. These maps are available for review and may be purchased at the Assessor's Office. (vi) Provides a public information service to assist taxpayers with questions about property ownership and assessment. Information on recent property sales is also available. In addition, property characteristic information is available for purchase by the public. What the Assessor Does Not Do:- (i) does not set property tax rates; (ii) does not compute property tax bills; (iii) does not mail out tax bills; (iv) does not collect property taxes; and (v) does not establish property tax laws. / Под Асессором, от Латинского слова Assessor, означающее Заседатель, в Древнем Риме, в средневековой Европе и в некоторых буржуазных государствах (например, в Германии) понимается судебное должностное лицо, заседатель; в России должность Асессор была введена Петром I в штаты Сената, Синода, судов и других коллегий, во 2-й половине XIX века эта должность постепенно была ликвидирована (дольше всего сохранялась в губернских правлениях), соответствовавший же ей чин – коллежский асессор – существовал до свержения царизма (1917) как гражданский чин восьмого класса по росписи чинов (так называемоу табели о рангах). Асессор, от Латинского слова Assessor, означающее Заседатель, в Древнем Риме и средневековой Европе должностное лицо, облечённое судебной властью. В царской России – должность, соответствующая 8 классу в Табели о Рангах Всех Чинов Воинских, Статских и Придворных (коллежский асессор), должность в центральных госучреждениях XVIII века, при Губернских Правлениях XIX – начала XX веков. В современном мире асессоры – это аттестаторы, которые участвуют в процессе независимой оценки соответствия:- аттестации персонала, рабочих мест, процессов, систем менеджмента качества и других видах аттестации и оценки соответствия. В Европе и США Асессорами называются также те, кто в России называются Оценщиками – эксперты по независимой оценке стоимости имущества.

ASSET = АКТИВ – (1) Anything an individual or a business owns that has commercial or exchange value. Asset is a resource that is expected to benefit the company financially, generally something owned by or owned to the business. / Актив – всё, имеющее коммерческую или обменную ценность и принадлежащее компании, институту или частному лицу. Актив:- (1) совокупность имущества и денежных средств, принадлежащих предприятию, фирме, компании (здания, сооружения, машины и оборудование, материальные запасы, банковские вклады, вложения в ценные бумаги, патенты, авторские права и другое), в которые вложены средства владельцев, хозяев. Активы принято делить на материальные (осязаемые) и нематериальные (неосязаемые), к последним относятся интеллектуальный продукт, патенты, долговые обязательства других предприятий, особые права на использование ресурсов; (2) актив баланса – часть бухгалтерского баланса предприятия, отражающая в

денежном выражении материальные и нематериальные ценности, принадлежащие предприятию, их состав и размещение; (3) превышение доходов над расходами.

(2) In accounting an Asset is initially measured at its cost. The cost of an item of property, plant and equipment comprises its purchase price and any directly attributable costs of bringing the asset to the working condition for its intended use. Cost is understood as the amount of cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction. Asset:- an economic resource, tangible or intangible, which is expected to provide benefits to a business. Something that belongs to an individual or company and which has a value, e.g., buildings, plant, stock, but also Account Receivable. There are several types of assets for business purposes, and they are usually classified in terms of their availability for exchange. / строка баланса (item). Актив является одной из сторон бухгалтерского баланса. Он отображает состав, размещение и использование средств, группируемых по признаку их функциональной роли в хозяйстве. закупочной цены и любых .

ASSET ALLOCATION = РАЗМЕЩЕНИЕ АКТИВОВ – Asset Allocation is an investment strategy that aims to balance risk and reward by apportioning a portfolio's assets according to an individual's goals, risk tolerance and investment horizon. The three main asset classes – equities, fixed-income, and cash and equivalents – have different levels of risk and return, so each will behave differently over time. There is no simple formula that can find the right asset allocation for every individual. However, the consensus among most financial professionals is that asset allocation is one of the most important decisions that investors make. In other words, your selection of individual securities is secondary to the way you allocate your investment in stocks, bonds, and cash and equivalents, which will be the principal determinants of your investment results. Asset-allocation mutual funds, also known as Life-Cycle, or Target-Date, funds, are an attempt to provide investors with portfolio structures that address an investor's age, risk appetite and investment objectives with an appropriate apportionment of asset classes. However, critics of this approach point out that arriving at a standardized solution for allocating portfolio assets is problematic because individual investors require individual solutions. Asset Allocation is the proportion of your total capital you invest in the different asset classes. This will be largely determined by your risk profile. The process of dividing investments among different kinds of assets, i.e. stocks, bonds, real estate and cash, to optimize the risk/reward tradeoff based on an institution's specific goals. / Размещение Активов – распределение средств инвестиционных фондов между различными категориями активов, такими, как эквиваленты наличных средств (cash equivalents), акции (stocks), вложения с фиксированным доходом (fixed income investments) и такими материальными активами, как недвижимость, ценные металлы и предметы коллекционирования. Это также относится и к государственным, муниципальным и корпоративным облигациям, а также к категории промышленных обыкновенных акций. Распределение активов влияет на риск и на доход и является центральным понятием в планировании частных финансовых вложений и инвестиционном мэнэдьжменте.

ASSET ALLOCATION FUND = ФОНД РАЗМЕЩЕНИЯ АКТИВОВ – Asset Allocation Fund is an investment fund which applies the official investment policy of the custodian bank. Depending on the risk category, the asset allocation fund can invest solely in the money market and bonds (income-oriented) or in equities as well (capital-gains-oriented).

ASSET AND LIABILITY MANAGEMENT = УПРАВЛЕНИЕ АКТИВАМИ И ПАССИВАМИ – Reconciliation of the assets, liabilities and off-balance sheet operations of a bank in order to optimize profitability, liquidity and security within the possibilities offered by the law. Management of a business in a way that coordinates decisions on assets and liabilities. Specifically, the ongoing process of formulating, implementing, monitoring and revising strategies related to assets and liabilities in an attempt to achieve financial objectives for a given set of risk tolerances and constraints.

ASSET–BACKED SECURITIES = ЦЕННЫЕ БУМАГИ, ОБЕСПЕЧЕННЫЕ АКТИВАМИ – Asset-Backed Securities (ABSs) are the securities whose value is derived from, and, in the case of cash (i.e. non-synthetic) ABS, collateralized or backed by, a specific pool of underlying assets. A security backed by notes or receivables against assets such as auto loans, credit cards, royalties, student loans and insurance. Asset Backed Securities (ABSs):- every transaction involving securities collateralized by debts is based on a triangular structure involving an originator (party selling the debt), a special purpose vehicle (SPV) and the investor. If a bank acts as originator with its own loan receivables (e.g., amounts receivable under mortgage loans, consumer loans) its first step is to bundle suitable loans in a 'debt pool' and then sell them to an SPV. If this sale is on-balance-sheet, it is referred to as a 'True Sale'. In return, the originator receives the value of the debts in cash. The SPV, in turn, refinances the purchase through the (public or private) placement of securities on the capital market. The coupon and redemption payments to investors are funded by the restructured interest and redemption payments made by the original borrowers. The SPV is formed for the sole purpose of securitizing these debts and its only asset is the risk from this diversified debt pool. The advantage for the originator lies primarily in the fact that he receives cash and can now invest it at a profit, e.g., by investing in products offering a higher return. He can also wind down his liabilities. This reduces his balance sheet and increases his capital adequacy ratio. With a true sale, the originator also improves his rating and thereby obtains better refinancing conditions. The capital costs of an investment funded by ABS are lower compared with traditional debt finance because the default risk is transferred to the SPV when the debts are sold. This risk transfer thereby reduces the regulatory capital backing requirement. Depending on the debtor, the bank has to provide less or no liable equity capital for the sold loans. Specially created securities used for refinancing and collateralized by a pool of similar claims (e.g., mortgage loans) and where debt service payments are covered by the income generated by the pool. / , например, . Ценные Бумаги, Обеспеченные Активами – облигации или иные долговые обязательства, обеспеченные заёмными бумагами или счетами к получению, источниками которых являются банки, компании, выдающие кредитные карты, предоставляющие кредит и часто поддержанные банковскими аккредитивами (letter of credit) или страховым покрытием со стороны организации, отличной от предоставившей данные долговые обязательства. Как правило, эти долговые обязательства продают в специально организованный трастовый фонд, который переоформляет их в ценные бумаги с минимальной деноминацией в 1 000 Долларов США и сроком погашения менее пяти лет. Ценные бумаги затем принимаются на реализацию брокерской фирмой, которая предлагает их для открытой перепродажи. Примерами могут служить сертификаты автомобильного кредита (certificates for automobile receivables (CARs) и так называемые пластиковые облигации (plastic bonds), обеспеченные счетами к получению по кредитным картам. Поскольку организации, являющиеся источником самих займов или счетов к получению, не несут ответственности по ним и не являются гарантами, инвесторам следует оценивать качество исходных бумаг, надёжность гаранта или страхователя и степень защиты.

ASSET BACKING = ОБЕСПЕЧЕНИЕ АКТИВА – Asset Backing:- useful check for investors that can be related to the firm's earning capacit. Asset Backing = Net Assets of a company (in Dollars) / number of issued shares. For example, XYZ Ltd with USD100 000.00 net assets and 10 000 shares issued has an Asset Backing of USD10.00 per share.

ASSET–BASED, THIRD PARTY PROVIDER = СТОРОННИЙ ОБЕСПЕЧИТЕЛЬ УСЛУГ НА ОСНОВАНИИ АКТИВОВ – Asset-Based, Third Party Provider is a third party provider that owns transportation and/or warehouse assets.

ASSET BOUNDARY = РАЗГРАНИЧЕНИЕ АКТИВОВ – Asset Boundary is a boundary separating assets included in creating core economic accounts (such as plant and factories, also including non-produced assets such as land and water resources) and those excluded (such as natural assets not managed for an economic purpose). Asset Boundary:- this is the national accounts term for what

is defined as an asset. Assets which lie inside the asset boundary, such as goods vehicles or a factory, are recorded on the national accounts stocks figures. Assets which lie outside the asset boundary, such as historic monuments or natural resources such as mineral deposits or a forest are not recorded in the core accounts. / Термин Разграничение Активов описывает действия, направленные на распределение активов инвестора по разным группам финансовых инструментов. Разграничение активов очень тесно связано с диверсификацией, но является более обширным понятием, с теми же базовыми целями. Главная задача тактического разграничения активов – как и диверсификации – минимизация риска при попытке сохранения прибыли.

ASSET MANAGEMENT = УПРАВЛЕНИЕ АКТИВАМИ – Asset Management is:- (1) the management of a client's investments by a financial services company, usually an investment bank. The company will invest on behalf of its clients and give them access to a wide range of traditional and alternative product offerings that would not be to the average investor. The expense of this service generally restricts it to high net-worth individuals, governments, corporations and financial intermediaries. This includes such products as equity, fixed income, real estate, agriculture and international investments. (2) An account at a financial institution that includes checking services, credit cards, debit cards, margin loans, the automatic sweep of cash balances into a money market fund, as well as brokerage services. Also known as an Asset Management Account or a Central Asset Account. When individuals deposit money into the account, it is placed into a money market fund that offers a greater return that can be found in regular savings and checking accounts. The added benefit to individuals is that they can do all of their banking and investing at the same institution instead of having a bank and brokerage account at two different companies. These types of accounts came about with the passing of the Gramm-Leach-Bliley Act in 1997, which replaced the Glass-Steagall Act. The Glass-Steagall Act was created during the Great Depression and did not allow financial institutions to offer both banking and security services. Range of services offered by banks and investment funds for the active management of a client's assets under a portfolio management mandate. Essentially synonymous with portfolio management but in practice often refers to the service provided to institutional investors.

ASSETS = АКТИВЫ (или АВУАРЫ) – (1) Assets are defined as probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events. If a building is leased, the future economic benefits of using the building are controlled by the lessee as the result of a past event (the signing of a lease agreement). Assets are grouped into two types:- (i) current assets and (ii) noncurrent assets. Property owned by a firm and claims it has against others. Major types of assets:- (i) fixed assets – those of a permanent nature, held for the purpose of earning revenue and not for resale, e.g., buildings, machinery, long-term investments; and (ii) current assets – those in which the business deals and which change value frequently in the course of trading. Entities over which ownership rights are enforced by institutional units, individually or collectively; and from which economic benefits may be derived by their owners by holding them over a period of time. Assets are probable future economic benefits obtained or controlled by an entity as a result of past transactions or events affecting the entity. The essential characteristics of an asset are:- (i) a probable future benefit exists involving a capacity to contribute directly or indirectly to future net cash inflows; (ii) the entity can obtain the benefit and control the access of others to it; and (iii) the transaction or event giving rise to the entity's claim to or control of the benefit has already occurred. Any possessions that have value in an exchange. Assets are all the items of value owned by or owed to a company and are set out in the balance sheet in relation to the firm's obligations (liabilities). The assets inform the reader how the capital invested in the company has been used. Equals the summation of all asset items on the balance sheet. Business accounting term for everything a company owns that has a monetary value, i.e. as shown in the balance sheet (credits, equipment and facilities, liquid assets, participations, etc). Total resources (total current assets and total non-current assets) belonging to a person, company, or group owns or is owed, such as cash, property, equipment, notes and accounts receivable. The opposite of Liabilities. See also Current Assets. Assets, in commerce, a term used to designate the stock in trade, and the entire property of all sorts, belonging to a merchant or to a trading association. It is also applied to goods or property placed, for the discharge of some particular trust or obligation, in the hands of executors, assignees, etc. / строка баланса (item). , то есть . Активы – ресурсы, контролируемые компанией в результате событий прошлых периодов, от которых компания ожидает экономических выгод в будущем. Активами считаются хозяйственные средства, контроль над которыми организация получила в результате свершившихся фактов её хозяйственной деятельности и которые должны принести ей экономические выгоды в будущем. Материально-вещественная форма актива и юридические условия его использования не являются критериями отнесения его к активам. Авуары:- (1) денежные средства банка в иностранной валюте на его счетах, в иностранных банках-корреспондентах, выполняющих финансовые операции по поручению данного банка; средства страны, государства за рубежом называют иностранными авуарами. За счёт авуаров можно производить платежи за рубежом и погашать обязательства. (2) Любые виды денег, денежных средств, ценных бумаг (наличные и безналичные деньги, чеки, векселя, аккредитивы), посредством которых можно производить платежи и погашать денежные обязательства. Активы – совокупность имущественных средств хозяйствующего субъекта. В международных стандартах финансовой отчётности активы трактуются как ресурсы, контролируемые организацией в результате событий прошлых периодов, от которых она ожидает экономические выгоды в будущем. Таким образом, заключённая в активах экономическая выгода представляет потенциал, который войдёт прямо или косвенно в поток денежных средств или денежных эквивалентов организации. Потенциал может быть продуктивным, то есть составлять часть операционной деятельности организации. Он может быть конвертирован в денежные средства или их эквиваленты, а также сокращать отток денежных средств (например, альтернативный производственный процесс снижает производственные затраты). Хозяйственные ресурсы, составляющие активы, должны:- приносить хозяйственную выгоду (доходы, прибыль, деньги) в будущем; находиться в распоряжении хозяйствующего субъекта, который мог бы их беспрепятственно использовать по собственному усмотрению или продать; быть результатом ранее совершённых сделок (быть готовыми к использованию в данный момент, а не находиться на стадии изготовления или доставки в рамках соответствующего договора, контракта). В состав активов включают имущество и права. К имуществу относят различные предметы, имеющие хозяйственную ценность в силу своих физических свойств (деньги, товары, материалы, строения, машины, оборудование). В активах различают недвижимое и движимое имущество, паи и акции в других организациях (долгосрочные финансовые вложения), оборотные средства (текущие активы) или оборотный капитал. Права делятся на овеществлённые и неовеществлённые. Овеществлённые права связаны с владением какой-либо ценной бумагой, дающей право на получение ценностей (векселем, чеком, облигацией, акцией и тому подобным). К неовеществлённым правам относят долговые требования (дебиторская задолженность в различных видах), исключительные права (например, патент, лицензия, авторское право, право на фирменное наименование и товарный знак) и прочие права, вытекающие из незаконченных хозяйственных операций (например, заранее произведённые затраты или ещё не полученные доходы). Перечисленные составляющие активов, количественно измеренные и оцененные, отражаются в одной из частей бухгалтерского баланса. Их классификация должна позволять, с одной стороны, судить о характере разнообразных средств хозяйствующего субъекта и его юридических отношениях с контрагентами, с другой – установить их относительное участие в общем обороте средств. Выявление всей совокупности имущественных средств путём годовой инвентаризации или на основе книжных (учётных) данных необходимо для:- определения собственного капитала или величины чистых активов (разность между суммой актива, выраженной стоимостью всех имущественных средств, и суммой обязательств); выявления всей совокупности благ, которая может служить обеспечением прав кредиторов. При определении

активов чужие ценности, временно находящиеся во владении хозяйствующего субъекта (например, переданные на хранение ценные бумаги или переданные для продажи товары и другие), должны быть в учёте выделены.

(2) Assets:- an investment vehicle. It may be a stock, a bond, an option on a stock. / Инвестиционный инструмент. Это может быть акция, облигация, опцион на акцию.

ASSET TURN = XX – Asset Turn:- xxxxx. See also Sales/Total Assets.

ASSET TURNOVER = ОБОРАЧИВАЕМОСТЬ АКТИВОВ – Asset Turnover is a measure of the efficiency of assets with regard to generating revenue. The higher the ratio, the better assets are being utilized to generate Delivered Sales.

ASSIGN = ПЕРЕУСТУПАТЬ (или ПЕРЕДАВАТЬ, или ПРИСВАИВАТЬ, или ОТЧУЖДАТЬ, или ПРЕЕМСТВО) – Assign:- to make an option seller perform his obligation to assume a short futures position (as a seller of a call option) or a long futures position (as a seller of a put option). Assign:- to transfer (property) to another especially in trust or for the benefit of creditors. / Переуступать или Передавать или Отчуждать:- подписывать документ о передаче права владения от одной стороны другой. Владение может быть в различных формах, включая материальную собственность, права (обычно являющиеся результатом контракта), а также право на передачу прав собственности по прошествии некоторого времени. Лицо, передающее права, называется Уступающий или Отчуждающий (Assignor), а лицо, которому передаются права, – Преемник или Правопреемник (Assignee). Процедура передачи акций и зарегистрированных облигаций происходит путём заполнения и подписания формы, напечатанной на обороте сертификата, или оформления особого документа, называемого Поручительством отдельно от сертификата или свидетельства на право владения акцией/облигацией (assignment separate from certificate or stock/bond power). Когда Опционная Клиринговая Корпорация (Options Clearing Corporation) получает информацию об исполнении опциона, она подготавливает документ передачи (assignment form), уведомляющий брокера-дилера об исполнении опциона, выписанного одним из его клиентов. Компания, в свою очередь, поручает исполнение опциона в соответствии со своими внутренними процедурами. Что касается передачи прав в интересах кредиторов, иногда называемой просто передачей прав (assigment), то она является альтернативой банкротству, при котором активы компании передаются кредиторам и в их интересах обращаются доверенным лицом в ликвидную форму.

ASSIGNABLE CONTRACT = ПЕРЕУСТУПАЕМЫЙ КОНТРАКТ (или ПРЕЕМСТВЕННЫЙ КОНТРАКТ) – Assignable Contract is a contract that allows the holder to convey his rights to a third party. Exchange-traded contracts are not assignable. / Контракт, который позволяет его контрактодержателю передавать свои права третьим лицам. Контракты, торгуемые на бирже, не переуступаются.

ASSIGNEE = ПРЕЕМНИК (или ПРАВОПРЕЕМНИК) – (1) Assignee is one who receives rights from an assignor. The acquirer of title or interest transferred by an assignor. Also known as Cessionary. Assignee, a person appointed by competent authority to do, act, or transact some business, or exercise some particular privilege or power, for or on account of some specified individual or individuals. Assignees may be created by deed, or by law:- by deed, wher the lessee of a farm assigns the same to another; by law, where the law makes an assignee, without any appointment of the person entitled, as an executor is assignee in law to the testator, and an administrator to an intestate. The term is most commonly applied to the official assignees appointed to manage bankrupt estates. / Получатель права собственности или процентов, передаваемого цедентом. Известен также как Цессионер или Цессионарий (Cessionary).

(2) Assignee is the entity that is the recipient of a transfer of a patent application, patent, trademark application or trademark registration from its owner of record (assignor).
