COUNT STRENGTH PRODUCT = ПРОДУКТ КРЕПОСТИ ПО НОМЕРУ – Count Strength Product (CSP) is an old Strength value, which is not used in several countries anymore. It is a number which is derived by multiplication of count and lea strength (in lbs). Note:- the higher the value the better the yarn. Lea:- in one lea 120 yards length of yarn is wound by 80 wraps. Each wrap has a length (circumference) of 1.5 yards. Lea Strength:- this is breaking load required to rupture one lea. It is generally expressed in pound. Note:- the higher the value the better the yarn.

COUNT VARIATION = ВАРИАЦИЯ ПО НОМЕРУ – Count Variation:- there is difference in count compared to required count. Spinning defect. Count Variation:- difference in count compared to require count. Fabric gives bad appearance and characterized by variation in density. The variations of lower and higher side for long and medium type. Probable reasons for this are:- (i) regular check on wrapping from gill box to ring frames; (ii) correct piecening of silver or that portion should be removed from the delivered sliver; (iii) during run out of material extra care is required to take; (iv) auto-leveller setting is to be checked for fault and material of below Std. Uster value to be taken back for processing; (v) top cots rollers condition at gill boxes, rovings and ring frame; (vi) tension at roving and ring frames vary. Barrels at roving should move freely; and (vii) top arm pressure, spacer, condenser and drafting zone condition of spinning frame. / Порок или дефект прядения. Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария.

COUPLING = СОЕДИНИТЕЛЬНАЯ МУФТА – Coupling:- a straight connector for fluid lines. Coupling is a device used to connect the ends of two adjacent objects, as in pipes or tubes. / Под Муфтой, от Немецкого слова Muffe, от Голландского слова Mouwtje, понимается устройство для соединения валов, тяг, труб, канатов, кабелей и тому подобного. Различают:- (i) Соединительные Муфты, которые в зависимости от выполняемых функций обеспечивают прочность соединения, герметичность, защищают от коррозии и так далее, например, кабельные муфты, некоторые фитинги; и (ii) Муфты Приводов машин и механизмов,

передающие вращательное движение и вращающий момент с одного вала на другой или с вала на свободно сидящую на нём деталь, например, шкив, зубчатое колесо. Муфты приводов выполняют и другие функции:- компенсируют монтажные отклонения, разъединяют валы, предохраняют машины от поломок в аварийных режимах и так далее. Передача момента в муфте может осуществляться с механической связью между деталями (например, глухие, зубчатые, втулочно-пальцевые, кулачковые, шарнирные муфты), за счёт сил трения или магнитного притяжения (например, фрикционные и электроиндукционные синхронные муфты), сил инерции или индукционным взаимодействием электромагнитных полей (например, гидромуфты и электроиндукционные асинхронные муфты). По характеру работы различают:- Управляемые Муфты; Самоуправляемые Муфты, или Автоматические Муфты (включаемые и выключаемые в зависимости от режима работы); муфты Скольжения (например, гидромуфты).

COUPON = КУПОН (или ОТРЕЗНОЙ ТАЛОН) – (1) Coupon is the interest rate stated on a bond when it's issued. The coupon is typically paid semiannually. This is also referred to as the 'Coupon Rate' or 'Coupon Percent Rate'. For example, a USD1 000 bond with a coupon of 7% will pay USD70 a year. It is called a 'Coupon' because some bonds literally have coupons attached to them. Holders receive interest by stripping off the coupons and redeeming them. This is less common today as more records are kept electronically. Interest voucher usually attached to bonds and exchangeable for cash on its due date (half yearly or yearly). Coupon is a certificate attached to a security, which can be detached and exchanged by its owner for an interest payment or dividend relating to the security. Coupons on bearer bonds are negotiable instruments, which are sent to the bond issuer or bank in exchange for a fixed payment to the holder. A fixed Dollar amount of interest payable per annum, stated as a percentage of principal value, usually payable in semiannual installments. Coupon is a certificate attached to a bond or share which, when detached and presented to the issuer of the security, entitles the bond or shareholder to receive the interest payment or dividend or to exercise rights. Coupon:- interest payments on a fixed-interest security (bond). A term Coupon refers to the interest paid on a bond's face value regardless of the current trading price of a stock, e.g., if the coupon is 10% and the bond's face value is CAD100, the annual interest (paid on the coupon) is CAD10. / в свою надлежащую (причитающуюся) дату. Под Купоном, от Французского слова Coupon, означающее Отрезной Талон, понимается часть ценой бумаги (акции или облигации), которая предъявляется для получения процента или дивиденда. Платёж по купонам производится эмитентом, начиная с 01 Марта 1899, за каждое полугодие по 2 Рубля 25 копеек. стрижка купонов. Купон:- процентная ставка (определённый процент от нарицательной стоимости) по долговым ценным бумагам, которую эмитент обязуется платить владельцу до наступления срока погашения ценной бумаги. Например, по облигациям с 10%-ным купоном ежегодно будет выплачиваться 10 Долларов на каждые 100 Долларов нарицательной стоимости, обычно в виде периодических (каждые шесть месяцев) выплат. Этот термин происходит от названия отрывной части сертификата на облигацию, которая даёт право владельцу сертификата на получение процентов. По мере распространения зарегистрированных облигаций (registered bonds) купоны постепенно перестают использовать.

(2) In marketing, a Coupon is a ticket or document that can be exchanged for a financial discount or rebate when purchasing a product. Customarily, coupons are issued by manufacturers of consumer packaged goods or by retailers, to be used in retail stores as a part of sales promotions. They are often widely distributed through mail, coupon envelopes, magazines, newspapers, the Internet, directly from the retailer, and mobile devices such as cell phones. Since only price conscious consumers are likely to spend the time to claim the savings, coupons function as a form of price discrimination, enabling retailers to offer a lower price only to those consumers who would otherwise go elsewhere. In addition, coupons can also be targeted selectively to regional markets in which price competition is great.

(3) In government, a Coupon is a paper certificate used to administer a benefit or permission.

COUPON BOND = КУПОННАЯ ОБЛИГАЦИЯ – Coupon Bond is a debt obligation with coupons attached that represent semiannual interest payments. Also known as a Bearer Bond. No record of the purchaser is kept by the issuer, and the purchaser's name is not printed on the certificate. Coupon Bond is a bond with interest coupons attached. The coupons are clipped as they come due and presented by the holder for payment of interest. See also Bearer Bond and Registered Bond. / Купонная Облигация:- облигации на предъявителя, выпускаемые с отрывными купонами, которые должны предъявляться эмитенту или его агенту для получения дивидендов за полгода. В настоящее время купонные облигации постепенно уступают место зарегистрированным облигациям (registered bonds), выплата дивидендов по некоторым из которых осуществляется с помощью электронного трансферта.

COUPON RATE = СТАВКА КУПОНА (или КУПОННАЯ СТАВКА) – Coupon Rate is the interest rate on a debt instrument expressed in terms of a percent on an annualized basis that the issuer guarantees to pay the holder until maturity. Coupon Rate (D):- the amount per unit nominal which when multiplied by the nominal amount of stock/security gives the interest/coupon payments per annum and it will specify how often the amount is paid, e.g., if the nominal amount of stock/security is £100 and the coupon rate is 6% (D = .06) payable half-yearly, then the fixed interest payments are £3 every 6 months (coupons). The coupon dates are the dates on the year when the interest/coupons are paid, e.g., if the coupon dates were 01 January and 01 July then £3 would be paid on each of these dates. / Процентная ставка по долговому инструменту, выраженная в качестве годового процента, который эмитент гарантирует выплатить владельцу до погашения.

COUPON SHEET = КУПОННЫЙ ЛИСТОК (или ЛИСТОК С КУПОНАМИ) – Coupon Sheet is a set of coupons normally attached to a bond or share certificate. The individual coupons are detached from the sheet at the respective due dates and entitle the owner to receive the interest or dividend upon presentation. The last of the coupons to be detached is called a Talon and qualifies the holder to obtain a new sheet of coupons. US shares are frequently issued without coupon sheets. The payment of the dividend is then mailed directly to the shareholder entered in the corporation's share register or to his bank. / в соответствующие надлежащие (причитающиеся) даты и . стрижка купонов. Тчалэн (или Талё (Talon)).

COURSE = ПЕТЕЛЬНЫЙ РЯД (или РЯД ПЕТЕЛЬ) – Course:- the rows of loops or stitches running across a knitted fabric. Corresponds to the weft or filling in woven goods. Course is the row of loops or stitches running across a knit fabric, corresponding to the filling in woven fabrics. Course:- the row of loops or stitches running across the width of a fabric corresponding to filling of a woven fabric. Course is the horizontal row of loops in knit fabric. / уточина в тканых тканях. Петельный Ряд – совокупность следующих друг за другом петель в направлении ширины полотна. Ряд Петель – петли, идущие в вязаном изделии друг за другом по горизонтали.

COURSE COUNT = ЧИСЛО ПЕТЕЛЬНЫХ РЯДОВ – Course Count:- the number of courses in a knit fabric per unit length measure. For example:- courses per inch.

COURSE LENGTH = ДЛИНА ПЕТЕЛЬНОГО РЯДА – Course Length is the amount of yarn used in forming all the knit-loops in one course of a knitted fabric. Also called Run-In.

COURSEPACKS = КУРСОВЫЕ ПОСОБИЯ (или МЕТОДИЧКИ) – Coursepacks are the copies of materials assembled by instructors to be used by students in a class, usually in lieu of or in addition to a text book. / Копии материалов, подобранных инструкторами, которые должны использоваться студентами в аудиториях, обычно вместо или в дополнение к тексту книги.

COURT DRESS = СУДЕБНОЕ ПЛАТЬЕ – Court Dress comprises the style of clothes prescribed for courts of law, and formerly for royal courts. Court dress is worn at hearings in open court in all Senior Courts of England and Wales and in county courts. However, court dress may be dispensed with at the option of the judge, e.g., in very hot weather, and invariably where it may intimidate children, e.g., in the Family Division and at the trials of minors. In the Supreme Court of the United Kingdom and in the Judicial Committee of the Privy Council counsel need not wear court dress if all advocates in a case agree on this. The judges dress in conventional business attire. Court dress is not worn at hearings in chambers and in the magistrates' courts.

COURT GUARANTEE = СУДЕБНАЯ ГАРАНТИЯ (или ГАРАНТИЯ ВОЗМЕЩЕНИЯ СУДЕБНЫХ ИЗДЕРЖЕК) – Court Guarantee given to a party involved in legal proceedings, to secure the payment of costs should these be awarded against the applicant as part of the judgement. Normally valid until a final judgement has been made and will not quote a specific expiry date. Court Guarantee:- this insurance covers the settlement of final rulings in lawsuits against Compagas. It has the same standing as a judicial bond, replacing judicial deposits in cash, attachment of assets, and bank guarantees. This performance bond is aimed at companies which, being under contract, are bound to guarantee to its customers that such contracts, as far as pricing, deadlines and other specifications, will be performed in full. Public agencies within the direct or indirect public administration may also, pursuant to Law no. 8,666/93 and to Law no. 8,883/94, receive insurance policies as guarantee from its suppliers of goods and services, contractors, and public tender participants. This type of insurance is designed to guarantee full performance of a contract. It does not cover damages but rather liabilities for breach of contract, and it is a form of contractual guarantee provided for by Brazilian law, which may replace bank guarantees, cash bonds, or government bonds. / Судебная Гарантия обеспечивает издержки процесса и сторон в ходе судебных производств, будь то в пользу судебных инстанций или сторон. Судебная Гарантия используется в качестве одной из мер по обеспечению иска в судопроизводстве. Если по требованию истца в качестве меры по обеспечению иска применён арест имущества или денежных средств ответчика, последний вправе предложить судебную гарантию как основание для отмены ареста. Судебная гарантия подлежит оплате по представлении решения суда или мирового соглашения, подтверждающего право истца на получение определённых денежных сумм с ответчика в удовлетворение своих исковых требований. Сумма гарантии, как правило, соответствует сумме иска или стоимости арестованного имущества. Вместе с тем, судебная гарантия предоставляет ответчику возможность вести обычную хозяйственную деятельность во время рассмотрения иска в суде, которое может охватывать довольно длительный период.

COURT OF AUDITORS = СУД АУДИТОРОВ – Court Of Auditors is an institution of the European Community which carries out the audit in the European Community. One of its duties is to examine the operational efficiency of the management of the European Central Bank (ECB).

COURT OF JUSTICE OF THE EUROPEAN COMMUNITIES = СУД СПРАВЕДЛИВОСТИ ЕВРОПЕЙСКИХ СООБЩЕСТВ – The Court of Justice of the European Communities (often referred to simply as 'the Court') was set up under the ECSC Treaty in 1952. It is based in Luxembourg. Its job is to make sure that EU legislation is interpreted and applied in the same way in all EU countries, so that the law is equal for everyone. It ensures, for example, that national courts do not give different rulings on the same issue. The Court also makes sure that EU member states and institutions do what the law requires. The Court has the power to settle legal disputes between EU member states, EU institutions, businesses and individuals. The Court is composed of one judge per member state, so that all 27 of the EU's national legal systems are represented. For the sake of efficiency, however, the Court rarely sits as the full court. It usually sits as a 'Grand Chamber' of just 13 judges or in chambers of five or three judges. The Court is assisted by eight 'advocates-general'. Their role is to present reasoned opinions on the cases brought before the Court. They must do so publicly and impartially. The judges and advocates-general are people whose impartiality is beyond doubt. They have the qualifications or competence needed for appointment to the highest judicial positions in their home countries. They are appointed to the Court of Justice by joint agreement between the governments of the EU member states. Each is appointed for a term of six years, which may be renewed. To help the Court of Justice cope with the large number of cases brought before it, and to offer citizens better legal protection, a 'Court of First Instance' was created in 1988. This Court (which is attached to the Court of Justice) is responsible for giving rulings on certain kinds of case, particularly actions brought by private individuals, companies and some organisations, and cases relating to competition law. This court also has one judge from each EU country. The European Union Civil Service Tribunal adjudicates in disputes between the European Union and its civil service. This tribunal is composed of seven judges and is attached to the Court of First Instance. The Court of Justice, the Court of First Instance and the Civil Service Tribunal each have a president chosen by their fellow judges to serve for a renewable term of three years. Vassilios Skouris was elected President of the Court of Justice in 2003. Marc Jaeger is the current President of the Court of First Instance. Paul J. Mahoney has been President of the Civil Service Tribunal since 2005. The Court gives rulings on cases brought before it. The five most common types of case are:- (i) references for a preliminary ruling; (ii) actions for failure to fulfil an obligation; (iii) actions for annulment; (iv) actions for failure to act; and (v) actions for damages. Court of Justice of the European Communities (CJEC), the institution ensures that the law is observed in the interpretation and application of the Treaties and of the legal acts laid down by the European institutions. / Василиос Скурис (Vassilios Skouris). Марк Йега (или Марк Жэгер (Marc Jaeger). Пол Дьжей. Махони (Paul J. Mahoney).

COUTURE HOUSE = ДОМ КУТЧИР (или ДОМ МОДЫ) – Couture House is the fashion designer house.

COVALENT BOND = КОВАЛЕНТНАЯ СВЯЗЬ – Covalent Bond is a chemical bond where a pair of electrons is are shared relatively equally between two atoms in the compound. Covalent bonds are formed between the fibers and reactive dyes. These are the strongest type of chemical bond, and are responsible for the excellent washfastness of reactive dyes.

COVARIANCE = КОВАРИАНСА (или КОВАРИАЦИЯ, или СОПРЯЖЁННОЕ ИЗМЕНЕНИЕ) – Covariance is a statistical measure used in computing the correlation coefficient between two variables; the covariance is the sum of (x-X)(y-Y) over all pairs of values for the variables x and y, where X is the mean of x values, and Y is the mean of the y values.

COVENANT = ДОГОВОР (или ХХ) – Covenant is basically a written contract in which one party promises to perform specified acts in exchange for specified performance by the other party. The seller in a warranty deed, for example, covenants five things sought by the buyer. See also Warranty Deed. Covenant is an agreement with a legal binding on the parties involved. The expression is often used in association with corporate debt, because the borrower is bound to the terms of the agreement. The expression is also used in property investment because the tenant or lessee is bound to the terms of the lease agreement. In fact the meaning of covenant has been extended in the context of property investment so that it usually refers to the quality of the tenant, e.g., a tenant with a good covenant is a good quality tenant who is unlikely to break the terms of the agreement.

COVER = ПЕРЕКРЫТИЕ (или ЗАСТИЛИСТОСТЬ (ТКАНИ), или ЗАПОЛНЕНИЕ, или XX) – Cover is:- (1) the degree of evenness of thread spacing. (2) The degree to which underlying structure is concealed by the surface material, as in carpets, the degree to which pile covers backing. (3) The ability of a dye to conceal defects in fabric. Cover is the 'full' even appearance of woven goods when the warp and filling yarns are uniformly well distributed. / основные и уточные пряжи .

(TO) COVER = ПОКРЫВАТЬ – (1) To Cover:- the purchase or sale of futures to offset a previously established position in the market. Purchasing futures to offset a short position. Also known as Short Covering. See also Liquidation and Offset. To Cover:- to sell a long position, or buy back a short position.

(2) To Cover:- to have in hand the physical commodity or other asset underlying a futures contract when a short futures position is taken. To have in hand the physical commodity when a short futures sale is made, or to acquire the commodity that might be deliverable on a short sale.

(3) To Cover:- to acquire the commodity to be delivered on a short futures position.

(4) To Cover:- to furnish security (collateral) for an unsecured debt.

(5) To Cover:- to effect insurance.

(6) To Cover:- to include within the coverage of a contract of insurance.

COVER = ПОКРЫТИЕ (или СОПРОВОЖДЕНИЕ) – Cover:- insurance or reinsurance as it applies to one or more specific risk exposures. A contract of insurance. Insurance and reinsurance protection based on a contractual agreement.

COVERAGE = (СТРАХОВОЕ) ПОКРЫТИЕ – Coverage:- the scope of protection provided under the contract of insurance. / Предел защиты, обеспечиваемой по договору или контракту страхования.

COVERAGE CAPITAL = КАПИТАЛ НА (СТРАХОВОЕ) ПОКРЫТИЕ – Coverage Capital:- the mathematically computed capital required by an insurer or pension fund to meet its future commitments.

COVERAGE PART = СТОРОНА (СТРАХОВОГО) ПОКРЫТИЯ – Coverage Part:- any one of the individual commercial coverage parts that may be attached to a commercial policy.

COVERAGE TRIGGER = ТРИГГЕР (СТРАХОВОГО) ПОКРЫТИЯ (или ТРИГГЕР СТРАХОВОЙ ЗАЩИТЫ) – Coverage Trigger is a mechanism that determines whether a policy covers a particular claim for loss. For example, the difference between the coverage triggers of liability 'occurrence' forms and 'claims made' forms is that the loss must occur during the policy period in the first case and the claim must be made during the policy period in the second case.

COVERALL = СПЕЦОВКА (или СПЕЦОДЕЖДА) – Coverall is a one-piece outer garment worn to protect other garments. Usually used in plural.

COVER BILL = КОНОСАМЕНТ ПОКРЫТИЯ – Cover Bill is a bill of lading issued by one carrier to another carrier that has arranged for cargo shut out from its own vessel to be shipped on the issuing carrier's vessel.

COVER CROP = ПОКРОВНАЯ КУЛЬТУРА – Cover Crop is a crop planted to prevent soil erosion and to provide humus.

COVERED CALL = ПОКРЫТЫЙ ОПЦИОН НА ПОКУПКУ (или ОБЕСПЕЧЕННЫЙ ОПЦИОН НА ПОКУПКУ) – Covered Call is an options strategy whereby an investor holds a long position in an asset and writes (sells) call options on that same asset in an attempt to generate increased income from the asset. This is often employed when an investor has a short-term neutral view on the asset and for this reason hold the asset long and simultaneously have a short position via the option to generate income from the option premium. This is also known as a Buy-Write. For example, let's say that you own shares of the TSJ Sports Conglomerate and like its long-term prospects as well as its share price but feel in the shorter term the stock will likely trade relatively flat, perhaps within a few dollars of its current price of, say, USD25. If you sell a call option on TSJ for USD26, you earn the premium from the option sale but cap your upside. One of three scenarios is going to play out:- (a) TSJ shares trade flat (below the USD26 strike price) – the option will expire worthless and you keep the premium from the option. In this case, by using the buy-write strategy you have successfully outperformed the stock. (b) TSJ shares fall – the option expires worthless, you keep the premium, and again you outperform the stock. (c) TSJ shares rise above USD26 – the option is exercised, and your upside is capped at USD26, plus the option premium. In this case, if the stock price goes higher than USD26, plus the premium, your buy-write strategy has underperformed the TSJ shares. Covered Call is a call contract an investor sells that is supported by shares that investor owns. For example, if you own 500 shares of Apple and sell 5 call contracts against your stock, you are giving another investor the right to buy your shares at a certain price by a certain date. Question:- How do you mitigate the risk of a large decline in the underlying stock in a Covered Call position? Answer:- The hit-and-run covered call. Covered calls or buy writes are a good way to reduce volatility in equity positions, but a big decline in the underlying stock still will scuttle a covered call position and lead to significant losses. Your loss is mitigated by the short call position, which will create gains as the option price follows the stock downward; but with a delta around .50, you still will take a hit. So, what can you do about it? For one, you can shorten the time exposure. You can sell an option that has only a few days to live. In other words, you can hit-and-run. To do that, you have to make the right choice of underlying stock and option. Stock selection:- select a stock that is at or near the bottom of its recent range. All else being equal, it will have a smaller probability of decline than a stock at or near its recent peak. Look for a stock that is sitting at or near recent lows or highs or at the edge of a price gap, as prices tend to find support at these levels. Favor lower priced stocks. Options on lower priced stocks tend to be cheaper and trade more actively, reducing the spread between the bid and ask prices. Stay away from thinly traded stocks for the same reason. Apply whatever other technical criteria you favor: Moving averages, price momentum or trend analysis. Avoid stocks that will announce earnings between now and option expiration. Betting on earnings surprises is another game. Option selection:- look for an option with a premium of USD1.50 or more. If you're going to take the risk, you might as well be paid well for it. Stay away from options with light trading volume. The spread between bid and ask prices on thinly traded options can be as much as 100% and too large to overcome. Sell the nearest expiration. The longer an option has to live, the more time the underlying stock has to tank. You want an option that is on its death bed:- 10 days to expiration is good, three days is better. Sell the strike that is at or just out-of-the-money. You're not going for a small chance at a big kill; you're after the premium. That sounds like a tall order as most out-of-the-money option prices drop to a few pennies during their last week of life. But with research you can find candidates for this trade. The first item you need is a list of 25 or so stock/call-option combinations with the highest potential returns. Many brokerage firms and options houses provide this information to their clients. A good list will show you the stock, several available option expiration months, the strikes for each month, the covered call's potential percent return and various Greek values. From these, you cull the stock/option combination that meets your criteria. It is possible to find very-short-term options with relatively low risk and good payouts to execute a hit-and-run covered call. You just have to get your hands on a compendium of high-potential stock/option combinations and do your homework. Calls are sold on the underlying currency with strikes which are higher

than the market price. The strike price limits the profit that can be realized from the position. Over the past year, the S&P 500 Index has continued its steady uptrend, reaching new all-time highs by the beginning of March. While this may be a good thing for the average investor, it has put some covered call traders in an uncomfortable position. A covered call is a market strategy that combines your stock position with a short call option position to generate additional income via the collection of the option premium. The success of covered call systems is well documented. In fact, the Chicago Board Options Exchange (CBOE®) now publishes a covered call benchmark called the Buy-Write Index (BXM), which shows that a covered call portfolio can not only outperform a standard portfolio of S&P 500 stocks, but can do so while decreasing overall market volatility. However, in markets that rise relatively quickly, the benefits of collecting the option premium may be overshadowed by the performance limits placed on your position by the short option. In quickly rising markets, a stock may run straight through your option strike, leading you to not only miss out on a potential stock move, but putting you in a position where you'll have your stock taken away, and potentially enduring some unintended tax consequences. What is a covered call? A covered call is a stock and option position constructed in the following manner:- (i) Step 1:- buy 100 shares of a stock; (ii) Step 2:- sell 1 call option with a strike price that is either equal to (at-the-money) or higher than (out-of-the-money) the current stock price. The idea is to use the premium collected from the sale of the option to enhance the market returns generated by just the stock. To illustrate, consider the following example where you buy 100 shares of XYZ stock for USD98 per share and you sell the 100-strike call at a price of USD3.50. Then, the graph of your P&L would look much like the image below:- XXXX. The red line shows your long stock position, while the blue line shows the combined stock and option position. The breakeven level on a covered call position is defined as the strike price plus the option premium, meaning that until the stock reaches a value of USD103.50, the covered call outperforms simple long stock. The problem arises when the stock rises above USD103.50 per share. Now, the sale of the call merely limits the performance of your portfolio. Furthermore, if the stock remains above USD100 on the expiration date of your option, you will be forced to sell off your stock at the stock price at the strike price. One way to avoid this consequence is to move the call so that it's no longer in the money. The process is referred to as 'Rolling' The Call. In essence, what you do is you buy back your short call option and sell a new call with a strike price that is higher than where the stock is trading. Suppose that when you initially bought Goldman Sachs (GS) stock, the stock was trading at USD145 per share. At the time, selling the 150-strike calls to obtain some extra premium seemed like a good idea. However, now, with the stock at USD153, your 150-strike calls are in-the-money. If the stock remains there until expiration, or if it drifts higher, you run the risk of having your stock called away. To obtain some peace of mind, you decide to roll your calls from the 150 strike, which is now in-the-money, to the 155 strike, which is out-of-the-money. To execute the roll, you would:- (i) Step 1:- buy back the March 150-strike calls for USD3.80 to close; and (ii) Step 2:- sell the March 155-strike calls at USD0.99 to open. The result is you would still have a covered call position, but would have accomplished two things in the roll process. First, you would have moved your short call position enough so that your call strike is now out-of-the-money, thereby minimizing the risk of having your stock called away. Second, you would have increased your breakeven level from 153.80 to 155.99. The downside to this process is that to achieve these benefits, you would have paid out a debit of USD2.81, or USD281 per contract, to roll your position. This decision could come back to haunt you if the stock then decides to move lower, possibly below USD150 per share. Solution:- roll the call up and out. Rolling your covered call up in strikes and out in time accomplishes the same thing as the previous technique, except that you get more time in the covered call position and it opens the possibility to roll the calls for a credit rather than a debit. Using this option chain, you can perform the same rolling technique as before, except that in addition to moving up in strikes, you also move out in time. The advantage is that you may no longer have to roll your short call for a debit. For example, if you wanted to roll form the 150-strike call in March to the 155-strike call in April, you would:- (i) Step 1:- buy back the March 150-strike calls for USD3.80 to close; and (ii) Step 2:- sell the April 155-strike calls at USD3.80 to open. By following the aforementioned steps, you not only would have successfully rolled your position from an in-the-money strike to an out-of-the-money one, but you also would have increased your breakeven level from USD153.80 to USD158.80, and for no additional cost. Now what if you thought GS was poised to move even higher? You could roll your covered call position even further out in time. For example, if you wanted to roll from the 150-strike call in March to the 160-strike call in July, you would:- (i) Step 1:- buy back the March 150-strike calls for USD3.80 to close; and (ii) Step 2:- sell the July 160-strike calls at USD5.15 to open. With this roll, you would have moved your short call position even further out-of-the-money, you would have increased your breakeven level from USD153.80 to USD165.15 and you would have collected a credit of USD1.35, or USD135 per contract. The covered call is a very popular strategy among money managers, and for good reason:- It has been shown not only to be able to enhance standard market returns, but to do so potentially with less portfolio variance. In strong markets, as your stocks continue to outperform the limits set by your covered calls, you may just want to allow the stock to run uncovered. Of course, if you decide to keep the covered call position, then knowing how to roll your calls can give your portfolio some much-needed breathing room. Furthermore, rolling up and out can give you breathing room without having to shell out extra money. Covered Call:- selling a call option while holding an equivalent in the underlying tradable. / СИБО® (CBOE®). Индекс от Эс.ЭндПи. 500 (S&P 500 Index). Ти.Эс.Джей. Спотс Кэнгламирэт (TSJ Sports Conglomerate). Бай-Райт Индэкс (Би.Экс.Эм.) (Buy-Write Index (BXM)). Голдмэн Сэкс (Goldman Sachs). Опционы на покупку соответствующей валюты продаются по сходным ценам, которые превышают рыночную цену. Сходная цена ограничивает уровень прибыли, которая могла бы быть получена в случае реализации данной позиции.

COVERED CALL WRITING = ВЫПИСКА ПОКРЫТОГО ОПЦИОНА НА ПОКУПКУ (или ВЫПИСКА ОБЕСПЕЧЕННОГО ОПЦИОНА НА ПОКУПКУ) – Covered Call Writing is a strategy of writing call options against a long position in the underlying asset. A covered put write being based on a short position in the asset. Covered Call Writing can provide steady returns and, more importantly, define your risk and reward, allowing you to maintain opportunity. For many, even experienced traders, the markets can be a source of great uncertainty and anxiety. Day to day, markets offer a wide variety of unknowns, from how long a trade will take, to its potential risk and reward. Not knowing can be tortuous mentally for traders, and this only is made worse in times of high volatility. While accepting that uncertainty and risk are part of the game, this doesn't provide much comfort, exacerbating the challenge of trading itself. This can lead to further mistakes in judgment and poor decision-making. Taking losses in stride soon goes out the window. Losing trades begin to snowball as you try to win back what you lost. For beginning traders with limited experience and low capital, this can be an even more frustrating and defeating experience. Beginners bravely attempt to succeed but lack planning on how to deal with not knowing where profits are being generated. This is made worse if traders are not capitalized well enough to sustain themselves through the learning curve. However, if you could know in advance how much money you were going to make and how long the trade was going to take, then you could eliminate the two biggest causes of anxiety and failure for a trader. A Winning Model:- writing covered calls has grown in popularity in recent years because of its potential to provide safe and steady returns, but many traders have an incomplete understanding of how to apply this approach in real-time. Covered call writing is simple. A call option gives the buyer the right, but not the obligation, to purchase the underlying stock at a specified price (the strike price). The seller, on the other hand, is obligated to sell the underlying stock at the strike price. Some call writers sell (or write) calls against stocks that they don't own. Covered call writers write calls against stocks that they have in their portfolios, or add to their portfolios concurrent to the writing of the option. One of the biggest benefits of covered call writing is that there is limited risk because the collected premium lowers the seller's overall cost per share. The technique also allows the sellers to calculate the profit potential in advance, as well as how long the trade is going to last before they can bank any profits. If used correctly, covered call writing can give you a steady, consistent revenue stream to enhance

your equity trading profits as well as provide a steady income. There are two challenges to proper covered call writing:- Appropriate stock selection and strategy approach. If you buy a stock that is on the decline, you're now in the awkward position of holding something that is losing value. Also, you have to find a stock whose options chain offers a high enough premium to be worth your risk, and then you must decide which option to sell and when to initiate that phase of the strategy. Complicating matters, what do you do if your position is called away? Do you repurchase the stock again? Or, if you're not called away, what do you do when the short option expires? These are questions that you need to have answered before you embark on this, or any, strategy. First, you need to have or plan to purchase 500 to 1 000 shares of an underlying stock. Generally, because of commissions, it won't be worth your while to attempt this strategy with smaller holdings, although technically it would be possible. Whatever your holdings, you will need 100 shares for each option you wish to write. You also will need a strategy to select stocks that have good price movement, to determine where to take a position in that stock's trend, to estimate where to sell the call option within the trend and to decide which call option to sell. If you have these factors in place, then the following benefits can emerge:- (i) solid investment vehicle for medium to long-term portfolios; (ii) potential returns of 5–20% every month; (iii) less risk than trading outrights; (iv) ability to lock in gains at the beginning; (v) knowing how much you potentially can make in advance; and (vi) knowing how much time the trade is going to take. The Method:- Selling In An Uptrend:- for example, EJ (E-House China Holdings Limited ADR) offered a low-risk pullback entry at around USD10.50 near the end of November 2013. As price moved up, the Williams %R indicator showed divergence, an oversold condition. The December 14 calls were priced around USD50, which would yield a 4.80% return through expiration on December 20. If the stock is called, then the yield could be as high as 33.33% (USD50 in premium collected + USD350 in capital gain / USD1 050 in stock = 33.33%). As mentioned, successful covered call writing is dependent on good stock selection and strategy approach. The method described here bridges this gap:- (i) stocks must be USD20 or less and have higher-than-average call option premiums; (ii) sell slightly out-of-the-money (OTM) call options with less than 30 days until expiration; (iii) the 50-day simple moving average (SMA) must be pointing upward or traveling in an upward trend; (iv) the 20-day SMA must be trading above the 50-day SMA; (v) price action must be trading above the 50-day SMA; (vi) the oscillator indicator Williams %R (14) must dip below the –80 mark to set up a possible signal; (vii) entry is triggered when Williams %R (14) rises up through the –80 level; (viii) set your stop under the price bar immediately preceding the entry bar at the lowest intraday pivot low; and (ix) entry confirmation is signaled when the fast EMA crosses the slow EMA (9), as indicated by moving average convergence-divergence (MACD (12, 26)). The 20- and 50-day SMA are used as a filter to identify periods that are ripe for long positions. This is why, for a bullish setup, price must be trading above the 50-day SMA. The Williams %R is a leading indicator that is used to signal a long entry into the trend when price pulls back, resulting in the indicator dipping under the –80 level.Entry is made on short-term strength. You enter on the close of the price bar after the Williams %R signals momentum has resumed into the dominant trend. Then, we confirm the entry by the MACD. The MACD is a lagging indicator. The MACD confirmation is not essential, but acts as a secondary signal to confirm the trade. Sell the OTM call option with less than three weeks until expiration when either the Williams %R or MACD begins to diverge or decline. This accomplishes two things. One, it shows that a top is occurring and allows you to sell the option as high as possible. Two, selling an OTM call option with less than three weeks left until expiry puts time decay on your side and quickly devalues the call option you sold, shortening your hold time on the covered call position until you can bank profits. For this particular approach to covered call writing, you want to avoid paying additional brokerage fees that would come from having to sell your position if the option went in-the-money and your stocks were called away. Insurance:- longevity as a trader is synonymous with controlling risk. Your ability to play defense and protect yourself from taking any loss while protecting gains is going to serve as the cornerstone to your success. For the risk-conscious who are worried about the stock tanking or a Black Swan event, you can protect yourself by buying a put option for insurance. Once you sell the call option, you can use part of the premium you collected to buy a put option with a strike price near your initial entry. If the unexpected happens, and the stock falls apart, the put will protect you from a severe loss. As with any strategy the goal is to be mindful of the downside. In trading, there always will be unknowns to deal with and the anxieties that come with them, but covered call writing lets you transfer some of that risk onto someone else. As with any strategy, the goal is to be mindful of the downside. With practice, it will help you achieve predictable profitability while minimizing risk of loss. To grant, or write, a call option while holding or having a long position in the underlying security, commodity, currency, index or futures contract. Covered Call Writing is considered to be a very conservative investment strategy. You buy stock and sell someone the right to buy it from you some days in the future (at expiration day). Let's look at an example with the stock of XYZ:- XYZ is trading at USD17. You sell someone the right to purchase your XYZ stock for USD17.50 for the next few days (until expiration day) for a premium of USD2. Technically this means, that you're selling a call (a purchase option for usually 100 shares) with a strike of 17.50 and a premium of USD2. Let's do the math:- Open Position (Order – Cashflow):- (i) Buy 500 shares of XYZ for USD17 – –USD8 500; and (ii) Sell 5 call contracts (each for 100 shares) of XYZ at USD17.50 for USD2 – +USD1 000. So your initial investment is USD7 500 (USD8 500 – USD1 000). Now let's look what happens at expiration day:- (1) Scenario A (Stock Unchanged):- the stock remains unchanged at USD17. The calls you sold expire worthless, because why should somebody buy the for USD17.50 from you when he can buy at the market for just USD17? Position (Order – Cashflow):- (i) You bought the 500 shares of XYZ for USD17 – –USD8 500; (ii) You keep the premium of 500 * USD2 – +USD1 000; and (iii) You sell 500 shares of XYZ for USD17 – +USD8 500. You have made a return of USD1 000 withouth the stock moving a single tick! That's a return of 13.3% for just some days holding stock of XYZ. But things get even better when we look at Scenario B... (2) Scenario B (Stock Up):- the stock of XYZ has moved to USD18 at expiration day. You're being 'called' from the owner of the options you sold:- you have to sell your XYZ stock to him for USD17.50 (the strike of the option you sold). Again, let's look at the return:- Position (Order – Cashflow):- (i) You bought the 500 shares of XYZ for USD17 – –USD8 500; (ii) You keep the premium of 500 * USD2 – +USD1 000; and (iii) You sell 500 shares of XYZ for USD17.50 – +USD8 750. This results in a profit of USD1 250 or 16.7%. But what if the stock price drops? (3) Scenario C (Stock Down):- the shares of XYZ are dropping to USD16. What's your result at expiration? Position (Order – Cashflow):- (i) You bought the 500 shares of XYZ for USD17 – –USD8 500; (ii) You keep the premium of 500 * USD2 – +USD1 000; and (iii) You sell 500 shares of XYZ for USD16 (the option expires worthless) – +USD8 000. Adding up these figures we see a profit of USD500, although the stock price dropped! Actually, we're making profit as long as the stock remains above USD15! / И-Хаус Чайна Холдиньгз Лимитид (E-House China Holdings Limited). %C Вилъйэмза (Williams %R). Предоставление или выписывание опциона на покупку с одновременным удержанием или наличием позиции на покупку соответствующей ценной бумаги, сырья, валюты, индекса или фьючерсного контракта. Выписка Покрытого Опциона На Покупку – опционная стратегия, которая заключается в открытии длинной позиции в базисных активах в сочетании с продажей опциона на покупку против этой позиции. Обеспечивает защиту от падения стоимости активов в пределах уровня безубыточности, который рассчитывается путём вычитания премии за опцион из цены актива в основе опциона на момент сделки. Максимальная прибыль реализуется, когда цена актива в основе опциона поднимается выше сходной цены; складывается из опционной премии и прибыли, получаемой за счёт длинной позиции в базисных активах. Стратегия эффективна на растущем или нейтральном рынке. Смотрите также Выписывание Непокрытого Опциона На Покупку (Uncovered Call Writing).

COVERED OPTION = ПОКРЫТЫЙ ОПЦИОН (или ОБЕСПЕЧЕННЫЙ ОПЦИОН) – Covered Option is a short call or put option position that is covered by the sale or purchase of the underlying futures contract or other underlying instrument. For example, in the case of options on futures contracts, a covered call is a short call position combined with a long futures position. A covered put is a

short put position combined with a short futures position. An option position that is offset by an equal and opposite position in the underlying asset. Covered Option is a covered call option is one where the writer owns the underlying asset on which the option is written. A covered put option is one where the writer sells the option while holding cash. Covered Option is an option contract backed by the shares underlying the option. The two types are covered call and covered put. Covered Option:- when you sell call options on stock that you own, they are covered options. That means if the option holder exercises the option, you can deliver your stock to meet your obligation if you are assigned to complete the transaction. Similarly, if you sell put options on stock and have enough cash on hand make the required purchase if the option holder exercises, the options are covered. Covered puts are also known as Cash-Secured Puts. One appeal of selling a covered call is that you collect the premium but don't risk potentially large losses. Otherwise, you may have to buy the stock at a higher market price in order to meet your obligation to deliver stock at the strike price if the option is exercised. The downside is that if your stock is called away from you, you'll no longer be in a position to profit from any potential dividends or increases in price. Covered Option is an option position that is offset by an equal and opposite position in the underlying security. Antithesis of naked option. Covered Option is a situation in which an investor writes an option while holding an equal and opposite position on the underlying asset. A covered call option occurs when the investor owns the underlying asset and writes a call so that the underlying is on hand to sell to the option holder if the option is exercised. A covered put option occurs when the investor writes a put and has enough cash to cover the strike if the put is exercised. It is thought that utilizing covered options is a beneficial tactic, as the investor may profit from the option premium. / Покрытый Опцион или Обеспеченный Опцион – опционный контракт, обеспеченный акциями, на которые заключён опцион. Например, если некто, имеющий 300 акций XYZ, продаёт три опциона на покупку акций XYZ, его позиция называется обеспеченным опционом. Если цена на акции XYZ растёт и опцион реализуется, то это означает, что инвестор владеет акциями, которые он должен доставить покупателю. Продажа опционов на покупку приносит премию, которую платит покупатель. Смотрите также Naked Option.

COVERED SMUT = ПОКРЫТАЯ ГОЛОВНЯ (или ПОКРЫВАЮЩАЯ ГОЛОВНЯ) – Covered Smut is a disease affecting cereal grain crops. / Покрывающая Головня (Closed Smut) – возбудитель Гриб Ustilago Kolleri. Твёрдая Головня (Covered Smut) – возбудители Грибы Ustilago Hordei и Ustilago Levis. Под Головнёй понимается болезнь Растений, вызываемая головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

COVERED WARRANT = ПОКРЫТЫЙ ВАРРАНТ (или ОБЕСПЕЧЕННЫЙ ВАРРАНТ) – The meaning of the term Covered Warrant has changed over the years. When the warrants market came into being, and this is still the case today, covered warrants were equities warrants embodying the right to the physical purchase of shares which, during the lifetime of the warrant, were held in a separate cover stock by the warrants issuer, who was not at the same time the issuer of the underlying shares. In more recent times, the cover stock as an instrument has been dispensed with to an increasing extent. Instead, issuers ensure with the help of other financial transactions that warrant holders' delivery rights are fulfilled when the option right is exercised. Over and above that, the term covered warrants also includes warrants for which cash settlement is possible instead of physical delivery. A warrant is said to be covered if the warrant issuer places the underlying securities of a warrant in a trust or other custodial arrangement. See also Fully Covered Warrant. Covered Warrant is a type of warrant that allows the holder to buy or sell a specific amount of equities, currency or other financial instruments from the issuer, usually a bank or a similar financial institution, at a specific price and time. The main differences between normal warrants and covered warrants are:- (i) Covered Warrants can have a wide variety of underlying financial products. Normal warrants only have a company's stock as their underlying financial product. (ii) Covered Warrants are only issued by financial institutions. Normal warrants are only issued by the company that issued the underlying equity. (iii) Covered Warrants can have a variety of exercise prices depending on the conditions set forth by each issue. Normal warrants generally have only one exercise price. (iv) Covered Warrants allow the warrant holder to buy or sell the underlying asset. Normal warrants allow the warrant holder only to buy the underlying equity.

COVERED WRITING = ПОКРЫТАЯ ВЫПИСКА (или ОБЕСПЕЧЕННАЯ ВЫПИСКА) – Covered Writing, also known as a Buy Write, is often touted as a safe way to generate extra income from a stock portfolio, and the Short Covered Call is often an investor's first introduction to trading options. It follows naturally from the simple purchase of stock. It is relatively easy to explain and results in immediate income. And finally, it seems to be just as safe as simply investing in stock. While speculative call buyers usually hold their position for only a short time, the covered call writer often expects to hold his position to expiration. If the option is out-of-the-money at that time, it expires worthless. If the option is in-the-money at expiration, the investor may decide to buy the option back to close the position and keep his stock, or he can do nothing and see his stock 'Called Away'. Some investors keep their stock and sell covered calls repeatedly after each expiration, thus continually adding to their income. A real plus is that covered writers make money during periods when their stock holdings go nowhere. And the income that can be generated can be impressive. Upwards of 20% annual returns are possible. But that kind of return is possible only if the stock goes up or remains at around the same price. When someone says they don't trade options because they're too risky, the covered call is usually cited as an example of using options to reduce risk. And it's true. The sale of call options against existing stock holdings does reduce the overall variance of returns, thus reducing risk in the traditional sense. However, if you take the time to study this strategy and its risk curve, it can in fact be a risky way to invest. The risk curve for this trade looks like, and in fact is exactly the same shape, as the risk curve that results from simply selling a naked put. While covered writing is attractive because of the extra income it generates, it also has a major shortcoming. The covered writer has the same downside risk as he did when he just owned the stock. At the same time, his upside potential is now limited. The basic strategy is that a trader sells (shorts) a near-term at-the-money (ATM) or slightly out-of-the-money (OTM) call, and then 'covers' the short position by going long (purchasing or already owning) 100 shares of the stock for each call sold. In other words, for every 100 shares of stock you own, you can sell one call against it. Option sellers are said to be 'writing' options, because they originate the contract (although nobody ever sees actual paper contracts). When you write a call, the credit received for the option you have sold goes immediately into your trading account. The hope is that the stock will move in a sideways or slightly downward pattern during the life of the option, and the call will eventually expire worthless. When this happens, you still have the stock (which otherwise would have made little profit during this time) and you keep the premium for the call sold. You can then sell another call in the next expiration month and collect even more premium. The key thing to remember is that when you sell calls against your stock holdings, you are giving someone the option to buy your stock from you any time during the life of the option for a stated price – the strike price – of the option. In return for giving up gains above the strike price, you receive cash for the options sold. So what happens if the stock does goes up? In that case, the short call will be exercised by the owner and your broker will 'assign' your stock (sell it to the holder of the option) for the strike price of the call you sold. This is not necessarily a bad thing, since it means that you sell the stock for a little bit more than you paid for it, plus you get to keep the premium from the option you sold. So what could possibly go wrong? Well, what we haven't looked at is what happens if the stock goes up or down a lot in a short time. If the stock price quickly increases, even doubles in price, your profit is limited (to the strike price of the option you sold, minus what you paid for the stock, plus the premium received for the short call). The main reason to buy a stock is that you expect it to increase in value. But with the covered call, your gains are limited by the option you have sold. In this case your decision to buy the stock was correct, yet you will profit very little from it. And what if the

stock price falls dramatically? Your calls really do nothing to protect you against losses as the market falls. Sure, you get to keep the premium from selling the call (when it expires worthless), but you still own the stock, which is now worth considerably less than what you paid for it. The problem then becomes that you will not be able to sell another call at the original strike price. Instead, the next time you will have to sell the call at a lower strike price. If the stock then moves back to its original price, you will be assigned on the short call at the lower strike, locking in a significant loss. If the stock continues to drop, you will end up worse than if you simply accepted your loss after the first month and moved on. This is the main 'knock' on covered writing – that it takes away your upside profit potential but leaves you with the same downside risk as a regular stockholder. While that's true in theory, experienced traders will keep some of their upside potential through careful position management. How? By rolling. After a stock moves up, they re-purchase the short calls (at a loss) and sell new calls at a higher strike. This strategy allows you to stay in an up-trending stock. Note that this also means that capital gains (from sale of the stock) are deferred, while the loss from the short calls can be claimed immediately. An upside down version of covered writing is the Short Covered Put. This strategy is so seldom used or discussed that the term 'covered write' is universally understood to mean buying stock and selling calls. But shorting the stock and selling put(s) is technically also a covered write. The covered put writer gives up control over his short stock position for a limited time in return for income from the sale of the put. One important thing that experienced option traders do when writing covered options is to sell only when options are expensive (as measured by their implied volatility). Option prices fluctuate between periods when they are cheap or expensive. If you focus on selling when options are expensive, it makes a big difference! You can use historical volatility charts, available in all the best options trading software, to help you know when a stock's options are cheap or dear on a historical basis. Covered Writing is the sale of an option against an existing position in the underlying futures contract. For example, short call and long futures. / Продажа опциона в противовес существующей позиции по соответствующему фьючерсному контракту. Например, продажа опциона на покупку при купленном фьючерсе.

COVERED YARN = ПОКРЫТАЯ ПРЯЖА – Covered Yarn (single or double) is the yarn with filament (elastane, other elastic or inelastic) core covered by one or more relatively inelastic cover yarns continuously wrapped around the core in one or opposite directions.

COVER FACTOR = ФАКТОР ПОКРЫТИЯ (или КОЭФФИЦИЕНТ ЗАПОЛНЕНИЯ (ТКАНИ)) – Cover Factor:- the fraction of the surface area that is covered by yarns assuming round yarn shape. An areal ratio of projected fabric surface area to nominal surface area.

COVERHOLDER = ДЕРЖАТЕЛЬ КОВЁРА (или ВЛАДЕЛЕЦ КОВЁРА) – Coverholder is a company or partnership authorized by a managing agent to enter into a contract or contracts of insurance to be underwritten by the members of a syndicate managed by it, in accordance with the terms of a binding authority. Coverholder is a firm either in the United Kingdom or overseas that is authorised by a managing agent under the terms of a binding authority to enter into contracts of insurance to be underwritten by members of a syndicate managed by the managing agent. A Lloyd's broker may act as a coverholder. / брокер у Лойда (Lloyd's broker).

COVERING = ПРИКРЫТИЕ – Covering:- purchase of an opposite futures or paper contract to offset a previously established sale (short position) or purchase (long position).

COVERING LOAN = ПОКРЫВАЮЩИЙ ЗАЁМ (или ПОКРЫВАЮЩАЯ ССУДА) – In Germany, Covering Loan:- collateral backing is required by law for certain types of covered bonds (Pfandbriefe). Mortgage loans, known as Covering Loans, typically serve as collateral. It is mandatory that the total amount of the covering loan at all times be at least as high, and yield the same interest income, as the total amount of the issued Pfandbriefe (principle of equilibrium). Local authority bonds are covered by local authority loans, i.e. bank claims on public-law entities and corporations. / Фандбрифэ (Pfandbriefe).

COVERING PURCHASE = ПРИОБРЕТЕНИЕ ПОКРЫТИЯ (или ПРИОБРЕТЕНИЕ ОБЕСПЕЧЕНИЯ) – Covering Purchase is a purchase of securities in order to be able to deliver stocks sold short, i.e. close the position. / , то есть .

COVERING TRANSACTION = ТРАНЗАКЦИЯ ПО ПОКРЫТИЮ (или ОПЕРАЦИЯ ПО ПРИКРЫТИЮ) – (1) Covering Transaction is a purchase or sale of an opposite futures or paper contract to offset a previously established sale (short position) or purchase (long position) accordingly. Transaction to cover stock market obligations incurred.

(2) Covering Transaction:- forcible settlement of a stock market transaction if the other party fails to meet its obligations.

COVER NOTE = КОВЁР НОУТ (или ВРЕМЕННОЕ СВИДЕТЕЛЬСТВО О СТРАХОВАНИИ, или СТРАХОВОЙ СЕРТИФИКАТ, или СПРАВКА О ПОКРЫТИИ) – Cover Note is a document issued by the insurer or agent confirming details of the insurance cover placed. In motor insurance, a cover note acts as a temporary certificate of insurance and policy. See also Certificate Of Motor Insurance. Insurance document evidencing that insurance cover for a consignment has been taken out, but not giving full details. Cover Note is a document issued by a broker pending the issue of a policy which confirms the arrangement of cover for the named insured/reassured. Motor insurance cover notes that are issued in the United Kingdom (which incorporate a certificate of insurance) are usually of short duration. An interim document evidencing the grant of insurance cover. See also Binder. Cover Note is a temporary certificate confirming that an insurance policy is in force. Used in motor insurance for taxation/registration purposes and in some other contexts such as life assurance to confirm that cover is effective on a temporary basis while further information is being gathered. A document issued by an insurance company giving temporary insurance until a formal policy is issued. Cover Note is a document confirming that recently-purchased insurance is in force. Used if a claim should be necessary before the full contract arrives. / Ковернот – документ, выдаваемый брокером страхователю в подтверждение того, что договор страхования по его поручению заключён.

COVER RATIO = СООТНОШЕНИЕ С ПОКРЫТИЕМ – Coverage Ratio is a measure of a company's ability to meet its financial obligations. In broad terms, the higher the coverage ratio, the better the ability of the enterprise to fulfill its obligations to its lenders. The trend of coverage ratios over time is also studied by analysts and investors to ascertain the change in a company's financial position. Common coverage ratios include the interest coverage ratio, debt service coverage ratio and the asset coverage ratio. While comparison of coverage ratios of companies in the same industry or sector will provide valuable insights into their relative financial positions, comparing ratios across companies in different sectors will not prove as useful, since it may be tantamount to comparing apples and oranges. For example, the interest coverage ratio measures the ability of a company to pay the interest expense on its debt. An energy producer may have an interest coverage ratio of 5, while a utility may have a coverage ratio of 4. This does not automatically imply that the energy producer is more solvent than the utility, since the energy producer may have greater volatility in its earnings and cash flows than the utility, due to fluctuations in oil and gas prices. As well, if the energy company's peers have an average interest coverage ratio of 7, while the utility's peers have an average coverage ratio of 3, the utility may actually be in better shape than the energy producer, especially in relation to their respective peers. Cover Ratio:- in Switzerland, this expression refers to the relation of capital funds to total liabilities as stipulated by the banking law.

COVERSTOCK = XX – Coverstock is a lightweight nonwoven material used to contain and conceal an underlying core material. Examples are the facing materials that cover the absorbent cores of diapers, sanitary napkins, and adult incontinence products. / легковесный нетканый материал, используемый для .

COVERT = КОВЭР (или КАВЁТ, или ПАЛЬТОВАЯ (ТКАНЬ)) – Covert is a mediumweight to heavyweight wool or wool blend cloth woven with a steep twill from two or more shades of yarn-dyed fibers to produce a mottled or melange effect. Covert is a firm durable twilled sometimes waterproofed cloth usually of mixed-color yarns. Woolen or worsted, also cotton and spun rayon. Twill weave. Made with two shades of color, e.g., medium and light brown. The warp is 2 ply (1 light; 1 dark) and filling 1 ply (dark or same as warp). Very rugged and closely woven. Has a mottled or speckled effect. First used as a hunting fabric. Has a clear finish and hard texture. Wears exceptionally well and has a smart appearance. Light in weight. / Под Ковэром, от Французского слова Covert, . уточина.

COVER–UP = XX (или ПОКРЫВАЛО, или НАКИДКА) – Cover-Up is a loose outer garment.

COVID–19 = КОВИБ–19 (или КОВИД–19) – COVID-19 (short for the Coronavirus Disease – 2019) is the infectious disease caused by the most recently discovered Coronavirus. This new Virus and disease were unknown before the outbreak officially began in Wuhan, China, in December 2019. COVID-19 is now a pandemic affecting many countries globally. / Коронавирусная Болезнь – 2019.

COWBOY BOOT = КОВВОЙСКИЙ БОТИНОК – Cowboy Boot is a boot made with a high arch, a high Cuban heel, and usually fancy stitching. / heel = каблук или пятка.

COWBOY HAT = КОВВОЙСКАЯ ШЛЯПА – Cowboy Hat is a wide-brimmed hat with a large soft crown. Also called Ten-Gallon Hat.

COWL = РЯСА (или СУТАНА С КАПЮШОНОМ, или XX) – Cowl:- a hood or long hooded cloak especially of a monk.

COWOVEN FABRIC = СОВМЕСТНО ТКАНАЯ ТКАНЬ – Cowoven Fabric:- in aerospace textiles, a fabric in which a reinforcing fiber and a matrix fiber are adjacent to each other as one end in the warp and/or filling direction. / и/или в направлении уточины.

COXCOMB = КАКСКОУМ (или ФАНФАРОН, или ФАТ, или ХЛЫЩ) – Coxcomb:- (obsolete) a jester's cap adorned with a strip of red.

COX FUNNEL = ВОРОНКА КОКСА – A Cox Funnel is used in determining test weight in conjunction with the 0.5-liter measure to control the flow of grain into the measure. Cox Funnel is a funnel with a 3.81 cm opening and a drop of 4.41 cm, from the opening in the funnel to the top of the measure used to uniformly direct the flow of grain into the 0.5 liter cup.

COX–ROSS–RUBINSTEIN OPTION PRICING MODEL = МОДЕЛЬ ЦЕНООБРАЗОВАНИЯ ОПЦИОНА ПО МЕТОДУ КОКСА–РОССА–РУБИНШТАЙНА – Cox, Ross, & Rubinstein Option-Pricing Model is a mathematical formula for estimating the value of an American option (exercisable at any time up to the expiration date). Used in determining if the early exercise of the option is advisable, it (unlike the Black-Scholes option pricing model) assumes that the price of the underlying asset follows binomial distribution. It divides the time to expiration into a certain number of intervals over which the price of the underlying contract is allowed to move up or down according to a specified probability. Invented in 1979 by the US mathematicians John Cox, Stephen Ross, and Mark Rubinstein. Cox-Ross-Rubinstein Option Pricing Model is an option pricing model developed by John Cox, Stephen Ross, and Mark Rubinstein that can be adopted to include effects not included in the Black-Scholes Model, e.g., early exercise and price supports. / Дьжон Кокс (John Cox), Стивин Росс (Stephen Ross), и Марк Рубинштайн (Mark Rubinstein). Модель Блэка-Сколза (Black-Scholes Model), например, .

КАРНЭ (или КНИЖКА ДТ) – CPD Carnet (short for the French term Carnet de Passages en Douane):- an international Customs document which incorporates an internationally valid guarantee and may be used, in lieu of national Customs documents and as security for import duties and taxes, to cover the temporary admission of means of transport. It may be accepted for controlling the temporary exportation and reimportation of means of transport but, in this case, the international guarantee does not

apply. The CPD carnet is issued under the terms of the Istanbul Convention, the Customs Convention on the temporary importation of private road vehicles, the Customs Convention on the temporary importation of commercial road vehicles and the Customs Convention on the temporary importation for private use of aircraft and pleasure boats. This term is also used when referring to any pat of the Customs Service or its main or subsidiary offices. This term is also used adjectivally in connection with officials of the Customs, import or export duties or controls on goods, or any other matter within the purview of the Customs (Customs officer, Customs duties, Customs office, Customs declaration). CPD Carnet is a document facilitating transit and temporary importation of means of transport by serving both as a customs declaration and authorisation as well as guarantee in countries that are a contracting party to the Istanbul Convention. See also Carnet De Passages En Douane. / привоз (importation). вывоз (exportation). Смотрите также Карнэ Дё Пассаж Ан Дуан или Книжка Допусков В Таможне (Carnet de Passages en Douane).

CRABBING = ЗАВАРКА (или ОПЕРАЦИЯ ЗАВАРКИ ТКАНЕЙ ИЗ ГРЕБЕННОЙ ШЕРСТИ) – Crabbing is a term used in the textile industry. Crabbing sets the cloth and yarn twist by rotating the fabric over cylinders through a hot-water bath, or through a series of progressively hotter baths, followed by a cold-water bath. Crabbing is done to stabilize the fabric before dyeing and finishing and is necessary only for worsted fabrics. Crabbing is a treatment used to set the cloth and yarn twists permanently in woolens and worsted goods. Crabbing is the process of heating wool or hair fabrics, under tension, in a hot or boiling liquid, then cooling under tension, to provide the fabric with dimensional stability for further wet processing.

CRACK = КРЕКИРОВАНИЕ – Crack:- in energy futures, the simultaneous purchase of crude oil futures and the sale of petroleum product futures to establish a refining margin. Any of a number of differentials which indicate relative refining profitability. The Heat Crack is the difference between the value of heating oil and the price of crude, and the Gas Crack is the difference between gasoline value and crude price. / для установления допуска на перегонку (очистку). печное бытовое топливо (heating oil) .

CRACK = ТРЕЩИНА (или НЕДОСЕКА, или НЕРОВНЫЙ БОЙ, или РАССЕЧКА) – Crack:- a narrow streak running parallel to the warp threads, characterized by the existence of a marked space between two adjacent threads. This defect is often caused by an imperfect reed, or a worn or maladjusted temple. / Под Рассечкой понимается распространённый порок в виде раздвинутых нитей основы из-за нарушения плотности зубьев бёрда. Рассечка (Crack):- порок основы в виде полосы во всю длину ткани из-за пониженной её плотности по основе. Примечание:- этот порок часто вызывается несовершенным бёрдом или не отрегулированной шпаруткой. Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 сантиметре (см). Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дециметр (дм) ткани, причина разладка основного регулятора или товарного механизма. Недосечка – поперечные полосы по всей ширине ткани, возникающие из-за пониженной плотности ткани по утку.

CRACKED BOLL = ТРЕСНУВШАЯ КОРОБОЧКА – Cracked Boll:- First visual sign of boll opening, when the carpel walls separate along sutures.

CRACKED RESIDUE = ГУДРОН (или КРЕКИРОВАННЫЙ (НЕФТЯНОЙ) ОСТАТОК) – Cracked Residue is the residue of fuel resulting from decomposition of hydrocarbons during thermal or catalytic cracking. See also Residue. Steam-Cracked Light Residue is a complex residuum from the distillation of the products from a steam-cracking process. It consists predominantly of aromatic and unsaturated hydrocarbons having carbon numbers greater than C7 and boiling in the range of approximately 101 °C to 555 °C (214 °F to 1 030 °F). The heavy residual liquid from cracking operations is called Cracked Residue. Cracked Residues are the residues of

streams derived from cracking processes. Also known as Carbon Black Oil. / Под Гудроном, от Французского слова Goudron, понимается чёрная смолистая масса, получающаяся после отгона из нефти топливных и масляных фракций. Выход гудрона из различных нефтей 15–30% (считая на нефть). Главные составные части гудрона:- (i) масла, не отогнавшиеся при перегонке нефти; (ii) нефтяные смолы; (iii) твёрдые асфальтообразные вещества (асфальтены, карбены, карбоиды); и (iv) смолистые вещества кислотного характера (асфальтогеновые кислоты и их ангидриды). Плотность гудрона 0.95–1.0 г /см^3, вязкость при 100 °C 18–45 градусов ВУ (градусов условной вязкости или Градусов Энглера). Гудрон, в котором сохранилась значительная доля масляных фракций, называется Полугудроном; его вязкость 18–25° ВУ, температура вспышки 140 °C. Гудронами называются также концентрированные остатки масляных нефтей (масляные гудроны), подвергаемые многостадийной очистке для получения высококачественных моторных масел. Смолистые остатки после сернокислотной очистки нефтепродуктов называются Кислым Гудроном. Гудрон используется для получения нефтяных битумов, как дорожно-строительный материал; полугудрон применяют для смазывания грубых механизмов; масляные гудроны – как мягчители в резиновой промышленности и в строительстве. Высокосмолистые гудроны крекингом, деструктивной гидрогенизацией могут быть переработаны в бензин, дизельное топливо и другое. Гудрон = Tar.

CRACKED SELVEDGE = РАССЕЧЁННАЯ КРОМКА (или НАДОРВАННАЯ КРОМКА) – Cracked Selvedge is a selvedge in which two or more adjacent warp yarns, not including the catch thread, are ruptured. This defect is often caused by mechanical damage or unbalanced warp tensions. / Повреждённая Кромка (cracked selvedge):- порок кромки ткани в виде оборванной, деформированной или другим способом нарушенной кромки. Примечание:- этот порок часто вызывается механическим повреждением или несбалансированным натяжением основы.

CRACKING = КРЕКИНГ (или КРЭКИНЬ, или РАСЩЕПЛЕНИЕ) – Cracking:- refinery processes whereby large, heavy, complex hydrocarbon molecules are broken down into simpler and lighter molecules in order to derive a variety of lighter, higher valued products. When this process is brought about applying heat only, the process is referred to as thermal cracking. If a catalyst is also used, the process is known as Catalytic Cracking, or Hydrocracking if the process is conducted over special catalysts in a hydrogen atmosphere. Cracking is the process whereby large molecules are broken down by the application of heat and pressure to form smaller molecules. Refining process to break large molecules into smaller ones. Principal cracking techniques are:- catalytic cracking, co-cracking, delayed coking, hydrocracking, steam cracking, and thermal cracking. / Процесс нефтепереработки, при которой крупные молекулы разбиваются на более мелкие. Основными разновидностями крекинга являются:- гидрокрекинг, замедленное коксование, каталитический крекинг, паровой крекинг, совмещённый крекинг, и термический крекинг. Под Крекингом, от Английского слова Cracking, означающее Раскалывание или Расщепление, понимается переработка нефти или её фракций для получения главным образом моторных топлив, а также сырья для химической промышленности. В процессе крекинга происходит распад тяжёлых молекул. В силу того, что данное слово было заимствовано из Английского языка, было бы правильнее писать и произносить его как Крэкин, однако в нефтегазовой отрасли почему-то этот термин прижился как слово Крекинг. Различают два основных вида крекинга:- (i) Каталитический Крекинг, происходящий при одновременном воздействии высокой температуры, давления и катализаторов, например, алюмосиликатных; и (ii) Термический Крекинг, осуществляемый только под воздействием высокой температуры и давления. Каталитический крекинг осуществляют, например, при температуре 450–530 °C, давлении до 0.37 МПа, в присутствии катализаторов – алюмосиликатов. Основное назначение каталитического крекинга – производство компонента высокооктанового автомобильного бензина (октановое число до 85). Для переработки нефти с высоким содержанием сернистых и смолистых веществ применяют каталитический крекинг при температуре 350–450 °C в присутствии водорода под давлением 5–30 МПа, так называемый Гидрокрекинг. Гидрокрекинг используют для получения авиационного керосина, дизельного топлива и других нефтепродуктов. Термический крекинг низкосортных видов тяжёлого остаточного нефтяного сырья осуществляется при температуре 470–540 °C и давлении 4–6 МПа с последующим риформингом. Термический крекинг, осуществляемый при температуре 500–600 °C и давлении, равном нескольким десятым МПа (коксование), применяют для превращения гудронов и других тяжёлых продуктов в широкую фракцию, используемую для переработки в моторные топлива. Высокотемпературный (650–750 °C) крекинг низкого давления (около 0.1 МПа), или пиролиз, применяют для превращения тяжёлого сырья в газы (пропилен, этилен и другие) и ароматические углеводороды, используемые как химическое сырьё. Под Крекингом понимается переработка нефти и её фракций для получения главным образом моторных топлив, а также химического сырья, протекающая с распадом тяжёлых углеводородов. Наряду с распадом при крекинге, происходят изомеризация и синтез новых молекул, например, в результате циклизации, полимеризации и конденсации. Крекинг является одним из основных методов получения моторных топлив (в частности, бензинов) и может осуществляться как чисто термический процесс – Термический Крекинг, так и в присутствии катализаторов – Каталитический Крекинг. Реакции распада при термическом крекинге обычно рассматриваются как цепные, протекающие по свободнорадикальному механизму. Продукты термического крекинга, осуществляемого обычно при 470–540 °C и давлении 4–6 МегаНьютонов на квадратный метр (МН/м^2) (40–60 ат), содержат много непредельных углеводородов, нестабильны при хранении, бензины из этих продуктов мало восприимчивы к тетраэтил-свинцу и требуют дальнейшей переработки путём Риформинга. Термическому крекингу подвергают низкосортные виды тяжёлого остаточного нефтяного сырья. Термический крекинг низкого давления, проводимый при 500–600 °C и под давлением несколько десятых долей МН/м^2 (несколько ат), называется также Коксованием и применяется для превращения тяжёлых продуктов, например, гудронов, в более лёгкие (выход 60–70%), используемые для дальнейшей переработки в моторные топлива. Наряду с этим получают до 20% кокса, применяемого в различных целях, например, при изготовлении электродов (для дуговых печей, гальванических элементов). Высокотемпературный (650–750 °C) Крекинг Низкого Давления, называемый также Пиролизом, проводят под давлением, близким к атмосферному; этим способом перерабатывают тяжёлое остаточное нефтяное сырьё в газ, содержащий до 50% непредельных углеводородов (этилен, пропилен и другие), и ароматические соединения; полученные продукты служат главным образом химическим сырьём. Термические крекинги обычно осуществляют в трубчатых печах или в реакторах с твёрдым циркулирующим теплоносителем, в качестве которого может быть использован образующийся кокс. Каталитический Крекинг, проводимый в присутствии катализаторов – синтетических или природных алюмосиликатов (активированные глины, например, монтмориллонит), служит для получения основного компонента высококачественного моторного бензина с октановым числом до 85, используемого в автотранспорте и авиации. При этом получают также керосино-газойлевые фракции, пригодные в качестве дизельного или реактивного топлива. Процесс осуществляют при 450–520 °C, под давлением 0.2–0.3 МН/м^2 (2–3 ат) в реакционных колоннах с неподвижным или непрерывно циркулирующим катализатором. И в том и в другом случае катализатор нуждается в регенерации, так как при крекинге на нём накапливаются углеродистые отложения (кокс), дезактивирующие катализатор. Кокс удаляют выжиганием. При каталитическом крекинге распад гораздо быстрее, чем при термическом. Кроме того, в этом случае происходит изомеризация с образованием насыщенных углеводородов. В результате выход лёгких продуктов больше, чем при термическом крекинге, а получаемый бензин содержит много изопарафинов и мало непредельных углеводородов, что обусловливает его высокое качество. Сырьём для каталитического крекинга служит обычно газойль, из которого получают 30–40% бензина (с содержанием

изопарафинов до 50%), 45–55% каталитического газойля, 10–20% газа (в том числе 6–9% бутан-бутиленовой фракции, являющейся химическим сырьём) и 3–6% кокса. Для переработки средних и тяжёлых нефтяных дистиллятов с большим содержанием сернистых и смолистых соединений, непригодных поэтому для переработки чисто каталитическим способом, большое распространение получил каталитический крекинг в присутствии водорода, так называемый Гидрокрекинг. Он осуществляется при температурах 350–450 °С, давлении водорода 3–14 МН/м^2 (30–140 ат) и расходе водорода 170–350 кубических метров (м^3) на 1 м^3 сырья. Катализаторами служат окислы или сульфиды молибдена и никеля, молибдат кобальта и другие на крекирующих носителях, например, на алюмосиликатах. Применение водорода обеспечивает эффективное гидрирование на катализаторе высокомолекулярных и сернистых соединений с их последующим распадом на крекирующем компоненте. Благодаря этому выход светлых продуктов повышается до 70% (в пересчёте на нефть) и сильно снижается содержание в продуктах серы и непредельных углеводородов. Получаемые моторные топлива (бензин, реактивное и дизельное топлива) отличаются высоким качеством. Значительное применение для получения непредельных углеводородов, используемых как химическое сырьё, находит крекинг с водяным паром. Исходными продуктами служат различные виды нефтяного сырья – от газов нефтепереработки до остатков после перегонки нефтепродуктов. Крекинг проводят при 650–800 °С в присутствии катализаторов, например, окиси никеля, на огнеупоре. Преимущество метода – низкое коксообразование и большой выход олефинов. Помимо указанных, существуют и частично используются на практике другие виды крекинга, например, Крекинг В Присутствии Кислорода (Окислительный Крекинг), Электрокрекинг при получении ацетилена (метан пропускают через электрическую дугу).

CRACKING PRESSURE = ДАВЛЕНИЕ РАСТРЕСКИВАНИЯ – Cracking Pressure is the pressure at which a pressure operated valve begins to pass fluid. / клапан начинает пропускать жидкость.

CRACK MARK = ОТМЕТИНА ОТ ТРЕЩИНЫ – Crack Mark is an open place causing a streak of variable length approximately parallel to the length or width. Synonym:- Open Place, and Thin Spot. Crack Mark is a sharp break or crease in the surface of a coated or laminated fabric. Crack Marks:- in a fabric, permanent or lines which run in various directions. Note:- this defect is caused by irregular creasing during wet finishing. / Пятно.

CRACKS = ЩЕЛИ (или ТРЕЩИНЫ, или НЕДОСЕКИ, или НЕРОВНЫЕ БОИ) – Cracks:- (i) loose beat up and work out bearing or cam action; (ii) faulty left off start-ups; (iii) any non-adjustment of feel of cloth gives crack; (iv) after maintenance if not adjustment of feel of cloth; (v) negligence of worker during weft threading; and (vi) clutch engagement of let off generates cracks across width of fabric. Minor Defect Classification:- 1–2 Picks. Major Defect Classification:- >= 2 Picks missing for > 0.5 cm. Weaving defect. Crackes:- a narrow streak running parallel to the weft due to pronounced opening between to adjacent yarns caused due to the erratic operation of the sley. Crack is a defect in a woven fabric consisting of an open fillingwise streak extending partly or entirely across the fabric. / 1–2 поперечных нитей. Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 сантиметре (см). Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дециметр (дм) ткани, причина разладка основного регулятора или товарного механизма. Неровный Бой – порок ткани. Полосатость По Утку. Порок или дефект ткачества.

CRACK SPREAD = КУРСОВАЯ РАЗНИЦА ПО КРЕКИРОВАНИЮ (или СПРЭД НА КРЕКИРОВАНИЕ) – A Crack Spread is a processing spread trade where crude oil futures are bought (long) and gasoline and heating oil futures are sold (short) simultaneously. Oil refineries use this hedging strategy to hedge the later purchase price of crude oil and the later sale price of gasoline and heating oil (both crude oil distillates). The term Crack refers to the process of refining crude oil into distillates like gasoline, heating oil, gasoil and diesel. The crack measures refining profit from processing crude oil. The simultaneous purchase or sale of crude oil against the sale or purchase of refined petroleum products. These spread differentials which represent refining margins are normally quoted in Dollars per barrel by converting the product prices into Dollars per barrel (multiply the cents-per-gallon price by 42) and subtracting the crude oil price. In energy futures, the simultaneous purchase of crude oil futures and the sale of petroleum product futures to establish a refining margin. See also Gross Processing Margin. Crack Spread is the spread created in commodity markets by purchasing oil futures and offsetting the position by selling gasoline and heating oil futures. This investment alignment allows the investor to hedge against risk due to the offsetting nature of the securities. The name of this strategy is derived from the fact that ‘cracking’ oil produces gasoline and heating oil. Therefore, oil refiners are able to generate residual income by entering into these transactions. During the summer of 2005, the effects of hurricanes in the Southeastern United States created large volatility in the crack spread. The difference between a product price (or an average basket of products) and a crude price in a given physical (or futures) market. Crack Spread is a term used in the oil industry and futures trading for the differential between the price of crude oil and petroleum products extracted from it – that is, the profit margin that an oil refinery can expect to make by ‘cracking’ crude oil (breaking its long-chain hydrocarbons into useful shorter-chain petroleum products). In the futures markets, the ‘crack spread’ is a specific spread trade involving simultaneously buying and selling contracts in crude oil and one or more derivative products, typically gasoline and heating oil. Oil refineries may trade a crack spread to hedge the price risk of their operations, while speculators attempt to profit from a change in the oil/gasoline price differential. Factors Affecting The Crack Spread:- one of the most important factors affecting the crack spread is the relative proportion of various petroleum products produced by a refinery. Refineries produce many products from crude oil, including gasoline, kerosene, diesel, heating oil, aviation fuel, asphalt and others. To some degree, the proportion of each product produced can be varied in order to suit the demands of the local market. Regional differences in the demand for each refined product depend upon the relative demand for fuel for heating, cooking or transportation purposes. Within a region, there can also be seasonal differences in demand for heating fuel versus transportation fuel. The mix of refined products is also affected by the particular blend of crude oil feedstock processed by a refinery, and by the capabilities of the refinery. Heavier crude oils contain a higher proportion of heavy hydrocarbons composed of longer carbon chains. As a result, heavy crude oil is more difficult to refine into lighter products such as gasoline. A refinery using less sophisticated processes will be constrained in its ability to optimize its mix of refined products when processing heavy oil. Futures Trading:- for integrated oil companies that control their entire supply chain from oil production to retail distribution of refined products, there is a natural economic hedge against adverse price movements. For independent oil refiners which purchase crude oil and sell refined products in the wholesale market, adverse price movements can present a significant economic risk. Given a target optimal product mix, an independent oil refiner can attempt to hedge itself against adverse price movements by buying oil futures and selling futures for its primary refined products according to the proportions of its optimal mix. For simplicity, most refiners wishing to hedge their price exposures have used a crack ratio usually expressed as X:Y:Z where X represents a number of barrels of crude oil, Y represents a number of barrels of gasoline and Z represents a number of barrels of distillate fuel oil, subject to the constraint that X = Y + Z. This crack ratio is used for hedging purposes by buying X barrels of crude oil and selling Y barrels of gasoline and Z barrels of distillate in the futures market. The crack spread X:Y:Z reflects the spread obtained by trading oil, gasoline and distillate according to this ratio. Widely used crack spreads have included 3:2:1, 5:3:2 and 2:1:1. As the 3:2:1 crack spread is the most popular of these, widely quoted crack spread benchmarks are the ‘Gulf Coast 3:2:1’ and the ‘Chicago 3:2:1’. Various financial intermediaries in the

commodity markets have tailored their products to facilitate trading crack spreads. For example, NYMEX® offers virtual crack spread futures contracts by treating a basket of underlying NYMEX® futures contracts corresponding to a crack spread as a single transaction. Treating crack spread futures baskets as a single transaction has the advantage of reducing the margin requirements for a crack spread futures position. Other market participants dealing over the counter provide even more customized products. The following discussion of crack spread contracts comes from the Energy Information Administration publication Derivatives and Risk Management in the Petroleum, Natural Gas, and Electricity Industries:- 'Refiners' profits are tied directly to the spread, or difference, between the price of crude oil and the prices of refined products. Because refiners can reliably predict their costs other than crude oil, the spread is their major uncertainty. One way in which a refiner could ensure a given spread would be to buy crude oil futures and sell product futures. Another would be to buy crude oil call options and sell product put options. Both of those strategies are complex, however, and they require the hedger to tie up funds in margin accounts. To ease this burden, NYMEX® in 1994 launched the crack spread contract. NYMEX® treats crack spread purchases or sales of multiple futures as a single trade for the purposes of establishing margin requirements. The crack spread contract helps refiners to lock-in a crude oil price and heating oil and unleaded gasoline prices simultaneously in order to establish a fixed refining margin. One type of crack spread contract bundles the purchase of three crude oil futures (30 000 barrels) with the sale a month later of two unleaded gasoline futures (20 000 barrels) and one heating oil future (10 000 barrels). The 3-2-1 ratio approximates the real-world ratio of refinery output – 2 barrels of unleaded gasoline and 1 barrel of heating oil from 3 barrels of crude oil. Buyers and sellers concern themselves only with the margin requirements for the crack spread contract. They do not deal with individual margins for the underlying trades. An average 3-2-1 ratio based on sweet crude is not appropriate for all refiners, however, and the OTC market provides contracts that better reflect the situation of individual refineries. Some refineries specialize in heavy crude oils, while others specialize in gasoline. One thing OTC traders can attempt is to aggregate individual refineries so that the trader's portfolio is close to the exchange ratios. Traders can also devise swaps that are based on the differences between their clients' situations and the exchange standards'. The simultaneous purchase or sale of crude against the sale or purchase of refined petroleum products. These spread differentials which represent refining margins are normally quoted in Dollars per barrel by converting the product prices into Dollars per barrel and subtracting the crude price. / НАЙМЭКС® (NYMEX®). Покупка или продажа сырой нефти с одновременной продажей или покупкой нефтепродуктов. Эти дифференциалы курсовой разницы, отражающие маржу НПЗ, как правило, рассчитываются в Долларах США за баррель посредством пересчёта цен на нефтепродукты в Доллары за баррель и вычитания цены нефти.

CRACKY WARP = РАССЕЧЁННАЯ ОСНОВА – Cracky Warp:- Fabric:- dress goods; Construction:- (i) Count:- 108 x 40; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 10/1 50% 1%-in. 1%-den. bright viscose rayon 50% 1%-in. 3-den. dull acetate rayon; Finish:- plain dyed light blue. Defect:- cracky appearance in warp. Analysis:- examination showed the sample submitted to have short warpwise cracks or open spaces across the full width of the piece. Determination of pick count disclosed the fact that the finisher had given only 2% warp shrinkage to the piece in question. Reference cuttings of the same style had a normal finishing shrinkage of about 8%. The defective piece was also finished about 1 inch wider than was recommended for this construction. It was therefore concluded that this defect was due to inadequate warp shrinkage and excessive width in finishing. Although the gray mill has no control over the converter or finisher and cannot dictate how goods are to be processed, the converter is usually guided by the appearance of one or more finished sample pieces. If he chooses to process the gray goods in an unorthodox manner, he must, of course, assume all responsibility for any abnormal finished appearance. / Уточина:- .

CRADLE = КИЛЬБЛОК – Cradle is a stowage rest for a ship's boat. Ship Cradle, supports a ship that is dry docked. / Кильблок или так называемый шлюпочный кильблок – .

CRADLE = ТЕЛЕЖКА (или РАМА, или ПОДСТАВКА, или ЛЮЛЬКА) – A Cradle is a frame that is used to secure loads with a tendency to roll, such as boats or cylindrical goods, e.g., boilers, large-diameter pipes, etc. The upper side of the cradle is shaped to fit the product it is designed to carry. / это рама, которая используется, например, .

CRAMDOWN = ПОНУЖДЕНИЕ (или ПРОТАЛКИВАНИЕ) – Cramdown:- when investors get heavily diluted by a subsequent round of investment especially when the investment is a down round. Also known as a Washout.

CRAMMED PICK = ПЕРЕПОЛНЕННАЯ ПОПЕРЕЧНАЯ НИТЬ – Crammed Pick is a strip in the fabric where the pick density is more than normal is called a Patti. The defect is caused by improper setting of the anti crack motion. Crammed:- certain parts of fabric are said to be crammed when they contain more thread per unit space than in another part of the cloth; usually made with several warps through one dent. Crammed stripes are purposely set in some fabrics for effect, as in shirtings, and handkerchief borders. It is done by cramming more than the usual number of ends in the particular reed splits which will guide the yarn into the material. If a filling-crammed motif is desired, an arrangement can be made to have the take-up motion stop on certain picks to give the effect. Crammed:- cloth with lines in the warp direction caused by faulty reeding which may have come from swollen dents in the reed. Crammed:- another name for Cockled Fabric. Crammed:- cloth with a higher warp or filling texture that it is supposed to have. Crammed Picks:- a strip in the fabric where the pick density is more than the normal is called Crammed Picks. The defect is caused by the improper setting of the anti-crack motion and the release finger or because of releasing of excessive cloth at the time of restarting the loom. / уточина. Порок или дефект ткачества.

CRAMOISIE = КРЭМОЙСИ (или КРЭМЭЗИ, или МАЛИНОВОЕ, или ТЁМНО–КРАСНОЕ) – Cramoisie:- crimson cloth. / полотно.

CRANE = КРАН – A Crane is a lifting machine, generally equipped with a winder (also called a Wire Rope Drum), wire ropes or chains and sheaves, that can be used both to lift and lower materials and to move them horizontally. It uses one or more simple machines to create mechanical advantage and thus move loads beyond the normal capability of a human. Cranes are commonly employed in the transport industry for the loading and unloading of freight, in the construction industry for the movement of materials and in the manufacturing industry for the assembling of heavy equipment. There are two major considerations in the design of cranes. The first is that the crane must be able to lift a load of a specified weight and the second is that the crane must remain stable and not topple over when the load is lifted and moved to another location. A machine designed for moving and lifting weight by means of a projecting arm or a horizontal beam. A materials handling device that lifts heavy items. There are two types:- bridge and stacker. See also Bridge Crane, Floating Crane, and Gantry Crane. / Устройство для переработки материалов, которое поднимает тяжёлые изделия или предметы. Существуют два типа:- мостовой кран и кран-штабелёр. Под Грузоподъёмным Краном понимается грузоподъёмная машина, работающая кратковременными повторяющимися циклами. Применяются в цехах промышленных предприятий, в строительстве, на транспорте и в других областях хозяйства. Состоит из несущих конструкций (башня, мачта, мост, стрела, ферма), главного подъёмного механизма (лебёдка, таль), направляющих и поддерживающих элементов (канаты, тросы, цепи), силовой установки, электрооборудования, грузозахватных приспособлений. По конструктивным признакам различают автомобильные краны, башенные краны, велосипедные краны, железнодорожные краны, кабельные краны, козловые краны, консольные краны, мачтовые краны, мостовые краны, мостовые перегружатели, плавучие краны, портальные краны, стреловые самоходные краны и другие. Грузоподъёмные краны бывают стационарные и передвижные. Кран, в данном случае

Подъёмный Кран, грузоподъёмная машина циклического действия для подъёма и горизонтального перемещения подвешенных грузов на небольшие расстояния. Различают подъёмные краны башенные, велосипедные, козловые, консольные, мостовые, портальные и другие. Автомобильный Кран или Автокран – самоходная погрузочно-разгрузочная машина, смонтированная на автомобильном шасси, с поворотной консольной стрелой. Привод кранового оборудования – электрический, гидравлический или механический с отбором мощности от двигателя автомобиля. В бывшем СССР выпускали автомобильные краны грузоподъёмностью до 16 тонн. Вылет стрелы 1.2–10 метров, а при наличии специальных вставок у автомобильного крана большой грузоподъёмности – до 22 тонн. Высота подъёма крюка 7–18.5 метров. Для повышения устойчивости во время подъёма груза автомобильные краны используют дополнительные внешние опоры (аутригеры). Башенный Кран (Tower Crane) – грузоподъёмный кран, применяемый главным образом в строительстве и имеющий высокую башню, поворотную стрелу и подъёмную лебёдку. Бывают передвижными и стационарными. Башня передвижного крана опирается на ходовые колёсные или гусеничные тележки, которые перемещаются по рельсовому пути или по земле. Грузоподъёмность передвижных башенных кранов достигает 100 тонн, стационарных – 400 тонн, высота подъёма до 150 метров, вылет стрелы до 50 метров. Велосипедный Кран, стреловой поворотный грузоподъёмный кран на колонне, которая установлена на 2–4 колёсной тележке, передвигающейся по одному рельсу. Верхняя часть колонны удерживается роликами в двух балках. Грузоподъёмность до 10 тонн, вылет стрелы 3–7 метров. Железнодорожный Кран – стреловой полноповоротный грузоподъёмный кран на платформе с железнодорожными ходовыми тележками нормальной колеи. Рабочее оборудование железнодорожного крана – нормальные и удлинённые стрелы с гуськами, а также грузозахватные устройства в виде грейферов, электромагнитов и крюковых подвесок. Привод механизмов от паровой машины, дизеля или дизель-электрический. Железнодорожные краны могут транспортироваться без разборки собственным ходом или в составе поезда. В бывшем СССР грузоподъёмность железнодорожных кранов для погрузочно-разгрузочных работ 6.3–125 тонн, высота подъёма 5–25 метров, вылет 4–26 метров, скорость передвижения собственным ходом 4–13 км/ч. грузоподъёмность железнодорожного крана для монтажных работ до 160 тонн. Кабельный Кран или Кабель-Кран – сооружение, предназначенное для подъёма (спуска) груза на высоту 50 метров и более и перемещения его на расстояние до 1 500 метров. Кабельный кран представляет собой однопролётную подвесную дорогу (канатную) и используется на открытых горных разработках для транспортирования вскрышных пород, руды, штучного камня и другого, в строительстве для перемещения больших объёмов земли, бетона и других материалов, на лесоскладах и так далее. Кабельный кран состоит из опор, несущего каната, тягового каната, подъёмного каната и тележки. Грузоподъёмность кабельных кранов от 1 до 150 тонн. Козловый Кран (Gantry Crane) – грузоподъёмный кран в виде моста на жёстких опорах (козлах), передвигающийся по наземному рельсовому пути или бетонному основанию. Пролётное строение (мост) козлового крана перекрывает при движении прямоугольную пощадь, на которой производят погрузочно-разгрузочные работы (на открытых складских и монтажных площадках, а также на заводских территориях). На мосту устанавливается и передвигается грузовая тележка или таль с грузозахватным приспособлением. Применяют для обслуживания открытых складов и в строительстве. Грузоподъёмность 3–50 тонн, иногда до 800 тонн, пролёты кранов общего назначения 4–40 метров, иногда до 170 метров. Под Консольным Краном (Cantilever Crane) понимается передвижной или стационарный грузоподъёмный кран с поворотной либо неподвижной консолью, по которой передвигается грузовая тележка или таль. Передвижные консольные краны перемещаются по рельсам, расположенным один за другим. Консольный Кран (Cantilever Crane) – передвижной или стационарный грузоподъёмный кран с поворотной либо неповоротной консольной фермой, по которой передвигается грузовая тележка или таль, перемещая грузы в вертикальном и горизонтальном направлениях. У консольных кранов с неповоротной фермой грузовая тележка передвигается по консоли, подкрановый путь не занимает площади больше цеха, поэтому такие краны нашли применение на различных промышленных предприятиях. Консольные краны с поворотной фермой имеют много конструктивных вариантов. К ним относятся велосипедный кран, кран на колонне, кран-укосина, мачтовый кран и другие. Передвижные консольные краны перемещаются по рельсам, расположенным один под другим. Консольные краны широко используются на машиностроительных заводах, стройках и в портах. Грузоподъёмность консольного крана 4–10 тонн. Мачтовый Кран – стреловой стационарный грузоподъёмный кран с независимым расположением металлоконструкции и механизмов. Металлоконструкция мачтового крана представляет собой комбинацию мачты и соединённой с ней шарнирно стрелы. В качестве подъёмных и поворотных механизмов мачтового крана используются лебёдки. Мачтовые краны делятся на жёстконогие и вантовые. Мачта жёстконогого крана неподвижна (прикреплена к стене сооружения или нижний конец укреплён в грунте, а верхний при необходимости расчален вантами), шарнир стрелы выполнен так, что она поворачивается в вертикальной плоскости и вокруг вертикальной оси. Мачта вантового крана снабжается шарнирными опорами:- нижней шаровой и верхней цилиндрической в виде ‘паука’, удерживаемого вантами. В кранах для грузов до 5 тонн стрела крепится вверху мачты, а в кранах для грузов до 40 тонн – внизу мачты. Мачтовые краны используют в основном при монтажных работах. Мостовой Кран (Overhead Crane) – грузоподъёмный кран, предназначенный для подъёма, опускания и горизонтального перемещения различных грузов. Он состоит из мостового пролётного строения или балки, снабжённых концевыми балками с ходовыми тележками, передвигающимися по рельсам, уложенным на подкрановые балки, и грузовой тележки (тали), перемещающейся вдоль пролётного строения. Мост перемещается по подкрановым рельсам, например, вдоль пролёта цеха, а грузовая тележка (таль) – по мосту поперёк пролёта. Мостовые краны широко используют как основное подъёмно-транспортное средство в литейных, механических, сборочных и других цехах крупных промышленных предприятий. Грузоподъёмность мостового крана 5–600 тонн. Мостовой Перегружатель – грузоподъёмный кран, предназначенный для выполнения погрузочно-разгрузочных работ на складах массовых грузов. Одно- или двухконсольное мостовое пролётное строение мостового перегружателя, опирающееся на 2 высокие ноги с ходовыми тележками, перекрывает всё площадь склада и передвигается вдоль фронта погрузочно-разгрузочных работ. По пролётногму строению перемещается грузовая тележка или консольный поворотный кран с грузозахватным приспособлением. Плавучий Кран (Floating Crane) – грузоподъёмный кран, установленный на самоходном или буксируемом понтоне. По конструкции верхние строения плавучего крана подразделяются на неповоротные (мачтовые, козловые и краны с качающимися стрелами), полноповоротные, или универсальные, у которых стрела может поворачиваться в вертикальной плоскости и вращаться вокруг вертикальной оси, и комбинированные с двухъярусным верхним строением (на нижней основной ферме установлен поворотный или передвижной кран). Плавучие краны для тяжеловесных грузов изготовляются с качающейся стрелой. Краны имеют чаще всего дизель-электрический, реже дизельный или паровой привод. Плавучие краны грузоподъёмностью до 25 тонн используют для массовых погрузочно-разгрузочных работ, а краны грузоподъёмностью до 1 600 тонн – для строительных (в том числе судостроительных), монтажных и аварийно-спасательных работ. Портальный Кран – грузоподъёмный кран, предназначенный для погрузочно-разгрузочных работ на больших открытых площадках. На П-образном портале портального крана размещается поворотная крановая часть – платформа, механизмы, стрела, связанная с порталом опорно-поворотным устройством. Портал крана опирается на 4 ноги с ходовыми тележками, передвигающимися по подкрановому пути. Портальные краны используют в морских и речных портах, на судостроительных заводах, в гидротехническом строительстве, на строительных площадках, промышленных предприятиях и так далее. Грузоподъёмность портальных кранов до 300 тонн, высота подъёма до 45 метров, наибольший вылет стрелы до 35 метров, у

судостроительных портальных кранов до 100 метров. Стреловой Самоходный Кран – грузоподъёмный кран с поворотной консольной стрелой, установленной на полноповоротной раме. В зависимости от ходового устройства различают автомобильные, гусеничные, пневмоколёсные краны и краны на специальном шасси. Для увеличения подстрелового пространства на стреле устанавливают жёсткий или управляемый (поворотный) гусёк (известный также как Клюв или Хобот, и являющийся частью шарнирно-сочленённой стрелы грузоподъёмного крана, увеличивающей радиус действия крана и позволяющей перемещать груз по горизонтали при изменении вылета стрелы), а также используют башенно-стреловую модификацию самоходного крана (стрела крепится к верхней части башни). Повышение устойчивости обеспечивается дополнительными выносными опорами (аутригерами), противовесами и другими специальными способами. Стреловые самоходные краны универсальны, мобильны, манёвренны. Применяются на монтажных и погрузочно-разгрузочных работах. Под Талью, от Голландского слова Talie, понимается компактная подвесная подвижная или неподвижная грузоподъёмная лебёдка. Привод тали может быть ручным, пневматическим или электрическим. Ручные тали грузоподъёмностью 0.1–10 тонн бывают стационарные или передвижные. Электрические тали обычно имеют грузоподъёмность 0.25–10 тонн, высоту подъёма груза 4–30 метров, скорость подъёма 8–20 м/мин и скорость передвижения 20–30 м/мин. Подвесные пути для передвижения электроталей могут иметь один или два рельса, стрелки, закругления и небольшие уклоны. Пневматические тали грузоподъёмностью до 0.1 тонны применяют в тех случаях, когда наличие электрического тока недопустимо по условиям производства. Длина путей передвижения пневматических талей ограничивается возможностями подачи сжатого воздуха. Тельфер (telpher), нерекомендуемое название подвижной электротали. Под Грузозахватным Приспособлением понимается устройство или механизм грузоподъёмной машины для захвата, перемещения и разгрузки различных грузов. Грузозахватные приспособления навешиваются на рабочий орган грузоподъёмной машины. Различают грузозахватные приспособления для штучных грузов – чалочные стропы, скобы, траверсы, клещи; для насыпных – грейферы, ковши, кюбели; для наливных – бадьи, специальные ёмкости. Разновидность грузозахватных приспособлений – подъёмные электромагниты, вакуумные грузозахваты и тому подобные. К грузозахватным приспособлениям относят также автостропы, обеспечивающие захват и освобождение штучных грузов при погрузочно-разгрузочных, строительных и монтажных работах без участия стропальщика. Операции строповки и отстроповки могут выполняться, например, с помощью электромагнита, установленного на автостропе и управляемого из кабины крановщиком. Грузозахватные Приспособления, вспомогательные устройства грузоподъёмных машин, с помощью которых захватывают груз, удерживают его при различных перемещениях и осуществляют разгрузку. Для непосредственого захвата груза используют крюки, которые при необходимости дополняются другими приспособлениями. Грузозахватные приспособления должны быть удобными и безопасными в работе, обеспечивать сохранность груза, иметь минимальную собственную массу, быстро захватывать и освобождать груз. Выбор грузозахватного приспособления определяется свойствами, размерами, формой и массой перемещаемых грузов, а также характером производственного процесса. По виду перемещаемых грузов различают грузозахватные приспособления для штучных грузов, для сыпучих и для жидких, а по роду привода в действие – ручные и автоматические, так называемые Автостропы. Наиболее просты по устройству так называемые Чалочные Грузозахватные Приспособления, или Стропы, для штучных грузов, представляющие собой отрезки канатов или сварных цепей, концы которых сращивают или снабжают коушами (специальное металлическое кольцо), крючьями или скобами. Получили распространение быстродействующие клещевые и эксцентриковые захваты для ящиков, бочек, мешков, листового проката и прочего. Захват и перемещение сыпучих грузов производят бадьями, кюбелями, грейферами, а жидких – при помощи бадей, ковшей и других ёмкостей. Автостропы позволяют освободить большое число рабочих-стропальщиков, обеспечивают более высокую степень безопасности работ и снижают их трудоёмкость. Нашли применение автостропы для железобетонных конструкций, контейнеров, грузов, сформированных в пакеты (смотрите Пакетоформирующая Машина) и другого. Для автоматического захвата изделий из чёрных металлов широко используют грузовые электромагниты. Длиномерные грузы поднимают несколькими электромагнитами, подвешенными к общей траверсе. Для подъёма грузов с ровными плоскими поверхностями (листы, строительные блоки, коробки) используют вакуумные грузозахватные приспособления, снабжённые захватами, головками или гибкими присосками. Принцип действия таких грузозахватных приспособлений основан на использовании разности атмосферных и внутренних давлений. Совершенствование современных грузозахватных приспособлений идёт как по линии разработки новых конструкций автоматических захватов, так и по линии создания специализированных захватов для определённых грузов, например, для рулонов листовой стали, пакетов листового материала, контейнеров, брёвен и тому подобного. Под Краном-Укосиной понимается простейший грузоподъёмный кран, у которого треугольный кронштейн-укосина с блоками закрепляется на колонне, стене и тому подобном. Через блоки пропускается канат подъёмной лебёдки. Грузоподъёмность крана-укосины до 5 тонн. Подкрановый Путь – два параллельных рельса, служащих направляющими для передвижных грузоподъёмных кранов. Рельсы подкранового пути могут быть расположены в одной горизонтальной плоскости (например, для мостового крана или крана-балки), в одной вертикальной плоскости (например, для велосипедного крана) или в разных уровнях (например, для полупортального или полукозлового крана). Подкрановая Балка – металлическая или железобетонная балка, опирающаяся на колонны, с укреплённым на ней рельсом для грузоподъёмного крана.

CRANE RATE = ПРОИЗВОДИТЕЛЬНОСТЬ КРАНА – Crane Rate is a measure of productivity based on the number of containers moved. Usually expressed as number of TEUs (short for Twenty-foot Equivalent Units) per gross hour per crane. / Мера производительности, основанная на количестве перемещённых контейнеров. Обычно выражается как количество ЭДКТС (сокращённо для Эквивалентных Двадцатифутовому Контейнеру Транспортных Средств) за валовый час по данному крану. Под Производительностью Оборудования понимается объём продукции (работы), производимой в единицу времени данным оборудованием в соответствии с его конструктивными особенностями, технической характеристикой и определёнными организационно-производственными условиями. Производительность оборудования измеряется в тоннах, штуках, метрах и так далее в единицу времени.

CRANK = КОЛЕНО (или КРИВОШИП, или ГОЛОВКА (ШАТУНА)) – A Crank is an arm attached at a right angle to a rotating shaft by which reciprocating motion is imparted to or received from the shaft. It is used to convert circular motion into reciprocating motion, or vice versa. The arm may be a bent portion of the shaft, or a separate arm or disk attached to it. Attached to the end of the crank by a pivot is a rod, usually called a Connecting Rod (Conrod). The end of the rod attached to the crank moves in a circular motion, while the other end is usually constrained to move in a linear sliding motion. The term often refers to a human-powered crank which is used to manually turn an axle, as in a bicycle crankset or a brace and bit drill. In this case a person's arm or leg serves as the connecting rod, applying reciprocating force to the crank. There is usually a bar perpendicular to the other end of the arm, often with a freely rotatable handle or pedal attached. In engines:- Almost all reciprocating engines use cranks (with connecting rods) to transform the back-and-forth motion of the pistons into rotary motion. The cranks are incorporated into a crankshaft. Crank is the extension of the axle to the footman. Crank (mechanism), in mechanical engineering, a bent portion of an axle or shaft, or an arm keyed at right angles to the end of a shaft, by which motion is imparted to or received from it. / Шатун состоит из стержня и верхней и нижней головок шатуна. соединительный стержень Connecting Rod.

CRANKCASE OIL = КАРТЕРНОЕ МАСЛО – Crankcase Oil is a lubricant used in the crankcase of the internal combustion engine. / Картерное Масло – смазка (или смазочный материал) используемый в картере двигателя внутреннего сгорания.

CRAPE = КРЭП (или ТРАУРНАЯ ВУАЛЬ, или ФЛЕР) – Crape or Crêpe is a soft thin light fabric with crinkled texture surface. Also, non relevant to fashion a crêpe is a French Pancake. / крэп (crêpe) является Французским Панкекь (или Пэнкейк (Pancake)).

CRAR = CAPITAL TO RISK ASSET RATIO

CRASH = КРАХ (или КРУШЕНИЕ) – Stock market crash. Sudden, sharp drop in stock market prices. By extension, financial collapse or disaster. Crash is an informal term for a very severe drop in prices on securities, financial and commodities markets. The most famous was the Wall Street Crash of 1929, which led to the 1930s depression. The largest in recent years was the worldwide drop in shares prices on 1987-October-15. / Крах фондового рынка. Внезапное, резкое падение цен на фондовом рынке. В более широком смысле слова, финансовый коллапс или бедствие. Это неформальный термин для обозначения серьёзного падения цен на рынке ценных бумаг, финансовом рынке и рынке сырья. Самым известным крахом стал Крах Вол Стрит (Wall Street Crash) в 1929, который привёл к депрессии 1930-х. Крупнейшим крахом последних лет стало всемирное падение цен на акции 15 Октября 1987.

CRASH = ХОЛСТ (или СУРОВОЕ ПОЛОТНО) – Crash is a cloth made from cotton or linen, or from combinations of these fibers. The material is rugged, substantial in feel, comes in white or natural shades. It may be made with stripe effects as in toweling, suitings, doilies, decorative cloths. Other uses of crash include dresses, cap cloth, summer coatings. The yarn is strong, irregular, and smooth. The fabric is of fairly good texture. Fiber content must be declared. Crash is a course fabric with a rough, irregular surface made from thick, uneven yarns. Crash is a coarse fabric used for draperies, toweling, and clothing and for strengthening joints of cased-in books. Plain weave. Generally linen. / Холст:- (1) узкая (40–60 сантиметров (см)) сравнительно грубая домотканая ткань, вырабатываемая полотняным переплетением нитей из льняной пряжи. Холстом называются также узкие (45–50 см) льняные и полульняные полотенечные ткани полотняного и мелкоузорчатого переплетения, изготовляемые промышленностью. (2) Полуфабрикат в прядильном производстве, а также при изготовлении нетканых и валяльно-войлочных изделий.

CRASH HELMET = ПРЕДОХРАНИТЕЛЬНАЯ КАСКА (или ПРЕДОХРАНИТЕЛЬНЫЙ ШЛЕМ) – Crash Helmet is a helmet that is worn, as by motorcyclists, as protection for the head in the event of an accident.

CRAT = CHARITABLE REMAINDER ANNUITY TRUST

CRATE = КЛЕТЬ (или РЕШЕТЧАТЫЙ ЯЩИК) – A Crate is a large shipping container, often made of wood, typically used to transport large, heavy or awkward items. Steel and aluminium crates are also used. Smaller plastic crates are used for delivery of bottles and other fragile items. A wooden crate has a self-supporting structure, with or without sheathing. For a wooden container to be a crate, all six of its sides must be put in place to result in the rated strength of the container. Crates are distinct from wooden boxes. The strength of a wooden box is rated based on the weight it can carry before the top (top, ends, and sides) is installed, whereas the strength of a crate is rated with the top in place. In general conversation, the term crate is sometimes used to denote a wooden box. Plastic crates are often used for shipment of bottles of water, beer, milk, etc. Many are designed to stack securely and to be returned for reuse. The term Crate is originally from Latin, where it was a generic term for baskets, and wickerwork baskets in particular. Crate is a wooden receptacle formed like a case or box, with the difference that the external walls and the lid are not fully closed. / Деревянное ложе, выполненное в форме ящика или коробки, с той лишь разницей, что внешние стенки и крышка не являются глухими (полностью закрытыми).

CRATE RESTRAINT SHOE = УДЕРЖИВАЮЩИЙ КЛЕТЬ БАШМАК – Crate Restraint Shoe is a steel bracket specially made to suit a specific crate, where the upper side of the shoe takes the crate and the underside of the shoe is designed to fit tightly to the transport medium or container. / стальной кронштейн (бракет) , верхняя сторона башмака .

CRAVAT = КРАВАТ (или ШЕЙНЫЙ ПЛАТОК, или ШИРОКИЙ ГАЛСТУК) – Cravat is a band or scarf worn around the neck; necktie. / шейная орденская лента.

CRAZING = ВОЛОСНЫЕ ТРЕЩИНЫ (или ОБРАЗОВАНИЕ ВОЛОСНЫХ ТРЕЩИН, или РАСТРЕСКИВАНИЕ) – Crazing:- a network of apparent fine cracks on or beneath the surface of materials, such as in transparent plastics, glazed ceramics, glass, or clear coatings. / Волосные Трещины – дефект покровного слоя бумаги.

CRB = COME RIGHT BACK

CRB℠ = COMMODITY RESEARCH BUREAU

CRB℠ INDEX = COMMODITY RESEARCH BUREAU INDEX

CRBT = CRYING REAL BIG TEARS

CRC = CONVENTION ON THE RIGHTS OF THE CHILD

CRC = COSTA RICAN COLON

CRD = CENTRAL REGISTRATION DEPOSITORY

CRDC = COTTON RESEARCH AND DEVELOPMENT CORPORATION

CRE = CONSTANT RATE OF EXTENSION

CREAM = КРЕМОВЫЙ – Cream:- a pale yellow.

CREAM OF TARTAR = КРЕМ ТАРТАР (или ВИННЫЙ КАМЕНЬ, или КИСЛЫЙ ВИННОКИСЛЫЙ КАЛИЙ) – Cream Of Tartar, $KHC_4H_4O_6$, more technically known as Potassium Hydrogen Tartrate, is a fine white powder with many culinary applications. It is a byproduct of the winemaking process as the powder forms inside wine barrels during fermentation. It comes from tartaric acid, a naturally occurring substance in grapes and some other tart fruits that in the principle acid in winemaking. It helps to help control the pH of fermenting grape juice (wine) and that also acts as a preservative for the wine. Tartaric acid has been used in winemaking for centuries (when separated from grapes and purified, it is a white powder that is similar to cream of tartar) and cream of tartar has been around just as long, put to use by creative cooks in a variety of culinary applications. It is an acid and it is often used as a major component in baking powder, combined with baking soda to react when the mixture is moistened to ensure that baked goods will rise well. Although it is an acid, the cream of tartar and the baking soda will not react when dry, so the entire reaction is saved for the mixing bowl and the oven. More visibly, since most of us do not mix our own baking powder, cream of tartar is used as a stabilizing agent and is added to beaten egg whites to increase their stability and volume. It is also sometimes added to candies or frostings to give them a

creamier texture because it can help to prevent the crystallization of cooked sugar. In some situations, vinegar can be substituted for cream of tartar, although there is no exact substitute for the powder. This can be done when beating egg whites or making meringue, and it can also be done in a baking recipe that calls for separate measures of cream of tartar and baking soda. For candy making, it is best to refer to the recipe and see if substitutions will work because the recipes are often very sensitive to substitutions. See also Potassium Bitartrate. / из винной кислоты (tartaric acid, $HOOC(CHOH)_2COOH$). Смотрите также Кислый Виннокислый Калий (Potassium Bitartrate).

CREASE = ЗАЛОМ (или СКЛАДКА, или МОРЩИНА, или НАЖИМ ВАЛЬЯНОМ, или ЗАСЕЧКА, или ЗАВАЛ, или ДОЛЕВАЯ ПОЛОСА) – Creases:- a hard fold in a fabric, i.e. one that cannot be readily removed by those means normally available to a garment maker, e.g., by steam pressing. Note:- this defect is most often caused by distortion of the yarns during wet processing. Crease:- a fabric defect across the fabric width usually caused by a sharp fold. Creases:- Fabric:- satin automobile slip-cover fabric; Construction:- (i) Count:- 240 x 72; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- 210/34 bright nylon; Finish:- cross-dyed navy (viscose) and white (nylon). Defect:- short warpwise creases. Analysis:- examination showed that the short creases started at filling changes, where the yarn seemed to have contracted more than normally for a few inches, giving a stretched- or tight-yarn appearance. Physical tests on the yarn from the 'tight' and normal areas confirmed the fact that the nylon varied in its stress-strain characteristics. This defect was attributed to the presence of some yarn which had not been so completely shrunk, or 'relaxed', as that in other sections. At the time these goods were woven, it was difficult for the yarn manufacturer to produce all nylon which was completely and uniformly relaxed, and the strained-yarn appearance was frequently encountered in both warp and filling of woven fabrics. Crease is a fabric defect evidenced by a break, line, or mark generally caused by a sharp fold. Synonym:- Mill Wrinkle. Creases:- caused by uneven tension and tautness on the cloth as it goes through the wet and dry finishing departments of the mill. They have to be combated in the finishing of cloth in order to make the material appealing to the eye. Washer wrinkles are most difficult to remove. Creases:- any fold. Finishing defect. Creases:- Garment:- woman's suit jacket; Fabric Construction:- (i) Count:- 104 x 74; (ii) Warp:- 20/1 25% 1'-in. L^-den. bright viscose rayon 50% 2-in. 3-den. dull viscose rayon 25% 58's wool cut 2 in.; (iii) Filling:- 22/1, same blend as warp. Complaint:- irregular creases in several places, which the garment manufacturer claimed could not be removed in pressing. Analysis:- it was impossible to take out the creases by any known pressing methods, wet, dry, or with a steam iron. Records indicated that the fabric in this garment had been given a resin crease-resistant finish. On removal of the urea formaldehyde resin from a cutting in the laboratory, it was found that the creases could be eliminated by ordinary hand ironing. It appeared that this defect was due to the introduction of creases in the goods just prior to the application of the resin and curing. As a result, they were permanently set or cured into the fabric as long as the resin was present. Crease is a break or line in a fabric generally caused by a sharp fold. Creases may be either desirable or undesirable, depending upon the situation. A crease may be intentionally pressed into a fabric by application of pressure and heat and sometimes moisture. / Найлан (Nylon). Уточина:- . Порок или дефект заключительной отделки. Под Заломом понимается местный порок в виде неустранимых следов складок. Размер порока – по всему куску. Под Складкой понимается порок в виде сгиба полотна. Нажим Вальяном – порок ткани. Размер порока – по всему куску. Долевая Полоса – порок валки тканей. Морщины – результат неодинаковой усадки ткани по ширине в процессе валки суконной ткани. Засечки:- представляют собой полосы, окрашенные менее интенсивно, чем вся ткань, образуются при крашении в расправленном состоянии вследствие образования складок, часто из-за плохого оформления шва между кусками. Торец (crease):- порок заключительной отделки ткани в виде сгиба полотна. Примечание:- этот порок чаще всего вызван неправильной намоткой ткани в рулон во время влажной обработки.

CREASE MARK = ОТМЕТИНА ОТ НАЖИМА ВАЛЬЯНОМ (или ОТМЕТИНА ОТ ЗАЛОМА) – Crease Mark is a visible deformation left in a fabric after a crease has been incompletely removed during fabric processing. Fabrics defect. Crease Mark is a mark left in a fabric after a crease has been removed during fabric processing. Note:- this defect is the result of a permanent distortion of the yarns or damage to the fibers during creasing. Crease Mark differs from crease streak in that streak will probably appear for an entire roll. Crease mark appears where creases are caused by fabric folds in the finishing process. On napped fabric, final pressing may not be able to restore fabric or original condition. Often discoloration is a problem. / Фиксация Залома (crease mark):- порок заключительной отделки ткани в виде неустранимых складок. Примечание:- этот порок – результат постоянного смятия ткани или повреждения волокон во время сдваивания полотна.

CREASE RECOVERY = ВОССТАНОВЛЕНИЕ СМИНАЕМОСТИ (или ИСЧЕЗНОВЕНИЕ СМИНАЕМОСТИ, или РАСПРАВЛЕНИЕ СКЛАДОК (после смятия)) – Crease Recovery:- crease is a fold in fabric introduced unintentionally at some stages of processing. Crease or crushing of textile material is a complex effect involving tensile, compressive, flexing and torsional stresses. Crease Recovery is a fabric property which indicates the ability of fabric to go back to its original position after creasing. Crease recovery is a measure of creases resistance, specified quantitatively in terms of crease recovery angle. To measure this, the popular instrument is Shirley crease recovery tester. The instrument consists of a circular dial which carries the clamp for holding the specimen. Directly under the centre of the dial there is a knife edge and an index line for measuring the recovery angle. Crease recovery is determined depending upon this recovery angle. If the angle is 0° then recovery is zero and if the angle is 180° then recovery is full. Crease recovery depends on the construction, twist of yarn, pressure, time etc. Usually crease recovery is more in warp way than in weft way. This is because warp yarns are well in quality, strength, treated with sizing, kept in more tension during weaving etc. See also Wrinkle Recovery. / Щёли (Shirley).

CREASE–RESISTANT = СТОЙКОЕ К ЗАЛОМАМ (или СТОЙКОЕ К СМИНАНИЮ, или НЕСМИНАЕМОЕ) – Crease-Resistant:- this refers to the ability of a fabric to resist and recover from creasing during use. Wool is considered to be very crease resistant, while cotton is not. And don't even get me started on linen! Crease-Resistant is a term used to describe a fabric treated chemically to improve its resistance to and recovery from wrinkling.

CREASE RESISTANT FINISH = ПРОТИВОСМИНАЕМАЯ ОТДЕЛКА (или НЕСМИНАЕМАЯ ОТДЕЛКА) – Crease Resistant Finish, also referred to as CRF. Finishes used on fabrics that make them resistant to wrinkling and creasing, such as synthetic resin type finishes like durable press. Today some fabrics are made highly resistant to wrinkling through fiber blending and construction.

CREASE RETENTION = УДЕРЖИВАНИЕ СМИНАЕМОСТИ (или СОХРАНЕНИЕ СМИНАЕМОСТИ) – Crease Retention is the ability of a cloth to hold or pleat or a crease, which has been intentionally created, through the use of a heat treatment. Heat setting of thermoplastic fibers causes creases to be permanently set. Crease Retention is the ability of a fabric to maintain an inserted crease. Crease retention can be measured subjectively or by the relation of a crease in a subsequent state to the crease in the initial state. Crease retention may be strongly dependent on the conditions of use, e.g., normal wear, washing or tumble-drying.

CREASE STREAK = ЗАТАСК ОТ ЗАЛОМА (или ПОЛОСКА ОТ СКЛАДКИ, или ЧЕРТА ОТ МОРЩИН или НАЖИМА ВАЛЬЯНОМ или ЗАСЕЧКИ или ЗАВАЛА или ДОЛЕВОЙ ПОЛОСЫ) – Crease Streak:- a dyed-in mark of a crease, usually along the length direction, of a lighter color within the crease area and often with edges darker than the adjacent normal fabric. Note:- this defect is often caused by the fabric being paddyed whilst creased. Crease Streak occurs in tubular knits. Results from creased fabric

passing through squeeze rollers in the dyeing process. Defect Name:- Crease Streak. Defect Type:- Finishing Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Crease Streak:- This is the result of creased fabric passing through squeeze rolls in the dyeing operation and the crease then being removed in a subsequent process. Severity:- Major. / Затаск от печати, не более 2 сантиметров (см). Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Засечки:- представляют собой полосы, окрашенные менее интенсивно, чем вся ткань, образуются при крашении в расправленном состоянии вследствие образования складок, часто из-за плохого оформления шва между кусками. Полосатость Складки (crease streak):- порок заключительной отделки ткани в виде затекания краски в складки обычно вдоль направления основы, более светлой в пределах участка складки и часто с краями, более тёмными, чем смежная обычная ткань. Примечание:- этот порок часто вызывается красильным раствором во время сминания.

CREASE SUEDED = XX – Defect Name:- Crease Sueded. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Crease Sueded:- This is the result of a creased fabric passing through the sueder. The precision set sueder roll cuts deeper into the creased areas due to the extra thickness. Severity:- Major.

CREATION = СОТВОРЕНИЕ (или СОЗДАНИЕ) – Creation:- most cultures subscribe to a legend that the earth or universe was created in a relatively short period of time by a supernatural power, together with all existing Species (presumably including the Cactaceae and all other succulent plants.) Compare with Evolution. / Виды (Species).

CREDIT = КРЕДИТ – (1) Credit:- entails the borrowing of a specific sum of money subject to certain conditions relating, in particular, to the interest rate, repayment and, possibly, pieces of collateral. Generally speaking, the word loan is used for long-term borrowing, whereas the term credit refers to the short, medium and long-term lending of money and capital. Examples of the various forms of credit are current account overdrafts, which are payable daily, bills of exchange and mortgages. Temporary granting of money by a lender (e.g., a bank) to a borrower (natural or legal entity) upon the promise of repayment at a later date, usually with interest. There are many different types of loans, such as consumer loans, lombard loans, mortgage loans, secured or unsecured credit, etc. Ability to obtain goods, services or money in exchange for a promise of future payment. Economic units do not always have the capital or resources required to pay for their business, investment or consumption needs at a given time. Credit is a primary means of bringing resources in line with needs, expectations or decisions. The word Credit is also used to denote the amount of credit that is potentially available to an individual, government, business or other public or private entity. In this sense, credit measures the possibility of securing loans or payment terms, and reflects a creditor's confidence in a borrower, based on the borrower's income and assets, whether personal or professional, including the borrower's character and good name. Also known as Loan. Credit is an amount of money that a lender provides to you. For credit cards and lines of credit, you can charge/spend any amount from your credit limit to make purchases or take cash advances. As long as you pay the minimum amount due each month by the due date, you can continue to use your remaining available credit. For fixed loans, the credit is the amount lent upon opening of the account. / (например,) . Хозяйствующие субъекты . выплата (repayment) . Под Кредитом, от Латинского слова Creditum, означающее Ссуда, понимается предоставление денег или товаров в долг (пользование на срок на условиях возвратности) и, как правило, с уплатой процента. Для докапиталистических формаций был характерен ростовщический кредит. При капитализме кредит превратился в форму движения ссудного капитала. При империализме кредит монополизируется. Кредит выступает как банковский и коммерческий. Кредит выдаётся на заранее обусловленную сумму, на фиксированный срок и возвращается (погашается) банку заёмщиком в заранее обусловленный день. Кредит выплачивается в обусловленный кредитным договором день. Кредит предусматривает, как правило, переход заёмщика на расчётно-кассовое обслуживание в банк кредитор. Кредит, как правило, выдаётся под залог и предусматривает обороты по расчётному счёту, адекватные сумме займа.

(2) In double-entry accounting, entry made on the right (or liabilities) side of an account to indicate the reduction or elimination of an asset or expense, or the creation of or addition to a liability or item of net worth or revenue. Counterpart of a Debit. Credit is a 'payment' entry into an account, or the right-side column of entries into the account. Credit is an accounting entry which results in either an decrease in assets or an increase in liabilities or net worth. The opposite of Debit. See also Debit. / строка баланса (item). В бухгалтерии под Кредитом, от Латинского слова Credit, означающее Он Верит, понимается правая сторона бухгалтерских счетов. В активных счетах запись в кредит показывает уменьшение, а в пассивных – увеличение средств.

(3) Credit is the promise to pay in the future in order to buy or borrow in the present. The right to defer payment of debt.

CREDIT AGREEMENT = СОГЛАШЕНИЕ О КРЕДИТЕ (или КРЕДИТНЫЙ ДОГОВОР) – (1) Credit Agreement is an arrangement in which one party borrows or takes possession in the present by promising to pay in the future. Contract by which a bank grants a customer either a loan or a credit line. / Соглашение о Кредите (или Кредитный Договор) представляет собой договорённость, по которой одна сторона заимствует или принимает во владение в настоящее время, обещая оплатить это в будущем. Контракт, по которому банк предоставляет клиенту либо ссуду, либо кредитную линию.

(2) Credit Agreement is an agreement between carrier and shipper for release of cargo with promise to pay ocean freight within a specified timeframe. Document signed by the shipper which binds shipper to credit terms of the conference or agreement body.

CREDIT BALANCE = КРЕДИТОВОЕ САЛЬДО – (1) Credit Balance is a balance remaining after one of a series of bookkeeping entries. This amount represents a liability or income to the entity. See also Balance, and Debit Balance. Credit Balance is the amount of money that somebody owes on a credit account. Credit Balance is Account Receivable term indicated money owed to the customer from a deposit on an undelivered sale, a cancelled sale or a returned item. Total of Credit Balances are reflected in the Liability account Customer Deposits. Balance remaining after one of a series of bookkeeping entries. This amount represents a liability or income to the entity. A balance that represents a liability or income to the company. In accounts payable general ledger account, a credit balance represents money owed to the company's vendors. / В бухгалтерском учёте под Кредитовым Сальдо понимается финансовое положение лица, при котором кредит больше дебета. Оно отражает состояние источников хозяйственных средств на определённую дату и показывается в пассиве баланса.

(2) In a client's cash account at a brokerage firm, the amount that the firm owes to the client. This equals money deposited and remaining after any purchases are paid, plus uninvested proceeds from securities sold and not sent to the client. Cash and the market value of securities held in a brokerage account. Compare Debit Balance. In a client's margin account at a brokerage firm a credit balance may mean either:- Proceeds from short sales that are held in escrow for the securities borrowed for these sales, plus the required margin for the trade. Proceeds:- Any free credit balances, or net balances, which can be withdrawn at any time. A free credit balance occurs when all previously margined securities have been paid for in full. Special miscellaneous account (SMA) balances are not free credit balances. If money is withdrawn, a new or increased debit balance will be incurred. SMA is generated from the borrowing power of margin securities within the client's account. In a cash account, the Credit Balance is the amount of money in a customer's account after all debts have been paid and all proceeds from sales received. In a margin account, a credit balance would

include the proceeds held from a short sale which would be held in escrow for the borrowed securities for these sales. In a client's cash account at a brokerage firm, the amount that the firm owes to the client. This equals money deposited and remaining after any purchases are paid, plus uninvested proceeds from securities sold and not sent to the client. The amount remaining in a cash account or margin account after all securities have been paid for. Credit Balance is the surplus in a cash account with a broker after purchases have been paid for, plus the extra cash from the sale of securities. / строка баланса (item).

CREDIT BUREAU = КРЕДИТНОЕ БЮРО – A Credit Bureau is a company that maintains credit files. Potential creditors generally check your credit bureau file when you apply for a loan, credit card or even to get the phone connected. The credit bureau also records cases of default in your obligations to lenders or credit providers. If you are denied credit, the creditor must tell you where they got the credit information. Credit Bureau is a business organization that puts together information for your credit file, keeps it up to date, and makes it available for a fee to lenders, insurance companies, and potential employers. Credit Bureau is an agency that researches and collects individual credit information and sells it for a fee to creditors so they can make a decision on granting loans. Typical clients include banks, mortgage lenders, credit card companies and other financing companies. Also commonly referred to as Consumer Reporting Agency or Credit Reporting Agency. A credit bureau doesn't decide whether an individual qualifies for credit or not. It only collects information that it considers relevant to a person's credit history and habits. The three main credit bureaus in the United States are Equifax Inc. (headquartered in Atlanta, State of Georgia), Experian PLC (headquartered in Dublin, Ireland) and TransUnion (headquartered in Chicago, State of Illinois). / Кредитное Бюро – деловая организация, которая собирает по частям и соединяет в одно целое информацию по Вашей папке по кредитам (кредитному файлу), хранит и своевременно пополняет её и делает её доступной за вознаграждение для ссудодателей (или займодавцев), страховых компаний и потенциальных работодателей. Кредитное Бюро – агентство, которое собирает информацию о кредитной истории клиентов и их кредитоспособности и предоставляет её учреждениям-кредиторам за комиссию. Бюро ведёт досье на миллионы клиентов, в которых подробно описывается, какие кредиты они получали, на какие подали заявки, как они обслуживали свои кредиты и вовремя ли оплачивали свои счета. Бюро получает эту информацию от организаций-кредиторов, таких, как компании кредитных карт, торговые фирмы, компании бензозаправочных станций и прочие. Потенциальные кредиторы изучают информацию бюро, которая постоянно обновляется, и на её основе принимают решение – предоставлять или нет кредит конкретному клиенту, а если да, то сколько средств ему можно выделить. Согласно федеральному Акту о Точной Отчётности по Кредитам (Fair Credit Reporting Act) клиент имеет право получить копию своего кредитного досье и оспорить любой его пункт, который он считает неправильным. В США существует 500 кредитных бюро, которые работают через три автоматизированные системы:- Эквифэкс Инк. (Equifax Inc.; со штабквартирой в Атланте, Штат Джорджия), Экспириэн Пи.Эл.Си. (Experian PLC; со штабквартирой в Дублине, Ирландия), ТчрэнсЮниэн (TransUnion; со штабквартирой в Чикаго, Штат Иллинойс) и Ти.Ар.ДаблЮ. Инк. (TRW Inc.; Штат Калифорния).

CREDIT CARD = КРЕДИТНАЯ КАРТА – Credit Card is a card indicating that the holder has been granted a line of credit. Credit Card is a bank payment card that enables the cardholder make cashless payments around the world, in the respective national currencies, by signing payment vouchers in establishments associated as merchant partners of the card company or the card system. The transactions are collected and invoiced to the cardholder once a month. The cardholder receives a clear statement of the transactions. The merchant companies (businesses, hotels, restaurants, travel agencies, filling stations, etc) are each identified as such by the respective credit card symbol. Furthermore, a credit card together with a PIN can also be used to obtain cash from ATMs at participating banks around the world. The most well known credit card organizations are MasterCard (Eurocard), Visa, Diners Club and American Express. Credit Card is any card, plate or coupon book that may be used repeatedly to borrow money or buy goods and services on credit. Card issued by credit card organizations (American Express, Cirrus, Diners Club International, Eurocard/MasterCard International Inc, VISA International Service Association) or department stores, etc, showing the member's name, signature and number, permitting the cashless purchase of goods and services at firms or enterprises associated with the credit card organization, such as hotels, retailers, restaurants, transport companies, etc. Payments are made monthly. Credit cards issued with Personal Identification Number (PIN) codes may also be used to withdraw cash from bancomats. / (Амэрикэн Экспрэс (American Express), Сирэс (Cirrus), Дайнёз Клаб Интёнэшэнэл (Diners Club International), Юэкард/МэстчёКард Интёнэшэнэл Инк. (Eurocard/MasterCard International Inc.), ВИЗА Интёнэшэнэл Сёвис Эсосиэйшэн (VISA International Service Association)). Кредитная Карта – пластиковая карточка, которая выпускается банком, ссудосберегательной компанией, крупным универмагом, нефтяной компанией или другой организацией, предоставляющей кредиты или продающей в кредит товары и услуги. Она даёт владельцу право совершать покупки с отсрочкой платежа примерно на 25 дней, в течение которых проценты на остаток долга не начисляются. После этого на невыплаченный остаток задолженности владельцу карточки начинает начисляться не вычитаемый из его базы налогообложения потребительский процент (consumer interest). По некоторым кредитным карточкам по остатку задолженности проценты начинают взиматься с того дня, как была зарегистрирована оплата покупки по карточке. Большинство кредитных карточек также позволяет своим владельцам получать наличные деньги в форме налично-денежных кредитов (cash advance).

CREDIT CHECKING = ПРОВЕРКА КРЕДИТОСПОСОБНОСТИ – Credit Checking is a check performed on the financial backing of the counterparties in a forex transaction. This credit check ensures that both parties have the means necessary to cover their leveraged positions in the trade and is done before the transaction takes place. Without the process of credit checking, one party in a forex transaction would have no assurances as to the creditworthiness of the other party involved. By engaging in credit checking before transactions take place, confidence is maintained that each party has enough credit to carry out and honor the transaction. Credit Checking:- credit is an important consideration when making trades. As large sums of money change hands it is important to check that the counter-party is capable of making the trade. Once the price has been agreed then the credit is checked. If the credit is not good then no trade takes place.

CREDIT COMMISSION = (ЕДИНОРАЗОВАЯ) КОМИССИЯ ЗА ПРЕДОСТАВЛЕНИЕ КРЕДИТА – Credit Commission is a special bank charge levied on a loan in addition to the interest. May also serve as a risk premium. / Особый банковский сбор, взимаемый за предоставление ссуды в добавок к проценту по этой ссуде. Может также расцениваться как премия за риск.

CREDIT COSTS = ЗАТРАТЫ ПО ОБСЛУЖИВАНИЮ КРЕДИТОВ (или ИЗДЕРЖКИ ПО КРЕДИТУ) – Credit Costs are all of the costs and expenses incurred by the borrower in utilizing a credit. In the case of personal loans, the additional instalment (hire purchase) charge must be paid on top of interest charges. In the case of construction loans, a credit commission is payable.

CREDIT DEFAULT OPTION = ОПЦИОН НА СЛУЧАЙ НЕПОГАШЕНИЯ КРЕДИТА (или ОПЦИОН НА СЛУЧАЙ НЕИСПОЛНЕНИЯ ОБЯЗАТЕЛЬСТВ ПО КРЕДИТУ) – Credit Default Option is an option that has a payoff linked to the credit worthiness or payment performance of the underlying. The option protects the holder against a default over a specified time period, the payout being conditional on some event of default or non-payment by the credit. Such options are used in international trade as a means of insuring the credit risk. Credit Default Option:- a put option that makes a payoff in the event the issuer of a specified

reference asset defaults. Also known as Default Option. In finance, a Default Option, Credit Default Swaption or Credit Default Option is an option to buy protection (payer option) or sell protection (receiver option) as a credit default swap on a specific reference credit with a specific maturity. The option is usually European, exercisable only at one date in the future at a specific strike price defined as a coupon on the credit default swap. Credit default options on single credits are extinguished upon default without any cashflows, other than the upfront premium paid by the buyer of the option, of course. Therefore buying a payer option is not a good protection against an actual default, only against a rise in the credit spread. This may explain why such options are very illiquid. They may also feature quite high implied volatilities, as shown by Damiano Brigo (2005). However options on credit indices such as iTraxx and CDX include any defaulted entities in the intrinsic value of the option when exercised. This is expressed at times by stating that the options offer 'front-end protection'. / Дамиано Бриго (Damiano Brigo). иТчрэкс (iTraxx) и Си.Ди.Экс. (CDX). Опцион на продажу, который окупается в случае неспособности продавца опциона выполнить обязательства по соответствующему активу. Известен также как Дифолтный Опцион (Default Option).

CREDIT DEFAULT SWAP = СВОП НА НЕСОСТОЯТЕЛЬНОСТЬ ПО КРЕДИТУ (или СВОП НА ДИФОЛТ ПО КРЕДИТУ, или СВОП НА СЛУЧАЙ НЕПОГАШЕНИЯ КРЕДИТА, или СВОП НА СЛУЧАЙ НЕИСПОЛНЕНИЯ ОБЯЗАТЕЛЬСТВ ПО КРЕДИТУ) – Credit Default Swaps (CDSs) are bilateral contracts between a credit protection seller (seller) and a credit protection buyer (buyer). Under a credit default swap contract the seller agrees to pay out sums by reference to a single or group of reference entities, which may be corporates or sovereigns. Parmalat, Enron, Worldcom and Railtrack were all popular reference entities in the credit default swap market before their respective collapses. The reference entity is not a party to the transaction and is probably unaware of its existence. The buyer buys a pre-agreed amount of credit protection on a reference entity's obligations. These are decided at the outset; for example, a specific security such as a €200 million floating rate bond issue, or a wide-ranging class of obligations such as bonds or loans above a certain threshold. The seller sells credit protection against the loss in value of the reference entity's obligations if certain events occur (that is, credit events). The parties choose which credit events are applicable to the reference entity from a list of definitions set out in the 2003 ISDA® Credit Derivatives Definitions:- namely, bankruptcy, failure to pay, restructuring, repudiation/moratorium, obligation acceleration and obligation default. The choice of credit events will also depend on the jurisdiction of incorporation and business type of the reference entity. For example, parties to a market standard credit default swap relating to Ford, a North American investment grade corporate as a reference entity, would select different applicable credit events to one with British Airways, a European investment grade corporate. If a defined credit event occurs, the seller (and also usually the buyer) has the right, but not the obligation, to declare a credit event. This is done by delivering a credit event notice to the other party and also usually attaching two sources of public information, such as news reports, to back up the claim. The transaction will then be settled either by the seller paying a cash amount to the buyer designed to mirror the losses made on the reference entity's securities or, alternatively, by physical settlement. In physically settled transactions, the seller accepts delivery of obligations of the reference entity with a face value equal to the transaction's notional amount. Although following the credit event they are worth far less than their face value, the seller pays the full face amount of the securities to the buyer. Contract, which commits two counterparties to exchange a periodic fee in exchange for a payment contingent on a default event or any other, agreed change in the credit quality of a reference asset for an agreed period of time. A Credit Default Swap (CDS) is a credit derivative contract in which one party (protection buyer) pays an periodic fee to another party (protection seller) in return for compensation for default (or similar credit event) by a reference entity. The reference entity is not a party to the credit default swap. It is not necessary for the protection buyer to suffer an actual loss to be eligible for compensation if a credit event occurs. The protection buyer gives up the risk of default by the reference entity, and takes on the risk of simultaneous default by both the protection seller and the reference credit. The protection seller takes on the default risk of the reference entity, similar to the risk of a direct loan to the reference entity. A bilateral over-the-counter contract in which the seller agrees to make a payment to the buyer in the event of a specified credit event in exchange for a fixed payment or series of fixed payments; the most common type of credit derivative. Also known as Credit Swap; similar to Credit Default Option. Credit-Default Swap is a credit default swap is a credit derivative contract between two counterparties. The buyer makes periodic payments to the seller, and in return receives a payoff if an underlying financial instrument defaults, typically a bond or loan. Single-name CDS is a credit derivative where the reference entity is a single name. Credit Default Swap (CDS) is a swap designed to transfer the credit exposure of fixed income products between parties. A credit default swap is also referred to as a Credit Derivative Contract, where the purchaser of the swap makes payments up until the maturity date of a contract. Payments are made to the seller of the swap. In return, the seller agrees to pay off a third party debt if this party defaults on the loan. A CDS is considered insurance against non-payment. A buyer of a CDS might be speculating on the possibility that the third party will indeed default. The buyer of a credit default swap receives credit protection, whereas the seller of the swap guarantees the credit worthiness of the debt security. In doing so, the risk of default is transferred from the holder of the fixed income security to the seller of the swap. For example, the buyer of a credit default swap will be entitled to the par value of the contract by the seller of the swap, should the third party default on payments. By purchasing a swap, the buyer is transferring the risk that a debt security will default. Multi-name CDS is a contract where the reference entity is more than one name, as in portfolio or basket CDS or CDS indices. A basket CDS is a CDS where the credit event is the default of some combination of the credits in a specified basket of credits. A Credit Default Swap (CDS) is a financial swap agreement that the seller of the CDS will compensate the buyer in the event of a loan default or other credit event. The buyer of the CDS makes a series of payments (the CDS 'fee' or 'spread') to the seller and, in exchange, receives a payoff if the loan defaults. It was invented by Blythe Masters (Blythe Sally Jess Masters (born:- 22 March 1969) is an economist and current head of Global Commodities at JPMorgan Chase & Co.) from JP Morgan in 1994. In the event of default the buyer of the CDS receives compensation (usually the face value of the loan), and the seller of the CDS takes possession of the defaulted loan. However, anyone can purchase a CDS, even buyers who do not hold the loan instrument and who have no direct insurable interest in the loan (these are called 'Naked' CDSs). If there are more CDS contracts outstanding than bonds in existence, a protocol exists to hold a credit event auction; the payment received is usually substantially less than the face value of the loan. Credit default swaps have existed since the early 1990s, and increased in use after 2003. By the end of 2007, the outstanding CDS amount was USD62.2 trillion, falling to USD26.3 trillion by mid-year 2010 but reportedly USD25.5 trillion in early 2012. CDSs are not traded on an exchange and there is no required reporting of transactions to a government agency. During the 2007–10 financial crisis the lack of transparency in this large market became a concern to regulators as it could pose a systemic risk. In March 2010, the (DTCC) Trade Information Warehouse announced it would give regulators greater access to its credit default swaps database. CDS data can be used by financial professionals, regulators, and the media to monitor how the market views credit risk of any entity on which a CDS is available, which can be compared to that provided by the Credit Rating Agencies. US Courts may soon be following suit. Most CDSs are documented using standard forms drafted by the International Swaps and Derivatives Association (ISDA), although there are many variants. In addition to the basic, single-name swaps, there are basket default swaps (BDSs), index CDSs, funded CDSs (also called Credit-Linked Notes), as well as Loan-Only Credit Default Swaps (LCDS). In addition to corporations and governments, the reference entity can include a special purpose vehicle issuing asset-backed securities. Some claim that derivatives such as CDS are potentially dangerous in that they combine priority in bankruptcy with a lack of transparency. A CDS can be unsecured (without collateral) and be at higher risk for a default. Description:- a CDS is linked to a 'reference entity' or 'reference obligor', usually a corporation or government. The reference entity is not a party to the contract. The buyer makes regular premium

payments to the seller, the premium amounts constituting the 'spread' charged by the seller to insure against a credit event. If the reference entity defaults, the protection seller pays the buyer the par value of the bond in exchange for physical delivery of the bond, although settlement may also be by cash or auction. A default is often referred to as a 'Credit Event' and includes such events as failure to pay, restructuring and bankruptcy, or even a drop in the borrower's credit rating. CDS contracts on sovereign obligations also usually include as credit events repudiation, moratorium and acceleration. Most CDSs are in the USD10–20 million range with maturities between one and 10 years. Five years is the most typical maturity. An investor or speculator may 'buy protection' to hedge the risk of default on a bond or other debt instrument, regardless of whether such investor or speculator holds an interest in or bears any risk of loss relating to such bond or debt instrument. In this way, a CDS is similar to credit insurance, although CDS are not subject to regulations governing traditional insurance. Also, investors can buy and sell protection without owning debt of the reference entity. These 'naked credit default swaps' allow traders to speculate on the creditworthiness of reference entities. CDSs can be used to create synthetic long and short positions in the reference entity. Naked CDS constitute most of the market in CDS. In addition, CDSs can also be used in capital structure arbitrage. A 'credit default swap' (CDS) is a credit derivative contract between two counterparties. The buyer makes periodic payments to the seller, and in return receives a payoff if an underlying financial instrument defaults or experiences a similar credit event. The CDS may refer to a specified loan or bond obligation of a 'reference entity', usually a corporation or government. As an example, imagine that an investor buys a CDS from AAA-Bank, where the reference entity is Risky Corp. The investor – the buyer of protection – will make regular payments to AAA-Bank – the seller of protection. If Risky Corp. defaults on its debt, the investor receives a one-time payment from AAA-Bank, and the CDS contract is terminated. If the investor actually owns Risky Corp's debt (i.e. is owed money by Risky Corp.), a CDS can act as a hedge. But investors can also buy CDS contracts referencing Risky Corp. debt without actually owning any Risky Corp. debt. This may be done for speculative purposes, to bet against the solvency of Risky Corp. in a gamble to make money, or to hedge investments in other companies whose fortunes are expected to be similar to those of Risky Corp.. If the reference entity (i.e. Risky Corp.) defaults, one of two kinds of settlement can occur:- (i) the investor delivers a defaulted asset to Bank for payment of the par value, which is known as Physical Settlement; and (ii) AAA-Bank pays the investor the difference between the par value and the market price of a specified debt obligation (even if Risky Corp. defaults there is usually some recovery, i.e. not all the investor's money is lost), which is known as Cash Settlement. The 'spread' of a CDS is the annual amount the protection buyer must pay the protection seller over the length of the contract, expressed as a percentage of the notional amount. For example, if the CDS spread of Risky Corp. is 50 basis points, or 0.5% (1 basis point = 0.01%), then an investor buying USD10 million worth of protection from AAA-Bank must pay the bank USD50 000. Payments are usually made on a quarterly basis, in arrears. These payments continue until either the CDS contract expires or Risky Corp. defaults. All things being equal, at any given time, if the maturity of two credit default swaps is the same, then the CDS associated with a company with a higher CDS spread is considered more likely to default by the market, since a higher fee is being charged to protect against this happening. However, factors such as liquidity and estimated loss given default can affect the comparison. Credit spread rates and credit ratings of the underlying or reference obligations are considered among money managers to be the best indicators of the likelihood of sellers of CDSs having to perform under these contracts. Differences From Insurance:- CDS contracts have obvious similarities with insurance, because the buyer pays a premium and, in return, receives a sum of money if an adverse event occurs. However there are also many differences, the most important being that an insurance contract provides an indemnity against the losses actually suffered by the policy holder on an asset in which it holds an insurable interest. By contrast a CDS provides an equal payout to all holders, calculated using an agreed, market-wide method. The holder does not need to own the underlying security and does not even have to suffer a loss from the default event. The CDS can therefore be used to speculate on debt objects. The other differences include:- (i) the seller might in principle not be a regulated entity (though in practice most are banks); (ii) the seller is not required to maintain reserves to cover the protection sold (this was a principal cause of AIG's financial distress in 2008; it had insufficient reserves to meet the 'run' of expected payouts caused by the collapse of the housing bubble); (iii) insurance requires the buyer to disclose all known risks, while CDSs do not (the CDS seller can in many cases still determine potential risk, as the debt instrument being 'insured' is a market commodity available for inspection, but in the case of certain instruments like CDOs made up of 'slices' of debt packages, it can be difficult to tell exactly what is being insured); (iv) insurers manage risk primarily by setting loss reserves based on the Law of large numbers and actuarial analysis. Dealers in CDSs manage risk primarily by means of hedging with other CDS deals and in the underlying bond markets; (v) CDS contracts are generally subject to mark-to-market accounting, introducing income statement and balance sheet volatility while insurance contracts are not; (vi) hedge accounting may not be available under US Generally Accepted Accounting Principles (GAAP) unless the requirements of FAS 133 are met. In practice this rarely happens; and (vii) to cancel the insurance contract the buyer can typically stop paying premiums, while for CDS the contract needs to be unwound. Risk:- when entering into a CDS, both the buyer and seller of credit protection take on counterparty risk:- (i) the buyer takes the risk that the seller may default. If AAA-Bank and Risky Corp. default simultaneously ('double default'), the buyer loses its protection against default by the reference entity. If AAA-Bank defaults but Risky Corp. does not, the buyer might need to replace the defaulted CDS at a higher cost. (ii) The seller takes the risk that the buyer may default on the contract, depriving the seller of the expected revenue stream. More important, a seller normally limits its risk by buying offsetting protection from another party – that is, it hedges its exposure. If the original buyer drops out, the seller squares its position by either unwinding the hedge transaction or by selling a new CDS to a third party. Depending on market conditions, that may be at a lower price than the original CDS and may therefore involve a loss to the seller. In the future, in the event that regulatory reforms require that CDS be traded and settled via a central exchange/clearing house, such as ICE TCC, there will no longer be 'counterparty risk', as the risk of the counterparty will be held with the central exchange/clearing house. As is true with other forms of over-the-counter derivative, CDS might involve liquidity risk. If one or both parties to a CDS contract must post collateral (which is common), there can be margin calls requiring the posting of additional collateral. The required collateral is agreed on by the parties when the CDS is first issued. This margin amount may vary over the life of the CDS contract, if the market price of the CDS contract changes, or the credit rating of one of the parties changes. Many CDS contracts even require to pay an upfront fee at the beginning (also referred to as 'Initial Margin'). Another kind of risk for the seller of credit default swaps is jump risk or jump-to-default risk. A seller of a CDS could be collecting monthly premiums with little expectation that the reference entity may default. A default creates a sudden obligation on the protection sellers to pay millions, if not billions, of dollars to protection buyers. This risk is not present in other over-the-counter derivatives. Sources of Market Data:- data about the credit default swaps market is available from three main sources. Data on an annual and semiannual basis is available from the International Swaps and Derivatives Association (ISDA) since 2001 and from the Bank for International Settlements (BIS) since 2004. The Depository Trust & Clearing Corporation (DTCC), through its global repository Trade Information Warehouse (TIW), provides weekly data but publicly available information goes back only one year. The numbers provided by each source do not always match because each provider uses different sampling methods. According to DTCC, the Trade Information Warehouse maintains the only 'global electronic database for virtually all CDS contracts outstanding in the marketplace'. The Office of the Comptroller of the Currency publishes quarterly credit derivative data about insured US commercial banks and trust companies. Uses:- credit default swaps can be used by investors for speculation, hedging and arbitrage. Credit Default Swap (CDS) is a contract whereby the seller commits to repay an obligation (e.g., bond) underlying the contract at par in the event of a default. To produce this guarantee, a regular premium is paid

by the buyer during a specified period. / Пармалат (Parmalat), Энрон (Enron), Волдкам (Worldcom) и Рэйлтчрэк (Railtrack). Фод (Ford), Бритиш Эавэйз (British Airways). Блайс Мастёз (Blythe Masters) (Блайс Сали Дьжес Мастёз (Blythe Sally Jess Masters; родился:- 22 Марта 1969)) – тогдашний экономист и глава по Глобальным Родам Сырья (head of Global Commodities) в Дьжей.Пи.Моргэн Чэйс Энд Ко. (JPMorgan Chase & Co.). Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)) . или суверенные (самостоятельные). окупаемость (payoff). пузырь (bubble). Корп. (Corp.). Рыски Корп. (Risky Corp.). Эй.Ай.Дьжи. (AIG). Дипазитчори Тчраст Энд Клыринь Корпорэйшэн (Ди.Ти.Си.Си.) (Depository Trust & Clearing Corporation (DTCC)), Тчрэйд Инфомэйшэн Вэахаус (Ти.Ай.ДаблЮ.) (Trade Information Warehouse (TIW)). Своп на Несостоятельность по Кредиту, или Своп на Дифолт по Кредиту, или Своп на Случай Непогашения Кредита, или Своп на Случай Неисполнения Обязательств по Кредиту – контракт, по которому продавец обязуется оплатить обязательство (например, облигацию), лежащее в основе контракта по номинальной стоимости в случае несостоятельности (или дифолта). Для предоставления этой гарантии покупатель в течение определённого периода платит регулярную премию.

CREDIT DERIVATIVE = ПРОИЗВОДНОЕ НА КРЕДИТЫ (или КРЕДИТНЫЙ ДЕРИВАТИВ) – Credit Derivatives are financial instruments that make it possible to value and separately trade the credit risks (risks of default) associated with loans, bonds and other credit instruments without having to liquidate the original products. As a result, certain credit risks in a portfolio can be reduced, diversified or spread according to requirements. The buyer of the credit derivative acquires the right to receive a specific payment from the seller upon the occurrence of a specified default event, e.g., impairment of a loan. This assumption of risk customarily takes place versus payment of premiums. Credit derivatives are mostly traded as over-the-counter (OTC) transactions. The most well known credit derivate products are credit default swaps, total return swaps and credit linked notes. A Credit Derivative is a privately negotiated agreement that explicitly shifts credit risk from one party to the other. An over-the-counter derivative designed to assume or shift credit risk, that is, the risk of a credit event such as a default or bankruptcy of a borrower. For example, a lender might use a credit derivative to hedge the risk that a borrower might default or have its credit rating downgraded. Common credit derivatives include Credit Default Options, Credit Default Swaps, Credit Spread Options, Downgrade Options, and Total Return Swaps. Credit Derivative:- privately held negotiable bilateral contracts that allow users to manage their exposure to credit risk. Credit derivatives are financial assets like forward contracts, swaps, and options for which the price is driven by the credit risk of economic agents (private investors or governments). For example, a bank concerned that one of its customers may not be able to repay a loan can protect itself against loss by transferring the credit risk to another party while keeping the loan on its books.

CREDIT ELIGIBILITY = КРЕДИТНОЕ ПРАВОМОЧИЕ – Credit Eligibility is a capacity to conclude legally-binding loan agreements. Natural persons of full legal capacity, legal entities pursuant to civil and public law and commercial partnerships are all eligible for credit. The term Credit Eligibility is often confused with Creditworthiness.

CREDIT EVENT = КРЕДИТНОЕ СОБЫТИЕ – Credit Event:- any sudden and tangible (negative) change in a borrower's credit standing or decline in credit rating. A credit event brings into question the borrower's ability to repay its debt. It is the defining trigger in a credit derivative contract, or credit default swap. If the borrower experiences a credit event, then the buyer of the contract must pay the seller an agreed-upon sum to cover the loss. Credit events include bankruptcies or violating a bond indenture or other loan agreement. Any decline in the borrower's credit rating can trigger the swap. Credit events always refer to the condition of the borrower pertaining to the underlying asset and not to either the lender or the purchaser of the swap. Credit Event is the event such as a debt default or bankruptcy that will affect the payoff on a credit derivative. The International Swaps And Derivatives Association, Inc (ISDA®) has published a definition of a credit event. A Credit Event occurs when a person or organization defaults on a significant transaction. Because the marketplace recognizes such events as related to one's credit worthiness, credit events can trigger specific protections provided by credit derivatives, e.g., credit default swap, credit default swap index, credit default swap index tranche. The events triggering a credit derivative are defined in a bilateral swap confirmation which is a transactional document that typically refers to an ISDA master agreement previously executed between the two swap counterparties. There are several standard credit events which are typically referred to in credit derivative transactions:- (i) Bankruptcy; (ii) Failure to Pay; (iii) Restructuring; (iv) Repudiation; (v) Moratorium; (vi) Obligation Acceleration; and (vii) Obligation Default. / Событие, такое как несостоятельность (дифолт) по долгу или банкротство, которое будет воздействовать на окупаемость (payoff) по производному инструменту на кредиты. Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)) публиковало определение кредитного события.

CREDIT FACILITY = ВОЗМОЖНОСТЬ КРЕДИТА – Credit Facility is a type of loan made in a business or corporate finance context. Specific types of credit facilities are: revolving credit, term loans, committed facilities, letters of credit and most retail credit accounts. Companies frequently implement a credit facility in conjunction with closing a round of equity financing (raising money by selling shares of its stock). A key consideration for any company is how it will incorporate debt in its capital structure, at the same time it must consider the parameters of its equity financing. The company must look at its capital structure as a whole, determining how much capital it needs immediately and over time, and the combination of equity and debt that it will use to fulfill those requirements. Credit Facility is a flexible and simple form of borrowing, enabling customers to overdraw their current account up to an agreed limit (credit line). Debit interest is charged for days on which customers have overdrawn their account. Additional interest is charged for exceeding the agreed overdraft limit. The interest amounts are generally debited to current account on a quarterly basis. Overdraft interest rates vary according to current market conditions. Also referred to as Overdraft Facility.

CREDIT FOR AN UNLIMITED PERIOD = КРЕДИТ НА НЕОГРАНИЧЕННЫЙ ПЕРИОД – Credit For An Unlimited Period:- a loan granted for an unlimited period. May be revoked or cancelled at any time by either of the parties involved, e.g., current account credit. / Займ, предоставленный на неограниченный период. Может быть отозван или отменён в любое время любой из вовлечённых в него сторон, например, кредит текущего счёта.

CREDIT HISTORY = КРЕДИТНАЯ ИСТОРИЯ – Your Credit History is a record of the way you manage your debt. It is kept by credit bureaus in the form of a credit bureau file. Banks and credit card issuers tell the credit bureau details of all applications for credit and if you have defaulted on any obligations. When you apply for new credit or a loan, the credit provider will check your credit history before granting any credit. Information such as missed or late payments will be on your credit report for up to five years and bankruptcy filings can remain there for as long as seven years. Credit History is a record of how a person has borrowed and repaid debt. / Кредитная история это запись о том, как лицо занимало и рассчитывалось по своим долговым обязательствам.

CREDIT INSTITUTION = КРЕДИТНОЕ УЧРЕЖДЕНИЕ (или КРЕДИТНАЯ ОРГАНИЗАЦИЯ) – Credit Institution:- the German Banking Act (KWG) defines credit institutions as enterprises that conduct banking business commercially or on a scale that requires commercially organized business operations. Accordingly, at least one of the banking businesses listed in § 1 of the German Banking Act (KWG) must be carried out, for example, the deposit, lending, investment or payments (giro) businesses. An undertaking whose business is to receive deposits or other repayable funds from the public and to grant credit for its own account. Credit Institution:- banks and savings banks are the commonest types of credit institutions. According to Article 1(1) of Directive 2000/12/EC, a credit institution

is (i) an undertaking whose business is to receive deposits or other repayable funds from the public and to grant credit for its own account; or (ii) an undertaking or any other legal person, other than those under (i), which issues means of payment in the form of electronic money. 'Electronic money' shall mean monetary value, as represented by a claim on the issuer, which is:- (a) stored on an electronic device; (b) issued on receipt of funds of an amount not lower in value than the monetary value issued; and (c) accepted as a means of payment by undertakings other than the issuer. / (Ка.Ве.Ге. (KWG)).

CREDIT INSURANCE = СТРАХОВАНИЕ КРЕДИТОВ – Credit Insurance is a type of life insurance policy purchased by a borrower that pays off one or more existing debts in the event of a death, disability, or in rare cases, unemployment. Credit insurance is marketed most often as a credit card feature, with the monthly cost charging a low percentage of the card's unpaid balance. Credit insurance can be a financial lifesaver in the event of certain catastrophes. However, many credit insurance policies are overpriced relative to their benefits, as well as loaded with fine print that can make it hard to collect on. If you feel that credit insurance would bring you peace of mind, be sure to read the fine print as well as compare your quote against a standard term life insurance policy. Insurance against financial losses sustained through the failure, for commercial reasons, of policyholders' clients to pay for goods or services supplied to them. Credit Insurance is an insurance against losses due to inability or failure of the insured's customers to pay for goods sold by the insured. The insurance normally covers a specified percentage of each loss beyond a deductible indicated in the policy. Insurance is available covering a variety of risks, e.g., political and transfer risks (country risks) and financial risks (called Commercial Risks). Even comprehensive insurance, however, will not cover non-payment for contract disputes. / , например, .

CREDIT INTEREST = ПРОЦЕНТЫ К УПЛАТЕ (или УПЛАЧЕННЫЕ ПРОЦЕНТЫ) – Credit Interest:- interest payable. Term used in double-entry bookkeeping:- the bank enters customers' deposits on the assets side of its balance sheet. The opposite of Interest Earned, and Interest Received.

CREDIT LIMIT = КРЕДИТНЫЙ ЛИМИТ (или ЛИМИТ ПО КРЕДИТУ) – A Credit Limit is the maximum amount of credit that a financial institution or other lender will extend to a debtor for a particular line of credit (sometimes called a Credit Line, Line Of Credit, or a Tradeline). For example, it is the most that a credit card company will allow a card holder to take out at once on a card. This limit is based on a variety of factors ranging from an individual's ability to make interest payments, an organization's cashflow and/or ability to repay the credit card debt and is an obligation of the consumer to pay just like all other parts of the balance. Credit Limit is the maximum amount that may be borrowed on a credit card or under a home equity line of credit plan. Credit Limit is the amount of credit that a financial institution extends to a client. Credit limit also refers to the maximum amount a credit card company will allow someone to borrow on a single card. Credit limits are usually determined based on information contained in the application of the person seeking credit, or that person's credit rating. A borrower's credit limit may be raised after he or she exhibits timely and full repayments. However, having a high credit limit and multiple lines of credit may hurt a person's overall credit rating. In these cases, new potential lenders can see that the applicant has access to a large amount of debt, which may lower the chances that this person will be able to repay his or her debts in the future. As a result, new potential lenders might be less likely to offer an additional source of debt. Credit Limit is the maximum balance you can carry on your credit card or line of credit account. / Максимальная сумма, которая может быть заимствована по кредитной карте или .

CREDIT LINE = КРЕДИТНАЯ ЛИНИЯ – A Credit Line is an available amount of money that you can borrow. What is a credit line used for? Just about anything. You can get a credit line for personal or business spending. Find out what a credit line is and how they're used. What is a Credit Line? A credit line is money available for you to borrow. Instead of borrowing a specific amount of money and paying it back over time, the bank allows you to borrow any amount you need (up to your credit limit), whenever you need it. Contrast the credit line to a loan, where you borrow a fixed amount of money and start paying back the loan (or 'amortizing') with each payment. How Amortization Works:- What is a Credit Line Good For? Credit lines are nice because they're flexible. You don't have to apply for a new loan every time you need money. Instead, you get a credit line that allows you to borrow money as needed. If you need USD1 000 for a repair and you have a credit line, you can just write a check against the credit line. If you never need any money, you avoid taking out a loan and paying interest on money that you didn't need to borrow. Credit Line:- maximum amount of credit granted by the bank to individual borrowers. If the customer does not draw the entire credit line at once, he can dispose over the remaining amount at any time within the agreed term of the loan without filing a new credit application. Also known as Credit Limit. Line Of Credit (LOC) is an arrangement between a financial institution, usually a bank, and a customer that establishes a maximum loan balance that the bank will permit the borrower to maintain. The borrower can draw down on the line of credit at any time, as long as he or she does not exceed the maximum set in the agreement. The advantage of a line of credit over a regular loan is that interest is not usually charged on the part of the line of credit that is unused, and the borrower can draw on the line of credit at any time that he or she needs to. Depending on the agreement with the financial institution, the line of credit may be classified as a demand loan, which means that any outstanding balance will have to be paid immediately at the financial institution's request.

CREDIT MANAGEMENT = УПРАВЛЕНИЕ КРЕДИТОМ – Credit Management is a function performed within a company to improve and control credit policies that will lead to increased revenues and lower risk including increasing collections, reducing credit costs, extending more credit to creditworthy customers, and developing competitive credit terms. Also called Credit Control. Credit Management is a planning, implementing and monitoring the credit operations of a company. Credit Management is the process for controlling and collecting payments from your customers. A good credit management system will help you reduce the amount of capital tied up with debtors (people who owe you money) and minimise your exposure to bad debts. Good credit management is vital to your cash flow. It is possible to be profitable on paper and but lack the cash to continue operating your business. Credit management tips:- it is best to minimise the likelihood of bad debts through good credit management practices. Prepare your own policies and procedures for credit management eg. terms and conditions, invoicing promptly and monitoring your debts. Terms and Conditions:- (i) clearly state in writing your terms and conditions of trade and your credit policy in writing; (ii) draft terms and conditions that suit your business; (iii) it is advised you seek legal advice before finalising the document to ensure it has internal consistency and covers all the key issues; (iv) ensure the document does not contain any illegal terms and can be relied on in the event that court action is necessary to recover a debt; (v) include your terms on all quotes, estimates, contracts, agreements, purchase orders, and related documentation; (vi) clearly specify what will be supplied, when the work will be done, and when and how payment is to be made; and (vii) obtain a written acceptance of the agreement along with written approval of any variations to the original agreement. Some terms and conditions to consider include, but are not limited to:- (i) penalties for late payment:- you must specify the exact fees and rate of interest; (ii) your policy on returns and refunds (this must comply with the Australian Consumer Law); (iii) incentives for early payment; and (iv) whether a fee is charged for payment by credit card. The amount in Dollars or the percentage to be charged must be disclosed. 'Retention of title' clauses were sometimes included in terms and conditions but now you register your security interest in goods you supply or lease on the national Personal Property Securities (PPS) Register. The PPS Register replaces various commonwealth, state and territory registers with a single online service that covers security interests in assets including stock, vehicles, machinery, office equipment, crops and livestock – almost anything except real estate. Invoice Promptly:- include accurate details on your invoice for the goods or services supplied, the amount due along with the date and preferred payment method. Always try to resolve invoice queries or disputes

quickly. Monitor Your Debtors:- maintain your debtors' records to identify any due or overdue debts. Develop a good records management system and keep records up to date so you can quickly identify who owes you money and how much is owed. Take a proactive approach to credit management by contacting clients a few days before the due date to remind them a payment is due and ask if they foresee any problems with meeting their payment. Implement your debt collection practices the minute a debt becomes overdue and ensure clients do not exceed their credit limits. Credit Management:- the way you handle the money you borrow from banks or credit providers. For example, you should try to pay more than the minimum due each month and make sure payments are received by the due date. There is no clear definition of what Credit Management is. It is usually regarded as assuring that buyers pay on time, credit costs are kept low, and poor debts are managed in such a manner that payment is received without damaging the relationship with that buyer. A trade credit insurance company does all that. Either directly or in conjunction with a company's credit department. An approved credit management policy can offer assurances to a financing bank, which may facilitate financing. / Планирование, использование и наблюдение за операциями по кредиту компании.

CREDIT MEMORANDUM = КРЕДИТНЫЙ МЕМОРАНДУМ – Credit Memorandum is:- (1) a form or document used by a seller to notify the buyer of merchandise that the buyer's accounts payable is being credited (decreased) due to errors or other factors requiring adjustments. (2) A form given by a bank to a depositor to indicate that the depositor's balance is being increased due to some event other than a deposit, such as the collection by the bank of the depositor's note receivable. Credit Memorandum is a written agreement under which the bank grants the customer (borrower) a credit or a credit line. Credit Memorandum:- a Credit Memo is a contraction of the term 'Credit Memorandum', which is a document issued by the seller of goods or services to the buyer, reducing the amount that the buyer owes to the seller under the terms of an earlier invoice. The credit memo usually includes details of exactly why the amount stated on the memo has been issued, which can be used later to aggregate information about credit memos to determine why the company is issuing them. A credit memo may be issued because the buyer returned goods to the seller, or there is a pricing dispute, or a marketing allowance, or other reasons under which the buyer will not pay the seller the full amount of the invoice. The seller records the credit memo as a reduction of its accounts receivable balance, while the buyer records it as a reduction in its accounts payable balance. If the buyer has not yet paid the seller, the buyer can use the credit memo as a partial offset to its invoice-based payment to the seller. If the buyer has already paid the full amount of the invoice, the buyer has the option of either using the credit memo to offset a future payment to the seller, or as the basis for demanding a cash payment in exchange for the credit memo. A credit memo may be considered an internal credit memo, in which case no copy is sent to the customer. This approach is typically used when the company is writing off an outstanding receivable balance. A credit memo is also known as a Credit Memorandum or a Credit Note. / Письменное соглашение, по которому банк предоставляет клиенту (заёмщику) кредит или кредитную линию.

CREDIT NOTE = КРЕДИТНЫЙ БИЛЕТ (или КРЕДИТ НОТА) – A Credit Note is a monetary instrument issued by a seller that allows a buyer to purchase any item or service from that seller on a future date. Credit notes may be issued by a seller as a goodwill gesture to a buyer who wishes to return previously purchased merchandize (instead of cash repayment) in circumstances where the original sales agreement did not include an explicit refund policy for returned items. In such circumstances, a credit note of value equal to the price of the returned item is usually issued allowing the buyer to exchange his purchase for other items available with the seller. Issued by a seller to a purchaser to record the reduction of a bill because of an allowance, return or cancellation. The opposite of an Invoice. Credit Note is a form or letter sent by a seller to a buyer, stating that a certain amount has been credited to the buyer's account. A credit note is issued in various situations to correct a mistake, such as when (i) an invoice amount is overstated, (ii) correct discount rate is not applied, (iii) goods spoil within guaranty period, or (iv) they do not meet the buyer's specifications and are returned. Also called Credit Memo. See also Debit Note. / выплата (repayment) . Под Кредитным Билетом понимается знак стоимости, выпускаемый эмиссионными банками и играющий роль кредитных денег. Понятие кредитный билет тождественно банковскому билету.

CREDITOR = КРЕДИТОР – Under the law of obligations a Creditor is a party who has a claim on another party, the debtor. The statutory relationship between creditor and debtor is known as a Debt Relationship. The party, which is owed funds by the debtor. Creditor is an entity (person or institution) that extends credit by giving another entity permission to borrow money if it is paid back at a later date. Creditors can be classified as either 'personal' or 'real'. Those people who loan money to friends or family are personal creditors. Real creditors (i.e. a bank or finance company) have legal contracts with the borrower granting the lender the right to claim any of the debtor's real assets (e.g., real estate or car) if he or she fails to pay back the loan. When creditors are notified of bankruptcy proceedings, they have a couple of options with respect to their claim against the debtor:- (i) They can share in any distribution from the bankruptcy estate according to the priority of their claim. Most unsecured, non-wage claims come low on the priority list. (ii) They can take the debtor to court and challenge a debtor's discharge (the right not to pay back) due to bankruptcy protection. Creditor is a party that loans money or other assets to another party. Creditor is a person or institution to whom any person, company or other legal entity owes money or property, i.e. any person who has an enforceable right to demand and recover a sum of money from another. If sets have to be realized, the proceeds are distributed in order of priority of the individual creditor classes. The opposite of Borrower, and Debtor. Creditor is a person, financial institutions or other business that lends money. / , то есть . Под Кредитором, от Латинского слова Creditor, означающего Веритель или Займодавец, понимаются:- (i) сторона в обязательстве, имеющая право требовать от другой стороны (дебитора, должника) исполнения обязанности совершить определённое действие либо воздержаться от определённых действий; или (ii) в бухгалтерском учёте под этим термином понимается физическое или юридическое лицо, перед которым данная компания или организация имеет задолженность, отражённую в её балансе.

CREDITORS = КРЕДИТОРЫ – Creditors:- ones to whom a debts are owed. Do not confuse with Debtor. See also Accounts Payable. / Смотрите также Кредиторская Задолженность (Accounts Payable).

CREDITOR'S FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ КРЕДИТОРА – Creditor's Financial Institution is the financial institution with whom the creditor maintains holds an account on which he receives the funds are credited. It may also be the financial institution, which is responsible for supporting the creditor's application to join a direct debiting scheme (sponsoring financial institution).

CREDITOR'S IDENTIFICATION NUMBER = ИДЕНТИФИКАЦИОННЫЙ НОМЕР КРЕДИТОРА – Creditor's Identification Number is a number identifying the creditor within a National Direct Debit Scheme. It may be:- (i) the bank account number; (ii) a unique number for each creditor given by a national organization; and (iii) any other type of identifier.

CREDITOR'S TRANSACTION REFERENCE = КРЕДИТОРСКАЯ ССЫЛКА НА ТРАНЗАКЦИЮ (или ССЫЛКА КРЕДИТОРА НА ОПЕРАЦИЮ) – Creditor's Transaction Reference is the transaction identification initiated by creditor, and can be part of creditor's own accounting/invoicing system.

CREDIT OVERDRAFT = ПРЕВЫШЕНИЕ КРЕДИТА (или ОВЕРДРАФТ ПО КРЕДИТУ) – Credit Overdraft:- drawing under a credit beyond the stipulated limit or credit line (overdraft). When this occurs, a higher rate of interest is charged.

CREDIT PROTECTION TRANSACTION = ТРАНЗАКЦИЯ ПО ЗАЩИТЕ КРЕДИТА (или ОПЕРАЦИЯ ПО ЗАЩИТЕ КРЕДИТА) – Credit Protection Transaction is a transaction in which one party pays either a single fixed amount or periodic fixed amounts or floating amounts determined by reference to a specified notional amount, and the other party (the credit protection seller) pays either a fixed amount or an amount determined by reference to the value of one or more loans, debt securities or other financial instruments (each a 'Reference Obligation') issued, guaranteed or otherwise entered into by a third party (the 'Reference Entity') upon the occurrence of one or more specified credit events with respect to the Reference Entity, e.g., bankruptcy or payment default. The amount payable by the credit protection seller is typically determined based upon the market value of one or more debt securities or other debt instruments issued, guaranteed or otherwise entered into by the Reference Entity. Credit protection transactions may also be physically settled by payment of a specified fixed amount by one party against delivery of specified Reference Obligations by the other party. A credit protection transaction may also refer to a 'Basket' of two or more Reference Entities. Some market participants may refer to Credit Protection Transactions as Credit Default Options, Credit Default Swaps, or Credit Swaps. / , например, .

CREDIT RATING = КРЕДИТНЫЙ РЭЙТИНЬГ – Credit Rating is a rating given to a company's debt by a credit-rating company as an indication of the likelihood of default. Top rating is usually AAA. Credit ratings are much used, and are generally highly reliable. Credit Rating is an estimate of the amount of credit that can be extended to an individual or business without undue risk. See also Credit Scoring System. Credit Rating is a rating determined by a rating agency that indicates the agency's opinion of the likelihood that a borrower such as a corporation or sovereign nation will be able to repay its debt. The rating agencies include Fitch Ratings Ltd, Moody's Investors Service Ltd and Standard & Poor's. / Фитч Рэйтиньгз Лимитид (Fitch Ratings Ltd), Мудиз Инвэстоз Сёвис Лимитид (Moody's Investors Service Ltd) и Стэндод энд Поз (Standard & Poor's). / или суверенная (самостоятельная) нация . Кредитный Рэйтиньг – оценка рэйтиньговым агентством способности и готовности эмитента своевременно и в полном объёме выполнять свои финансовые обязательства.

CREDIT REPORT = КРЕДИТНЫЙ ОТЧЁТ – Credit Report is a loan and bill payment history, kept by a credit bureau and used by financial institutions and other potential creditors to determine the likelihood that a future debt will be repaid.

CREDIT RISK = КРЕДИТНЫЙ РИСК – Credit Risk refers to the risk that a borrower will default on any type of debt by failing to make payments which it is obligated to do. Though this risk is not in itself directly related to rising rates, the change in the rate environment does have its effects. Along with a rising rate environment, comes the higher cost of financing for businesses that require an injection of fund capital on a regular basis. The yield spread or the amount of yield received over and above a risk free government bond generally contract in an improving economic environment. The contraction of spread, to a degree, can offset the rise in yield as interest rates increase. Spread changes due to ratings changes or business specific conditions within select ratings or industry segments can provide opportunistic valuations within investment grade and high yield corporate bonds during rising rates. Credit Risk is a risk that a borrower will not be able to fulfil his obligations to the lender. Also known as Default Risk. Credit Risk refers to the risk that a borrower will default on any type of debt by failing to make payments which it is obligated to do. The risk is primarily that of the lender and include lost principal and interest, disruption to cash flows, and increased collection costs. The loss may be complete or partial and can arise in a number of circumstances. For example:- (i) a consumer may fail to make a payment due on a mortgage loan, credit card, line of credit, or other loan; (ii) a company is unable to repay amounts secured by a fixed or floating charge over the assets of the company; (iii) a business or consumer does not pay a trade invoice when due; (iv) a business does not pay an employee's earned wages when due; (v) a business or government bond issuer does not make a payment on a coupon or principal payment when due; (vi) an insolvent insurance company does not pay a policy obligation; (vii) an insolvent bank won't return funds to a depositor; and (viii) a government grants bankruptcy protection to an insolvent consumer or business. To reduce the lender's credit risk, the lender may perform a credit check on the prospective borrower, may require the borrower to take out appropriate insurance, such as mortgage insurance or seek security or guarantees of third parties, besides other possible strategies. In general, the higher the risk, the higher will be the interest rate that the debtor will be asked to pay on the debt. Types of Credit Risk:- credit risk can be classified in the following way:- (i) Credit Default Risk:- the risk of loss arising from a debtor being unlikely to pay its loan obligations in full or the debtor is more than 90 days past due on any material credit obligation; default risk may impact all credit-sensitive transactions, including loans, securities and derivatives. (ii) Concentration Risk:- the risk associated with any single exposure or group of exposures with the potential to produce large enough losses to threaten a bank's core operations. It may arise in the form of single name concentration or industry concentration. (iii) Country Risk:- the risk of loss arising from a sovereign state freezing foreign currency payments (transfer/conversion risk) or when it defaults on its obligations (sovereign risk).. The risk that economic loss will result from the failure of an obligor to repay financial institutions according to the terms and conditions of a contract or agreement. Credit Risk is the risk that a counterparty will not settle an obligation for full value, either when due or at any time thereafter. Credit risk includes pre-settlement risk (replacement cost risk) and settlement risk (principal risk). A deterioration in the solvency, or, even worse, the bankruptcy of a borrower means at least a partial loss of the capital invested. The risk that one contracting party (borrower) will not satisfy his obligations and so inflict financial damage on the other party (lender). Risk incurred by a seller of goods that the buyer cannot or will not pay for them. Credit Risk is the risk of a financial loss arising from a counterparty's failure to service its debt in a timely manner. This is the largest risk that the bank faces. Credit risk includes:- (i) default risk; (ii) settlement risk; and (iii) transfer risk. The bank manages its exposure to credit risk by placing limits on the amount of risk accepted in relation to one borrower or a group of borrowers. Such risks are monitored on a regular basis and are subject to at least an annual review and will be adjusted as deemed appropriate. The main criterion for these reviews is the ability of borrowers and potential borrowers to meet interest and capital repayment obligations. Limits on the level of credit risk are approved by the bank's management within a framework set by the Board of Directors. Actual exposures are monitored daily against limits. The bank also obtains collateral, in addition to reverse repurchase agreements, to mitigate credit risk on derivative financial instruments, and has established bilateral setoff agreements with certain of its counterparties. Credit Risk is the risk that the counter-party to an agreement will be unable or unwilling to make the payments required under the agreement. / порядки и условия . в дополнение к обратным соглашениям об откупе, . выплата (repayment). Кредитный Риск – риск возникновения у кредитной организации убытков вследствие неисполнения, несвоевременного либо неполного исполнения должником финансовых обязательств перед кредитной организацией в соответствии с условиями договора. К указанным финансовым обязательствам могут относиться обязательства должника по:- (i) полученным кредитам, в том числе межбанковским кредитам (депозитам, займам), прочим размещённым средствам, включая требования на получение (возврат) долговых ценных бумаг, акций и векселей, предоставленных по договору займа; (ii) учтённым кредитной организацией векселям; (iii) банковским гарантиям, по которым уплаченные кредитной организацией денежные средства не возмещены принципалом; (iv) сделкам финансирования под уступку денежного требования (факторинг); (v) приобретённым кредитной организацией по сделке (уступка требования) правам (требованиям); (vi) приобретённым кредитной организацией на вторичном рынке закладным; (vii) сделкам продажи (покупки) финансовых активов с отсрочкой платежа (поставки финансовых активов); (viii) оплаченным кредитной организацией аккредитивам (в том числе непокрытым аккредитивам); (ix) возврату денежных средств (активов) по сделке по приобретению финансовых активов с обязательством их обратного отчуждения; и (x) требованиям кредитной организации (лизингодателя) по операциям финансовой аренды (лизинга). Концентрация кредитного риска проявляется в предоставлении крупных

кредитов отдельному заёмщику или группе связанных заёмщиков, а также в результате принадлежности должников кредитной организации либо к отдельным отраслям экономики, либо к географическим регионам или при наличии ряда иных обязательств, которые делают их уязвимыми к одним и тем же экономическим факторам. Кредитный риск возрастает при кредитовании связанных с кредитной организацией лиц (связанном кредитовании), то есть предоставлении кредитов отдельным физическим или юридическим лицам, обладающим реальными возможностями воздействовать на характер принимаемых кредитной организацией решений о выдаче кредитов и об условиях кредитования, а также лицам, на принятие решения которыми может оказывать влияние кредитная организация. При кредитовании связанных лиц кредитный риск может возрастать вследствие несоблюдения или недостаточного соблюдения установленных кредитной организацией правил, порядков и процедур рассмотрения обращений на получение кредитов, определения кредитоспособности заёмщика(ов) и принятия решений о предоставлении кредитов.

CREDIT RISK EQUIVALENT = ЭКВИВАЛЕНТ КРЕДИТНОГО РИСКА – Credit Risk Equivalent:- reference figure on the credit risk (risk-weighted assets) for regulatory purposes that must be backed by capital, namely equal to the amount derived by multiplying the risk-weighted assets by a credit conversion factor for these assets. Credit Risk Equivalent is a potential risk arising from off balance sheet financial instruments, computed as the current exposure (determined as the positive fair market value of the instruments or portfolio) weighted according to the counterpartys' creditworthiness.

CREDIT RISK INSURANCE = СТРАХОВАНИЕ КРЕДИТНОГО РИСКА – Credit Risk Insurance is a type of insurance policy that covers the risk of non-payment by debtors up to a specified amount. Credit Risk Insurance is a form of insurance which protects the seller against loss due to default on the part of the buyer. While I have rarely heard it called Credit Risk Insurance, that is an accurate descriptive name for what is normally called Business Credit Insurance or just credit insurance. The term Business Credit Insurance differentiates it from consumer credit insurance (credit life, credit health, etc). So, what is it? Business credit insurance is a type of property and casualty insurance that is purchased by businesses that sell to other businesses on open credit terms. The insurance protects the business's accounts receivable (often the business's largest and most vulnerable asset). The insurance guarantees against excessive bad debt losses. Businesses purchase business credit insurance for many reasons. The most obvious reason is to protect that large, vulnerable business asset. You insured every step of the cycle to get to the point where your finished product has been delivered to someone else (out of your control). All of the work you have done:- from finding the prospect, selling the product, making the product, storing the product, to shipping the product has been invested and you want to assure that you get paid for it all. There are several other reasons businesses purchase business credit insurance, e.g., they are able to safely increase their sales; they sometimes use the insurance in combination with accounts receivable financing to protect and improve their cash flow; they use the insurance company as a third party credit clearing house (guaranteed), and probably other reasons. / Форма страхования, которая защищает продавца от убытков, которые могут возникнуть вследствие дифолта со стороны покупателя.

CREDIT SCORING SYSTEM = СИСТЕМА УЧЁТА КРЕДИТОВ – Credit Scoring System is a statistical system used to determine whether to grant credit by assigning numerical scores to various characteristics related to creditworthiness. Credit Score is a statistically derived numeric expression of a person's creditworthiness that is used by lenders to access the likelihood that a person will repay his or her debts. A credit score is based on, among other things, a person's past credit history. It is a number between 300 and 850 – the higher the number, the more creditworthy the person is deemed to be. A FICO® score is the most widely used credit scoring system. FICO® is an acronym for Fair Isaac Corporation (the leading provider of analytics and decision management technology; headquartered in San Jose, State of California (CA), the United States), the company that provides the credit score model to financial institutions. There are other providers of credit scoring systems as well. Consumers can typically keep their credit scores high by maintaining a long history of always paying their bills on time and not having too much debt. A credit score plays a large role in a lender's decision to extend credit and under what terms. For example, borrowers with a credit score that is under 600 will be unable to receive a prime mortgage and will typically need to go to a subprime lender for a subprime mortgage, which will typically have a higher interest rate. / ФАЙКО® (FICO®) – сложносокращённое слово для Фэа Айзэк Корпорэйшэн (Fair Isaac Corporation).

CREDIT SECURED BY COLLATERAL = КРЕДИТ ПОД ЗАЛОГ ОБЕСПЕЧЕНИЯ – Credit Secured By Collateral may consist of movables (e.g., merchandise or securities) or immovables (e.g., real estate). / Может состоять из движимого имущества (например, товарная продукция, или ценные бумаги) или недвижимого имущества (например, недвижимость).

CREDIT SOLVENCY = КРЕДИТОСПОСОБНОСТЬ – Credit Solvency:- solvency is an indicator for evaluating the ability of someone to repay a loan. Each bank has its own way to evaluate the creditworthiness of its customers. However, we will explain here the basis to calculate your credit solvency. What is the criteria of credit solvency? The credit solvency of a person depends of course on its financial position, but not only. In fact, credit solvency depends on:- (i) Income:- indeed, the higher the monthly income of an individual is, the higher its rating will be considered 'good'. (ii) Expenses:- having high income is not sufficient to be considered 'creditworthy'. It should also not have to much spending, relative to your income. (iii) Job Stability:- generally, an employee who has worked in the same company for many yers has more chances to get a credit than someone who changed all the time. (iv) Family Situation:- this factor, little known a priori, is yet so real. A family man, married with children, will often be better considered by banks (in the case of a credit application), than a single mother for example. For that reason, credit agencies need to know your marital status. (v) The Antecedents:- a person who already has a credit history (without any problem) will be considered better than someone whose loan is the first one. How will my credit solvency affect my application? More you will be considered a solvent person, most likely you are to see your loan application accepted. Furthermore, in case of acceptance, you will be able to get better conditions. Also known as Creditworthiness. / Известна также как Кредитоспособность (Creditworthiness). независимый от опыта (a priori).

CREDIT SPREAD = КРЕДИТНАЯ КУРСОВАЯ РАЗНИЦА (или КРЕДИТНЫЙ СПРЭД) – A Credit Spread is the difference in yield between two debt issues of similar maturity and duration. The credit spread is often quoted as a spread to a benchmark floating-rate index such as Libor, or alternatively as a spread to a highly rated reference security such as a government security. The credit spread is often used as a measure of relative creditworthiness, with reduction in the credit spread reflecting an improvement in the borrower's perceived creditworthiness. The difference between the yield on the debt securities of a particular corporate or sovereign borrower (or a class of borrowers with a specified credit rating) and the yield of similar maturity Treasury debt securities. Credit Spread is:- (1) the spread between Treasury securities and non-Treasury securities that are identical in all respects except for quality rating. For instance, the difference between yields on treasuries and those on single A-rated industrial bonds. A company must offer a higher return on their bonds because their credit is worse than the government's. (2) An options strategy where a high premium option is sold and a low premium option is bought on the same underlying security. An example would be buying a Jan 50 call on ABC for USD2, and writing a Jan 45 call on ABC for USD5. The net amount received (credit) is USD3. The investor will profit if the spread narrows. Can also be called Credit Spread Option or Credit Risk Option. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Разница между доходностью по долговым ценным бумагам конкретной корпорации или суверенного (самостоятельного)

заёмщика (или класса заёмщиков со спецификационным кредитным рэйтиньгом) и доходностью долговых ценных бумаг Казначейств, имеющих аналогичные сроки погашения.

CREDIT SPREAD FORWARD = ФОРВАРД НА КРЕДИТНУЮ КУРСОВУЮ РАЗНИЦУ (или ФОРВАРД НА КРЕДИТНЫЙ СПРЭД) – Credit Spread Forward is a credit spread derivative whose payoff is based on changes in the perceived credit quality of a reference credit as reflected in the credit spreads. More specifically, a credit spread forward is a cash-settled forward contract in which settlement amounts are based on the credit spread between two prespecified debt issues on the maturity date. In other words, the underlying asset in this forward contract is a credit spread. The payoff of a credit spread forward can be calculated using the following formula:- Duration x N x (K – $S(t_1)$). where N is the notional amount, K is the credit spread today, $S(t_1)$ is the actual spread at time (t_1). Both credit spreads are expressed as percentages. Purchasing a credit spread forward means entering into a long position in the underlying bond (the buyer expects the risky bond price will increase relative to the risk-free bond. If that turns out to be true, the buyer receives the payoff from the seller. Credit Spread Forward is an agreement to pay or receive at some time in the future a cash payment that depends on the difference between a spread (i.e. the difference in yields between two financial assets) agreed at contract initiation and that prevailing at settlement. / , то есть .

CREDIT SPREAD OPTION = ОПЦИОН НА КРЕДИТНУЮ КУРСОВУЮ РАЗНИЦУ (или ОПЦИОН НА КРЕДИТНЫЙ СПРЭД) – Credit Spread Option is an option contract that gives the right to receive a cash payment if a spread, i.e. the difference in yields between two financial assets, widens beyond an agreed strike level during a specific period. An option whose payoff is based on the credit spread between the debt of a particular borrower and similar maturity Treasury debt. Credit Spread Option is a financial derivative contract that transfers credit risk from one party to another. An initial premium is paid by the buyer in exchange for potential cash flows if a given credit spread changes from its current level. The buyer of a credit spread option will receive cash flows if the credit spread between two specific benchmarks widens or narrows. Credit spread options come in the form of both calls and puts, allowing both long and short credit positions. Credit spread options can be issued by holders of a specific company's debt to hedge against the risk of a negative credit event. The buyer of the credit spread option (call) assumes all or a portion of the risk of default, and will pay the option seller if the spread between the company's debt and a benchmark level (such as LIBOR) grows. Options and other derivatives based on credit spreads are vital tools for managing the risks associated with lower-rated bonds and debt. Credit Spread Option is an option on the credit spread between two debt issues. The option will pay out the difference between the credit spread at maturity and a strike spread determined at the outset. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). , то есть . Опцион, окупаемость которого основывается на .

CREDIT SPREAD TRANSACTION = ТРАНЗАКЦИЯ ПО КРЕДИТНОЙ КУРСОВОЙ РАЗНИЦЕ (или ОПЕРАЦИЯ ПО КРЕДИТНОМУ СПРЭДУ) – Credit Spread Transaction is a transaction involving either a forward or an option where the value of the transaction is calculated based on the credit spread implicit in the price of the underlying instrument.

CREDIT STANDING = КРЕДИТНАЯ ИСТОРИЯ (или КРЕДИТОСПОСОБНОСТЬ) – Credit Standing means creditworthiness. A person's or a company's creditworthiness is determined by the lender (e.g., based on so-called 'Credit Scoring Models') or by a third party (e.g., a rating agency) acting on behalf of the lender. In securities business, credit standing designates the issuer's ability to perform debt service on an issue and to repay it. Credit Standing is the reputation for discharging financial obligations. The characteristics which, in the eyes of the potential lender, make an individual or a corporate entity trustworthy enough to receive a loan. Credit standing is reflected in the rating granted by companies such as Moody's Investors Service Ltd or Standard & Poor's. Also known as Credit Rating, and Credit Quality. / Мудиз Инвэстоз Сёвис Лимитид (Moody's Investors Service Ltd) или Стэндод энд Поз (Standard & Poor's).

CREDIT SWAP = СВОП НА КРЕДИТ (или КРЕДИТНЫЙ СВОП) – Credit Swap is a swap whose value depends on the quality of the underlying credit. See also Credit Default Swap. / Смотрите также Своп На Случай Непогашения Кредита или Своп На Случай Неисполнения Обязательств По Кредиту (Credit Default Swap).

CREDIT TERMS = ПОЛОЖЕНИЯ О ПРЕДОСТАВЛЕНИИ КРЕДИТА (или КРЕДИТОВЫЕ ПОРЯДКИ, или ПОРЯДКИ КРЕДИТА) – Credit Terms:- the agreement between two or more enterprises concerning the amount and timing of payment for goods or services. / Соглашение между двумя или более предприятиями, касающееся суммы и распределения времени оплаты за товары или услуги.

CREDIT TRANSFER = КРЕДИТОВЫЙ ПЕРЕВОД – Credit Transfer is a direct payment from one bank account to another initiated by the payer. / Прямой платёж с одного банковского счёта на другой, инициированный плательщиком.

CREDIT UNION = КРЕДИТНЫЙ СОЮЗ – Credit Union is a financial cooperative organization of individuals who have a common bond, such as place of employment or residence or membership in a labor union. Credit unions accept deposits from members, pay interest (in the form of dividends) on the deposits out of earnings and use their funds to provide consumer installment loans to members.

CREDITWORTHINESS = КРЕДИТОСПОСОБНОСТЬ – Creditworthiness:- solvency, ability to repay advances and debts, and other positive characteristics which determine the rating of a bank customer or company placing a bond issue. Ability of an individual or entity to pay its debts as they come due, without liquidating any fixed assets. Creditworthiness is a criterion for granting credit. A borrower is creditworthy if he can be expected to fulfill the obligations of his loan agreement. There are two types of creditworthiness:- personal and material. While for personal creditworthiness the borrower's personal reliability, as well as vocational and entrepreneurial qualifications are examined, for material creditworthiness financial aspects are considered, such as the borrower's financial situation, income, etc. Creditworthiness is frequently confused with credit eligibility. Creditworthiness is a creditor's measure of a consumer's past and future ability and willingness to repay debts. / Кредитоспособность – критерий для предоставления кредита. Заёмщик признаётся кредитоспособным, если может быть предположение, что он выполнит свои обязательства по соглашению о займе. Существуют два типа кредитоспособности:- персональная и материальная кредитоспособности. Под персональной кредитоспобностью понимается персональная ответственность заёмщика, а также .

CREEK = РУЧЕЙ – Creek is a small stream channel usually in tidal areas in a coastal marsh, or between the mud banks of an estuary.

CREEL = ШПУЛЯРНИК (или СТОЙКА, или РАМКА) – Creel is:- (1) a framework arranged to hold slivers, rovings, or yarns so that many ends can be withdrawn smoothly and evenly without tangling. (2) A similar device used to aggregate sub-tows to tows in manufactured staple processing, especially polyester. / Стойки для сновальных валиков на шлихтовальной машине. Рамка, куда ставятся катушки с ровницей

CREELING = НАДЕВАНИЕ (или ЗАПРАВКА, или СТАВКА) – Creeling is the mounting of supply packages in a creel to feed fiber to a process, i.e. beaming or warping. / Надевание или Ставка початков. Операция по замене на рамках машин порожних катушек полными катушками, заправка катушек на рамки, заправка на стойки, рамку и так далее.

CREEP = КРИП (или ПОЛЗУЧЕСТЬ) – In materials science, Creep is the tendency of a solid material to move slowly or deform permanently under the influence of stresses. It occurs as a result of long-term exposure to high levels of stress that are below the yield strength of the material. Creep is more severe in materials that are subjected to heat for long periods, and near their melting point. Creep always increases with temperature. The rate of this deformation is a function of the material properties, exposure time, exposure temperature and the applied structural load. Depending on the magnitude of the applied stress and its duration, the deformation may become so large that a component can no longer perform its function, for example, creep of a turbine blade will cause the blade to contact the casing, resulting in the failure of the blade. Creep is usually of concern to engineers and metallurgists when evaluating components that operate under high stresses or high temperatures. Creep is a deformation mechanism that may or may not constitute a failure mode. Moderate creep in concrete is sometimes welcomed because it relieves tensile stresses that might otherwise lead to cracking. Unlike brittle fracture, creep deformation does not occur suddenly upon the application of stress. Instead, strain accumulates as a result of long-term stress. Creep is a 'time-dependent' deformation. The temperature range in which creep deformation may occur differs in various materials. For example, tungsten requires a temperature in the thousands of degrees before creep deformation can occur while ice will creep near 0 °C (32 °F). As a rule of thumb, the effects of creep deformation generally become noticeable at approximately 30% of the melting point (as measured on a thermodynamic temperature scale such as kelvin or rankine) for metals and 40–50% of melting point for ceramics. Virtually any material will creep upon approaching its melting temperature. Since the minimum temperature is relative to melting point, creep can be seen at relatively low temperatures for some materials. Plastics and low-melting-temperature metals, including many solders, creep at room temperature as can be seen markedly in old lead hot-water pipes. Glacier flow is an example of creep processes in ice. Stages of Creep:- in the initial stage, or primary creep, the strain rate is relatively high, but slows with increasing time. This is due to work hardening. The strain rate eventually reaches a minimum and becomes near constant. This is due to the balance between work hardening and annealing (thermal softening). This stage is known as Secondary or Steady-State Creep. This stage is the most understood. The characterized 'creep strain rate' typically refers to the rate in this secondary stage. Stress dependence of this rate depends on the creep mechanism. In tertiary creep, the strain rate exponentially increases with stress because of necking phenomena. See also Delayed Deformation. / Закалка или Упрочнение (Hardening).

CREEPERE = XX (или ПОДХАЛИМ) – Creepere is a usually one-piece garment for a child at the crawling age.

CREMNET = CROP RESOURCES MANAGEMENT NETWORK

CRENATE = ГОРОДЧАТОЕ (или ОКРУГЛОЗУБЧАТОЕ) – Crenate:- with rounded teeth or notched edges.

CRENULAR CROSS SECTION = МЕЛКОЗУБЧАТОЕ ПОПЕРЕЧНОЕ СЕЧЕНИЕ – Crenular Cross Section:- xxxxx. See also Cross Section.

CRENULATE = МЕЛКОЗУБЧАТОЕ (или МЕЛКОЗАЗУБРЕННОЕ, или МЕЛКОГОРОДЧАТОЕ) – Crenulate:- with shallow-toothed edges.

CRÊPE = КРЭП – Crêpe is a silk fabric of a gauzy texture, having a peculiar crisp or crimpy appearance. It is woven of hard-spun silk yarn in the gum or natural condition. There are two distinct varieties of the textile:- soft, Canton or Oriental crape, and hard or crisped crêpe. It can be used to create clothing such as blouses, suits and dresses. Polyester crêpe is machine-washable, while rayon and silk crêpes need to be dry-cleaned. Crêpe is a general classification of fabric characterized by a broad range of crinkled or gained surface effects. Methods of making crêpe include the use of hard twisted yarns, special chemical treatment, special weaves and embossing. Crêpe Fabric is a fabric characterized by a crinkled, puckered or pebbly surface with highly twisted yarns in the weft and sometimes in the warp or both. Crêpe is usually made with a plain weave. The crinkly texture of this soft and pliable fabric can be smooth or quite rough. The fabric is woven from all of the major fibers, natural or man-made. Surface textures range from fine, flat crêpes to pebbled and mossy effects; some surfaces resemble tree bark. Crêpe is a lightweight fabric characterized by a crinkling surface obtained by the use of:- (i) hard-twist filling yarns, (ii) chemical treatment, (iii) crêpe weaves, and (iv) embossing. Crêpe is a lightweight fabric of silk, rayon, cotton, wool, man-made, or blended fibers, and characterized by a crinkled surface. This surface is obtained through the use of crêpe yarns (yarns that have such a high twist that the yarn kinks), and by chemical treatment with caustic soda, embossing, or weaving (usually with thicker warp yarns and thinner filling yarns). Although crêpe is traditionally woven, crêpe yarns are now used to produce knit crêpes. Crêpe:- worsted cotton, wool, silk, man-made synthetics. Mostly plain, but various weaves. Has a crinkled, puckered surface or soft mossy finish. Comes in different weights and degrees of sheerness. Dull with a harch dry feel. Woolen crêpes are softer than worsted. If it is fine, it drapes well. Has very good wearing qualities. Has a very slimming effect. Depending on weight, it is used for dresses of all types, including long dinner dresses, suits, and coats. / высокая крутка . уточные пряжи . Под Крэпом, от Французского слова Crêpe, от Латинского слова Crispus, означающее Волнистый или Шероховатый, понимаются ткани (главным образом шёлковые), имеющие на поверхности мелкую шероховатость; обычно вырабатываются из нитей с очень большой (крэповой) круткой. Из крэпа шьют женское платье. Крэп – группа тканей, главным образом шёлковых, вырабатываемых из нитей с очень большой (крэповой) круткой, а также в некоторых случаях специальным (крэповыми) переплетениями. Наиболее распространены:- крэпдёшин, крэп-шифон, крэп-жоржет, крэп-сатин. При выработке крэпа обычно применяют одновременно нити, скрученные направо и налево, в определённом чередовании. Такая крутка нитей, придающая им повышенную упругость, вызывает большую усадку ткани, что в сочетании с различным направлением крутки создаёт на ткани мелкошероховатый, теневой эффект. Кроме шёлковых, вырабатываются полушёлковые крэпы, хлопчатобумажные, шерстяные и полушерстяные, а также из искусственных и синтетических нитей. В этих тканях крэповый эффект достигается главным образом за счёт применения крэповых и других мелкоузорчатых переплетений, иногда без крэповой крутки. Достоинства крэпа – хорошая драпируемость и малая сминаемость. Крэп применяется для шитья женских платьев и костюмов.

CRÊPE–BACKED SATIN = КРЭП–XX АТЛАС – Crêpe-Backed Satin is a two-faced fabric that can be used on either side. One is satin whereas the reverse, made of twisted yarns, is crêpe. Crêpe-Backed Satin can be used on either side. While the surface is satin, the back is crêpe. It is mainly used for the production of clothing. Connected to:- crêpe and satin crêpe.

CRÊPE–BACK SATIN = КРЭП–XX АТЛАС – Crêpe-Back Satin is a satin fabric in which highly twisted yarns are used in the filling direction. The floating yarns are made with low twist and may be of either high or low luster. If the crêpe effect is the right side of the fabric, the fabric is called Satin-Back Crêpe. Crêpe-Back Satin or Satin-Back Crêpe or Crêpe-Satin or Satin-Crêpe is a satin weave on the face and a crêpe effect on the back obtained with twisted crêpe yarns in the filling – 2 or 3 times as many ends as picks per inch. It is a soft fabric which is reversible. It is usually piece dyed. Very interesting effects can be obtained in a garment by using both sides, in different parts, e.g., the crêpe side for the body and trim or binding with the satin part up. / , от Французского слова Crêpe, означающее Крэп или Лента или Траурная Повязка, понимается . с низкой круткой и могут быть либо . уточина. Как продольных, так и поперечных нитей на дюйм.

CRÊPE DE CHINE = КРЭП ДЁ ШИН – Crêpe de Chine ('krape dee sheen'), French for 'Crêpe from China', is similar to Silk Crêpe, but lighter weight and less textured fabric made with S and Z highly twisted filament yarns alternating in the weft and with a normally twisted filament warp. The matte surface and pebbled texture of this graceful fabric reflect individual pinpoints of light, giving it wonderful chromatic depth and striking eye-appeal. This luxurious silk has the additional virtues of great durability and excellent wrinkle resistance. Lightweight with a pleasing drape, designers choose it among silk fabrics for elegant slacks, skirts, dresses, suits, and eveningwear. Crêpe de Chine is thinner and comes in three different weights:- two-ply, used for lingerie and blouses; three-ply, used for dresses, fuller pants and dresses; and four-ply, the nicest of the three, used for coats and trousers. Crêpe De Chine:- silk warp and crêpe twist silk filling 25 x 22. More ends than picks per inch. Has a soft hand and considerable lustre. Made of raw silk or rayon. It is easy to manipulate and handle. It is fairly sheer. Could be piece dyed or printed. Has a slight rippled texture. Heavy crepe de chine is called 'Canton Crêpe' which is slightly ribbed and now mostly made in rayon. Crêpe De Chine:- traditionally, a very sheer, pebbly, washable silk with the fabric degummed to produce crinkle. Today, it is a sheer, flat crêpe in silk or man-made fibers. It is used for lingerie, dresses, and blouses. / уточина. филаментная (комплексная) пряжа (filament yarn). Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

CRÊPE GEORGETTE = КРЭП ЖОРЖЭТ – Crêpe Georgette is a sheer fabric, similar to chiffon, made with a crêpe yarn that gives the fabric a crêpe appearance. See also Chiffon and Crêpe.

CREPON = КРЭПОН (или КРЕПО) – Crepon:- crêpe effect appears in direction of the warp and achieved by alternate S and Z, or slack, tension, or different degrees of twist. Originally a wool crêpe but now made of silk and rayon. It is much stouter and more rugged than the average crêpe. Has a wavy texture with the 'waves' or 'crinkles' running in a lengthwise direction. Mostly used for prints.

CREST = КРЭСТ – CREST is the United Kingdom's principal settlement system, and currently settles transactions in UK and Irish equities, government bonds and corporate fixed interest stocks held in dematerialised form. The system is operated by CRESTCo Ltd, a private sector company owned by a wide range of financial institutions operating in the securities markets. In 1999, control of the Bank of England's settlement systems Central Gilts Office (CGO) (for gilts and non-British government Sterling debt) and Central Moneymarkets Office (CMO) (for money market instruments) was transferred to CRESTCo, although the Bank of England continues to provide depository services for CMO instruments. Settlement of gilts and non-British government sterling debt was successfully absorbed into an enhanced CREST system in July 2000 and the CGO was closed; work is under way to integrate CMO instruments into CREST, thereby creating a single unified UK securities settlement system (SSS). CREST has also established links to other settlement systems in Europe and North America to enable transactions in foreign securities to be settled in CREST. In September 2002, a merger between CRESTCo and Euroclear was completed. The aim is to have a new settlement platform in place by 2005, although CREST members will for the time being access this platform using the system functionality currently available to them in CREST. The paperless share settlement system through which trades executed on markets can be settled. CREST is operated by CRESTCo Ltd and was introduced in 1996. CREST is the electronic real-time gross settlement system for United Kingdom government bonds (Gilts), collective instruments (unit investment trusts, open-ended investment companies), and money market instruments, and also for United Kingdom and Irish corporate securities. Participants hold securities in uncertificated form (see dematerialization), and transfers are made DVP (at the same time payment is made) electronically. It was introduced in 1997 by the Bank of England and replaced a former system TALISMAN (short for Transfer Accounting, Lodgement for Investors, Stock Management for Jobbers). See also Delivery Versus Payment. Irish equity trades are settled in CREST, the system which settles transactions in UK and Irish equities and UK Government and corporate debt. Transactions in Irish government bonds are settled in Euroclear, while trades in Irish equities are settled in CREST. CREST was inaugurated on 1996-July-15, and was originally owned and operated by a private sector company, CRESTCo Ltd, which itself was owned by a range of CREST users. Following completion of the merger with Euroclear in September 2002, CRESTCo Ltd became a wholly owned subsidiary of Euroclear Bank. In CREST terminology, there is a distinction between 'participants' and 'users'. Participants are those who hold securities in CREST ('members') or who provide payment services ('settlement banks') or registration services ('registrars'). Users are those who communicate with CRESTCo Ltd on behalf of participants. CRESTCo Ltd requires users to locate their gateway computers (the secure equipment used for sending/receiving electronic messages to/from CREST) in the United Kingdom, Ireland, the Isle of Man or, with the prior consent of CRESTCo Ltd, another EU member state. Most corporate members maintain and operate their own securities accounts in CREST ('direct members'). 'Personal members' (mainly individuals) maintain accounts in their own name, but use the facilities of a user (a 'sponsor') to communicate with CREST. Sponsors are required to be authorized under the the Financial Services and Markets Act 2000 (FSMA 2000). Non-members of CREST which are active participants in the equity or gilt markets typically hold their accounts with custodians or brokers who are direct members of the system, although individuals may choose to hold their securities outside the system altogether, in paper form. Applicants must enter a contractual agreement with CREST and arrange a daylight credit limit for payments settlement with an approved settlement bank. CRESTCo Ltd may require participants and users incorporated or resident outside the United Kingdom to provide a legal opinion confirming the participant's or user's ability to be bound by the terms of the agreement executed by CRESTCo Ltd and the participant or user. CREST settles the purchase, sale, loan and repo of UK and Irish equities and UK government and corporate debt. Moreover, through its links to other settlement systems in Europe and the United States, members are able to hold foreign securities. But the regulations governing CREST (i.e. the Uncertificated Securities Regulations (USRs) 1995) permit only the holding of securities governed by English, Scottish and Northern Irish laws (under a multi-jurisdictional approach, securities governed by Irish, Jersey, Guernsey and Isle of Man laws are held pursuant to the laws of those jurisdictions). CRESTCo Ltd owns and operates the United Kingdom's two settlement systems, CREST and the CMO. Opened in 1996, CREST initially settled UK and Irish equities and corporate bonds. In July 2000, UK government debt was integrated into the system and the CGO was closed. Money market instruments continue to settle in the CMO, but work is under way to integrate them into CREST (by end-2003). CRESTCo Ltd has, in addition, established direct links to CSDs in Switzerland (SIS SegaInterSettle) and the United States (DTCC) and to Euroclear, enabling CREST members to hold securities which settle in those systems. CSDs from the following countries have also established links to CREST:- Sweden (VPC); the Netherlands (Necigef); and Australia (CHESS). Most recently (September 2002), the merger between CRESTCo Ltd and Euroclear has taken place. CRESTCo Ltd has become a wholly owned subsidiary of Euroclear Bank, but will continue to operate as CRESTCo Ltd at least until the launch of the new group's 'single settlement engine', planned for 2005. / ТЭЛИЗМЭН (TALISMAN). КРЭСТКо Эл.ти.ди. (CRESTCo Ltd). Эс.И.Эс. (СигаИнтаСэтэл) (SIS (SegaInterSettle)). Юроклыэ (Euroclear). Вэ.Пэ.Сэ. (VPC). Нэйсихэф (Necigef). ЧЭС (CHESS). КРЭСТ является электронной системой валовых расчётов в режиме реального времени для правительственных облигаций Соединённого Королевства (Гилтс (Gilts)), коллективных инструментов ().

CRETONNE = КРЭТОН – Cretonne is a light-weight single cloth, all cotton fabric, weighing from 2 to 5 ounces per yard, and composed of yarns ranging from 1/40's to 1/20's in the warp and 1/20's to 1/7's in the filling. It is usually woven with either the plain weave 1/1, 2/2, twill 45 degree, or a fancy effect resembling a granite weave, such as is used as a foundation weave in dress goods. The fabric is woven with either an all bleached or gray cotton warp and filling, the patterns being fancy stripes and all over floral effects

printed in bright colors upon one side of the goods. This gives the printed or face side of the fabric somewhat of the appearance of an elaborately figured Jacquard design. Those colors found most effective for this purpose are bright and medium shades of red, blue, green, yellow, etc, and a good jet black. Used for draperies and upholstery. The various grades are used for couch covers, draperies, lambrequins, and confortables or bed quilts. History:- in 1640, a weaver of Vimoutiers, a smalltown in French Normandy, Paul Creton invents a new fabric made of hemp and flax:- the 'Cretonne'. See also Chintz. Cretonne is a plain-weave, carded cotton fabric, usually printed with large designs. Cretonne is unglazed, and is used for draperies, slipcovers, and other home furnishings. Cretonne:- cotton, linen, rayon. Plain or twill weave. Characteristics:- finished in widths from 30 to 50 inches. The warp counts are finer than the filling counts which are spun rather loose. Strong substantial and gives good wear. Printed cretonne often has very bright colors and patterns. The fabric has no lustre (when glazed, it is called Chintz). Some are warp printed and if they are, they are usually completely reversible. Designs run from the conservative to very wild and often completely cover the surface. Used bedspreads, chairs, draperies, pillows, slipcovers, coverings of all kinds, beach wear, sportswear. / уточина. Жакяр (Jacquard). в 1640 ткач из Вимутье (Vimoutiers), , Поль Крэтон (Paul Creton) изобрёл новую ткань, выработанную из . , лямбрёкэны или ламбрекены (lambrequins). Чинтц (Chintz). Под Крэтоном, от Французского слова Cretonne, понимается ткань полотняного или сатинового переплетения с крупным ярким набивным рисунком. Крэтон – хлопчатобумажная ткань полотняного переплетения из предварительно окрашенной пряжи, что позволяло получать цветные геометрические орнаменты в виде полос и клеток. Иногда такой рисунок дополнялся орнаментом в технике набойки. Название ткани 'крэтон' – производное от названия первоначального центра производства – Creton в Нормандии (Франция). Так как крэтон был довольно плотным, его охотно использовали для обивки мебели, занавесок, тентов и различных драпировок.

CREW = ЭКИПАЖ (или КОМАНДА, или РАСЧЁТ, или ВАХТА) – A Crew is the personnel engaged on board ship, excluding the master and officers and the passengers on passenger ships. Crew, in relation to a vessel, means the persons (including the master of the vessel) whose duty it is to navigate or work the vessel or to carry out any other operations on the vessel. The group of people who work or operate a ship, aeroplane, bus, etc. The word Crew, in law, is ordinarily used as equivalent to ship's company, including master and other officers. When the master and other officers are excluded, the context always shows it. Synonyms:- Gang, and Work Party. In an extended sense, any small body of men associated for a purpose; a gang; as (Naut.), the carpenter's crew; the boatswain's crew. / хозяина (или капитана) и . Под Экипажем, от Французского слова Équipage, понимается личный состав судна, корабля, космического корабля, самолёта, или танка.

CREWEL = ВЫШИВКА – Crewel is a decorative form of surface embroidery using wool and a variety of different embroidery stitches to follow a design outline applied to the fabric. Usually it involves hand embroidery in which fine yarn is stitched on cotton cloth. Imperfections are prevalent in this technique and are characteristic of genuine crewel.

CREWEL = ВЫШИВАЛЬНАЯ ПРЯЖА ИЗ КРОССБРЕДНОЙ ШЕРСТИ (или КРУОЛ) – Crewel is a fine, loosely-twisted, two-ply worsted yarn. Common applications are embroidery (typically worsted wool on a plain weave fabric) and crewel lace (narrow edging).

CREWELSLACKLY = XX – Crewelslackly:- twisted worsted yarn used for embroidery.

CREW LIST = СУДОВАЯ РОЛЬ (или СПИСОК ЭКИПАЖА) – Crew List is a list prepared by the master of a ship showing the full names, nationality, passport or discharge book number, rank and age of every officer and crew member engaged on board that ship. This serves as one of the essential ship's documents which is always requested to be presented and handed over to the customs and immigration authorities when they board the vessel on arrival. / хозяином (или капитаном) судна, . Судовая Роль – список лиц судового экипажа. Судовая Роль, в торговом мореплавании основной судовой документ, содержащий сведения о количестве и составе экипажа при приходе и отходе судна. Судовая роль содержит сведения:- о судне (название и национальная принадлежность судна, порт прибытия (убытия), дата прибытия (убытия), из какого порта прибыло), о членах экипажа (фамилия, имя и отчество, дата и место рождения, гражданство, должность на судне, серия и номер паспорта моряка или иного документа, удостоверяющего личность моряка). Ведение судовой роли, то есть заполнение, подпись и удостоверение подлинности (заверение) осуществляется в соответствии с Правилами ведения судовой роли, утверждённой Приказом Минтранса РФ № 28 от 2000-Апреля-03, которые учитывают положения Конвенции по Облегчению Международного Морского Судоходства от 1965. Правила устанавливают единый порядок ведения судовой роли и являются обязательными для работников Службы Морского Флота и Службы Речного Флота Минтранса РФ, морских администраций портов, государственных бассейновых управлений водных путей и судоходства, капитанов морских торговых портов, судовладельцев, капитанов морских судов и судов смешанного (река – море) плавания, плавающих под Государственным Флагом РФ.

CREW MEMBER = ЧЛЕН ЭКИПАЖА (или УЧАСТНИК КОМАНДЫ) – Crew Member is any person actually employed for duties on board during a voyage in the working or service of a ship and included in the crew list.

CREW NECK = ВОРОНЁНАЯ ШЕЯ (или КРУГЛЫЙ ВЫРЕЗ, или ВЫРЕЗ ЛОДОЧКОЙ, или МАТРОССКИЙ ВОРОТНИК) – Crew Neck is a sweater with a crew neck, namely a round collarless neckline.

CREW'S EFFECTS = ПОЖИТКИ ЭКИПАЖА (или СРЕДСТВА КОМАНДЫ, или ИМУЩЕСТВА РАСЧЁТА, или СРЕДСТВА ВАХТЫ) – Crew's Effects:- clothing, items in everyday use and other articles, which may include currency, belonging to the crew and carried on the ship.

CREW SOCK = ВОРОНЁНЫЙ НОСОК (или МАТРОССКИЙ НОСОК, или ТОЛСТЫЙ НОСОК ПО КОЛЕНО) – Crew Sock:- a short bulky usually ribbed sock.

CRF = COMPUTER READABLE FORMAT

CRIFC = CENTRAL RESEARCH INSTITUTE FOR FOOD CROPS

CRIG = COCOA RESEARCH INSTITUTE OF GHANA

CRIMP = ИЗВИТОК (или ЗАВИВАТЬ, или ГОФРИРОВАТЬ, или ИЗВИТОСТЬ, или ЗАВИТОСТЬ, или ГОФРЕННОСТЬ, или ГОФР, или БУРТИК, или БОРТ) – Crimp is:- (1) the waviness of a fiber expressed as crimps per unit length. (2) The difference in distance between two points on an unstretched fiber and the same two points when the fiber is straightened under specified tension. Crimp is expressed as a percentage of the unstretched length. (3) The difference in distance between two points on a yarn as it lies in a fabric and the same two points when the yarn has been removed from the fabric and straightened under specified tension, expressed as a percentage of the distance between the two points as the yarn lies in the fabric. Crimp is the waviness of a fiber, yarn or tow. Note:- this characteristic may be expressed numerically by the combination of the crimp frequency either with the crimp contraction or – in the case of textured yarns – with the crimp elongation. Crimp:- the wave effect in the wool fiber. Usually the finer wools show the most crimp. Uniformity of desired crimp generally indicates superior wool. (i) Distinct:- refers to crimps that are sharp and clear – fine wools have more crimps per inch. (ii) Bold:- larger crimp refers to spaces widely apart – coarser wools have fewer crimps per inch. In

yarns, crimp relates to the distortion of a yarn due to its interlacing in a fabric. Crimp:- natural waviness of wool fibers. The term Crimp has become a very familiar term to Alpaca breeders. Crimp is defined as the natural wave formation of the fiber, expressed as waves or crimps per unit of length. Visually, crimp is most notable in the well organized staples found in the fleece. Crimp also occurs along the shaft of a single fiber. This has been defined by Cameron Holt, of the Melbourne College of Textiles, as Crinkle. In the wool trade, breeders, graders, classers, and manufacturers have traditionally held the view that more crimp meant finer fiber. This misperception has been codified into the various count systems used to classify the fineness of sheep's wool. Crimp:- in fibers, the natural or artincally introduced waviness. In yarns, the difference in the length of yarn as it lies in the fabric and its length when it is straightened out but not stretched, usually expressed as a percentage of the length in the fabric.

CRIMP AMPLITUDE = АМПЛИТУДА ИЗВИТКОВ – Crimp Amplitude is the height of displacement of the fiber from its uncrimped condition.

CRIMP CONTRACTION = УРАБОТКА (или СОКРАЩЕНИЕ, или СТЯГИВАНИЕ, или УКОРОЧЕНИЕ, или СУЖЕНИЕ) ИЗВИТКОВ – Crimp Contraction (also known as Percentage Crimp) is the contraction of a crimped fiber or a textured yarn owing to the development of crimp, expressed as a percentage of its straightened length. / Под Сужением Полотна понимается порок в виде отклонения от заданной ширины полотна.

CRIMP DEREGISTERING = XX ИЗВИТКА – Crimp Deregistering is the process of opening a tow band by causing the peaks and valleys of the crimp to lay randomly rather that uniformly.

CRIMPED YARN = ИЗВИТАЯ ПРЯЖА – Crimped Yarn:- (bulked yarns) achieved with mechanical treatment and heat, crimped yarns made of synthetic filaments. See also Textured Yarns. Crimped Yarns are usually obtained by goffering from synthetic yarns that are tightly packed into a special chamber and subjected to heat treatment. The term gofron is used in the USSR for such yarns; it corresponds to the trade names 'Ban-Lon' and 'Textralized' used abroad. Crimped yarns are marked by a zigzag crimp, softness, high bulk, and comparatively low stretchability. In a second method, a synthetic yarn is drawn across the sharp edge of a steel plate. The yarn undergoes complex deformation, and the individual fibers acquire a spiral shape. In the USSR such yarn is known as Rilon; the trade name 'Agilon' is used abroad. Crimped yarns are also produced by the knitting method. Ordinary thermoplastic compound yarns are used on high-speed knitting machines to produce a fabric that is subsequently subjected to heat treatment, as a result of which the yarns acquire a permanent twist after the cloth is removed.

CRIMP ELONGATION = УДЛИНЕНИЕ ИЗВИТКОВ – Crimp Elongation is the lengthening of a crimped fiber or of a textured yarn after development of crimp when it is straightened under specified tension expressed as a percentage of its initial length.

CRIMP ENERGY = ЭНЕРГИЯ ИЗВИТКА – Crimp Energy is the amount of work required to uncrimp a fiber.

CRIMP FREQUENCY = ЧАСТОТА ИЗВИТКОВ – Crimp Frequency is the number of crimps per unit of length of filament yarn, staple fiber or tow. Note:- different methods are in common use for expressing crimp frequency, based on half or whole waves and on straightened or unstraightened length. These bases must therefore be specified in any quantification. Crimp Frequency is the crimp level, or number of crimps per inch in yarn or tow. / филаментная (комплексная) пряжа (filament yarn).

CRIMPING = ИЗВИТОСТЬ (или ГОФРИРОВАНИЕ, или ГОФРИРОВКА) – Crimping is the process of imparting crimp to tow or filament yarn.

CRIMP LIVELINESS = ЖИВУЧЕСТЬ ИЗВИТКОВ – Crimp Liveliness is the tendency for a textured yarn to develop its crimp immediately after the reduction of an applied tension.

CRIMP RECOVERY = ВОССТАНОВЛЕНИЕ ИЗВИТКОВ (или ВОССТАНОВЛЕНИЕ ЗАВИВКИ, или ВОССТАНОВЛЕНИЕ ГОФРИРОВАНИЯ) – Crimp Recovery is the ability of a yarn or fiber to return to its original crimped state after being released from a tensile force.

CRIMP SETTING = ОФОРМЛЕНИЕ (или ФИКСАЦИЯ) ИЗВИТКОВ – Crimp Setting is an aftertreatment to set the crimp in yarn or fiber. Usually heat and steam are used, although the treatment may be chemical in nature.

CRIMP STABILITY = СТАБИЛЬНОСТЬ (или ПОСТОЯНСТВО, или УСТОЙЧИВОСТЬ) ИЗВИТКОВ – Crimp Stability is the ratio of the crimp of a fiber or textured yarn after a specified treatment to the crimp prior to treatment, expressed as a percentage. Note:- the method for determination of crimp and the treatment must be reported.

CRIMSON = КРИМЗЭН (или МАЛИНОВЫЙ, или ПУРПУРНОКРАСНЫЙ, или ТЁМНО–КРАСНЫЙ, или РУМЯНЦЕВОЕ) – Crimson:- any of several deep purplish reds. / любой из нескольких глубоких пурпурных красных цветов.

CRIN = CARIBBEAN RICE IMPROVEMENT NETWORK

CRINKLE = МОРЩИНИСТОСТЬ – Crinkle is a disease whose causal agent is yet unknown. / Морщинистость (возбудитель – вирус).

CRINKLE = СМИНАНИЕ (или ИЗГИБ, или ИЗВИЛИНА, или МОРЩИНА, или СКЛАДКА) – Crinkle is:- (1) a wrinkled or puckered effect in fabric. It may be obtained either in the construction or in the finishing of the fabric. (2) The term is sometimes incorrectly used to describe the crimp of staple fiber. Crinkle: the waviness of each individual fiber when separated from a lock. It is responsible for elasticity and is usually irregular. / Морщины – результат неодинаковой усадки ткани по ширине в процессе валки суконной ткани. Под Складкой понимается порок в виде сгиба полотна.

CRINKLE CRÊPE = СКЛАДЧАТЫЙ КРЭП – Crinkle Crêpe is a fabric with an taneven surface, created by use of caustic soda that causes it to shrink unevenly. Plissé is an example of a crinkle crêpe fabric. Crinkle crêpe and plisse usually have a larger pattern to surface irregularities than crêpe. / плиссе или складчатое (plissé) .

CRINKLE YARN = СКЛАДЧАТАЯ ПРЯЖА – Crinkle Yarn is a torque-free textured yarn that is characterized by periodic wave configurations. Crinkle yarns can be formed by the stuffer box, gear crimping, or knit-de-knit methods. See also Textured Yarns.

CRINOLINE = КРИНОЛИН (или БОРТОВКА, или БОРТОВЫЙ ВОЛОС) – A Crinoline is a type of women's undergarment, originally made from a material of the same name. Crinoline was a mixture of linen and horsehair marketed for its strength and stiffness. As the material began to be used exclusively in the creation of stiff petticoats, the petticoats themselves came to be known as Crinolines, to distinguish them from softer silk and taffeta petticoats. The crinoline reached its height as a fashion item in the early 1800s, and had almost disappeared entirely by the late 1800s. The name 'Crinoline' was a portmanteau developed by an inventor of the fabric. It combines crin, a French word for hair, with lin, the French for flax. Other etymologists believe that the word is derived from the Latin words for these objects, crinis and linum respectively. The fabric was stiff enough to support the full skirts in fashion in the

1800s, and was undoubtedly scratchy and uncomfortable as well. Full skirts became popular in the early 1800s, when women of all classes wore multiple petticoats and a crinoline to inflate their skirts. The bulky petticoats would have made women very hot, and also subjected them to the potential of becoming tangled in their skirts. The development of the crinoline helped to reduce the number of necessary petticoats, and the cage crinoline, introduced in the 1850s, further reduced the number of skirts which needed to be worn. The cage crinoline is very similar to a hoop skirt. It uses bands of stiff material in graduating sizes to create a bell shaped support for a dress or skirt. However, the crinoline was worn by women of all social classes, rather than just upper class women, as was the case with the hoop skirt. Cage crinolines were just as dangerous as hoop skirts, unfortunately. The lightweight flammable materials used to make them were a serious fire risk, and women could also unwittingly knock things over, especially in larger skirts. The crinoline could also catch in moving machinery, posing a serious risk to the wearer. As women's fashions changed, the crinoline evolved into the crinolette, which put the bulk of the material towards the back of the body, creating a wedge shape. The crinolette in turn gave way to the bustle, which ultimately evolved into a wad of stiff material which caused the back of a dress to flounce out. A slip would have been worn under a crinoline to prevent scratching and for modesty. When big skirts came back into fashion in the 1950s and 1960s, so did the crinoline, to help support them. Crinolines are still used in some types of formal wear, and by historical reenactors who want their skirts to be full, flowing, and even. Modern crinolines are much smaller than the formidable hoop skirts of the 1800s, and are somewhat easier to wear, because they are made with lightweight plastics and elastic attaching systems. Crinoline is a lightweight, plain weave, stiffened fabric with a low yarn count (few yarns to the inch in each direction). Crinoline is a fabric composed of cotton warp, horsehair filling or all cotton yarns. It is sold in varying widths, and is used by tailors and dressmakers in stiffening clothing. It first appeared in 1830. The name Crinoline comes the combination of two Latin words:- Crinis (Hair) and Linum (Flax). Crinoline fashion was invented in France in 1830 and crinoline craze spread throughout the world. It is a cheap cloth of low texture and simple construction. The distinguishing feature:- being the stiff finish with either a dull or highly glazed face on the cloth. Crinoline, having a horsehair filling, requires a loom of special construction to handle the hair, as it is hung in a neat bundle on the end of the loom, the hair being of a uniform length and color, generally black; the mechanism on the loom drawing a strand of hair from the bunch and placing it in the shed formed by the harness. A herring-bone twill weave is used in this grade of the cloth. Practically the same effect can be produced by using a glazed warp thread and a cotton filling. The glazing process is to take the cotton warp thread, and after charging heavily with a solution of sizing, the yarns are run through super-heated cylinders and rollers, the effect being a highly polished surface to the yarn. Crinoline composed of regular cotton yarns is stiffened by weighting the fabric with sizing; the weight of the size, in some cases, equals 20 per cent of that of the yarns used in construction. Crinoline is made generally on the-roller or cam loom of 1/20's to 1/26's cotton warp and filling yarn, using 25 to 40 ends and picks per inch, the cloth losing about 10 per cent of its width from loom to finished width. The warps are sized 6 to 10 per cent and the woven cloth made to absorb 15 to 20 per cent of its weight, during sizing operation. To finish crinoline means to stiffen it. Crinoline is a stiff, heavily sized fabric used as an interlining or to support areas such as the edge of a hem. Crinoline is an open-weave fabric or horsehair or cotton that is usually stiffened and used especially for interlinings and millinery. A full stiff skirt or underskirt made of crinoline fabric, namely stiffened open-weave horsehair or cotton. / уточина. Бортовка, плотная полульняная или хлопчатобумажная ткань полотняного переплетения, употребляется при шитье верхней одежды в качестве прокладки, придающей устойчивость её формам (борта, грудь, плечи и так далее). Бортовка при отделке пропитывается аппретом с целью повышения упругости при изгибе (жёсткости) и уменьшения растяжимости.

CRIOLLO COCOA BEAN = БОБ КАКАО КРИОЙО (или БОБ КАКАО КРИОЛЛО) – The Criollo Cocoa Bean is native to Central America. The word Criollo is derived from Creole, meaning native, authentic and indigenous. The Spanish called Cocoa Trees planted in Venezuela Criollo; but they actually came from neighboring Mexico and Guatemala. Criollo grows in very small numbers in Mexico, Nicaragua and Guatemala, as it did 3000 years ago, accounting for five to eight percent of Cocoa grown. Criollo can also be found, but in rather purer and more restricted form in Venezuela, Colombia and some Caribbean islands, including Trinidad, Jamaica and Grenada. Criollo also grows on the islands of the Indian Ocean, such as Java, Madagascar and the Comoros. It constitutes only about 1–5% of the total Cocoa world production. It is considered the finest and most expensive variety in the market. Its characteristics include:- (i) slightly bitter but not unpleasantly so; (ii) offers aromatic power combining strength and delicacy after processing; (iii) only mildly astringent and low in tannin; (iv) pale in color giving chocolate a reddish tinge; and (v) offers flavor finesse that can be compared to that of Arabica Coffee.

CRISPED = КУРЧАВОЕ (или КУДРЕВАТОЕ) – Crisped:- with wavy, curled or crumpled margins. / , завитое или .

CRISPNESS = КУРЧАВОСТЬ (или ЗАКРУЧЕННОСТЬ) – Crispness is a property of a product, e.g., bakery products.

CRISPUS = КРИСПУС (или КУРЧАВОЕ, или КУДРЯВОЕ, или ЗАВИТОЕ) – Crispus (-um):- with wavy, curled or crinkled or crumpled margins. / с волнистыми, извилистыми .

CRISTATE = ГРЕБЕШКОВОЕ (или ГРЕБЕНЧАТОЕ) – Cristate:- crest-shaped or crested. An abnormal form of growth resulting from lateral distortion of the growing point. / с гребешком.

CRITICAL CIRCUMSTANCES = КРИТИЧЕСКИЕ ОБСТОЯТЕЛЬСТВА – Critical Circumstances:- a determination made by the Assistant Secretary for the US Import Administration as to whether there is a reasonable basis to believe or suspect that there is a history of dumping in the United States or elsewhere of the merchandise under consideration, or that the importer knew or should have known that the exporter was selling this merchandise at less than fair value, and there have been massive imports of this merchandise over a relatively short period. This determination is made if an allegation of critical circumstances is received from the petitioner.

CRITICAL LENGTH = КРИТИЧЕСКАЯ ДЛИНА – Critical Length:- normally the matrix has a much lower modulus than the fiber so it strains more. This occurs at a distance from the fiber. Right next to the fiber, the strain is limited by the fiber. Thus, for a composite under tension, a shear stress appears in the matrix that pulls from the fiber. The pull is uniform over the area of the fiber. This makes the force on the fiber be minimum at the ends and maximum in the middle, like in the tug-of-war game. To achieve effective strengthening and stiffening, the fibers must be larger than a critical length l_c, defined as the minimum length at which the center of the fiber reaches the ultimate (tensile) strength s_f, when the matrix achieves the maximum shear strength t_m:- $l_c = s_f\ d\ /2\ t_m$. Since it is proportional to the diameter of the fiber d, a more unified condition for effective strengthening is that the aspect ratio of the fiber is $l/d > s_f\ /2\ t_m$. See also Breaking Length.

CRITICAL MASS = КРИТИЧЕСКАЯ МАССА – (1) Critical Mass:- operating expenditure as a percentage of total assets.

(2) When enough buyers and sellers participate in a Net market so goods or services change hands efficiently. Also, the time when a market gains momentum, achieves liquidity, and becomes a more efficient way to buy or sell than the traditional physical market or channel.

CRITICAL NUTRIENT CONCENTRATION = КРИТИЧЕСКАЯ КОНЦЕНТРАЦИЯ ПИТАТЕЛЬНОГО ВЕЩЕСТВА (или ПРЕДЕЛЬНО ДОПУСТИМАЯ КОНЦЕНТРАЦИЯ ПИТАТЕЛЬНОГО ВЕЩЕСТВА) – Critical Nutrient Concentration is the nutrient concentration in the plant or its organs at the time the nutrient becomes deficient for growth.

CRITICAL PHOTOPERIOD = КРИТИЧЕСКИЙ ФОТОПЕРИОД (или ПРЕДЕЛЬНО ДОПУСТИМЫЙ ФОТОПЕРИОД) – Critical Photoperiod is the longest photoperiod at which the plant will flower, or beyond which the plant will not flower.

CRITICAL REACTION = КРИТИЧЕСКАЯ РЕАКЦИЯ (или ПРЕДЕЛЬНО ДОПУСТИМАЯ РЕАКЦИЯ) – Critical Reaction:- in biology, that pH at which a biological process becomes too slow to be measured or at which organisms die.

CRITICAL VALUE ANALYSIS = АНАЛИЗ КРИТИЧЕСКОЙ ОЦЕНКИ – Critical Value Analysis is a modified ABC analysis in which a company assigns a subjective critical value to each item in an inventory. / строка баланса (item) в статье баланса 'материально-производственные запасы' (inventory).

CRITICAL WATER CONTENT = КРИТИЧЕСКОЕ ВЛАГОСОДЕРЖАНИЕ (или КРИТИЧЕСКОЕ СОДЕРЖАНИЕ ВОДЫ) – Critical Water Content is a water content of cargo at which a change in quality is expected.

CRL = CERTIFICATE REVOCATION LIST

CROCHET = КРОШЕ (или ВЯЗАНИЕ РУЧНЫМ КРЮЧКОМ, или ТАМБУРНЫЙ КРУЧОК) – Crochet is a method of making fabric in which one yarn and one needle are used to form loops into which other loops are inserted. True crochet is a handcraft. Machine-made crochets are usually knitted on Raschel machines. / Под Кроше, от Французского слова Crochet, означающее Крюк или Крючок, понимается .

CROCHETED LACE = КРУЖЕВО КРОШЕ – Crocheted Lace is a lace made with a single yarn. A crochet hook is used to form loops joined to other loops to form the design. / Крючок для вязания (или тамбурный кручок) используется для формирования петель, .

CROCHETING = ПЕРЕВИВКА (или ВЫШИВАНИЕ ТАМБУРОМ) – Crocheting is the interlocking of loops from a single thread with a hooked needle. Crocheting can be done either by hand or by machine. / взаимное связывание петель из одиночной нити с крюкообразной иглой. Крошэ, от Французского слова Crochet, означающее Крюк или Крючок, .

CROCI = CASH RETURN ON CAPITAL INVESTED

CROCKING = ИСТИРАНИЕ (или ПОТЁРТОСТЬ, или ОКРАШИВАЕМОСТЬ) – (1) Crocking is the transfer of color from a dyed or a printed piece of goods to another piece of fabric when it is rubbed against it. Crocking is the name given to when excess dye rubs off from fibers. Crocking is the rubbing-off of dye from a fabric. Crocking can be the result of lack of penetration of the dyeing agent, the use of incorrect dyes or dyeing procedures, or the lack of proper washing procedures and finishing treatments after the dyeing process. / Истирание – стирание красителя с ткани. В России быстроту истирания краски на тканях определяют с помощью взятия пробы на сухое и влажное трение. Под Кроки, от Французского слова Croquis, означающее Набросок или Чертёж, понимается:- (1) набросок, быстро сделанный рисунок (беглая зарисовка с натуры, эскиз композиции); (2) чертёж машины или детали, выполненный с натуры карандашом, как правило, от руки, обычно на клетчатой бумаге; или (3) чертёж участка местности, отображающий её важнейшие элементы, выполненный при глазомерной съёмке.

(2) Crocking is the tendency of excess dyes to rub off. Napped and pile fabrics in deep colors are most likely to crock. Industry has set standards and tests to measure and prevent crocking. Crocking is the rubbing-off of dye from a fabric as a result of insufficient dye penetration or fixation, the use of improper dyes or dyeing methods, or insufficient washing and treatment after the dyeing operation. Crocking can occur under dry or wet conditions.

(3) Crocking:- excess of dye on thread that rubs off. Thread defects, and namely – Dyeing. / Порок или дефект ниток, а именно – дефект крашения.

(4) Crocking is a transfer of color from dyed or pigmented fabric by rubbing. Wet crocking refers to transfer of color from a piece of dyed fabric to another piece of fabric, or to an undyed area of the same fabric, while the fabric is wet. Dry crocking means the same, except that the fabric is dry. Crocking is the transfer of dye stuff from one fabric to another item by friction. This usually happens when a fabric or yarn has been overdyed. Crocking is the rubbing on of color from the fabric surface. It may occur from wear alone, along the edges of hems and creases. It can also occur in washing or dry-cleaning. Crocking is expected in some garments, such as denims, but the technology exists to produce deep colors that do not streak or fade. Crocking is a transfer of color from the surface of a colored fabric to an adjacent area of the same fabric or to another surface principally by rubbing action. Compare Color Staining. / протирание или притирка (rubbing).

(5) Crocking is the tendency of color to transfer from the leather onto other surfaces when rubbed under dry or damp conditions. The color may comprise finish pigments, leather dyes, fatliquors (lubricating oils) or leather fibers.

CROOKED CLOTH = ИЗВИЛИСТОЕ (или ИСКРИВЛЁННОЕ) ПОЛОТНО – Crooked Cloth:- How can you determine if a fabric is crooked? (1) Make a straight cut from selvage to selvage of the fabric as it comes off the roll. (2) Advance the cloth about 1/2 yard. (3) Make a small cut on one selvage and tear the swatch across the width. (4) Fold the swatch in half. The difference between the lengths of the selvage is the bias of the cloth. As a general rule, the tolerance for the bias is determined by the width of the fabric. For example, the acceptable bias for 72 inch wide fabric is 2-1/2 inches industry wide. Our tolerance level is 1-1/2 inches. See also Baggy Cloth. / Смотрите также Мешковатое Полотно (Baggy Cloth).

CROOP = КРУП – Croop:- a silk, especially after immersion in a weak acid, when compressed and rubbed, gives out a peculiar rustling sound, which is known as 'Croop'.

CROP = УРОЖАЙ (или (СЕЛЬСКОХОЗЯЙСТВЕННАЯ) КУЛЬТУРА, или СБОР) – Crop is the plants on a farm that are managed for economic purposes, producing a physical product for farm use or sale. / Под Урожаем понимается валовой сбор продукции сельскохозяйственной культуры. Под Сельскохозяйственной Культурой, от Латинского слова Cultura, означающее Возделывание или Воспитание или Образование или Развитие или Почитание, понимается .

CROP DAMAGE = ПОВРЕЖДЕНИЕ УРОЖАЯ – Crop Damage is a measurable reduction in quality and/or quantity of crop produce caused by injury due to pests and/or abiotic factors. Any reduction in quantity or quality of yield that results from injury caused by environmental factors, chemicals, or pests. / абиотические факторы.

CROP DEVELOPMENT = РАЗВИТИЕ УРОЖАЯ – Crop Development is the sequence of processes and events involved in producing new tissues and organs throughout the crop cycle. Change in growth stage (phenology) and morphogenesis (new organs).

CROP GROWTH RATE = ТЕМП РОСТА УРОЖАЯ – Crop Growth Rate is the crop's rate of dry matter accumulation.

CROP INJURY = ВРЕД УРОЖАЮ (или УЩЕРБ УРОЖАЮ) – Crop Injury is visible and measurable symptoms and/or signs caused by physical or biological pathogens, Insects, Weeds, and other factors.

CROP LESS = ПОТЕРЯ УРОЖАЯ – Crop Loss is a reduction in value and/or financial return due to damage; often measured as the difference between actual yield and attainable yield due to the effects of one or more pathogens or pests.

CROPPING = СТРИЖКА (или УБОРКА) – Cropping is the process of cutting the pile on a fabric to uniform height or cutting loose fibers from the surface of a cloth after weaving.

CROPPING INTENSIVITY INDEX = ИНДЕКС ПО ИНТЕНСИВНОСТИ ЗЕМЛЕДЕЛИЯ – Cropping Intensity Index (CII) is a time-weighted land-use index that evaluates the fraction of the total hectare-months available to the farmer that are used for crop production.

CROPPING PATTERN = МОДЕЛЬ ЗЕМЛЕДЕЛИЯ – Cropping Pattern is the spatial and temporal combination of crops on a plot and the management used to produce them.

CROPPING SYSTEM = СИСТЕМА ЗЕМЛЕДЕЛИЯ – (1) Cropping System (farming) is the crop production activity of a farm. It comprises all components required for the production of a set of crops in a farm and the relationship between the crops and the environment. These components include all necessary physical and biological factors as well as technology, labor, and management. (2) Cropping System (research) is the set of techniques performed on plots which are handled in an identical way. Each cropping system is defined by the kind of crops and their succession order and the itineraries of techniques applied to these several crops, including the choice of varieties for selected crops. / Под Системой Земледелия понимается комплекс взаимосвязанных агротехнических, мелиоративных и организационных мероприятий для восстановления и повышения плодородия почвы. Отражает различные фазы интенсификации земледелия. Примитивные системы земледелия (подсечно-огневая и лесопольная, переложная и залежная) применялись в дофеодальный период. При феодализме из заменили экстенсивные системы; восстановление плодородия почвы стало направляться человеком (введение пара и другое). При переходных системах земледелия, например, травопольной, воздействие человека на почвенное плодородие возросло (посевы трав, улучшенная обработка и тому подобное). Для современных интенсивных систем земледелия (плодосменная, пропашная, вольная и другие) характерно повышение плодородия почвы путём использования удобрений, чередования сельскохозяйственных культур и другого.

CROP REMOVAL = ВЫНОС УРОЖАЕМ (или ВЫНОС (СЕЛЬСКОХОЗЯЙСТВЕННОЙ) КУЛЬТУРОЙ) – Crop Removal is an absorption of soil nutrients by crops.

CROP REPORTS = ОТЧЁТЫ ОБ УРОЖАЕ – Crop Reports are the reports compiled by the US Department of Agriculture (USDA) on various agriculture commodities that are released throughout the year. Information in the reports includes estimates on planted acreage, yield, and expected production, as well as comparison of production from previous years.

CROP RESIDUE MANAGEMENT = УПРАВЛЕНИЕ ПОЖНИВНЫМИ ОСТАТКАМИ (или УПРАВЛЕНИЕ ЖНИВЬЁМ, или УПРАВЛЕНИЕ СТЕРНЕЙ) – Crop Residue Management is the operation and management of crop land to remove stubble, stalks, and other crop residue or maintain them on the surface to prevent wind and water erosion, to conserve water, and to decrease evaporation. / Пожнивные Остатки; Жнивьё; Стерня.

CROP ROTATION = РОТАЦИЯ КУЛЬТУР (или ЧЕРЕДОВАНИЕ КУЛЬТУР, или СЕВООБОРОТ, или КУЛЬТУРООБОРОТ) – Crop Rotation is an integral part of the crop production system. A well-planned crop rotation will:- (i) increase yields; (ii) aid in maintaining or improving soil structure and organic matter levels; (iii) protect against soil erosion; (iv) improve soil resilience against weather extremes; (v) provide residual nitrogen from legumes in the rotation; (vi) help to disrupt insect and disease cycles; (vii) reduce weed pressure; and (viii) spread out workload. The basic rule of crop rotation is that a crop should never follow itself. Continuous cropping of any crop will increase the buildup of diseases and insects specifc to that crop and will potentially result in heavier infestations and reduced yields. The more often the same crop type has been grown in the same field, the greater the potential risk. The greatest beneft from crop rotation comes when crops, including cover crops, grown in sequence are from diferent families; monocots (grasses) and dicots (broadleaves). The fibrous root systems of cereal and forage crops (including red clover) are excellent for building soil structure. The advantage of including Wheat in the rotation often goes beyond the Wheat year. Crop Rotation is a planned sequence of growing crops in a regularly recurring succession on the same area of land, as contrasted to continuous culture of one crop or growing different crops in a haphazard order. See also Rotation. Crop Rotation is an integral part of the crop production system. The greatest benefit to a good crop rotation is increased yields. A well-planned crop rotation will:- (i) aid in maintaining or improving soil structure and organic matter levels; (ii) protect against soil erosion; (iii) improve soil resilience against weather extremes; (iv) provide residual nitrogen from legumes in the rotation; (v) help to control insect and disease cycles; (vi) reduce weed pressure; and (vii) spread workload. The basic rule of crop rotation is that a crop should never follow itself. Continuous cropping of any crop will result in the build-up of diseases and insects specific to that crop, and cause a reduction in crop yields. The more often the same crop has been grown in the same field, the greater this impact will be. For example, the practice of growing two or more years of Soybeans is becoming increasingly common. Perhaps the greatest impact of back-to-back years of Soybeans has been the accelerated spread of Soybean Cyst Nematode (SCN). The increased years of Soybeans in the rotation is also increasing the susceptibility of Ontario's soils to erosion. Soil structure in Corn-Soybean rotations can actually be poorer than the structure of soils in continuous Corn production. For example, the soil erosion that follows an intense June rainstorm in first-year Corn following 2 years of Soybeans is often twice as high as that following Corn, or Wheat underseeded with red clover or alfalfa. Relatively poor soil structure after 2 years of Soybeans not only increases erosion susceptibility, but also reduces soil porosity (the ability for the rainwater to infiltrate the soil). Reduced rainwater infiltration increases the likelihood of erosion, water ponding and/or soil moisture deficits; all of these efects can reduce crop productivity, particularly in years with weather-related stress. The greatest benefit from crop rotation comes when crops grown in sequence are in totally different families. The two families are grasses (monocots) and broad-leaves (dicots). The grasses include forages grasses, cereals and Corn. Soybeans, white beans, Alfalfa and Canola are examples of broadleaf crops. / Смотрите также Ротация или Чередование (Rotation). Под Культурооборотом понимается чередование овощных, декоративных и других культур в теплицах, парниках (называется также Рамооборот), оранжереях, утеплённом грунте в течение года. Под Ротацией Севооборота, от Латинского слова Rotatio, означающее Круговращение, понимается период (обычно 4–10 лет), в течение которого все сельскохозяйственные культуры и пар занимают последовательно (согласно схеме их чередования) каждое поле севооборота. Под Севооборотом понимается научно обоснованное чередование сельскохозяйственных культур (и пара) по полям и во времени; основная часть системы земледелия. При введении севооборота его земельную площадь разбивают на приблизительно равные участки, обычно 4–10. Каждая культура в определённой последовательности (согласно схеме севооборота) высевается на каждом из них, проходя за время чередования (ротация) через все поля. По сравнению с монокультурой севооборот обеспечивает восстановление и повышение плодородия почвы, рациональное использование земли. Севообороты подразделяют на полевые (возделывание зерновых, Картофеля и технических культур); кормовые (трав, Кукурузы и других); специальные (овощей, Риса, Табака и других). Севооборот – научно обоснованное чередование сельскохозяйственных культур на полях и во времени, способствующее восстановлению и повышению плодородия

почвы; важнейшая часть системы земледелия. В севообороте соблюдаются агротехнические мероприятия – обработка почвы, применение удобрений, химических средств защиты растений от сорняков, болезней и вредителей; мелиоративные мероприятия – орошение, осушение, химическая мелиорация. Период, в течение которого культуры и пар в установленной последовательности проходят через каждое поле севооборот, называется Ротацией; перечень групп сельскохозяйственных культур и паров в порядке их чередования – Схемой Севооборота. Рациональное сочетание в хозяйстве нескольких севооборотов составляет Систему Севооборота. Научные Основы Севооборота:- задолго до научного обоснования севооборота практика земледелия показала, что при бессменном возделывании культурных растений на одном и том же участке, особенно без внесения удобрений, их урожаи снижаются. Изучение биологических особенностей растений и их влияния на свойства почвы позволило дать научное объяснение этому явлению и доказать необходимость чередования сельскохозяйственных культур. Развитию учения о севообороте способствовали исследования Немецких учёных Альбрэштя Даниэля Та (Albrecht Daniel Thaer; 1752–1828), Юстуса Фрайхэ фон Либихя (Justus Freiherr von Liebig), Хэрмана Хэльригэля (Hermann Hellriegel; 1831–1895), Французского агрохимика Жо Батистэ Жозэфа Дьёдонэ Бусанго (Jean Baptiste Joseph Dieudonné Boussingault; 1802–1887), Российских учёных Василия Васильевича Докучаева (1846–1903), Павла Андреевича Костычева (1845–1895), Климента Аркадьевича Тимирязева (1843–1920), Дмитрия Николаевича Прянишникова (1865–1948), Василия Робертовича Вильямса (1863–1939), Николая Максимовича Тулайкова (1875–1938) и других. Мировую известность получили работы старейших научно-исследовательских учреждений Западной Европы и США:- Ротемстедской Опытной Станции (Великобритания), Института Земледелия и Растениеводства в Галльском Университете (Германская Демократическая Республика (ГДР)), опытных станций в Аскове (Дания), Штатах Монтана, Миннесота, Иллинойс, Айова, Огайо (Соединённые Штаты Америки (США)) и других; научно-исследовательских учреждений бывшего Союза Советских Социалистических Республик (СССР). Обобщение фактов, накопленных мировой наукой, позволило создать современную теорию чередования культур. Химические основы севооборота связаны с особенностями питания растений (неодинаковая потребность в питательных веществах, различная способность корневых систем извлекать их из глубоких слоёв почвы и труднодоступных соединений, способность Бобовых культур фиксировать атмосферный азот и обогащать им почву и тому подобные). Внесением удобрений можно регулировать соотношение питательных веществ в почве в соответствии с требованиями возделываемой культуры. Однако удобрения более эффективны в севообороте, поскольку чередование растений обеспечивает наиболее полное их использование. Введение в севооборот Бобовых культур значительно сокращает расход удобрений. После уборки сельскохозяйственных культур разных видов в почве остаётся неодинаковое количество растительных остатков. Этим и объясняется различное действие растений на физические свойства почвы, в том числе её структуру, и на устойчивость к водной и ветровой эрозии. Правильным подбором и чередованием культур в сочетании с внесением органических и минеральных удобрений можно регулировать процессы создания и разложения органического вещества в почве, добиваться его бездефицитного баланса. Размещение чередующимися полосами посевов многолетних трав или зерновых культур с пропашными уменьшает опасность возникновения эрозии почвы. Биологические факторы раньше других оказывают отрицательное действие при вторичных посевах ряда культур. Оно проявляется в увеличении засорённости посевов, распространении возбудителей болезней и вредителей, что в комплексе с химическими и физическими факторами вызывает Почвоутомление. Соблюдением севооборота предотвращают это явление (в севооборот не допускают вторичных посевов ряда культур, например, Льна по Льну, не размещают растения, страдающие одинаковыми болезнями, и так далее). Экономическая целесообразность севооборота заключается в рациональном использовании земли, обеспечении высоких и устойчивых урожаев, расширении ассортимента производимой продукции, уменьшении сезонности производства в связи с различными сроками сева, обработки и уборки чередующихся культур. Культуры В Севообороте:- сельскохозяйственные культуры и чистый пар, занимавшие поле в предыдущем году, называются Предшественниками. По степени влияния на свойства почвы и урожаи основных культур они объединяются в несколько групп. (i) Многолетние Бобовые Травы (Клевер, Люцерна, Эспарцет и другие) и их смеси со Злаковыми травами, обладающие способностью повышать почвенное плодородие, при хорошем развитии (в районах достаточного увлажнения и при орошении) служат отличным предшественником для всех сельскохозяйственных культур (кроме Бобовых); используются в первую очередь под наиболее ценные и продуктивные культуры – Пшеницу, Хлопчатник, Лён, Просо, Кукурузу, Картофель и другие. Положительное последействие 3–5 лет; при слабом развитии ценность их как предшественника снижается. (ii) Зернобобовые Культуры (Люпин, Вика, Горох, Нут, Чина и другие) при хорошем развитии затеняют почву, улучшают её структуру и заглушают сорняки; хороший предшественник для всех Яровых и Озимых культур (кроме растений семейства Бобовых). Положительное последействие не менее 2 лет. (iii) Пропашные Культуры (Картофель, Свёкла, Кукуруза, Подсолнечник, Хлопчатник и другие) разнообразны по биологическим особенностям. Специфика их возделывания (многократные междурядные обработки, очищающие почву от сорняков и способствующие сохранению почвенной влаги) обусловливает повышение жизнедеятельности полезной микрофлоры в почве, улучшение питания растений. Возможны вторичные посевы некоторых Пропашных культур (Кукурузы, Хлопчатника, Сахарной Свёклы – особенно при орошении и отсутствии заболеваний; Картофеля – в специальных овоще-картофельных севооборотах, не более 2 лет подряд). Пропашные – хороший предшественник для всех Яровых Зерновых культур, Льна и Конопли. Кукуруза и кормовые Бобы на силос, ранние сорта Картофеля – неплохие предшественники для Озимых культур. Положительное последействие 2 года. (iv) Озимые Зерновые Культуры (Рожь, Пшеница, Ячмень) хорошо кустятся, затеняют почву и угнетают многие сорные растения. Убираются раньше других культур, что создаёт благоприятные условия для накопления осадков в послеуборочный период. Удобренные озимые – хороший предшественник для Пропашных культур, многолетних трав, Яровых Зерновых, Зернобобовых, Льна и так далее. Так, на Кубани, Украине и в ряде районов чернозёмной полосы бывшего СССР, где нет опасности поражения корневыми гнилями, возможны посевы Озимых по Озимым. (v) Технические Прядильные Культуры сплошного сева (Лён, Конопля и другие) требовательны к плодородию почвы, так как используют влагу и элементы питания из самого верхнего её слоя; Конопля хорошо усваивает труднорастворимые соединения фосфора; при оптимальной технологии возделывания удовлетворительные предшественники для Колосовых и Пропашных культур. (vi) Яровые Колосовые и Крупяные Культуры сплошного сева (Пшеница, Ячмень, Овёс, Просо, Гречиха) примерно в одинаковой степени выносят из почвы элементы питания, слабо её затеняют и нередко бывают сильно засорены. Удовлетворительные предшественники для других растений той же группы, а также для Пропашных культур. Например, в условиях Сибири и Казахстана хороший предшественник – Яровая Пшеница, посеянная по пласту или кулисному пару; в Европейской части бывшего СССР – Яровая Пшеница после многолетних Бобовых или Бобовых и Злаковых трав. (vii) Чистые (чёрные и ранние) и Кулисные Пары хорошо сохраняют весенние и летние атмосферные осадки, обеспечивают успешную борьбу с сорняками, усиливают полезную микробиологическую деятельность почвы, увеличивают запас в ней питательных веществ; отличные предшественники во всех зонах бывшего СССР (особенно в засушливых и полузасушливых) для Озимых культур; в условиях Сибири и Казахстана – для Яровой Пшеницы. Положительное последействие не менее 2–3 лет. В районах с достаточным количеством осадков на чистых от сорняков почвах в качестве предшественников Озимых и Яровых Зерновых культур часто применяют занятые пары. Классификация Севооборотов:- в соответствии с классификацией севооборота, действовавшей в бывшем СССР с 1968,

выделяли 3 типа севооборота:- (i) полевые, (ii) кормовые и (iii) специальные. В Полевых Севооборотах большую часть площади занимают Зерновые, Картофель и Технические культуры; в Кормовых Севооборотах – более половины площади отводится под Кормовые культуры; в Специальных Севооборотах выращивают культуры, требующие определённых условий и технологии выращивания (овощи, Табак, Конопля, Хлопчатник, Рис и другие). По соотношению сельскохозяйственных культур и паров типы севооборота подразделяют на виды:- (i) зерно-паровые, (ii) зерно-паропропашные, (iii) зерно-травяные, (iv) зерно-пропашные, (v) травопольные, (vi) травяно-пропашные, (vii) сидеральные, (viii) зерно-травянопропашные (плодосеменные), и (ix) пропашные. В Зерно-Паровых Севооборотах посевы Зерновых культур прерываются чистым паром; Зерновые занимают 50–70% севооборотной площади. Эти севообороты вводили в хозяйствах засушливых районов Северного Казахстана и степной части Сибири. В Зерно-Паропропашных Севооборотах посевы Зерновых прерываются чистым паром и Пропашными культурами; Зерновые занимают половину и более площади севооборота. Распространены в хозяйствах степных и лесостепных районов Юга и Юга-Востока бывшего СССР. В Зерно-Травяных Севооборотах большая часть площади отводилась под Зерновые, меньшая – под Однолетние и Многолетние травы. Применялись в хозяйствах нечернозёмной зоны бывшей РСФСР. В льноводческих районах в зерно-травяные севообороты включали одно поле льна (Зерно-Льняно-Травяные Севообороты). В Зерно-Пропашных Севооборотах половина и более площади отводилась под Зерновые, которые чередовались с Пропашными. Характерны для увлажнённых районов (Северный Кавказ, центральночернозёмная зона, лесостепь бывшей УССР). В Травопольных Севооборотах более половины площади занимали Многолетние травы; на остальной части пашни высевали Однолетние полевые культуры (Зерновые, Лён, Однолетние травы и так далее). Применялись главным образом в хозяйствах нечернозёмной зоны и в других районах (при орошении). В Травяно-Пропашных Севооборотах возделывание пропашных культур прерывалось Многолетними травами, занимавшими два поля и более. Эти севообороты вводили на пойменных и осушенных землях. К ним относились Люцерно-Хлопковые Севообороты в хлопкосеющих республиках. В Сидеральных Севооборотах выращивали культуры, возделываемые на зелёное удобрение (например, Люпин) в занятых (сидеральных) парах. Вводятся на суглинистых, супесчаных и песчаных почвах. В Зерно-Травяно-Пропашных, или Плодосеменных, Севооборотах возделывались Зерновые, Пропашные и Бобовые культуры, причём Зерновые занимали не более половины всей площади, что давало возможность осуществлять Плодосмен, то есть ежегодно менять растения разных групп на каждом поле. Эти севообороты были распространены в нечернозёмной зоне бывшей РСФСР, в лесостепных районах Европейской части бывшего СССР, на орошаемых землях засушливых районов. Пропашные Севообороты, в которых половина или более площади занималась Пропашными культурами широкорядного, квадратного и квадратно-гнездового посева, вводились в увлажнённых районах Северного Кавказа и бывшей УССР. Введение И Освоение Севооборотов В Бывшем СССР:- в хозяйствах севооборот обычно проектируют одновременно с составлением организационно-хозяйственного плана. Эта работа проводилась республиканскими проектными землеустроительными институтами с участием специалистов колхозов и совхозов. Подготовка к разработке проекта севооборота заключалась в изучении климатических и почвенно-гидрологических условий хозяйства. Пользуясь почвенными картами и агрохимическими картограммами, все пахотные земли делили на несколько производственных категорий. Одновременно обследовали и оценивали другие сельскохозяйственные угодья. На основании материалов обследования составляли план внутри хозяйственного землеустройства и план трансформации земельных угодий (перевод менее ценных в более продуктивные). Затем в соответствии с главными показателями развития хозяйства и государственным планом продажи сельскохозяйственной продукции разрабатывали структуру посевных площадей. Для решения вопроса о системе севооборота сопоставляли их различные варианты с оценкой:- по объёму производства продукции растениеводства на 1 га пашни, производству кормов в целом, каждому их виду и по выходу протеина, степени использования тракторов и сельскохозяйственных машин, объёму внутрихозяйственных перевозок. В соответствии с оптимальным для хозяйства вариантом устанавливали число и площадь севооборотов, количество полей и чередование культур в севообороте, размещение севооборота на территории хозяйства. В каждом севообороте создавали наилучшие условия для ведущей культуры. Проект системы севооборота обсуждали на совещании специалистов проектной организации и хозяйства, производственном совещании совхоза или собрании уполномоченных колхоза и после внесения поправок представляли для утверждения в вышестоящие сельскохозяйственные органы. Утверждённый проект переносили на территорию (проводили внутрихозяйственное землеустройство), устанавливали границы каждого севооборота и поля. После землеустройства и оформления всей документации севооборот считали введённым. Севообороты осваивали обычно в течение 2–3 лет. Освоенным считали такой севооборот, в котором каждая культура занимала установленное проектом число полей с соблюдением их границ. В бывшем СССР на 01 Ноября 1974 севообороты были введены на 196.2 миллионах га пашни (93% её общей площади) и освоены на 157.4 миллионах га (75% пашни). Севообороты За Рубежом:- Плодосменные Севообороты, господствующие повсеместно в странах Западной Европы, Соединённых Штатах Америки (США) и Канаде с XVIII до середины XX веков, уступили место в зерновых районах Зерновым Севооборотам без пара (кроме пшеничных зон США и Канады, где применяют Двух и Трёхпольные Паро-Зерновые С.); в районах интенсивного животноводства – Кормовым Севооборотом, в пригородных овощеводческих хозяйствах – Специализированным Севооборотом. В связи с усиленной интенсификацией земледелия наблюдается общая тенденция к углублению специализации и сокращению ротации севооборотов. В Восточных районах Великобритании, где более 100 лет применялся Норфолкский Севооборот, с конца 1960-х 27% хозяйств занимали Зерновыми культурами более 70% пашни. Практикуется применение Севооборотов С Промежуточными Культурами – Подсевными, Пожнивными и Озимыми (в Германской Демократической Республике (ГДР), Федеративной Республике Германия (ФРГ) и ряде других стран Западной Европы), которые дают возможность расширить посевы (до 30%) на той же площади и сохранить почву от разрушения в районах обильно выпадающих осадков. Для борьбы с почвенной эрозией вводят Почвозащитные Севообороты (в США, Канаде и ряде Европейских стран). В индивидуальных фермерских хозяйствах с небольшой площадью пахотных земель ограничиваются одним севооборотом с минимальным количеством культур. В странах Азии и Африки практикуют чередование культур в течение одного года. В зависимости от степени увлажнения почвы в определённый период подбираются культуры с различными требованиями к влаге. Например, в Бурунди распространено следующее чередование:- Ноябрь–Май – Рис; Июль–Сентябрь – Арахис; Ноябрь–Май следующего года – Рис; Май–Ноябрь – пар. В других рисосеющих странах используют сочетание Риса с различными Бобовыми культурами, например, Рис – Сладкий Клевер или Рис – Вика (Малагасийская Республика). При возделывании Арахиса применяют короткие севообороты:- Арахис – Просо, Арахис – Сорго, пар – Арахис – Сорго и другие. В тропических районах землю используют 2–3 года под Полевые культуры и 4–5 лет под залежь.

CROP TERMINATION = ПРЕКРАЩЕНИЕ КУЛЬТУРЫ (или ХХ) – Crop Termination:- The induction of ‘cutout’ or the termination of vegetative and reproductive growth, usually achieved with the use of plant growth regulators.

CROP TOP = КОРОТКИЙ ТОП (или ТОПИК, или ХХ) – Crop Top is a very short women’s top ending just below the breasts; a tank-style brassiere cropped to midriff length.

CROP YEAR = ГОД УРОЖАЯ (или СЕЛЬСКОХОЗЯЙСТВЕННЫЙ ГОД, или СЕЗОН) – The Crop Year is from August 01 to July 31 of the following year, as defined in the Canada Grain Act. The Governor in Council may, by order, vary the period of a crop year to another period of not less than three hundred and sixty-five days. Also known as Marketing Year. See also Marketing Year. Crop Year is the year in which a crop is planted. Also called the Cotton Marketing Year, which is the year beginning August 01 and ending July 31. Crop Year is the time span from one harvest to the next harvest for agricultural commodities. The crop marketing year varies slightly with each ag commodity, but it tends to begin at harvest and end before the next year's harvest, e.g., the marketing year for Cotton begins August 01 and ends July 31, for Soybeans begins September 01 and ends August 31, for Wheat begins June 01 and ends May 31, etc. The futures contract month of November represents the first major new-crop marketing month, and the contract month of July represents the last major old-crop marketing month for soybeans. The new marketing year for soybean cake and meal, soybean oil, sunflowerseed oil, cottonseed cake and meal, and cottonseed oil begins October 01 and ends September 30. The period of time from one harvest or storage cycle to the next; varies with each commodity. Crop Year for Coarse Grains:- refers to the crop marketing year beginning 01 April for Japan, 01 July for the European Union and New Zealand, 01 August for Canada and 01 October for Australia. The US crop year begins 01 June for Barley and Oats and 01 September for Maize and Sorghum. Crop Year for Cotton:- refers to the crop marketing year beginning 01 August for all countries. Crop Year for Oilseeds:- refers to the crop marketing year beginning 01 April for Japan, 01 July for the European Union and New Zealand, 01 August for Canada and 01 October for Australia. The US crop year begins 01 June for Rapeseed, 01 September for Soyabeans and for Sunflower seed. Crop Year for Rice:- refers to the crop marketing year beginning 01 April for Japan, Australia, 01 August for the United States, 01 September for the European Union, 01 November for Korea and 01 January for other countries. Crop Year for Sugar:- a common crop marketing year beginning 01 October and extending to 31 September, used by ISO (short for the International Sugar Organization). Crop Year for Wheat:- refers to the crop marketing year beginning 01 April for Japan, 01 June for the United States, 01 July for the European Union and New Zealand, 01 August for Canada and 01 October for Australia. Crop Year represents the 12-month period between the beginning of harvest one year and the beginning of harvest the following year. / Период времени от одного до следующего урожая или цикла хранения; различается для каждого конкретного сырья. , например, . В бывшем СССР Хозяйственный Год совпадал с календарным годом и начинался с 01 Января, а заканчивался 31 Декабря. Однако в период с 1921 по 1930 он исчислялся с 01 Октября текущего года и заканчивался 30 Сентября последующего года. Во многих странах мира хозяйственный год в промышленности совпадает с календарным годом, а в сельском хозяйстве определяется периодом сельскохозяйственного года. Под Сезоном, от Французского слова Сэзо (Saison), от Латинского слова Сатио (Satio), означающее Время Сева или Сеяние, понимается:- (1) время года (весна, лето, осень, зима). (2) Часть года, характеризующаяся какими-либо явлениями природы (например, сезон дождей) или постоянно используемая для определённых работ (например, сезон уборки урожая), занятий или отдыха (например, сезон охоты, лечебный сезон и прочие). (3) Театральный, музыкальный сезоны – период, в течение которого регулярно работают театры, концертные залы и тому подобное.

CRORE = КРОР – Crore is a traditional unit of quantity in India, equal to 10^7 or 10 million. Large numbers are usually described in India using the crore and the lakh (10^5). For example, the number 31 200 000 is called 3 crore 12 lakh and written 3,12,00,000. See also Lakh. / Крор – традиционная мера количества в Индии, равная 10^7 или 10 миллионам. В Индии большие цифровые значения обычно указываются с применением кроров и лаков (10^5). Например, число 31 200 000 (тридцать один миллион двести тысяч) будет указываться как 3 крора 12 лаков, а записываться как 3,12,00,000. Смотрите также Лак (Lakh).

CROSS = ПОМЕСЬ (или КРОСС) – Cross is a hybrid between two genetically dissimilar parents. / Под Помесью или Метисом понимается животное, полученное от скрещивания особей разных пород. Благодаря неоднородной генетической структуре наследственности обычно отличается повышенной продуктивностью, жизнеспособностью. Служит хорошим материалом для отбора при выведении новых пород.

CROSS–BORDER PAYMENT = ТРАНСГРАНИЧНЫЙ ПЛАТЁЖ – Cross-Border Payments means:- (i) 'cross-border credit transfers' being transactions carried out on the initiative of an originator via an institution or its branch in one Member State (in the European Union), with a view to making an amount of money available to a beneficiary at an institution or its branch in another Member State; the originator and the beneficiary may be one and the same person; (ii) 'cross-border electronic payment transactions' being:- (a) the cross-border transfers of funds effected by means of an electronic payment instrument, other than those ordered and executed by institutions; (b) cross-border cash withdrawals by means of an electronic payment instrument and the loading (and unloading) of an electronic money instrument at cash dispensing machines and automated teller machines at the premises of the issuer or an institution under contract to accept the payment instrument; and (iii) 'cross-border cheques' being those paper cheques defined in the Geneva Convention providing uniform laws for cheques of 1931-March-19 drawn on an institution located within the Community and used for cross-border transactions within the Community. A payment by an originator whose account from which payment is to be made, is held by an institution or its branch in one country, to be made available to a beneficiary at an institution or its branch in another country. Payments involving at least one party which is non-resident.

CROSS–BORDER SETTLEMENT = ТРАНСГРАНИЧНЫЙ РАСЧЁТ – Cross-Border Settlement is a settlement that takes place in a country other than the country in which one or both of the trade counterparties are located. / Расчёт, который имеет место в стране иной, нежели той, в которой расположена одна или оба участника сделки.

CROSS–BORDER TRANSACTION = ТРАНСГРАНИЧНАЯ ТРАНЗАКЦИЯ (или ТРАНСГРАНИЧНАЯ ОПЕРАЦИЯ) – Cross-Border Transaction is a transaction in a foreign security, or a transaction in a domestic security, when at least one trade counterparty is located outside the domestic market. / Операция (или сделка) с иностранной ценной бумагой, или операция (или сделка) с национальной ценной бумагой, в которой по крайней мере одна из сторон сделки расположена за пределами национального рынка.

CROSSBRED = КРОССБРЕД (или ГИБРИДНОЕ, или СКРЕЩЁННОЕ, или СМЕШАННОЕ, или ПОМЕСНОЕ) – Crossbred or Cross Bred:- a wool produced by crossing different breeds of sheep.

CROSSBRED WOOL = КРОССБРЕДНАЯ ШЕРСТЬ (или ПОМЕСНАЯ ШЕРСТЬ) – Crossbred Wool:- a sheep bred from two distinct breeds; also a classification for wool of medium fineness. In the United States, wool obtained from sheep of long-wool x fine-wool breeding. Usually this wool grades at 3/8 or 1/2 blood. See also Wool Grades.

CROSS–CERTIFICATION = ПЕРЕКРЁСТНАЯ СЕРТИФИКАЦИЯ – In banking, Cross-Certification is a process by which two Certification Authorities mutually certify each other's public keys. / В банковском обслуживании процесс, посредством которого два Органа по Сертификации (Certification Authorities) взаимно сертифицируют публичные ключи друг друга.

CROSS COMPLIANCE PROGRAMS = ПРОГРАММЫ ПЕРЕКРЁСТНОЙ УСТУПЧИВОСТИ (или ПРОГРАММЫ ВСТРЕЧНОЙ УСТУПЧИВОСТИ) – In the United States, when a full Cross-Compliance Program is in effect, a producer participating in one commodity program (Cotton, feed grains, Rice, or Wheat) on a farm must also participate on that farm in any of the other commodity

programs. When a limited cross-compliance program is in effect, a producer participating in one commodity program must not plant in excess of the crop acreage base on that farm for any of the other program commodities for which an acreage reduction program is in effect.

CROSS CONTAMINATION = ПЕРЕКРЁСТНАЯ КОНТАМИНАЦИЯ (или ПЕРЕКРЁСТНОЕ ЗАГРЯЗНЕНИЕ) – Cross Contamination:- in insect rearing, a situation where a culture of one insect species is infested with insects of another species.

CROSS CULTIVATION (CROSS PLOWING) = ПЕРЕКРЁСТНАЯ КУЛЬТИВАЦИЯ (ПЕРЕКРЁСТНАЯ ПАХОТА) – Cross Cultivation (Cross Plowing) is the tillage of a field, orchard, etc, in which the field is cultivated in one direction followed by cultivation at right angles to the first.

CROSS CURRENCY DEALING = ОСУЩЕСТВЛЕНИЕ СДЕЛОК С ПЕРЕКРЁСТНЫМИ ВАЛЮТАМИ – Cross Currency Dealing is currency transaction carried out in a currency other than local currency, for example purchase of USD for Yen in London by a Swiss bank.

CROSS–CURRENCY RATE SWAP = СВОП НА ВАЛЮТНЫЙ КРОСС КУРС – A Cross-Currency Rate Swap is essentially an interest rate swap in which each side is denominated in a different currency. Upon initiation of a cross-currency swap, the counterparties make an initial exchange of notional principals in the two currencies. During the life of the swap, each party pays interest (in the currency of the principal received) to the other. And at the maturity of the swap, the parties make a final exchange of the initial principal amounts, reversing the initial exchange at the same spot rate. A cross-currency rate swap is sometimes confused with a traditional FX Swap, which is simply a spot currency transaction that will be reversed at a predetermined date with an offsetting forward transaction; the two are arranged as a single transaction. A transaction in which one party pays periodic amounts in one currency based on a specified fixed rate (or a floating rate that is reset periodically) and the other party pays periodic amounts in another currency based on a floating rate that is reset periodically. All calculations are determined on predetermined notional amounts of the two currencies; often such swaps will involve initial and/or final exchanges of amounts corresponding to the notional amounts.

CROSS–DESIGNATIONS = ПЕРЕКРЁСТНЫЕ НАЗНАЧЕНИЯ – Cross-Designations are codes or numbers assigned to crosses made in a breeding program as a means to identify the crosses, usually with a letter prefix to identify the research institute followed by a number.

CROSS DIRECTION = ПОПЕРЕЧНОЕ НАПРАВЛЕНИЕ – Cross Direction:- the width dimension, within the plane of the fabric, that is perpendicular to the direction in which the fabric is being produced by the machine.

CROSS–DOCK = ПЕРЕГРУЗКА (или ПЕРЕВАЛКА) – Cross-Dock:- product or orders that are brought into the warehouse but not put-away. Instead of the stock arriving and being placed into storage, the stock is temporarily stored at the dock to be delivered or goes out immediately on another vehicle to be shipped. This stock is usually shipped immediately or within a day and does not go into storage.

CROSS–DOCK = СТЫКОВОЧНЫЙ ДОК – Cross-Dock is an enterprise that provides services to transfer goods from one piece of transportation equipment to another.

CROSS–DOCKING = СОСТЫКОВКА В ДОКЕ – Cross-Docking is an operations efficiency routine whereby newly received products are moved directly from the receiving area to the delivery staging area, eliminating the process of putting away and picking. The movement of goods directly from receiving dock to shipping dock to eliminate storage expense. The process of moving merchandise directly from the receiving dock to the shipping dock, eliminating the need to place the merchandise in storage. / для избежания расходов по хранению.

CROSS DOCKING AND TRANS–LOADING WAREHOUSES = СТЫКОВОЧНЫЕ СКЛАДЫ В ДОКЕ И ПЕРЕГРУЗОЧНЫЕ СКЛАДЫ – Cross Docking and Trans-Loading Warehouses are the warehouses that provide cross dock and trans-loading services. Container or railcar tracking is generally important. These services often require temporary storage with charges adjusted for free days or a grace period.

CROSS–DYED = ОДНОВАННОЕ КРАШЕНИЕ – Cross-Dyed:- the dyeing of two or more dissimilar fibers with different dyestuff affinity to different shades in the same piece of fabric.

CROSS–DYED EFFECT = ЭФФЕКТ ОДНОВАННОГО КРАШЕНИЯ – Cross-Dyed Effect:- Fabric:- all-rayon lining twill; Construction:- (i) Count:- 112 x 68; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed gray. Defect:- slight cross-dyed effect, accentuating tendency to warp streaky appearance. Analysis:- rayon yarn identification, confirmed by the weaving mill's records, showed that two different makes of viscose rayon had been used in this fabric, the warp yarn having a higher dye index than the filling yarn. When the use of two different makes of yarn is unavoidable, experienced weavers are generally cautious in selecting yarns with approximately the same dye index. Such information either is obtainable from the yarn manufacturers or may be determined by laboratory dyeing tests. A similar condition will result when cotton and viscose rayon are used in the same fabric. Because the cot ion absorbs the dyestuff much more slowly, it will normally dye lighter than almost any of the viscose process rayons. This variation can be minimized by the use of special technique on the part of the dyer to slow down the pickup of color by the rayon until the cotton has had a chance to come up to shade. / Уточина:- такая же как и основа.

CROSS DYEING = ПЕРЕКРЁСТНОЕ (или ПОПЕРЕЧНОЕ) КРАШЕНИЕ (или ОДНОВАННЫЙ СПОСОБ КРАШЕНИЯ) – Cross Dyeing is a method of dyeing blend or combination fabrics to two or more shades by the use of dyes with different affinities for the different fibers. See also Dyeing. Cross-Dyeing is a method of coloring fabrics made from more than one kind of fiber, for example, a wool and cotton blend. Each fiber in a fabric designed for cross-dyeing takes a specific dye in a different color or in variations of a color. A fabric that is crossdyed is more than one color. Cross-dyeing is often used to create heather effects (soft, misty colorings), but strongly patterned fabrics can also be achieved, depending on the fibers used in the fabric.

CROSSED CHECK = ПЕРЕЧЁРКНУТЫЙ ЧЕК (или КРОССИРОВАННЫЙ ЧЕК) – Crossed Check is a check restricted in use by means of special endorsements. A general crossed check has two parallel lines across the face and may also be endorsed '& Co.' for instance. The bank on which a crossed check is drawn may only pay it to one of its customers or to a bank. A special crossed check bears the name of a bank between the parallel lines, denoting that it may only be paid to the designated bank. If the bank on which the check is drawn is itself the designated bank, then the check may be paid to one of its customers. A general crossed check may be converted into a special crossed check, but not vice versa. Check with two lines drawn diagonally across its face, indicating that it must be presented to a bank for payment and cannot be endorsed to a third party. Used primarily in Europe. Crossed Cheque is a cheque marked 'A/c payee only' on the front which, in contrast to cash cheques, may not be redeemed in cash by the drawee bank specified on the cheque but can only be credited to the bearer's account. / Во внешней торговле чек с двумя линиями, проведёнными по

диагонали на его лицевой стороне и свидетельствующими, что чек должен быть представлен в банк для оплаты, и что он не может быть передан третьему лицу. Термин используется, главным образом, в Европе.

CROSS–FERTILIZATION = ПЕРЕКРЁСТНОЕ ОПЛОДОТВОРЕНИЕ – Cross-Fertilization is the fertilization of egg nuclei (ovules) of one plant by the pollen from another plant.

CROSS–FLOW QUENCH = ЗАКАЛИВАНИЕ ПОПЕРЕЧНЫМ ПОТОКОМ – Cross-Flow Quench:- in cooling extruded polymer filaments, refers to cooling air directed from one side cross the path of the filaments. There may be some type of suction on the opposite side to remove the heated air.

CROSS–HEDGE = ПЕРЕКРЁСТНЫЙ ХЭДЬЖ – Cross-Hedge is a hedging a cash market position in a futures or option contract for a different but price-related commodity. Hedging a cash market risk in a futures or options contract for a different but price-related commodity, security, currency or index.

CROSS–HEDGING = ПЕРЕКРЁСТНОЕ ХЭДЬЖИРОВАНИЕ – Cross-Hedging is a hedging a cash commodity using a different but related futures contract when there is no futures contract for the cash commodity being hedged and the cash and futures market follow similar price trends, e.g., using soybean meal futures to hedge fish meal. / , например, .

CROSSING OVER = ПЕРЕКРЁСТ (или КРОСИН ОУВО, или КРОССИНГ ОВЕР) – Crossing Over (X-Over) is a genetic recombination during meiosis resulting in the exchange of (usually) equivalent segments between homologous chromosomes. / В генетике под Перекрёстом или так называемыемым Кросиноуво или Кроссинговером понимается взаимный обмен участками гомологичных (парных) хромосом, приводящий к перераспределению (рекомбинации) локализованных в них генов. Происходит в процессе деления клеток; один из механизмов наследственной изменчивости. В экспериментальной генетике используется для построения генетических карт хромосом.

CROSSING THE LINE = ПЕРЕСЕЧЕНИЕ ЛИНИИ – Crossing The Line (maritime term):- crossing the Equator.

CROSS–LINKING = ПЕРЕКРЁСТНОЕ СВЯЗЫВАНИЕ – Cross-Linking is the stabilization of cellulosic or manufactured fibers through chemical reaction with certain compounds in such a way that the cellulose or manufactured polymer chains are bridged across or ‘crosslinked’. Cross-linking improves such mechanical factors as wrinkle resistance. Random cross-linking in manufactured polymers is undesirable and leads to brittleness and loss of tensile strength.

CROSS–MARGINING = ПЕРЕКРЁСТНОЕ МАРЖИНАЛЬНОЕ ОБЕСПЕЧЕНИЕ – Cross-Margining is a procedure for margining related assets jointly when different clearing organizations clear each side of the position. / Процедура совместных расчётов маржи по взаимосвязанным активам, когда различные клиринговые палаты производят расчёт по каждой стороне определённой позиции.

CROSS MEMBER = ТРАВЕРСА (или ПОПЕРЕЧИНА) – Cross Member is the main support of container floor. Transverse members fitted to the bottom side rails of a container, which support the floor. / Под Траверсой понимается горизонтальная балка, являющаяся частью различных конструкций и машин (главным образом станин). Подвижные траверсы станков называются поперечинами, например в гидравлическом прессе, продольно-строгальном станке.

CROSS–NUMBERING = ПЕРЕКРЁСТНОЕ ИСЧИСЛЕНИЕ – Cross-Numbering is an identification and numbering system used to name and number the different crosses produced by researchers everywhere.

CROSSOVER = ПЕРЕСЕЧЕНИЕ – Crossover is a point on a graph where two lines intersect. Depending on which lines they are, a crossover may indicate a buy or sell signal. For example, the price line crossing above a moving average line may generate a buy signal. Oscillators such as MACD and Chaikin Money Flow experience centerline crossovers. When a primary indicator line moves above or below a secondary indicator line. Normally considered to be an important technical consideration in providing an initial trading signal, or used as a confirming indicator. / В техническом анализе биржевых рынков, когда линия главенствующего индикатора пересекает вверх или вниз линию вторичного индикатора. Обычно, рассматривается в качестве важного технического фактора в обеспечении сигнала начала торговли, или используется в качестве подтверждающего индикатора. МЭКДИ (MACD) и Денежный Поток Чэйкина (Chaikin Money Flow).

CROSS–POLINATION = ПЕРЕКРЁСТНОЕ ОПЫЛЕНИЕ – Cross-Pollination is the transfer of pollen from the flowers (florets) of one plant to the stigma of another plant. It may or may not lead to fertilization. / Под Перекрёстным Опылением понимается перенос пыльцы из пыльника одного цветка на рыльце пестика другого. Совершается у многих растений с помощью ветра (анемофилия), воды (гидрофилия) и животных (зоофилия). Типы перекрёстного опыления – гейтоногамия и ксеногамия.

CROSS–PROTECTION = ПЕРЕКРЁСТНАЯ ЗАЩИТА – Cross-Protection is the phenomenon in which a plant tissue infected with one strain of a virus is protected from infection by other strains of the same virus.

CROSS RATE = КРОСС КУРС – Cross Rate: is the currency exchange rate between two currencies, both of which are not the official currencies of the country in which the exchange rate quote is given in. This phrase is also sometimes used to refer to currency quotes which do not involve the US Dollar, regardless of which country the quote is provided in. For example, if an exchange rate between the British Pound (also known as Cable or Sterling) and the Japanese Yen was quoted in an American newspaper, this would be considered a cross rate in this context, because neither the Pound or the Yen is the standard currency of the United States. However, if the exchange rate between the Pound and the US Dollar were quoted in that same newspaper, it would not be considered a cross rate because the quote involves the US official currency. Cross Rate is an exchange rate between two currencies. It is usually made up from the individual exchange rates of the two currencies, measured against the US Dollar. In foreign exchange, the price of one currency in terms of another currency in the market of a third country. For example, the exchange rate between Japanese Yen and Euros would be considered a cross rate in the US market. CHF – Swiss Franc (or Swissy). CAD – Canadian Dollar (or Loonie). Exchange rate computed by pricing two currencies against a third. For example, USD1.0000 = CHF1.3138 and USD1.0000 = EUR0.8432 equals EUR1.0000 = CHF1.5581. / Обменный курс двух валют, установленный через курс каждой из них по отношению к третьей валюте. Например, .

CROSS REFERENCE = ПЕРЕКРЁСТНАЯ ССЫЛКА – Cross Reference:- document that indicates Bill of Lading and corresponding container(s) or vice-versa. / Документ, который указывает на Коносамент и соответствующий контейнер(ы) или наоборот.

CROSS–SECTION = (ПОПЕРЕЧНОЕ) СЕЧЕНИЕ – Cross-Section is the shape of an individual filament when cut at right angles to its axis. Normal shapes for manufactured fibers vary, e.g., round (Nylon, polyester, polypropylene, and some acrylics), serrated or crenular (viscose rayon, acetate, and triacetate), bean-shaped (some acrylics and modacrylics). The shaped of manufactured fibers can be modified by changing the shape of the holes in the spinneret. Cross-sectional variants are produced intentionally in wide variety of shapes for different physical effects such as change in luster or hand, improved resistance to soiling, etc. Examples are Trilobal® (T

and Y) and other multilobal shapes (cruciform, K, X, pentalobal, star, etc), I-beam, ribbon, square, triangular, elliptical, hollow, and many others. Cross Section is the shape of a fiber when viewed perpendicular to its axis. Note:- the shape of man-made fibers can be influenced by the spinning process and subsequent processing and treatments, such as texturizing. / Найлан (Nylon). Тчрайлобэл® (Trilobal®).

CROSS SELLING = КРОССИРОВАННАЯ (или ПЕРЕКРЁСТНАЯ) ПРОДАЖА – Cross-Selling is the action or practice of selling among or between clients, markets, traders, etc or the action or practice of selling an additional product or service to an existing customer. This article deals exclusively with the latter meaning. In practice, businesses define cross-selling in many different ways. Elements that might influence the definition might include the size of the business, the industry sector it operates within and the financial motivations of those required to define the term. The objectives of cross-selling can be either to increase the income derived from the client or clients or to protect the relationship with the client or clients. The approach to the process of cross-selling can be varied. Unlike the acquiring of new business, cross-selling involves an element of risk that existing relationships with the client could be disrupted. For that reason, it is important to ensure that the additional product or service being sold to the client or clients enhances the value the client or clients get from the organization. In practice, large businesses usually combine cross-selling and up-selling techniques to enhance the value that the client or clients gets from the organization (and vice versa). Cross-Selling of Professional Services:- benefits that can accrue to the customer include the efficiency and leverage that result from using a single supplier for multiple products. When buying complex professional services, like consulting needed to make and integrate an acquisition, the use of one firm reduces the fingerpointing that is common when a problem occurs in an area that straddles two or more services; if only one firm is responsible, fingerpointing is eliminated. For the vendor, the benefits are also substantial. The most obvious example is an increase in revenue. There are also efficiency benefits in servicing one account rather than several. Most importantly, vendors that sell more services to a client are less likely to be displaced by a competitor. The more a client buys from a vendor, the higher the switching cost. Though there are some ethical issues with most cross-selling, in some cases they can be huge. Arthur Andersen's dealings with Enron provide a highly visible example. It is commonly felt that the firm's objectivity, being an auditor, was compromised by selling internal audit services and massive amounts of consulting work to the account. Though most companies want more cross-selling, there can be substantial barriers:- (i) a customer policy requiring the use of multiple vendors; (ii) different purchasing points within an account, which reduce the ability to treat the customer like a single account; and (iii) the fear of the incumbent business unit that its colleagues would botch their work at the client, resulting with the loss of the account for all units of the firm. Broadly speaking, cross-selling takes three forms. First, while servicing an account, the product or service provider may hear of an additional need, unrelated to the first, that the client has and offer to meet it. Thus, for example, in conducting an audit, an accountant is likely to learn about a range of needs for tax services, for valuation services and others. To the degree that regulations allow, the accounts may be able to sell services that meet these needs. This kind of cross-selling helped major accounting firms to expand their businesses considerably. Because of the potential for abuse, this kind of selling by auditors has been greatly curtailed under the Sarbanes-Oxley Act. Selling add-on services is another form of cross-selling. That happens when a supplier shows a customer that it can enhance the value of its service by buying another from a different part of the supplier's company. When one buys an appliance, the salesperson will offer to sell insurance beyond the terms of the warranty. Though common, that kind of cross-selling can leave a customer feeling poorly used. The customer might ask the appliance salesperson why he needs insurance on a brand new refrigerator, 'Is it really likely to break in just nine months'? The third kind of cross-selling can be called selling a solution. In this case, the customer buying air conditioners is sold a package of both the air conditioners and installation services. The customer can be considered buying relief from the heat, unlike just air conditioners. Examples:- (i) a Life Insurance company suggesting its customer sign up for car or health insurance; (ii) a wholesale mobile retailer suggesting a customer choose a network or carrier after one purchases a mobile; (iii) a television brand suggesting its customers go for a home theater of its or another's brand; and (iv) a laptop seller offering a customer a mouse, pen-drive, and or accessories. Cross Selling is the sale of different categories of product/service via common channels. Particularly common at full-service banks. Cross Selling or Cross-Sell is the practice of selling or suggesting related or complimentary products to a prospect or customer. Cross selling is one of the easiest and most effective methods of marketing. In the financial services arena, cross selling can mean selling different types of investments to investors, or even insurance to investors, or tax preparation to retirement planning clients. If done effectively, cross selling can mean significant profits for stockbrokers, insurance agents and financial planners. Income tax preparers who are licensed can offer insurance and investment products to their tax clients, and this is among the easiest of all sales to make. Effective cross selling is not only a good business practice, but is effective financial planning as well.

CROSS–STITCH = ВЫШИВКА КРЕСТОМ (или КРЕСТОВОЙ СТЕЖОК) – Cross-Stitch is a popular form of counted-thread embroidery in which X-shaped stitches in a tiled, raster-like pattern are used to form a picture. Cross-stitch is often executed on easily countable evenweave fabric called Aida Cloth. The stitcher counts the threads in each direction so that the stitches are of uniform size and appearance. This form of cross-stitch is also called Counted Cross-Stitch in order to distinguish it from other forms of cross-stitch. Sometimes cross-stitch is done on designs printed on the fabric (stamped cross-stitch); the stitcher simply stitches over the printed pattern. Fabrics used in cross-stitch include aida, linen, and mixed-content fabrics called 'Evenweave'. All cross stitch fabrics are technically 'evenweave', it refers to the fact that the fabric is woven to make sure that there are the same number of threads in an inch both left to right and top to bottom (vertically and horizontally). Fabrics are categorized by threads per inch (referred to as 'Count'), which can range from 11 to 40 count. Aida fabric has a lower count because it is made with two threads grouped together for ease of stitching. Cross stitch projects are worked from a gridded pattern and can be used on any count fabric, the count of the fabric determines the size of the finished stitching. History:- cross-stitch is one of the oldest forms of embroidery and can be found all over the world. Many folk museums show examples of clothing decorated with cross-stitch, especially from continental Europe and Asia. Two-dimensional (unshaded) cross-stitch in floral and geometric patterns, usually worked in black and red cotton floss on linen, is characteristic of folk embroidery in Eastern and Central Europe. The cross stitch sampler is called that because it was generally stitched by a young girl to learn how to stitch and to record alphabet and other patterns to be used in her household sewing. These samples of her stitching could be referred back to over the years. Often, motifs and initials were stitched on household items to identify their owner, or simply to decorate the otherwise-plain cloth. In the United States, the earliest known cross-stitch sampler is currently housed at Pilgrim Hall in Plymouth, Massachusetts. The sampler was created by Loara Standish, daughter of Captain Myles Standish and pioneer of the Leviathan stitch, circa 1653. Traditionally, cross-stitch was used to embellish items like household linens, tablecloths, dishcloths, and doilies (only a small portion of which would actually be embroidered, such as a border). Although there are many cross-stitchers who still employ it in this fashion, it is now increasingly popular to work the pattern on pieces of fabric and hang them on the wall for decoration. Cross stitch is also often used to make greeting cards, pillowtops, or as inserts for box tops, coasters and trivets. Multicolored, shaded, painting-like patterns as we know them today are a fairly modern development, deriving from similar shaded patterns of Berlin wool work of the mid-XIX century. Besides designs created expressly for cross stitch, there are software programs that convert a photograph or a fine art image into a chart suitable for stitching. One stunning example of this is in the cross stitched reproduction of the Sistine Chapel charted and stitched by Joanna Lopianowski-Roberts. There are many cross-stitching

'guilds' and groups across the United States and Europe which offer classes, collaborate on large projects, stitch for charity, and provide other ways for local cross-stitchers to get to know one another. Individually owned local needlework shops (LNS) often have stitching nights at their shops, or host weekend stitching retreats. Today cotton floss is the most common embroidery thread. It is a thread made of mercerized cotton, composed of six strands that are only loosely twisted together and easily separable. While there are other manufacturers, the two most-commonly used (and oldest) brands are DMC® and Anchor, both of which have been manufacturing embroidery floss since the 1800s. Other materials used are pearl (or perle) cotton, Danish flower thread, silk and Rayon. Different wool threads, metallic threads or other novelty threads are also used, sometimes for the whole work, but often for accents and embellishments. Hand-dyed cross stitch floss is created just as the name implies – it is dyed by hand. Because of this, there are variations in the amount of color throughout the thread. Some variations can be subtle, while some can be a huge contrast. Some also have more than one color per thread, which in the right project, creates amazing results. Cross stitch is widely used in traditional Palestinian dressmaking. Систинэ Капэль (Sistine Chapel) Канадка, живущая в Соединённых Штатах Америки, Дьжоэна Лопиановски-Рабэтс (Joanna Lopianowski-Roberts).

CROSS TRADE = ПЕРЕКРЁСТНАЯ ТОРГОВЛЯ – (1) Cross Trade is a foreign-to-foreign trade carried by ships from a nation other than the two trading nations. Shipping services provided by a Carrier between countries other than that in which the vessel(s) is/are registered (UNCTAD).

(2) Cross Trade is a trade between a broker and its customer, which is not revealed to the rest of the market but for registration purposes it is entered in the matching process by the clearing member as a buy and sell contract to and from itself.

CROSS TRADING = ПЕРЕКРЁСТНАЯ ТОРГОВЛЯ – Cross Trading:- offsetting match by a broker of the buy order of one customer against the sell order of another, or a match of a trade made by a broker with his customer, a practice that is permissible only when executed in accordance with the US Commodity Exchange Act, the US Commodity Futures Trading Commission regulations, and rules of the contract market. Neither NYMEX® Division nor COMEX® Division members are permitted to take the opposite side of a customer's order, except, under certain circumstances, for trades involving long-dated (nine months or more forward) COMEX® Division copper futures. Offsetting or noncompetitive match of the buy order of one customer against the sell order of another, a practice that is permissible only when executed in accordance with the US Commodity Exchange Act, the Commodity Futures Trading Commission (CFTC) regulations, and rules of the exchange. / НАЙМЭКС® (NYMEX®). КОМЭКС® (COMEX®).

CROSS–TRAINING = ОБУЧЕНИЕ СМЕЖНЫМ СПЕЦИАЛЬНОСТЯМ – Cross-Training:- allowing employees to have experience in multiple tasks, job functions, or across multiple accounts in order to increase productivity and provide backup.

CROSSWISE = ПОПЕРЕЧНАЯ (или ИЗ СТОРОНЫ В СТОРОНУ) – Crosswise:- across, from side to side, when plowing in a field.

CROTCH SEAM = ШОВ В ПРОМЕЖНОСТИ – Crotch Seam is the short seam from the back of the pants fly to the inseam. / до внутреннего шва (inseam).

CROWDFUNDING = ОБЩЕСТВЕННОЕ ФОНДИРОВАНИЕ – Crowdfunding is the practice of funding a project or venture by raising many small amounts of money from a large number of people, typically via the Internet. Crowdfunding is a form of crowdsourcing and of alternative finance. In 2015, it was estimated that worldwide over USD34 billion was raised this way. Although similar concepts can also be executed through mail-order subscriptions, benefit events, and other methods, the term crowdfunding refers to Internet-mediated registries. This modern crowdfunding model is generally based on three types of actors:- the project initiator who proposes the idea and/or project to be funded, individuals or groups who support the idea, and a moderating organization (the 'platform') that brings the parties together to launch the idea. Crowdfunding has been used to fund a wide range for-profit entrepreneurial ventures such as artistic and creative projects, medical expenses, travel, or community-oriented social entrepreneurship projects. History:- crowdfunding has a long history with several roots. Books have been crowdfunded for centuries:- authors and publishers would advertise book projects in praenumeration or subscription schemes. The book would be written and published if enough subscribers signaled their readiness to buy the book once it was out. The subscription business model is not exactly crowdfunding, since the actual flow of money only begins with the arrival of the product. The list of subscribers has, though, the power to create the necessary confidence among investors that is needed to risk the publication. War bonds are theoretically a form of crowdfunding military conflicts. London's mercantile community saved the Bank of England in the 1730s when customers demanded their pounds to be converted into gold – they supported the currency until confidence in the pound was restored, thus crowdfunded their own money. A clearer case of modern crowdfunding is Auguste Comte's scheme to issue notes for the public support of his further work as a philosopher. The 'Premiere Circulaire Annuelle adressée par l'auteur du Systeme de Philosophie Positive' was published on 14 March 1850, and several of these notes, blank and with sums have survived. The cooperative movement of the XIX and XX centuries is a broader precursor. It generated collective groups, such as community or interest-based groups, pooling subscribed funds to develop new concepts, products, and means of distribution and production, particularly in rural areas of Western Europe and North America. In 1885, when government sources failed to provide funding to build a monumental base for the Statue of Liberty, a newspaper-led campaign attracted small donations from 160 000 donors. Crowdfunding on the Internet first gained popular and mainstream use in the arts and music communities. The first noteworthy instance of online crowdfunding in the music industry was in 1997, when fans underwrote an entire US tour for the British rock band Marillion, raising USD60 000 in donations by means of a fan-based Internet campaign. They subsequently used this method to fund their studio albums. In the film industry, independent writer/director Mark Tapio Kines designed a website in 1997 for his then-unfinished first feature film Foreign Correspondents. By early 1999, he had raised more than USD125 000 on the Internet from at least 25 fans, providing him with the funds to complete his film. In 2002, the 'Free Blender' campaign was an early software crowdfunding precursor. The campaign aimed for open-sourcing the Blender 3D computer graphics software by collecting USD100 000 from the community while offering additional benefits for donating members. Crowdfunding started to gain mainstream traction with the launch of ArtistShare (2003). As the model matured, more crowdfunding sites started to appear on the web such as Kiva (2005), IndieGoGo (2008), Kickstarter (2009), GoFundMe (2010) and Microventures (2010). The phenomenon of crowdfunding is older than the term 'Crowdfunding'. According to wordspy.com, the earliest recorded use of the word was in August 2006. Types:- the Crowdfunding Centre's May 2014 report identified two primary types of crowdfunding:- (i) rewards crowdfunding:- entrepreneurs presell a product or service to launch a business concept without incurring debt or sacrificing equity/shares; and (ii) equity crowdfunding:- the backer receives shares of a company, usually in its early stages, in exchange for the money pledged. / схема Огюста Комта (Auguste Comte's scheme) (в честь Французского философа и писателя Изидора Мари Огюст Фросуа Гзавье Комта (Isidore Marie Auguste François Xavier Comte; 1798–1857), сформулировавшего доктрину позитивизма). Британская рок группа Морилиэн (Marillion). Независимый писатель/директор Марк Тапио Кайнз (Mark Tapio Kines; 1970–). Блэндё СриДи. (Blender 3D computer graphics software). АтистЩеа (ArtistShare) (в 2003). Кивэ (Kiva) (в 2005), ИндиГоуГоу (IndieGoGo) (в 2008), Кикстотё (Kickstarter) (в 2009), ГоуФандМи (GoFundMe) (в 2010) и Майкровэнтчуз (Microventures) (в 2010). водспайДатКам (wordspy.com).

CROWN = ГОЛОВКА (или ДНИЩЕ, или НАИВЫСШАЯ ТОЧКА) – Crown is the top of the piston in an internal combustion engine above the fire ring, exposed to direct flame impingement. / Головка или Днище поршня – вершина поршня в двигателе внутреннего сгорания .

CROWN = КОРОНА (или ВЕНЕЦ) – Crown is a royal or imperial headdress of cap of sovereignty, diadem.

CROWN = КРОНА – Crown is the part of a tree above the first branching. The area from which new shoots arise or the point at which the roots meet the stem. / Под Кроной, от Немецкого слова Krone, от Латинского слова Corona, означающее Венец, понимается надземная разветвлённая часть дерева. Крону плодовых и декоративных деревьев формируют обрезкой, обычно с учётом их природных особенностей.

CROWSFEET = ГУСИНЫЕ ЛАПКИ (или ВОРОНЬИ ЛАПКИ, или МОРЩИНКИ В УГОЛКАХ ГЛАЗ) – Crowsfeet is a fabric defect consisting of breaks or wrinkles of varying degrees of intensity and size, resembling bird's footprints in shape, and occurring during wet processing of fabrics. Crowsfeet:- in fabrics, fine wrinkles of varying degrees of intensity, size, and shape. Discussion:- crowsfeet may occur during wet processing and on finished goods after folding. Crows' Feet:- wrinkles of varying degrees of intensity and size that give the overall effect of birds' footprints. Note:- this defect maybe caused during wet processing or by careless folding of finished goods. Note:- this defect is caused by excessive dyestuff present during dyeing, or by precipitation of the dyestuff. / Ёлка, Гусиные Лапки (crows' feet):- порок заключительной отделки ткани; морщины различной степени интенсивности и размера, представляющие эффект следов птиц. Примечание:- этот порок возникает во время крашения и отжима или при небрежном складывании полотна.

CROW'S NEST = ВОРОНЬЕ ГНЕЗДО (или МАРСОВАЯ ПЛОЩАДКА) – Crow's Nest (maritime term):- the platform or tub on the mast for the look-out. / Воронье Гнездо или Марсовая Площадка – наблюдательный пункт на стеньге.

CRP = CONSERVATION RESERVE PROGRAM

CRP = CONTINUOUS REPLENISHMENT PROGRAM

CRR = CASH RESERVE RATIO

CRR/HHT = CARD READER REPLACEMENT/HAND HELD TERMINAL

CRRI = CENTRAL RICE RESEARCH INSTITUTE

CRRN = CARIBBEAN RICE RESEARCH NETWORK

CRSP = COLLABORATIVE RESEARCH SUPPORT PROGRAM

CRU = CENTRAL REEXAMINATION UNIT

CRUCIFORM = КРЕСТОВИДНОЕ (или КРЕСТООБРАЗНОЕ) – Cruciform:- shaped like a cross.

CRUCIFORM PERIMETER–BASE PALLET = ПОДДОН С НИЖНИМ НАСТИЛОМ ПО ПЕРИМЕТРУ С КРЕСТООБРАЗНО РАСПОЛОЖЕННЫМИ ДОСКАМИ (или ПОДДОН С КРЕСТООБРАЗНЫМ И ПО ПЕРИМЕТРУ ОСНОВАНИЕМ) – Cruciform Perimeter-Base Pallet with two centre bottom deck components at right angles to each other. Note:- all bottom components are in the same plane. / Поддон С Нижним Настилом По Периметру С Крестообразно Расположенными Досками:- плоский поддон с нижним настилом по периметру, с двумя центральными досками, расположенными взаимноперпендикулярно. Примечание:- детали нижнего настила поддона находятся в одной плоскости.

CRUDE OIL = НЕФТЬ – Crude Oil is a naturally occurring liquid composed mostly of hydrogen and carbon. It is usually found underground but can also be found above ground in oil seeps or tar pits. It is used to produce fuel for cars, trucks, airplanes, boats and trains, asphalt for roads, lubricants, plastics for toys, bottles, food wrap and computers. Barrels from an area in which the crude oil's molecular characteristics have been determined and the oil has been classified are used as pricing references throughout the world. Some of the common reference crude oils are:- (i) West Texas Intermediate (WTI), a very high-quality, sweet, light oil delivered at Cushing, Oklahoma for North American oil; (ii) Brent Blend, comprising 15 oils from fields in the Brent and Ninian systems in the East Shetland Basin of the North Sea; and (iii) Dubai-Oman, used as benchmark for Middle East sour crude oil flowing to the Asia-Pacific region. Different types of crude oil futures are traded at the NYMEX® (New York, NY, USA), ICE Futures Europe® (London, UK) and TOCOM (Tokyo, Japan). Crude Oil is technically defined as a mixture of hydrocarbons that exists in the liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Crude Oil, also called Petroleum, is a complex mixture of carbon and hydrogen (hydrocarbons), which exist as a liquid in the earth's crust. Crude oil has many compositions, some is black, thick and tar like, while other crude oils are lighter in color and thinner. The carbon and hydrogen in crude oil are thought to have originated from the remains of microscopic marine organisms that were deposited at the bottom of seas and oceans and was transformed at high temperature and pressure into crude oil and natural gas. This oil and gas migrates upward through the porous rock, as it is less dense than the water which fills the pores. The oil and gas is trapped by a layer of impermeable rock through which they can't flow. Several different types of oil and gas 'traps' exist; a common dome formed by folded sedimentary rocks. Crude oil is obtained by drilling a hole into the reservoir rock (sandstone, limestone etc) and pumping it out. Crude Oil is a complex mixture of hydrocarbons of different molecular weights, in which there is a generally small fraction of compounds containing sulfur and nitrogen. The composition of the oil is variable and can be divided into three classes, according to the distillation residues, as paraffins, asphalts or a combination of both. Oil is used as a raw material in refineries for processing and obtaining its derivatives. In specific cases, it is also used for final consumption in given industrial activities. Crude Oil is mineral oil of natural origin comprising a mixture of hydrocarbons and associated impurities, such as sulphur. It exists in the liquid phase under normal surface temperature and pressure and its physical characteristics (density, viscosity, etc) are highly variable. This category includes field or lease condensate recovered from associated and non-associated gas where it is co-mingled with the commercial crude oil stream. See also Petroleum. Crude Oil is a mineral oil of natural origin comprising a mixture of hydrocarbons and associated impurities, such as sulphur. It exists in the liquid phase under normal surface temperature and pressure and its physical characteristics (density, viscosity, etc) are highly variable. This category includes field or lease condensate recovered from associated and non-associated gas where it is co-mingled with the commercial crude oil stream. Crude is normally refined prior to use but it is sometimes burned directly in the power generation sector. A mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Depending upon the characteristics of the crude stream, it may also include:- (i) small amounts of hydrocarbons that exist in gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casinghead) gas in lease separators and are subsequently commingled with the crude stream without being separately measured. Lease condensate recovered as a liquid from natural gas wells in lease or field separation facilities and later mixed into the crude stream is also included; (ii) small amounts of nonhydrocarbons

produced with the oil, such as sulfur and various metals; and (iii) drip gases, and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Liquids produced at natural gas processing plant are excluded. Crude oil is refined to produce a wide array of petroleum products, including:- asphalt; diesel, gasoline and jet fuels; butane, ethane, and propane; heating oils; lubricants; and many other petrochemical and other products used for their energy or chemical content. Crude Oil includes condensate and natural gas liquids. Also known as Oil. Crude Oil is the term for 'unprocessed' oil, the stuff that comes out of the ground. It is also known as Petroleum. Crude oil is a fossil fuel, meaning that it was made naturally from decaying plants and animals living in ancient seas millions of years ago – most places you can find crude oil were once sea beds. Crude oils vary in color, from clear to tar-black, and in viscosity, from water to almost solid. Crude oils are such a useful starting point for so many different substances because they contain hydrocarbons. Hydrocarbons are molecules that contain hydrogen and carbon and come in various lengths and structures, from straight chains to branching chains to rings. There are two things that make hydrocarbons exciting to chemists:- (i) Hydrocarbons contain a lot of energy. Many of the things derived from crude oil like gasoline, diesel fuel, paraffin wax and so on take advantage of this energy. (ii) Hydrocarbons can take on many different forms. The smallest hydrocarbon is methane (CH_4), which is a gas that is a lighter than air. Longer chains with 5 or more carbons are liquids. Very long chains are solids like wax or tar. By chemically cross-linking hydrocarbon chains you can get everything from synthetic rubber to nylon to the plastic in tupperware. Hydrocarbon chains are very versatile! The major classes of hydrocarbons in crude oils include:- (i) Alkenes:- general formula:- C_nH_{2n} (n is a whole number, usually from 1 to 20), linear or branched chain molecules containing one carbon-carbon double-bond, can be liquid or gas, examples:- ethylene, butene, isobutene; (ii) Aromatics:- general formula:- C_6H_5–Y (Y is a longer, straight molecule that connects to the benzene ring), ringed structures with one or more rings, rings contain six carbon atoms, with alternating double and single bonds between the carbons, typically liquids, examples:- benzene, napthalene; (iii) Dienes and Alkynes:- general formula:- C_nH_{2n-2} (n is a whole number, usually from 1 to 20), linear or branched chain molecules containing two carbon-carbon double-bonds, can be liquid or gas, examples:- acetylene, butadienes; (iv) Napthenes or Cycloalkanes:- general formula:- C_nH_{2n} (n is a whole number usually from 1 to 20), ringed structures with one or more rings, rings contain only single bonds between the carbon atoms, typically liquids at room temperature, examples:- cyclohexane, methyl cyclopentane; and (v) Paraffins:- general formula:- C_nH_{2n+2} (n is a whole number, usually from 1 to 20), straight- or branched-chain molecules, can be gasses or liquids at room temperature depending upon the molecule, examples:- methane, ethane, propane, butane, isobutane, pentane, hexane. On average, crude oils are made of the following elements or compounds:- carbon – 84%, hydrogen – 14%, sulfur – 1 to 3% (hydrogen sulfide, sulfides, disulfides, elemental sulfur), nitrogen – less than 1% (basic compounds with amine groups), oxygen – less than 1% (found in organic compounds such as carbon dioxide, phenols, ketones, carboxylic acids), metals – less than 1% (nickel, iron, vanadium, copper, arsenic), and salts – less than 1% (sodium chloride, magnesium chloride, calcium chloride). Crude Oil or Petroleum:- mineral oil consisting of a mixture of hydrocarbons of natural origin, yellow to black in color, of variable density and viscosity. Data in this category also includes crude mineral oils extracted from bituminous minerals (shale, bituminous sand, etc). Data also includes lease (field) condensate which is recovered from gaseous hydrocarbons in lease separation facilities. Crude Oil is an organic liquid substance often found below the Earth's surface. It is made up of thousands of molecules composed of different hydrogen and carbon atoms. Such compounds are called Hydrocarbons. These hydrocarbons also contain different proportions of impurities like oxygen, sulphur, nitrogen and heavy metal atoms. Crude oil is highly flammable and is an excellent source of energy. Its 'sister' hydrocarbon, natural gas, is another source of energy. Oil is called a non-renewable energy source because it cannot be replenished. Oil is formed from the accumulation of hydrocarbons. Hydrocarbons accumulate naturally, thousands of feet below the surface of the Earth, from the decomposition of organic materials like plants and marine animals which died during the Palaeozoic Era (between 245 and 544 million years ago). Trapped beneath the ground under enormous pressure and high temperatures, these hydrocarbons were compressed and eventually transformed into crude oil after millions of years. Underground oil accumulations are formed when three conditions are met. First, there must be a 'source' rock rich in hydrocarbons and buried deep enough so that the heat from the Earth's core can 'cook' them into oil. Second, there should be a porous rock nearby in which oil can accumulate (it is often sandstone). If the holes in the rock are interconnected, then oil can flow easily out of the rock. This condition is called Permeability. The porous rock must have good permeability, which is why studying the structure of rocks is an important step to finding oil. Third, there is usually a 'cap rock' or seal to trap the oil in the underground reservoirs and prevent it from seeping to the surface. Within these reservoirs, hydrocarbons are typically organized like a three-layer cake – with a layer of water below the oil and a layer of gas above it. Much of the oil that escapes to the surface often evaporates into the air. But it can leave behind deposits of residual hydrocarbons called Bitumen. Oil Properties:- Crude oil properties can vary widely depending on where the oil is found and under what conditions it was formed. Its different physical properties are used to design the right kind of refineries, classify the oil (for example, West Texas Intermediate or Oman) and determine an appropriate price for it. The properties of oil include its density, called the API Gravity (named after the American Petroleum Institute), sulphur content, nitrogen content, carbon residue and distillation range. Each of these properties is important for different reasons. For example, the sulphur content of crude oil is important because it determines the kind of treatment that it will require at a refinery. The higher the sulphur level, the bigger the effect it will have on the environment – and the more corrosive effect it will have on equipment. API gravity is also important. It is essentially a measure of density. It determines whether a specific type of crude oil has a higher or lower boiling range (or distillate yields), which is important for separating and extracting different parts (or fractions). Different oil-producing areas produce different kinds of crude oil. And depending on its mixture of hydrocarbons, crude oil can vary in colour, composition and consistency. It is quite common to classify crude oil into different types or grades. The following classifications are most common. Light/Heavy:- crude oil can be classified as either light or heavy depending on its API gravity (or density). Generally, the higher its API gravity, the lower its density. Oil that is lighter in color, has a thin consistency and flows easily usually contains less metals and sulphur compounds. It is known as Light Oil. Oil that is high in metal and sulphur content is considered low-grade oil. It generally has too much carbon, not enough hydrogen and is more timeconsuming to produce and hard to refine. It is known as Heavy Oil. Sour/Sweet:- crude oil can also be classified as either sour or sweet, depending on the amount of sulphur it contains. Oil with a high sulphur content (0.5% and above, by weight) is considered sour. Sweet crude oil, on the other hand, has low amounts of these sulphur compounds. Reference Crude Oil:- some common crude oil types are used as a reference or benchmark to determine the value of other crude oils. Some of these reference crude oils are:- Brent Blend; Dubai-Oman; Tapis Crude; West Texas Intermediate (WTI). Brent Blend:- A blend of several crude oils from fields in the North Sea region, located above Germany and the United Kingdom. The price of oil produced in Africa, Europe and the Middle East tends to be based on this oil. Dubai-Oman:- used as a benchmark for Middle East sour crude oil flowing to the Asia-Pacific region. Tapis Crude:- oil produced in Malaysia that is used as a reference for light oil from East Asia. West Texas Intermediate (WTI):- a very high-quality, sweet, light oil produced in North America. A brief history of the industry:- Tthe world's first oil wells were drilled in China around the IV century AD. The Chinese used simple bamboo poles to drill these wells. The dark, sticky material they extracted was then used primarily as a source of fuel. In later centuries, oil was found across Asia and Europe. Sometimes it accumulates in natural pools above the ground. Travellers and settlers used the mysterious black liquid for fuel, as well as for medical treatment. The modern oil industry began in the mid-XIX century. On August 27, 1859, Colonel Edwin L. Drake discovered the first underground oil reservoir near Titusville, Pennsylvania (USA), after drilling a well only 21 meters (69 feet) deep. The oil flowed easily. It was also easy to work with and distil. This oil was known as a Paraffin Type Of Oil. Drake worked for the

Pennsylvania Rock Oil Company which wanted to use the oil to light street lamps. Drake's well initially produced 30 barrels of oil per day (b/d). (One barrel is equal to 159 liters or 42 US gallons). Its success marked the beginning of the modern oil industry. Oil soon began to receive more attention from the scientific community. After some research, a variety of products were eventually developed from crude oil. For example, kerosene for heating was one of the first products. Soon other products (like gasoline and diesel to run engines) were also on the market. In 1890, the mass production of automobiles began creating a huge demand for gasoline and pushing companies to find more oil fields. Why is oil important? Crude oil is a central part of modern life and the world's most important energy resource. We rely on it in many ways for the food we eat, the clothes we wear and the electronics we use at home and in the workplace. Without oil, we would not be able to continue to enjoy the same standard of living. The way people live, work and travel all depend on oil. Oil is, in fact, the world's most important transportation fuel. About 90% of all transportation fuels come from crude oil. It is also the raw material from which other important products are made, which have improved the quality of our lives over the past century and a half. It has been used to keep people's houses warm during the winter for centuries. But oil is also used to make medicines, plastics and cleaning products. In fact, modern life as we know it today would be impossible without oil and its products. Many of the everyday items people use are either made from oil or are dependent on oil for their production. Some of these products include heating oil, jet fuel, kerosene, dentures, diapers, fertilizers, lipstick, shampoo, deodorant, shaving cream, crayons, musical devices, cameras, computers, glue, contact lenses, toothpaste, synthetic fibers, tires, artificial hearts and even aspirin. So now you have an idea of how important oil is in our daily life! How much Oil does the world need? The world needs more energy as its population grows and as countries become more economically prosperous. The United States has the world's largest demand for oil. Although it has only about 5% of total world population, it uses nearly 25% of the world's total oil production and 45% of the world's total gasoline production. And as the economies of countries like Brazil Russia, India and China become richer, and their economies expand, their need for more oil will grow. To meet all this demand for oil without provoking market imbalances, the right supply levels are needed. Measuring this is always a challenge for the experts who work in the oil industry. Finding oil and getting it out of the ground is a challenging and exciting activity. It requires great effort and travel to distant lands – and the results can often be surprising. So how do we find oil? It starts with the simple decision to explore for oil based on preliminary survey data. Once oil is discovered, the initial results are tested. If the results are good, then the development of a production well begins. Because of the importance of oil in our lives, it is necessary to understand how the industry as a whole works in both its upstream and downstream sectors. For this, it is helpful to look at the oil industry by first considering what is called the Upstream Sector. The upstream sector is the part of the oil industry involved with finding oil fields and bringing oil up from the ground. Upstream activities include exploratory work, such as the search for underground (or underwater) oil and gas reservoirs, and the initial drilling, followed by the production phase, which is the actual extraction of oil from the ground. Exploration is almost like detective work. It requires looking for clues, careful observation of ground conditions, taking notes of different information and the evaluation of survey data. This is the job of petroleum geoscientists, who are experts on rocks. Petroleum geoscientists working at oil companies begin looking for places where there might be oil. They look for signs that may indicate the presence of hydrocarbons underground and are responsible for determining the best places to drill. They start by examining the shapes of different underground layers of rock. They have to use special tools in order to 'see' the rocks underground. Thus, using advanced technology – and special tools like aerial photography, satellite pictures and specialized machines that measure variations in the Earth's gravity and magnetic fields – geoscientists try to identify likely crude oil fields. Oil can also be found underground at the bottom of the sea. In this case, special ships are used to look for these underwater oil fields. Geoscientists use several special technical tools – such as sound waves used in seismic technology – to form a clear picture of underwater rock layers. But the only way to be absolutely sure that there is oil in the ground is simply to drill a well. This is a big gamble because not all wells result in the discovery of oil. It may take the drilling of many different wells until a new oil field is found. This costs a large amount of money because sophisticated equipment is needed and many people need to be hired. That is why the geoscientists then supply all their survey data to the economists and financial planners at the oil companies, who help make the decision whether or not to drill exploratory wells. Surveyors record the seismic waves that are produced by an explosion or sound generator. Since different rock types reflect sound waves differently, the surveyor can create a picture of the subterranean rocks. Production:- once oil is found after the preliminary exploration phase and the drilling of exploratory wells, the production phase can begin. There are two forms of drilling:- onshore and offshore. Crude oil found underground is usually mixed with water, sand, salt and natural gas. As it is extracted, the pressure of these different substances must be kept at just the right levels. This is done by turning valves on and off at the surface level. Because these valves are often green in color and the small dials are red, much like the pine trees decorated at Christmas time, this assembly is often referred to as a Christmas Tree. Onshore Drilling is used for underground oil reservoirs anywhere on dry land. Drilling on land generally requires relatively low investments and entails fewer risks. Once the crude oil is extracted from the ground, it is taken to gathering centers where the water, sand and salt are removed. While there, natural gas is also separated from the crude oil and then sent to a booster station. The oil is then pumped to storage tanks before being sent to either a refinery for proper processing or to oil tankers for shipment elsewhere. Offshore drilling is used to extract oil deposits buried under the ocean floor. Offshore Drilling rigs are installed, operated and serviced on large platforms built out in the ocean. These platforms can either float or sit on tall 'legs' that touch the seabed. In this way, the offshore rig is able to remain stable and resist waves, wind and, in colder regions, floating chunks of ice. Because of its difficulty, offshore drilling consumes more than 65% of planned investments even before oil is extracted, increasing the risk of financial losses, especially if wells come up dry! Huge investments are required. Finding underground oil reservoirs and drilling wells are risky, complicated and expensive activities. The cost of drilling an exploratory oil well can be anything from USD1 million to USD35 million. Building and developing a well depends on many factors:- the location of the potential oil field (if it is on land or under water), the size of the oil field, the amount of information that is already available and the type of rocks found underground. That is why an important first step before drilling a well is to obtain information about what is going on thousands of meters below the surface of the Earth. This requires careful exploration and mapping of the 'sub-surfaces' in order to locate the exact type of rocks that tend to have oil deposits. All this requires investments in the latest geographic and seismic technology. Many oil fields are found in hard-to-reach areas on land or below deep ocean water. New technology is helping oil companies reach these oil fields and increase the amount of oil extracted from the ground. But in order to pay for new technology, hundreds of millions of Dollars in investments are needed. The average amount of time needed to discover, extract and market oil is between 3 to 10 years. But oil explorers also need time to raise the necessary money in order to deal with all the technical challenges. Much of the time needed depends on the location of the oil field. An offshore oil field in deep water can take much longer to discover and test, especially when the sea bottom is thousands of meters below the surface. The story doesn't end once crude oil is found and produced from a well. More hard work is needed in order to get the crude oil to the marketplace and to turn it into products that can be used easily by consumers. So What Happens After We Find Oil? Once oil starts flowing, it needs to be extracted in large volumes and then taken to special sites where it is treated carefully before being transported internationally. Downstream:- the downstream sector is the part of the oil industry involved with purifying crude oil and refining it into different products. It also involves the transportation and marketing of crude oil and its products. The process through which crude oil is purified and treated to remove unusable substances is called Refining. This process is also used to separate oil into different usable petroleum products. All this takes place in an oil refinery. All refineries perform three basic functions:- (i) Separation; (ii) Conversion; and (iii) Treatment. Refineries are highly automated and

technologically advanced. That is why a typical refinery costs billions of Dollars to build. It also costs millions to operate, employing hundreds of people and running every day of the year. Separation:- In this phase, a refinery heats crude oil to different temperature levels. Different parts of crude oil have different boiling points. As the temperature rises, these different parts or fractions are separated. This is done inside distillation towers. The lightest fractions, which include gasoline and Liquefied Petroleum Gas (LPG), vaporize quickly and rise to the top of the distillation towers. There they condense back into liquids. The medium-weight fractions, which include kerosene and diesel oil distillates condense in the middle of the distillation tower. The heaviest liquids (called Residual Oils) have the highest boiling points and leave through the bottom of the distillation tower. Refineries also use chemical agents called Catalysts. These help refine oil further by either removing carbon or adding hydrogen. Refining methods are constantly being improved. A variety of complex operations are now used which have improved their output. Refineries today turn more than half of every barrel of crude oil into gasoline. One barrel is equal to 159 liters (42 US gallons). This is a big advance from only 70 years ago when only 41 liters (11 gallons) of gasoline were produced from each barrel of crude. Conversion:- In this phase, high temperatures and pressure, as well as chemical catalysts, are used to 'crack' or split heavy hydrocarbon molecules into smaller, more desirable ones. This is the most widely used conversion method and it is called Cracking. This is carried out in a cracking unit which consists of a reactor with a thick wall, and a network of large furnaces, dividers and compartments. Other refining processes can rearrange hydrocarbon molecules rather than simply splitting them, while other processes clean them of impurities like sulphur (a process called Desulphurization) which are harmful to the environment. Refineries also treat the wastes produced by the refining process. This helps to minimize air and water pollution. Modern refineries are equipped with advanced pollution control systems. They purify waste water, remove chemicals and capture the emissions of gases and toxic materials. An oil refinery is a network of interconnected buildings and plants where oil is pre-treated and divided into different parts or fractions. These fractions are then converted, treated further and blended to produce specific oil products according to pre-set specifications. Treatment:- the final phase is treatment. In this step, the fractions produced during separation are treated to improve their quality. They are then blended with other elements to produce the final products. A variety of products can be made from crude oil, including gasoline, jet fuel, kerosene, diesel and petroleum Coke. The different products are later placed in large storage tanks until they can be delivered to places such as gas stations, airports and chemical plants. In addition to fuel oils, refineries can produce other oil-based products like asphalt, cleaning products, paints – and even some of the components used to make chewing gum and diapers! Transportation:- the transportation and delivery of crude oil is a big global business and an important part of the downstream sector. It includes the transfer of crude oil to the consuming countries and the distribution and sale of the products made from crude oil. Getting oil from a well to a refinery, and getting the products to service stations, requires a complex system of transportation and storage. In fact, millions of barrels of oil are transported around the world every day through these pipeline networks, on fleets of tankers and on thousands of railway tanks and trucks. Pipelines:- oil pipelines are made from steel. They usually have an inner diameter of about 10 to 120 cm (about 4 to 48 inches) and can run for hundreds or thousands of kilometers. Advances in technology are constantly improving the size and strength of these pipelines. Although pipelines are less flexible than other forms of transportation, they are the safest, most efficient and most economical way to move oil. All large modern oil fields have direct connections to major pipelines. Without these pipelines, it would be impossible for oil and oil products to reach consumers. Roads And Railway:- oil products are also transported from storage centers to distribution areas on specialized railway tankers and trucks. These are large, long and have special storage units to protect against accidents. Since oil and oil products like gasoline are highly flammable, they need to be transported carefully. If not, they can easily start fires or large explosions. Ocean Tankers:- oil tankers are large, specialized oceangoing ships specifically built to carry unrefined crude oil from one part of the world to another. They usually carry oil from where it is produced to where it is refined and consumed. Oil tankers are classified by their size, which can range from small coastal tankers to ultralarge crude carriers (ULCC). The largest tankers often travel from the Gulf region and West Africa to Japan and other Asian countries. Other tankers travel to the northeastern United States and to countries across the Mediterranean region. / Найлан (Nylon). и ассоциированные примеси, . и (iii) газоконденсаты . печное бытовое топливо (heating oil) . НАЙМЭКС® (NYMEX®; Нью Йорк, НЙ, США), Ай.Си.И. Фьючез Юрэп® (ICE Futures Europe®; Лондон, СК) и ТЧОКОМ (TOCOM; Токио, Япония). 27 Августа 1859, Полковник Эдвин Эл. Дрэйк (Colonel Edwin L. Drake) открыл первый подземный нефтяной резервуар близ (Titusville, Pennsylvania (USA)) после бурения скважины всего лишь на глубины в 21 метр (69 футов). Пэнсэлвэйниэ Рак Оил Кампэни (Pennsylvania Rock Oil Company). Под Нефтяными Маслами (Минеральными Маслами) понимаются жидкие сложные смеси высококипящих углеводородов ($t_{кип}$ 300–600 °C) парафинового, нафтенового и ароматического рядов, а также их гетеропроизводных; молекулярной массой 250–1 000 и более, кинематической вязкостью от $(2–3)\cdot10^{-6}$ м^2/с до $(600–1\ 100)\cdot10^{-6}$ м^2/с при 100 °C. Общее число различных углеводородов в нефтяных маслах составляет от 2 000–3 000 до 50 000–70 000. Нефтяные масла получают дистилляцией нефти или удалением нежелательных компонентов из гудронов. Нефтяные масла используют также для получения гидравлических и смазочно-охлаждающих жидкостей, пластичных и технологических смазок, как смазочные масла и теплоносители. По областям применения нефтяные масла подразделяют на изоляционные, консервационные, смазочные, технологические, электроизоляционные и белые масла. Как правило, нефтяные масла содержат присадки, улучшающие их эксплуатационные свойства. Под Нефтью, через Тюркское слово Neft, от Персидского слова Нефт; восходит к Аккадскому слову Напатум, означающее Воспламенять или Вспыхивать, понимается жидкое горючее ископаемое, маслянистая жидкость от чёрного до бурого цвета, иногда с красноватым, зеленоватым, оранжевым оттенком; обычно тёмно-бурая. Плотность 750–970 (обычно 800–900) килограммов на кубический метр (кг/м^3); различают лёгкие (плотностью менее 850), средние (850–900) и тяжёлые (более 900) нефти. Теплота сгорания 43.7–46.2 МегаДжоулей на килограмм (МДж/кг). По составу нефть – сложная смесь парафиновых (метановых), нафтеновых и реже ароматических углеводородов; содержание углерода около 82–87%, водорода – 11.5–14.5%. В качестве примесей (4–5%) в нефти находятся соединения, содержащие кислород (главным образом нафтеновые кислоты), серу и азот, смолистые и асфальтовые вещества. Компонентный состав (%):- масел 65–100, смол 0–30, асфальтенов 0–5. Парафиновые нефти содержат 62% и более твёрдых углеводородов. Нефти делятся на малосернистые (серы до 0.5%) и сернистые (свыше 0.5%), по смолистости – на малосмолистые (до 18%), смолистые (18–35%) и высокосмолистые (свыше 35%). Спутниками нефти часто являются нефтяной газ и вода. Нефть залегает обычно в пористых или трещиноватых горных породах (песках, песчаниках, известняках) и часто тяготеет к куполам. Добывают нефть скважинным, редко шахтным способами. Нефть – важнейшее энергетическое топливо современной промышленности. Перегонкой из нефти получают бензин, керосин, лигроин, масла, парафин и другое. Характерны тенденция к наиболее полной утилизации нефти с максимальным получением светлых продуктов, а также использование её как химического сырья для производства синтетических материалов. Мировая добыча нефти в 1986 превысила 2.827 миллиарда тонн (в том числе в Северной Америке около 600 миллионов тонн, на Ближнем и Среднем Востоке 624, в Латинской Америке около 330.4 миллионов тонн). Всего с начала промышленной добычи нефти (с конца 1850-х) до конца 1986 в мире было извлечено из недр около 70 миллиардов тонн. Из некоторых тяжёлых нефтей извлекают ванадий. Под Нефтью, от Турецкого слова Neft, от Персидского слова Нефт, понимается горючая маслянистая жидкость, распространённая в осадочной оболочке Земли. Нефть является важнейшим полезным ископаемым. Она представляет собой сложную смесь алканов, некоторых цикланов и аренов, а также кислородных, сернистых и азотистых соединений. Различают лёгкую нефть (0.65–0.87 г/см^3), среднюю нефть (0.871–0.91 г/см^3) и тяжёлую нефть (0.91–1.05 г/см^3).

Теплота сгорания 43.7–46.2 МДж/кг (10 400–11 000 ккал/кг). В бывшем СССР нефть классифицировали по содержанию серы (S) на малосернистые (до 0.5% S), сернистые (0.5 – 2% S) и высокосернистые (свыше 2% S). Нефть используют с 6-го тысячелетия до Нашей Эры. Путём перегонки из нефти получают бензин, реактивное топливо, осветительный керосин, дизельное топливо, мазут. Нефть является жидким ископаемым сырьём, используемым для производства горюче-смазочных материалов и другой нефтехимической продукции. Обычно это маслянистая жидкость, имеющая цвет от янтарного до тёмно-зелёного или почти чёрного. Это углеводородное сырьё, образующееся из мёртвой органической материи в результате сложных биохимических, химических и геологических реакций. Накопление в осадочных породах органической материи происходило преимущественно на шельфах, в лагунных бассейнах и морских заливах в геологические периоды, характеризующиеся бурным развитием биологической жизни. Около 15% запасов нефти датируются Палеозойской Эрой (600–220 миллионов лет назад), однако почти половина запасов геологически значительно моложе, так как образовалась в период от 180 до 1 миллион лет назад. В зависимости от вида нефти в её состав входят соединения, состоящие из пяти основных элементов (содержащихся, в зависимости от месторождения, в различных количествах):- углерода (80–88%), водорода (10–14%), серы (0.01–7.4%), азота (0.02–1.1%) и кислорода (0.04–1.8%). В состав нефти могут входить также другие элементы, однако их количество не превышает в общей сложности 0.01–0.3%. Перечисленные элементы входят в состав химических соединений, которые можно отнести к следующим группам:- углеводороды, органические соединения, содержащие иные, чем углерод и водород, элементы инеорганические соединения. Основную группу составляют углеводороды (соединения, состоящие исключительно из атомов углерода и водорода), которые, в свою очередь, можно поделить на алифатические (так называемые парафиновые углеводороды), с линейными и разветвлёнными цепями, углеводороды нафтенового ряда (содержащие циклические структуры – замкнутые углеводородные цепи) и ароматические углеводороды (содержащие замкнутые цепи, в которых атомы углерода образуют делокализованные связи, не встречающиеся у нафтеновых углеводородов). Чтобы определить содержание отдельных групп соединений, необходим точный химический анализ. Единственной предпосылкой, позволяющей ориентировочно определить углеводородный состав нефти, является её возраст:- нефть более молодого геологического возраста (расположенная в верхних пластах месторождения) характеризуется большим содержанием аренов, в то время как нефть более старого возраста содержит больше насыщенных углеводородов (имеет более парафиновый характер). Нефть, добываемая из разных месторождений, отличается по своему составу и физико-химическим свойствам, различен также состав нефти из разных пластов одного месторождения. Ввиду некоторых различий в технологических схемах нефтеперерабатывающих заводов, обусловленных видом и количеством конечной продукции (топливо, различные масляные основы, другая нефтяная и нефтехимическая продукция), не каждая нефть одинаково подходит для конкретных целей. Таким образом, попытка классификации нефти вызвана желанием ориентировочно показать возможности её замены либо сочетания с другими сортами нефти, а в более широкой перспективе – определить экономическую пригодность для применения на конкретном нефтеперерабатывающем заводе. Для полного и тщательного сравнения нефти из разных месторождений необходимо определить следующие физико-химические параметры:- плотность, содержание серы, содержание хлоридов, содержание воды и твёрдых загрязнений, содержание микроэлементов, вязкость, температура текучести, давление паров, кислотное число, остаток после коксования, содержание асфальтенов, содержание парафина, содержание азота и фракционный состав. Исторические классификации нефти учитывали только некоторые факторы из приведённого списка физико-химических параметров, химический состав либо пригодность для определённых целей. По плотности (обозначаемой буквой d) нефть разделяли на три класса:- (i) Лёгкую Нефть ($d < 0.878$ г/см^3); (ii) Среднюю Нефть ($0.884 > d > 0.878$ г/см^3); и (iii) Тяжёлую Нефть ($d > 0.884$ г/см^3). Согласно химической классификации нефти, выделяют:- (i) парафиновые, (ii) парафино-нафтеновые, (iii) парафино-нафтено-ароматические, и (iv) нафтено-ароматические. Геологическая классификация делила нефть согласно индекса зрелости, определяемого по содержанию линейных углеводородов определённой структуры. Наконец, технологическая классификация делила нефти на три класса в зависимости от содержания серы:- (i) Малосернистые – менее 0.5% S, (ii) Сернистые – от 2.0 до 0.5% S, и (iii) Высокосернистые – более 2% S. Приведённые сведения в общих чертах демонстрируют разнородность систем классификации, которые сегодня представляют уже только исторический интерес, но, тем не менее, часто появляются в текстах популярного характера (например, в ежедневной прессе) на темы, связанные с нефтью. Благодаря развитию гидропроцессов в технологии деструктивной переработки нефти сегодня практически из любого сорта нефти можно получить один и тот же тип продуктов одинакового качества. На протяжении последних лет основным типом нефти, перерабатываемой в Польше, является Уральская нефть среднего качества (смесь нескольких сортов, добываемых на разных нефтяных полях России), асфальтового типа, характеризующаяся содержанием серы порядка 1.5% м/м, высокой плотностью и большим содержанием металлов и азота. В этой нефти содержание топливных фракций составляет около 50% м/м. Похожими на Уральскую нефть характеристиками обладает также лёгкая Иранская нефть. Третьим главным типом нефти, перерабатываемым в Польше, является нефть, привозимая (или импортируемая) с Северного Моря, с содержанием серы около 0.09–0.3%, выходом топливных фракций порядка 60–70% и низким содержанием тяжёлых металлов. Альтернативой для инфраструктуры трубопроводов является ‘Нафтопорт’, позволяющий доставлять нефть из любой точки мира. Переработка Нефти:- сырая нефть не находит сегодня практического применения. Для получения готовых товарных продуктов с соблюдением необходимых количественных пропорций сырая нефть должна быть подвергнута ряду физических процессов, а зачастую также химическим превращениям. Подготовка нефти к собственно переработке заключается в удалении из неё воды (до содержания 0.1–0.3%) вместе с растворёнными в ней солями (в основном NaCl, KCl, $MgCl_2$). Этот процесс осуществляется на одной установке, предназначенной и для обессоливания, и для обезвоживания. Суть процесса заключается в том, что предварительно подогретая и смешанная с деэмульгатором нефть подвергается действию высокого напряжения в электродегидраторе. Основным процессом нефтепереработки является фракционная дистилляция (перегонка), в результате которой получают фракции – группы углеводородных соединений с похожей температурой кипения. Температура разложения содержащихся в нефти химических соединений составляет примерно 420 °C, поэтому чтобы отделить соединения, закипающие при более высоких температурах, необходимо проводить дистилляцию в два этапа. Первый этап – это дистилляция при атмосферном давлении (около 760 миллиметров ртутного столба), а второй – это дистилляция при пониженном давлении (около 60–70 миллиметров ртутного столба). Основными аппаратами, применяемыми для дистилляции, являются трубчатые печи и ректификационные колонны. Нефть, очищенная от воды и минеральных солей, поступает в теплообменник, в котором нагревается до температуры 200 °C, а затем подаётся в стабилизационную колонну. Здесь происходит так называемая Стабилизация Нефти, заключающаяся в отделении газов и выпаривании наиболее тяжёлой части бензина. В этой же колонне отделяется большая часть корродирующих компонентов (таких как H_2S и HCl). Таким образом, суть работы колонны стабилизации – уменьшение нагрузки на главную дистилляционную колонну и предохранение её от коррозии. Остаток колонны стабилизации нагревается в трубчатой печи, под давлением 2 МПа, до температуры около 350 °C, и через редукционный клапан подаётся в атмосферную колонну, где в результате однократного испарения происходит разделение на паровую фазу, ректификация которой протекает в верхней части колонны, и жидкую фазу, из которой в нижней части колонны с помощью водяного пара отгоняются более лёгкие компоненты. Остаток атмосферной колонны (мазут)

нагревается в трубчатой печи примерно до 420 °C и подаётся в вакуумную колонну, в которой перегоняется на масляные фракции (лёгкую, среднюю, тяжёлую) и остаток, называемый Гудроном. В результате такой перегонки в атмосферной колонне получают газы (от метана до бутана), бензиновую фракцию (с диапазоном температур кипения 40–200 °C), керосин (200–250 °C) и газойль (250–350 °C). В вакуумной же колонне получают масляные дистилляты:- лёгкий (220–250 °C), средний (250–300 °C) и тяжёлый (300–380 °C), а также остаток в виде гудрона. Гудрон, в свою очередь, является сырьём, из которого, путём деасфальтизации жидким пропаном, получают деасфальтизат – фракцию основного масла высокой вязкости (около 30 сСт при 100 °C, в то время как максимальная вязкость масляных дистиллятов составляет 13 сСт), служащую для получения так называемого Брайтстока (bright stock) и нефтяного битума. По необходимости схема может быть расширена за счёт добавления дополнительных элементов, например, дополнительной вакуумной колонны, чтобы улучшить разделение масляных фракций. В результате перегонки нефти можно получить до 15% бензинов, до 20% керосина, до 20% газойля и до 50% мазута. Из мазута можно получить приблизительно от 50 до 65% масляных фракций, а из оставшегося гудрона – до 30% деасфальтизата. Пример среднего процентного выхода отдельных фракций, полученного в 2006 на перегонной установке Гданьского Нефтеперерабатывающего Завода (Польша), представлен в приводимой таблице. Таблица (Выход нефтепродуктов (м/м) Vacuum residue:- сухие газы – 0.32%; сжиженные газы – 1.48%; лёгкий бензин – 5.15%; тяжёлый бензин – 11.99%; керосин – 7.85%; лёгкий газойль (ЛГ) – 4.86%; средний газойль (СГ) – 13.73%; тяжёлый газойль (ТГ) – 6.05%; вакуумный газойль (ВГ) – 8.05%; масляная фракция A – 1.33%; масляная фракция B – 5.36%; масляная фракция C – 9.72%; масляная фракция D – 2.47%; некондиционная фракция – 1.94%; вакуумный остаток – 19.54%. Получаемые таким образом фракции не являются готовыми товарными продуктами и требуют облагораживания, то есть улучшения определённых свойств, что достигается на дальнейших этапах процесса переработки. Для удовлетворения существующего спроса на нефтепродукты необходимо увеличивать выход из нефти топлив и сырья для химической промышленности (этилена, пропилена, толуола, ксилолов и другого). Для этого можно подвергать полученные путём перегонки продукты так называемым деструктивным процессам для получения большего количества некоторых продуктов (фракций) или углеводородов, не содержащихся в сырой нефти, на которые в настоящий момент на рынке существует наибольший спрос. Процессы деструктивной переработки нефти можно поделить на термические (термический крекинг, висбрекинг, коксование, пиролиз) и каталитические (каталитический крекинг, гидрокрекинг, риформинг, гидродеалкилирование, изомеризация, полимеризация и алкилирование). Чтобы из масляных фракций, получаемых путём вакуумной дистилляции, получить готовые масляные основы, их подвергают процессам рафинирования. Масляные фракции могут также служить сырьём для получения топлив – в этом случае их подвергают каталитическому крекингу или гидрокрекингу. Каталитический Крекинг (от Английского слова To Crack – Расщеплять) основан на реакции разложения фракций тяжёлого газойля, смешанных с вакуумными масляными дистиллятами, при температуре в диапазоне 440–480 °C и под давлением 0.2–0.5 МПа в присутствии катализатора. Во время каталитического крекинга проходят, в основном, реакции расщепления связей между атомами углерода, ведущие к образованию парафинов с меньшей молекулярной массой и (в меньших количествах) ненасыщенных углеводородов. Путём каталитического крекинга получают продукты, которые легче сырья, и остаток с температурным диапазоном кипения сырья. В отличие от термического крекинга, в этом случае нельзя получить тяжёлые фракции, поскольку продукт вторичных реакций – кокс – осаждается на катализаторе. Основным продуктом каталитического крекинга является бензин с высоким октановым числом, получаемым за счёт большого количества ненасыщенных, ароматических соединений и разветвленных углеводородов. Процесс гидрокрекинга принципиально отличается от процесса каталитического крекинга наличием дополнительной функции, а именно гидрирования полученных в ходе крекинга продуктов, что связано с характером катализатора. В связи с этим в ходе гидрокрекинга не образуется кокс, а все продукты имеют меньшую молекулярную массу, чем сырьё. Главным преимуществом этого процесса является возможность переработки любого сырья на более лёгкие продукты (с меньшей молекулярной массой и более низкой температурой кипения), не содержащие ненасыщенных углеводородов, с низким содержанием серы и азота. Благодаря этому они могут использоваться в качестве готового топлива. Например, на Гданьском Нефте-Перегонном Заводе (Польша) гидрокрекингу подвергают материал, содержащий некоторое количество тяжёлого и вакуумного газойля, масляных фракций и продуктов других процессов нефтепереработки, а в качестве готового продукта получают, в частности, около 20% бензиновой фракции. Нефть – горючая маслянистая жидкость со специфическим запахом, распространённая в осадочной оболочке Земли, являющаяся важнейшим полезным ископаемым. Образуется вместе с газообразными углеводородами (смотрите Природные Горючие Газы) обычно на глубинах более 1.2–2 километров (км). Вблизи земной поверхности нефть преобразуется в густую мальту, полутвёрдый асфальт и другое. (I) Общие Сведения:- нефть состоит из различных углеводородов (алканов, циклоалканов, аренов – ароматических углеводородов – и их гибридов) и соединений, содержащих, помимо углерода и водорода, гетероатомы – кислород, серу и азот. Нефть сильно варьирует по цвету (от светло-коричневой, почти бесцветной, до тёмно-бурой, почти чёрной) и по плотности – от весьма лёгкой (0.65–0.70 грамма на кубический сантиметр (г/см^3)) до весьма тяжёлой (0.98–1.05 г/см^3). Пластовая нефть, находящаяся в залежах на значительной глубине, в различной степени насыщена газообразными углеводородами. По химическому составу нефти также разнообразны. Поэтому говорить о среднем составе нефти или ‘Средней’ Нефти можно только условно. Менее всего колеблется элементный состав:- 82.5–87% C; 11.5–14.5% H; 0.05–0.35, редко до 0.7% O; 0.001–5.3% S; 0.001–1.8% N. Преобладают малосернистые нефти (менее 0.5% S), но около 1/3 всей добываемой в мире нефти содержит свыше 1% S. Мировые (без социалистических стран) разведанные запасы нефти оценивались к началу 1973 в 71.2 миллиард тонн (т) (данные по запасам нефти, публикуемые за рубежом, возможно занижены). Запасы нефти в недрах по странам и регионам распределяются крайне неравномерно. Мировая добыча нефти удваивается примерно каждое десятилетие. В 1938 она составляла около 280 миллионов т, в 1950 около 550 миллионов т, в 1960 свыше 1 миллиарда т, а в 1970 свыше 2 миллиардов т. В 1973 мировая добыча нефти превысила 2.8 миллиарда т. В бывшем Союзе Советских Социалистических Республик (СССР) в 1940 было добыто 31.1 миллион т, в 1973 – 429 миллионов т. Всего с начала промышленной добычи (с конца 1850-х) до конца 1973 в мире было извлечено из недр 41 миллиард т, из которых половина приходится на 1965–73. Нефть занимает ведущее место в мировом топливно-энергетическом хозяйстве. Её доля в общем потреблении энергоресурсов непрерывно растет:- 3% в 1900, 5% перед Первой Мировой Войной 1914–18, 17.5% накануне Второй Мировой Войны 1939–45, 24% в 1950 и 41.5% в 1972. Нефть составляет основу топливно-энергетических балансов всех экономически развитых стран. В Соединённых Штатах Америки (США) на её долю (включая газовый конденсат) приходится 46% общего потребления энергии (1972), в странах Европейского Экономического Сообщества (ЕЭС) – свыше 60% (1972), в Японии – 70% (1972). В бывшем СССР доля нефти в суммарной добыче топлива (в пересчёте на условное топливо) составляла 42.3% в 1972. Опережающий рост потребления жидкого топлива в развитых капиталистических странах (США, страны Западной Европы, Япония, Канада, Австралийский Союз), на долю которых приходилось свыше 4/5 потребления нефтепродуктов в мире (без социалистических стран), но около 10% разведанных запасов и около 30% её добычи, привёл к углублению географического разрыва между районами добычи и потребления нефти. Быстрый рост добычи нефти в развивающихся странах (особенно на Ближнем и Среднем Востоке), за счёт которых покрываются растущие промышленные и военно-стратегические потребности развитых капиталистических стран, оказывает решающее воздействие

на нефтяное хозяйство капиталистического мира. Смотрите Нефтяные Монополии. (II) Происхождение И Условия Залегания:- в познании генетической природы нефти и условий её образования можно выделить несколько периодов. Первый из них (донаучный) продолжался до средних веков. Так, в 1546 Немецкий учёный Георгиус Агрикола (Georgius Agricola (на Латинском); настоящее имя Георг Бауа (Georg Bauer); 1494–1555) писал, что нефть и каменные угли имеют неорганическое происхождение; последние образуются путём сгущения и затвердевания нефти. Второй период – научных догадок – связывается с датой опубликования труда Русского учёного – Михаила Васильевича Ломоносова (1711–1765) 'О Слоях Земных' (1763), где была высказана идея о дистилляционном происхождении нефти из того же органического вещества, которое даёт начало каменным углям. Третий период в эволюции знаний о происхождении нефти связан с возникновением и развитием нефтяной промышленности. В этот период были предложены разнообразные гипотезы неорганического (минерального) и органического происхождения нефти. В 1866 Французский химик Пьер Ужен Марсэля Бертэлё (Pierre Eugène Marcellin Berthelot; 1827–1907) высказал предположение, что нефть образуется в недрах Земли при воздействии углекислоты на щелочные металлы. В 1871 Французский химик Г. Биассон (Н. или А. Biasson) выступил с идеей о происхождении нефти путём взаимодействия воды, CO_2, H_2S с раскалённым железом. В 1877 Русский химик и изобретатель Дмитрий Иванович Менделеев (1834–1907) предложил минеральную (карбидную) гипотезу, согласно которой возникновение нефти связано с проникновением воды в глубь Земли по разломам, где под воздействием её на 'углеродистые металлы' – карбиды – образуются углеводороды и окись железа. В 1889 Русский геолог Владимир Дмитриевич Соколов (1855–1917) изложил гипотезу космического происхождения нефти. По этой гипотезе исходным материалом для возникновения нефти служили углеводороды, содержавшиеся в газовой оболочке Земли ещё во время её звёздного состояния. По мере остывания Земли углеводороды поглотились расплавленной магмой. Затем, с формированием земной коры, углеводороды проникли в осадочные породы в газообразном состоянии, конденсировались и образовали нефть. В 1950–60-е в бывшем СССР (Николай Александрович Кудрявцев (1893–1971), Владимир Борисович Порфирьев (1899–1982), Григорий Назарович Доленко (1917–1990) и другие) и за рубежом (Английский учёный Сэр Фрэд Хойл (Sir Fred Hoyle; 1915–2001) и другие) возрождаются различные гипотезы неорганического (космического, вулканического, магматогенного) происхождения нефти. Однако на 6-м (1963), 7-м (1967) и 8-м (1971) Международных Нефтяных Конгрессах неорганические гипотезы не получили поддержки. Важным для познания генезиса нефти являлось установление в конце XIX–начале XX веков оптической активности нефти, а также тесной связи нефти с сапропелевым органическим веществом в осадочных породах. Сапропелевую гипотезу, высказанную впервые Немецким ботаником Хэнри Потони (Henry Potonié; 1857–1913) в 1904–05, в дальнейшем развивали Русские и Советские учёные – Николай Иванович Андрусов (1861–1924), Владимир Иванович Вернадский (1863–1945), Иван Михайлович Губкин (1871–1939), Николай Дмитриевич Зелинский (1861–1953) и другие. Сапропелевая гипотеза ассимилирована современной теорией осадочно-миграционного происхождения нефти. Развитию представлений о природе нефти и условиях формирования её залежей способствовали также труды Немецкого учёного Карля Освальда Викто Энгля (Carl Oswald Viktor Engler; 1842–1925), Американских геологов Дьжона Строна Ньюбёри (John Strong Newberry; 1822–1892), Эдвода Отчэна (Edward Orton; 1829–1899), Чарлза Дэйвида Вайта (Charles David White; 1862–1935), Русских и Советских учёных – Георгия Павловича Михайловского (1870–1912), Дмитрия Васильевича Голубятникова (1866–1933), Михаила Владимировича Абрамовича (1884–1965), Карла Ивановича Богдановича (1864–1947) и других. Четвёртый период характеризуется организацией широких геолого-геохимических исследований, направленных на решение проблемы нефтеобразования и органически связанной с ней проблемы нефтематеринских отложений. В бывшем СССР такие работы осуществлены Андреем Дмитриевичем Архангельским (1879–1940) в 1925–26. В США аналогичные исследования были начаты в 1926 Паркёром Дэйвизом Тчраском (Parker Davies Trask; 1899–1961). В 1932 была опубликована классическая работа Ивана Михайловича Губкина 'Учение О Нефти', сыгравшая огромную роль в развитии представлений о генезисе нефти и формировании её залежей. В 1934 в нефтях, асфальтах и ископаемых углях были найдены порфирины, входящие в молекулу хлорофилла и других природных пигментов. Начало пятого периода связано с открытием в 1950-е (в СССР – А.И. Горской, в США – Ф. Смисом (F. Smith)) нефтяных углеводородов в осадках водоёмов различного типа (в озёрах, заливах, морях, океанах). Дальнейшему прогрессу в этой области способствовали работы многих учёных и коллективов исследователей в разных странах:- в СССР (Андрей Дмитриевич Архангельский, Владимир Иванович Вернадский, Александр Павлович Виноградов (1895–1975), Иван Михайлович Губкин, Николай Михайлович Страхов (1900–1978), Андрей Алексеевич Трофимук (1911–1999), Абид Муратович Акрамходжаев (1920–1996), Игнатий Осипович Брод (1902–1962), Николай Брониславович Вассоевич (1902–1981), Василий Валерианович Вебер (1900–1987), Александр Флавианович Добрянский (1889–1965), Николай Андреевич Ерёменко (1918–2000), Алексей Эмильевич Конторович (1934–), Михаил Фёдорович Мирчинк (1901–1976), Сергей Германович Неручев (1927–2012), Ксения Филипповна Родионова (1920–), Борис Александрович Соколов (1930–2004), Владимир Алексеевич Успенский (1906–1981) и другие), в США (Фрэнсис Эм. Вэн Та (Francis M. Van Tuyl; 1887–1975), Клод Ифрайм ЗоБел (Claude Ephraim ZoBell; 1904–1989), Ворэн Дьжи. Майншайн (Warren G. Meinschein; 1920–1997), Арвил Орвин Лэворсэн (Arville Irving Levorsen; 1894–1965), Дьжей.И. Смис (J.E. Smith), Ф. Смис (F. Smith), Дьжон Эм. Хант (John M. Hunt; 1918–2005), Халыс Дау Хэдбёрг (Hollis Dow Hedberg; 1903–1988), Э. Эвэнз (E. Evans), Филып Хоге Эйбэлсэн (Philip Hauge Abelson; 1913–2004), Дьжей. Годэн Ордмэн (J. Gordon Erdman) и другие), во Франции (Бернар Пе. Тиссо (Bernard P. Tissot) и другие), в ГДР (Эр. Майнхольд (R. Meinhold), Пе. Мюлля (P. Mueller) и другие), в ФРГ (Марлис Тайхмюлля (Marlies Teichmüller; 1914–2000), Дитрихь Уго Вельтэ (Dietrich Hugo Welte; 1935–) и другие), а также в Японии, Великобритании и других. Убедительные доказательства биогенной природы нефте-материнского вещества были получены в результате детального изучения эволюции молекулярного состава углеводородов и их биохимических предшественников (прогениторов) в исходных организмах, в органическом веществе осадков и пород и в различных нефтях из залежей. Важным явилось обнаружение в составе нефти хемофоссилий – весьма своеобразных, часто сложно построенных молекулярных структур явно биогенной природы, то есть унаследованных (целиком или в виде фрагментов) от органического вещества. Изучение распределения стабильных изотопов углерода (C^{12}, C^{13}) в нефти, органическом веществе пород и в организмах (Александр Павлович Виноградов, Эрик Михайлович Галимов (1936–)) также подтвердило неправомочность неорганических гипотез. Было установлено, что нефть – результат литогенеза. Она представляет собой жидкую (в своей основе) гидрофобную фазу продуктов фоссилизации (захоронения) органического вещества (керогена) в водно-осадочных отложениях. Нефтеобразование – стадийный, весьма длительный (обычно много миллионов лет) процесс, начинающийся ещё в живом веществе. Выделяется ряд стадий:- (i) подготовительная, во время которой под влиянием биохимических и биокаталитических факторов образуется диффузно рассеянная в материнской породе нефть (Микронефть); (ii) главная, когда в результате битуминизации генерируется основная масса микронефти, происходит её 'созревание', сближение по составу с собственно нефтью и миграция в коллекторы, а по ним в ловушки; (iii) постумная, когда усиливается накопление низкомолекулярных углеводородов, обусловливающее образование обычно лёгкой газорастворённой нефти – газоконденсата; (iv) постепенно газы становятся всё более 'сухими' (то есть богатыми CH_4). Иван Михайлович Губкин выделял также стадию разрушения нефтяных месторождений. Считается, что основным исходным веществом нефти обычно является планктон, обеспечивающий наибольшую биопродукцию в водоёмах и накопление в осадках органического вещества сапропелевого

типа, характеризующегося высоким содержанием водорода (благодаря наличию в керогене алифатических и алициклических молекулярных структур). Породы, образовавшиеся из осадков, содержащих такого типа органическое вещество, потенциально нефтематеринские. Чаще всего это глины, реже – карбонатные и песчано-алевритовые породы, которые в процессе погружения достигают верхней половины зоны мезокатагенеза (смотрите Катагенез), где вступает в силу главный фактор нефтеобразования – длительный прогрев органического вещества при температуре от 50 °С и выше. Верхняя граница этой главной зоны нефтеобразования располагается на глубине от 1.3 – 1.7 километр (км) (при среднем геотермическом градиенте 4 °С/100 м) до 2.7–3 км (при градиенте 2 °С/100 м) и фиксируется сменой буроугольной степени углефикации органического вещества каменноугольной. Главная фаза нефтеобразования приурочена к зоне, где углефикация органического вещества достигает степени, отвечающей углям марки Г (смотрите Каменный Уголь). Эта фаза характеризуется значительным усилением термического и (или) термокаталитического распада полимерлипоидных и других компонентов керогена. Образуются в большом количестве нефтяные углеводороды, в том числе низкомолекулярные (C_5–C_{15}), почти отсутствовавшие на более ранних этапах превращения органического вещества. Эти углеводороды, дающие начало бензиновой и керосиновой фракциям нефти, значительно увеличивают подвижность микронефти. Одновременно, вследствие снижения сорбционной ёмкости материнских пород, увеличения внутреннего давления в них и выделения воды в результате дегидратации глин, усиливается перемещение микронефти в ближайшие коллекторы. При миграции по коллекторам в ловушки нефть всегда поднимается, поэтому её максимальные запасы располагаются на несколько меньших глубинах, чем зона проявления главной фазы нефтеобразования, нижняя граница которой обычно соответствует зоне, где органическое вещество пород достигает степени углефикации, свойственной коксовым углям (К). В зависимости от интенсивности и длительности прогрева эта граница проходит на глубинах (имеются в виду максимальной глубины погружения за всю геологическую историю данной серии осадочных отложений) от 3–3.5 до 5–6 км. Нефть находится в недрах в виде скоплений различного объёма от нескольких кубических миллиметров ($мм^3$) до нескольких десятков миллиардов кубических метров ($м^3$). Практический интерес имеют залежи нефти, представляющие её скопления с массой от нескольких тысяч тонн (т) и больше, находящиеся в пористых и проницаемых породах-коллекторах. Различают 3 основных типа коллекторов:- межгранулярные (главным образом песчаные и алевритовые породы), кавернозные (например, карстово-кавернозные, рифогенные и другие известняки) и трещинные (карбонатные, кремнистые и другие трещиноватые породы). Залежь обычно располагается под слабопроницаемыми породами, слагающими Покрышку. Каждая залежь нефти находится в ловушке, задержавшей мигрировавшие нефть и газ и сохранявшей их в течение длительного времени. Можно выделить 3 основных типа ловушек:- замкнутые, полузамкнутые и незамкнутые. Первые 2 типа связаны с первичным выклиниванием (стратиграфическое несогласие, тектоническое экранирование) коллекторов и поэтому именуются Ловушками Выклинивания. Незамкнутые ловушки являются гидравлическими – в них газ и нефть удерживаются в сводовой части антиклинального перегиба слоёв (весьма распространённый тип залежей нефти) или выступа подземного рельефа (например, захороненного рифа). Наиболее приподнятую часть ловушки иногда занимает газ (‘Газовая Шапка’); в этом случае залежь называется Газонефтяной Залежью; под нефтью располагается вода. Нефть залегает на разных глубинах, вплоть до 6–7 км, однако на глубине 4.5–5 км нефтяные залежи всё чаще сменяются газовыми и газоконденсатными. Максимальное число залежей нефти располагается в интервале 0.5–3 км, а наибольшие запасы сосредоточены в пределах 0.8–2.4 км. (III) Нефтегазоносные Бассейны, Области, Районы, Месторождения:- обязательным условием нефтеобразования является существование крупных осадочных бассейнов, в процессе развития которых осадки (породы), содержащие углеродистое органическое вещество, могли при опускании достичь зоны, где осуществляется главная фаза нефтеобразования. Выделение осадочных бассейнов, являющихся родиной нефти, имеет большое значение при нефтегазогеологическом районировании территорий и акваторий. Такие бассейны сильно варьируют по размерам – от нескольких тысяч до нескольких миллионов квадратных километров ($км^2$), однако около 80% их имеют площадь от 10 000 до 500 000 квадратных километров ($км^2$). Всего в современном структурном плане Земли насчитывается (если исключить небольшие, преимущественно межгорные) около 350 таких бассейнов. Промышленная нефтегазоносность установлена в 140 бассейнах; остальные являются перспективными. По тектоническому строению среди осадочных бассейнов различают внутриплатформенные (около 30%), внутрискладчатые (около 35%), складчато-платформенные, или краевых прогибов (около 15%), периокеанические платформенные (около 15%) и другие. К кайнозойским отложениям приурочено около 25% всех известных запасов нефти, к мезозойским – 55%, к палеозойским – 20%. В пределах нефтегазоносных бассейнов выделяют нефтегазоносные области, районы и (или) зоны, характеризующиеся общностью строения и автономией. Месторождения нефти являются основной низшей единицей районирования. Это участки земной коры площадью в десятки – сотни, редко тысячи $км^2$, имеющие одну или несколько залежей нефти в ловушках. Большей частью это участки, где нефть собирается путём боковой или реже вертикальной миграции из зон нефтеобразования. В мире известно (1973) около 28 000 месторождений нефти; из них 15–20% газонефтяные. Распределение месторождений по запасам подчинено закону, близкому к логнормальному. На долю месторождений с общими геологическими запасами каждого свыше 3 миллионов тонн (т) (извлекаемые запасы нефти обычно составляют около 1/4–1/2 геологических) приходится лишь 1/6 всех месторождений; из них более 400 находится в прибрежных зонах моря. Около 85% мировой добычи нефти дают 5% разрабатываемых месторождений; среди них в 1972 насчитывалось 27 гигантов с начальными извлекаемыми запасами каждого, превышающими 0.5 миллиардов т. Больше всего таких месторождений на Ближнем Востоке. Только в двух из них – Гавар (Саудовская Аравия) и Бурган (Кувейт) – сосредоточено более 20% всех разведанных запасов нефти мира (без социалистических стран). Месторождения нефти выявлены на всех континентах (кроме Антарктиды) и на значительной площади прилегающих акваторий. На территории бывшего Союза Советских Социалистических Республик (СССР) месторождения нефти были открыты в XIX веке на Апшеронском Полуострове (смотрите Бакинский Нефтегазоносный Район), в районе Грозного, Краснодарском Крае, на Полуострове Челекен, в Тимано-Печорской области и на Острове Сахалин. Накануне и после Великой Отечественной войны 1941–45 открыты и введены в разработку месторождения в Волго-Уральской Нефтегазоносной Области, позже выявлены месторождения в Западной Туркмении, в Казахстане (смотрите Мангышлакский Нефтегазоносный Район), в Ставропольском Крае, на Украине и в Белоруссии. В 1950–60-х был открыт один из крупнейших в мире Западно-Сибирский Нефтегазоносный Бассейн, в пределах которого обнаружены значительные месторождения нефти. Среди других социалистических стран ряд месторождений имелся в Румынии и Китае, а также на территории Югославии, Польши, Венгрии. Единичные мелкие месторождения открыты в Болгарии, Германской Демократической Республике (ГДР) и Монголии. Среди развитых капиталистических и развивающихся стран наиболее крупные месторождения нефти (oil fields) открыты в странах Ближнего и Среднего Востока. Крупные месторождения нефти открыты в 1950–60-х также в странах Северной и Западной Африки (Ливия, Алжир, Нигерия и Ангола), в Австралии и Юго-Востоке Азии (Индонезия, Бруней), несколько меньшие по запасам – в Индии, Бирме, Малайзии и совсем мелкие – в Японии. В Соединённых Штатах Америки (США) известно свыше 13 000 (в основном мелких) месторождений нефти; наиболее крупное открыто на Аляске (Прадо Бэй (Prudhoe Bay)), второе по величине – в Техасе (Ист Тэксэс (East Texas)), несколько меньшие (по запасам) месторождения известны в Калифорнии (смотрите Калифорнийская Нефтеносная Область), Оклахоме и других штатах (смотрите Нефтегазоносный Бассейн Мексиканского Залива). Крупные месторождения нефти выявлены в Канаде и Мексике. В Южной

Америке месторождения с большими запасами открыты в Венесуэле, где расположено одно из крупнейших месторождений-гигантов Боливар (Bolivar), объединяющее группу месторождений (например, Лягунийас (Lagunillas), Бачакеро (Bachaquero), Тыа Хуана (Tia Juana)) на Северо-Восточном побережье Озера Маракайбо (смотрите Маракайбский Нефтегазоносный Бассейн); единичные крупные месторождения имеются в Аргентине, Колумбии, Бразилии, на острове Тринидад и в смежных с ним акваториях. В Западной Европе крупные месторождения открыты лишь в акватории Северного Моря (на шельфах Великобритании, Норвегии и Дании). Месторождения нефти открыты во многих акваториях:- Каспийского, Чёрного, Северного, Средиземного, Яванского, Южно-Китайского, Японского и Охотского морей, Персидского, Суэцкого, Гвинейского, Мексиканского, Кука и Пария заливов, Пролива Басса, прибрежных частей Атлантического (вблизи Анголы, Конго, Бразилии, Аргентины, Канады), Тихого (вблизи Калифорнии, Перу и Экуадора) и Индийского (вблизи Северо-Западной Австралии) океанов. О размерах добычи по странам смотрите Нефтяная Промышленность.

CRUDE OIL WASHING = ПРОМЫВКА ОТ НЕФТИ – Crude Oil Washing is a technique of cleaning tanks in oil tankers.

CRUDE OIL WELL = НЕФТЯНАЯ СКВАЖИНА – Crude Oil Well is a well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells. / Скважина – искусственная цилиндрическая горная выработка глубиной от нескольких метров до 10 километров и более и диаметром обычно 75–800 миллиметров. Скважины разделяются на взрывные, вспомогательные (вентиляционные, водоотливные и так далее), разведочные, специальные (дренажные, замораживающие и тому подобные), эксплуатационные (для добычи воды, газа, нефти и так далее). Проходка скважины осуществляется буровыми установками. Элементы скважины:- забой – дно; ствол или стенки – боковая поверхность; устье – выход на поверхность скважины. Буровая Скважина – цилиндрическая горная выработка, имеющая относительно малое поперечное сечение (обычно 75–350 миллиметров). Различают горнотехнические, исследовательские, строительные и эксплуатационные скважины.

CRUISE SHIP = КРУИЗНОЕ СУДНО – Cruise Ship is a ship on an international voyage carrying passengers participating in a group programme and accommodated aboard, for the purpose of making scheduled temporary tourist visits at one or more different ports, and which during the voyage does not normally:- (i) embark or disembark any other passengers; and (ii) load or discharge any cargo.

CRURRS = CENTRAL RAINFED UPLAND RICE RESEARCH STATION

CRUSHED SLIDER = РАЗДАВЛЕННЫЙ БЕГУНОК (или ХХ) – (1) Crushed Slider:- may be due to improper garment pressing or to padding or compensating springs in the presses not being in best condition. Closure defects, and namely – Zippers:- Slider Defects. / Порок или дефект застёжки.

(2) Crushed Slider:- same as for metal zippers. May be due to improper garment pressing or to padding or compensating springs in the presses not being in best condition. Closure defects, and namely – Nylon Spiral Zipper:- Slider Defects. / Порок или дефект застёжки. Найлан (Nylon).

CRUSH SPREAD = КУРСОВАЯ РАЗНИЦА В ОТНОШЕНИИ ОТЖИМА (или СПРЭД НА ОТЖИМ) – A Crush Spread is a processing spread trade where Soybean futures are bought (long) and Soybean oil and Soybean meal futures are sold (short) simultaneously. Processors use this hedging strategy to hedge the later purchase price of soybeans and the later sale price of Soybean oil and Soybean meal (both Soybean byproducts). The term Crush refers to the process of crushing the Soybeans in vats to produce oil and meal. In the Soybean futures market, the purchase of Soybean futures and the simultaneous sale of Soybean oil and meal futures to establish a processing margin. See also Gross Processing Margin and Reverse Crush Spread. Crush Spread is a trading strategy used in the Soybean futures market. A Soybean crush spread is often used by traders to manage risk by combining Soybean, Soybean oil and Soybean meal futures positions, into a single position. The spread position is used to hedge the margin between Soybean futures, and Soybean oil and meal futures. By simultaneously purchasing Soybean futures and selling Soybean meal futures, a trader is attempting to establish an artificial position in the processing of Soybeans, created through the spread. Since the spread relationship between the futures will vary over time, traders can gain directional exposure to the movements.

CRUT = CHARITABLE REMAINDER UNITRUST

CRUTCHED WOOL = ОБНОЖКА – Crutched Wool is a wool that has been clipped from rear end and udder area of ewes in the early spring to prevent collection of manure and fly strike. / овечек или ярочек (ewes).

CRY1AC = КРАЙ.УАН.ЭЙ.СИ. – Cry1Ac protoxin is a crystal protein produced by the Bacterium Bacillus Thuringiensis (Bt) during sporulation. Cry1Ac is one of the delta endotoxins produced by this Bacterium which act as insecticides. Because of this, the genes for these have been introduced into commercially important crops by genetic engineering (e.g., Cotton and Corn) in order to confer pest resistance on those plants. Transgenic Bt Cotton initially expressed a single Bt gene, which codes for Cry1Ac. Subsequently, Bt Cotton has added other delta endotoxins. Products such as Bt Cotton, Bt brinjal and genetically modified Maize have received attention due to a number of issues, including genetically modified food controversies, and the Séralini affair. Cry1Ac is a mucosal adjuvant (an immune-response enhancer). It has been used in research to develop a vaccine against the Amoeba Naegleria Fowleri. This Amoeba can invade and attack the human nervous system and brain, causing primary amoebic meningoencephalitis, which is nearly always fatal. See also Cry2Ab. Cry1Ac:- one of three proteins produced in Bollgard 3 Cotton plants that is derived from a common soil Bacterium and that is toxic to specific insects. Protein name:- pesticidal crystal protein Cry1Ac; Alternative names:- 133kDa crystal protein; Crystaline entomocial protoxin; and Insecticidal delta-endotoxin CryIA(c). Gene name:- Cry1Ac; Synonyms:- Cry1A(c); Cry218; and CryIA(c). Organism:- Bacillus Thuringiensis. Biotechnological Use:- introduced by genetic manipulation and expressed in insect-resistant Cotton and Tomato by Calgene (Monsanto) and in Maize by Dekalb Genetics. Developmental Stage:- the crystal protein is produced during sporulation and is accumulated both as an inclusion and as part of the spore coat. / Бактерия Палочка Турингийская (ПТ) или . Хлопчатнике и Томате (или Помидоре) Американской компанией Кялдьжин Инк. (CalgeneInc.) (Мансэнто Кампэни (Monsanto Company)) и в Кукурузе Американской компанией ДиКэб Дьжинэтикс Корпорэйшэн (DeKalb Genetics Corporation).

CRY2AB = КРАЙ.ТЧУ.ЭЙ.БИ. – Cry2Ab:- one of three proteins produced in Bollgard 3 Cotton plants that is derived from a common soil Bacterium and that is toxic to specific insects. See also Cry1Ac. / Болгад 3 (Bollgard 3).

CRYOGENICS = КРИОГЕНИКА (или ФИЗИКА НИЗКИХ ТЕМПЕРАТУР) – Cryogenics is the branch of physics relating to the production and effects of very low temperatures. / Под Крио…, от Греческого слова Krýos, означающее Лёд или Мороз или Холод, понимается часть сложных слов, означающая связь со льдом, низкими температурами (например, криогенез, криоскопия, криосфера).

CRYPTOCLIMATE = КРИПТОКЛИМАТ – Cryptoclimate:- (Greek:- Kryptós – concealed, hidden) Microclimate in a closed space such as a container. / Под Криптоклиматом, от Греческих слов Kryptós, означающее Скрытый или Тайный, и Klima, означающее Наклон (земной поверхности к солнечным лучам), понимается .

CRYPTOGAM = КРИПТОГАМНОЕ – Cryptogam:- lower plants reproducing by spores rather than seeds, e.g., Ferns, Mosses, Fungi etc. / Криптогамное (споровое) растение, низшее растение, размножающееся посредством спор, а не семян, например, Папоротники, Мхи, Грибы и тому подобные. Под Криптогамным, от Греческого слова Kryptós, означающее Скрытый или Тайный, и Gámos, означающее Брак, понимается .

CRYPTOGRAPHIC MODULE = КРИПТОГРАФИЧЕСКИЙ МОДУЛЬ – Cryptographic Module is a set of hardware, software, firmware, or some combination thereof that implements cryptographic logic or processes, and is contained within the cryptographic boundary of the module.

CRYPTOGRAPHY = КРИПТОГРАФИЯ – Cryptography is the discipline, which embodies principles, means, and methods for the transformation of data in order to hide its information content, prevent its undetected modification and/or prevent its unauthorised use. / Под Криптографией, от Греческих слов Kryptós, означающее Скрытый или Тайный, и Gráphō, означающее Пишу, понимается:- (i) тайнопись, система изменения письма с целью сделать текст непонятным для непосвящённых лиц; или (ii) отрасль палеографии, изучающая графику систем тайнописи.

CRYPTOPERIOD = КРИПТОПЕРИОД – Cryptoperiod, sometimes called a Key Lifetime or a Validity Period, is a specific time span during which a cryptographic key setting remains in effect. A key uses an algorithm to create ciphertext from plaintext (ordinary unencrypted text) and, for the receiver of the encrypted text, to decipher it. Once the crptoperiod ends, the key is no longer available for either encryption or decryption. The cryptoperiod is decided by weighing factors such as the sensitivity of the encrypted data, the risk of key compromise, and the cost of rekeying (encrypting the same material with a new key). Throughout the cryptoperiod, a key can be used to verify or decrypt data. The effective use of cryptoperiods is an important part of key management. A cryptoperiod is usually expressed as a span of calendar or clock time, but may also be expressed as a maximum volume of data to be encrypted by an algorithm for a particular key. The span of a cryptoperiod can be a number of decades where keys are needed for encrypted text that is archived. See also Key Cryptoperiod. A Cryptoperiod is the time span during which a specific cryptographic key is authorized for use. Common government guidelines range from 1 to 3 years for asymmetric cryptography, and 1 day to 7 days for symmetric cipher traffic keys. Factors to consider include the strength of the underlying encryption algorithm, key length, the likelihood of compromise through a security breach and the availability of mechanims of revoking keys. In traditional cryptographic practice, keys were changed at regular intervals, typically at the same time each day. The code word for a key change, in The National Security Agency (NSA) parlance, is HJ or Hotel Juliet; or A = Alpha, B = Bravo, C = Charlee, etc in the NATO phonetic alphabet (more accurately known as the International Radiotelephony Spelling Alphabet and also called the International Civil Aviation Organization (ICAO) phonetic or ICAO spelling alphabet, as well as the International Telecommunication Union (ITU) phonetic alphabet, is the most widely used spelling alphabet). / Под Криптопериодом, от Греческих слов Kryptós, означающее Скрытый или Тайный, и Periodos, означающее Круговращение или Обход или Определённый Круг Времени, понимается временной интервал, в течение которого допускается использование определённого ключа, либо в течение которого могут действовать ключи для компьютерной системы. Смотрите также Криптопериод Ключа (Key Cryptoperiod).

CRYSTALINA PLASTISOL = КРИСТАЛЬНЫЙ ПЛАСТИЗОЛ – Crystalina Plastisol:- printing process where specialty inks are used to give prints a multi-color pearlescent appearance when printed directly on light colored garments or over a flashed color. Crystalina can also be used for producing cold peel transfers.

CRYSTALLINE = КРИСТАЛЛИЧЕСКОЕ (или КРИСТАЛЬНОЕ) – Crystalline:- made up of crystals. The term Crystalline applies to sections of all chemical fibers, which consists of alternate crystalline and amorphous (noncrystalline) regions. These regions are influenced by manufacturing conditions and to some extent can be controlled. The degree of crystallinity influences the physical properties of fibers.

CRYSTALLINE GROWTH = КРИСТАЛЛИЧЕСКИЙ РОСТ (или КРИСТАЛЬНЫЙ РОСТ) – Crystalline Growth is:- (1) the expansion and development of a crystal. The process involves diffusion of the crystallizing material to special sites on the surface of the crystal, incorporation of the molecules into the surface at these sites, and diffusion of heat away from the surface of the crystal. (2) The transformation of disoriented molecules, usually of the same substance, to a higher state of order. This process generally occurs rapidly for small molecules; however, the process is slow for polymer molecules and is arrested at temperatures below the glass transition temperature.

CRYSTALLINITY = КРИСТАЛЛИЧНОСТЬ (или КРИСТАЛЛИЧЕСКОЕ СОСТОЯНИЕ) – Crystallinity is:- (1) the state of quality of being crystalline. (2) The extent to which a polymer exists in a lattice structure.

CRYSTALLIZATION = КРИСТАЛЛИЗАЦИЯ – Crystallization is the formation of highly-ordered substances (crystals) from solutions or melts. In polymers, crystalline areas are interspersed with amorphous areas in a lattice-like network. See also Macrolattice.

CSVLI = CASH SURRENDER VALUE OF LIFE INSURANCE

CSX COAL = УГОЛЬ ОТ СИ.ЭС.ЭКС. – CSX Coal is coal transported by the CSX Corporation the largest coal transporter East of the Mississippi River, serving more than 130 load-outs in 9 states. CSX provides service from the largest number of active coal origination points:- Alabama, Beem, Belington, Cumberland-Piedmont East, Fairmont, Gauley North, Grafton, MGA, Mountain, Big Sandy, Clinchfield, Southwest Virginia, Illinois/Indiana, Western Kentucky, among others. Service interchanges with Western railroads and short lines, and provides access to multiple Eastern seaports. CSX coal futures are traded at the ICE Futures Europe® under ticker symbol UCX. Contract size is 1 000 tons quoted in US Dollars per ton. / Си.Эс.Экс. Корпорэйшэн (CSX Corporation). Ай.Си.И. Фьючез Юрэп® (ICE Futures Europe®).

CT = COLD TOLERANCE

CT = COMBUSTION TURBINE

CT = COTTON

CT = СИ.ТИ. – CT is the ticker symbol – code abbreviation of Cotton for identification purposes. / Си.Ти. (CT) – это тикерный символ для фьючерсного контракта на Хлопок № 2^{3O}; иными словами, кодовое обозначение, используемое в целях идентификации Хлопка среди других фьючерсных контрактов на сырьё.

CTA = COMMODITY TRADING ADVISOR

CTA = CONSOLIDATED TAPE ASSOCIATION

CTA = CUMULATIVE TRANSLATION ADJUSTMENT

CTAB = CETYLTRIMETHYLAMMONIUM BROMIDE

CTAC = CHEMICAL TRANSPORTATION ADVISORY COMMITTEE

CT B/L = COMBINED TRANSPORT BILL OF LADING

CTD = COMBINED TRANSPORT DOCUMENT

CTI = CUSTOMER TYPE INDICATOR

CTI1 = СИ.ТИ.АЙ.1 – CTI1:- trading for the person who holds trading privileges for the person's own account or an account for which the person has discretion. Trade is a floor broker trading for his personal account. / Сделка, в которой брокер на полу торгует за свой собственный счёт.

CTI2 = СИ.ТИ.АЙ.2 – CTI2:- trading for a proprietary account of the clearing member's firm. Trade is a broker trading for a clearing member's proprietary account. / Сделка, в которой брокер торгует за собственный счёт клирингового члена.

CTI3 = СИ.ТИ.АЙ.3 – CTI3:- trading for another person who holds trading privileges who is currently present on the trading floor or for an account controlled by such other person. Trade is a broker trading for another broker who is present of the floor. / Сделка, в которой брокер торгует для другого брокера, работающего на полу.

CTI4 = СИ.ТИ.АЙ.4 – CTI4:- trading for any other type of customer. Trade is a broker trading for a customer's account. / Сделка, в которой брокер торгует за счёт клиента.

CTI5 = СИ.ТИ.АЙ.5 – CTI5:- trade is a broker fills an order for a member that isn't on the trading floor. / Сделка, в которой брокер исполняет распоряжение для участника, не торгующего самостоятельно на торговом полу биржи.

CTU = CARGO TRANSPORT UNIT

CTU GUIDELINES = CARGO TRANSPORT UNIT GUIDELINES

CU = CUBA

CU = CUBIC

CUBE = КУБ (или БРИКЕТ) – Cube:- xxxxx. See also Pellets. / Под Кубом, от Латинского слова Cubus, от Греческого слова Kýbos, понимается . Синоним – Брикет. Под Брикетом, от Французского слова Briquette, понимаются спресованные в виде кирпича плитки и тому подобный уголь, руда, опилки или другой мелкий материал с целью уменьшения потерь при дальнейшем его использовании. Для упрочения брикетов используют следующие добавки (битум, пек, жидкое стекло, цемент и другие). Предложено в России изобретателем Андреем Петровичем Вешняковым в 1830-е в качестве метода получения прочных брикетов из древесного и каменного угля, названных им Карболеином. Его метод давал возможность получать карболеин с разной теплотворной способностью, скоростью сгорания и плотностью.

CUBE OUT = КУБАТУРА ИСЧЕРПАНА (или ОБЪЁМ ИСЧЕРПАН, или ЗАПОЛНЕН) – Cube Out occurs when a container or vessel has reached its volumetric capacity before its permitted weight limit. / В грузоперевозках под Кубатурой понимается число кубических единиц в объёме данного транспортного средства или помещения.

CUBE UTILIZATION = ЗАГРУЖЕННОСТЬ В КУБАХ – Cube Utilization:- space utilized versus space available.

CUBIC = КУБИЧЕСКОЕ – Cu is an abbreviation for 'Cubic', as in cubic feet or cubic meters. This symbol is forbidden by the SI, but it remains in common use in ordinary English text. The proper symbol for cubic feet is ft^3, not cu. ft.

CUBIC CAPACITY = КУБАТУРА (или КУБИЧЕСКАЯ ВМЕСТИМОСТЬ) – Cubic Capacity is the carrying capacity of a piece of equipment according to measurement in cubic feet. / Полезный объём единицы оборудования в соответствии с его параметрами в кубических футах. В грузоперевозках под Кубатурой понимается число кубических единиц в объёме данного транспортного средства или помещения.

CUBIC FEET PER DAY = КУБИЧЕСКИХ ФУТОВ В СУТКИ – Cubic Feet Per Day usually used to quantify the rate of flow of a gas well or pipeline. / Обычно используется для определения уровня прокачки на газовой скважине или газовом трубопроводе.

CUBIC FOOT = КУБИЧЕСКИЙ ФУТ – Cubic Foot is the most common measure of gas volume, referring to the amount of gas needed to fill a volume of one cubic foot at 14.73 pounds per square inch absolute pressure and 60 degrees Fahrenheit. One cubic foot of natural gas contains, on average, 1 027 Btus. 1 728 cubic inches. A volume contained in a space measuring one foot high, one foot wide and one foot long. Cubic Foot is the unit of volume equal to 1 cubic foot at a pressure base of 14.73 pounds standard per square inch absolute and a temperature base of 60 degrees Fahrenheit. 1 standard cubic foot equals 0.028 3 standard cubic meters. 1 standard cubic foot equals 1 000 British thermal units (Btus). Cubic Foot (ft^3, cu ft, or cf) is a traditional unit of volume in English speaking countries. One cubic foot equals 1 728 in^3, 1/27 yd^3, 0.028 316 85 m^3, or 28.316 85 liters. The cubic foot also holds about 7.480 5 US liquid gallons or about 6.228 8 British Imperial gallons.

CUBIC METER = КУБИЧЕСКИЙ МЕТР – Cubic Meter (CBM or cbm or m^3) is the Système International (SI) unit of volume, equal to 10^6 or 1 000 000 cubic centimeters (cm^3), 1 000 liters, 35.314 7 cubic feet (ft^3), or 1.307 95 cubic yards (yd^3). A cubic meter holds about 264.17 US liquid gallons or 219.99 British Imperial gallons. A Cubic Meter (m^3) is the International System of Units (SI) derived unit of volume. It is defined as the volume of a cube with edges one meter in length. 1 cubic meter = 35.314 666 7 cubic feet. One Cubic Meter equals 35.314 7 cubic feet. 1 cubic meter of natural gas equals 1 standard cubic meter of natural gas. 1 000 standard cubic meters of natural gas equals 6.29 barrels of oil equivalent (boe). 1 billion standard cubic meters of natural gas equals 1 million standard cubic meters of oil equivalent. / Единица объёма в Международной Системе Единиц (СИ), равная 10^6 или 1 000 000 кубическим сантиметрам ($см^3$), 1 000 литрам, 35.314 7 кубическим футам (ft^3), или 1.307 95 кубическим ярдам (yd^3). Кубический метр содержит приблизительно 264.17 Американских жидкостных галлонов или 219.99 Британских Имперальных галлонов.

CUBS = CALLS UNDERWRITTEN BY SWANBROOK

CUCURBITACIN = КУКУРБИТАЦИН – Cucurbitacin is a toxic steroid developed by some Plants, especially in the Family Cucurbitaceae as a defence against herbivores. Cucurbitacin is one of the most bitter tasting substances known. Some analogues have been shown to be toxic to cancer cells. / в Семействе Тыквенных (Family Cucurbitaceae). Противогельминтный эффект семян Тыквы так же обуславливается содержащимися в ней гликозидами, в основном кукурбитацин, который стимулирует выделение пищеварительных ферментов и подвергает тем самым глистов перевариванию (его, кстати, много содержится в горьких огурцах), маслами (которые вызывают послабляющий эффект), и наличием кукурбитина (который оказывает парализующее действие на гельминтов). Как и любое другое народное средство, семена тыквы мало эффективны, хотя и не такие токсичные, отхождения паразитов без головок можно ожидать лишь до 30% случаев, а с головками и того меньше – 10–15%. В то же самое время, современные препараты показывают эффективность более, чем 90%.

CUE = CONSISTENT USER EXPERIENCE

CUFF = МАНЖЕТА (или ОБШЛАГ, или ОТВОРОТ НА БРЮКАХ) – (1) Cuff (Lined) is a cuff with interlining placed between the two pieces of body fabric.

(2) Cuff (One-Piece):- a two-ply cuff formed by folding over a single piece of fabric, usually with a lining in between.

(3) Cuff (Topstitched):- a cuff with an added row of stitching along the folded edges. / втачивание (stitching).

(4) Cuff (Two-Piece):- a cuff in which two identical pieces of fabric, usually with a lining in between, are joined by a seam along the edge, then turned and sometimes topstitched near the folded edges.

(5) Cuff:- hem of shirt sleeve.

CUIRASS = КИРАСА – Cuirass is a piece of armor covering the body from neck to waist; also, the breastplate of such a piece.

CUISSE = КВИСС (или НАБЕДРЕННИК) – Cuisse is a piece of plate armor for the front of the thigh. / .

CULET = КУЛЭТ – Culet:- plate armor covering the buttocks. / .

CULOTTE = КЮЛЁТ (или ЮБКА–БРЮКИ, или РЕЙТУЗЫ, или КУЛАТС) – Culotte is a divided skirt; also, a garment having a divided skirt. Often used in plural. / короткие мужские штаны до колен.

CULM = СОЛОМИНА – Culm is the stem of a grass or sedge. The round smooth-surfaced, ascending axis of the shoot, consisting of hollow internodes joined by solid nodes. Culm (syn. Stem, and Haulm) is the round, smooth-surfaced ascending axis of the shoot, consisting of hollow internodes jointed by solid nodes. It bears the leaves, panicle, adventitious roots and axillary buds, it may be primary, secondary, or tertiary, depending on tillering order. / Под Соломиной понимается цилиндрический, обычно полый в

междоузлиях стебель злаков; у современных сортов Овса, Пшеницы, Ржи и других сельскохозяйственных культур; устойчив к полеганию.

CULM LENGTH = ДЛИНА СОЛОМИНЫ – Culm Length is a length of the Rice stem from the base of the plant to the base of the panicle or neck node.

CULTIGEN = КУЛЬТИГЕН – Cultigen is a plant species known only in cultivation with its origin from domestication; for example, Oryza Sativa and Oryza Glaberrima. / Культиген – вид, существующий только в культуре. Под Культигеном, от Латинского слова Cultura, означающее Возделывание, и ..., означающее Ген, понимается вид, существующий только в культурном состоянии и созданный человеком, например, собака домашняя.

CULTIPACK = КУЛЬТИУПЛОТНЕНИЕ – Cultipack is a soil crushing and firming operation utilizing wide rollers having corrugated or jagged working surfaces. / широкие катки, имеющие рабочие поверхности.

CULTIVAR = КУЛЬТИВАР (или ГРУППА, или РАЗНОВИДНОСТЬ, или СОРТ (РАСТЕНИЙ)) – Cultivar is a plant originated or selected artificially. Names of Cultivars may be appended after the Species name, (e.g., Lithops Bromfieldii 'Sulphurea') sometimes following the letters 'CV'. A Cultivar (Cultivarietas in Latin) is not the same thing as a hybrid. See also Variety. Cultivar is:- (1) a variety; or/and (2) a cultivated Variety; the international term for Variety. Cultivar:- synonymous with Variety; the international equivalent of Variety. / , от позднелатинского слова Cultivo, означающее Возделываю или Обрабатываю, . Под Культиваром или Сортом Растений понимается совокупность растений, созданная в результате селекции и обладающая определёнными, передающимися по наследству морфологическими, физиологическими, хозяйственными признаками и свойствами; низшая классификационная единица для культурных растений. Различают местные и селекционные сорта растений. (i) Местные Сорта Растений создаются в результате длительного действия естественных и простейших приёмов искусственного отбора при возделывании той или иной культуры в определённой местности; часто служат исходным материалом в селекции. (ii) Селекционные Сорта Растений создаются в научно-исследовательских учреждениях на основе научных методов селекции. Различают:- (a) Линейные Сорта Растений – генетически однородное потомство одного самоопыляющегося растения, полученное методом индивидуального отбора; (b) Сорта-Популяции – генетически неоднородная совокупность перекрёстно- или самоопыляющихся растений, полученная путём массового отбора (все местные сорта перекрёстно- или самоопыляющихся культур – сорта-популяции); (c) Сорта-Клоны – отобранное потомство одного вегетативно размножаемого растения (отличается высокой степенью выравненности, нарушающейся только под влиянием естественного мутагенеза); (d) особое положение занимают Гибриды, отличающиеся повышенной урожайностью (явление гетерозиса) в 1-м поколении. Родственные сорта растений, имеющие сходные хозяйственные и биологические признаки, для удобства изучения и инвентаризации объединяют в группы – Сортотипы. В бывшем Союзе Советских Социалистических Республик (СССР) все сорта растений проходили государственное Сортоиспытание в целях отбора лучших для внедрения в производство. Размножением их занимается Семеноводство. Определение подлинности сорта растений осуществляет Сортовой Контроль.

CULTIVATE = ОКУЛЬТУРИВАТЬ (или КУЛЬТИВИРОВАТЬ) – Cultivate:- (1) preparing the land for planting or sowing seed. (2) To grow crops or plants. / Под Окультуриванием Почвы понимается повышение плодородия почвы путём почвоуглубления, систематической обработки, удобрения, известкования или гипсования, орошения, осушения и тому подобного. Под Культивированием, от позднелатинского слова Cultivo, означающее Возделываю или Обрабатываю, понимается рыхление культиваторами поверхностного слоя обработанной почвы без оборачивания. Уничтожает сорняки, предохраняет почву от высыхания.

CULTIVATED SILK = ОКУЛЬТУРЕННЫЙ ШЁЛК (или КУЛЬТИВИРУЕМЫЙ ШЁЛК, или ШЁЛК КУЛЬТУРНОГО ШЁЛКОПРЯДА) – Cultivated Silk:- fibers from a silkworm that have had scientific care.

CULTIVATED VARIETY = ОКУЛЬТУРЕННАЯ РАЗНОВИДНОСТЬ (или КУЛЬТИВИРУЕМАЯ РАЗНОВИДНОСТЬ) – Cultivated Variety is a named group of plants within a cultivated species that is distinguishable by a character or group of characters and that maintains its identity when propagated either asexually or sexually. / свойство (character) .

CULTIVATION = КУЛЬТИВАЦИЯ – Cultivation is:- (1) a tillage operation used in preparing land for seeding or transplanting or later for weed control and for loosening the soil; (2) the processes used in growing field crops, vegetables, plants, fruits, trees, flowers, and fish. / Под Культивацией, от позднелатинского слова Cultivo, означающее Возделываю или Обрабатываю, понимается рыхление культиваторами (cultivators) поверхностного слоя обработанной почвы без оборачивания. Уничтожает сорняки, предохраняет почву от высыхания.

CULTIVATION DAMAGE = ПОВРЕЖДЕНИЕ ПРИ КУЛЬТИВАЦИИ – Cultivation Damage may occur along narrow guess rows during cultivation, when cultivator 'knives' are set too close to the row or when the concentration of a tractor driver wanders temporarily! Cultivation damage may be exacerbated when hills/beds are very dry and blocky. / Культиваторы – сельскохозяйственные орудия для рыхления почвы, уничтожения сорняков в междурядьях, подкормки растений, прореживания всходов.

CULTURAL CONTROL = КУЛЬТУРАЛЬНЫЙ КОНТРОЛЬ (или КУЛЬТУРНЫЙ КОНТРОЛЬ) – Cultural Control is the use of agronomic practices such as soil tillage, varying planting time, fertility level, sanitation, water management, crop diversification, crop rotation, and short-duration cultivars to reduce pest populations or stresses.

CULTURAL PRACTICES = КУЛЬТУРАЛЬНЫЕ ПРАКТИКИ (или КУЛЬТУРНЫЕ ПРАКТИКИ, или ПРАКТИКИ КУЛЬТИВИРОВАНИЯ) – Cultural Practices are activities or operations that are usually carried out in raising field crops, e.g., land preparation, seed selection, crop establishment, fertilization, etc.

CULTURAL REQUIREMENTS = КУЛЬТУРАЛЬНЫЕ ПОТРЕБНОСТИ – Cultural Requirements are the conditions which provide optimal growth of a plant in cultivation. / Под Культуральными Потребностями понимаются условия, которые обеспечивают оптимальный рост растения при культивировании.

CULTURE = КУЛЬТУРА (или КУЛЬТИВИРОВАТЬ) – Culture:- (n) The rearing of organisms such as insect to serve as a source of varietal resistance studies. (v) To artificially grow microorganisms or plant tissue on a prepared food material; a colony of microorganisms or plant cells artificially maintained on such food material. / Под Культурой, от Латинского слова Cultura, означающее Возделывание или Воспитание или Обрабатывание или Образование или Развитие или Почитание, понимается .

CULTURE MEDIUM = КУЛЬТУРНАЯ СРЕДА – Culture Medium:- in insect rearing, a food source for the insect.

CUM = С (или ПРИ, или ЗАОДНО, или ВМЕСТЕ, или НАРЯДУ, или В СОПРОВОЖДЕНИИ, или С ПОМОЩЬЮ, или С ПРИЛОЖЕННЫМ) – Meaning 'With'. For example, Cum Dividend means that shares are being traded with the current dividend attached and thus the buyer rather than the seller receives the dividend declared. Cum-Dividend Shares quoted Cum-Dividend entitle

the buyer to the dividend then current. Cum-Rights Shares quoted Cum-Rights entitle the buyer to participate in a New Issue of shares then current. / в переводе с Латинского языка, .

CUM DIVIDEND = С ДИВИДЕНДОМ (или С ПРИЛОЖЕННЫМ ДИВИДЕНДОМ) – Shares that are sold with the right of the new holder to claim the next dividend payment. Cum means 'With'. Shares quoted cum dividend entitle the buyer to the current dividend. The price of the shares will usually reflect the amount of the dividend. Similarly, shares 'cum rights' entitle the buyer to participate in the new issue of shares. See also Ex-Dividend, and xd. / С Дивидендами (на Латинском Cum Dividend). Так говорят об акциях, покупатель которых имеет право на получение декларируемых дивидендов. Акции обычно продаются 'с дивидендами' в сделках, совершаемых за 5 дней или более до наступления даты регистрации (record date), когда окончательно утверждается список зарегистрированных владельцев на данный период получения дивидендов. Торговые сделки менее чем за 5 дней до этой даты совершаются Без Дивидендов (Ex-Dividend).

CUMMERBUND = КАМЕРБАНД (или КУШАК, или ШИРОКИЙ ПОЯС) – Cummerbund is a broad waistband usually worn in place of a vest with men's dress clothes and adapted in various styles of women's clothes.

CUMMING = XX – Cumming:- stripes of dark and light green combined with red and blue stripes to form the plaid. In faded or antique colors, ttris tartan is especially attractive.

CUM PREF = CUMULATIVE PREFERRED SHARE

CUMULATIVE = КУМУЛЯТИВНОЕ (или НАКОПИТЕЛЬНОЕ) – In sharemarket, a term Cumulative refers to the right of some preference shares to receive a dividend for each financial period even though no dividend has been declared. When such a dividend has been omitted it becomes an arrear.

CUMULATIVE DEGREE DAY SUM = КУМУЛЯТИВНАЯ СУММА ГРАДУСО–ДНЕЙ – Cumulative Degree Day Sum is a physiological unit of time calculated as the number of degrees above a threshold temperature x the number of days accumulated. Similar to day degree or degree day.

CUMULATIVE INFILTRATION = КУМУЛЯТИВНАЯ ИНФИЛЬТРАЦИЯ – Cumulative Infiltration is a total volume of water infiltrated per unit area during a specified time period. / Под Инфильтрацией, от Латинского слова In, означающее В, и позднелатинского слова Filtratio, означающее Процеживание, в геологии понимается проникновение атмосферных и поверхностных вод в почву, горную породу по капиллярным и субкапиллярным порам и другим пустотам.

CUMULATIVE PREFERENCE DIVIDEND = ДИВИДЕНД ПО КУМУЛЯТИВНОЙ ПРИВИЛЕГИРОВАННОЙ АКЦИИ – Cumulative Preference Dividend:- dividends on preference shares that accrue as a commitment of the company if they are not paid in any year. Arrears of cumulative preference dividends must be paid before any dividends are paid to ordinary shareholders. Unless specifically stated to be non-cumulative, dividends on all preference shares are deemed to be cumulative.

CUMULATIVE PREFERENCE SHARE = КУМУЛЯТИВНАЯ ПРИВИЛЕГИРОВАННАЯ АКЦИЯ (или НАКОПИТЕЛЬНАЯ ПРИВИЛЕГИРОВАННАЯ АКЦИЯ) – In the United Kingdom, Cumulative Preference Shares give holders the right that, if a dividend cannot be paid one year, it will be carried forward to successive years. Dividends on cumulative preference shares must be paid, despite the earning levels of the business. See also Ordinary Shares, Preference Shares, Redeemable Shares, and Shares. / Под Привилегированной Акцией понимается акция, по которой уплачивается твёрдый, фиксированный доход, независимо от величины прибыли акционерного общества. Иногда привилегированными акциями называют акции, дающие несколько голосов на собрании акционеров. Выделяются два типа привилегированных акций:- кумулятивные и конвертируемые. Кумулятивными считаются такие акции, по которым невыплаченный или не полностью выплаченный дивиденд, размер которого определён в уставе, накапливается и выплачивается впоследствии. Выпуск таких акций может привлечь инвесторов возможностью увеличения своих доходов. Если владелец привилегированной акции такого типа решит продать её при невыплате дивидендов, то он будет вынужден продавать её по низкой курсовой стоимости. Купивший же такую акцию имеет возможность получить дивиденды за весь период, в течение которого они не выплачивались. Владелец кумулятивной привилегированной акции получает право голоса на тот период, в течение которого он не получает дивиденд, и теряет это право с момента выплаты всех накопленных по указанной акции дивидендов в полном размере.

CUMULATIVE PREFERRED SHARE = КУМУЛЯТИВНАЯ ПРИВИЛЕГИРОВАННАЯ АКЦИЯ – Cumulative Preferred Share is a form of preferred shares on which unpaid dividends accumulate until they can be paid. When profits are insufficient to meet the full dividend on such shares, any unpaid dividend accumulates until enough profit cover is earned (and meanwhile no dividend may be paid on other types of stock). In the case of limited cumulative preferred shares, the number of years in which dividends may accrue is limited. Also known as Cumulative Preference Share in the United Kingdom. A stock having a position that if one or more dividends are omitted, the omitted dividends must be paid before dividends may be paid on the company's common stock. / Под Привилегированной Акцией понимается акция, по которой уплачивается твёрдый, фиксированный доход, независимо от величины прибыли акционерного общества. Иногда привилегированными акциями называют акции, дающие несколько голосов на собрании акционеров.

CUMULATIVE REVOLVING LETTER OF CREDIT = КУМУЛЯТИВНЫЙ ВОЗОБНОВЛЯЕМЫЙ АККРЕДИТИВ (или НАКОПИТЕЛЬНЫЙ РЕВОЛЬВЕРНЫЙ АККРЕДИТИВ) – Cumulative Revolving Letter Of Credit is a revolving letter of credit that permits the seller to carry over any amounts not drawn into successive periods. / Аккредитив может быть револьверным. По такому аккредитиву по мере его использования (выплат) сумма аккредитива (квота) автоматически восстанавливается без внесения изменений в его условия, о чём делается специальная оговорка. Квота может восстанавливаться сразу после каждой выплаты по аккредитиву либо с определённой периодичностью в пределах установленной общей суммы лимита и срока для представления документов по аккредитиву. Револьверный аккредитив с указанной периодичностью использования квоты (платёж раз в месяц, раз в квартал и другой) может быть кумулятивным или некумулятивным. Если аккредитив обозначен как 'кумулятивный', то квота, не использованная в течение какого-либо периода, переносится на следующий период и может быть использована дополнительно к квоте следующего периода. Квота, не использованная в течение указанного в некумулятивном аккредитиве периода, на следующий период не переносится. Аккредитив, разрешающий частичные отгрузки, но не содержащий специальную оговорку о возобновлении его суммы, не является револьверным.

CUMULATIVE THRESHOLD = КУМУЛЯТИВНЫЙ ПОРОГ – Cumulative Threshold is the point at which consecutive scouting assessments of subthreshold levels of the same species justify treatment.

CUMULATIVE VOTING = КУМУЛЯТИВНОЕ ГОЛОСОВАНИЕ – Cumulative Voting is a method of voting for corporate directors that enables the shareholders to multiply the number of their shares by the number of directorships being voted on and to cast the total for one director or a selected group of directors. A 10-shareholder normally casts 10 votes for each of, say, 12 nominees to the board of

directors. One thus has 120 votes. Under the cumulative voting principle, one may do that or may cast 120 (10 x 12) votes for only one nominee, 60 for two, 40 for three, or any other distribution one chooses. Cumulative voting is required under the corporate laws of some states and is permitted in most others.

CUMULIC = НАМЫТОЕ – Cumulic:- derived from accumulation. Descriptive of a wetland type where 100 mm of accumulated water will stay for more than 7 days when the soil has been puddled, even without rain or irrigation.

CUNA = CREDIT UNION NATIONAL ASSOCIATION

CUNEATE = КЛИНОВИДНОЕ (или КЛИНООБРАЗНОЕ) – Cuneate:- wedge-shaped with straight sides converging at the base. Cuneate:- wedge-shaped, tapering toward point of attachment.

CUP = CUBAN PESO

CUP = ПОПЕРЕЧНОЕ КОРОБЛЕНИЕ (или ПОПЕРЕЧНАЯ ПОКОРОБЛЕННОСТЬ) – Cup is a distortion of a board in which there is a deviation from a straight line across the width of the board. / Искривление доски, у которой имеется девиация (величина отклонения) в отношении прямой линии поперёк ширины доски. Под Короблением Древесины понимается изменение формы пиломатериалов, заготовок и деталей при их высыхании (разбухании). Различают:- винтовое коробление, поперечное коробление и продольное коробление. Винтовое коробление древесины образуется при наличии тангенциального наклона волокон. Основная причина поперечного коробления древесины – различие в усушке (разбухании) в радиальном и тангенциальном направлениях. Продольное коробление древесины вызывается разницей усушки вдоль волокон отдельных зон доски, например, при наличии такого порока древесины, как крень. Временное коробление древесины может наблюдаться при неравномерных увлажнении или сушке пиломатериалов. Коробление древесины происходит также при механической обработке пиломатериалов или заготовок, имеющих значительные остаточные напряжения, сохранившиеся после камерной сушки. Крень – порок древесины хвойных пород, который образуется в сжатой зоне изогнутых стволов, когда годичные слои уширяются за счёт развития реактивной древесины, тёмным цветом напоминающий позднюю древесину. Различают сплошную и местную крень. Порок увеличивает усушку древесины вдоль волокон, способствует короблению, ухудшает и ряд других её свойств.

CUP = ЧАШЕЧКА – Cup is an athletic supporter reinforced usually with plastic to provide added protection for the wearer.

CUPELLATION = КУПЕЛЯЦИЯ (или КУПЕЛИРОВАНИЕ) – Cupellation:- in this method the impure metal is heated in a blast of air when impurities are oxidised and blown away. For example, when impure silver is heated in air, lead present in it is oxidised to litharge (PbO) and blown away leaving a shining of silver. / Купелирование – окисление расплавленного свинца, содержащего золото и серебро. Купеляция или Купелирование (от Французского слова Coupelle, означающее Разделительная Печь или буквально Чашечка), окислительное плавление сплава свинца с благородными металлами (золотом, серебром) с целью выделения их в чистом виде. Купеляция основана на том, что свинец и другие неблагородные металлы при высокой температуре легко окисляются кислородом воздуха, тогда как благородные металлы не изменяются. В пробирном анализе купеляция служит для установления пробы, то есть количественного содержания благородных металлов в их сплавах. Купеляция производится в капелях – чашечках из пористого огнеупорного материала (костяной золы, магнезита и других) при температуре 850–900 °С. При купеляции свинец и другие неблагородные металлы превращаются в расплавленные окислы, которые поглощаются капелью, тогда как благородные металлы остаются на её поверхности в виде так называемого Королька. В металлургии купеляция – операция выделения благородных металлов из серебристого свинца – осуществляется в пламенных печах при температуре около 1 000 °С. Под действием кислорода дутья свинец и неблагородные металлы окисляются. Смесь окислов, в которой преобладает свинцовый глёт PbO, в жидком виде непрерывно стекает с поверхности расплава в приёмный сосуд. На поду печи получают золото-серебряный сплав, содержащий иногда платиновые металлы. Купеляция или Купелирование – процесс окислительного плавления сплава благородных металлов со свинцом в целях выделения благородных металлов. Осуществляется в капелях (купелях) или тиглях из пористого огнеупорного материала (из магнезита, цемента, костяной золы и другого). Купеляция применяется в цветной металлургии для переработки продуктов, содержащих свинец и благородные металлы; является одним из методов пробирного анализа. Купеляция основывается на том, что Pb и другие неблагородные металлы окисляются кислородом воздуха при температуре около 1 000 °С; при этих условиях благородные металлы не окисляются. В так называемых купеляционных печах (подовые печи периодического действия) расплав благородных металлов стекает из ванны-купели по сливному каналу (расположенному в её передней части) в чугунные изложницы. Купеляцию проводят также в печах с выдвижным подом и принудительной подачей воздуха. Смесь оксидов неблагородных металлов непрерывно стекает с поверхности расплава в приёмный сосуд, сплав благородных металлов (так называемый Королёк) образуется на поду печи. Купеляция применялась ещё в Древнем Египте, Вавилонии, Древней Греции для получения благородных металлов; в России, как метод пробирного анализа, развивалась со времён Петра I (1672–1725).

CUP FOOT = ЧАШЕЧНАЯ ОПОРА (или ЧАШЕЧНАЯ XX) – Cup Foot is a type of foot used on post pallets or cage pallet. Note:- a cup foot can be round and resemble an inverted cup or square. See also Pallet. / Чашечная Опора (Cup Foot):- опора, применяемая в стоечных или сетчатых поддонах. Примечание:- чашечная опора может быть круглой, квадратной или в виде перевёрнутой чашки. Смотрите также Поддон (Pallet).

CUPIONI = XX – Cupioni is a type of specialty or novelty yarn having slubs or enlarged sections of varying length.

CUPRAMMONIUM = МЕДНОАММИАЧНОЕ – Cuprammonium is a process of producing a type of regenerated rayon fiber. In this process, the wood pulp or cotton liners are dissolved in an ammoniac copper oxide solution. Bemberg rayon is a type of Cuprammonium rayon. / Под Медноаммиачным Волокном понимается искусственное волокно, формуемое из прядильного раствора, который получают действием на целлюлозу водного раствора соединения формулы $(Cu(NH_3)_n)(OH)_2$. Мягкое, эластичное, малопрочное, сравнительно дорогое. Применяется, например, в производстве ковров, трикотажных изделий. Медноаммианое Волокно выпускается в виде штапельного волокна и текстильной нити. Медноаммиачное Волокно получают из хлопкового пуха и облагороженной древесной целлюлозы. Целлюлозу растворяют в медноаммиачном растворе и продавливают через фильеры. Формуют волокно мокрым способом, в растворах. По физико-механическим свойствам медноаммиачные волокна превосходят вискозу. Волокно ровное, гладкое, с мягким приятным блеском, хорошо окрашивается, в сухом состоянии прочнее вискозного, более упруго и эластично. Применяется медноаммиачное волокно в производстве трикотажа, а в смеси с шерстью – для изготовления тканей и ковров. Производится это волокно в небольших количествах, так как его производство значительно дороже, чем производство других искусственных волокон. Медноаммиачное Волокно – один из видов искусственных целлюлозных волокон, формуют их по ‘мокрому’ методу в воду или раствор щёлочи. Прядильный раствор готовят действием на целлюлозу водного раствора куприаммингидрата $(Cu(NH_3)_n)(OH)_2$. Штапельные медноаммиачные волокна применяют в основном для производства ковров и сукна, тонкие текстильные нити (толщина 5–10

текс) – для выработки трикотажных изделий, лёгких тканей. Для технических целей медноаммиачные волокна не используют из-за низкой прочности. Стоимость медноаммиачных волокон выше, чем у их конкурентов – вискозных волокон.

CUPRAMMONIUM RAYON = МЕДНОАММИАЧНЫЙ РЭЙОН (или МЕДНОАММИАЧНЫЙ ИСКУССТВЕННЫЙ ШЁЛК) – Cuprammonium Rayon is a rayon made from cellulose dissolved in cuprammonium solution. Cuprammonium Rayon:- filaments produced by precipitating cellulose dissolved in a solution of copper oxide in ammonia. See also Rayon Fiber. Cuprammonium Rayon Fibers are the rayon fibers and polynosic fibers, the same group as cuprammonium rayon fiber, are made from pulp as raw material. By contrast, the cuprammonium rayon fibers are made from cotton linters as main raw material. The cuprammonium rayon fibers are manufactured in fine yarn and used, in large quantities, for tricot fabrics and thin fabrics, because they are flexible and in good tactile feeling to the human skin. The cuprammonium rayon fiber are manufactured mainly in filament yarn but are also manufactured, in a little quantity, in staple fibers. End-Uses (in Japan):- (i) For Clothing:- a variety of fabrics for women's wear, blouses, underwear, Japanese dresses, linings, Hakkake, accessories for Japanese dresses, scarves, etc; (ii) For Home Furnishings And Bedding:- curtain, bedclothes, cover cloth for Zabuton mats, etc; and (iii) For Other Uses:- Furoshiki (square cloth for wrapping things), umbrellas, etc. Features:- (i) extremely fine yarns are available; (ii) soft feeling, fabric hand as that of silk fibers, delicate and elegant luster are most suitable for thin fabrics of high-quality; and (iii) fibers superior in dyeability and difficult to fade due to launderings and sun light. Care Instructions:- avoid hard washing and hard squeezing, because most fabrics are thin. See also Linters. Cuprammonium Rayon is a rayon made by a process that allows very fine filament fibers to be formed. The fineness of its filaments is its best known characteristic. Cuprammonium Rayon Fibers:- the rayon fibers and polynosic fibers, the same group as cuprammonium rayon fiber, are made from pulp as raw material. By contrast, the cuprammonium rayon fibers are made from cotton linters as main raw material. The cuprammonium rayon fibers are manufactured in fine yarn and used, in large quantities, for tricot fabrics and thin fabrics, because they are flexible and in good tactile feeling to the human skin. The cuprammonium rayon fiber are manufactured mainly in filament yarn but are also manufactured, in a little quantity, in staple fibers. End-Uses:- (i) for clothing:- A Variety of Fabrics for Women's Wear, Blouses, Underwear, Japanese Dresses, Linings, Hakkake, Accessories for Japanese Dresses, Scarves, etc. (ii) for home furnishings and bedding:- Curtain, Bedclothes, Cover Cloth for Zabuton mats, etc. (iii) for other uses:- Furoshiki (square cloth for wrapping things), Umbrellas, etc. Features:- (i) extremely fine yarns are available; (ii) soft feeling, fabric hand as that of silk fibers, delicate and elegant luster are most suitable for thin fabrics of high-quality; and (iii) fibers superior in dyeability and difficult to fade due to launderings and sun light. Care Instructions:- avoid hard washing and hard squeezing, because most fabrics are thin. Definition of Technical Terms:- Cotton Linters are the remaining short fibers after removing cotton lint from cotton seeds. / непрерывные элементарные нити, произведённые . Забутон (Zabuton).

CUPRO = МЕДНОАММИАЧНОЕ (ВОЛОКНО) (или КЬЮПРО, или КУПРО) – Cupro is a cellulose fiber obtained by the cuprammonium process. Alphabetic code – CUP; and relevant commercial allowance – 13.00. Cupro is the European cousin of Tencel. Cupro is also somewhat similar to rayon in that it is reprocessed cellulose. Like tencel and rayon, the base material for cupro is a regenerated cellulose fiber. Cupro gets its name from cuprammonium, the process that is used to process the wood pulp or cotton linters that are its base material. In this process, the wood pulp or cotton liners are dissolved in an ammoniac copper oxide solution. Cupro fabric breathes like cotton, drapes beautifully, and feels like silk on your skin. Its slinky, curve-hugging drape makes it great for elegant dresses and blouses. Cupro is a cellulose fiber made from recovered cotton waste. Cupro is:- (i) a regenerated cellulose fiber derived from cotton linter (the ultrafine, silky fibers that stick to the seeds of the cotton plant after it's been ginned) that has been dissolved in a solution of ammonia and copper oxide. (ii) It is similar to rayon, but breathes and regulates body temperature like cotton. (iii) Often used as a silk substitute, cupro is noted for its ability to create beautifully draped clothing, except it can be machine-washed and -dried. (iv) A European relative of Tencel, cupro is a hypoallergenic, antistatic fabric that is resistant to stretching out of shape at higher temperatures. / Медноаммиачное Волокно – волокно из целлюлозы, полученное медноаммиачным способом.

CUP SIZE = РАЗМЕР ЧАШЕЧКИ – The bra size is determined by the underbust girth and bust girth and the Cup Size is determined by the difference between the bust girth and the underbust girth. The Cup Sizes:- (i) AA – 10–12 cm; (ii) A – 12–14 cm; (iii) B – 14–16 cm; (iv) C – 16–18 cm; (v) D – 18–20 cm; (vi) E – 20–22 cm; (vii) F – 22–24 cm; (viii) G – 24–26 cm; and (ix) H – 26–28 cm.

CUP WITH HANDLE = ЧАША С РУЧКОЙ – In technical analysis, Cup With Handle is a bullish chart pattern that marks a consolidation period followed by a breakout. The Cup part of the pattern resembles a rounding bottom, and is followed by a Handle that acts as a final consolidation before a breakout. A Cup And Handle chart is a bullish continuation pattern in which the upward trend has paused but will continue in an upward direction once the pattern is confirmed. As you can see in Figure 2, this price pattern forms what looks like a cup, which is preceded by an upward trend. The handle follows the cup formation and is formed by a generally downward/sideways movement in the security's price. Once the price movement pushes above the resistance lines formed in the handle, the upward trend can continue. There is a wide ranging time frame for this type of pattern, with the span ranging from several months to more than a year.

CURB TRADING = СДЕЛКИ НА СТОРОНЕ – Curb Trading is a trading by telephone or by other means that takes place after the official market has closed and that originally took place in the street on the curb outside the market. Under the US Commodity Exchange Act and the Commodity Futures Trading Commission (CFTC) rules, curb trading is illegal. Also known as Kerb Trading. / Известны также как Торговля На Стороне (Kerb Trading).

CURCH = КЁЧ (или ГОЛОВНОЙ ПЛАТОК) – Curch:- (Scottish) kerchief.

CURCUMIN = КУРКУМИН – Curcumin is a brightly-colored yellow polyphenol pigment prepared from the root of turmeric (lili haldi), a member of the Zingiberaceae (Ginger Family). Several related compounds are present in turmeric at lower concentrations. Turmeric is widely used as a food coloring (E100) and is an important constituent of Indian food to which it imparts both flavor and color. Curcumin is used in Indian Ayurvedic medicine and is said to have some activity against a wide range of medical conditions including arthritis, although little is absorbed from food. Curcumin has anti-oxidant and anti-inflammatory properties probably from inhibition of cyclooxygenases. In the presence of boric acid, Curcumin forms a red pigment (rosocyanine). This color change is sufficiently sensitive and specific that it has been used as an analytical test for boron ions. / из корня . Натуральный краситель Куркумин (Турмерик) (E100) позволяет окрашивать пищевые продукты в жёлтый цвет. Куркумин жирорастворим по своей природе и диспергируется в воде при добавлении эмульгаторов. Он также применяется для коррекции оттенка(ов) смесей специй, приправ, для имитации желтизны куриного жира. Куркумин является сильным антиоксидантом, улучшает пищеварение, способствует нормализации кишечной микрофлоры, связывает свободные радикалы, помогает в борьбе с возрастными болезнями, предотвращает рак, является антибактериальным агентом, способствует детоксикации печени, предотвращает формирование катаракты и формирование желчных камней, стимулирует работу желчного пузыря.

CURE = ЗАТВЕРДЕНИЕ (или ВУЛКАНИЗАЦИЯ) – Cure is the setting of an adhesive by chemical reaction, usually accomplished by the action of heat or a catalyst with or without pressure. / Под Вулканизацией понимается превращение каучука в резину, осуществляемое с участием так называемых вулканизирующих агентов (например, серы, органических пероксидов, некоторых

синтетических смол) или под действием ионизирующей радиации. В результате вулканизации повышаются прочность, твёрдость, эластичность, тепло- и морозостойкость каучука, снижается его растворимость в органических растворителях.

CURING = ВУЛКАНИЗАЦИЯ (или ПРОГРЕВ, или ТЕРМООБРАБОТКА, или ВЫДЕРЖИВАНИЕ, или ОТВЕРЖДЕНИЕ, или СУШКА, или ВЯЛЕНИЕ, или КОПЧЕНИЕ) – (1) In finishing fabrics, Curing is the process by which resins or plastics are set in or on textile materials, usually by heating.

(2) Curing is a baking process with the use of resin finishes, applying heat under carefully controlled conditions to a fabric or the garment, which cause a reaction in the finishing agents and make them work. Crease-retention, water repellency, wrinkle resistance, and durable press are examples of finishes that are cured. In rubber processing, a vulcanization. It is accomplished either by heat treatment or by treatment in cold sulfuryl chloride solution. / Под Вулканизацией понимается превращение каучука в резину, осуществляемое с участием так называемых вулканизирующих агентов (например, серы, органических пероксидов, некоторых синтетических смол) или под действием ионизирующей радиации. В результате вулканизации повышаются прочность, твёрдость, эластичность, тепло- и морозостойкость каучука, снижается его растворимость в органических растворителях.

CURLED AND FOLDED SELVEDGES = ЗАГНУТЫЕ И СЛОЖЕННЫЕ КРОМКИ (или ЗАВЁРНУТЫЕ или ИЗВИТЫЕ или СЛОЖЕННЫЕ КРОМКИ, или ЗАГНУТЫЕ И СЛОЖЕННЫЕ КАЙМОЙ КРОМКИ) – Curled and Folded Selvedges:- this defect is characterized by the appearance of curls and folds in the fabric selvedges. The following points merit attention:- (i) Denting Order – the number of ends per reed dent in the selvedge should be 50 to 100% more than that in the body; (ii) Warp Tension – an increase in warp tension results in a tighter selvedge; (iii) Selvedge Construction – the selvedge yarns should be preferably two ply and should be drawn one end per heald eye. / Порок или дефект. Нарушение Кромки – оборванная или деформированная кромка (стянутая, загнутая, гофрированная). Нарушение Кромки:- (1) Оторванная Кромка; размер порока свыше 0.5 до 5 метра (м). (2) Стянутая Кромка:- (a) размер порока более 1 до 2.5 сантиметров (см); и (b) более 2.5 до 4 см. Порок Стянутая Кромка определяют как разность между длиной по фону (на расстоянии 5 см от кромки) и по кромке на трёхметровой длине ткани. Оценка порока относится ко всему куску. Нарушение кромки оценивается для тканей, поставляемых швейным предприятиям, для розничной торговли – не допускается. Для бархата, предназначенного для промышленной переработки, порок не учитывается.

CURLED SELVAGE = ЗАГНУТАЯ КРОМКА (или ЗАВЁРНУТАЯ КРОМКА, или ИЗВИТАЯ КРОМКА) – Curled Selvage:- self-descriptive. Synonym:- Rolled Selvage, and Turned-Over Edge. Fabrics defect.

CURLED YARN = ЗАВИТАЯ ПРЯЖА (или ГОФРИРОВАННАЯ ПРЯЖА, или КУДРЯВАЯ ПРЯЖА) – Curled Yarn is a textured yarn made by a heated blade that curls the filaments.

CURLS = ИЗВИТКИ (или ЗАВИТКИ) – Fiber Curl is the inherent curvature along a specific length of any fiber that is exhibited to some degree by all fibers. See also Kink. / Извиток волокна является свойственной извитостью со специфической длиной у любого волокна, которое представлено в некоторой степени всеми волокнами. Слегка скрученные волокна, легко растаскиваемые руками. Смотрите также Сукрутина (Kink).

CURL YARN = ПРЯЖА ФАСОННОЙ КРУТКИ С ПЕТЕЛЬКАМИ (или ПРЯЖА С СУКРУТИНАМИ, или ЗАВИТАЯ ПРЯЖА, или КУДРЯВАЯ ПРЯЖА) – Curl Yarn is a type of yarn which presents curls or loops of various sizes all along its surface. It is usually produced as follows:- Two threads, a thick and a thin are twisted together, the thin being held tightly and the thick thread slackly twisted around it. This two-fold yarn is then twisted in the reverse direction with another thin thread, this untwisting throwing up the thick thread as a loop, the two fine threads holding the loops firmly. / (2) Пряжа с Сукрутинами – порок пряжи. Петли и сукрутины – образуются при намотке пряжи вследствие очень большой крутки или слабого натяжения.

CURRENCY = ВАЛЮТА – In the United States, a Currency is the paper money that consists mainly of Federal Reserve notes. Other types of currency that were once issued by the United States include silver certificates, United States notes, and national bank notes. The medium of exchange of value defined by reference to the geographical location of the authorities responsible for it. Currency is any form of money in actual use as a medium of exchange. In general, the monetary unit, involved in a transaction and represented by a name or a symbol. Circulating money accepted as a medium of exchange in the payment of debts. The term ordinarily applies only to paper money, not coins. Any form of money issued by a government or central bank and used as legal tender as a basis for trade. Circulating money in a particular country or group of countries accepted as a medium of exchange for the payment of debts. Depending on the confidence a currency enjoys internationally, it is termed hard, strong or stable on the one hand or weak or soft on the other. Currency is a country's valid legal tender. Currency is also a description of a country's monetary structure which is formulated by legislators in its monetary policy. Currency (Cash in hand):- notes and coins that are of fixed nominal values and accepted as legal tender in an economy that are issued by the central bank and/or government. This category should also include currency that is no longer legal tender, but that can be exchanged immediately for current legal tender. Non-financial corporations do not have any liability in the shape of currency because those are not issuing authorities. / Валюта это денежная единица страны и её тип (бумажная, золотая или серебряная). Под валютой могут пониматься также бумажные деньги, векселя, монеты, чеки, используемые в международных расчётах. Под Валютой, от Итальянского слова Valuta, от Латинского слова Valeo, означающее Стою, понимается:- (1) денежная единица страны и её тип (золотая, серебряная, бумажная); (2) денежные знаки иностранных государств, а также кредитные и платёжные документы, выраженные в иностранных денежных единицах (векселя, чеки и так далее) и используемые в международных расчётах (иностранная валюта). До XIX века всеобщее распространение имела либо серебряная валюта, либо Биметаллизм, при котором роль денежного металла одновременно выполняли и серебро и золото. В начале XIX века в Англии (а со 2-й половины XIX века и в других капиталистических странах) получает распространение золотая валюта. Для периода общего кризиса капитализма характерна бумажная валюта, то есть неразменные на золото или серебро банкноты и бумажные деньги. Неразменные банкноты и бумажные деньги подвержены инфляции, они обесцениваются, изменяется количество золота, реально представляемого бумажноденежной единицей, что ведёт также к понижению курса валюты страны (смотрите Валютный Курс) в отношении иностранных валют. Для современного капитализма характерны неустойчивые, падающие валюты. Обесценение валют влечёт за собой снижение их золотого содержания. В течение всего послевоенного периода имеют место хронические инфляции и систематические девальвации валют, в том числе массовые девальвации валют в 1949 и 1967. В этих условиях некоторые капиталистические страны стараются искусственно поддержать номинальное золотое содержание своих валют. Например, в США, где уровень цен на товары, даже по официальным данным, в 1969 превышал довоенный более чем в 2.5 раза, золотое содержание Доллара, установленное 31 Января 1934 и равное 0.888 671 грамма (г) чистого золота, сохраняется. Во многих странах курс валют поддерживается с помощью валютных ограничений (из 115 стран, входивших в Международный Валютный Фонд в конце 1969, только около одной трети не применяли валютных ограничений). Валюты капиталистических стран подразделяются на Обратимые (Конвертируемые), Частично Обратимые и Необратимые (Замкнутые). Валюты стран, полностью отменивших валютные ограничения как для нерезидентов (иностранных физических и юридических лиц), так и для резидентов (физических и юридических лиц данной страны), являются Обратимыми Валютами и могут обмениваться на

любую иностранную валюту (Американский Доллар, Канадский Доллар, Швейцарский Франк, Марка ФРГ и другие). Валюты стран, отменивших валютные ограничения не по всем валютным операциям или только для нерезидентов, называются Частично Обратимыми Валютами. К Частично Обратимым Валютам относятся валюты большинства Западно-Европейских стран (Великобритании, Франции, Италии, Бельгии, Нидерландов, Швеции, Дании, Норвегии, Финляндии и Австрии), которые в Декабре 1958 отменили валютные ограничения для нерезидентов, что дало последним возможность свободно переводить вывозную (или экспортную) выручку и принадлежащие им суммы на банковских счетах в Американские Доллары и другие полностью или частично конвертируемые валюты. К Необратимым (Замкнутым) Валютам относятся валюты стран, сохраняющих валютные ограничения по всем валютным операциям и для резидентов и нерезидентов. К ним относятся, в частности, валюты зависимых и развивающихся стран, которые в большинстве своём прикреплены к валютам метрополий (или бывших метрополий) и курсы которых устанавливаются на уровне, выгодном для иностранных монополий. В бывшем Союзе Советских Социалистических Республик (СССР) и других социалистических странах устойчивость валюты обеспечивалась в основном товарной массой, поступающей в обращение через государственную и кооперативную торговлю по плановым ценам. В основе укрепления валют социалистических стран лежали плановое, бескризисное и поступательное развитие социалистической экономики, планирование денежного обращения и товарооборота. Устойчивость валют социалистических стран опиралась также на государственный золотой запас в качестве одного из обеспечений валюты, на планирование внешнеэкономических связей, в том числе поступлений и платежей в валюте и на государственную валютную монополию.

CURRENCY ADJUSTMENT FACTOR = ФАКТОР ПЕРЕОЦЕНКИ ВАЛЮТ (или ФАКТОР ВЛИЯНИЯ ИЗМЕНЕНИЙ ВАЛЮТНЫХ КУРСОВ) – Currency Adjustment Factor (CAF) is an adjustment to shipping companies' freight rates to take into account the effect over time of fluctuations in currency exchange rates. Currency Adjustment Factor (CAF) is a fee applied to the shipping costs to compensate for exchange rate fluctuations. Currency Adjustment Factor (CAF) is a type of charge applied on top of freight costs by carriers servicing trade between the United States and Pacific Rim countries. The charge was developed due to costs that carriers incur from constantly changing exchange rates between the US Dollar and other foreign currencies. The currency adjustment factor rises as the value of the US Dollar falls. It is applied as a percentage on top of the base exchange rate, which is calculated as the average exchange rate for the previous three months. Due to this added charge, shippers are now looking to enter into 'all inclusive' contracts at one price, that accounts for all applicable charges, to limit the effect of the CAF. CAF calculation example:- (i) BAS (Basis Ocean freight) = USD2 500.00; (ii) BAF (Bunker Adjustment Factor) = USD359.00; (iii) CAF = %12 = (USD2 500.00 x %12) / 100 = USD300.00; (iv) Total ocean freight = USD2 500.00 + USD359.00 + USD300.00 = USD3 159.00. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. Currency Adjustment Factor (CAF) is used to adjust ocean freight due to currency fluctuations. Currency Adjustment Factor (CAF) is a charge, expressed as a percentage of a base rate, that is applied to compensate ocean carriers of currency fluctuations. A surcharge imposed by a carrier on ocean freight charges to offset foreign currency fluctuations. Adjustment made by shipping lines or liner conferences on freight rates to offset losses or gains for carriers as a result of fluctuations in exchange rates of tariff currencies. / судоходными линиями или линейными конференциями . вследствие колебаний стоимости той или иной валюты. фрахтовые надбавки или доплаты (freight surcharge) .

CURRENCY APPRECIATION = УДОРОЖАНИЕ ВАЛЮТЫ – Currency Appreciation is an increase in the value of one currency relative to another currency. Appreciation occurs when, because of a change in exchange rates, a unit of one currency buys more units of another currency.

CURRENCY BASKET = ВАЛЮТНАЯ КОРЗИНА – Currency Basket:- artificial currency unit consisting of specific amounts of currencies from several nations for use as a reference for international monetary transactions, and which cannot be privately owned. An example is the European Currency Unit. / Искусственная валютная единица, состоящая из определённой суммы валют нескольких стран для использования в качестве ссылки для международных монетарных операций, и которая не может быть частным владением. Примером служит Европейская Единица Валюты (European Currency Unit).

CURRENCY BOARD SYSTEM = СИСТЕМА ВАЛЮТНОГО ПРАВЛЕНИЯ – Currency Board System:- when it instals a currency board, a country pegs its currency's exchange rate to an anchor currency. The entire domestic money supply must be covered by the foreign currency. Monetary policy independence is forfeited because the disposable money supply can only increase to the extent that reserves are available in the anchor currency.

CURRENCY BONDS = ВАЛЮТНЫЕ ОБЛИГАЦИИ – Currency Bonds are bonds issued domestically in foreign currency, i.e. not in domestic currency. Accordingly, interest and redemption payments are made in foreign currency.

CURRENCY DEPRECIATION = ОБЕСЦЕНЕНИЕ ВАЛЮТЫ – Currency Depreciation is a decline in the value of one currency relative to another currency. Depreciation occurs when, because of a change in exchange rates, a unit of one currency buys fewer units of another currency.

CURRENCY DERIVATIVE = ВАЛЮТНЫЙ ПРОИЗВОДНЫЙ ИНСТРУМЕНТ (или ВАЛЮТНЫЙ ДЕРИВАТИВ) – There are three types of Currency Derivatives:- Cross-Currency Rate Swap, Currency Forward, and Currency Option. / Существуют три типа валютных производых (валютных деривативов):- Своп На Валютный Кросс Курс (Cross-Currency Rate Swap), Валютный Форвард (Currency Forward) и Валютный Опцион (Currency Option).

CURRENCY DEVALUATION = ДЕВАЛЬВАЦИЯ ВАЛЮТЫ (или ОБЕСЦЕНИВАНИЕ ВАЛЮТЫ) – Currency Devaluation is a deliberate downward adjustment in the official exchange rate established, or pegged, by a government against a specified standard, such as another currency or gold.

CURRENCY FORWARD CONTRACT = ВАЛЮТНЫЙ ФОРВАРДНЫЙ КОНТРАКТ (или ФОРВАРДНЫЙ ВАЛЮТНЫЙ КОНТРАКТ, или ФОРВАРДНЫЙ КОНТРАКТ НА ВАЛЮТУ) – Currency Forward Contract is a contract in which the parties agree to exchange cash flows in two different currencies at an agreed upon date in the future. Currency Forward is an agreement to exchange a specified amount of one currency for another at a future date at a certain rate. The exchange of currencies is priced so as to allow no risk-free arbitrage. In other words, pricing is not a market estimate of the spot rate at that date, but is made according to the two currencies' respective interest rates. For example, assuming that Eurosterling interest rates are 10% and Eurodollar 5%, and the US Dollar/Sterling spot rate is 1.75, the forward rate should reflect the 5% interest rate advantage of depositing money in sterling. Thus the 12-month forward rate should be 1.6695. Forwards are more appropriate than options if a company has a strong directional view of expected movements in exchange rates. But certainty is rare and hedging entirely with forwards may leave a company locked into unfavorable exchange rates. Unlike options, forwards do not enable companies to take advantage of favorable currency movements. The purchaser of a forward, unlike the purchaser of a future, carries the credit risk of the firm from which it makes the purchase. Since the contracts are not easily reassignable, it is difficult to reduce this risk.

CURRENCY OPTION = ВАЛЮТНЫЙ ОПЦИОН (или ОПЦИОН НА ВАЛЮТУ) – Currency Option:- product description:- a transaction featuring an option to buy or sell a foreign currency – depending on your cash flow, 4 alternatives of FX options may be used:- (i) you can buy an option to sell a foreign currency at a future date using an agreed exchange rate and you pay a premium for the execution of the deal (depending on the current situation you can either use the option or sell your funds at more favorable market conditions); (ii) you can buy an option to buy a foreign currency at a future date using an agreed exchange rate and you pay a premium for the execution of the deal (depending on the current situation you can either use the option or purchase the required volume of the foreign currency at more favorable market conditions); (iii) you sell the option => you are obliged to sell the foreign currency for the agreed exchange rate at a future date and you collect a premium for the execution of the deal (the Bank may or may not use its option right depending on the current situation, you keep the premium for the execution of the deal); and (iv) you sell the option => you are obliged to buy the foreign currency for the agreed exchange rate at a future date and you collect a premium for the execution of the deal (the Bank may or may not use its option right depending on the current situation, you keep the premium for the execution of the deal). Each of the options may take two forms – the so-called European or American Option:- (i) an European option may only be exercised on the agreed expiration date; and (ii) an American option may be exercised at any time prior to and including its expiration date. Terms of Service:- (i) accounts in the relevant currencies; (ii) minimum notional amount per expiration is, e.g., CZK1 000 000 or an equivalent in EUR, USD, GBP, CHF and PLN, for other currencies have been the minimum volume certify; (iii) maturity – up to 1 year; (iv) traded currencies are limited by the scope of the foreign exchange list of the investing bank; (iv) Master Agreement on treasury Trades; and (v) Agreement on Financial Collateral Account. Currency Option is a contract that gives the buyer the right, but not the obligation, to exchange one currency for another at a predetermined exchange rate on or until the maturity date. Currency Option is an option contract that gives the right to buy or sell a currency with another currency at a specified exchange rate during a specified period. This category also includes exotic foreign exchange options such as average rate options and barrier options. These instruments are included in the over-the-counter (OTC) options section. Option contract:- the right to buy or sell a specific amount of a particular currency at a pre-agreed price. Currency Option:- a transaction in which one party grants to the other party (in consideration for a premium payment) the right, but not the obligation, to purchase (in the case of a call) or sell (in the case of a put) a specified amount of a given currency at a specified strike price. / (iv) Головное Соглашение по .

CURRENCY REFORM = ВАЛЮТНАЯ РЕФОРМА – Currency Reform is the reorganization of a country's monetary system. This happens whenever the currency of an economy ceases to function as a unit of account, means of payment or store of value. Currency reforms are often preceded by inflation and excessive national debt. Currency reforms generally lead to a strong depreciation of existing assets. On 1948-June-20, for example, a currency reform was implemented in Germany in which the D-Mark replaced the Reichsmark. It is important to distinguish between currency reform and monetary union. Whilst currency reforms involve the replacement of one currency by another currency – usually involving major depreciation – a monetary union (e.g., European Monetary Union) is a situation where several currencies are merged, with no loss of value, into a new, common currency.

CURRENCY REVALUATION = РЕВАЛЬВАЦИЯ ВАЛЮТЫ (или УДОРОЖАНИЕ ВАЛЮТЫ) – Currency Revaluation is a deliberate upward adjustment in the official exchange rate established, or pegged, by a government against a specified standard, such as another currency or gold.

CURRENCY RISK = ВАЛЮТНЫЙ РИСК – Declining exchange rates reduce the value of investments in foreign currencies.However, the foreign exchange market also offers opportunities for profits.The currency risk can be eliminated by investing only in the client's domestic currency.However, companies operating on an international scale are exposed to exchange-rate trends to some degree. Such trends can therefore also exercise an indirect influence on the price movements of securities. Currency Risk is the potential impact on the fair value of assets and liabilities from changes in exchange rates. The bank is exposed to currency risk principally through the assets relating to the management of its equity. The bank is also exposed to currency risk through managing its customer deposits and through acting as an intermediary in foreign exchange transactions between central and commercial banks. The bank reduces its currency exposures by matching the assets relating to the management of its equity to the constituent currencies of the SDR on a regular basis, and by allowing only small currency exposures relating to customer deposits and foreign exchange transaction intermediation. / Валютный Риск – риск убытков вследствие неблагоприятного изменения курсов иностранных валют и (или) драгоценных (благородных) металлов по открытым кредитной организацией позициям в иностранных валютах и (или) драгоценных металлах.

CURRENCY SPECULATION = ВАЛЮТНАЯ СПЕКУЛЯЦИЯ (или СПЕКУЛЯЦИЯ ВАЛЮТОЙ) – Currency Speculation:- buying or selling of foreign currencies on the spot or forward market in the hopes of making profits from fluctuations in the exchange rate. See also Agiotage, and Speculation. / от флуктуаций (колебаний) обменного курса.

CURRENCY SWAP = ВАЛЮТНЫЙ СВОП (или СВОП НА ВАЛЮТУ) – A Currency Swap is a contract which commits two counterparties to exchange streams of interest payments in different currencies for an agreed period of time and to exchange principal amounts in different currencies at a pre-agreed exchange rate at maturity. Contract which commits two counterparties to exchange streams of interest payments in different currencies for an agreed period of time and to exchange principal amounts in different currencies at a pre-agreed exchange rate at maturity. A swap that involves the exchange of one currency (e.g., US Dollars) for another (e.g., Japanese Yen) on a specified schedule. Also known as Bank Swap. Currency Swap is a transaction in which one party pays fixed periodic amounts of one currency and the other party pays fixed periodic amounts of another currency. Payments are calculated on a notional amount. Such swaps may involve initial and/or final payments that correspond to the notional amount. / , например, . / Позволяет привлечь рубли под залог валюты.

CURRENCY SWAPTION = ОПЦИОН НА ВАЛЮТНЫЙ СВОП – Currency Swaption is an OTC (over-the-counter) option to enter into a currency swap contract. These products are included in the over-the-counter (OTC) options section.

CURRENCY WARRANT = ВАЛЮТНЫЙ ВАРРАНТ (или ВАРРАНТ НА ВАЛЮТУ) – Currency Warrant is an OTC (over-the-counter) option; long-dated (over one year) currency option. These products are included in the OTC options section. In Australia, Currency Warrants give holders exposure to movements in the exchange rate between two different currencies. Holders of currency warrants may exchange an amount of foreign currency for Australian Dollars on or before the expiry date.

CURRENT = ТОК – Current (electric) is a flow of electrons in an electrical conductor. The strength or rate of movement of the electricity is measured in Amperes. See also Electric Current. Current is the flow of electricity commonly measured in Amperes. / Под Электрическим Током понимается всякое упорядоченное движение электрических зарядов (заряженных частиц и тел). По физической природе различают:- (i) конвекционный электрический ток – движение заряженных частиц и тел в вакууме или в среде, не обладающей электрической проводимостью; (ii) электрический ток поляризации – движение связанных заряженных частиц в диэлектрике при изменении поляризации диэлектрика; и (iii) электрический ток проводимости – упорядоченное движение носителей тока, возникающее в проводнике или полупроводнике под действием электрического поля. Мерой электрического тока служит сила тока и плотность тока.

CURRENT ACCOUNT = ТЕКУЩИЙ СЧЁТ – Current Account is an account where the debits and credits resulting from the business relations between the bank and current account customer are effected on an ongoing basis, with a running balance being kept. May also be maintained as a debit or credit account. Statements are furnished quarterly or semi-annually. Current accounts offer little or no interest return but unlimited withdrawal privileges and many other services, such as automated cash withdrawal, checkbooks, payment transfers, etc. Also known as Balance Of Payments. In balance of payments accounting, Current Account is an account recording exports and imports of merchandise (visible items of trade) and services, profits earned abroad, and interest (invisible items of trade). The current account balance is equal to the balance of goods and services, plus unilateral foreign transfers from the public or private sector, such as aid to developing countries. It is the difference between total exports and imports of goods and services, while the balance of trade is the difference between total exports and imports of goods (visible items only). See also Checking Account. Current Account is an account (also referred to as a Giro Account or Personal Account) maintained with a bank that can be used, in principle, at any time for deposits, withdrawals, transfers or cheques and that serves as the primary means of payments. In many cases, it is possible to arrange an overdraft facility for the current account. The account holder usually receives a bank customer card enabling him to make use of self-service facilities, such as ATMs and bank statement printers. / Под Текущим Счётом понимается счёт лица в банке. Владелец текущего счёта может вносить (депонировать) и изымать имеющиеся на нём средства согласно условиям текущего счёта.

CURRENT ACCOUNT BALANCE = РАСЧЁТНЫЙ БАЛАНС (или САЛЬДО ТЕКУЩЕГО СЧЁТА, или САЛЬДО СЧЁТА ТЕКУЩИХ ОПЕРАЦИЙ) – Current Account Balance:- the sum of payments from a country's cross-border deliveries of goods (trade balance), services (invisible balance), income and unilateral transfers. Component of balance of payments. Current Account Balance is the difference between the nation's total exports of goods, services and transfers and its total imports of them. Current account balance calculations exclude transactions in financial assets and liabilities. The Current Account Balance is the difference between credits (exports and income receipts) and debits (imports and income payments) in the current account. The balance is a net measure of current account transactions between the United States and the rest of the world. A positive balance indicates a current account Surplus. A negative balance indicates a current account Deficit. / Компонент платёжного баланса (balance of payment). Под Расчётным Балансом понимается соотношение между денежными требованиями и денежными обязательствами страны, возникшими в результате её торговых и иных (кроме кредитных) отношений с другими странами за определённый период или на определённую дату. Расчётный баланс включает в себя торговый баланс, вывоз и ввоз золота, баланс услуг, расходы туристов и доходы от иностранного туризма, доходы от заграничных инвестиций и связанные с ними расходы и другое.

CURRENT ACCOUNT CREDIT = КРЕДИТ ТЕКУЩЕГО СЧЁТА (или КОНТОКОРРЕНТНЫЙ КРЕДИТ) – Current Account Credit:- used in particular to cover changing credit needs of corporate clients. If a client draws out more money than is in his account, the account becomes overdrawn. An overdraft may be converted into a current account credit offering the possibility to draw a desired amount at any time up to a specified limit within the agreed period. May take the form of a secured or unsecured loan. Also known as Overdraft.

CURRENT ACCOUNT FACILITY = ВОЗМОЖНОСТЬ ПО ТЕКУЩЕМУ СЧЁТУ – Current Account Facility is a bank loan the borrower can draw upon within a precisely defined credit line. The customer can make withdrawals against this credit line either fully or partially at any time without any further arrangements or agreements with the bank. Advances on current account are often granted in the form of an overdraft facility to private clients.

CURRENT ASSETS = ТЕКУЩИЕ АКТИВЫ (или КРАТКОСРОЧНЫЕ АКТИВЫ, или ОБОРОТНЫЕ СРЕДСТВА) – Current Asset is an asset that one can reasonably expect to convert into cash, sell, or consume in operations within a single operating cycle, or within a year if more than one cycle is completed each year. Current Assets are assets which can be turned into cash within one year. Cash or other assets of the entity that would in the ordinary course of operations of the entity be consumed or converted into cash within twelve months after the end of the last financial year of the entity. Assets that are readily convertible into cash, usually maturing in less than one year, such as cash on hand, inventories, marketable securities, and notes and accounts receivable. The opposite of Fixed Assets, and Non-Current Assets. Those assets of a company that are reasonably expected to be realized in cash, or sold, or consumed during one year. These include cash and equivalents, bonds, receivables and money due usually within one year, and inventories. A total current assets is the total amount of assets considered to be readily convertible into cash within short period of time, usually a year, such as cash on hand, notes and accounts receivable, inventories, and marketable securities. Contrast with Fixed Assets, Non-Current Assets. Current Assets are those assets that are normally converted into cash within 1 year or, in some cases, within the normal operating cycle of the business. For example, since large aircraft take longer than 1 year to manufacture, the inventory of an aircraft manufacturer represents the materials that would be converted to cash under their normal production and sales cycle, rather than over 1 year. Assets are listed in a specific order, with those most easily converted into cash (referred to as More 'Liquid' Assets) listed first followed by less liquid assets. Thus, current assets are listed before noncurrent assets, and cash is the first item listed. Current Assets is the sum of account receivables, inventories, cash and deposits. It represents assets that should be turned into cash in the near future. / строка баланса (item). Оборотные Средства – это средства, используемые предприятием для осуществления своей постоянной деятельности, оборотные средства включают в себя производственные запасы предприятия (основные и вспомогательные материалы, топливо), полуфабрикаты, незавершённое производство, запасы готовой и отгруженной продукции, дебиторскую задолженности, а также наличные деньги в кассе и денежные средства на счетах предприятия. Оборотные средства являются непременным условием для осуществления предприятием хозяйственной деятельности. По сути, оборотные средства – это денежные средства, авансированные в оборотные производственные фонды и фонды обращения, не стоит путать их с денежными средствами, вложенными в основные фонды. Сущность оборотных средств определяется их экономической ролью, необходимостью обеспечения воспроизводственного процесса, включающего как процесс производства, так и процесс обращения. В отличие от основных фондов, неоднократно участвующих в процессе производства, оборотные средства функционируют только в одном производственном цикле и независимо от способа производственного потребления полностью переносят свою стоимость на готовый продукт. Основные средства бывают собственными и заёмными.

CURRENT CREDIT EXPOSURE AND LIABILITIES = ТЕКУЩИЕ ОБЪЁМЫ ЗАЯВЛЕННЫХ КРЕДИТОВ И ОБЯЗАТЕЛЬСТВ – Current Credit Exposure And Liabilities:- in BIS (short for the Bank for International Setlements) reports:- current credit exposure represents the gross value of contracts that have a positive market value after taking account of legally enforceable bilateral netting agreements. Liabilities arising from OTC derivatives contracts represent the gross value of contracts that have a negative market value taking account of legally enforceable bilateral netting agreements. / соглашения о двустороннем взаиморасчёте или сведении.

CURRENT DELIVERY = ТЕКУЩАЯ ПОСТАВКА – Current Delivery:- deliveries being made during a present month. Sometimes current delivery is used as a synonym for Nearby Delivery. / Поставки, осуществлённые в течение настоящего месяца. Иногда текущая поставка используется в качестве синонима для Ближайшей Поставки (Nearby Delivery).

CURRENT DELIVERY MONTH = ТЕКУЩИЙ МЕСЯЦ ПОСТАВКИ – Current Delivery Month:- the futures contract which matures and becomes deliverable during the present month or the month closest to delivery. Also known as Spot Month. / Фьючерсный контракт, срок действия которого истекает и который становится поставочным в течение настоящего месяца или ближайшего к поставке месяца. Известен также как Месяц Безотлагательной Поставки (Spot Month).

CURRENT ESTIMATE = ТЕКУЩАЯ ОЦЕНКА – Current Estimate is the expected value based on current knowledge. / Предполагаемая стоимость, основанная на текущих сведениях.

CURRENT EXPOSURE = ТЕКУЩАЯ ПОДВЕРЖЕННОСТЬ – Current Exposure is the loss that would be incurred today on a contract or set of contracts if a counterparty failed to perform on its obligations. Also known as Replacement Cost, current exposure is what it would cost to replace a given contract if the counterparty defaulted now. See also Potential Future Exposure. / Смотрите также Потенциальная Подверженность В Будущем (Potential Future Exposure).

CURRENT FAR EAST SHIPMENT PRICE = XX – Current Far East Shipment Price means, during the period in which two daily price quotations are available for the growth quoted for Middling (M) 1-3/32 inch cotton, CFR (cost and freight) Far East, the price quotation for cotton for shipment no later than August/September of the current calendar year.

CURRENT FILING BASIS = ОСНОВАНИЕ ДЛЯ ТЕКУЩЕЙ ПОДАЧИ (или ТЕКУЩИЙ БАЗИС ПОДАЧИ) – Current Filing Basis:- in applications under §§ 1 and 44 of the Trademark Act, the applicant may claim more than one basis, and may add or substitute a basis after filing the application. The 'Current Filing Basis' means the basis, as amended (changed after the initial or original filing). If the basis has not been amended, the current filing basis is the same as the original filing basis.

CURRENT INCOME SAVINGS BOND = СБЕРЕГАТЕЛЬНАЯ ОБЛИГАЦИЯ ТЕКУЩЕГО ДОХОДА – In the United States, Current Income Savings Bond is a savings bond, typically Series H or HH, on which interest is paid every six months, usually via Direct Deposit, to the owner or co-owners. The purchase or issue price of a current income savings bond (the principal) is its face (or par) value and remains constant. Series G and Series K bonds, both now matured, were also current income savings bonds.

CURRENT LIABILITIES = ТЕКУЩИЕ ОБЯЗАТЕЛЬСТВА (или КРАТКОСРОЧНЫЕ ОБЯЗАТЕЛЬСТВА) – Current Liability is an obligation whose liquidation is expected to require the use of existing resources classified as current assets, or the creation of other current liabilities. Current Liabilities are liabilities which must be satisfied within one year. Current Liabilities is the sum of overdrafts, short-term loans, unpaid tax, unpaid dividends, trade creditors and other short-term liabilities. It represents the liabilities that must be paid during the next year. Liabilities due within one year, such as salaries, accounts payable and short-term notes. Obligations that are expected or could be required to be discharged on demand or within twelve months. In a company's annual report, this figure shows the amount of debt due to be repaid within twelve months. Money owed and payable by a company, usually within one year. / Текущие Обязательства или Краткосрочные Обязательства – задолженности или иные обязательства, подлежащие оплате в течение года, например, овердрафт и другие.

CURRENT MARKET VALUE = ТЕКУЩАЯ РЫНОЧНАЯ СТОИМОСТЬ – Current Market Value (CMV):- the resale valuation attached to a security held long in an investor's margin account. The current market value is usually taken as the closing price for listed securities or the bid price offered for over-the-counter (OTC) securities. In a margin account, an investor essentially engages in owning securities purchased for a total price greater than the amount of cash he/she has in his/her account; the investor borrows the excess cash needed from his/her brokerage to fund the remainder of the purchase. Due to this leveraged purchase situation, the brokerage account values the investor's assets periodically, and if the total account value falls below the required margin amount, the brokerage will require the investor to top up the account with cash or to liquidate some or all of his or her securities into cash. The current market value (CMV) is the standardized price that is taken periodically to track the change in value of the investor's assets. Current Market Value:- realizable proceeds from the sale of a property, such as a house, under normal circumstances. In addition to the property yield, it is an important indicator used for financing, assessing and determining the mortage value of construction properties. / Текущая Рыночная Стоимость – стоимость ценных бумаг, составляющих портфель вложений клиента на настоящий момент времени в текущих рыночных ценах, указанных в ежемесячном брокерском отчёте или чаще, если акции покупаются под залог или продаются со ставкой на понижение. Для котирующихся на бирже акций и облигаций текущая рыночная стоимость определяется согласно ценам закрытия биржи на предшествующий рабочий день. Для ценных бумаг внебиржевого рынка используется цена предложения.

CURRENT PORTION OF LONG–TERM DEBT = ТЕКУЩАЯ ПОРЦИЯ ДОЛГОСРОЧНОГО ДОЛГА (или ТЕКУЩАЯ ПОРЦИЯ ДОЛГОСРОЧНОЙ ЗАДОЛЖЕННОСТИ) – Current Portion Of Long-Term Debt, the last current liability listed on company's balance sheet, is the portion of company's total outstanding debt that must be repaid over the next year. As with deferred income, the balance sheet divides debt liabilities into two portions:- (i) the amount payable over the next year and (ii) the amount payable beyond 1 year. Only the principal component of debt is listed on the balance sheet. Interest payments are an expense included on the income statement. To calculate company's total debt service for a given year from its financial statements, one needs to sum the interest expense from the income statement for that year (interest payments) and the current portion of long-term debt from the balance sheet for the end of the prior year (principal payments).

CURRENT RATIO = ТЕКУЩЕЕ СООТНОШЕНИЕ (или КОЭФФИЦИЕНТ ТЕКУЩЕЙ ЛИКВИДНОСТИ, или КОЭФФИЦИЕНТ ПОКРЫТИЯ) – Current Ratio is the current assets divided by the current liabilities. It is a key measure of liquidity as it measures the company's short-term ability to pay its bills. It is generally accepted that (for a manufacturing company) the current ratio should be approximately 1.5. If it is substantially below this figure then suppliers and bankers will be concerned about the company's ability to pay its bills. If it is substantially above this figure, the company is probably making inefficient use of its current assets (and therefore reducing the potential level of profitability). The current ratio is also called the Working Capital Ratio or the Liquidity Ratio. Current Ratio is a measurement of a business's liquidity based on the ability to generate cash and pay short-term debts. Current Ratio is a liquidity ratio that measures a company's ability to pay short-term obligations. The Current Ratio formula is:- Current Ratio = Current Assets / Current Liabilities. Also known as Liquidity Ratio, Cash Asset Ratio and Cash Ratio. The ratio is mainly used to give an idea of the company's ability to pay back its short-term liabilities (debt and payables) with its short-term assets (cash, inventory, receivables). The higher the current ratio, the more capable the company is of paying its obligations. A ratio under 1 suggests that the company would be unable to pay off its obligations if they came due at that point. While this shows the company is not in good financial health, it does not necessarily mean that it will go bankrupt – as there are many ways to access financing – but it is definitely not a good sign. The current ratio can give a sense of the efficiency of a company's operating cycle or its ability to turn its product into cash. Companies that have trouble getting paid on their receivables or have long inventory turnover can run into liquidity problems because they are unable to alleviate their obligations. Because business operations differ in each industry, it is always more useful to compare companies within the same industry. This ratio is similar to the acid-test ratio except that the acid-test ratio does not include inventory and prepaids as assets that can be liquidated. The components of current ratio (current assets and current liabilities) can be used to derive working

capital (difference between current assets and current liabilities). Working capital is frequently used to derive the working capital ratio, which is working capital as a ratio of sales. Ratio of current assets to current liabilities. The main liquidity ratio used to determine a business entity's ability to pay its bills. Also known as Working Capital Ratio. Current Ratio is a measure of liquidity that shows a company's ability to pay its short-term debts. Current Ratio = (Current Assets / Current Liabilities) = Number Of Times Covered. Current Ratio:- current assets divided by current liabilities. / Текущее Соотношение – отношение текущих активов к текущим пассивам. Данное отношение отражает способность компании оплатить текущие обязательства из текущих активов. По большей части, компании, имеющие небольшой товарный запас и высоколиквидные счета к получению, могут безопасно действовать при низком текущем соотношении активов к пассивам, чем компании, поток наличных средств (cash flow) в которых является менее надёжным. Смотрите также Quick Ratio.

CURRENT REDEMPTION VALUE = ТЕКУЩАЯ СТОИМОСТЬ ПОГАШЕНИЯ – In the United States, Current Redemption Value (CRV):- what a bond is worth. To find out how much money you can get for your bond right now, you need to check the current redemption value. The current redemption value of any savings bond can be determined using the savings bond calculator on the Treasury Direct website. The calculator requires the serial number of the bond, the issue date and the face amount. The Treasury Direct website also provides downloadable software that can store your savings bond information and regularly update the values. The software is called the Savings Bond Wizard. If you do not have the specific bond details but would like to know what previously issued bonds would be currently worth, the website also has redemption tables. The tables show the current value of a bond based on the face amount and issue date.

CURRENT RETURN = ТЕКУЩАЯ ОТДАЧА (или ТЕКУЩЕЕ ПОСТУПЛЕНИЕ) – Current Return, also called Current Yield, is the amount of interest you earn on a bond in any given year, expressed as a percent of the current market price. The current return will, in most cases, not be the same as the coupon rate, or the interest rate the bond pays calculated as a percentage of its par value. For example, if the par, or face value, of a bond is USD1 000 and the coupon rate is 5%, then the interest payments, or annual income, from the bond is USD50 per year. If, however, the bond is trading at USD900, then that USD50 annual income is actually a current return of 5.6%. The current return does not take capital gains or losses into account, so it is not a reflection of the total return on your bond investment. It is the present earnings from any investment. Present annual rate of return of income from any investment. See also Yield. Current Return's formula:- Nominal Interest Rate x 100 / Purchase Price. / Смотрите также Доходность (Yield).

CURRENT VALUE = ТЕКУЩАЯ СТОИМОСТЬ – (1) Current Value is a value of an asset at the present time as compared with the asset's historical cost.

(2) In finance, Current Value is the amount determined by discounting the future revenue stream of an asset using compound interest principles.

CURRENT YIELD = ТЕКУЩАЯ ДОХОДНОСТЬ – Current Yield is the annual income (interest or dividends) divided by the current price of the security. This measure looks at the current price of a bond instead of its face value and represents the return an investor would expect if he or she purchased the bond and held it for a year. This measure is not an accurate reflection of the actual return that an investor will receive in all cases because bond and stock prices are constantly changing due to market factors. Formula:- Current Yield = Annual Cash Inflows / Market Price. Also referred to as Bond Yield, or Dividend Yield for stocks. For example, if a bond is priced at USD95.75 and has an annual coupon of USD5.10, the current yield of the bond is 5.33%. If the bond is a 10-year bond with nine years remaining and you were only planning to hold it for one year, you would receive the USD5.10, but your actual return would depend on the bond's price when you sold it. If, during this period, interest rates rose and the price of your bond fell to USD87.34, your actual return for the period would be –3.5% (–USD3.31 / USD95.75) because although you gained USD5.10 in dividends, your capital loss was USD8.41. Current Yield is the ratio of the coupon to the current market price of the debt instruments. Formula:- Current Yield = Annual Coupons / Current Bond Price. Current Yield is a bond's annual return based on its annual coupon payments and current price (as opposed to its original price or face). The formula for current yield is a bond's annual coupons divided by its current price. Use of the Current Yield Formula:- the current yield formula is used to determine the yield on a bond based on its current price. The current yield formula can be used along with the bond yield formula, yield to maturity, yield to call, and other bond yield formulas to compare the returns of various bonds. The current yield formula may also be used with risk ratings and calculations to compare various bonds. As a general rule in financial theory, one would expect a higher premium, or return, for a riskier investment. If two bonds are held constant in respect to their risk, a higher return would be preferable. Current Yield vs. Other Bond Formulas:- there are various formulas that are used to compare the yields on bonds. Current yield, as its name implies, is the current or 'here and now' annual yield based solely on coupons. This is the difference between the bond yield and current yield. The bond yield looks at the original price of the bond or face value. The current yield differs from the yield to maturity in that the yield to maturity looks at all future inflows, including a higher or lower face value than its current price, to determine the yield based on a present value equal to the current price of the bond. The formula for current yield only looks at the current price and one year coupons. Example of the Current Yield Formula:- an example of the current yield formula would be a bond that was issued at USD1 000 that has an aggregate annual coupon of USD100. The bond yield on this particular bond would be 10%. Suppose that the same bond is currently selling for USD900 based on today's market rates. Recall that if the price of a bond goes down, the market rates or bond rate has gone up. For this example, the current yield formula would be shown as:- USD100 / USD900, which would return a current yield of 11.11%. / Соотношение купона с текущей рыночной ценой долговых инструментов. Текущая Доходность – ежегодная ставка процента по облигации, разделённая на рыночную цену (обязательства). Это реальная ставка доходности в противоположность купонной ставке доходности (обе они были бы равны, если бы облигации покупались по номиналу) или доходу до наступления срока погашения. Например, облигация со ставкой доходности 10% (купонная ставка) с нарицательной стоимостью 1 000 Долларов США приобретена по рыночной цене в 800 Долларов, ежегодная доходность по этой облигации составляет 100 Долларов. Но поскольку за облигацию было уплачено только 800 Долларов, текущая доходность равна 100 Долларам, разделённым на 800 Долларов, то есть 12.5%.

CURTAIN SIDER = СО ШТОРАМИ ПО БОКАМ – Curtain Sider:- train carriage with soft sides. / На жаргоне грузоперевозчиков прицеп со шторами по бокам. В случае если цельный тент покрывает и крышу прицепа, дальнобойщики используют жаргонный термин Мешок.

CURVED OR CROOKED CHAIN = XX – Curved Or Crooked Chain:- readily noticeable by its waviness. Causes difficulty at sewing operation and distorts finished garment's appearance. See also Humpy Chain. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

CURVOSPINA = КУРВОСПИНА (или КРИВОШИП, или КРИВО КОЛЮЧЕЕ) – Curvospina:- with curved spines.

CUSHION–BACK CARPET = КОВЁР С АМОРТИЗИРУЮЩЕЙ ИЗНАНКОЙ (или КОВЁР С ПОДКЛАДКОЙ НА ИЗНАНКЕ) – Cushion-Back Carpet is a carpet with padding made as an integral part of the backing.

CUSHION GAS = БУФЕРНЫЙ ГАЗ (или ТЕХНОЛОГИЧЕСКИЙ ГАЗ) – Cushion Gas:- the amount of gas required in a storage pool to maintain sufficient pressure to keep the working gas recoverable. Also known as Base Gas. / Количество газа в хранилище, требуемого для поддержания достаточного давления с тем, чтобы активный газ непрерывно возмещался. Известен также как Буферный Газ или Технологический Газ (Base Gas).

CUSIP® = COMMITTEE ON UNIFORM SECURITY IDENTIFICATION PROCEDURES

CUSIP® INTERNATIONAL NUMBERING SYSTEM = МЕЖДУНАРОДНАЯ СИСТЕМА НУМЕРАЦИИ КЕПИЦБ® – CGS CINS (short for the CUSIP® Global Services CUSIP® International Numbering System) is a 9-character alphanumeric identifier that employs the same 9 characters as CUSIP®, but also contains a letter of the alphabet in the first position signifying the issuer's country or geographic region. CGS CINS was developed in 1989 as an extension to CUSIP® in response to US demand for global coverage, and is the local identifier of more than 30 non-North American markets. The Committee on Uniform Security Identification Procedures' (CUSIP®) International Numbering System (CINS) uses the CUSIP® numbering format to identify international securities. he first six characters are known as the Base (or CUSIP-6), and uniquely identify the issuer. Issuer codes are assigned alphabetically from a series that includes deliberate built-in 'gaps' for future expansion. The 7th and 8th digit identify the exact issue. The 9th digit is an automatically generated checksum (some clearing bodies ignore or truncate the last digit). The last three characters of the issuer code can be letters, in order to provide more room for expansion. CUSIP® is a registered trademark of the American Bankers Association. CUSIP Global Services (CGS) is managed on behalf of the American Bankers Association by Standard & Poor's. / Си.Ю.Эс.Ай.Пи.® (CUSIP®). Стэндод Энд Поз (Standard & Poor's).

CUSTODIAN = ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ (или РАСПОРЯДИТЕЛЬ) – Custodian is an organisation which undertakes the role of holding and accounting for assets in a portfolio on behalf of an investment manager or trustees. Custodian is a bank or other financial institution that provides safekeeping services and administers securities for its customers. Custodian means the person (other than a client) who holds assets to which the nominee and custody service (NCS) relates. / Доверительный Управляющий или Распорядитель – банк или иная финансовая организация, осуществляющая опеку над сертификатами на акции и иными активами взаимного фонда, частного лица или клиентов-корпораций. Кастодиан – банк или другая организация, принимающая на хранение финансовые активы или другие ценности; может выполнять функции агента по кредитованию.

CUSTODIAN (BANK) = ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ (БАНК) (или (БАНК) РАСПОРЯДИТЕЛЬ) – Custodian (Bank) is a bank which holds the assets of an investment fund, acts as an agent for the issue and redemption of units and handles the fund's payment transactions. The custodian also ensures that the fund adheres to the provisions of the Investment Fund Act and the investment regulations.

CUSTODIAN SERVICES = УСЛУГИ ДОВЕРИТЕЛЬНОГО УПРАВЛЯЮЩЕГО – Custodian Services:- this is a service whereby a person or entity agrees to hold and manage assets on behalf of another person or entity.

CUSTODY = ДОВЕРИТЕЛЬНОЕ УПРАВЛЕНИЕ (или ДОВЕРИТЕЛЬНОЕ РАСПОРЯЖЕНИЕ) – Custody is the safekeeping, settlement, and servicing of securities for customers. / Ответственное хранение, расчёт и обслуживание ценных бумаг для заказчиков.

CUSTODY ACCOUNT = СЧЁТ ДЕПО (или СЧЁТ ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ) – Custody Account:- custody account-keeping consists in recording financial instruments in account(s) kept in the name of their owner, i.e. giving recognition to the rights of the holder in respect of said financial instruments, and safeguarding the corresponding assets under the terms and conditions applicable to each financial instrument. Custodians hold a range of assets on behalf of their customers. These include equities, government bonds, corporate bonds, other debt instruments, mutual fund investments, warrants and derivatives. Also known as Safekeeping Account. between the custody account-keeper and the account holder. The custody account-keeper may appoint another custody account-keeper as its agent for performing all or part of the tasks related to its custodial activity. / , то есть . порядки и условия. Известен также как Счёт Ответственного Хранения (Safekeeping Account).

CUSTODY RISK = РИСК ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ – Custody Risk is the risk of loss of securities held in custody occasioned by the insolvency, negligence or fraudulent action of the custodian or of a sub-custodian.

CUSTODY SERVICES = УСЛУГИ ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ – Custody Services are the services provided by a bank custodian are typically the settlement, safekeeping, and reporting of customers' marketable securities and cash. A custody relationship is contractual, and services performed for a customer may vary. Banks provide custody services to a variety of customers, including mutual funds and investment managers, retirement plans, bank fiduciary and agency accounts, bank marketable securities accounts, insurance companies, corporations, endowments and foundations, and private banking clients. Banks that are not major custodians may provide custody services for their customers through an arrangement with a large custodian bank. Processing cross-border securities trades, keeping financial assets safe and servicing the associated portfolios. Custodians hold a range of assets on behalf of their customers. These include equities, government bonds, corporate bonds, other debt instruments, mutual fund investments, warrants and derivatives. Custodians effect settlement of trades (that is, completion of a transaction, wherein the seller transfers securities or financial instruments to the buyer and the buyer transfers money to the seller) and provide safekeeping of the assets on behalf of clients. The services also include:- (i) collection of income arising from the portfolios (dividends and interest payable); (ii) application of entitlements to reduced rates of withholding tax at source and reclaiming withheld taxes after-the-fact; and (iii) notification and dealing with corporate actions (such as bonus issues, rights issues and takeovers). Also known as Securities Administration. A custodian providing core domestic custody services typically settles trades, invests cash balances as directed, collects income, processes corporate actions, prices securities positions, and provides recordkeeping and reporting services.

CUSTOMARY DEDUCTIONS = ОБЫЧНЫЕ ВЫЧЕТЫ – Customary Deductions:- new for old deductions made by an average adjuster from the cost of repairs for general average damage to a ship over 15 years old. Hull underwriters do not make new for old deductions from claims for repairing damage to the ship, whether they be for general average (GA) sacrifice or particular average.

CUSTOMER = ЗАКАЗЧИК – Customer:- in exchange deals, this term means a person, including another clearing member, for whom a clearing member carries an account. / В биржевых операциях, этот термин обозначает лицо, в том числе и другого клирингового члена, для которого данный клиринговый член осуществляет операции по его счёту.

CUSTOMER = КЛИЕНТ – Customer is a private person or an institution, on whose behalf (ordering customer) or in whose favor (beneficiary customer), a payment is effected. The term 'Customer' means a person having an account with a bank. Person having subscribed to a domestic or international payment scheme of an issuing bank or institution.

CUSTOMER = ПОТРЕБИТЕЛЬ – In reference to electricity, Customer is a person whose user system or equipment is directly connected to the grid and who purchases or receives, or who is seeking to purchase or receive, regulated transmission services. This

may include a person who operates a generation facility, a distribution utility or an end-user subject to the commission's decisions. In addition, a customer includes an embedded generator purchases or receives, or is seeking to purchase or receive, the regulated transmission services referred to in paragraphs (e) or (g) of the definition of Regulated Transmission Services. See also Equipment, and Regulated Transmission Services. / По отношению к электричеству, лицо, потребляющая система или оборудование которого, напраямую подключены к энергосистеме, и которое покупает и получает или стремится покупать или получать услуги подачи электроэнергии на договорных условиях. К нему могут быть причислены и лица, обслуживающие генерирующую установку, сбытовые энергетические компании или конечный потребитель, на которого распространяется решение комиссии. Кроме того, потребителем считается лицо, покупающее или получающее, или стремящееся покупать или получать услуги подачи электроэнергии на договорных условиях от стационарного генератора согласно пунктам (e) и (g) в определении термина Услуги Подачи Электроэнергии на Договорных Условиях или Подконтрольная Подача Электроэнергии (Regulated Transmission Services). Смотрите также Оборудование (Equipment) и Услуги Подачи Электроэнергии на Договорных Условиях или Подконтрольная Подача Электроэнергии (Regulated Transmission Services).

CUSTOMER ACCOUNT = СЧЁТ ЗАКАЗЧИКА – Customer Account:- this term means an account carried for a customer, including an Omnibus Account.

CUSTOMER DEPOSITS = ВКЛАДЫ КЛИЕНТОВ (или ДЕПОЗИТЫ ЗАКАЗЧИКОВ) – Customer Deposits is the amount of funds held as a deposit from written sales, treated as a liability due to the fact that these funds are to be returned to the customer if the sale is not fulfilled. The borrowings (liabilities) accepted by a bank from the general public (non-banks), excluding acceptances and promissory notes. Customer Deposits is the amount of funds held as a deposit from written sales, treated as a Liability due to the fact that these funds are to be returned to the customer if the sale is not fulfilled.

CUSTOMER MARGIN = МАРЖА ЗАКАЗЧИКА – Customer Margin:- within the futures industry, financial guarantees required of both buyers and sellers of futures contracts and sellers of options contracts to ensure fulfillment of contract obligations. FCMs are responsible for overseeing customer margin account. Margins are determined on the basis of market risk and contract value. Also referred to as Performance-Bond Margin. See also Clearing Margin.

CUSTOMER NUMBER = НОМЕР ЗАКАЗЧИКА – In the US patent law, Customer Number (previously referred to as 'Payor Number') is a number assigned by the Office of the United States Patent and Trademark Office (USPTO) that is used to simplify the submission of an address change, to appoint a practitioner, or to designate the fee address for a patent. Customer numbers are primarily used by attorneys and law firms, and must be requested using the 'Request for Customer Number' form (PTO/SB/125).

CUSTOMER ORDER = ЗАКАЗ ЗАКАЗЧИКА – Customer Order is the seller's internal translation of their buyer's Purchase Order. The document contains much of the same information as the purchase order but may use different Product IDs for some or all of the line items. It will also determine inventory availability.

CUSTOMER OWN TRANSPORT = СОБСТВЕННЫЙ ТРАНСПОРТ ЗАКАЗЧИКА – Customer Own Transport:- the customer arranges his own transport of the container to and from the terminal or depot but agrees to restitute the container back to the terminal or depot. / терминал или депо или парк.

CUSTOMER PAYMENTS = ПЛАТЕЖИ ЗАКАЗЧИКОВ (или КЛИЕНТСКИЕ ПЛАТЕЖИ) – Customer Payments:- movement of funds between accounts of both corporate and personal customers for a wide range of transactions arising from electronic links (generally used by larger corporates), Internet banking, telephone banking and other over-the-counter services.

CUSTOMER PICK–UP = ВЫБОР ЗАКАЗЧИКА – Customer Pick-Up:- cargo picked up by a customer at a warehouse. Customer Pick-Up:- a load that is picked up at the warehouse by the customer (usually within the same day the order is placed).

CUSTOMER RETURN = ВОЗВРАТ ЗАКАЗЧИКОМ (или XX) – Customer Return:- merchandise that has been purchased at a retail level and then returned to the original store for various reasons. Some returns are defective, broken or simply returned for no apparent reason at all. A consumer might return merchandise because it was bought in haste or by impulse. In this scenario if the original packaging is not intact or missing a component the retailer will deem it salvaged. Defective or broken merchandise is a tricky area, often products can be repaired if you have the skill required.

CUSTOMER SEGREGATED FUNDS = СРЕДСТВА ОТДЕЛЬНЫХ ЗАКАЗЧИКОВ – Customer Segregated Funds:- When you open an account to trade commodity futures, you will write a check or wire funds to a registered Futures Commission Merchant (FCM). An FCM is a broker or clearing firm in the industry that is regulated by the Commodity Futures Trading Commission (CFTC). The funds will be deposited in a Customer Segregated Account at a major bank. Many FCMs use Harris Bank of Chicago to hold the funds. The idea of customer segregated funds is to keep investor money out of the hands of the brokerage firms. If the brokerage firms were to run into financial troubles, it should have zero impact on the customers accounts. By law, the brokers cannot mix their business accounts with customer accounts. This means they should have absolutely no access to your funds other than deposit or send you funds. In extreme cases, they can take money out of your account to cover your own liabilities that accrued on your behalf. FCMs are often ranked by the amount of their customer segregated funds. This is the total amount of funds in the accounts of all the customers who trade with the broker. The CFTC publishes a monthly report on the financial data of FCMs at FCM Reports. The customer segregated funds is a security feature that protects investor funds. The CFTC is expected to monitor FCMs to ensure the funds are not being commingled. It is a rare event that funds are commingled, but we have seen an event where it has happened. MF Global was a major player in the futures industry and one of the largest clearing firms. Their CEO Jon Corzine was a former executive at Goldman Sachs. You would think this firm would be fairly solid and maybe one of the best to trade with – right? In October 2011 we found out that Corzine wasn't the financial whiz that everyone thought he was. He basically took higher risk investments in European Sovereign debt that blew up in his face. His USD6.1 billion bet rightfully worried credit agencies, investors and trading partners. This accelerated a liquidity shortfall and MF Global quickly fell into bankruptcy. After the dust settled, it was revealed that MF Global commingled customer segregated funds with their own investments. This was not a good thing. Customers who traded with MF Global had their accounts frozen and trustees are still sorting out the mess more than a month later and all the funds have not been accounted for. This was an extreme example that rarely happens, but it did happen on a very large scale. All the customer funds have not been replaced yet, but I am sure they will be. The CME Group is playing a big part in sorting the mess and they might even have to kick in some money. It is certainly bad for business if investors lose confidence in the security of their funds and they aren't made whole. Someone will have to step up to the table and make sure faith is restored in the futures markets. You might be asking where the regulators were in this whole mess. That is a good question and one the CFTC will have to answer. The CFTC and NFA are expected to perform regular audits and make sure all members comply with the rules and regulations. The exchanges are also expected to enforce regulations within their exchanges. Somebody was asleep at the switch in this instance. It is funny how the SEC and CFTC are never held accountable for any of their negligence. For the most part customer segregated funds work well to protect investors. This one story made huge headlines, but people have been trading on the exchanges for decades where their accounts have been safe under this protection. You should

consider that your money is safe in your account, now whether it is safe from your trading is another question. See also Segregated Account. Xxxxx. Until the autumn of 2011, more specifically the collapse of MF Global (headquartered in New York, State of New York (NY), the United States), few outside of the futures industry were aware of the term 'Customer-Segregated Funds'. The failure of Principal Financial Group Inc. (PFG; headquartered in Des Moines, State of Iowa (IA), the United States) to uphold the sanctity of customer-segregated funds in the summer of 2012 catapulted the phrase into daily usage in national media outlets, and maybe even the homes of many Americans. Customer-segregated funds are exactly what the name implies; they are monetary deposits made by clients that are segregated from the assets of the brokerage firm. When a client opens a trading account with a futures commission merchant (FCM), which is a term for a brokerage firm registered with the Commodities Futures Trading Commission (CFTC), he is writing a check payable to the FCM for deposit in a bank account that holds client funds but not the brokerage firm's funds. Or if funding by wire, funds are sent directly into an account under the name of the FCM titled 'customer-segregated account'. The CFTC requires brokerage firms (FCMs) to hold customer margin deposits in segregated accounts as a safeguard against a brokerage firm bankruptcy. In theory, if the FCM suffers financial trouble and files for bankruptcy, any client funds on deposit will be unaffected. In fact, in such a case it is common practice for the funds and open positions to simply be transferred to an alternative FCM, leaving the insolvent FCM to deal with its issues. The CFTC requires that FCMs report the status of their customer-segregated funds on a monthly basis. With the data collected, they publish a monthly report on the financial data of each FCM. Events leading up to, and subsequent to, the PFG debacle was a painful reminder that data portrayed on the report might not always be verified. As you may be aware, the top executive at PFG was reporting false customer-segregated funds figures to the CFTC and using falsified bank statements to fool regulators into assuming the reported data was accurate. Within the report, clients, employees, and brokers can find information such as the total value of customer-segregated deposits, the amount the brokerage firm must have in the customer-segregated funds account to be compliant, and any excess or deficiency in the account. You might be wondering why an FCM would have more in their customer-segregated funds account than their customers have on deposit, but the truth is cash inflows and outflows are constantly taking place as clients deposit and withdraw funds, buy and sell options and futures contracts, and pay brokerage fees. Simply put, the math isn't quite as easy as we might think – so instead of there being a black and white figure, there is quite a bit of gray. Nonetheless, the regulations in place that require brokerage firms to segregate customer funds from their own worked flawlessly to protect client funds for decades before MF Global and PFG pilfered customer-segregated funds accounts. The failure of MF Global and PFG to avoid the comingling of firm and client money reminded us that rules are only as good as their followers – and enforcers. Both FCMs displayed a disregard to compliance stipulations intended to protect the customers who enabled their longstanding success as brokerage firms. Regrettably, industry regulators weren't able to detect the violations until after it was too late. As painful as back-to-back system failures were for clients, employees, and brokers of both MF Global and PFG, there might be some long-term good that comes of it. For instance, in the aftermath of these events, the NFA has been provided electronic access to the bank accounts of FCMs enabling verification of customer-segregated funds balances in real time and on a frequent basis. There has also been a proposed insurance fund discussed within the CFTC that would provide deposit insurance to commodity traders up to USD250 000. This insurance fund would be similar to the banking system's FDIC deposit insurance and eliminates the risk of unforeseen events such as a bank insolvency or a brokerage failure to comply with segregation rules. The violation of customer-segregated funds regulations is rare, despite the recent hiccup in its track record. Even without new safety nets in place to avoid another calamity of this sort, it would likely not happen again anytime soon. Nevertheless, for those of us whose livelihood depends on a properly functioning marketplace in which we can be confident, positive changes in oversight are welcomed with open arms! / Голдмэн Сэкс (Goldman Sachs). Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). Дьжан Козайн (Jon Corzine). Эм.Эф. Глобэл (MF Global). Принсипэл Файнэншэл Груп Инк. (Principal Financial Group Inc.; Пи.Эф.Дьжи. (PFG)).

CUSTOMER SERVICE = СЛУЖБА ЗАКАЗЧИКА – Customer Service is a department designed to meet customer requirements. / Департамент, образованный для удовлетворения потребностей заказчиков.

CUSTOMER TO CUSTOMER = ОТ ЗАКАЗЧИКА ЗАКАЗЧИКУ

CUSTOMER TRANSFER = ПЕРЕВОД ЗАКАЗЧИКА (или ПЕРЕВОД КЛИЕНТА) – Customer Transfer is a payment where either the ordering customer, the final beneficiary customer or both are non-financial institutions.

CUSTOMER TYPE INDICATOR = ИНДИКАТОР ТИПА ЗАКАЗЧИКА – These consist of five identifiers that describe transactions by the type of customer for which a trade is effected. The five codes are:- CTI1, CTI2, CTI3, CTI4, and CTI5. Transaction data classified by the above codes are included in the trade register report produced by a clearing organization. A Customer Type Indicator (CTI) is a number given to distinguish the type of customer involved in the trade. / Индикатор Типа Заказчика – это предоставленный номер, соответствующий типу заказчика, вовлечённого в торговлю.

CUSTOMHOUSE = ТАМОЖЕННЫЙ ПОСТ – Customhouse is a government office where duties are paid, import documents filed, etc, on foreign shipments. / Правительственное управление, где производится оплата пошлин, заполняются документы на ввоз и прочие действия, связанные с ввозом иностранных товаров.

CUSTOMHOUSE BROKER = БРОКЕР ТАМОЖЕННОГО ПОСТА – Customhouse Broker is a person or firm, licensed by the treasury department of their country when required, engaged in entering and clearing goods through Customs for a client (importer).

CUSTOM–HOUSE BROKERS = БРОКЕРЫ ТАМОЖЕННОГО ПОСТА – Custom-House Brokers (in 1844):- it is enacted by the 3 & 4 Will. 4. c. 52., that no person shall be authorised to act as an agent for transacting business at the Custom-house in the port of London, relative to the entrance or clearance of any ship, &c., unless authorised by licence of the commissioners of customs, who are to require bond with one surety for 1 000l., for the faithful conduct of such person and his clerks. This regulation does not, however, apply to the clerk or servant of any person or persons transacting business at the Custom-house on his or their account. The commissioners may extend this regulation to other ports.

CUSTOMS = ТАМОЖНЯ – Customs is the Government Service which is responsible for the administration of Customs law and the collection of import and export duties and taxes and which also has responsibility for the application of other laws and regulations relating, inter alia, to the importation, transit and exportation of goods. This term is also used when referring to any part of the Customs Service or its main or subsidiary offices. This term is also used adjectivally in connection with officials of the Customs, import or export duties or control on goods, or any other matter within the purview of the Customs (Customs officer, Customs duties, Customs office, Customs declaration). The regulatory body of most governments which inspects and certifies that the cargo is described. Administrates governmental regulations pertaining to foreign commerce. The authorities designated to collect duties levied by a country on imports and exports. The term also applies to the procedures involved in such collection. Government agency charged with enforcing the rules passed to protect the country's import and export revenues. Customs has a major role to play in the administration of trade. This includes the collection of Customs duties and taxes, the preparation of foreign trade statistics, trade compliance, supply chain security and facilitation, and the protection of society, the environment and cultural heritage. As international trade has developed within the global economy, out-of-date, incompatible, and inefficient customs procedures have been recognized as a costly constraint. Customs

modernisation and harmonisation therefore represent a key objective to facilitate international trade. Customs must also continue to maintain effective controls to combat cross-border crime, which has grown and become sophisticated as a result of the new possibilities offered by world markets. A Government body that deals with the levy of duties and taxes on imported goods from foreign countries and the control over the export and import of goods, for instance, quotas, prohibited goods. Customs tasks:- Customs is a modern service provider for the economy. Its goals and its range of tasks today extend far beyond border-related activities:- (i) though the efficient collection of duties, Customs ensures the state's ability to provide public services; (ii) Customs uses modern practices and methods to promote trade and the economy and thus Europe as a location for business and investment; (iii) Customs protects citizens, the economy and the environment; (iv) Customs combats undeclared work and unlawful employment to stabilise the social systems and labor market; and (v) Customs fights international organised crime – from the drug trade, to product piracy and smuggling all the way to money laundering. The range of activities extends from the straightforward provision of services to exercising sovereign jurisdiction. Customs has to satisfy a twofold demand in the process. On the one hand, Customs is a service provider to private persons and businesses. On the other hand, Customs also executes public powers for the protection of the state, its citizens, the economy and the environment. In order to makes this dual role more transparent and understandable, Customs actively engages its partners in a dialogue as well as providing them with information and advice. Customs is a country's governmental agency authorized to collect tariffs on imported and exported goods. / привоз (importation). вывоз (exportation). Таможня – государственное учреждение (государственный орган, государственная служба, таможенный орган), обеспечивающее порядок перемещения через таможенную границу товаров и транспортных средств, вещей и иных предметов, применение таможенных режимов, взимание таможенных платежей, производящее таможенный контроль и таможенное оформление, сбор и обработку сведений о перемещаемых товарах и транспортных средствах, возбуждающее уголовные дела по фактам совершения таможенных преступлений, производящее дознание и осуществляющее оперативно-розыскную деятельность, использующее метод контролируемой поставки, контролирующее выполнение санитарных и карантинных правил и тому подобное; обычно располагается в морских портах, аэропортах и на сухопутной границе в местах пересечения её водными, железнодорожными и автомобильными путями. В Российской Федерации (РФ) Таможня является правоохранительным органом, входит в единую систему таможенных органов РФ и, действуя на основании положений, утверждаемых Федеральной Таможенной Службой РФ (ФТС России), непосредственно осуществляет таможенное дело. Под Таможней, от слова Тамга, понимается государственное учреждение, контролирующее провоз грузов, в том числе багажа и почтовых отправлений, через государственную границу. Таможня взимает пошлины и другие сборы с провозимых грузов. Обычно таможни располагаются в морских, речных портах и международных аэропортах, на пограничных пунктах и железнодорожных станциях, в крупных центрах страны.

CUSTOMS BONDED WAREHOUSE = ТАМОЖЕННЫЙ СКЛАД, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ (или ТАМОЖЕННЫЙ СКЛАД, ОБЕСПЕЧЕННЫЙ ГАРАНТИЕЙ) – Customs Bonded Warehouse is the warehouse where imported merchandise may be stored temporarily without payment of customs duties or taxes. In the United States, the temporary storage period cannot exceed three years. Also known as Bonded Warehouse. A Customs Bonded Warehouse is a building or other secured area in which imported dutiable merchandise may be stored, manipulated, or undergo manufacturing operations without payment of duty for up to 5 years from the date of importation. Authority for establishing bonded warehouses is set forth in Title 19, United States Code (USC), Section 1555. The regulations covered the operation of bonded warehouses is found at 19 CFR 19. Upon entry of goods into the warehouse, the warehouse proprietor incurs a liability for the merchandise under a warehouse bond. This liability is generally cancelled when the merchandise is:- (i) Exported; (ii) Withdrawn for supplies to a vessel or aircraft; (iii) Destroyed under the US Customs and Border Protection (CBP) supervisions; or (iv) Withdrawn for consumption within the United States after payment of duty. Classes of bonded warehouses There are eleven different classes of bonded warehouses authorized under 19 CFR 19.1:- (1) Premises that may be owned or leased by the Government, when the exigencies of the service as determined by the port director so require, and used for the storage of merchandise undergoing examination by CBP, under seizure, or pending final release from CBP custody. Merchandise will be stored in such premises only at CBP direction and will be held under 'General Order' (GO). (2) Importers private warehouse used exclusively for the storage of merchandise belong to or consigned to the proprietor. A class 4 or 5 warehouse may be bonded exclusively for the storage of goods imported by the proprietor, in which case it shall be known as a Private Bonded Warehouse. (3) Public bonded warehouse used exclusively for the storage of imported merchandise. (4) Bonded yards or sheds for the storage of heavy and bulky imported merchandise; stables, feeding pens, corrals, other similar buildings or limited enclosures for the storage of imported animals; and tanks for storage of imported liquid merchandise in bulk. (5) Bonded bins or parts of buildings or elevators to be used for the storage of grain. (6) Bonded warehouses established for the manufacture in bond, solely for exportation, of articles made in whole or in part of imported materials or of materials subject to internal revenue tax; and for the manufacture for domestic consumption or exportation of cigars made in whole of tobacco imported from one country. (7) Bonded warehouses established for smelting and refining imported metal-bearing materials for exportation or domestic consumption. (8) Bonded warehouses established for the cleaning, sorting, repacking, or otherwise changing the condition of, but not the manufacturing of, imported merchandise, under CBP supervision, and at the expense of the proprietor. (9) Bonded warehouses, known as Duty-Free Stores, used for selling conditionally duty-free merchandise for use outside the Customs territory. Merchandise in this class must be owned or sold by the proprietor and delivered from the warehouse to an airport or other exit point for exportation by, or on behalf of, individuals departing from the Customs territory or foreign destinations. These stores may also sell other than duty-free merchandise. (10) Bonded warehouses for international travel merchandise, goods sold conditionally duty-free aboard aircraft and not at a duty-free store. This is based on amendments to 19 USC, Section 1555(c), approved 11/00. Regulations governing this type of warehouse are being written. (11) Bonded warehouses established for the storage of General Order (GO) merchandise. GO is any merchandise not claimed or entered for 15 days after arrival in the United States (or final US destination for in-bond shipments). Advantages of Using a Bonded Warehouse:- Duty is not collected until the merchandise is withdrawn for consumption. An importer, therefore, has control over use of his money until the duty is paid upon withdrawal of the merchandise. If no domestic buyer is found for the imported articles, the importer can sell merchandise for exportation, thereby eliminating his obligation to pay duty. Many items subject to restrictions may or may be stored in a bonded warehouse. Check with the nearest CBP office before assuming that such merchandise may be placed in a bonded warehouse. Duties owed on articles that have been manipulated are determined at the time of withdrawal from the bonded warehouse. How to Establish a Bonded Warehouse:- Application:- An applicant seeking to establish a bonded warehouse must make written application to the local CBP port director describing the premises, giving the location, and stating the class of warehouse to be established. Except in the case of a Class 2 or Class 7 warehouse, the application must state whether the warehouse is to be operated only for the storage or treatment of merchandise belonging to the applicant, or whether it is to be operated as a public bonded warehouse. If the warehouse is to be operated as a private bonded warehouse, the application must also state the general character of the merchandise to be stored therein, with an estimate of the maximum duties and taxes that will be due on the merchandise at any one time. Other Requirements:- The application must be accompanied by the following:- (i) A certificate signed by the president or a secretary of a board of fire underwriters that the building is a suitable warehouse and acceptable for fireinsurance purposes. At ports where there is no board of fire underwriters, certificates should be obtained and signed by officers of agents of two or more insurance companies. (ii) A blueprint showing measurements of the building or space to be bonded. If the warehouse to be bonded is a tank, the

blueprint should identify all outlets, inlets, and pipelines and be certified as correct by the proprietor of the tank. A gauge table showing the capacity of the tank in US gallons per inch or fraction of an inch of height, should be included and certified by the proprietor as correct. When a part or parts of the building are to be used as a warehouse, a detailed description of the materials and construction of all partitions shall be included. The port director may ask for a list of names and addresses and a set of fingerprints for all company officers, principals, and those individuals with access to the recordkeeping information. Class 9 warehouses have specific requirements governing their establishment. These requirements include location, exit points, record-keeping systems, and the approval of local governments. Bonds Required:- Bonds for each class of warehouse are executed on a CBP Form 301. Where are CBP offices located? CBP has more than 300 ports of entry in the United States, Puerto Rico, and the US Virgin Islands. Please consult your local telephone directory under Federal government listings, Department of Homeland Security, US Customs and Border Protection. The material contained in this section is for information purposes only. The warehouse proprietor and/or importer must comply with all the legal and technical requirements set forth in the law and in the regulations. CBP is unable to recommend existing bonded warehouses for the use of individual importers. Any additional questions regarding bonded warehouses operations should be directed to the local CBP office nearest you. / Склад, в котором привозимая (или импортируемая) продукция может быть временно размещена для хранения без оплаты пошлин или налогов. В Соединённых Штатах Америки период временного хранения не может превышать трёх лет. В Российской Федерации такой тип складов относится просто к Таможенному Складу, организуемому и обслуживаемому независимой от таможни компанией или организацией. Известен также как Склад, Обеспеченный Гарантией (Bonded Warehouse). Под Таможенным Складом, Обеспеченным Обязательством (Customs Bonded Warehouse), понимается федеральный склад Американской таможни, где товар содержится до уплаты импортёром пошлины. Здесь же хранятся товары, находящиеся в залоге у таможни.

CUSTOMS BROKER = ТАМОЖЕННЫЙ БРОКЕР – Customs Broker is an agent representative licensed by FMC who negotiates customs clearance for import cargo on behalf of the Consignee through US Customs. A person or firm, licensed by the treasury department of their country when required, engaged in entering and clearing goods through Customs for a client (importer). Customs Brokers are private individuals, partnerships, associations or corporations licensed, regulated and empowered by US Customs and Border Protection (CBP) to assist importers and exporters in meeting Federal requirements governing imports and exports. Brokers submit necessary information and appropriate payments to CBP on behalf of their clients and charge them a fee for this service. An authorised agent specialised in customs clearance procedures on behalf of importers/exporters. Also known as Customhouse Broker, or Customs House Broker.

CUSTOMS CLEARANCE = ТАМОЖЕННАЯ ОЧИСТКА – The accomplishment of the Customs formalities necessary to allow goods to be exported, to enter home use or to be replaced under another Customs procedure. Customs Clearance:- the procedures involved in getting cargo released by Customs through designated formalities such as presenting import license/permit, payment of import duties and other required documentations by the nature of the cargo such as FCC or FDA approval. Shipment cleared by Customs for movement. Customs Clearance is the process of declaring and clearing cargoes through Customs. / Процесс декларирования и очистки грузов на таможне. Таможенная Очистка заключается в:- (i) процедуре выполнения комплекса формальностей, предусмотренных таможенными правилами страны, при ввозе (вывозе) товаров и транспортных средств. Таможенная очистка грузов включает в себя таможенное оформление, уплату таможенных платежей, всевозможные административные действия, связанные с легализацией груза, необходимых для ввоза (вывоза) товаров; и (ii) в разрешении таможни на ввоз (вывоз) товара. В понятийном аппарате Таможенного Кодекса Российской Федерации термин Таможенная Очистка отсутствует. На обывательском уровне используются термины Затаможка и Растаможка, означающие таможенное оформление, то есть процедуру помещения товаров под определённый таможенный режим и завершения действия этого режима в соответствии с законом.

CUSTOMS CO–OPERATION COUNCIL = СОВЕТ ПО ТАМОЖЕННОМУ СОТРУДНИЧЕСТВУ – The Convention establishing the Council means the Convention establishing a Customs Co-operation Council, done at Brussels on 1950-December-15. Established in 1952 as the Customs Co-operation Council (Conseil de Coopération Douanière), the WCO is an independent intergovernmental body whose mission is to enhance the effectiveness and efficiency of Customs administrations. With 169 Member Governments, it is the only intergovernmental worldwide organization competent in Customs matters. In order to fulfil this mission, the World Customs Organization:- (i) establishes, maintains, supports and promotes international instruments for the harmonization and uniform application of simplified and effective Customs systems and procedures governing the movement of commodities, people and conveyances across Customs frontiers; (ii) reinforces Members' efforts to secure compliance with their legislation, by endeavouring to maximize the level of effectiveness of Members' co-operation with each other and with international organizations in order to combat Customs and other transnational offences; and (iii) assists Members in their efforts to meet the challenges of the modern business environment and adapt to changing circumstances, by promoting communication and co-operation among Members and with other international organizations, and by fostering integrity, human resource development, transparency, improvements in the management and working methods of Customs administrations and the sharing of best practices. The history of the WCO began in 1947 when the thirteen European Governments represented in the Committee for European Economic Co-operation agreed to set up a Study Group. This Group examined the possibility of establishing one or more inter-European Customs Unions based on the principles of the General Agreement on Tariffs and Trade (GATT). In 1948, the Study Group set up two committees – an Economic Committee and a Customs Committee. The Economic Committee was the predecessor of the Organization for Economic Co-operation and Development (OECD), the Customs Committee became the Customs Co-operation Council (CCC). In 1952, the Convention formally establishing the CCC came into force. The Council is the governing body of the CCC and the inaugural Session of the Council was held in Brussels on 1953-January-26. Representatives of seventeen European countries attended the first Council Session of the CCC. After years of membership growth, in 1994 the Council adopted the working name World Customs Organization, to more clearly reflect its transition to a truly global intergovernmental institution. It is now the voice of 169 Customs administrations which operate on all continents and represent all stages of economic development. Today, WCO Members are responsible for processing more than 98% of all international trade. The CCC is an international organization consisting of representatives of about 150 countries. The Council serve as a technical body which studies and seeks to resolve the various countries' customs problems in an attempt to harmonize customs operations and promote trade. The Council was established in 1952; headquarters are in Brussels, Belgium. World Customs Organization (WCO) is an intergovernmental organization that helps member states communicate and cooperate on customs issues. It was established in 1952 as the Customs Co-operation Council; it adopted its current name in 1994. One hundred sixty nine member states (2007), including Canada, Mexico and the US, with the goal of promoting international cooperation in customs matter. See also World Customs Organization. / Совет по Таможенному Сотрудничеству или, как это звучит на Французском языке по месту регистрации, Консэй дё Кооперасьён Дуаньер (Conseil de Coopération Douanière). Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

CUSTOMS CO–OPERATION COUNCIL NOMENCLATURE = НОМЕНКЛАТУРА СОВЕТА ПО ТАМОЖЕННОМУ СОТРУДНИЧЕСТВУ – It should be noted that in all the Member States of the EC – and in many other countries too – statistics on external trade are produced in close collaboration between the customs services and statistical offices. All the Member States of the Communities are also members of the Customs Cooperation Council (CCC) and are obliged to incorporate the conventions of that intergovernmental organization in their own customs legislation and practice, including the CCC's nomenclature. The latter is commonly referred to as the 'Brussels Nomenclature' but its official name is now, since 1976, the 'Customs Cooperation Council Nomenclature' (CCCN). As a result, Community legislation on customs matters is constructed within the CCC system, and the 'Nomenclature of the Common External Tariff of the European Communities' (CCT) is embodied in the CCCN, and is in fact a subdivision of it. Customs Cooperation Council Nomenclature (CCCN) is a customs tariff nomenclature formerly used by many countries, including most European nations but not the United States (US). It has been superseded by the Harmonized System Nomenclature to which most major trading nations, including the US, adhere. Customs Cooperation Council Nomenclature (CCCN) is a customs tariff nomenclature formerly used by many countries, including most European nations but not the United States. It has been superseded by the Harmonized System Nomenclature to which most major trading nations, including the United States, adhere. / Номенклатура – классифицированный перечень.

CUSTOMS DUTY = ТАМОЖЕННАЯ ПОШЛИНА – Customs Duty is a duty laid down in the Customs tariff, to which goods are liable on entering or leaving the Customs territory. Customs Duty is an indirect tax that provides protection for national industry, charged on imported goods. For example, in the countries of the European Union, this includes ad valorem duty, agricultural charges and other import charges provided for under the Common Agricultural Policy (CAP). It does not include excise duty and Value Added Tax (VAT). / Косвенный налог, призванный обеспечить защиту национальной промышленности, взимаемый при ввозе товаров на территорию данной страны. В странах Европейского Союза, например, она включает в себя пошлину по стоимости (адвалорную пошлину), сельскохозяйственные и иные сборы, взимаемые в соответствии с Общей Сельскохозяйственной Политикой (ОСП). Она не включает в себя акцизную пошлину или акциз и Налог на Добавленную Стоимость (НДС). Под Таможенной Пошлиной понимается денежный сбор с товаров, имущества, ценностей, пропускаемых через границу под контролем таможни; вид косвенного налога. Таможенные пошлины делятся на ввозные, вывозные и транзитные. Взимаются по ставкам, установленным таможенным тарифом на единицу товара или цену.

CUSTOMS ENTRIES = ТАМОЖЕННЫЕ РЕЖИМЫ ВВОЗА – Customs Entries:- all countries require that the importer make a declaration on incoming foreign goods. The importer then normally pays a duty on the imported merchandise. The importer's statement is compared against the carrier's vessel manifest to ensure that all foreign goods are properly declared. There are five type of customs entries:- (1) Consumption Entry; (2) Immediate Delivery Entry (ID Entry); (3) Immediate Transportation Entry (IT Entry); (4) Transportation and Exportation Entry (T&E Entry); and (5) Vessel Repair Entry. In the United States, Customs Entries:- Consumption Entry Form required by US Customs for importing goods into the United States. The form contains information as to the origin of the cargo, a description of the merchandise and estimated duties applicable to the particular commodity. Estimated duties must be paid at the time the entry is filled. (i) Immediate Delivery Entry is used to expedite clearance of cargo. It allows up to ten days for the payment of estimated duty and processing of the consumption entry. In addition, it permits the delivery of the cargo prior to payment of the estimated duty and then allows for the subsequent filing of the consumption entry and duty. Also known as an ID Entry. (ii) Immediate Transportation Entry allows the cargo to be moved from the pier to an inland destination via a bonded carrier without the payment of duties or finalization of the entry at the port of arrival. Known as an IT Entry. (iii) Transportation and Exportation Entry allows goods coming from or going to a third country, such as Canada or Mexico, to enter the United States for the purpose of transshipment. Known as a T&E Entry. (iv) Vessel Repair Entry is the law known as the 'Foreign Vessel Repair Statute'. It provides that when any repairs in a foreign country are made on a vessel documented under the laws of the United States, an ad valorem duty of 50% is imposed on the cost of repair, including labor and labor costs, when the vessel arrives in the United States. All equipment, parts or materials purchased, and repairs made outside the United States must be declared on Customs Form 226 (CF-226) and filed at the port of first arrival within 5 working days. / вывоз (exportation).

CUSTOMS FORMALITIES = ТАМОЖЕННЫЕ ФОРМАЛЬНОСТИ – Customs Formalities:- all the operations which must be carried out by the person concerned and by the Customs in order to comply with the statutory or regulatory provisions which the Customs are responsible for enforcing in connection with the control of persons at the Customs frontier and the clearance of baggage, goods and means of transport at importation, exportation and in transit. These formalities may include those relating to phytosanitary, veterinary, immigration, currency and licensing regulations. The Customs formalities in connection with various Customs procedures are dealt with in the Annexes to the Kyoto Convention. / привоз (importation). вывоз (exportation).

CUSTOMS HOUSE BROKER = БРОКЕР ТАМОЖЕННОГО ПОСТА – Customs House Broker is an independent broker certified by the US Bureau of Customs to act for importers and businessmen in the handling of customs formalities and other details of importing and exporting goods. Also known as Customs Broker, or Customhouse Broker. / Известен также как Таможенный Брокер (Customs Broker) или Брокер Таможенного Поста (Customhouse Broker).

CUSTOMS IMPORT VALUE = ВВОЗНАЯ ТАМОЖЕННАЯ СТОИМОСТЬ – Customs Import Value:- this is the US Customs Service appraisal value of merchandise. Methodologically, the Customs value is similar to FAS (Free Alongside Ship) value since it is based on the value of the product in the foreign country of origin, and excludes charges incurred in bringing the merchandise to the United States (import duties, ocean freight, insurance, and so forth); but it differs in that the US Customs Service, not the importer or exporter, has the final authority to determine the value of the good.

CUSTOMS INVOICE = ТАМОЖЕННЫЙ СЧЁТ–ФАКТУРА – Customs Invoice is a form requiring all data in a commercial invoice along with a certificate of value and/or a certificate of origin. Required in a few countries (usually former British territories) and usually serves as a seller's commercial invoice. Document required by the customs in an importing country in which an exporter states the invoice or other price, and specifies costs for freight, insurance and packing etc, terms of delivery and payment, for the purpose of determining the customs value and assessment of duties in the importing country. A few countries require the use of a special invoice form called a Customs Invoice (this is usually in place of a seller's commercial invoice). This form, besides requiring all of the usual data required in a commercial invoice, will have (in many cases) a certificate of value and/or a certificate of origin. See also Commercial Invoice, Consular Invoice, Final Invoice, Invoice, Preliminary Invoice, Pro-Forma Invoice, and Provisional Invoice. / Некоторые страны требуют использовать специальную форму счёта-фактуры, называемую Таможенным Счётом-Фактурой (обычно взамен коммерческого счёта-фактуры продавца). Эта форма, кроме всех обычных данных, требуемых для коммерческих счётов-фактур, будет дополнена (в большинстве случаев) оценочным сертификатом и/или сертификатом происхождения. Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Консульский Счёт-Фактура (Consular Invoice), Заключительный или Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), Замещаемый Счёт-Фактура (Pro-Forma Invoice), и Условный Счёт-Фактура (Provisional Invoice).

CUSTOMS OF THE PORT = ПОРТОВЫЕ ОБЫЧАИ (или ОБЫЧАИ ПОРТА) – Customs Of The Port:- a phrase often included in charter parties and freight contracts referring to local rules and practices which may impact upon the costs borne by the various parties.

CUSTOMS PROCEDURE = ТАМОЖЕННАЯ ПРОЦЕДУРА (или ТАМОЖЕННЫЙ РЕЖИМ) – Customs Procedure:- a treatment applied by the Customs to goods which are subject to Customs control. The reference to 'goods' includes means of transport. There are various Customs procedures which are dealt with in the Annexes to the Kyoto Convention:- clearance for home use, Customs warehousing, temporary admission for inward processing or temporary admission subject to re-exportation in the same State, Customs transit, etc. In the European Union, the Community Customs Code provides for 8 customs procedures:- release for free circulation, transit, customs warehousing, inward processing, processing under customs control, temporary importation, outward processing, and exportation. / привоз (importation). вывоз (exportation). Под Таможенным Режимом понимается установленная в зависимости от характера и цели перемещения товара через границу государства совокупность таможенных процедур, подлежащих применению к данному товару. В России классификатором таможенных режимов предусматривались следующие основные таможенные режимы:- (i) Вывоз Товаров Для Свободного Обращения За Границей (код 10); (ii) Временный Вывоз За Границу (код 20), в том числе:- Временный Вывоз За Границу Для Переработки (код 21), и Временный Вывоз За Границу С Обратным Ввозом В Неизменном Состоянии (код 23); (iii) Обратный Вывоз За Границу (код 30), в том числе:- Вывоз Ранее Временно Ввезённых Товаров В Неизменном Состоянии (код 31), и Вывоз За Границу Компенсационных Товаров (код 32); (iv) Ввоз Товаров Для Свободного Обращения В Российской Федерации (код 40); (v) Временный Ввоз В Российскую Федерации (код 50), в том числе:- Временный Ввоз Для Переработки (код 51), и Временный Ввоз С Обратным Вывозом За Границу В Неизменном Состоянии (код 53); (vi) Обратный Ввоз В Российскую Федерацию (код 60), в том числе:- Ввоз Ранее Временно Вывезенных Товаров В Неизменном Состоянии (код 61), и Ввоз Компенсационных Товаров (код 62); (vii) Ввоз В Российскую Федерацию Для Использования Под Таможенным Контролем (код 70), в том числе:- Ввоз Товаров В Свободные Экономические Зоны (код 71), и Ввоз Товаров В Магазины Беспошлинной Торговли (код 72); (viii) Транзит (код 80); (ix) Иной Ввоз В Российскую Федерацию (код 90). Таможеное оформление завершается после проверки всех сведений и документов, представленных для контроля, и, в случае необходимости, проведения досмотра заявленных товаров. Завершение таможенного оформления товаров, ввозимых в Россию и вывозимых из России для свободного обращения, подтверждается штампом 'Выпуск Разрешён'.

CUSTOMS PROCEDURES WITH ECONOMIC IMPACT = ТАМОЖЕННЫЕ ПРОЦЕДУРЫ С ЭКОНОМИЧЕСКИМ ВЛИЯНИЕМ – Customs Procedures With Economic Impact:- the following customs procedures require an authorisation and in some situations an evaluation of their economic impact:- customs warehousing, inward processing, processing under customs control, temporary importation, and outward processing. / привоз (importation).

CUSTOMS SEAL = ПЕЧАТЬ ТАМОЖНИ – Customs Seal is a seal applied by a customs agent which places the cargo in bond and cannot be opened without customs authority. An assembly consisting of a seal and a fastening which are joined together in a secure manner. Customs seals are affixed in connection with certain Customs procedures (Customs transit, in particular) generally to prevent or to draw attention to any unauthorized interference with the sealed items. Customs seals are generally affixed to packages, containers, load compartments of means of transport, etc. They may also be used as means of identification of the goods themselves.

CUSTOMS STATION = ТАМОЖЕННАЯ СТАНЦИЯ – Customs Station is an area where containers are brought for Customs inspection. / Зона, в которую доставляются контейнеры для таможенного досмотра.

CUSTOMS TERRITORY = ТАМОЖЕННАЯ ТЕРРИТОРИЯ – Customs Territory is the territory in which the Customs law of a State applies in full. As a rule, the Customs territory of a State corresponds to its national territory including land, sea and air space. However, certain portions of the national territory may be excluded, e.g., free zones or the waters between the coastline and the State's territorial boundary at sea. The excluded portions of the national territory are called 'Customs Exclaves'. By international agreement the Customs territory of a State may include a Customs exclave of another State. The area so included is called a 'Customs Enclave'. / Таможенная Территория:- сухопутная территория государства, территориальные и внутренние воды и воздушное пространство над ними.

CUSTOMS TERRITORY OF THE COMMUNITY = ТАМОЖЕННАЯ ТЕРРИТОРИЯ СООБЩЕСТВА – The Customs Territory of the Community comprises of the territory of:- Austria, Belgium, Bulgaria, Cyprus (pending a settlement to the Cyprus problem, the application of the Community 'acquis' is suspended in those areas in which the Government of the Republic of Cyprus does not exercise effective control), the Czech Republic, Denmark (except the Faroe Islands and Greenland), Estonia, Finland, France, (except New Caledonia, Mayotte, Saint-Pierre and Miquelon, Wallis and Futuna Islands, French Polynesia and French Southern and Antarctic Terrirories), Germany (except the Island of Heligoland and the territory of Büsingen), Greece, Hungary, Ireland, Italy (except the municipalities of Livigno and Campione d'Italia and the national waters of Lake Lugano which are between the bank and the political frontier of the area between Ponte Tresa and Porto Ceresio), Latvia, Lithuania, Luxembourg, Malta, the Netherlands in Europe, Poland, Portugal, Romania, the Slovak Republic, Slovenia, Spain (except Ceuta and Melilla), Sweden, the United Kingdom of Great Britain and Northern Ireland and the Channel Islands and the Isle of Man. The customs territory of the Community includes the territorial waters, the inland maritime waters and the airspace of the Member States, except for the territorial waters, the inland maritime waters and the airspace of those territories which are not part of the customs territory of the Community as listed above. The following territories, including their territorial waters, inland maritime waters and airspace, situated outside the territory of the Member States, shall also be considered to be part of the customs territory of the Community:- the territory of the principality of Monaco; the territory of the United Kingdom Sovereign Base Areas of Akrotiri and Dhekelia, in Cyprus. / территория Акротири (Akrotiri) и Дэкелья (Dhekelia), Суверенных Базовых Ареалов Соединённого Королевства на Кипре.

CUSTOMS TRANSIT = ТАМОЖЕННЫЙ ТРАНЗИТ – Customs Transit:- Customs procedures under which goods are transported under Customs control from one Customs office to another. The Customs authorities normally allow goods to be transported under Customs transit in their territory:- (a) from an office of entry to an office of exit (through transit); (b) from an office of entry to an inland Customs office (inward transit); (c) from an inland Customs office to an office of exit (outward transit); (d) from one inland Customs office to another inland Customs office (interior transit). Customs transit movements as described in (a) – (c) above are termed 'international Customs transit' when they take place as part of a single Customs transit operation during which one or more frontiers are crossed in accordance with a bilateral or multilateral agreement. Customs transit is dealt with in Annex E.1. to the Kyoto Convention.

CUSTOMS UNION = ТАМОЖЕННЫЙ СОЮЗ – Customs Union is an entity formed by a Customs territory replacing two or more territories and having in its ultimate state the following characteristics:- (i) a common Customs tariff and a common or harmonized Customs legislation for the application of that tariff; (ii) the absence of any Customs duties and charges having equivalent effect in trade between the countries forming the Customs Union in products originating entirely in those countries or in products other countries in respect of which import formalities have been complied with and Customs duties and charges having equivalent effect have been levied or guaranteed and if they have not benefited from a total or partial drawback of such duties and charges; and (iii) the elimination

of restrictive regulations of commerce within the Customs Union. The merger of two or more customs territories with the effect that customs duties and non-tariff barriers are eliminated between the members of the union for substantially all trade, and a common customs tariff and common rules for non-tariff barriers are introduced for substantially all trade with non-member countries. When the European Communities were founded in 1958, one of the main goals was to create a common customs union. Just 10 years later, on 01 July 1968, the Member States made this idea a reality. They founded the customs union, with a common customs tariff on goods imported from third countries, and ceased collecting customs duties at intra-Community borders from that point on. This was an important milestone along the path to the European Union as we know it today. Customs controls at internal borders were abolished with the introduction of the single market on 01 January 1993 and the enlarge ments that took place in 2004 and 2007. The EU's customs administrations today receive around 175 million customs declarations each year, which means they clear more than 22 percent of the world's trade volume. The customs officials do an impressive job in the process. They receive almost six customs declarations every second, every day, collecting an annual total of more than EUR17 billion for the EU budget (in 2007). An agreement between two or more countries to remove trade barriers with each other and to establish common tariff and nontariff policies with respect to imports from countries outside of the agreement. The European Community (1995) is the most well-known example. / порядка 175 миллионов таможенных деклараций каждый год, . Соглашение между двумя или более государствами о снятии торговых барьеров по отношению друг к другу и установлению общей тарифной и нетарифной политики в отношении привоза (или импорта) из стран, не входящих в это соглашение. Наиболее известным примером служит Европейское Сообщество. Под Таможенным Союзом понимается соглашение двух или нескольких государств об упразднении таможенных границ между ними и образовании территории с единым таможенным тарифом. Товары каждого государства, входящего в таможенный союз, ввозятся на территорию других членов таможенного союза беспошлинно.

CUSTOMS VALUATION = ТАМОЖЕННАЯ ОЦЕНКА – Customs Valuation:- the determination of the value of imported goods for the purpose of collecting ad valorem duties. This valuation is made by Customs officials, based on the declared value of the goods.

CUSTOMS VALUE = ТАМОЖЕННАЯ СТОИМОСТЬ – Customs Value is the value of goods established according to the customs rules for the levying of ad-valorem duties. Customs Value is the value of the imported goods on which duties will be assessed. The cargo value expressed in a monetary amount, for a shipment declared to Customs for duty and statistical reasons. / Таможенная Стоимость – стоимость товара (товаров и транспортных средств), определяемая в соответствии с законом Российской Федерации (РФ) 'О Таможенном Тарифе' и используемая при обложении товара пошлиной, ведении таможенной статистики внешней торговли и специальной таможенной статистики, а также применении иных мер государственного регулирования торгово-экономических отношений, связанных со стоимостью товара, включая осуществление валютного контроля внешнеторговых сделок и расчетов банков по ним в соответствии с законодательными актами государства; является основой для исчисления таможенной пошлины, акцизов, таможенных сборов и налога на добавленную стоимость. Система определения таможенной стоимости таможней (таможенной оценки товаров) основывается на общих принципах такой оценки, принятых в международной практике, и распространяется на товары, ввозимые на таможенную территорию РФ. Порядок её применения устанавливается Правительством РФ на основании положений закона РФ 'О Таможенном Тарифе'. Порядок определения таможенной стоимости таможней, вывозимых с таможенной территории РФ, также устанавливается Правительством РФ. Таможенная стоимость таможни заявляется декларантом таможенному органу РФ при перемещении через таможенную границу РФ. Её определение декларантом производится согласно методам определения таможенной стоимости таможней, установленным законом РФ 'О Таможенном Тарифе'. Порядок и условия заявления таможенной стоимости ввозимых товаров, а также форма таможенной декларации устанавливается Федеральной Таможенной Службой России в соответствии с законодательством РФ. Контроль за правильностью определения таможенной стоимости таможней осуществляется таможенным органом РФ, производящим таможенное оформление товара. Информация, представляемая декларантом при заявлении таможенной стоимости таможней, определённая в качестве составляющей коммерческую тайну или являющаяся конфиденциальной, может использоваться таможенным органом РФ исключительно в таможенных целях и не может передаваться третьим лицам, включая иные государственные органы, без специального разрешения декларанта, за исключением случаев, предусмотренных законодательством РФ. Таможенная Стоимость:- стоимость товара, определяемая в соответствии с таможенным законодательством страны, используемая при обложении товара пошлиной, ведении таможенной статистики внешней торговли и специальной таможенной статистики, а также применении иных мер государственного регулирования торгово-экономических отношений, связанных со стоимостью товара, включая осуществление валютного контроля внешнеторговых сделок и расчётов банков по ним в соответствии с законодательными актами государства. Является основой для исчисления таможенной пошлины, акцизов, таможенных сборов и налога на добавленную стоимость.

CUSTOMS WAREHOUSE = ТАМОЖЕННЫЙ СКЛАД (или СКЛАД ВРЕМЕННОГО ХРАНЕНИЯ) – Customs Warehouse:- where cargo is temporarily stored awaiting inspection or where cargo is stored when seized by customs for lack of permit/entry. See also Bonded Warehouse. / Склад, в котором груз временно хранится в ожидании инспекции или в связи с наложением ареста таможней вследствие отсутствия разрешения/ввозных документов. За рубежом такой тип складов организуется и обслуживается при таможне самой таможней. В Российской Федерации такой тип складов известен как Склад Временного Хранения (СВХ), организуемый независимой от таможни компанией или организацией. Смотрите также Склад, Обеспеченный Обязательством или Склад, Обеспеченный Гарантией (Bonded Warehouse). Таможенный Склад:- (1) таможенный режим, при котором ввезённые товары хранятся под таможенным контролем без взимания таможенных пошлин, налогов и без применения к ним мер экономической политики в период хранения, а вывозимые товары, хранятся под таможенным контролем с предоставлением установленных льгот. Под режим таможенный склад могут помещаться любые товары, за исключением запрещённых к ввозу и вывозу на территорию данной страны. (2) Специально выделенное и обустроенное помещение или иное место, где действует таможенный режим таможенный склад. Могут быть открытого типа (доступными для использования любыми лицами) и закрытого типа (для хранения товаров определённых лиц). Ответственность за уплату таможенных пошлин, налогов и внесение иных таможенных платежей несёт владелец таможенного склада, за исключением случая когда склад принадлежит таможенным органам (ответственность несёт лицо, поместившее товары на хранение).

CUT = ОТРЕЗ – Cut is a bolt or length of fabric as it comes from the loom or in the finished state; most woolen and worsted cut lengths run from 60 to 70 yards. Cut is a length of woven cloth. / Отрез это кусок или длина ткани .

CUT = ПАСМА (или ПАСЬМА) – (1) Cut:- the standard of 300 yards to one pound of the number 1 cut wool yarn; also known as Philadelphia Cut System in the United States. The run system has 1 600 yards in one pound of the Number 1 yarn and is also known as the Boston System for wool yarn counts or sizes. Cut wool – standard of 300 yards to one pound of the #1s yarn. Run wool – the number of 1 600 yards hanks of yarn in one pound; the number is known as the Count Of The Yarn. 300 yards length of single woolen yarn. Cut is a unit of yarn number. The number of 100-yard lengths per pound avoirdupois of asbestos yarn or glass yarn, or the number of 300-yards lengths per pound avoirdupois of woolen yarn. Cut is a unit of yarn number. The number of 100-yard lengths per pound avoirdupois of asbestos yarn or glass yarn, or the number of 300-yards lengths per pound avoirdupois of woolen yarn. Cut is a

traditional unit of length for yarn in Scotland and northern England. One cut equals 1/12 hank, a unit varying with the material. A cut of cotton yarn is 70 yards; a cut of wool is 46 2/3 yards. / Пасьма:- мера длины льняной пряжи, равная 300 ярдам или 274.3 метрам. Номер:- (i) номер шерстяной аппаратной пряжи – число раз по 300 ярдов на 1 фунт веса; или (ii) номер асбестовой нити – число раз по 100 ярдов нити на 1 фунт веса. Пасма – мера длины пряжи, составляющая часть мотка или тальки. При различных системах нумерации и для различных материалов имеет разную величину, как, например:- (1) по Метрической системе Пасма содержит 100 метров (м) и равна 1/10 части мотка; (2) по Английской системе для хлопка Пасма содержит 120 ярдов (109.7 м) и равна 1/7 части мотка (куфты), для шерсти пасма = 80 ярдам (73.1 м) = 1/7 части мотка, для льна пасма = 300 ярдам (274.25 м) = 1/10 части мотка; (3) по Саксонской системе для шерсти пасма содержит 90.4 м и равна 1/5 мотка или 113 м и равна 1/4 мотка; (4) по Французской системе для шерсти (Седан) пасма содержит 67.9 м и составляет 1/22 мотка; (5) по Ирландской системе, для льна пасма содержит 300 ярдов и составляет 1/12 мотка; (6) для хлопчатого шёлка (бур-де-суа, Chappe) пасма = 100 м = 1/3 мотка.

(2) Standard length of the warp for worsteds is 70 yards.

(3) Cut is the same as Lea – measure for wet spun linen yarn. It means the number of 300 yard cuts that weight one pound. Twelve leas make a hank, 200 leas or 16½ hanks make a bundle.

(4) Jute yarn measure equal to 300 yards.

CUT = XX (или ЧИСЛО ИГЛ) – Cut is the number of needles per inch on a circular-knitting machine. A machine with 34 needles per inch is a 34-cut machine, and a fabric produced thereon is called a 34-Cut Fabric. / Число Игол на один дюйм (2.54 сантиметра) на кругловязальной машине в вязальном производстве.

CUTAWAY = XX (или С РАЗРЕЗОМ) – Cutaway is a coat with skirts tapering from the front waistline to form tails at the back.

CUT FILLING = ОБРЕЗАННАЯ УТОЧИНА (или РАССЕЧЁННАЯ УТОЧИНА, или ОБОРВАННАЯ УТОЧИНА) – Cut Filling:- Fabric:- Alpaca-type dress goods; Construction:- (i) Count:- 64 x 60; (ii) Warp:- 60/1 combed cotton; (iii) Filling:- 150/40 bright viscose rayon; Finish:- plain dyed pink. Defect:- small holes throughout piece. Analysis:- microscopic examination showed that the holes were due to cut filling yarns. In some instances the same yarn was severed in two consecutive places across the filling. Obviously, the yarn could not have been cut in this peculiar manner at the time of weaving. This defect was traced to a condition known as 'Sand-Roll Cuts', fairly common in the early days of rayon weaving when take-up rolls covered with perforated tin, sand-paper, or card clothing were used on looms, the sharp edges cutting the delicate rayon filaments readily during weaving. In modern rayon-weaving looms, the take-up rolls are of large diameter, to minimize slippage of the cloth by providing greater surface of contact; and they are covered with crepe rubber or composition material, which grips the fabrics with no danger of cutting.

CUT FLOWERS AND BRANCHES = ЦВЕТКИ И ВЕТВИ НА СРЕЗКУ – Cut Flowers And Branches is a commodity class for fresh parts of plants intended for decorative use and not for planting.

CUTICLE = КУТИКУЛА – Cuticle is a thin wax-like waterproof layer, composed of cutin, covering the epidermis. The outer coat of the seed. Cuticle is the outer layer of cells of a fiber which are hard, flattened and do not fit together evenly and whose tips point away from the fiber shaft forming serrated edges. These serrated edges cause the fibers to grip together during processing and manufacturing. The cuticle is the outer waxy layer which contains pectins and proteinaceous materials. It serves as a smooth, water resistant coating which protects the rest of the fiber. This layer is removed from the fiber by scouring. Cuticle:- in plants, it is a thin layer over the aerial parts (particularly leaves) It functions to protect the plant from injury and to prevent excessive water loss. / Кутикула это наружный водянистый слой или прослойка, содержащая пектины и протеиновые вещества. Она выполняет функцию . Под Кутикулой, от Латинского слова Cuticula, означающее Кожица, понимается:- (i) у животных – плотное образование на поверхности клеток эпителиальной ткани; и (ii) у растений – тонкая плёнка, пропитанная кутином и покрывающая эпидермис листьев и стеблей. Кутикула выполняет защитную и опорную функции. Стенка хлопкового волокна имеет слоистое строение. Наружный слой, толщиной менее 1 мк, называется первичной стенкой, или кутикулой. По химическому составу и структуре она существенно отличается от основной целлюлозной стенки; в ней содержится (в %):- целлюлозы – 54, протеина – 14, пектиновых веществ – 9, воска – 8, золы – 3, кутина – 4. Химический состав различен в разных проммышленных сортах. Наличие воска, имеющего гидрофобные свойства, приводит к тому, что волокно плохо смачивается водой. Первичная стенка состоит из фибрилл – тончайших нитей толщиной 100–200 А. Они образуют две сетчатые системы, покрывающие основной целлюлозную стенку с внешней стороны.

CUTIN = КУТИН – Cutin is a waxy, water-impermeable complex fatty substance impregnating the cell walls and as a separate layer, the cuticle, on the outer surface of the epidermis. / Под Кутином понимается воскоподобное вещество, выделяемое эпидермисом листьев растений. Препятствует потере воды поверхностью листа. По химической природе – смесь высших жирных кислот и их эфиров.

CUT MARK = ОТМЕТИНА ОТРЕЗА (или ОТМЕТИНА ДЛЯ КРОЯ) – Cut Mark is a mark stamped near the selvage of a warp during slashing to indicate a definite length or to separate one piece or 'cut' of cloth from the next.

CUTOFF = ОБРЕЗКИ (или XX) – Cutoff:- (plural) shorts originally made from jeans with the legs cut off at the knees or higher.

CUT–OFF GRADE = КРАЙНИЙ (ДОПУСТИМЫЙ) СОРТ (или ПРЕДЕЛЬНО ДОПУСТИМЫЙ СОРТ, или ПОРОГОВЫЙ СОРТ, или СОРТ ОТСЕЧКИ) – In mining industry, Cut-Off Grade is the lowest grade of mineralized material considered economic to process. Used in the calculation of ore reserves and resources. / В горной (горнодобывающей) промышленности, .

CUT–OFF TIME = ВРЕМЯ ПРЕКРАЩЕНИЯ ОПЕРАЦИЙ ТОГО ЖЕ ДНЯ – Cut-Off Time is a time of day specified by the receiver before which a batch must be received for processing to commence on that day. The deadline for performing a given action on a given day, e.g., for accepting payment messages from Real-Time Gross Settlement (RTGS) participants. / от участников Валовых Расчётов в Режиме Реального Времени (ВРРРВ).

CUT–OFF TIME = КРАЙНИЙ СРОК (или ОТВЕДЁННОЕ ВРЕМЯ) – Cut-Off Time is a last possible time when containers/cargoes may be delivered to a ship or designated point. The latest time cargo may be delivered to a terminal for loading to a scheduled train or ship. Last possible date cargoes may be delivered to a ship or a designated point.

CUT–ON–CROSS = РАЗРЕЗ ПОПЕРЁК – Cut-On-Cross:- a fabric that is cut so that the warp runs horizontally across the garment piece.

CUT–ON–FOLD = РАЗРЕЗ ВСКЛАДКУ – Cut-On-Fold:- a fabric that is doubled, then cut.

CUT OR GAUGE = ПОРЕЗ ИЛИ ШАГ – Cut or Gauge is the number of needles per inch in the circumference of the cylinder or dial of a knitting machine. / число игл на дюйм в окружности цилиндра или игольного диска (циферблата) трикотажной машины.

CUTOUT = ПРОРЕЖИВАНИЕ (или ЧЕКАНКА, или ПЕРИОД ПОКОЯ, или ЗАМЕДЛЕНИЕ РОСТА, или ОСТАНОВКА РОСТА) – Cutout is a final stage of Cotton Plant growth before boll opening; characterized by the predominance of more mature fruit, general absence of squares and blooms, and cessation of new terminal growth. According to more recent terminology, Cotton is approaching cutout at five nodes above white bloom and is generally considered to be cutout at three nodes above white bloom. Cotton blooming out the top is considered cutout. Cutout is a period of reduced growth and square production following a fruiting cycle. Usually deemed to start when nodes appear above flower. Cutout is a general empirical term used to signify the cessation or extended lapse in terminal growth due to the development of the boll load sink and the resulting demand for available nutrient and photosynthate resources. Cutout designates the end of the effective fruiting period, which may be related to the physiology of the plant (referred to as Physiological Cutout) or to the end-of-season growing conditions (referred to as Seasonal Cutout). (1) Physiological Cutout:- Crop development stage characterized by an nodes above white flower (NAWF) = 5. Without end-of-season restraints, physiological cutout signals the flowering date of the last effective boll population, i.e. NAWF=5 occurs before the last possible cutout date. (2) Premature Cutout:- Early cutout associated with excessive stress, e.g., drought or nitrogen deficiency. (3) Seasonal Cutout:- When the flowering date of the last effective flower date is determined by end-of-season weather restraints rather than crop maturity. Also referred to as the Last Possible Cutout Date. / Прореживание ветвей в кроне. , общего отсутствия подцветников и цветков, и . Период задержки роста и образования подцветника, следующий за циклом плодоношения. Считается, что обычно он начинается в момент образования узлов из цветков. Период Покоя:- период, во время которого рост замедляется и растению требуется меньше тепла и воды. Одни растения не имеют явного периода покоя, но у других, таких, как Цикламен, он выражен.

CUT PICK = ОБОРВАННАЯ (или РАССЕЧЁННАЯ, или ПОДРЕЗАННАЯ, или ОТОРВАННАЯ, или НАДОРВАННАЯ, или РАЗРЕЗАННАЯ) ПОПЕРЕЧНАЯ НИТЬ – Cut Pick:- xxxxx. See also Broken Pick. Fabrics defect. Broken Picks:- if a weft yarn is absent in the fabric for a very short or long width, and then this fabric defect is called Broken Picks.

CUT PILE = РАЗРЕЗНОЙ ВОРС – Cut Pile is a carpet fabric. In this type of weave the face of the carpet is composed of cut ends of pile yarn. The tops of the loops are cut in an uniform length. It is one of the most popular constructions for carpets. It is durable but the durability depends upon the type of fiber, density of the tufts and the amount of twist in the yarn. The cut pile is always twisted so that the shape is maintained uniformly. The tighter the twist is, the less bulky is the carpet, which does not show the footprints. Looser twisting creates a luxurious look and feel but it does not hold its shape well. See also Uncut Pile, and Weave. Cut Pile is a pile surface obtained by cutting the loops of yarn in a tufted or woven carpet. / Ткань с разрезным ворсом.

CUTS OR HOLES = ПОРЕЗЫ (или РАССЕЧКИ, или ПОДРЕЗЫ, или ОБРЫВЫ) ИЛИ ОТВЕРСТИЯ (или ДЫРЫ, или ПРОБОИНЫ) – Cuts Or Holes:- Fabric:- crêpe dress goods; Construction:- (i) Count:- 96 x 64; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 100/40 viscose-rayon crêpe, 2 S and 2 Z; Finish:- plain dyed rose. Defect:- small cuts throughout. Analysis:- examination revealed very small cuts and holes in various portions of the full piece, with no particular pattern or repeat. Since it was known that this fabric was woven on looms which were equipped with rubber-covered take-up rolls, it was considered unlikely that the damage could have occurred during weaving. It was learned from the dyer that, in keeping with the normal manner of processing this construction, the goods had been embossed prior to boil-off. The embossing acts to control irregular creping by guiding the pattern formation when the yarns contract during boil-off. In this case, it appeared that, through faulty operation of the embossing roll, or because of some defect in the engraving itself, the delicate rayon yarns had been slightly cut. In the following wet operations, the damaged and weakened yarns disintegrated, and this resulted in the appearance of numerous holes. / крэп (crêpe). Уточина:- .

CUTS or NICKS = ПОРЕЗЫ (или РАССЕЧКИ, или ПОДРЕЗЫ, или ОБРЫВЫ) или ЗАРУБКИ – Cuts or Nicks:- caused by indifferent handling of scissors, snips or mechanical trimmers. Finishing department defects, and namely – Trimming Defects. / Порок или дефект .

CUT SELVAGE = РВАНАЯ КРОМКА (или РАССЕЧЁННАЯ КРОМКА, или РАЗРЕЗАННАЯ КРОМКА, или НАДОРВАННАЯ КРОМКА) – Cut Selvage:- a cut or break occurring only in the selvage. A cut selvage is caused by incorrect loom adjustment during weaving or improper edge construction. The term also refers to loose edges cut during shearing of the fabric. Cut Selvage:- cuts or breaks that occur in the selvage only. Synonym:- Broken Selvage, and Damaged Selvage.

CUT STAPLE = РЕЗАНЫЙ СТАПЕЛЬ (или РАССЕЧЁННЫЙ СТАПЕЛЬ, или РВАНЫЙ СТАПЕЛЬ) – Cut Staple is:- (1) an inferior cotton fiber that was accidentally cut because it was too damp during ginning. (2) A term sometimes used to denote staple of manufactured fibers.

CUT TAPE = РАЗРЕЗАННАЯ ЛЕНТА (или РАССЕЧЁННАЯ ЛЕНТА, или НАДОРВАННАЯ ЛЕНТА) – (1) Cut Tape:- xxxxx. See also Slit Tape.

(2) A Cut Tape has the last major division at the head subdivided into finer graduations, usually in tenths of a foot (or meter), sometimes in hundredths. The use of this tape requires that the minor reading be subtracted from the major division reading. Some tapes have minor divisions at both the head and tail.

CUTTER = ЗАКРОЙЩИК – Cutter is:- (1) a firm engaged in making up garments from finished fabrics. (2) A person employed in the wholesale garment industry whose specific work is to cut layers of fabric to be formed into garments.

CUTTER = РЕЗАК (или РЕЗЕЦ) – Cutter is a mechanical device used to cut tow into staple.

CUTTING = ЧЕРЕНОК (или ОТВОДОК) – Cutting is a section of a plant capable of developing into a new plant. / Под Черенком понимается отрезок зелёного или одревеснevшего побега с почками, используемый для вегетативного размножения растений – укоренения, прививок. Черенки заготавливают с высококачественных растений, называемых Маточными. Полученные черенки сохраняют их свойства и признаки. Различают черенки стеблевые, листовые и корневые. Стеблевые черенки, взятые после опадения листьев, называются Зимними, а облиственные черенки – Летними или Зелёными. Зимние черенки (длиной 20–30 см) обычно заготавливают Осенью, чаще от однолетних приростов, высаживают Осенью или хранят прикопанными в подвале или в снегу и высаживают в грунт ранней Весной. Для летних черенков используют облиственные побеги, разрезая их на части длиной 5–10 см; иногда срезают часть коры с древесиной и одной почкой. Корневые черенки обычно заготавливают Осенью, разрезают на части длиной 10–15 см и хранят прикопанными в песке или торфе; высаживают Весной. В стеблевых и корневых черенках различают морфологически нижний, или базальный, конец, образующий корни, и верний, или апикальный, образующий побеги. Под Отводком понимается часть наземного стебля с почками, отделённая от материнского растения и посаженная самостоятельно путём засыпания землёю для получения нового растения. Один из простых и старейших способов вегетативного размножения. Размножение отводками применяется при разведении Земляники, Крыжовника, Фикуса и других растений. Под Отводком понимается часть наземного стебля с почками, не отделяемая от материнского растения на

период укоренения. Стебель с почками пригибают к земле и присыпают почвой. После его укоренения получают корнеспособные растения, которые сохраняют все биологические признаки материнской особи. Их отрезают и пересаживают на постоянное место. Используют в садоводстве, в том числе декоративном, лесоводстве.

CUTTING FLUID = ЖИДКОСТЬ ДЛЯ ФРЕЗЕРОВАНИЯ (или СМАЗОЧНО–ОХЛАЖДАЮЩАЯ ЖИДКОСТЬ, или ЭМУЛЬСОЛ) – Cutting Fluid is any fluid applied to a cutting tool to assist in the cutting operation by cooling, lubricating or other means. / Смазочно-Охлаждающие Жидкости (СОЖ), обычно сложные многокомпонентные системы, предназначенные в основном для смазки и охлаждения металлообрабатывающих инструментов и деталей, что способствует снижению износа инструментов и повышению точности обработанных деталей (в процессе обработки материалов СОЖ выполняют, кроме того, ряд других функций:- вымывают абразивную пыль и стружку, защищают обработанные детали, инструмент и оборудование от коррозии, улучшают санитарно-гигиенические условия работы). В зависимости от состава различают три группы СОЖ:- (1) Чистые минеральные масла или масла с противоизносными и противозадирными присадками жиров, органических соединений серы, хлора, фосфора; часто к ним добавляют также антикоррозионные, антиокислительные и антипенные присадки в количестве 5–50%. (2) Водные эмульсии минеральных масел, которые получают на месте потребления разбавлением водой эмульсолов, состоящих из 40–80% минерального масла и 20–60% эмульгаторов, связующих веществ, ингибиторов коррозии, антивспенивателей, бактерицидов. (3) Водные растворы поверхностно-активных веществ и низкомолекулярных полимеров, которые, аналогично эмульсолам, получают из концентратов, содержащих 40–60% поверхностно-активных веществ, полимеров, ингибиторов коррозии, антивспенивателей, бактерицидов и 40–60% воды. Концентрация рабочих эмульсий и растворов зависит от условий применения и обычно составляет 2–10%. СОЖ получают компаундированием (смешением) базовой основы с присадками. Применяются СОЖ главным образом при обработке металлов резанием, обработке металлов давлением, при обработке пластмассы и металлокерамики. В каждом отдельном случае выбор СОЖ определяется видом и режимом обработки, составом и свойствами инструментального и обрабатываемого материалов, требованиями к качеству обработанной поверхности, способом подачи жидкости и другим. Масляные СОЖ, благодаря их высоким смазочным свойствам, широко применяют при тяжёлых режимах обработки (низкие скорости, большие глубины резания); водные СОЖ с учётом их охлаждающих свойств используют главным образом для высокоскоростной обработки. Эмульсол – эмульсия для смазывания и охлаждения режущих инструментов. Эмульсолы, многокомпонентные составы на основе минеральных масел и поверхностно-активных веществ. При смешении с водой эмульсолы образуют устойчивые коллоидно-дисперсные системы типа лиофильных эмульсий или мицеллярных растворов, содержащих водонерастворимые компоненты в солюбилизованном состоянии (смотрите Солюбилизация). На 40–80% эмульсолы чаще всего состоят из масел нефтяных, на 10–30% – из мыл или мылоподобных поверхностно-активных веществ (сульфонатов, оксиэтилированных алкилфенолов, алифатических кислот и других), играющих роль эмульгаторов и солюбилизаторов. Кроме того, эмульсолы могут содержать спирты и полиэтиленгликоли, различного рода присадки, бактерициды, воду, иногда высокодисперсные твёрдые тела. Эмульсолы разных марок выпускаются промышленностью в виде концентратов, разбавлением которых водой получают смазочно-охлаждающие жидкости.

CUTTING OIL = МАСЛО ДЛЯ ФРЕЗЕРОВАНИЯ (или СМАЗОЧНО–ОХЛАЖДАЮЩЕЕ МАСЛО) – Cutting Oil is a lubricant used in machining operations for lubricating the tool in contact with the workpiece, and to remove heat. The fluid can be petroleum based, water based, or an emulsion of the two. The term Emulsifiable Cutting Oil normally indicates a petroleum-based concentrate to which water is added to form an emulsion which is the actual cutting fluid.

CUTTY SARK = КАТИ САК (или ОБРЕЗАННАЯ РУБАШКА) – Cutty Sark:- (chiefly Scottish) a short garment, especially a woman's short undergarment.

CUT VELVET = РАЗРЕЗНОЙ БАРХАТ – Cut Velvet has a pattern of velvet on a bare ground. Cut Velvet is a brocaded fabric with a background of chiffon or voile and a pattern of velvet. See also Beaded Velvet. Cut Velvet is:- (1) a fabric in which the looped pile has been cut; compare Velvet; and (2) a fabric having a pattern of figured velvet with a backing of chiffon or voile.

CUT–WATER = ВОДОРЕЗ (или ФАЛЬСТЕМ) – Cut-Water (maritime term):- the foremost part of the stem, cutting the water as the vessel forges ahead.

CUT WEFT = ПОДРЕЗАННЫЙ (или РАССЕЧЁННЫЙ, или НАДОРВАННЫЙ) УТОК – Cut Weft:- a pinhole in the finished fabric caused by the use of weak weft with a strong warp. Weaving defect. / Порок или дефект ткачества.

CUTWORM = ПОДГРЫЗАЮЩИЙ ЧЕРВЬ (или СОВКА) – Cutworm is a scientific name:- Spodoptera litura. A pest primarily of upland rice. Lowland rice suffers only from cutworm larvae migrating from adjacent grassy areas. Seedlings may be cut at ground level; the larvae defoliate older plants.

CUT YARN = РАЗРЕЗАННАЯ ПРЯЖА (или ПЕРЕСЛЕЖИСТАЯ ПРЯЖА, или ПРЯЖА С НАСЕЧКАМИ, или РАССЕЧЁННАЯ ПРЯЖА) – Cut Yarn is a defective yarn, i.e. cut partially or completely through, resulting from malprocessing. / Пряжа С Насечками – с толстыми и тонкими местами.

CV = CAPE VERDE

CV = CHEVAUX VAPEUR

CV = COEFFICIENT OF VARIATION

CV = CONSTRUCTED VALUE

CV = CONVERTIBLE (SECURITY)

CV = CULTIVAR

CV = CURRICULUM VITAE

CVD = COUNTERVAILING DUTY

CVE = CAPE VERDEAN ESCUDO

CVPA = COST–VOLUME–PROFIT ANALYSIS

CVP ANALYSIS = COST–VOLUME–PROFIT ANALYSIS

CW = CASEWORM

CWD = COURSEWARE DEVELOPMENT

CWE = CARCASS WEIGHT EQUIVALENT

CWE = CLEARED WITHOUT EXAMINATION

CWO = CASH WITH ORDER

CX = CANTOR EXCHANGE™

CX = CHRISTMAS ISLAND

CY = CONTAINER YARD

CY = CROP YEAR

CY = CYPRUS

CYAN = ЦИАНОВОЕ (или СИНЕ–ЗЕЛЁНОЕ, или ГОЛУБОЕ, или ЦИАН) – Cyan is a greenish blue color. Cyan is 'officially' the subtractive primary. It is the bluish color that is used in most printing processes, such as computer inkjet printing. The blue color that appears in those little colored squares that are sometimes found near the fold on advertising flyers, or on the bottom or flap of printed packages is cyan, or at least, cyan as approximated by the printing ink used. In the popular MX reactive dye family, Turquoise MX-G is a very good cyan. Cyan:- greenish blue. One of the four primary colors. / Краситель, применяемый при печати по субтрактивному трёхцветному методу. Туркуаз (в переводе с Французского языка – Бирюза или Бирюзовое) Эм.Экс.-Дьжи. (Turquoise MX-G).

CYAN, MAGENTA, YELLOW, BLACK = ЦИАНОВЫЙ, ФУКСИН (или КРАСНОВАТО–ЛИЛОВОЕ), ЖЁЛТОЕ, ЧЁРНОЕ – Cyan, Magenta, Yellow, Black (CMYK):- the colors used when printing process color (often referred to as 4-Color Process). These are special pigment colors of ink that are very transparent. CMYK is used where a photo realistic look and many colors are required. The blending of these 4 primary colors can generate the effect of several other colors.

CYATHIUM = ЦИАТИЙ (или БОКАЛЬЧИК, или БУКЕТИК, или КОРЗИНКА) – The name Cyathium is from the Latin Kuathion, diminutive of Kuathos, meaning Ladle. Cyathium is the cup-shaped inflorescence of a Euphorbia consisting of a cup-like involucre containing a single pistil (female flower) surrounded by male flowers, each contributing a single stamen. Variations on this occur with all-male or all-female flowers. The cyathium may be surounded by brightly colored bracts that give the appearance of a large flower. Cyathium is an inflorescence consisting of a cuplike cluster of modified leaves enclosing unisexual flowers or a female flower and several male flowers. Ciathya are the typical inflorescence of the Euphorbia. A Cyathium is the very special pseudanthia (false flower) in the Genus Euphorbia (Euphorbiaceae). It is an inflorescence with unisexual flowers (or a female flower and several male flowers) surrounded by a cup-like cluster of involucral bracts. This bracts or bracteoles are usually five (or four). The cyathium comprises also 1 to 10 nectar glands. The true female flower consists of an ovary on a short stem with pistil, it is extremely reduced and stands in the center. The 5 (-4) male flowers at the base of each bracteole are extremely reduced too, each consist of a single anther on a stem. The flower-like appearance of the cyathia are often emphasized by brightly colored nectar glands and by petal-like appendages to the nectar glands, or brightly colored, petal-like bracts positioned under the cyathia, e.g., the poinsettia. The cyathia are rarely solitary, but mostly in terminal or axillary cymes or clusters. Male cymes 1–10-flowered. / , означающее Ковш. единственную тычинку (stamen). Букетик – тип соцветия. Циатий – маленькое чашеобразное соцветие. Под Корзинкой понимается тип соцветия, в котором цветки сидят на расширенной оси в виде блюдцевидной или шаровидной площадки (у Подсолнечника, Ромашки и других Сложноцветных). Циатий или Бокальчик или Букетик (Cyathium), тип соцветия у Растений Семейства Молочайных. Состоит из конечного голого пестичного цветка и пяти групп сложных монохазиев тычиночных цветков, каждый из одной тычинки с сочленением между тычиночной нитью и цветоножкой. Циатий окружён пятью бокалообразно сросшимися кроющими листьями, несущими нектарные желёзки, и внешне напоминает один цветок (антодий).

CYC = CONTAINER YARD CHARGES

CY/CFS = КД/ГКС – CY/CFS:- cargo loaded in a full container by a shipper at origin, delivered to pier facility at destination, and then devanned by carrier for loose pick up. Full container, stuffed by a shipper at origin and delivered to a pier facility at destination where it is devanned by the carrier for subsequent delivery.

CYCLE = ЦИКЛ – Cycles:- variation where a point of observation returns to its origin. Certain price movement patterns are believed and observed to have recurrence according to Fibonacci sequential numbers, and thus can be predicted accordingly. It is most often used to provide an estimate of timing of a suspected turn of market movements, or a trend reversal. Cycle is a single complete operation consisting of progressive phases starting and ending at the neutral position. Repetitive or rhythmic price events over a long period of time that unfold in waves of higher and lower trends that have some predictive value. / Под Циклом, от Греческого слова Kýklos, означающее Круг, понимается совокупность явлений, процессов, составляющая кругооборот в течение известного промежутка времени, например, годовой цикл. В технике под Циклом понимается совокупность процессов в системе периодически повторяющихся явлений, при которых объект, подвергающийся изменению в определённой последовательности, вновь приходит в исходное состояние. В термодинамике Цикл – то же самое, что и круговой процесс. Цикл, совокупность взаимосвязанных процессов, работ, явлений, образующих законченный круг развития чего-либо, стройную систему (например, цикл лекций). Смотрите также Цикл Двигателя, Производственный Цикл. Цикл двигателя, совокупность последовательных процессов, периодически происходящих в двигателе внутреннего или внешнего сгорания и обусловливающих его работу. Различают термодинамический и действительный циклы. В отличие от термодинамического цикла в действительном цикле учитываются потери (тепловые, гидродинамические и другие). Цикл двигателя может быть изображён графически в координатах объём–давление (V, p) или энтропия–температура (S, T) рабочего тела в виде замкнутого контура; площадь, ограниченная этим контуром, пропорциональна совершаемой работе. В качестве примера на рисунке показаны термодинамические циклы, являющиеся прототипами действительных циклов карбюраторного двигателя и дизеля. Цикл карбюраторного двигателя состоит из сжатия рабочего тела (адиабата ac), подвода тепла Q_1 (изохора cz), неполного расширения (адиабата zb) и отвода тепла Q_2 (изохора ba). Цикл дизеля состоит из сжатия рабочего тела (адиабата ac), подвода тепла Q_1 (изобара cz), неполного расширения рабочего тела (адиабата zb) и отвода тепла Q_2 (изохора ba) или из сжатия рабочего тела (изотерма ac), подвода тепла Q'_1 (изохора cz") и $Q"_1$ (изобара zz"), неполного расширения рабочего тела (адиабата zb) и отвода тепла Q_2 (изохора ba). Газотурбинные установки работают по циклу с подводом тепла при постоянном давлении и полным расширением. Он состоит из сжатия рабочего тела (адиабата ac), подвода тепла Q_1 (изобара cz), расширения рабочего тела (адиабата zb) и отдачи тепла Q_2 (изобара ba). Возможна работа газотурбинных двигателей по циклу с подводом тепла Q_1 при постоянном объёме. Паровые машины и турбины работают по Циклу Ранкина. Смотрите также Цикл Карно, Круговой Процесс. Цикл – совокупность процессов, работ, операций, образующих в совокупности законченную круговую последовательность. Например, жизненный цикл, производственный цикл, воспроизводственный цикл.

CYCLE COUNT = ЦИКЛИЧНЫЙ (или ЦИКЛИЧЕСКИЙ) ПОДСЧЁТ – Cycle Count is a counting inventory by checking a particular location or set of locations and comparing the physical counts with the system-maintained inventory levels.

CYCLE COUNTING = ЦИКЛИЧНЫЙ (или ЦИКЛИЧЕСКИЙ) ПОДСЧЁТ – Cycle Counting is the physical counting of portions of inventory on an on-going basis. After a period of time all products have been counted. A cycle is then defined as the time it takes to count all inventory once.

CYCLES PER SECOND = ЦИКЛОВ В СЕКУНДУ – Cycles-Per-Second is a measure of the frequency in an ac electric system. Abbreviated cps or cycles. Now replaced with the unit Hertz. Also known as Frequency. / Циклов в Секунду – единица измерения частоты в электрической системе переменного тока. Обозначение:- цвс (cps) или циклы (cycles). В настоящее время заменено единицей измерения Герц. Известны также как Частота (Frequency).

CYCLE TIME = ВРЕМЯ ЦИКЛА (или СРОК ОБРАЩЕНИЯ) – Cycle Time is the elapsed time between commencement and completion of a process. Cycle Time is the amount of time it takes to complete a business process. For example, the amount of time from when a service is ordered until it is received by the customer.

CYCLE TIME REDUCTION = СОКРАЩЕНИЕ ВРЕМЕНИ ЦИКЛА – Cycle Time Reduction is the process of reducing cycle time, cutting costs and improveing customer service.

CYCLICALS = CYCLICAL SECURITIES

CYCLICALS = CYCLICAL STOCKS

CYCLICAL STOCKS = ЦИКЛИЧНЫЕ ЦЕННЫЕ БУМАГИ – Cyclical Stocks are the shares of companies that are highly sensitive to economic performance, such as provision of raw materials, metals, etc. Cyclical stocks tend to perform well when the economy is growing and suffer when the economy contracts with the business cycle. For example, auto (General Motors), chemical (DuPont), paper (International Paper), steel (Nucor), and transportation (FDX Corp.) represent a few cyclical industries. / Дьженерэл Мотоз (General Motors), ДюПо (DuPont), Интёнэшэнэл Пэйпё (International Paper), Нюкор (Nucor), и Эф.Ди.Экс. Корп. (FDX Corp.).

CYCLICAL UNEMPLOYMENT = ЦИКЛИЧНАЯ БЕЗРАБОТИЦА – Cyclical Unemployment is unemployment caused by a low level of aggregate demand associated with recession in the business cycle.

CYCLIC STRESS–STRAIN = ЦИКЛИЧЕСКОЕ НАПРЯЖЕНИЕ–ДЕФОРМАЦИЯ – Cyclic Stress-Strain:- repeated loading of a yarn on a tensile testing machine and the determination of the physical properties of the yarn during these cycles.

CYCLIC TRIMER = ЦИКЛИЧЕСКИЙ ТРИМЕР – Cyclic Trimer:- strictly, a polymer, in cyclic form, that contains three repeating groups. Cyclic trimer is a by-product found in all commercial polyester and results in deposit buildup in package-dyeing equipment.

CYCLODEXTRIN = ЦИКЛОДЭКСТРИН (или ЦИКЛОДЕКСТРИН) – Cyclodextrin:- the enzymatic degradation of starch by cyclodextrin-glycosyltransferase (CGT) produces cyclic oligomers:- Cyclodextrins non-reducing, crystalline, water soluble, cyclic, oligosaccharides. Cyclodextrins consist of glucose monomers arranged in a donut shape ring. Three naturally occurring CDs are alpha Cyclodextrin, beta Cyclodextrin, and gamma Cyclodextrin. All the hydroxyl groups in Cyclodextrins are oriented to the outside of the ring while the glucosidic oxygen and two rings of the non-exchangeable hydrogen atoms are directed towards the interior of the cavity. This combination gives Cyclodextrins a hydrophobic inner cavity and a hydrophilic exterior. The hydrophobic internal cavity provides the capability to form inclusion complexes with a variety of 'guest' hydrophobic molecules (e.g., aromatics, alcohols, halides, fatty acids, esters, etc). How does Cyclodextrin look like? Cyclodextrins have a specific toroidal shape:- a tight conical cylinder with a hydrophilic exterior (due to the presence of hydroxyl radicals) and a hydrophobic cavity of a specific size. Generally 6–8 sugar units. What are the types of Cyclodextrin? The most common cyclodextrins are alpha, beta, and gamma cyclodextrins having six (α), seven (β), or eight (γ) anhydroglucose units in the ring structure. Among them, beta Cyclodextrin is mostly common used. Different sizes lead to different physicochemical characteristics for the respective molecules:- (i) characteristics – α, number of glucose units – 6, molecular weight – 972, cavity diameter (nm) – 0.57, height of torus (nm) – 0.78, and solubility in water (g/100ml) at 25 °C – 14.5; (ii) characteristics – β, number of glucose units – 7, molecular weight – 1 135, cavity diameter (nm) – 0.78, height of torus (nm) – 0.78, and solubility in water (g/100ml) at 25 °C – 1.85; and (iii) characteristics – γ, number of glucose units – 8, molecular weight – 1 297, cavity diameter (nm) – 0.95, height of torus (nm) – 0.78, and solubility in water (g/100ml) at 25 °C – 23.2. Chemically modified Cyclodextrins:- cyclodextrins can be modified by various procedures such as:- (i) substituting one or more hydrogen atoms in the primary and/or secondary hydroxyl groups (esters, ethers, glycosylcyclodextrin); and (ii) substituting one or more primary and/or secondary hydroxyl groups. Chemically modified Cyclodextrins (CDM's) exhibit substantially increased aqueous solubility with concomitant retention of the inclusion complexing properties of the starting Cyclodextrin. They therefore appear to offer specific applications within various industries, such as foods, pharmaceuticals, personal care/cosmetics, diagnostics, etc. Hydroxyalkyl b Cyclodextrins such as Hydroxypropyl b Cyclodextrin (the Febreze active) are examples of those chemically modified. How does Cyclodextrin work? Cyclodextrin inclusion is a molecular phenomenon in which usually only one guest molecule interacts with the cavity of a Cyclodextrin molecule to become entrapped and form a stable association. Molecules or functional groups of molecules those are less hydrophilic than water, can be included in the Cyclodextrin cavity in the presence of water. In order to become complex, the 'guest molecules' should fit, at least partly, into the Cyclodextrin cavity. The cavity sizes as well as possible chemical modifications determine the affinity of Cyclodextrins to the various molecules. In the case of some low molecular weight molecules, more than one guest molecule may fit into the cavity. On the opposite, some high molecular weight molecules may bind more than one Cyclodextrin molecule. Therefore a 1 to1 molar ratio is not always achieved, which broadens the range of applications. Cyclodextrins are able to form inclusion complexes with broad range hydrophobic molecules as poorly soluble drugs, rapidly deteriorating flavours, volatile fragrances, toxic pesticides or dangerous explosives, even gases; entrapping these substances in their inner cavities. For example, a-Cyclodextrin forms inclusion complexes with both aliphatic hydrocarbons and gases, such as carbon dioxide. B-Cyclodextrin typically forms complexes with small aromatic molecules. G-Cyclodextrin can accept more bulky compounds, including vitamin D2 or organic macro cycles. This results in the physical and chemical characteristics of the guest molecules:- (i) In the solid state:- (a) the guest molecule is molecularly dispersed in the CD matrix, even with gaseous guest molecules; (b) the guest molecule is effectively protected against any type of reaction, except with CD's hydroxyls; and (c) sublimation and volatility are reduced to a very low level. (ii) In aqueous solution:- (a) concentration of the poorly soluble guest molecule in the dissolved phase increases significantly; (b) reactivity of the guest molecule decreases in most cases; and (c) the diffusion and volatility of the included guest decrease significantly. How does Cyclodextrin Work for Febreze? Febreze is an odor-eliminating product with modified β Cyclodextrin as one of its main ingredients. When Febreze is sprayed onto fabrics, the some-what soluble malodour molecules are dissolved in water. This is an essential part of the deodorization process. As a second step, when the solution dries, more and more malodour molecules complex with Cyclodextrin and are effectively retained to keep their concentration in the air low. This total process (water dissolution + complexation) decreases the volatility of the malodour molecules and causes odor elimination. The chemical equilibria involved in the deodorization process are as follows:- (i) solubilization of the

volatile compound (G); (ii) complexation with the Cyclodextrin (C) molecule; and (iii) precipitation of the complex as item dries. What does Cyclodextrin do? (i) Solubilization:- (a) enhancement of water solubility of lipophilics; and (b) change of rheological Properties Increase of bioavailability. (ii) Stabilization:- (a) of an active ingredient; (b) of an emulsion; (c) of a volatile compound; (d) against UV light; (e) against temperature; (f) against Oxidation; and (g) against hydrolysis. (iii) Reduction of:- (a) bad taste; (b) unpleasant odor; (c) skin irritation; and (d) hygroscopicity. (iv) Controlled release of actives. (v) Selective extraction. Where is Cyclodextrin used? (1) Ink Industry:- (i) water soluble dyes in water based systems for ink jet printers; (ii) water resistance – fixing characteristics in ink jet printers; (iii) water resistance in thermal ink jet printing; (iv) aqueous composition/wettability in writing ustencils; and (v) greater florescent yield in highlighter pen. (2) Fragrance/Flavour:- (i) controlled release (ex:- chewing-gum flavor); and (ii) complexation of perfumes/oils. (3) Food:- (i) selective extraction of Naringen & limonen from citrus juice; (ii) selective extraction of caffeine from tea/coffee; (iii) selective extraction of pigments which are precursors of enzymic browning of fruit juices; (iv) complexation of triglycerides in vegetable oils with a high content of polyunsaturated fatty acids to improve stability. (4) Cosmetics:- (i) reduced irritancy of fragrances in shampoos; (ii) controlled release of actives (ex: fragrance in body lotion); (iii) protection of actives against oxidization; (iv) skin treatment of acne, through complexation of sebum; (v) foot deodorants; (vi) increased stability of antiplaque toothpaste; (vii) higher concentration of lipophilic substances in aqueous emulsions (ex: face lotions); and (viii) masking unpleasant odor of a volatile compound (ex: mercaptan in permanent wave product / self tanning products). / Сродство (Affinity). /смачиваемость (wettability). Под Циклодекстринами, от Греческого слова Kýklos, означающее Круг, и Латинского слова Dexter, означающее Правый, понимаются . Под Декстринами понимаются продукты частичного расщепления полисахаридов. Декстрины из крахмала применяют в качестве клеящих веществ в текстильной, полиграфической и обувной промышленности.

CYCLONE = ЦИКЛОН – In the cotton gin, Cyclone is a centrifugal air pollution control device for separating solid particles from an airstream. / В хлопковом волокноотделителе (или джине) под Циклоном, от Греческого слова Kyklōn, означающее Вращающийся или Кружащийся, понимается центрифужное устройство контроля загрязнения воздуха для отделения твёрдых частий из воздушного потока.

CYCLONE ROBBER SYSTEM = СИСТЕМА ЦИКЛОНОВ ДЛЯ ОЧЁСЫВАНИЯ – In the cotton gin, Cyclone Robber System a secondary cyclone trash handling system. These systems are not used at most cotton gins.

CY/CY = КД/КД – CY/CY:- cargo loaded by shipper in a full container at origin and delivered to carrier's terminal at destination for pick up intact by consignee. Full container, stuffed by shipper at origin and delivered to carrier's terminal for vessel loading and discharged at destination terminal for pick up and unstuffing by consignee. / Полный контейнер, забитый грузоотправителем на месте происхождения и поставленный на терминал перевозчика для погрузки на судно и выгруженный на терминал пункта назначения для доставки и разбивки консигнатором.

CYLINDER = БАРАБАН (или ЦИЛИНДР, или ГРУЗОВИК) – Cylinder is:- (1) in carding, a large cast iron shell, with an outer diameter of 40 to 45 inches, completely covered with card clothing on the surface. The shell is mounted rigidly on a shaft which projects at each end to rest in bearings. The cylinder must be accurately balanced since it rotates at speeds of 160 revolutions per minute and higher. (2) The main roll, or pressure bowl, on roller printing machines. The engraved rolls that apply color are arranged around the cylinder. See also Printing, and Roller Printing. (3) A slotted cylindrical housing for the needles in a circular-knitting machine. The number of slots per inch in the cylinder determines the cut of the machine. (4) See also Drying Cylinders. / Призма Жаккардовой машины. (1) барабан чёсальной машины. (2) Грузовик или Пресс вальцовой печатной машины. (4) Смотрите также Сушильные Барабаны (Drying Cylinders).

CYLINDER = ЦИЛИНДР – Cylinder is a device which converts fluid power into linear mechanical force and motion. It usually consists of a moveable element such as a piston and piston rod, plunger rod, plunger or ram, operating with in a cylindrical bore. / Под Цилиндром понимается одна из основных деталей машин и механизмов, например, двигателя внутреннего сгорания, паровой машины, гидравлических или пневматических систем, – полая деталь с цилиндрической внутренней поверхностью. В цилиндре совершает возвратно-поступательное или вращательное и поступательное движение поршень, который взаимодействует с рабочим телом, в результате чего осуществляется рабочий процесс. Под Цилиндром, от Греческого слова Kýlindros, означающее Валик или Каток, понимается деталь машины, имеющая внутреннюю цилиндрическую полость, в которой может перемещаться поршень или плунжер, изменяя объём полостей по одну и другую сторону поршня. В цилиндре преобразуется энергия подаваемого в него рабочего тела (пара, горючей смеси), оказывающего давление на поршень, в энергию движения поршня (в тепловых двигателях) или энергия движения поршня – в энергию жидкости или газа (в насосах или компрессорах). Если используется полость с одной стороны поршня, то цилиндр закрывают крышкой с одного конца, если же используют обе полости, то предусматривают две крышки и шток, связывающий поршень с ползуном. В гидравлическом и пневматическом приводах поступательные движения (в металлорежущих станках, прессах, подъёмниках), а также в некоторых поршневых машинах цилиндры выполняют в виде обособленной детали. В многоцилиндровых поршневых машинах (в двигателях внутреннего сгорания и других) цилиндры часто объединяют в общий блок, располагая их в ряд (рядный двигатель), под углом (V–образный двигатель) или друг против друга (оппозитный двигатель), – так называемый Блок Цилиндров. В насосах и гидромоторах бесступенчатых приводов вращательного движения цилиндры часто размещают в роторе радиально или параллельно оси ротора.

CYLINDER CLEANER = ЦИЛИНДРИЧЕСКИЙ (или ЦИЛИНДРОВЫЙ, или БАРАБАННЫЙ) ОЧИСТИТЕЛЬ – In the cotton gin, Cylinder Cleaner is a machine with rotating spiked drums that open the locks and clean the cotton by removing dirt and small trash.

CYLINDER OIL = ЦИЛИНДРОВОЕ МАСЛО – Cylinder Oil is a lubricant for independently lubricated cylinders, such as those of steam engines and air compressors; also for lubrication of valves and other elements in the cylinder area. Steam cylinder oils are available in a range of grades with high viscosities to compensate for the thinning effect of high temperatures; of these, the heavier grades are formulated for super-heated and high-pressure steam, and the less heavy grades for wet, saturated, or low-pressure steam. Some grades are compounded for service in excessive moisture. See also Compounded Oil. Cylinder oils lubricate on a once-through basis. / ; также для смазывания клапанов и других элементов в . Под Цилиндровыми Маслами понимаются дистиллятные и остаточные нефтяные смазочные масла, предназначенные главным образом для горячих частей паровых машин. Бывают двух типов:- для машин, работающих на насыщенном паре, и для машин, работающих на перегретом паре. В последнем случае цилиндровые масла должны отличаться более высокими вязкостью и температурой вспышки. Основные свойства цилиндровых масел – хорошее распыливание, стойкость против смывания и окисления (нагарообразования). Кинематическая вязкость цилиндровых масел $(9–70)\cdot10^{-6}$ $м^2/с$ (при 100 °C). Цилиндровые Масла, малоочищенные нефтяные масла, используемые для смазывания цилиндров, золотников, штоков и клапанов паровых машин. Некоторые цилиндровые масла применяют в судовых крейцкопфных дизелях. Цилиндровые масла обладают хорошей смазывающей способностью, не склонны к нагарообразованию, предотвращают коррозию металлических поверхностей. Различают цилиндровые масла для машин, работающих с насыщенным и с перегретым паром. Цилиндровые масла имеют сравнительно высокую вязкость (до

$70 \cdot 10^{-6}$ квадратных метров в секунду ($м^2$/сек) при 100 °C), обусловливающую их герметизирующую способность и стойкость к смыванию конденсатом или влажным паром.

CYLINDRIC = ЦИЛИНДРИЧЕСКИЙ – Cylindric:- with a cylindrical shape.

CYLINDER LOADING = ЗАБИВКА БАРАБАНА (или ЗАГРУЗКА ЦИЛИНДРА) – Cylinder Loading:- fibers imbedded so deeply in the wire clothing on a card cylinder that they resist transfer to the doffer cylinder according to the normal fiber path through the card. Causes include improper finish, excess moisture, or static on the fiber. The fiber builds up to such an extent that the carding operation is adversely affected. In extreme cases, the card will be slowed or stopped.

CYMATIC PRINTING = СИМАТИЧЕСКОЕ ПЕЧАТАНИЕ – Cymatic Printing:- this proprietary process owned by KBC is a method in which the oscillations of a musical chord are 'caught' on a quartz plate and the vibration patterns photographed. The patterns thus obtained are used in making unique print fabrics of unusual variety and originality.

CYME = ПОЛУЗОНТИК (или ЛОЖНЫЙ ЗОНТИК, или ЩИТОК) – From Latin Cyma, meaning 'the young sprount of a cabbage', from Greek Kuma = Anything Swollen. Cyme is a flat-topped or domed inflorescence in which the central or terminal flower in the cluster opens first. Cyme is an inflorescence in which the first flower is the terminal bud of the main stem and subsequent flowers develop as terminal buds of lateral stems. Cyme is a usually flat-topped or convex determinate inflorescence in which the central main stem and each side branch end in a flower. The flowers in the cluster begin blooming from the flower on the main stem downwards or outwards. Baby's breath, dogwood, and the tomato have cymes. / в котором центральный или верхушечный цветок в грозди (cluster) открывается первым. Под Зонтиком понимается тип соцветия с укороченной главной осью и цветками, располагающимися на удлинённых цветоножках почти в одной плоскости. Простой зонтик у Вишни, Примулы, сложный – у многих Растений Семейства Зонтичных, например, Анис, Вех, Кориандр, Петрушка, Тмин, Укроп. Под Щитком понимается:- (1) тип соцветия, в котором нижние цветоножки (простой щиток) или ветви (сложный щиток) длиннее верхних, а цветки располагаются в одной плоскости, например, у Тысячелистника и других. (2) Первый (семядольный) лист зародыша злаков, прилегающий к эндосперму и использующий его питательные вещества.

CYNARRHODIUM = СИНАРРОДИУМ (или ЦИНАРРОДИЙ) – Cynarrhodium is a fleshy, hollow fruit enclosing achenes, typical of Roses. / мясистый (fleshy) , содержащий семянки, .

CYP = CYPRUS POUND

CYTOGENETICS = ЦИТОГЕНЕТИКА – Cytogenetics is a branch of biology that deals with the correlated study of genetics and cytology. / Под Цитогенетикой, от Греческих слов Кýtos, означающее Вместилище или Клетка (в данном случае), и Génesis, означающее Происхождение, понимается отрасль генетики, изучающая закономерности наследственности и изменчивости на уровне клетки и субклеточных структур (главным образом хромосом).

CYTOKINESIS = ЦИТОКИНЕЗ (или ЦИТОТОМИЯ) – Cytokinesis is the process of division of a whole cell, distinct from karyokinesis division of the cell nucleus. / Под Цитокинезом или Цитотомией, от Греческих слов Кýtos, означающее Вместилище или Клетка, и Tomē, означающее Рассечение, понимается деление тела клетки в заключительной стадии – телофазе; в растительной клетке образуется клеточная перегородка, в животной – перетяжка, или борозда деления.

CYTOKININS = ЦИТОКИНИНЫ – Cytokinins are a group of plant growth-regulating substances and hormones (natural or synthetic) that regulate cell division and shoot formation. / Под Цитокининами или Кининами понимается группа гормонов растений, производные азотистого основания пурина. Повышают скорость деления клеток; способствуют дифференцировке растительных клеток, выращиваемых в культуре. Основной представитель – кинетин.

CYTOLOGY = ЦИТОЛОГИЯ – Cytology is a branch of biology that deals with the study of structure, function, development, reproduction, and life history of cells. / Под Цитологией, от Греческих слов Кýtos, означающее Вместилище или Клетка (в данном случае), и Lógos, означающее Слово или Учение, понимается наука о клетке. Изучает строение и функции клеток, их связи и отношения в органах и тканях у многоклеточных организмов, а также одноклеточные организмы. Исследуя клетку как важнейшую структурную единицу живого, цитология занимает центральное положение в ряду биологических дисциплин; она тесно связана с гистологией, анатомией растений, физиологией, генетикой, биохимией, микробиологией и другим. Изучение клеточного строения организмов было начато микроскопистами XVII века (Английский естествоиспытатель, разносторонний учёный и экспериментатор Робэт Хук (или Гук (Robert Hooke); 1635–1703), Итальянский биолог и врач Марчэллё Мальпиги (Marcello Malpighi; 1628–94), Нидерландский натуралист Антони фан Лэйвэнюк (Antonie van Leeuwenhoek; 1632–1723)); в XIX веке была создана единая для всего органического мира клеточная теория (Немецкий физиолог Тиодор Шванн (Theodor Schwann; родился 07 Декабря 1810 – умер 11 Января 1882) в 1839). В XX веке быстрому прогрессу цитологии способствовали новые методы (электронная микроскопия, изотопные индикаторы, культивирование клеток и другое).

CYTOPLASM = ЦИТОПЛАЗМА – Cytoplasm is the contents of the cell excluding the cell nucleus. Cytoplasm is all the protoplasm of a cell except the nucleus. / Под Цитоплазмой, от Греческих слов Цито (Кýtos), означающее Вместилище или Клетка, и Плазма (Plásma), означающее Вылепленное или Оформленное, понимается внеядерная часть протоплазмы животных и растительных клеток. Состоит из гиалоплазмы, в которой содержатся органоиды и другие включения.

CYTOPLASMIC HEREDITY/INHERITANCE = ЦИТОПЛАЗМАТИЧЕСКАЯ НАСЛЕДСТВЕННОСТЬ/НАСЛЕДОВАНИЕ – Cytoplasmic Heredity/Inheritance is the transmission of characters from parent to offspring through the cytoplasm of the germ cell. / свойства (characters) .

CYTOPLASMIC MALE STERILE LINE = СТЕРИЛЬНАЯ МУЖСКАЯ ЦИТОПЛАЗМЕННАЯ ЛИНИЯ – Cytoplasmic Male Sterile (CMS) Line is a line whose anthers produce no pollen or only abortive pollens. A genetic factor which induces sterility is present in its cytoplasm. No seed is set on this line by selfing. But its pistil is normal and can produce seeds when pollinated by a restorer or maintainer line. / Линия, пыльники которой . В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

CZ = CZECH REPUBLIC

CZK = CZECH KORUNA

- D -

d = DAY

d = DECI = 10^{-2}

D = DELTA

D = DENIER

D = DURATION OF TREATMENT

D = ДИ. – (1) D is fifth letter of a NASDAQ® stock symbol specifying that it is a new issue, such as the result of a reverse split. / НЭЗДЭК® (NASDAQ®) .

(2) The letter 'D' some times stands for Denier.

D&A = DRY AND ABANDONED

D&B = DUN AND BRADSTREET

D&H = DANGEROUS AND HAZARDOUS

da = DEKA = 10

DA = DEPOSIT ACCOUNT

DA = DISBURSEMENT ACCOUNT

D/A = DOCUMENTS AGAINST ACCEPTANCE

DAA = DAYS AFTER ANTHESIS

DAC = DEFERRED ACQUISITION COSTS

DAC = DELIVERY AGAINST COST

DAC = DEVELOPMENT ASSISTANCE COMMITTEE

DACRON® = ДЭКРОН® (или ДАКРОН®) – Dacron® is a trademark for a polyester fiber. Dacron® is a condensation polymer obtained from ethylene glycol and terephthalic acid. Its properties include high tensile strength, high resistance to stretching, both wet and dry, and good resistance to degradation by chemical bleaches and to abrasion. The continuous filament yarn is used in curtains, dress fabrics, high-pressure fire hoses, men's shirts, and thread. The staple fiber is ideal for mixing with wool in men's and women's suits, as well as in dress fabrics, knitted wear, and washable woven sportswear. Dacron® is a trademark used for a synthetic polyester textile fiber. Polyester is today's 'classic' sailcloth fiber. It is often called by the Dupont trade name Dacron® although there are other suppliers of polyester yarn used in sailcloth. Polyester is widely used for its combination of reasonably low stretch, good strength, low cost and durability. Because it can be heated and shrunk during weaving to form a tight, stable woven cloth, polyester woven sailcloth remains a good choice for cruising sails and certain racing sails. Polyester is available in many types. DuPont's Type 52 fiber was the standard yarn type found in 'Dacron®' sailcloth for many years as it offered a good balance of strength, reasonably low stretch and maximum shrinkage during heat setting (which 'temperature tightens' the weave during manufacturing). Type 52 yarn was discontinued several years ago by the manufacturer, but other premium polyesters with comparably excellent properties at more attractive prices, are now available from Asian and European suppliers. Their use in sailcloth has increased over the last few years at the expense of Dacron®. / ДюПо (DuPont) торговое название Дэкрон® (или Дакрон®; Dacron®).

DAD = DAYS AFTER DRAINING

DAE = DAYS AFTER EMERGENCE

DAF = DAYS AFTER FLOWERING

DAF = DELIVERED AT FRONTIER

DAF = DNA AMPLIFICATION FINGERPRINTING

DAH = DAYS AFTER HARVEST

DAI = DAYS AFTER INOCULATION

DAILY BALANCE INTEREST CALCULATION = КАЛЬКУЛЯЦИЯ ПОСУТОЧНОЙ СТАВКИ ПРОЦЕНТА НА ОСНОВЕ БАЛАНСА (или КАЛЬКУЛЯЦИЯ ПРОЦЕНТА НА ОСНОВЕ УЧЁТА ЕЖЕДНЕВНОГО (или ПОСУТОЧНОГО) БАЛАНСА (или САЛЬДО)) – Daily Balance Interest Calculation is a method customarily used for calculating interest on current accounts, with interest based on the daily balance. Interest is paid on the existing balance until it changes.

DAILY CHART = ПОСУТОЧНЫЙ ГРАФИК – In technical analysis, Daily Chart is a graphical representation of price where the time interval is one day for each bar. The term Daily is used to describe those charts that are constructed of daily bars. Each daily bar contains the open, high, low and close that occurred during each trading day. / Термин Посуточный используется для описания графиков, строящихся на суточных штрихах. Каждый суточный штрих содержит цены открытия, максимальную, минимальную и закрытия, которые были в течение каждого торгового дня.

DAILY CLOSE = ПОСУТОЧНОЕ ЗАКРЫТИЕ – The Daily Close is the last price received at the end of the last trading session of the trading day. / Посуточное Закрытие это последняя цена в конце последней торговой сессии данного торгового дня.

DAILY OFFICIAL LIST = ПОСУТОЧНЫЙ ОФИЦИАЛЬНЫЙ СПИСОК – In the United Kingdom, the Daily Official List (DOL) is a daily record setting out the prices of all trades in securities conducted on the exchange. / В Соединённом Королевстве, Посуточный Официальный Список (ПОС) является ежедневным бюллетенем, излагающим цены всех сделок с ценными бумагами, выставленными на бирже.

DAILY PRICE LIMIT = ПОСУТОЧНЫЙ ЛИМИТ ЦЕНЫ – Daily Price Limit is the maximum price advance or decline from the previous day's settlement price permitted during one trading session, as fixed by the rules of an exchange. Daily Price Limit is the maximum price, increase/decrease, permitted from the previous day's settlement price. / Посуточный Лимит Цены – максимальное повышение или понижение от установленной цены предыдущего дня, разрешённое в течение одной торговой сессии, как определено регламентом биржи.

DAILY REVERSAL = ПОСУТОЧНЫЙ РАЗВОРОТ – Daily Reversal is a specific pattern of one day in duration that is expected to lead to a change in direction for the market. / Посуточный Разворот – специфическая модель продолжительностью в одни сутки, которая предположительно приведёт к изменению направления движения рынка.

DAILY SHIPMENT COUNT = ПОСУТОЧНЫЙ ПОДСЧЁТ ОТГРУЗОК – Daily Shipment Count:- an alternative method of recording revenue cargo traffic volume in addition to more conventional measures such as weight (e.g., tonnes and tons) and combining weight with distance (e.g., revenue tonne-kilometers and revenue tonne-miles). Most often used by integrated (express) carriers because their business is composed largely of smaller parcels.

DAILY TRADING LIMIT = ПОСУТОЧНЫЙ ЛИМИТ ТОРГОВЛИ – Daily Trading Limit is the maximum amount of gain or loss that can occur on a particular security or, more commonly, derivative on a trading day. Derivatives, currencies, and commodities can be extremely volatile investments. In order to prevent this volatility from spiraling out of control, options and futures exchanges enact daily trading limits stating that a security cannot rise or fall more than a certain percent in a given trading day. If a security reaches the daily trading limit, trading on that security is suspended for the remainder of the day. This is called a Locked Market. See also Limit Down, and Limit Up. Daily Trading Limit is the maximum price range set by the exchange each day for a contract. Daily Trading Limit is the maximum gain or loss on a derivative contract, such as options and futures contracts, that is allowed in any one trading session. The limits are imposed by the exchanges in order to protect against extreme volatility or manipulation within the markets. When daily trading limits have been reached, it is said to be a 'locked market', and trading will halt for any trades that break the threshold or trading will close for that particular security. Daily trading limits can also be in place for currency trading, such as China's daily trading limit of 0.5% for the Chinese renminbi against the US Dollar. When a particular commodity or contract has reached the daily trading limit, it may be considered 'limit up' or 'limit down', depending on the direction of the day's move. Trading limits are much more important for derivatives than for stocks or bonds, for example, because so many investors use massive amounts of leverage to trade commodities, currencies and futures contracts. In commodities, Daily Trading Limit is the range of prices within which trades may take place during a day. The limit is usually determined on the basis of the previous day's settlement price. / Максимальный ценовой диапазон для любого контракта, установленный биржей на каждые сутки. Посуточный Лимит Торговли – максимально допустимый подъём или спад цен по многим видам ценных бумаг и товарно-сырьевой продукции в течение одного дня. Когда рынок в начале дня достигает разрешённого предела и остаётся на этом уровне в течение всего дня, такой день называется днём верхнего или нижнего предела. Биржи обычно устанавливают посуточный лимит по каждому контракту. Например, Чикагская Товарная Биржа ограничивает колебания цен двумя пунктами (2 000 Долларов по каждому контракту) вверх или вниз на свои фьючерсные опционные контракты на казначейские облигации.

DAIRY BULLS = БЫКИ МОЛОЧНОЙ ПОРОДЫ (или МОЛОЧНЫЕ БЫКИ) – Dairy Bulls:- intact male dairy breed Cattle intended for reproductive purposes.

DAIRY CALVES = ТЕЛЯТА МОЛОЧНОЙ ПОРОДЫ (или МОЛОЧНЫЕ ТЕЛЯТА) – Dairy Calves:- female or male dairy cattle fed a ration that includes milk or liquid milk replacer and not intended for veal production.

DAIRY CATTLE = КРУПНЫЙ РОГАТЫЙ СКОТ МОЛОЧНОЙ ПОРОДЫ (или КРУПНОРОГАТЫЙ СКОТ МОЛОЧНОЙ ПОРОДЫ, или МОЛОЧНЫЙ СКОТ) – Dairy Cattle:- the Cattle that are intended for or related to the production of milk for human consumption and/or offspring that will produce milk or meat for human food (including veal calves).

DAISY DUKES = ДЭЙЗИ ДЮКС – Daisy Dukes:- brief, tight-fitting denim shorts for women, typically made from a pair of cut-off jeans. Origin (1990s):- from Daisy Mae Duke, the name of a character in the 1970s US television series The Dukes of Hazzard, who often wore shorts of this type. (She appeared numerous times wearing tight and short denim shorts, which later became colloquially known as 'Daisy Dukes'.) Daisy Mae Duke is a fictional character, played by Catherine Bach, from the American television series The Dukes of Hazzard. She was the cousin of Bo and Luke, the main protagonists of the show, who were also cousins, and the three lived on a farm on the outskirts of Hazzard County with their Uncle Jesse. Although never mentioned in the series itself, some press material for the show suggests that Daisy's parents, along with Bo and Luke's, were killed in a car accident. However, in the 1997 reunion movie, Daisy says her mother died when she was born. Daisy would frequently become involved in the Dukes' car chases, originally her Plymouth Road Runner or, from the mid-second season onwards and more famously, her Jeep. Daisy also worked as a waitress at the Boar's Nest, the local bar owned by Boss Hogg that was the main meeting place in Hazzard. She also aspired to be both a songwriter/singer, and a journalist, at various times. / Короткие, облегающие женские шорты. Дэйзи Мэй Дюк (Daisy Mae Duke) Кэсэрин Бак (Catherine Bach), телевизионном сериале Зи Дюкс оф Хазод (The Dukes of Hazzard). Бо (Bo) и Лук (Luke), Дядя Дьжэси (Uncle Jesse). Плымэс Роуд Ранё (Plymouth Road Runner) Дьжип (Jeep). Борз Нэст (Boar's Nest), местный бар, принадлежащий Босу Хогу (Boss Hogg).

THE DALIAN COMMODITY EXCHANGE = ДАЛЯНЬСКАЯ СЫРЬЕВАЯ БИРЖА – Established on 1993-February-28, the Dalian Commodity Exchange (DCE) is the largest agricultural futures market in China as one of the four futures exchanges approved by the State Council. It was set up as a non-profit, self-regulating legal entity. The first standardized contracts traded at the exchange on 1993-November-18; the contracts were for Soybeans, Corn, Soybean meal, green beans, red beans and Rice. DCE currently trades Corn, Soybeans, Soybean meal and Soybean oil futures contracts. Headquartered in Dalian, Liaoning Province, China. The Dalian Commodity Exchange (DCE), founded on 1993-February-28, is one of the four futures exchanges in China and the only futures exchange in Northeast China. Approved by the China Securities Regulatory Commission (CSRC), DCE offers a wide range of futures products including Corn, No. 1 Soybeans (non-gmo), No. 2 Soybeans (gmo), Soybean meal, Soybean oil, RBD palm olein, linear low density polyethylene (LLDPE) and polyvinyl chloride (PVC). Over the past 17 years, with its sound operation and quick growth, DCE has become an important futures exchange in China. In 2006, DCE entered a period of rapid development as volumes sky-rocketed. Trading volumes in 2007, 2008 and 2009 were 371 million contracts, 638 million contracts and 834 million contracts respectively, while the turnover was 11.92 trillion RMB, 27.49 trillion RMB and 37.64 trillion RMB respectively. In 2008, DCE ranked 10th among 54 exchanges worldwide in terms of trading volume making DCE the largest agricultural commodity exchange in Asia and the second largest globally. Trading volume remained steady in 2010 with over 806 million contracts traded valued at 41.70 trillion RMB. As 2010 drew to a close, DCE's member companies reached 188, its designated delivery storage facilities amounted to 83 and it attracted 1 200 000 investors from 28 provinces. DCE has been playing an important role in commodity price discovery, protecting the interests of farmers by offering risk management tools and providing guidance for agricultural production and distribution. DCE is also contributing to the construction of Dalian into a regional financial center and an important international shipping hub in Northeast Asia. In August 2007, the State Council approved the 'Plan to Revitalize Northeast China', in which the development of the futures markets is a fundamental building block. DCE has an important role to play in the construction of a vibrant futures industry in China and a prosperous Northeast China. DCE is taking great efforts to realize its goals and become a leading futures exchange in Asia. Early in 1990s, there were almost 50 futures exchanges in China. In October 1994, the State Council of People's Republic of China regulated and merged these exchanges into 15. The DCE was kept and its trading volume ranked No. 9 in China in 1994.The 15 futures

exchanges were regulated again and restructured into three by the State Council in 1998. The DCE is one of the three exchanges kept. Corn, Soybeans, soy meal and soy oil futures were formally approved to be traded at the DCE. On 2000-July-17, the DCE started trading soy meal, which was the first contract listed after the restructuring of China's futures exchanges in 1998. On 2002-March-15, DCE started trading No. 1 Soybeans futures, which means that only Non-GMO Soybeans are allowed to be delivered. Half year later, this contract became the largest agricultural futures contract in China and the largest Non-GMO Soybeans futures contract in the world. According to Futures Industry Association (FIA) statistics, No. 1 Soybeans futures is the only commodity futures contract in top 20 futures contracts in the world in 2003; its annual volume ranks No. 18. On 2004-September-22, the DCE started trading Corn futures. On 2004-December-22, the DCE started trading No. 2 soybeans futures, which including all imported soybeans and China's homegrown Soybeans. On 2006-January-09, the DCE started trading Soybean oil futures. Since the establishment, DCE has exerted the market functionality of price discovery and hedge and been a necessary part in the fields of Soybeans production and circulating. The domestic demand for grain in China has been increased largely for years; however, China's production capaility was unable to be improved in time. Therefore, China made a large number of grain purchase at international markets. Along with the rapid increase of domestic demand, more and more soybeans were imported, which makes China's domestic soybeans price integrated into the global market gradually. Therefore, China's enterprises of proceeding soybeans are facing more risk of price fluctuation. The soybeans futures market plays an important role to protect China's Soybeans production, to reduce Soybeans risk of price fluctuation, and to promote soybeans marketization of circulation. Currently, many oil crushing plants and feeds firms have been members of DCE and utilize futures market to reduce operating expense and to improve capital efficiency. Further, many grain import and export firms also attend hedge trading, which not only avoids price risk but improves the capability to survive and develop. China's central and local governments have been supporting the DCE since its establishment and affirm the DCE's market functionality for promoting domestic marketization of economy. The Dalian Commodity Exchange (DCE) is a nonprofit, self-regulating and membership legal entity and was established on 1993-February-28. Through the 5th generation electronic trading system, 197 member firms with more than 110 000 clients trade Soybeans, soy meal and corn futures at the DCE. In October 1994, China's State Council consolidated nearly 50 local futures exchanges to create 15 larger regional exchanges. The DCE was included in those 15 exchanges. At the same time, dry kelp was added as a pilot product. By the end of 1994, the DCE was ranked No. 9 in China by market share. In October 1995, the first long-distance trading system was established in multiple cities throughout China. On 1996-July-15, trading margins became managed in stages, according to the expiration date of contracts; margins were increased step-by-step starting in the month prior to the delivery month. In September 1996, trading margins became managed by classification and, according to the change of one-side open interest, increased step-by-step. On 1997-December-12, cumulative annual turnover at the DCE exceeded RMB 1 trillion for the first time. On 1998-July-23, the DCE's website (http://www.dce.com.cn) was formally launched. On 1998-August-01, the State Council further consolidated the 15 regional exchanges down to three major national exchanges. The DCE and ZCE (Zhengzhou Commodity Exchange) were maintained, while the Shanghai Metal Exchange, Shanghai Commodity Exchange and Shanghai Grain and Oil Exchange were merged to create the Shanghai Futures Exchange. Soybeans, soybean meal and beer barley were formally approved for trading at the DCE. On 1998-December-07, new trading software was released, which adopted Market Price Orders, Stop Orders, Multi-matching Principal sand Centralized Pricing Systems. On 2000-May-08, margins became collected by a percentage; delivery and storage fees were charged by the exchange; and T+0 settlements were applied. On 2000-July-17, the DCE started formally trading soybean meal, the first new product listed after the final merger of China's futures exchanges. For the next four years, soybean meal futures were one of the most rapidly developing futures contracts in China's futures market. On 2000-August-04, daily turnover exceeded RMB 10 billion for the first time. In 2000, the DCE became the No. 1 futures exchange in China by trading volume. On 2001-January-01, electronic financing was applied and electronic receipts were issued to members for the first time. On 2001-June-11, daily soybean futures trading volume exceeded 1 million contracts for the first time; total daily turnover also exceeded RMB 20 billion for the first time. On 2001-July-05, the first delivery warehouses outside Dalian were approved; seven warehouses outside Dalian were approved as DCE Soybean meal delivery warehouses. On 2002-March-15, the DCE started trading No. 1 Soybeans futures (non-genetically-modified Soybeans). It quickly became the largest agricultural futures contract in China and the largest Non-GMO Soybeans futures contract in the world half a year later. Starting on 2003-April-16, electronic transfers for margins were allowed. On 2003-August-01, the payment method for delivery funds was adjusted; members were allowed to use settlement guarantee funds to pay delivery funds for the first time. No. 1 Soybeans ranked 18th among all futures contracts in the world in 2003. No. 1 Soybeans futures were the only commodity futures contract among the top 20 futures contracts in 2003. In 2003, the DCE's total trading volume reached more than 149 million contracts, accounting for 53% of China's total futures market. The DCE joined the Futures Industry Association (FIA) in 2003, ranking in the top ten among all international exchange members. On 2004-September-22, the DCE started trading corn futures again for the second time. On 2004-December-22, the DCE started trading No. 2 (genetically-modified) Soybean futures. According to FIA statistics regarding trading volume in 2004, the DCE ranked No. 8 among international futures exchanges. On 2006-January-09, the DCE started trading Soybean oil futures. On 2006-October-20, the DCE, together with Bursa Malaysia, held the first International Oils and Oilseeds Conference in Beijing. The conference was a great success and has been held in each subsequent year in Guangzhou. On 2007-June-18, the DCE allowed trading in arbitrage orders for the first time. Over 30 000 arbitrage orders were placed on the first day of trading. On 2007-July-31, the DCE started trading LLDPE futures, the first non-agricultural commodity traded at the exchange. On 2007-September-11, the DCE held the first International Corn Conference in Dalian. The conference was co-sponsored by the Dalian Municipal Government and the State Grain Administration. Since its inception, the annual conference has attracted top international talent to come to Dalian to speak and offer insights into the industry. On 2007-October-29, the DCE started trading RBD Palm Olein futures. On 2008-October-20, the DCE and the China Petroleum and Chemical Industry Association held the first International Synthetics Resin Conference in Hangzhou. The conference was highly successful and was expanded in 2009 to include the entire plastics industry. On 2009-May-25, the DCE started trading PVC futures, the second plastics futures product at the exchange. On 2009-December-07, daily trading volume at the DCE surpassed 7 million contracts for the first time. On 2010-November-05, DCE and Bursa Malaysia signed an agreement to continue jointly hosting the annual China International Oils and Oilseeds Conference for a further three years. Over 800 people participated in the 5th Conference, a new record. On 2010-November-15, daily trading volume at the DCE surpassed 10 million contracts for the first time. This was the first time any Chinese futures exchange had over 10 million contracts traded in a single day. On 2010-November-29, the DCE launched its new international English language website. The websites features a completely redesigned look from its Chinese language counterpart and was designed to be a window into China's futures market for DCE's overseas friends and partners. / , от Латинского слова Affirmo, означающее Утверждаю, . риск колебания цены. Штабквартира расположена в городе Далянь (Дальний), Провинция Ляонин, Китай.

DALMATIC = ДЭЛМЭТИК (или САККОС) – Dalmatic:- a wide-sleeved overgarment with slit sides.

DAM = ДАМБА (или ПЛОТИНА) – Dam (pitting, basin listing):- (1) forming pits, small basins, or water-holding cavities at intervals with appropriate equipment, for irrigating fields. (2) A structure for impounding and storing available water as a reservoir for further use. / Под Дамбой, от Нидерландского слова Dam, понимается гидротехническое сооружение, аналогичное по устройству земляной плотине. Различают дамбы:- (i) напорные оградительные, предназначенные для защиты низменностей в долинах крупных рек

и морских побережий от затопления; (ii) сопрягающие – для соединения сооружений гидроузла с берегами; и (iii) безнапорные – для регулирования русел рек. Под Плотиной понимается гидротехническое сооружение, перегораживающее реку (или другой водоток) для подъёма уровня воды в ней, сосредоточения напора в месте расположения сооружения или создания водохранилища. Плотина может быть:- (i) глухой, лишь преграждающей течение воды; и (ii) водосбросной, предназначенной для сброса избыточной воды. По основному материалу различают:- бетонные, деревянные, железобетонные, земляные, каменные и другие плотины.

DAMAGED (ABORTED) TERMINALS = ПОВРЕЖДЁННЫЕ (АБОРТИРОВАННЫЕ) ВЕРХУШКИ – Damaged (Aborted) Terminals:- Damaged main-stem tissue in the plant apex causes a loss of apical dominance. Nodes above white flower (NAWF) counts preferably should not be taken on a plant having an aborted terminal above the uppermost white flower.

DAMAGED CARGO REPORT = РАПОРТ О ПОВРЕЖДЁННОМ ГРУЗЕ (или АКТ О ПОВРЕЖДЕНИИ ГРУЗА, или ЗАКЛЮЧЕНИЕ О ПОВРЕЖДЁННОМ ГРУЗЕ) – Damaged Cargo Report is a statement used for insurance claims that describes the extent and value of damages to cargo and/or equipment incurred during shipment. Damaged Cargo Report is a written statement concerning established damages to cargo and/or equipment.

DAMAGED GRAINS = ПОВРЕЖДЁННЫЕ ЗЁРНА (или ИСПОРЧЕННЫЕ ЗЁРНА) – Damaged Grains are those distinctly discolored or damaged by water, insects, heat, or any other means (includes yellow grains).

DAMAGED KERNELS = ПОВРЕЖДЁННАЯ ЗЕРНОВКА (или ПОВРЕЖДЁННЫЕ ЯДРА) – (1) Damaged Kernels mean kernels that are obviously damaged as can be seen by the naked eyes due to moisture, heat, fungi, insects or other. Whole or broken kernels of Rice which are distinctly discolored or damaged by water, insects, heat, or any other means, and whole or large broken kernels of parboiled Rice in non-parboiled Rice. Heat-damaged kernels shall not function as damaged kernels.

(2) In the Wheat industry, kernels, pieces of Wheat kernels, and other grains that are badly ground-damaged, badly weather-damaged, diseased, frost-damaged, germ-damaged, heat-damaged, insect-bored, mold-damaged, sprout-damaged, or otherwise materially damaged. / зародыш (germ).

(4) In the Canola industry, Canola and pieces of Canola that are heat-damaged, sproutdamaged, mold-damaged, distinctly green damaged, frost damaged, rimed damaged, or otherwise materially damaged.

DAMAGED OR CRUSHED = ПОВРЕЖДЁННОЕ ИЛИ РАЗДАВЛЕННОЕ (или РАЗДРОБЛЕННОЕ) – Damaged Or Crushed:- may be due to lack of padding or compensating springs in presses. Springs and padding should be checked frequently to make sure that they are in proper condition. Closure defects, and namely – Metal Buttons, Snap Fasteners, Rivets and Burrs. / Порок или дефект застёжки.

DAMAGED SELVAGE = ПОВРЕЖДЁННАЯ КРОМКА – Damaged Selvage:- a cut or break occurring only in the selvage. A cut selvage is caused by incorrect loom adjustment during weaving or improper edge construction. The term refers also to loose edges cut during shearing of the fabric. See also Cut Selvage. / Под Нарушением Кромки понимается местный порок в виде оборванной, деформированной или другим способом нарушенной кромки.

DAMAGE–FREE CAR = НЕПОВРЕЖДЁННЫЙ (или БЕЗОПАСНЫЙ) ВАГОН – Damage-Free Car is the boxcar equipped with special bracing material.

DAMAGE IN THE COURSE OF TRANSPORTATION = ПОВРЕЖДЕНИЕ В ПРОЦЕССЕ ТРАНСПОРТИРОВКИ – Damage In The Course Of Transportation:- this designates the damage (sea damage or other) which took place in the course of transportation whether by sea or by land. / Этот термин подразумевает повреждение (морское повреждение или иное), которое имело место в процессе транспортировки либо по морю, либо по земле. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

DAMAGE PRIOR TO FORWARDING = ПОВРЕЖДЕНИЕ ДО ЭКСПЕДИРОВАНИЯ – Damage Prior To Forwarding:- this designates the damage (country damage or other) which took place before the bales concerned are at buyer's risk as defined by INCOTERMS®. / Обозначает повреждение (внутри страны происхождения товара или иное), которое имело место пока соответствующие кипы, не перешли в соответствии с условиями ИНКОТЁРМЗ® под риск покупателя. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

DAMAGE REPORT = ОТЧЁТ О ПОВРЕЖДЕНИИ (или АКТ О ПОВРЕЖДЕНИИ, или РАПОРТ ОБ УЩЕРБЕ) – Damage Report is a form on which physical damage is recorded, e.g., containers. Damage Report is a form on which physical damage to containers is recorded. / , например, . Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

DAMAGES = НЕУСТОЙКА (или УЩЕРБ) – In law, Damages are an award, typically of money, to be paid to a person as compensation for loss or injury. The rules for damages can and frequently do vary based on the type of claim which is presented (e.g., breach of contract versus a tort claim) and the jurisdiction. At common law, damages are categorized into compensatory damages and punitive damages. Compensatory damages are further categorized into special damages, which are economic losses such as loss of earnings, property damage and medical expenses, and general damages, which are noneconomic damages such as pain and suffering and emotional distress. Damages means the financial compensation payable to the claimant. 'Damages' is the legal word for compensation or indemnity for loss suffered for a breach of contract. (It is also payable for breach of 'tort', another branch of law, but this does not concern us here.) The amount of damages is, generally, the amount of loss actually suffered by one party by the failure of the other party to perform the contract. / Неустойка означает финансовую компенсацию, оплачиваемую взыскателю (или претендателю, или заявителю претензии). Под Неустойкой в Гражданском Кодексе России понимается денежная сумма, определённая законом или договором, которую должник обязан уплатить кредитору в случае неисполнения или ненадлежащего исполнения обязательства, в частности в случае просрочки исполнения.

DAMAGE SELVEDGE = ПОВРЕЖДЁННАЯ КРОМКА – Damage Selvedge:- xxxxx. / Кромка – край. Нарушение Кромки – оборванная или деформированная кромка (стянутая, загнутая, гофрированная). Нарушение Кромки:- (1) Оторванная Кромка; размер порока свыше 0.5 до 5 м. (2) Стянутая Кромка:- (a) размер порока более 1 до 2.5 см; и (b) более 2.5 до 4 см. Порок Стянутая Кромка определяют как разность между длиной по фону (на расстоянии 5 см от кромки) и по кромке на трёхметровой длине ткани. Оценка порока относится ко всему куску. Нарушение кромки оценивается для тканей, поставляемых швейным

предприятиям, для розничной торговли – не допускается. Для бархата, предназначенного для промышленной переработки, порок не учитывается.

DAMAGES FOR DETENTION = НЕУСТОЙКА ЗА ВЫНУЖДЕННУЮ ЗАДЕРЖКУ – Damages For Detention:- 'Damages' is the legal word for compensation or indemnity for loss suffered for a breach of contract. (It is also payable for breach of 'tort', another branch of law, but this does not concern us here.) The amount of damages is, generally, the amount of loss actually suffered by one party by the failure of the other party to perform the contract. The contract is the charter. Damages can be 'liquidated', that is, agreed by the parties as compensation. The obvious sample of liquidated damages for delay is 'demurrage'. 'Unliquidated Damages' is the amount that has not been ascertained in advance or agreed in the contract. It is left to an arbitrator or judge to decide the amount based on the actual loss suffered by the shipowner, for example, the ship's running expenses plus any Loss caused by the time lost. 'Damages for Detention' is an example of unliquidated damages. If the charterer delays (or 'detains') the ship by loading or discharging in a longer time than agreed or for any other reason, he has breached the contract and must compensate the shipowner. Normally, if the Charterer exceeds the laytime allowed in the charter, he pays compensation at an agreed rate of demurrage. However, if demurrage is not agreed at the time of entering into the contract, or if the agreed excess time more than the agreed laytime is exceeded, damages for detention is the name given to the compensation. For example, if the Charterer agrees that laytime is x days, and agrees to pay a fixed sum of $A per day for y days maximum time on demurrage, and the actual cargo handling time is x + y + z days, the Charterer will have to pay demurrage for y days at the agreed rate and damages for detention for z days at a rate that is reached by negotiation, settlement or imposed by an arbitrator or by a judge if a dispute arises and has to be decided. Usually, a judge decides damages for detention at the same rate as the agreed rate of demurrage. Suppose a ship has already spent some reasonable time on demurrage, 'reasonable' being a difficult word to define, the shipowner may wish to claim a higher rate of damages for detention. However, if the charterparty does not specify a fixed demurrage period, the shipowner can only claim demurrage at the agreed rate for the time lost. If the Charterer delay the ship before laytime begins, for example, because of failure to nominate a loading/discharging port, damages for detention becomes payable, perhaps at the demurrage rate. Another example of a shipowner's claim for damages for detention may be where a ship is chartered to discharge (or load) at berths which are 'always accessible' and the charterparty contains a clause allowing the Notice of Readiness to be given and laytime to commence whether in berth or not (WIBON)-but the ship cannot proceed to the berth for example, because of fog and the consequent closure of the port. The shipowner may not be able to claim for demurrage for any reason but may claim for damages for detention on the ground that in breach of the charter the berth nominated by the Charterer was not 'always accessible'. (This was one claim on appeal by the shipowner in a case reported in 1989 concerning the ship Kyzikos.) It is submitted that the shipowner would fail in this situation because the accessibility ('approachability') of the berth was not obstructed. The fog conditions would be outside the charterer's control. In the Kyzikos case the shipowner did fail in his claim because they could not show the judge that the Charterer failed to nominate a berth that was 'always accessible'. Yet another example where an Owner can claim for damages for detention, perhaps at the rate of demurrage, would occur if the ship arrived at the discharge port and the receivers or charterers wanted the cargo discharged without their presenting original bills of lading. Normally, the master of the ship can refuse to discharge cargo unless the original bills of lading for the cargo are presented. In modern practice, if the bills have not arrived before the ship's arrival, the receivers or consignees sometimes offer the master or ship's agent a 'letter of indemnity' or 'letter of guarantee' usually with a (bank) guarantee. However, the master still remains free to insist on the presentation of the original bills of lading in case the guarantee is unacceptable for any reason. If the charterers refuse to discuss the issue of a bank guarantee, the delay because of non-presentation of the original bills of lading would have to be compensated by payment of damages for detention. Damages for detention. This expression is used to refer to the compensation payable by a Charterer if a vessel is delayed without agreement. This type of 'delay' can be known as 'Wrongful Detention' and can occur, for example, if the agreed laytime expires and no rate of demurrage (or 'liquidated damages') has been agreed. It can also arise if laytime expires and any agreed, fixed demurrage period also expires. In modern chartering, fixed demurrage periods would be unusual, demurrage being payable for all time lost at the agreed rate. One use of damages for detention may be where the vessel is delayed because the Charterer fails to nominate a berth, which is reachable on the vessel's arrival; end the vessel arrives and has to wait. However, if the charterparty contains a clause dealing with 'time lost waiting for berth' being counted as laytime, then demurrage would be more applicable than damages for detention. Damages For Detention (DAMFORDET):- penalty if cargo is not ready when ship arrives for working (1st day of Laycan). This is not detention which is charged for ships time on delay. If the cargo is ready there is no DAMFORDET. / судно Кизикос (Kyzikos). хозяин (или капитан) судна. Штраф, предусмотренный в тех случаях, когда груз не готов к моменту прихода судна под погрузку (1-й день срока сталии либо аннулирования). Она не является вынужденной задержкой, которая оплачивается в случае задержки самого судна. В случае, когда груз находится в готовности к погрузке на судно, то неустойка за вынужденную задержку не взимается.

DAMASK = ДАМАССКАЯ (или ДАМАСКА) – Damask, a white fabric with a woven, textured pattern. Damask belongs to the group embracing brocades, brocatelles, and Jacquards. The cloth is made from cotton, linen, wool, worsted, silk, rayon, and other fibers. Used for tablecloths, napkins, towels, doilies, runners, interior decoration, wall coverings, furniture covering. Elaborate designs are possible and Damask is made on the intricate Jacquard looms where it is possible to give vent to the whims of the designer of these cloths. Linen or cotton Damask is made on a five-shaft satin weave; double Damask is made on an eight-end satin weave. The cloth is beetled, calendered, and is usually grass-bleached. Very durable, reversible fabric; sheds dirt; the firmer the texture the better in the quality. Launders well and holds high luster, particularly in the linen goods. Smaller designs give a stronger cloth than designs that have long floats in the weave formation. Linen Damsk, 'The Cloth of Kings', is widely imitated and cheapened. The price range of Damask is very great, inexpensive to costly fabrics. Damask is a firm, glossy, Jacquard-patterned fabric that may be made from linen, cotton, rayon, silk, or a combination of these with various manufactured fibers. Similar to brocade, but flatter and reversible, damask is used for napkins, tablecloths, draperies, and upholstery. The name Damask is technically applied to certain classes of fabrics, richly decorated with figures of foliage, fruits, scrolls and other ornamental patterns, usually of a large and elaborate character. The weaves usually employed are twills (mostly satin) and the figures In the fabric are made by alternately exchanging warp for weft surface or vice versa. The materials employed vary according to the purpose to which the fabrics are to be applied. In the manufacture of upholstery cloth for hangings and furniture covering, silk or worsted is used, while for tablecovers, towels, napkins, etc, linen is generally employed, except in the cheapest grades, when cotton is the material used. The name was derived from the city of Damascus, when that city was a center for the production of textile fabrics, and originally was applied only to silken fabrics, whose designs were very elaborately woven in colors and often with gold thread. About the XII century the above-mentioned city, even then long celebrated for the production of its looms, so far outstripped all other places for beauty of design, that her silken textiles were in demand everywhere, and thus, as often happens, traders fastened the name of Damascen or Damask upon every silken fabric richly wrought and curiously designed, no matter whether it came or not from Damascus. In order to explain the modus operandi for the production of Damask in this country, suppose we place ourselves in the position of a public designer, whose specialty is the designing of patterns for such fabrics. The Sketch:- the first step in the operation is to prepare a dozen or more sketches, which are to be shown to manufacturers to take their choice. A specimen of such is illustrated at Fig. 1 (reduced), the original of which is drawn on ordinary tracing paper, the

exact size, as It will appear in the cloth. This design or sketch is to be made into a Damask tablecover, having 50 threads warp and 44 picks weft per inch, the figure of which is to be a 5-leaf 4–1 satin twill (warp face) and the ground a 5-leaf 1–4 satin twill (weft face). Proper Design Paper:- the next step to be taken Is to select the proper designing paper. The size of which that is the number of rectangles, warp and weft.in each large square, must be in the exact proportion to the number of threads (warp) and picks (weft) in one inch of the finished cloth. The mode of figuring is after the following manner:- (i) Paper for warp ruled eight rectangles per large square; paper for weft ruled in the same ratio to eight as 44 is to 50. (ii) Operation:- x : 8 : : 44 : 50; therefore 44 x 8 equals 352 divided by 50 equals 7.04, answer. 7.04 is near enough to call it 7; therefore, 8 x 7 is the proper size of design paper required. Tie-Up. (iii) Then the tie-up must be considered, which in the present instance will be a 600-hook, with the tie-up as illustrated at Fig. 2 French system – point for border, and straight through for body, in six divisions. (iv) The next process is to enlarge the design as it appears in the sketch, so that one repeat will exactly fit on 600 rectangles (warp) of the designing paper selected. That portion of the border shown at A, in conformity with the tie-up should occupy the first 15 squares or 120 rectangles; that shown at B the next 15 squares or 120 rectangles; that partion shown at C is not required on the design paper, because it is a repetition of that part shown at A, but simply reversed. For the body of the design shown at D, 45 squares or 360 rectangles will be required, which will complete the 600 hooks of the machine. In order to ascertain how many squares or rectangles the design will occupy weft-wise the sketch must be measured, which in this case happens to be seven inches. Therefore 44 picks per inch times 7 inches equals 308 rectangles; but as 5, the number of threads in one repeat of weave (satin), will not divide into 308 evenly, 310 must be taken (310 divided by 5 equals 62). Therefore the design will occupy 600 rectangles (warp) times 310 rectangles (weft). Painting In The Design:- after the design is transferred to the design paper, the next process is to paint in the weave, in the following manner, or as shown by a portion odt the design, taken from sketch at E, and illustrated by Fig. 3. (i) Paint in the figure in solid red (vermillion or scarlet lake), keeping well within the lines. (ii) Paint in the 1–4 satin twill in the ground, running the twill toward the right. (iii) Paint in the 4–1 saitin twill in tine figure by using black paint over tlhe red. Twill to the left. In joining the ground and figure twills great care must be exercised so as to effect a clear outline between figure and ground, which is done by the following method:- where it is possible to bring a riser (black) of the ground beside a sinker (white) in the figure weave or vice versa, it must be done and an some cases, where the risers and sinkers will not join, it is well to alter the weaves slightly so as to effect it; and where it is impossible to do this, then tlhe weaves of each must not be extended so as to actually join, but a certain length of weft in the ground must join a certain length of warp in the figure. When painting in the satin twill of the ground in the border of the design it is necessary that the twill should extend to the right for one-half the ‘distance and to the left for the remainder, therefore, as this breaking of the twill line causes a slight imperfection, which Is unavoidable, care must be used so as to make the break in such portion of the border as will render it unnoticeable. Again it is necessary also to be careful so as to make the weave of the so as to actually join, but a certain length of weft in the ground must join a certain length of warp in the figure. When painting in the satin twill of the ground in the border of the design it is necessary that the twill should extend to the right for one-half the distance and to the left for the remainder, therefore, as this breaking of the twill line causes a slight imperfection, which Is unavoidable, care must be used so as to make the break in such portion of the border as will render it unnoticeable. Again it is necessary also to be careful so as to make the weave of the border join perfectly with that of the body; and this is done by carefully examining the tie-up so as to ascertain which warp threads will join each other in the cloth and take steps to make a perfect juncture. In this particular instance, warp thread No. 1, which is the first of the border, is in juxtaposition with warp thread No. 241, which is tlhe first of the body. Therefore the satin twill of the body, commencing with ‘warp thread No. 241, should continue, without a break, the satin twill of the border finished at warp thread No. 1. Weaves To Use:- although in the majority of damask faibrics nothing but satin twill weaves are employed (principally 5 and 8 harness), very good effects are sometimes obtained by combining other weaves with the satin twills. For instance, one side of a leaf may be painted In with a satin twill weave, and the other side may be a straight twill, thus giving the leaf a shaded effect, which may be very pleasing. Another method of shading and the one generally employed is to gradually change from warp-up to weft-up or vice versa. Two Methods Of Making Damask:- in Damask there is probably a greater field for the production of large figures than in amy other class of weaving. There are two methods of weaving Damask. First, by the use of the ordinary Jacquard, which is discussed in the present article, and second, by the use of what is called the Compound Pressure Harness. By the first method, although very elaborate figures can be woven and a fine cloth produced, yet by the second method a command isobtained over four or five times as many warp threads as by the first, thus allowingthe production of a fabric of much finer texture and even more elaborate ornamentation. A description of Damask weaving by the use of the compound pressure harness will be given later. Where Damasks are made all of one color, which is generally the case, as In white linen tablecovers, the effect is given by the threads lying at right angles to each other, and the light falling upon them brings the pattern in bold relief and makes it easily visible. Finishing Of Cloth:- as it is impossible in the scope at the present article Co describe the bleaching, dyeing and finishing of all the various Damask fabrics, we can at least say this – that in the case of the linen tablecovers, towels, etc, all the finishing required is bleaching, starching and pressing. But as the beauty of the fabric largely depends upon its whiteness, it is essential that the bleaching of the cloth must be very carefully done. It is on ace’ Urit of the excellence of her bleacheries that Ireland has been able to make Irish linen famous the world over. Carding and Spinning Particulars:- cotton Damask is made in several grades and should be considered as being made in mills equipped with machinery for making medium and high-class goods. The grades of cotton used for this class of cloth are middling to good middling, the staple varying from I1/! to 1% inches strong, according to the grade of Damask to be made. The mixing should be as large as possible and, if good waste is used, i.e. sliver waste-from ttie front of the cards, and drawings, also sliver waste from sliver lap machines and combers, and cut roving waste from the slubber and fly frames, it should not be used in larger proportions than 1 to 3. In up-to-date mills and in fact most mills nowadays it is the general custom to have a waste machine into which the cut waste from the slubber and fly frames is picked. This is called a Waste Machine. This oiaclidne is constructed so as to take out all the twist in the roving and generally has for this purpose two or three porcupine beaters, and the cut roving waste is delivered in a fluffjr sheet, from which all the twist has been taken. The good sliver waste from the machines above mentioned Is mixed with the raw stock, while the cut roving waste, after being run through the waste machine, is fed to a picker and made into a lap of the same weight as the laip being used at the finisher picker, for this class of goods, and then. The Waste Lap is run through with the raw stock lap at the finisher picker in tihe proportion of three laps of raw stock to one of cut-waste, the cut waste being generally put so that it will come in the centre of the delivered lap. The cotton, after being mixed, is put througb a hopper opener and either two or three processes of pickers, two processes being best, the speed of beater being 1 050 revolutions per minute for openers, 1 500 for breakers and 1 450 for finishers, also 1 450 revolution per minute for intermediate pickers, When used. This gives about 42 beat per inch at the finisher. The weight of laps should be 40 pounds at breaker, 37 pounds at intermediate and 36 pound at finisher. Damask is a glossy Jacquard fabric, usually made from linen, cotton, rayon, silk, or blends. The patterns are flat and reversible. The fabric is often used in napkins, tablecloths, draperies, and upholstery. Damask is a type of textile closely associated with drapes, tablecloths, cloth wallpapering, and upholstery. It has also historically been used to make jackets and other heavy outer garments. Classical Damask is made from silk, although the term is now widely used to refer to the style of weaving, regardless as to the material used. Damask is characterized by a background of lustrous fabric against which raised designs appear. Many pieces of antique upholstered furniture are covered in Damask fabric, which is how many consumers become acquainted with this fabric. Many fabric stores sell Damask in several patterns and colors. It tends to be expensive, because the dense weave requires a great deal of thread. Silk Damask will command a high price, because of

the costliness of silk as a raw material. Manufacturing companies also sell Damask in bulk by the bolt, which is advised if a large project is being undertaken. Purchasing a single bolt of Damask ensures uniform weave and color. The patterns used in damask are often geometric or botanical in theme, although the pattern may also integrate animals or simple scenes. The weaving style originated in Asia, spread across the Middle East, and reached into Europe thanks to the efforts of traders like Marco Polo. By the XII century, the fabric had been named after Damascus, which was quickly rising to fame as a center of textile production. The ornate fabrics exported from Damascus were well known, leading many people to associate the fabric with the city. Italy also housed numerous well known manufacturers of Damask. For many consumers, Damask is closely associated with luxury. The weave of damask is very dense, resulting in a substantial cloth. The designs are often multicolored, causing them to stand out clearly against the satin background of the fabric. Damask continues to be made from silk, although materials like cotton, linen, wool, and synthetic fibers are also used in the manufacturing of damask. Synthetic damask tends to be much more durable than Damask made from organic materials, although it does not have the same feel. In the 1900s, the invention of the Jacquard loom made Damask much easier to create. Jacquard fabric was woven with the direction of a series of punch cards which could be used to alter the position of the warp threads in the fabric. These punch cards automated the weaving process, allowing manufacturers to mass produce Damask patterns and making the resulting fabric much less expensive than it once had been. Modern Jacquard weaving is accomplished with computer controls. Damask is a heavy Jacquard fabric woven in silk, linen, cotton, worsted wool and man-made fibers. Traditionally woven with an 8 and 8 satin weave. The reversible pattern is distinguished from the background by contrasting luster. The word derives from a rich silk fabric introduced into Europe through Damascus. Damask is a figured fabric of silk, wool, linen, cotton or synthetic fibers, with a pattern formed by weaving. Made with one warp and one weft in which, generally, warp satin and weft sateen weaves interchange. Twill or other binding weaves are sometimes integrated. Damask weaves in linen, cotton, synthetic or blended fibers are currently most commonly found in table linens. The highlights in these cloths are obtained by long floats of warp and weft, and as these are set at right angles, they reflect the light differently according to the angle of the rays of light; the effect changes also with the position of the observer. Subdued effects are produced by shorter floats of yarn and sometimes by special weaves. Damask is a glossy, heavy, firm-textured Jacquard weave fabric, similar to brocade, but lighter, with flat and reversible patterns. It is made of silk, linen, cotton, rayon or a combination of fibers in double or single Damask. It is used for tablecloths, napkins, home furnishings, draperies and upholsteries, and occasionally clothing, such as afternoon and evening dresses. Damask:- (1) a grayish red. (2) Linen, silk, rayon, cotton, synthetics, wool, worsteds. Figured on Jacquard loom. Originally made of silk, that came to us from China via Damascus. In the XIII Century, Marco Polo gave an interesting tale about it. It is one of the oldest and most popular cloths to be found today. Very elaborate designs are possible. Cloth is beetled, calendared and the better qualities are gross-bleached. Very durable. Reversible fabric. Sheds dirt. The firmer the texture, the better the quality. Launders well and holds a high lustre – particularly in linen. There are two types of damask table cloths:- (1) single Damask table cloths:- construction:- thread count is usually around 200. (2) Double Damask has an 8 shaft satin construction with usually twice as many filling yarns as warp yarns. This gives a much greater distinctness to the pattern. Thread count ranges from 165 to 400. The quality of both depends on the yarn used and the thread count. If the same quality and thread count are used, single is better than double because the shorter floats are more serviceable and the yarns hold more firmly. Double Damask with less than 180 thread count is no good for home use. / Жакяр (Jacquard). луговое беление (grass bleaching). брокатель (brocatelle). Уточные пряжи. Дамасская – шёлковая, шерстяная или хлопчатобумажная ткань, тканная полотняным или копровым переплетением, иногда в комбинации с атласным. Шёлковая Дамасская ткань имеет Восточное происхождение. Эта тяжёлая густотканая материя предназначалась прежде всего для церковного облачения и для обивки мебели, и лишь некоторые более лёгкие её виды – для одежды. Хлопчатобумажная и льняная Дамасская ткань в новое время используется для белья, занавесок и обивочной ткани. В XVIII веке Дамасская ткань часто имитировала кружево путём создания белого тонкого рисунка на тёмном фоне.

DAMFORDET = DAMAGES FOR DETENTION

DAMP = ВЛАЖНАЯ (или ВЯЗКАЯ) – A sample of grain is identified as Damp if the moisture content exceeds the tough range defined for that class of grain. With increasing moisture content, grain is graded straight, tough, damp, moist, and wet. / Проба зерна идентифицируется как Влажная (или Вязкая), если содержание влаги в нём превосходит уровень влаги для зерна средней сухости, установленный для такого класса зерна. В случае увеличения содержания влаги зерно будет последовательно отсортировано как сухое или твёрдое (straight), средней сухости или мягкое (tough), влажное или вязкое (damp), сырое (moist) и мокрое (wet).

DAMPENING = ЗАТУХАНИЕ – Dampening (in tire cord) is the relative ability to absorb energy and deaden oscillation after excitation. / после возбуждения (excitation).

DAMP FINISH = ВЛАЖНАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Damp Finish:- vacuum system in need of draining, steam too moist. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования.

DAMPING OFF = ВЫПРЕВАНИЕ (или УВЯДАНИЕ, или ПОЛЕГАНИЕ, или ЧЁРНАЯ НОЖКА) – Damping Off is a potentially fatal fungal disease, usually of seedlings or cuttings. / грибная болезнь, как правило, . Чёрная Ножка (возбудители – Грибы Pithium, Rhizoctonia, Fusarium и Бактерии типа Bacterium Phytophthorum).

DAMPING–OFF DISEASE = БОЛЕЗНЬ ВЫПРЕВАНИЯ (или БОЛЕЗНЬ ЧЁРНАЯ НОЖКА) – Damping-Off Disease is a disease caused by one or a combination of two or more species of water molds. Evidence of damping-off disease is seen as cottony growths; the hyphae of the parasitic fungi are seen on the seed surface. The hyphae usually grow from a slit in the seedcoat that has been opened or broken during germination or threshing. / Под Чёрной Ножкой понимается болезнь растений, вызываемая паразитическими почвенными грибами (Pithium, Rhizoctonia, и Fusarium), реже бактериями (типа Bacterium Phytophthorum). Поражает Картофель, Морковь и другие.

DAMPNESS = СЫРОСТЬ (или ПОДМОЧЕННОСТЬ) – Dampness is the excessive humidity on the outside or in the interior of the bale detected by eye or by hand. / Чрезмерная влажность снаружи или внутри кипы, определяемая на глаз или рукой.

DAMP WOOL = ВЛАЖНАЯ ШЕРСТЬ – Damp Wool is a wool that has become damp or wet before or after bagging and may mildew. This weakens the fibers and seriously affects the spinning properties.

daN = DECA NEWTON

DANGEROUS CARGO = ОПАСНЫЙ ГРУЗ – Dangerous Cargo:- transportations of cargo ADR are carried out according to the European agreement on the international road transportation of dangerous cargoes, operating since 2001-July-01. Dangerous Cargoes – substances, materials and the products possessing properties, manifestation of which can serve as a cause of the explosion and (or) a fire to lead to death, to disease, to a poisoning, an irradiation or burns of people and (or) animals and also to cause damage of constructions, vehicles, other objects of transportation and (or) to harm the environment. Transportation of dangerous cargoes – a set of organizational and technological operations for moving dangerous cargoes by rail, road, water, air and other transport modes or

combination of such modes to be performed on a contractual basis and other legal grounds. Road rolling stock, engaged for the carriage of dangerous cargoes, has all necessary licenses and approvals, equipped with appropriate equipment and the additional protection, and the drivers received special training in accordance with the requirements of international transport of dangerous cargoes (ADR). Dangerous cargoes are divided into classes. This classification is based on the Model Rules and Recommendations on the Transport of Dangerous Cargoes by the United Nations (UN), as well as in accordance with the hazardous properties of cargoes. Classification of dangerous cargoes:- Class 1 – explosive materials (EM); Class 2 – gases compressed, liquefied and dissolved under pressure; Class 3 – flammable liquids (FL); Class 4 – flammable solids (FS), spontaneously igniting substance (SIS), substances that emit flammable gases in contact with water; Class 5 – oxidizing substances (OS) and organic peroxides (OPs); Class 6 – toxic substances (TS) and infectious substances (IS); Class 7 – radioactive materials (RM); Class 8 – caustic and corrosive substances (CCS); Class 9 – miscellaneous dangerous substances; – explosive materials (EM); - gases compressed, liquefied and dissolved under pressure – flammable liquids (FL); – flammable solids (FS), spontaneously igniting substance (SIS), substances that emit flammable gases in contact with water – Oxidizing substances (OS) and organic peroxides (OPs) – Toxic substances (TS) and infectious substances (IS) – Radioactive material (RM) – caustic and (or) corrosive substances (CCS) – other hazardous substances. The following features of the transport of dangerous cargoes:- (i) vehicle for the carriage of dangerous cargoes must be ordered in advance (usually within 2–3 working days from the expected date of shipping); (ii) for the transport of dangerous goods to prepare emergency cards, which are prepared on the basis of the passport matter, as well as route sheets, which indicate the route of dangerous cargoes. The driver must strictly adhere to the routes specified in the itinerary; (iii) it is necessary to prepare supporting documents for dangerous cargoes:- certificates, passports substance TTH, invoices. Typically, the registration and coordination of the route of dangerous cargoes must be in 3–5 days; (iv) transportation of dangerous cargoes must comply with high-speed mode, so the high-speed transport ADR cargo is not permitted; (v) some groups of dangerous cargoes are allowed to co-transport; and (vi) during loading, unloading and transport of dangerous cargoes, the driver is a responsible person, in connection with which he has the right not to accept the cargo for carriage in the ADR, if incorrectly or correctly framed the accompanying documentation are not complied with regulations for the transport of dangerous cargoes, damaged or deformed packaging. Dangerous Cargo is all substances of an inflammable nature which are liable to spontaneous combustion either in themselves or when stowed adjacent to other substances and, when mixed with air, are liable to generate explosive gases or produce suffocation or poisoning or tainting of foodstuffs. ADR (formally, the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR)) is a 1957 United Nations treaty that governs transnational transport of hazardous materials. 'ADR' is derived from the French name for the treaty:- **A**ccord Européen Relatif au Transport International des Marchandises **D**angereuses par **R**oute).

DANGEROUS GOODS = ОПАСНЫЕ ТОВАРЫ – Dangerous Goods are solids, liquids, or gases that can harm people, other living organisms, property, or the environment. They are often subject to chemical regulations. In the United States and sometimes in Canada dangerous goods are more commonly known as Hazardous Materials, (abbreviated as HAZMAT or HazMat). 'HazMat teams' are personnel specially trained to handle dangerous goods. Dangerous goods include materials that are radioactive, flammable, explosive, corrosive, oxidizing, asphyxiating, biohazardous, toxic, pathogenic, or allergenic. Also included are physical conditions such as compressed gases and liquids or hot materials, including all goods containing such materials or chemicals, or may have other characteristics that render them hazardous in specific circumstances. In the United States, dangerous goods are often indicated by diamond-shaped signage on the item, its container, and/or the building where it is stored. The colors of each diamond in a way has reference to its hazard, i.e.:- (i) Flammable = red because fire and heat are generally of red color; (ii) Explosive = orange, because mixing red (flammable) with yellow (oxidising agent) creates orange; (iii) Non-flammable Non-toxic Gas = green, due to all compressed air vessels being this color in France after World War II. France is where the diamond system of HazMat identification originated. Cargo of a hazardous nature as classified under International Maritime Organization (IMO) regulations. Dangerous Goods are the goods to be considered dangerous if transport of such might cause harm, risk, peril or other evil to people, environment, equipment or property. Transport of dangerous goods (TDG) needs to be regulated in order to prevent, as far as possible, accidents to persons or property and damage to the environment, the means of transport employed or to other goods. However, with different regulations in every country and for different modes of transport, international trade in chemicals and dangerous products would be seriously impeded, if not made impossible and unsafe. Moreover, dangerous goods are also subject to other kinds of regulations, e.g., work safety regulations, consumer protection regulations, storage regulations, environment protection regulations. In order to ensure consistency between all these regulatory systems, the United Nations has developed mechanisms for the harmonization of hazard classification criteria and hazard communication tools (GHS (is short for the Globally Harmonized System of Classification and Labelling of Chemicals)) as well as for transport conditions for all modes for transport (TDG). In addition, the UNECE (short for the United Nations Economic Commission for Europe) administers regional agreements that ensure the effective implementation of these mechanisms as far as transport of dangerous goods by road, rail and inland waterways is concerned. Dangerous Goods is the International Maritime Consultative Organization term for hazardous materials. Dangerous Goods are materials or items with hazardous properties which, if not properly controlled, present a potential hazard to human health and safety, infrastructure and/ or their means of transport. The transportation of dangerous goods is controlled and governed by a variety of different regulatory regimes, operating at both the national and international levels. Prominent regulatory frameworks for the transportation of dangerous goods include the United Nations Recommendations on the Transport of Dangerous Goods, ICAO's Technical Instructions (ICAO = International Civil Aviation Organization), IATA's Dangerous Goods Regulations (IATA = International Air Transport Association) and the IMO's International Maritime Dangerous Goods Code (IMO = International Maritime Organization). Collectively, these regulatory regimes mandate the means by which dangerous goods are to be handled, packaged, labelled and transported. Regulatory frameworks incorporate comprehensive classification systems of hazards to provide a taxonomy of dangerous goods. Classification of dangerous goods is broken down into nine classes according to the type of danger materials or items present:- Class 1 – Explosives; Class 2 – Gases; Class 3 – Flammable Liquids; Class 4 – Flammable Solids; Class 5 – Oxidizing Substances; Class 6 – Toxic & Infectious Substances; Class 7 – Radioactive Material; Class 8 – Corrosives; and Class 9 – Miscellaneous Dangerous Goods. The multitude of dangerous goods regimes across the world and the complexity of dangerous goods classifications and regulations render compliance a particularly difficult task. However some companies, as a logistics company specialising in dangerous goods, is well placed to deliver tailored solutions to all customer's dangerous goods needs. Such company is proficient in all nine classes of dangerous goods and provides a range of services including packaging, packing, labelling, freight forwarding and training. The classification Dangerous Goods applies to all goods and substances that may pose a danger to a person's health or safety, property or the environment. The air transport of dangerous goods is strictly regulated worldwide and dangerous goods regulations apply on all Finnair flights. / ХэзМэт (HazMat).

DANGEROUS GOODS DECLARATION = ДЕКЛАРАЦИЯ ОБ ОПАСНЫХ ТОВАРАХ – Dangerous Goods Declaration is a document issued by a shipper in accordance with applicable conventions or regulations, describing hazardous goods or materials for transport purposes, and certifying that the latter have been packed and labelled in accordance with the provisions of the prevailing conventions or regulations.

DANGEROUS GOODS PACKING CERTIFICATE = СЕРТИФИКАТ (или СВИДЕТЕЛЬСТВО) ОБ УПАКОВКЕ ОПАСНЫХ ТОВАРОВ – Dangerous Goods Packing Certificate is a document as part of the dangerous goods declaration in which the responsible party declares that the cargo has been stowed in accordance with the rules in a clean container according to the International Maritime Dangerous Goods (IMDG) code regulations and properly secured.

DANGEROUS GOODS SAFETY ADVISOR = СОВЕТНИК ПО БЕЗОПАСНОСТИ В ОТНОШЕНИИ ОПАСНЫХ ТОВАРОВ (или ОТВЕТСТВЕННЫЙ ПО ТЕХНИКЕ БЕЗОПАСНОСТИ В ОТНОШЕНИИ ОПАСНЫХ ТОВАРОВ) – Dangerous Goods Safety Adviser (DGSA):- dangerous goods with a calculated value of 1660 (a figure of 1000 is specified for the purposes of ADR 1.1.3.6.4) would be considered a 'significant risk', therefore shipments of this nature would require the operator to have a DGSA formally appointed in writing. Notwithstanding the assessment criteria outlined above, it remains the duty of an undertaking to appoint a safety adviser if it's own risk assessment leads to the belief of the existence of a significant risk. It is important to remember that even if you do not need to formally appoint a dangerous goods safety adviser, specific requirements under the Carriage of Dangerous Goods by Road Regulations still apply, e.g., correct packaging, labelling, documentation etc and therefore you are likely to need support and guidance in this area to ensure safety and compliance with the regulations. This level of support is best provided by a DGSA or a health and safety professional with competence in this area. Who can I appoint as a Dangerous Goods Safety Adviser? You may appoint an existing employee, yourself, or a consultant – provided they hold a current vocational training certificate (VTC) obtained by passing the approved examinations valid both for the mode of transport, i.e. 'road' and for the Class, i.e. the type of dangerous goods being transported. The examination regime is administered in Ireland by the Chartered Institute of Logistics & Transport. Advisers will need to pass an examination every five years in order to remain qualified. What do Dangerous Goods Safety Advisers need to do? Your DGSA will need to:- (i) provide you with advice on all aspects of the transport of dangerous goods related to the relevant activities of the undertaking; (ii) monitor compliance, by all appropriate means and by all appropriate action, with the legal requirements on the safe transport of dangerous goods and related health and safety practices and procedures (including the preparation of accident reports) in line with functions listed in Appendix 1; and (iii) ensure the preparation of an annual report, not later than 3 months after the end of each calendar year, on your activities concerning the transport of dangerous goods. Such reports are primarily internal documents and so the format and content can vary from undertaking to undertaking. However a template is provided in Appendix 2 for guidance. As a minimum the contents should summarise the results/conclusions of the safety advisers' monitoring activities (including accidents), with a view to assisting compliance with the transport of dangerous goods legal requirements. You will need to keep any such reports for five years, and make them available to enforcement agencies, such as the Health and Safety Authority, on request. It is important when appointing or assigning a Safety Adviser that you ensure that the adviser is clear about his or her responsibilities and is satisfied in terms of:- (a) what is expected to be done, i.e. range of functions; (b) how it is to be done, e.g., directly or by delegation; (c) where it is to be done, e.g., multiple sites; and (d) the resources available being adequate. This should entail, as appropriate, a preliminary evaluation by the Safety Adviser(s) of the activities of the undertaking involving the loading, transport and unloading of dangerous goods. This evaluation should cover the state of compliance with the relevant legislation and outline what may be necessary in terms of:- (a) advising the undertaking on the transport of dangerous goods; (b) ensuring a system is in place for monitoring compliance with the rules governing the transport of dangerous goods; (c) ensuring a system is in place to monitor the practices and procedures of the undertaking relating to those activities; and (d) ensuring an annual report to the undertaking is prepared on those activities of the undertaking. A Safety Adviser may be satisfied following the evaluation that there are already certain suitable monitoring systems in place, albeit the Adviser is not directly involved. The Adviser's involvement could then, in respect of those systems, be one of auditing the systems at frequencies dictated by the result of the initial evaluation. Any persons involved in activities related to the safe transport of dangerous goods, in support or otherwise of an Adviser, must be adequately trained. The preparation of the Annual Report may also in certain situations reflect substantive preparation by the undertaking but always with final clearance and submission to the undertaking by the Safety Adviser(s). It is important that a Safety Adviser keeps you informed, preferably in writing, of any issues arising as a consequence of the carrying out of his or her functions which necessitate appropriate action being taken by you to address the issues, and where necessary, to rectify any problems. Ongoing unresolved problems should be highlighted in the Annual Report while at the same time recognising the potential, where significant concern arises, of either party approaching the Health and Safety Authority directly. How many Safety Advisers do I need? The regulations leave it open to you to decide how many safety advisers you need to appoint. In deciding the appropriate number you will need to consider and make provision for issues such as:- (i) the time, information and facilities the safety adviser(s) will need to fulfil their functions and duties; (ii) how many operating sites they will need to cover; and (iii) whether they will prepare reports and carry out monitoring themselves or simply ensure others do these things. It is also left open to you to co-operate with other undertakings in appointing the same safety adviser(s) – this may be particularly useful on sites where more than one undertaking is involved in the transport, loading or unloading of dangerous goods, such as at ports and airports. However if you appoint more than one adviser you will have to, (i) as with the appointment of just one adviser, ensure that the time available for any safety adviser and the means at his or her disposal to fulfil his or her functions are adequate having regard to those functions; (ii) make arrangements for ensuring adequate co-operation between the advisers (e.g., who will be responsible for writing the annual report, investigating accidents, carrying out audits etc); and (iii) ensure that the number of individuals appointed by you is sufficient to ensure that their functions can be carried out effectively. Whether you appoint one or more Advisers it must be recognised, in the context of a Safety Adviser maintaining competency in respect of fulfilling his or her functions, that ongoing relevant training will be necessary in such areas as legislation, the ADR, multi-modal transport, accident investigation techniques, monitoring techniques etc. Accident Reports:- your dangerous goods safety adviser or advisers are required to prepare and give you a report on each accident which affects the health and safety of any person, or causes damage to the environment or property, and which occurs during the transport of dangerous goods by the undertaking that has appointed him/her. This can be deemed to exclude accidents which have no implications for the dangerous goods being carried, such as a driver spraining an ankle while getting out of the cab or minor road traffic accidents. Such reports are primarily internal documents, and without prejudice to any other reporting legal requirement (e.g., Part X of the Safety Health and Welfare at Work (General Application) Regulations 1993), do not have to be sent to the Health and Safety Authority, but need to be kept by you for five years. The report format and content can therefore vary from undertaking to undertaking. For minor incidents your existing incident recording arrangements may be sufficient but will need the safety adviser's overview and will need to reflect remedial action both recommended and taken. However, more serious incidents will warrant a fuller report giving, as a minimum, details and causes of the incident, any legal implications, and the actions needed to prevent a recurrence. This implies that safety advisers must be made aware by you of all relevant accidents if they are to fulfil their legal duties. For reporting concerning serious accidents or incidents (see ADR 1.8.5.3), a report must be prepared in the form prescribed in ADR 1.8.5.4 and submitted to the competent authority. The functions of a safety adviser include in particular the following:- (a) monitoring compliance with the rules governing the transport of dangerous goods; (b) advising the undertaking on the transport of dangerous goods; (c) ensuring that an annual report to the undertaking is prepared on the activities of the undertaking concerning the transport of dangerous goods; (d) monitoring the following practices and procedures relating to the activities of the undertaking which concern the transport of dangerous goods; (e) the procedures for compliance with the rules governing the identification of dangerous goods being transported; (f) the practice of the undertaking in taking into account, when purchasing means

of transport, any special requirements in connection with the dangerous goods to be transported; (g) the procedures for checking the equipment used in connection with the transport of dangerous goods; (h) the proper training of the undertaking's employees and the maintenance of records of such training; (i) the implementation of proper emergency procedures in the event of any accident or incident that may affect safety during the transport of dangerous goods; (j) the investigation of and, where appropriate, preparation of reports on serious accidents, incidents or serious infringements recorded during the transport of dangerous goods; (k) the implementation of appropriate measures to avoid the recurrence of accidents, incidents or serious infringements; (l) the account taken of the legal prescriptions and special requirements associated with the transport of dangerous goods in the choice and use of subcontractors or third parties; (m) verification that employees involved in the transport of dangerous goods have detailed operational procedures and instructions; (n) the introduction of measures to increase awareness of the risks inherent in the transport of dangerous goods; (o) the implementation of verification procedures to ensure the presence, on board the means of transport, of the documents and safety equipment which must accompany transport and the compliance of such documents and equipment with health and safety regulations; (p) the implementation of verification procedures to ensure compliance with legislation governing loading and unloading of dangerous goods; and (q) the existence of the security plan indicated in ADR 1.10.3.2. Dangerous Goods Safety Advisor (DGSA):- in compliance with the regulations concerning the carriage of dangerous goods by road, the entrepreneur and other entity performing the carriage of dangerous goods or loading and unloading connected with such carriage, is obliged to conduct the internal supervision over these actions and appoint, at his own expenses, a certified dangerous goods safety advisor (ADR Advisor). A Dangerous Goods Safety Advisor (DGSA) is a person appointed to provide advice, monitor compliance with legal requirements and ensure the preparation of an annual report. The role of a DGSA for carriage by road is specified in ADR 1.8.3. Who needs to appoint a DGSA? As an undertaking involved in the carriage of dangerous goods by road, whose activities include the carriage, or the related packing, loading, filling or unloading, of dangerous goods by road, subject to some limited exemptions, must appoint a vocationally qualified safety adviser or advisers. Their function is to advise you on health, safety and environmental matters in connection with the carriage of dangerous goods. The undertakings affected are those:- (i) who consign dangerous goods for carriage and who are involved in loading the means of transport; (ii) who are operators of road vehicles; and (iii) who load or unload dangerous goods while they are in transit to their final destination, such as freight forwarders or warehouses. This category also covers undertakings at ports and airports that load/unload dangerous goods onto/off road vehicles, but does not include consignees who only unload at the final destination, e.g., petrol station operators or supermarkets. Who is classified as the Consignor? Regulation 2(9) of S.I. No.349 of 2011, defines 'Consignor' as the person who consigns dangerous goods either on its own behalf or for a third party and shall be construed as:- (i) any person who having a place of business in the State supplies, whether as a principal or agent for another, dangerous goods for carriage by road; or (ii) if no person satisfies the requirements of clause (i), the consignee of those goods in so far as that person has control over the carriage of those dangerous goods in the State. Also Regulation 2(9) states if the transport operation is carried out under a contract for carriage, 'Consignor' means the consignor according to the contract for carriage.

DANGEROUS LIQUIDS = ОПАСНЫЕ ЖИДКОСТИ – Dangerous Liquids (DL) are liquids giving off inflammable vapors. The samples are:- benzin, chlorpyrifos 500, pure alcohol 96°, sulfuric acid, etc.

DANIDA = DANISH INTERNATIONAL DEVELOPMENT AGENCY

DAP = DAYS AFTER PLANTING

DAP = DELIVERED AT PLACE

DAPE = DAYS AFTER PANICLE EMERGENCE

DAPI = DAYS AFTER PANICLE INITIATION

DAPOG = ДАПОГ (или ЛОТОК) – Dapog Method is preferable in areas where water management is excellent. The dapog seedbed should be watered with a sprinkler or wet stick broom so that the seeds will not be displaced. It can be made on various surfaces. A concrete floor, a raft made of banana stalks with soil on top, or an elevated platform can be used as the seedbed. Characteristics of Dapog Seedlings:- good dapog seedlings are uniform in size; free from diseases, pests and mechanical injury; and hardly, with short but erect leaves and vigorous roots. Advantages of Dapog Method:- (i) time in the seedbed is greatly reduced; (ii) area required for the seedbed is reduced; (iii) there are more choices for seedbed location; (iv) seedlings do not suffer from root or stem injury; and (v) labor cost for pulling seedlings is eliminated. Disadvantages:- (i) larger quantity of seeds is required; (ii) seedlings are short; and (iii) number of seedlings per hill cannot be controlled easily. 'Dapog' is a method of raising Rice seedlings on banana leaves, polythene, or a cement slab. Seedlings are raised in the same way as in the wetbed method. Because the seeds are sown thickly (3 kg seeds per square meter), seedlings look like a mat or carpet and can be rolled for transplanting when they are 10–14 days old. / В Юго-Восточной Азии методом Дапог .

DAPS = DAYS ALL PURPOSES

DARE = DEPARTMENT OF AGRICULTURAL RESEARCH AND EDUCATION

DARK CLOUD COVER = ЗАВЕСА ТЁМНЫМ ОБЛАКОМ – In technical analysis, Dark Cloud Cover is a bearish reversal pattern that continues the uptrend with a long white body. The next day opens at a new high then closes below the midpoint of the body of the first day. / В техническом анализе биржевых рынков, под Завесой Тёмным Облаком понимается медвежья модель разворота, встречающаяся при восходящей тенденции вслед за длинным прозрачным телом. Следующий день открывается с нового максимума, а затем происходит снижение цены до среднего уровня изменения цены в предыдущий день.

DARKENED KERNELS (AMBER DURUM) = ПОТЕМНЕВШАЯ ЗЕРНОВКА (ЯНТАРНОЙ ДУРУМ) – Darkened Kernels (Amber Durum) are similar in appearance to penetrated smudge with the exception that discoloration is gray to charcoal in color rather than red to dark brown. For grading purposes, darkened kernels should be considered as, and in conjunction with severe midge damage. / изменение цвета .

DARK POOL = ТЁМНЫЙ ПУЛ – Dark Pools are an ominous-sounding term for private exchanges or forums for trading securities; unlike stock exchanges, dark pools are not accessible by the investing public. Also known as 'Dark Pools Of Liquidity', they are so named for their complete lack of transparency. Dark pools came about primarily to facilitate block trading by institutional investors, who did not wish to impact the markets with their large orders and consequently obtain adverse prices for their trades. While dark pools have been cast in a very unfavorable light in Michael Lewis' bestseller 'Flash Boys:- A Wall Street Revolt', the reality is that they do serve a purpose. However, their lack of transparency makes them vulnerable to potential conflicts of interest by their owners and predatory trading practices by some high-frequency traders. The current controversy surrounding dark pools may lead one to think that they are a recent innovation, but they have actually been around since the late 1980s. Non-exchange trading in the United States has surged in recent years, accounting for about 40% of all US stock trades in 2014 compared with 16% six years ago. Dark pools have been at the forefront of this trend towards off-exchange trading, accounting for 15% of US volume as of 2014, according to figures

given by industry insiders. Why did dark pools come into existence? Consider the options available to a large institutional investor who wanted to sell 1 million shares of XYZ stock prior to the advent of non-exchange trading. This investor could either (a) work the order through a floor trader over the course of a day or two and hope for a decent VWAP (volume weighted average price); (b) split the order up into say five pieces and sell 200 000 shares per day, or (c) sell small amounts until a large buyer could be found who was willing to take up the full amount of the remaining shares. The market impact of a 1-million sale of XYZ shares could still be sizeable, regardless of whether the investor chose (a), (b), or (c), since it was not possible to keep the identity or intention of the investor secret in a stock exchange transaction. With options (b) and (c), the risk of a decline in the period while the investor was waiting to sell the remaining shares was also significant. Dark pools were one solution to these issues. Why Use a Dark Pool? Contrast this with the present-day situation, in which an institutional investor uses a dark pool to sell a 1 million share block. The lack of transparency actually works in the institutional investor's favor, since it may result in a better realized price than if the sale was executed on an exchange. Note that as dark pool participants do not disclose their trading intention to the exchange prior to execution, there is no order book visible to the public. Trade execution details are only released to the consolidated tape after a delay. The institutional seller has a better chance of getting a buyer for the full share block in a dark pool, since it is a forum dedicated to large investors. The possibility of price improvement also exists if the mid-point of the quoted bid and ask price is used for the transaction. Of course, this assumes that there is no information leakage of the investor's proposed sale, and that the dark pool is not vulnerable to high-frequency trading (HFT) predators who could engage in front-running once they get a whiff of the investor's trading intentions. Types of dark pools:- as of April 2014, there were 45 dark pools in the US, consisting of the following three types:- (i) Broker-Dealer Owned:- these dark pools are set up by large broker-dealers for their clients, and may also include their own proprietary traders. These dark pools derive their own prices from order flow, so there is an element of price discovery. Examples of such dark pools, of which there were 19 as of April 2014, include Credit Suisse's CrossFinder, Goldman Sachs' Sigma X, Citi's Citi Match and Citi Cross, and Morgan Stanley's MS Pool. (ii) Agency Broker or Exchange-Owned:- these are dark pools that act as agents, not as principals. As prices are derived from exchanges – such as the midpoint of the National Best Bid and Offer (NBBO), there is no price discovery. Examples of agency broker dark pools include Instinet, Liquidnet, and ITG Posit, while exchange-owned dark pools include those offered by BATS Trading and NYSE Euronext. (iii) Electronic Market Makers:- these are dark pools offered by independent operators like Getco and Knight, who operate as principals for their own account. Like the broker-dealer owned dark pools, their transaction prices are not calculated from the NBBO, so there is price discovery. Pros and Cons:- the advantages of dark pools are as follows:- (i) Reduced Market Impact:- as noted earlier, the biggest advantage of dark pools is that market impact is significantly reduced for large orders. (ii) Lower Transaction Costs:- transaction costs may be lower, since dark pool trades do not have to pay exchange fees, while transactions based on the bid-ask mid-point do not incur the full spread. Dark pools have the following drawbacks:- (i) Exchange Prices May Not Reflect The Real Market:- if the amount of trading in dark pools owned by broker-dealers and electronic market makers continues to grow, stock prices on exchanges may not reflect the actual market. For example, if a well-regarded mutual fund owns 20% of company RST's stock and sells it off in a dark pool, the sale of the stake may fetch the fund a good price, but unwary investors who have just bought RST shares will have paid too much for it, since the stock could well collapse once the fund's sale becomes public knowledge. (ii) Pool Participants May Not Get The Best Price:- the lack of transparency in dark pools can also work again a pool participant, since there is no guarantee that the institution's trade was executed at the best price. Lewis points out in 'Flash Boys' that a surprisingly large proportion of broker-dealer's dark pool trades get executed within the pools – a process known as internalization – even in cases where the broker-dealer has a small share of the US market. As Lewis notes, the dark pool's opaqueness can also give rise to conflicts of interest if a broker-dealer's proprietary traders trade against pool clients, or if the broker-dealer sells special access to the dark pool to HFT firms. (iii) Vulnerability To Predatory Trading By HFTs:- the recent controversy over dark pools has been spurred by Lewis' claims that dark pool client orders are ideal fodder for predatory trading practices by some HFT firms, which employ tactics such as 'pinging' dark pools to unearth large hidden orders, and then engage in front running or latency arbitrage. (iv) Small Average Trade Size Reduces Need For Dark Pools:- somewhat surprisingly, the average trade size in dark pools has declined to only about 200 shares, Exchanges like the New York Stock Exchange (NYSE®), who are seeking to stem their loss of trading market-share to dark pools and alternative trading systems, claim that this small trade size makes the case for dark pools less than compelling. Curb Appeal:- the recent HFT controversy has drawn significant regulatory attention to dark pools. Regulators have generally viewed dark pools with suspicion because of their lack of transparency, and the controversy may lead to renewed efforts to curb their appeal. One measure which may help exchanges reclaim market share from dark pools and other off-exchange venues could be a pilot proposal from the Securities and Exchange Commission (SEC) to introduce a 'trade-at' rule. The rule would require brokerages to send client trades to exchanges rather than dark pools, unless they can execute the trades at a meaningfully better price than that available in the public market. If implemented, this rule could present a serious challenge to the long-term viability of dark pools. Bottom Line:- dark pools provide pricing and cost advantages to buy-side institutions such as mutual funds and pension funds, and these benefits ultimately accrue to the retail investors who own these funds. However, dark pools' lack of transparency makes them susceptible to conflicts of interest by their owners and predatory trading practices by HFT firms. The recent HFT controversy has drawn increasing regulatory attention to dark pools, and implementation of the proposed 'trade-at' rule could pose a threat to their long-term viability. Dark Pools are networks – usually private exchanges or forums – that allow institutional investors to buy or sell large amounts of stock without the details of the trade being released to the wider market. Dark pools can also be referred to as Dark Pool Liquidity, or Dark Liquidity. They came about as a way for large-scale investors to make deals with each other that would not result in an adverse price move against them. If an investor wants to sell a major portion of a company's stock on a public exchange they must declare their intention, and run the risk that the value of the stock will drop thanks to the swell in supply. Dark pools remove this risk by announcing deals only after they have taken place, and restricting access to deals. 2012-October-17:- Dark Pools started in the 1980s when some institutional investors got together to trade in a place where they could avoid the prying eyes of public exchanges or brokers. They wanted to be able to buy or sell large quantities of stocks without affecting the market and thus get better execution prices. Around 2005 these dark pools only made up 3–5% of market activity. Then things started changing in 2007, when the SEC passed new regulations known as Reg NMS (Regulation National Market System). In Reg NMS were provisions that seriously upped competition for the exchanges. For one, it got rid of rules that protected manual quotations by exchanges. All of the sudden investors had the option of skipping exchanges if they could find a better price more quickly elsewhere. Broker-dealers saw an opportunity in this (and in the rise of automated trading), and they started setting up their own dark pools. Institutional investors and bulge bracket banks started heading over to them to save on trading costs. Today trading in dark pools accounts for about 12% of volume in the US. Ultimately, the key benefit of trading in the dark pool is 'price improvement'. Say the bid for a stock on an exchange is USD10.00, and the first asking price is USD10.10. A typical dark pool will set the price at USD10.05, the midpoint between the bid and the ask. And traders like that. No, they love that. Trading In The Dark:- the thing is, though, you don't know who else is in the dark pool with you and you don't know if anyone wants what you're selling at all. So how do brokers decide to send an order into a dark pool if they don't know what's inside? Some brokers cut 'payment for order flow' deals where they agree to send orders to a certain dark pool. Another, more controversial way they do this is by getting 'indications of interest' (IOI) from dark pools. The IOIs can contain any of the following pieces of information – the ticker of stock, the buy/sell interest, the price, or how much is up for grabs. Sounds like a price quote right? Nope. This IOI is not a hard and fast quote

and is not made public across the market. The SEC has proposed making them quotes, but it hasn't happened. Another downside to the dark pool, which comes from not knowing whether or not what you need (a buyer or seller) is even in there, is the fact that you may not be able to get your order filled as quickly as on the open exchange. That's where Professor Zhu's latest research comes in. His paper is called 'Do Dark Pools Harm Price Discovery'. According to Zhu, even though you can get a good price in a dark pool, investors lose when they can't get their order filled ASAP. In the end, he says, it all has to do with risk and volatility. For example:- 'You really want to sell this stock because it's costly to hold it on your balance sheet', Zhu explained. 'The more you delay the more the stock price could move, which is volatility. The higher the volatility the more costly it is to hold the position'. And waiting is especially bad if you're trading on information – academics call these traders 'informed traders'. Ultimately, a wait time could mean the difference between an informed trader making their trade before anyone knows what they know, and getting caught in the herd. 'Information can become stale, that's an informed traders' delay cost', said Professor Zhu. How Dark Pools Widen Spreads On Open Exchanges:- to ensure that someone, like a market maker, is on the other side of their trade when they need them, Professor Zhu has found that informed traders are heading back to the exchanges. They're self-selecting. That means two things. Market makers at the exchanges learn more precise information about a stock from informed traders trying to make the best trade. When market makers see more informed traders coming, they widen the spread between the bid and ask so they don't lose too much. In short:- the prices on the open exchanges become more precise, according to Professor Zhu, but market makers are widening spreads to protect themselves from the onslaught informed traders. Meanwhile uninformed traders – investors who are trading to hedge, for example – can stay in the dark pool where they're nice and anonymous. That means they're not on the open exchanges to help market makers by adding liquidity, and thus narrowing spreads. What Does This Mean For You? On the upside, it means investors handling your retirement account etc could be getting better deals on stocks in a dark pool. On the downside, if what Professor Zhu's thesis is correct, dark pools are widening spreads on open exchanges, which no one likes because it makes a stock more expensive. That aside though, the biggest hazard in dark pools is that we don't know how they operate or who's operating inside them. Earlier this month the SEC charged one dark pool operator, eBX LLC, with sharing their clients' confidential trading information with an outside company. That includes information about their clients' unexecuted orders. From the SEC:- 'Dark pools are dark for a reason:- buyers and sellers expect confidentiality of their trading information', said Robert Khuzami, Director of the SEC's Division of Enforcement. 'Many eBX subscribers didn't get the benefit of that bargain – they were unaware that another order routing system was given exclusive access to trading information that it used for its own benefit'. eBX paid an USD800 000 fee to settle the charges, but who knows how much they gained by sharing the information. Xxxxx. A Dark Pool is the romantic – or sinister, depending on your viewpoint – name given to a network that allows traders to buy or sell large orders without running the risk that other traders will work out what is going on and put the price up, or down, to take advantage of the order. They have been criticised for their lack of transparency and because the inevitable fragmentation of trading could lead to less efficient pricing in traditional open stock exchanges. In dark pools, pre-trade prices – the price at which shares are offered for sale – are not visible to anyone, even the participants in them, and the price at which shares change hands is only revealed after the trade is done. The Purpose Of Dark Pools:- the primary purpose of dark pools is to minimise market impact. By restricting access to undesired market participants (such as high frequency trading firms), and by not revealing quotes, dark pools enable institutional investors to minimise their information leakage and realise more efficient executions. More specifically, dark trading facilities provide the possibility of price improvement and reduced transaction costs by crossing orders at the midpoint of the quoted best bid and offer prices, thereby saving on both the bid-offer spread and on exchange fees. For these reasons, dark pools have been popular for the execution of large block orders. The Prevalence Of Dark Pools:- at the beginning of 2013 it was estimated that non-displayed trading accounted for a third of total volume in the US and dark pools about 13 per cent of total volume. A similar volume was said to be taking place in Europe. Rapid growth had been noted of about 50 per cent over the preceding three years in the US, while in Europe, trading in dark pools relative to order-book activity had more than doubled over the preceding two years. Why Trading In Dark Pools Has Been Growing:- dark pools have become prevalent due to technological developments that have lowered costs allowing broker/dealers to route more of the order flow they handle to their own private pools first before sending unwanted orders to the public markets. Dark Pools In The News:- in the US in April 2013, chief executives of NYSE Euronext, Nasdaq OMX and BATS Global Markets argued for regulators to introduce rules permitting transactions to only take place away from a public exchange if a customer is getting a much-improved price. They pointed to similar steps taken by Canadian and Australian regulators to combat the rise of off exchange trading, otherwise known as Dark Pools. In June 2014, New York's top securities regulator sued Barclays for allegedly favouring high speed traders in its 'dark pool'. The complaint was set to increase the pressure on other dark pool operators such as those run by Credit Suisse, Bank of America, Goldman Sachs and Morgan Stanley to provide investors with more information about how they operate. In recent months, some dark pools had begun voluntarily publishing more information on how they work. / КросФайндё от Крэди Свисс (Credit Suisse's CrossFinder), Сигма Экс. от Голдмэн Сэкс (Goldman Sachs' Sigma X), Сыти Мэтч и Сыти Крос от Сыти (Citi's Citi Match and Citi Cross), и Эм.Эс. Пул от Моргэн Стэнли (Morgan Stanley's MS Pool). Директор Робэт Кузами (Robert Khuzami). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Эн.Уай.Эс.И. Юроунэкст (NYSE Euronext). Баклиз (Barclays). Крэди Свисс (Credit Suisse), Банк Америки (Bank of America), Голдмэн Сэкс (Goldman Sachs) и Моргэн Стэнли (Morgan Stanley). НЭЗДЭК® (NASDAQ®).

DARK SLUBS = ТЁМНЫЕ ТОЛСТЫЕ ПРИСУЧКИ (или ТЁМНЫЕ XX) – Dark Slubs:- Fabric:- spun-rayon-blend flannel dress goods; Construction:- (i) Count:- 58 x 50; (ii) Warp:- 15/1 50% 2-in. 1%-den. dull viscose rayon, 50% 2-in. 3-den. dull acetate rayon; (iii) Filling:- same as warp; Finish:- cross-dyed dark green (viscose) and white (acetate). Defect:- long dark slubs throughout warp and filling. Analysis:- microscopic analysis showed the dark slubs to be composed almost entirely of the viscose rayon (dyed green). This defect was apparently caused by faulty blending and drawing. If these goods had been dyed in solid shades and a good color match obtained between the viscose and acetate, this particular defect would have been much less noticeable. / Уточина:- такая же как и основа.

DARK SPECKS = ТЁМНЫЕ КРАПИНКИ (или ТЁМНЫЕ МУШКИ) – Dark Specks:- Fabric:- combination-yarn crêpe; Construction:- (i) Count:- 52 x 44; (ii) Warp:- 100/40 viscose-rayon crêpe ply-twisted with 150/40 dull acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed light blue. Defect:- dark specks. Analysis:- microscopic analysis showed that the dark-dyed specks were actually comparatively coarse single filaments protruding from, but still making up pan of the continuous-filament viscose-crêpe yarns. Only the extreme free ends of these filaments were coarse and dark, the remainder tapering off to normal size and shade. This defect, which would not be noticeable in white or dark-dyed goods, was attributed to faulty rayon manufacture. om a clogged hole in a spinnerette suddenly clearing or 'uncorking' with a coarse gob of forming on the tip end. The clogging of rayon spinnerettes is a serious problem to the yarn manufacturer. Poorly filtered via >lution may be one source of clogging; but the chemical composition of the spinning bath may also be a critical factor. Numerous patents have been issued on techniques and formulas to prevent holes from filling up and producing asively fine filaments or subnormal filament counts. / Уточина:- такая же как и основа.

DARK SPOT = ТЁМНОЕ ПЯТНО – Dark Spot:- Fabric:- twill dress goods; Construction:- (i) Count:- 92 x 64; (ii) Warp:- 150/40 dull viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed pink. Defect:- dark spot. Analysis:- the so-called 'Dark Spot' was found to be a dirty warp knot which resisted cleaning during normal wet processing of the fabric. Chemical tests revealed the presence of traces

of iron, as well as unremoved soil. Laboratory scouring tests indicated that the finisher was not at fault in claiming inability to eliminate the dirty knots. The iron was apparently coming from small amounts of rust, which were picked up along with the unremovable dirt while the warp was passing through the reed or the heddles. In certain cases in which the classification of such goods as suitable for white and light shades may command a premium price, it is sometimes possible for the finisher to use special scouring procedures which will result in removal of most of the soil in such dirty knots, but this special handling is necessarily more costly and necessitates extra charge by the finisher. / Уточина:- такая же как и основа.

DARK STREAKS NEAR SELVAGE = ТЁМНЫЕ ЗАТАСКИ ВБЛИЗИ КРОМКИ (или ТЁМНЫЕ ПОЛОСКИ ВБЛИЗИ КРОМКИ, или ТЁМНЫЕ ЧЕРТЫ ВБЛИЗИ КРОМКИ) – Dark Streaks Near Selvage:- Fabric:- iridescent-type cotton-and-nylon dress goods; Construction:- (i) Count:- 96 x 86; (ii) Warp:- 70/34 semidull nylon; (iii) Filling:- 60/1 combed cotton; Finish:- plain dyed helio. Defect:- dark-appearing sections running warpwise about 4 inches in width adjacent to each selvage. Analysis:- microscopic examination showed no evidence of any mechanical damage to either the warp or the filling yarns in the dark-appearing sections. Laboratory stripping and redyeing resulted in considerable improvement, but not in complete removal of the dark sections. This defect was at first attributed to a slight distortion or imperceptible damage by the temple rolls. However, it was later learned that the weaving mill had used small pads saturated with a sulphonated oil and placed in contact with the warp yarns on the loom on either side, adjacent to the selvages, to provide for better weaving. With this information as a guide, chemical extraction of the warp yarns in the finished goods showed small amounts of unremoved oil in the dark areas. It appeared that normal scouring operations by the dyer did not completely remove this oil. which had been assumed to be readily emulsifiable, but which probably was too much absorbed by the nylon or affected by aging when the gray goods were not processed immediately. Dark Streaks:- Fabric:- rayon-and-wool dress goods; Construction:- (i) Count:- 84 x 46; (ii) Warp:- 24/2 60% 2-in. 1%-den. dull viscose rayon, 40% 64's wool cut 2 in.; (ii) Filling:- 12/1 same blend as warp; Finish:- plain dyed white. Defect:- short dark streaks in warp and filling. Analysis:- analysis showed that the short dark streaks were due to the presence of numerous dark-brown and black wool hairs spun in with the regular yarns. When wool is used for blends to be finished in white or light shades, it must be especially selected for freedom from black hairs, since there is no means of removing or bleaching them in finishing. / Уточина:- . Найлан (Nylon). Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

DART = ВЫТАЧКА (или СМЁТКА, или ШОВ, или РЫВОК) – (1) Dart (cut-in) is an open dart cut in approximately 12" under the armhole.

(2) Dart (front or double):- an additional closed dart located toward the front edge of the garment, used to get maximum waist suppression.

(3) Dart (panel):- a panel sewn full length to the front that is used for waist suppression.

DAS = DAYS AFTER SEEDING/SOWING

DASA = DAYS AFTER STRAW APPLICATION

DAS–ELISA = DOUBLE ANTIBODY SANDWICH ENZYME–LINKED IMMUNOSORBENT ASSAY

DASHIKI = ДОЩИКИ – Dashiki:- a usually brightly colored loose-fitting pullover garment. The word Dashiki comes from the Yoruba word Danshiki, used to refer to the loose-fitting pullover which originated in West Africa as a functional work tunic for men, comfortable enough to wear in the heat. The Yoruba loaned the word Danshiki from the Hausa term Dan Ciki, which means 'Underneath'. The Dan Chiki garment was commonly worn by males under large robes. Similar garments were found in sacred Dogon burial caves in Southern Mali, which date back to the XII and XIII centuries. / (Danshiki). (Dan Ciki).

DASYACANTHUS = ДАСЯКАНТУС – Dasyacanthus:- with dense spination.

DAT = DAYS AFTER TREATMENT

DAT = DAYS AFTER TRANSPLANTING

DAT = DELIVERED AT TERMINAL

DATA = ДАННЫЕ – Data is the collection of facts of experiments, instruments, and surveys and treatments that are calculated statistically to give measured statistical results.

DATABASE = БАЗА ДАННЫХ – Database (DB) is facts or information and figures stored for future use. / Под Базой Данных понимается организованная совокупность данных, предназначенная для их хранения, накопления, обработки с помощью электронной вычислительной машины (ЭВМ). Для создания и ведения баз данных (обновления, обеспечения доступа к ним по запросам и выдачи их пользователю) используется совокупность языковых и программных средств, называемая Системой Управления Базой Данных (СУБД).

DATABASE CITATIONS = ЦИТАЦИИ БАЗ ДАННЫХ – Database Citations is a publicly accessible sources of nucleotide or protein sequence information.

DATA CARRIER EXCHANGE = ОБМЕН ДАННЫМИ НА ЭЛЕКТРОННЫХ НОСИТЕЛЯХ – Data Carrier Exchange:- payment settlement service for bills and salaries using storage media (e.g., diskettes, magnetic disks) or file transfer. / Услуга по осуществлению платежей по векселям и зарплатам с использованием магнитных носителей (например, дискеты, магнитные диски) или передачи файлов.

DATA ELEMENT DESCRIPTIONS = ОПИСАНИЯ ЭЛЕМЕНТОВ ДАННЫХ (или СВЕДЕНИЯ ОБ ЭЛЕМЕНТАХ ДАННЫХ) – Data Element Descriptions:- the text that describes each data element on the International Payment Instruction (IPI) form.

DATA ELEMENTS = ЭЛЕМЕНТЫ ДАННЫХ – Data Elements are the items of variable information printed by the beneficiary or supplied by the ordering customer.

DATA ENCRYPTION STANDARD = СТАНДАРТ ШИФРОВКИ ДАННЫХ – Data Encryption Standard (DES):- symmetric block cipher encryption algorithm defined in the American standard FIPS 46-2 (1977; FIPS – Federal Information Processing Standards). DES is used either as 'single DES' with a 56 bit key, or as 'triple DES' with 112 bits or 168 bits keys. Also known as Data Encryption Algorithm (DEA).

DATA INTEGRITY = ЦЕЛОСТНОСТЬ ДАННЫХ – Data Integrity is the property that data has not been altered or destroyed in an unauthorised manner.

DATA KEY = КЛЮЧ К ДАННЫМ – Data Key is a cryptographic key used for the encipherment, decipherment, verification or authentication of data.

DATA LOGGER = САМОПИСЕЦ ДАННЫХ – Data Logger is a device used for automatic (and continuous) recording of data. The data can then be read out at a later time, for instance, using a laptop. Data Logger is an electronic device for storing and accumulating data. Data can either be automatically entered into the datalogger via a cable from a sensing unit (e.g., temperature probe) or entered by hand (e.g., into a Psion or Polycorder trade names). / Сайон (Psion) или Поликодё (Polycorder).

DATA ORIGIN AUTHENTICATION = ИЗНАЧАЛЬНАЯ АУТЕНТИФИКАЦИЯ ДАННЫХ (или ИЗНАЧАЛЬНОЕ УДОСТОВЕРЕНИЕ ПОДЛИННОСТИ ДАННЫХ) – Data Origin Authentication is the corroboration that the source of data received is as claimed.

DATA PROTECTION = ЗАЩИТА ДАННЫХ – The purpose of Data Protection, as defined by Germany's Federal Data Protection Act (BDSG), is to counteract any unwanted or harmful effects on natural living persons resulting from electronic data processing (protection of personal rights). The object of data protection is to safeguard the privacy rights of individuals and provide for the use of data in a responsible way. This applies not only to the data saving, modification, transmission, blocking and deletion phases that fall under the term 'Processing', but also to the collection, application and use of such data. This act does not apply to data relating to legal entities.

DATA REFERENCE MODEL = МОДЕЛЬ СПРАВКИ ПО ДАННЫМ – Data Reference Model (DRM), also known as a Data and Information Reference Model, describes the data and information that support program and line operations. Helps describe the types of interactions that occur between the Federal Government and others. Purpose of a DRM is to establish a commonly understood classification for Federal data that will lead to the identification of duplicative data resources.

DATE CODE = КОД ДАТЫ – Date Code is a label that shows when a product was manufactured.

DATE DRAFT = ТРАТТА НА ОПРЕДЕЛЁННЫЙ ДЕНЬ – Date Draft is a bill of exchange that becomes payable (matures) on a fixed date, irrespective of the date it was accepted by the payer. Date Draft is a draft that matures on a fixed date, regardless of the time of acceptance. Date Draft is a draft which matures a specified number of days after the date it is issued, without regard to the date of acceptance.

DAVIS INOCULATOR = ИНОКУЛЯТОР ДЭЙВЭСА – Davis Inoculator is a mechanical device developed by Frank Davis, Mississippi State University, USA, used to dispense insect larvae in artificial in oculation of plants. / Фрэньк Дэйвэс (Frank Davis), Университет Штата Миссисипи (Mississippi State University), Соединённые Штаты Америки.

DAVITS = ШЛЮПБАЛКИ – Davits are two radial cranes on a ship which hold the lifeboats. They are constructed in such a way as to lower and lift the lifeboats the easiest way possible and are also unobstructed in case of an emergency. Davit is a curved metal spar for handling a boat or other heavy objects. / спасательные шлюпки.

DAX® = DEUTSCHER AKTIENINDEX

DAY AHEAD = ДНЁМ ВПЕРЁД – Day Ahead is the calendar day immediately preceding an operating day. See also Next Day. / Смотрите также Следующим Днём (Next Day).

DAY–AND–NIGHT MARK = ОТМЕТИНА ДЕНЬ–И–НОЧЬ – Day-And-Night Mark is a mark stamped on gray goods during weaving to show cha of weaver from one shift to the next – sometimes referred to as a 'Shift Mark' and often takim:- the form of a Bymbo] Blich as D X.

DAY DEGREES = СУТОЧНЫЙ ДИАПАЗОН ТЕМПЕРАТУР (или СРЕДНЕСУТОЧНАЯ ТЕМПЕРАТУРА, или СУММА АКТИВНЫХ ТЕМПЕРАТУР (ЗА ВЕГЕТАЦИОННЫЙ ПЕРИОД)) – The Day Degree Report:- the Day Degree calculation used by the Australian Cotton industry is based on daily maximum and minimum temperatures, and can indicate the amount of crop development expected on a given day. Summing these values can identify the degree of progress towards a development stage, e.g., first square. Report Options:- (i) Cold Shock Option:- the day degree calculation can be modified to minus 5.2 degrees from the accumulation each time a cold day (Min <= 11 °C) occurs. This option is based on results from research into the cold tolerance of cotton. (ii) Advanced Options:- dates predicted in the targets report can be modified by changing the number of accumulated day degrees for each cotton growth target. The detailed report presents the accumulated day degrees for each day within the specified date range for the last 5 years. The report (starting) years advanced option can be used to modify this default. Day Degree Reports:- (i) Summary Report:- this is a summary for the specified date range, showing the average number of Day Degrees, the average number of cold days and the average number of hot days. (ii) Detailed Report:- this report presents the accumulated day degrees for each day within the specified date range, as well as each day within the specified date range for the last 5 years unless specified otherwise through the advanced options. The report also presents accumulated day degrees for each day within the specified date range for the years were the maximum and minimum number of accumulated day degrees occurred. In addition to this, the report contains a column showing the average accumulated day degrees for the specified date range. (iii) Targets Report:- this report presents target dates for cotton growth for your location. This report is based on cotton growth target dates (e.g., when 1st Flower occured) predicted using a default or a user defined number of accumulated day degrees (e.g., 1st flower occurs at 777 day degrees). The report shows the actual, minimum, maximum, average and mean dates. Day Degrees:- the unit combining temperature and time, useful for monitoring and comparing crop growth when temperatures fluctuate. The day degree calculator equations used in cotton are as follows:- (i) if Min Temp > 12, DD = ((Max – 12) + (Min – 12)) / 2; (ii) if Min Temp ≤ 12, DD = (Max – 12) / 2. / Единица, комбинирующая температуру и время, используемая при мониторинге и сравнении роста сельскохозяйственной культуры при меняющихся температурах. Среднесуточная Температура или Суточный Диапазон Температур для Хлопчатника вычисляется с помощью следующих уравнений:- (i) если минимальная температура более 12, то DD = ((Max – 12) + (Min – 12)) / 2; (ii) если минимальная температура менее или равна 12, то DD = (Max – 12) / 2.

DAYLENGTH = ДОЛГОТА ДНЯ (или ПРОДОЛЖИТЕЛЬНОСТЬ ДНЯ) – Daylength (photoperiod) is a duration of the daylight period including twilight during a given day; the number of hours between sunrise and sunset. / Под Днём понимается светлая часть суток между восходом и заходом верхнего края Солнца. Продолжительность (долгота) дня зависит от географической широты места и меняется с изменением склонения Солнца. За полярными кругами долгота дня может превышать 24 часа (полярный день). Часто днём называют сутки.

DAYLIGHT = ДНЕВНОЙ СВЕТ – Daylight is a type of light used in a commercial light box to simulate natural daylight. The correct technical definition is as follows:- Daylight is a light source providing a color temperature of 6 500 ±200 K at an illumination of 90 to 120 ft/candles. This source is typically provided by four filtered 750 W Tungsten Halogen lamps. The daylight filters must be certified by the manufacturer to ensure consistency of the transmitted color temperature between each filter/location. The resulting spectral power distribution of the transmitted light must be maintained to confirm to that of the filter manufacturer's standard. (K = Kelvin).

DAYLIGHT ILLUMINANTS = ИСТОЧНИКИ (или ОСВЕТИТЕЛЬНЫЕ СРЕДСТВА, или ИЛЛЮМИНАНТЫ) ДНЕВНОГО СВЕТА – Daylight Illuminants (according to CIE (short for the Commission Internationale de l'Eclairage is the French title of the International Commission on Illumination)):- series of illuminant spectral power distribution curves based on measurements of natural daylight and recommended by the CIE in 1965. Values are defined for the wavelength region 300 to 830 nm. They are described in terms of the correlated color temperature. The most important is D6500 (often referred to as Average Daylight) because of the closeness of its correlated color temperature to that of Illuminant C = 6 774 K. D7500, bluer than D6500 and D5000, yellower than D6500, are also used. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

DAYLIGHT OVERDRAFT = ДНЕВНОЙ ОВЕРДРАФТ (или ОДНОДНЕВНЫЙ ОВЕРДРАФТ) – Daylight Overdraft:- a negative balance in an institution's Federal Reserve Bank account at any time during the operating hours of the Fedwire Funds Service. A Daylight Overdraft occurs at any point in the business day when the balance in an institution's account becomes negative. To monitor an institution's overdraft activity and its compliance with the Payment System Risk (PSR) policy and to calculate daylight overdraft charges, the Federal Reserve has developed Account Balance Services (ABS) Ex-Post Services. Daylight Credit Usage Reports:- the Reserve Banks use ABS to generate various reports at the end of each day and at the end of each two-week reserve maintenance period. Daily reports are used by Reserve Bank PSR monitoring staff and institutions. The two-week reserve maintenance period reports capture information, such as peak daily overdrafts for the period, overdrafts in excess of net debit cap, book-entry overdrafts, non-Fedwire account activity, end-of-minute account balances for a particular day, and related ratios, such as the peak daily overdraft relative to net debit cap. Account Balance Services (ABS) is a centralized application that monitors ex-post depository institutions' compliance with the Board of Governors' Payment System Risk (PSR) policy. The Board's PSR policy is intended to control the use of intraday credit, which is extended to account holders that incur negative balances in their Federal Reserve accounts. Throughout the business day, numerous transactions are posted to an institutions' account in real-time, some with associated predetermined posting times, depending on the type of transaction. Once the transaction information is consolidated into end-of-minute balances, ABS determines daylight credit usage and calculates a daily charge, if applicable, based on each depository institution's average overdraft for a given day. Situation that occurs when a bank allows a customer's account to go into the red, on the understanding that the debt will be repaid by the end of the day. Daylight Overdraft occurs when a clearinghouse bank issues a payment during the day that is in excess of the originator's reserve account balance. Daylight overdrafts must be covered by the end of the business day. In order to encourage banks to manage and reduce potential default risks, the Federal Reserve Board assesses a charge for daylight overdrafts. Credit extended for less than one business day. For example, in a clearing system with end-of-day final settlement, intra-day credit is extended by a participant that accepts and acts on a payment order, even though that participant will not receive final funds until the end of the business day. Daylight Overdraft (called also Intraday Overdraft) refers to a scenario in which a debit balance occurs in a customer's account in the course of the banking day and is expected to be repaid by a credit to the account prior to the end of the banking day. Under most circumstances a daylight overdraft incurred by a customer of bank for an account will not face overdraft fees if the balance is brought positive by the next business day. An example of a daylight overdraft is making a USD100 deposit at an Automated teller machine which allows for instant withdrawal of the first USD100 deposited. This atm transaction will post the next day however if you were to transfer the funds from this account to another account using other means (internet, telephone) the funds would be withdrawn that day and will post your account negative the next day. Another example is the Federal Reserve policy of daylight overdraft when a fee is not imposed on collateralized daylight overdrafts, but a 50 basis points fee is taken on uncollateralized ones.

DAYLIGHT SAVING TIME = ВРЕМЯ СБЕРЕЖЕНИЯ ДНЕВНОГО СВЕТА (или ЛЕТНЕЕ ВРЕМЯ) – The main purpose of Daylight Saving Time (called 'Summer Time' in many places in the world) is to make better use of daylight. We change our clocks during the summer months to move an hour of daylight from the morning to the evening. Countries have different change dates. If you live near the equator, day and night are nearly the same length (12 hours). But elsewhere on Earth, there is much more daylight in the summer than in the winter. The closer you live to the North or South Pole, the longer the period of daylight in the summer. Thus, Daylight Saving Time (Summer Time) is usually not helpful in the tropics, and countries near the equator generally do not change their clocks. According to some sources, DST saves energy. Studies done by the US Department of Transportation in 1975 showed that Daylight Saving Time trims the entire country's electricity usage by a small but significant amount, about one percent each day, because less electricity is used for lighting and appliances. Similarly, in New Zealand, power companies have found that power usage decreases 3.5 percent when daylight saving starts. In the first week, peak evening consumption commonly drops around five percent. The rationale behind the 1975 study of DST-related energy savings was that energy use and the demand for electricity for lighting homes is directly related to the times when people go to bed at night and rise in the morning. In the average home, 25 percent of electricity was used for lighting and small appliances, such as TVs and stereos. A good percentage of energy consumed by lighting and appliances occurred in the evening when families were home. By moving the clock ahead one hour, the amount of electricity consumed each day decreased. In the summer, people who rose before the sun rises used more energy in the morning than if DST were not in effect. However, although 70 percent of Americans rose before 7:00 am, this waste of energy from having less sunlight in the morning was more than offset by the savings of energy that results from more sunlight in the evening. In the winter, the afternoon Daylight Saving Time advantage is offset for many people and businesses by the morning's need for more lighting. In spring and fall, the advantage is generally less than one hour. So, the rationale was that Daylight Saving Time saves energy for lighting in all seasons of the year, but it saves least during the four darkest months of winter (November, December, January, and February), when the afternoon advantage is offset by the need for lighting because of late sunrise. In addition, less electricity was thought to be used because people are home fewer hours during the 'longer' days of spring and summer. Most people plan outdoor activities in the extra daylight hours. When people are not at home, they don't turn on the appliances and lights. In addition, some argue that there is a public health benefit to Daylight Saving Time, as it decreases traffic accidents. Several studies in the United States and Great Britain have found that the DST daylight shift reduces net traffic accidents and fatalities by close to one percent. An increase in accidents in the dark mornings is more than offset by the evening decrease in accidents. However, recent research indicates that pedestrian fatalities from cars soar at 6:00 pm during the weeks after clocks are set back in the fall. Walkers are three times as likely to be hit and killed by cars right after the switch than in the month before DST ends. Researchers from Carnegie Mellon University, who found a 186 percent jump in the risk of being killed by a car for every mile walked, speculate that drivers go through an adjustment period when dusk arrives earlier. Although the risk drops in the morning, because there are fewer pedestrians at 06:00 am, the lives saved in the morning don't offset those lost in the evening. The idea of daylight saving was first conceived by Benjamin Franklin during his sojourn as an American delegate in Paris in 1784, in an essay, 'An Economical Project'. Some of Franklin's friends, inventors of a new kind of oil lamp, were so taken by the scheme that they continued corresponding with Franklin even after he returned to America. The idea was first advocated seriously by London builder William Willett (1857–1915) in the pamphlet, 'Waste of Daylight' (1907), that proposed advancing clocks 20 minutes on each of four Sundays in April, and retarding them by the same amount on four Sundays in September. As he was taking an early morning a ride through Petts Wood, near Croydon, Willett was struck by the fact that the blinds of nearby houses were closed, even though the sun was fully risen. When questioned as to why he didn't simply get up an hour earlier, Willett replied with typical British humor, 'What?' In his pamphlet 'The Waste of Daylight' he wrote:- 'Everyone appreciates the long, light evenings. Everyone laments

their shortage as Autumn approaches; and everyone has given utterance to regret that the clear, bright light of an early morning during Spring and Summer months is so seldom seen or used'. About one year after Willett began to advocate daylight saving (he spent a fortune lobbying), he attracted the attention of the authorities. Robert Pearce – later Sir Robert Pearce – introduced a bill in the House of Commons to make it compulsory to adjust the clocks. The bill was drafted in 1909 and introduced in Parliament several times, but it met with ridicule and opposition, especially from farming interests. Generally lampooned at the time, Willett died on 1915-March-04. Following Germany's lead, Britain passed an act on 1916-May-17, and Willett's scheme of adding 80 minutes, in four separate movements was put in operation on the following Sunday, 1916-May-21. There was a storm of opposition, confusion, and prejudice. The Royal Meteorological Society insisted that Greenwich time would still be used to measure tides. The parks belonging to the Office of Works and the London County Council decided to close at dusk, which meant that they would be open an extra hour in the evening. Kew Gardens, on the other hand, ignored the daylight saving scheme and decided to close by the clock. In Edinburgh, the confusion was even more marked, for the gun at the Castle was fired at 01:00 pm. Summer Time, while the ball on the top of the Nelson monument on Calton Hill fell at 01:00 Greenwich Time. That arrangement was carried on for the benefit of seamen who could see it from the Firth of Forth. The time fixed for changing clocks was 02:00 am on a Sunday. There was a fair bit of opposition from the general public and from agricultural interests who wanted daylight in the morning, but Lord Balfour came forward with a unique concern:- 'Supposing some unfortunate lady was confined with twins and one child was born 10 minutes before 1 o'clock. ... the time of birth of the two children would be reversed. ... Such an alteration might conceivably affect the property and titles in that House'. After World War I, Parliament passed several acts relating to Summer Time. In 1925, a law was enacted that Summer Time should begin on the day following the third Saturday in April (or one week earlier if that day was Easter Day). The date for closing of Summer Time was fixed for the day after the first Saturday in October. The energy saving benefits of Summer Time were recognized during World War II, when clocks in Britain were put two hours ahead of GMT during the summer. This became known as Double Summer Time. During the war, clocks remained one hour ahead of GMT throughout the winter. Today, approximately 70 countries utilize Daylight Saving Time in at least a portion of the country. Japan, India, and China are the only major industrialized countries that do not observe some form of daylight saving. Equatorial and tropical countries (lower latitudes) generally do not observe Daylight Saving Time. Since the daylight hours are similar during every season, there is no advantage to moving clocks forward during the summer. China has had a single time zone since 1980-May-01, observing summer Daylight Saving Time from 1986 through 1991; they do not observe DST now. There are many oddities. For example, some parts of the United States and Canada do not observe Daylight Saving Time, such as the state of Arizona (US) and the province Saskatchewan (Canada). Some countries adopt Daylight Saving Time (DST) for part of the year. During Daylight Saving Time, clocks are turned forward an hour, effectively moving an hour of daylight from the morning to the evening. The official spelling is Daylight Saving Time, not Daylight Savings Time. Saving is used here as a verbal adjective (a participle). It modifies time and tells us more about it nature; namely, that it is characterized by the activity of saving daylight. It is a saving daylight kind of time. Because of this, it would be more accurate to refer to DST as daylight-saving time. Similar examples would be a mind-expanding book or a man-eating tiger. Saving is used in the same way as saving a ball game, rather than as a savings account. Nevertheless, many people feel the word savings (with an 's') flows more mellifluously off the tongue. Daylight Savings Time is also in common usage, and can be found in dictionaries. Adding to the confusion is that the phrase Daylight Saving Time is inaccurate, since no daylight is actually saved. Daylight Shifting Time would be better, and Daylight Time Shifting more accurate, but neither is politically desirable. Many countries add one hour to standard time during all or several months of the year (usually April through October in the Northern Hemisphere; November through March in the Southern Hemisphere), thereby utilizing more daylight hours each day. Exact dates vary from country to country. Each year, at 01:00 or 02:00 am on the last Sunday in March, Daylight Savings Time (DST) comes into effect in some countries and all clocks are advanced by one hour. At 01:00 or 02:00 am on the last Sunday in October, these countries revert to Standard Time. In some countries (e.g., the United States) in the Northern Hemisphere DST comes into effect at 02:00 am on the second Sunday in March, and these countries revert to Standard (winter) Time at 02:00 am on the first Sunday in November. 02:00 am was originally chosen as the changeover time because it was practical and minimized disruption. Most people were at home and this was the time when the fewest trains were running. It is late enough to minimally affect bars and restaurants, and it prevents the day from switching to yesterday, which would be confusing. It is early enough that the country switches by daybreak, and the changeover occurs before most early shift workers and early churchgoers are affected. In the United States, each time zone switches at a different time. More over, for the US and its territories, DST is not observed in American Samoa, Arizona, the Commonwealth of Northern Mariana Islands, Guam, Hawaii, Puerto Rico, and the Virgin Islands. The Navajo Nation participates in the Daylight Saving Time policy, even in Arizona, due to its large size and location in three states. The main purpose of Daylight Saving Time (DST; called 'Summer Time' in many places in the world) is to make better use of daylight. We change our clocks during the summer months to move an hour of daylight from the morning to the evening. Countries have different change dates. Glide your cursor over the map to see how changing the clocks affects different latitudes. If you live near the equator, day and night are nearly the same length (12 hours). But elsewhere on Earth, there is much more daylight in the summer than in the winter. The closer you live to the North or South Pole, the longer the period of daylight in the summer. Thus, Daylight Saving Time (Summer Time) is usually not helpful in the tropics, and countries near the equator generally do not change their clocks. A poll conducted by the US Department of Transportation indicated that Americans liked Daylight Saving Time because 'there is more light in the evenings / can do more in the evenings'. A 1976 survey of 2.7 million citizens in New South Wales, Australia, found 68% liked daylight saving. Indeed, some say that the primary reason that Daylight Saving Time is a part of many societies is simply because people like to enjoy long summer evenings, and that reasons such as energy conservation are merely rationalizations. According to some sources, DST saves energy. Studies done by the US Department of Transportation in 1975 showed that Daylight Saving Time trims the entire country's electricity usage by a small but significant amount, about one percent each day, because less electricity is used for lighting and appliances. Similarly, in New Zealand, power companies have found that power usage decreases 3.5 percent when daylight saving starts. In the first week, peak evening consumption commonly drops around five percent. The rationale behind the 1975 study of DST-related energy savings was that energy use and the demand for electricity for lighting homes is directly related to the times when people go to bed at night and rise in the morning. In the average home, 25 percent of electricity was used for lighting and small appliances, such as TVs and stereos. A good percentage of energy consumed by lighting and appliances occurred in the evening when families were home. By moving the clock ahead one hour, the amount of electricity consumed each day decreased. In the summer, people who rose before the sun rises used more energy in the morning than if DST were not in effect. However, although 70 percent of Americans rose before 07:00 am, this waste of energy from having less sunlight in the morning was more than offset by the savings of energy that results from more sunlight in the evening. In the winter, the afternoon Daylight Saving Time advantage is offset for many people and businesses by the morning's need for more lighting. In spring and fall, the advantage is generally less than one hour. So, the rationale was that Daylight Saving Time saves energy for lighting in all seasons of the year, but it saves least during the four darkest months of winter (November, December, January, and February), when the afternoon advantage is offset by the need for lighting because of late sunrise. In addition, less electricity was thought to be used because people are home fewer hours during the 'longer' days of spring and summer. Most people plan outdoor activities in the extra daylight hours. When people are not at home, they don't turn on the appliances and lights. Although a 1976 report by the National Bureau of Standards disputed the 1975 US Department of Transportation (DOT) study, and

found that DST-related energy savings were insignificant, the DOT study continued to influence decisions about Daylight Saving Time. The argument in favor of saving energy swayed Indiana, where until 2005, only about 16 percent of counties observed Daylight Saving Time. Based on the DOT study, advocates of Indiana DST estimated that the state's residents would save over USD7 million in electricity costs each year. Now that Indiana has made the switch, however, researchers have found the opposite to be the case. Scientists from the University of California, Santa Barbara, compared energy usage over the course of three years in Indiana counties that switched from year-round Standard Time to DST. They found that Indianans actually spent USD8.6 million more each year because of Daylight Saving Time, and increased emissions came with a social cost of between USD1.6 million and USD5.3 million per year. Commentators have theorized that the energy jump is due to the increased prevalence of home air conditioning over the past 40 years, in that more daylight toward the end of a summer's day means that people are more likely to use their air conditioners when they come home from work. However, the Indiana research findings don't necessarily apply elsewhere. In cooler climates, for example, energy savings may well occur. In addition, some argue that there is a public health benefit to Daylight Saving Time, as it decreases traffic accidents. Several studies in the United States and Great Britain have found that the DST daylight shift reduces net traffic accidents and fatalities by close to one percent. An increase in accidents in the dark mornings is more than offset by the evening decrease in accidents. However, recent research indicates that pedestrian fatalities from cars soar at 06:00 pm during the weeks after clocks are set back in the fall. Walkers are three times as likely to be hit and killed by cars right after the switch than in the month before DST ends. Researchers from Carnegie Mellon University, who found a 186 percent jump in the risk of being killed by a car for every mile walked, speculate that drivers go through an adjustment period when dusk arrives earlier. Although the risk drops in the morning, because there are fewer pedestrians at 06:00 am, the lives saved in the morning don't offset those lost in the evening. This research corroborates a 2001 study by researchers at the University of Michigan, which found that 65 pedestrians were killed by car crashes in the week before DST ended, and 227 pedestrians were killed in the week following the end of DST. There may also be an economic benefit to DST, as daylight evening hours encourage people to go out and shop, potentially spurring economic growth. The idea of daylight saving was first conceived by Benjamin Franklin during his sojourn as an American delegate in Paris in 1784, in an essay, 'An Economical Project'. Some of Franklin's friends, inventors of a new kind of oil lamp, were so taken by the scheme that they continued corresponding with Franklin even after he returned to America. The idea was first advocated seriously by London builder William Willett (1857–1915) in the pamphlet, 'Waste of Daylight' (1907), that proposed advancing clocks 20 minutes on each of four Sundays in April, and retarding them by the same amount on four Sundays in September. As he was taking an early morning a ride through Petts Wood, near Croydon, Willett was struck by the fact that the blinds of nearby houses were closed, even though the sun was fully risen. When questioned as to why he didn't simply get up an hour earlier, Willett replied with typical British humor, 'What?' In his pamphlet 'The Waste of Daylight' he wrote:- 'Everyone appreciates the long, light evenings. Everyone laments their shortage as Autumn approaches; and everyone has given utterance to regret that the clear, bright light of an early morning during Spring and Summer months is so seldom seen or used'. About one year after Willett began to advocate daylight saving (he spent a fortune lobbying), he attracted the attention of the authorities. Robert Pearce – later Sir Robert Pearce – introduced a bill in the House of Commons to make it compulsory to adjust the clocks. The bill was drafted in 1909 and introduced in Parliament several times, but it met with ridicule and opposition, especially from farming interests. Generally lampooned at the time, Willett died on 1915-March-04. Following Germany's lead, Britain passed an act on 1916-May-17, and Willett's scheme of adding 80 minutes, in four separate movements was put in operation on the following Sunday, 1916-May-21. There was a storm of opposition, confusion, and prejudice. The Royal Meteorological Society insisted that Greenwich time would still be used to measure tides. The parks belonging to the Office of Works and the London County Council decided to close at dusk, which meant that they would be open an extra hour in the evening. 'Kew Gardens', on the other hand, ignored the daylight saving scheme and decided to close by the clock. In Edinburgh, the confusion was even more marked, for the gun at the Castle was fired at 01:00 pm Summer Time, while the ball on the top of the Nelson monument on Calton Hill fell at 01:00 Greenwich Time. That arrangement was carried on for the benefit of seamen who could see it from the Firth of Forth. The time fixed for changing clocks was 02:00 am on a Sunday. There was a fair bit of opposition from the general public and from agricultural interests who wanted daylight in the morning, but Lord Balfour came forward with a unique concern:- 'Supposing some unfortunate lady was confined with twins and one child was born 10 minutes before 1 o'clock. ... the time of birth of the two children would be reversed. ... Such an alteration might conceivably affect the property and titles in that House'. After World War I, Parliament passed several acts relating to Summer Time. In 1925, a law was enacted that Summer Time should begin on the day following the third Saturday in April (or one week earlier if that day was Easter Day). The date for closing of Summer Time was fixed for the day after the first Saturday in October. DAY ORDER = РАСПОРЯЖЕНИЕ НА ДЕНЬ (или СУТОЧНОЕ ПОРУЧЕНИЕ) – Day Order is an order that if not executed expires automatically at the end of the trading session on the day it was entered. Day Order is an order that expires automatically at the end of each day's trading session. There may be a day order with time contingency. For example, an 'off at a specific time' order is an order that remains in force until the specified time during the session is reached. At such time, the order is automatically canceled. Orders that are placed for execution, if possible, during only one trading session. If the order cannot be executed that day, it is automatically canceled. Day Order is an order to buy or sell at a certain price on a certain day of trading. Orders are generally considered day orders unless specified as Open Orders. Day Order is an order to buy or sell at a particular price level which is only valid for one business day. / Распоряжения, поступившие для исполнения, и которые должны быть, если это будет возможно, исполнены в течение только лишь одной торговой сессии. Если это распоряжение не будет исполнено в эти сутки, то оно автоматически аннулируется.

DAYS ALL PURPOSES = СУТОК НА 'ВСЁ ПРО ВСЁ' – A term Days All Purposes (DAPS) means total days for loading and unloading cargo.

DAYS OF FORWARD DEMAND = СУТОК ПРЕДСТОЯЩЕГО СПРОСА (или СУТОК БУДУЩЕГО СПРОСА) – Days Of Forward Demand are calculated on the basis of the average daily demand for the next three months. Stock comparisons with previous years are

made in volume terms and days of forward demand. Comparisons in absolute terms effectively understate the differences since they ignore any growth in demand which increases operating minima while comparisons in days of forward demand tend to overstate differences since operating minima increase by less in percentage terms than the growth in demand. They also depend on the accuracy of the demand forecast.

DAYS OF FORWARD REFINERY THROUGHPUTS = СУТОК ПРЕДСТОЯЩЕЙ ЗАГРУЗКИ ПРЕДПРИЯТИЙ ПЕРЕРАБОТКИ (или БУДУЩАЯ ОБЕСПЕЧЕННОСТЬ ЗАПАСАМИ В СУТКАХ ПЕРЕРАБОТКИ) – Days Of Forward Refinery Throughputs:- days of forward coverage are calculated on the basis of the average refinery throughput of crude oil for the next month.

DAYS OF GRACE = ЛЬГОТНЫЙ СРОК (или ЛЬГОТНЫЕ СУТКИ, или СУТОК ОТСРОЧКИ) – Days Of Grace is the number of days the acceptor of a draft may go past due before being judged in default and triggering any guarantor to pay on the acceptor's behalf. When an avalized draft is sold to a forfaiter, the forfaiter will impute the days of grace into the financing period. In the United Kingdom, period of three days still permitted for the payment of any bill of exchange except bills of sight. Days of grace have been abolished in most other countries. Days Of Grace is number of days for which insurance cover continues beyond the actual expiry date of a renewable policy. If the renewal premium is not paid within this period, the policy lapses.

DAYS OF IEA NET IMPORTS = СУТОК ЧИСТЫХ ПРИВОЗОВ ПО МАЭ (или ОБЪЁМ ЗАПАСОВ ЧИСТОГО ИМПОРТА В СУТОЧНОМ ИСЧИСЛЕНИИ ПО МАЭ) – Days Of IEA Net Imports:- stocks are calculated according to International Energy Agency (IEA) methodology in terms of net imports of crude oil and products of the previous year.

DAYS OF SUPPLY = СУТОК ЗАГРУЗКИ – Days Of Supply:- the number of days that inventories would satisfy demand. The Energy Information Administration calculates the days of supply by dividing the total inventory of a product by the latest four-week average of product supplied. In the United States (US) oil industry, Days Of Supply calculated as:- US Crude Oil Stocks / Four-Week Average US Crude Oil Refinery Inputs.

DAYS TO COVER = СУТОК ДЛЯ ПОКРЫТИЯ – Days To Cover:- this is an important technical measure when looking at a short position. 'Days To Cover' is defined as the number of shares sold short divided by the average daily trading volume. So, if a company has 1 million shares sold short and trades 200 000 shares a day, it is five days to cover. The lower the number, the better, because this typically correlates with the overall short position in the stock. The larger the number of days to cover, the more likely an investor will get caught in a short-squeeze.

DAYS TO HEADING = ДНЕЙ ДО ВЫМЁТЫВАНИЯ – Days to Heading:- number of days from seeding to heading.

DAY–TO–DAY MONEY = ОДНОДНЕВНЫЕ РАСЧЁТНЫЕ ДЕНЬГИ (или ДЕНЬГИ ДЕНЬ КО ДНЮ) – Day-To-Day Money borrowed particularly by a financial institution which is temporarily illiquid. The money is lent to companies wishing to be paid interest on money earned in the previous day's trading. Interest rates on day-to-day money are high and variable. Also known as Call Money, Day-To-Day Loan, and Overnight Loan. / Известны также как Однодневный Расчётный Займ или Займ Овернайт (Overnight Loan).

DAY TRADE = СУТОЧНАЯ ТОРГОВЛЯ (или ОДНОДНЕВНАЯ ТОРГОВЛЯ) – A term Day Trade refers to opening and closing the same position or positions within one day's trading. The purchase and sale of a futures or an options contract in the same day, thus ending the day with no established position in the market or being flat. Day Trade is the purchase and sale or the short sale and cover of the same security in a margin account on the same day. Also known as Daylight Trade.

DAY TRADERS = СУТОЧНЫЕ ТОРГОВЦЫ (или ОДНОДНЕВНЫЕ ТОРГОВЦЫ) – Day Traders are the commodity traders, generally members of the exchange on the trading floor, who take positions in commodities and then offset them prior to the close of trading on the same trading day. Day Trader is a trader, often a person with exchange trading privileges, who takes positions and then offsets them during the same trading session prior to the close of trading. Day Traders are the speculators who will normally initiate and offset a position within a single trading session. Usually requires the use of intra-day data and intra-day trading. Most day traders want to be out of any positions before the close of the markets. Day Trader is an investor who attempts to profit by making rapid trades intraday. A day trader often closes out all trades before the market close and does not hold any open positions overnight. Some day traders use leverage to magnify the returns generated from small stock price movements. Day trading is often glamorized as an easy path to riches. However, this is rarely the case. The SEC (short for the United States Securities and Exchange Commission) warns, 'Day traders typically suffer severe financial losses in their first months of trading, and many never graduate to profit-making status'. Day traders are handicapped by the bid-ask spread, trading commissions and expenses for real-time news feeds and financial analysis packages. These costs require day traders to earn significant trading profits just to break even. Speculators who take positions in futures or options contracts and liquidate them prior to the close of the same trading day. Day Trader:- a trader who is content to take profits on fractional gains and usually prefers to be out of the market at the end of the day.

DAY TRADING = ТОРГОВЛЯ ОДНИМ ДНЁМ (или СУТОЧНАЯ ТОРГОВЛЯ, или ОДНОДНЕВНАЯ ТОРГОВЛЯ) – Day Trading is a style of trading where all positions are cleared before the end of the trading day. Contrast this position trading, where stocks or securities may be held for longer periods. Day Trading:- day traders rapidly buy and sell stocks throughout the day in the hope that their stocks will continue climbing or falling in value for the seconds to minutes they own the stock, allowing them to lock in quick profits. Day trading is extremely risky and can result in substantial financial losses in a very short period of time. If you are a day trader, or are thinking about day trading, read our publication, Day Trading:- Your Dollars at Risk. We also have warnings and tips about online trading and day trading. For more information on day trading and the related FINRA® (short for the Financial Industry Regulatory Authority, Inc.; Washington, DC, the United States) margin rules, please read the SEC (short for the United States Securities and Exchange Commission) staff's investor bulletin 'Margin Rules for Day Trading'. Refers to establishing and liquidating the same position or positions within the same trading session. Day Trading refers to the practice of speculation in securities, specifically buying and selling financial instruments within the same trading day, such that all positions are usually closed before the market close for the trading day. Traders who participate in day trading are called Active Traders or Day Traders. Traders who trade in this capacity with the motive of profit, assume the capital markets role of speculator. Not widely known, the correct definition of an 'intra-day' means the move as measured from the previous close and not just relative to another price traded on the same day. Some of the more commonly day-traded financial instruments are stocks, stock options, currencies, and a host of futures contracts such as equity index futures, interest rate futures, and commodity futures. Day trading used to be an activity that was exclusive to financial firms and professional speculators. Many day traders are bank or investment firm employees working as specialists in equity investment and fund management. However, with the advent of electronic trading and margin trading, day trading has become increasingly popular among at-home traders. Although collectively called Day Trading, the practice contains many styles with specific qualities and risks. Scalping is an intra-day speculation technique that usually has the trader holding a position for a few minutes or even seconds. Shaving is a method which allows the scalping speculator to jump inside the bid or the ask by a small amount, and a full round trip (a buy and a sell execution) is often completed in under one second. Suppose the bid is USD102.00 and the ask is USD102.03. The scalper will place

an order inside the bid at USD102.01, thus becoming the best bid and therefore the first in line to be able to purchase the stock. And since the best offer is USD102.03, the shaver will again place an order inside the current market to be first in line and sell one cent cheaper at USD102.02. Completing a buy and a sell at these prices make for a profit of USD0.01 per share traded. Since the profit per share in a shaving strategy is typically very small, traders are required to execute many shares in this fashion in order to make a reasonable profit. It is possible to make a little more on the trade by getting rebates for providing liquidity. Another strategy a day trader might use is to actively search for potential trading setups. When a day trader thinks prices are ready to accelerate in either direction, the stock is said to be in a 'tension state'. By correctly identifying the direction of the price movement, there is a potential for substantial profit. The number of trades one can make per day is almost unlimited, as are the profits and losses. Some day traders focus on very short-term trading within the trading day, in which a trade may last just a few minutes. Day traders may buy and sell many times in a trading day and may receive trading fee discounts from their broker for this trading volume. Some day traders focus only on price momentum, others on technical patterns. Some traders choose to focus on an unlimited number of strategies they feel can be profitable. Most day traders exit positions before the market closes to avoid unmanageable risks – negative price gaps (differences between the previous day's close and the next day's open bull price) at the open – overnight price movements against the position held. Other traders believe they should let the profits run, so it is acceptable to stay with a position after the market closes. Day traders sometimes borrow money to trade. This is called Margin Trading. Since margin interests are typically only charged on overnight balances, the trader pays no fees for the margin benefit, though still running the risk of a Margin call. The margin interest rate is usually based on the Broker's call. Profit and Risks:- because of the nature of financial leverage and the rapid returns that are possible, day trading can be either extremely profitable or extremely unprofitable, and high-risk profile traders can generate either huge percentage returns or huge percentage losses. Because of the high profits (and losses) that day trading makes possible, these traders are sometimes portrayed as 'bandits' or 'gamblers' by other investors. Some individuals, however, make a consistent living from day trading. Nevertheless day trading can be risky, especially if any of the following is present while trading:- (i) trading a loser's game/system rather than a game that's at least winnable; (ii) trading with poor discipline (ignoring your own day trading strategy, tactics, rules); (iii) inadequate risk capital with the accompanying excess stress of having to 'survive'; and (iv) incompetent money management, i.e. executing trades poorly. The common use of buying on margin (using borrowed funds) amplifies gains and losses, such that substantial losses or gains can occur in a very short period of time. In addition, brokers usually allow bigger margins for day traders. Where overnight margins required to hold a stock position are normally 50% of the stock's value, many brokers allow pattern day trader accounts to use levels as low as 25% for intraday purchases. This means a day trader with the legal minimum USD25 000 in his or her account can buy USD100 000 (4x leverage) worth of stock during the day, as long as half of those positions are exited before the market close. Because of the high risk of margin use, and of other day trading practices, a day trader will often have to exit a losing position very quickly, in order to prevent a greater, unacceptable loss, or even a disastrous loss, much larger than his or her original investment, or even larger than his or her total assets. History:- originally, the most important US stocks were traded on the New York Stock Exchange. A trader would contact a stockbroker, who would relay the order to a specialist on the floor of the NYSE®. These specialists would each make markets in only a handful of stocks. The specialist would match the purchaser with another broker's seller; write up physical tickets that, once processed, would effectively transfer the stock; and relay the information back to both brokers. Brokerage commissions were fixed at 1% of the amount of the trade, i.e. to purchase USD10 000 worth of stock cost the buyer USD100 in commissions. (Meaning that to profit trades had to make over 1.010 101...% to make any real gain.) One of the first steps to make day trading of shares potentially profitable was the change in the commission scheme. In 1975, the United States Securities and Exchange Commission (SEC) made fixed commission rates illegal, giving rise to discount brokers offering much reduced commission rates. Financial Settlement:- financial settlement periods used to be much longer:- Before the early 1990s at the London Stock Exchange, for example, stock could be paid for up to 10 working days after it was bought, allowing traders to buy (or sell) shares at the beginning of a settlement period only to sell (or buy) them before the end of the period hoping for a rise in price. This activity was identical to modern day trading, but for the longer duration of the settlement period. But today, to reduce market risk, the settlement period is typically three working days. Reducing the settlement period reduces the likelihood of default, but was impossible before the advent of electronic ownership transfer. Techniques:- the following are several basic strategies by which day traders attempt to make profits. Besides these, some day traders also use contrarian (reverse) strategies (more commonly seen in algorithmic trading) to trade specifically against irrational behavior from day traders using these approaches. Some of these approaches require shorting stocks instead of buying them:- the trader borrows stock from his broker and sells the borrowed stock, hoping that the price will fall and he will be able to purchase the shares at a lower price. There are several technical problems with short sales – the broker may not have shares to lend in a specific issue, some short sales can only be made if the stock price or bid has just risen (known as an 'Uptick'), and the broker can call for the return of its shares at any time. Some of these restrictions (in particular the uptick rule) don't apply to trades of stocks that are actually shares of an exchange-traded fund (ETF). The Securities and Exchange Commission removed the uptick requirement for short sales on July 06, 2007. (i) Trend Following:- trend following, a strategy used in all trading time-frames, assumes that financial instruments which have been rising steadily will continue to rise, and vice versa with falling. The trend follower buys an instrument which has been rising, or short sells a falling one, in the expectation that the trend will continue. (ii) Contrarian Investing:- contrarian investing is a market timing strategy used in all trading time-frames. It assumes that financial instruments which have been rising steadily will reverse and start to fall, and vice versa with falling. The contrarian trader buys an instrument which has been falling, or short-sells a rising one, in the expectation that the trend will change. (iii) Range Trading:- range trading, or range-bound trading, is a trading style in which stocks are watched that have either been rising off a support price or falling off a resistance price. That is, every time the stock hits a high, it falls back to the low, and vice versa. Such a stock is said to be 'trading in a range', which is the opposite of trending. The range trader therefore buys the stock at or near the low price, and sells (and possibly short sells) at the high. A related approach to range trading is looking for moves outside of an established range, called a Breakout (price moves up) or a Breakdown (price moves down), and assume that once the range has been broken prices will continue in that direction for some time. (iv) Scalping:- scalping was originally referred to as Spread Trading. Scalping is a trading style where small price gaps created by the bid-ask spread are exploited by the speculator. It normally involves establishing and liquidating a position quickly, usually within minutes or even seconds. Scalping highly liquid instruments for off-the-floor day traders involves taking quick profits while minimizing risk (loss exposure). It applies technical analysis concepts such as over/under-bought, support and resistance zones as well as trendline, trading channel to enter the market at key points and take quick profits from small moves. The basic idea of scalping is to exploit the inefficiency of the market when volatility increases and the trading range expands. (v) Rebate Trading:- rebate trading is an equity trading style that uses the Electronic Communications Network (ECN) rebates as a primary source of profit and revenue. Most ECNs charge commissions to customers who want to have their orders filled immediately at the best prices available, but the ECNs pay commissions to buyers or sellers who 'add liquidity' by placing limit orders that create 'market-making' in a security. Rebate traders seek to make money from these rebates and will usually maximize their returns by trading low priced, high volume stocks. This enables them to trade more shares and contribute more liquidity with a set amount of capital, while limiting the risk that they will not be able to exit a position in the stock. Rebate trading was pioneered at Datek Online and Domestic Securities. Omar Amanat founded Tradescape and the rebate trading group at Tradescape helped to contribute to a USD280 million buyout from online trading giant E-Trade

Financial Corporation (often styled E*Trade). (vi) News Playing:- news playing is primarily the realm of the day trader. The basic strategy is to buy a stock which has just announced good news, or short sell on bad news. Such events provide enormous volatility in a stock and therefore the greatest chance for quick profits (or losses). Determining whether news is 'good' or 'bad' must be determined by the price action of the stock, because the market reaction may not match the tone of the news itself. The most common cause for this is when rumors or estimates of the event (like those issued by market and industry analysts) were already circulated before the official release, and prices have already moved in anticipation – the news is already priced in the stock. (vii) Price Action:- keeping things simple can also be an effective methodology when it comes to trading. There are groups of traders known as Price Action Traders who are a form of technical traders that rely on technical analysis but do not rely on conventional indicators to point them in the direction of a trade or not. These traders rely on a combination of price movement, chart patterns, volume, and other raw market data to gauge whether or not they should take a trade. This is seen as a 'simplistic' and 'minimalist' approach to trading but is not by any means easier than any other trading methodology. It requires a sound background in understanding how markets work and the core principles within a market, but the good thing about this type of methodology is it will work in virtually any market that exists (stocks, foreign exchange, futures, gold, oil, etc). (viii) Artificial Intelligence:- an estimated one third of stock trades in 2005 in United States were generated by automatic algorithms, or high-frequency trading. The increased use of algorithms and quantitative techniques have led to more competition and smaller profits. Cost:- (i) Trading Equipment:- some day trading strategies (including scalping and arbitrage) require relatively sophisticated trading systems and software. This software can cost USD45 000 or more. Since the masses have now entered the day trading space, strategies can now be found for as little as USD5 000. Many day traders use multiple monitors or even multiple computers to execute their orders. Some use real time filtering software which is programmed to send stock symbols to a screen which meet specific criteria during the day, such as displaying stocks that are turning from positive to negative. Some traders use community based tools including forums and chat rooms. (ii) Brokerage:- day traders do not use discount brokers because they are slower to execute trades, trade against order flow, and charge higher commissions than direct-access brokers, who allow the trader to send their orders directly to the ECNs. Direct access trading offers substantial improvements in transaction speed and will usually result in better trade execution prices (reducing the costs of trading). Outside the US, day traders will often use CFD or financial spread betting brokers for the same reasons. (iii) Commission:- commissions for direct-access brokers are calculated based on volume. The more shares traded, the cheaper the commission. The average commission per trade is roughly USD5 per round trip (getting in and out of a position). While a retail broker might charge USD7 or more per trade regardless of the trade size, a typical direct-access broker may charge anywhere from USD0.01 to USD0.000 2 per share traded (from USD10 down to USD.20 per 1 000 shares), or USD0.25 per futures contract. A scalper can cover such costs with even a minimal gain. As for the calculation method, some use pro-rata to calculate commissions and charges, where each tier of volumes charges different commissions. Other brokers use a flat rate, where all commissions and charges are based on which volume threshold one reaches. (iv) Spread:- the numerical difference between the bid and ask prices is referred to as the Bid-Ask Spread. Most worldwide markets operate on a bid-ask-based system. The ask prices are immediate execution (market) prices for quick buyers (ask takers) while bid prices are for quick sellers (bid takers). If a trade is executed at quoted prices, closing the trade immediately without queuing would always cause a loss because the bid price is always less than the ask price at any point in time. The bid-ask spread is two sides of the same coin. The spread can be viewed as trading bonuses or costs according to different parties and different strategies. On one hand, traders who do not wish to queue their order, instead paying the market price, pay the spreads (costs). On the other hand, traders who wish to queue and wait for execution receive the spreads (bonuses). Some day trading strategies attempt to capture the spread as additional, or even the only, profits for successful trades. (v) Market Data:- market data is necessary for day traders, rather than using the delayed (by anything from 10 to 60 minutes, per exchange rules) market data that is available for free. A real-time data feed requires paying fees to the respective stock exchanges, usually combined with the broker's charges; these fees are usually very low compared to the other costs of trading. The fees may be waived for promotional purposes or for customers meeting a minimum monthly volume of trades. Even a moderately active day trader can expect to meet these requirements, making the basic data feed essentially 'free'. In addition to the raw market data, some traders purchase more advanced data feeds that include historical data and features such as scanning large numbers of stocks in the live market for unusual activity. Complicated analysis and charting software are other popular additions. These types of systems can cost from tens to hundreds of Dollars per month to access. (vi) Candlestick Charts:- candlestick charts are used by traders using technical analysis to determine chart patterns. Once a pattern is recognized in the chart, traders use the information to take a position. Some traders consider this method to be a part of price action trading. (vii) Regulations and Restrictions:- day trading is considered a risky trading style, and regulations require brokerage firms to ask whether the clients understand the risks of day trading and whether they have prior trading experience before entering the market. (viii) Pattern Day Trader:- in addition, Financial Industry Regulatory Authority and SEC further restrict the entry by means of 'pattern day trader' amendments. Pattern day trader is a term defined by the SEC to describe any trader who buys and sells a particular security in the same trading day (day trades), and does this four or more times in any five consecutive business day period. A pattern day trader is subject to special rules, the main rule being that in order to engage in pattern day trading the trader must maintain an equity balance of at least USD25 000 in a margin account. It is important to note that this requirement is only for day traders using a margin account. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Относится к открытию и ликвидации одной и той же позиции или позиций в рамках одной торговой сессии. в Дэтэк Онлайн (Datek Online) и Домэстик Сыкьюритиз (Domestic Securities). Омар Эмэнэт (Omar Amanat) основал Тчрэйдскэйп (Tradescape) и Тчрэйдскэйп (Tradescape) И-Тчрэйд Файнэншэл Корпорэйшэн (E-Trade Financial Corporation) (часто называемую И*Тчрэйд (E*Trade)).

DEAD = УТРАТА СИЛЫ – In the US trademark law, a Dead or Abandoned Status for a trademark application means that specific application is no longer under prosecution within the United States Patent and Trademark Office (USPTO), and would not be used as a bar against your filing. It does not necessarily mean that there are not other marks that the trademark examining attorney would cite. It is also possible to revive an abandoned application (for example, if the USPTO declared the application abandoned for failure of the applicant to respond to an Office action, but the applicant later proved that a response was sent and the USPTO simply failed to match it with the file in a timely manner, then the case could be revived). Also, regardless of the status of an application within the USPTO, the owner may still claim common law rights, i.e. the mark may still be in use in commerce. / В законодательстве США по товарным знакам, утрата силы или статус отказа применительно к заявке на товарный знак означает, что процесс обработки данной заявки прекращён Управлением Соединённых Штатов Америки по Патентам и Товарным Знакам (УСШПТЗ), и она не может служить препятствием Вашей заявке. Это вовсе не означает, что не может быть других знаков, на которые сошлётся проверяющий поверенный по товарным знакам. Кроме того, можно восстановить заявку, от которой отказались (например, если УСШПТЗ объявило заявку отказной из-за неспособности заявителя ответить на действия Управления, однако в последствии заявитель доказал, что ответ был таки направлен, а УСШПТЗ просто не смогло вовремя связать его с самой заявкой; в таком случае дело может быть возобновлено). Также, независимо от статуса заявки в УСШПТЗ, владелец может воспользоваться своими правами в рамках общего права.

DEAD AHEAD = НАМЕРТВО ВПЕРЁД (или ПРЯМО ПО КУРСУ, или ПРЯМО ПО НОСУ) – Dead Ahead (maritime term):- directly ahead on the extension of the ship's fore and aft line.

DEAD AIR ZONE = ВОЗДУШНАЯ МЁРТВАЯ ЗОНА – Dead Air Zone is an area in a cargo stack with insufficient ventilation.

DEAD COTTON = МЁРТВЫЙ ХЛОПОК – Dead Cotton:- a small nep of cotton fibers which is gathered on the surface of the fabric and which is different in color from the surrounding fabric. Undeveloped or unripe Cotton fiber. It is difficult to spin or dye. Dead Cotton is an extreme form of immature and undeveloped Cotton, having a thin fiber wall. Can result from disease, pest attack or a foreshortened ripening period. Immature, undeveloped, or unripe Cotton. / Незрелый, недоразвитый или неразвившийся хлопок. Совершенно незрелое волокно, представляющее собой тонкостенную трубочку. Оно непрочно, непригодно к прядению и плохо окрашивается красителями, обычно применяемыми для крашения хлопка. Это объясняется тем, что стенка такого волокна состоит почти из одного тонкого защитного слоя – кутикулы, в котором много жиро-восковых веществ, но мало целлюлозы (клетчатки). Под микроскопом мертвые волокна имеют вид неправильно смятых ленточек без заметных стенок, а в кипах при визуальном осмотре – блестящих пластиков.

DEAD FIBERS = МЁРТВЫЕ ВОЛОКНА – Dead Fibers are the fibers which, after swelling, have a wall thickness of one-fifth or less of the maximum fiber width. Dead fibers are present in various forms, from flat ribbons with no convolutions and little or no fiber wall, to highly convoluted forms with somewhat greater development. See also Dead Cotton.

DEAD FREIGHT = МЁРТВЫЙ ФРАХТ (или БЕЗДЕЙСТВУЮЩИЙ ФРАХТ) – Dead Freight:- freight rate which is paid on empty space in a vessel when the charterer is responsible for the freight rate of a full cargo. It should be paid before sailing. / Ставка фрахта, уплатой которой было оплачено и пустое пространство на судне. Такое встречается в тех случаях, когда фрахтователь отвечает за ставку фрахта для всего груза вцелом. Мёртвый фрахт должен быть оплачен до выхода судна в плавание.

DEADFREIGHT FACTOR = ФАКТОР МЁРТВОГО ФРАХТА (или ФАКТОР БЕЗДЕЙСТВУЮЩЕГО ФРАХТА) – Deadfreight Factor is a percentage of a ship's carrying capacity that is not utilized.

DEAD FURROW = ТУПАЯ БОРОЗДА (или ЗАКРЫТАЯ БОРОЗДА, или ГЛУХАЯ БОРОЗДА) – Dead Furrow is a furrow left in the field that is slightly wider than twice the width of a plow bottom, usually occurring at the completion of a field. / Под Бороздой понимается канавка, образованная почвообрабатывающим или другим орудием, для отвода воды с полей при избыточном увлажнении, поливе в орошаемом земледелии и для посева сельскохозяйственных культур. Борозда, канавка, образованная почвообрабатывающим или другим орудием. В зонах избыточного увлажнения служит для отвода воды с полей, в орошаемом земледелии – для полива. Бороздной посев защищает семена и всходы от выдувания.

DEAD–HEAD = ПОРОЖНИЙ (или ПОРОЖНЯКОМ) – Dead-Head:- a one-way move/round-trip movement with one leg as either a bobtail or pulling an empty container. One leg of a move without a paying cargo load. Usually refers to repositioning an empty piece of equipment. Dead Head is movement of freight without charges or else movement of empty trailers.

DEADHEART = МЁРТВАЯ СЕРДЦЕВИНА (или МЁРТВОЕ СЕРДЕЧКО, или МЁРТВАЯ ВЕРХУШЕЧНАЯ ПОЧКА) – Deadheart:- dead rice tiller caused by the attack and gridling of the tiller's base by stem borers.

DEAD LIGHT = ГЛУХАРЬ (или ГЛУХОЙ СВЕТОВОЙ ЛЮК, или МЁРТВЫЙ СВЕТ) – Dead Light (maritime term):- steel disc, that is dogged down over a porthole to secure against breakage of the glass and to prevent light from showing through. / Штормовая или затемнительная крышка иллюминатора.

DEAD–LINE = ПРЕДЕЛЬНЫЙ СРОК – Dead-Line:- a container determined to be incapable of use for loading freight or any other vehicle that is taken out of service, repair and/or maintenance.

DEADLOAD = МЁРТВЫЙ ГРУЗ (или ПОЛЕЗНАЯ НАГРУЗКА, или ЧИСТАЯ ГРУЗОПОДЪЁМНОСТЬ, или СОБСТВЕННЫЙ ВЕС) – Deadload is the difference between the actual and calculated ship's draft. / Разница между фактической и расчётной осадкой судна.

DEAD LOAD = ПОСТОЯННАЯ НАГРУЗКА (или СТАТИЧЕСКАЯ НАГРУЗКА) – Dead Load is any permanent load resulting from the weight of building materials or installed equipment. / В строительной механике под Постоянной Нагрузкой понимается нагрузка, которая при расчёте сооружения принимается неизменной по значению, направлению действия и месту приложения, например, вес сооружения, давление грунта и другая. В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям. Статическая Нагрузка – нагрузка, значение, направление и место приложения которой изменяются столь незначительно, что при расчёте сооружения их не принимают не зависящими от времени и поэтому пренебрегают влиянием сил инерции, обусловленных такой нагрузкой. Примеры статической нагрузки – собственный вес сооружения, снеговая нагрузка. Равномерно-Распределённая Нагрузка – сплошная нагрузка постоянной интенсивности. В строительной механике Сплошная Нагрузка – нагрузка, распределённая непрерывно по данной площади или по данной линии. Сплошная нагрузка может быть равномерно распределённой (постоянной интенсивности) или изменяться по другому закону, например, линейному, квадратичному.

DEAD STOCK = МЁРТВЫЙ ЗАПАС (или ЗАТОВАРИВАНИЕ, или НЕПРИКОСНОВЕННЫЙ ЗАПАС, или ЗАПАС БЕССРОЧНОГО ХРАНЕНИЯ) – Dead Stock:- product that has been in inventory for an extended period of time without being moved or ordered.

DEADWEIGHT = ДЭДВЭЙТ (или ДЕДВЕЙТ, или ПОЛНАЯ ГРУЗОПОДЪЁМНОСТЬ) – Deadweight is a common measure of ship carrying capacity. The number of tons (2 240 lbs) of cargo, stores and bunkers that a vessel can transport. It is the difference between the number of tons of water a vessel displaces 'light' and the number of tons it displaces 'when submerged to the 'deep load line''. A vessel's cargo capacity is less than its total deadweight tonnage. The difference in weight between a vessel when it is fully loaded and when it is empty (in general transportation terms, the net) measured by the water it displaces. This is the most common, and useful, measurement for shipping as it measures cargo capacity. The total weight of cargo, cargo equipment, bunkers, provisions, water, stores and spare parts which a vessel is designed to carry. The Deadweight is expressed in tons. Deadweight is defined as weight of cargo plus fuel and consumable stores, and lightweight as the weight of the hull, including machinery and equipment. The designer must choose dimensions such that the displacement of the vessel is equal to the sum of the deadweight and the lightweight tonnages. The fineness of the hull must be appropriate to the speed. Deadweight is the number of tons of 2 240 pounds that a vessel can transport of cargo, stores and bunker fuel. It is the difference between the number of tons of water a vessel displaces 'light' and the number of tons it displaces when submerged to the 'load line'. Abbreviation:- dwt. / Под Дэдвэйтом или Дедвейтом или Полной Грузоподъёмностью судна понимается максимальный вес груза (полезный груз, судовые запасы, экипаж), который оно способно принять на борт. Дедвейт при осадке по грузовую марку в морской воде является показателем размеров грузового судна и его основной эксплуатационной характеристикой. Дедвейт равен разности между водоизмещением и собственной

массой судна с готовыми к действию механизмами (заполненными топливными трубопроводами, водой в котлах и теплообменниках и другим). Обозначение:- грп.

DEADWEIGHT CARGO = ТЯЖЕЛОВЕСНЫЙ ГРУЗ – Deadweight Cargo:- heavy goods such as coal and stone. The cost of carrying deadweight cargo is calculated according to its weight, not according to the amount of space it fills. Deadweight Cargo is a long ton of cargo that can be stowed in less than 40 cubic feet. Deadweight Cargo:- in ocean transportation, any cargo with a stowage factor of 40 or less; that is, which measures less than 40 cubic feet to the ton. A vessel's maximum carrying capacity is the available space (cubic) for light cargo, i.e. cargo with low specific weight, and the ability to carry tonnage or weight (deadweight capacity) for heavy cargo, i.e. cargo with high specific weight. Deadweight Cargo:- dense cargo, a long ton (2 240 pounds) of which occupies 70 cubic feet (19.6 cubic meters) or less.

DEADWEIGHT TON = ТОННА ДЕДВЕЙТ (или ТОННА ПОЛНОЙ ГРУЗОПОДЪЁМНОСТИ) – Deadweight Tons are the measure, in long tons (1 016 kg), of a tanker's total capacity to carry bunkers, cargo, people, stores, and water. A tanker's capacity to carry crude or product cargo, in metric tons (1 000 kg), is slightly less. Deadweight Ton is a measurement of a ship's tonnage indicating the actual carrying capacity of the ship, usually in tones. Also refers to the actual weight of cargo aboard at any point of time. / полная грузоподъёмность судна, обычно в тоннах. Обозначение:- т грп.

DEADWEIGHT TONNAGE = ТОННАЖ ДЕДВЕЙТОМ (или ТОННАЖ ПОЛНОЙ ГРУЗОПОДЪЁМНОСТИ) – Deadweight Tonnage is a measurement of total contents of a ship including cargo, fuel, crew, passengers, food, and water aside from boiler water. It is expressed in long tons of 2 240 pounds (1 016 kilograms). What is the difference between dead weight tonnage and gross tonnage? Deadweight (DWT) and displacement are expressions of physical weight; and the gross register tonnage (GRT) was a calculation of the number of 100 cubic foot 'boxes' a ship could accommodate in its enclosed space. Net register tonnage (NRT) reflected the same figure, but just for the money earning spaces. Now the figure is based around cubic meters and is adjusted with a sliding figure to bring it more into line with the tonnages it was replacing. Deadweight is how much the ship can carry, while displacement is how much water the ship has to move out of the way. Tankers and bulk carriers will, more or less, have DWTs roughly two-thirds to double the gross tonnage (GT). A container ship will have a DWT in close proximity to its GT, while passenger ships, gas carriers, and car carriers will have quite small DWTs compared to their GT. To understand this a bit better, a cruise ship has lots of enclosed space. But the weight of the people it carries – even if they've overdone it on the buffet each day – isn't great. A tanker of equivalent GT on the other hand, is full of oil and this weights a lot more. Technically, the term Deadweight Tonnage refers to the actual weight of cargo, fuel and stores required to bring the ship down to her loadline marks. In marine insurance practice the term refers to the dimension of a ship used for the purpose of calculating the premium for a hull & machinery policy on full conditions. Deadweight Tonnage (also known as Deadweight abbreviated to DWT, D.W.T., d.w.t., or dwt) is a measure of how much weight a ship is carrying or can safely carry. It is the sum of the weights of cargo, fuel, fresh water, ballast water, provisions, passengers, and crew. The term is often used to specify a ship's maximum permissible deadweight, the DWT when the ship is fully loaded so that its Plimsoll line is at the point of submersion, although it may also denote the actual DWT of a ship not loaded to capacity. Deadweight tonnage was historically expressed in long tons but is now usually given internationally in tonnes. Deadweight tonnage is not a measure of the ship's displacement and should not be confused with gross tonnage or net tonnage (or their more archaic forms gross register tonnage or net register tonnage).

DEAD WOOL = МЁРТВАЯ ШЕРСТЬ – Dead Wool is a wool taken from the sheep that have died on the range or have been killed. Wool recovered from sheep that have been dead for some time is occasionally referred to as 'Merrin'. Wool taken from sheep that have died on the range or have been killed. Dead wool fiber is decidedly inferior in grade and is used in low-quality cloth.

DEAERATOR = ДЕАЭРАТОР – Deaerator is a separator that removes air from the system fluid through the application of bubble dynamics. / Под Деаэратором, от Латинского слова – приставки De, означающее Отделение или Отмену или Удаление или Уничтожение, и Греческого слова Aēr, означающее Воздух, понимается аппарат для удаления из воды растворённых кислорода и диоксида углерода, вызывающих коррозию оборудования. Деаэратор устанавливают на теплоэлектростанциях (ТЭС) и атомных электростанциях (АЭС) для деаэрации питательной воды, подаваемой в парогенераторы, и подпиточной воды, подаваемой в тепловую сеть. По принципу действия различают Сталестружечные Деаэраторы; Термические Деаэраторы (газы удаляются при подогреве воды); Химические Деаэраторы и другие. Сталестружечные деаэраторы, в которых металл, окисляясь, поглощает кислород, применяют в небольших котельных с паропроизводительностью менее 2 тонн в час (т/ч). Дорогие химические деаэраторы с сульфитом натрия используют лишь как коррекционные в энергетических установках. Деаэратор, устройство для деаэрации воды, то есть удаления из неё растворённых газов. Деаэратор устанавливают на тепловых электростанциях для деаэрации питательной воды, подаваемой в парогенераторы, и подпиточной воды, подаваемой в тепловую сеть. При отсутствии деаэрации растворённые в воде коррозионно-активные газы (кислород и свободная двуокись углерода), выделяясь в парогенераторе или тепловой сети, вызывают коррозию металла. По принципу действия различают деаэраторы термические (нашли наибольшее распространение), десорбционные, химические и другие.

DEAL = СДЕЛКА – A Deal is the reflection of the fact of a trade operation execution based on an order that contains a trade request. Each trade is described by properties that allow to obtain information about it. Deal is an agreement or transaction; in particular, any bargain made on a market. / Соглашение или операция, в частности, любая сделка, совершённая на рынке. Под Сделкой понимается действие, направленное на установление, изменение или прекращение гражданских прав и обязанностей. Наиболее распространённый вид сделки – контракт (договор), то есть двусторонняя или многосторонняя сделка. Возможны односторонние сделки, выражающие волю одного лица, например, завещание.

DEALER = ДЕЛЕЦ (или ДИЛЕР) – Dealer is a firm that enters into transactions as a counterparty on both sides of the market in one or more products. Over-the-counter (OTC) derivatives dealers are primarily large international financial institutions – mostly commercial banks but also some securities firms and insurance companies – as well as a few affiliates of what are primarily non-financial firms. See also End-user. In the securities trade in the United States, one who buys and sells for his own account, as distinguished from a broker who acts as buying and selling agent for others. The two functions now frequently overlap. Dealer is an individual or firm in the securities business who buys and sells stocks and bonds as a principal rather than an agent. The dealer's profit or loss is the difference between the price paid and the price received for the same security. The dealer's confirmation must disclose to the customer that the principal has been acted upon. The same individual or firm may function, at different times, either as broker or dealer. See also Broker, NASD, and Specialist. Dealer is an individual or firm that acts as a market maker in an instrument such as a security or foreign currency. Dealer is an individual who acts as a principal or counterpart to a transaction. Principals take one side of a position, hoping to earn a spread (profit) by closing out the position in a subsequent trade with another party. In contrast, a broker is an individual or firm that acts as an intermediary, putting together buyers and sellers for a fee or commission. / Делец – человек, который успешно (иногда не стесняясь в средствах) ведёт дела, например, биржевой делец или тёмный делец. Дилер или Делец – это:- (1) частное лицо или компания, действующая в качестве принципала (principal) по сделкам с ценными бумагами. Принципалы ведут торговые операции по своим собственным счетам и на свой риск. При покупке ценных бумаг у брокера, действующего в

качестве дилера, клиент получает ценные бумаги из имеющихся в запасе фирмы; этот факт должен указываться в конфирмационном заявлении. Когда биржевые брокеры (специалисты) ведут торговые операции на своих счетах, что входит в их обязанности по поддержанию упорядоченного рынка, они действуют в качестве дилеров. Поскольку большинство брокерских фирм действует в качестве как брокеров, так и принципалов, часто используется термин Брокер-Дилер (Broker-Dealer). (2) Лицо, занимающееся приобретением товаров или услуг для перепродажи их потребителям. Элемент риска, связанного с владением товаром, отличает дилера от агента или торгового представителя. Дилер – агент, предоставляющий котировки и исполняющий инструкции инвесторов относительно решений, связанных с покупкой или продажей валют.

DEALER OPTION = ДЕЛЕЦКИЙ ОПЦИОН (или ДИЛЕРСКИЙ ОПЦИОН) – Dealer Option is an option issued on the physical inventory of a commodity. A dealer option is typically issued by companies that buy, sell or otherwise use a commodity in conducting business. This type of option is not traded on an exchange, meaning that it is traded as an over-the-counter security, and thus are less subject to scrutiny and regulation. These options are typically written by firms such as clearing houses, which hold the physical commodities and offer them to the public on the over-the-counter market. While dealer options exist outside of traditional trading markets, their sale is still heavily scrutinized because they represent a contract between parties. Dealer Option is a put or call on a physical commodity, not originating on or subject to the rules of an exchange, in which the obligation for performance rests with the writer of the option. Dealer options are normally written by firms handling the underlying commodity and offered to public customers, although the reverse may also be true. A Dealer Option is a contract issued on the physical inventory of a commodity. A dealer option is typically issued by companies that buy, sell, or otherwise use a commodity in conducting business. This type of option is not traded on an exchange. Rather, it is traded as an over-the-counter (OTC) security, and is thus less subject to scrutiny and regulation. Dealer options are typically written by firms, such as clearing houses, that hold the physical commodities and then offer them to the public on the OTC market. While dealer options exist outside of traditional trading markets, their sale is still heavily scrutinized because they represent a contract between parties. The firms that deal in these types of contracts typically hold sufficient quantities of the physical commodity or cash to satisfy either a call or put contract, whichever they opt to enter. How Dealer Options Work:- Since dealer options are traded over the counter, typically by people involved with the physical commodity, the options can be used to take physical possession of a commodity, or transfer that commodity to another party via the contract. Since the contracts are traded OTC, the parties can agree on personalized terms. Unlike an exchange-traded futures contract which involves a specific amount of a certain grade of the commodity, the dealer option could be for any amount or grade the two parties agree to. A dealer may have 150 ounces of gold to sell. Another party is interested in buying 150 ounces of gold, in the future, if gold prices continue to rise. Exchange-traded futures and options are standardized to 100 ounces, leaving both the seller and buyer with 50 ounces to get rid of/acquire. A dealer option solves this problem. The price of gold is USD1 500. The two parties agree that the buyer will buy at a call option with a strike price of USD1 550. The call option will expire in three months. In exchange for the right to buy the gold at USD1 550 per ounce, even if it goes much higher in the next three months, the option buyer agrees to pay the option seller a premium. If the price doesn't rise above USD1 550, then there is no need for the option buyer to exercise the contract and buy the gold at USD1 550, since it is cheaper to buy the gold on the open market where it is trading below USD1 550. In this scenario, the option seller gets to keep the premium as well as their gold. If the price of gold moves above USD1 550, the option buyer will exercise their option. It is worthwhile to do so since the price of gold is now above USD1 550 an ounce. The seller will provide the 150 ounces of gold, potentially via a vault receipt, and the option buyer will pay the option seller USD1 550 x 150 ounces. Dealer options are traded OTC, and require that the other party be able to hold up their end of the deal. Therefore, these types of agreements are made between firms or individuals that know each or have financially verified each other.

DEALER TANK WAGON PRICE = ДИЛЕРСКАЯ ЦЕНА ПРИ ПОСТАВКЕ В ЖЕЛЕЗНОДОРОЖНОЙ ЦИСТЕРНЕ (НА УСЛОВИЯХ СИФ) – Dealer Tank Wagon Price is the price, usually of gasoline, offered by the majors which is branded and delivered to the service station on a cost, insurance, and freight basis.

DEALS = СЛЕГИ (или ЛАГИ, или ДИЛЬСЫ, или ДИЛЗ) – Lengths of timber between 3 feet and 5 feet (91.44 centimeters and 152.40 centimeters) in length, and between 2 inches and 9 inches (50.8 millimeters and 228.6 millimeters) thick. Deals are parallel-sided pieces of timber from 2 to 4 inches (from 50.8 to 101.6 millimeters) thick, 9 inches (228.6 millimeters) wide, and from 8 to 21 feet (from 243.84 to 640.08 centimeters) long. / Отрезы из строительного пиломатериала длиной в пределах от 91.44 сантиметров до 152.40 сантиметров (от 3 футов до 5 футов) и толщиной в пределах от 50.8 миллиметров до 228.6 миллиметров (от 2 дюймов до 9 дюймов). Под Слегами/Лагами/Дильсами понимаются изделия из строительного пиломатериала с параллельными пластями толщиной в пределах от 50.8 до 101.6 миллиметров (от 2 до 4 дюймов), шириной 228.6 миллиметров (9 дюймов), и длиной в пределах от 243.84 до 640.08 сантиметров (от 8 до 21 фута). Слега – толстая жердь, брус. Лаги – брёвна, брусья или металлические балки, расположенные горизонтально и являющиеся опорой для полов здания или помостов. Под Диленами (Дилены) или Эндсами (Эндсы), от Английских слов Deal-Ends, понимаются короткие доски, так называемые Концы, длиной меньше 2.7 метра (м), предназначенные на вывоз (или экспорт). Деловые Концы.

DEBARKING = ОКОРКА – Debarking is a removal of bark from round wood. Debarking does not necessarily make the wood bark-free. / Удаление коры с кругляка. Вовсе не обязательно, что в процессе окорки удаляется вся кора с обрабатываемой древесины. Под Окоркой понимается удаление коры с хлыстов и сортиментов. Осуществляется окорочными станками и инструментами. Необходима для последующей химической и механической переработки древесины. Окорка – удаление коры с круглой древесины (окорка не обязательно означает, что древесина становится свободной от коры).

DEBASEMENT = УДЕШЕВЛЕНИЕ – Debasement is a decrease in the intrinsic value of a currency; especially, reduction in weight, purity or both of the precious metal content of a monetary unit.

DEBENTURE = ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО – A Debenture is a document that either creates a debt or acknowledges it, and it is a debt without collateral. In corporate finance, the term is used for a medium- to long-term debt instrument used by large companies to borrow money. In some countries the term is used interchangeably with bond, loan stock or note. A debenture is thus like a certificate of loan or a loan bond evidencing the fact that the company is liable to pay a specified amount with interest and although the money raised by the debentures becomes a part of the company's capital structure, it does not become share capital. Senior debentures get paid before subordinate debentures, and there are varying rates of risk and payoff for these categories. Debentures are generally freely transferable by the debenture holder. Debenture holders have no rights to vote in the company's general meetings of shareholders, but they may have separate meetings or votes, e.g., on changes to the rights attached to the debentures. The interest paid to them is a charge against profit in the company's financial statements. Attributes:- (i) a movable property; (ii) issued by the company in the form of a certificate of indebtedness; (iii) it generally specifies the date of redemption, repayment of principal and interest on specified dates; (iv) may or may not create a charge on the assets of the company; and (v) corporations often issue bonds of around USD1 000, while government bonds are more likely to be USD5 000. Debentures gave rise to the idea of the rich 'clipping their coupons', which means that a bondholder will present their 'coupon' to the bank and receive a payment each quarter (or in whatever period is specified in the

agreement). There are also other features that minimize risk, such as a 'sinking fund', which means that the debtor must pay some of the value of the bond after a specified period of time. This decreases risk for the creditors, as a hedge against inflation, bankruptcy, or other risk factors. A sinking fund makes the bond less risky, and therefore gives it a smaller 'coupon' (or interest payment). There are also options for 'convertibility', which means a creditor may turn their bonds into equity in the company if it does well. Companies also reserve the right to call their bonds, which mean they can call it sooner than the maturity date. Often there is a clause in the contract that allows this; for example, if a bond issuer wishes to rebuy a 30 year bond at the 25th year, they must pay a premium. If a bond is called, it means that less interest is paid out. Failure to pay a bond effectively means bankruptcy. Bondholders who have not received their interest can throw an offending company into bankruptcy, or seize its assets if that is stipulated in the contract. Security in Different Jurisdictions:- in the United States, debenture refers specifically to an unsecured corporate bond, i.e. a bond that does not have a certain line of income or piece of property or equipment to guarantee repayment of principal upon the bond's maturity. Where security is provided for loan stocks or bonds in the US, they are termed 'mortgage bonds'. However, in the United Kingdom a debenture is usually secured. In Canada, a debenture refers to a secured loan instrument where security is generally over the debtor's credit, but security is not pledged to specific assets. Like other secured debts, the debenture gives the debtor priority status over unsecured creditors in a bankruptcy; however debt instruments where security is pledged to specific assets (such as a bond) receive a higher priority status in a bankruptcy than do debentures. In Asia, if repayment is secured by a charge over land, the loan document is called a Mortgage; where repayment is secured by a charge against other assets of the company, the document is called a Debenture; and where no security is involved, the document is called a Note or 'Unsecured Deposit Note'. Convertibility:- there are two types of debentures:- (i) Convertible Debentures, which are convertible bonds or bonds that can be converted into equity shares of the issuing company after a predetermined period of time. 'Convertibility' is a feature that corporations may add to the bonds they issue to make them more attractive to buyers. In other words, it is a special feature that a corporate bond may carry. As a result of the advantage a buyer gets from the ability to convert, convertible bonds typically have lower interest rates than non-convertible corporate bonds. (ii) Non-Convertible Debentures, which are simply regular debentures, cannot be converted into equity shares of the liable company. They are debentures without the convertibility feature attached to them. As a result, they usually carry higher interest rates than their convertible counterparts. In the United Kingdom (UK), a long-term bond issued by a UK or foreign company and secured on fixed assets. A debenture entitles the holder to a fixed interest payment or a series of such payments. In the United Kingdom, a long-term loan to a company made at a fixed rate of interest and usually with a specified maturity date, generally between 10 and 40 years. Debenture holders are numbered with the company's creditors, and in the event of liquidation have preferential claims on the firm. Debentures may be treated as tradeable securities. A loan to a company at a fixed rate of interest and for a fixed term, usually one to five years. The debenture is secured by a trust deed over an asset, or assets, of a company. Unsecured general debt obligation in the form of a security usually with a fixed interest rate or no interest (zero coupon bond). With few exceptions (such as perpetual bonds or uncallable annuities), these instruments have a fixed maturity, e.g., bond issues, medium-term notes. General expression for different types of bonds. A promissory note or bond backed only by the general credit of the issuer and usually not secured by any specific collateral, such as a mortgage or property. Most corporate bonds are debentures. Debentures are fixed-income securites (bonds, promissory notes, debt instruments). They certify the right to the repayment of the nominal value plus interest. By issuing debentures, the issuer procures long-term debt capital. Issuers on the capital markets are the public sector, banks and industrial companies. Correspondingly, these instruments are called Public Sector, Bank And Industrial Bonds (Debentures). Debentures:- long-term securities that give the holders the unconditional right to one or both of:- (a) a fixed or contractually determined variable money income in the form of coupon payments, i.e. payment of interest is not dependent on earnings of the debtors; and (b) a stated fixed sum as a repayment of principal on a specified date or dates when the security is redeemed. Debenture is a debt security, issued by a government or large company, that is not secured by an asset or lien, but rather by the all issuer's assets not otherwise secured. That is, a debenture carries no collateral and is considered unsecured; in case of bankruptcy, the debenture holder is considered a general creditor. A debenture can be traded, and the term is often interchangeable with a bond. Debentures issued by governments are considered risk-free. See also Treasury Security. In the United States (US), a Debenture is a long-term debt issued mainly to evidence an unsecured corporate debt. Debenture is a type of debt instrument that is not secured by physical assets or collateral. Debentures are backed only by the general creditworthiness and reputation of the issuer. Both corporations and governments frequently issue this type of bond in order to secure capital. Like other types of bonds, debentures are documented in an indenture. Debentures have no collateral. Bond buyers generally purchase debentures based on the belief that the bond issuer is unlikely to default on the repayment. An example of a government debenture would be any government-issued Treasury bond (T-bond) or Treasury bill (T-bill). T-bonds and T-bills are generally considered risk free because governments, at worst, can print off more money or raise taxes to pay these type of debts. Debenture is a loan made to a company which is secured against the assets of the company. Debentures usually have a floating charge over the assets of the company so that debenture holders rank above other creditors should the company be wound up. Debentures with fixed charges are called Mortgage Debentures. Debenture is a fixed interest stock/security issued by a commercial organisation normally on a secured basis which means that when it comes to the redemption date and suppose that the commercial company has not got enough money to repay the stock then the debenture holders will have the legal right to sell certain pre-specified assets of the company (e.g., a building) in order to get enough money to repay the stock. These assets are described as the assets over which the debenture is secured. / , например, . Долговое Обязательство – обязательство общего характера, обеспеченное лишь доверием к должнику и документируемое соглашением, называемым контрактом о предоставлении займа (indenture). Необеспеченные облигации (unsecured bonds) являются долговыми обязательствами без особого обеспечения.

DEBENTURE BOND = НЕОБЕСПЕЧЕННАЯ ОБЛИГАЦИЯ – Debenture Bond is an unsecured bond whose holder has the claim of a general creditor on all assets of the issuer not pledged specifically to secure other debt. Compare subordinated debenture bond and collateral trust bonds. In the United States, Debenture Bond is the unsecured fixed-rate bond. Frequently sold at a discount since interest and redemption are less certain than in the case of ordinary bonds. Embody a money claim on the issuer (borrower). Depending on the market situation, debenture bonds offer a higher return than other forms of fixed-interest investment.

DEBENTURE STOCKS = АКЦИИ С ДОЛГОВЫМИ ОБЯЗАТЕЛЬСТВАМИ (или ДОЛГОВЫЕ АКЦИИ) – Debenture Stock is a stock entitling the bearer to a certain fixed dividend at set periods of time. Like debenture debt, debenture stock offers fixed payments with no collateral beyond the company's performance. Unlike debenture debt, however, debenture stock is a form of equity, which puts it in a position behind all debts in the event of liquidation. Debenture stock operates almost identically to preferred stock. Debenture Stock is a type of stock that makes fixed payments at scheduled intervals of time. Debenture stock differs from a debenture in that it has the status of equity, not debt, in liquidation. Debenture Stock is a form of investment that is somewhat like preferred stock. With a debenture stock offering, the terms and conditions that govern the stock issue include a schedule for making payments to the investor at regular intervals. From this perspective, debenture stock functions more like any type of debenture rather than like other forms of stock. One of the keys to understanding how debenture stock functions is to realize that the stock offering is treated as equity rather than debt. This is the factor that tends to make the stock more like other forms of stock and less like a debenture. The classification of debenture stock also establishes a degree of protection for investors in the event the company shuts down and the assets of the

corporation go through a liquidation process. With debenture stock, investors receive payments that are issued on a specific schedule. The schedule remains in effect for as long as the investor holds on to shares of the stock. Depending on the exact terms of the purchase agreement, an investor may receive one last scheduled payment after selling the shares. However, this is not true in most cases. Normally, the next scheduled payment is issued to the new owner of the stocks. Debenture stock carries a degree of risk, just like any type of stock issue. The advantages of the stock are the fixed payments that take place at regular intervals. This helps to ensure that the investor can anticipate a steady return on the investment at specific times throughout the calendar year. In addition, the terms that govern the return are usually liberal enough to make the stock offering to investors who wish to maintain a high degree of organization with their stocks while minimizing the opportunities for the unexpected to occur. Debenture stock does provide protection for the investor in the event that the company fails. However, it is important to note that holding the stock does not entitle the investor to receive compensation while the corporation goes through the liquidation process. In most localities, investors have to wait for Accounts Payable items to be settled before receiving any compensation for the shares in their possession. This applies to debenture stock in a manner similar to many other forms of stock. All outstanding debts are settled before payments on the debenture stock are issued to any of the investors. In the United States, Debenture Stocks is the infrequently used name for Preferred Stock. In the United Kingdom, an obligation or debt due from a company and secured by a trust deed, usually with real estate property as collateral.

DEBIT = ДЕБЕТ (или ДЭБЭТ) – Debit is an entry on the left side of a double-entry bookkeeping system that represents the addition of an asset or expense or the reduction to a liability or revenue. See also Credit. Charges to an account. Debit is an accounting entry which results in either an increase in assets or a decrease in liabilities or net worth. The opposite of Credit. Debit is a 'debt' entry into an account, or the left-side column of entries into the account. From Latin, Debet. In accounting, entry on the left or asset side of an account, indicating the creation or addition to an asset or expense, or the reduction or elimination of a liability. A debit is the counterpart of credit on the liabilities side of an account. / В бухгалтерском учёте под Дебетом понимается проводка по счёту на левой стороне или стороне активов, указывающая на создание или прирост активов или расходов, или уменьшение или ликвидацию пассивов (обязательств). Дебет составляет пару с кредитом в отношении пассивов (обязательств) по счёту. Расходы по счёту. Под Дебетом, от Латинского слова Дэбэт (Debet), означающее Он Должен, понимается название левой стороны бухгалтерских счётов. Все хозяйственные операции записываются в дебете одного и кредите другого счёта. В активных счетах дебет означает увеличение учитываемых сумм, а в пассивных счетах – уменьшение. Так, в Активных Имущественных Счетах, служащих для учёта движения товарно-материальных ценностей, дебет показывает наличие этих ценностей на начало года и поступление их в отчётном году. В Активных Расчётных Счетах – задолженность дебиторов на начало года и её последующее увеличение, в Пассивных Расчётных Счетах – погашение задолженности кредиторов.

DEBIT ADVANCE ADVICE = ПРЕДВАРИТЕЛЬНОЕ ИЗВЕЩЕНИЕ О ДЕБЕТОВАНИИ – Debit Advance Advice is an advice sent by or on behalf of the debtor's financial institution to the debtor to inform him that a debit is to be made.

DEBIT ADVICE = ДЕБЕТОВОЕ АВИЗО – Debit Advice is an advice sent by the debtor's financial institution to the debtor to inform him that a direct debit is to be or has been made. What Is Debit Advice and Credit Advice? The next time you receive a statement from your bank, check additions and deductions made on the statement. The bank usually puts in the 'plus category' items that increase your account balance and in the 'minus category' elements that reduce funds in the account. Understanding the banking concepts of 'Debit Advice' and 'Credit Advice' can help you track your spending. A Debit Advice is also called a Debit Memorandum, Debit Note or Debit. A banker sends a debit note to customers to inform them of deductions from their accounts. In other words, a debit refers to a decrease in a deposit account balance, such as a check posted to the account. These days, the advent of the Internet has made debit advices quicker. Consequently, deductions resulting from debit advices occur in real time. For example, you can advise your bank to pay a monthly utility bill automatically, and the corresponding debit advice happens in real time. Credit Advice:- unlike a debit advice, a credit note is a transaction that increases a customer's funds. Stated differently, a credit memorandum refers to an increase in a deposit account balance, such as a deposit made to the account. For example, you file your annual tax return and advise the Internal Revenue Service to send your refund electronically. Once the IRS approves the refund amount, it sends the funds to your bank, which in turn credits your account. Significance:- the concepts of debit and credit are at the heart of modern-day banking. These terms help bankers run their businesses efficiently, ensuring that customer accounts reflect accurate balances. Account accuracy helps financial institutions retain customers and improve their reputation in the marketplace. There is correlation between 'Debit Advice' and 'Credit Advice' because a debit memorandum in one customer's account represents a credit note in another client's account. Tools:- banks rely on specific tools and state-of-the-art technology to make sure employees record accurate debits and credits. These tools include customer relationship management, database management system programs and operating system applications. Other resources include mainframe computers, banking administration software, financial analysis software, and credit adjudication and lending management system software, or CALMS. Accounting and Reporting:- the accounting terms of 'credit' and 'debit' are distinct from banking concepts. Accountants follow a different set of rules when recording transactions in financial accounts. These include assets, liabilities, equity items, revenues and expenses. An accountant debits an asset or expense account to increase its amount and credits the account to reduce its balance. The opposite is true for a revenue, liability or equity account. For example, a debit note to the cash account means a reduction of corporate funds because cash is an asset account. / Авизо, отправленное финансовым учреждением должника самому должнику с целью информирования его о том, что должно быть произведено или уже произведено прямое дебетование. Авизо – извещение, направляемое банком его клиенту или банку корреспонденту; Кредитовое Авизо – сообщение о зачислении средств на счёт (кредитовании), Дебетовое Авизо – сообщение о списании средств со счёта (дебетовании). Дебетовое Авизо, дебет-нота – извещение, посылаемое одной из находящихся в расчётных отношениях сторон другой стороне о записи в дебет счёта последней определённой суммы ввиду наступления какого-либо обстоятельства, создающего право требования этой суммы, например, извещение банком клиента о дебетовой записи по его счёту.

DEBIT BALANCE = ДЕБЕТОВОЕ САЛЬДО (или ДЕБЕТОВЫЙ ОСТАТОК) – (1) Debit Balance is a balance remaining after one or a series of bookkeeping entries. This amount represents an asset or an expense of the entity. See also Balance, and Credit Balance. Balance remaining after one or a series of bookkeeping entries. This amount represents an asset or an expense of the entity. Money owed by the customer from a completed sale. Total of Debit Balances are reflected in the Asset account Accounts Receivable. See also Balance, and Credit Balance. Debit Balance is the difference between debits and credits in an account where the value of debits is greater. / В бухгалтерском учёте под Дебетовым Сальдо понимается финансовое положение лица, при котором дебет больше кредита. Оно отражает состояние данного вида хозяйственных средств на определённую дату и показывается в активе баланса.

(2) In a margin account it is money owed by the client to the broker. Debit Balance is the amount owed in a brokerage margin account. A Debit Balance occurs when an investor purchases securities on margin or borrows money from the account by using securities as collateral. Brokerage firms typically charge an interest rate on the borrowed funds that varies with the size of the debit balance. Compare Credit Balance. Money owed to a broker from the purchase of stock or bonds in a customer's margin account. This money is

a loan extended by the broker to the margin customer and the customer pays interest on the debit balance in the account. In a customer's margin account, that portion of the purchase price of asset that is covered by credit extended by the broker to the margin customer. See also Margin. / .

DEBIT CARD = ДЕБЕТОВАЯ КАРТА (или РАСЧЁТНАЯ КАРТА) – Debit Card is a card enabling the cardholder to have his purchases directly charged to funds on his account at a financial institution. Plastic card issued by a bank to its customers which may be used in place of a check book. By accessing the bank's electronic records, the debit card makes direct debit of an account possible. Debit Card is an electronic card issued by a bank which allows bank clients access to their account to withdraw cash or pay for goods and services. This removes the need for bank clients to go to the bank to remove cash from their account as they can now just go to an ATM or pay electronically at merchant locations. This type of card, as a form of payment, also removes the need for checks as the debit card immediately transfers money from the client's account to the business account. The major benefits to this type of card are convenience and security. Along with the convenience of accessing account funds at anytime it also removes the hassles associated with having to write checks as payment like showing ID and associated fees. Debit cards are also considered to be a safer form of payment as a code is required to access the account funds, while checks can be easily stolen. Debit Card is a card that resembles a credit card but which debits a transaction account (checking account) with the transfers occurring contemporaneously with the customer's purchases. A debit card may be machine readable, allowing for the activation of an automated teller machine or other automated payments equipment. A Debit Card (also known as a Bank Card or Check Card) is a plastic payment card that provides the cardholder electronic access to his or her bank account(s) at a financial institution. Some cards have a stored value with which a payment is made, while most relay a message to the cardholder's bank to withdraw funds from a payee's designated bank account. The card, where accepted, can be used instead of cash when making purchases. In some cases, the primary account number is assigned exclusively for use on the Internet and there is no physical card. In many countries, the use of debit cards has become so widespread that their volume has overtaken or entirely replaced cheques and, in some instances, cash transactions. The development of debit cards, unlike credit cards and charge cards, has generally been country specific resulting in a number of different systems around the world, which were often incompatible. Since the mid-2000s, a number of initiatives have allowed debit cards issued in one country to be used in other countries and allowed their use for internet and phone purchases. Unlike credit and charge cards, payments using a debit card are immediately transferred from the cardholder's designated bank account, instead of them paying the money back at a later date. Debit cards usually also allow for instant withdrawal of cash, acting as the ATM card for withdrawing cash. Merchants may also offer cashback facilities to customers, where a customer can withdraw cash along with their purchase. / Дебетовая Карта – пластиковая карточка, выпущенная банком, с помощью которой клиенты получают доступ к своим средствам через электронный платёжный терминал. Дебетовые карты могут заменить чеки (в качестве средства оплаты товаров и услуг) и более удобны, чем чеки. Дебетовые карты также могут использоваться для снятия наличных денег со счёта с помощью автоматических кассовых машин. Однако, в отличие от обладателей кредитных карт, клиенты дебетовых карт не имеют преимуществ от 'флоута' (float), поскольку средства списываются со счёта немедленно.

DEBIT INTEREST = ПОЛУЧЕННЫЕ ПРОЦЕНТЫ (или ПРОЦЕНТЫ К ПОЛУЧЕНИЮ) – Debit Interest is an interest received or interest earned. In double-entry bookkeeping, banks enter interest due from customers on the debit side of the balance sheet. The opposite of Interest Payable.

DEBIT NOTE = ДЕБЕТ НОТА (или ДЕБЕТОВЫЙ БИЛЕТ) – In accounting, Debit Note is a notification sent to a customer that the supplier is about to debit the client's account with a certain sum. Debit notes are normally issued in unusual situations, e.g., when a client has been charged too little for goods received. A note indicating an amount owed by a person or company. Serves the same function as an invoice. Debit Note is anote to a person or a company signifying an amount owed. Although it is very similar to an invoice, the invoice always represents sales, whereas a debit note is used for deducting money without a sale being made. A Debit Note is a bill issued by one party calling for payment by some other party whilst credit note is like a notice advising some other party that some amount has been paid to their account for them to check in due course. See also Credit Note.

DEBIT NOTICE = ДЕБЕТОВОЕ УВЕДОМЛЕНИЕ – Debit Notice is a written confirmation indicating that an amount has been charged to an account, usually a bank account. / Письменное подтверждение, указывающее на то, что сумма была списана со счёта, обычно с банковского счёта.

DEBIT ORDER MANDAT = МАНДАТ РАСПОРЯЖЕНИЕ НА ДЕБЕТОВАНИЕ – Debit Order Mandate is a debtor's mandate, done in writing and revocable at any time, to his bank authorising it to pay all future debit transfers to a specific payee (creditor) if sufficient funds are provided; besides the direct debit mandate, the debit order mandate is the less customary variant of the debit transfer system. It is used principally for payees who, over a long period, are owed different amounts of money, payable at irregular intervals, by certain customers.

DEBIT PROCESS = УПРАВЛЕНИЕ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТЬЮ (или СПИСАНИЕ СО СЧЁТА, или ДЕБЕТОВАНИЕ) – Debit Process:- with the agreement of its customers (debit authorization) companies inform the banks on behalf of a large number of customers (insurances, electricity utilities) of the amounts to be debited directly to the accounts of the creditors. The transmission of the data is carried out electronically.

DEBRIS = ОСТАТКИ – Debris:- rubbish, vegetable matter, dry weeds, etc.

DEBT = ДОЛГ (или ЗАДОЛЖЕННОСТЬ) – In the United States, a Debt is an obligation owed by one party (the debtor) to a second party, the creditor; usually this refers to assets granted by the creditor to the debtor, but the term can also be used metaphorically to cover moral obligations and other interactions not based on economic value. A debt is created when a creditor agrees to lend a sum of assets to a debtor. Debt is usually granted with expected repayment; in modern society, in most cases, this includes repayment of the original sum, plus interest. In finance, debt is a means of using anticipated future purchasing power in the present before it has actually been earned. Some companies and corporations use debt as a part of their overall corporate finance strategy. Before a debt can be made, both the debtor and the creditor must agree on the manner in which the debt will be repaid, known as the Standard Of Deferred Payment. This payment is usually denominated as a sum of money in units of currency, but can sometimes be denominated in terms of goods or services. Payment can be made in increments over a period of time, or all at once at the end of the loan agreement. Types of Debt:- a company uses various kinds of debt to finance its operations. The various types of debt can generally be categorized into:- (i) secured and unsecured debt; (ii) private and public debt; (iii) syndicated and bilateral debt; and (iv) other types of debt that display one or more of the characteristics noted above. A debt obligation is considered secured, if creditors have recourse to the assets of the company on a proprietary basis or otherwise ahead of general claims against the company. Unsecured debt comprises financial obligations, where creditors do not have recourse to the assets of the borrower to satisfy their claims. Private debt comprises bank-loan type obligations, whether senior or mezzanine. Public debt is a general definition covering all financial instruments that are freely tradeable on a public exchange or over the counter, with few if any restrictions. A basic loan or 'Term Loan' is the simplest form of debt. It consists of an agreement to lend a fixed amount of money, called the Principal Sum or Principal, for a fixed period of time, with this

amount to be repaid by a certain date. In commercial loans interest, calculated as a percentage of the principal sum per year, will also have to be paid by that date, or may be paid periodically in the interval, such as annually or monthly. Such loans are also colloquially called Bullet Loans, particularly if there is only a single payment at the end – the 'bullet' – without a 'stream' of interest payments during the life of the loan. There are many conventions on how interest is calculated – see day count convention for some – while a standard convention is the annual percentage rate (APR), widely used and required by regulation in the United States and United Kingdom, though there are different forms of APR. In some loans, the amount actually loaned to the debtor is less than the principal sum to be repaid; the additional principal has the same economic effect as a higher interest rate (see point), and is sometimes referred to as a Banker's Dozen, a play on 'banker's dozen' – owe twelve (a dozen), receive a loan of eleven (a banker's dozen). Note that the effective interest rate is not equal to the discount: if one borrows USD10 and must repay USD11, then this is (USD11 – USD10) / USD10 = 10% interest; however, if one borrows USD9 and must repay USD10, then this is (USD10 – USD9) / USD9 = 11 1/9% interest. Rather than the entire principal amount of the loan being due at the end of the loan, the principal may be slowly repaid or 'amortized' over the course of the loan – see Amortizing Loan. This is particularly common in mortgages and in the minimum payment on credit cards. A syndicated loan is a loan that is granted to companies that wish to borrow more money than any single lender is prepared to risk in a single loan, usually many millions of Dollars. In such a case, a syndicate of banks can each agree to put forward a portion of the principal sum. Loan syndication is a risk management tool that allows the lead banks underwriting the debt to reduce their risk and free up lending capacity. A bond is a debt security issued by certain institutions such as companies and governments. A bond entitles the holder to repayment of the principal sum, plus interest. Bonds are issued to investors in a marketplace when an institution wishes to borrow money. Bonds have a fixed lifetime, usually a number of years; with long-term bonds, lasting over 30 years, being less common. At the end of the bond's life the money should be repaid in full. Interest may be added to the end payment, or can be paid in regular installments (known as Coupons) during the life of the bond. Bonds may be traded in the bond markets, and are widely used as relatively safe investments in comparison to equity. Debt Syndication:- a syndicated loan is one that is provided by a group of lenders and is structured, arranged, and administered by one or several commercial banks or investment banks known as Arrangers. In national accounting, debts are added according to those who are indebted. Household debt is the debt held by households. 'National' or Public debt is the debt held by the various governmental institutions (federal government, states, cities ...). Business debt is the debt held by businesses. Financial debt is the debt held by the financial sector (from one financial institution to another). Total debt is the sum of all those debts, excluding financial debt to prevent double accounting. These various types of debt can be computed in debt/GDP ratios. Those ratios help to assess the speed of variations in the indebtedness and the size of the debt due. For example, the USA has a high consumer debt and a low public debt, while in eastern European countries the opposite tends to be true. There are differences in the accounting of debt for private and public agents. If a private agent promises to pay something later, it has a debt, and this debt is enforceable by public agents. If a public body passes a law stating that it'll pay something later (a kind of promise), it keeps the right to change the law later (and not to pay). This is why, for instance, the money governments promised to pay for retirements does not show up in the public debt assessment, whereas the money private companies promised to pay for retirements does. Money owed. Also known as Liability. Debt is an amount of money borrowed by one party from another. Many corporations/individuals use debt as a method for making large purchases that they could not afford under normal circumstances. A debt arrangement gives the borrowing party permission to borrow money under the condition that it is to be paid back at a later date, usually with interest. Bonds, loans and commercial paper are all examples of debt. For example, a company may look to borrow USD1 million so they can buy a certain piece of equipment. In this case, the debt of USD1 million will need to be paid back (with interest owing) to the creditor at a later date. Debt is an amount owed by one party to another and offset by a credit, an account receivable or a note receivable in the lender's books. In accounting, debt is recorded on the liabilities side of the balance sheet, and is classified on the basis of duration, type of debt, or type of creditor. Also known as Borrowings in the United Kingdom. Debt is an amount that must be repaid is generally referred to as a Debt. There are many types of debt – secured (e.g., collateralized by a lien on certain assets) versus unsecured (creditor is at full risk), convertible notes, short term vs long-term, etc. It is a balance sheet item reported under liabilities. For example:- Federal Debt – this refers to the total debt that is being carried (i.e. financed) on a government's balance sheet. / Долг или Задолженность:- (1) Деньги, товары или услуги, которые одна сторона должна другой стороне в соответствии с явным или подразумеваемым соглашением. (2) Общее название для облигаций, векселей, ипотечных займов и иных видов ценных бумаг, служащих подтверждением сумм задолженностей и подлежащих оплате на указанную дату или по требованию.

DEBT CAPITAL = ДОЛГОВОЙ КАПИТАЛ – Debt Capital is the capital that a business raises by taking out a loan. It is a loan made to a company that is normally repaid at some future date. Debt capital differs from equity or share capital because subscribers to debt capital do not become part owners of the business, but are merely creditors, and the suppliers of debt capital usually receive a contractually fixed annual percentage return on their loan, and this is known as the Coupon Rate. Debt capital ranks higher than equity capital for the repayment of annual returns. This means that legally, the interest on debt capital must be repaid in full before any dividends are paid to any suppliers of equity. A company that is highly geared has a high debt-to-equity capital ratio. Debt Capital:- capital funds raised by a company through issuing debentures or increasing other liabilities to finance its operations. For example, a company may increase its debt capital by negotiating a long-term loan facility with a bank. An alternative to equity capital. See also Equity Capital, and Equity Funding. Debt Capital is the capital, usually money, raised through issuing bonds. Although most of the time the capital raised is money, it could be other goods of value as well. The capital raised must be paid back to those who finance the debt. Both private companies and governments can raise debt capital this way. To raise capital, companies have a number of different options. Of course, the purpose of most companies is to sell a product or service for a profit. However, some may need or wish to raise money faster than the normal course of buying and selling will provide. To do that, they may consider debt capital. In some ways, debt capital may be more attractive to a company than another form of raising money, such as an additional stock issue. Companies may not want to issue more stock because that would dilute the ownership of the existing stock. Issuing more stock runs the risk of lowering the stock price as well, depending on how much is issued. Investors may also find that supplying debt capital through buying bonds is an attractive option. While the option provides no ownership stake in the company, it does offer a bit more security than stocks. Bond payments take priority over dividend payments, which stockholders receive. If the company makes only enough money to cover its debt capital obligations, it is the stockholders who do not receive any payments. As with most other forms of debt, bonds are repaid with interest. Debt capital is normally raised through a bond issuance, though other options also exist. Companies may also borrow from banks, which is a popular option for many small businesses. However, most larger companies see bonds as a more popular option for a variety of reasons. In some cases, debt capital may be used to pay debt capital that is already outstanding by issuing more bonds to payoff the first set of bonds. This is called 'Calling The Bonds'. Usually, this means the original bonds issued are being paid off before the end of the term. Companies, or governments, may choose to do this because the interest rates are more advantageous at some other point in the life of the bonds. Debt capital is usually issued after a consultation with a bond attorney, who determines a number of different factors, including how best to sell the bonds. The bonds may be sold through negotiation with one underwriter or through a bidding process. In some cases, especially for governments, bonds may only be allowed to be issued for certain projects. Bond attorneys will inform government administrators on all legal issues. Debt Capital is funds supplied by lenders that is part of a firm's capital structure. Debt capital usually refers to long-term capital, specifically bonds, rather than short-term loans to be paid off within

one year. If the short-term debt is continually rolled over, however, it can be considered relatively permanent and thus debt capital. Debt capital has advantages and disadvantages over equity, the other component of a company's capital structure. The regular interest payments for debt capital represent a cost of doing business and, unlike dividends, are tax deductible. Debt capital also enables the firm to expand its profits indefinitely, provided it can make a greater return on the debt capital than the costs of servicing it. However, unlike dividends, interest payments to bondholders must be met on time and in full. Furthermore, as debt becomes a greater part of the firm's capital structure, a downturn in business threatens the company's survival, as the costs of servicing debt capital mount. Financial analysts thus spend much effort trying to determine the best proportion of debt capital in a company's capital structure.

DEBT COLLECTION = ВЗЫСКАНИЕ ДОЛГА – Debt Collection is a legal action to enforce payment in cash or the provision of cash coverage by a debtor who fails to meet his or her payment obligations. The proceedings are instigated after the creditor in question submits the appropriate application. The debt collection industry has grown into a multi-billion Dollar business, and in order to stay competitive and profitable, collection companies are buying collection account portfolios from almost any company that's willing to sell them or commission them to collect on their behalf. This includes credit card issuers, auto and mortgage lenders, cell phone companies, utility companies (cable, Internet, water, etc), public libraries, gyms – and even video stores, as evidenced in your case. A few years ago, these types of low dollar collections made headlines when a number of people began receiving collections for old, unpaid library fines that had been turned over to collections and reported in their credit reports. Yes, even minor past-due debts can turn into collections, regardless of how minor the amount. It's something we should all be aware of. If you find that you owe a small debt that seems trivial or insignificant and you're on the fence about paying, it's better to pay it than risk the chance of it turning into a collection and potentially hurting your credit down the road. No one wants to deal with the hassle of a collection, and it's important to remember that a forgotten movie rental can happen to any of us. How to respond to a collection letter? If you receive a collection letter in the mail, it's important that you address the collection as quickly as possible. If you think the debt might not be yours or you don't agree that you owe the debt, you only have 30 days to dispute the collection and request that the debt be validated. If the collector is unable to validate the debt by providing written proof that the debt belongs to you and that you do in fact owe it, they have no grounds for pursuing the collection and must stop all further collection attempts. If they don't, they will be in direct violation of the Fair Debt Collection Practices Act. If the debt is valid and you owe it, it's best to pay it. For higher dollar collections, we'd normally suggest negotiating a settlement over paying the full amount, but there's not much room for negotiation with an USD8 debt. It would be worth contacting the collection company directly to find out if they plan to report the collection. Order copies of your credit reports from AnnualCreditReport.com to confirm whether or not the collection has been reported yet. You can also monitor your credit score every month to ensure it isn't reported using the free Credit Report Card. If the collection agency has not yet reported the collection, it may be in your best interest to go ahead and pay the USD8 rather than going through the hassle of disputing or validating the debt. Debt Collection:- Are your invoices paid on time? Forget those justifiable fears about how to collect late payment from customers without damaging the relationship. Our wide experience in handling defaulting customers sensitively usually results in a positive return within weeks with no damage to your customer relationship. No matter how large or small the invoice default, you will find our credit management professionals have the required deep understanding of the complexity and importance of correctly tracking and managing the payment processes of each of your individual customers. Calls from debt collectors can be very annoying, to say the least. For some, the calls are so bothersome that phone numbers have to be changed or disconnected to stop debt collection calls. When Can Debt Collectors Call? The Fair Debt Collection Practices Act (FDCPA) is the Federal law that says what debt collectors can and can't do. For starters, they aren't to call you about a debt that you don't owe. When a debt collector first contacts you about a debt, you have the right to request them to verify the debt is yours. If the debt collector can't come back with proof that you owe the debt, they're not allowed to contact you anymore. Make Debt Collectors Prove You Owe? Even without sending a validation request, debt collectors have certain rules they must follow when it comes to contacting you over the phone. For example, they can't call you before 08 am or after 09 pm your local time. They can't call you repeatedly, and they can't call you at anytime you've previously stated is inconvenient. For specific situations timing of debt collector calls check out When Can Debt Collectors Call. Stop Debt Collection Calls:- there's no law that says you have to communicate with a debt collector by phone. If you hang up on a debt collector there is nothing they can do about it. But, if the collector continues to call you repeatedly even after you have hung up on them, they are in violation of the FDCPA. All you have to do to stop debt collectors from calling you is tell them that you prefer to communicate with them in writing. Written communication works in your favor because it gives you a record of everything that is said. If the debt collector violate the FDCPA, you have hard evidence that could lead to a lawsuit in your favor. Keep in mind that, by law, the debt collector does not have to honor this request. The surest way to stop debt collectors from calling you is by sending what is known as a Cease and Desist Letter. In the letter, state that the collector should cease and desist further communication with you. Note that the cease and desist letter only applies to debt collectors, not the original creditor. Debt Collectors Contacting You About Someone Else's Debt:- people who've recently changed their phone numbers are often plagued with calls from collectors trying to reach that number's previous owner. You might have this problem even if you've had the same number for years. Unfortunately, telling the debt collector that they have the wrong number may not be enough to stop the calls for good. Instead, you should send a cease and desist letter as if the debt were yours. Of course, you shouldn't admit to the debt, especially since you're not the debtor. If calls persist after the cease and desist letter, report the collector to your state Attorney General and the Federal Trade Commission. Debt collectors might also contact you trying to locate another person, like a friend or relative. Somehow in their background check, your contact information has been liked to the debtor. The law does allow debt collectors to contact a third-party to get a phone number, address, and employment information, but the collector can only contact a specific third-party once and they can't reveal any information about the debt. A debt collector is violating the law if they continue to contact you for contact information even after you've told them what you know. If you're attorney for, spouse of, or parent or guardian of a minor who owes a debt collection, the collectors are allowed to contact you. A cease and deist letter can stop collection calls in these cases, too. What Happens After the Cease and Desist? Once the collection agency receives your cease and desist letter they can communicate with you once more, via mail, letting you know one of three things:- that further efforts to collect the debt are terminated, that certain actions may be taken by the debt collector, or that the debt collector is definitely going to take certain actions. When you send the cease and desist letter to the debt collector, send it via certified mail with return receipt requested. This will provide proof that the letter was sent and received. If the debt collector communicates with you beyond the single instance allowed by law, this evidence will allow you to seek punitive action against the debt collector.

DEBT CONSOLIDATION = КОНСОЛИДАЦИЯ ДОЛГА – Debt Consolidation is the act of combining several loans or liabilities into one loan. Debt consolidation involves taking out a new loan to pay off a number of other debts. Most people who consolidate their debt usually do it to attain a lower interest rate, or the simplicity of a single loan. Also known as a Consolidation Loan. This is common among companies or people with credit problems (maxed-out credit cards, car loans, student loans, etc), who combine all of their debts into one loan to create greater ease in repayment. In the case of credit card debt, this can often be advantageous because credit cards generally carry a high interest rate. Debt Consolidation:- conversion of short-term credit into more stable financing, for a long-term loan, or the exchange of an advance or outstanding debt for equity. See also Consolidation.

DEBT COVERAGE RATIO = СООТНОШЕНИЕ ДОЛГ ПОКРЫТИЕ (или КОЭФФИЦИЕНТ ОБСЛУЖИВАНИЯ ДОЛГА) – The formula for Debt Coverage Ratio is Net Operating Income divided by Debt Service. The debt coverage ratio is used in banking to determine a companies ability to generate enough income in its operations to cover the expense of a debt. On a broader level, it may also be used internally by a company for the same reason. A company's net operating income is its revenues minus its operating expenses. For comparison, a company's net income considers interest expenses on debt, taxes, and income not earned in its natural operations. A company's net operating income can be found on its income statement. Example of Debt Coverage Ratio Formula:- an example of the debt coverage ratio would be a company that shows on its income statement an operating income of USD200 000. The debt payments for the same period is USD35 000. By dividing the USD200 000 by USD35 000, the company would show a debt coverage ratio of 5.71. Use of the Debt Coverage Ratio Formula:- as stated in a prior section, the debt coverage ratio may be used internally by a company to determine its ability to cover payments on its debt. The debt coverage ratio may also be used in lending by financial institutions for the same reason. In lending, a financial institution will generally have various metrics to determine a borrower's ability to meet the debt. This applies to business and consumer loans. The debt coverage ratio could be considered, in a very broad sense, to be an inverse of the debt to income ratio used in consumer loans as it is income divided by debt payments. This is not to be taken literally as there are differences. In finance, Debt Coverage Ratio (DCR) is a ratio measuring a business entity's ability to meet its loan payments as they come due. Used to assess a business entity's borrowing capacity. The ratio is expressed as the cash flow dividend by total long-term debt, i.e. debt maturing in more than one year. Also known as Debt Carrying Capacity, and Debt Service Ratio. / , то есть .

DEBT/EQUITY RATIO = СООТНОШЕНИЕ ЗАЁМНЫХ СРЕДСТВ С СОБСТВЕННЫМИ (или КОЭФФИЦИЕНТ ЗАДОЛЖЕННОСТИ) – Debt/Equity Ratio is a measure of a company's financial leverage calculated by dividing its total liabilities by stockholders' equity. It indicates what proportion of equity and debt the company is using to finance its assets. Formula:- Debt/Equity Ratio = Total Liabilities / Shareholders Equity. Note:- sometimes only interest-bearing, long-term debt is used instead of total liabilities in the calculation. Also known as the Personal Debt/Equity Ratio, this ratio can be applied to personal financial statements as well as corporate ones. A high debt/equity ratio generally means that a company has been aggressive in financing its growth with debt. This can result in volatile earnings as a result of the additional interest expense. If a lot of debt is used to finance increased operations (high debt to equity), the company could potentially generate more earnings than it would have without this outside financing. If this were to increase earnings by a greater amount than the debt cost (interest), then the shareholders benefit as more earnings are being spread among the same amount of shareholders. However, the cost of this debt financing may outweigh the return that the company generates on the debt through investment and business activities and become too much for the company to handle. This can lead to bankruptcy, which would leave shareholders with nothing. The debt/equity ratio also depends on the industry in which the company operates. For example, capital-intensive industries such as auto manufacturing tend to have a debt/equity ratio above 2, while personal computer companies have a debt/equity of under 0.5. Most recent quarter long-term debt divided by the most recent quarter common stock equity. Indicates financial leverage. The lower the ratio, the more the leverage. Debt/Equity Ratio shows the relationship between funds provided by borrowing and funds provided by shareholders. The debt/equity ratio shows to what extent a company is financed by debt. Debt/Equity Ratio = (Total Debt / Shareholder Equity) x 100. Also known as Gearing, or Leverage Ratio.

DEBT FINANCE = ДОЛГОВЫЕ ФИНАНСЫ – Debt Finance:- sources of funds other than equity finance. There are a number of types of Debt Finance which may be best for your situation. In fact sometimes when you pitch for Angel Funding an Angel will offer you a mixture of equity and debt funding, often as a convertible loan. The disadvantages of debt funding are that, unlike equity funding, it shows as a debt that must be repaid on the balance sheet (affecting the value of the business) and you must keep up repayments or the lender could call in the loan and force you to fold the company. The advantage is that there is no need to value the company at an early stage or part with a share of the company.

DEBT FUNDING = ДОЛГОВОЕ ФИНАНСИРОВАНИЕ – Debt Funding is a basic loan/credit debt, which requires a regular payment schedule of interest and principle. The basic forms of debt funding are:- (i) Bank Loans; (ii) Credit Cards; (iii) Lines of Credit; (iv) Bonds; and (v) IOU's. This type of funding is usually what is used by most smaller businesses as it does not relinquish any control over the company and is generally easy to acquire. The raising of debt capital (borrowing) is less complicated than raising equity capital by selling shares of stock. However, lenders to new businesses require very detailed information in addition to a business plan. Basic information required in all complete loan packages:- (i) current financial statement; (ii) profit and loss statements for three years; (iii) list of collateral offered as security; (iv) amount of loan being requested and purpose of use; (v) pro forma (income and expense for first year of operation); and (vi) further information may be required. Debt Funding is the process of debt financing through issuing debentures or bonds; or increasing other liabilities to finance operations. Alternative to Equity Funding. There are two main categories that you need to know about when it comes to business funding:- (i) Debt Funding and (ii) Equity Funding. Both of these finance options have their advantages and disadvantages; making it easier to fund the one that fits your business in the best ways. The term Debt Funding refers to money that it borrowed and has to be repaid over a period of time, this is normally re-paid with interest. This debt funding can either be short term or long term. In a short term sense the full amount to be repaid is done so within a year. In a long term sense the repayments will go on for over a year. With debt funding your only obligation to your lender is to pay back your loan. However in the case of smaller businesses guarantees will probably be needed; making commercial debt funding almost the same as personal debt funding. Debt funding comes from resources such as banks and traditional lenders. With debt funding you will have to make re-payments monthly, which will include interest. The advantages of Debt Funding are:- (i) don't have to give up ownership/future profits of your business; your lender has no control of the running of your business; (ii) using borrowed money to get your business assets will allow you to make your business profit in the company meaning you can use this profit to pay a return to owners of the company; and (iii) interest is tax deductible. Disadvantages of Debt Funding are:- (i) too much debt may impair your credit rating; (ii) use profit to pay back debt means if you have a lot of debt all your profit will be used to repay it, leaving nothing to show for your hard work; (iii) must have sufficient cash flow in your business in order to repay loans; (iv) the riskier the loan the higher the interest rate; and (v) debt funding can require collateral to secure your loan, which will be seized if you can't repay your debt. The term Equity Funding is the exchange of money for a share of business. This allow you to obtain funds for your business without incurring any debt. Selling equity means taking on investors. Many small businesses raise equity by bringing in investors to make their business succees and get a return on investment. The two main types of equity funding are business angels and venture capitalists. The advantages of Equity Funding are:- (i) you do not have to pay your investors even if your company goes bankrupt; (ii) business assets do not have to be pledged as collateral to obtain equity; (iii) business with sufficient equity will look better to lenders, investors, etc; and (iv) your business will have more cash available because it will not have to make debt payments. Disadvantages of Equity Funding are:- (i) you will have to relinquish ownership and a share of your business profit to other investors; (ii) other owners may have different ideas than yours on how businesses should be run; (iii) payments to investors in C-corporations are not tax deductible.

DEBTOR = ДЕБИТОР (или ДОЛЖНИК) – Debtor:- from Latin, Debitor. Person or company that owes money, goods or services to another (Creditor). Debtor is a company or individual who owes money. If the debt is in the form of a loan from a financial institution,

the debtor is referred to as a Borrower. If the debt is in the form of securities, such as bonds, the debtor is referred to as an Issuer. It is not a crime to fail to pay a debt. Except in certain bankruptcy situations, debtors can choose to pay debts in any priority they choose. But if you've failed to pay a debt, you have broken a contract or agreement between you and a creditor. Generally, most oral and written agreements for the repayment of consumer debt – debts for personal, family or household purposes secured primarily by a person's residence – are enforceable. However, most debts for business or commercial purposes must be in writing to be enforceable. If the agreement requires the debtor to pay a certain amount of money, then the creditor does not have to accept a lesser amount. Also, if there was no actual agreement but the creditor has loaned money, performed services or provided the debtor with a product, that debtor must pay the creditor. / Под Дебитором, от Латинского слова Дэбитор (Debitor), означающее Должник или Обязанный, в Гражданском Праве понимается сторона в обязательстве, обязанная совершить определённое действие или воздержаться от совершения действия. В качестве дебитора могут выступать лишь лица, способные быть носителями гражданских прав и обязанностей, то есть граждане и юридические лица. В двусторонних договорных обязательствах одно и то же лицо выступает и в качестве Дебитора и в качестве Кредитора, например, по договору поставки, поставщик является дебитором в обязательстве передать товар и кредитором в обязательстве уплаты денег. В обязательствах на стороне дебитора могут выступать несколько лиц (так называемая Множественность Дебиторов). В этом случае обязательство исполняется каждым дебитором в своей доле, а при солидарной ответственности каждый из дебиторов должен исполнить обязательство в полном объёме, например, при неделимости предмета обязательства, при совместной выдаче поручительства. Дебитор, выполнивший обязательство в целом, имеет Право Обратного (Регрессного) требования к остальным дебиторам. В гражданском праве Дебитором является физическое или юридическое лицо, которое должно деньги, товары или услуги другому физическому или юридическому лицу (Кредитору). Этот термин используется также в хозяйственной и бухгалтерской практике. Дебитор или Должник – лицо или предприятие, имеющее денежную задолженность. Если эта задолженность принимает форму ссуды у финансового института, то такой должник называется Заёмщиком (Borrower). Когда обязательства имеют форму ценных бумаг, например облигаций, то должника по таким обязательствам называют Эмитентом (Issuer).

DEBTORS = ДЕБИТОРЫ (или ДОЛЖНИКИ) – Debtors:- amounts due from customers for goods or services already provided. Also known as Receivables. See also Accounts Receivable. Debtors are people who have taken your stuff but have not paid for it yet. Debtors are people who 'owe' you. So debtors are assets. When somebody buys something from you on credit they become your Debtor. / Смотрите также Дебиторская Задолженность или Счета К Получению (Accounts Receivable).

DEBTOR'S FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ ДОЛЖНИКА – Debtor's Financial Institution is the financial institution with whom the debtor holds an account on which the funds are debited.

DEBTORS REPAYMENT PERIOD = ПЕРИОД ВЫПЛАТЫ ДЕБИТОРАМИ (или ПЕРИОД ВЫПЛАТЫ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ) – In analysing shares as investments, the Debtors Repayment Period (also known as Debtor Days) is calculated to show the length of time the company's debtors take to pay their accounts. Debtors repayment period = (Trade debtors / Sales revenue) x 365 days = # of days. / выплата (repayment) .

DEBTOR WARRANT = ВАРРАНТ ДЕБИТОРА (или ГАРАНТИЯ ДЕБИТОРА) – Debtor Warrant is a written promise from a debtor to make periodic payments to a creditor (payments being contingent on the profits generated by the debtor's company) thus compensating the creditor for not enforcing his right to have a restructuring program imposed on the debtor.

DEBT RATIO = СООТНОШЕНИЕ С ЗАДОЛЖЕННОСТЬЮ – Debt Ratio:- the subject of one of the fiscal criteria used to define the existence of an excessive deficit, as laid down in Article 104(2) of the EC Treaty. It is defined as the ratio of government debt to gross domestic product at current market prices, while government debt is defined in Protocol No 20 (on the excessive deficit procedure) as the total gross debt at nominal value outstanding at the end of the year and consolidated between and within the sectors of general government. Debt Ratios are the ratios that measure a business entity's use of debt financing or financial leverage. The two most commonly used ratios are debt-equity (or debt-net worth) and debt-total assets (or debt ratio). The liabilities side of a balance sheet shows all shareholders' equity and debt. The shareholders' equity plus long-term debt represent a business entity's stable sources of funds, or long-term capital. Leverage ratios are used to determine how much of a business entity's equity is subordinated to debt, that is, the extent of its financial autonomy. Debt Ratio measures the percent of total funds provided by creditors. Debt includes both current liabilities and long-term debt. Creditors prefer low debt ratios because the lower the ratio, the greater the cushion against creditor's losses in liquidation. Owners may seek high debt ratios, either to magnify earnings or because selling new stock would mean giving up control. Owners want control while 'using someone else's money'. Debt Ratio is best compared to industry data to determine if a company is possibly over or under leveraged. The right level of debt for a business depends on many factors. Some advantages of higher debt levels are:- (i) the deductibility of interest from business expenses can provide tax advantages; (ii) returns on equity can be higher; (iii) debt can provide a suitable source of capital to start or expand a business. Some disadvantages can be:- (i) Sufficient cash flow is required to service a higher debt load. The need for this cash flow can place pressure on a business if income streams are erratic. (ii) Susceptibility to interest rate increases. (iii) Directing cash flow to service debt may starve expenditure in other areas such as development which can be detrimental to overall survival of the business. Formula:- Total Liabilities / (Total Liabilities + Stockholders Equity). Debt Ratio:- total debt, including capital lease obligations, divided by total debt plus Chevron Corporation stockholders' equity. / Шеврон Корпорэйшэн (Chevron Corporation). Удельный Вес Заёмного Капитала (Debt Ratio).

DEBT RECOVERY ACTION FOR REALIZATION OF PLEDGED PROPERTY = ВОЗМЕЩЕНИЕ ДОЛГА (или УРЕГУЛИРОВАНИЕ ЗАДОЛЖЕННОСТИ) ПОСРЕДСТВОМ РЕАЛИЗАЦИИ ЗАЛОЖЕННОГО ИМУЩЕСТВА – Debt Recovery Action For Realization Of Pledged Property:- legal action to enforce debt recovery under claims secured by pledged collaterals or mortgages and necessitating the sale of the property concerned.

DEBT RECOVERY ACTION VIA BANKRUPTCY PROCEEDINGS = ВОЗМЕЩЕНИЕ ДОЛГА (или УРЕГУЛИРОВАНИЕ ЗАДОЛЖЕННОСТИ) ПОСРЕДСТВОМ ИНИЦИАЦИИ ПРОЦЕДУРЫ БАНКРОТСТВА – In Australia, Bankruptcy is the Debt Recovery Action that is taken against a person. If successful, it will result in the debtor handing over nearly all of their goods and assets to a 3rd party called a Trustee, to manage and to pay all of the debtor's debts. The debt must be over AUD2 000.00, to take action to bankrupt a debtor. Keep in mind though, that a debt may start out at less than this amount, but it can increase to above AUD2 000.00, if you take other legal debt recovery actions to recover the money through the Courts. This is because the Court fees and prescribed legal costs in debt recovery collection can be added to the debt. You have 6 years from the date of the court judgement debt to make a debtor bankrupt. After that time, you have another 6 years to take other debt recovery action through the Courts to collect the debt, provided the debtor has not gone bankrupt in the meantime. If you really want to bankrupt the Debtor, you should have a Solicitor or Lawyer do it for you. Debt Recovery Action Via Bankruptcy Proceedings:- legal action to enforce the sale of all assets of a debtor who fails to meet his payment obligations.

DEBT REGISTER CLAIM = ИСК ДОЛГОВОГО РЕЕСТРА – Debt Register Claims are assets not evidenced by a stock certificate. In Germany, examples are Federal bonds and five-year Federal bonds which are entered in the Federal Debt Register. This means that

there are no physical securities certificates. Investors can choose between a securities account credit note (collective share) and individual Debt Register claim:- with an individual debt register claim, his share is entered separately in the Debt Register and managed directly by the Federal Debt Administration. A claim on the state arising from a loan or credit entered in an official register of debt (in Switzerland, Federal Debt Register). No securities are issued for such claims; they are recorded solely in the Register.

DEBT RESCHEDULING = РЕСТРУКТУРИЗАЦИЯ ДОЛГА – Debt Rescheduling:- when a debtor has difficulties making repayments, a method by which the lender defers interest or repayments, extends the loan period, or agrees to a completely new loan. Adjustment of the terms applying to the existing liabilities of an overindebted company or country; for example, a reduction of interest rates and an extension of the time required for payment. See also Moratorium. / выплата (repayment) .

DEBT SECURITY = ДОЛГОВАЯ ЦЕННАЯ БУМАГА – (1) Debt Security is any debt instrument that can be bought or sold between two parties and has basic terms defined, such as notional amount (amount borrowed), interest rate and maturity/renewal date. Debt securities include government bonds, corporate bonds, CDs, municipal bonds, preferred stock, collateralized securities (such as CDOs, CMOs, GNMAs) and zero-coupon securities. The interest rate on a debt security is largely determined by the perceived repayment ability of the borrower; higher risks of payment default almost always lead to higher interest rates to borrow capital. Also known as Fixed-Income Securities. Most debt securities are traded over-the-counter, with much of the trading now conducted electronically. The total dollar value of trades conducted daily in the debt markets is much larger than that of stocks, as debt securities are held by many large institutional investors as well as governments and non-profit organizations. Debt securities on the whole are safer investments than equity securities, but riskier than cash. Debt securities get their measure of safety by having a principal amount that is returned to the lender at the maturity date or upon the sale of the security. They are typically classified and grouped by their level of default risk, the type of issuer and income payment cycles. Debt Security:- an unsecured note, except one convertible to a share or unit. / Долговая Ценная Бумага – ценные бумаги, представляющие заимствованные средства, по которым выплачивается фиксированная сумма. Они имеют конкретный срок погашения и конкретную процентную ставку или скидку при первоначальной покупке. Например, простой вексель (bill), облигация (bond), коммерческие ценные бумаги (commercial paper) или переводный вексель (note).

(2) Debt Security is a debenture, except one convertible to a share or unit.

(3) Any security that the Australian Securities Exchange (ASX) decides to classify as a Debt Security. / Любая ценная бумага, которую Австралийская Биржа Ценных Бумаг решает классифицировать в качестве долговой ценной бумаги.

(4) But not a security the Australian Securities Exchange (ASX) decides to classify as an Equity Security.

DEBT SERVICE = ОБСЛУЖИВАНИЕ ДОЛГА – Debt Service:- the cash that is required for a particular time period to cover the repayment of interest and principal on a debt. Debt service is often calculated on a yearly basis. Debt service for an individual often includes such financial obligations as a mortgage and student loans. Companies may have outstanding loans or outstanding interest on bonds or the principal of maturing bonds that count towards the company's debt service. An individual or company that is not able to make payments to service the debt can be said to be 'unable to service (his/her/its) debt'. For example, a property developer is said to be 'servicing a lot of debt' when he or she has made a large investment in a property and has not yet sold many of the subdivided lots or individual units. The debt service is simply how much money is owed on a loan, including both the interest and the principal amounts. Individuals seeking loans from banks and other lenders are often required to list their entire debt service (the amount of all outstanding loans and financial obligations) on an income statement (a profit and loss statement). Debt Service is a periodic payment of the principal and interest on a loan. Debt Service is the amount you pay on a loan in principal and interest, over a period of time. Usually debt service is calculated for a year. Banks and other lenders prefer that you list debt service separately on your Income Statement (P&L (short for the Profit And Loss Statement)). For income tax purposes, the interest on the loan is considered a deductible business expense, while the principal is not. Also known as Loan Payment Amount. Examples:- if your business borrows USD100 000 at 9 percent interest, for 10 years, the first year principal and interest is USD6 333.79. This amount is your 'debt service' for the first year. / К Обслуживанию Долга относится осуществление периодических платежей для погашения основной суммы и процентов по займу. Обслуживание Долга – уплата доли долга и процентов по кредиту. Наличные средства, необходимые в данное время, обычно в течение одного года, для выплаты процентов и текущего погашения основной суммы долга. Для корпорационных облигаций обслуживание долга означает ежегодные выплаты процента плюс платежи в резервный фонд; для государственных облигаций это ежегодные выплаты в фонд обслуживания долга.

DECATING = ДЕКАТИРОВКА – Decating is a process applied to woollens and worsteds, man-made and blended fiber fabrics, and various types of knits. It involves the application of heat and pressure to set or develop lustre and softer hand and to even the set and grain of certain fabrics. When applied to double knits it imparts crisp hand and reduces shrinkage. In wet decating, which gives a subtle lustre, or bloom, fabric under tension is steamed by passing it over perforated cylinders. See also Decatizing. Decating is a process for setting the luster on wool, silk, spun silk, and rayons. / Декатировка, от Французского слова Decatir, означающее (основное значение) Уничтожать Блеск, обработка шерстяных тканей паром или горячей водой для предотвращения усадки при последующей обработке и носке и улучшения внешнего вида. Декатировка производится на специальных аппаратах – декатирах. Различают декатиры для сухой и мокрой декатировки. Декатир для сухой декатировки представляет собой герметически закрывающийся цилиндрический котёл, внутри которого находится вращающийся полый цилиндр с перфорированной поверхностью, приспособленный для наматывания ткани. Подаваемый в котёл пар проходит через слои ткани, намотанной с минимальным натяжением, внутрь цилиндра и отсасывается через его открытый конец. В декатире для мокрой декатировки цилиндр с намотанной на нём тканью вращается в корыте с горячей (50–60 °C) водой. Декатир соединён не только с паропроводом, но и с водопроводом.

DECATING MARK = ОТМЕТИНА ОТ ДЕКАТИРОВКИ – Decating Mark is a crease mark or impression extending across the cloth near the beginning or end of a piece due to the thickness of the fabric leader seam. Synonym:- Apron Mark, and Leader Mark. Decating Mark is a crease mark or impression extending fillingwise across the fabric near the beginning or end of the piece. / по утку (fillingwise).

DECATIZING = ДЕКАТИРОВКА – Decatizing is a finishing process in which fabric, wound tightly on a perforated roller, either has hot water circulated through it (wet decatizing), or has steam blown through it (dry decatizing). The process is aimed chiefly at improving the hand and removing wrinkles. / мокрая декатировка (wet decatizing) горячей водой; сухая декатировка (dry decatizing). Декатировка, от Французского слова Decatir, означающее (основное значение) Уничтожать Блеск, обработка шерстяных тканей паром или горячей водой для предотвращения усадки при последующей обработке и носке и улучшения внешнего вида. Декатировка производится на специальных аппаратах – декатирах. Различают декатиры для сухой и мокрой декатировки. Декатир для сухой декатировки представляет собой герметически закрывающийся цилиндрический котёл, внутри которого находится вращающийся полый цилиндр с перфорированной поверхностью, приспособленный для наматывания

ткани. Подаваемый в котёл пар проходит через слои ткани, намотанной с минимальным натяжением, внутрь цилиндра и отсасывается через его открытый конец. В декатире для мокрой декатировки цилиндр с намотанной на нём тканью вращается в корыте с горячей (50–60 °C) водой. Декатир соединён не только с паропроводом, но и с водопроводом.

DECAY = ГНИЕНИЕ (или ЗАГНИВАНИЕ, или РАЗЛОЖЕНИЕ) – Decay is the decomposition of wood substance caused by the action of wood- destroying fungi, resulting in softening, loss of strength, weight, and often in change of texture and color. / Под Гниением понимается процесс расщепления сложных азотсодержащих органических соединений (преимущественно белков) под действием гнилостных микроорганизмов. Гниение играет важную роль в круговороте веществ в природе. Для предохранения пищевых продуктов от процессов гниения используют стерилизацию, засолку, копчение и другое.

DECEASED INVENTOR = СКОНЧАВШИЙСЯ ИЗОБРЕТАТЕЛЬ – In the US patent law, Deceased Inventor is a named inventor who has died prior to the filing of a patent application or during the prosecution of a patent application. / В патентном праве США, изобретатель, скончавшийся до подачи заявки на патент или в течение процедуры обработки заявки на патент.

DECEDENT = СКОНЧАВШИЙСЯ (или УМЕРШИЙ) – Decedent is a person who is no longer living. Just as a taxpayer's possessions become his or her estate upon death, so does the person become a Decedent upon death. Decedents still have the power to effect financial transactions and so forth through proper estate planning. This term is used chiefly in the tax, estate planning and law arenas. Attorneys carry out the wishes of Decedents after their death with the proper execution of their wills and other estate planning documents. A final tax return must also be filed for Decendents in the year of their death. Decedent is a deceased person. Decedent is the person who has died, sometimes referred to as the 'Deceased'. In the acts of descent and distribution in Pennsylvania, this word is frequently used for a deceased person, testate or intestate.

DECIBEL = ДЕЦИБЕЛ – DeciBel is a logarithmic measure of the ratio of two quantities. Abbreviated dB. For electrical power, 1 dB = $10 \cdot \log_{10} P_1/P_2$. For electric Voltage or current, 1 dB = $20 \cdot \log_{10} E_1/E_2$. / Под ДециБелом, от Латинского слова Decem, означающее Десять, и фамилии родившегося в Шотландии Американского изобретателя телефона Алыгзэндёра Грээма Бэла (Alexander Graham Bell; родился 03 Марта 1847 в Эдинбурге (Edinburgh) – умер 02 Августа 1922 в Beinn Bhreagh, Cape Breton Island, Nova Scotia, Canada), понимается допускаемая к применению внесистемная дольная единица логарифмической величины (уровня звукового давления, усиления, ослабления и тому подобного). Обозначение:- дБ (dB). ДециБел – десятая часть Бела. 1 дБ = 0.1 Б. Под Белом понимается единица логарифмической величины, представляющей собой логарифм безразмерного отношения физической величины к одноимённой физической величине, принимаемой за исходную:- уровень звукового давления, усиление, ослабление и так далее. Обозначение:- Б (B). 1 Б = lg (P_2/P_1) при $P_2 = 10P_1$; 1 Б = 2lg (F_2/F_1) при $F_2 = \sqrt{(10 \cdot F)}$, где P_1, P_2 – одноимённые энергетические величины (мощности, энергии, плотности энергии и тому подобные), F_1, F_2 – одноимённые силовые величины (напряжения, силы тока, давления, напряжённости поля и тому подобные). Чаще применяется дольная единица Бел – дециБел (дБ); 1 дБ = 0.1 Б. При необходимости указать исходную величину её значение помещают в скобках после обозначения логарифмической величины. Например, для уровня звукового давления при краткой форме записи:- 20 дБ (re 20 мкПа), где re – начальные буквы Английского слова Reference, означающее Базисный или Исходный.

DECIDUOUS = ОПАДАЮЩЕЕ (или ОСЫПАЮЩЕЕСЯ, или ЛИСТВЕННОЕ, или ЛИСТОПАДНОЕ) – Deciduous:- shed periodically or annually or at maturity. Often applied to the seasonal shedding of leaves.

DECITEX = ДЕЦИТЕКС – Decitex is the count grading for filament and spinning yarns recognized by all international bodies in the manmade fibers industry. 1 g / 10 000 m = 1 / 10 tex. See also Tex. Decitex is one tenth of a tex. Decitex is a unit of weight indicating the fineness of yarns and equal to a yarn weighting one gram per each 10 000 meters. The abbreviation for this is 'd'tex'. / Под Децитексом, от от Латинских слов Decem, означающее Десять, и Texo, означающее Сплетаю или Тку, понимается десятая часть внесистемной единицы линейной плотности волокон или нитей, равная отношению их массы к длине. 1 текс = 1 г/км = 1 мг/м. Величина текс характеризует толщину однородных материалов. Текс заменил титр, в котором за единицу массы принимали денье (0.05 грамма (г)), за единицу длины – 450 метров (м).

DECK = РАСПОРЯЖЕНИЯ НА ОЧЕРЕДИ – Deck:- the orders for purchase or sale of futures and option contracts held by a Floor Broker. / Распоряжения на покупку или продажу фьючерсных и опционных контрактов, удерживаемые Брокером На Полу для их исполнения.

DECK = НАСТИЛ – Deck is one or more boards or panels comprising the top or bottom surface of the pallet. See also Pallet. Deck is a top or bottom surface of a pallet. / Одна или более досок или панелей, составляющих верхнюю или нижнюю поверхность поддона. Настил Поддона:- верхняя или нижняя поверхности поддона.

DECK = ПАЛУБА – Deck is a permanent covering over a compartment or hull. More broadly:- any extended horizontal structure in a vessel or an aircraft, serving as a floor and structural support, covering, partially or fully, a portion of the vessel or aircraft. / Постоянное или верхнее перекрытие отсека или корпуса. В более широком смысле, любая простирающаяся горизонтальная структура на морском или воздушном судне, служащая в качестве пола и структурной опоры, перекрытия, и являющаяся частично или полностью частью морского или воздушного судна. Под Палубой понимается горизонтальное перекрытие в корпусе судна, состоящее из настила и набора (бимсов, карлингсов и другого). Верхняя непрерывная палуба является основной продольной связью корпуса, обеспечивающей его общую прочность и поперечную жёсткость. Нижние палубы служат для разделения грузовых помещений по высоте (грузовые суда), размещения пассажиров (пассажирские суда), технологического оборудования (например, рыбообрабатывающие) и прочего. Палубы, ограничивающие сверху надстройки, называются палубами надстроек. Вышележащие палубы имеют названия по их назначению, например, прогулочная палуба, шлюпочная палуба и так далее. Палуба, горизонтальное перекрытие в составе корпуса судна, расположенное по всей его длине. В отличие от палубы, перекрытие, расположенное на части длины или ширины судна, называется Платформой. В корпусе судна может быть одна или несколько палуб и платформ. Палуба состоит из настила (собственно палубного настила и палубного стрингера по линии примыкания палубы, к борту) и набора (бимсов, карлингсов и других). Так называемая Верхняя (Непрерывная) Палуба служит основной продольной связью корпуса судна, обеспечивающей его общую прочность и поперечную жёсткость. Палуба, до которой доводят водонепроницаемые переборки и измеряют надводный борт, называется Главной Палубой; ею может служить верхняя или вторая сверху палуба (на шельтердечных судах и судах со сплошной судовой надстройкой). На верхней палубе грузовых судов размещают грузовые устройства, на пассажирских судах – каюты, на военных кораблях – вооружение и другое. Нижние палубы служат для разделения грузовых помещений по высоте и укладки грузов (грузовые суда), размещения кают, общественных и вспомогательных помещений (пассажирские суда), технологического оборудования (рыбообрабатывающие суда) и прочего. Межпалубное пространство называется Твиндеком, а помещение под самой нижней палубой – Трюмом. Отверстия в верхней палубе (Люки) обрамляют комингсами и снабжают непроницаемыми закрытиями. Палубы, ограничивающие сверху надстройки, называют Палубой Надстроек; вышележащие

палубы различают по их назначению (шлюпочная, прогулочная и другие). Толщину палубы и размеры палубного набора гражданских судов регламентируют правила классификационных обществ.

DECKBOARD = ДОСКА НАСТИЛА – Deckboard is an element or component of a pallet deck, oriented perpendicular to the stringer or stringerboard. See also Pallet. Deckboard is an individual component of a top deck or bottom deck. / Элемент или компонент настила поддона, ориентированный перпендикулярно продольным или поперечным доскам. Доска Настила:- деталь верхнего или нижнего настилов.

DECKBOARD SPACING = ПРОСТРАНСТВО МЕЖДУ ДОСКАМИ НАСТИЛА – In pallets, Deckboard Spacing is a distance between adjacent deckboards. See also Pallet.

DECKBOARD SPAN = ЗАЗОР МЕЖДУ ДОСКАМИ НАСТИЛА – In pallets, Deckboard Span is a distance between deckboard supports (stringers, stringerboards or blocks). See also Pallet.

DECK CARGO = ПАЛУБНЫЙ ГРУЗ – Deck Cargo is a cargo carried outside rather than within the enclosed cargo spaces of a vessel. Deck Cargo is a cargo carried on deck rather than stowed under deck. On-deck carriage is required for certain commodities, such as explosives.

DECK GANG = ПАЛУБНАЯ ШАЙКА (или РОГАЧИ) – Deck Gang:- the officers and seamen comprising the deck department aboard ship. Also known as Deck, Deck Crew, or Deck Department. / Жаргонный термин для матросов Палубной Команды, в Русскоязычном жаргоне для их обозначения используется термин Рогачи. Известна также как Палуба (Deck), Палубный Отсек (Deck Department), или Палубный Расчёт (Deck Crew).

DECKHAND = ПАЛУБНЫЙ МАТРОС – Deckhand:- seaman who works on the deck of a ship and remains in the wheelhouse attending to the orders of the duty officers during navigation and maneuvering. He also comes under the direct orders of the bosun.

DECK HOUSE = ПАЛУБНАЯ РУБКА – Deck House is a small superstructure on the top deck of a vessel that contains the helm and other navigational instruments. / Небольшая надстройка на палубе судна, в которой находятся руль и другие навигационные приборы. Под Рубкой, от Голландского слова Roef, означающее Каюта, понимается закрытое сооружение (жилое, служебное, хозяйственное) на главной палубе или надстройке судна, не доходящее до бортов. В рубках, часто располагаемых в несколько ярусов, размещают жилые и служебные помещения. Различают боевую, рулевую, штурманскую и другие рубки.

DECKING = НАСТИЛ (или ХХ) – Plank Decking is tongue and groove lumber at least 38 mm (1-1/2”) thick, with the flat face laid over supports such as beams or purlins to provide a structural deck for for floors and roofs. It is used where the appearance of the decking is desired as an architectural feature, or where the mass of decking is required to add to the fire safety of Heavy Timber construction. Individual planks can span simply between supports, but are generally random lengths spanning several supports for economy, and to take advantage of increased stiffness. Wood species commonly used for plank decking include western red cedar, Douglas fir, western hemlock, and various species of the Spruce-Pine-Fir group. Cedar is often selected for exposed applications where its natural durability is an added advantage to its attractiveness. The general term Decking is used to describe both tongue and groove lumber laid flat (plank decking), and lumber laid on edge (laminated decking). Laminated Decking is dimension lumber placed on edge so that each member acts like a joist, and adjoining pieces are usually nailed to each other to create a nail-laminated load sharing unit. Laminated decking was once a popular method of building construction where a heavy floor was required and may in fact have some building applications where an industrial type floor is required. Sizes and Shapes:- plank decking is produced in three thicknesses; 38 mm (1-1/2”), 64 mm (2-1/2”), and 89 mm (3-1/2”). The 38 mm (1-1/2”) decking has a single tongue and groove and is available in 127 mm (5”) or 178 mm (7”) widths. The two thicker sizes are double tongue and groove and usually available only in 133 mm (5-1/4”) face width. These sizes may be ordered with pre-drilled 6 mm (1/4”) holes at 760 mm (30” 0 spacings so that each piece may be nailed to the adjacent piece with 200 mm (8”) No.3 gauge decking spikes. All decking is V-grooved on the face which is the best in appearance. Grades:- plank decking is available in two grades, Select and Commercial, based on the appearance of the best face as shown in Table 1 below. Select Grade is used for high quality construction where high strength and fine appearance for exposed locations are desired. Commercial Grade contains more growth characteristics and more manufacturing defects than Select grade. Commercial grade is chosen when appearance and strength are less critical such as in industrial buildings. Moisture Content:- plank decking is generally specified, dressed, and supplied S-Dry (moisture content 19 percent or less at time of surfacing). It is generally kiln dried to an average moisture content of 15 percent to minimize on site shrinkage or warping. Ordering:- plank decking is usually purchased in random lengths ranging from 1.83 m (7’) to 6.10 m (20’). Longer lengths may be specifically ordered. While decking may be ordered in specific lengths, designers should expect limited availability and extra costs. A typical specification for random lengths is as follows:- (i) 90% of planks 3.0 m (10’) and longer; and (ii) 40 percent to 50 percent of planks 4.9 m (16’) and longer. For both 64 and 89 mm (2-1/2” and 3-1/2”) decking, designers should check that the decking lengths are adequate for spans. A rule of thumb is that spans should not be more than about 600 mm (2’) longer than the length which 40 percent of the decking shipment exceeds. Long lengths may only be available in certain species such as Douglas fir and western red cedar. For simple-span or two-span continuous decking, uniform lengths should be specified even though unit material costs will be higher. Installation:- there are three methods of installing plank decking. The first method, called Controlled Random, is the most economical because random length material is used. The controlled random pattern is shown in the figure below and consists of the following:- (i) Each deck must consist of at least 3 spans; (ii) End joints are not permitted in the outer half of end spans; (iii) End joints in adjacent courses must be staggered at least 600 mm (2’); (iv) Where end joints occur in the same general line, they must be separated by at least two intervening courses; and (v) In floors and roofs, planks which do not span more than one support must be flanked by courses resting on both supports of that span. They must be separated from the next unsupported plank by at least six courses extending over at least one support (this is only permitted for double tongue and groove planks at least 64 mm (2-1/2”) thick). The second method is called Simple Span. All pieces rest on two supports and are the same length. The third method is Two Span Continuous. All pieces rest on three supports and are the same length. Both the latter methods require planks of predetermined length and a consequent cost premium. Fire Safety:- the thickness of plank decking makes it a more fire-resistant material compared to panel and board sheathing. For this reason it is often used in large commercial buildings where fire performance must meet Heavy Timber construction requirements for fire safety and where the superior appearance characteristics of this material are desired.

DECK LOG = ВАХТЕННЫЙ ЖУРНАЛ – Ship’s log recording general details concerning the running of the ship, including accidents concerned with ship or cargo. Also known as Captain’s Log. Deck Log is a full nautical record of a ship’s voyage, written up at the end of each watch by the deck officer on watch. The principal entries are:- courses steered; distance run; compass variations, sea and weather conditions; ship’s position, principal headlands passed; names of lookouts, and any unusual position, principal headlands passed; names of lookouts, and any unusual happenings such as fire, collision, and the like. / Известен также как Капитанский Журнал (Captain’s Log).

DECK MAT = ПОКРЫТИЕ НАСТИЛА – Deck Mat:- assembly of deckboards and stringerboards, forming the deck of a block pallet.

DECK OFFICER = ВАХТЕННЫЙ ПОМОЩНИК – Deck Officer:- as distinguished from engineer officer, refers to all officers who assist the master in navigating the vessel when at sea, and supervise the handling of cargo when in port. / хозяину (или капитану) в навигации судна по морю, и .

DECLARATION = ДЕКЛАРАЦИЯ – (1) Declaration is a signed statement by the insured, usually at the foot of a proposal or claim form, certifying that the information given is accurate. In insurance, a form filled out by assured and sent to the insurance company when reporting individual shipments coming within the terms of an Open Policy. / В страховании, форма, заполняемая страхователем и направляемая в страховую компанию, каждый раз при осуществлении конкретной отгрузки на условиях Открытого Полиса.

(2) In the US patent law, a Declaration is a document in which an applicant for patent declares, under penalty of fine or imprisonment, or both (18 USC 1001), that (1) he or she is the original or sole inventor, (2) shall state of what country he or she is a citizen, (3) that he or she has reviewed and understands the contents of the specification and claims which the declaration refers to, and (4) acknowledges the duty to disclose information that is material to patentability as defined by 37 CFR § 1.56. An oath or declaration must be filed in each nonprovisional patent application.

DECLARATION ADJUSTMENT = ДЕКЛАРАТИВНАЯ ПЕРЕОЦЕНКА (или ПЕРЕОЦЕНКА ПО ДЕКЛАРАЦИИ) – Declaration Adjustment:- sometimes the premium is calculated based on estimates of wageroll or turnover provided by the insured. In this case, the insured is required to maintain records to enable a declaration of actual wageroll or turnover to be made. The insurer may then adjust the premium for that period by making an additional or return premium.

DECLARATION BY FOREIGN SHIPPER = ДЕКЛАРИРОВАНИЕ (или ДЕКЛАРАЦИЯ) ИНОСТРАННЫМ ГРУЗООТПРАВИТЕЛЕМ – Declaration By Foreign Shipper:- the US Customs Service defines this term as a statement by the shipper in the foreign country attesting to certain facts. For example, articles shipped from the United States to an insular possession and then returned must be accompanied by a declaration by the shipper in the insular possession, indicating that, to the best of his or her knowledge, the articles were exported directly from the United States to the insular possession and remained there until the moment of their return to the United States.

DECLARATION DATE = ДАТА ДЕКЛАРАЦИИ (или ДАТА ОБЪЯВЛЕНИЯ) – Declaration Date is the date on which the Board of Directors declares an annual meeting record and meeting date, or a dividend record and payable date. Also known as Expiration Date. Declaration Date is the last date on which the holder of an option may advise the grantor of his intention to exercise the option. / Известна также как Дата Прекращения Признания (Expiration Date).

DECLARATION OF INDEMNITY = ДЕКЛАРАЦИЯ О ВОЗМЕЩЕНИИ (или КОМПЕНСАЦИИ) – Declaration Of Indemnity is a declaration whereby a person who has received substitute instruments upon the loss of securities, coupons or savings books stipulates that he will indemnify the bank or company concerned for any improper use of the lost documents.

DECLARATION (OF OPTIONS) = ПРЕДЪЯВЛЕНИЕ (или ОБЪЯВЛЕНИЕ, или ДЕКЛАРАЦИЯ) (ОПЦИОНОВ) – Declaration (Of Options):- xxxxx. Also known as Exercise. Declaration Date is the last day on which the holder of an option must indicate whether he or she will exercise the option. Also known as Expiration Date. The declaration date of all listed stock options in the United States is on the third Friday of the listed month. If there is a holiday on the Friday, the declaration date falls on the third Thursday. For options, the Declaration Date is the last date the holder of an option can indicate whether they will exercise their option. Declaration Dates are also associated with stock options as it is the last date an option holder may exercise their stock options. A stock option contract between two consenting parties generally consists of 100 shares of an underlying stock. Put and call options are the two major types of options. In a call, a buyer enters into a contract to purchase a stock at a specific price by a specific date. In a put, the option buyer takes out a contract to sell a stock at an agreed-on price on or before a specific date. / Известно также как Исполнение (Exercise).

DECLARATION OF ORIGIN = ДЕКЛАРАЦИЯ О ПРОИСХОЖДЕНИИ – Declaration Of Origin:- appropriate statement as to the origin of the goods, made in connection with their exportation by the manufacturer, producer, supplier, exporter or other competent person on the commercial invoice or any document relating to goods. / вывоз (exportation).

DECLARATION OF VALUE = ДЕКЛАРАЦИЯ О ПРИЗНАНИИ (или ДЕКЛАРАЦИЯ О ЗНАЧИМОСТИ) – The Declaration Of Value is a an information document describing the qualification awarded to a given person by an institution belonging to an education system other than the Italian system. It is used by the competent University offices to assess the qualification for the purposes of admission to a degree programme or for the recognition of the foreign qualification. It generally contains the following information:- (i) legal status and nature of the issuing institution; (ii) access requirements for the programme leading to the qualification; (iii) legal duration of the study programme and/or overall commitment required of the student in terms of credits or hours; and (iv) value of the qualification in the system/country it was issued by, for academic and/or professional purposes. The declaration of value is an official document issued by the Italian Embassy in the country in which the qualification was issued. If the qualification was issued in a country in which the legislation provides for legalization, the Italian Embassy issues the declaration of value only after the qualification has been legalized by the competent authorities in that country. Important:- if the qualification is issued by a school with a system that differs from that in force in the place of residence (for example, Swiss student studying in a school under the British system in Switzerland) or place of study of the candidate (e.g., Swiss student studying in Kenya in a school under the British system) the declaration of value and legalization must be requested from the Italian Embassy in the country of the system to which the school issuing the qualification refers (in both of the above cases:- the Italian General Consulate in London). Cases when a declaration of value is not required:- a declaration of value is not required for International Baccalaureate (IB) Diplomas and for Advanced Placements (APs). The declaration of value can be substituted by a Diploma Supplement, based on the European Commission form, for academic qualifications awarded by institutions in countries in the European Higher Education Area (Bologna Process). The declaration of value can also be substituted by attestations issued by ENIC-NARIC centres that contain all the information given in the Declaration of Value, which are necessary for the evaluation of the degree. Important:- if you submit a Diploma Supplement for admission to a second cycle degree, you are not required to submit the certificate listing the exams or the syllabus.

DECLARATION PAGE = ДЕКЛАРАТИВНАЯ СТРАНИЦА – Declaration Page:- that page of the insurance policy which lists the insurance company, its address, name of the policyholder, starting and ending dates of coverage, and the actual coverages given in the contract, including the locations and amounts.

DECLARED INCOME = ДЕКЛАРИРУЕМЫЙ ДОХОД – Declared Income is the amount of income reported to the tax authorities by an individual or business entity. / Размер дохода, заявляемый физическим или юридическим лицом налоговым органам.

DECLARED VALUE FOR CARRIAGE = ОБЪЯВЛЕННАЯ ЦЕННОСТЬ ДЛЯ ПЕРЕВОЗКИ – Declared Value For Carriage is the value of the goods, declared by the shipper on a bill of lading, for the purpose of determining a freight rate or the limit of the carrier's liability.

DECLINATURE = УКЛОНЕНИЕ (или ОТКАЗ, или ОТКЛОНЕНИЕ, или ОТВОД) – Declinature is the refusal of an insurer or reinsurer to offer terms of cover.

DECLINING = СНИЖЕНИЕ (или ПАДЕНИЕ) – Declining is a market stage of a stock that is characterized by a downtrend with subsequently lower highs and lower lows.

DECLIVITY = НАКЛОН (или ПОКАТОСТЬ, или УКЛОН, или СКЛОН, или ОТКОС, или СПУСК) – Declivity is the angle of the launching ways at a shipyard.

DÉCOLLETAGE = ДЕКОЛЬТАЖ (или ДЕКОЛЬТЕ) – Décolletage or Décolleté is a dress, namely a strapless dress or one with a plunging neckline. / Декольтаж (Décolletage) или Декольте (Décolleté) , Обнажение Плеч.

DECOLORIZED PATCH ON FABRIC = ОБЕСЦВЕЧЕННЫЙ ЛЯПОК (или ПЯТНО, или УЧАСТОК) НА ТКАНИ – Decolorized Patch On Fabric along with breakage of yarn. Possible Cause:- chemical spillage of fabric could have cause de-coloration and weakening of the fabric. Major defect unless it is located at a place from where it can be easily cut out. Dyeing/Finishing defect.

DECOMPOSER = РЕДУЦЕНТ (или ДЕСТРУКТОР, или БИОРЕДУКТОР, или РАЗЛАГАТЕЛЬ, или РАЗЛАГАЮЩЕЕ) – Decomposer is an organism (fungus, bacterium, etc) that breaks down and digests the remains of other organisms. / Организм, разлагающий органические вещества.

DECOMPOSITION = РАСПАД (или РАЗЛОЖЕНИЕ, или РАСЩЕПЛЕНИЕ) – Decomposition is the process of resolving into constituent parts.

DECOMPOUNDED = МНОГОРАЗДЕЛЬНОЕ (или МНОГОСЛОЖНОЕ) – Decompounded:- divided several times.

DECONSOLIDATION = РАСКОМПЛЕКТАЦИЯ (или ДЕКОНСОЛИДАЦИЯ) – Deconsolidation is a separating cargoes (that have been transported together) for shipment. / Разделение грузов, которые транспортировались вместе, для их дальнейшей транспортировки в отдельности.

DECONSOLIDATION POINT = ПУНКТ РАСКОМПЛЕКТАЦИИ (или ПУНКТ ДЕКОНСОЛИДАЦИИ) – Deconsolidation Point is a place where loose or other non-containerized cargo is ungrouped for delivery.

DECONSOLIDATOR = РАСКОМПЛЕКТОВЩИК (или ДЕКОНСОЛИДАТОР) – Deconsolidator is an enterprise that provides services to un-group shipments, orders, goods, etc, to facilitate distribution.

DECORATIVE FABRICS = ДЕКОРАТИВНЫЕ ТКАНИ – Decorative Fabrics is a term used to describe fabrics for upholstery, slipcovers, curtains, and draperies. These fabrics are usually of heavier weights than the fashion fabrics used in clothing. Also called Decorator Fabrics and Home Furnishing Fabrics.

DECORTICATING = ИЗВЛЕЧЕНИЕ ЛУБА – Decorticating is a mechanical process for separating the woody matter from the bast fiber of such plants as Ramie and Hemp. / извлечение луба из сухих стеблей.

DECOUPLED PAYMENTS = РАЗДЕЛЬНЫЕ ПЛАТЕЖИ – Decoupled Payments are the budgetary payments paid to eligible recipients who are not linked to current production of specific commodities or livestock numbers or the use of specific factors of production. Decoupled Payments are the direct payments which are not linked to current production of specific commodities or livestock numbers or the use of specific factors of production. See also Direct Payments.

DECOUPLING INVENTORY = РЕЗЕРВНЫЕ ТОВАРНО–МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или РЕЗЕРВНЫЙ ИНВЕНТАРЬ) – Decoupling Inventory is a stock retained to make the independent control of two successive operations possible. A Decoupled Inventory consists of inventory stock set aside in the event of a slowdown or stoppage in production. Decoupling inventory cushions the company's inventory against potential issues in the production line. These issues can occur when one part of the production line works at a different speed than another. When this happens, the production line stalls, and products remain unfinished, which reduces the renewal rate of inventory stocks. Examples of Decoupling Inventory:- the manufacturing of video game consoles requires the assembly of several sensitive parts, such as the central processing units, internal hard drives, motherboards and video connection ports. When the processes involved in building the microchips required to power the central processing units slows down, the entire production line grinds to a halt. A decoupled inventory allows the manufacturer to ship its consoles on time while it resolves the issues with the microchips.

DECOUPLING POINT = ТОЧКА РАЗВЯЗКИ – Decoupling Point is the point in the supply chain which provides a buffer between differing input and output rates. / выработка (output).

DECREMENT BIDS = ДЕКРЕМЕНТНЫЕ ПРЕДЛОЖЕНИЯ НА ПОКУПКУ – Decrement Bids are the financial offers to purchase specified amounts of MW (MegaWatt) in the Day-Ahead Energy Market at, or above, a given price. / финансовые оферты на приобретение указанных сумм МВт (МегаВатт) на Рынке Энергии Предстоящего Дня по или выше данной цены.

DECRYPTION = ДЕШИФРОВКА (или РАСШИФРОВКА) – Decryption is the reversal of a corresponding reversible encipherment. Also known as Decipherment. / Под Дешифровкой, от Французского слова Déchiffrer, означающее Разбирать или Расшифровывать, понимается чтение и восстановление понимания текста, написанного шифром, тайнописью или древней системой письменности, ранее недоступной для прочтения.

DECUMBENS = СТЕЛЮЩЕЕСЯ (или ПОЛЗУЧЕЕ, или ПРИГНУТОЕ К ЗЕМЛЕ, или ЛЕЖАЩЕЕ, или ВОЗЛЕЖАЩЕЕ) – Decumbens:- lying on the substrate with an ascending apex.

DECUMBENT = СТЕЛЮЩЕЕСЯ (или ПОЛЗУЧЕЕ) – Decumbent:- (1) The stem lying on the ground and tending to rise at the end. (2) Lying flat with the apex ascending.

DECURRENT = СБЕГАЮЩЕЕ (или НИСХОДЯЩЕЕ) – Decurrent:- of a terminal spine extended down the leaf margin.

DECUSSATE = ПЕРЕКРЁСТНО–ПАРНОЕ (или ПЕРЕКРЕЩИВАТЬСЯ, или ПЕРЕСЕКАТЬСЯ) – Decussate:- of leaves arranged on a stem in opposite pairs at right angles to adjacent pairs of leaves above and below to form four vertical rows of leaves. Crossed or intersected in the form of an X. / о листьях, расположенных на стебле супротивными парами под прямыми углами к .

DEDICATED SERVICE = ПЕРСОНАЛЬНОЕ ОБСЛУЖИВАНИЕ – Dedicated Service is a service specially designed for the use by one or more particular customers.

DEDICATED TRAIN = СПЕЦИАЛИЗИРОВАННЫЙ ПОЕЗД (или СОСТАВ) – Dedicated Train:- one that exclusively carries intermodal equipment (containers and trailers).

DEDICATED TRUCK = СПЕЦИАЛИЗИРОВАННЫЙ ГРУЗОВИК – Dedicated Truck is a truck assigned exclusively to one shipment for security or other reasons.

DEDICATED VEHICLE = СПЕЦИАЛИЗИРОВАННОЕ ПРЕДПРИЯТИЕ – At the Corporation of Lloyd's, Dedicated Vehicle is a corporate member that only participates on one or more syndicates that are managed by the same managing agent or group of managing agents. The term is often used interchangeably with the expression aligned member. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

DEDUCTIBLE = ПОДЛЕЖАЩЕЕ ВЫЧЕТУ (или ФРАНШИЗА) – Deductible:- an amount or percentage, expressed in a policy, that is deducted from partial loss claims. Most commonly seen in policies covering hull and machinery, where the policy deductible is applied to all claims arising out of any accident or series of accidents comprising one occurrence, other than a total loss claim or sue and labor charges relating to a total loss. The cost of sighting the bottom for stranding damage is exempt from the deductible in the Institute hull clauses. The amount of loss paid by the policyholder before the insurance policy benefits become payable. Also known as Excess, or Franchise. Deductible:- the amount that is deducted from some or all claims arising under an insurance or reinsurance contract. The practical effect is the same as an excess:- the insured or reassured must bear a proportion of the relevant loss. If that loss is less than the amount of deductible/excess then the insured or reassured must bear all of the loss (unless there is other insurance in place to cover the deductible). An increase in deductible should result in a reduction in premium. Deductible is the specified amount which the insured will contribute to any claim, also called Excess or Insured's Contribution. As the insurer is dealing with the claim on the insured's behalf, they may require payment of the deductible prior to settlement with the claimant.

DEDUCTIBLE TEMPORARY DIFFERENCES = ПОДЛЕЖАЩИЕ ВЫЧЕТУ ВРЕМЕННЫЕ РАЗНИЦЫ – Deductible Temporary Differences are the temporary differences that result in deductible amounts in future years when the related asset or liability is recovered or settled, respectively. Also refer to Temporary Difference.

DEDUCTIBLE VALUE ADDED TAX = ПОДЛЕЖАЩИЙ ВЫЧЕТУ НАЛОГ НА ДОБАВЛЕННУЮ СТОИМОСТЬ – Deductible Value Added Tax (VAT) is the VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers. See also Non-Deductible Value Added Tax.

DEDUCTION = ВЫЧЕТ (или ДЕДУКЦИЯ) – Deduction is the act of deducting; subtraction. It is an amount that is or may be deducted, e.g., tax deductions. In the United Kingdom, a Deduction is the something which reduces the amount of your taxable income or your chargeable gains. A business expense, such as the purchase of stationery supplies, is a deduction that can be used to reduce the amount of your taxable business profits. Indexation allowance (to April 1998) is a deduction that can be made in the calculation of your chargeable gain on the disposal of an asset. / Под Дедукцией, от Латинского слова Deductio, означающее Выведение, понимается . Вычет:- (1) Суммы, которые Служба Внутренних Доходов США (Internal Revenue Service (IRS)) позволяет вычитать из скорректированного совокупного дохода при подсчёте облагаемого налогом дохода данного лица. Подобные скидки предоставляются по некоторым видам выплаченных дивидендов, государственным штатовским налогам, а также по взносам на благотворительность. (2) Корректировка суммы счёта, допускаемая продавцом в случае ошибки, недостачи и тому подобного.

DEED = АКТ (или СВИДЕТЕЛЬСТВО О ПРАВЕ, или ДОКУМЕНТ О ПРАВЕ НА ЧТО–ЛИБО, или ПРАВОВОЙ ДОКУМЕНТ, или ПИСЬМЕННОЕ СОГЛАШЕНИЕ) – For example, Assignment Deed. Deed (or Conveyance) is a written instrument signed (by the seller), sealed, and delivered (to the buyer), used to transfer (convey) the title to real property from the seller to the buyer. The deed is recorded in the office of the duly constituted recording official (for the jurisdiction in which the property involved is situated) to give public notice of the transfer. Document that records a transaction and may bear the seals of the parties concerned to testify to its validity. Deed is a written instrument conveying the right to ownership. There are myriad forms of ownership rights:- rights to tangible assets (buildings, goods, land, objects); rights to capital, intangible assets or securities (equity in a company, in plant or equipment); credit owed by an individual or legal entity, i.e. the right to receive a good or service which has been paid for in advance (right to delivery of a good, to enter into possession of property, to receive dividends or interest, etc). Ownership of these rights is evidenced by documents or deeds which identify the holder of the deed, or grantee, who can demand that the right be fulfilled (debt repaid, property delivered) or, in some cases, can transfer or sell that right to a third party. / Например, Передаточный Акт или Акт Уступки (Assignment Deed). , то есть право на получение товаров или услуг, которые были оплачены предварительно ().

DEED OF TRUST = АКТ О ДОВЕРИТЕЛЬНОЙ СОБСТВЕННОСТИ (или ХХ) – Deed Of Trust is a written instrument through which the legal title to realty is transferred to a trustee, who holds same as security for payment of a debt. The trustee is someone other than the creditor. The deed of trust is similar to a Mortgage.

DE–EMPTION = УПРЕЖДАЮЩЕЕ СНИЖЕНИЕ – De-Emption:- the reverse of a pre-emption is a de-emption, where the managing agent decides (or is required by Lloyd's) to decrease the overall capacity of the syndicate. The member has no alternative but to accept such a decision and the nominal capacity is therefore reduced, even though their percentage share of the syndicate will, all other things being equal, remain unchanged. The member would not be compensated for this reduction in nominal capacity, but it may separately lead to the release by Lloyd's of some of the Name's Funds at Lloyd's (LLM1200). A de-emption does not necessarily mean that the market value of the syndicate capacity has decreased. In fact, a de-emption may indicate that the syndicate is writing keener, more profitable, business thereby increasing the value of a share in its capacity. Pre-emption or de-emption is not unusual, and Names may frequently adjust their portfolio of syndicate capacity from time to time too. Where a managing agent reduces the underwriting capacity of a syndicate, for example when it expects to write less business in future. The participations of the members of the syndicate are reduced proportionately. The opposite of Pre-Emption. / В страховом деле в том случае, когда управляющий агент уменьшает потенциал расписывания (ёмкость расписывания) синдиката Лойдз (Лойдз), например, когда он предполагает сокращение бизнеса в будущем. Участия членов синдиката уменьшаются пропорционально.

DEEP CRACK = ГЛУБОКАЯ НЕДОСЕКА (или ГЛУБОКАЯ УТОЧНАЯ ПОЛОСКА, или ГЛУБОКАЯ ПОЛОСАТОСТЬ ПО УТКУ, или ГЛУБОКИЙ НЕРОВНЫЙ БОЙ, или ГЛУБОКАЯ ТРЕЩИНА, или ГЛУБОКИЙ РАССЛОЙ, или ГЛУБОКАЯ ЩЕЛЬ) – Deep Crack:- a crack is a blemish in cloth caused by a mispick; runs in filling direction. / в направлении уточины. Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 см. Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дм ткани, причина разладка основного регулятора или товарного механизма. Недосечка – поперечные полосы по всей ширине ткани, возникающие из-за пониженной плотности ткани по утку.

DEEP–DYEING VARIANTS = ВАРИАНТЫ ГЛУБОКОГО КРАШЕНИЯ – Deep-Dyeing Variants:- polymers that have been chemically modified to increase their dyeability. Fibers and fabrics made therefrom can be dyed to very heavy depth.

DEEP–LANE STORAGE = ХРАНЕНИЕ В ГЛУБОКОМ ПРОХОДЕ – Deep-Lane Storage:- product is stored more than one unit deep in an aisle.

DEEP PINNING = ГЛУБОКИЙ ПРОКОЛ – Deep Pinning:- conspicuous pin stenter marks appearing in the body of the fabric and so reducing the usable width of the fabric. Note:- this defect is often caused by incorrect feed on to a pin stenter. / Глубокий Пиннинг (deep pinning):- порок заключительной отделки ткани; заметные отметки от сушильно-ширильной машины с игольчатыми клуппами, появляющиеся в полотне и уменьшающие его полезную ширину ткани. Примечание:- этот порок возникает в результате неправильной подачи материала на сушильно-ширильную машину с игольчатыми клуппами.

DEEP PLACEMENT = ГЛУБОКОЕ ВНЕСЕНИЕ – Deep Placement is a method of applying fertilizers in which the fertilizers are placed directly in the reduced zone of the paddy soil.

DEEP SEA TRADES = РЕЙСЫ ПО ГЛУБОКИМ МОРЯМ – Deep Sea Trades are the traffic routes of both cargo and passenger vessels which are regularly engaged on the high seas or on long voyages.

DEEP STOWAGE = ВМЕСТИТЕЛЬНАЯ ШТИВКА – Deep Stowage:- any bulk, bagged or other type of cargo stowed in single hold ships. / Любой навалочный, в мешках или иной тип груза, размещённый в однотрюмовых судах.

DEEP TANK = ДИПТАНК (или ВМЕСТИТЕЛЬНАЯ ЦИСТЕРНА) – Deep Tank is a tank fitted and equipped for the carriage of liquids in bulk. Deep Tank is a tank fitted and equipped for the carriage of vegetable oil (e.g., palm oil and coconut oil) and other liquids in bulk. By means of oil-tight bulkheads and/or decks it is possible to carry different kinds of liquid in adjacent tanks. Deep tanks may be equipped with heating facilities in order to carry and discharge oil at the required temperature (shipping). / , например, . перевозить и разгружать нефть при требуемой температуре (судоходство). Под Диптанком или Глубокой Цистерной понимается судовая цистерна, возвышающаяся над вторым дном. В диптанках содержат водяной балласт, хранят жидкое топливо или перевозят жидкий груз.

DEEP TILLAGE = ГЛУБОКАЯ ОБРАБОТКА ПОЧВЫ (или ГЛУБОКАЯ ВСПАШКА) – Deep Tillage:- Increasing axle loads of farm machinery, and the general concern that soils have become more compacted, have increased the use of deep tillage systems. The main reason offered for deep tillage is that elimination of compacted sub-soil layers and/or tillage pans will promote rapid and deep root growth and improve drainage. However, in Ontario, Canada, subsoils loosened using deep tillage are often easily re-compacted by wheel traffic. Moreover, it is possible that deep-tilled soils receiving wheel traffic end up with poorer drainage because deep tillage destroyed the natural pores created by worms or previous crop roots. Deep tillage into dry soils combined with deep rooted crops (alfalfa, sweet clover) offer the best opportunity for repairing compacted soils.

DEEPWATER RICE = ГЛУБОКОВОДНЫЙ РИС – Deepwater Rice is a long-duration Rice that grows under rainfed, nonflooded conditions for 1–3 months, then is subject to flooding with water depths more than 50 cm for a month or longer. Plants elongate as the flood rises, above the water, in normal flood conditions, but may be submerged in deep flash floods. Maximum water depth varies greatly.

DEEPWATER RICE AREAS = АРЕАЛЫ ГЛУБОКОВОДНОГО РИСА – Deepwater Rice Areas are low-lying lands on the river deltas of South and Southeast Asia where water accumulates during the rainy season in depths varying from 50 cm to more than 3 meters.

DEERSKIN = ЛОСИНА (или ОЛЕНЬЯ КОЖА, или ОЛЕНЬЯ ШКУРА, или ЗАМША) – Deerskin is a garment of deerskin, namely leather made from the skin of a Deer. / Оленья перчаточная кожа с сохранённым лицевым слоем.

DEERSTALKER = ОХОТНИЧИЙ ШЛЕМ (или ВОЙЛОЧНАЯ ШЛЯПА) – Deerstalker is a close-fitting hat with a visor at the front and at the back and with earflaps that may be worn up or down. Deerstalker is a type of hat that is typically worn in rural areas, often for hunting, especially deer stalking. Because of the hat's popular association with Sherlock Holmes, it is also a stereotypical hat of a detective. / Щэлок Холмз (Sherlock Holmes).

DE FACTO = ДЭ ФАКТО (или НА ДЕЛЕ, или ФАКТИЧЕСКИ) – De Facto:- in Latin, something that is automatically accepted. By virtue of existence, rather than any legal right, e.g., the de facto owner of a property may be the person in occupation, whether or not he or she has legal title to the land. Latin for Actually, or In Fact, or As A Matter Of Fact. It is commonly used as opposed to De Jure (meaning By Law) when referring to matters of law or governance or technique (such as standards), that are found in the common experience as created or developed without or against a regulation. / Выражение Дэ Факто, от Латинского De Facto, означающее На Деле, в современном плане означает Фактически. В международном праве это выражение может быть использовано в качестве одной из форм признания государства или правительства, означающей официальное, но неполное признание.

DEFAULT = НЕСОСТОЯТЕЛЬНОСТЬ (или ДИФОЛТ) – (1) Default, generally, failure to satisfy an obligation when due, or the occurrence of one of the defined events of default agreed by the parties under a contract. Failure to fulfill a contractual obligation, such as repayment of a loan. Default gives the note holder the right to foreclose on the collateral. In finance, Default is what occurs when a party is unwilling or unable to pay their debt obligations. This can occur with all debt obligations including bonds, debentures, mortgages, loans, and notes. Default can also occur with sovereign bonds, that is, governments can default on their payments to creditors. In corporate finance, a default is typically a prelude to bankruptcy. With most mortgages and loans the total amount owing becomes immediately payable on the first instance of a default of payment. Default is a failure to comply with the terms set out in a contract. Legal proceedings generally follow if the matter cannot be settled amicably. / Неспособность исполнения контрактных обязательств, таких как выплата ссуды. Под Несостоятельностью понимается неспособность должника к полной оплате денежных требований кредиторов. Несостоятельность или Дифолт – невнесение должником своевременных платежей по процентам или основной сумме займа по мере наступления сроков или неисполнение иных положений контракта на выпуск облигаций. В случае невыполнения обязательств владельцы облигаций могут предъявлять требования на получение активов компании эмитента с целью возмещения основной суммы займа.

(2) Default is a failure to complete a funds or securities transfer according to its contractual terms for reasons that are not technical or temporary in nature. The reason is often a counterparty's bankruptcy or insolvency. Default is usually distinguished from a failed transaction.

(3) In futures trading, the failure to perform on a futures contract as required by exchange rules, such as a failure to meet a margin call or to make or take delivery.

(4) Default is a failure to meet the terms of a credit agreement. Default is a failure to meet any financial obligation. Default triggers a creditor's rights and remedies identified in the agreement and under the law.

DEFAULT CHARGE = СБОР ЗА НЕИСПОЛНЕНИЕ ОБЯЗАТЕЛЬСТВА (или СБОР ЗА ДИФОЛТ) – (1) Default Charge is a fee or combination of charges that are assessed on a lessee in the event the lessee misses a stated number of payments during a lease

period. The charges can include remaining payments, repossession costs and collection costs. Default Charge is a (standard) charge applicable for a trade, stretch or location. A Default Charge is a type of fee or charge that is added to a customer account when the client has failed to comply with the terms and conditions governing a legal agreement with another party. Typically, this type of charge is not applied until certain events found in the contract have come to pass and the client is considered to be in default of those provisions. While this type of charge may be found in a number of different types of contracts, the default charge is most commonly applied to specific situations that arise with a lease on a piece of real estate. It is important to note that a default charge may actually represent several different fees and charges that are applied to a customer account after that client is declared to be in default on some type of legally binding agreement. Typically, this collection of charges will include fees related to the attempts of the provider to aid the client in getting back on track with missed payments or other factors that have led to the breach of contract situation. The default charge does not replace any other types of punitive charges and fees that are outside the scope of the charge itself, but are assessed in addition to those other stand-alone fees. One of the more common examples of how a default charge functions is to consider a situation if a tenant begins to miss payments on a lease involving an apartment or rental home. Typically, the landlord will make reasonable efforts to work with the tenant to incrementally catch up on the back payments, possibly exercising the right to apply some sort of interest and penalties to the balance owed in arrears on the tenant's account. The scope of those efforts will be governed by the contents of the lease agreement and any local laws that may have to do with the rental of property and the processes necessary for eviction. If all reasonable efforts are made and the tenant still fails to pay the amount in arrears, the landlord may declare the tenant to be in default and assess a default charge on any amount due up to the date of the declaration. The actual amount of a default charge will vary, depending on local laws and the provisions found within the lease agreement. In some jurisdictions, the requirement is that the charge must be stated in terms of a flat or fixed rate. At other times, the default charge may be a percentage of the amount of the arrears, but not be allowed to exceed a certain amount. Depending on the circumstances that determine the amount of the default charge, this additional assessment may be enough to offset at least some of the costs landlords incur when having a client legally evicted, or provide no more than a token amount that may or may not eventually be collected through a court system.

(2) Default Charge:- in the absence of specifics (not otherwise specified/enumerated) a general amount has been set.

DEFAULT INTEREST = ПРОЦЕНТ В СЛУЧАЕ НЕСОСТОЯТЕЛЬНОСТИ (или ПРОЦЕНТ НА ДИФОЛТ) – Default Interest is the interest that a borrower would pay if the borrower will not fulfill the loan covenants. The default interest is usually much higher than the original interest since it is reflecting the aggravation in the financial risk of the borrower. The default interest compensates the lender for the added risk. Banks tend to add default interest to the loan agreements in order to separate between different scenarios. Default Interest is the rate of interest charged on an overdue debt, from the date of default to the date of eventual settlement.

DEFAULT OPTION = ОПЦИОН НА СЛУЧАЙ НЕСОСТОЯТЕЛЬНОСТИ (или ОПЦИОН НА ДИФОЛТ) – In finance, a Default Option, Credit Default Swaption or Credit Default Option is an option to buy protection (payer option) or sell protection (receiver option) as a credit default swap on a specific reference credit with a specific maturity. The option is usually European, exercisable only at one date in the future at a specific strike price defined as a coupon on the credit default swap. Credit default options on single credits are extinguished upon default without any cashflows, other than the upfront premium paid by the buyer of the option, of course. Therefore buying a payer option is not a good protection against an actual default, only against a rise in the credit spread. This may explain why such options are very illiquid. They may also feature quite high implied volatilities, as shown by Damiano Brigo (2005). However options on credit indices such as iTraxx and CDX include any defaulted entities in the intrinsic value of the option when exercised. This is expressed at times by stating that the options offer 'front-end protection'. Proper inclusion of front end protection complicates index options valuation, see for example Claus M. Pedersen (2003), or Damiano Brigo and Massimo Morini (2008). Default Option is an option that is selected automatically unless an alternative is specified. See also Credit Default Option. / Профессор математики из Имперальный Колледж Лондона (Imperial College London) Дамиано Бриго (Damiano Brigo; 1966–) (в 2005). Однако опционы на кредитные индексы (credit indices) такие как эТракс (iTraxx) и Си.Ди.Экс. (CDX). Сотрудник Лимэн Бразёз Инк. (Lehman Brothers Inc.) Кляус Эм. Пидасэн (Claus M. Pedersen) (2003), или Дамиано Бриго (Damiano Brigo) и Итальянский учёный финансист из Миланского Коммерческого Университета (Università Commerciale Люидьжи Боккони Luigi Bocconi) Массимо Морини (Massimo Morini) (2008)). Смотрите также Опцион На Случай Некредитоспособности (Credit Default Option).

DEFAULT RISK = РИСК НЕСОСТОЯТЕЛЬНОСТИ (или РИСК ДИФОЛТА) – Default Risk is the risk that a counterparty will not fulfil its obligations in accordance with the agreed terms of a transaction. Default risk arises on financial assets and derivatives, as well as committed facilities that the bank provides for central banks and international organizations. The Bank controls its default risk on both a counterparty and a portfolio level. Credit exposures are restricted using a series of credit limits covering individual counterparties and countries of risk. The bank conducts its own detailed independent credit analysis resulting in the assignment of internal credit grades. Based on this analysis the bank sets its credit limits. Default risk on the bank's holdings of securities is reduced by the highly liquid nature of most of the assets. Securities are sold when the bank's management considers that a counterparty has an unacceptable risk of default. Default risk on over-the-counter (OTC) derivatives is mitigated using collateral management agreements. Xxxxx. Default Risk and Bond Pricing:- bonds normally promise a fixed flow of income but this does not mean that they are riskless Investments. Although US government bonds are treated as risk-free, this is not the case for corporate bonds. If a company goes bankrupt then the bondholders will not receive the payments that they have been promised and therefore there is some uncertainty surrounding future bond payments. This uncertainty is called Default Risk. The default risk is measured by Moody's Investors Services Ltd, Standard & Poor's Corporation, and Fitch Investors Service. All three of these entities provide financial information on firms as well as well as ratings on corporate and municipal bonds. Investment Grade Bonds Bonds that are rated BBB or above by Standard & Poor's, or Baa or above by Moody's are called Investment Grade Bonds. Speculative Grade or Junk Bonds Bonds that are rated BB or lower by Standard and Poor's, Ba or lower by Moody's, or bonds that are unrated are considered junk bonds or speculative grade bonds. Bond rating agencies use financial ratios to grade bonds. The key ratios used are show below as follows:- (i) Coverage ratios; (ii) Leverage ratio; (iii) Liquidity ratios; (iv) Profitability ratios; and (v) Cash Flow -to-debt ratio. / Риск Несостоятельности – риск того, что должник прекратит выплату процентов или не вернёт основную сумму долга в установленный срок. Одним из методов учёта кредитного риска является анализ рэйтиньгов (raiting), публикуемых рэйтиньговыми агентствами, такими, как Фитч Инвэстоз Сёвис (Fitch Investors Service), Мудиз Инвэстоз Сёвис Лимитид (Moody's Investors Service Ltd) и Стэндод энд Поз Корпорэйшэн (Standard & Poor's Corporation). Наивысший рэйтиньг (AAA или Aaa) означает наименьший риск несостоятельности заёмщика. Некоторые ценные бумаги, такие, как Американские Казначейские Облигации, которые обеспечены всем достоянием и кредитом правительства США, считаются свободными от риска невыполнения государством обязательств по ним. В отличие от них 'бросовые' облигации (junk bonds) являются высокорисковыми. Одним из способов защиты инвесторов от несостоятельности эмитента муниципальных облигаций является страхование муниципальных облигаций (municipal bond insurance).

DEFAULT SWAP = СВОП НА НЕСОСТОЯТЕЛЬНОСТЬ (или СВОП НА ДИФОЛТ) – Default Swap is a contract, typically written using standardized documentation from ISDA®, wherein one party, the protection purchaser, makes periodic payments (based on a notional principal amount) in exchange for a payment from the other party, the protection seller, solely upon the occurrence of a credit

event (a default on a reference debt obligation or an insolvency event with respect to a reference obligor). Default swaps are typically settled either:- (i) in cash, with a payment equal to the difference between the principal amount of the reference obligation and its post-credit event fair market value (or, in some cases, with a payment of a predetermined fixed amount); or (ii) physically, by the delivery of deliverable obligations (either the reference obligation or other obligations of the reference obligor that are expected to approximate the postdefault value of the reference obligations) in exchange for the principal amount of the reference obligation. / Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)) . Дифолтный Своп – финансовый контракт, по которому одна сторона осуществляет фиксированный платёж, а другая сторона осуществляет платёж в случае, если с базовым активом происходит какое-либо событие, снижающее его кредитное качество (например, снижение рэйтиньга эмитента). Размер платежа определяется исходя из изменения стоимости базового актива в результате события.

DEFEASIBLE INTEREST = НЕВОСПОЛНИМЫЙ ПРОЦЕНТ – Defeasible Interest is a cargo insurable interest that ceases during the transit of goods.

DEFECT = ДЕФЕКТ (или ПОРОК) – (1) Defect is:- (i) an imperfection that impairs worth or utility; (ii) want or absence of something necessary for completeness or perfection; and (iii) a fault that spoils the material. / Под Дефектом, от Латинского слова Defectus, понимается изъян, недостаток, недочёт.

(2) Fabric Defects:- an alternate way of classifying the defects in the textile materials is to base identification and analysis of a defect upon its visual characteristics. Also, there are other requirements of such a classification scheme:- it should be hierarchically arranged to minimize the search process, and should be general enough to accommodate new defect descriptions added at a later date. A description of a necessary and sufficient set of these visual attributes of defects is introduced in the next chapter as a conceptual basis for representing the classification of fabric defects. The same defect can occur in several ways on the fabric, owing to technological reasons. For example, a single bobbin of coarse yarn will result in a thin, single warp-wise streak running along the length of the fabric. If that bobbin is in the filling, the coarse yam will manifest itself as a rectangular bar across the fabric. Because of this possibility of multiple modes of occurrence, a thorough technological analysis has been carried out for each of the 85 fabric defects, with a goal of achieving a complete map of every conceivable manifestation. In the same vein, there may be more than one technological reason for a defect to occur in a certain manner. Depending on the mode of occurrence, every defect was fully investigated as to the possible human/machine/process/random causes which could contribute to its incidence. In every case where a defect has multiple causes, all of the possible causes are listed in the diagnosis file pertaining to that fabric defect. Each defect has its own diagnosis file, comprising a set of probable causes, and a listing of suggested remedies. List of Fabric Defects in the Fabric Defects Analysis System (FDAS):- (i) Point Defects:- (1) burnt hole; (2) cockled yarn; (3) finger mark; (4) fuzz balls; (5) gout; (6) harness skip; (7) holes – damaged rolls; (8) Holes – singeing; (9) knots in selvage; (10) large knots; (11) long knot tails; (12) mending hole; (13) neps; and (14) tear drop. (ii) Line Defects:- (1) abrasion; (2) broken end; (3) broken pick; (4) coarse yarn; (5) corded selvage; (6) crackers; (7) crease mark; (8) double end; (9) double pick; (10) end out; (11) float; (12) hanging thread; (13) harness skip; (14) jerk-in; (15) kinky yarn; (16) looping pick; (17) misdraw; (18) missing pick; (19) mixed yarn – blend; (20) mixed yarn – twist; (21) oily/dirty yarn; (22) reed mark; (23) rotary yarn piecing; (24) rotary yarn slubs; (25) seam mark; (26) shade variation – yarn; (27) slack end; (28) slack pick; (29) thin yarn; (30) tight end; (31) tight pick; (32) uneven yarn; (33) warp burl; (34) warp streak; (35) yarn shade variation; (36) yarn slubs; and (37) waste in filling (on loom). (iii) Area Defects:- (1) abrasion; (2) apron mark; (3) beam/fabric contamination; (4) bowed filling; (5) break out; (6) burnt holes; (7) coarse yarn; (8) color bleeding; (9) crease mark; (10) filling bar; (11) finishing bar; (12) hairiness; (13) hard size; (14) holes; (15) mat-up; (16) oil stain; (17) puckered fabric; (18) reediness; (19) rolled selvage; (20) rust stain; (21) selvage tails; (22) shade variation – fabric; (23) shade variation – yarn; (24) shrink mark; (25) shuttle smash; (26) soiled fabric; (27) specky dyeing; (28) temple mark; (29) tender spot; (30) thick place; (31) thin place; (32) torn cloth; (33) uneven fabric width; (34) uneven finish; (35) uneven yarn; (36) variable selvage dyeing; (37) wavy fabric; (38) wavy selvage; and (39) wrong pattern. A woven fabric is a planar assembly with a finite width and a nominally infinite length. In case of the fabric having some flaw or imperfection, it (the defect) is likely to have a certain orientation and extent. Fabric defects can be classified on the basis of the following attributes:- (i) type of defect; (ii) direction and extent of defect (with respect to the fabric); (iii) repeating pattern of the defect along the two principal fabric directions (length & width); (iv) appearance of defect; (v) size of detect; and (vi) location of defect. The descriptors used to characterize each of the defects according to these characteristics were listed. Some defect characteristics, such as Type, Direction, and Pattern had only a limited number of possible descriptors. Appearance had almost as many descriptors as the number of defects. These three were the primary attributes forming the current defect classification and identification scheme. The Location of the defect was found to be useful only for separating selvage defects from the rest of the defects. The Size of the defect was used only in some instances to characterize the defects. Therefore, these characteristics were not included in the list of key characteristics finally adopted for the system; on occasion, their descriptors were incorporated into the accepted visual attributes given above. The defect characteristics with limited number of possible descriptors, i.e. Type, Direction, Lengthwise and Widthwise patterns, were used to classify the defects into broad categories. For example, the Type defect characteristic has three descriptors:- Point, Line and Area. Similarly, the Direction characteristic has five descriptors:- Continuously Along the Length, Partially Along the Length, Continuously Across the Width, Partially Across the Width, and No Preferred Orientation. The intersection sets of all these categories divide the whole set of fabric defects into smaller subsets. Figure 5.2 shows the classification of area defects using the additional visual characteristics Direction, and Length and Widthwise Patterns. The other two subclasses based on Type, i.e. Line and Area defects are also broken down in a similar hierarchical fashion. The nomenclature of the defect subclasses that is being used is shown in the box at the top of Figure 5.2, which is a pictorial representation of all the intersection sets of the classification categories. The acronyms used and their expansions are shown to the left of the figure. The general format of the subclass names is ZZ[Z]-WX[X]FY[Y]. ZZ[Z] represents the direction of defect with a two or three lettered acronym. The second part of the name, i.e. WX[X]FY[Y], represents the lengthwise and widthwise patterns of the defect, respectively. W (for warp) and F (for filling) indicate lengthwise and widthwise pattern of the defect, respectively. X[X] and Y[Y] represent the widthwise and lengthwise patterns with one or two lettered acronyms. For example, the class name NPO_WIFR, stands for defects with No Preferred Orientation (ZZ[Z]), whose lengthwise pattern is Isolated (WX[X]), and widthwise pattern is Random (FY[Y]). For illustration purposes, the classes corresponding to defects with no preferred orientation (NPO) are ‘sliced off’ from the other classes in Figure 5.2. Figure 5.3 takes this slice and expands to show more detail; all the NPO classes and the individual defects in two classes viz., NPOWIFR and NPO_WReFI, are shown. Whenever the number of defects contained in a subset was more than eight, as in NPO_WIFR, it was further divided using additional discriminating criteria such as the Size of the defect or other appropriate characteristics. Ultimately, the Appearance of the defect, which is unique to each element in a subset, was used to identify the defect uniquely. The proposed scheme marks a departure from the traditional methods of classifying fabric defects as warp and filling defects or as spinning and weaving defects. The traditional methods presuppose knowledge of the exact identity of the defect and its origin, whereas this is precisely the information sought by a user from a defects analysis system. The scheme of classification in FDAS depends only on the visual attributes of fabric defects, which would be input by the user. The identity of the defect, its probable causes and remedies will be in the output of the system (FDAS). Defect:- a fault that would reduce the expected performance of the fabric or, if

it appeared in a prominent position in an article made from the fabric, would readily be seen and rejected by a prospective purchaser. Fabric Grading Systems:- the two fabric grading systems currently being used by the United States textile industry are the 10-point system and the 4-point system. Both systems identify defects, and assign a demerit point value for each defect, based on the seriousness of the defect. The 10-point grading system assigns points for warp-way faults based on four standard imperfection sizes as follows:- (i) up to 1" – 1 point; (ii) 1–5" – 2 point; (iii) 5–10" – 5 points; and (iv) 10–36" – 10 points. Filling-way defects ranging from 5" to half the width of the fabric are assigned 5 points. Defects exceeding half the fabric width are assigned 10 points. No yard of fabric is assigned more than 10 demerit points no matter how bad or how frequent the defects are. The total number of defect points recorded is compared against the number of yards in the inspected piece. If the number of penalty points does not exceed the number of linear yards, the fabric is considered a First Quality Fabric. If the fabric width is greater than 50", up to 10% more penalty points are allowed for a first quality classification. Also, greige fabrics that are to be subsequently printed are allowed 50% more penalty points. The 4-point grading system also assigns demerit points to individual defects, but the basis for point assignment is different from that of the 10-point system. The standard point assignments for different defect extents are as follows:- (i) 3" or less – 1 point; (ii) more 3" but less 6" – 2 points; (iii) more 6" but less 9" – 3 points; and (iv) more 9" – 4 points. Not more than 4 demerit points are assignable to a single yard of fabric; the total number of points are normally figured on the basis of 100 square yards. The acceptable level of quality can vary between buyers and sellers. Generally, not more than 40 penalty points are acceptable in 100 square yards of a first-quality fabric. The 4-point system has the broadest base of support. In addition the American Society for Quality Control (ASQC) and the National Association of Sportswear Manufacturers, the Federal Government and the American Apparel Manufacturers Association (AAMA) have endorsed the 4-point system. Most Defects in cloth occur while it is woven on the loom. Some of these fabric defects are visible, while others are not. Again some fabric defects may be rectified during weaving and after weaving while others are not. The quality of a final garment depends on the quality of its fabric when it is received as a roll. Even the most outstanding manufacturing methods cannot compensate for defective materials. Amount To Select:- inspect at least 10% of the total rolls of the shipment. Selection Of Rolls:- select at least one roll of each color. If more than one role must be selected, then choose the additional roles in proportion to the total number of roles per color received. Defect Classification (Four-Point System; Size Defect – Penalty):- (i) 3 inches or less – 1 Point; (ii) over 3 inches, but less than 6 – 2 Points; (iii) over 6 inches, but less than 9 – 3 Points; and (iv) over 9 inches – 4 Points. The length of the defect is used to determine the number of penalty points assigned to a defect. Only major defects are considered. No penalty points are assigned to minor defects. (A major defect is any defect that would cause a final garment to be considered a second.) Major Defects:- (i) major woven fabric defects include but are not limited to slubs, holes, missing yarns, yarn variation, end out, soiled yarns, and wrong yarn; and (ii) major dye or printing defects are out of register, dye spots, machine stop, color out, color smear, or shading. Acceptance Criteria and Calculation:- (i) 40 points per 100 yards is the acceptable defect rate; and (ii) # of Points per 100 yds = (# of penalty points / Yds inspected) x 100. Inspection Procedure:- (i) determine the amount to inspect (10% of rolls); (ii) select the rolls to inspect; (iii) put the rolls on the inspection machine; (iv) cut off a 6 inch piece across the width off the end of the roll. Mark the right and left side of the strip. Stop the inspection process every 50 yards and use the strip to check for any shading problems. Be sure to check the end of the role as well. (v) Inspect for visual defects with the light on at a speed slow enough to locate any defects. (The fabric must be checked at a slow rate in order to effectively find flaws). Sometimes you may have to turn the light off to see how a flaw will affect the appearance of a finished garment. (vi) Check that the roll contains the correct yardage as stated by the piece goods source. (vii) Check for skewed, biased, and bowed fabric. (viii) Mark any defects to the side with colored tape so that they can be easily found and noted. (ix) Record any defects. Xxxxx. (i) Bow & Skew:- no roll shall be accepted as first quality that exhibit bow or skew more than the guidelines established between Factory and Mill, as it will adversely affect the final product appearance. Tolerance for bowed condition not affecting the full width will be fractionalized part of the maximums as stated above according to the area affected by the bow. Penalty points will not be assigned for fabrics found to have conditions of bowing in excess of the above stated tolerances but shall be noted in the inspection report. And if any fabric exhibits bow or skew where its end becomes doubtful, then that fabric will be rejected. (ii) Fabric Odors:- no roll shall be accepted that exhibits objectionable odors. (iii) Fabric Width:- fabric width will be checked minimum of three times during the inspection of a roll (beginning, middle and end of the roll). Rolls having width less than the specified are potential problems. In such cases width deviation of more than that agreed upon in the Fabric Specification, width tolerance would constitute a major fault. Factory and Mill will discuss how to handle rejected fabric. Overall, fabric width is measured from out side of the selvage to the outside of the opposite selvage. (iv) Full Width Defects:- a full width major fabrics defect would cause that meter of fabric to be assigned four penalty points. (v) Holes:- all defects that break the fabric, regardless of size, shall be penalized a maximum of four points. A hole consists of two or more broken yarns. (vi) Roll Length:- rolls having meters less than that stated on the packing are a problem. Any roll having less fabric than the ticketed amount is rejected. Note:- factory and mill will agree on how deficits are managed. The entire shipment shall be rejected if the total measured meters in the sample audit are less than agreed amount between factory & mill. (vii) Running Defects:- any major fabrics defect found to repeat and/or run in a continuous manner will constitute a running defect. All major running defects must be assigned four penalty points to every meter in the roll where it occurs. (viii) Splices:- rolls can be composed of several spliced parts. Rolls shall be accepted that contains splices less than that agreed between mill and factory. In case of piece goods, the fabric length and the number of splices / roll are strictly followed as per the requirement between mill and factory. Xxxxx. Gray Fabric Inspection is the process of identifying weaving faults in the fabric just after the gray fabric production in the loom. Equipment:- (1) inspection table; and (2) fabric inspection machine. Key Accessories:- Nipper, Pointer, Cutter, Comb etc. Safety Measures:- (1) smoking inside the inspection area is strictly prohibited; (2) fire extinguishers are placed in the inspection area and all are trained to use it; and (3) no fabric stack is placed in front of electric panels. Inspection Procedure:- Operation Staff:- cloth doffer, cloth mender, and inspector. Checks List Before Inspection:- (1) machine parameters are set; (2) man power is made available; (3) all the tools/accessories are made available; and (4) fabric is made ready for inspection. Method:- (1) as the fabric reaches its 'set cut length' in the loom the cloth is cut and the cloth roll is doffed off from the loom; (2) the cloth roll might also be cut and doffed off before the preset length as and when it is needed; (3) according to set rule the 'cloth doffer' cuts and doffs off cloth roll and record the doff length in the loom quality/doffing card and also sticks a doffing stickers over the cloth roll for identification; (4) the roll is then unrolled over the inspection table where it is visually checked yard to yard (100%) against light and repaired or mended for any smaller extent of faults like protruding or projecting yarn, yarn naps, slubs, crack, floats, oil stains which can't be repaired, the fault area is identified by putting yarn tails or laces in the selvedge area; and (5) the mended fabric is then inspected over the grey fabric inspection machine visually against light in a pre-set speed (m/min). Investigation:- in the inspection table the operator finds out faults in the fabric and analyses their intensity by visual inspection. Some of the common weaving faults are:- (1) stop mark; (2) pick faults, e.g., miss pick and double pick; (3) wrong density/drawing; (4) pattern or design break; (5) selvedge faults, e.g., lashing in, cut selvedge; (6) oil stain; (7) crack and hole; (8) missing ends; (9) slubs; etc. As per standard, designed and set by Quality Control (QC) Department of textile mill, the intensity of some of the major and common weaving faults are marked with points (Numerical value) ranging 1 to 6, 6 being the highest point for every faults. The defects found and the points given against them are recorded in the gray fabric inspection sheet in the case of solid dyed fabric and in yarn dyed fabric inspection sheet for yarn dyed fabric. The measured length, fabric sort, yarn lot, machine number etc are also written down at the tail end of each fabric piece. Apart from these two forms another from called gray fabric inspection daily production sheet is filled to keep the record of total inspected gray fabric in the shifts in a day. At the bottom of

this sheet total amount of rejection is also shown. All the data entered in this form are done according to various sort, construction and quality. Acceptance Of Fabric:- (i) any piece of fabric with the rating of total 36 points faults per 100 linear meter is allowed to pass as ‘A’ grade fabric; and 36–50 is the point range for ‘B’ grade fabric; (ii) any piece having more than 50 points is graded as ‘C’ which is rejected (iii) a minimum of 20 meter ‘A’ grade fabric is allowed to pass with other long pieces; pieces less than 20 meter is recorded as cut pieces. Rejection Of Fabric:- any area of the fabric that contains:- (1) objectionable (too frequent) presence of weaving faults like stop/starting mark and pick faults; (2) oil or grease spot; (3) crack/holes, floats and warp end miss etc are cut to a separate pieces and recorded as rejected. Any fabric having points more than 50 is graded as ‘C’ and also rejected. Response To Weaving Faults:- as a response to any weaving faults and rejection, cloth inspector directly contacts with the head or in charge of the weaving department along with his report for immediate remedial measures. Machine Area Cleaning:- inspection area is cleaned twice a day by the helpers. Storage:- the gray fabrics thus inspected are piled separately according to lot and sort/quality or construction and to store; store upon receiving the production sheet physically checks and receives the fabric. A fabric Defect is any abnormality in the fabric that hinders its acceptability by the consumer. Importance of fabric defect:- (i) due to the increasing demand for quality fabrics, high quality requirements are today greater since customer has become more aware of poor quality problems; (ii) to avoid rejection of fabric, it is necessary to avoid defects; (iii) price of fabric is reduced by 45–65% due to the presence of defects; and (iv) company image will go down. A list of fabrics defects in woven fabrics:- broken ends woven in a bunch; broken pattern; colored flecks; double end; float; gout; hole, cut or tear; knots; lashing-in; local distortion; missing ends; missing picks; oil and other stain; oily ends; oily picks; reed mark; shuttle smash; slough off; slub; snarls; stitches; untrimmed loose threads; and weft bar. / масляный развод (или потёк). уточина. (i) Перекос и Кривизна (Bow & Skew). (ii) Запахи У Ткани (Fabric Odors). (iii) Ширина Ткани (Fabric Width). (iv) Пороки Полной Ширины (Full Width Defects). (v) Дыры или Отверстия или Пробоины (Holes). (vi) Длина Рулона (Roll Length). (vii) Набегающие Пороки (Running Defects). (viii) Сплётки или Стростки или Сращивания (Splices). В соответствии с действовавшими в России стандартами Пороки текстильных полотен подразделялись на:- (i) Местные Пороки:- пороки, расположенные на ограниченном участке текстильного полотна; (ii) Общие Пороки:- пороки, имеющие одинаковый внешний вид независимо от вида текстильного полотна; (iii) Пороки Внешнего Вида:- видимое нежелательное изменение внешнего вида текстильного полотна; (iv) Распространённые Пороки:- пороки, расположенные на всей длине куска текстильного полотна или на его значительной части; и (v) Специфические Пороки:- пороки, типичные для одного вида текстильного полотна в зависимости от технологии производства. Пороки ткани довольно разнообразны и обусловлены пороками пряжи, но в большинстве случаев возникают в процессе ткачества, отбелки, крашения, печатания и окончательной отделки ткани. (1) На тканях могут быть следующие пороки, связанные с неровнотой и другими пороками пряжи:- (i) Мушковатость является результатом применения сорной пряжи и портит внешний вид ткани, на поверхности которой находятся небольшие кусочки коробочек и листьев хлопка. (ii) Петли-Сукрутины образуются вследствие применения сильно перекрученной уточной нити. (iii) Шишковатость – неровная, рябая поверхность ткани, обусловленная различными местными утолщениями (краксами, шишками, толстыми пропусками) и утонениями (переслежистостью, тонкими пропусками) пряжи. (2) К основным порокам ткачества относятся следующие:- (i) Близна представляет собой местное отсутствие по основе одной или двух соседних нитей, оборванных при ткачестве; этот порок проявляется на ткани в виде продольной полосы с рушенным переплетением. (ii) Ворсовальные Плешины представляют собой участки ткани, на которых отсутствует начёс. (iii) Дыры, или Пробоины, – местные сквозные повреждения ткани. (iv) Забоина – порок, противоположный недосекам (переуплотнение нитей утка по всей ширине ткани); в ткани выявляется в виде светлых поперечных полос, портящих её внешний вид. (v) Морщины – присборенные поперечные полосы, образованные в результате неравномерной усадки утка. (vi) Недосека – наличие разреженных полос по утку из-за отсутствия на отдельных участках ткани уточных нитей в результате неправильной работы станка. (vii) Неподработка Нитей образуется, когда нити основы на некотором протяжении не переплетаются с утком по принятому рисунку, а выступают на поверхности ткани. Смотрите также Поднырки. (viii) Неровный Бой, или Полосатость, выражается в чередовании уплотнённых и разреженных участков по утку. Разный уток, то есть выработанный из пряжи разных номеров, в ткани проявляется в виде заметного изменения нормального рисунка (широкие поперечные полосы, которые особенно выделяются после крашения). (ix) Парочки – белая продольная полоса, состоящая из двух нитей основы, участвующих в переплетении за одну. (x) Поднырки – тот же порок, образуемый уточными нитями; то есть образуется когда нити утка на некотором протяжении не переплетаются с основой по принятому рисунку, а выступают на поверхности ткани. Смотрите также Неподработка Нитей. (xi) Подплетина – нарушение рисунка ткани на отдельных участках в результате одновременного обрыва нескольких основных нитей, заплетённых с утком. (xii) Промётки, или Пролёты, образуются вследствие обрыва уточной нити и внешне напоминают близну, но располагаются поперёк ткани. (xiii) Пятна или Загрязнённые Нити – загрязнения ткани или пряжи машинным маслом, ржавчиной, краской и тому подобным. (xiv) Слёт, или Спуск, Утка, – утолщения уточной нити, сходящей со шпули целым пакетиком, состоящим из нескольких нитей и заработанным в ткань. (3.1.) К порокам отбелки относятся:- (i) Местное Ослабление Ткани в результате плохого размешивания белящего раствора или местного высыхания при белении. Ослабление всей ткани от применения слишком крепкого белящего раствора. (ii) Непробелка – неполная отбелка (желтизна) вследствие недостаточного воздействия на ткань белящих растворов. (iii) Следы Хлора из-за недостаточно тщательной промывки, что ведёт к разрушению ткани. (3.2.) В результате крашения могут появиться следующие пороки:- (i) Засечки – слабо окрашенные полосы, которые получаются в результате образования складок на ткани, проходящей через машину; при печатании в местах складок получаются полосы, лишённые печатного рисунка. (ii) Маркость проявляется в способности ткани пачкать при трении, что объясняется недостаточной тщательностью промывки окрашенной ткани. (iii) Належки – белые или цветные пятна, образующиеся, когда слои недостаточно просушенной ткани лежат один на другом. (iv) Непрокрас – неравномерная окраска по толщине, придающая ткани белесоватость. (v) Неравномерность Окраски – тёмные и светлые полосы или пятна, а также постепенное изменение тона окраски (разнооттеночность) по ширине или по длине куска. (vi) Разнокромочная Ткань образуется в результате неодинакового отжима при крашении ткани по концам вала. (vii) Слабая или Полная Середина – неодинаковая окраска краёв и середины от неравномерного срабатывания отжимных валов. Пороки делятся на два вида:- местные и распространённые. Местные пороки – небольшие по размерам, расположенные на небольшом участке ткани (пятна, близны, слёты, подплетины). Пороки внешнего вида, расположенные на значительной части куска или по всему куску, называются распространёнными (засорённость, разнооттеночность, полосатость, растраф). Как местные, так и распространённые пороки ткани могут возникнуть на разных этапах производства:- как при прядении, вследствие низкого качества сырья или нарушения технологических режимов, так и при ткачестве и отделке. В процессе ткачества могут возникнуть различные Пороки (или Дефекты), понижающие качество тканей. Ниже приведены описания главнейших видов дефектов и их влияние на качество тканей и швейных изделий. (i) Близна – отсутствие одной или нескольких основных нитей на большем или меньшем протяжении. Дефект проявляется вследствие обрыва нитей основы в процессе ткачества при неисправности ламельного устройства или при недосмотре ткача, несвоевременно остановившего станок, если отсутствуют ламели. Наиболее рельефно выделяются близны на тканях полотняного переплетения. Близны в две нити длиной более 10 см в хлопчатобумажных и шёлковых тканях и более 20 см в шерстяных швейных изделиях I сорта не допускаются. На закрытых частях изделия близны не учитываются. (ii) Дыры, Пробоины, Просечки – отверстия разных

размеров, возникающие от неправильной работы станка. В изделиях этот дефект не допускается. (iii) Забоина – наличие по утку уплотнённых полос вследствие увеличения плотности нитей. Образуется при неправильной работе ткацкого станка. Дефект портит внешний вид ткани и в изделиях I и II сортов не допускается, в изделиях III сорта допускается в двух местах. (iv) Загрязнения и Масляные Пятна образуются от обильной смазки станка, от использования грязного утка и другого. Дефект в изделиях I сорта на видимых частях не допускается, на закрытых частях не учитывается. (v) Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 см. Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дм ткани, причина разладка основного регулятора или товарного механизма. Недосека – наличие по утку разреженных полос вследствие уменьшения плотности нитей. Образуется при неправильной работе ткацкого станка. Недосеки ухудшают внешний вид ткани и снижают её прочность. Дефект в 3–5 нитей на деталях изделий I и II сортов не допускается, в изделиях III сорта допускается в одном месте. (vi) Неподработка Нитей – нити основы в отдельных местах не переплетаются с нитями утка и выступают на поверхность ткани. Этот дефект возникает вследствие обрыва или ослабления отдельных галев. На качество изделия влияет так же, как и подплетина. (vii) Подныpки – нити утка на коротких участках не переплетаются с основными, а выступают в виде скобочек сверху или снизу ткани. Дефект образуется вследствие провисания нескольких нитей основы в зеве. На качество изделия влияет так же, как и подплетина. (viii) Подплетина – одновременный обрыв нескольких основных нитей и заработка их концов в структуру ткани, вследствие чего в этом месте получается неправильное строение ткани. Подплетина очень заметна в ткани и в изделиях I и II сортов не допускается. В изделиях III сорта подплетина допускается в одном месте. (ix) Промётки или Пролёты – отсутствие уточной нити по всей ширине ткани или только по отдельной её части. Дефект возникает вследствие разрегулировки станка после обрыва утка, а иногда в результате обрыва уточины, конец которой захватывается краем зева и зарабатывается в ткань. Промётки допускаются в изделиях I сорта в одном месте, II сорта – в трёх местах, III сорта – в пяти местах. На закрытых частях изделия промётки не учитываются. (x) Слёт Утка – затканные пучки утка, полученные в результате слета с початка уточной нити в виде петель. Дефект образуется вследствие повышенной крутки утка, недостаточной его влажности и недостаточного торможения уточины при выходе из челнока. Слёты по 5 нитей в изделиях I сорта из хлопчатобумажных и шерстяных тканей допускаются в одном месте, в изделиях II сорта – в двух местах, в изделиях III сорта – в четырёх местах. (xi) Уточные Петли (Сукрутины) – петельки, образующиеся из сильно скрученного утка; они могут быть заработаны внутрь полотна, напоминая слеты утка, или же выступать на поверхности. При отделке петли часто удаляют с поверхности ткани, что приводит к уменьшению прочности ткани. (xii) Кроме того, могут возникнуть такие дефекты, как парочки, сбой ткацкого рисунка, неровный бой, рассечка бёрдом и другие. Некоторые дефекты ткани в процессе её отделки устраняются. Местные дефекты снижают сортность ткани, но могут быть обойдены при раскрое её, что позволит выпустить изделие высшим сортом. В текстильной продукции под Пороком или Дефектом понимается порок, который снижает ожидаемое качество ткани, если он расположен на видном месте готового изделия, изготовленного из ткани, которое может отбраковываться покупателем. Дефекты Пряжи и Нитей:- В пряже и нитях встречаются дефекты, ухудшающие их внешний вид и снижающие механическую прочность. Причинами дефектов являются плохая подготовка и очистка волокон, нарушения технологии прядения или кручения. К наиболее распространённым дефектам относятся следующие:- (i) Ворсистость Поверхности Нити:- появляется вследствие обрыва филаментных волокон на небольших участках. (ii) Грязная или Масляная Пряжа или Нити:- дефекты, вызывающие загрязнение тканей и неровноту их крашения. (iii) Меньшая Толщина Нитей:- результат отсутствия одного или нескольких волокон. (iv) Непропрядки и Перекрутины:- наличие толстых рыхлых недокрученных мест (непропрядки) и тонких перекрученных (перекрутины). Так же как и переслежины и пересечки, они резко ухудшают внешний вид и свойства ткани. (v) Неравномерная Окрашиваемость получается в неравномерных по различным показателям нитях (особенное влияние оказывает неравномерность натяжений). (vi) Переслежины и Пересечки:- чередующиеся тонкие и толстые места в пряже. Этот дефект резко ухудшает внешний вид ткани и её механические свойства. (vii) Сорная Пряжа:- результат плохой очистки волокна, в котором остались колючки (остатки Хлопчатника, репей – в шерстяной пряже, костра – в льняной). (viii) Узелки:- образуются спутанными на поверхности пряжи группами волокон; этот дефект сильно ухудшает внешний вид ткани. (ix) Шишковатая Пряжа:- резкие утолщения вследствие заработки приставшего к пряже пуха. (x) Штопорность:- является дефектом кручёной пряжи или нитей. Вследствие большого натяжения одна из составляющих оказывается более прямолинейной, а другая обвивает её по спирали. Ткацкие Дефекты:- в процессе ткачества могут возникнуть ткацкие дефекты вследствие разладки работы механизмов ткацкого станка или вследствие применения пряжи (нитей) с различными дефектами. Все ткацкие дефекты можно разделить на три группы:- дефекты по основе, дефекты по утку, общие дефекты. Дефекты по основе связаны главным образом с её обрывом или неправильной проборкой. По Основе могут возникать следующие дефекты:- (i) Близна:- отсутствие одной-двух нитей основы вследствие их обрыва; дефект хорошо виден на просвет, особенно в тканях полотняного переплетения. Близна ухудшает внешний вид тканей и уменьшает срок их службы. (ii) Неподработка Нитей Основы:- дефект, состоящий в том, что некоторые нити основы не переплетаются с уточными. Образуется этот дефект вследствие ослабления натяжения части основных нитей, их провисания, в результате чего не образуется ‘чистого’ зева и нити основы не зарабатываются в ткань. Неподработка основы – грубый дефект, резко ухудшающий внешний вид и свойства тканей. (iii) Отрывы:- обрыв большого количества нитей основы с последующей неудовлетворительной их приработкой. На ткани видна поперечная полоса по месту отрыва и приработки. Обрывы основы могут возникать при зажиме челнока в зеве. (iv) Парочка:— две нити основы переплетаются за одну. Причиной дефекта является неправильная проборка в галево ремизок. Дефект ухудшает внешний вид ткани, имеет вид продольной утолщённой или тёмной (на просвет) полосы. (v) Подплетина:- представляет собой обрыв группы нитей основы с их последующим перепутыванием с нитями утка и общим нарушением переплетения. Подплетина является очень грубым, недопустимым дефектом, ухудшающим внешний вид и свойства ткани. К Общим Дефектам тканей относятся следующие:- (i) Дыры:- образуются при механическом повреждении ткани. (ii) Залипы:- дефекты шёлковых тканей; образуются в результате налипания шлихты, вследствие чего нарушается процесс зевообразования и возникает искажение переплетения на небольшом участке. (iii) Плохие Кромки:- возникают при слабом натяжении кромочных нитей основы, излишнем натяжении утка, неправильной заводке кромочных нитей в галево ремизок. (iv) Проколы:- нарушения целостности ткани иглами шпарутки, главным образом у кромок. (v) Прощипы (Прощипки):- дефекты шёлковых и шерстяных тканей; образуются при удалении с поверхности заработанного пуха и нитей. (vi) Пятна:- возникают вследствие загрязнения ткани машинным маслом. Ткань с этим дефектом не прокрашивается или приобретает другой оттенок. (vii) Рассечка Бёрдом:- разреженные полосы, идущие вдоль ткани; они возникают вследствие сдвига основных нитей, например при погнутости зубьев бёрда. (viii) Редочь:- недостаточная плотность ткани по основе или утку. По основе этот дефект возникает при её проборке в бёрдо, не соответствующей установленной плотности; по утку при установке сменных шестерней, вызывающих слишком быструю подачу ткани на товарный валик. (ix) Сбитый Рисунок:- изменение переплетения вследствие нарушений в работе кареточного механизма, цепляния ремизок одна за другую и других неполадок в зевообразовании. (x) Узкая Ткань:- уменьшение ширины ткани; может иметь место вследствие увеличения натяжения нитей основы или утка, плохого удерживания ткани шпарутками

при неправильной заводке кромочных нитей в галево ремизок. Дефекты, Возникающие При Подготовке Ткани К Крашению:- дефекты отделки могут образоваться при проведении любой отделочной операции при применении недоброкачественных отделочных препаратов или нарушении технологических процессов. Все дефекты можно подразделить в зависимости от этапа отделки на группы:- дефекты, возникающие при подготовке к крашению, дефекты гладкого крашения, дефекты узорчатой расцветки, дефекты заключительной и специальной отделки. Дефекты, возникающие при подготовке к крашению:- (i) Витамины:- заломы получаются вследствие пластической деформации некоторых тканей при обработке их в жгуте. (ii) Известковые Пятна:- получаются вследствие отложения на ткани содержащихся в воде солей кальция и магния, являются в дальнейшем причиной появления пятен при крашении, печатании. (iii) Малая Белизна ткани:- возникает вследствие небольшой концентрации, малой длительности действия и температуры белящего раствора. (iv) Недоворсовка:- недостаточная густота и высота ворса. (v) Недостаточный Блеск:- получается при низкой концентрации щёлочи или слабом натяжении ткани при мерсеризации. (vi) Непроварка:- результат того, что спутники целлюлозы при отварке оказались неудалёнными; непроверенная ткань остаётся жёстковатой, имеет малую капиллярность, что затрудняет крашение и печатание. Причины непроварки:- недостаточная концентрация и циркуляция варочной жидкости (едкого натра и другого). (vii) Непропалка:- дефект ткани, когда на поверхности остались неудалённые торчащие волокна. Они образовались вследствие большой скорости движения ткани над горелкой и недостаточно высокой температуры опаливания. (viii) Неравномерное Опаливание:- результат неравномерного распределения пламени горелки по ширине ткани, разной интенсивности нагрева, образования складок на ткани при опаливании. (ix) Неровный Ворс:- ворс, неравномерный по высоте и густоте. (x) Ослабление Ткани:- возникает при попадании в котлы кислорода воздуха. Это неисправимый и недопустимый дефект. Ослабление ткани появляется при повышенной концентрации и температуре белящих растворов, слишком длительной лежке или плохой промывке. (xi) Пережог (общий, местный):- имеет вид жёлто-коричневых пятен. Дефект неисправим и недопустим. Он образуется при малой скорости движения ткани над горелкой, слишком высокой температуре и отсутствии воды в искрогасильной ванне. (xii) Разрыв Кромки ткани:- происходит при сильном её натяжении на ширильной машине. (xiii) Ржавая Кромка:- дефект, появляющийся при плохом состоянии клупп, служащих для удерживания краёв ткани. (xiv) Ржавые Пятна:- имеют тёмно-коричневый цвет, образуются при отложении на ткани гидроокиси железа, вызывают появление дефектов при крашении и печатании. Дефекты Узорчатой Расцветки (Печатания):- (i) Забитая Фигура:- образуется при попадании пуха в гравюру печатного вала, вследствие чего на ткани остаются непропечатанные места. (ii) Засечки:- при печати имеют вид продольных непропечатанных полос, возникающих вследствие наличия складок на ткани при её прохождении через печатную машину. (iii) Затаск:- имеет вид сильно вытянутого пятна краской со светлой полосой посередине. Причина образования затаска такая же, как и щелчка:- под раклю попадает пух и он дольше задерживается под раклей. (iv) Зашиб Вала:- возникает при повреждении печатного вала в одном месте, при этом на ткани отпечатывается периодически повторяющееся пятно от краски. (v) Належки:- отпечатки рисунка, образующиеся при соприкосновении светлых мест с окрашенными в плохо высушенной ткани. (vi) Однобокая Печать (Разнокромочность):- имеет неодинаковую интенсивность в оттенках по ширине ткани; причиной этого дефекта является неравномерное давление печатного вала или неправильное поступление свежей краски (с одной стороны ящика). (vii) Печатный Останов:- поперечная непропечатанная полоса, образующаяся при останове машины вследствие высыхания краски в гравюре печатного вала на участке между раклей и тканью. (viii) Подмочки:- растекшиеся пята с ореолом, возникающие при сушке вследствие попадания капель сконденсировавшейся влаги. (ix) Растраф Рисунка:- представляет собой смещение частей многовального рисунка. (x) Штриф:- представляет собой продольную тонкую (иногда двойную) полосу, проведённую на ткани краской. Она появляется при повреждении ракли или поверхности печатного вала по всей окружности песчинкой, кусочком металла. При повреждении ракли последняя не счищает краску с печатного валика и образует на ткани извилистую полосу (ракля имеет поперечное относительно ткани движение). При повреждении печатного вала полоса получается прямой. (xi) Щелчок:- имеет вид пятна краской со светлой полосой посередине, образуется при попадании под раклю на короткое время твердого комочка. Комочек приподнимает в этом месте раклю, и она не счищает краску с печатного валика.

DEFECTIVE GOODS INVENTORY = ИНВЕНТАРЬ ДЕФЕКТНЫХ (или БРАКОВАННЫХ) ТОВАРОВ (или МАТЕРИАЛЬНО–ПРОИЗВОДСТВЕННЫЕ ЗАПАСЫ С ДЕФЕКТОМ) – Defective Goods Inventory (DGI):- those items that have been returned, have been delivered damaged and have a freight claim outstanding, or have been damaged in some way during warehouse handling. Defective Goods Inventory (DGI):- this part of inventory consits in goods delivered damaged and that are under an outstanding freight claim.

DEFECTIVE PLATING = ДЕФЕКТИВНОЕ (или НЕТОЧНОЕ, или РАЗЛАЖЕННОЕ) ПЛАТИРОВАНИЕ – Defective Plating:- the appearance on the face side of a fabric of the wrong one of two yarns knitted simultaneously at a feeder. Note:- this defect is caused by poorly differentiated feed heights or tension during plating. / Платирование – операция введения подкладочных нитей, которые соединяются с товаром платиновыми петлями в местах, где изгибы ложатся на иглы.

DEFECTIVE SELVEDGE = ДЕФЕКТНАЯ КРОМКА (или ДЕФЕКТИВНАЯ КРОМКА) – Defective Selvedge:- at the start of beam gaiting, the Jaquard Monogram and selvedge ends are properly checked for any abnormalities in selvedge. Improper Selvedge Tuck - in or loops at the edge of selvedge, Tails out or Weavy selvedge to be looked in to so that fabric woven is perfect as selvedge is the decoration of the fabric. Weaving defect. Defective Selvedge:- tails out, warp selvedge, loops, uneven, under tuck in, over tuck in, defect in monogram, curly selvedge are classified as defective selvedge. See also Faulty Selvedge. Defective Selvedge:- (i) Curled Selvedge:- caused due to incorrect balance of cloth structure between body and selvedge; (ii) Cut, Torn or Burst Selvage:- caused due to selvedge sticking to emery roller or damages caused by temple roller; (iii) Loppy Selvedge:- caused when the selvedge or cut the race board felt at the reed and the weft is caught on this groove when the sley beats up; (iv) Pulled In Selvedge:- caused due to isolated tight picks; (v) Rugged or Ragged Selvedge:- caused due to the variations in tension of the selvedge ends; (vi) Slacked Selvedge:- caused due the incorrect balance of cloth structure between the body and the selvedge; (vii) Tight Selvedge:- caused due to incorrect balance of structure between body and selvedge,selvedge yarns woven at high tension; and (viii) Uneven Selvedge:- caused by the variation in weft tension, lack of control on number of selvedge ends. / Порок или дефект ткачества. жёлоб или паз (groove).

DEFECTIVE WOOL = ДЕФЕКТНАЯ ШЕРСТЬ (или ДЕФЕКТИВНАЯ ШЕРСТЬ, или БРАКОВАННАЯ ШЕРСТЬ) – Defective Wool is a wool that contains excessive vegetable matter, such as burs, seeds, and straw, or which is kempy, cotty, tender, or otherwise faulty.

DEFECTS = ПОРОКИ (или ДЕФЕКТЫ) – (1) In textile industry, Defects is a general term that refers to some flaw in a textile product that detracts from either performance or appearance properties. / Дефект – невыполнение предполагаемого потребительского требования. Примечания:- (i) Термин Дефект применим, когда признак качества продукции, процесса или услуги оценивают с точки зрения использования в отличие от соответствия техническим условиям. (ii) Поскольку термин Дефект имеет определённое значение в законодательстве, им нельзя пользоваться как общим термином.

(2) In the grain industry, damaged kernels, foreign material, and shrunken and broken kernels. The sum of these three factors may not exceed the limit for the factor defects for each numerical grade. / В зерновой индустрии, повреждённая зерновка (повреждённые ядра), инородные примеси, и щуплая и битая зерновка. Сумма этих трёх показателей не может превышать лимита установленных цифровых показателей дефектов для каждого сорта.

(3) Metal Defects are the imperfections in the structure of metals and alloys. Metal defects impair the physicomechanical properties of such materials (for example, electrical conductivity, magnetic permeability, strength, density, and plasticity). A distinction is made between metal defects of the fine structure (on an atomic scale) and coarser defects – submicroscopic cracks that form along the boundaries of the blocks of a crystal and on its surface. Still coarser metal defects are the microscopic and macroscopic defects that are disturbances of continuity or homogeneity and that form in a metal as a result of the imperfection of processes or the poor technological nature of multicomponent alloys, which require particularly precise observance of conditions at each stage of their manufacture and processing. The defects found in metal products and intermediate products are distinguished on the basis of size and location, as well as nature and origin. They may form during smelting of the metal and production of castings (nonmetallic and slag inclusions, contraction cavities, pores, gas porosity, and blisters); during pressure treatment (ply separation, forging defects, laps, fine cracks, blisters, and flakes); as a result of thermal, chemicothermal, electrochemical, and mechanical treatment (cracks, burns, and decarburization); and in the process of joining metals – during welding, soldering, riveting, and so on (poor penetration, poor soldering, cracks, and corrosion). In addition, defects in intermediate and finished products may occur during storage, shipment, and operation (corrosion damage). Metal defects may be local (various faults of continuity, such as pores, cavities, cracks, ply separations, flakes, forging defects, and laps), distributed in limited zones (liquation conglomerations, incomplete hardening zones, zones of corrosive damage, and local cold hardening), or distributed throughout the entire volume or surface of a product (nonconformity of chemical composition, structure, or quality of machine processing). Local defects, which are confined to a limited volume, may be point, line, plane, or three-dimensional. Depending on their location they are divided into external (surface and subsurface) and internal (deep-seated). In an applied, technical sense, deviations from the normal quality that impair the operating characteristics of a metal or product and lead to a reduction in grade or to rejection of products should be considered defects. However, not every metal defect is a defect in the product; deviations from the normal quality of the metal that are not essential to the functioning of a particular product should not be considered defects for that product. Deviations from normal quality that are defects for products that operate under some conditions (such as fatigue loading) may be of no consequence under other conditions (such as static loading). The quality of a metal and of a product efficiently manufactured from it can be improved with complete elimination of the most dangerous defects (such as cracks, contraction cavities, ply separations, and flakes) and with a reduction to a certain minimum of the other defects that represent a lesser danger under the specific operating conditions of the particular product. High quality of the metal and of the products manufactured from it can be ensured by improving the production technology in order to preclude the possibility of the appearance of defects and by improving the methods of monitoring the quality of the metal in order to detect flaws and reject defective stock and intermediate and finished products. The quality of the metal is monitored by methods of chemical, spectral, X-ray structural, and metallographic analysis, which make it possible to detect deviations from the desired composition and structure. These methods generally require the taking of special samples of the metal and lead to damage to or destruction of the monitored products; therefore, they are used only for selective quality control. More reliable, thorough monitoring of metal defects that are disruptions of continuity or homogeneity is accomplished through the physical methods of nondestructive testing (flaw detection), which are based on the study of changes in the physical characteristics of the metal. For a final resolution of the question of whether the quality of the stock or product conforms to the standard, it is necessary to take into consideration not only the number, size, location, and character of the detected flaws but also the specific conditions of loading of the product and of its individual zones in use. / Ликвация (Liquation). Плавка или Выплавка или Плавление (Smelting). литьё или отливка (casting). пористость или рыхлость (porosity). ковка или штамповка (forging). Закалка или Упрочнение (Hardening). В металлах под Дефектами понимаются отклонения от предусмотренного техническими условиями качества металла по химическому составу, структуре, сплошности, состоянию поверхности, механическим и другим свойствам.

DEFENSE IN DEPTH = ЭШЕЛОНИРОВАННАЯ ЗАЩИТА – Defense In Depth (DiD):- multiple layers of security to provide added protection to IT resources.

DEFENSE MEMORANDA OF UNDERSTANDING = МЕМОРАНДУМ О ВЗАИМОПОНИМАНИИ В ВОПРОСАХ ОБОРОНЫ – Defense Memoranda Of Understandings (MOUs) are defense cooperation agreements. The MOUs are signed by the United States Department of Defense (US DOD) with allied nations and are related to research, development or production of defense equipment, or reciprocal procurement of defense items.

DEFENSIVE STOCKS = БЕЗОПАСНЫЕ АКЦИИ – Defensive Stock is a stock that provides a constant dividend and stable earnings regardless of the state of the overall stock market. This is not to be confused with a 'Defense Stock', which refers to stock in companies which manufacture things like weapons, ammunition and fighter jets. Defensive stocks remain stable during the various phases of the business cycle. During recessions they tend to perform better than the market; however, during an expansion phase it performs below the market. Betas of defensive stocks are less than one. To illustrate this phenomenon, consider a stock with a beta of 0.5. If the market is expected to drop 15%, and the existing risk-free rate is 3%, a defensive stock will only drop 9% (0.5*(–15%–3%)). On the other hand, if the market is expected to increase 15%, with a risk-free rate of 3%, a defensive stock will only increase 6% (0.5*(15%–3%)). The utility industry is an example of defensive stocks because during all phases of the business cycle, people need gas and electricity. Many active investors will invest in defensive stocks if a market downturn is expected. However, if the market is expected to prosper, active investors will often choose stocks with higher betas in an attempt to maximize return. Also known as a Non-Cyclical Stock because it is not highly correlated with the business cycle. Shares which offer a good return but have only limited potential for an appreciation in price. Exposure to price declines is also only marginal. Defensive Stocks are the shares of companies that are not affected by economic cycles, because they produce necessities, e.g., food.

DEFERRED ACCOUNT = РАСЧЁТ В РАССРОЧКУ – The Deferred Account facility offers bullion clients both gearing and flexibility. As an alternative to an outright forward transaction with a set timescale and quantity, a deferred account offers the facility to trade in bullion as a spot deal but to run the position through time without settling transactions. It can be considered an open-ended, rolling forward. The underlying premise of the facility is that settlement and delivery of transactions are deferred on a day-by-day basis – the buyer does not pay Dollars and the seller does not deliver bullion. While bullion against purchases or sales is credited or debited to a client's unallocated account in gold or silver, and the cash countervalue of the transaction is debited or credited to his currency account, actual settlement and delivery are not effected. The client is then charged interest on day-to-day balances for the account that is in debit – either metal or cash – and paid for the account that is in credit, based on an agreed formula set by the dealer. Interest is applied to the accounts at specified intervals. Deferred Account is a system allowing the shipowner to pay his annual premium by installments. Deferred Account is an account that postpones tax liabilities until a future date. A deferred account refers to one where there is a deferral of tax, usually in accounts specifically designed for retirement, such as an Individual Retirement Account (IRA) in the

United States. Deferred accounts have proved to be enormously popular since their introduction, especially as fewer companies offer pensions and the burden of saving for retirement has shifted to individuals. The rationale behind deferred accounts is that they facilitate saving for retirement by enabling investments to grow tax-free until withdrawal. This tax-free compounding effect may generally enable investments in deferred accounts to grow faster than in taxable accounts. Another benefit of deferred accounts is that investments are only taxed upon withdrawal, which is usually assumed to be at retirement, when the contributor is presumably in a lower tax bracket. / Система, позволяющая владельцу судна оплачивать причитающуюся ежегодную премию частями.

DEFERRED ASSET = ОТЛОЖЕННОЕ ТРЕБОВАНИЕ (или ОТЛОЖЕННЫЙ АКТИВ) – The term Deferred Asset refers to a deferred charge or a deferred debit. A deferred charge is reported on the balance sheet in the long-term asset section other assets. An example of a deferred charge is bond issue costs. These costs include all of the fees that a corporation incurs in order to register and issue bonds. The fees are paid near the time that the bonds are issued but they will not be expensed at that time. Rather, the bond issue costs are initially deferred to the long-term asset section of the balance sheet. Then in each year of the life of the bonds, a portion of the bond issue costs will be systematically moved from the balance sheet and will appear as an expense on the income statement. The process of systematically reducing this deferred charge is known as amortizing the bond issue costs. Deferred Asset:- expense incurred that does not match the income it will provide in the same accounting period. Also known as Deferred Debit. See also Deferred Charge. Deferred Asset:- prepaid recurring expense (such as insurance, interest, or rent) carried forward as an asset, until the associated service or benefit is received. Also called Deferred Debit.

DEFERRED CHARGE = РАСХОДЫ БУДУЩИХ ПЕРИОДОВ (или ОТЛОЖЕННЫЕ РАСХОДЫ, или ОТСРОЧЕННЫЕ РАСХОДЫ) – Deferred Charge:- a prepaid expense that is treated as an asset on a balance sheet and is carried forward until it is actually used. Deferred charges often stem from a business making a payment for a good or service that it has not yet received, such as the prepaying of insurance premiums or rent. A company may pay for a year of rent in advance, for example, to receive more favorable terms; this advanced payment is recorded as a deferred charge on the balance sheet. Each month, the company can then use a portion of the funds in its deferred charges account and recognize this amount as an expense on any financial statements. Also called Prepaid Expense. Recording deferred charges ensures that a company's accounting practices are operating within the generally accepted accounting principles (GAAP) by matching revenues with expenses each month. A company may capitalize the underwriting fees on a corporate bond issue as a deferred charge, subsequently amortizing over the life of the bond issue. Deferred charges refer to payments that the company has made prior to receiving the corresponding goods and/or services. Deferred revenue, on the other hand, refers to money that the company has received as payments before a product has been delivered. A prime example of a deferred charge is rent. Consider the case where a company pays a lump sum to its landlord to cover rent for six months. As each month approaches, the company will use a portion of the funds from its deferred charges account and recognize this portion as an expense on its financial statements. This process ensures that revenues for the month are matched with the expenses incurred for that month. Cost already incurred that is deferred to the future. Deferred charges are classified as non-current assets because their life extends beyond one year. Deferred Charge:- expenditure not recognised as an expense of the period when occurred but carried forward to a future period for the purpose of matching against subsequent revenues. Also known as Deferred Asset, Deferred Cost, and Deferred Expenditure.

DEFERRED CREDIT = КРЕДИТ БУДУЩИХ ПЕРИОДОВ (или ОТЛОЖЕННЫЕ ПОСТУПЛЕНИЯ) – Deferred Credit:- income that is received by a business but not immediately reported as income. Typically, this is done on income that is not fully earned and, consequently, has yet to be matched with a related expense. Such items include consulting fees, subscription fees and any other revenue stream that is intricately tied to future promises. For example, a book club might defer income from a two-year membership plan until all the costs of procurement and shipping are assessed. Also known as Deferred Income or Deferred Revenue. Deferred credit is used largely for bookkeeping purposes and as a means to even out, or 'smooth' financial records and give a more accurate picture of business activities. Using the previous example of a book club, if all membership or subscriptions fees just happened to come in during the first quarter and all products were shipped out in the second, the quarter-to-quarter income statement would obviously be skewed. Deferred Credit:- income received by a business entity that has not yet been earned. For example, prepaid rent is a deferred credit for a landlord who receives rent in advance. Also known as Deferred Income, Deferred Liability, Deferred Revenue, and Unearned Income. A Deferred Credit could mean money received in advance of it being earned, such as deferred revenue, unearned revenue, or customer advances. A deferred credit could also result from complicated transactions where a credit amount arises, but the amount is not revenue. A deferred credit is reported as a liability on the balance sheet. Depending on the specifics, the deferred credit might be a current liability or a noncurrent liability. In the past, it was common to see a noncurrent liability section with the heading Deferred Credits.

DEFERRED DELIVERY = ОТЛОЖЕННАЯ ПОСТАВКА (или ОТСРОЧЕННАЯ ПОСТАВКА) – Deferred Delivery:- shares quoted 'dd' are the result of a reconstruction of the company's share capital where shareholders have surrendered old scrip to the company but the company has yet to issue new scrip. Shareholders who wish to sell must do so on a 'dd' basis so buyers know that they cannot yet expect delivery of scrip.

DEFERRED (DELIVERY) MONTH = ОТДАЛЁННЫЙ МЕСЯЦ (ПОСТАВКИ) – Deferred (Delivery) Month:- the more distant months in which futures trading is taking place, as distinguished from the nearby (futures delivery) month. See also Back Month.

DEFERRED EXPENDITURE = РАСХОДЫ БУДУЩИХ ПЕРИОДОВ – Deferred Expenditure:- also known as Deferred Expenses or Deferred Revenue Expenditures, Deferred Expenditures are any type of business expenses that are paid for in one accounting period but are carried over into subsequent periods due to the benefit of those purchases providing benefits later on. Many companies account for these types of expenditures by tracking them in a special deferred expenditure account that is associated with other non-current expenses carried by the company. Once the benefits from the purchase are realized, the amount can be transferred to the profit and loss statement as a normal or current expenditure. One of the easiest ways to determine if a particular expense should be classed as a deferred expenditure is to consider when benefits from the purchase will be realized. If the benefits are incurred immediately, then the expenditure should be classed as current. Should the benefits be realized incrementally over the course of several periods, then it is proper to account for the transaction in a deferred expenditure account. It is not unusual for a business to make sure that specific guidelines are in place for classifying various purchases, often as a means of keeping the process uniform and also making it easier to reconcile the accounting records for audits and for the preparation of reports used in preparing tax returns. A common example of a deferred expenditure is the cost of advertising. When a company launches a new advertising campaign, the chances of achieving immediate benefit in terms of revenue may or may not be present. Typically, the returns that are generated directly as a result of the advertising expenses incurred during one accounting period will be spread over several periods. In the interim, the cost is accounted for as non-current in the accounting records, and can be transferred once it is determined that the benefits associated with those particular expenditures have been fully realized. Many companies also class several other types of expenses in this manner. Any type of prepaid insurance premiums may be classed as deferred expenses. In like manner, office supplies purchased in one period for use

in a subsequent period qualify as a deferred expenditure. Just about any type of good or service that is purchased and paid for with plans to use it in a future accounting period will fit into this category. As long as the full benefit is not derived until a later point in time, there is a good chance that it can rightly be identified as a Deferred Expenditure. Deferred Expenditure is an expenditure for which payment has been made or a liability incurred but which is carried forward on the presumption that it will be of benefit over a subsequent period or periods. This is also referred to as Deferred Revenue Expenditure. See also Deferred Charge. Deferred Expenditure is a cost to the company that has invariably been paid but doesn't impact on the company's profit/loss accounts in the month it was paid but further into the financial year or possibly the next depending on when it will be utilized. Small companies may not reflect deferred expenditure in their accounts but larger corporate entities will have company accounting policies to deal with deferred expenditure or prepayments as by the very nature of the business and the size may have a big impact in the financial records of the company. An example would be if your company were to purchase £4 000 of packing materials but only used £1 000 in the month they were purchased, by charging the full amount of £4 000 to your Profit/loss account in one month you would be distorting your figures so better to place the remaining amount on the balance sheet as deferred expenditure and charge an appropriate amount the following month.

DEFERRED FUTURES = ОТДАЛЁННЫЕ ФЬЮЧЕРСЫ (или ОТСРОЧЕННЫЕ ФЬЮЧЕРСЫ) – Deferred Futures are the futures delivery months, of those currently trading, that expire farthest in the future. Also known as Back Months, or Forward Months. The opposite of Nearby. / Отдалённые Фьючерсы или Отсроченные Фьючерсы:- те месяцы поставки фьючерсов, торгуемых в данное время, по которым срок действия истекает в будущем в дальнейшем. Известны также как Отдалённые Месяцы (Back Months), или Форвардные Месяцы (Forward Months). В противоположность Ближайший (Nearby).

DEFERRED INCOME = ДОХОДЫ БУДУЩИХ ПЕРИОДОВ – Deferred Income refers to an obligation to provide goods or service for which company received advance payment. For example, company may have entered into research and development contracts and received up front payment for some of these activities. If company needs to acquire facilities and equipment and hire scientists before it can begin the research, it might be paid for some costs in advance. Although company has received cash, it cannot recognize this payment as revenue, since under the realization concept it has not provided these services yet. Thus the advance payment is offset by a deferred income liability for the same amount. The deferred income liability will be reduced as the company completes the research and development services and recognizes the revenue for these activities. Company may have a second deferred income liability that is not listed under current liabilities. This means that company received advance payment for obligations that extend beyond 1 year. The portion of the advance payment for research activities over the next year is listed under current liabilities while the balance is listed as a noncurrent liability. See also Deferred Credit. Deferred Income is income received but not earned until all events have occurred. Deferred income is reflected as a liability.

DEFERRED LIABILITY = ОТЛОЖЕННОЕ ОБЯЗАТЕЛЬСТВО (или ОТСРОЧЕННОЕ ОБЯЗАТЕЛЬСТВО, или ДОЛГОСРОЧНОЕ ОБЯЗАТЕЛЬСТВО) – Deferred Liability refers to a debt which is incurred and due which a person or entity does not resolve with a payment. The payment will be due at some point in the future and thus the liability is said to be 'deferred'. A number of types of liabilities can be deferred, ranging from payments on loans to income taxes which must be paid. Deferred liabilities are accounted for in the accounting books to provide a more complete financial picture. Deferred tax liability is a very common form of deferred liability. In this case, it is recognized in the books that extra tax liability is being incurred, but it is not paid at the time. There are lots of reasons why people might incur liability which remains unpaid, such as changes in accounting practices and tax rates, acceptance of credits which are not yet applied, and so forth. By recording the deferred liability in the books, an accountant can make sure that it is recorded so that it will not be a surprise when it comes due. Debts in general, also known as Liabilities because they represent a liability in someone's books, can be deferred for a number of reasons. Deferred payment may be structured into a debt, as for example when someone buys a new car and makes no payments for the first year, and changing circumstances may require renegotiation of the debt, including deferment of payments. As long as a debt is owed and not paid, it is considered a deferred liability. Financing is one of the cornerstones of operations for businesses large and small as well as individuals. Incurring debt allows people to make investments which would otherwise not be accessible so that their companies and financial positions can grow. Without the ability to access credit, people would be limited to their cash on hand when it comes to making investments and this can be limiting. The ability to defer debt and stagger payments is also important as it allows people to repay debt at a rate which is sustainable. Care must be taken to record deferred liabilities so that accounts are accurate, as failure to record a debt can make the books appear better than they are. With debts also come related expenses such as service charges, interest, and so forth. A deferred liability represents a business or personal liability which will be payable in the future. Deferred Liability is a liability that does not fall due until after a period of a year. Deferred Liability is a liability of indeterminate term introduced into the accounting records in order to match revenues and expenses of the current period, e.g., a deferred income tax liability relates to the proportion of income tax expense arising from timing differences in a period. / , например, .

DEFERRED PAYMENT = ОТЛОЖЕННЫЙ ПЛАТЁЖ (или ПЛАТЁЖ С ОТСРОЧКОЙ) – Deferred Payment is delayed payment on the sale of a commodity, at a preestablished price. Expression used for a letter of credit with a deferred payment date, e.g., 90, 120, 180 days after the date of the bill of lading. No draft is required. Deferred Payment:- payment a set period of time after shipment or presentation of shipping documents, as opposed to immediately or at sight. A distinction is drawn between a letter of credit that is available for deferred payment and one that is available for acceptance of time drafts in that no drafts are involved under a deferred payment L/C. Without accepted drafts, the beneficiary's ability to sell, or discount, his right to payment to a lender or investor is restricted. / , например, . Отсроченный Платёж (как способ исполнения аккредитива):- платёж по аккредитиву, осуществляемый через определённое количество дней или в течение определённого времени после предоставления документов бенефициаром в банк, либо после даты выписки транспортного документа, либо другой даты.

DEFERRED PAYMENT CREDIT = АККРЕДИТИВ С ОТСРОЧКОЙ ПЛАТЕЖА (или АККРЕДИТИВ С ОТЛОЖЕННЫМ ПЛАТЕЖОМ) – Deferred Payment Credit is a type of Letter of Credit. Provides for payment some time after presentation of shipping documents by exporter. Under a Deferred Payment Credit, the issuing bank and any confirming bank undertake to effect payment at a specified later date (for instance, 90 days after the date of shipment) subject to the presentation of the stipulated documents within the expiry date of the documentary credit. As such, the maturity date must be ascertainable in accordance with the tenor stated in the credit. The exporter thus grants the importer time to pay. Features:- the credit is available by deferred payment:- (i) in the case of unconfirmed credits, only the issuing bank is liable to the exporter for payment on the due date. Consequently, there is a long period during which the credit and country risk are not covered. (ii) In the case of confirmed credits, the exporter receives such a payment undertaking from both the issuing and the confirming bank. Advantages:- the advantages of unconfirmed deferred payment credits:- (i) the importer is not required to effect payment until the due date. If necessary, the goods can be re-sold during the payment period and the proceeds of the sale used to settle the documentary credit. (ii) More cost-effective than a confirmed credit. The additional advantages of confirmed deferred payment credits:- (i) the additional advantages of confirmed deferred payment credits: this form of credit offers the exporter extensive security as the credit risk is extremely limited – bank UBS AG, for instance, is liable to the exporter

– and the country risk is eliminated altogether. (ii) The credit is available with the confirming bank, which means that the exporter receives the payment undertaking from the confirming bank (UBS) as soon as the stipulated documents have been presented if they constitute a complying presentation. (iii) The risks associated with postage – late delivery or loss – for the exporter are largely eliminated as the credit is deemed to have been utilized once the complying documents have been presented to the confirming bank. (iv) Under certain circumstances, the exporter can benefit from the prepayment of the credit subject to an interest charge once the complying documents have been presented. Disadvantages:- the disadvantages of unconfirmed deferred payment credits:- (i) under certain circumstances, there is a risk that the exporter will not be paid in the event of problems in the country in which the issuing bank is based or credit-related difficulties on the part of the issuing bank. (ii) The exporter must bear the financing costs during the payment period. (iii) Compared with payment against open account or documentary collection, the administrative costs are higher. The disadvantage of confirmed deferred payment credits:- this is a more expensive option than an unconfirmed credit because the confirming bank effectively guarantees the payment and thus charges a commitment fee for the risk it assumes. Special Features:- in contrast to acceptance credits, in this instance there is no liability on a bill. Furthermore, as a general rule no time draft should be necessary for the purposes of the credit. Should the terms of the credit nevertheless require one, drawn on the buyer, this is treated as an additional document. Even if a documentary credit does not include a confirmation instruction, the nominated bank can in certain cases enter into a special agreement with the exporter in the form of a so-called Silent Confirmation. Such an agreement will set out the risks covered by the nominated bank. Recommendations:- unconfirmed deferred payment credits are only appropriate if the exporter is able to accurately assess and accept the country risk and the credit risk on the part of the issuing bank. Furthermore, he should be in a position to await payment until the due date and not require pre-financing of the payment period. Should the exporter require greater security and/or financing of the payment period, however, he should request a confirmed acceptance or negotiation credit. We recommend that the exporter contact us before entering into any major deals in order to establish whether or not UBS would be willing to issue such a confirmation. We recommend that the exporter incorporate the following payment clause in the basic agreement. Payment Clause:- (i) Unconfirmed Credits:- '… against documentary credit, to be advised through UBS AG, Trade Finance, PO Box, CH-8098 Zurich (SWIFT UBSWCHZH80A), in our favor, available until (= date) with the advising bank, by deferred payment at ... days after the date of shipment, against presentation of the stipulated documents'. The exporter awaits payment until the due date. (ii) Confirmed Credits:- '… against documentary credit to be issued by a prime bank and confirmed by UBS AG, Trade Finance, PO Box, CH-8098 Zurich (SWIFT:- UBSWCHZH80A), in our favor, available until (= date) with the confirming bank, by deferred payment at ... days after the date of shipment against presentation of the stipulated documents'. In certain cases the exporter can arrange for a prepayment on the payment subject to deduction of an interest charge. Deferred Payment Credit is a type of a letter of credit where payment is made at a specified interval after collection papers are submitted. Deferred Payment Credit:- when getting a business loan of any kind, it's always a good idea to look into some deferred payment credit options. Deferred credit means that the borrower can repay the loan on various terms that are more suitable and flexible. Some examples of a deferred payment credit include import loans, which only require repayment on the loan when proof of delivery of goods is shown. Some loans will also let the business owner begin repaying only when they can show .... / Ю.Би.Эс. А.Ге. (UBS AG) .

DEFERRED PREMIUM = ОТЛОЖЕННАЯ ПРЕМИЯ (или ОТСРОЧЕННАЯ ПРЕМИЯ) – In reference to insurance, a Deferred Premium is the part of a premium which, following agreement with the insurer, is payable by monthly, quarterly or half-yearly instalments.

DEFERRED PRICE CONTRACT = КОНТРАКТ С ОТЛОЖЕННОЙ ЦЕНОЙ (или ДОГОВОР С ОТСРОЧЕННОЙ ЦЕНОЙ) – Deferred Price Contract is a contract that transfers title of the commodity from the producer to the buyer, with the price to be determined at a future date.

DEFERRED PRINTING OF SECURITIES = ОТЛОЖЕННАЯ ПУБЛИКАЦИЯ О ЦЕННЫХ БУМАГАХ (или ОТСРОЧЕННАЯ ПУБЛИКАЦИЯ О ЦЕННЫХ БУМАГАХ) – Deferred Printing Of Securities:- system of holding securities in safekeeping in non-certificate form, i.e. purchases and sales are merely recorded in customers' accounts. Security certificates are only printed at the express wish of the customer, e.g., for over-the-counter delivery. / , то есть . , например, .

DEFERRED REBATE = ОТЛОЖЕННЫЙ ВОЗВРАТ (ЧАСТИ ПЛАТЕЖА) (или ОТСРОЧЕННЫЙ ВОЗВРАТ (ЧАСТИ ПЛАТЕЖА)) – Deferred Rebate:- the return of a portion of the freight charges by a carrier or a conference shipper in exchange for the shipper giving all or most of his shipments to the carrier or conference over a specified period of time (usually six months). Payment of the rate is deferred for a further similar period, during which the shipper must continue to give all or most of his shipments to the rebating carrier or conference. The shipper thus earns a further rebate that will not, however, be paid without an additional period of exclusive or almost exclusive patronage with the carrier of conference. In this way, the shipper becomes tied to the rebating carrier or conference. Although the deferred rebate system is illegal in the US foreign commerce, it generally is accepted in the ocean trade between other countries. Deferred Rebate:- when a carrier refunds a percent of charges to shippers who commit cargo for a period of time to the carrier. It is paid at the end of the period. Deferred Rebate:- arrangement under which a carrier offers to refund a percentage of the total freight charges to shippers who commit their cargo for a certain period (usually six months) to the carrier. This refund is paid out at the end of the period.

DEFERRED REIMBURSEMENT = ОТЛОЖЕННАЯ ОПЛАТА (или ОПЛАТА С ОТСРОЧКОЙ) – Deferred Reimbursement:- arrangement under a letter of credit (L/C) where the issuing bank agrees up front with its customer, the applicant, to pay the beneficiary upon presentation of the documents required in the L/C but to defer charging the applicant until a later date, thereby financing the purchase of goods under the L/C, usually for the expected amount of time the applicant needs in order to re-sell the goods.

DEFERRED SETTLEMENT = ОТЛОЖЕННЫЙ РАСЧЁТ (или ОТСРОЧЕННЫЙ РАСЧЁТ) – Deferred Settlement is an arrangement whereby settlement of both sides of a bullion deal, metal and money, are deferred on a day-to-day basis. Deferred Settlement is a situation in which the settlement of a bullion market contract is deferred by mutual agreement on a daily basis. A settlement in which the obligation to settle on a trade date plus three (3) business days (T+3) basis is deferred until the time following the dispatch date that the Australian Securities Exchange (ASX) fixes. A situation in which the settlement of a bullion market contract is deferred daily.

DEFERRED STOCKS = ОТЛОЖЕННЫЕ АКЦИИ (или ОТСРОЧЕННЫЕ АКЦИИ) – Shares which are not entitled to a dividend until the other share categories have had a dividend paid on them or which remain without dividend for a stipulated number of years and are then automatically converted into ordinary shares. Also known as Deferred Shares, Dividend Deferred Shares; or Subordinated Issues in Switzerland.

DEFERRED TAX ASSET = АКТИВ С ОТЛОЖЕННЫМ НАЛОГООБЛОЖЕНИЕМ – Deferred Tax Asset is an asset on a company's balance sheet that may be used to reduce any subsequent period's income tax expense. Deferred tax assets can arise due to net loss carryovers, which are only recorded as assets if it is deemed more likely than not that the asset will be used in future fiscal periods. It must be determined that there is more than a 50% probability that the company will have positive accounting income in the next fiscal period before the deferred tax asset can be applied. If, for example, a company has a deferred tax asset of USD25 000 on its balance

sheet, and then the company earns USD75 000 in before-tax accounting income, accounting tax expense will be applied to USD50 000 (USD75 000 – USD25 000), instead of USD75 000. Deferred Tax Asset:- the deferred tax consequences attributable to deductible temporary differences and carryforwards. A deferred tax asset is measured using the applicable enacted tax rate and provisions of the enacted tax law. A deferred tax asset is reduced by a valuation allowance if, based on the weight of evidence available, it is more likely than not that some portion or all of a deferred tax asset will not be realized.

DEFERRED TAX CONSEQUENCES = ПОСЛЕДСТВИЯ ОТЛОЖЕННОГО НАЛОГООБЛОЖЕНИЯ – Deferred Tax Consequences:- the future effects on income taxes as measured by the applicable enacted tax rate and provisions of the enacted tax law resulting from temporary differences and carryforwards at the end of the current year.

DEFERRED TAX LIABILITY = ПАССИВ С ОТЛОЖЕННЫМ НАЛОГООБЛОЖЕНИЕМ (или ОБЯЗАТЕЛЬСТВО С ОТЛОЖЕННЫМ НАЛОГООБЛОЖЕНИЕМ) – Deferred Tax Liabilities arise from timing difference between recognized tax liabilities in an organization's account and tax liabilities reported to the tax authorities; the tax amount due in one period but deferred for payment in another period. The deferred tax consequences attributable to taxable temporary differences. A deferred tax liability is measured using the applicable enacted tax rate and provisions of the enacted tax law. Deferred Tax Liability is an account on a company's balance sheet that is a result of temporary differences between the company's accounting and tax carrying values, the anticipated and enacted income tax rate, and estimated taxes payable for the current year. This liability may or may not be realized during any given year, which makes the deferred status appropriate. Because there are differences between what a company can deduct for tax and accounting purposes, there will be a difference between a company's taxable income and income before tax. A deferred tax liability records the fact that the company will, in the future, pay more income tax because of a transaction that took place during the current period, such as an installment sale receivable.

DEFIBRILLATION = ДЕФИБРИЛЛЯЦИЯ – Defibrillation is a removal of fibrils from the surface of a fabric. Individual fibers can become partially separated from the yarns that make up a fabric, poking up and degrading the appearance of the fabric. Fibrillation can result from long wet processing, especially if agitation is vigorous. With cellulose fibers, cellulase enzymes are now commonly used to remove fibrils from dyed garments.

DEFICIENCY = НЕДОСТАТОЧНОСТЬ – Deficiency is any inadequacy or shortage of substances essential to growth and development of plants. Lacking in some quality, faculty, or characteristic necessary for completeness.

DEFICIENCY PAYMENT = ПЛАТЁЖ НЕДОСТАЮЩЕЙ СУММЫ (или НЕДОСТАЮЩИЙ ПЛАТЁЖ) – In the United States, Deficiency Payment is a direct Government payment to participating producers if farm average prices fall below specified target price levels during the calendar year. Payment rates cannot exceed the difference between target prices and price support loan rate.

DEFICIT = ДЕФИЦИТ – Deficit is an amount by which expenditures exceed revenues, or uses of funds exceed sources of funds, for a given period. In public accounting, a deficit is a debit balance in the retained earnings account, presented on the balance sheet as a contra account to shareholders' equity. It can also mean negative net income for an accounting period. In governmental accounting, a budget deficit is the excess of spending over receipts, and is financed by increasing the public debt. In balance of payments accounting, a balance of trade or balance of payments deficit is the excess of a nation's imports over its exports. The opposite of Surplus. Deficit is the amount each year by which government spending is greater than government income. Deficit:- as in Federal Deficit – this refers to a fiscal year shortfall in annual federal revenues over federal expenditures, somewhat akin to the loss as reported on a profit and loss statement. Deficit is a financial shortage that occurs when liabilities exceed assets. / Под Дефицитом, от Латинского слова Deficit, означающее Недостаёт, понимается недостаток, нехватка чего-либо, а также товар, которого нет в достаточном количестве. Дефицит:- ситуация, при которой совокупность издержек или потерь на счёте клиента превышает доход или прибыль.

DEFICIT RATIO = СООТНОШЕНИЕ С ДЕФИЦИТОМ – Deficit Ratio:- the subject of one of the fiscal criteria used to define the existence of an excessive deficit, as laid down in Article 104(2) of the EC Treaty. It is defined as the ratio of the planned or actual government deficit to gross domestic product at current market prices. The government deficit is defined in Protocol No. 20 (on the excessive deficit procedure) as net borrowing of the general government.

DEFICIT WEIGHT = НЕДОСТАЮЩАЯ НАГРУЗКА (или НЕДОСТАЮЩИЙ ВЕС) – Deficit Weight is the weight by which a shipment is less than the minimum weight.

DEFINED BENEFIT = УСТАНОВЛЕННАЯ ВЫПЛАТА – Defined Benefit is a compensation scheme used by pension funds. Here participants are promised a specific monthly benefit – or single lump-sum payment – at retirement. Opposite:- Defined Contribution.

DEFINED BENEFIT PLAN = ПЛАН УСТАНОВЛЕННЫХ ВЫПЛАТ – Defined Benefit Plan is a company retirement plan in which a retired employee receives a specific amount based on salary history and years of service and in which the employer bears the investment risk.

DEFINED BENEFIT SUPERANNUATION PLAN = ПЛАН УСТАНОВЛЕННЫХ ВЫПЛАТ ПОСЛЕ ВЫХОДА НА ПЕНСИЮ – Defined Benefit Superannuation Plan:- a superannuation fund where the benefits are defined, as opposed to being the sum of the contributions and interest, less any management expenses.

DEFINED CONTRIBUTION = УСТАНОВЛЕННАЯ КОНТРИБУЦИЯ – Defined Contribution is a commitment on the part of an employer to make contributions towards an employee's retirement pension. Under a defined contribution plan, no specific amount of benefits is promised. Opposite:- Defined Benefit.

DEFINITIVE SECURITIES = ДЕЙСТВИТЕЛЬНЫЕ (или ОКОНЧАТЕЛЬНЫЕ, или РЕШИТЕЛЬНЫЕ) ЦЕННЫЕ БУМАГИ – Definitive Securities are the securities that are issued in the form of a paper certificate as opposed to book-entry securities which are electronic entries into a computer. Examples of definitive securities include bearer and registered bonds. Con artists use scams offering the opportunity to 'rent' or 'lease' Treasury securities. These assets typically exist in book entry form and allow the scam to appear legitimate while providing the con artist with ample excuses when asked to present proof of ownership. In the United States, Definitive Securities are the securities that are recorded on engraved paper certificates and payable to the bearers or to specific, registered owners. Definitive Securities are the securities issued in certificate form, as distinguished from book-entry security where ownership is indicated by entries in a computer. Most Treasury securities are in book-entry form. Also, a permanent bond issued by a corporation, replacing a temporary bond. See also Bearer Bond, and Registered Bond.

DEFLATION = ДЕФЛЯЦИЯ (или РАЗВЕВАНИЕ) – Deflation is a persistent and widespread decline in price levels for goods and services in an economy. Opposite:- Inflation. Deflation may be caused by economic (decline in demand) or monetary factors (restrictive monetary policy). Deflationary policies aim to combat inflationary pressure by restricting the money supply or pursuing an anti-inflationary course which keeps state spending low to counteract the widespread rise in demand. Deflation is a process in which the

general price level falls continuously over a sustained period of time. The opposite of Inflation – that is, a sustained fall over time in the general level of prices, normally measured by the annual percentage increases or decreases of a weighted index of prices of some large and representative sample of goods and services (both consumers' goods and producers' goods) regularly traded in the particular economy under consideration. Just as very large scale inflations are normally the result of large percentage increases in the money stock, large-scale deflations are normally the consequence of substantial reductions in the available money stock. Persistent decrease in prices, generally caused by a fall in the level of economic activity within a country. What is the difference between Disinflation and Deflation? Are they the same? These terms are often confused with each other. Deflation refers to a sustained fall in price levels. This is a phenomenon when the periodic change in the Consumer Price Index (CPI) is negative. Disinflation, on the other hand, is a decline in the rate of increase in price levels. Confusing? Here's an example. Canada underwent deflation in the 1930s when their CPI dropped more than 20% over a four-year period. For disinflation, let's look at a hypothetical example... In 1990, a nation's CPI increased by 5% from a year earlier. In 1991, the CPI rose by 4%. The following year CPI climbed by 3% and the year after it rose by 2%. And finally in 1994, CPI increased by 1%. From 1990 to 1994, the nation underwent a period of disinflation because the increase in CPI was declining (5%, 4%, and so on until 1%). This is very different from deflation because the price level change was positive. Disinflation is a decrease in the rate of inflation (i.e. from 2.0@ to 1.8%) while deflation is the decrease in the deflation is a decrease in the general price of a set of goods and services (from 0.0% to –0.5%). They are not the same. Disinflation refers to the decrease of inflation rate; while deflation happens when prices goes down. Most people think that disinflation is good and deflation bad. However, with deflation, consumers have more purchasing power but less access to money. Those who have debts will suffer because of dropped income but payments are constant. Deflation is the decrease in the general price level. It can also be referred to as Negative Inflation. Disinflation is a fall in the rate of inflation, i.e. from 4% to 2%. Deflation is a sharp decline in prices or an increase in the purchasing power of money, brought about by a decrease in the amount of money in circulation relative to the amount of goods and services available. Accompanied as a rule by a contraction in capital spending activity. Deflation is a sustained decline in the general price level, e.g., in the consumer price index, over an extended period. In common usage Deflation is generally considered to be 'falling prices'. But there is much more to it than that. Often people confuse deflation with disinflation or with Depression (as in 'the Great Depression'). These three terms are related but not synonymous. According to Investorwords.com the definition of Deflation is 'a decline in general price levels, often caused by a reduction in the supply of money or credit. Deflation can also be brought about by direct contractions in spending, either in the form of a reduction in government spending, personal spending or investment spending. Deflation has often had the side effect of increasing unemployment in an economy, since the process often leads to a lower level of demand in the economy. The opposite of Inflation.' Deflation Cause and Effects:- Although the above definition is basically true it confuses cause and effect. In that the cause of price deflation (falling prices) can be monetary deflation (a decrease in the money supply) but there can be other causes as well. And the effects are different depending on the cause. Deflation doesn't always have the side effect of unemployment or even making the masses poorer. It all depends on the cause of the deflation. Deflation has 4 major causes, one of which is actually an improvement in the technology of production, i.e. increased productivity. A good example of this was during the industrial revolution and again with the development of the personal computer (technological revolution) both times prices fell and employment rose. People could afford marvelous machines like cars and computers that increased productivity and made the general populace richer as a result. What Causes Deflation? For a true understanding of both Inflation and Deflation we need to understand Supply and Demand. Just like every other commodity there is a supply of and a demand for 'Money'. In this article I am not going to address the issues of what true money is, for the sake of this article we will assume money is simply something other people are willing to accept in exchange for goods or services. Price levels are the direct result of the relationship between the supply and the demand for any given item. But the value of the money used to pay for those items is also subject to the same relationship. For the sake of simplicity let's assume that we are on an island and there are ten equally desirable goods in our universe and ten USD1.00 bills available to purchase them with. We can safely assume that each item will end up costing USD1.00 each. If the quantity of money increases to USD20 (without increasing the quantity of goods) the price of the goods will increase to USD2.00 – that is inflation. If, however, the quantity of money decreases to USD5.00 the price will fall to 50¢ (deflation). This is what the first part of the above definition is referring to. The money supply can also be reduced if someone on our island hoards half of it and refuses to spend it on anything no matter what. This is the second part of the definition (reduction in spending). So far we have only looked at part of the equation, the supply of money. But what happens if the quantity of goods available increases? What if instead of having ten items we build ten more? We now have twenty items and only USD10.00 so once again each item is worth 50¢. This form of deflation is the good type. Everyone assumes that deflation is bad because the last major deflation that we had was during the 'Great Depression' so deflation and Depression are synonymous in many peoples minds. In actuality, if prices go down because the goods can be manufactured more cheaply this ends up increasing everyone's wealth. This is exactly what happened in the late 1990s, with cheap productivity available from former Communist countries the quantity of goods is increased while the money supply increased at a slower rate. How Does Demand Affect Deflation? What about the demand for goods? If everyone on our island already has one of the items available and no one needs any more, naturally the price will also fall as sellers try to find someone to take them off their hands. So far we have dealt with the supply of money, the supply of goods and the demand for goods, but what about the demand for money? Is it possible that the demand for money could increase or decrease? Generally, the demand for money is measured by how much people are willing to pay to borrow it (i.e. interest rates). If inflation is high, interest rates will have to be higher to compensate for the loss of purchasing power. But also if the demand for money rises banks can charge more to loan it. Conversely, if the demand for money falls interest rates will also fall. So there are four causes for Deflation:- (i) Deflation from Decreasing Money Supply; (ii) Deflation from Increasing Supply of Goods; (iii) Deflation from Decreasing Demand for Goods; and (iv) Deflation from Increasing Demand for Money. Note:- Increasing demand or decreasing supply of money have the same result, i.e. 'tight money' either way people want more money than is available. Both could also result in (or cause) higher interest rates. But the higher interest rates should also tend to balance (or decrease the demand for money because it is now more expensive). In other words as interest rates rise at some point the demand drops off because people don't want it bad enough to pay such high rates. Is Deflation Good or Bad? Actually, deflation itself is neither good nor bad. It depends on the cause of the deflation whether people will suffer or rejoice. As I said, if the cause is increasing supply of goods that would be good. Another example of this is in the late 1800's as the industrial revolution dramatically increased productivity. However, if deflation is caused by a decreasing supply of money as in the great depression (or the crash of 2008), that would be bad. The stock market crash sucked all the liquidity out of the market place, the economy contracted, people lost their jobs and then banks stopped loaning money because people were defaulting. The problem compounded as more people lost their jobs and money supply fell further causing more people to lose their jobs, etc. Note:- During the Depression demand for money was high (but no one could afford it) because supply was low. During the liquidity crisis of 2008 the same thing happened as all forms of derivatives deleveraged and massive amounts of liquidity were destroyed. This time the FED stepped in and assumed massive amounts of debt in an effort to stop the deflation and consequently transferred all that debt from private hand to the public. So what could have been remedied through bankruptcy and liquidation is now a trillion Dollar burden on future generations. So deflation can be caused by several different things and can be good or bad depending on the cause. / В экономике под Дефляцией, от позднелатинского слова Deflatio, означающее Выдувание или Сдувание, понимается уменьшение денежной массы в обращении путём изъятия части избыточных, по сравнению с

потребностями денежного обращения, бумажых денег. Она производится государствами в целях борьбы с инфляцией путём повышения налогов, учётной ставки центрального банка, сокращения бюджетных расходов, стимулирования сокращения кредитов, роста сбережений и так далее. Дефляция – процесс, обратный инфляции, – падение уровня цен. Дефляция, уменьшение денежной массы путём изъятия из обращения излишних бумажных денег. Дефляция часто предшествует денежным реформам. После 2-й Мировой Войны (1939–45) дефляция чаще всего принимает вид так называемой дефляционной политики капиталистических государств, цель которой приостановить или уменьшить темпы роста денежной массы и цен на товары. Осуществляется путём кредитной рестрикции (повышение процентных ставок, лимитирование кредитов), увеличения налогов, сокращения социально-культурных расходов, 'замораживания' заработной платы и других мероприятий, проводимых капиталистическими государствами, что приводит к снижению темпов экономического развития, ухудшению положения трудящихся, обострению классовой борьбы. Дефляция – снижение уровня цен на товары и услуги. Дефляция противоположна инфляции (inflation); её не следует путать с дизинфляцией (disinflation), которая представляет собой снижение скорости роста цен. Как правило, экономические последствия дефляции противоположны последствиям инфляции с двумя значительными исключениями:- (i) цены, которые росли в ходе инфляции, не обязательно снижаются в период дефляции, например ставки заработной платы; (ii) в то время как инфляция может стимулировать или не стимулировать производство и занятость, очевидная дефляция всегда негативно влияет на них.

DEFLECTION = ПОГИБЬ (или ПРОГИБ) – In engineering, Deflection is the degree to which a structural element is displaced under a load. It may refer to an angle or a distance. The deflection distance of a member under a load is directly related to the slope of the deflected shape of the member under that load and can be calculated by integrating the function that mathematically describes the slope of the member under that load. Deflection can be calculated by standard formula (will only give the deflection of common beam configurations and load cases at discrete locations), or by methods such as virtual work, direct integration, Castigliano's method, Macaulay's method or the direct stiffness method, amongst others. The deflection of beam elements is usually calculated on the basis of the Euler-Bernoulli beam equation while that of a plate or shell element is calculated using plate or shell theory. An example of the use of deflection in this context is in building construction. Architects and engineers select materials for various applications. The beams used for frame work are selected on the basis of deflection, amongst other factors. Building codes determine the maximum deflection, usually as a fraction of the span, e.g., 1/400 or 1/600. Either the strength limit state (allowable stress) or the serviceability limit state (deflection considerations amongst others) may govern the minimum dimensions of the member required. The deflection must be considered for the purpose of the structure. When designing a steel frame to hold a glazed panel, one allows only minimal deflection to prevent fracture of the glass. The deflective shape of a beam can be represented by the moment diagram, integrated. Deflection:- displacement of a member usually due to dead and live loads. Deflection is the amount of deformation or bending in a pallet or pallet component under load. / метод (Castigliano), метод (Macaulay) или. обычно рассчитывается на основе (Euler-Bernoulli). В строительной механике под Прогибом понимается вертикальное перемещение точек оси элемента (балки, рамы, пояса фермы и тому подобное) под действием нагрузки, изменений температуры и другого. Максимальная величина прогиба в конструкциях обычно нормируется. Прогиб – вертикальное перемещение точки, лежащей на оси балки (арки, рамы и тому подобного) под действием силовых, температурных и других факторов. Максимальный прогиб обычно нормируется. Для определения прогиба используются специальные приборы - прогибомеры.

DEFLEXED = ПОВЁРНУТОЕ РЕЗКО ВНИЗ (или ЗАГНУТОЕ ВНИЗ, или ОТОГНУТОЕ) – Deflexed:- curved or bent back down on itself or towards the plant surface.

DEFOLIANT = ДЕФОЛИАНТ – A Defoliant is a chemical that causes the leaves to abscise from a plant. Defoliant is a chemical dust or spray applied to plants to cause their leaves to drop off prematurely. Defoliants sometimes are applied to crop plants such as cotton in order to facilitate harvesting. They are also used in warfare to eliminate enemy food crops and potential areas of concealment by enemy forces. Defoliants were employed for these purposes by South Vietnamese and US forces in the Vietnam War; among the more controversial of these substances was the chemical compound known as Agent Orange. Sprayed on plants to make the leaves fall off prior to picking. This makes it easier for mechanical picking and diminishes boll staining. Defoliants, or harvest aids, are used to defoliate Cotton, enhance boll opening, and control regrowth prior to harvest. Defoliants effectively terminate the Cotton crop and prepare it for machine harvest at the end of the growing season. These chemicals also give the producer some control over harvest timing and increase harvest efficiency. Defoliant performance is affected by temperature, plant condition, spray coverage and product rate. Temperature is the primary force in determining harvest-aid rate. Under optimal conditions, a Cotton crop might be harvestable in as little as 7 days after defoliation, but cool temperatures will prolong the defoliation process. See also Defoliation. Defoliant is a harvest-aid material applied to the Cotton Plant to accelerate leaf drop in preparation for harvest. See also Defoliation. Defoliant is any of a variety of chemicals that induce leaf abscission when sprayed on the Cotton Plant. Defoliants are frequently used to facilitate spindle-picking of Cotton. / Под Дефолиантами, от приставки Де и Латинского слова Folium, означающее Лист, понимаются химические препараты из группы пестицидов, вызывающие старение листьев у Растений и опадение листвы (искусственный листопад), что ускоряет созревание и облегчает машинную уборку урожая сельскохозяйственных культур. В качестве дефолиантов используют, например, тиоцианат натрия, фосфорорганические соединения, хлорат магния, цианамид кальция и некоторые производные мочевины. Применяют для предуборочного опадения листьев – дефолиации, в основном у Хлопчатника. Под Дефолиантами, от Латинских слов De (Де) – приставка, означающая:- (1) отделение, удаление, уничтожение, отмену (например, демобилизация); или (2) движение вниз, понижение (например, деградация, деморализация), и Folium, означающее Лист, понимаются химические препараты для удаления листьев с Растений (смотрите Дефолиация). Одним из дефолиантов является этилен, который, по данным ряда исследователей, образуется в Растениях и вызывает естественный листопад. Дефолианты, широко применяемые в сельском хозяйстве, и нормы их расхода (килограммов на один гектар (кг/га) в пересчёте на 100%-ный продукт) приведены ниже:- (i) Хлорат магния 6–10 <; (ii) Хлорат-пентаборат натрия – 8–15; (iii) Хлорат-хлорид кальция – 6–10; (iv) Бутифос (S, S, S^- трибутил-тритиофосфат) – 0.7–2; (v) Мерфос (S, S, S^- трибутил-тритиофосфат) – 0.7–1.5; (vi) Цианамид кальция – 40–45; (vii) Бутиндиол-1,4 – 3–5; (viii) Мышьяковая кислота – 1–3; и (ix) Цис-b-хлоракрилат натрия – 2–10. Наилучшие результаты даёт применение бутифоса и мерфоса. Однако их недостатками являются неприятный запах и сравнительно высокая токсичность для позвоночных. Эффективны как дефолианты также хлораты, но действие их более медленно. В несколько меньших масштабах применяют соли эндоксогексагидрофталевой кислоты (эндотал) и бутиндиол. Обычно при применении дефолиантов опадает 70–95% листьев, а остальные засыхают. Дефолианты широко используются для предуборочного удаления листьев с Хлопчатника. Дефолианты применялись армией Соединённых Штатов Америки (США) для массового уничтожения растительности при проведении агрессивных военных действий в 1960-х во Вьетнаме.

DEFOLIATION = ДЕФОЛИАЦИЯ (или ОБЕЗЛИСТВЛЕНИЕ) – Defoliation:- when enough bolls have opened naturally, harvest aids are applied to the plant to help speed up the maturation process. This, also, is done either by ground or air application. Defoliation helps the leaves to dry and fall off and to help any of the remaining unopened Cotton bolls to open. This practice enables the grower to

hasten the opening of the Cotton bolls which can then be gathered quickly, in a short period of time. It is essential that the crop is harvested before weather and rain can damage or ruin its quality and reduce yield. Frost also causes the plant to shed its leaves naturally and assists in splitting bolls, but may occur too late in the season to benefit harvest. Now the Cotton crop is ready to be harvested. See also Defoliant. Hot temperatures are best for more effective defoliation results. Before mechanical Cotton pickers were invented, the requirement for hand harvesting was only the opening of bolls. This allowed the greatest preservation of natural Cotton fiber properties and yield. On Australian Cotton fields where mechanical harvesters gather up the seed cotton, the leaves must be removed from the plant to prevent contaminating the lint. This preparation is known as Defoliation. Conditioning (or defoliation) usually should occur when the top harvestable boll is mature. The two common methods used to determine boll maturity include first examining seed maturity inside the developing boll, and, second, the nodes above cracked boll (NACB) method. In some years with ideal growing conditions, some degree of vegetative growth control may be necessary mid-season to ensure the plant remains manageable for later pesticide and defoliant applications, and picking. The use of a growth regulator, applied once or as a lower rate split application, may be warranted under these conditions. Conditioning and/or defoliation (by artificial means) describes a management practice which aids the formation of abscission layers in the leaf petioles and results in the desiccation or shedding of foliage earlier than would have occurred naturally. It artificially prepares a crop for harvest. Chemicals used to condition and defoliate include dimethipin (Harvade®), and thidiazuron + Diuron (Dropp Ultra®) for cool conditions, thidiazuron (Dropp WP®) for hot conditions, ethephon (Prep®), ethephon and AMADS (CottonQuick®) and ethephon + Cyclanilide (Finish®). Desiccation or the rapid drying and death of foliage is often used to describe conditioning and defoliation. Desiccants include Diquat (Reglone®) and Paraquat plus diquat (Sprayseed®), and sodium chlorate (Atlacide®, Leafex®). Plant growth regulators are compounds applied directly to a target plant to alter its phenology or its structure to improve quality, reduce disease risk, increase yield or facilitate harvesting. Mequat chloride (PIX®) and ethephon (Prep 720®) are the only growth regulants used in cotton. A synergist is a chemical which increases the action of another, e.g., Endothal (Accelerate®). A wetting agent is a substance that by reducing the surface tension of a liquid allows it to spread on the leaf surface or penetrate the leaf cuticle, e.g., D-C-TRON. Cotton growers in the various growing areas, covering both short and long season districts, begin the defoliation process to:- (i) remove the leaf canopy or foliage to allow more efficient operation of mechanical pickers; (ii) promote earlier picking; (iii) eliminate material that could stain Cotton fibers; and (iv) reduce the trash content of seed cotton. The aim in timing a defoliant application is to apply the material when the crop is physiologically mature. Physiological maturity is defined as that time when the crop has put all available nutrients into its reproductive tissues and has started to slow its transpiration rate prior to natural senescence. Physiological maturity is determined by several well accepted methods. The first is by examining seed maturity inside the developing Cotton boll. Bolls that are difficult to cut using a sharp knife and show no 'jelly' within the developing seed will be harvestable after a defoliant is applied. The seed coat (on a cross section) should be turning brown (seen as a distinct brown ring within the immature seed coat). The second well accepted method is the 'nodes above cracked boll' method. This method shows that the last harvestable bolls occurs 4 nodes above the most recently cracked (opening) boll. Defoliating when the crop is physiologically mature is a more reliable method than the previous reliance on a percent open boll threshold. The relevance of this method is greatly influenced by the length of the fruiting period. A crop set over a six week period might incur a yield penalty if defoliated at 65% open, while one set in three weeks might be safely defoliated at 40 to 50% open because all bolls are maturing at approximately the same time. Percent open bolls may be used as a guide but should not be used as the sole criteria in determining when to commence defoliation. When determining crop and plant maturity, all of the above methods should be used in conjunction with each other to select the correct time for defoliant application. Ideally defoliation should commence when the last desired harvestable boll is physiologically mature. Modern Cotton production has worked towards a single picking. The economics of second picking Cotton have to be carefully assessed. Boll openers like Ethephon (Prep720®) and defoliation enhancement products like CottonQuick® and Finish®, help speed up the time required for all the bolls to open. These products will open immature bolls as well so they should not be applied too early. Many factors control the success of a defoliation application. They involve plant growth, weather, spray coverage, chemical degradation, chemical absorption and translocation which contain both controllable and uncontrollable inputs for the grower. There is a need to produce manageable crops where nitrogen runout can be controlled. This task becomes easier after several seasons of cropping. Finally, when the Cotton producer confronts the crop at defoliation time, an assessment of the objectives, the grower's needs and the tools and techniques available has to be made to successfully pick Australia's high quality Cotton crop. Defoliation:- removal of the leaves of a plant or entire crop by chemically induced abscission or by mechanical means. Verticillium wilt and possibly other diseases can also cause defoliation. See also Abscission, and Boll Shedding. Defoliation is the loss of leaves from the Cotton Plant; may be damaging and happen prematurely (i.e. Soybean Loopers consuming Cotton Plant leaves before cutout or leaf loss caused by a potassium deficiency) or naturally (the predictable loss of leaves of all deciduous plants). / Потеря листьев ; . Хавэйд® или Харвадэ® (Harvade®), + Дайрэн или Дайурон (Diuron) Дроп Олтчра® (Dropp Ultra®) Дроп ДаблЮ.Пи.® (Dropp WP®) Прэп® (Prep®), ЭМЭДЗ (AMADS) КатэнКвик® (CottonQuick®) + Сайклэнилайд (Cyclanilide) Финиш® (Finish®). Дайкват (Diquat) Рэглоун® (Reglone®) и Пэрэкват Плас Дайкват (Paraquat Plus Diquat) Спрэйсид® (Sprayseed®), и Атласайд® (Atlacide®), Лифэкс® (Leafex®). Мэкват хлорид (Mequat chloride) ПИКС® или Пи.Ай.Экс.® (PIX®) и Эсэфэн (Ethephon) Прэп 720® (Prep 720®) . , Эндосал (Endothal) Эксэлэрэйтч® (Accelerate®). Ди.-Си.-ТЧРОН (D-C-TRON). Эсэфэн (Ethephon) Прэп 720® (Prep 720®) и КатэнКвик® (CottonQuick®) и Финиш® (Finish®). Дефолиация или Обезлиствление, предуборочное удаление листьев с Растений для облегчения механизированной уборки урожая. Дефолиацию проводят химическими веществами – дефолиантами, которые вызывают в Растениях процессы, аналогичные происходящим при естественном старении листьев. Опрыскивая Хлопчатник дефолиантами во время раскрытия на нём 1–3 коробочек, стимулируют опадение листьев и ускоряют созревание нераскрытых коробочек. Хорошие результаты даёт также дефолиация декоративных и плодовых культур, Эвкоммии и так далее.

DEFOLIATOR = ДЕФОЛИАТОР – Defoliator is any Chewing Insect that feeds on the leaves of plant, or chemical that removes foliage. / Под Дефолиатором, от Латинских слов De, означающее:- (i) Отмена или Отсутствие или Устранение Чего-Либо (например, дегазация, дезориентация, демобилизация); и (ii) Движение Вниз или Понижение (например, девальвация), и Folium, означающее Лист, понимается .

DEFORMATION = ДЕФОРМАЦИЯ – Deformation is a change in the shape of a specimen, e.g., an increase in length produced as the result of the application of a tensile load or force. Deformation may be immediate or delayed, and the latter may be recoverable or nonrecoverable. / Под Деформацией, от Латинского слова Deformatio, означающее Искажение, понимается изменение относительного положения частиц тела, связанное с их перемещением. Деформация представляет собой результат изменения междуатомных расстояний и перегруппировки блоков атомов. Обычно деформация сопровождается изменением величин междуатомных сил, мерой которого является упругое напряжение. Наиболее простые виды деформации тела в целом:- растяжение – сжатие, сдвиг, изгиб, кручение. В большинстве случаев наблюдаемая деформация представляет собой несколько деформаций одновременно. В конечном счёте, однако, любую деформацию можно свести к 2 наиболее простым:- растяжению (или сжатию) и сдвигу. Деформация тела вполне определяется, если известен вектор перемещения каждой его точки. Деформация твёрдых тел в связи со структурными особенностями последних изучается физикой твёрдого тела, а

движения и напряжения в деформируемых твёрдых телах – теорией упругости и пластичности. У жидкостей и газов, частицы которых легкоподвижны, исследование деформации заменяется изучением мгновенного распределения скоростей. Деформация твёрдого тела может явиться следствием фазовых превращений, связанных с изменением объёма, теплового расширения, намагничивания (магнитострикционный эффект), появления электрического заряда (пьезоэлектрический эффект) или же результатом действия внешних сил. Деформация называется упругой, если она исчезает после удаления вызвавшей её нагрузки, и пластической, если после снятия нагрузки она не исчезает (во всяком случае полностью). Все реальные твёрдые тела при деформации в большей или меньшей мере обладают пластическими свойствами. При некоторых условиях пластическими свойствами тел можно пренебречь, как это и делается в теории упругости. Твёрдое тело с достаточной точностью можно считать упругим, то есть не обнаруживающим заметных пластических деформаций, пока нагрузка не превысит некоторого предела. Природа пластической деформации может быть различной в зависимости от температуры, продолжительности действия нагрузки или скорости деформации. При неизменной приложенной к телу нагрузке деформация изменяется со временем; это явление называется Ползучестью (смотрите Ползучесть Материалов). С возрастанием температуры скорость ползучести увеличивается. Частными случаями ползучести являются релаксация и последействие упругое. Релаксация – процесс самопроизвольного уменьшения внутреннего напряжения с течением времени при неизменной деформации. Процесс самопроизвольного роста деформации с течением времени при постоянном напряжении называется Последействием. Одной из теорий, объясняющих механизм пластической деформации, является теория дислокаций в кристаллах. В теории упругости и пластичности тела рассматриваются как ‘сплошные’. Сплошность, то есть способность заполнять весь объём, занимаемый материалом тела без всяких пустот является одним из основных свойств, приписываемых реальным телам. Понятие Сплошности относится также к элементарным объёмам, на которые можно мысленно разбить тело. Изменение расстояния между центрами каждых двух смежных бесконечно малых объёмов у тела, не испытывающего разрывов, должно быть малым по сравнению с исходной величиной этого расстояния. Простейшей элементарной деформацией является относительное удлинение некоторого элемента:- $e = (l_1 - l) / l$, где l_1 – длина элемента после деформации, l – первоначальная длина этого элемента. На практике чаще встречаются малые деформации, так что $e << 1$. Измерение деформации производится либо в процессе испытания материалов с целью определения их механических свойств, либо при исследовании сооружения в натуре или на моделях для суждения о величинах напряжений. Упругие деформации весьма малы, и измерение их требует высокой точности. Наиболее распространённый метод исследования деформации – с помощью тензометров. Кроме того, широко применяются тензодатчики сопротивления, поляризационно-оптический метод исследования напряжения, Рентгеновский структурный анализ. Для суждения о местных пластических деформациях применяют накатку на поверхности изделия сетки, покрытие поверхности легко растрескивающимся лаком и так далее.

DEGAS = ДЕГАЗАЦИЯ – (1) Degas:- removing air from a liquid, usually by ultrasonic and/or vacuum methods. / Под Дегазацией, от Латинского слова – приставки De, означающее Отделение или Отмену или Удаление или Уничтожение, и Французского слова Gaz, означающее Газ, понимается:- (1) разложение отравляющего вещества (ОВ) до нетоксичных продуктов и удаление их с поверхности объектов и местности с целью снижения заражённости до допускаемых норм. Производится дегазирующими веществами с помощью специальных технических средств – приборов, комплектов, дегазационных машин. (2) Дегазация воды – то же, что деаэрация воды. Смотрите также Деаэратор (Deaerator). (3) Дегазация стали – удаление из жидкой стали растворённых в ней газов, ухудшающих качество стали. Дегазация происходит при кипении металла, перемешивании, раскислении металла и охлаждении его в процессе разливки. Особо эффективным способом дегазации стали перед её разливкой является Вакуумирование – кратковременная обработка под вакуумом стали, выплавленной в каком-либо сталеплавильном агрегате обычным (открытым) способом. Для этой цели используются вакууматоры различных конструкций. (4) Дегазация шахт – отсос, сбор и вывод из подземных горных выработок на поверхность рудничного газа или газовоздушной смеси. Дегазация осуществляется бурением скважин в разрабатываемый массив горных пород или проведением горных выработок, а также отсосом газа с высоким содержанием метана из выработанных пространств.

(2) Degas:- xxxxx. / Дегазация стали, удаление газов из жидкой стали. Газы оказывают вредное влияние на физико-механические свойства стали (смотрите Газы В Металлах). Решить задачу получения стали с минимальным содержанием газов удалось только в начале 1950-х благодаря созданию способа внепечной вакуумной обработки жидкой стали в ковше перед разливкой, предложенного Советскими учёными Александром Михайловичем Самариным (1902–1970) и Львом Моисеевичем Новиком в 1940. Промышленное опробование этого способа было впервые в мировой практике осуществлено в бывшем Союзе Советских Социалистических Республик (СССР) в 1952 на Енакиевском Металлургическом Заводе; позднее – в 1954 в Федеративной Республике Германия (ФРГ) на заводе Бохума Фаайн (Bochumer Verein) был опробован способ дегазации металла в струе. Промышленное внедрение ковшового способа вакуумирования впервые осуществлено в СССР в 1955. Этими работами было положено начало новому направлению – внепечной вакуумной металлургии. В конце 1950-х разработаны другие разновидности процессов внепечного вакуумирования жидкой стали:- порционное, циркуляционное и другие, которые, как и ковшовый способ, получили широкое промышленное применение во многих странах мира. Теоретической основой внепечных вакуумных процессов является повышение раскислительной способности углерода и понижение растворимости водорода и азота при снижении парциального давления CO, H_2 и N_2. Важным направлением в развитии внепечных вакуумных процессов в конце 1960-х явилась вакуумная обработка рядовой кипящей стали, позволившая решить сложную задачу получения низкоуглеродистой стали. При внепечной вакуумной обработке нераскисленной стали раскислительная способность углерода увеличивается в 10–20 раз. В этих условиях становится возможным получение низкоуглеродистой стали с весьма низким содержанием кислорода. Металл с таким низким содержанием углерода и кислорода обладает весьма высокими пластическими свойствами, а слитки и слябы, отлитые на установках непрерывной разливки стали, имеют плотное и однородное строение. Внепечные вакуумные процессы при небольших затратах на сооружение и эксплуатацию вакуумных установок значительно повышают технико-экономические показатели металлургического производства за счёт сокращения на 10–20% продолжительности плавки, уменьшения до 30% расхода раскислителей и легирующих добавок, увеличения выхода годной стали и повышения её качества. Кроме того, срок службы изделий, изготовленных из вакуумированной стали, повышается. В мире в 1970 насчитывалось около 400 работающих установок по внепечному вакуумированию стали.

(3) Degas:- xxxxx. / Дегазация шахт, мероприятия по отсосу, сбору и выводу из подземных горных выработок на поверхность рудничного газа или газо-воздушной смеси. Вывод газа из шахты производится по проложенным в горных выработках трубопроводам или по буровым скважинам, соединяющим выработки с поверхностью. Дегазация шахт применяется для уменьшения поступлений метана из угольных пластов и пород в горные выработки и облегчает проветривание шахты, полностью прекращает или значительно снижает простои выемочных (добычных) участков из-за загазирования выработок; позволяет применять в газовых шахтах электроэнергию вместо менее эффективной пневматической энергии; повышает производительность труда рабочих и безопасность ведения горных работ в газовых шахтах и при определённых условиях

предотвращает полностью или частично (снижает интенсивность) необычные газопроявления – суфляры, внезапные выбросы угля и газа и тому подобное. Дегазационные системы состоят из дегазационных горных выработок или буровых скважин, шахтных газопроводов с защитными устройствами, дегазационных установок, регулирующей, регистрирующей и защитной аппаратур и устройств, а в случаях утилизации каптируемого газа – также и газопровода к потребителю (оборудуются на поверхности шахт и состоят из вакуумнасосов или ротационных воздуходувок с неискрящими лопатками, обеспечивающих движение газа в дегазационной системе, приводов к ним и аппаратуры, регулирующей и контролирующей работу машин и приводов). Применение дегазации шахт привело к созданию новой технологии разработки газоносных угольных пластов, которые в ряде наиболее газоносных месторождений разрабатываются комплексно с учётом попутной добычи метана. Известны три основных способа дегазации шахт:- предварительная дегазация разрабатываемых угольных пластов, дегазация смежных угольных пластов и отсос концентрированных метано-воздушных смесей из выработанных пространств. Предварительная дегазация шахт проводится до начала разработки угольного пласта и заключается в бурении параллельных скважин глубиной по 100–250 метров (м) и диаметром 80–120 миллиметров (мм) через 10–25 м. Каждая дегазационная скважина через водоотделитель подсоединяется к шахтной сети газопроводов. Отсос газа из угольного пласта производится под разрежением до 13.5–27 килоНьютонов на квадратный метр (кН/м^2) (100–200 миллиметров ртутного столба (мм рт.ст.)) в течение длительного периода времени (свыше 100–150 суток). При дегазации смежных угольных пластов используется эффект частичной их разгрузки от горного давления, способствующий переходу сорбированного этими пластами метана в свободное состояние. При этом способе дегазации скважины бурят из горных выработок до смежных пластов, залегающих выше и ниже разрабатываемого пласта на различных расстояниях, не превышающих радиус эффективной дегазации шахт. Скважины подсоединяются к газопроводной системе. При отсосе газа из выработанных пространств они тщательно изолируются перемычками и воздухонепроницаемыми (например, из породы с различными уплотнителями) полосами от действующих горных выработок и при помощи шахтных газопроводов производится отвод газа с высоким содержанием метана, скопившегося в пустотах, образованных между обрушившимися кусками пород. Впервые промышленная дегазация шахты была применена в 1943 в Руре (Германия), а в бывшем Союза Советских Социалистических Республик (СССР) – в 1952 в Донбассе. В 1970 дегазация шахт применялась в 518 шахтах 15 стран с суммарным количеством каптированного метана около 3 миллиардов кубических метров (м^3) в год, в том числе на 156 шахтах СССР (свыше 750 миллионов м^3).

(4) Degas:- xxxxx. / Дегазация, удаление (разрушение, нейтрализация) отравляющих веществ (ОВ) с заражённого вооружения, боевой техники, местности, одежды, продовольствия; одно из мероприятий по ликвидации последствий химического нападения противника (смотрите Защита От Оружия Массового Поражения). Дегазация заражённого вооружения, боевой и другой техники осуществляется различными механическими способами с использованием дегазирующих растворов и растворителей или испарением ОВ потоком горячих газов; местности – с помощью дегазационных машин (поливкой местности дегазирующими растворами, рассыпанием сыпучих дегазирующих веществ), а в некоторых случаях удалением срезанного верхнего слоя почвы (снега) с помощью дорожных машин, изоляцией заражённой поверхности местности путём засыпки её незаражённым грунтом (снегом) или устройства деревянных и других настилов. С твёрдых покрытий (асфальт, бетон) ОВ удаляются струёй воды из поливочных и пожарных машин. Дегазация верхней одежды, белья достигается кипячением в воде и водных растворах соды; обработкой дегазирующими растворами и другим. Заражённую воду дегазируют хлорированием, фильтрованием через специальные вещества и кипячением. Сильно заражённые (залитые) ОВ продовольствие и фураж уничтожаются. Продукты в герметической металлической или стеклянной таре дегазируются кипячением в содовом растворе, протиранием дегазирующими растворами или растворителями; в деревянной таре – проветриванием. Годность продуктов к употреблению определяется после химического анализа. Дегазация помещений от паров и газов ОВ достигается вентиляцией (сквозняками).

DEGERMED KERNELS = ДЕГЕРМИНИРОВАННАЯ ЗЕРНОВКА (или ДЕГЕРМИНИРОВАННЫЕ ЯДРА) – Degermed Kernels have had their germ removed. If the sample contains sprouted kernels, degermed kernels that are clearly not mechanically damaged are classed as sprouted. Degermed kernels are a grading factor for Wheat, Rye and Triticale. / зародыш (germ). и Тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью).

DEGRADATION = ДЕГРАДАЦИЯ – (1) Degradation is the progressive failure of a machine or lubricant. / Под Деградацией понимается постепенное ухудшение свойств; снижение или утрата положительных качеств.

(2) Soil Degradation is the decline in soil condition caused by its improper use or poor management, usually for agricultural, industrial or urban purposes. It is a serious environmental problem. Soils are a fundamental natural resource, and are the basis for all terrestrial life. Avoiding soil degradation is crucial to our well-being. Examples Of Soil Degradation:- Soil degradation is the physical, chemical and biological decline in soil quality. It can be the loss of organic matter, decline in soil fertility, and structural condition, erosion, adverse changes in salinity, acidity or alkalinity, and the effects of toxic chemicals, pollutants or excessive flooding. Soil degradation can involve:- (i) water erosion (includes sheet, rill and gully erosion); (ii) wind erosion; (iii) salinity (includes dryland, irrigation and urban salinity); (iv) loss of organic matter; (v) fertility decline; (vi) soil acidity or alkalinity; (vii) structure decline (includes soil compaction and surface sealing); (viii) mass movement; and (ix) soil contamination (including effects of toxic chemicals and pollutants). / Деградация почвы, процесс, приводящий к частичной потере почвой накопленных ранее органических веществ, обменных щелочноземельных катионов и илистой фракции. Под этим термином ранее понимали оподзоливание чернозёмов под влиянием произраставшего на них леса. Соответственно в классификации почв вместо прежних деградированных чернозёмов теперь выделяют чернозёмы оподзоленные (смотрите Чернозёмы). Деградация почвы в начальной её стадии обнаруживается в нижней части гумусового горизонта и в иллювиальном карбонатном горизонте почвы (под гумусовым горизонтом). При деградации в нижней, а иногда и в средней части гумусового горизонта появляются так называемая Кремнезёмистая Присыпка, состоящая из зёрен кварца и полевых шпатов, слабая ненасыщенность основаниями, некоторое накопление кремнезёма и уменьшение содержания полуторных окислов (по сравнению с материнской породой) и другие признаки слабого оподзоливания. Однако это не приводит к сколько-нибудь значительному снижению плодородия почвы. Деградированные, то есть оподзоленные, чернозёмы относятся к почвам, не уступающим по своему плодородию типичным чернозёмам.

(3) Degradation:- xxxxx. / Деградация в биологии, упрощение строения и функции животных или растений под влиянием изменившихся условий существования. Различают онтогенетическую деградацию – упрощение организма на конечных стадиях развития по сравнению с начальными стадиями, и филогенетическую деградацию – упрощение строения потомков по сравнению с организацией их предков. Смотрите также Дегенерация.

(4) Degradation is the loss of desirable physical properties by a textile material as a result of some process or physical/chemical phenomenon.

DEGREASING = ОБЕЗЖИРИВАНИЕ (или УДАЛЕНИЕ ЖИРОПОТА ИЗ ШЕРСТИ, или УДАЛЕНИЕ ЖИРА) – Degreasing is any method that removes yolk, suint, and dirt from wool.

DEGREE DAY = ГРАДУСО–ДЕНЬ – (1) Degree Day is the unit used in meteorology and engineering to measure the demand for heating or cooling. In the United States, it's agreed that 65 °F (18.3 °C) is the critical outside temperature; below this tempeature heating is needed and above it cooling is needed. The number of degree days recorded on a given date is equal to the difference between 65 and the mean temperature for that date (figured as the average of the highest and lowest temperatures). If the mean temperature is above 65, cooling degree days (CDD) are recorded; if it is below 65, heating degree days (HDD) are recorded. The total number of heating or cooling degree days recorded in any period of time measures rather accurately the demand during that time for fuel used in heating and cooling buildings. See also Cooling Degree-Days, Degree-Days Normals, Heating Degree-Days, and Heat Units. Degree Day is a unit, based upon temperature difference and time, used in estimating fuel consumption and specifying nominal annual heating and cooling loads of a building. When the mean temperature is less than 65 degrees Fahrenheit, the heating degree days are equal to the total number of hours that temperature is less than 65 degrees Fahrenheit for an entire year. / Градусо-День – единица измерения, используемая в метеорологии и промышленности для определения спроса на отопление или охлаждение (кондиционирование). В Соединённых Штатах Америки принято считать 65 градусов Фаренгейта (18.3 градусов Цельсия) в качестве критической наружной температуры воздуха; если температура ниже, то требуется отопление, а если выше – то необходимо охлаждение или кондиционирование. Количество градусо-дней на определённую дату равно разнице между 65 и среднесуточной температурой этого дня (вычисляемой как среднеарифметический показатель макисмального и минимального значений температуры). Если среднесуточная температура выше 65, то такие дни учитываются как градусо-дни кондиционирования (ГДК); а если ниже 65, то такие дни учитываются как градусо-дни отопления. Общее количество градусо-дней отопления или кондиционирования, учтённых для любого периода времени, достаточно точно измеряет спрос на топливо, используемое для отопления или кондиционирования зданий в этот период. Смотрите также Градусо-Дни Кондиционирования (Cooling Degree-Days), Среднестатистические Градусо-Дни (Degree-Days Normals), и Градусо-Дни Отопления (Heating Degree-Days).

(2) Degree Day is the unit combining temperature and time used in monitoring growth and development of organisms. / Единица измерения, объединяющая температуру и время при наблюдении за ростом и развитием организмов.

DEGREE–DAYS NORMALS = СРЕДНЕСТАТИСТИЧЕСКИЕ ГРАДУСО–ДНИ – Degree-Days Normals:- simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period). The averages may be simple degree-day normals or population-weighted degree-day normals. See also Cooling Degree-Days, Degree Day, and Heating Degree-Days. Degree Day Normals:- the simple arithmetic averages of monthly or annual degree days over a baseline comparison period. International agreement set the baseline comparison period as the mean of a 30–year period, which will be updated at the end of each decade. The 'official' period is 1971–2000. / Простые среднеарифметические значения градусо-дней за месяц или за год, учитываемые на протяжении длительного периода времени (обычно 30 лет). Эти среднеарифметические показатели могут быть простыми среднестатистическими градусо-днями или среднестатистическими градусо-днями из расчёта на душу населения. Смотрите также Градусо-Дни Кондиционирования (Cooling Degree-Days), Градусо-День (Degree-Day), и Градусо-Дни Отопления (Heating Degree-Days).

DEGREE OF ESTERIFICATION = СТЕПЕНЬ ЭСТЕРИФИКАЦИИ (или СТЕПЕНЬ ОБРАЗОВАНИЯ СЛОЖНОГО ЭФИРА) – Degree Of Esterification:- the extent to which the acid groups of terephthalic and/or other acids have reacted with diols to form ester groups in polyester polymer production.

DEGREE OF FIBER WALL THICKENING = СТЕПЕНЬ ТОЛЩИНЫ СТЕНОК ВОЛОКНА – Degree Of Fiber Wall Thickening is the ratio of actual cross-sectional area of the wall to the area of the circle with the same perimeter. / Соотношение фактической площади поперечного сечения стенки волокна с площадью круга с тем же периметром.

DEGREE OF MILLING = СТЕПЕНЬ РУШЕНИЯ – The Degree Of Milling is a measure of the percent bran removed from the brown Rice kernel. Milling degree affects milling recovery and influences consumer acceptance. Apart from the amount of white Rice recovered, milling degree influences the color and also the cooking behavior of Rice. Unmilled brown Rice absorbs water poorly and does not cook as quickly as milled Rice. The water absorption rate improves progressively up to about 25% milling degree after which, there is very little effect. Degree Of Milling is a percent efficiency of bran removal from brown Rice during milling; done visually with well-milled Rice as 100% milled (Indonesia, Bangladesh). Thailand classifies milled Rice into ordinary, reasonably well-, well-, and extra well milled. Milling Degree Designations of Rice:- Milling Degree is usually defined as the extent to which the bran layers of rice have been removed during milling. Milling removes the germ and the bran layers which include the outer pericarp of the Rice kernel, the aleurone layer, and some of the starchy endosperm. How measured:- (i) Visually-See Federal Grain Inspection Services (FGIS) designations below; (ii) Color – typically, the higher the milling degree, the whiter the kernel. There are several different commercial ways of measuring the whiteness-Satake milling meter, Kett whiteness meter, and commercial color meters (Hunter, Minolta, etc); and (iii) Surface Lipid content-most of the lipid in the kernel is in the germ and bran. As milling degree increases, the surface lipid content is reduced. Surface lipids are extracted and quantitatively measured. Significance:- milling degree affects processing properties of Rice:- (i) Undermilled Rice still has bran attached to the kernel. This can reduce water absorption, adds fiber, protein, and lipids (thus reducing % starch). This would affect applications such as cooking time, kernel to kernel interactions (stickiness versus separateness), color of the Rice and interactions with other ingredients. (ii) Higher lipid content would affect how a rice kernel would pick up spices or seasoning coating. (iii) Highly milled Rice will have a higher starch content and lower lipids and protein than a Rice milled to a lower milling degree. This affects starch pasting properties and the effect can be seen in a higher curve run on an RVA (Rapid Visco Analyser). Industry specifications for Milling Degree:- at the current time, there is no one way to specify milling degree. Different suppliers use different methods as described above. An experienced supplier can help one select the correct Rice for an application. Federal Grain Inspection Services (FGIS) of the US Department of Agriculture (USDA) Milling Degree Designations:- Interpretive Line Samples:- showing the official scoring line for factors that are determined by visual observation shall be maintained by the Federal Grain Inspection Service, US Department of Agriculture, and shall be available for reference in all inspection offices that inspect and grade Rice. Milling Requirements:- the degree of milling for milled Rice; i.e. 'hard milled', 'well-milled', and 'reasonably well-milled', shall be equal to, or better than, that of the interpretive line samples for such Rice. Most US Rice falls into the category of well-milled which means that all of the bran and germ have been removed during milling. Only a minimal amount of the endosperm (starchy area) has been removed. Hard-milled means Rice has been milled longer and removed more of the bran and outer endosperm layer. It will typically be stickier than well-milled Rice. Its protein level may be lower also. Reasonably well-milled Rice will have the germ and most of the bran removed, but may still have bran streaks (patches of bran that have not been removed) on the kernels.

DEGREE OF POLYMERIZATION = СТЕПЕНЬ ПОЛИМЕРИЗАЦИИ – A term Degree Of Polymerization refers to the number of monomer units in an average polymer. It can be controlled during processing and affects the properties of the end product. Degree of

Polymerization (DP) determines chain length. The degree of polymerization is the number of monomeric units in a macromolecule or polymer or oligomer molecule.

DEGREE OF RUSTING = СТЕПЕНЬ РЖАВЛЕНИЯ – Degree Of Rusting:- assessment of the visible amount of rusting, i.e. the degree of damage to iron and steel cargoes as a result of corrosion. The American Rust Standard is frequently used in international trade to describe the degree of rusting.

DEGREES OF FREEDOM = СТЕПЕНИ СВОБОДЫ – Degrees Of Freedom:- (i) the number of independent comparisons that can be made in a set of data; and (ii) the maximum number of quantities whose values are free to vary before the remainder of the quantities are determined.

DEGROUPAGE = ДЕГРУППИРОВАНИЕ (или РАЗБИВКА) – Degroupage is the splitting up shipments into small consignments.

DEGUMMING = ОБЕСКЛЕИВАНИЕ (или ВЫВАРИВАНИЕ КЛЕЯ ИЗ ШЁЛКОВЫХ ОТХОДОВ) – Degumming is the boiling-off of silk in silk and hot water, in order to dissolve and wash away the natural gum (seracin) which surrounds the fiber. Degumming is the process of removing natural gum or sericin from silk yarn or fabric by boiling in a soap solution. Degumming is the removal of gum from silk by boiling in a mildly alkaline solution. Usually accomplished on the knit or woven fabric. Degumming is a process for removing natural gum from silk by boiling it in a soap solution.

DEHISCENT = РАСТРЕСКИВАНИЕ (или ОТКРЫВАЮЩЕЕСЯ РАСТРЕСКИВАНИЕМ) – Dehiscent:- splitting or bursting open along defined lines, e.g., of a fruit. Dehiscent is a splitting spontaneously when ripe.

DEHORNING = ОБЕЗРОЖИВАНИЕ (или УДАЛЕНИЕ РОГОВ, или ОПИЛИВАНИЕ РОГОВ) – Dehorning:- may be practiced if the breed of cattle typically grow horns, e.g., Herefords.

DEHULL = ШЕЛУШИТЬ (или ВЫЛУЩИВАТЬ, или ЛУЩИТЬ) – Dehull or Dehusk:- to remove the hulls or husk from a grain.

DE–HULLED = ШЕЛУШЁНОЕ (или ЛУЩЁНОЕ) – De-Hulled:- having removed the outer covering from seeds.

DEHUMIDIFY = ОСУШАТЬ (или ВЫСУШИВАТЬ, или ПРОСУШИВАТЬ, или ОБЕЗВОЖИВАТЬ) – Dehumidify:- the removal of moisture from the air.

DEHYDRATE = ДЕГИДРАТИРОВАТЬ (или ОБЕЗВОЖИВАТЬ) – Dehydrate:- to lose a high proportion of water content.

DEHYDRATOR = ДЕГИДРАТОР (или ВОДООТДЕЛИТЕЛЬ, или ОБЕЗВОЖИВАЮЩЕЕ СРЕДСТВО, или СУШИЛКА, или ОБЕЗВОЖИВАТЕЛЬ) – Dehydrator is a separator that removes water from the system fluid.

DE JURE = ДЭ ЮРЭ (или ДЭ ЙУРЭ, или ПО ПРАВУ, или ЮРИДИЧЕСКИ) – De Jure:- in Latin, By Law; According To Law; From The Law. Rightful, By Right. Latin for as A Matter Of Law, and By Law or By Right. Something that is rightful, legitimate or just according to law or equity. The term describes a state of affairs or a condition that exists based on a right under the law, rather than a de facto condition in which something exists in fact regardless of its right to exist. / В международном праве под Латинским словосочетанием Дэ Юрэ (De Jure), означающее По Праву, понимается полное официальное признание государства или правительства.

DEKATHERM = ДЕКАТЕРМИЯ – Dekatherm:- ten Therms, 1 million British thermal units. / Десять Термий, 1 миллион Британских единиц теплоты.

DELAINE WOOL = ГРЕБЕННАЯ ШЕРСТЬ СУКОННОГО ТИПА – Delaine Wool is a fine, strictly combing wool, usually from Ohio and Pennsylvania. Delaine wool does not necessarily have to come from the Delaine-Merino; however, that breed is noted for this class of wool.

DELAMINATION = ДЕЛАМИНАЦИЯ (или РАССЛОЕНИЕ, или ОТСЛАИВАНИЕ, или РАССЛАИВАНИЕ, или РАСЩЕПЛЕНИЕ) – Delamination is the separation of layers in laminated wood or plywood because of failure of the adhesive, either within the adhesive itself or at the interface between the adhesive and the wood. / Под Деламинацией, от позднелатинского слова Delamino, означающее Разделяю На Слои, или Латинского слова Delaminatio, от приставки De, означающей Отмену или Отсутствие или Понижение или Устранение, и Lamina, означающее Пластинка или Слой, понимается один из способов гаструляции, при котором клетки зародыша делятся параллельно его поверхности.

DELAMINATION WEAR = РАССЛАИВАНИЕ ИЗНОС – Delamination Wear:- a complex wear process where a machine surface is peeled away or otherwise removed by forces of another surface acting on it in a sliding motion. See also Wear.

DELAY = ЗАДЕРЖКА (или ЗАПАЗДЫВАНИЕ, или ОТСТАВАНИЕ, или ПРОМЕДЛЕНИЕ) – Delay:- even under All Risk coverage, damage due to delay is not recoverable. Most underwriters have inserted a Delay Cause in the Open Cargo Policy, which states specifically that damage caused by delay is not recoverable even if the delay was due to a peril insured against. / Под Запаздыванием понимается отставание от графика.

DELAYED CERTIFICATION = ЗАПАЗДЫВАЕМАЯ СЕРТИФИКАЦИЯ – Under Delayed Certification samples of the Cotton must be delivered to the USDA in readiness for classification not later than eight o'clock pm on the second business day proceeding the last delivery day. The USDA classing office must be contacted and told that the cotton will be arriving before 08:00 pm. / При запаздываемой сертификации крайним сроком доставки образцов хлопка в классификационный офис ДСХ США (USDA) для последующей сертификации служат 8 часов вечера во второй рабочий день, предшествующий последнему дню поставки. Классификационный офис ДСХ США должен быть извещён о том, что хлопок будет доставлен до 20:00 часов.

DELAYED COKING = ЗАМЕДЛЕННОЕ КОКСОВАНИЕ – Delayed Coking:- thermal cracking of atmospheric/vacuum residues to make electrode grade coke. / Термический крекинг остатков атмосферной и вакуумной перегонки нефти для получения электродного кокса.

DELAYED DEFORMATION = ЗАМЕДЛЕННАЯ ДЕФОРМАЦИЯ – Delayed Deformation is a deformation that is time-dependent and is exhibited by material subjected to a continuing load; creep. Delayed deformation may be recoverable following removal of the applied load.

DELAYED OPENING = ЗАПАЗДЫВАЕМОЕ ОТКРЫТИЕ – Delayed Opening:- the postponement of trading of an issue on a stock exchange beyond the normal opening of a day's trading because of market conditions that have been judged by exchange officials to warrant such a delay. Reasons for the delay may be an influx of either buy or sell orders, an imbalance of buyers and sellers, or pending corporate news that requires time for dissemination.

DELAYED PAYMENT CONTRACT = КОНТРАКТ С ОТСРОЧЕННЫМ ПЛАТЕЖОМ – Delayed Payment Contract is an agreement in which the price is established and the grain is delivered but payment is postponed until later. It is used to shift taxable income into the following year. See also Basis Contract; Elevator Cash Contract; Forward Contract; Hedge-To-Arrive Contract; Minimum Price Contract; Offer Contract; and Price-Later (Delayed Price) Contract.

DELAY IN STARTUP INSURANCE = СТРАХОВАНИЕ ОТ ЗАДЕРЖКИ НА НАЧАЛЬНОМ ЭТАПЕ – Delay In Startup Insurance is a policy to protect the seller of a construction project from penalties if the project is not completed on time. See also Liquidated Damages.

DEL CREDERE = ДЭЛЬ КРЭДЭРЭ – Del Credere:- in Italian, Of Belief or Trust. In mercantile law, an agreement by which an agent or factor, in consideration of an additional premium or commission (called a Del Credere Commission), engages, when he sells goods on credit, to insure, warrant, or guarantee to his principal the solvency of the purchaser, the engagement of the factor being to pay the debt himself if it is not punctually discharged by the buyer when it becomes due. / Дэль Крэдэрэ:- ручательство комиссионера перед комитентом за исполнение договора, заключённого комиссионером с третьим лицом. За такой договор комиссионер получает особое вознаграждение.

DEL CREDERE AGENT = АГЕНТ ПО ДЭЛЬ КРЭДЭРЭ – Del Credere Agent is a person who accepts goods on consignment from exporters, agreeing (in return for an additional commission) to pay for them in the event that the original purchaser defaults. Agent who assures remittance. / Агент, который обеспечивает перечисление денежных средств.

DELIBERATE CUT PLACED IN FABRIC = УМЫШЛЕННЫЙ (или ПРЕДНАМЕРЕННЫЙ) НАДРЕЗ (или ПОДРЕЗ), ПРОИЗВЕДЁННЫЙ В ТКАНИ – Deliberate Cut Placed In Fabric:- Possible Cause:- a rib defect occurred during knitting which was detected by quality control (QC) who placed a cut on the defect to ensure that the garment does not go through further stages. This is a prime example of how the classification of defects can vary in different situations. The Rib defect may not have been visible with ease and slipped through making it a minor defect. However, for the QC department it was a major defect. Knitting defect.

DELIMITING SURVEY = ДЕЛИМИТИРУЮЩЕЕ ОБСЛЕДОВАНИЕ (или ДЕЛИМИТИРУЮЩЕЕ ИЗЫСКАНИЕ) – Delimiting Survey is a survey conducted to establish the boundaries of an area considered to be infested by or free from a pest.

DELINQUENCY = НАРУШЕНИЕ СРОКОВ (или ПРОСРОЧКА) – Delinquency is the failure to make timely payments under a loan or other credit agreement. / Делинквент, от Латинского слова Delinquens, означающее Совершающий Поступок, подразумевает лицо с социально-отклоняющимся поведением, например, нарушителя, преступника и им подобного.

DELINQUENT LIST = СПИСОК ДОЛЖНИКОВ (или СПИСОК НЕПЛАТЕЛЬЩИКОВ) – Delinquent List:- accounts owing money past due; issued by carrier if monies are outstanding past credit agreement terms. The Texas Alcoholic Beverage Commission (TABC) official Delinquent List is published/effective at 12:01 am on the 1st and 16th of each month. All payments must have been received by wholesaler prior to 12:01 am on the 1st and/or 16th as applicable to avoid regulatory action. Any orders received for delivery, will call, salesperson pick-up or hot shot prior to the publication date may be delivered by the Wholesaler and/or Local Distributor on the day of the publication. Such orders must be invoiced and billed prior to the publication time of 12:01 am and must be delivered by 01:00 pm on the publication date. If the publication date falls on a Saturday, Sunday, or a state or federal holiday, the publication date shall be the next regular business day.

DELINTING (OF SEEDS) = ЛИНТЕРОВАНИЕ (СЕМЯН) (или ОГОЛЕНИЕ (СЕМЯН)) – Delinting is the process of separating the very short fibers (linters) remaining on the seed after the longer fiber has been removed in the ginning process. Delinting is another name for second-time ginning of cotton. It is done in the large cities of the South of the United States, and not on the plantation or community gin where first-time ginning occurs. Delinted fibers are very short, brown in color, and when refined serve as a raw material in the manufacture of acetate and rayon. An improved process for the purification of raw cotton linters includes the cutting of a first, second, third or mill run cut raw cotton linters to a particle size that passes through a 2 500 micrometer screen and then mechanically separating the linters into clean and unclean fractions. The clean fraction contains purified cut raw cotton linters and the unclean fraction contains the impurities. Short fibers (known as Linters) that were not removed by ginning remain on these cotton seeds. At the oil mill the linters are removed from the seeds by delinting machines, employing the same principles as saw gins. The seeds can be run through a delinting machine once, in which case the linters produced are known as Mill Run Linters. Most mills run the seed through twice and produce first-cut and second-cut linters. First-cuts consist of longer, more resilient fibers and are used in a number of nonwoven products. Second-cuts are made up of short fibers and are used to produce high grade bond paper and as a source of cellulose in the chemical industry. After removal of the linters, the remainder of the cotton seed is converted into food for people, feed for livestock, fertilizer and mulch for plants. The linters of the highest grade, referred to as First-Cut Linters (longer more resilient fibers) are used in manufacturing non-chemical products, such as medical supplies, twine, and candle wicks. The second-cut linters (short fibers or fuzz), removed in further delinting steps, are incorporated in chemical products, found in various foods, toiletries, film, and paper. / примеси. Линтерованные семена. Снятие (или Съём) с поверхности семян Хлопчатника коротких волокон, оставшихся после линтерования, для придания им свойства сыпучести. Технологическая операция отделения линта от семян Хлопчатника после джинирования.

DELIQUESCENT = МНОГОСТВОЛЬНОЕ (или РАСПАДАЮЩЕЕСЯ, или РАЗЛАГАЮЩЕЕСЯ) – Deliquescent is a tendency to absorb moisture and become liquid.

DELISTED = НЕКОТИРУЕМЫЕ (или ИСКЛЮЧЁННЫЕ ИЗ КОТИРОВАЛЬНОГО СПИСКА) – Delisted:- removed shares or securities that were once quoted on a stock exchange.

DELIVERABILITY = ПРОПУСКНАЯ СПОСОБНОСТЬ – (1) Deliverability:- the volume that a particular well, storage field, pipeline or distribution system can supply during a 24-hour period. / Объем, который определённая скважина, хранилище, трубопровод или система распределения может выдать в течение суток.

(2) In gas industry, Deliverability (from storage) is the rate at which gas can be supplied from a storage in a given period. In a salt cavity storage facility for example, the rate would depend on a number of factors including reservoir pressure, reservoir rock characteristics and withdrawal facilities such as pipeline capacity. The term is also used for the volume of gas which a field, pipeline, well, storage or distribution system can supply in a single 24-hour period.

DELIVERABLE GRADES = ПОСТАВЛЯЕМЫЕ СОРТА – The standard grades of commodities or instruments listed in the rules of the exchanges that must be met when delivering cash commodities against futures contracts. Grades are often accompanied by a schedule of discounts and premiums allowable for delivery of commodities of lesser or greater quality than the standard called for by the exchange. Also known as Contract Grades. Deliverable Grades are the commodity grades that can be delivered to satisfy a futures contract.

DELIVERABLES = DELIVERABLE OPTIONS

DELIVERABLE STOCKS = ПОСТАВЛЯЕМЫЕ ЗАПАСЫ – Deliverable Stocks are the stocks of commodities located in exchange-approved storage, for which receipts may be used in making delivery on futures contracts. In the cotton trade, the term refers to cotton certified for delivery. See also Certificated Stocks and Certified Stocks.

DELIVERABLE SUPPLY = ПРЕДЛОЖЕНИЕ НА ПОСТАВКУ – Deliverable Supply:- the total supply of a commodity that meets the delivery specifications of a futures contract. See also Economically Deliverable Supply.

DELIVERABLE WARRANT = ПОСТАВОЧНЫЙ ВАРРАНТ – Deliverable Warrant:- upon exercise of the warrant and making the relevant payments, deliverable warrants are settled by a transfer of the underlying asset, e.g., Equity Warrants. Deliverable Warrant:- settlement of a warrant by transfer of the underlying asset rather than by payment of cash. / , например, .

DELIVERABLE WEIGHT = ПОДЛЕЖАЩИЙ ПОСТАВКЕ ВЕС (или ПОСТАВЛЯЕМЫЙ ВЕС) – In the cotton futures trading, Deliverable Weight is the official net weight of a bale of cotton as indicated in the Electronic Warehouse Receipt (EWR) by the warehouse. The net weight shall be gross weight (scale weight) of the bale less the actual tare weight. Bales weighing less than 400 pounds net or more than 650 pounds net, shall not be delivered on any contract for future delivery. Also known as Tenderable Weight.

DELIVERED = ПОСТАВЛЕНО – Delivered:- often regarded as synonymous with cost, insurance, and freight in the international cargo trade, its terms differ from the latter in a number of ways. Generally, the seller's risks are greater in a delivered transaction because the buyer pays on the basis of landed quality/quantity. Risk and title are borne by the seller until such time as the commodity, such as oil, passes from shipboard into the connecting flange of the buyer's shore installation. The seller is responsible for clearance through customs and payment of all duties. Any in-transit contamination or loss of cargo is the seller's liability. In delivered transactions, the buyer pays only for the quantity of oil actually received in storage. / контаминация .

DELIVERED AT FRONTIER = ПОСТАВЛЕНО НА ГРАНИЦУ (или ПОСТАВКА НА ГРАНИЦЕ, или ФРАНКО ГРАНИЦА) – 'Delivered At Frontier' (DAF), a term of INCOTERMS® 2000, means that the seller delivers when the goods are placed at the disposal of the buyer on the arriving means of transport not unloaded, cleared for export, but not cleared for import at the named point and place at the frontier, but before the customs border of the adjoining country. The term Frontier may be used for any frontier including that of the country of export. Therefore, it is of vital importance that the frontier in question be defined precisely by always naming the point and place in the term. However, if the parties wish the seller to be responsible for the unloading of the goods from the arriving means of transport and to bear the risks and costs of unloading, this should be made clear by adding explicit wording to this effect in the contract of sale. This term may be used irrespective of the mode of transport when goods are to be delivered at a land frontier. When delivery is to take place in the port of destination, on board a vessel or on the quay (wharf), the DES or DEQ term should be used. / ИНКОТЁРМЗ® 2000. Франко Граница (ФРГ (DAF)).

DELIVERED AT PLACE = ПОСТАВЛЕНО НА МЕСТО (или ПОСТАВКА НА МЕСТО) – Delivered At Place (DAP) (named destination place), Incoterms® 2010:- this term means that the seller delivers when the goods are placed at the disposal of the buyer on the arriving means of transport ready for unloading at the named place of destination. This is exactly what the old Incoterm® DDU stipulated. Delivered At Place (DAP), applies to any mode of transport. The seller delivers at the agreed place of destination. The seller takes all risks till destination and takes care of the export Custom Clearance. The buyer is responsible for the discharging of the goods and for the import Custom clearance. Delivered At Place (DAP):- the seller's obligation ends when he has delivered the goods to the disposal of the buyer at the named destination place, cleared for export, but not cleared for import. The seller and buyer should agree which party will be responsible for unloading. The buyer is responsible for the import clearance of the goods. Under the new rules, delivery under DAP, delivery is when the seller puts the goods at the disposal of the buyer at a named place, on a vehicle ready for unloading (that is, not unloaded). DAP can be used regardless of the mode of transport; it is not just limited to maritime transport. The changes should make it more useful for container traffic. For container traffic, where goods are sold on a 'delivered' basis, the normal options will be:- DAP (buyer's premises) where delivery is at the buyer's premises but not cleared for import. DAP specifically does not refer to 'duty' in its title to encourage its use in domestic and free trade (as well as in international trade). DAP (insert named place of destination) Incoterms® 2010. This rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. 'Delivered at Place' means that the seller delivers when the goods are placed at the disposal of the buyer on the arriving means of transport ready for unloading at the named place of destination. The seller bears all risks involved in bringing the goods to the named place. The parties are well advised to specify as clearly as possible the point within the agreed place of destination, as the risks to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the place of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. DAP requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. If the parties wish the seller to clear the goods for import, pay any import duty and carry out any import customs formalities, the DDP (Delivered Duty Paid) term should be used. / Инкотёрмз® 2010.

DELIVERED AT PLACE UNLOADED = ПОСТАВЛЕНО НА МЕСТО ВЫГРУЖЕНО (или ПОСТАВКА НА МЕСТО ВЫГРУЖЕНО) – Delivered At Place Unloaded (DPU) (insert named destination place), Incoterms® 2020:- Delivery And Risk:- Delivered at Place Unloaded means that the seller delivers the goods – and transfers risk – to the buyer:- when the goods, once unloaded from the arriving means of transport, are placed at the disposal of the buyer at a named place of destination or at the agreed point within that place, if any such point is agreed. The seller bears all risks involved in bringing the goods to and unloading them at the named place of destination. In this Incoterms® rule, therefore, the delivery and arrival at destination are the same. DPU is the only Incoterms® rule that requires the seller to unload goods at destination. The seller should therefore ensure that it is in a position to organise unloading at the named place. Should the parties intend the seller not to bear the risk and cost of unloading, the DPU rule should be avoided and DAP (Delivered At Place) should be used instead. Mode Of Transport:- This rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. Identifying The Place Or Point Of Delivery/Destination Precisely:- The parties are well advised to specify the destination place or point as clearly as possible and this for several reasons. First, risk of loss of or damage to the goods transfers to the buyer at that point of delivery/destination – and it is best for the seller and the buyer to be clear about the point at which that critical transfer happens. Secondly, the costs before that place or point of delivery/destination are for the account of the seller and the costs after that place or point are for the account of the buyer. Thirdly, the seller must contract or arrange for the carriage of the goods to the agreed place or point of delivery/destination. If it fails to do so, the seller is in breach of its obligations under this rule and will be liable to the buyer for any ensuing loss. The seller would, for example, be responsible for any additional costs levied by the carrier to the buyer for any additional oncarriage. 'Or Procuring The Goods So Delivered' – The reference to 'procure' here caters for multiple sales down a chain (string sales), particularly common in the commodity trades. Export/Import Clearance:- DPU requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import or for post-delivery transit through third countries, to pay any import duty or to carry out any import customs formalities. As a result, if the buyer fails to organise import clearance, the goods will be held up at a port or inland

terminal in the destination country. Who bears the risk of any loss that might occur while the goods are thus held up at the port of entry in the destination country? The answer is the buyer:- delivery will not have occurred yet, B3(a) ensuring that the risk of loss of or damage to the goods is with the buyer until transit to a named inland point can be resumed. If, in order to avoid this scenario, the parties intend the seller to clear the goods for import, pay any import duty or tax and carry out any import customs formalities, the parties might consider using DDP (Delivered Duty Paid) rule. / Инкотёрмз® 2020.

DELIVERED AT TERMINAL = ПОСТАВЛЕНО НА ТЕРМИНАЛ (или ПОСТАВКА НА ТЕРМИНАЛ) – Delivered At Terminal (DAT), Incoterms® 2010:- applies for any mode of transport. The vendor delivers in the agreed terminal in said port or place of destination. The seller takes all risks till delivery into the terminal en is responsilble for unloading the goods and export Custom Clearance. The consignee is responsible for Custom Clearance at imports. Terminal:- every place such as the wharf, warehouse, container- , road-, rail- or air terminal. Delivered At Terminal (DAT):- the seller's obligation ends when he has delivered the goods to the disposal of the buyer, unloaded from the arriving carrier at the named destination terminal, cleared for export, but not cleared for import. The buyer is responsible for the import clearance of the goods. If the seller is also to be responsible for delivering the goods past the terminal to another place, then DAP (Delivered At Place) or DDP (Delivered Duty Paid) terms should be used. DAT (insert named terminal at port or place of destination), Incoterms® 2010. This rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. 'Delivered at Terminal' means that the seller delivers when the goods, once unloaded from the arriving means of transport, are placed at the disposal of the buyer at a named terminal at the named port or place of destination. 'Terminal' includes any place, whether covered or not, such as a quay, warehouse, container yard or road, rail or air cargo terminal. The seller bears all risks involved in bringing the goods to and unloading them at the terminal at the named port or place of destination. The parties are well advised to specify as clearly as possible the terminal and, if possible, a specific point within the terminal at the agreed port or place of destination, as the risks to that point are for the account of the seller. The seller is advised to procure a contract of carriage that matches this choice precisely. Moreover, if the parties intend the seller to bear the risks and costs involved in transporting and handling the goods from the terminal to another place, then the DAP (Delivered At Place) or DDP (Delivered Duty Paid) rules should be used. DAT requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. Under the new rules, delivery under DAT takes place when the seller puts the goods at the disposal of the buyer unloaded at the named terminal. DAT can be used regardless of the mode of transport; it is not just limited to maritime transport. The changes should make it more useful for container traffic. For container traffic, where goods are sold on a 'delivered' basis, the normal options will be:- DAT (named terminal) where delivery is at the container port/terminal. / Инкотёрмз® 2010.

DELIVERED DUTY PAID = ПОСТАВЛЕНО С ОПЛАТОЙ ПОШЛИН (или ПОСТАВЛЕНО ПОШЛИНА ОПЛАЧЕНА, или ПОСТАВКА С ОПЛАТОЙ ПОШЛИН, или ФРАНКО (МЕСТО НАЗНАЧЕНИЯ) СБОРЫ ОПЛАЧЕНЫ) – Delivered Duty Paid (DDP), a term of Incoterms® 2000, means that the seller delivers the goods to the buyer, cleared for import, and not unloaded from any arriving means of transport at the named place of destination. The seller has to bear all the costs and risks involved in bringing the goods thereto including, where applicable, and Duty (which term includes the responsibility for and the risk of the carrying out of customs formalities and the payment of formalities, customs duties, taxes and other charges) for import in the country of destination. Whilst the EXW term represents the minimum obligation for the seller, DDP represents the maximum obligation. This term should not be used if the seller is unable directly or indirectly to obtain the import licence. However, if the parties wish to exclude from the seller's obligations some of the costs payable upon import of the goods (such as value-added tax (VAT)), this should be made clear by adding explicit wording to this effect in the contract of sale. If the parties wish the buyer to bear all risks and costs of the import, the DDU (Delivered Duty Unpaid) term should be used. This term may be used irrespective of the mode of transport but when delivery is to take place in the port of destination on board the vessel or on the quay (wharf), the DES (Delivered Ex Ship) or DEQ (Delivered Ex Quay) terms should be used. Delivered Duty Paid (DDP) is used when the seller undertakes the delivery of goods to the place named in the country of import, most likely the buyer's warehouse, with all costs and duties paid. DDP (insert named place of destination) Incoterms® 2010:- this rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. 'Delivered Duty Paid' means that the seller delivers the goods when the goods are placed at the disposal of the buyer, cleared for import on the arriving means of transport ready for unloading at the named place of destination. The seller bears all the costs and risks involved in bringing the goods not only for export but also for import, to pay any duty for both export and import and to carry out all customs formalities. DDP represents the maximum obligation for the seller. The parties are well advised to specify as clearly as possible the point within the agreed place of destination, as the costs and risks to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the place of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. The parties are well advised not to use DDP if the seller is unable directly or indirectly to obtain import clearance. If the parties wish the buyer to bear all risks and costs of import clearance, the DAP rule should be used. Any VAT or other taxes payable upon import are for the seller's account unless expressly agreed otherwise in the sale contract. / Инкотёрмз® 2000. Франко (место назначения) Сборы Оплачены (ФОП (DDP)).

DELIVERED DUTY UNPAID = ПОСТАВЛЕНО БЕЗ ОПЛАТЫ ПОШЛИН (или ПОСТАВЛЕНО ПОШЛИНА НА ОПЛАЧЕНА, или ПОСТАВКА БЕЗ ОПЛАТЫ ПОШЛИН, или ФРАНКО (МЕСТО НАЗНАЧЕНИЯ) СБОРЫ НЕ ОПЛАЧЕНЫ) – Delivered Duty Unpaid (DDU), a term of Incoterms® 2000, means that the seller delivers the goods to the buyer, not cleared for import, and not unloaded from any arriving means of transport at the named place of destination. The seller has to bear the costs and risks involved in bringing the goods thereto, other than, where applicable, any Duty (which term includes the responsibility for and the risks of the carrying out of customs formalities, and the payment of formalities, customs duties, taxes and other charges) for import in the country of destination. Such duty has to be borne by the buyer as well as any costs and risks caused by his failure to clear the goods for import in time. However, if the parties wish the seller to carry out customs formalities and bear the costs and risks resulting therefrom as well as some of the costs payable upon import of the goods, this should be made clear by adding explicit wording to this effect in the contract of sale. This term may be used irrespective of the mode of transport but when delivery is to take place in the port of destination on board the vessel or on the quay (wharf), the DES (Delivered Ex Ship) or DEQ (Delivered Ex Quay) terms should be used. / Инкотёрмз® 2000. Франко (место назначения) Сборы Не Оплачены (ФНО (DDU)).

DELIVERED EX SHIP = ПОСТАВЛЕНО ФРАНКО СУДНО (или ПОСТАВЛЕНО С СУДНА, или ПОСТАВКА С СУДНА) – Delivered Ex Ship (DES), a term of Incoterms® 2000, means that the seller delivers when the goods are placed at the disposal of the buyer on board the ship not cleared for import at the named port of destination. The seller has to bear all the costs and risks involved in bringing the goods to the named port of destination before discharging. If the parties wish the seller to bear the costs and risks of discharging the goods, then the DEQ (Delivered Ex Quay) term should be used. This term can be used only when the goods are to be delivered by sea or inland waterway or multimodal transport on a vessel in the port of destination. / Инкотёрмз® 2000. Поставлено С Судна (ПСС (DES)).

DELIVERED EX QUAY = ПОСТАВЛЕНО ФРАНКО ПРИЧАЛ (или ПОСТАВЛЕНО С ПРИЧАЛА, или ПОСТАВКА С ПРИЧАЛА) – Delivered Ex Quay (DEQ), a term of Incoterms® 2000, means that the seller delivers when the goods are placed at the disposal of the buyer not cleared for import on the quay (wharf) at the named port of destination. The seller has to bear costs and risks involved in bringing the goods to the named port of destination and discharging the goods on the quay (wharf). The DEQ term requires the buyer to clear the goods for import and to pay for all duties, formalities, taxes and other charges upon import. This is a reversal from previous Incoterms® versions which required the seller to arrange for import clearance. If the parties wish to include in the seller's obligations all or part of the costs payable upon import of the goods, this should be made clear by adding explicit wording to this effect in the contract of sale. This term can be used only when the goods are to be delivered by sea or inland waterway or multimodal transport on discharging from a vessel onto the quay (wharf) in the port of destination. However, if the parties wish to include in the seller's obligations the risks and costs of the handling of the goods from the quay to another place (terminal, transport station, warehouse, etc) in or outside the port, the DDU (Delivered Duty Unpaid) or DDP (Delivered Duty Paid) terms should be used. / Инкотёрмз® 2000. Поставлено С Причала (ПСП (DEQ)).

DELIVERER = ПОСТАВЩИК – In the US Cotton futures trading, a Deliverer is the clearing member that issued the notice and has the responsibility of effecting the delivery.

DELIVERIES = ПОСТАВКИ – In some oil reviews, Deliveries refer to the supply of oil products from primary stocks to wholesalers and retailers or direct to end-users.

DELIVERING CARRIER = ПОСТАВЛЯЮЩИЙ ПЕРЕВОЗЧИК – Delivering Carrier is the carrier who delivers the consignment to the consignee or his agent (aircargo). / В перевозках авиационных грузов .

DELIVERING PARTY = ПОСТАВЛЯЮЩАЯ СТОРОНА – Delivering Party is the entity supplying the capacity and/or energy to be transmitted at Point(s) of Receipt.

DELIVERY = ПОСТАВКА – (1) Delivery is the act of transfering possession, as the transfert of property from consignor to carrier, one carrier to another, or carrier to consignee. The physical and legal transfer of a shipment from consignor to carrier and from carrier/ transport agent to consignee. The process of delivering the shipment to the Consignee at the agreed place. Delivery is the term has distinct meaning when used in connection with futures contracts. Delivery generally refers to the changing of ownership or control of a commodity under specific terms and procedures established by the exchange upon which the contract is traded. Typically, except for energy, the commodity must be placed in an approved warehouse, precious metals depository, or other storage facility, and be inspected by approved personnel, after which the facility issues a warehouse receipt, shipping certificate, demand certificate, or due bill, which becomes a transferable delivery instrument. Delivery of the instrument usually is preceded by a Notice Of Intention To Deliver. After receipt of the delivery instrument, the new owner typically can take possession of the physical commodity, can deliver the delivery instrument into the futures market in satisfaction of a short position, or can sell the delivery instrument to another market participant who can use it for delivery into the futures market in satisfaction of his short position or for cash, or can take delivery of the physical himself. The procedure differs for energy contracts. Bona fide buyers or sellers of the underlying energy commodity can stand for delivery. If a buyer or seller stands for delivery, the contract is held through the termination of trading. The buyer and seller each file a Notice Of Intent To Make or Take Delivery with their respective clearing members who file them with the exchange. Buyers and sellers are randomly matched by the exchange. The delivery payment is based on the contract's final settlement price. The tender and receipt of the actual commodity, the cash value of the commodity, or of a delivery instrument covering the commodity (e.g., warehouse receipts or shipping certificates), used to settle a futures contract. See also Delivery Notice and Notice Of Delivery. The transfer of the cash commodity from the seller of a futures contract to the buyer of a futures contract. Each futures exchange has specific procedures for delivery of a cash commodity. Some futures contracts, such as stock index contracts, are cash settled. The tender and receipt of an actual commodity, warehouse receipt or other negotiable instrument covering such commodity in settlement of a futures contract. Delivery is the actual transfer of the ownership of precious metal. It may not involve physical movement of metal and is usually made by a simple paper transfer in the clearing system. Final transfer of a security or financial instrument. Delivery is the settlement of a futures contract by receipt of the actual physical commodity or by the tender of a warehouse receipt covering a contract unit of the commodity. Delivery is the transfer of the physical commodity in satisfaction of a futures contract. / Тендер и получение фактического сырья, складская расписка или иной оборотный инструмент на такое сырьё для расчёта по фьючерсному контракту. заслуживающий доверия или действительный (bona fide). , например, .

(2) Delivery is the act of putting property into the legal possession of another, whether involving the actual transfer of the physical control of the object from one to the other or being constructively effected in various other ways.

DELIVERY APPOINTMENT = СРОК ПОСТАВКИ – Delivery Appointment:- the time agreed upon between two enterprises for goods or transportation equipment to arrive at a selected location.

DELIVERY DATE = ДАТА ПОСТАВКИ – The Delivery Date is the date when the actual commodity must be delivered after the futures contract has expired. Commodities futures contracts have typically two or more delivery dates per year. Delivery dates are different for each commodity. The date on which the commodity or instrument of delivery must be delivered to fulfill the terms of a contract. Delivery Date is the specified day on which precious metal must be delivered to fulfil a contract.

DELIVERY DAY = ДЕНЬ ПОСТАВКИ – Delivery Day:- the third day in the delivery process at the Chicago Board of Trade, when the buyer's clearing firm presents the delivery notice with a certified check for the amount due at the office of the seller's clearing firm. / в Чикагской Палате Торговли (Чикагском Табло Торговли, если быть более точными).

DELIVERY INSTRUCTION = ИНСТРУКЦИЯ ПО ПОСТАВКЕ – Delivery Instructions are the directions to an inland carrier by a shipper about the delivery of a shipment to a particular carrier or pier for export. Not to be confused with delivery order document which pertains to the release of a shipment to a specified party. Order to pick up goods at a named place and deliver them to a pier. Usually issued by exporter to trucker but may apply to a railroad, which completes delivery by land. Use is limited to a few major US ports. Also known as Shipping Delivery Order. Delivery Instruction provides specific information to the inland carrier concerning the arrangement made by the forwarder to deliver the merchandise to the particular pier or steamship line. Not to be confused with Delivery Order, which is used for import cargo. / Инструкция По Поставке:- указания наземному перевозчику от грузоотправителя о поставке .

DELIVERY INSTRUMENT = ИНСТРУМЕНТ ПОСТАВКИ – Delivery Instrument is a document used to effect delivery on a futures contract, such as a warehouse receipt or shipping certificate.

DELIVERY MONTH = МЕСЯЦ ПОСТАВКИ – Delivery Month is the month in which a futures contract matures and delivery may be made or contract settlement made. Delivery Month is the month specified in a given physicals or futures contract for delivery of the actual physical commodity or cash. The specified month within which a futures contract matures and can be settled by delivery or the specified month in which the delivery period begins under the terms of the futures contract. Also known as Contract Month. Delivery

Month is the specified month in which delivery is made under the terms of the futures contract. Delivery Month is a key characteristic of a futures contract that designates when the contract expires and when the underlying asset must be delivered. The exchange on the futures contract is traded will also establish a delivery location and a date within the delivery month when the delivery can take place. Not all futures contracts require physical delivery of a commodity, and many are settled in cash. Also referred to as Contract Month. On the ticker, delivery month is indicated by a letter:- January:- F; February:- G; March:- H; April:- J; May:- K; June:- M; July:- N; August:- Q; September:- U; October:- V; November:- X; and December:- Z. Some commodities can be delivered in any month. Others are only delivered in certain months. For example, Cocoa can only have a delivery month of March, May, July, September or December, while copper can be delivered year round. The complete ticker symbol for a futures contract will describe the commodity, the delivery month and the year. 'CCZ20', for instance, indicates a Cocoa futures contract for delivery in December 2020. / Указанный месяц, в рамках которого истекает срок действия фьючерсного контракта и может быть согласована процедура фактической поставки или в который начинается период поставки в соответствии с условиями фьючерсного контракта. Известен также как Контрактный Месяц (Contract Month).

DELIVERY NOTE = НОТА ПОСТАВКИ (или ТРАНСПОРТНАЯ НАКЛАДНАЯ, или ПОСТАВОЧНЫЙ БИЛЕТ) – (1) Delivery Note is a document accompanying a shipment of goods that lists the description, and quantity of the goods delivered. A copy of the delivery note, signed by the buyer or consignee, is returned to the seller or consignor as a proof of delivery. Broadly, a note advising a recipient of the intended delivery of goods. Delivery Note is a document recording the delivery of products to a consignee (customer). A document evidencing the delivery of a shipment to a Consignee. A Delivery Note is a type of document used in business; it often comes with shipments of goods, and details what is included in the shipment. The delivery note may also include information about what is not included in the shipment, if items were ordered together, yet some have not arrived. This document is often used as proof for both the client accepting the delivery, as well as the business providing the goods; it documents that that the goods were delivered, and also that the client accepted them. It is important for businesses to keep good records of these types of documents in case there are any discrepancies. Though the specific template for each delivery note may be different, most businesses include similar information on each. This includes the name and address of the company delivering the goods, as well as the name and address of the company accepting them. It may also include line item descriptions for each item included in the shipment, the quantity of the items, and occasionally price information. The date of order as well as the date of delivery is typically included as well. The person receiving the shipment may then have the opportunity to inspect the shipment and check the delivery note to make sure they match, then sign the document; each person will then get a copy for his or her records. In these cases, a delivery note helps to protect both parties involved in the transaction. If the note is signed, no one can come back and say they didn't receive the delivery, or that the shipment didn't match. This is important in business, and is an easy way to prevent disputes which could otherwise become quite costly. If certain products were ordered, but were not included in the shipment, this is typically mentioned on the delivery note as well, possibly with an expected future date of delivery. For some businesses, a delivery note is synonymous with an invoice, and the customer receiving this document will be expected to pay. Some will require immediate payment, while others will allow future payment and billing. This is less common, however, and most companies will send invoices or bills separately for goods and services. For businesses looking to create their own delivery notes to send with shipments, there are numerous templates available for free online that can be customized in many different computer programs, and then simply printed and copied for ongoing use. Type of waybill accompanying merchandise shipments.

(2) In the securities market, a Delivery Note requests the delivery of a security.

DELIVERY NOTICE = УВЕДОМЛЕНИЕ О ПОСТАВКЕ – Delivery Notice is a notice presented through an exchange's clearing house by a clearing member announcing the intention to deliver the actual commodity in satisfaction of a contract obligation. Delivery Notice is a notice of the intent to deliver or a request to receive delivery of a commodity under the terms of a futures contract. The written notice given by the seller of his intention to make delivery against an open short futures position on a particular date. This notice, delivered through the clearing organization, is separate and distinct from the warehouse receipt or other instrument that will be used to transfer title. Also known as Notice Of Delivery or Notice Of Intent To Deliver. / Уведомление продавца, выполненное в письменной форме, о его намерении осуществить поставку по открытой короткой позиции по фьючерсному контракту в определённую дату. Известно также как Уведомление О Поставке (Notice Of Delivery) или Уведомление О Намерении Поставить (Notice Of Intent To Deliver).

DELIVERY OPTION = ОПЦИОН ПОСТАВКИ – Delivery Option is a provision of a futures contract that provides the short with flexibility in regard to timing, location, quantity, or quality in the delivery process.

DELIVERY ORDER = РАСПОРЯЖЕНИЕ ПО ПОСТАВКЕ (или ПОРУЧЕНИЕ ПО ПОСТАВКЕ, или ДЕЛИВЕРИ ОРДЕР) – Delivery Order is an order from the consignee, shipper or owner of freight to a terminal operator, carrier or warehouse to deliver freight to another party. On imports, it may also be known as a Pier Release. A document which is neither a bill of lading or a waybill but contains an undertaking which:- (i) is given under or for the purposes of a contract for the carriage by sea of goods to which the document relates, or of goods which include those goods; and (ii) is an undertaking by the carrier to a person identified in the document to deliver those goods to that person which the document relates. Delivery orders are capable of transferring contractual rights by way of endorsements, but they are not necessarily documents of title in the sense of being able to pass constructive possession. The UK's Carriage of Goods by Sea Act 1992 creates a further class of document known as a Ship's Delivery Order which contains an undertaking to carry goods by sea but is neither a bill nor a waybill. Delivery Order is:- (1) in freight-prepaid shipments, written directions from a consignor (or shipper) of a shipment to a carrier or freight forwarder to release the shipment to the named delivery party. (2) In freight-collect (free on board) shipments, order by a carrier to the port authorities to release a shipment to the named delivery party on payment of the specified freight charges. Not to be confused with delivery instructions document which pertains to inland transportation. A document issued by or on behalf of the Carrier authorising the release of import cargo to Consignee. A Delivery Order (abbreviated D/O) is a document from a consignor, a shipper, or an owner of freight which orders the release of the transportation of cargo to another party. Usually the written order permits the direct delivery of goods to a warehouseman, carrier or other person who in the course of their ordinary business issues warehouse receipts or bills of lading. According to the Uniform Commercial Code (UCC) a delivery order refers to an 'order given by an owner of goods to a person in possession of them (the carrier or warehouseman) directing that person to deliver the goods to a person named in the order'. A Delivery Order which is used for the import of cargo should not to be confused with delivery instructions. Delivery Instructions provides 'specific information to the inland carrier concerning the arrangement made by the forwarder to deliver the merchandise to the particular pier or steamship line'. 'A delivery order was not regarded as a document of title at common law with the result that the transfer of the delivery order did not effect transfer of constructive possession of the goods. Attornment on the part of the bailee was required, i.e. an acknowledgement that the bailee held the goods on behalf of the transferee. The Uniform Documents of Title Act permits the use of negotiable delivery orders (if the order directs delivery to a named person or order). However, it is still necessary to single out delivery orders for special treatment. Until the delivery order is accepted by the bailee, there is no basis for imposing obligations on the bailee. See discussion under

sections 18 and 19. See also the definition of 'Issuer''. Issued by the consignee or his customs broker to the ocean carrier as authority to release the cargo to the inland carrier. Includes all data necessary for the pier delivery clerk to determine that the cargo can be released to the domestic carrier. A Delivery Order is a legal document that instructs the recipient, the bailee, to release supplies or goods to the designated individual or organization named in the order. It's defined by the Uniform Commercial Code, and it's also described in each region's contract law. The industry term for a delivery order is D/O, and it's commonly used in international trade, authorizing the release of imported cargo. Businesses often use standard delivery order forms that can be printed from the Internet or legal software programs. The person who completes a delivery order is often called the Consignor. A simple form consisting of one page is often used by the owner of the goods to complete the delivery order, and it's similar to a packing slip. The main difference between a packing slip and the delivery order is the additional requirement of the bailee to ship the goods. The information on the order includes the container that's to be delivered or the product and quantity. It also includes the name and address of the person who will receive the shipment and the name of the representative who will make the payment if it's to be collected upon delivery. The delivery date is included so that the carrier knows when to ship the goods and to ensure that the designated party receives the goods on time. The bill of lading is not to be confused with a delivery order. It's the document that the carrier sends to the consignor to confirm that the goods were delivered to the person specified and at a specific address. Some delivery orders include a delivery confirmation, which is a line or space for the carrier to sign in order to confirm that the goods were delivered pursuant to the delivery instructions. The receiver also signs the confirmation so that the carrier has proof that the goods were delivered and received. A consignor may accept a copy of the delivery confirmation in addition to or in lieu of the bill of lading. Some exporters use delivery orders as a release form to import goods. The bailee has to release the goods to the designated party, such as a customs broker or other individual. The exporter is referred to as The Owner Of The Freight, and she often uses the delivery order to instruct the bailee to release the freight to an individual or business. Another form, called Delivery Instructions, is used for the delivery of goods to inland carriers.

DELIVERY PARTY = СТОРОНА ПОСТАВКИ – Delivery Party is the party to which the shipment is to be delivered.

DELIVERY POINTS = ПУНКТЫ ПОСТАВКИ – Delivery Points:- those locations designated by commodity exchanges where stocks of a commodity represented by a futures contract may be delivered in fulfillment of the contract. A location designated by the futures exchange where a physical commodity covered by a futures contract may be delivered in fulfillment of contract terms. Delivery Points:- the locations and facilities designated by a commodity exchange where stocks of a commodity represented by a futures contract may be delivered in fulfillment of the contract, under procedures established by the exchange. Also known as Location. Those points designated by futures exchanges where the physical commodity covered by a futures contract may be delivered in fulfillment of such contract. Delivery Points are those locations (cities and/or elevators) designated by the exchange as authorized for placement of the physical commodity in fulfillment of an expiring futures contract. Delivery Points are the locations at which commodities may be delivered to satisfy a futures contract. / Те выбранные фьючерсной биржей пункты, в которые фактический товар по фьючерсному контракту может быть поставлен для исполнения такого контракта.

DELIVERY PRICE = ЦЕНА ПОСТАВКИ – Delivery Price is the price fixed by the clearing house at which deliveries on futures contracts are invoiced – generally the price at which the futures contract is settled when deliveries are made. Also known as Invoice Price. See also Settlement Price. Delivery Price is the settlement price designated by the Clearing House as the final price received or paid in fulfillment of a commodity futures contract. / Цена Поставки – цена, зафиксированная клиринговой палатой, для выставления счетов-фактур в отношении поставок по фьючерсным контрактам, ну а в общем, это цена для расчёта по фьючерсному контракту, по которому произведены поставки.

DELIVERY RELIABILITY = НАДЁЖНОСТЬ ПОСТАВКИ – Delivery Reliability:- the proportion of total delivery occasions in which the time, place, quality and quantity of products delivered accords with the order.

DELIVERY SCHEDULE = ГРАФИК ПОСТАВКИ – Delivery Schedule is the required and/or agreed time of delivery of goods or services, purchased for a future period.

DELIVERY TIME = СРОК ПОСТАВКИ – Delivery Time is the time between order and delivery. / Период времени между датами размещения заказа и осуществления поставки.

DELIVERY VERIFICATION CERTIFICATE = СЕРТИФИКАТ О ПОДТВЕРЖДЕНИИ ПОСТАВКИ (или СВИДЕТЕЛЬСТВО О ВЕРИФИКАЦИИ ПОСТАВКИ) – The US Customs Service defines a Delivery Verification Certificate (DVC) as a form used to track imported merchandise from the custody of the importer to the custody of a manufacturer and is used to substantiate a manufacturing drawback claim. The DVC is also known as a Certificate of Delivery.

DELIVERY VERSUS PAYMENT = ПОСТАВКА ПРОТИВ ОПЛАТЫ – Delivery Versus Payment (DVP) is a securities industry settlement procedure in which the buyer's payment for securities is due at the time of delivery. Delivery versus payment (DVP) is a settlement system that stipulates that cash payment must be made prior to or simultaneously with the delivery of the security. Delivery versus payment is from the buyer's perspective; from the seller's perspective, this system is called Receive Versus Payment (RVP). DVP/RVP requirements arose as a result of institutions being prohibited from paying money for securities before the securities were held in negotiable form. Also known as Delivery Against Payment (DAP), Delivery Against Cash (DAC), and Cash On Delivery. A DVP settlement system ensures that delivery will occur only if a payment occurs. The system acts as a link between a funds transfer system and a securities transfer system. A significant source of credit risk in securities settlement is the principal risk associated with the settlement date. The idea behind the RVP/DVP system is that part of that risk can be removed if the settlement procedure ensures that delivery occurs only if payment occurs (in other words, that securities are not delivered prior to the exchange of payment for the securities). The system helps ensure that payments accompany deliveries, thereby reducing principal risk, reducing the chance that deliveries or payments would be withheld during periods of stress in the financial markets and reducing liquidity risk. By law, institutions are required to demand assets of equal value in exchange for the delivery of securities. The delivery of the securities is typically made to the bank of the buying customer, while the payment is made simultaneously by bank wire transfer, check or direct credit to an account. Following the October 1987 worldwide drop in equity prices, the central banks in the Group of Ten worked to strengthen settlement procedures and eliminate the risk that a security delivery could be made without payment, or that a payment could be made without delivery (known as Principal Risk). The DVP procedure reduces or eliminates the counterparties' exposure to this principal risk. Delivery Versus Payment (DVP) is a link between a securities transfer system and a funds transfer system that ensures that delivery occurs if, and only if, payment occurs. The International Securities Services Association defines Delivery Versus Payment (DVP) as simultaneous, final, irrevocable, and immediately available exchange of securities and cash on a continuous basis throughout the day. The Bank for International Settlement defines DVP as a link between a securities transfer system and a funds transfer system that ensures that delivery occurs if, and only if, payment occurs. / Поставка Против Оплаты – это система, по которой расчёты в ценных бумагах и деньгах осуществляется одновременно. Это система, по которой в биржевой системе должны использовать расчёты так, чтобы расчёты деньги-ценные бумаги произошли одновременно и не было ситуации, когда кто-то не получит

своих активов. Поставка Против Оплаты более чётко учитывает возможности расчётов за ценные бумаги и выполнения долгов.

DELORS COMMITTEE = КОМИТЕТ ДЭЛЁРА – In June 1988 the European Council confirmed the objective of the progressive realization of economic union and mandated a Committee chaired by Jacques Delors, the then President of the European Commission, to study and propose concrete stages leading to this union. The Committee was composed of the governors of the EC national central banks; Alexandre Lamfalussy, the then General Manager of the Bank for International Settlements; Niels Thygesen, Professor of Economics, Copenhagen; and Miguel Boyer, the then President of the Banco Exterior de España. The resulting 'Delors Report' proposed that economic and monetary union should be achieved in three discrete but evolutionary steps. In May 1989, the 'Delors Report' was submitted to the European Council; and in June 1989, the European Council agrees on the realization of Economic and Monetary Union (EMU) in three stages. In July 1990, Stage One of EMU begins. In January 1994, Stage Two of EMU begins and the European Monetary Institute (EMI) is established. In January 1999, Stage Three of EMU begins; the Euro becomes the single currency of the Euro area; conversion rates are fixed irrevocably for the former national currencies of the participating Member States; a single monetary policy is conducted for the Euro area. (1) Stage One of EMU:- On the basis of the Delors Report, the European Council decided in June 1989 that the first stage of the realisation of economic and monetary union should begin on 1990-July-01 – the date on which, in principle, all restrictions on the movement of capital between Member States were abolished. At this time, the Committee of Governors of the Central Banks of the Member States of the European Economic Community, which had played an increasingly important role in monetary cooperation since its creation in May 1964, was given additional responsibilities. These were laid down in a Council Decision dated 1990-March-12 and included holding consultations on, and promoting the coordination of, the monetary policies of the Member States, with the aim of achieving price stability. In view of the relatively short time available and the complexity of the tasks involved, the preparatory work for Stage Three of Economic and Monetary Union (EMU) was also initiated by the Committee of Governors. The first step was to identify all the issues which should be examined at an early stage, to establish a work programme by the end of 1993 and to define accordingly the mandates of the existing sub-committees and working groups established for that purpose. For the realisation of Stages Two and Three, it was necessary to revise the Treaty establishing the European Economic Community (the 'Treaty of Rome') in order to establish the required institutional structure. To this end, an Intergovernmental Conference on EMU was convened, which was held in 1991 in parallel with the Intergovernmental Conference on political union. The negotiations resulted in the Treaty on European Union (Maastricht Treaty) which was agreed in December 1991 and signed in Maastricht on 1992-February-07. However, owing to delays in the ratification process, the Treaty (which amended the Treaty establishing the European Economic Community – changing its name to the Treaty establishing the European Community – and introduced, inter alia, the Protocol on the Statute of the European System of Central Banks and of the European Central Bank and the Protocol on the Statute of the European Monetary Institute) did not come into force until 1993-November-01. (2) Stage Two of EMU, establishment of the EMI and the ECB:- The establishment of the European Monetary Institute (EMI) on 1994-January-01 marked the start of the second stage of EMU and with this the Committee of Governors ceased to exist. The EMI's transitory existence also mirrored the state of monetary integration within the Community. The EMI had no responsibility for the conduct of monetary policy in the European Union – this remained the preserve of the national authorities – nor had it any competence for carrying out foreign exchange intervention. The two main tasks of the EMI were:- (i) to strengthen central bank cooperation and monetary policy coordination; and (ii) to make the preparations required for the establishment of the European System of Central Banks (ESCB), for the conduct of the single monetary policy and for the creation of a single currency in the third stage. To this end, the EMI provided a forum for consultation and for the exchange of views and information on policy issues and it specified the regulatory, organizational and logistical framework necessary for the ESCB to perform its tasks in Stage Three. In December 1995 the European Council agreed to name the European currency unit to be introduced at the start of Stage Three, the 'Euro', and confirmed that Stage Three of EMU would start on 1999-January-01. A chronological sequence of events was pre-announced for the changeover to the euro. This scenario was mainly based on detailed proposals elaborated by the EMI. At the same time, the EMI was given the task of carrying out preparatory work on the future monetary and exchange rate relationships between the euro area and other EU countries. In December 1996 the EMI presented its report to the European Council, which formed the basis of a Resolution of the European Council on the principles and fundamental elements of the new exchange rate mechanism (ERM II), which was adopted in June 1997. In December 1996 the EMI also presented to the European Council, and subsequently to the public, the selected design series for the euro banknotes to be put into circulation on 2002-January-01. In order to complement and to specify the Treaty provisions on EMU, the European Council adopted the Stability and Growth Pact in June 1997 – two Regulations form part of the Stability and Growth Pact, which aims to ensure budgetary discipline in respect of EMU. The Pact was supplemented and the respective commitments enhanced by a Declaration of the Council in May 1998. On 1998-May-02 the Council of the European Union – in the composition of Heads of State or Government – unanimously decided that 11 Member States (Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland) had fulfilled the conditions necessary for the adoption of the single currency on 1999-January-01. These countries were therefore to participate in the third stage of EMU. The Heads of State or Government also reached a political understanding on the persons to be recommended for appointment as members of the Executive Board of the ECB. At the same time, the ministers of finance of the Member States adopting the single currency agreed together with the governors of the national central banks of these Member States, the European Commission and the EMI that the current ERM bilateral central rates of the currencies of the participating Member States would be used in determining the irrevocable conversion rates for the euro. On 1998-May-25 the governments of the 11 participating Member States appointed the President, the Vice-President and the four other members of the Executive Board of the ECB. Their appointment took effect from 1998-June-01 and marked the establishment of the ECB. The ECB and the national central banks of the participating Member States constitute the Eurosystem, which formulates and defines the single monetary policy in Stage Three of EMU. With the establishment of the ECB on 1998-June-01, the EMI had completed its tasks. In accordance with Article 123 (ex Article 109l) of the Treaty establishing the European Community, the EMI went into liquidation on the establishment of the ECB. All the preparatory work entrusted to the EMI was concluded in good time and the rest of 1998 was devoted by the ECB to the final testing of systems and procedures. (3) Stage Three of EMU, irrevocable fixing of exchange rates:- On 1999-January-01 the third and final stage of EMU commenced with the irrevocable fixing of the exchange rates of the currencies of the 11 Member States initially participating in Monetary Union and with the conduct of a single monetary policy under the responsibility of the ECB. The number of participating Member States increased to 12 on 2001-January-01, when Greece entered the third stage of EMU. Since that day the Bank of Greece has been part of the Eurosystem. Greece's participation followed a decision taken on 2000-June-19 by the EU Council – meeting in the composition of the Heads of State or Government – that Greece fulfilled the convergence criteria. In June 1988 the European Council mandated a committee chaired by Jacques Delors, the then President of the European Commission, to study and propose concrete stages leading to economic and monetary union. The committee was composed of the governors of the then European Community (EC) national central banks; Alexandre Lamfalussy, the then General Manager of the Bank for International Settlements (BIS); Niels Thygesen, professor of economics, Denmark; and Miguel Boyer, the then President of the Banco Exterior de España. The resulting Delors Report proposed that economic and monetary union should be achieved in three stages. / В Июне 1988 Европейский Совет уполномочил комитет под председательством Жакя Дэлёра (Jacques Delors),

тогдашнего Президента Европейской Комиссии, изучить и предложить конкретные шаги, ведущие к созданию экономического и монетарного союза. Данный комитет был сформирован из членов правления национальных центральных банков тогдашнего же Европейского Сообщества (ЕС). Кроме того, в его состав вошли Александрэ Лёмфалюси (Alexandre Lamfalussy), тогдашний Генеральный Управляющий Банка Международных Расчётов (БМР; the Bank for International Settlements (BIS)); Нильс Чиюсэн (Niels Thygesen), профессор экономики, Дания; и Мигэль Бойэр (Miguel Boyer), тогдашний Президент Банко Экстэриор дэ Эспанья (Banco Exterior de España). Последовавший Отчёт Дэлёра (Delors Report) предложил, чтобы формирование экономического и монетарного союза прошло в три этапа.

DELPHACIDAE = ДЭЛЬФАСИДЭ – Delphacidae are a Family of Plant-Sucking Insects characterized by the presence of a large movable spur at the apex of the hind tibia. They are usually slow moving and move sideward or backward. They stay at the basal parts of the Rice Plant. Examples are Planthoppers.

DELTA = ДЭЛТА (или ДЭЛЬТА, или ДЕЛЬТА) – (1) Delta is a fan-shaped alluvial deposit at a river mouth formed by the deposition of successive layers of sediment from upstream areas. Delta:- (1) the comparatively narrow strip of land in Western Mississippi between the Yazoo and Mississippi Rivers. It is a very rich region, famous for the production of high quality Cotton. (2) The triangular tract of land at the mouth of the Nile River roughly bounded by Alexandria, Cairo, and Port Said. It is the most important Cotton growing region in Egypt. / Под Дельтой понимается низменность в низовьях крупных рек, впадающих в мелководные участки моря или озера, образованная речными отложениями. Прорезана сетью рукавов и протоков. Название Дельта происходит от заглавной буквы Греческого алфавита Δ (Дельта), по сходству с которой оно было дано в древности треугольной дельте реки Нил в Африке.

(2) Delta measures the degree to which an option is exposed to shifts in the price of the underlying asset. Delta is a measure of the change in an options price resulting from a change in the underlying commodity. The value of Delta should range from –100.00 to 0 for puts and 0 to 100.00 for calls. Delta is a measure indicating the sensitivity of an option's or warrant's price to price movement in the underlying asset. A measure of the rate of change in an option or warrant's theoretical value for a one-unit change in the price of the underlying asset. See also Gamma. Statistical measure of the change in the price of an option when the underlying moves one unit in price. The sensitivity of an option's value to a change in the price of the underlying futures contract, also referred to as an Option's Futures-Equivalent Position. Deltas are positive for calls, and negative for puts. Deltas of deep in-the-money options are approximately equal to one; Deltas of at-the-money options are 0.5; and Deltas of deep out-of-the-money options approach zero. The expected change in an option's price given a one-unit change in the price of the underlying futures contract or physical commodity. For example, an option with a Delta of 0.5 would change USD0.50 when the underlying commodity moves USD1.00. A measure of how much an option premium changes, given a unit change in the underlying futures price. Delta often is interpreted as the probability that the option will be in-the-money by expiration. The amount of change of an option's price or theoretical value for a unit change in the price of the underlying security, commodity, currency, index or futures contract. Delta is the option risk parameter that measures the sensitivity of an option price to changes in the price of its underlying instrument. Delta is the rate of change to the premium of an option as the underlying price changes. The Delta of an option describes its premium's sensitivity to changes in the price of the underlying. In other words, an option's Delta will be the amount of the underlying necessary to hedge changes in the option price for small movements in the underlying. The Delta of an option changes with changes in the price of the underlying. An at-the-money option will have a Delta of close to 50%. It falls for out-of-the-money options and increases for in-the-money options, but the change is non-linear: it changes much faster when the option is close-to-the-money. The rate of change of Delta is an option's Gamma. / Разница в изменении цены опциона или теоретический объём для единицы изменения в цене соответствующих ценных бумаг, сырья, валюты, индексов или фьючерсных контрактов. В анализе ситуации в биржевой торговле опционами название буквы Дэльта (прописная – Δ, строчная – δ) Греческого алфавита было использовано для обозначения . Под Дэльтой понимается:- (i) мера соотношений между ценой опциона и соответствующего фьючерсного контракта или ценой акций. В случае опциона на покупку Дэльта в 0.50 означает повышение на полпункта премии на каждый Доллар, на который поднимается цена акции. В случае опционных контрактов на продажу премия растёт по мере падение цен на акции. По мере приближения срока прекращения признания (экспирации) опциона у прибыльных опционных контрактов (in-the-money) Дэльта приближается к значению, равному 1. (ii) На Лондонской Фондовой Бирже Дэльта Акции (delta stocks) являются видом наименьших платёжных (бонусных) средств и не указываются в электронных дилерских системах. Дэльта – показатель (процентная доля) изменения цены опциона в зависимости от изменения цены активов, лежащих в его основе. Например, Дэльта в 50% означает, что цена опциона будет увеличиваться (или уменьшаться) на половину процентного пункта при каждом повышении (или понижении) цены акций в основе опциона на один процентный пункт. Опционы на покупку имеют позитивную Дэльту, а опционы на продажу – негативную. Дэльта повышается с ростом цены базисных активов и сокращается при их снижении. Этот показатель часто используется для установления приблизительной вероятности того, что опцион к моменту прекращения признания окажется прибыльным.

DELTA = ДЭЛТА (или ДЭЛЬТА) – Delta (pronunciation:- DELL-tah) or D is international nautical signal flag meaning:- I am maneuvering with difficulty; keep clear. Meaning:- keep clear of me, I am maneuvering with difficulty. Meaning:- I am having difficulty maneuvering; keep clear. With 2, 4, or 6 numerals, the date.

DELTA–BASED MARGINING = БАЗИРУЮЩИЙСЯ НА ДЭЛЬТЕ ДОХОД – Delta-Based Margining is the same as Delta Margining.

DELTA D = ДЭЛТА ДИ. (или ДЭЛЬТА ДИ.) – Delta D:- indicates deviation or difference.

DELTA E = ДЭЛЬТА И. (или ДЭЛЬТА И.) – Delta E or Delta e or D E or D e:- the total color difference computed with a color difference equation. It is generally calculated as the square root of the sum of the squares of the chromaticity difference, D a + D b, and the lightness difference, D L; in CMC identified as the 'commercial factor' (CF).

DELTA FACTOR = ФАКТОР ДЭЛЬТА – Delta Factor:- a ratio of the change in the option premium due to a one unit change in futures price. For example, a Delta of 0.5 means that the premium will change by one-half cent for every one cent change in futures price. See also Delta.

DELTA HEDGING = ХЭДЬЖИРОВАНИЕ ПО ДЭЛЬТЕ (или ДЭЛЬТА ХЭДЬЖИРОВАНИЕ) – Delta Hedging is the process whereby the grantor of an option decides to buy or sell more or less of an underlying futures contract in order to protect against being declared upon by the options holder. If Delta hedging, the grantor of a call option will buy more of the futures contract if it rises in value towards the strike price (as the probability of being declared upon rises towards 100%). The grantor of a put option will typically sell more of the underlying futures contract if it slides in value (as the probability of being declared upon rises towards 100%). Metal bought (sold) by the grantor of a call (put) in order to cover his potential risk. The more the price of the underlying asset moves in favor of the option purchaser, the higher the risk to the grantor that the option will be exercised against him; he will need to be covered against that risk. Delta Hedging:- an option is said to be Delta-hedged if a position has been taken in the underlying in proportion to its Delta. For

example, if one is short a call option on an underlying with a face value of USD1 million and a Delta of 25%, a long position of USD250 000 in the underlying will leave one Delta-neutral with no exposure to small changes in the price of the underlying. Such a hedge is only effective instantaneously, however. Since the Delta of an option is itself altered by changes in the price of the underlying, interest rates, the option's volatility and its time to expiry, changes in any of these factors will shift the net position away from Delta-neutrality. In practice, therefore, a Delta-hedge must be rebalanced continuously if it is to be effective. Delta Hedging is a strategy undertaken by granters of options to protect their exposure. A Delta hedge calculation takes into account changes in the spot price, the time to expiry and the difference between the strike and spot prices. / Операция, в рамках которой предоставивший опцион покупает или продаёт большее или меньшее количество базовых фьючерсных контрактов, чтобы обеспечить себе защиту на случай, если держатель опциона предъявит его к исполнению. В рамках хэдьжирования по дэльте предоставивший опцион на покупку приобретёт большее количество фьючерсных контрактов, если они поднимаются в цене, приближаясь к сходной цене (а вероятность предъявления опциона к исполнению приближается к 100%). Предоставивший опцион на продажу, как правило, продаст большее количество базовых фьючерсных контрактов, если они падают в цене (а вероятность предъявления опциона к исполнению приближается к 100%). Дэльта Хэдьжирование – метод хэдьжирования, используемый в торговле опционами и основанный на изменении премии (цены опциона) вследствие изменения цены инструмента, лежащего в основе опциона. Изменение премии вследствие изменения цены финансового инструмента на 1 пункт называется Дэльтой (Delta), а взаимосвязь между движением двух цен – Соотношением С Хэдьжем (Hedge Ratio). Например, если опцион на покупку имеет соотношение с хэдьжем 40, то опцион на покупку должен вырасти на 40% от изменения цены лежащих в его основе ценных бумаг, если их цена снизится. Дэльта опциона на продажу, наоборот, величина отрицательная. Значение Дэльты обычно помогает нивелировать небольшое изменение цен на лежащие в основе опциона ценные бумаги за короткое время. Когда опцион имеет высокое соотношение с хэдьжем, то, как правило, прибыльнее купить этот опцион, чем выступать в роли его продавца (writer), поскольку большее процентное изменение премии по сравнению с изменением цен лежащих в его основе ценных бумаг и относительно меньшее время 'разъедания' стоимости позволяет покупателю создать большой финансовый Рычаг или Плечо (Leverage). Для опционов с низким соотношением с хэдьжем, соответственно наоборот. Смотрите также Соотношение С Хэдьжем (Hedge Ratio).

DELTA MARGINING = ДОХОД ПО ДЭЛЬТЕ – Delta Margining or Delta-Based Margining:- an option margining system used by some exchanges that equates the changes in option premiums with the changes in the price of the underlying futures contract to determine risk factors upon which to base the margin requirements. Also known as Delta-Based Margining.

DELTA NEUTRAL = НЕЙТРАЛЬНАЯ В ОТНОШЕНИИ ДЭЛТЫ (или НЕЙТРАЛЬНАЯ ПО ДЭЛЬТЕ) – Delta Neutral:- a portfolio consisting of positions with offsetting positive and negative Deltas so that the position of delta is zero. A Delta neutral portfolio balances out the response to market movements for a certain range to bring the net change of the position to zero. Delta measures how much an option's price changes when the underlying security's price changes. As the value of the underlying assets changes, the position of the Greeks will shift between being positive, negative and neutral. Investors who want to maintain Delta neutrality must adjust his or her holdings accordingly. Puts always have a negative Delta (ranging from –100 to zero), while long calls always have a positive Delta (ranging from zero to 100), so the two can be used together to create a Delta neutral position. Options traders can use a neutral position Delta strategy to make money when implied volatility declines. Refers to a position involving options that is designed to have an overall Delta of zero. To understand the Delta Neutral Strategy we need to clearly define Delta. Delta is nothing but a ratio comparing the change in the price of the underlying asset (e.g., cash market price of RIL (symbol for Reliance Industries Ltd) share) to the corresponding change in the price of a derivative (e.g., F&O (short for the Futures and Options) price of RIL). So in the case of Call Options a delta of 0.8 means that for every Rs.1.00 the underlying stock increases, the call option will increase by Rs.0.80. In the case of Put Options the Delta will be reversed (negative) because as the underlying security increases, the value of the option will decrease. So a put option with a delta of –0.8 will decrease by Rs.0.80 for every Rs.1.00 increase in the underlying price. An in-the-money call option nears expiration, it will approach a delta of 1.00, and as an in-the-money put option nears expiration, it will approach a delta of –1.00. So what is Delta Neutral Options Trading Strategy? The term 'Delta Neutral' refers to any strategy where the sum of your deltas is equal to zero. So, for instance, if you buy 10 call options, each having a delta of 0.60 and you also buy 20 put options, each having a delta of –0.30 you have the following:- (10 x 0.60) + (20 x (–0.30)) = 6.00 + (–6.00) = 0. Your position delta (total delta) is zero, which means you are delta neutral. A state where the grantor of an option has balanced the probability of being declared upon through buying/selling the underlying futures contract. The Delta Neutral usually describes a spread strategy involving a long and a short position – when the combined values of each are at or near zero. The term can involve a number of different strategies, but the concept of Delta neutrality is always the central theme. Other than spreads, a delta neutral can also consist of an option position and 100 shares of the underlying stock. This creates an 'equivalent stock position' or a synthetic (an options-based of stock-and-options position that changes value just like 100 shares of stock). In theory, the Delta neutral position eliminates risk on both the long and short side. Realistically, this changes as soon as values begin to move or when implied volatility changes. A mistake for options traders who do not want exercise is to open Delta neutral spreads with two short options, a call and a put. The 'neutrality' of offsetting exercise risk does not eliminate exercise exposure, it only ensures that one side or the other will be in the money before expiration. This may be true even when different strikes are used. For example, when stock is at 43, a trader sells a 45 call and a 40 put. Both options are out of the money, and the exposure is moved above 45 or below 40 by the value of the sold options. This is a fine theory, but what happens when the stock price moves quickly and substantially? One side of the Delta neutral position ends up in the money and has to be closed at a loss, rolled forward, or allowed to exercise. Many of the elegant theories of risk-less option positions end up losing a lot of money because conditions change. This risk is made even worse with a short straddle. Because both call and put have the same strike, one or the other is always going to be in the money. Unless the exposed side is closed or rolled before exercise occurs, it will be very difficult to make a short straddle profitable. The position is delta neutral if the stock price is near the common strike at expiration. But the Delta neutral status only works out well if the stock's price moves exactly to the strike and never evolves above or below. That does not happen in the expensive, real world. Delta neutral trading makes more sense when synthetic long or short stock is used. You can eliminate risk even for synthetic short stock (a long put and a short call at the same strike). By owning 100 shares of the underlying, the call becomes a covered call and the synthetic position is made safer. This is an example of a highly conservative Delta neutral position. Because the cost of the long put is offset by the premium from the short call, the option cost is close to zero (it may even by a small credit). The market risk in the short call is eliminated through ownership of 100 shares. The call can be closed at a profit as long as stock remains at or below strike. The long put can be closed to offset point-for-point declines in the stock, or exercised to sell stock at the strike. Because the net option cost is virtually zero, there is no need to worry about time decay in the put. / символ для компании Рилайэнц Индэстриз Эл.ти.ди. (Reliance Industries Ltd). Состояние, при котором предоставивший опцион уравновесил вероятность предъявления опциона к исполнению посредством покупки/продажи соответствующего фьючерсного контракта.

DELTA NEUTRAL SPREAD = КУРСОВАЯ РАЗНИЦА НЕЙТРАЛЬНАЯ ПО ДЭЛЬТЕ (или СПРЭД НЕЙТРАЛЬНЫЙ ПО ДЭЛЬТЕ) – Delta Neutral Spread is a spread where the total Delta position on the long side and on the short side add up to approximately zero, thereby making the commodity risk neutral. Sometimes, a rise or fall in prices is attributed to traders attempting to

get a Delta neutral spread. Delta Neutral Spread is a spread where the total Delta position on the long side and the total Delta on the short side add up to approximately zero.

DELTA VALUE = СТОИМОСТНАЯ ОЦЕНКА ДЭЛЬТЫ – In exchange trading, Delta Value is the expected change in an option's price given a one-unit change in the price of the underlying futures contract or physical commodity.

DELTOID = ДЕЛЬТОИД – Deltoid:- triangular.

DELUGIC = ЗАТОПЛЯЕМОЕ (или ЗАЛИВНОЕ) – Delugic:- derived from deluge. Descriptive of a land type where the water levels stay for more than 2 weeks at a depth greater than 30 cm, which is above the normal height of bunds or dikes, during high-rainfall months.

DELUSTERING = МАТИРОВАНИЕ – Delustering is a subduing or dulling the natural luster of a textile material by chemical or physical means. The term often refers to the use of titanium dioxide or other white pigments as delustrants in textile materials. / Матирование это подавление (subduing) или притупление (dulling) естественного глянца текстильного материала химическими или физическими средствами. Данный термин часто относится к использованию . Матирование искусственного волокна.

DELUSTRANT = МАТИРУЮЩЕЕ ВЕЩЕСТВО – Delustrant is a substance that can be used to dull the luster of a manufactured fiber. Often a pigment such as titanium dioxide. Delustrant is a chemical substance added to the polymer in order to reduce the lustre or transparency of a fiber. / Матирующий материал – вещество, сообщающее матовый вид.

DELY = DELIVERY

DEM = DEMMURAGE

DEM = DEUTSCHE MARK

DEMAND = ПОТРЕБЛЕНИЕ (или ПОТРЕБЛЯЕМАЯ МОЩНОСТЬ, или СПРОС) – (1) In reference to electricity, Demand is the rate at which electricity is delivered to or by a system at a given instant or averaged over a designated period, usually expressed in kiloWatts or MegaWatts. Demand is the rate at which energy is delivered to loads and scheduling points by generation, transmission or distribution facilities. The level at which electricity or natural gas is delivered to users at a given point in time. Electric demand is expressed in kiloWatts. Demand (electric) is the rate at which electric energy is delivered to or by a system, part of a system or piece of equipment, at a given instant or averaged over any designated period of time. / По отношению к электричеству, объёмы поставок электроэнергии в какую-либо систему или какой-либо системой в определённый момент времени или в среднем за определённый период; выражается, как правило, в килоВаттах или МегаВаттах.

(2) In oil industry, Demand is total inland deliveries plus refinery fuels and bunkers minus backflows from the petrochemicals sector. It is thus equivalent to oil consumption plus any secondary and tertiary stock increases. In oil industry, the rate of consumption of refined products, normally measured in millions of barrels per day, or in million tones per year. / В нефтяной отрасли, уровень потребления нефтепродуктов; выражается, как правило, в миллионах баррелей в сутки или в миллионах тонн в год.

DEMAND = СПРОС – Demand is the amount of a commodity that people are ready and able to buy at a given time for a given price. Demand:- the willingness and ability of the people within a market area to purchase particular amounts of a good or service at a variety of alternative prices during a specified time period. The quantity of goods required by the market to be delivered in a particular period or at a specific date. Demand is an amount of a good that buyers are ready to purchase for a given price, in a particular market, over a certain period of time. Demand is a fundamental aspect of any market economy. It is the willingness of buyers to offer money in exchange for goods or services. In macroeconomics, demand plays a fundamental role in analyzing economic mechanisms at the national (rather than individual, or microeconomic) level, in forecasting, and in the development of economic policy and planning.

DEMAND = ТРЕБОВАНИЕ – Demand:- Form PCT/IPEA/401, filed with an International Preliminary Examining Authority, demanding that an international application shall be the subject of an international preliminary examination. / Требование проведения международной предварительной экспертизы.

DEMAND CHAIN = ЦЕПОЧКА СПРОСА – A term Demand Chain is another name for the Supply Chain, with emphasis on the customer or party controlling demand.

DEMAND DEPOSIT = ДЕПОЗИТ ДО ВОСТРЕБОВАНИЯ (или ВКЛАД ДО ВОСТРЕБОВАНИЯ, или ОТЗЫВНЫЙ ВКЛАД) – Demand Deposit:- funds held in an account from which deposited funds can be withdrawn at any time without any advance notice to the depository institution. Demand deposits can be 'demanded' by an account holder at any time. Many checking and savings accounts today are demand deposits and are accessible by the account holder through a variety of banking options, including teller, ATM and online banking. In contrast, a term deposit is a type of account which cannot be accessed for a predetermined period (typically the loan's term). M1 is a category of the money supply that includes demand deposits as well as physical money, such as coins and currency, and Negotiable Order of Withdrawal (NOW) accounts. According to the Federal Reserve's Consumer Compliance Handbook, demand deposit accounts have these characteristics:- no maturity period (or an original maturity of fewer than seven days), payable on demand, may be interest bearing, no limit on the number of withdrawals or transfers an account holder may make, and no eligibility requirements. Demand Deposit is a deposit that may be withdrawn at any time without prior written notice to the depository institution. A checking account is the most common form of demand deposit. Demand Deposit is a deposit that the depositor has a right to withdraw at any time without prior notice to the depository institution. By law, no interest can be paid on such deposits. Demand deposits are commonly offered in the form of checking accounts. Bank balances which are withdrawable at any time, i.e. without any previous notification. Also known as Sight Deposit. Demand Deposits, Bank Money or Scriptural Money are funds held in demand deposit accounts in commercial banks. These account balances are usually considered money and form the greater part of the narrowly defined money supply of a country. In the United States (US), demand deposits arose following the 1865 tax of 10% on the issuance of state bank notes. In the United States, demand deposits only refer to funds held in checking accounts (or cheque offering accounts) other than NOW accounts; however, in a 1970s and 1980s response to the 1933 promulgation of Regulation Q in the US, demand deposits in some cases came to allow easier access to funds from other types of accounts, e.g., savings accounts and money market accounts. For the historical basis of the distinction between demand deposits and NOW accounts in the US (see NOW Account). Demand deposits are usually considered part of the narrowly defined money supply, as they can be used, via checks and drafts, as a means of payment for goods and services and to settle debts. The money supply of a country is usually held to consist of currency plus demand deposits. In most countries, demand deposits account for a majority of the money supply. During times of financial crisis, bank customers will withdraw their funds in cash, leading to a drop in demand deposits and a shrinking of the money supply. Economists have speculated that this effect contributed to the severity of the Great Depression. This did not happen, however, in the financial crisis that began in 2008. In fact, demand deposits in the US increased dramatically, from around USD310bn in August

2008 to a peak of around USD460bn in December 2008. Deposit of a sum of money with a bank, building society or other financial institution that may be withdrawn at a moment's notice. / , то есть .

DEMAND GUARANTEE = ГАРАНТИЯ ПО ТРЕБОВАНИЮ (или ГАРАНТИЯ ПО ПЕРВОМУ ТРЕБОВАНИЮ) – Demand Guarantee is a type of protection that one party in a transaction can impose on another party in the event that the second party does not perform according to predefined specifications. In the event that the second party does not perform as promised, the first party will receive a predefined amount of compensation by the guarantor, which the second party will be required to repay. For example, an importer of cars in the United States can ask a Japanese exporter for a demand guarantee. The exporter goes to a bank to purchase a guarantee and sends its to the American importer. If, for example, the exporter does not fulfill its end of the agreement, the importer can go to the bank and present the demand guarantee. The bank will then give the importer the predefined amount of money specified, which the exporter will be required to repay to the bank. A demand guarantee is very similar to a letter of credit except that the demand guarantee provides much more protection. For instance, the letter of credit only provides protection against non-payment, whereas a demand guarantee can provide protection against non-performance, late performance and even defective performance. See also Bank Guarantee. Demand Guarantee is a type of guarantee that is payable immediately upon presentation of documents specified, without inquiry as to the validity of the documents or into compliance with the underlying contract, as opposed to an Ancillary Guarantee. Also known as Independent Guarantee. Although there are separate rules of practice for demand guarantees and letters of credit, they are both considered letters of credit under the US law. Demand Guarantee is a performance bond or other type of guarantee payable to the obligee on demand, often without the presentation of other documents and without the need to show the demand is in compliance with the terms of the underlying contract. In effect, it is a substitute for a cash deposit. Under UK law, a demand guarantee is independent of the underlying contract and is separate from the counter-guarantee (if any) given by the obligee's bank to the obligor's bank. Under US law also a demand guarantee enjoys similar protection and is called a Standby Letter Of Credit. Also called Independent Guarantee. / Безусловная Гарантия – форма банковской гарантии, при которой банк гарант выдаёт обязательство бенефициару произвести платёж в его пользу в размере определённой суммы при наступлении гарантийного случая против простого требования бенефициара об оплате ему этой суммы.

DEMAND LETTER = ПИСЬМЕННЫЙ ЗАПРОС – Demand Letter:- the stopper of a notice of delivery of the underlying commodity must make a written demand on the issuer for delivery of the underlying commodity. Demand Letter must include the date of delivery, the warehouse and the point of delivery, the contract number, the quantity of the underlying commodity, an information as to whom the documents are to be delivered. The Demand Letters are not transferable. The Demand Letter, must be delivered by hand delivery or facsimile or email to the issuer by four o'clock on the notice day. Also known as Stopping Notice. / Останавливающий уведомление о поставке.

DEMAND NOTICE = УВЕДОМЛЕНИЕ О ЗАИНТЕРЕСОВАННОСТИ (или УВЕДОМЛЕНИЕ ЗАПРОС) – In the cotton futures trading, Demand Notice is a written notice of the holding of a notice given by the Receiver of such notice to the Issuer. The Demand Notice (document letter) will include the notice price and the location to deliver documents. A sample instruction letter must be sent to the Owner of samples listed on the Delivery Notice.

DEMAND PULL = УСИЛЕНИЕ (или ГРУППА) СПРОСА – Demand Pull occurs when imports are required to balance shortfalls in local supply, the cost of those imports at the margin sets local prices. That is, price rise enough to balance supply with local demand, pulling supply.

DEMAND RESPONSE (EMERGENCY DEMAND RESPONSE PROGRAM/DAY–AHEAD DEMAND RESPONSE PROGRAM) = XX – Demand Response (Emergency Demand Response Program/Day-Ahead Demand Response Program) DR (EDRP/DADRP):- DR (also known as Load Response) is the action taken by end-use customers in reducing their electricity consumption in response to power grid needs, economic signals from a competitive wholesale market, or special retail rates. A customer enrolled in a DR program receives incentive payments to lower their electric use at times of high wholesale market prices or when system reliability is jeopardized. Demand response can involve actually curtailing power being used, or by starting on-site generation, which displaces some or all of the electricity being supplied by an energy provider. Under conditions of tight electricity supply, DR can significantly decrease the peak price and, in general, electricity price volatility. DR programs are designed to be, both, fiscally and environmentally responsible ways to respond to occasional and temporary peak demand periods. The programs offer incentives to businesses that volunteer and participate by temporarily reducing their electricity use when demand could outpace supply. Why does this matter? Price-based DR gives customers time-varying rates that reflect the cost of electricity in different time periods. Armed with this information, customers tend to use less electricity at times when electricity prices are high. Incentive-based DR programs pay participating customers to reduce their loads at times requested by the program sponsor, triggered by either a grid reliability problem or high electric prices. Both types of DR provide a customer with a method to reduce their energy costs.

DEMAND–SIDE MANAGEMENT = УПРАВЛЕНИЕ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (или СПРОСА) (или УПРАВЛЕНИЕ ПОТРЕБЛЕНИЕМ) – Demand-Side Management:- the planning, implementation, and monitoring of utility activities designed to encourage consumers to modify patterns of electricity usage, including the timing and level of electricity demand. It refers only to energy and load-shape modifying activities that are undertaken in response to utility-administered programs. It does not refer to energy and load-shape changes arising from the normal operation of the marketplace or from government-mandated energy efficiency standards. Demand-Side Management (DSM) covers the complete range of load-shape objectives, including strategic conservation and load management, as well as strategic load growth. All activities or programs undertaken by an electricity system or consumers to influence the amount and timing of electricity use. / сохранение (conservation). Любые действия или программы, реализуемые энергетической системой или потребителями в целях воздействия на объемы и сроки потребления электроэнергии.

DEMAND–SIDE MANAGEMENT COSTS = ЗАТРАТЫ (или ИЗДЕРЖКИ) НА УПРАВЛЕНИЕ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (или СПРОСА) (или ЗАТРАТЫ НА УПРАВЛЕНИЕ ПОТРЕБЛЕНИЕМ) – Demand-Side Management Costs are the costs incurred by the utility to achieve the capacity and energy savings from the Demand-Side Management Program. Costs (expenditures) incurred by consumers or third parties are to be excluded. The costs are to be reported in nominal dollars in the year in which they are incurred, regardless of when the savings occur. Program costs include expensed items incurred to implement the program, incentive payments provided to consumers to install Demand-Side Management measures, and annual operation and maintenance expenses incurred during the year. Utility costs that are general, administrative, or not specific to a particular Demand-Side Management category are to be included in 'other' costs.

DEMATERIALIZATION = ДЕМАТЕРИАЛИЗАЦИЯ – Dematerialization (DEMAT) is the move from physical certificates to electronic book keeping. Actual stock certificates are slowly being removed and retired from circulation in exchange for electronic recording. With the age of computers and the Depository Trust Company, securities no longer need to be in certificate form. They can be registered and transferred electronically. Dematerialization:- the elimination of physical certificates or documents representing ownership of securities so that the securities exist only as accounting records. See also Book-Entry Securities, and Immobilization.

DEMDES = DEMMURAGE/DESPATCH

DEMI–LUSTRE WOOL = ПОЛУЛЮСТРОВАЯ ШЕРСТЬ (или ПОЛУБЛЕСТЯЩАЯ ШЕРСТЬ) – Demi-Lustre Wool is a wool that has some luster but not enough to be classed as luster wool. Wool of this type is produced by the Romney and similar breeds.

DEMISE CHARTER = ФРАХТОВАНИЕ СУДНА С ПРАВОМ ВЫБОРА ЭКИПАЖА (или ДИМАЙЗ ЧАРТЕР) – (1) Demise Charter is an agreement whereby the charterer takes over control costs and responsabilities of the vessel for an agreed period. Also known as Demise Charterparty. A contract whereby the ship owner leases his vessel to the charterer for a period of time during which the whole use and management of the vessel passes to the charterer, which involves that the charterer is to pay all expenses for the operation and maintenance of the vessel. Officers and crew will become servants of the charterer. Demise Charter is a contract whereby the shipowner leases his vessel to the Charterer for a period of time during which the use and management of the vessel passes to the Charterer, who pays all expenses for the manning, operation and maintenance of the vessel. / Димайз Чартер (Demise Charter):- договор найма судна, при котором судовладелец на оговорённый срок передаёт судно фрахтователю в полное владение. Фрахтователь принимает на себя все расходы по эксплуатации судна, зарплату экипажа, страхование, оплату необходимого ремонта. Действия или бездействие экипажа, причинившие вред, рассматриваются как вина фрахтователя.

(2) A Demise Charter whereby the charterer has the right to place his own master and crew on board of the vessel is also called Bareboat Charter. See also Bareboat Charter, Charter, Time Charter. / право разместить своего собственного хозяина (или мастера) и экипаж (или команду) на борту судна . Смотрите также Фрахтование Судна Без Экипажа или Бербоут Чартер (Bareboat Charter), Фрахтование Судна На Время или Тайм Чартер (Time Charter), и Фрахтование Судна или Чартер (Charter).

DEMOCRACY = ДЕМОКРАТИЯ – Democracy is a universally recognized ideal and is one of the core values of the United Nations (UN). Democracy provides an environment for the protection and effective realization of human rights. These values are embodied in the Universal Declaration of Human Rights and further developed in the International Covenant on Civil and Political Rights, which enshrines a host of political rights and civil liberties underpinning meaningful democracies. United Nations activities in support of democracy and governance are carried out through the United Nations Development Programme (UNDP), the United Nations Democracy Fund (UNDEF), the Department of Peacekeeping Operations (DPKO), the Department of Political Affairs (DPA) and the Office of the High Commissioner for Human Rights (OHCHR), among others. Such activities are inseparable from the UN's work in promoting human rights, development, and peace and security, and include:- (i) assisting parliaments to enhance the checks and balances that allow democracy to thrive; (ii) helping to strengthen the impartiality and effectiveness of national human rights machinery and judicial systems; (iii) helping to develop legislation and media capacities to ensure freedom of expression and access to information; (iv) providing electoral assistance and long-term support for electoral management bodies; and (v) promoting women's participation in political and public life. Over the past 20 years (2013) the United Nations has provided various forms of electoral assistance to more than 100 countries – including advisory services, logistics, training, civic education, computer applications and short-term observation. Democracy has emerged as a cross-cutting issue in the outcomes of the major United Nations conferences and summits since the 1990s and in the internationally agreed development goals they produced, including the Millennium Development Goals. World leaders pledged in the Millennium Declaration to spare no effort to promote democracy and strengthen the rule of law, as well as respect for human rights and fundamental freedoms. The UN General Assembly has reaffirmed that 'democracy is a universal value based on the freely expressed will of people to determine their political, economic, social and cultural systems and their full participation in all aspects of their lives', as previously stated in the outcome document of the World Summit in September 2005. At that summit governments renewed their commitment to support democracy and welcomed the establishment of a Democracy Fund at the United Nations. The large majority of UNDEF funds go to local civil society organizations for projects that strengthen the voice of civil society, promote human rights, and encourage the participation of all groups in democratic processes. The UN supports women's political participation, including efforts to increase the share of women elected into office and to build women's capacity as effective legislators once elected. In July 2010, the United Nations General Assembly created UN Women, the United Nations Entity for Gender Equality and the Empowerment of Women. In doing so, UN Member States took an historic step in accelerating the Organization's goals on gender equality and the empowerment of women. The International Day of Democracy:- on 08 November 2007, the General Assembly proclaimed 15 September as the International Day of Democracy, inviting Member States, the United Nations system and other regional, intergovernmental and non-governmental organizations to commemorate the Day. The International Day of Democracy provides an opportunity to review the state of democracy in the world. Democracy is as much a process as a goal, and only with the full participation of and support by the international community, national governing bodies, civil society and individuals, can the ideal of democracy be made into a reality to be enjoyed by everyone, everywhere. Democracy is a form of government in which all eligible citizens have an equal say in the decisions that affect their lives. Democracy allows eligible citizens to participate equally – either directly or through elected representatives – in the proposal, development, and creation of laws. It encompasses social, economic and cultural conditions that enable the free and equal practice of political self-determination. The term originates from the Greek Dēmokratía = Rule Of The People, which was coined from Dêmos = People and Kratos = Power or Rule in the V century BCE (Before the Common Era) to denote the political systems then existing in Greek city-states, notably Athens; the term is an antonym to ἀριστοκρατία (aristocratie) 'rule of an elite'. While theoretically these definitions are in opposition, in practice the distinction has been blurred historically. The political system of Classical Athens, for example, granted democratic citizenship to an elite class of free men and excluded slaves and women from political participation. In virtually all democratic governments throughout ancient and modern history, democratic citizenship consisted of an elite class until full enfranchisement was won for all adult citizens in most modern democracies through the suffrage movements of the XIX and XX centuries. The English word dates to the XVI century, from the older Middle French and Middle Latin equivalents. A democratic government contrasts to forms of government where power is either held by one, as in a monarchy, or where power is held by a small number of individuals, as in an oligarchy. Nevertheless, these oppositions, inherited from Greek philosophy, are now ambiguous because contemporary governments have mixed democratic, oligarchic, and monarchic elements. Karl Popper defined democracy in contrast to dictatorship or tyranny, thus focusing on opportunities for the people to control their leaders and to oust them without the need for a revolution. Several variants of democracy exist, but there are two basic forms, both of which concern how the whole body of all eligible citizens executes its will. One form of democracy is direct democracy, in which all eligible citizens have direct and active participation in the decision making of the government. In most modern democracies, the whole body of all eligible citizens remain the sovereign power but political power is exercised indirectly through elected representatives; this is called Representative Democracy. The concept of representative democracy arose largely from ideas and institutions that developed during the European Middle Ages, the Reformation, the Age of Enlightenment, and the American and French Revolutions. Characteristics:- while no consensus exists on how to define democracy, equality and freedom have both been identified as important characteristics of democracy since ancient times. These principles are reflected in all eligible citizens being equal before the law and having equal access to legislative processes. For example, in a representative democracy, every vote has equal weight, no unreasonable restrictions can apply to anyone seeking to become a representative, and the freedom of its eligible citizens is secured by legitimized rights and liberties which are generally protected by a

constitution. One theory holds that democracy requires three fundamental principles:- (i) upward control, i.e. sovereignty residing at the lowest levels of authority; (ii) political equality; and (iii) social norms by which individuals and institutions only consider acceptable acts that reflect the first two principles of upward control and political equality. The term Democracy is sometimes used as shorthand for liberal democracy, which is a variant of representative democracy that may include elements such as political pluralism; equality before the law; the right to petition elected officials for redress of grievances; due process; civil liberties; human rights; and elements of civil society outside the government. In the United States, separation of powers is often cited as a central attribute, but in other countries, such as the United Kingdom, the dominant principle is that of parliamentary sovereignty (while maintaining judicial independence). In other cases, 'democracy' is used to mean direct democracy. Though the term 'democracy' is typically used in the context of a political state, the principles also are applicable to private organizations. Majority rule is often listed as a characteristic of democracy. Hence, democracy allows for political minorities to be oppressed by the 'tyranny of the majority' in the absence of legal protections of individual or group rights. An essential part of an 'ideal' representative democracy is competitive elections that are fair both substantively and procedurally. Furthermore, freedom of political expression, freedom of speech, and freedom of the press are considered to be essential rights that allow eligible citizens to be adequately informed and able to vote according to their own interests. It has also been suggested that a basic feature of democracy is the capacity of all voters to participate freely and fully in the life of their society. With its emphasis on notions of social contract and the collective will of the all voters, democracy can also be characterized as a form of political collectivism because it is defined as a form of government in which all eligible citizens have an equal say in the decisions that affect their lives. While democracy is often equated with the republican form of government, the term 'republic' classically has encompassed both democracies and aristocracies. Some democracies are constitutional monarchies, such as the United Kingdom and Japan. Xxxxx. Democracy, literally, rule by the people. The term is derived from the Greek Dēmokratiā, which was coined from Dēmos ('People') and Kratos ('Rule') in the middle of the V century BC to denote the political systems then existing in some Greek city-states, notably Athens. Fundamental Questions:- the etymological origins of the term democracy hint at a number of urgent problems that go far beyond semantic issues. If a government of or by the people – a 'popular' government – is to be established, at least five fundamental questions must be confronted at the outset, and two more are almost certain to be posed if the democracy continues to exist for long. (1) What is the appropriate unit or association within which a democratic government should be established? A town or city? A country? A business corporation? A university? An international organization? All of these? (2) Given an appropriate association – a city, for example – who among its members should enjoy full citizenship? Which persons, in other words, should constitute the dēmos? Is every member of the association entitled to participate in governing it? Assuming that children should not be allowed to participate (as most adults would agree), should the dēmos include all adults? If it includes only a subset of the adult population, how small can the subset be before the association ceases to be a democracy and becomes something else, such as an aristocracy (government by the best, aristos) or an oligarchy (government by the few, oligos)? (3) Assuming a proper association and a proper dēmos, how are citizens to govern? What political organizations or institutions will they need? Will these institutions differ between different kinds of associations, for example, a small town and a large country? (4) When citizens are divided on an issue, as they often will be, whose views should prevail, and in what circumstances? Should a majority always prevail, or should minorities sometimes be empowered to block or overcome majority rule? (5) If a majority is ordinarily to prevail, what is to constitute a proper majority? A majority of all citizens? A majority of voters? Should a proper majority comprise not individual citizens but certain groups or associations of citizens, such as hereditary groups or territorial associations? (6) The preceding questions presuppose an adequate answer to a sixth and even more important question:- Why should 'the people' rule? Is democracy really better than aristocracy or monarchy? Perhaps, as Plato argues in the Republic, the best government would be led by a minority of the most highly qualified persons – an aristocracy of 'philosopher-kings'. What reasons could be given to show that Plato's view is wrong? (7) No association could maintain a democratic government for very long if a majority of the dēmos – or a majority of the government – believed that some other form of government were better. Thus, a minimum condition for the continued existence of a democracy is that a substantial proportion of both the dēmos and the leadership believes that popular government is better than any feasible alternative. What conditions, in addition to this one, favour the continued existence of democracy? What conditions are harmful to it? Why have some democracies managed to endure, even through periods of severe crisis, while so many others have collapsed? Democratic Institutions:- since the time of the ancient Greeks, both the theory and the practice of democracy have undergone profound changes, many of which have concerned the prevailing answers to questions (1) through (3) above. Thus, for thousands of years the kind of association in which democracy was practiced, the tribe or the city-state, was small enough to be suitable for some form of democracy by assembly, or 'direct democracy'. Much later, beginning in the XVIII century, as the typical association became the nation-state or country, direct democracy gave way to representative democracy – a transformation so sweeping that, from the perspective of a citizen of ancient Athens, the governments of gigantic associations such as France or the United States might not have appeared democratic at all. This change in turn entailed a new answer to question (3):- Representative democracy would require a set of political institutions radically different from those of all earlier democracies. Another important change has concerned the prevailing answers to question (2). Until fairly recently, most democratic associations limited the right to participate in government to a minority of the adult population – indeed, sometimes to a very small minority. Beginning in the XX century, this right was extended to nearly all adults. Accordingly, a contemporary democrat could reasonably argue that Athens, because it excluded so many adults from the dēmos, was not really a democracy – even though the term democracy was invented and first applied in Athens. Despite these and other important changes, it is possible to identify a considerable number of early political systems that involved some form of 'rule by the people', even if they were not fully democratic by contemporary standards. Prehistoric Forms of Democracy:- although it is tempting to assume that democracy was created in one particular place and time – most often identified as Greece about the year 500 BC – evidence suggests that democratic government, in a broad sense, existed in several areas of the world well before the turn of the V century. It is plausible to assume that democracy in one form or another arises naturally in any well-bounded group, such as a tribe, if the group is sufficiently independent of control by outsiders to permit members to run their own affairs and if a substantial number of members, such as tribal elders, consider themselves about equally qualified to participate in decisions about matters of concern to the group as a whole. This assumption has been supported by studies of nonliterate tribal societies, which suggest that democratic government existed among many tribal groups during the thousands of years when human beings survived by hunting and gathering. To these early humans, democracy, such as it was practiced, might well have seemed the most 'natural' political system. When the lengthy period of hunting and gathering came to an end and humans began to settle in fixed communities, primarily for agriculture and trade, the conditions that favour popular participation in government seem to have become rare. Greater inequalities in wealth and military power between communities, together with a marked increase in the typical community's size and scale, encouraged the spread of hierarchical and authoritarian forms of social organization. As a result, popular governments among settled peoples vanished, to be replaced for thousands of years by governments based on monarchy, despotism, aristocracy, or oligarchy, each of which came to be seen – at least among the dominant members of these societies – as the most natural form of government. Then, about 500 BC, conditions favourable to democracy reappeared in several places, and a few small groups began to create popular governments. Primitive democracy, one might say, was reinvented in more advanced forms. The most crucial developments occurred in two areas of the Mediterranean, Greece and Rome. Classical Greece:- during the Classical period (corresponding roughly to the V and IV centuries BC), Greece was of

course not a country in the modern sense but a collection of several hundred independent city-states, each with its surrounding countryside. In 507 BC, under the leadership of Cleisthenes, the citizens of Athens began to develop a system of popular rule that would last nearly two centuries. To question (1), then, the Greeks responded clearly: The political association most appropriate to democratic government is the polis, or city-state. Athenian democracy foreshadowed some later democratic practices, even among peoples who knew little or nothing of the Athenian system. Thus the Athenian answer to question (2) – Who should constitute the dēmos? – was similar to the answer developed in many newly democratic countries in the XIX and XX centuries. Although citizenship in Athens was hereditary, extending to anyone who was born to parents who were themselves Athenian citizens, membership in the dēmos was limited to male citizens 18 years of age or older (until 403, when the minimum age was raised to 20). Because data is scanty, estimates of the size of the Athenian dēmos must be treated with caution. One scholar has suggested that in the mid-IV century there may have been about 100 000 citizens, 10 000 resident foreigners, or metics, and as many as 150 000 slaves. Among citizens, about 30 000 were males over 18. If these numbers are roughly correct, then the dēmos comprised 10 to 15 percent of the total population. Regarding question (3) – What political institutions are necessary for governing? – the Athenians adopted an answer that would appear independently elsewhere. The heart and centre of their government was the Assembly (Ecclesia), which met almost weekly – 40 times a year – on the Pnyx, a hill west of the Acropolis. Decisions were taken by vote, and, as in many later assemblies, voting was by a show of hands. As would also be true in many later democratic systems, the votes of a majority of those present and voting prevailed. Although we have no way of knowing how closely the majority in the Assembly represented the much larger number of eligible citizens who did not attend, given the frequency of meetings and the accessibility of the meeting place, it is unlikely that the Assembly could have long persisted in making markedly unpopular decisions. The powers of the Assembly were broad, but they were by no means unlimited. The agenda of the Assembly was set by the Council of Five Hundred, which, unlike the Assembly, was composed of representatives chosen by lot from each of 139 small territorial entities, known as Demes, created by Cleisthenes in 507. The number of representatives from each deme was roughly proportional to its population. The Council's use of representatives (though chosen by lot rather than by election) foreshadowed the election of representatives in later democratic systems. Another important political institution in Athens was the popular courts (dikasteria; see Dicastery), described by one scholar as 'the most important organ of state, alongside the Assembly', with 'unlimited power to control the Assembly, the Council, the magistrates, and political leaders'. The popular courts were composed of jurors chosen by lot from a pool of citizens over 30 years of age; the pool itself was chosen annually and also by lot. The institution is a further illustration of the extent to which the ordinary citizens of Athens were expected to participate in the political life of the city. In 411 BC, exploiting the unrest created by Athens's disastrous and seemingly endless war with Sparta, a group known as the Four Hundred seized control of Athens and established an oligarchy. Less than a year later, the Four Hundred were overthrown and democracy was fully restored. Nine decades later, in 321, Athens was subjugated by its more powerful neighbour to the north, Macedonia, which introduced property qualifications that effectively excluded many ordinary Athenians from the dēmos. In 146 BC what remained of Athenian democracy was extinguished by the conquering Romans. The Roman Republic:- at about the same time that popular government was introduced in Greece, it also appeared on the Italian Peninsula in the city of Rome. The Romans called their system a Rēspūblica, or republic, from the Latin rēs, meaning thing or affair, and pūblicus or pūblica, meaning public – thus, a republic was the thing that belonged to the Roman people, the populus romanus. Like Athens, Rome was originally a city-state. Although it expanded rapidly by conquest and annexation far beyond its original borders to encompass all the Mediterranean world and much of western Europe, its government remained, in its basic features, that of a moderately large city-state. Indeed, throughout the republican era (until roughly the end of the I century BC), Roman assemblies were held in the very small Forum at the center of the city. Who constituted the Roman dēmos? Although Roman citizenship was conferred by birth, it was also granted by naturalization and by manumission of slaves. As the Roman Republic expanded, it conferred citizenship in varying degrees to many of those within its enlarged boundaries. Because Roman assemblies continued to meet in the Forum, however, most citizens who did not live in or near the city itself were unable to participate and were thus effectively excluded from the dēmos. Despite their reputation for practicality and creativity, and notwithstanding many changes in the structure of Roman government over the course of centuries, the Romans never solved this problem. Two millennia later, the solution – electing representatives to a Roman legislature – would seem obvious. As they adapted to the special features of their society, including its rapidly increasing size, the Romans created a political structure so complex and idiosyncratic that later democratic leaders chose not to emulate it. The Romans used not only an extremely powerful Senate but also four assemblies, each called Comitia ('Assembly') or Concilium ('Council'). The Comitia Curiata was composed of 30 curiae, or local groups, drawn from three ancient tribus, or tribes; the Comitia Centuriata consisted of 193 centuries, or military units; the Concilium Plebis was drawn from the ranks of the plebes, or plebeians (common people); and the Comitia Tributa, like the Athenian Assembly, was open to all citizens. In all the assemblies, votes were counted by units (centuries or tribes) rather than by individuals; thus, insofar as a majority prevailed in voting, it would have been a majority of units, not of citizens. Although they collectively represented all Roman citizens, the assemblies were not sovereign. Throughout the entire period of the republic, the Senate – an institution inherited from the earlier era of the Roman monarchy – continued to exercise great power. Senators were chosen indirectly by the Comitia Centuriata; during the monarchy, they were drawn exclusively from the privileged patrician class, though later, during the republic, members of certain plebeian families were also admitted. The Italian Republics From the XII century to the Renaissance:- 'Constitutional Oligarchies':- after the Western Roman Empire collapsed in 476, the Italian Peninsula broke up into a congeries of smaller political entities. About six centuries later, in northern Italy, some of these entities developed into more or less independent city-states and inaugurated systems of government based on wider – though not fully popular – participation and on the election of leaders for limited periods of time. In this respect, their governments may be viewed as small-scale precursors of later representative systems. Such governments flourished for two centuries or more in a number of cities, including Venice, Florence, Siena, and Pisa. Drawing on Latin rather than Greek, the Italians called their city-states republics, not democracies. Although membership in the dēmos was at first restricted mainly to the nobility and large landowners, in some republics in the first half of the XIII century groups from lower social and economic classes – such as the newly rich, small merchants and bankers, skilled craftsmen organized in guilds, and foot soldiers commanded by knights – began to demand the right to participate in government at some level. Because they were more numerous than the upper classes and because they threatened (and sometimes carried out) violent uprisings, some of these groups were successful. Even with these additions, however, the dēmos in the republics remained only a tiny fraction of the total population, ranging from 12 percent in XIV-century Bologna to 2 percent or less in XV- and XVI-century Venice, where admission to the ruling nobility had been permanently closed during the XIV century. Thus, whether judged by the standards of Classical Greece or those of Europe and the United States in the XVIII century and later, the Italian republics were not democracies. A more accurate characterization, proposed by the historian Lauro Martines, is 'constitutional oligarchies'. After about the mid-XIV century, the conditions that had favoured the existence of independent city-states and wider participation in government – particularly their economic growth and the civic loyalty of their populations – gradually disappeared. Economic decline, corruption, factional disputes, civil wars, and wars with other states led to the weakening of some republican governments and their eventual replacement by authoritarian rulers, whether monarchs, princes, or soldiers. A Democratic Dilemma:- the Greeks, the Romans, and the leaders of the Italian republics were pioneers in creating popular governments, and their philosophers and commentators exercised enormous influence on later political thought. Yet their political institutions were not

emulated by the later founders of democratic governments in the nation-states of northern Europe and North America. As the expansion of Rome had already demonstrated, these institutions were simply not suited to political associations significantly larger than the city-state. The enormous difference in size between a city-state and a nation-state points to a fundamental dilemma. By limiting the size of a city-state, citizens can in principle, if not always in practice, directly influence the conduct of their government, e.g., by participating in an assembly. But limiting size comes at a cost:- important problems – notably defense against larger and more powerful states and the regulation of trade and finance – will remain beyond the capacity of the government to deal with effectively. Alternatively, by increasing the size of the city-state, i.e. by enlarging its geographic area and population – citizens can increase the capacity of the government to deal with important problems, but only at the cost of reducing their opportunities to influence the government directly through assemblies or other means. Many city-states responded to this dilemma by forming alliances or confederations with other city-states and with larger political associations. But the problem would not finally be solved until the development of representative government, which first appeared in northern Europe in the XVIII century. Toward Representative Democracy:- Europe and North America to the XIX Century:- until the XVII century, democratic theorists and political leaders largely ignored the possibility that a legislature might consist neither of the entire body of citizens, as in Greece and Rome, nor of representatives chosen by and from a tiny oligarchy or hereditary aristocracy, as in the Italian republics. An important break in the prevailing orthodoxy occurred during and after the English Civil Wars (1642–51), when the Levelers and other radical followers of Puritanism demanded broader representation in Parliament, expanded powers for Parliament's lower house, the House of Commons, and universal manhood suffrage. As with many political innovations, representative government resulted less from philosophical speculation than from a search for practical solutions to a fairly self-evident problem. Nevertheless, the complete assimilation of representation into the theory and practice of democracy was still more than a century away. Regional Developments:- Continental Europe:- about AD 800, freemen and nobles in various parts of northern Continental Europe began to participate directly in local assemblies, to which were later added regional and national assemblies consisting of representatives, some or all of whom came to be elected. In the mountain valleys of the Alps, such assemblies developed into self-governing cantons, leading eventually to the founding of the Swiss Confederation in the XIII century. By 900, local assemblies of Vikings were meeting in many areas of Scandinavia. Eventually the Vikings realized that to deal with certain larger problems they needed more-inclusive associations, and in Norway, Sweden, and Denmark regional assemblies developed. In 930 Viking descendants in Iceland created the first example of what today would be called a national assembly, legislature, or parliament – the Althing. In later centuries, representative institutions also were established in the emerging nation-states of Norway, Sweden, Denmark, Switzerland, and The Netherlands. England:- among the assemblies created in Europe during the Middle Ages, the one that most profoundly influenced the development of representative government was the English Parliament. Less a product of design than an unintended consequence of opportunistic innovations, Parliament grew out of councils that were called by kings for the purpose of redressing grievances and for exercising judicial functions. In time, Parliament began to deal with important matters of state, notably the raising of revenues needed to support the policies and decisions of the monarch. As its judicial functions were increasingly delegated to courts, it gradually evolved into a legislative body. By the end of the XV century, the English system displayed some of the basic features of modern parliamentary government: for example, the enactment of laws now required the passage of bills by both houses of Parliament and the formal approval of the monarch. Other important features had yet to be established, however. England's political life was dominated by the monarchy for centuries after the Middle Ages. During the English Civil Wars, led on one side by radical Puritans, the monarchy was abolished and a republic – the Commonwealth – was established (1649), though the monarchy was restored in 1660. By about 1800, significant powers, notably including powers related to the appointment and tenure of the prime minister, had shifted to Parliament. This development was strongly influenced by the emergence of political factions in Parliament during the early years of the XVIII century. These factions, known as Whigs and Tories, later became full-fledged parties. To king and Parliament alike it became increasingly apparent that laws could not be passed nor taxes raised without the support of a Whig or Tory leader who could muster a majority of votes in the House of Commons. To gain that support, the monarch was forced to select as prime minister the leader of the majority party in the Commons and to accept the leader's suggestions for the composition of the cabinet. That the monarch should have to yield to Parliament in this area became manifest during a constitutional crisis in 1782, when King George III (reigned 1760–1820) was compelled, much against his will, to accept a Whig prime minister and cabinet – a situation he regarded, according to one scholar, as 'a violation of the Constitution, a defeat for his policy, and a personal humiliation'. By 1830 the constitutional principle that the choice of prime minister, and thus the cabinet, reposed with the House of Commons had become firmly entrenched in the (unwritten) British Constitution. Parliamentary government in Britain was not yet a democratic system, however. Mainly because of property requirements, the franchise was held by only about 5 percent of the British population over 20 years of age. The Reform Act of 1832, which is generally viewed as a historic threshold in the development of parliamentary democracy in Britain, extended the suffrage to about 7 percent of the adult population. It would require further acts of Parliament in 1867, 1884, and 1918 to achieve universal male suffrage and one more law, enacted in 1928, to secure the right to vote for all adult women. The United States:- whereas the feasibility of representative government was demonstrated by the development of Parliament, the possibility of joining representation with democracy first became fully evident in the governments of the British colonies of North America and later in the founding of the United States of America. Conditions in colonial America favored the limited development of a system of representation more broadly based than the one in use in Great Britain. These conditions included the vast distance from London, which forced the British government to grant significant autonomy to the colonies; the existence of colonial legislatures in which representatives in at least one house were elected by voters; the expansion of the suffrage, which in some colonies came to include most adult white males; the spread of property ownership, particularly in land; and the strengthening of beliefs in fundamental rights and popular sovereignty, including the belief that the colonists, as British citizens, should not have to pay taxes to a government in which they were not represented ('no taxation without representation'). Until about 1760, most colonists were loyal to the mother country and did not think of themselves as constituting a separate nation of 'Americans'. After Britain imposed direct taxation on the colonies through the Stamp Act (1765), however, there were public (and sometimes violent) displays of opposition to the new law. In colonial newspapers there was also a sharp increase in the use of the term Americans to refer to the colonial population. Other factors that helped to create a distinct American identity were the outbreak of war with Britain in 1775 and the shared hardships and suffering of the people during many years of fighting, the adoption of the Declaration of Independence in 1776, the flight of many loyalists to Canada and England, and the rapid increase in travel and communication between the newly independent states. The colonists' sense of themselves as a single people, fragile as it may have been, made possible the creation of a loose confederacy of states under the Articles of Confederation in 1781–89 and an even more unified federal government under the Constitution in 1789. Because of the new country's large population and enormous size, it was obvious to the delegates to the Constitutional Convention (1787) that 'the People of the United States', as the opening words of the Constitution referred to them, could govern themselves at the federal level only by electing representatives – a practice with which the delegates were already familiar, given their experience of state government and, more remotely, their dealings with the government in Britain. The new representative government was barely in place, however, when it became evident that the task of organizing members of Congress and the electorate required the existence of political parties, even though such parties had been regarded as pernicious and destructive – 'the bane of republics' – by political thinkers and by many delegates to the Constitutional Convention. Eventually, political parties in the United States would provide nominees for local, state,

and national offices and compete openly and vigorously in elections. It was also obvious that a country as large as the United States would require representative government at lower levels, e.g., territories, states, and municipalities – with correspondingly limited powers. Although the governments of territories and states were necessarily representative, in smaller associations a direct assembly of citizens was both feasible and desirable. In many New England towns, for example, citizens assembled in meetings, Athenian style, to discuss and vote on local matters. Thus, the citizens of the United States helped to provide new answers to question (1) – What is the appropriate unit or association within which a democratic government should be established? – and question (3) – How are citizens to govern? Yet, the American answer to question (2) – Who should constitute the dēmos? – though radical in its time, was by later standards highly unsatisfactory. Even as the suffrage was broadly extended among adult white males, it continued to exclude large segments of the adult population, such as women, slaves, many freed blacks, and Native Americans. In time, these exclusions, like those of earlier democracies and republics, would be widely regarded as undemocratic. Democracy or Republic? Is democracy the most appropriate name for a large-scale representative system such as that of the early United States? At the end of the XVIII century, the history of the terms whose literal meaning is 'rule by the people' – democracy and republic – left the answer unclear. Both terms had been applied to the assembly-based systems of Greece and Rome, though neither system assigned legislative powers to representatives elected by members of the dēmos. As noted above, even after Roman citizenship was expanded beyond the city itself and increasing numbers of citizens were prevented from participating in government by the time, expense, and hardship of travel to the city, the complex Roman system of assemblies was never replaced by a government of representatives – a parliament – elected by all Roman citizens. Venetians also called the government of their famous city a republic, though it was certainly not democratic. When the members of the United States Constitutional Convention met in 1787, terminology was still unsettled. Not only were democracy and republic used more or less interchangeably in the colonies, but no established term existed for a representative government 'by the people'. At the same time, the British system was moving swiftly toward full-fledged parliamentary government. Had the framers of the United States Constitution met two generations later, when their understanding of the constitution of Britain would have been radically different, they might have concluded that the British system required only an expansion of the electorate to realize its full democratic potential. Thus, they might well have adopted a parliamentary form of government. Embarked as they were on a wholly unprecedented effort to construct a constitutional government for an already large and continuously expanding country, the framers could have had no clear idea of how their experiment would work in practice. Fearful of the destructive power of 'factions', for example, they did not foresee that in a country where laws are enacted by representatives chosen by the people in regular and competitive elections, political parties inevitably become fundamentally important institutions. Given the existing confusion over terminology, it is not surprising that the framers employed various terms to describe the novel government they proposed. A few months after the adjournment of the Constitutional Convention, James Madison, the future fourth president of the United States, proposed a usage that would have lasting influence within the country though little elsewhere. In Federalist 10, one of 85 essays by Madison, Alexander Hamilton, and John Jay known collectively as the Federalist papers, Madison defined a 'pure democracy' as 'a society consisting of a small number of citizens, who assemble and administer the government in person', and a republic as 'a government in which the scheme of representation takes place'. According to Madison, 'The two great points of difference between a democracy and a republic, are:- first, the delegation of the government, in the latter, to a small number of citizens elected by the rest; secondly, the greater the number of citizens, and greater sphere of country, over which the latter may be extended'. In short, for Madison, democracy meant direct democracy, and republic meant representative government. Even among his contemporaries, Madison's refusal to apply the term democracy to representative governments, even those based on broad electorates, was aberrant. In November 1787, only two months after the convention had adjourned, James Wilson, one of the signers of the Declaration of Independence, proposed a new classification. 'The three species of governments', he wrote, 'are the monarchical, aristocratical and democratical. In a monarchy, the supreme power is vested in a single person:- in an aristocracy … by a body not formed upon the principle of representation, but enjoying their station by descent, or election among themselves, or in right of some personal or territorial qualifications; and lastly, in a democracy, it is inherent in a people, and is exercised by themselves or their representatives'. Applying this understanding of democracy to the newly adopted constitution, Wilson asserted that 'in its principles, … it is purely democratical:- varying indeed in its form in order to admit all the advantages, and to exclude all the disadvantages which are incidental to the known and established constitutions of government. But when we take an extensive and accurate view of the streams of power that appear through this great and comprehensive plan … we shall be able to trace them to one great and noble source, THE PEOPLE'. At the Virginia ratifying convention some months later, John Marshall, the future chief justice of the Supreme Court, declared that the 'Constitution provided for 'a well regulated democracy' where no king, or president, could undermine representative government'. The political party that he helped to organize and lead in cooperation with Thomas Jefferson, the future third president of the United States, was named the Democratic-Republican Party; the party adopted its present name, the Democratic Party, in 1844. Following his visit to the United States in 1831–32, the French political scientist Alexis de Tocqueville asserted in no uncertain terms that the country he had observed was a democracy – indeed, the world's first representative democracy, where the fundamental principle of government was 'the sovereignty of the people'. Tocqueville's estimation of the American system of government reached a wide audience in Europe and beyond through his monumental four-volume study Democracy in America (1835–40). Solving the Dilemma:- thus, by the end of the XVIII century both the idea and the practice of democracy had been profoundly transformed. Political theorists and statesmen now recognized what the Levelers had seen earlier, that the nondemocratic practice of representation could be used to make democracy practicable in the large nation-states of the modern era. Representation, in other words, was the solution to the ancient dilemma between enhancing the ability of political associations to deal with large-scale problems and preserving the opportunity of citizens to participate in government. To some of those steeped in the older tradition, the union of representation and democracy seemed a marvelous and epochal invention. In the early XIX century the French author Destutt de Tracy, the inventor of the term Idéologie ('Ideology'), insisted that representation had rendered obsolete the doctrines of both Montesquieu and Jean-Jacques Rousseau, both of whom had denied that representative governments could be genuinely democratic. 'Representation, or representative government', he wrote, 'may be considered as a new invention, unknown in Montesquieu's time …. Representative democracy … is democracy rendered practicable for a long time and over a great extent of territory'. In 1820 the English philosopher James Mill proclaimed 'the system of representation' to be 'the grand discovery of modern times' in which 'the solution of all the difficulties, both speculative and practical, will perhaps be found'. One generation later Mill's son, the philosopher John Stuart Mill, concluded in his Considerations on Representative Government (1861) that 'the ideal type of a perfect government' would be both democratic and representative. Foreshadowing developments that would take place in the XX century, the dēmos of Mill's representative democracy included women. New Answers to Old Questions:- Suffrage:- representation was not the only radical innovation in democratic ideas and institutions. Equally revolutionary were the new answers being offered, in the XIX and XX centuries, to some of the fundamental questions mentioned earlier. One important development concerned question (2) – Who should constitute the dēmos? In the XIX century property requirements for voting were reduced and finally removed. The exclusion of women from the dēmos was increasingly challenged – not least by women themselves. Beginning with New Zealand in 1893, more and more countries granted women the suffrage and other political rights, and by the mid-XX century women were full and equal members of the dēmos in almost all countries that considered themselves democratic – though Switzerland, a pioneer in establishing universal male suffrage in 1848, did not grant women the right to vote in national elections until 1971. Although the United

States granted women the right to vote in 1920, another important exclusion continued for almost half a century:- African Americans were prevented, by both legal and illegal means, from voting and other forms of political activity, primarily in the South but also in other areas of the country. Not until after the passage and vigorous enforcement of the Civil Rights Act of 1964 were they at last effectively admitted into the American dēmos. Thus, in the XIX and XX centuries the dēmos was gradually expanded to include all adult citizens. Although important issues remained unsettled – for example, should permanent legal foreign residents of a country be entitled to vote? – such an expanded dēmos became a new condition of democracy itself. By the mid-XX century, no system whose dēmos did not include all adult citizens could properly be called 'democratic'. Factions and Parties:- in many of the city-state democracies and republics, part of the answer to question (3) – What political institutions are necessary for governing? – consisted of 'factions', including both informal groups and organized political parties. Much later, representative democracies in several countries developed political parties for selecting candidates for election to parliament and for organizing parliamentary support for (or opposition to) the prime minister and his cabinet. Nevertheless, at the end of the XVIII century leading political theorists such as Montesquieu continued to regard factions as a profound danger to democracies and republics. This view was also common at the United States Constitutional Convention, where many delegates argued that the new government would inevitably be controlled and abused by factions unless there existed a strong system of constitutional checks and balances. Factions are dangerous, it was argued, for at least two reasons. First, a faction is by definition a group whose interests are in conflict with the general good. As Madison put it in Federalist 10:- 'By a faction, I understand a number of citizens, whether amounting to a majority or a minority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community'. Second, historical experience shows that, prior to the XVIII century, the existence of factions in a democracy or republic tended to undermine the stability of its government. The 'instability, injustice, and confusion introduced into the public councils' by factionalism, Madison wrote, have been 'the mortal diseases under which popular governments have everywhere perished'. Interestingly, Madison used the presumed danger of factions as an argument in favour of adopting the new constitution. Because the United States, in comparison with previous republics, would have many more citizens and vastly more territory, the diversity of interests among its population would be much greater, making the formation of large or powerful factions less likely. Similarly, the exercise of government power by representatives rather than directly by the people would 'refine and enlarge the public views, by passing them through the medium of a chosen body of citizens, whose wisdom may best discern the true interest of their country'. As to political parties, Madison soon realized – despite his belief in the essential perniciousness of factions – that in a representative democracy political parties are not only legally possible, necessary, and inevitable, they are also desirable. They were legally possible because of the rights and liberties provided for in the constitution. They were necessary in order to defeat the Federalists, whose centralizing policies Madison, Jefferson, and many others strongly opposed. Because parties were both possible and necessary, they would inevitably be created. Finally, parties were also desirable, because by helping to mobilize voters throughout the country and in the legislative body, they enabled the majority to prevail over the opposition of a minority. This view came to be shared by political thinkers in other countries in which democratic forms of government were developing. By the end of the XIX century, it was nearly universally accepted that the existence of independent and competitive political parties is an elementary standard that every democracy must meet. Majority Rule, Minority Rights, Majority Tyranny:- the fear of 'majority tyranny' was a common theme in the XVII century and later, even among those who were sympathetic to democracy. Given the opportunity, it was argued, a majority would surely trample on the fundamental rights of minorities. Property rights were perceived as particularly vulnerable, since presumably any majority of citizens with little or no property would be tempted to infringe the rights of the propertied minority. Such concerns were shared by Madison and other delegates at the Convention and strongly influenced the document they created. Here too, however, Madison's views changed after reflection on and observation of the emerging American democracy. In a letter of 1833, he wrote, 'Every friend to Republican government ought to raise his voice against the sweeping denunciation of majority governments as the most tyrannical and intolerable of all governments .... No government of human device and human administration can be perfect; … the abuses of all other governments have led to the preference of republican government as the best of all governments, because the least imperfect; and the vital principle of republican governments is the lex majoris partis, the will of the majority'. The fear of factions was eased and finally abandoned after leaders in various democratic countries realized that they could create numerous barriers to unrestrained majority rule, none of which would be clearly inconsistent with basic democratic principles. Thus, they could incorporate a bill of rights into the constitution; require a supermajority of votes – such as two-thirds or three-fourths – for constitutional amendments and other important kinds of legislation; divide the executive, legislative, and judicial powers of government into separate branches; give an independent judiciary the power to declare laws or policies unconstitutional and hence without force of law; adopt constitutional guarantees of significant autonomy for states, provinces, or regions; provide by statute for the decentralization of government to territorial groups such as towns, counties, and cities; or adopt a system of proportional representation, under which the proportion of legislative seats awarded to a party is roughly the same as the proportion of votes cast for the party or its candidates. In such a multiparty system, cabinets are composed of representatives drawn from two or more parties, thus ensuring that minority interests retain a significant voice in government. Although political theorists continue to disagree about the best means to effect majority rule in democratic systems, it seems evident that majorities cannot legitimately abridge the fundamental rights of citizens. Nor should minorities ever be entitled to prevent the enforcement of laws and policies designed to protect these fundamental rights. In short, because democracy is not only a political system of 'rule by the people' but necessarily also a system of rights, a government that infringes these rights is to that extent undemocratic. The Spread of Democracy in The XX Century:- during the XX century, the number of countries possessing the basic political institutions of representative democracy increased significantly. At the beginning of the XXI century, independent observers agreed that more than one-third of the world's nominally independent countries possessed democratic institutions comparable to those of the English-speaking countries and the older democracies of Continental Europe. In an additional one-sixth of the world's countries, these institutions, though somewhat defective, nevertheless provided historically high levels of democratic government. Altogether, these democratic and near-democratic countries contained nearly half the world's population. What accounted for this rapid expansion of democratic institutions? Failures of Nondemocratic Systems:- a significant part of the explanation is that all the main alternatives to democracy – whether of ancient or of modern origins – suffered political, economic, diplomatic, and military failures that greatly lessened their appeal. With the victory of the Allies in World War I, the ancient systems of monarchy, aristocracy, and oligarchy ceased to be legitimate. Following the military defeat of Italy and Germany in World War II, the newer alternative of fascism was likewise discredited, as was Soviet-style communism after the economic and political collapse of the Soviet Union in 1990–91. Similar failures contributed to the gradual disappearance of military dictatorships in Latin America in the 1980s and '90s. Market Economies:- accompanying these ideological and institutional changes were changes in economic institutions. Highly centralized economies under state control had enabled political leaders to use their ready access to economic resources to reward their allies and punish their critics. As these systems were displaced by more decentralized market economies, the power and influence of top government officials declined. In addition, some of the conditions that were essential to the successful functioning of market economies also contributed to the development of democracy:- ready access to reliable information, relatively high levels of education, ease of personal movement, and the rule of law. As market economies expanded and as middle classes grew larger and more influential, popular support for such conditions increased, often accompanied by demands for further democratization. Economic Well-

Being:- the development of market economies contributed to the spread of democracy in other ways as well. As the economic well-being of large segments of the world's population gradually improved, so too did the likelihood that newly established democratic institutions would survive and flourish. In general, citizens in democratic countries with persistent poverty are more susceptible to the appeals of antidemocratic demagogues who promise simple and immediate solutions to their country's economic problems. Accordingly, widespread economic prosperity in a country greatly increases the chances that democratic government will succeed, whereas widespread poverty greatly increases the chances that it will fail. Political Culture:- during the XX century, democracy continued to exist in some countries despite periods of acute diplomatic, military, economic, or political crisis, such as occurred during the early years of the Great Depression. The survival of democratic institutions in these countries is attributable in part to the existence in their societies of a culture of widely shared democratic beliefs and values. Such attitudes are acquired early in life from older generations, thus becoming embedded in people's views of themselves, their country, and the world. In countries where democratic culture is weak or absent, as was the case in the Weimar Republic of Germany in the years following World War I, democracy is much more vulnerable, and periods of crisis are more likely to lead to a reversion to a nondemocratic regime. Contemporary Democratic Systems:- differences among democratic countries in historical experience, size, ethnic and religious composition, and other factors have resulted in significant differences in their political institutions. Some of the features with respect to which these institutions have differed are the following. Presidential and Parliamentary Systems:- whereas versions of the American presidential system were frequently adopted in Latin America, Africa, and elsewhere in the developing world (where the military sometimes converted the office into a dictatorship through a coup d'état), as European countries democratized they adopted versions of the English parliamentary system, which made use of both a prime minister responsible to parliament and a ceremonial head of state (who might be either a hereditary monarch, as in the Scandinavian countries, The Netherlands, and Spain, or a president chosen by parliament or by another body convoked specially for the purpose). A notable exception is France, which in its fifth constitution, adopted in 1958, combined its parliamentary system with a presidential one. Unitary and Federal Systems:- in most older European and English-speaking democracies, political authority inheres in the central government, which is constitutionally authorized to determine the limited powers, as well as the geographic boundaries, of subnational associations such as states and regions. Such unitary systems contrast markedly with federal systems, in which authority is constitutionally divided between the central government and the governments of relatively autonomous subnational entities. Democratic countries that have adopted federal systems include – in addition to the United States – Switzerland, Germany, Austria, Spain, Canada, and Australia. The world's most populous democratic country, India, also has a federal system. Proportional and Winner-Take-All Systems:- electoral arrangements vary enormously. Some democratic countries divide their territories into electoral districts, each of which is entitled to a single seat in the legislature, the seat being won by the candidate who gains the most votes – hence the terms first past the post in Britain and winner take all in the United States. As critics of this system point out, in districts contested by more than two candidates, it is possible to gain the seat with less than a strict majority of votes (50 percent plus one). As a result, a party that receives only a minority of votes in the entire country could win a majority of seats in the legislature. Systems of proportional representation are designed to ensure a closer correspondence between the proportion of votes cast for a party and the proportion of seats it receives. With few exceptions, Continental European countries have adopted some form of proportional representation, as have Ireland, Australia, New Zealand, Japan, and South Korea. Winner-take-all systems remain in the United States, Canada, and, for parliamentary elections, in Britain. Two-Party and Multiparty Systems:- because proportional representation does not favour large parties over smaller ones, as does the winner-take-all system, in countries with proportional representation there are almost always three or more parties represented in the legislature, and a coalition government consisting of two or more parties is ordinarily necessary to win legislative support for the government's policies. Thus the prevalence of proportional representation effectively ensures that coalition governments are the rule in democratic countries; governments consisting of only two parties, such as that of the United States, are extremely rare. Majoritarian and Consensual Systems:- because of differences in electoral systems and other factors, democratic countries differ with respect to whether laws and policies can be enacted by a single, relatively cohesive party with a legislative majority, as is ordinarily the case in Britain and Japan, or instead require consensus among several parties with diverse views, as in Switzerland, The Netherlands, Sweden, Italy, and elsewhere. Political scientists and others disagree about which of the two types of system, majoritarian or consensual, is more desirable. Critics of consensual systems argue that they allow a minority of citizens to veto policies they dislike and that they make the tasks of forming governments and passing legislation excessively difficult. Supporters contend that consensual arrangements produce comparatively wider public support for government policies and even help to increase the legitimacy and perceived value of democracy itself. Here again, it appears that a country's basic political institutions need to be tailored to its particular conditions and historical experience. The strongly majoritarian system of Britain would probably be inappropriate in Switzerland, whereas the consensual arrangements of Switzerland or The Netherlands might be less satisfactory in Britain. The Theory of Democracy:- Democratic Ideas from Pericles to Rawls:- Pericles:- in a funeral oration in 430 BC for those who had fallen in the Peloponnesian War, the Athenian leader Pericles described democratic Athens as 'the school of Hellas'. Among the city's many exemplary qualities, he declared, was its constitution, which 'favors the many instead of the few; this is why it is called a democracy'. Pericles continued:- 'If we look to the laws, they afford equal justice to all in their private differences; if to social standing, advancement in public life falls to reputation for capacity, class considerations not being allowed to interfere with merit; nor again does poverty bar the way; if a man is able to serve the state, he is not hindered by obscurity of his condition. The freedom which we enjoy in our government extends also to our ordinary life'. Aristotle:- a century later, Aristotle discussed democracy in terms that would become highly influential in comparative studies of political systems. At the heart of his approach is the notion of a 'constitution', which he defines as 'an organization of offices, which all the citizens distribute among themselves, according to the power which different classes possess'. He concludes that 'there must therefore be as many forms of government as there are modes of arranging the offices, according to the superiorities and the differences of the parts of the state'. Ever the realist, however, he remarks that 'the best government is often unattainable, and therefore the true legislator and statesman ought to be acquainted, not only with (1) that which is best in the abstract, but also with (2) that which is best relatively to circumstances'. Aristotle identifies three kinds of ideal constitution – each of which describes a situation in which those who rule pursue the common good – and three corresponding kinds of perverted constitution – each of which describes a situation in which those who rule pursue narrow and selfish goals. The three kinds of constitution, both ideal and perverted, are differentiated by the number of persons they allow to rule. Thus 'rule by one' is monarchy in its ideal form and tyranny in its perverted form; 'rule by the few' is aristocracy in its ideal form and oligarchy in its perverted form; and 'rule by the many' is 'polity' in its ideal form and democracy in its perverted form. Aristotle's general scheme prevailed for more than two millennia, though his unsympathetic and puzzling definition of democracy – which probably did not reflect the views of most Greeks in his time – did not. Aristotle himself took a more favorable view of democracy in his studies of the variety, stability, and composition of actual democratic governments. In his observation that 'the basis of a democratic state is liberty', Aristotle proposed a connection between the ideas of democracy and liberty that would be strongly emphasized by all later advocates of democracy. Locke:- nearly 20 centuries after Aristotle, the English philosopher John Locke adopted the essential elements of the Aristotelian classification of constitutions in his Second Treatise of Civil Government (1690). Unlike Aristotle, however, Locke was an unequivocal supporter of political equality, individual , democracy, and majority rule. Although his work was naturally rather abstract and not particularly programmatic, it provided a powerful philosophical foundation for

much later democratic theorizing and political programs. The Legitimacy of Government:- according to Locke, in the hypothetical 'state of nature' that precedes the creation of human societies, men live 'equal one amongst another without subordination or subjection', and they are perfectly free to act and to dispose of their possessions as they see fit, within the bounds of natural law. From these and other premises Locke draws the conclusion that political society, i.e. government – insofar as it is legitimate, represents a social contract among those who have 'consented to make one Community or Government … wherein the Majority have a right to act and conclude the rest'. These two ideas – the consent of the governed and majority rule – became central to all subsequent theories of democracy. For Locke they are inextricably connected:- 'For if the consent of the majority shall not in reason, be received, as the act of the whole, and conclude every individual; nothing but the consent of every individual can make anything be the act of the whole:- But such a consent is next to impossible ever to be had'. Thus no government is legitimate unless it enjoys the consent of the governed, and that consent cannot be rendered except through majority rule. Given these conclusions, it is somewhat surprising that Locke's description of the different forms of government (he calls them 'commonwealths') does not explicitly prescribe democracy as the only legitimate system. Writing in England in the 1680s, a generation after the Commonwealth ended with the restoration of the monarchy (1660), Locke was more circumspect than this. Nevertheless, a careful reading of the relevant passages of the Second Treatise shows that Locke remains true to his fundamental principle, that the only legitimate form of government is that based on the consent of the governed. Locke differentiates the various forms of government on the basis of where the people choose to place the power to make laws. His categories are the traditional ones:- If the people retain the legislative power for themselves, together with the power to appoint those who execute the laws, then 'the Form of the Government is a perfect Democracy'. If they put the power 'into the hands of a few select Men, and their Heirs or Successors, … then it is an Oligarchy:- Or else into the hands of one Man, and then it is a Monarchy'. Nevertheless, his analysis is far more subversive of nondemocratic forms of government than it appears to be. For whatever the form of government, the ultimate source of sovereign power is the people, and all legitimate government must rest on their consent. Therefore, if a government abuses its trust and violates the people's fundamental rights – particularly the right to property – the people are entitled to rebel and replace that government with another to whose laws they can willingly give their consent. And who is to judge whether the government has abused its trust? Again, Locke is unequivocal:- the people themselves are to make that judgment. Although he does not use the term, Locke thus unambiguously affirms the right of revolution against a despotic government. Less than a century later, Locke's views were echoed in the famous words of the United States Declaration of Independence:- We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the pursuit of Happiness. That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed, that whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or abolish it, and to institute new government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Answers to Fundamental Questions:- although Locke's ideas were radical – even quietly revolutionary – in his time, his answers to questions (1) through (3) would need further elaboration, and even some alteration, as the theory and practice of democracy continued to develop. Regarding question (1) – What is the appropriate association within which a democratic government should be established? – despite the generality of his conclusions, Locke clearly intended them to apply to England as a whole, and presumably also to other nation-states. Departing from views that still prevailed among political philosophers of his time, Locke held – as the Levelers did – that democracy did not require a small political unit, such as a city-state, in which all members of the dēmos could participate in government directly. Here again, Locke was at the forefront of the development of democratic ideas. Regarding question (2) – Who should constitute the dēmos? – Locke believed, along with almost everyone else who had expressed an opinion on the issue, that children should not enjoy the full rights of citizenship, though he maintained that parents are morally obliged to respect their children's rights as human beings. With almost no substantive argument, Locke adopted the traditional view that women should be excluded from the dēmos, though he insisted that they retain all other fundamental rights. More than a century would pass before 'the consent of the people' was generally understood to include the consent of women. Unlike the men of Athens or the small male aristocracy of Venice, obviously the men of England could not govern directly in an assembly. In this case, then, the answer to question (3) – What political institutions are necessary for governing? – would have to include the use of representatives chosen by the people. Yet, though it seems clear that Locke's government by consent requires representation, he provided little guidance as to the form it might take. This is perhaps because he, like his contemporary readers, assumed that democracy and majority rule would be best implemented in England through parliamentary elections based on an adult-male franchise. Montesquieu:- the French political theorist Montesquieu, through his masterpiece The Spirit of the Laws (1748), strongly influenced his younger contemporary Rousseau and many of the American Founding Fathers, including John Adams, Jefferson, and Madison. Rejecting Aristotle's classification, Montesquieu distinguishes three ideal types of government:- monarchy, 'in which a single person governs by fixed and established laws'; despotism, 'in which a single person directs everything by his own will and caprice'; and republican (or popular) government, which may be of two types, depending on whether 'the body, or only a part of the people, is possessed of the supreme power', the former being a democracy, the latter an aristocracy. According to Montesquieu, a necessary condition for the existence of a republican government, whether democratic or aristocratic, is that the people in whom supreme power is lodged possess the quality of 'public virtue', meaning that they are motivated by a desire to achieve the public good. Although public virtue may not be necessary in a monarchy and is certainly absent in despotic regimes, it must be present to some degree in aristocratic republics and to a large degree in democratic republics. Sounding a theme that would be loudly echoed in Madison's Federalist 10, Montesquieu asserts that without strong public virtue, a democratic republic is likely to be destroyed by conflict between various 'factions', each pursuing its own narrow interests at the expense of the broader public good. Hume:- the destructive power of factions was also strongly emphasized by the Scottish philosopher and historian David Hume, whose influence on Madison was perhaps even greater than Montesquieu's. For it was from Hume that Madison seems to have acquired a view about factions that turned the issue of the desirability of larger political associations – i.e. those larger than the city-state – on its head. For the purpose of diminishing the destructive potential of factionalism, so Hume and Madison argued, bigger is in fact better, because in bigger associations each representative must look after a greater diversity of interests. It is also likely that Madison was influenced by Hume when in Federalist 10 he rejected the term democracy for the type of government based on representation, preferring instead to call it a republic. Rousseau:- when compared with Locke, Jean-Jacques Rousseau sometimes seems the more radical democrat, though a close reading of his work shows that, in important respects, Rousseau's conception of democracy is narrower than Locke's. Indeed, in his most influential work of political philosophy, The Social Contract (1762), Rousseau asserts that democracy is incompatible with representative institutions, a position that renders it all but irrelevant to nation-states. The sovereignty of the people, he argues, can be neither alienated nor represented. 'The idea of representatives is modern', he wrote. 'In the ancient republics … the people never had representatives …. The moment a people allows itself to be represented, it is no longer free:- it no longer exists'. But if representation is incompatible with democracy, and if direct democracy is the only legitimate form of government, then no nation-state of Rousseau's time or any other can have a legitimate government. Furthermore, according to Rousseau, if a political association that is small enough to practice direct democracy, such as a city-state, were to come into existence, it would inevitably be subjugated by larger nation-states and thereby cease to be democratic. For these and other reasons, Rousseau was pessimistic about the prospects of democracy. 'It is against the natural order for the many to govern and the few to be governed',

he wrote. ‘It is unimaginable that the people should remain continually assembled to devote their time to public affairs’. Adopting a view common among critics of democracy in his time, Rousseau also held that ‘there is no government so subject to civil wars and intestine agitations as democratic or popular government’. In a much-cited passage, he declares that, ‘were there a people of gods, their government would be democratic. So perfect a government is not for men’. Despite these negative conclusions, Rousseau hints, in a brief footnote (Book III, Chapter 15), that democratic governments may be viable if joined together in confederations. Some years later, in a discussion of how the people of Poland might govern themselves, he allowed that there is simply no alternative to government by representation. However, he left the problem of the proper size or scale of democratic political associations largely unsolved. Mill:- in his work On Liberty (1859) John Stuart Mill argued on utilitarian grounds that individual liberty cannot be legitimately infringed – whether by government, society, or individuals – except in cases where the individual’s action would cause harm to others. In a celebrated formulation of this principle, Mill wrote that the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection …. The only purpose for which power can be rightfully exercised over any member of a civilised community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. Mill’s principle provided a philosophical foundation for some of the basic freedoms essential to a functioning democracy, such as freedom of association, and undermined the legitimacy of paternalistic laws, such as those requiring temperance, which in Mill’s view treated adult citizens like children. In the area of what he called the liberty of thought and discussion, another freedom crucial to democracy, Mill argued, also on utilitarian grounds, that legal restrictions on the expression of opinion are never justified. The ‘collision of adverse opinions’, he contended, is a necessary part of any society’s search for the truth. In another work, Considerations on Representative Government (1861), Mill set forth in a lucid and penetrating manner many of the essential features of the new type of government, which had not yet emerged in Continental Europe and was still incomplete in important respects in the United States. In this work he also advanced a powerful argument on behalf of woman suffrage – a position that virtually all previous political philosophers (all of them male, of course) had ignored or rejected. Dewey:- according to the American philosopher John Dewey, democracy is the most desirable form of government because it alone provides the kinds of freedom necessary for individual self-development and growth – including the freedom to exchange ideas and opinions with others, the freedom to form associations with others to pursue common goals, and the freedom to determine and pursue one’s own conception of the good life. Democracy is more than merely a form of government, however; as Dewey remarks in Democracy and Education (1916), it is also a ‘mode of associated life’ in which citizens cooperate with each other to solve their common problems through rational means (i.e. through critical inquiry and experiment) in a spirit of mutual respect and good will. Moreover, the political institutions of any democracy, according to Dewey, should not be viewed as the perfect and unchangeable creations of visionary statesmen of the past; rather, they should be constantly subject to criticism and improvement as historical circumstances and the public interest change. Participation in a democracy as Dewey conceived it requires critical and inquisitive habits of mind, an inclination toward cooperation with others, and a feeling of public spiritedness and a desire to achieve the common good. Because these habits and inclinations must be inculcated from a young age, Dewey placed great emphasis on education; indeed, he called public schools ‘the church of democracy’. His contributions to both the theory and practice of education were enormously influential in the United States in the XX century. Dewey offered little in the way of concrete proposals regarding the form that democratic institutions should take. Nevertheless, in The Public and Its Problems (1927) and other works, he contended that individuals cannot develop to their fullest potential except in a social democracy, or a democratic welfare-state. Accordingly, he held that democracies should possess strong regulatory powers. He also insisted that among the most important features of a social democracy should be the right of workers to participate directly in the control of the firms in which they are employed. Given Dewey’s interest in education, it is not surprising that he was greatly concerned with the question of how citizens might better understand public affairs. Although he was a proponent of the application of the social sciences to the development of public policy, he sharply criticized intellectuals, academics, and political leaders who viewed the general public as incompetent and who often argued for some form of democratic elitism. Only the public, he maintained, can decide what the public interest is. In order for citizens to be able to make informed and responsible decisions about their common problems, he thought, it is important for them to engage in dialogue with each other in their local communities. Dewey’s emphasis on dialogue as a critical practice in a democracy inspired later political theorists to explore the vital role of deliberation in democratic systems. Habermas:- in a series of works published after 1970, the German philosopher and social theorist Jürgen Habermas, employing concepts borrowed from Anglo-American philosophy of language, argued that the idea of achieving a ‘rational consensus’ within a group on questions of either fact or value presupposes the existence of what he called an ‘ideal speech situation’. In such a situation, participants would be able to evaluate each other’s assertions solely on the basis of reason and evidence in an atmosphere completely free of any nonrational ‘coercive’ influences, including both physical and psychological coercion. Furthermore, all participants would be motivated solely by the desire to obtain a rational consensus, and no time limits on the discussion would be imposed. Although difficult if not impossible to realize in practice, the ideal speech situation can be used as a model of free and open public discussion and a standard against which to evaluate the practices and institutions through which large political questions and issues of public policy are decided in actual democracies. Rawls:- from the time of Mill until about the mid-XX century, most philosophers who defended democratic principles did so largely on the basis of utilitarian considerations, i.e. they argued that systems of government that are democratic in character are more likely than other systems to produce a greater amount of happiness (or well-being) for a greater number of people. Such justifications, however, were traditionally vulnerable to the objection that they could be used to support intuitively less-desirable forms of government in which the greater happiness of the majority is achieved by unfairly neglecting the rights and interests of a minority. In A Theory of Justice (1971), the American philosopher John Rawls attempted to develop a nonutilitarian justification of a democratic political order characterized by fairness, equality, and individual rights. Reviving the notion of a social contract, which had been dormant since the XVIII century, he imagined a hypothetical situation in which a group of rational individuals are rendered ignorant of all social and economic facts about themselves – including facts about their race, sex, religion, education, intelligence, talents or skills, and even their conception of the ‘good life’ – and then asked to decide what general principles should govern the political institutions under which they live. From behind this ‘veil of ignorance’, Rawls argues, such a group would unanimously reject utilitarian principles – such as ‘political institutions should aim to maximize the happiness of the greatest number’ – because no member of the group could know whether he belonged to a minority whose rights and interests might be neglected under institutions justified on utilitarian grounds. Instead, reason and self-interest would lead the group to adopt principles such as the following:- (1) everyone should have a maximum and equal degree of liberty, including all the liberties traditionally associated with democracy; (2) everyone should have an equal opportunity to seek offices and positions that offer greater rewards of wealth, power, status, or other social goods; and (3) the distribution of wealth in society should be such that those who are least well-off are better off than they would be under any other distribution, whether equal or unequal. (Rawls holds that, given certain assumptions about human motivation, some inequality in the distribution of wealth may be necessary to achieve higher levels of productivity. It is therefore possible to imagine unequal distributions of wealth in which those who are least well-off are better off than they would be under an equal distribution.) These principles amount to an egalitarian form of democratic liberalism. Rawls is accordingly regarded as the leading philosophical defender of the modern democratic capitalist welfare state. ‘Ideal Democracy’:- as noted above, Aristotle found it useful to classify actually existing governments in terms of three ‘ideal constitutions’. For essentially the same reasons, the notion of an ‘ideal

democracy' also can be useful for identifying and understanding the democratic characteristics of actually existing governments, be they of city-states, nation-states, or larger associations. It is important to note that the term ideal is ambiguous. In one sense, a system is ideal if it is considered apart from, or in the absence of, certain empirical conditions, which in actuality are always present to some degree. Ideal systems in this sense are used to identify what features of an actual system are essential to it, or what underlying laws are responsible, in combination with empirical factors, for a system's behaviour in actual circumstances. In another sense, a system is ideal if it is 'best' from a moral point of view. An ideal system in this sense is a goal toward which a person or society ought to strive (even if it is not perfectly attainable in practice) and a standard against which the moral worth of what has been achieved, or of what exists, can be measured. These two senses are often confused. Systems that are ideal in the first sense may, but need not, be ideal in the second sense. Accordingly, a description of an ideal democracy, such as the one below, need not be intended to prescribe a particular political system. Indeed, influential conceptions of ideal democracy have been offered by democracy's enemies as well as by its friends. Features of Ideal Democracy:- at a minimum, an ideal democracy would have the following features:- (i) Effective Participation:- before a policy is adopted or rejected, members of the dēmos have the opportunity to make their views about the policy known to other members. (ii) Equality In Voting:- members of the dēmos have the opportunity to vote for or against the policy, and all votes are counted as equal. Informed electorate. Members of the dēmos have the opportunity, within a reasonable amount of time, to learn about the policy and about possible alternative policies and their likely consequences. (iii) Citizen Control of The Agenda:- the dēmos, and only the dēmos, decides what matters are placed on the decision-making agenda and how they are placed there. Thus, the democratic process is 'open' in the sense that the dēmos can change the policies of the association at any time. (iv) Inclusion:- each and every member of the dēmos is entitled to participate in the association in the ways just described. (v) Fundamental Rights:- each of the necessary features of ideal democracy prescribes a right that is itself a necessary feature of ideal democracy: thus every member of the dēmos has a right to communicate with others, a right to have his voted counted equally with the votes of others, a right to gather information, a right to participate on an equal footing with other members, and a right, with other members, to exercise control of the agenda. Democracy, therefore, consists of more than just political processes; it is also necessarily a system of fundamental rights. Ideal and Representative Democracy:- in modern representative democracies, the features of ideal democracy, to the extent that they exist, are realized through a variety of political institutions. These institutions, which are broadly similar in different countries despite significant differences in constitutional structure, were entirely new in human history at the time of their first appearance in Europe and the United States in the XVIII century. Among the most important of them is naturally the institution of representation itself, through which all major government decisions and policies are made by popularly elected officials, who are accountable to the electorate for their actions. Other important institutions include:- (i) Free, Fair, and Frequent Elections:- citizens may participate in such elections both as voters and as candidates (though age and residence restrictions may be imposed). (ii) Freedom of Expression:- citizens may express themselves publicly on a broad range of politically relevant subjects without fear of punishment. (iii) Independent Sources of Information:- there exist sources of political information that are not under the control of the government or any single group and whose right to publish or otherwise disseminate information is protected by law; moreover, all citizens are entitled to seek out and use such sources of information. (iv) Freedom of Association:- citizens have the right to form and to participate in independent political organizations, including parties and interest groups. Institutions like these developed in Europe and the United States in various political and historical circumstances, and the impulses that fostered them were not always themselves democratic. Yet, as they developed, it became increasingly apparent that they were necessary for achieving a satisfactory level of democracy in any political association as large as a nation-state. The relation between these institutions and the features of ideal democracy that are realized through them can be summarized as follows. In an association as large as a nation-state, representation is necessary for effective participation and for citizen control of the agenda; free, fair, and frequent elections are necessary for effective participation and for equality in voting; and freedom of expression, independent sources of information, and freedom of association are each necessary for effective participation, an informed electorate, and citizen control of the agenda. Actual Democracies:- since Aristotle's time, political philosophers generally have insisted that no actual political system is likely to attain, to the fullest extent possible, all the features of its corresponding ideal. Thus, whereas the institutions of many actual systems are sufficient to attain a relatively high level of democracy, they are almost certainly not sufficient to achieve anything like perfect or ideal democracy. Nevertheless, such institutions may produce a satisfactory approximation of the ideal – as presumably they did in Athens in the V century BC, when the term democracy was coined, and in the United States in the early XIX century, when Tocqueville, like most others in America and elsewhere, unhesitatingly called the country a democracy. For associations that are small in population and area, the political institutions of direct democracy seem best to approximate the ideal of 'government by the people'. In such a democracy all matters of importance to the association as a whole can be decided on by the citizens. Citizens have the opportunity to discuss the policies that come before them and to gather information directly from those they consider well-informed, as well as from other sources. They can meet at a convenient place – the Pnyx in Athens, the Forum in Rome, the Palazzo Ducale in Venice, or the town hall in a New England village – to discuss the policy further and to offer amendments or revisions. Finally, their decision is rendered in a vote, all votes being counted equal, with the votes of a majority prevailing. It is thus easy to see why direct democracies are sometimes thought to approach ideal democracy much more closely than representative systems ever could, and why the most ardent advocates of direct democracy have sometimes insisted, as Rousseau did in The Social Contract, that the term representative democracy is self-contradictory. Yet, views like these have failed to win many converts. The Value of Democracy:- Why should 'the people' rule? Is democracy really superior to any other form of government? Although a full exploration of this issue is beyond the scope of this article, history – particularly XX-century history – demonstrates that democracy uniquely possesses a number of features that most people, whatever their basic political beliefs, would consider desirable:- (1) democracy helps to prevent rule by cruel and vicious autocrats; (2) modern representative democracies do not fight wars with one another; (3) countries with democratic governments tend to be more prosperous than countries with nondemocratic governments; and (4) democracy tends to foster human development – as measured by health, education, personal income, and other indicators – more fully than other forms of government do. Other features of democracy also would be considered desirable by most people, though some would regard them as less important than (1) through (4) above; (5) democracy helps people to protect their fundamental interests; (6) democracy guarantees its citizens fundamental rights that nondemocratic systems do not, and cannot, grant; (7) democracy ensures its citizens a broader range of personal freedoms than other forms of government do. Finally, there are some features of democracy that some people – the critics of democracy – would not consider desirable at all, though most people, upon reflection, would regard them as at least worthwhile; (8) only democracy provides people with a maximum opportunity to live under laws of their own choosing; (9) only democracy provides people with a maximum opportunity to take moral responsibility for their choices and decisions about government policies; and (10) only in a democracy can there be a relatively high level of political equality. These advantages notwithstanding, there have been critics of democracy since ancient times. Perhaps the most enduring of their charges is that most people are incapable of participating in government in a meaningful or competent way because they lack the necessary knowledge, intelligence, wisdom, experience, or character. According to Plato, for example, the best government would be an aristocracy of 'philosopher-kings' whose rigorous intellectual and moral training would make them uniquely qualified to rule. The view that the people as a whole are incapable of governing themselves has been espoused not only by kings and aristocratic rulers but also by political theorists (Plato foremost among them), religious leaders, and other authorities. The view was prevalent in one form or

another throughout the world during most of recorded history until the early XX century, and since then it has been most often invoked by opponents of democracy in Europe and elsewhere to justify various forms of dictatorship and one-party rule. No doubt there will be critics of democracy for as long as democratic governments exist. The extent of their success in winning adherents and promoting the creation of nondemocratic regimes will depend on how well democratic governments meet the new challenges and crises that are all but certain to occur. Problems and Challenges:- at the beginning of the XXI century, democracy faced a number of challenges, some of which had been problems of long standing, others of which were of more recent origin. Inequality of Resources:- although decentralized market economies encouraged the spread of democracy, in countries where they were not sufficiently regulated such economies eventually produced large inequalities in economic and social resources, from wealth and income to education and social status. Because those with greater resources naturally tended to use them to influence the political system to their advantage, the existence of such inequalities constituted a persistent obstacle to the achievement of a satisfactory level of political equality. This challenge was magnified during regularly occurring economic downturns, when poverty and unemployment tended to increase. Immigration:- after World War II, immigration to the countries of Western Europe, Australia, and the United States, both legal and illegal, increased dramatically. Seeking to escape poverty or oppression in their homelands and usually lacking education, immigrants primarily from the developing world typically took menial jobs in service industries or agriculture. Differences in language, culture, and appearance between immigrant groups and the citizens of the host country, as well as the usually widespread perception that immigrants take jobs away from citizens and use expensive social services, made immigration a hotly debated issue in many countries. In some instances, anti-immigrant sentiment contributed to the rise of radical political parties and movements, such as the National Front in France, The Republicans in Germany, the militia movement in the United States, and the skinhead movement in the United States and Britain. Some of these groups promoted racist or neofascist doctrines that were hostile not only to immigrants but also to fundamental political and human rights and even to democracy itself. Terrorism:- acts of terrorism committed within democratic countries or against their interests in other parts of the world occurred with increasing frequency beginning in the 1970s. In the United States remarkably few terrorist attacks had taken place before the 1993 bombing of the World Trade Center in New York City. The deadliest single act of terrorism anywhere, the September 11 attacks of 2001, destroyed the World Trade Center and killed some 3 000 people, mainly in New York City and Washington, DC. In response to such events, and especially in the wake of the September 11 attacks, democratic governments adopted various measures designed to enhance the ability of police and other law-enforcement agencies to protect their countries against terrorism. Some of these initiatives entailed new restrictions on citizens' civil and political liberties and were accordingly criticized as unconstitutional or otherwise inconsistent with democratic principles. In the early XXI century it remained to be seen whether democratic governments could strike a satisfactory balance between the sometimes conflicting imperatives of ensuring security and preserving democracy. International Systems:- at the end of the XVIII century, in response to the dilemma of size described earlier, the focus of both the theory and the practice of democracy shifted from the small association of the city-state to the far larger nation-state. Although their increased size enabled democracies to solve more of the problems they confronted, there remained some problems that not even the largest democracy could solve by itself. To address these problems several international organizations were established after World War II, most notably the United Nations (1945), and their numbers and responsibilities grew rapidly through the rest of the XX century. These organizations posed two related challenges to democracy. First, by shifting ultimate control of a country's policies in a certain area to the international level, they reduced to a corresponding extent the influence that citizens could exert on such policies through democratic means. Second, all international organizations, even those that were formally accountable to national governments, lacked the political institutions of representative democracy. How could these institutions be made democratic – or at least more democratic? In their struggle to forge a constitution for the new European Union at the beginning of the XXI century, European leaders faced both of these challenges, as well as most of the fundamental questions posed at the beginning of this article. What kind of association is appropriate to a democratic government of Europe? What persons or entities should constitute the European dēmos? What political organizations or institutions are needed? Should decisions be made by majority? If so, by what kind of majority – a majority of persons, of countries, of both countries and persons, or of something else? Do all the conditions necessary for satisfactory democratic government exist in this huge and diverse association? If not, would a less-democratic system be more desirable? Transition, Consolidation, Breakdown:- for many of the countries that made a transition to democracy in the late XX and early XXI centuries, the problems and challenges facing democracy were particularly acute. Obstacles in the path of a successful consolidation of democratic institutions included economic problems such as widespread poverty, unemployment, massive inequalities in income and wealth, rapid inflation, and low or negative rates of economic growth. Countries at low levels of economic development also usually lacked a large middle class and a well-educated population. In many of these countries, the division of the population into antagonistic ethnic, racial, religious, or linguistic groups made it difficult to manage political differences peacefully. In others, extensive government intervention in the economy, along with other factors, resulted in the widespread corruption of government officials. Many countries also lacked an effective legal system, making civil rights highly insecure and allowing for abuse by political elites and criminal elements. In these countries the idea of the rule of law was not well established in the prevailing political culture, in some cases because of constant warfare or long years of authoritarian rule. In other respects the political culture of these countries did not inculcate in citizens the kinds of beliefs and values that could support democratic institutions and practices during crises or even during the ordinary conflicts of political life. In light of these circumstances, it is quite possible that the extraordinary pace of democratization begun in the XX century will not continue long into the XXI century. In some countries, authoritarian systems probably will remain in place. In some countries that have made the transition to democracy, new democratic institutions probably will remain weak and fragile. Other countries might lose their democratic governments and revert to some form of authoritarian rule. Yet, despite these adversities, the odds are great that in the foreseeable future a very large share of the world's population, in a very large share of the world's countries, will live under democratic forms of government that continue to evolve in order to meet challenges both old and new. / , от Латинского слова Affirmo, означающее Утверждаю, . Австрийско-Британский философ Сэр Каль Раймунд Попа (Sir Karl Raimund Popper; 1902–1994). Британский Король Дьжодьж III (King George III (1738–1820); властвовавший в 1760–1820). Английский философ и врач Дьжон Лок (John Locke; 1632–1704), Швейцарско-Французский философ Жо-Жакь Русу (Jean-Jacques Rousseau; 1712–1778). Русу, . , Русу. , Русу. , Русу. Мил (Mill):- в своей работе (On Liberty) (в 1859) Британский философ и политический экономист Дьжон Стюэт Мил (John Stuart Mill; 1806–1873). Американский философ Дьжон Дюи (John Dewey; 1859–1952). Немецкий философ и социальный теоретик Юргэн Хабамас (Jürgen Habermas; 1929–), . . Американский философ Дьжон Бодли Ролз (John Bordley Rawls; 1921–2002). Палацо Дукале (Palazzo Ducale). Под Демократией, от Греческих слов Demos, означающее Народ, и Kratos, означающее Власть, понимается:- (1) форма государственно-политического устройства, которой присущи следующие признаки:- признание воли большинства в качестве источника власти, установление и соблюдение прав и свобод граждан, их равноправия, возможности управлять процессами общественной жизни, выборность основных органов власти, верховенство закона. Возникает в период разложения первобытнообщинного строя вместе с появлением государства. Её конкретно-исторические формы генетически обусловлены способом производства и спецификой социально-политической жизни общества; она ‘служит, в конечном счёте, производству и определяется, в конечном счёте, производственными отношениями данного общества’ (Владимир Ильич Ленин, Том 42, страница 276). Каждая последующая ступень развития общества предоставляет большие возможности для реализации демократических прав и свобод и вместе с тем создаёт известные ограничения для полного воплощения принципов демократии. Существуя в условиях разделения общества на классы, демократия неизбежно носит классовый характер и служит реализации господства того класса, в руках которого находятся средства производства и политическая власть. Демократия зачастую становилась формой диктатуры господствующего класса. (2) В широком смысле слова Демократия – форма организации и функционирования самоуправляющегося общественного организма (понимаемого как отдельный социальный институт, и как определённая сфера общественной жизни), основанная на принципах равного права всех членов общества (организации, коллектива) принимать участие в управлении им, выборности руководящих органов, их подотчётности выборщикам. В этом смысле демократия существует не только в политической сфере, но и в других сферах общественной жизни – в экономике (производственная демократия), в деятельности общественных организаций, не входящих в политическую систему общества. Различают Непосредственную и Представительную Демократии. При первой основные решения принимаются самими избирателями (на народных собраниях, путём референдумов), при второй – выборными учреждениями, например, парламентами. В условиях перестройки на основе восстановления и развития Ленинской концепции взаимосвязи демократии и социализма должно произойти коренное изменение всей системы общественных отношений, преодолено отчуждение трудящихся от собственности, от самого процесса труда, управления и духовных ценностей. Этому призвана служить политическая реформа, основная цель которой – радикальная демократизация всей политической системы, утверждение социалистического самоуправления народа, то есть власти трудящихся, действующей в их интересах и осуществляемой ими же самими. Обновление социализма требует нового видения демократии и серьёзных усилий по реализации её потенциала не только в политической, но и в других областях общественной жизни. В центре этих усилий – повышение роли личности в обществе, превращение каждого труженика в реального собственника средств производства, жизненно заинтересованного в эффективной и качественной работе, в выработке и выполнении управленческих решений, в контроле за деятельностью руководителей. Этим же целям соответствуют и новая концепция централизма, и курс на повышение роли Советов, трудовых коллективов и общественных организаций, чёткое разграничение прав и функций государственных органов разного уровня, укрепление правопорядка, формирование социалистического правового государства. На подъём творческой активности масс и перестройку общественного сознания направлено развитие гласности, критики и самокритики, требование безусловного учёта общественного мнения при выработке решений и других форм демократизации духовной жизни.

DEMONSTRATION PLOT = ДЕМОНСТРАЦИОННЫЙ УЧАСТОК – Demonstration Plot is a plot that shows the characteristics or evidence for the local people to observe; planted specifically as a demonstration at a research station. / Под Демонстрационным Участком, от Латинского слова Demonstratio, означающее Показывание, понимается .

DEMOUNTABLE BOX PALLET = РАЗБОРНЫЙ ЯЩИЧНЫЙ ПОДДОН (или ДЕМОНТИРУЕМЫЙ ЯЩИЧНЫЙ ПОДДОН) – Demountable Box Pallet is a box pallet with removable sides. / Разборный Ящичный Поддон:- ящичный поддон со съёмными стенками.

DEMOUNTABLE CAGE PALLET = ДЕМОНТИРУЕМЫЙ КЛЕТЬЕВОЙ ПОДДОН (или ДЕМОНТИРУЕМЫЙ СЕТЧАТЫЙ ПОДДОН) – Demountable Cage Pallet is a cage pallet with removable sides.

DEMOUNTABLE POST PALLET = ДЕМОНТИРУЕМЫЙ СТОЕЧНЫЙ ПОДДОН (или РАЗБОРНЫЙ СТОЕЧНЫЙ ПОДДОН, или ПОДДОН С ДЕМОНТИРУЕМЫМИ СТОЙКАМИ) – Demountable Post Pallet is a post pallet with removable posts. / Поддон С Демонтируемыми Стойками или Разборный Стоечный Поддон – стоечный поддон со съёмными стойками.

DEMULSIBILITY = ДЕЭМУЛЬГИРУЕМОСТЬ – Demulsibility is the ability of a fluid that is insoluble in water to separate from water with which it may be mixed in the form of an emulsion. / Деэмульгируемость – степень неустойчивости эмульсий; способность нефти или масла выделяться из эмульсии или отделяться от воды. Деэмульгирование, процесс, обратный эмульгированию, разрушение эмульсий, то есть дисперсных систем, состоящих из двух несмешивающихся жидкостей, одна из которых в виде мелких капель равномерно распределена в объёме другой. Капли эмульсии при деэмульгировании укрупняются вследствие коалесценции (слияния) в процессе Броуновского движения, седиментации (оседания) или перемешивания. Деэмульгирование приводит к полному или частичному расслоению образующих эмульсию жидкостей. Деэмульгирование происходит, когда действие стабилизаторов эмульсий (эмульгаторов) перестаёт быть эффективным, то есть образуемые ими на поверхности капель защитные оболочки разрушаются или теряют способность предотвращать коалесценцию. В промышленности и в лабораториях деэмульгирование осуществляют механическими методами (центрифугированием, фильтрацией через пористые материалы, перемешиванием), нагреванием или вымораживанием, воздействием электрического поля, высаливанием (введением электролитов), а также введением специальных реагентов – деэмульгаторов, которые нейтрализуют действие эмульгаторов, реагируя с ними химически, или вытесняют их с поверхности капель эмульсии. Деэмульгаторами обычно служат поверхностно-активные вещества, обладающие более высокой, чем эмульгаторы данной эмульсии, поверхностной активностью, но меньшей стабилизующей способностью. Деэмульгирование широко используют при обезвоживании и обессоливании сырой нефти, во многих процессах химической технологии, при получении сливочного масла и так далее.

DEMULSIFIER = ДЕЭМУЛЬГАТОР – Demulsifier is an additive that promotes oil-water separation in lubricants that are exposed to water or steam. / Деэмульгаторы в нефтедобыче, вещества, способствующие разрушению эмульсий, образовавшихся из нефти и воды. При введении в эмульсию деэмульгаторы адсорбируются на поверхностном слое частиц дисперсной фазы (так называемых Глобул), образуя вокруг глобул новый слой, насыщенный деэмульгатором, который обладает меньшей механической прочностью. Благодаря этому при столкновении глобул облегчается их слияние и разрушение эмульсии. Теория разрушения эмульсий разрабатывалась в бывшем Союзе Советских Социалистических Республик (СССР) школой академика

Пётра Александровича Ребиндера (1898–1972), в Соединённых Штатах Америки (США) Орвином Лангмиром (Irving Langmuir; 1881–1957). Главные потребители деэмульгаторов (десятки тысяч тонн (т) в год) – нефтяные промыслы и нефтеперерабатывающие заводы, где деэмульгаторы применяются для обезвоживания и обессоливания нефти. Расход деэмульгаторов при разрушении эмульсии типа 'вода в нефти' колеблется от нескольких десятков до нескольких сотен граммов (г) на 1 т эмульсии. Деэмульгаторы для разрушения эмульсии типа 'вода в нефти' обычно представляют собой неионогенные поверхностно-активные вещества, синтезированные на основе окиси этилена и окиси пропилена.

DEMURRAGE = ДЕМЕРЕДЖ (или КОНТРСТАЛИЙНЫЕ, или СБОР ЗА ЗАДЕРЖКУ СВЕРХ СРОКА СТАЛИИ) – Demurrage:- the sum agreed by charter to be paid as damages for delay beyond the stipulated time for loading or discharging. It should be collected daily by the master or agent. The term is sometimes used in hull insurance practice to refer to loss of hire money. A charge assessed for detaining a container, freight car, truck or other vehicle beyond the freetime stipulated for loading or unloading. Demurrage is a compensation (as liquidated damages) for delay in removing cargo from terminal facilities. Excess time taken for loading or unloading a vessel. Demurrage refers only to situations in which the charter or shipper, rather than the vessel's operator, is a fault. Demurrage is a fee levied by the shipping company upon the port or supplier for not loading or unloading the vessel by a specified date agreed upon by contract. Usually, assessed upon a daily basis after the deadline. Additional charge imposed for exceeding the free time included in the freight rate for the use of equipment. Demurrage is a penalty charge against shippers or consignees for delaying the carrier's equipment beyond the allowed free time. The free time and demurrage charges are set forth in the charter party or freight tariff. See also Despatch, Detention, Dispatch, and Per Diem. Money paid to shipper for occupying port space beyond a specified free time. The detention or delay of a vessel in loading or unloading beyond the time agreed upon. Demurrage charges are usually incurred for any delay. / хозяином (или капитаном) или агентом. Срок обождания (простой) или задержка судна при погрузке или разгрузке сверх оговорённого времени. Сборы демередж или контрсталийные обычно взимаются в отношении любой задержки. Под Демереджем или Контрсталийными понимается денежная сумма, уплачиваемая перевозчику за простой судна под погрузкой/выгрузкой сверх установленных сроков погрузки/выгрузки по вине фрахтователя/грузополучателя.

DEMURRAGE/DESPATCH MONEY = ДЕНЬГИ В СЧЁТ ДЕМЕРЕДЖА/ДИСПАЧА – Demurrage/Despatch (DEMDES) Money:- under vessel chartering terms, the amount to be paid if the ship is loading/discharging slower/faster than foreseen. Demurrage/Despatch Money:- owed when chartered vessel unloads cargo faster/slower than forseen. Demurrage and Despatch:- 'Other days are sometimes given also favour of the charterer, which are called Demurrage Days. Those are days beyond the lay day but during which the amount that he has to pay for the use of the ship is a fixed sum, necessarily what it costs the owner to keep his ship, but a fixed sum, which is usually about what it is supposed it costs the owner to keep the ship. This stipulation also is in favour of the charterer, because instead of being involved in a dispute as to what he would have to pay for days during which the ship is kept idle, a sum is fixed, and he knows what he has to pay if he keeps the ship beyond the lay days. Those are the 'demurrage days'. If he keeps the ship beyond the lay days, when he pays nothing, and only the number of demurrage days, he pays a fixed sum for demurrage. If he keeps the ship after that, it is a question of damages, and he does not know what he has to pay until the question is settled by tribunal or by agreement. (Per Lord Esher in Nielsen v Wait (1885) 16 QBD 67 at pp.70-71)'. When a laytime (certain amount of time agreed between the owner and the charterer for loading and discharging operations during which the charterer does not pay for the use of the ship) is exceeded the charterers are in breach of the charterparty contract. As a result of this breach the charterer becomes liable in liquidated damages, as contractually agreed, by way of demurrage. A marine adventure by its nature has always been exposed to the risk of being prevented, impeded or delayed by a variety of causes beyond the control of either party, therefore often:- 'It may be … that the breach arises without what one might call fault on their part but the ultimate question is what does this charter-party provide are the respective liabilities of owners and charterers .... (By Roskill J in The President Brand (1967) 2 Lloyd's Rep 338)'. Thus, from a commercial point of view it is not so important to know that the risk should be borne by one party rather than by the other, what really matter is that it should be accurately defined, at the time the charterparty is made, by which of them it will be borne. Stipulation as to demurrage is introduced into a charterparty for the benefit of both the charterer and the owner, i.e. the owner receives an additional payment (based on the current freight rate) for the delay beyond the laydays and cannot withdraw the ship from the service, so the charterer is entitled to keep the vessel for agreed period or, if not agreed, as long as it will not commercially frustrate the adventure, as Scrutton LJ said in Inverkip Steamship Company, Limited v Bunge & Co. (1917) 2 K.B. 193 at p.201:- 'To enable the ship to abandon the charter without the consent of the charterer I think the shipowner must show either such a failure to load as amounts to a repudiation of or final refusal to perform the charter, which the shipowner may accept as a final breach and depart claiming damages – Mersey Steel and Iron Co. v. Naylor, Benzon & Co. (1884) 9 App. Cas. 434, 439 – or such a commercial frustration of the adventure by delay under the doctrine of Jackson v Union Marine Insurance Co. (1874) LR 10 CP 125 as puts an end to the contract'. When instead of number of laydays permitted for loading and discharging the contract requires to load and discharge with customary despatch, demurrage will not accrue unless the charterer fails to do all they reasonably could to discharge the vessel. Demurrage rate varies with the rate for the freight, therefore if freight rates are high then demurrage rates are also high. Prolonged delays can bring this sum to some significant amount; hereof provisions for laytime and demurrage are of utmost importance to both parties. Therefore most of voyage charter forms, when dealing with demurrage, do not limit the demurrage period. One of the few which did limit was the Gencon 76. Clause 7 (Demurrage) provided that 'Ten running days on demurrage at the rate stated … per day or pro rata for any part of a day, payable day by day, to be allowed merchants altogether at ports of loading and discharging'. In the latest revision of this form the Gencon 94 these references have been deleted.When the charterer complete loading or discharging before the laytime has expired so that the vessel is available to the owner earlier than if the charterer's full laytime entitlement had been used, the owner may to be liable to pay dispatch money to the charterers if, but only when there is a special clause in the charterparty to this effect. Such clauses in more or less similar wording (see below) are often found in dry cargo voyage charters. Norgrain 89 (Code Name for the North American Grain Charterparty 1973):- Demurrage/Despatch Money 20:- 'Demurrage at loading and/or discharging ports is to be paid at the rate of … per day or pro rata for part of a day and shall be paid by Charterers in respect of loading port(s) and by Charterers/Receivers in respect of discharging port(s). Despatch money to be paid by Owners at half the demurrage rate for all laytime saved at loading and/or discharging ports'. Commercial background of monetary value of despatch payment as a half of the demurrage rate has been explained by Donaldson J. in Navico A.G. v Vrontados Nafiki Etairia P.E. (1968) 1 Lloyd's Rep. 379 at p. 383:- 'Since the shipowners may have difficulty in obtaining another engagement at short notice or in advancing the date of the ship's next voyage, he stands to gain less by unexpected expedition in loading and discharging than he stands to lose by delay. Accordingly dispatch is usually payable at half the demurrage rate'. / По Лорду Эшё (Per Lord Esher) в деле Нилсэна против Вэйта (Nielsen v Wait) (1885) 16 QBD 67 at pp.70-71)'. Роскилом Дьжей. (Roskill J) в Зи Прэзидэнт Брэнд (The President Brand) (1967) 2 Lloyd's Rep 338)'. Скратэн Эл.Дьжей. (Scrutton LJ) говорил в деле Инвёкип Стимшип Кампэни, Лимитид против Бандьж Энд Ко. (Inverkip Steamship Company, Limited v Bunge & Co.) (1917) 2 K.B. 193 at p.201:- Мёзи Стил энд Айэн Ко. против Нэйло, Бэнзэн Энд Ко. (Mersey Steel and Iron Co. v. Naylor, Benzon & Co.) (1884) 9 App. Cas. 434, 439 – или в деле Дьжяксэна против Юниэн Морин Иншурэнс Ко. (Jackson v Union Marine Insurance Co. (1874) LR 10 CP 125). Ногрэйн 89 (Norgrain 89). Донэлдсэн Дьжей.

(Donaldson J.) в Навико А.Ге. (Navico A.G.) против Вронтадос Нафики Этайриа Пэ.Э. (Vrontados Nafiki Etairia P.E.) (1968) 1 Лойдз (Lloyd's).

DEMUTUALISING = АКЦИОНИРОВАНИЕ (или ПОТЕРЯ ВЗАИМНОГО СТАТУСА) – In the United Kingdom, Demutualising is a process by which a mutual society is converted into a public limited company. Originally building societies and insurance companies were mutual organizations. In a mutual, savers and policyholders are the equivalent of shareholders:- they are the members of the organization, and any profits belong to them. In practice mutuals did not make great efforts to distribute profits to its members – a useful definition of a mutual is an organization run for the benefit of management. Demutualising means listing the company on the stock market. The most common reason given for demutualising is that the company will obtain access to capital, allowing it to grow and compete, and thus provide its members with better value. But you can be justifiably cynical here and point out that the division of profits between shareholders and savers/policyholders has to mean that you will get less. In order to prevent such awkward questions, demutualising companies pay bribes, known as Bonuses, to their members. These are of course only a share of the society's profit, so they already belong to you. But the money is locked up in the society, and it usually takes a demutualisation to release it. Although some committed mutuals are now passing profits to savers and borrowers in the form of better rates, most people prefer bonuses in the hand to benefits in the bush. / преобразование общества взаимного страхования в акционерное страховое общество.

DENATURED FUEL ETHANOL = ДЕНАТУРИРОВАННЫЙ ТОПЛИВНЫЙ ЭТАНОЛ (или ДЕНАТУРИРОВАННЫЙ ТОПЛИВНЫЙ ЭТИЛОВЫЙ СПИРТ) – Denatured Fuel Ethanol is ethanol intended for blending with unleaded or leaded gasoline for use as a spark-ignition automotive engine fuel. Denaturants used for blending with fuel ethanol include natural gasoline, gasoline components, or unleaded gasoline at the minimum concentration prescribed. Must conform to standard specification ASTM D4806 plus California Standards. Denatured Ethanol Fuel futures are traded from 2005-April-08 at the CBOT® under ticker symbol EH. Contract size is 29 000 gallons (approximately one railcar) quoted in US Dollars and Cents per gallon, to be delivered all calendar months. Settlement is done by physical delivery. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Денатураты используются для смеси с топливным этанолом . СИБАТ® (CBOT®). Денатурат или Денатурированный Этиловый Спирт – этиловый спирт-сырец, содержащий добавки красителя, окрашивающего спирт в сине-фиолетовый цвет, и специальных веществ, придающих ему неприятные запах и вкус. Растворитель лаков и политур. Ядовит.

DENATURED PROTEIN = ДЕНАТУРИРОВАННЫЙ БЕЛОК – Denatured Protein is a protein whose properties have been altered by treatment with physical or chemical agents. / , от Латинских слов De, означающее:- (i) Отмена или Отсутствие или Устранение Чего-Либо (например, дегазация, дезориентация, демобилизация); и (ii) Движение Вниз или Понижение (например, девальвация), и Natura, означающее Природные Свойства, понимается .

DENATURING GRADIENT GEL ELECTROPHORESIS = ЭЛЕКТРОФОРЕЗ В ДЕНАТУРИРУЮЩЕМ ГРАДИЕНТНОМ ГЕЛЕ – Denaturing Gradient Gel Electrophoresis (DGGE) is a method to separate DNA or proteins by altering the pH inside a gel. As the molecules migrate in the electric field, they encounter denaturing conditions, which slow down their mobility. Different molecules respond differently to the denaturation condition and therefore respond at a different severity of denaturant (resulting in a loss of mobility at a different point in the gel).

DENIER = ДЕНЬЕ (или ДОНЬЕ) – (1) Denier is a system of measuring the weight of a continuous filament fiber. In the United States, this measurement is used to number all manufactured fibers (both filament and staple), and silk, but excluding glass fiber. The lower the number, the finer the fiber; the higher the number, the heavier the fiber. Numerically, a denier is the equivalent to the weight in grams of 9 000 meters of continuous filament fiber. Denier is a metric system method of measuring fibers. It is the weight in grams of 9 000 meters of the fiber. The Denier system is a direct-management type, employed internationally to measure the size of silk and man-made filaments and yarns, and derived from an earlier system for measuring silk filaments (based on the weight in drams of 1 000 yards). Denier number indicates the weight in grams of 9 000 meters of filament or filament yarn. For example, if 9 000 meters of a yarn weigh 15 grams, it is a 15-denier yarn; if 9 000 meters of a yarn weigh 100 grams, it is a 100-denier yarn, and much coarser than the 15-denier yarn. Thus a smaller number indicates a finer yarn. This system is not convenient for measurement of staple yarns because their greater weight would require the use of very large numbers. Three methods are used to find denier yarn sizes and the yards per pound of yarn for silk and man-made filaments with relation between a given length and given weight. These follow:- (i) Standard Yardage Method, (ii) Thousand Meters-Units Per Kilogram Method, and (iii) Gram Method. Denier is a unit of weight indicating the fineness of fiber filaments and yarns, both silk and synthetic, and equal to a yarn weighting one gram per each 9 000 meters; used especially in indicating the fineness of women's hosiery. The abbreviation for this is 'd' or 'D'. A traditional unit of yarn density. One denier is the density of a thread having a mass of 1 gram per 9 000 meters of length (Gram Method). The metric unit of yarn density is the tex; 1 denier equals 1/9 tex or 10/9 decitex. Denier is a weight-per-unit-length measure of any linear material. Officially, it is the number of unit weights of 0.05 grams per 450-meter length. This is numerically equal to the weight in grams of 9 000 meters of the material. Denier is a direct numbering system in which the lower numbers represent the finer sizes and the higher numbers the coarser sizes. In the United States (US), the denier system is used for numbering filament yarns (except glass), manufactured fiber staple (but not spun yarns), and tow. In most countries outside the US, the denier system has been replaced by the tex system. The following denier terms are in use:- (i) Denier Per Filament (dpf), (ii) Total Denier, and (iii) Yard Denier. Weight of a man-made fiber or yarn, expressed as the weight in grams of 9 000 meters of the thread. The lower the number, the finer the thread. Denier is a unit of measure by which silk yarn is weighed and its fineness calculated. This unit expresses the linear mass density of silk filaments (or manmade fibers and yarns) given by weight / mass in grams per 9 000 meters of material. In the International System of Units, the Tex is used instead of denier. Unit of measurement of the fineness of silk yarn; the denier is the weight of a certain length of yarn, varying from 450 to 500 meters in different localities. Denier is a technical term referring to a unit of yarn number equal to the weight in grams of 9 000 meters of the yarn. It is used for silk and man-made yarns in hosiery as a description of sheerness.The lower the denier number, the more sheer the stocking, panty hose, or garment. For instance, 40 denier hose are much finer and more sheer than 60 denier hose. Denier:- in yarns, the measure of the yarn count as applied to continuous-filament rayon or silk, the numerical value being the weight in grams of 9 000 meters. This term is also used as a measure of the size of the individual filaments in continuous filament yarns or in rayon staple. Denier:- the weight, in grams, of 9 000 meters of yarn. The lower the denier number the finer the size of yarn, and the higher the number the larger the size of yarn. In countries other than the USA, Denier is replaced by the Tex system. Yarn Denier is the denier of filament yarn. It is the product of the denier per filament and the number of filaments in the yarn. Total Denier:- the product of the denier per filament and the number of filaments in the tow. Denier is the unit of fineness for rayon, nylon, and silk, based on a standard mass per length of 1 gram per 9 000 meters of yarn. / Найлан (Nylon). филаментная (комплексная) пряжа (filament yarn). при указании тонины женских чулочных изделий. Официально, это число единиц веса в 0.05 грамма на 450 метров длины. Вес искусственного волокна или пряжи, выраженный как вес в граммах 9 000 метров нити. Более низкий номер соответствует более тонкой нити. Под Денье понимается единица измерения линейной плотности нити (волокна); равна массе 9 000 метров (м) нити в граммах (г). Денье – весовой номер волокна, титр волокна.

(2) Denier is a traditional French weight unit, comparable to the English pennyweight. Like the pennyweight, the denier is equal to 24 grains (1.275 grams). This unit was also called the Scrupule. / Денье, эта единица известна также как Скрупул (Scrupule), от Латинского слова Scrupulum, от Scrupulus, означающее Маленький Острый Камешек, единица вышедшего из употребления аптекарского веса. В Британской Империальной Системе 1 Скрупул = 1/3 Драхмы = 20 гранам = 1.295 98 грамма. Русский аптекарский скрупул равнялся 1.244 грамма и использовался в качестве единицы массы до введения Метрической Системы Мер.

DENIER PER FILAMENT = ДЕНЬЕ НА ЭЛЕМЕНТАРНУЮ НИТЬ – Denier Per Filament (DPF) is the size of an individual filament, or an individual staple fiber if it were continuous. The dpf is determined by dividing the yarn denier per filament by the number of filaments in the yarn. Denier Per Filament (dpf):- the denier of an individual continuous filament or an individual staple fiber if it were continuous. In filament yarns, it is the yarn denier divided by the number of filaments.

DENIER VARIATION = ВАРИАЦИЯ ПО ДЕНЬЕ (или ИЗМЕНЧИВОСТЬ ПО ДЕНЬЕ) – Denier Variation:- usually variation in diameter, or other cross-sectional dimension, along the length of a filament or bundle of filaments. It is caused by malfunction or lack of process control in fiber manufacturing and degrades resulting fabric appearance or performance.

DENIM = ДЁНИМ (или ДЖИНСА, или ДЖИНСОВАЯ ТКАНЬ, или ДЖИНСОВКА) – Denim:- this staple cotton cloth is rugged and serviceable, and is, recognized by a left-hand twill on the face. Coarse, single yarns are used most, but some of the cloth used for dress goods may be of better quality stock. A 2-up and 1-down (2/1) or a 3-up and 1-down (3/1) twill may be used in the weave formation. Standard denim is made with indigo-dyed warp yarn and a gray or mottled white filling. It is the most important fabric in the work-clothes group and it is used for overalls, coats, jumpers, caps. Denim is also popular in dress goods in the women's wear field and has even been used as evening wear. Popular also in the upholstery and furniture trades. Sample:- 3/1 Twill, 7's x 6's, 64.1 x 41T. Denim is a firm 2 x 1 or 3 x 1 twill-weave fabric, often having a whitish tinge, obtained by using white filling yarns with colored warp yarns. Heavier weight denims, usually blue or brown, are used for dungarees, work clothes, and men's and women's sportswear. Lighter weight denims with softer finish are made in a variety of colors and patterns and are used for sportswear and draperies. Denim is a type of cotton textile, known for its use in blue jeans and other clothing. Denim uses a sturdy twill weave with a characteristic diagonal ribbing. Originally used for workmen's clothes, denim is now ubiquitous and has even entered the world of high fashion. Nearly everyone has at least one denim garment in the closet these days. Levi Strauss is credited with making the first blue jeans out of denim in the 1850s, for gold miners in California. In the 1930s and 1940s, commercially sold denim workwear became very popular, with new companies such as Dickies and Wrangler joining the trend. Comfortable, durable, and associated with blue collar culture, denim soon became fashionable among the working class youth throughout the United States. Denim jackets became a fashion statement in the 1950s along with jeans. Throughout the decades, denim continued to gain a wider market. By the 1970s, women were wearing denim as often as men, and denim skirts and dresses could be found in numerous styles. In the 1980s, designer jeans were the rage, and a style once associated with the working class was updated for affluent yuppies. Though denim is still considered a casual material, it is not usually worn for more formal occasions, it is not unusual to see people sporting jeans at high end night clubs, and many designer denim garments cost in the hundreds of US Dollars (USD). Denim was originally dyed blue with indigo hence the characteristic color of 'blue jeans'. While blue remains a popular color for denim, the fabric can be found today in nearly any color imaginable. Denim is also available in cotton blends, though it is traditionally 100% cotton. Some denim blends add a bit of Lycra or spandex to create stretch denim. The earliest denim manufacturers, including Levi and Dickies, still dominate the market, though haute couture designers like Calvin Klein are also well-known for their denim garments. True Denim is a twill weave cotton-like fabric made with different colored yarns in the warp and the weft. Due to the twill construction, one color predominates on the fabric surface. Denim is a strong, medium-weight, single-cloth fabric, weighing from 4% to 5 ounces per yard and composed of single cotton yarn in warp and filling. It is usually made with a small, uneven-sided twill weave, such as I–45° twill, and in solid color warp effects, generally indigo blue or dart brown, and white filling. White selvedge is used in all grades. A grade known as Covert Cloth is made of twist yarn in the warp, and dark colored, single filling. The twist yarns are usuallly blue and white and the cloth of a similar texture to that of the regular denim. In effect denim is a stout, twilled fabric, having excellent wearing qualities, and is made to sell at 10c. to 15c. per yard, retail. It is used principally in the manufacture of overalls, to be worn by workmen who operate machinery, or by those who perform hard, rough labor of any description. Denim can be woven in any singie box Toller loom, such as Mason, Lowell, Lewiston, Colvin, etc, the warp being prepared on the slasher, in the same manner as a sheeting warp. It is cnen drawn in on the harness or hoddles, in accordance with weave desired. The finish of this fabric is a rather heavy sizing, after which the goods are dried and pressed. Denim is sometimes dyed in the piece, in light shades of tan, blue, etc, and the goods made up into summer outing skirts for ladies' wear. 'Sergedenim' and 'Searge Denim' were advertised in Boston and Harford newspaper in the 1770's. Production Techniques in 1910:- Carding and Spinning Particulars:- denim is constructed of yarns that are made in either the first or second divisions of mills as given in a previous lesson. In the second divison of mills the raw stock would be run through a bale breaker, as this class of mills would undoubtedly contain this machine in their equipment. In the first division of mills the mixing would be done by hand. When bale breakers are used, it is of great advantage to have a blower in connection with them. This Mower is generally placed at the delivery end of the machine and blows the cotton, after it has passed through the bale breaker, through trunking onto an endless lattice which deposits it in the mixing bins. A blower is of advantage because it opens the cotton and the current of air helps to dye it and the cotton does not have to dry out in the mixing bins as is the case when a blower is not used. Mixing is a very important part of the card room and too little attention is generally given to it. It will be understood that if the cotton is not properly mixed, this defect cannot be remedied at any subsequent machine. Denim is a well-known basic cotton or blended fabric in a right- or left-hand woven twill. Generally, the warp is dyed blue with a weft. Denim is a cotton twill weave fabric made of single hard-twisted yarns. The staple type has colored warp and white or undyed filling thread. When the fabric (and the look) became popular, the name denim was given to many other types of fabric, including cross-dyed fabrics and brushed fabrics, both knit and woven, that resemble true denim. Most jeans are made of denim and the most popular and traditional denim color is blue. Sports denim is softer and lighter in weight. It is now available in many colors, and in plaids and stripes. Woven-in stripes and plaids are popular for draperies, upholstery, and bedspreads. Denim is a rugged, cotton twill textile, in which the weft passes under two or more warp fibers. This produces the familiar diagonal ribbing identifiable on the reverse of the fabric. It is typically used for jeans and jackets, but can be combined with Lycra to add stretch. Manufacturing Process of Denim:- the term 'Denim' has originated from the city of Nimes in France where 'serge de Nimes' was manufactured. Denim is made from a vat dye, the Indigo dye, which is applied to cotton fabric in loosely held form in layers. As far as manufacturing process of denim is concerned, it is similar to that of gray fabric up to the process of weaving with the only difference that in case of Denim Fabric, it is dyed at the stage of sizing where as in case of Gray Fabric, the decision regarding dyeing stage depends upon the finished product. Spinning:- the initial processes of denim manufacturing consist of the regular activities of opening and blending of cotton fibers. Carding is done to remove any foreign matter and the short fibers so that cotton takes the form of a web which is then converted into a rope-like form, the sliver. Then drawing process produces a single, uniform sliver from a number of carded slivers. Yarn is then spun through Open-End Spinning or Ring Spinning. Roving is also carried on, if the spinning has to be done through Ring Spinning. Generally, denim fabric are 3/1 warp-faced twill fabric made from a yarn dyed warp and an undyed weft yarn. Normally dyed and Grey ring or open- end

yarns are used in warp and weft respectively. Traditionally speaking, the warp yarn is indigo dyed. Warp Preparation – Dyeing and Sizing Processes:- warp yarns are indigo dyed and sized with the help of two methods:- (i) threads from several back beams are combined to form a warp sheet and dyed and sized on the same machine; and (ii) threads, about 350–400 in number are formed into ropes. 12–14 ropes run adjacent to each other through the continuous dyeing unit. After dyeing, the ropes are dried on drying cylinders and then collected in a can. After that, a worker's beam is prepared. Sizing is then done in the conventional manner. There are various dyeing and sizing processes, which can be classified into four categories:- (i) Continuous Indigo-Rope dyeing and sizing; (ii) Continuous Indigo dyeing and sizing; (iii) Indigo-back beam dyeing and sizing; and (iv) Continuous dyeing and sizing. Continuous Indigo-Rope dyeing and sizing:- the yarn coming out from the ring frames is wound into cheeses or cones and then placed on the ball warper on which 350–400 threads are formed into a rope and are cross wound to a ball in accordance with the length of warp beam. During this process, lease bands are inserted at particular intervals as they are required for further processing on Long Chain Beamer. Based on the size of the rope dyeing plant, 12–24 ropes, at a time, are dyed, oxidized, dried and placed in large containers. These ropes are then opened on the Long Chain Beamer through tension roll and expansion comb and wound on to a back beam. Back beams are then sized and the sized warp is then woven. This system is commonly used in the United States. Continuous Indigo dyeing and sizing:- in this process, back beams are processed on the dyeing/sizing machine instead of ropes. The warp is dyed, oxidized, dried and sized at a one go. Although this process is less cumbersome, the risk of individual thread breakage is greater than dyeing in rope form. This method is commonly used in the European countries. Indigo-back beam dyeing and sizing:- dyeing and sizing is done in two stages in this method. In the first stage, back beams are dyed, oxidized, dried and wound on a batch roll. The batch roll is then sized, dried and wound on a weaver's beam. Continuous dyeing and sizing:- although glass is hard and rigid yet it can be transformed into fine, translucent and flexible Glass Fiber, commonly known as Fiberglass. It is very glossy in appearance and feels like silk. There are two methods for glass fiber manufacturing, Continuous Filament Process and Staple Fiber Process. Apart from being glossy and flexible, glass fiber is also heat resistant. Due to its many qualities, this fiber is widely used for home furnishings, apparels and many other industrial purposes. It's really very interesting to know about the whole process of Glass Fiber Manufacturing. Weaving:- the weaving process interlaces the warp, which are the length-wise indigo dyed yarn and the filling, which are the natural-colored cross-wise yarn. The warp thread is in the form of sheet. The weft thread is inserted between two layers of warp sheets by means of a suitable carrier, such as Shuttle, Projectile, Rapier, Air current, Water current, etc. The selection of carrier depends upon the type of weaving machinery used. The two different technologies available for weaving machines are – Conventional Shuttle Weaving System which is done by Ordinary Looms or Automatic Looms; and the Shuttle less Weaving System which is done by Airjet, Waterjet, Rapier, or a Projectile weaving machine. The Conventional Shuttle loom results in lesser production due to slow speed and excessive wear and tear of machinery. As such, now denim is generally woven through Shuttle less Weaving System namely, airjet looms, rapier looms or projectile looms. Finishing:- the final woven fabric, wound on a cloth roll, is taken out from weaving machines at particular intervals and checked on inspection machines so that any possible weaving fault can be detected. In this quality control exercise, wherever any fault is seen, corrective measures are taken then and there only. The woven Denim Fabrics then goes through various finishing processes, such as brushing, singeing, washing, impregnation for dressing and drying. Brushing and singeing eliminate impurities and help to even the surface of denim fabric. Dressing regulates the hand and rigidity of the fabric while compressive shrinking manages its dimensional stability. The standard width denim fabrics is then sent for making up. In this process, the fabric is cut into the desired width according to the size required. The made-up denim fabric is then thoroughly checked for defects such as weaving defects, uneven dyeing, bleaching and dyeing defects, oil stains, or patches. After inspection, the final product is categorized quality-wise. The fault less fabrics are sent to the packaging department while the defective ones are sent for further corrections. Denim is a relatively heavy, yarn-dyed twill fabric traditionally made of cotton with color warp yarns and undyed fill yarns. Most denim fabric is used to make trousers. Denim is a name derived from French 'Serge de Nimes'. Originally had dark blue, brown or dark grey warp with a white or gray filling giving a mottled look and used only for work clothes. A firm durable twilled usually cotton fabric. (Plural) overalls or trousers usually of blue denim, namely a firm durable twilled usually cotton fabric woven with colored warp and white filling threads. Twill – right hand – may be L2/1 or L3/1. / масляный развод (или потёк). уточные пряжи. Леви Штраус (Levi Strauss). , с новыми компаниями такими как Дикиш (Dickies) и Рэнглё (Wrangler). Леви (Levi) и Дикиш (Dickies), Кэлвин Клайн (Calvin Klein). ткацкий станок Толя (Toller loom), такой как Мэйсэн (Mason), Лоэл (Lowell), Люистэн (Lewiston), Колвин (Colvin), . В самом начале 1500-х на Юге Франции в городе Ним (Nîmes) освоили и впервые стали изготавливать ткань саржу (по-Французски – Сэрж (Serge)). Дешёвый голубой (blue) краситель из Индии – Индиго (Indigo) доставлялся в Ним в основном из Итальянского порта Генуя (по-Французски – Жени (Gênes)), и именовался во Франции Блю дё Жени (Bleu de Gênes). Из готовой голубой ткани очень скоро стали шить для Генуэзских моряков штаны, а о поставляемой ткани говорили как о Сарже из Нима (по-Французски – Сэрж дё Ним (Serge de Nîmes)). От сюда со временем и пошли сокращённые термины Дёним или Дэним (Denim) и Голубая Дьжин или Джинса (Blue Jean). Смотрите также Дьжин или Джинса или Джинсовка или Джинсовая Ткань (Jean). Хлопчатобумажная ткань с трёхнитным основонастилочным саржевым переплетением. От Кутюр, от Французского Haute Couture, означающее буквально Высокая Мода, . Дёним – первоначальное название хлопчатобумажной джинсовой ткани, плотной и прочной. Её производство было начато в конце XIX века во Франции. У дёнима окрашена только нить основы, а уточная нить – белая. Благодаря такому переплетению лицевая сторона чаще всего синяя или чёрная, а изнаночная – белая. Дёним, от Французских слов Serge de Nimes, означающие Саржа Из Нима, – это грубая, плотная ткань саржевого переплетения. Из дёнима были сшиты первые классические джинсы. История:- многие историки сходятся во мнении, что слово Дёним берёт своё происхождение от Французского города Ним, который славился своими прочными тканями. Около 300 года Нашей Эры во Французском городе Ним изготовляли ткань, которая называлась Serge de Nimes – Саржа из Нима. Саржа, от Латинского слова Sericus, означающее Шёлковый, – это хлопчатобумажная, шёлковая или искусственная ткань с диагональным переплетением нитей. В экспедиции Христофора Колумба паруса на кораблях были пошиты из ткани Serge de Nimes. Ещё в XVI веке в Европе была известна хлопчатобумажная саржа диагонального переплетения под названием Дьжин (Jean). Эту ткань вырабатывали во Франции, в городе Ним (de Nimes), а город Генуя поставлял краситель индиго. Через много столетий из этой ткани стали шить джинсы (изначально спецодежду для ковбоев и золотоискателей). К середине XX века из дёнима уже шили любую одежду и аксессуары (куртки, жакеты, платья, сарафаны, юбки, сумки, береты и так далее). Если раньше одежда из денима считалась прерогативой бедняков, то сегодня из этой ткани шьют даже вечерние платья! Одежда из дёнима в наши дни уместна как на пикнике, так и вечеринке. Исключением станет, пожалуй, лишь офис или предприятие (во многих компаниях одежда из дёнима запрещена правилами дресс-кода). Одежда, аксессуары и даже обувь – из дёнима сегодня изготавливают всё, что угодно. Дёним можно также встретить и в дизайне интерьера. Шанэль (Chanel), Дисэль (Diesel), Стэла МэКатни (Stella McCartney), Кавалли (Cavalli), Эрве Лежи (Hervé Léger) – эти модные дома практически всегда имеют в своих коллекциях одежду и аксессуары из дёнима.

DENITRIFICATION = ДЕНИТРИФИКАЦИЯ – Denitrification is the biochemical reduction and loss of nitrate or nitrite to gaseous nitrogen, either as N_2 or oxides of nitrogen (N_2O, NO, NO_2). / Под Денитрификацией, от Латинского слова De, означающее:- (i) Отмена или Отсутствие или Устранение Чего-Либо (например, дегазация, дезориентация, демобилизация); и (ii) Движение Вниз или Понижение (например, девальвация), Греческого слова Nitron, означающее первоначально – Природная Сода, затем

– Селитра, и Латинского слова Facio, означающее Делаю, понимается восстановление так называемыми денитрифицирующими Бактериями почвы и водоёмов нитратов и нитритов до молекулярного азота или закиси азота. Протекая в условиях высокой влажности и плохой аэрации в почве, денитрификация снижает содержание азота в ней. Обработка почвы, улучшающая её аэрацию угнетает денитрификацию.

DENKS = DUAL EMPLOYED, NO KIDS

DENOMINATION = ДЕНОМИНАЦИЯ – (1) Denomination is a class of units having specified values, such as a system of currency. / Под Деноминацией понимается изменение нарицательной стоимости денежных знаков с целью стабилизации валюты и упрощения расчётов. При проведении деноминации денежные знаки прежних выпусков обмениваются на новые, более крупные денежные единицы. При этом, соответственно, пересчитываются цены, тарифы и заработные платы.

(2) Denomination is the Dollar amount shown on the face of the security. Also known as Face Amount or Face Value. In the case of securities, classification of the security in accordance with the amount of the par value. / В случае с ценными бумагами, классификация ценной бумаги в соответствии с суммой её номинальной стоимости.

DENOMINATION UNIT = ЕДИНИЦА ДЕНОМИНАЦИИ (или НОМИНАЛ, или НАРИЦАТЕЛЬНАЯ СТОИМОСТЬ) – Denomination Unit:- the face value or principal amount for which a bond is made out.

DENSE PANICLE = ПЛОТНАЯ МЕТЁЛКА – Dense Panicle (Dn) is a very crowded arrangement of spikelets on the panicle branches, resulting in a large number of spikelets per unit length of panicle. A panicle that contains many grains close together (a high number of grains per unit area). / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

DENSITOMETER = ДЕНСИТОМЕТР – Densitometer is an instrument designed for measuring optical density of a photographic negative or positive or a printed image; not suitable for colorimetry. / Под Денситометром, от Латинского слова Densitas, означающее Плотность, и Греческого слова Metréō, означающее Измеряю, понимается прибор для измерения оптической плотности (оптической передачи или отражения) таких материалов, как фотоплёнка или фотопластинки. Его применяют в спектроскопии для определения позиции спектральных линий и полос, а также для замера их относительной плотности, а значит и интенсивности. Денситометр – инструмент для измерения оптической плотности печати (денситометры отражённого излучения) и оптической плотности негативов (денситометры пропущенного излучения).

DENSITOMETRY = ДЕНСИТОМЕТРИЯ – Densitometry is a technique for measurement of optical density by use of a densitometer. / Под Денситометрией, от Латинского слова Densitas, означающее Плотность, и Греческого слова Metréō, означающее Измеряю, понимается раздел фотографической сенситометрии, в котором изучаются и разрабатываются способы измерения оптической плотности фотографических слоёв. Приборы, используемые для измерения оптической плотности, называются Денситометрами.

DENSITY = ПЛОТНОСТЬ (или ОБЪЁМНЫЙ ВЕС, или АБСОЛЮТНАЯ ПЛОТНОСТЬ) – (1) Density:- as a measure of physical properties of a substance, the ratio of the mass (weight) of the substance to its volume. Knowing the density of something makes it possible to reasonably approximate a required weight of the substance by measuring volume, which is often more convenient. For example, fine granulated salt may have a density of about 1.25 grams per cubic centimeter. Density is the mass per unit volume (usually expressed as grams per cubic centimeter (g/cc)). See also Specific Gravity. / Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды. Плотность – одна из основных физических характеристик вещества или тела, равная отношению массы dm малого элемента вещества или тела объёмом dV к этому объёму:- $\rho = dm / dV$. Единица плотности в Международной Системе Единиц СИ – кг/м^3.

(2) The mass of wood substance enclosed within the boundary surfaces of a wood-plus-voids complex having unit volume. It is variously expressed as pounds per cubic foot, kilograms per cubic meter, or grams per cubic centimeter, at a specified moisture content.

DENSITY = ПЛОТНОСТЬ (или ГУСТОТА, или КОНЦЕНТРАЦИЯ) – (1) Density:- the mass of a unit volume of a substance. Its numerical value varies with the units used. Density is the mass per unit volume (usually expressed as grams per cubic centimeter (g/cc)). See also Specific Gravity. Density:- as a measure of physical properties of a substance, the ratio of the mass (weight) of the substance to its volume. Knowing the density of something makes it possible to reasonably approximate a required weight of the substance by measuring volume, which is often more convenient. For example, fine granulated salt may have a density of about 1.25 grams per cubic centimeter. / Смотрите также Удельный Вес (Specific Gravity). Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды. Плотность тела или вещества – одна из основных физических характеристик тела или вещества, равная отношению массы dm малого элемента тела или вещества объёмом dV к этому объёму:- $\rho = dm/dV$. Плотность однородного тела или вещества одинакова во всех его точках и равна:- $\rho = m/V$. Плотность неоднородного тела или вещества неодинакова в разных его точках. Средняя плотность тела или вещества равна:- $\rho_{ср} = m/V$. Плотность тела или вещества растёт с увеличением давления и, как правило, убывает с ростом температуры. При переходе вещества из жидкого состояния в газообразное и из твёрдого в жидкое плотность скачкообразно уменьшается (исключение представляют вода и чугун, плотность которых при плавлении увеличивается). Единица измерения плотности в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) – килограмм на кубический метр (кг/м^3). В отношении смазочных масел под плотностью понимается объёмная масса вещества, показатели которой обычно приводятся в кг/м^3 при температуре +15 °C или +20 °C. Плотность смазочных масел находится в диапазоне 700–950 кг/м^3 в зависимости от качества базового масла, густоты и присадок. Под Плотностью Тела понимается одна из основных физических характеристик тела (вещества), равная отношению массы dm малого элемента вещества объёмом dV к этому объёму:- $\rho = dm / dV$. Плотность однородного тела одинакова во всех его точках и равна:- $\rho = m / V$. Плотность неоднородного тела неодинакова в разных его точках; средняя плотность тела $\rho_{СР} = m / V$. Плотность вещества растёт с увеличением давления и, как правило, убывает с ростом температуры. При переходе вещества из жидкого состояния в газообразное и из твёрдого в жидкое. Плотность скачкообразно уменьшается (исключение представляют вода и чугун, плотность которых при плавлении увеличивается). Единица плотности в Международной Системе Единиц СИ – килограмм на кубический метр (кг/м^3). Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды. Плотность (ρ), физическая величина, определяемая для однородного вещества его массой в единице объёма.

Плотность неоднородного вещества – предел отношения массы к объёму, когда объём стягивается к точке, в которой определяется плотность. Отношение плотностей двух веществ при определённых стандартных физических условиях называется Относительной Плотностью:- для жидких и твёрдых веществ она обычно определяется по отношению к плотности дистиллированной воды при 4 °C, для газов – по отношению к плотности сухого воздуха или водорода при нормальных условиях. Средняя Плотность Тела определяется отношением массы тела m к его объёму V, то есть ρ = m/V. Единицей плотности в СИ является килограмм на кубический метр (кг/м^3), в СГС Системе Единиц грамм на кубический сантиметр (г/см^3). На практике пользуются также внесистемными единицами плотности:- грамм на литр (г/л), тонна на кубический метр (т/м^3) и другие. Для измерения плотности веществ применяют плотномеры, пикнометры, ареометры, гидростатическое взвешивание (смотрите Весы Мора). Другие методы определения плотности основаны на связи плотности с параметрами состояния вещества или с зависимостью протекающих в веществе процессов от его плотности. Так, плотность идеального газа может быть вычислена по уравнению состояния ρ = Pm/RT, где P – давление газа, m – его молекулярная масса (мольная масса), R – газовая постоянная, T – абсолютная температура, или определена, например, по скорости распространения ультразвука c = 1 / √βρ (здесь β – адиабатическая сжимаемость газа). Диапазон значений плотности природных тел и сред исключительно широк. Так, плотность межзвёздной среды не превышает 10^{-21} кг/м^3, средняя плотность Солнца составляет 1 410 кг/м^3, Земли – 5 520 кг/м^3, наибольшая плотность металлов – 22 500 кг/м^3 (осмий), плотность вещества атомных ядер – 10^{17} кг/м^3, наконец, плотность нейтронных звёзд может, по-видимому, достигать 10^{20} кг/м^3. Значения плотности некоторых широко используемых веществ и материалов приведены в таблице. Смотрите также Газы, и Металлы. Для пористых и сыпучих тел различают Истинную Плотность (её определяют без учёта имеющихся в теле пустот) и Кажущуюся Плотность (отношение массы тела ко всему занимаемому им объёму). Плотность, как правило, уменьшается с ростом температуры (вследствие теплового расширения тел) и увеличивается с повышением давления. Аномально ведут себя, например, вода, чугун, аморфный кварц. Так, у воды плотность имеет максимальное значение при 4 °C и уменьшается как с повышением, так и с понижением температуры. При агрегатных превращениях вещества плотность изменяется скачком (смотрите Агрегатные Состояния), причём при переходе из жидкого состояния в твёрдое плотность обычно растёт, однако у воды, например, она при затвердевании уменьшается. Под Концентрацией, от новолатинского слова Concentratio, от латинских слов Con (Cum), означающее Вместе или С, и Centrum, означающее Средоточие или Центр, понимается сосредоточение, скопление, насыщенность, объединение. Смотрите Концентрация В Химии, Концентрация Производства. Концентрация в химии, величина, выражающая относительное количество данного компонента (независимой составной части) в физико-химической системе (смеси, растворе, сплаве). Чаще всего применяют следующие способы выражения концентрации:- (i) Долевая Концентрация По Массе (Весовая Долевая Концентрация) – отношение массы данного компонента к массе всей системы; это отношение, умноженное на 100, даёт процентную концентрацию по массе (весовые проценты). (ii) Атомная (Мольная) Долевая Концентрация – отношение числа грамм-атомов (молей) данного компонента к общему числу грамм-атомов (молей) системы; это отношение, умноженное на 100, даёт концентрацию в атомных (мольных) процентах. (iii) Объёмная Долевая Концентрация – отношение объёма данного компонента к общему объёму системы; умноженная на 100, она даёт концентрацию в объёмных процентах. Концентрацию жидких систем часто выражают массой вещества, растворённого в 100 граммах (г) (иногда в 1 литре (л)) растворителя, или же числом молей вещества в 1 000 молей растворителя. В учении о растворах постоянно пользуются понятиями Молярность (число молей растворённого вещества, содержащееся в 1 л раствора) и Молярность (число молей вещества, растворённого в 1 000 г растворителя). В объёмном анализе концентрацию выражают Нормальностью (числом грамм-эквивалентов действующей составной части в 1 л раствора) и титром (числом граммов действующего или определяемого вещества, отвечающим 1 миллилитру (мл) раствора). На практике для определения концентрации служат как обычные приёмы количественного анализа, так и некоторые инструментальные методы, позволяющие быстро и достаточно точно установить содержание главной составной части (например, определение концентрации водных растворов кислот, щёлочей, солей, этилового спирта по измерению плотности ареометром).

(2) Density:- the weight of cargo per cubic foot or other unit. A physical characteristic measuring a commodity's mass per unit volume or pounds per cubic foot; an important factor in ratemaking, since density affects the utilization of a carrier's vehicle. Density is a quantity or number per unit volume or area. The weight of an article or container per cubic foot or cubic meter. The ratio or mass to bulk or volume. The number tons carried over a line (or section of a line) in a unit of time.

(3) Density is an index of the number of wool fibers per unit of a sheep's body. Fine-wool breeds show greater fleece density than the coarser wool breeds.

DENSITY RATE = СТАВКА ЗА КОМПАКТНОСТЬ – Density Rate is a rate based upon the density and shipment weight.

DENT = ЗУБ (или ЗУБЕЦ) – Dent:- on a loom, the space between the wires of a reed. / Зуб бёрда.

DENTATE = ЗУБЧАТОЕ (или ЗУБОВИДНОЕ) – Dentate:- toothed, usually with the sharp teeth pointed outward. Dentate:- with sharp teeth perpendicular to the margin.

DENTATE LEAF = ЗУБЧАТЫЙ ЛИСТ – Dentate Leaf has little teeth at the margin. / Простые не расчленённые листья разделяются по краю листовой пластинки на зубчатые – острые зубцы с равными сторонами.

DEODORIZATION = ДЕЗОДОРАЦИЯ (или ОТБИВАНИЕ НЕПРИЯТНОГО ЗАПАХА) – Deodorization:- (Latin:- odor – odor; de – negation = to render odorless) elimination of odors. / Устранение запахов. Под Дезодорацией, от Французской приставки Des или Dés, означающее Отрицание или Отсутствие Чего-либо или Удаление или Уничтожение, и Латинского слова Odoratio, означающее Запах, понимается устранение или ослабление или маскировка неприятных запахов, например, от гниения отбросов, при очистке воздуха, воды. Неприятный запах обусловлен присутствием в воздухе аммиака, сероводорода, скатола, индола, летучих жирных кислот и других веществ, образующихся в результате гнилостного разложения органических субстратов. Дезодорация достигается вентиляцией, применением специальных веществ, поглощающих газы (древесный уголь, торф и тому подобное) или изменяющих их состав (хлористый цинк, формалин, хлорная известь и другие). Дезодорация воздуха осуществляется пропусканием его через поглотители (например, активированный уголь), озонированием, распылением дезодоранта; дезодорация воды – аэрацией воды, введением аммиака и тому подобного. Наличие неприятного запаха в животноводческом помещении – показатель нарушения ветеринарно-санитарных правил эксплуатации объектов, недостаточной их вентиляции. Дезодорация в животноводческих помещениях достигается в процессе своевременной уборки навоза, нормальной работы жижестоков, вентиляции, применения глубокой подстилки. Для дезодорации на мясокомбинатах и холодильниках внутренние поверхности помещений обрабатывают 1%-ным раствором марганцовокислого калия, горячим 1%-ным раствором едкой щёлочи или раствором хлорной извести, содержащим 2% активного хлора. Для окисления летучих жирных кислот в помещения через вентиляционные устройства вводят озон, концентрация которого не должна превышать 0.05–0.1 м^2 на 1 м^3 воздуха.

DEOXYRIBONUCLEIC ACID = ДЕЗОКСИРИБОНУКЛЕИНОВАЯ КИСЛОТА – The genetic make-up of all organisms consists of Deoxyribonucleic Acid (DNA), a very long double-strand molecule consisting of a repetition of just four basic nucleotide building blocks – adenine, cytosine, guanine and thymine. The precise sequence of these building blocks differs from organism to organism. The more remote the relationship between organisms, the greater the difference in their DNA sequence. These differences represent the basis for identifying different species. Independently of the nature of the sample to be analyzed, the examination generally comprises three steps. A crucial factor influencing the success of any analytical examination of the DNA is the availability of sufficient quantities of DNA in the purest possible form. The quality and quantity of the DNA isolated from a parent material depends directly on the degree to which it is processed. The more strongly a material is processed, the shorter the average fragment length of the originally very long DNA. Deoxyribonucleic Acid (DNA):- the molecule that is the repository of genetic information in all cellular organisms and many viruses. The information coded in DNA determines the structure and function of the organism. Deoxyribonucleic Acid (DNA) is the genetic material, contained in the chromosomes of all cellular organisms and some viruses, e.g., potato spindle tuber virus. An extremely long double-helical linear polymer in which the gene sequences are encoded as the order in which four types of nucleotide bases occur, each paired with a complementary base. Groups of three base pairs in a structural gene specify the code for the 20 types of amino acids (and one or two rare ones such as selenocysteine) that make proteins. Other sequences encode control functions such as start or stop (transcribing a sequence) signals. Much of the DNA in many organisms consists of apparently non-coding or repetitive sequences of unknown function. / виды (species). Генетическое строение всех организмов состоит из Дезоксирибонуклейновой кислоты (ДНК), очень длинной двунитевой (двухцепочечной) молекулы, состоящей из повторения всего навсего четырёх базовых нуклеотидных гнездящихся блоков (мономеров) – аденина (adenine), гуанина (guanine), тимина (thymine) и цитозина (cytosine). Чем больше отдалённость во взаимосвязи между организмами, тем значительнее разница в последовательности их ДНК. Качество и количество выделенной из материнского материала ДНК напрямую зависит от степени . Дезоксирибонуклеиновая кислота (ДНК) это высокополимерное природное соединение, содержащееся в ядрах клеток живых организмов. Вместе с белками гистонами ДНК образует вещество хромосом. ДНК является носителем генетической информации, а её отдельные участки соответствуют определённым генам. Молекула ДНК состоит из двух полинуклеотидных цепей, закрученных одна вокруг другой в спираль. Цепи построены из большого числа мономеров четырёх типов – нуклеотидов, специфичность которых определяется одним из четырёх азотистых оснований:- (i) аденин, (ii) гуанин, (iii) тимин и (iv) цитозин. Сочетания трёх рядом стоящих нуклеотидов в цепи ДНК (триплеты или кодоны) составляют генетический код. Нарушения последовательности нуклеотидов в цепи ДНК приводят к наследственным изменениям в организме – мутациям. ДНК точно воспроизводятся при делении клеток, что обеспечивает в ряду поколений клеток и организмов передачу наследственных признаков и специфических форм обмена веществ.

DEPARTMENT OF ENERGY = ДЕПАРТАМЕНТ ЭНЕРГЕТИКИ (или МИНИСТЕРСТВО ЭНЕРГЕТИКИ) – On 1977-October-01, the Department of Energy (DOE) became the twelfth cabinet-level department in the US Federal Government. The Department of Energy's (DOE's) overarching mission is to advance the national, economic, and energy security of the United States; to promote scientific and technological innovation in support of that mission; and to ensure the environmental cleanup of the national nuclear weapons complex. The Department's strategic goals to achieve the mission are designed to deliver results along five strategic themes:- (i) Energy Security:- Promoting America's energy security through reliable, clean, and affordable energy; (ii) Nuclear Security:- Ensuring America's nuclear security; (iii) Scientific Discovery and Innovation:- Strengthening US scientific discovery, economic competitiveness, and improving quality of life through innovations in science and technology; (iv) Environmental Responsibility:- Protecting the environment by providing a responsible resolution to the environmental legacy of nuclear weapons production; and (v) Management Excellence:- Enabling the mission through sound management. The Department of Energy (DOE) has one of the richest and most diverse histories in the Federal Government. Although only in existence for a quarter century, the Department traces its lineage to the Manhattan Project and beyond. Researchers interested in documenting DOE history are welcome to browse DOE records, including declassified materials on the nuclear weapons program. DOE supports museums and historic facilities across the country dedicated to displaying and interpreting the history of the Department and its scientific and technological missions. Public tours are also available at some of the Department's sites. Owning some of the XX century's most historically significant physical properties, the Department oversees a vigorous historic preservation program dedicated to preserving and interpreting its heritage. The origins of the Department of Energy can be traced to the Manhattan Project and the race to develop the atomic bomb during World War II. In 1942, the US Army Corps of Engineers established the Manhattan Engineer District to manage the project. Following the war, Congress engaged in a vigorous and contentious debate over civilian versus military control of the atom. The Atomic Energy Act of 1946 settled the debate by creating the Atomic Energy Commission, which took over the Manhattan Engineer District's sprawling scientific and industrial complex. The Atomic Energy Commission was specifically established to maintain civilian government control over the field of atomic research and development. During the early Cold War Years, the Commission focused on designing and producing nuclear weapons and developing nuclear reactors for naval propulsion. The Atomic Energy Act of 1954 ended exclusive government use of the atom and began the growth of the commercial nuclear power industry, giving the Atomic Energy Commission authority to regulate the new industry. In response to changing needs in the mid 1970's, the Atomic Energy Commission was abolished and the Energy Reorganization Act of 1974 created two new agencies: the Nuclear Regulatory Commission to regulate the nuclear power industry and the Energy Research and Development Administration to manage the nuclear weapon, naval reactor, and energy development programs. However, the extended energy crisis of the 1970's soon demonstrated the need for unified energy organization and planning. The Department of Energy Organization Act brought the federal government's agencies and programs into a single agency. The Department of Energy, activated on 1977-October-01, assumed the responsibilities of the Federal Energy Administration, the Energy Research and Development Administration, the Federal Power Commission, and parts and programs of several other agencies. The Department provided the framework for a comprehensive and balanced national energy plan by coordinating and administering the energy functions of the federal government. The Department undertook responsibility for long-term, high-risk research and development of energy technology, federal power marketing, energy conservation, the nuclear weapons program, energy regulatory programs, and a central energy data collection and analysis program. Over its two decade history, the Department has shifted its emphasis and focus as the needs of the nation have changed. During the late 1970's, the Department emphasized energy development and regulation. In the 1980's, nuclear weapons research, development, and production took a priority. Since the end of the Cold War, the Department has focused on environmental clean up of the nuclear weapons complex, nonproliferation and stewardship of the nuclear stockpile, energy efficiency and conservation, and technology transfer and industrial competitiveness. Today, the Department of Energy contributes to the future of the nation by ensuring our energy security, maintaining the safety and reliability of our nuclear stockpile, cleaning up the environment from the legacy of the Cold War, and developing innovations in science and technology. US Department of Energy (US DOE) is the federal department established by the Department of Energy Organization Act to consolidate the major federal energy functions into one cabinet-level department that would formulate a comprehensive, balanced national energy policy. The agency is headquartered in Washington, DC. / инновация . сохранение (conservation).

DEPENDANT DEMAND = ЗАВИСИМЫЙ СПРОС – Dependant Demand is a demand directly related to or derived from the demand for other items or end products. Dependent demands are therefore calculated, and need not and should not be forecast.

DEPENDENT CLAIM = ЗАВИСИМАЯ ПРЕТЕНЗИЯ (или ЗАВИСИМЫЙ ПУНКТ МНОГОЗВЕННОЙ ФОРМУЛЫ ИЗОБРЕТЕНИЯ) – Dependent Claim is a claim that refers back to (depends on) and further limits a preceding dependent or independent claim. A dependent claim shall include every limitation of the claim from which it depends.

DEPLETE = ИСТОЩАТЬ (или ОБЕДНЯТЬ) – Deplete:- the depletion of additives expressed as an approximate percentage. / истощение присадок, выраженное как .

DEPLETION = ИСТОЩЕНИЕ (или РАЗУБОЖИВАНИЕ, или ИСЧЕРПЫВАНИЕ, или ИСЧЕРПАНИЕ) – Depletion is a method of computing a deduction to account for a reduction in value of extractable natural resources. Exhaustion or amortization of a natural resource, such as a mineral deposit or oil well. / Истощение или амортизация природных ресурсов, таких как минеральные ископаемые или нефть. Под Разубоживанием понимается снижение содержания полезного компонента или полезной составляющей в добытом полезном ископаемом по сравнению с содержанием их в массиве (балансовых запасах). Разубоживание характеризуется коэффициентом разубоживания – отношением разности содержания полезного компонента в погашенных балансовых запасах и в добытом полезном ископаемом к содержанию в погашенных балансовых запасах. Разубоживание вызывается перемещением вмещающих пород с полезными ископаемыми при их добыче и ведёт к увеличению затрат на обогащение полезных ископаемых. Истощение или Разубоживание:- практика бухгалтерского учёта, которой могут пользоваться компании, занимающиеся добычей нефти, газа, угля и иных полезных ископаемых. Обычно истощение или разубоживание рассматривается в качестве формы кредита, который сокращает облагаемый налогами доход. Товарищества с ограниченной ответственностью по добыче нефти и газа передают этот кредит своим партнёрам с ограниченной ответственностью, которые могут использовать его для сокращения своего подоходного налога.

DEPLETION ACCOUNTING = УЧЁТ ИСТОЩЕНИЯ (или УЧЁТ РАЗУБОЖИВАНИЯ) – Depletion Accounting:- natural resources, such as metals, oil, gas and timber, which conceivably can be reduced to zero over the years, present a special problem in capital management. Depletion is an accounting practice consisting of charges against earnings based upon the amount of the asset taken out of the total reserves in the period for which accounting is made. A bookkeeping entry, it does not represent any cash outlay nor are funds earmarked for that purpose.

DEPOSIT = ДЕПОЗИТ (или ВКЛАД) – (1) Deposit:- goods or money placed with a bank or other financial institution, or an initial payment made on an item to reserve it, or an initial payment for something being bought on hire purchase or by means of a credit sale agreement. Deposit is any money in a savings or a checking account or in a certificate of deposit (CD). The entrust securities or other valuables to a bank or other institution for safekeeping. The initial outlay required by a broker of a client to open a futures position, returnable upon liquidation of that position. Deposit is:- (1) a transaction involving a transfer of funds to another party for safekeeping. This type of deposit is identical to the money an investor transfers into a bank's savings or checking accounts. (2) A portion of funds that is used as security or collateral for the delivery of a good. Some contracts require a percentage of funds to be transferred before delivery as an act of good faith. An example is the initial margin deposit required for entering into a new futures contract. Amounts deposited with banks by customer (term used in particular in connection with demand and time deposits). / Депозит это взнос денежных средств или ценных бумаг на хранение в специализированном учреждении. и вкладные операции. К Вкладам или Депозитам относятся денежные средства, хранящиеся в банках или иных финансовых учреждениях. Вклады подразделяются на:- бессрочные вклады, вклады до востребования, выигрышные вклады, срочные вклады и условные вклады. Вкладчик или Депонент, от Латинского слова Дэпоно (Depono), означающее Кладу, понимаеся физическое или юридическое лиц, внёсшее ценности в депозит. Под Депозитом, от Латинского слова Дэпозитум (Depositum), означающее Вещь, Отданная На Хранение, понимаются:- (i) вклады в банках и иных финансовых учреждениях; или (ii) материальные ценности, такие как деньги или ценные бумаги, поступающие в специализированные финансовые учреждения и подлежащие возврату внёсшему их лицу (вкладчику или депоненту) или какому-либо другому лицу по его указанию по наступлении определённых условий. В бывшем Союзе Советских Социалистических Республик (СССР) операции по депозитам осуществлялись судебными, нотариальными, таможенными, лечебными и некоторыми другими учреждениями, для чего учреждения Госбанка СССР открывали им специальные счета по депозитным суммам. На депозитные счета судов денежные суммы вносили во исполнение судебных решений для передачи взыскателям. В депозиты нотариальной конторы деньги или ценные бумаги вносились при невозможности вручить их самому кредитору (нотариальная контора принимала их в депозит, не проверяя основания взноса). Сданные в депозит денежные суммы хранились в течение сроков исковой давности (если они были сданы бюджетным учреждением – то до конца данного календарного года), а затем перечислялись в доход государственного бюджета.

(2) In Customs, Deposit is a sum of money provisionally paid (French:- 'Consignation'), or title deeds, bearer bonds, etc, lodged as security for the payment of such duties, taxes or other sums as may become chargeable.

DEPOSIT ACCOUNT = ДЕПОЗИТНЫЙ СЧЁТ – (1) Deposit Account is the bank account that pays interest, but sometimes notice has to be given before funds may be withdrawn.

(2) In the US trademark law, Deposit Account is an account that is established in the US Patent and Trademark Office (USPTO), upon payment of a fee for establishing such an account, for the convenience in paying any fees due, in ordering services offered by the USPTO, copies of records, etc.

DEPOSITARY = ДЕПОЗИТАРИЙ – Depositary is a corporate agency established to safekeep customer securities in its nominee name. Depositaries simplify securities trading by immobilizing the securities and by offering book entry settlement between participants. Banks or brokers where the valuables contained in a safekeeping account are stored for safe custody. / Счёт Ответственного Хранения (Safekeeping Account). Депозитарий:- в международном праве, государство или международная организация, взявшие на себя обязательство хранить текст конкретного международного договора, документы о его ратификации и так далее. Как правило, депозитарий обозначается в самом договоре.

DEPOSITARY BANK = БАНК ДЕПОЗИТАРИЙ – The term Depositary Bank means:- (i) the first bank to which a check is transferred, even if such bank is also the paying bank or the payee; or (ii) a bank to which a check is transferred for deposit in an account at such bank, even if the check is physically received and indorsed first by another bank. In the United States, Depositary Bank (receiving depository institution in the Expedited Funds Availability Act (EFAA)) means the first bank to which a check is transferred, even if it is also the paying bank or the payee. When a check is deposited in an account, the bank that holds the account is deemed to have received the first transfer of the check, and thus is the depositary bank, even if the check is physically received and indorsed first by another bank.

DEPOSIT BANKING = БАНКОВСКОЕ ОБСЛУЖИВАНИЕ ВКЛАДОВ (или БАНКОВСКОЕ ОБСЛУЖИВАНИЕ ДЕПОЗИТОВ) – Deposit Banking:- bank transactions that serve in the procurement of cash capital, thus representing liabilities for the bank. Deposit banking comprises the acceptance of deposits and the issue of the bank's own promissory notes (debentures). Opposite:- Lending Business.

DEPOSIT BASE = ДЕПОЗИТНАЯ БАЗА – Deposit Base:- average volume of customer deposits available to the bank for investment at any given time regardless of withdrawal options available to customers.

DEPOSIT BUSINESS = ДЕПОЗИТНЫЙ БИЗНЕС (или ВКЛАДНЫЙ БИЗНЕС) – Deposit Business:- transactions under which the bank accepts borrowed funds and thereby assumes liabilities in respect of customers in the form of savings or investments. Also includes the issue of medium-term notes and own offerings. The opposite of Lending Business. / Вкладные операции.

DEPOSIT FACILITY = ДЕПОЗИТНАЯ СИСТЕМА (или СИСТЕМА ВКЛАДОВ, или ОБЕСПЕЧЕНИЕ ВКЛАДОВ) – Deposit Facility:- facility is an internationally widely used term for a credit line or borrowing framework. Deposit facility refers to a standing facility of the European Central Bank (ECB) which eligible counterparties (banks) may use to make overnight deposits with the Eurosystem at a previously established interest rate. Generally speaking, this interest rate is the lower limit of the overnight rate. Deposit Facility is a standing facility of the Eurosystem which counterparties may use to make overnight deposits, remunerated at a pre-specified interest rate, at an national central bank. Deposit Facility is a standing facility of the Eurosystem which counterparties may use to make overnight deposits, which are remunerated at a pre-specified interest rate, at an national central bank (NCB). See also Key ECB Interest Rates. / однодневных расчётных депозитов, .

DEPOSIT OF ESTIMATED DUTIES = ДЕПОЗИТ ОЦЕНОЧНЫХ ПОШЛИН – Deposit Of Estimated Duties:- this refers to antidumping duties which must be deposited upon entry of merchandise which is the subject of an antidumping duty order for each manufacturer, producer or exporter equal to the amount by which the foreign market value exceeds the United States price of the merchandise.

DEPOSITOR PROTECTION = ЗАЩИТА ВКЛАДЧИКА (или ЗАЩИТА ДЕПОНЕНТА) – Depositor Protection is a safeguard for customer claims in the event of a bank filing for bankruptcy. Under a private law agreement reached among the banks, the latter would advance privileged claims under bankruptcy.

DEPOSITORY ELIGIBLE TRANSACTION = ТРАНЗАКЦИЯ, ПРОВОДИМАЯ ЧЕРЕЗ ДЕПОЗИТАРИЙ (или ОПЕРАЦИЯ, ПРОВОДИМАЯ ЧЕРЕЗ ДЕПОЗИТАРИЙ) – Depository Eligible Transaction means transactions in those securities for which confirmation, affirmation, and book entry settlement can be performed through the facilities of a Clearing Agency. / , от Латинского слова Affirmo, означающее Утверждаю, .

DEPOSITORY INSTITUTION = ДЕПОЗИТАРНОЕ УЧРЕЖДЕНИЕ – Depository Institution is a financial institution that obtains its funds mainly through deposits from the public. This includes commercial banks, savings and loan associations, savings banks and credit unions. Although historically they have specialized in certain types of credit, nonbank depository institutions have broadened their powers in recent years. For example, Negotiable Order of Withdrawal (NOW) accounts, credit union share drafts and other services similar to checking accounts may be offered by thrift institutions. Financial institution that makes loans and obtains its funds mainly through accepting deposits from the public; includes commercial banks, savings and loan associations, savings banks, and credit unions. Depository Institutions are the banks and thrifts that are licensed to accept deposits from customers. Virtually all US depository institutions are insured by the Financial Crisis Inquiry Commission (FDIC).

DEPOSITORY RECEIPT = ДЕПОЗИТАРНАЯ РАСПИСКА – Depository Receipt or Depositary Receipt is a negotiable financial instrument issued by a bank to represent a foreign company's publicly traded securities. The depositary receipt trades on a local stock exchange. Depositary receipts make it easier to buy shares in foreign companies because the shares of the company don't have to leave the home state. When the depositary bank is in the United States, the instruments are known as American Depositary Receipts (ADRs). European banks issue European depositary receipts, and other banks issue global depositary receipts (GDRs). Depository Receipt is a document issued by a bank indicating ownership of an asset stored in a bank depository. In the case of many assets deliverable against futures contracts, transfer of ownership of an appropriate depository receipt may effect contract delivery. See also Vault Receipt and Warehouse Receipt. There are five types of Depository Receipt facilities:- (1) Unsponsored Depositary Receipts are issued by one or more depositaries in response to market demand, but without a formal agreement with the company. Today, unsponsored Depository Receipts are considered obsolete and, under most circumstances, are no longer established due to the lack of control of the facility and their hidden costs. (2) Sponsored Depository Receipts are issued by one depositary appointed by the company under what is known as a Deposit Agreement or service contract. Sponsored Depository Receipts give control of the facility to the company, and provide the flexibility to list on a national exchange in the US and the ability to raise capital. (3) A Sponsored Level-I Depository Receipt program is the simplest method for companies to access the US and non-US capital markets. Level-I Depositary Receipts are traded in the US over-the-counter (OTC) market and on some exchanges outside the United States. The company does not have to comply with US Generally Accepted Accounting Principles (GAAP) or full Securities and Exchange Commission (SEC) disclosure. A Sponsored Level-I Depository Receipt program allows a company to create a program to facilitate investment without changing its current reporting process. The Sponsored Level-I Depositary Receipt market is the fastest growing segment of the Depository Receipt market. Of the more than 1 800 Depositary Receipt programs currently trading, the vast majority of the sponsored programs are Level-I facilities. In addition, because of the benefits investors receive by investing in Depository Receipts, it is not unusual for a company with a Level-I program to obtain 5 percent to 15 percent of its shareholder base in Depository Receipt form. (4) A Sponsored Level-II And Level-III Depository Receipts, companies that wish to list their Depository Receipts on a stock exchange (NASDAQ®, American or New York) in the US, raise capital or make an acquisition using shares, use sponsored Level-II or III Depository Receipts. Level-II and III Depository Receipt programs require SEC registration and adherence to US GAAP. These types of Depository Receipts can also be listed on some exchanges outside the United States. Level-II Depository Receipts are exchange-listed securities but do not involve raising of new capital. Level-III programs typically generate the most US investor interest because capital is being raised. Generally, companies that choose either a Level-II or Level-III program will attract a significant number of US investors. (5) Private Placement (144A) Depositary Receipts, in addition to the three levels of sponsored Depository Receipt programs that trade publicly, a company can also access the US and other markets outside the US through a private placement of sponsored Depository Receipts. Rule 144A Depository Receipts are capital-raising issues in which securities are privately placed to qualified institutional buyers (QIBs). As a result, these Depository Receipt programs do not require compliance with US GAAP or SEC registration. A company can also offer a Depository Receipt program to non-US investors using the Regulation S structured facility. Depending on the circumstances, a Level-I Depository Receipt program may be established alongside a 144A program. An instrument issued in one country that establishes an entitlement to a security held in custody in another country. For example, American Depository Receipts (ADRs), which are receipts for shares of foreign-based corporations, are traded on US exchanges; however, the underlying foreign shares are held in custody outside the United States. In the United Kingdom, Depositary Receipt is a negotiable certificate which gives evidence of the ownership of a company's shares. Often used as a medium by international investors,

particularly for investments in emerging markets, as they may be more marketable than the shares they represent. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). НЭЗДЭК® (NASDAQ®).

THE DEPOSITORY TRUST AND CLEARING CORPORATION = ДЕПОЗИТАРНАЯ ТРАСТОВАЯ И КЛИРИНГОВАЯ КОРПОРАЦИЯ – A holding company established in September 1999 to oversee two principal subsidiaries: the Depository Trust Company and the National Securities Clearing Corporation. The Depository Trust & Clearing Corporation (DTCC) was established in 1999 as a holding company for a group of operating companies providing securities clearance, settlement, custody and information services. Several of our companies have been serving the financial services industry for over three decades. Others were set up more recently to serve new customer groups or meet the changing needs of capital markets throughout the world. DTCC has operating facilities in multiple locations in the United States and overseas. DTCC through its subsidiaries, provides clearance, settlement and information services for equities, corporate and municipal bonds, government and mortgage-backed securities, money market instruments and over-the-counter derivatives transactions. DTCC provides custody and asset servicing for more than two million securities issues from the United States and 100 other countries and territories. In addition, DTCC is a leading processor of mutual funds and insurance transactions, linking funds and carriers with their distribution networks. For more than 35 years, DTCC's family of companies has helped automate, centralize, standardize and streamline processes that are critical to the safety and soundness of the capital markets. DTCC, through its subsidiaries, provides clearing, settlement and information services for equities, corporate and municipal bonds, government and mortgage-backed securities, money market instruments and over-the-counter derivatives. In addition, DTCC is a leading processor of mutual funds and insurance transactions, linking funds and carriers with their distribution networks. DTCC's depository provides custody and asset servicing for 3.6 million securities issues from the United States and 121 other countries and territories, valued at almost USD34 trillion. In 2009, DTCC settled more than USD1.48 quadrillion in securities transactions. DTCC operates through 10 subsidiaries – each of which serves a specific segment and risk profile within the securities industry:- (i) Avox Ltd; (ii) The Depository Trust Company (DTC); (iii) DTCC Derivatives Repository Ltd; (iv) DTCC Deriv/SERV LLC; (v) DTCC Loan/SERV LLC; (vi) DTCC Solutions LLC; (vii) EuroCCP Ltd; (viii) Fixed Income Clearing Corporation (FICC); (ix) National Securities Clearing Corporation (NSCC), and (x) The Warehouse Trust Company LLC. DTCC's joint venture company with Thomson Reuters, Omgeo, has over 6 000 customers in 45 countries and plays a critical role in institutional post-trade processing, acting as a central information management and processing hub for brokers, investment managers and custodian banks. DTCC's joint company with Markit, MarkitSERV, combines the DTCC Deriv/SERV and Markit Wire trade confirmation platforms to cover all major asset classes including credit, interest rate, equity and commodity derivatives. Pending regulatory approval, DTCC's joint venture company with NYSE Euronext, NYPC, will combine the industry-leading capabilities of NYSE Euronext's US futures exchange (NYSE Liffe US) and DTCC's Fixed Income Clearing Corporation (FICC) to offer innovative risk management, clearing and settlement efficiencies for US fixed income securities and derivatives. Our Mission, Vision and Values:- (i) Mission:- we protect our clients and financial markets and systems as a whole. We leverage our scale and expertise to perfect a more robust, unified infrastructure and promote solutions that systematically reduce risks, amplify operating efficiency and minimize cost. (ii) Vision:- we are unwavering in our commitment to drive out risks and costs. To achieve this, we partner with clients to bring stability to the global financial markets and create efficiencies for an ever-expanding industry. (iii) Values:- DTCC's core values are the foundation upon which our mission and purpose are built. These values are:- (a) Integrity and Trust; (b) Quality and Excellence; (c) Customer Focus; (d) Employee Focus and Respect; (e) Innovation; and (f) Teamwork. DTCC is a holding company established in 1999 to combine The Depository Trust Company (DTC) and National Securities Clearing Corporation (NSCC). The depository, DTC, and the oldest of our clearing subsidiaries, NSCC, were both created in response to the paperwork crisis that developed in the securities industry in the late 1960s and early 1970s. At that time, brokers still exchanged paper certificates and checks for each trade, sending hundreds of messengers scurrying throughout Wall Street clutching bags of checks and securities. Wall Street's 'Paperwork Crisis':- With the New York Stock Exchange (NYSE®) handling 10 to 12 million shares daily, brokers were literally buried in paperwork, and concern about risk was growing in Congress, the Securities and Exchange Commission, and elsewhere. The crisis became so severe that, in order to help reduce the backlog, the exchanges closed every Wednesday, shortened trading hours on the other days, and extended settlement to T+5 from T+4. Eventually the industry developed two separate and distinct approaches to solve the paperwork problem. One Solution:- Immobilization:- The first solution was to immobilize physical stock certificates by maintaining them in a central location or depository, and to record changes of ownership using 'book-entry' accounting methods where no certificates actually change hands. Initially, this was done by the NYSE® and its Central Certificate Service. That led to the creation of DTCC's depository subsidiary in 1973. Another Solution:- Netting:- The second approach to solving the paperwork crisis involved a concept called Multilateral Netting. If one broker does 100 trades in IBM, both buying and selling at different prices with a variety of different brokers, there are few opportunities for netting. By interposing a central organization as the counterparty to all trades, all that broker's trades in IBM can settle to one net position, and all money for trades in all securities can settle to a single Dollar figure owed to or from the central counterparty. Today, with net money settlement, only a single money transfer is required, reducing the Dollar amount of financial obligations by as much as 98%. Headquartered in New York, NY, the United States. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). (:- (i) Эвокс Эл.ти.ди. (Avox Ltd); (ii) Зи Депазытори Тчраст Кампэни (The Depository Trust Company; Ди.Ти.Си. THE DEPOSITORY TRUST COMPANY = ДЕПОЗИТАРНАЯ ТРАСТОВАЯ КОМПАНИЯ – The Depository Trust Company (DTC) established in 1973, was created to reduce costs and provide clearing and settlement efficiencies by immobilizing securities and making 'book-entry' changes to ownership of the securities. It provides settlement services for all National Securities Clearing Corporation (NSCC) trades and for institutional trades, which typically involve money and securities transfers between custodian banks and broker/dealers. A participant-owned central securities depository in the United States and a subsidiary of the Depository Trust & Clearing Corporation (DTCC). DTC is a national clearinghouse for the settlement of trades in corporate and municipal securities. It performs custody services for its bank and broker/dealer customers. DTC products and services include:- (i) DTC Hub:- DTC's centralized communications system that consolidates messages between institutional investors and bank custodians; (ii) Institutional Delivery (ID) System:- DTC's confirmation/affirmation service; and (iii) Standing Instruction Database (SID):- A database which provides the participants' account and settlement instructions for all security types, settlement locations, and currencies. The NYSE® established the Central Certificate Service (CCS) on a limited basis in 1968 to keep track of the total number of shares held and transferred by broker-dealers who were NYSE® members. CCS would not have been successful, however, unless banks participated.

That spurred the formation of the Banking and Securities Industry Committee (BASIC) to investigate this and other issues and to recommend solutions. BASIC's work led to the creation of The Depository Trust Company (DTC), a limited-purpose trust company that would immobilize securities for broker-dealers and banks, complete the book-entry delivery of those securities, and handle the myriad operational tasks required to provide centralized, automated processing. In 1973 DTC assumed the operations of CCS and focused on custodial services for banks, brokers and other institutions. DTC also began providing centralized post-trade processing of institutional trades to further streamline this activity. The Depository Trust Company (DTC) is the world's largest securities depository, holding nearly USD20 trillion in assets for its Participants and their customers. DTC is a national clearinghouse for the settlement of trades in corporate and municipal securities and performs asset services for its participating banks and broker/dealers. DTC's network links more than 11 000 broker/dealers, custodian banks, and institutional investors, as well as transfer agents, paying agents, and exchange and redemption agents for securities issuers. DTC is owned by members of the financial industry. DTCC's subsidiary, The Depository Trust Company (DTC), established in 1973, was created to reduce costs and provide clearing and settlement efficiencies by immobilizing securities and making 'book-entry' changes to ownership of the securities. DTC provides securities movements for NSCC's net settlements, and settlement for institutional trades (which typically involve money and securities transfers between custodian banks and broker/dealers), as well as money market instruments. In 2009, DTC settled transactions worth more than USD299 trillion, and processed 299.5 million book-entry deliveries. In addition to settlement services, DTC brings efficiency to the securities industry by retaining custody of more than 3.5 million securities issues worth almost USD34 trillion, including securities issued in the US and more than 120 foreign countries and territories. Services of The Depository Trust Company (DTC) include:- (i) Custody and Safekeeping Services; (ii) Deposit and Withdrawal Services; (iii) Direct Registration Service; (iv) Dividend, Reorganization and Proxy Services; (v) Restricted Securities Family of Services; and (vi) Underwriting Services. DTC is a member of the US Federal Reserve System, a limited-purpose trust company under New York State banking law and a registered clearing agency with the Securities and Exchange Commission. The New York Stock Exchange affiliated organization Depository Trust Company (DTC) provides a central securities certificate depository through which brokers deliver securities by computerized bookkeeping entries, vastly reducing physical transfer of stock certificates. DTC is operated by a separate management and has an independent board of directors. Headquartered in New York, NY, the United States. The Depository Trust Company (DTC) is a systemically important system for custodial and settlement services. Therefore, DTC has assessed itself against the Recommendations for Securities Settlement Systems (SSS Recommendations). Sixteen of the nineteen SSS Recommendations are applicable to DTC. DTC observes each of the applicable sixteen SSS Recommendations as more fully described herein. The United States Congress requires clearing agencies, such as DTC, to be registered with the US Securities and Exchange Commission (the SEC) and subject to the SEC's comprehensive oversight. The clearing agency standards that DTC is required to adhere to as a clearing agency mirror some of the SSS Recommendations. DTC has wellfounded and transparent legal framework that is based upon the laws and regulations governing the settlement of securities transactions and the conduct of securities clearing agencies in the United States. DTC's corporate governance structure is designed to fulfill the public interest requirements of the Securities Exchange Act of 1934 as amended (Exchange Act) and provides for fair representation of users. DTC's rules are clear and enable its Participants to understand the financial risks associated with participation in DTC. DTC provides DTC Participants with safe and secure operations while maintaining cost-effectiveness. Background:- DTC is a wholly-owned subsidiary of The Depository Trust & Clearing Corporation. DTC is a limited purpose trust company organized under the New York Banking Law, a clearing agency registered under the Exchange Act, a clearing organization as defined in the Federal Deposit Insurance Corporation Improvement Act (FDICIA), a clearing corporation as defined in the Uniform Commercial Code (UCC) and a member bank of the Federal Reserve System. DTC is subject to supervision or regulation by the SEC, the New York State Banking Department and the Federal Reserve Bank of New York. Established in 1973, DTC was created to reduce costs and provide clearing and settlement efficiencies by immobilizing securities and making 'book-entry' changes to ownership of the securities. DTC is the world's largest securities depository and a clearing house for the settlement of securities trading activity. DTC is engaged in the business of effecting the transfer and pledge by computerized book-entry of securities deposited with it by its Participants. In order to facilitate subsequent transfers, all securities deposited by Participants with DTC are registered in the name of its partnership nominee, Cede & Co. When the certificates are registered in the name of Cede & Co., they become fungible. Participants do not have an interest in any particular certificate; they have a proportionate interest in the total inventory of certificates of an issue. The deposit of securities with DTC and their registration in the name of Cede & Co. effect no change in beneficial ownership. DTC provides DTC Participants with a variety of Settlement Services to facilitate the end-of-day net settlement of obligations resulting from their trading activity in multiple markets. As described more fully below, DTC processes the movement of securities for trades that are cleared and settled in the Continuous Net Settlement (CNS) system operated by National Securities Clearing Corporation (NSCC), processes transactions settled in Canadian Dollars through its interface with CDS Clearing and Depository Services, Inc., provides settlement services for institutional trades (which typically involve money and securities transfers between custodian banks and broker/dealers) that are affirmed/matched by Omgeo, and provides for the settlement of issuances and maturities of money market instruments. DTC Interface with NSCC:- NSCC is a systemically important system for clearing and settling virtually all broker-tobroker equity and corporate and municipal debt securities transactions in the United States. On an average trading day, NSCC clears over 40 million securities transactions (based upon 2008 transaction data). NSCC was established in 1976 as a New York business corporation. Since 1999, it has been a wholly-owned subsidiary of The Depository Trust & Clearing Corporation. NSCC is registered with the SEC as a clearing agency. NSCC's core services are trade capture, and clearance and settlement through its CNS system. Trade capture, the first step in the clearance and settlement process, involves the daily receipt of trade data from over 50 trading venues, including national and regional securities exchanges, automated trading facilities and electronic communication networks and from NSCC Members submitting transaction data directly. That data is then compared or recorded. Trade comparison consists of validating and matching the buy and sell sides of a securities transaction, and results in a compared trade that is reported to its Members. As straight through processing measures have been adopted by the marketplaces, today over 99% of trade data is submitted to NSCC on a 'locked-in' basis, meaning that it is already compared by the marketplace of execution, and when submitted it is validated, recorded and reported to NSCC Members. The only trade comparison currently being done by NSCC is for some over-the-counter equity product and fixed income (corporate and municipal) securities processing. Under the CNS system, all compared and recorded transactions are netted by issue into one net long (buy) or net short (sell) position. As a continuous net system, those positions are further netted with positions of the same issue that remain open after their originally scheduled settlement date (usually T+3), so that trades scheduled to settle on any day are netted with fail positions to result in a single deliver or receive obligation for each Member for each issue in which it has activity. NSCC becomes the contra-party for settlement purposes, assuming the obligation of its Members that are receiving securities to receive and pay for those securities, and the obligation of Members that are delivering securities to make the delivery. CNS netting thus reduces the costs associated with securities transfers by reducing the number of securities movements required to settle transactions. In 2008, NSCC reduced the total value of obligations requiring financial settlement by 99% – from USD315.1 trillion to USD2.89 trillion. CNS relies on an interface with DTC for the book-entry movement of securities to settle obligations. CNS short positions (i.e. obligations to deliver) are compared against Members' DTC accounts to determine issue availability. If securities are available, they are transferred from the NSCC Member's account at DTC to NSCC's

account at DTC to cover the NSCC Member's short obligations to CNS. To control the automatic delivery of securities from their DTC accounts, NSCC Members can use CNS exemption procedures (partial settlements are permissible). The allocation of CNS long positions (i.e. obligations to receive) to receiving NSCC Members is processed in an order determined by an algorithm built into the system. Securities are automatically allocated to NSCC Members' long positions as the securities are received by NSCC. NSCC Members can request that they receive priority for some or all issues on a standing or override basis. Submission of buy-in notices and other specified activity will also affect the priority of a NSCC Member's long position. NSCC Daily money settlement for CNS activity is based on the value of all settled positions plus or minus mark-to-the-market amounts for all open CNS positions, and occurs through NSCC. The CNS deliveries made through DTC are made free of payment. NSCC's self-assessment of compliance with the CPSS-IOSCO Recommendations for Central Counterparties can be found at http://www.dtcc.com/legal/compliance. DTC Interface with CDS Clearing and Depository Services Inc.:- in 2006, DTC established with CDS Clearing and Depository Services Inc. (CDS) a 'northbound' Canadian-Link Service that supports valued transactions settled in Canadian Dollars. This Canadian-Link Service enables DTC Participants to clear and settle two categories of securities transactions – cross-border Canadian dollar securities transactions with participants of CDS (CDS Participants) and intra-DTC Canadian Dollar securities transactions with other DTC Participants. The Canadian-Link Service also enables DTC Participants to transfer Canadian Dollar funds to CDS Participants (through the facilities of CDS) and to other DTC Participants (through Canadian settlement banks acting for DTC and such DTC Participants). As with US Dollar transactions, Participants' security positions received versus Canadian Dollars are immediately available for redelivery in DTC as long as sufficient collateral and debit cap controls exist. The Canadian-Link provides Participants with a single depository interface for US and Canadian Dollar transactions and reduces cross-border processing costs and inefficiencies. The link also eliminates the problems associated with maintaining split inventories by permitting Participants to concentrate all US and Canadian security positions in their DTC accounts. This eliminates the need for Participants to maintain some portion of a position in a dually-listed issue in CDS for Canadian dollar settlements and the remainder in DTC for US Dollar settlements. It also eliminates the need for Participants to reposition inventory in preparation for corporate action events and or transaction processing. DTC Interface with Omgeo:- for institutional trades, DTC accepts electronic transmission of affirmed/matched trades from any service provider that has SEC approval to provide such services in the US market. Currently, Omgeo, a joint venture between DTCC and Thomson Reuters, is the only such approved provider. Omgeo provides global trade confirmation and trade matching systems. Institutional investors' trades affirmed in Omgeo's trade confirmation and trade matching systems are passed to DTC's settlement system electronically for automated settlement on a trade-fortrade basis. As a result of this automated process, the DTC Participants who settle such trades are not required to affirm/match the trade a second time. Rather, DTC Participants that are to deliver traded securities give electronic authorization to DTC to attempt the deliveries on their behalf and if they have a sufficient quantity of such securities in their accounts, the deliveries are completed. Issuances and Maturities of Money Markets Instruments (MMIs):- prior to 1990, most US money market instruments were issued and traded in physical form. This started to change in 1987 when DTC expanded its services to include a mechanism for the settlement of transactions against same-day funds in certain types of securities which customarily settle on that basis. Initially, the service was made available for municipal notes with a maturity of one year or less; municipal bonds issued with demand options; zero coupon bonds backed by US Government securities; collateralized mortgage obligations and other asset-backed securities; auction-rate and tender-rate preferred stocks and notes; and medium term notes. Beginning in 1990, commercial paper, as well as money-market certificates of deposit and bankers acceptances were made eligible for DTC services. Today, approximately 99% of all US commercial paper is distributed and settled through DTC. MMIs represent approximately 42% of DTC's total settlement value and 3% of the total number of transactions processed. DTC also offers full asset services for the various eligible types of MMI. The operating procedures followed by Participants for MMI's are the same as for other DTC eligible securities with the exception of the processing of maturity presentments (MPs). As part of the MMI program, DTC provides Participants and Issuing/Paying Agents (IPAs) with an automated book-entry system for settling issuances and maturity presentments of money market instruments. The IPA must be a DTC bank Participant with a Participant account established for its issuing agent or paying agent activity. The MMI issuer's Issuing Agent sends issuance instructions to DTC electronically, identifying the MMI issue(s) by CUSIP number. The MMI securities are credited to the account of the receiver designated by the MMI Issuing Agent and, simultaneously, a memo entry is made to the Issuing Agent Account reflecting that the MMI securities have been delivered as instructed. The instruction of an MMI Issuing Agent to DTC to deliver MMI securities in connection with their issuance constitutes a representation that such MMI securities are issued in accordance with applicable law. MMI securities may be subject of a free delivery or a delivery versus payment. If, in connection with their issuance, MMI securities are subject of a delivery versus payment, such delivery is subject to DTC's risk management controls applicable to money settlement described more fully below. Under DTC's procedures for the processing of MPs, early on the maturity date (generally around 02:00 am) DTC initiates deliveries of the maturing paper from the accounts of Participants having position in the maturing paper to the MMI Participant account of the IPA. These MPs are processed as the equivalent of book-entry deliveries versus payment. (Similar procedures are used to process other payments, such as periodic interest payments, periodic principal and interest payments, or reorganization payments.) As such, MPs may 'pend' just as any delivery would if the net debit cap or collateralization controls applicable to the IPA's account prevent the delivery from updating. Pending MPs would update once additional funds (e.g., from intra-day Settlement Progress Payments ('SPPs') or new issuances) are credited to the IPA's account. The processing system seeks to 'align' settlement credits from an issuer's new issuances to settlement debits from that issuer's MPs (although, if no such MPs are pending, the netting process may cause these credits to offset the processing of other MPs). Further, IPAs can target settlement credits from an SPP to a specific issuer's maturity presentments. IPAs also have the option to prioritize the order and manner in which MPs are processed, and to take other steps to control their risk in connection with this process. (For example, IPAs also have the option to designate issuer processing priority, meaning that a selected issuer's MPs are last in the priority queue to have access to the IPA's net debit cap or settlement credits.) Money Settlement At DTC:- in addition to a securities account at DTC, each Participant has a settlement account. During the day, debits and credits are entered into the Participant's settlement account. The debits and credits arise from securities transfers against payment made and received by the Participant and from other transactions such as principal and income payments received in respect of securities credited to the Participant's securities account. At the end of each day, the debits and credits in the Participant's settlement account are netted. Then, DTC and NSCC net the settlement balances of each DTC Participant that is also a member of NSCC. After netting with NSCC, DTC pays any net credit balance in the account to the Participant, and the Participant pays any net debit balance to DTC. Payments are made to and from DTC's account at the Federal Reserve Bank of New York through the Federal Reserve NSS System. Each Participant must choose a bank that is a DTC Participant bank with access to the Fedwire system and NSS, to act on the Participant's behalf in settling with DTC ('Settling Bank'). A Participant which qualifies as a Settling Bank may act as its own Settling Bank. A Settling Bank is not required to pay DTC a debit balance on behalf of a Participant and is not required to advance funds to a Participant. Settling Banks, however, are required to both acknowledge their balance with DTC and to fund their master account at the Federal Reserve on a daily basis. Failure to do either by the time specified in DTC's Failure to Settle Procedures, may result in a fine. A Settling Bank may refuse to settle for one or more of the Participants it represents. If a Participant's Settling Bank refuses to settle for it, then that Participant has until 10:00 am the next business day to settle its obligation with DTC. Risk Management Controls Applicable to Money Settlement:- Risk management controls play a major role in the

design of DTC's settlement system. Intended to protect DTC Participants against the inability of one or more Participants to pay for their settlement obligations, DTC's risk management controls are based on guidelines established by the Federal Reserve for book-entry securities systems that settle over Fedwire. DTC currently employs three primary risk management controls for securities processing, i.e. collateralization, net debit caps, and for money market instruments exclusively, the Largest Provisional Net Credit (LPNC) control. Collateralization is meant to assure that a Participant that fails to pay for its settlement obligation will have collateral in its account sufficient to cover that obligation and available to be liquidated in the event it were insolvent. DTC's collateralization monitoring procedures prevent the completion of transactions that would cause a Participant's net debit to exceed the total available collateral in its account. Similarly, the application of net debit cap controls helps assure that DTC will have sufficient liquidity to cover the failure of any single Participant, or of a financial family of affiliated DTC Participants (Affiliated Family). (Affiliated Family means each Participant that controls or is controlled by another Participant and each Participant that is under the common control of any Person. For purposes of this definition, 'Control' means the direct or indirect ownership of more than 50% of the voting securities or other voting interests of any Person.) DTC's system prevents the completion of transactions that would cause a Participant's net debit to rise above a specific amount – its net debit cap. Participants' net debit caps are limited by DTC's established maximum net debit cap, the value of which is always set lower than DTC's total available liquidity. Although the vast majority of transactions will be subject to DTC's risk management controls, there are certain types of activity that will be allowed to override collateralization and net debit cap controls. They are: validated reclaims with a settlement value less than USD15 million, payment orders valued less than USD1 million and DTC-generated activity (e.g., monthly billing charges). A validated reclaim is the return of delivery of the same securities (and, if against payment, against the same payment) or a payment order initiated by the original receiver to the original deliverer on the same day that the original delivery is received. A payment order is a method for settling amounts of money related to securities transactions that are effected separately through DTC earlier on the same day. Payment orders can be used to collect premiums and marks-tomarket on open contracts such as stock loans. In addition to requiring Participants to have sufficient collateral to support their net debits and ensuring that their net debits do not exceed their net debit caps, an additional procedure – LPNC, has been established to ensure that the occurrence of a combined Money Market Instrument (MMI) issuer's default and a Participant's failure to settle does not expose DTC to loss and liquidity risks. If by 03:00 pm (ET), DTC is informed by an MMI Paying Agent of its refusal to pay for the maturity presentments of an MMI issuer, or if DTC learns of the insolvency of an MMI issuer, DTC would invoke Issuer Failure procedures. These procedures entail the unwinding (reversal) of that issuer's maturity presentments, valued issuances, and valued deliveries and pledges originating from new issuances of the failed issuer. LPNC procedures help ensure that unwinding transactions in any failed MMI issue does not cause any Participant's net debit to become under-collateralized or exceed its net debit cap. LPNC procedures provisionally 'withhold' from Participants the benefit of the largest net settlement credit they would have received in any MMI program during most of the processing day. To support this process, DTC's system tracks all of a Participant's MMI activity and continuously monitors the MMI program in which the Participant has the largest net credit. This net credit is the Participant's LPNC, or largest provisional net credit (referred to as 'provisional' because of its reversible nature). It is the largest net credit that is 'withheld' to assure protection regardless of which MMI issuer fails. The provisional net credit is not made available to the Participant as collateral to support its net debit, nor is it deemed a credit in the calculation of the Participants' net debit. Because transactions in a failing MMI issue would be reversed only if DTC is informed of the default by 03:00 pm (ET), LPNC procedures remain in effect only until approximately 03:05 pm (ET) at which time, assuming no issuer default, the credit becomes final (i.e. it is no longer 'withheld') and is applied to calculate the Participant's collateral and net debit. DTC maintains a Participants Fund. While the minimum deposit is USD10 000, each Participant is required to make a deposit to the Participants Fund based upon a sixty business-day rolling average of the Participant's intra-day net debit peaks. In the event that DTC becomes concerned with a Participant's operational or financial soundness, DTC may require an additional deposit to the Participants Fund. A Participant may make a voluntary deposit to the Participants Fund in excess of the amount required. In addition to being a liquidity resource, the Participants Fund is available to satisfy any uninsured loss incurred by DTC, including a loss resulting from a Participant's failure to settle. In the event of such loss, DTC would first charge the loss to that Participant's deposit to the Participants Fund (including its voluntary deposit, if any). If the loss exceeded the failing Participant's deposit DTC could charge the excess to its retained earnings or pro rata to the required Participants Fund deposits of all other Participants. Should DTC make a charge against a Participant's required deposit to the Participants Fund (pro rata or otherwise), the Participant must make an additional deposit to the Participants Fund in an amount equal to the charge. To date, DTC has never had to use the Participants Fund (other than a failing Participant's own deposit) to satisfy a loss. Other Services:- DTC also provides a wide range of settlement, custody and related tax services for its member banks, broker-dealers and clearing agencies. Its network links broker-dealers, custodian banks and institutional investors, as well as transfer, paying, exchange and redemption agents for securities issuers. Its relationships with other clearing agencies and its strategic partnerships with industry service providers contribute to efficient global trading and settlement. The principal Settlement Services also include:- (i) Underwriting Service:- in general, DTC-eligible securities are securities that are registered with the SEC pursuant to the Securities Act of 1933, as amended (the Securities Act), or are exempt from such registration under an exemption that does not involve transfer restrictions or are eligible for resale under Rule 144A of the Securities Act or Regulation S (Regulation S) of the Securities Act. Securities eligible for all DTC services include corporate equities and bonds, municipal bonds, money market instruments, mortgage bonds and Treasury and Agency securities and others. DTC provides services for most asset-backed securities, collateralized mortgage obligations, Rule 144A securities exempt from registration under the Investment Company Act of 1940 pursuant to section 3(c)(7) and Regulation S securities, as well as American depository receipts and global issues. (ii) Prospectus Repository System:- an electronic repository for prospectuses and offering memoranda for issues that are DTC-eligible. DTC provides DTC Participants with a variety of Asset Services to facilitate efficient and effective centralization, simplification and automation in the handing of physical securities and the processing of principal and income payments and corporate actions for securities that are DTC-eligible. The principal Asset Services that DTC provides include:- (i) Deposit Service:- allows DTC Participants to deposit DTC-eligible securities for a full range of safekeeping and book-entry processing services; (ii) Custody Service:- allows DTC Participants to deposit for custody-only securities that are not eligible for book-entry processing, such as customer-registered securities, restricted securities, certificated money market instruments, private placements and limited partnerships; (iii) Direct Registration System (DRS):- provides for the electronic direct registration of securities in the names of investors on the books of securities issuers or their transfer agents, and allows such securities to be transferred electronically between transfer agents and broker-dealers by DTC book-entry delivery to facilitate purchases and sales; (iv) Dividends Service:- facilitates the announcement, collection, allocation and reporting of dividend, interest and certain principal payments for securities held in custody by DTC; (v) Reorganization Service:- provides DTC Participants with information about various issuer reorganization activities (e.g., mergers, stock dividends, redemptions), and processes such actions on behalf of Participants having those issuers' securities credited to their DTC accounts; and (vi) Restricted Deposit Service:- allows DTC Participants to use DTC to intermediate in the removal of transfer restrictions on securities, including negotiability and documentation reviews and the registration of transfer of securities into unrestricted form. DTC provides DTC Participants with a variety of Global Tax Services to facilitate compliance with their tax obligations, including international tax regulations, tax treaty provisions and withholding tax reporting requirements. The principal Global Tax Services that DTC provides include:- (i) Domestic Tax Reporting Service:- accumulates year-

end tax reporting information on various types of US securities to permit timely and accurate reporting; (ii) US Tax Withholding Service:- an automated service that enables non-US financial institutions holding US securities at DTC to comply with US nonresident alien withholding tax rules; (iii) DTC Tax Relief:- a technology-based communications facility that enables DTC Participants to withhold international tax for themselves or their customers at the time a non-US dividend payment is made or, subsequently, through an accelerated refund; and (iv) DTC Tax Info:- a tax information database on withholding rates and tax relief opportunities related to international securities held at DTC. (CDS Clearing and Depository Services, Inc.).

DEPOSIT PREMIUM = ПРЕМИЯ В ЗАДАТОК (или ПРЕМИЯ ЗАДАТКОМ) – In reinsurance, Deposit Premium:- when the terms of a policy provide that the final earned premium be determined at some time after the policy itself has been written, companies may require tentative or 'deposit' premiums at the beginning which are readjusted when the actual earned charge has been later determined. A premium that is payable at the inception (start) of an insurance or reinsurance contract and in respect of which an adjustment premium (usually an additional premium) is due depending on the performance of the contract including, possibly, the amount of the business that is ceded thereunder.

DEPOSIT PROTECTION FUND = ФОНД ЗАЩИТЫ ВКЛАДОВ – Deposit Protection Fund serves to protect customers' deposits with banks. The member banks participate in the Deposit Protection Fund by means of contributions. The purpose of the fund is to give assistance, in the interest of depositors, in the event of imminent financial difficulties and prevent the impairment of public confidence in private banks. The protection ceiling for the non-bank depositors is 30% of the liable capital of the bank in question.

DEPOSITS = ДЕПОЗИТЫ (или ВКЛАДЫ) – Deposits are credit balances held by customers with banks. They are formed by means of cash payments or amounts credited to the customer's account by bank transfer or presentation of a cheque. These deposits constitute an obligation on the part of the bank to its creditors. In company balance sheets, funds accepted from customers or banks are generally described as deposits. In bank balance sheets, this term has been replaced by liabilities. The opposite of Advances, Loans, or Receivables. Also known as Creditors, and Payables. / Под Депозитом, от Латинского слова Дэпозитум (Depositum), означающее Вещь, Отданная На Хранение, понимаются:- (i) вклады в банках и иных финансовых учреждениях; или (ii) материальные ценности, такие как деньги или ценные бумаги, поступающие в специализированные финансовые учреждения и подлежащие возврату внёсшему их лицу (вкладчику или депоненту) или какому-либо другому лицу по его указанию по наступлении определённых условий.

DEPOSITS = ОТЛОЖЕНИЕ – Deposits are the oil-insoluble materials that result from oxidation and decomposition of lube oil and contamination from external sources and engine blow-by. These can settle out on machine or engine parts. Examples are sludge, varnish, lacquer and carbon.

DEPOSITS AND BORROWED FUNDS = ДЕПОЗИТЫ И ЗАЁМНЫЕ СРЕДСТВА – Deposits And Borrowed Funds are the funds (shown in the balance sheet) which a bank or other company borrows or accepts from third parties, e.g., bondholders, depositors, shareholders, etc. Together with the retained earnings and surplus carried forward, they make up the liabilities. / , например, .

DÉPÔT = ДЕПО (или ПАРК, или БАЗА, или ДВОР, или СТАНЦИЯ, или ОТДЕЛЕНИЕ) – In French, Dépôt is a container freight station or a designated area where empty containers can be picked up or dropped off. The place designated by the carrier where empty containers are kept in stock and received from or delivered to the container operators or merchants. Dépôt is a location designated by the carrier where empty containers are kept in stock and received from or delivered to the container operators or shippers/consignees. / Под Депо, от Французского слова Dépôt, означающее буквально Склад или Хранилище, понимается предприятие, обеспечивающее стоянку, эксплуатацию и ремонт подвижного состава:- вагонов, локомотивов, подъёмных кранов на железнодорожном ходу, мотор-вагонных секций железных дорог и метрополитена, трамваев, троллейбусов, а также пожарных машин. Применительно к подвижному составу городского транспорта употребляют также термин Парк, например, автобусный, трамвайный, троллейбусный парки. Различают депо:- специализированные по виду и типу подвижного состава (локомотивные, вагонные, моторвагонные и тому подобные) и смешанного типа, предназначенные для эксплуатации различных видов подвижного состава одновременно, например электровозов, тепловозов, моторвагонных поездов и кранов на железнодорожном ходу. Основные задачи и виды работ, осуществляемых в депо, – эксплуатация подвижного состава в соответствии с графиком движения и выполнение его ремонта для обеспечения безопасности движения. На территории депо находятся производственные здания с технологическим (станки, приспособления, инструменты), энергетическим оборудованием и подъёмно-транспортными средствами, склады для запасных частей и материалов, сооружения для очистки и обмывки подвижного состава, а также деповские (тракционные) пути, устройства для поворота подвижного состава и снабжения его топливом, песком, водой и другими материалами. Наиболее крупные предприятия, обслуживающие подвижной состав, – локомотивные и вагонные депо. Локомотивные Депо различают:- (i) основные и (ii) оборотные, или пункты оборота. Основные депо имеют приписной парк подвижного состава, в плановом порядке контролируют его состояние и выполняют различные виды ремонта. При длине участков обращения до 1 000–2 000 километров (км) локомотивы обслуживаются сменными бригадами разных депо. Производственная деятельность депо характеризуется численностью подвижного состава, общим годовым пробегом и количеством периодических ремонтов. Важными показателями эксплуатационной работы депо являются объём перевозок и их себестоимость. На железнодорожном транспорте принята система планово-предупредительного ремонта. Проверка состояния и различные виды ремонта подвижного состава осуществляются в зависимости от пробега или через определённые промежутки времени. Основным методом ремонта является агрегатно-узловой метод, основанный на применении взаимозаменяемых узлов и деталей. Для этого в депо имеются так называемые оборотные фонды, состоящие из заранее отремонтированных или новых узлов и деталей. Строят локомотивные депо с прямоугольным, ступенчатым и веерным расположением зданий. Наиболее перспективны депо ступенчатого типа. По сравнению с прямоугольными они имеют меньшую ширину, но большее количество путей, два и более стойл на одном пути, мастерские, расположенные ближе к местам ремонта, лучшее естественное освещение всех помещений. Расширение депо ступенчатого типа легко осуществляется пристройкой новых секций. Депо веерного типа строились для паровозов, требованиям содержания современного подвижного состава они не отвечают. Оборотные депо предназначены для экипировки локомотивов, их осмотра и устранения обнаруженных неисправностей. В пунктах оборота имеются комнаты отдыха локомотивных бригад между поездками. Для осмотра и выполнения ремонта подвижного состава посменно дежурят квалифицированные работники, есть необходимые инструменты, запасные части и материалы. Депо Метрополитена имеют большое число путей для отстоя подвижного состава, выполнения всех видов ремонта (основные депо), для осмотров и других операций, кроме крупных плановых ремонтов (отстойные депо). На каждой линии метрополитена строят, как правило,

своё депо. Трамвайные Депо и Троллейбусные Депо также имеют большие парки отстоя и выполняют ремонт трамвайных вагонов и троллейбусов. Депо строятся по типовым проектам.

DEPRECIABLE AMOUNT = СУММА ИЗНОСА (или ОБЕСЦЕНИВАЕМАЯ СУММА) – Depreciable Amount is that part of the acquisition cost or revalued amount of an asset, acquisition less salvage value, that is to be written off as an expense over the economic life of the asset as depreciation. Also known as Depreciable Cost.

DEPRECIATION = (ФИЗИЧЕСКИЙ) ИЗНОС (или ОБЕСЦЕНЕНИЕ) – In accounting, Depreciation is a noncash expense that accounts for the diminution in an asset's value over time. Depreciation is deducted as an expense to represent this economic cost to a business, but it has no impact on company's cash flow. Company never writes a check or makes a payment for its depreciation expense. Depreciation is the amount of expense charged against earnings by a company to write off the cost of a plant or machine over its useful live, giving consideration to wear and tear, obsolescence, and salvage value. If the expense is assumed to be incurred in equal amounts in each business period over the life of the asset, the depreciation method used is straight line (SL). If the expense is assumed to be incurred in decreasing amounts in each business period over the life of the asset, the method used is said to be accelerated. Two commonly used variations of the accelerated method of depreciating an asset are the sum-of-years digits (SYD) and the double-declining balance (DDB) methods. Frequently, accelerated depreciation is chosen for a business' tax expense but straight line is chosen for its financial reporting purposes. Depreciation is the book cost of using fixed assets charged in the period. It provides a way of charging for capital assets that have a life longer than the trading period. The fixed assets on the Balance Sheet are reduced each period by the amount of depreciation, and this depreciation is charged to the Profit & Loss account. Depreciation:- assets lose their value over time. The amount of value reduction in a particular period of time is referred to as Depreciation. For example, cars depreciate in value as they age and get used. Most assets are depreciated by given percentages during an accounting period. Companies can set their own depreciation rates but for tax purposes, governments prescribe allowable rates for various asset classes. This prevents companies from depreciating assets too rapidly in order to avoid taxes. Normally, charges against earnings to write off the cost, less salvage value, of an asset over its estimated useful life. It is a bookkeeping entry and does not represent any cash outlay nor are funds earmarked for the purpose. The difference between the cost (or value) of an asset and its residual value allocated over the series of accounting periods in the asset's useful life. The depreciation expense for a period is usually based on:- (i) the likely useful economic life of the asset; (ii) the pattern of reduction in services during life; and (iii) its likely residual (or salvage) value on disposal at the end of its life. Compare Amortisation. See also Accumulated Depreciation. / Износ или Обесценение:- (1) Экономика:- потребление капитала в процессе производства – износ зданий и средств производства (механизмов и оборудования). (2) Финансы:- снижение стоимости основных средств производства, таких, как здания и оборудование, учитываемое для того, чтобы распределить расходы в течение срока их полезной службы. Износ или Обесценение сокращает подлежащий налогообложению доход, но не сокращает наличных средств. Среди наиболее известных методов учёта износа или обесценения – обычный износ или обесценение (straight-line depreciation), ускоренный износ или обесценение (accelerated depreciation), а также ускоренная система восстановления расходов (accelerated cost recovery system). Остальные методы включают ежегодные выплаты, переоценку, подсчёт сложного процента, производственный износ, оценку на основе стоимости замены, учёт устаревания, а также метод фонда погашения (sinking fund method). (3) Иностранная валюта:- падение стоимости одной валюты относительно другой валюты.

(1) Amortization of fixed assets, such as plant and equipment, to allocate their cost to their period of use, or depreciable life. Depreciation reduces taxable income, but not cash. Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life. Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value. Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item shall be depreciated separately. The depreciation charge for each period shall be recognised in profit or loss unless it is included in the carrying amount of another asset. The depreciation method used shall reflect the pattern in which the asset's future economic benefits are expected to be consumed by the entity.

(2) Depreciation:- the decrease in value of an asset through wear and tear or other factors limiting its usefulness. Fixed assets are depreciated in accounts by regularly reducing their book value in the balance sheet. Decrease in the value of any type of tangible property over a period of time resulting from use, wear, tear, deterioration, and obsolescence. Decline in value. In accounting, decline in the market value of assets with a limited life, caused by wear and tear, deterioration by the elements and technical obsolescence. In foreign exchange, fall in the price of a currency on the foreign exchange market (the reverse of exchange appreciation). Currency depreciation differs from devaluation, which results from a decision by the issuing government and produces a new official exchange rate. The opposite of Appreciation. See also Amortization, and Write-Off. / Под Физическим Износом понимается снашивание, постепенная утрата потребительской стоимости средств труда в процессе производства. Интенсивность физического износа зависит от производственной нагрузки и условий содержания средств труда, от воздействия на них сил природы (влажность и так далее).

(3) Depreciation:- the decrease in the value of an item due to age, use or wear and tear. Such devaluation is not covered under a contract of indemnity. However an insurer may agree to provide cover on 'a new for old' basis which represents a modification of the principle of indemnity and avoids the need to determine rates and amounts of deprecation when settling claims. Depreciation is expense allowance made for wear and tear on an asset over its estimated useful life. See also Accelerated Depreciation.

DEPRECIATION AND AMORTIZATION = ИЗНОС И АМОРТИЗАЦИЯ (или ОБЕСЦЕНЕНИЕ И АМОРТИЗАЦИЯ) – Depreciation And Amortization:- there are two different kinds of depreciation an investor must grapple with when analyzing financial statements. They are accumulated depreciation and depreciation expense. Each is unique, though new investors often confused them. In order to understand why they are important and how they work, we must discuss the terms individually. Depreciation Expense:- according to a major brokerage firm, 'Depreciation is the process by which a company gradually records the loss in value of a fixed asset. The purpose of recording depreciation as an expense over a period is to spread the initial purchase price of the fixed asset over its useful life. Each time a company prepares its financial statements, it records a depreciation expense to allocate the loss in value of the machines, equipment or cars it has purchased. However, unlike other expenses, depreciation expense is a 'non-cash' charge. This simply means that no money is actually paid at the time in which the expense is incurred'. An Example of Depreciation Expense:- to help you understand the concept, let's look at an example of depreciation expense:- Sherry's Cotton Candy Company earns USD10 000 profit a year. In the middle of 2002, the business purchased a USD7 500 cotton candy machine that it expected to last for five years. If an investor examined the financial statements, they might be discouraged to see that the business only made USD2 500 at the end of 2002 (USD10k profit – USD7.5k expense for purchasing the new machinery). The investor would wonder why the profits had fallen so much during the year. Fortunately, Sherry's accountants come to her rescue and tell her that the USD7 500 must be allocated over the entire period it will benefit the company. Since the cotton candy machine is expected to last five years, Sherry can take the cost of the cotton candy machine and divide it by five (USD7 500 / 5 years = USD1 500 per year). Instead of realizing a one-time

expense, the company can subtract USD1 500 each year for the next five years, reporting earnings of USD8 500. This allows investors to get a more accurate picture of how the company's earning power. The practice of spreading-out the cost of the asset over its useful life is depreciation expense. When you see a line for depreciation expense on an income statement, this is what it references. This presents an interesting dilemma. Although the company reported earnings of USD8 500 in the first year, it was still forced to write a USD7 500 check, effectively leaving it with USD2 500 in the bank at the end of the year (USD10 000 profit – USD7 500 cost of machine = USD2 500 remaining). The result is that the cash flow of the company is different from what it is reporting in earnings. The cash flow is very important to investors because they need to be ensured that the business can pay its bills on time. The first year, Sherry's would report earnings of USD8 500 but only have USD2 500 in the bank. Each subsequent year, it would still report earnings of USD8 500, but have USD10 000 in the bank because, in reality, the business paid for the machinery up-front in a lump-sum. This is vital because if an investor knew that Sherry had a USD3 000 loan payment due to the bank in the first year, he may incorrectly assume that the company would be able to cover it since it reported earnings of USD8 500. In reality, the business would be USD500 short. There have been cases of companies going bankrupt even though they were reporting substantial profits. This is where the third major financial report, the cash flow statement, comes into an investor's analysis. The cash flow statement is like a company's checking account. It shows how much cash was spent and generated, at what time, and from which source. That way, an investor could look at the income statement of Sherry's Cotton Candy Company and see a profit of USD8 500 each year, then turn around and look at the cash flow statement and see that the company really spent USD7 500 on a machine this year, leaving it only USD2 500 in the bank. The cash flow statement is the focus of Investing Lesson 5. Accounting for Depreciation Expense in Your Income Statement Analysis:- some investors and analysts incorrectly maintain that depreciation expense should be added back into a company's profits because it requires no immediate cash outlay. In other words, Sherry wasn't really paying USD1 500 a year, so the company should have added those back in to the USD8 500 in reported earnings and valued the company based on a USD10 000 profit, not the USD8 500 figure. This is incorrect (honestly, I'm being polite – it's idiotic). Depreciation is a very real expense. Depreciation attempts to match up profit with the expense it took to generate that profit. This provides the most accurate picture of a company's earning power. An investor who ignores the economic reality of depreciation expense will be apt to overvalue a business and find his or her returns lacking. As one famous investor quipped, the tooth fairy doesn't pay for a company's capital expenditure needs. Whether you own a motorcycle shop or a construction business, you have to pay for your machines and tools. To pretend like you don't is delusional. *Depreciation expenses are deductible but the tax laws are complex. In many cases, a company will depreciate their assets to the IRS far faster than they do on their income statement, resulting in a timing difference. In other words, a machine may be worth USD50 000 on the GAAP financial statements and USD10 000 on the IRS tax statements. To adjust for this, accounting rules setup a special USD40 000 'deferred tax asset' account on the balance sheet that will naturally work itself out by the time the asset has been fully depreciated down to scrap value. You don't really need to know that for now, but for those of you who get really excited about this sort of thing, I thought I'd throw it in there. Depreciation And Amortization:- non-cash charge that represents a reduction in the value of fixed assets due to wear, age or obsolescence. This figure also includes amortization of leased property, intangibles and goodwill, and depletion. What is the difference between depreciation and amortization? Because very few assets last forever, one of the main principles of accrual accounting requires that an asset's cost be proportionally expensed based on the time period over which the asset was used. Both depreciation and amortization (as well as depletion) are methods that are used to prorate the cost of a specific type of asset to the asset's life. It is important to mention that these methods are calculated by subtracting the asset's salvage value from its original cost. Amortization usually refers to spreading an intangible asset's cost over that asset's useful life. For example, a patent on a piece of medical equipment usually has a life of 17 years. The cost involved with creating the medical equipment is spread out over the life of the patent, with each portion being recorded as an expense on the company's income statement. Depreciation, on the other hand, refers to prorating a tangible asset's cost over that asset's life. For example, an office building can be used for a number of years before it becomes run down and is sold. The cost of the building is spread out over the predicted life of the building, with a portion of the cost being expensed each accounting year. Depletion refers to the allocation of the cost of natural resources over time. For example, an oil well has a finite life before all of the oil is pumped out. Therefore, the oil well's setup costs are spread out over the predicted life of the oil well. It is important to note that in some places, such as Canada, the terms amortization and depreciation are often to used interchangeably to refer to both tangible and intangible assets. / вследствие снашивания, возраста или . Щэриз Катчэн Кэнди Кампэни (Sherry's Cotton Candy Company).

DEPRECIATION/STAFF COSTS (%) = ИЗНОС И АМОРТИЗАЦИЯ/ЗАТРАТЫ НА ШТАТНЫХ ДОЛЖНОСТНЫХ ЛИЦ (%) (или ОБЕСЦЕНЕНИЕ И АМОРТИЗАЦИЯ/ЗАТРАТЫ НА ШТАТНЫХ ДОЛЖНОСТНЫХ ЛИЦ (%)) – Depreciation/Staff Costs (%) is the depreciation expressed as a percentage of staff costs. Therefore it is a measure of the relationship between capital equipment and staff (capital intensity). Highly automated businesses will have a high depreciation/staff costs percentage. Labor-intensive businesses will have a low percentage.

DEPRESSED = СПЛЮЩЕННОЕ (или ДЕПРЕССИВНОЕ, или ПОДАВЛЕННОЕ, или УГНЕТЁННОЕ, или СДАВЛЕННОЕ, или ВДАВЛЕННОЕ, или ВОГНУТОЕ) – Depressed:- flattened from above. / Под Депрессивным, от Латинского слова Depressio, означающее Подавление, понимается .

DEPRESSED PALEA = ВДАВЛЕННАЯ (ЦВЕТКОВАЯ) ЧЕШУЯ (или СПЛЮЩЕННАЯ (ЦВЕТКОВАЯ) ЧЕШУЯ) – Depressed Palea (DP) is the palea is underdeveloped and shows a depressed appearance. / Под Чешуйками понимаются:- (1) мелкие хитиновые пластинки на теле членистоногих, главным образом насекомых. Часто окрашены, например, у чешуекрылых, комаров, некоторых перепончатокрылых. (2) Выросты кожицы (эпидермиса) у растений, например, на листьях Облепихи, или видоизменённые листья, например, чешуйки в цветках. Выполняют защитную функцию.

DEPRESSION = ДЕПРЕССИЯ – Depression is a cyclical period of serious decline in the national economy, characterized by temporarily decreased levels of business activity across most economic sectors, and consequently by decline in Gross Domestic Product, relatively higher levels of unemployment, rising numbers of business bankruptcies and (at least in the most severe instances) a falling general price level (deflation). A general business slump of somewhat less severity and shorter duration is typically referred to as a Recession. There is no precise dividing line that is generally recognized by economists to distinguish a recession from a depression, and incumbent policy-makers since World War II have almost always resisted describing their contemporaneous economic situation as a depression, preferring the milder sounding term 'Recession'. The term 'recession' has largely replaced the older and more emotion-laden term 'Depression' in most economic literature as well, except in referring to such catastrophic slumps of the past as 'The Great Depression' of the 1930s. In the United States, there is a highly respected private academic research foundation called the National Bureau of Economic Research (NBER) that is the uncontested leader in the collection and analysis of extremely detailed data measuring multitudinous aspects of business activity. The NBER, after exhaustive research, periodically decrees the definitive dating of the latest periods of decline and recovery in the business cycle – but unfortunately NBER's procedures are so elaborate and so painstaking that recessions are nearly always clearly over by the time that NBER officially verifies that they have begun. Consequently, the NBER declarations are very useful for historians and economic theory-builders but definitely not for time-pressured

policy- makers and journalists. While everyone is waiting for a definitive ruling by the NBER, there is a quick-and-dirty rule of thumb for identifying the onset of recessions that is almost universally employed by professional economists as a first approximation for policy purposes:- if inflation-adjusted Gross Domestic Product (or, alternatively, the closely related measure called Gross National Product) declines for two successive quarters (i.e. six months in a row), a recession has begun, and when inflation-adjusted GDP subsequently rises for two consecutive quarters, the recession has ended and recovery is under way. Depression is a period marked by slackening activity or outright failure of businesses or banks, widespread unemployment, falling prices and wages, and general economic collapse. Prolonged phase in the business cycle of capitalist economies, marked by a decline in proportion and prices and an increase in unemployment. A depression occurs in times of economic crisis and is triggered by a series of factors:- a sharp decline in demand (consumption, investment) causes a decrease in production, followed by unemployment, business failures and lower income, which keeps production down. See also Business Cycle, and Recession. In macroeconomic term a Depression means a slump in economic activity (recession), expressed in particular by a significant reduction in the economy's aggregate output (social product), deflation and high unemployment. The last great depression to hit the world economy took place in the early 1930s. / Под Депрессией, от Латинского слова Depressio, означающее Подавление или Угнетение, понимается застой, понижение, упадок. В экономике депрессия – фаза цикла, наступающая после кризиса перепроизводства. Характеризуется прекращением упадка производства, постепенным рассасыванием 'излишка' товарных масс, вялой хозяйственной конъюнктурой, большой безработицей. Синонимами Депрессии являются Застой и Стагнация. Депрессия – экономическая ситуация, характеризующаяся падением цен, снижением покупательной способности и превышением предложения над спросом, ростом безработицы, накоплением товарных запасов, дефляцией, сокращением производства, паническим общественным настроением, а также общим спадом деловой активности в течение продолжительного времени. Великая депрессия 1930-х в США и странах Европы вызвала отголоски во всем мире.

DEPTH = ГЛУБИНА – Depth is a measurement from the top to the bottom, e.g., from the surface of the water to the ground or to the bottom of a container.

DEPTH FILTER = ГЛУБОКИЙ ФИЛЬТР – Depth Filter is a filter medium that retains contaminants primarily within tortuous passages. See also Filter. Depth Filters rely on a torturous path to capture particles within the matrix or depth of the filter. Simply put, particles are caught within the depth of the filter as they come in contact with obstructions. There is rarely a uniform, defined pore structure in a depth filter and in many configurations such as fibrous filters there are no pores at all. Even though there may not be defined pores, depth filters can be performance rated based on challenge testing. In these tests, the filter is challenged with pre-set quantity of defined size particles or organisms. This type of testing renders the filter unusable and is referred to as Destructive Testing. Manufacturers will perform these tests on a representative sample of each filter batch. Since every filter cannot be tested and verified individually, a 'nominal' rating is associated with depth filters. Depth filters can be produced using several methods. The most common types are fiber filters and sintered filters. Fiber filters are either spun or woven into a cloth or felt. Sintered filters such as ceramic, metal or porous plastic filters are formed by fusing particles together under heat and pressure. The spaces between the particles form the flow path or pores of the filter. Filter aids, such as activated charcoal, may be added to improve the filtration capability of the filter. Many filter aids use attractive forces such as chemical or electro-differential (Zeta) to pull particles out of the water stream and hold them to the surface of the filter aid. This process is called adsorption.

DEPTH FILTER MEDIA = ГЛУБОКАЯ ФИЛЬТРУЮЩАЯ СРЕДА – Depth Filter Media:- porous materials which primarily retain contaminants within a tortuous path, performing the actual process of filtration.

DEPTH OF DISCHARGE = ГЛУБИНА РАЗРЯДА – Depth Of Discharge is the percent of rated capacity of a battery that has been discharged from the battery.

DEPTH OF REFINING = ГЛУБИНА ПЕРЕРАБОТКИ – Depth Of Refining is a ratio of crude oil volumes processed at primary refining facilities, excluding saleable heating oil, liquid fuel used in production, and losses in drying and desalination, to total crude oil volumes processed at primary refining facilities. / Под Глубиной Переработки нефти понимается отношение фактических объёмов нефти, переработанных на установках первичной переработки, за вычетом продаваемого (товарного) печного бытового топлива, жидкого топлива, используемого в производстве на технологические нужды, и потерь на обезвоживание и обессоливание, ко всем объёмам нефти, переработанной на установках первичной переработки.

DEPTH OF SHADE = ГЛУБИНА ОТТЕНКА – Depth Of Shade (DOS) is a ratio of weight of dye to weight of goods dyed, usually expressed as percentage; amount of dye owg. Depth of shade, in these terms, is not really a very good way of comparing the darkness or intensity of color of finished fabrics, due to inherent differences in the hues of different dyes within a family, differences between dye families, and differences due to the nature of the fabric. Dye manufacturers' shade cards are typically show one or two depths of shade for a particular dye, often between 1% and 4%, except for black, which is typically 3% to 6%.

DEQ = DELIVERED EX QUAY

DE–RAMP = СГРУЖАТЬ (или ВЫГРУЖАТЬ) – De-Ramp:- to unload from a flat car.

DERANGEMENT = НЕИСПРАВНОСТЬ (или НЕИСПРАВНОЕ СОСТОЯНИЕ) – Mechanical and/or Electrical Derangement is an insurance industry term to describe malfunction, or non-function, of an appliance for reasons other than obvious external damage. From time to time, an electronic or mechanically operated item will prove to be inoperable upon arriving at its destination. See also Mechanical Derangement. / Под Неисправностью или Неисправным Состоянием понимается состояние изделия (устройства), при котором оно не соответствует одному или нескольким требованиям, предъявляемым как в отношении основных параметров, характеризующих его способность выполнять заданные функции, так и в отношении удобств эксплуатации, внешнего вида, комплектности и тому подобного. Неисправность – более общее понятие, чем неработоспособность (неработоспособное состояние). Неисправность возникает вследствие повреждения. Под Отказом понимается одно из основных понятий надёжности. Событие, заключающееся в нарушении работоспособности изделия (один или несколько рабочих параметров изделия выходят за допустимые пределы). Отказ изделия возникает вследствие отказов его компонентов, расстройки, разрегулирования, разрушения конструкции или изменения структуры изделия, помех и другого. Различают отказы внезапные и постепенные, полные и частичные, зависимые и независимые.

DERBY = ДАБИ (или ДЁБИ, или ДЕРБИ, или КОТЕЛОК) – Derby is a man's stiff felt hat with dome-shaped crown and narrow brim. History of Bowler Hat:- the first bowler hat was originaly created for Edward Coke, the younger brother of the 2nd Earl of Leicester in 1849. It was designed by London hatmakers Thomas and William Bowlers for hatters Lock & Co of St James's. The brief was to create a piece of headgear that could be worn by gamekeeps when they were out riding to protect their heads from low-hanging branches. It is thought that before accepting the hat Coke arrived at the shop in London and stamped on the crown twice to check its robustness. He paid 12 shillings for it. The Bowler went on to be associated with businessmen in the City of London. During the 1950s and 60s men wore the Bowler as part of the City uniform but the practice died out during the seventies. Perhaps one of the most

famous icons of the XXI century to wear a bowler hat was Sir Winston Churchill. Cavalry officers still traditional wear Bowler hats and suits for their annual parade and both Princes William and Harry have worn them for official duties. The tradition for officers to wear bowler hats for their annual parade dates back to the first such event 82 years ago, when the outfit was considered correct dress for walking out. Officers are still expected to wear their City gent attire whenever they are in London on duty. The Bowler rather than a cowboy hat or a Stetson was also the most popular hat worn by men in America in the XIX century – such Billy the Kid and Butch Cassidy. Lock & Co. still sells around 4 000 to 5 000 Bowlers each year 'mostly to City workers, ex-miolitary gentlemen and young Americans'. Famous Bowler hat icons:- a bowler hat is the logo of British bank Bradford & Bingley. In the James Bond film Goldfinger, the evil henchman Oddjob threw an iconic, razor-edged bowler as a weapon. Thomson and Thompson, identical twin detectives from Hergé's The Adventures of Tintin, are recognisable for their bowler hats and walking sticks. The villains in the steampunk anime Steamboy wear bowler hats; as well as one of Batman's best known villains, The Riddler. In Stanley Kubrick's film A Clockwork Orange the lead character Alex DeLarge wears a bowler hat. Stan Laurel and Oliver Hardy were well-known for their bowler hats, as was Lou Costello. During the Silent Film Era, Charlie Chaplin's character 'The Tramp' almost always wore a bowler. / Даби (в Соединённом Королевстве) или Дёби (в Соединённых Штатах Америки). Эдвод Коук (Edward Coke). Сэр Винстэн Чочил (Sir Winston Churchill). Принцы Вильэм (Princes William) и Хари (Harry). Стэтсэн (Stetson). Билы зи Кид (Billy the Kid) и Буч Кэсыди (Butch Cassidy). Лок Энд Ко. (Lock & Co.). Британский банк Брэдфэд Энд Биньли (Bradford & Bingley). В фильме Золотой Палец (или Голдфингё; Goldfinger) о Дьжеймзе Бонде (James Bond) Оддьжоб (Oddjob). Томсэн энд Томпсэн (Thomson and Thompson). Эрже (Hergé) Приключения Тата (The Adventures of Tintin). Стимбой (Steamboy); Бэтмэн (Batman). Зи Ридлё (The Riddler). В фильме Стэнли Кюбрика (Stanley Kubrick) фильм Заводной Апельсин (A Clockwork Orange) Элекс ДэЛадьж (Alex DeLarge) носит . Стан Лорэл (Stan Laurel) и Алывё Харди (Oliver Hardy), Лу Кастэло (Lou Costello). В течение всей Эры Немого Кино (the Silent Film Era), Чарли Чаплын (Charlie Chaplin) 'Зи Тчрэмп' ('The Tramp'). Шляпа с узкими ровными полями и жёсткой куполообразной тульёй. Котелок (от Английского словосочетания Bowler Hat) – это Европейская шляпа полусферической формы из твёрдого войлока. История:- первый котелок был изготовлен в 1849 Лондонской фирмой Томэса и Вильэма Боулёров (Thomas and William Bowler), отсюда и пошло название шляпы – Боулё Хэт (Bowler Hat). Шляпники Боулёры выполняли заказ для фирмы Дьжеймза и Дьжодьжа Локов – Лок Энд Ко. (Lock & Co.), которые в свою очередь выполняли заказ для некоего Вильэма Коука (William Coke). Пожелания Коука были простыми:- требовалась плотно прилегающая к голове шляпа низкой посадки для егерей, чтобы за неё не цеплялись ветки деревьев при обходе лесных угодий. Первое время шляпу называли Коук по имени землевладельца, заказавшего её своим егерям. Своё нынешнее название Котелок (Bowler) эта шляпа получила лишь около 1859, когда её массовым изготовлением занялась фирма Боулё Энд Сан (Bowler & Son). К концу XIX века котелки стали очень популярными, все сильнее вытесняя дорогостоящие и более громоздкие цилиндры. Тем не менее, в начале XX века котелки стали вытеснять канотье и федоры. Нельзя сказать, что котелок – это исключительно мужская шляпа. Его также носили и женщины. Сначала дамы надевали котелки на верховую езду (причем именно незамужние девушки), а позже котелок пришёлся по вкусу и суфражисткам. В Великобритании котелки продолжали оставаться частью повседневного туалета вплоть до 1960-х (преимущественно среди мелкой буржуазии, юристов).

DEREGISTERING (CRIMP) = XX – Deregistering (Crimp) is a process of disordering or disaligning the crimp in a tow band to produce bulk. See also Threaded-Roll Process. / Crimp = Завивать или Гофрировать или Уработка. процесс разупорядочения или смещения (или сдвига, или перемещения) .

DEREGULATION = ДЕРЕГУЛИРОВАНИЕ (или ОСЛАБЛЕНИЕ РЕГУЛИРОВАНИЯ, или СНЯТИЕ ОГРАНИЧЕНИЙ) – Deregulation is the act or process of removing restrictions and regulations including government regulation of tariffs, market entry and exit and/or facilities in public services. Dismantling of anti-competitive legislation, particularly on the financial markets (liberalization). Generally speaking this refers to a controlled reduction of government intervention in economic processes. Removal of controls and abandonments of state supervision of private enterprise. Deregulation is the reduction or elimination of government power in a particular industry, usually enacted to create more competition within the industry. Traditional areas that have been deregulated are the telephone and airline industries. In the late 1990s and early 2000s the utility industry (power companies) in North America started to deregulate. / Дерегулирование или Снятие Ограничений – значительное сокращение государственного регулирования для предоставления большей свободы действию рыночных сил. После снятия ограничений на брокерские операции с акциями в середине 1970-х комиссионные перестали быть фиксированными. После снятия ограничений на банковскую деятельность в начале 1980-х банки получили большую свободу в установлении процентных ставок по вкладам и займам. В таких областях, как транспорт и связь, также были сняты определённые ограничения, что оживило конкуренцию, способствовало росту инноваций, а также объединению более слабых производителей. Однако определённая степень государственного контроля обычно сохраняется.

DERELICT = БОМЖ (или ЛИЦО БЕЗ ОПРЕДЕЛЁННОГО МЕСТА ЖИТЕЛЬСТВА) – Derelict is a person without a home, job, or property.

DERELICT = БРОШЕННОЕ (или ПОКИНУТОЕ КОМАНДОЙ СУДНО, или ОСТАВЛЕННОЕ ЭКИПАЖЕМ СУДНО, или НИЧЕЙНОЕ) – Derelict is a vessel that has been abandoned by the crew but has not sunk. Abandoned and derelict vessels (ADVs) threaten our oceans, coasts, and waterways by obstructing navigational channels, causing harm to the environment, and diminishing commercial and recreational activities. Assessing, removing, and disposing of these vessels requires significant financial and technical resources, which many states and territories lack. In addition, a number of federal agencies have different mandates and authorities to respond to abandoned and derelict vessels. Derelict (maritime term):- an abandoned vessel at sea (a danger to navigation). / Покинутое Командой Судно, но находящееся на плаву. Судно, которое было покинуто экипажем, но не затонуло.

DERIVATIVE = ПРОИЗВОДНОЕ (или ДЕРИВАТИВ) – Derivatives are financial instruments whose value varies with the value of an underlying asset (such as a stock, bond, commodity or currency) or index such as interest rates. Financial instruments whose characteristics and value depend on the characterization of an underlying instrument or asset. Derivative is a financial contract the value of which depends on the value of one or more underlying reference assets, rates or indices. For analytical purposes, all derivatives contracts can be divided into basic building-blocks of forward contracts, options or combinations thereof. A financial instrument or other contract with all three of the following characteristics:- (i) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the Underlying); (ii) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors; and (iii) it is settled at a future date. Financial instruments whose value is linked to changes in the value of another financial instrument, an indicator or a commodity. In contrast to the holder of a primary financial instrument (e.g., a government bond or a bank deposit), who has an unqualified right to receive cash (or some other economic benefit) in the future, the holder of a derivative has only a qualified right to receive such a benefit. Examples of derivatives are options and swaps. Derivatives, or Secondary Instruments, are those contracts that are based on

other products, either financial or real, or prices associated with financial products. Derivative contracts involve:- (i) future delivery, receipt or exchange of financial items such as cash or another derivative instrument; or (ii) future exchange of real assets for financial items where the contract may be tradeable and has a market value. The contracts can either be binding on both parties (as with a currency swap) or subject to the exercise by one party of a right contained in the contract (as with options). The counterparty in a derivative contract is the party assuming the credit risk. For exchange-traded contracts this is the exchange, for over-the-counter (OTC) contracts through a bank, the bank is the counterparty. A Derivative is an financial instrument that derives its value from that of an underlying instrument (such as shares, share price indices, fixed interest securities, commodities, currencies etc). Warrants Futures and, exchange-traded options and some warrants are types of derivatives. A Derivative is a risk-shifting agreement, the value of which is derived from the value of an underlying asset. The underlying asset could be a company's stock, a currency, an interest rate, a physical commodity, a stock index, or virtually any other tradable instrument upon which two parties can agree. Derivatives fall into two categories. One consists of customized, privately negotiated derivatives, which are known generically as Over-The-Counter (OTC) derivatives or, even more generically, as Swaps. The other category consists of standardized, exchange-traded derivatives, known generically as Futures. In addition, there are various types of product within each of the two categories as described below. Privately negotiated (OTC) derivatives differ from futures. First, the terms of a futures contract, including delivery places and dates, volume, technical specifications, and trading and credit procedures, are standardized for each type of contract. For swaps, the same characteristics are subject to negotiation by the parties to the contracts. Second, futures contracts are always traded on an exchange, while swaps are traded on a bilateral basis. Third, those who engage in futures transactions assume exposure to default by the exchange's clearinghouse; for OTC derivatives, the exposure is to default by the counterparty. Fourth, credit risk mitigation measures, such as regular mark-to-market and margining, are automatically required for futures but optional for swaps. Finally, futures are generally subject to a single regulatory regime in one jurisdiction, while swaps, although usually transacted by regulated firms, are transacted across jurisdictional boundaries and are primarily governed by the contractual relations between the parties. Various products, including futures contracts and exchange-traded options, fall within the generic category of futures, but all have the common characteristics described above. The definitions that follow refer exclusively to Privately Negotiated (over-the-counter (OTC)) derivatives. Financial instrument derived from a cash market commodity, futures contract, or other financial instrument. Derivatives can be traded on regulated exchange markets or over-the-counter. For example, futures contracts are derivatives of physical commodities, options on futures are derivatives of futures contracts. Derivative is a financial instrument, traded on or off an exchange, the price of which is directly dependent upon (i.e. 'derived from') the value of one or more underlying securities, equity indices, debt instruments, commodities, other derivative instruments, or any agreed upon pricing index or arrangement, e.g., the movement over time of the Consumer Price Index or freight rates. Derivatives involve the trading of rights or obligations based on the underlying product, but do not directly transfer property. They are used to hedge risk or to exchange a floating rate of return for a fixed rate of return. Derivatives include futures, options, and swaps. For example, futures contracts are derivatives of the physical contract and options on futures are derivatives of futures contracts. A type of investment whose value depends on the value of their investments, indices or assets. Futures contracts and stock options are common types of derivatives. Derivatives are trades that are derived from some other existing products, such as shares, bonds, currencies and commodities. Derivatives can be traded through an exchange or out of exchange (over the counter). Over-the-counter (OTC) derivatives carry more credit risk as they are traded direct with the counter-party rather than through an exchange. Examples of derivative instruments include caps, floors, interest rate swaps, and options. Derivative is the collective term for a future or call or a put option the price of which is derived form the value of the underlying metal. Derivative is a security whose price is dependent upon or derived from one or more underlying assets. The derivative itself is merely a contract between two or more parties. Its value is determined by fluctuations in the underlying asset. The most common underlying assets include stocks, bonds, commodities, currencies, interest rates and market indexes. Most derivatives are characterized by high leverage. Futures contracts, forward contracts, options and swaps are the most common types of derivatives. Derivatives are contracts and can be used as an underlying asset. There are even derivatives based on weather data, such as the amount of rain or the number of sunny days in a particular region. Derivatives are generally used as an instrument to hedge risk, but can also be used for speculative purposes. For example, a European investor purchasing shares of an American company off of an American exchange (using US Dollars to do so) would be exposed to exchange-rate risk while holding that stock. To hedge this risk, the investor could purchase currency futures to lock in a specified exchange rate for the future stock sale and currency conversion back into Euros. Derivatives are products whose value is primarily derived from the price, price fluctuations and price expectations of an underlying asset (such as stocks, bonds, currencies or indices). Owing to the way they are constructed, derivatives fluctuations are more pronounced than those of the underlying asset. For this reason they can be used both as a hedge against future losses and to speculate on price gains. Options, futures and swaps are among the most common types of derivatives. Derivatives are financial instruments which can be traded (e.g., options, warrants, rights, futures contracts, options on futures, etc) on various markets. They are called Derivatives because they are 'derived' from some real, underlying item of value (such as a company share or other real, tangible commodity). A derivative is a tradable 'contract', created by exchanges and dealers. A warrant or option is the simplest form of derivative. The most common usage relates to the trading of commodity futures and options on futures – where pre-defined contracts relating to a right to buy or sell and underlying commodity or security are traded as opposed to the actual commodity or security itself. They are risky because they are time-fused and can expire worthless. Yet, the rewards are enormous and they are used primarily as Hedging instruments. / , то есть . , например, . , от Латинского слова Derivatio, означающее Отведение, .

DERIVATIVE INSTRUMENTS = ПРОИЗВОДНЫЕ ИНСТРУМЕНТЫ (или ДЕРИВАТИВНЫЕ ИНСТРУМЕНТЫ) – A Derivative Instrument or product is one whose value changes with changes in one or more underlying market variables, such as equity or commodity prices, interest rates or foreign exchange rates. Basic derivatives include, forwards, futures, swaps, options, warrants and convertible bonds. In mathematical models of financial markets, derivatives are known as Contingent Claims. Derivative Instrument is a financial instrument with a value dependent on the value of some other, underlying asset. Derivative Instruments is a collective term for synthetic financial market products based on other instruments (underlyings) such as bonds, commodities, indices, shares, etc. / Обобщённый термин для синтетических продуктов финансового рынка, основанных на других (соответствующих) инструментах, таких как облигации, сырьё, индексы, акции и тому подобное.

DERIVATIVES CLEARING ORGANIZATION = ОРГАНИЗАЦИЯ ПО РАСЧЁТУ ПРОИЗВОДНЫХ (или ОРГАНИЗАЦИЯ ПО КЛИРИНГУ ДЕРИВАТИВОВ) – In the United States, a Derivatives Clearing Organization (DCO) is a clearinghouse, clearing association, clearing corporation, or similar entity that enables each party to an agreement, contract, or transaction to substitute, through novation or otherwise, the credit of the DCO for the credit of the parties; arranges or provides, on a multilateral basis, for the settlement or netting of obligations; or otherwise provides clearing services or arrangements that mutualize or transfer credit risk among participants. Any clearinghouse that seeks to provide clearing services with respect to futures contracts and options on such futures contracts traded on a designated contract market (DCM) must register with the CFTC as a DCO before it can begin providing such services. To obtain and maintain registration, a DCO must comply with the DCO core principles established in Section 5b, 7 USC § 7a-1 (7 USC is short for the United States Code:- Title 7), of the Commodity Exchange Act (CEA):- (i) adequate financial, operational,

and managerial resources; (ii) appropriate standards for participant and product eligibility; (iii) adequate and appropriate risk management capabilities; (iv) ability to complete settlements on a timely basis under varying circumstances; (v) standards and procedures to protect member and participant funds; (vi) efficient and fair default rules and procedures; (vii) adequate rule enforcement and dispute resolution procedures; (viii) adequate and appropriate systems safeguards, emergency procedures, and plan for disaster recovery; (ix) obligation to provide necessary reports to allow the CFTC to oversee clearinghouse activities; (x) maintenance of all business records for five years in a form acceptable to the CFTC; (xi) publication of clearinghouse rules and operating procedures; (xii) participation in appropriate domestic and international information-sharing agreements; and (xiii) avoidance of actions that are unreasonable restraints of trade or that impose anti-competitive burdens on trading. A clearing organization or similar entity that, in respect to a contract (i) enables each party to the contract to substitute, through novation or otherwise, the credit of the derivatives clearing organization for the credit of the parties; (ii) arranges or provides, on a multilateral basis, for the settlement or netting of obligations resulting from such contracts; or (iii) otherwise provides clearing services or arrangements that mutualize or transfer among participants in the derivatives clearing organization the credit risk arising from such contracts. / новация (заключение нового обязательства взамен ранее существовавшего). взаиморасчёт или сведение (netting) .

DERIVATIVES MARKET = РЫНОК ПРОИЗВОДНЫХ (или РЫНОК ДЕРИВАТИВОВ) – Derivatives Market is a market for options and futures. In contrast to trading in shares and bonds, transactions in derivatives trading – such as delivery, acceptance and payment – are not completed until an agreed point in the future has been reached. The Derivatives Market is the financial market for derivatives, financial instruments like futures contracts or options, which are derived from other forms of assets. The market can be divided into two, that for exchange-traded derivatives and that for over-the-counter derivatives. The legal nature of these products is very different as well as the way they are traded, though many market participants are active in both. (i) Futures exchanges, such as Euronext LIFFE and the Chicago Mercantile Exchange, trade in standardized derivative contracts. These are options contracts and futures contracts on a whole range of underlying products. The members of the exchange hold positions in these contracts with the exchange, who acts as central counterparty. When one party goes long (buys a futures contract), another goes short (sells). When a new contract is introduced, the total position in the contract is zero. Therefore, the sum of all the long positions must be equal to the sum of all the short positions. In other words, risk is transferred from one party to another. The total notional amount of all the outstanding positions at the end of June 2004 stood at USD53 trillion. That figure grew to USD81 trillion by the end of March 2008. (ii) Tailor-made derivatives, not traded on a futures exchange are traded on over-the-counter markets, also known as the OTC Market. These consist of investment banks who have traders who make markets in these derivatives, and clients such as hedge funds, commercial banks, government sponsored enterprises, etc. Products that are always traded over-the-counter are swaps, forward rate agreements, forward contracts, credit derivatives, accumulators etc. The total notional amount of all the outstanding positions at the end of June 2004 stood at USD220 trillion. By the end of 2007 this figure had risen to USD596 trillion and in 2009 it stood at USD615 trillion. The derivative markets have been accused lately for their alleged role in the financial crisis of 2007–10. The leveraged operations are said to have generated an 'irrational appeal' for risk taking, and the lack of clearing obligations also appeared as very damaging for the balance of the market. The G-20's proposals for financial markets reform all stress these points, and suggest:- (i) higher capital standards; (ii) stronger risk management; (iii) international surveillance of financial firms' operations; and (iv) dynamic capital rules. / Юроунэкст ЛАЙФ (Euronext LIFFE).

DERIVATIVES TRADING PLATFORM = ПЛАТФОРМА ДЛЯ ТОРГОВЛИ ПРОИЗВОДНЫМИ (или ПЛАТФОРМА ДЛЯ ТОРГОВЛИ ДЕРИВАТИВАМИ) – The Derivatives Trading Platform (DTP) is the computer system and associated network operated by the Australian Securities Exchange (ASX) in conducting the market for futures and exchange traded options.

DERIVATIVES TRANSACTION EXECUTION FACILITY = СИСТЕМА ИСПОЛНЕНИЯ ТРАНЗАКЦИЙ С ПРОИЗВОДНЫМИ (или СИСТЕМА ИСПОЛНЕНИЯ ОПЕРАЦИЙ С ДЕРИВАТИВАМИ) – A board of trade that is registered with the US Commodity Futures Trading Commission as a Derivatives Transaction Execution Facility (DTEF). A DTEF is subject to fewer regulatory requirements than a Contract Market. To qualify as a DTEF, an exchange can only trade certain commodities (including excluded commodities and other commodities with very high levels of deliverable supply) and generally must exclude retail participants (retail participants may trade on DTEFs through Futures Commission Merchants with adjusted net capital of at least USD20 million or registered Commodity Trading Advisors that direct trading for accounts containing total assets of at least USD25 million). / Палата Торговли (Табло Торговли, если быть более точными) .

DERIVATIVE SUIT = ПРОИЗВОДНОЕ ДЕЛО – In the United States, a Derivative Suit is a lawsuit brought by a shareholder on behalf of a corporation to protect the corporation from wrongs committed against it. / В Соединённых Штатах Америки под Производным Делом понимается судебное дело (lawsuit), возбуждённое акционером от имени корпорации с целью защиты корпорации от правонарушений, допущенных в её адрес.

DERIVED DEMAND = ПРОИЗВОДНЫЙ СПРОС – Derived Demand is the demand for each of the factors of production is often referred to as a 'derived' demand to emphasize the fact that the relationship between the factor's price and the quantity of the factor demanded by firms employing it in production is directly dependent on consumer demand for the final product(s) the factor is used to produce. If for some reason (say, for example, a spontaneous shift in consumer tastes) the demand for men's hats increases (shifts to the right) so that more hats than before can be sold at any given price, then the 'derived' demand for felt used in making hats will also increase (shift to the right) so that felt-makers will be able to sell more felt at any given price. (We would also expect the hat-makers' demand for the labor of hatters and for specialized hat-making machinery to shift to the right in a similar fashion in response to the public's greater demand for hats.) What is the mechanism by which a shift in demand for the final product is translated into a shift in demand for the factors of production used in its manufacture? The key is the change in the price of the final product brought about by the shift in demand for it. If the demand curve for hats shifts to the right and the (upwardly sloping) supply curve remains unchanged, then the equilibrium price and quantity in the hat market will now involve both a somewhat higher price for hats and a somewhat larger quantity of hats being produced and sold to the public. (Because of the price rise, the marginal revenues earned by the manufacturers per additional hat sold will be higher, so consequently their desire to maximize profits will lead them to produce additional hats until the marginal cost for the last hat rises to equal the new higher price.) But producing more hats than before will require more of the relevant factors of production than before, which they will want to purchase from their suppliers, shifting the demand curves for each of the factors to the right. This increase in demand for the factors in turn will tend to raise the factor prices somewhat and to increase the quantity of them sold, which then affects the factor producers' demand for their own necessary inputs and brings about further price-and-quantity adjustments throughout the economy in an ever-widening ripple effect. The demand for a product's transportation is derived from the product's demand at some location. / Спрос на услуги транспортировки товаров, возникающий исходя из спроса на эти товары в каком-то месте.

DERMATITIS = ДЕРМАТИТ – Dermatitis is the inflammation of the skin. Repeated contact with petroleum products can be a cause. Dermatitis:- (Latin:- Derma = Skin; -itis = suffix denoting 'Inflammation') inflammation of the skin. / Воспаление кожи. Под

Дерматитом, от Греческого слова Dérma, родительный падеж Dérmatos, означающее Кожа, понимается воспалительные заболевания кожи, развивающиеся при воздействиях на неё внешних (биологических, физических, химических) раздражителей. Дерматит, воспаление кожи, возникающее под влиянием непосредственного воздействия на неё различных агентов внешней среды – механических, физических или химических. Среди раздражителей, вызывающих дерматит, одни являются безусловными, способными вызвать дерматит у каждого человека (например, крепкие кислоты, щёлочи, высокие и низкие температуры), другие лишь условными, вызывающими дерматит только у лиц с повышенной чувствительностью (смотрите Аллергия) к ним (так называемые Аллергические Дерматиты). По течению различают острые и хронические формы дерматита. В зависимости от свойств, силы и длительности действия раздражителя, острые дерматиты характеризуются или только покраснением и отёчностью кожи, или появлением на покрасневшей коже пузырей, вскрывающихся с образованием ссадин, реже – омертвением кожи с образованием язв. Сопровождаются чувством жжения, жара, покалывания, иногда боли, реже зуда. Хронические дерматиты, возникающие под влиянием длительного воздействия относительно слабых раздражителей, характеризуются застойно-синюшной окраской, усилением кожного рисунка и более или менее выраженным утолщением её рогового слоя. Дерматиты появляются преимущественно на месте приложения раздражителя, вызвавшего дерматит; по прекращении его действия дерматиты сравнительно быстро исчезают. Дерматиты чаще возникают в производственных условиях (профессиональные дерматиты), иногда как следствие терапевтических воздействий (например, мазевые дерматиты, лучевые ожоги и тому подобное). Из механических факторов, вызывающих дерматит, наибольшее практическое значение имеют длительное давление и трение (образование потёртостей, чаще на стопах из-за ношения плохо пригнанной обуви; на коже ладоней, например, от трения вёсел, непривычного давления инструментов и тому подобного); из физических – воздействие высоких и низких температур (ожоги, отморожения), а также лучевые воздействия (Солнечные лучи, Рентгеновское и радиоактивное излучения). Чаще всего встречаются дерматиты от действия химических факторов. Число неорганических и органических химических веществ, вызывающих дерматит, значительно и с развитием промышленности увеличивается. Наиболее часто возникают дерматиты от скипидара, солей никеля, соединений хрома, различных красок, в частности урсола, применяемого для окраски меха (иногда волос). Условными раздражителями могут служить и некоторые фармакологические средства, вызывающие дерматит у лиц медицинского персонала и больных (новокаин, соединения ртути, некоторые антибиотики и другие). Дерматиты могут возникать от соприкосновения с некоторыми растениями. Насчитывается более 100 растений, одни из которых являются безусловными раздражителями (Лютик, Молочай, Ясинец Кавказский и другие), другие (Примула и другие) – условными. Лечение:- наружное применение различных противовоспалительных средств в форме примочек, мазей, паст. Профилактика:- на производстве – мероприятия, устраняющие контакт рабочих с химическими веществами, снабжение рабочих специальной защитной одеждой и индивидуальными защитными приспособлениями (щитки, маски, фартуки, перчатки и тому подобное).

DEROGATION = ДЕРОГАЦИЯ (или ПРЕНЕБРЕЖЕНИЕ, или УМАЛЕНИЕ) – Derogation is the partial revocation of a law, as opposed to abrogation or the total abolition of a law. The term is used in both civil law and common law. It is sometimes used, loosely, to mean abrogation, as in the legal maxim:- Lex posterior derogat priori, i.e. a subsequent law imparts the abolition of a previous one. Derogation differs from dispensation in that it applies to the law, where dispensations applies to specific people affected by the law. In terms of European Union legislation, a derogation can also imply that a member state delays the implementation of an element of an EU Regulation (etc) into their legal system over a given timescale, such as five years; or that a member state has opted not to enforce a specific provision in a treaty due to internal circumstances (typically a state of emergency). Derogation:- according to Article 122 of the EC Treaty, Member States with a derogation are the ones which are preparing to adopt, but have not yet adopted, the Euro. This status refers to 10 Member States (Sweden and nine of the new Member States):- rights and obligations relating to the introduction of the Euro as a single currency are not applicable to them. The case of Denmark and the United Kingdom is different:- they have an exemption from participating in the third stage of Economic and Monetary Union. A Derogation is a provision in an EU legislative measure which allows for all or part of the legal measure to be applied differently, or not at all, to individuals, groups or organisations. The option to derogate is often granted to Member States and also to the social partners. In this context, derogation is not a provision excluding application of the legal measure:- it is a choice given to allow for greater flexibility in the application of the law, enabling Member States or social partners to take into account special circumstances. An example is Article 17 (entitled 'Derogations') of Council Directive 93/104/EC of 23 November 1993 concerning certain aspects of the organisation of working time (as amended by Directive 2000/34 of 22 June 2000). Article 17(1) provides for derogation 'when, on account of the specific characteristics of the activity concerned, the duration of the working time is not measured and/or predetermined or can be determined by the workers themselves …'. Article 17(2) provides for derogations regarding 'specified activities'. Many EU directives on employment and industrial relations allow for derogations from their provisions by collective agreement. An example is in Article 17(3) of Council Directive 93/104/EC:- 'Derogations may be made from Articles 3, 4, 5, 8 and 16 by means of collective agreements or agreements concluded between the two sides of industry at national or regional level or, in conformity with the rules laid down by them, by means of collective agreements or agreements concluded between the two sides of industry at a lower level'. Another example is Article 5 of Council Directive 2002/14 establishing a framework for informing and consulting employees in the European Community:- 'Member States may entrust management and labour at the appropriate level, including at undertaking or establishment level, with defining freely, and at any time through negotiated agreement, the practical arrangements for informing employees and consulting with them'. This follows a common practice in Member States allowing for such derogations provided the result is more favourable for the workers concerned. An example of this principle is found in Article 15 of the Working Time Directive:- 'This Directive shall not affect Member States' right … to facilitate or permit the application of collective agreements or agreements concluded between the two sides of industry, which are more favourable to the protection of the safety and health of workers'. / Под Дерогацией, от Латинского слова Derogatio, понимается частичная отмена устаревшего закона, решения, постановления, договора, соглашения. Под Аброгацией, от Латинского слова Abrogatio, понимается отмена устаревшего закона либо в силу его бесполезности, либо если он противоречит духу и нравам времени. Аброгация объявляется новым законом. Термин Аброгация заимствован из Римского права. Различают:- собственно аброгацию – полную отмену старого закона новым, дерогацию – частичную отмену старого закона, оброгацию – внесение необходимых изменений в старый закон и суброгацию – дополнение старого закона.

DERRICK = ГРУЗОВАЯ СТРЕЛА (или ДЕРРИК) – (1) Derrick is the lifting equipment on a conventional vessel for loading and discharging cargo, consisting of a vertical post attached to the deck and an inclined boom. Lifting equipment on board a conventional vessel for loading and discharging cargo, consisting of a post attached to the deck and an inclined spar. / состоящее из вертикальной мачты или колонны, прикреплённой к палубе и балки-укосины (наклонённой стрелы). Под Грузовой Стрелой понимается судовое грузоподъёмное средство, представляющее собой балку-укосину, шарнирно закреплённую нижним концом на мачте или колонне, а верхним – подвешенную на тросе так, что она может поворачиваться вокруг вертикальной оси и изменять наклон. Груз поднимают и опускают с помощью лебёдки. Грузоподъёмность грузовой стрелы обычно не превышает 10 тонн, в особых случаях – до 300 тонн (тяжеловесные стрелы). Грузовая Стрела, судовое грузоподъёмное средство. Представляет собой балку-укосину, шарнирно закреплённую нижним концом на мачте или колонне, а верхним концом подвешенную на тросе

так, что она может поворачиваться вокруг вертикальной оси и изменять наклон к горизонту. Груз поднимают и опускают лебёдкой. Грузоподъёмность грузовой стрелы обычно не превышает 10 тонн (т), тяжеловесных – до 300 т. Грузовая стрела обычно состоит из стрелы, топенанта, мачты, грузового блока, грузового шкентеля, гака, оттяжек и грузовой лебёдки. Смотрите также Такелаж.

(2) Derrick is a load-bearing tower-like structure over a natural gas or crude oil well that holds the hoisting and lowering equipment for drilling, testing and reworking wells.

DES = DATA ENCRYPTION STANDARD

DES = DELIVERED EX SHIP

DESCENDING TRIANGLE = НИСХОДЯЩИЙ ТРЕУГОЛЬНИК – Descending Triangle:- in visual analysis, a sideways price pattern between two converging trendlines in which the upper trendline is descending while the lower line is flat. This is generally a bearish pattern. A formation on a bar or candle chart that is similar to a right triangle, but where the hypotenuse points in the direction of the prevailing trend, lower in this case. The breakout is expected to be in the direction of the trend (lower) which would be through the flat side of the triangle.

DESCENDING WEDGE = НИСХОДЯЩИЙ КЛИН – Descending Wedge:- in visual analysis, a narrowing of price movement within a trend lower that resembles a triangle, except both trendlines that form the boundary of the formation are pointing lower. This is considered a reversal pattern when prices break above the upper boundary line.

DESCRIPTIVE MARK = ОПИСАТЕЛЬНЫЙ ЗНАК (или ЗНАК ОПИСАТЕЛЬНОГО ХАРАКТЕРА) – Descriptive Mark:- in the US trademark law, a mark is considered merely descriptive if it describes an ingredient, quality, characteristic, function, feature, purpose or use of the specified goods or services. If a mark is merely descriptive or deceptively misdescriptive of the goods or services to which it relates, the mark will be refused registration on the Principal Register under §2(e)(1) of the Trademark Act, 15 USC §1052(e)(1); 15 USC is short for the United States Code:- Title 15. Examples of descriptive marks include:- Medical Guide for website services featuring medical guides, Denim for jeans, and Spicy Sauce for salsa.

DESCRIPTORS = ДЕСКРИПТОРЫ (или ОПИСАТЕЛИ) – Descriptors:- terms used to describe or characterize cultivars or to distinguish plants or seeds collected in germplasm programs. / Под Дескрипцией, от Латинского слова Descriptio, означающее Описание, понимается .

DESERT = ПУСТЫНЯ – Desert is a very dry area that receives less than 10 inches (25 cm) of precipitation each year. / выпадающих каждый год осадков. Под Пустыней понимается тип биома в областях с постоянно сухим и жарким климатом, препятствующим развитию растительности, которая не образует в пустыне сомкнутого покрова. Пустыни покрывают около 20% поверхности суши Земли и занимают обширные пространства в Северной и Юго-Западной Африке, Средней и Юго-Западной Азии, Австралии, на западном побережье Южной Америки. В зависимости от подстилающих пород различают глинистые, каменистые, песчаные, солончаковые и другие типы пустынь. Типичные растения – кактусы, кендырь, саксаул, солянка, эфедра; много эфемеров и эфемероидов. Животный мир:- антилопы, куланы, песчанки, суслики, тушканчики, ящерицы и многочисленные насекомые.

DESICCANT = ДЕСИКАНТ (или ОСУШИТЕЛЬ, или ВЫСУШИВАЮЩЕЕ СРЕДСТВО) – Desiccant is a substance for absorbing moisture. / Под Десикантами, от Латинских слов Desicco, означающее Высушиваю, или Desiccans (Desiccantis), означающее Высушивающий, понимаются химические препараты из группы пестицидов, вызывающие обезвоживание тканей растений. В качестве десикантов применяют, например, пентахлорфенол, тиоцианат натрия, хлорат магния, цианамид кальция. Применение десикантов способствует ускорению созревания сельскохозяйственных культур и облегчению механизации их уборки. Десиканты используются для подсушивания – десикации Картофеля, Клещевины, Риса, Хлопчатника и других.

DESICCATORS = ДЕСИКАТОР – Desiccator is a glass jar, fitted with an airtight cover, containing some desiccating (drying) agent such as calcium chloride at the bottom.

DESIGNATED AGENT = НАЗНАЧЕННЫЙ АГЕНТ – Designated Agent is any entity that performs actions or functions on behalf of the Transmission Provider, an eligible Customer or the Transmission Customer required under the Tariff.

DESIGNATED CONTRACT MARKET = ОПРЕДЕЛЁННЫЙ (или ПРЕДСТАВЛЕННЫЙ, или ЦЕЛЕВОЙ) РЫНОК КОНТРАКТОВ – Designated Contract Markets (DCMs) are boards of trade (or exchanges) that operate under the regulatory oversight of the US Commodity Futures Trading Commission (CFTC), pursuant to Section 5 of the Commodity Exchange Act (CEA), 7 USC 7. DCMs are most like traditional futures exchanges, which may allow access to their facilities by all types of traders, including retail customers. DCMs may list for trading futures or option contracts based on any underlying commodity, index or instrument. Part 38 of the CFTC's regulations, 17 CFR Part 38, details the procedures and requirements for operating as a board of trade (or exchange). How to Become a Designated Contract Market? Any market that seeks to provide a trading facility for non-eligible contract participants to trade futures, options on futures or options on commodities must apply to the Commission to be designated as a contract market (DCM), unless some exemption or exclusion would apply to the facility. Criteria, procedures and requirements for designation as a DCM are set forth in Section 5 of the CEA, 7 USC 7, and Part 38 of the CFTC's regulations. Appendix A and B provide specific information on these requirements and guidance to applicants seeking to become designated as DCMs. Security futures products are subject to special requirements such as joint CFTC and Securities and Exchange Commission (SEC) oversight, and can be offered only by markets that are either regulated by the CFTC and notice-registered with the SEC or regulated by the SEC and notice-registered with the CFTC. Options on securities and securities indexes can only be traded on a securities exchange under the jurisdiction of the SEC. To obtain and maintain its designation, a DCM must also comply, on an initial and ongoing basis, with the following twenty-three Core Principles established in Section 5(d) of the CEA, 7 USC 7(d) and Part 38 of the CFTC's regulations and with the implementing regulations under Part 38 of the CFTC's regulations:- Designation as Contract Market; Compliance with Rules; Contracts Not Readily Subject to Manipulation; Prevention of Market Disruption; Position Limitations or Accountability; Emergency Authority; Availability of General Information; Daily Publication of Trading Information; Execution of Transactions; Trade Information; Financial Integrity of Transactions; Protection of Markets and Market Participants; Disciplinary Procedures; Dispute Resolution; Governance Fitness Standards; Conflicts of Interest; Composition of Governing Boards of Contract Markets; Recordkeeping; Antitrust Considerations; System Safeguards; Financial Resources; Diversity of Boards of Directors; and Securities and Exchange Commission. Appendix A to Part 38 of the CFTC's regulations includes Form DCM, which contains instructions and a list of necessary information and documentation required to initiate the designation process. Appendix B to Part 38 provides guidance on complying with certain core principles. For certain core principles, Appendix B also provides acceptable practices for meeting selected requirements. The Division of Market Oversight's Examinations Branch conducts regular reviews of each DCM's ongoing compliance with core principles and the implementing regulations under Part 38, examining the self-regulatory programs operated by the exchange in order to enforce its rules, prevent market manipulation and

customer and market abuses, and ensure the recording and safe storage of trade information, among other requirements. These reviews are known as Rule Enforcement Reviews (RERs). DCMs may implement new rules or rule amendments by filing with the CFTC a certification that the rule or rule amendment complies with the CEA and CFTC regulations and policies and/or by requesting approval from the CFTC, pursuant to the requirements under Part 40 of the CFTC's regulations. DCMs, like other entities, may submit requests that the CFTC take action on a number of other issues, including requesting no-action relief, interpretations, or guidance on particular issues. DCMs also may list new products by filing with the CFTC, among other things, a certification that the product complies with the CEA and CFTC regulations and policies and/or by requesting approval from the CFTC. A dormant contract market defined in CFTC Regulation 40.1, is any DCM on which no trading has occurred during a period of twelve consecutive calendar months, preceding the first day of the most recent calendar month. Prior to listing or re-listing products for trading (including listing new contract months in existing products), a dormant DCM must reinstate its designation. To be reinstated, a dormant contract market submits an application for reinstatement under the procedures found in CFTC Regulation 38.3(a)(1) and (2), although the application might rely on previously submitted materials that still pertain to, and accurately describe, the contract market conditions. Newly designated contract markets, however, are not considered to be dormant until the end of a grace period of 36 consecutive calendar months following the day that the order of designation is issued. Exchanges previously designated by the CFTC or by the Secretary of Agriculture prior to 1975 as contract markets under the CEA and subsequently vacated at the request of the exchange or whose designation was otherwise revoked must reapply to the CFTC for contract market designation prior to listing contracts for trading. See also Contract Market.

DESIGNATED FACILITY = НАЗНАЧЕННОЕ МЕСТО – Designated Facility, as relates to the US/Canada Greenhouse Certification Program (the Program), a designated facility is a nursery establishment that has signed a compliance agreement and is in compliance with the terms and conditions of the Program. Plants shipped by a designated facility may be produced at their own facility or may be produced at another facility approved in the Program. / Парник (Greenhouse).

DESIGNATED OFFICE = УКАЗАННОЕ ВЕДОМСТВО (или УКАЗАННАЯ КОНТОРА) – Designated Office (DO) is the national office or intergovernmental organization of or acting for the Contracting State designated by the applicant under Chapter I of the Patent Cooperation Treaty. / Указанное Ведомство, в котором предполагается получить правовую охрану на основе международной заявки.

DESIGNATED SELF–REGULATORY ORGANIZATION = НАЗНАЧЕННАЯ САМОРЕГУЛИРУЕМАЯ ОРГАНИЗАЦИЯ – Designated Self-Regulatory Organization:- Self-Regulatory Organizations (SRO, i.e. the commodity exchanges and registered futures associations) must enforce minimum financial and reporting requirements for their members, among other responsibilities outlined in the US CFTC's (short for the Commodity Futures Trading Commission) regulations. When a Futures Commission Merchant (FCM) is a member of more than one Self-Regulatory Organization, the SROs may decide among themselves which of them will be primarily responsible for enforcing minimum financial and sales practice requirements and, upon approval of the plan by the Commission, be appointed the 'designated self-regulatory organization' for that particular FCM. The US National Futures Association is the Designated Self-Regulatory Organization (DSRO) for all non-exchange member FCMs. See also Self-Regulatory Organization. Designated Self Regulatory Organization (DSRO):- when a futures commission merchant (FCM) is a member of more than one Self-Regulatory Organization (SRO), the SROs may decide among themselves which of them will be primarily responsible for enforcing minimum financial and sales practice requirements. With approval, the SRO will be appointed DSRO for the particular FCM. / , то есть .

DESIGNATED SPONSOR = НАЗНАЧЕННЫЙ СПОНСОР – Designated Sponsor is a banks or specialized traders who bridge temporary imbalances between supply and demand in Xetra® electronic stock trading, thereby improving a stock's liquidity. They do so by quoting bid and ask limits (market making), either on their own initiative, on request of a market participant (quote reuest) or in auctions. The fact that these quotes are shown in the order books gives investors greater security for limiting their orders. Depending on the market segment involved, a stock may have one or more designated sponsors, or none at all. On arrangement with issuers, designated sponsors with the necessary capabilities may also provide research or investor relations services. / Ксэтра® (Xetra®).

DESIGNATION = ЗВАНИЕ (или ПРЕДСТАВЛЕНИЕ, или ОБОЗНАЧЕНИЕ, или ПРЕДНАЗНАЧЕНИЕ, или ЧИН) – Designation, in relation to a member of the crew of a vessel, includes:- (i) the position held by that member of the crew; (ii) a description of the duties of that member of the crew; and (iii) the class of certificate of competency held by that member of the crew. / Звание, в отношении члена экипажа судна, заключается в:- (i) должности, удерживаемой данным членом экипажа; (ii) описании обязанностей данного члена экипажа; и (iii) классе свидетельства о компетентности, удерживаемого данным членом экипажа. Чин, служебный разряд служащих, с которым связаны определённые права и обязанности.

DESIGNATION = УКАЗАНИЕ – In the US patent law, Designation is an indication made by applicant, in the request for an International Application filed under the Patent Cooperation Treaty, as to the Contracting States in which protection for an invention is desired.

DESIGNATION DATE = ДАТА ПРЕДСТАВЛЕНИЯ (или ДАТА НАЗНАЧЕНИЯ, или ДАТА УТВЕРЖДЕНИЯ) – The Designation Date is the date on which the exchange was authorized to trade the contract, i.e. the exchange was 'designated' as a 'contract market' in that particular commodity by the US Commodity Futures Trading Commission (CFTC) or its predecessor agency. If an exchange was previously designated by the Secretary of Agriculture as a contract market in a commodity, and that designation was in effect on July 18, 1975, the Commission did not specifically designate them as such on July 18, 1975. Those designations continued in force and effect by virtue of section 411 of the Commodity Futures Trading Commission Act of 1974. Prior to July 18, 1975, the commodities for which designation was granted by the Secretary of Agriculture were among the list of agricultural and animal product commodities explicitly set forth in section 2(a)(1) of the Commodity Exchange Act. On July 18, 1975, the Commission gave contract market designation to many of the exchanges which traded in previously unregulated commodities, having given provisional contract market designations on April 18, 1975, and having extended such designations on May 05. The effect of the July 18, 1975, designations was to bring under federal regulation all commodities for which a futures contract was actively traded. Previously unregulated commodities, such as COMEX's mercury and rubber contracts, for which no contract market designations were granted on that date, were not permitted to continue trading after July 18, 1975.

DESIGN DAY = ПЛАНОВЫЕ СУТКИ (или УСЛОВНЫЕ СУТКИ) – Design Day:- a 24-hour period of demand used as a basis for planning gas capacity requirements. / Период спроса продолжительностью 24 часа, используемый в качестве основы для планирования потребностей в газовых мощностях.

DESIGNERS = ДИЗАЙНЕРЫ (или МОДЕЛЬЕРЫ) – Designers are people with a desire to create. They combine practical knowledge with artistic ability to turn abstract ideas into formal designs for the clothes that we wear, the living and office space that we inhabit, and the merchandise that we buy. Designers usually specialize in a particular area of design, such as automobiles, clothing,

furniture, home appliances, industrial equipment, interiors of homes or office buildings, movie and theater sets, packaging, or floral arrangements.

DESIGN OF EXPERIMENT = ДИЗАЙН ЭКСПЕРИМЕНТА – Design Of Experiment:- the complete sequence of steps taken ahead of time to ensure that the appropriate data will be obtained, which will permit an objective analysis and will lead to valid inferences regarding the stated problem.

DESIGN PATENT = ПАТЕНТ НА ПРОМЫШЛЕННЫЙ ОБРАЗЕЦ (или ПАТЕНТ НА ДИЗАЙН, или ПАТЕНТ НА ПРОЕКТ) – Design Patent may be granted to anyone who invents a new, original, and ornamental design for an article of manufacture. See also Patent. / Может быть предоставлен тому, кто изобретает новый, оригинальный и орнаментальный дизайн для изделия изготовления. Промышленный Образец, новое художественно-конструкторское решение изделия, определяющее его внешний вид, соответствующее требованиям технической эстетики, пригодное к осуществлению промышленным способом и дающее положительный эффект. Объект промышленной собственности. Под Дизайном, от Английского слова Design, означающее Задумать или Проектировать или Чертить, а также План или Проект или Рисунок, понимается термин, обозначающий новый вид деятельности по проектированию предметного мира. Дизайн возник в начале XX века как реакция на стихийное формирование визуальных и функциональных свойств предметной среды. Дизайн разрабатывает образцы её рационального построения, соответствующие сложному функционированию современного общества. Иногда под дизайном понимают лишь одну из его областей – проектирование эстетических свойств промышленных изделий. Дизайн, однако, решает более широкие социально-технические проблемы – функционирования производства, потребления, существования людей в предметной среде. Дизайн находится в особом отношении ко всем традиционным видам проектирования, разрешая затруднения, которые связаны с внедрением в жизнь конкретных людей и общества в целом новых предметных организаций, создающих неравновесную ситуацию в предметном мире. Слово ‘Дизайн’ применяется также для обозначения результата проектной деятельности (например, в таких словосочетаниях, как Дизайн Вещи, Дизайн Автомобиля), причём в данном употреблении оно не всегда связывается с современной практикой и порой означает морфологию предметного мира, создаваемого человеком на разных стадиях развития общества. В этом смысле говорят о первобытном дизайне, о дизайне XVIII века и тому подобном. Для обозначения дизайнерской деятельности в разных её аспектах и проявлениях в различных языках, наряду с термином Дизайн, существуют и другие:- ‘Художественное Конструирование’ (в Русском), Formgebung и Formgestaltung (в Немецком), Wzornictwo Przemysłowe (в Польском) и так далее. Но в 1959 на первой генеральной ассамблее МСОИД (ICSID (International Council of Societies of Industrial Design); Международный Совет Организаций Индустриального Дизайна), членом которого являлся и бывший Союз Советских Социалистических Республик (СССР), в качестве основного международного термина был всё же принят термин Industrial Design (в профессиональном сокращении – Design), как наиболее ёмкий по своей смысловой структуре. В бывшем СССР дизайнерская деятельность осуществляется в системе организаций, состоящей из специальных художественно-конструкторских бюро. Научно-исследовательскими и опытно-конструкторскими центрами являлись Всесоюзный НИИ Технической Эстетики и его филиалы, а также Экспериментальная Студия при Союзе Художников СССР. Они осуществляли методическое руководство, разрабатывали перспективные модели, методы прогнозирования, устанавливали критерии качества промышленных изделий, изучали теорию и историю дизайна. Вопросы дизайна систематически освещались в журнале Декоративное Искусство СССР и бюллетене Техническая Эстетика.

DESIGN PATENT APPLICATION = ЗАЯВКА НА ПОЛУЧЕНИЕ ПАТЕНТА НА ПРОМЫШЛЕННЫЙ ОБРАЗЕЦ (или ЗАЯВКА НА ПОЛУЧЕНИЕ ПАТЕНТА НА ДИЗАЙН, или ЗАЯВКА НА ПОЛУЧЕНИЕ ПАТЕНТА НА ПРОЕКТ) – Design Patent Application is an application for a patent to protect against the unauthorized use of new, original, and ornamental designs for articles of manufacture. See also Application, and Patent.

DESIGN SEARCH CODE MANUAL = РУКОВОДСТВО ПО ВЫБОРУ КОДОВ ДИЗАЙНА – Design Search Code Manual lists the numerical codes for searching designs in the USPTO’s (short for the United States Patent and Trademark Office) trademark database (the US Trademark Electronic Search System (TESS)).

DESIZING = РАСШЛИХТОВКА – Desizing is a removal of size from fabric. Desizing is an important step prior to dyeing fabric, since size can interfere with dye uptake. Some size materials wash out easily. Starch is commonly used for size, and can be quite difficult to remove. Amylase enzymes are often used industrially for starch removal. Some sizes can be readily removed by hot water washing. Desizing is a removal of warp sizing from gray goods in the finishing plant; enzymes are often used for the purpose. Desizing is the process whereby the warp sizing of gray goods is removed, usually by use of an enzyme. / Расшлихтовка:- основной задачей расшлихтовки является удаление из ткани шлихты, нанесённой с целью упрочить нити основы перед ткачеством. Выбор рациональных способов расшлихтовки определяется составом шлихты и характером волокнистого материала. В настоящее время значительная часть основ в хлопчатобумажном производстве шлихтуется производными крахмала, характеризующимися интенсивной адгезией к поверхности волокон и сходством их химического строения с целлюлозой. Поэтому под расшлихтовкой ткани понимают такую её обработку, которая обеспечивает перевод крахмала шлихты из нерастворимых в растворимые в воде продукты с последующим их удалением промывкой. В последние два десятилетия постепенная замена крахмала водорастворимыми материалами стала возможной благодаря применению для шлихтования новых искусственных и синтетических шлихтующих материалов. Крахмальные препараты частично заменяются водорастворимыми полимерами и оглнгомерами. Однако, чтобы понять сущность процессов расшлихтовки, надо знать свойства крахмала и других шлихтующих материалов. Крахмал – основной резервный углевод растений – представляет собой смесь двух полисахаридов:- линейного – амилозы (10–30%) и разветвлённого – амилопектина (70–90%). Полисахариды крахмала относятся к высокомолекулярным, высокополимерным соединениями и построены из остатков глюкозы, соединённых между собой 1,4-а-глкжозидными связями, неустойчивыми к действию гидролизующих агентов, к которым относятся минеральные кислоты, ферменты а- и р-амилазы, глюкоамилаза, способные гидролизовать крахмал полностью, вплоть до глюкозы. Продукты гидролиза крахмала не только хорошо набухают в воде, как и сам крахмал, но способны, хотя и в различной степени, растворяться в воде. А это главное условие для удаления шлихты с ткани промывкой её водой. Предварительно на крахмал шлихты необходимо подействовать сильно диссонирующей кислотой, в результате чего происходит постепенное превращение крахмала в растворимые в воде продукты гидролиза по схеме крахмал → растворимый крахмал → декстрин → амило-декстрин → эритродекстрин → ахродекстрин → мальтодекстрин → мальтоза → глюкоза. Следовательно, под влиянием кислот или ферментов происходит гидролитический распад амилозы и амилопектина крахмала с образованием простых соединений, которые отличаются большой растворимостью в воде и высокой восстановительной способностью. При действии на крахмал щёлочей образуются растворимые в воде соединения типа алкоголятов; при действии окислителей крахмал и крахмалопродукты окисляются с образованием низкомолекулярных производных, растворимых в воде. При действии энзимов и ферментов крахмал подвергается гидролизу и брожению, то есть распаду с образованием простых соединений, отличающихся растворимостью в воде и восстановительной способностью. Пользуясь указанными выше реагентами в соответствующих технологических условиях, крахмал можно перевести в соединения, более

растворимые в воде, и удалить с волокна. В процессах расшлихтовки крахмал переводится лишь в растворимую форму, так как в последующих стадиях гидролиза здесь нет необходимости. Основная масса шлихты удаляется с ткани при расшлихтовке, оставшаяся на волокне незначительная часть крахмала окончательно снимается в процессах отварки ткани. До настоящего времени потребность текстильной промышленности в материалах, заменяющих пищевые крахмалопродукты, ещё далеко не удовлетворяется химической промышленностью. Новые искусственные и синтетические шлихтующие материалы для хлопчатобумажных основ применяются ещё довольно мало. Среди них представляют интерес поливиниловый спирт (ПВС), простые эфиры целлюлозы в виде карбоксиметилцеллюлозы (КМЦ) и оксиэтилцеллюлозы, сульфонаты целлюлозы, а также 8%-ный полиакриламид (ПАА).

THE DESK = УПРАВЛЕНИЕ – In the United States, The Desk is the trading desk at the Federal Reserve Bank of New York through which open market purchases and sales of government and federal agency securities are made. The desk maintains direct telephone communication with major government securities dealers. A 'foreign desk' at the Federal Reserve Bank of New York conducts transactions in the foreign exchange market. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

DESORPTION = ДЕСОРБЦИЯ – Desorption:- opposite of absorption or adsorption. In filtration, it relates to the downstream release of particles previously retained by the filter. Desorption is a release of the water vapor from a substance. / Под Десорбцией, от Латинской приставки De, означающей Отделение или Отмену или Удаление или Уничтожение, и Латинского слова Sorbeo, означающее Поглощаю, понимается удаление поглощённого вещества с поверхности адсорбента, ионита или из объёма абсорбента. Проводится при повышении температуры (например, термодесорбция) или промывкой ионита каким-либо раствором. Десорбция – удаление из жидкостей или твёрдых тел веществ, поглощённых при адсорбции или абсорбции. Применяется при регенерации адсорбентов и абсорбентов путём нагревания, понижения давления, продувки несорбируемыми газами или парами, обработки растворителями. Десорбция, удаление адсорбированного вещества с поверхности адсорбента. Десорбция обратна адсорбции и происходит при уменьшении концентрации адсорбируемого вещества в среде, окружающей адсорбент, а также при повышении температуры. Десорбцию применяют для извлечения из адсорбентов поглощённых ими газов, паров или растворённых веществ, а также для регенерации адсорбента. Практически при десорбции через слой адсорбента продувают горячий водяной пар, воздух или инертные газы, увлекающие ранее поглощённое вещество, или промывают слой адсорбента различными реагентами, которые растворяют адсорбированное вещество. Адсорбент после десорбции обычно сушат и охлаждают. Скорость десорбции зависит от температуры, природы и скорости потока десорбирующего газа или растворителя, а также от особенностей структуры адсорбента. Десорбция – один из обязательных циклов при адсорбции в аппаратах периодического действия. Десорбция в адсорберах с подвижным адсорбционным слоем протекает непрерывно.

DESORPTION ISOTHERM = ИЗОТЕРМА ДЕСОРБЦИИ – Desorption Isotherm is a graphical representation of the release of water vapor from a substance in relation to its water content at a specified temperature. For product information purposes, the isotherms are usually taken for a temperature of 20 °C. / Под Изотермами, от Греческих слов Isos, означающее Одинаковый или Равный, и Thérmē, означающее Тепло, понимаются:- (1) в физике:- линии на диаграммах состояния, изображающие равновесный изотермический процесс; или (2) в географии:- изолинии температур на картах, гидрологических разрезах и так далее, соединяющие точки с одинаковой температурой воды, воздуха или почвы в определённый период времени. Под Десорбцией, от Латинских слов De, означающее Отмена или Отсутствие или Устранение чего-либо, или Движение Вниз или Понижение, и Sorbeo, означающее Поглощаю, понимается удаление из жидкостей или твёрдых тел веществ, поглощённых при абсорбции или адсорбции. Применяется при регенерции абсорбентов и адсорбентов путём нагревания, понижения давления, продувки несорбируемыми газами или парами, обработки растворителями.

DESPATCH = ДИСПАЧ (или ПРЕМИЯ ЗА ДОСРОЧНОЕ ОКОНЧАНИЕ СТАЛИИ) – Despatch:- an incentive payment paid to a carrier to loading and unloading the cargo faster than agreed. Usually negotiated only in charter parties. Also known as Dispatch. See also Demurrage, and Dispatch. / Диспач это денежная сумма, уплачиваемая перевозчиком грузоотправителю или грузополучателю в качестве премии за освобождение судна из-под погрузки/выгрузки до истечения установленных сроков погрузки/выгрузки.

DESPATCH ADVICE = ИЗВЕЩЕНИЕ ОБ ОТПРАВКЕ – Despatch Advice:- information send by shippers to the recipient of goods informing that specified goods are sent or ready to be sent advising the detailed contents of the consignment.

DESPATCH DAYS = СУТКИ ДИСПАЧА (или СУТКИ ДОСРОЧНОГО ОКОНЧАНИЯ ПОГРУЗКИ ГРУЗА) – Despatch Days are the days gained if the free time included in the rate and allowed for the use of certain equipment is not fully used.

DESPATCH DATE = ДАТА ВЫПИСКИ – In sharemarket, Despatch Date is the date by which an issuer must have dispatched certificates (or in the case of rights, entitlement and acceptance forms) or entered Financial Products into holders' uncertificated holdings.

DESSICATED = ВЫСУШЕННОЕ (или СУШЁНОЕ) – Dessicated:- dried, wrinkled. / , от Латинского слова Desicco, означающее Высушиваю, понимается .

DESTINATION = ПУНКТ НАЗНАЧЕНИЯ – (1) Destination is the place to which a shipment is consigned. / Место, в которое произведена отгрузка.

(2) Destination is the place where carrier actually turns over cargo to consignee or his agent. / Место, в котором грузоперевозчик сдаёт груз грузополучателю или его агенту.

DESTINATION CONTROL STATEMENT = КОНТРОЛЬНАЯ ВЫПИСКА ИЗ ПУНКТА НАЗНАЧЕНИЯ – Destination Control Statement:- any of various statements which the US Government requires to be displayed on export shipments and which specify the destinations for which export of the shipment has been authorized.

DESTINATION DELIVERY CHARGE = СБОР ЗА ПОСТАВКУ К МЕСТУ НАЗНАЧЕНИЯ – A charge assessed by the carrier for handling positioning of a full container within the container yard. Destination Delivery Charge (DDC) is a charge, based on container size, that is applied in many tariffs to cargo. This charge is considered accessorial and is added to the base ocean freight. This charge covers crane lifts off the vessel, drayage of the container within the terminal and gate fees at the terminal operation.

DESTINATION INTERCHANGE TERMINAL = ТЕРМИНАЛ ВЗАИМООБМЕНА ПЕРЕД ПУНКТОМ НАЗНАЧЕНИЯ – Destination Interchange Terminal (DIT) is a facility operated by the ocean carrier or his agent at which containers are interchanged with the delivering motor carrier.

DESTINATION MOTOR TERMINAL = АВТОМОБИЛЬНЫЙ ТЕРМИНАЛ ПО МЕСТУ НАЗНАЧЕНИЯ – Destination Motor Terminal is a location designated by a motor carrier at destination points where, the motor carrier or his authorized agent assembles, holds or stores an ocean carrier's containers and chassis; where loaded containers are received from shippers or their agents; where empty containers are delivered to shippers or their agents. See also Origin Motor Terminal and Origin Rail Terminal.

DESTINATION RAIL FREIGHT STATION = ГРУЗОВАЯ ЖЕЛЕЗНОДОРОЖНАЯ СТАНЦИЯ НАЗНАЧЕНИЯ – Destination Rail Freight Station is the same as container freight station (CFS) at destination, except a destination rail freight station (DRFS) is operated by the rail carrier participating in the shipment.

DESTUFF = ОПОРОЖНЯТЬ – Destuff:- to empty a container. / Опоражнивать контейнер.

DETECTION = ВЫЯВЛЕНИЕ (или ОБНАРУЖЕНИЕ) – Detection is the discovery of a specimen of the target pest. / Под Выявлением понимается обнаружение вредителя в ходе досмотра или анализа привозимого (или импортируемого) груза.

DETECTION SURVEY = ОБСЛЕДОВАНИЕ НА ВЫЯВЛЕНИЕ (или ИЗЫСКАНИЕ НА ВЫЯВЛЕНИЕ) – Detection Survey is a survey conducted in an area to determine if pests are present.

DETECTOR = ДЕТЕКТОР – Detector is a device to convert radiant energy (light) into a neural signal (such as the eye) or an electrical signal (such as a phototube, photomultiplier tube, photocell, photodiode, or the like).

DETENTION = ЗАДЕРЖАНИЕ – (1) Detention is a keeping a consignment in official custody or confinement, as a phytosanitary measure. See also Quarantine.

(2) According to the Lisbon Rules, Detention means the period of time during which the claimant is deprived of the use of the vessel. / Согласно Лиссабонским Правилам, под Задержанием понимается период времени, в течение которого претендатель (заявитель претензии) лишён возможности использования судна по назначению.

DETENTION = СРОК ОБОЖДАНИЯ (или ПРОСТОЙ, или КОНТРСТАЛИЯ) – Detention:- keeping equipment beyond the free time allowed. See also Demurrage, and Per Diem. Compensation payable to the ocean carrier/container owner for the detention of his equipment beyond the allowable free time. Detention:- costs incurred when a shipper/consignee or his/her agent removes a container from the carrier's origin/destination container yard (CY) to the shipper/consignee's place of business, and does not return the loaded/empty container to the CY or to another location designated by the carrier within the permitted freetime as stipulated in the applicable tariff. A penalty charge against shippers or consignees for delaying carrier's equipment beyond allowed time. Demurrage applies to cargo; detention applies to equipment.

DETENTION CHARGE = СБОР ПО СРОКУ ОБОЖДАНИЯ (или СБОР ЗА ПРОСТОЙ, или КОНТРСТАЛИЙНЫЕ) – Charges levied on usage of equipment exceeding free time period. Detention Charges are the charges levied on usage of equipment exceeding free time period as stipulated in the pertinent inland rules and conditions.

DETERGENT = ДЕТЕРГЕНТ (или МОЮЩЕЕ СРЕДСТВО) – Detergent:- in lubrication, either an additive or a compounded lubricant having the property of keeping insoluble matter in suspension thus preventing its deposition where it would be harmful. A detergent may also redisperse deposits already formed. Detergent is a synthetic cleaning agent containing surfactants that do not precipitate in hard water and have the ability to emulsify oil and suspend dirt. Detergent is a synthetic cleansing agent resembling soap in its ability to emulsify oil and remove hard dirt, and contains surfactants that do not precipitate in hard water. / осадок (precipitate). Под Детергентами за рубежом понимаются синтетические моющие средства – многокомпонентные смеси веществ, водяные растворы которых применяют для очистки поверхности различных тел от загрязнений. В состав большинства моющих средств, помимо моющих веществ, входят соли неорганических кислот (карбонаты, фосфаты), усиливающие моющее действие, а также отбеливающие и дезинфицирующие вещества, пенообразователи или пеногасители, ароматизирующие вещества, красители и другие. Моющие Средства, вещества или смеси веществ, применяемые в водных растворах для очистки (отмывки) поверхности твёрдых тел от загрязнений. К моющим средствам относятся многокомпонентные смеси синтетических моющих (мылоподобных) веществ и различных вспомогательных составляющих (минеральных солей, органических добавок и других) – так называемых Синтетических Моющих Средств, все виды товарного жирового мыла, ряд продуктов природного происхождения (например, сапонины, жёлчь). С древнейших времён как моющие средства употреблялись щелочные соли (поташ из растительной золы, природная сода), гидрофильные глины (например, бентонитовые), сок или водная вытяжка из некоторых растений. Все эти природные моющие средства быстро утратили своё хозяйственное значение с возникновением в XIX веке мыловаренной промышленности. Промышленный выпуск синтетических моющих средств впервые осуществлён в Германии ещё в 1930-х; с 1950-х их производство резко возросло во всех промышленно развитых странах, причём доля жирового мыла в общем выпуске моющих средств значительно снизилась. К 1965 уже 50–90% общего объёма производства моющих средств в основных капиталистических странах составляли синтетические моющие средства. Снижение выработки жирового мыла идёт за счёт сокращения производства хозяйственного мыла. Производство же туалетного мыла во всех странах из года в год возрастает. В бывшем Союзе Советских Социалистических Республик (СССР) выработка туалетного мыла в 1970 увеличилась в 1.4 раза по сравнению с 1965. Суммарный выпуск синтетических моющих средств и мыла (в пересчёте на 40%-ное содержание жирных кислот) в бывшем СССР в 1965 и 1972 составил соответственно (в тысяч тонн (т)):- 1 926 (в том числе синтетических моющих средств 144) и 1 757 (534). Моющие Вещества (МВ) составляют основу всех моющих средств и определяют их свойства; это мицеллообразующие поверхностно-активные вещества, благодаря которым растворы (правильнее – полуколлоидные системы) обладают моющей способностью (смотрите Моющее Действие). МВ делятся на два класса:- (i) ионогенные вещества, диссоциирующие в воде на ионы, и (ii) неионогенные – не подверженные электролитической диссоциации. Ионогенные МВ называются Анионактивными, если поверхностно-активные ионы несут отрицательный заряд, Катионактивными, если поверхностно-активны положительно заряженные ионы, и Амфотерными, или Амфолитными, если поверхностно-активные ионы имеют отрицательный заряд в щелочной среде и положительный – в кислой. Анионактивные МВ получили наиболее широкое распространение. На их основе получают все жировые мыла и большинство синтетических моющих средств. Для производства товарных жировых мыл служат главным образом натриевые или калиевые соли высших жирных кислот, изготавливаемые из масел растительных и жиров животных. Важнейшие представители синтетических анионактивных МВ – соли сульфокислот и кислых сульфоэфиров (алкилсульфонаты, алкиларилсульфонаты, алкилсульфаты) и сульфированные жиры, масла и жирные кислоты. Другие анионактивные МВ выпускаются в относительно малых количествах. Неионогенные МВ, входящие в состав некоторых моющих средств, занимают 2-е место после анионактивных по объёму промышленного производства. Большинство неионогенных веществ – полиоксиэтиленовые (полигликолевые) эфиры различных органических кислот, спиртов, алкилфенолов и алкилнафтолов, полиоксиэтиленовые производные алифатических аминов и амидов, меркаптанов и так далее. Катионактивные и амфотерные вещества составляют лишь несколько % в общем объёме производства МВ и имеют ограниченное хозяйственное значение. Из катионактивных веществ наиболее важны соли

четвертичных аммониевых и пиридиниевых оснований, обладающие бактерицидным действием. В молекулах амфотерных веществ находятся как основные (обычно аминогруппы), так и кислотные (карбоксильные, сульфоновые или сульфоэфирные) группы. Синтетические моющие средства обязательно содержат ряд вспомогательных веществ, улучшающих их моющую способность. В состав моющих композиций для стирки включают щелочные соли слабых неорганических кислот (карбонат и бикарбонат натрия, силикаты натрия, фосфаты различного состава), нейтральные соли (сульфат, хлорид натрия), соли перекисных кислот, обладающие отбеливающими и дезинфицирующими свойствами (перборат и перкарбонаты натрия). Важную роль играют органические компоненты моющих средств:- карбоксиметилцеллюлоза, предотвращающая ресорбцию – повторное отложение загрязнений из моющего раствора на отмытую поверхность; оптические отбеливатели (красители), применяемые для устранения жёлтого оттенка неокрашенных тканей; так называемые Гидротропы, увеличивающие растворимость и ускоряющие растворение МВ в воде (смотрите Гидротропия). Некоторые моющие средства содержат ферменты, обеспечивающие удаление нерастворимых белковых загрязнений, органические бактерициды (гексахлорофен, трихлоркарбанилид и другие), стабилизаторы пены (например, алкилоламиды) или пеногасители; во многие моющие средства добавляют душистые вещества (отдушки). Рецептурный состав моющих средств определяется их назначением, экономическими и санитарно-гигиеническими требованиями. Большая часть (80–90%) поступающих в продажу синтетических моющих средств – порошки; выпускаются также таблетки, ‘вермишель’, чешуйки, хлопья, пасты и жидкости. Различают синтетические моющие средства для стирки, мытья посуды и домашней утвари, туалетные, промышленного назначения и другие. Моющие средства для стирки можно разделить на группы:- средства для шерстяных и шёлковых тканей, хлопчатобумажных и льняных тканей, универсальные средства для тканей разных типов, в том числе из химических волокон, для стирки сильно загрязнённых изделий из грубых тканей. Современные синтетические моющие средства для стирки не уступают по качеству лучшим сортам жирового мыла, причём их моющая способность, в отличие от мыла, не снижается при отмывке кислых загрязнений и пользовании жёсткой водой. В бывшем СССР выпускались порошки для стирки хлопчатобумажных и льняных тканей (‘Эра’), шёлковых, шерстяных тканей и тканей из искусственных и синтетических волокон (‘Новость’) и универсального порошка для любых тканей (‘Лотос’). В связи с прогрессирующим загрязнением окружающей среды промышленными и бытовыми отходами особое внимание при разработке новых рецептур синтетических моющих средств уделяют подбору веществ биологически ‘мягких’, то есть легко разлагаемых Бактериями в природных условиях. Препараты на основе таких веществ (например, производных алифатических кислот и спиртов линейного строения) постепенно вытесняют из употребления моющие средства, содержащие биологически ‘жёсткие’ – неразлагаемые – компоненты (например, производные алкилароматических соединений разветвлённого строения). Синтетические моющие средства в виде порошка чаще всего получают высушиванием жидкой композиции при распылении. Композиция обычно представляет собой высокодисперсную суспензию, содержащую 55–65% твёрдых веществ. В случаях, когда метод распыления применять нельзя, порошки готовят методом смешения компонентов. Этим путём получают также жидкие и пастообразные моющие средства. В производстве моющих средств широко применяются непрерывно действующие автоматизированные технологические линии.

DETERGENT ADDITIVE = ДЕТЕРГЕНТНАЯ ПРИСАДКА (или МОЮЩАЯ ПРИСАДКА) – Detergent Additive is an additive mixed to fuel and lubricants in order to keep the engine clean. The most used detergent additives in motor oils are metallic soaps that have enough base reserves to neutralize the acids formed during engine operation. See also Additive.

DETERGENT OIL = ДЕТЕРГЕНТНОЕ МАСЛО (или МОЮЩЕЕ МАСЛО, или ПРОМЫВОЧНОЕ МАСЛО) – Detergent Oil is a lubricating oil possessing special sludge-dispersing properties usually conferred on the oil by the incorporation of special additives. Detergent oils hold formed sludge particles in suspension and thus promote cleanliness especially in internal-combustion engines. However detergent oils do not contain ‘detergents’ such as those used for cleaning of laundry or dishes. Also detergent oils do not clean already ‘dirty’ engines, but rather keep in suspension the sludge that petroleum oil forms so that the engine remains cleaner for longer period. The formed sludge particles are either filtered out by Oil Filters or drained out when oil is changed.

DETERIORATION = ПОРЧА – Deterioration is the downgrading of a product due to prolonged storage, damage to packing or other external influences. / Понижение в качестве продукта вследствие затянувшегося хранения, повреждения при упаковывании или иных факторов внешнего воздействия.

DETERIORATION IN RESERVES = ИЗНОС (или УБЫЛЬ) РЕЗЕРВОВ – Deterioration In Reserves:- where the reserves of an insurer or reinsurer for prior years are insufficient to meet the estimated liabilities of one or more loss exposures and therefore require to be increased.

DETERIORATION OF NYLON HOSIERY = ПОРЧА (или УХУДШЕНИЕ, или ИЗНАШИВАНИЕ) НАЙЛАНОВЫХ ЧУЛОК И КОЛГОТОК – Deterioration Of Nylon Hosiery:- Complaint:- during at least two periods in the last few years there were reported, in widely separated localities, instances of mysterious deterioration of women’s nylon hosiery while it was being worn. According to the reports, holes and runs were developed in the stockings of scores of wearers when there was apparently no direct contact with any possible source of damage. Analysis:- investigation disclosed the fact that there were tiny particles of soot in the damaged hose and, in many cases, traces of sulphuric acid were detected around the holes. In the particular localities where the mysterious destruction took place, it appeared that there was an abnormally high concentration of sulphur present in the atmosphere, probably from fuel-coinbustion products. The deposits of the soot- and sulphur-bearing materials and the subsequent formation of small amounts of sulphuric acid were considered the cause of the deterioration of the fine nylon filaments. / Найлан (Nylon).

DETERMINATE = ДЕТЕРМИНАНТНЫЙ – Determinate:- said of a condition when the terminal bud ceases to grow, preventing elongation of the main axis and promoting auxiliary growth. Term applied to cotton varieties which display a complete interruption of growth following a fruiting cycle. See also Indeterminate Growth. Having stems and branches that stop growing at a certain point, usually after producing flowers. In cotton, this term is applied to varieties with a distinct interruption in growth following fruit set.

DETERMINATE = ДЕТЕРМИНАНТНОЕ (или ПОЛУЗОНТИЧНОЕ) – Determinate – (i) of a growing tip terminated by a bud or flower which may stop or limit growth; and (ii) of sequential flowering from a central or apical bud to lateral or basal buds. See also Indeterminate. / Полузонтичное (о соцветии).

DETERMINATION LETTER = ПИСЬМО О РЕШЕНИИ – In the United States, Determination Letter:- after reviewing the Application for Recognition of Exemption, the US Internal Revenue Service (IRS) will do one of three things. The IRS may issue a determination letter recognizing an organization’s exempt status. Alternatively, the IRS may request additional information in order to establish whether an organization meets the requirements for exemption. Finally, the Determination Letter may deny the application outright and give the applicant time to appeal the denial decision. The Determination Letter is an important document that the non-profit should keep in its office.

DETERMINISTIC = ДЕТЕРМИНИСТИЧЕСКАЯ – Deterministic:- a system in which no randomness is involved in the development of future states of the system. / Детерминистическая, от Латинского слова Determino, означающее Определяю, .

DET NORSKE VERITAS = ДЭ НОШКЕ ВЭРИТАС – Det Norske Veritas (DNV) is a global provider of services in areas such as enterprise risk management, safety, health and the environment, technology verification and clean energy technology. Their stated purpose is to safeguard life, property and the environment. Det Norske Veritas is the Norwegian classification society. DNV GL is a global quality assurance and risk management company. Driven by our purpose of safeguarding life, property and the environment, we enable our customers to advance the safety and sustainability of their business. We provide classification, technical assurance, software and independent expert advisory services to the maritime, oil and gas, power and renewables industries. We also provide certification, supply chain and data management services to customers across a wide range of industries. Combining technical, digital and operational expertise, risk methodology and in-depth industry knowledge, we empower our customers' decisions and actions with trust and confidence. We continuously invest in research and collaborative innovation to provide customers and society with operational and technological foresight. With origins stretching back to 1864 and operations in more than 100 countries, our experts are dedicated to helping customers make the world safer, smarter and greener. Driven by our purpose of safeguarding life, property and the environment, we enable organisations to advance the safety and sustainability of their business. Our Purpose:- to safeguard life, property and the environment. Our Vision:- Global impact for a safe and sustainable future. Our Values:- (i) We build trust and confidence; (ii) We never compromise on quality or integrity; (iii) We are committed to teamwork and innovation; (iv) We care for our customers and each other; and (v) We embrace change and deliver results. Our History:- the common history of DNV GL goes back to 1864. DNV GL's shared roots stretch back to 1864, when Det Norske Veritas (DNV) was founded as a membership organisation in Oslo. Norway's mutual marine insurance clubs banded together to establish a uniform set of rules and procedures, used in assessing the risk of underwriting individual vessels. The group aimed to provide 'reliable and uniform classification and taxation of Norwegian ships'. At the time, the Norwegian shipping industry was experiencing rapid growth and breaking out of its traditional local boundaries. An emerging, nationwide market for marine insurance was needed. Three years later in Germany, a group of 600 ship owners, shipbuilders and insurers gathered in the great hall of the Hamburg Stock Exchange. It was the founding convention of Germanischer Lloyd (GL), a new non-profit association based in Hamburg. GL was formed out of a desire to achieve transparency. Merchants, ship owners and insurers often received little information about the state of a ship. As an independent classification society, GL was created to evaluate the quality of ships and deliver the results to stakeholders. GL's first international ship classification register from 1868 reports 273 classed ships. By 1877, the number had grown tenfold. The surveyor network extended rapidly as a result. The DNV fleet also grew rapidly. First agents, then permanent surveyors were appointed in a number of countries to serve Norwegian vessels abroad. Steamships were introduced in the 1870s, dramatically changing the classification business and the work and competence required of surveyors. GL and DNV began collaborating from the very beginning. DNV Council records from September 1868 list plans to create a common class register for the two organisations. These discussions were ultimately unsuccessful, as were similar talks in 1891 over the mutual recognition of certificates and a common ship register. Social Drivers:- society became an increasingly demanding stakeholder in the predominantly private, liberal industry. Load lines developed by Samuel Plimsoll became compulsory on every British ship from 1891, saving the lives of seamen along the British coasts. Load lines became mandatory in Norway in 1907. The Titanic disaster in 1912 brought safety at sea to the forefront of public concern. International classification societies played an important part in discussions on ship safety. Nevertheless, GL's managing director Carl Pagel and Johannes Bruun from DNV were the only official classification industry delegates at the adoption of the first International Convention for the Safety of Life at Sea (SOLAS). The Cost Of War:- for GL, the First World War was a severe setback. International relationships were severed and foreign-flagged ships changed class. The inter-war period represented improvement and new growth until the Second World War took its toll. Germany's economic recovery following WWII led to rapid improvement and growth for GL. After WWI, the transition from sailing ships to steamers brought a fundamental change in technology and skills needed for the classification industry. The outdated rules were no longer in harmony with the shipbuilding methods of the time. Between 1920 and 1940 DNV was technically independent, and established a new culture prioritizing engineering, construction and design. Then came the hardships of WWII, and DNV was almost split as an organization. New Vision:- When Georg Vedeler was appointed DNV's managing director in 1951, he introduced a more scientific approach to ship construction. His vision was to build safer ships in a more efficient way, using scientific competencies and skills. New rules based on an analytical and theoretical scientific approach were introduced, and a significant step was taken towards establishing a dedicated research department. This provided opportunities for DNV in the more demanding segments of shipbuilding, which initially involved the new super tankers and later extended to gas and chemical tankers. The fleet was still predominantly Norwegian, but internationalization was taking off. GL also took a scientific approach in developing the organization after WWII. This led to the introduction of high-powered computer analysis, enabling the design and construction of larger and more modern ships. GL's research investments resulted in new construction rules for container ships, and the company soon dominated this segment within international shipping. North Sea Oil Boom:- DNV was well prepared in terms of competence and impact when commercial oil was discovered in the North Sea. The firm came to play an important role in this new industry within Norway as an advisor for both authorities and oil companies. DNV used its experience and technological competence within the maritime industry to develop and introduce oil and gas verification, inspection and risk management services. The world's first pipeline rules were published by DNV in 1976, setting a global standard. From the early 1970's, DNV was offered most of the building supervision and inspection assignments on the Norwegian continental shelf. Offshore floating rigs and supply vessels also became a strong new segment for DNV in traditional ship classification. Offshore technology also became an important field of activity for GL at the start of the 1970s, on behalf of the German Federal Ministry of Research and Technology. Many other offshore technology projects followed, but unlike DNV, GL lacked the support of a strong home market in this segment. Emerging Industries:- in 1977, wind energy was introduced as a new business segment. For both GL and DNV, this and other climate-friendly service areas represented new opportunities for organizational growth from a strong, research-driven technology base. New rules were developed, and certification of land-based and offshore windmills became an important growth area for DNV. Despite periods of setbacks and declines in shipping and oil, both DNV and GL were able to focus on growth and internationalization as the twentieth century came to a close. In the late 1980s and early 1990s the new industry of management system certification based on ISO-standards emerged, and both DNV and GL took global positions in the expanding TIC industry. Age of alliances:- alliances, mergers, and acquisitions became a strong strategic driver for both GL and DNV. The acquisitions of Advantica (UK) in 2008 and Trident (Malaysia) in 2009 broadened GL's service scope to consultancy services in the oil and gas sectors. The merger with Noble Denton in 2009 further expanded its activities in offshore technical services. This was supported by the acquisitions of PVI (Canada) in 2007, MCS (US) in 2008 and IRS (Singapore) in 2009, which advanced the inspection business. In 2009, GL acquired the world's largest wind energy consultancy, UK based Garrad Hassan. GL had already acquired the Canadian wind energy consulting and engineering company Hélimax and the German company WINDTEST, which are experts on measurements for wind turbines and wind farms. This, coupled with the offshore wind expertise of Noble Denton, meant that GL was able to deliver a full service approach with a comprehensive service portfolio towards the wind energy sector. In 2005, DNV acquired CCT (US), a specialist in corrosion control and pipeline and plant integrity analysis. It followed up with the acquisitions of Global Energy Concepts (US) in 2008 and US-based Behnke, Erdman and Whitaker (BEW) in 2010. To support prevailing strategies within the new

climate-friendly service fields, DNV established its Sustainability Centre in Beijing in 2009 and a Clean Technology Centre in Singapore in 2010. Safer, Smarter, Greener:- strategically adapting to the challenges of climate change, and following the development of the Kyoto Protocol agreement, DNV was accredited by the UN Framework Convention on Climate Change for its clean development mechanism (CDM) in 2005. By 2006, DNV had approximately 50 per cent of the global market for emission reductions verification. In 2012, DNV and KEMA joined forces to create a world-leading consulting, testing and certification company for the global energy sector. KEMA was established by the Dutch electrical power industry in 1927, and had subsequently developed into a high profile international brand that provided services to the global energy sector. These included renewable energy, carbon reduction and energy efficiency, power generation, transmission and distribution. The newly formed DNV GL Group became operational on September 12, 2013. It followed a long courtship which included numerous relationship-building advances and discussions about co-operation and mergers in 1986, 2000 and again in 2006. Changes in ownership and strategic alignment between the two companies and their leadership provided new opportunities, and the merger was finally successful. The DNV GL Group today operates in over 100 countries. Today DNV GL is well positioned as a global player within the maritime, oil and gas, and energy industries as well as food and health care to meet new challenges, while balancing the needs of business and society. / Самюэл Плимсэл (Samuel Plimsoll). Управляющий Директор Каль Погэль (Carl Pagel) и Йоханнэс Брун (Johannes Bruun). Георь Федэлер (Georg Vedeler). находящаяся в Соединённом Королевстве Гарад Хасан (Garrad Hassan). Эдвэнтика (Advantica; Соединённое Королевство) в 2008 и Тчрайдэнт (Trident). Нобл Дэнтэн (Noble Denton). Канадская компания Элимакс (Hélimax) и Немецкая компания Виндтэст (WINDTEST). Бэньк, Одмэн энд Витэкё (Behnke, Erdman and Whitaker; Би.И.ДаблЮ. (BEW)). КЕМА (KEMA). Дэ.Эн.Вэ. Гэ.Эль. (DNV GL) является международным сертификационным и классификационным обществом, ключевой компетентностью которого является оценка, консалтинг и менеджмент риска. Создано в 2013 в результате слияния двух организаций:- Дэ Ношке Вэритас (Det Norske Veritas) и Германиша Лойд (Germanischer Lloyd). Дэ.Эн.Вэ. Гэ.Эль. является крупнейшим классификационным обществом, в регистре которого находится 13 175 судов и мобильных офшорных установок суммарным водоизмещением 265.4 миллионов тонн, что представлет собой 21% мирового рынка. Компания является центром компетентности в следующих областях:- возобновляемые, альтернативные и традиционные источники энергии, офшорные и оншорные ветровые, волновые и солнечные электростанции, нефть и газ. 65% всех подводных трубопроводов спроектированы и построены по техническим стандартам Дэ.Эн.Вэ. Гэ.Эль. (DNV GL). Организация является одним из крупнейших сертификационных обществ. Дэ.Эн.Вэ. Гэ.Эль. Груп (DNV GL Group) имеет штат более 16 тысяч работников, представительства и дочерние компании в более чем 100 странах (около 400 офисов). Дэ.Эн.Вэ. Гэ.Эль. ведёт свою историю с 1864 года, когда в Норверии было создано Дэ Ношке Вэритас (Det Norske Veritas) для инспекции и надзора за Норвежским коммерческим флотом. С другой стороны в Гамбурге в 1867 году более 600 судовладельцев, верфей и страховых компаний образовали Германиша Лойд (Germanischer Lloyd). Дэ.Эн.Вэ. Гэ.Эль. отпраздновало свое 150-летие в 2014. 20 Декабря 2012 подписано соглашение об объединении Дэ Ношке Вэритас с Немецким классификационным обществом Германиша Лойд Эс.Э. (Germanischer Lloyd SE) в единую группу компаний Дэ.Эн.Вэ. Гэ.Эль. Груп (DNV GL Group) (в форме закрытого акционерного общества, по-Норвежски – Aksjeselskap (AS)). По соглашению 63.5% акций объединённой компании принадлежит фонду DNV Foundation, а 36.5% акций – Немецкой компании Майфайа Фамёгенсфавальтун Эс.Э. (Mayfair Vermögensverwaltungs SE), владельцу Германиша Лойд Эс.Э. (Germanischer Lloyd SE). После одобрения сделки антимонопольными ведомствами Норвегии, ЕС, США, Южной Кореи и КНР объединённая компания – Дэ.Эн.Вэ. Гэ.Эль. Груп А.Эс. (DNV GL Group AS) – была зарегистрирована 12 Сентября 2013. Страна регистрации объединённой компании – Норвегия, штаб-квартира Дэ.Эн.Вэ. Гэ.Эль. Груп (DNV GL Group) расположена в Хёвик – пригороде Осло. Материнской компанией этой группы является Дэ.Эн.Вэ. Гэ.Эль. А.Эс. (DNV GL AS), также зарегистрированная в Норвегии (ранее называлась Дэ Ношке Вэритас А.Эс. (Det Norske Veritas AS)).

DETRITUS = ДЕТРИТ – Detritus is the dead organic matter, mostly from plants and usually in particulate form, including dissolved organic matter, but not inorganic matter and various organisms often associated with it. / Под Детритом, от Латинского слова Detritus, означающее Истёртый, понимается скопление растительных или животных остатков; скопление обломков породы. Под Детритом понимается:- (1) мелкие частицы органического или частично минерализованного вещества, взвешенные в толще воды или осевшие на дно водоёма. Образуется из отмерших растений и животных и их выделений; в нём живут микроорганизмы. Детрит служит пищей животным детритофагам. (2) В медицине – продукт распада тканей. Детрит оспенный – соскоб оспенных пузырьков с кожи искусственно заражённого животного для приготовления оспенной вакцины.

DEUTSCHE BANK LIQUID COMMODITIES INDEX = ИНДЕКС ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ ДОЙЧЭ БАНКА (или ИНДЕКС ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ НЕМЕЦКОГО БАНКА) – Deutsche Bank Liquid Commodities Index (DBLCI) is an index aims to represent the performance of the commodity market, it invests in six commodities; Sweet Light Crude Oil (WTI), Heating Oil, Aluminium, Gold, Wheat and Corn. The weights are fixed and have been designed to be broadly representative of the commodity markets. Historical Inception Date:- 1988-December-01. Index Live Date:- 2003-February-28. The Deutsche Bank Liquid Commodity Index (DBLCI) was launched in February 2003. It tracks the performance of six commodities in the energy, precious metals, industrial metals and grain sectors. The DBLCI has constant weightings for each of the six commodities and the index is rebalanced annually in the first week of November. Consequently, the weights fluctuate during the year according to the price movement of the underlying commodity futures. Rolling Methodology:- energy contracts are rolled monthly, all other commodity futures contracts are rolled annually. This rolling procedure was adopted given the historical tendency for energy curves to be in backwardation and metal and agricultural forward curves to be in contango. Futures contracts rolling takes place between the second and sixth business day of the month. The DBLCI is quoted in both total returns and excess returns terms in US Dollars as well as a variety of major currencies. Characteristics of the DBLCI:- (i) six commodities:- WTI crude oil, heating oil, aluminium (industrial metal), gold (precious metal), Corn and Wheat; (ii) constant weighting which reflect world production and inventory, providing a diverse and balanced commodity exposure; (iii) a rule-based and transparent calculation methodology; energy contracts are rolled monthly, metal and grain contracts annually; and (iv) total and excess returns data are available from December 01, 1988. Salient Features of the DBLCI:- two of the main distinguishing features between the DBLCI and other commodity indices relate to the number of components and the overall allocation to the energy complex. While the number of commodities in the S&P Goldman Sachs Commodity Index, Dow Jones-AIG and the Reuters-Jeffries/CRB index are broadly similar ranging from 19 to 24 commodities, the DBLCI has just six commodities. The allocation to energy also differs substantially ranging from 70% in the S&P GSCI, 55% in the DBLCI, 39% in the RJ/CRB and 33% in the Dow Jones-AIG. A lower number of commodities in an index can offer certain advantages. For example, it involves an investor in only the most liquid commodity contracts in their respective sectors. Last year, aluminium accounted for 46% of combined turnover on the LME. Consequently, a commodity index which has part of its basket in lead or nickel would entail greater liquidity risk since these two metals constitute only 11% of total turnover on the LME. Energy markets exhibit a similar degree of market concentration with the benchmark West Texas Intermediate (WTI) crude oil contract representing 37% of total energy futures turnover on NYMEX® in 2006. Components and Base Weights:- (i) WTI Crude Oil – Index Weight:- 35.00% and Exchange:- NYMEX®; (ii) Heating Oil – Index Weight:- 20.00% and Exchange:- NYMEX®; (iii) Gold – Index Weight:- 10.00% and Exchange:- COMEX®; (iv) Aluminium – Index Weight:- 12.50% and Exchange:- LME; (v) Corn – Index Weight:- 11.25% and Exchange:- CBOT®; and (vi) Wheat – Index Weight:- 11.25% and Exchange:-

СВОТ®. / Индекс по Сырью от Эс.ЭндПи. Голдмэн Сэкс (S&P Goldman Sachs Commodity Index), Дау Дьжонз-Эй.Ай.Дьжи. (Dow Jones-AIG) и индекс от Ройтас-Дьжефёриз/Си.Ар.Би. (Reuters-Jeffries/CRB index). НАЙМЭКС® (NYMEX®). КОМЭКС® (COMEX®); СИБАТ® (СВОТ®).

DEUTSCHE BANK LIQUID COMMODITIES INDEX MEAN REVERSION = ВОЗВРАЩЕНИЕ К СРЕДНЕЙ ВЕЛИЧИНЕ ИНДЕКСА ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ ДОЙЧЭ БАНКА (или ВОЗВРАЩЕНИЕ К СРЕДНЕЙ ВЕЛИЧИНЕ ИНДЕКСА ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ НЕМЕЦКОГО БАНКА) – Deutsche Bank Liquid Commodities Index Mean Reversion (DBLCI MR) is an index invests in six commodities; Sweet Light Crude Oil (WTI), Heating Oil, Aluminium, Gold, Wheat and Corn. The weights of the commodities in the DBLCI MR index are systematically adjusted depending on the relative richness or cheapness of the commodity. The commodity weight is linked to the ratio between a one-year and five-year moving average price. Relatively expensive commodities have lower weights; conversely, relatively cheap commodities have higher weights. Historical Inception Date:- 1988-December-01. Index Live Date:- 2003-February-14. The DBLCI Mean Reversion Index is a commodity index published by the Deutsche Bank. Launched at the same time as the Deutsche Bank Liquid Commodity Index (DBLCI) in February 2003, the DBLCI-Mean Reversion has the same underlying assets. The listed instruments are also rolled using the same mechanism as the DBLCI, namely energy contracts are rolled monthly and the metal and grain contracts are rolled annually. This occurs between the second and sixth business day of the month. The DBLCI-MR is also quoted in both total returns and excess returns terms in US Dollars as well as EUR, JPY and GBP. Rolling Methodology:- in contrast to the DBLCI, the DBLCI-MR undertakes no annual re-balancing. Instead, the individual commodity weights are reset every time any one of the commodities undergoes a 'trigger event'. This happens when the one-year moving average of the commodity price is a whole multiple of 5% away from the five-year moving average. When this happens, the weights of all the commodities are re-balanced such that 'expensive' commodities have their weights reduced while 'cheap' commodities have their weights increased according to a simple, pre-defined formula. The entire process is rule-based and mandatory. The fact that there exist clear pre-set 'hurdle rates' to trigger a re-weighting, minimises the number of re-weightings and thus reduces the transactions costs for replication. Characteristics of the DBLCI-Mean Reversion:- (i) six commodities:- WTI crude oil, heating oil, aluminium, gold, Corn and Wheat; the same rolling schedule as the DBLCI; (ii) no annual rebalancing; instead commodity weights are adjusted according to a pre-defined formula; (iii) it is the only commodity index in the marketplace which possesses a dynamic rule-based asset allocation mechanism which attempts to underweight 'expensive' commodities and overweight 'cheap' commodities; and (iv) total and excess returns data are available from December 01, 1988. Rationale and Index Mechanism:- the DBLCI-Mean Reversion is the only index which dynamically changes its weights according to whether a commodity is considered cheap or expensive. When all the commodities are within 5% of their five-year averages, the weights will automatically revert to the weights of the base index, the DBLCI. The rationale behind the construction of the DBCLI-MR is to exploit the tendency of commodity prices to trade within wide, but, defined ranges because:- (i) as prices of commodities rise, new production capacity is brought on line to benefit from higher prices; (ii) more supply becomes available from alternative sources previously considered uneconomic; (iii) in oil markets, quota systems that attempt to control supply come under strain as the rewards for cheating rise; and (iv) as prices rise, the demand for the commodity will begin to fall as it faces competition from cheaper sources. The net effect is to keep commodity prices bound around their long run average price. In essence the DBLCI-MR is a strategy to buy low and sell high. It therefore tends to take profits gradually in a bull run and re-invest those proceeds into cheaper commodities. One benefit of this approach is that the DBLCI-MR tends to extract volatility from the index since as commodity prices rally so to does volatility. Evidence suggests that portfolios comprising past losers tend to outperform past winners and vice versa over time. In fact this has been a recurring theme of commodity markets over the past few years. We find that it has been common for a commodity to be at the bottom of the league table in terms of total returns in one year, to be close to the top in the following year only to reverse these gains in the next 12 month period.

DEUTSCHE BANK LIQUID COMMODITIES INDICES OPTIMUM YIELD = ОПТИМАЛЬНАЯ ДОХОДНОСТЬ ПО ИНДЕКСАМ ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ ДОЙЧЭ БАНКА (или ОПТИМАЛЬНАЯ ДОХОДНОСТЬ ПО ИНДЕКСАМ ПО ЛИКВИДНЫМ РОДАМ СЫРЬЯ ОТ НЕМЕЦКОГО БАНКА) – The Deutsche Bank Liquid Commodities Indices Optimum Yield (DBLCI-OY) employs a rulebased approach when it rolls from one futures contract to another for each commodity in the index. Rather than select the new future based on a predefined schedule (e.g. monthly) the index rolls to that future (from the list of tradable futures which expire in the next thirteen months) which generates the maximum implied roll yield. The index aims to maximize the potential roll benefits in backwardated markets and minimize the loss from rolling down the curve in contango markets. The selected DBLCI-OY index future contract is rolled to a new contract, when the existing contract is close to expiry. DBLCI-OY is based on six commodity futures; Sweet Light Crude Oil (WTI), Heating Oil, Aluminium, Gold, Wheat and Corn. The weights are fixed and have been designed to be broadly representative of the commodity markets. Historical Inception Date:- 1988-December-02. Index Live Date:- 2006-May-31. See also Deutsche Bank Liquid Commodities Index.

DEUTSCHE BÖRSE AG = ДОЙЧЭ БЁРЗЭ А.ГЕ. (или НЕМЕЦКАЯ БИРЖА АО) – Deutsche Börse AG:- As one of the world's leading exchange organisations Deutsche Börse Group provides investors, financial institutions and companies access to global capital markets. Our business covers the entire process chain from securities and derivatives trading, clearing, settlement and custody, through to market data and the development and operation of electronic trading systems. Our reliable systems and our integrity as a neutral provider form the basis of our business philosophy. We operate to the most exacting standards to create products and services to meet the needs of international financial markets. As a listed company we work to create value for our customers and our shareholders. The main business areas of Deutsche Börse Group:- (i) with the Xetra® trading platform and Frankfurter Wertpapierbörse (FWB®, the Frankfurt Stock Exchange), Deutsche Börse operates one of the largest fully electronic cash markets in the world; (ii) Eurex® is a global market leader in trading futures and options contracts. As Europe's largest central counterparty, Eurex Clearing offers services for derivatives and cash market products traded on-exchange and over the counter; (iii) Clearstream, a subsidiary of Deutsche Börse, provides integrated banking, custody und settlement services for the trading of fixed-interest securities and shares; (iv) Deutsche Börse channels the information flows of its markets through Market Data & Analytics. Clients receive products such as prices, indices and company-related data that are tailored to their individual needs. And (v) new technologies play a central role at Deutsche Börse Group. In its own data centre it operates 20 trading platforms around the world and supplies the technology for international service providers. Headquartered in Frankfurt am Main, Germany. Deutsche Börse Group is far more than a mere marketplace organiser for the trading in shares and other securities. It is one of the largest exchange organisations worldwide. With advanced technology it affords companies and investors access to the world's capital markets. Deutsche Börse has a broader basis than any of its competitors. Its product and service portfolio covers the entire process chain:- including securities and derivatives trading and clearing, netting and transaction settlement, custody, the provision of market information, as well as the development and operation of electronic trading systems. With its process-oriented business model, Deutsche Börse increases the efficiency of capital markets:- issuers benefit from low capital costs; investors enjoy the advantages of high liquidity and low transaction costs. About 3 300 employees service customers in Europe, America and Asia. Deutsche Börse has locations in Germany, Luxembourg, Switzerland, Spain, the Czech Republic and the US, as well as representative offices in Beijing, Berlin, Chicago, Dubai, Hong Kong, London, Moscow, New York, Paris, Shanghai, Singapore, Tokyo and Washington, DC. The German term Börse (and French bourse) comes

from the XV century, from the Belgian city of Bruges. The word described a periodic meeting of rich Italian traders at ter buerse plaza – a market place that was named after the patrician family Van der Beurse, who had lived there (Latin Bursa = Bag or Change Purse). 1150:- The Frankfurt autumn fair is mentioned in writing for the first time, the direct precursor of the Frankfurt Stock Exchange. Merchant traders from all over flocked to Frankfurt when the first harvest fairs were held. They were the reason why the city developed into a center for commercial and monetary transactions over the course of the centuries. Already in the XVI century, the city's prosperity was not lost on prominent temporary observer Martin Luther, who called Frankfurt a 'silver and gold hole'. 1240:- a privilege from Emperor Frederick II renews the imperial escort to the Frankfurt fair, which was first provided to its visitors in 1227. 1330:- Emperor Louis IV ('the Bavarian') permits the holding of a second fair in Frankfurt, the spring fair. Following the decline of the Champagne fairs in France, Frankfurt takes over their role. 1396:- for the first time, documents record money-changing transactions in connection with the Frankfurt fairs. 1402:- Frankfurt establishes its first exchange bank. 1478:- the first book dealers visit the Frankfurt fair, where the most valuable goods of the late Middle Ages are traded: books, weapons, spices and cloth. Financial transactions also take place. 1585-September-09:- in an assembly Frankfurt's merchants established uniform exchange rates for the first time, marking the birth of the Frankfurt exchange. Their motivation was the same as today:- to create transparency. An unmanageable variety of different coins combined with non-uniform exchange rates threatened to paralyze the financial system, fostering large-scale fraud and usury. 1605:- a new name for the merchants' assembly appears for the first time in the records:- 'Burs', meaning 'Exchange'. 1625-April-11:- Pursuant to a Council edict, moneychangers and the most prominent merchants were required to establish an average rate for the payment week following the fair. The first quotations sheet lists twelve currencies and interest rates for deposit. 1639:- money changing at official rates during the year outside of the fair dates is introduced, as specifically outlined in an edict issued by the City Council. 1642-September-21:- the first printed quotations sheet for currency exchange rates is published. 1643:- for the first time at the Frankfurt fairs, outstanding debts are recognized for offsetting against cash amounts due. In the payment week, debts are offset and remaining differences paid in coin or by promissory note. 1666-June-18:- The City Council issues a regulation for bill and merchant business introducing a register of companies and authorized representatives. The document illustrates how international the fair has become, being printed and published in German, Dutch, French, Italian and Spanish. 1675 Following urges of Frankfurt merchants, the obligation to pay in taler (Talerzwang) is introduced. 1694:- the practice of holding open-air meetings on the Frankfurt town hall square (Römerberg) ends and the assembly of exchange members moves inside, into the 'Großer Braunfels' building at Liebfrauenberg. As the city's most spacious and prestigious building, this new location reflects the commercial significance of the assembly. 1707:- the exchange presidents are recognized as the merchants' official representatives, whose association was a precursor to the chamber of commerce. 1721:- the oldest surviving Frankfurt quotations sheet dates from this year, listing exchange rates for 16 coinage types. 1739:- exclusion and distinction:- foreign traders' permits are revoked by an act of law, in which distinction is also made for the first time between money and goods traders. 1754:- The Frankfurt bank owned by the Bethmann brothers issues governmental, regional and municipal bonds for the first time. 1778:- the era of government loans begins:- Bethmann Bank floats the first bond offering valued in the millions, for the Emperor in Vienna. To be able to place such a sum, the bank first issued fractional bonds of 1 000 guilders of the twenty-guilder standard for eight years at 4.5 percent. Anyone with sufficient funds could buy these securities, thereby being entitled to regular interest payments. This deal was a watershed moment for the Frankfurt exchange, which by 1850 had become the number one location for safe government bonds and funds, creating a reputation of solidity for the city:- it becomes a 'gateway for capital exports'. 1797-July-03:- the earliest surviving printed exchange list for government bonds contains 26 bonds, 14 of which are imperial, three Prussian and three Palatinate. 1799-November-26:- separate exchange regulations are enacted for currency and goods traders respectively. 1808-May-07:- The Frankfurt chamber of commerce is founded. The directors of the exchange are assigned to a newly-formed committee within the Chamber. From now on, the Chamber of Commerce is the body responsible for the Frankfurt stock exchange. 1813:- Jewish businessmen are no longer excluded, receiving official permission to enter the exchange. 1816:- regular securities trading begins and the exchange experiences its first boom, which continues until 1826. 1820:- participating certificates of the Austrian National Bank constitute the first common shares that are listed and traded in Frankfurt. However, the innovation fails to catch on:- Frankfurt's traders are for a long time skeptical about equities, a financing instrument enjoying increasing popularity elsewhere. Bonds remain the focus of trading. 1836:- Frankfurt's most prestigious banking houses establish the private club Stocks Society (Effekten-Societät). Members are allowed to trade outside the official exchange to continue trading especially in the evening. These extremely speculative evening transactions occasionally exceeded the turnover on the official exchange. 1843-December-11:- Frankfurt evolves into an international capital market and exchange alongside London and Paris. The 'Großer Braunfels' building is bursting at the seams. On 11 December, the exchange moves into its own dedicated premises in the immediate vicinity of the Paulskirche church. 1851-January-02:- The Frankfurt Brokers' Syndicate releases its first quotations sheet. 1853-March-01:- The Frankfurt securities depository (Frankfurter Vereins-Kasse) is founded in Frankfurt. It is involved in the settlement of securities transactions. Until then, securities sales had been effected in cash, but transporting barrels and sacks filled with silver coins to and from the trading center presented a high risk. 1854:- the trading floor as we know it today is introduced, an enclosed area in the exchange hall accessible only to officially approved traders, based on the model of the Paris exchange. 1878:- The Stocks Society running after-hours trading (Abendbörse) is given rights to cooperate with the official exchange run by the chamber of commerce. 1879:- the next relocation is to the new exchange building at Rahmhof, today's Börsenplatz. The architects of this newly constructed building very effectively united functionality and prestige in a magnificent structure. Along with the main railway station and the old opera house, it is still one of the most important Frankfurt buildings dating from the Wilhelmian era. 1881:- The German Empire implements a stamp tax (Stempelabgabe) on both the issue and the trading of securities on exchanges. In 1894 and 1900 the tax level is considerably raised, thus contributing to the acceleration of concentration in the banking sector. 1896:- After-hours trading on the Frankfurt Abendbörse is integrated into the official exchange organization. 1914:- The First World War and its consequences impact the internationally oriented Frankfurt securities exchange. By the end of the war, all foreign securities have disappeared from German quotation sheets, depriving Frankfurt of its status as an international securities exchange. After the war, the exchange suffers from the destruction of its foreign relationships. 1923:- the inflation after the war reaches its first peak. The stock exchange sees unprecedented losses in securities of monetary value. By contrast, demand for equities as speculation objects sharply increases – until stock exchange prices fall dramatically due to the breakout of the Great Depression in October 1929. 1933:- The National Socialist party assumes power, interfering heavily in the business and financial sectors. The imperial government usurps authority to regulate exchanges from the states, and the number of securities exchanges is reduced from 21 to 9. The Frankfurt stock exchange takes over the Mannheim stock exchange in 1935 and is renamed the Rhine-Main Stock Exchange (Rhein-Mainische Börse), though as a so-called Homeland Exchange (Heimatbörse) it no longer has a significant function, as any investment capital is diverted into the wartime economy. 1944:- In the course of an allied bomb attack, the Frankfurt stock exchange building is severely damaged. The exchange continues to operate in the cellars. 1945-September-14:- The Frankfurt stock exchange resumes unofficial trading. Official trading only starts up again following the currency reform of 1948. 1949-July-12:- The Frankfurt central securities depository (Frankfurter Kassenverein) is founded as a stock corporation. One of its first and most significant tasks is the necessary settlement and clearance of securities after the war. 1953-May-04:- Four currency exchanges are opened, for the US Dollar, Canadian Dollar, Swiss Franc and currencies of the European Payments Union. 1956-May:- Currency traders are allowed to buy foreign securities – giving the Frankfurt

market a significant boost in activity. 1957-February-09:- The Main Trading Hall of the exchange building is reopened in renovated form. 1958-May-22:- Foreign shares are listed on the Frankfurt stock exchange for the first time since the war. US industrial shares had been traded on the unofficial market (Freiverkehr), however, since late September 1956. 1968:- The price of gold is allowed to float. Trading in gold resumes in Frankfurt and on other exchanges. 1969-February-01:- The digital age arrives – at the Frankfurt stock exchange earlier than at its competitors. Traders can now process securities transactions electronically. 1970:- Börsen-Daten-Zentrale GmbH (BDZ) is founded. As the data center of the Frankfurt stock exchange, BDZ is one of the precursors of Deutsche Börse Systems AG. September:- Exchange member firms are now able to interact with the exchange computer via telex. 1983:- Options on equities, reapproved by law in the Federal Republic of Germany since the middle of the year 1970, are now standardized and modernized enough to allow secondary market trading – which is concentrated in Frankfurt. 1987-September-16:- The computer-based KISS price information system replaces the display boards on the trading floor used since 1964. 1988-July-01:- Germany's leading index is born – the DAX® index is calculated and published for the first time. The index reaches an all-time high on 2007-July-13 at 8 151.57. It immediately became established as the uncontested, internationally recognized German blue-chip index, whose predecessors were quickly forgotten. 1990-January-26:- Deutsche Terminbörse (DTB®) starts trading. For the first time, futures contracts are traded in Germany – and the process to become one of the leading derivatives exchanges worldwide begins. August-01:- Frankfurter Wertpapierbörse AG (FWB®, the Frankfurt Stock Exchange), which has been set up by banks and exchange brokers, is entered into the commercial register. The stock exchange management transfers the overall charge of the Frankfurt Stock Exchange, as an institution under public law, from the Chamber of Industry and Commerce to the FWB®. 1991-April-05:- The Frankfurt Stock Exchange rolls out IBIS, an integrated exchange trading and information system for the cash market. IBIS is a simple supply and demand system that does not perform automated matching. 1992-December-11:- Frankfurter Wertpapierbörse AG is renamed Deutsche Börse AG. This new company holds all shares of both the DTB® derivatives exchange and the German central securities depository (Deutscher Kassenverein). 1997-March:- Opening of Neuer Markt ('new market'). This market segment, which exists until March 2003, gives innovative start-up companies the opportunity to raise equity via the stock exchange. 1997-April:- Deutscher Kassenverein is reorganized as Deutsche Börse Clearing AG, a predecessor of today's Clearstream International SA. June:- Deutsche Wertpapierdaten-Zentrale GmbH (DWZ) is merged into Deutsche Börse Systems AG, founded in late 1996 as the IT house of Deutsche Börse Group. 1997-November-28:- A new era of exchange trading begins:- Xetra®, the fully electronic trading system for the cash market, replaces the former IBIS system. From that date on, the exchange is now wherever there are screens. 1998:- In concert with the Swiss Stock Exchange, Deutsche Börse merges the Soffex and DTB® futures markets to form Eurex®:- the world's first cross-border derivatives exchange. 2000-January-01:- Deutsche Börse Clearing AG merges with Cedel International SA at the start of the year to form Clearstream International SA, a new provider of settlement services for national and international securities transactions and the custody of securities. Deutsche Börse AG holds an initial 50 percent stake in the joint venture. August:- Spot trading in electricity begins at European Energy Exchange AG (EEX). Indices based on EEX electricity prices are calculated starting in December. Derivatives trading begins in March 2001:- futures are listed on base and peak loads. 2001-February-05:- Deutsche Börse AG goes public. 2002-July:- Following its capital increase in June, Deutsche Börse AG acquires all shares of Clearstream International SA, which is integrated into Deutsche Börse Group. 2003-January-01:- The new segmentation of the stock market comes into force at the Frankfurt Stock Exchange at the beginning of the year. At its heart are two new market segments, Prime Standard and General Standard. Prime Standard places high transparency requirements on issuers. In General Standard, the legal requirements continue to apply. March:- Deutsche Börse introduces the central counterparty in Xetra® and floor trading at the Frankfurt Stock Exchange. 2005-October:- The Entry Standard is established for small and mediumsized companies. This new segment of the Open Market is open to companies that want their shares to be included in exchange trading while meeting less stringent formal requirements. 2007-February:- After almost five months of renovation work, trading resumes on the modernized Main Trading Hall of the Frankfurt Stock Exchange. 2010-September:- 425 years after its foundation, Deutsche Börse begins the relocation to its future Group headquarters. The construction of a new building in Eschborn underpins the Group's commitment to the Rhine-Main region. The building, which is around 90 meters tall and accommodates over 2 000 workers, is designed to meet strictest ecological standards. Employees will have relocated to the new headquarters by the end of 2010. / Мартин Люта (Martin Luther), который называл Франкфурт (Frankfurt) 'дырой для серебра и золота' ('silver and gold hole'). 1240:- Император Фрэдэрик II (Emperor Frederick II). 1330:- Император Люис IV (Emperor Louis IV) (Баварский ('the Bavarian')). (Deutsche Börse AG)) и Нью Йоркской НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) с целью создания крупнейшей в мире фондовой биржи. Решение Еврокомиссии было обоснованным, органы по надзору за конкуренцией не совершили никаких юридических ошибок при анализе запланированного слияния, объявил суд в Люксембурге в Понедельник, 09 Марта. Дойчэ Бёрзэ А.Ге. сообщила, что принимает к сведению решение суда, однако рассмотрит возможность подачи апелляции в Европейский суд как высшую инстанцию. 'Предприятие по-прежнему считает, что Еврокомиссия применила слишком узкое токование понятия 'рынок', – пояснили в Дойчэ Бёрзэ. Слияние Дойчэ Бёрзэ и НЙФБ® было заблокировано Еврокомиссией в 2012. Ранее провалом окончились планы объединения Немецкой фондовой биржи с Европейской Euronext и Лондонской LSE. Между тем НЙФБ® уже поглощена Американской биржей Ай.Си.И. (ICE). В результате консолидация биржевой отрасли происходит без участия Дойчэ Бёрзэ А.Ге. Дойчэ Бёрзэ А.Ге. – компания, действующая на рынках наличных и производных финансовых инструментов в Германии, на Немецкой Срочной Бирже или Дойчэ Тэрминбёрзэ (НСБ или Дэ.Тэ.Бе.® (DTB®); Deutsche Terminbörse), биржах финансовых фьючерсов и Франкфуртской Фондовой Бирже (Frankfurt Stock Exchange). Для этих бирж Дойчэ Бёрзэ А.Ге. оказывает услуги по подбору сотрудников, приобретению оборудования и недвижимости, помогает привлекать финансовые ресурсы. Отдельные подразделения компании также выполняют функции клиринговой палаты для НСБ.

DEUTSCHER AKTIENINDEX = ДОЙЧА АКЦИЭНИНДЭКС (или ИНДЕКС ПО НЕМЕЦКИМ АКЦИЯМ) – The Deutscher Aktienindex, known as DAX® Index, is made up of 30 major German stocks (blue chips). It represents roughly 75 percent of the combined share capital of domestic joint-stock corporations listed in Germany and accounts for some 85 percent of overall trading in German equities. DAX® stock are admitted to trading on the Official Markt and Regulated Market and are quoted in the Prime Standard segment. The criteria for stock weighting in the DAX® Index are exchange turnover and market capitalization on the basis of free float share capital and sectoral representativeness. Changes to the DAX® are resolved by the Executive Board of Deutsche Börse AG on the basis of proposal made by the Working Committee for Equity Indices. Stock index, which measures the performance of the 30 largest German companies in terms of order book turnover and market capitalization. Abbreviation:- DAX®. The German share index tracks the movement in value of the 30 most important German shares. As well as the list prices, the index also shows the dividend payments. The DAX® began at the end of 1987 with a value of 1 000. Deutscher Aktienindex is an arithmetic index of the share price of 30 blue chip German companies weighted by capitalization. The DAX® is based on the Frankfurt Stock Exchange and is calculated every 60 seconds during trading hours. 1988-July-01:- Germany's leading index is born – the DAX® index is calculated and published for the first time. The index reaches an all-time high on 2007-July-13 at 8 151.57. It immediately became established as the uncontested, internationally recognized German blue-chip index, whose predecessors were quickly forgotten. Index of 30 major German stocks. Also known as DAX®. DAX® is the benchmark for the German stock market and an important sentiment barometer for the German economy as a whole. The 30 standard shares which make up this blue-chip index constitute 74 percent of the turnover on the Frankfurt Stock Exchange and around 80 percent of the market capitalization on the German equity market as a whole. The German Stock Index. The indices DAX®, DivDAX®, MDAX®, TecDAX® and SDAX® are among Deutsche Börse's most important sources of market information. Deutsche Börse is also involved in the development of STOXX® indices, which are among the leading European equity indices. In total, Deutsche Börse calculates and distributes around 2 500 indices, the majority of which are not for equities, however, but for German and other European government bonds. DAX®:- blue-chip index; comprises the 30 largest and most liquid equities in the Prime Standard segment and has been the most trusted underlying instrument for certificates and warrants in Germany for years. DivDAX®:- strategy index; comprises the 15 DAX® companies with the highest dividend yield. MDAX®:- mid-cap index; comprises the 50 largest equities from classic sectors of the Prime Standard segment of the stock exchange, ranking directly below DAX®. TecDAX®:- technology index; comprises the 30 largest equities from technology sectors of the Prime Standard segment of the Frankfurt Stock Exchange, ranking directly below DAX®. SDAX®:- small-cap index; comprises the 50 largest equities from classic sectors of the Prime Standard segment of the Frankfurt Stock Exchange, ranking directly below MDAX®. EURO STOXX 50®:- European blue-chip equity index; comprises the 50 largest equities with the highest turnover in the countries participating in the European Monetary Union. Admission to an index:- market capitalization of the free float (the share of freely tradable stocks) and order book turnover are the decisive criteria for evaluating a company regarding its admission to an index or when the composition of an index is reviewed. The decision is taken by the Working Committee for Equity Indices, an independent panel comprising representatives of key market participants and Deutsche Börse. / Дойча Акциэниндэкс или Индекс По Немецким Акциям (Deutscher Aktienindex). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). Обозначение:- . ДифДАКС® (DivDAX®). ДАКС® (DAX®). ТэкДАКС® (TecDAX®). СДАКС® (SDAX®). ЭМДАКС® (MDAX®). ЮРОУ СТАКС 50® (EURO STOXX 50®).

DEUTSCHES INSTITUT FÜR NORMUNG EV = НЕМЕЦКИЙ ИНСТИТУТ ПО СТАНДАРТИЗАЦИИ (или ДОЙЧЭС ИНСТИТУТ ФЮР НОРМУН Э.ФАУ.) – Deutsches Institut für Normung EV (DIN) or German Institute for Standardization is one of the world's leaders in standardization. More than 30 000 experts from industry, research, consumer protection and the public sector work together at DIN to develop market-oriented standards and specifications that promote global trade and innovations, assure efficiency and quality, and help protect the environment and society as a whole. DIN deals with subjects ranging from A as in Acoustics to Z as in Zinc. A focus is also placed on trending topics such as Industry 4.0 and smart cities. External specialists use their expertise to develop the content of standards, while DIN's project managers make sure the entire process runs smoothly. DIN staff members coordinate national, European and international projects, and ensure all internal rules of procedure are followed. This increases the global acceptance of DIN Standards. DIN is a private organization that is registered as a non-profit association. Its members include businesses, associations, government bodies, and other institutions from industry, commerce, trade and science. DIN is based in Berlin, Germany. A public-private partnership:- in 1975 DIN entered a public-private partnership with the German Federal Republic by signing the Standards Agreement in which DIN is acknowledged as the sole national standards body in Germany. According to this Agreement, DIN is obliged to:- (i) consider the public interest in the preparation of standards; (ii) ensure that its standards can be referenced as documents which describe technical requirements, in legislation, in matters affecting public administration, and in legal relations; and (iii) contribute to international understanding in the field of standardization. The German Federal Government undertakes to:- (i) recognize DIN as the competent standards organization for Germany and as the national standards body representing Germany in non-governmental international standards organizations; and (ii) apply DIN standards in its administrative departments, when issuing invitations to tender or placing orders, and to use its influence to ensure that other public authorities placing contracts do the same. / Немецкий Институт по Стандартизации или, как это звучит на Немецком, Дойчэс Институт фюр Нормун Э.Фау. (Дэ.И.Эн.; Deutsches Institut für Normung EV (DIN)).

DEUTSCHE TERMINBÖRSE = ДОЙЧЭ ТЭРМИНБЁРЗЭ (или НЕМЕЦКАЯ СРОЧНАЯ БИРЖА) – Die Deutsche Terminbörse (DTB®) GmbH:- formerly the German financial futures and options market. Merged with the Swiss Options and Financial Futures Exchange (SOFFEX) in September 1998 to form EUREX®, the European derivatives exchange. Deutsche Terminbörse GmbH (DTB®) is Frankfurt am Main-based electronic options and financial futures exchange. Eurex® is the fully electronic exchange has more than 400 participants in about 20 countries, creating decentralized and standardized access to its markets. Members are linked to the Eurex® system through a dedicated wide-area communications network (WAN). Access points have been installed in Amsterdam, Chicago, New York, Helsinki, London, Madrid, Paris, Hong Kong and Tokyo, and Sydney. Eurex® is the successor to Deutsche Termin Borse, Germany's first fully computerized exchange and the first German exchange for trading financial futures. DTB® merged with Deutsche Börse AG and in September 1998 merged with the Swiss Options and Financial Futures Exchange (SOFFEX) to form Eurex®. The exchange lists some 20 product groups, including Dutch, Finnish, French, German, Italian, Swiss, and US equity products; Finnish, German, and Swiss index products; and Finnish, German, and Swiss fixed-income products. In the derivatives markets, Eurex® lists futures and options on the Euro-schatz, Euro-bobl and Euro-bund, Euro-buxl and conf futures; futures and options on the three-month Euribor and futures on the one-month Euribor; futures and options on the DAX®, NEMAX 50, SMI and HEX 25 indices; Dow Jones Global Titans 50 Index futures and options; and futures and options on a family of Dow Jones STOXX products. Eurex® operates in three trading phases:- pretrading, from 07:30 am to 09 am; trading, 09 am to 08 pm; and post-trading, 08 am to 08:30 pm. Extension of trading hours is planned in phases. 1990-January-26:- Deutsche Terminbörse (DTB) starts trading. For the first time, futures contracts are traded in Germany – and the process to become one of the leading derivatives exchanges worldwide begins. / Дойчэ Тэрминбёрзэ Ге.эм.бе.Ха.(Deutsche Terminbörse GmbH) (Дэ.Тэ.Бе.® (DTB®)). ЮРИБО или ЮРАЙБО (EURIBOR). Ойрэкс® или Юрэкс® (Eurex®). Дау Дьжонз (Dow Jones). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). СОФЭКС (SOFFEX). Электронная

биржа опционов и финансовых фьючерсов, расположенная во Франкфурте. Была создана 26 Июля 1988. (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) . фьючерсы и опциона на Ойро-шатц (Euro-schatz), Ойро-бобэль (Euro-bobl) и Ойро-бунд (Euro-bund), Ойро-буксэль (Euro-buxl). Индексы ДАКС® (DAX®), НЭМАКС® 50 (NEMAX® 50), Эс.Эм.Ай. (SMI) и ХЭКС 25 (HEX 25); Дау Дьжонз СТАКС (Dow Jones STOXX). Немецкая Срочная Биржа (НСБ® или Дэ.Тэ.Бе.® (DTB®); Deutsche Terminbörse) это первая в Германии полностью компьютеризованная биржа и первая в Германии биржа для торговли финансовыми фьючерсами, открытая в Январе 1990. В Январе 1994 НСБ слилась с Немецкой Биржей АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). На ней не применяется система торгов путём прямых контактов между продавцом и покупателем. Для обеспечения электронной связи с Французской Фьючерсной Биржей в Париже (МАТИФ (MATIF)) и с Французской Биржей Производных Инструментов (French Derivatives Exchange) было подписано соглашение о совместной деятельности. Члены МАТИФ начали торговлю контрактами НСБ во Франции с Сентября 1994, они также могут продавать и покупать контракты на МАТИФ через терминалы в Германии. Биржа торгует опционами на основе 16 Немецких голубых фишек (blue chip) и тремя инструментами на основе Немецкого Фондового Индекса (Индекса ДАКС (DAX) – German Stock Index) опционами ДАКС, фьючерсами на ДАКС к опционами на основе фьючерсов на ДАКС. На НСБ также продаются четыре вида процентных фьючерсных контрактов любой принятой срочности:- фьючерсы на основе ставки предложения на Межбанковском депозитном рынке Франкфурта-на-Майне – ФИБО (FIBOR) (3-месячные), на основе БОБЭЛЬ (BOBL) (от 3.3 до 5 лет), на основе БУНД (BUND) (от 8.5 до 10 лет) и БУКСЭЛЬ (BUXL) (от 15 до 30 лет). Продаются опционы на основе фьючерсов на БОБЭЛЬ и БУНД.

DEVALUATION = ДЕВАЛЬВАЦИЯ – Devaluation is a reduction of the external value of a currency. In a system of fixed exchange rates or bloc currencies, devaluation is effected by the legal or official lowering of the exchange rate (or parity) of a currency in terms of the other currencies (formerly against gold). In the case of flexible or floating exchange rates, depreciation is the result of a decline in the exchange rate on the currency market in synch with supply and demand. The opposite of Revaluation. Devaluation is the official lowering of the value of one country's currency in terms of one or more foreign currencies. Thus, if the US Dollar is devalued in relation to Euro, one Dollar will 'buy' fewer Euros than before the devaluation. Voluntary decrease in the value of a nation's currency relative to gold and/or other currencies. Devaluation differs from exchange depreciation in that it is a deliberate act undertaken by a government to reduce the value of its currency. Devaluations first occurred in France in 1926 and in Great Britain in 1931. Devaluations are ordinarily used to correct a chronic balance of payments deficit, by lowering the price of exports in terms of foreign currencies and raising the price of imports domestically. A formal official decrease in the value of a country's currency, typically by that country. Devaluation is a deliberate downward adjustment to a country's official exchange rate relative to other currencies. In a fixed exchange rate regime, only a decision by a country's government (i.e. central bank) can alter the official value of the currency. Contrast to 'Revaluation'. There are two implications for a currency devaluation. First, devaluation makes a country's exports relatively less expensive for foreigners and second, it makes foreign products relatively more expensive for domestic consumers, discouraging imports. As a result, this may help to reduce a country's trade deficit. Devaluation is an official reduction of the exchange rate of a nation's currency. / Формальное снижение официального курса национальной валюты в отношении к признанной в мире валюте другой страны. Не так давно под Девальвацией понималось официальное уменьшение золотого содержания денежной единицы или понижение курса национальной валюты по отношению к золоту, серебру, какой-либо иностранной валюте. Девальвация – снижение органами власти курса валюты страны по отношению к золоту или валютам иных стран. Девальвация может также быть результатом роста курса других валют, соотносящихся с валютой данной страны.

DEVANNING = ВЫГРУЗКА (или ОПОРОЖНЕНИЕ) – The removal of freight. Devanning is the unloading of a container or cargo van. Also known as Stripping, and Unstuffing. Unpacking a container. / Выгрузка грузов из контейнера или грузового фургона. Известна так же как Разборка (Stripping) и Разгрузка (Unstuffing).

DEVELOPED DYES = ПРОЯВЛЕННЫЕ (или ПРОЯВЛЯЮЩИЕСЯ) КРАСИТЕЛИ – Developed Dyes:- any of a group of direct azo dyes that after application to the fiber can be further diazotized and coupled on the fiber to form shades faster to washing. Called also Diazo Dye. See also Dyes.

DEVELOPED RESERVES = ДОБЫТЫЕ РЕЗЕРВЫ – Developed Reserves are expected to be recovered from existing wells including reserves behind pipe. Improved recovery reserves are considered developed only after the necessary equipment has been installed, or when the costs to do so are relatively minor. Developed reserves may be subcategorized as producing or non-producing. See also Reserves.

DEVELOPING = ПРОЯВЛЕНИЕ (или РАЗВИТИЕ) – Developing is a stage in dyeing or printing in which leuco compounds, dyes, or dye intermediates are converted to the final, stable state or shade. / Проявляющийся краситель.

DEVELOPING COUNTRY = РАЗВИВАЮЩАЯСЯ СТРАНА – Developing Country is a nation with a standard of living and level of production that is rising but still below the attainable potential, and that has not yet reached the takeoff stage of economic development. Also known as Less-Developed Country, and Third World Country. / Нация со стандартом жизни и уровнем производства, которые, несмотря на свой рост, продолжают оставаться ниже достигаемого потенциала, и которые пока что не достигли стадии завершения экономического развития. Известна также как Слаборазвитая Страна (Less-Developed Country), и Страна Третьего Мира (Third World Country). Развивающиеся Страны, термин для обозначения группы независимых, в том числе бывших колоний и полуколоний (освободившихся), стран, отставших от развитых стран по уровню социальноэкономического развития вследствие продолжительной эксплуатации их со стороны империалистических государств, сохранения докапиталистических производственных отношений и другого. Развивающиеся страны ведут борьбу за установление равноправных международных экономических отношений, включая валютные, кредитные, торговые и другие. Большинство развивающихся стран придерживается политики неприсоединения и позитивного нейтралитета.

DEVELOPMENT = РАЗВИТИЕ – Development:- Drilling, construction and related activities following discovery that are necessary to begin production and transportation of crude oil and/or natural gas.

DEVELOPMENTAL THRESHOLD = ПОРОГ РАЗВИТИЯ – Developmental Threshold is the lowest temperature at which growth occurs in a given species. Developmental thresholds are different for all insect species. For Cotton = 11 °C, for Helicoverpa = 12 °C. / Самая низкая температура, при которой происходит рост данных видов. Для Хлопчатника = 11 °C, для Хлопкового Коробочного Червя (Хэликовэрпа) = 12 °C.

DEVELOPMENT WELL = НАБЛЮДАТЕЛЬНАЯ СКВАЖИНА (или ОЦЕНОЧНАЯ СКВАЖИНА, или ЭКСПЛУАТАЦИОННАЯ СКВАЖИНА) – Development Well is a well drilled in a proven producing area for the production of oil or gas. A development well is drilled to a depth that is likely to be productive, so as to maximize the chances of success. A development well stands in contrast to an

exploratory well, which is one that is drilled to find oil or gas in an unproved area. As a result, dry or unsuccessful development wells are rarer than dry exploratory wells. It is also known as an Exploitation Well. Energy companies expend significant resources in pinpointing the best locations for drilling wells, since a dry or unproductive well can be a substantial expense. The accounting treatment for development wells differs from exploratory wells. The costs of dry development wells are usually capitalized, whereas the costs associated with dry exploratory wells are expensed. Development Well is a well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive. / Скважина, пробуренная в пределах обоснованной или доказанной территории нефтяного или газового месторождения до глубины стратиграфического горизонта или отложения одного возраста, по которому имеется предположение что оно продуктивно. Скважина – искусственная цилиндрическая горная выработка глубиной от нескольких метров до 10 километров и более и диаметром обычно 75–800 миллиметров. Скважины разделяются на взрывные, вспомогательные (вентиляционные, водоотливные и так далее), разведочные, специальные (дренажные, замораживающие и тому подобные), эксплуатационные (для добычи воды, газа, нефти и так далее). Проходка скважины осуществляется буровыми установками. Элементы скважины:- забой – дно; ствол или стенки – боковая поверхность; устье – выход на поверхность скважины. Буровая Скважина – цилиндрическая горная выработка, имеющая относительно малое поперечное сечение (обычно 75–350 миллиметров). Различают горнотехнические, исследовательские, строительные и эксплуатационные скважины.

DEVIATION = ДЕВИАЦИЯ (или ОТКЛОНЕНИЕ) – (1) In statistics, Deviation is a difference between values in a set and a fixed value, usually the mean of the set. The most frequently used indicator of deviation is variance, which is the square of the standard deviation. Deviation is a departure of an observation from its expected value. / Под Девиацией, от позднелатинского слова Deviatio от Латинского слова Devio, означающее Уклоняюсь С Дороги, понимается отклонение.

(2) A vessel's going to some other point or taking some course other than that described in the Bill of Lading. A Deviation occurs when a ship is on a voyage and departs from the customary or designated route with the intention of returning to that route to complete the voyage. A hull time policy is not affected by deviation, nor is a cargo policy that is subject to the Institute Cargo Clauses. In the case of a hull voyage policy deviation discharges the underwriter from all liability as from the time the vessel leaves the stated or customary course, except where the deviation is excused by s.49 of the Marine Insurance Act (MIA) 1906, or the assured gives the underwriter immediate notice of the deviation upon receipt of advices, agrees to any amended terms of cover required and pays an additional premium, if required. / Под Девиацией понимается отклонение движущегося корабля от заданного направления движения (расчётной траектории, заданного курса) под влиянием каких-либо случайных внешних причин.

DEVITALIZATION = ЛИШЕНИЕ ЖИЗНЕСПОСОБНОСТИ – Devitalization is a procedure rendering commodities incapable of germination, growth or further reproduction.

DEVORÉ = ДЭВОРЕ (или ПОЖИРАТЬ, или СЪЕДАТЬ) – Devoré is a a technique for 'sculpting' fabric using etchants or burn-out paste. / Devoré:- (1) Дэворе; (2) Пожирать; (3) Съедать. используя травители или .

DEWAXING = ДЕПАРАФИНИЗАЦИЯ (или ОБЕСПАРАФИНИВАНИЕ) – Dewaxing is a removal of wax from a base oil in order to reduce the pour point. / Депарафинизация или обеспарафинивание масел. Депарафинизация нефтепродуктов, извлечение из нефтяных продуктов (дизельных топлив, масел) парафина и церезина, в результате чего улучшается их качество, в частности снижается температура застывания. Депарафинизацию нефтепродуктов проводят следующими методами:- кристаллизацией указанных компонентов из раствора нефтепродукта, например, масла в лигроине, при охлаждении; избирательным растворением нефтепродукта в растворителе, не растворяющем парафин и церезин; используют также способность парафинов образовывать комплексы с мочевиной (карбамидная депарафинизация) и микробиологический метод. Получаемые при этом парафин и церезин служат ценным сырьём для различных отраслей промышленности.

DEWKS = DUAL EMPLOYED, WITH KIDS

DEW PERIOD = ПЕРИОД РОСЫ (или РОСНЫЙ ПЕРИОД, или РОСЯНОЙ ПЕРИОД) – Dew Period is the time period or number of consecutive hours, during which there is free water (dew) on the leaf surface. / Период времени или количество последовательных часов, в течение которых присутствует свободная вода (роса) на поверхности листьев. Под Росой понимаются капли воды, образующиеся при конденсации водяного пара на наземных предметах, почве и траве при охлаждении их вследствие излучения. Возникает в ясные и тихие ночи, когда велико земное излучение.

DEWPOINT = ТОЧКА РОСЫ – Dewpoint is the temperature at which a gas begins to condense as a liquid at a given pressure. Thus in air, it is the temperature at which the air becomes saturated when cooled with no further addition of moisture or change in pressure.

DEW POINT TEMPERATURE = ТЕМПЕРАТУРА ТОЧКИ РОСЫ – The Dewpoint Temperature is the temperature, at which the liquid and gaseous phases of the water in the atmosphere are in equilibrium (at a given gas pressure), that means, liquid water evaporates at the same rate, at which vapour condenses. Dew Point Temperature is the temperature at which water vapor in the air reaches saturation point and condenses ('dew' appears). / Под Точкой Росы понимается температура, до которой нужно охладить воздух или другой газ, чтобы содержащийся в нём водяной пар достиг состояния насыщения. При этой температуре в воздухе и на соприкасающихся с ним предметах наблюдается конденсация водяных паров (выпадает роса). Точка Росы – одна из основных характеристик влажности воздуха. Росы точку можно измерить конденсационным гигрометром.

DEXTRIN = ДЭКСТРИН (или ДЕКСТРИН) – Dextrin is a modified starch. Dextrin is used as a thickener for some textile printing processes, and as a resist for some direct application dyeing techniques (it generally isn't usable for immersion dyeing because it washes off too easily). It is made by partially breaking down starch to smaller molecules using acids and/or heat. There are several different dextrins with different properties. Dextrin may also called British Gum, but some workers regard them as distinct. / Дэкстрин (Dextrin).

DF = DAMAGE FREE

DF CAR = DAMAGE–FREE CAR

DFZ = DUTY–FREE ZONE

DG = DIRECTOR GENERAL

DGGE = DENATURING GRADIENT GEL ELECTROPHORESIS

DGI = DEFECTIVE GOODS INVENTORY

DGISP = DANISH GOVERNMENT INSTITUTE OF SEED PATHOLOGY

DG MARKT = INTERNAL MARKET AND SERVICES DIRECTORATE GENERAL

DGSA = DANGEROUS GOODS SAFETY ADVISER

DGSX = DUBAI GOLD AND COMMODITIES EXCHANGE

DH = DEADHEART

DH = DOUBLE HAPLOID

DHCP = DYNAMIC HOST CONFIGURATION PROTOCOL

DHL = DOUBLED HAPLOID LINES

DHOTI = ДОТИ – Dhoti is a draped garment for the lower trunk and legs, common throughout India, mostly for men. Wrapped around the waist, tucked or knotted like a sarong (or bath towel) save that the remaining fabric, often half or more of the total, is then pleated and wrapped around the legs, then tucked in. Drapes vary by region and caste, from basically skirt-like to tidy trouser-like arrangements. Traditional dhoti drapes and sari drapes blend into one another; many saris draped without a petticoat start with a dhoti drape, but use a longer cloth and drape the upper body with part of it.

DHURRIE = ДУРИ – Dhurrie is a thick flat-woven cotton cloth made in India.

DIA = DIAPHORASE

DIADEM = ДИАДЕМА (или ВЕНЕЦ) – Diadem:- crown; specifically, a royal headband.

DIAGONAL (45°) FLAME TEST = ТЕСТ НА ДИАГОНАЛЬНОЕ ВОСПЛАМЕНЕНИЕ ПОД УГЛОМ В 45° (или ТЕСТ ПО ДИАГОНАЛЬНОМУ (45°) ОКРАШИВАНИЮ ПЛАМЕНИ) – Diagonal (45°) Flame Test:- in this test for flame resistance, a specimen is mounted at a 45° angle and exposed to an open flame for a specific time. This test measures the ease of ignition and rate of burning of the samples. See also Flammability Test. / образец, подвешенный под углом 45° и .

DIAGONAL SPREAD = ДИАГОНАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или ДИАГОНАЛЬНЫЙ СПРЭД) – Diagonal Spread is an options strategy established by simultaneously entering into a long and short position in two options of the same type (two call options or two put options) but with different strike prices and expiration dates. This strategy is called a Diagonal Spread because it combines a horizontal spread, which represents the difference in expiration dates, with a vertical spread, which represents the difference in strike prices. An example of a diagonal spread is the purchase of a December USD20 call option and the sale of an April USD25 call. Diagonal Spread is a spread between two call options or two put options with different strike prices and different expiration dates. See also Horizontal Spread and Vertical Spread. The Diagonal Spread is an option spread strategy that involves the simultaneous purchase and sale of equal number of options of the same class, same underlying security with different strike prices and different expiration months. The diagonal spread is very much like the calendar spread, where near term options are sold while long term options are bought to take advantage of the rapid time decay in options that are soon to expire. The main difference between the calendar spread and the diagonal spread lies in the near term outlook. The employer of the diagonal spread has a near term outlook that is slightly more bullish or bearish. Diagonal Call Spread:- if the option trader's near term outlook is mildly bullish, he can implement a diagonal bull spread by writing higher strike near-month calls against lower strike far-month calls. Diagonal Put Spread:- if the option trader's near term outlook is mildly bearish, he can employ a diagonal bear spread by writing lower strike near-month puts against higher strike far-month puts. Diagonal Spread involves buying on option and selling another (both calls or both puts) where both the maturity and the exercise prices are different. / Разница между двумя опционами на покупку или двумя опционами на продажу с различными сходными ценами и различными датами прекращения признания. Смотрите также Вертикальная Курсовая Разница или Вертикальный Спрэд (Vertical Spread), и Горизонтальная Курсовая Разница или Горизонтальный Спрэд (Horizontal Spread).

DIAL = ИГОЛЬНЫЙ ДИСК (или ЦИФЕРБЛАТ, или КРУЖОК С ДЕЛЕНИЯМИ, или ЛИМБ, или КРУГОВАЯ ШКАЛА, или ЦИФЕРБЛАТ) – In a circular-knitting machine, Dial is a circular steel plate with radially arranged slots for needles. A knitting machine equipped with both a dial and a cylinder can produce double-knit fabrics.

DIALER = НАБОРЩИК – A Dialer is a program designed to redirect the user's telephone connection (dial-up) to the Internet to use a premium rate number. These programs can be used legally when paying for Internet services, but fraudulent dialers can be used for redirecting a connection to a more expensive number without the computer user's knowledge. This type of threat has become rare in areas where broadband is available.

DIAL HEIGHT = ВЫСОТА ИГОЛЬНОГО ДИСКА – Dial Height the distance between the bottom edge of the dial section on a knitting machine at its perimeter from the corresponding upper edge of the cylinder at its perimeter.

DIALLEL = ДИАЛЛЕЛЬНОЕ (или ПАРНОЕ) – Diallel:- intercrossing among a group of parents in all combinations.

DIAL–UP ACCESS = ДОСТУП ЧЕРЕЗ НАБОР – Dial-Up Access is an access to digital materials through connection with a remote server through a modem or other remote access device.

DIAMINE = ДИАМИН (или ДИАМИНОВОЕ) – Diamine is a compound with two amino groups. Hexamethylenediamine, one of the intermediates in the manufacture of nylon 66 salt, is an example of this chemical type. / торговое название группы субстантивных красителей. Найлан (Nylon).

DIAPAUSE = ДИАПАУЗА – Diapause is a period of physiologically controlled dormancy in insects. Diapause is a period during which growth or development is suspended. / Период физиологически контролируемого покоя или отсутствия роста у насекомых.

DIAPER = ПОДГУЗНИК (или ПАМПЕРС, или САЛФЕТОЧНАЯ ТКАНЬ, или ПЕЛЁНКА, или УЗОРЧАТОЕ (ПОЛОТНО), или КАМЧАТОЕ (ПОЛОТНО)) – Diaper is a fabric with a distinctive pattern; a rich silk fabric; a soft usually white linen or cotton fabric used for tablecloths or towels. A basic garment for infants consisting of a folder cloth or other absorbent material drawn up between the legs and fastened about the waist. / Скатертные Полотна с квадратными и ромбовидными узорами.

DIAPHRAGM = ДИАФРАГМА (или ПЕРЕГОРОДКА) – Diaphragm is a horizontal or nearly horizontal roof or floor structural element designed to resist lateral loads (wind and earthquake loads) and transmit these loads to the vertical resisting elements (shearwalls). / для придания жёсткости . Под Диафрагмой, от Греческого слова Diáphragma, означающее Перегородка, понимается сплошной или решётчатый элемент пространственной конструкции, способствующий увеличению её жёсткости. Применяется в тонкостенных конструкциях, каркасно- и крупнопанельных зданиях и так далее.

DIBBLE = САДИЛЬНИК (или САДИЛКА, или САЖАЛЬНЫЙ КОЛ) – Dibble:- (1) a small hand implement used to make holes in the soil. (2) To make holes with a long dibble stick.

DIBBLING = ПОСАДКА ПОД КОЛ (или ГНЕЗДОВОЙ ПОСЕВ) – Dibbling:- planting seeds in holes made by a pointed implement such as bamboo or wooden stick. It is usually practiced along sloping or hilly areas.

DICHASIUM = ДИХАЗИЙ – A Dichasium is one unit of a cyme and is characterized by a stunted central flower and two lateral flowers on elongated pedicels, as in the wood stichwort (Species Stellaria Nemorum). / (виды Стеллярии Нэморум (Stellaria Nemorum)). Под Дихазием, от Греческого слова Dicházō, означающее Делю Надвое, понимается соцветие, в котором под верхушечным цветком главной оси развиваются 2 побега с верхушечными цветками. Простой дихазий – у Земляники, некоторых Лютиков, сложный – у Звездчатки (или Стеллярии).

DICHOTOMOUS = ДИХОТОМИЧЕСКОЕ (или ВИЛООБРАЗНО–РАЗДВОЕННОЕ) – Dichotomous:- forking equally, divided into two parts, e.g., double-headed plants. Dichotomous:- forking regularly into two. / , от Греческого слова Dichotomia, означающее Разделение Надвое, . Вилообразно-раздвоенное.

DICHOTOMOUS KEY = ДИХОТОМИЧЕСКИЙ КЛЮЧ – Dichotomous Key is a systematic procedure for determining the identity of an organism (or other object) by making a series of binary choices, according to the characteristics of the object, each of which leads to other choices or to the correct name. / Дихотомический Ключ – таблица для определения растений, состоящая из ступеней, в которых противопоставлены определённые признаки.

DICKEY = МАНИШКА (или ФАРТУК, или ХХ) – Dickey is an article of clothing worn to fill in the neckline, as a man's separate or detachable shirtfront.

DICOT = ДИКОТ – Dicot is abbreviated term for dicotyledon; preferred in scientific literature over broadleaf to describe plants.

DICOTYLEDON = ДВУДОЛЬНОЕ (или ДИКОТИЛЕДОН) – Dicotyledon is a large group of flowering plants with two cotyledons that initially emerge from the seed. The Cactaceae are dicotyledons. John Ray (1627–1705) is an emminent English naturalist who worked on classification of organisms and was the first to divide flowering plants into monocotyledons and dicotyledons. He also recognized fossils as the remains of once living organisms. Dicotyledon is a member of the Dicotyledonae; one of two classes of angiosperms usually characterized by the following:- two seed leaves (cotyledons), leaves with net venation, and root systems with tap roots. Dicotyledon is a plant with two cotyledons or seed leaves, netted leaf venation, and branched tap roots. Floral parts occur in groups of 4 or 5. / главных или стержневых корней. Двудольные большая группа цветущих или цветковых растений с двумя котиледонами (семядолями), которые первоначально возникают из семени. Кактусовые (Cactaceae) растения являются двудольными. цветущие или цветковые растения на однодольные и двудольные. Представление о двудольных растениях было введено Английским биологом Дьжоном Рэем (John Ray). Под Двудольными Растениями (Dicotyledones, или Magnoliopsida) понимается Класс Покрытосеменных (Цветковых) Растений, характеризующийся зародышем с двумя семядолями (отсюда название). В отличие от однодольных имеют, как правило, листья с сетчатым, перистым или пальчатым жилкованием, проводящие пучки располагаются кольцеобразно в 1 или 2 круга, а между древесиной (ксилемой) и лубом (флоэмой) находится образовательная ткань (камбий), обеспечивающая вторичное утолщение; число частей цветка (плодолистиков, тычинок и чашелистиков) обычно кратно 4 или 5. Травы, кустарники, деревья. Составляют около 75% всех Цветковых Растений, включая свыше 175 000 Видов (350–360 Семейств); в бывшем Союзе Советских Социалистических Республик (СССР) свыше 15 000 Видов. Распространены по всему земному шару. Среди Двудольных Растений много пищевых и кормовых (в том числе Зернобобовых, Масличных; Бахчевые, Горох, Гречиха, Картофель, Свёкла), а также Плодовых и Ягодных (Виноград, Слива, Смородина, Яблоня), технических (Арахис, Подсолнечник, Хлопчатник) культур, много лекарственных, декоративных и других хозяйственно важных растений.

DID = DEFENSE IN DEPTH

DIDC = DEPOSITORY INSTITUTIONS DEREGULATORY COMMITTEE

DIELECTRIC BREAKDOWN VOLTAGE = ПРОБИВНОЕ ДИЭЛЕКТРИЧЕСКОЕ НАПРЯЖЕНИЕ – Dielectric Breakdown Voltage:- in an electrical insulating material, the voltage at which electrical breakdown occurs, i.e. the voltage at which current will flow and/or the material melts.

DIELECTRIC CONSTANT = ДИЭЛЕКТРИЧЕСКАЯ ПОСТОЯННАЯ – Dielectric Constant is a measure of the ability of a dielectric material to store electrical potential energy under the influence of an electric field, measured by the ratio of the capacitance of a condenser with the material as the dielectric to its capacitance with a vacuum as the dielectric.

DIELECTRIC STRENGTH = ДИЭЛЕКТРИЧЕСКАЯ ПРОЧНОСТЬ – Dielectric Strength is a measure of the ability of an insulating material to withstand electric stress (voltage) without failure. Fluids with high dielectric strength (usually expressed in Volts or kiloVolts) are good electrical insulators. (ASTM Designation D 877). Dielectric Strength is the average voltage gradient at which electrical failure or breakdown occurs. Expressed in Volts per mil. / Американское Общество по Испытаниям и Материалам (АОИМ). Диэлектрическая Прочность – пробивное напряжение диэлектрика.

DIESEL FUEL = ДИЗЕЛЬНОЕ ТОПЛИВО – Diesel Fuel is a crude-oil distillate fuel oil used in compression-ignition engines. Alternative types of diesel can also be obtained from alternatives sources that are not derived from petroleum, such as biodiesel, biomass to liquid (BTL) or gas to liquid (GTL) diesel which are increasingly being developed and adopted. To avoid confusion, petroleum-derived diesel is also called Petrodiesel. Diesel fuel is similar to home heating oil, but must meet a cetane number specification of 40 or more. In the US the new standard for highway diesel fuel, as of December 2010, is the Ultra Low Sulfur Diesel (ULSD), a cleaner-burning diesel fuel that contains 97% less sulfur than Low-Sulfur Diesel (LSD). Distillate Fuel oil used in compression-ignition engines. It is similar to home heating oil, but must meet a cetane number specification of 40 or more. / Дистиллятные маловязкие фракции топлива, используемые в двигателях внутреннего сгорания. Сопоставимо с печным бытовым топливом для отопления домов, но цетановое число которого по спецификации должно быть от 40 и выше. Под Дизельным Топливом понимается жидкое нефтяное топливо:- газойлевые, керосиновые и соляровые фракции прямой перегонки нефти (для быстроходных дизелей) и более тяжёлые фракции или остаточные нефтепродукты (для тихоходных дизелей). Важнейшей характеристикой дизельного топлива является цетановое число. Под Дизельным Топливом понимается нефтяное топливо, применяемое в двигателях внутреннего сгорания с воспламенением от сжатия (в дизелях). Различают две группы дизельного топлива:- (i) вязкие остаточные (моторные) для среднеоборотных (1 000–500 оборотов в минуту (об/мин)) и малооборотных (ниже 500 об/мин) дизелей; и (ii) дистиллятные маловязкие (газойлевые и керосиновые фракции прямой перегонки нефти) для быстроходных двигателей с частотой вращения 1 000 об/мин и более. Для разных климатических зон и условий работы дистиллятные топлива выпускают трёх видов:- арктическое, зимнее и летнее, различающееся температурой застывания, фракционным составом и другими показателями. Моторное топливо выпускают двух сортов:- для дизелей, оборудованных системой подготовки топлива (подогрев, отстой, сепарация), и для дизелей, не оборудованных такой системой. Дизельное Топливо – жидкое нефтяное топливо, применяемое в дизелях. Выпускаются две группы дизельного

топлива:- (1) Дистиллятные Топлива или Дистиллятные Маловязкие Топлива, применяемые в быстроходных форсированных двигателях; и (2) Остаточные Топлива или Высоковязкие Остаточные Топлива, используемые в тихоходных дизелях. Для производства дистиллятных дизельных топлив используют керосино-газойлевые фракции прямой перегонки нефти и частично (до 20%) газойли каталитического крекинга. Топлива для тихоходных дизелей вырабатывают из смеси мазутов с керосино-газойлевыми фракциями нефти. Дистиллятные Топлива в свою очередь подразделяются на две погруппы:- (1.1) Для Автотракторных Двигателей и (1.2) Для Тепловозных и Судовых Двигателей. Автотракторные Дистиллятные Топлива состоят из двух подгрупп:- (1.1.1) Малосернистое; и (1.1.2) Сернистое. Малосернистые Дистиллятные Топлива Для Автотракторных Двигателей подразделяются на:- (i) малосернистое арктическое ДА (вязкость при 20 °C, сст – 2.5–4.0; цетановое число – 40; содержание серы – 0.2; $t_{заст}$, °C – –60; $t_{всп}$, °C – 35); (ii) малосернистое зимнее ДЗ (вязкость при 20 °C, сст – 3.5–6.0; цетановое число – 40; содержание серы – 0.2; $t_{заст}$, °C – –45; $t_{всп}$, °C – 50); (iii) малосернистое летнее ДЛ (вязкость при 20 °C, сст – 3.5–8.0; цетановое число – 45; содержание серы – 0.2; $t_{заст}$, °C – –10; $t_{всп}$, °C – 60); и (iv) малосернистое специальное ДС (вязкость при 20 °C, сст – 2.5–4.0 (4.0 при 50 °C); цетановое число – 50; содержание серы – 0.2; $t_{заст}$, °C – –15; $t_{всп}$, °C – 90). Сернистые Дистиллятные Топлива Для Автотракторных Двигателей подразделяются на:- (i) сернистое арктическое А (вязкость при 20 °C, сст – 1.5–2.5; цетановое число – 45; содержание серы – 0.4; $t_{заст}$, °C – –55; $t_{всп}$, °C – 30); (ii) сернистое зимнее З (вязкость при 20 °C, сст – 2.2–3.2; цетановое число – 45; содержание серы – 0.6; $t_{заст}$, °C – –35; $t_{всп}$, °C – 35); (iii) сернистое летнее Л (вязкость при 20 °C, сст – 3.0–6.0; цетановое число – 45; содержание серы – 1.0; $t_{заст}$, °C – –10; $t_{всп}$, °C – 40); и (iv) сернистое специальное С (вязкость при 20 °C, сст – 4.5–8.0; цетановое число – 50; содержание серы – 1.0; $t_{заст}$, °C – –15; $t_{всп}$, °C – 90). Дистиллятные Топлива Для Тепловозных и Судовых Двигателей подразделяются на:- (i) зимнее ТЗ (вязкость при 20 °C, сст – 2.2–5.0; цетановое число – 45; содержание серы – 0.5; $t_{заст}$, °C – –35; $t_{всп}$, °C – 40); и (ii) летнее ТЛ (вязкость при 20 °C, сст – 3.5–6.5; цетановое число – 45; содержание серы – 0.5; $t_{заст}$, °C – –10; $t_{всп}$, °C – 65). 1 ст = 10^{-4} $м^2$/сек. Остаточные Топлива подразделяются на:- (i) топливо ДТ (вязкость при 50 °C, сст – 36; коксуемость, % – 3.0; содержание серы – 0.5–1.5; $t_{заст}$, °C – –5; $t_{всп}$, °C – 65); и (ii) топливо ДМ (вязкость при 50 °C, сст – 150; коксуемость, % – 10.0; содержание серы – 3.0; $t_{заст}$, °C – 10; $t_{всп}$, °C – 85).

DIESELISATION = ДИЗЕЛИЗАЦИЯ – Dieselisation is an increase in the proportion of diesel-fuelled cars to gasoline-fuelled cars. As diesel-fuelled cars are generally more energy efficient than those fuelled by gasoline, this change in the car population contributes to lower transport fuel demand (in volume terms) than would otherwise occur.

DIESEL PARTICULATE FILTER = ДИЗЕЛЬНЫЙ МАКРОЧАСТИЧНЫЙ ФИЛЬТР – Diesel Particulate Filter (DPF) is a physical filter that reduces the solid particle content of the exhaust gases. See also Filter.

DIFFERENCE IN APPEARANCE = ОТЛИЧИЕ ПО ВНЕШНЕМУ ВИДУ (или РАЗЛИЧИЕ ВО ВНЕШНЕМ ВИДЕ) – Difference In Appearance:- Fabric:- novelty combination-yarn dress goods; Construction:- (i) Count:- 56 x 52; (ii) Warp:- one end of 100/60/50 S bright viscose rayon, ply-twisted S with one end of 150/40/3 S dull acetate rayon, alternating with one end of the same combination but all Z twist. Arranged Z, S, Z in one dent; (iii) Filling:- 150/40/20 S dull acetate rayon; Finish:- plain dyed navy. Defect:- fabric delivered to customer differed in appearance from the original sample approval pieces since it showed none of the desired pronounced stripe or ‘rib’ effect in the warp. Analysis:- analysis disclosed that the fabric constructions were identical except for the twist direction of the filling yarn and the warp arrangement of S, Z, S combination in one dent, instead of Z, S, Z, as in the original. This difference in twist arrangement and reeding resulted in a less pronounced rib effect, which no finishing operation could correct. / Уточина:- .

DIFFERENCE IN FINISH = РАЗЛИЧИЕ В ЗАКЛЮЧИТЕЛЬНОЙ ОТДЕЛКЕ – Difference In Finish:- Fabric:- spun-rayon-and-wool flannel sportswear; Construction:- (i) Count:- 72 x 72; (ii) Warp:- 24/1 30% 1%-in. 1%-den. dull viscose rayon 30% 2-in. 3-den. dull viscose rayon 40% 64’s wool cut 2 in.; (iii) Filling:- same as warp; Finish:- plain dyed brown. Defect:- several pieces in the same dye lot had appreciably different hand, as well as a slightly different shade, from the major portion of the goods. Analysis:- analysis of the samples of each shade and finish showed yarn count, size, twist, and composition to be identical. On the stripping of a swatch of each and the redyeing of only the rayon, the wool being left white, the same difference in shade was observed. It was noticed, however, that in the darker dyeing swatch the wool appeared much more compact and felted. Investigation of the dyeing procedure disclosed that this construction normally received a fulling or milling treatment, in processing prior to dyeing. Apparently some pieces had received more of this treatment than others, and it was concluded that the difference in the dyeing of the rayon, as well as the variation in hand, was due to this difference in the fulling of the pieces before dyeing. / Уточина:- такая же как и основа.

DIFFERENCE IN LUSTER = РАЗЛИЧИЕ В БЛЕСКЕ – Difference In Luster:- Fabric:- cotton-and-rayon dobby broadcloth; Construction:- (i) Count:- 100 x 64; (ii) Warp:- 40/1 combed cotton with stripes of 150/40 bright viscose rayon; (iii) Filling:- 40/1 combed cotton; Finish:- plain white. Defect:- the goods delivered to customer appeared to be duller than the original sample submitted. Analysis:- although from preliminary examination it seemed that a dull or semidull rayon had been used in the warp, instead of a bright-luster rayon, analysis showed the construction to be identical with that of the original sample. Further examination, however, revealed the presence of a starch finish on the goods which had been rejected by the customer. Laboratory scouring and removal of this finish restored the bright, lustrous appearance which was desired. The starch finish, which had apparently coated the bright rayon sufficiently to make it dull, was readily removed from the entire lot in a refinishing operation. / Уточина:- .

DIFFERENTIAL PRESSURE INDICATOR = УКАЗАТЕЛЬ ПЕРЕПАДА ДАВЛЕНИЯ (или ИНДИКАТОР ПЕРЕПАДА ДАВЛЕНИЯ) – Differential Pressure Indicator is an indicator which signals the difference in pressure between two points, typically between the upstream and downstream sides of a filter element. / Индикатор Давления, прибор для измерения и регистрации изменений давления в устройствах пневмоавтоматики, цилиндрах поршневых машин и так далее. Индикатор давления обычно имеет воспринимающую часть (датчик), передающее и регистрирующее устройства. В пневматическом индикаторе давления давление на поршень или мембрану (воспринимающая часть) через шток передаётся на рычаг самописца, фиксирующего изменения положения поршня (мембраны), то есть изменения давления. В электрическом индикаторе давления колебания давления преобразуются датчиком в электрические сигналы, которые регистрируются с помощью осциллографа, электрических измерительных приборов и другого. Смотрите также Датчик Давления.

DIFFERENTIAL PRESSURE VALVE = КЛАПАН ПЕРЕПАДА ДАВЛЕНИЯ (или ДИФФЕРЕНЦИАЛЬНЫЙ НАГНЕТАТЕЛЬНЫЙ КЛАПАН) – Differential Pressure Valve is a valve whose primary function is to limit differential pressure. See also Valve.

DIFFERENTIALS = ДИФФЕРЕНЦИАЛЫ – Differentials:- the discount (premium) allowed for grades or locations of a commodity lower (higher) than the par of basis grade or location specified in the futures contract. See also Allowance. Price differences between classes, grades, and delivery locations of various stocks of the same commodity. Differential is an amount added or deducted from base rate to make a rate to or from some other point or via another route. Differentials:- the difference between two prices. A large and increasing percentage of all oil transactions are effected on the basis of differentials, also known as Spreads, rather than outright flat prices. / Разница между двумя ценами. Большой и все увеличивающийся процент всех нефтяных сделок заключается на

основе дифференциалов, также известных как спрэды, а не твердой абсолютной цены. Смотрите также Отчисление (Allowance). Под Дифференциалом, от Латинского слова Differentia, означающее Различие или Разность, понимается .

DIFFERENTIAL THERMAL ANALYSIS = ДИФФЕРЕНЦИАЛЬНЫЙ ТЕРМАЛЬНЫЙ АНАЛИЗ – Differential Thermal Ananlysis is a method of determining the temperature at which thermal events occur in a material undergoing continuous heating.

DIFFERENTIATE = ДИФФЕРЕНЦИРОВАТЬ – Differentiate:- to recognize the differences between different plant types or different characters in different varieties of the same species. / , от Латинского слова Differentia, означающее Различие или Разность, . свойства (characters) .

DIFFERENTIATION = ДИФФЕРЕНЦИАЦИЯ – Differentiation is the progressive physiological and morphological changes in cells, tissues, organs or the whole plant during development from meristem tissue to a mature or adult form. Differentiated tissues are usually more functionally specialized than undifferentiated ones. Differentiation is:- (1) process of cell and tissue specialization involving differential gene expression. (2) Sum of the processes where unorganized cells attain an organized form and function. / В биологии под Дифференциацией, от Французского слова Différentiation, от Латинского слова Differentia, означающее Различие или Разность, понимается:- (i) в филогенезе – расчленение группы организмов на две или несколько в процессе эволюции; наиболее важная филогенетическая дифференциация – видообразование; (ii) в онтогенезе – то же, что дифференцировка – превращение в процессе индивидуального развития организма (онтогенеза) первоначальных одинаковых, неспециализированных клеток зародыша в специализированные клетки тканей и органов.

DIFFUSE = ДИФФУЗНОЕ – Diffuse:- widely spread. / , от Латинского слова Diffusio, означающее Распространение или Рассеивание или Растекание, . Широко распространённое.

DIFFUSE REFLECTION = РАССЕЯННОЕ ОТРАЖЕНИЕ (или РАССЕЯННАЯ РЕФЛЕКСИЯ, или РАССЕЯННОЕ ОТОБРАЖЕНИЕ) – Diffuse Reflection is the reflection in which flux is scattered in many directions by diffusion at or below the surface.

DIFFUSION = ДИФФУЗИЯ – Diffusion is:- (1) a more or less gradual movement of molecules or ions through a solution or fiber as a result of the existence of a concentration gradient or repulsive or attractive forces. (2) The random movement of gas molecules. / Под Диффузией, от Латинского слова Diffusio, означающее Распространение или Рассеивание или Растекание, понимается движение частиц среды, приводящее к переносу вещества и выравниванию концентраций или к установлению равновесного распределения концентрации частиц данного сорта в среде. В отсутствие макроскопического движения среды (например, конвекции) диффузия молекул (атомов) определяется их тепловым движением (так называемая молекулярная диффузия). В однородной системе (газ, жидкость) при молекулярной диффузии в отсутствие внешних воздействий диффузионный поток (поток массы) пропорционален градиенту его концентрации. Коэффициент пропорциональности называется коэффициентом диффузии. В физике, кроме диффузии молекул (атомов), рассматривают диффузию электронов проводимости, дырок, нейтронов и других частиц. Диффузия – распространение вещества в какой-либо среде в направлении убывания его концентрации, обусловленное тепловым движением атомов, ионов, молекул, а также более крупных частиц. Диффундировать могут как растворённые в веществе посторонние частицы, так и частицы самого вещества (самодиффузия). Если в системе поддерживается неравномерное распределение температуры или на систему действуют внешние силы, например, электричество, то происходит соответственно термодиффузия, электродиффузия, в результате которых устанавливается неравномерное распределение концентрации. Для одномерной диффузии в идеальных растворах при отсутствии внешних сил справедлив первый закон Фика, согласно которому вектор плотности потока частиц при диффузии пропорционален и противоположен по направлению градиенту их концентрации. Коэффициент пропорциональности в этом законе называют коэффициентом диффузии (обозначается D и выражается (в СИ) в $м^2/с$). Диффузия имеет большое практическое значение, так как ею в значительной степени определяется скорость многих физико-химических процессов (адсорбции, десорбции, кристаллизации, растворения и так далее), а также производственных процессов, например, дубление кож, крашение тканей.

DIFFUSION LAW = ЗАКОН ДИФФУЗИИ – Diffusion Law:- (Latin:- diffundere – to pour out, spread) water vapor always flows from the higher to the lower partial pressure. / .

DIGESTIBILITY = ПЕРЕВАРИВАЕМОСТЬ (или УСВОЯЕМОСТЬ) – Digestibility (as applied to organic wastes) is the potential degree to which organic matter in waste water or sewage can be broken down into simpler and/or more biologically stable products. / Под Усвояемостью понимается степень использования организмом пищевых веществ для восполнения его энергетических затрат и затрат на биосинтез различных соединений. Определяется разностью между количеством поступивших в организм белков, жиров, углеводов и количеством их, выведенным из организма. Усвояемость животных белков 92–96%, растительных – 46–70%, жиров – 95%, углеводов – 98%.

DIGITAL CIRCUIT = ЦИФРОВАЯ ЦЕПЬ (или ЦИФРОВАЯ СХЕМА) – Digital Circuit is an electronic circuit that can take on only a finite number of states. That is contrasted with analog circuits, whose voltages or other quantities vary in a continuous manner. Binary (two-state) digital circuits are the most common.

DIGITAL CURRENCY = ЦИФРОВАЯ ВАЛЮТА – Digital Currency is a form of currency that is available only in digital or electronic form, and not in physical form. It is also called Digital Money, Electronic Money, Electronic Currency, or Cyber Cash. Key Takeaways:- (i) Digital currencies are currencies that are only accessible with computers or mobile phones, as they only exist in electronic form; (ii) Since digital currencies require no intermediary, they are often the cheapest method to trade currencies; (iii) All cryptocurrencies are digital currencies, but not all digital currencies are crypto; and (iv) Digital currencies are stable and are traded with the markets, whereas cryptocurrencies are traded via consumer sentiment and psychological triggers in price movement. Understanding Digital Currency:- Digital currencies are intangible and can only be owned and transacted in by using computers or electronic wallets connected to the Internet or the designated networks. In contrast, physical currencies, like banknotes and minted coins, are tangible and transactions are possible only by their holders who have their physical ownership. Like any standard fiat currency, digital currencies can be used to purchase goods as well as to pay for services, though they can also find restricted use among certain online communities, like gaming sites, gambling portals, or social networks. Digital currencies have all intrinsic properties like physical currency, and they allow for instantaneous transactions that can be seamlessly executed for making payments across borders when connected to supported devices and networks. For instance, it is possible for an American to make payments in digital currency to a distant counterparty residing in Singapore, provided that they both are connected to the same network required for transacting in the digital currency. Digital currencies offer numerous advantages. As payments in digital currencies are made directly between the transacting parties without the need of any intermediaries, the transactions are usually instantaneous and low-cost. This fares better compared to traditional payment methods that involve banks or clearing houses. Digital currency-based electronic transactions also bring in the necessary record keeping and transparency in dealings. Difference Between Digital, Virtual, and Crypto Currencies:- Since they exist in a lot of variants, digital currencies can be considered a superset of virtual currencies and crypto currencies. If issued by a central bank of a country in a regulated form, it is called the ‘Central Bank Digital Currency (CBDC)’. While the CBDC only exists in

conceptual form, England, Sweden, and Uruguay are a few of the nations that have considered plans to launch a digital version of their native fiat currencies. Along with the regulated CBDC, a digital currency can also exist in an unregulated form. In the latter case, it qualifies for being called a virtual currency and may be under the control of the currency developer(s), the founding organization, or the defined network protocol, instead of being controlled by a centralized regulator. Examples of such virtual currencies include cryptocurrencies, and coupon- or rewards-linked monetary systems. (Note:- Since cryptocurrencies are unregulated, they are also considered to be virtual currencies.) A cryptocurrency is another form of digital currency which uses cryptography to secure and verify transactions and to manage and control the creation of new currency units. Bitcoin and ethereum are the most popular cryptocurrencies. Essentially, both virtual currencies and cryptocurrencies are considered forms of digital currencies. Digital Currencies:- Regulated or unregulated currency that is available only in a digital or electronic form. Virtual Currencies:- An unregulated digital currency that is controlled by its developer(s), the founding organization, or the defined network protocol. Cryptocurrencies:- A virtual currency that uses cryptography to secure and verify transactions as well as to manage and control the creation of new currency units. Xxxxx. Digital Currency is a payment method which exists only in electronic form and is not tangible. Digital currency can be transferred between entities or users with the help of technology like computers, smartphones and the internet. Although it is similar to physical currencies, digital money allows borderless transfer of ownership as well as instantaneous transactions. Digital currencies can be used to purchase goods and services but can also be restricted to certain online communities such as a gaming or social networks. Digital currency is also known as digital money and cybercash. Digital currency currently has only a limited user base and the regulatory framework as well as tax treatments of digital currencies is still evolving. The infrastructure needed to support digital currency is still being determined and developed. Cryptocurrencies and virtual currencies are categories of digital currencies. As payments are made directly between payors and payees, digital currencies can eliminate intermediaries, process steps and costs related to infrastructure unlike traditional payment methods which cannot bypass banks or clearing houses. It can also help in making the funds flow more simply and transparently. There are many benefits associated with digital currencies, such as the ability to easily make payments on time and lower transaction costs. Another manner in which digital currencies can help organization is by eliminating/reducing the exposure risks by using them as a transport currency. At present, digital currencies are not accepted by banks, and as a result, interest cannot be earned on them by individuals or organizations. There are also risks associated with digital currencies such as security, currency volatility and payment beneficiary identification. Some areas of uncertainty like compliance with regulations and customer identification along with risk, limit the acceptance of digital currencies in the payment industry. / Цифровой Валютой признаётся совокупность электронных данных (цифрового кода или обозначения), содержащихся в информационной системе, которые предлагаются и (или) могут быть приняты в качестве средства платежа, не являющегося денежной единицей Российской Федерации, денежной единицей иностранного государства и (или) международной денежной или расчётной единицей, и (или) в качестве инвестиций и в отношении которых отсутствует лицо, обязанное перед каждым обладателем таких электронных данных, за исключением оператора и (или) узлов информационной системы, обязанных только обеспечивать соответствие порядка выпуска этих электронных данных и осуществления в их отношении действий по внесению (изменению) записей в такую информационную систему её правилам. Цифровыми Финансовыми Активами признаются цифровые права, включающие денежные требования, возможность осуществления прав по эмиссионным ценным бумагам, права участия в капитале непубличного акционерного общества, право требовать передачи эмиссионных ценных бумаг, которые предусмотрены решением о выпуске цифровых финансовых активов в порядке, установленном настоящим Федеральным Законом Российской Федерации (№ 259-ФЗ от 31 Июля 2020), выпуск, учёт и обращение которых возможны только путём внесения (изменения) записей в информационную систему на основе распределённого реестра, а также в иные информационные системы. (Примечания:- (i) под Распределённым Реестром понимается совокупность баз данных, тождественность содержащейся информации в которых обеспечивается на основе установленных алгоритмов (алгоритма); и (ii) под Узлами Информационной Системы понимаются пользователи информационной системы на основе распределённого реестра, обеспечивающие тождественность информации, содержащейся в указанной информационной системе, с использованием процедур подтверждения действительности вносимых в неё (изменяемых в ней) записей).

DIGITAL DOLLARS = ЦИФРОВЫЕ ДОЛЛАРЫ – The term Digital Dollars' means US Dollar balances consisting of digital ledger entries recorded as liabilities in the accounts of any Federal Reserve bank.

DIGITAL DOLLAR WALLETS = БУМАЖНИКИ ПОД ЦИФРОВЫЕ ДОЛЛАРЫ – The term Digital Dollar Wallet means a digital wallet or account, maintained by a Federal Reserve bank on behalf of any person, for the purpose of holding digital US Dollar balances.

DIGITAL OPTIONS = ЦИФРОВЫЕ ОПЦИОНЫ – Digital Options:- for over-the-counter markets of weather derivatives, binary options are also known as Binary Options. / Цифровые Опционы:- на внеучётном рынке погодных деривативов цифровые опционы известны также как Бинарные Опционы (Binary Options).

DIGITAL SIGNATURE = ЦИФРОВАЯ ПОДПИСЬ – Digital Signature:- data appended to, or a cryptographic transformation of a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery, e.g., by the recipient. See also Electronic Signature. / Смотрите также Электронная Подпись (Electronic Signature). (Электронная) Цифровая Подпись (ЭЦП):- строка бит, полученная в результате процесса формирования подписи. Данная строка имеет внутреннюю структуру, зависящую от конкретного механизма формирования подписи. Примечание:- в целях сохранения терминологической преемственности с действующими в России нормативными документами и опубликованными научно-техническими изданиями установлено, что термины 'Цифровая Подпись' и 'Электронная Цифровая Подпись (ЭЦП)' являются синонимами. Электронная Цифровая Подпись:- используемый при передаче финансовых документов в компьютерной системе 'клиент-банк' зашифрованный идентификатор лица, передающего информацию. Информация принимается к исполнению при совпадении идентификатора с образцом, эталоном, у принимающей стороны.

DIGITAL SUBSCRIBER LINE = ЦИФРОВАЯ ЛИНИЯ ПОДПИСЧИКА – Digital Subscriber Line (DSL) is one of a range of technologies which allows high bandwidth services to be carried over a traditional copper twisted pair. The bandwidth achievable usually depends on the length of the copper pair. The most common form is ADSL or 'Asymmetric Digital Subscriber Line' under which the bandwidth available in each direction is different. These technologies are collectively known as xDSL.

DIGITATE = ПАЛЬЧАТОЕ – Digitate:- a compound structure whose members arise and diverge from the same point, like the fingers of the hand.

DIGITIZING = ОЦИФРОВКА (или ОЦИФРОВЫВАНИЕ) – Digitizing:- embroidery digitizing is the process of converting artwork to stitches.

DIHYBRID = ДИГИБРИД – Dihybrid is a hybrid for two different genes. Heterozygous for two pairs of alleles.

DILUENT = РАЗБАВИТЕЛЬ (или РАЗЖИЖИТЕЛЬ) – Diluent is a solid or liquid chemical used to dilute another. Sodium sulfate is a common diluent for dry dyes. Since the manufacturing of dyes does not always result in exactly the same strength of dye from batch to

batch, manufactures routinely add a diluent to adjust the batch to a standardized strength. Diluents may make up a large portion of dyes designed to yield pale shades. For example, a dye that yields dark red at 2% o.w.g. (on weight of garment) may be diluted to yield a pale pink using 2% o.w.g. of the diluted dye. Diluting dry dyes in the way is done primarily as a convenience to the dyer. Diluent is any gas, liquid, or solid material used to reduce the concentration of an active ingredient in a formulation.

DILUTION = РАЗВОДНЕНИЕ (или РАЗБАВЛЕНИЕ, или РАЗВЕДЕНИЕ, или РАЗЖИЖЕНИЕ, или РАСТВОРЕНИЕ, или ОБЕДНЕНИЕ (СМЕСИ)) – (1) Dilution is a watering down effect.

(2) Dilution is the reduction in the skill of a workforce overall, as comparatively unskilled workers are recruited in response to a rise in demand.

(3) Dilution is a deliberate increase in the number of shares on the market that has the effect of reducing the price of each individual share. A term Dilution refers to the issuance of more shares from a company's treasury – thereby diluting other shareholders. Hence, companies sometimes report 'fully diluted earnings', i.e. the earnings per share AS IF all shares under option had been exercised. This can be very significant. It is also used in the context of a cash-per-share dilution for new investors. For example, when new capital is invested in a company, those investors immediately dilute the cash value of their investment since it is pooled with previous investors. A dilutive acquisition is one that reduces earnings per share. / Разводнение Капитала.

DILUTION OF OWNERSHIP = РАЗВОДНЕНИЕ ВЛАДЕНИЯ – Dilution Of Ownership is a decrease in the value of a share resulting from capital increases through the issue of additional shares or from retained earnings, or similar measures. A Dilution Of Ownership is a process that involves the decrease of the fractional ownership that is enjoyed by shareholders of a given company. This reduction in the value of each individual share takes place when the company chooses to issue additional shares for purchase. A dilution of ownership can also take place due to the conversion of one security into another form, such as the conversion of preferred stock to common stock. The decision to initiate a dilution of ownership is not something that a company does without careful consideration. Usually, the investigation into the possibility of issuing additional shares begins well before any action is taken. If the idea is determined to be in the best interests of the future operations of the company, an escalation process is normally implemented. The structure of the implementation must be in compliance with the bylaws and other founding documents of the company. This means that if any amendments must be made to those documents, they must be approved and registered before the dilution of ownership and the accompanying issuance of additional shares of stock takes place. While this dilution of ownership may appear to be of more benefit to the company than to the individual shareholder, this is not necessarily the case. The offering of additional shares may in fact be a sign that the company is preparing to experience a period of rapid growth. When this is the case, the market price for each unit of stock has an excellent chance of increasing significantly. As a result, the shareholders have the chance to acquire additional shares and may soon see the overall worth of their investment in the company increase substantially. The benefits of a dilution of ownership to a company are more readily apparent. By issuing additional shares of stock, the company is able to derive the most benefit from the capital increase that probably generated interest in the dilution process. In the short term, it may mean that the company can make better use of retained earnings. Over the long term, a dilution of ownership may position the company for expansion opportunities that would not have been possible otherwise. / Разводнение Капитала.

DILUTION PROTECTION = ЗАЩИТА ОТ РАЗВОДНЕНИЯ – Dilution Protection guartantees initial shareholders that, in the event of a capital increase, the proportion of their share in the company will remain unchanged. They are granted the right to subscribe to new shares in the event of a capital increase. The option terms also contain protective clauses that protect the holder of equity warrants against dilution of their option right through any capital measures taken by the stock company. / Разводнение Капитала.

DIM = DIVIDEND AND INTEREST MATRIX

DIMENSIONAL RESTORABILITY = РАЗМЕРНАЯ ВОССТАНАВЛИВАЕМОСТЬ (или ВОССТАНАВЛИВАЕМОСТЬ РАЗМЕРОВ) – Dimensional Restorability is the ability of a fabric to be returned to its original dimensions after laundering or dry cleaning, expressed in percent. For example, 2% dimensional restorability means that although a fabric may shrink more than this in washing, it can be restored to within 2% of its original dimensions by ordinary home pressing methods. / Способность ткани восстанавливать после стирки и утюжки размеры без отклонения от объявленного допуска на усадку.

DIMENSIONAL STABILITY = РАЗМЕРНАЯ СТАБИЛЬНОСТЬ (или СТАБИЛЬНОСТЬ РАЗМЕРОВ) – Dimensional Stability is the ability of textile material to maintain or return to its original geometric configuration. / Размерная Стабильность:- существует несколько типов размерной стабильности, о которых следует знать, прежде чем шить одежду из той или иной ткани. (1) Релаксационная Усадка:- возникает при намокании одежды во время её ручной или машинной стирки. Такая усадка обычно невелика и происходит только один раз. (2) Усадка При Сухой Чистке:- возникает во время сухой чистки одежды и бывает очень небольшой. (3) Свойлачивающая Усадка:- возникает, когда стирка одежды в машине или сушка в барабане происходит слишком интенсивно, что ведёт к её необратимой усадке по причине спутывания волокон между собой. (4) Влажное Расширение:- возникает, когда шерстяное волокно впитывает в себя водяной пар, что ведёт к росту диаметра волокон и увеличению размеров ткани. Это явление характерно для тканей, крашеных в полотне. (5) Паровая Усадка:- возникает в результате паровой обработки ткани при швейном процессе; аналогична релаксационной усадке. (6) Усадка Под Паровым Прессом:- возникает по ходу проклейки тканей клеевыми материалами; может привести к появлению морщин на ткани, если данная ткань несовместима с клеевой прокладкой.

DIMENSION LUMBER = МЕРНЫЙ ПИЛОМАТЕРИАЛ (или ПИЛОМАТЕРИАЛ УСТАНОВЛЕННОГО РАЗМЕРА, или СОРТОВОЙ ПИЛОМАТЕРИАЛ, или КАЛИБРОВАННЫЙ ПИЛОМАТЕРИАЛ) – Dimension Lumber:- joists, planks, rafters and other standard commodity lumber that usually range in width from 1 to 2 inches, in thickness from 2 to less than 5 inches, and in length from 3 to 12 feet. Dimension Lumber is a lumber 38 to 102 millimeters (2" to 4" nominal) in smaller dimension. See also Lumber, and Timber. Dimensional Lumber is a term used for lumber that is finished/planed and cut to standardized width and depth specified in inches. Examples of common sizes are 2 x 4 (pictured) (also two-by-four and other variants, such as four-by-two in the United Kingdom, Australia, New Zealand), 2 x 6, and 4 x 4. The length of a board is usually specified separately from the width and depth. It is thus possible to find 2 x 4s that are four, eight, or twelve feet in length. In the United States and Canada the standard lengths of lumber are 6, 8, 10, 12, 14, 16, 18, 20, 22, and 24 feet. For wall framing, 'stud', or 'precut' sizes are available, and commonly used. For an eight, nine, or ten foot ceiling height, studs are available in 92 5/8 inches, 104 5/8 inches, and 116 5/8 inches. Because the term 'stud' is used inconsistently when referring to length, care should be taken to always specify the exact, actual length required. Solid dimensional lumber typically is only available up to lengths of 24 ft. Engineered wood products, manufactured by binding the strands, particles, fibers, or veneers of wood, together with adhesives, to form composite materials, offer more flexibility and greater structural strength than typical wood building materials. Pre-cut studs save a framer a lot of time as they are pre-cut by the manufacturer to be used in 8 ft, 9 ft & 10 ft ceiling applications, which means they have removed a few inches of the piece to allow for the sill plate and the double top plate with no additional sizing necessary. In the Americas, two-bys (2 x 4s, 2 x 6s, 2 x 8s, 2 x 10s, and 2 x 12s), along with

the 4 x 4, are common lumber sizes used in modern construction. They are the basic building block for such common structures as balloon-frame or platform-frame housing. Dimensional lumber made from softwood is typically used for construction, while hardwood boards are more commonly used for making cabinets or furniture. Lumber's nominal dimensions are given in terms of green (not dried), rough (unfinished) dimensions. The finished size is smaller, as a result of drying (which shrinks the wood), and planing to smooth the wood. However, the difference between 'nominal' and 'finished' lumber size can vary. So various standards have specified the difference between nominal size, and finished size, of lumber. Early standards called for green rough lumber to be of full nominal dimension when dry. However, the dimensions have diminished over time. In 1910, a typical finished 1-inch- (25 mm) board was 13/16 in (21 mm). In 1928, that was reduced by 4%, and yet again by 4% in 1956. In 1961, at a meeting in Scottsdale, Arizona, the Committee on Grade Simplification and Standardization agreed to what is now the current US standard:- in part, the dressed size of a 1 inch (nominal) board was fixed at 3/4 inch; while the dressed size of 2 inch (nominal) lumber was reduced from 1-5/8 inch to the current 1-1/2 inch. / Пиломатериал размерами от 38 до 102 миллиметров (от 2 до 4 дюймов по номиналу) в наименьшем измерении. Смотрите также Пиломатериал (Lumber), и Лесоматериал (Timber). строганый размер (dressed size). Калиброванный Пиломатериал это пиломатериал (заготовка), высушенный и обработанный до заданного размера. Калиброванный Пиломатериал – это:- (i) пиломатериал одинаковых размеров в одной партии; (ii) пиломатериал, подлежащий или не подлежащий дальнейшей обработке в сыром состоянии, у которого допускаемые отклонения по толщине и/или по ширине меньше, чем у чернового пиломатериала; и (iii) пиломатериал, высушенный или обработанный до заданного размера. Калиброванные пиломатериалы (калиброванная доска, брус) активно применяется в строительстве и мебельном производстве.

DIMENSIONS = РАЗМЕРЫ (или ГАБАРИТЫ) – Dimensions:- measurements in length, width and height, regarding cargo. See also Pallet Dimensions. / Размеры (или Габариты) – измерения по длине, ширине и высоте соответствующего груза. Смотрите также Габариты Поддона или Размеры Поддона (Pallet Dimensions). Под Габаритами, от Французского слова Gabarit, понимаются предельные внешние очертания предметов, сооружений и устройств. Габарит определяет возможность безопасного перемещения или правильного расположения какого-либо предмета среди других.

DIMENSIONS OUT OF TOLERANCE = ПРЕВЫШЕНИЕ ДОПУСКА В РАЗМЕРАХ – Dimensions Out Of Tolerance:- could be caused by faulty pattern, cutting, previous operations in stitching or by indifferent operator attention to the specified tolerance. Sewing Room Defects. / при втачивании (stitching). раскрой (cutting). Порок или дефект швейного производства.

DIMETHYL TEREPHTHALATE = ДИМЕТИЛ ТЕРЕФТАЛАТ – Dimethyl Terephthalate, (p-$C_6H_4(COOCH_3)_2$) is an intermediate used in the production of polyethylene terephthalate, the polymer from which polyester fibers and resins are made. / Диметил Терефталат – химическая формула:- $C_6H_4(COOCH_3)_2/C_{10}H_{10}O_4$. Молекулярная масса:- 194.2. Физические свойства:- температура кипения:- 288 °C; температура плавления:- 140 °C; относительная плотность (вода = 1):- 1.2; растворимость в воде:- нерастворимо; давление паров, кПа при 150 °C:- 1.7; относительная плотность пара (воздух = 1):- 5.5; температура вспышки:- 153 °C (OC); и температура самовоспламенения:- 518 °C.

DIMITY = ДВУНИТКА (или ДИМИТИ, или КАНИФАС) – Dimity is a light-weight cotton wash fabric, the distinguishing feature of which is the cords or ribs running warpwise through the cloth, and produced by doubling the warp threads in either heddle or reed in sufficient quantity to form the rib desired. Dimity is a ladies' summer dress fabric and is made of regular cotton yarn, from 1/60's to the very finest counts in both warp and filling, and is made in white and colors, solid white being used in the more expensiva grades (warp and filling). Dimity is made in ribbed stripe effects, and in such colors as ecru, pearl, light blue and blue. These colors are sometimes printed upon the face of the fabric, after it has been woven in the white. Jacquard scroll and other figures are printed upon the white dimity to create elaborate patterns. Dimity is always woven with a plain weave 2-j, and by printing fancy floral designs upon the white surface of the cloth, that compactness of texture Is retained which the plain weave alone can give. If, for instance, the floral effect were woven into the cloth, ends and picks remaining the same as for the plain weave, there would be created loose places warpwise of the cloth, due to the warp floats in forming figures. Dimity, being a light-weight fabric composed of very fine yarns, is therefore best adapted to the lightest running looms. A plain or dobby loom would be the most suitable for this fabric; one capable of weaving from two beams, as these are usually woven. Dimity is made in grades having from 64 ends and picks per inch to 100 and more ends and picks per inch, the count of the yarn varying in accordance with the degree of texture desired. Dimity as a dress fabric has a rather soft feel, and so receives but very slight amount of starch in finishing, which process includes washing, drying and calendering the goods, which are afterward rolled or lapped into bolts, 'each cut or piece constituting a bolt'. Each bolt or piece is then folded, the paper bands put on, and the goods are ready to pack and ship. Dimity is a sheer, thin, spun cloth that sometimes has cords or stripes woven in. It is used for aprons, pinafores, and many types of dress goods. Dimity:- plain weave with a crosswise or lenghtwise spaced rib or crossbar effect; made of cotton. A thin sheer with corded spaced stripes that could be single, double or triple grouping. Made of combed yarn and is 36" wide. Has a crisp texture which remains fairly well after washing. Resembles lawn in the white state. It is easy to sew and to manipulate and launders well. Creases unless crease-resistant. May be bleached, dyed, or printed and often printed with a small rose-bud design. It is mercerized and has a soft lustre. Used for children's dresses, women's dresses, and blouses, infant's wear, collar and cuff sets, basinettes, bedspreads, curtains, underwear. Has a very young look. Dimity:- literally, double thread. / уточина. Жакяр (Jacquard). (1) Хлопчатобумажная ткань типа камчатой. Применяется на столовое бельё. (2) Лёгкая хлопчатобумажная ткань полотняного переплетения в рубчик. Димити – хлопчатобумажная ткань для покрывал, штор и тому подобного. Под Канифасом понимается лёгкая плотная хлопчатобумажная ткань с рельефным тканым рисунком, в старину – полосатая. Под Английским словом Dimity, от Греческого слова Dimitos, означающее Двунитный, понимается Английская киперная хлопчатобумажная ткань. Канифас – плотная хлопчатобумажная ткань, чаще однотонная, реже набивная или с текстильным орнаментом в виде полос. Известна в России с Петровского времени. Сортов канифаса очень много. Некоторые из них использовались как ткань для парусов. Разновидностями канифаса были базин, базин-рояль и другие. Благодаря своей прочности, канифас был излюбленной тканью бедноты в больших городах. Изделия из канифаса назывались то канифасными, то канифасовыми.

DIMORPHIC = ДИМОРФНОЕ – Dimorphic:- having two forms. / Под Диморфным, от Греческих слов Di, означающее Дважды или Двойной, и Morphē, означающее Форма, понимается существующее в двух совершенно разных формах.

DIN = DEUTSCHES INSTITUT FÜR NORMUND EV

DINERS (CLUB) CARD = КАРТА ДАЙНЁЗ (КЛАБ) – Diners (Club) Card is a credit card entitling members to charge to their account goods or services provided by airlines, restaurants, shops, etc throughout the world that are under contract to Diners Club. Diners Club International (a subsidiary of Discover Financial), founded as Diners Club, is a charge card company formed in 1950 by Frank X. McNamara, Ralph Schneider and Matty Simmons. When it first emerged, it became the first independent credit card company in the world that established an idea of self-sufficient company producing credit cards for travel and entertainment. Headquartered in Riverwoods, State of Illinois, the United States. The first credit card charge was made on February 08, 1950, by Frank McNamara,

Ralph Schneider and Matty Simmons at Major's Cabin Grill, a restaurant adjacent to their offices in the Empire State Building. McNamara was bought out two years later by department store heir Alfred Bloomingdale, who resigned several years later. Schneider died in the early 1960s. Simmons resigned in 1967 to form the publishing company that became National Lampoon. During that approximately 20-year period, these four men were the only major participants in the Diners Club operation. Diners Club created what would later be dubbed the 'travel and entertainment' (T&E) card market, which focused on frequent travelers with a substantial income to pay for other high-value charges. As these customers had no need to pay for purchases over time, these cards required that the entire balance of the bill be paid upon receipt. This type of account is known today as a charge card. Diners Club's monopoly was short-lived, as American Express and Carte Blanche (which later partnered with Diners Club) began to compete with Diners Club in the T&E card market. American Express now dominates the 'member card' arena, providing thousands of customers with cards that require the monthly balance to be paid in full. Towards the end of the 1960s Diners Club also faced competition from banks that issued revolving credit cards through BankAmericard (later renamed Visa), and Interbank MasterCharge (later renamed MasterCard). Diners Club began early on to allow franchises of the Diners Club name, at first in Europe and later throughout the world, for many years eclipsing the BankAmericard or Interbank MasterCharge networks abroad. Amoco also issued for a time its own co-branded Diners Club cards called American Torch Club, and Sun Oil Company issued its version called Sun Diner Club Card. In 1981, Citibank, a unit of Citigroup Inc., acquired Diners Club International, the franchisor that holds rights to the Diners Club trademark, and many of the largest franchises worldwide. A majority of the abroad franchises remain independently owned. In a transaction completed July 01, 2008, Discover Financial Services purchased Diners Club International from Citi for USD165 million. The deal was announced in April 2008 and approved by the US government in May 2008. By merging the North American Discover Network with the international Diners Club Network, Discover created a global payment processing system. Discover Bank has no plans to issue Diners Club-branded cards, which continue to be issued by Diners Club International licensees. In 2011, Discover began putting its logo on Diners Club cards. Some payment processors, like PayPal, can only process new Diners Club cards with the Discover logo on them. MasterCard alliance:- in 2004, Diners Club announced an agreement with MasterCard. Diners Club cards issued in the United States and Canada now feature a MasterCard logo and 16-digit account number on the front, and can be used wherever MasterCard is accepted. Cards from other countries continued to bear a 14-digit account number on the front, with the MasterCard logo on the back. However, since the takeover of Diners Club International by Discover Financial Services, these cards have had the Discover logo on the back. Carte Blanche:- Carte Blanche originated as a travel and entertainment card owned by Hilton Hotels, and competed with American Express and Diners Club. Hilton sold the company to Citibank for a brief period during the 1960s, and repurchased it in 1979. The card was phased out of service in the late 1980s. Throughout most of the 1960s and 1970s, the Carte Blanche card was considered to be a more prestigious worldwide travel and entertainment card than American Express or Diners Club, though its small cardmember base hindered its success. Carte Blanche also was the first to implement a 'Gold Card' program, but initially only as a means to recognize cardholders who were frequent users and paid their bills on time. In 2000, the Carte Blanche name was revived in the United States when Diners Club, which was also acquired by Citibank in 1981, introduced an upscale version of its card: the Diners Club Carte Blanche Card. It is an upper-level charge card on par with the American Express Platinum card. The card carries a USD300 annual fee and offers an extensive menu of perks geared toward spendthrift travelers. It is accepted wherever regular Diners Club cards are accepted. Although Diners Club requires payment in full within 30 days, corporate accounts can pay within 60 days without penalty. enRoute:- Diners Club expanded its customer base in Canada by acquiring the enRoute card from Air Canada in 1992, and marketed the card under the combined name for a period of time as the 'Diners Club/en route Card'. The enRoute business was valued at over USD300 million. Diners Club remains a minor player in Canada. Acquisition by BMO:- in November 2009, Citibank announced that Diners Club International's North American franchise has been sold to Bank of Montreal (BMO). The deal gives BMO exclusive rights to issue Diners cards in the United States and Canada. At the time, BMO said the Diners Club fits well with its existing commercial card business, adding that commercial cards are one of the fastest growing segments in the credit card business. Switzerland and Germany franchise:- in a transaction that closed on August 06, 2010, Citibank sold the Switzerland and Germany franchises to a private investment group headed by Anthony J. Helbling. United Kingdom and Ireland franchise:- on August 07, 2012, Citigroup Inc. announced the sale of its Diners Club franchise in the United Kingdom and Ireland to Affiniture Cards Ltd., a private investor group. / Дайнёз Клаб Интёнэшэнэл (Diners Club International). Фрэньк МэкНэмэра (Frank McNamara), Ральф Шнайда (Ralph Schneider) и Мати Симэнз (Matty Simmons) из Мэйдьжоз Кэбин Грил (Major's Cabin Grill), в Здании Эмпайэ Стэйт (Empire State Building). БэнькАмэрикад (BankAmericard) или Интёбэньк МэстчёЧадьж (Interbank MasterCharge). Амэрикэн Точ Клаб (American Torch Club), и Сан Оил Кампэни (Sun Oil Company) Сан Дайнёз Клаб Кад (Sun Diner Club Card). В 1981, Сытибэньк (Citibank). Дискавё Файнэншэл Сёвисиз (Discover Financial Services). Кяртэ Блёш (Carte Blanche). Хилтэн Хотэлз (Hilton Hotels). Энсэни Дьжей. Хэлблинь (Anthony J. Helbling). Сытигруп Инк. (Citigroup Inc.). Виза (Visa). МэстчёКард (MasterCard). Амэрикэн Экспрэс (American Express). Аффинитчо Кадз Эл.ти.ди. (Affiniture Cards Ltd.).

DINGY = ТУСКЛАЯ (или ВЫЦВЕТШАЯ, или ПРОПЫЛЁННАЯ, или ТЁМНАЯ) – Dingy:- wool that is dark or grayish in color and generally heavy in shrinkage. May be caused by excessive yolk, poor farming conditions, or parasites.

DINKS = DUAL INCOME, NO KIDS

DINNER JACKET = ОБЕДЕННЫЙ ЖАКЕТ (или СМОКИНГ) – Dinner Jacket is a jacket for formal evening wear.

DIODE = ДИОД – Diode is an electronic semiconductor device that predominantly allows current to flow in only one direction. / Под Диодом, от Греческого слова Di, означающее Дважды или Двойной, и (Электро)од, понимается двухэлектродный электровакуумный, полупроводниковый или газоразрядный прибор с односторонней электрической проводимостью. Основные разновидности диодов:- газотрон; кенотрон – электровакуумный диод; и полупроводниковый диод. Применяется в электро- и радиоаппаратуре главным образом для выпрямления переменного тока, детектирования, преобразования частоты, переключения электрических цепей.

DIOECIOUS = ДВУДОМНОЕ – Dioecious:- having male and female flowers on separate plants of the same species. Dioecious:- with male and female flowers on separate plants. / В зоологии – раздельнополое; в ботанике – двудомное. Под Двудомными растениями понимается группа растений, у которых мужские (тычиночные) и женские (пестичные) цветки или мужские и женские органы полового размножения (у нецветковых растений) находятся на разных особях. К двудомным растениям относятся Инжир, Конопля, Облепиха, Тополь, Фисташка, многие овощные растения и другие. Сравните с Многодомными Растениями и Однодомными Растениями (Monoecious).

DIOPSIS FLY = МУХА ДИОПСИС (или СТЕБЕЛЬЧАТОГЛАЗАЯ МУХА) – The Stalk-Eyed Fly or Diopsid, Diopsis Sp. (Diptera, Diopsidae) is key pests for Rice crop in Tropical Africa. Its larva or asticot is very harmful to Rice plants. The two main species commonly found in Benin are Diopsis thoracica Westwood and Diopsis apicalis Westwood. Diopsid can be found in all Rice ecological zones of Tropical Africa but preferentially in humid and shady lowland and also in irrigated Rice fields. Damage from Diopsid larvae is similar to the primary damage made by Lepidopteran larvae. The central meristem of the plant is bored, resulting in the deadheart. One

larva can destroy between 3 to 10 Rice stems. In cases of high infestation, larvae can attack Rice panicles. Diopsis sp. are present on Rice throughout the growing period but they are more abundant in the field at pre-tillering and tillering stages. Feeding by the larvae significantly decreases tiller density, effective panicles, grain weight and the total yield and increases the number of immature panicles. In endemic areas, 66% of the tillers and 100% of the hills can be infested. Varieties with improved resistance appear to be a sustainable and effective option for controlling this pest. However, Rice varieties with high levels of resistance to Diopsis sp. are not yet available. In addition, screening for resistance to Diopsis sp. has been very difficult to be achieved until now. Diopsis Fly is an insect producing larva which causes deadheart in young Rice tillers. The Stalk-Eyed Fly or Diopsid, Diopsis Sp. (Diptera, Diopsidae) is an economically significant insect pest of Rice in Tropical Africa. The objective of this study is to develop a fast screening method of Rice varieties for resistance to Diopsis Sp. in a view to advice breeders on resistance sources and to guide producers in the use of resistant varieties to reduce or avoid insecticidal treatments of the fields. The study was conducted in 2008 at the Africa Rica Center (Africa Rice; IITA Station), Cotonou where, 18 upland NERICA (New Rice for Africa) varieties and their parents (Oryza Glaberrima and Oryza Sativa) were twice screened under artificial infestation of Diopsid's eggs and adults. The screening method was based on Brown Plant Hopper screening techniques using small cages. As results, only Nerica 16 and Nerica 18 showed good resistance to Diopsid attack at 20 days after infestation (DAI) under egg infestation. The remaining 18 entries were more or less susceptible. Under adult infestation, 16 Nerica varieties showed very good resistance to the stalk-eyed fly attack at 20 DAI. Of these, Nerica 6, Nerica 11, Nerica 15 and Nerica 18 were highly resistant (% deadhearts <7%). Only Nerica 9 and Nerica 17 were moderately susceptible. The African Oryza glaberrima parent CG14 was the most resistant entry. The Asian parent line WAB56-104 also suffered less damage from Diopsis Sp. than most of the Nericas. In this experiment, the adult infestation appeared to be more realistic than infestation with eggs because it is a free choice method in which pest pressure is weak and where varieties can demonstrate their real behaviour.

DIOSGENIN = ДИОСГЕНИН – Diosgenin is a steroid sapogenin extracted from the tubers of Dioscorea (wild Yam) Species, especially Dioscorea Mexicana and Dioscorea Villosa. Diosgenin is used for the commercial synthesis of cortisone, pregnenolone, progesterone, and other steroid pharmaceuticals. Diosgenin also occurs in Fenugreek. / Диосгенин – стероидный сапогенин, экстрагируемый из клубней (tubers) Видов Диоскорея (дикий Ямс; Dioscorea (wild yam)), особенно Диоскорея Мексиканского и Диоскорея Волосистого (или Ворсинчатого). Диосгенин используется в коммерческом синтезе кортизона, прегненолона, прогестерона и другой стероидной фармацевтики. Диосгенин также образуется в Греческом Пажитнике (Fenugreek).

DIP = ОКУНАНИЕ (или ПОГРУЖЕНИЕ, или ПОГРУЖАТЬ, или ОКУНАТЬ, или ПРОПИТКА, или ПРОПИТОЧНЫЙ СОСТАВ, или ТРАВИЛЬНЫЙ РАСТВОР) – Dip is a chemical composition applied to a cord or fabric to improve its adhesion to rubber or elastomers. Direction of lay. See also Twist. Dip is:- (1) an immersion of a textile material in some processing liquid. The term is usually used in connection with a padding or slashing process. (2) The rubber compound with which tire cords and other in-rubber textiles are treated to give improved adhesion to rubber. / (2) резиновая смесь.

DIP = ОПУСКАНИЕ (или ПРИСПУСКАНИЕ, или САЛЮТ) – Dip (maritime term):- a position of a flag when lowered part way in salute (method of salute between vessels, like planes dipping wings). / Салют флагом.

DIP COATING = НАНЕСЕНИЕ ПОКРЫТИЯ ОКУНАНИЕМ – Dip Coating is the process of passing a fabric through a solution of resin or elastomer, then through squeeze rolls to remove excess and leave a thin surface layer on the base fabric. In this process, both sides can be coated in one pass. See also Dip Treating.

DIP DYEING = КРАШЕНИЕ ОКУНАНИЕМ (или КРАШЕНИЕ ПРОПИТКОЙ) – Dip Dyeing:- also known as Color Bleeding, Gradated Dyeing and Ombré, is an effect usually achieved by hand dipping fabric in dye so that it gradually goes from light to dark, or sometimes from one color to another. See also Dyeing. / Омбре (Ombré) – с переходом тонов.

DIPLOID = ДИПЛОИД (или ДИПЛОИДНЫЙ) – Diploid (2n) is an organism having two chromosomes of each kind. Diploid:- having the basic two sets of chromosomes. / Организм с двойным числом хромосом. Под Диплоидом, от Греческих слов Diplóos, означающее Двойной, и Éidos, означающее Вид, понимается клетка или особь с двумя гомологичными наборами хромосом. Диплоидны все зиготы и, как правило, клетки тела (кроме половых) большинства видов растений и животных. Сравните с Гаплоидом – клеткой или особью с одинарным (гаплоидным) набором непарных хромосом. Под Диплоидом понимается организм с двумя гомологичными (парными) наборами хромосом в соматических клетках (2n). У большинства сельскохозяйственных животных и растений диплоиды представляют основную фазу жизненного цикла (диплофаза, спорофит). Переход от диплоидного состояния (диплофазы) к гаплоидному (гаплофаза) осуществляется при первом мейотическом делении, обеспечивающем образование половых клеток – гамет. При слиянии гамет (образование зиготы) восстанавливается диплоидное число хромосом. Если вследствие аномалий мейоза не происходит редукция числа хромосом, образуется диплоидная (нередуцированная) гамета.

DIPLOSPORY = ДИПЛОСПОРНОЕ – Diplospory:- a form of apomixis in which the embryo develops from unreduced egg cell. / Под Диплоспорным, от Греческих слов Diplóos, означающее Двойной, и Sporá, означающее Посев или Семя, понимается .

DIP PENETRATION = ПОГЛОЩАЕМОСТЬ ПОГРУЖЕНИЯ (или ПРОНИКНОВЕНИЕ ПРИ ОКУНАНИИ, или ПРОСАЧИВАНИЕ ПРИ ОКУНАНИИ, или ПРОНИЦАЕМОСТЬ ПРИ ОКУНАНИИ) – Dip Penetration is the degree of saturation through a tire cord after impregnation with an adhesive.

DIP PICKUP = УВЕЛИЧЕНИЕ ПРОПИТКИ ПОГРУЖЕНИЕМ (или НАЛИПАНИЕ ОКУНАНИЕМ, или ДАТЧИК ОКУНАНИЯ) – Dip Pickup is the amount of adhesive applied to a tire cord by dipping, expressed as a percentage of the weight of the cord before dipping.

DIP TREATING = ОБРАБОТКА ОКУНАНИЕМ (или ПРОПИТКА ПОГРУЖЕНИЕМ) – Dip Treating is the process of passing fiber, cord, or fabric through an adhesive bath, followed by drying and heat-treating of the adhesive-coated fiber to obtain better adhesion.

DIRECT APPLICATION = ПРЯМОЕ ПРИМЕНЕНИЕ – Direct Application usually used to mean a method where a dye solution is locally applied to areas of fabric, such as by painting, squirting, spraying, stamping, etc.

DIRECT BANKING = ПРЯМОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ (или ПОСТОЯННОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ) – Direct Banking is the round the clock banking made possible with state-of-the art information technology, e.g., Internet Banking, Telebanking, and Telephone Banking. / Круглосуточное банковское обслуживание, которое стало возможным благодаря доведённой до совершенства информационной технологии, например, Банковское Обслуживание с Использованием Интернета (Internet Banking), Дистанционное Банковское Обслуживание или Банковское Обслуживание На Отдалении (Telebanking), и Банковское Обслуживание По Телефону (Telephone Banking).

DIRECT BANKS = ПРЯМЫЕ БАНКИ (или НЕПОСРЕДСТВЕННЫЕ) БАНКИ) – Direct Banks are branchless banks which conduct business solely by telephone, telefax or Internet. They offer round-the-clock execution of money and securities transactions at favorable conditions, but usually without advisory services. Payment business is conducted via cash dispensers and other banks'

branch networks. Since they employ the latest communication technology, direct banks are not bound to any specific location. They are often domiciled in economically weak regions which have low labor costs and a favorable tax environment. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

DIRECT BROKERAGE = ПРЯМОЕ БРОКЕРСКОЕ ОБСЛУЖИВАНИЕ – Direct Brokerage securities service operated by a direct bank or discount broker without customized investment advice. This is a low-cost alternative suited primarily for experienced investors.

DIRECT CLEARING MEMBER = ПРЯМОЙ КЛИРИНГОВЫЙ ЧЛЕН – Direct Clearing Member is a clearing member of an exchange entitled to clear its own transactions, those of affiliated companies without a clearing license, as well as those of its clients.

DIRECT COATING = ПРЯМОЕ ПОКРЫТИЕ – Direct Coating is the simplest method of coating, this procedure involves spreading the coating with a knife. The moving fabric substrate is usually supported by a roller or a sleeve. The gap between the knife and the fabric determines coating thickness.

DIRECT COLLECTION = ПРЯМОЕ ИНКАССО – Direct Collection is a documentary collection in which documents are sent directly to the importer's bank by the exporter. The documents are accompanied by a form with collecting instructions provided by Citibank® (cover letter). A copy of the form is sent to Citibank® for tracking and collections processes the same as in traditional collections. Advantages:- (i) time is saved since documents do not have to be sent to one bank which in turn sends it to the importer's bank; (ii) collections possess the same power as if they had been remitted directly by Citibank® since the cover letter appears to have been sent by Citibank® with its own reference number; and (iii) the tracking and collection are exactly that of traditional collections. Please note that:- the exporter assumes responsibility for the use of Citibank®'s numbered forms, since these will be received by the banks as coming directly from Citibank®. Costs:- (i) usually a percentage on the total amount of the collection with a minimum expressed in USD; and (ii) Others Costs:- protest, special handling of unpaid transactions, etc. Direct Collection:- service for handling export draft collections in which the exporter's bank provides him with forms that bear the bank's own letterhead for mailing documents to the buyer's bank for collection. To the buyer's bank, it will appear that the documents were sent from the exporter's bank, but time and expense are saved by bypassing unnecessary processing at the exporter's bank. / Сытибэньк® (Citibank®).

DIRECT CONSIGNMENT = ПРЯМАЯ КОНСИГНАЦИЯ – Direct Consignment (in GATT):- most origin rules require the direct consignment of goods, meaning that for a product to be eligible for origin treatment its transport must be effected directly from the place of production to its preferential destination. The purpose of such a rule is primarily to ensure that the imported goods, in particular bulk cargo etc, whose identity is difficult to establish, are identical with the goods that left the exporting country. Provision is, however, made in most origin rules that goods may be transported through territory other than that of their origin or final destination, cr that of an area country in case of preferential arrangements, if this is justified, e.g., for geographical reasons and if the goods in question have remained under customs surveillance and have not entered into the commerce of the transit country. Direct Consignment:- one company shipping directly to another without third party involvement. / ГЯТ или Дьжи.Эй.Ти.Ти. (GATT). Под Прямой Консигнацией понимается отгрузка товаров одной компанией другой без вовлечения третьих лиц.

DIRECT COST = ПРЯМАЯ ЗАТРАТА – Direct Cost is a cost of producing the product which a company sells. It would include such items as materials and labor that go directly into producing the shipped item. Another term for this is variable cost. These costs are usually shown directly under revenues on an income statement as the first costs associated with producing the revenues that are recorded. Direct Costs are the costs that are traceable to the production of a specific product or enterprise. See also Direct Labor Costs, and Direct Materials Costs.

DIRECT COTTON DYES = ПРЯМЫЕ КРАСИТЕЛИ ДЛЯ ХЛОПКА – Direct Cotton Dyes are dyes which contain an acidic group and which also have a direct affinity for cellulosic fibers. They do not require the use of a mordant. Their introduction in 1884 was thus of considerable importance. The first member of the group, Congo red, is a diazo-dye derived from benzidine, and the majority of direct dyes follow this pattern. In application, the addition of a simple salt (sodium chloride or sulphate) is needed to promote affinity and the dyes may be subdivided according to the proportion of salt required. The affinity is also affected by the temperature of the dye-bath and this property is also used to regulate the course of dyeing. Fastness, particularly to washing, is not good, but with some dyes, such as Griesheim red, it may be improved by suitable after-treatments, e.g., with copper or chromium salts, diazotisation, and coupling. See also Direct Dyes, and Dyes.

DIRECT COUNTS = ПРЯМЫЕ ПОДСЧЁТЫ – Direct Counts:- in soil microbiology, any one of several methods of estimating the total number of microorganisms in a given mass of soil by direct microscopic examination.

DIRECT CREDIT = ПРЯМОЙ КРЕДИТ – Direct Credit is an electronic credit to a customer's account initiated directly by the payer. Direct credits consist primarily of business-to-individual payments for wages, salaries, pensions, state benefits and tax credits, payments initiated by businesses to pay their trading partners and by individuals to pay bills. / Под Прямым Банковским Кредитованием пониается непосредственное кредитование банками предприятий и организаций. В социалистических странах прямое банковское кредитование – преимущественный вид организации кредитных отношений (смотрите Банковский Кредит, и Кредит). В бывшем СССР прямое банковское кредитование пришло на смену Коммерческому Кредиту (1930). Использовалось в качестве экономического инструмента планомерного управления производством. Осуществлялось Госбанком СССР и Стройбанком СССР. Через систему прямого банковского кредитования формировалось около половины оборотных средств предприятий и организаций, планомерно осуществлялась мобилизация денежных накоплений и производительное их использование, возвратное перераспределение денежных средств, общегосударственный учёт производства и распределения общественного продукта, создание кредитных средств обращения и регулирование денежного обращения страны. В условиях экономической реформы происходил процесс совершенствования прямого банковского кредитования – расширение границ и укрупнение объектов банковского кредитования, развитие кредитов под затраты в основные фонды, связанные с интенсификацией производства, техническим прогрессом, улучшением качественных характеристик производимой продукции и её обновлением. Совершенствовались методы кредитования – по обороту и под остатки производственных запасов и затрат, дифференциация режимов кредитования предприятий, предусматривавшая введение кредитных санкций и льгот в зависимости от соблюдения ими основ хозрасчёта, договорной дисциплины и выполнения государственных планов. Развитие прямого банковского кредитования базировалось на дальнейшем укреплении и использовании принципов кредитования социалистического хозяйства. В других социалистических странах прямое банковское кредитование также являлось основой организации кредитного дела. Происходило сосредоточение кредитной деятельности в едином банке или в двух-трёх (кроме Германской Демократической Республики (ГДР)). Улучшалась система планомерного использования кредита в сфере плановой организации оборотных средств всех отраслей хозяйства и формирования различных элементов кругооборота средств. Наряду с прямым банковским кредитованием в отдельных социалистических странах имели место элементы коммерческого кредитования (например, в Венгерской Народной Республике (ВНР)). В капиталистических странах банковский кредит в значительной мере базируется на коммерческой

вексельном кредите, то есть носит косвенный характер. Рост прямого банковского кредитования отражал процесс сращивания банковского капитала с промышленным.

DIRECT CURRENT = ПОСТОЯННЫЙ ТОК – Direct Current is the electrical current that normally flows in one direction only. Abbreviated DC or dc. See also Alternating Current. Direct Current (DC) is the unidirectional flow of electric charge. Direct current is produced by sources such as batteries, thermocouples, solar cells, and commutator-type electric machines of the dynamo type. Direct current may flow in a conductor such as a wire, but can also flow through semiconductors, insulators, or even through a vacuum as in electron or ion beams. The electric current flows in a constant direction, distinguishing it from alternating current (AC). A term formerly used for direct current was galvanic current. The abbreviations AC and DC are often used to mean simply alternating and direct, as when they modify current or Voltage. Direct current may be obtained from an alternating current supply by use of a current-switching arrangement called a Rectifier, which contains electronic elements (usually) or electromechanical elements (historically) that allow current to flow only in one direction. Direct current may be made into alternating current with an inverter or a motor-generator set. The first commercial electric power transmission (developed by Thomas Edison in the late XIX century) used direct current. Because of the significant advantages of alternating current over direct current in transforming and transmission, electric power distribution is nearly all alternating current today. In the mid-1950s, HVDC transmission was developed, and is now an option instead of long-distance high voltage alternating current systems. For applications requiring direct current, such as third rail power systems, alternating current is distributed to a substation, which utilizes a rectifier to convert the power to direct current. Direct current is used to charge batteries, and in nearly all electronic systems, as the power supply. Very large quantities of direct-current power are used in production of aluminum and other electrochemical processes. Direct current is used for some railway propulsion, especially in urban areas. High-Voltage direct current is used to transmit large amounts of power from remote generation sites or to interconnect alternating current power grids. Within electrical engineering, the term DC is used to refer to power systems that use only one polarity of voltage or current, and to refer to the constant, zero-frequency, or slowly varying local mean value of a voltage or current. For example, the voltage across a DC voltage source is constant as is the current through a DC current source. The DC solution of an electric circuit is the solution where all voltages and currents are constant. It can be shown that any stationary voltage or current waveform can be decomposed into a sum of a DC component and a zero-mean time-varying component; the DC component is defined to be the expected value, or the average value of the voltage or current over all time. Although DC stands for ‘direct current’, DC often refers to ‘constant polarity’. Under this definition, DC voltages can vary in time, as seen in the raw output of a rectifier or the fluctuating voice signal on a telephone line. Some forms of DC (such as that produced by a voltage regulator) have almost no variations in voltage, but may still have variations in output power and current. A direct current circuit is an electrical circuit that consists of any combination of constant Voltage sources, constant current sources, and resistors. In this case, the circuit Voltages and currents are independent of time. A particular circuit Voltage or current does not depend on the past value of any circuit Voltage or current. This implies that the system of equations that represent a DC circuit do not involve integrals or derivatives with respect to time. If a capacitor or inductor is added to a DC circuit, the resulting circuit is not, strictly speaking, a DC circuit. However, most such circuits have a DC solution. This solution gives the circuit voltages and currents when the circuit is in DC steady state. Such a circuit is represented by a system of differential equations. The solution to these equations usually contain a time varying or transient part as well as constant or steady state part. It is this steady state part that is the DC solution. There are some circuits that do not have a DC solution. Two simple examples are a constant current source connected to a capacitor and a constant voltage source connected to an inductor. In electronics, it is common to refer to a circuit that is powered by a DC Voltage source such as a battery or the output of a DC power supply as a DC circuit even though what is meant is that the circuit is DC powered. Direct-current installations usually have different types of sockets, switches, and fixtures, mostly due to the low voltages used, from those suitable for alternating current. It is usually important with a direct-current appliance not to reverse polarity unless the device has a diode bridge to correct for this (most battery-powered devices do not). The Unicode symbol for direct current is U+2393. DC is commonly found in many low-Voltage applications, especially where these are powered by batteries, which can produce only DC, or solar power systems, since solar cells can produce only DC. Most automotive applications use DC, although the alternator is an AC device which uses a rectifier to produce DC. Most electronic circuits require a DC power supply. Applications using fuel cells (mixing hydrogen and oxygen together with a catalyst to produce electricity and water as byproducts) also produce only DC. Through the use of a DC-DC converter, high DC Voltages such as 48V to 72V DC can be stepped down to 36V, 24V, 18V, 12V or 5V to supply different loads. In a telecommunications system operating at 48V DC, it is generally more efficient to step Voltage down to 12V to 24VDC with a DC-DC converter and power equipment loads directly at their native DC input Voltages versus operating a 48VDC to 120VAC inverter to provide power to equipment. Many telephones connect to a twisted pair of wires, and internally separate the AC component of the voltage between the two wires (the audio signal) from the DC component of the voltage between the two wires (used to power the phone). Telephone exchange communication equipment, such as DSLAM, uses standard – 48V DC power supply. The negative polarity is achieved by grounding the positive terminal of power supply system and the battery bank. This is done to prevent electrolysis depositions. / Томэс Эдэсэн (Thomas Edison). Постоянный Ток (DC или direct current), электрический ток, не изменяющийся во времени ни по силе, ни по направлению. Постоянный ток используется в различных отраслях промышленности, например, в электрометаллургии, на транспорте (тяговые электродвигатели), для питания устройств связи, автоматики и телемеханики, сигнализации и так далее.

DIRECT DAMAGE = ПРЯМОЕ ПОВРЕЖДЕНИЕ – Direct Damage (entomology) is a plant damage caused by the feeding of an insect through the removal of plant sap or plant parts (compare with indirect damage caused by a disease transmitted by an insect which causes delayed symptoms).

DIRECT DEBIT = ПРЯМОЙ ДЕБЕТ (или ПРЯМОЕ СПИСАНИЕ, или ПРЯМОЕ ДЕБЕТОВАНИЕ, или БЕЗАКЦЕПТНОЕ СПИСАНИЕ, или СПИСАНИЕ В БЕЗАКЦЕПТНОМ ПОРЯДКЕ) – Direct Debit:- collection document that a payee can use to have an amount debited from a debtor’s account through the services of a bank. Unlike a standing order, the payment is not initiated by the debtor but by the payee who submits the direct debt to his bank (first collecting agent), which then credits the direct debit amount to the account and charges it to the debtor’s bank (paying agent). Direct debits are based either on a direct debit order or a pre-authorized payment mandate. Pre-authorized payment systems are particularlly suitable for periodically recurring payments of different amounts. The automated transfer of funds from a debtor’s account to a creditor’s account at the initiative of the creditor and based on the debtor’s authorisation. Each billing period the billing organization will issue a bill to you in the normal way. The bill will state the date in which it will be settled, and the last date on which you may query the bill before it will be settled. If you have a query you must contact the billing organization at your earliest opportunity. If the query results in a change to your bill the billing organization will advise you how to proceed. If you have no queries, or no changes result from your queries, the bill will be settled automatically from your nominated account on the specified date. Please make sure the account will have sufficient funds to settle the bill on the specified date. If it does not, the bill will not be settled and the billing organization will contact you to demand payment by another means. Where an organization receives fixed amounts from its customers or others the Standing Orders facility is probably better suited to its needs. Direct Debit is a way of paying bills automatically. It differs from a Standing Order in that the amount is variable, according to the size of the bill, and in that the debit action is initiated by the Billing Organization. Banks worldwide offer Direct Debit to their customers. To you,

the customer, the major advantage offered by Direct Debit is that your participating bills are settled automatically, without effort, though with protections to ensure that debits are properly conducted. This means no more special trips to the bank to make a bill payment; no more accidental missed payments; and no need to worry if you are overseas when your bill becomes due. Direct Debit enables a beneficiary (that is, a direct debit originator) to request payment from the payer's bank account by automated means. The payer gives prior authority for his/her account to be debited by completing a Direct Debit Instruction (DDI). The 'direct debit guarantee' provides comprehensive consumer safeguards. If you wish to stop paying an organization by Direct Debit you must cancel the Mandate. You do this by writing to the bank, identifying the billing Mandate you wish to cancel. From the date the bank processes the cancellation no further debits will be taken in respect of this billing organization, even if the billing organization requests them. Specifically, the bank undertakes that no debits will be taken commencing the working day after receipt of the cancellation, and will – on a best endeavours basis – attempt to prevent any debits being taken on the day the cancellation is received. However, if the Mandate withdrawal reaches the bank after a debit has already been processed the debit will not be reversed. Note that if you cancel the Mandate before an outstanding bill is settled you will need to pay that bill (as all future bills) by another means. Direct Debit shall mean a payment service for debiting a payer's payment account, where a payment transaction is initiated by the payee on the basis of the payer's consent given to the payee, to the payee's payment service provider or to the payer's own payment service provider. Direct Debit, also referred to as Direct Withdrawal, Electronic Checks, and Direct Payments is a type of payment system that allows businesses to debit funds directly from customers' bank accounts. The debits are made utilizing an electronic funds transfer method. Direct debit is widely used by organizations worldwide and is recognized as one of the most efficient methods for collecting payments. All types of organizations can utilize direct debits and today, many insurance companies, utility companies, banks, local authorities, telecommunication suppliers, and charities utilize direct debiting. Direct debt processing is much the same as credit card processing. Authorization and bank information is typically required, received by fax, phone or internet, and then submitted to the bank or payment processor where the payments are to be processed. Direct debits are generally set up in one of two ways. The first method requires the consumer to provide an authorization to one's bank allowing the debit note to be withdrawn from one's bank account. The second method requires the consumer to provide authorization to the organization that is to make the debit from one's bank account. The types of methods used by organizations vary worldwide and the rules that govern direct debit do vary from country to country. Depending on the country the consumer lives in and the form of authorization provided, direct debit can be utilized to arrange for recurring payments, to prepay orders, or to pay a particular invoiced amount. Benefits of Direct Debit:- (i) ensures timely payment(s); (ii) eliminates need for checks; (iii) reduces administrative costs; (iv) enables auto-recurring billing; (v) reduces customer attrition and increases renewals; and (vi) allows for payment to be received by phone or online. The Process:- if using a direct debit provider, an agreement is made between both organizations. Bank account information is then collected from customers by fax, mail, telephone, or Internet, and then submitted for proper authorization and processing. Once the processing is complete with proper authorization, then the bank is allowed to debit consumers' accounts accordingly. In most countries, it is necessary to include a direct debit permission (authorization) or mandate. United States:- in the United States, typically an Automated Clearing House (ACH) will be utilized to transfer monies from a consumer's bank account to a collector (billing) organization. The ACH is an electronic network that processes large volumes of both debit and credit transactions. The ACH network is governed by the Federal Reserve and the NACH-The Electronic Payments Association, which formerly was known as the National Automated Clearing House Association. United Kingdom and Republic of Ireland:- the United Kingdom caters to almost 40 million direct debit users; however, it has a much more rigorous set of requirements compared to other countries for merchants seeking to process direct debits. Organizations seeking to utilize direct debits in order to collect payments from consumers must have an Originators Identification Number (OIN). If an organization wishes to utilize direct debiting online, the United Kingdom mandates the utilization of a CyberSource processor. Furthermore, before direct debits can be set up, the consumer must complete a Direct Debit Instruction to his or her bank, which then must be properly vetted by the bank. This is required in order to avoid the defrauding of consumers and to ensure that proper protocols are in place that follow governing regulations. Germany:- in Germany, direct debiting (Lastschrift, Bankeinzug) is provided by banks after a direct debit authorization is obtained. In Germany, two methods are used for direct debits. The most common method is known as 'Einzugsermächtigung'. It authorizes the organization to debit the consumer's account either for a fixed amount, for a future invoice, or for recurring payments. Authorization is obtained from the consumer who then sends it to the organization that is collecting the payment. Before authorization is given, the organization must sign an agreement that it will only process direct debits where it has obtained the appropriate authorization. The second method, 'Abbuchungsauftrag', is rarely utilized by private consumers, but on occasion is used between businesses. The difference with this method is that the payer provides authorization to his or her bank to honor direct debit requests from a particular organization. The bank then checks for incoming direct debits that are flagged as 'Abbuchungsauftrag' and verifies that there is a matching authorization held on file. If such an authorization is not on file, then the direct debit is returned. Australia:- in Australia, direct debits can be authorized when the consumer provides such an authorization to the organization that is seeking to collect payment(s). Notification to the consumer's bank is not required. The Netherlands:- as with Germany and Australia, in the Netherlands consumers do not need to notify their banks, but simply provide authorization of the direct debit to the payee. Authorization may be for a one-time charge or a recurring charge. Japan:- in Japan, direct debit services are offered on the basis of a tri-party agreement and authorization between the consumer, the payee, and the consumer's bank. The payee sends the authorization obtained, along with instructions to the bank on a paper basis, on magnetic tape, or through online transmission. / Лястшрифт (Lastschrift), Банкайнцуг (Bankeinzug). Айнцугсамяхтигон (Einzugsermächtigung).

DIRECT DEBIT CONTRACT = КОНТРАКТ НА ПРЯМОЕ СПИСАНИЕ (или ДОГОВОР НА ПРЯМОЕ ДЕБЕТОВАНИЕ, или КОНТРАКТ НА БЕЗАКЦЕПТНОЕ СПИСАНИЕ, или КОНТРАКТ НА СПИСАНИЕ В БЕЗАКЦЕПТНОМ ПОРЯДКЕ) – Direct Debit Contract is an agreement between the creditor and the creditor's financial institution and possibly a third party, which allows the creditor to originate direct debits.

DIRECT DEBITING = ПРЯМОЕ СПИСАНИЕ (или ПРЯМОЕ ДЕБЕТОВАНИЕ, или БЕЗАКЦЕПТНОЕ СПИСАНИЕ, или СПИСАНИЕ В БЕЗАКЦЕПТНОМ ПОРЯДКЕ) – A Direct Debit is an instruction from a customer to the bank authorizing specific organizations to collect varying amounts from the customer's account in settlement of outstanding bills for goods or services provided. Direct Debiting is a practice of debiting a bank account with the sum owed on the authorization of the account holder, but without his or her direct involvement, e.g., in issuing a check or making a cash transfer, at the time. The essence is that it is a claim made by a creditor as opposed to a payment made by a debtor. It is a type of banker's order, although the amount to be debited is not specified. Also known as Direct Debit, and Direct Debit System.

DIRECT DEBIT MANDATE = МАНДАТ НА ПРЯМОЕ СПИСАНИЕ (или МАНДАТ НА ПРЯМОЕ ДЕБЕТОВАНИЕ) – Direct Debit Mandate:- alongside debit advice mandates ('Abbuchungsauftrag'), direct debit mandates ('Einzugsermächtigung') are the more common form of direct debit transaction. Direct debit mandates are used primarily to settle the payment of typical bulk transactions based on standardised, long-term contractual relationships. Under this procedure, the debtor authorizes the payee in writing to charge payments as they fall due by means of direct debit to the debtor's account. This mandate may be revoked at any time. Direct Debit Mandate is an agreement authorised by the debtor allowing the creditor to originate direct debits for debiting the debtor's account.

DIRECT DEBIT ORDER = РАСПОРЯЖЕНИЕ НА ПРЯМОЕ СПИСАНИЕ (или РАСПОРЯЖЕНИЕ НА ПРЯМОЕ ДЕБЕТОВАНИЕ) – No need to remember the payment dates. By using a Direct Debit Order, the bank will execute transfers for the payment of bills on your behalf. A direct debit order is the most convenient way to pay regular bills. The bank will make the payment from your account at the previously agreed time. The amount of payment may be different each time; the bank will get this information from the beneficiary. You can use the direct debit order for the payment of, e.g., electricity, phone, Internet, insurance and kindergarten services:- (i) the bills are always paid on time; (ii) you do not have to spend time on making the payments; and (iii) with direct debit order service, you will save money, since it is always free for you. You can use a direct debit order for the payment of bills, if the beneficiary has an agreement concluded with the bank. Make sure that there are sufficient funds in your account on the agreed payment date. If the necessary sum is not received in the account within three days or if the amount of bill exceeds the permitted limit, we shall not effect the payment or shall transfer the amount, available in the account. We advise you to subscribe to an SMS or e-mail notification in case the funds in your account are insufficient on the payment date or the amount of bill exceeds the permitted limit. Direct Debit Order is a written order of a person obliged to pay to his bank with instructions to accept all debits from a specific creditor. This type of order is above all interesting for regular payments with fluctuating amounts.

DIRECT DEBIT PROCESS = ПРЯМОЕ СПИСАНИЕ (или ПРЯМОЕ ДЕБЕТОВАНИЕ, или БЕЗАКЦЕПТНОЕ СПИСАНИЕ, или СПИСАНИЕ В БЕЗАКЦЕПТНОМ ПОРЯДКЕ) – Direct Debit Process is a direct debit transfer or debit transfer:- authorization and direct debit process. With the agreement on the debit transfers it is possible to retrieve receivables through the banking system.

DIRECT DEBIT SYSTEM = СИСТЕМА ПРЯМОГО СПИСАНИЯ (или СИСТЕМА ПРЯМОГО ДЕБЕТОВАНИЯ) – Direct Debit System is a collection system which enables banks to debit clients' account directly. HSBC Direct Debiting System (DDS) is a collection system for the Main Company and a payment system for the buyer (vendor, branch, distributor or customer), which enables buyers to make payments to the main company through their accounts at HSBC within the limits of their DDS loan limits and conditions set by the Bank. Within this system, payments of the buyers are automatically collected by the Bank on their due dates on behalf of the Main Company and transferred to the Main Company accounts. Features and Advantages:- (i) transactions are carried out on the basis of the invoice terms agreed upon by the vendor and the Main Company; (ii) within Direct Debit System (with or without a credit line), the Main Company collects receivables from the vendors and/or customers on the basis of the invoice information; (iii) collection risk of the Main Company is minimized by the utilization of DDS limit to the vendors; and (iv) the systematic management of collection flow ensures convenience both for the vendor and the Main Company. Advantages for the Main Company:- (i) operational workload, and consequent waste of time and operational costs decrease; (ii) guarantee monitoring costs decrease; (iii) collection risk is minimized with the DDS limit assigned to the vendors; (iv) financing cost of vendors decrease; (v) with the letter of guarantee, collection costs decrease; (vi) effective cash flow plans can be made; (vii) automatic account recording decreases operational workload; and (viii) collection, Limit/Risk reports eases monitoring the risk of vendors. Advantages for the Vendor/Client:- (i) DDS credit limit facilitates easy payment; (ii) Letter of Guarantee, cheques/notes follow-up costs are reduced; and (iii) the transportation risk, cost and consequent waste of time decreases parallel to the decrease in the usage of cheques and notes. / Эйч.Эс.Би.Си. (HSBC).

DIRECT DELIVERY = ПРЯМАЯ ПОСТАВКА – Direct discharge from vessel onto railroad car, road vehicle or barge. Direct Delivery is the conveyance of goods directly from the vendor to the buyer. Frequently used if a third party acts as intermediary agent between vendor and buyer. / Прямая (непосредственная) разгрузка из судна в железнодорожный вагон, автодорожное транспортное средство или баржу.

DIRECT DEPOSIT = ПРЯМОЕ ДЕПОНИРОВАНИЕ – In the United States, Direct Deposit is the automatic deposit of payments to a checking or savings account at a financial institution. Direct deposit of interest payments on Series HH/H bonds is required on all bonds purchased October 1989 and later. HH/H bonds with issue dates prior to that date may be directly deposited. Direct Deposit is a method of payment which electronically credits your checking or savings account.

DIRECT DNA UPTAKE = ПРЯМОЕ ПОГЛОЩЕНИЕ ДНК – Direct DNA Uptake (direct gene transfer) is a transformation procedure in which naked DNA is added to a suspension of protoplasts. The protoplasts are then rendered naked by disrupting the cell membrane through chemical treatment (i.e. PEG) or through electroporation allowing DNA to pass into the cell. / Прямое Поглощение ДНК (прямой перенос генов) процедура преобразования, в которой депротеинизированная ДНК .

DIRECT DYES = ПРЯМЫЕ КРАСИТЕЛИ – Direct Dyes are also quite important in cellulose fibers dyeing:- 75 % of the total consumption of these colorants is used, in fact, to dye cotton or viscose substrates. Direct dyes are applied directly from the dye bath together with salt (sodium chloride or sodium sulphate) and auxiliary agents, which ensure a thorough wetting and dispersing effect. Mixtures of non-ionic and anionic surfactants are used for this purpose. In the batch process the dye is made into paste, then dissolved in hot water and added to the dye bath. The electrolyte is then added to the dye bath. After the dye bath has been drained, the fabric is washed with cold water and generally subjected to after-treatment. Pad processes encompass the following techniques:- (i) pad-steam; (ii) pad-roll; (iii) cold pad-batch; and (iv) pad-jig process (the material is padded with the dye and then passed through a salt liquor in a jigger). In all processes the material is rinsed at the end with cold water. With increasing depth of color the wet fastness can decrease to such an extent that after-treatment must generally be carried out. Two methods exist:- (i) removing the unfixed dye by washing with complexing agents or surfactants with a dispersing effect; and (ii) reducing the solubility of the dye by blocking the hydrophilic groups ('enlargement of the molecule'). Various techniques can be applied to achieve this enlargement of the molecule. Namely, the dyed textile can be treated with:- (i) fixative cationic agents:- these are complex substances that form with the anionic dye a salt-like compound less soluble than the original dye. Quaternary ammonium compounds with long hydrocarbon chains, polyamines and polyethyleneimine derivatives can be used for this purpose; (ii) metal salts:- copper sulphate and potassium dichromate can form with certain azo dyes metal-complex with higher light fastness; (iii) agents based on formaldehyde condensation products with amines, polynuclear aromatic phenols, cyanamide or dicyandiamide (the use of these condensation products leads to the formation of sparingly soluble adducts with the dye molecules); and (iv) diazotised bases:- after dyeing, the material is submitted to diazotisation and is then coupled with aromatic amines or phenols that must not contain hydrosolubilising groups. Environmental concerns arise when after-treating with formaldehyde condensation products or metal salts. The method using fixative cationic agents is, therefore, the most frequently applied. However, quaternary ammonium compounds are often non-biodegradable, fish-toxic and contain nitrogen. See also Dyes. Direct Dyes is a class of aniline dyes, so called because they have such great affinity for cellulose fibers, i.e. cotton and linen. While both these and acid dyes are sodium salts of dye acids, direct dyes do not require the use of a mordant. Their shades are duller than those of either acid or basic dyes and they tend to have less tinctorial value than the basic dyes; however, they have the very important advantages of being much more lightfast than the basic dyes and possibly more so than acid dyes. Direct Dye is a dye class based on application method, which is essentially by immersion of the fiber in a solution of dye without the need for other chemicals to bond the dye to the fiber (though other chemicals may aid exhaustion). Direct dyes have high substantivity, but bond weakly to fibers, and therefore usually have poor washfastness. Lightfastness varies from poor to very good. A post-dyeing fixative is often used to improve washfastness. Brightness can be limited in direct dyes, because brightness often is associated with small molecules and small

molecules tend to make poor direct dyes. 'Household' dyes, of the sort that are sold in grocery stores, typically are union dyes which contain a direct dye and an acid dye. Direct Dyes is a class of dyestuffs that are applied directly to the substrate in a neutral or alkaline bath. They produce full shades on cotton and linen without mordanting and can also be applied to rayon, silk, and wool. Direct dyes give bright shades but exhibit poor washfastness. Various aftertreatments are used to improve the washfastness of direct dyes, and such dyes are referred to as 'Aftertreated Direct Colors'. Direct Dyes:- color cellulose fibers directly without the use of mordants. They are used for dyeing wool, silk, nylon, cotton, rayon etc. These dyes are not very bright and have poor fastness to washing although they are fairly fast to light. / Найлан (Nylon). щелочное (alkaline). сродство (affinity). субстантивность (substantivity). стойкость (fastness). бихромат калия или двухромокислый калий (potassium dichromate). Прямые Красители или Субстантивные Красители – органические красители (по химической классификации – главным образом дис- и полиазокрасители, в том числе металлсодержащие, а также фталоцианиновые, антрахиноновые и другие), окрашивающие волокно непосредственно ('прямо'), то есть без применения протрав. Дёшевы, просты в применении, образуют окраски всех цветов. Используются преимущественно для крашения целлюлозных текстильных материалов, реже – натурального шёлка и полиамидных волокон, а также шерстяных волокон. С помощью прямых красителей окрашивают также кожу и шубную овчину. Прямые Красители или Субстантивные Красители, синтетические красители, обладающие способностью при крашении непосредственно без протрав (отсюда название 'Прямые') достаточно прочно адсорбироваться целлюлозными волокнами. Предполагается, что прямые красители удерживаются на волокне за счёт водородных связей и дисперсионных сил Ван-дер-Ваальса. Водородные связи могут образовывать гидроксильные группы целлюлозы и группы –OH, $–NH_2$, –CONH– красителей. По химическому строению большая часть прямых красителей относится к группе азокрасителей, а отдельные представители к диоксазиновым и фталоцианиновым красителям; они обычно содержат сульфогруппы и хорошо растворимы в воде. Типичный представитель прямых красителей – прямой чисто-голубой. Существуют прямые красители всех цветов; по яркости они уступают реактивным красителям. Светоустойчивость многих прямых красителей низкая. Для повышения устойчивости окрасок к воде, поту, механическим воздействиям при стирке и другому прямые красители обрабатывают на материале закрепителями – специальными веществами, образующими на волокне высокомолекулярные защитные плёнки или дающие с красителем нерастворимые в воде соли, которые прочно удерживаются в порах волокна. Прямые красители применяются для крашения хлопка, вискозы, а также кожи, бумаги, в меньшей степени – натурального шёлка, шерсти и полиамидных волокон. Широкому применению прямых красителей способствуют их невысокая стоимость и простые методы крашения.

DIRECTED APPLICATION = НАПРАВЛЕННОЕ ПРИМЕНЕНИЕ – Directed Application is a precise application to a specific area or plant organ, such as, to a row or bed, or to the leaves or stems of plants.

DIRECTED SPRAYS = НАПРАВЛЕННЫЕ ОПРЫСКИВАНИЯ – Directed Sprays:- e.g., Directed Foliar Sprays are herbicide-water sprays aimed at target plant foliage to cover all leaves to the point of runoff, applied with various low and high volume spray equipment. Herbicide application by directed foliar spray is a cost effective method for treating many types of invasive plant Species. With this method, herbicides are thoroughly mixed in water, often with a non-ionic surfactant, and applied to the foliage and growing tips of woody plants or to completely cover herbaceous plants. Foliar sprays are usually most effective when applied from midsummer to late fall, although spring and winter applications have use on specific plants and situations. Selective treatment is possible because the applicator directs the spray towards target plants and away from desirable plants. Another safeguard is to only use foliar active herbicides, because directed sprays of soil-active herbicides can damage or kill surrounding plants when their roots are within the treatment zone. Never use herbicides with soil activity to treat invasive plants under desirable trees or shrubs. See also Directed Application.

DIRECT ESTERIFICATION = ПРЯМАЯ ЭСТЕРИФИКАЦИЯ (или ПРЯМОЕ ОБРАЗОВАНИЕ СЛОЖНОГО ЭФИРА) – Direct Esterification:- in the production of polyethylene terephthalate, the process in which ethylene glycol is reacted with terephthalic acid to form bis-β-hydroxyethyl terephthalate monomer with the generation of water as a by-product.

DIRECT EXPENSES = ПРЯМЫЕ РАСХОДЫ – In accounting, Direct Expenses are the part of expenses classification. In expenses classification, we can divide total expenses into direct and indirect. Direct expenses are relating to production and purchasing of goods. All expenses which are incurred for production or purchasing are called Direct Expenses. It is the part of prime cost or cost of goods sold of company's product. It shows the debit side of trading account. Following are its main example:- (i) Freight; (ii) Carriage Inward; (iii) Wages; (iv) Factory Expenses; (v) Oil and Fuel; (vi) Factory Fixed Assets' Depreciation; (vii) Royalty on Production; (viii) Import Duty; (ix) Excise Duty; and (x) Clearing and Port Charges. Direct Expenses are the costs directly related to one of the operating cost categories of a business entity and allocable thereto. / Затраты, напрямую связанные с одной из категорий операционных расходов хозяйствующего субъекта и присуждаемые к ним.

DIRECT HIT SHIPMENTS = ОТГРУЗКИ ПРЯМОГО НАЗНАЧЕНИЯ – Direct Hit Shipments:- the operator of a licensed terminal elevator or licensed transfer elevator may receive grain without causing it to be officially inspected and officially weighed and without issuing an elevator receipt for it if:- (a) the grain is transferred directly from a railway car or other conveyance to a ship and is officially inspected and weighed on transfer to the ship; and (b) the operator provides the Canadian Grain Commission with advance notice of the shipment. Direct Hit Shipments are those shipments where Canadian grains, oilseeds and/or pulses are transferred from trucks and/or railcars directly to a vessel without added processing.

DIRECT IDENTIFICATION DRAWBACK = ВОЗВРАТ ПО ЯВНОЙ ИДЕНТИФИКАЦИИ – Direct Identification Drawback which provides a refund of duties paid on imported merchandise that is partially or totally used in the manufacture of an exported article. Identification of the imported merchandise from import to export is required by proper recordkeeping procedures. The imported merchandise must be used in the manufacturing process and exported within 5 years from the date of importation of merchandise. See also Drawback, Same Condition Drawback, and Substitution Drawback. / привоз (importation).

DIRECT INTERCHANGE = ПРЯМОЙ ВЗАИМООБМЕН – Direct Interchange is a transfer of leased equipment from one lessee to another (container). Transfer of leased containers from one lessee to another.

DIRECT INVESTMENT = ПРЯМОЕ ИНВЕСТИРОВАНИЕ – In the United Kingdom, Direct Investment is the net investment by UK/overseas companies in their overseas/UK branches, subsidiaries or associated companies. A direct investment in a company means that the investor has a significant influence on the operations of the company. Investment includes not only acquisition of fixed assets, stock building and stock appreciation but also all other financial transactions such as additions to, or payments of, working capital, other loans and trade credit and acquisitions of securities. Estimates of investment exclude depreciation. Capital export, i.e. by acquiring, establishing or making a strategic investment in companies abroad. Direct Ivestment is defined in the International Monetary Fund's Balance of Payments Manual as 'investment that is made to acquire a lasting interest in an enterprise operating in an economy other than that of the investor, the investor's purpose being to have an effective voice in the management of the enterprise'. In the United States, direct investment is defined for statistical purposes as the ownership or control, directly or indirectly, by one person of 10 percent of more of the voting securities of an incorporated business enterprise or an equivalent interest in an unincorporated business

enterprise. Direct investment transactions are not limited to transactions in voting securities. The percentage ownership of voting securities is used to determine if direct investment exists, but once it is determined that it does, all parent-affiliate transactions, including those not involving voting securities, are recorded under direct investment. See also Capital Export, and Portfolio Investment. Direct Investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence over the management of an enterprise resident in another economy. Ownership or control of 10 percent or more of the voting securities of an entity is the threshold for separating direct investment from other types of investment. Direct investment transactions include transactions in equity (including reinvestment of earnings) and debt instruments. / , то есть . Руководство (Manual). Смотрите также Вывоз Капитала. Вывоз Капитала выступает в двух формах:- как (i) Вывоз Предпринимательского Капитала и как (ii) Вывоз Ссудного Капитала. Вывоз капитала в форме предпринимательского (или функционирующего) означает вложение капитала в промышленные, сельскохозяйственные, транспортные, торговые и другие предприятия (прямые и портфельные инвестиции). Прямые Инвестиции – вложения главным образом в акции промышленных, торговых, банковских предприятий, плантации и тому подобное, обеспечивающие полное владение или дающие возможность полного контроля над их деятельностью. Значительная часть (по США около 40%) всех прямых инвестиций осуществляется за счёт реинвестиций. Портфельные Инвестиции представляют собой вложения капиталов в заграничные ценные бумаги, формально не дающие их владельцам права на полное владение или полный контроль над иностранными предприятиями. Часто портфельные инвестиции маскируют вывоз капитала национальной вывеской из опасений возможной национализации, выступают как форма ‘сотрудничества’ иностранных и национальных компаний и так далее. За 1958–67 при росте прямых инвестиций США в Латинской Америке на 32% портфельные инвестиции выросли в 2.8 раза. Прямые инвестиции остаются главной формой вывоза капитала. Прибыль от прямых инвестиций в 1968 составляла 72% прибыли, получаемой США от вывоза капитала, и 84% всей прибыли от вывоза капитала Великобритании. Вывоз ссудного капитала происходит в виде краткосрочных – до 1 года (вклады в иностранные банки) и долгосрочных (внешние займы) кредитов. Главную роль играют межправительственные займы – форма вывоза капитала, возникшая в годы Первой Мировой Войны 1914–18 под названием ‘Межсоюзнических Долгов’. Удельный вес их в общей массе заграничных инвестиций в форме ссудного капитала составил 85% в конце 1947, 59% в конце 1968.

DIRECT INVESTMENT ENTERPRISE = ПРЕДПРИЯТИЕ С ПРЯМЫМИ ИНВЕСТИЦИЯМИ – Direct Investment Enterprise is an incorporated or unincorporated enterprise in which a foreign investor owns 10 per cent or more of the ordinary shares or voting power of an incorporated enterprise or the equivalent of an unincorporated enterprise. The numerical guideline of ownership of 10 per cent of ordinary shares or voting stock determines the existence of a direct investment relationship. An effective voice in the management, as evidenced by an ownership of at least 10 per cent, implies that the direct investor is able to influence or participate in the management of an enterprise; it does not require absolute control by the foreign investor. Some countries may still feel it necessary to treat the 10 per cent cut-off point in a flexible manner to fit the circumstances. In some cases, the ownership of 10 per cent of the ordinary shares or voting power may not lead to the exercise of any significant influence while, on the other hand, a direct investor may own less than 10 per cent but have an effective voice in the management. Some countries may consider that the existence of elements of a direct investment relationship may be indicated by a combination of factors such as:- (i) representation on the board of directors; (ii) participation in policy-making processes; (iii) material inter-company transactions; (iv) interchange of managerial personnel; (v) provision of technical information; and (vi) provision of long-term loans at lower than existing market rates.

DIRECTIONAL CONTROL SERVO VALVE = СЕРВО КЛАПАН КОНТРОЛЯ НАПРАВЛЕНИЯ (или СЕРВО КЛАПАН РАСПРЕДЕЛИТЕЛЬНОГО КОНТРОЛЯ) – Directional Control Servo Valve is a directional control valve which modulates flow or pressure as a function of its input signal. See also Valve. / Смотрите также Клапан (Valve).

DIRECTIONAL CONTROL VALVE = КЛАПАН КОНТРОЛЯ НАПРАВЛЕНИЯ (или КЛАПАН РАСПРЕДЕЛИТЕЛЬНОГО КОНТРОЛЯ) – Directional Control Valve is a valve whose primary function is to direct or prevent flow through selected passages. See also Valve. / Смотрите также Клапан (Valve).

DIRECTIONALITY = НАПРАВЛЕННОСТЬ – Directionality:- (1) perceived, the degree to which the appearance of a surface changes as the surface is rotated in its own plane, under fixed conditions of illumination and viewing. In color the addition of metal flake and or pearlescent pigments will greatly increase the visual color effects. Surface striation and texture may also greatly change color appearance. (2) Measured – (scattering indicatrix, azimuthally nonisotropic) – difference in pattern of near-specular and semidiffusely scattered light, dependent upon the azimuthal angles of the incident and viewing beams.

DIRECTIONALLY ORIENTED FABRICS = НАПРАВЛЕННО ОРИЕНТИРОВАННЫЕ (или ПО НАПРАВЛЕННОСТИ) ТКАНИ – Directionally Oriented Fabrics:- rigid fabric constructions containing inlaid warp or fill yarns held in place by a warp-knit structure. Used in geotextiles, coated fabrics, composites, etc.

DIRECTIONAL MOVEMENT INDICATOR = ИНДИКАТОР НАПРАВЛЕННОГО ДВИЖЕНИЯ – In technical analysis, Directional Movement Indicator is an indicator that plots a Positive Directional Indicator (+DI) line measuring buying pressure or the force of the up moves, and a Negative Directional Indicator (–DI) line measuring selling pressure or the force of the down moves over a set period. The Directional Movement Indicator (DMI) pattern is bullish as long as the +DI line is above the –DI line. The Average Directional Index line is derived from this system and is based on the spread between the +DI and –DI lines. Directional Movement is a sophisticated indicator by Welles Wilder. Directional Movement is one of few indicators that signals whether a trend is suitable to trade. Welles Wilder is a developer of the RSI indicator and the Directional Movement Indicator (DMI) system. / В техническом анализе биржевых рынков, . Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. Результатом этой деятельности стали многочисленные статьи в специализированных журналах для биржевых торговцев и инвесторов, а также книги, и частности, книга Новые Концепции в Технических Системах Торговли (New Concepts in Technical Trading Systems). Вайлдё разработал систему Delta Plus, технические индикаторы ADX, ART, DMI, RSI, параболическую систему SAR, и другие. В 1980-е он основал общество Delta Society International, помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

DIRECTIONAL TRADING = ТОРГОВЛЯ СООТВЕТСТВЕННО НАПРАВЛЕНИЮ – Directional Trading:- trading strategies designed to speculate on the direction of the underlying market, especially in contrast to volatility trading.

DIRECTION OF LAY = НАПРАВЛЕНИЕ СВИВКИ – Direction Of Lay:- the helical disposition of the component, of a filament, strand or cord. Direction of lay is in the ‘S’ or left hand lay (‘Z’ or right hand lay) when the components of a filament, strand or cord held vertically slope in the same direction as the middle part of the letter S (or Z). See also Lay, and Twist.

DIRECTION OF TWIST = НАПРАВЛЕНИЕ КРУТКИ – The Direction Of Twist in yarns and other textile strands is indicated by the capital letters S and Z. Yarn has S-twist if when it is held vertically, the spirals around its central axis slope in the same direction as the middle portion of the letter S, i.e. to the right; and Z-twist if they slope in the same direction as the middle portion of the letter Z, i.e. to the left. When two or more yarns, either single or plied, are twisted together, the letters S and Z are used in a similar manner to indicate the direction of the last twist inserted. See also Twist. Direction Of Twist:- (S twist or Z twist). To determine twist, hold yarn in a vertical position and examine the angle of the spiral. The angle of the S twist will correspond to the center portion of the S. The angle of the Z twist will correspond to the center portion of the Z. When spinning, the wheel should rotate counter clockwise for an S twist and rotate clockwise for a Z twist.

DIRECT LABOR COSTS = ПРЯМЫЕ ТРУДОВЫЕ ЗАТРАТЫ (или ПРЯМЫЕ РАСХОДЫ НА ТРУД) – Direct Labor Costs are the costs of labor that are physically traceable to a specific product or enterprise.

DIRECT LISTING = ПРЯМОЙ ЛИСТИНГ (или ПРЯМОЕ ВНЕСЕНИЕ В СПИСОК) – Direct Listing:- one unit or one hundred units of a foreign currency expressed in units of the local currency. See also Indirect Quotation.

DIRECT LOAD CONTROL = ПРЯМОЙ КОНТРОЛЬ НАГРУЗКИ – Term 'Direct Load Control' refers to program activities that can interrupt consumer load at the time of annual peak load by direct control of the utility system operator by interrupting power supply to individual appliances or equipment on consumer premises. This type of control usually involves residential consumers. Direct Load Control excludes Interruptible Load and Other Load Management effects. (Direct Load Control, as defined here, is synonymous with Direct Load Control Management reported to the North American Electric Reliability Council on the voluntary Office of Energy Emergency Operations Form OE-411, 'Coordinated Regional Bulk Power Supply Program Report', with the exception that annual peak load effects are reported here and seasonal (i.e. summer and winter) peak load effects are reported on the OE-411).

DIRECT LOADING = ПРЯМАЯ ЗАГРУЗКА – Direct Loading is a loading of freight in a container directly at a shipper's rate.

DIRECT MAIL = ПРЯМАЯ ПОЧТА – Direct Mail is a form of advertising and selling. Individual potential customers receive promotional material and information through the post, and order goods that are delivered by post or courier.

DIRECT MATERIALS COSTS = ПРЯМЫЕ МАТЕРИАЛЬНЫЕ ЗАТРАТЫ (или ПРЯМЫЕ РАСХОДЫ НА МАТЕРИАЛЫ) – Direct Materials Costs are the costs of all materials and components that can be physically traced to a specific product or enterprise.

DIRECT MERCHANT = ПРЯМОЙ (или ПОСТОЯННЫЙ) КОММЕРСАНТ – Direct Merchant works directly with fabric mills and clothing manufacturers, eliminating the markups of middlemen. They typically pass the savings on to their customers, who shop directly with them.

DIRECT MORTGAGE LOAN = ПРЯМАЯ ССУДА ПОД ЗАКЛАДНУЮ (или ПРЯМАЯ ИПОТЕЧНАЯ ССУДА) – Under a Direct Mortgage Loan, the bank receives the lien to the property as security for its loan exposure. Where cover is provided by a mortgage note, this becomes the property of the bank. If the bank's claims are not met when due, it can take legal action to enforce the sale of the underlying property and use the proceeds to settle the outstanding debt directly.

DIRECTOR = ДИРЕКТОР – In the United States, Director is a member of a board of person who control or govern the affairs of an institution or corporation. Member of the board of directors of a corporation. A corporation's initial directors are either named in the by-laws or appointed by the shareholders at the organization meeting. They are subsequently elected at the annual shareholders' meeting. Person elected by shareholders, usually during an annual meeting, to serve on the board of directors of a corporation. The directors appoint the president, vice president and all other operating officers. Directors decide, among other matters, if and when dividends shall be paid. In the United Kingdom, Director is one of the principals of a company, in a public limited company (PLC) appointed by its shareholders. Most companies have a group of directors (the board of directors) who act collectively as the senior management of the company, being responsible to the shareholders for its efficient running and future development. The duties and legal responsibilities of a director are defined in the UK Companies Act of 1985. They include the compilation of an annual report and the recommendation of an annual dividend on shares. / Под Директором, от Латинского слова Director, означающее Направляющий, понимается .

DIRECT OR HELD COVERED = ПРЯМОЙ ИЛИ УДЕРЖИВАЕМЫЙ ПОКРЫТЫМ – Direct Or Held Covered:- a condition requiring that the insured voyage be direct from one place to another. If the voyage is delayed en route or there is a deviation from the direct route the insurance cover continues subject to payment of an additional premium, but only if the assured gives prompt notice of such delay or deviation immediately on receipt of advices, unless the policy provides otherwise.

DIRECTORS = ДИРЕКТОРА – In the United States, Directors are the individuals who, acting as a group known as the Board Of Directors, manage the business and affairs of a corporation. Persons elected by shareholders who are responsible for the implementation of corporate objectives. Can include Chairman, Deputy Chairman, Managing Director, Joint Managing Director and Chief Executive Officer. Directors are people with overall responsibility for a business, who act in accordance with the best interests of the corporation and its shareholders. The Directors elect the Officers (for example, President, Vice President, Secretary, Chief Financial Officer) to handle the corporation's day-to-day affairs. / Лица, избранные акционерами, которые несут ответственность за осуществление целей корпорации. Могут включать в себя Председателя, Заместителя Председателя, Управляющего Директора, Общего Управляющего Директора и Главного Исполнительного Руководителя.

DIRECTORS' AND OFFICERS' LIABILITY INSURANCE = СТРАХОВАНИЕ ОТВЕТСТВЕННОСТИ ДИРЕКТОРОВ И РУКОВОДЯЩЕГО СОСТАВА – Directors' And Officers' Liability Insurance is an insurance that indemnifies against any claims for compensation and legal fees for any actions on the part of the company directors or officers which is outside of their duties, responsibilities or powers. Liability insurance for directors and officers of an entity, providing cover for their personal legal liability towards shareholders, creditors, employees and others arising from wrongful acts such as errors and omissions. Directors And Officers Liability Insurance (often called D&O) is liability insurance payable to the directors and officers of a company, or to the organization(s) itself, as indemnification (reimbursement) for losses or advancement of defense costs in the event an insured suffers such a loss as a result of a legal action brought for alleged wrongful acts in their capacity as directors and officers. Such coverage can extend to defense costs arising out of criminal and regulatory investigations/trials as well; in fact, often civil and criminal actions are brought against directors/officers simultaneously. It has become closely associated with broader management liability insurance, which covers liabilities of the corporation itself as well as the personal liabilities for the directors and officers of the corporation. / таких как ошибки и упущения.

DIRECTOR'S BONUS = ДИРЕКТОРСКИЙ БОНУС – Director's Bonus:- share of a corporation's profits, after dividends and profit sharing, allocated to the members of its board of directors in addition to their normal compensation.

DIRECT PAYMENTS = ПРЯМЫЕ ПЛАТЕЖИ – Direct Payments are the payments made directly by governments to producers. / Прямые Платежи – платежи, произведённые напрямую правительствами производителям.

DIRECT PLACEMENT = ПРЯМОЕ РАЗМЕЩЕНИЕ – Direct Placement is a selling of shares directly to the public without using an underwriter. Direct Placement is a direct sale of securities to one or more professional investors. Such securities may or may not be registered with the securities and exchange commission. They may be bonds, private issues of stock, limited partnership interests, mortgage-backed securities, venture capital investments, or other sophisticated instruments. These investments typically require large minimum purchases, often in the millions of Dollars. Direct placements offer higher potential returns than many publicly offered securities, but also present more risk. Buyers of direct placements are large, sophisticated financial institutions including insurance companies, banks, mutual funds, foundations, and pension funds that are able to evaluate such offerings. Also called Private Placement.

DIRECT PRINTING = ГЛАДКАЯ ПЕЧАТЬ (или ПРЯМОЕ ПЕЧАТАНИЕ, или ПРЯМАЯ НАБИВКА, или ПЕЧАТАНИЕ СУБСТАНТИВНЫМИ КРАСИТЕЛЯМИ) – Direct Printing is a process wherein the colors for the desired designs are applied directly to the white or dyed cloth, as distinguished from discharge printing and resist printing. See also Printing. Direct Printing is the most common approach to apply a color pattern onto a fabric. If done on colored fabric, it is known as Overprinting. The desired pattern is produced by pressing dye on the fabric in a paste form. To prepare the print paste, a thickening agent is added to a limited amount of water and dye is dissolved in it. Earlier starch was preferred as a thickening agent for printing. Nowadays gums or alginates derived from seaweed are preferred as they allow better penetration of color and are easier to wash out. Most pigment printing is done without thickeners because the mixing up of resins, solvents and water produces thickening anyway. / Гладкая Печать – печатание узоров по белым или окрашенным тканям.

DIRECT PRODUCT PROFITABILITY = НЕПОСРЕДСТВЕННАЯ ПРИБЫЛЬНОСТЬ ПРОДУКТА – Direct Product Profitability (DDP) is defined as a way of measuring a product's handling costs from the time it reaches the warehouse until a customer buys it in the retail store. According to the American Marketing Association (retailing definition) DDP is the profit on sale of a product after deducting the cost of the goods and only the expenses directly related to that particular product or product line. Direct Product Profitability:- calculation of the net profit contribution attributable to a specific product or product line. Direct Product Profit (DPP) is a measure of profitability commonly used by the retailers, and it was first used in the retail food industry. Direct product profit (DPP) equals an item's gross margin rupees, plus discounts and allowances earned, less direct handling, selling, and inventory holding costs. DPP focuses on the contribution profit of individual retail items in individual stores. It enables the retailer to develop results for brands, categories, departments, stores etc, thus forming the basis for merchandising decisions.

DIRECT ROUTE = ПРЯМОЙ МАРШРУТ – Direct Route is the shortest operated route between two points. / Самый короткий действующий маршрут между двумя пунктами.

DIRECT SEEDING = ПРЯМОЙ ПОСЕВ – Direct Seeding is a system of planting rice in which seeds, either pregerminated or dry, are broadcast or sown directly in the field, with either dryland or wetland preparation; no transplanting process is involved. / Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта.

DIRECT STORE DELIVERY = ПРЯМАЯ ПОСТАВКА В УНИВЕРМАГ – Direct Store Delivery is a logistics strategy to improve services and lower warehouse inventories. Direct Store Delivery (DSD) is a key method of selling and distributing products for a large variety of industries, like food, beverage, home personal care products, and like wholesale and distribution, oil and gas, service industries to name industries beyond consumer products. DSD is a business process that manufacturers use to both sell and distribute goods directly to point of sales (PoS) or point of consumption (PoC) including additional product and market related services such as merchandising, information gathering, or equipment service and bypassing any retailer or wholesaler logistics. A company that performs DSD does not send goods to any locations using any independent third party actor – neither an independent wholesaler, nor the retailer's own warehouses. DSD is an alternative distribution model to centralized distribution and tends to be used extensively in the food industry for fresh products such as milk and bread where minimizing the number of days in the supply chain is a key concern. Similarly, DSD is used effectively for full truckload orders where bypassing distribution centers makes economic sense. DSD is also a favored approach when there is a strong requirement for supplier knowledge or service such as is the case with greeting cards for example. Having said this, there is pressure building up in the food supply chain to reduce the retailer's reliance on DSD and push more volume through centralized distribution channels. The Standard Interchange Language (SIL) acts as an interface standard for transferring data between proprietary store systems like DSD and PoS.

DIRECT UNDERWRITING = ПРЯМАЯ ПОДПИСКА (или ПРЯМОЕ РАЗМЕЩЕНИЕ, или ПРЯМОЕ РАСПИСЫВАНИЕ) – Direct Underwriting:- firm underwriting is a commitment by the bank to buy the securities if the offering fails to attract sufficient investor interest. Firm Commitment Underwriting is an underwriting in which an investment banking firm commits to buy and sell an entire issue of stock and assumes all financial responsibility for any unsold shares. Firm underwriting is a commitment by the bank to buy the securities if the offering fails to attract sufficient investor interest. See also Underwriting. Underwriting is the procedure by which an underwriter brings a new security issue to the investing public in an offering. In such a case, the underwriter will guarantee a certain price for a certain number of securities to the party that is issuing the security (in exchange for a fee). Thus, the issuer is secure that they will raise a certain minimum from the issue, while the underwriter bears the risk of the issue. Also known as Firm Underwriting.

DIRECT UTILITY COST = ПРЯМАЯ ЗАТРАТА ПРЕДПРИЯТИЯ – Direct Utility Cost is the utility cost that is identified with one of the Demand-Side Management (DSM) program categories, i.e. Energy Efficiency, Direct Load Control, Interruptible Load, Other Load Management, Other DSM Programs, Load Building.

DIRNDL = ДИРНДЛЬ – Dirndl is a dress with tight bodice, short sleeves, low neck, and gathered skirt; a full skirt with a tight waistband. / В Германии, Дирндль – платье с обтягивающим лифом, короткими рукавами, низкой шеей и собранной юбкой; пышная юбка с узким поясом.

DIRT = COP – Dirt is the foreign substance or matter of any type in the cotton lint. See also Neps, and Shives.

DIRT CAPACITY = ГРЯЗЕЁМКОСТЬ – Dirt Capacity is the weight of a specified artificial contaminant which must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.

DIRTY–APPEARING NUBS = ЗАГРЯЗНЁННЫЕ (или СОРНЫЕ) ПОЯВЛЯЮЩИЕСЯ ШИШЕЧКИ – Dirty-Appearing Nubs:- Fabric:- spun-rayon linen-type dress goods; Construction:- (i) Count:- 48 x 48; (ii) Warp:- 30, 1 80$ 1%-in. 1%-den. bright viscose rayon 20% viscose rayon cut to make flake yarn, plied with 14/1 combed cotton; (iii) Filling:- same as warp; Finish:- plain dyed gold. Defect:- nubs which appeared to be dirty or darker than the fabric itself. Analysis:- examination showed that the nubs had a greenish cast, giving the appearance of being dirty in contrast with the gold back-ground. Microscopic analysis of these nubs showed that they were

no different in composition from the remainder of the rayon staple in the spun yarn. It was observed that the bobbin tails or hang threads at the selvage had a similar greenish color. This defect was attributed to the dyer's use of a combination of dyestuffs which did not exhaust at the same rate. Apparently one of the components was a green or blue dyestuff which exhausted from the dye bath and went on to the fiber more rapidly than the yellow. Since the nubs, or open fiber tufts, are comparatively loose and absorb the color more rapidly than does the remainder of the hard-spun yarns, they took on the dirty greenish appearance which produced this detect. / Уточина:- такая же как и основа.

DIRTY CARGO = ТЁМНЫЕ НЕФТЕПРОДУКТЫ – Dirty Cargo:- those petroleum products which leave significant amounts of residue in tanks. Generally applies to crude oil and residual fuel oil. / Те нефтепродукты, которые оставляют значительное содержание остатков в цистернах. В основном относится в сырой нефти и остаточным мазутовым фракциям.

DIRTY FLOAT = НАВЯЗЫВАЕМОЕ УРАВНОВЕШИВАНИЕ – Dirty Float is a type of floating exchange rate that is not completely freely floating because central banks intervene from time to time to alter the rate from its free-market level. It is still a floating rate because it has not been pegged at a predetermined par value.

DIRTY PANICLE = ГРЯЗНАЯ МЕТЁЛКА – Dirty Panicle is a term commonly used in relation to the disease syndrome of grain discoloration of Rice. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

DIRTY PRICE = ГРЯЗНАЯ ЦЕНА – Dirty Price:- a price that has to be paid to buy a bond is known as the Dirty Price. It is made up of the bond's clean price including accrued interest. See also Clean Price. Dirty Price is the price derived from an actuarial present value of future payments. The dirty price is discontinuous across xd dates. You pay the dirty price when you buy the stock.

DIRTY TANKER = ТАНКЕР ДЛЯ ТЁМНЫХ НЕФТЕПРОДУКТОВ – Dirty Tankers carry loads of crude oil and residual fuels, while clean tankers carry lighter products such as diesel, gasoline, No. 2 heating oil, and jet fuel. Light products cannot be carried in dirty tankers because they will become contaminated and no longer meet product specifications. Generally, smaller tankers carry clean cargoes of refined products, while the larger tankers carry crude oil and other dirty products. Prior to the tightening of pollution controls concerning the dumping of bilge water used in cleaning, it was easier for tankers to switch from dirty to clean fixtures. The original oil tankers used high pressure jets of hot sea water to clean oil residue from the storage tanks, which was then dumped into the sea. Over time, environmental regulations were slowly tightened, and now tankers are not permitted to discharge any oil-contaminated water into the ocean. Now, cleaning a dirty tanker for clean cargoes takes about two weeks, using streams of crude oil to remove the sludge and residue in the storage tanks, which then must be piped out. Increased demand coupled with decreased flexibility in the fleet have led to very tight capacity in both clean and dirty tankers, with the effect being felt most keenly in clean tankers. See also Clean Tanker. / печное бытовое топливо № 2 (No. 2 heating oil) . разгрузить загрязнённую воду с любым содержанием нефти в океан. Смотрите также Танкер Для Светлых Нефтепродуктов (Clean Tanker).

DIRTY THREAD = ГРЯЗНАЯ НИТЬ – Dirty Thread:- grease or dirt in thread processing machinery. Thread defects, and namely – Spinning. / Порок или дефект ниток.

DIRTY TIPS = ГРЯЗНЫЕ МЫСКИ (или КОНЧИКИ, или КРАЯ) – Dirty Tips:- the weathering that occurs on the ends of some locks. These may not completely wash out or evenly dye.

DIS = DATA AND INFORMATION SYSTEM

DISABILITY INSURANCE = СТРАХОВАНИЕ НА СЛУЧАЙ НЕТРУДОСПОСОБНОСТИ – Insurance against the incapacity to exercise a profession as a result of sickness or other infirmity. / Нетрудоспособность – неспособность к труду в связи с состоянием здоровья, возрастом и в других предусмотренных законом случаях. Нетрудоспособность различают:- (i) по её степени – полная, частичная; (ii) в зависимости от перспектив восстановления трудовой функции – временная, постоянная (стойкая); (iii) по видам трудовой деятельности – общая, профессиональная. В бывшем Союзе Советских Социалистических Республик (СССР) нетрудоспособность определялась на основе медицинской проверки индивидуальной потери трудоспособности врачебно-консультационной комиссией или врачебно-трудовой экспертной комиссией. При стойком нарушении трудоспособности, которое приводит больного к необходимости прекращения профессионального труда на длительный срок или требует значительных изменений условий труда, устанавливается Инвалидность. Нетрудоспособность – основное условие для назначения пенсии, пособия, предоставления различных льгот в области условий труда, налогов, обеспечения жильём, бытового, медицинского обслуживания и другого.

DISABLED SHIP = АВАРИЙНОЕ СУДНО (или ВЫВЕДЕННОЕ ИЗ СТРОЯ СУДНО) – Disabled Ship:- when a ship is unable to sail efficiently or in a seaworthy state as a result of engine trouble, lack of officers or crew, damage to the hull or ship's gear.

DISAGIO = ДИЗАЖИО (или СКИДКА) – (1) Disagio is the difference between the nominal or par value and the underlying market value, e.g., if the issue or market price expressed in percent of the nominal value drops below par, i.e. below 100. The opposite of Agio. / Дизажио – разница между номиналом или лицевой стоимостью и соответствующей рыночной стоимостью, например, если выпуск или рыночная цена, выраженная в процентах от номинальной стоимости, падает ниже номинала, то есть ниже 100. В противоположность Ажио (Agio). Дизажио – отклонение биржевого (рыночного) курса ценных бумаг, фондовых ценностей или денежных знаков в сторону понижения по сравнению с их номинальной стоимостью. Дизажио обычно выражается в процентном отношении к номиналу. Дизажио, от Латинского слова Disagio, – величина скидки, с которой продаётся товар, от его номинальной стоимости (номинала). Обычно дизажио выражается в процентах от номинала. Противоположностью дизажио является Ажио. Дизажио, от Итальянского слова Disaggio, означающее Затруднение:- (1) разница, выраженная в процентах, между номиналом ценной бумага и её упавшим рыночным курсом; (2) понижение биржевого курса ценных бумаг в сравнении с их номиналом; (3) отрицательная разница между ценой товара, находящегося в наличии, и ценой по срочной сделке; (4) понижение курса ценных бумаг на иностранных фондовых биржах в сравнении с курсом на национальных биржах.

(2) In foreign exchange operations, Disagio is the discount charged for exchanging a depreciated foreign currency and the charge or discount deducted for exchanging abraded or worn coins. Also known as Discount.

DISAPPEARANCE = ИСПОЛЬЗОВАНИЕ (или РАСХОД) – Disappearance:- in the United States, textile mill raw fiber consumption plus raw fiber exports.

DISAPPEARANCE OF PATTERN = ИСЧЕЗНОВЕНИЕ УЗОРА – Disappearance Of Pattern:- Garment:- woman's white waffle-pique dress; Fabric Construction:- (i) Count:- 84 x 72; (ii) Warp:- 36/1 cotton; (iii) Filling:- 40/1 cotton. Complaint:- waffle pattern disappeared after laundering. Analysis:- examination of the dress fabric and chemical tests showed that the pique pattern was not woven but was produced by the application of a resin finish followed by the embossing of the pattern in the finishing plant. This type of finish, while it is not considered permanent, is reasonably durable to dry cleaning and washing, provided that the fabric is not ironed with too much

pressure on the right side while wet. The flattening out of the fabric and disappearance of the waffle pattern in the garment returned was apparently due to lack of caution in pressing the damp fabric on the right (pattern) side. Laboratory tests made on similar fabrics at a later date indicated that the technique of applying finishes of this type had improved greatly, making them much more durable in repeated laundering and ironing. / Уточина:- .

DISAPPEARING STITCHES IN STRETCH DENIM = ПРОПАДАЮЩИЕ СТЕЖКИ В РАСТЯГИВАЮЩЕМСЯ ДЁНИМЕ – Disappearing Stitches In Stretch Denim is where the thread looks much smaller on seams sewn in the warp direction than in the weft direction of the fabric. Notice that the thread looks much smaller on the seat seam as compared to the Yoke seam. Recommended Solutions to minimizing disappearing stitches on stretch denim:- (1) use a heavier thread size (T-120, T-135, T-150) on topstitching; (2) go to a longer stitch length (from 8 to 6 spi); (3) make sure the thread tensions are as loose as possible so the thread sits on top of the fabric rather than burying in the fabric on seams sewn in the warp. Fabrics defect.

DISASTER PAYMENTS = ПЛАТЕЖИ ЗА ПРИРОДНЫЕ БЕДСТВИЯ – Disaster Payments:- in the United States, Government payments to participating producers who are prevented from planting any portion of their permitted acreage under a program, or who suffer low yields, due to weather and related conditions. Starting in 1982, disaster payments, as a rule, were available only to those producers who had no access to Federal crop insurance.

DISBURSEMENT = ДИСБУРСМЕНТ (или ВЫПЛАТА, или РАСЧЁТ) – (1) Disbursement is a payment by cash or check. / :- оплата наличными или чеком.

(2) Disbursement is a payment made on behalf of a client by a banker, solicitor, or other professional person. It is ultimately charged to the client's account. / :- оплата, произведённая банкиром, солиситором (в Великобритании адвокат) или иным профессиональным лицом от имени клиента. В конечном итоге сумма взыскивается со счёта клиента.

(3) Expenses incurred by the shipowner in connection with running a ship. Sums paid out by a ship's agent at a port and recovered from the carrier. Disbursement:- sums paid on behalf of a carrier by a ship's agent at a port and subsequently recovered from the carrier. / Расходы, понесённые владельцем судна в .

DISBURSEMENTS CLAUSE = ОГОВОРКА О ВЫПЛАТАХ – Disbursements Clause is a clause in a policy covering hull and machinery of a ship, which incorporates a warranty prohibiting the assured from effecting additional insurances to include total loss of the ship, other than those listed in the clause. Breach of this warranty is not held covered, and discharges the underwriter from all liability under the hull and machinery policy as from the date of breach of warranty. The clause permits a maximum amount that may be insured in respect of 'disbursements', 'increased value', 'anticipated freight', etc without breach of warranty taking place. / ручательство (warranty).

DISC = DISCOUNT

DISC = DOMESTIC INTERNATIONAL SALES CORPORATION

DISC FLORET = ТРУБЧАТЫЙ ЦВЕТОЧЕК – Disc Floret is one of the central tubular flowers of a composite flower head. / Трубчатый Цветочек в центральной части соцветия у сложноцветных.

DISC FLOWER = ТРУБЧАТЫЙ ЦВЕТОК – Disc Flower is one of the multiple inner tubular florets on flower heads of Compositae (Sunflower family). / У сложноцветных. цветочки (florets) на цветочных головках или головках цветка (flower heads) Сложноцветных (семейства Подсолнечников).

DISCHARGE = ВЫТРАВЛИВАНИЕ (или ВЫТРАВКА) – Discharge is a localized removal of dye from fabric. Discharge is used to remove dye from fabric in printing and similar processes. Often another illuminating dye is applied to the area that is discharged. Sometimes the new color is included in the discharge paste. Some dyes are quite easy to discharge, others are very difficult to discharge. This can be the case even within a single dye family. Commercially dyed black fabric is notorious for producing unpredictable results in discharge. This is because most black dyes are mixtures of several colors. Industrial discharge processes use reducing agents such as thiourea dioxide, sodium formaldehyde sulfoxylate, zinc formaldehyde sulfoxylate or tin chloride. Art dyers will often use household chlorine bleach for discharge techniques (this author knows of no commercial use of chlorine bleach for discharge). Some discharge techniques decolorize the dye but leave remnants fixed to the fiber, while others break the bond between the dye and the fiber. / хлорный отбеливатель (chlorine bleach). диоксид тиомочевины (thiourea dioxide), формальдегид сульфоксилат натрия (sodium formaldehyde sulfoxylate), формальдегид сульфоксилат цинка (zinc formaldehyde sulfoxylate).

DISCHARGE = ВЫСВОБОЖДЕНИЕ (или РАЗГРУЗКА) – (1) Discharge is the unloading of a vessel, vehicle, or aircraft. / Разгрузка судна, транспортного средства или самолёта.

(2) Discharge is the landing of cargo. / Выгрузка груза на землю.

DISCHARGE PORT = ПОРТ ВЫСВОБОЖДЕНИЯ (или ПОРТ РАЗГРУЗКИ) – Discharge Port is a port where cargo is unloaded from vessel. The name of the port where the cargo is unloaded from the export vessel. This is the port reported to the US Census on the Shipper's Export Declaration, Schedule K, which is used by US companies when exporting. This can also be considered the first discharge port. / Порт, в котором груз выгружается из судна.

DISCHARGE PRINTING = ВЫТРАВНОЕ ПЕЧАТАНИЕ – Discharge Printing:- in 'white' discharge printing, the fabric is piece dyed, then printed with a paste containing a chemical that reduces the dye and hence removes the color where the white designs are desired. In 'colored' discharge printing, a color is added to the discharge paste in order to replace the discharged color with another shade. See also Printing. Discharge Printing is a method of obtaining light designs on a very dark ground. The fabric is piece dyed first, then the color is discharged or bleached in spots, leaving white designs in a pattern. An additional step is often the roller printing of these design areas with patterns and colors. See also Dyeing. Discharge Printing is a type of printing in which the fabric is first dyed and is then printed with a paste which contains material to destroy or 'discharge' the original dyed color. When the discharged area is to be replaced with another color, instead of being left white, the paste also contains the new color, which is unaffected by the discharge agent and which is applied at the same time. / вытравное печатание белого грунтового рисунка ('white' discharge printing). вытравное печатание цветного грунтового рисунка ('colored' discharge printing) . Вытравная Печать – один из распространённых способов получения рисунка на ткани. При вытравной печати на поверхность предварительно окрашенной ткани наносятся в определённых местах печатные составы, которые разрушают окраску, благодаря чему на ткани появляется рисунок. Различают белую и цветную вытравную печать. В первом случае в печатный состав краситель не вводится и после окончания процесса получается белый рисунок на окрашенном фоне, во втором – в состав печатной краски добавляется краситель, устойчивый к действию вещества, разрушающего окраску фона, и получается цветной рисунок на окрашенной ткани. Обычно для цветной вытравной печати применяют кубовые красители.

DISCHARGES = СВИДЕТЕЛЬСТВО О ПРОФЕССИОНАЛЬНОЙ ПРИГОДНОСТИ – Discharges is an essential document for officers and seamen as it serves an official certificate confirming sea experience in the employment for which he was engaged.

DISCIPLINARY RESEARCH = ДИСЦИПЛИНАРНОЕ ИССЛЕДОВАНИЕ – Disciplinary Research is a research conducted by specialists of a particular discipline.

DISCLAIMER = ОТКАЗ ОТ ОТВЕТСТВЕННОСТИ (или ОТКАЗ ОТ ПРЕТЕНЗИЙ, или БЕЗПРЕТЕНЗИОННОСТЬ, или НЕПРЕТЕНЗИОННОСТЬ, или НЕПРИЕМЛЕМОСТЬ ПРЕТЕНЗИИ) – (1) A Disclaimer is a legal statement which generally states that the person/group authoring the disclaimer is not responsible for any mishap in the event of using whatever object or information the disclaimer is attached to. This is generally done as a measure of legal protection; if someone hurts himself misusing something with such a disclaimer, he could not (legally) claim in a court of law that he was unaware of the potential safety risks. A statement made to free oneself from responsibility. Also known as Hedge Clause. Disclaimer is a statement denying responsibility for a particular action.

(2) In the US patent law, a Disclaimer:- a patentee, whether of the whole or any sectional interest therein, may, on payment of the fee required by law, make disclaimer (give up all or part of the owner's rights to enforce claims) of any complete claim, stating therein the extent of their interest in such patent. Such disclaimers are required to be in writing and recorded in the United States Patent and Trademark Office (USPTO), and are considered as part of the original patent to the extent of the interest actually possessed by the disclaimant and by those claiming under him. Any patentee or applicant may disclaim or dedicate to the public the entire term, or any terminal part of the term (from a certain point in time throught the projected end of the entire term), of the patent granted or to be granted. There are two types of disclaimers:- a statutory disclaimer and a terminal disclaimer.

(3) In the US trademark law, a Disclaimer is a statement that the applicant or registrant does not claim the exclusive right to use a specified element or elements of the mark. The purpose of a disclaimer is to permit the registration of a mark that is registrable as a whole but contains matter that would not be registrable standing alone, without creating a false impression of the extent of the registrant's right with respect to certain elements in the mark.

DISCLOSED RESERVES = РАСКРЫТЫЕ РЕЗЕРВЫ – Disclosed Reserves are reserves about which a company gives details and information. An example of a disclosed reserve would be the share premium reserve which appears on balance sheets. Disclosed reserves are included as part of Tier 1 capital under the Basle Capital Accord. Disclosed Reserves are reserves openly reported in a company's balance sheet. The opposite of Undisclosed Reserves. Also known as Declared Reserves, and Published Reserves.

DISCLOSURE = РАСКРЫТИЕ СУЩНОСТИ (или РАЗЪЯСНЕНИЕ, или ДИСКЛОУЗ, или ОТКРЫТОСТЬ) – (1) Disclosure is the duty of the assured and his broker to tell the underwriter every material circumstance before acceptance of the risk.

(2) Disclosure:- in the US patent law, in return for a patent, the inventor gives as consideration a complete revelation or disclosure of the invention which protection is sought.

(3) Disclosure:- all commercial enterprises in Germany are subject to rules on financial disclosures. Depending on the company's legal structure and size, these are either closely or broadly defined. Stock corporations must report the most extensively on the development and results of their business operations. This usually takes place through the publication of annual financial statements and the annual report, comprising the balance sheet and income statement. Disclosure is a process of divulging accounting information so that the content of financial statements is understood. / Требования к раскрытию информации, устанавливающие объём информации, который должен быть раскрыт непосредственно в финансовой отчётности и в примечаниях к ней.

DISCLOSURE DOCUMENT = ДОКУМЕНТ, РАСКРЫВАЮЩИЙ СУЩНОСТЬ ИЗОБРЕТЕНИЯ – In the US patent law, Disclosure Document is a paper disclosing an invention (called a Disclosure Document) and signed by the inventor or inventors that has been forwarded to the United States Patent and Trademark Office (USPTO) by the inventor (or by any one of the inventors when there are joint inventors), by the owner of the invention, or by the attorney or agent of the inventor(s) or owner. The Disclosure Document will be retained for two years, and then be destroyed unless it is referred to in a separate letter in a related patent application filed within. Disclosure Document:- the USPTO eliminated its Disclosure Document Program on 2007-February-01. For more information, see the Federal Register notice at the following address:- http://www.uspto.gov/web/offices/com/sol/notices/71fr64636.pdf. A document disclosing an invention, and signed by the inventor or inventors, that is forwarded to the USPTO only as evidence of the date of conception of the invention. The Disclosure Document may be forwarded to the USPTO by the inventor (or by any one of the inventors when there are joint inventors), by the owner of the invention, or by the attorney or agent of the inventor(s) or owner. A disclosure document is not the only type (and not necessarily the best type) of evidence of the date of conception of an invention. Notarized records or a conventional, witnessed, permanently bound, and page-numbered laboratory notebook may also serve as evidence of the date of conception of an invention. A Disclosure Document will be retained for two years, and then be destroyed unless it is referred to in a separate letter in a related patent application filed within those two years. A Disclosure Document is not a patent application, and the date of its receipt in the USPTO will not become the effective filing date of any patent application subsequently filed.

DISCLOSURE DOCUMENTS = ПОЯСНИТЕЛЬНЫЕ (или РАСКРЫТЫЕ, или РАЗЪЯСНИТЕЛЬНЫЕ) ДОКУМЕНТЫ – Disclosure Documents:- a document or prospectus that outlines the details of a new issue of securities to ensure that investors are fully informed. The statement that must be provided to prospective customers that describes trading strategy, fees, performance, etc.

DISCLOSURE DUTY = ОБЯЗАННОСТЬ РАСКРЫТИЯ СУЩНОСТИ (или ОБЯЗАННОСТЬ РАЗЪЯСНЕНИЯ, или ОБЯЗАННОСТЬ ОТКРЫТОСТИ) – Disclosure Duty:- companies are required by law to inform the public of their financial situations and of any change they may undergo. In this context, listed companies are subject to special obligations to regularly publish information on the development of their business and must also report on facts with a price-relevancy immediately (ad hoc disclosure rules). Deutsche Börse places additional requirements on companies listed in the prime standard segment (Frankfurt Stock Exchange):- these companies must regularly publish quarterly reports in addition to their annual reports, hold at least one analysts' conference a year and issue ad hoc disclosures in English, too. The bodies of Deutsche Börse monitor compliance with the disclosure duty. The purpose of these rules is to guarantee a minimum amount of information for a company's stakeholders and shareholders. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). для данного случая (ad hoc).

DISCLOSURE MEETING = ОТКРЫТОЕ ЗАСЕДАНИЕ – Disclosure Meeting is an informal meeting at which the US International Trade Administration discloses to parties to the proceeding the methodology used in determining the results of an antidumping investigation or administrative review.

DISCLOSURE OF HOLDINGS = ОТКРЫТОСТЬ ВЛАДЕНИЙ – Disclosure Of Holdings:- in Switzerland, provision contained in Stock Exchange Act stipulating that the shareholders of listed companies must disclose share purchases or sales that result in their exceeding or falling below a threshold of 5, 10, 20, 33-1/3, 50 or 66-2/3% of that company's voting rights. A listed company may write a clause into its articles of association either dispensing with the disclosure requirement or setting different limits.

DISCOLORATION = ИЗМЕНЕНИЕ ЦВЕТА (или ОБЕСЦВЕЧИВАНИЕ) – (1) Discoloration is the changing of color of grains, leaves, or stems due to disease, weather, water stress, insect damage, or lack of nutrients.

(2) Discoloration:- varies in degree and quite noticeable in extreme condition. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

DISCOLORATION IN COLLARS = ИЗМЕНЕНИЕ ЦВЕТА (или ВЫЦВЕТАНИЕ) ВОРОТНИЧКОВ – Discoloration In Collars:- Garments:- men's gray broadcloth shirts; Fabric Construction:- (i) Count:- 136 x 60; (ii) Warp:- 80/2 combed cotton; (iii) Filling:- 40/1 combed cotton. Complaint:- a shirt manufacturer advised that fused collars turned reddish after the garments were delivered to the customers. Analysis:- laboratory tests confirmed the fact that the fabric in the shirts was dyed with standard vat colors. On separation of the plies of the fused collar on one of the new shirts, which was returned, it was observed that the collar lining was slightly reddish in color. Laboratory spot tests made with acetone (one of the compounds generally used in the wet-fusing operation) showed a bleeding of the red component in the dyed broadcloth. Although the particular collar lining used in these shirts was of the thermoplastic-coated type, which permitted dry fusing without the use of any solvents, it appeared that one of the compounds in the coating had a solvent effect on the red dyestuff component. As it was understood that this particular shirt manufacturer had intended to use the dyed broadcloth for the fused-collar type of shirts, the dyer was considered responsible for not having selected a combination of dyestuffs which would not be affected by the chemicals generally used in this kind of collar lining, regardless of whether it was of the dry- or the wet-fusing process type. / Уточина:- 40/1 .

DISCOLORED FILLING = УТОЧИНА ИЗМЕНЁННОГО ЦВЕТА (или ВЫЦВЕТШАЯ УТОЧИНА) – Discolored Filling:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 200 x 64; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 120/40 bright acetate rayon; Finish:- plain dyed light blue. Defect:- irregular dark bands varying in width up to 3 inches across the fabric. Analysis:- examination showed a peculiar pattern effect starting at the shuttle changes. Laboratory stripping and redyeing resulted in only partial elimination of the bands. Microscopic analysis I, j" disclosed no solid deposit of any kind on the yarns in the discolored sections. After checking further with the mill, it was determined that this condition was caused by the transfer of some undried fresh varnish on the wooden filling bobbins to the yarn in question, which was lying next to the wood. This is the type of defect which would be practically impossible to trace without the cooperation of the mill. Chemical analysis of the yarn would be extremely difficult, since the contaminating varnish would be, by the time of analyzing, completely oxidized and hardened and the quantities necessary to produce the staining effect were very small. / Уточина:- 120/40 .

DISCOLORED PICK = ПОПЕРЕЧНАЯ НИТЬ ИЗМЕНЁННОГО ЦВЕТА (или ВЫЦВЕТШАЯ ПОПЕРЕЧНАЯ НИТЬ, ОБЕСЦВЕЧЕННАЯ ПОПЕРЕЧНАЯ НИТЬ) – Discolored Pick:- xxxxx. See also Filling, and Mixed End.

DISCOUNT = СКИДКА (или ДИСКОНТ) – (1) Discount:- price differences between futures of different delivery months, as in the phrase 'July is trading at a discount to May', indicating that the price of the July future is lower than that of May. / Разница в ценах на фьючерсные контракты с разными месяцами поставки, как во фразе 'Июльский торгуется со скидкой по отношению к Майскому', означающей, что цена Июльского фьючерса ниже цены Майского. Под Дисконтом может пониматься:- (i) процент, взимаемый банками при учёте векселей (учётный процент), или (ii) сам учёт векселей.

(2) Discount:- cash commodity prices below the futures price. / Цены на наличный товар ниже цен фьючерсов.

(3) Discount:- the amount by which a preferred stock or bond may sell below its par value. Also used as a verb to mean 'takes into account' as the price of the stock has discounted the expected dividend cut. Less than Par. If a future delivery is selling at a discount to the spot delivery, then it's selling for a lower price than the spot price. A discount refers to the difference between the face value of a security (or loan) and its lower market price (or loan amount actually disbursed). A discount is usually expressed as a percentage of the security's nominal (par) value. Opposite:- Premium. Discount is a reduction from the full amount of a price or debt.

(4) Discount:- situation in which currency can be bought more cheaply for delivery at a future date than for immediate delivery. Also known as Markdown. See also Premium.

(5) Discount:- price reduction expressed in percent which may be deducted from the invoice amount if payment is made within a specified period.

(6) Discount:- interest deducted in advance if claims falling due later, esp. bills and drafts, are purchased. The net amount of the claim after deduction of the discount is immediately credited to the beneficiary upon presentation. Discounting is usually effected by a bank. / Под Учётом Векселя понимается покупка банком векселя до наступления срока платежа по нему. При учёте векселя банк авансирует клиенту деньги, взимая за это учётный процент. Под Учётным Процентом понимается плата, взимаемая банками при учёте векселей (центральными эмиссионными банками – официальный учётный процент). Величина учётного процента определяется средним уровнем ссудного процента, сроком и обеспеченностью учитываемого векселя.

(7) Discount:- when an option is trading for less than its intrinsic value. / Ситуация на рынке, когда опцион торгуется по цене ниже его внутренней ценности.

(8) Discount:- an amount agreed between buyer and seller to be subtracted from an existing benchmark. / Сумма, согласованная между продавцом и покупателем, для вычитания из существующей эталонной цены.

DISCOUNT = СКИДКА (или РЕФАКЦИЯ) – Discount:- a downward adjustment in price allowed for delivery of stocks of a commodity of lesser than contract grade against a futures contract. Reduction in price from the base rate in order to purchase a commodity of lesser grade. / Уменьшение в цене базовой ставки при приобретении товара более низкого сорта. Скидки к оптовым ценам за качество, отклонение фактической цены от прейскурантной в силу изменения потребительских свойств изделия. Наряду с надбавками, скидки стимулируют предприятия к обновлению продукции, повышению её качества.

DISCOUNT BASIS = ДИСКОНТНЫЙ БАЗИС (или БАЗИС ДИСКОНТА) – When a security is issued on a Discount Basis, the buyer pays less than face value now, for an instrument which will be worth its face value at a future date. The return to the investor is the difference between the discounted purchase price and the par or face value received at maturity. Thus, the instrument is traded on a discount basis, without any interest or coupon payments. Some securities may give their return through a combination of a discount and interest payments. Discount Basis is a method of quoting securities where the price is expressed as a annualized discount from maturity value.

DISCOUNT BOND = ДИСКОНТНАЯ ОБЛИГАЦИЯ (или ОБЛИГАЦИЯ С ДИСКОНТОМ) – Discount Bond is a bond that is issued for less than its par (or face) value, or a bond currently trading for less than its par value in the secondary market. The 'discount' in a discount bond doesn't necessarily mean that investors get a better yield than the market is offering, just a price below par. Depending on the length of time until maturity, zero-coupon bonds can be issued at very large discounts to par, sometimes 50% or more. Because

a bond will always pay its full face value at maturity (assuming no credit events occur), discount bonds issued below par – such as zero-coupon bonds – will steadily rise in price as the maturity date approaches. These bonds will only make one payment to the holder (par value at maturity) as opposed to periodic interest payments. A distressed bond (one that has a high likelihood of default) can also trade for huge discounts to par, effectively raising its yield to very attractive levels. The consensus, however, is that these bonds will not receive full or timely interest payments at all; because of this, investors who buy into these issues become very speculative, possibly even making a play for the company's assets or equity. Discount Bond is a bond selling below par. Discount Bond is a bond or other debt instrument that is issued at a price below its face value. For example, a bond with par of USD10 000 might be issued to an investor for USD7 000. All zero-coupon bonds are discount bonds. Discount Bond is a debt sold for less than its principal value. If a discount bond pays no coupon, it is called a Zero Coupon Bond. Discount Bond is a bond selling at a price that is less than its par value. In addition to semiannual interest payments, a discount bond offers investors additional appreciation if the security is held until maturity. / Облигация проданная по цене ниже номинальной.

DISCOUNT BROKER = ДИСКОНТНЫЙ БРОКЕР – Discount Broker:- limited service stockbrokers who execute buy or sell orders on securities for their customers for reduced fees and commissions. Discount Broker is a stockbroker who carries out buy and sell orders at a reduced commission compared to a full-service broker, but provides no investment advice. It used to be that only the wealthy could afford a broker and access to the stock market. The internet has brought an explosion of discount brokers which let you trade at a smaller fee. However, it is important to remember that discount brokers don't provide personalized advice. Because of discount brokers, nearly anybody can afford to invest in the market. For those who wish to do their own research or don't want to invest a lot of money, a discount broker is an excellent way to invest. Broker who charges a lower fee for settling exchange trades but does not provide advisory services. A Discount Brokerage is a business that charges clients significantly lower fees than traditional brokerage firm, typically offering comparatively fewer services and/or support. In the securities industry, a discount brokerage helps clients buy and sell securities on a stock exchange. Discount brokerages usually allow their clients to trade for their own account with little or no action with a live broker. Some brokers, like Bank of America, have now offered no-commission trades to their clients that have a specific amount of money with them. Discount brokers, like Lightspeed Financial, TD Ameritrade, Zerodha, PTI Securities & Futures and E-Trade, also provide advanced trading systems, which is why they appeal most to frequent and active traders. Beginner investors may turn away from discounted brokers because of the advanced systems and terms, and instead go to traditional brokers. Whether you deal with a discount brokerage, a full-service discount brokerage, or a traditional brokerage, most brokers are regulated and licensed by a local authority. In the United States, the Financial Industry Regulatory Authority (FINRA) oversees brokerages, and consumers can do an online search to check the broker's standing at. In the United Kingdom, the Financial Services Authority, handles regulation of brokerage firms. / Некоторые брокеры, типа Бэньк оф Амэрика (Bank of America), стали предлагать своим клиентам . Лайтспид Файнэншэл (Lightspeed Financial), Ти.Ди. Амэритчрэйд (TD Ameritrade), Зирода (Zerodha), Пи.Ти.Ай. Сыкьоритиз Энд Фьючез (PTI Securities & Futures) и И-Тчрэйд (E-Trade).

DISCOUNT CREDIT = ДИСКОНТНЫЙ КРЕДИТ – Discount Credit is a credit or discount line granted to a customer by a bank for the procurement of liquid funds on presentation of bills of exchange or similar commercial paper. On the strength of the discount approval, the customer can have bills discounted up to a stipulated total amount, but, due to his endorsement of the bill, remains liable along with the other endorsers as joint debtor until the bill is paid on maturity. / Дисконтный Кредит имеет место тогда, когда банку с вычетом процента продаётся ещё не просроченная дебиторская задолженность (по осуществленным поставкам товаров и услуг), оформленная в виде простых векселей. Его значимость возрастает, если поставщики предоставляют (или вынуждены предоставлять) своим клиентам товарный кредит с оплатой товара либо услуг с оплатой векселем, а сами не в состоянии или не готовы ждать погашения векселя со стороны дебитора. Досрочная продажа таких векселей оборачивается тогда для них возможностью обменять с соответствующим дисконтом (скидкой) свои требования (дебиторскую задолженность) на 'живые деньги'. Особенностью дисконтного кредита является то, что обычно этот кредит возвращается не получателем, а должником по векселю (тем, кто его выписывал, или тем, на кого он обращён), от которого по истечении срока векселя банк истребует задолженность. С точки зрения обеспечения хозяйственного процесса на предприятии здесь речь идёт, таким образом, не столько о взятии кредита, сколько о продаже дебиторской задолженности со скидкой. Продавец векселя по отношению к купившему вексель банку остаётся тем не менее лицом, на которое банк как на потенциального дебитора может перенести ответственность за неуплату задолженности должником по векселю при неуплате последним своего долга. Стоимость дисконтного кредита определяется рыночной кредитной ставкой, налогом на операции с векселями (в Германии они с 1992 отменены) и текущими дополнительными транзакционными издержками. Рыночная кредитная ставка, по которой сумма векселя дисконтируется для получения её текущей стоимости, в Европе при этом привязывается к определяющей ставку дисконтирования так называемой базисной ставке процента (на которую, в частности, в Германии должен ориентироваться Бундесбанк после перехода с 01 Января 1999 к новой системе денежных отношений между центральными банками Европейского Союза). К ней коммерческими банками добавляется также надбавка, зависящая от их оценки кредитоспособности и репутации заёмщика. Свойственная рассматриваемым операциям рыночная кредитная ставка, однако, обычно ниже чистой процентной ставки по контокоррентному кредиту. Следует учитывать также, что номинальные процентные ставки по дисконтному кредиту приводятся по отношению не к сумме кредита, а к общей сумме его погашения и процентного платежа. Чтобы рассчитать эффективную ставку процента по этому кредиту, необходимо пересчитать отношение процентного платежа непосредственно к сумме выручки от продажи дебиторской задолженности. Налог по операциям с векселями был отменен в Германии с 1992. До этого момента предполагалось, что независимо от срока до погашения векселя налог при любой операции с векселем должен был составлять 0.15 Евро с каждых 100 Евро номинальной суммы векселя.

DISCOUNTED CASH FLOW = ДИСКОНТИРОВАННОЕ ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ (или ДИСКОНТИРОВАННЫЙ ДЕНЕЖНЫЙ ПОТОК) – Discounted Cash Flow:- if a series of cash flows is discounted to a present value, based on a certain interest rate, the total present value of that series is referred to as the Discounted Cash Flow.

DISCOUNTED DRAFT = ДИСКОНТИРОВАННАЯ ТРАТТА (или УЧТЁННАЯ ТРАТТА) – Discounted Draft is a time draft under a letter of credit that has been accepted and purchased by a bank at a discount. / Срочная тратта по аккредитиву, которая была акцептована или приобретена банком при дисконтировании.

DISCOUNTED INITIAL RATE = ДИСКОНТИРОВАННАЯ ПЕРВОНАЧАЛЬНАЯ СТАВКА – In the United States, in an adjustable-rate mortgage (ARM) with a Discounted Initial Rate, the lender offers you a lower rate and lower payments for part of the mortgage term (usually for 1, 3, or 5 years). After the discount period, the ARM rate will probably go up depending on the index rate. Discounts can occur in all types of mortgages, not just ARMs. Also known as Start Rate, and Teaser Rate. / В Соединённых Штатах Америки в случае с закладной с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) .

DISCOUNT IN ADVANCE = ПРЕДВОРЯЕМЫЙ ДИСКОНТ (или ДИСКОНТ В ПРЕДВЕРИИ) – Discount In Advance:- to anticipate the future trend and performance of investments by placing a higher or lower value on them. For example, the announcement of a dividend increase is discounted by an increase in the market price of the related share.

DISCOUNTING = ДИСКОНТИРОВАНИЕ – Discounting is a practice of extending credit in which the borrower endorses a negotiable instrument or other commercial paper in the borrower's portfolio over to the lender in exchange for funds from the lender in the amount of the instrument's face value less the interest due over the term of the loan, that is, the 'discounted' value. / Под Учётом Векселя понимается покупка банком векселя до наступления срока платежа по нему. При учёте векселя банк авансирует клиенту деньги, взимая за это учётный процент.

DISCOUNT MARKET = УЧЁТНЫЙ РЫНОК (или ДИСКОНТНЫЙ РЫНОК) – In the United Kingdom, Discount Market is that part of the market dealing with short-term borrowing. It is called the Discount Market because the interest on loans is expressed as a percentage reduction (discount) on the amount paid to the borrower. For example, for a loan of £100 face value when the discount rate is 5% the borrower will receive £95.00 but will repay £100.00 at the end of the term.

DISCOUNT METHOD = МЕТОД УЧЁТА (или МЕТОД ДИСКОНТА) – Discount Method is a method of paying interest by issuing a security at less than par and repaying par value at maturity. The difference between the higher par value and the lower purchase price is the interest.

DISCOUNT PAYMENT = ОПЛАТА ДИСКОНТА – Discount Payment is the difference between the face value and the price paid for a security. / разница между лицевой стоимостью ценной бумаги и ценой, выплаченной за неё.

DISCOUNT RATE = УЧЁТНАЯ СТАВКА (или ДИСКОНТНАЯ СТАВКА, или СТАВКА ДИСКОНТА) – (1) In the United States, the Discount Rate is the interest rate charged to commercial banks and other depository institutions on loans they receive from their regional Federal Reserve Bank's lending facility – the discount window. The Federal Reserve Banks offer three discount window programs to depository institutions:- primary credit, secondary credit, and seasonal credit, each with its own interest rate. All discount window loans are fully secured. Under the primary credit program, loans are extended for a very short term (usually overnight) to depository institutions in generally sound financial condition. Depository institutions that are not eligible for primary credit may apply for secondary credit to meet short-term liquidity needs or to resolve severe financial difficulties. Seasonal credit is extended to relatively small depository institutions that have recurring intra-year fluctuations in funding needs, such as banks in agricultural or seasonal resort communities. The discount rate charged for primary credit (the primary credit rate) is set above the usual level of short-term market interest rates. Because primary credit is the Federal Reserve's main discount window program, the Federal Reserve at times uses the term 'Discount Rate' to mean the primary credit rate. The discount rate on secondary credit is above the rate on primary credit. The discount rate for seasonal credit is an average of selected market rates. Discount rates are established by each Reserve Bank's board of directors, subject to the review and determination of the Board of Governors of the Federal Reserve System. The discount rates for the three lending programs are the same across all Reserve Banks except on days around a change in the rate. In the United States, Discount Rate is the interest rate at which eligible depository institutions may borrow funds, usually for short periods, directly from a Federal Reserve Bank. The law requires the board of directors of each Reserve Bank to establish the discount rate every 14 days subject to review and determination by the Board of Governors. A term Discount Rate refers to the interest rate used when calculating the present value of a cash flow, i.e. you are 'discounting a cash flow' to its present value. Spreadsheet programs such as 1-2-3 or Microsoft's Excel have very useful built-in functions for the purpose. The challenge is to figure out what value for 'i' to use. Interest rates on investments are based on risk. So, when discounting a cash flow use an appropriate rate. For example, if you are discounting interest payments that you receive from a reliable and predictable source, you would use a bank rate of interest. If you are discounting profit cash flows from a business, you would use a rate typical for that business (e.g., real estate income is less risky than a high tech business so you might use 5% for bank income, 10% for real estate or 30% for a high tech concern). You should probably use two or three rates in order to give you a range of values. Interest rate charged by a central bank on loans to domestic financial institutions. In the United States, interest rate charged by the Federal Reserve System to Federal Reserve member banks. Discount Rate is the interest rate that banks pay on loans made to them from the Federal Reserve. Banks whose reserves dip below the reserve requirement set by the Federal Reserve's Board of Governors must take immediate action to make good their shortfall. The Federal Reserve is normally willing to make a short-term loan of reserves to a bank in this situation to give the bank a brief period of time to make adjustments in its loan and investment portfolio that will permit it to raise its reserves or lower its loans outstanding. (The bank might stop making new loans for a few days while the normal repayment flow on old loans proceeds to top up their cash position. If the situation is truly critical, the bank might even begin calling in some of its loans that it would normally have been willing to renew.) Bankers normally do not like to borrow money from the Fed in this manner, partly because the interest they must pay to the Fed for such a loan (the discount rate) is normally higher than other short-term borrowing rates, but mostly because this may trigger closer regulatory scrutiny by the Fed. If possible, they prefer to borrow reserves from other banks that have excess reserves at the Fed. The Fed uses changes in the discount rate as another tool of monetary policy. Raising the discount rate makes it more expensive to borrow from the Fed, and bankers tend to build up their reserve position further above the minimum percentage legally required, just to be extra sure they will not be put to this unnecessary trouble in case their projection of the flow of loan repayments by their customers turns out to be a little on the high side. The more conservative reserve position diminishes the volume of the loans they would otherwise be making, and so an increase in the discount rate tends to cause a decrease in the money stock and thus higher short-term interest rates. In contrast, lowering the discount rate is expansionary. As the cost of borrowing from the Fed to meet a temporary emergency falls, bankers tend to reduce their excess reserves to a minimum, extending more loans and thus increasing the money stock and tending to lower interest rates in the short term. The interest rate charged on loans by the US Federal Reserve or by a central bank to member banks or to domestic financial institutions accordingly. Discount Rate is an interest rate at which a central bank purchases bills of exchange conforming to certain requirements. Adjustments to the discount rate and the rediscount quota (restrictions on volume) are traditional monetary policy instruments used by central banks. Since banks turn to the central bank to cover their funding needs to varying degrees, an increase or reduction in the discount rate may have an effect on the terms and conditions banks pass on to their customers. Now that the European Central Bank (ECB) has assumed responsibility for monetary policy, discount business has been discontinued within the Euro area. Discount Rate is the percentage rate of interest which a bank or other lender deducts in advance from loans made, or from the face value of bills of exchange or commercial paper bought. It is calculated for the period from presentation to maturity of the instrument. The amount of the discount rate depends on the liquidity of the financial markets and the party liable under the bill. For example, Swiss commercial banks apply the private discount rate in their discounting operations; as a rule, this is higher than the official discount rate of the Swiss National Bank. / По Дисконтной Ставке Кредитования получают займы депозитарные институты США. Эта ставка учитывается банками Федерального Резерва США.

(2) Discount Rate is a rate at which a bill of exchange is discounted.

THE DISCOUNT WINDOW = УЧЁТНОЕ ОКНО (или ДИСКОНТНОЕ ОКНО) – The Federal Reserve's lending at The Discount Window serves two primary functions. It complements open market operations in achieving the target federal funds rate by making Federal Reserve balances available to depository institutions when the supply of balances falls short of demand. It also serves as a backup source of liquidity for individual depository institutions. Although the volume of discount window borrowing is relatively small, it plays an important role in containing upward pressures on the federal funds rate. If a depository institution faces an unexpectedly low balance in its account at the Federal Reserve, either because the total supply of balances has fallen short of demand or because it failed to receive an expected transfer of funds from a counterparty, it can borrow at the discount window. This extension of credit increases the supply of Federal Reserve balances and helps to limit any upward pressure on the federal funds rate. At times when the normal functioning of financial markets is disrupted – for example after operational problems, a natural disaster, or a terrorist attack – the discount window can become the principal channel for supplying balances to depository institutions. The discount window can also, at times, serve as a useful tool for promoting financial stability by providing temporary funding to depository institutions that are having significant financial difficulties. If the institution's sudden collapse were likely to have severe adverse effects on the financial system, an extension of central bank credit could be desirable because it would address the liquidity strains and permit the institution to make a transition to sounder footing. Discount window credit can also be used to facilitate an orderly resolution of a failing institution. An institution obtaining credit in either situation must be monitored appropriately to ensure that it does not take excessive risks in an attempt to return to profitability and that the use of central bank credit would not increase costs to the deposit insurance fund and ultimately the taxpayer. In ordinary circumstances, the Federal Reserve extends discount window credit to depository institutions under the primary, secondary, and seasonal credit programs. The rates charged on loans under each of these programs are established by each Reserve Bank's board of directors every two weeks, subject to review and determination by the Board of Governors. The rates for each of the three lending programs are the same at all Reserve Banks, except occasionally for very brief periods following the Board's action to adopt a requested rate change. The Federal Reserve also has the authority under the Federal Reserve Act to extend credit to entities that are not depository institutions in 'unusual and exigent circumstances'; however, such lending has not occurred since the 1930s. On 2003-January-09, the Federal Reserve significantly revised its discount window lending programs, replacing the previous adjustment and extended credit programs with primary and secondary credit facilities. Adjustment credit had been made available to help depository institutions make short-term balance-sheet adjustments and to provide an alternate source of funds in the event of a shortfall in the supply of Federal Reserve balances. Extended credit, which was intended to accommodate depository institutions' somewhat longer-term liquidity needs resulting from exceptional circumstances, had not been used since 1995. Adjustment credit was extended at the basic discount rate, which over the previous decade had been 25 to 50 basis points below the usual level of overnight market interest rates. The below-market interest rate on adjustment credit had caused several significant problems. The incentive for depository institutions to exploit the below-market rate meant that borrowing requests necessarily were subject to considerable administration by Reserve Banks. In particular, borrowers were required to seek funds elsewhere before coming to the window. Partly as a result of those requirements, many depository institutions were reluctant to borrow from the discount window, reducing the effectiveness of the discount window in buffering shocks to the money market. Under the revised lending programs, the above-market rate and the fact that primary credit is restricted to financially sound institutions mean that primary credit can be extended largely without administration, making depository institutions more willing to borrow and so making the discount window a more effective monetary policy tool. The central banks of nearly all industrialized countries have similar lending facilities that extend collateralized credit at an above-market rate with little or no administration. By law, all discount window loans must be secured by collateral to the satisfaction of the lending Reserve Bank. Most loans that are not past due and most investment-grade securities held by depository institutions are acceptable as collateral. Reserve Banks must be able to establish a legal right in the event of default to be first in line to take possession of and, if necessary, sell all collateral that secures discount window loans. Reserve Banks assign a lendable value to assets accepted as collateral. The lendable value is the maximum loan amount that can be backed by that asset. It is based on market values, if available, or par values – in both cases reduced by a margin. The margin depends on how accurately the asset can be valued, how much its value tends to vary over time, the liquidity of the asset, and the financial condition of the pledging institution. Discount Window is a figurative expression for the US Federal Reserve facility for extending credit directly to eligible depository institutions (those with transaction accounts or nonpersonal time deposits). At times when the normal functioning of financial markets is disrupted, the discount window can become the principal channel for supplying balances to depository institutions. Figurative expression for the Federal Reserve facility that extends credit directly to eligible depository institutions (those subject to reserve requirements); so named because, in the early days of the Federal Reserve System, bankers would come to a Reserve Bank teller window to obtain credit. Also known as The Window. Discount Window:- credit facilities in which financial institutions go to borrow funds from the Federal Reserve. These loans, which are priced at the discount rate, are often structured as secured loans to alleviate pressure in reserve markets. It helps to reduce liquidity problems for banks and assists in assuring the basic stability of financial markets. The Federal Reserve has 3 rates that it charges financial institutions for using the discount window. The primary credit rate is a short-term rate charged for the most financially secure financial institutions. The secondary credit rate is a short rate that is charged for financial institutions that do not qualify for the primary rate. The seasonal credit rate is charged for debt obligations that last up to 9 months. The Federal Reserve may lower the discount rate and/or make temporary changes to the terms of the loans in order to make the discount window a more attractive source for financial institutions to borrow from in times of financial distress.

DISCOUNT WINDOW CREDIT = КРЕДИТ УЧЁТНОГО ОКНА – In the United States, Discount Window Credit is a credit extended by a Federal Reserve Bank to an eligible depository institution. All discount window borrowing must be secured by collateral. Three types of discount window credit are available to eligible depository institutions:- (i) primary credit; (ii) seasonal credit; and (iii) secondary credit. See also Primary Credit, Seasonal Credit, and Secondary Credit.

DISCOUNT WITHOUT RECOURSE = БЕЗОБОРОТНЫЙ УЧЁТ (или ДИСКОНТ БЕЗ РЕГРЕССА) – Discount Without Recourse:- purchase of negotiable instruments where the buyer waives the right of recourse in respect of the seller of the instrument, although the buyer would be entitled to such a right under the legislation governing bills of exchange. Mainly used in connection with exports to developing nations. See also Non-Recourse Financing.

DISCOVERY PERIOD = ПЕРИОД РАЗБИРАТЕЛЬСТВА (или ПЕРИОД ЗАЯВЛЕНИЯ) – Discovery Period is the time allowed the insured after termination of certain bond and policy provisions to discover that he has sustained a loss which occurred during the period covered by the contract.

DISCREPANCIES = РАСХОЖДЕНИЯ (или НЕСООТВЕТСТВИЯ) – Discrepancies:- in the context of letters of credit, term used to describe deviations between documents presented and requirements set in the letter of credit or inconsistencies among the documents themselves. / Расхождения или Несоответствия:- в контексте с аккредитивами, этот термин используется для описания отклонений между представленными документами и требуемым по аккредитиву комплектом, или противоречия среди самих документов.

DISCREPANCY = РАСХОЖДЕНИЕ (или НЕСООТВЕТСТВИЕ, или РАЗЛИЧИЕ) – Discrepancy is a disagreement or inconsistency as in data of an experiment.

DISCREPANCY LETTER OF CREDIT = АККРЕДИТИВ С РАСХОЖДЕНИЯМИ (или АККРЕДИТИВ С НЕСООТВЕТСТВИЯМИ) – Discrepancy Letter Of Credit:- when documents presented do not conform to the requirements of the letter of credit (L/C), it is referred to as a Discrepancy. Banks will not process L/C's which have discrepancies. They will refer the situation back to the buyer and/or seller and await further instructions.

DISCRETE DATA = РАЗДЕЛЬНЫЕ ДАННЫЕ (или РАЗОБЩЁННЫЕ ДАННЫЕ) – Discrete Data are observations made by categorizing subjects so that there is a distinct interval between any two possible values (c.f. continuous data).

DISCRETE RANDOM VARIABLE = РАЗДЕЛЬНАЯ ПРОИЗВОЛЬНАЯ ПЕРЕМЕННАЯ – Discrete Random Variable is a random variable with a finite set of possible values.

DISCRETIONARY ACCOUNT = ДИСКРЕЦИОННЫЙ СЧЁТ (или СВОБОДНЫЙ СЧЁТ) – Discretionary Account is an account into which discretionary funds are placed. Discretionary fund is a sum of money left with a broker, to be invested at his or her discretion. Discretionary Account is an account where a broker does not need the owner's consent to place individual buy and sell orders. Discretionary Account is an account that allows a broker to buy and sell securities without the client's consent. The client must sign a discretionary disclosure with the broker as documentation of the clients consent. This is sometimes referred to as a Managed Account. Sometimes broad guidelines are set by the client regarding trading in the account. For example, a client might only permit investments in blue chip stocks. An account in which the customer gives the broker or someone else discretion to buy and sell securities, commodities including selection, timing, amount, and price to be paid or received. An arrangement by which the holder of the account gives written power of attorney to someone else, often a broker or Commodity Trading Advisor, to buy and sell assets without the account holder's prior approval. Also known as Controlled Account or Managed Account. / Соглашение, по которому владелец счёта представляет доверенность в письменной форме кому-либо, чаще брокеру, на право покупать и продавать активы без предварительного одобрения владельцем счёта. Известен также как Контролируемый Счёт (Controlled Account) или Управляемый Счёт (Managed Account).

DISCRETIONARY INCOME = ДИСКРЕЦИОННЫЙ ДОХОД – Discretionary Income is disposable income (after-tax income), minus all payments that are necessary to meet current bills. It is total personal income after subtracting taxes and typical expenses (such as rent or mortgage, utilities, insurance, medical, transportation, property maintenance, child support, food and sundries, etc) to maintain a certain standard of living. It is the amount of an individual's income available for spending after the essentials (such as food, clothing, and shelter) have been taken care of:- Discretionary Income = Gross Income – Taxes – All Compelled Payments (bills). Despite the definitions above, disposable income is often incorrectly used to denote discretionary income. The meaning should therefore be interpreted from context. Commonly, disposable income is the amount of 'play money' left to spend or save. The Consumer Leverage Ratio is the expression of the ratio of Total Household Debt to Disposable Income.

DISCRETIONARY ORDER = ДИСКРЕЦИОННОЕ РАСПОРЯЖЕНИЕ – Discretionary Order:- this procedure, designed to safeguard the best interests of the customer, is applied to unlimited or limited buy or sell orders which could possibly have a considerable impact on the price of a security. Brokers spread order execution over the day in several stages and file a report on the same day with the market surveillance office. Applied above all to large orders or securities with a narrow market.

DISCRETIONARY PARTICIPATION FEATURE = ОСОБЕННОСТЬ ДИСКРЕЦИОННОГО УЧАСТИЯ (или ОСОБЕННОСТЬ УЧАСТИЯ ПО УСМОТРЕНИЮ) – Discretionary Participation Feature is a contractual right to receive, as a supplement to guaranteed benefits, additional benefits:- (i) that are likely to be a significant portion of the total contractual benefits; (ii) whose amount or timing is contractually at the discretion of the issuer; and (iii) that are contractually based on:- (a) the performance of a specified pool of contracts or a specified type of contract; (b) realized and/or unrealized investment returns on a specified pool of assets held by the issuer; or (c) the profit or loss of the company, fund or other entity that issues the contract.

DISC TEST = ТЕСТ НА XX – Disc Test is an in-rubber test used to predict the fatigue resistance of tire cords and other industrial yarns.

DISEASE = БОЛЕЗНЬ (или ЗАБОЛЕВАНИЕ) – Disease is a set of symptoms incited by a biological agent (a pathogen). Symptoms of a disease may include death, destruction or discoloration of host tissue or abnormal growth or differentiation. Disease is a harmful deviation from the normal functioning of physiological and biochemical processes caused by plant pathogens (fungi, viruses, bacteria, parasites). / или изменение цвета. Под Болезнью понимается нарушение нормальной жизнедеятельности организма, обусловленное функциональными и/или морфологическими изменениями. Возникновение болезни связано с воздействием на организм вредных факторов внешней среды (биологических, социальных, физических и химических), с его генетическими дефектами и так далее. У растений наряду с инфекционными (бактериальными, вирусными, грибными и другими) болезнями наблюдаются патологические процессы, обусловленные неблагоприятными абиотичными факторами среды. Болезни растений наносят ущерб сельскому и лесному хозяйству. Болезнь, процесс, возникающий в результате воздействия на организм вредоносного (чрезвычайного) раздражителя внешней или внутренней среды, характеризующийся понижением приспособляемости живого организма к внешней среде при одновременной мобилизации его защитных сил. Болезнь проявляется нарушением равновесия организма с окружающей средой, выражающимся в возникновении побочных (неадекватных) реакций, а у человека – снижением на время болезни его трудоспособности.

DISEASE CONTROL = БОРЬБА С БОЛЕЗНЯМИ – Disease Control is the use of chemicals or resistant varieties to control or eradicate the disease present.

DISEASE CYCLE = ЦИКЛ БОЛЕЗНИ – Disease Cycle is the sequence of events that occurs between the time of infection and the final expression of the disease.

DISEASE INCIDENCE = ЗАБОЛЕВАЕМОСТЬ – Disease Incidence:- (1) the frequency of occurrence of a disease; commonly, the proportion of plants affected in a given population. (2) The number of plant units infected expressed as % of the total number of plant units assessed. / Под Заболеваемостью понимается распространённость болезней среди населения или отдельных его групп; статистический показатель; характеризует состояние здоровья населения; количество зарегистрированных заболеваний на 100, 1 000 или 10 000 населения определённой территории за один год. В медицинских учреждениях бывшего СССР учитывались общая заболеваемость, заболеваемость с временной утратой трудоспособности, заболеваемость инфекционными, профессиональными и другими болезнями.

DISEASE RESISTANCE = УСТОЙЧИВОСТЬ К БОЛЕЗНЯМ – Disease Resistance is an ability of the plant to survive and grow without symptoms of the disease that has infected it.

DISEASE SEVERITY = ТЯЖЕСТЬ ЗАБОЛЕВАНИЯ (или НАПРЯЖЁННОСТЬ БОЛЕЗНИ) – Disease Severity is the degree of infection of disease in an individual plant; refers to the area of plant tissue affected by the disease expressed as % of the total area assessed.

DISEASE TESTED = ПРОТЕСТИРОВАНО НА ПРЕДМЕТ БОЛЕЗНИ – Disease Tested, as relates to Potatoes, a process using approved methods where each explant has been tested for and found free from Potato spindle tuber viroid (PSTV), Potato virus A (PVA), Potato virus M (PVM), Potato virus S (PVS), Potato virus X (PVX), Potato virus Y (PVY), leafroll (PLRV), bacterial ring rot (BRR), and bacterial soft rot/blackleg (Erwinia Spp.).

DISGUISE = ПЕРЕОДЕВАНИЕ (или МАСКИРОВКА) – Disguise is an apparel assumed to conceal one's identity or counterfeit another's. / Переодевание или Маскировка:- одежда, предназначенная для того, чтобы скрыть свою личность или подделать чужую.

DISHABILLE = ДИСАБИЛ (или ДЕЗАБИЛЬЕ, или ДОМАШНЕЕ ПЛАТЬЕ) – Dishabille:- (archaic) negligee.

DISHCLOTH = ПОСУДНОЕ ПОЛОТЕНЦЕ (или ПОЛОТНО ДЛЯ ТАРЕЛОК) – Dishcloth is a cloth for washing dishes.

DISHONOR = ОТКАЗ – Dishonor:- checks are sometimes dishonored (bounced) by a bank if there are insufficient funds in the drawer's account to make the payment. Failure or refusal by the drawee to accept a draft presented for acceptance or to pay a draft presented for payment. / Несостоятельность или отказ плательщика акцептовать представленную для акцепта тратту или оплатить представленную для платежа тратту.

DISHONORED CHECK = ЧЕК, НЕ ПРИНЯТЫЙ К ОПЛАТЕ (или ОПРОТЕСТОВАННЫЙ ЧЕК, или ОТКАЗНОЙ ЧЕК) – A Dishonored Check or Dishonoured Cheque cannot be redeemed for its value and is worthless; they are also known as an RDI (Returned Deposit Item), or NSF (Non-Sufficient Funds) Check. Checks are usually dishonored because the drawer's account has been frozen or limited, or because there are insufficient funds in the drawer's account when the check was redeemed. A check drawn on an account with insufficient funds is said to have bounced and may be called a Rubber Check. Banks will typically charge customers for issuing a dishonored check, and in some jurisdictions such an act is a criminal action. A drawer may also issue a stop on a check, instructing the financial institution not to honor a particular check. In the United Kingdom they are typically returned marked 'Refer to Drawer' – an instruction to contact the person issuing the check for an explanation as to why the check was not honored. This wording was brought in after a bank was successfully sued for libel after returning a check with the words 'Insufficient Funds' after making an error – the court ruled that as there were sufficient funds the statement was demonstrably false and damaging to the reputation of the person issuing the check. A check may also be dishonored because it is stale or not cashed within a 'void after date'. Many checks have an explicit notice printed on the check that it is void after some period of days. In the United States, banks are not required by the Uniform Commercial Code to honor a stale dated-checks, which are checks presented six months after they are made.

DISH TOWEL = СТОЛОВОЕ ПОЛОТЕНЦЕ – Dish Towel is one of the few textile products which is still made of linen (occasionally they are made of cotton or even paper). Dish towels are used for hand-drying dishes after washing. Many linen dish towels are made in Ireland and printed with colorful pictures. Ilish towels can also be made of terry cloth and huck toweling. See also Huck, and Terry Cloth.

DISINFLATION = ДЕЗИНФЛЯЦИЯ – To fully understand Disinflation we need to first understand inflation. The reasons this is trickier than it first appears is because the word Inflation is actually used in two different contexts. The most common usage of the word Inflation means rising prices. Commonly 'consumer prices' so when you go to the gas station or the grocery store and the things you buy cost more than last month (or when it is really bad even more than last week) this is more precisely defined as 'Price Inflation'. The second meaning of the word Inflation is actually the original meaning. And that is an increase in the money supply that causes 'Price Inflation' and this is called 'Monetary Inflation'. Inflation is measured by an index called the 'Consumer Price Index' and the percentage change in this index from one year to the next is commonly called the inflation rate. This is a measure of price inflation. So now the question is which 'inflation' are we 'dis'-ing. Once again in common usage 'Disinflation' means that prices are not rising as fast as they once were. So if the inflation rate is 5% one month (for the previous 12 months) and the following month it drops to 4% (for the previous 12 months) we have experienced 1% disinflation. Note that 11 of the monthly periods in this example overlap so the major difference occurred between the first month of the first period and the last month of the second period. Often people confuse disinflation with deflation. Perhaps because they think disinflation is the opposite of inflation. This however is not the case, in some ways disinflation is kind of like baby inflation. In disinflation, prices have not yer fallen which would be the opposite of rising prices they have simply stopped rising as fast as they once were. Deflation on the other hand is where prices have stopped rising altogether and are actually falling. So in our previous example we had an inflation rate of 5% when the rate dropped to 4% we had disinflation and if it dropped all the way to a negative 1% (–1%) we would then have deflation (falling prices). Recently we have experienced deflation in the price of gasoline as it went from over USD4.00/gal down to USD2.00/gal. we have had 50% deflation in the price of gasoline. Spotting disinflation in the real world is much more difficult. If the price of gasoline was USD4.00 one month and USD4.40 the following month we could recognize a monthly inflation rate of 10%. If the following month the price was USD4.62 we would say prices inflated by 5% this month because they were up 5%. We wouldn't say that they disinflated by 5% because they rose 5% less than the month before.

DISINTERMEDIATION = ДЕЗИНТЕРМЕДИАЦИЯ (или ИЗЪЯТИЕ ИЗ ОДНОГО И ВЛОЖЕНИЕ В ДРУГОЕ, или УСТРАНЕНИЕ ПОСРЕДНИКА, или ОТКАЗ ОТ (УСЛУГ ФИНАНСОВЫХ) ПОСРЕДНИКОВ) – (1) Disintermediation:- withdrawal of a financial intermediary from a negotiation.

(2) The flow of funds from lenders to borrowers 'off the balance sheet' without the intervention of an intermediary, e.g., a mortgage broker. Disintermediation:- trend away from bank to market financing or – seen in the bank's perspective – away from balance-sheet to off-balance-sheet operations. Banks are acting less as independent borrowers and lenders (transformation function) and more as brokers between investors and debtors. See also Securitization.

DISMISSAL OF PETITION = ОТКЛОНЕНИЕ ПЕТИЦИИ (или ОТКЛОНЕНИЕ ПРОШЕНИЯ, или ОТКЛОНЕНИЕ ХОДАТАЙСТВА) – Dismissal Of Petition:- a determination made by the US International Trade Administration that the petition does not properly allege the basis on which antidumping duties may be imposed, does not contain information deemed reasonably available to the petitioner supporting the allegations, or is not filed by an appropriate interested party.

DISOMIC = ДИСОМИК (или ДИСОМНОЕ) – Disomic:- having one or more chromosomes duplicated but not an entire genome duplicated. An organism with euploid chromosome complement. / Дисомик – диплоидный организм, имеющий по две гомологичные хромосомы каждой пары.

DISPATCH = ДИСПАЧ (или ПРЕМИЯ ЗА ДОСРОЧНОЕ ОКОНЧАНИЕ СТАЛИИ) – Dispatch is an amount paid by a vessel's operator to a charter if loading or unloading is completed in less time than stipulated in the charter agreement. Also known as

Despatch. See also Demurrage, and Despatch. / Премия за погрузку/выгрузку до истечения срока сталии (сталийного времени). Диспач это денежная сумма, уплачиваемая перевозчиком грузоотправителю или грузополучателю в качестве премии за освобождение судна из-под погрузки/выгрузки до истечения установленных сроков погрузки/выгрузки.

DISPATCH = ОТПРАВКА – Dispatch is the act of sending off something. / Действие по отправке чего-либо.

DISPATCH MONEY = ДЕНЬГИ В СЧЁТ ДИСПАЧА (или ДЕНЬГИ ЗА ДОСРОЧНОЕ ОКОНЧАНИЕ СТАЛИИ) – Dispatch Money:- when so agreed in the charter-party, this is paid by the shipowner to the charterer as a result of the vessel completing loading or discharging before the stipulated time.

DISPATCH RATE = СТАВКА ОТПРАВКИ – Dispatch Rate:- control signal, expressed in Dollars per MWh (MegaWatt-hour), calculated by PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC)) and transmitted continuously and dynamically to generating units to direct the output level of all generation resources dispatched by the PJM Office of the Interconnection. / :- контрольный сигнал, выраженный в Долларах за МВтч (МегаВатт-час), расчитываемый Пи.Дьжей.Эм. (Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC; или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)) и непрерывно и динамически передаваемый генерирующим единицам для направления исходящего уровня всех ресурсов генерации, отправляемой Конторой Взаимосвязи Пи.Дьжей.Эм..

DISPENSING = ДОЗИРОВАНИЕ (или РАЗДАЧА, или РАЗБРОС) – Dispensing:- giving out or distributing through a container in convenient units.

DISPERSAL = ДИСПЕРСНОЕ (или ДИСПЕРСИОННОЕ, или РАССЕЯННОЕ, или РАССРЕДОТОЧЕННОЕ) – Dispersal:- distribution, usually of seed. / , от Латинского слова Dispersio, означающее Рассеяние, .

DISPERSAL = РАСПРОСТРАНЯТЬ (или ПЕРЕДАВАТЬ, или РАЗНОСИТЬ) – Dispersal:- the means of spread or transfer of the cause of a disease (the inoculum of the pathogen) from one area to another or from one host plant to another host plant. / Это значит распространение или передачу причины болезни или инфекции (инокулята патогена (болезнетворного организма)) из одной зоны в другую или от одного растения-хозяина (растения переносчика) другому растению-хозяину. (инфекция передаётся, болезнь распространяется).

DISPERSANT = ДИСПЕРСАНТ (или ДИСПЕРГАТОР, или ДИСПЕРГИРУЮЩИЙ АГЕНТ) – Dispersant:- in lubrication, a term usually used interchangeably with detergent. An additive, usually nonmetallic ('ashless'), which keeps fine particles of insoluble materials in a homogeneous solution. Hence, particles are not permitted to settle out and accumulate. Dispersant is a dispersing agent, often of a surface active chemical, that promotes formation of a dispersion or maintains a state of dispersion by preventing settling or aggregation. / Под Дисперсантом, от от Латинского слова Dispersus, означающее Рассеянный или Рассыпанный, понимается вещество, используемое для очистки водоёмов от нефтяного загрязнения. Дисперсанты (в виде суспензии или эмульсии) раздробляют нефтяную плёнку или комки нефти на мелкие частицы. Дисперсантом называют и нефть в стадии эмульсии, суспензии (дисперсии).

DISPERSANT ADDITIVE = ДИСПЕРГИРУЮЩАЯ ПРИСАДКА – Dispersant Additive is an additive, which keeps the solid contaminants in colloid suspension, thus prevents the oil sludge and varnish buildup on the engine parts. This additive is usually non metallic (ashless) and it's used together with detergent additives. See also Additive. / Диспергирующая Присадка – присадка, препятствующая, ограничивающая, или задерживающая время образования ржавчины на поверхностях деталей и сплавов на основе железа.

DISPERSE DYES = ДИСПЕРСНЫЕ КРАСИТЕЛИ – Disperse Dye is a dye that is almost totally insoluble in water. Disperse dyes exist in the dye bath as a suspension or dispersion of microscopic particles, with only a tiny amount in true solution at any time. They are the only dyes that are effective for 'normal' polyester. Some types are used for nylon and acetate. Polyester is dyed with disperse dyes by boiling with carrier chemicals, or by heating the liquor to about 130 °C, which requires elevated pressure (like a pressure cooker). Thermosol dyeing, where the fabric is padded with dye liquor then dried and heated to about 200 °C for about 90 seconds, is also used for polyester and for coloring the polyester component of poly-cotton blends. Disperse dyes on polyester are generally very washfast and resistant to bleaching. Nylon can be dyed at or below 100 °C without the use of a carrier, but washfastness is only moderate. Disperse dyes are also used for sublimation printing of synthetic fibers, and are the colorant used in crayons and inks sold for making 'iron-on' transfers. See also Dyes. Disperse Dyes is a class of slightly water-soluble dyes originally introduced for dyeing acetate and usually applied from fine aqueous suspensions. Disperse dyes are widely used for dyeing most of the manufactured fibers. Disperse Dyes:- in this class the dyes are also insoluble. Instead of being chemically converted into a water- soluble derivative, the dyes are very finely ground and used in an aqueous dispersion with the assistance of a dispersing agent. They were originally introduced for application to cellulose acetate, which cannot be dyed with the normal water-soluble dyes. More recently they have acquired further importance in dyeing the newer synthetic fibers such as Nylon, Terylene, and Orion. Disperse Dyes are water insoluble. These dyes are finely ground and are available as a paste or a powder that gets dispersed in water. These particles dissolve in the fibers and impart color to them. These dyes were originally developed for the dyeing of cellulose acetate but now they are used to dye nylon, cellulose triacetate, and acrylic fibers too. / Найлан (Nylon). ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Дисперсные Красители – органические красители (главным образом моноазокрасители и антрахиноновые) с высокой степенью дисперсности частиц (до 0.2–2 микрометров (мкм)). Нерастворимы в воде. Применяются в виде водных суспензий для крашения химических волокон, преимущественно полиэфирных, полиамидных, ацетатных. Дисперсные Красители, группа плохо растворимых в воде красителей, применяемых для окрашивания полиамидных, полиэфирных, полиакрилонитрильных и ацетатных волокон. Дисперсные красители характеризуются отсутствием кислотных групп SO3H и COOH, молярной массой не более 350; в процессе производства диспергируются до размеров 0.2–2 микрометров (мкм). Смотрите также Крашение.

DISPERSIBLE GRANULE = ДИСПЕРГИРУЕМАЯ ГРАНУЛА – Dispersible Granule is a dry granular formulation that will separate or disperse to form a suspension when added to water.

DISPERSION = ДИСПЕРСИЯ (или РАССЕИВАНИЕ) – Dispersion is:- (1) a system consisting of finely divided particles and the medium in which they are distributed. (2) Separation of light into colors by diffraction or refraction. (3) A qualitative estimation of the separation and uniform distribution of fibers in the liquid during the production of a wet-formed nonwoven fabric. / Под Дисперсией, от Латинского слова Dispersio, означающее Рассеяние, понимается:- в математической статистике и теории вероятностей, наиболее употребительная мера рассеивания, то есть отклонения от среднего. В статистическом понимании дисперсия есть среднее арифметическое из квадратов отклонений величин (xi) от их среднего арифметического. В теории вероятностей дисперсией случайной величины X называется математическое ожидание $E\ (X - m_x)^2$ квадрата отклонения X от её математического ожидания $m_x = E\ (X)$. Дисперсия случайной величины X обозначается через D (X) или через s^2X. Квадратный корень из дисперсии (то есть s, если дисперсия есть s^2) называется Средним Квадратичным Отклонением (смотрите

Квадратичное Отклонение). В теории вероятностей большое значение имеет теорема:- Дисперсия суммы независимых слагаемых равна сумме их дисперсий. Не менее существенно Неравенство Чебышева, позволяющее оценивать вероятность больших отклонений случайной величины X от её математического ожидания. Дисперсия Света, зависимость показателя преломления n вещества от частоты n (длины волны l) света или зависимость фазовой скорости световых волн от частоты. Следствие дисперсии света – разложение в спектр пучка белого света при прохождении сквозь призму (смотрите Оптические Спектры). Изучение этого спектра привело Айзэка (или Исаака) Ньютона (в 1672) к открытию дисперсии света. Для веществ, прозрачных в данной области спектра, n увеличивается с увеличением n (уменьшением l), чему и соответствует распределение цветов в спектре; такая зависимость n от l называется Нормальной Дисперсией Света. Вблизи полос поглощения вещества ход изменения n с длиной волны значительно сложнее. Так, для тонкой призмы из красителя цианина в области поглощения красные лучи преломляются сильнее фиолетовых, а наименее преломляемым будет зелёный, затем синий (так называемая Аномальная Дисперсия Света). У всякого вещества имеются свои полосы поглощения, и общий ход показателя преломления обусловлен распределением этих полос по спектру. Преломление света в веществе возникает вследствие изменения фазовой скорости света; показатель преломления $n = c_0/c$, где c_0 – скорость света в вакууме, c – фазовая скорость его в данной среде.

DISPLACED INLAY YARN = ПРЯЖА КАК СМЕЩЁННАЯ (или СДВИНУТАЯ) МОЗАИКА – Displaced Inlay Yarn:- a break in the intended pattern of an inlay pile fabric. Note:- this defect is caused by a disruption in the synchronization of the knitting elements that control the position of a fleecy yarn in a laid-in fabric.

DISPLACEMENT = ВОДОИЗМЕЩЕНИЕ – Displacement is the weight of the vessel and all weights on board. The units most commonly used are metric tons. The concept that weight and displacement of a floating vessel are equal is called Archimedes Principle. Displacement = Weight of the Vessel + All the Stuff on the Vessel. Lightweight Displacement = Weight of the Vesse. Deadweight = All the Stuff on the Vessel. Deadweight, abbreviated dwt is the carrying capacity of individual ships and is used to compare ships as well as a nations entire merchant marine and loses at war. Deadweight includes cargo, fuel, water, lube oil, stores, the crew. It might seem odd to refer to paying cargo as dead weight but the term deadweight implies that the ship itself is alive. A sailing ship in danger might jettison deadweight, paying or not – the origin of the concept of general average. Displacement is measured in two ways:- (i) by summing up all weights on board and adding them to the lightship weight. This is done by a program, basically a spreadsheet. The lightship weight is supplied by the builder. The chief engineer supplies the fuel, lube oil. The chief mate manages the ballast. The program computes drafts, in meters, displacement in metric tons and GM (abbreviation for the metacentric height; a measurement of the initial static stability of a floating body; where:- G – gravity, and M – metacentre) in meters. (ii) The vessel's drafts:- the two factors that determine draft are displacement and the density of the water. Drafts can be converted to displacement using a table provided by the builder. Using some real numbers the PCTC pictured above:- Lightship weight is 16 108 mt. Here are some typical weights that comprise deadweights:- Cargo:- 8 520 mt – 5 500 standard cars at 1.5 mt each; Fuel:- 2 000 mt (max 3 095); Ballast:- 4 000 mt (max 9 523 mt); Fresh Water:- 400 mt (max 420 mt); Diesel Oil:- 100 mt (max 190 mt); Crew and Associated Gear and Equipment is 135 mt. Total Deadweight is this case is 15 155 mt. Lightship Weight + Deadweight = Displacement. Displacement = 16 108 mt + 15 155 mt = 31 263 mt. A Pure-Car-Truck-Carrier (PCTC) is at one end of the deadweight/lightweight ratio spectrum. At the other end are large tankers. For example from this site:- a Very Large Crude Carrier (VLCC) is a is a ship with a deadweight of from 200 000 to 315 000 tons. The standard VLCC is about 300 000 tons which will allow is to carry about 2 million barrels of oil. The lightweight of such a ship will be around 42 000 tons. The weight of the quantity of water displaced by the vessel. Displacement is the weight, in tons of 2 240 pounds, of the vessel and its contents. Calculated by dividing the volume of water displaced in cubic feet by 35, the average density of sea water. Displacement (maritime term):- the weight of the water displaced by a vessel. / Под Водоизмещением понимается характеристика размеров судна, отражающая количество воды, вытесненной плавающим судном. Различают:- (i) массовое водоизмещение, равное массе всего судна и находящихся на нём грузов, включая судовые запасы, твёрдый и жидкий балласт, иными словами равное массе воды, помещающейся в объёме подводной части судна; и (ii) объёмное водоизмещение, под которым понимается объём подводной части судна в $м^3$ ниже ватерлинии. При постоянном массовом водоизмещении объёмное водоизмещение меняется в зависимости от плотности воды. Изменение массового водоизмещения происходит вследствие, например, расходования топлива, приёма и снятия грузов, расходования боеприпасов (на военных кораблях).

DISPLACEMENT TONNAGE = ТОННАЖ ПО ВОДОИЗМЕЩЕНИЮ (или ВЕСОВОЕ ВОДОИЗМЕЩЕНИЕ) – A Displacement Tonnage or Ship's Displacement is the weight of the water that a ship displaces when it is floating; the term is defined ordinarily such that the ship's fuel tanks are full and all stores are aboard. The term is applied usually to naval vessels. Displacement is the actual weight of the ship, since a floating body displaces its own weight in water (Archimedes' principle). Another way of thinking about displacement is the weight of the water that would spill out of a completely filled container were the ship placed into it. A number of synonymous terms exist for this maximum weight, such as loaded displacement, full load displacement and designated displacement. As a measurement of weight, displacement should not be confused with similarly named measurements of volume or capacity such as net tonnage, gross tonnage, or deadweight tonnage. The density (weight per unit of volume) of water can vary. For example, the average density of seawater at the surface of the ocean is 1 025 kg/m^3 (10.25 lb/ga, 8.55 lb/US gallon); fresh water on the other hand has a density of about 1 000 kg/m^3 (10.00 lb/ga, 8.35 lb/US gallon). Consider a 100-ton ship passing from a saltwater sea into a freshwater river. It always displaces exactly 100 tons of water, but it has to displace a greater volume of fresh water to amount to 100 tons. Therefore it would sit slightly lower in the water in the freshwater river than it would in the saltwater sea. It can be useful to know a ship's displacement when it is unloaded or loaded partially. Terms for these measurements include light displacement, standard displacement, and normal displacement. These terms are defined below. Displacement Tonnage:- this term is chiefly used when referring to warships and other non-cargo carrying vessels. It is the actual weight of water displaced by the vessel when floating at her loaded draught. The Displacement, essentially the weight, of a ship is traditionally expressed in long tons. To simplify measurement it is determined by measuring the volume, rather than weight, of water displaced, and calculating the weight from the volume and density. For practical purposes the displacement ton (DT) is a unit of volume, 35 cubic feet (0.991 1 m^3), the approximate volume occupied by one ton of seawater (the actual volume varies with salinity and temperature). It is slightly less than the 224 imperial gallons (1.018 m^3) of the water ton (based on distilled water).

DISPLAY = ОТОБРАЖЕНИЕ (или ПОКАЗ) – Display:- information that appears on the screen of a computer terminal.

DISPLAY PACKAGING = ПРОСМАТРИВАЕМАЯ УПАКОВКА – Display Packaging is a packaging designed for a specific product (e.g., pears) which are also suitable for presentation at the point of sale.

DISPO = ДИСПО – Dispo:- disposition log of all containers on any particular ship. Used in booking to match off with final booking printout to verify destination ports.

DISPOSABLE = РАСПОЛАГАЕМОЕ (или РАЗМЕЩАЕМОЕ, или УДАЛЯЕМОЕ) – Disposable:- a filter element intended to be discarded and replaced after one service cycle.

DISPOSABLE INCOME = РАСПОЛАГАЕМЫЙ ДОХОД (или ЧИСТЫЙ ДОХОД) – (1) Disposable Income is the amount of money that households have available for spending and saving after income taxes have been accounted for. Disposable personal income is often monitored as one of the many key economic indicators used to gauge the overall state of the economy. Calculated as:- DPI = Personal Income – Personal Income Taxes Payments. Also known as Disposable Personal Income (DPI). For example, let's assume your household personal income includes USD100 000 from salaries and you are paying at the 35% tax rate. Your household's disposable income would then be USD65 000 (USD100 000 – USD35 000). Economists use DPI to gauge households' rate of savings and spending. In 2005, the average disposable personal income dipped into negative territory for the first time since 1933. This means that in 2005, Americans were spending their entire DPI and then tapping into debt for further spending. Disposable Income:- in national accounting, total household income minus taxes and savings. Disposable Income is total personal income minus personal current taxes. In national accounts definitions, personal income, minus personal current taxes equals disposable personal income. Subtracting personal outlays (which includes the major category of personal (or, private) consumption expenditure) yields personal (or, private) savings. Restated, consumption expenditure plus savings equals disposable income after accounting for transfers such as payments to children in school or elderly parents' living arrangements. The marginal propensity to consume (MPC) is the fraction of a change in disposable income that is consumed. For example, if disposable income rises by USD100, and USD65 of that USD100 is consumed, the MPC is 65%. Restated, the marginal propensity to save is 35%. For the purposes of calculating the amount of income subject to garnishments, United States' federal law defines disposable income as an individual's compensation (including salary, overtime, bonuses, commission, and paid leave) after the deduction of health insurance premiums and any amounts required to be deducted by law. Amounts required to be deducted by law include federal, state, and local taxes, state unemployment and disability taxes, social security taxes, and other garnishments or levies, but does not include such deductions as voluntary retirement contributions and transportation deductions. Those deductions would be made only after calculating the amount of the garnishment or levy. The definition of disposable income varies for the purpose of state and local garnishments and levies. / В национальном бюджетном процессе, .

(2) Disposable Income:- that part of a person's income that he or she may dispose of in any way, i.e. what is left after such necessities as accommodation and food have been paid for.

DISPOSABLE PALLET = ОДНОРАЗОВЫЙ ПОДДОН – Disposable Pallet is a pallet intended to be discarded after a single cycle of use. Also known as Expendable Pallet, and One-Way Pallet. See also Pallet. Disposable Pallet or Expendable Pallet or One-Trip Pallet is a pallet intended to be discarded after a single loaded cycle of use. / Одноразовый Поддон (One-Trip Pallet):- поддон, предназначенный для одноразового применения. Смотрите также Поддон (Pallet).

DISSAVING = ПРОЕДАНИЕ СБЕРЕЖЕНИЙ (или ПЕРЕРАСХОД) – Dissaving:- excess of consumption over income, resulting in a decrease in total saving. Consumers can spend more than they earn by using past savings or credit. Total dissaving is subtracted from gross saving to calculate net saving, which is used in national accounting. / используется в национальном бюджетном процессе.

DISSECT = РАССЕКАТЬ (или ПРЕПАРИРОВАТЬ, или ВСКРЫВАТЬ) – Dissect:- to separate and expose the parts of an organism for examination.

DISSECTED = РАССЕЧЁННОЕ (или РАЗРЕЗАННОЕ, или ПРЕПАРИРОВАННОЕ) – Dissected:- deeply divided or cut into parts. / , от Латинского слова Disseco, означающее Рассекаю, понимается .

DISSEMINATED = РАСПРЕДЕЛЁННОЕ (или ВКЛЮЧЁННОЕ, или ВКРАПЛЁННОЕ) – Disseminated is a term applied to ore deposits consisting of fine grains of ore mineral dispersed through the host rock.

DISSEMINATION = ДИССЕМИНАЦИЯ (или РАССЕИВАНИЕ) – Dissemination is the distribution of germplasm, information, etc. / Под Диссеминацией, от Латинского слова Disseminatio, означающее Распространение или Сеяние, понимается распространение возбудителя болезни из первичного очага болезни по кровеносным или лимфатическим путям, серозным оболочкам (при сепсисе, туберкулёзе и так далее).

DISSENTERS RIGHT = ПРАВО НЕСОГЛАСНЫХ – In the United States, a Dissenters Right is a right granted to shareholders that entitles them to have their shares appraised and purchased by the corporation if the corporation enters into certain transactions that the shareholders do not approve of.

DISSIMILATION = ДИССИМИЛЯЦИЯ (или РАСПАД) – Dissimilation is the decomposition or transformation of an organic substrate to yield energy for use by the organism or organisms. / Под Диссимиляцией, от Латинского слова Dissimilis, означающее Несходный, понимается:- (1) в биологии – то же, что Катаболизм (от Греческого слова Katabolē, означающее Разрушение или Сбрасывание) – совокупность протекающих в живом организме ферментативных реакций расщепления сложных органических веществ (в том числе пищевых). В процессе катаболизма происходит освобождение энергии, заключённой в химических связях крупных органических молекул, и запасание её в форме богатых энергией фосфатных связей АТФ. Катаболические процессы – дыхание, гликолиз, брожение. Основные конечные продукты катаболизма – вода, CO_2 и NH_3, мочевина, молочная кислота. (2) В лингвистике – замена одного из двух одинаковых или сходных звуков в слове (смежных и несмежных) другим звуком, отличным или менее сходным с ним, например, Латинское слово Februarius – Русское слово Февраль.

DISSIPATION = ДИССИПАЦИЯ (или РАССЕЯНИЕ, или ТЕХНИЧЕСКИЕ ПОТЕРИ) – In reference to electricity, Dissipation is the loss of MegaWatts due to the movement of power across the system. / По отношению к электричеству, потеря МегаВатт, связанная с передачей электроэнергии внутри системы. Под Диссипацией, от Латинского слова Dissipatio, означающее Рассеяние, в зависимости от контекста понимается:- (i) диссипация энергии – в физике переход части энергии упорядоченных процессов (кинетической энергии движущегося тела, энергии электрического тока и так далее) в энергию неупорядоченных процессов, в конечном итоге – в теплоту; или (ii) диссипация газов земной атмосферы в межпланетное пространство.

DISSOLUTION = ДИССОЛЮЦИЯ (или ПРЕКРАЩЕНИЕ ДЕЯТЕЛЬНОСТИ, или РОСПУСК) – In the United States, a Dissolution is the statutory procedure that terminates the existence of a domestic corporation. See also Administrative Dissolution, Involuntary Dissolution, Judicial Dissolution, and Voluntary Dissolution. Dissolution, in law, means to end a legal entity or agreement such as a marriage, adoption, or corporation, or unions. In law, Dissolution has multiple meanings. Dissolution is the last stage of liquidation, the process by which a company (or part of a company) is brought to an end, and the assets and property of the company redistributed. Dissolution may also refer to the termination of a contract or other legal relationship; for example, the dissolution of a marriage, or divorce. Dissolution is also the term for the legal process by which an adoption is reversed. While this applies to the vast majority of adoptions which are terminated, they are more commonly referred to as Disruptions, even though that term technically applies only to those that are not legally complete at the time of termination. In international law, dissolution is when a state has broken up into several entities, and no longer has power over those entities, as it used to have previously. An example of this is the case of the former USSR

dissolving into different republics. / Смотрите также Прекращение Деятельности В Административном Порядке (Administrative Dissolution), Прекращение Деятельности В Добровольном Порядке (Voluntary Dissolution), Прекращение Деятельности В Принудительном Порядке (Involuntary Dissolution), и Прекращение Деятельности В Судебном Порядке (Judicial Dissolution). Под Диссолюцией, от Латинских слов, частицы Dis, и Solvere, означающее Распускать, понимается .

DISSOLVE = РАСТВОРЯТЬ – Dissolve:- to cause to pass into solution, such as to dissolve sugar in water.

DISSOLVED AIR = РАСТВОРЁННЫЙ ВОЗДУХ – Dissolved Air is an air which is dispersed in a fluid to form a mixture.

DISSOLVED GASES = РАСТВОРЁННЫЕ ГАЗЫ – Dissolved Gases are those gases that enter into solution with a fluid and are neither free nor entrained gases.

DISSOLVED WATER = РАСТВОРЁННАЯ ВОДА – Dissolved Water is aater which is dispersed in the fluid to form a mixture.

DISTAFF = ПРЯЛКА – Distaff is a staff with a cleft or formed-end for holding flax from which the fiber is drawn in spinning. May be attached to a spinning wheel. The Monastic Heritage Museum shows a wheel-mounted distaff on a wheel from the 1800's. Distaff is a device used to hold fibers while spinning. Distaves can take many forms from a 'Y' shaped twig, to a bracelet, to a paddle shape, etc.

DISTAL = ДИСТАЛЬНОЕ – Distal:- towards the unattached or developing end of an organ. See also Proximal. / В анатомии под Дистальным, от Латинского слова Disto, означающее Отстою, понимается расположенный дальше от срединной плоскости тела (в руке кисть – дистальный отдел) или от основного органа соответствующей системы (дистальные сосуды находятся дальше от сердца). Смотрите также Проксимальное (Proximal).

DISTANT MONTHS = ОТДАЛЁННЫЕ МЕСЯЦЫ – Distant Months:- the month of an option contract or futures contract which has the latest delivery date. Also known as Far Months, or Furthest Months. See also Back Month. / Отдалённые Месяцы – месяцы поставки по фьючерсному или опционному контракту, имеющие самые отдалённые даты поставок.

DISTICHOUS = ДВУХРЯДНОЕ (или ДВУХСТОРОННЕЕ) – Distichous:- of opposite leaf pairs aranged along the stem in two ranks or planes, so each pair is parallel to those above and below. The result is a plant with a flat appearance. / о супротивных парах листьев, расположенных вдоль стебля в двух .

DISTILLATE FUEL OIL = ДИСТИЛЛЯТНЫЕ МАЛОВЯЗКИЕ ФРАКЦИИ ТОПЛИВА (или ДИСТИЛЛЯТНОЕ ДИЗЕЛЬНОЕ ТОПЛИВО) – Distillate Fuel Oil is a general classification for one of the petroleum fractions produced in conventional distillation operations. It includes diesel fuels and fuel oils. Products known as No. 1, No. 2, and No. 4 diesel fuel are used in on-highway diesel engines, such as those in trucks and automobiles, as well as off-highway engines, such as those in railroad locomotives and agricultural machinery. Products known as No. 1, No. 2, and No. 4 fuel oils are used primarily for space heating and electric power generation. Products of refinery distillation sometimes referred to as Middle Distillates, such as diesel fuel, home heating oil, and kerosene. Distillate Fuel Oil is a general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on-and-off-highway diesel engine fuel (including railroad engine fuel and fuel for agriculture machinery), and electric power generation. Included are Fuel Oils No. 1, No. 2, and No. 4; and Diesel Fuels No. 1, No. 2, and No. 4. / Продукты дистилляции при перегонке, относимые иногда к средним дистиллятам (погонам), таким как дизельное топливо, керосин и печное бытовое топливо для отопления домов.

DISTILLATION = ДИСТИЛЛЯЦИЯ (или ПЕРЕГОНКА) – (1) Distillation is the first stage in the refining process of separating crude oil components at atmospheric pressure by heating, and condensing, of the fractions (unfinished petroleum products) by cooling. Also known as Atmospheric Crude Oil Distillation. / Под Дистилляцией или Перегонкой, от Латинского слова Distillatio, означающее Стекание Каплями, понимается разделение многокомпонентных жидких смесей на отличающиеся по составу фракции путём частичного испарения смеси и конденсации образующихся паров. Полученный конденсат обогащён низкокипящими компонентами, остаток жидкой смеси – высококипящими. Дистилляция применяется в нефтеперерабатывающей, фармацевтической и химической промышленности, а также в лабораторной практике.

(2) Distillation:- some metals have very low melting point and soon vaporize on behind heating, while the associated impurities remains in the solid state. Zinc, mercury and arsenic are purified by this method. Vacum distillation gives very pure product and is used in the refining of the metals of IA and IIA Groups. / В металлургии под Дистиляцией понимается метод получения цветных металлов (магния, ртути, цинка и других) из руд или рудных концентратов путём их перевода в парообразное состояние с последующей конденсацией, а также химически чистых веществ, например тетрахлоридов (в хлоридной технологии получения металлов – титана и других).

DISTILLATION METHOD (ASTM D–95) = МЕТОД ДИСТИЛЛЯЦИИ (АОИМ ДИ.–95) – Distillation Method (ASTM D-95) is a method involving distilling the fluid sample in the presence of a solvent that is miscible in the sample but immiscible in water. The water distilled from the fluid is condensed and segregated in a specially-designed receiving tube or tray graduated to directly indicate the volume of water distilled. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

DISTILLER'S DRIED GRAIN = СУШЁНОЕ ОТРАБОТАННОЕ ВИНОКУРАМИ ЗЕРНО (или СУХАЯ ПОСЛЕСПИРТОВАЯ БАРДА) – Distillers' Dried Grain is a commodity obtained after the removal of ethyl alcohol by distillation from the yeast fermentation of a grain or grain mixture by separating the resultant coarse grain fraction of the whole stillage and drying it by methods employed in the grain distilling industry. The predominating grain shall be declared as the first word in the name.

DISTINCTLY GREEN KERNELS = ЧЁТКО ВЫРАЖЕННАЯ ЗЕЛЁНАЯ ЗЕРНОВКА (или ЧЁТКО ВЫРАЖЕННЫЕ ЗЕЛЁНЫЕ ЯДРА) – In Canola industry of the United States, Distinctly Green Kernels are the Canola and pieces of Canola which, after being crushed, exhibit a distinctly green color.

DISTORTED GRADING = ИСКАЖЁННАЯ СОРТИРОВКА – Distorted Grading:- unbalanced patterns which would cause twisted seams, puckering, pleating and a general uneconomical yardage waste. Cutting Room Defects, and namely – Pattern Grading Defects. / Порок или дефект раскроя.

DISTORTION = ИСКАЖЕНИЕ – In economics, Distortion is an imbalance in relationships among economic factors, producing disequilibrium. In statistics, factor affecting the validity of statistical results. / В экономике разбалансировка среди экономических факторов, приводящая к неустойчивости. В статистике, фактор, воздействующий на действительность статистических результатов.

DISTORTION = СКРУЧИВАНИЕ (или ИСКРИВЛЕНИЕ, или ПЕРЕКАШИВАНИЕ, или ИСКАЖЕНИЕ, или ДИСТОРСИЯ (растра), или ПЕРЕДЁРГИВАНИЕ) – Distortion:- in a fabric, the displacement of fill fiber from the 90 angle (right angle) relative to

the warp fiber. In a laminate, the displacement of the fibers (especially at radii), relative to their idealized location, due to motion during lay-up and cure.

DISTRESSED SECURITIES = УЦЕНЁННЫЕ (или ИСТОЩЁННЫЕ) ЦЕННЫЕ БУМАГИ – Distressed Security is a security of a firm that has declared or is about to declare bankruptcy. In the context of hedge funds, a style of management that focuses on securities of companies that have declared bankruptcy and may be undergoing reorganization. Investment holdings can include bonds as well as stock in these firms.

DISTRESS SIGNAL = СИГНАЛ БЕДСТВИЯ – Distress Signal (maritime term):- a flag display or a sound, light, or radio signal calling for assistance.

DISTRIBUTABLE RESERVES = РАСПРЕДЕЛЯЕМЫЕ РЕЗЕРВЫ – In the United Kingdom accounting, a term 'Negative Distributable Reserves' means:- Distributable Reserves = Accumulated Undistributed Realised Profits – Accumulated Realized Losses Not Previously Written Off. Making a distribution when you have calculated that, if the FRS17 (short for the Financial Reporting Standard No. 17) deficit were included now, the employer would have negative distributable reserves may not (yet) be a breach of company law but might be considered risky. Negative distributable reserves therefore occur if accumulated undistributed realised profits are less than accumulated realised losses not previously written off.

DISTRIBUTED DENIAL OF SERVICE = РАСПРЕДЕЛЁННЫЙ ОТКАЗ В ОБСЛУЖИВАНИИ – A Distributed Denial of Service (DDoS) attack is when multiple computers make repeated requests for data to one computer or device, overwhelming its ability to process those requests efficiently, causing it to slow down or even crash in some cases. DDoS attacks are often performed against web sites by bots acting on instructions from a Command and Control server by criminal gangs seeking to either extort money or as a form of retaliation.

DISTRIBUTION = ДИСТРИБУЦИЯ (или РАСПРОСТРАНЕНИЕ, или РАСПРЕДЕЛЕНИЕ, или СБЫТ) – In business, Distribution is a process of conveying goods and services to market. In 1949, the Interbational Chamber of Commerce (Paris, France) gave this definition:- distribution is the stage following the production stage of goods, from the time the goods are brought to market until they are delivered to the ultimate consumer. Distribution includes various activities and procedures to make goods and services available to buyers, including intermediate and end users, by helping them select, purchase and use the goods and services. / В бизнесе под Дистрибуцией, от Латинского слова Distributio, понимается процесс продвижения товаров и услуг на рынок. В 1949 Международная Торговая Палата (Париж, Франция) предложила такое определение:- дистрибуция или сбыт – это стадия, следующая за производством товара, с момента поступления товара на рынок до момента его доставки конечному потребителю. Сбыт включает различные виды деятельности и процедуры, делающие товары и услуги доступными покупателям, включая посредников и конечных потребителей, помогая им выбрать, приобрести и использовать эти товары и услуги.

DISTRIBUTION = РАСПРЕДЕЛЕНИЕ – (1) In United Kingdom accounting, a Distribution is defined as every description of distribution of a company's assets to members of the company, whether in cash or otherwise, except distributions made by way of:- (i) an issue of shares as fully or partly paid bonus shares; (ii) redemption or purchase of any of the company's own shares out of capital (including a new issue of shares) or out of unrealized profits; (iii) reduction of share capital; and (iv) a distribution of assets to members of the company on its winding-up. Distributions is a payment by a business entity to its owners of items such as cash assets, stocks, or earnings. A Distribution means any distribution of a company's assets to its members, the exception only being for purposes laid down in the UK Companies Act (of 1985) itself, e.g., an issue of bonus shares. Thus, if the directors were to sell the company's stock to themselves at less than normal retail price, the distribution would consist of the difference between the actual selling price and the normal retail selling price. Distribution is a transfer of money or other property made by a corporation to a shareholder in respect of the corporation's shares. / строка баланса (item).

(2) Distribution is a collective term for the payment of dividends and the issuance of bonus or scrip shares etc to shareholders of an enterprise. In the broader sense, distribution may also cover interest paid. Payment of a dividend on shares or participation certificates or of the annual income on the units of investment funds. / Оплата дивидендов по акциям или сертификатам долевого участия или годового дохода по паям инвестиционных фондов.

(3) Distribution:- the full range of activities and planning required to move a product from the production line to the end-user.

(4) In national accounting, Distribution is a division of a nation's aggregate income among its members or among factors of production. / В национальном бюджетном процессе, распределение совокупного дохода нации между её составляющими или отраслями производства. В экономике под Распределением понимается фаза общественного воспроизводства, связующее звено между производством и потреблением. В процессе распределения средства производства и трудовые ресурсы направляются по отраслям экономики, предприятиям, районам страны, а определённая доля национального дохода распределяется между классами, социальными группами и отдельными членами общества. Характер и формы распределения определяются способом производства. В свою очередь, распределение активно воздействует на производство, ускоряя или замедляя его развитие.

(5) In statistics a Distribution is the set of possible values for a random variable together with a probability measure defining the likelihood of those values.

DISTRIBUTION = СБРОС – Distribution:- the systematic selling of a security without significantly affecting the price. After an advance, a stock may start forming a top and trade sideways for an extended period. While this top forms, a security's shares may experience distribution as well-informed traders or investors seek to unload positions. A quiet distribution period is usually subtle and not enough to put downward pressure on the price. More aggressive distribution will likely put downward pressure on prices. / Систематическая продажа пакета ценных бумаг без оказания значительного воздействия на её цену. Вслед за повышением цена акции может сформировать некий верхний предел цены, и далее рынок может идти вбок в течение длительного периода. Пока формируется верхний предел акции этого пакета могут подвергаться сбросу, когда хорошо информированные торговцы или инвесторы стремятся разгрузить свои позиции. Период незаметного сброса обычно не долог и его недостаточно для продавливания цены вниз. Более агрессивный сброс скорее всего приведёт к продавливанию цены вниз.

DISTRIBUTION = СБЫТ (или РАСПРЕДЕЛЕНИЕ) – Distribution:- in reference to electricity, the portion of the transmission and facilities of an electric system off the bulk power system that is dedicated to delivering electric service to the end-user sector. / По отношению к электричеству, часть подаваемой электроэнергии и электроустановок, выделенных из общей энергосистемы для поставок электричества сектору конечного потребления.

DISTRIBUTION CENTER = ЦЕНТР РАСПРЕДЕЛЕНИЯ (или ЦЕНТР ПО РАСПРОСТРАНЕНИЮ, или РАСПРЕДЕЛИТЕЛЬНЫЙ ЦЕНТР) – Distribution Center (DC) is a warehouse that manages and distributes inventory per the direction of corporate systems and customer demand. Logistics Depot Distribution Centers are warehouse facilities that store, manage, and ship inventory on behalf of its clients. Inbound carriers bring product into the Distribution Center. Product can be immediately allocated to existing orders, or it can be placed into storage for the purpose of filling future orders. Outbound carriers transport stock from the Distribution Center to the end user. Logistics Depot Distribution Centers are strategically placed close to major transportation lanes, i.e. highways, railroads. Logistics Depot relies on outside carriers as well its own fleet of trucks to transport product. A warehouse for the receipt, the storage and the dispersal of goods among customers. Distribution Center (DC) is a massive warehouse facility (e.g., some as large as 2 million square feet and as small as 10 000 square, feet) in which cargo is received and consolidated for distribution to other facilities or retail locations. / , например, .

DISTRIBUTION CHANNEL = КАНАЛ СБЫТА (или КАНАЛ РАСПРОСТРАНЕНИЯ, или КАНАЛ РАСПРЕДЕЛЕНИЯ) – Distribution Channel is the route by which a company distributes goods. / Маршрут, по которому компания распределяет товары.

DISTRIBUTION CHANNEL MANAGEMENT = УПРАВЛЕНИЕ КАНАЛОМ СБЫТА (или УПРАВЛЕНИЕ КАНАЛОМ РАСПРЕДЕЛЕНИЯ) – Distribution Channel Management is the organizational and pipeline strategy for getting products to customers. Direct channels involve company sales forces, facilities, and/or direct shipments to customers; indirect channels involve the use of wholesalers, distributors, and/or other parties to supply the products to customers. Many companies use both strategies, depending on markets and effectiveness.

DISTRIBUTION COSTS = ЗАТРАТЫ (или ИЗДЕРЖКИ) НА ДИСТРИБУЦИЮ (или РАСПРОСТРАНЕНИЕ, или РАСПРЕДЕЛЕНИЕ, или СБЫТ) – Distribution Costs these are the total costs of packing and distributing the product to the customer during the period.

DISTRIBUTION COSTS/SALES = ЗАТРАТЫ (или ИЗДЕРЖКИ) НА ДИСТРИБУЦИЮ (или РАСПРОСТРАНЕНИЕ, или РАСПРЕДЕЛЕНИЕ, или СБЫТ)/ПРОДАЖИ – Distribution Costs/Sales is the distribution costs expressed as a percentage of the value of sales.

DISTRIBUTION FUND = РАСПРЕДЕЛИТЕЛЬНЫЙ ФОНД – Distribution Fund is an investment fund which distributes the bulk of its earnings to unitholders. The opposite of Capital Appreciation Fund.

DISTRIBUTION LENGTH = ДЛИНА РАСПРЕДЕЛЕНИЯ – Distribution Length:- in fibers, a graphic or tabular presentation of the proportion or percentage (by number or by weight) of fibers having different lengths.

DISTRIBUTION LICENSE = ЛИЦЕНЗИЯ НА ДИСТРИБУЦИЮ (или ЛИЦЕНЗИЯ НА РАСПРОСТРАНЕНИЕ) – The Disribution License (DL) is a special license that allows the holder to make multiple exports of authorized commodities to foreign consignees who are approved in advance by the US Bureau of Export Administration. The procedure also authorizes approved foreign consignees to reexport among themselves and to other approved countries. Applicants and consignees must establish Internal Control Programs to ensure the proper distribution of items under the DL. Each program must include comprehensive procedures for ensuring that the items exported will be used only for legitimate end-uses. The Distribution License is a bulk license that allows the holder to make multiple exports of authorized commodities to foreign consignees who are approved in advance by the US Bureau of Export Administration. The procedure also authorizes approved foreign consignees to reexport among themselves and to certain approved countries. / Обратный Вывоз или Реэкспорт (Reexport).

DISTRIBUTION REQUIREMENTS PLANNING = ПЛАНИРОВАНИЕ РАСПРЕДЕЛЕНИЯ ПО ЗАПРОСАМ – Distribution Requirements Planning is a system of determining demand for inventory at distribution centers, consolidating the demand information backwards, and acting as input to the production and material system.

DISTRIBUTION SYSTEM = РАСПРЕДЕЛИТЕЛЬНАЯ СИСТЕМА (или СИСТЕМА ДИСТРИБУЦИИ, или СИСТЕМА СБЫТА) – Distribution System is the portion of an electric system that is dedicated to delivering electric energy to an end user.

DISTRIBUTION WAREHOUSE = РАСПРЕДЕЛИТЕЛЬНЫЙ СКЛАД (или СКЛАД ПО РАСПРОСТРАНЕНИЮ) – Distribution Warehouses are the warehouses performing distribution services on behalf of their customers. This generally requires that products be received and tracked by lot or sub-lot, with or without tracking numbers, such as pallet tags or serial numbers. Shipping is usually by the pallet or bulk unit. Handling and storage charges generally relate to the item with accessorial charges being billed by the transaction. On-going storage charges are generally billed ahead on the first of each month. Distribution Warehouse is a finished goods warehouse from which a company assembles customer orders. / Склад готовой продукции, из которого компания собирает заказы потребителей.

DISTRIBUTOR = ДИСТРИБУТОР (или РАСПРОСТРАНИТЕЛЬ, или РАСПРЕДЕЛИТЕЛЬ, или СБЫТОВАЯ КОМПАНИЯ) – (1) Distributor is a company that specializes in distributing other companies' products, i.e. has contractual relationships with one or more vendors (producers of the original products) under which the distributor has certain rights, responsibilities and restrictions related to marketing and selling the vendors' products to the ultimate end-users. For example, when American producers of software decide to market their products internationally, they need to choose, for each foreign country they choose to enter, whether to set up company offices ('go direct') or, alternatively, to sign up a distributor to represent their products in that country. Going direct has the advantage of enabling the vendor to retain all enduser revenue (no need to pay distributor commissions). On the other hand, going through a distributor in a foreign country may offer the benefit of faster time-to-market, established customer relationships, and working with a partner familiar with local language and business customs. (2) In some industries that have multi-tier distribution systems – e.g., the steel industry, as well as many retail sectors – the term Distributor is alternatively used to describe a company that serves an intermediary role between a products' original producers and the companies that actually sell to end-users; these intermediaries typically purchase products from multiple vendors, provide warehousing and transport to the retailers. For example, book publishers typically do not sell their products directly to bookstores; rather, they sell to distributors whose intermediary role is to purchase, warehouse and ship multiple publishers' titles to independent retailers and chain bookstores. An agent or business that buys books from a publisher to resell, at a higher cost, to wholesalers, retailers, or individuals. Distribution houses are often excellent marketing enterprises, with their own roster of sales representatives, publicity and promotion personnel, and house catalogs. Skillful use of distribution networks can give a small publisher considerable national visibility. Distributor is an individual or organization that re-sells, sublicenses or otherwise makes digital information available from the owner to end-users. A foreign agent who sells directly for a supplier and maintains an inventory of the supplier's products. / , то есть . , например, . Дистрибутор, как правило, выполняет обязательства по продаже на местном рынке крупных партий товара и часто получает эксклюзивные права на продажу этих товаров. От Агента его отличают следующие факторы:- (i) дистрибутор принимает право владения товарами и поэтому принимает на себя риск за убытки и получает доходы за счёт перепродажи товаров; (ii) дистрибуторы не могут обязывать

контрактом компанию, производящую данные товары; (iii) дистрибуторы сами устанавливают цены и условия продажи данных товаров; (iv) дистрибуторы не имеют условий по трудоустройству в отношении к местным законам по труду, однако они могут быть защищены другими законами и поэтому, должны включать в дистрибуторское соглашение положение – 'без отношений трудоустройства по найму'.

DISTRICT CHECK = РАЙОННАЯ КЛЕТКА – District Check is the name given to several quite different woven check patterns that originated in Scotland. The term applies to designs ranging from glen checks to shepherd checks.

DISTURBANCE CONTROL STANDARD = СТАНДАРТ ХХ – Disturbance Control Standard:- a NERC-defined metric measuring the ability of a control area to return area control error (ACE) either to zero or to its predisturbance level after a disturbance such as a generator or transmission loss. North American Electric Reliability Council (NERC).

DISTURBED PLACE = НАРУШЕННОЕ (или РАСТРОЕННОЕ, или БЕСПОРЯДОЧНОЕ) МЕСТО – Disturbed Place:- an area where the knit structure has been disarranged, but where the yarns are undamaged. / Нарушенный Участок (Disturbed Place):- порок ткани; участок, на котором нарушено ткацкое переплетение, но пряжа не повреждена.

DIT = DEPRECIATION, INTEREST AND TAXES

DIT = DESTINATION INTERCHANGE TERMINAL

DITM = DEEP IN THE MONEY

DITTY–BAG = МЕШОК ДЛЯ ПРИНАДЛЕЖНОСТЕЙ (или КИСА, или МАТРОССКИЙ ЧЕМОДАН) – Ditty-Bag (maritime term):- a small bag used by seamen for stowing small articles.

DIVERGENCE = ДИВЕРГЕНЦИЯ (или РАСХОЖДЕНИЕ) – A Divergence occurs when a momentum indicator or other instrument fails to confirm a move in the price action of the market under observation. For instance, if the SP futures makes a new low in price, but the 3/10 oscillator fails to make a new momentum low, then the SP is said to be diverging from the oscillator. Likewise, if the SP futures make a new low that is not confirmed by new lows in a related market or index (for example the SP versus the Dow Industrials, or the SP versus the TICK), this is also considered a form of divergence. Divergences are useful in that they warn of a loss of momentum and often precede a reversal in price. Divergence is a term which describes the non conformity of two or more indicators or when an asset price does not agree with the trend of an indicator. The indicator(s) or price and indicator are diverging from each other. A situation that occurs when two lines on a chart move in opposite directions vertically. People often look for divergences by comparing a stock's direction to the direction of its MACD, its RSI or its Stochastic Oscillator. There are two kinds of divergences:- (i) positive, and (ii) negative. A positive divergence occurs when the indicator moves higher while the stock is declining. A negative divergence occurs when the indicator moves lower while the stock is rising. A visual comparison between a technical indicator that measures momentum (an oscillator) and the underlying price itself. Divergence occurs when new price highs/lows are not confirmed by new momentum highs/lows. This is thought to be a warning sign of a change in trend. When two or more indicators fail to pattern after price trends, they are often observed to be an omen of major market corrections or trend reversals. It shows up nearly without a fail on all formations of double-tops/bottoms, much more so in case of triple-tops/bottoms. / В биржевом деле под Дивергенцией, от средневекового Латинского слова Divergo, означающее Отклоняюсь или Отхожу, понимается ситуация, которая возникает на графиках, когда две линии двигаются в противоположных направлениях вертикально. Биржевые дельцы часто смотрят на дивергенции, сравнивая направление изменения цены биржевого актива или инструмента с направлением движения технических индикаторов по нему, таких как МЭКДИ (MACD), Ар.Эс.Ай. (RSI) или Стохастический Осциллятор (Stochastic Oscillator). Существуют два вида дивергенции:- (i) положительная и (i) отрицательная. Положительная дивергенция возникает в том случае, когда линия индикатора движется всё выше и выше в то время, как цена актива или инструмента снижается. А отрицательная дивергенция возникает в том случае, когда линия индикатора движется всё ниже и ниже в то время, как цена актива или инструмента повышается. Визуальное сравнение между направлениями линии технического индикатора, который измеряет момент (осциллятор), и линией движения самой цены соответствующего биржевого актива или инструмента. Дивергенция возникает, когда новые максимумы/минимумы цены не подтверждаются новыми максимумами/минимумами момента. Это должно послужить предупреждающим знаком о смене направления существующей на рынке тенденции движения цены.

DIVERSE = РАЗНООБРАЗНОЕ (или ДИВЕРСИФИЦИРОВАТЬ) – Diverse:- having various forms or qualities.

DIVERSIFICATION = ДИВЕРСИФИКАЦИЯ (или ПЕРЕРАСПРЕДЕЛЕНИЕ) – (1) Diversification is an extension of the range of goods or services offered into new areas, either material or geographical. / Под Диверсификацией, от позднелатинского слова Diversificatio, означающее Изменение или Разнообразие, понимается расширение сфер деятельности, номенклатуры продукции, производимой монополистическими объединениями.

(2) Attempts by local authorities or central government to attract a variety of industries to an area heavily dependent upon a single industry, particularly one in decline. / С середины 1950-х Диверсификация как явление получила развитие в экономике развитых стран. Она связана с процессом концентрации на межотраслевом уровне и усилением внутренней неустойчивости хозяйства. В результате диверсификации монополистические объединения превращаются в многоотраслевые комплексы, подразделения которых подчас не связаны между собой технологически.

(3) Diversification is the distribution of investments among several companies to lessen the risk of loss. Spreading investments over a variety of investment categories in order to reduce risk. You may also invest in different countries to spread your risk. Spreading investments among different types of securities and various companies in different fields. Investing in numerous markets or stocks or investments vehicles to reduce the overall risk to a portfolio. A strategy of spreading an investment over different assets in order to reduce the risk of earnings fluctuations. / риск флуктуации (колебания) заработков. Диверсификация, от Латинских слов Diversus, означающее Разный, и Facere, означающее Делать, – в широком смысле – стратегическая ориентация на создание многопрофильного производства или портфеля ценных бумаг. Диверсификация – распределение инвестиционного фонда между ценными бумагами с различными рисками, доходностями и корреляциями, с целью минимизации несистематического риска. Диверсификация портфеля ценных бумаг – образование инвестиционного портфеля из широкого круга ценных бумаг с целью избежания серьёзных потерь, в случае падения цен одной или нескольких ценных бумаг.

DIVERSIFIED PORTFOLIO = ДИВЕРСИФИЦИРОВАННЫЙ ПОРТФЕЛЬ – Diversified Portfolio is a portfolio that holds a variety of assets over more than one asset class or one market. This may include shares, property, or fixed interest. A diversified portfolio will protect you in a tough market. 5 Tips For Diversifying Your Portfolio:- for establishing a strategy that tempers potential losses in a bear market, the investment community preaches the same thing that the real estate market preaches for buying a house:- 'location, location, location'. Diversification is a battle cry for many financial planners, fund managers, and individual investors alike. When the

market is booming, it seems almost impossible to sell a stock for any less than the price at which you bought it. When the indexes are on their way up, it may seem foolish to be in anything but equities. But because we can never be sure of what the market will do at any moment, we cannot forget the importance of a well-diversified portfolio (in any market condition). Looking Back:- a Lesson in the Importance of Diversification:- with the luxury of hindsight, we can sit back and critique the gyrations and reactions of the markets as they began to stumble after the '90s, and again in 2007. Diversification is not a new concept. We should remember that investing is an art form, not a knee-jerk reaction, so the time to practice disciplined investing with a diversified portfolio is before diversification becomes a necessity. By the time an average investor 'reacts' to the market, 80% of the damage is done. Here, more than most places, a good offense is your best defense and in general, a well-diversified portfolio combined with an investment horizon of three to five years can weather most storms. Here are some diversification tips:- (1) Spread the Wealth:- equities are wonderful, but don't put all of your investment in one stock or one sector. Create your own virtual mutual fund by investing in a handful of companies you know, trust, and perhaps even use in your day-to-day life. People will argue that investing in what you know will leave the average investor too heavily retail-oriented, but knowing a company or using its goods and services can be a healthy and wholesome approach to this sector. (2) Consider Index or Bond Funds:- consider adding index funds or fixed-income funds to the mix. Investing in securities that track various indexes make a wonderful long-term diversification investment for your portfolio. By adding some fixed-income solutions, you are further hedging your portfolio against market volatility and uncertainty. (3) Keep Building:- add to your investments on a regular basis. Lump-sum investing may be a sucker's bet. If you have USD10 000 to invest, use dollar-cost averaging. This approach is used to smooth out the peaks and valleys created by market volatility:- you invest money on a regular basis into a specified portfolio of stocks or funds. (4) Know When to Get Out:- buying and holding and Dollar-cost averaging are sound strategies, but just because you have your investments on autopilot does not mean you should ignore the forces at work. Stay current with your investment and remain in tune with overall market conditions. Know what is happening to the companies you invest in. (5) Keep a Watchful Eye on Commissions:- if you are not the trading type, understand what you are getting for the fees you are paying. Some firms charge a monthly fee, while others charge transactional fees. Be cognizant of what you are paying and what you are getting for it. Remember, the cheapest choice is not always the best. The Bottom Line:- investing can (and should) be fun. It can be educational, informative and rewarding. By taking a disciplined approach and using diversification, buy-and-hold and dollar-cost-averaging strategies, you may find investing rewarding – even in the worst of times.

DIVERSION = ОТКЛОНЕНИЕ – Diversion is a change in the billing after the shipment has been received by the carrier at the point of origin and prior to delivery at destination. A change made either in the route of a shipment in transit or of the entire ship. See also Reconsignment. / Смотрите также Переадресация (Reconsignment).

DIVERSIONARY DUMPING = ДИВЕРСИОННЫЙ ДЕМПИНГ (или ДЕМПИНГ С ОТВЛЕЧЕНИЕМ ВНИМАНИЯ, или ОТВЛЕКАЮЩИЙ ДЕМПИНГ) – Diversionary Dumping occurs when foreign producers sell to a third country market at less than fair value and the product is then further processed and shipped to another country. Diversionary Dumping:- a Situation or scheme under which almost-finished goods are imported into a country, where they are minimally processed into the finished form for export to a third country. Also called Downstream Dumping. Diversionary Dumping is the sale of foreign products to a third country at less than fair value where the product is further processed and shipped to another country.

DIVERSION CHARGE = СБОР ЗА ОТКЛОНЕНИЕ – Diversion Charge is a fee for diverting cargo from original intended destination port to a new location. Fee for diverting cargo from one discharge port to another. / из одного порта разгрузки в другой.

DIVERSION PAYMENTS = ПЛАТЕЖИ ЗА ОТВОД ЗЕМЛИ (или ПЛАТЕЖИ ЗА СОКРАЩЕНИЕ ПОСЕВНЫХ ПЛОЩАДЕЙ) – (1) In the United States, Diversion Payments are the Government payments made to farmers in some years for not planting a specified portion of crop-acreage base or permitted acreage. A specified acreage is usually diverted to soil-conserving uses. / изъятие .

(2) In the United States, Diversion covers a short-term financial gap when a family's earned income temporarily stops or reduces. The intention of Diversion is to 'divert' the family from the immediate crisis and the need for ongoing TANF (short for the Temporary Assistance for Needy Families) benefits. A Diversion payment is a lump sum of either one, two, or three months of the Family size Allowance (FSA), depending on the time span of the need. A Diversion period extends from the first day of the month that the County Assistance Office (CAO) authorizes Diversion until the last day of the final month of Diversion eligibility. Recipient families only can receive Diversion once in 12 months. Note:- diversion is not an annual entitlement to cover expected, ongoing needs. The intent of Diversion is to fill a short-term, non-recurring financial gap until a family's income resumes. The CAO must base Diversion eligibility on this intent. Because Diversion is a cost-saving initiative, the CAO should evaluate each situation independently. Diversion Payments:- if you have a job or a source of income that will start within the next few weeks, you may be able to receive a diversion payment instead of going on monthly cash help. You must be eligible for the Family Employment Program before this payment can be offered. The Diversion payment is an emergency payment you can use for your basic needs until the job begins or the source of income is received. Diversion shall equal 3 months of the Family Employment Program (FEP) assistance.

DIVERSITY = РАЗНООБРАЗИЕ – Diversity is the condition of being different or having differences.

DIVERSITY EXCHANGE = СТАНЦИЯ (или КОММУТАТОР) РАЗНОВРЕМЕННОСТИ – Diversity Exchange is an exchange of capacity or energy, or both, between systems whose peak loads occur at different times.

DIVIDED THREADLINE EXTRUSION = ЭКСТРУЗИЯ (или ВЫДАВЛИВАНИЕ) РАЗДЕЛЁННЫХ (или РАЗВЕТВЛЁННЫХ) НИТЕЙ – Divided Threadline Extrusion is a spinning of two separate threadlines from one spinneret. / Экструзия или Выдавливание (Extrusion).

DIVIDEND = ДИВИДЕНД – In the United Kingdom, at the end of a calendar year, a company's board decides whether the business has done well enough to pay shareholders a Dividend. A dividend is a part of the company's profits that is given to shareholders. In larger companies, it is common for an interim dividend to be paid at the half-year point. The dividend is calculated per share, so the more shares you own, the more money you get. Dividends attract income tax, but not National Insurance. Many company share schemes allow employee shareholders to reinvest dividends in further shares called Dividend Shares. A maximum of £1 500.00 in dividends can be reinvested in this way each year. If an employee holds these shares for three years, they pay no income tax on them. If not, the dividend used to pay for the shares becomes taxable. When paying dividends, the company must send a dividend voucher to the shareholder by post. This shows the amount of the dividend and the amount of tax credit. The tax credit shows the amount of tax paid by the company on the shareholder's behalf. Dividends are paid after tax has been deducted at the basic rate. If you pay a higher rate of tax, you may be liable to pay additional tax on your dividend. Companies can pay dividends electronically if a shareholder agrees to it. Companies no longer need to send a dividend voucher in such cases. Dividend is a share of profits paid to a stockholder. Dividend is an arbitrary payment that companies make to their shareholders based on the Company's after-tax earnings. Companies, such as tech companies, often pay no dividends because they re-invest their profits back into the company to fuel further growth. Generally only profitable and cash-rich companies pay dividends. Dividend payouts are approved by a company's Board of Directors

and are declared on a per-share basis (e.g., Company X has declared a dividend of CAD0.08 per share). In some countries (e.g., Canada), dividends may be taxed at a lower rate than ordinary income. Distribution of part of a company's net profit to shareholders. Usually expressed as a number of cents per share. Portion of a corporation's net earnings that is distributed to shareholders, in proportion to the number of shares owned, as their share of profits. Dividends are payable only when declared by the board of directors, and are usually distributed at regular intervals, whether quarterly, semiannually or annually. A payment made to company shareholders from current or previously retained profits. See also Dividend And Interest Matrix. A share in the profits of a corporation or limited company or cooperative. The rate of dividend is determined at the General Meeting upon the proposal of the Board of Directors. Distributions to the owners of participation certificates and dividend-right certificates are also called Dividends. Dividends can take the form of a Cash Dividends (payment in cash), Stock Dividends (allocation of new shares of the corporation) and Dividends In Kind (distribution of tangible assets). That part of a company's profits after tax which is distributed to shareholders, usually expressed in pence per share. Dividend is the payment designated by the board of directors to be distributed pro rata among the shares outstanding. For preferred shares, the dividend is usually a fixed amount. For common shares, the dividend varies with the fortunes of the company and the amount of cash on hand, and may be omitted if business is poor or if the directors determine to withhold earnings to invest in plants and equipment. Sometimes a company will pay a dividend out of past earnings even if it is not currently operating at a profit. The return of shares held in a company. In the case of preference shares it is a fixed rate shown in the title of the shares, e.g., 8% preference shares. Usually calculated on paid up value of a share. Dividends are distributions of earnings to owners. For a dividend to be declared, the board of directors must take formal action to designate the medium of payment, the dividend rate, the shareholder record date and date of payment. Although dividends are usually declared and paid in either cash or stock, occasionally they are used to distribute real or personal property. This latter transaction is a 'dividend-in-kind'. A Dividend is a distribution by a corporation to its stockholders on a pro rata basis. A Dividend is a portion of a corporation's after-tax earnings that are distributed to its shareholders. typically on a quarterly basis. Dividends are often paid in cash, but they can also be paid in other ways, such as in the form of company stock. While dividends put money in the pockets of a company's shareholders, they are not without their disadvantages. Dividend is a distribution of a corporation's earnings to its shareholders. Dividend is a portion of a a joint-stock company's distributable profit paid out to shareholders on to each share. Dividends are expressed either as a percentage of the share's par value or in currency units per share. Dividend distribution is resolved by the general (shareholders') meeting. In Germany, dividends are paid annually, while in the USA and other countries it is common for quarterly dividend payouts to be made (quarterly dividend). Dividend is a cash bonus or other distribution made by a company to its shareholders and applicable to every share that they hold in relation to that company. Spread bets in relation to individual equities do not qualify for dividends. Dividend is:- (1) a distribution of a portion of a company's earnings, decided by the board of directors, to a class of its shareholders. The dividend is most often quoted in terms of the dollar amount each share receives (dividends per share). It can also be quoted in terms of a percent of the current market price, referred to as Dividend Yield. Also referred to as Dividend Per Share (DPS). Dividends may be in the form of cash, stock or property. Most secure and stable companies offer dividends to their stockholders. Their share prices might not move much, but the dividend attempts to make up for this. High-growth companies rarely offer dividends because all of their profits are reinvested to help sustain higher-than-average growth. (2) Mandatory distributions of income and realized capital gains made to mutual fund investors. Mutual funds pay out interest and dividend income received from their portfolio holdings as dividends to fund shareholders. In addition, realized capital gains from the portfolio's trading activities are generally paid out (capital gains distribution) as a year-end dividend. Dividend this Profit and Loss account entry is the total dividend paid or to be paid for the period. Profit distributed to the share holders for their investment in the company is called Dividend. Dividend is approved by the share holders in the annual general meeting at the recommendation of the directors. Dividend is paid out of profits. If, in any year, company could not make any profit. No dividend will be paid to share holders. Dividend is paid to registered share holders of the company. Registered share holders are those members of the company, who are enlisted in the register of share holders of the company. Dividend is a cash payment the company is expected to make to stockholders in the next 12 months. Dividend:- the payments made (normally once or twice a year) to shareholders of variable interest securities (e.g., ordinary shares) when the company concerned distributes some of its profits to shareholders. / и Дивиденды В Натуре (Dividends In Kind). Под Дивидендом, от Латинского слова Dividendum, означающее То, Что Надлежит Разделить, понимается доход, периодически (обычно ежегодно) выплачиваемый акционерами на каждую акцию из прибыли акционерного общества. В соответствии с Пунктом 1 Статьи 43 НК РФ Дивидендом признаётся любой доход, полученный акционером (участником) от организации при распределении прибыли, остающейся после налогообложения (в том числе в виде процентов по привилегированным акциям), по принадлежащим акционеру (участнику) акциям (долям) пропорционально долям акционеров (участников) в уставном (складочном) капитале этой организации. К дивидендам также относятся любые доходы, получаемые из источников за пределами Российской Федерации, относящиеся к дивидендам в соответствии с законодательством иностранных государств. Дивиденд, от Латинского слова Dividendus, означающее Подлежащий Разделу, – часть прибыли акционерного общества, ежегодно распределяемая между акционерами в соответствии с количеством (суммой) и видом акций, находящихся в их владении. Обычно дивиденд выражается в денежной сумме на акцию. Общая сумма чистой прибыли, подлежащая выплате в качестве дивиденда, устанавливается после уплаты налогов, отчислений в фонды расширения и модернизации производства, пополнения страховых и других резервов, выплаты процентов по облигациям и дополнительных вознаграждений директорам акционерного общества.

DIVIDEND AMOUNT = СУММА ДИВИДЕНДА (или ДИВИДЕНДНАЯ СУММА) – Dividend Amount:- the dividend shown as cents per share. For example, a figure of 19 represents AUD0.19 and a figure of 7.5 represents AUD0.075. Where the company is a foreign company that has announced its dividend in a foreign currency, the amount in this field is in Australian Dollar (AUD), converted as at the ex dividend date. Therefore actual amounts received may vary from this figure based on exchange rate movements. Sometimes the dividend amount is referred to as dividend rate in company announcements. Dividend Amount is the cash adjustment factor in a holding period return time period used to calculate returns. It is an adjusted summation of all distribution cash amounts available in the distribution history with Ex-distribution dates after the previous period and up to and including the current period, adjusted to the basis at the end of the previous period. Dividend Amount can be divided into nonordinary and ordinary types. Nonordinary dividends include return of capital distributions. Ordinary dividends are excluded from capital appreciation returns calculations. To calculate an adjusted Dividend Amount in Period to its basis at the end of a date range, the following formula may be used with data items extracted through ts print:- Divamt in period adjusted to end of range = divamt / cumfacpr / facpr; where:- divamt – Dividend Amount in Period; cumfacpr – Cumulative Factor to Adjust Prices over a Date Range; and facpr – Factor to Adjust Price in Period. Thus, to calculate a total return using adjusted prices and dividends:- Total Return = (adjprc + (divamt / cumfacpr / facpr)) / prev adjprc – 1; where:- adjprc – Price Adjusted, End of Period; prev adjprc – Price Adjusted, End of Previous Period.

DIVIDEND AND INTEREST MATRIX = ДИВИДЕНДНАЯ И ПРОЦЕНТНАЯ МАТРИЦА (или МАТРИЦА ДИВИДЕНДОВ И ПРОЦЕНТОВ) – The Dividend and Interest Matrix (DIM) represents property income flows related to holdings of financial transactions.

DIVIDEND CERTIFICATE = ДИВИДЕНДНОЕ СВИДЕТЕЛЬСТВО (или СВИДЕТЕЛЬСТВО НА ДИВИДЕНД, или ДИВИДЕНДНЫЙ СЕРТИФИКАТ, или СЕРТИФИКАТ НА ДИВИДЕНД) – Dividend Certificate:- also known as Dividend Coupon, it

entitles the holder to payment of the annual dividend. A coupon sheet containing 10 to 20 coupons is attached to the physical share certificate. A coupon is detached from the sheet on the due date and redeemed as a dividend. / в надлежащую (причитающуюся) дату и .

DIVIDEND COUPON = ДИВИДЕНДНЫЙ КУПОН (или КУПОН НА ДИВИДЕНД) – Dividend Coupon:- securitized claim to a share in the profit or dividend. Dividends coupons may be attached to regular shares, dividend-right certificates or participation certificates. Not customary in the United States. The opposite of Fixed-Interest Securities. / Дивидендный Купон – купон (отрезной талон) ценной бумаги, при предъявлении которого выплачиваются дивиденды по итогам года, указанного на купоне.

DIVIDEND COVER = ДИВИДЕНДНОЕ ПОКРЫТИЕ (или ПОКРЫТИЕ ДИВИДЕНДА) – Dividend Cover:- the number of times that the dividend payments are covered by earnings for the relevant period. Defined as the earnings per share divided by the dividend per share. It is the inverse of the payout ratio. Care needs to be taken that the tax treatment of the earnings and dividend figures are consistent.

DIVIDEND COVER RATIO = СООТНОШЕНИЕ ДИВИДЕНДНОГО ПОКРЫТИЯ – Dividend Coverage Ratio essentially calculates the capacity of the firm to pay dividend. Generally, this ratio is calculated specifically for preference equity shareholders. Preference shareholders have right to receive dividends. The dividends of preference shares may be postponed but payment is compulsory and therefore they are considered as a fixed liability. Dividend coverage ratio is a ratio between earnings and dividend where earnings being the numerator and dividend amount is the denominator. The ratio is relevant for capital providers but especially important for preference shareholders. These shareholders have a preferred right to receive dividends over normal equity shareholders. The dividend payout to equity shareholders is at the discretion of the management but in case of preference shareholders, the dividend payout is a compulsory. The payout of dividend can be postponed but cannot be avoided. How to calculate Dividend Coverage Ratio (DCR)? The computation of DCR is very simple. We just need two elements to compute the ratio viz. net earnings and dividends. The formula used to calculate the DCR is as follows:- Dividend Coverage Ratio (DCR) = Net Earnings / Dividend. Net Earnings:- net earnings means the earnings left after all the expenses including the taxes. Why net earnings are used in the calculation of dividend coverage ratio? It is because the dividend is paid out of profits left out to the shareholders. Though preference dividend is a fixed liability but it is not charged to profits of the firm and considered as appropriation of profits. To add to it, there is no point taking profit before taxes because there is no tax shield available for this fixed liability. Out of the different types of shareholders, the preference shareholders get the preference over others and therefore get paid before any other equity holder receives dividend. Dividend:- the dividend here is the amount of dividend entitled to be received by preference shareholders. Difference between Dividend Coverage Ratio and Dividend Payout Ratio (DCR vs. DPR):- let us not confuse between the dividend payout ratio and dividend coverage ratio. The dividend payout ratio is the ratio of earnings which is distributed to equity shareholders. It is simply a ratio between total dividends declared by management divided by total available earnings for the equity shareholders. Interpretation of Dividend Coverage Ratio:- The formula of DCR provides an absolute value rather than a percentage. Ideally, if the ratio comes out to be greater than 1, it means that the earnings are sufficient enough to serve preference shareholders with their dividend. To evaluate the business or firm's ability to serve, the ratio should be as higher as possible. Keeping a cushion for uncertainties, the ratio above 2 can be considered good. From the view point of preference shareholders, on the lower side, the ratio of 1 may be sufficient but with a ratio of just 1, equity shareholders have no change to receive any dividend. So for equity shareholders to expect dividend, the ratio has to be much higher than 1. Dividend Cover Ratio is a ratio showing the number of times a company's dividend is covered by its net profit. Dividend Cover Ratio = Net Profit / Dividend Paid. A low dividend cover points to a company paying out most of their net profit, while a high cover suggests much of the profit is being retained.

DIVIDEND DATE = ДАТА ДИВИДЕНДА – Dividend Date is the date from which the right to dividends on a new issue of stock is computed. By extension, the dividend-right date is the date on which this right can be exercised. See also Interest Accrual Date.

DIVIDEND DISCOUNT MODEL = МОДЕЛЬ ДИСКОНТИРОВАНИЯ ДИВИДЕНДОВ – Dividend Discount Model (DDM) is a procedure for valuing the price of a stock by using predicted dividends and discounting them back to present value. The idea is that if the value obtained from the DDM is higher than what the shares are currently trading at, then the stock is undervalued. Value Of Stock = Dividend Per Share / (Discount Rate – Dividend Growth Rate). This procedure has many variations, and it doesn't work for companies that don't pay out dividends. For example one variation is the supernormal dividend growth model which takes into account a period of high growth followed by a lower, constant growth period. The principal behind the model is the net present value of the cash flows. To get a growth number, one option is to take the return on equity (ROE) and multiply it by the retention ratio (which is 1-the payout ratio). Dividend Discount Model is a model for calculating the current value of a share which consists in discounting future dividends anticipated. The Dividend Discount Model (DDM) is a method of valuing a company based on the theory that a stock is worth the discounted sum of all of its future dividend payments. In other words, it is used to value stocks based on the net present value of the future dividends. The equation most widely used is called the Gordon Growth Model. It is named after Myron J. Gordon of the University of Toronto, who originally published it along with Eli Shapiro in 1956 and made reference to it in 1959; although the theoretical underpin was provided by John Burr Williams in his 1938 text 'The Theory of Investment Value'. The variables are:- P is the current stock price; g is the constant growth rate in perpetuity expected for the dividends; r is the constant cost of equity for that company; D_1 is the value of the next year's dividends. There is no reason to use a calculation of next year's dividend using the current dividend and the growth rate, when management commonly disclose the future year's dividend and websites post it. $P = D_1 / (r – g)$. The equation can also be understood to generate the value of a stock such that the sum of its dividend yield (income) plus its growth (capital gains) equals the investor's required total return. Consider the dividend growth rate as a proxy for the growth of earnings and by extension the stock price and capital gains. Consider the company's cost of equity capital as a proxy for the investor's required total return. Income + Capital Gain = Total Return; Dividend Yield + Growth = Cost Of Equity. Problems with the model:- (a) the presumption of a steady and perpetual growth rate less than the cost of capital may not be reasonable; (b) if the stock does not currently pay a dividend, like many growth stocks, more general versions of the discounted dividend model must be used to value the stock. One common technique is to assume that the Miller-Modigliani hypothesis of dividend irrelevance is true, and therefore replace the stocks's dividend D with E earnings per share. However, this requires the use of earnings growth rather than dividend growth, which might be different. (c) The stock price resulting from the Gordon model is hyper-sensitive to the growth rate g chosen. / Майрон Дьжей. Годэн (Myron J. Gordon). Дьжон Бё Вилъйэмз (John Burr Williams).

DIVIDEND/EARNINGS (%) = ДИВИДЕНД/ЗАРАБОТКИ (%) – Dividend/Earnings (%) is the dividend expressed as a percentage of earnings. Thus it measures the balance between the immediate rewards for stockholders and reinvestment for the future. Also known as Dividend Payout Ratio.

DIVIDEND IMPUTATION = НАЛОГОВЫЙ ВЫЧЕТ ДИВИДЕНДОВ – Dividend Imputation:- in Australia, the tax credits passed on to a shareholder who receives a franked dividend. Under provisions of the Income Tax Assessment Act, imputation credits entitle investors to a rebate for tax already paid by an Australian company.

DIVIDEND INCOME = ДИВИДЕНДНЫЙ ДОХОД (или ДОХОД ПО ДИВИДЕНДАМ) – The main source of income from share investments is Dividend Income. This is a cash payment made to shareholders from a company's profits. Many Australian Securities Exchange (ASX) listed companies pay dividends twice each year, usually as a smaller 'interim' dividend and a larger 'final' dividend. Franked dividends can be a very tax-effective form of investment income. Dividend Income:- distribution of earnings to shareholders that may be in the form of cash, stock, or property. Mutual fund dividends are paid out of income, usually on a quarterly basis, from interest generated by a fund's investments. Also known as a Dividend Distribution. Dividend Income:- dividends paid to shareholders in a publicly-traded company or mutual fund. Various factors, notably how long one has held the shares and whether one reinvests the dividend, determine whether dividend income is taxed as ordinary income or capital gains, or not taxed until one sells the shares. Dividend income is also called Dividend Distribution. See also Dividend Reinvestment Plan. Dividend Income from investments in common or preferred stock is normally recognized as of the date of record (the date at which official ownership of shares is determined for the purpose of paying the dividend). Dividend income cannot be accrued in the absence of a dividend declaration by the small business's board of directors. This treatment applies to all dividends, including dividends on redeemable preferred stock or similar securities with some debt-like characteristics. / Дивидендный Доход обычно вычисляется путём деления дивидендов, приходящихся на одну акцию, на текущую цену акций, то есть согласно формуле:- Дивидендный Доход – Годичный Дивиденд На Акцию / Текущая Цена Акции. Тем не менее существуют расхождения относительно того, как вычисляются годичные дивиденды на акцию, что ведёт к разным оценкам дивидендного дохода для одних и тех же акций. Одни используют дивиденды, выплаченные за последний финансовый год, другие – дивиденды, выплаченные за последние четыре квартала, а некоторые используют ожидаемые дивиденды на акцию за следующий финансовый год. Если более высокие дивиденды делают акции более привлекательными вложениями, акции с более высоким дивидендным доходом должны создавать более высокую прибыль, чем акции с более низким дивидендным доходом. Дивидендный Доход – суммма годового дивиденда в процентном выражении от текущей цены акций.

DIVIDEND OPTION = ОПЦИОН НА ДИВИДЕНД (или ДИВИДЕНДНЫЙ ОПЦИОН) – Dividend Option:- a dividend payment that carries an option to accept stock in place of cash.

DIVIDEND PAYOUT RATIO = СООТНОШЕНИЕ ДИВИДЕНД ВЫПЛАТА – Dividend Payout Ratio:- latest fiscal year payout per share divided by the fiscal earnings per share, expressed as a percentage. The percentage indicates the percent of earnings per share paid out as a dividend. See also Dividend/Earnings (%).

DIVIDEND PER SHARE = ДИВИДЕНД НА АКЦИЮ – Dividend Per Share (DPS) is the sum of declared dividends for every ordinary share issued. Dividend per share (DPS) is the total dividends paid out over an entire year (including interim dividends but not including special dividends) divided by the number of outstanding ordinary shares issued. DPS can be calculated by using the following formula:- DPS = (D – SD) / S; where:- D – sum of dividends over a period (usually 1 year); SD – special, one time dividends; and S – shares outstanding for the period. Dividends per share are usually easily found on quote pages as the dividend paid in the most recent quarter which is then used to calculate the dividend yield. Dividends over the entire year (not including any special dividends) must be added together for a proper calculation of DPS, including interim dividends. Special dividends are dividends which are only expected to be issued once so are not included. The total number of ordinary shares outstanding is sometimes calculated using the weighted average over the reporting period. For example:- ABC company paid a total of USD237 000 in dividends over the last year of which there was a special one time dividend totalling USD59 250. ABC has 2 million shares outstanding so its DPS would be (USD237 000 – USD59 250) / 2 000 000 = USD0.088 9 per share. Dividends are a form of profit distribution to the shareholder. Having a growing dividend per share can be a sign that the company's management believes that the growth can be sustained. / Дивиденды На Акцию – отношение суммы дивидендов, выплаченных за последние 12 месяцев, к (средневзвешенному) количеству обыкновенных акций, находившихся в обращении в этот период.

DIVIDEND PER SHARE ADJUSTED = ПЕРЕОЦЕНЕННЫЙ ДИВИДЕНД НА АКЦИЮ – Dividend Per Share Adjusted:- total dividend, in cents per share (DPS), for the year, adjusted by a dilution factor to take account of issues and reconstructions.

DIVIDEND PLAN = ДИВИДЕНДНЫЙ ПЛАН (или ПЛАН НА ДИВИДЕНДЫ) – Dividend Plan is any plan which gives holders of securities the opportunity to accept securities in place of dividend, distribution or interest payments (either partly or wholly). Also known as Distribution Plan, and Dividend Reinvestment Plan.

DIVIDEND REINVESTMENT PLAN = ПЛАН РЕИНВЕСТИРОВАНИЯ ДИВИДЕНДОВ – Dividend Reinvestment Plan (DRIP):- an alternative to cash dividends, allowing shareholders to receive new shares instead of cash. These shares are often issued at a discount and no brokerage or stamp duty is paid. Dividend Reinvestment Plan is usually a plan whereby shareholders may elect to receive all or a portion of the dividend in shares instead of cash. You should refer to announcements by the company or contact the company to obtain further information regarding the rules and operation of the plan. Dividend Reinvestment Plan is a plan sponsored by an issuer that allows shareholders to buy the company's stock with their cash dividends. Dividend Reinvestment Plan (DRIP) is a plan offered by a corporation that allows investors to reinvest their cash dividends by purchasing additional shares or fractional shares on the dividend payment date. A DRIP is an excellent way to increase the value of your investment. Most DRIPs allow you to buy shares commission free and at a significant discount to the current share price. Most DRIPS don't allow reinvestments much lower than USD10. This term is sometimes abbreviated as DRP. A program offered by companies that allow investors to buy their stock directly from the company, without using a brokerage firm. Dividend Reinvestment Plan allows investors to use their dividends to purchase additional shares of stock in the company. Dividend Reinvestment Plan is a plan set up by corporations that allows their shareholders to automatically use their dividends to purchase additional shares of the company's stock or depositary receipts representing shares of the company's stock. Dividend Reinvestment plans vary from company to company, and may include such features as Optional Cash Payment (sending additional funds to purchase shares), partial investment (reinvesting a portion of the dividend and receiving cash for the balance) and safekeeping (depositing certificate shares with the agent). Many dividend reinvestment plans charge nominal fees for the purchase or sale of shares.

DIVIDEND–RIGHT CERTIFICATE = СВИДЕТЕЛЬСТВО О ПРАВЕ НА ДИВИДЕНД (или СЕРТИФИКАТ О ПРАВЕ НА ДИВИДЕНД) – Dividend-Right Certificate:- equity paper which does not confer any ownership rights (no voting rights, for example) but grants the holder the right to participate in the profit and the liquidation proceeds, as well as the right to subscribe to new shares (in the case of a rights issue).

DIVIDEND ROLLOVER PLAN = ПЛАН ПЕРЕНОСА ДИВИДЕНДОВ – Dividend Rollover Plans are processes that involve the buying and selling securities that are shortly going to pay a dividend. When timed correctly, the dividend rollover plan can allow the investor to qualify for receiving a dividend from the investment, even though the stock has not been held for a long period. In order to make use of this type of plan, investors must pay close attention to the scheduling of both the record date and the ex-dividend date associated with the stock. When companies are preparing to issue dividends to investors, they establish what is known as a Record Date. This is simply the date set aside for calculating and issuing the dividends to qualified investors. As part of the preparation for this process, the

corporation advises NASDAQ® of the record date through what is known as a Dividend Notification. The market in turn uses information about record dates to schedule ex-dividend dates. The scheduling of the ex-dividend date is very important to investors who are currently engaged in transactions related to the stock offering. In order to qualify for participation in the issuance of dividends, the investor must own the stock before the arrival of the ex-dividend date. As added incentive, any pending transactions not completed before the arrival of the ex-dividend date are subject to a reduction in the value of the shares. In order to maximize the return on stock issues that will shortly issue dividends, the investor wants to be sure to complete the purchase of the related shares before the ex-dividend date arrives. Ownership of the shares as of the ex-dividend date qualifies the investor for the dividend payments that will begin issuing on the record date. However, the dividend rollover plan requires one more step to be complete. When the ex-dividend date arrives, the investor will sell the shares at some point during that trading day. That effectively allows the investor to avoid incurring a great deal of reduction in the value of the stocks involved. By timing this combination of a buy and a sale just right, the investor can make a significant return without incurring much in the way of a loss, resulting in a net profit from the use of the dividend rollover plan. Sometimes referred to as a Dividend Capture Strategy, the dividend rollover plan has the advantage of providing excellent potential for making money while carrying a relatively low degree of risk. However, market analysts that do not consider a dividend rollover plan sometimes note that the actual return may not be as significant as envisioned, since the market is likely to anticipate the reduction in value that comes along with any dividend pay out. Dividend Rollover Plan is a method of buying and selling stocks around their ex-dividend date so as to collect the dividend and-hopefully-make a small profit on the trade. Dividend Rollover Plan is an investment strategy in which a dividend-paying stock is purchased right before the ex-dividend date, which gives the purchaser the right to the divided, with the position being sold off shortly after the ex-dividend date. The sole intention of this practice is to reap the value of the dividends while breaking even on the shares. Ideally, this strategy is designed to maximize short-term return on shares while minimizing risk. Also known as Dividend Capture Strategy. For example, suppose that XYZ Corp. announces that it will distribute a dividend of USD2.00/share and that the ex-dividend date will be on March 16. Joe can attempt a dividend rollover plan by buying the XYZ Corp. stock on March 15 (or any other day before the March 16) and then selling the shares on March 16 to regain most of the purchase value of the shares. Ideally Joe should profit by USD2.00/share (the dividend's value). Proponents of dividend rollover planning argue that immediate returns on investments are made while reducing risk. However, opponents of the strategy believe that the expected dividend value is already incorporated into the stock before the ex-dividend date because the market anticipates the dividend payout. Dividend Rollover Plan is a method of buying and selling stocks around their ex-dividend dates so as to collect the dividend and make a small profit on the trade. This entails buying shares about two weeks before a stock goes ex-dividend. After the ex-dividend date the price will drop by the amount of the dividend, then work its way back up to the earlier price. By selling slightly above the purchase price, the investor can cover brokerage costs, collect the dividend, and realize a small capital gain in three or four weeks. Also known as Dividend Capture. / НЭЗДЭК® (NASDAQ®). Экс.Уай.Зэд. Корп. (XYZ Corp.).

DIVIDENDS IN ARREARS = ОТСРОЧЕННЫЕ (или ДЕПОНИРОВАННЫЕ) ДИВИДЕНДЫ (или ЗАДОЛЖЕННОСТЬ ПО ДИВИДЕНДАМ) – Dividends In Arrears are the dividends on cumulative preference shares that have not been declared each period in accordance with the terms of their issue. See also Cumulative Preference Dividends.

DIVIDENDS RECEIVABLE/PAYABLE = ДИВИДЕНДЫ ПОЛУЧАЕМЫЕ/ОПЛАЧИВАЕМЫЕ – Dividends Receivable/Payable:- Dividends Receivable on corporate shares arise from the recording of dividends when the dividends are declared, rather than when the dividends are paid. Dividends Payable are distribution of earnings to shareholders prorated by the class of security and paid in the shape of money, stock, scrip, or, rarely, company products or property. The amount is decided by the Board of Directors and is usually paid quarterly. Mutual fund dividends are paid out of income, usually on a quarterly basis from the fund's investments.

DIVIDEND TYPE = ТИП ДИВИДЕНДА – Dividend Type:- all dividends are classified by the Australian Securities Exchange (ASX) as either interim or final. The last dividend in the company's financial year is classified as final and all others are classified as interim. Some dividends may also be classified as 'Special' in accordance with the advice given by the company about the dividend. Ordinarily the term 'Special' is used to indicate that the dividend is not one that is paid regularly each year but the term may be used differently by different companies. Each company may have its own policies on classifying dividend type and it is emphasised that ASX's classification is an independent one carried out for the purposes of allowing its systems to correctly calculate certain ratios. You should refer to announcements by the company or contact the company for more information on dividend type.

DIVIDEND YIELD = ДИВИДЕНДНАЯ ДОХОДНОСТЬ (или ДОХОДНОСТЬ ПО ДИВИДЕНДАМ) – Dividend Yield:- the annual dividend shown as a percentage of the last sale price for the shares. A simplified rate of return on an investment. An indication of the income generated by a share of stock. Dividend Yield is calculated as:- Annualized Dividends Per Share/Price Per Share. Dividend Yield is a return on an investment in shares, expressed as a percentage of the share price. Dividend yield is an important indicator for measuring the profitability of an equity investment. Dividend Yield is the Dividend expressed as a percentage of Market Capitalization. Also called Yield. A term Dividend Yield normally refers to ordinary shares/equities and is the level of dividend currently paid per share in a year divided by the price of one share. If the company currently pays 6p in dividend (for each share) and the price of one share is 100p then the dividend yield is 6% pa. Dividend Yield is the running yield (dividend divided by share price) on an equity. / Дивидендная Доходность или Доходность По Дивидендам – ежегодный дивиденд, указанный в форме процента цены последней продажи данных акций. Упрощённая ставка отдачи на вложения (или инвестиции).

DIVIDER = ДЕЛИТЕЛЬ – Divider is a vertically mounted partition in a compartment on board. / Вертикально установленная переборка в отсеке на палубе.

DIVING SUIT = ВОДОЛАЗНЫЙ КОСТЮМ (или КОСТЮМ ДЛЯ ПОДВОДНОГО ПЛАВАНИЯ, или ГИДРОКОСТЮМ) – Diving Suit is a waterproof suit with a removable helmet worn by a diver who is supplied with air pumped through a tube.

DIVISION = ОТДЕЛ – Division or Divisio is a major taxonomic grouping and primary division of a Kingdom, as in Kingdom Plantae, ranking above Class in size. See also Class, Family, Genus, Kingdom, Order, Phylum, Specie, Tribe, and Type. / Смотрите также Вид (Specie), Класс (Class), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). В ботанике под Отделом (Division или Divisio) понимается таксономическая категория (ранг) в систематике Растений. В Отдел (иногда сначала в Подотдел) объединяют:- близкие по происхождению Классы. Например, Классы Двудольных и Однодольных образуют Отдел Цветковых. Всего в систематике Растений выделяют от 14 до 20 Отделов. В систематике Животных Отделу соответствует Отряд (Тип). Отдел (Divisio), (1) в систематике Растений – высшая по рангу таксономическая категория из принятых для Царства Растений; (2) в систематике Животных – таксономическая категория, иногда применяемая при построении системы высших таксонов – Типов; в число таксонов, принятых Международным Кодексом Зоологической Номенклатуры, не входит; (3) в зоогеографии термином Отдел обозначают неарктическую (Новый Свет – Неарктический Отдел) и палеарктическую (Старый Свет – Палеарктический Отдел) части Голарктической зоогеографической области; (4) в анатомии и морфологии термин Отдел применяется для обозначения участков тела или его частей (передний, или краниальный, задний, или каудальный, туловищный, шейный и тому подобный

Отдел). В биологии под Отрядом (Phylum) понимается таксономическая категория (ранг) в систематике Животных. В Отряд (иногда сначала в Подотряд) объединяют родственные Семейства. Например, Семейства Енотовые, Кошачьи, Куньи, Псовые и другие образуют Отряд Хищных. Близкие Отряды составляют Класс, иногда сначала Надотряд. В систематике Растений Отряду соответствует Порядок (Order).

DIVISION = ОТДЕЛЕНИЕ (или РАЗДЕЛЕНИЕ) – Division:- carriers' practice of dividing revenue received from through rates where joint hauls are involved. This is usually according to agreed formulae. / , от Французского слова Division, означающее Разделение, понимается .

DIVISIONAL APPLICATION = ВЫДЕЛЕННАЯ ЗАЯВКА – Divisional Application is a later application for an independent or distinct invention disclosing and claiming (only a portion of and) only subject matter disclosed in the earlier or parent application. / Выделенная Заявка:- из другой заявки, содержавшей два или более предмета изобретения.

DIVISION OF LABOR = РАЗДЕЛЕНИЕ ТРУДА – Division Of Labor is the division of a complex production process into a number of simpler tasks, each one of which is undertaken by a different individual who typically (but not necessarily) specializes in one task (or a very few tasks) on a more or less permanent basis. The advantages of division of labor for enhancing human productivity were first extensively analyzed by Adam Smith in his 1776 classic The Wealth of Nations, where he coined the phrase. Whereas Smith's famous analysis of the pin factory emphasized improvements in technical efficiency (the time and physical movement saved by workers no longer having to switch from one operation and set of tools to another), it also took note of the improvements in allocational efficiency made possible by developing and then taking advantage of workers' differing skills and talents according to the (at that time not yet named) principle of comparative advantage. In the broadest sense, the extension of the division of labor is the fundamental feature of a modern or developed economy, in which gigantic increases in the volume and variety of production have been attained – but at the cost of massively increasing economic interdependence within larger and larger populations spread over larger and larger geographical areas. In such a complex society, instead of each individual or family attempting to produce all or most of what it consumes, the individual specializes in producing only a few kinds of good or service (or perhaps only small components of a single good or service) and then acquires all other desired goods or services from the production of other specialists by means of mutual exchange (or, in non-market economies, perhaps through coercive or customary transfer). It is worth noting that, while economists tend to emphasize the immense production- and efficiency-enhancing effects of a complex, geographically extensive, and highly specialized division of labor and the markedly higher average standard of living it makes possible, anthropologists, sociologists, and social-psychologists (as well as many philosophers, artists and social theorists) tend to focus more on other presumed non-economic side-effects of greater social differentiation that they typically view in a much more negative light – such as the development of a diminished sense of wholeness or personal authorship that may result in lessened emotional satisfaction from one's work; greater difficulties in generating agreement on moral principles and a sense of social solidarity or 'belongingness' when the far-flung members of society live their lives in such varied ways and develop such diverse interests; the insecurity of the individual's social status when people are no longer assigned their place in society but must continually compete with others to retain or improve their own social positions; the loss of the sense of community mastery over one's fate that comes with dependence upon distant and unknown people for the provision of most of one's vital necessities, and so on. Analyzing and critiquing the many consequences of an advanced and highly specialized division of labor is among the central themes in the works of such pioneer modern social theorists as Jean-Jacques Rousseau, Karl Marx, Ferdinand Toennies, Henry Maine, Max Weber, and Emile Durkheim, to mention only a few, and these same topics still remain central to much of contemporary social thought. / Эдэм Смис (Adam Smith). Жо-Жакь Русу (Jean-Jacques Rousseau), Кал Макс (Karl Marx), Фэрдинанд Тёнис (Ferdinand Tönnies), Хэнри Мэйн (Henry Maine), Макс Веба (Max Weber), и Эмиль Дюркэм (Émile Durkheim).

DIZ = XX – Diz:- the small tool that is used to help form and even top in wool combing. Traditionally a diz was made out of carved horn. You can also make (or buy) very nice ones out of wood. A cheap, none-classy alternative is to trim a piece of plastic and punch or drill a hole in the middle of it. I've seen this done with the bottom corners of a plastic milk jug or a crescent cut from a section of PVC pipe. As always, if it involves worsted spinning, please see 'Hand Woolcombing and Spinning' by Peter Teal. Diz is generally a concave device with a small hole in it used while preparing fibers. It can be used as part of the combing or carding process. It is a pre-drafting aide. The end product is generally considered to be a sliver. / Питё Тил (Peter Teal).

DJ = DJIBOUTI

DJELLABA = ДЖЕЛЛАБА – Djellaba is a long loose garment with full sleeves and a hood.

DJF = DJIBOUTIAN FRANC

DOBBY = КАРЕТКА – Dobby is a mechanical attachment on a loom. A dobby controls the harnesses to permit the weaving of geometric figures.

DOBBY = КАРЕТОЧНОЕ – (1) Dobby is a general term for a fabric woven on a special dobby loom, which allows the weaving of small, geometric figures. A dobby weave can often be distinguished from a plain weave by the patterns are beyond the range of simple looms. Dobby is a fabric woven on a dobby loom. A Dobby fabric is one with small geometric figures incorporated into the weave, and is made with a dobby attachment on the loom. Less elaborate than a Jacquard attachment, which also produces geometric designs, the dobby is used to produce geometric designs such as those found in pique fabrics. (2) A loom equipped with a dobby. Dobby is a fabric made with a dobby, namely a loom with an attachment for weaving small figures. / Жакяр (Jacquard). ткацкий станок с кареткой или кареточный ткацкий станок (dobby loom). Кареточная Ткань – ткань, выработанная с помощью каретки, с ткацким рисунком, выполняемым только на каретке. Под Кареткой, от Итальянского слова Carretta, означающее Тележка, понимается узел машины или механизма, передвигающийся по направляющим или (и) вращающийся в подшипниках. Каретки имеются в металлорежущих станках (опорная часть суппорта), ткацких станках (часть зевообразовательного механизма), пишущих машинах.

DOBBY MISTAKE = ОШИБКА КАРЕТКИ – Dobby Mistake:- defects like shaft hold, design cut, wrong color selection that is related to dobby, called Dobby Mistake. Weaving defect. Dobby Mistake:- improper punch card, faulty jack and needle broken harness or faulty lifting of ends:- (i) working of heald shafts; (ii) condition of dobby card according to weft pattern provided to piece ticket (total information, i.e. details of the yarn, weave and specification etc); (iii) condition of dobby traction elements; (iv) pattern in dobby card according to weft pattern provided in piece ticket; and (v) dobby card cylinder setting. / Порок или дефект.

DOBBY WEAVE = КАРЕТОЧНОЕ ПЕРЕПЛЕТЕНИЕ – Dobby Weave is a patterned fabric like Jacquard weave but the patterns are smaller. It produces an allover figured fabrics. The figures are bird's eye, small diamonds with a dot at the center, or smaller geometric patterns. The construction of the weave is very complex and the design is repeated frequently. Dobby weave is created on dobby machines. The machine selectively raises some warp threads and selectively depresses others with the help of a dobby card. Dobbies vary in weight or compactness. It ranges from very fine to coarse and fluffy yarns. The standard dobbies are generally flat and relatively fine or sheer. Uses of Dobby Weave:- (i) a good example of dobby weave is stripes or waffle cloth but the designs need to be straight vertically or horizontally; and (ii) heavyweight dobby fabrics are used as home furnishings and for heavy apparel. Dobby Weave is a decorative weave, characterized by small figures, usually geometric, that are woven into the fabric structure. Dobbies may be of any weight or compactness, with yarns ranging from very fine to coarse and fluffy. Standard dobby fabrics are usually flat and relatively fine or sheer. However, some heavyweight dobby fabrics are available for home furnishings and for heavy apparel. See also Weave. / Жакяр (Jacquard). Мелкоузорчатое переплетение.

DOC = DEPARTMENT OF COMMERCE

DOCK = ДОК – (1) Dock is:- (1) the area of water between two piers or alongside a pier that receives a ship for loading, unloading, or repairs; (2) a pier; a wharf; (3) a group of piers on a commercial waterfront that serve as a general landing area for ships or boats. Often used in the plural. (4) A platform at which trucks or trains load or unload cargo. Dock:- where vessel positions itself to

load/unload. Dock is an artificially enclosed basin into which vessels are brought for inspection and repair. Originally, docks were used for many purposes:- as dry basins, isolated from the water by dikes or other means, they served as a place for building and repairing ships (dry docks); as wet basins, open to the water, they provided berthing space for ships in the normal course of traffic and cargo transfer. The latter function was later rendered by another group of structures especially designed for that purpose and given different designations such as quay wall, pier, and wharf. The term Dock is still often used in a generic sense to indicate all waterfront docking facilities, either dry basin or berthing structures. Docks used as berthing structures include quay walls, wharves, piers, and floating pontoon docks. Perhaps the oldest and most common waterfront facility for vessels, the quay wall is simply a retaining wall along the shore topped with a deck or platform, serving both as a barrier to protect the shore and as a staging area for cargo and passengers. Usually earth is placed behind the wall in order to build up the deck to the needed height above the prevailing high water level. In addition, it may be necessary to do some dredging in front of the wall to obtain the required water depth. Portland cement, either poured in place or used as precast blocks, has supplanted stone as the leading quay-wall material. The entire system also may be built of timber or of concrete framing, with concrete or sheet steel piling used as retaining walls. At locations where the conformation of the shore and depth of water do not favour economical construction of a quay wall, a wharf, consisting of a trestle-mounted rectangular platform running parallel to the shoreline, and with a connecting passageway to the shore, may be constructed. Normally only the front or seaward side of a wharf is used for berthing, because the water depth and accessibility on the other three sides may not be suitable for many vessels. Because quay walls occupy valuable waterfront space, docking cost at a quay wall is high. A more economical expedient is the pier, which in its simplest form is merely a platform extending over the water, usually at right angles to the shoreline. Vessels can be moored to the pier, which serves as a transfer platform for cargo and passengers. A pier is composed of two main parts:- the deck and its supporting system. The deck is usually built of reinforced concrete, though timber may be used. The supporting system is an assembly of beams, girders, and bearing piles, framed together to form a series of bents or trestles. The framing material may be wood, concrete, steel, or a combination of these. In some piers with concrete framing, the deck and walls are cast together to form an enclosed cellular structure. The buoyancy of such a structure greatly reduces the load on the foundations, and the interior space can be utilized for storage. Floating pontoon docks, of which few have been built, rise and fall with the water level. One such dock floats up or down guided by walls of sheet-steel piling driven to bedrock, which serves to anchor or moor the whole assemblage. Access to shore is provided by a trestle hinged at the shore end and resting freely on the pontoon at the other end. For ships, a cargo handling area parallel to the shoreline where a vessel normally ties up. The term Dock has a number of meanings. It is an artificially enclosed basin into which vessels are brought for inspection and repair. A dock is a place, usually man-made area of enclosed water, where ships are loaded, unloaded or repaired. Originally, it denotes an area of water that can accommodate a ship and can be closed off by locks to allow regulation of the water level. It also means a space between two wharves or piers for the mooring of ships, i.e. a Dock Basin. Often it can be interchanged with the terms wharf or pier. In US it often indicates a small landing pier for accommodating boats in a river or lake creek. / Под Доком, от Голландского слова Dok, понимается сооружение (камера) для извлечения судов из воды, осмотра и ремонта их подводной части (докование) либо для постройки судов. Различают наливные, плавучие и сухие доки. Камера наливного дока имеет канал для ввода судов и площадки с опорами для их установки, расположенные выше обычного уровня воды. В наливном доке судно садится на опоры при откачке из дока воды. Плавучий док состоит из плоского прямоугольного понтона, на палубе которого размещены опоры для судов, и одной-двух продольных башен. Плавучий док при установке судна притопляется. Сухой док представляет собой водонепроницаемую камеру, закрываемую в головной части (со стороны акватории) шлюзом с затвором. При постановке в сухой док судно вводят в камеру, закрывают затвор, осушают камеру, и судно садится на опоры. Все доки оборудуют механизмами и устройствами для ввода и установки судов на опоры, насосами для перекачки воды, передвижными кранами, устройствами для подачи электрической энергии, пара, воды, сжатого воздуха и тому подобным при ремонтных или строительных работах. (2) Под доком понимается искусственный портовый бассейн с затвором для стоянки судов под погрузкой-разгрузкой в местах больших приливно-отливных колебаний уровня моря. (3) Комплекс сооружений (платформы, стеллажи, стремянки и другие) для технического обслуживания и ремонта летательных аппаратов. Различают стационарные доки, размещаемые в ангарах, и подвижные доки, используемые на открытых стоянках летательных аппаратов.

(2) Dock is a warehouse door with an extending platform where trailers are loaded and unloaded. For land transportation, Dock is a loading or unloading platform at an industrial location or carrier terminal. / Для наземной транспортировки, погрузочная или разгрузочная платформа на промышленном объекте или терминале перевозчика.

DOCKAGE = ДОКЕДЖ (или ЛЕГКО ОТДЕЛЯЕМЫЕ ПРИМЕСИ) – (1) Dockage is material that must be removed from grain by the use of approved cleaning equipment so that the grain can be assigned a grade. Once it has been removed from the grain, dockage is called Screenings. / Высевки (Screenings).

(2) Dockage is defined under the Canada Grain Act as 'any material intermixed with a parcel of grain, other than kernels of grain of a standard of quality fixed by or under this Act for a grade of that grain, that must and can be separated from the parcel of grain before that grade can be assigned to the grain'. In the United States, Dockage is all matter other than Wheat that can be removed from the original sample by use of an approved device according to procedures prescribed in the US Federal Grain Inspection Service (FGIS) instructions. Also, underdeveloped, shriveled, and small pieces of Wheat kernels removed in properly separating the material other than Wheat and that cannot be recovered by properly rescreening or recleaning. / иной, нежели ядра зерна по стандарту качества . тщательным перепросевом или повторной очисткой.

(3) In Canola industry of the United States, Dockage is all matter other than Canola that can be removed from the original sample by use of an approved device according to procedures prescribed in the US Federal Grain Inspection Service (FGIS) instructions. Also, underdeveloped, shriveled, and small pieces of Canola kernels that cannot be recovered by properly rescreening or recleaning. Machine separated dockage is added to conspicuous admixture in the computation of total dockage. / и малые элементы зерновки кэнолы . тщательным перепросевом или повторной очисткой.

DOCK BUMPERS = ДОКОВЫЙ КРАНЕЦ (или ДОКОВЫЕ БАМПЕРЫ) – Dock Bumpers are the cushioning devices (rubber, plastic, wood, etc) mounted at the extreme rear of a chassis or trailer to take the impact when it backs into a loading dock or platform (road cargo). / Под Кранцем, от Голландского слова Krans, понимается приспособление для смягчения ударов судна о причал или борт другого судна. Судовые кранцы вывешивают за борт перед швартовкой или закрепляют на борту в местах, наиболее подверженных ударам. Причалы часто оборудуются постоянными кранцами. Изготавливают кранец из податливых материалов (дерева, резины), плетёными из растительных тросов или надувными (пневматическими). Для швартовки судов в открытом море наиболее удобны резинотканевые пневматические кранцы. На речных судах в слаборазвитых странах можно встретить кранец в виде деревянного бруса, старой автомобильной покрышки и прочего. Под Кранцем, от Голландского слова Krans, понимается приспособление для смягчения ударов бортов судна о причал или о другое судно. Кранцы вывешиваются за борт перед подачей швартовов. Изготовляют кранец из дерева, резины, плетёными из растительных тросов или надувными.

DOCKET = ВНОСИТЬ В РЕГЛАМЕНТ – Docket:- present a rate proposal to a conference meeting for adoption as a conference group rate. / Вносить предложение о ставке на встрече конференции для адаптации в качестве конференционной групповой ставки.

DOCKET = ДОСЬЕ (или КРАТКОЕ ИЗЛОЖЕНИЕ ДОКУМЕНТА) – Docket is a list of cases (applications) awaiting office (the United States Patent and Trademark Office (USPTO)) actions.

DOCK FACE = ЛИЦО ДОКА – Dock Face:- outer wall of dock door.

DOCK LEVELER = УРАВНИТЕЛЬ ДОКА (или ДОКОВЫЙ УРАВНИТЕЛЬ) – Dock Leveler:- a plate at the dock door entrance that raised and lowered either manually or hydraulically to accommodate trailer floor heights. / табличка на . Уравнитель Дока – приспособление для дифферентовки плавучего дока. Доклевелер, или Уравнительная Платформа, представляет собой связующее звено между платформой грузовика и складом для проезда погрузчика внутрь грузовика. Главным назначением доклевелера является преодоление разницы высот между грузовиком и погрузочной платформой.

DOCK LIGHT = ДОКОВЫЙ СВЕТ – Dock Light is a light used to illuminate the inside of a trailer in order to aid in the loading and unloading processes.

DOCK PLATE = ДОКОВАЯ ТАБЛИЧКА – Dock Plate is a moveable metal plate that is placed between the warehouse dock door and a trailer or railcar and makes it easier/smoother to access a trailer or railcar with a forklift or similar equipment. / табличка.

DOCK RECEIPT = ДОКОВАЯ РАСПИСКА – Dock Receipt is a receipt given for a shipment received or delivered at a pier or dock. When delivery of a foreign shipment is completed, the dock receipt is exchanged for a bill of lading with the transportation line. A dock receipt is used to transfer accountability when the export item is moved by the domestic carrier to the port of embarkation and left with the international carrier for export. Document issued by a shipping line acknowledging receipt of goods for shipment. Dock Receipt is a form used to acknowledge receipt of cargo and often serves as basis for preparation of the ocean bill of lading. When delivery of a foreign shipment is completed, the dock receipt is surrendered to the transportation line and a bill of lading is issued.

DOCTOR BLADE = ЛЕЗВИЕ РАКЛИ (или ЛЕЗВИЕ СКРЕБЛА) – Doctor Blade is a metal knife that cleans or scrapes the excess dye from engraved printing rollers, leaving dye paste only in the valleys of engraved areas. Also used to describe other blades that are used to apply materials evenly to rollers or fabrics. / Doctor = Ракля на печатной машине или Ракля клеепромазочной машины; Скребло – чистильный нож.

DOCTOR BLADE STREAK = ЗАТАСК ОТ ЛЕЗВИЯ РАКЛИ (или ПОЛОСКА ОТ ЛЕЗВИЯ РАКЛИ, или ЧЕРТА ОТ ЛЕЗВИЯ СКРЕБЛА) – Defect Name:- Doctor Blade Streak. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Doctor Blade Streak:- This is the result of a bent or damaged doctor blade not cleaning properly, allowing color to escape. Severity:- Major. Doctor Blade Streak; doctor streak:- on a fabric, a length ways streak of excess color or excess coating. Note:- this defect is caused by a damaged or incorrectly set doctor. / Затаск от печати, не более 2 сантиметров (см). Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Полоса, Образованная Зазубриной Текстильного Ножа; Полоса, Образованная Текстильным Ножом (doctor blade streak; doctor streak):- порок заключительной отделки ткани; разноотеночные полосы по длине и ширине полотна, отличающиеся линейной плотностью нитей, натяжением. Примечание:- этот порок вызван повреждённым или неправильным текстильным ножом.

DOCTOR STREAK = ПОЛОСА ОТ РАКЛИ (или ЗАТАСК ОТ СКРЕБЛА) – Doctor Streak is a defect in printed fabrics consisting of a wavy white or colored streak in the warp direction. It is caused by a damaged or improperly set doctor blade on the printing machine. Doctor Streak:- in printed cloth, a wavy white or colored streak in the warp direction of printed cloth caused by a defective doctor blade. Doctor Streaks are the streaks on printed cloth caused by some damage or deficient operation of the doctor blade, which is a metal scraper on a print machine supposed to remove excess color from the engraved print roll before it contacts the cloth. / Streak = Затаск – порок печатного товара в виде параллельных цветных полос.

DOCTOR TEST = ИСПЫТАНИЕ НА СЕРНИСТОСТЬ (или ТЕСТ НА СЕРНОСТЬ) – Doctor Test is a qualitative method of detecting undesirable sulfur compounds in petroleum distillates; that is, determining whether an oil is sour or sweet. / качественный метод определения нежелательных .

DOCTRINE OF EQUIVALENTS = ДОКТРИНА ЭКВИВАЛЕНТОВ – In the US patent law, a Doctrine Of Equivalents is a judicially created theory for finding patent infringement when the accused process or product falls outside the literal scope of the patent claims. The essential objective inquiry is:- 'Does the accused product or process contain elements identical or equivalent to each claimed element of the patented invention'?.

DOCUMENTARY ACCEPTANCE CREDIT = ДОКУМЕНТАРНЫЙ АКЦЕПТНЫЙ КРЕДИТ (или ДОКУМЕНТАРНЫЙ АКЦЕПТНЫЙ АККРЕДИТИВ) – Documentary Acceptance Credit is a credit used in foreign trade finance and granted primarly on the basis of a documentary credit. The importer's bank assumes liability for the acceptance and payment of the draft drawn by the exporter on his bank provided that all the conditions specified in the letter of credit are met. Acceptance credit used for import or export financing. Usually secured by an irrevocable documentary credit issued by the buyer's bank. See also Documentary Credit. / Акцептный кредит, используемый при финансировании привоза (или импорта) и вывоза (или экспорта). Обычно обеспечивается безотзывным документарным аккредитивом (кредитом), выставляемым банком покупателя. Смотрите также Документарный Аккредитив (Documentary Credit).

DOCUMENTARY COLLECTION = ДОКУМЕНТАРНОЕ ИНКАССО – As an exporter, Documentary Collection offers you far greater security than selling on open account, but not as much as a documentary credit. Credit, political and transfer risks, for instance, are not covered. You should therefore check before starting sales negotiations whether documentary collection is the right method of payment for you as an exporter. Having said that, documentary collection costs less and involves less time and effort for settlement. The advantages:- (i) straightforward, less expensive settlement process; (ii) payment is usually quicker than with open account; (iii) the documents and thus the goods can be released to the importer simultaneously on payment of the amount owed or acceptance of a draft; this applies where the goods are not addressed directly to the importer in the shipping document or the latter cannot redeem them without the shipping documents; and (iv) clear internationally recognized guidelines in the Uniform Rules for Collections (URC), ICC Publication no. 522. The disadvantages:- (i) payment is not guaranteed as credit, political and transfer risks are not covered; (ii) the payment date is unsure; and (iii) if the importer refuses to accept the documents or the draft on the due date, losses can be incurred. It may prove extremely costly or even impossible to find an alternative buyer or have the goods shipped back. As the exporter exposes himself to a certain risk by producing/shipping the goods or providing another service before receiving payment, we would only recommend documentary collections under following circumstances:- (i) there needs to be a relationship of trust between the exporter and the importer; (ii) there must be no doubt as to the importer's willingness and ability to pay; (iii) the importing country must

be politically, economically and legally stable; and (iv) international payment transactions with the importing country must not be hampered or threatened by currency controls or any other such restrictions. Please note:- the Bank's liability is limited to the forwarding and release of documents against payment, acceptance or promise of payment (letter of undertaking) by the importer. The Uniform Rules for Collections (URC) form the basis for the processing of documentary collections. They govern the essential rights and obligations of the parties to the agreement. The current URC 522 guidelines, published by the International Chamber of Commerce (ICC), Paris, France, have been in force since 1996-January-01 and are extremely well established internationally. Alongside the URC 522, local legislation governing documentary collections also remain important. Types of documentary collections:- (i) collection with acceptance:- release of documents only against payment; (ii) documents against acceptance; (iii) documents against a letter of undertaking; and (iv) documents against payment. The collection of a sum due from a buyer by a bank against delivery of certain documents. The basis for the execution of documentary collections is provided by the Uniform Rules For Collections (URC) drafted by the International Chamber of Commerce in Paris, France. Documents Against Payment stipulate that the exporter ships goods to the importer without a letter of credit or another form of guaranteed payment. The importer must sign a sight draft before receiving the necessary documents to pick up the goods. Documents Against Acceptance (D/A) are instructions given by a shipper to a bank stating that the documents transferring title to goods should be delivered to the buyer only upon the signing of a time draft. In this manner an exporter extends credit to the importer and agrees to accept payment at a readily determined future date. Documentary Collection means collection of:- (i) financial documents accompanied by commercial documents; and (ii) commercial documents not accompanied by financial documents. See also Clean Collection. Documentary Collection:- the bank, as entrusted by an exporter, collects payments from an importer through a foreign collecting bank upon presentation of the exporter's commercial and financial documents. Functions:- the product satisfies the needs of international trade settlement. Compared with remittance, the product provides more certainty of payment in two forms, i.e. documents against payment (D/P) and documents against acceptance (D/A). Features:- (i) Low Cost:- low banking fees, help reduce financial expenses and control the costs; (ii) Easy To Use:- simple procedures, easy to use as compared with L/Cs; and (iii) Lower Risk:- the importer can only take delivery of the goods after acceptance or payment, which helps reduce the risks for the exporter as compared with open account sales. Target Customers:- (i) exporters know the credit status of the importers and have sufficient funds for preparation and delivery of goods; and (ii) in the sellers' market, the exporters are advised to choose D/P and in the buyers' market where the importers are asking for financial facility, the exporters may choose D/A. Application Qualifications:- (i) the applicant shall be approved and registered in accordance with the law, and hold a business license that has passed the annual inspection or other valid certificates which fully prove its legal operation and scope of business; and (ii) the applicant shall have the qualification to engage in import and export trade. Required Documents:- (i) the following documents are required when applying for export collection:- the power of attorney for collection and the complete set of documents for documentary collection; and (ii) the following documents are required for first-time applications:- business license (original and duplicate copies), permit for operating import and export trade, authorization letter of legal representative. Process:- (i) the exporter submits relevant documents to the bank for collection after preparation and delivery of goods; (ii) the bank mails the documents for collection to the foreign collecting bank; (iii) the foreign collecting bank presents the received documents to the importer; and (iv) the importer makes the due payment to the bank of exporter via the collecting bank and the bank of exporter pays it to the exporter. Kind Reminder:- (i) in case that the importer refuses to make payment or acceptance, it would be better if you timely authorize the collecting bank to help you make arrangements for your goods; and (ii) exporter have actually extended the payment time of the importer under D/A, so exporter is advised to consider interest-related costs when determining price. Documentary Collection is a service provided by banks to sellers as a secure way of settling payments. The buyer is presented with commercial documents in exchange for payment of the countervalue ('cash against documents') or for signing a bill of exchange ('documents against acceptance'). Documentary collection ensures that goods are paid on delivery. / или тратты в надлежащую (причитающуюся) дату, . Документарное Инкассо означает инкассо:- (i) финансовых документов, сопровождаемых коммерческими документами; и (ii) коммерческих документов, не сопровождаемых финансовыми документами. Смотрите также Чистое Инкассо (Clean Collection). В международной торговле Документарное Инкассо применяется в двух разновидностях:- (i) документы против платежа; и/или (ii) документы против акцепта. Техника расчётов для данных разновидностей во многом схожа. Расчёты начинаются в банке продавца. В первом случае продавец сдаёт своему банку вместе с товарными документами инкассовое поручение, которое банком продавца пересылается через банк покупателя самому покупателю, который выписывает на этом основании платёжное поручение и через свой банк производит оплату. В другом случае продавец вместе с товарными документами сдаёт своему банку переводный вексель (тратту). Эти документы, как правило, курьерской почтой пересылаются в банк покупателя. Покупатель акцептует этот переводный вексель и через свой банк возвращает банку продавца. Тот учитывает переводный вексель и представляет своему клиенту (продавцу) учётный кредит, до наступления даты погашения векселя. С наступлением срока погашения векселя покупатель осуществляет оплату через свой банк банку продавца. Поскольку переводный вексель предусматривает риск неуплаты с наступлением срока погашения, банк покупателя может применить метод защиты своих интересов. Это делается так:- товары, предусмотренные для получения покупателем, задерживаются на месте отгрузки до наступления срока погашения векселя. После оплаты векселя банк покупателя отдаёт своему клиенту документы, необходимые для получения товара.

DOCUMENTARY CREDIT = ДОКУМЕНТАРНЫЙ АККРЕДИТИВ – Documentary Credit:- method of payment for a business transaction whereby a banker acts as the importer's agent, and the exporter provides documents showing proof of ownership, giving both parties a measure of security. The documentary credit was devised by bankers to provide confidence in the transaction of business between two parties who do not know each other well because they are separated by great distances. The seller will not release merchandise without guarantee that payment will be received at the time of shipment. The buyer will not pay for the merchandise until it has ascertained that it conforms to its order. Also known as Commercial Letter Of Credit. The basis of international trade by means of which payment is made against surrender of the original transport documents (B/L). Documentary Credit is the most common form of the commercial letter of credit, the documentary credit is an arrangement for the safe negotiation of a payment and credit transaction, esp. in connection with international deliveries of merchandise. The documentary credit covering merchandise consists of a written undertaking on the part of a bank to pay, on instructions from the buyer (the applicant), a certain amount to the seller (beneficiary) within a prescribed period and against surrender of stipulated documents covering the shipment of goods contracted for between seller and buyer, to accept said payment or to negotiate it, or to authorize another bank to make such payments or draft negotiations if the conditions are met. All instructions to open, confirm or advise of a documentary credit must list precisely the documents to be presented. These include:- (i) shipping documents, on board bills of lading; (ii) insurance documents; (iii) commercial, consular or other invoices; (iv) certifications of origin; (v) weight or quality certificates. A documentary credit may be Revocable or Irrevocable. Unless clearly marked as revocable, it is assumed to be irrevocable. Irrevocable credits are normally used in international trade as they guarantee the seller that the opening bank will make payment if the documents stipulated under the documentary credit terms are presented as agreed. If payment is effected via a correspondent bank, the opening bank can request the correspondent bank at the demand of the principal not only to advise of the irrevocable documentary credit but also to confirm it. This obligates the correspondent bank at the domicile of the beneficiary to make the payment upon the due presentation of the documents. The rules and

regulations governing documentary credit transactions were summarized by the International Chamber of Commerce in Paris, France in the Uniform Customs And Practice For Documentary Credits (UCP). The new regulations (UCP 500) drafted in 1993 have been in force since 1994-January-01. Documentary Credit is the officially correct term for Letter of Credit. The UCP500 only mentions 'Documentary Credit' not 'Letter of Credit'.

DOCUMENTARY DRAFT = ДОКУМЕНТАРНАЯ ТРАТТА – Documentary Draft is a draft drawn by the seller on the buyer and accepted by the latter in connection with a documentary transaction (documentary collection). If the draft contains the notation Documents Against Acceptance (D/A) the documents are handed over upon acceptance of the draft. If it is marked Documents Against Payment (D/P), they are handed over only after the acceptance has been paid. Draft accompanied by documents having commercial value. Disposition instructions typically accompany the draft.

DOCUMENTARY DRAFT COLLECTION = ИНКАССО ДОКУМЕНТАРНОЙ ТРАТТЫ – Documentary Draft Collection is a process for collecting payment in a sale of goods wherein a legal demand for payment from the buyer is made by a bank acting as collecting agent for the seller. Demand is made by presenting a draft. The collecting bank is also entrusted with documents to deliver in accordance with accompanying instructions, usually once the draft is either paid or accepted. These documents are generally needed by the buyer to show title to the goods and/or to clear customs. / представлением тратты.

DOCUMENTARY LETTER OF CREDIT = ДОКУМЕНТАРНЫЙ АККРЕДИТИВ – A Documentary Letter Of Credit (LC) is a written undertaking given by a bank on behalf of an Importer to pay the Exporter a given sum of money within a specified time, providing that the Exporter presents documents which comply with the terms laid down in the Letter of Credit. Letters of Credit can be for any amount, in any freely traded currency, and, subject to the presentation of compliant documents, may be payable:- at sight, which means as soon as a compliant set of documents are presented to the paying bank; or, after a specified term, e.g., at 30, 60, 90 or 180 days of sight or Bill of Lading date. If the documents are not presented exactly as specified in the Letter of Credit, payment will not be made unless the Importer gives their authority to waive or amend the specified condition. A fundamental principle of Letters of Credit is that banks deal with documents and not with the goods to which the documents refer. For example, if the Importer is not happy with the quality of the goods but the documents comply with the terms and conditions of the Letter of Credit, the Importer's bank is obliged to pay the Exporter. Parties involved in a Letter of Credit transaction:- in the process of a Letter of Credit transaction, there are essentially four parties involved. These parties can be referred to by a number of terms, outlined below:- Buyer meaning Importer, Applicant, Accountee or Accreditor. In this guide we use the term Importer. Seller meaning Exporter or Beneficiary; here we use the term Exporter. The Issuing or Opening Bank (Importers Bank). The Advising/Confirming Bank – usually a bank in the Exporters country which may or may not be the Exporters Bank. A Documentary Letter of Credit is one for which the issuing bank stipulates that certain documents must accompany a draft. The documents assure the applicant (importer) that the merchandise has been shipped and that title to the goods has been transferred to the importer. Term sometimes used (incorrectly) to refer to commercial letters of credit – the term is redundant in that all letters of credit are documentary. See also Letter Of Credit. / Документарный Аккредитив – аккредитив, используемый при расчётах по внешнеторговым сделкам, независимо от того, как он назван и обозначен (документарный аккредитив, аккредитив, аккредитивное письмо и тому подобное), представляющий собой одностороннее, условное денежное обязательство банка, выдаваемое им по поручению клиента приказодателя аккредитива (импортёра) в пользу его контрагента по контракту – бенефициара (экспортёра), по которому банк, открывший аккредитив (банк эмитент), должен произвести бенефициару платёж (немедленно или с отсрочкой) или акцептовать тратты бенефициара при условии предоставления бенефициаром документов, предусмотренных в аккредитиве, и при выполнении других условий аккредитива. По форме аккредитивы делятся на безотзывные и отзывные. По способу исполнения:- исполняемые путём платежа по предъявлению, путём отсроченного платежа, путём акцепта, путём негоциации. В международной практике встречаются специальные аккредитивы:- трансферабельные, резервные, компенсационные, револьверные.

DOCUMENTARY SIGHT DRAFT = ДОКУМЕНТАРНАЯ ТРАТТА ПО ПРЕДЪЯВЛЕНИИ – Documentary Sight Draft is a sight draft accompanied by documents. / Тратта по предъявлении, сопровождаемая документами.

DOCUMENTARY TIME DRAFT = ДОКУМЕНТАРНАЯ СРОЧНАЯ ТРАТТА – Documentary Time Draft is a time draft accompanied by documents. / Срочная тратта, сопровождаемая документами.

DOCUMENT OF TITLE = ТОВАРОРАСПОРЯДИТЕЛЬНЫЙ ДОКУМЕНТ – Document Of Title is a term to mean that possession of the specified document entitles the holder to control of the goods listed in that document.

DOCUMENTS = ДОКУМЕНТЫ – Documents are the financial documents and/or commercial documents. / Обычно под документами понимаются финансовые и/или коммерческие документы.

DOCUMENTS AGAINST ACCEPTANCE = ДОКУМЕНТЫ ПРОТИВ АКЦЕПТА – Documents Against Acceptance or D/A. The presenting bank may only release the documents against acceptance of a draft by the importer, e.g., on a date 180 days after the goods were dispatched. The importer takes possession of the merchandise before payment is made. The advantage of this is that he can re-sell the goods immediately, thereby raising the necessary funds to pay the draft on the due date. The exporter thus grants the importer a period of credit and in return receives a draft accepted by the drawee. As this is all he can rely on until the draft matures, the principal bears the risk of non-payment. If the exporter requires greater security, he can request a guarantee or surety from a prime bank. However, he must ensure that this is contractually covered and request advance confirmation from the guarantor bank. Instructions given by a shipper to a bank indicating that documents transferring title to goods should be delivered to the buyer (or drawee) only upon the buyer's payment of the attached draft. Way of paying for exported goods in which the exporter sends a bill of exchange with the shipping documents which is held, on arrival, by an agent or bank which releases the goods when the bill has been accepted. Documents Against Acceptance (D/A) is notation used in export business signifying that documents may be surrendered to the drawee only against acceptance of the accompanying bill. / Представляющий банк . оплатить тратту в надлежащую (причитающуюся) дату.

DOCUMENTS AGAINST A LETTER OF UNDERTAKING = ДОКУМЕНТЫ ПРОТИВ ПИСЬМА О ПРИНЯТОМ ОБЯЗАТЕЛЬСТВЕ – Documents Against A Letter Of Undertaking:- the presenting bank releases the documents to the importer against a letter of undertaking, the wording of which is determined by the remitting bank or the importer. By signing the letter of undertaking, the importer undertakes to pay the collection amount on a specific date. For the legal enforcement of such a letter of undertaking, it is imperative that it is clearly and unambiguously formulated. As with documentary collection against acceptance, the exporter grants the importer a period of credit. The letter of undertaking is not covered by legislation governing drafts. / Представляющий банк .

DOCUMENTS AGAINST PAYMENT = ДОКУМЕНТЫ ПРОТИВ ПЛАТЕЖА – Documents Against Payment or D/P or Cash Against Documents or C.a.D.. The presenting bank may only release the documents simultaneously against immediate payment. In practice, buyers will often delay payment and thus acceptance of the documents until the goods arrive. In order to avoid such delays, the collection instruction should state the exact period of time within which any action is to be taken by the drawee (The Uniform Rules for

Collections (URC) Art. 5b). However, local or national legislation may prescribe that – contrary to Art. 18 of the URC – collection documents may be released against payment in the national currency (foreign exchange authorization procedure in countries with exchange controls). Notation used in export transactions indicating that documents may be handed over to the buyer only against payment. Stipulate that the exporter ships goods to the importer without a letter of credit or another form of guaranteed payment. The importer must sign a sight draft before receiving the necessary documents to pick up the goods. Documents Against Acceptance (D/A) are instructions given by a shipper to a bank stating that the documents transferring title to goods should be delivered to the buyer only upon the signing of a time draft. In this manner an exporter extends credit to the importer and agrees to accept payment at a readily determined future date. Instructions given by an exporter stating that documents attached to a draft are deliverable to the importer only upon payment of the draft. / Представляющий банк .

DOCUMENT TYPE DIFINITION = ОПРЕДЕЛЕНИЕ ТИПА ДОКУМЕНТА – Document Type Definition (DTD) is a format specification file that accompanies documents prepared according to SGML (standard generalized markup language), including XML (extensible markup language). It lists the tags or structural labelling for each distinctive section of text, images, or other embedded file object (examples:- title, author, etc) so that the document can be easily shared and worked with in different operating environments.

DOD = DEPARTMENT OF DEFENCE

DOE = DEPARTMENT OF ENERGY

DOESKIN = ЗИМНИЙ ДРАП (или ЗАМША, или ОЛЕНЬЯ КОЖА) – A term Doeskin is generally used to describe a type of fabric finish in which a low nap is brushed in one direction to create a soft suede-like feel on the fabric surface. End-uses include billiard table surfaces and mens' sportswear. Doeskin is a firm, woolen cloth with a smooth, velvety surface often used for menswear; also, a densely napped finish for particular wool fabrics, such as flannel. Doeskin:- wool and also rayon. Very smooth, lustrous surface made with a slight short nap very close and compact weave to look like fine leather. Weave not visible because of napping. Very high quality wool used. Needs care in handling. Medium weight. Women's suits and coats, and also in a lighter weight for dresses. Sportswear and riding habits for both men and women. Trousers and waistcoats for men. / (1) Тяжёлая хлопчатобумажная ткань саржевого переплетения с односторонним начёсом (идёт на изготовление искусственной кожи или заменителя кожи и на пошив спортивных костюмов). (2) Драп шерстяной с коротко подстриженным ворсом на лицевой стороне, имитирующий замшу. Драп, от Французского слова Drap, означающее Сукно, тяжёлая, плотная шерстяная ткань сложного переплетения из пряжи аппаратного (суконного) прядения. Драп состоит обычно из 2 слоёв, благодаря чему обладает высокими теплоизолирующими свойствами. Лицевая сторона ткани часто вырабатывается из более высококачественной шерсти, чем изнанка. В зависимости от структуры и рисунка переплетения драп может быть ворсованным и неворсованным, одно- и многоцветным, с гладким лицом и рисунчатой подкладкой. Из драпа шьют зимние и демисезонные пальто. В Русском языке название 'драп' относится только к двойным сукнам, а более легкие ткани называются сукнами. Замша Тканая – ткань, вырабатываемая атласным переплетением с плотным уточным застилом на лицевой поверхности и подвергаемая в отделке ворсованию и аппретированию, благодаря чему по внешнему виду и на ощупь она напоминает натуральную замшу. Замша тканая употребляется для изготовления спортивных костюмов, курток и тому подобного.

DOESKIN FINISH = ОТДЕЛКА ПОД ОЛЕНЬЮ КОЖУ – Doeskin Finish is a soft low nap that is brushed in one direction. Cloth with this type of finish is used on billiard tables and in men's wear.

DOFF = СЪЁМ (или СНЯТИЕ СЪЁМА) – (1) Doff:- to remove, as in doffing a drum carder. Doff:- to replace empty bobbins with a set of full bobbins.
