POLYURETHANE FOAM = ПОЛИУРЕТАНОВАЯ ПЕНА – Polyurethane Foam:- used to insulate refrigerated containers. It is also known as Construction Foam. See also Foam. / Полиуретановую Пену (или Монтажную Пену) изобрёл (создал) Оту Байа (Otto Bayer) в 1947. Сначала полиуретаны нашли применение в промышленности как изоляционные плиты, но в 1970-х наступил технологический перелом в химии и началось широкое применение полиуретановой пены в аэрозольном баллоне (PUR). Первой компанией упаковавшей пену в баллон была Английская Ройэл Кэмикэл Индэстри (Royal Chemical Industry), а первой страной применившей пену в строительстве была Швеция – это произошло в начале 1980-х, так что на сегодняшний день пена является молодым строительным продуктом. Для производства современной монтажной пены необходимы инновационные рецептуры и высокое качество продукции. Ключевым показателем успеха является разработка Отделом Исследований и Развития соответствующей химической рецептуры, а также соответствующий контроль качества во время производственного процесса. От потребителя требуется использовать товар в соответствии с инструкцией производителя, указанной на этикетке. Полиуретановая пена это особый продукт. Пена является отличным заполнителем для различных пустот и щелей и обладает хорошими звуко- и теплоизоляционными свойствами (1 см отвердевшей пены по своим термичным свойствам соответствует 1.4–1.8 см полистирола или 1.75 см минеральной ваты). Также полиуретановая пена обладает высокими физическими (плотность, производительность) и механическими свойствами (устойчивость на сжатие и разрыв, адгезия к строительным материалам). Практическое применение является мерой ценности полиуретановой монтажной пены. Полиуретановые пены применяются для монтажа окон и дверей, звуко- и теплоизоляции, заполнения арок, соединения строительных материалов, теплоизоляции и уплотнения перегородок в здания, автомобилях и катерах, а также монтажной пеной часто выполняют строительные работы общего назначения. Потребителю необходимо знать различия между монтажной пеной с трубкой и пеной, предназначенной под пистолет. Стандартную полиуретановую пену отличает большая плотность 19–23 кг/м, широкое распространение на рынке и более доступная цена. Профессиональную пену характеризует

лёгкость и высокая точность нанесения, повышенная производительность, более низкое вторичное расширение до 150%, более короткое время отвердения пены, высокая стабильность и возможность многоразового применения. Также существуют двухкомпонентные пены, отличающиеся хорошими параметрами прочности, большая плотность 30–40 кг/м, минимальное вторичное расширение и высокая стабильность размеров, более короткое время обработки, отсутствие необходимости в увлажнении пены. Сравнивая пену на полке в магазине или у оптовика, следует обратить внимание на дату производства и срок хранения на упаковке, звук при вымешивании пены, вес баллона, чистоту клапана. Очень важно взвесить баллон до и после выпуска пены, а также размешивание. Один из основных критериев выбора пены – сезон применения. При применении летней пены минимальной температурой окружающей среды является +5 °C, а температура самого баллона не должна быть ниже +10 °C. При низких температурах увеличивается время отвердевания пены, для ускорения добавляются различные катализаторы и стабилизаторы. Существует опасность что при применении летней пены в зимний период пена сплывёт с вертикальных поверхностей, раскрошится, могут появиться стеклянные пузырьки. Температура применения всесезонной монтажной пены до –10 °C, температура баллона должна быть не ниже +5 °C. Все полиуретановые пены неустойчивы к ультрафиолету и требуют защиты (силикон, грунтовка, краска). При нанесении выпуск пены должен быть равномерный, с одинаковой скоростью. После нанесения пена не должна сплывать с вертикальных поверхностей. Полиуретановая пена должна быть устойчива к кратковременному воздействию химикатов и гниению. Выпущенная пена должна иметь стабильные размеры и выдерживать положенный срок работы. Застывшая полиуретановая пена имеет определённую внутреннюю структуру. Чем меньше ячейки в теле пены, тем лучше механические свойства, лучше адгезия к строительным материалам и выше устойчивость к влаге. Пена не держится на поверхности. Причина:- пена слишком густая, тяжёлая; слишком низкая или слишком высокая температура (низкая адгезия); во время нанесения газы выходят в жидком виде. Результат:- пена не держится на строительных элементах, образуются просветы и дыры. Мокрый стержень. Причина:- плохая рецептура пены; неправильно подобранное время отвердения пены; слишком низкая температура во время применения и отвердения. Результат:- вторичное расширение, грозит деформацией оконных рам и дверных коробок. Недостаток стабильности размеров – усадка. Причина:- плохая рецептура; плохо подобранный вид и количество стабилизатора; слишком высокая температура при применении (после охлаждения давление в ячейках уменьшается и происходит усадка). Результат:- появляются просветы, несоответствующий монтаж элементов; уменьшается адгезия к строительным материалам и эластичность. Стеклянные пузырьки. Причина:- слишком быстро улетучивающиеся газы пропан и бутан растворяют ячейки на поверхности пены. Результат:- понижение механических свойств пены.

POLYVINYL ALCOHOL = ПОЛИВИНИЛОВЫЙ СПИРТ (или ПОЛИВИНИЛОВЫЙ АЛКОГОЛЬ) – Polyvinyl Alcohol is a colorless, water-soluble resin made by the hydrolysis of a polyvinyl ester (usually the acetate). Polyvinyl alcohol is used in textile processing as a size, frequently for nylon, and in fiber manufacture as a raw material for the production of polyvinyl alcohol fibers. / Найлан^{T3} (Nylon^{TM}). Поливиниловый Спирт, $(–CH_2–CH(OH)–)_n$, синтетический полимер, продукт взаимодействия поливинилацетата с метиловым спиртом; твёрдое вещество белого цвета. Плотность около 1 300 кг/м^3; при 220–235 °C размягчается с разложением. Хорошо растворяется в воде, устойчив к действию жиров, большинства универсальных органических растворителей, масел, разбавленных кислот и растворов щёлочей. Нетоксичен. Применяется в синтезе поливинилацеталей, в производстве поливинилспиртового волокна, плёнок, для шлихтования пряжи и аппретирования тканей, как эмульгатор, загуститель водных растворов и латэксов и другого. Специальные марки поливинилового спирта используют как плазмозаменитель при переливании крови и в производстве лекарственных препаратов. Поливиниловый Спирт, твёрдый полимер белого цвета формулы $(–CH_2–CH(OH)–)_n$ (степень полимеризации n может достигать 5 000):- содержит до 68% кристаллической фазы в виде микрокристаллических образований; нетоксичен. Единственным для поливинилового спирта растворителем на практике служит вода; он не растворяется в органических растворителях, особенно устойчив к действию масел, жиров, бензина и других углеводородов, а также к действию разбавленных кислот и щёлочей. В промышленности поливиниловый спирт получают омылением поливинилацетата в растворе метилового спирта; катализаторы – сильные кислоты и щёлочи. Регулируя степень омыления, можно получать поливиниловый спирт, содержащий до 30% (по массе) остаточных звеньев винилацетата (так называемые сольвары, или совиолы). Поливиниловый спирт применяют для получения волокон (смотрите Поливинилспиртовые Волокна), плёнок (смотрите Полимерные Плёнки), в качестве эмульгатора, загустителя, клея. Специальные марки низкомолекулярного поливинилового спирта используют в пищевой промышленности, в медицине (при изготовлении лекарств, в качестве плазмозаменителя при переливании крови и другого). Мировое производство поливинилового спирта в 1973 составляло около 220 000 тонн (т) в год.

POLYVINYL ALCOHOL FIBER = ПОЛИВИНИЛСПИРТОВОЕ ВОЛОКНО – Polyvinyl Alcohol Fiber is a manufactured textile fiber developed in Japan. It is made by dissolving polyvinyl alcohol in hot water and extruding this solution through a spinneret into a sodium sulfate coagulating bath. In Japan, the fiber is used in apparel, household, and industrial fabrics. / Поливинилспиртовое Волокно – синтетическое волокно, формуемое из растворов поливинилового спирта. Прочно, износо- и светостойко, гигроскопично, устойчиво к действию кислот, растворов щёлочей средней концентрации. Из поливинилспиртового волокна изготовляют различные ткани (в том числе ажурные), трикотаж, фетр, фильтровальные материалы, рыболовные сети, синтетические бумаги и другое. Основные торговые названия:- Виналон (в КНДР), Винол (в бывшем СССР), Кремона, Куралон (в Японии). Поливинилспиртовые Волокна – синтетические волокна, формуемые из растворов поливинилового спирта главным образом по мокрому методу (о методах формования смотрите Химические Волокна). Поливинилспиртовые волокна в зависимости от технологии производства могут иметь различные механические свойства. Как правило, они обладают высокой прочностью и устойчивостью к истиранию и изгибу. Может быть получено поливинилспиртовое волокно с наибольшей среди других синтетических волокон гигроскопичностью. Поливинилспиртовые волокна обладают отличной устойчивостью к действию света, микроорганизмов, пота, различных реагентов (кислот, щёлочей, окислителей умеренных концентраций, малополярных растворителей, нефтепродуктов). Штапельные поливинилспиртовые волокна применяют (в чистом виде или в смеси с хлопком, шерстью, льном или химическими волокнами) при получении одёжных, бельевых, гардинных и других тканей и трикотажа, фетра, войлока, парусины, брезентов, фильтровальных материалов (в том числе нетканых) и другого. Водорастворимые штапельные поливинилспиртовые волокна служат вспомогательным (удаляемым) компонентом в смесях с другими волокнами при получении ажурных изделий, тонких тканей, гипюра. Технические нити из поливинилспиртовых волокон используют для армирования резинотехнических изделий и пластиков, в производстве канатов, рыболовных снастей. Поливинилспиртовые волокна выпускают во многих странах под следующими торговыми названиями:- Винол (СССР), Винилон, Куралон (Япония), Виналон (КНДР) и другими. Мировое производство поливинилспиртового волокна в 1973 превысило 100 000 тонн (т).

POLYVINYL CHLORIDE = ПОЛИВИНИЛ ХЛОРИД – Polyvinyl Chloride is a synthetic polymer (plastic). Polyvinyl Chloride (PVC) is a very widely used plastic that varies from rigid to very flexible, depending upon additives. It has quite good resistance to most dyeing chemicals, with the exception of carriers for disperse dyes. PVC pipe, intended for plumbing use, is popular for ‘forms’ around which to wrap fabric for direct dye application techniques such as shibori. Temperature resistance depends on additives and varies

considerably. PVC is used extensively as water-proofing coatings on fabrics and for imitation leather. Polyvinyl Chloride (PVC) is a widely-used plastic. In terms of revenue generated, it is one of the most valuable products of the chemical industry. Globally, over 50% of PVC manufactured is used in construction. As a building material PVC is cheap, and easy to assemble. / Под Поливинил Хлоридом (ПВХ), $(–CH_2–CHCl–)_n$, понимается синтетический полимер, продукт полимеризации винилхлорида; твёрдое вещество белого цвета. Отличается хорошими механическими и электро-изоляционными свойствами, сравнительно невысокой термо- и светостойкостью. На основе поливинил хлорида получают жёсткие (винипласт) и мягкие (пластикат) пластмассы, пластизоли. Используется в производстве поливинилхлоридного волокна. Поливинилхлорид, преимущественно линейный термопластичный полимер винилхлорида, формула $(–CH_2–CHCl–)n$. Пластик белого цвета, молекулярная масса 6 000–160 000, степень кристалличности 10–35%, плотность 1.35–1.43 грамма на кубический сантиметр (г/см^3) (20 °C); физиологически безвреден. Поливинилхлорид достаточно прочен (при растяжении 40–60 МегаНьютонов на квадратный метр (МН/м^2), или 400–600 килограмм-силы на квадратный сантиметр (кгс/см^2), при изгибе 80–120 МН/м^2, или 800–1 200 кгс/см^2), обладает хорошими диэлектрическими свойствами. Он ограниченно растворим в кетонах, сложных эфирах, хлорированных углеводородах; устойчив к действию влаги, кислот, щёлочей, растворов солей, промышленных газов (например, NO_2, Cl_2, Cl_3, HF), бензина, керосина, жиров, спиртов; совмещается со многими пластификаторами (например, фталатами, фосфатами, себацинатами); стоек к окислению и практически негорюч. Поливинилхлорид обладает невысокой теплостойкостью (по Мартенсу, 50–80 °C); при нагревании выше 100 °C заметно разлагается с выделением HCl, вследствие чего может приобретать окраску (от желтоватой до чёрной); разложение ускоряется в присутствии O_2, HCl, некоторых солей, под действием УФ-, b- или g-облучения, сильных механических воздействий. Для повышения теплостойкости и улучшения растворимости поливинилхлорид подвергают хлорированию (смотрите Перхлорвиниловые Смолы). В промышленности поливинилхлорид получают свободнорадикальной полимеризацией мономера в массе, эмульсии или суспензии. Способ полимеризации определяет основные свойства поливинилхлорида и области его применения. Так, поливинилхлорид, полученный в массе или суспензии, используется для производства жёстких (смотрите Винипласт), а также полумягких и мягких, то есть пластифицированных (смотрите Пластикат), пластических масс, перерабатываемых прессованием, литьём под давлением, экструзией, каландрованием. Эмульсионный поливинилхлорид (пастообразующие сорта) применяют в производстве изделий (главным образом искусственной кожи и пенопластов) из пластизолей, органозолей и другого. Поливинилхлорид – один из наиболее распространённых пластиков; из него получают свыше 3 000 видов материалов и изделий, используемых для разнообразных целей в электротехнической, лёгкой, пищевой промышленности, тяжёлом машиностроении, судостроении, сельском хозяйстве, медицине, в производстве стройматериалов (смотрите также Полимерные Плёнки, Поливинилхлоридные Волокна). Мировое производство поливинилхлорида в 1973 составляло около 8 миллионов тонн (т).

POLYVINYL CHLORIDE FIBER = ПОЛИВИНИЛХЛОРИДНОЕ ВОЛОКНО – Polyvinyl Chloride Fibers are invented in Germany in 1931 and earliest fibers among synthetic fibers. Vinyl chloride is polymerized into polyvinyl chloride and is spun into polyvinyl chloride fibers. Durable and resistant in weathering, non-attackable by acid and alkali and superior in warmth retention property. By rubbing, polyvinyl chloride fibers are charged with negative static electricity. Accordingly, it is said that the wearing of underwear of this fiber will be effective against rheumatism, and underwear of polyvinyl chloride fiber is available as a healthy underwear. However, this fiber is less resistant to heating. Filament fiber yarn starts to shrink from ca. 60 and stable fibers start to shrink from ca. 90~100. Thus polyvinyl chloride fibers are less used for clothing which needs ironing. Although fibers of high resistance to heating are manufactured, even these fibers start to shrink from ca. 105~110 °C. End-Uses:- (i) For clothing:- underwear of knitted fabrics, socks, etc. (ii) For home furnishings:- Drape Curtains, Bath Rugs, Carpets, Blankets, Wadding for Bedding etc. (iii) For industrial uses:- Fishing Nets, Ropes, Filter Cloth, Coverings of an Electric Wire, Canvas, Felts, Insect-proofing Nets, etc. (iv) For other uses:- Medical Supporter, Wigs, etc. Features:- (i) extremely resistant to chemical agents and sun-light; (ii) high thermal and electrical insulation; (iii) chargeable with negative static electricity; (iv) does not absorb water completely; (v) highly bulky and superior in warmth retention; (vi) flame retardant; and (vii) most care should be taken for heat, because of low resistance to heating. Care Instructions:- dDo not pour hot water, or do not dry near a stove. Do not iron clothing of general polyvinyl chloride fibers. / Поливинилхлоридное Волокно – синтетическое волокно, формуемое из растворов поливинилхлорида или его производных. Отличается очень низкой тепло- и электропроводностью; огнестойко, устойчиво ко многим химическим реагентам. Из поливинилхлоридного волокна изготовляют фильтровальные и негорючие драпировочные ткани, спецодежду, теплоизоляционные материалы, лечебное бельё. Основные торговые названия:- хлорин, виньон, ровиль, тевирон. Поливинилхлоридные Волокна, синтетические волокна, формуемые из растворов поливинилхлорида, перхлорвиниловой смолы или сополимеров винилхлорида. Формование осуществляют по сухому или мокрому методу (смотрите Химические Волокна). Поливинилхлоридные волокна обладают высокой химической стойкостью, очень низкой тепло- и электропроводностью, не горючи, устойчивы к действию микроорганизмов. Для поливинилхлоридных волокон, не подвергнутых термофиксации, характерна высокая усадка (в кипящей воде до 55%). Поливинилхлоридные волокна применяют для производства фильтровальных и негорючих драпировочных тканей, спецодежды, нетканых материалов, теплоизоляционных материалов, используемых при низких температурах. Способность поливинилхлоридных волокон накапливать высокий электростатический заряд используется для изготовления из них лечебного белья. В смесях с другими волокнами поливинилхлоридные волокна часто применяют для получения эффекта усадочности (в производстве тканей повышенной плотности, рельефных тканей, ковров, искусственной кожи, пушистых трикотажных изделий и другого). Поливинилхлоридные волокна выпускают в виде непрерывных нитей или штапельных волокон во многих странах под следующими торговыми названиями:- Хлорин (СССР), Саран, Виньон (США), Ровиль (Франция), Тевирон (Япония) и другие. В 1973 мировое производство поливинилхлоридного волокна составило 1.5–2% от общего производства синтетических волокон.

POLYVINYLIDENE FIBER = ПОЛИВИНИЛИДЕНОВОЕ ВОЛОКНО – Polyvinylidene Fibers are the fibers manufactured by copolymerization of polyvinyl chloride with polyvinylidene chloride. Resistant in chemical agents, abrasion and high in specific gravity. Widely used for household and industrial applications. However not used for clothing. Superior in sound transmission. High-tenacity polyethylene fibers produced with a special manufacturing procedure are three times strong than (high-tenacity) Nylon fibers and are used for an anchoring rope. End-Uses:- Blinds, Artificial Turves, Curtains, Radio Grille, Brushes, Filter Cloth, Fishing Nets, Ropes, etc. Features:- (i) resistant to chemical agents such as acid and alkali. Does not absorb water and moisture completely; (ii) superior in sound transmission; (iii) flame retardant; and (iv) heaviest among all fibers (1.70 in specific gravity). / Найлан^{ТЗ} (Nylon^{TM}).

POME = ПЛОД (или ЯБЛОКО) – Pome is a fleshy fruit (e.g., apple, pear) having seed chambers formed from an inferior ovary surrounded by an outer fleshy part made from an enlarged hypanthium. / Яблоко – тип мясистого (fleshy) плода (например, Груша, Яблоко), имеющего из увеличившегося гипантия (hypanthium). Под Яблоком понимается сочный, обычно многосемянный нераскрывающийся плод Растений Семейства Розоцветных Подсемейства Яблоневых – Айвы, Груши, Рябины, Яблони и другие. В быту яблоком называют плод Яблони.

POMOLOGY = ПОМОЛОГИЯ (или СОРТОВЕДЕНИЕ) – Pomology is that branch of science that studies fruits. / Под Помологией, от Латинского слова Pomum, означающее Плод, и Греческого слова Lógos, означающее Слово или Учение, понимается наука о сортах плодовых и ягодных растений. Занимается производственно-биологическим изучением и районированием сортов, их интродукцией, разрабатывает сортовые классификации. Помология или Сортоведение, агрономическая научная дисциплина, занимающаяся изучением сортов плодовых и ягодных растений с целью отбора лучших из них для хозяйственного разведения в различных районах, постоянного улучшения сортового состава садов и отдельных сортов и рационального использования их в плодоводстве. Начало Помологии положил Русский учёный и писатель Андрей Тимофеевич Болотов (1738–1833), который в конце XVIII века написал первый в истории плодоводства 8-томный помологический труд ‘Изображения И Описания Различных Пород Яблок И Груш, Родящихся В Дворениновских, А Отчасти И В Других Садах. Рисованы и описаны Андреем Болотовым в Дворенинове с 1797 по 1801’. В Западной Европе в трудах Немецких помологов Аугуста Фридрихя Адриана Диэля (August Friedrich Adrian Diel; 1756–1839), Кала Фридрихя Эдуада Люкаса (Karl Friedrich Eduard Lucas; 1816–1882), Вильхэльма Ляухэ (Wilhelm Lauche; 1827–1883), Йохана Геога Конрада Обадика (Johann Georg Conrad Oberdieck; 1794–1880), Французского помолога Одре Лёруа (André Leroy; 1801–1875) и других. Помология приняла описательное направление. В России сложилась помология, основанная на всестороннем изучении сортов в различных почвенно-климатических и экономических условиях. Её развивали Василий Васильевич Пашкевич (1856–1939), Михаил Васильевич Рытов (1846–1920), Лев Платонович Симиренко (1855–1920), Степан Степанович Рогозин (1859–1935) и другие. Основополагающее значение для развития помологии в бывшем Союзе Советских Социалистических Республик (СССР) имели труды Ивана Владимировича Мичурина (1855–1935), который считал, что сорта плодовых культур подлежат непрерывному и бесконечному усовершенствованию. Помологию в бывшем СССР считали составной частью селекции плодовых и ягодных культур (раньше селекцию включали в помологию). Американский помолог ДаблЮ.Пи. Хэндрик (W.P. Hendrik), Немецкий учёный Кал Хайнрихь Эмиль Кох (Karl Heinrich Emil Koch; 1809–1879) и другие рассматривают помологию как часть ботаники, специализирующуюся на изучении ботаническими методами плодовых растений в их сортовом многообразии. Основные вопросы помологии в СССР – порайонное производственно-биологическое изучение сортов плодовых и ягодных растений. На фоне природных и агротехнических условий определяются:- зимостойкость и устойчивость сортов к засухе, жаре, ветрам и так далее; урожайность, скороплодность сортов; устойчивость их против болезней и вредителей; степень самоплодности (способность давать плоды при самоопылении); лучшие опылители и качество плодов. Помология занимается также выявлением, изучением и хозяйственной оценкой местных сортов народной селекции, интродукцией сортов из зарубежных стран, районированием сортов на основе их порайонного производственно-биологического изучения. Порайонное производственно-биологическое изучение сортов осуществляется в трёх формах (видах):- (1) первичное, или станционное, сортоизучение проводят в помологических садах научных учреждений; первичным сортоизучением охватываются большие наборы сортов; (2) государственное сортоиспытание осуществляют на специальных участках в совхозах и колхозах (в СССР существует свыше 200 госсортоучастков); в него включаются перспективные сорта, как правило, уже прошедшие первичное сортоизучение; и (3) производственное сортоиспытание организуют в колхозах и совхозах; сюда включаются наиболее перспективные сорта, положительно зарекомендовавшие себя в первичном сортоизучении и на участках государственного сортоиспытания. В результате порайонного изучения сортов для каждой местности подбирают лучшие сорта, пригодные для массового внедрения в производство. После всестороннего изучения сорта составляется помологическое описание, включающее его подробную производственно-биологическую характеристику и морфологическое описание с указанием признаков, по которым он отличается от других сортов. Один из важных вопросов помологии – классификация сортов. Лучшей признаётся классификация по эколого-географическому принципу:- сорта делятся на группы по месту их селекции. Например, сорта Яблони СССР по этому принципу делятся на 18 эколого-географических групп:- Закавказские, Молдавские, Украинские, Среднерусские, Прибалтийские, Уральские, Сибирские, Узбекские и другие. В пределах каждой эколого-географической группы сорта разделяют на подгруппы по сроку созревания – летние, осенние, зимние. Внутри эколого-географических групп во многих случаях выделяются определённые сортотипы (группы сортов, очень близких друг другу по родству и ряду биологических признаков). Большие помологические сады, в которых ведётся углублённое изучение сортов плодовых и ягодных культур, были созданы во Всесоюзном Научно-Исследовательском Институте Садоводства имени Ивана Владимировича Мичурина (Мичуринск), Научно-Исследовательском Институте Садоводства Нечернозёмной Полосы (Бирюлёво, под Москвой), Молдавском Научно-Исследовательском Институте Садоводства, Виноградарства и Виноделия (Кишинёв), Научно-Исследовательском Институте Плодоводства имени Рихарда Рихардовича Шредера (Ташкент) и других.

POMPON = ПОМПОН – Pompon is a fluffy ball, usually made from yarn and used as a decorative accent.

PONCHO = ПОНЧО – Poncho is a blanket with a slit in the middle so that it can be slipped over the head and worn as a sleeveless garment; a waterproof garment resembling a poncho and having an integral hood. / Под Пончо, от Испанского слова Poncho, заимствование из языка Индейцев Арауканов), плащ из прямоугольного куска ткани с отверстием посередине для головы, традиционная одежда Индейцев Южной и Центральной Америки. Индейцы Кечуа, Аймара и соседние с ними народы носят пончо, сделанные из двух прямоугольных полотнищ шерстяной полосатой ткани, которые посредине не сшивают, оставляя отверстие для головы. Плащи типа пончо из меха известны у Даяков Острова Калимантан, из тапы (материя из луба) – у Полинезийцев.

PONGEE = ЭПОНЖ (или ПОНДЬЖИ) – Pongee:- thin soft fabric woven from raw silk or an imitation in cotton, polyester, or rayon. Originally from China and originally woven on hand looms in the home. Light or medium weight. Tan or ecru in color. Woven ‘in the gum’. Some is dyed, but color is not quite uniform. Some printed. Warp is finer and more even than filling. Nubs or irregular cross ribs produced by uneven yarns. It is woven from wild tussah silk and it is a ‘raw silk’. Pongee cotton is made of combed yarns and given a variety of finishes. Pongee is the most common form is a naturally colored lightweight, plain weave, silk-like fabric with a slubbed effect. End-uses include blouses, dresses, etc. Pongee is a plain-weave, fairly lightweight silk fabric with a slight slub to the yarns. Today, the terms Honan and Pongee are used interchangeably for fabrics with this texture, but made from man-made fabrics. Standard construction of the gray fabric in Japan:- 100% polyester filament 75d, 175 threads per inch, 36” (or 44”, WJL or 48”, WJL or 58”, WJL). Pongee is:- (1) a thin, naturally tan-colored silk fabric with a knotty, rough weave. (2) A cotton fabric made from yarns spun from fine-combed staple and finished with a high luster. This fabric is used for underwear. (3) Fabrics like cotton pongee made from manufactured fibers. / Основа более тонкая и более равномерная, нежели уточина. Honan = Китайская шёлковая ткань типа чесучи. (1) Ткань из природно окрашенного в коричневый цвет Китайского шёлка шёлкопряда Antheraca Pernyi или её имитация. (2) Толстая, пухлая ткань полотняного переплетения с шишковатым утком. (3) Шёлковая ткань типа чесучи. (4) Хлопчатобумажная гребенная бельевая ткань лощёной отделки. Под Эпонж, от Французского слова Éponge, означающее Губка, понимается хлопчатобумажная или шёлковая ткань с шероховатой (губчатой) поверхностью, с разноцветным рисунком в виде узорчатого меланжа, клеток, широких полос и другого.

PONLAI = ПОНЛАЙ – Ponlai:- Rice Cultivars developed in Taiwan from the crosses between Japonicas or Japonica and local Cultivars.

PONTE DI ROMA = ПОНТЭ ДИ РОМА – Ponte Di Roma is a common double-knit fabric construction with a four-feed repeat produced with the dial and cylinder needles in interlock gaiting. The fabric is plain and looks the same on both sides.

POODLE = ПУДЛ (или XX) – Poodle is a fabric with a nubby or coarsely looped surface that resembles a poodle's coat, also called Poodle Cloth. / Ткань Пудл с вьющимся длинным ворсом из ангорской шерсти.

POOL = ПУЛ – (1) Pool is a permanent positioning of one or more containers at a location to facilitate continuous volume loading, i.e. large shipper. The shared use of, e.g., equipment by a number of companies, which make together the investments in the equipment mentioned. Pool is a community of persons or companies with common interests which combine to carry out common measures, contribute to a common fund of resources or further a common effort, e.g., shipping pools, insurance company pools. A stockholder's pool combines the shareholdings of several or a number of shareholders in order to better represent common interests at stockholders' meetings. The rights and duties of pool members are usually governed by a contract. Agreement between governments to jointly manage part of their resources. In insurance, grouping of insurers to spread the risk of a large policy. See also Commodity Pool. / , например, . Пул, одна из форм соглашений между предприятиями, при которой прибыль поступает в общий фонд и распределяется согласно квотам, заранее установленным участниками пула.

(2) Pool is an organization of insurers or reinsurers through which particular types of risks are underwritten with premiums, losses, and expenses shared in agreed ratios.

(3) Pool is a combination of less than truckload (LTL) freight built to form a full or almost full truckload. By 'sharing' space in a vehicle, the client and Logistics Depot can minimize cost.

POOLING = ГРУППИРОВАНИЕ (или ОБЪЕДИНЕНИЕ, или ЦЕНТРАЛИЗАЦИЯ) – Pooling:- the sharing of cargo or the profit or loss from freight by member lines of a liner conference. Pooling arrangements do not exist in all conferences. / участником линий линейной конференции.

POOLING OF INTERESTS = СВЕДЕНИЕ ИНТЕРЕСОВ (или ОБЪЕДИНЕНИЕ ИНТЕРЕСОВ) – In the United States, Pooling Of Interest is the item by item addition of the assets and liabilities of acquired or merged firm(s) to the balance sheet of the surviving corporation. In contrast, purchase acquisition method treats the acquisition as an investment, and puts goodwill on the balance sheet of the surviving corporation to reflect a premium (or discount) on the book value of the assets of the merged firms(s). Also known as Merger Accounting in the United Kingdom. / строка баланса (item).

POOL PALLET = ПУЛОВЫЙ ПОДДОН (или РЕЗЕРВНЫЙ ПОДДОН) – Pool Pallet is an exchange or rental pallet in a network distribution system. Note:- a rental pallet remains in the ownership of a third party. See also Pallet. / Резервный Поддон (Pool Pallet):- обменный или инвентарный поддон в системе обращения. Примечание:- инвентарный поддон остаётся в собственности третьей части потребителей. Смотрите также Поддон (Pallet).

POOP = ЮТ – Poop is the aft part of a vessel where the steering engine is located. / Кормовая надстройка судна, в которой размещается рулевая машина. Под Ютом, от Голландского слова Hut, понимается кормовая надстройка судна. В юте размещают каюты и служебные помещения, иногда и грузовые помещения – грузовой твиндек. На парусных судах – кормовая часть палубы (от кормовой мачты).

POOP DECK = ПАЛУБА ЮТА (или ПАЛУБА ПОЛУЮТА) – Poop Deck (maritime term):- a partial deck at the stern above the main deck, derived from the Latin 'Puppio' for the sacred deck where the 'Pupi' or doll images of the deities were kept.

POOPED = XX – Pooped (maritime term):- an opening in a ship's side, such as an air port, or cargo port.

POOR BALANCE = ПЛОХОЙ БАЛАНС – Poor Balance:- the condition in which the twist of the individual plies does not balance correctly with the twist of the combined plies. Thread defects, and namely – Spinning. / Порок или дефект ниток.

POOR COLORFASTNESS AFTER LAUNDRY = ПЛОХАЯ УСТОЙЧИВОСТЬ ОКРАСКИ ПОСЛЕ СТИРКИ – Poor Colorfastness After Laundry is where the thread does not washdown consistently in the garment or changes to a different color altogether. (i) Mixing threads in a Garment. (ii) Using threads with different color fastness. (iii) Not doing pre-production testing. Recommended Solutions to poor colorfastness after laundry:- (1) use thread with proper color fastness characteristics; (2) use threads from the same thread supplier and do not mix threads in a garment; (3) always do preproduction testing on denim garments using new colors to assure that they will meet your requirements; and (4) make sure sewing operators select thread by type and color number and do not just pick a thread off the shelf because it looks close in color. Note:- if preproduction testing shows a problem, then make sure to contact your global thread company for assistance. Fabrics defect.

POOR COVER = XX – Defect Name:- Poor Cover. Defect Type:- Pattern Defects. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Poor Cover:- This is due to improper loom settings that allows excessive filling show through and creates a chopped effect. Severity:- Major. / уточина.

POOR FEN = ОБЕДНЁННОЕ НИЗИННОЕ БОЛОТО (или ПЕРЕХОДНОЕ БОЛОТО) – A Poor Fen (also known as Transitional Bog, Transitional Mire or Sedge Mire) is a natural wetland habitat, consisting of dense low growth of small sedges and other plants. It develops on wet ground where the water is fairly acidic and has very few plant nutrients. Poor fen is intermediate between the taller vegetation of fen, which occurs where the water is much less acidic, and the short, mossy vegetation of bog, which is even more acidic. Poor fen is found where the ground is permanently wet with nutrient-poor water which is somewhat acidic. For example it occurs as the vegetation of flushes (marshy springs on slopes), in places where neutral water enters more acidic bogs, in wet acidic grassland, and sometimes in the flatter parts of flood-meadows where much of the water is ombrotrophic (derived directly from rainfall). It sometimes forms a floating mat over water or very wet peat, making a mobile surface known as Quaking Bog. Poor fen is usually grazed by wild animals or livestock, which prevent ecological succession into wet woodland. In north-western Europe, characteristic Plant Species of poor fen communities include common Sedge (Carex Nigra), Carnation Sedge (Carex Panicea), Star Sedge (Carex Echinata), White Beak-Sedge (Rhynchospora Alba) and many other small Sedges, as well as other Plants such as jointed Rush (Juncus Articulatus), marsh Cinquefoil (Potentilla Palustris), bog-Bean (Menyanthes Trifoliata), bog Pimpernel (Anagallis Tenella), Lesser Skullcap (Scutellaria Minor) and marsh Valerian (Valeriana Dioica). Sphagnum mosses also occur, but are not dominant as they would be in bog vegetation. There may also be some grasses, but these are usually inconspicuous amongst the sedges and rushes. Poor Fen is a peat-accumulating wetland that is transitional between a true bog and a true fen. See also Fen. / тене (ombro).

POOR FINISH = ПЛОХАЯ ОТДЕЛКА – Poor Finish:- may be the result of improper finishing or pocking of the metal surfaces and, while this defect does not interfere with the functional operation, it may not leave the desired finished appearance of the garment.

Improper plating could result in rust if exposed to dampness. Closure defects, and namely – Hooks and Eyes. / Порок или дефект застёжки.

POOR LIGHT FASTNESS = ПЛОХАЯ УСТОЙЧИВОСТЬ К СВЕТУ (или ПЛОХАЯ СВЕТОСТОЙКОСТЬ) – Poor Light Fastness:- fading of inner lining of roll up blinds where it is exposed by light. Possible Cause:- the dye for inner lining should be tested for light fastness and chosen accordingly. This is a major defect which becomes visible when the blind is rolled up. Dyeing/Poor fiber selection defect. / устойчивость (окраски) к свету.

POORLY PACKED IN CARTON = ПЛОХО УПАКОВАННОЕ В КАРТОННЫЙ КОРОБ – Poorly Packed In Carton:- causing chafing or crushed comes in transit which weakens thread. Thread defects, and namely – Packing. / Порок или дефект ниток.

POOR STOWAGE = ПЛОХАЯ УКЛАДКА – Poor Stowage:- what containerised carriage has done is to remove the expertise of ship's officers and stevedores in the loading, stowing and handling of goods and to place that duty in the hands of inexperienced parties. Above all it should be remembered that a properly secured container is to all intents part of the structure of the ship and the container will roll, yaw and turn in the same way as the vessel does. On many occasions, we have seen that shippers are not always aware of the lashing and stowage requirements for carriage over sea, such as for instance with steel coils.

POP = PERSISTANT ORGANIC POLLUTANTS

POPCORN = ПОПКОРН (или ВОЗДУШНАЯ КУКУРУЗА) – Popcorn is:- (1) a special-effect yarn containing short, thick spots. (2) In polymer manufacture a term used to describe oversize, deformed chip.

POPLIN = ПОПЛИН – Poplin is a fabric made using a rib variation of the plain weave. The construction is characterized by having a slight ridge effect in one direction, usually the filling. Poplin used to be associated with casual clothing, but as the 'world of work' has become more relaxed, this fabric has developed into a staple of men's wardrobes, being used frequently in casual trousers. Poplin is a plain weave fabric with a cross-wise rib. Poplin, sometimes called Tabinet, is a type of medium to heavy weight durable fabric that is now most frequently made of cotton or a cotton/polyester blend. The name derives from the French papelaine a fabric, normally made with silk, used in the 1400s. Common usage of poplin until about the XX century was to make silk, cotton or heavy weight wool dresses, suitable for winter wear. Poplin was also a popular upholstery fabric. You can find a reference to poplin in numerous books, most particularly Little Women. Joe and Meg are invited to a ball early in the book and must wear their best dresses made of poplin. Both are conscious that the dresses are not really dressy enough for a dance, and Meg longs instead for a silk dress. The poplin dresses in Little Women were likely made partly of silk, but silk fabrics used for dressier purposes were often distinguished from poplin. The difference lies primarily in the weave, which produces a heavier fabric and in the fact that silk would have been combined in weaving with a worsted wool or cotton yarn. Poplin in its early days was made by using a silk warp weave and a worsted yarn weft. The result is a sturdy fabric that has noticeable ridges. Today poplin is popular in shirts and pants and is often a combination of softer and heavier grades of cotton. Because of its manufacturing process, it tends not to wrinkle easily, and is somewhat water and stain resistant. Both men and women's pants and shirts can be made of poplin and sometimes feel soft and exhibit a little shine. Although Meg might have mourned not having a silk dress for the ball, men's shirts made with cotton poplin is often considered the highest quality, and they can be quite expensive. The higher quality the fabric, especially when it is 100% cotton, the greater the price. A good quality men's poplin shirt can easily cost 50 US Dollars (USD) or more. The expense is usually considered worth it, since poplin tends to wear well and is easy care. Poplin pants are usually made in the cotton khaki style. Designer pairs may cost over 100 USD, though you can certainly find some for about 40–50 USD. Again, difference in prices may reflect quality of materials used. Cotton/polyester blend poplin tends to be less expensive. Poplin is a plain-weave fabric of various fibers characterized by a rib effect in the filling direction. Poplin is a closely woven, mediumweight fabric with somewhat of a ribbed effect. The ribs run across the fabric from selvage to selvage. Poplins are used for dress purposes and for rich upholstery work. They are formed by using coarse filling yarns in a plain weave. Shirts made from this material are easy to iron and do not wrinkle easily. Standard construction of the gray fabric in Japan:- 100% cotton, 40's x 40's, 90 x 64 threads per inch, 44"; and in China:- 100% cotton CD40's/2 x CD40's/2, 110 x 54 threads per inch, 63". The term 'Poplin or Broadcloth' means plain weave fabrics, not of square construction, whether or not napped, but does not include the following types:- (i) fabrics weighing not more than 200 grams per square meter, containing 33 or less warp ends and filling picks per square centimeter; and (ii) fabrics weighing more than 200 grams per square meter, of average yarn number 26 or lower number. Poplin:- from French Papeline, it is a staple dress-goods material. In staple and plain colors, the material may be used for office coats and linings. Cotton poplin has a more pronounced rib filling effect than broadcloth. The filling is bulkier than the warp, and there are more ends than picks per inch in the material. In the carded poplin the textures vary from 88 x 40 to 112 x 46; combed poplin ranges from 88 x 44 to 116 x 56. The cloth is mercerized and usually chased for high luster. May be bleached or dyed with vat colors; printed poplin is also popular. Heavy poplin is given water-repellent finish for outdoor use; some of the fabric is given suede finish. This formidable fabric is used for blouses, boy's suits, gowns, draperies, robes and shirting; much uniform fabric is made from the cloth, as well. Poplin:- cotton, wool, and other textile fibers. Crosswise rib. The filling is cylindrical. Two or three times as many warp as weft per inch. Has a more pronounced filling effect than broadcloth. It is mercerized and has quite a high lustre. It may be bleached, or dyed (usually vat dyes are used) or printed. Heavy poplin is given a water-repellent finish for outdoor use. Originally made with silk warp and a heavier wool filling. Some also mildew-proof, fire-retardant, and some given a suede finish. American cotton broadcloth shirting is known as Poplin in Great Britain. / уточина. Тэбинэт (Tabinet). Дьжоу (Joe) и Мэг (Meg). Под Поплином, от Французского слова Папёлин (Poleline), понимается ткань из хлопка, шёлка или химических волокон, имеющая поперечные рубчики. Из поплина шьют блузки, мужские сорочки. Поплин имеет в два с лишним раза большую плотность по основе, чем по утку. Под Поплином, от Французского слова Popeline, Papeline, от Итальянского слова Papalino, означающее Папский, так как якобы впервые был получен в резиденции папы в Авиньоне, понимается ткань полотняного переплетения с мелким поперечным рубчиком, образующимся сочетанием тонкой основы с более толстым утком. Изготовляется преимущественно из хлопка или химических волокон, реже из натурального шёлка по основе и камвольного шерстяного утка. Плотность поплина по основе в 1.5–2 раза выше, чем по утку. Выпускается отбелённым, гладкокрашеным и набивным.

POPPED = ВСПУЧЕННОЕ – Popped:- said of Rice kernels that have burst open due to exposure to heat.

POPPY = ПОПИ (или МАКОВОЕ, или МАК) – Poppy:- a strong reddish orange.

POPULATION = ПОПУЛЯЦИЯ (или ЧИСЛЕННОСТЬ) – Population:- (1) in genetics, a community of individuals which share a common gene pool at a given site. In statistics, a hypothetical and infinitely large series of potential observations among which actual observations constitute a sample. (2) A group of individuals (plants) within a species or a variety that are found at one site or field. Plants in the population may or may not be genetically alike. In ecology, population is a group of individuals of any one species. / В экологии, совокупность особей одних любых видов. Под Популяцией, от Латинского слова Populus, означающее Народ или Население, понимается совокупность особей одного вида, длительно занимающая определённое пространство и воспроизводящая себя в течение большого числа поколений. Под Популяцией, от позднелатинского слова Populatio, от

Латинского слова Populus, означающее Народ или Население, в генетике, экологии и эволюционном учении, понимается совокупность особей одного вида, более или менее длительно занимающая определённое пространство и воспроизводящая себя в течение большого числа поколений; особи одной популяции имеют большую вероятность скрещиваться друг с другом, чем с особями других популяций; это связано с тем, что данная совокупность особей отделена от других таких же совокупностей особей той или иной степенью давления различных форм изоляции. Основной характеристикой популяции, определяющей её центральное положение как элементарной единицы эволюционного процесса, является её генетическое единство:- в пределах популяции в той или иной степени осуществляется Панмиксия. Вместе с тем особям, составляющим популяцию, присуща генетическая гетерогенность (в пределах единого генофонда популяции), определяющая приспособленность популяции к различным условиям среды обитания и создающая столь важный для эволюции резерв наследственной изменчивости. Вследствие генетической и морфофизиологической неравноценности особей, неоднородности окружающей среды популяция имеет сложную структуру:- особи различаются по полу и возрасту, принадлежности к разным, обычно перекрещивающимся поколениям, к разным фазам жизненного цикла, к тем или иным малоустойчивым группировкам внутри популяции (стадо, колония, семья и тому подобное). Биологический вид обычно представлен множеством взаимодействующих популяций. Число особей, входящих в популяцию, широко варьируя не только у разных видов, но и в пределах одного вида, всегда достаточно велико (обычно не менее нескольких сотен, однако у ряда видов может достигать сотен, тысяч, а может быть, и миллионов особей). Границы пространства, занятого популяцией, часто бывает трудно определить, так как они всегда динамичны, что обусловлено, например, колебаниями численности и плотности популяции (смотрите Волны Жизни). На популяционном уровне постоянно ощущается влияние всех других основных уровней организации жизни – молекулярно-генетического, организменного, биогеоценотического. Генетически детерминированные процессы клеточного метаболизма обусловливают в процессе индивидуального развития разную приспособленность отдельных особей к абиотическим и биотическим условиям среды обитания. Характер взаимоотношений между особями, в частности то место в установившейся внутри популяции иерархии, какое занимает данная особь, определяет важные свойства популяции. Изменение биогеоценотической среды влечёт за собой изменение генетического состава и структуры популяции, её численности и величины занимаемого ею пространства. В свою очередь, в процессе жизнедеятельности популяция воздействует на все уровни среды и, в частности, влияя на численность и структуру популяций других видов, служит фактором, обусловливающим динамику биогеоценоза. В пределах популяции (и при взаимодействии разных популяций) протекают процессы микроэволюции – основа эволюционного процесса в целом. Поэтому динамика генетического состава популяции, её численности и структуры, обмена веществ и энергии между популяцией и средой интенсивно изучаются популяционной генетикой, популяционной экологией, биогеоценологией, а ‘популяционное мышление’ необходимо во многих разделах общей биологии. Всестороннее изучение популяции (прежде всего, динамики численностей и обусловливающих её факторов) служит основой как рационального использования хозяйственно-полезных животных, так и мер борьбы с вредителями сельского хозяйства, переносчиками инфекционных заболеваний и так далее. Изучение генофондов природных популяций растений (сородичей культурных растений, древесных пород и тому подобного) – непременное условие успешного решения многих проблем селекции, интродукции, лесоведения. Наряду с природными популяциями изучаются лабораторные (экспериментально созданные) популяции, например, дрозофил, мышевидных грызунов, некоторых растений. В современной Англо-Американской литературе термин Популяция часто подменяется термином Дем (в Советской научной литературе Демом обычно обозначают внутрипопуляционные ‘семейные’ группировки). Термин Популяция употребляют также для обозначения отдельных обособленных групп домашних животных (породы, стада) и культурных растений (сорта, клоны, линии). В гистологии, медицине, микробиологии Популяцией называют однородные группы клеток в тканях многоклеточных организмов или в культуре клеток. Смотрите также Биология, Видообразование, Генетика, Эволюционное Учение.

POPULATION DENSITY = ПЛОТНОСТЬ ПОПУЛЯЦИИ – Population Density is the number of plants per unit area. / Под Плотностью Популяции понимается число растений на единицу ареала (площади).

POPULATION GROWTH = РОСТ ПОПУЛЯЦИИ – Population Growth is an increase in numbers of a population over a given period due to reproduction. / Увеличение в численности популяции .

POPULATION PEAK = ПИК ПОПУЛЯЦИИ – Population Peak:- when a given population is at its highest level.

POPULATION–WEIGHTED DEGREE–DAYS = ВЗВЕШЕННЫЕ ПО НАСЕЛЕНИЮ ГРАДУСО–ДНИ – Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree-days, each US State is divided into from one to nine climatically homogeneous divisions, which are assigned weights based on the ration of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and those products are then summed to arrive at the State population-weighted degree-day figure. To compute national population-weighted degree-days, the Nation is divided into nine Census regions, each comprising from three to eight States, which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and those products are then summed to arrive at the national population-weighted degree-day figure. Population-Weighted Degree Days:- Heating or cooling degree days weighted by the population in the area in which the degree days are recorded. For example, to calculate the state population-weighted degree days, the state is divided into nine climatically similar divisions that are assigned weights based on the ratio of the population of the division to the total population of the state. Degree day readings for each division are multiplied by the corresponding population weight for each division, and these products are then summed to arrive at the state population-weighted degree day figure. / Взвешенные по населению градусо-дни отопления и кондиционирования для территории, где эти градусо-дни учтены. Для расчёта взвешенных по населению градусо-дней для конкретного штата, каждый штат США разделяется на от одного до девяти климатически однородных районов, которым придаётся определённый вес исходя из отношения количества жителей этого района к населению всего штата. Показатели градусо-дней каждого района умножаются на соответствующий весовой коэффициент по населению и полученные результаты суммируются для определения конечного показателя взвешенных по населению градусо-дней для всего штата. Для расчёта взвешенных по населению градусо-дней в национальном масштабе, всё население страны делится на девять статистических районов, включающих в себя от трёх до восьми штатов, которым придаётся определённый вес исходя из отношения количества жителей этого района к населению всей страны. Показатели градусо-дней каждого района умножаются на соответствующий весовой коэффициент по населению и полученные результаты суммируются для определения конечного показателя взвешенных по населению градусо-дней для всей страны.

POPULISM = ПОПУЛИЗМ – (1) Populism is the ideologies of any of a number of political movements that demand the redistribution of political power, economic dominance and/or cultural leadership away from what are seen as corrupt, greedy, over-centralized, urban-based oligarchies in favor of empowering ‘the common people’, particularly those who live in rural or small-town areas, since such people are typically idealized by populists as embodying a simpler, more virtuous way of life based on traditional values and customs.

Populists generally believe in the elitist theory of politics as the best description of how policy-making works, and they find it completely illegitimate. Populists characteristically favor strong but fairly selective government intervention in the economy to counteract market forces undermining the viability of favored traditional occupations such as small farming and small-scale commercial activities. Populists typically also favor strong government action to stop the spread of non-traditional religious and cultural values and to punish and repress minorities pursuing unconventional or 'foreign' life-styles. Sociologically-oriented historians usually interpret the growth of populist protest movements as a backward-looking reaction against the stresses of rapid economic and technological change and the painful disruptions of traditional values and customs that accompany such changes; however the policy measures pushed through by successful populist movements in order to protect traditional ways of life have themselves often produced unintended but nevertheless radical changes in politics, the economy and society. / Под Популизмом, от Французского слова Populisme, от Латинского слова Populus, означающее Народ, понимается .

(2) Populism:- French literary school of the late 1920's and the 1930's whose followers advocated a faithful depiction of the daily life of the urban and rural poor, free of political bias and social generalizations; a variety of naturalism. While expressing a superficial love for the people, Populisme opposed the development of a truly democratic French literature during the period of the Front Populaire (Popular Front). The literary critic Léon Lemonnier (1890–1953) and such writers as Céline Lhotte (1888–1963), Léon Eugène Frapié (1863–1949), Maurice Mardelle (1886–1948), Camille CÉ (Chemin) (1878–1959) and Pierre Béarn (1902–2004) belonged to the group, and Henry Poulaille (1896–1980) maintained close ties with it. The novelists Eugène Dabit (1898–1936), Tristan Rémy (1897–1977), and André Chamson (1900–1956), who at first adhered to the principles of Populisme, later abandoned them. / Под Популизмом, от Французского слова Populisme, от Латинского слова Populus, означающее Народ, в литературе понимается Французская литературная школа, существовавшая в конце 1920–30-х. Популизм декларировал достоверное изображение повседневного быта городской и сельской бедноты, свободное от политических тенденций и социальных обобщений. Фактически популизм проявил себя как разновидность натурализма. При внешнем народолюбии популизм противостоял развитию подлинно демократической Французской литературы Народного Фронта. К популизму принадлежали критик Лео Лёмони (Léon Lemonnier; 1890–1953), писатели Сэлин Лёт (Céline Lhotte; 1888–1963), Лео Ожен Фрапье (Léon Eugène Frapié; 1863–1949), Морис Мардэль (Maurice Mardelle; 1886–1948), Кямий СЭ (Шома) (Camille CÉ (Chemin); 1878–1959), Пьер Беарн (Pierre Béarn; 1902–2004) и другие. Близко к популизму стоял Ори Пуляйэ (Henry Poulaille; 1896–1980). Первоначально разделявшие принципы популизма романисты Ожен Даби (Eugène Dabit; 1898–1936), Тристо Рэми (Tristan Rémy; 1897–1977), Одрэ Шамсо (André Chamson; 1900–1956) впоследствии от них отошли.

POR = PAY ON RETURN

PORE = ПОРА – Pore is a small channel or opening in a filter medium which allows passage of fluid. See also Pore Size, Pore Size Distribution, and Porosity. / Поры – промежутки, или полости, между структурными элементами твёрдого тела. Различают открытые (сообщающиеся) поры-каналы, пронизывающие весь объём пористого тела, и замкнутые (не сообщающиеся) поры-ячейки. Первые характерны для адсорбентов, катализаторов, разнообразных фильтрующих материалов, вторые – для пеноматериалов, вулканических стекол и другого. По размерам поры, согласно классификации Михаила Михайловича Дубинина (1900(1901)–1993), делят на:- Микропоры (средний эффективный радиус r < 15–16Å), Мезопоры (Переходные Поры), 16–20 < r < 2 000 Å) и Макропоры (r > 2 000 Å, вплоть до пор, видимых невооружённым глазом). Микропоры бывают двух типов:- 'Мелкие' (r < 6–7 Å, например, поры в цеолитах, активных углях) и 'крупные' (6–7 < r < 15–16 Å, например, поры в некоторых силикагелях). Для каждого класса пор действуют свои закономерности адсорбции и других физических явлений. Микропоры соизмеримы с размерами молекул (атомов, ионов) твёрдого тела и не нарушают его однородности (гомогенности). Так, поглощение газов или жидкостей микропористыми сорбентами сопровождается заполнением их пор и по многим признакам сходно с растворением (абсорбцией, окклюзией). Макропоры и мезопоры намного превышают размеры молекул (а в случае полимеров – размеры мономерных звеньев макромолекулы) и присущи типично гетерогенным материалам. В сообщающихся микропорах при перепаде давлений происходит вязкое массовое течение жидкостей и газов, тогда как в микропорах возможна только диффузия. Совокупная характеристика размеров и количества пор в теле, то есть занимаемого порами суммарного пространства, называется Пористостью. Её выражают объёмом пор в единице объёма или массы пористого тела, а также его удельной поверхностью. Искусственные и природные пористые тела широко используются в технике; пористость горных пород и почв определяет интенсивность и характер многих процессов, связанных с тепло- и массо-обменом в земной коре и на её поверхности.

PORE SIZE = РАЗМЕР ПОР – A term Pore Size correctly refers to the actual opening size of the pores (holes) in a membrane filter. This may be reported in a minimum pore size (smallest measurable hole), maximum pore size (largest measurable hole, which is the most meaningful classification), or a pore size range (example, 5–10 µm). In many cases the actual pore size rating of a given filter may be much larger than the removal rating of a given filter. See also Pore.

PORE SIZE DISTRIBUTION = РАСПРЕДЕЛЕНИЕ РАЗМЕРОВ ПОР – Pore Size Distribution is the ratio of the number of effective holes of a given size to the total number of effective holes per unit area expressed as a percent and as a function of hole size. See also Pore.

PORE SPACE = ПОРОВОЕ ПРОСТРАНСТВО – Pore Space is the space in soils not occupied by solid particles.

PORK–BARREL LEGISLATION = ЗАКОНОДАТЕЛЬСТВО СВИНИНА–БАРРЕЛЬ – Pork-Barrel Legislation is appropriations of public funds by Congress (or other legislative assemblies) for projects that do not serve the interests of any large portion of the country's citizenry but are nevertheless vigorously promoted by a small group of legislators because they will pump outside taxpayers' money and resources into the local districts these legislators represent. Successful promotion of such pork-barrel legislation (often through skillful logrolling) is very likely to get the legislator re-elected by his constituents. Classic examples of such pork-barrel legislation include Federal appropriations bills for dams, river and harbor improvements, bridge and highway construction, and job-training centers, as well as legislation designed to prevent closure of obsolete or unneeded military installations, prisons, VA hospitals and the like.

PORK BELLIES = СВИНЫЕ БРЮШИНЫ – The Pork Belly is the underside of the hog, from which bacon is made in the United States. In other parts of the world, bacon is more often made from back and side meats and bacon made from bellies is referred to as 'Streaky' or 'American Style'. This cut of meat is enormously popular in Chinese cuisine and Korean cuisine where it is generally marinated and cooked as a whole slab. Pork bellies and pork belly futures contracts have been traded on the Chicago Mercantile Exchange since September 1961. The unit of trading is 20 tons of frozen, trimmed bellies. Pork bellies can be kept in cold storage for an extended period of time, and generally it is the frozen bellies that are most actively traded. Bellies typically weigh around 13 pounds. Prices vary depending on the amount of inventory in cold storage and the seasonal demand for bacon. One of the major cuts of the hog carcass that, when cured, becomes bacon. The Chicago Mercantile Exchange® (CME®) began trading Frozen Pork Belly futures in 1961 – the first futures contract based on frozen, stored meats. Trading in Frozen Pork Bellies contracts was developed as a risk

management device to meet the needs of meat packers who processed pork and had to contend with volatile hog prices as well as price risks on processed products held in inventory. Thus, the futures contract was designed to help processors and warehouse operators manage these price risks. Hence, the Frozen Pork Bellies futures contracts performs the same two primary functions common to many futures contracts, that of:- guiding inventories and establishing forward pricing. The Pork Belly is the meat from the underside of a hog. It extends between the front and rear legs and goes about halfway up each side of the animal. This section is cut from each side of the carcass to produce 2 pork bellies. Bellies make up 10–15% of the hog carcass. Each belly usually weighs 10–20 pounds. Bellies are primarily processed into bacon. Frozen bellies are held in storage and remain unsliced. / Свиные Брюшины – мясо из нижней части борова или свиньи.

PORKPIE HAT = ШЛЯПА В СТИЛЕ СВИНОГО ПИРОГА – Porkpie Hat is a hat with a low telescoped crown, flat top, and brim turned up all around or up in back and down in front. / Шляпа с круглой плоской тулёй и загнутыми кверху полями.

POROSITY = ПОРИСТОСТЬ – A term Porosity refers to the ratio of open space in a filter matrix to the amount of volume taken by the filter media itself. Typically, a filter with high porosity will have a more open structure, and therefore, higher flow with lower pressure drops. High porosity does not necessarily mean that the filter will remove particles better than a low porosity filter. See also Pore. Porosity is the ratio of pore volume to total volume of a filter medium expressed as a percent. Porosity is the ratio of the volume of air or void contained within the boundaries of a material to the total volume (solid matter plus air or void) expressed as a percentage. % Porosity = (V_v x 100) / V_t; where V_v – Volume of Voids, and V_t – Total Volume. / Пористость – совокупная характеристика размеров и количества пор в твёрдом теле. Смотрите также Пористость Горных Пород.

PORRECT = ПРОСТИРАЮЩЕЕСЯ (или ПРОТЯЖЕНИЕ) – Porrect:- extended horizontally, stretched out, pointing outward and forward.

PORT = ПОРТ (или ГАВАНЬ) – (1) Port is a facility for receiving ships and transferring cargo. They are usually situated at the edge of an ocean, sea, river, or lake. Ports often have cargohandling equipment such as cranes (operated by longshoremen) and forklifts for use in loading/unloading of ships, which may be provided by private interests or public bodies. Often, canneries or other processing facilities will be located near by. Harbour pilots and tugboats are often used to maneuver large ships in tight quarters as they approach and leave the docks. Ports which handle international traffic have customs facilities. The terms Port and Seaport are used for ports that handle ocean-going vessels, and River Port is used for facilities that handle river traffic, such as barges and other shallow draft vessels. Some ports on a lake, river, or canal have access to a sea or ocean, and are sometimes called Inland Ports. A Fishing Port is a type of port or harbor facility particularly suitable for landing and distributing fish. A Dry Port is a term sometimes used to describe a yard used to place containers or conventional bulk cargo, usually connected to a seaport by rail or road. A Warm Water Port is a port where the water does not freeze in winter. Because they are available year-round, warm water ports can be of great geopolitical or economic interest, with the ports of Saint Petersburg and Valdez being notable examples. A Port Of Call is an intermediate stop, for example to collect supplies or fuel. The world's busiest port is contested by several ports around the world, as there is as yet no standardised means of evaluating port performance and traffic. For the past decade the distinction has been claimed by both the Port of Rotterdam and the Port of Singapore. The former based its measurement on cargo tonnage handled (total weight of goods loaded and discharged), while the latter ranks in terms of shipping tonnage handled (total volume of ships handled). Since 2005, the Port of Shanghai has exceeded both ports to take the title in terms of total cargo tonnage. The following ports have variously made claims to be largest world port:- Port of Shanghai, Port of Singapore, Port of Rotterdam, Port of Hong Kong, Port of New York/New Jersey. Harbor with facilities (piers or docks) for vessels to moor and load or discharge. Port:- any port, terminal, offshore terminal, ship and repair yard or roadstead which is normally used for the loading, unloading, repair and anchoring of ships, or any other place at which a ship can call. Port:- a harbor or haven where ships may anchor. The term Port or Seaport normally includes the harbour and the adjacent town or city suitable for loading goods and embarking men. A Haven is a type of harbor used in literature or in names and adds the idea of refuge. Ships are accommodated and handled, i.e. loaded and unloaded, at such port structures as:- wharfs or quays, piers and jetties, and sometimes alongside moles or breakwaters. Port Accommodation is divided into berthing and storage accommodation. Berthing accommodation includes general cargo berths (wharves, quays, piers, docks), oil tanker jetties or terminals, bulk cargo facilities, container and rollon/roll-off terminals, liquefied gas terminals, etc. Storage facilities include transit sheds (along the wharves or docks), back-up storage located away from the dock, warehouses, stockyards and stacking areas for containers, stockpiles for bulk cargo etc. Port is a place from which goods are sent out of a country or received from abroad. The location of the customs usually determines the port. / и грузиться или разгружаться. Под Портом, от Французского слова Port, от Латинского слова Portus, означающее Гавань или Пристань, понимается участок берега моря, озера, водохранилища или реки и прилегающая водная площадь (акватория), обычно естественно или искусственно защищённые от волнения (воздействия волн) и оборудованные для стоянки и обслуживания судов, складирования грузов, выполнения перегрузочных (погрузочно-разгрузочных) и других работ. Различают порты:- (i) морские, обслуживающие морское судоходство; и (ii) речные – на внутренних водных путях. Различают торговые порты:- (i) общие, выполняющие операции с разнообразными грузами; (ii) специализированные, служащие преимущественно для операций с грузом одной категории (сюда могут быть отнесены пассажирские порты). Для обслуживания пассажиров в порту служит морской вокзал, сооружаемый на молах или на площадках с искусственным основанием в прибрежной части. По месторасположению порты подразделяются на:- (i) береговые; (ii) внутренние; (iii) лагунные; и (iv) устьевые (наиболее распространённые). Порт (гавань) – участок берега моря, озера, водохранилища или реки и прилегающая водная площадь, естественно или искусственно защищенные от волнения и оборудованные для стоянки и обслуживания судов, выполнения перегрузочных и других операций. Различают:- (1) Морские Порты, обслуживающие морское судоходство, и (2) Речные Порты – на внутренних водных путях. Краткая Историческая Справка:- возникновение портов относится к глубокой древности. Первоначально стоянками судов служили естественно защищённые от волнения места (залив, губа, устье реки, прикрытый островом берег). По мере развития торговли и судоходства возникла необходимость в возведении причальных и оградительных сооружений; этим было положено начало портостроению. Известно о существовании морского порта у города Месара на Острове Крит (3400 лет до Нашей Эры), двух больших портов у городов Сидон и Тир на Средиземном Море. В период Римской Империи были основаны порты на островах Сицилия и Сардиния. Обширным портом (с внешними и внутренними бассейнами) обладал Карфаген. Одним из крупнейших Римских портов был Порт Остия, сооружённый в устье Реки Тибр. В средние века развитию портостроения способствовали Великие географические открытия, расширение торговли и судоходства, сосредоточение больших количеств грузов в портовых пунктах на морских побережьях. Были созданы крупные порты в Нидерландах, Испании, позднее в Англии. На территории бывшего СССР одни из первых портов, через которые осуществлялась торговля со странами Западной Европы, возникли в XI–XII веках на месте современного Таллина и Риги. Ряд крупных морских портов был основан при Петре I:- Таганрогский, Петровский (ныне Махачкала), Петербургский (бывший Ленинградский, в устье Реки Невы), Кронштадтский (на Острове Котлин в Финском Заливе), Петропавловский (на Камчатке). Однако значительное развитие портостроение (как в России, так и в других странах) получило лишь с начала XIX века в связи с появлением парового флота, увеличением

размеров судов, их грузоподъёмности и осадки, а также использованием землечерпательных машин для создания искусственно углублённых акваторий портов и подходов к ним. Строительство железных дорог существенно облегчило доставку грузов к портам и во многом содействовало их интенсивному развитию. Общие Характеристики Порта:- основные элементы порта:- (i) акватория (водная часть) и (ii) территория (береговая часть). В состав Акватории обычно входят водные подходы к порту, рейды и внутренние бассейны. Водные подходы могут быть естественными (в виде участка моря или реки) или искусственными (с устройством подходных каналов, связывающих порт с естественными глубинами). Рейды – участки акватории, защищённые от сильного волнения, где суда могут стоять на якорях в ожидании разрешения на подход к причалам или на выход из порта. При отсутствии в порту глубоководных причалов, на рейдах также производят перегрузочные операции, для чего используют вспомогательные мелкосидящие суда – лихтеры и баржи. Внутренние Бассейны (иногда называют Гаванями или Портовыми Бассейнами), прилегающие непосредственно к портовой территории, предназначаются для стоянки судов у причалов; в них производят основные и некоторые вспомогательные грузовые операции. Судоходная трасса к порту оборудуется знаками навигационной обстановки. Территория Порта включает:- сухопутные подходы к порту (железнодорожные пути, автомобильные дороги, трубопроводы транспортного назначения); прикордонную часть, примыкающую к причальной линии, на которой размещаются так называемые прикордонные железнодорожные линии и автомобильные проезды, перегрузочные устройства и механизмы, склады и площадки для кратковременного хранения грузов, пассажирский вокзал (морской вокзал, речной вокзал); тыловую часть, обычно занимаемую внутрипортовыми железнодорожными путями, автомобильными дорогами (в том числе для городского транспорта), складами долгосрочного хранения грузов, подсобными предприятиями порта, служебными и административными зданиями. Гидротехнические Сооружения Порта:- оградительные сооружения – молы, волноломы; причальные сооружения – пирсы, портовые набережные; судоподъёмные и судоремонтные сооружения – эллинги, слипы, доки. К портовым гидротехническим сооружениям относятся также морские маяки и знаки судоходной обстановки, расположенные в пределах акватории порта. В состав Основного Оборудования Порта входят:- перегрузочные устройства и механизмы цикличного действия (портальные, гусеничные, козловые и мостовые краны, вагоноопрокидыватели) и непрерывного действия (передвижные и стационарные транспортёры, пневматические и гидравлические установки и насосные станции); устройства для бункеровки (снабжения судов топливом), энергосиловые установки, системы освещения и связи, противопожарные устройства и так далее. Внутрипортовый Транспорт Порта:- железная дорога (обычно нормальной колеи), грузовой автотранспорт, специальный безрельсовый транспорт (самоходные тележки, погрузчики, автолесовозы и другое). Внутрипортовые водные перевозки осуществляются служебно-вспомогательным флотом (главным образом баржами с буксирами). Основные Технические Характеристики Порта:- глубина у причала, длина причальной линии и отметка портовой территории. Глубина у причала отсчитывается от наинизшего судоходного уровня воды и определяется расчётными осадками судов и запасом глубины под килем судна. В современных морских портах глубина у причалов для сухогрузных судов составляет 10–15 м, нефтеналивных – 15–20 м. Длина причальной линии определяет количество судов, которые могут одно временно стоять у причалов и подвергаться обработке. Количество причалов устанавливается отдельно по каждой категории грузов. Кроме причалов, необходимых для выполнения грузовых и пассажирских операций, в портах предусматриваются также вспомогательные причалы, обслуживающие бункеровку, стоянку служебно-вспомогательного флота и судоремонт. Отметка Портовой Территории (возвышение над уровнем воды) выбирается с таким расчётом, чтобы территория порта при высоком стоянии уровня не затоплялась и были созданы наиболее благоприятные условия для выполнения грузовых и других операций. Отметка Прикордонной Части портовой территории, как правило, постоянна, что облегчает движение железнодорожного транспорта. План Порта – общее взаимно увязанное расположение всех его частей – составляется с учётом рельефа, метеорологических, гидрологических и других местных условий и согласуется с планом примыкающего города. Так, например, морской порт не должен ‘отрезать’ город от моря и в то же время необходимо, чтобы в городской застройке была оставлена свободной часть прибрежной территории для дальнейшего развития порта. Пассажирская часть порта, располагаемая, как правило, поблизости от центральной части города, должна обеспечивать удобный для городского транспорта доступ к морскому (или речному) вокзалу. Причальные Линии могут располагаться фронтально (вдоль берега), вдоль молов, на выступающих в акваторию пирсах, а также вдоль внутренних береговых бассейнов. Размещение причалов должно обеспечивать, с одной стороны, удобство подхода и швартовки судов, а с другой – возможность обслуживания причалов железнодорожным и автомобильным транспортом. Основные Транспортно-Экономические Характеристики Порта:- его грузооборот, пропускная способность, судооборот. Грузооборот (главный показатель работы порта) – суммарное количество грузов (в тоннах), прошедших через порт в обоих направлениях (с суши на воду и наоборот) в течение года. Пропускная Способность Порта – наибольшее количество грузов, которое порт может пропустить (переработать) в течение года в обоих направлениях при его заданных технических характеристиках, определённом режиме перевозки грузов и при использовании прогрессивной технологии перегрузочных работ. Под Судооборотом Порта понимается количество судов, посещающих порт в течение данного периода (год, месяц, сутки). Классификация Современных Портов:- (1) Морские Порты разделяются в основном на Гражданские (Торговые, Рыбные и другие) и Военные. Торговые Порты обычно служат перевалочными пунктами для грузов, направляемых морским путём за границу (вывоз (или экспорт)) или обратно (привоз (или импорт)), а также для грузов, перевозимых между портами одной страны (каботаж). Среди торговых портов различают:- (i) Порты Общего Назначения, выполняющие разнообразные грузовые операции (к ним относится большинство крупных портов международной торговли – Санкт-Петербург (бывший Ленинград), Владивосток, Лондон, Марсель, Нью Йорк и другие); и (ii) Специализированные Порты, предназначенные главным образом для операций с грузом одной категории, определяющим характер всей работы порта, например, с углем (Кардифф), лесом (Архангельск), нефтью (Абадан); сюда же могут быть отнесены пассажирские порты (например, Ялта, Сочи, Французский Порт Кале), для которых грузовые операции имеют второстепенное значение. Особый вид морских портов – Морские Станции, обеспечивающие снабжение проходящих судов топливом, пресной водой, продовольствием. Рыбные Порты (например, Калининградский или Мурманский) служат базами рыболовецкого флота; в них помимо складов-холодильников нередко размещаются и предприятия по переработке рыбы. Порты-Убежища представляют собой рейды, на которых во время штормов под искусственной или естественной защитой могут становиться на свои якоря или специальные бочки суда каботажного плавания, траулеры, промысловые шхуны, моторные боты. В портах-убежищах обычно имеются судоремонтные мастерские и судоподъёмные средства для оказания помощи судам, получившим повреждения. Военные Порты служат для базирования соединений кораблей военного флота и обычно являются составной частью военно-морских баз. По месту расположения морские порты делятся на:- устьевые, лагунные, береговые, внутренние. Устьевые Порты (наиболее распространённые) сооружаются при выходе в море водного пути, проникающего глубоко внутрь страны и несущего большие потоки грузов. Крупнейшие порты мира – Роттердам, Лондон, Нью Йорк, Санкт-Петербург (бывший Ленинград), Архангельск, Гамбург – находятся в устьях рек. Характерная особенность таких портов – расположение причальных устройств по берегам рек, на некотором удалении от моря, что исключает необходимость возведения оградительных сооружений. Лагунные Порты устраивают на береговых озёрах (лагунах), отделённых от моря естественно возникшими песчаными косами и соединённых с ним каналами (Порт Ильичёвск близ Одессы, Иранский Порт Пехлеви). Береговые Порты, создаваемые непосредственно на

открытом морском берегу (например, Марсельский и Одесский порты), обычно требуют устройства достаточно развитых оградительных сооружений (молов и волномолов); при расположении их в бухтах, имеющих естественную защиту (например, в Севастополе, Владивостоке, Рио дэ Жанэйро, Сан Франциско), оградительные сооружения, как правило, не устраивают. Внутренние Порты размещают на значительном расстоянии от моря на низовых (глубоководных) участках рек (например, Херсон, Николаев, Руан) либо на искусственных каналах, прорытых от моря внутрь страны (Манчестер, Амстердам, Брюссель). По транспортному значению различают порты:- Мировые Порты (центры мировой торговли), представляющие собой узлы мощных грузовых потоков, направляющихся с океана внутрь материка и обратно; Международные Порты, обслуживающие обмен грузов между различными странами; и Местные Порты, посещаемые преимущественно судами каботажного плавания или служащие укрытиями для мелких судов. В бывшем СССР морские порты по грузообороту и административным признакам подразделялись на 3 разряда. (2) Речные Порты по назначению делятся на:- Общие, Специальные, Аванпорты, и Порты-Убежища. Общие и Специальные Порты предназначены для передачи грузов с судов на берег и обратно. В Аванпортах, расположенных на водохранилищах (в верхних бьефах шлюзов), составы судов или плоты переформировываются перед вводом их в камеру шлюза; аванпорты используются также для отстоя судов и плотов, прибывающих из нижнего бьефа в верхний во время шторма. Иногда под защитой одних и тех же оградительных сооружений находятся одновременно аванпорт и порт общего назначения (Самарский (бывший Куйбышевский), Цимлянский и другие). Порты-Убежища служат лишь для отстоя судов и плотов во время шторма; они создаются обычно в естественных бухтах; причальные сооружения в них, как правило, не устраиваются. По расположению различают порты:- Порты На Свободных Реках, характерной особенностью которых являются значительные колебания уровня воды (до 15 м и более); Порты На Судоходных Каналах, в которых амплитуда колебаний уровня всегда невелика; Водохранилищные и Озёрные Порты, подвергающиеся воздействию ветровых волн и требующие, как правило, устройства оградительных сооружений (эти порты имеют много общего с морскими). Русловые Порты на свободных реках обычно имеют на акватории 2 рейда (рейд прибытия и рейд отправления), на которых соответственно расформировываются или формируются буксируемые составы и откуда отдельные баржи подаются буксирами к причалам для грузовых операций. Рейды обычно располагаются выше или ниже причалов с тем, чтобы не стеснять транзитного судового хода и акватории у причалов. Значительные колебания уровня воды определяют характер причальных устройств в речном порту и обусловливают применение Дебаркадеров и в некоторых случаях так называемых Весенних Причалов. Внерусловые Порты на свободных реках и порты на судоходных каналах располагаются в естественных бухтах, в искусственных бассейнах и на уширениях каналов. Основные элементы, гидротехнические сооружения и технические характеристики речных портов те же, что и у морских портов. По навигационному грузообороту речные порты бывшего СССР подразделялись на 5 классов. Под Гаванью понимается:- (i) прибрежная часть водного пространства для стоянки, ремонта и зимовки судов, естественно или искусственно защищённая от ветра, волн и течений; или (ii) часть акватории порта для производства грузопассажирских операций. Под Гаванью, от Голландского слова Haven, понимается естественно или искусственно защищённая от волн, ветра и течений прибрежная часть водного пространства; место стоянки судов. Гаванью называется также прилегающая к причалам часть портовой акватории, где производят грузовые операции (в соответствии со специализацией по роду перерабатываемых грузов или типу обслуживаемых судов – каботажная, лесная, нефтяная, угольная гавани и так далее) или посадку-высадку пассажиров (пассажирская гавань). Различают гавани для стоянки судов специального назначения (например, военная, рыбачья гавани), ремонта судов (ремонтная гавань) или их отстоя в межнавигационный период (зимовочная гавань). Под Лиманом, от Греческого слова Limēn, означающее Бухта или Гавань, понимается залив с извилистыми невысокими берегами, образующийся при затоплении морем долин равнинных рек в результате относительного погружения прибрежных частей суши. Илистые отложения лимана (грязи) часто используются для бальнеологических целей. Под Портом понимается участок берега с прилегающим водным районом и комплексом сооружений и устройств для погрузки-разгрузки судов, их снабжения топливом, водой и прочим, ремонта и оказания других услуг. Различают морские порты, речные порты, комбинированные порты и порты-убежища. Порты бывают торговые и военные. Торговые порты делятся на грузовые (общего назначения и специализированные по определённым грузам) и пассажирские (часто совмещаемые с грузовыми). Порты характеризуются:- пропускной способностью, грузо- и пассажирооборотом, глубиной на подходах и у причалов, длиной причальной линии, количеством, грузоподъёмностью и производительностью перегрузочных средств, степенью механизации портовых работ, наличием хранилищ для грузов, объёмом технического обслуживания судов. Военные порты, предназначенные для базирования кораблей военно-морского флота, в отличие от торговых портов, характеризуются наличием больших рейдов, бассейнов для снаряжения и ремонта кораблей, фортификационных сооружений. Водная часть порта называется акваторией, береговая – территорией порта. Порт-Убежище – акватория на море, озере или водохранилище, защищённая искусственным сооружениями или расположенная в естественной бухте (заливе); используется для укрытия судов во время шторма.

(2) Port:- an opening in a ship's side for handling freight. / Проход или место в сторону от судна для обработки фрахта. Под Портом понимается отверстие в борту судна для посадки-высадки пассажиров, приёма-выдачи грузов (грузовые порты), на старых военных кораблях – для стрельбы из расположенных у бортов пушек (пушечные порты). Обычно порты снабжают непроницаемыми крышками.

PORT = ПОРТ (или ОТВЕРСТИЕ, или ПРОРЕЗЬ, или ВЛЁТ) – Port:- an opening or aperture in an integrating sphere.

PORT = ПОРТ (или ШПИГАТ, или КЛЮЗ, или ЛАЦПОРТ, или ЛЕВЫЙ БОРТ, или БАКБОРТ) – Port (maritime term):- that side of a vessel on the left hand of a person who stands on board facing the bow. See also Port Side, and Starboard. Left side of a ship when facing forward. / Левая сторона судна, если смотреть вперёд по движению (от кормы к носу судна). Левый Борт или Бакборт судна, совокупность элементов набора и обшивки, образующих боковые стенки корпуса от кормы к носу судна. Смотрите также Бакборт или Левый Борт (Port Side); и Штирборт или Правый Борт (Starboard). Борт судна (от Немецкого слова Bord), совокупность элементов набора и обшивки, образующая боковые стенки корпуса судна. Различают левый (бакборт) и правый (штирборт) борта, если смотреть от кормы к носу судна. От высоты борта зависит грузовместимость судна; высотой непроницаемого надводного борта определяется запас плавучести судна. Высота надводного борта влияет также на остойчивость при больших углах крена и на продольную прочность корпуса. Борта в средней части судна обычно вертикальны, иногда наклонены наружу (борт с развалом), а на ледоколах и некоторых других судах – наклонены внутрь (борт с завалом).

PORTABLE ALPHA = ПОРТАТИВНАЯ АЛЬФА – Portable Alpha:- an active portfolio management strategy that obtains its Alpha from one asset class and its Beta from another. Alpha generally refers to the difference between the return of an actual portfolio and its performance benchmark. Beta refers to the stability of the return of an investment compared to its asset class. / В биржевой торговле Портативная Альфа относится к активной стратегии управления портфелем, которая применяет свою Альфу от одного класса активов и свою Бету от другого. В целом же Альфа относится к разнице между отдачей фактического портфеля и ориентиром его поведения. Бета относится к стабильности отдачи от вложений в сравнении с её классом активов.

PORTABLE DOCUMENT FORMAT = ФОРМАТ ПЕРЕНОСИМЫХ ДОКУМЕНТОВ – Portable Document Format (PDF) is a common proprietary document format from Adobe used for documents having mixtures of text and images that preserves the look and feel of a printed page and permits the user to zoom and magnify the pages when viewing; not 'archival' because of its proprietary nature.

PORTAGE BILL = СЧЁТ ЗА ПЕРЕВОЗКУ (или ВЕДОМОСТЬ ЗА ПЕРЕПРАВКУ, или СЧЁТ ЗА ПОХОД) – Portage Bill is a bill giving the statement of wages of each member of the crew at the end of a voyage. / Счёт/ведомость, предоставляющий выписку о заработных платах каждого члена экипажа в конце рейса.

PORTAINER™ = ПОРТЭЙНЁ (или ПОРТЭЙНЁР™) – A Portainer™ is a large dockside crane in the form of a specialized type of gantry crane used to load and unload container ships, and only seen at container terminals. The term Portainer™ is a registered trademark of Paceco® Corporation (Hayward, State of California, the United States) who is generally believed to have delivered the first Container Crane to a marine terminal in Alameda, CA, the United States in the 1960s. Container cranes have a special lifting device called a Spreader Bar (also known as Spreader or Expandable Spreader) for loading and discharging of containers. The spreader bar has four or eight (twin-lift) twistlocks which lock and unlock into the cornercastings of the containers and can be used in 20', 40', or 45' positions depending on the size of the containers. Horizontal gantry rails and their supporting structure are cantilevered out from between frame uprights spaced to suit the length of a standard freight container, so that the gantry rails project over a quayside and over the width of an adjacent ship allowing the hoist to lift containers from the quay and move out along the gantry rails on its trolley to place the containers on the ship. The whole crane runs on two rails so that it can traverse along the wharf (or the dock) to position the containers at any point on the length of the ship. Also known as Container Crane, Container Handling Gantry Crane, Quay Crane, Ship-To-Shore Crane or STS Crane. / Портэйнё™ (Portainer™). Пэйсэко® Корпорэйшэн (Paceco® Corporation).

PORTAINER® CRANE = КРАН ПОРТЭЙНЁ® (или КРАН ПОРТЭЙНЁР®) – The Portainer® Crane is the key element in ship to shore operations. Its speed, precision and controllability ensure optimum container throughput. The type and size of the Portainer® Crane are defined as a function of the characteristics of the largest ship expected to dock where the cranes on one side, and the characteristics of the dock where the rail track is located in relation to high and low tides on the other. As well as having optimum performance, the crane should be the simplest and most reliable possible. When defining the crane parameters it should be recognised that the earning capacity of the investment in the crane stems from the earning capacity of the ship docked beneath it. To achieve this the operation needs to optimise two factors, the speed with which the ship may be loaded and unloaded, and the certainty that the crane will function reliably when the ship arrives. The Portainer® Crane achieves both objectives. See also Portainer™. Xxxxx. Portainer Cranes perform the vital work of loading and unloading marine cargo containers to and from container ships. The industry regards the Portainer crane as amongst the highest quality and most reliable container handling cranes available. In addition, Portainer cranes are easy to maintain and their performance is second to none. PACECO® Corp. (Hayward, State of California, the United States) has developed a number of Portainer crane designs to suit a variety of customer needs. The 'Low Profile' and 'Articulated Boom' Portainer cranes are designed for use around airports or where height restrictions may be a problem. PACECO Corp. also has designs for 'monogirder' and 'machinery on trolley' Portainer cranes, as well as full AC drive cranes. Full AC drive cranes have reduced maintenance requirements, and offer more responsive controls. We also provide supplementary systems such as gantry articulation for curved rail applications, anti-sway, seismic isolation, snag protection, and boom anti-collision devices. / ПЭЙСЭКО® Корп. (PACECO® Corp.). Смотрите также Портэйнё™ (Portainer™).

PORTAL = PRIVATE OFFERING, RESALES AND TRADING THROUGH AUTOMATED LINKAGES

PORTAL CRANE = ПОРТАЛЬНЫЙ КРАН – Portal Crane is a type of gantry crane with vertical legs of sufficient height and width to permit vehicles or railroad equipment to pass between the legs. / Портальный Кран – тип козлового крана на вертикальных опорах, имеющих достаточный вес и широту, для возможного перемещения между ними транспортных средств или железнодорожного оборудования. Портальный Кран – грузоподъёмный кран, предназначенный для погрузочно-разгрузочных работ на больших открытых площадках. На П-образном портале портального крана размещается поворотная крановая часть – платформа, механизмы, стрела, связанная с порталом опорно-поворотным устройством. Портал крана опирается на 4 ноги с ходовыми тележками, передвигающимися по подкрановому пути. Портальные краны используют в морских и речных портах, на судостроительных заводах, в гидротехническом строительстве, на строительных площадках, промышленных предприятиях и так далее. Грузоподъёмность портальных кранов до 300 тонн, высота подъёма до 45 метров, наибольший вылет стрелы до 35 метров, у судостроительных портальных кранов до 100 метров. Смотрите также Подъёмный Кран. Портал, порталообразная часть конструкции или машины, например, опорная часть портального подъёмного крана, станины металлорежущего станка. В технике под Порталом понимается металлическая несущая конструкция П-образной формы, состоящая из 2 боковых или 4 попарно соединённых между собой стоек (ног) и верхней балки или рамы; является частью некоторых машин, например, портального подъёмного крана, портального станка и другого. Порталы применяются при установке на постоянной высоте рабочего органа машины и других узлов. Порталы бывают неподвижными или передвигающимися по направляющим или рельсовому пути.

PORT AND TERMINAL SERVICE CHARGE = СБОР ЗА ОБСЛУЖИВАНИЕ В ПОРТУ И ТЕРМИНАЛЕ – The Port And Terminal Service Charge (PTSC) is the South Europe Conference (SEAC) charge incurred when the shipper is not able to deliver cargo directly alongside the vessel. The carrier may assess its expenses in moving cargo from the shipper's point of delivery to the vessel.

PORTFOLIO = ПОРТФЕЛЬ – Portfolio:- collection of loans or assets, classified by type of borrower or asset. For example, a bank's portfolio might include loans, investment securities, and assets managed in trust; the loan portfolio might include commercial, mortgage, and consumer installment loans. A collection of investments owned or managed by the same individual or organization. A list of the securities owned by a single investor. In the Balance of Payments statistics, portfolio investment is investment in securities that does not qualify as direct investment. All securities and other assets owned by a person or company. Holdings of assets by an individual or institution. / Совокупность активов, которыми располагает инвестор. Обычно такой портфель формируется исходя из соображений оптимизации рисков и прибыли, согласно предпочтениям самого инвестора.

(1) Portfolio:- holdings of bills and bill-like paper managed or administered by a bank on behalf of a customer. / Удерживание векселей и аналогичных им бумаг, управляемое и администрируемое банком от имени заказчика.

(2) Portfolio:- selection of securities held by a person or institution. Portfolios generally include a wide variety of stocks and bonds to spread the risk of investment, and the contents of a portfolio are managed – that is, continually changed in order to maximize income or growth. Selection of securities held by a bank in a safekeeping account for administration or discretionary management or held and managed by the investor himself. Part or all of the asset items that a client or a company owns. Primarily, these are securities, but they can also include buildings or real estate. A securities portfolio thus comprises a securities account with equities, bonds, investment funds, etc. / Счёт Ответственного Хранения (Safekeeping Account).

PORTFOLIO ANALYSIS = АНАЛИЗ ПОРТФЕЛЯ (или ПОРТФЕЛЬНЫЙ АНАЛИЗ) – Portfolio Analysis:- technique of strategic analysis used to distinguish the characteristics of different business units in a multi-business corporation. See also Safekeeping Account Analysis. / Техника стратегического анализа, используемая при рассмотрении характеристик различных составляющих бизнеса в корпорации, осуществляющей свою деятельность в разных направлениях. Смотрите также Анализ Счёта Ответственного Хранения (Safekeeping Account Analysis).

PORTFOLIO IMPAIRMENTS = ОБЕСЦЕНЕНИЯ ПОРТФЕЛЯ – Portfolio Impairments are the impairments to a specific portfolio within the performing lending book exposed to similar risks.

PORTFOLIO INSURANCE = СТРАХОВАНИЕ ПОРТФЕЛЯ (или ПОРТФЕЛЬНОЕ СТРАХОВАНИЕ) – Portfolio Insurance is a form of hedging that uses stock index futures contracts and index options to limit the downside risk of holding a diversified portfolio of common stocks. Portfolio insurance (PI) programs are offered by major banks, brokerage firms, insurance companies, and other financial institutions. A trading strategy that uses stock index futures and/or stock index options to protect stock portfolios against market declines. Portfolio Insurance is a trading strategy which attempts to alter the nature of price changes in a portfolio to substantially reduce the likelihood of returns below some predetermined level for an established period of time. This can be achieved by moving assets among stocks, cash and fixed-income securities or, with the advent of stock index futures contracts, by hedging a stock-only portfolio by selling stock index futures in a declining market or purchasing futures in a rising market. The objective is to create an exposure similar to that of a stock portfolio with a protective purchased put option.

PORTFOLIO INVESTMENT = ПОРТФЕЛЬНЫЕ ИНВЕСТИЦИИ – Portfolio Investment transactions consist of cross-border transactions involving equity and investment fund shares and debt securities, excluding those included in direct investment or reserve assets. Portfolio Investment is a capital export in the form of a non-participating investment of domestic capital in instruments whose risk/return potential lies abroad (foreign equities, loans and other claims on entities abroad). In general, any foreign investment that is not direct investment is considered portfolio investment. Foreign portfolio investment includes the purchase of voting securities (stocks) at less that a 10 percent level, bonds, trade finance, and government lending or borrowing, excluding transactions in official reserves. See also Capital Export, and Direct Investment. / Смотрите также Вывоз Капитала. Вывоз Капитала (Capital Export), перемещение (миграция) капитала из страны, где находится его собственник, в другую страну для систематического извлечения прибавочной стоимости, а также в политических целях. Часть извлечённой прибавочной стоимости переводится в страну, вывозящую капитал, часть капитализируется (то есть снова вкладывается в производство) в стране, привозящей (или импортирующей) капитал (или реинвестируется). В условиях домонополистического капитализма с полным господством свободной конкуренции вывоз капитала играл второстепенную роль. Вывоз товаров был главной формой международных экономических связей, на базе которых возник мировой товарный рынок. В эпоху господства монополий вывоз капитала, в отличие от вывоза товаров, становится одной из характернейших особенностей империализма. На пороге XX века в странах развитого капитализма образовались монополистические союзы капиталистов, создалась монополия на капитал немногих богатейших стран, в которых накопление капитала достигло гигантских размеров; образовался громадный ‘избыток капитала’. Возможность вывоза его была создана тем, что ряд отсталых стран уже оказался втянутым в оборот мирового капитализма. В этих странах прибыль была высока, так как органическое строение капитала низкое, рабочая сила и сырьё дёшевы, а цена земли сравнительно невелика. Вывоз капитала стал необходимым в связи с тем, что ‘... в немногих странах капитализм ‘перезрел’, и капиталу недостаёт (при условии неразвитости земледелия и нищеты масс) поприщ ‘прибыльного’ помещения’ (Владимир Ильич Ленин, Полное Собрание Сочинений, 5 Изд., Т. 27, С. 360). Уже в 1899 доходы Великобритании от вывоза капитала были в 5 раз выше её доходов от внешней торговли. В 1968 доходы Соединённых Штатов Америки (США) от вывоза капитала были в 6 раз больше их доходов от внешней торговли. Объём вывоза капитала в целом и по отдельным капиталистическим странам, таким, как, например, США, Великобритания, Франция, Германия (а затем ФРГ (Федеративная Республика Германия)), резко возрастал. Вывоз капитала выступает в двух формах:- как вывоз предпринимательского капитала и как вывоз ссудного капитала. Вывоз капитала в форме предпринимательского (или функционирующего) означает вложение капитала в промышленные, сельскохозяйственные, транспортные, торговые и другие предприятия (прямые и портфельные инвестиции). Прямые инвестиции – вложения главным образом в акции промышленных, торговых, банковских предприятий, плантации и тому подобное, обеспечивающие полное владение или дающие возможность полного контроля над их деятельностью. Значительная часть (по США около 40%) всех прямых инвестиций осуществляется за счёт реинвестиций. Портфельные инвестиции представляют собой вложения капиталов в заграничные ценные бумаги, формально не дающие их владельцам права на полное владение или полный контроль над иностранными предприятиями. Часто портфельные инвестиции маскируют вывоз капитала национальной вывеской из опасений возможной национализации, выступают как форма ‘сотрудничества’ иностранных и национальных компаний и так далее. За 1958–67 при росте прямых инвестиций США в Латинской Америке на 32% портфельные инвестиции выросли в 2.8 раза. Прямые инвестиции остаются главной формой вывоза капитала. Прибыль от прямых инвестиций в 1968 составляла 72% прибыли, получаемой США от вывоза капитала, и 84% всей прибыли от вывоза капитала Великобритании. Вывоз ссудного капитала происходит в виде краткосрочных – до 1 года (вклады в иностранные банки) и долгосрочных (внешние займы) кредитов. Главную роль играют межправительственные займы – форма вывоза капитала, возникшая в годы Первой Мировой Войны 1914–18 под названием ‘Межсоюзнических Долгов’. Удельный вес их в общей массе заграничных инвестиций в форме ссудного капитала составил 85% в конце 1947, 59% в конце 1968. С усилением государственно-монополистического характера империализма изменилась роль государства в сфере вывоза капитала. Государство превращается в крупнейшего экспортёра капитала. Одновременно оно принимает на себя страхование вывоза (или экспорта) частного капитала от коммерческого и политического риска, связанного с ростом антиимпериалистического движения в других странах. Иногда государство выступает как партнёр отдельных монополий при строительстве предприятий) принимая на себя реализацию наиболее невыгодных с коммерческой точки зрения проектов. В условиях обострившейся борьбы за рынки сбыта вывоз государственного капитала стимулирует также вывоз (или экспорт) товаров, выполняя тем самым функцию, которую раньше целиком осуществляли частные экспортёры капитала. Большие размеры принял вывоз капитала в форме займов международных государственных кредитных учреждений, главным образом Международного Банка Реконструкции и Развития (МБРР), его дочерних обществ – Международной Ассоциации Развития и Международной Финансовой Корпорации, а также региональных банков – Межамериканского Банка Развития, Азиатского Банка Развития, Европейского Инвестиционного Банка. Вывоз капитала – важнейшее экономическое орудие неоколониализма. Более 60% прямых инвестиций Великобритании вложено в пределах бывшей Британской Империи. Большая часть заграничных инвестиций Франции находится в зоне Франка. Основной сферой вывоза капитала из США остаётся Долларовая зона – Канада и Латинская Америка, хотя их удельный вес сократился с 54% в 1946 до 43% в 1968; однако вырос удельный вес стран Азии, Африки и Австралии (с 11 до 24%). До Второй Мировой Войны и в первые послевоенные годы вывозимые монополистическом капиталом в развивающиеся страны средства шли в основном на закрепление аграрно-сырьевой структуры их экономики. В условиях распада колониальных империй и усиления борьбы за экономическую самостоятельность развивающихся стран империалистические державы стремятся путём вывоза капитала

захватить ключевые позиции в ведущих отраслях обрабатывающей промышленности этих стран. За 1950–68 удельный вес обрабатывающей промышленности в прямых инвестициях США в наиболее развитых странах Латинской Америки – Аргентине, Бразилии и Мексике – вырос с 40 до 67%. Удельный вес вложений в обрабатывающую промышленность в инвестициях США в ЮАР (Африка) вырос с 31 до 48%. В странах Среднего Востока удельный вес инвестиций в обрабатывающую промышленность вырос с 0.1 до 3.4%. Основная масса средств, поступающих из империалистических держав в развивающиеся страны Азии, Африки и Латинской Америки, представляет собой вывоз капитала в форме государственных средств. Причём из общей суммы государственных средств, поступивших в эти страны в 1960-х, около 60% приходилось на безвозвратные субсидии, не включаемые официальной статистикой в общую сумму заграничных инвестиций, а остальные 40% на займы; субсидии и займы превратились в орудие проникновения империалистических держав в развивающиеся страны под видом 'экономической помощи'. Государственные займы развивающимся странам значительно превосходят размеры ссудного капитала, вывозимого частными монополиями, и становятся главной формой вывоза государственного капитала. Под влиянием помощи социалистических стран капиталистические державы вынуждены снижать ставки процентов по займам и удлинять их сроки. Вывоз капитала в значительных размерах направляется также из одних развитых капиталистических стран в другие и используется монополиями стран-экспортёров в борьбе за рынки сбыта и сферы приложения капитала. Особенно его размеры возросли после Второй Мировой Войны, что связано с распадом колониальной системы империализма и национализацией иностранных предприятий в ряде развивающихся стран. Развернувшаяся в середине XX века научно-техническая революция создала поле прибыльных крупных капиталовложений в экономике развитых капиталистических стран и вызвала важные изменения в направлениях и формах вывоза капитала. Монополии получили возможность выколачивать колоссальные прибыли путём строительства предприятий новых отраслей гражданского и военного производства как в своей стране, так и в других развитых капиталистических странах. С 1950 по 1968 общая сумма прямых заграничных инвестиций США увеличилась с 11.8 до 64.8 миллиардов Долларов (почти в 5.5 раза), а в Западной Европе инвестиции возросли с 1.7 до 19.4 миллиардов Долларов, или в 11.4 раза. В развитые страны вывозится в основном частный капитал. Вывоз капитала развивается крайне неравномерно, что обусловлено неравномерностью развития капиталистических стран. Если до Второй Мировой Войны на первом месте по заграничным инвестициям стояла Великобритания, то после войны лидерство прочно захватили США, заграничные инвестиции которых превышают сумму заграничных инвестиций всех капиталистических стран, вместе взятых. Второе место занимает Великобритания, третье – Франция, четвёртое – ФРГ. В эпоху империализма в немногих крупных капиталистических странах скапливаются громадные массы денежного капитала. Необычайно растёт слой рантье, лиц, живущих стрижкой купонов и совершенно отделённых от участия в каком бы то ни было предприятии. Вывоз капитала '... ещё более усиливает эту полнейшую оторванность от производства слоя рантье, налагает отпечаток паразитизма на всю страну, живущую эксплуатацией труда нескольких заокеанских стран и колоний' (там же, Т. 27, С. 397–398). Поэтому Владмир Ильич Ленин называл Вывоз Капитала 'паразитизмом в квадрате' (смотрите там же, Т. 30, С. 164). В рантье превращаются целые государства. 'Мир разделился на горстку государств-ростовщиков и гигантское большинство государств-должников' (там же, Т. 27, С. 398). Баланс международных инвестиций капиталистических стран, то есть сопоставление капитала, помещённого за границей в долгосрочной форме, с иностранным капиталом, помещённым в данной стране, позволяет определить, является ли данная страна государством-рантье или страной-должником. Так, на основе данных баланса международных инвестиций в 1967 к государствам-рантье могут быть отнесены наряду с крупнейшими странами-экспортёрами капиталов (США, Великобританией, Францией) такие страны, как Швейцария, Нидерланды, Бельгия, Швеция, Португалия, Ирландия. В государства-рантье быстрыми темпами превращаются ФРГ, Япония и Италия. Остальные страны капиталистического мира выступают как страны-должники. Буржуазные экономисты рассматривают вывоз капитала как помощь развивающимся странам, но факты говорят о том, что страны-рантье получают из развивающихся стран гораздо больше средств, чем предоставляют им. Так, вывоз капитала из США в Латинскую Америку (включая экономические субсидии) за 1950–1968 составил 12 миллиардов Долларов, а перевод процентов и дивидендов в США составил за эти годы 20 миллиардов Долларов. Вывоз капитала (включая субсидии) в страны Ближнего Востока составил 2 миллиарда Долларов, перевод дивидендов по ним в США 12.5 миллиардов Долларов. Предоставляя ссуды, страны-экспортёры капитала ставят в качестве условия покупку на эти средства вывозимых (или экспортируемых) ими товаров, и притом по монопольным ценам. Большую роль в вывозе капитала играют банки государств-рантье, создаваемые за рубежом, и их отделения, которые являются одним из оплотов неоколониализма. Рост вывоза государственного капитала придаёт вывозу капитала в современных условиях военно-полицейский характер. Вывоз капитала – одна из важнейших основ империалистической политики, роста милитаризма и агрессии.

PORTFOLIO MANAGEMENT = УПРАВЛЕНИЕ ПОРТФЕЛЕМ – Portfolio Management is the management of assets by an asset manager commissioned to perform this function on the basis of a management mandate. The asset administration service provided by the banks is sometimes linked with the safe custody business. Also known as Asset Management. See also Managed Account, Open Safekeeping Account, and Sealed Safekeeping Account. / Счёт Ответственного Хранения (Safekeeping Account).

PORTFOLIO MORTGAGE = ПОРТФЕЛЬНАЯ ЗАКЛАДНАЯ (или ПОРТФЕЛЬНАЯ ИПОТЕКА) – Portfolio Mortgage:- adjustable-rate mortgage split into several fixed-rate mortgages each of which is renewed on maturity for the same term. The rate of interest on a portfolio mortgage is calculated as a sliding average of the rates on the component fixed-rate mortgages. Advantage:- 'evened out' rate of interest with minimized risk of fluctuation. / Закладная с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) разделяется на несколько закладных с фиксированной ставкой (fixed-rate mortgages), каждая из которых . риск флуктуации (колебания).

PORTFOLIO REINSURANCE = ПОРТФЕЛЬНОЕ ПЕРЕСТРАХОВАНИЕ – Portfolio Reinsurance:- in transactions of reinsurance, it refers to all the risks of the reinsurance transaction. For example, if one company reinsures all of another's outstanding Automobile business, the reinsuring company is said to assume the 'portfolio' of Automobile business and it is paid the total of the unearned premium on all the risks so reinsured (less some agreed commission).

PORTFOLIO RUN–OFF = XX – In reinsurance, Portfolio Run-Off:- permitting premiums and losses in respect of in-force business to run to their normal expiration upon termination of a reinsurance treaty. The opposite of Return Of Portfolio.

PORTHOLE CONTAINER = КОНТЕЙНЕР С ВЕНТИЛЯЦИОННЫМИ ОТВЕРСТИЯМИ (или КОНТЕЙНЕР С ЕСТЕСТВЕННОЙ ВЕНТИЛЯЦИЕЙ) – Porthole Containers:- openings for supply and return air in an external unit. Such containers are also known as 'Porthole Containers', the name arising from the similarity between these openings and the round ships' windows known as Portholes. Porthole Containers are refrigerated containers without a separate refrigeration unit:- Porthole refrigerated containers, also called Insulated or CONAIR Containers, do not have their own refrigeration unit. They are thus reliant on an external supply of cold air. This is achieved by refrigeration units of various types, permanently installed on the ship, permanently installed in the terminal or clip-on units for individual containers. Porthole containers are thermally insulated and have two sealable openings on the end walls (the portholes) through which cold air can be blown into the container and warm air can be extracted. The cold air is forced through the lower opening

into the container, then distributed throughout the load via the T-bar floor, and subsequently flows through the load to the top of the container and is extracted through the upper opening. / КОНЭА (CONAIR). С торца у такого контейнера имеются два круглых отверстия, через которые может подаваться воздух от присоединяемой термоустановки.

PORT MARKS = ПОРТОВЫЕ ЗНАКИ – Port Marks:- an identifying set of letters, numbers and/or geometric symbols followed by the name of the port of destination, which are placed on export shipments. / Идентифицирующий набор букв, цифр и/или геометрических символов, сопровождающий название порта назначения, и который размещается на вывозимых партиях груза.

PORT OF CALL = ПОРТ ЗАХОДА – Port Of Call is a port where a ship discharges or receives traffic. Place where a vessel actually moors during a voyage. / Порт Захода – порт, в котором судно разгружает или получает .

PORT OF DISCHARGE = ПОРТ РАЗГРУЗКИ – The Port Of Discharge is a port where cargo is actually discharged/unloaded from seagoing vessel. / Порт Разгрузки – порт, в котором груз фактически разгружается/выгружается из идущего морем судна.

PORT OF ENTRY = ПОРТ ВВОЗА – Port Of Entry is a port at which foreign goods are admitted into the receiving country. / Порт Ввоза – порт, через который иностранные товары завозятся в страну назначения.

PORT OF LOADING = ПОРТ ПОГРУЗКИ – Port Of Loading is a port where cargo is loaded on board seagoing vessel. The port where the cargo is actually loaded on board the vessel. / Порт Погрузки – порт, в котором груз фактически загружается на борт морского или океанского судна.

PORT SIDE = БАКБОРТ (или ЛЕВЫЙ БОРТ) – Port Side (maritime term):- the left side of a vessel when looking forward. See also Starboard. / Бакборт или Левый Борт – морской термин, означающий левую сторону судна при его направлении вперёд. Смотрите также Штирборт или Правый Борт (Starboard). Борт судна (от Немецкого слова Bord), совокупность элементов набора и обшивки, образующая боковые стенки корпуса судна. Различают левый (бакборт) и правый (штирборт) борта, если смотреть от кормы к носу судна. От высоты борта зависит грузовместимость судна; высотой непроницаемого надводного борта определяется запас плавучести судна. Высота надводного борта влияет также на остойчивость при больших углах крена и на продольную прочность корпуса. Борта в средней части судна обычно вертикальны, иногда наклонены наружу (борт с развалом), а на ледоколах и некоторых других судах – наклонены внутрь (борт с завалом).

PORT STATE CONTROL = ГОСУДАРСТВЕННЫЙ ПОРТОВЫЙ КОНТРОЛЬ – Port State Control:- the inspection of foreign ships in national ports for the purpose of verifying that the condition of a ship and its equipment comply with the requirements of international conventions and that the vessel is manned and operated in compliance with applicable international law.

PORT TO PORT CARRIAGE = ПЕРЕВОЗКА ИЗ ПОРТА В ПОРТ – Port-To-Port Carriage means carriage between the port of loading and the port of discharge. If carriage under the Bill of Lading is Port-to-Port:- (i) the period of responsibility of the carrier for any loss of or damage to the goods shall commence only at the moment that the goods are loaded on board the vessel and shall end when the goods have been discharged from the vessel; (ii) the Bill of Lading shall be subject to the Hague Rules unless the governing law makes the Hague or the Hague-Visby Rules compulsorily applicable in which case the said Hague or Hague-Visby Rules will apply to the Bill of Lading only to the extent that they are compulsorily applicable; and (iii) notwithstanding the above, in case and to the extent that the governing law, or a contractual arrangement, or custom and practice, or any court or tribunal decision extends the carrier's period of responsibility whether in contract, tort, bailment or otherwise to all or any part of the period before loading, or the period after discharge, including for misdelivery, then carrier shall have the benefit of every right, defence, immunity, limitation and liberty provided for in the Hague Rules during such additional period of responsibility, notwithstanding that the loss, damage or misdelivery did not occur during the carriage by sea.

POS = PERMANENTLY OUT OF SERVICE

POS = POINT OF SALE

POSH = ШИКАРНОЕ (или РОСКОШНОЕ, или ФЕШЕНЕБЕЛЬНОЕ) – Posh (maritime term):- elegant, luxurious. Originally an acronym for Port Over Starboard Home. Created by British travelers to India or Australia, describing the preferred accommodations aboard ship, which lessened effects of the tropical sun on the cabins during the voyage.

POSITION = ПОЗИЦИЯ – Position:- an interest in the market, either long or short, in the form of one or more open contracts. Also, 'In Position' refers to a commodity located where it can readily be moved to another point or delivered on a futures contract. Commodities not so situated are out of position. Soybeans in Mississippi are out of position for delivery in Chicago, but in position for export shipment from the Gulf. In the stock market, a Position is the amount of a stock owned or owed by an investor or trader, or the relationship between an investor's or trader's short positions and long positions. The net total of a trader's open contracts, either long or short, in a particular underlying commodity. A Position is a market commitment expressed by buying or selling. An interest in the market in the form of one or more open commitments, either long or short. Usually this term with respect to any person shall mean all the exchange contracts held by such person A buyer of an asset is said to have a long position and, conversely, a seller of an asset is said to have a short position. Position is an interest in the market in the form of open commitments, either long or short. Position:- the net tonnage a party has bought or sold on any given prompt date. Also the overall position, being the net tonnage bought or sold for all prompt dates combined. Position is an open commitment in a market, long or short. A term Position describes the position of a trader as a buyer (long position), a seller (short position), or a spread trader (long and short). / Интерес в рынке в форме одного или более открытых обязательств, будь-то покупки (длинная позиция) или продажи (короткая позиция). В отношении любого лица этот термин, обычно, обозначает все биржевые контракты, удерживаемые таким лицом. О покупателе актива говорят, что он имеет длинную позицию, и наоборот, о продавце актива говорят, что он имеет короткую позицию. В биржевой деятельности под Позицией, от Латинского слова Positio, означающее Положение, понимается открытое обязательство в рынке, будь-то в виде покупки или в виде продажи.

POSITION ACCOUNTABILITY = ВОЗМОЖНОСТЬ ОТЧЁТНОСТИ ПО ПОЗИЦИИ – Position Accountability is a rule adopted by an exchange requiring persons holding a certain number of outstanding contracts to report the nature of the position, trading strategy, and hedging information of the position to the exchange, upon request of the exchange. See also Speculative Position Limit.

POSITIONAL CLONING = ПОЗИЦИОНАЛЬНОЕ КЛОНИРОВАНИЕ – Positional Cloning is the experimental approach used to locate and isolate gene sequences for which the gene product is not known. Instead the phenotype is mapped and large fragments are isolated in the region of informative molecular markers known to segregate closely with the gene of interest. / .

POSITION DAY = ДЕНЬ ПОЗИЦИИ – Position Day:- according to the Chicago Board of Trade rules, the first day in the process of making or taking delivery of the actual commodity on a futures contract. The clearing firm representing the seller notifies the Board of

Trade Clearing Corporation that its short customers want to deliver on a futures contract. / Согласно правил Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными), первый день .

POSITIONING = ПОЗИЦИОНИРОВАНИЕ (или УСТАНОВКА НА МЕСТО, или ПЕРЕМЕЩЕНИЕ В ТРЕБУЕМОЕ МЕСТО) – The moving of empty equipment from surplus areas to deficit areas. Positioning:- the transport of empty equipment from a depot to shipper's premises or from consignee's premises back to a depot as the empty leg of a carrier haulage transport. / перевозка порожнего оборудования из депо (парка) (depot) в помещения отправителя или из помещений .

POSITION LIMIT = ЛИМИТ ПОЗИЦИИ (или ПОЗИЦИОННЫЙ ЛИМИТ) – Position Limit:- the maximum position, either net long or net short, in a futures market, an options market or in a futures and its related options market combined, that may be held or controlled by one person as prescribed by an exchange or the US Commodity Futures Trading Commission (CFTC). Such limits can be set for individual expiration months and for all listed expiration months combined. Because hedgers often are exempt from these limits, they often are termed speculative limits. Position Limit is the maximum futures market position speculators are legally permitted to own or control. Also known as Trading Limit. See also Speculative Position Limit. The maximum number of speculative futures contracts, as prescribed by an exchange or the US CFTC, either net long or net short, in one futures or in all futures of one commodity combined that may be held or controlled by one person or firm in its own name. Does not apply to bona fide hedgers. / заслуживающий доверия или действительный (bona fide). Лимит Позиции – максимальное количество срочных контрактов, которым может владеть одно лицо.

POSITION OF GARMENT IN PACKAGE OR BOX = ПОЛОЖЕНИЕ ШВЕЙНОГО ИЗДЕЛИЯ В УПАКОВКЕ ИЛИ КОРОБКЕ – Position Of Garment In Package Or Box:- Must be sufficient for shipping and possible display depending upon the tradition of merchandising of the individual type garment in question. Finishing department defects, and namely – Packaging. / Порок или дефект заключительной обработки.

POSITION SQUARING = РАСКВИТЫВАНИЕ С ПОЗИЦИЕЙ – Position Squaring is a squaring a current market position by either buying back a short position or selling a long position. For example:- an investor has sold 100 shares short, i.e. he has borrowed equity and then sold it. Up until the time he repurchases the 100 shares (in order to give them back to the original lender) he is faced with the risk of rising prices, which means that he would have to pay more to buy them back than the sales proceeds he received. That risk ceases to exist as soon as the 100 shares have been purchased. This is called Squaring (or Closing) an open position.

POSITION TRADER = ПОЗИЦИОННЫЙ ТОРГОВЕЦ – Position Trader is a commodity trader who either buys or sells contracts and holds them for an extended period of time, as distinguished from the Day Trader, who will normally initiate and offset a futures position within a single trading session. A futures trader who either buys or sells contracts and holds them for an extended period of time, as distinguished from a day trader, who will normally initiate and offset a futures position within a single trading session and end the day flat. Position Trader is a trader who carries long or short positions from one day to another. Short term position traders carry positions as short as one week. Long term position traders may take positions extending over a year. / Позиционный Торговец – торговец, либо покупающий, либо продающий фьючерсные контракты, и удерживающий их в течение разных периодов времени, в отличие от внутрисуточного торговца, обычно открывающего и закрывающего позиции по фьючерсным контрактам в пределах одной торговой сессии и заканчивающий день как сложилось.

POSITION TRADING = ПОЗИЦИОННАЯ ТОРГОВЛЯ – Position Trading is a style of trading characterized by holding open positions for an extended period of time. Contrast this with day trading, where a trader buys, then sells out of a position before the market closes that day. / Позиционная Торговля – стиль торговли, характеризуемый удержанием открытых позиций в течение длительного периода времени. Это противоположность торговле в течение дня, в которой торговец покупает, а затем продаёт, тем самым закрывая позицию, до того, как в этот день закроется соответствующий рынок.

POSITIVE ACKNOWLEDGEMENT = ПОДТВЕРЖДЕНИЕ В ПРИЁМЕ (или ПОДТВЕРЖДЕНИЕ ПРАВИЛЬНОГО ПРИЁМА) – A Positive Acknowledgement, sent by the receiving system to the sender, that a request SWIFT message has been successfully processed. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

POSITIVE CARRY = ПРЯМЫЕ РАСХОДЫ (или ПОЗИТИВНЫЕ РАСХОДЫ) – Positive Carry:- the cost of financing a financial instrument (the short-term rate of interest), where the cost is less than the current return of the financial instrument. See also Carrying Charges, and Negative Carry. / , от Латинского слова Positivus, означающее Положительное, .

POSITIVE CRANKCASE VENTILATION SYSTEM = СИСТЕМА ПРИНУДИТЕЛЬНОЙ ВЕНТИЛЯЦИИ КАРТЕРА – Positive Crankcase Ventilation System (PCV System) is a system which prevents the vapors of a crankcase from being directly discharged into the atmosphere. / картера от .

POSITIVE CRANKCASE VENTILATION VALVE = КЛАПАН ПРИНУДИТЕЛЬНОЙ ВЕНТИЛЯЦИИ КАРТЕРА – A Positive Crankcase Ventilation (PCV) Valve is a one-way valve that ensures the continual flow and evacuation of gases from the crankcase into the engine. See also Valve. / из картера в двигатель. Смотрите также Клапан (Valve).

POSITIVE FEED = ПРЯМАЯ ПОДАЧА – Positive Feed:- when the yarn is metered off the warp beam by a metering device. See also Negative Feed.

POSITIVE YIELD CURVE = ПОЛОЖИТЕЛЬНАЯ КРИВАЯ ДОХОДНОСТИ (или КРИВАЯ ПОЛОЖИТЕЛЬНОЙ ДОХОДНОСТИ) – A Positive Yield Curve results when the yield on long-term US Treasury bonds is higher than the yield on on short-term Treasury bills. You create the curve by plotting a graph with yield on the vertical axis and maturity date on the horizontal axis and connecting the dots. When the curve is positive the highest point is to the right. In most periods, the yield curve is positive because investors demand more for tying up their money for a longer period. When the reverse is true, and yields on short-term investments are higher than the yields on long-term investments, the curve is negative, or inverted. That typically occurs if inflation spikes after a period of relatively stable growth or if the economic outlook is uncertain. The yield curve can also be flat, if the rates are essentially the same. Positive Yield Curve:- when long-term debt interest rates are higher than short-term debt rates (because of the increased risk involved with long-term debt security). See also Yield Curve. Normal Yield Curve is a yield curve in which short-term debt instruments have a lower yield than long-term debt instruments of the same credit quality. This gives the yield curve an upward slope. This is the most often seen yield curve shape. Sometimes referred to as Positive Yield Curve. This yield curve is considered 'normal' because the market usually expects more compensation for greater risk. Longer-term bonds are exposed to more risks such as changes in interest rates and an increased exposure to potential defaults. Also, investing money for a long period of time means an investor is unable to use the money in other ways, so the investor is compensated for this through the time value of money component of the yield. Positive Yield Curve:- the normal relationship between bond yields and maturity lengths that results from higher interest rates on long-term bonds than on

short-term bonds. Positive refers to the slope of the curve drawn to depict this relationship. Compare Negative Yield Curve. See also Flat Yield Curve. Positive Yield Curve:- a situation in which long-term debt instruments have higher yields than short-term debt instruments. This is the usual condition, and happens because investors demand a higher return for taking on the additional risk of the longer-term investment. Also called Normal Yield Curve. / Смотрите также Кривая Доходности (Yield Curve).

POSSESSION = ПОСЭССИЯ (или ПОСЕССИЯ, или ВЛАДЕНИЕ, или ОБЛАДАНИЕ) – (1) Possession:- the ownership, control, or occupancy of a thing, most frequently land or personal property, by a person. The United States Supreme Court has said that 'there is no word more ambiguous in its meaning than possession'. Depending on how and when it is used, the term possession has a variety of possible meanings. As a result, possession, or lack of possession, is often the subject of controversy in civil cases involving real and personal property and criminal cases involving drugs and weapons – for example, whether a renter is entitled to possession of an apartment or whether a criminal suspect is in possession of stolen property. The idea of possession is as old as the related concepts of private property and ownership. Our modern possession laws originated in the ancient Roman doctrines of possessio. English natural law inherited most of the Roman possession ideas, and later the British brought their law of possession to the American colonies. Following the War of Independence, state and federal courts continued to use and expand upon the historical notions of possession. Possession versus Ownership:- although the two terms are often confused, possession is not the same as ownership. No legal rule states that 'possession is nine-tenths of the law', but this phrase is often used to suggest that someone who possesses an object is most likely its owner. Likewise, people often speak of the things they own, such as clothes and dishes, as their possessions. However, the owner of an object may not always possess the object. For example, an owner of a car could lend it to someone else to drive. That driver would then possess the car. However, the owner does not give up ownership simply by lending the car to someone else. The myriad distinctions between possession and ownership, and the many nuances of possession, are complicated even for attorneys and judges. To avoid confusion over exactly what is meant by possession, the word is frequently modified by adding a term describing the type of possession. For example, possession may be actual, adverse, conscious, constructive, exclusive, illegal, joint, legal, physical, sole, superficial, or any one of several other types. Many times these modifiers are combined, as in 'joint constructive possession'. All these different kinds of possession, however, originate from what the law calls 'Actual Possession'. Actual Possession:- 'Actual possession is what most of us think of as possession – that is, having physical custody or control of an object'. Actual possession, also sometimes called Possession In Fact, is used to describe immediate physical contact. For example, a person wearing a watch has actual possession of the watch. Likewise, if you have your wallet in your jacket pocket, you have actual possession of your wallet. This type of possession, however, is by necessity very limited. Frequently, a set of facts clearly indicate that an individual has possession of an object but that he or she has no physical contact with it. To properly deal with these situations, courts have broadened the scope of possession beyond actual possession. Constructive Possession:- constructive possession is a legal theory used to extend possession to situations where a person has no hands-on custody of an object. Most courts say that constructive possession, also sometimes called 'Possession In Law', exists where a person has knowledge of an object plus the ability to control the object, even if the person has no physical contact with it. For example, people often keep important papers and other valuable items in a bank safety deposit box. Although they do not have actual physical custody of these items, they do have knowledge of the items and the ability to exercise control over them. Thus, under the doctrine of constructive possession, they are still considered in possession of the contents of their safety deposit box. Constructive possession is frequently used in cases involving criminal possession. Criminal Possession:- both federal and state statutes make possession of many dangerous or undesirable items criminal. For example, the federal statute 26 USCA § 5861 (1996; 26 USCA is short for the United States Code Annotated:- Title 26) prohibits possession of certain firearms and other weapons. Likewise, the possession of other items considered harmful to the public, such as narcotics, burglary tools, and stolen property, is also made criminal under various laws. Criminal possession, especially of drugs, has been a major source of controversy. Making possession a crime allows for arrests and convictions without proving the use or sale of a prohibited item. Historically, actual possession was required for a criminal possession conviction. Beginning in the 1920s, however, courts began expanding criminal possession to include constructive possession. The federal prohibition of intoxicating liquors spawned several cases involving criminal possession. In one of the first criminal cases to use constructive possession, the court found a defendant guilty of possessing illegal liquor in trunks in the actual possession of another person. Subsequent cases, especially narcotics cases, have continued to expand the law of criminal possession. Possession and Intent:- In civil cases intent is rarely a part of possession. However, in criminal cases possession usually requires conscious possession. In other words, the person must be conscious of the fact that the item is illegal and that he or she possesses it. A person with possession of illegal drugs may avoid conviction if he or she believed the drugs were legal. Generally, to be guilty of criminal possession, a person must either know the item is illegal when it is received or must keep possession of the object after learning it is illegal. / Под Посэссией, от Латинского слова Possessio, означающее Владение, понимается условное владение. Посэссионное Право или Посессионное Право – условное владение людьми или землями, предоставленное промышленными предпринимателям России в XVIII–XIX веках. Условность владения заключалась в неотчуждаемости рабочей силы и земель от данного предприятия. Впервые термин Посэссия появился в указе 11 Августа 1797. Начало посэссионного права было положено указом 1721, по которому промышленникам-недворянам разрешалась покупка населённых имений с целью развития производства. Посэссионное право распространяло крепостничество на сферу промышленности в период развития крупной мануфактуры. Посэссионное право на рабочую силу сохранялось до падения крепостнических отношений (отменено указами 16 Марта 1861 и 27 Мая 1863), а на владение землями – местами до 1917.

(2) Possession is a having, holding, or detaining property in one's control. When compared with mere custody, possession involves custody plus the assertion of a right to exercise dominion. The holding, control, or custody of property for one's use, either as owner or person with another right.

(3) The Possession is an ownership or control of information, as distinct from confidentiality. For example, if confidential information such as a user ID-password combination is in a sealed container and the container is stolen, the owner justifiably feels that there has been a breach of security even if the container remains closed (this is a breach of possession or control over the information). Possession is one of the six fundamental components of information security.

POSSESSORY LIEN = ПОСЭССИОННОЕ УДЕРЖАНИЕ (или ПОСЕССИВНОЕ УДЕРЖАНИЕ, или ПРАВО ОБРЕМЕНЕНИЯ ИМУЩЕСТВА, или УДЕРЖАНИЕ ИМУЩЕСТВА В РАСПОРЯЖЕНИИ) – Possessory Lien:- property that is in the hands of, or is possessed by, the individual who grants the lien. A lien is the claim that one person has over the property of another as security for the payment of a debt. In a possessory lien, the creditor has a right to remain in possession of the property under the lien until the debtor has satisfied his or her debt. For example, if an individual buys something on credit, the item will not be in his or her possession until the debt to the creditor has been paid. This is different from most liens in the United States, where the lienee is granted possession of the property before the debt is satisfied, as is the case in a home mortgage. A lien does not constitute ownership; rather, it is a type of encumbrance. Liens are attached to the property and not to a person. Possessory Lien is the legally founded right to retain property until a claim is met. Possession must be continuous, rightful and not for a particular purpose. The English common law early recognized the creditor's Possessory Lien, a right of a creditor to retain possession of a debtor's goods until

the satisfaction of the debt, generally the payment of the purchase price. In time, the common law developed two kinds of possessory liens:- specific liens and general liens. Possessory Lien is a claim which can be enforced in case the lienor has possession of the goods of the lienee. For instances, agents, bankers or carriers can exercise possessory lien. / Под Посэссией, от Латинского слова Possessio, означающее Владение, понимается условное владение. Юридически обоснованное право удерживать имущество до той поры, пока не будет удовлетворена претензия. Распоряжение должно быть непрерывным, правомочным и не для какой-то конкретной цели. Удержание – в гражданском праве один из способов обеспечения исполнения обязательств. Согласно Гражданского Кодекса Российской Федерации кредитор, у которого находится вещь, подлежащая передаче должнику либо лицу, указанному должником, вправе – в случае неисполнения последним в срок обязательства по оплате этой вещи или возмещению кредитору связанных с нею издержек и других убытков – удерживать её до тех пор, пока соответствующее обязательство не будет исполнено. Удержание вещи могут обеспечивать и требования, если они возникли из обязательства, сторонами которого являются предприниматели. Кредитор может удерживать вещь даже после того, как права на неё приобретены третьим лицом. Требования кредитора, удерживающего вещь, удовлетворяются из её стоимости в объёме и порядке, предусмотренных для залоговых обязательств. Общеизвестно, что собственник вправе совершать любые законные действия в отношении принадлежащего ему имущества – отчуждать его во владение другим лицам, отдавать в залог, обременять другими способами. Под обременением понимают наличие установленных законом или уполномоченными органами условий, запрещений, стесняющих правообладателя при осуществлении права собственности либо иных вещных прав на конкретный объект недвижимого имущества. Наиболее распространённые виды ограничения – аренда, ипотека, сервитут, доверительное управление. Обременение правами третьих лиц – это один из способов распоряжения имуществом. Его нередко применяют в целях исключения ‘недружественного’ захвата имущества (в данном случае совершение всех сделок необходимо осуществлять исключительно с ‘дружественными’ компаниями). Обременение – действие, процесс или событие, направленные на уменьшение свободы действий субъекта или на уменьшение возможностей изменения состояния объекта. Обременённый объект или субъект всегда является в определённом смысле ущербным по отношению к необременённому, поскольку лишён каких-либо качеств, свойств или возможностей к изменению своего состояния или статуса. Обременение – статус объекта или субъекта, выражающийся в ограниченной свободе действий субъекта или на уменьшении возможностей изменения состояния объекта. Обременение – статус объекта, ограничивающий возможность действий по распоряжению объектом, а также по изменению его качеств, характеристик и состояния. Наиболее распространёнными видами обременения являются залог и арест.

POSSIBLE DUPLICATE EMISSION TRAILER = КОНЦОВКА О ВОЗМОЖНОМ ВЫПУСКЕ ДУБЛИКАТА – A Possible Duplicate Emission (PDE) Trailer:- this user trailer warns the receiver that the same message may already have been input and received via SWIFT. / Концовка о Возможном Выпуске Дубликата (ВВД):- эта концовка пользователя предупреждает получателя о том, что то же самое сообщение уже могло быть поступившим и полученным по каналам связи СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

POSSIBLE RESERVES = ВОЗМОЖНЫЕ РЕЗЕРВЫ – Possible Reserves are those unproved reserves which analysis of geological and engineering data suggests are less likely to be recoverable than probable reserves. In this context, when probabilistic methods are used, there should be at least a 10% probability that the quantities actually recovered will equal or exceed the sum of estimated proved plus probable plus possible reserves. In general, possible reserves may include (1) reserves which, based on geological interpretations, could possibly exist beyond areas classified as probable, (2) reserves in formations that appear to be petroleum bearing based on log and core analysis but may not be productive at commercial rates, (3) incremental reserves attributed to infill drilling that are subject to technical uncertainty, (4) reserves attributed to improved recovery methods when (a) a project or pilot is planned but not in operation and (b) rock, fluid, and reservoir characteristics are such that a reasonable doubt exists that the project will be commercial, and (5) reserves in an area of the formation that appears to be separated from the proved area by faulting and geological interpretation indicates the subject area is structurally lower than the proved area. See also Reserves. Possible Reserves:- valuable mineralization not sampled enough to estimate accurately its tonnage and grade, or even verify its existence. Also called as Inferred Reserves. In oil industry, possible reserves are an estimate of reserves from an undrilled site or one that has not bee seismically tested. / Залежи полезных ископаемых, по которым не отобраны пробы в объёме, достаточном для точной оценки тоннажа и сорта, или хотя бы для подтверждения их наличия. Известны также как Предполагаемые Резервы (Inferred Reserves). В нефтяной отрасли показатель возможных резервов представляет собой расчёт резервов на неразбуренном месторождении или на месторождении, где не проводилась сейсморазведка.

POST = СТОЙКА – Post is a member, either fixed, collapsible or detachable, positioned vertically on a pallet to take the weight of superimposed pallets. See also Pallet. / Стойка (Post):- вертикальная деталь стоечного поддона, закреплённая или съёмная и предназначенная для восприятия нагрузки при штабелировании поддонов. Смотрите также Поддон (Pallet).

POST = СТОЛБ (или СТОЙКА, или ПОДПОРКА, или ПОДКОС, или МАЧТА) – Post is a timber with larger dimension not more than 51 mm (2”) greater than the smaller dimension and usually graded for use as a column. / Неподвижное звено механизма называют Стойкой.

POSTAGE PAID = ПЕРЕСЫЛКА ОПЛАЧЕНА – Postage Paid:- in Australia, for example, if you have an envelope that says ‘Postage Paid’ it’s only intended for use by businesses who have a franking machine, or who lodge their mail using Australia Post’s Bulk Lodgement service, or who have an existing mail pickup arrangement with Australia Post. They still pay the postage this way. It’s a convenience. If an individual has an envelope with Postage Paid on it, it doesn’t mean anything. You still have to put a stamp, because you never paid the postage using alternative methods. If the business you are sending mail to has a ‘Reply Paid’ address and number, it just means that the recipient will be invoiced for the postage. Also known as Free (Of Charge), and Freight Prepaid. ‘Postage Paid’ is only in terms of posting the letter to any destination within the country during a business day (weekdays, non public holidays), so anything you post over seas or weighs more than what is stated either on the envelope or in the T and C of the post office, you will have to pay the difference, to cover the posting expense of the post office.

POSTAL CHECK = ПОЧТОВЫЙ ЧЕК – Postal Check is a special order used by the holder of a postal checking account to dispose over the balance in his account and make payments. / Специальный ордер, используемый владельцем почтового чекового счёта для распоряжения остатком на своём счёте и осуществления платежей.

POSTAL GIRO TRANSFER = ПОЧТОВЫЙ БЕЗНАЛИЧНЫЙ ПЕРЕВОД (или ПОЧТОВЫЙ ПЕРЕВОД ЖИРО) – Postal Giro Transfer is a cashless transfer of money between different postal checking accounts. / Безналичный перевод денег между почтовыми чековыми счетами.

POSTAL MONEY ORDER = ПОЧТОВОЕ ДЕНЕЖНОЕ ПОРУЧЕНИЕ – In Switzerland, Postal Money Order is an instrument used for paying/transferring money to a person or entity that does not maintain a postal checking account. / В Швейцарии, инструмент,

используемый для оплаты или перевода денежных средств физическому или юридическому лицу, не имеющему своего счёта на почте.

POSTAL PAYMENT ORDER = ПОЧТОВОЕ ПЛАТЁЖНОЕ ПОРУЧЕНИЕ – In Switzerland, Postal Payment Order is an order by the owner of a postal checking account to make payment to a beneficiary who himself is not a postal checking accountholder. It is also possible nowadays to use an assignment check for such purposes. In the United Kingdom, Postal Order for the payment of money up to the value of GBP20.00 that can be purchased at any UK Post Office and encashed at a Post Office or paid into a bank account. A commission called Poundage (95p (pences) on a GBP20.00 postal order) is paid by the person who buys the order.

POSTAL RETAIL FACILITY = ПОЧТОВАЯ РОЗНИЧНАЯ УСТАНОВКА – The term Postal Retail Facility:- (a) means post office, post office branch, post office classified station, or other facility that is operated by the US Postal Service, the primary function of which is to provide retail postal services; and (b) does not include a contractor-operated facility offering postal services. Each postal retail facility and each member bank with total consolidated assets of not greater than USD10 000 000 000 shall be reimbursed each calendar quarter by the relevant Federal Reserve bank for the actual and reasonable operational costs incurred by the postal retail facility or member bank in offering pass-through digital Dollar wallets. See also Digital Dollar Wallets, and Pass-Through Digital Dollar Wallets.

POSTAL SERVICE = ПОЧТОВАЯ СЛУЖБА – The term Postal Service means the United States Postal Service.

POSTCARD RECEIPT = КВИТАНЦИЯ О ПРИЁМЕ ПОЧТОВОЙ ОТКРЫТКИ – Postcard Receipt:- a self-addressed, stamped postcard with itemized list of parts of patent application and number of pages per MPEP 503; used as a receipt for what was submitted in an application. / почтовая квитанция, представляющая собой документ, по которому устанавливается приоритет.

POSTCLIMACTERIC = ПОСТКЛИМАКТЕРИЧЕСКОЕ – Postclimacteric:- (Latin:- post – after; climactericus – turning point, critical time) Physiological ripeness.

POST–CURE = С ПОСЛЕДУЮЩЕЙ ВУЛКАНИЗАЦИЕЙ – Post-Cure:- a type of durable press finish in which the finish is applied to the fabric by the mill, but the garment manufacturer completes the cure of the finish by applying heat, using an oven, or press, or both to the completed garment. Postcure:- additional elevated-temperature cure especially without pressure, to improve final properties and/or complete the cure, or decrease the percentage of volatiles in the compound.

POSTED PRICE = ЗАЯВЛЕННАЯ ЦЕНА – Posted Price is an announced or advertised price indicating what a firm will pay for a commodity or the price at which the firm will sell it. The price some refiners will pay for crude of a certain American Petroleum Institute gravity from a particular field or area.

POSTEMERGENCE = ПОСЛЕВСХОДОВОЕ – Post Emergence:- factors that are relevant after the emergence of the seedling or weed from the soil. Postemergence (POST):- applied after the emergence of the specified crop.

POSTEMERGENCE–DIRECTED = УКАЗАННОЕ (или НАПРАВЛЕННОЕ, или ВНОСИМОЕ) ПОСЛЕВСХОДОВОЕ – Postemergence-Directed is a herbicide placement after seedling emergence directed to the base of cotton plants; better control if cotton has grown significantly taller than weeds, e.g., Bladex.

POSTEMERGENCE HERBICIDE = ПОСЛЕВСХОДОВЫЙ ГЕРБИЦИД – Postemergence Herbicide is a weed-killing chemical applied soon after cotton emerges. Spray is directed on small weeds below the cotton leaves. A herbicide applied after crop or weed emergence. Postemergence Herbicide is an herbicide applied after the crop and or weeds have emerged from the soil. / Гербицид, применяемый после всхода сельскохозяйственной культуры или сорняков.

POSTEMERGENCE OVER THE TOP = ПОСЛЕВСХОДОВОЕ XX – Postemergence Over The Top is the herbicides applied directly over the canopy of both cotton and weeds; sometimes represents a salvage treatment following inadequate PPI or preemergence weed control; some compounds may cause maturity delays and yield reductions, e.g., Cotoran.

POSTEMERGENT = ПОСЛЕВСХОДОВЫЙ – Postemergent:- period of time after the emergence of crop seedlings. / Период времени, следующий за всходом посевов сельскохозяйственной культуры.

POST–EMPLOYMENT BENEFITS = ВЫПЛАТЫ ПО ОКОНЧАНИИ ТРУДОВОЙ ДЕЯТЕЛЬНОСТИ – Post-Employment Benefits are employee benefits (other than termination benefits) which are payable after the completion of employment. Post-employment benefit plans are formal or informal arrangements under which an entity provides post-employment benefits for one or more employees. Post-employment benefit plans are classified as either defined contribution plans or defined benefit plans, depending on the economic substance of the plan as derived from its principal terms and conditions. (i) Post-employment benefits:- defined contribution plans:- Defined contribution plans are post-employment benefit plans under which an entity pays fixed contributions into a separate entity (a fund) and will have no legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits relating to employee service in the current and prior periods. Under defined contribution plans:- (a) the entity's legal or constructive obligation is limited to the amount that it agrees to contribute to the fund. Thus, the amount of the post-employment benefits received by the employee is determined by the amount of contributions paid by an entity (and perhaps also the employee) to a post-employment benefit plan or to an insurance company, together with investment returns arising from the contributions; and (b) in consequence, actuarial risk (that benefits will be less than expected) and investment risk (that assets invested will be insufficient to meet expected benefits) fall on the employee. When an employee has rendered service to an entity during a period, the entity shall recognise the contribution payable to a defined contribution plan in exchange for that service:- (a) as a liability (accrued expense), after deducting any contribution already paid. If the contribution already paid exceeds the contribution due for service before the balance sheet date, an entity shall recognise that excess as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund; and (b) as an expense, unless another accounting standard requires or permits the inclusion of the contribution in the cost of an asset (see, for example, IAS 2 (short for International Accounting Standard No. 2) Inventories and IAS 16 Property, Plant and Equipment). (ii) Post-employment benefits:- defined benefit plans:- Defined benefit plans are post-employment benefit plans other than defined contribution plans. Under defined benefit plans:- (a) the entity's obligation is to provide the agreed benefits to current and former employees; and (b) actuarial risk (that benefits will cost more than expected) and investment risk fall, in substance, on the entity. If actuarial or investment experience are worse than expected, the entity's obligation may be increased. Accounting by an entity for defined benefit plans involves the following steps:- (a) using actuarial techniques to make a reliable estimate of the amount of benefit that employees have earned in return for their service in the current and prior periods. This requires an entity to determine how much benefit is attributable to the current and prior periods (see paragraphs 67–71) and to make estimates (actuarial assumptions) about demographic variables (such as employee turnover and mortality) and financial variables (such as future increases in salaries and medical costs) that will influence the cost of the benefit (see paragraphs 72–91); (b) discounting that benefit using the Projected Unit Credit Method in order to determine the present value of the defined benefit obligation and the current service cost (see paragraphs 64–66); (c) determining the fair value of any plan assets (see paragraphs 102–104); (d)

determining the total amount of actuarial gains and losses and the amount of those actuarial gains and losses to be recognised (see paragraphs 92–95); (e) where a plan has been introduced or changed, determining the resulting past service cost (see paragraphs 96–101); and (f) where a plan has been curtailed or settled, determining the resulting gain or loss (see paragraphs 109–115). Where an entity has more than one defined benefit plan, the entity applies these procedures for each material plan separately. See also Employee Benefits. / Смотрите также Выплаты Работникам (Employee Benefits). МСБУ 2 (сокращение для Международного Стандарта Бухгалтерского Учёта № 2) – . порядки и условия .

POSTENTRY QUARANTINE = ПОСЛЕВВОЗНОЙ КАРАНТИН – Postentry Quarantine is a quarantine applied to a consignment after entry.

POSTERIOR = ЗАДНЕЕ (или ПОСЛЕДУЮЩЕЕ, или ПОЗДНЕЕ) – Posterior:- towards the back or towards the main axis. / основной оси (axis).

POST EXECUTION REPORTING SYSTEM = СИСТЕМА ОТЧЁТА ПО ИСПОЛНЕНИЮ (РАСПОРЯЖЕНИЙ) – Post Execution Reporting System is the American Stock Exchange® (AMEX®) equities trading system. / АМЭКС® (AMEX®).

POST–FERMENTATION = ПОСТФЕРМЕНТАЦИЯ (или ПОСЛЕБРОЖЕНИЕ) – Post-Fermentation:- heat and moisture can cause products such as coffee, cocoa, tobacco to ferment again, which in turn can make them unfit for consumption.

POSTGIROT = ПОСТШИРО – The Swedish Postgirot is essentially a system for credit transfers between accounts held with what is now the Postgirot Bank, recently purchased by Nordea. The Postgirot system handles all kinds of transactions, both low-value payments to and from households and large-value government payments. Households make extensive use of the Postgirot system, partly as a result of the cooperation agreements that exist between some of the banks and the Postgirot system. Nordea, one of the largest commercial banks, has established links between its system for handling salary payments to government employees and the Postgirot system. In addition, the savings banks have a large number of salary accounts linked to the Postgirot system. The fact that all post office branches in the country can handle transactions, and that they have longer opening hours than the banks, has of course contributed to the popularity of the system. The Postgirot Bank has customer relations with households, companies and other banks which use the Postgirot Bank's services. Banks are charged according to specific arrangements between the bank in question and the Postgirot Bank. With regard to households, companies and organizations, the Postgirot Bank has price lists containing information on fees for the different services it offers. Since 1986 the Postgirot system has been a member of the SWIFT network for international transactions. At the beginning of the 1990s the Postgirot was integrated into Euro-giro, the European network for postal giro systems for the handling of cross-border payments. In 1999 the Swedish government decided to sell the Postgirot Bank. The four major banking groups in Sweden announced their willingness to jointly acquire the whole stock of accounts held by the Postgirot Bank. Their intention was to merge the Postgirot and the Bankgirot systems. However, the Swedish Competition Authority decided against this merger on the grounds that it would lead to the creation of a private monopoly. Instead of the joint takeover, one of the four major banking groups, Nordea, acquired the Postgirot Bank. The Postgirot Bank has recently become a full member of the Bankgirot system. / Нордэа (Nordea). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). Постширо (Postgirot) и Банкширо (Bankgiro). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

POST HARVEST ROT = ПОСЛЕУБОРОЧНАЯ ГНИЛЬ – Post Harvest Rot, or Module Rot, of seed cotton develops when water enters the module through a hole in the module tarp or along the ropes holding the module tarp in place. An 'inky cap' fungus (Coprinus species) is often present in these areas of rotted seed cotton. / Послеуборочная Гниль, или Модульная Гниль, хлопка-сырца развивается когда вода попадает в модуль через отверстие в брезентовой накидке модуля или вдоль мест обвязки поясами брезентовой накидки модуля. Грибы с 'чернильной шляпкой' или чернильные Грибы (Виды Корпинуса (Corpinus)) часто прорастают в этих зонах загниваемого хлопка-сырца.

POST–HARVEST TILLAGE = ПОСЛЕУБОРОЧНАЯ ОБРАБОТКА (ПОЧВЫ) – Pre-(Post) Harvest Tillage is the tillage operations which when placed in a time frame of reference based on the date of crop harvest occur after crop harvest.

POST–INITIATED PROMOTION = XX ПРОДВИЖЕНИЕ – Post-Initiated Promotion:- there is a scheduled low budget trade promotion totally within resources at post, such as the US Business Information Office, Business Facilitation Center or Business Sponsored or Between Show Promotion.

POSTMORTEM = ПОСТМОРТЭМ (или ПОСМЕРТНОЕ) – Postmortem:- (Latin:- post – after; mors – death) after death.

POSTNET = ПОЧТОВАЯ СЕТЬ (или XX) – The POSTNET barcode is used on envelopes and postcards that are sent through the US Postal Service. This barcode is placed in the lower right-hand corner of the envelope.

POST PALLET = СТОЕЧНЫЙ ПОДДОН – Post Pallet is a pallet fitted with posts or blocks between the decks or beneath the top deck. See also Block Pallet. Post Pallet is a pallet having posts to permit stacking, and fitted with either removable rails or gates. / Стоечный Поддон – поддон со съёмными или закреплёнными стойками.

POST–PLANTING TILLAGE = ПОСЛЕПОСАДОЧНАЯ ОБРАБОТКА (ПОЧВЫ) (или ПОСЛЕПОСЕВНАЯ ОБРАБОТКА (ПОЧВЫ)) – Post-Planting Tillage is a tillage operations which when placed in a time frame of reference based on the date of crop planting occur after the crop is planted. / Послепосевная Обработка Почвы – совокупность приёмов механического воздействия на почву в период от посева (посадки) до уборки возделываемой культуры. Послепосевная обработка почвы улучшает аэрацию почвы, уменьшает испарение почвенной влаги, уничтожает всходы сорных растений и создаёт наилучшие условия для прорастания семян и появления дружных всходов сельскохозяйственных растений. При возделывании культур сплошного рядового посева послепосевная обработка почвы состоит обычно из прикатывания почвы и боронования. При возделывании культур широкорядного посева кроме названных приёмов применяют междурядную обработку почвы (культивация, окучивание и другое). При возделывании сахарной Свёклы и некоторых овощных культур междурядную обработку сочетают с нарезкой букетов в рядках.

POST–SHIPMENT VERIFICATIONS = ВЕРИФИКАЦИИ ПОСЛЕ ОТГРУЗКИ (или ПОДТВЕРЖДЕНИЯ ПОСЛЕ ОТГРУЗКИ, или ПОСЛЕОТГРУЗОЧНЫЕ СВЕРКИ) – Post-Shipment Verifications (PSVs) conducted to determine that a commodity is being used for the purposes for which its export was licensed. Firms or individuals representing the end user, intermediate consignees or the purchaser may be subject to inquiries pertaining to the post-shipment verification. As part of the PSV process, the US Bureau of Export Administration forwards a cable to the US embassy or consulate in the respective geographical location to conduct an on-site inspection to ensure that the commodity is physically present and used as stated in the application. Post-shipment verifications are usually conducted six-to-eight months subsequent to export of the commodity.

POST SUPPORT SYSTEM = СИСТЕМА ПОДДЕРЖКИ ПОСТОВ – Post Support System links a Local Area Network (LAN), allowing data to be transmitted to trading floor devices.

POT ASH = ПОТАШ (или УГЛЕКИСЛЫЙ КАЛИЙ) – Potash is a common name for potassium or potassium compounds. Generally used to mean potassium carbonate. Pot Ash:- Potassium Carbonate. A replacement for dye activator or soda ash. / Карбонат Калия или Углекислый Калий или Углекалиевая Соль (Potassium Carbonate). Под Поташем, от Голландского слова Potasch, понимается техническое название Карбоната Калия (K_2CO_3).

POTASSIUM = КАЛИЙ – Potassium is a reactive alkali metal element essential for plant growth and proper development. / Щёлочь (Alkali). Под Калием (Латинское название Kalium (K)) понимается химический элемент I группы Периодической Системы Менделеева; атомный номер 19, атомная масса 39.098 3, относится к щелочным металлам. Название от Арабского слова Аль-Кали, означающее Поташ – давно известное соединение калия, добывавшееся из древесной золы. Серебристо-белый металл, мягкий, легкоплавкий; плотность 0.862 г/см^3, $t_{пл}$ 63.55 °C. Быстро окисляется на воздухе, с водой реагирует со взрывом. По распространённости в земной коре занимает 7-е место (минералы:- каинит, карналлит, сильвин и другие). Постоянная составная часть тканей растительных и животных организмов. Около 90% добываемых солей используется как удобрения. Сам металл применяют для получения надпероксида KO_2; сплавы K с Na – теплоносители в ядерных реакторах. Под Поташем понимается техническое название Калия Карбоната.

POTASSIUM BITARTRATE = КИСЛЫЙ ВИННОКИСЛЫЙ КАЛИЙ – Potassium Bitartrate is a cream of tartar, potassium acid tartrate, potassium hydrogen tartrate, $KHC_4H_4O_6$. Potassium bitartrate is often used with other chemicals as mordant for natural dyes.

POTASSIUM DICHROMATE = ДВУХРОМОКИСЛЫЙ КАЛИЙ (или БИХРОМАТ КАЛИЯ) – Potassium Dichromate, also called Potassium Bichromate; $K_2Cr_2O_7$. Potassium dichromate is the most commonly used chromium ('chrome') mordant in wool dyeing, both with synthetic and natural dyes. In terms of health risks of repeated exposure, it is one of the most hazardous chemicals used by textile art dyers. It is corrosive to tissues and can cause ulceration. It is known to be a human carcinogen. It poses serious disposal problems. Do not use this chemical unless you have consulted and understood a material safety data sheet (MSDS) for it, and have the necessary safety equipment. / Бихромат Калия (Potassium Bichromate) или Двухромокислый Калий – дубитель коллоидных и желатиновых светочувствительных слоёв.

POTASSIUM FIXATION = ФИКСАЦИЯ КАЛИЯ (или СВЯЗЫВАНИЕ КАЛИЯ) – Potassium Fixation is the process of converting exchangeable or water-soluble potassium to moderately soluble potassium.

POTASSIUM MONOPERSULFATE = МОНОПЕРСУЛЬФАТ КАЛИЯ – Potassium Monopersulfate is a 'peroxygen' compound. Potassium monopersulfate can be used as an alternative to hydrogen peroxide for bleaching. It is quite expensive, but a reasonably stable and safe-to-handle dry chemical. Some 'non-chlorine shock' chemicals for swimming pools are based on this compound.

POTASSIUM PERMANGANATE = ПЕРМАНГАНАТ КАЛИЯ (или МАРГАНЦОВОКИСЛЫЙ КАЛИЙ) – Potassium Permanganate, $KMnO_4$. Potassium permanganate is a powerful oxidizing agent which has been used in garment washing indigo-dyed denim to produce a worn, faded appearance. It has also found some use in discharge printing of indigo. It is no longer favored by industry because of environmental concerns. It is quite hazardous, and can be caustic to skin. Care must be used when mixing it with organic materials because it can cause spontaneous combustion. Consult an MSDS if you contemplate using it.

POTASSIUM–SUPPLYING POWER OF SOILS = МОЩЬ ПОЧВ ПО СНАБЖЕНИЮ КАЛИЕМ – Potassium-Supplying Power Of Soils is the capacity of the soil to supply potassium to growing plants in both the exchangeable and the moderately available forms.

POTATOES = КАРТОФЕЛЬ – Potatoes are any wild or commercially produced plant, tuber, or other part of Solanum tuberosum, including all closely related species and cultivars. / Под Картофелем понимаются многолетние клубненосные виды (150) семейства Паслёновых. Выращивают для пищевых, кормовых и технических целей Картофель Андийский (в Южной Америке) и Картофель Чилийский, или Клубненосный (как однолетнее растение в странах с умеренным климатом). Родина – Южная Америка. В Европу завезён в середине XVI века; в полевой культуре (в том числе в России) с XVIII века. Средняя урожайность 150–200 центнеров (ц) с 1 гектара (га). Под Картофелесажалкой понимается машина, которая служит для посадки клубней картофеля с одновременным внесением в почву минеральных удобрений. Основные рабочие органы – ложечно-дисковые высаживающие аппараты, приводимые в действие от вала отбора мощности трактора. Производительность от 1.0 (4-рядные картофелесажалки) до 2 (6-рядные картофелесажалки) га/ч. Под Картофелекопателем понимается навесная машина, которая подкапывает рядки картофеля (1–2), отсеивает почву, отделяет клубни от ботвы и сбрасывает их на поле. Рабочие органы (лемехи, подкапывающие рядки, элеваторы, грохоты или швырялка) приводятся в действие от вала отбора мощности трактора. Производительность 0.3–0.45 га/ч. Под Картофелеуборочным Комбайном понимается машина, которая подкапывает рядки картофеля, отделяет клубни от ботвы, почвы и других примесей, собирает клубни в бункер или транспортные средства. Основные рабочие органы – лемехи, элеваторы или грохоты, ботвоудаляющее устройство, переборочный стол, бункер для клубней. Ширина захвата 1.4–2.8 метра. Производительность 0.2–0.45 га/ч. Под Картофелехранилищем или Постоянным Картофелехранилищем понимаются заглублённые, полузаглублённые или наземные; оборудуются сортировочными и калибровочными машинами; временные картофелехранилища – бурты и траншеи.

POTATO VIRUS X = КАРТОФЕЛЬНЫЙ ВИРУС ИКС. – Potato Virus X (PVX) is the most widespread of all the Potato viruses. It is also referred to as Latent Mosaic, Potato Latent Virus and Potato Mottle Virus.

POTENTIAL EVAPOTRANSPIRATION = ПОТЕНЦИАЛЬНАЯ ЭВАПОТРАНСПИРАЦИЯ – Potential Evapotranspiration (PET):- the loss of moisture by direct evaporation and transpiration from vegetation; a pressure measured in mm. / Эвапотранспирация или Суммарное Испарение (испарение и транспирация).

POTENTIAL FUTURE EXPOSURE = ПОТЕНЦИАЛЬНАЯ ПОДВЕРЖЕННОСТЬ В БУДУЩЕМ – Potential Future Exposure is the additional exposure that a counterparty might potentially assume during the life of a contract or set of contracts beyond the current replacement cost of the contract or set of contracts. See also Current Exposure. / Смотрите также Текущая Подверженность (Current Exposure).

POTENTIALLY UNWANTED APPLICATION = ПОТЕНЦИАЛЬНО НЕНУЖНОЕ ПРИЛОЖЕНИЕ – Potentially Unwanted Application (PUA) or Grayware is a broad category of software, whose intent is not as unequivocally malicious as with other types of malware, such as viruses or Trojan horses. It may however install additional unwanted software, change the behavior of the digital device, or perform activities not approved or expected by the user. Categories that may be considered grayware include:- advertising display software, download wrappers, various browser toolbars, software with misleading behavior, bundleware, trackware, or any other borderline software, or software that uses illicit or at least unethical business practices (despite appearing legitimate) and might be deemed undesirable by an end user who became aware of what the software would do if allowed to install. A Potentially Unsafe

Application is one that is in itself legitimate (possibly commercial) software but which might be misused by an attacker. Detection of these types of application can be enabled or disabled by users of ESET software.

POTENTIAL PEAK LOAD REDUCTION = ПОТЕНЦИАЛЬНОЕ СНИЖЕНИЕ ПИКОВОЙ НАГРУЗКИ – Potential Peak Load Reduction:- the amount of annual peak load reduction capability (measured in kilowatts) that can be deployed from Direct Load Control, Interruptible Load, Other Load Management, and Other Demand-Side Management (DSM) Program activities. It represents the load that can be reduced either by the direct control of the utility system operator or by the consumer in response to a utility request to curtail load. It reflects the installed load reduction capability, as opposed to the Actual Peak Reduction achieved by participants, during the time of annual system peak load.

POTENTIAL RESOURCES = ПОТЕНЦИАЛЬНЫЕ РЕСУРСЫ – Potential Resources:- the volume of natural gas or crude oil that is thought to exist based on geological knowledge, but has not been proven to exist though geophysical techniques or drilling. / Объём природного газа или нефти, который предположительно должен иметься в наличии исходя из геологических познаний, но реальное существование которого не было подтверждёно геофизической техникой или бурением.

POTENTIAL, SOIL WATER = ПОТЕНЦИАЛЬНАЯ, ПОЧВЕННАЯ ВОДА – Potential, Soil Water is the potential energy of a unit quantity of water produced by the interaction of the water with such forces as capillary (matric), ion hydration (osmotic), and gravity, expressed relative to an arbitrarily selected reference potential. In practical application, potentials are used to predict the direction and rate of water flow through soils, or between the soil and some other system, such as plants or the outer atmosphere.

POTENTIAL YIELD = ПОТЕНЦИАЛЬНАЯ УРОЖАЙНОСТЬ – Potential Yield is the maximum yield of a cultivar in the absence of any abiotic or biotic stress, e.g., yield obtained in the absence of yield-limiting factors such as water, fertilizer, proper cropping practices and in the absence of yield-reducing factors such as pests and natural calamities. / любого абиотического или биотического . Под Урожайностью понимается количество растениеводческой продукции, получаемой с единицы площади – 1 га или 1 м^2 (в парниках, теплицах) в тоннах, центнерах.

POT HAT = ШЛЯПА КОТЕЛОК (или КОТЕЛКОВАЯ ШЛЯПА) – Pot Hat is a hat with a stiff crown, especially a derby.

POTHOLE = ТРАВЯРЫТВИНА (или ВЫБОИНА, или КОТЛОВИНА, или МУЛЬДА) – Pothole is a shallow pond dominated by grasslike vegetation.

POT SPINNING = ЦЕНТРИФУГАЛЬНОЕ ПРЯДЕНИЕ – Pot Spinning is a method formerly used for making viscose rayon. The newly spun yarn was delivered into the center of a rapidly rotating, centrifugal pot, where it received twist and centrifugal force caused it to go to the wall of the pot. The yarn package so formed was called a Cake.

POTTED BULB PLANTS = ГОРШОЧНЫЕ ЛУКОВИЧНЫЕ РАСТЕНИЯ – Potted Bulb Plants:- as relates to the US/Canada Greenhouse Certification Program, potted bulb plants are those produced by forcing bulbs to flower, usually for the Christmas and Easter markets. Potted bulb plants include tulips, narcissus, crocus, hyacinths, iris, and amaryllis. / Парник (Greenhouse).

POULTRY BRIDGE = УЧАСТОК ТРАНСПОРТИРОВКИ ДОМАШНЕЙ ПТИЦЫ – Poultry Bridge is a miniland bridge movement set up for poultry. / для домашней птицы.

POUND = ФУНТ – (1) The British monetary Pound is historically linked with the minting of silver coins (sterlings) from the Tower pound. Large payments were reckoned in ‘pounds of sterlings’, later shortened to ‘pounds sterling’. Standard currency unit of Cyprus, Egypt, Falklands Islands, Gibraltar, Lebanon, Sudan, Syria and the United Kingdom. / Фунт – стандартная денежная единица в Гибралтаре, Египте, Ирландии, Кипре, Ливане, Мальте, Сирии, Соединённом Королевстве (Фунт Стерлингов), Судане, и Фолклендских Островах. В зависимости от страны он состоит:- в Египте – из 100 пиастров (piasters) или 1 000 мильемов (milliems), в Ирландии – из 100 пенсов, в Сирии – из 100 пиастров (piastres), в Соединённом Королевстве – из 100 пенсов (pences). Фунт, денежная единица АРЕ (Египетский Фунт = 100 пиастрам = 1 000 милльемам), Израиля (Израильский Фунт = 100 агорам), Ирландии (Ирландский Фунт = 100 пенсам), Ливана, Сирии (Ливанский, Сирийский Фунт = 100 пиастрам), а также Кипра, Судана, Мальты, Гибралтара и некоторых других стран. По курсу Госбанка СССР (Сентябрь 1977) 100 Сирийских Фунтов = 18 Рублей 82 Копейки, 1 Египетский Фунт = 1 Рубль 85 Копеек, 100 Ливанских Фунтов = 23 Рубля 50 Копеек, 1 Суданский Фунт = 2 Рубля 14 Копеек.

(2) Pound is unit of avoirdupois weight, equal to 16 ounces, 7 000 grains, or 0.453 6 kg, and of Troy and apothecaries’ weight, equal to 12 ounces, 5 760 grains, or 0.37 kg. The Roman ancestor of the modern pound, the libra, is the source of the abbreviation lb. In medieval England several derivations of the libra vied for general acceptance. Among the earliest of these, the Tower pound, so called because its standard was kept in the Royal Mint in the Tower of London, was applied to precious metals and drugs and contained 5 400 grains, or 0.35 kg, while the mercantile pound contained 6 750 grains, or 0.437 kg. The Troy pound, believed to have originated in Troyes, France, superseded the lighter Tower pound in 1527 as the gold and silver standard. Increased trade with France led also to the adoption of the 16-ounce avoirdupois pound in the XVI century to replace the mercantile pound. Pound is the unit of weight equal to 16 ounces, or 0.453 592 37 kilograms. Abbreviation:- lb. / Единица веса равная 16 унциям, или 0.453 592 37 килограммам. обозначение:- фт. Под Фунтом, от Латинского слова Pondus, означающее Вес или Гиря или Тяжесть, понимается основная единица массы в Британской Империальной Системе. Обозначение:- фт (lb). 1 торговый фунт = 0.453 592 37 килограмма. Единица массы в системе Русских мер, 1 фунт = 0.409 512 41 килограмма = 1/40 пуда = 32 лотам = 96 золотникам = 9 216 долям. Под Фунтом, от Польского слова Funt, от Немецкого слова Pfund, от Латинского слова Pondus, означающее Вес или Гиря или Тяжесть, понимаются:- (1) единица массы в Русской системе мер, отменённой в 1918. 1 Фунт (торговый) = 1/40 пуда = 32 лотам = 96 золотникам = 9 216 долям = 0.409 512 41 килограмма (кг). Эталоном фунта служил прототип, хранимый в Главной Палате Мер и Весов (центральное государственное метрологическое учреждение, созданное в России в 1893 по инициативе Русского химика Дмитрия Ивановича Менделеева (1834–1907)). В России применялся также аптекарский фунт, равный 7/8 торгового фунта, то есть 0.358 323 36 кг (смотрите Аптекарский Вес). (2) Основная единица в системе Английских мер (обозначается lb). 1 фунт (торговый) = 0.453 592 37 кг. Фунт подразделяется на 16 унций, на 16 ´ 16 = 256 драхм, а также на 7 000 гранов. Кроме торгового фунта, в Соединённых Штатах Америки (США), Великобритании и ряде других стран применяются аптекарский и Тройский (монетный) фунты, равные 0.373 241 77 кг.

(3) Pound:- a Troy or apothecary pound is a unit of weight equal to 12 ounces, or 0.373 241 7 kilograms. / Тройский или аптекарский Фунт – это единица веса, равная 12 унциям, или 0.373 241 7 килограммам. 1 Тройский и аптекарский, или монетный фунт = 0.373 241 77 килограмма.

POUNDED = ЗАБИТОЕ – Pounded:- reduced to small particles by beating or striking heavily and repeatedly.

POUND PER SQUARE INCH = ФУНТ НА КВАДРАТНЫЙ ДЮЙМ – Pound per Square Inch (lbf/in^2 or psi) is a traditional unit of pressure. 1 psi equals 144 pounds per square foot (psf), 6.894 75 kiloPascals (kPa), 68.947 5 millibars (mb), 2.036 inches of mercury

(in Hg), 27.761 2 inches of water (in WC), or 70.513 4 centimeters of water (cm H_2O). Pound Per Square Inch (PSI) is a pressure a gas or liquid exerts on the walls of its container. Also called Pound per Square Inch Gauge (PSIG). See also Bar. psi is a traditional symbol for pressure units used in hydraulics and plumbing. See also psia, psid, and psig. Corresponding symbols for pound per square foot (psf (short for the pound per square foot), etc) are also used.

POUND PER SQUARE INCH ABSOLUTE = АБСОЛЮТНЫЙ ФУНТ НА КВАДРАТНЫЙ ДЮЙМ – Pounds Per Square Inch Absolute (psia):- pounds per square inch gauge (psig) + 14.696. psia is a traditional symbol for pressure units used in hydraulics and plumbing. psia means pound per square inch absolute, which is the total pressure including the pressure of the atmosphere.

POUND PER SQUARE INCH DIFFERENTIAL = ДИФФЕРЕНЦИРОВАННЫЙ ФУНТ НА КВАДРАТНЫЙ ДЮЙМ – psid is a traditional symbol for pressure units used in hydraulics and plumbing. psid, pound per square inch differential, is a symbol for a difference between two pressures, neither of which is atmospheric pressure.

POUND PER SQUARE INCH GAUGE = ФУНТ НА КВАДРАТНЫЙ ДЮЙМ ПО ИЗМЕРИТЕЛЬНОМУ ПРИБОРУ (или ИЗБЫТОЧНОЕ ДАВЛЕНИЕ В ФУНТАХ НА КВАДРАТНЫЙ ДЮЙМ) – Pounds Per Square Inch Gauge (psig):- pounds per square inch absolute (psia) – 14.696. psig is a traditional symbol for pressure units used in hydraulics and plumbing. psig is a symbol for pound per square inch gauge; this means that the pressure has been read from a gauge which actually measures the difference between the pressure of the fluid and the pressure of the atmosphere.

POUR BOX PALLET = ЛОТКОВЫЙ ЯЩИЧНЫЙ ПОДДОН – Pour Box Pallet or Chute-Sided Box Pallet is a box pallet with one or more sloping sides to assist discharge of contents. / Лотковый Ящичный Поддон – ящичный поддон, одна или несколько стенок которого расположена с наклоном для обеспечения удобства выгрузки содержимого.

POURING OIL ON TROUBLED WATERS = РАЗЛИВШАЯСЯ НЕФТЬ НА ТРУДНЫХ ВОДАХ (или РАЗЛИВШАЯСЯ НЕФТЬ ПРИ ВОЛНЕНИИ) – Pouring Oil On Troubled Waters (maritime term):- heavy-weather practice of pouring oil on the sea so as to form a film on the surface, thus preventing the seas from breaking. To smooth out some difficulty.

POURPOINT = ПУРПУЭН (или КАМЗОЛ) – Pourpoint:- a padded and quilted doublet. / .

POUR POINT = ТОЧКА ОТВЕРДЕВАНИЯ (или ТОЧКА ЗАГУЩЕНИЯ, или ТОЧКА ЗАСТЫВАНИЯ, или ТОЧКА ТЕКУЧЕСТИ, или ТЕМПЕРАТУРА ТЕКУЧЕСТИ, или ТОЧКА ПОТЕРИ ТЕКУЧЕСТИ) – Pour Point is the lowest temperature at which an oil or distillate fuel is observed to flow, when cooled under conditions prescribed by test method ASTM D 97. The pour point is 3 °C (5 °F) above the temperature at which the oil in a test vessel shows no movement when the container is held horizontally for five seconds. American Society for Testing and Materials (ASTM). Pour Point indicates the fluidity of the oil or fuel on low temperature. It's the lowest temperature on which the fluid still flows. Pour Point of the oil can be defined as the temperature at which the oil stops to flow. Pour point is lowered using additives known as Pour Point Depressants. Pour Point is a temperature 5 degrees Fahrenheit (–15 °C) higher than the temperature at which crude oil or a refined product stops flowing. / Американское Общество по Испытаниям и Материалам (АОИМ). Точка Отвердевания или Точка Загущения . Температура, превышающая на 5 градусов по Фаренгейту (°F) (–15 °C) уровень температуры, при котором у нефти или очищенных нефтепродуктов прекращается текучесть. Температура Текучести – минимальная рабочая температура трансмиссионных масел, при которой масло сохраняет текучесть. Точка Застывания или Температура Застывания – это самая низкая температура, при которой масло ещё полностью не потеряло текучесть при наклонении пробирки, в которой его охладили. Температура застывания характеризует момент резкого увеличения вязкости и/или кристаллизации парафина при снижении температуры в такой степени, что масло перестаёт течь под собственным весом. Точка Застывания или Температура Застывания:- при снижении температуры смазочное масло загустевает. При определённой температуре оно перестаёт течь под действием собственной силы тяжести. Эту температуру называют Температурой Застывания. Температура застывания зависит, в частности, от вязкости смазочного масла и химической структуры. У парафиновых масел, например, застывание происходит из-за находящегося в составе масла воска, который образует кристаллы. Чем больше такое масло остывает, тем крупнее становятся его кристаллы, в итоге создавая в таком масле сеть, препятствующую течению.

POUR POINT DEPRESSANT = ДЕПРЕССАНТ ТОЧКИ ОТВЕРДЕВАНИЯ (или ДЕПРЕССАНТ ТОЧКИ ЗАГУЩЕНИЯ, или ДЕПРЕССАНТ ТОЧКИ ЗАСТЫВАНИЯ, или ДЕПРЕССАНТ ТОЧКИ ТЕКУЧЕСТИ) – Pour Point Depressant is an additive which retards the adverse effects of wax crystallization, and lowers the pour point. / Присадка, понижающая температуру застывания масел.

POUR STABILITY = СТАБИЛЬНОСТЬ ОТВЕРДЕВАНИЯ (или СТАБИЛЬНОСТЬ ЗАГУЩЕНИЯ, или СТАБИЛЬНОСТЬ ЗАСТЫВАНИЯ, или СТАБИЛЬНОСТЬ ТЕКУЧЕСТИ) – Pour Stability is the ability of a pour depressed oil to maintain its original ASTM pour point when subjected to long-term storage at low temperature approximating winter conditions. American Society for Testing and Materials (ASTM). / Стабильность температуры застывания при хранении масел. Американское Общество по Испытаниям и Материалам (АОИМ).

POWDER BLUE = ПОРОШКОВОЕ ГОЛУБОЕ (или ХХ) – Powder Blue:- a pale blue.

POWDER–BONDED NONWOVEN = СКРЕПЛЁННАЯ ПОРОШКОМ НЕТКАНКА – Powder-Bonded Nonwoven is a manufactured product in which a carded web is produced and treated with a thermoplastic powder that has a melting point less than that of the fiber in the web. The powder is heated to its melting point by through-air and infrared heating or by hot-calendering to effect bonding.

POWDER BONDING = СКРЕПЛЕНИЕ ПОРОШКОМ (или ПОРОШКОВОЕ СВЯЗЫВАНИЕ) – In Powder Bonding, the adhesive powder of thermoplastic polymers is applied onto webs by heat and pressure. Polyesters and polyolefins with low Tg's and molecular weight can be used as powder binders. The advantages are the bulky structure of dense nonwovens and the applicability of polyester or polypropylene webs. The disadvantage lies in difficulties of suitable particle sizes and ranges, and their distribution.

POWDER METALLURGY = ПОРОШКОВАЯ МЕТАЛЛУРГИЯ – Powder Metallurgy (P/M) consists of making solid parts out of metal powders. The powder is mixed with a lubricant, pressed into a die to form the desired shape, and then sintered, or heated to a temperature below the melting point of the alloy where solid-state bonding of the particles takes place. In the absence of any external force, sintering typically leaves the sample containing about 5 percent pores by volume, but, when pressure is applied during sintering (a process called Hot Pressing), virtually zero porosity remains. In some parts made by mixing two different elements, one component melts at the sintering temperature, and this liquid phase aids sintering of the solid particles. Applications:- the following roughly chronological account indicates the types of products that can be made by P/M. The earliest commercial use of P/M was in the production of such high-melting-point metals as platinum, tungsten, and tantalum. Pure powders of these metals could be made by the low-temperature reduction of powders, usually oxides, and, since these metals melt at extremely high temperatures, it was easier to form solid parts by pressing and sintering the powders than by melting and casting. For example, P/M played an important role in the

development of tungsten filaments for electric light bulbs. Another early P/M product was porous-metal bearings and filters. In such parts sintering is conducted at a relatively low temperature so that the pores between the particles remain open and connected. Disks sintered in this way can serve as filters for liquids, or the sintered part can be impregnated with oil to make a self-lubricating bearing. In the latter case, the oil is held in the pores by surface tension. When the bearing heats up in use, some oil flows out and lubricates the surface, and, when the part cools, surface tension pulls the oil back into the fine channels. Cemented carbides form another class of sintered product. Pure tungsten carbide (WC) is an extremely hard compound, but it is too brittle to be used in tools. However, useful tools can be made by mixing WC powder with cobalt powder and sintering at a temperature above the melting point of cobalt. Liquid cobalt then reacts with the surface of the WC, and when the part is cooled the cobalt freezes, holding the WC tightly together to form a composite structure with enough toughness to be used for tools and dies. The greatest volume of P/M parts is now produced from iron powder, a process that was first developed during World War II. Small, complex parts, such as gears, require much work if machined from steel bars, and a significant volume of material is wasted as chips from the machining. However, if the part is made by P/M processes, little or no machining is necessary, there is less wasted material, and the cost is much lower. Many small parts for automobiles and appliances are produced in this manner. The second greatest volume of P/M parts is made from aluminum powder. These parts are light, corrosion-resistant, and (if alloy is used) can be heat treated to appreciably increase the strength. Small parts for automobiles and appliances are the most common applications. A recent process uses P/M methods to improve the homogeneity and toughness of high-alloy tool steels. Cast ingots of these alloys contain a coarse network of brittle phases that are very difficult to break up by hot working, but if, instead of being cast into ingots, the liquid is atomized (solidified as small droplets), the rapidly solidified particles will be homogeneous. This powder can then be hot pressed into consolidated bars with better mechanical properties than those produced by ingot casting. Consolidation is often achieved by hot isostatic pressing, wrapping the pressed powder in an envelope of steel or glass, and heating it in a hot inert gas at high pressure. The consolidated metal is then worked into finished parts. Processes:- the most common method of producing metal powders is atomization of a liquid. Here a stream of molten metal is broken up into small droplets with a jet of water, air, or inert gas such as nitrogen or argon. Atomization in water yields irregularly shaped particles that can be pressed to a higher initial, or ‘green’, strength and density than can the spherical particles formed by atomizing with an inert gas. In other atomization processes, centrifugal force is used. The metal can be poured onto a spinning disk that breaks up the stream, or a spinning rod can be melted by an electric arc so that it throws off particles as it spins. The liquid metal being atomized may be an alloy or a pure metal that will subsequently be blended with other elements to form an alloy. After atomization, the powder must be separated into size ranges by passing it through a series of sieves. Powders of different sizes (and of different metals) are then blended for pressing into parts. Powders are often produced by chemically reducing a powdered oxide – for example, iron oxide reduced with carbon or hydrogen. The resulting metal aggregate is then milled and sieved to obtain the desired powder. Powder also can be made by electrodepositing the metal at a high current density, followed by milling to break up the deposit. The above processes often produce powders that are roughly 50 to 200 micrometers in diameter. Powders less than one-tenth this size can be found in the finest fraction of the powder produced by atomization. Such fine powders can be mixed with a wax, injection molded to form several parts at once, and then sintered. The resulting parts require very little machining to yield a finished product. / литьё или отливка (casting). пористость или рыхлость (porosity). Под Порошковой Металлургией понимается область техники, охватывающая совокупность методов изготовления порошков металлов и металлоподобных соединений, полуфабрикатов и изделий из них (или их смесей с неметаллическими порошками) без расплавления основного компонента. Технология порошковой металлургии включает следующие операции:- получение исходных металлических порошков и приготовление из них шихты (смеси) с заданными химическим составом и технологическими характеристиками; формование порошков или их смесей в заготовки с заданными формой и размерами (главным образом прессованием); спекание, то есть термическую обработку заготовок при температуре ниже точки плавления всего металла или основной его части. После спекания изделия обычно имеют некоторую пористость (от нескольких процентов до 30–40%, а в отдельных случаях до 60%). С целью уменьшения пористости (или даже полного устранения её), повышения механических свойств и доводки до точных размеров применяется дополнительная обработка давлением (холодная или горячая) спечённых изделий; иногда применяют также дополнительную термическую, термохимическую или термомеханическую обработку. В некоторых вариантах технологии отпадает операция формования:- спекают порошки, засыпанные в соответствующие формы. В ряде случаев прессование и спекание объединяют в одну операцию так называемого горячего прессования – обжатия порошков при нагреве. Получение Порошков:- Механическое измельчение металлов производят в вихревых, вибрационных и шаровых мельницах. Другой, более совершенный метод получения порошков – распыление жидких металлов:- его достоинства – возможность эффективной очистки расплава от многих примесей, высокая производительность и экономичность процесса. Распространено получение порошков железа, меди, вольфрама, молибдена высокотемпературным восстановлением металла (обычно из окислов) углеродом или водородом. Находят применение гидрометаллургические методы восстановления растворов соединений этих металлов водородом. Для получения медных порошков наиболее часто используют электролиз водных растворов. Имеются и другие, менее распространённые методы приготовления порошков различных металлов, например, электролиз расплавов и термическая диссоциация летучих соединений (карбонильный метод). Формование Порошков:- Основной метод формования металлических порошков – прессование в пресс-формах из закалённой стали под давлением 200–1 000 МегаНьютонов на квадратный метр (МН/м^2) (20–100 килограмм-силы на квадратный милиметр (кгс/мм^2)) на быстроходных автоматических прессах (до 20 прессовок в 1 минуту (мин)). Прессовки имеют форму, размеры и плотность, заданные с учётом изменения этих характеристик при спекании и последующих операциях. Возрастает значение таких новых методов холодного формования, как изостатическое прессование порошков под всесторонним давлением, прокатка и экструзия порошков. Спекание проводят в защитной среде (водород; атмосфера, содержащая соединения углерода; вакуум; защитные засыпки) при температуре около 70–85% от абсолютной точки плавления, а для многокомпонентных сплавов – несколько выше температуры плавления наиболее легкоплавкого компонента. Защитная среда должна обеспечивать восстановление окислов, не допускать образования нежелательных загрязнений продукции (копоти, карбидов, нитридов и так далее), предотвращать выгорание отдельных компонентов (например, углерода в твёрдых сплавах), обеспечивать безопасность процесса спекания. Конструкция печей для спекания должна предусматривать проведение не только нагрева, но и охлаждения продукции в защитной среде. Цель спекания – получение готовых изделий с заданными плотностью, размерами и свойствами или полупродуктов с характеристиками, необходимыми для последующей обработки. Расширяется применение горячего прессования (спекания под давлением), в частности изостатического. Порошковая металлургия имеет следующие достоинства, обусловившие её развитие. (1) Возможность получения таких материалов, которые трудно или невозможно получать другими методами. К ним относятся:- некоторые тугоплавкие металлы (вольфрам, тантал); сплавы и композиции на основе тугоплавких соединений (твёрдые сплавы на основе карбидов вольфрама, титана и других):- композиции и так называемые Псевдосплавы Металлов, не смешивающихся в расплавленном виде, в особенности при значительной разнице в температурах плавления (например, вольфрам – медь); композиции из металлов и неметаллов (медь – графит, железо – пластмасса, алюминий – окись алюминия и так далее); пористые материалы (для подшипников, фильтров, уплотнений, теплообменников) и другие. (2) Возможность получения некоторых материалов и изделий с более высокими технико-экономическими показателями. Порошковая

металлургия позволяет экономить металл и значительно снижать себестоимость продукции (например, при изготовлении деталей литьём и обработкой резанием иногда до 60–80% металла теряется в литники, идёт в стружку и тому подобное). (3) При использовании чистых исходных порошков можно получить спечённые материалы с меньшим содержанием примесей и с более точным соответствием заданному составу, чем у обычных литых сплавов. (4) При одинаковом составе и плотности у спечённых материалов в связи с особенностью их структуры в ряде случаев свойства выше, чем у плавленых, в частности меньше сказывается неблагоприятное влияние предпочтительной ориентировки (текстуры), которая встречается у ряда литых металлов (например, бериллия) вследствие специфических условий затвердевания расплава. Большой недостаток некоторых литых сплавов (например, быстрорежущих сталей и некоторых жаропрочных сталей) – резкая неоднородность локального состава, вызванная ликвацией при затвердевании. Размеры и форму структурных элементов спечённых материалов легче регулировать, и главное, можно получать такие типы взаимного расположения и формы зёрен, которые недостижимы для плавленого металла. Благодаря этим структурным особенностям спечённые металлы более термостойки, лучше переносят воздействие циклических колебаний температуры и напряжений, а также ядерного облучения, что очень важно для материалов новой техники. Порошковая металлургия имеет и недостатки, тормозящие её развитие:- сравнительно высокая стоимость металлических порошков; необходимость спекания в защитной атмосфере, что также увеличивает себестоимость изделий порошковой металлургии; трудность изготовления в некоторых случаях изделий и заготовок больших размеров; сложность получения металлов и сплавов в компактном беспористом состоянии; необходимость применения чистых исходных порошков для получения чистых металлов. Недостатки порошковой металлургии и некоторые её достоинства нельзя рассматривать как постоянно действующие факторы:- в значительной степени они зависят от состояния и развития как самой порошковой металлургии, так и других отраслей промышленности. По мере развития техники порошковая металлургия может вытесняться из одних областей и, наоборот, завоёвывать другие. Впервые методы порошковой металлургии разработали в 1826 Русский инженер и учёный Пётр Григорьевич Соболевский (1782–1841) и Русский металлург Василий Васильевич Любарский (1795–1852) для изготовления платиновых монет. Необходимость использования для этой цели порошковой металлургии была обусловлена невозможностью достижения в то время температуры плавления платины (1 769 °C). В середине XIX века в связи с развитием техники получения высоких температур промышленное использование методов порошковой металлургии прекратилось. Порошковая металлургия возродилась на рубеже XX века как способ производства из тугоплавких металлов нитей накала для электрических ламп. Однако развивавшиеся в дальнейшем методы дугового, электроннолучевого, плазменного плавления и электроимпульсного нагрева позволили получать не достижимые ранее температуры, вследствие чего удельный вес порошковой металлургии в производстве этих металлов несколько снизился. Вместе с тем прогресс техники высоких температур ликвидировал такие недостатки порошковой металлургии, ограничивавшие её развитие, как, например, трудность приготовления порошков чистых металлов и сплавов:- метод распыления даёт возможность с достаточной полнотой и эффективностью удалить в шлак примеси и загрязнения, содержавшиеся в металле до расплавления. Благодаря созданию методов всестороннего обжатия порошков при высоких температурах в основном преодолены и трудности изготовления беспористых заготовок крупных размеров. В то же время ряд основных достоинств порошковой металлургии – постоянно действующий фактор, который, вероятно, сохранит своё значение и при дальнейшем развитии техники. О свойствах и применении продукции порошковой металлургии смотрите в статье Спечённые Материалы.

POWDER RIVER BASIN COAL = УГОЛЬ ИЗ БАССЕЙНА РЕКИ ПАУДЕР – The Powder River Basin is the largest coal mining region in the United States, but most of the coal is buried too deeply to be economically accessible. The Powder River Basin coal beds are shaped like elongated bowls and as mines expand from east to west in the Powder River Basin, they will be going ‘down the sides of the bowl’. This means that the overburden (rock lying over the coal) will increase as will the stripping ratio (the ratio of rock that needs to be moved to get to a ton of coal). Presently the approximately 15 mines in the Powder River Basin are working in areas where the stripping ratio is between 1:1 (i.e. one ton of rock for one ton of coal) and 3:1. As the mines expand the stripping ratio will increase. As more rock needs to be moved (using large electrically powered draglines and diesel and electric mining trucks) the production cost will also increase. The United States uses about 1 billion tons of coal a year, with about 40 percent of the coal currently coming from the Powder River Basin. The amount of coal coming from the Powder River Basin has been increasing over the last 20 years. The majority of the coal mined in the Powder River Basin is part of the Fort Union Formation (Paleocene), with the low sulfur and ash content of the coal in the region making it very desirable. Coal supplies about half of the United States’ electricity supplies, with the Powder River Basin mines supplying around 40 percent of the coal that fuels those stations, mainly to the east of the Rocky Mountains, for generating electricity. Powder River Basin (PRB) Coal is coal produced in the Powder River basin, a region located in southeast Montana and northeast Wyoming. It is defined as ‘Sub-Bituminous’ Coal with an average energy content of 8 500 btu/lb and low in sulfur dioxide (SO_2). PRB coal was essentially worthless until air pollution emissions from power plants became a concern. The Powder River region is said to contain the largest deposits of coal on the planet. The region supplies about 40% of the coal consumed as electricity in the United States. Almost all of the coal in the Powder River Basin is federally owned a leased to mining companies. There are currently 13 mining companies operating in this area. Powder River Basin Coal futures are traded at the ICE Futures Europe® under ticker symbol UCP. Contract size is 1 000 tons quoted in US Dollars per ton.

POWER = PATENT COOPERATION TREATY OPERATIONS WORKFLOW AND ELECTRONIC REVIEW

POWER = МОЩНОСТЬ – Power is the rate at which work is performed or that energy is transferred. Electric power is commonly measured in Watts or kiloWatts. A power of 746 Watts is equivalent to 1 horsepower. Power:- the rate at which energy is transferred. Electrical energy is usually measured in Watts. Also used for a measurement of capacity. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность.

POWER BOX = ЭНЕРГОСУНДУК (или СУНДУК С ЭНЕРГОУСТАНОВКОЙ) – Power Box is a container equipped with self-contained diesel generators to provide auxiliary power for reefers over and above the normal reefer complement of the vessel.

POWER CABLE TRANSMISSION = ТРАНСМИССИЯ (или ПЕРЕДАЧА) ПО ЭНЕРГЕТИЧЕСКОМУ КАБЕЛЮ – Power Cable Transmission (PCT) is a transfer of digital data by means of the high-voltage power cable.

POWER FACTOR = ФАКТОР МОЩНОСТИ – Power Factor is the ratio of real power to apparent power delivered in an ac electrical system or load. Its value is always in the range of 0.0 to 1.0 or 0% to 100%. A unity power factor (1.0) indicates that the current is in phase with the voltage and that reactive power is zero. Power Factor:- of an insulating material, the ratio of the power in watts dissipated in a capacitor in which the material is dielectric, to the product of the sinusoidal voltage and current expressed in effective Volt-Amperes.

POWERLOOM = ПРИВОДНОЙ ТКАЦКИЙ СТАНОК – Powerlooms are mechanized handlooms initially established to increase textile production beyond what was achievable with traditional handlooms. Since their introduction, they have quickly dominated the industry; powerlooms now (in 2005) account for more than 40 per cent of total Indian cloth production. By comparison, traditional handlooms are now responsible for less than 20 per cent of production. The advantages held by the powerloom sector become apparent when you compare these production totals with the number of employees in each sector; whereas 6.5 million people are employed in the Indian handloom sector, only slightly more than 4.8 million are employed on powerlooms. Given these production advantages and the preference among spinners to produce powerloom-compatible cone yarn, it seems likely powerlooms will continue to dominate the Indian market and eat into the share held by the handloom sector. And while the sector is not yet well-organized, its political power continues to grow due to both its production strengths and the number of employees – and voters – involved in the sector. Powerloom operations are also frequently grouped with traditional handlooms by the government for support schemes, thereby benefiting from plans designed to support their chief competitors. Powerloom operators do still face a number of challenges:- intermittent power supply, a lack of access to credit, uneven quality and technological obsolescence continue to plague the sector. / Приводные Ткацкие Станки – механизированные ручные ткацкие станки, первоначально устанавливавшиеся для увеличения производства текстиля по сравнению с традиционными ручными ткацкими станками. С момента их появления они быстро доминировали в отрасли. В настоящее время (2005) в Индии приводные ткацкие станки, используемые при выработке полотен, насчитывают более 40% от всего объёма продукции. Для сравнения, на традиционные ручные ткацкие станки сейчас приходится менее 20% выработки от всего объёма продукции. Преимущества, которыми обладает сектор приводных ткацких станков, становятся очевидными, когда вы сравниваете эти объёмы продукции с числом работников в каждом из этих секторов. В то время как в Индийском секторе ручных ткацких станков трудятся 6.5 миллионов человек, в секторе приводных ткацких станков – лишь 4.8 миллиона человек. Учитывая эти преимущества производства и предпочтение прядильщиков вырабатывать пряжу на конусах, совместимых с приводными ткацкими станками, предполагается что и в дальнейшем приводные ткацкие станки продолжат доминировать на Индийском рынке и ещё больше поглощать долю, принадлежащую сектору ручных ткацких станков. И хотя этот сектор ещё не очень хорошо организован, его политическая власть продолжает расти и из-за его производственных мощностей, и из-за количества работников – избирателей, вовлечённых в данный сектор. Операции на приводных ткацких станках также очень часто группируются с традиционными ручными ткацкими станками правительством Индии для схем поддержки, получая тем самым выгоду от планов, разработанных для поддержки их главных конкурентов. Операторы приводных ткацких станков до сих пор сталкиваются с рядом вызовов:- снабжение электроэнергией с перебоями, отсутствие доступа к кредитам, неравномерное качество и устаревание технологий продолжают преследовать данный сектор.

POWER MARKETER = ЭНЕРГОСБЫТОВАЯ КОМПАНИЯ – Power Marketer is a wholesale power entity that has registered with the US Federal Energy Regulatory Commission (FERC) to buy and sell wholesale power from and to each other and other public entities at market-derived prices. Power marketing companies include investor-owned, utility-affiliated companies, natural gas marketing companies, financial intermediaries, independent power producers, and entrepreneurs. Typically, power marketers do not own generating facilities. Power Marketers are business entities engaged in buying and selling electricity, but do not own generating or transmission facilities. Power marketers, as opposed to brokers, take ownership of the electricity and are involved in interstate trade. These entities file with FERC for status as a power marketer. / Энергосбытовые Компании – юридические лица, занимающиеся оптовой продажей электроэнергии, которым Федеральная Комиссия США по Энергонадзору (ФКЭН) официально предоставила право оптовых закупок и продаж электроэнергии друг другу и другим предприятиям по рыночным ценам. К энергосбытовым компаниям относятся компании, принадлежащие инвесторам, компании, аффилированные с электростанциями, компании по продаже природного газа, финансовые посредники, независимые производители электроэнергии и предприниматели.

POWER OF ATTORNEY = ПОЛНОМОЧИЕ АТТОРНЕЯ (или ПОЛНОМОЧИЕ ПОВЕРЕННОГО) – Power Of Attorney is a power of an authorised person to conduct legal transactions on behalf of and for the account of the grantor of the power of attorney. Full power of representation authorizes the holder to conduct all legal or commercial transactions and legal acts the operation of a business entails, power of attorney to conduct all or certain transactions and legal transactions the operation of such a business normally entails. A document which empowers one person to act for another. In the United States, Power Of Attorney is an instrument whereby the person (grantor) giving the power authorizes another (attorney-in-fact) to act on his or her behalf. The instrument itself is called a Power Of Attorney. The person acting under the power is called an Attorney-In-Fact. Instrument authorizing a person to act legally for another either generally or in a specified manner. An account holder has the possibility to grant a power of attorney to other people to operate his account. Differences are made in both the duration of the power of attorney as well as in the number of people who are authorized to issue legally binding instructions to the bank. Power of Attorney (POA) is formal assignment to another of the right to legally act on your behalf.

POWERPOINT = ПАВЭПОИНТ – PowerPoint (PPT) file is a native, editable type of Microsoft slideshow file.

POWERPOINT SHOW = ПАВЭПОИНТ ШОУ (или ПРЕДСТАВЛЕНИЕ ПАВЭПОИНТ) – PowerPoint Show (PPS) file is a type of encapsulated, non-editable Microsoft slideshow.

POWER POOL = МОЩНОСТНОЙ ПУЛ (или ПУЛ МОЩНОСТЕЙ) – Power Pool is an association of two or more interconnected electric systems having an agreement to coordinate operations and planning for improved reliability and efficiencies.

POWER TAKE–OFF = ОТБОР МОЩНОСТИ – Power Take-Off (PTO):- drive shaft from tractor, or other vehicle engine used to drive ancillary machinery. Can be used to power some wood chippers.

POWER UNIT = БЛОК ПИТАНИЯ (или ЭНЕРГЕТИЧЕСКИЙ АГРЕГАТ, или ЕДИНИЦА МОЩНОСТИ, или СИЛОВОЙ АГРЕГАТ, или СИЛОВАЯ УСТАНОВКА, или ИСПОЛНИТЕЛЬНЫЙ МЕХАНИЗМ) – Power Unit is a combination of pump, pump drive, reservoir, controls and conditioning components which may be required for its application.

POW WOW = ПАУ ВАУ – The POW WOW is a trade show (held annually in the United States and annually in Europe) which brings together US sellers and foreign buyers of travel-related services pertaining to travel to the United States. / ПАУ ВАУ – это торговое представление, проводимое ежегодно в Соединённых Штатах Америки (США) и в Европе, которое призвано сводить вместе продавцов из США с иностранными покупателями в отношении услуг, связанных со сферой путешествий, относящейся к путешествию в США.

POY = PARTIALLY ORIENTED YARN

PP = PURCHASE PRICE

PPA = PROTOCOL OF PROVISIONAL APPLICATION

PPAC = PATENT PUBLIC ADVISORY COMMITTEE

PPD = PLANT POPULATION DENSITY

PPI = PRODUCER PRICE INDEX

ppm = PARTS PER MILLION

PPO = PERCENTAGE PRICE OSCILLATOR

PPP = PENULTIMATE PROFIT PROSPECT

PPP = PURCHASING POWER PARITY

PPQ = PLANT PROTECTION AND QUARANTINE

PPQ FORM 572 = ФОРМА 572 ЗКР – PPQ Form 572 (short for the Plant Protection and Quarantine Form 572) is an application of Inspection and Certification of Domestic Plants and Plant Products for Export. See also Application for Inspection and Certification of Domestic Plants and Plant Products for Export. / Форма 572 Защиты и Карантина Растений (ЗКР) это заявление на Инспекцию и Сертификацию Местных Растений и Растительных Продуктов для Вывоза (или Экспорта). Смотрите также Заявление на Инспекцию и Сертификацию Местных Растений и Растительных Продуктов для Вывоза (Application for Inspection and Certification of Domestic Plants and Plant Products for Export).

PPQ FORM 577 = ФОРМА 577 ЗКР – PPQ Form 577 (short for the Plant Protection and Quarantine Form 577) is an accountable inspection certificate used to certify domestic plants and unprocessed or unmanufactured agricultural commodities for export that have been inspected and/or tested according to appropriate official procedures, that are considered to be free from quarantine pests specified by the importing country party, conform with the current phytosanitary requirements of the importing country.party, including those for regulated non-quarantine pests. / Форма 577 Защиты и Карантина Растений (ЗКР).

PPQ FORM 578 = ФОРМА 578 ЗКР – PPQ Form 578 (short for the Plant Protection and Quarantine Form 578) is the Export Certificate, Processed Plant Products. See also Export Certificate, Processed Plant Products. / Форма 578 Защиты и Карантина Растений (ЗКР).

PPQ FORM 579 = ФОРМА 579 ЗКР – PPQ Form 579 (short for the Plant Protection and Quarantine Form 579) is the Phytosanitary Certificate for Reexport. See also Phytosanitary Certificate for Reexport. / Форма 579 Защиты и Карантина Растений (ЗКР). обратный вывоз (или реэкспорт; reexport).

PPS = PRIOR PREFERRED STOCK

PPSAM = PURSE PROVIDER SECURE APPLICATION MODULE

PPSC = POLICY PROCESS STEERING COMMITTEE

PPT = PROMPT

PR = PARTIAL RESISTANCE

PR = PHOSPHATE ROCK

PR = PUBLIC RELATIONS

PR = PUERTO RICO

PR 17 = PUBLIC RESOLUTION 17

PRA = PARTICIPATORY RURAL APPRAISAL

PRA = PEST RISK ANALYSIS

PRA AREA = АРЕАЛ АРПВ – PRA (short for the Pest Risk Analysis) Area is an area in relation to which a Pest Risk Analysis is conducted. / Ареал АРПВ (сокращение для Анализа Риска Проявления Вредителя) – ареал, в отношении которого проводится Анализ Риска Проявления Вредителя.

PRACTICAL APPLICATION = ПРАКТИЧЕСКОЕ ПРИМЕНЕНИЕ – The term Practical Application means to manufacture in the case of a composition or product, to practice in the case of a process or method, or to operate in the case of a machine or system; and, in each case, under such conditions as to establish that the invention is being utilized and that its benefits are to the extent permitted by law or government regulations available to the public on reasonable terms.

PRACTICALLY FREE = ПРАКТИЧЕСКИ СВОБОДНОЕ – Practically Free:- of a consignment, field, or place of production, without pests (or a specific pests) in numbers or quantities in excess of those that can be expected to result from, and be consistent with good cultural and handling practices employed in the production and marketing of the commodity. As a working definition for export certification purposes, practically free means not to exceed a 2 percent infestation level unless otherwise stated by the importing country. Also, practically free refers to a judgement that the pests are not in excess of the amount expected to result from, and be consistent with, good culturing and handling practices employed in the production and marketing of the commodity. When the US Federal Grain Inspection Service (FGIS) inspection certificates are used as supporting documentation for certifying grain, practically free refers to FGIS' acceptance standards for insects found in grain.

PRACTICALLY FREE FROM OTHER INJURIOUS PESTS = ПРАКТИЧЕСКИ СВОБОДНОЕ ОТ ИНЫХ ПАГУБНЫХ ВРЕДИТЕЛЕЙ – Practically Free From Other Injurious Pests or Practically Free:- as relates to the US/Canada Greenhouse Certification Program, practically free from other injurious pests means not carrying pests or a specific pest in numbers or quantities in excess of those that can be expected to result from and be consistent with good culturing and handling practices employed in the production and marketing of the commodity. / Парник (Greenhouse).

PRACTICE GUIDELINES = ПРАКТИЧЕСКИЕ ПОСОБИЯ (или ПРАКТИЧЕСКИЕ ДИРЕКТИВЫ) – Practice Guidelines:- a class 4 International Actuarial Standard of Practice (IASP). These are educational in nature, representing a statement of good practice (or

perhaps practice as generally accepted among actuaries) and intended, for example, to help the client audience to understand better what they should expect from the work product of actuaries in the area in question. They might also serve to show non-actuaries who carry out similar work how an actuary is expected to approach the subject matter.

PRACTITIONER = ПРАКТИКУЮЩИЙ (или ПРАКТИК) – Practitioner is one who stands for or acts on behalf of another. A patent attorney or patent agent may represent the inventors named in a patent application. See also Agent, and Attorney. Practitioner is a person who makes use of an International Actuarial Standard of Practice (IASP).

PRATIQUE = ПРАКТИКА (или СВИДЕТЕЛЬСТВО О СНЯТИИ КАРАНТИНА, или РАЗРЕШЕНИЕ НА СВОБОДНОЕ СНОШЕНИЕ С БЕРЕГОМ, или СВИДЕТЕЛЬСТВО ОБ ОТСУТСТВИИ КАРАНТИНА, или ПРАТИК, или ПРИМЕНЕНИЕ) – Pratique is a certificate, given after compliance with quarantine regulations, permitting a ship to land passengers and crew. A term used particularly in the south of Europe. Pratique is a permission to land crew and cargo after the vessel has satisfied the port doctor as to the state of health on board. Pratique is the license given to a ship to enter port on assurance from the captain to convince the authorities that he/she is free from contagious disease. The clearance granted is commonly referred to as Free Pratique. A ship can signal a request for 'Pratique' by flying a solid yellow square-shaped flag. This yellow flag is the Q flag in the set of International maritime signal flags. Pratique is a permission given to a ship to do business with a port once quarantine and other regulations have been complied with. Pratique is a clearance granted to a ship to proceed into port after compliance with health regulations or quarantine. French, from Old French Practique, from Medieval Latin Prāctica = Practice, ultimately from Greek Prāktikē, from feminine of Prāktikos, = Practical. Historical Terms formal permission given to a vessel to use a foreign port upon satisfying the requirements of local health authorities. Pratique (maritime term):- a permit by the port doctor for an incoming vessel, being clear of contagious disease, to have the liberty of the port.

PRD = PUBLIC RECORDS DIVISION

PREARRANGED TRADING = ТОРГОВЛЯ ПО ПРЕДВАРИТЕЛЬНОЙ ДОГОВОРЁННОСТИ (или ТОРГОВЛЯ ПО ПРЕДВАРИТЕЛЬНОМУ СГОВОРУ) – In the United States, Prearranged Trading is a trading between brokers in accordance with an expressed or implied agreement or understanding. Prearranged trading is a violation of the US Commodity Exchange Act and Commodity Futures Trading Commission regulations. / В Соединённых Штатах Америки торговля между брокерами в соответствии с явным или подразумеваемым соглашением или договорённостью. Торговля по предварительной договорённости является нарушением предписаний Акта США о Сырьевой Бирже (the US Commodity Exchange Act) и Комиссии по Торговле Сырьевыми Фьючерсами (Commodity Futures Trading Commission regulations).

PRE–AUTHORISED DIRECT DEBIT = ПРЕДВАРИТЕЛЬНО УПОЛНОМОЧЕННОЕ ПРЯМОЕ ДЕБЕТОВАНИЕ – Pre-Authorised Direct Debit is a direct debit based on an initial general mandate given by the debtor.

PRECARRIAGE = ПОДВОЗ – The Precarriage or Pre-Carriage is a carriage of goods (containers) by any mode of transport from the place of receipt to the port (place) of loading into the ocean vessel (main means of transport). Carriage of goods by any mode of transit from place of receipt to port of loading. The carriage of cargo by any mode of transport from the place of receipt to the port of loading into the ocean vessel.

PRECARRIER = ПОДВОЗЧИК – Precarrier is the carrier by which the goods are moved prior to the main transport. The carrier by which the cargo is moved prior to the port of loading.

PRECAUTIONARY DESIGNATION = ОБОЗНАЧЕНИЕ, ПРИМЕНЯЕМОЕ ДЛЯ ПРЕДОСТОРОЖНОСТИ (или УКАЗАНИЕ О ПРЕДОСТОРОЖНОСТИ) – Precautionary Designation is a designation of a Contracting State in an international application filed under the Patent Cooperation Treaty which must be confirmed prior to 15 months from the priority date.

PRECIOUS METALS = БЛАГОРОДНЫЕ МЕТАЛЛЫ – Precious Metals are rare naturally-occurring elements of high economic value. This category includes gold, silver, platinum and palladium. Historically, precious metals were used as currency, but are now regarded mainly as investment and as industrial commodities. These precious metals have each an ISO 4217 currency code:- (i) Gold (one Troy ounce):- XAU 959; (ii) Silver (one Troy ounce):- XBA 955; (iii) Platinum (one Troy ounce):- XPT 962; and (iv) Palladium (one Troy ounce):- XPD 964. Precious metals are traded at COMEX® (gold & silver), NYMEX® (platinum & palladium), LME (gold), ASX (Australia), TOCOM (Japan), SHFE (China), and BM&F (Brazil). Precious Metals are the metals of great value being gold, silver, platinum, palladium and other platinum group metals. What's So Precious? While gold still rides in a gilded carriage the other precious metals have been put to work. Silver, gold's long-time companion, while still considered a store of value by some, has developed multiple commercial applications. Uses in electronics and medical applications will most likely cause this correlation to shift. 'Silver prices are going to gain momentum, at least the ratio between gold and silver', says RJO's Phillip Streible (Senior Commodities Broker). 'Silver is significantly oversold in correlation to gold, silver prices have a better chance to rebound because the fundamental use of silver continues to increase on a year-over-year basis', he says. But the most interesting markets in the formerly precious metals camp are platinum and palladium, which are pushing major highs thanks to some traditional supply and demand dynamics as well as geopolitical risk with Russia reliving its Soviet heyday. Platinum and Palladium:- platinum and palladium are less precious and more industrial as they are used in building catalytic converters for cars and demand has been good. South African mine strikes and real (as well as threatened) sanctions on Russia have pushed prices of platinum and palladium higher, though there was a correction in late March. 'Platinum and palladium were overbought', RBC's George Gero (a precious-metals trader) says. 'It was an overreaction to Russia; markets became overbought. There was rush. We don't know what is coming and when there is uncertainty people pull the trigger'. Streible agrees that the market got ahead of itself but is bullish on both markets. 'The rally in platinum and palladium got overdone and corrected but is not over', he says (in April 2014). 'Platinum could get to USD1 700 pretty easily; and with palladium, USD850 to USD900 is possible'. Platt agrees that platinum and palladium have been the most interesting markets in the sector. 'Palladium and platinum has been the biggest story lately. Both markets, particularly palladium, have outperformed gold through (March 2014)', Stephen Platt (Analyst with Archer Financial Services) says. Some of that is a reflection of fear, he adds. Russia is a major producer of palladium and the newer cars use catalytic converters that rely on palladium. With car sales picking up and Russia having reportedly worked down its inventories, it puts palladium in a tighter balance than it has been in a long time'. He also notes that stricter requirements for diesel engines are coming online later this year, which should be a boost for platinum. Diesel engines use mostly platinum in exhaust systems while palladium is used more for gas engines. Platt sees both markets heading to new highs. 'We will probably try and make a run at the USD1 000 area in palladium', Platt says. 'On platinum, I wouldn't be surprised if we pull in here and then make a run at USD1 800', he says. While most analysts are bullish on both platinum and palladium, they are basing it on supply and demand and don't anticipate more costly Russian sanctions or a supply disruption. 'If anything, the fact that Russia will need the foreign exchange, they probably will be more willing sellers', Platt says. A bigger problem is simply that they may not have a lot of inventory. 'They reportedly had sold off into 2012–13 a lot of their strategic stockpiles and had worked them down pretty low', he says. 'It is not a factor of Russia stopping sales but more a fact that they can't sell. They don't have the product'. And there are not a lot of

alternatives. ‘The problem is the products that Russia is controlling are such necessities to the global economy that you can’t fully punish them because of the risk and shock to the system’, Streible says. ‘All you can do is negotiate. Other countries recognize the power that they have. If they shut natural gas off to the Ukraine tomorrow, that would be catastrophic for the Ukraine’, he says. The situation may be tighter with platinum due to mine strikes in South Africa. ‘It looks like it is getting worse rather than better in terms of mine output out of South Africa, which is key to platinum’, Platt says. ‘South Africa accounts for about 73% of platinum production. See also Gold, Palladium, Platinum, and Silver. / ТЧОКОМ (TOCOM). Дьжодьж Дьжеро (George Gero). Стивэн Плат (Аналитик из Ачё Файнэншл Сёвисиз) (Stephen Platt (Analyst with Archer Financial Services)). Филып Стчрайбл (Phillip Streible). Под Благородными Металлами понимаются золото, серебро, платина и металлы платиновой группы (иридий, осмий, палладий, родий и рутений). Обладают химической стойкостью, тугоплавкостью (кроме Au и Ag), красивым внешним видом в изделиях (отсюда название). Под Благородными Металлами понимаются золото, серебро, платина и металлы платиновой группы (иридий, осмий, палладий, родий, рутений), получившие своё название главным образом благодаря высокой химической стойкости и красивому внешнему виду в изделиях. Кроме того, золото, серебро и платина обладают высокой пластичностью, а металлы платиновой группы – тугоплавкостью. Эти достоинства отдельных благородных металлов сочетаются в их сплавах, широко применяемых в технике. Золото и серебро известны человечеству несколько тысячелетий; об этом свидетельствуют изделия, найденные в древних захоронениях, и примитивные горные выработки, сохранившиеся до наших дней. Основными центрами добычи благородных металлов в древности были Верхний Египет, Нубия, Испания, Колхида (Кавказ); имеются сведения о добыче благородных металлов на Американском континенте (Центральная и Южная Америка) и в Азии (Индия, Алтай, Казахстан, Китай). На территории России золото добывали уже во 2–3-м тысячелетии до Нашей Эры (так называемые Чудские Работы). Из россыпей благородные металлы извлекали промывкой песков на щитах, поверх которых укладывали шкуры животных с подстриженной шерстью (для улавливания крупинок золота), а также при помощи примитивных желобов, лотков и ковшей. Благородные металлы из руд добывали нагреванием породы до растрескивания с последующими дроблением глыб в каменных ступах, и стиранием жерновами и промывкой. Разделение по крупности проводили на ситах. Из техники того времени интересны способ разделения сплавов золота и серебра кислотами, выделение золота и серебра из свинцового сплава купеляцией (Древний Египет), извлечение золота амальгамированием ртутью или с помощью жировой поверхности (Древняя Греция). Купеляцию осуществляли в глиняных тиглях, куда добавляли свинец, соль, олово и отруби. В XI–VI веках до Нашей Эры золото добывали в Испании в долинах рек Тахо, Дуэро, Миньо и Гуадьяро. В VI–IV веках до Нашей Эры начались разработки коренных и россыпных месторождений золота в Трансильвании и Западных Карпатах. В средние века (вплоть до XVIII века) добывали преимущественно серебро, добыча золота снизилась. С XVI века Испанцы начинают разработку благородных металлов на территории Южной Америки:- с 1532 – в Перу и Чили, а с 1537 – в Новой Гранаде (современная Колумбия). В Боливии в 1545 началась разработка ‘серебряной горы’ Потоси. В 1577 были обнаружены золотоносные россыпи в Бразилии. К середине XVI века в Америке добывали золота и серебра в 5 раз больше чем, в Европе до открытия Нового Света. В 1-й половине XVI века Испанские колонизаторы обратили внимание на неплавкий тяжёлый белый металл, встречающийся попутно с золотом в россыпях Новой Гранады (New Granada). По внешнему сходству с серебром (Испанское слова Plata) они дали ему уменьшительное название ‘Платина’ (Platina). Платина была известна ещё в древности, самородки этого металла находили вместе с золотом и называли их ‘Белым Золотом’ (Египет, Испания, Абиссиния), ‘Лягушачьим Золотом’ (Остров Борнео) и так далее. Первоначально Испанцы считали её вредной примесью, поэтому был издан правительственный декрет, предписывающий выбрасывать платину в море. Первое научное описание платины сделал Британец Вильэм Вотсэн (William Watson; 1715–1787) в 1741 в связи с началом её добычи в промышленных масштабах в Колумбии (1735). В 1803 Английский учёный Вильэм Хайд Волэстчэн (William Hyde Wollaston; 1766–1828) открыл палладий и родий, а в 1804 Английский учёный Смитсэн Тчэнэнтч (Smithson Tennant; 1761–1815) открыл иридий и осмий. В 1808 Польский учёный Йенджей Шнядэцки (Jędrzej Śniadecki; 1768–1838), исследуя платиновую руду, привезённую из Южной Америки, извлек новый химический элемент, названный им Вестием. В 1844 профессор Казанского Университета Карл Эрнст Кляус (Karl Ernst Claus; 1796–1864) всесторонне изучил этот элемент и назвал его в честь России Рутением (или Российский). Металлы платиновой группы встречаются в природе чаще всего в полиметаллических (медно-никелевых) рудах, а также в месторождениях золота и платины. Добыча благородных металлов в России началась в XVII веке в Забайкалье с разработки серебряных руд, которая велась подземным способом. Первое письменное упоминание о добыче золота из россыпей Урала относится к 1669 (летопись Долматовского Монастыря). Одно из первых месторождений золота в России было открыто в Карелии в 1737; его разработка относится к 1745. Началом золотого промысла на Урале принято считать 21 Мая (01 Июня) 1745, когда житель села Шарташ Ерофей Марков открыл Берёзовское рудное месторождение. В 1819 в россыпных месторождениях золота на Урале был обнаружен ‘Новый Сибирский Металл’ (Платина). В 1824 на Восточном склоне Уральских Гор найдена богатая россыпь платины с золотом и заложен первый в России и Европе платиновый прииск. Позднее К.П. Голляховским и другими открыта Исовская система золото-платиновых россыпей, получившая мировую известность. В 1828 Русский учёный металлург Василий Васильевич Любарский (1795–1852) опубликовал работы о первом в мире коренном месторождении платины, обнаруженном у Главного Уральского Хребта. 95% платины до 1915 в основном добывали из россыпей, остальное количество получали при электролитическом рафинировании меди и золота. Для извлечения благородных металлов из россыпных месторождений в XIX веке создаются многочисленные конструкции золотоизвлекательных машин (например, бутара, вашгерд). С 1-й половины XIX века на Уральских приисках широко применялась буторная разработка. В 1830-х на приисках воду для размыва пород россыпей подавали под напором. Дальнейшее совершенствование этого способа привело к созданию водобоев – прототипов гидромонитора. В 1867 горный инженер А.П. Чаусов около Озера Байкал впервые осуществил гидравлическую разработку россыпи; позднее (1888) этот способ был применён Е.А. Черкасовым в долине Реки Чебалсук в Абаканской тайге. В начале XIX века для добычи золота и платины из обводнённых россыпей применили землечерпалки, а в 1870 в Новой Зеландии для этой цели – драгу. Начиная со 2-й половины XIX века глубокие россыпи в России разрабатываются подземным способом, а в 1890-х внедряются экскаваторы и скреперы. В 1767 изобретатель-металлург Фёдор Бакунин в России впервые применил плавку серебряных руд с использованием шлаков в качестве флюсов. В работах Шведского химика-фармацевта Каль Вильхэм Сэля (Carl Wilhelm Scheele; 1742–1786) в 1772 содержалось указание на переход золота в раствор при действии цианистых соединений. В 1843 Русский учёный-металлург Пётр Романович Багратион (1818–1876) опубликовал труд о растворении золота и серебра в водных растворах цианистых солей в присутствии кислорода и окислителей, заложив основы гидрометаллургии золота (смотрите Гидрометаллургия). Очистка и обработка платины затруднялась высокой температурой её плавления (1 773.5 °C). В 1-й половине XIX века Российский химик и минералог Граф Аполлос Аполлосович Мусин-Пушкин (Count Apollos Apollosovich Musin-Pushkin; 1760–1805) получил ковкую платину прокаливанием её амальгамы. В 1827 Русский инженер и учёный Пётр Григорьевич Соболевский (1782–1841) и Русский учёный и металлург Василий Васильевич Любарский (1795–1852) предложили новый способ очистки сырой платины, положивший начало порошковой металлургии. В течение года этим способом было очищено впервые в мире около 800 килограммов (кг) платины, то есть осуществлена переработка платины в больших масштабах. В 1859 Французские учёные-химики Ори Сэнт-Клер Довиль (Henri Sainte-Claire Deville; 1818–1881) и

Жюль Ори Добрэ (Jules Henri Debray; 1827–1888) впервые выплавили платину в печи в кислородно-водородном пламени. Первые работы по электролизу золота относятся к 1863, в производство этот метод введён в 1880-х. Кроме амальгамации, в 1886 впервые в России было осуществлено извлечение золота из руд хлорированием (Кочкарьский рудник на Урале). В 1896 на том же руднике пущен первый в России завод по извлечению золота цианированием (первый такой завод построен в Йоханнесбурге (Южная Африка) в 1890). Вскоре цианистый процесс применили для извлечения серебра из руд. В 1887–88 в Англии Дьжон Стюэтч МакАсо (John Stewart MacArthur; 1857–1920) и братья Доктор Робэтч Водроп Форэст (Dr Robert Wardrop Forrest; 1840–1919) и Доктор Вилъйэм Форэст (Dr William Forrest) получили патенты на способы извлечения золота из руд обработкой их разбавленными щелочными цианистыми растворами и осаждения золота из этих растворов цинковой стружкой. В 1893 проведено осаждение золота электролизом, в 1894 – цинковой пылью. В бывшем Союзе Советских Социалистических Республик (СССР) золото добывали в основном из россыпей; за рубежом около 90% золота – из рудных месторождений. По эффективности добычи благородных металлов из россыпей лучшим является дражный способ (смотрите Дражная Разработка), менее экономичны скреперно-бульдозерный и гидравлический. Подземная разработка россыпей почти в 1.5 раза дороже дражного способа; в СССР её применяли на глубоких россыпях в долинах рек Лены и Колымы. Серебро добывали главным образом из рудных месторождений. Оно встречается в основном в свинцово-цинковых месторождениях, дающих ежегодно около 50% всего добываемого серебра; из медных руд получают 15%, из золотых 10% серебра; около 25% добычи серебра приходится на серебряные жильные месторождения. Значительную часть платиновых металлов извлекают из медно-никелевых руд. Платину и металлы её группы выплавляют вместе с медью и никелем, и при очистке последних электролизом они остаются в шламе. Для извлечения благородных металлов широко пользуются методами гидрометаллургии, часто комбинируемыми с обогащением. Гравитационное обогащение благородных металлов позволяет выделять крупные частицы металла. Его дополняют цианирование и амальгамация, первое теоретическое обоснование которой дано Советским учёным Игорем Николаевичем Плаксиным (1900–1967) в 1927. Для цианирования наиболее благоприятно хлористое серебро; сульфидные серебряные руды часто цианируют после предварительного хлорирующего обжига. Золото и серебро из цианистых растворов осаждают обычно металлическим цинком, реже углём и смолами (ионитами). Извлекают золото и серебро из руд селективной флотацией. Около 80% серебра получают главным образом пирометаллургией, остальное количество – амальгамацией и цианированием. Благородные металлы высокой чистоты получают аффинажем. Потери золота при этом (включая плавку) не превышают 0.06%, содержание золота в аффинированном металле обычно не ниже 999.9 пробы; потери платиновых металлов не свыше 0.1%. Ведутся работы по интенсификации цианистого процесса (цианирование под давлением или при продувке кислорода), изыскиваются нетоксичные растворители для извлечения благородных металлов, разрабатываются комбинированные методы (например, флотационно-гидрометаллургический), применяются органические реагенты и другое. Осаждение благородных металлов из цианистых растворов и пульп эффективно осуществляется с помощью ионообменных смол. Успешно извлекаются благородные металлы из месторождений при помощи Бактерий (смотрите Бактериальное Выщёлачивание). Сохраняя функции валютных металлов, главным образом золото (смотрите Деньги), благородные металлы в то же время получили широкое применение в технике. В электротехнической промышленности из благородных металлов изготовляют контакты с большой степенью надёжности (стойкость против коррозии, устойчивость к действию образующейся на контактах кратковременной электрической дуги). В технике слабых токов при малых напряжениях в цепях используются контакты из сплавов золота с серебром, золота с платиной, золота с серебром и платиной. Для слаботочной и средненагруженной аппаратуры связи широко применяют сплавы палладия с серебром (от 60 до 5% палладия). Представляют интерес металлокерамические контакты, изготовляемые на основе серебра как токопроводящего компонента. Магнитные сплавы благородных металлов с высокой коэрцитивной силой употребляют при изготовлении малогабаритных электроприборов. Сопротивления (потенциометры) для автоматических приборов и тензометров делают из сплавов благородных металлов (главным образом палладия с серебром, реже с другими металлами). У них малый температурный коэффициент электрического сопротивления, малая термоэлектродвижущая сила в паре с медью, высокое сопротивление износу, высокая температура плавления, они не окисляются. В химическом машиностроении и лабораторной технике из благородных металлов изготовляют различные коррозионностойкие аппараты, электрические нагреватели, высокотемпературные печи, аппаратуру для производства оптического стекла и стекловолокна, термопары, эталоны сопротивления и другое. При этом благородные металлы используются в чистом виде, как биметалл и в сплавах (смотрите Платиновые Сплавы). Химические реакторы и их части делают целиком из благородных металлов или только покрывают фольгой из благородных металлов. Покрытые платиной аппараты применяют при изготовлении чистых химических препаратов и в пищевой промышленности. Когда химической стойкости и тугоплавкости платины или палладия недостаточно, их заменяют сплавами платины с металлами, повышающими эти свойства:- иридием (5–25%), родием (3–10%) и рутением (2–10%). Примером использования благородных металлов в этих областях техники является изготовление котлов и чаш для плавки щёлочей или работы с соляной, уксусной и бензойной кислотами; автоклавов, дистилляторов, колб, мешалок и другого. В медицине благородные металлы применяют для изготовления инструментов, деталей, приборов, протезов, а также различных препаратов, главным образом на основе серебра. Сплавы платины с иридием, палладием и золотом почти незаменимы при изготовлении игл для шприцев. Из медицинских препаратов, содержащих благородные металлы, наиболее распространены ляпис, протаргол и другие. Благородные металлы применяют при лучевой терапии (иглы из радиоактивного золота для разрушения злокачественных опухолей), а также в препаратах, повышающих защитные свойства организма. В электронной технике из золота, легированного германием, индием, геллием, кремнием, оловом, селеном, делают контакты в полупроводниковых диодах и транзисторах. В фото-кинопромышленности благородные металлы применяют в виде солей при изготовлении светочувствительных материалов (главным образом серебро в виде бромистой соли, являющейся важнейшей частью светочувствительной эмульсии), реже – соли золота и платины при вирировании изображения (смотрите Окрашивание Фотографических Изображений). В ювелирном деле и декоративно-прикладном искусстве применяют сплавы благородных металлов (смотрите Ювелирные Сплавы). В качестве покрытий других металлов благородные металлы предохраняют основные металлы от коррозии или придают поверхности этих металлов свойства, присущие благородным металлам (например, отражательная способность, цвет, блеск и так далее). Золото эффективно отражает тепло и свет от поверхности ракет и космических кораблей. Для отражения инфракрасной радиации в космосе достаточно тончайшего слоя золота в 1/60 микрометра (мкм). Для защиты от внешних воздействий, а также для улучшения наблюдения за спутниками на их внешнюю оболочку наносят золотое покрытие. Золотом покрывают некоторые внутренние детали спутников, а также помещения для аппаратуры с целью предохранения от перегрева и коррозии. Благородные металлы используют также в производстве зеркал (серебрение стекла растворами или покрытие серебром распылением в вакууме). Тончайшую плёнку благородных металлов наносят изнутри и снаружи на кожухи авиационных двигателей самолётов высотной авиации. Благородные металлы покрывают отражатели в аппаратах для сушки инфракрасными лучами, электроконтакты и детали проводников, а также радиоаппаратуру и оборудование для рентгено- и радиотерапии. В качестве антикоррозийного покрытия благородные металлы используют при производстве труб, вентилей и ёмкостей специального назначения. Разработан широкий ассортимент золотосодержащих пигментов для покрытия металлов, керамики, дерева. Широко распространены

антифрикционные сплавы, припои на основе благородных металлов. Например, припои с серебром значительно превосходят по прочности медно-цинковые, свинцовые и оловянные, их применяют для пайки радиаторов, карбюраторов, фильтров и так далее. Сплавы иридия с осмием, а также золота с платиной и палладием используют для изготовления компасных игл, напаек 'вечных' перьев. Высокие каталитические свойства некоторых благородных металлов позволяют применять их в качестве катализаторов:- платину – при производстве серной и азотной кислот; серебро – при изготовлении формалина. Радиоактивное золото заменяет более дорогую платину в качестве катализатора в химической и нефтеперерабатывающей промышленности. Благородные металлы используют также для очистки воды.

PRECIOUS METALS COMMODITIES INDEX = СЫРЬЕВОЙ ИНДЕКС ПО БЛАГОРОДНЫМ МЕТАЛЛАМ – The Precious Metals Commodities Index is published by Goldman Sachs. Gold, platinum and silver are the listed metals. / Сырьевой Индекс по Благородным Металлам, публиковавшийся корпорацией Голдмэн Сэкс (Goldman Sachs), включал в себя стоимость золота, платины и серебра.

PRECIPITATE = ОСАДОК – Precipitate:- in chemistry, a solid formed by a reaction in a solution or as a result of physical changes, such a temperature, of the solution. A precipitate has low solubility in the solution from which it was formed, giving a cloudy appearance, or actually settling out of solution. / Осадок .

PRECIPITATION = ОСАДОК – Precipitation is:- (1) a formation of a solid from a solution as a result of a physical or chemical change. (2) A deposit on the earth of hail, mist, rain, sleet or snow. (3) The quantity of water deposited. / Под атмосферными Осадками понимаются вода в жидком или твёрдом состоянии (дождь, снег, крупа, наземные гидрометеоры и прочее), выпадающая из облаков или осаждающаяся из воздуха на земной поверхности и на предметах. Осадки измеряются толщиной слоя выпавшей воды в миллиметрах (мм). В среднем на земном шаре выпадает около 1 000 мм осадков в год, а в пустынях и в высоких широтах – менее 250 мм в год.

PRECIPITATION INTERCEPTION = ПЕРЕХВАТ ОСАДКОВ (или ЗАДЕРЖАНИЕ ОСАДКОВ) – Precipitation Interception is the stopping, interrupting, and temporary holding of precipitation in any form by a vegetative canopy or vegetation residue.

PRECISION = ТОЧНОСТЬ (или ПРЕЦИЗИОННОСТЬ) – Precision:- the closeness of agreement between test results obtained under prescribed conditions. / Под Точностью или Прецизионностью, от Французского слова Précision, означающее Точность, понимается .

PRE–CLEANER = МАШИНА ПРЕДВАРИТЕЛЬНОЙ ОЧИСТКИ (или ПРЕДВАРИТЕЛЬНЫЙ ОЧИСТИТЕЛЬ) – (1) In cotton ginning, Pre-Cleaner is a machine that is used for preliminary cleaning of seed cotton by removing of yellow/pre-matured bolls, trash, stones and others impurities from raw cotton, thus improving the quality of raw cotton prior to ginning. Pre-Cleaner protects fiber quality, cleans gently and efficiently, and optimizes ginning performance. It also protects gin from damage by impurities. Precleaning is the process or processes, after unloading the cotton and before passing through the gin stand, designed primarily to remove dirt and small pieces of leaves, bracts, and other vegetative matter from seed cotton. It can include cylinder cleaners, dryers, and extractor machinery, such as bur machines, stick machines, and extractor-feeders. / и мелкие кусочки листьев (leaves), прицветничков или прилистников (bracts) и прочих . таких как машин, удаляющих створки коробочки (bur machines), черешки (stick machines), и экстракторы-питатели (extractor-feeders).

(2) Precleaning should be gentle. Since removing finer trash particles is difficult, seeds and bigger trash particles should not be broken. Finer trash particles require severe treatment in Fine openers. This will lead to fiber damage and more nep generation. Therefore, precleaning should be as gentle as possible and no compromise on this. If preopening and precleaning are done properly, consistency in trash removal by fine openers is assured. Dust removal should be started in this machine. Enough care should be taken remove dust in this process. Rieter's Uniclean B11 and Trützschler's Axiflow or Maxiflow are the machines which does this work:- (i) the fiber treatment in this machine is very gentle because the fibers are not gripped by the feed roller during beating. Fiber tufts treated by the pin beater when it is carried by air medium; (ii) all heavy trash particles fall down before it is broken; (iii) cleaning efficiency of this machine is very high in the blow room line; (iv) mostly all heavy seeds (full seeds) fall in this machine without any problem; (v) around 50 Pascal suction pressure should be maintained in the waste chamber for better cleaning efficiency; (vi) beater speed, air velocity through the machine, grid bar setting and gap between grid bars will affect the cleaning efficiency; (vii) higher the cleaning efficiency, higher the good fiber loss, higher the nep generaion and higher the fiber rupture; (viii) the optimum cleaning means maximum cleaning performance, minimum loss of good fibers, a high degree of fiber preservation and minimum nep generation; (ix) Rieter has a unique concept called 'VARIOSET'. With this machine, selective trash removal is possible. Waste amount can be changed in a range of 1:10. (x) with normal machines like Monocylinder or axiflow, a lot of trials to be conducted to arrive at optimum beater speed, air velocity (fan speed), grid bar setting and grid bar gap; and (xi) in general the beater speed is around 750 and minimum 50 pascal suction pressure to be maintained in the suction chamber. Mostly all heavy seeds (full seeds) fall in this machine without any problem. Pre-cleaner is an highly effective opening, cleaning and dust-removal machine generally used as the first opening/cleaning machine in the blowroom line. Designed to take advantage of the exceptionally efficient pre-opening of the automatic bale opener the new modern pre-cleaner through its unique 'single sheet' material processing technique gives not only exceptional cleaning but also maximum fiber yield with minimal nep generation when compared to other first stage cleaners currently available. The machines high processing capacity (2 000 kg per hour) together with its in-built cleaning programmes aloow multiple opening lines processing varying materials blends to be fed from a pre-cleaner. When the pre-cleaner is linked to a programmable bale opening machine the machines feeding rates are automatically optimized in line with the automatic bale opener to suit the current production rate required by down-stream opening machines. Precleaning should be gentle. Since removing finer trash particles is difficult, seeds and bigger trash particles should not be broken. Finer trash particles require severe treatment in Fine openers. This will lead to fiber damage and more nep generation. Therefore, precleaning should be as gentle as possible and no compromise on this. If preopening and precleaning are done properly, consistency in trash removal by fine openers is assured. Dust removal should be started in this machine. Enough care should be taken remove dust in this process. The Crosrol Pre-cleaner is an highly effective opening, cleaning and dust-removal machine generally used as the first opening/cleaning machine in the blowroom line. Designed to take advantage of the exceptionally efficient pm-opening of the automatic bale opener the Crosrol pre-cleaner through its unique 'single sheet' material processing technique gives not only exceptional cleaning but also maximum fiber yield with minimal nep generation when compared to other first stage cleaners currently available. The machines high processing capacity (2 000 kg's per hour) together with its in-built cleaning programmes allow multiple opening lines processing varying materials blends to be fed from a single Crosrol pre-cleaner. Dust removal:- a large perforated hood separates the incoming material from the air stream and provides a substantial surface area for the removal of the liberated dust and fine trash particles. Feed control:- the material reserve section in conjunction with the inverter driven feed rollers ensure a constant and controlled feed to the opening beater. Opening and cleaning:- a large single cylinder Inverter controlled beater with helically positioned opening prongs opens and forms the material into a low density uniformed sheet of material ensuring optimum opening and cleaning of each and every fiber tuft. Micro dust removal:- the opened material passes a secondary perforated screen for highly effective removal

of small trash particles and dust. Control and flexibility:- newly developed remotely controlled grid bars are formed into two independently adjustable banks which provide optimum Cleaning with maximum fiber yield for any given material been processed. Waste extraction:- liberated trash particles fall into a pressure controlled waste collection chamber and are extracted via the air-lock wheel. Protection of fiber parameters:- after a single interaction with the grid bar area, the sheet of low density fibers are efficiently stripped from the beater so as to negate the need for unnecessary over-working of the fibers at this early stage of the opening line. The Crosrol pre-cleaners in-built cleaning programmes together with its high production capabilities enable multiple opening lines to be fed from a Single pre-cleaner machine thus leading to much reduced capital investment. Lower space requirements and significantly reduced operating costs. Unlike other first stage cleaners that have multiple random attempts to open and clean the material. The Crosrol pre-cleaner processes a singular sheet of low density material which ensures that each singular tuft of material is subjected to exactly the same degree of opening and cleaning as the next tuft. This unique working principal ensures that all trash particles are fully exposed to the cleaning actions of the machine rather than been concealed (as with other similar types of machines) inside multiple dense rolls of material, this unique feature of the Crosrol Pre-Cleaner also ensures that nap generation and fiber damage are kept to an absolute minimum. The Rieter UNIclean B 12 eliminates approximately 70% of the trash. As the material is fed to the opening rollers in free flight, a high degree of fiber preservation may be achieved. With VarioSet the settings can be adjusted during production. Cleaning can easily be optimized by entering only two parameters:- cleaning intensity and relative volume of waste. The B 12 achieves maximum operational efficiency with a minimum of cleaning points, giving optimal gentle fiber handling, and high exploitation of the raw material. Pre-cleaner is an efficient cleaning and dedusting machine which is used immediately after bale opening. Cotton and other natural fibers such as flax can be cleaned and dedusted gently for card production. The material is fed to the pre-cleaner and passed mechanically up to seven times over the cleaning grid on special pins. In the process the raw material is guided over the integrated dedusting filter, where dust, fiber fragments and pepper trash are stripped off mechanically. The cleaning process takes place undisturbed by air currents and thus in a controlled and effective manner. Only approximately 0.5 m^3/s of dust-laden air therefore has to be removed. The trash removed drops into the waste chamber and is fed to the waste removal system by an airlock cylinder. / Риэта (Rieter). Трущшля (Trützschler). Машина Предварительной Очистки является эффективной машиной для очистки и обеспыливания, которая устанавливается сразу же после кипоразборщика. Хлопковое и другие натуральные волокна, типа льна, могут быть бережно очищены и обеспылены для последующей стадии чесания. Материал подаётся в машину предварительной очистки и там прогоняется по кругу до семи раз на специальных штифтах очистительной колосниковой решётки. Во время этого процесса сырьё проходит мимо встроенного обеспыливающего фильтра, где пыль, фрагменты волокон и мелкие частицы сора удаляются механическим образом. Воздух не влияет на процесс очистки и поэтому данный процесс контролируем и эффективен. Приблизительно лишь 0.5 $м^3$/секунду запылённого воздуха должно удаляться. Выделяемые отходы попадают в камеру для угаров и подаются к агрегату удаления отходов посредством использования шлюзового валика.

PRE–CLEARANCE = ПРЕДВАРИТЕЛЬНАЯ ОЧИСТКА – Pre-Clearance:- phytosanitary certification and/or clearance in the country of origin, performed by or under the regular supervision of the National Plant Protection Organization of the country of destination.

PRECLIMACTERIC = ПРЕКЛИМАКТЕРИЧЕСКОЕ – Preclimacteric:- (Latin:- climactericus - turning point, critical time) Picking, harvesting, shipping or industrial ripeness.

PRECONDITIONING = ПРЕДВАРИТЕЛЬНОЕ КОНДИЦИОНИРОВАНИЕ – Preconditioning:- bringing a sample or specimen of textile material to a relatively low moisture content (approximate equilibrium in an atmosphere between 5 and 25% relative humidity) prior to conditioning in a controlled atmosphere of higher humidity for testing. While preconditioning is frequently translated as predrying, specimens should not be brought to the overdry state. Preconditioning is the process of bringing a textile material to approximate equilibrium with the atmosphere for preconditioning.

PRECOOKED RICE = ЗАРАНЕЕ ПРИГОТОВЛЕННЫЙ РИС (или ПРЕДВАРИТЕЛЬНО СВАРЕННЫЙ РИС) – Precooked Rice has been milled, cooked, and dehydrated before packaging. Precooked Rice, in its dried form, is more porous so that boiling water can penetrate the grains and rehydrate them in a short time. Precooked Rice is a white or brown Rice that has been completely cooked and dehydrated after milling. This process reduces time required for cooking. Precooked Parboiled Rice characteristics:- short prep time. Applications:- (i) frozen/prepared entrees; (ii) side dishes; (iii) microwave meals; (iv) packaged rice mixes; (v) dehydrated soup mixes; and (vi) foodservice products. / К Заранее Приготовленному Рису относится Рис, подвергнутый процессу рушения, приготовления (варки) и обезвоживания перед упаковыванием. Заранее приготовленный Рис, в своём высушенном виде, является более пористым, что позволяет кипящей воде в короткий срок проникать в зёрна, наполняя их водой.

PRE–COOLING = ПРЕДВАРИТЕЛЬНОЕ ОХЛАЖДЕНИЕ – Pre-Cooling is a process employed in the shipment of citrus fruits and other perishable commodities. The fruit is packed and placed in a cold room from which the heat is gradually extracted. The boxes of fruit are packed in containers that have been thoroughly cooled and transported through to destination without opening the doors. / Процесс, осуществляемый при отгрузке цитрусовых фруктов и других скоропортящихся товаров. Фрукт упаковывается и помещается в холодное помещение, из которого постепенно было выведено тепло. Коробки с фруктами укладываются в контейнеры с тем, чтобы должным образом охлаждаться и перевозиться к месту назначения, не открывая при этом дверей.

PRE–CURE = С ПРЕДВАРИТЕЛЬНОЙ ВУЛКАНИЗАЦИЕЙ – Pre-Cure:- a finishing treatment in which the durable press finish is applied to the fabric and set, or cured, through the use of heat at the mill, prior to shipment of the fabric to the garment manufacturer.

PREDATION = ХИЩНИЧЕСТВО – Predation is a direct attack and feeding of one organism on a second organism, the predator typically being larger than its prey. Predation:- a biological interaction where the predator feeds on its prey. / Хищничество, форма взаимоотношений между организмами разных Видов, из которых один (хищник) поедает другого (жертву, добычу), обычно предварительно убив его. Сравните с терминами Паразитизм, Симбиоз, Комменсализм, и Квартирантство.

PREDATOR = ХИЩНИК – Predator is an organism that kills and consumes another (its prey); a number of small predator insects can provide significant natural control of several pests. Predator is a natural enemy that preys and feeds on other animal organisms, more than one of which are killed during its lifetime. Predator is an animal that attacks and feeds on the other animals, such as a bird or spider which feeds on many different species of insects and attacks a number of prey by quickly eating or sucking their body fluids. / Хищник – естественный враг, который охотится за другими животными организмами и питается ими, и убивает их более одного за время своей жизни.

PREDATORY = ХИЩНИЧЕСТВО – Predatory means a practice that violates the antitrust laws as defined in the first section of the Clayton Act (15 USC 12). / Акт Клэйтэна (Clayton Act).

PREDATORY LENDING = ХИЩНИЧЕСКОЕ РОСТОВЩИЧЕСТВО – Predatory Lending is the targeting loans to elderly, low-income and other people to take advantage of their financial status or lack of financial knowledge. / Под Ростовщичеством понимается предоставление денежных ссуд под высокий процент.

PREDICTED ENVIRONMENTAL CONCENTRATION = ПРЕДСКАЗУЕМАЯ ОКРУЖАЮЩАЯ КОНЦЕНТРАЦИЯ – Predicted Environmental Concentration (PEC):- estimated environmental concentration based on either measured or calculated data.

PREDICTED NO EFFECT CONCENTRATION = ПРЕДСКАЗУЕМАЯ НЕ ВОЗДЕЙСТВУЮЩАЯ КОНЦЕНТРАЦИЯ – Predicted No Effect Concentration (PNEC):- environmental concentration which is regarded as a level below which the balance of probability is that an unacceptable effect will not occur.

PREDICTIVE MAINTENANCE = ПРЕДСКАЗУЕМЫЙ (или ПРОГНОЗИРУЕМЫЙ) РЕМОНТ – Predictive Maintenance is a type of condition-based maintenance emphasizing early prediction of failure using non-destructive techniques such as vibration analysis, thermography, and wear debris analysis. / остатки (debris) износа.

PRE–DIP = ПРЕДВАРИТЕЛЬНОЕ ПОГРУЖЕНИЕ (или ОКУНАНИЕ) – Pre-Dip is a chemical composition applied to a cord or fabric to improve the reactivity of the surface.

PREEMERGENCE = ПРЕДВСХОДОВОЕ (или ДОВСХОДОВОЕ) – (1) Preemergence (PRE):- applied to the soil before emergence of the specified crop. Pre-Emergence:- the period after sowing before the germination of the seed. / Используется в отношении почвы до момента всходов конкретной сельскохозяйственной культуры.

(2) Preemergence is a term most often referring to broadleaf herbicides applied at or after planting but before seedling emergence; Pre herbicides, e.g., Zorial.

PREEMERGENCE HERBICIDE = ДОВСХОДОВЫЙ ГЕРБИЦИД (или ПРЕДВСХОДОВЫЙ ГЕРБИЦИД) – Preemergence Herbicide is a residual weed-killing chemical applied to the soil for several weeks before the cotton emerges. Kills weeds as they emerge. A herbicide normally applied between planting and crop or weed emergence. Pre-Emergence Herbicide is a herbicide applied after the crop has been planted but before the crop and or weeds emerge. / Гербицид, используемый обычно в период между посадкой и всходом самой культуры или сорняков.

PREEMERGENT = ПРЕДВСХОДОВЫЙ (или ДОВСХОДОВЫЙ) – Preemergent:- period of time before the emergence of crop seedlings. / Период времени, предшествующий всходам посевов сельскохозяйственной культуры.

PRE–EMPTION = УПРЕЖДАЮЩЕЕ ПОВЫШЕНИЕ – Pre-Emption:- the member also the right to a 'pre-emption offer' from the managing agent if the successor syndicate is to be expanded in the subsequent year. A pre-emption offer is an invitation by a syndicate to the member to increase their nominal capacity in line with the increase in a syndicate's increase in capacity in order that the Name has proportionately the same share of the syndicate's capacity in that subsequent year. There is no cost to taking up a pre-emption offer, but the member may be required to increase their Funds at Lloyd's (LLM1200) in order to support the increased personal underwriting. A member may accept all or part of a pre-emption offer and sell via the auction process (LLM1140) any part that they do not wish to take up. Alternatively they may simply decline all or part of the offer, or allow it to lapse. Example:- for the 2002 underwriting account, Name A's allocated capacity on syndicate 7777 (2002) was £50 000.00. The stamp capacity of syndicate 7777 (2002) was £100M. For the 2003 underwriting account, syndicate X increases its capacity by £10M to £110M. Name A has the pre-emption right to additional capacity of £10M / £100M x £50 000.00, i.e. £5 000.00 on syndicate X for the 2003 account. If they take up that right, they will still have the same percentage share of the syndicate's capacity. Where a managing agent increases the underwriting capacity of a syndicate, for example when it expects to write more business in future. The participations of the members of the syndicate are increased proportionately to the extent the managing agent's pre-emption offer is taken up. The opposite of De-Emption.

PRE–EMPTIVE RIGHT = ПРЕИМУЩЕСТВЕННОЕ ПРАВО – Pre-Emptive Right:- sometimes incorrectly called Participatory Right or Subscription Right. The right of shareholders to maintain their percentage of ownership of a company by buying that number of shares to achieve this end.

PRE–EXPORT FINANCING = ПРЕДВЫВОЗНОЕ ФИНАНСИРОВАНИЕ (или ПРЕДЭКСПОРТНОЕ ФИНАНСИРОВАНИЕ) – Pre-Export Financing:- specific form of working capital lending in which the borrower is given funds needed to obtain or manufacture goods that have been ordered by a buyer in another country. As such financing is normally earmarked to individual sales, documentation of each sale must be provided to the lender, often in the form of a letter of credit with proceeds assigned to the lender. Generally only a percentage of the sale value is lent.

PRE–FABRICATED LASHING BELTS = ПРЕДВАРИТЕЛЬНО ИЗГОТОВЛЕННЫЕ СВЯЗЫВАЮЩИЕ ПОЯСА – Pre-Fabricated Lashing Belts:- these are ready-made lashing belts with hooks and tensioning elements sewn in.

PREFABRICATED WOOD I–JOIST = ЗАГОТОВКА В ВИДЕ ДВУТАВРОВОЙ ВТОРОСТЕПЕННОЙ ДЕРЕВЯННОЙ БАЛКИ (или СБОРНАЯ ДЕРЕВЯННАЯ ДВУТАВРОВАЯ ВТОРОСТЕПЕННАЯ БАЛКА) – Prefabricated Wood I-Joist:- a structural wood member made by using adhesive to attach wood flanges (LVL (Laminated Veneer Lumber), MSR (Machine Stress Rated) Lumber, or high quality dimension lumber) to a plywood or OSB web (oriented strandboard web). / Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов.

PREFERENCE = ПРЕФЕРЕНЦИЯ (или ПРЕДПОЧТЕНИЕ) – (1) Preference is an insect's choice to feed on, oviposit in, or use as shelter a resistant variety.

(2) (2) In economics and other social sciences, Preference refers to the set of assumptions related to ordering some alternatives, based on the degree of happiness, satisfaction, gratification, enjoyment, or utility they provide, a process which results in an optimal 'choice' (whether real or imagined). Although economists are usually not interested in choices or preferences in themselves, they are interested in the theory of choice because it serves as a background for empirical demand analysis. Preference:- tax measures are largely directed at removing preferences and increasing fairness. / Преференция – особые льгота и преимущество. В таможенном деле под Преференциями, от позднелатинского слова Praeferentia, означающее Предпочтение, понимаются льготные таможенные пошлины, устанавливаемые государством для всех или некоторых товаров отдельных стран и не распространяемые на товары других стран.

PREFERENCE SHARES = ПРИВИЛЕГИРОВАННЫЕ АКЦИИ – Preference Shares are shares evidencing special rights to shareholders, e.g., a preferential dividend. The purchase of preference shares, however, has the disadvantage that preference shares, unlike ordinary shares, do generally not, or only in exceptional cases, carry voting rights. The individual preferential rights of preference

shares are set out in the stock company's articles of association. Preference Shares are generally superior to an ordinary share in some way, usually because they have first preference or right to a dividend. Preference shares generally don't have voting rights. Some preference shares are convertible, that is, they can be converted to ordinary shares at some stage in the future. These type of shares are also know as hybrids. In the United Kingdom, Preference Shares typically carry a right that gives the holder preferential treatment when annual dividends are distributed to shareholders. Shares in this category have a fixed value, which means that a shareholder would not benefit from an increase in the business' profits. However, usually they have rights to their dividend ahead of ordinary shareholders if the business is in trouble. Also, where a business is wound up, they are likely to be repaid the par or nominal value of shares ahead of ordinary shareholders. See also Cumulative Preference Shares, Ordinary Shares, Redeemable Shares, and Shares. Preference shareholders take precedence over the ordinary shareholders but after debenture holders in the payment of dividends and also normally in the return of capital in a liquidation. In the United Kingdom, this type of share guarantees its holder a prior claim on dividends. The dividend paid to preference share holders is normally more than that paid to holders of ordinary shares. Preference shares may give the holder a right to a share in the ownership of the company (participating preference shares). However in the United Kingdom they usually do not, and are therefore classified as bonds. In Australia, shares that rank before ordinary shares in the event of liquidation of the issuing company and that usually receive a fixed rate of return. Preference Shares offer the shareholder preferential claims to dividends, usually at a fixed rate, and a prior claim to ordinary shareholders on the company's assets in the event of liquidation. The market price for preference shares tends to be more stable than that of ordinary shares. Preference shareholders may not vote at meetings of ordinary shareholders. Preference shares fall into five categories:- (i) cumulative, (ii) non-cumulative, (iii) redeemable, (iv) participating, and (v) convertible. In the United Kingdom, a share with preference rights, i.e. which is preferred over other stocks of the same company in terms of dividend payments and any distribution of assets on liquidation. The full dividend must be paid on preferred shares before any dividend can be paid on other shares. Also known as Preferred Shares in the United States; and Preferred Stock. Preference Shares is a particular class of shares which generally rank ahead of ordinary shares. Preference shareholders are normally entitled to a specified rate of dividend, and, unlike ordinary shareholders, are not entitled to residual profits. Although part of a company's share capital, from an investment perspective preference shares are much more like fixed interest bonds. / , то есть . Привилегированная Акция, акция, по которой уплачивается твёрдый, фиксированный доход, независимо от величины прибыли акционерного общества. Иногда привилегированными акциями называют акции, дающие несколько голосов на собрании акционеров. Привилегированная Акция, акция, по которой уплачивается твёрдый фиксированный доход, в отличие от обыкновенной акции, дивиденд по которой колеблется в зависимости от прибыли акционерного общества.

PREFERENTIAL TARIFF = ПРЕФЕРЕНЦИАЛЬНЫЙ ТАРИФ – Preferential Tariff:- international trade regulation that gives more favorable treatment by granting lower duty rates on goods imported from a certain country or group of countries. / Международное упорядочение торговли, которое предполагает режим наибольшего благоприятствования посредством предоставления более низких ставок пошлин на товары, ввозимые из определённой страны или группы стран. Под Преференциями, от позднелатинского слова Praeferentia, означающее Предпочтение, от Латинского слова Praefero, означающее Предпочитаю, понимаются особо льготные (или предпочтительные) ввозные пошлины, устанавливаемые данным государством для всех или некоторых товаров отдельных стран и не распространяемые на товары прочих стран (смотрите также Таможенные Пошлины). Империалистические державы используют преференции главным образом для получения дешёвого сырья и продовольствия из зависимых и развивающихся стран. Преференции практиковались обычно в торговле между метрополией и колониями. Великобритания широко применяла преференции в торговле со странами Стерлинговой зоны (смотрите Валютные Зоны). После 2-й Мировой Войны (1939–45) преференции используются Соединёнными Штатами Америки (США), Францией, Бельгией, Нидерландами. Например, почти все основные товары, ввозимые из стран Латинской Америки и Филиппин в США, облагаются преференциальными пошлинами, а во многих случаях ввозятся беспошлинно. Это даёт основание США добиваться снижения цен на ввозимые из этих стран сырьё и продовольствие и диктовать цены, по которым они экспортируют свои товары. При установлении преференций важное значение имеют политические интересы стран-импортёров. Так, до народной революции в Кубе (1959) США в торговле с ней применяли преференции. Социалистические преобразования в Кубе послужили причиной того, что в Октябре 1962 эта страна была официально лишена таможенных преференций и включена в список государств, не пользующихся в США режимом наибольшего благоприятствования. Таможенные льготы и преференции Африканских стран, ассоциированных с 'Общим Рынком', позволяют Западно-Европейскими монополиям урезывать цены на сырьё, экспортируемое Африканскими странами, и повышать цены на промышленные товары, экспортируемые Западно-Европейскими монополиями. По данным Экономической Комиссии ООН для Африки, к 1970 Африканские страны в результате неравноправных условий торговли с Европейским Экономическим Сообществом (ЕЭС) потерпели убытки на сумму 7 миллиардов Долларов США. Разновидностью преференций являются картельные пошлины. Последние устанавливаются соглашениями и договорами ряда стран, которые имеют предприятия или объединения, входящие в международный картель, производят и реализуют продукцию какой-либо отрасли промышленности. Например, картельные пошлины на алюминий применялись до 2-й Мировой Войны (1939–45) странами, входящими в Международный Алюминиевый Картель (Канадой, Францией, Германией и другими). Ставки картельных пошлин устанавливаются в пониженных размерах по сравнению с генеральными (общими), или в виде процентной скидки с общей ставки, или путём закрепления на срок конвенции (международные соглашения, договора) действующей нормы. Основная цель картельных пошлин – способствовать разделению рынков сбыта для получения монопольной прибыли, осуществлению внешнеторговой экспансии. В 1960–70-е картельные пошлины находили всё большее распространение в связи с гигантским сосредоточением экономической мощи, производства и сбыта определённых видов продукции в руках международных монополий. Социалистические страны применяли преференции прежде всего в торговле с развивающимися странами Азии, Африки и Латинской Америки для оказания им бескорыстной помощи. В целях дальнейшего расширения торговли с развивающимися странами в Союзе Советских Социалистических Республик (СССР) с 01 Января 1965 отменены таможенные пошлины на товары, ввозимые и происходящие из развивающихся стран Азии, Африки и Латинской Америки. По Советско-Индонезийскому торговому соглашению (Март 1974) предусматривалось взаимное предоставление сторонами режима наибольшего благоприятствования во всех вопросах торговли.

PREFERENTIAL TRADE AREA FOR EASTERN AND SOUTHERN AFRICA = АРЕАЛ ПРЕФЕРЕНЦИАЛЬНОЙ ТОРГОВЛИ ДЛЯ СТРАН ВОСТОЧНОЙ И ЮЖНОЙ АФРИКИ – The Preferential Trade Area Of Eastern And Southern Africa is the Treaty establishing the Preferential Trade Area for Eastern and Southern Africa was signed in December 1981, as a first step towards higher forms of regional economic cooperation and integration to bring about sustainable growth and development of Member States. The Treaty came into force in September 1992 following ratification by nine Member States. The PTA is primarily funded by subscriptions paid by Member States. Subscriptions were initially based on the following formula:- country's GDP, income per capita and value of intraregional exports. Weights of 30%, 40% and 30% were assigned to each parameter respectively. The formula was revised in 1989 to 30%, 15% and 42.5% respectively, and included a new parameter i.e. intraregional imports weighted at 7.5%. It should be noted that

the formula is currently under review in response to complaints that it places a heavier burden on a few states. Formation of the Preferential Trade Area (PTA):- following the recommendation of the Lagos Plan of Action to expand intraAfrica trade, the United Nations Economic Commission for Africa (ECA), set up five subregional Multinational Programming and Operational Centres (MULPOC's). These centers were for Eastern and Southern Africa, West Africa, Central Africa and the Great Lakes Community comprising Burundi, Rwanda and Zaire. It was recommended that preferential trade areas with similar arrangements be established within each MULPOC area not later than December 1984. The MULPOC for Eastern and Southern Africa, based in Lusaka, Zambia, successfully negotiated a treaty for the establishment of the Preferential Trade Area for Eastern and Southern Africa in 1981. Membership and location:- the PTA Treaty was signed on 21 September 1982 following ratification by more than seven signatory states as provided for in Article 50. Today, twenty-two states are members of the PTA:- Angola, Burundi, Comoros, Djibouti, Eritrea, Ethiopia, Kenya, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Rwanda, Seychelles, Somalia, Sudan, Swaziland, Tanzania, Uganda, Zambia and Zimbabwe. The Republic of South Africa is expected to join in the near future. Botswana is not yet a member. The PTA is headquatered in Lusaka, Zambia. Objectives and funding of the organization:- (1) the objectives of the PTA are summarised as follows:- (i) to promote cooperation and integration covering all areas of economic activity, particularly trade and customs, industry, transport and communications, agriculture and monetary affairs; (ii) to raise the standards of living of the people of the region by fostering closer relations among Member States; (iii) to create a common market by the year 2000 in order to allow the free movement of goods, capital and labor within the subregion; and (iv) to contribute to the progress and development of all other African countries. (2) Towards attainment of these objectives, PTA strategy includes:- (i) reduction and elimination of trade barriers on selected goods traded within the area; (ii) cooperation in customs through simplification and harmonisation of customs procedures and regulations; (iii) introduction of rules of origin to determine which goods will receive preferential treatment; (iv) granting of transit rights to all transporters when coming from or entering other Member States or third countries; (v) clearing and payments arrangements to promote trade in goods and services within the subregion; (vi) cooperation to develop coordinated and complementary policies and systems in transport and communications; (vii) cooperation in the field of industrial development in order to promote self sustained industrialisation within the PTA, to expand trade in industrial products and to bring about structural transformation of industry for the purpose of fostering the overall social and economic development of Member States; (viii) cooperation in the area of agricultural development so as to raise production and supply of food to coordinate the export of agricultural commodities to harmonise programmes in agricultural production develop land and water resources share agricultural services, technology and marketing and stabilize the prices of agricultural commodities in the subregion; (ix) simplification and harmonisation of trade documents and procedures in the area; and (x) interventions to assist the least industrialised Member States, e.g., through special consideration in allocating multinational industries. Thus, the PTA has a broad and challenging mandate. Organisational structure:- (1) the authority:- The Authority consisting of heads of state and government is the supreme policy organ of the PTA. The decisions and directions of the Authority are by consensus and are based on recommendations of the Council of Ministers. The Authority is empowered to decide on the accession of members under Articles 46 and 50 of the Treaty, appoint the Secretary General of the PTA, as well as the judges of the Tribunal. It also decides on the accession of bodies, institutions or enterprises to membership of the Eastern and Southern African Trade and Development Bank. (2) Council of ministers:- Ministers, preferably of trade and industry and designated by Member states, sit on the council. The Council is responsible for ensuring that the PTA functions in accordance with the Treaty. It keeps PTA's activities under constant review in order to advise the Authority on matters of policy and gives directions to all the other subordinated institutions of the PTA. Decisions of the Council are taken on the recommendation of the Intergovernmental Commission of Experts. (3) Intergovernmental commission of experts (ICE):- Member State's experts in customs and trade, industry, agriculture, transport and communications, administrative and budgetary affairs and legal and financial matters sit on the Commission. The ICE'S main function is to oversee the implementation of the provisions of the Treaty. The Commission also considers reports from all the technical committees of the PTA. Its decisions are recommendations to the Council of Ministers. (4) Technical committees and subcommittees:- There are technical committees for each economic sector forming the activities of the PTA. The technical committees have authority to appoint subcommittees which report to them. Current technical committees of the PTA are the Committee on Industrial Development, Committee on Agricultural Cooperation, the Transport and Communications Committee, the Committee on Botswana, Lesotho and Swaziland, the Committee of Legal Experts and the Administrative, Finance and Budgetary Committee. The decisions of the technical committees are recommendations to the Commission and are taken by simple majority. (5) The PTA tribunal:- the Tribunal is the judicial organ of the PTA and it ensures proper interpretation and application of the provision of the Treaty. It adjudicates any disputes that may arise among Member States relating to the interpretation and application of the Treaty. The decisions of Tribunal are binding and final. (6) The Committee of Central Bank Governors:- determines the maximum debit and credit limits in relation to the Clearing House and the daily interest rate for outstanding debit balance. The Committee also deals with issues concerning monetary and financial cooperation. (7) The Secretariat:- the head of the Secretariat is the Secretary General of the PTA. The Secretariat administers, undertakes research and implements the decisions of the Authority and the Council of Ministers. It assists all institutions of the PTA in carrying out their functions. There are seven divisions in the Secretariat, namely, Administration, Trade and Customs, industry, Energy and the Environment, Transport and Communications, Agriculture, Fisheries and Forestry, Monetary Affairs and Legal Affairs. Each division is headed by a Director reporting directly to the Secretary General. The programme of action of the PTA:- the PTA programme of action covers trade liberalisation, clearing and payments procedures, cooperation in transport and communications, industry, agricultural development and monetary and financial cooperation. Achievements in trade liberalisation and promotion since 1982 include:- (i) a 60 percent average tariff reduction on goods originating in the subregion. It is envisaged that interregional tariffs will be progressively eliminated by the year 2000 as follows:- 1994 70%, 1996 80%, 1998 90% and 2000 100%; (ii) abolition of the Common List which specified the products in each member state that could be traded at reduced tariff rates, resulting in preferential exchange of all commodities produced within the subregion; (iii) the Protocol on the Rules of Origin has been streamlined to facilitate intraregional trade and investment. The majority local equity and local management clause has been deleted. Value added criteria is being applied with a commodity said to originate from a Member State if its value added is at least 45 percent; and (iv) establishment of a computer based subregional trade information network (TINET) with focal points in each Member State, providing information on the enterprises in each country, countries' imports and exports and tenders. Transport and communications:- achievements in transport and communications have been:- (i) rehabilitation and upgrading of interstate roads, railways, ports and telecommunications links. About 50 percent of the network has been restored; (ii) the PTA Third Party Motor Vehicle Insurance Scheme (the Yellow Card) implemented in July 1987 has facilitated the movement of vehicles within the subregion; and (iii) road customs transit documents have been simplified and harmonised with the introduction of a single Road Customs Transit Declaration Document. Monetary and financial cooperation:- achievements in monetary and financial cooperation have been:- (i) establishment of the Clearing House (headquartered in Harare) in February 1984 under the Reserve Bank of Zimbabwe; (ii) establishment of the PTA Trade and Development Bank for Eastern and Southern Africa (PTA Bank; based in Bujumbura, Burundi since 1985) in November 1985. The Bank provides finance for multinational development projects and financial resources to promote intraregional trade; (iii) introduction of PTA travellers' checks, UAPTA, in August 1988 enabling Member States' citizens to travel within the region without having to use foreign currency. The UAPTA is equivalent to 1 Special Drawing Right (SDR) of the International Monetary Fund and, (iv) the launching of the PTA Monetary

and Financial Harmonisation Programme in November 1990 with the eventual goal of establishing a monetary union to facilitate the economic integration process. Preferential Trade Agreement (PTA) for Eastern and Southern Africa, established in 1981, has headquarters in Lusaka, Zambia. The PTA's 19 members are:- Burundi, The Comoros, Djibouti, Ethiopia, Kenya, Lesotho, Malawi, Mauritius, Rwanda, Somalia, Swaziland, Tanzania, Uganda, Zambia and Zimbabwe. Preferential Trade Area for Eastern and Southern African States (PTA):- the PTA was established on 1981-December-21 to promote economic cooperation between member states, particularly in the areas of agriculture, industry, transportation, and communications. It also aims to facilitate international trade through the lowering of tariff barriers between states. Members (22) are:- Angola, Burundi, Comoros, Djibuti, Eritrea, Ethiopia, Kenya, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Rwanda, Seychelles, Somalia, Sudan, Swaziland, Tanzania, Uganda, Zambia, and Zimbabwe. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Преференциальное Соглашение о Торговле (ПСТ) между Странами Восточной и Южной Африки, установленное в 1981, предполагает наличие штабквартиры в Лусаке, Замбия. 19 членами СПТ являются:- Бурунди, Джибути, Замбия, Зимбабве, Кения, Коморы (Коморские Острова), Лесото, Маврикий, Малави, Руанда, Свазиленд, Сомали, Танзания, Уганда, и Эфиопия.

PREFERRED CLAIM UNDER BANKRUPTCY = ПРИВИЛЕГИРОВАННОЕ ПРАВО ТРЕБОВАНИЯ ПРИ БАНКРОТСТВЕ – Preferred Claim Under Bankruptcy:- preferential position among claims in the event of a bankruptcy suit. Not until all claims of the preceding class have been satisfied can the proceeds from the liquidation of any remaining bankruptcy assets be used to meet lower-ranking claims. In the event a bank files for bankruptcy, the law provides for a special class of claim (between the second and third priority class) for specific claims up to a maximum sum for the country.

PREFERRED SHARES = ПРИВИЛЕГИРОВАННЫЕ АКЦИИ – Preferred Shares are the shares which are issued by a company with specified rights and privileges. Preferred usually means that the shares are ranked above common shares with respect to payout or dividend rights. They generally also carry an interest rate payment obligation by the company. Because these shares are less risky and more secure, there is usually less upside potential (unless they are convertible into common shares) associated with them. In the United States, Preferred Shares is a class of shares that entitles the holders to preferences over the holders of common shares, usually with regard to dividends and distributions of assets upon dissolution or liquidation. A share with preference rights, i.e. which is preferred over other stocks of the same company in terms of dividend payments and any distribution of assets on liquidation. The full dividend must be paid on preferred shares before any dividend can be paid on other shares. Also known as Preference Shares in the United Kingdom. / Акция с привилегированными правами, то есть которая имеет предпочтения над иными акциями той же самой компании в отношении условий платежей дивидендов и любого распределения активов при ликвидации. Дивиденд по привилегированным акциям должен быть оплачен полностью до того, как любые другие дивиденды будут оплачиваться по иным акциям. Известны также как Привилегированные Акции (Preference Shares) в Соединённом Королевстве. Привилегированная Акция – акция, по которой уплачивается твёрдый фиксированный доход, в отличие от Обыкновенной Акции, дивиденд по которой колеблется в зависимости от прибыли акционерного общества. Привилегированная Акция, акция, по которой уплачивается твёрдый, фиксированный доход, независимо от величины прибыли акционерного общества. Иногда привилегированными акциями называют акции, дающие несколько голосов на собрании акционеров. Привилегированная Акция, в отличии от обычной, не даёт права голоса на общем собрании акционеров, а привилегии владельца такой акции заключаются в том, что в уставе должны быть определены размер дивиденда и/или стоимость, выплачиваемая при ликвидации общества (ликвидационная стоимость), которые определяются в твёрдой денежной сумме или в процентах к номинальной стоимости привилегированных акций. Однако закон определяет случаи, когда владелец привилегированной акции получает право участвовать в общем собрании акционеров с правом голоса при решении вопросов:- (1) о реорганизации и ликвидации общества; (2) о внесении изменений и дополнений в устав общества, ограничивающих или изменяющих права акционеров, владельцев привилегированных акций; и (3) право голоса владелец привилегированных акций получает и в том случае, если на годовом собрании акционеров принимается решение о невыплате или неполной выплате установленных дивидендов. В Законе об Акционерных Обществах предусматривается выпуск одного или нескольких типов привилегированных акций. Выделяются два типа привилегированных акций:- Кумулятивные и Конвертируемые. Кумулятивными считаются такие акции, по которым невыплаченный или не полностью выплаченный дивиденд, размер которого определён в уставе, накапливается и выплачивается впоследствии. Выпуск таких акций может привлечь инвесторов возможностью увеличения своих доходов. Если владелец привилегированной акции такого типа решит продать её при невыплате дивидендов, то он будет вынужден продавать её по низкой курсовой стоимости. Купивший же такую акцию имеет возможность получить дивиденды за весь период, в течение которого они не выплачивались. Владелец кумулятивной привилегированной акции получает право голоса на тот период, в течение которого он не получает дивиденд, и теряет это право с момента выплаты всех накопленных по указанной акции дивидендов в полном размере. При выпуске конвертируемых привилегированных акций должны быть определены возможность и условия их конвертации в обыкновенные акции или привилегированные акции иных типов. При выпуске конвертируемых акций необходимо установить период, пропорциональность и курс обмена. Период обмена конвертируемых акций должен быть не менее трёх лет. Курс конвертации устанавливается в момент выпуска таких акций и он немного превышает текущий рыночный курс обыкновенных акций в тот период. Поэтому если в установленный период обмена текущий рыночный курс обыкновенных акций превысит курс конвертации, владелец конвертируемой привилегированной акции имеет возможность получить дополнительный доход, обменяв свою акцию по курсу конвертации и тут же продав её по более высокому курсу. Такая возможность позволяет эмитенту устанавливать по конвертируемым привилегированным акциям дивиденд ниже, чем по другим типам привилегированных акций. Если срок обмена закончен, а владелец конвертируемой привилегированной акции не обменял её ни на какую другую акцию, она признается прямой (простой) привилегированной акцией. Устав может наделить владельца конвертируемой привилегированной акции правом голоса на общем собрании акционеров, при этом количество голосов должно соответствовать тому количеству обыкновенных акций, на которые обменивается принадлежащая ему привилегированная акция. Акционерное общество по закону может выпускать два и более типа привилегированных акций. Большое распространение за рубежом получили отзывные, или возвратные, привилегированные акции. Суть их заключается в том, что они могут быть погашены в отличие от обычных, которые не могут гаситься до тех пор, пока существует акционерное общество, их выпустившее. Отзыв или возвратность акционерное общество может обеспечить разными способами:- (1) Выкуп с премией. Премия выступает в роли своеобразной компенсации инвестору за то, что он теряет принадлежащий ему источник дохода. При этом выкуп может происходить целиком в любое время после уведомления о выкупе или частями в установленные сроки. Погашение происходит по цене, которая устанавливается выше номинала с учётом невыплаченных дивидендов. (2) Выкуп через выкупной или отложенный фонды. Формирование выкупного фонда даёт возможность ежегодно выкупать через вторичный рынок определённую часть привилегированных отзывных акций и тем самым способствовать стабилизации рынка своих акций. Отложенный фонд формируется акционерным обществом для того, чтобы произвести выкуп с премией. (3) Обеспечение гарантий досрочного выкупа по инициативе держателя за счёт выпуска так называемых ретрективных привилегированных акций. К их выпуску прибегают тогда, когда у эмитента нет абсолютных гарантий отзыва

привилегированных акций путём погашения с помощью выкупа. При выпуске таких типов привилегированных акций держатель сам устанавливает срок гашения, уведомляет об этом эмитента и при наступлении срока гашения предъявляет их. Акционерное общество может выпустить привилегированные акции с долей участия. Такие акции дают право её владельцу не только на фиксированный дивиденд, установленный при её выпуске, но и на дополнительный дивиденд, если дивиденд по обыкновенным акциям по итогам года его превысит. В зарубежной практике получают распространение привилегированные акции с плавающей ставкой дивиденда, ориентированной на доходность каких-либо общепризнанных ценных бумаг (например, в нашей Российской практике на доходность по Государственным Краткосрочным Облигациям (ГКО)). Могут выпускаться гарантированные привилегированные акции. Такие акции могут быть выпущены дочерними предприятиями. В этом случае дивиденд по привилегированным акциям гарантируется репутацией вышестоящей организации. Это должно привлечь инвесторов к покупке акций дочернего предприятия. В России существуют специфические привилегированные акции:- типа А и Б. Они появились в ходе тотальной приватизации. Привилегированные акции типа А выпускались при создании открытых акционерных обществ и предназначались работникам преобразуемых предприятий, получавшим их бесплатно. Число привилегированных акций типа А составляет 25% уставного капитала, а для выплаты дивидендов по этим акциям выделяется 10% чистой прибыли. Эти акции дают право владельцам присутствовать на ежегодных собраниях акционеров, вносить предложения по обсуждаемым вопросам, но не дают права голоса. Собственники таких акций имеют право свободной их продажи. Привилегированные акции типа Б выпускались в счёт доли уставного капитала, принадлежащей фонду имущества, и владельцем таких акций становился фонд имущества, также получавший их бесплатно. Для выплаты дивидендов по таким акциям направляется 5% чистой прибыли, но размер дивиденда по ним не должен быть ниже дивиденда, выплачиваемого по обыкновенным акциям. Число таких акций не должно превышать 25% уставного капитала. Фонд имущества, который является держателем акций данного типа, имеет право без согласия других акционеров свободно продавать их неограниченному кругу покупателей, однако при их продаже они автоматически конвертируются в обыкновенные акции. Держатель привилегированных акций типа Б не имеет права голоса, хотя может присутствовать на собраниях акционеров и вносить свои предложения по обсуждаемым вопросам. По новому законодательству привилегированным акциям можно придавать ряд свойств. Так, уставом акционерного общества может быть предусмотрен выпуск кумулятивных акций. Свойство кумулятивности предполагает, что дивиденды или их определённая часть в случае невыплаты накапливаются и полностью выплачиваются впоследствии. Другое свойство привилегированных акций – конвертация. При этом владельцу привилегированной акции даётся право обменять её на акцию другого типа. В данном случае уставом может быть предусмотрено право голоса по таким привилегированным акциям. Итак, привилегированные акции:- (а) практически безрисковые; (б) ставка их дивиденда может даже превышать ставку по обычным акциям; и (в) но они не позволяют владельцу участвовать в управлении организацией.

PREFERRED STOCK = ПРИВИЛЕГИРОВАННЫЙ УСТАВНЫЙ КАПИТАЛ – Preferred Stock is a hybrid security because it is contains some features of both debt and equity. It pays a dividend like common equity, and the dividend can be missed without forcing the firm into default. If a firm goes into default, sometimes preferred shareholders will get a seat on the board of directors and a say in the company's running. Preferred stock pays a fixed income like debt does, making it resemble a perpetual bond. The preferred dividend does not increase, even if the firm is doing well. US corporations prefer to receive preferred dividends rather than debt coupon payments because they are able to exclude most of the dividend income received from their taxable income. A less risky form of stock ownership, but also with potentially less reward. Preferred stock holders can have fixed dividends that may not increase when the dividends for the common stock increase. A class of stock with a claim on the company's earnings before payment may be made on common stock and usually entitled to priority over common stockholders if the company fails or liquidates. Preferred stock also is entitled to dividends at a specified rate when declared by the company's board of directors and before payment of a dividend on the common stock. Preferred stock normally does not include voting rights. Stock that pays a fixed dividend and gives its owners claims to assets of a corporation ahead of common stock holders, in the event of liquidation. Preferred Stock is a hybrid security because it is contains some features of both debt and equity. It pays a dividend like common equity, and the dividend can be missed without forcing the firm into default. If a firm goes into default, sometimes preferred shareholders will get a seat on the board of directors and a say in the company's running. Preferred stock pays a fixed income like debt does, making it resemble a perpetual bond. The preferred dividend does not increase, even if the firm is doing well. US corporations prefer to receive preferred dividends rather than debt coupon payments because they are able to exclude most of the dividend income received from their taxable income. See also Common Stock. A class of stock with a claim on the company's earnings before payment may be made on the common stock and usually entitled to priority over common stock if the company liquidates. Usually entitled to dividends at a specified rate – when declared by the board of directors and before payment of a dividend on the common stock – depending upon the terms of the issue. Preferred Stocks are shares of a corporation, which represent ownership in a corporation with the distinction that if company earnings are sufficient, and dividends are to be paid, dividends must be first paid to these holders of stock. Preferred shares have priority over common shares in the distribution of dividends and assets. Preferred stock/shares that provide for participation in the residual value on dissolution of an incorporated enterprise should be reported under this category. Also known as Preference Shares in the United Kingdom. Capital stock which provides a specific dividend that is paid before any dividends are paid to common stock holders.

PREFERRED STOCKHOLDERS = ПРИВИЛЕГИРОВАННЫЕ АКЦИОНЕРЫ (или ПРИВИЛЕГИРОВАННЫЕ ДОЛЬЩИКИ) – Preferred Stockholders are behind debtholders in their claim on the firm's assets, but are ahead of common shareholders. Preferred shareholders typically do not have voting rights, but may if the company misses a preferred dividend. Like bonds, preferred stock is likely to be callable. If interest rates go down, the company generally likes to have the option to call preferred stock and perhaps reissue it at a lower dividend rate. Preferred stock may also be convertible into common shares, usually at a conversion price greater than the current stock price. See also Common Shareholders.

PREFIT = ЗАРАНЕЕ УСТАНОВЛЕННАЯ ОСНАСТКА – Prefit is a process of checking the fit of mating detail parts in an assembly prior to adhesive bonding, to ensure proper bond lines. / процесс проверки .

PREFORM = ПРЕФОРМА – Preform is:- (1) fabrics that have been stacked in multiple layers and bonded with a stitching yarn or by other means. The preform may be cut into a shape for subsequent molding into a composite part. (2) A preshaped nonwoven made by distributing fibers over a screen in the approximate contour of the finished part. (3) A preshaped, three-dimensional reinforcement made via braiding, weaving, or knitting or some combination of these. (4) A formed but not fully consolidated stack of prepreg layers which have the contour of the finished product. (5) The first stage in the production of blow-molded products such as PET bottles. Preform is a preshaped fibrous reinforcement formed by distribution of chopped fibers or cloth by air, water flotation, or vacuum over the surface of a perforated screen to the approximate contour and thickness desired in the finished part. Also, a preshaped fibrous reinforcement of mat or cloth formed to the desired shape on mandrel or mock-up before being placed in a mold press. / Под Преформацией, от Латинского слова Praeformo, означающее Заранее Образую или Предобразую, или предобразованием понимается .

PREGERMINATE = ПРОРАСТИТЬ – Pregerminate:- to germinate seed before sowing by exposing it to moist conditions.

PREGERMINATED SEEDS = ПРЕДВСХОДОВЫЕ СЕМЕНА – Pregerminated Seeds are seeds soaked in water for 24 hours and incubated for 24–48 hours until sprouting is visible.

PREGERMINATION = ПРЕДВСХОДОВОЕ СОСТОЯНИЕ – Pregermination is the process of making the seed sprout before sowing or direct seeding. Soaking and incubating the seed hasten sprouting.

PRE–HARVEST TILLAGE = ПРЕДУБОРОЧНАЯ ОБРАБОТКА (ПОЧВЫ) – Pre-Harvest Tillage is the tillage operations which when placed in a time frame of reference based on the date of crop harvest occur before crop harvest.

PRE–IGNITION = ПРЕЖДЕВРЕМЕННОЕ ВОСПЛАМЕНЕНИЕ (или КАЛИЛЬНОЕ ВОСПЛАМЕНЕНИЕ) – Pre-Ignition is the combustion of the fuel/air mixture that occurs in internal combustions engines before the spark plug fires. Typical reasons are the hot fuel or the lubricant buildup in the combustion chamber. It reduces engine power and it can damage the engine. / Воспламенение – процесс возникновения горения. Может происходить путём зажигания или самовоспламенения.

PRE–IRRIGATION = ПРЕДПОСАДОЧНАЯ (или ПРЕДПОСЕВНАЯ) – The term Pre-Irrigation refers to irrigating before planting a crop. / Относится к ирригации или орошению перед посевом сельскохозяйственной культуры.

PRE–LICENSE CHECKS = ПРЕДЛИЦЕНЗИОННЫЕ ПРОВЕРКИ – In the United States, Pre-License Checks (PLCs) are conducted to determine that a request for a license to export a controlled commodity represents a legitimate order. Firms or individuals representing the licensee (the applicant), a consignee, the purchaser, an intermediate consignee or the end user may be subject to inquiries pertaining to the pre-license check. As part of the process, the US Bureau of Export Administration (BXA) forwards a cable to the US embassy or consulate in the respective geographical location to conduct an inspection or meet with company representatives to conduct inquiries on BXA's behalf.

PRELIMINARY DETERMINATION = ПРЕДВАРИТЕЛЬНОЕ ОПРЕДЕЛЕНИЕ (или УСТАНОВЛЕНИЕ, или РЕШЕНИЕ) – The dumping determination by the US International Trade Administration announcing the results of the investigation conducted within 160 days (or, in extraordinarily complicated cases, 210 days) after a petition is filed or an investigation is self-initiated by the International Trade Administration. If the International Trade Administration determines that there is a reasonable basis to believe or suspect that the merchandise under consideration is being sold or is likely to be sold at less than fair value, liquidation of all affected entries is suspended, and the matter is referred to the International Trade Commission (ITC). 'Preliminary determination' also refers to the decision by the ITC where there is a reasonable indication that an industry in the United States is materially injured, or threatened with material injury, or the establishment of an industry in the United States is materially retarded by reason of the imports of the merchandise which is the subject of the petition. The ITC must make its decision within 45 days after the date on which the petition is filed or an investigation is self-initiated by the International Trade Administration. If this determination is negative, the investigation is terminated.

PRELIMINARY INVOICE = ПРЕДВАРИТЕЛЬНЫЙ СЧЁТ–ФАКТУРА – Circumstances sometimes require that a so-called 'Preliminary' or 'Provisional' Invoice be issued instead of a final, definitive invoice, e.g., when it is not possible at the time of shipment to determine the final weight, quantity, value of the goods being shipped, when settlement can only be made after importer receives goods and weighs them, etc. Document serving as a Preliminary Invoice, containing – on the whole – the same information as the Final Invoice, but not actually claiming payment. Once published, an invoice cannot be deleted under any circumstances. Only a preliminary invoice can be deleted. Also known as Pro-Forma Invoice, and Provisional Invoice. See also Commercial Invoice, Consular Invoice, Customs Invoice, Final Invoice, Invoice, Pro-Forma Invoice, and Provisional Invoice. / Иногда обстоятельства требуют того, чтобы так называемый Предварительный Счёт-Фактура или Условный Счёт-Фактура был выписан вместо заключительного, окончательного счёта-фактуры, например, когда невозможно во время отгрузки определить заключительный вес, количество, стоимость отгруженных товаров, и когда расчёт может быть произведён только после того, как импортёр получит эти товары и определится с их весом, и так далее. Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Консульский Счёт-Фактура (Consular Invoice), Таможенный Счёт-Фактура (Customs Invoice), Заключительный или Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Pro-Forma Invoice), и Условный Счёт-Фактура (Provisional Invoice). , например, .

PRELIMINARY TRIAL or EXPERIMENT = ПРЕДВАРИТЕЛЬНЫЙ ОПЫТ или ЭКСПЕРИМЕНТ – Preliminary Trial or Experiment is a test or trial to gain initial information that can be used in more detailed and critical experiments later.

PREM = PREMIUM

PRE–MATCHING PROCESS = ПРОЦЕСС ПРЕДВАРИТЕЛЬНОГО ПОДБОРА – Pre-Matching Process is a process by which counterparties compare trade or settlement information before other matching or comparison procedures are followed. Generally, pre-matching does not bind counterparties. See aslo Confirmation/Affirmation Process. / , от Латинского слова Affirmo, означающее Утверждаю, .

PREMATURE SENESCENCE = ПРЕЖДЕВРЕМЕННОЕ УВЯДАНИЕ – Premature Senescence occurs when potassium is relocated from the upper parts of the plant to maturing bolls. Leaves develop reddening on the upper surface. Rows at the edge of fields remain green. High fruit load increases the demand for potassium and the severity of symptoms. Single plants that have filled all bolls will senesce prematurely and may defoliate. Alternaria leaf spot, if present, is more severe. The cotton plant's peak demand for Potassium occurs during boll filling. Potassium is mobile within the plant. If the levels of Potassium in the soil are inadequate or if prevailing weather conditions are not conducive to Potassium uptake from the soil, then there is a relocation of Potassium within the plant from younger leaves to maturing bolls. The younger leaves towards the top of the plant turn red and senesce prematurely. Well shaded leaves and branches remain green. Plants with a heavy boll load are affected first while plants with few bolls are usually unaffected. The plants in the row along the edge of the field are also less affected because of less competition for available soil nutrients. Premature senescence often develops during extended periods of overcast, cool weather late in the season when bolls are filling. Crops affected by premature senescence are very susceptible to epidemics of Alternaria leaf spot if exposed to further periods of wet weather. / Пик спроса растения Хлопчатника на Калий (Potassium) проявляется в течение наполнения коробочки.

PRE–METALLIZED DYE = ПРЕДВАРИТЕЛЬНО МЕТАЛЛИЗИРОВАННЫЙ КРАСИТЕЛЬ (или ПРОТРАВНОЙ КРАСИТЕЛЬ) – Pre-Metallized Dye is a dye that is a complex of dye molecules with a metal atom; metal complex dye. The term 'Pre-Metallized' is used primarily to refer to classes of acid dyes, although sometimes considered as apart from acid dyes. The metal is part of the dye structure as it comes from the manufacturer. There are 1:1 metallized dyes, having one dye molecule per metal atom, and 2:1 types, with two dye molecules per metal atom (use is inconsistent here 2:1 and 1:2 mean the same thing). The metal in the complex helps the dye attach to the fiber, typically wool or polyamide. These dyes have excellent washfastness, but leveling may be difficult. There is a

wide range of 'pure' colors (as opposed to mixtures) available, though the brightness is the lowest of the acid dye subgroups. Application temperature is typically at or near the boil. 1:1 types are usually applied at very low pH, often with formic or sulfuric acid in quite large quantities, while 2:1, sometimes called 'Neutral Dyeing', are often applied using acid donor chemicals, so the bath is nearly neutral at the start an becomes more acid with continued boiling. Premetallized Dyes are the acid dyes that are treated with coordinating metals such as chromium. This type of dye has much better wetfastness than regular acid dye. Premetallized dyes are used on nylon, silk, and wool. See also Dyes. / Найлан^{T3} (Nylon^{TM}). металлокомплексный краситель (metal complex dye). Кислотный Донор (Acid Donor). Красители, колорированные металлокомплексами.

PREMISES = ПОМЕЩЕНИЯ (или МЕСТОНАХОЖДЕНИЕ СОБСТВЕННОСТИ) – Premises:- the particular location of a property or a portion thereof as designated in a policy. Real estate. / Конкретное местонахождение собственности или её части, которое обозначено в полисе. Недвижимость.

PREMIUM = ПРЕВЫШЕНИЕ – (1) Premium:- price differences between futures of different delivery months, as in the phrase 'The July/Dec straddle also traded out to 250 points Dec premium', indicating that the price of the July future is lower than that of December. A point, in cotton dealing, is 1/100 cent or 0.0001 Dollar. / Превышение:- разница в ценах фьючерсных контрактов с разными месяцами поставки, как во фразе 'Июльско-Декабрьский стрэдл в ходе торговли расширился до 250 пунктов с превышением цены Декабрьского фьючерса', означающей, что цена Июльского фьючерса ниже цены Декабрьского. Пункт в биржевой торговле хлопком равен 1/100 цента или 0.0001 Доллара США.

(2) Premium:- this term designates the amount by which the issue price of new securities exceeds their nominal value. For example, to buy a security with a nominal value of EUR1 000.00 and a premium of 3%, the investor would have to pay EUR1 030.00, i.e. 103% of nominal. The premium which the investor often has to pay when buying mutual fund shares is called 'Front Load'. Used with reference to options and warrants, the term premium is understood to mean the percentage by which the purchase or sale of the underlying asset by purchasing the option or warrant and immediately exercising the option right is more expensive than buying or selling the underlying asset directly on the stock market. It is not permitted to issue shares at a price below their nominal value or for less than the amount of share capital attributable to each no par value share; on the contrary, it is customary to pay a premium. The share premium obtained from a capital increase for cash must be added to the capital reserve (share premium account) and forms part of reported shareholders' equity. Excess amount paid for a bond over its face amount. Premium is the amount by which the auction price of a bill, note, or bond is higher than its face value. The opposite of Discount. In stock exchange trading, the difference between the par value and the higher market value of a security expressed as a percentage of the par value. The amount by which a bond or stock may sell above its par value or face value. May refer, also, to redemption price of a bond or preferred stock if it is higher than face value. Above par. Used to quote one price in reference to another. In securities trading, the amount by which a security trades above its principal value. In foreign exchange above spot. If the forward rate for US Dollar is at a premium to spot Dollar, it is selling above the spot price. / Превышение это та сумма, на которую аукционная цена векселя, ноты или облигации, превосходит их лицевую стоимость. Превышение – ценовое преимущество более дорогого фьючерсного контракта по отношению к менее дорогому контракту, торгуемому на срочном рынке, или к наличной рыночной цене.

(3) Premium:- cash prices that are above the futures price. / Превышение:- разница, на которую цены на наличный товар превосходят цены фьючерсов на данный товар.

PREMIUM = ПРЕМИЯ – (1) In option trading, Premium is an amount paid by the buyer of an option to an option seller (grantor or writer) for the purchase or the granting of an option contract. Premium multiplied by the number of units of the underlying asset or futures contract for each option. The premium can be considered as consisting of the two components:- the intrinsic value and the extrinsic (or time) value. Option premium is synonymous with the price of an option. The price or cost of an option determined competitively by buyers and sellers in open outcry trading on the exchange trading floor. Premium is the component of the price of a put or call that is over and above the real (or intrinsic) value of that contract. For example, a USD15.00 Dell put when Dell is trading at USD113.00 a share is worth USD2.00. If this put contract is priced at USD3.50, the premium is USD1.50. The premium typically reflects the time value of the contract (how much time is left before it expires) as well as market sentiment. Premium often rises in more-volatile markets. Premium is an amount paid by the buyer of an option to its seller. Premium is the one-off payment, made at the outset, to purchase an option. The premium is a write-off unless the option is traded on either at a profit or when some or all of the premium may be recovered. / В торговле опционами под Премией понимается сумма, уплаченная покупателем опциона продавцу опциона (предоставившему (grantor) или выписывающему (writer)) за приобретение или предоставление опционного контракта. (предоставивший или эмитент).

(2) In insurance, the cost of specified coverage for a designated period of time. Premium is an amount paid periodically to the insurer by the insured for covering his risk. In an insurance contract, the risk is transferred from the insured to the insurer. For taking this risk, the insurer charges an amount called the Premium. The premium is a function of a number of variables like age, type of employment, medical conditions, etc. The actuaries are entrusted with the responsibility of ascertaining the correct premium of an insured. The premium paying frequency can be different. It can be paid in monthly, quarterly, semiannually, annually or in a single premium. Premium is the consideration paid for a contract of insurance, often paid monthly, quarterly or annually. In insurance, the amount charged by an insurer or reinsurer as the price of granting insurance or reinsurance cover, as stated before or after the subtraction of brokerage and other deductions. / В страховании, под Премией понимается сумма, взимаемая страховщиком или перестраховщиком в качестве цены за предоставления страхового или перестрахового покрытия, которая указывается до или после вычитания брокерского вознаграждения и иных вычетов.

(3) Premium is a penalty payable if one party to a contract withdraws from a transaction. / Неустойка, выплачивая в тех случаях, когда одна сторона контракта отказывается от осуществления сделки. Отступные.

PREMIUM = ПРЕМИЯ (или НАКИДКА, или БОНИФИКАЦИЯ) – Premium is the number of points paid for some particular cotton above the quoted price for the basis grade and staple. Also known as Points On. An amount by which a price would be increased in order to buy a commodity of a better quality or a higher grade. / Сумма, на которую могла бы возрасти цена в случае покупки товара лучшего качества или более высокого сорта. Надбавки к оптовым ценам за качество, отклонение фактической цены от прейскурантной в силу изменения потребительских свойств изделия. Наряду со скидками, надбавки стимулируют предприятия к обновлению продукции, повышению её качества. Накидки и скидки являются элементом розничных цен. Они составляют доходы торговых организаций. Накидки и скидки устанавливаются в зависимости от уровня издержек на производство и транспортировку товаров. Под Бонификацией, от Французского слова Bonification, от позднелатинского слова Bonifico, означающее Улучшаю, в гражданском праве в договорах купли-продажи понимается надбавка к установленной договором цене за поставку товара более высокого качества. Наиболее часто применяется во внешней торговле. Смотрите также Рефакция.

PREMIUM DEAL = СДЕЛКА С ПРЕМИЕЙ – Premium Deal is a special type of forward or option deals in which the buyer or seller can withdraw from concluding the transaction by paying a premium agreed upon in advance. In some countries, only buyers can withdraw. / Сделка С Премией – специальный тип сделки с форвардом или опционом, при которой покупатель или продавец могут отказаться от завершения осуществления сделки посредством выплаты заранее оговорённой премии или неустойки. В некоторых странах, только покупатели могут предпринимать такие действия.

PREMIUMS TRUST FUND = ПРЕМИАЛЬНЫЙ ТРАСТОВЫЙ ФОНД (или ПРЕМИАЛЬНЫЙ ТРЕСТОВСКИЙ ФОНД) – Premiums Trust Fund:- the premiums and other monies that members receive in respect of their underwriting at Lloyd's are held by their managing agents in trust for them subject to the discharge of their underwriting liabilities. The premiums trust funds comprise a Sterling Fund, Lloyd's American Trust Fund, Lloyd's Dollar Trust Funds, Lloyd's Canadian Trust Fund and the Lloyd's Asia trust funds (which cover general business written through coverholders in Singapore). These premiums trust funds are available to fund overseas regulatory deposits, claims, return premiums, underwriting expenses and (once a year of account has been closed) any profit that is payable to the member after providing for all future liabilities.

PREMIUM TAX = НАЛОГ НА ПРЕМИЮ – Premium Tax is a payment to a state or municipality by an insurance company based on premiums paid by residents. See also Insurance Premium Tax. Premium Tax is an assessment levied by a state government, usually on the net premium income collected in that state by insurance companies. Insurance Premiums Tax is a tax paid by all life insurance companies, all stock insurance companies, all mutual insurance companies, and all captive insurers doing business in Kentucky, the United States. The tax is assessed on premiums collected by insurance companies on policies written in Kentucky during the preceding calendar year. / Смотрите также Налог На Страховую Премию (Insurance Premium Tax).

PRE–MONEY VALUATION = ПРЕД–ДЕНЕЖНОЕ ОЦЕНИВАНИЕ – Pre-Money Valuation:- when a company raises capital from investors, it and the investors generally agree on a so-called 'Pre-Money' Valuation, meaning a value for the company prior to receiving any investment. For example, if the pre-money valuation is CAD900K, and investors put in CAD100K, then they would end up with 10% of the company. Its post-money valuation is thus CAD1 000 000.

PRE–OPENING = ПРЕДОТКРЫТИЕ – Pre-Opening:- periods before and after permanent trading on the exchange. Orders can be entered and cancelled during pre-trading, but trades cannot be made. / Периоды времени до и после постоянной торговли на бирже. Распоряжения могут быть выставлены и отменены в течение, так называемой предторговли, но сделки в это время не могут быть заключены.

PREOXIDIZED FIBER = ПРЕДВАРИТЕЛЬНО ОКСИДИРОВАННОЕ ВОЛОКНО (или ПРЕДВАРИТЕЛЬНО ОКИСЛЕННОЕ ВОЛОКНО) – Preoxidized Fiber:- in carbon fiber production, a fiber that results from a relatively lowtemperature (200–500 °C) heat treatment in the presence of oxygen which converts the precursor fiber, PAN or rayon, to an infusible fiber that is stable to further processing.

PREPAID EXPENSE = РАСХОДЫ БУДУЩИХ ПЕРИОДОВ (или ПРЕДВАРИТЕЛЬНО (или ЗАРАНЕЕ) ОПЛАЧЕННЫЕ (или АВАНСОМ) РАСХОДЫ) – Prepaid Expense is an expenditure made in one accounting period covering a term which extends beyond the end of that period, e.g., an insurance premium paid annually in advance. To the extent that the expenditures are for future benefits they should be carried forward in the balance sheet. Also known as Expenses Prepaid, and Prepayments. Expenditures paid in one accounting period but not completely used until the next accounting period, such as insurance premiums. Prepaid expenses are listed under current assets. See also Accruals And Deferrals. Prepaid Expenses, the final current asset category, are costs that the business has paid for but that are not yet treated as expenses based on the matching concept. Businesses often pay in advance for expenses recognized in future periods. For example, a firm may pay for an annual insurance policy in advance of the policy period. This advance payment is an asset, something of value that the firm acquired that will be used in the future course of its business. The prepaid expense amount will be reduced each month of the period covered by the policy, as the business 'uses' its insurance policy. An accounting entry will be made to record a business expense equal to the reduction in the prepaid expense asset. / , например, .

PREPAID EXPENSES AND ACCRUED INCOME = РАСХОДЫ БУДУЩИХ ПЕРИОДОВ (или ПРЕДВАРИТЕЛЬНО (или ЗАРАНЕЕ) ОПЛАЧЕННЫЕ РАСХОДЫ) И НАЧИСЛЕННЫЙ ДОХОД – Accounting apportionment items listed on the assets side of the balance sheet, such as expenses paid during the last financial year, but relating to the new fiscal year. The opposite of Income Received In Advance. Prepaid Expenses And Accrued Income mainly contain prepayments attributable to the following financial year. The item for Prepaid Expenses and Accrued Income is for amounts spent prior to the reporting date to cover expenses payable for a certain period thereafter. Prepaid Expenses and Accrued Income primarily include interest, rent and insurance contributions. The Prepaid Expenses and Accrued Income primarily contain advanced lease payments and arrangement fees. Prepaid Expenses and Accrued Income are presented in accordance with the matching principle in terms of substance and time. Prepaid Expenses include prepayments for operating costs (such as rent and insurance premiums); and Accrued Income consists mainly of supplier rebates and prepaid customer rebates. All Prepaid Expenses and Accrued Income are settled within 12 months of the balance sheet date. / строка баланса (item).

PRE PAID INSURANCE PREMIUM = ПРЕДВАРИТЕЛЬНО ОПЛАЧЕННАЯ СТРАХОВАЯ ПРЕМИЯ – Pre Paid Insurance Premium:- these are prepayments of premium held by insurance corporations (including automobile, health, term life, accident/injury, income maintenance, and other forms of non-life insurance). At the end of the accounting period when the balance sheet is drawn up, parts of the insurance premium payable during the accounting period are intended to cover risks in the subsequent period. These prepayments of premiums are assets of the policyholders and form part of the insurance technical reserves. Total premium paid for the subsequent period less premium consumed during the reporting period would be reported.

PREPARATION = ПРИГОТОВЛЕНИЕ – (1) Old definition:- Preparation is the term used to describe the degree of efficiency and smoothness or roughness with which the cotton has been ginned, and the relative amount of neppiness or nappiness of the ginned lint fibers. / Старое определение:- Приготовление – этот термин использовался для описания степени приготовления (efficiency) и шелковистость/ровность (smoothness) или шелковистость/шероховатости (roughness), с которой был джинирован хлопок, а также относительной суммы узелковатости (neppiness) или зажгученности (nappiness) джинированного волокна.

(2) New definition:- Preparation is the classer's determination of the degree of roughness or smoothness of the ginned lint cotton. The harvesting and ginning of Cotton, which contains too much moisture may result in lint cotton with a twisty, knotty appearance. Such Cotton is difficult to process and produces inferior yarn. / Новое определение:- Приготовление – это классёрская оценка степени шероховатости/шелковистости и шелковистости/ровности джинированного хлопкового волокна. Слишком большая влажность во время сбора урожая и при джинировании хлопка-сырца может вызвать появление в хлопковом волокне закрученности (twisty) и узелковатости (knotty). Такое хлопковое волокно создаёт сложности при переработке и из него получается пряжа плохого качества.

(3) In the manufacture of cotton yarns, depending on the time and trouble invested in the preparations for spinning (for example by executing an intensive carding process or an additional combing process), it is possible to substantially improve the degree of purity as regards abrasion-inducing particles. Certainly the OE method permits the reduction of processes and the use of a higher contaminated cotton with a shorter staple length with the result that these yarns create a higher wear. / что касается частиц, вызывающих истирание. Приготовительное Производство:- обработка волокон до получения пряжи. В Приготовительное Производство волокно поступает в пресованных кипах. До того, как из волокна будет получена пряжа, само волокно подвергается дополнительной обработке – кипу разрыхляют, волокна подвергаются трепанию, чесанию гребнями, на ровничных машинах получают ровницу, а уже из ровницы получают пряжу. Машины пневмомеханического прядения позволяют получать пряжу непосредственно из лент, минуя ровничный переход. В цеха Приготовительного Производства неочищенное и необработанное волокно поступает в пресованных кипах. Для получения из волокна качественной пряжи, удовлетворяющей всем техническим требованиям, необходимо пройти ряд технологических переходов приготовительного отдела. Волокно разрыхляют и очищают, подвергают трепанию, чесанию гребнями, получают ленту и ровницу, и, наконец, конечный продукт – пряжу.

PREPARED FOR DYEING = ПРИГОТОВЛЕННАЯ ДЛЯ КРАШЕНИЯ – Prepared For Dyeing:- a fabric or garment that is specially made to be dyed; sometimes ‘preferred for dyeing’; usually abbreviated PFD or P.F.D.. PFD fabrics have been desized, scoured, and fully bleached, but have been processed without optical brighteners or softeners which can interfere with dye uptake. Often called ‘Prepared For Garment Dyeing’ or PFGD, such fabrics are usually only carried by specialty suppliers. Most fabric is prepared for dyeing at the same facility that does dyeing. Any fabric can be prepared for dyeing and sold as such, but types other than cotton are extremely rare, and often available only by special order of large quantities. PFD cotton garments are made with PFD fabrics and sewn with cotton thread, so that the thread will dye similarly to the fabric. Sometimes they are made oversize to allow for shrinkage in dyeing processes. A few large manufactures of t-shirts offer PFD shirts. Other PFD garments are quite rare, though Dharma Trading in California has quite a good range. It may be advisable to wash PFD products before dyeing, mostly as a hedge against contaminants picked up in handling or to remove thread lubrication oils that might have been used in garment construction. / Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

PREPARED FOR PRINTING = ПРИГОТОВЛЕННАЯ ДЛЯ ПЕЧАТАНИЯ (или ПРИГОТОВЛЕННАЯ ДЛЯ НАБИВКИ) – Prepared For Printing (PFP):- a fabric that has been processed to be ready for printing, usually meaning printing with dye. PFP cotton will be very similar to PFD cotton, but is almost always mercerized to improve the color uptake. Wool fabrics are usually chlorinated in preparation for printing.

PREPARE–FOR–GARMENT–DYE = ПРИГОТОВЛЕННЫЙ ДЛЯ ШВЕЙНЫХ ИЗДЕЛИЙ КРАСИТЕЛЬ – Prepare-For-Garment-Dye:- a fabric is cut into the greige state, bleached and sewn into a garment and later dyed into the desired color. Using ‘prepare-for-garment-dye’ allows a company to move garments to retail more quickly. As the retailer determines which colors are selling best, they can quickly get back into stock on those colors.

PREPAYMENT = ПРЕДОПЛАТА (или ПРЕДВАРИТЕЛЬНАЯ ОПЛАТА) – (1) Prepayment:- is a current asset and represents an amount paid in the current period but relating to a subsequent one. Payment made in advance. / Предварительно осуществлённая оплата.

(2) Prepayment:- when applied to a bill of exchange, prepayment is the payment before the bills matures. / Применительно к векселям, предоплата представляет собой оплату до того, как истечёт срок действия векселя.

(3) Prepayment:- in the context of mortgages it is the repayment of the debt before its maturity. / В контексте с закладными это представляет собой выплату долгового обязательства до окончания его срока действия.

PREPAYMENT PENALTY = НЕУСТОЙКА ЗА ПРЕЖДЕВРЕМЕННУЮ ОПЛАТУ – Prepayment Penalty:- in the United States, extra fees that may be due if you pay off the loan early by refinancing your loan or selling your home, usually limited to the first 3 to 5 years of the loan’s term. If your loan includes a prepayment penalty, be aware of the penalty you would have to pay. Compare the length of the prepayment penalty period with the first adjustment period of the adjustable-rate mortgage (ARM) to see if refinancing is costeffective before the loan first adjusts. Some loans may have prepayment penalties even if you make only a partial prepayment. / с первым периодом переоценки закладной с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) . Под Неустойкой в Гражданском Кодексе России понимается денежная сумма, определённая законом или договором, которую должник обязан уплатить кредитору в случае неисполнения или ненадлежащего исполнения обязательства, в частности в случае просрочки исполнения.

PREPLANT HERBICIDE = ПРЕДПОСАДОЧНЫЙ ГЕРБИЦИД – Preplant Herbicide is a herbicide applied before the crop is planted.

PRE–PLANT APPLICATION = ПРЕДПОСАДОЧНОЕ ВНЕСЕНИЕ (или ДОПОСАДОЧНОЕ ВНЕСЕНИЕ) – Pre-Plant Application:- applied before planting a crop, either as a foliar application to control existing vegetation or as a soil application.

PREPLANT INCORPORATED = ВНОСИМЫЙ ПЕРЕД ПОСАДКОЙ – A term Preplant Incorporated (PPI) refers mostly to grass and small-seeded broadleaf herbicides (but also some other weed species such as nutsedge) applied and incorporated before planting; PPI herbicides, e.g., Treflan. Preplant Incorporated (PPI):- applied and blended into the soil before seeding.

PRE–PLANTING TILLAGE = ПРЕДПОСАДОЧНАЯ ОБРАБОТКА (ПОЧВЫ) (или ПРЕДПОСЕВНАЯ ОБРАБОТКА (ПОЧВЫ)) – Pre-Planting Tillage is a tillage operations which when placed in a time frame of reference based on the date of crop planting occur before the crop is planted. / Предпосевная Обработка Почвы – совокупность приёмов механического воздействия на почву (боронование, культивация и другое), выполняемых в определённой последовательности перед посевом или посадкой сельскохозяйственных культур. Предпосевную обработку почвы проводят с целью сохранения почвенной влаги, разрыхления или уплотнения почвы (при необходимости – поделка гряд, гребней), обеспечения заделки удобрений, семян культурных растений на оптимальную глубину, выравнивания поверхности пашни и подрезания сорняков. Для предпосевной обработки почвы используют бороны, культиваторы, фрезы, катки и другие сельскохозяйственные орудия. При применении комбинированных орудий предпосевную обработку почвы совмещают с посевом. Различают предпосевную обработку почвы:- под культуры раннего срока сева проводят обработку в 1 или 2 приёма – боронование и культивацию; под поздно высеваемые кроме боронования проводят 2 культивации, иногда перепашку; под озимые и промежуточные посевы (в зависимости от почвы и погодных условий) применяют неглубокую вспашку или обработку культиватором-плоскорезом, лущильником; под мелкосемянные культуры, а при иссушении верхнего слоя для всех культур – прикатывание почвы. Предпосевную обработку почвы проводят поперёк направления вспашки или по диагонали, а на склоновых землях – поперёк уклона. К показателям качества предпосевной обработки почвы относят:- срок обработки, глубину и её равномерность, степень крошения почвы и подрезания сорняков.

PRE–(POST) EMERGENCE TILLAGE = ПРЕД–(ПОСЛЕ) ВСХОДОВАЯ ОБРАБОТКА (ПОЧВЫ) – Pre-(Post) Emergence Tillage is the tillage operations which when placed in a time frame of reference based on the date of crop emergence occur before (after) crop emergence.

PREPOTENCY = ПРЕПОТЕНЦИЯ – Prepotency is a capacity of a parent to impress characteristics on its offspring so that they are more alike. / Препотенция – способность производителя передавать свои признаки потомству.

PREPREG = ПРЕПРЕГ – Prepreg composite materials are becoming increasingly common in the composite industry due to their ease of use, consistent properties, and high quality surface finish. However, there is much to understand about prepregs prior to committing to using this material. What are Prepregs? The term 'Prepreg' is actually an abbreviation for the phrase pre-impregnated. A prepreg is an fiber reinforced polymer (FRP) reinforcing that is pre-impregnated with a resin. Most often, the resin is an epoxy resin, however other types of resins can be used, including the majority of thermoset and thermoplastic resins. Although both are technically prepregs, thermoset and thermoplastic prepregs are dramatically different. (1) Thermoplastic Prepregs:- thermoplastic prepregs are composite reinforcements (fiberglass, carbon fiber, aramid, etc.) that are pre-impregnated with thermoplastic resin. Common resins for Thermoplastic prepregs include PP, PET, PE, PPS, and PEEK. Thermoplastic prepregs can be provided in unidirectional tape, or in fabrics that are woven or stitched. The primary difference between thermoset and thermoplastic prepreg is that thermoplastic prepregs are stable at room temperature, and generally, do not have a shelf life. This is a direct result of the differences between thermoset and thermoplastic resins. (2) Thermoset Prepregs:- more commonly used in prepreg composite manufacturing is thermoset prepregs. The primary resin matrix used is epoxy. However, other thermoset resins are made into prepregs including Bis-Maleimids (BMI) and phenolic resins. With a thermoset prepreg, the thermosetting resin starts as a liquid and fully impregnates the fiber reinforcement. Excess resin is precisely removed from the reinforcement. Meanwhile, the epoxy resin is undergoes a partial curing, changing the state of the resin from a liquid to a solid. This is know as the 'B-stage'. In the B-stage, the resin is partially cured, and usually tacky. When the resin is brought up to an elevated temperature, it often returns briefly to a liquid state prior to hardening completely. Once cured, the thermoset resin which was in the b-stage, is now fully cross-linked. Advantages of Prepregs:- perhaps the greatest advantage of using prepregs is their ease of use. For example, say one is interested in manufacturing a flat panel out of carbon fiber and epoxy resin. If they were to use liquid resin in a closed molding or open molding process, they would be required to obtain a fabric, the epoxy resin, and the hardener for the epoxy. Most epoxy hardeners are considered hazardous, and dealing with resins in a liquid state can be messy. With an epoxy prepreg, only one item needs to be ordered. An epoxy prepreg comes on a roll and has the desired amount for both resin and hardener already impregnated in the fabric. Most thermoset prepregs come with a backing film on both sides of the fabric to protect it during transit and preparations. The prepreg is then cut to the desired shape, the backing is pealed off, and the prepreg is then laid into the mold or tool. Both heat and pressure are then applied for the specified amount of time. Some of the most common types of prepregs take an hour to cure, at around 250 degrees F, but different systems are available at both lower and higher cure temperatures and times. Disadvantages of Prepregs:- (i) Shelf Life:- since the epoxy is in a B-stage, it is required to be stored either refrigerated or frozen prior to use. Additionally, the overall shelf life can be low; and (ii) Cost Prohibitive:- when manufacturing composites through a process such as pultrusion or vacuum infusion, the raw fiber and resin are combined on site. However, when using prepregs, the raw material must first be prepregged. This is most often done off-site at a specialized company that focuses on prepregs. This added step in the manufacturing chain can add increased cost, and in some instances close to double the material cost. Prepreg:- ready-to-mold, reinforcing material, either fiber, fabric, or mat, that is fully impregnated with resin and in some cases, partially cured. Prepregs are then used by fabricators in laying-up and molding composites after which curing is completed. / Закалка или Упрочнение (Hardening). Препрег – полуфабрикат композиционного пластика. предварительно пропитанное (pre-impregnated). Бис-Имиды Малеиновой Кислоты (БИМК; Bis-Maleimids (BMI)) Имид Малеиновой Кислоты $C_4H_3NO_2$ (Maleimids). Фенольное (Phenolic).

PRESCHEDULE = ПРЕДВАРИТЕЛЬНОЕ СОСТАВЛЕНИЕ ГРАФИКА ПОСТАВКИ – In reference to electricity, Preschedule is the act of buyer and seller arranging in advance to deliver electricity, usually 24 hours in advance. / По отношению к электричеству, действия покупателя и продавца по согласованию поставки электричества, обычно за 24 часа до непосредственной поставки.

PRESENTATION = ПРЕДСТАВЛЕНИЕ (или ПРЕЗЕНТАЦИЯ) – Presentation is either the act of delivering documents under a credit or the documents as delivered to the issuing bank or nominated bank. / Представление:- либо действие по поставке документов по аккредитиву, либо документов, которые поставлены в эмиссионный банк (банк эмитент (issuing bank)) или исполняющий банк (номинированный банк (nominated bank)).

PRESENTATION OF FINANCIAL STATEMENTS = ПРЕДСТАВЛЕНИЕ ФИНАНСОВЫХ ОТЧЁТОВ – IAS 1 (short for International Accounting Standard No. 1) Presentation of Financial Statements – This Standard prescribes the basis for presentation of general purpose financial statements to ensure comparability both with the entity's financial statements of previous periods and with the financial statements of other entities. It sets out overall requirements for the presentation of financial statements, guidelines for their structure and minimum requirements for their content. A complete set of financial statements comprises:- (a) a statement of financial position as at the end of the period; (b) a statement of comprehensive income for the period; (c) a statement of changes in equity for the period; (d) a statement of cash flows for the period; (e) notes, comprising a summary of significant accounting policies and other explanatory information; and (f) a statement of financial position as at the beginning of the earliest comparative period when an entity applies an accounting policy retrospectively or makes a retrospective restatement of items in its financial statements, or when it reclassifies items in its financial statements. An entity whose financial statements comply with IFRSs shall make an explicit and unreserved statement of such compliance in the notes. An entity shall not describe financial statements as complying with IFRSs unless they comply with all the requirements of IFRSs. The application of IFRSs, with additional disclosure when necessary, is presumed to result in financial statements that achieve a fair presentation. When preparing financial statements, management shall make an assessment of an entity's ability to continue as a going concern. An entity shall prepare financial statements on a going concern basis unless management either intends to liquidate the entity or to cease trading, or has no realistic alternative but to do so. When management is aware, in making its assessment, of material uncertainties related to events or conditions that may cast significant doubt upon the entity's ability to continue as a going concern, the entity shall disclose those uncertainties. An entity shall present separately each material class of similar items. An entity shall present separately items of a dissimilar nature or function unless they are immaterial. An entity shall not offset assets and liabilities or income and expenses, unless required or permitted by an IFRS. An entity shall present a complete set of financial statements (including comparative information) at least annually. Except when IFRSs permit or require otherwise, an entity shall disclose comparative information in respect of the previous period for all amounts reported in the current period's financial statements. An entity shall include comparative information for narrative and descriptive information when it is relevant to an understanding of the current period's financial statements. When the entity changes the presentation or classification of items in its financial statements, the entity shall reclassify comparative amounts unless reclassification is impracticable. An entity shall clearly identify the financial statements and distinguish them from other information in the same published document. IAS 1 requires an entity to present, in a statement of changes in equity, all owner changes in equity. All non-owner changes in equity (ie

comprehensive income) are required to be presented in one statement of comprehensive income or in two statements (a separate income statement and a statement of comprehensive income). Components of comprehensive income are not permitted to be presented in the statement of changes in equity. An entity shall recognise all items of income and expense in a period in profit or loss unless an IFRS requires or permits otherwise. The notes shall:- (a) present information about the basis of preparation of the financial statements and the specific accounting policies used in accordance with paragraphs 117–124; (b) disclose the information required by IFRSs that is not presented elsewhere in the financial statements; and (c) provide information that is not presented elsewhere in the financial statements, but is relevant to an understanding of any of them. An entity shall disclose, in the summary of significant accounting policies or other notes, the judgements, apart from those involving estimations (see paragraph 125), that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. An entity shall disclose information about the assumptions it makes about the future, and other major sources of estimation uncertainty at the end of the reporting period, that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year. An entity shall disclose information that enables users of its financial statements to evaluate the entity's objectives, policies and processes for managing capital. / МСБУ 1 (сокращение для Международного Стандарта Бухгалтерского Учёта № 1) – .

PRESENTING BANK = ПРЕДСТАВЛЯЮЩИЙ БАНК (или ПРЕЗЕНТУЮЩИЙ БАНК) – Presenting Bank is a bank seeking payment of a financial document, such as a banker's draft, bill of exchange or check, from the drawer's bank. In a draft collection transaction, the bank that contacts the drawee, generally the buyer of goods, for acceptance and/or payment. The Presenting Bank which is the collecting bank making presentation to the drawee. / Представляющий Банк – это инкассирующий банк, делающий представление трассату (плательщику).

PRESENTMENT FEE = ВОЗНАГРАЖДЕНИЕ ЗА ПРЕДОСТАВЛЕНИЕ – Presentment Fee is a fee that a bank receiving a check imposes on the bank collecting payment.

PRESENT VALUE = ПРИВЕДЁННАЯ СТОИМОСТЬ – Present Value is a current value of a given future cash flow stream, discounted at a given rate. Present Value or Present Worth is the value of future cash flows discounted to a present value by using an appropriate interest rate. Can be easily determined using financial functions found on most calculators and computer spreadsheets and financial programs. The Present Value of future cash flow discounted at a specific discounting rate. Present Value, at a particular point in time, of one or several future positive or negative payments. The present value of a future payment flow is obtained arithmetically by discounting. Present value allows a comparison of investments with divergent payment series but the same maturity. / Приведённая Стоимость движения денежных средств будущего периода, учтённая по специфической (характерной) ставке учёта.

PRESERVATIVE = ЗАЩИТНОЕ СРЕДСТВО (или СРЕДСТВО ЗАЩИТЫ) – Preservative is any substance effective in preventing the development and action of wood-rotting fungi, borers of various kinds, and harmful insects that cause the deterioration of wood. / Любое вещество , точильщики разных видов, и .

PRESERVED FOODS = СОХРАНЁННЫЕ ПРОДУКТЫ (или СОХРАНЁННАЯ ПИЩА) – Preserved Foods are semi-preserved foodstuffs with limited shelf life.

PRESERVED FOODSTUFFS = КОНСЕРВЫ (или КОНСЕРВИРОВАННЫЕ ПИЩЕВЫЕ ПРОДУКТЫ) – Preserved Foodstuffs are foodstuffs preserved by sterilization and stored in cans/jars.

PRE–SETTLEMENT RISK = ПРЕДРАСЧЁТНЫЙ РИСК – Pre-Settlement Risk:- the risk that one party of a contract will fail to meet the terms of the contract and default before the contract's settlement date, prematurely ending the contract. This type of risk can lead to replacement-cost risk. For example, let's say ABC company forms a contract on the foreign-exchange market with XYZ company to swap US Dollars for Japanese Yen in two years. If prior to settlement XYZ company goes bankrupt, it will be unable to complete the exchange and must default on the contract. ABC company will have to form a new contract with another party which leads to replacement-cost risk. Pre-Settlement Risk is the risk that a counterparty to an outstanding transaction for completion at a future date will fail to perform on the contract or agreement during the life of the transaction. The resulting exposure is the cost of replacing the original transaction at current market prices. Also known as Replacement Cost Risk. See also Credit Risk. Pre-Settlement Risk is the risk that a trade will not settle. For example, a buyer may not receive delivery of the securities he/she bought by the settlement date. A failure to deliver can occur because of the negligence or deliberate withholding on the part of the seller. If a buyer does not receive the securities, he/she is not obligated to make payment until delivery is made, but it renders him/her unable to resell or conduct other activities that would advance his/her investment goals. / Предрасчётный Риск представляет собой риск того, что одна из сторон контракта прекратит выполнять условия контракта и объявит дифолт по своим обязательствам до наступления даты расчётов по контракту, что может привести к досрочному расторжению контракта. Данный тип риска может привести к формированию риска стоимости замещения первоначальной сделки. Предрасчётный Риск – риск потерь из-за невыполнения обязательств контрагентом или клиентом, когда размер потерь зависит от преобладающих ставок или курсов на рынке. Предрасчётный Риск – риск того, что контрагент не выполнит своих обязательств по сделке до расчётов и банку придётся заменить данный контракт сделкой с другим контрагентом, но уже по текущей (и возможно неблагоприятной) рыночной цене.

PRE–SHIPMENT INSPECTION = ПРЕДОТГРУЗОЧНАЯ ИНСПЕКЦИЯ – Pre-Shipment Inspection is the checking of goods before shipment for the purpose of determining the quantity and/or quality of said goods by an independent surveyor (inspection company) for phytosanitary, sanitary and veterinary controls. Presently there is a tendency by developing countries to use the inspection also for the purpose of determining whether the price charged for certain goods is correct.

PRE–SHRUNK = ПОДВЕРГШЕЕСЯ ПРЕДВАРИТЕЛЬНОЙ УСАДКЕ – Pre-Shrunk:- fabrics which have received a treatment, which causes shrinking. Often done on cottons before cutting the fabric in order to remove the tendency for shrinkage in the finished garment. The percent of residual shrinkage must be indicated on the label of the treated goods or garments. / раскрой (cutting).

PRESIDENT = ПРЕЗИДЕНТ – In the United States, a President is one appointed or elected to preside over an organized body of people; the chief officer or a government branch, company or corporation. In the United States, a chief executive of a company, equivalent to a managing director in the United Kingdom. / В Соединённых Штатах Америки, главное исполнительное лицо компании, эквивалент управляющему директору в Соединённом Королевстве. Под Президентом, от Латинского слова Praesidens, означающее Сидящий Впереди, понимается:- (i) в большинстве современных государств с республиканской формой правления выборный глава государства; или (ii) в ряде общественных и научных учреждений, организаций, в том числе международных, выборный представитель исполнительного органа. Главное должностное лицо.

PRESIDENT'S EXPORT COUNCIL = ВЫВОЗНОЙ СОВЕТ ПРИ ПРЕЗИДЕНТЕ (или ЭКСПОРТНЫЙ СОВЕТ ПРИ ПРЕЗИДЕНТЕ) – In the United States, the President's Export Council (PEC) advises the President on government policies and programs that affect US trade performance; promote export expansion; and provide a forum for discussing and resolving trade-related problems among the

business, industrial, agricultural, labor and government sectors. The Council was established by Executive Order of the President in 1973 and was originally composed only of business executives. The Council was reconstituted in 1979 to include leaders of the labor and agricultural communities, Congress and the Executive branch. Twenty-eight private sector members serve 'at the pleasure of the President' with no set term of office. Other members include five US Senators and five Members of the House, the Secretaries of Agriculture, Commerce, Labor, State, and Treasury, the Chairman of the Export-Import Bank and the US Trade Representative. The Council reports to the President through the Secretary of Commerce.

PRE–SLINGING = ПРЕДВАРИТЕЛЬНАЯ СТРОПОВКА (или ПРЕДВАРИТЕЛЬНАЯ ОБВЯЗКА) – Pre-Slinging is the act of placing goods in slings which are left in position and used for loading into and discharging from a conventional vessel. The act of grouping goods in slings for subsequent loading into and discharging from a conventional vessel.

PRESLUNG CARGO UNITS = ПРЕДВАРИТЕЛЬНО ОБВЯЗАННЫЕ ГРУЗОВЫЕ ЕДИНИЦЫ – Preslung Cargo Units:- in order to accelerate unloading, the strops used on loading are left on the cargo units. This then makes slinging unnecessary when discharging the cargo.

PRESS = ПРЕСС – Press is:- (1) a device that uses heat and pressure to remove wrinkles and creases and smooth fabrics during garment construction. (2) A device used to press or compress raw materials. (3) To iron in the home or commercial laundry. (4) To squeeze liquid out of a fabric through the use of roller presses. / Под Прессом, от Французского слова Presse, от Латинского слова Presso, означающее Давлю или Жму, понимается машина статического (неударного) действия для обработки материалов давлением (брикетирования, получения искусственных алмазов и других целей). В металлообработке используют для ковки, штамповки, прессования (выдавливания), сборочных операций (запрессовки или распрессовки деталей) и так далее. По виду привода подразделяют на гидравлические, механические и гидромеханические. Усилие, развиваемое наиболее крупным прессом около 750 МегаНьютонов (МН) (или 75 000 тонно-сил (тс)). Под Прессом понимается машина статического (неударного) действия для обработки материалов давлением. Прессы широко применяют в различных отраслях промышленности для обработки металлов, пластических масс, резины, сельскохозяйственных и пищевых продуктов и других материалов, а также для исследования их свойств при высоких давлениях. Наибольшее распространение прессы имеют в металлообрабатывающей промышленности для ковки, объёмной и листовой штамповки, прессования (выдавливания), сборочных операций (запрессовки шестерён, пальцев, колец подшипников), механических испытаний и других целей. Историческая Справка:- Ещё в XV–XVI века в различных ремёслах, не связанных с обработкой металла (маслоделие, виноградарство, переплётное и печатное дело), применялись винтовые прессы с ручным приводом. В конце XVII и начале XVIII веков винтовые прессы начали применять для обработки металлов давлением, в частности для чеканки монет и медалей, а затем для штамповки. С середины XIX века в кузнечно-штамповочном производстве получили распространение гидравлические прессы. С развитием крупносерийного и массового производства, особенно после появления электродвигателя, широкое применение нашли кривошипные прессы, которые представляют наиболее многочисленную группу кузнечно-штамповочных машин. Устройство И Принцип Действия:- Основные части прессов:- ползун (поперечина, траверса), станина с направляющими для ползуна и столом, привод, механизмы управления, средства механизации и автоматизации, инструмент. Подвижная часть инструмента крепится к ползуну (который совершает возвратно-попоступательное движение), неподвижная часть – к столу пресса. Формообразование изделия происходит при сдавливании заготовки между подвижной и неподвижной частями инструмента. Главные параметры прессов, в совокупности определяющие его технологические возможности и конструктивные особенности, – номинальное усилие, ход и скорость движения ползуна, размеры стола, Основные Типы Прессов:- По виду привода различают гидравлические, механические (кривошипные, винтовые, фрикционные) и гидромеханические прессы. Действие гидравлических прессов основано на движении ползуна под давлением жидкости (воды, эмульсии, масла), которая является носителем энергии и при поступлении в рабочий цилиндр перемещает плунжер (поршень), связанный с ползуном. В основе работы кривошипного пресса лежит преобразование вращательного движения привода в возвратно-поступательное движение ползуна посредством кривошипного механизма. Принцип действия винтового пресса заключается в использовании винтового шпинделя с несамотормозящей резьбой для сообщения движения ползуну. Шпиндель приводится во вращение либо электродвигателем через фрикционную передачу (фрикционный пресс), либо давлением жидкости (гидровинтовой пресс). В зависимости от назначения прессы бывают с вертикальным (например, для штамповки) или горизонтальным (например, для прессования) движением ползуна. Самые мощные прессы – гидравлические, наиболее крупные из которых штамповочные прессы, развивающие усилие до 735 МегаНьютонов (МН) (75 000 тонно-сил (тс)), а также прессы для получения алмазов усилием до 490 МН (50 000 тс). Максимальное усилие кривошипных прессов около 100 МН, винтовых – около 125 МН.

PRESS CLAVE = ПРЕССКЛАВ – Press Clave is a simulated autoclave made by using the platens of a press to seal the ends of an open chamber, providing both the force required to prevent the loss of the pressurizing medium and the heat required to cure the laminate inside. / Под Прессклавом, от Латинских слов Presso, означающее Давлю или Жму, и Clavis, означающее Ключ, понимается смоделированный автоклав, сделанный с использованием валиков пресса для запечатывания концов открытой камеры, обеспечивая как силу, требующуюся для предотвращения потери xxxxx.

PRESSING OMITTED, BURNED or SCORCHED GARMENTS = УТЮЖКА ПРОПУЩЕНА, ПРОГОРЕЛА или ВЫГОРЕЛА ШВЕЙНЫЕ ИЗДЕЛИЯ – Pressing Omitted, Burned or Scorched Garments:- self-explanatory. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

PRESSING PRODUCING A SHINE IN FABRIC = УТЮЖКА, ПРОИЗВОДЯЩАЯ БЛЕСК НА ТКАНИ – Pressing Producing A Shine In Fabric:- usually caused by excessive heat or incorrect type of pressing surface. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

PRESSLEY = ПРЭСЛИ – Tenacity:- the fiber tenacity in the International Calibration Cotton (ICC) mode is available at the Stelo or the Pressley level. The latter is about 18 per cent higher. These are adjusted to agree with the tenacity obtained with conventional mechanical machines known as the Stelometer and the Pressley strength tester – the latter is known to be about 25 per cent higher than the other because the Pressley machine works at 10 times the speed of the Stelometer and the test result is prone to give an overshoot error while recording the breaking load. In the HVI mode, the tenacity given by the machine is much higher than the two measures obtained in the ICC mode as shown by data in the Table. The HVI tenacity is about 25–30 per cent higher than even the tenacity obtained in the ICC mode. The correlation between the two is, however, quite high unlike in the case of the length variability indices – UR per cent and UI per cent. Pressley Index is a measure of the strength of fiber bundles determined under prescribed conditions and expressed in an arbitrary unit, pounds per milligram. Tenacity by tests on fiber bundles on the Pressley instrument, expressed as Pressley ratio. The Pressley ratio converted into tenacity in lb/sq inch using an empirical formula. Tenacity by test on fiber bundles using Stelometer. Tenacity by test on comb samples using High Volume Instrument (HVI) machine set in the International Calibration Cotton (ICC) mode giving both Stelo- and Pressley-level tenacity. Tenacity by test on comb samples using HVI machine set

in the HVI calibration mode giving what is called HVI Tenacity. Measurement of fiber strength. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Стэло (Stelo) или Прэсли (Pressley). пучков волокна (fiber bundles). Показатель прочности волокна.

PRESS MARKS = ОТМЕТИНЫ ОТ ПРЕССА – Press Marks:- weft wise marking on uniform distance. Finishing defect. / Порок или дефект заключительной отделки.

PRESS–OFF = РАСПРЕССОВКА (или ШПИЛЬКА ВЫТЕСНИТЕЛЯ) – Press-Off:- results when all or some of the needles on circular knitting fail to function and the fabric either falls off the machine or design is completely disrupted or destroyed. Many knitting needles are broken and have to be replaced when bad press-off occurs. Bad press-offs usually start a new roll of fabric. Knitted fabric defect. Press-Off:- in knitted fabrics, a condition in which the yarn fails to knit and either the fabric falls off the needles or the design is distorted or incomplete. Press-Off:- a breakdown in the knitted structure over a discrete area. Defect Name:- Press-Off. Defect Type:- weft lines, horizontal lines. Fabric Type:- Double Knit Fabrics. Description:- Press-Off:- In circular knits, this is a condition where all or part of the needles cease to function and the fabric either falls off the machine or the design is completely disrupted or destroyed. Severity:- Major. / Порок или дефект.

PRESSURE = ДАВЛЕНИЕ – Pressure is a force per unit area, usually expressed in pounds per square inch. / Давление – физическая величина, характеризующая интенсивность нормальных (перпендикулярных к поверхности) сил, с которыми одно тело действует на поверхность другого (например, фундамент здания на грунт, жидкость на стенки сосуда, газ в цилиндре двигателя на поршень и тому подобное). Если силы распределены вдоль поверхности равномерно, то давление p на любую часть поверхности равно p = F/S, где S – площадь этой части, F – сумма приложенных перпендикулярно к ней сил. При неравномерном распределении сил это равенство определяет среднее давление на данную площадку, а в пределе, при стремлении величины S к нулю, – давление в данной точке. В случае равномерного распределения сил давление во всех точках поверхности одинаково, а в случае неравномерного – изменяется от точки к точке. Для непрерывной среды аналогично вводится понятие Давление в каждой точке среды, играющее важную роль в механике жидкостей и газов. Давление в любой точке покоящейся жидкости по всем направлениям одинаково; это справедливо и для движущейся жидкости или газа, если их можно считать идеальными (лишёнными трения). В вязкой жидкости под Давлением в данной точке понимают среднее значение давления по трём взаимно перпендикулярным направлениям. Давление играет важную роль в физических, химических, механических, биологических и других явлениях. Давление в газовой среде связано с передачей импульса при столкновениях находящихся в тепловом движении молекул газа друг с другом или с поверхностью граничащих с газом тел. Давление в газах (его можно назвать Тепловым Давлением) пропорционально температуре (кинетической энергии частиц, смотрите Газы). В отличие от газов, где средние расстояния между хаотически движущимися частицами много больше самих частиц, в конденсированных средах (жидкостях и твёрдых телах) расстояния между атомами сравнимы с их размерами и определяются равновесием межатомных (межмолекулярных) сил отталкивания и притяжения. При сближении атомов силы отталкивания возрастают и обусловливают так называемое Холодное Давление. В конденсированных средах давление имеет также и ‘тепловую’ составляющую, связанную с тепловыми колебаниями атомов (ядер). При фиксированном или уменьшающемся объёме конденсированной среды ‘тепловое’ давление увеличивается с ростом температуры. При температурах ~104 °К и выше заметный вклад в ‘тепловое’ давление вносит тепловое возбуждение электронов. Физическая природа давления волн (звуковых, ударных, электромагнитных) рассмотрена отдельно – в статьях Давление Звука, Давление Света, Ударная Волна. Измеряют давление манометрами, барометрами, вакуумметрами, а также различными давления датчиками. Единицы давления имеют размерность силы, делённой на площадь; в Международной Системе Единиц СИ единица давления – Н/м, в МКГСС Системе Единиц – кгс/см^2. Существуют внесистемные единицы давления:- атмосфера физическая (атм), атмосфера техническая (ат), бар, а также миллиметров водяного столба (мм вод.ст.) и миллиметров ртутного столба (мм рт.ст.) (тор), с помощью которых измеряемое давление сравнивают с давлением столба жидкости (воды, ртути). В США и Великобритании давление выражают в lbf/in^2 (фунт-сила на квадратный дюйм), в pdl/ft^2 (паундаль на квадратный фут), в inH_2O (дюймах вод.ст.), в ftH_2O (футах вод.ст.), в inHg (дюймах рт.ст.) и других. 1 lbf/in^2 = 6 894.76 Н/м^2, 1 pdl/ft^2 = 1.488 16 Н/м^2, 1 inH_2O = 249.089 Н/м^2; 1 ftH_2O = 2 989.07 Н/м^2, 1 inHg = 3 386.39 Н/м^2.

PRESSURE CONTROL VALVE = КЛАПАН КОНТРОЛЯ ДАВЛЕНИЯ (или РЕДУКЦИОННЫЙ КЛАПАН, или УРАВНИТЕЛЬНЫЙ КЛАПАН) – Pressure Control Valve whose primary function is to limit system pressure. See also Valve.

PRESSURE DROP = ПЕРЕПАД ДАВЛЕНИЯ (или ПАДЕНИЕ ДАВЛЕНИЯ) – Pressure Drop:- resistance to flow created by the element (media) in a filter. Defined as the difference in pressure upstream (inlet side of the filter) and downstream (outlet side of the filter). Pressure Drop is:- (1) a decrease in pressure that is caused by friction between a flowing liquid and a constricting container. The pressure drop is increased by a reduction in diameter of the container. (2) The change in pressure across a filter. Pressure Drop or Differential Pressure is the difference in pressure from the upstream side of the filter to the down stream side of the filter. Pressure drop is reported using the Greek symbol Δ (Delta) followed by the letter P and is stated Delta-P.

PRESSURE DYEING = КРАШЕНИЕ ПОД ДАВЛЕНИЕМ – Pressure Dyeing is a dyeing by means of forced circulation of dye through packages of fiber, yarn, or fabric under superatmospheric pressure. See also Dyeing.

PRESSURE GAGE = ИЗМЕРИТЕЛЬ ДАВЛЕНИЯ (или МАНОМЕТР) – (1) Pressure Gage:- pressure differential above or below atmospheric pressure. See also Gage.

(2) Pressure Gage is a gauge for measuring and indicating fluid pressure. Synonyms:- Pressure Gauge. Types:- (i) Manometer is a pressure gauge for comparing pressures of a gas; (ii) Sphygmomanometer is a pressure gauge for measuring blood pressure; and (iii) Tensimeter is a manometer for measuring vapor pressure. Type of:- Gage, Gauge:- a measuring instrument for measuring and indicating a quantity such as the thickness of wire or the amount of rain etc. Pressure Gauge is a mechanical instrument designed to measure the internal pressure and/or vacuum of a vessel or system. Pressure gauges are offered in a variety of styles, sizes, and wetted part materials to meet the demands of standard and special applications. Pressure Gauge is an instrument for measuring the condition of a fluid (liquid or gas) that is specified by the force that the fluid would exert, when at rest, on a unit area, such as pounds per square inch (psi) or Newtons per square centimeter (N/sq.sm). The reading on a gauge, which is the difference between two pressures, is known as the Gauge Pressure. If the lower of the pressures is the pressure of the atmosphere, the Total, or Absolute, Pressure is the sum of the gauge and atmospheric pressures. The simplest device for measuring static pressures up to about 90 pounds per square inch (62 Newtons per square cm) is a U-Tube Manometer, in which one column of a liquid in the tube is open to a region of high pressure and the other column to a region of low pressure. The differential pressure is indicated by the difference in level between the two columns of liquid, and it is calculated as the difference in level multiplied by the density of the liquid. The manometer liquids most commonly used are mercury, oil, alcohol, and water. The Bourdon-Tube Gauge, invented about 1850, is still one of the most widely used instruments for measuring the pressure of liquids and gases of all kinds, including steam, water, and air up to pressures of 100 000 pounds per square inch (70 000 Newtons per square cm). The device consists of a flattened circular tube coiled

into a circular arc. One end is soldered to a central block and is open to the fluid whose pressure is to be measured; the other end is sealed and coupled to the pointer spindle. When the pressure inside the tube is greater than the outside pressure, the tube tends to straighten, thus turning the pointer. The pressure is read on a circular scale. Metal bellows and diaphragms are also used as pressure-sensing elements. Because of the large deflections for small pressure changes, bellows instruments are particularly suitable for pressures below atmospheric. Two corrugated diaphragms sealed at their edges to form a capsule, which is evacuated, are used in aneroid barometers to measure atmospheric pressure (see Altimeter). These instruments employ mechanical linkages and so are primarily useful for measuring static pressures or pressures that change slowly. For rapidly changing pressures, electrical pressure transducers that convert pressure to an electrical signal are more suitable. These include strain gauges; moving contact resistance elements; and inductance, reluctance, capacitative, and piezoelectric devices. Electromechanical Transducers, which are used in hydraulic controllers, where speed and power are needed, convert changes in pressure of fluid to electrical signals. / Под Манометром, от Греческих слов Manós, означающее Неплотный или Редкий, и Métron, означающее Мера, Metréo, означающее Измеряю, понимается прибор для измерений давления жидкостей и газов. Различают манометры для измерений абсолютного давления, отсчитываемого от нуля (полного вакуума); манометры для измерений избыточного давления, то есть разности между абсолютным и атмосферным давлением, когда абсолютное давление больше атмосферного; дифманометры для измерений разности двух давлений, каждое из которых, как правило, отличается от атмосферного. Для измерений давления, соответствующего атмосферному, применяют барометры, для измерений давления разреженных газов – вакуумметры (главным образом в вакуумной технике). При измерениях давления пользуются манометрами, у которых шкалы градуированы в различных единицах (смотрите Давление). Основа измерительной системы манометра – чувствительный элемент, являющийся первичным преобразователем давления. В зависимости от принципа действия и конструкции чувствительного элемента различают жидкостные, поршневые, деформационные (пружинные) манометры. Кроме того, находят применение приборы, действие которых основано на измерении изменений физических свойств различных веществ под действием давления. Кроме Манометров с непосредственным отсчётом показаний или их регистрацией, широко используются так называемые Бесшкальные Манометры с унифицированными пневматическими или электрическими выходными сигналами, которые поступают в системы контроля, автоматического регулирования и управления различными технологическими процессами. В жидкостных манометрах чувствительным элементом является столб жидкости, уравновешивающий измеряемое давление. Идея использовать жидкость для измерения давления принадлежит Итальянскому учёному Эванджэлиста Торричэлли (Evangelista Torricelli (1608–1647); 1640). Первые ртутные манометры были сделаны Итальянским механиком Винчэнцо Вивиани (Vincenzo Viviani (1622–1703); 1642) и Французским учёным Блезом Паскалем (Blaise Pascal (1623–1662); 1646). Конструктивное исполнение жидкостных манометров отличается большим разнообразием. Основные разновидности жидкостных манометров:- U-образные (двухтрубные), чашечные (однотрубные) и двухчашечные. Современные жидкостные манометры имеют пределы измерений от 0.1 Ньютона на квадратный метр (Н/м^2) до 0.25 МН/м^2 (~ от 0.01 миллиметров водяного столба (мм вод.ст.) до 1 900 миллиметров ртутного столба (мм рт.ст.) и находят применение главным образом для измерений с высокой точностью в лабораторных условиях. Жидкостные манометры, служащие для измерения малых избыточных давлений и разрежений менее 5 кН/м^2 (37.5 мм рт.ст.), называются Микроманометрами. При малых пределах измерений жидкостные манометры заполняются лёгкими жидкостями (вода, спирт, толуол, силиконовые масла), а при увеличении пределов измерений – ртутью. При измерении давления чашечным микроманометром заполняющая сосуд жидкость вытесняется в трубку, изменение уровня жидкости сравнивают со шкалой, отградуированной в единицах давления. Пределы измерений прибора не превышают 2 кН/м^2 (~200 мм вод.ст.) при наибольшем угле наклона. Для точных измерений и поверки микроманометров других типов применяют двухчашечные микроманометры компенсационного типа, в которых один из сосудов (чашка) жёстко закреплён, а второй сосуд с целью создания необходимого для уравновешивания давления столба жидкости перемещается в вертикальном направлении. Перемещение, определяемое при помощи точной шкалы с нониусом или по концевым мерам длины, непосредственно характеризует измеряемое давление. Компенсационными микроманометрами можно измерять давления до 5 кН/м^2 (~500 мм вод.ст.), при этом погрешность не превышает (2–5)·10^{-3} Н/м^2, или (2–5)·10^{-2} мм вод.ст.. Верхний предел измерения жидкостных манометров можно повысить, увеличив высоту столба жидкости и выбрав жидкость с большей плотностью. Однако даже при заполнении манометра ртутью его верхний предел измерения редко превышает 0.25 МН/м^2 (~1 900 мм рт.ст.), например, в чашечных манометрах, в которых широкий сосуд сообщён с вертикальной трубкой. Жидкостные манометры для измерений с высокой точностью оснащают электрическими или оптическими отсчётными устройствами, а их конструктивное исполнение позволяет устранить различные источники погрешностей (влияние температуры, воздействие вибраций, капиллярные силы и так далее). Высокую точность обеспечивает двухчашечный ртутный манометр абсолютного давления с так называемым ёмкостным отсчётом, который применяется для определения температуры в эталонном газовом термометре (Всесоюзный Научно-Исследовательский Институт Метрологии имени Дмитрия Ивановича Менделеева). Пределы измерений манометра составляют (0–0.13) МН/м2 (0–1 000 мм рт.ст.). Для улучшения эксплуатационных характеристик (в основном точности показаний) в жидкостных манометрах применяют следящие системы, которые позволяют автоматически определять высоту столба жидкости. В поршневых манометрах чувствительным элементом является поршень или другое тело, с помощью которого давление уравновешивается грузом или каким-либо силоизмерительным устройством. Распространение получил манометр с так называемым неуплотнённым поршнем, в котором поршень притёрт к цилиндру с небольшим зазором и перемещается в нём в осевом направлении. Впервые подобный прибор был создан в 1833 Русскими учёными иностранного происхождения Жёржем-Фрэдэриком (Егором Ивановичем) Пару (или Парротом; George-Frédéric von Parrot; 1767–1852) и Эмилием Христиановичем Ленцем (Heinrich-Freidrich Emil Lenz; 1804–1865); широкое применение поршневые манометры нашли во второй половине XIX века благодаря работам Е. Рухгольца (E. Ruckholz; Германия) и А. Амага (Франция), которые независимо друг от друга предложили ‘неуплотнённый’ поршень. Основное преимущество поршневых манометров перед жидкостными заключается в возможности измерения ими больших давлений при сохранении высокой точности. Поршневой манометр с относительно небольшими габаритами (высота ~0.5 м) превосходит по пределам измерений и точности 300-метровый ртутный манометр, конструкция которого была разработана Французским химиком и физиком Люи Полем Кайётэ (Louis Paul Cailletet; 1832–1913) в 1891. Манометр был смонтирован на Эйфелевой Башне в Париже. Верхний предел измерения поршневых манометров составляет около 3.5 ГН/м^2 (3.5·10^8 мм вод.ст.). При этом высота измерительной установки не превышает 2.5 метров (м). Для измерения такого давления ртутным манометрам потребовалось бы довести его высоту до 26.5 километров (км). Наиболее распространены грузопоршневые манометры с простым неуплотнённым поршнем. Пространство под поршнем заполнено маслом, которое под давлением поступает в зазор между поршнем и цилиндром, что обеспечивает смазку трущихся поверхностей. Вращение поршня относительно цилиндра предотвращает появление контактного трения. Давление определяется весом грузов, уравновешивающих его, и площадью сечения поршня. Изменяя вес грузов и площадь сечения поршня, можно в широком диапазоне менять пределы измерений, которые для манометров данного типа составляют 0.04–10 МН/м^2 (0.4–100 кгс/см^2). При этом погрешности наиболее точных эталонных манометров не более 0.002–0.005%. При дальнейшем повышении пределов измерений площадь поршня становится столь малой, что для грузов необходимо конструировать специальные устройства (опорные штанги, рычажные

устройства). Например, для уменьшения веса грузов в манометрах системы манометра Михаила Константиновича Жоховского (СССР) уравновешивающее усилие создаётся при помощи гидравлического мультипликатора. В этом случае даже при измерении высоких давлений 2.5 ГН/м^2 (2.5·10^4 кгс/см^2) измерительная установка предельно компактна и не требует наложения большого числа грузов. Поршневые Манометры специальных конструкций применяются также при измерении небольших избыточных давлений, разрежений, абсолютного и атмосферного давлений. Как правило, поршневые системы таких манометров предварительно уравновешиваются специальным устройством, что позволяет понизить нижний предел измерений практически до нуля. Поршень может быть уравновешен, например, пружинным механизмом. Вращение поршня осуществляется от электродвигателя. При создании разрежения в пространстве над верхней частью поршня избыток атмосферного давления уравновешивают грузы, накладываемые на его нижнюю часть. Кроме цилиндрических поршней, применяют сферические и конические поршни. В так называемых Колокольных Манометрах роль поршня выполняет колокол, а в манометрах типа ‘Кольцевых Весов’ – плоская перегородка внутри полого кольца. Поршневые манометры применяют для градуировки и поверки манометров других типов, при точных измерениях и контроле давления с выходом показаний на цифровой счётчик или с передачей их на расстояние. В Деформационных Манометрах чувствительным элементом является упругая оболочка, которая воспринимает измеряемое давление. Деформация этой оболочки является мерой вызвавшего её давления. Деформационные манометры в зависимости от конструкции чувствительного элемента делятся на трубчатые, мембранные и сильфонные. Принцип определения давления по упругой деформации тонкой оболочки был предложен в 1846 Швейцарским железнодорожным инженером Рудольфом Эдуадом Шинцем (Rudolf Eduard Schinz; 1812–1855), а частный случай этого метода – определение давления по деформации полой трубчатой пружины – в 1848 Французским учёным Уженом Бурдо (Eugène Bourdon; 1808–1884), по имени которого трубчатая пружина часто называется трубкой Бурдо (или Бурдона; Tube de Bourdon). Пределы измерений деформационных манометров охватывают широкий диапазон давлений – от 10 Н/м^2 до 1 000 МН/м^2 (1–10^8 мм вод.ст.). Простота принципа действия, компактность конструкции, удобство в эксплуатации обусловили применение деформационных манометров при промышленных измерениях. Простейший Трубчатый Манометр имеет полую, изогнутую по дуге трубку, один конец которой присоединён к объёму, где измеряется давление, второй, запаянный конец – к рычагу передаточного механизма. При изменении давления трубка деформируется, перемещение её конца через передаточный механизм сообщается стрелке, которая показывает давление по шкале. Наряду с трубчатой пружиной в манометрах часто применяют мембрану или сильфон. Кроме механического преобразования деформации чувствительного элемента в показания манометра, применяются также электрические или оптические методы преобразования, в том числе с передачей результатов измерений на расстояние. В системах автоматического регулирования и контроля технологических процессов применяют деформационные манометры с силовой компенсацией (по методу измерений). В этом случае манометр состоит из измерительного блока и унифицированного электрического или пневматического силового преобразователя. Измеряемое давление преобразуется чувствительным элементом измерительного блока в усилие, которое уравновешивается силой, развиваемой механизмом обратной связи, а не деформацией чувствительного элемента. На выходе преобразователя механизма создаётся стандартный электрический или пневматический сигнал, пропорциональный измеряемому давлению. Данная система позволяет применять один и тот же преобразователь в манометре для измерения абсолютного, избыточного давления и разрежения, разности давлений, а также других теплоэнергетических параметров (температуры, уровня, плотности, расхода). При этом возможно изменение пределов измерений в широком диапазоне за счёт изменения соотношений плеч рычагов преобразователя и площадей сильфонов. Измерительный блок манометра абсолютного давления состоит из двух сильфонов, связанных с Т-образным рычагом преобразователя. В одном из сильфонов создано разрежение, второй сообщён с объёмом, в котором измеряется давление. Под действием давления заслонка Т-образного рычага прижимается к соплу, что приводит к увеличению давления в сильфоне обратной связи и появлению уравновешивающего усилия. Преобразователь питается сжатым воздухом от постороннего источника. Выходное давление при помощи пневмоусилителя передаётся на аппаратуру, фиксирующую результаты измерений. При измерении очень высоких давлений (свыше 2.5 МН/м^2) или давлений, близких к нулю (менее 10 Н/м^2), применение манометров указанных выше типов связано с большими трудностями или просто невозможно. В этих случаях нашли применение манометры, принцип действия которых основан на измерении какого-либо физического параметра, связанного с давлением определённой зависимостью. При измерении малых абсолютных давлений применяют ионизационные, тепловые, вязкостные, радиометрические манометры (смотрите Вакуумметрия). При измерении высоких давлений широко используют, например, Манганиновые Манометры, в которых под действием давления изменяется электрическое сопротивление тонкой манганиновой проволоки. Находят применение также манометры, действие которых основано на магнитострикционном эффекте (смотрите Магнитострикция), скорости распространения звука в среде и другом. Высокой точностью отличаются манометры, принцип действия которых основан на зависимости температуры плавления ртути от давления. Переход ртути из твёрдого состояния в жидкое сопровождается скачкообразным изменением объёма, что позволяет надёжно фиксировать соответствующие моменту плавления температуру и давление и обеспечивает хорошую воспроизводимость результатов. Измерительная установка с таким манометром позволяет определять давления до 4 ГН/м^2 (~4·10^2 мм вод.ст.) с погрешностью, не превышающей 1%, и используется в качестве эталона сверхвысокого давления (до 4 ГН/м^2) при поверке и градуировке манометра. Дальнейшее совершенствование манометров предполагает повышение их точности, расширение пределов измерений, обеспечение более высокой надёжности и долговечности, удобства эксплуатации. Повышению точности манометров способствует использование таких материалов, как дисперсионно-твердеющие сплавы, кварц (например, для изготовления чувствительных элементов деформационных манометров), применение упругих опор, оптических и электрических методов снятия показаний и регистрации их. При автоматизации измерений находят применение различные средства, позволяющие передавать результаты измерений на устройства с цифровым отсчётом, записывающие и печатающие устройства, которые могут находиться на значительных расстояниях от мест измерений (например, передача результатов измерения атмосферного давления на Марсе и Венере при облёте их искусственными спутниками), и так далее.

PRESSURE INDICATOR = УКАЗАТЕЛЬ ДАВЛЕНИЯ (или ИНДИКАТОР ДАВЛЕНИЯ, или МАНОМЕТР) – Pressure Indicator is an indicator that signals pressure conditions.

PRESSURE LINE FILTER = ФИЛЬТР ЛИНИИ ДАВЛЕНИЯ (или ФИЛЬТР НАГНЕТАТЕЛЬНОГО ТРУБОПРОВОДА) – Pressure Line Filter is a filter located in a line conducting working fluid to a working device or devices. See also Filter.

PRESSURE MARK = ОТМЕТИНА ОТ НАЖИМА – Pressure Mark is a fabrics defect found in processed film which may appear as reduced or increased density. See also Bruise, and Finger Mark. Pressure Mark:- an area of greater lustre, or of reduced thickness, in a fabric when compared to the adjacent normal fabric. Note:- this defect is often caused by irregularities of pressure during the finishing process. / Ласы (pressure mark):- порок заключительной отделки ткани; зоны в полотне с более интенсивным блеском или меньшей толщиной по сравнению с соседними участками полотна. Примечание:- этот порок возникает в результате неравномерности давления на полотно во время отделки.

PRESSURE SUIT = СКАФАНДР (или КОСТЮМ ПОД ДАВЛЕНИЕМ) – Pressure Suit is an inflatable suit for high-altitude or space flight to protect the body from low pressure.

PRESSURE SWITCH = ВЫКЛЮЧАТЕЛЬ ДАВЛЕНИЯ (или РЕЛЕ ДАВЛЕНИЯ) – Pressure Switch is an electric switch operated by fluid pressure.

PRESSURE–TREATING = ПРОПИТКА ПОД ДАВЛЕНИЕМ – Pressure-Treating is the process of impregnating wood with preservative or fire retardant chemicals by placing the wood and chemical in a pressure chamber. See also Empty-Cell Process Pressure-Treating, and Full-Cell Process Pressure-Treating. / Процесс пропитки древесины .

PRÊT–À–PORTER = ПРЭТ–А–ПОРТЭ (или ОДЕЖДА ШИРПОТРЕБ) – Prêt-À-Porter:- ready-to-wear clothes. / Под Прэт-А-Портэ, от Французского словосочетания Prêt-À-Porter, означающее буквально Готовое Платье, понимается готовая к носке одежда ширпотреб (широкого потребления).

PRETAX = НАЧИСЛЕННОЕ ДО ВЫЧЕТА НАЛОГОВ (или НАЧИСЛЕННОЕ ДО НАЛОГООБЛОЖЕНИЯ) – Pretax is a person's salary before state and federal income taxes are calculated. / В Соединённых Штатах Америки под Начисленным До Вычета Налогов понимается жалованье лица, до подсчёта штатовских и федеральных налогов на доход.

PRETENSION = ПРЕДВАРИТЕЛЬНОЕ НАТЯЖЕНИЕ (или ПРЕДВАРИТЕЛЬНОЕ РАСТЯЖЕНИЕ) – Pretension is the relatively low tension applied to remove kinks and crimp when mounting a specimen preparatory to making a test or to a textile processing operation, etc. Pretension is the specified tension applied to a test specimen preparatory to making a test.

PRE–TRIP INSPECTION = ПРЕДРЕЙСОВАЯ ИНСПЕКЦИЯ – Pre-Trip Inspection (PTI) is a test to examine correct operation of a refrigerated container. The test should be carried out before transporting refrigerated goods. A technical inspection of reefer containers prior to positioning for stuffing. Pre-Trip Inspection (PTI) is a technical inspection of reefer containers prior to their being positioned for stuffing. Typically the shipping line's inspection of reefer containers prior to release to the shipper for stuffing/loading. / Предрейсовая Инспекция (ПРИ) .

PREVENTER = ПРЕДОХРАНИТЕЛЬ – Preventer (maritime term):- a rope used for additional support or for additional securing, e.g., preventer stay. / , например, лось-штаг.

PREVENTIVE MAINTENANCE = ПРЕВЕНТИВНЫЙ РЕМОНТ (или ПРЕДУПРЕДИТЕЛЬНЫЙ РЕМОНТ, или ПРОФИЛАКТИЧЕСКИЙ РЕМОНТ) – Preventive Maintenance is a maintenance performed according to a fixed schedule involving the routine repair and replacement of machine parts and components.

PREVENTIVE MEASURES = ПРЕВЕНТИВНЫЕ МЕРЫ – Preventative Measures are actions taken in advance to prevent any undesirable effects from lack of nutrients or pests and diseases. / Под Превентивным, от Французского слова Préventif, от Латинского слова Praeventio, означающее Опережаю или Предупреждаю, понимается предупреждающий, предохранительный, например, превентивная прививка.

PRF = PULSE REPETITION FREQUENCY

PRICE = ЦЕНА – (1) Price is a cost of purchasing a unit of goods or services. Very broadly, prices are generally set by the manufacturer and retailer, taking into account all fixed costs and variable costs and allowing for a profit margin. Price is the amount of money or consideration-in-kind for which a service is bought, sold, or offered for sale. / Расход на приобретение единицы товаров или услуг. В широком смысле слова, цены, как правило, устанавливаются изготовителем и розничным торговцем, принимая в расчёт . Под Ценой понимается денежное выражение стоимости товара. Цены складываются стихийно и колеблются вокруг стоимости в простом товарном производстве или вокруг цены производства в зависимости от спроса и предложения. Основными видами цен являются:- закупочные, оптовые и розничные.

(2) Price means a rate, fare, or charge.

(3) Price:- securities and merchandise are quoted at a market or selling price. Foreign exchange is quoted in rates, not prices. Exchange value of a good or service expressed in monetary terms. Prices are expressed in fractions. Common fractions:- 1/8 = 12.5 ¢, 1/4 = 25 ¢, 3/8 = 37.5 ¢, 1/2 = 50 ¢, 5/8 = 62.5 ¢, 3/4 = 75 ¢, and 7/8 = 87.5 ¢.

PRICE BANDING = ЦЕНОВОЕ СВЯЗЫВАНИЕ (или СВЯЗЫВАНИЕ ЦЕНЫ) – Price Banding (at CME GROUP) is a similar mechanism to price limits which rejects orders outside a given range, or band, to maintain orderly markets in futures and options markets whether there is high volatility or not. Bands are calculated dynamically for each product based on the last price, plus or minus a fixed value. If markets quickly move in one direction, the price bands dynamically adjust to accommodate new trading ranges. CME GCC (The CME Global Command Center provides customer support 24 hours a day, beginning at 14:00 Sunday through 16:30 Friday, Central Time:- United States:- +1-800-438 8616, Europe:- +44-20-76234747, and Asia:- +65-65325010; for general, non-production issues, email the GCC at gcc@cmegroup.com.) Price Banding:- Futures Price Banding:- A Price Band Variation (PBV) is a static value that varies by product. It is symmetrically applied to both the upside (for bids) and downside (for offers) to determine the Price Band Variation Range (PBVR). With each price change the PBVR is recalculated and the new range is applied. The CME Globex platform rejects all bids and offers outside the PBVR. Applying the PBV to a reference price determines the PBVR. The reference price depends on the market state and trading activity:- (i) During the Pre-Open and the Pre-Open/Non-Cancel period, the contract's Settlement Price is the reference price; (ii) Once the first Indicative Opening Price (IOP) is calculated, it becomes the reference price; (iii) During trading hours, the Last Price is the reference price; (iv) If no IOP or Last Price is established, the Settlement Price remains the reference price until a Last Price is established; and (v) In the event of a market emergency, when a market is placed in a non-trading mode during trading hours, the IOP serves as the reference price during the non-regular Pre-Open and Pre-Open/Non Cancel Period. If no IOP is available, the Last Price is the reference price. Options Price Banding:- Enhanced Options price banding is identical to futures price banding, with the following modifications:- For Outright Options – based on market conditions, the reference price is set to either the:- (i) Last Price of the option; (ii) Theoretical Options Price based on well-established options pricing algorithms; and (iii) Last Price in combination with the Theoretical Options Price, if practical. For Options Spreads (UDS) – the reference price is a theoretical value derived from the reference prices of the legs within the UDS. A change to the legs' reference prices will result in an updated reference price of the UDS. The Last Price or Bid/Offer of the UDS will not update the reference price. If a customer experiences issues entering orders due to price banding, contact the CME Global Command Center (GCC) to adjust price bands. The width of the price bands is determined by one of the following:- (i) A fixed PBV for the entire option series, identical to the current price banding practice; (ii) A dynamic PBV based on the delta of the option, as estimated by the TOP calculation; or, (iii) A dynamic PBV based on a percentage of the TOP, where the percentage is based on the delta of the option. Please note:- (i) If market conditions dictate a wider price band, for example, in a volatile market where prices are fluctuating rapidly, CME Group may elect to temporarily relax or suspend the price banding restriction; (ii) In addition to the PBVR, Daily Trading Limits may be in effect for certain products; and Daily Trading Limits are

always given priority over PBVR in rejecting orders with erroneous prices; and (iii) PBVR are monitored throughout the day by the CME Global Command Center (GCC) and may be adjusted if necessary. Price Banding Rules:- Different price banding rules apply to options and futures to reflect the differences between these markets:- (i) Although a series of options on a particular futures contract may trade frequently, any single option with a specific strike price may not trade or even be quoted regularly; (ii) The price of the underlying futures contract may change substantially subsequent to the option's Last Price, causing the market value of a formerly out-of-the-money option to increase substantially while the PBVR is locked in place:- In this situation, the Last Price on a specific option would be an unrepresentative reference price; and (iii) Options with different strikes require different price band widths:- PBVRs for out-of-money options are narrower than those for in-the-money options to reflect the extent to which bids and offers departing from their fair market value may be considered erroneous. See also Circuit Breaker, Price Limits, and Velocity Logic.

PRICE BASING = БАЗИРОВАНИЕ ЦЕНЫ – Price Basing:- a situation where producers, processors, merchants, or consumers of a commodity establish commercial transaction prices based on the futures prices for that or a related commodity, e.g., an offer to sell Corn at 5 cents over the December futures price. This phenomenon is commonly observed in grain and metal markets. / Ситуация, при которой производители, переработчики, коммерсанты или потребители сырья устанавливают цены по коммерческим операциям, базирующиеся на ценах фьючерсов для такого же или связанного с ним вида сырья, например, оферта на продажу кукурузы по цене, на 5 центов превышающую цену Декабрьского фьючерса на Кукурузу. Такое явление обычно наблюдается на рынках зерна, хлопка и металлов.

PRICE/BOOK (EQUITY) RATIO = СООТНОШЕНИЕ ЦЕНА/БАЛАНСОВАЯ СТОИМОСТЬ (СОБСТВЕННЫХ СРЕДСТВ) – Price/Book (Equity) Ratio:- closing price of the stock on the last trading day of the fiscal year divided by the fiscal year book value per share. Book value is the same figure as common stock equity from the 10Q or 10K reports.

PRICE BY VOLUME = ЦЕНА К ОБЪЁМУ – Price By Volume is a horizontal histogram plotted on the chart of a security, which corresponds to the volume of shares traded at a specific price level. Price by volume histograms are found on the Y-axis and are used by technical traders to predict areas of support and resistance. Large price by volume bars are used to illustrate high buying and selling interest, and they are often regarded as a sign that the given price level will act as a strong area of support or resistance. It is common to see the price of an asset face little resistance when traveling between levels that have small PBV bars, but pushing the price past areas with large PBV bars is substantially more difficult. A horizontal histogram that overlays a price chart. The histogram bars stretch from left to right starting at the left side of the chart. The length of each bar is determined by the cumulative total of all volume bars for the periods during which the closing price fell within the vertical range of the histogram bar. / В техническом анализе биржевых рынков, .

PRICE/CASH FLOW RATIO = СООТНОШЕНИЕ ЦЕНА/ОБЪЁМ ДВИЖЕНИЯ ДЕНЕЖНЫХ СРЕДСТВ – The Price To Cash Flow (PCF) Ratio is derived by dividing the cash flow per share by the share price. As a variable that focuses on liquidity, the price/cash flow ratio helps to evaluate the development of a company's future earnings potential and compare different companies with one another. The increased significance of PCF can be traced back to, among other things, the fact that it is much less susceptible to accounting policy manipulations than the net income figure reported in the annual financial statements. This should considerably improve the quality of information relating to the predictability in the development of company revenues. Ratio of the share price to the cash flow of a company. The price of the share is divided by the cash flow. See also Price Earnings Ratio.

PRICE CHANNELS = ЦЕНОВЫЕ КАНАЛЫ (или КАНАЛЫ ЦЕНЫ) – Price Channels are an important technical condition prevalent on almost all price charts on all time frames. Traders use these simple formations to identify profitable trade setups on both the long and short sides. If drawn and analyzed correctly, price channels can provide precise entry, exit, stop-loss and profit-taking levels for all types of traders in all markets. However, price channels have their limits, and those who put too much faith in them can get burned. A price channel combines an existing trendline with a second, parallel trendline so that when the lines are taken together, they fully contain the price fluctuations in the current leg of the move. The upper trendline connects significant highs of the move, and the lower trendline connects the lows of the move. These trendline levels represent areas where key demand (support) and supply (resistance) exist. An asset's price will oscillate between these levels – the upper and lower trendlines – helping traders position their entries and risk-aware exits. All else equal, buy entries tend to be more profitable when placed at the lower end of the channel, and sell entries tend to be more profitable when placed at the upper end. Of course, that thinking assumes the channel will hold. Likewise, traders can set stop-loss and profit-target orders in the vicinity of these established highs and lows to protect the bottom line or get the most out of a position. What also is clear is that channels aren't always picture perfect. Highs and lows are fluid, and traders must be alert and flexible as channels develop. Similar to Bollinger Bands®, Price Channels form boundries above and below the price line and can be used as indicators of volatility. Price channels are created by specifying a number of periods that will chart an n-period high or low around the price line. Understanding Channels:- during a trading range, traders scalp by buying near the bottom and selling near the top, both to initiate positions and take profits. Channels are weak trends and can behave more like a spike or a trading range. When they are tight and steep with only small and brief pullbacks, they are spikes on higher time frame charts and should be traded like strong trends. In a steep bear channel with only small pullbacks, traders only should look to short. When a channel is broad with large swings made of pullbacks lasting 10 or more bars, and the slope is relatively flat, it essentially is trading a range. The broader and flatter it is, the more traders will trade in both directions, looking mostly for scalps, as they do in trading ranges. The tighter and steeper it is, the more inclined traders will be to trade in the direction of the trend. Every type of market has characteristics that make it difficult to trade. The more the market resembles a trading range, the less certain that a breakout or a reversal will hold. The steeper the trend, the higher the probability of success, but the stop usually is farther away, increasing the risk; generally it is better to swing than to scalp. For example, in a bull trend, traders usually will trail the stop below the most recent higher-low after every new high. This usually means that the size of the risk is greater, which is typically the case when the probability is higher, as it is in strong trends. Whenever the risk is greater, traders should reduce the size of their trade so that the total dollars at risk are not greater than on any other trade. / В техническом анализе биржевых рынков, индикатор, аналогичный Пограничным Полосам Болындьжёра® (Bollinger Bands®). В графическом плане каналы цены формируют границы выше и ниже линии цены биржевого актива или инструмента, и которые могут быть использованы в качестве индикаторов лихорадочности. Каналы цены создаются определённым числом временных периодов торговли таким образом, чтобы отражать на графике n-период максимумов или минимумов вокруг линии цены.

PRICE CONTROLS = ЦЕНОВЫЕ КОНТРОЛИ (или КОНТРОЛИ ЦЕНЫ) – Price Controls is a form of government intervention in the economy in which a government agency uses its law-making power to regulate the prices at which otherwise voluntary private exchanges may take place. The government agency may attempt to fix and enforce the exact prices at which a particular good or service may be sold (as for example when state regulatory commissions fix the rates for electricity, gas or water to be sold by monopoly utility companies in particular geographic areas). Alternatively, the government agency may be content to set 'ceiling prices' or 'floor prices' for particular goods or services. Ceiling price controls set a maximum price that may be charged but do not prohibit

transactions at lower prices below the ceiling price (for example, rent control). Floor price controls set a minimum price that may legally be charged but do not prohibit transactions at higher prices above the floor price (for example, minimum wage laws).

PRICE DISCOVERY = ЦЕНООБРАЗОВАНИЕ – Price Discovery:- the manner of making prices visible and readily available to the public. The process of determining the price of an asset by trading conducted in open outcry at an exchange. The process of determining the price level for a commodity based on supply and demand conditions. Price discovery may occur in a futures market or cash market. / Под Ценообразованием понимается процесс формирования цен на товары и системы цен в целом. Цены складываются стихийно под воздействием спроса и предложения в условиях конкуренции производства, под действием закона стоимости.

PRICE DRAWN BY LOT = ЦЕНА, РАСПИСАННАЯ ПО ЛОТ(У/АМ) – Price Drawn By Lot:- price at which more than one buyer wishes to purchase the same stocks or bonds from the same seller, or several sellers wish to sell to only one buyer. If not enough units are available to satisfy the entire demand, lots are drawn to decide who can effect the purchase or sale.

PRICE DURATION CURVE = КРИВАЯ ПРОДОЛЖИТЕЛЬНОСТИ ЦЕНЫ – Price Duration Curve (in electricity) is a graphic representation of the percent of hours that a system's price was at or below a given level during the year. / В сфере электроснабжения Кривая Продолжительности Цены представляет собой графическое оформление процента часов, в течение которых цена системы была на уровне или ниже данного уровня в течение года.

PRICE–EARNINGS–GROWTH RATIO = СООТНОШЕНИЕ ЦЕНА–ЗАРАБОТКИ–РОСТ – Price-Earnings-Growth (PEG) Ratio is a ratio compares a company's price-to-earnings multiple to its earnings growth rate. It is calculated by dividing the P/E ratio by the percentage growth rate in earnings. A company with a P/E of 50 and an earnings growth rate of 25% has a PEG of 2 (a lower number is better). This makes it easier to compare similar stocks trading at different levels.

PRICE EARNINGS RATIO = СООТНОШЕНИЕ ЦЕНА ЗАРАБОТКИ – Price Earnings Ratio (P/E Ratio):- a stock's market capitalization divided by it's after-tax earnings over a 12-month period, usually the trailing period but occasionally the current or forward period. The price to book ratio is one of the factors commonly used to distinguish between value and growth stocks. A company's share price divided by its earnings per share. Price/Earnings Ratio is the current Stock Exchange value of the company compared with the profits earned. Thus it is a measure of the stockholders' return. The value varies depending on the industry, degree of competition, risk and business efficiency but a typical figure is about 11. The value varies also according to the stockholders' expectations for the company. For example, a 'blue chip' company will have a lower ratio than a growth company (whose stockholders expect the value of their holdings to appreciate as the company grows). Relationship (ratio) of the share price to the net profit of a company. Calculated by dividing the market price of the shares by the earnings per share. Common indicator for the assessment of stocks. The Price Earnings (P/E) Ratio is figured by dividing the price of a stock by the company earnings per share. For example, a stock selling at USD50.00, with earnings at USD5.00 per share for the previous year, has a P/E Ratio of 10 (50 / 5 = 10). This value is also known as Multiple. Current market price of a share of stock divided by the issuing corporation's earnings per share for a 12-month period. Considered to be a benchmark of value for investors, the price earnings (P/E) ratio measures the price of a business entity's stock compared with its profits and indicates how other investors regard the stock. A popular way to compare stocks selling at various price levels. The Price Earnings Ratio is the price of a share of stock divided by earnings per share for a twelve-month period. For example, a stock selling for USD50.00 a share that earned USD5.00 a share is said to be selling at a price-earnings ratio of 10. The ratio of the price of a stock to the earnings per share. The total profit of a company divided by the number of shares outstanding. In equity research, the Price/Earnings Ratio is calculated from the current market share price divided by the (estimated) profit per share. The P/E ratio is a variable for assessing the past and future earnings power of a stock corporation and is used to evaluate the relative trading level of a share. The calculated value first becomes relative by comparing it with the figure from other companies in the same sector and/or the figures from previous years. Latest closing price divided by the earnings per share based on the last twelve months of earnings. Companies with negative earnings receive an 'NE'. Price/Earnings (P/E):- this ratio compares the current share price to the trailing 12-months' earnings and is a useful way to compare various companies and industry sectors. For example, a company earning CAD0.50 per share (last year) which is trading at CAD10.00 per share has a P/E of 20. If you buy a share today, and the performance stays the same, you can expect to earn CAD0.50 on each share you own. High P/E's are common in high tech because of the rapid growth anticipated in future earnings. Technology company P/E's are generally in the 30+ range. Note that tech companies rarely pay dividends, i.e. pay a portion of the profits to shareholders. They usually reinvest the cash to make the company more valuable – meaning that the share price will go up. The shareholder still owns the profit (or loss), but doesn't get it in her hands. If there is a loss, shareholders share that loss, too (in terms of value), but they do not, of course, have to personally make up that loss and they are not liable for it. If there are stock options or warrants outstanding, then there will be more shares among which earnings have to be divided. The term diluted EPS is used to include such additional shares. Price Earnings Ratio is the ratio of a share's price to its net earnings. The earnings per share used can be historic or prospective. Shows the number of times the price covers the earnings per share over a twelve month period. Investors commonly use this ratio to measure the attractiveness of particular shares and to compare shares in one company with those in another. / Соотношение Цена Заработки является наиболее известным и популярным коэффициентом для определения недооценённых акций. Под Ценой в данном случае подразумевается текущая рыночная стоимость акции, а под Заработками – заработок на одну такую акцию за двенадцати-месячный период. Фактически данное соотношение оценивает компанию с точки зрения результата её работы – размера прибыли. Его значение можно было бы интерпретировать следующим образом:- сколько лет понадобилось бы покупателю 100% акций данной компании, чтобы, распределяя всю прибыль в виде дивидендов, окупить свои затраты. Некая зависимость между соотношением цена заработки и доходностью акций действительно существует. Однако, несмотря на огромную популярность, его использование для оценки возможной стоимости акций Российских компаний может привести к существенным ошибкам в принятии решения о покупке акций. В чём тут дело? Данное соотношение имеет весьма слабую связь с самыми важными фундаментальными показателями деятельности компании. Нередко в поисках недооценённых акций в расчёт закладывается среднее по соответствующей отрасли соотношение цена заработки. Это не всегда правильно, поскольку показатели прибыли компаний могут сильно отличаться друг от друга в течение определённого периода времени, а некоторые компании и вовсе то ли по объективным, то ли из корыстных побуждений вместо прибыли показывают убытки. Стало быть соотношение цена заработки теряет смысл для последних, так как они будут исключены из анализа общей ситуации в отрасли. Это, в свою очередь, приведёт к смещению усреднённого значения данного соотношения в сторону повышения и тем самым даст ошибку при выявлении недооценённых акций.

PRICE ENVELOPE BAND = ОГИБАЮЩАЯ ЦЕНОВАЯ ПОЛОСА – Price Envelopes (or Percentage Bands) are plotted at a set percentage above and below a moving average. They are used to indicate overbought and oversold levels and can be traded on their own or in conjunction with a momentum indicator. An envelope is generally two moving averages, one adjusted to be above price, the other adjusted to be below. Typically, an envelope defines the limits of a security's normal trading range. In use, traders tend to trade

reversals using the bands, e.g., if price penetrates the upper band they go short, if it penetrates the lower band they go long. The definition of the band depends to a large extent on volatility, which is why Bollinger Bands® are so useful – they self-modify as volatility expands and contracts. Envelopes can employ simple moving averages, exponential moving averages, or other more complicated averaging strategies. Day traders make extensive use of envelopes, and in fact you could argue that the SureFireThing Camarilla Equation uses 'reversion to mean' theory to generate a number of pseudo-envelopes which sit around a nominal center point providing incredibly useful day trading signals (although they also provide breakout points, not just reversals). They tend to work best on liquid stocks, as they track the market's expectations, and the more liquid a security, the closer it approaches ideal behaviour. An envelope is comprised of two moving averages:- one moving average is shifted upward and the second moving average is shifted downward. A trading band composed of two moving averages, one of which is shifting upwards and the other shifting downwards. These trading bands are used by technical analysts to define a stock's upper and lower boundaries. Signals to sell occur when the stock price reaches the upper band, and buy signals are generated when the price reaches the lower band. The reasoning behind the sell and buy signals is that stock prices tend to bounce off the bands. Even though buyers and sellers will temporarily pressure a stock's price to its extremes, it should re-stabilize to more realistic levels found within the envelope. / В техническом анализе биржевых рынков, . Пограничные Полосы Болындьжёра® (Bollinger Bands®) . , например, с индикатором момента. Огибающая ценовая полоса может быть получена из скользящей средней величины. Верхняя линия огибающей ценовой полосы определяется как скользящая средняя величина плюс определённый процент от скользящей средней величины. Аналогичным образом, но только с вычетом определённого процента определяется нижняя линия огибающей ценовой полосы. Выбирая соответствующее процентное отклонение для данной скользящей средней величины, можно так определить огибающую ценовую полосу, что она будет охватывать подавляющую часть ценовой активности, причём верхняя граница будет примерно совпадать с относительными максимумами, а нижняя – с относительными минимумами. Таким образом, этот показатель является достаточно хорошим индикатором возможного приближения к точке разворота тенденции, но тем не менее цены могут долго оставаться рядом с одной из границ огибающей ценовой полосы.

PRICE FIXING = ФИКСИРОВАНИЕ ЦЕНЫ – Price Fixing is the fixing of market prices for all securities listed on the stock exchange. Exchange prices in floor trading on the Frankfurt Stock Exchange are determined by the official brokers. The process is governed by the Exchange Rules. The trade is concluded at the price at which most orders (purchases and sales) can be executed (principle of maximum possible execution). The market price of securities can be quoted once during a trading day on the stock exchange (standard quotation) or more than once a day on a continuous basis (variable quotation).

PRICE GAP = РАЗРЫВ В ЦЕНЕ – Price Gap is a chart pattern of the price movement of a commodity when the low price of one bar on a chart is higher than the high of the preceding bar (or inversely, the high is lower than the low of the preceding bar); depicting a price or price range where no trades take place. The price patterns are used by technical analysts to try to recognize changes in a price trend.

PRICE INDEX = ИНДЕКС ПО ЦЕНАМ – In contrast to a performance index, Price Index is not adjusted for dividends and capital increases or decreases or interest payments. As a result, the price index reflects only the development of the prices of a specific portolio of shares or bonds. Examples of such calculated price indexes are the Dow Jones and Nikkei. The Price Index or the Naked Index is the 'classic' CAC 40® price index calculated continuously every 15 seconds. Price Index is a measure of relative price changes, consisting of a series of numbers arranged so that a comparison between the values for any two periods or places will show the average change in prices between periods or the average difference in prices between places. Price indexes were first developed to measure changes in the cost of living in order to determine the wage increases necessary to maintain a constant standard of living. They continue to be used extensively to estimate changes in prices over time and are also used to measure differences in costs among different areas or countries. See also Consumer Price Index, and Wholesale Price Index. / индексы от Дау Дьжонз и Никкэй. Индекс По Ценам или Оголённый Индекс это, например, 'классический' Французский индекс по стоимости акций Сэ.А.Сэ. 40® или КАК 40® (CAC 40®), рассчитываемый непрерывно каждые 15 секунд.

PRICE–LATER (DELAYED PRICE) CONTRACT = КОНТРАКТ С (ОТЛОЖЕННОЙ ЦЕНОЙ) ЦЕНОЙ, ОПРЕДЕЛЯЕМОЙ ПОЗЖЕ – In the United States, a Price-Later (Delayed Price) Contract is an agreement in which grain is delivered and legal title passes to the elevator but price is established later at the discretion of the producer. The price to the producer on any given day is the elevator cash price less a service charge. See also Basis Contract; Delayed Payment Contract; Elevator Cash Contract; Forward Contract; Hedge-To-Arrive Contract; Minimum Price Contract; and Offer Contract.

PRICE LEVEL = ЦЕНОВОЙ УРОВЕНЬ (или УРОВЕНЬ ЦЕН) – Price Level is the average level of the prices of products and services purchased by consumers. / Ценовой Уровень или Уровень Цен это средний уровень цен на товары и услуги, приобретаемые потребителями.

PRICE LIMIT ORDER = РАСПОРЯЖЕНИЕ С ОГРАНИЧЕНИЕМ ЦЕНЫ – Price Limit Order is a customer order that specifies the price at which a trade can be executed. / Распоряжение заказчика, которое определяет цену, по которой сделка может быть исполнена.

PRICE LIMITS = ЦЕНОВЫЕ ПРЕДЕЛЫ (или ПРЕДЕЛЫ ЦЕНЫ, или ЦЕНОВЫЕ ЛИМИТЫ, или ЛИМИТЫ ЦЕНЫ) – The New York Stock Exchange's Price Limits are calculated each calendar quarter, based upon the average settlement price of the nearest primary futures contract, during the month prior to beginning of the quarter (denoted as Average Price). The only other commodities traded on the New York Board of Trade with price limits are Cotton, Orange Juice and Potatoes. These price limits are described on the contract specifications. The maximum advance or decline, from the previous day's settlement price, permitted for a futures contract in one trading session by the rules of the exchange. Also known as Maximum Price Fluctuation. Price Limits (at CME GROUP) represent the maximum price range permitted for a futures contract in each trading session. Price limits vary from product to product, as does what happens when a price limit is hit. Some markets may temporarily halt until price limits can be expanded or trading may be stopped for the day based on each exchange's rulebook (grain futures have daily hard limits, for example). Equity Product Price Limits And Circuit reakers:- Our US Equity futures markets have a range of automated safeguards in place – some of which are coordinated with cash equity markets. CME Group US Equity futures have 5% price limits overnight and remain open for trading at that limit. If markets reach 5% up or down during the overnight session, they remain open but can only trade up to those price limits. Daytime trading employs market-wide circuit breakers, a kind of price limit that halts trading for a period of time to help the market reset. CME Group US Equity futures markets are coordinated with stock circuit breakers at market 7%, 13%, and 20%. The 7% and 13% circuit breakers are each followed by 15-minute trading halts; if the 20% level is reached, the market closes for the trading day. FAQ:-This FAQ applies to all US-based Equity Index futures and options except E-mini S&P 500, Micro E-mini S&P 500 and S&P 500 futures and options. What Are Price Limits And How Do They Function? Price limits are a series of price fluctuation limits based on a reference price. In the case of futures on US equity indices, the reference price is based on previous trading day's volume-weighted Average Price ('VWAP') of the lead month contract determined between 2:59:30 p.m. – 3:00 p.m. Central Time (CT) for the lead month futures

contract of each index. Note:- Equity price limits are downside limits during US trading hours, with hard upside and downside limits of 5% during non-US trading hours. What Are The Provisions During US Trading Hours? From 8:30 a.m. to 2:25 p.m. CT, there are successive Price Limits corresponding to 7% (for Level 1), 13% (for Level 2) and 20% (for Level 3) declines below the previous trading day's reference Price. From 2:25 p.m. until the 3:00 p.m. CT close of the cash equity market, only the 20% (for Level 3) price limit will be applicable. From 3:00 p.m. CT until the end of the current Trading Day at 4:00 p.m., there is a hard upside and downside limit of 5% based on the 3:00 p.m. reference price. The downside price limit, however, is either 5% below the 3:00 p.m. reference price or the 20% price limit that applied before 3:00 p.m., whichever is closer to the 3 p.m. price. What Are The Provisions During Non-US Trading Hours? 5:00 p.m. to 8:30 a.m. CT:- There is a hard upside and downside limit of 5% from 5:00 p.m. to 8:30 a.m. The midpoint of the 5% limit is based on the 3:00 p.m. futures fixing price. The width of the 5% limit is based on 5% of the underlying index value at 3:00 p.m. If the Primary futures contract is limit bid or limit offered at 8:23 a.m. and remains limit bid or limit offered at 8:25 a.m., then trading will be halted until 8:30 a.m. During the halt, the Exchange will provide an indicative opening with price limits expanded to 7% down. What Happens When The Primary Futures Contract Declines By 7%, 13%, Or 20%? (i) 7% Decline:- If the primary futures contract limit is offered at the 7% down limit before 2:25 p.m. CT, a 2-minute monitoring period will commence for the primary futures contract and all associated futures and options. During this monitoring period, trading will continue at or above the 7% down limit. If a limit condition exists at the end of the 2-minute monitoring period, a 2-minute trading halt occurs for the primary futures contract and all associated futures and options with price limits expanding to Level 2 (13%). If a limit condition does not exist, trading will continue with price limits expanding to Level 2 (13%). (ii) 13% Decline:- If the primary futures contract is limit offered at the 13% down limit, a 2-minute monitoring period will commence for the primary futures contract and all associated futures and options. During this monitoring period, trading will continue at or above the 13% down limit. If a limit condition exists at the end of the 2-minute monitoring period, a 2-minute trading halt occurs for the primary futures contract and all associated futures and options with price limits expanding to Level 3 (20%). If a limit condition does not exist, trading will continue with price limits expanding to Level 3 (20%). (iii) 20% Decline:- If the primary futures contract is limit offered at the 20% down limit before 2:25 p.m. CT, trading will continue at or above the 20% down limit for the remainder of the trading day for the primary futures contract and all associated futures contracts. Options, however, will enter into a pre-open state, and trading will be halted so long as a limit condition exists. Once a limit condition does not exist, options will resume trading. Also note that from 2:25 p.m. to – 3:00 p.m. CT, only the 20% market-wide circuit breaker level will be applicable. What Happens When The Underlying S&P 500 Index Hits A Level 1 (7%), Level 2 (13%), Or Level 3 (20%) Circuit Breaker Level? When NYSE 80B is triggered due to a 7% or 13% decline in the underlying S&P 500 Index, a coordinated market trading halt for the cash equity market and for all US-based equity index futures and options products. Trading will resume for all US-based equity index futures and options products when trading in the cash equity market resumes, with price limits expanding to the next level. A 20% decline (Level 3 circuit breaker) in the S&P 500 Index will terminate trading for the remainder of the trading day in both the cash equity market and for all US-based equity index futures and options. Trading in all US-based equity index futures and options will resume in coordination with the cash equity market. Note:- overnight trading will resume at the start of the next trading day, at 5:00 p.m. CT the evening before the next business day. How Is The Futures Reference Price Determined When Trading In The Cash Equity Market Is Terminated Early? The Reference Price will be the VWAP for the primary E-mini S&P 500 futures contract during the last 30 seconds of trading in the cash equity market. During The 2-Minute Monitoring Period, Can Orders Be Placed Below The Applicable Price Limit? An offer entered with a price below the prevailing down limit will be rejected. For instance, if the prevailing Level 1 (7%) is the prevailing circuit breaker, then orders below the 7% down limit will not be accepted. The order will be accepted, however, when the price limit is expanded to Level 2 (13%), provided that it is offering at higher than the 13% limit. What Is The Relationship Between Lead Month And Deferred Contracts Under The Circuit Breaker Methodology? Upon a circuit breaker event, all deferred futures contracts will follow the behavior of the lead month contract. Do Options Halt Trading If The Futures Are Either Limit Bid Or Limit Offered At The 5% ETH Daily Limit? If the primary futures contract is either limit bid or limit offered at the 5% ETH daily limit, then the associated options will be transitioned to a 'pre-open' market state. During the pre-open market state, trade matching does not occur but orders can be entered, modified or cancelled. The primary futures contract price level will be reviewed every ten minutes by the GCC manager (The CME Global Command Center provides customer support 24 hours a day, beginning at 14:00 Sunday through 16:30 Friday, Central Time:- United States:- +1-800-438 8616, Europe:- +44-20-76234747, and Asia:- +65-65325010; for general, non-production issues, email the GCC at gcc@cmegroup.com.). If a limit bid of limit offer condition does not exist at the time of review, then the associated options will be re-opened for trading. The GCC reserves the right to keep the options in a pre-open market state if a clear movement off the limit does not exist. All reviews are done on a best case basis. Note:- All times listed are in Central Time (CT). Crude Oil Product Circuit Breakers:- Our Energy markets have dynamic circuit breakers, which means the range in which prices can move is reset continuously on a rolling 60-minute lookback window. If markets move ±15% in that time, a 2-minute halt is initiated. A price limit is the maximum price range permitted for a futures contract in each trading session. When markets hit the price limit, different actions occur depending on the product being traded. Markets may temporarily halt until price limits can be expanded, remain in a limit condition or stop trading for the day, based on regulatory rules. Check Daily Price Limits during the trading day to make sure your trades are never left hanging during a price limit halt. Find daily price limits for CME Group Agricultural, Energy, Equity Index, Interest Rates, and Metals products. See also Circuit Breaker, Price Banding, and Velocity Logic. Price Limits are usually set by exchanges for daily price moves. There are no price limits on the expiring futures contract on or after its first notice day. See also Variable Limit. Early History Of Price Limits:- the earliest occurrence of a price limit in futures trading was at the Dojima exchange in Japan during the early XVIII century. Settlement in the Koku 'Small Futures' contract for Rice was determined by the average of the previous three days' forward-closing prices. If this price deviated by more than a fixed amount from the cash price for Rice, all contracts were either reversed out or delivered. This effectively discontinued trading in the contract by eliminating all futures positions. Also, the futures price was tied to the cash market, avoiding the potential criticism that futures trading caused problems in cash markets. Imposition of the rule came during a time when Rice markets were described as 'deteriorating'. Deteriorating markets are often characterized by price volatility. The first instance of a price limit rule in the United States came during the First World War. On February 01, 1917, Germany announced that its submarines would sink all ships found in the major Atlantic shipping lanes. Cotton prices for May delivery on the New York Cotton Exchange closed down by a record of over five cents a pound. By the following Monday, however, the market had recovered to within one and one-half cents of the earlier price. In subsequent weeks, futures prices continued to be extremely volatile. The threat of attacks on shipping continued to run down prices as traders feared lost access to the European markets. Cotton prices rose as markets responded to news of potentially large purchases of cotton for military uniforms. Congress responded by supplying flat-rate three percent war loss insurance – a substantial discount from the then-current Lloyd's of London quote of ten percent. Cotton prices reached an all-time high following the introduction of this subsidized insurance. The futures exchanges trading cotton responded to this volatility in two ways. On June 20, 1917, the British Board of Trade closed down cotton futures trading and the New York Cotton Exchange increased margin requirements. Separately, the US Government requested a price limit on the cotton contract. On August 22, 1917, a three-cent price limit was imposed. This limit remained in effect for the duration of the war. Interestingly, there is no record of a limit day during this period. Also during the First World War, the Food Administration froze prices on wheat to prevent profiteering in that commodity. This action closed down trading in wheat futures at the Chicago Board of Trade. However, other grain prices were not frozen and their

corresponding futures contracts traded freely. Since these grains are partially substitutable for Wheat, government policy regarding Wheat induced volatility in other grains. Futures prices for these commodities reflected this volatility, attracting the attention of the Food Administration. As a result of this scrutiny, the Board of Trade instituted a two-cent per day price limit on the oat contract and the New York Mercantile Exchange introduced a three-cent per day price limit on soy bean oil contracts. These price limits were removed once trading in wheat futures resumed after the war. Price limits were formalized in 1925 at the Chicago Board of Trade. The 1925 Annual Report reported a modification to all contracts allowing the Board of Directors to set price-change limits of five percent of the preceding day's average closing price, following a ten-hour notice period. (For comparison, a five percent limit on Wheat in today's Wheat contract comes to 18.9 cents per bushel. The present limit is twenty cents per bushel.) Determination of an emergency was left to the Board. Nevertheless, price limits retained their temporary character, to be used only in emergency situations. Direct federal intervention in agricultural markets during peace time began in the early 1930s under the authority of the Agricultural Adjustment Act. The Federal Farm Board, attempting to maintain prices in spite of large supplies of wheat, opened long futures contracts in May 1931 and 1932 wheat. Uncertainty about government policy (including complaints that officials were manipulating prices in their own interests) increased the frequency of emergency use of price limits. (A recent proposal by Robert Heller makes similar use of futures markets. He argues the current policy of supplying liquidity during a market break disrupts monetary policy. Instead he suggests the Fed supply liquidity directly by taking long futures positions. His use of futures contracts is reasoned from the same basis as the Federal Farm Board policy of six decades ago – both approaches avoid the problem of the federal government holding and disposing of assets. The experience of the 1930s suggests that careful consideration should be given to the problem of contract expiration.) (The Heller proposal is in Heller, R., 'Have the Fed Support Stock Market, Too', Wall Street Journal, October 27, 1989, p. A14. An analysis of the 1930s experience is in Moser, James T., 'Public Policy Intervention Through Futures Market Operations', forthcoming in the Journal of Futures Markets.) Passage of the National Industrial Recovery Act in July 1933 opened the way for trade associations to enforce price stabilization agreements, with the federal government acting both as architect and enforcing partner. Application for these partnerships was made through the National Recovery Administration (NRA) with the agreements chartered through Executive Orders by President Franklin Roosevelt. The agreements came in the form of codes for fair competition. Grain price volatility continued to be high after the Farm Board ceased its price manipulations. The drought of the period and uncertainty about government policy were contributing factors. This high volatility led to Department of Agriculture pressure in July 1933 for a fair-trade agreement among the grain exchanges. Pressure on the exchanges to comply came in the form of a proposal by the Agricultural Adjustment Administration and the Grain Futures Administration that would have empowered the Secretary of Agriculture to modify and enforce trading rules at the futures exchanges. The proposed authority included limits on individual trading, limits on daily price changes, and margin setting. The futures exchanges complied with the request and Executive Order No. 6648, entitled 'Code of Fair Competition for Grain Exchanges and Members Thereof', was signed by President Roosevelt on March 20, 1934. The agreement, implemented the next day, included price limits which could not be exceeded, but did permit exchanges to set limits below the prescribed maximums. The Supreme Court ruling in the Schechter Poultry Corporation case on May 27, 1935, declared the NRA codes unconstitutional. Following the Schechter decision, Congressional hearings began on the Commodity Exchange Act to broaden the scope of federal regulatory powers over the futures exchanges. These powers had previously been lodged within the Grain Futures Administration. Congressional discussion indicated the proposed Act would institutionalize the defunct NRA codes. To thwart increased regulation, the Chicago Board of Trade incorporated permanent price limits on all its contracts. (At the same time, the Board of Trade also eliminated trading of options on futures, then called 'Priviledges'. These were also targeted in Congressional hearings.) The action began the use of price limits as a standard contract feature. The Commodity Exchange Act later passed specifying only regulatory review, rather than expanded powers, over contract details – including price limits. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Лимиты Цен Нью Йоркской Фондовой Биржи рассчитываются каждый календарный квартал. Они основываются на усреднённой расчётной цене ближайшего главенствующего фьючерсного контракта в течение месяца, предшествующего началу такого квартала (обозначается как Усреднённая Цена (Average Price)). Лишь прочие роды сырья, торговавшиеся в Нью Йоркской Палате Торговли (Нью Йоркском Табло Торговли, если быть более точными) с лимитами цен, являлись хлопок, апельсиновый сок (точнее – замороженный концентрат) и картофель. Эти лимиты цен были прописаны в контрактных спецификациях по этим родам сырья. Максимальное повышение или понижение от расчётной цены предшествующих суток, разрешённое в соответствии с правилами биржи для фьючерсного контракта в течение одной торговой сессии. Смотрите также Максимальное Колебание Цены (Maximum Price Fluctuation).

PRICE MANIPULATION = ЦЕНОВАЯ МАНИПУЛЯЦИЯ (или МАНИПУЛЯЦИЯ С ЦЕНАМИ) – Price Manipulation is any planned operation, transaction or practice calculated to cause or maintain an artificial price. / Какая-либо спланированная операция, сделка или практика, рассчитанная на создание или поддержание искусственной цены.

PRICE MARKDOWN = СКИДКА С ЦЕНЫ (или ЦЕНОВАЯ СКИДКА) – Price Markdown is a price addendum in official as well as pre and post-exchange trading that indicates the exchange price has moved down at least 5%, for stocks, convertible bonds and warrants. A doubled price markdown (– –) signalizes a decline of at least 10%. Opposite:- Price Markup.

PRICE MARKUP = НАКИДКА К ЦЕНЕ (или ЦЕНОВАЯ НАКИДКА) – Price Markup is a price addendum of the Frankfurt Stock Exchange in preliminary, exchange or after-hours trading that indicates a significant upwards change in the price of a security. Depending on the extent of the price increase, a distinction is made between a simple (+), double (++) or triple (+++) price markup. Opposite:- Price Markdown.

PRICE MOMENTUM OSCILLATOR = ОСЦИЛЛЯТОР МОМЕНТА ЦЕНЫ – Decision Point's proprietary Price Momentum Oscillator (PMO) plays a central role among the analysis tools on the Decision Point web site. It is used as:- (i) a device by which we can perform relative strength ranking of various stocks, mutual funds, and indexes; and (ii) a momentum indicator for analyzing price movement, internal strength, and making buy and sell decisions. This dual function is unique and extremely useful because, while viewing it in its role as a traditional analysis tool to analyze a single price index, we also get a sense of the probable performance of the index within the context of relative strength rotation. To help you fully understand and utilize the PMO we have prepared a series of articles explaining how to use and interpret it. In order to perform relative strength ranking, we need an indicator that is 'normalized' in a way that permits such comparisons, so we have developed our proprietary Price Momentum Oscillator (PMO). The PMO is based on a Rate of Change (ROC) calculation that is exponentially smoothed. To calculate an ROC we divide today's closing price by a prior closing price. For example, a one-day ROC would be calculated by dividing today's close by yesterday's close. Since this is an internal ratio calculation (versus external, which uses another price index for calculating the ratio), it returns a result that can be compared to an identically calculated ROC result for any other security or index. Below we have charts of the Dow and Diamonds, but this time with Decision Point's PMO. Note that, not only are the two PMOs shaped the same, but the absolute value of the two PMOs are also virtually the same – the small difference of 0.02 shows that the Dow was actually stronger by a minuscule amount. The PMO oscillates in relation to a zero line. Normally, the PMO direction tells us if strength is increasing or decreasing, and the steepness of the trend angle demonstrates the power behind the move. We will discuss this more at a later time, as it is a key element when using the PMO

as a momentum indicator that can assist in trading decisions. As a final clarification, remember that the PMO is an expression of the internal strength of a specific security that can be used as a tool for relative strength comparisons, whereas the Price Relative is a direct expression of the relationship of one price index to another. Either indicator can be useful in its own right, but the PMO has more flexibility and utility, as we shall demonstrate in later discussions. The PMO generates a crossover BUY or SELL Signal when it crosses up or down through its 10-EMA. These signals tend to be short-term in duration, but they can last for several weeks. Do not take them at face value because they can whipsaw quite a bit. They should be used to alert you to possible trading opportunities not used as a mechanical trading model. Always check our daily stock charts to verify the price pattern and the configuration of the PMO. Signals are best when price appears extended, is near support or resistance, and the PMO is very overbought or oversold. These signals may also be used to manage positions based on our Price Momentum Model signals. The most reliable signals are generated when the PMO is near the extremes of its normal range, or when a direction change and crossover occurs following a strong, clean, straight PMO move. Quite a bit of 'noise' can be generated around the zero line and while the PMO is moving in a relatively flat pattern. A proprietary indicator created by Carl Swenlin and featured on his website, http://www.decisionpoint.com. This page has more information on the Price Momentum Oscillator (PMO). / В техническом анализе биржевых рынков, собственнический индикатор, который разработал Карл Свэнлин (Carl Swenlin). Он же представил его на своём вэбсайте, http://www.decisionpoint.com. На этой странице представлено гораздо больше информации об Осцилляторе Момента Цены (ОМЦ).

PRICE MOVEMENT LIMIT = ПРЕДЕЛ ДВИЖЕНИЯ ЦЕНЫ (или ЛИМИТ ДВИЖЕНИЯ ЦЕНЫ) – In Hungary, a Price Movement Limit is:- (1) Limits on the cash market:- limits with the aim of protecting investors, are meant to prevent unreasonable price movements on the market. In order to ensure this, the Exchange usually applies two limits. These are:- the order limit and the trading halt limit. Order limit: this is a limit for price movements, set as a percentage, preventing the entering of orders into the Order Book at a price higher or lower, in comparison with the security's closing price for the previous day. The Exchange applies a 15% order limit for all equities listed in the category 'A' and/or included in the basket of the BUX index, and also for all debt-type securities. A 20% order limit is applicable to all other equity products. Trading halt limit:- if the change in the transaction price exceeds 10% in comparison with the previous day's closing price, this means that the trading halt limit was reached and this automatically implies the temporary stop of trading that security for at least two (2), but not more than fifteen (15) minutes. In respect of securities traded on the equity market, the Exchange applies a halt only once within one trading day for each product. On the certificates market the issuer can request the application of order limits by product. In the case of those certificates where order limits are applied, Budapest Stock Exchange (BSE) can, for the request of the certificate's issuer, amend these limits during trading hours by inserting a five-minute trading halt. Technically the actual base price is moved to the upper or lower order limit depending on the direction of the underlying product's price movement. The possibility to amend the base price ensures the contingency of the market making in volatile market conditions on the underlying market. (2) Limits in the derivatives and commodities sections:- on the futures market, two limits are applied, one of them for the maximum price movements during the day and one for the clearing spread. Limits applicable to futures contracts are included in the Product List. The limit for the daily maximum price movement, similar to the cash market order limit, does not allow the entering of orders into the Order Book at prices higher or lower. If the price of a buy order exceeds the sum of the previous day's settlement price and of the maximum daily price movement, or the price of a sell order is lower than the difference between the previous day's settlement price and the maximum daily price movement, then the order shall be automatically rejected by the system. If a transaction is made on the futures market at a price higher than the sum of the previous day's settlement price and of the clearing spread, or lower than their difference, then trading shall be halted in respect of the given product for at least two (2), but not more than five (5) minutes. As data transfer between KELER (the Central Depository and Clearing House) and the Exchange during trading is effectuated on a real-time basis, and KELER continuously monitors the positions of the brokerage firms, during the trading halt there is no need to perform an intraday clearing procedure. On the options market, the Exchange applies no clearing spread. See also Limit Down, and Limit Up. / Смотрите также Лимит На Понижение (Limit Down) и Лимит На Повышение (Limit Up).

PRICE NURSING = ПОДДЕРЖАНИЕ ЦЕН – Price Nursing:- prevention of accidental large-scale fluctuations in the prices of shares or bonds by selling such securities in the event of excessive price rises and purchasing them when prices come under extremely heavy pressure. See also Support Purchase. / Предотвращение случайных крупномасштабных колебаний цен на акции или облигации посредством продажи таких ценных бумаг в случае чрезмерного роста цен и посредством их приобретения в случае падения цен вследствие экстремального давления на них.

PRICE OBJECTIVE = ЦЕНОВОЙ ОРИЕНТИР – Price Objective:- very simple calculations based on standard Point & Figure chart patterns. They are of questionable value but some technical analysts include them on their charts because they have been used for such a long time. StockCharts.com makes no claim about their accuracy or usefulness whatsoever.

PRICE OSCILLATOR = ЦЕНОВОЙ ОСЦИЛЛЯТОР (или ОСЦИЛЛЯТОР ЦЕНЫ) – Price Oscillator is an indicator based on the difference between two moving averages that is expressed as either a percentage or in absolute terms. / В техническом анализе биржевых рынков, осциллятор, базирующийся на разнице между двумя скользящими средними величинами и который выражается либо в процентах, либо в абсолютных значениях.

PRICE PATTERNS = ЦЕНОВЫЕ МОДЕЛИ (или ЦЕНОВЫЕ УЗОРЫ) – Price Patterns are the patterns that appear on price charts possessing predictive values. Patterns are divided into reversal and continuation pattern. Price Patterns are asset chart formation that occur with some regularity and are thought to resolve themselves in known manners or directions.

PRICE RELATIVE = ОТНОСИТЕЛЬНО ЦЕНЫ (или ЦЕНОВОЕ СРАВНЕНИЕ, или СРАВНЕНИЕ ЦЕН) – Price Relative:- a calculation that compares the performance of one security to another. It is often used to compare the performance of a particular stock to a market index, usually the S&P 500. / Калькуляция, которая сравнивает ситуацию с изменением цены одной ценной бумаги по отношению к другой. Это часто используется для сравнения ситуации с движением цены конкретной акции в отношении индекса по рынку, обычно 500 от Эс.Энд.Пи. (S&P 500).

PRICE RETURN = ЦЕНОВОЕ ПОСТУПЛЕНИЕ (или ЦЕНОВАЯ ОТДАЧА) – Price Return:- in index trading, each constituent in an index is weighted by its market-capitalization, as determined by multiplying its price by the number of shares outstanding after float adjustment. The price return of an index is a measure of the cap-weighted price movement of each constituent within the index.

PRICE RISK = ЦЕНОВОЙ РИСК (или РИСК ЦЕНЫ) – Price Risk results from changes in the value of marked-to-market financial instruments that occur when interest rates change. For example, trading portfolios, held-for-sale loan portfolios, and mortgage servicing assets contain price risk. When interest rates decrease, mortgage servicing asset values generally decrease. Since those assets are marked-to-market, any value loss must be reflected in current earnings.

PRICE/SALES RATIO = СООТНОШЕНИЕ ЦЕНА/ПРОДАЖИ – Price/Sales Ratio:- latest closing price of the stock divided by the last twelve months revenue/sales per share. / Самая последняя цена акции по закрытии, разделённая на соотношение выручка/продажи на акцию за последние двенадцать месяцев.

PRICE–SENSITIVE BID = ПРЕДЛОЖЕНИЕ НА ПОКУПКУ, ЧУВСТВИТЕЛЬНОЕ К ЦЕНЕ – Price-Sensitive Bid:- purchases of a defined MegaWatt (MW) level of energy only up to a specified locational marginal price (LMP). Above that LMP, the load bid is zero.

PRICE–SETTING MARKET = РЫНОК, УСТАНАВЛИВАЮЩИЙ ЦЕНЫ – In a perfect market, Price-Setting Market is the location at which supply and demand curves cross and prices are set. For example, when a refiner at Cushing, Oklahoma makes an identical profit or loss whether he runs a barrel of Brent or WTI, then Cushing is said to be the price-setting market for Brent.

PRICE SLIDE = XX – Price Slide establishes the price adjustment for differences between projected livestock base weight (after shrink) and actual sale weight (pay weight). Price slides are necessary because heavier weight cattle usually sell for a lower price per hundred weight than lighter weight cattle.

PRICE SMOOTHING = ЦЕНОВОЕ СГЛАЖИВАНИЕ (или СГЛАЖИВАНИЕ ЦЕНЫ) – Price Smoothing is special interventions in the capital market or stock exchange – mostly with the involvement of syndicate banks – to regulate and support the prices of the securities. The holders of the securities should be offered the possibility to buy and sell through the exchange at any time. Price smoothing increases a security's fungibility. It is carried out flexibly and not rigidly while taking the market situation into account.

PRICE SPREAD = ЦЕНОВАЯ КУРСОВАЯ РАЗНИЦА (или КУРСОВАЯ РАЗНИЦА В ЦЕНАХ) – Price Spread is a price difference between different products, months or geographical locations for physicals or futures, e.g., gasoline Rotterdam versus New York, July Brent contract versus June Brent contract. / Ценовая Курсовая Разница или Курсовая Разница В Ценах представляет собой ценовую разницу между различными продуктами, месяцами или географическими месторасположениями для реального сырья или в отношении фьючерсов, например, цена бензина в Роттердаме против цены на аналогичный товар в Нью Йорке или цена контракта на нефть марки Брэнт с поставкой в Июле против цены контракта на нефть марки Брэнт с поставкой в Июне.

PRICE STABILITY = ЦЕНОВАЯ СТАБИЛЬНОСТЬ (или СТАБИЛЬНОСТЬ ЦЕН) – The Treaty establishing the European Community has assigned the Eurosystem – which comprises the European Central Bank (ECB) and the national central banks (NCBs) of those countries that have adopted the Euro as their currency – the primary mandate of maintaining price stability. This mandate is considered to be the principal objective of the Eurosystem for good economic reasons. It reflects the lessons we have learnt from previous experience and is supported by economic theory and empirical research, which indicate that by maintaining price stability, monetary policy will make a significant contribution to general welfare, including high levels of economic activity and employment. Given the widespread recognition of the benefits of price stability, we consider it essential to explain, particularly to young people, the importance of price stability, how it can best be achieved, and how maintaining it supports the broader economic goals of the European Union. The benefits of price stability, as well as the costs associated with inflation or deflation, are closely associated with money and its functions. Price Stability supports higher living standards by reducing uncertainty about general price developments, there by improving the transparency of the price mechanism. It makes it easier for consumers and companies to recognize price changes which are not common to all goods (so-called 'Relative Price Changes'). Moreover, price stability contributes to general well-being by reducing inflation risk premia in interest rates, by rendering activities which aim at hedging against inflation risks unnecessary and by reducing the distortive effects of taxation systems and social security systems. Finally, price stability prevents the arbitrary distribution of wealth and income associated, for instance, with the erosion of the real value of nominal claims (savings in the form of bank deposits, government bonds, nominal wages) resulting from inflation. Large erosions of real wealth and income due to high inflation can be a source of social unrest and political instability. To sum up, by maintaining price stability, central banks help broader economic goals to be achieved, thus contributing to general political stability. See also Deflation, and Inflation. Price Stability is a primary objective of the Eurosystem. The Governing Council defined price stability as a year-on-year increase in consumer prices (measured by Harmonised Index of Consumer Prices (HICP)) for the Euro area of below 2%. In the pursuit of price stability the Governing Council aims to maintain the annual inflation rate at below but close to 2% over the medium term. Inflation And Deflation:- inflation and deflation are important economic phenomenona that have negative consequences for the economy. Basically, inflation is defined as a general, or broadly-based, increase in the prices of goods and ser vices over an extended period which consequently leads to a decline in the value of money and thus its purchasing power. Deflation is often defined as the opposite of inflation, namely as a situation in which the overall price level falls over an extended period. When there is no inflation or deflation, we can say that there is price stability if, on average, prices neither increase nor decrease but stay stable over time. If, for instance, EUR100 can buy the same basket of goods as it could, say, one and two years ago, then this can be called a situation of absolute price stability. Movements In Individual Prices And In The General Price Level:- it is important to make a distinction between movements in prices of any individual good or service and movements in the general price level. Frequent changes in individual prices are quite normal in market-based economies, even if there is price stability overall. The changes in supply and/or demand conditions of individual goods or services inevitably lead to changes in their price. For example, in recent years we have seen substantial declines in the prices of computers and mobile phones, mainly resulting from rapid technological progress. However, from the beginning of 1999 to mid-2006, oil and other energy prices increased, partly as a result of concerns regarding the future supply of energy and partly as a result of increased demand for energy, in particular from fast-growing economies. On the whole, inflation in most industrialised countries remained low and stable – stability in the general price level can go hand-in-hand with substantial changes in individual prices as long as falling and rising prices offset each other so that the overall price level remains unchanged. By maintaining Price Stability, central banks contribute to broader economic goals. All of these arguments suggest that a central bank that maintains price stability contributes substantially to the achievement of broader economic goals, such as higher standards of living, high and more stable levels of economic activity and employment. This conclusion is supported by economic evidence which, for a wide variety of countries, methodologies and periods, demonstrates that in the long run, economies with lower inflation appear on average to grow more rapidly in real terms. Primary Objective:- the primary objective of the Eurosystem is to maintain Price Stability in the Euro area, thus protecting the purchasing power of the Euro. As discussed earlier, ensuring stable prices is the most important contribution that monetary policy can make in order to achieve a favourable economic environment and a high level of employment. Both inflation and deflation can be very costly to society economically and socially speaking. Without prejudice to its primary objective of price stability, the Eurosystem also supports the general economic policies in the European Community. Furthermore, the Eurosystem acts in accordance with the principles of an open market economy, as stipulated by the Treaty establishing the European Community. The ECB has defined price stability in quantitative terms:- while the Treaty clearly establishes the maintenance of price stability as the primary objective of the ECB, it does not give a precise definition. In order to specify this objective more precisely, the Governing Council of the ECB announced the following quantitative definition in 1998:- 'Price Stability shall be defined as a year-on-year increase in the Harmonised Index of Consumer Prices (HICP) for the Euro area of below 2%. Price stability is to be maintained over the medium term'. In 2003, the ECB's Governing Council further clarified that, within the definition, it aims to maintain inflation rates below but 'close to 2% over the medium term'. The definition both anchors inflation expectations and adds to the ECB's transparency and accountability:- the Governing Council decided to publicly announce a quantitative definition of price stability for a number of reasons. First, by clarifying how the Governing Council interprets the goal that it has been assigned by the Treaty, the definition helps to make the monetary policy framework easier to understand, i.e. it makes

monetary policy more transparent. Second, the definition of price stability provides a clear and measurable yardstick against which the public can hold the ECB accountable. In case of deviations of price developments from the definition of price stability, the ECB would be required to provide an explanation for such deviations and to explain how it intends to re-establish price stability within an acceptable period of time. Finally, the definition gives guidance to the public, allowing it to form its own expectations regarding future price developments. Price Stability is the maintenance of price stability is the primary objective of the Eurosystem. The Governing Council defines price stability as a year-on-year increase of below 2% in the Harmonised Index of Consumer Prices (HICP) for the Euro area. The Governing Council has also made it clear that, in the pursuit of price stability, it aims to maintain inflation rates below, but close to, 2% over the medium term. In October 1998 the Governing Council of the ECB defined Price Stability as 'a year-on-year increase in the Harmonised Index of Consumer Prices (HICP) for the Euro area of below 2%' and added that price stability 'was to be maintained over the medium term'. The Governing Council confirmed this definition in May 2003 following a thorough evaluation of the ECB's monetary policy strategy. On that occasion, the Governing Council clarified that 'in the pursuit of price stability, it aims to maintain inflation rates below but close to 2% over the medium term'. The reference to 'the HICP for the Euro area' indicates two things:- first that the goal of the ECB's monetary policy is price stability in the Euro area as a whole, and second that it reflects the public's usual focus on consumer prices. The HICP is the index that most closely approximates the changes over time in the price of a representative basket of consumer goods and services purchased by Euro area households. The phrase 'below 2%' sets a clear upper boundary for the rate of measured HICP inflation that is consistent with price stability over the medium term. At the same time, aiming for low positive inflation rates 'close to 2%' provides 'an adequate margin to avoid the risks of deflation'. In addition, it takes into account the possible presence of a measurement bias in the HICP and the implications of inflation differentials of a structural nature within the Euro area. Finally, the term 'Over The Medium Term' reflects the consensus that monetary policy cannot fine-tune developments in prices or inflation over short horizons of a few weeks or months. Changes in monetary policy only affect prices with a time lag, and the magnitude of the eventual impact is uncertain. This implies that monetary policy cannot offset all unanticipated shocks to the price level in a short period of time. Some short-term volatility in inflation is therefore inevitable.

PRICE SUPPORT = ЦЕНОВАЯ ПОДДЕРЖКА – (1) Price Support:- in the exchange market, actions that limit changes in the price of an underlying instrument or asset. / Под Ценовой Поддержкой на биржевых рынках понимаются действия, ограничивающие изменение цены соответствующего инструмента или актива.

(2) In the United States, a Government Price Support programs for Cotton and other farm commodities are administered by USDA's Agricultural Stabilization and Conservation Service (or USDA's Farm Service Agency). Various methods of supporting producers' price have been used over the years. Support has commonly been achieved through nonrecourse loans, purchases, and payments at announced levels. Recent legislation is designed to make export commodities more competitive in the world markets through market price support at or near world price levels. At the same time, producers' incomes are enhanced through deficiency payments. Export competitiveness is further enhanced by issuing marketing certificates to first handlers if world prices fall below producers' loan repayment levels. / выплата (repayment). Служба Стабилизации и Сохранения Сельского Хозяйства (Agricultural Stabilization and Conservation Service).

PRICE TO BOOK RATIO = СООТНОШЕНИЕ ЦЕНЫ С БАЛАНСОВОЙ СТОИМОСТЬЮ – Price To Book Ratio is a stock's capitalization divided by its book value. The price to book ratio is one of the factors commonly used to distinguish between value and growth stocks.

PRICE TO CASH FLOW RATIO = СООТНОШЕНИЕ ЦЕНЫ С ДЕНЕЖНЫМ ПОТОКОМ – The Price To Cash Flow (PCF) Ratio is derived by dividing the cash flow per share by the share price. As a variable that focuses on liquidity, the price/cash flow ratio helps to evaluate the development of a company's future earnings potential and compare different companies with one another. The increased significance of PCF can be traced back to, among other things, the fact that it is much less susceptible to accounting policy manipulations than the net income figure reported in the annual financial statements. This should considerably improve the quality of information relating to the predictability in the development of company revenues.

PRICE–TO–EARNINGS RATIO = СООТНОШЕНИЕ ЦЕНЫ С ЗАРАБОТКАМИ – Price-To-Earnings Ratio (PE Ratio) or the price of a share of stock divided by earnings per share.

PRICE TRANSPARENCY = ПРОЗРАЧНОСТЬ ЦЕНЫ (или ПРОЗРАЧНОЕ ЦЕНООБРАЗОВАНИЕ) – Price Transparency:- when both buyer and seller know pricing. Net markets can eliminate arbitrage situations when only a broker knows the price. Net markets can result in sellers making more money and buyers paying a lower price, since broker margins are reduced.

PRICE VOLATILITY = ЛИХОРАДОЧНОСТЬ ЦЕНЫ – Price Volatility:- in the stock market, sensitivity of the price of a share or of a stock portfolio to overall fluctuations in the stock market. A stock is said to be volatile if it is highly sensitive to such fluctuations. / Лихорадочность Цены:- на фондовом рынке чувствительность цены акции или фондового портфеля в целом к всеобщим колебаниям на данном фондовом рынке. О цене акции говорят, что её лихорадит, если она весьма чувствительна к таким колебаниям. Как правило, это сопровождается значительными изменениями как в сторону повышения, так и в сторону понижения цены.

PRICKER = ПРОБОЙНИК (или МАЛАЯ ТАКЕЛАЖНАЯ СВАЙКА, или ИНСТРУМЕНТ ДЛЯ ПРОКАЛЫВАНИЯ) – Pricker (maritime term):- small marlinespike.

PRIFAS = PROGRAMME DE RECHERCHES INTERDISCIPLINAIRES FRANÇAIS SUR LES ACRIDIENS DU SAHEL

PRIMA FACIE = ПРИМА ФАСИЭ – Prima Facie:- in Latin, On The Face Of It; At First Sight. An obvious case that requires no further proof. Prima Facie is a Latin expression meaning 'At First Sight', used in common law regions to denote a case that is strong enough to justify further discovery and possibly a full trial. Latin, 'On First Appearance'. A term frequently encountered in foreign trade. When a steamship company issues a clean bill of lading, it acknowledges that the goods were received 'in apparent good order and condition' and this is said by the courts to constitute prima facie evidence of the conditions of the containers; that is, if nothing to the contrary appears, it must be inferred that the cargo was in good condition when received by the carrier. / сразу или на первый взгляд (prima facie). В переводе с Латинского означает С Первого Взгляда; Судя По Внешнему Виду Явлений; относящийся к доказательствам, представляющимся достаточными, если они не опровергнуты или не оспорены.

PRIMAGE = ПРИБАВКА К ФРАХТУ – Primage is a charge paid by shippers to ship agents for services provided by the agent in Turkish and Greek ports, generally for loading activities conducted by port stevedores. It is not an actual contractual term so the obligation to pay does not depend on its inclusion in the bill of lading. Turkey:- 3% on Total Ocean Freight including all surcharges and intermodal charges. Greece:- 3% Piraeus, 5% Salonika, except on cargo originating in Bulgaria. / включая все надбавки или доплаты (surcharges) и .

PRIMARIES = ПЕРВИЧНЫЕ (или ОСНОВНЫЕ (ЦВЕТА)) – Primaries are the three basic hues. Ah, but which primary. The Painters Primaries include red, blue, and yellow. This is the palatte we learned in school. The Printers Primaries include magenta, cyan, and yellow. This is the palatte used for color printing. The Light Primaries include red, blue, and green. This is the palatte used on your computer screen. See also Primary Colors. / Под Основными Цветами понимаются три цвета, смешением которых в разных пропорциях можно получить любой цвет. Число возможных систем основных цветов бесконечно. Часто основными цветами являются зелёный, красный и синий.

PRIMARY = ПЕРВИЧНОЕ – Primary:- (1) essential or related to first principles, the first objectives. (2) The first plant parts such as the root, leaf and tillers, e.g., primary leaf, primary tillers. / такая как корень, лист и .

PRIMARY ACCOUNT NUMBER = ПЕРВИЧНЫЙ НОМЕР СЧЁТА – Primary Account Number (PAN) is a number used to identify a customer account or relationship. The PAN identifies the card issuer and the cardholder. This number is composed of a card issuer identification number, an individual account identification number and an accompanying check digit.

PRIMARY BACKING = ПЕРВИЧНАЯ ПОДКЛАДНАЯ ТКАНЬ – Primary Backing is the material, usually woven or nonwoven polypropylene or jute, into which a carpet is tufted. The primary backing allows the positioning of each tuft and holds the tufts in position during processing, after which a secondary backing (q.v.) is applied to provide dimensional stability.

PRIMARY COLORANTS = ПЕРВИЧНЫЕ (или ОСНОВНЫЕ) ОКРАШИВАЮЩИЕ ВЕЩЕСТВА (или ПИГМЕНТЫ, или КРАСИТЕЛИ) – Primary Colorants:- a small number (pallet) of colorants (dyes or pigments) that may be mixed to produce a large gamut of colors.

PRIMARY COLORS = ПЕРВИЧНЫЕ ЦВЕТА (или ОСНОВНЫЕ ЦВЕТА) – Primary Colors:- magenta, yellow, and cyan (red, yellow, blue); these are the subtractive primaries used when mixing dyes, paints, etc, to make all other colors. In the CIE (Commission Internationale de l'Eclairage or International Commission on Illumination; headquartered in Vienna, Austria) system of color measurement, which is the international system most widely used today, the primary color vectors are red, green, and blue-violet. These are additive primaries based on the perception of color of reflected light by the human eye. See also Primaries. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)). Под Основными Цветами понимаются три цвета, смешением которых в разных пропорциях можно получить любой цвет. Число возможных систем основных цветов бесконечно. Часто основными цветами являются зелёный, красный и синий.

PRIMARY CREDIT = ПЕРВИЧНЫЙ КРЕДИТ – In the United States, Primary Credit is a credit extended to generally sound depository institutions at a rate above the target federal funds rate on a very short-term basis as a backup source of funding. Primary Credit is available to generally sound depository institutions on a very short-term basis, typically overnight. To assess whether a depository institution is in sound financial condition, its Reserve Bank regularly reviews the institution's condition, using supervisory ratings and data on adequacy of the institution's capital. Depository institutions are not required to seek alternative sources of funds before requesting occasional advances of primary credit, but primary credit is expected to be used as a backup, rather than a regular, source of funding. The rate on primary credit has typically been set 1 percentage point above the FOMC's (short for the US Federal Open Market Committee) target federal funds rate, but the spread can vary depending on circumstances. Because primary credit is the Federal Reserve's main discount window program, the Federal Reserve at times uses the term 'Discount Rate' specifically to mean the primary credit rate. Reserve Banks ordinarily do not require depository institutions to provide reasons for requesting very short-term primary credit. Borrowers are asked to provide only the minimum information necessary to process a loan, usually the requested amount and term of the loan. If a pattern of borrowing or the nature of a particular borrowing request strongly indicates that a depository institution is not generally sound or is using primary credit as a regular rather than a backup source of funding, a Reserve Bank may seek additional information before deciding whether to extend the loan. Primary credit may be extended for longer periods of up to a few weeks if a depository institution is in generally sound financial condition and cannot obtain temporary funds in the market at reasonable terms. Large and medium-sized institutions are unlikely to meet this test. See also Seasonal Credit, and Secondary Credit.

PRIMARY CREEP = ПЕРВИЧНАЯ ПОЛЗУЧЕСТЬ (или ПЕРВИЧНАЯ ТЕКУЧЕСТЬ) – Primary Creep is the recoverable component of creep. See also Delayed Deformation.

PRIMARY CUSTODIAN = ПЕРВИЧНЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ – For purposes of the Investment Company Act of 1940, a Primary Custodian is a bank or qualified foreign bank that contracts directly with a mutual fund to provide custodial services related to maintaining the fund's assets outside the United States. Also known as Global Custodian. Primary Custodian means a US Bank or Qualified Foreign Bank that contracts directly with a Fund to provide custodial services related to maintaining the Fund's assets outside the United States.

PRIMARY DEALER = ПЕРВИЧНЫЙ ДИЛЕР (или ПЕРВИЧНЫЙ ДЕЛЕЦ) – A designation given by the US Federal Reserve System to commercial banks or broker/dealers who meet specific criteria. Among the criteria are capital requirements and meaningful participation in the Treasury auctions. Primary Dealers are approximately 20 large financial institutions that are the counterparties with which the Federal Reserve undertakes open market operations. In order to be a primary dealer, an institution must, among other things, meet relevant Basel or SEC (short for the Securities and Exchange Commission) capital requirements and maintain a good trading relationship with the Federal Reserve. / Целью введения института Первичных Дилеров (ПД) в России является повышение ликвидности и ёмкости рынка ГКО-ОФЗ, а также снижение стоимости обслуживания государственного внутреннего долга. Факторами повышения ликвидности и ёмкости рынка являются поддержание первичными дилерами твёрдых котировок по ряду выпусков государственных облигаций, а также увеличение объёма сделок за счёт операций между первичными дилерами. Основная функция первичных дилеров – посредничество между эмитентом и инвесторами, а также 'создание рынка' – установление цен на государственные облигации и обеспечение спроса на аукционах Минфина России. В обмен на выполнение обязательств первичным дилерам предоставляется ряд преимуществ перед другими участниками рынка.

PRIMARY DELIVERER = ПЕРВИЧНЫЙ ПОСТАВЩИК – In the cotton futures trading, Primary Deliverer is the original issuer of the Delivery Notice during the delivery period and the initial Owner of the duplicate samples. The Primary Deliverer, the Initial Owner, is obligated to maintain the duplicate samples at the location stated in his Delivery Notice until such time as the Initial Owner has been instructed, via a Sample Instruction Letter, to transfer the duplicate samples to a Receiver. The Primary Deliverer shall have the option of returning the duplicated samples of the bales tendered to the point of storage of the cotton or of holding the samples at a location other than the point of storage. The Primary Deliverer must inform the Initial Stopper, via Delivery Notice, of the exact location of the duplicate samples and the name of the Primary Deliverer's Clearing Member and the name of the Owner of the duplicate samples. / начального Останавливающего. дубликатные образцы из кип, поданных для участия в конкурсе в пугкт хранения хлопка или .

PRIMARY DISTRIBUTION = ПЕРВИЧНОЕ РАСПРЕДЕЛЕНИЕ – Primary Distribution is the original sale of a company's securities. Also known as Primary Offering, or Public Offering. See also Investment Banker. / Первоначальная продажа ценных бумаг

компании. Известно также как Первичное Предложение (Primary Offering) или Публичное Предложение (или Открытая Подписка) (Public Offering). Смотрите также Инвестиционный Банкир (Investment Banker).

PRIMARY ELEVATOR = ЗАГОТОВИТЕЛЬНЫЙ ЭЛЕВАТОР (или ПЕРВИЧНЫЙ ЭЛЕВАТОР) – A Primary Elevator is a licensed elevator used to accept deliveries of grain directly from producers for storage or forwarding.

PRIMARY EXAMINER = СТАРШИЙ ЭКСПЕРТ (или ПЕРВИЧНЫЙ ЭКЗАМЕНАТОР) – Primary Examiner is a patent examiner who is fully authorized to sign office (the United States Patent and Trademark Office (USPTO)) actions (signatory authority) regarding patentability.

PRIMARY GROWTH = ПЕРВИЧНЫЙ РОСТ – Primary Growth is a growth initiated by the stem and root meristems. / корневая .

PRIMARY INFECTION = ПЕРВИЧНАЯ ИНФЕКЦИЯ – Primary Infection is the first infection by a pathogen after going through a resting or dormant period.

PRIMARY INOCULUM = ПЕРВИЧНЫЙ ИНОКУЛЯТ – Primary Inoculum is a pathogen or a part such as spores, fragments of mycelium, etc. that can cause primary infection in a life cycle. / , такие как споры, фрагменты . Под Инокуляцией, от Латинского слова Inoculatio, означающее Прививка, понимается введение живых микроорганизмов, инфицированного материала, сыворотки или других веществ в ткани растений, животных или человека, а также в питательные среды.

PRIMARY LEAF = ПЕРВИЧНЫЙ ЛИСТ – Primary Leaf is the first seedling leaf, without a blade. Rice Primary Leaf (syn. Prophyll, and Second Leaf). The first seediing leaf without a blade that emerges next to the coleoptile.

PRIMARY MARKET = ПЕРВИЧНЫЙ РЫНОК – (1) Primary Market is a market of the first issue of securities (issue) and their sale (placement). Synonym:- New Issues Market. Opposite:- Secondary Market. The market for securities during the issuing period (such as Eurobonds). Primary Market is a market of new issues of securities. The process by which a corporation's stock is issued for the first time. It is then sold to the public on the secondary market. Also known as New-Issues Market. See also Secondary Market.

(2) Primary Market:- for producers, their major purchaser of commodities; to processors, the market that is the major supplier of their commodity needs; and in commercial marketing channels, an important center at which spot commodities are concentrated for shipment to terminal markets. (1) For producers, their major purchaser of commodities; (2) in commercial marketing channels, an important center at which spot commodities are concentrated for shipment to terminal markets; and (3) to processors, the market that is the major supplier of their commodity needs.

PRIMARY OPERATING INTERFACES = ПЕРВИЧНЫЕ ОПЕРАЦИОННЫЕ ИНТЕРФЕЙСЫ – Primary Operating Interfaces are typically defined by a cross section of transmission paths or single facilities which affect a wide geographic area. These interfaces are modeled as constraints whose operating limits are respected in performing dispatch operations.

PRIMARY PANICLE BRANCHES = ВЕТВИ ПЕРВИЧНЫХ МЕТЁЛОК (или ВЕТВИ ПЕРВИЧНЫХ ПОБЕГОВ) – Primary Panicle Branches are the structures arising from the panicle axis. They bear the secondary branches and primary spikelets. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

PRIMARY ROOT SYSTEM = ПЕРВИЧНАЯ КОРНЕВАЯ СИСТЕМА – Primary Root System:- the first root and its branches. / первый корень и его ответвления.

PRIMARY SHARES = АКЦИИ ПЕРВОГО ВЫПУСКА (или ПЕРВИЧНЫЕ АКЦИИ) – In an equity offering, Primary Shares, in contrast to secondary shares, refer to newly issued shares of common stock that are sold to investors. The cash generated from the sale of the primary shares, net of the gross spread, are transferred to the company. See also Secondary Share.

PRIMARY STANDARD = ПЕРВИЧНЫЙ СТАНДАРТ (или ОСНОВНОЙ СТАНДАРТ) – Primary Standard is a physical standard calibrated by an absolute method.

PRIMARY STANDARD SAMPLES = ПЕРВИЧНЫЕ СТАНДАРТНЫЕ ПРОБЫ – Primary Standard Samples are prepared for most grades of grain and represent as nearly as possible the minimum quality of each grade, considering the predominant grading factors in the current crop. They are used as visual guides to grading grain before and on delivery at terminal elevators, and on shipments from terminal elevators when no export standard sample is established for a grade.

PRIMARY STOCKS = ПЕРВИЧНЫЕ ЗАПАСЫ – Primary Stocks include stocks held in refineries, natural gas processing plants, oil terminals and entrepots (where these are known), pipelines and stocks held on board incoming ocean vessels in port or at mooring. They exclude power station stocks (since demand is reported as deliveries from primary stocks). They are on a national territory basis, i.e. they include all primary stocks within the national boundaries regardless of ownership (stocks held abroad by government or companies are thus excluded). Stocks of crude oil or refined products held in storage at leases, refineries, natural gas processing plants, pipelines, tankfarms, and bulk terminals that can store at least 50 000 barrels of refined products. In oil industry, Primary Stocks are held by the various companies supplying the market, ranging from producers, refiners to importers. They are held in refinery tanks, bulk terminals, pipeline tankage, barges and coastal tankers (if they stay in the same country), tankers in port (if they are to be discharged at port) and in inland ship bunkers. Additionally, stocks held for strategic purposes by governments (e.g., US SPR (United States Strategic Petroleum Reserve)) or by stockholding organizations (e.g., EBV (short for the Erdölbevorratungsverband, German National Petroleum Stockpiling Agency) in Germany) are included in the primary stock category. / , то есть . , танкеры в порту(если они должны быть разгружены в порту) и . (например, Э.Бэ.Фау. (EBV – сокращение для Эдуобэфоратунсфабанд (Erdölbevorratungsverband) – Германское Национальное Агентство по Организации Запаса Нефти) в Германии).

PRIMARY TILLAGE = ПЕРВИЧНАЯ ОБРАБОТКА (ПОЧВЫ) – Primary Tillage is initial cutting of soil where a crop has been grown or harvested. It is commonly referred to as Plowing. / как Вспашка или Пахота (Plowing). Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

PRIMARY TILLERS = ПЕРВИЧНЫЕ ПОБЕГИ (или ПЕРВИЧНЫЕ РОСТКИ, или ПЕРВИЧНЫЕ ОТРОСТКИ) – Primary Tillers are tillers arising from the lowermost nodes of the main culm.

PRIMARY TRISOMIC = ПЕРВИЧНЫЙ ТРИСОМИК – Primary Trisomic is a trisomic in which the extra chromosome is one of the normal chromosomes of the complement. / Трисомик – клетка с двумя нормальными наборами хромосом.

PRIMARY WALL = ПЕРВИЧНАЯ СТЕНКА – The Primary Wall is the original thin cell wall. It is mainly cellulose made up of a network of fine fibrils (small strands of cellulose). This makes for a well organized system of continuous, very fine capillaries. It is well known

that fine capillaries rob liquids from coarse capillaries. The fine surface capillaries of each cotton fiber contribute greatly to cotton's wipe-dry performance. / фибриллы . Стенка хлопкового волокна имеет слоистое строение. Наружный слой, толщиной менее 1 мк, называется первичной стенкой, или кутикулой. По химическому составу и структуре она существенно отличается от основной целлюлозной стенки; в ней содержится (в %):- целлюлозы – 54, протеина – 14, пектиновых веществ – 9, воска – 8, золы – 3, кутина – 4. Химический состав различен в разных проммышленных сортах. Наличие воска, имеющего гидрофобные свойства, приводит к тому, что волокно плохо смачивается водой. Первичная стенка состоит из фибрилл – тончайших нитей толщиной 100 – 200 А. Они образуют две сетчатые системы, покрывающие основной целлюлозную стенку с внешней стороны. Первичные клеточные стенки соседних клеток соединены между собой когезивным межклеточным веществом – срединной пластинкой. В период роста срединная пластинка на 2/3 состоит из пектиновых веществ, затем происходит её лигнификация.

PRIME = PRESCRIBED RIGHT TO INCOME AND MAXIMUM EQUITY

PRIME BROKERAGE = ПЕРВОКЛАССНОЕ БРОКЕРСКОЕ ОБСЛУЖИВАНИЕ – Prime Brokerage:- the provision by firms (typically large securities houses) of credit, clearing, securities lending, and other services to clients (typically hedge funds).

PRIME BROKERAGES = ПЕРВИЧНЫЕ БРОКЕРЫ – Prime Brokerage describes an arrangement that allows customers to conduct FX transactions (spot, forward, and options) in the name of a bank or 'prime broker'. In a typical prime brokerage arrangement, the customer chooses one or two prime brokers to service their account. The prime broker's responsibility is to set up documentation and procedures that allow the customer to conduct FX transactions directly with several counterparties, but in the name of the prime broker. These executing counterparties recognize the prime broker as their legal counterparty in such trades. The prime broker enters into equal and opposite trades with the customer and executing counterparties. Specific procedures are agreed upon among the customer, prime broker, and executing counterparties to effectuate the trading and 'give up' relationships. The prime broker typically charges the customer a fee for prime brokerage. Also known as Investment Bank. / Известны также как Инвестиционные Банки (Investment Bank).

PRIME MOVER = (ОСНОВНОЙ) ТЯГАЧ – In Australia, Prime Mover is an articulated lorry consisting of a towing engine. Also known as Tractor in the United States, and Truck in New Zealand and the United Kingdom.

PRIME MOVER = ПЕРВИЧНЫЙ ДВИГАТЕЛЬ (или ПЕРВИЧНЫЙ ДВИЖИТЕЛЬ) – Prime Mover is the engine, turbine, water wheel, or similar machine that drives an electric generator; or, for reporting purposes, a device that converts energy to electricity directly, e.g., photovoltaic solar and fuel cells.

PRIME PROPERTY = ОСНОВНАЯ СОБСТВЕННОСТЬ (или ХХ) – Prime Property:- property that is most attractive to investors. Prime property would score highly on all of the following factors:- location, age and condition, quality of tenant, the number of comparable properties available, lease structure and size. to determine the rent at rent review and for valuation purposes.

PRIMER = ГРУНТОВКА – Primer:- one or more preliminary base coats of paint system, applied prior to the application of finishing coats. / Основным назначением грунтовки является создание надёжного сцепления верхних слоёв покрытия с окрашиваемой поверхностью. Грунтовки образуют нижние слои лакокрасочных покрытий. Грунтовки или Грунтовочные Составы, материалы, образующие нижние слои лакокрасочных покрытий. Основное назначение грунтовки – создание надёжного сцепления верхних (кроющих) слоёв покрытия с окрашиваемой поверхностью. Кроме того, грунтовки могут выполнять и другие функции:- защищать металл от коррозии (смотрите Защитные Лакокрасочные Покрытия), 'выявлять' текстуру дерева, перекрывать поры и другие дефекты окрашиваемой поверхности и так далее. Грунтовки готовят на основе природных или синтетических, жидких или твёрдых плёнкообразующих веществ – олиф, алкидных смол, мочевино-формальдегидных смол, эпоксидных смол и других; твёрдые плёнкообразующие материалы применяют в виде концентрированных растворов или дисперсий в органических растворителях или в воде. Многие грунтовки содержат в своём составе пигменты (например, железный или свинцовый сурик, цинковый крон), а иногда и наполнители (например, тальк, слюду, мел). На окрашиваемую поверхность грунтовку наносят шпателем, кистью, распылением и другими способами. Толщина плёнки грунтовочного состава 10–100 мкм (0.01–0.1 мм). Высушенную загрунтованную поверхность покрывают краской или лаком. О грунтовках, используемых при грунтовании холста для живописи, смотрите Грунт в живописи.

PRIMER = ЗАТРАВКА (или ПРАЙМЕР) – Primer is a short sequence of DNA (or RNA) used to initiate DNA replication.

PRIME RATE = ПРИВИЛЕГИРОВАННАЯ СТАВКА (или ПЕРВОКЛАССНАЯ СТАВКА) – (1) The Prime Rate is the interest rate large American banks charge for short-term loans to top commercial clients. It represents a kind of key interest rate upon which all of the other lending rates are based. The term 'Prime Rate' has also come into use in Germany for the interest rate charged for loans to the best customers. Prime Rate is the lowest interest rate on bank loans, offered to preferred borrowers. Prime Rate is the best rate of interest charged by the commercial banks to their preferred (i.e. very credit-worthy) customers. In Canada, it has been in the 3–4% range (early 2004), which is very low when compared to recent history. The Bank of Canada rate is normally 1.5% below that and is the rate at which banks can borrow from the central bank. The Prime Rate is a very useful 'indicator' to track on a regular basis. It is the single most important factor in predicting business behavior such as raising capital, capital equipment acquisitions, cost of financing assets, etc. Interest rate charged by commercial banks for short-term loans to their most creditworthy corporate customers. The prime rate serves as a basis for setting other interest rates. In the United States, the prime rate usually follows changes in the discount rate. Prime Rate is the short-term interest rate that is charged by banks to their most creditworthy, financially sound customers, i.e. customers who have sufficient capital and stable sources of income. In the United States, The prime rate is defined by The Wall Street Journal as 'the base rate on corporate loans posted by at least 75% of the nation's 30 largest banks'. All types of lending institutions such as banks, credit unions, credit card companies, thrifts, etc, use the prime rate as a foundation rate for pricing short- and medium-term loans and products. Providers of consumer and commercial loan products often use the prime interest rate as a base lending rate, to which a profit margin is added based on the amount of risk associated with a specific loan. The prime rate is typically tied to the benchmark Internet rate (in the United States, the Federal Funds Target Rate or the Fed Funds Target Rate). In other words, the US prime rate is calculated by adding up the Fed funds target rate and a policy-determined rate which is set officially by central banks or monetary authorities. The policy-determined rate has been set, since Q2 1994, as a rule of thumb, at 3%. It follows that the US prime rate is (as in February 2012):- Prime Rate = Fed Funds Target Rate + Policy-Determined Rate = 0.25 + 3 = 3.25%. in the aftermath of global financial crisis (2008), many countries lowered their prime rates to zero in order to stimulate the economy and fend off recessionary pressures. Although many interest rates such as the LIBOR index can change daily, the prime rate moves less frequently and is one of the most stable financial values for the global economy. The prime rate is sometimes referred to as Reference Rate, Prime Interest Rate, and Prime Lending Rate. In the United States, it is also known as Wall Street Journal Prime Rate or WSJ Prime Rate. The lowest interest rate charged by commercial banks to their biggest and most creditworthy corporate customers. Other interest rates are scaled up from the prime rate. It is a good indication of general interest rate levels within a country. Prime Rate is the interest rate that commercial banks charge their most credit-worthy customers. Generally a bank's best customers consist of large

corporations. The prime interest rate, or prime lending rate, is largely determined by the federal funds rate, which is the overnight rate which banks lend to one another. The prime rate is also important for retail customers, as the prime rate directly affects the lending rates which are available for mortgage, small business and personal loans. Default risk is the main determiner of the interest rate a bank will charge a borrower. Because a bank's best customers have little chance of defaulting, the bank can charge them a rate that is lower than the rate that would be charged to a customer who has a higher likelihood of defaulting on a loan. The rate of interest charged by US banks for first-class or prime commercial paper. Now more commonly used to describe the rate of interest charged by the banks for commercial loans to first-class corporate borrowers. It is approximately equivalent to the Minimum Lending Rate in the United Kingdom. See also Market Discount Rate. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Зэ Вол Стрит Дьжонэл (The Wall Street Journal). Самая низкая процентная ставка предлагаемая коммерческими банками своим крупнейшим и наиболее кредитоспособным корпоративным клиентам. Другие же процентные ставки обычно выше привилегированной ставки. Привилегированная Ставка является хорошим индикатором общих уровней процентных ставок внутри страны. Данная ставка по корпоративным займам предлагается, по крайней мере, 75% из тридцати крупнейших банков из разных стран мира.

(2) Prime Rates are the interest rates such as personal, automobile, commercial and financing loans are often pegged to the prime. / Процентные ставки по таким ссудам как, персональные, автомобильные, коммерческие и финансовые, которые часто увязаны с привилегированной или первоклассной ставкой.

PRIME STANDARD = ПЕРВИЧНЫЙ СТАНДАРТ – At the Frankfurt Stock Exchange, Prime Standard is the listing segment for companies that fulfil especially high international standards on transparency. Admission to the prime standard segment requires the fulfilment of the following transparency criteria:- quarterly reports, international accounting standards according to the International Accounting Standards (IAS) or US Generally Accepted Accounting Principles (GAAP), submission of a company calendar and ad hoc disclosures also in English. Companies that want to be listed in this segment must apply for admission. A prime standard listing is a prerequisite for inclusion in the 'selection indices' of the Frankfurt Stock Exchange. / для данного случая (ad hoc).

PRIMITIVE = ПРИМИТИВ (или ПРИМИТИВНОЕ) – Primitive:- a fleece with both long and short fibers. See also Double Coated. / Под Примитивом, от Латинского слова Primitivus, означающее Первый или Самый Ранний, понимается:- (1) нечто простое, не развившееся (по сравнению с позднейшим, более совершенным). (2) Устаревшее название памятника искусства раннего периода развития культуры.

PRIMITIVE FORMS = ПРИМИТИВНЫЕ ФОРМЫ – Primitive Forms are unimproved plants having features or traits that are akin to wild Rice relatives. Plants having primitive features such as pigmented plant parts, long awns, lax panicles, extreme shattering, and perennial growth habit. / Под Примитивными Формами, от Латинского слова Primitivus, означающее Первый или Самый Ранний, понимаются .

PRIMROSE YELLOW = БЛЕДНО–ЖЁЛТОЕ – Primrose Yellow:- a light to moderate greenish yellowish; a light to moderate yellow.

PRINCE ALBERT = ПРИНЦ АЛБЁТ – Prince Albert:- a double-breasted frock coat with the upper part fitted to the body.

PRINCE OF WALES CHECK = КЛЕТКА КАК У ПРИНЦА ВЭЙЛЗСКОГО – Prince Of Wales Check:- perhaps is one of the most misused terms, the original of which was made for Edward VII when he was Prince of Wales. It is actually a very large check with a repeat of nine inches in bold red or brown on a cream ground with a grey overcheck. However, a misunderstanding arose when Edward, Duke of Windsor became the Prince of Wales and he favoured a black and white Glen Urquhart check and the two designs became confused in many people's minds. / Эдвод, Виндзэра (Edward, Duke of Windsor) Глэн Окетц (Glen Urquhart).

PRINCIPAL = ПРИНЦИПАЛ (или ДОВЕРИТЕЛЬ) – Principal is a person who places goods under the transit procedure, even where this is done by an authorised representative. / от Латинского слова Princeps, означающее Глава или Первый, . Принципал – лицо, размещающее товары в таможенный режим транзита, даже если делается уполномоченным представителем.

PRINCIPAL = ПРИНЦИПАЛ (или КОМИТЕНТ) – (1) Principal is a party to a transaction that acts on its own behalf. In acting as a principal, a firm is buying/selling (or lending/borrowing) for its own account. Party entrusting a draft and/or documents to a bank for collection of payment, generally the seller of goods. Party for whom another acts as agent. The party entrusting the handling of a collection to a bank. / Сторона, поручающая банку операцию по инкассированию. По поручению комитента другая сторона договора комиссии – комиссионер обязуется за вознаграждение заключить с третьим лицом сделку от своего имени, но в интересах и за счёт комитента. Принципал – лицо (экспортёр), выдающее инкассовые инструкции банку ремитенту об отправке документов в представляющий банк на инкассо. Также используется для обозначения приказодателя по банковской гарантии.

(2) Principal is the person for whom a broker executes an order or dealers buying or selling for their own accounts. / Лицо, для которого брокер исполняет распоряжение; или дилеры, покупающие и продающие за свой собственный счёт.

(3) Usually the party to whom professional services are provided. The principal has the right to provide direction to the provider of professional services. / Обычно сторона, которой оказываются профессиональные услуги. Принципал имеет право обеспечить руководство поставщику профессиональных услуг.

PRINCIPAL = ГЛАВА (или РУКОВОДИТЕЛЬ, или ПЕРВЫЙ, или КОМИТЕНТ) – With respect to any firm, Principal is any person who is an executive officer, general partner, director or other person, who, in each case, exercises a controlling influence over the business of such firm, and any person who owns ten percent (10%) or more of the outstanding shares of stock of, or has contributed ten percent (10%) or more of the capital to, such firm. / В отношении к любой фирме, любое лицо, являющееся исполнительным должностным лицом, генеральным партнёром, директором или иным лицом, которое .

PRINCIPAL = НОМИНАЛ ОСНОВНОЙ СУММЫ (или ПЕРВОНАЧАЛЬНАЯ СУММА, или ОСНОВНОЙ ДОЛГ) – Principal is the amount of money borrowed or the amount still owed on a loan. Principal is the unpaid balance on a loan, not including interest; the amount of money invested. In finance, Principal is an original amount of capital invested or lent, as distinguished from profits or interest. This term may refer to a person's capital or to the face amount of a bond. In the United Kingdom, the lump sum that is lent under a loan or a bond.

PRINCIPAL CO–OWNER = СОВЛАДЕЛЕЦ ПРИНЦИПАЛ (или ОСНОВНОЙ СОВЛАДЕЛЕЦ) – In the United States, the Principal Co-Owner is the co-owner whose funds were used to purchase the savings bonds or who received the bonds as a gift, as an inheritance, or through court proceedings and had the bonds reissued to add another person as co-owner without receiving any contribution from that other person.

PRINCIPAL OFFICE = ГЛАВНАЯ КОНТОРА (или ГЛАВНЫЙ ОФИС) – In the United States, Principal Office (also known as Principal Place of Business) is a location for the head office of a business where the books and records are kept and/or management works. In most states, including Arkansas, corporations must report their principal place of business to the Secretary of State. See also Registered Office.

PRINCIPAL REGISTER = ГЛАВНЫЙ РЕЕСТР – In the United States, a Principal Register is a primary trademark register of the United States Patent and Trademark Office (USPTO). When a mark has been registered on the Principal Register, the mark is entitled to all the rights provided by the Trademark Act. The advantages of owning a registration on the Principal Register include the following:- (i) constructive notice to the public of the registrant's claim of ownership of the mark (15 USC Section 1072); (ii) a legal presumption of the registrant's ownership of the mark and the registrant's exclusive right to use the mark nationwide on or in connection with the goods and/or services listed in the registration (15 USC Sections 1057(b) and 1115(a); (iii) a date of constructive use of the mark as of the filing date of the application (15 USC Section 1057(c); TMEP Section 201.02); (iv) the ability to bring an action concerning the mark in federal court (15 USC Section 1121); (v) the ability to file the US registration with the US Customs Service to prevent importation of infringing foreign goods (15 USC Section 1124); (vi) the registrant's exclusive right to use a mark in commerce on or in connection with the goods or services covered by the registration can become 'incontestable', subject to certain statutory defenses (15 USC Sections 1065 and 1115(b)); and (vii) the use of the US registration as a basis to obtain registration in foreign countries. / привоз (importation).

PRINCIPALS' MARKET = РЫНОК ПРИНЦИПАЛОВ – Principals' Market is a market where the ring dealing members act as principals for the transactions they conclude across the ring and with their clients.

PRINCIPLE OF CONSTANT EQUITY = ПРИНЦИП ПОСТОЯНСТВА ДОЛИ (или ПРИНЦИП ПОСТОЯНСТВА АКЦИОНЕРНОГО КАПИТАЛА) – Principle Of Constant Equity is a legal principle according to which changes in capital stock are subject to strict regulations governing their form and issuance.

PRINT = НАБИВНАЯ (или НАБОЙКА) – Print is a fabric with designs applied by means of dyes or pigments used on engraved rollers, blocks, or screens. See also Printing. Print:- a cloth with a pattern or figured design applied by printing. An article of clothing of print cloth, namely a cloth with a pattern or figured design applied by printing. / Набойка или Набивка:- (1) вид декоративно-прикладного искусства; ручной способ получения цветного узора на ткани при помощи рельефных форм. (2) Ткань с узором, полученным способом набойки. Формами для набойки служат резные деревянные доски либо наборные медные пластины с гвоздиками. При набойке на ткань накладывают покрытую краской форму и ударяют по форме специальным молотком (отсюда название 'Набойка'). Для многоцветных узоров число печатных форм должно соответствовать числу цветов. Художественная особенность набойки заключается в графическом лаконизме линий и обобщённости цветовых пятен. Нередко графическая строгость узора смягчается естественно возникающими при ручной печати наложениями цветовых пятен друг на друга, трепетной прерывностью линий, пробелами светлого, неокрашенного фона. Набойка известна с древности у многих народов мира. У народов бывшего Союза Советских Социалистических Республик (СССР) была известна с X–XII веков, особенно была развита в XVI–XVIII века. С конца XVIII века набойка стала вытесняться печатанием тканей. Однако некоторые виды набойки продолжали существовать у ряда народов на протяжении XIX – начала XX веков. Ныне технические и декоративные приёмы набойки используются художниками тканей.

PRINT BONDING = СКРЕПЛЕНИЕ ПЕЧАТАНИЕМ (или ПЕЧАТНОЕ СВЯЗЫВАНИЕ) – Print Bonding applies binder only in predetermined areas. It is used for fabric applications that require a part of the area of the fabric to be binder-free, such as wipes and coverstocks. Many lightweight nonwovens are print bonded. Printing patterns are designed to enhance strength, fluid transport, softness, hand, absorbency, and drape. Print bonding is most often carded out with gravure rolls. Binder addition levels are dependent on engraved area and depth as well as binder-solids level. Increased pattern versatility can be achieved with the use of rotary screen rolls. Drying and curing are carried out on heated drums or steam-heated cans. In print bonding, high viscose binders are applied to limited, patterned areas. A prewet/prebond step is required for enough strength of webs, and typical steps. There are two types of printers:- rotary screen and rotogravure printers. Binders are applied through a hollow applicator roll in rotary screen printer, while in rotogravure printer they are applied by an engraved applicator roll. The main advantage is that outstanding softness of nonwoven fabrics with adequate strength can be achieved. See also Bonding. Print Bonding is a process of binding fibers into a nonwoven fabric by applying an adhesive in a discrete pattern.

PRINT CLOTH = НАБИВНОЕ ПОЛОТНО – Print Cloth is a mediumweight, plain-weave fabric made of carded yarns, usually cotton or polyester/cotton blends, with counts from 28's to 42's. Millions of yards of printcloth are printed annually and other millions are finished as white goods. Large amounts of the goods are also used in the greige for bags, containers, and base fabric for coated materials. The term 'Printcloth' means plain weave fabrics, weighing not more than 200 grams per square meter, of average yarn numbers 43–68, containing more than 33 singles yarns per square centimeter and not containing multiple (folded) or cabled yarns, of square construction, not combed, whether or not napped. Print Cloth is a carded cotton cloth made with about the same yarns as cheesecloth but with more warp and weft threads per inch. Most print cloths are made in narrow widths up to 40 inches. Print cloth is given a wide range of finishes, thus producing cambric, lawn, longcloth, muslin, printed percale, etc. Narrow print cloths are 27" to 40" wide with constructions varying from 64 x 60 up to 80 x 92. Yards per pound runs from 3.50 to about 7.60. Wide print cloths are 45 inches wide with textures ranging from 60 x 48 to 64 x 60. Yards per pound go from 4.65 to about 5.35. / номеров Английских (Ne или 's) от 28's до 42's. Миллионы ярдов . Набивная Ткань – ткань, поверхность которой украшена печатным рисунком. Первоначально набивные ткани вырабатывались ручным способом при помощи форм с рельефными узорами (смотрите Набойка). Впоследствии термин Набивная Ткань стали применять также для всех тканей, на которые рисунок наносится печатными машинами.

PRINTEAS = ПЕЧАСЭПТ – PrinTEAS or e-TEAS (short for the The Trademark Electronic Application System):- a former feature of the USPTO's (short for the United States Patent and Trademark Office) electronic filing system that allowed applicants to complete a trademark application on-line, and then print it out for mailing to the USPTO. PrinTEAS was removed from production on 02 November 2003. / ПечаСЭПТ (или Печатная Система Электронного Применения Товарного Знака) или Э-СЭПТ (или Электронная Система Электронного Применения Товарного Знака).

PRINTING = ПЕЧАТАНИЕ (или НАБИВКА) – Printing is a process of decorating textile fabrics by application of pigments, dyes, or other related materials in the form of patterns. Although apparently developed from the hand painting of fabrics, such methods are also of great antiquity. There is evidence of printing being carried out in India during the IV century BC, and a printing block dated at about AD 300 has been unearthed in the burial grounds of Akhmīn in Upper Egypt. Pre-Columbian printed textiles have been found in Peru and Mexico. Textile printing has become highly sophisticated and has involved the skills of many artists and designers. The four main methods of textile printing are block, roller, screen, and heat transfer printing. In each of these methods, the application of the color, usually as a thickened paste, is followed by fixation, usually by steaming or heating, and then removal of excess color by washing.

Printing styles are classified as direct, discharge, or resist. In direct printing, colored pastes are printed directly on the cloth. For discharge printing, the cloth is first dyed with a background color, which is destroyed by reagents, or reducing agents, carried in a print paste. This action may leave the discharged design white on a colored background, although print pastes may also contain coloring matters not destroyed by the discharging agent, producing a colored design. In the resist process, the cloth is first printed with a substance called a resist, protecting these printed areas from accepting color. When the cloth is dyed or pigment padded only those parts not printed with the resist are dyed. A special application of this technique, imparting plissé effects, is the printing of the fabric with a resist, followed by treatment with caustic soda. Printing is a process for producing a pattern on yarns, warp, fabric, or carpet by any of a large number of printing methods. The color or other treating material, usually in the form of a paste, is deposited onto the fabric which is then usually treated with steam, heat, or chemicals for fixation. Various types of printing are described below. See also Dyeing. (1) Methods of Producing Printed Fabrics:- Block Printing; Blotch Printing; Burn-Out Printing; Direct Printing; Discharge Printing; Duplex Printing; Etching; Extract Printings; Heat Transfer Printing; Ink-Jet Printing; Photographic Printing; Pigment Printing; Resist Printing; Roller Printing; Rotary Screen Printing; Screen Printing; and Warp Printing. (2) Methods of Producing Printed Carpets:- Millitron® Process; Mitter Printing Machine; Stalwart Printing Machine; Zimmer Flatbed Printing Machine; and Zimmer Rotary Printing Machine. / (Millitron®). Печатная Машина Столвот или Печатающая Машина Столвот (Stalwart Printing Machine); Цимма (Zimmer). эффекты плиссе или складчатого (Plissé). Печатание тканей, узорчатая расцветка тканей, получение рисунка на ткани одной или несколькими красками. Для сохранения формы рисунка краситель наносят в загущенном состоянии. Для печатания тканей применяют дающие наиболее прочные и яркие окраски красители:- кубовые, активные, пигменты и другие. В качестве загустителей используют вещества, способные образовывать при растворении в воде или при разваривании клейкие системы-загустки (крахмал, декстрин, трагант, камедь и другие). В состав печатных красок могут входить также растворители, диспергаторы, окислители, восстановители, кислоты, щёлочи, соли, пластификаторы, пеногасители. По способу создания рисунков различают прямую, вытравную и резервную печать. (1) При Прямой Печати краску наносят на белую или светлоокрашенную ткань, причём в последнем случае печатание выполняют красителями тёмных цветов. (2) Вытравная Печать – получение узора на предварительно окрашенной ткани в результате разрушения первоначальной окраски в местах нанесения вытравки. (3) При Резервной Печати на ткань перед крашением наносят печатный резервирующий состав, в который вводятся вещества (например, воск), препятствующие окраске волокон при последующем крашении. Если резервирующий состав не содержит красителя, на окрашенной ткани получаются белые узоры. Нанесение рисунка на ткань производят на тканепечатающих машинах. Для закрепления печатной краски ткань после сушки обычно подвергают паровой обработке. В паровой среде краситель переходит с поверхности в толщу ткани и отдельных волокон. Для удаления загустителя и отложившегося на поверхности ткани красителя её промывают. При необходимости на промывных аппаратах производится специальная обработка, например, окислителями, для окончательного закрепления красителя на ткани. Помимо печатания тканей, иногда производят расцветку чёсальной ленты (‘фигуре’) и пряжи как в виде мотков, так и в форме основы (‘фламме’). В некоторых случаях узоры на ткани получают приклеиванием (в электростатическом поле) к поверхности текстильного материала мелко нарезанного волокна-флока. Для специальных целей применяют фотохимический метод печатания.

PRINTING MACHINE STOP = ОСТАНОВ ПЕЧАТНОЙ МАШИНЫ – Printing Machine Stop:- dye or ink smudged along width of fabric as a result of the printing machine stopping.

PRINTING PROCESS = ПРОЦЕСС ПЕЧАТАНИЯ (или ПРОЦЕСС НАБИВКИ) – Printing Process:- applying colored patterns and designs to decorate a finished fabric is called ‘Printing’. In a proper printed fabric, the color is affixed to the fiber, so that it may not be affected by washing and friction. Whether a fabric is dyed or printed can be known by examining the outline of the design. On a printed fabric, the outline of a design is sharply defined on the outer side. The design generally do not penetrate to the back of the cloth. However, the design may show up on the reverse side of transparently thin fabrics. These fabrics may be confused with the woven designs where yarn dyed warp and filling are used. If the design is printed on such a fabric, the yarns will show some areas on which color is not equally distributed. The Dyes used for printing mostly include vat, reactive, naphthol and disperse colors which have good fastness properties. The pigments, which are not truly dyes, are also used extensively for printing. These colors are fixed to the fiber through resins that are very resistant to laundering or drycleaning. Pigments are among the fastest known colors and are effective for light to medium shades. If used for applying dark colors, they may crock or rub off. Improved resins, better pigments or more effective anticrock agents must be used to solve this problem. Cheap prints are made from basic colors mixed with tartar emetic and tannic acid but they are not acceptable in todays market. For cotton printing vat and reactive dyes are generally used. Silk is usually printed with acid colors. Wool is printed with acid or chrome dyes but before printing it is treated with chlorine to make it more receptive to colors. Manmade fibers are generally printed with disperse and cationic dyes. Methods of Printing:- three different approaches or techniques are prevalent for printing color on a fabric:- Direct, Discharge and Resist. (i) Direct Printing:- it is the most common approach to apply a color pattern on fabric. It can be done on white or a colored fabric. If done on colored fabric, it is known as Overprinting. The desired pattern is produced by imprinting dye on the fabric in a paste form. To prepare the print paste, a thickening agent is added to a limited amount of water and dye is dissolved in it. Earlier corn starch was preferred as a thickening agent for cotton printing. Nowadays gums or alginates derived from seaweed are preferred because they are easier to wash out, do not themselves absorb any color and allow better penetration of color. Most pigment printing is done without thickeners as the mixing up of resins, solvents and water itself produces thickening. (ii) Discharge Printing:- in this approach, the fabric is dyed in piece and then it is printed with a chemical that destroys the color in the designed areas. Sometimes, the base color is removed and another color is printed in its place. The printed fabric is steamed and then thoroughly washed. This approach is on decline these days. (iii) Resist Printing:- in this technique, a resist paste is imprinted on the fabric and then it is dyed. The dye affects only those parts that are not covered by the resist paste. After dyeing, the resist paste is removed leaving a pattern on a dark background. There are various methods of printing in which one of the above three techniques is used – Block Printing, Roller Printing, Duplex Printing, Stencil Printing, Screen Printing, Transfer Printing, Blotch Printing, Jet Spray Printing, Electrostatic Printing, Photo Printing, Differential Printing, Warp Printing, Batik Dyeing, Tie Dyeing, Airbrush (Spray) Painting and Digital printing. Block Printing:- the designs are carved on a wooden or metal block and the paste dyestuff is applied to the design on the face of the block. The block is pressed down firmly by hand on the surface of the fabric. Roller Printing:- in this machine counterpart of block printing, engraved copper cylinders or rollers are used in place of handcarved blocks. With each revolution of the roller, a repeat of the design is printed. The printed cloth is passed into a drying and then a steam chamber where the moisture and heat sets the dye. Duplex Printing:- a printing is done on both sides of the fabric either through roller printing machine in two operations or a duplex printing machine in a single operation. Screen Printing:- it is done either with flat or cylindrical screens made of silk threads, nylon, polyester, vinyon or metal. The printing paste or dye is poured on the screen and forced through its unblocked areas onto the fabric. Based on the type of the screen used, it is known as ‘Flat Screen Printing’ or ‘Rotary Screen Printing’. Stencil Printing:- the design is first cut in cardboard, wood or metal. The stencils may have fine delicate designs or large spaces through which color is applied on the fabric. Its use is limited due to high costs involved. Transfer Printing:- the design on a paper is transferred to a fabric by vaporization. There are two main processes for this- Dry Heat Transfer Printing and Wet Heat

Transfer Printing. In Conventional Heat Transfer Printing, an electrically heated cylinder is used that presses a fabric against a printed paper placed on a heat resistant blanket. In Infrared Heat Vacuum Transfer Printing, the transfer paper and fabric are passed between infrared heaters and a perforated cylinder which are protected from excessive heat by a shield. The Wet Heat Transfer Printing uses heat in a wet atmosphere for vaporizing the dye pattern from paper to fabric. Blotch Printing:- it is a direct printing technique where the background color and the design are both printed onto a white fabric usually in a one operation. Any of the methods like block, roller or screen may be used. Airbrush (Spray) Painting:- designs may be hand painted on fabric or the dye may be applied with a mechanized airbrush which blows or sprays color on the fabric. Electrostatic Printing:- a dye-resin mixture is spread on a screen bearing the design and the fabric is passed into an electrostatic field under the screen. The dye-resin mixture is pulled by the electrostatic field through the pattern area onto the fabric. Photo Printing:- the fabric is coated with a chemical that is sensitive to light and then any photograph may be printed on it. Differential Printing:- it is a technique of printing tufted material made of yarns having different dyeing properties such as carpets. Upto a ten color effect is possible by careful selection of yarns, dyestuffs and pattern. Warp Printing:- it is roller printing applied to warp yarns before they are woven into fabric. Tie Dyeing:- firm knots are tied in the cloth before it is immersed in a dye. The outside of the immersed portion is dyed but the inside is not penetrated. There are various forms of Tie dyeing like Ikat Dyeing where bundles of warp and/or weft yarns are tie dyed prior to their weaving. In Plangi Dyeing the gathered, folded or rolled fabric is usually held with stitching to form specific patterns. Batik Dyeing:- it is a resist dyeing process. Designs are made with wax on a fabric which is then immersed in a dye. The unwaxed portion absorbs the color. Jet Spray Printing:- designs are imparted to fabrics by spraying colors in a controlled manner through nozzles. Digital Printing:- in this form of printing micro-sized droplets of dye are placed onto the fabric through an inkjet printhead. The print system software interprets the data supplied by academic Textile digital image file. The digital image file has the data to control the droplet output so that the image quality and color control may be achieved. This is the latest development in textile printing and is expanding very fast. Digital Textile Printing. / основа и уточина . Найлан^{Т3} (Nylon^{TM}). Шёлкотрафаретная Печать. Шёлкография – вид трафаретной печати, в котором изображение наносится масляными или водяными красками на сетку (из шёлка или другой прочной материи), натянутую на рамку (участки сетки, соответствующие пробельным местам композиции, покрывают непроницаемым для краски составом); при печатании краска продавливается ракелем через отверстия сетки на воспринимающую поверхность. Техника шёлкографии, возникшая в середине XX века, используется для воспроизведения изображений (в том числе для репродуцирования произведений искусства), а также применяется для создания авторских произведений, отличающихся повышенной яркостью и декоративной красочностью колорита.

PRINT OUT OF REPAIR = РАСПЕЧАТКА ПЕРЕДВОЕНИЯ – Print Out Of Repair:- caused by print rollers not being synchronized properly. This results in various colors of the design not being printed in the proper position.

PRINT PASTE = ЗАГУСТКА – Print Paste is the mixture of gum or thickener, dye, and appropriate chemicals used in printing fabrics. Viscosity varies according to the types of printing equipment, the type of cloth, the degree of penetration desired, etc.

PRIOR DAMAGE = ПРЕДВАРИТЕЛЬНОЕ ПОВРЕЖДЕНИЕ (или ПРЕДШЕСТВУЮЩЕЕ ПОВРЕЖДЕНИЕ, или ИЗНАЧАЛЬНОЕ ПОВРЕЖДЕНИЕ) – Prior Damage is the pre-existing damage that occurred prior to the loss in question. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

PRIORITY ACCOUNT = ПРИОРИТЕТНЫЙ СЧЁТ – Priority Account is the major account with volume potential/performance deserving special attention.

PRIORITY ACTION = ПРИОРИТЕТНОЕ ДЕЙСТВИЕ (или ДЕЙСТВИЕ ПРИОРИТЕТА) – In the US patent and trademark laws, Priority Action:- a letter in which an examining attorney sets forth specific requirements that the applicant must meet before an application can be approved for publication. An examining attorney will issue a priority action after consulting with an applicant or the applicant's attorney. Unlike an examiner's amendment, the priority action does not confirm resolution of the issues; instead, it explains the requirements still outstanding. The applicant must respond to a priority action within 6 months from the date the priority action is mailed. If the applicant fails to do so, the application will be abandoned. Please note that examining attorneys have no discretion to extend the time for filing a response to an Office of the USPTO (short for the United States Patent and Trademark Office) action. The benefit of a priority action is that, if the applicant responds within 2 months, the application will be given priority in processing the response.

PRIORITY CLAIM = ИСК О ПРИОРИТЕТЕ (или ПРИТЯЗАНИЕ НА ПРИОРИТЕТ) – Priority Claim:- claims under 35 USC 119(a)-(e) and 35 USC 120 for the benefit of the filing date of earlier filed applications.

PRIORITY NOTICE OF CONVEYANCE = ПРИОРИТЕТНОЕ УВЕДОМЛЕНИЕ О ПЕРЕДАЧЕ (или УВЕДОМЛЕНИЕ О ПРИОРИТЕТЕ ПЕРЕДАЧИ) – Priority Notice Of Conveyance is a priority notice to safeguard a claim to change of registration of ownership in the Land Register. It is based upon § 883 German Civil Code and is generally incorporated into real estate purchase agreements, in favor of the buyer. If other arrangements are made after a priority notice has been entered, they will be invalid with respect to the person entitled to the priority notice if they frustrate or adversely affect the claim to be protected. That is why the owner can no longer dispose over the property. The priority notice of conveyance is entered in Section II (Encumbrances and Restrictions) of the Land Register.

PRIORITY NOTICE OF RIGHT TO DELETION = УВЕДОМЛЕНИЕ О ПРИОРИТЕТЕ ПРАВА НА ВЫЧЁРКИВАНИЕ – Priority Notice Of Right To Deletion:- applicable in Germany up to 1978. As a result, an owner's right of lien could be prevented. The priority notice of right to deletion has been replaced by the claim for deletion, which is regulated in § 1179 German Civil Code (BGB) and which is part of the legal content of every real property lien. Accordingly, the property owner can demand the deletion of priority or equal-ranking real property liens from the land register as soon as the property owner has acquired such claims, for example, by complete repayment of the underlying loan.

PRIVATE = ПРИВАТНЫЙ (или ЧАСТНЫЙ) – Private is not available for public use, control, or participation. / Частный это значит недоступный для общего пользования, контроля или участия. Под Приватным, от Латинского слова Privatus, означающее Частный, понимается устаревшее обозначение частного, неофициального.

PRIVATE AND CONFIDENTIAL = ЧАСТНАЯ И КОНФИДЕНЦИАЛЬНАЯ – Private And Confidential (P&C):- used by commodities traders to describe non-public transactions. / Термин Частная и Конфиденциальная (ЧИК (P&C)) используется торговцами сырьём для обозначения операций или сделок, условия которых не разглашаются.

PRIVATE BANK = ЧАСТНЫЙ БАНК – (1) Private Bank is a banking institution where the owner or partners are liable with their personal assets. Under the law of some countries, the expression 'private bank' refers only to institutions with the legal form of an

individual proprietorship, partnership firm or limited partnership. Such banks are now almost non-existent in the United Kingdom, but are still found in the United States.

(2) Private Bank is a bank that is not a member of a clearing house, but uses a member bank as an agent for this purpose. / Банк, не являющийся членом клиринговой палаты, но пользующийся для этой цели услугами банка члена.

PRIVATE BANKING = ЧАСТНОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ (или БАНКОВСКОЕ ОБСЛУЖИВАНИЕ В ЧАСТНОМ ПОРЯДКЕ, или ПЕРСОНАЛЬНОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ) – Private Banking:- offshore banking services are most commonly handled by the private banking departments of commercial banks or by private banks that cater solely to private banking clientele. Private banking is a relatively recent term that refers to a higher level of financial services afforded to a bank's wealthiest clients. The private banking department of a commercial bank has been described as functioning as a bank within a bank, maintaining its own separate books and records, and subject to separate operating procedures. Private banking activities are conducted through relationship managers and marketing officers who have access to a team of specialists around the world in order to provide personal money management, financial advice, and investment services to their high net worth clients. Private bankers are in a unique position of having knowledge and understanding of their client's personal and business backgrounds, sources of wealth, and uses of private banking accounts. Our use of this term doesn't imply that private banking is a term usually associated with abusive tax schemes. It is a commonly used term to describe many of the services discussed above. Investment counseling and portfolio asset management services offered to international private and institutional clients.

PRIVATE BRANCH EXCHANGE = ЧАСТНЫЙ ФИЛИАЛЬНЫЙ ОБМЕН (или ЧАСТНАЯ ТЕЛЕФОННАЯ СТАНЦИЯ) – Private Branch Exchange (PBX) is a telephony term describing a private telephone network used within an enterprise. Users of the PBX share a certain number of outside lines for making external telephone calls.

PRIVATE COMPANY = ЧАСТНАЯ КОМПАНИЯ – Private Company is a company whose shares are not available to the general public through the medium of a stock exchange, and whose members do not exceed 50 in number. Private Company:- in general, a company with a small number of shareholders (less than 50 in some jurisdictions) is considered to be a privately held company and is not required to disclose its business affairs to the public. Note:- in Canada, Government departments – such as the Taxation department (federal) and the Securities Commission (provincial) use different definitions for 'private company'. / Компания, акции которой не доступны общей публике через посредника в лице фондовой биржи, и количество участников которой не превышает 50 лиц.

PRIVATE ENTERPRISE = ЧАСТНОЕ ПРЕДПРИЯТИЕ – Private Enterprise is a business or other economic organization not owned by the government but rather operated for profit or other private benefit.

PRIVATE EQUITY = ЧАСТНАЯ ДОЛЯ (или ЧАСТНЫЙ КАПИТАЛ) – Private Equity is a capital held by private and institutional investors in unlisted (publicly) traded companies. Private equity investors provide equity capital and management expertise temporarily. After five to seven years they sell their shareholding once again. Private equity firms draw their profit from the increase in value the company experiences during the period of the holding. A distinction is made between buyout capital and venture capital. Buyout funds usually acquire significant, that is, majority shareholdings in mature, established companies in the industrial and services sectors, which they finance with equity and debt capital. These include typical small and mid-sized companies as well as business units of large corporations that are spun off for strategic reasons. Venture capital funds, in contrast, hold stakes in young technology companies in an early phase of development (called Start-Ups).

PRIVATE EQUITY FINANCE = ФИНАНСИРОВАНИЕ ЧАСТНОГО КАПИТАЛА – Private Equity Finance:- equity financing provided by the bank to newly established or fast-growing companies with a sound credit rating. Also known as Equity Banking.

PRIVATE EXPORT FUNDING CORPORATION = КОРПОРАЦИЯ ПО ФИНАНСИРОВАНИЮ ЧАСТНОГО ВЫВОЗА (или КОРПОРАЦИЯ ПО ФИНАНСИРОВАНИЮ ЧАСТНОГО ЭКСПОРТА) – Private Export Funding Corporation (PEFCO) was created in 1970 to assist in the financing of US exports by supplementing the financing available from commercial banks and other lenders. PEFCO provides a broad range of export finance programs as a direct lender and as a secondary market buyer of export loans originated by other lenders (PEFCO does not buy loans directly from exporters). To be eligible for financing by PEFCO, loans must be protected against nonpayment under an appropriate guarantee or insurance policy issued by the Export-Import Bank of the United States (Ex-Im Bank) or for certain small business export loans under a guarantee issued by the Small Business Administration (SBA). Headquartered in New York, NY, the United States. The Private Export Funding Corporation (PEFCO) works with Eximbank in using private capital to finance US exports. PEFCO acts as a supplemental lender to traditional commercial banking sources by making loans to public and private borrowers located outside of the United States who require medium and/or longer-term financing of their purchases of US goods and services. PEFCO is a private sector, tax-paying entity incorporated under Delaware law and headquartered in New York City. Shareholders include commercial banks, industrial companies and financial services companies. Ownership of PEFCO shares are restricted to institutions engaged in financing, producing or exporting US goods or services. PEFCO's Board of Directors includes senior managers from international lending institutions and officers of major exporting companies. PEFCO management includes persons with significant experience in export finance and the programs of the Export-Import Bank of the United States (Ex-Im Bank), and in finance company management. PEFCO is also assisted by an Advisory Board of international lenders, an Exporters' Council of representatives from exporting companies, and a Small Business Lender Council, a network of lenders that support Ex-Im Bank's outreach to small US exporters. PEFCO was established with the support of the United States Department of the Treasury and Ex-Im Bank. Ex-Im Bank cooperates with PEFCO through a variety of agreements and maintains a broad measure of supervision over PEFCO's major financial management decisions. Ex-Im Bank is entitled to representation at all meetings of PEFCO's Board of Directors, Advisory Board, Exporter's Council, and Small Business Lender Council. PEFCO achieves its objectives by offering a broad range of financing programs as a direct lender and as a secondary market buyer of loans that finance the export sales of US goods and services and that are originated by lenders (PEFCO does not buy loans from exporters). To be eligible for financing by PEFCO, all loans must be protected against nonpayment under an appropriate guarantee or insurance policy issued by Ex-Im Bank. PEFCO programs cover the entire range of the Ex-Im Bank-supported export finance continuum:- short-term, medium-term, and long-term. Under our various programs, PEFCO support US Exports as a:- (i) short-term (60 days to 1 year):- (a) buyer of working capital loans; (b) buyer of loans financing export receivables; (c) buyer of working capital loans; (d) buyer of loans financing insured export receivables; and (e) buyer of insured buyer credit loans; (ii) medium-term (1 to 7 years):- (a) buyer of notes with floating and fixed interest rates; (b) direct lender of loans with floating and fixed interest rates; and (c) buyer of notes with floating or fixed interest rates; and (iii) long-term (7 to 15 years):- (a) direct lender of loans with fixed interest rates; and (b) buyer of notes with floating and fixed interest rates. Additionally, the PEFCO Small Business Initiative offers special programs to support loans that are not efficiently served under PEFCO's standard formats. PEFCO uses several methods to fund its programs:- (i) short-term commercial paper; (ii) long-term secured notes; and (iii) long-term collateralized notes. All of PEFCO's debt instruments are rated by Moody's and Standard & Poor's. / Мудиз Инвэстоз Сёвис Лимитид (Moody's Investor Service Ltd) и Стэндод энд Поз (Standard & Poor's).

PRIVATE ISSUER = ЧАСТНЫЙ ЭМИТЕНТ – Private Issuer:- this is a more precise term used by a Securities Commission to define a private company that has fewer then a specified number of shareholders, e.g., 50 in the case of British Columbia (BC), Canada. Issuer refers to the issuance of securities which is normally a company.

PRIVATE KEY = ЧАСТНЫЙ КЛЮЧ – Private Key:- in a public key cryptosystem that key of a user's key pair which is known only by that user.

PRIVATE MOTOR CARRIER = ЧАСТНЫЙ АВТОМОБИЛЬНЫЙ ПЕРЕВОЗЧИК – The term 'Private Motor Carrier' in the ICC (short for the Interstate Commerce Commission; it was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations) Termination Act of 1995 is defined as a person, other than the motor carrier, transporting property by commercial motor vehicle in interstate or foreign commerce when the person is the owner, lessee, or bailee of the property being transported, and the property is being transported for sale, lease, rent or bailment or to further a commercial enterprise. 49 USC §13102(13); 49 USC is short for the United States Code:- Title 49. A shipper cannot recover under Carmack against a private carrier because it is not a 'motor carrier'. See 49 USC §13102(13). A private carrier is liable as a bailee for negligence, and the plaintiff must prove that the damage or loss resulted from a cause for which the carrier is liable.

PRIVATE OFFERING, RESALES AND TRADING THROUGH AUTOMATED LINKAGES = ЧАСТНЫЕ ПРЕДЛОЖЕНИЯ, ПЕРЕПРОДАЖИ И ТОРГОВЛЯ ЧЕРЕЗ АВТОМАТИЗИРОВАННЫЕ СВЯЗИ – Private Offering, Resales And Trading Through Automated Linkages (PORTAL):- a screen-based automated trading system providing security descriptions and pricing information. Private offering, resales and trading through automated linkages (PORTAL) was developed by the National Association Of Securities Dealers (NASD) to support the distribution of private placements and to facilitate liquidity in the secondary trading of Rule 144A securities.

PRIVATE PLACEMENT = ЧАСТНОЕ РАЗМЕЩЕНИЕ (или РАЗМЕЩЕНИЕ ПО ЗАКРЫТОЙ ПОДПИСКЕ) – (1) Private Placement:- in Euromarket, the placing of short- to long-dated notes with a select group of investors (international private placements).

(2) Private Placement:- in Switzerland, the sale of medium-term notes. Under current legislation, an issue prospectus has to be published.

(3) A Private Placement is understood to be the private sale (not a public offering) of specific assets. In a private placement, the issuing bank is responsible for contacting financially strong investors, such as institutional investors or capital investment companies, and to place large blocks (tranches) of the issue with these investors without the involvement of an exchange. The advantage of a private placement is in avoiding the costs for the production of a prospectus and initial public offering as well as in enabling a quick raising of funds. Sale of the whole of a new issue of shares to a financial institution. Private Placement:- this is when companies raise capital by selling their shares (or other securities) to private investors. It is a private placement in that the shares are not offered to the public at large by way of a prospectus or exchange offering. Companies – public and private – are free to enter into such financing deals as long as they comply with relevant securities regulations. In the United States, a securities offering that is not registered with the SEC and therefore is not available to the general public. Private placements are sold to sophisticated investors with resales to Qualified Institutional Buyers (QIBs) permitted by Rule 144A.

PRIVATE PROPERTY RIGHTS = ПРАВА ЧАСТНОЙ СОБСТВЕННОСТИ – Private Property Rights are the basic rights of individuals (and organizations or associations of people functioning as a single conglomerate 'legal person' such as corporations, partnerships, churches, non-profit foundations, etc) to the peaceful possession, control and enjoyment of the things they own as well as their rights to make contracts to rent, sell or give away all or part of their various ownership rights over these possessions (or these possessions' services) to any other people willing to accept the owners' terms. The possessions over which a person has property rights may be tangible (like real estate, factory machinery, livestock, automobiles or a jack-knife) or intangible (like contractual obligations to provide goods or services at some time in the future, shares of common stock in a corporation, bonds, insurance policies, the right to broadcast over a designated radio frequency, patents, trademarks and copyrights). In highly specialized societies, property rights over particular resources may be 'unbundled' and parcelled out among many individuals according to quite complex rules of division of authority over particular aspects or uses of the resource specified in written contracts – for example, separating mineral rights from surface rights to a parcel of land, utility easements over the same land, restrictive deed covenants and so on.

PRIVATE RELEASE = ЧАСТНЫЙ ВЫПУСК – Private Release:- variety or germplasm developed and released by a private company.

PRIVATE SECTOR = ЧАСТНЫЙ СЕКТОР – In the United States, a Private Sector is the part of an economy in which goods and services are produced and distributed by individuals and organizations that are not part of the government or state bureaucracy. In the United Kingdom, private non-financial corporations, financial corporations other than the Bank of England (and Girobank when it was publicly owned), households and the non-profit institutions serving households (NPISH) sector. / В Соединённом Королевстве сектор, включающий в себя частные нефинансовые корпорации, финансовые корпорации, иные нежели Банк Англии (Bank of England) и Жиробанк (Girobank), когда он был открытым акционерным обществом, домовладения и бесприбыльные учреждения, обслуживающие сектор домовладений (БПУОД).

PRIVATE WAREHOUSE = ЧАСТНЫЙ СКЛАД (или СКЛАД ЗАКРЫТОГО ТИПА) – Private Warehouse is a warehouse operated by the owner of the goods stored there. Private Warehouse is a warehouse that is operated by the owner of what is being stored inside of it. / Склад, эксплуатируемый владельцем товаров, хранимых в нём.

PRIVILEGED VESSEL = ПРИВИЛЕГИРОВАННОЕ СУДНО – Privileged Vessel (maritime term):- one which has the right of way. / Судно, которому обязаны уступать дорогу при расхождении.

PRM = PERFORMANCE REFERENCE MODEL

PROACTIVE MAINTENANCE = УПРЕЖДАЮЩИЙ РЕМОНТ – Proactive Maintenance is a maintenance strategy for stabilizing the reliability of machines or equipment. Its central theme involves directing corrective actions aimed at failure root causes, not active failure symptoms, faults, or machine wear conditions. A typical proactive maintenance regiment involves three steps:- (i) setting a quantifiable target or standard relating to a root cause of concern, e.g., a target fluid cleanliness level for a lubricant; (ii) implementing a maintenance program to control the root cause property to within the target level, e.g., routine exclusion or removal of contaminants; and (iii) routine monitoring of the root cause property using a measurement technique, e.g., particle counting, to verify the current level is within the target. / износ .

PROBABILITY = ВЕРОЯТНОСТЬ – Probability is the proportion of times in which an event occurs in an infinitely large and hypothetical series of cases, each capable of producing an event. / Под математической Вероятностью понимается числовая

характеристика степени возможности появления какого-либо случайного события при тех или иных определённых, могущих повторяться неограниченное число раз условиях.

PROBABLE RESERVES = ВЕРОЯТНЫЕ РЕЗЕРВЫ – Probable Reserves are reserves believed to exist with reasonable certainty based on geological information. Valuable mineralization not sampled enough to estimate accurately the terms of tonnage and grade. Also called as Indicated Reserves. Probable Reserves are those unproved reserves which analysis of geological and engineering data suggests are more likely than not to be recoverable. In this context, when probabilistic methods are used, there should be at least a 50% probability that the quantities actually recovered will equal or exceed the sum of estimated proved plus probable reserves. In general, probable reserves may include (1) reserves anticipated to be proved by normal step-out drilling where sub-surface control is inadequate to classify these reserves as proved, (2) reserves in formations that appear to be productive based on well log characteristics but lack core data or definitive tests and which are not analogous to producing or proved reservoirs in the area, (3) incremental reserves attributable to infill drilling that could have been classified as proved if closer statutory spacing had been approved at the time of the estimate, (4) reserves attributable to improved recovery methods that have been established by repeated commercially successful applications when (a) a project or pilot is planned but not in operation and (b) rock, fluid, and reservoir characteristics appear favorable for commercial application, (5) reserves in an area of the formation that appears to be separated from the proved area by faulting and the geologic interpretation indicates the subject area is structurally higher than the proved area, (6) reserves attributable to a future workover, treatment, re-treatment, change of equipment, or other mechanical procedures, where such procedure has not been proved successful in wells which exhibit similar behavior in analogous reservoirs, and (7) incremental reserves in proved reservoirs where an alternative interpretation of performance or volumetric data indicates more reserves than can be classified as proved. See also Reserves. / Залежи полезных ископаемых, по которым не отобраны пробы в объёме, достаточном для точной оценки количества и качества. Также называются как Указываемые Резервы (Indicated Reserves).

PROBE = ПРОБА (или ЩУП, или ЗОНД) – Probe is:- (1) in epidemiological studies, a trap plant used to determine the conduciveness of a given environment to disease development. (2) A DNA or RNA fragment labeled with a radioactive or nonradioactive marker and used in nucleic acid hybridization experiments to detect specific DNA and RNA sequences. / Под измерительным Щупом понимаются калиброванные пластины для проверки зазоров между поверхностями. Толщина одной пластины 20 мкм – 1 мм. Обычно выпускается в виде набора пластин различной толщины. Под Зондом, от Французского слова Sonde, понимается различной формы металлические, резиновые инструменты для исследования каналов и полостей тела (например, мочеиспускательного канала), а также проведения некоторых лечебных процедур (например, промывания желудка).

PROC = PEOPLE'S REPUBLIC OF CHINA

PROCAMPO = ПРОКАМПО – PROCAMPO is a programme of direct support to farmers in Mexico. It provides for direct payments per hectare on a historical basis.

PROCESS AIDS = ВСПОМОГАТЕЛЬНЫЕ СРЕДСТВА ДЛЯ ПРОЦЕССА (или УСКОРИТЕЛИ ПРОЦЕССА) – Process Aids are used to promote easy pouring and mixing into the wash. In a liquid laundry product, water performs that function. Water also aids in dissolving other product ingredients into the formula. In a powder formula, sodium sulfate can be used.

PROCESSED PLANT PRODUCT = ПЕРЕРАБОТАННАЯ РАСТЕНИЕВОДЧЕСКАЯ ПРОДУКЦИЯ (или ПЕРЕРАБОТАННЫЙ РАСТИТЕЛЬНЫЙ ПРОДУКТ) – Processed Plant Product is a commodity derived from a plant that has been subjected to a procedure believed to have rendered the commodity free from plant pests. See the Export Certification Project (EXCERPT) for a list of processed products that are eligible for certification. EXCERPT will indicate which certificate the commodity is eligible for.

PROCESSED PLANT PRODUCTS EXPORT CERTIFICATE = ВЫВОЗНОЕ СВИДЕТЕЛЬСТВО НА ПЕРЕРАБОТАННУЮ РАСТЕНИЕВОДЧЕСКУЮ ПРОДУКЦИЮ (или ЭКСПОРТНЫЙ СЕРТИФИКАТ НА ПЕРЕРАБОТАННЫЕ РАСТИТЕЛЬНЫЕ ПРОДУКТЫ) – Processed Plant Products Export Certificate is an accountable certificate, PPQ Form 578 (short for the Plant Protection and Quarantine Form 578), used to certify eligible processed products for which PPQ Form 577 or PPQ Form 579 cannot be issued. The intended purpose of the Export Certificate, Processed Plant Products is to assist US exporters whose shipments may be placed in jeopardy if such a document is not issued. See also Completing PPQ Form 578.

PROCESSED SAMPLE = ПРОБА ОБРУШЕННОГО ЗЕРНА – A Processed Sample is a sample of grain that appears to have been cleaned at seed cleaning plants before being delivered to terminal or transfer elevators. See also Unprocessed Sample.

PROCESSED WOOD MATERIAL = ПЕРЕРАБОТАННЫЙ ДРЕВЕСНЫЙ МАТЕРИАЛ – Processed Wood Material is the products that are a composite of wood constructed using glue, heat and pressure, or any combination thereof. / К Переработанному Древесному Материалу относятся продукты, составленные из древесины сформированные с использованием клея, тепла, давления, или комбинирования перечисленных методов.

PROCESS ELEVATOR = ПРОИЗВОДСТВЕННЫЙ ЭЛЕВАТОР – A Process Elevator is an elevator which is used principally to receive and store grain for processing directly into other products.

PROCESS HEATING = ОТОПЛЕНИЕ ПРОЦЕССОВ (или ПРОЦЕССНЫЙ НАГРЕВ) – Process Heating:- Energy Efficiency program promotion of increased electric energy efficiency applications in industrial process heating.

PROCESSING = ПЕРЕРАБОТКА – Processing:- to prepare, treat, or convert to some special process.

PROCESSING DAMAGE = ПОВРЕЖДЕНИЕ ПРИ ПЕРЕРАБОТКЕ – Processing Damage is any type of damage from shearing, stenter, NIKKI Press or any machine. Finishing defect. / Порок или дефект заключительной отделки.

PROCESSING GAIN = ПРИБЫЛЬ ОТ ПЕРЕРАБОТКИ – Processing Gain:- the volumetric amount by which total refinery output is greater than input for a given period of time. This difference is due to the processing of crude oil into products, which, in total, have a lower specific gravity than the crude oil, and feedstocks processed, e.g., in conversion processes. / выработка (output). , например, .

PROCESSING OPERATIONS = ОПЕРАЦИИ ПО ПЕРЕРАБОТКЕ – Processing Operations:- this term covers:- (i) the processing of goods; (ii) the repair of goods, including restoring them and putting them in order; (iii) the use of certain goods which are not be found in the processed products, but which allow or facilitate their production, excluding fuel, energy, lubricants, equipment and tools; and (iv) the working of goods, including assembling them or fitting them to other goods.

PROCESSING PLANT = ПЕРЕРАБАТЫВАЮЩИЙ ЗАВОД (или ГАЗОПЕРЕРАБАТЫВАЮЩИЙ ЗАВОД) – Processing Plant is a plant which separates natural gas into methane and the various other gases, e.g., butane, ethane, or propane. / В газовой отрасли под Перерабатывающим или, как его называют в России, Газоперерабатывающим Заводом понимается завод по очистке газа, выделяющий из природного газа метан и иные газы, например, бутан, пропан или этан.

PROCESSING SPREAD = КУРСОВАЯ РАЗНИЦА ПО ПЕРЕРАБОТКЕ (или СПРЭД НА ПЕРЕРАБОТКУ) – A Processing Spread is a spread trade where futures contracts are bought (long) on the input (raw materials) and futures contracts are sold (short) on the output (finished goods) simultaneously. Manufacturers and processors use this hedging strategy to hedge the later purchase price of the input and the later sale price of the output. Processing spreads include: crack spread, crush spread and cattle feeder spread.

PROCESSING UNDER CUSTOMS CONTROL = ПЕРЕРАБОТКА ПОД ТАМОЖЕННЫМ КОНТРОЛЕМ – Processing Under Customs Control is a procedure allowing goods to be imported under suspension of import duties and commercial policy measures for the purposes of processing and subsequent release for free circulation at a more favorable import duty.

PROCESS LOAD = ЗАГРУЗКА ДЛЯ ПЕРЕРАБОТКИ – Process Load is a volume of material with a specified loading configuration and treated as a single entity.

PROCESS OIL = ТЕХНОЛОГИЧЕСКОЕ МАСЛО – Process Oil is an oil that serves as a temporary or permanent component of a manufactured products. Aromatic process oils have good solvency characteristics; their applications include proprietary chemical formulations, ink oils, and extenders in synthetic rubbers. Naphthenic process oils are characterized by low pour points and good solvency properties. Paraffinic process oils are characterized by low aromatic content and light color. Process Oils are special oils which are used in a wide variety of chemical and technical industries either as raw material component or as an aid to processing. / Технологические Масла – группа смазочных материалов, используемых при прокатке, прессовании, волочении, свободной ковке, объёмной и листовой штамповке чёрных и цветных металлов с целью облегчения их деформации и улучшения качества обрабатываемой поверхности. К технологическим маслам относят также масла, применяемые при закалке стали и композиции, которыми смазывают литейные формы. В качестве технологических масел применяют главным образом смеси нефтяных масел, животных и растительных жиров, мыл на основе высших жирных кислот. В их состав включают противозадирные, антиокислительные присадки, антифрикционные добавки (графит, дисульфид молибдена, тальк и другие), эмульгаторы и другие поверхностно-активные вещества.

PROCION® = ПРОСИЭН® (или ПРОСАЙЭН®, или ПРОЦИОН®) – Procion® or Procion® MX is a trade name, originally belonging to Imperial Chemical Industries PLC of Britain (in 1956), now to DyStar® of Germany (Singapore), and used for their lines of 'cold' reactive dyes, including the very popular MX family. Although it is often seen in art and hobby dyeing publications, the term 'Procion Dye' is incorrect because it omits the name of the specific family such as MX (usually what is meant) or H or H-E. DyStar® apparently no longer manufactures Procion® MX, but others, not entitled to use the Procion® name, do manufacture 'MX' type dyes. Procion® MX Dye:- this cold water fiber reactive MX dye is known the world over. Use it for immersion dyeing, tie dye, batik, airbrush, garment dyeing, screen printing, spatter painting, gradation dyeing and more. This is the only dye you can fix without using heat in some form. / Процион® – активный краситель. Английская Ройэл Кэмикэл Индэстри (Royal Chemical Industry). ДиСта® (DyStar®).

PROCUMBENT = ЛЕЖАЧЕЕ (или СТЕЛЮЩЕЕСЯ) – Procumbent:- lying on the ground but not rooting. Procumbent:- trailing or lying flat but not rooting. / стелющееся (о побегах). , но не укореняясь.

PROCURATION ENDORSEMENT = ОБЕСПЕЧИТЕЛЬНЫЙ ИНДОССАМЕНТ (или ИНДОССАМЕНТ ПО ДОВЕРЕННОСТИ) – Procuration Endorsement is an endorsement whereby the endorsee is given only the full authority to collect, without transfer of the ownership on paper.

PROCUREMENT = СНАБЖЕНИЕ (или ОБЕСПЕЧЕНИЕ) – The activities which ensure the availability of the material and or services in the desired quantity, quality, place and time from the supplier. Procurement is the process of acquiring material and/or services in the desired quantity, quality, place and time from a supplier.

PRODUCER = ПРОИЗВОДИТЕЛЬ (или ПРОДУЦЕНТ) – In the United States, Producer is a person who, as owner, landlord, tenant, or sharecropper, is entitled to a share of the crops available for marketing from the farm or a share of the proceeds. / в качестве хозяина, землевладельца, съёмщика или испольщика (издольщика), котому дана доля в . В Соединённых Штатах Америки под Кроппером, от Английского слова Cropper от слова Crop, означающее Собирать Урожай, понимается арендатор-издольщик, получающий за работу часть собранного урожая.

PRODUCER CAR = ВАГОН ПРОИЗВОДИТЕЛЯ – A Producer Car is a railcar that is loaded and shipped by a producer to a terminal elevator. Producers apply to the Canadian Grain Commission (CGC) to have a railcar allocated to them.

PRODUCER–COLORED = ВЫКРАШЕНОЕ ПРОИЗВОДИТЕЛЕМ – Producer-Colored:- xxxxx. See also Dyeing, Mass-Colored. What is the difference between producer-colored and piece-dyed fabrics? Producer-Colored Fibers are colored during the fiber-making process, while piece-dyed fabrics are colored after the fabric is woven together. Producer-colored fibers generally have better color stability to light and heat exposures. Piece-dyed products tend to come in a wider variety of shades.

PRODUCER GAS = РАБОЧИЙ ГАЗ (или ГЕНЕРАТОРНЫЙ ГАЗ) – Producer Gas is the mixture of gases produced by the gasification (BECGasification) of organic material such as biomass at relatively low temperatures (700 to 1 000 °C). Producer gas is composed of carbon monoxide (CO) and hydrogen (H_2) plus carbon dioxide (CO_2) and typically a range of hydrocarbons such as methane (CH_4). Producer gas can be burned as a fuel gas such as in a boiler for heat or in an internal combustion gas engine for electricity generation or CHP. The composition of the gas can be modified by choice of gasification parameters to be optimized as a fuel gas (producer gas) or synthesis gas which contains almost exclusively CO and H_2 and is suitable for synthesis of liquid biofuels.

PRODUCER PRICE INDEX = ИНДЕКС ПО ЦЕНАМ ПРОИЗВОДИТЕЛЕЙ – Producer Price Index (PPI) is a measure of the average price level for a fixed basket of capital and consumer goods paid by producers. An index that shows the cost of resources needed to produce manufactured goods during the previous month. Producer Price Index (PPI) is a family of indexes that measures the average change in selling prices received by domestic producers of goods and services over time. PPIs measure price change from the perspective of the seller. The PPI looks at three areas of production:- industry-based, commodity-based, and stage-of-processing-based companies. / Индекс, который показывает стоимость ресурсов, необходимых для изготовления товаров в течение предыдущего месяца.

PRODUCER SUPPORT ESTIMATE = СМЕТА ПОДДЕРЖКИ ПРОИЗВОДИТЕЛЯ – Producer Support Estimate (PSE) is an indicator of the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers, measured at farm gate level, arising from policy measure, regardless of their nature, objectives or impacts on farm production or income. The PSE measure support arising from policies targeted to agriculture relative to a situation without such policies, i.e. when producers are subject only to general policies (including economic, social, environmental and tax policies) of the country. The PSE is a gross notion implying that any costs associated with those policies and incurred by individual producers are not deducted. It is also a nominal assistance notion meaning that increased costs associated with import duties on inputs are not deducted. But it is an indicator net of producer contributions to help finance the policy measure (e.g., producer levies) providing a given transfer to producers. The PSE includes implicit and explicit

payments. The percentage PSE is the ration of the PSE to the value of total gross farm receipts, measured by the value of total production (at farm gate prices), plus budgetary support. The nomenclature and definitions of this indicator replaced the former Producer Subsidy Equivalent in 1999. Producer Support Estimate (PSE) Indicator developed and compiled by the Organisation for Economic Co-operation and Development (OECD) showing the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers, measured at farm gate level, and arising from policy measures (regardless of their nature, objectives or impacts on farm production or income). The PSE measures support arising from policies targeted to agriculture relative to a situation without such policies, i.e. when producers are subject only to general policies (including economic, social, environmental and tax policies) of the country. The percentage PSE is the ratio of the PSE to the value of total gross farm receipts, measured by the value of total production (at farm gate prices) plus budgetary support.

PRODUCER–TEXTURED YARNS = ТЕКСТУРИРОВАННАЯ ПРОИЗВОДИТЕЛЕМ ПРЯЖА – Producer-Textured Yarns:- continuous filament yarns that have been bulked during manufacturing by the fiber producer. See also Texturing. / филаментная (комплексная) пряжа (filament yarn).

PRODUCER TWIST = КРУТКА ПРОИЗВОДИТЕЛЯ – Producer Twist:- small amounts of twist, usually 1/2 turn per inch or less, applied to yarns by the manufacturer to provide cohesion of filaments for further processing.

PRODUCING BROKER = БРОКЕР, ЗАКЛЮЧАЮЩИЙ СДЕЛКИ – Producing Broker:- this term may refer to:- (i) the individual broker who obtains a proposal for insurance or reinsurance for the broking firm for which he works; or (ii) a broking firm or individual broker that is responsible for introducing a proposal for insurance or reinsurance to another broking firm. The original producing broker will be the person who deals directly with the client. The term producing broker is often used in contrast to the term of placing broker although it is common for individual brokers and broking firms to undertake both functions.

PRODUCING RESERVES = РАБОЧИЕ РЕЗЕРВЫ – Producing Reserves:- reserves subcategorized as producing are expected to be recovered from completion intervals which are open and producing at the time of the estimate. Improved recovery reserves are considered producing only after the improved recovery project is in operation. See also Reserves.

PRODUCT CARRIER = ПЕРЕВОЗЧИК НЕФТЕПРОДУКТОВ – Product Carrier is a tanker, which is generally below 70 000 deadweight tons and used to carry refined oil products from the refinery to the consumer. In many cases, four different grades of oil can be handled simultaneously. Vessel specially designed for the transport of refined petroleum products.

PRODUCT CODE = КОД ПРОДУКТА – Product Code is a series of characters assigned by the manufacturer to identify each of its products. This is usually the Stock Keeping Unit (SKU).

PRODUCT DATA SHEET = ЛИСТ ДАННЫХ О ПРОДУКТЕ (или ПАСПОРТ ПРОДУКТА) – Product Data Sheet (PDS):- With any product you purchase, it is important to read the label and product data sheet (and assembly instructions, if any) before you purchase it. The data sheet provides you with the physical properties or specifications of the product, defines where or how the product should be used, and details the expected performance of the product. This, in turn, provides you with the information needed to compare competing products and to take performance differences into consideration when evaluating cost differences. For a simple item like a can of soup, you might be looking at calories per serving, sodium content, and whether the soup is gluten, dairy, or soy free. For a riding lawnmower, you may be considering horsepower, transmission type, cutting-deck width, power or manual steering, turning radius, availability of parts and services, and warranty. If you happen to live in California, you need that riding mower to be emissions compliant as well. The ASTM standards also establish minimum performance criteria for each of the defined properties. The manufacturer's data sheets can be used to determine if a product meets the minimum criteria necessary to conform to the applicable standard. The typical insulation product data sheet (or data submittal sheet) also includes information regarding recommended uses and code compliance so that a prospective mechanical engineering specifier or end user can determine whether the specific product is suitable for a particular application (i.e. will it perform to expectation and will it conform to any applicable building codes?). While we are using flexible elastomeric insulation as an example, it is important to note that any insulation product manufactured domestically has an ASTM standard associated with it. See also Material Safety Data Sheet. Product Data Sheet (PDS):- When a manufacturer completes a Product Data Template using online data software the created output is called a Product Data Sheet (PDS). A Product Data Sheet summarises the performance and other technical characteristics of each construction product, material or component according to specific regulatory, market or client-specific requirements that have been incorporated in the template's mechanism. A PDS is like a product's passport – it is traceable to the manufacturer and unique for the construction product. PDSs allow the whole supply chain to benefit from the most accurate, up-to-date manufacturer's data, delivered by the most credible source. In addition, having data as opposed to PDFs or CDs allows for automation. Manufacturers can integrate their PDSs repository software with their PDM (product data management), PIM (product information management), DAM (digital asset management) or ERP (enterprise resource planning) systems to ensure that the data held in the PDS is always up-to-date. They can also choose the PDSs as their single source of truth (SSoT) and automatically update further third-party systems with the most accurate data. PDSs can be populated with construction product data by roles other than the manufacturer. Such PDSs are often referred to as 'project-specific' PDSs, because their author can verify the accuracy of the data held in the PDS during a limited period of time. / Лист Данных О Продукте (ЛДП) – в Российском понимании это можно было бы перевести как заводской Паспорт Продукта. Смотрите также Лист Данных О Безопасности Материала (Material Safety Data Sheet).

PRODUCT GROUPS = ГРУППЫ ПРОДУКТОВ – Product Groups are the commodity groupings used for export control purposes. / Группирования сырья, используемые в целях вывозного (или экспортного) контроля.

PRODUCTION = ПРОДУКЦИЯ – Production:- total production refers to all the crude oil (including synthetic oil), NGLs and natural gas produced from a property. Net production is the company's share of total production after deducting both royalties paid to landowners and a government's agreed-upon share of production under a production-sharing contract (PSC). Liquids production refers to crude oil, condensate, NGLs and synthetic oil volumes. Oil-equivalent production is the sum of the barrels of liquids and the oil-equivalent barrels of natural gas produced. See also Barrels Of Oil-Equivalent, Oil-Equivalent Gas, and Production-Sharing Contract.

PRODUCTION = ПРОИЗВОДСТВО – Production is a creation of a good or service intended to satisfy a need. Production is a process that creates utility. Technically, production implies the combination of certain factors of production (natural resources, labor, property) to produce a certain output. In economics, the concept of production varies from country to country, according to the types and characteristics of goods or services produced by the combination of production factors and the conditions under which they are offered to satisfy needs. / выработка (output). Под Материальным Производством понимается процесс создания материальных благ. Представляет естественное условие человеческой жизни и материальную основу других видов деятельности. Две стороны производства:- производительные силы и производственные отношения образуют способ производства, определяющий характер данного общества.

PRODUCTION BOUNDARY = РАЗДЕЛ (или РАЗМЕЖЕВАНИЕ) ПРОДУКЦИИ – Production Boundary is a boundary between production included in creating core economic accounts (such as all economic activity by industry and commerce) and production which is excluded (such as production by households which is consumed within the household).

PRODUCTION FUNCTION = ФУНКЦИЯ ПРОДУКЦИИ (или ФУНКЦИЯ ПРОИЗВОДСТВА) – Production Function is a statistically estimated function that relates the output of a production system (e.g., Rice) to the inputs used in its production, e.g., labor, capital, fertilizer, pesticides.

PRODUCTION SEQUENCE = ПОСЛЕДОВАТЕЛЬНОСТЬ ПРОИЗВОДСТВА – Production Sequence:- shearing, sorting, opening, cleaning, carding, drawing, possibly combing, possibly roving, twisting or spinning.

PRODUCTION SHARING AGREEMENT = СОГЛАШЕНИЕ О РАЗДЕЛЕ ПРОДУКЦИИ – StatoilHydro:- equity and entitlement volumes of oil and gas:- equity volumes represent volumes produced under a Production Sharing Agreement (PSA) that correspond to StatoilHydro's percentage ownership in a particular field. Entitlement volumes, on the other hand, represent StatoilHydro's share of the volumes distributed to the partners in the field, which are subject to deductions for, among other things, royalties and the host government's share of profit oil. Under the terms of a PSA, the amount of profit oil deducted from equity volumes will normally increase with the cumulative return on investment to the partners and/or production from the licence. The distinction between equity and entitlement is relevant to most PSA regimes, whereas it is not applicable in most concessionary regimes such as those in Norway, the UK, Canada and Brazil. The overview of equity production provides additional information for readers, as certain costs described in the profit and loss analysis were directly associated with equity volumes produced during the reported years. Production Sharing Agreements (PSAs) are a common type of contract signed between a government and a resource extraction company (or group of companies) concerning how much of the resource (usually oil) extracted from the country each will receive. Production sharing agreements were first used in Bolivia in the early 1950s, although their first implementation similar to today's was in Indonesia in the 1960s. Today they are often used in the Middle East and Central Asia. In production sharing agreements the country's government awards the execution of exploration and production activities to an oil company. The oil company bears the mineral and financial risk of the initiative and explores, develops and ultimately produces the field as required. When successful, the company is permitted to use the money from produced oil to recover capital and operational expenditures, known as 'Cost Oil'. The remaining money is known as 'Profit Oil', and is split between the government and the company, typically at a rate of about 80% for the government, 20% for the company. In some production sharing agreements, changes in international oil prices or production rate can affect the company's share of production. Production sharing agreements can be beneficial to governments of countries that lack the expertise and/or capital to develop their resources and wish to attract foreign companies to do so. They can be very profitable agreements for the oil companies involved, but often involve considerable risk. In Russia, a Production Sharing Agreement (PSA) is a commercial contract between the investor and the state, which allows the investor to undertake large scale, long term and high-risk investments. The purpose of the PSA is to define the terms and conditions for the exploration and development of resources by replacing existing tax and license regimes with a contract based arrangement that exists for the life of the project. Main Points:- (i) Under the PSA the Russian Federation government retains its rights and ownership of the oil and gas resources. The company invests all the capital needed to develop the fields and pays bonuses to the Russian Federation at key milestones during the project development. (ii) Sakhalin Energy pays a royalty of six percent of the oil and gas produced to the Russian government throughout the lifetime of the project. The balance of revenues, less operating expenses from production sales in the early years, is used to repay our capital investment. The remaining production, after payback of investments, is shared between the Russian Federation, the Sakhalin Oblast' (regional government) and our organization. (iii) The Russian Federation government will receive an increasing proportion of revenues from production as the project progresses. If profitability exceeds certain specified levels then the Russian Federation government receives an increasingly bigger share of the extra revenues, which can be as high as 70 percent. In addition, we pay tax on any profit that our company makes. / СтатойльХидро (StatoilHydro).

PRODUCTION–SHARING CONTRACT = КОНТРАКТ О РАЗДЕЛЕ ПРОДУКЦИИ – Production-Sharing Contract (PSC) is an agreement between a government and a contractor (generally an oil and gas company) whereby production is shared between the parties in a prearranged manner. The contractor typically incurs all exploration, development and production costs, which are subsequently recoverable out of an agreed-upon share of any future PSC production, referred to as cost recovery oil and/or gas. Any remaining production, referred to as profit oil and/or gas, is shared between the parties on an agreed-upon basis as stipulated in the PSC. The government may also retain a share of PSC production as a royalty payment, and the contractor typically owes income tax on its portion of the profit oil and/or gas. The contractor's share of PSC oil and/or gas production and reserves varies over time, as it is dependent on prices, costs and specific PSC terms.

PRODUCTION STANDSTILL = ПРОИЗВОДСТВЕННАЯ ОСТАНОВКА (или ПЕРЕБОЙ ПРОИЗВОДСТВА) – Regularly recurring Production Standstill in order that all furnaces and connected plant can be overhauled, maintained and repaired.

PRODUCTIVE ACTIVITY = ПРОДУКТИВНАЯ АКТИВНОСТЬ – Productive Activity:- task that provides the household and community with economic benefits, such as crop and livestock production, handicraft, marketing, and wage employment.

PRODUCTIVE SOIL = ПРОДУКТИВНАЯ ПОЧВА – Productive Soil is a soil in which the chemical, physical, and biological conditions are very favorable for the production of crops.

PRODUCTIVE TILLER = ПРОДУКТИВНЫЙ ПОБЕГ (или ПРОДУКТИВНЫЙ РОСТОК, или ПРОДУКТИВНЫЙ ОТРОСТОК) – Productive Tiller is a tiller that produces a panicle.

PRODUCTIVITY = ПРОДУКТИВНОСТЬ – Productivity:- output of any of the factors of production, such as capital, labor and land, per unit of input. Productivity may be enhanced by the improvement of any one of the three factors, most usually by the introduction of new technology or an incentive scheme. Productivity of capital is generally measured as a percentage per annum, that of labor in output per working hour, and that of land in output per acre or hectare. In economic theory, output of any factor of production (land, labor or capital) per unit of output. The productivity of land may be measured in terms of output per acre; the productivity of labor is measured in output per hour. Productivity:- the value of output (goods and services) produced per unit of input (productive resources) used. Thus an increase in productivity means producing more goods and services with the same amount of resources, or producing the same goods and services with fewer resources, or some combination of these two possibilities. While productivity is often measured or referred to only in terms of the productivity of labor (output per man-hour), a more precise and complete view of the sources of productivity incorporates the effects of all inputs to production, including capital, land and materials. The principal means of increasing overall productivity are:- (i) greater specialization and a more complex division of labor (often involving a geographical or territorial expansion of the relevant market area, incorporating new people with different skills and endowments of natural resources); (ii) investment in increasing the stock of capital goods; (iii) investment in so-called human capital (for example, teaching workers new or more efficient production skills; and (iv) technological innovation that creates new ways of combining somewhat different inputs of the factors of

production to produce the same goods at lower costs. The concept of the marginal productivity of an input in a productive process is a particularly important idea in economic analysis, because under competitive conditions, the equilibrium price of a factor of production (including wages, interest etc.) will tend toward equality with its marginal productivity. Marginal productivity is the increase in the value of output that can be produced by adding in one more unit of the particular input while holding other inputs constant. Thus the higher the productivity of a factor of production, the higher the income that may be expected to accrue to its providers, and anything that raises overall levels of productivity within a society may be expected to increase the average overall prosperity of the society as a whole. Productivity is the amount of physical output for each unit of productive input. / Выработка (output). Под Производительностью Оборудования понимается объём продукции (работы), производимой в единицу времени данным оборудованием в соответствии с его конструктивными особенностями, технической характеристикой и определёнными организационно-производственными условиями. Производительность оборудования измеряется в метрах, тоннах, штуках и так далее в единицу времени.

PRODUCTIVITY DECLINE = СНИЖЕНИЕ ПРОДУКТИВНОСТИ – Productivity Decline is a decline in total factor productivity (TFP) over time, where total factor productivity is the productivity of all inputs taken together.

PRODUCT LIABILITY INSURANCE = СТРАХОВАНИЕ ОТВЕТСТВЕННОСТИ ЗА КАЧЕСТВО ПРОДУКЦИИ – Product Liability Insurance is insurance that covers against any claims for compensation for injury or damage caused by your products. Insurance of the liability of the manufacturer or supplier of goods for damage caused by their products. / Страхование ответственности изготовителя или поставщика товаров за причинение ущерба, вызванного их продукцией.

PRODUCT LIFECYCLE MANAGEMENT = УПРАВЛЕНИЕ СРОКОМ СЛУЖБЫ ПРОДУКТА – Product Lifecycle Management (PLM) is a business strategy that helps fashion companies share product data, apply common processes, and leverage corporate knowledge for the development of clothing, textiles or trimming from conception to retirement, across the extended enterprise. By including all company departments, business partners, suppliers, original equipment manufacturer (OEM), and customers, PLM enables the entire team to operate as a single entity to conceptualize, design, build, and support products.

PRODUCT STANDARD = СТАНДАРТ НА ПРОДУКТ – Product Standard:- the material having a color designated as standard for a specified product.

PROFESSIONAL CORPORATION = ПРОФЕССИОНАЛЬНАЯ КОРПОРАЦИЯ – In the United States, a Professional Corporation is the corporation whose purposes are limited to professional services, such as those performed by doctors, dentists and attorneys. A professional corporation is formed under special state laws that stipulate exactly which professionals are required to incorporate under this status. In the United States, Professional Corporations (abbreviated as PC or P.C.) are those corporate entities for which many corporation statutes make special provision, regulating the use of the corporate form by licensed professionals such as attorneys, architects, and doctors.

PROFESSIONAL INDEMNITY INSURANCE = СТРАХОВАНИЕ ПРОФЕССИОНАЛЬНОЙ ОТВЕТСТВЕННОСТИ (или СТРАХОВАНИЕ ОТ ОШИБОК И УПУЩЕНИЙ В РАБОТЕ) – Professional Indemnity Insurance:- liability insurance cover which protects professional specialists such as physicians, architects, engineers, lawyers, accountants and others against third party claims arising from activities in their professional field; policies and conditions vary according to profession. Professional Indemnity Insurance is insurance that indemnifies a professional against their legal liability towards third parties for loss arising from their professional negligence or that of their employees.

PROFESSIONAL INVESTOR FUND = ФОНД (ДЛЯ) ПРОФЕССИОНАЛЬНЫХ ВКЛАДЧИКОВ КАПИТАЛА (или ФОНД (ДЛЯ) ПРОФЕССИОНАЛЬНЫХ ИНВЕСТОРОВ) – A Professional Investor Fund (PIF) is a type of Collective Investment Scheme (CIS) that, generally, takes the form of an open-ended investment company in the form of a SICAV (short for Société d'Investissement à Capital Variable (SICAV); in French investment company with variable capital). Since a PIF is a non-retail form of CIS, it is not subject to the rigid requirements traditionally associated with other retail forms of CISs. Since PIFs are non-retail and due to the high degree of risk associated with them, 2 main conditions are imposed:- (i) they may not be sold to the general public but only to Authorised Investors (also known as Professional Investors or Qualified Investors) who must satisfy certain criteria; and (ii) they are subject to a minimum investment threshold of USD100 000.00 (in Malta) or the equivalent in any convertible currency. A Professional Investor Fund (PIF) must impose a minimum subscription of EUR125 000.00 and can avail of increased flexibility in relation to investment and borrowing parameters compared to retail CISA (short for new Swiss Federal Collective Investment Schemes Act of 2006-June-23 which is came into force on 2007-January-01) PIF must impose a minimum subscription of EUR125 000.00 and can avail of increased flexibility in relation to investment and borrowing parameters compared to retail collective investment scheme (CIS). / Сосьетэ Давэстисмо а Капиталь Варъябль (Эс.И.Сэ.А.Ви.; Société d'Investissement à Capital Variable (SICAV)).

PROFESSIONAL LIABILITY INSURANCE = СТРАХОВАНИЕ ПРОФЕССИОНАЛЬНОЙ ОТВЕТСТВЕННОСТИ – Professional Liability Insurance is the liability insurance to indemnify professionals, doctors, lawyers, architects, etc for the loss or expense resulting from claim on account of bodily injuries because of any malpractice, error or mistake committed or alleged to have been committed by the insured in his profession.

PROFESSIONAL REINSURER = ПРОФЕССИОНАЛЬНЫЙ ПЕРЕСТРАХОВЩИК – Professional Reinsurer is a term used to designate a company whose business is confined solely to reinsurance and the peripheral services offered by a reinsurer to its customers as opposed to primary insurers who exchange reinsurance or operate reinsurance departments as adjuncts to their basic business of primary insurance. The majority of professional reinsurers provide complete reinsurance and service at one source directly to the ceding company.

PROFESSIONAL SERVICES = ПРОФЕССИОНАЛЬНЫЕ УСЛУГИ (или ЭКСПЕРТНЫЕ УСЛУГИ) – Professional Services are the services provided to a principal that may include the rendering of advice, recommendations, findings, or an opinion based upon actuarial considerations with respect to financial reporting under the International Financial Reporting Standards (IFRSs) and consistent with recognized actuarial practice.

PROFESSIONAL TRADERS = ПРОФЕССИОНАЛЬНЫЕ ТОРГОВЦЫ – Professional Traders are the banks and brokers directly represented on the securities markets and stock exchanges and which trade in bonds and stocks for their own account or that of clients. / Банки и брокеры, непосредственно представленные на рынке ценных бумаг и фондовых биржах и которые торгуют облигациями и акциями за свой собственный счёт или за счёт клиентов.

PROFIT = ПРИБЫЛЬ – In the United States, a Profit is the amount of the excess of total sales revenue over the total costs of production of the good(s) or service(s) produced by a business firm. The term 'Profit' is used somewhat more narrowly by economists than the way it is used by the Internal Revenue Service (IRS) or even by most businessmen and accountants. The economists' concept of profit emphasizes that 'costs of production' for purposes of the definition include the full opportunity costs of all the factors of

production utilized – an amount for each reflecting what it could yield if employed in the most lucrative available alternative use. This would include not only the amount of money actually paid out for wages, materials, rent, machinery and what have you but also what the money tied up in the business could otherwise be earning in other uses at similar levels of risk. Whereas accountants and the IRS (short for the Internal Revenue Service) do not subtract out the opportunity costs of capital (unless interest is actually being paid by the firm to an outside lender), economists would insist that 'profit' in the true sense refers only to what is left after deduction of the going rate of return on capital for the owners equity in the business as well. In other words, for the economist, the owners' profit does not technically include the amount of 'interest' that they should be paying themselves for the use of their own capital – pure economists' profit includes only what the owners are making above and beyond the going rate of interest they could be making by loaning out their financial resources rather than using them to run a business. So a firm that is managing to cover all its bills and its maintenance / replacement costs out of sales with, say, 5% of the value of the investment left over at the end of each year would not technically be making a profit in the eyes of an economist if the owners could be making 5% on their invested capital by just putting it in a CD at the bank or savings and loan. The IRS and most accountants would still say that same firm is 'profitable' in their usage of the term. In the case of unincorporated firms where the owner (or owners) works full time in the business, the divergence between economists' definition of profit and the IRS/accounting definition of profit is still larger because any 'salary' that an owner- manager takes out of the till for his living expenses is still counted by the IRS as part of the profits (and hence, in the eyes of the IRS, 'unearned income'); the economist, on the other hand would deduct what the owner-manager's services could command as an employee elsewhere from profits as part of the labor costs of production. Profits (in the economists' sense, but not in the accounting sense) are a direct measure of the net increase in total value generated by employing scarce resources in one particular use rather than in their most valuable alternative use in some other undertaking. Economic profitability indicates (in the absence of externalities) that consumers value the product more than any others that could have been produced with the resources expended. Conversely, losses indicate that resources have been used unwisely – the firm has miscalculated, and the resources committed could better have been used to produce other products more desired by consumers. Hence follows the famous conclusion of Adam Smith that in selfishly seeking to maximize his profits the businessman unwittingly is also maximizing the benefits to society as a whole from the efficient utilization of the resources under his control. In the United Kingdom, a Profit is the return received on a business undertaking after all operating expenses have been met. The income remaining after deduction of all expenses during a specific period. In the case of banks, total income less interest paid is considered gross operating earnings, whereas total gross income minus all operating and non-operating expenses is called the Net or Clear Profit. The disposable net profit consists of the net profit for the year plus any surplus carried forward from the previous financial year. Excess of selling price over all costs of making a sale. Gross profit equals total sales minus the cost of sales. Gross profit less operating expenses (overhead) equals operating profit. Operating profit less income taxes gives net profit. In the United States, for the purposes of constructed value in an antidumping duty investigation or review, the Profit used is the profit normally earned by a producer, from the country of export, of the same or similar product as that under investigation. By statute, the amount of profit shall not be less than 8 percent of the sum of general expenses and cost. Also known as Earnings or Income in the United States. Profit is the income remaining after all business expenses are paid. / Прибыль, экономическая категория, выражающая финансовые результаты хозяйственной деятельности предприятий. При капитализме прибыль – превращённая форма прибавочной стоимости, результат эксплуатации труда наёмных рабочих – составляет цель капиталистического производства. Представляет собой изишек стоимости над издержками производства. В условиях домонополистического капитализма стремление к получению наивысших прибылей воплощалось, с одной стороны, в присвоении отдельными капиталистами добавочной прибыли – сверхприбыли, с другой – в образовании средней прибыли. Переход к монополистическому капитализму создал экономические предпосылки для извлечения монопольной прибыли.

PROFITABILITY = РЕНТАБЕЛЬНОСТЬ (или ПРИБЫЛЬНОСТЬ) – Profitability:- the capacity to gain or profit, or to return a profit or income. The productive capacity of a company, measured in terms of the profit produced during a certain period in relation to the capital employed. More narrowly defined, the ratio of the net profit generated to the capital resources. See also Return On Equity. Capacity of invested capital to produce income, expressed in financial terms, as a yield, or of a business entity to produce profits. Profitability are measures that attempt to answer the question 'Are we making enough money for the effort?' and allow strengths and weaknesses to be identified. Profitability measures the relationship between the profits earned and the amount of financial resources necessary to earn the profit. Thus the basic measure expresses a return (Profit) as a percentage of an investment. Additionally, measures of profitability must be from two viewpoints, those of management and of stockholders. Key measures of profitability are as follows:- (i) Operating Profit/Total Assets (%); (ii) Operating Profit/Sales; (iii) Sales/Total Assets; (iv) Return on Capital Employed; (v) Earnings/Stockholders' Equity; (vi) Dividends/Earnings; (vii) Times Covered; (viii) Market Capitalization; and (ix) Price Earnings Ratio. / Под Рентабельностью, от Немецкого слова Rentabel, означающее Выгодный или Доходный или Прибыльный, понимается показатель экономической эффективности производства на предприятиях (объединениях), в отраслях и народном хозяйстве в целом. Комплексно отражает использование материальных, трудовых и денежных ресурсов и природных богатств. Рентабельность – один из важнейших экономических показателей работы предприятия, означающий, что средствами, полученными предприятием от реализации своей продукции, оно полностью возмещает затраты на производство продукции и обеспечивает сверх того получение чистого дохода (прибыли). В бывшем СССР различали:- (i) общую рентабельность – процентное отношение балансовой (общей) прибыли к среднегодовой суммарной стоимости производственных основных фондов и нормируемых оборотных средств; и (ii) расчётную рентабельность – отношение расчётной прибыли к среднегодовой стоимости тех производственных основных фондов, с которых взимается плата за фонды. Применялся также показатель уровня рентабельности к текущим затратам (отношение прибыли к себестоимости товарной или реализованной продукции).

PROFIT AND LOSS ACCOUNT = СЧЁТ ПРИБЫЛЕЙ И УБЫТКОВ (или ОТЧЁТ О ПРИБЫЛЯХ И УБЫТКАХ) – In the United Kingdom, Profit And Loss Account is the annual summary of a company's financial operations, required by law to be submitted by every trading company. The profit-and-loss account has three sections:- (i) the trading account, (ii) the profit-and-loss account, and (iii) the appropriation account. The profit and loss section of the account takes the profit or loss figure from the trading account, and after accounting for income not concerned with trading and expenses such as those incurred in administration, deducts tax from the final profit or loss figure. In the United Kingdom, a list comparing all expense items and all income items of a company for the past financial year. Also known as Income Statement in the United States. Profit and Loss Account shows the net profit which is left after all relevant business expenses have been deducted. / строка баланса (item).

PROFIT AND LOSS ACCOUNT RESERVE = РЕЗЕРВ СЧЁТА ПРИБЫЛЕЙ И УБЫТКОВ – In the United Kingdom, Profit And Loss Account Reserve is a reserve that contains the balance of retained earnings to carry forward. It is fully distributable and shown as part of shareholders' reserves on the balance sheet. Also known as Retained Earnings in the United States.

PROFIT AND LOSS STATEMENT = ОТЧЁТ О ПРИБЫЛЯХ И УБЫТКАХ – Profit And Loss (P&L) Statement is a financial statement that summarizes the revenues, costs and expenses incurred during a specific period of time - usually a fiscal quarter or year. These records provide information that shows the ability of a company to generate profit by increasing revenue and reducing costs. The P&L

statement is also known as a 'Statement Of Profit And Loss', an 'income statement' or an 'income and expense statement'. The statement of profit and loss follows a general form as seen in this example. It begins with an entry for revenue and subtracts from revenue the costs of running the business, including cost of goods sold, operating expenses, tax expense and interest expense. The bottom line (literally and figuratively) is net income (profit). Many templates can be found online for free, that can be used in creating your profit and loss, or income statement. The balance sheet, income statement and statement of cash flows are the most important financial statements produced by a company. While each is important in its own right, they are meant to be analyzed together. Profit & Loss Statement is a key account providing information describing how the company has been trading over a period of time. It is described under Income Statement. Profit And Loss Statement is a financial statement that compares sales to expenses to measure profitability. This statement is usually viewed by corporation and store (profit center) for months, quarters and years. Also known as Income or P&L Statement.

PROFIT ATTRIBUTABLE TO SHAREHOLDERS = ПРИБЫЛЬ, ОТВОДИМАЯ АКЦИОНЕРАМ – In accounting in the United Kingdom, Profit Attributable To Shareholders is the difference between revenue from sales and other operations and costs and expenses over a given accounting period. Also known as Net Income in the United States.

PROFIT COMMISSION = КОМИССИЯ С ПРИБЫЛИ – Profit Commission is a commission that is payable according to a pre-determined formula as an incentive and reward for profitable underwriting. The following are examples of profit commission:- (i) the commission paid to a coverholder by a managing agent for underwriting a profitable account; (ii) at the Corporation of Lloyd's, the commission paid by a member to a managing agent in respect of the profitability of its syndicate in a given year of account; and (iii) the commission paid by a reinsurer to an insurer in respect of a profitable reinsurance treaty. Profit Commission is a provision found in some reinsurance agreements which provides for profit sharing. Parties agree to a formula for calculating profit, an allowance for the reinsurer's expenses, and the cedant's share of such profit after expenses.

PROFIT FOR THE YEAR = ПРИБЫЛЬ ЗА ОТЧЁТНЫЙ ГОД – In the United Kingdom, . Also known as Net Income in the United States. Profit is the term used to describe the amount of income received after deducting all the expenses paid out in earning that income. May also be used to describe the amount you receive on the sale of an asset after deducting the cost of the asset and any expenses that you incurred in buying or selling that asset. Profit is a difference between the selling price and the production cost. This means production cost in its wide sense, that is not only the cost of manufacturing a product, but all the fixed and variable costs incurred in the process of producing and delivering the product or service. A more refined definition of profit is that of net profit. This is the income remaining after all costs have been subtracted. The net profit figure may be stated as being before or after tax. Operating profit is a term used to define profit (or loss) arising from the principal trading activity of a company. Operating profit is calculated by deducting operating expenses – expenses vital to core activity – from trading profit – profit before deduction of items such as auditors fees, interest etc. Normal profit is the profit needed to keep a firm from switching its resources into the production of other goods and services. Abnormal profit is profit earned over and above normal profit. Pre-tax profit is profit before corporation tax and any other taxes on profit have been paid; post-tax profit is profit after tax. Retained profit is profit not distributed to shareholders but kept back to invest in the business. The Profit and Loss (P&L) Statement is also known as the Income Statement. It shows how well a company buys and sells inventory (or services) to make a profit. A firm must create a profit in order to survive and remain solvent. Careful analysis of the components of a P&L is important in determining the cash flow available to repay existing debt, finance additional debt (for business expansion), or to reinvest in the company. Just as the Balance Sheet is a snapshot of the financial condition of a company at a certain point in time, the Profit and Loss statement shows the results of financial operations over a period of time. The amount of time could be a month, a quarter of a year, a half year, or a year. / строка баланса (item).

PROFIT MARGIN = РЕНТАБЕЛЬНОСТЬ (или МАРЖА ПО ПРИБЫЛИ, или ПРИБЫЛЬНАЯ ВЫГОДА, или КОЭФФИЦИЕНТ ПРИБЫЛЬНОСТИ) – Profit Margin:- with respect to financial reporting, this term refers to a company's performance with respect to it's net profitability after taking into account overhead or operating costs. For example, if a company sells goods for total proceeds of CAD100K and the direct cost of producing (or acquiring) those goods is CAD60K, then the gross margin is CAD40K, usually expressed as a percentage, i.e. 40% GM. After subtracting fixed (i.e. overhead) expenses such as salaries and rent, from the Gross Margin, the result is Net Profit (before tax) or Profit Margin. In the example, if the expenses and operating costs are CAD30K, this has to be subtracted from Gross Margin leaving a Profit Margin of CAD10K (i.e. 10%). Profit Margin is a ratio of net profit and sales, determined by subtracting the total cost of sales from net sales income. Gross profit, usually expressed as a percentage of net sales, or as simple net profit. Company policy generally specifies some profit margin below which it is hardly worthwhile producing goods.

PROFIT–SHARING = УЧАСТИЕ В ПРИБЫЛИ – Practice of distributing part of a business entity's profits to employees as a kind of incentive bonus, in addition to regular salaries. Profit-Sharing:- distribution of some or all of a firm's profits to its employees as a bonus. The distribution may be in the form of cash or shares.

PROFIT TAKING = ВЗЯТИЕ ПРИБЫЛИ (или ФИКСАЦИЯ ПРИБЫЛИ) – (1) Profit Taking occurs when dealers believe that the market will not improve much more, at least in the short term. Selling asset which has appreciated in value since purchase, in order to realize the profit. Realizing a stock market profit by either selling the securities at a price which is higher than the cost price or, in the case of a short sale, by repurchasing the securities at a price which is lower than the selling price. The liquidation of positions that have accrued trading profits. Most often given as the reason for a slight pullback in the market after a rally. Stock market term used to describe the action taken by investors to sell their securities when prices are rising in order to secure gains. This enables market participants to realize profits before prices possibly start to fall again. See also Paper Profit. / откупанием ценных бумаг .

(2) Profit Taking:- this term is often used to explain a downturn in the market following a period of rising prices. / Этот термин часто используется при объяснении снижения цен на рынке, происходящего вслед за периодом роста цен.

PRO FORMA = ПРО ФОРМА – Pro Forma:- in Latin, For Form; As A Matter Of Form; Performed In A Set Manner. In Latin, term meaning For The Sake Of Form. Pro Forma is a presentation of financial information that gives effect to an assumed event, e.g., merger. / Про Форма:- Замещаемая Форма в переводе с Латинского языка. Под Про Формой понимается:- (1) бланк, формуляр какого-либо документа. (2) Формально выполненное условие, действие; исполнение чего-либо только для вида.

PRO–FORMA INVOICE = СЧЁТ–ФАКТУРА ПРО–ФОРМА (или ЗАМЕЩАЕМЫЙ СЧЁТ–ФАКТУРА) – Pro-Forma Invoice is an invoice provided by a supplier prior to the shipment of merchandise, informing the buyer of the kinds and quantities of goods to be sent, their value, and specifications (weight, size, etc). Draft invoice sent to an importer by the exporter prior to order confirmation and shipment to assist in matters relating to obtaining import licences or foreign exchange allocations, or to advise the value of a shipment for the purposes of opening Letters of Credit. Pro-Forma Invoice is a document serving as a preliminary invoice, containing – on the whole – the same information as the Final Invoice, but not actually claiming payment. Once published, an invoice cannot be deleted under any circumstances. Only a preliminary invoice can be deleted. Also known as Preliminary Invoice, and Provisional Invoice. See also Commercial Invoice, Consular Invoice, Customs Invoice, Final Invoice, Invoice, Preliminary Invoice, and Provisional Invoice. /

Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Консульский Счёт-Фактура (Consular Invoice), Таможенный Счёт-Фактура (Customs Invoice), Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), и Условный Счёт-Фактура (Provisional Invoice). Замещаемый Счёт-Фактура:- счёт, выписываемый при частичных поставках товара или в тех случаях, когда приёмка товара производится по прибытии к покупателю. После поставки всей партии или приёмки, продавцом выписывается счёт-фактура, по которому производится окончательный расчёт.

PROGENY = ПОТОМОК (или ПОТОМСТВО) – Progeny:- offspring; individuals resulting from mating.

PROGENY TEST = ТЕСТ ПО ПОТОМСТВУ – Progeny Test determines the genetic characteristics and evaluates the genotype of a variety or parent based on the performance of its progeny. / и вычисляет генотип разновидности или .

PROGRAM = ПРОГРАММА – Program (agricultural):- Government activities aimed at accomplishing a certain result. Such activities include agricultural price support loans, purchases and payments, commodity storage, transportation, exports, and acreage reduction.

PROGRAM COSTS = ЗАТРАТЫ ПО ПРОГРАММЕ – Program Costs:- no single definition it applicable to all uses. Program costs may be gross or net expenditures of the US governmental Commodity Credit Corporation (CCC) on a commodity during a fiscal year or other period. Program costs may be the realized loss on disposition of a commodity, plus other related net costs during a fiscal year or other period. Program costs may be the net costs attributed to a particular year's crop of a commodity during the marketing year for that commodity.

PROGRAM EVALUATION AND REVIEW TECHNIQUE = ТЕХНИКА ПРОГРАММНОГО ВЫЧИСЛЕНИЯ И ОБЗОРА – Program Evaluation And Review Technique (PERT) is a management tool for defining and integrating events and processes that must be accomplished in time to assure completion of project objectives on schedule.

PROGRAM TRADING = ПРОГРАММНАЯ ТОРГОВЛЯ – Program Trading is use of computer-based market analyses programs for a computerized specification of buy and sell decisions based on mathematical models. The necessity and advantageousness of this computerized operation results from its capacity to rapidly and efficiently process large amounts of data (spot and futures market prices, interest rates, dividends, taxes, transaction costs). Thus it provides the possibility to monitor and evaluate price developments in different markets and thus, if appropriate, to act or react quickly. Program trading is used for the purposes of arbitrage between the spot and futures markets. The purchase (or sale) of a large number of stocks contained in or comprising a portfolio. Originally called program trading when index funds and other institutional investors began to embark on large-scale buying or selling campaigns or 'programs' to invest in a manner that replicates a target stock index, the term now also commonly includes computer-aided stock market buying or selling programs, and index arbitrage.

PROGRESSIVES = ПРОГРЕССИВНЫЕ (или ПРОДВИНУТЫЕ, или ПРОГРЕССИСТЫ) – In the United States, Progressives are the farmers and ranchers opposed to big Eastern-based money trusts and conservatives in the government during the late 1800s and early 1900s.

PROGRESSIVE TAX = ПРОГРЕССИВНЫЙ НАЛОГ – Progressive Tax is a tax that tends to take a smaller percentage of the incomes of lower income citizens compared to the percentage it takes of the incomes of wealthier citizens. Example:- an income tax with steeper rates for those in higher income brackets, or a special sales tax levied only on expensive 'luxuries' like yachts or jewelry. See also Regressive Tax.

PROHIBITION = ЗАПРЕЩЕНИЕ – Prohibition is a phytosanitary regulation forbidding the importation or movement of specified pests or commodities. / привоз (importation).

PROJECT FINANCE = ПРОЕКТНОЕ ФИНАНСИРОВАНИЕ – Project Finance is a complex financing program for an independent economic unit. The companies behind the project bear only part of the risk, collateral is restricted to project assets, and debts are paid exclusively out of the project cash flow. Financing is usually for major projects and is provided by international banking consortiums. / Программа комплексного финансирования независимого хозяйствующего субъекта.

PROJECTILE LOOM = МЕТАТЕЛЬНЫЙ ТКАЦКИЙ СТАНОК (или ТКАЦКИЙ СТАНОК С ЛЕТЯЩИМ ТЕЛОМ) – The Projectile Weaving Machine made its appearance in the market at the beginning of the 1950's and is today still used in the whole world. Thanks to its steady renovation and to the use of advanced electronic systems as well as of microprocessors for the supervision and the control of the various devices, this machine is characterized by a good productivity level (450 rpm and 1 050 m/min of inserted weft) and by high operational reliability. It is established especially in the field of machines with high reed width. General operation:- in this weaving machine the weft insertion is carried out by small clamp projectiles, which number depends on the weaving width and which with their grippers take out the weft yarn from big cross-wound bobbins and insert it into the shed always in the same direction. The projectiles work in sequence, that is they are launched in succession. They run therefore one after the other, describing in the space a continuous, endless route, as if they would be stuck on a conveyor belt. The first projectile takes and holds in its back the weft in form of a tail; then, pushed by the release of the projectile thrower, it passes through the shed and deposits the weft inside the warp; subsequently the projectile falls and is collected by a device which, by passing under the array of the warp threads, takes it at reduced speed back to the starting point. Here the projectile goes up to take up a new weft; meanwhile the other projectiles have run after each other making the same operation. Projectile Loom is a shuttleless loom that uses small, bullet-like projectiles to carry the filling yarn through the shed. Fill is inserted from the same side of the loom for each pick. A tucked selvage is formed. See also Weft Insertion. Sulzer brothers, Winterthur, Switzerland, Who are pioneer in the field of projectile method of weft insertion, have been able to convert a brilliant concept Roshman into a viable commercial weaving machine. It is introduced in the market in 1953.The main feature of this machine is weft insertion system. A bullet like shuttle 90 millimeters (mm) long and weighting about 40 grams (g), technically named as gripper projectile is used here to insert the weft thread into the warp threads. Sulzer projectile weaving machine differs from a conventional automatic loom mainly in two respects:- The method of insertion of weft into the warp shed; and The method of moving the reed and the projectile track. Main Features of Projectile Loom:- (1) The picking are projectile receiving units are separated from the moving sley. The sley carries the reed and gripper guides. (2) The gripper projectile made of fine steel, 90 mm long 14 mm wide and 6 mm thickness weight is 40 g. It carries the weft thread into the warp shed. (3) The weft is drawn directly from a large stationary cross wound package. There is no weft winding. (4) The gripper projectile is picked across the warp shed at a very high speed ,the picking energy being derived from the energy stored in a metal torsion bar which is twisted at predetermined amount of released to give the projectile a high rate of acceleration. (5) Picking always takes place from one side, but several projectiles are employed and all of them return to the picking side by a conveyor chain located underneath the warp shed. (6) During its flight through the shed the projectile runs in a rake likes steel guides, so that the warp threads are touched neither by the projectile nor weft thread. (7) Every pick is cut off at the picking side near the selvedge after weft insertion, leaving a length about 15 mm from the edge. Similar length of weft also projects from the selvedge on the receiving side. (8) The ends of weft thread projecting on both sides of the cloth are tucked into the next shed by means of special tucking device and woven in with next pick, thus providing firm selvedges. (9) The reed is not

reciprocated as in a shuttle loom, but rocked about its axis by a pair of cams. (10) The reed and projectile guides are stationary during pick insertion. (11) The sley which carries the reed and projectile guides is moved forward and backward through a saddle carrying two follower bowls, which bear against the surface of two matched cams. (12) A sley dwell of 25 degree at back center enables the projectile to travel through the warp shed without being unnecessary reciprocated by the sley. (13) Whenever the reed width is reduced for weaving a small width cloth from the standard reed width, the projectile receiving unit is moved inward on the telescope shaft, to the new selvedge position, and so the projectile travel distance is reduced. (14) Smaller shed opening because of the smaller size projectile. This might result in lower warp breakage rate. (15) Weft insertion rate up to 900–1 500 meters per minute (m/min) is possible depending up to the width of the weaving machine. (16) The color changing mechanism is less complicated. (17) In case of weft breakage the take up beam and heald frames can de driven in reverse by a pick finding mechanism. Advantages of Projectile Loom as a Modern Loom:- (1) Two or three cloths can be woven simultaneously. (2) It is possible to achieve weaving performances with breakage rate per square meter of cloth. 50% of the number of breaks that would occur on a conventional loom. (3) The lower warp breakage rate in a projectile weaving machine may be due to:- (i) Smaller warp shed; (ii) Reed with higher ratio of air to wire (70:30); and (iii) Beat up line being nearer to the centre of the reed between the two baulks. Smaller warp shed will reduce the warp threads tension to some extent. However care should be taken to maintain uniform tension to ensure that the warp shed is of same depth from one end to another. Otherwise a few slack warp threads at the top shed will result in stitching and end cut of the projectile. (4) Since the projectile is passing through guides there is no reed to projectile or projectile to yarn contact. (5) With the introduction of four/six colors weaving machine all the mechanical problems of the conventional pick and pick multicolored loom are eliminated. Suggestions:- The main feature of projectile loom is inserting the weft thread by projection method. If the fault from the machine can be reduced then it will have the more weaving speed. / уточная пряжа . братья Зульца (Sulzer).

PROJECT LICENSE = ЛИЦЕНЗИЯ НА ПРОЕКТ – The US Bureau of Export Administration uses the Project License to authorize largescale exports of a wide variety of commodities and technical data for specified activities. Those activities can include capital expansion, maintenance, repair or operating supplies or the supply of materials to be used in the production of other commodities for sale.

PROKARYOTE = ПРОКАРИОТ – Prokaryote:- organisms characterized by the absence of major organelles such as nucleus and plastids. / Под Прокариотами, от Латинского слова Pro, означающее Вместо или Вперёд, и Греческого слова Káryon, означающее Ядро, понимаются организмы, не обладающие, в отличие от эукариот, оформленным клеточным ядром и типичным хромосомным аппаратом. Наследственная информация реализуется и передаётся через ДНК. Типичный половой процесс отсутствует. К Прокариотам относятся Бактерии, в том числе Цианобактерии (Синезелёные Водоросли). В системе органического мира Прокариоты составляют Надцарство. Прокариоты доядерные (Prokariota), организмы, не обладающие типичным клеточным ядром и хромосомным аппаратом. К Прокариотам относятся Бактерии, синезелёные водоросли, риккетсии, микоплазмы и другие. Согласно новейшей системе органического мира, Прокариоты придают ранг Царства или Надцарства, противопоставляя его другому Царству или Надцарству – Эукариотам. Материальный субстрат, связанный с передачей и реализацией наследственной информации, представлен у Прокариотов нитью дезоксирибонуклеиновой кислоты (ДНК), имеющей обычно кольцеобразную форму и локализованной более или менее в центральной части организма. Эта часть, называемая Нуклеоидом, не отграничена мембраной от цитоплазмы. ДНК у Прокариот, в отличие от Эукариотов, обычно не связана с белками гистонами (не образует нуклеогистон), и регуляция работы генов осуществляется через метаболиты. У них нет также митохондрий и сложно устроенных жгутиков. Прокариоты играют очень важную роль в круговороте веществ в биосфере. Синезелёные Водоросли были, вероятно, первыми автотрофными организмами, появившимися на Земле в процессе эволюции жизни. Прокариоты – это организмы, в клетках которых отсутствует оформленное ядро. Его функции выполняет нуклеоид (то есть ‘подобный ядру’); в отличие от ядра, нуклеоид не имеет собственной оболочки. Тело Прокариот, как правило, состоит из одной клетки. Однако при неполном расхождении делящихся клеток возникают нитчатые, колониальные и полинуклеоидные формы (бактероиды). В прокариотических клетках отсутствуют постоянные двумембранные и одномембранные органоиды:- пластиды и митохондрии, эндоплазматическая сеть, аппарат Гольджи и их производные. Их функции выполняют мезосомы – складки плазматической мембраны. В цитоплазме фотоавтотрофных Прокариот имеются разнообразные мембранные структуры, на которых протекают реакции фотосинтеза. Иногда их называют Бактериальными Хроматофорами. Специфическим веществом клеточной стенки Прокариот является муреин, однако у некоторых Прокариот муреин отсутствует. Поверх клеточной стенки часто имеется слизистая капсула. Пространство между мембраной и клеточной стенкой служит резервуаром протонов при фотосинтезе и аэробном дыхании. Размеры прокариотических клеток изменяются от 0.1–0.15 мкм (микоплазмы) до 30 мкм и более. Большинство Бактерий имеет размеры 0.2–10 мкм. У подвижных Бактерий имеются жгутики, основой которых служит белки флагеллины.

PROLIFEROUS = ПРОЛИФЕРИРУЮЩЕЕ (или ОТПРЫСКОВОЕ) – Proliferous:- bearing vegetative offsets. Used to describe flowers or fruits that produce further flowers. / В ботанике Отпрысковое . Под Пролиферацией, от Латинских слов Proles, означающее Отпрыск или Потомство, и Fero, означающее Несу, понимается .

PROLONGATION = ПРОЛОНГАЦИЯ (или ПРОДЛЕНИЕ) – Prolongation:- extension of the maturity or running period of a transaction or an order. If a stock exchange transaction is not executed at the performance date as agreed but further extended, the act of postponement is known as a Prolongation (carry-over transaction). Postponing the due date of a bill is called Bill Renewal or Prolongation. Also known as Renewal. / надлежащая (причитающаяся) дата . Под Пролонгацией, от позднелатинского слова Prolongatio от Prolongo, означающее Удлиняю, понимаются:- (i) продление договора сверх предусмотренного при его заключении срока; или (ii) продление срока погашения ссуд, выданных банком предприятиям и организациям.

PROLONGED BLAST = ПРОТЯЖНЫЙ ГУДОК – Prolonged Blast (maritime term):- a blast of from 4 to 6 seconds’ duration.

PROMISSORY NOTE = ПРОСТОЙ ВЕКСЕЛЬ – Promissory Note is a evidence of a debt with specific amount due and interest rate. The note may specify a maturity date or it may be payable on demand. The promissory note may or may not accompany other instruments such as a mortgage providing security for the payment thereof. Promissory Note is a written promise on a financial instrument to repay the money plus interest. Promissory Note is the written promise to pay a stated amount on a specified date. The issuer of a promissory note acknowledges that it is a debtor to the beneficiary named in the note. Unlike a bill of exchange or draft, which specifies that payment is to be made by a third party, the issuer of a promissory note is responsible for payment. The note may be negotiable or non-negotiable. A note promising to pay a certain person a stated sum on a specified date. A written unconditional promise to pay, issued and signed by the debtor himself. The latter undertakes to pay on demand at a fixed or determinable future date a certain sum of money to the order of a specified person, or to bearer. Also known as Note Of Hand. Promissory Note is a security which entitles the bearer to receive cash. These may be issued by companies or other institutions. See also Commercial Paper. Loan certified in the form of a Promissory Note (document in which the borrower undertakes to make a specific payment, generally for the payment of interest and repayment of a specified sum of money). Promissory notes are issued by companies, but also by the public

sector, special credit institutions and supranational borrowers. Principal lenders are insurance companies, mortgage banks and savings banks. The advantage for both sides is the ease of handling; a further advantage is that companies not eligible to issue shares can access the capital market. An additional positive aspect for lenders is that there are no write-off requirements if capital market rates rise. With usual terms of two to ten years, repayments are made in equal installments. An unconditional written promise to pay a specified sum of money on demand or at a specified date. For accounting purposes, promissory notes are treated the same as bills of exchange. See also Bill Of Exchange, and Draft. / Смотрите также Переводный Вексель (Bill Of Exchange), и Тратта (Draft). Под Соло-Векселем, от Итальянского слова Solo, означающее Один, понимается простой вексель, в отличие от переводного, имеет подпись только одного лица, обязанного совершить платёж. Простой Вексель – ценная бумага, представляющая собой безусловное обязательство векселедателя уплатить определённую сумму денег лицу, указанному на векселе, либо лицу, указанному посредством передаточной надписи, в установленный срок или по предъявлению. Простой Вексель – безусловное денежное обязательство векселедателя уплатить после наступления срока платежа определённую сумму денег владельцу векселя (векселедержателю).

PROMIX FIBER = ПРОМИКСНОЕ ВОЛОКНО – Promix Fibers are made by polymerization of acrylonitrile, a raw material of acrylic fibers, with natural animal casein (milk protein). They are one of semi-synthetic fibers. Promix fibers have an optimal moisture absorption, tactile feeling as silk fibers and beautiful luster. End-Uses:- Japanese Traditional Dresses, Accessories for Japanese Traditional Dresses, Women's Dresses, Sweaters, Blouses, Neckties, Scarves, etc. Features:- (i) promix fibers have warm tactile feeling extremely similar to silk fibers and beautiful luster; (ii) excellent in resistance to weathering; and (iii) a little resistant to insect but attackable with mold. Care should be taken to storage. Care Instructions:- (i) do not use chlorinated bleaching agents; and (ii) avoid steam ironing.

PROMOTER = ПРОМОТОР (или АКТИВАТОР, или СТИМУЛЯТОР, или УСКОРИТЕЛЬ) – Promoter is a region on a DNA or RNA strand which is recognized by RNA polymerase in order to initiate transcription. / Под Промоторами, от Латинского слова Promoveo, означающее Продвигаю, понимаются вещества, добавление которых к катализаторам повышает их активность и избирательность, а иногда и устойчивость. Входят в большинство промышленных катализаторов; например, в синтезе аммиака катализатор (губчатое железо) в качестве промотера содержит Al_2O_3, K_2O и другие.

PROMOTION = ПРОДВИЖЕНИЕ – Promotion is the advertising and awareness generation. This is one of the four P's of marketing. Sometimes it is used in a negative sense, as in aggressive stock promotion.

PROMPT = ПОСТАВЛЯЕМЫЙ НЕЗАМЕДЛИТЕЛЬНО – A Prompt Cargo describes a cargo available for immediate lifting (one to two days). Prompt Tonnage refers to tankers available to lift cargoes immediately. The tanker and petrochemical world's abbreviation is PPT. / Груз, Поставляемый Незамедлительно, означает груз, доступный для немедленного налива (в течение одного-двух дней). Тоннаж, Поставляемый Незамедлительно, относится к танкерам, которые могут быть незамедлительно поданы под погрузку. На рынках танкеров и нефтехимической продукции для обозначения этого принято Англоязычное обозначение PPT.

PROMPT BARREL = БАРРЕЛЬ НЕЗАМЕДЛИТЕЛЬНОЙ ПОСТАВКИ – Prompt Barrel is a product which will move or become available within three to four days. / Продукт, который будет перемещён или станет доступным в течение трёх-четырёх дней.

PROMPT CORRECTIVE ACTION = НЕЗАМЕДЛИТЕЛЬНОЕ ДЕЙСТВИЕ ПО КОРРЕКТИВЕ – Prompt Corrective Action:- in the United States, supervisory framework, created under the Federal Deposit Insurance Corporation Improvement Act of 1991, that links enforcement actions closely to the level of capital held by banks.

PROMPT DATE = ДАТА НЕЗАМЕДЛИТЕЛЬНОЙ ПОСТАВКИ – Prompt Date is the date on which the buyer of an option will buy or sell the underlying commodity (or futures contract) if the option is exercised.

PRO NUMBER = ПОР НОМЕР (или ПОРЯДКОВЫЙ НОМЕР) – Pro Number:- used by freight carriers as a tracking number. Short for Progressive Number. Pro Number is a number assigned to the shipment by a carrier for tracking purposes. Consumers can receive their own version of a pro number when they order something online. They, like a carrier, can use it to keep track of where their shipment is. Pro Number is a number assigned to a shipment by the carrier for tracking purposes. Pro Number is a number in a single continuous series of numbers assigned by a motor transportation company to successive shipments regardless of classification.

PROOF OF DELIVERY = ДОКАЗАТЕЛЬСТВО ПОСТАВКИ – Proof Of Delivery (POD) is a receipt or bill of lading (b/l) signed by the consignee upon delivery. / Доказательство Поставки – расписка или коносамент, подписанные грузополучателем при выполненной поставке.

PROOF OF LOSS = ДОКАЗАТЕЛЬСТВО УБЫТКА (или ДОКАЗАТЕЛЬСТВО УЩЕРБА) – Proof Of Loss is a statement made to the insurance company under oath setting out the basis of an insured's claim under the insurance policy.

PROOF OF ORIGIN = ДОКАЗАТЕЛЬСТВО ПРОИСХОЖДЕНИЯ – Proof Of Origin is a proof that the goods fulfil the origin requirements laid down, e.g., EUR.1, Form A, invoice declaration. / Доказательство того, что данные товары удовлетворяют сформулированным требованиям о происхождении, например, в сертификатах Формы EBP.1 (EUR.1) или Формы A (Form A), или задекларированным в счёте-фактуре.

PROP = PROPRIETOR

PROPAGANDA = ПРОПАГАНДА – Propaganda is persuasive communications directed at a specific audience that are designed to influence the targeted audience's opinions, beliefs and emotions in such a way as to bring about specific, planned alterations in their behavior. The information communicated by the propagandist may be true or false, the values appealed to may be sincerely held by the propagandist or cynically manipulated, and the presentation may be either logically and dispassionately argued or rhetorically tailored to arouse the most irrational emotions and prejudices – but the message content of propaganda is always deliberately selected and slanted to lead the audience toward a predetermined mindset that benefits the cause of the propagandist. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Пропагандой, от Латинского слова Propaganda, означающее Подлежащее Распространению, от Латинского слова Propago, означающее Распространяю, понимается распространение научных, политических, философских, художественных и других идей в обществе; в более узком смысле – политическая или идеологическая пропаганда с целью формирования у масс определённого мировоззрения. Пропаганда, распространение политических, философских, научных, художественных и других взглядов и идей с целью их внедрения в общественное сознание и активизации массовой практической деятельности. Основные элементы процесса пропаганды:- её субъект (социальная группа, интересы которой выражает пропаганда), содержание, формы и методы, средства или каналы пропаганды (радио, телевидение, печать, система лекционной пропаганды и так далее), объект (аудитория или социальные общности, которым адресована пропаганда). Решающим для понимания процесса пропаганды являются социальные интересы её субъекта, их соотношение с интересами общества в целом и отдельных групп, к которым

обращена пропаганда. Это определяет её содержание и оказывает существенное влияние на выбор форм, методов и средств пропаганды. В более узком смысле пропаганда обозначает один из её видов – политическую или идеологическую пропаганду – распространение взглядов, идей и теорий с целью формирования у масс определённого мировоззрения, представлений, отражающих интересы субъекта пропаганды, и стимулирования соответствующих им практических действий. Ядром политической пропаганды является определённая классовая идеология. В современном мире выделяют два противоположных типа пропаганды:- буржуазную и коммунистическую. Буржуазные исследователи нередко отрицают обусловленность пропаганды характером идеологии класса и пытаются представить её как универсальное средство манипуляции массовым сознанием в интересах определённых групп. Действительно, в эксплуататорском обществе пропаганда используется господствующим классом как средство представления своего группового интереса в качестве всеобщего, искажения реального положения в собственных интересах и навязывания широким массам ложных идей, теорий, необъективной информации. Этим целям служат средства массовой коммуникации, контролируемые монополистической буржуазией и буржуазным государством. Однако введение в заблуждение и манипуляция сознанием масс – отнюдь не универсальное свойство пропаганды, а выражение лишь сущности буржуазной пропаганды, обусловленной антагонизмом классов капиталистического общества, противоречием между коренными интересами империалистической буржуазии и закономерностями современного общественного развития. Буржуазной пропаганде противостоит коммунистическая пропаганда, основным положения которой были сформулированы и реализованы на практике Немецким философом, социологом, экономистом и писателем Калем Хайнрихём Максом (Karl Heinrich Marx; 1818–1883) и Немецким философом и мыслителем Фридрихём Энгельсом (Friedrich Engels; 1820–1895). Они получили творческое развитие в трудах Российского политика Владимира Ильича Ленина (1870–1924) и наиболее полно изложены в его работах ‘Что Такое ‘Друзья Народа’ И Как Они Воюют Против Социал-Демократов?’, ‘Наша Программа’, ‘Что Делать?’, ‘Об Отношении Рабочей Партии К Религии’, ‘Детская Болезнь ‘Левизны’ В Коммунизме’ и других. Коммунистическая пропаганда представляет собой научно обоснованную систему духовной деятельности, разработанную коммунистической партией. В процессе пропаганды под руководством коммунистической партии осуществляется распространение Марксистско-Ленинской идеологии и политики с целью просвещения, воспитания и организации масс. Характер коммунистической пропаганды обусловлен природой рабочего класса, интересы которого совпадают с интересами всех трудящихся и выражены в Марксистско-Ленинской идеологии и политике коммунистической партии. Основными принципами коммунистической пропаганды, определяющими её содержание, являются:- строгая научность, партийность, тесная связь с жизнью, единство пропагандистской и организаторской работы. Социальными функциями коммунистической пропаганды являются:- связь коммунистической партии с рабочим классом и всеми трудящимися; соединение научного социализма, идейно-теоретической деятельности партии с рабочим движением и революционно-преобразовательной деятельностью масс; объединение и организация систематического общения национальных отрядов рабочего, коммунистического и демократического движения, а при социализме всех классов, наций и социальных групп общества в процессе их революционного творчества; координация их действий, обмен опытом и информацией о проблемах и результатах борьбы; выражение общественного мнения рабочего класса, трудящихся, их потребностей и интересов; разоблачение иллюзий и лжи буржуазной и ревизионистской пропаганды; распространение правды о социалистическом обществе. Организатором коммунистической пропаганды на уровне общества выступают коммунистическая партия, социалистическое государство, общественные организации трудящихся. Коммунистическая пропаганда – одно из средств руководства партией процессами революционной борьбы, социалистических и коммунистических преобразований. В ходе активного целенаправленного воздействия коммунистической пропаганды на массы вытесняются иллюзии обыденного сознания, устарелые взгляды и традиции и утверждаются научные представления и программы практических действий, наиболее полно выражаются потребности переживаемого этапа общественного развития, в соответствии с которым видоизменяются формы и задачи пропаганды. Коммунистическая пропаганда стремится пробудить активность трудящихся масс и каждого человека, вовлекая их в практическую борьбу за социализм и коммунизм. В пропаганде как процессе распространения идей научного социализма в массах выделяют две относительно самостоятельные фазы и соответствующие им формы деятельности:- пропаганду и агитацию. В этом случае понятие ‘Пропаганда’ означает распространение идей, теоретических знаний, выражающих основное содержание идеологии, в отличие от агитации, которая является более популярным изложением одной из идей, актуальной для современного движения и ставшей непосредственной задачей практики масс. Коммунистическая пропаганда не может успешно функционировать и развиваться без постоянной, организованной обратной связи, то есть изучения духовных потребностей, интересов, общественного мнения, настроения масс и изменения этих факторов под влиянием объективных условий и пропагандистского воздействия. В современный период такое изучение приобретает особенно важное значение вследствие роста идеологической зрелости, компетентности, активности и инициативы масс, мнения и суждения которых важны не только для оценки эффективности пропаганды и корректирования пропагандистского процесса, но и служат важным источником познания процессов общественного развития и выработки форм управления ими. Обратная связь в системе коммунистической пропаганды выполняет важную роль в процессе дальнейшей демократизации социалистического общества. Значение обратной связи возрастает и вследствие развития средств массовой пропаганды и информации (печать, радио, телевидение и другие), в которых отсутствует элемент непосредственного общения между объектом пропаганды и аудиторией. Важное значение в повышении эффективности пропаганды имеет знание психологических механизмов восприятия пропагандистского воздействия, что связано с формированием системы социальных установок, избирательного отношения к информации со стороны аудитории, которой адресована пропаганда. Одно из условий эффективности пропаганды – подкрепление распространяемых знаний, идей и взглядов практической деятельностью масс. Поэтому существенные принципы партийной пропаганды – её конкретность, объективный анализ социальной действительности, показ реальных достижений и критика существующих недостатков и трудностей в достижении поставленных целей. Центральная задача коммунистической пропаганды – формирование у трудящихся Марксистско-Ленинского мировоззрения, высоких идейно-политических качеств, норм коммунистической морали, сознательного творческого участия каждого в процессе социалистического и коммунистического преобразования общества (смотрите также статью Партийное Просвещение). Степень реализации этой цели выступает общим критерием эффективности коммунистической пропаганды, а её общим показателем – уровень социальной активности масс.

PROPAGATE = РАЗВОДИТЬ – Propagate:- produce an identical organism from a given organism. To multiply by sexual or asexual reproduction through seeds or cuttings.

PROPAGATION = РАЗВЕДЕНИЕ (или КУЛЬТИВИРОВАНИЕ, или РАСПРОСТРАНЕНИЕ, или РАЗМНОЖЕНИЕ, или ВОСПРОИЗВОДСТВО, или СБЛИЖЕНИЕ) – Propagation is the breeding of specimens of a plant or animal by natural processes from the parent stock; e.g., the propagation of plants by root cuttings. Plant Propagation is the process of creating new plants. There are two types of propagation:- sexual and asexual. Sexual reproduction is the union of the pollen and egg, drawing from the genes of two parents to create a new, third individual. Sexual propagation involves the floral parts of a plant. Asexual propagation involves taking a part of one parent plant and causing it to regenerate itself into a new plant. The resulting new plant is genetically identical its parent.

Asexual propagation involves the vegetative parts of a plant:- stems, roots, or leaves. The advantages of sexual propagation are that it may be cheaper and quicker than other methods; it may be the only way to obtain new varieties and hybrid vigor; in certain species, it is the only viable method for propagation; and it is a way to avoid transmission of certain diseases. Asexual propagation has advantages, too. It may be easier and faster in some species; it may be the only way to perpetuate some cultivars; and it bypasses the juvenile characteristics of certain species. (1) Sexual Propagation:- sexual propagation involves the union of the pollen (male) with the egg (female) to produce a seed. The seed is made up of three parts:- the outer seed coat, which protects the seed; the endosperm, which is a food reserve; and the embryo, which is the young plant itself. When a seed is mature and put in a favorable environment, it will germinate (begin active growth). In the following section, seed germination and transplanting of seeds will be discussed. Seed:- to obtain quality plants, start with good quality seed from a reliable dealer. Select varieties to provide the size, color, and habit of growth desired. Choose varieties adapted to your area which will reach maturity before an early frost. Many new vegetable and flower varieties are hybrids, which cost a little more than open pollinated types. However, hybrid plants usually have more vigor, more uniformity, and better production than non-hybrids and sometimes have specific disease resistance or other unique cultural characteristics. Although some seeds will keep for several years if stored properly, it is advisable to purchase only enough seed for the current year's use. Quality seed will not contain seed of any other crop, weeds, seeds, or other debris. Printing on the seed packet usually indicates essential information about the variety, the year for which the seeds were packaged, and germination percentage you may typically expect, and notes about any chemical seed treatment. If seeds are obtained well in advance of the actual sowing date or are stored surplus seeds, keep them in a cool, dry place. Laminated foil packets help ensure dry storage. Paper packets are best kept in tightly closed containers and maintained around 40 °F. in a low humidity. The door shelves in a refrigerator work well. Some gardeners save seed from their own gardens; however, such seed is the result of random pollination by insects or other natural agents, and may not produce plants typical of the parents. This is especially true of the many hybrid varieties. Germination:- germination will begin when certain internal requirements have been met. A seed must have a mature embryo, contain a large enough endosperm to sustain the embryo during germination, and contain sufficient hormones to initiate the process. In general, do not expect more than 65% to 80% of new seeds to germinate. From those germinating, expect about 60% to 75% to produce satisfactory, vigorous, sturdy seedlings. There are four environmental factors which affect germination: water, oxygen, light, and heat. Water:- the first step in the germination process is the imbibition or absorption of water. Even though seeds have great absorbing power due to the nature of the seed coat, the amount of available water in the substrate affects the uptake of water. An adequate, continuous supply of water is important to ensure germination. Once the germination process has begun, a dry period can cause the death of the embryo. Light:- light is known to stimulate or to inhibit germination of some types of seed. The light reaction involved here is a complex process. Some crops which have a requirement for light to assist seed germination are ageratum, begonia, browallia, impatiens, lettuce, and petunia. Conversely, peas, beans, calendula, centaurea, annual phlox, verbena, and vinca will germinate best in the dark. Other plants are not specific at all. Seed catalogs and seed packets often list germination or cultural tips for individual varieties. When sowing light-requiring seed, do as nature does, and leave them on the soil surface. If they are covered at all, cover them lightly with fine peat moss or fine vermiculite. These two materials, if not applied too heavily, will permit some light to reach the seed and will not limit germination. When starting seed in the home, supplemental light can be provided by fluorescent fixtures suspended 6 to 12 inches above the seeds for 16 hours a day. High intensity lights will provide more light over the course of the day and will enhance the quality of seedlings. These lights cost more than the common shop lights, but are often worth the investment if you plan on growing plants indoors. Oxygen:- in all viable seed, respiration takes place. The respiration in dormant seed is low, but some oxygen is required. The respiration rate increases during germination, therefore, the substrate in which the seeds are placed should be loose and well-aerated. If the oxygen supply during germination is limited or reduced, germination can be severely retarded or inhibited. Temperature:- a favorable temperature is another important requirement of germination. It not only affects the germination percentage but also the rate of germination. Some seeds will germinate over a wide range of temperatures, whereas others require a narrow range. Many seeds have minimum, maximum, and optimum temperatures at which they germinate. For example, tomato seed has a minimum germination temperature of 50 degrees F. and a maximum temperature of 95 degrees, but an optimum germination temperature of about 80 degrees. Where germination temperatures are listed, they are usually the optimum temperatures unless otherwise specified. Generally, 65 to 75 degrees F. is best for most plants. This often means the germination flats may have to be placed in special chambers or on radiators, heating cables, or heating mats to maintain optimum temperature. The importance of maintaining proper substrate temperature to achieve maximum germination percentages cannot be over-emphasized. It's also very important to note that the recommended temperatures need to be maintained 24 hours a day. Methods Of Breaking Dormancy:- one of the functions of dormancy is to prevent a seed from germinating before it is surrounded by a favorable environment. In some trees and shrubs, seed dormancy is difficult to break, even when the environment is ideal. Various treatments are performed on the seed to break dormancy and begin germination. Scarification:- seed scarification involves breaking, scratching, or softening the seed coat so that water can enter and begin the germination process. There are several methods of scarifying seeds. In acid scarification, seeds are put in a glass container and covered with concentrated sulfuric acid. The seeds are gently stirred and allowed to soak from 10 minutes to several hours, depending on the hardness of the seed coat. When the seed coat has become thin, the seeds can be removed, washed, and planted. Another scarification method is mechanical. Seeds are filed with a metal file, rubbed with sandpaper, or cracked with a hammer to weaken the seed coat. Hot water scarification involves putting the seed into hot water (170 to 212 degrees F). The seeds are allowed to soak in the water, as it cools, for 12 to 24 hours and then planted. A fourth method is one of warm, moist scarification. In this case, seeds are stored in nonsterile, warm, damp containers where the seed coat will be broken down by decay over several months. Stratification:- seeds of some fall-ripening trees and shrubs of the temperate zone will not germinate unless chilled underground as they over winter. This so called 'After Ripening' may be accomplished artificially by a practice called stratification. The following procedure is usually successful. Put sand or vermiculite in a clay pot to about 1 inch from the top. Place the seeds on top of the medium and cover with 1/2 inch of sand or vermiculite. Wet the medium thoroughly and allow excess water to drain through the hole in the pot. Place the pot containing the moist medium and seeds in a plastic bag and seal. Place the bag in a refrigerator. Periodically check to see that the medium is moist, but not wet. Additional water will probably not be necessary. After 10 to 12 weeks, remove the bag from the refrigerator. Take the pot out and set it in a warm place in the house. Water often enough to keep the medium moist. Soon the seedlings should emerge. When the young plants are about 3 inches tall, transplant them into pots to grow until time for setting outside. Another procedure that is usually successful uses sphagnum moss or peat moss. Wet the moss thoroughly, then squeeze out the excess water with your hands. Mix seed with the sphagnum or peat and place in a plastic bag. Seal the bag and put it in a refrigerator. Check periodically. If there is condensation on the inside of the bag, the process will probably be successful. After 10 to 12 weeks, remove the bag from the refrigerator. Plant the seeds in pots to germinate and grow. Handle seeds carefully. Often the small roots and shoots are emerging at the end of the stratification period. Care must be taken not to break these off. Temperatures in the range of 35 to 45 degrees F (2 to 70C) are effective. Most refrigerators operate in this range. Seeds of most fruit and nut trees can be successfully germinated by these procedures. Seeds of peaches should be removed from the hard pit. Care must be taken when cracking the pits. Any injury to the seed itself can be an entry path for disease organisms. Starting Seeds:- Substrate (aka Media):- a wide range of materials can be used to start seeds, from plain vermiculite or mixtures of soilless substrates to the various amended soil mixes. With

experience, you will learn to determine what works best for the seeds that you are starting. When choosing a substrate its important to keep in mind what the good qualities of a germinating substrate are. It should be rather fine and uniform, yet well-aerated and loose. It should be free of insects, disease organisms, and weed seeds. It should also be of low fertility or total soluble salts and capable of holding and moving moisture by capillary action. One mixture which supplies these factors is a combination of 1/3 sterilized soil, 1/3 sand or vermiculite or perlite, and 1/3 peat moss. The importance of using a sterile medium and container cannot be over-emphasized. The home gardener can treat a small quantity of soil mixture in an oven. Place the slightly moist soil in a heat-resistant container in an oven set at about 250 degrees F. Use a candy or meat thermometer to ensure that the mix reaches a temperature of 180 degrees F. for at least 1/2 hour. Avoid over-heating as this can be extremely damaging to the soil. Be aware that the heat will release very unpleasant odors in the process of sterilization. This treatment should prevent damping-off and other plant diseases, as well as eliminate potential plant pests. Growing containers and implements should be washed to remove any debris and rinsed in a solution of 1 part chlorine bleach to 9 parts water. An artificial, soilless mix also provides the desired qualities of a good germination substrate. The basic ingredients of such a mix are sphagnum peat moss and vermiculite, both of which are generally free of diseases, weed seeds, and insects. The ingredients are also readily available, easy to handle, lightweight, and produce uniform plant growth. ‘Peat-lite’ mixes or similar products are commercially available or can be made at home using this recipe:- 4 quarts of shredded sphagnum peat moss, 4 quarts of fine vermiculite, 1 tablespoon of superphosphate, and 2 tablespoons of ground limestone. Mix thoroughly. These mixes have little fertility, so seedlings must be watered with a diluted fertilizer solution soon after they emerge. Do not use garden soil by itself to start seedlings; it is not sterile, is too heavy, and will not drain well. Containers:- flats and trays can be purchased or you can make your own containers for starting seeds by recycling such things as cottage cheese containers, the bottoms of milk cartons or bleach containers, and pie pans, as long as good drainage is provided. At least one company has developed a form for recycling newspaper into pots, and another has developed a method for the consumer to make and use compressed blocks of soil mix instead of pots. You can make your own flats from scrap lumber. A convenient size to handle would be about 12 to 18 inches long and 12 inches wide with a depth of about 2 inches. Leave cracks of about 1/8-inch between the boards in the bottom or drill a series of holes to ensure good drainage. Clay or plastic pots can be used and numerous types of pots made of compressed peat and other biodegradable materials are also on the market. Multi-cell containers (packs) where each cell holds a single plant reduce the risk of root injury when transplanting young plants. Peat pellets, peat or fiber-based blocks, and expanded foam cubes can also be used for seeding. The downside to sowing seeds in individual cells or pellets is that they dry out faster than multiple seedlings sown in a flat or larger container. Seeding:- the proper time for sowing seeds for transplants depends upon when plants may safely be moved out-of-doors in your area. This period may range from 4 to 12 weeks prior to transplanting, depending upon the speed of germination, the rate of growth, and the cultural conditions provided. A common mistake is to sow the seeds too early and then attempt to hold the seedlings back under poor light or improper temperature ranges. This usually results in tall, weak, spindly plants which do not perform well in the garden. After selecting a container, fill it to within 3/4 inch of the top with moistened substrate. For very small seeds, at least the top 1/4-inch should be a fine, screened mix or a layer of vermiculite. Gently firm the substrate at the corners and edges with your fingers or a block of wood to provide a uniform, flat surface. For medium and large seeds, make furrows 1 to 2 inches apart and 1/8 to 1/4-inch deep across the surface of the container using a narrow board or pot label. By sowing in rows, good light and air movement results, and if damping-off fungus does appear, there is less chance of it spreading. Seedlings in rows are easier to label and handle at transplanting time than those which have been sown in a broadcast manner. Sow the seeds thinly and uniformly in the rows by gently tapping the packet of seed as it is moved along the row. Lightly cover the seed with dry vermiculite or sifted substrate if they require darkness for germination. A suitable planting depth is usually about twice the diameter of the seed. Do not plant seeds too deeply. Extremely fine seed such as petunia, begonia, and snapdragon are not covered, but lightly pressed into the medium or watered in with a fine mist. If these seeds are broadcast, strive for a uniform stand by sowing half the seeds in one direction, then sowing the other way with the remaining seed in a crossing pattern. Large seeds are frequently sown into some sort of a small container or cell pack which eliminates the need for early transplanting. Usually 2 or 3 seeds are sown per unit and later thinned to allow the strongest seedling to grow. A germination test will allow you to determine how many seeds need to be sown per cell. If seeds have a very low germination rate (<40%), sow at least 3 seeds per cell or consider tossing out the seed. For germination rates of 40–80%, sow 2–3 seeds per cell. If you want to be frugal with your seeds, sow only 1 per cell if your rate is over 80%. Seed Tape:- most garden stores and seed catalogs offer indoor and outdoor seed tapes. Seed tape has precisely spaced seeds enclosed in an organic, water-soluble material. When planted, the tape dissolves and the seeds germinate normally. Seed tapes are especially convenient for tiny, hard-to-handle seeds. However, tapes are much more expensive per seed. Seed tapes allow uniform emergence, eliminate overcrowding, and permit sowing in perfectly straight rows. The tapes can be cut at any point for multiple-row plantings, and thinning is rarely necessary. Pregermination:- another method of starting seeds is pregermination. This method involves sprouting the seeds before they are planted. This reduces the time to germination, as the temperature and moisture are easy to control. A high percentage of germination is achieved since environmental factors are optimum. Lay seeds between the folds of a cotton cloth or on a layer of vermiculite in a shallow pan. Keep moist, in a warm place. When roots begin to show, place the seeds in containers or plant them directly in the garden. While transplanting seedlings, be careful not to break off tender roots. Continued attention to watering is critical. Some seed companies sell carefully dried pregerminated seeds. They are usually more expensive compared to conventional seeds and their shelf life is relatively short (approximately a month), but it’s a convenient way to ensure a relatively high production rate for the seeds being sown. When planting fresh, pregerminated seeds in a container to transplant in the garden later, place 1 seed in a 2- to 3-inch container. Plant the seeds at only 1/2 the recommended depth. Gently press a little soil over the sprouted seed and then add about 1/4 inch of milled sphagnum or sand to the soil surface. These materials will keep the surface uniformly moist and are easy for the shoot to push through. Keep in a warm place and care for them as for any other newly transplanted seedlings. A convenient way to plant small, delicate, pre-germinated seeds is to suspend them in a gel. You can make a gel by blending cornstarch with boiling water to a consistency that is thick enough so the seeds will stay suspended. Be sure to cool thoroughly before use. Place the gel with seedlings in a plastic bag with a hole in it. Squeeze the gel through the hole along a pre-marked garden row. Spacing of seeds is determined by the number of seeds in the gel. If the spacing is too dense, add more gel; if too wide, add more seeds. The gel will keep the germinating seeds moist until they establish themselves in the garden soil. Watering:- after the seed has been sown, moisten the planting mix thoroughly. Use a fine mist or place the containers in a pan or tray which contains about 1 inch of warm water. Avoid splashing or excessive flooding which might displace small seeds. When the planting mix is saturated, set the container aside to drain. The soil should be moist but not wet. Ideally, seed flats should remain sufficiently moist during the germination period without having to add water. One way to maintain moisture is to slip the whole flat or pot into a clear plastic bag after the initial watering. The plastic should be at least 1 inch from the soil. Keep the container out of direct sunlight; otherwise the temperature may rise to the point where the seeds will be harmed. Many home gardeners cover their flats with panes of glass instead of using a plastic sleeve. Be sure to remove the plastic bag or glass cover as soon as the first seedlings appear. Surface watering can then be practiced if care and good judgment are used. Lack of uniformity, overwatering, or drying out are problems related to manual watering. Excellent germination and moisture uniformity can be obtained with a low-pressure misting system. Four seconds of mist every 6 minutes or 10 seconds every 15 minutes during the daytime in spring seems to be satisfactory. Bottom heat is an asset with a mist system. Subirrigation or watering

from below may work well, keeping the flats moist. However, as the flats or pots must sit in water constantly, the soil may absorb too much water, and the seeds may rot due to lack of oxygen. Temperature And Light:- several factors for good germination have already been mentioned. The last item, and by no means the least important, is temperature. Since most seeds will germinate best at an optimum temperature that is usually higher than most home night temperatures, special warm areas must often be provided. The use of thermostatically controlled heating cables is an excellent method of providing constant heat. After germination and seedling establishment, move the flats to a light, airy, cooler location, at a 55 to 60 degree F. night temperature and a 65 to 70 degree F. day reading. This will prevent soft, leggy growth and minimize disease troubles. Some crops, of course, may germinate or grow best at a different constant temperature and must be handled separately from the bulk of the plants. Seedlings must receive bright light after germination. Place them in a window facing south, if possible. If a large, bright window is not available, place the seedlings under a fluorescent light. Use two 40-watt, cool-white fluorescent tubes or special plant growth lamps. Position the plants 6 inches from the tubes and keep the lights on about 16 hours each day. As the seedlings grow, the lights should be raised. Transplanting And Handling:- if the plants have not been seeded in individual containers, they must be transplanted to give them proper growing space. One of the most common mistakes made is leaving the seedlings in the seed flat too long. The ideal time to transplant young seedlings is when they are small and there is little danger from setback. This is usually about the time the first true leaves appear above or between the cotyledon leaves (the cotyledons or seed leaves are the first leaves the seedling produces). Don't let plants get hard and stunted or tall and leggy. To transplant, carefully dig up the small plants with a knife or wooden plant label. Let the group of seedlings fall apart and pick out individual plants. Handle small seedlings by their leaves, not their delicate stems. Gently ease them apart in small groups which will make it easier to separate individual plants. Avoid tearing roots in the process. Punch a hole in the medium into which the seedling will be planted (see below for information about media). Make it deep enough so the seedling can be put at the same depth it was growing in the seed flat. Small plants or slow growers should be placed 1 inch apart and rapid-growing, large seedlings about 2 inches apart. After planting, firm the soil and water gently. Keep newly transplanted seedlings in the shade for a few days, or place them under fluorescent lights. Keep them away from direct heat sources. Continue watering and fertilizing as in the seed flats. Most plants transplant well and can be started indoors, but a few plants are difficult to transplant. These are generally directly seeded outdoors or sown directly into individual containers indoors. Examples include peas, beans, carrots, beets, chard, zinnias and cucurbits, such as melons and squash. Media For Transplanting:- seedling growing mixes and containers can be purchased or prepared similar to those mentioned for germinating seed. The medium should contain more plant nutrients than a germination mix, however. Some commercial soilless mixes have fertilizer already added. When fertilizing, use a soluble house plant fertilizer, at the dilution recommended by the manufacturer, about every 2 weeks after the seedlings are established. Remember that young seedlings are easily damaged by too much fertilizer, especially if they are under any moisture stress. Containers For Transplanting:- there is a wide variety of containers from which to choose for transplanting seedlings. These containers should be economical, durable, and make good use of space. The type selected will depend on the type of plant to be transplanted and individual growing conditions. Standard pots may be used, but they waste a great deal of space and may not dry out rapidly enough for the seedling to have sufficient oxygen for proper development. There are many types of containers available commercially. Those made out of pressed peat can be purchased in varying sizes. Individual pots or strips of connected pots fit closely together, are inexpensive, and can be planted directly in the garden. When setting out plants grown in peat pots, be sure to cover the pot completely. If the top edge of the peat pot extends above the soil level, it may act as a wick, and draw water away from the soil in the pot. To avoid this, tear off the top lip of the pot and then plant flush with the soil level. Community packs are containers in which there is room to plant several plants. These are generally inexpensive. The main disadvantage of a community pack is that the roots of the individual plants must be broken or cut apart when separating them to put out in the garden. Compressed peat pellets, when soaked in water, expand to form compact, individual pots. They waste no space, don't fall apart as badly as peat pots, and can be set directly out in the garden. If you wish to avoid transplanting seedlings altogether, compressed peat pellets are excellent for direct sowing. Community packs and cell packs, which are strips of connected individual pots, are also available in plastic and are frequently used by commercial bedding plant growers, as they withstand frequent handling. In addition, many homeowners find a variety of materials from around the house useful for containers. These homemade containers should be deep enough to provide adequate soil and have plenty of drainage holes in the bottom. Hardening Plants:- hardening is the process of altering the quality of plant growth to withstand the change in environmental conditions which occurs when plants are transferred from a greenhouse or home to the garden. A severe check in growth may occur if plants produced in the home are planted outdoors without a transition period. Hardening is most critical with early crops, when adverse climatic conditions can be expected. Hardening can be accomplished by gradually lowering temperatures and relative humidity and reducing water. This procedure results in an accumulation of carbohydrates and a thickening of cell walls. A change from a soft, succulent type of growth to a firmer, harder type is desired. This process should be started at least 2 weeks before planting in the garden. If possible, plants should be moved to a 45 to 50 degree F. temperature indoors or outdoors in a shady location. A cold frame is excellent for this purpose. When put outdoors, plants should be shaded, and then gradually moved into sunlight. Each day, gradually increase the length of exposure. Don't put tender seedlings outdoors on windy days or when temperatures are below 45 degrees F. Reduce the frequency of watering to slow growth, but don't allow plants to wilt. Even cold-hardy plants will be hurt if exposed to freezing temperatures before they are hardened. After proper hardening, however, they can be planted outdoors and light frosts will not damage them. The hardening process is intended to slow plant growth. If carried to the extreme of actually stopping plant growth, significant damage can be done to certain crops. For example, cauliflower will make thumb size heads and fail to develop further if hardened too severely. Cucumbers and melons will stop growth if hardened. Propagation Of Ferns By Spores:- though ferns are more easily propagated by other methods, some gardeners like the challenge of raising ferns from spores. One tested method for small quantities follows:- Put a solid, sterilized brick (bake at 250 degrees F. for 30 minutes) in a pan and add water to cover the brick. When the brick is wet throughout; squeeze a thin layer of moist soil and peat (1:1) onto the top of the brick. Pack a second layer (about an inch) on top of that. Sprinkle spores on top. Cover with plastic (not touching the spores) and put in a warm place in indirect light. It may take up to a month or more for the spores to germinate. Keep moist at all times. A prothallus (one generation of the fern) will develop first from each spore, forming a light green mat. Mist lightly once a week to maintain high surface moisture; the sperm must be able to swim to the archegonia (female parts). After about three weeks, fertilization should have occurred. Pull the mat apart with tweezers in 1/4-inch squares and space them 1/2-inch apart in a flat containing a 2-inch layer of sand, 1/4-inch of charcoal, and about 2 inches of soil/peat mix. Cover with plastic and keep moist. When fern fronds appear and become crowded, transplant to small pots. Gradually reduce the humidity until they can survive in the open. Light exposure may be increased at this time. (2) Asexual Propagation:- asexual propagation, as mentioned earlier, is the best way to maintain some species, particularly an individual that best represents that species. Clones are groups of plants that are identical to their one parent and that can only be propagated asexually. The Bartlett pear (1770) and the Delicious apple (1870) are two examples of clones that have been asexually propagated for many years. The major methods of asexual propagation are cuttings, layering, division, budding and grafting. Cuttings involve rooting a severed piece of the parent plant; layering involves rooting a part of the parent and then severing it; and budding and grafting is joining two plant parts from different varieties. Cuttings:- many types of plants, both woody and herbaceous, are frequently propagated by cuttings. A cutting is a vegetative plant part which is severed from the parent plant in order to regenerate itself, thereby forming a whole new plant. Take

cuttings with a sharp blade to reduce injury to the parent plant. Dip the cutting tool in rubbing alcohol or a mixture of one part bleach : nine parts water to prevent transmitting diseases from infected plant parts to healthy ones. Remove flowers and flower buds from cuttings to allow the cutting to use its energy and stored carbohydrates for root and shoot formation rather than fruit and seed production. To hasten rooting, increase the number of roots, or to obtain uniform rooting (except on soft, fleshy stems), use a rooting hormone, preferably one containing a fungicide. Prevent possible contamination of the entire supply of rooting hormone by putting some in a separate container for dipping cuttings. Insert cuttings into a rooting medium such as coarse sand, vermiculite, soil, water, or a mixture of peat and perlite. It is important to choose the correct rooting medium to get optimum rooting in the shortest time. In general, the rooting medium should be sterile, low in fertility, drain well enough to provide oxygen, and retain enough moisture to prevent water stress. Moisten the medium before inserting cuttings, and keep it evenly moist while cuttings are rooting and forming new shoots. Place stem and leaf cuttings in bright, indirect light. Root cuttings can be kept in the dark until new shoots appear. Stem Cuttings:- numerous plant species are propagated by stem cuttings. Some can be taken at any time of the year, but stem cuttings of many woody plants must be taken in the fall or in the dormant season. Tip Cuttings:- detach a 2 to 6-inch piece of stem, including the terminal bud. Make the cut just below a node. Remove lower leaves that would touch or be below the medium. Dip the stem in rooting hormone if desired. Gently tap the end of the cutting to remove excess hormone. Insert the cutting deeply enough into the media to support itself. At least one node must be below the surface. Medial Cuttings:- make the first cut just above a node, and the second cut just above a node 2 to 6 inches down the stem. Prepare and insert the cutting as you would a tip cutting. Be sure to position right side up. Axial buds are always above leaves. Cane Cuttings:- cut cane-like stems into sections containing one or two eyes, or nodes. Dust ends with fungicide or activated charcoal. Allow to dry several hours. Lay horizontally with about half of the cutting below the media surface, eye facing upward. Cane cuttings are usually potted when roots and new shoots appear but new shoots from dracaena and croton are often cut off and re-rooted in sand. Single Eye:- the eye refers to the node. This is used for plants with alternate leaves when space or stock material are limited. Cut the stem about 1/2-inch above and 1/2-inch below a node. Place cutting horizontally or vertically in the medium. Double Eye:- this is used for plants with opposite leaves when space or stock material is limited. Cut the stem about 12-inches above and 12-inches below the same node. Insert the cutting vertically in the medium with the node just touching the surface. Heel Cutting:- this method uses stock material with woody stems efficiently. Make a shield-shaped cut about halfway through the wood around a leaf and axial bud. Insert the shield horizontally into the medium. Leaf Cuttings:- leaf cuttings are used almost exclusively for a few indoor plants. Leaves of most plants will either produce a few roots but no plant, or just decay. Whole Leaf With Petiole:- detach the leaf and up to 1-1/2 inches of petiole. Insert the lower end of the petiole into the medium. One or more new plants will form at the base of the petiole. The leaf may be severed from the new plants when they have their own roots, and the petiole reused. Whole Leaf Without Petiole:- this is used for plants with sessile leaves. Insert the cutting vertically into the medium. A new plant will form from the axillary bud. The leaf may be removed when the new plant has its own roots. Split Vein:- detach a leaf from the stock plant. Slit its veins on the lower leaf surface. Lay the cutting, lower side down, on the medium. New plants will form at each cut. If the leaf tends to curl up, hold it in place by covering the margins with the rooting medium. Leaf Sections:- this method is frequently used with snake plant and fibrous rooted begonias. Cut begonia leaves into wedges with at least one vein. Lay leaves flat on the medium. A new plant will arise at the vein. Cut snake plant leaves into 2-inch sections. Consistently make the lower cut slanted and the upper cut straight so you can tell which is the top. Insert the cutting vertically. Roots will form fairly soon, and eventually a new plant will appear at the base of the cutting. These and other succulent cuttings will rot if kept too moist. Root Cuttings:- root cuttings are usually taken from 2 to 3 year old plants during their dormant season when they have a large carbohydrate supply. Root cuttings of some species produce new shoots, which then form their own root systems, while root cuttings of other plants develop root systems before producing new shoots. Plants With Large Roots:- make a straight top cut. Make a slanted cut 2 to 6 inches below the first cut. Store cutting about 3 weeks in moist sawdust, peat moss, or sand at 40 degrees F. Remove from storage. Insert the cutting vertically with the top approximately level with the surface of the rooting medium. This method is often used outdoors. Plants With Small Roots:- take 1 to 2 inch sections of roots. Insert the cuttings horizontally about 12 inches below the medium surface. This method is usually used indoors or in a hotbed. Layering:- stems still attached to their parent plants may form roots where they touch a rooting medium. Severed from the parent plant, the rooted stem becomes a new plant. This method of vegetative propagation, called Layering, promotes a high success rate because it prevents the water stress and carbohydrate shortage that plague cuttings. Some plants layer themselves naturally, but sometimes plant propagators assist the process. Layering is enhanced by wounding one side of the stem or by bending it very sharply. The rooting medium should always provide aeration and a constant supply of moisture. The following propagation methods can all be considered types of layering, as the new plants form before they are detached from their parent plants:- (i) Tip Layering:- dig a hole 3 to 4 inches deep. Insert the shoot tip and cover it with soil. The tip grows downward first, then bends sharply and grows upward. Roots form at the bend, and the recurved tip becomes a new plant. Remove the tip layer and plant it in the early spring or late fall. Examples:- purple and black raspberries, trailing blackberries. (ii) Compound Layering:- this method works for plants with flexible stems. Bend the stem to the rooting medium as for simple layering, but alternately cover and expose stem sections. Wound the lower side of the stem sections to be covered. Examples:- heart-leaf philodendron, pothos. (iii) Mound (Stool) Layering:- cut the plant back to 1 inch above the ground in the dormant season. Mound soil over the emerging shoots in the spring to enhance their rooting. Examples:- gooseberries, apple rootstocks. (iv) Air Layering:- air layering is used to propagate some indoor plants with thick stems, or to rejuvenate them when they become leggy. Slit the stem just below a node. Pry the slit open with a toothpick. Surround the wound with wet unmilled sphagnum moss. Wrap plastic or foil around the sphagnum moss and tie in place. When roots pervade the moss, cut the plant off below the root ball. Examples:- dumbcane, rubber tree. (v) Simple Layering:- bend the stem to the ground. Cover part of it with soil, leaving the last 6 to 12 inches exposed. Bend the tip into a vertical position and stake in place. The sharp bend will often induce rooting, but wounding the lower side of the branch or loosening the bark by twisting the stem may help. Examples:- rhododendron, honeysuckle. Division:- plants with more than one rooted crown may be divided and the crowns planted separately. If the stems are not joined, gently pull the plants apart. If the crowns are united by horizontal stems, cut the stems and roots with a sharp knife to minimize injury. Divisions of some outdoor plants should be dusted with a fungicide before they are replanted. Examples:- dahlias, iris, rhubarb, day lilies. Separation:- separation is a term applied to a form of propagation by which plants that produce bulbs or corms multiply. Bulbs:- new bulbs form beside the originally planted bulb. Separate these bulb clumps every 3 to 5 years for largest blooms and to increase bulb population. Dig up the clump after the leaves have withered. Gently pull the bulbs apart and replant them immediately so their roots can begin to develop. Small, new bulbs may not flower for 2 or 3 years, but large ones should bloom the first year. Examples:- tulip, narcissus. Corms:- a large new corm forms on top of the old corm, and tiny cormels form around the large corm. After the leaves wither, dig up the corms and allow them to dry in indirect light for 2 or 3 weeks. Remove the cormels, and then gently separate the new corm from the old corm. Dust all new corms with a fungicide and store in a cool place until planting time. Examples:- crocus, gladiolus. Grafting:- grafting and budding are methods of asexual plant propagation that join plant parts so they will grow as one plant. These techniques are used to propagate cultivars that will not root well as cuttings or whose own root systems are inadequate. One or more new cultivars can be added to existing fruit and nut trees by grafting or budding. The portion of the cultivar that is to be propagated is called the scion. It consists of a piece of shoot with dormant buds that will produce the stem and branches. The rootstock, or stock, provides the new plant’s root system and sometimes the lower part of the stem. The cambium is a layer of cells

located between the wood and bark of a stem from which new bark and wood cells originate. Four conditions must be met for grafting to be successful:- the scion and rootstock must be compatible; each must be at the proper physiological stage; the cambial layers of the scion and stock must meet; and the graft union must be kept moist until the wound has healed. Cleft Grafting:- cleft grafting is often used to change the cultivar or top growth of a shoot or a young tree (usually a seedling). It is especially successful if done in the early spring. Collect scion wood 3/8 to 5/8 inch in diameter. Cut the limb or small tree trunk to be reworked, perpendicular to its length. Make a 2-inch vertical cut through the center of the previous cut. Be careful not to tear the bark. Keep this cut wedged apart. Cut the lower end of each scion piece into a wedge. Prepare two scion pieces 3 to 4 inches long. Insert the scions at the outer edges of the cut in the stock. Tilt the top of the scion slightly outward and the bottom slightly inward to be sure the cambial layers of the scion and stock touch. Remove the wedge propping the slit open and cover all cut surfaces with grafting wax. Bark Grafting:- unlike most grafting methods, bark grafting can be used on large limbs, although these are often infected before the wound can completely heal. Collect scion wood 3/8 to 1/2 inch in diameter when the plant is dormant, and store the wood wrapped in moist paper in a plastic bag in the refrigerator. Saw off the limb or trunk of the rootstock at a right angle to itself. In the spring, when the bark is easy to separate from the wood, make a 12-inch diagonal cut on one side of the scion, and a 1-1/2-inch diagonal cut on the other side. Leave two buds above the longer cut. Cut through the bark of the stock, a little wider than the scion. Remove the top third of the bark from this cut. Insert the scion with the longer cut against the wood. Nail the graft in place with flat-headed wire nails. Cover all wounds with grafting wax. Whip Or Tongue Grafting:- this method is often used for material 1/4 to 1/2 inch in diameter. The scion and rootstock are usually of the same diameter, but the scion may be narrower than the stock. This strong graft heals quickly and provides excellent cambial contact. Make one 2-1/2-inch long sloping cut at the top of the rootstock and a matching cut on the bottom of the scion. On the cut surface, slice downward into the stock and up into the scion so the pieces will interlock. Fit the pieces together, then tie and wax the union. Care Of The Graft:- very little success in grafting will be obtained unless proper care is maintained for the following year or two. If a binding material such as strong cord or nursery tape is used on the graft, this must be cut shortly after growth starts to prevent girdling. Rubber budding strips have some advantages over other materials. They expand with growth and usually do not need to be cut, as they deteriorate and break after a short time. It is also an excellent idea to inspect the grafts after 2 or 3 weeks to see if the wax has cracked, and if necessary, rewax the exposed areas. After this, the union will probably be strong enough and no more waxing will be necessary. Limbs of the old variety which are not selected for grafting should be cut back at the time of grafting. The total leaf surface of the old variety should be gradually reduced as the new one increases until at the end of 1 or 2 years, the new variety has completely taken over. Completely removing all the limbs of the old variety at the time of grafting increases the shock to the tree and causes excessive suckering. Also, the scions may grow too fast, making them susceptible to wind damage. Budding:- budding, or bud grafting, is the union of one bud and a small piece of bark from the scion with a rootstock. It is especially useful when scion material is limited. It is also faster and forms a stronger union than grafting. Patch Budding:- plants with thick bark should be patch budded. This is done while the plants are actively growing, so their bark slips easily. Remove a rectangular piece of bark from the rootstock. Cover this wound with a bud and matching piece of bark from the scion. If the rootstock's bark is thicker than that of the scion, pare it down to meet the thinner bark so that when the union is wrapped the patch will be held firmly in place. Chip Budding:- this budding method can be used when the bark is not slipping. Slice downward into the rootstock at a 45 degree angle through 1/4 of the wood. Make a second cut upward from the first cut, about one inch. Remove a bud and attending chip of bark and wood from the scion shaped so that it fits the rootstock wound. Fit the bud chip to the stock and wrap the union. T-Budding:- this is the most commonly used budding technique. When the bark is slipping, make a vertical cut (same axis as the root stock) through the bark of the rootstock, avoiding any buds on the stock. Make a horizontal cut at the top of the vertical cut (in a T shape) and loosen the bark by twisting the knife at the intersection. Remove a shield-shaped piece of the scion, including a bud, bark, and a thin section of wood. Push the shield under the loosened stock bark. Wrap the union, leaving the bud exposed. Care Of Buds:- place the bud in the stock in August. Force the bud to develop the following spring by cutting the stock off 3 to 4 inches above the bud. The new shoot may be tied to the resulting stub to prevent damage from the wind. After the shoot has made a strong union with the stock, cut the stub off close to the budded area. See also Vegetative Propagation. / Разведение По Линиям, система племенной работы с заводскими породами сельскохозяйственных животных, основанная на рациональном использовании в ряде поколений ценных качеств выдающихся производителей (смотрите Линия в генетике). Для создания линии отбирают из наиболее ценных производителей, оцененных по потомству, родоначальника линии, подбирают к нему лучших маток, от спаривания с которыми получают потомство желательного типа и продуктивности; затем выделяют из этого потомства лучших производителей, а из них – продолжателя линии (также на основе оценки по потомству). Потомков мужского пола от ведущего производителя (продолжателя линии) снова оценивают по потомству и из них выделяют нового продолжателя линии и так далее на протяжении 3–6 поколений. Для усиления наследственного влияния родоначальника иногда прибегают к умеренно-родственному спариванию (смотрите Инбридинг). При разведении по линиям широко используют и ценных маток (что обогащает генофонд линии) через их потомство, а также проводят работу с маточными семействами, что облегчает подбор лучших маток к производителю. Применяют также межлинейные скрещивания (кроссы) наиболее удачно сочетающихся линий. Разведение по линиям способствует расчленению породы на генетически не тождественные группы, вследствие чего создаётся и поддерживается сложная структура породы и обеспечивается непрестанное её совершенствование. Впервые разведение по линиям стали применять в XVIII веке при выведении пород Лошадей (в России – Орловского Рысака). В разработке теории разведения по линиям большая заслуга принадлежит Русским учёным Еллию Анатольевичу Богданову (1872–1931), Дмитрию Андреевичу Кисловскому (1894–1957) и другим. Некоторые отличия от других отраслей животноводства имеет разведение по линиям в птицеводстве:- это получение так называемых инбредных линий, создаваемых целеустремлённым отбором на протяжении 3–5 поколений в пределах стада (в так называемых Закрытых Популяциях). Скрещиванием инбредных линий, систематически проверяемых на сочетаемость, получают так называемую Гибридную Птицу. Разведение 'В Себе', заключительный этап племенной работы при скрещивании пород, то есть прекращение дальнейшего межпородного скрещивания и разведение животных путём спаривания между собой межпородных помесей, если они удовлетворяют поставленным требованиям. Смотрите также Разведение Сельскохозяйственных Животных. Разведение Сельскохозяйственных Животных (animal breeding), наука о размножении сельскохозяйственных животных и улучшении их наследственных качеств, совершенствовании существующих и выведении новых пород и высокопродуктивных пользовательных стад; раздел зоотехнии. Разведение сельскохозяйственных животных разрабатывает теоретические основы и практические приёмы племенной работы в животноводстве, главными элементами которой являются отбор лучших животных, основанный на оценке их (а также их предков и потомства) по комплексу признаков (конституции, экстерьеру, продуктивности и другим), обоснованный подбор родительских пар и правильное (в оптимальных условиях кормления и содержания) выращивание молодняка. При разведении сельскохозяйственных животных человек имеет дело не только с отдельными животными, но и с целостными, упорядоченными племенными работой группами – породами животных, стадами, зональными типами. Поэтому в задачу разведения сельскохозяйственных животных входит разработка приёмов управления эволюцией пород на основе глубокого познания биологии животных, в частности генетических процессов, свойственных целым породам и популяциям (стадам). Зарождение учения о разведении сельскохозяйственных животных относится к глубокой древности. С периода первобытнообщинного строя, когда впервые были приручены или одомашнены

дикие предки многих современных домашних животных, человек постепенно изменял и совершенствовал их в разных направлениях. Методы улучшения домашних животных были известны с давних пор и передавались в виде практических советов из поколения в поколение. Многие ценные рекомендации, выработанные тысячелетия назад, донесла до нас античная и средневековая литература. Так, в трудах Римского учёного и писателя Марка Теренция Варрона (Marcus Terentius Varrō; 116–27 до Нашей Эры) имеется рекомендация об отборе на племя животных на основе оценки их по происхождению, внешнему виду и качеству потомства. У древнегреческого философа, писателя и историка Ксенофонта (Xenophon; 430–354 до Нашей Эры) и древнегреческого врача Гиппократа (Hippocrates; 460–370 до Нашей Эры) встречается упоминание о конституции животных. В средние века начало складываться близкое к современному понятие породы. В XVIII веке в связи с интенсивным развитием племенного животноводства был создан и получил широкое распространение основной метод разведения животных – чистопородное разведение. Французский учёный, натуралист, естествоиспытатель и писатель XVIII века Жорж-Люи Лёклер, Граф дё Бюфо (Georges-Louis Leclerc, Comte de Buffon; 1707–1788) разработал теорию скрещивания, близкую к современной. Большое влияние на теоретические основы разведения сельскохозяйственных животных оказало эволюционное учение Чалза Робэта Давина (Charles Robert Darwin; 1809–1882) (‘Происхождение Видов’, 1859), вскрывшее огромную роль искусственного отбора в создании и эволюции пород. Во 2-й половине XIX века в ряде сочинений по разведению сельскохозяйственных животных авторы (Немецкие учёные Хэрман Энгельхард фон Натузиос (Hermann Engelhard von Nathusius; 1809–1879), Хэрман Густаф Зэтэгаст (Hermann Gustav Settegast; 1819–1908) и другие) основывают свои исследования на эволюционном учении Давина. Во 2-й половине XIX – начале XX веков в России появляются зоотехнические работы Русских учёных, заложивших основы современной теории и практики разведения сельскохозяйственных животных. Так, Николаем Петровичем Чирвинским (1848–1920) вскрыты основные закономерности роста и развития сельскохозяйственных животных (смотрите Онтогенез). Павлом Николаевичем Кулешовым (1854–1936) разработано учение о конституции сельскохозяйственных животных, приёмы отбора и подбора. Труды Еллия Анатольевича Богданова (1872–1931) посвящены дальнейшей разработке учения о конституции, вопросам подбора, разведения чистопородных животных по линиям, а также происхождения и одомашнивания животных. Михаил Иванович Придорогин (1862–1923) многое сделал в изучении вопросов экстерьера животных. Михаил Фёдорович Иванов (1871–1935) разработал современные приёмы племенной работы и создал методику выведения пород, позволившую в короткие сроки значительно улучшить существующие и вывести около 60 новых высокопродуктивных пород разных видов сельскохозяйственных животных в бывшем Союзе Советских Социалистических Республик (СССР). На протяжении XX века основы разведения сельскохозяйственных животных развивались в работах учёных многих стран. В бывшем СССР – это труды Ефима Федотовича Лискуна(1873–1958) по экстерьеру и конституции животных, вопросам племенного дела и повышения продуктивности молочного и мясного скота; Дмитрия Андреевича Кисловского (1894–1957) – по онтогенезу, филогенезу, эволюции домашних животных, проблемам инбридинга; Николая Александровича Юрасова (1881–1936) – по вопросам инбридинга и разведения по линиям; Владимира Оскаровича Витта (1889–1964) – по теории и практике коннозаводства, и многих других. За рубежом важные работы выполнены Швейцарским учёным Йоханом Ульрихём Дюрстом (Johann Ulrich Dürst; 1876–1950) по основам разведения крупного рогатого скота; Английским учёным Сэром Дьжоном Хамэндом (Sir John Hammond; 1889–1964) – по росту и развитию сельскохозяйственных животных, биологии размножения, лактации и другому; Американскими учёными Юдьжином Дэвэнпотом (Eugene Davenport; 1856–1941) – по основам племенного разведения, Сиволом Грином Райтом (Sewall Green Wright; 1889–1988), Дьжейэм Лорэнцэм Лашем (Jay Laurence Lush; 1896 – 1982) и В. Райсом (V. Rice) – по генетике (главным образом популяционной) животных. Современное разведение сельскохозяйственных животных располагает богатым теоретическим материалом и эффективными методами, позволяющими вести животноводство на современном научном уровне. Важнейшие методы разведения сельскохозяйственных животных – чистопородное разведение, скрещивание и гибридизация при тщательном отборе и подборе пар (смотрите Отбор В Животноводстве, Подбор В Животноводстве, Бонитировка Сельскохозяйственных Животных). В результате применения методов разведения и специализации животных в определённых направлениях созданы разнообразные высокопродуктивные породы. Ценные качества пород, их наследственная устойчивость совершенствуются высшими формами племенной работы – разведением по линиям и семействам (смотрите Линия в генетике). Развивается учение о породе в животноводстве. Создана классификация пород, изучаются их структура и факторы, влияющие на их образование и эволюцию. Углубляются исследования по происхождению сельскохозяйственных животных и изменению их под влиянием одомашнивания (смотрите Одомашнивание, Домашние Животные); по индивидуальному развитию (онтогенезу) и управлению этим процессом; экстерьеру и конституции, которые изучаются в тесной связи с жизнеспособностью и продуктивностью животных (смотрите Конституция Сельскохозяйственных Животных, Экстерьер); по продуктивности сельскохозяйственных животных, её изменчивости и наследуемости. Большая роль в разрешении теоретических и практических проблем разведения сельскохозяйственных животных принадлежит генетике, позволившей найти методы управления наследственностью животных для получения нужных форм. Впервые генетика проникла в науку о разведении сельскохозяйственных животных в начале XX века, когда было сформулировано понятие гена и установлено, что наследственное разнообразие создаётся комбинированием генов при скрещивании или в результате изменения самих генов – мутаций. Однако в тот период генетика не оказала заметного влияния на разведение сельскохозяйственных животных. Современная генетика (особенно популяционная), развивающаяся на основе потребностей практики, оказывает на разведение сельскохозяйственных животных всё большее влияние. Вскрытие сущности понятий Фенотипа и Генотипа потребовало более точной оценки наследственных качеств животных как объектов селекции, практическим следствием чего явилось дополнение методов оценки отбираемых на племя животных оценкой по качеству потомства. Анализ закономерностей наследования разнообразных признаков в популяциях позволил разработать генетико-математические методы определения наследуемости практически любого признака. Так, знание закономерностей наследования окраски волосяного покрова норок позволило получить десятки цветных вариантов меха этих зверей. В овцеводстве методом комбинирования мутаций получают цветные каракульские смушки. В шёлководстве имеются практические достижения в управлении полом Тутового Шёлкопряда. Разрабатываются генетические методы управления явлением гетерозиса у помесных (смотрите Помесь) и гибридных (смотрите Гибридизация) животных. Для контроля за происхождением животных всё шире применяются методы иммуногенетики. Генетические исследования современных советских и зарубежных учёных в области зоотехнии и животноводства связаны преимущественно с достижениями биологических наук:- исследуются белки крови, куриных яиц, молока в связи с их наследственной обусловленностью и продуктивностью животных; изучаются методы селекции животных по качеству продукции, оплате корма и тому подобное. В бывшем СССР и зарубежных странах курс разведения сельскохозяйственных животных преподавался на зоотехнических факультетах высших и средних сельскохозяйственных учебных заведений. Издаётся учебная, справочная и монографическая литература по разведению сельскохозяйственных животных.

PROPAGATIVE PLANT MATERIAL = ПОСАДОЧНЫЙ РАСТИТЕЛЬНЫЙ МАТЕРИАЛ (или РАСТИТЕЛЬНЫЙ МАТЕРИАЛ ДЛЯ РАЗВЕДЕНИЯ) – Propagative Plant Material:- plants or plant parts for planting or multiplication. / Посадочный Растительный Материал:- растения или части растений для посадки и размножения.

PROPAGULES = РОСТКИ (или ЧЕРЕНКИ, или ПОБЕГИ, или ОТПРЫСКИ, или СЕЯНЦЫ) – Propagule is a part of an organism that may be disseminated. Propagules:- any plant part used for asexual propagation. / для бесполового размножения. Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов Высших Растений. У Однолетних Растений побеги живут один сезон; у Многолетних Растений – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, надземные – в усики, колючки. Под Сеянцем понимается 1–2 летнее древесное растение, выращенное из семени в плодовом или лесном питомниках (подвой в плодоводстве и посадочный материал в лесоразведении). Под Черенком понимается отрезок зелёного или одревеснешего побега с почками, используемый для вегетативного размножения растений – укоренения, прививок. Под Подвоем понимается растение (или часть его), на которое прививают часть (черенок, почку и тому подобное) другого растения – Привоя. Через корневую систему подвоя осуществляется минеральное питание и водоснабжение привитого растения. Привой снабжает подвой продуктами ассимиляции. Полнота срастания привитых компонентов и нормальное развитие полученного растительного организма зависят от физиологической совместимости подвоя и привоя. Подвой влияет на силу роста, урожайность и долговечность привоя, его зимостойкость, устойчивость к болезням и вредителям. Привой, в свою очередь, может влиять на зимостойкость подвоя, на развитие его корневой системы. В плодоводстве в зависимости от производственных задач для одной и той же культуры применяют разные подвои. Например, Яблоню прививают на Юге и в центральных районах бывшего Союза Советских Социалистических Республик (СССР) на сеянцах культурных сортов и лесной Яблони, в более Северных районах – на сливолистной Яблоне (Китайке), а на Востоке и Севере – на Сибирской Яблоне. В питомниках бывшего СССР для выращивания привитых саженцев плодовых культур использовали около 40 видов подвоев, различающихся происхождением (дикорастущие и культурные), силой роста и способом размножения (семенные и вегетативные).

PROPANE = ПРОПАН – Propane is a natural hydrocarbon occurring in a gaseous state under normal atmospheric pressure and temperature, however, propane is usually liquefied through pressurization for transportation and storage. Propane is primarily used for rural heating and cooking and as a fuel gas in areas not serviced by natural gas mains and as a petrochemical feed stock. Propane is a component of natural gas consisting of three carbon atoms and eight hydrogen atoms, condenses into a liquid at relatively low temperature and pressure. / Пропан, $CH_3CH_2CH_3$, бесцветный газ, $t_{кип}$ –42.1 °C. Содержится в природном горючем и попутном нефтяных газах, в газах нефтепереработки образуется при крекинге нефтепродуктов. Применяется в органическом синтезе (например, для получения нитрометана, пропилена и этилена), для получения технического углерода, как растворитель, хладагент, газовая среда в аэрозольных упаковках, в смеси с бутаном используется как бытовой газ и так далее.

PROPANE CARRIER = ПЕРЕВОЗЧИК ПРОПАНА – Propane Carrier is a ship designed to carry propane in liquid form. The propane is carried in tanks within the holds; it remains in liquid form by means of pressure and refrigeration. Such ships are also suitable for the carriage of butane.

PROPELLER = ПРОПЕЛЛЕР (или ВИНТ) – Propeller includes a part, appurtenance, and accessory of a propeller. / Под Пропеллером, от Латинского слова Propello, означающее Гоню или Толкаю Вперёд, понимается то же, что Винт. Под Винтом, от Польского слова Gwint, от Немецкого слова Gewinde, означающее Нарезка или Резьба, понимается:- (1) ходовой винт – ведущее звено в винтовой передаче; (2) лопастной (воздушный, гребной) винт – вал с винтовыми лопастями, обеспечивающий движение вертолёта, самолёта, судна; или (3) крепёжная деталь – стержень с головкой (обычно имеет шлиц под отвёртку) и резьбой.

PROPER HANG TAG AND FIBER IDENTIFICATION NOT APPLIED = ТЩАТЕЛЬНО НАВЕШЕННАЯ БИРКА И ИДЕНТИФИКАЦИЯ ВОЛОКНА НЕ ПРИЛОЖЕНЫ – Proper Hang Tag And Fiber Identification Not Applied:- omission of fabric contents violates Fiber Product Identification Act. Hang tag and label should correspond. Finishing department defects, and namely – Final Inspection Checks. / Порок или дефект заключительной обработки.

PROPERTY = ИМУЩЕСТВО (или СОБСТВЕННОСТЬ) – Legally, Property is divided into real and personal property. Real property may be defined as land and buildings held freehold. Personal property consists of other personal possessions. More specifically, property is sometimes defined as something appreciating in value or yielding income. According to the Lisbon Rules, property means cargo, goods and other thing on board a vessel. / В гражданском праве под Имуществом понимаются:- (i) материальный объект гражданских прав, прежде всего права собственности; и (ii) совокупность имущественных прав (актив) или имущественных прав и обязательств (актив и пассив), принадлежащих определённому лицу.

PROPERTY DAMAGE INSURANCE = СТРАХОВАНИЕ ИМУЩЕСТВА ОТ ПОВРЕЖДЕНИЯ – Property Damage Insurance:- protection against liability for damage to the property of another not in the care, custody and control of the insured, as distinguished from liability for bodily injury.

PROPERTY INCOME = ДОХОД ОТ (ИСПОЛЬЗОВАНИЯ) ИМУЩЕСТВА – Property Income:- incomes that accrue from lending or renting financial or tangible nonproduced assets, including land, to other units. See also Tangible Assets.

PROPERTY INSURANCE = СТРАХОВАНИЕ ИМУЩЕСТВА (или ИМУЩЕСТВЕННОЕ СТРАХОВАНИЕ) – Property Insurance:- two main types of contracts – homeowner's and commercial – have been developed to insure against loss from accidental destruction of property. These contracts (or forms) typically are divided into three or four parts:- insuring agreements, identification of covered property, conditions and stipulations, and exclusions. Insurance which indemnifies a person with an interest in physical property for its loss or the loss of its income-producing ability. Collective term for fire and business interruption insurance as well as burglary, fidelity guarantee and allied lines.

PROPERTY, PLANT AND EQUIPMENT = ИМУЩЕСТВО, ЗАВОД (или ПРОМЫШЛЕННЫЕ ЗДАНИЯ) И ОБОРУДОВАНИЕ – IAS 16 (short for International Accounting Standard No. 16) – Property, Plant and Equipment – The objective of this Standard is to prescribe the accounting treatment for property, plant and equipment so that users of the financial statements can discern information about an entity's investment in its property, plant and equipment and the changes in such investment. The principal issues in accounting for property, plant and equipment are the recognition of the assets, the determination of their carrying amounts and the depreciation charges and impairment losses to be recognised in relation to them. Property, plant and equipment are tangible items that:- (a) are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes; and (b) are expected to be used during more than one period. The cost of an item of property, plant and equipment shall be recognised as an asset if, and only if:- (a) it is probable that future economic benefits associated with the item will flow to the entity; and (b) the cost of the item can be measured reliably. Measurement at recognition:- An item of property, plant and equipment that qualifies for recognition as an asset shall be measured at its cost. The cost of an item of property, plant and equipment is the cash price equivalent at the recognition date. If payment is deferred beyond normal credit terms, the difference between the cash price equivalent and the total payment is recognised as interest over the period of credit unless such interest is recognised in the carrying amount of the item in accordance with the allowed alternative treatment in IAS 23. The cost of an item of property, plant and equipment comprises:- (a) its

purchase price, including import duties and non-refundable purchase taxes, after deducting trade discounts and rebates; (b) any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management; and (c) the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period. Measurement after recognition:- An entity shall choose either the cost model or the revaluation model as its accounting policy and shall apply that policy to an entire class of property, plant and equipment. Cost model:- After recognition as an asset, an item of property, plant and equipment shall be carried at its cost less any accumulated depreciation and any accumulated impairment losses. Revaluation model: After recognition as an asset, an item of property, plant and equipment whose fair value can be measured reliably shall be carried at a revalued amount, being its fair value at the date of the revaluation less any subsequent accumulated depreciation and subsequent accumulated impairment losses. Revaluations shall be made with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the balance sheet date. If an asset's carrying amount is increased as a result of a revaluation, the increase shall be credited directly to equity under the heading of revaluation surplus. However, the increase shall be recognised in profit or loss to the extent that it reverses a revaluation decrease of the same asset previously recognised in profit or loss. If an asset's carrying amount is decreased as a result of a revaluation, the decrease shall be recognised in profit or loss. However, the decrease shall be debited directly to equity under the heading of revaluation surplus to the extent of any credit balance existing in the revaluation surplus in respect of that asset. Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life. Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value. Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item shall be depreciated separately. The depreciation charge for each period shall be recognised in profit or loss unless it is included in the carrying amount of another asset. The depreciation method used shall reflect the pattern in which the asset's future economic benefits are expected to be consumed by the entity. The residual value of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life. To determine whether an item of property, plant and equipment is impaired, an entity applies IAS 36 Impairment of Assets. The carrying amount of an item of property, plant and equipment shall be derecognised:- (a) on disposal; or (b) when no future economic benefits are expected from its use or disposal. Property, Plant, And Equipment represent the land, buildings, and equipment owned by the business. These items are often listed under the term Fixed Assets since they are, with the exception of noninstalled equipment, immovable. Since property, plant, and equipment have a limited useful life, firms reduce the value of their fixed assets each year to account for the implicit costs associated with their wearing out and replacement over time. The term for this reduction in value of fixed assets is Depreciation. Also known as Tangible Fixed Assets in the United Kingdom. In the United States, Property, Plant And Equipment is recognized when the cost of an asset can be reliably measured and it is probable that the entity will obtain future economic benefits from the asset. Property, plant and equipment is measured initially at cost. Cost includes the fair value of the consideration given to acquire the asset (net of discounts and rebates) and any directly attributable cost of bringing the asset to working condition for its intended use (inclusive of import duties and nonrefundable purchase taxes). Directly attributable costs include the cost of site preparation, delivery, installation costs, relevant professional fees and the estimated cost of dismantling and removing the asset and restoring the site (to the extent that such a cost is recognized as a provision). Subsequent expenditure relating to an item of property, plant and equipment is capitalized if it meets the recognition criteria. Property, plant and equipment may have parts with different useful lives. Depreciation is calculated based on each individual part's life. In case of replacement of one part, the new part is capitalized to the extent that it meets the recognition criteria of an asset, and the carrying amount of the parts replaced is derecognized. The cost of a major inspection or overhaul of an item occurring at regular intervals over the useful life of the item is capitalized to the extent that it meets the recognition criteria of an asset. The carrying amount of the parts replaced are derecognized. In the balance sheet, Property, Plant And Equipment is recorded at cost less accumulated depreciation. Depreciation is determined on a straight-line basis over the estimated useful lives of the assets of approximately 20 years for buildings, 5 years for R&D (Researh and Development) equipment, 3–5 years for furniture and office equipment and 3 years for IT hardware and software. Land-use rights are depreciated over the term of the granted right. Incl:- buildings, construction in progress, land and land-use rights, and machinery and equipment. / МСБУ 16 (сокращение для Международного Стандарта Бухгалтерского Учёта № 16) – . строка баланса (item). Под Основными Фондами понимается совокупность материально-вещественных ценностей, действующих в течение длительного времени. К ним относятся:- здания, машины, оборудование, рабочий и продуктивный скот, сооружения, транспортные средства и тому подобное. Основные фонды, функционирующие в сфере материального производства, называются производственными основными фондами, в непроизводственной сфере – непроизводственными основными фондами. Основные фонды являются важной частью национального богатства. Основные фонды, выраженные в денежном эквиваленте, называются основными средствами.

PROPERTY RIGHTS = ПРАВА СОБСТВЕННОСТИ – Property Rights:- a property right is the exclusive authority to determine how and by whom a particular resource is used. More broadly, property rights may be seen as a bundle of separate and distinct rights over a particular good – including at least the right of personal use, the right to demand compensation as a prerequisite for its use by other people, and the right to transfer any or all of these rights to others (either permanently by sale or temporarily through some form of contractual arrangement). Property rights may be exercised by governments through their designated officials (public ownership or public property) as well as by private individuals and other sorts of non-governmental organizations (private property).

PROPHYLL = ПРИЦВЕТНИЧЕК (или ПЕРВЫЙ ЛИСТ) – Prophyll is a rudimentary leaf at the base of a leafy shoot. / Под Прицветником понимается лист, в пазухе которого развиваются цветок или соцветие. Прицветниками называют также маленькие листья (один или два) на цветоножке.

PROPHYLLUM = ПРОФИЛЛУМ (или ПРИЦВЕТНИЧЕК, или ПЕРВЫЙ ЛИСТ) – Prophyllum is the first two-keeled bract and bladeless rudimentary leaf at the base of the main culm. A membranous structure between the shoot and stem in grasses. Morphologically it is the first leaf of the developing shoot. Prophyllum (syn. Coleoptyloid) is a small, 2-keeled bract enclosed by the leaf sheath with the back against the parent culm and its margins clasping the young tiller. / Под Профиллумом, от Латинского слова Pro, означающее Вместо или Вперёд, и Греческого слова Phýllon, означающее Лист, понимается .

PROPORTIONAL REINSURANCE = ПРОПОРЦИОНАЛЬНОЕ ПЕРЕСТРАХОВАНИЕ – Proportional Reinsurance is a type of reinsurance in which the reinsurer shares similar proportions of the premiums earned and the claims incurred by the reassured plus certain associated expenses. Compare non-proportional reinsurance. Quota share treaties and surplus line treaties are examples of proportional reinsurance. Form of reinsurance in which the premiums and claims of the insurer are shared proportionally by the insurer and reinsurer. / Форма перестрахования, в которой страховые премии и претензии страховщика поделены пропоционально между страховщиком и перестраховщиком.

PROPOSAL FORM = ФОРМА ЗАЯВЛЕНИЯ НА СТРАХОВАНИЕ – Proposal Form is a standard form which is prepared by an insurer and which contains a number of questions which a person seeking insurance is required to answer for the purpose of enabling the insurer to decide whether or not it is willing to grant cover and, if so, the terms on such cover. Proposal Form is a document completed by a prospective insured, giving details required by insurers to enable them to decide whether to accept the risk and on what premium terms and conditions. Once agreed by both parties, it forms the basis of the insurance contract. / порядки и условия.

PROPOSER = ПРЕДЛАГАЮЩИЙ – Proposer is a person who seeks insurance (frequently by means of completing a proposal form).

PROPRIETARY ACCOUNT = СВОЙСКИЙ СЧЁТ – Proprietary Account is an account that a Futures Commission Merchant (FCM) carries for itself or a closely related person, such as a parent, subsidiary or affiliate company, general partner, director, Associated Person, or an owner of ten percent or more of the capital stock. The FCM must segregate customer funds from funds related to proprietary accounts.

PROPRIETARY MESSAGE = ЧАСТНОЕ СООБЩЕНИЕ (или СВОЙСКОЕ СООБЩЕНИЕ) – Proprietary Message:- this SWIFT message type is used for formats defined and agreed between users for those messages not (yet) live. / Этот тип сообщения Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) используется для форматов, определённых и согласованных между пользователями таких сообщений, которые (даже) ни актуальны. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

PROP SHOP = СВОЙСКАЯ ЛАВОЧКА – Proshop:- a proprietary trading group, especially one where the group's traders trade electronically at a physical facility operated by the group.

PRO RATA = НА ПРОПОРЦИОНАЛЬНОЙ ОСНОВЕ – Pro Rata is a distribution of an expense, fund, or dividend proportionate with ownership. Pro rata means that if you own 10% of the common shares, you will receive 10% of the dividend. / Пропорционально Распределённый (на Латинском Pro Rata):- например, возврат уплаченных налогов может быть пропорционально поделен (распределён) между налогоплательщиками на основании первоначальной оценки их налогов, так что все получают равный процент.

PRO RATA CANCELLATION = РАСТОРЖЕНИЕ НА ПРОПОРЦИОНАЛЬНОЙ ОСНОВЕ – Pro Rata Cancellation:- when an insurance contract is terminated mid-term by an insurer, the return premium will usually be calculated on a pro rata basis. For example this means that if a 12 month contract is cancelled 4 months before its expected expiry date then the insured would receive back 4/12 of its premium.

PRO–RATA PREMIUM = ПРЕМИЯ НА ПРОПОРЦИОНАЛЬНОЙ ОСНОВЕ – In reference to insurance, Pro-Rata Premium is a charge for a number of days a risk is covered, calculated as a precise fraction of the annual premium.

PRO RATE = В ПРОПОРЦИИ – Pro Rate:- cancellation of an insurance contract by the insurance company, allowing a policyholder a share of the premium relating to the remainder of the time under the contract that bears to the total contract premium.

PRORATE = ПРОПОРЦИЯ (или ПРОПОРЦИОНАЛЬНОСТЬ) – Prorate:- a portion of a joint rate or charge obtained by proration (aircargo). / В перевозках авиационных грузов .

PRORATION = В ПРОПОРЦИИ (или В ПРОПОРЦИОНАЛЬНОСТИ) – Proration:- division of a joint rate or charge between the carriers concerned on an agreed basis (aircargo). / В перевозках авиационных грузов .

PRO SE = ПРО СЭ (или ЗА СЕБЯ, или ХХ) – Pro Se:- used to designate an independent inventor who has elected to file an application by themselves without the services of a licensed representative. Pro Se is a Latin term meaning 'On One's Own Behalf'. In the court setting, it refers to persons who present their own cases without lawyers or other representatives. Some individuals choose to act pro se because they have legal experience or are otherwise confident in their ability to convey their claim or defense without assistance. Others may simply wish to avoid paying attorneys' fees and the often exorbitant expenses associated with hiring a lawyer. In England and Wales, the phrase 'Litigant in Person' is sometimes used to refer to such parties.

PROSPECTUS = ПРОСПЕКТ – In the United States, Prospectus is a major part of the registration statement filed with the Securities and Exchange Commission (SEC) for public offerings. A prospectus generally describes securities or partnership interests to be issued and sold. The Prospectus is a document that makes investors aware of the risks of an investment. A Prospectus is a formal, legal document in which a company tells all to the public. It is a formal disclosure document about the past, present, and future plans of the company. It is used when raising money from the public to make sure that investors fully understand what they are investing in (securities commissions regulate this to ensure that the public interest is protected). If a company makes misleading statements, investors can seek recourse (through litigation). / Проспект является документом, который служит инвесторам представлением рисков по инвестициям. Под Проспектом, от Латинского слова Prospectus, означающее Вид, понимается:- (i) подробное изложение плана будущей книги; или (ii) печатная реклама или торговый каталог с описанием товаров и условий их приобретения.

(1) The Prospectus is a formal legal document describing details of a corporation. The prospectus is generally created for a proposed offering (usually an IPO), but they can still be obtained from existing businesses as well. The prospectus includes company facts that are vitally important to potential investors. A document issued by a company or public authority planning to float a bond or shares. As well as describing the modalities of the issue, the profit outlook and the securities to be issued, it also contains an invitation to subscribe. See also Prospectus Liability. A document that provides details about a new offering of securities for sale to the public. It gives a detailed financial background of the issuing company, how the proceeds of the securities will be used, and other pertinent information investors will need to make an informed decision. For the admission of securities to trading on the official or regulated market, the Stock Exchange Act and the Securities Prospectus Act, among other things, impose a general duty to write a prospectus and to file it with the stock exchange listing office. The prospectus contains all important information about the security, the issuer, the company's structure, its financial situation, business activities and all bodies and companies involved in the issue. It should allow the formation of an accurate judgement of the issuer's assets and liabilities, financial situation, profits and losses and future prospects. The Federal Financial Supervisory Authority checks the prospectus for formal, but not material, correctness. The issuer and issuing syndicate are responsible and liable for the correctness of the content. / Проспект (эмиссии) – формальное письменное предложение о продаже ценных бумаг, в котором представлен план предлагаемого коммерческого предприятия или представлены факты, касающиеся уже существующего предприятия, которые должен знать инвестор для принятия осознанного решения. Проспекты также выпускаются и взаимными фондами (mutual funds). В них описываются история, основные цели фонда, приводятся финансовый отчёт и иные основные данные. Проспект для предложения ценных бумаг в открытой продаже (public offering) должен быть представлен в Комиссию по Ценным Бумагам и Биржам (Securities and

Exchange Commission (SEC)) и доступен покупателям при предложении ценных бумаг. Проспекты должны содержать финансовую информацию, а также описание истории компании, сведения о её управляющих, операциях, текущих судебных процессах (если таковые имеются), а также планах (включая направления использования поступлений от реализации данного выпуска ценных бумаг). До того как инвесторы получат окончательный вариант проспекта, называемого утверждённым проспектом (statutory prospectus), они могут получить предварительный проспект (preliminary prospectus), на жаргоне часто называемый 'красной селедкой' (red herring). Этот документ не завершён в некоторых деталях, хотя в него включены основные факты, необходимые для предложения ценных бумаг. Окончательный вариант проспекта называется также циркулярным предложением (offering circular). Предложение ценных бумаг компаниями с ограниченной ответственностью также сопровождается проспектами. Предприятия, занимающиеся недвижимостью, нефтью и газом, предоставлением в аренду оборудования, и иные компании с ограниченной ответственностью должны быть подробно в них описаны, представлены соответствующие финансовые данные, общее описание основных партнеров и приведены поддерживающие отзывы юристов.

(2) In this case of mutual funds, a prospectus describes the fund's objectives, history, manager background, and financial statements. / В случае со взаимными фондами, проспект отражает цели фонда, его историю, опыт управляющих и финансовые отчёты.

PROSPECTUS LIABILITY = ОТВЕТСТВЕННОСТЬ ПО ПРОСПЕКТУ – Prospectus Liability:- issuers and syndicates of banks are liable for the correctness of the information in the sales prospectus. Accordingly, a buyer of a security has the right to return the security to the issuer or syndicate of banks if the prospectus contains verifiably untrue or misleading information. The issue price plus the costs the buyer incurs for the purchase are refunded to him. If he acquired the securities at a later date, he receives repayment of the amount for the purchase. For securities that have already been sold, he is refunded the loss incurred. The buyer's claim to damages is subject to the statute of limitation of six months after he determined the faulty information, at the latest, however, three years following the publication of the sales prospectus. Liability towards shareholders and bondholders on the part of the authors and corporate bodies drafting a prospectus. Legislation in many countries embraces all losses caused by intentionally or negligently supplying inaccurate information or information which fails to meet the legal requirements.

PROSTATE = ПРОСТАТА (или ПРЕДСТАТЕЛЬНАЯ ЖЕЛЕЗА) – Prostate:- lying flat on the ground. The Prostate (from Greek Prostates, literally 'One Who Stands Before', 'Protector', 'Guardian') is a compound tubuloalveolar exocrine gland of the male reproductive system in most mammals. It differs considerably among species anatomically, chemically, and physiologically. In 2002, female paraurethral glands, or Skene's glands, were officially renamed the female prostate by the Federative International Committee on Anatomical Terminology. Structure:- a healthy human prostate is classically said to be slightly larger than a walnut. The mean weight of the 'normal' prostate in adult males is about 11 grams, usually ranging between 7 and 16 grams. It surrounds the urethra just below the urinary bladder and can be felt during a rectal exam. It is the only exocrine organ located in the midline in humans and similar animals. The secretory epithelium is mainly pseudostratified, comprising tall columnar cells and basal cells which are supported by a fibroelastic stroma containing randomly orientated smooth muscle bundles. The epithelium is highly variable and areas of low cuboidal or squamous epithelium are also present, with transitional epithelium in the distal regions of the longer ducts. Within the prostate, the urethra coming from the bladder is called the Prostatic Urethra and merges with the two ejaculatory ducts. The prostate can be divided in two ways:- by zone, or by lobe. It does not have a capsule, rather an integral fibromuscular band surrounds it. It is sheathed in the muscles of the pelvic floor, which contract during the ejaculatory process. / Под Предстательной Железой или Простатой понимается непарная железа мужской половой системы человека и животных. У человека расположена в малом тазу, между дном мочевого пузыря и прямой кишкой. Секрет предстательной железы обеспечивает жизнедеятельность сперматозоидов в семенной жидкости. Воспаление предстательной железы – простатит.

PROSTRATE = СТЕЛЮЩЕЕСЯ (или РАСПРОСТЁРТОЕ, или ОБЕССИЛЕННОЕ, или ИЗМОЖДЁННОЕ) – Prostrate:- lying flat upon the ground. / , от позднелатинского слова Prostratio, означающее Угнетение или Упадок, понимается .

PROTECT = ОБЕСПЕЧИТЬ – Protect:- to assure payment of (drafts, or notes for example) by setting aside funds. / Под термином 'Обеспечить' понимается гарантировать оплату (тратт или нот к примеру) за счёт размещения соответствующих денежных средств.

PROTECTED AREA = ЗАЩИЩЁННЫЙ АРЕАЛ (или ПРЕДОХРАНЁННЫЙ АРЕАЛ) – Protected Area is a regulated area that the National Plant Protection Organization (NPPO) has determined to be the minimum area necessary for the effective protection of an endangered area.

PROTECTING SAMPLES = ЗАЩИЩЁННЫЕ ПРОБЫ – Protecting Samples:- official personnel shall protect samples from manipulation, substitution, and improper and careless handling which would deprive the samples of their representativeness or which would change the physical and chemical properties of the commodity from the time of sampling until inspection services are completed and file samples have been discarded.

PROTECTION AND INDEMNITY INSURANCE = СТРАХОВАНИЕ ЗАЩИТЫ И ВОЗМЕЩЕНИЯ (или СТРАХОВАНИЕ НА УСЛОВИЯХ 'ЗАЩИТА И ВОЗМЕЩЕНИЕ') – Protection And Indemnity Insurance, commonly known as P&I Insurance, is a form of marine insurance provided by a P&I club. A P&I club is a mutual (i.e. co-operative) insurance association that provides cover for its members, who will typically be ship-owners, ship-operators or demise charterers. Unlike a marine insurance company, which is answerable to its shareholders, a P&I club is the servant only of its members. Both P&I clubs and conventional marine insurers are governed by the provisions of the Marine Insurance Act 1906. Marine insurers provide cover for known quantifiable risks, mainly Hull & Machinery insurance for shipowners, and Cargo Insurance for cargo owners. By contrast, P&I Clubs provide insurance cover for broader indeterminate risks, such as third party liabilities that marine insurers are loath to cover. Third party risks include a carrier's liability to a cargo-owner for damage to cargo, a ship's liability after a collision, environmental pollution and war risk insurance; (although some marine insurers are also prepared to cover war risks). It follows that any given cargo may be insured twice: the shipper/cargo-owner will take out conventional cover, and the carrier will have P&I cover. If the cargo is lost or damaged, the cargo-owner should first make a cargo claim against the carrier; but the latter may avoid liability because either (i) he did not cause the loss, or (ii) the Hague-Visby Rules grant exemption from liability. In such a case, the cargo owner will claim against his own insurer. If the cargo-owner fails to claim first against the carrier, but claims against his own insurer, the latter (having reimbursed their client) will, through subrogation, be able to pursue the claim in their own right against the carrier. Marine insurers charge a premium, which guarantees to the assured full cover during the validity of the policy; but P&I insurance is financed not by premiums but by 'calls'. Club members contribute to the club's common pool, out of which claims are paid. If the pool is insufficient, the club members will be asked to pay a further call; but if the pool is in surplus, the club will ask for a reduced call the following year, or may even make a refund to members. (Only ship operators with a sound reputation will be allowed to join a P&I club; and any P&I club member who incurs reckless or avoidable losses to the club may be asked to leave.) Whereas a marine insurer will, on average, pay out £70 for every £100 received in premiums, a P&I club seeks to run as a non-profit-making business. Curiously, the largest P&I club, Norway's Gard, manages to combine mutual P&I business with conventional marine insurance. Should the Rotterdam Rules come into force, third-

party liabilities will increase; and this may result in conventional insurers losing more and more business to P&I clubs. / В страховании океанских и морских перевозок, Страхование На Условиях Защита И Возмещение (ЗиВ Страхование (P&I Insurance)) представляет собой расширенную форму страхования ответственности судовладельцев (операторов судна), обеспечивающая защиту их интересов при наступлении ответственности за возмещение ущерба, нанесённого причинением вреда здоровью лиц, находящихся на борту судна (пассажиров или членов команды), повреждением или утратой принадлежащего им имущества или повреждением груза, а также по ответственности за ущерб, причинённый неподвижным объектам, таким, как пирс, причал, док, в результате допущенной небрежности. Клуб Взаимного Страхования – P&I Club:- защита интересов и возмещение ущерба нужны владельцам судна на случай повреждения находящегося под их ответственностью груза, смерти или травмы пассажиров, экипажа, повреждения перегрузочной техники, пирсов, доков, подводных кабелей, мостов, а в последнее время – и от ущерба, наносимого загрязнением окружающей среды. Условия страхового полиса могут быть расширены, ограничены, исключены, модифицированы или изменены по требованию клиента. Защитой интересов и возмещением ущерба традиционно занимаются ассоциации взаимного страхования, известные под названием Клубы ‘Пи энд Ай’, предлагающие высокую степень страхования ответственности перед третьими сторонами, включая риск загрязнения окружающей среды, риски пассажиров и прочие обязательные риски, которые обычно несут судовладельцы. Клубы Пи энд Ай представляют собой ассоциации взаимного страхования, создаваемые самими судоходными компаниями под управлением менеджеров клуба. Как и требуется по условиям взаимного страхования, убытки покрываются за счёт дополнительных страховых взносов. Страхуемые Риски:- (i) ущерб или компенсация по болезни, в результате личной травмы или смерти любого лица, не являющегося членом экипажа судна; (ii) болезнь, травма, гибель членов экипажа судна и утрата их личного имущества; (iii) безбилетные пассажиры, беженцы или лица, спасённые в море; (iv) столкновение с другими судами, а также повреждение груза при столкновении; (v) гибель или ущерб имуществу; (vi) риски загрязнения; (vii) буксирование; (viii) подъём остатков кораблекрушения; (ix) ответственность за груз; (x) общая авария; (xi) иски и расходы на рабочую силу и судебные издержки; (xii) штрафы; (xiii) расходы по расследованию аварии или несчастного случая; и (xiv) различные риски, возникающие, например, в результате войны, ответственности за отклонение от пути следования, забастовки и так далее – все эти риски могут быть включены в условия страхования по требованию клиента. Страховые взносы для судовладельца рассчитываются в зависимости от суммы затрат за период страхования, предела ответственности, оговорённого в полисе, вида перевозимого груза, типа судна и данных об ущербе за предшествующий период.

PROTECTIONISM = ПРОТЕКЦИОНИЗМ – Protectionism is any of several political-economic doctrines that have in common advocating that government impose political barriers to international trade (usually taxes on imports or quantitative restrictions limiting the volume of legally allowable imports of each particular good) in order to ‘protect’ a domestic firm (or firms) manufacturing these same goods from foreign competition and thereby make it (them) more profitable than would otherwise be the case under free competition. Although difficult to justify on the basis of economic theory, protectionist measures often enjoy considerable political support because it is usually much easier for a tiny group of firms (and their associated labor unions) that stand to benefit greatly from a protectionist measure to organize for political influence than it is for the much larger group of consumers who each stand to lose smaller individual amounts by the proposed measure – even though the total losses normally greatly exceed the total gains. Economic doctrine, theory or policy advocating or implementing measures which protect and favor domestically produced goods over imports. Policy based on self-interest, e.g., one that shields an industry from overseas competition, usually by the imposition of selective or general quotas and tariffs. Protectionism:- act of defending against foreign investment and competition by taxing or restricting imports. / Под Протекционизмом понимается экономическая политика государства, направленная на ограждение национальной экономики от иностранной конкуренции. Реализуется посредством финансового поощрения отечественной промышленности, стимулирования вывоза (или экспорта), ограничения привоза (или импорта). Для домонополистического капитализма характерен ‘защитительный’ протекционизм (охрана развивающихся отраслей национальной промышленности, проводится в противовес фритредерству). Для империализма характерен ‘наступательный’ протекционизм (защита наиболее развитых, высокомонополизированных отраслей промышленности, завоевание внешних рынков путём вывоза (или экспорта) капитала, демпинга и тому подобного). Протекционизм – практика защиты отечественных производителей товаров и услуг от иностранной конкуренции с помощью тарифов и нетарифных барьеров, протекционизм вызывает повышение цен для покупателей, так как отечественные производители не ощущают иностранной конкуренции и могут, следовательно, устанавливать высокие цены. Но отечественные экспортёры могут также и пострадать, потому что зарубежные страны стремятся ответить на протекционизм собственными тарифами и привозными (или импортными) барьерами. Многие экономисты считают, что депрессия 1930-х была ускорена протекционистскими торговыми барьерами, установленными Соединёнными Штатами, согласно Акту Смута-Холи (Smoot-Hawley Act), что привело к ответной реакции со стороны многих стран мира. В более поздние годы многие протекционистские торговые барьеры упали после принятия Генерального Соглашения по Тарифам и Торговле (ГСТТ; General Agreement on Tariffs and Trade (GATT)), которое вступило в силу в 1995.

PROTECTION OF STORED COMMODITIES = ЗАЩИТА ХРАНИМЫХ ВИДОВ СЫРЬЯ – Protection Of Stored Commodities is a protection of goods against spoilage by animal pests.

PROTECTIVE ORDER = ПРОТЕКЦИОНИСТСКОЕ ТРЕБОВАНИЕ – Protective Order:- with regard to antidumping cases, a term for the order under which most business proprietary information is made available to an attorney or other representative of a party to the proceeding.

PROTEIN = ПРОТЕИН (или БЕЛОК) – Protein is a large biological macromolecule made from linear chains of amino acids (polypeptides) linked together by amide bonds. Proteins can have structural or functional (e.g., enzymes) roles in cells, and large proteins may be formed from multiple polypeptide subunits. The structure of each protein or polypeptide subunit is specified by a single gene. Protein is a biopolymer consisting of many different amino acids linked by peptide bonds. Proteins can be more than 100 amino acids long and are very complex in structure. Protein:- biological polymers made up of amino acids. All hair-based fibers (wool, mohair, etc) are protein based. Silk is also a protein fiber. Acid dyes are the most common type used for protein fibers. Reactive dyes are used in some cases. Basic dyes can be used, but generally produce very poor fastness on protein fibers. / Под Протеинами понимаются белки, состоящие только из остатков аминокислот. К протеинам относятся многие ферменты. Часто термин Протеины употребляют как синоним Белков. Белки выполняют в организме многообразные функции – пластические, гормональные, транспортные. Белки – сложные азотсодержащие биополимеры, мономерами которых служат аминокислоты. Аминокислоты делятся на эссенциальные и неэссенциальные в зависимости от того, возможно ли их образование в организме из предшественников. Источником аминокислот является белок пищи. Для здорового человека характерно состояние азотного равновесия, когда потери белка соответствуют количеству, поступившему с пищей. Длительное воздействие холода даже умеренной интенсивности приводит к отрицательному влиянию на обмен и развитию катаболических эффектов и преобладанию процессов распада белка. Безопасный уровень потребления белка, то есть минимальное количество белка, которое может употребляться человеком без ущерба для здоровья 0.83–0.86 грамм на килограмм (г/кг) массы тела. Обычный

ежедневный приём белка у среднестатистического человека составляет приблизительно 100 г. Согласно Приказу № 330 Министерства Здравоохранения Российской Федерации от 05 Августа 2003 стандартной для питания больных в стационарах признана диета, содержащая 85–90 г белка. Сохранение азотного равновесия достигается легче при употреблении высококачественного белка, близкого к 'идеальному', содержащего оптимальные количества незаменимых или эссенциальных аминокислот. Состав его сходен с составом молока и яиц. Далеки от 'идеального' растительные белки, за исключением соевых бобов. Имеет значение и усвояемость белка, его биологическая ценность. Скорость переваривания и абсорбции наиболее высока у рыбного и молочного белка, несколько ниже у мясного и наиболее мала у растительных белков. Для нервной ткани необходимы более высокие концентрации аминокислот, являющихся предшественниками нейромедиаторов. Специфическую роль играет триптофан, являющийся предшественником серотонина. Снижение уровня серотонина в мозге является одним из факторов формирования депрессивных состояний и тяжёлых форм мигрени. В рационе, особенно в осенне-зимний период должны присутствовать рыба, мясо, яйца, молочные продукты с необходимой коррекцией в случае заболевания. Содержание белка в основных пищевых продуктах (в г на 100 г продукта):- апельсины 0.9, баранина 15.6–19.8, говядина 18.6–20.0, горох 20.5, грибы сушёные (белые) 20.1, груши 0.4, икра осетровых (паюсная) 36.0, капуста белокачанная 1.8, картофель 2.0, колбаса любительская варёная 12.2, крупа гречневая ядрица 12.3, крупа манная 10.3, крупа рисовая 7.0, куры 18.2–21.2, макаронные изделия высшего сорта 10.4–11.8, макаронные изделия диетические безбелковые 1.0, масло сливочное бутербродное 2.9, масло сливочное несолёное 0.5, молоко коровье пастеризованное 2.79, морковь 1.3, мука пшеничная первого сорта 10.6, навага 15.1–19.2, печень говяжья 17.9, саго 0.8, сардельки свиные 10.1, свёкла 1.5, свинина мясная 14.3, сервелат 24.0, смородина чёрная 1.0, соя 34.9, судак 18.4, сыры (твёрдые) 19.0–31.0, творог нежирный 18.0, томаты 1.1, треска 16.0, утки 15.8–17.2, фасоль 21.0, хлеб безбелковый из пшеничного крахмала 0.7, хлеб из муки пшеничной 7.6–8.1, хлеб из муки ржаной 4.7–7.0, яблоки 0.4, ядра ореха фундук 16.1, яйца куриные 12.3. Смотрите также Триптофан (Tryptophan).

PROTEIN CONTENT = СОДЕРЖАНИЕ БЕЛКА (или БЕЛКОВОСТЬ) – Protein Content is specified for all bakery flours and is a key part of the contract. For most breadmaking flour, Wheat with a protein content above 13% dry matter, is preferred. If protein content cannot be achieved using home-grown Wheat, imported high protein Wheat or Wheat gluten can be added in. For most biscuits and cakes, gluten formation is not required and much lower protein flours may be used. Protein Content is the amount of protein in a living organism based on the analysis for total N. The percent protein is computed by multiplying the percent N by 6.25.

PROTEIN ENGINEERING = БЕЛКОВАЯ ИНЖЕНЕРИЯ – Protein Engineering is technique used to alter the gene encoding for an enzyme in order to change or obtain new properties. The genetic integrity of the organism producing the enzyme is not changed. Each enzyme consists of several hundreds of amino acids located in such a delicate three-dimensional structure. This structure determines the properties of the enzyme such as reactivity, stability and specificity. Based on protein engineering, scientists can construct slightly altered enzymes by modifying the gene encoding for the enzyme. Engineered organisms then produce the modified enzyme which is subsequently tested to evaluate whether the structure/function models have been correct. Such innovative methods have led to the discovery of detergent enzymes which are much more active, efficient and / or robust in terms of pH, temperature and / or chemical stability, e.g., vs bleach. / Белковая Инженерия – совокупность биохимических методов, с помощью которых осуществляют конструирование новых белков. Методами белковой инженерии синтезируют белки de novo, осуществляют комбинирование крупных блоков полипептидных цепей (доменов) разных белков, а также производят определенные модификации природных белков (замены отдельных аминокислот).

PROTEIN FIBER = БЕЛКОВОЕ ВОЛОКНО – Protein Fiber is a fiber composed of protein, including such naturally occurring animal fibers as wool, silk, Alpaca, Llama and other hair and fur fibers. Protein Animal Fiber are:- Alpaca, Camel hair, cashmere, fur fibers, Llama, mohair, silk, Vicuna, and wool. Protein Fibers are:- ardil (peanut), casein, zein.

PROTEIN MEALS = БЕЛКОВЫЕ ВИДЫ МУКИ (или ПРОТЕИНОВЫЕ ВИДЫ МУКИ) – Protein Meals:- defined as oilseed meals, coconut meal, cotton meal and palm kernel meal.

PROTEIN QUALITY = КАЧЕСТВО ПРОТЕИНА (или КАЧЕСТВО БЕЛКА) – Protein Quality:- when wetted,during dough making, some of the proteins in Wheat flour form a visco-elastic substance – gluten. This can hold gas produced during fermentation and supports the starch and bran producing a typical well-risen UK loaf. The amount and quality of gluten produced indicates potential performance. No fixed threshold exists.

PROTEST = ПРОТЕСТ – (1) Protest is a written declaration by the master and witnessed before a notary public. Protest is a sworn statement by the master describing any unusual event during a voyage. / Заявление хозяина (или капитана) судна в письменной форме, засвидетельствованное общественным (государственным) нотариусом. Под Протестом, от Латинского слова Protestor, означающее Публично Доказываю, понимается возражение и заключается в мотивированном возражении против судебного или управленческого акта.

(2) In a draft collection transaction, the formal legal process of registering that payment or acceptance of the draft has been demanded but the drawee has refused to pay or accept the draft. Protest is a formal written notice that the drawee of a bill has refused to accept or pay it, i.e. that the bill has been dishonored. Filing the protest within the prescribed period is a condition for the right to seek recourse, except if the bill carries the notation 'without costs' or 'without protest'. Checks can also be protested in the case of nonpayment, it being sufficient for the drawee to make a written, dated declaration on the check or for a clearing house to make a dated statement. Legal document constituting evidence of non-payment of a check, bill of exchange or promissory note. / протест векселя. за исключением тех случаев, когда вексель несёт в себе нотацию 'оборот без издержек' или 'без протеста'. , то есть . Протест векселя – нотариальное удостоверение в неакцепте или неплатеже по векселю. Протест векселя:- в соответствии с вексельными законодательствами большинства стран мира полный или частичный отказ плательщика в оплате векселя должен быть удостоверен в определённый срок актом, составленным в публичном порядке – протестом.

PROTEST SYSTEM = СИСТЕМА ОПРОТЕСТОВАНИЯ – In the United States, the Protest System, a part of Customs' Automated Commercial System, tracks protests from the date they are received through final action. A protest is the legal means by which an importer, consignee or other designated part may challenge decisions made by a District Director of Customs.

PROTHALLUS = ПРОТАЛЛУС (или ЗАРОСТОК, или ПРОТАЛЛИЙ) – Prothallus is the growth, typical of pteridophytes, following a germination of a spore which for the purpose of sexual reproduction produces the antheridia and archegonia. / зарождением споры, .

PROTHORAX = ПРОТОРАКС (или ПРОТОРАКАЛЬНОЕ) – Prothorax is the anterior division of the thorax of an insect, bearing the first pair of legs. / Под Проторакальными Железами, от Греческих слов Pró, означающее Перёд, и Thōrax, означающее Грудь, понимаются эндокринные органы насекомых, вырабатывающие гормон экдизон. Расположены главным образом в переднегруди.

PROTOCOL = ПРОТОКОЛ – (1) Protocol:- in the United States, (i) Ambassadors-at-large have a higher rank than a regular ambassador and are higher ranked on protocol than say the head of the CIA; (ii) the Deputy Chief of Mission, almost always a career officer, has the personal rank of minister which is one rank down from Ambassador; (iii) the rank of Minister-Counselor is just a little step below Minister; (iv) the Deputy Principal Officer is a position at large consulates; (v) the Charge d'Affairs may either be acting, or indefinite, and is regarded as the acting Ambassador when the Ambassador is out of the country or when, for political reasons, an Ambassador is not appointed to a country; (vi) an Attache may be either fairly high or fairly low (in terms of rank an attaché can be anything; a military attaché is of at least medium rank, but the military holds no diplomatic rank); (vii) a consulate is not a diplomatic mission, nor is it autonomous (it is established at international organizations (such as US Mission to the European Communities or North Atlantic Treaty Organization) or is used for reasons of diplomatic snobbery or pique. / Под Протоколом, от Французского слова Protocole, понимается:- (i) официальный документ, в котором фиксируются какие-либо фактические обстоятельства (процессуальные или следственные действия, судебное заседание, ход собрания); (ii) дипломатический протокол – совокупность общепринятых правил, традиций и условностей, соблюдаемых правительствами, дипломатическими представительствами, дипломатическими работниками в международном общении.

(2) Protocol is the plan for communicating questions, concerns, and unresolved issues about export certification.

PROTOCOL OF PROVISIONAL APPLICATION = ПРОТОКОЛ ОБ УСЛОВНОМ ПРИМЕНЕНИИ – Protocol Of Provisional Application:- a legal device that enabled the original contracting parties to accept general GATT (short for the General Agreement on Tariffs and Trade) obligations and benefits, despite the fact that some of their existing domestic legislation at that time discriminated against imports in a manner that was inconsistent with certain GATT provisions. Although meant to be 'temporary', the Protocol has remained in effect; and countries that signed the Protocol of Provisional Application in 1947 continue to invoke it to defend certain practices that are otherwise inconsistent with their GATT obligations. Countries that acceded to the GATT after 1947 have also done so under the terms of the Protocol. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

PROTOGYNY = ПРОТОГИНИЯ (или ПРОТЕРОГИНИЯ) – Protogyny is a maturation of the pistils (female part) before the stamen (male part). / (женский орган) до тычинки (stamen; мужской орган). Протогиния или Протерогиния – созревание женских половых элементов раньше мужских. Под Протогинией, от Греческих слов Prōtos, означающее Первый, и Gynē, означающее Женщина, понимается более раннее созревание в цветке рылец, чем пыльников, например, у Жимолостных, многих Злаков. Препятствует самоопылению. Известна также как Протерогиния. Протогиния или Протерогиния (от Греческого слова Próteros, означающее Более Ранний), более раннее по сравнению с пыльцой созревание рылец пестиков в цветках растений. Одно из приспособлений к перекрёстному опылению (смотрите Дихогамия). Сравните Протандрия.

PROTOPLASM = ПРОТОПЛАЗМА (или ЖИВОЕ ВЕЩЕСТВО) – Protoplasm is that portion of cellular tissue active in life processes. / Под Протоплазмой, от Греческих слов Prōtos, означающее Первый, и Plásma, означающее Вылепленное или Оформленное, или Живым Веществом понимается содержимое цитоплазмы и ядра клетки, из которого состоят организмы. Протоплазма, содержимое живой клетки, включая её ядро и цитоплазму; материальный субстрат жизни, живое вещество, из которого состоят организмы. Физические свойства, химический состав и структурно-морфологические особенности протоплазмы животных, растительных и микробных клеток, а также одноклеточных организмов имеют много общего, что служит одним из свидетельств единства живой природы. Представление о протоплазме возникло и утвердилось в связи с изучением строения и свойств клетки и развитием клеточной теории. В период становления этой теории основной структурой клетки считалась оболочка; содержимое клетки признавалось второстепенным веществом – 'Камедью'. Так, в 1840-х ботаники не относили к обязательной части клеток их содержимое, как содержимое сосуда не есть самый сосуд. Однако к середине XIX века, главным образом благодаря работам ботаников, становилось всё яснее, что именно содержимое клетки – основной субстрат жизни. Оформление подобных представлений связано прежде всего с именем Немецкого ботаника Уго фон Моля (Hugo von Mohl; 1805–1872) (в 1844, 1846), который широко пользовался термином 'Протоплазма' (впервые его применил в 1839 Чешский учёный Ян Эвангэлиста Пуркине (Jan Evangelista Purkyně; 1787–1869) для обозначения подобного камбию у растений вещества, из которого развиваются клетки животных). Другое направление исследований связано с трудами зоологов (например, Французского учёного Феликса Дюжарда (Félix Dujardin; 1801–1860)), изучавших протистов (особенно корненожек) и то студенистое вещество – Саркоду, из которого они состоят. Мысль о том, что протоплазма растительных клеток и саркода животных – принципиально одна и та же субстанция, была сформулирована Немецким ботаником Фэрдинандом Юлиусом Коном (Ferdinand Julius Cohn; 1828–1898) (в 1850). В дальнейшем изучении протоплазмы значительную роль сыграли Немецкие учёные Хайнрихь Антон Де Бари (Heinrich Anton De Bary; 1831–1888), Франц фон Лайдиг (Franz von Leydig; 1821–1908), Макс Йохан Зигисмунд Шульцэ (Max Johann Sigismund Schultze; 1825–1874) и Русский ботаник и микробиолог Лев Семёнович Ценковский (1822–1887). В 1925 Американский учёный Эдвод Азборн Вилсэн (Edward Osborne Wilson; 1929–) предложил коллоидную теорию протоплазмы, согласно которой протоплазма – многофазный коллоид, где дисперсионной средой служит вода, а основными дисперсными фазами – белки и липиды. Начиная с 1940–50-х, с развитием и широким внедрением в биологию физико-химических методов анализа, получено много новых данных о составе и структуре протоплазмы. Были открыты новые и детально изучено строение уже известных внутриклеточных органоидов – ядра, митохондрий, рибосом, Гольджи комплекса, эндоплазматической сети и других. Стала ясной важная регуляторная и структурная роль биологических мембран. Оказалось, например, что многочисленные ферменты клетки не распределены беспорядочно в протоплазме, а закреплены на различных внутриклеточных структурах. Этот этап исследования протоплазмы характеризуется стремлением рассматривать различные структуры в связи с их функциями. Изучение этого единства на уровне ультраструктур протоплазмы и составляющих их биополимеров обусловило становление и развитие молекулярной биологии. Иногда термином 'Протоплазма' неправильно называют внеядерную часть клетки, то есть Цитоплазму. Смотрите также Клетка, и Цитология.

PROTOPLAST = ПРОТОПЛАСТ – Protoplast is the plasma membrane, nucleus and cytoplasm of the cell. A plant cell from which the rigid cell wall has been removed. Protoplast is a plant cell from which the cell wall has been removed, usually by enzymatic process. / Под Протопластом, от Греческих слов Prōtos, означающее Первый, и Plastós, означающее Вылепленный или Образованный, понимается содержимое растительной клетки; состоит из клеточной мембраны, цитоплазмы и ядра, но не включает внешнюю клеточную оболочку. Протопласт, содержимое растительной клетки; состоит из клеточной мембраны, цитоплазмы и ядра, но не включает клеточную оболочку. Сравните Протоплазма.

PROTOPLAST CULTURE = КУЛЬТУРА ПРОТОПЛАСТОВ – Protoplast Culture is the isolation and culture of these protoplasts in nutrient medium to form callus and to regenerate plants.

PROTOPLAST FUSION = СЛИЯНИЕ ПРОТОПЛАСТОВ – Protoplast Fusion is an in vitro technique of producing somatic hybrids between two cultivars, species, or genera. Protoplast fusion provides the unique opportunity to exploit cytoplasmic variability in two parental lines.

PROVEDORE = СНАБЖЕНЕЦ (или ПРОВИЗОР) – Provedore is the person who supplies provisions for a vessel such as food and drink. / Лицо, поставляющее провизию для судна, такую как продовольствие и напитки. Под Провизором, от Латинского слова Provisor, означающее Заготовляющий, понимается аптечный работник с высшим фармацевтическим образованием.

PROVED PLUS PROBABLE RESERVES = ДОКАЗАННЫЕ ПЛЮС ВЕРОЯТНЫЕ РЕЗЕРВЫ – In oil industry, oil reserves fall into three categories:- (i) Proved Reserves, (ii) Proved Plus Probable Reserves, and (iii) Proved Plus Probable Plus Possible Reserves. Proved plus probable oil reserves are reserves based on median estimates of the accumulation that are more likely to be recovered than not (50% confidence). This can result from either better reservoir behaviour than expected under the proved category or additional investments to be decided over the medium to long term (three to ten years) using conventional techniques with possible economic uncertainties.

PROVED PLUS PROBABLE PLUS POSSIBLE RESERVES = ДОКАЗАННЫЕ ПЛЮС ВЕРОЯТНЫЕ ПЛЮС ВОЗМОЖНЫЕ РЕЗЕРВЫ – In oil industry, oil reserves fall into three categories:- (i) Proved Reserves, (ii) Proved Plus Probable Reserves, and (iii) Proved Plus Probable Plus Possible Reserves. Proved plus probable plus possible oil reserves are reserves based on a maximum estimate of the accumulation with maximum recovery factors without economic considerations (10% to 20% confidence).

PROVED RESERVES = ДОКАЗАННЫЕ РЕЗЕРВЫ – Proved Reserves are those quantities of petroleum which, by analysis of geological and engineering data, can be estimated with reasonable certainty to be commercially recoverable, from a given date forward, from known reservoirs and under current economic conditions, operating methods, and government regulations. Proved reserves can be categorized as developed or undeveloped. If deterministic methods are used, the term reasonable certainty is intended to express a high degree of confidence that the quantities will be recovered. If probabilistic methods are used, there should be at least a 90% probability that the quantities actually recovered will equal or exceed the estimate. Establishment of current economic conditions should include relevant historical petroleum prices and associated costs and may involve an averaging period that is consistent with the purpose of the reserve estimate, appropriate contract obligations, corporate procedures, and government regulations involved in reporting these reserves. In general, reserves are considered proved if the commercial producibility of the reservoir is supported by actual production or formation tests. In this context, the term proved refers to the actual quantities of petroleum reserves and not just the productivity of the well or reservoir. In certain cases, proved reserves may be assigned on the basis of well logs and/or core analysis that indicate the subject reservoir is hydrocarbon bearing and is analogous to reservoirs in the same area that are producing or have demonstrated the ability to produce on formation tests. The area of the reservoir considered as proved includes (1) the area delineated by drilling and defined by fluid contacts, if any, and (2) the undrilled portions of the reservoir that can reasonably be judged as commercially productive on the basis of available geological and engineering data. In the absence of data on fluid contacts, the lowest known occurrence of hydrocarbons controls the proved limit unless otherwise indicated by definitive geological, engineering or performance data. Reserves may be classified as proved if facilities to process and transport those reserves to market are operational at the time of the estimate or there is a reasonable expectation that such facilities will be installed. Reserves in undeveloped locations may be classified as proved undeveloped provided (1) the locations are direct offsets to wells that have indicated commercial production in the objective formation, (2) it is reasonably certain such locations are within the known proved productive limits of the objective formation, (3) the locations conform to existing well spacing regulations where applicable, and (4) it is reasonably certain the locations will be developed. Reserves from other locations are categorized as proved undeveloped only where interpretations of geological and engineering data from wells indicate with reasonable certainty that the objective formation is laterally continuous and contains commercially recoverable petroleum at locations beyond direct offsets. Reserves which are to be produced through the application of established improved recovery methods are included in the proved classification when (1) successful testing by a pilot project or favorable response of an installed program in the same or an analogous reservoir with similar rock and fluid properties provides support for the analysis on which the project was based, and, (2) it is reasonably certain that the project will proceed. Reserves to be recovered by improved recovery methods that have yet to be established through commercially successful applications are included in the proved classification only (1) after a favorable production response from the subject reservoir from either (a) a representative pilot or (b) an installed program where the response provides support for the analysis on which the project is based and (2) it is reasonably certain the project will proceed. See also Reserves. Reserves that can be economically produced with a large degree of certainty from known reservoirs using existing technology. In oil industry, oil reserves fall into three categories:- (i) Proved Reserves, (ii) Proved Plus Probable Reserves, and (iii) Proved Plus Probable Plus Possible Reserves. Proved oil reserves are estimated quantities of crude oil, condensates and natural gas liquids which geological and engineering data demonstrate with reasonable certainty (80% to 90% confidence) to be recoverable in future years by specified techniques (the development scenario has been defined and uses known technology) and which are commercial under current economic conditions (prices and costs prevailing at the time of the evaluation). Reserves that have been sampled extensively, for example, in mining, by closely spaced diamond drill holes or by underground working giving an accurate picture of size and quality of reserves. Also called as Measured Reserves. In oil, proven reserves are an estimate based on seismic and other exploratory data, linked to an assessment of economic and operating viability. / Резервы, в отношении которых проводился широкомасштабный отбор проб, например, в горнодобывающей промышленности, посредством устройства близко расположенных скважин алмазного бурения либо подземных выработок, дающих точную картину объёмов и качества запасов. Называются также как Подсчитанные Резервы (Measured Reserves). В нефтяной отрасли доказанные резервы представляют собой расчётный показатель, основанный на данных сейсмической, геологической и другой разведки и привязанный к оценке экономической и эксплуатационной целесообразности.

PROVISION = ОБЕСПЕЧЕНИЕ – (1) Provisions are formed to cover company liabilities of uncertain cause or amount which are to be allocated to the current reporting period. These may, in principle, be all types of liabilities. A liability of uncertain timing or amount. An amount charged against profit to provide for the diminution in value of assets or for liabilities the amount of which cannot be determined with substantial accuracy.

(2) Provision:- if a company anticipates that it may be faced with certain expenses, it could make a ‘provision’ for this in reporting its financial results. It is similar to a write-off except that it is more of an estimate that a company makes in anticipation of an actual expense that it must report. Conservative companies will make such provisions to avoid overstating their financial performance.

PROVISIONAL INVOICE = УСЛОВНЫЙ СЧЁТ–ФАКТУРА – Provisional Invoice is a document serving as a preliminary invoice, containing – on the whole – the same information as the Final Invoice, but not actually claiming payment. Once published, an invoice cannot be deleted under any circumstances. Only a provisional invoice can be deleted. Also known as Preliminary Invoice, and Pro-Forma Invoice. See also Commercial Invoice, Consular Invoice, Customs Invoice, Final Invoice, Invoice, Preliminary Invoice, and Pro-Forma Invoice. / Условный Счёт-Фактура – документ, служащий в качестве предварительного счёта-фактуры, содержащий в целом ту же самую информацию, что и Окончательный Счёт-Фактура (Final Invoice), но фактически не требующий оплаты. Единожды выставленный счёт-фактура не может быть удалён ни при каких обстоятельствах; удалён может быть лишь условный счёт-фактура. Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Консульский Счёт-Фактура

(Consular Invoice), Таможенный Счёт-Фактура (Customs Invoice), Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), и Замещаемый Счёт-Фактура (Pro-Forma Invoice).

PROVISIONAL MEASURE = ОБЕСПЕЧИТЕЛЬНАЯ (или ПРОФИЛАКТИЧЕСКАЯ) МЕРА – Provisional Measure is a phytosanitary regulation or procedure established without full technical justification owing to current lack of adequate information. A provisional measure is subjected to periodic review and full technical justification as soon as possible.

PROVISIONAL PATENT APPLICATION = ПРЕДВАРИТЕЛЬНАЯ ЗАЯВКА НА ПАТЕНТ (или ОБЕСПЕЧИТЕЛЬНАЯ ЗАЯВКА НА ПАТЕНТ) – Provisional Patent Application:- a provisional application for patent is a US national application for patent filed in the United States Patent and Trademark Office (USPTO) under 35 USC § 111(b). It allows filing without a formal patent claim, oath or declaration, or any information disclosure (prior art) statement. It provides the means to establish an early effective filing date in a nonprovisional patent application filed under 35 USC § 111(a) and automatically becomes abandoned after one year. It also allows the term 'Patent Pending' to be applied. / В США подача Предварительной Заявки На Патент стала возможной с 1995. Заявка даёт возможность зарезервировать приоритет. Теряет силу, если в годовой срок не была заменена нормальной заявкой.

PROVISIONAL TRANSFER = УСЛОВНАЯ ПЕРЕДАЧА – Provisional Transfer is a conditional transfer in which one or more parties retain the right by law or agreement to rescind the transfer.

PROVISION FOR IMPAIRMENT = ОБЕСПЕЧЕНИЕ ПОД ОБЕСЦЕНЕНИЕ – Provision For Impairment:- the balance sheet allowance for accumulated impairment of assets. At present only loans and advances are impaired, therefore it is the sum of the provision for individual impairment and the collective impairment.

PROVISION FOR RISK AND UNCERTAINTY = ОБЕСПЕЧЕНИЕ ПОД РИСК И НЕОПРЕДЕЛЁННОСТЬ – Provision For Risk And Uncertainty:- the increase in liability created by the inclusion of margins for risk and uncertainty. / Прирост .

PROVISIONS = ПОЛОЖЕНИЯ – Provisions:- statements contained in an insurance policy which explain the benefits, conditions and other features of the insurance contract. / Заявления, содержащиеся в страховом полисе, которые разъясняют преимущества, условия и иные особенности контракта или договора страхования.

PROVISIONS = ОБЕСПЕЧЕНИЯ (или РЕЗЕРВНЫЕ ФОНДЫ) – Allowances. Provisions:- in the United Kingdom, a liability item in the balance sheet charged to the profit and loss account to cover future liabilities or anticipated losses. Frequently listed under other liabilities in the balance sheet. Provisions for risks in the lending business, and in foreign exchange trading are of particular significance for banks. Specific provisions are set aside to cover particular risks, while contingency (del credere) reserves or provisions cover general expected losses which cannot yet be specified in detail. Contrary to reserves, provisions are not allocated from the net profit but from operating profit. In accounting, in American usage, entry showing the amount of an estimated expense that must be recognized currently. The opposite of Reserve. Also known as Long-Term Liabilities Other Than Debt And Specific Accounts Payable in the United States. / строка баланса (item). (дэль крэдэрэ (del credere)) .

PROVISIONS, CONTINGENT LIABILITIES AND CONTINGENT ASSETS = ОБЕСПЕЧЕНИЯ, УСЛОВНЫЕ ОБЯЗАТЕЛЬСТВА И УСЛОВНЫЕ АКТИВЫ – IAS 37 (short for International Accounting Standard No. 37) Provisions, Contingent Liabilities and Contingent Assets – The objective of this Standard is to ensure that appropriate recognition criteria and measurement bases are applied to provisions, contingent liabilities and contingent assets and that sufficient information is disclosed in the notes to enable users to understand their nature, timing and amount. IAS 37 prescribes the accounting and disclosure for all provisions, contingent liabilities and contingent assets, except:- (a) those resulting from executory contracts, except where the contract is onerous. Executory contracts are contracts under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent; (b) those covered by another Standard. Provisions:- A provision is a liability of uncertain timing or amount. Recognition:- A provision should be recognised when, and only when:- (a) an entity has a present obligation (legal or constructive) as a result of a past event; (b) it is probable (i.e. more likely than not) that an outflow of resources embodying economic benefits will be required to settle the obligation; and (c) a reliable estimate can be made of the amount of the obligation. The Standard notes that it is only in extremely rare cases that a reliable estimate will not be possible. In rare cases it is not clear whether there is a present obligation. In these cases, a past event is deemed to give rise to a present obligation if, taking account of all available evidence, it is more likely than not that a present obligation exists at the balance sheet date. Measurement:- The amount recognised as a provision shall be the best estimate of the expenditure required to settle the present obligation at the balance sheet date. The best estimate of the expenditure required to settle the present obligation is the amount that an entity would rationally pay to settle the obligation at the balance sheet date or to transfer it to a third party at that time. Where the provision being measured involves a large population of items, the obligation is estimated by weighting all possible outcomes by their associated probabilities. Where a single obligation is being measured, the individual most likely outcome may be the best estimate of the liability. However, even in such a case, the entity considers other possible outcomes. Contingent liabilities:- A contingent liability is:- (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or (b) a present obligation that arises from past events but is not recognised because:- (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or (ii) the amount of the obligation cannot be measured with sufficient reliability. An entity should not recognise a contingent liability. An entity should disclose a contingent liability, unless the possibility of an outflow of resources embodying economic benefits is remote. Contingent assets:- A contingent asset is a possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity. An entity shall not recognise a contingent asset. However, when the realisation of income is virtually certain, then the related asset is not a contingent asset and its recognition is appropriate. / МСБУ 37 (сокращение для Международного Стандарта Бухгалтерского Учёта № 37) – .

PROVISIONS FOR DOUBTFUL DEBTS = ОБЕСПЕЧЕНИЕ ПОД СОМНИТЕЛЬНЫЕ ДОЛГИ – In the United Kingdom, Provision For Doubtful Debts takes into consideration that when a company conducts it business, there is bound to be some billings during the year whereby the customers might not be able to pay hence eventually turning bad. If this occurs during the accounting year then the company can directly write it off in the Income Statement, otherwise a Provision needs to be created for these doubtful customers. Also known as Allowance For Bad And Doubtful Accounts Receivable in the United States.

PROW = НОС (или ФОРШТЕВЕНЬ) – Prow (maritime term):- the part of the bow above the water.

PROXIMAL = ПРОКСИМАЛЬНЫЙ – Proximal:- towards the base of something near to where it is attached. See also Distal. / В анатомии под Проксимальным, от Латинского слова Proximus, означающее Ближайший, понимается расположенный ближе к телу (или органу):- например, в руке плечо – проксимальный отдел по отношению к предплечью, а кисть – дистальный. Смотрите также Дистальный (Distal).

PROXIMATE CAUSE = НЕПОСРЕДСТВЕННАЯ ПРИЧИНА – Proximate Cause:- every event is the outcome of a chain (or net) of previous events, but in the words of Bacon 'It were infinite for the law to consider the causes of causes, and their impulsions one of another; therefore it contenteth itself with the immediate cause'. This immediate or effective cause, not necessarily that closest in time to the event, is termed the proximate cause. Unless the insurance policy otherwise provides the Insurer is liable for any loss which is proximately caused by an insured peril. An insurer will only be liable to pay a claim under an insurance contract if the loss that gives rise to the claim was proximately caused by an insured peril. This means that the loss must be directly attributed to an insured peril without any break in the chain of causation. The most effective cause of a loss in a chain of events leading to the loss. A basic principle of insurance in that, unless the policy provides otherwise, the underwriter is not liable for any loss that is not proximately caused by an insured peril. The most direct cause of loss, that is, the most effective and dominant cause in a chain of events which ends in the loss. Every event is the outcome of a chain (or net) of previous events, but in the words of Sir Francis Bacon (The English Lord Chancellor, Francis Bacon, 1st Viscount St Alban (1561–1626), was a prominent Tudor politician, philosopher and scientist):- 'It were infinite for the law to consider the causes of causes, and their impulsions one of another; therefore it contenteth itself with the immediate cause'. This immediate or effective cause, not necessarily that closest in time to the event, is termed the proximate cause. The immediate and effective cause of loss or damage. It is an unbroken chain of cause and effect between the occurrence of an insured peril or a negligent act and resulting injury or damage. / Франсис Бэйкан (Francis Bacon), Вайкаунт Сэнт Олбэн (Viscount St Alban).

PROXY = ПРЕДСТАВИТЕЛЬСТВО (или ДОВЕРЕННОСТЬ, или МАНДАТ, или ПОЛНОМОЧИЕ, или ПОРУЧЕНИЕ) – A Proxy is a document that enables shareholders to vote on a company's proposals without attending the shareholder meeting. In the context of the Australian sharemarket, a written authorisation given by one person to another so that the second person can act in place of the first person, e.g., attending and voting at shareholders' meetings. The person authorised to act is also known as the Proxy. Written authorization given by a shareholder to someone else to represent him and vote his shares at a shareholders' meeting. This is another word for 'Substitute'. It usually refers to a document or a right used by a shareholder to give a designated person, often an officer of the company, the right to vote on behalf of that shareholder. A shareholder could give a person (anyone) their proxy to attend and vote their shares at an AGM (Annual General Meeting) or any duly called meeting of shareholders. Proxy is a document authorizing someone other than the shareholder to exercise the right to vote the stock owned by the shareholder. A Proxy is a 'substitution'. For example, it allows a shareholder to substitute someone for himself to attend, and vote at, corporate meetings. A proxy form is something shareholders sign in order to be represented at a meeting which they cannot attend. It transfers their voting rights to another party who is able to attend. Shareholders are entitled to appoint anyone as their proxy – not just the persons suggested by management on the pre-printed forms. Proxy is another word for 'substitute'. It usually refers to a document or a right used by a shareholder to give a designated person, often an officer of the company, the right to vote on behalf of that shareholder. A shareholder could give a person (anyone) their proxy to attend and vote their shares at an AGM (Annual General Meeting) or any duly called meeting of shareholders. / , например, . Под Мандатом, от Латинского слова Mandatum, означающее Поручение, понимается документ, удостоверяющий те или иные полномочия предъявителя, права на что-либо, например, депутатский мандат. В гражданском праве под Представительством понимается совершение сделок и иных юридических действий одним лицом (представителем) от имени и в интересах другого лица в соответствии с доверенностью или в силу закона.

PROXY = ЗАМЕНИТЕЛЬ (или АНАЛОГ) – Proxy is a security or index whose correlation with another security or index is so strong that it is used as a substitute for the other. For example, General Electric (GE) has a very high correlation to the performance of the S&P 500. As GE goes, so goes the S&P 500. Therefore, GE can be used as a proxy for the S&P 500. The authority or instrument that transfers a shareholder's voting rights to an agent of the shareholder. Proxy may also mean the person empowered to act as agent to vote in place of the shareholder. Depositary Receipt holders: Foreign companies seek the participation of ADR/GDR holders in their Annual General Meetings through distribution of proxies or voting instruction cards which detail the various resolutions to be voted on at the meeting. Technically, voting instruction cards are not proxy cards since Depositary Receipt holders do not own shares directly. They simply instruct the Depositary on how to vote its proxy. / Дьженерэл Элэктчрик (Дьжи.И.; General Electric (GE)). Эс.ЭндПи. 500 (S&P 500).

PROXY FIGHT = БОРЬБА ЗА ДОВЕРЕННОСТИ – Proxy Fight:- sometimes a group(s) of shareholders will attempt to get other shareholders' proxy to vote shares, i.e. in an attempt to get enough votes to swing a decision – such as putting in a new Board of Directors.

PROXY STATEMENT = ВЫПИСКА ИЗ ДОВЕРЕННОСТИ (или ВЫПИСКА ИЗ ПОРУЧИТЕЛЬСТВА, или УПОЛНОМОЧИВАЮЩАЯ ВЫПИСКА) – Proxy Statement:- information given to stockholders in conjunction with the solicitation of proxies.

PROXY VOTE = ГОЛОСОВАНИЕ ПО ДОВЕРЕННОСТИ – Proxy Vote:- when a shareholder does not vote his shares directly but allows another person to vote the shares on his behalf.

PROXY VOTING RIGHT = ПРЕДСТАВИТЕЛЬСКОЕ ПРАВО ГОЛОСА (или ПРАВО ГОЛОСА ПО ДОВЕРЕННОСТИ) – Proxy Voting Right:- every shareholder can authorize a bank, a professional shareholder representative or another third party to exercise his voting rights at the general meeting. For practical reasons, shareholders frequently authorize their depository bank to exercise their voting rights, giving rise to the inaccurate term 'depository voting rights'. Proxy given to banks to vote the shares of third parties lodged with them for safekeeping, administration and management at the meetings of shareholders.

PRUDENT MAN RULE = ПРАВИЛО ПРЕДУСМОТРИТЕЛЬНОГО ЧЕЛОВЕКА – Prudent Man Rule is an investment standard. In some US states, the law requires that a fiduciary, such as a trustee, may invest the fund's money only in a list of securities designated by the state, the so-called legal list. In other US states, the trustee may invest in a security if it is one that would be bought by a prudent man of discretion and intelligence, who is seeking a reasonable income and preservation of capital.

PRUINOSE = ПОКРЫТОЕ БЕЛОВАТЫМ НАЛЁТОМ – Pruinose:- having a frosted appearance with a white powdery coating. / Покрытое Беловатым Налётом:- имеющее замороженное или заиндевелое образование с белым порошкообразным покрытием.

PRUNE = ПОДРЕЗАТЬ (или ОБРЕЗАТЬ) – Prune:- to cut off what is not needed, such as to prune tillers so that the number of tillers in each entry is uniform. An example of to prune is to trim dead leaves off a plant. An example of to prune is to reduce the number of jobs in a company. / Отсекать то, что ненужно.

PRUNING = ОБРЕЗКА (или ЧЕКАНКА) – Topping is the removal of the terminal bud of the main stem. Pruning is the removal of apical points of vegetative and fruiting branches. For Pima S2 Cotton Cultivar:- The results indicated that topping plants at 120 cm height increased number of retended bolls, fruiting sites, days to first open boll, open boll, unopen bolls and seed cotton yield. Side branch pruning at 120 cm height increased final plant height, monopodia, main stem internodes, sympodia, earliness percentage and boll weight. Topping + pruning at 100 cm height only decreased number of aborted sites. Topping + pruning at 120 cm height increased

additional fruiting branch bolls, percentage of bolls on vegetative branches, boll weight and seed cotton yield. Topping at 120 cm height and 40 cm hill spacing resulted in the highest number of retended bolls and seed cotton yield. See also Topping. / Чеканка Хлопчатника – прищипка верхушек главного стебля и моноподиальных ветвей, – которая приостанавливает ростовые процессы и имеющиеся запасы питательных веществ у растений направляет на усиление питания плодовых органов. Чеканка также способствует лучшему освещению Растений. Чеканку начинают:- на высокоплодородных участках с мощным развитием растений при образовании 16–18 плодовых ветвей с 15–20 Июля; на участках со средним развитием растений при 15–16 плодовых ветвях с 20–25 Июля; на участках со слабым развитием Растений чеканку проводят в период с 01 по 10 Августа при образовании 13–14 плодовых ветвей. Эти сроки могут изменяться в зависимости от состояния Хлопчатника и климатических условий года. Чеканка Растений – удаление верхушек побегов или верхних побегов у сельскохозяйственных Растений для прекращения их роста. Агротехнический приём, улучшает плодообразование и ускоряет созревания урожая. Чеканка обеспечивает усиленный приток питательных веществ к завязям за счёт прекращения роста побегов. Это уменьшает опадение завязей и создаёт лучшие условия для развития плодов. Чеканка Хлопчатника уменьшает полегание растений, ускоряет созревание волокна и раскрытие коробочек. Чеканку проводят после развития на кустах 14–16 плодовых ветвей. При чеканке боковые побеги обрезают на 2–3 см, главный стебель – на 4–6 см. Хлопчатник чеканят одновременно с рыхлением междурядий или нарезкой борозд для полива, применяя для этого приспособление к культиватору или специальные машины. Под Обрезкой (Trim) Растений понимается удаление ветвей или их укорачивание. Обрезают плодовые и декоративные растения для формирования кроны, регулирования сроков прохождения фаз развития растений, омолаживания. Под Пинцировкой (Topping), от Немецкого слова Pinzieren, означающее Удалять Конец, или Прищипкой понимается удаление верхушки молодого побега растения. Применяется при формировании кроны Персика, Яблони, некоторых декоративных Растений, для ускорения созревания урожая Огурца (в теплицах), Табака и другого. Под Чеканкой Растений понимается удаление верхушек побегов (topping) или верхних побегов в основном у Винограда и Хлопчатника для прекращения их роста. Уменьшает опадение завязей, создаёт лучшие условия для развития плодов.

PRUNÈLLA = ПРУНЭЛЛА (или ПРЮНЕЛЬ, или ПРУНЭЛЛЯ, или СЛИВОВОЕ) – Prunèlla is a twilled woolen dress fabric; a heavy woolen fabric used for the upper of shoes. / Прюнель – лёгкая и плотная шерстяная или шёлковая ткань, идущая на изготовление верха обуви, на обивку мебели.

PRUSSIAN BLUE = ПРУССКОЕ ГОЛУБОЕ (или ПРУССКАЯ ЛАЗУРЬ) – Prussian Blue:- a greenish blue.

PS = OCCUPIED PALESTINIAN TERRITORY

PS = PARTIALLY STERILE

PS = PEDIGREE SELETION

PS = PFERDESTÄRKE

PS = POTENTIAL SINK

PSA = PRODUCTION SHARING AGREEMENT

PSA = PUBLIC SECURITIES ASSOCIATION

PSAE = PHILIPPINE SOCIETY OF AGRICULTURAL ENGINEERS

PSAM = PURCHASE SAM

PSAM ID = PURCHASE SAM ID

PSAMMOPHYTES = ПСАММОФИТЫ (или ПЕСКОЛЮБЫ) – Psammophytes are the plants which prefer or tolerate sand, particularly fine to medium sand, as a habitat. / Под Псаммофитами, от Греческих слов Psámmos, означающее Песок, и Phytón, означающее Растение, понимаются Растения, приспособленные к жизни на подвижных песках. Деревья и Кустарники образуют придаточные корни на стволах (Кандым, Саксаул), Травы – подземные побеги или длинные корневища (Осока Песчаная, Селин). Многие Псаммофиты используются для закрепления песков.

PSC = PRODUCTION SHARING CONTRACT

PSE = PACIFIC STOCK EXCHANGE

PSE = PRODUCER SUPPORT ESTIMATE

PSEUDO ALLELES = ПСЕВДОАЛЛЕЛИ – Pseudo Alleles are alleles that are functionally similar but structurally different. / Под Псевдоаллелями, от Греческих слов Pséudos, означающее Ложь, и Allēlōn, означающее Взаимно или Друг Друга, понимаются аллели, которые .

PSEUDOCEPHALIUM = ПСЕВДОЦЕФАЛИЙ – Pseudocephalium:- development of wool and bristles on a mature flowering stem which continues growth. See also Cephalium. / Под Псевдоцефалием, от Греческих слов Pséudos, означающее Ложь, и Kephalē, означающее Голова, понимается .

PSEUDO MARK = ПСЕВДО ЗНАК – Pseudo Mark:- a way of locating a word mark that is comprised of an alternative or intentionally corrupted spelling of an English word. The pseudo mark search locates spellings that are very similar or phonetically equivalent to the word mark.

PSEUDORESISTANCE = ПСЕВДОРЕЗИСТЕНТНОСТЬ (или ЛОЖНАЯ СОПРОТИВЛЯЕМОСТЬ, или ЛОЖНАЯ УСТОЙЧИВОСТЬ) – Pseudoresistance is apparent resistance which results from transitory characters in potentially susceptible host plants. Types of pseudoresistance are host evasion, induced resistance, and escape. / свойства (characters) .

psi = POUNDS PER SQUARE INCH

psia = POUNDS PER SQUARE INCH ABSOLUTE

psid = POUNDS PER SQUARE INCH DIFFERENTIAL

psig = POUNDS PER SQUARE INCH GAUGE

PSIPS = PUBLICATION SITE FOR ISSUED AND PUBLISHED SEQUENCES

PSL = PARALLEL STRAND LUMBER

PSMR = PAYMENT SETTLEMENT MESSAGE REQUEST

PSP = PHOTOPERIOD–SENSITIVE PHASE

PSR = PAYMENT SYSTEM RISK

PSS = PEAK SEASON SURCHARGE

PSS = POST SUPPORT SYSTEM

PSS = PRELIMINARY SCREENING SET

PSTN = PUBLIC SWITCHED TELEPHONE NETWORK

PSU = PRODUCTION SPACING UNIT

PSV = POST–SHIPMENT VERIFICATION

PSYCHROPHILIC MICROORGANISMS = ПСИХРОФИЛИЧЕСКИЕ МИКРООРГАНИЗМЫ (или ХОЛОДОЛЮБИВЫЕ МИКРООРГАНИЗМЫ) – Psychrophilic Microorganisms:- (Greek:- Psychros – Cold, Philos – Love) Microorganisms that thrive at low temperatures.

PSYCHROPHILIC SPOILAGE = ПСИХРОФИЛИЧЕСКАЯ ПОРЧА – Psychrophilic Spoilage is a spoilage on the surface of meat/fish.

PT = PORTUGAL

PT = POWER TILLER

PT3 = 6–8 HP POWER TILLER WITH STEERING CLUTCHES

PT5 = 5 HP POWER TILLER

PT6 = 3 TO 8 HP POWER TILLER

PTA = PATENT TERM ADJUSTMENT

PTA = PREFERENTIAL TRADE AREA FOR EASTERN AND SOUTHERN AFRICA

PTBF = PRICE TO BE FIXED

PTCRD = PHILIPPINE TRAINING CENTER FOR RURAL DEVELOPMENT

PTD = PERSONAL TRUSTED DEVICE

PTDL = PATENT AND TRADEMARK DEPOSITORY LIBRARY

PTE = PATENT TERM EXTENSION

PTE = PORTUGESE ESCUDO

PTERIDOPHYTE = ПТЕРИДОФИТ (или ПАПОРОТНИКОВИДНОЕ) – Pteridophyte is the general name for the Ferns and related Genera. / для Папоротников и . Под Птеридофитом, от Греческих слов Pterón, означающее Перо, и Phytón, означающее Растение, и Phytón, означающее Растение, понимается . Под Папоротниковидными понимается Отдел Высших Бессемянных Растений. Травянистые или Древовидные Наземные и Водные Растения. На листьях (большей частью на нижней стороне) расположены группы спорангиев – сорусы. Около 12 000 Видов (300 Родов), по всему земному шару. Многие декоративны, некоторые съедобны (например, молодые побеги Кочедыжника, одного из Видов Орляка), другие лекарственные (например, Папоротник Мужской), некоторые ядовиты. Современные Папоротниковидные известны с карбона.

PTF = PREMIUMS TRUST FUND

PTFE FABRIC = ТКАНЬ ПТФЭ – PTFE Fabric is a fabric made from Polytetrafluoroethylene, such as Gore-Tex. / Ткань ПТФЭ – ткань, изготовленная из Политэтрафторэтилена, такая как Го-Тэкс (Gore-Tex).

PTI = PRE–TRIP INSPECTION

PTO = PATENT AND TRADEMARK OFFICE

PTO = POWER TAKE–OFF

PTOL = PATENT AND TRADEMARK OFFICE LEGAL

PTOS = PATENT AND TRADEMARK OFFICE SOCIETY

PTR = PROSPERITY THROUGH RICE

PTR2 = PROSPERITY THROUGH RICE PHASE 2

PTSC = PORT AND TERMINAL SERVICE CHARGE

PTT = POLYTRIMETHYLENE TEREPHTHALATE

PU = AXIAL FLOW PUMP

PU = PRILLED UREA

PU4 = 6” DIAMETER AXIAL FLOW PUMP

PU5 = 10” DIAMETER AXIAL FLOW PUMP

PUA = POTENTIALLY UNWANTED APPLICATION

PUBERULENT = КОРОТКООПУШЁННОЕ – Puberulent:- slightly pubescent.

PUBESCENT = ОПУШЁННОЕ (или ПУШИСТОЕ) – Pubescent:- having a fuzzy surface; specifically, covered with fine soft short hairs. Pubescent:- covered with short, soft downy hairs (like a peach).

PUBISPINA = С РАЗРОШИМИСЯ (СОЧНЫМИ, ПЫШНЫМИ, ВЗРОСЛЫМИ) ШИПАМИ – Pubispina:- with downy spines. See also Arachnoid, Barbate, Canescence, Capillaceus, Capillatus, Ciliate, Cephalium, Coma, Felt, Glochids, Hirsute, Lanate, Lasiacantha, Penicillate, Pubescent, Scabrous, Villous, Woolly. / , Войлок (Felt), .

PUBLIC = ПУБЛИКА (или ТОЛПА) – In trade parlance, Public is non-professional speculators as distinguished from hedgers and professional speculators or traders. / На языке профессиональных биржевых дельцов под Публикой (или Толпой) понимаются непрофессиональные спекулянты, не являющиеся хэдьжерами и профессиональными спекулянтами или торговцами.

PUBLIC = ОБЩЕСТВЕННЫЙ (или ПУБЛИЧНЫЙ) – Public:- connected with or acting on behalf of the people, community, or government rather than private matters or interests. Describing something that is the hands of the people and, as such, managed or controlled by the government; or that which is open to anyone.

PUBLIC ACCESS TERMINALS = ТЕРМИНАЛЫ ОБЩЕГО ДОСТУПА – Public Access Terminals:- terminals are made available to the patrons of a library or other research institution for use by the general public. / Терминалы Общего Доступа предназначены для того, чтобы позволить обществу пользоваться фондами покровителей библиотеки или иных исследовательских институтов.

PUBLIC AIRCRAFT = ВОЗДУШНОЕ СУДНО ОБЩЕСТВЕННОГО НАЗНАЧЕНИЯ – Public Aircraft means any of the following:- (i) except with respect to an aircraft described in subparagraph (E), an aircraft used only for the United States Government, except as provided in section 40125 (b); (ii) an aircraft owned by the Government and operated by any person for purposes related to crew training, equipment development, or demonstration, except as provided in section 40125 (b); (iii) an aircraft owned and operated by the government of a State, the District of Columbia, or a territory or possession of the United States or a political subdivision of one of these governments, except as provided in section 40125 (b); (iv) an aircraft exclusively leased for at least 90 continuous days by the government of a State, the District of Columbia, or a territory or possession of the United States or a political subdivision of one of these governments, except as provided in section 40125 (b); (v) an aircraft owned or operated by the armed forces or chartered to provide transportation or other commercial air service to the armed forces under the conditions specified by section 40125 (c). In the preceding sentence, the term 'other commercial air service' means an aircraft operation that:- (a) is within the United States territorial airspace; (b) the Administrator of the Federal Aviation Administration determines is available for compensation or hire to the public, and (c) must comply with all applicable civil aircraft rules under title 14, Code of Federal Regulations.

PUBLICATION FOR OPPOSITION = ПУБЛИКАЦИЯ ДЛЯ ПРОТИВОПОСТАВЛЕНИЯ (или ВОЗРАЖЕНИЯ) – Publication For Opposition:- if the examining attorney raises no objections to registration, or if the applicant overcomes all objections, the examining attorney will approve the mark for publication in the Official Gazette. The United States Patent and Trademark Office (USPTO) will send a Notice of Publication to the applicant stating the date of publication. Any party who believes it may be damaged by registration of the mark has thirty (30) days from the publication date to file either an opposition to registration or a request to extend the time to oppose. If no opposition is filed or if the opposition is unsuccessful, the application enters the next stage of the registration process. A Certificate of Registration will issue for applications based on use, or on a foreign registration under § 44, or a Notice of Allowance will issue for intent-to-use applications.

PUBLICATION NUMBER = ПУБЛИКАЦИОННЫЙ НОМЕР (или НОМЕР ПУБЛИКАЦИИ) – In the US patent and trademark law, Publication Number is a number assigned to the publication of patent applications filed on or after November 29, 2000. It includes the year, followed by a seven digit number, followed by a kind code. Example:- 200011234567A1.

PUBLIC AUTHORITIES = ОБЩЕСТВЕННЫЕ ВЛАСТИ (или ПУБЛИЧНЫЕ ОРГАНЫ ВЛАСТИ, или ПУБЛИЧНЫЕ ВЕДОМСТВА) – Public Authorities:- the agencies or officials in a state responsible for the application and enforcement of the laws and regulations of that state which relate to any aspect of the standards and recommended practices contained in this annex.

PUBLIC AUTHORITY SERVICE TO PUBLIC AUTHORITIES = УСЛУГА (или ОБСЛУЖИВАНИЕ) ПУБЛИЧНЫХ ВЕДОМСТВ ДЛЯ ПУБЛИЧНЫХ ВЕДОМСТВ – Public Authority Service To Public Authorities:- public authority service includes electricity supplied and services rendered to municipalities or divisions or agencies of State or Federal governments, under special contracts or agreements or service classifications applicable only to public authorities.

PUBLIC COMPANY = ПУБЛИЧНАЯ КОМПАНИЯ (или ПУБЛИЧНОЕ АКЦИОНЕРНОЕ ОБЩЕСТВО) – Public Company:- a company is generally considered to be a public company if it has many shareholders. It does not necessarily mean that its shares are listed on a recognized stock exchange. In some jurisdictions, a company is deemed to be public if it has more than 50 shareholders. The definition of 'Public' may vary depending on the jurisdiction. Indeed, different agencies have different definitions. For example, the tax department (CRA in Canada) does not use the same definition as certain securities regulators, e.g., the BC Securities Commission (the Province of British Columbia)! See also Company. Public Company is a legal entity whose equity (shares) is publicly traded (mostly in the form of shares) and which is as a rule listed on one or several stock exchanges. Also known as Public Limited Company in the United Kingdom; and Company Limited By Shares, or Corporation in the United States. / Смотрите также Компания или Акционерное Общество (Company).

PUBLIC COMPANY ACCOUNTING OVERSIGHT BOARD = ПАЛАТА ПО НАДЗОРУ ЗА ВЕДЕНИЕМ БУХГАЛТЕРСКОГО УЧЁТА ПУБЛИЧНЫМИ КОМПАНИЯМИ (или ПАЛАТА ПО НАДЗОРУ ЗА ВЕДЕНИЕМ БУХГАЛТЕРСКОГО УЧЁТА ПУБЛИЧНЫМИ АКЦИОНЕРНЫМИ ОБЩЕСТВАМИ) – Public Company Accounting Oversight Board (PCAOB) is a five-member board created by Sarbanes Oxley Act which has the authority to set and enforce auditing, attestation, quality control, and ethics (including independence) standards for public companies. It is also empowered to inspect the auditing operations of public accounting firms that audit public companies as well as impose disciplinary and remedial sanctions for violations of the board's rules, securities laws, and professional auditing standards. The Public Company Accounting Oversight Board (PCAOB) is a private-sector, non-profit corporation created by the Sarbanes–Oxley Act, a 2002 United States federal law, to oversee the auditors of public companies. Its stated purpose is to 'protect the interests of investors and further the public interest in the preparation of informative, fair, and independent audit reports'. Although a private entity, the PCAOB has many government-like regulatory functions, making it in some ways similar to the private 'self-regulatory organizations' (SROs) which regulate stock markets, broker-dealers, etc in the United States. In conversation, the PCAOB is often pronounced 'peekaboo'. The PCAOB has five members, including a chairman, each of whom is appointed by the US Securities and Exchange Commission (SEC). Precisely two members of the PCAOB must be or have been a Certified Public Accountant. However, if the chairman of the PCAOB is one of those two members, he or she may not have been a practicing certified public accountant for at least five years prior to being appointed to the Board. Each member serves full-time, for staggered five-year terms. As of 2009, the salary of the PCAOB's chairman is USD672 676.00 per year, while the salaries of other board members are USD546 891.00 annually. The Board's annual budget of approximately USD180 million, which must be approved by the SEC each year, is funded by fees paid by US securities issuers. The organization has a staff of over 600, and its headquarters is in Washington, DC. The PCAOB's first chairman was the former New York Federal Reserve President, William J. McDonough. The Board's immediate past Chairman is Mark W. Olson, a former Federal Reserve Board governor. The PCAOB's current Chairman is James R. Doty. Under

Section 101 of the Sarbanes-Oxley Act, the PCAOB has the power to:- (i) register public accounting firms that prepare audit reports for issuers; (ii) set auditing, quality control, ethics, independence and other standards relating to the preparation of audit reports by issuers; (iii) conduct inspections of registered public accounting firms; (iv) conduct investigations and disciplinary proceedings concerning, and impose appropriate sanctions where justified upon, registered public accounting firms and associated persons of such firms (including fines of up to USD100 000.00 against individual auditors, and USD2 million against audit firms); (v) perform such other duties or functions as the Board (or the SEC) determines are necessary or appropriate to promote high professional standards among, and improve the quality of audit services offered by, registered public accounting firms and their employees; (vi) sue and be sued, complain and defend, in its corporate name and through its own counsel, with the approval of the SEC, in any Federal, State or other court; (vii) conduct its operations, maintain offices, and exercise all of its rights and powers in any part of the United States, without regard to any qualification, licensing or other provision of State or municipal law; (viii) hire staff, accountants, attorneys and other agents as may be necessary or appropriate to the PCAOB's mission (with salaries set at a level comparable to private sector self-regulatory, accounting, technical, supervisory, or other staff or management positions); (ix) allocate, assess, and collect accounting support fees that fund the board; and (x) enter into contracts, execute instruments, incur liabilities, and do any and all other acts and things necessary, appropriate, or incidental to the conduct of its operations and the exercise of its powers under the Sarbanes-Oxley Act. Part of the PCAOB's power to set rules of the auditing industry includes the power to regulate the non-audit services that audit firms may offer their audit clients (such as consulting or tax services). This power was given to the PCAOB as a result of allegations, in cases such as Enron and Worldcom, that auditors' independence from their clients' managers had been compromised because of the large fees that audit firms were earning from these ancillary services. In addition, as part of the PCAOB's investigative powers, the Board is empowered to require that audit firms, or any person associated with an audit firm, provide testimony or documents in its (or his or her) possession. If the firm or person refuses to provide this testimony or these documents, the PCAOB may suspend or debar that person or entity from the public audit industry. The PCAOB may also seek the SEC's assistance in issuing subpoenas for testimony or documents from individuals or entities not registered with the PCAOB. Under Section 103 of the Sarbanes-Oxley Act of 2002, PCAOB was to establish auditing and related attestation, quality control, ethics, and independence standards and rules to be used by registered public accounting firms in the preparation and issuance of audit reports as required by the Act or the rules of the Securities and Exchange Commission. The Board's Office of the Chief Auditor advises the Board on the establishment of such auditing and related professional practice standards. As of 2011, PCAOB has issued fifteen broad Auditing Standards. Government oversight of the PCAOB:- each of these powers is subject to approval and oversight by the Securities and Exchange Commission. Individuals and audit firms subject to PCAOB oversight may appeal PCAOB decisions (including any disciplinary actions) to the SEC and the SEC has the power to modify or overturn PCAOB rules. The PCAOB is subject to SEC inspections and enforcement and the Sarbanes-Oxley Act gives the SEC the power to censure or remove PCAOB members for cause. Inspection Reports:- PCAOB periodically issue Inspection Reports of registered public accounting firms. While a large part of such reports are made public, portions of an inspection report that deal with criticisms of, or potential defects in, the firm's quality control systems are not made public if the firm addresses those matters to the Board's satisfaction within 12 months after the report date. Those portions are made public, however, if (1) the Board determines that a firm's efforts to address the criticisms or potential defects were not satisfactory, or (2) the firm makes no submission evidencing any such efforts. History:- the PCAOB was created in response to an ever-increasing number of accounting 'restatements' (corrections of past financial statements) by public companies during the 1990s, and a series of high-profile accounting scandals and record-setting bankruptcies by large public companies, notably those in 2002 involving WorldCom and Enron. Prior to the creation of the PCAOB, the audit industry was essentially self-regulated through the Public Oversight Board, a private organization whose members were appointed by the auditing industry. The Public Oversight Board was formally dissolved on March 31, 2002, though its members had resigned en masse in January 2002 to protest then-SEC Chairman Harvey Pitt's proposal for a new private auditor oversight body to regulate the industry (a proposal which would evolve into the PCAOB). Appointment of chairman Webster:- the first chairman of the PCAOB was William H. Webster, a prominent lawyer and former director of both the FBI and CIA. This appointment was controversial, however, for while Webster was widely recognized for his integrity and intellect, two of the SEC's five commissioners believed that SEC Chairman Harvey Pitt had not properly vetted the candidates or consulted with them on the appointment (and, indeed, had previously agreed with them on appointing TIAA-CREF chairman John Biggs as PCAOB chairman). In one of the most contentious SEC public hearings in recent memory, these two commissioners (Harvey Goldschmid and Roel Campos) publicly criticized the process of the appointment (though not Webster himself). Webster nonetheless was approved by the SEC by a 3–2 vote to become the PCAOB's first chairman. An audio recording of this contentious October 25, 2002 SEC public hearing at which Webster's nomination was voted on (and debated) can be listened to here. Just a few weeks after Webster was appointed to the PCAOB, however, another controversy erupted when newspapers reported that Webster had served on the board audit committee of US Technologies, a high-tech company being investigated for accounting irregularities. Pitt, whose tenure as SEC chair had already proven controversial, found himself in an untenable position. One of the claims made by Goldschmid during the rancorous October SEC hearing was that the candidates put forward by Pitt had not been properly vetted. Goldschmid's criticisms seemed prescient, and this, combined with other pressures, led Pitt to announce his resignation from the SEC on election day (November 04, 2002). Webster himself announced his resignation from the PCAOB a week later. Constitutional challenge:- in February 2006, the Free Enterprise Fund and Beckstead and Watts, LLP (a small Nevada-based accounting firm) filed a lawsuit in federal court challenging the constitutionality of the PCAOB. According to the lawsuit, the provision of the Sarbanes-Oxley Act establishing the PCAOB violates the 'Appointments Clause' of the US Constitution, since the PCAOB members should be viewed as 'officers of the United States' because of the public purposes PCAOB serves, and, as such, must either be appointed by the President of the United States, with the advice and consent of the US Senate, or by the 'head' of a 'department', whereas PCAOB's board is appointed by the SEC, rather than by the Chairman of the SEC. The lawsuit also challenged the PCAOB as violating the Constitution's separation of powers, since the organization has quasi-executive, quasi-legislative and quasi-judicial functions. On August 22, 2008, the US Court of Appeals for the District of Columbia Circuit upheld the PCAOB as constitutional. The court found that board members are inferior officers not required to be appointed by the President, and that the President retains sufficient control of the Board via the SEC that the Board does not violate the separation of powers. The United States Supreme Court granted certiorari on May 18, 2009, to consider three questions:- (1) Whether the Sarbanes-Oxley Act of 2002 violates the Constitution's separation of powers by vesting members of the (PCAOB) with far-reaching executive power while completely stripping the President of all authority to appoint or remove those members or otherwise supervise or control their exercise of that power, or whether, as the court of appeals held, the Act is constitutional because Congress can restrict the President's removal authority in any way it 'deems best for the public interest'. (2) Whether the court of appeals erred in holding that, under the Appointments Clause, PCAOB members are 'inferior officers' directed and supervised by the US Securities and Exchange Commission (SEC), where the SEC lacks any authority to supervise those members personally, to remove the members for any policy-related reason or to influence the members' key investigative functions, merely because the SEC may review some of the members' work product. (3) If PCAOB members are inferior officers, whether the Act's provision for their appointment by the SEC violates the Appointments Clause either because the SEC is not a 'Department' or because the five commissioners, acting collectively, are not the 'Head' of the SEC. Free Enterprise Fund and Beckstead and Watts, LLP v. Public Company Accounting Oversight Board, et al. was

argued on December 07, 2009. In addition to the PCAOB, the United States (represented by Solicitor General Elena Kagan) also appeared as a respondent in the case and argued separately, defending the constitutionality of the Sarbanes-Oxley Act. Thirteen amici, ranging from libertarian think-tanks like the Cato Institute to managers of state public-employee pension funds, filed briefs in the case. On June 28, 2010, in a five-justice majority opinion written by Chief Justice John G. Roberts, the Supreme Court found the appointment provisions of the act constitutional, but struck down the for-cause removal provision. The Court did not accept petitioners' argument that the constitutional infirmity made all of the Board's prior activity unconstitutional; rather, it simply severed the for-cause removal clause from the rest of Sarbanes-Oxley, leaving the Board itself intact. / Вилъйэм Дьжей. МэкДона (William J. McDonough). Марк Дабл.Ю. Олсэн (Mark W. Olson). Дьжеймз Ар. Доти (James R. Doty). ВорлдКам (WorldCom) и Энрон (Enron). Хави Пит (Harvey Pitt). Вилъйэм Эйч. Вэбстё (William H. PUBLIC CORPORATIONS = ПУБЛИЧНЫЕ КОРПОРАЦИИ – In the United Kingdom, Public Corporations are public trading bodies which have a substantial degree of financial independence from the public authority which created them. A public corporation is publicly controlled to the extent that the public authority, i.e. central or local government, usually appoints the whole or a majority of the board of management. Such bodies comprise much the greater part of sub-sector S.11001, public non-financial corporations.

PUBLIC ELEVATORS = ПУБЛИЧНЫЕ ЭЛЕВАТОРЫ – Public Elevators are the grain elevators in which bulk storage of grain is provided to the public for a free. Grain of the same grade but owned by different persons is usually mixed or commingled as opposed to storing it 'identity preserved'. Some elevators are approved by exchanges as regular for delivery on futures contracts. See also Regular Warehouse. Public Elevators are the licensed and regulated bulk storage facilities where grain is stored for a rental fee. The elevators may also be approved for delivery on commodity futures exchanges.

PUBLIC ENTERPRISE = ПУБЛИЧНОЕ ПРЕДПРИЯТИЕ – Public Enterprise is an enterprise (i) whose debt or equity securities are traded in a public market, including those traded on a stock exchange or in the over-the-counter market, including securities quoted only locally or regionally; or (b) whose financial statements are filed with a regulatory agency in preparation for the sale of any class of securities. Public Enterprises:- resident corporations controlled by the government. Control may be exercised through ownership of more than half the voting shares, legislation, decree, or regulations that establish specific corporate policy or allow the government to appoint the directors.

PUBLIC FINANCE = ПУБЛИЧНЫЕ ФИНАНСЫ (или ГОСУДАРСТВЕННЫЕ ФИНАНСЫ) – Public Finance:- revenue collection and expenditure activities of government, and management of the public debt. The adjective, financial, is widely used to denote activities pertaining to money matters. The verb, to finance, means to provide means of payment, capital or credit, and its substantive, financing, denotes this process.

PUBLIC GOODS = ОБЩЕСТВЕННЫЕ ТОВАРЫ – Public Goods, also known as Collective Goods. These are a very special class of goods which cannot practically be withheld from one individual consumer without withholding them from all (the 'nonexcludability criterion') and for which the marginal cost of an additional person consuming them, once they have been produced, is zero (the 'nonrivalrous consumption' criterion). The classic example of a nearly pure public good is national defense:- you cannot defend the vulnerable border regions of a country from the ravages of foreign invaders without also simultaneously defending everyone else who lives within the borders. The inability of potential providers to exclude people who refuse to pay from nevertheless consuming and benefitting from an expensive public good usually means that very many of the consumers of the good will act as free riders and choose not to help pay for its provision. Consequently private production of the good or service may prove unprofitable, and the good or service thus may not be provided at all by the free market – even though everyone might concede they would be better off with some positive level of production of the good in question. Actually, the public goods problem is not quite as hopeless as the simple version of the theory makes it sound. Various social arrangements have evolved to encourage the provision of public goods. The non-profit 'third sector' of the economy devotes considerable effort to the provision of public goods financed by voluntary contributions that are motivated by appeals to people's 'civic conscience' (or to their desire for the honors and respect that the community spontaneously accords to 'public benefactors'). Voluntary contributions may also be gathered from those people most intensely and deeply concerned about the particular social need being addressed or from those who can be 'shamed' into it by informal social pressures that withdraw status and respect from people identified and stigmatized as free riders. In addition to these non-profit approaches, the provision of public goods may often be handled through ordinary market forces if some way can be found to link the consumption of the public good to the consumption of some other good that does not suffer from the 'non-excludability' problem and hence can generate a profit. A shopping mall offers good examples of such 'tying' arrangements. The mall management provides such public goods to shoppers as security protection, a clean and pleasant environment, public water fountains and rest rooms, entertainment, etc without direct charges – but, since these amenities attract larger crowds of customers to the mall and increase sales for the stores located there, the mall's owners are able to command higher rents from their tenants. It should also be noted that at least a partial provision of public goods often occurs when there is a single person (or a rather small group of persons) who feel they stand to benefit personally from a particular public good to such an unusually large degree that it is worthwhile for them to go ahead and just pay for the whole thing while ignoring the many other small-time free riders as irrelevant. Remember, by the definition of a public good, the free riders' additional consumption does not cost anything extra. The classic 'solution' to the problem of under-provision of public goods has been government funding through compulsory taxation (often, but not necessarily, accompanied by actual government agency production of the good or service in question). Although this may substantially alleviate the problem of numerous 'free riders' that refuse to pay for the benefits they nevertheless love to receive, it should be noted that the political process does not provide any very plausible method for determining what the 'optimal' level of provision of a public good actually is. When we cannot observe what individuals are willing to give up in order to get the public good, how can we (or the politicians) assess how urgently they really want more or less of it, given the other possible uses of their money? So any given public good will still most likely be either under-provided or over-provided under government stewardship. Note also that the 'public goods' problem is an extreme special case of the more general problem of externalities.

PUBLIC KEY = ПУБЛИЧНЫЙ КЛЮЧ – In a Public Key cryptosystem that key of a user's key pair which is publicly known. / В криптосистеме публичного ключа тот ключ из пары ключей пользователя, который известен публично.

PUBLIC KEY INFRASTRUCTURE = ИНФРАСТРУКТУРА ПУБЛИЧНОГО КЛЮЧА (или ИНФРАСТРУКТУРА ПУБЛИЧНЫХ КЛЮЧЕЙ) – (1) A Public Key Infrastructure (PKI) is a combination of hardware and software products, policies and procedures that provide the basic security required to carry out electronic business so that users, who do not know each other, or are widely distributed can communicate securely through a chain of trust. A Public Key Infrastructure is based on digital certificates that act like 'electronic passports'. It should consist of a security policy, a certification authority, a registration authority, a certificate distribution system and

PKI-enabled applications. Public Key Infrastructure (PKI) is a system of administrative procedures and methods, combined with secure information technologies, that is used to manage secure electronic commerce. Provides for a means of securely identifying participants in electronic transactions as well as secure transmission and handling of data.

(2) Public Key Infrastructure (PKI) is a collection of hardware, software, policy and human roles that successfully bind a subscriber's identity to a key pair (public and private) through the issuance and administration of digital certificates throughout their 'life-cycle' (creation, maintenance, archival records and destruction).

PUBLIC LAW = ПУБЛИЧНОЕ ПРАВО – Public Law is the set of legal principles which govern the exercise of power by public bodies. What are public bodies? There are many public bodies of various kinds who take decisions every day which affect the lives of thousands of individuals. They include government ministers and departments, local authorities, the prison service, NHS Trusts, coroners' courts and many more. What are public law remedies? There are many procedures by which individuals can challenge the legality of decisions made by public bodies. They include:- (i) judicial review:- court proceedings in which a judge is asked to review the lawfulness of the decision which is being challenged; (ii) complaints procedures such as the social service complaints procedure; and (iii) Ombudsman schemes such as the Local Government Ombudsman, and the Parliamentary Commissioner for Administration. For example, Public Law 480 (PL 480) in the United States is the principal legislative authority for channeling US food and fiber to needy countries. First enacted in 1954, PL 480 was extended by the Food for Peace Act of 1966 and subsequent legislation. Public Law is a theory of law governing the relationship between individuals (citizens, companies) and the state. Under this theory, constitutional law, administrative law and criminal law are sub-divisions of public law. This theory is at odds with the concept of constitutional law, which requires all laws to be specifically enabled, and thereby sub-divisions, of a constitution. Generally speaking, private law is the area of law in a society that affects the relationships between individuals or groups without the intervention of the state or government. In many cases the public/private law distinction is confounded by laws that regulate private relations while having been passed by legislative enactment. In some cases these public statutes are known as Laws Of Public Order, as private individuals do not have the right to break them and any attempt to circumvent such laws is void as against public policy. / В теории права под Публичным Правом понимаются правовые нормы, регулирующие деятельность государственных органов, отношения между гражданами и органами государства. Деление права на публичное право и частное право заимствовано буржуазным правом из Римского права. Публичное Право, в буржуазной теории права нормы, устанавливающие структуру и порядок деятельности государственных органов, регулирующие отношения, складывающиеся между гражданами и органами государства. Утверждая, что публичное право защищает интересы всех членов общества, буржуазные юристы противопоставляют его частному праву, защищающему якобы интересы отдельных личностей. Основанием разделения права на публичное и частное является также различие способов охраны интересов управомоченных лиц:- в публичном праве они защищаются по инициативе государственного органа независимо от желания потерпевшего. Впервые разделение права на публичное и частное было введено Римскими юристами, в дальнейшем это деление было развито буржуазной юриспруденцией. Такое деление отражает антагонистические противоречия между интересами общества и отдельной личности, порождаемые капиталистической частной собственностью. К сфере публичного права относят государственное, административное, финансовое, уголовное, процессуальное право, то есть отрасли права, назначение которых – охрана интересов класса буржуазии в целом. Социалистическое право не знает деления на публичное и частное.

PUBLIC LAW 480 = ПУБЛИЧНОЕ ПРАВО 480 – Public Law 480 (PL 480) is the principal legislative authority for channeling US food and fiber to needy countries. First enacted in 1954, PL 480 was extended by the Food for Peace Act of 1966 and subsequent legislation.

PUBLIC LIABILITY INSURANCE = СТРАХОВАНИЕ ПУБЛИЧНОЙ ОТВЕТСТВЕННОСТИ (или СТРАХОВАНИЕ ОБЩЕСТВЕННОЙ ОТВЕТСТВЕННОСТИ) – Public Liability Insurance is an insurance that indemnifies against any claims for injury or damage by members of the public to their property by you or your business.

PUBLIC LIMITED COMPANY = ПУБЛИЧНОЕ АКЦИОНЕРНОЕ ОБЩЕСТВО (или ПУБЛИЧНАЯ КОМПАНИЯ С ОГРАНИЧЕННОЙ ОТВЕТСТВЕНОСТЬЮ) – In the United Kingdom, Public Limited Company (PLC) is a company whose shares may be traded publicly. Requires an authorized minimum share capital of £50 000.00; of which it must have allotted shares to the value of at least £50 000.00 and a minimum of 25% must be fully paid up prior to starting business.

PUBLIC OFFERING = ОТКРЫТАЯ ПОДПИСКА (или ПУБЛИЧНОЕ ПРЕДЛОЖЕНИЕ) – Public Offering is the sale of equity shares or other financial instruments by an organization to the public in order to raise funds for business expansion and investment. Public offerings of corporate securities in the United States must be registered with and approved by the US Securities and Exchange Commission (SEC) and are normally conducted by an investment underwriter. Generally, any sale of securities to more than 35 people is deemed to be a public offering, and thus requires the filing of registration statements with the appropriate regulatory authorities. The offering price is predetermined and established by the issuing company and the investment bankers handling the transaction. The term public offering is equally applicable to a company's initial public offering, as well as subsequent offerings. See also Primary Distribution. / Смотрите также Первичное Размещение (Primary Distribution).

PUBLIC RELEASE = ПУБЛИЧНЫЙ ВЫПУСК – Public Release:- variety or germplasm developed and released by public institutions, such as universities, colleges, institutes, centers, USDA-ARS.

PUBLIC RESOLUTION 17 = ПУБЛИЧНАЯ РЕЗОЛЮЦИЯ № 17 – Public Resolution No. 17 (PR 17) is the public resolution which requires that US Government financed cargoes (Eximbank) must be shipped 100 percent in US flag ships, but that the requirement may be waived up to 50 percent in some cases. / Публичная Резолюция № 17 (ПР 17) – это Публичная Резолюция Конгресса США, требующая того, чтобы Правительство США финансировало грузы (Эксимбэньк (Eximbank)), которые на все 100 процентов должны перевозиться судами под флагом США, но и чтобы данное требование в некоторых случаях могло быть соблюдено и до 50 процентов.

PUBLIC SECTOR = ПУБЛИЧНЫЙ СЕКТОР (или ОБЩЕСТВЕННЫЙ СЕКТОР) – In the United States, Public Sector is the part of an economy in which goods and services are produced and/or (re)distributed by government agencies. Comprises general government plus public non-financial corporations. / Публичный или Общественный Сектор состоит из обычных правительственных структур и публичных нефинансовых корпораций.

PUBLIC SECTOR BOND = ОБЛИГАЦИЯ ПУБЛИЧНОГО СЕКТОРА (или ОБЛИГАЦИЯ ОБЩЕСТВЕННОГО СЕКТОРА) – Public Sector Bonds are interest-bearing debentures issued by private mortgage banks and public sector banks to finance public sector loans (loans to public sector institutions – the federal and state authorities, as well as towns and cities – to implement public sector investments. Also referred to as Public Sector Mortgage Bonds.

PUBLIC SECTOR LOAN = ССУДА ПУБЛИЧНОМУ СЕКТОРУ (или ССУДА ОБЩЕСТВЕННОМУ СЕКТОРУ) – Public Sector Loan is borrowing by towns and cities, local authorities and associations of local authorities. Public sector loans are provided by commercial banks, savings banks and mortgage banks.

PUBLIC STREET AND HIGHWAY LIGHTING = ОСВЕЩЕНИЕ ОБЩЕСТВЕННЫХ УЛИЦ И АВТОСТРАД – Public Street And Highway Lighting includes electricity supplied and services rendered for the purposes of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

PUBLIC SWITCHED TELEPHONE NETWORK = ОБЩЕСТВЕННАЯ КОММУТАЦИОННАЯ ТЕЛЕФОННАЯ РАБОЧАЯ СЕТЬ – The Public Switched Telephone Network (PSTN) is a circuit-switched network that is used primarily for voice communications worldwide, with more than 800 million subscribers. Originally a network of fixed-line analog telephone systems, the PSTN is now almost entirely digital and also includes mobile as well as fixed telephones. The Public Switched Telephone Network (PSTN) is the network of the world's public circuit-switched telephone networks, in much the same way that the Internet is the network of the world's public IP-based packet-switched networks. Originally a network of fixed-line analog telephone systems, the PSTN is now almost entirely digital, and now includes mobile as well as fixed telephones. PSTN (short for the Public Switched Telephone Network) is the world's collection of interconnected voice-oriented public telephone networks, both commercial and government-owned. It's also referred to as the Plain Old Telephone Service (POTS). It's the aggregation of circuit-switching telephone networks that has evolved from the days of Alexander Graham Bell ('Doctor Watson, come here!'). Today, it is almost entirely digital in technology except for the final link from the central (local) telephone office to the user. In relation to the Internet, the PSTN actually furnishes much of the Internet's long-distance infrastructure. Because Internet service providers (ISPs) pay the long-distance providers for access to their infrastructure and share the circuits among many users through packet-switching, Internet users avoid having to pay usage tolls to anyone other than their ISPs. / Алыкзэндё Грээм Бэл (Alexander Graham Bell) Доктор Ватсэн (Doctor Watson). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

PUBLIC WAREHOUSE = ПУБЛИЧНЫЙ СКЛАД (или СКЛАД ОТКРЫТОГО ТИПА) – Public Warehouse is a business that provides the use of space for storage to a variety of clients. This space can be leased for varying amounts of time determined by the contract set by both parties. Public Warehouse:- a warehouse which is available to all companies and persons who wish to make use of the services offered. Public Warehouse is a warehouse available to all companies and persons who wish to make use of the services offered. / В США под Складом Общественного Пользования (Public Warehouse) понимается склад на территории или вблизи порта, на котором хранятся товары после их разгрузки с судна или ожидающие погрузки на судно. После помещения товаров на склад общественного пользования выдаётся складской варрант, который должен быть составлен до того, как товары смогут покинуть склад.

PUC = PAID–UP CAPITAL

PUC = PUBLIC UTILITIES COMMISSION

PUCE = ПЬЮС (или КРАСНОВАТО–КОРИЧНЕВОЕ) – Puce:- a dark red. / тёмно-красное.

PUCKER = СКЛАДКА (или СБОРКА, или МОРЩИНА) – Pucker:- the gathering of material resulting from improper tension adjustment, fittings selection and adjustment, needle selection. Pucker is the uneven surface caused by differential shrinkage of the yarns in a fabric or differential shrinkage of the fabric and sewing thread. May be desirable and planned, or undesirable. Machinery defects, and namely – Sewing Machines and Attachments. See also Pleats. Pucker is the uneven surface caused by differential shrinkage in the two layers of a bonded fabric during processing, dry cleaning, or washing. / Порок или дефект от машинного оборудования. Морщины – результат неодинаковой усадки ткани по ширине в процессе валки суконной ткани.

PUCKERED AND DISCOLORED BAND = СМОРЩЕННАЯ (или МОРЩИНИСТАЯ) И ИЗМЕНИВШАЯ ЦВЕТ ПОЛОСА – Puckered And Discolored Band in denim trouser along the weft direction. Possible Cause:- insertion of weft with different shrinkage and color change characteristics due to further treatment. Major defect as it foils garment appearance. Weaving defect.

PUCKERED SEAMS = СМОРЩЕННЫЕ (или МОРЩИНИСТЫЕ) ШВЫ – Puckered Seams:- an irregular seam surface usually caused by:- (a) inherent fabric characteristic, (b) needle puncture, (c) machine feed slippage or (d) incorrect machine application. Sewing Room Defects. / Порок или дефект швейного производства.

PUCKERED SELVAGE = СМОРЩЕННАЯ (или ПЕРЕГНУТАЯ) КРОМКА – Puckered Selvage:- usually caused by selvage being stretched in finishing or by uneven wetting out in sanforization process.

PUDDLE = ЗАГРУБЕВШЕЕ (или УПЛОТНЁННОЕ) – Puddle:- to stir up; make muddy or turbid.

PUDDLED SOIL = ЗАГРУБЕВШАЯ ПОЧВА (или УПЛОТНЁННАЯ ПОЧВА) – Puddled Soil is a soil whose structure has been mechanically destroyed, allowing the soil to run together when saturated with water. A soil that has been puddled is usually in a massive nonstructural state.

PUDDLING = ВЗМУЧИВАНИЕ (ПОЧВЫ) (или ОСАДКА (ПОЧВЫ) ПРИ УВЛАЖНЕНИИ) – Puddling:- turning the soil into a muddy or watertight paste through secondary tillage.

PUDOC = CENTRE FOR AGRICULTURAL PUBLISHING AND DOCUMENTATION

PUGGAREE = ПАГЭРИ (или ТЮРБАН) – Puggaree is a light scarf wrapped around a sun helmet or used as a hatband. Puggaree is a thin muslin scarf tied round a sun helmet so as to hang down over the wearer's neck and shield it from the sun.

PUHCA = PUBLIC UTILITY HOLDING COMPANY ACT OF 1935

PULCHELLUS = ПУЛЬХЭЛЛУС (или ХОРОШЕНЬКОЕ, или КРАСАВЧИК, или МОЛОДЧИК) – Pulchellus:- small and beautiful.

PULLBACK = ОТКАТ – A Pullback is a pause or moderate drop in a stock or commodities pricing chart from recent peaks that occur within a continuing uptrend. A pullback is very similar to Retracement or Consolidation, and the terms are sometimes used interchangeably. The term pullback is usually applied to pricing drops that are relatively short in duration – for example, a few consecutive sessions – before the uptrend resumes. Key Takeways:- (i) A pullback is a temporary reversal in the price action of an asset or security. (ii) The duration of a pullback is usually only a few consecutive sessions. A longer pause before the uptrend resumes is generally referred to as Consolidation. (iii) Pullbacks can provide an entry point for traders looking to enter a position when other technical indicators remain bullish. What Does a Pullback Tell You? Pullbacks are widely seen as buying opportunities after a security has experienced a large upward price movement. For example, a stock may experience a significant rise following a positive earnings announcement and then experience a pullback as traders with existing positions take the profit off the table. The

positive earnings, however, are a fundamental signal that suggests that the stock will resume its uptrend. Most pullbacks involve a security's price moving to an area of technical support, such as a moving average or pivot point, before resuming their uptrend. Traders should carefully watch these key areas of support since a breakdown from them could signal a reversal rather than a pullback. Example of How to Use a Pullback:- Pullbacks typically don't change the underlying fundamental narrative that is driving the price action on a chart. They are usually profit-taking opportunities following a strong run-up in a security's price. For example, a company may report blow-out earnings and see shares jump 20%. The stock may experience a pullback the next day as short-term traders lock in profits. However, the strong earnings report suggests that the business underlying the stock is doing something right. Buy and hold traders and investors will likely be attracted to the stock by the strong earnings reports, supporting a sustained uptrend in the near-term. Every stock chart has examples of pullbacks within the context of a prolonged uptrend. While these pullbacks are easy to spot in retrospect, they can be harder to assess for investors holding a security that's losing value. In the example above, the SPDR® S&P 500® ETF (SPY) experiences four pullbacks within the context of a prolonged trend higher. (Notes:- SPDR is a short for the Standard & Poor's Depositary Receipt; and ETF is a short for the exchange-traded fund.) These pullbacks typically involved a move to near the 50-day moving average where there was technical support before a rebound higher. Traders should be sure to use several different technical indicators when assessing pullbacks to ensure that they don't turn into longer-term reversals. The Difference Between a Reversal and a Pullback:- Pullbacks and reversals both involve a security moving off its highs, but pullbacks are temporary and reversals are longer term. So how can traders distinguish between the two? Most reversals involve some change in a security's underlying fundamentals that force the market to reevaluate its value. For example, a company may report disastrous earnings that make investors recalculate a stock's net present value. Similarly, it could be a negative settlement, a new competitor releasing a product or some other event that will have a long-term impact on the company underlying the stock. These events, while happening outside of the chart, so to speak, will appear over several sessions and initially will seem much like a pullback. For this reason, traders use moving averages, trendlines and trading bands to flag when a pullback keeps going and is at risk of entering reversal territory. Limitations in Trading Pullbacks:- The biggest limitation of trading pullbacks is that a pullback could be the start of a true reversal. Being that both pullbacks and reversals happen on a range of timeframes, including intraday if you want to go granular, one trader's multi-session pullback is actually a reversal for a day trader looking at the same chart. If the price action breaks the trendline for your timeframe, then you may be looking at a reversal rather than a pullback. In this case, it is not the time to enter a bullish position. Of course, adding other technical indicators and fundamental data scans to the mix will increase a trader's confidence in identifying pullbacks from true reversals. See also Consolidation, and Retracement.

PULLED–IN FILLING = ПРОТЯНУТАЯ УТОЧИНА – Pulled-In Filling is an extra thread dragged into the shed with the regular pick and extending only a part of the way across the fabric.

PULLED WOOL = ВЫЩИПАННАЯ (или СНЯТАЯ) ШЕРСТЬ (или ПОДПАР, или ЗАВОДСКАЯ ОВЕЧЬЯ ШЕРСТЬ) – Pulled Wool is a wool pulled from skins of slaughtered sheep. The wool is pulled from the skins after treatment of the fleshy side of skins with a depilatory. Pulled wool should not be confused with 'dead wool'.

PULLEY = ШКИВ (или БАРАБАН) – Pulley is a small wheel that turns by a belt to transmit or apply power. / Под Шкивом, от Нидерландского слова Schijf, понимается деталь ремённой или канатной передачи, колесо, обод которого имеет цилиндрическую бочкообразную или профилирующую (для клиновых ремней) форму. Под Барабаном понимается:- (1) деталь машин и сооружений в форме полого цилиндра, конуса или многогранника. (2) Опирающаяся на своды цилиндрическая или многогранная верхняя часть здания (обычно с окнами), служащая основанием купола.

PULL–IN = ПРОТЯНУТЬ (или ПРОДЁРГИВАТЬ, или ВТЯГИВАТЬ, или СТЯГИВАТЬ, или СДЕРЖИВАТЬ или ОСАЖИВАТЬ) – Pull-In:- xxxxx. See also Jerk-In. Fabrics defect. Pull-In:- to rein in; restrain. / Pull-In = Втягивать или Стягивать или Сдерживать или Осаживать.

PULLOVER = XX (или ПУЛОВЕР, или ФУФАЙКА) – Pullover:- a pullover garment, as a sweater.

PULP = ПУЛЬПА (или МЯКОТЬ) – (1) Pulp is the product of cooking wood chips, cotton, or some source of cellulose with water and appropriate chemicals. Used in the manufacture of cellulosic fibers, paper, and other cellulose-based products. Pulp is a generic term for the processed fibrous material manufactured for different end-uses such as fibers, paper, compounds.

(2) Pulp:- xxxxx. / Под Пульпой, от Латинского слова Pulpa, означающее Мякоть, понимается:- (i) зубная мякоть, содержимое коронковой и корневой полостей зуба; или (ii) основная масса селезёнки. Пульпа:- (1) зубная мякоть, содержимое коронковой и корневой полостей зуба; состоит из соединительной ткани, богатой нервными окончаниями, лимфатическими и кровеносными сосудами. Пульпа обеспечивает питание и рост зубов. (2) Основная масса селезёнки. Различают красную пульпу, состоящую из ретикулярной ткани, в петлях которой располагаются главным образом эритроциты, и белую пульпу, состоящую из ретикулярной ткани с лимфоидными клетками.

(3) Pulp is the juicy flesh filling the cavity of a fruit. / Пульпа или Мякоть – сочный мясистый налив полости плода.

(4) Pulp:- xxxxx. / Пульпа, смесь тонкоизмельчённого (мельче 1–0.5 миллиметра (мм)) полезного ископаемого с водой. Пульпа образуется при измельчении руд перед обогащением, при гидродобыче, гидротранспорте и тому подобном. От плотности (отношение массы твёрдой и жидкой фаз) и дисперсности (количество классов различной крупности) зависят вязкость пульпы, возрастающая с увеличением плотности и количества тонких классов (микронных размеров), а также скорость оседания твёрдых частиц, уменьшающаяся с повышением плотности пульпы и содержания в ней мелких частиц.

PULPIT = ПУЛЬПИТ (или ПОМОСТ, или ПОПИТ) – Pulpit is a raised structure adjacent to, or in the center of, the pit or ring at a futures exchange where market reporters, employed by the exchange, record price changes as they occur in the trading pit or ring. / Возвышающееся строение, примыкающее к или находящееся в центре ямы или ринга (арены) на бирже фьючерсов, в котором репортёры рынка, нанятые биржей, записывают все изменения в ценах по мере их проявления в процессе торговли в этой яме или ринге (арене).

PULP PAPER = XX – Pulp Paper:- pulp is a lignocellulosic fibrous material prepared by chemically or mechanically separating cellulose fibers from wood, fiber crops, waste paper, or rags. Pulp is the major raw material used in papermaking and in the industrial production of other paper products.

PULQUE = ПУЛЬКЕ – Pulque is a traditional alcoholic drink made in Mexico from the fermented sap of Maguey (various Agave species). Unlike beer, the fermentable carbohydrate is fructose, not starch. / Пульке (в Испанском языке слово Pulque было заимствовано из языков Мексиканских Индейцев), Мексиканский национальный напиток, получаемый из сладкого сока Агавы (Agave Salmiana, Agave Atrovirens и другие Виды). Для получения сока перед зацветанием срезают цветочную стрелку и из среза собирают сок (4–7 литра (л) ежедневно в течение 3 месяцев (мес)). Сок быстро забраживает, и получается пульке, содержащий 4–8% алкоголя. Ещё в древности пульке употреблялся Ацтеками во время религиозных церемоний. Пульке, или

Октиль (Окчу) (Испанское Pulque, Octil) – Мексиканский традиционный алкогольный напиток из ферментированного сока Агавы. В до-Испанские времена местные жители получали из ферментированного сока Растений Агавы напиток, называемый Пульке. Магхэй (Maguey) – это другое имя для Растения Агава, из которого производится тэкиля (tequila), но это не местное название, а привезённое с Антильских Островов (первое упоминание об Агаве встречается в книге Питё Мартё (Peter Martyr) в 1533). Индейцы племени Науатли (Náhuatle) называли это Растение Metl или Mexcametl – откуда и произошло название Мескаль. Для них это было божественное Растение, почитаемое как ранняя инкарнация богини Майяэул (Mayaheul), которая имела 400 грудей для её 400 детей (Centzon Totchtin). У других аборигенов были свои названия для Растения:- Индейцы Пурепэча (Purépecha) называли его Карнаба (Carnaba) или Токамба (Tocamba); Индейцы Отоми (Otomi) – Гуада (Guada). Агава играла намного большую роль, чем источник сырья для алкогольного напитка. Её листья использовались подобно пеньковому волокну для изготовления спальных матов, одежды, верёвок и бумаги. Напиток Пульке, получаемый из неё, был питателен и богат витаминами. Это растение Индейцы Центральной Америки очень метко звали ‘el arbol de las maravillas’ – ‘дерево чудес’.

PULSE = БОБ (или БОБОВОЕ, или ПУЛЬС) – Pulse (crop):- the dried edible seeds of cultivated Legumes; applied especially to leguminous crops grown in tropical and subtropical Asia.

PULSE FIELD GEL ELECTROPHORESIS = ГЕЛЬ–ЭЛЕКТРОФОРЕЗ В ПУЛЬСИРУЮЩЕМ ПОЛЕ – Pulse Field Gel Electrophoresis (PFGE) is a variation on the electrophoresis procedure where a computer flips the electric field in preset pulses in different directions and defined strengths.

PULSES = БОБОВЫЕ (КУЛЬТУРЫ) (или ЗЕРНОБОБОВЫЕ (КУЛЬТУРЫ)) – Pulses are a type of leguminous crop that are harvested solely for the dry seed. Dried beans, lentils and peas are the most commonly known and consumed types of pulses. Pulses do not include crops which are harvested green (e.g., green peas, green beans) – these are classified as vegetable crops. Also excluded are those crops used mainly for oil extraction (e.g., Soybean and Groundnuts) and leguminous crops that are used exclusively for sowing purposes (e.g., seeds of Clover and Alfalfa). What Are Some Examples Of Pulses? You probably already eat more pulses than you realize! Popular pulses include all Varieties of dried beans, such as kidney beans, lima beans, butter beans and broad beans. Chick Peas, Cowpeas, Black-eyed Peas and Pigeon Peas are also Pulses, as are all Varieties of Lentils. Staples dishes and cuisines from across the world feature Pulses, from hummus in the Mediterranean (Chick Peas), to a traditional full English breakfast (baked navy beans) to Indian Dal (Peas or Lentils). Why Are They Important Crops? Pulses are essential crops for a number of reasons. They are packed with nutrients and have a high protein content, making them an ideal source of protein particularly in regions where meat and dairy are not physically or economically accessible. Pulses are low in fat and rich in soluble fibre, which can lower cholesterol and help in the control of blood sugar. Because of these qualities they are recommended by health organizations for the management of non-communicable diseases like diabetes and heart conditions. Pulses have also been shown to help combat obesity. For farmers, pulses are an important crop because they can be both sold and consumed by the farmers and their families. Having the option to eat and sell the pulses they grow helps farmers maintain household food security and creates economic stability. Furthermore, the nitrogen-fixing properties of pulses improve soil fertility, which increases and extends the productivity of the farmland. By using pulses for intercropping and cover crops, farmers can also promote farm biodiversity and soil biodiversity, while keeping harmful pests and diseases at bay. Pulses can contribute to climate change mitigation by reducing dependence on the synthetic fertilizers used to introduce nitrogen artificially into the soil. Greenhouse gases are released during the manufacturing and application of these fertilizers, and their overuse can be detrimental to the environment. However, pulses fix atmospheric nitrogen in the soil naturally, and in some cases free soil-bound phosphorous, thus significantly decreasing the need for synthetic fertilizers. Pulses are crops grown for their edible seeds, such as Peas, Lentils, Chick Peas or Beans. Pulses are the edible seeds of Plants in the Legume Family. Pulses grow in pods and come in a variety of shapes, sizes and colors. The United Nations Food and Agriculture Organization (FAO) recognizes 11 types of Pulses:- dry beans, dry broad beans, dry peas, chickpeas, cow peas, pigeon peas, lentils, Bambara beans, vetches, lupins and pulses nes (not elsewhere specified – minor pulses that don’t fall into one of the other categories). Pulses have a long, rich history. The first evidence of pulses comes from 11 000 years ago in the Fertile Crescent, a region in the Middle East which was home to some of the earliest human civilizations. Pulses are annual crops that yield between one and 12 grains or seeds. The term Pulses is limited to crops harvested solely as dry grains, which differentiates them from other vegetable crops that are harvested while still green. Between 2010 and 2013, 173 different countries grew and exported pulses. Pulses are healthy, nutritious and easy to cook with. Growing pulses also promotes sustainable agriculture, as pulse crops help decrease greenhouse gases, increase soil health, and use less water than other crops. Pulses are the dried seeds of the legume plants. Hundreds of different varieties of pulses are grown around the globe. Common Pulses:- dry beans, lentils, faba beans, dry peas, chickpeas, cowpeas, Bambara beans, pigeon peas, lupins, vetches. Hundreds of Varieties of pulses are grown in 173 countries around the world. The names of the above list are a small representation of the pulse Varieties that you may see at your local market. / Под Бобовыми или Зернобобовыми Культурами понимаются сельскохозяйственные культуры, выращиваемые вследствие съедобности их семян, такие как, Горох, Чечевица, Нут обыкновенный или Бобы. Бобовые относятся к Семейству Двудольных Растений, имеющих плод – боб. По всему земному шару они насчитывают приблизительно 17 000 Видов или приблизительно 700 Родов. Бобовые включают в себя три Подсемейства:- (i) собственно Бобовые или Мотыльковые; (ii) Мимозовые, главным образом Деревья и Кустарники; и (iii) Цезальпиниевые, преимущественно Деревья и Кустарники с перистыми листьями. Среди Бобовых имеются:- (i) продовольственные культуры, к которым относятся Горох, Соя, Фасоль и другие; (ii) кормовые культуры, к которым относятся Вика, Клевер, Люцерна и другие; (iii) технические, декоративные растения и так далее. Продукты из Бобовых богаты белками. На корнях Бобовых живут клубеньковые Бактерии. Бобовые (Fabaceae, Leguminosae), Семейство Двудольных Растений, широко распространённое во всех областях земного шара. Некоторые под названием Бобовые объединяют 3 близкородственных Семейства:- Мотыльковые (Papilionaceae, или Fabaceae), Цезальпиниевые (Caesalpiniaceae) и Мимозовые (Mimosaceae). Листья у Бобовых большей частью очередные, как правило, с прилистниками и сложные. Цветки преимущественно в кистевидных, колосовидных или головчатых соцветиях, обычно зигоморфные (так называемые мотыльковые), очень редко актиноморфные. Чашечка сростнолистная. Лепестков 5; верхний, или задний, – самый крупный (так называемый флаг, или парус); 2 боковых лепестка меньшего размера образуют так называемые вёсла, или крылья; 2 ещё более мелких составляют так называемую лодочку, или киль. Изредка венчик редуцирован. Тычинки (10, очень редко 9–5) сросшиеся все или только 9, одна остаётся свободной. Пестик из одного плодолистика; завязь верхняя; плод – боб. К Бобовым относится около 500 Родов и 12 000 Видов Однолетних и Многолетних Трав, Полукустарников, Кустарников, Лиан и реже Деревьев (главным образом в тропиках). В бывшем Союзе Советских Социалистических Республик (СССР) более 60 Родов и 1 800 Видов. На корнях Бобовых образуются своеобразные клубеньки, содержащие клубеньковые Бактерии, способные фиксировать атмосферный азот. Вместе со Злаками Бобовые являются наиболее питательными луговыми Травами (смотрите Кормовые Травы). Особенно высока кормовая ценность Клевера, Люцерны, Вики, Люпина, Эспарцета, Чины, Сераделлы и других, имеющих также важное значение в травопольных севооборотах. Богатые белками семена Бобовых, например, Гороха, Бобов, Сои, многих Видов Фасоли, Чечевицы, Нута, Арахиса (Земляного Ореха), Голубиного

Гороха (Каянуса) и других, – широко распространённые пищевые продукты. Масло из семян Арахиса, Сои и других Видов также идёт в пищу и используется в технических целях. Среди Бобовых немало Видов, дающих продукты, применяемые в технике, например, выделяющие камедь Трагакантовые Астрагалы и ценные Бальзамные Деревья (Виды Рода Myroxylon). Из некоторых Бобовых получают дорогую древесину – так называемое Розовое Дерево (Виды Рода Dalbergia) и Африканское Чёрное Дерево (Dalbergia Melanoxylon). Красное Сандаловое Дерево (Pterocarpus Santalinus) и древесина других Видов Рода Pterocarpus используются для изготовления дорогой мебели, а также для получения смолы кино. Среди Бобовых есть и красильные – Индиго, Дрок и другие. Важным техническим и вместе с тем лекарственным растением является Солодка. Из других лекарственных Растений наиболее известны Термопсис, Стальник, Донник, Сферофиза, а также сильно ядовитое тропическое Растение – так называемые Калабарские Бобы (Physostigma Venenosum). Некоторые Бобовые (Деррис, Лонхокарпус и другие) ядовиты и используются как инсектициды. На полях Бобовые могут играть роль Сорных Растений, в том числе ядовитые Виды (Термопсис и Софора). Многие Бобовые широко используют в качестве Декоративных Растений (Душистый Горошек, Люпины, Глицинии, Робиния, Карагана и другие). Бобовые Овощные Культуры, Однолетние Растения Семейства Бобовых, выращиваемые для получения овощей:- Бобы, Горох, Фасоль, Вигна (Лобия). Богаты белками, углеводами, витаминами, минеральными солями калия, фосфора, кальция и магния. Выращиваются ради получения молодых бобов, называемых лопатками, а также недозрелых семян. Бобовые овощи идут в пищу в свежем и консервированном виде (их сушат и замораживают). Под Зернобобовыми Культурами понимаются Растения Семейства Бобовых, возделываемые для получения продовольственного и кормового зерна. В бывшем Союзе Советских Социалистических Республик (СССР) более 60 Видов из 17 Родов – Вика, Горох, Нут (Бараний Горох), Соя, Фасоль, Чечевица и другие. В сухом веществе зерна 25–40% белка, 2–2.5% (в Сое до 37%) жира, 25–60% углеводов, а также витамины, ферменты и другие.

PULTRUSION = ПУЛТРУЗИЯ – Pultrusion:- the production of continuous lengths of fiber-reinforced advanced composites. Fibers are fed as roving, fabric, or mat, or some combination of these, through a resin impregnation process, to a forming guide, then to a heated die to produce a specific shape, and finally to a puller where the structure is pulled through different forming and cooling stages. Thermoplastic fibers may be substituted for the resin in the pultrusion process. / Пултрузия – процесс получения одноосноориентированного волокнистого пластика.

PULVERULENT = ПЫЛЬНОЕ (или МУЧНИСТОЕ) – Pulverulent:- with a dusty coating.

PUMP = НАСОС – Pump, a device that expends energy in order to raise, transport, or compress fluids. The earliest pumps were devices for raising water, such as the Persian and Roman waterwheels and the more sophisticated Archimedes screw. The mining operations of the Middle Ages led to development of the suction (piston) pump, many types of which are described by a German mineralogist and metallurgist Georgius Agricola (Latinized pen name of Georg Bauer known as ‘the father of mineralogy’; 1494–1555) in his book De Re Metallica (1556). A suction pump works by atmospheric pressure; when the piston is raised, creating a partial vacuum, atmospheric pressure outside forces water into the cylinder, whence it is permitted to escape by an outlet valve. Atmospheric pressure alone can force water to a maximum height of about 34 feet (10 meters), so the force pump was developed to drain deeper mines. In the force pump the downward stroke of the piston forces water out through a side valve to a height that depends simply on the force applied to the piston. Classification Of Pumps:- Pumps are classified according to the way in which energy is imparted to the fluid. The basic methods are (1) volumetric displacement, (2) addition of kinetic energy, and (3) use of electromagnetic force. A fluid can be displaced either mechanically or by the use of another fluid. Kinetic energy may be added to a fluid either by rotating it at high speed or by providing an impulse in the direction of flow. In order to use electromagnetic force, the fluid being pumped must be a good electrical conductor. Pumps used to transport or pressurize gases are called compressors, blowers, or fans. Pumps in which displacement is accomplished mechanically are called positive displacement pumps. Kinetic pumps impart kinetic energy to the fluid by means of a rapidly rotating impeller. Broadly speaking, positive displacement pumps move relatively low volumes of fluid at high pressure, and kinetic pumps impel high volumes at low pressure. A certain amount of pressure is required to get the fluid to flow into the pump before additional pressure or velocity can be added. If the inlet pressure is too small, cavitation (the formation of a vacuous space in the pump, which is normally occupied by liquid) will occur. Vaporization of liquid in the suction line is a common cause of cavitation. Vapour bubbles carried into the pump with the liquid collapse when they enter a region of higher pressure, resulting in excessive noise, vibration, corrosion, and erosion. The important characteristics of a pump are the required inlet pressure, the capacity against a given total head (energy per pound due to pressure, velocity, or elevation), and the percentage efficiency for pumping a particular fluid. Pumping efficiency is much higher for mobile liquids such as water than for viscous fluids such as molasses. Since the viscosity of a liquid normally decreases as the temperature is increased, it is common industrial practice to heat very viscous liquids in order to pump them more efficiently. Positive Displacement Pumps:- Positive displacement pumps, which lift a given volume for each cycle of operation, can be divided into two main classes, reciprocating and rotary. Reciprocating pumps include piston, plunger, and diaphragm types; rotary pumps include gear, lobe, screw, vane, and cam pumps. The plunger pump is the oldest type in common use. Piston and plunger pumps consist of a cylinder in which a piston or plunger moves back and forth. In plunger pumps the plunger moves through a stationary packed seal and is pushed into the fluid, while in piston pumps the packed seal is carried on the piston that pushes the fluid out of the cylinder. As the piston moves outward, the volume available in the cylinder increases, and fluid enters through the one-way inlet valve. As the piston moves inward, the volume available in the cylinder decreases, the pressure of the fluid increases, and the fluid is forced out through the outlet valve. The pumping rate varies from zero at the point at which the piston changes direction to a maximum when the piston is approximately halfway through its stroke. The variation in pumping rate can be reduced by using both sides of the piston to pump fluid. Pumps of this type are called double acting. Fluctuations in pumping rate can be further reduced by using more than one cylinder. Overall pumping rates of piston pumps may be varied by changing either the reciprocating speed of the piston rod or the stroke length of the piston. The piston may be driven directly by steam, compressed air, or hydraulic oil or through a mechanical linkage or cam that transforms the rotary motion of a drive wheel to a reciprocating motion of the piston rod. Piston and plunger pumps are expensive, but they are extremely reliable and durable. Piston pumps are known to have been running without repair or replacement for more than 100 years. The action of a diaphragm pump is similar to that of a piston pump in which the piston is replaced by a pulsating flexible diaphragm. This overcomes the disadvantage of having piston packings in contact with the fluid being pumped. As in the case of piston pumps, fluid enters and leaves the pump through check valves. The diaphragm may be actuated mechanically by a piston directly attached to the diaphragm or by a fluid such as compressed air or oil. Diaphragm pumps deliver a pulsating output of liquids or gases or a mixture of both. They are useful for pumping liquids that contain solid particles and for pumping expensive, toxic, or corrosive chemicals where leaks through packing cannot be tolerated. Diaphragm pumps can be run dry for an extended period of time. Furthermore, the pumping rate of most such pumps can be changed during operation. The most common type of gear pump is illustrated in Figure 1. One of the gears is driven and the other runs free. A partial vacuum, created by the unmeshing of the rotating gears, draws fluid into the pump. This fluid is then transferred to the other side of the pump between the rotating gear teeth and the fixed casing. As the rotating gears mesh together, they generate an increase in pressure that forces the fluid into the outlet line. A gear pump can discharge fluid in either direction, depending on the direction of the gear rotation. An internal gear pump is shown in Figure 2. The driven gear is a rotor with internally cut teeth, which mesh with the teeth of an externally cut idler gear,

set off-centre from the rotor. The crescent part of the fixed casing divides the fluid flow between the idler gear and the rotor. Gear pumps can pump liquids containing vapours or gases. Since they depend on the liquid pumped to lubricate the internal moving parts, they are not suitable for pumping gases. They deliver a constant output with negligible pulsations for a given rotor speed. Erosion and corrosion lead to an increase in the amount of liquid slipping back through the pump. Since gear pumps are subject to clogging, they are not suitable for pumping liquids containing solid particles. Since they do not need check valves, however, they can be used to pump very viscous liquids. Lobe pumps resemble external gear pumps, but have rotors with two, three, or four lobes in place of gears; the two rotors are both driven. Lobe pumps have a more pulsating output than external gear pumps and are less subject to wear. Lobe-type compressors are also used to pump gases; each rotor has two lobes. In a screw pump, a helical screw rotor revolves in a fixed casing that is shaped so that cavities formed at the intake move toward the discharge as the screw rotates. As a cavity forms, a partial vacuum is created, which draws fluid into the pump. This fluid is then transferred to the other side of the pump inside the progressing cavity. The shape of the fixed casing is such that at the discharge end of the pump the cavity closes, generating an increase in pressure that forces the fluid into the outlet line. Screw pumps can pump liquids containing vapours or solid particles. They deliver a steady output with negligible pulsations for a given rotor speed. Since screw pumps do not need inlet and outlet check valves, they can be used to pump very viscous liquids. Although screw pumps are bulky, heavy, and expensive, they are robust, slow to wear, and have an exceptionally long life. A sliding vane pump is illustrated in Figure 3. The rotor is mounted off-centre. Rectangular vanes are positioned at regular intervals around the curved surface of the rotor. Each vane is free to move in a slot. The centrifugal force from rotation throws the vanes outward to form a seal against the fixed casing. As the rotor revolves, a partial vacuum is created at the suction side of the pump, drawing in fluid. This fluid is then transferred to the other side of the pump in the space between the rotor and the fixed casing. At the discharge side, the available volume is decreased, and the resultant increase in pressure forces the fluid into the outlet line; the pumping rate can be varied by changing the degree of eccentricity of the rotor. Vane pumps do not need inlet and outlet check valves; they can pump liquids containing vapours or gases but are not suitable for pumping liquids containing solid particles. Vane-type compressors are used to pump gases. Vane pumps deliver a constant output with negligible pulsations for a given rotor speed. They are robust, and their vanes, easily replaced, are self-compensating for wear. Pumping capacity is not affected until the vanes are badly worn. Kinetic Pumps:- Kinetic pumps can be divided into two classes, centrifugal and regenerative. In kinetic pumps a velocity is imparted to the fluid. Most of this velocity head is then converted to pressure head. Even though the first centrifugal pump was introduced about 1680, kinetic pumps were little used until the XX century. Centrifugal pumps include radial, axial, and mixed flow units. A radial flow pump is commonly referred to as a Straight Centrifugal Pump; the most common type is the volute pump, illustrated in Figure 4. Fluid enters the pump near the axis of an impeller rotating at high speed. The fluid is thrown radially outward into the pump casing. A partial vacuum is created that continuously draws more fluid into the pump. Volute centrifugal pumps are robust and relatively inexpensive, quiet, and dependable, and their performance is relatively unaffected by corrosion and erosion. They are compact, simple in construction, and do not require inlet and outlet check valves. Volute centrifugal pumps can pump liquids containing solid particles, but, when pumping liquids containing more than a small amount of vapour, their suction is broken by cavitation. Volute centrifugal pumps operate best when pumping relatively nonviscous liquids, and their capacity is greatly reduced when used to pump viscous liquids. Another type of radial flow centrifugal pump is the diffuser pump, in which, after the fluid has left the impeller, it is passed through a ring of fixed vanes that diffuse the liquid, providing a more controlled flow and a more efficient conversion of velocity head into pressure head. In axial flow centrifugal pumps the rotor is a propeller. Fluid flows parallel to the axis as illustrated in Figure 5. Diffusion vanes are located in the discharge port of the pump to eliminate the rotational velocity of the fluid imparted by the propeller. Axial flow compressors are also used to pump gases. In mixed flow pumps, fluid is discharged both radially and axially into a volute-type casing. A regenerative pump is also called a Turbine, or Peripheral, Pump. The impeller has vanes on both sides of the rim that rotate in a ringlike channel in the pump's casing. The fluid does not discharge freely from the tip of the impeller but is recirculated back to a lower point on the impeller diameter. This recirculation, or regeneration, increases the head developed. Because of close clearances, regenerative pumps cannot be used to pump liquids containing solid particles. They can pump liquids containing vapours and gases, and in fact they can pump gases provided that they contain sufficient liquid to seal the close clearances. Regenerative pumps are suitable only for pumping mobile liquids. Electromagnetic Pumps:- These can be used only to pump fluids that are good electrical conductors. The pipe carrying the fluid is placed in a magnetic field and a current passed crosswise through the fluid, so that it is subjected to an electromagnetic force in the direction of the flow. The current and the field can be produced in a variety of ways. The principle of the electromagnetic pump is the same as that of the electric motor. Electromagnetic pumps are used for pumping liquid metals, which are used for cooling nuclear reactors. Other Types Of Pumps:- Gas Lifts are used to raise liquids from the bottoms of wells. Compressed gas is introduced into the liquid near the bottom of the well as in Figure 6. The resulting mixture of gas and liquid is lighter and more buoyant than the liquid alone so that the mixture rises and is discharged. Gas lifts have no moving parts, and they can be used to pump liquids containing solid particles. Although air, or gas, lifts are now little-used, they were once widely used for pumping water, brine, and oil. In the jet ejector pump, fluid passes through a venturi nozzle (see Venturi Tube) and develops a suction that causes a second stream of fluid to be entrained. In the aspirator pump, water flows through a venturi nozzle and develops a suction for drawing in air. Steam ejectors are widely used for pumping large volumes of vapours and gases at low pressures. Steam at high velocity enters the main body of the pump and transfers some of its momentum to the gas, which is sucked in from the inlet line. A mixture of steam and gas enters the main venturi nozzle known as the Diffuser. Kinetic energy is converted to pressure energy, and the mixture of steam and gas is compressed. Thus, energy in the steam is used to compress gas from a low to a higher pressure. Jet ejector pumps have been used since about 1850. The hydraulic ram pump uses the energy of a downward-flowing stream of water to lift a proportion of the water to a higher level. Flowing water in the inlet pipe causes a check valve to close. As in a water hammer (in which a flow of water is suddenly stopped, producing a hammering action), kinetic energy is converted to pressure energy, and a second check valve is opened to allow some water into the air chamber and up the discharge pipe. The pressure falls in the inlet water pipe, and the first check valve reopens. The compressed air closes the check valve to the air chamber, and the whole cycle is repeated. Approximately 15 percent of the water flowing in the inlet pipe may be raised to a height of five times the fall in the inlet pipe. Hydraulic ram pumps were developed in the late XVIII century and are still used in some domestic water systems. Vacuum pumps are simply compressors that take in gas at a pressure lower than atmospheric pressure, compress it, and discharge the gas at atmospheric pressure. Since gas at low pressures has a large volume, vacuum pumps tend to be bulky. Steam jet ejectors are extensively used industrially for creating vacuum. Reciprocating piston and rotary-vane pumps are also widely used for producing vacuum. Pump is a device which converts mechanical force and motion into hydraulic fluid power. See also Fixed Displacement Pump, Hydraulic Pump, Vacuum Pump, and Variable Displacement Pump. / Немецким минералогом и металлургом Георгиусом Агрикола (Georgius Agricola) (Латинизированный псевдоним Геога Бауа (Georg Bauer), известного как 'отец минералогии' ('the father of mineralogy'); 1494–1555) в его книге Дэ Рэ Мэталлика (De Re Metallica) (1556). / Насос – устройство (гидравлическая машина, аппарат или прибор) для напорного перемещения (всасывания и нагнетания) главным образом капельной жидкости в результате сообщения ей внешней энергии (потенциальной и кинетической). Устройства для безнапорного перемещения жидкости насосами обычно не называют и относят к водоподъёмным машинам. Основной параметр насоса – количество жидкости, перемещаемое в единицу времени, то есть осуществляемая объёмная подача Q.

Для большинства насосов важнейшими техническими параметрами также являются:- развиваемое давление p или соответствующий ему напор H, потребляемая мощность N и коэффициент полезного действия (кпд) h. Терминология:- названия большинства устройств, применяемых для всасывания и нагнетания жидкостей, состоят из слова Насос и соответствующего определения, характеризующего, как правило, либо принцип его действия (например, центробежный, электромагнитный), либо особенности конструкции (горизонтальный, зубчатый, шиберный), либо подаваемую среду (например, грунтовой насос). Иногда определительное слово фиксирует назначение или область применения насоса (например, лабораторный, дозировочный), тип привода (ручной, с электроприводом), а также автора конструкции (например, Насос Хамфри (или Гемфри; Humphrey Pump; назван в честь Британского инженера и изобретателя Хобёта Элфрида Хамфри (Herbert Alfred Humphrey)) или название фирмы (насос ЗиХи (или СиХи) – по первым буквам слов названия Немецкой компании Зимэн Унд Хинш (Siemen & Hinsch (SiHi), Санкт Маргаретен, Германия); Насос Фарко – по имени владельца завода (Farko Plant, Париж, Франция). Некоторые из рассматриваемых устройств получили особые названия, например:- газлифт, одна из конструкций которого называется маммут-насос, или насос Маммута; вытеснители, к которым относится монжус, называемый также насосом Монтежю, или пневматический насос; гидроэлеватор, инжектор и эжектор, являющиеся разновидностями струйного насоса. Под названием Насос известны также устройства совершенно иного назначения, например:- вакуумные насосы, предназначенные для удаления газов из замкнутых объёмов; тепловой насос – установка для передачи теплоты из окружающей среды (воздуха или воды), имеющей низкую температуру, к объекту с более высокой температурой (например, к воде отопительной системы); насос магнитного потока, осуществляющий периодические изменения магнитного потока в замкнутой цепи, и другие. Классификация:- устройства для напорного перемещения жидкостей разделяют на виды и разновидности по различным признакам, например, по принципу действия и конструкции. Такой признак положен в основу классификации, представленной в Государственном Стандарте СССР (ГОСТ 17389-72). Насосы можно также условно разделить на 2 группы:- (i) насосы-машины, приводимые в действие от двигателей, и (ii) насосы-аппараты, которые действуют за счёт иных источников энергии и не имеют движущихся рабочих органов. Насосы-машины бывают лопастные (центробежные, осевые, вихревые), поршневые, роторные (шестерённые, коловратные, пластинчатые, винтовые и другие). К насосам-аппаратам относятся струйные (жидкостно-жидкостные и газожидкостные), газлифты (в том числе эрлифты), вытеснители (в том числе паровые и газовые), гидравлические тараны, магнитогидродинамические насосы и другие. Насосы всех типоразмеров в СССР имеют условные обозначения (марки), состоящие обычно из букв и цифр. Историческая Справка:- изобретение насоса относится к глубокой древности. Первый насос для тушения пожаров, который изобрёл древнегреческий математик и механик Ктесибий (Ctesibius или Ktesibios), был описан в I веке до Нашей Эры древнегреческим учёным Героном (Heron) из Александрии в сочинении Pneumatica, а затем Римским архитектором и военным инженером Маркусом Витрувиусом Поллио (Marcus Vitruvius Pollio) в труде De Architectura. Простейшие деревянные насосы с проходным поршнем для подъёма воды из колодцев, вероятно, применялись ещё раньше. До начала XVIII века поршневые насосы по сравнению с водоподъёмными машинами использовались редко. В дальнейшем в связи с ростом потребностей в воде и необходимостью увеличения высоты её подачи, особенно после появления паровой машины, насосы постепенно стали вытеснять водоподъёмные машины. Требования к насосам и условия их применения становились всё более разнообразными, поэтому наряду с поршневыми насосами стали создавать вращательные насосы, а также различные устройства для напорной подачи жидкостей. Таким образом, исторически наметились три направления их дальнейшего развития:- создание поршневых насосов, вращательных насосов и гидравлических устройств без движущихся рабочих органов. Подъём в развитии поршневых насосов наблюдался в конце XVIII века, когда для их изготовления стали применять металл и использовать привод от паровой машины. С середины XIX века начали широко внедряться в производство паровые прямодействующие поршневые насосы. К этому периоду относится создание крыльчатых насосов, прообразом которых является поршневой насос с кольцевым цилиндром, описанный Итальянским инженером Агостино Рамэлли (Agostino Ramelli; 1531–1608) в 1588 (Le Diverse Et Articiose Machine). Развитие теории поршневых насосов тесно связано с работами отечественных учёных и инженеров (К. Бах, Г. Берг, А.П. Герман, В.Г. Шухов, П.К. Худяков, И.И. Куколевский, А.А. Бурдаков и другие). Достижения в области поршневых насосов были широко использованы также при создании поршневых компрессоров, гидравлических прессов и других устройств, но сами поршневые насосы, начиная с 1920–30-х стали заметно вытесняться из ряда областей центробежными, роторными и другими. Другой путь развития насосов начался с изобретения так называемых вращающихся насосов, имевших по одному ротору, которые также были описаны Рамэлли. Насос с эксцентрическим ротором является прототипом современных шиберных насосов. В 1624 Француз Жо Лерэшу (Jean Leurechon; 1591–1670) в книге La Récréation Mathématique описал двухроторный коловратный насос, который можно рассматривать как прообраз современных зубчатых насосов. В дальнейшем появились и другие разновидности роторных насосов, представителем которых является, например, лабиринтный насос, созданный уже в 1950. Первый вихревой насос, названный центробежным самовсасывающим, был предложен в 1920 в Германии инженером С. Хиншем (S. (Johannes) Hinsch), затем появились и другие разновидности. Идея использования центробежной силы для подачи жидкостей возникла в XV веке ещё у Леонардо да Винчи и, по-видимому, независимо от него была реализована в начале XVII веке Французским инженером Бланкано, построившим простейший центробежный насос для подачи воды, рабочим органом которого служило открытое вращающееся колесо. Один из первых центробежных насосов со спиральным корпусом и четырёхлопастным рабочим колесом был предложен родившимся во Франции Британским физиком и изобретателем Дони Папа (Denis Papin; 1647–1712), который усовершенствовал конструкцию ранее известной воздуходувки xxx (Hessians). В конце XIX века, когда появились быстроходные тепловые, а затем электрические двигатели, центробежные насосы получили более широкое применение. В 1838 Русский военный инженер, изобретатель Александр Александрович Саблуков (1783–1857) на основе созданного им ранее вентилятора построил одноступенчатый центробежный насос, в 1846 Американский инженер ДаблЮ.Эйч. Дьжонсэн (W.H. Johnson) предложил многоступенчатый горизонтальный насос, в 1851 аналогичный насос был создан в Великобритании по патенту Дьжона Гвына (насос Гвына (или Гуинна; John Gwynne)), в 1899 Русский инженер В.А. Пушечников разработал вертикальный многоступенчатый насос для буровых скважин глубиной до 250 метров (м). Этот насос, построенный в Париже на заводе Фарко (насос Фарко), предназначался для водоснабжения Москвы, имел подачу 200 кубических метров в час ($м^3$/ч), кпд до 70%. В России первые центробежные насосы начали изготовлять в 1880 на заводе родившегося в Германии Российского предпринимателя Густава Ивановича Листа (1835–1913) в Москве. Развитие осевых насосов основывалось на опыте аналогичных им гидротурбин. Проектирование и исследование осевых (пропеллерных и поворотно-лопастных) насосов относится к концу XIX – началу XX веков. В СССР эти насосы разрабатывались начиная с 1932 на заводе Борец (под руководством М.Г. Кочнева), во Всесоюзном Научно-Исследовательском Институте Гидромашиностроения (Сергей Сергеевич Руднев (1902–1990) и другие), в Харьковском институте Промэнергетика (Г.Ф. Проскура и другие), а с 1934 на опытной установке в Дмитрове (под руководством И.Н. Вознесенского). Большую роль в создании теории и совершенствовании конструкции центробежных и осевых насосов сыграли труды Л. Эйлера (Eiler), Английского физика и инженера Озбона Рэйнолдза (или Осборна Рейнольдса) (Osborne Reynolds; 1842–1912), Российских учёных Николая Егоровича Жуковского (1847–1921) и Сергея Алексеевича Чаплыгина (1869–1942), К. Пфлайдерера (Pfleiderer) и других учёных. Третье направление развития устройств для напорной подачи жидкостей

объединяет несколько путей создания и совершенствования насосов-аппаратов. Прототипы вытеснителей, согласно свидетельству Герона, изготовлялись уже в Древней Греции (устройства для вытеснения из сосуда воды подогретым воздухом или водяным паром). Первым вытеснителем производственного назначения была предложенная в 1698 Английским инженером Томэсом Сэйвэри (Thomas Savery; 1650–1715) паровая водоотливная установка. Это устройство можно считать прототипом изобретённого в Германии в 1871 Халлем пульсометра (pulse-meter), имевшего 2 камеры и действовавшего автоматически. Идея использования сжатого воздуха для подачи воды высказывалась в 1707 Французским математиком, физиком и изобретателем Дони Папа (Denis Papin; 1647–1712) и другими инженерами, но практически была применена значительно позже (в XX веке) – в монжусе и в двухкамерном водоподъёмнике вытеснения для водяных скважин (конструкция инженера В.П. Савотина, СССР). Подача воды под действием давления продуктов сгорания жидкого топлива была осуществлена в Великобритании в 1911 Л. Гемфри (Gemphrey) (смотрите в статье Вытеснитель). Принципиально иной способ подачи воды или нефти из скважин с помощью сжатого воздуха или другого газа был применен в газлифтах, которые были предложены в середине XIX века, а позднее нашли и практическое применение (с 1897 в России на нефтепромыслах в Баку, с 1901 в США). С изобретением Монгольфье в 1796 автоматически действующего гидравлического тарана наметился ещё один путь развития устройств для напорной подачи жидкости, принцип действия которых был основан на использовании для подачи воды периодически создаваемых гидравлических ударов. В дальнейшем были предложены различные конструкции гидравлических таранов. В СССР нашли распространение установки инженера Дмитрия Ивановича Трембовельского (1927) и другие. Одной из разновидностей насосов-аппаратов явился водоструйный насос, который как лабораторный прибор был предложен Английским учёным Д. Томпсоном (Thomson) в 1852 и служил для отсасывания воды и воздуха. Первый промышленный образец струйного аппарата применил инженер Нагель в 1866 (предположительно в Германии) для удаления воды из шахт. Позднее созданы различные струйные насосы в виде водо-водяных эжекторов, паро-водяных инжекторов и многие другие. Основы теории струйных насосов были заложены в работах Г. Цейнера и У. Ранкина во второй половине XIX века и получили существенное развитие в 1930-х благодаря исследованиям Американских инженеров О'Брайена (O'Bryan) и Гослина (Goslin) и Советских специалистов Л.Д. Бермана, К.К. Баулина, А.Н. Ложкина, Е.Я. Соколова, Н.М. Зингера и других. Позднее предложен гидропневматический водоподъёмник для скважин (В.П. Сироткин, Я.С. Суреньянц), в конструкции которого объединены струйный насос и эрлифт. Одним из направлений развития насосов-аппаратов является создание магнитогидродинамических насосов. Первые такие насосы на постоянном токе были предложены Голденом (Gould; 1907) и Гартманом (Hartmann; 1919) и насосы на переменном токе – Чаббом (Lewis W. Chubb; 1915). Однако широко их стали применять в СССР и за рубежом только в 1950–60-е, главным образом в связи с успехами атомной энергетики. Таким образом, техника подъёма и перемещения вначале только воды, а затем нефти и других жидкостей в каждую эпоху в основном соответствовала уровню развития производительных сил и производственных отношений. Основные Типы Современных Насосов:- Центробежные Насосы являются наиболее распространёнными и предназначаются для подачи холодной или горячей (t° > 60 °C) воды, вязких или агрессивных жидкостей (кислот и щёлочей), сточных вод, смесей воды с грунтом, золой и шлаком, торфом, раздробленным каменным углём и тому подобным. Их действие основано на передаче кинетической энергии от вращающегося рабочего колеса тем частицам жидкости, которые находятся между его лопастями. Под влиянием возникающей при этом центробежной силы P частицы подаваемой среды из рабочего колеса перемещаются в корпус насоса и далее, а на их место под действием давления воздуха поступают новые частицы, обеспечивая непрерывную работу насосов. Рабочие колёса насоса могут быть не только с односторонним подводом жидкости, но и с двухсторонним, что позволяет почти полностью уравнивать давление жидкости на внешние боковые поверхности колеса. Одной из важных практических характеристик рабочих колёс центробежных и некоторых других насосов является коэффициент быстроходности n_s – число оборотов в 1 минуту (мин) такого рабочего колеса, которое геометрически подобно рассматриваемому и при подаче Q = 75 литров в секунду (л/сек) развивает напор H = 1 метр (м). Классификация рабочих колёс центробежных насосов по коэффициенту быстроходности представлена в ниже, в которой каждый тип колеса характеризуется отношением внешнего диаметра $D_{вн}$ к диаметру его входного отверстия $D_{отв}$, (Тип Колеса – ns, об/мин – Dвн/Dотв):- (i) Тихоходное – 50–80 – 3–2.5; (ii) Нормальной Быстроходности – 80–150 – 2; и (iii) Быстроходное – 150–350 – 1.8–1.4. Значения n_s < 50 имеют вихревые насосы, а область n_s = 400–1 500 оборотов в минуту (об/мин) соответствует осевым, а также диагональным насосам, занимающим промежуточное положение между центробежными и осевыми насосами. Для создания больших напоров применяют многоступенчатые насосы, в которых жидкость проходит последовательно несколько рабочих колёс, получая от каждого из них соответствующую энергию. Важнейшей особенностью центробежных насосов является непосредственная зависимость напора, а также мощности, кпд и допустимой высоты всасывания от подачи, которая для каждого типа насоса выражается соответствующими графиками, называемыми Характеристиками. Кпд центробежного насоса при определённом режиме его работы достигает максимального значения, а затем с увеличением подачи снижается. Крупнейшие центробежные насосы отечественного производства могут обеспечить подачу воды до 65 000 кубических метров в час ($м^3$/ч) при напоре 18.5 метров (м), потребляя мощность 7.5 МВт, максимальный кпд равен 88–92%. В США для насосной станции Гранд-Кули создан вертикальный одноступенчатый центробежный насос с подачей 138 000 $м^3$/ч и напором 95 м при мощности 48 МВт. Осевые Насосы предназначаются главным образом для подачи больших объёмов жидкостей. Их работа обусловлена передачей той энергии, которую получает жидкость при силовом воздействии на неё лобовой поверхности вращающихся лопастей рабочего колеса. Частицы подаваемой жидкости при этом имеют криволинейные траектории, но, пройдя через выправляющий аппарат, начинают перемещаться от входа в насос до выхода из него, в основном вдоль его оси (откуда и название). Существуют две основных разновидности осевых насосов:- жёстколопастные с лопастями, закреплёнными неподвижно на втулке рабочего колеса, называемые пропеллерными, и поворотно-лопастные, оборудованные механизмом для изменения угла наклона лопастей. Насосы обеих разновидностей строят обычно одноступенчатыми, реже двухступенчатыми. Изменением наклона лопастей рабочего колеса достигается регулирование подачи с поддержанием кпд на высоком уровне в широких пределах. Рабочие колёса осевого насоса имеют очень высокий коэффициент быстроходности (ns от 500 до 1 500 об/мин). При малых подачах характеристики H – Q и N – Q круто снижаются. Максимальные значения H и N соответствуют режиму холостого хода. Крупнейший отечественный осевой поворотно-лопастной насос рассчитан на Q = $(45.50)\cdot 10^3$ $м^3$/ч при H от 13 до 10 м, N = 2 МВт и 11 = 86%. Марка этого насоса:- ОП2-185, где ОП – осевой поворотно-лопастной, 2 – тип рабочего колеса и 185 – диаметр рабочего колеса (по концам лопастей, в сантиметрах (см)). Вихревые Насосы обладают хорошей способностью самовсасывания, то есть возможностью начинать действие без предварительного заполнения всасывающей трубы подаваемой средой, если она имеется в корпусе насоса. Благодаря этому они применяются для подачи легкоиспаряющихся или насыщенных газами капельных жидкостей и в комбинации с центробежными насосами. Существуют две разновидности вихревых насосов:- закрытого и открытого типа. В вихревом насосе закрытого типа частицы жидкости из ячеек, расположенных по периферии рабочего колеса, под влиянием центробежных сил будут переходить в канал корпуса насоса и затем, передав часть своей кинетической энергии находящейся там среде, возвратятся в другие ячейки. Совершая винтообразное вихревое перемещение, каждая частица за время её нахождения в насосе несколько раз побывает в ячейках ротора и получит от него определённую энергию. В результате такого многоступенчатого действия вихревые насосы по

сравнению с такими же (по размерам и скорости вращения) центробежными насосами развивают в 3–7 раз больший напор, но работают с более низким (в 2–3 раза) кпд. В вихревых насосах открытого типа жидкость подводится вблизи вала насоса, проходит между лопатками рабочего колеса и отводится к выходному отверстию в корпусе из открытого (без перемычки) периферийного канала. В зарубежной литературе вихревые насосы называются Фрикционными, Регенеративными, Турбулентными, Самовсасывающими и другими. Поршневые Насосы отличаются большим разнообразием конструкций и широтой применения. Действие поршневых насосов состоит из чередующихся процессов всасывания и нагнетания, которые осуществляются в цилиндре насоса при соответствующем направлении движения рабочего органа – поршня или плунжера. Эти процессы происходят в одном и том же объёме, но в различные моменты времени. По способу сообщения рабочему органу поступательно-возвратного движения поршневые насосы разделяют на Приводные Насосы (обычно с коленчатым валом и шатунным механизмом) и Прямодействующие Насосы. Чтобы периодически соединять рабочий объём то со стороной всасывания, то со стороной нагнетания, в насосах предусмотрены всасывающий и нагнетательные клапаны. Во время работы насосов жидкость получает главным образом потенциальную энергию, пропорциональную давлению её нагнетания. Неравномерность подачи, связанная с изменением во времени скорости движения поршня или плунжера, уменьшается с увеличением кратности действия насоса и может быть почти полностью устранена применением воздушно-гидравлического компенсатора. Поршневые насосы классифицируют на горизонтальные и вертикальные, одинарного и многократного действия, одно- и многоцилиндровые, а также по быстроходности, роду подаваемой жидкости и другим признакам. По сравнению с центробежными насосами поршневые имеют более сложную конструкцию, отличаются тихоходностью, а следовательно, и большими габаритами, а также массой на единицу совершаемой работы. Но они обладают сравнительно высоким кпд и независимостью (в принципе) подачи от напора, что позволяет использовать их в качестве дозировочных. Поршневые насосы могут создавать при нагнетании жидкости давления порядка 100 МН/м^2 (1 000 кгс/см^2) и более. Роторные Насосы получили распространение главным образом для осуществления небольших подач жидкости. По особенностям конструкции рабочих органов роторные насосы можно подразделить на зубчатые (в том числе шестерённые), винтовые, шиберные, коловратные, аксиально- и радиально-поршневые, лабиринтные и другие. Каждый из них имеет свои разновидности, но объединяющий их признак – общность принципа действия, в основном аналогичного действию поршневых насосов. Роторные насосы отличаются отсутствием всасывающего и нагнетательного клапанов, что является их большим преимуществом и упрощает конструкцию. Зубчатый Насос с внешним зацеплением двух шестерён – наиболее распространённый – всасывает жидкость при выходе зубьев одного колеса из впадин другого и нагнетает её при входе зубьев одной шестерни в зацепление с другой – справа, при вращении верхней шестерни по часовой стрелке. Зубчатые насосы снабжаются предохранительным клапаном, который при достижении максимально допустимого давления перепускает жидкость со стороны нагнетания на сторону всасывания. Зубчатые насосы используют для подачи нефтепродуктов и других жидкостей без абразивных примесей. Шиберный Пластинчатый Насос действует в результате изменения рабочих объёмов, заключённых между соседними пластинами и соответствующими участками поверхностей ротора и корпуса насоса. В левой части насоса при вращении по часовой стрелке эксцентрично расположенного ротора этот объём увеличивается, из-за чего давление в нём понижается и создаётся возможность для всасывания жидкости. В другой части насоса при вращении ротора межлопаточные пространства уменьшаются, что обеспечивает нагнетание подаваемой среды. Эти насосы бывают одинарными и сдвоенными. Они предназначены для нагнетания чистых не очень вязких минеральных масел до давления 6 МН/м^2 (60 кгс/см^2) и более и применяются в системах гидропривода и других устройствах. Струйные Насосы из числа насосов-аппаратов имеют наиболее широкую область применения и наибольшее разнообразие конструкций. Одним из них является водоструйный насос, действие которого состоит в основном из трёх процессов – преобразования потенциальной энергии рабочей жидкости в кинетическую (в конической сходящейся насадке), обмена количеством движения между частицами рабочей жидкости и подаваемой среды (в камере смешения), а также перехода кинетической энергии смеси рабочей и транспортируемой жидкостей в потенциальную (в диффузоре). Благодаря этому в камере смешения создаётся разрежение, что обеспечивает всасывание подаваемой среды. Затем давление смеси рабочей и транспортируемой жидкостей значительно повышается в результате снижения скорости движения, что делает возможным нагнетание. Струйные насосы просты по устройству, надёжны и долговечны в эксплуатации, но их кпд не превышает 30%. Области Применения:- особенности конструкции и принцип действия различных насосов определяют диапазоны подачи и напора, в пределах которых целесообразно применять насос того или иного типа. Использование трёх основных типов насосов характеризуется следующими данными:- (i) Поршневой Насос:- Подача Q – 1–200 м^3/ч, Напор H – 10–10 000 м; (ii) Центробежный Насос:- Подача Q – 1–100 000 м^3/ч, Напор H – 1–4 500 м; и (iii) Осевой Насос:- Подача Q – 100–100 000 м^3/ч, Напор H – 1–20 м. Рассматривая области применения устройств для напорной подачи жидкостей, следует также иметь в виду, что ещё в XIX веке, особенно в Великобритании, насосы использовались (до внедрения электропривода) как генераторы гидравлической энергии. Эта энергия от центральных энергетических установок (с поршневыми насосами и паровыми машинами) по специальным водопроводам высокого давления передавалась на промышленные предприятия к потребителям. С начала XX века стали применять центробежные и роторные насосы в качестве генераторов гидравлической энергии в гидравлических передачах и системах гидропривода машин, в которых наряду с гидравлическими двигателями они являются основным элементом. О конструкции и конкретном применении насосов смотрите статьи Винтовой Насос, Вытеснитель, Газлифт, Гидравлический Таран, Глубоководный Насос, Индукционный Насос, Коловратный Насос, Кондукционный Насос, Крыльчатый Насос, Лабиринтный Насос, Погружной Насос, Шестерённый Насос, Штанговый Насос.

PUMP = ТУФЛЯ ЛОДОЧКА (или ТУФЛЯ НА НИЗКОМ КАБЛУКЕ, или ХХ) – Pump:- a shoe that grips the foot chiefly at the toe and heel, especially a close-fitting woman's dress shoe with a moderate to high heel. / heel = каблук или пятка.

PUMPABILITY = ПЕРЕКАЧИВАЕМОСТЬ (или ПРОКАЧИВАЕМОСТЬ) – Pumpability:- the low temperature, low shear stress-shear rate viscosity characteristics of an oil that permit satisfactory flow to and from the engine oil pump and subsequent lubrication of moving components. Pumpability:- a low-temperature property of the oil, which determines to what extent is the oil capable to flow to the pump on low temperatures. / Перекачиваемость – способность к перекачиванию в зависимости от вязкости жидкости.

PUMP AND DUMP = ВЫКАЧИВАНИЕ И ВЫБРАСЫВАНИЕ – In exchange trading, Pump And Dump is one of trading traps. Pump and Dump is tricks of the trade:- also referred to as Ramping, this is an old trick often perpetrated by sly old hands who prey on newcomers. / В биржевой торговле Выкачивание и Выбрасывание является одной из западней торговли, относящейся также к обдираловке (вымогательству). Фактически, это один из старых трюков, часто совершаемых лукавыми торговцами, имеющими большой опыт, которые избирают новичков в качестве своих жертв.

PUMPED STORAGE HYDROELECTRIC PLANT = ГИДРОАККУМУЛИРУЮЩАЯ (или НАПОРНАЯ–САМОТЁЧНАЯ) ГИДРОЭЛЕКТРОСТАНЦИЯ – Pumped Storage Hydroelectric Plant is a plant that usually generates electric energy during peak-load periods by using water previously pumped into an elevated storage reservoir during off-peak periods when excess generating capacity

is available to do so. When additional generating capacity is needed, the water can be released from the reservoir through a conduit to turbine generators located in a power plant at a lower level.

PUMPMAN = НАСОСЧИК (или ДОНКЕРМАН) – Pumpman (tankers) (engine department (unlicensed)):- operates pumps and discharges petroleum products. Maintains and repairs all cargo handling equipment. Pumpman:- a rating who tends to the pumps of an oil tanker.

PUMPMAN AND ELECTRICIAN = ХХ И ЭЛЕКТРИК – Pumpman And Electrician (engine department (unlicensed)):- qualified members of the engine department (QMED):- trained in all crafts necessary to engine maintenance (welding, refrigeration, lathe operation, die casting, electricity, pumping, water purification, oiling, evaluating engine gauges, etc). Usually watchstanders but on some ships, day workers.

PUMP–OVER = ПЕРЕКАЧКА – Pump-Over:- in oil and gas industry, an intra, or inter-facility transfer. For example, when one pipeline pumps crude oil or refined products from its tanks or mainline into the mainline or storage tank of the receiving pipeline.

PUMP PRICE = ЦЕНА ИЗ ТРУБЫ (или ЦЕНА ПРОКАЧКИ) – Pump Price:- in the US oil industry, the price of retail petroleum as it is purchased by the consumer at the pump. In Canada, this is the same price as is usually posted on pump price street signs, and invariably includes all taxes, including GST (GST is approximately 3–4 cents per liter, depending upon the actual pump price). FuleFacts sometimes refers to Ex-Tax pump price, which is the pump price, less taxes. In Canada taxes on gasoline and diesel fuel include:- (i) Federal Excise Tax (10 cents per liter), (ii) Provincial Tax (ranges from 9 to 16.5 cents per liter); and (iii) GST or HST (GST is approximately 3–4 cents per liter, depending upon the actual pump price). In addition, some municipalities collect a Provincial pump tax surcharge. Quebec also charges a retail sales sales tax, and in some border communities, provides a pump tax reduction. See also Retail Price. / налоговая надбавка или доплата (tax surcharge).

PUNCTIFORM = В ФОРМЕ ВПАДИНЫ – Punctiform:- with a depression in the center. / :- с ямкой в центре.

PUNCTULATE = МЕЛКОТОЧЕЧНОЕ (или МЕЛКОЯМЧАТОЕ) – Punctulate:- covered with very fine points or dots, e.g., the surface of a seed.

PUNGENT = ОСТРОЕ (или ЖГУЧЕЕ, или ЕДКОЕ) – Pungent:- terminating in a rigid sharp point. With an acrid, biting or sharp smell or taste.

PUNT = ПЛОСКОДОННАЯ ШЛЮПКА (или МАЛАЯ ШАЛАНДА, или РАБОЧИЙ ПЛОТИК) – Punt (maritime term):- a rectangular flat-bottomed boat used by vessels for painting the ship's side and general use around the ship's water: line, fitted with oar-locks on each side and usually propelled by sculling. / Рабочий Плотик:- для работы по окраске судна.

PUP = ЩЕНОК (или ПЛЕМЯННИК) – Pup is a short semi-trailer used jointly with a dolly and another semi-trailer to create a twin trailer. / Дословно – Щенок, а по смыслу в переводе с Англоязычного жаргона на Русскоязычный – Племянник. Короткий полуприцеп используемый вместе с шасси и другим полуприцепом для создания двойного прицепа.

PUPA = КУКОЛКА – Pupa is the compact, often protected, resting stage of an Insect preceding the adult stage (Bollworms overwinter in the pupal stage under the soil surface). A non feeding, inactive stage in which the tissues of the larval stage are formed into those of the adult. Also known as Pupae. See also Diapause. A Pupa (Latin Pupa for Doll, pl:- Pupae or Pupas) is the life stage of some Insects undergoing transformation. The pupal stage is found only in holometabolous, those that undergo a complete metamorphosis, going through four life stages; embryo, larva, pupa and imago. The pupae of different groups of Insects have different names such as chrysalis in the Lepidoptera and tumbler in Mosquitoes. Pupae may further be enclosed in other structures such as cocoons, nests or shells. Pupa (pl. Pupae) is a non-feeding and usually inactive stage in Insect development which occurs between the larval and adult stages. Chrysalis is another term for Pupa. / Непитающаяся, неактивная стадия, в процессе которой ткани личиночной стадии Насекомого развиваются в ткани взрослого Насекомого. В Англоязычном написании для обозначения множественного числа куколок может также использоваться Латинское слово Pupae. Смотрите также Диапауза (Diapause). Под Куколкой понимается стадия развития Насекомых с полным превращением (Бабочек, Двукрылых, Жуков, Перепончатокрылых и другие). На стадии куколки личинка формируется во взрослое Насекомое – имаго. Куколка, промежуточная стадия развития Насекомых, претерпевающих в процессе онтогенеза полное превращение (смотрите Метаморфоз). Куколка питается и обычно неподвижна, однако в ней происходит интенсивная внутренняя перестройка, в процессе которой Насекомое превращается из личинки во взрослую особь – имаго. Различают 3 типа куколок. У свободной куколки крылья, усики и ноги плотно прижаты к телу, но не сцеплены с ним (например, у Перепончатокрылых, Сетчатокрылых, большинства Жуков). Свободные куколки Ручейников и Верблюдок активно передвигаются. У покрытой куколки общий покров охватывает ноги, усики и крылья (например, у Дневных Бабочек, Божьих Коровок и Жуков Листоедов). Такая куколка менее подвижна, чем свободная. У скрытой, или бочонкообразной, куколка личиночная шкурка при последней линьке не сбрасывается, а превращается в бочонкообразный ложный кокон (пупарий), в котором лежит куколка (например, у высших Мух и у Галлиц). Окукливание личинок происходит обычно в укрытиях (в почве, лесной подстилке, под корой, в древесине), реже открыто (на коре деревьев, листьях и тому подобном). Часто перед окукливанием личинки вьют коконы. У некоторых Насекомых с неполным превращением (например, Червецов и Щитовок) самцы тоже проходят стадию куколки.

PURCHASE = ПРИОБРЕТАТЬ – Purchase:- action whereby an economic unit acquires ownership of a good or service in exchange for payment of a price. In monetary economy, purchasing is the principal means of acquiring ownership of a good to satisfy the needs of an individual or a company. The purchaser may enter into possession immediately by paying cash or on credit, or in the future, through installment or lay-away purchases. Payment may also be immediate (in cash) or deferred (on credit or in installments). The practice of exchanging goods or services, i.e. barter, is rare, except in underdeveloped economies. Purchasing is the foundation of demand and is the basis that determines production or distribution (supply). / Действие, посредством которого, хозяйствующий субъект , то есть .

PURCHASE = ТАЛИ (или ГИНИ) – Purchase (maritime term):- a tackle (blocks and falls).

PURCHASE ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ ПРИОБРЕТЕНИЙ – In the United States, Purchase Accounting is a method of accounting for a merger that treats the acquirer as having purchased the assets and assumed the liabilities of the acquiree, which are then written up or down to their respective fair market values. The difference between the purchase price and the net assets acquired is attributed to goodwill. Also known as Acquisition Accounting in the United Kingdom.

PURCHASE AND SALE STATEMENT = ОТЧЁТ О КУПЛЕ–ПРОДАЖЕ (или БЮЛЛЕТЕНЬ КУПЛИ–ПРОДАЖИ) – Purchase And Sale (P&S) Statement is a statement sent by a Futures Commission Merchant (brokerage firm) to a customer when any part of his futures or options position has been changed, liquidated, offset or extinguished by delivery. A Purchase And Sale (P&S) statement typically shows the number of contracts involved, the prices at which and dates on which the contracts were bought and sold, the gross

profit or loss, the commission charges, the net profit or loss on the transactions, and the account balance. Sometimes combined with a Confirmation Statement.

PURCHASE CANCELLATION TRACE = СЛЕД ОТМЕНЫ ПРИОБРЕТЕНИЯ – Purchase Cancellation Trace is a set of data elements specifying all relevant details of a Purchase Cancellation Transaction kept in the Purchase Device.

PURCHASE CANCELLATION TRANSACTION = ТРАНЗАКЦИЯ ПО ОТМЕНЕ ЗАКУПКИ (или ОПЕРАЦИЯ ПО ОТМЕНЕ ЗАКУПКИ) – Purchase Cancellation Transaction is a transaction performed at a Purchase Device in order to cancel the last Purchase Transaction in the European Electronic Purse (EEP).

PURCHASED CAPACITY = ПРИОБРЕТАЕМАЯ МОЩНОСТЬ (или ЗАКУПАЕМАЯ МОЩНОСТЬ) – Purchased Capacity:- in reference to electricity, the amount of electric energy and capacity available for purchase from outside a utility system. / В отношении к электричеству, количество электроэнергии и мощность, доступные для приобретения на стороне вне системы электростанций.

PURCHASE DEVICE = УСТРОЙСТВО ДЛЯ ПРИОБРЕТЕНИЯ (или СРЕДСТВО ДЛЯ ПРИОБРЕТЕНИЯ) – Purchase Device is a physical device, operated by the acceptor, used to accept payment from an European Electronic Purse (EEP) in a Purchase Transaction.

PURCHASED POWER ADJUSTMENT = ПЕРЕОЦЕНКА ПРИОБРЕТЁННОЙ МОЩНОСТИ – Purchased Power Adjustment:- a clause in a rate schedule that provides for adjustments to the bill when energy from another electric system is acquired and it varies from a specified unit base amount.

PURCHASE ORDER = ЗАКАЗ НА ПРИОБРЕТЕНИЕ – Purchase Order:- common grouping of orders for goods/services. Several Stock Keeping Unit (SKU) categories may be listed on one purchase order. Most customers group their orders in a particular way to facilitate distribution at the other end. For example, one purchase order for an apparel importer might encompass 2 dozen green sweaters and 2 dozen red sweaters. If those Purchase Orders (POs) originated from the same store, it is simple for the store to put all items under that PO onto the right truck.

PURCHASE PRICE = ЦЕНА ПРИОБРЕТЕНИЯ (или ЦЕНА ЗАКУПКИ, или ЗАКУПОЧНАЯ ЦЕНА) – (1) Purchase Price is a statutory term used in dumping investigations to refer to the United States sales price of merchandise which is sold or likely to be sold prior to the date of importation, by the producer or reseller of the merchandise for exportation to the United States. Certain statutory adjustments (e.g., import duties, commissions, freight) are made, if appropriate, to permit a meaningful comparison with the foreign market value of such or similar merchandise. / привоз (importation). вывоз (exportation). , например, .

(2) The Purchase Price is an actual price paid for the purchase of a security. The size of the purchase price influences the yield.

PURCHASER = ПРИОБРЕТАТЕЛЬ (или ЗАКУПЩИК) – Within the context of export controls, the Purchaser is that person abroad who has entered into the export transaction with the applicant to purchase the commodities or technical data for delivery to the ultimate consignee. With respect to any option, the floor broker purchasing such option on the trading floor (either as agent or principal), until the time such option is accepted by the clearing organization. Thereafter, the term purchaser means the clearing member which cleared such option for the customer purchasing it.

PURCHASE REVERSAL = ОБРАТЫ ОТ ПРИОБРЕТЕНИЯ – Purchase Reversal:- a part of a purchase transaction that recovers the previous status of the European Electronic Purse (EEP) if a problem prevented the purchase transaction from being finished successfully.

PURCHASERS' PRICES = ЦЕНЫ ЗАКУПЩИКОВ – Purchaser's Prices:- in the United Kingdom, these are the prices paid by purchasers. They include transport costs, trade margins and taxes (unless the taxes are deductible by the purchasers from their own tax liabilities).

PURCHASE SAM = PURCHASE SECURE APPLICATION MODULE

PURCHASE SAM ID = PURCHASE SECURE APPLICATION MODULE ID

PURCHASE SECURE APPLICATION MODULE = НАДЁЖНЫЙ МОДУЛЬ ПРИЛОЖЕНИЯ ДЛЯ ПРИОБРЕТЕНИЯ – Purchase Secure Application Module:- a SAM (Secure Application Module) installed in connection with a Purchase Device providing the necessary security for purchase-related transactions and the collection process.

PURCHASE SECURE APPLICATION MODULE ID = ИДЕНТИФИКАЦИЯ НАДЁЖНОГО МОДУЛЯ ПРИЛОЖЕНИЯ ДЛЯ ПРИОБРЕТЕНИЯ (или АЙ.ДИ. НАДЁЖНОГО МОДУЛЯ ПРИЛОЖЕНИЯ ДЛЯ ПРИОБРЕТЕНИЯ) – Purchase Secure Application Module ID is the unique identification of a PSAM (Purchase Secure Application Module). It consists of the Acquiring Technical Operator ID and the PSAM number.

PURCHASE TRACE = СЛЕД ПРИОБРЕТЕНИЯ – Purchase Trace is a set of data elements specifying all relevant details of a Purchase Transaction kept in the Purchase Device.

PURCHASE TRANSACTION = ТРАНЗАКЦИЯ ПО ПРИОБРЕТЕНИЮ (или ОПЕРАЦИЯ ПО ПРИОБРЕТЕНИЮ) – Purchase Transaction is the transaction performed using a Purchase Device whereby value is transferred from an European Electronic Purse (EEP) to the Purchase Device in exchange for goods or services.

PURCHASING AGENT = АГЕНТ ПО ЗАКУПКАМ – Purchasing Agent is an agent who purchases goods in his/her own country on behalf of large foreign buyers such as government agencies and large private corporations. / Агент, который приобретает товары в его/её собственной стране от имени крупных зарубежных покупателей, таких как правительственные агентства и крупные частные корпорации.

PURCHASING HEDGE = ХЭДЬЖ ПРИОБРЕТЕНИЕМ – Purchasing Hedge:- buying futures contracts to protect against a possible price increase of cash commodities that will be purchased in the future. At the time the cash commodities are bought, the open futures position is closed by selling an equal number and type of futures contracts as those that were initially purchased. Also known as Buying Hedge, and Long Hedge. See also Hedging.

PURCHASING POWER PARITY = ПАРИТЕТ ПОКУПАТЕЛЬНОЙ СПОСОБНОСТИ – Purchasing Power Parities (PPPs) are the rates of currency conversion that equalize the purchasing power of different currencies by eliminating the differences in price levels between countries. In their simplest form, PPPs show the ratio of the prices in national currencies of the same good or service in different countries. Purchasing Power Parities (PPPs) are the rates of currency conversion that eliminate the differences in price levels between countries. The PPPs are given in national currency units per US Dollar. 'Effective' external value of a currency determined by comparing different countries' relative price levels. For example, a basket of goods costing USD100.00 in the United States and

CHF132.00 in Switzerland would give a parity rate of CHF1.32 per USD. Proponents of Purchasing Power Parity (PPP) theory hold the view that an exchange rate will move in the direction of purchasing power parity over the long term or at least reflect the differing price trends.

PURCHASING POWER PARITY THEORY = ТЕОРИЯ О ПАРИТЕТЕ ПОКУПАТЕЛЬНОЙ СПОСОБНОСТИ – Purchasing Power Parity (PPP) Theory is an economic theory that estimates the amount of adjustment needed on the exchange rate between countries in order for the exchange to be equivalent to each currency's purchasing power. The relative version of PPP is calculated as:- $S = P_1 / P_2$. Where:- 'S' represents exchange rate of currency 1 to currency 2; 'P_1' represents the cost of good 'x' in currency 1; and 'P_2' represents the cost of good 'x' in currency 2. In other words, the exchange rate adjusts so that an identical good in two different countries has the same price when expressed in the same currency. For example, a chocolate bar that sells for CAD1.50 in a Canadian city should cost USD1.00 in a United States city when the exchange rate between Canada and the United States is 1.50 USD/CAD. (Both chocolate bars cost USD1.00. The exchange rate between any two currencies adjusts to reflect changes in the price levels within the two countries. Purchasing Power Parity (PPP) is a theory which states that exchange rates between currencies are in equilibrium when their purchasing power is the same in each of the two countries. This means that the exchange rate between two countries should equal the ratio of the two countries' price level of a fixed basket of goods and services. When a country's domestic price level is increasing (i.e. a country experiences inflation), that country's exchange rate must depreciated in order to return to PPP. The basis for PPP is the 'law of one price'. In the absence of transportation and other transaction costs, competitive markets will equalize the price of an identical good in two countries when the prices are expressed in the same currency. For example, a particular TV set that sells for 750 Canadian Dollars (CAD) in Vancouver should cost 500 US Dollars (USD) in Seattle when the exchange rate between Canada and the US is 1.50 CAD/USD. If the price of the TV in Vancouver was only 700 CAD, consumers in Seattle would prefer buying the TV set in Vancouver. If this process (called 'Arbitrage') is carried out at a large scale, the US consumers buying Canadian goods will bid up the value of the Canadian Dollar, thus making Canadian goods more costly to them. This process continues until the goods have again the same price. There are three caveats with this law of one price. (1) As mentioned above, transportation costs, barriers to trade, and other transaction costs, can be significant. (2) There must be competitive markets for the goods and services in both countries. (3) The law of one price only applies to tradeable goods; immobile goods such as houses, and many services that are local, are of course not traded between countries. Economists use two versions of Purchasing Power Parity:- absolute PPP and relative PPP. Absolute PPP was described in the previous paragraph; it refers to the equalization of price levels across countries. Put formally, the exchange rate between Canada and the United States $E_{CAD/USD}$ is equal to the price level in Canada P_{CAN} divided by the price level in the United States P_{USA}. Assume that the price level ratio P_{CAD}/P_{USD} implies a PPP exchange rate of 1.30 CAD per 1 USD. If today's exchange rate $E_{CAD/USD}$ is 1.50 CAD per 1 USD, PPP theory implies that the CAD will appreciate (get stronger) against the USD, and the USD will in turn depreciate (get weaker) against the CAD. Relative PPP refers to rates of changes of price levels, that is, inflation rates. This proposition states that the rate of appreciation of a currency is equal to the difference in inflation rates between the foreign and the home country. For example, if Canada has an inflation rate of 1% and the US has an inflation rate of 3%, the US Dollar will depreciate against the Canadian Dollar by 2% per year. This proposition holds well empirically especially when the inflation differences are large. Does PPP determine exchange rates in the short term? No. Exchange rate movements in the short term are news-driven. Announcements about interest rate changes, changes in perception of the growth path of economies and the like are all factors that drive exchange rates in the short run. PPP, by comparison, describes the long run behaviour of exchange rates. The economic forces behind PPP will eventually equalize the purchasing power of currencies. This can take many years, however. A time horizon of 4–10 years would be typical. How is PPP calculated? The simplest way to calculate purchasing power parity between two countries is to compare the price of a 'standard' good that is in fact identical across countries. Every year The Economist magazine publishes a light-hearted version of PPP:- its 'Hamburger Index' that compares the price of a McDonald's hamburger around the world. More sophisticated versions of PPP look at a large number of goods and services. One of the key problems is that people in different countries consumer very different sets of goods and services, making it difficult to compare the purchasing power between countries. According to PPP, by how much are currencies overvalued or undervalued? The PPP estimates are taken from studies carried out by the Organization of Economic Cooperation and Development (OECD) and others; however, they should not be taken as 'definitive'. Different methods of calculation will arrive at different PPP rates. The currencies listed below are compared to the US Dollar. A green bar indicated that the local currency is overvalued by the percentage figure shown on the axis; the currency is thus expected to depreciate against the US Dollar in the long run. A red bar indicates undervaluation of the local currency; the currency is thus expected to appreciate against the US Dollar in the long run. / МэкДанэлд (McDonald). Обменный курс для любых двух валют переоценивается с целью отражения изменений в ценовых уровнях в пределах данных двух стран.

PUREBRED = ЧИСТОКРОВНАЯ – Purebred:- an animal of pure breeding, registered or eligible for registration in the heard book of the breed to which it belongs.

PURE CULTURE = ЧИСТАЯ КУЛЬТУРА – Pure Culture:- the growth of a single species or strain of an organism in the absence of any other living species or strain.

PURE LINE = ЧИСТАЯ ЛИНИЯ – Pure Line is:- (1) a line that has been made almost completely homozygous by repeated self-pollination and selection of a specific type (or by the removal of off-types) over generations. (2) A group of identical individuals that always produce offsprings of the same phenotype when intercrossed. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

PURE LINE SELECTION = СЕЛЕКЦИЯ ПО ЧИСТОЙ ЛИНИИ (или ОТБОР ПО ЧИСТОЙ ЛИНИИ) – Pure Line Selection is a method of selecting the best progeny for breeding from individual plants of a variety or cultivar. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

PURE PREMIUM = ЧИСТАЯ ПРЕМИЯ – In reinsurance, Pure Premium is the portion of the premium calculated to enable the insurer to pay losses and, in some cases, allocated claim expenses or the premium arrived at by dividing losses by exposure and in which no loading has been added for commission, taxes, and expenses.

PURE PUMPED STORAGE HYDROELECTRIC PLANT = ЧИСТО ГИДРОАККУМУЛИРУЮЩАЯ (или НАПОРНАЯ–САМОТЁЧНАЯ) ГИДРОЭЛЕКТРОСТАНЦИЯ – Pure Pumped Storage Hydroelectric Plant is a plant that produces power only from water that has previously been pumped to an upper reservoir.

PURE SEED = ЧИСТОЕ СЕМЯ – Pure Seed has a high level or purity with little or no contamination of other varieties or species. Seeds give rise to genetically similar plants.

PURITY = ЧИСТОТА (или БЕСПРИМЕСНОСТЬ, или ДОБРОКАЧЕСТВЕННОСТЬ) – (1) Purity refers to the absence of dark fibers, kemp or hair.

(2) Seed Purity:- Xxxxx. The Purity Test:- Object of the test:- The object of the purity analysis is to determine the percentage composition by weight of the sample being tested and by inference the composition of the seed lot and to identify the various species of seeds and inert particles constituting the sample. General principles:- a prescribed weight of seed is examined by a trained analyst and the various constituents found are identified, weighed and reported. In seed testing we only identify down to species level therefore a purity test will give no indication of seed variety. Standards:- all seed offered for sale within the European Union must conform to purity standards. The following are the minimum standards for some commonly tested species:- Species – Minimum Purity Standard:- (i) Barley – 98%, (ii) Oats – 98%, (iii) Oil Seed Rape – 98%, (iv) Perennial Ryegrass – 96%, (v) Wheat – 98%. Purity test reports:- The purity test report states the percentage of pure seeds found in the examined prescribed weight. The report will also state what inert matter was found and may include the following:- (i) Broken seed, soil, scraps; (ii) Other seed:- All seed other than the stated species; (iii) Ergot:- Ergot is a fungus of the genus Claviceps; (iv) Pests:- Any live pests insects etc. Latin names:- genus and species names are reported in Latin. The main purposes of seed testing are to:- (i) study the physiological quality of seed; and (ii) study seed procurement of the species. Seed tests are based on the standards recommended by International Seed Testing Association (ISTA) and include:- (i) Purity; (ii) Seed weight, (iii) Moisture content, and (iv) Viability. Purity is the composition by weight of pure seed in a sample. Seed samples must be carefully prepared in order to represent the whole seed lot. Sub-samples should be drawn from 2–3 different places within the seed lot, mixed thoroughly, and then divided into test samples of about 2 500 seeds. Purity affects the number of pure seeds per kilogram, and therefore, the price and quantity requirements for sowing. Purity is affected by the level of seed extraction. Purity is needed before seed sales; before seed storage; during seed processing. Purity Test:- as a measure of the cleanness of seed, pure seed is separated from impure seed, and then separately weighed. Seed is considered pure if it appears normal in terms of size, shape, and general outward appearance. Conversely, seed that is too small, has been partly eaten by insects, or exhibits fungal stains is regarded as impure. A sample for a purity test may consist of 100 to 1 000 seeds. A purity percentage is calculated as:- Purity Percentage = (Weight of Pure Seed / Total Weight of Sample) x 100. Although a purity test is simple, it may not be as accurate in assessing quality as other tests. One problem encountered in applying a purity test is the subjectivity injected in separating pure seed from impure seed. / Чистота – процент семян основной культуры в отобранной для анализа пробе. Этот показатель качества семян важен для окончательного определения нормы высева на единицу площади. Ведь в любой партии семян могут присутствовать живой сор (семена сорняков и других культур) и мёртвый сор (растительные остатки, песок, земля и другое), дефектные семена. Чистота семян характеризуется массой семян основной культуры, выраженной в процентах к навеске, взятой для анализа. Чистоту семян определяют по двум навескам установленного размера.

PURL = КАНИТЕЛЬ (или РЯБЬ, или ПЕТЛЯ, или ИЗНАНОЧНАЯ ПЕТЛЯ) – Purl is:- (1) a knitting stitch that results in horizontal ridges across the fabric. It is made by drawing alternate courses through each side of the fabric. (2) A picot or small loop that edges needlework, lace, or ribbon. Sometimes spelled Pearl. See also Picot. (3) Coiled gold or silver thread used for embroidery. / Двухизнаночный Стежок (или петля) или Бисерный Стежок при обмётке петли. / (2) Пико или Зубчик (Picot). Под Канителью, от Французского слова Cannetille, понимается:- (1) тонкая металлическая (обычно золотая или серебряная) нить, употребляемая для вышивания. (2) В переносном смысле – затяжное дело, связанное с длительными задержками и хлопотами. ‘Тянуть канитель’ – делать что-либо однообразное и ненужное.

PURL KNIT FABRIC = ОБОРОТНАЯ (или ДВУХИЗНАНОЧНАЯ) ВЯЗАНАЯ ТКАНЬ – Purl Knit Fabrics look the same on both sides of the fabric. Many attractive patterns and designs can be created with the purl stitch. It is often used in the manufacture of bulky sweaters and for some children’s clothing. A major disadvantage of this method is that production is slow.

PURL STITCH = БИСЕРНЫЙ СТЕЖОК (или ДВУХИЗНАНОЧНЫЙ ТОВАР) – Purl Stitch is a basic stitch used in weft knitting, which produces knit fabrics that have the same appearance on both sides. The purl stitch is frequently used in combination with the Jersey and rib stitches to produce a knitted fabric design. Sweaters, knitted fabrics for infants and children’s wear, knitted fabrics for specialized sportswear, and bulky knit fabrics are commonly made using the purl stitch. / Бисерный Стежок при обмётке петли.

PURPLE = ПУРПУРОВОЕ (или БАГРЯНОВОЕ, или ЛИЛОВОЕ) – Purple:- cloth dyed purple. Any of various colors that fall about midway between red and blue in hue. A garment of purple color, especially a purple robe worn as an emblem of rank or authority.

PURPLISH = ПУРПУРИСТОЕ (или БАГРЯНИСТОЕ) – Purplish:- somewhat purple.

PURPLY = ПУРПУРНО (или БАГРЯНИСТО, или С ЛИЛОВЫМ ОТТЕНКОМ) – Purply:- purplish.

PURPOSE CREDIT = ЦЕЛЕВОЙ КРЕДИТ – Purpose Credit is a credit used for the purpose of buying, carrying or trading in securities. / Под Целевым Кредитом может пониматься, например, кредит, используемый с целью покупки и удерживания или торговли ценными бумагами.

PURPURE = ПУРПУРНОЕ (или ПУРПУР) – Purpure:- the heraldic color purple.

PURSE = КОШЕЛЁК – Purse is a small bag for money.

PURSE HOLDER = ВЛАДЕЛЕЦ КОШЕЛЬКА – Purse Holder is any person in possession of an electronic purse.

PURSE PROVIDER = ПОСТАВЩИК УСЛУГ, СВЯЗАННЫХ С КОШЕЛЬКОМ – Purse Provider:- the organization that is responsible for installing the electronic purse application in the integrated circuit card and guaranteeing the electronic value in the electronic purse.

PURSER = КАЗНАЧЕЙ (или РАСХОДЧИК) – Purser is a ship’s officer who is in charge of accounts, especially on a passenger ship.

PURSE SCHEME = СХЕМА КОШЕЛЬКА (или КОШЕЛЬКОВАЯ СХЕМА) – Purse Scheme is a set of rules and regulations for issuance, acceptance and use of electronic purse cards established and enforced by an organization(s).

PURSE SCHEME ADMINISTRATOR = АДМИНИСТРАТОР СХЕМЫ КОШЕЛЬКА (или АДМИНИСТРАТОР КОШЕЛЬКОВОЙ СХЕМЫ) – Purse Scheme Administrator:- the entity responsible for the purse scheme rules, security and overall scheme management.

PURSE SEINER = КОШЕЛЬКОВЫЙ СЕЙНЕР – Purse Seiner:- in purse seining, the fish shoal is surrounded by the net, which has a rope that seals the bottom of the net to trap the fish. Small fish may be pumped out of the net, or the net can be hauled on board and the fish released for sorting. The North American purse seiner is generally laid out with a forward wheelhouse and aft working deck. A characteristic of this vessel is the powerful net block on the end of a long boom supported by the mast and a crow’s nest on the mast for spotting fish shoals. European purse seiners are generally larger than their North American counterparts, being typically 30 meters in length. They have an aft wheelhouse and the net is hauled at the stern. The herring and mackerel caught by these vessels, needing sensitive handling and storage, are stored in tanks of chilled seawater built amidships in the hull. Thrusters (screws that provide sideways movement) are usually fitted to these vessels to give improved maneuverability when laying and hauling nets. Tuna purse

seiners are large vessels mainly designed for long-range fishing, although smaller types operate in the Mediterranean. They are similar in design to, but larger than, the North American purse seiner, and they have a sloping stern where a tuna skiff, used for laying the net, is stowed. Several smaller boats are also carried to help with handling the catch and removing unwanted or protected fish from the nets. In addition to a crow's nest for spotting fish shoals, a light helicopter is sometimes carried on a helicopter deck above the forward wheelhouse. Modern tuna vessels store the catch in chilled seawater tanks. / невод (seine). Тунцеловный кошельковый сейнер (tuna purse seiner) . Сейнер – судно для лова рыбы кошельковым (иногда донным) неводом, ставными сетями и ярусами. Снабжены промысловыми и грузоподъёмными машинами, наиболее крупные несут вертолёт для поиска рыбы. Под Сейнером, от Английского слова Seiner, от Seine, означающее Кошельковый Невод, понимается рыбопромышленное судно для лова рыбы кошельковым неводом. Сейнер – обычно однопалубное судно с надстройкой, смещённой к носовой части. На корме имеются рабочее пространство для хранения и обработки невода и поворотная площадка, откуда он вымётывается при облове. Один конец невода при лове закрепляется на вспомогательной моторной лодке, которая во время переходов и поиска рыбы находится на рабочей палубе сейнера или буксируется им. Для повышения манёвренности у крупных сейнеров иногда предусматриваются средства активного управления (активные рули, поворотные выдвижные колонки, бортовые винты и тому подобное). Сейнеры оборудуются устройствами для выборки невода и его укладки, установками для охлаждения и машинами для обработки рыбы. Для поиска концентраций рыбы сейнеры оснащаются рыбопоисковой аппаратурой. Наиболее крупные сейнеры строятся (на 1975) в Соединённых Штатах Америки (США), Испании, Японии. Длина их до 70 метров (м), мощность главного двигателя 2.5 МегаВатт (МВт), скорость 16–17 узлов (уз). Подобные сейнеры используются для лова тунца, макрели, скумбрии и других пелагических рыб с высокой скоростью передвижения. В бывшем Союзе Советских Социалистических Республик (СССР) были наиболее распространены сейнеры типа РС-300, СО, БЧС (длина 25–35 м, мощность главного двигателя 220 килоВатт (кВт)), а также сейнеры-траулеры типа 'Альпинист' (длина 49 м, мощность 970 кВт, скорость 13 уз).

PURSE PROVIDER SECURE APPLICATION MODULE = НАДЁЖНЫЙ МОДУЛЬ ПРИЛОЖЕНИЯ ПОСТАВЩИКА УСЛУГ, СВЯЗАННЫХ С КОШЕЛЬКОМ – Purse Provider Secure Application Module:- the Secure Application Module (SAM) of the Purse Provider providing the necessary functionality for the secure transactions of the European Electronic Purse (EEP) Scheme as seen from the Purse Provider's viewpoint, e.g., secure activation, load and auditing functions.

PUSH–BACK RACK = ГРАВИТАЦИОННЫЙ СТЕЛЛАЖ – Push-Back Rack is a rack system that pushes stored product up an inclined ramp in order to provide for deep pallet storage.

PUSHER SEAL = НАЖИМНОЕ (или ХХ) УПЛОТНЕНИЕ – Pusher Seal is a mechanical seal in which the secondary seal is pushed along the shaft or sleeve to compensate for misalignment and face wear. See also Seal. / это механическое уплотнение, в котором вторичное уплотнение износ. Смотрите также Уплотнение (Seal).

PUSH SORTER = ПОДТАЛКИВАЮЩИЙ СОРТИРОВЩИК – Push Sorter is a device used with conveyer systems, a push sorter moves product on the conveyer using a stationary device with an arm that can push and sort.

PUT(S) = PUT OPTION(S)

PUTAWAY = РАЗМЕЩЕНИЕ ПО НАЗНАЧЕНИЮ – Putaway is a movement of stock from the time it is unloaded to the time it is put in its final location.

PUT–CALL PARITY = ПАРИТЕТ ОПЦИОН НА ПРОДАЖУ–ОПЦИОН НА ПОКУПКУ – Put-Call Parity:- the relationship between a European-style put option and a European-style call option on the same underlying with the same exercise price and maturity. Put-call parity states that the pay-off profile of a portfolio containing an asset plus a put option is identical to that of a portfolio containing a call option of the same strike on that same asset (with the rest of the money earning the risk-free rate of return). In practice, a put option on, say, a stock index, can be constructed by shorting the stock and buying a call option. The relationship means that traders are able to arbitrage mispriced options.

PUT/CALL RATIO = СООТНОШЕНИЕ ОПЦИОНЫ НА ПРОДАЖУ/ОПЦИОНЫ НА ПОКУПКУ – Based on Chicago Board Options Exchange, Inc. (CBOE®) statistics, the Put/Call Ratio equals the total number of puts divided by the total number of calls. When more puts are traded than calls, the ratio will exceed 1. As an indicator, the Put/Call Ratio is used to measure market sentiment. When the ratio gets too low, it indicates that call volume is high relative to put volume and the market may be overly bullish or complacent. When the ratio gets too high, it indicates that put volume is high relative to call volume and the market may be overly bearish or in panic. When put volume becomes excessive in relation to call volume, it is an indication of excessive bearishness in the market, which is usually bullish. To calculate the Put/Call Ratio simply divide the number of puts by the number of calls. The raw ration can then be smoothed into a moving average. We use a 10-day moving average. Sometimes the CBOE® final data is so late that we estimate the final volume based on the 03:00 pm ET (GMT –5 hours) CBOE® tape, therefore, if you are using our Daily Market Summary to collect the data, you should be sure and get the corrected figures on the report the following day. On our charts we reverse the scale so that oversold readings show as bottoms and overbought readings as tops. / СИБО® (CBOE®). Соотношение Опционы На Продажу/Опционы На Покупку:- индикатор настроения инвесторов:- отношение объёма торгов по опционам на продажу к объёму торгов по опционам на покупку. Соотношение рассчитывается для контрактов на отдельные акции, индексы или для рынка в целом. Соотношение Опционы На Продажу/Опционы На Покупку является обратным индикатором и указывает на приближение финансового инструмента или рынка к уровням максимумов или минимумов:- при падении инструмента соотношение, как правило, возрастает, при росте, наоборот, снижается.

PUT DATE = ДАТА ВЫКУПА – Put Date is the next date on which the holder can redeem the security.

PUT OPTION = ОПЦИОН НА ПРОДАЖУ – Put Option is a contract that entitles the buyer (holder or taker) the right, but not the obligation, to enter into an underlying futures contract to sell a fixed quantity of a particular commodity or underlying asset for delivery in the option month, or, by other words, to obtain a short futures position at a stated price (the strike price) at any time during the life of the option. The seller of the put option has the obligation, upon exercise, to enter into an underlying futures contract to buy a commodity for delivery in such option month at a stated strike price. A put option is purchased to protect against a fall in price. The buyer pays a premium to the seller/grantor of this option. The buyer has the right to sell the commodity or enter into a short position in the futures market if the option is exercised. The future contract concern requires, in principle, future delivery of the asset. The opposite of Call Option. The owner of the put option is speculating that price of the asset will go down and is therefore bearish. Put is a term from the options business. A put option entitles the buyer to sell a certain number of units in the underlying (e.g., a stock) at a specified price by or at a certain time. The counterparty to this contract, the seller of the put option, is called the Option Writer (bid), as he must have the agreed purchase price in the event the option is excercised. In exchange, he receives a premium from the buyer of the put. The buyer of a put expects the underlying's price to fall. The seller of a put, in contrast, expects increasing or at least stagnating prices; in this case, his counterparty will hardly exercise the option, so he can book the option premium received as profit. Opposite:- Buy Option, or Call Option. Put Option is a contract to sell a fixed number of shares – typically 100 shares per put contract – at a fixed price

in the future. This contract expires at specified dates and with it the right to sell the stock at that fixed price. Put Option is a contract which gives the buyer the right, but not the obligation, to sell a specified amount of an asset at a predetermined price on or before a specified date. Put Option is a sell option with which the buyer can hedge against the risk of falling prices. Put Option is a contract to sell a specified amount of a stock or commodity at an agreed time at the stated exercise price. Put is the abbreviated term for 'Put Option', e.g., as in 'I bought five Nortel CAD10 Puts'. See also Stock Options. Put Option is the right, but not the obligation, to sell a specified asset at a specified price at specified times. Put Option is the right, but not the obligation, to sell a specified asset on a specified date, at a specified price. Put Option is an option to sell a specified amount of a commodity at an agreed price and time at any time until the expiration of the option. A put option is purchased to protect against a fall in price. The buyers pays a premium to the seller/grantor of this option. The buyer has the right to sell the commodity or enter into a short position in the futures market if the option is exercised. See also Call Option. Put Option is an option that gives the buyer the right, but not the obligation, to sell (go short) the underlying futures contract at the strike price on or before the expiration date. Put Option is an option contract giving the buyer the right, but not the obligation, to sell a futures contract at a specific price during a specific time period. The put option seller is obligated to buy futures from the put option buyer if the buyer exercises the option. / продавец/предоставивший этот опцион. Опционом на продажу покупатель может захэдьжироваться от риска падения цены. Нотэл (Nortel). Опцион На Продажу – опционный контракт, который даёт покупателю право, но не налагает на него обязанности, продать определённое количество финансовых инструментов, лежащих в основе опциона, по заранее установленной цене исполнения в течение определённого периода времени. Продавец опциона на продажу обязуется, в случае желания покупателя исполнить опцион, купить у него финансовые инструменты в основе опциона по установленной цене на дату исполнения контракта или до её наступления. Владелец опциона на продажу (имеющий по нему длинную позицию) рассчитывает на то, что финансовые инструменты в основе опциона упадут в цене. Смотрите также Опцион На Покупку (Call).

PUT PRICE = ЦЕНА ВЫКУПА – Put Price is the price for which the holder can redeem the security on the put date.

PUT RATIO BACK SPREAD = ПРОПОРЦИОНАЛЬНЫЙ ОБРАТНЫЙ СПРЭД К ОПЦИОНУ НА ПРОДАЖУ (или XX) – Put Ratio Back Spread:- when to use:- normally entered when market is near A and shows signs of increasing activity, with greater probability to downside (for example, if last major move was up, followed by stagnation). Profit characteristics:- profit limited on upside (to net credit taken in when position was established) but open-ended in collapsing market. Loss characteristics:- maximum loss, is amount of B – A – initial credit (or B – A + initial debit), realized if market is at A at expiration. This loss is less than for the equivalent long straddle, the trade-off for sacrificing profit potential on the upside. Decay characteristics:- dependent on the net time value purchased or sold via this strategy. If more time value sold than bought, then time value decays work to the benefit of the holder. Category:- precision. Short 1 put B, long 2 or more puts A. How can you profit from a volatile stock positively skewed to the downside while keeping your risk defined? Answer:- Establish a Put Ratio Back Spread. A back spread is an options spread in which the trader has a net long options position. This can be accomplished by being long more options than short, or proportionally more than the underlying product. If you are back spreading calls, you are long more calls than you are short stock, ETFs or futures. If the trader is back spreading puts, then he or she would be long more puts than long the underlying. A simple long straddle or strangle where the trader is long both calls and puts would be considered a back spread. A back spread has a defined amount of risk in the position. Because a back spread is net long options, there never can be unlimited risk in the position. In an ideal back spread scenario, the underlying market experiences wild gyrations. The net long options profits keep increasing with each incremental move in the underlying, whichever direction that happens to be. In a nightmare scenario the underlying just sits within a very narrow trading range. The time value that is embedded in the option premium steadily erodes, as does the trader's account. To understand back spreading, a trader also must understand volatility skew. Before that, a trader must understand the meaning of implied volatility. Historical volatility shows the movement of an underlying instrument over a certain time period. This can be accomplished by measuring the variance of returns of the underlying. The greater the trading range over a period of time the greater the historical volatility. Implied volatility is a reverse engineering process whereby the price level of the time value that is embedded in an option premium indicates where the future volatility of the underlying instrument is expected to be. Every options trader in the world has a vote. Aggressive premium buying results in a high implied volatility, while aggressive premium selling results in a low implied volatility. Implied volatility is at its highest during times of uncertainty. The period immediately prior to earnings reports, crop reports and economic reports is when implied volatility is at its highest depending upon the underlying instrument. Volatility skew refers to the difference in implied volatility among the at-the-money, out-of-the-money and in-the-money options. When out-of-the-money options have a higher implied volatility than at-the-money options, it is known as a Positive Skew. When out-of-the-money options have a lower implied volatility than at-the-money options, it indicates a negative skew. Let's take a look at IBM's pricing. With the stock trading at USD192.95, the July 170 puts, which are USD22.95 out-of-the-money, are trading at USD3.50. The July 215 calls, which are USD22.05 out-of-the-money, are trading at USD2.00. This means that IBM options are positively skewed to the downside and negatively skewed to the upside; 99% of stocks are skewed that way. Options on agricultural futures usually are positively skewed to the upside and flat or negative to the downside. When the trader is constructing an initial position, being net long puts makes sense. Going long three of the July 170 puts at USD3.50 and short two of the July 180 puts at USD5.60 is a good example. If IBM closes at the July expiration at USD180 or above the trader profits 70¢ (USD70). No harm, no foul. If IBM closes at USD170, the trader loses USD17.30 (USD1 730). That's a fair amount of harm for a simple 3x2 spread. If IBM closes at USD150, the trader is back to the 70¢ profit. Below that price point is all gravy. There is almost a 30-point range where the put back spread is unprofitable. That, however, is taking into account only what happens to the untouched position at expiration. While 10% of profits usually are derived from establishing a sensible initial position, the other 90% comes from knowing how, when and why to adjust that position. With this position, if the stock starts heading south, the position instantly will become profitable. The implied volatility for all options will increase with a sharp downside move. Because the trader has a net positive inventory of put options, that inventory will be priced higher. The trader then either can unwind the position for a profit or adjust it by selling some puts at a much higher implied volatility. Buying low and selling high works the same for implied volatility as it does for market direction. / Одна из стратегий торговли. Обратный Пропорциональный Спрэд Пут:- опционная стратегия с хэдьжирующим компонентом, позволяющая торговцу получать небольшую прибыль или выходить на уровень безубыточности в случае, когда торги складываются не в его пользу. Позиция характеризуется неограниченным потенциалом прибыли при ограниченном риске потерь. Обратный пропорциональный спрэд пут подразумевает продажу одного опциона на продажу 'близкого к деньгам' (что отражается в более высокой цене исполнения) и покупку двух или более опционов на продажу 'без денег'. Эта стратегия используется инвесторами, ожидающими снижения акций в основе опциона. Она наиболее эффективно работает в случае резкого падения акций и повышения волатильности. Смотрите также Call Ratio Back Spread.

PUTREFACTION = РАЗЛОЖЕНИЕ (или ГНИЕНИЕ, или РАСЩЕПЛЕНИЕ) – Putrefaction is an autolysis due to enzymes within the meat. / аутолиз.

PUT SPREAD = КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПРОДАЖУ (или СПРЭД ПО ОПЦИОНАМ НА ПРОДАЖУ) – Put Spread is an options position comprised of the purchase of a put option at one level and the sale of a put option at some lower level.

The premium received by selling one option reduces the cost of buying the other, but participation is limited if the underlying goes down.

PUTTEE = ПУТИ (или ОНУЧА, или НОЖНАЯ ОБМОТКА, или КРАГА) – Puttee is a cloth strip wrapped around the leg from ankle to knee; a usually leather laced, strapped, or catched legging.

PUT–TO–LIGHT = УКЛАДКА ДО ПРОСВЕТА – Put-To-Light:- similar to pick-to-light. Lights are used to guide which container the picked item is to be put into.

PUT TO SEA = УХОДИТЬ В МОРЕ (или ВЫЙТИ В МОРЕ) – Put To Sea (maritime term):- to leave port.

PUTTY = ШПАКЛЁВКА (или МАСТИКА, или СЕРОВАТО–КОРИЧНЕВОЕ) – Putty:- a light brownish gray to light grayish brown textile color.

PUT–UP = СКЛАДЫВАНИЕ (или ПАКОВКА) – Put-Up is a term used to describe how a fabric is supplied. Put-Up is usually described in terms of length, on rolls, or bulk supplied and may have standards as to how many 'cuts' are allowed per roll or box.

PUT VOLUME INDICATOR = ИНДИКАТОР ОБЪЁМА ПО ОПЦИОНАМ НА ПРОДАЖУ – John Bollinger, who invented this fine indicator, uses the CBOE® data which is an aggregate of all stock options; however, since we track the OEX for the purpose of OEX options trading, we tested it using only OEX put volume and found that it worked just as well. We track both the PVI on our Daily Market/Signal Summary Report. The Bollinger Put Volume Indicator (PVI) is a sentiment indicator that measures excessive pessimism by tracking put volume. The PVI is a contrary indicator because, when negative sentiment reaches extremes, it is usually a sign that the market is about to rally. To calculate the PVI simply divide today's put volume by a 10-day moving average of put volume. The threshhold reading for a BUY Signal is 2.0 or greater (today's put volume is twice the 10 DMA). Market reaction can be expected within the next few days after a spike in put volume, and, while a PVI BUY Signal often precedes a major rally, the signal should only be considered to have short-term implications. Even though 2.0 is the accepted signal threshhold, the chart will show when put volume is higher (or lower) than normal. In addition to extreme peaks in put volume being coincident with market bottoms, you will notice that extremely low put volume often coincides with market tops. For this reason we use the OEX PVI as one component of the Decision Point Short-Term Model, which also includes a volume-based oscillator (STVO) and a breadth based oscillator (STO). I consider the PVI to be unreliable when BUY Signals are generated on options expiration day. Much of the high put volume generated is the result of expiring puts being rolled into new positions, and not just volume generated by negative sentiment. Note:- the value scale on our PVI chart has been reversed so that it more logically displays when the market is overbought or oversold. / Дьжон Болындьжё (John Bollinger), который изобрёл этот прекрасный индикатор, использует данные . СИБО® (CBOE®).

PV = PRESENT VALUE

PVBP = PRICE VALUE OF A BASIS POINT

PVC = POLYVINYL CHLORIDE

PVI = PUT VOLUME INDICATOR

PVO = PERCENTAGE VOLUME OSCILLATOR

PVR = PLANT VARIETY RIGHT

PVR = PROFIT/VOLUME RATIO

PVSA = PASSENGER VESSEL SERVICES ACT

PVT = PRESSURE–VOLUME–TEMPERATURE

PVT = PRICE VOLUME TREND

PVX = POTATO VIRUS X

PW = PALAU

Pw = WORLD PRICE

PWD = PONDING WATER DEPTH

PY = PARAGUAY

PY = POTENTIAL YIELD

PYCNOMETER = ПИКНОМЕТР – Pycnometer:- (Greek:- Pyknos = Sealed) measuring device used to determine the density of liquids.

PYG = PARAGUAYAN GUARANI

PYRAMIDED GENES = ПИРАМИДНЫЕ (или ПИРАМИДАЛЬНЫЕ, или МНОГОУРОВНЕВЫЕ) ГЕНЫ – Pyramided Genes:- xxxxx. See also Stacked Genes.

PYRAMIDING = НАРАЩИВАНИЕ ОТКРЫТОЙ ПОЗИЦИИ ЗА СЧЁТ ПРИБЫЛИ – Pyramiding is a speculating strategy where, after establishing a futures position, an speculator increases the size of his initial open profitable position by adding more contracts in declining increments if prices of the underlying commodity continue increasing. For example, let's say a speculator opens a position by buying three futures contracts of a specific commodity. If the price of the underlying commodity is on the rise, the speculator could add two more contracts. If the favorable price upward trend persists, the speculator could add one more contract. The use of unrealized profits on existing positions as margin to increase the size of the position, normally in successively smaller increments. The view held by the 1934 US Congress and those that continue to believe that high margin requirements attenuate volatility is that low initial margins enable speculators to exert undue inuence in stock markets and thereby create excess volatility. It is alleged that speculators force stock prices above their fundamental values through a process known as Pyramiding. Pyramiding refers to the dynamic in which gains in stock prices allow over-optimistic agents to borrow additional funds for equity purchases. These leveraged purchases in turn create additional upward pressures on equity prices and the gains can be used to borrow additional funds for further equity purchases. When the inevitable market correction begins, leveraged investors faced with margin calls are forced to liquidate positions. The Depyramiding process allegedly causes overshooting of the fundamental equilibrium. As a result, low margin requirements create an additional source of volatility over the volatility attributable to fundamental economic forces. Despite the intuitive appeal of this pyramiding-depyramiding argument, it is at best incomplete. It only identifies one possible avenue through which margin requirements may affect volatility. Using profits on a previously established position as margin for adding to that position. Pyramiding is the using profits from an

existing position to expand the size of that position. / Использование прибыли по предыдущим сделкам в качестве маржи для дальнейшего наращивания оборота сделок.

PYRAMIDING GENES = ПИРАМИДНЫЕ ГЕНЫ – Pyramiding Genes:- combining into one genotype several major genes that control a trait.

PYRAMID SCHEME = ПИРАМИДНАЯ СХЕМА (или СХЕМА ПИРАМИДЫ) – Pyramid Scheme is an investment scam whereby pay-outs and redemptions are financed not from investment income but out of the funds invested by newly acquired customers. The scheme collapses if sufficient stream of new customers cannot be found.

PYRETHROIDS = ПИРЕТРОИДЫ – Pyrethroids is a class of insecticides characterized by very low mammalian toxicity and high insect control at low usage rates. / Первые Пиретроиды (перметрин и циперметрин) были получены в 1970-х. С тех пор объёмы применения этих инсектицидов росли с каждым годом. Долгое время изобретение пиретроидов оставалась революционным событием в сфере защиты растений. Наиболее очевидным изменением стало резкое (более чем в 100 раз) сокращение нормы расхода препаратов на основе пиретроидов по сравнению с существовавшими в то время инсектицидами (при сохранении того же уровня эффективности). В 1980-х применение пиретроидов росло быстрыми темпами и к 1986 препараты данного класса занимали уже 20% рынка инсектицидов. В стоимостном выражении продажи пиретроидов достигли 17% от объёма рынка. Этот уровень продаж сохранился до настоящего времени, несмотря на появление новых классов инсектицидов и распространение устойчивых к вредителям генномодифицированных сортов. С 2002 года, когда потребители стали предъявлять более высокие требования к качеству продуктов питания, объёмы продаж многих устаревших групп пестицидов резко снизились, а пиретроидов – снова выросли и достигли 1.4 миллиарда Долларов США. Площадь земель, обрабатываемых пиретроидами в период с 1996 по 2006, варьировалась от 175 до 245 миллинов гектаров. В настоящее время продажи пестицидов на основе пиретроидов достигли наиболее высоких за всю историю значений. Механизм действия и использование:- пиретроиды являются синтетическими производными природных пиретринов, получаемыми из ромашек рода Pyrethrum. Инсектицидные свойства пиретринов основаны на активности эфиров хризантемовой и пиретровой кислот. Эти кислоты обладают высокой гидрофобностью, быстро проникают через хитиновый покров многих насекомых и парализуют их нервную систему. Как природные пиретрины, так и синтетические пиретроиды используются для борьбы с насекомыми как в сельском хозяйстве, так и в быту (в том числе и против эктопаразитов человека). Часто пиретроиды комбинируются с действующими веществами, которые относятся к другим химическим классам. При этом наблюдается синергетический эффект, позволяющий снизить норму расхода компонентов при сохранении высокой эффективности и не допустить возникновения устойчивости насекомых-вредителей к инсектицидам. У сельхозпроизводителей наиболее популярным пиретроидом является лямбда-цигалотрин. Высокие продажи демонстрируют также перметрин, циперметрин, дельтаметрин, эсфенвалерат, фенпропатрин, бифентрин и цифлутрин. В настоящее время к классу синтетических пиретроидов относится 74 соединений.

PYRETHRUM = ПИРЕТРУМ – Pyrethrum is a natural insecticide produced by Chrysanthemums, especially Chrysanthemum Cinerariifolium and Chrysanthemum Coccineum. The dried, powdered flowers of Chrysanthemums have been used as natural insecticides against lice for over 2000 years. Synthetic analogues of Pyrethrin are produced as insecticides. Structure of Pyrethrin. / Под Пиретрумом понимается Род Многолетних Трав Семейства Сложноцветных. Около 100 Видов, в умеренном поясе Евразии и Северной Америки; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 55 Видов. Возделывают 2 Вида, содержащих пиретрины, которые используются как инсектициды; некоторые Виды декоративные. 2 Вида находились в Красной Книге СССР.

PYRICULARIA ORYZAE = ПИРИКУЛАРИЯ ОРИЗЭ – Pyricularia Oryzae is the Fungus that causes blast disease of Rice.

PYRIFORM = ГРУШЕОБРАЗНОЕ (или ГРУШЕВИДНОЕ) – Pyriform:- pear-shaped. / :- в форме груши.

PYROCLASTIC = ПИРОКЛАСТИЧЕСКОЕ – Pyroclastic:- pertaining to broken fragments of volcanic origin – ash and rock material. / Под Пирокластическими Породами понимаются обломочные горные породы, образовавшиеся в результате накопления обломочного материала, выброшенного при извержении вулканов (вулканические брекчии, туфы, игнимбриты).

PYROLYSIS = ПИРОЛИЗ (или СУХАЯ ПЕРЕГОНКА) – Pyrolysis is a chemical change brought about by the action of heat, usually in the absence of a reactive medium. Complex chemical molecules are reduced to simpler chemical units as a result of pyrolysis. Pyrolysis is a high-temperature process of deep thermal refining of petroleum products and/or gas to obtain inputs for petrochemical synthesis. The main product of pyrolysis is gas rich in unsaturated hydrocarbons (ethylene, propylene, butadiene). / Пиролиз это высокотемпературный процесс глубокой термической переработки нефтепродуктов и/или газа с целью получения сырья для нефтехимического синтеза. Основным продуктом пиролиза является газ, богатый непредельными углеводородами (этиленом, пропиленом, бутадиеном). Под Пиролизом, от Греческих слов Pýr, означающее Жар или Огонь, и Lýsis, означающее Разложение или Распад, понимается разложение органических веществ под действием высоких температур. Промышленное значение имеет пиролиз нефтепродуктов, древесины, каменного и бурого углей с целью получения главным образом непредельных и ароматических углеводородов. Пиролиз, превращение органических соединений в результате деструкции их под действием высокой температуры. Обычно термин используют в более узком смысле и определяют пиролиз как высокотемпературный процесс глубокого термического превращения нефтяного и газового сырья, заключающийся в деструкции молекул исходных веществ, их изомеризации и других изменениях (смотрите также Крекинг). Пиролиз – один из важнейших промышленных методов получения сырья для нефтехимического синтеза. Целевой продукт пиролиза – газ, богатый непредельными углеводородами:- этиленом, пропиленом, бутадиеном. На основе этих углеводородов получают полимеры для производства пластических масс, синтетических волокон, синтетических каучуков и других важнейших продуктов. Первые заводы пиролиза были построены в России (в Киеве и Казани) в 1870-х. Пиролизу подвергали преимущественно керосин с целью получения газа для освещения. Позднее была доказана возможность выделения из смолы, образующейся при пиролизе, ароматических углеводородов. Пиролиз получил широкое развитие во время Первой Мировой Войны (1914–18), когда возникла большая потребность в толуоле – сырье для производства тротила (тринитротолуола). Сырьё для пиролиза весьма разнообразно:- от газообразных углеводородов (этана, пропана) до тяжёлых дистиллятов и сырой нефти. Однако основная масса перерабатываемого пиролизного сырья представлена газообразными углеводородами и бензинами. Эти виды сырья дают наибольшие выходы целевых продуктов при наименьшем коксообразовании. Основное распространение получили в промышленности пиролизные установки трубчатого типа. Сырьё (например, бензин) проходит через паровой подогреватель, смешивается перед поступлением в печь с перегретым водяным паром и подвергается в печи дальнейшему нагреванию и пиролитическому разложению. Конечная температура реакции (на выходе из печи) составляет 750–850 °C. Высокие температуры, короткое время пребывания сырья в зоне реакции и разбавление сырья водяным паром способствуют преимущественному расщеплению с образованием значительного количества газа. Наряду с газом образуется и побочный жидкий продукт пиролиза – смола. Выход смолы для газового сырья в среднем 5%, для бензинов – около 20% (по

массе). Для прекращения реакций пиролиза парогазовая смесь, выходящая из печи, подвергается быстрому охлаждению в смесителе – так называемом Закалочном Аппарате (путём прямого контакта с водяным конденсатом, который при этом испаряется). Дальнейшее охлаждение проходит в котле-утилизаторе, где вырабатывается пар высокого давления. Частично охлаждённая парогазовая смесь после котла-утилизатора проходит масляную промывку для удаления частиц сажи и кокса и из неё выделяется тяжёлая часть смолы. Облегчённая парогазовая смесь подвергается дальнейшему охлаждению с последующим отделением водного и лёгкого углеводородного конденсата от собственно газов пиролиза, которые направляются на газофракционирующую установку для выделения этилена и пропилена. Смола пиролиза характеризуется высокой концентрацией ароматических углеводородов – бензола, толуола, нафталина и других, а также содержит непредельные углеводороды, в том числе циклопентадиен – сырьё для синтеза многих органических продуктов. Компоненты смолы используются для производства высокооктанового бензина, ароматических углеводородов, связующих веществ (кумароно-инденовых смол), электродного нефтяного кокса. Пиролиз нефти и других наиболее тяжёлых видов сырья сопровождается значительными отложениями кокса и нуждается в специальном аппаратурном оформлении. Разработаны модификации пиролиза с использованием циркулирующего теплоносителя. Это позволяет интенсифицировать процесс, сжигая образующийся кокс внутри системы (если применяется твёрдый теплоноситель – кварцевый песок, нефтяной кокс), либо значительно снизить коксоотложение (при газовом теплоносителе, например, водяном паре). С целью улучшения технико-экономических показателей пиролиза разрабатывается технология каталитических процессов. Осуществление пиролиза газообразного сырья при температурах около 1 200 °C способствует более глубокому превращению сырья:- основным продуктом пиролиза является в этом случае ацетилен (сырьё для производства хлоропренового каучука, ацетальдегида и другого).

PYROLYSIS OIL = ПИРОЛИЗНОЕ МАСЛО – Pyrolysis Oil is a bio-oil produced by fast pyrolysis of biomass. A dark brown, mobile liquid containing much of the energy content of the original biomass, with a heating value about half that of conventional fuel oil. Can be burned directly, either alone or co-fired with other fuels, gasified or otherwise upgraded. Conversion of raw biomass to pyrolysis oil represents a considerable increase in energy density and it can thus represent a more efficient form in which to transport it.

PYROMETALLURGY = ПИРОМЕТАЛЛУРГИЯ – Pyrometallurgy:- two of the most common pyrometallurgical processes, in both extraction and refining, are oxidation and reduction. In oxidation, metals having a great affinity for oxygen selectively combine with it to form metallic oxides; these can be treated further in order to obtain a pure metal or can be separated and discarded as a waste product. Reduction can be viewed as the reverse of oxidation. In this process, a metallic oxide compound is fed into a furnace along with a reducing agent such as carbon. The metal releases its combined oxygen, which recombines with the carbon to form a new carbonaceous oxide and leaves the metal in an uncombined form. Oxidation and reduction reactions are either exothermic (energy-releasing) or endothermic (energy-absorbing). One example of an exothermic reaction is the oxidation of iron sulfide (FeS) to form iron oxide (FeO) and sulfur dioxide (SO_2) gas:- $2FeS + 3O_2 \rightarrow 2FeO + 2SO_2$. This process gives off large quantities of heat beyond that required to initiate the reaction. One endothermic reaction is the smelting reduction of zinc oxide (ZnO) by carbon monoxide (CO) to yield zinc (Zn) metal and carbon dioxide (CO_2):- $ZnO + CO \rightarrow Zn + CO_2$. For this reaction to proceed at a reasonable rate, external heat must be supplied to maintain the temperature at 1 300 °C to 1 350 °C (2 375 °F to 2 450 °F). / Плавка или Выплавка или Плавление (Smelting). Под Пирометаллургией, от Греческих слов Рýr, означающее Жар или Огонь, и Metallurgéo, означающее Добываю Руду или Обрабатываю Металлы, от Métallon, означающее Металл или Рудник, и Érgon, означающее Работа, понимается совокупность металлургических процессов, протекающих при высоких температурах. Пирометаллургия – основная и старейшая область металлургии. С древних времён до конца XIX века производство металлов базировалось почти исключительно на пирометаллургических процессах. На рубеже XIX и XX веков промышленное значение приобрела другая крупная ветвь металлургии – гидрометаллургия, однако пирометаллургия продолжает сохранять главенствующее положение как по масштабам производства, так и по многообразию процессов. В начале XX века наряду с пламенными способами нагрева в металлургии начали применяться различные виды электрического нагрева (дуговой, индукционный и другие); примерно в это же время в промышленность был внедрён электролиз расплавленных химических соединений (производство алюминия и других цветных металлов). Во 2-й половине XX века получили распространение плазменная плавка металлов (смотрите Плазменная Металлургия), зонная плавка и электроннолучевая плавка. Металлургические процессы, основанные на использовании электрического тока, можно выделить в самостоятельную область пирометаллургии – Электрометаллургию. В современной металлургии пирометаллургия занимает ведущее место в производстве чугуна и стали, свинца, меди, никеля и других важнейших металлов. По технологическим признакам выделяют следующие виды пирометаллургических процессов:- обжиг, плавка, конвертирование, рафинирование, дистилляция. Обжиг характеризуется тем, что материал сохраняет твёрдое состояние при изменении состава и некотором укрупнении частиц; проводится в печах кипящего слоя (эффективный процесс, широко применяемый в цветной металлургии), многоподовых печах (например, производство меди, ферромолибдена), трубчатых печах (магнетизирующий обжиг железных концентратов), на агломерационных машинах (смотрите Агломерация), в муфельных печах (металлургия редких металлов). Плавка характеризуется полным расплавлением шихты и разделением расплава обычно на 2 слоя (металл и шлак или металл и штейн); проводится в шахтных печах (например, доменное производство, производство свинца, никеля, меди), отражательных печах (Мартеновское производство, отражательная плавка медных концентратов), электропечах (производство стали, ферросплавов, меди, никеля), циклонных камерах (переработка медно-цинкового сырья) и других агрегатах. В особую группу плавок выделяют так называемые Металлотермические Процессы (смотрите Металлотермия), основанные на реакциях восстановления металлов из их соединений химически более активными металлами (реакции протекают с выделением значительного количества тепла). Конвертирование, которое можно рассматривать как разновидность плавки, заключается в продувке воздухом или кислородом расплавленных материалов (чугун, штейн) с присадкой флюсов и небольшого количества сырья (лом, богатые концентраты); конвертирование основано на использовании тепла экзотермических реакций и осуществляется в конвертерах (конвертерное производство, производство меди, никеля). Рафинирование – обработка расплавленных черновых металлов с помощью присадок (солей, щёлочей, металлов), наведением специальных шлаков, окислением примесей, вакуумированием расплава и так далее (иногда рафинирование проводят в процессе кристаллизации жидкого металла); агрегатами для рафинирования могут служить отражательные печи (производство меди, цинка, золота), котлы (производство свинца, олова). Дистилляция заключается в переводе восстанавливаемого металла в парообразное состояние с последующей конденсацией; осуществляется в ретортных печах (производство цинка), шахтных печах (производство свинца, цинка, олова), печах с кипящим слоем (производство титана).

PYT = PRELIMINARY YIELD TRIAL

- Q -

Q = КЬЮ. – (1) Q is fifth letter of a NASDAQ® stock symbol specifying that it is in bankruptcy proceedings. / Кью. (Q) – пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что производятся разбирательства по делу о банкротстве.

(2) Q:- fluid flow rate in gallons per minute (gal/min or GPM). / Кью. (Q):- норма потока, или ставка потока, жидкости выраженная в галлонах в минуту (гал./мин) (gallons per minute (gal/min или GPM)).

QIPAO = КИПАО (или ЩИПАО) – Qipao or Cheongsam are one-piece Chinese dresses that have been worn since the Manchu ruled China in the XVII century. What Does a Qipao Look Like? The original qipao was wide and baggy. The one-piece dress featured a high neck and straight skirt. It covered all of a woman's body except for her head, hands, and toes. The qipao was traditionally made of silk and featured intricate embroidery. The qipao worn today are modeled after ones made in Shanghai in the 1920s. The modern qipao is a one-piece, formfitting, floor length dress that has a high slit on one or both sides. Modern variations may have bell sleeves or be sleeveless and are made out of a variety of fabrics. When Is a Qipao Worn? In the XVII century, the qipao was worn nearly every day. Nowadays, the qipao is worn during formal occasions like weddings, parties, and beauty pageants. The qipao is also used as a uniform at restaurants, hotels, and on airplanes in Asia. Who Came Up with the Design of the Qipao? During Manchu rule, Nurhachi (Nǔ'ěrhāchì), a chieftan, established the Banner System, a structure for organizing all Manchu families into administrative divisions. The traditional dress that Manchu women wore became known as the Qipao (banner gown). After 1636, all Han Chinese men in the banner system had to wear the male version of the Qipao, Chángpáo. In the 1920s in Shanghai, the dress was modernized and became popular among celebrities and the upper class. The dress became less popular when Communist rule began in 1949. The Shanghainese took the dress to Hong Kong where it remained popular in the 1950s with working women who often paired it with a jacket. An off-the-rack qipao can cost about USD100 while tailor made ones can cost hundreds or thousands of Dollars. Where Can I Buy a Qipao? Elements of traditional Chinese dress often seen in the qipao, like high colors and embroidery, are now incorporated into everyday wear by design houses like Shanghai Tang. Simpler, inexpensive designs can also be bought online. / Кипао (Qipao) или Чионгсэм (Cheongsam). Чанпао (Chángpáo).

QIVIUT = КИВИЭТ (или КВАЙВЬЮТ) – Qiviuq (sg) or Qiviut (pl) (/'kɪviət/KIV-ee-ət; Inuktitut Syllabics; Inuinnaqtun, qiviuq; Inupiaq qiviu or qiviuq sometimes spelled qiveut) is an Inuit word commonly used to indicate the wool of the muskox. The word was originally used to refer to the down feathers of birds as well as the inner wool of the muskox. It is valued for its use as a fiber as, unlike sheep's wool, it does not shrink in water at any temperature. However, this means that it also is not useful for felting. It is most commonly used for hats and scarves, and is among the softest wools. It is very expensive; a high quality knitted scarf can cost more than 300 US Dollars, but will last over 20 years with good care. The muskox has a two-layered coat, and qiviut refers specifically to the soft underwool beneath the longer outer wool. The muskox sheds this layer of wool each spring. Qiviut is plucked from the coat of the muskox during the molt or gathered from objects the animals have brushed against; unlike sheep, the animals are not sheared. Much of the commercially available qiviut comes from Canada, and is obtained from the pelts of muskoxen after hunts. In Alaska, qiviut is obtained from farmed animals or gathered from the wild during the molt. Qiviut is stronger and eight times warmer than sheep's wool, and softer than cashmere wool. Wild muskoxen have qiviut fibers approximately 18 micrometers in diameter. Females and young animals have slightly finer wool. Domestication of the musk ox was begun with the Musk Ox Project, headed by John J. Teal, Jr with the first domestic musk ox farm in Fairbanks. The project continues at the Musk Ox farm in Palmer, Alaska. Oomingmak, the Musk Ox Producers' Cooperative, was formed in the late 1960s by Native women on Nunivak Island, with the help of Dr Teal and Mrs L. Schell. It is a knitting cooperative that works with qiviut and is still in operation today. The cooperative has its headquarters in Anchorage and is owned by approximately 200 native Alaskans from many remote villages in Alaska. The name of the cooperative comes from an Inupiaq word, umiŋmak, 'the animal with skin like a beard'. An adult muskox can produce four to seven pounds of qiviut a year. Qiviut is produced by the muskox's secondary hair follicles, which are not associated with sebaceous glands, and therefore is a much drier fiber than wool, having only about 7 percent oils. The hair follicle density is very high (approximately 42 per square millimeter) and qiviut is shed in a tightly synchronized spring molting period. The qiviut will loosen from the animal's skin and pull away slightly, creating a 'spectacled' look around the eyes and becoming visible all over the body at the surface of the pelt. At this stage of the molt, the undercoat is a short but relatively uniform distance from the skin. This lends itself to combing the qiviut from the animal in a single large sheet. If not combed, the qiviut will begin to fall out in clumps or be rubbed off by the animal, and may be plucked off the ground or bushes, but qiviut collected this way is of lower quality and requires more cleaning. At the Robert G. White Large Animal Research Station (LARS), a modified bison crush is used to gently but firmly hold the muskoxen in place, and the pelt combed out using a long-toothed comb or hair pick. After the fleece is removed, it is cleaned by hand, removing vegetation and other foreign matter, and then dehaired. Dehairing is the removal of intermediate hairs (greater than 30 micrometers in diameter). Dehairing is accomplished by carding as one would cashmere. Mechanical carding can cause breakage and weaken and roughen the qiviut. (Because the pelt is combed rather than shaved, there are very few guard hairs using this method. Pelts from hunted animals are shaved, so the dehairing process in this case is more laborious.) After dehairing, the qiviut may be cleaned again, if necessary. The raw, cleaned qiviut is then spun into yarn and the yarn washed gently in warm water. The yarn may then be overdyed, but bleaching and dyeing can weaken the fiber and reduce its softness. Qiviut:- down undercoat fiber from the Musk Ox. The non-profit Musk Ox Farm is dedicated to the domestication of the musk ox, an Ice Age mammal that once roamed the earth alongside saber tooth tigers and woolly mammoths. Known to native Alaskans as 'Oomingmak', which means 'The Bearded One', this once-endangered animal produces an annual

harvest of qiviut, the finest wool in the world. We welcome visitors to the farm for a close up experience of these magnificent Paleolithic ruminants with guided tours, engaging exhibits, a gift shop featuring hand-knit qiviut items, and community events throughout the year. Our historic 1930s-era Colony farm is located just 45 miles north of Anchorage in the spectacular Matanuska Valley, the heart of Alaskan agriculture. The Musk Ox, Ovibos moschatus, is an ancient species of arctic mammal currently found in remote areas of the far North, including Greenland, Alaska, Canada and Siberia. During the Pleistocene, musk oxen wandered across the Bering Land Bridge to populate North America with the likes of the woolly mammoth, saber-toothed cat, and giant ground sloth. Fossil records indicate musk oxen ranged across Europe, Asia and North America during the last Ice Age, roaming as far south as France and Ohio. They lived both in Arctic regions that were not glaciated as well as more southerly regions beyond the ice sheets. At the end of the Ice Age, they died off in more southerly regions but persisted in the north. The largest wild populations of musk oxen can be found in Canada, especially on Banks and Victoria Islands, Northwest Territory. Musk ox were extinct within Alaska by the late 1800's and were reintroduced from wild herds in eastern Greenland in the 1930's by the US Fish and Wildlife Service. Although it is sometimes claimed that their die-off was caused by hunting, research suggests it was more likely due to fluctuations in the climate at the southern extreme of their range. Native Alaskans did hunt the musk oxen prior to their disappearance, but the number of people was small enough that their hunting alone could not have been enough to extirpate musk oxen, and their numbers declined during that period throughout their range even in areas where there was no hunting. Once in danger of disappearing completely, musk ox populations have made a dramatic comeback with a current worldwide population of about 150 000 animals. Despite their common name, musk ox have no musk glands and are not oxen. Although they may resemble small bison, musk ox are more closely related to goats and sheep. This arctic ungulate, like domestic cattle, has a four-chambered stomach and eats a wide variety of foods such as lichens, grasses, and leaves. It was long believed that their closest relative was the golden-fleeced takin which lives in China, India, Bhutan and possibly Myanmar. Recent genetic research indicates that this is not actually the case, and that their closest relative could be either the Asian goral or North American mountain goat. It has long been believed that there are two subspecies of musk ox:- Ovibos moschatus moschatus (Barren Ground musk ox) and O. moschatus wardi (Greenland or 'white face' musk ox). Recent studies have shown that there is little to no genetic difference between the two, and they are more likely geographic variants. An adult Barren Ground bull stands about six feet tall at the shoulder and weighs up to 1 000 lbs. The smaller Greenland musk ox bull stands four and a half to five feet tall at the shoulder and weighs up to 800 lbs. The herd at the Musk Ox Farm is descended from wild animals originating both in Canada and Greenland. Qiviut:- fiber comes from the hair of the musk ox. It resembles pale gray cashmere but does not shrink. It is very hard to find. / Дьжон Дьжей. Тил (John J. Teal). Эл. Шэл (L. Schell). Робэт Дьжи. Вайт (Robert G. White). Овцебык/Як. Комки или Глыбы (Clumps).

QMED = QUALIFIED MEMBER OF THE ENGINE DEPARTMENT

QOMS = QUALITY OF MARKETS COMMITTEE

QQQ = КЬЮ.КЬЮ.КЬЮ. – QQQ is the ticker symbol for the Nasdaq 100 Index which is a tradable index (you can buy and sell it just like shares in a company) – much like a mutual fund except that it comprises the companies in the Nasdaq 100 (it is possible to get the list and the weightings by going to the Nasdaq website). PowerShares QQQ, formerly known as 'QQQ' or the 'NASDAQ-100 Index Tracking Stock', is based on the Nasdaq-100 Index. The Index includes 100 of the largest domestic and international nonfinancial companies listed on the Nasdaq Stock Market based on market capitalization. The portfolio is rebalanced quarterly and reconstituted annually. / НЭЗДЭК® (NASDAQ®) .

QQS REINSURANCE = QUALIFYING QUOTA SHARE REINSURANCE

Q–RANK = РАНЖИР КЬЮ. – The Q-Rank is a combination of nine fundamental and technical models, melded together for ranking stocks. The combined score ranges from 99 (highest) to 1 (lowest); that is, a stock with a Q-Rank of 99 has combined qualities better than 99% of the stocks measured. The Q-Rank system, devised by Paul Rabbit, combines a Technical Sub-Rank (TSR) and an Earnings Sub-Rank (ESR) which offer further insight into the qualities influencing the total Q-Rank. Q-Rank can improve timing by delaying purchases or sales that may be just a little too early. Q-Rank stocks ranked above 90 tend to significantly outperform the market; those under 10 tend to significantly under-perform. Investors considering buying a stock with a Q-Rank under 50 should consider delaying purchase unless the stock offers an extremely solid value, new product and/or turnaround story. Investors considering selling a stock with a Q-Rank over 90 should consider holding the stock until its rank declines. The Q-Rank is meant to assist pure fundamental research, not replace it. Regardless of style, the overlay of a Q-Rank rank should improve performance. For example, a value investor can use the Q-Rank to stay in value stocks that have performed so well they may no longer represent good value but may just be hitting a strong momentum phase. / Пол Рэбит (Paul Rabbit).

QR = QUANTITATIVE RESTRICTION

QR CODE = QUICK RESPONSE CODE

QSTK = QSTICK

QT = QUESTIONED TRADE

Q–TIP TRUST = QUALIFIED TERMINABLE INTEREST PROPERTY TRUST

QTL = QUANTITATIVE TRAIT LOCUS

QUAD = КВАД (или КВАДРИЛЛИОН) – Quad:- an energy quantity of one quadrillion (10^{15} or 1 000 000 000 000 000) British thermal units (BTUs) or 1 055 petaJoules, which is approximately the energy equivalent contained in one trillion cubic feet of natural gas. An amount of energy equal to 170 million barrels of oil. Total US consumption of all forms of energy is (in the 1990s) about 83 quads in an average year. A Quad is a unit of energy equal to 10^{15} (a short-scale quadrillion) BTU, or $1.055\ 06 \cdot 10^{18}$ Joules (1.055 06 ExaJoules or EJ) in SI units. The unit is used by the US Department of Energy in discussing world and national energy budgets. The global primary energy production in 2004 was 446 quad, equivalent to 471 EJ. Some common types of an energy carrier approximately equal 1 quad are:- (i) 8 007 000 000 gallons (US) of gasoline; (ii) 293 083 000 000 kiloWatt-hours (kWh); (iii) 36 000 000 tons of coal; (iv) 970 434 000 000 cubic feet of natural gas; (v) 5 996 000 000 UK gallons of diesel oil; (vi) 25 200 000 tons of oil; (vii) 252 000 000 tons of TNT or five times the energy of the Tsar Bomba nuclear test. / Квадриллион, от Французского слова Quadrillion, число, изображаемое в десятичной записи единицей с 15 нулями, то есть число 10^{15}. В некоторых странах квадриллионом называют число 10^{24}.

QUADRANGULARIS = ЧЕТЫРЁХУГОЛЬНОЕ – Quadrangularis:- with four angles. / , от Латинского слова Quadrans, означающее Четвёртая Часть, .

QUADRANGULISPINUS = С ЧЕТЫРЁХУГОЛЬНЫМИ ШИПАМИ – Quadrangulispinus:- with four angled spines. / , от Латинского слова Quadrans, означающее Четвёртая Часть, .

QUADRICOSTATUS = ЧЕТЫРЁХРЕБРИСТОЕ (или С ЧЕТЫРЬМЯ (КРЕПКИМИ) РЁБРАМИ) – Quadricostatus:- with four ribs. / , от Латинского слова Quadrans, означающее Четвёртая Часть, .

QUADRILATERAL MEETINGS = ЧЕТЫРЁХСТОРОННИЕ ВСТРЕЧИ – Quadrilateral Meetings are meetings involving trade ministers from the United States, the European Community, Canada and Japan to discuss trade policy matters. / К ним относятся встречи вовлечённых министров торговли из Соединённых Штатов, Европейского Сообщества, Канады и Японии с целью обсуждения вопросов торговой политики.

QUADRIPOLYMER = КВАДРИПОЛИМЕР – Quadripolymer is a polymer made from four distinct monomers. / Квадриполимер – полимер, сделанный из четырёх отличных мономеров.

QUADRISPINUS = С ЧЕТЫРЬМЯ ШИПАМИ – Quadrispinus:- with four spines. / , от Латинского слова Quadrans, означающее Четвёртая Часть, .

QUAD TIER = ЧЕТВЁРТЫЙ ЯРУС (или КВАДРАТИЧНЫЙ ЯРУС, или ЧЁТВЁРТЫЙ УРОВЕНЬ, или ЧЁТВЁРТЫЙ ШТАБЕЛЬ) – Quad Tier is a stowage condition whereby a fourth tier of containers is loaded above deck. The container tiers are numbered with even numbers, starting from the bottom. The conventional way is start with 02 in the hold and then count up with 04, 06 etc. In the case of deck cargoes, it is conventional to start numbering with 80 or 82. There are sometimes slight differences between ships. On this ship, the containers standing directly on the main deck are numbered 80 and those standing on the hatches are number 82. The number is incremented by two for each higher layer.

QUALIFICATION = КВАЛИФИКАЦИЯ – In the United States, a Qualification is the filing of required documents by a foreign corporation to secure a certificate of authority to conduct its business in a state other than the one in which it was incorporated. Limited liability companies or similar business entities may also conduct this process.

QUALIFIED CERTIFICATE = КВАЛИФИКАЦИОННОЕ СВИДЕТЕЛЬСТВО (или КВАЛИФИКАЦИОННЫЙ СЕРТИФИКАТ) – Qualified Certificate is a certificate that meets specific requirements laid down by Annex I of the EU directive on electronic signatures and is provided by a certification-service-provider who fulfils requirements laid down by Annex II of the same directive.

QUALIFIED INSTITUTIONAL BUYER = КВАЛИФИЦИРОВАННЫЙ ИНСТИТУЦИОНАЛЬНЫЙ ПОКУПАТЕЛЬ – In the United States, a Qualified Institutional Buyer (QIB) is an investor eligible to participate in the Rule 144A market, primarily institutions that manage at least USD100 million in securities including banks, savings and loans, insurance companies, investment companies, public employee benefit plans, employee benefit plans under ERISA (ERISA is an acronym for the 'Employee Retirement Income Security Act', the federal law that regulates and enforces employee benefit and retirement plans), or an entity owned entirely by qualified investors. Also included in this area are registered broker-dealers owning and investing, on a discretionary basis, USD10 million in securities of non-affiliates. / ЭРИСА (ERISA).

QUALIFIED MEMBER OF THE ENGINE DEPARTMENT = КВАЛИФИЦИРОВАННЫЙ ЧЛЕН МОТОРНОГО ОТСЕКА (или МАШИННОГО ОТДЕЛЕНИЯ) – Qualified Member Of The Engine Department (QMED):- unlicensed members of the engine department who attend to a fully automated engine room.

QUALIFIED MINORITY HOLDING = КВАЛИФИЦИРОВАННЫЙ МИНОРИТАРНЫЙ КОНТРОЛЬНЫЙ ПАКЕТ (или КВАЛИФИЦИРОВАННОЕ МИНОРИТАРНОЕ УДЕРЖИВАНИЕ) – Qualified Minority Holding:- stake held by a company in another company that exceeds a certain amount (in general 10% or 25%) of the company's equity. Under certain circumstances, minority interests can lead to domestic or international tax privileges.

QUALIFIED PLAN = КВАЛИФИЦИРОВАННЫЙ ПЛАН – In the United States, Qualified Plan is a tax-deferred retirement plan for the self-employed.

QUALIFIED VENDOR = КВАЛИФИЦИРОВАННЫЙ РАЗРАБОТЧИК – Qualified Vendor is a vendor of electronic confirmation and affirmation services that meets the standards prescribed by NYSE® Rule 387. / , от Латинского слова Affirmo, означающее Утверждаю, . который удовлетворяет стандартам, прописанным в Правиле № 387 НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

QUALIFYING FACILITY = УДОВЛЕТВОРЯЮЩАЯ ТРЕБОВАНИЯМ УСТАНОВКА (или КВАЛИФИЦИРОВАННАЯ УСТАНОВКА) – (1) Qualifying Facility (QF) is a cogenerator or small power producer which under federal law, has the right to sell its excess power output to the public utility. / Согенератор или мелкий производитель электроэнергии по федеральному законодательству имеющий право продавать излишки произведённой энергии государственным электростанциям.

(2) Qualifying Facility (QF) is a generator or small power producer that meets certain ownership, operating, and efficiency criteria established by the US Federal Energy Regulatory Commission (FERC), and has filed with FERC for Qualifying Facility (QF) status or has self-certified. QFs are physical generating facilities. Under the Public Utilities Regulatory Policies Act of 1978 (PURPA), QFs were allowed to sell their electric output to the local utility at avoided cost rates. To become a QF, the independent power supplier had to produce electricity with a specified fuel type (cogeneration or renewables), and meet certain ownership, size, and efficiency criteria established by the Federal Energy Regulatory Commission. Qualifying Facility (QF) is a cogeneration or small power production facility that meets certain ownership, operating, and efficiency criteria established by the Federal Energy Regulatory Commission (FERC) pursuant to the Public Utility Regulatory Policies Act (PURPA). / Генератор или мелкий производитель электроэнергии, отвечающий определённым критериям владения, эксплуатации и эффективности, установленным Федеральной Комиссией США по Энергонадзору (ФКЭ), и получивший от ФКЭ статус Квалифицированного Производителя (КП) или сертифицированный самостоятельно. КП являются действующие генерирующие производители. В соответствии с Актом о Регулировании Деятельности Государственных Электростанций от 1978, КП было разрешено продавать выработанное ими электричество местным электростанциям по особым ставкам. Для того, чтобы стать КП независимый поставщик электроэнергии должен производить электроэнергию с применением определённого вида топлива (согенерация или возобновляемые источники), и отвечать определённым критериям владения, размера и эффективности производства, установленным Федеральной Комиссией по Энергонадзору.

(3) Qualifying Facility (QF):- QFs are non-utility power producers that often generate electricity using renewable and alternative resources, such as hydro, wind, solar, geothermal or biomass (solid waste). QFs must meet certain operating, efficiency, and fuel-use standards set forth by the Federal Energy Regulatory Commission (FERC). If they meet these FERC standards, utilities must buy power from them. QFs usually have long-term contracts with utilities for the purchase of this power, which is among the utility's highest-priced resources. / КП являются производители электроэнергии, не относящиеся к электростанциям, и производящие электричество с использованием возобновляемых или альтернативных источников, таких как вода, ветер, солнечная или геотермальная энергия или биомасса (твёрдые отходы). КП должны удовлетворять определённым стандартам в отношении производства, эффективности и использования определённых видов топлива, утверждённых Федеральной Комиссией по

Энергонадзору. Если они удовлетворяют этим требованиям ФКЭ, то электростанции должны покупать у них электроэнергию. КП обычно имеют долгосрочные контракты с электростанциями по закупке этой энергии, производство которой для электростанций является наиболее затратным.

QUALIFYING INVESTOR FUND = ФОНД УДОВЛЕТВОРЯЮЩИХ ТРЕБОВАНИЯМ ВКЛАДЧИКОВ КАПИТАЛА (или ФОНД КВАЛИФИЦИРОВАННЫХ ИНВЕСТОРОВ) – A Qualifying Investor Fund (QIF) must impose a minimum subscription of EUR250 000.00 and must meet qualifying criteria in relation to net worth. Regulatory limits in relation to investment diversification and borrowings are not applied.

QUALIFYING QUOTA SHARE REINSURANCE = ПЕРЕСТРАХОВАНИЕ НА ОСНОВЕ УДОВЛЕТВОРЯЮЩЕГО ТРЕБОВАНИЯМ (или КВАЛИФИКАЦИОННОГО) ВЫДЕЛЕНИЯ КВОТ – Qualifying Quota Share Reinsurance:- a quota share treaty that may be purchased by a managing agent with the permission of Lloyd's so as to increase the underwriting capacity of its managed syndicate, subject to a specified limit and subject to the treaty complying with certain terms and conditions. / порядки и условия. Лойдз (Lloyd's).

QUALITATIVE CHARACTER = КАЧЕСТВЕННОЕ СВОЙСТВО – Qualitative Character is a character in which variation is discontinuous. A discrete, heritable character that is transmitted with well-defined limits and in a simple alternate manner.

QUALITATIVE INSPECTION = КАЧЕСТВЕННАЯ ИНСПЕКЦИЯ – Qualitative Inspections encompass inspections with regard to the quality of the commodity, the handling and the means of transport and implies observation during handling of a commodity or a commodity in stock. Handling is the loading or unloading of a commodity in a port, terminal, mine or works. Means of transport include all possible means, like conveyor-belt, storage area, warehouse. These inspections exclude weighing, sampling and testing. / обсервация (наблюдение). Качество – совокупность свойств и признаков продукции или услуги, которые влияют на их способность удовлетворять установленные или предполагаемые потребности.

QUALITATIVE MEASUREMENT = КАЧЕСТВЕННОЕ ИЗМЕРЕНИЕ – Qualitative Measurement is the valuation of qualities or characteristics in other than monetary or numeric terms.

QUALITY = КАЧЕСТВО – Quality is a distinguishing character, the degree of excellence which is possessed. Quality:- refers to the degree of fineness. Quality is a degree of excellence. A distinguishing property or characteristic. See also Cotton Quality, Seconds, and Yarn Quality. Quality:- consistent performance of a uniform product meeting the customer's needs for economy and function. / свойство (character). В переработке шерсти Качество относится к степени тонины. Качество – совокупность свойств и признаков продукции или услуги, которые влияют на их способность удовлетворять установленные или предполагаемые потребности.

QUALITY ASSURANCE = ЗАВЕРКА КАЧЕСТВА – Quality Assurance:- activities involving a review of quality of services and the taking of any corrective actions to remove any deficiencies. / Виды деятельности, заключающиеся в обзоре качества услуг и принятии любых корректив ных действий с целью устранения любых недостатков.

QUALITY ASSURANCE, QUALITY CONTROL = ЗАВЕРКА КАЧЕСТВА, КОНТРОЛЬ КАЧЕСТВА – Quality Assurance, Quality Control:- the inspection of product as it comes in or goes out of the warehouse in order to ensure quality.

QUALITY ASSURANCE SYSTEM = СИСТЕМА ЗАВЕРКИ КАЧЕСТВА – Quality Assurance System is a planned and regularly monitored framework of controls, based on documented procedures, which is applied to critical operational activities in the production of potatoes or the performance of a service (e.g., diagnostics) or activity (e.g., the conduct of a test) to ensure operational efficiency and reliable compliance with specified quality standards.

QUALITY CONTROL = КОНТРОЛЬ КАЧЕСТВА – Quality Control:- the systematic planning, measuring and control of a combination of people, materials, metrology and machines, with the objective of producing a product that satisfies the quality and profitability of the enterprise. / Под Контролем Качества понимается контроль параметров и свойств изделий и их составных частей. Контроль качества на предприятиях складывается из входного контроля качества поступающих материалов и полуфабрикатов, контроля технологических процессов, контроля качества изготовляемых предприятием составных частей и приёмочного контроля продукции в целом. Контроль качества осуществляется отделами технического контроля (ОТК), проставляющими специальные знаки на продукции, соответствующей требованиям технической документации. Контроль Качества:- методы и виды деятельности оперативного характера, которые используют для выполнения требований к качеству.

QUALITY MANAGEMENT = УПРАВЛЕНИЕ КАЧЕСТВОМ – Quality Management is all activities of the overall management function that determine the quality policy, objectives, and responsibilities and implement them by means such as quality planning, quality control, quality assurance and quality improvement within the quality system. / , заверка качества и .

QUALITY OF MARKETS COMMITTEE = КОМИТЕТ ПО КАЧЕСТВУ РЫНКОВ – Quality Of Markets Committee:- oversees and advises on the quality and competitiveness of the New York Stock Exchange market, as well as on issues related to market structure. The Quality Of Markets Committee, a standing board committee, is assisted by two operating committees and an ad hoc advisory committee. / для данного случая (ad hoc).

QUALITY PREMIUM = ПРЕМИЯ ЗА КАЧЕСТВО (или НАДБАВКА ЗА КАЧЕСТВО) – Quality Premium is the additional payment an exchange specifies for delivery of a commodity of higher than required quality against a futures contract.

QUALITY SYSTEM = СИСТЕМА КАЧЕСТВА – Quality System is the organizational structure, procedures, processes and resources needed to implement quality management.

QUANTITATIVE = КОЛИЧЕСТВЕННОЕ – Quantitative:- the amount of a substance; measurable by assigning numerical value to indicate how many or how much.

QUANTITATIVE CHARACTER = КОЛИЧЕСТВЕННОЕ СВОЙСТВО – Quantitative Character is a heritable character that has continuous variation and is readily affected by the environment. Thus, classification into discrete categories is not possible.

QUANTITATIVE EASING = КОЛИЧЕСТВЕННОЕ СМЯГЧЕНИЕ – Quantitative Easing (QE) is often referred to as 'money printing' or a way for the government to increase the money supply. According to Wikipedia, quantitative easing is different from the typical method whereby governments buy treasury debt to increase the money supply. In QE1 when the market was panicked, and banks didn't want to buy government bonds, the central bank implemented 'quantitative easing' by purchasing relatively worthless financial assets (like mortgage backed securities) from banks and giving them new electronically created money. So this is straight forward money printing compared to the more round about traditional method. Thus Quantitative Easing increases the excess reserves of the banks creating liquidity for the markets. Effects of Quantitative Easing:- Legendary American economist, Milton Friedman once said:- 'Inflation is always and everywhere a monetary phenomenon'. In other words, inflation is always caused by printing too much money. But the

results are seen in prices of commodities like food, clothing and energy after the printed money works its way through the economy. Generally, after a round of 'Quantitative Easing' (also known as Money Printing) it usually takes one to two years for it to show up in popular pricing. The time lag gets smaller as people catch on to the cause and begin to anticipate more inflation. The time lag is also why many people fail to see the correlation between money printing and inflation. Since the majority of our money these days is not physical paper but simply numbers on a balance sheet, instead of physically cranking up the printing presses these days, the way the FED increases the money supply is by buying debt on the open market and replacing it with bank deposits. In other words, it takes liabilities and magically turns them into assets. Theoretically someone owed the banks this money but the banks may have had to wait 30 years to get it (if they got paid at all). But the FED bought it and so the banks are now liquid (but the FED is holding all the worthless debt). The First Round of Quantitative Easing (QE1):- In the case of QE1, the US Federal Reserve held USD700–800 billion of Treasury Notes (government debt) before the recession began. In November 2008, the Fed began buying USD600 billion Mortgage-Backed Securities (MBS). This is private debt backed by sometimes worthless mortgages. By March 2009, it held USD1.75 trillion of bank debt, MBS, and Treasury Notes, with it reaching USD2.1 trillion in June 2010. So based on the 1 to 2 year time frame you would expect inflation from QE1 to begin between March 2010 and March 2011 and if no more easing occurred, we'd expect the inflationary pressure to end somewhere between June 2011 and June 2012. QE1 Inflation Begins:- As predicted, inflation began well within that target range. Inflation began in earnest in January of 2011 with a monthly rate of 0.48% (roughly 21 months after QE1 began). It probably started a bit slowly because of the massive deflation that was affecting the world-wide economy. And by mid-2011 the effects of QE1 began to peter out with October, November and December having monthly deflation. Theoretically, since the QE1 money creation spree lasted 19 months it is quite possible that the inflationary effects will last approximately 19 months. However, the evidence from the end of 2011 seems to be that its effects are primarily spent. But QE1 was not a steady increase it had its ups and downs so we can expect the inflation rate to fluctuate as well. Although it appears that inflation from QE1 has subsided, as we saw in January 2012, we may still see some effects between now and July of 2012 with some up and down fluctuations. On the other hand January through March could be simply an Oil shock based on the 'saber-rattling' between Iran and the US. The Second Round of Quantitative Easing (QE2):- QE2 began in November of 2010 and ended in June of 2011. So we have an additional 8 months or so of monetary increases from that. So if it follows the pattern of QE1 we can expect the effects of QE2 to begin roughly 21 months from November 2010 or around July 2012. But because we aren't in the throes of a massive deflationary panic (unlike when QE1 started) it may have begun earlier, pick up quicker and have a greater impact. So far January and February 2012 each had 0.44% inflation for the month March had a whopping 0.76% and April had 0.30%. This may be the beginning of the effects of QE2 and it could continue through as late as August 2013. By that time we could see inflation as high as 10–12% if the Euro crisis doesn't create massive deflationary forces to counteract it. Theoretically, the rise in the price of Oil in March could be the beginning of the results of QE2 and Oil is just more sensitive to it. However, in an effort to hold the price of oil down the government has threatened to release strategic oil reserves which masks the inflationary effects of quantitative easing. The other area we may be seeing the results of QE2 is in the stock market as the liquidity flows there. Interestingly, the stock market is one place where people like to see inflation, the other place is in the housing market (even though it tends to price new buyers out of the market). However, Inflation rates above 5% begin to cripple the economy as we saw with the last Oil spike (July 2008). So as the higher monthly numbers continue to drop out of the equation over the next couple of months we should see the inflation rate continue to fall giving people a false sense of security as they don't realize the effects of QE2 are still around the corner. Current Quantitative Easing Moderating Factors:- The only reason Inflation isn't 100 times worse than it is currently is because the Fed is paying banks to hold on to all that money it printed. Basically the FED created money out of thin air and loaned it to the banks at almost zero percent interest. The banks turned around and loaned it back to the government at about 3% interest to finance the public debt. This results in a hidden form of bank bailout as the banks make 3% profit on free money and the government can pretend that it isn't bankrupt. China on the other hand is accumulating Gold like crazy in a possible bid to eventually become the World's reserve currency and avoid the effects of the Dollar. This could be the biggest trend of the coming decade and you need to know about it. / Легендарный Американский экономист Милтчэн Фридмэн (Milton Friedman; 1912–2006). Казначейские Билеты (Treasury Notes).

QUANTITATIVE MEASUREMENT = КОЛИЧЕСТВЕННОЕ ИЗМЕРЕНИЕ – Quantitative Measurement is the valuation of qualities or characteristics in monetary or other numeric terms.

QUANTITATIVE PHOTOPERIOD REACTION = КОЛИЧЕСТВЕННАЯ РЕАКЦИЯ ФОТОПЕРИОДА – Quantitative Photoperiod Reaction is the degree of the plant's responses to daylength. / растения к долготе дня. Фотопериод – длина светового дня.

QUANTITATIVE (QUANT) ANALYSIS = КОЛИЧЕСТВЕННЫЙ (КОЛ–ВО) АНАЛИЗ – Quantitative (Quant) Analysis is a modern mathematical techniques used to aid stock and sector selection.

QUANTITATIVE RESTRICTIONS = КОЛИЧЕСТВЕННЫЕ ОГРАНИЧЕНИЯ – Quantitative Restrictions (QRs):- explicit limits, usually by volume, on the amount of a specified commodity that may be imported into a country, sometimes also indicating the amounts that may be imported from each supplying country. Compared to tariffs, the protection afforded by Quantitative Restrictions (QRs) tends to be more predictable, being less affected by changes in competitive factors. Quotas have been used at times to favor preferred sources of supply. The GATT (short for the General Agreement on Tariffs and Trade) generally prohibits the use of quantitative restrictions, except in special cases, such as those cited in Articles XX (which permits exceptions to protect public health, national gold stocks, goods of archaeological or historic interest, and a few other special categories of goods), or Article XXI (which permits exceptions in the interest of 'national security'), or for safeguard purposes, when the appropriate procedures in Article XIX have been followed. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

QUANTITATIVE TIGHTENING = КОЛИЧЕСТВЕННОЕ УЖЕСТОЧЕНИЕ – Quantitative Tightening (QT) is a contractionary monetary policy, i.e. the opposite of Quantitative Easing (QE). From 2009 through 2014 the Federal Reserve (FED) engaged in three separate rounds of Quantitative Easing where the FED acquired various forms of Government and even private debt and added it to its books as 'assets'. This massive Quantitative Easing led the FED to increase its balance sheet from USD869 Billion to nearly USD4.5 Trillion predominately made up of US Treasuries and Mortgage Backed Securities. The FED maintained this level of holdings by 'rolling over' its investments. That is when the assets matured they reissued new ones of the same value. Quantitative Easing is considered a new 'tool' in the belt of the FED and was a last ditch effort to stem the tide in the massive contraction of the money supply in 2008–09. It was necessary due to the massive contraction in the stock market which reduced asset values by Trillions of Dollars virtually overnight thus reducing individuals and corporations 'perceived wealth'. Although the stock market isn't considered part of the money supply, individuals and corporations consider it part of their wealth and so if they see it contracting they become less likely to spend other assets. Beginning in 2018 the FED decided that the economy was healthy enough that they could begin retiring some of that debt. Rather than selling their debt on the open market the FED decided to simply let the Government Debt it held expire and not issue new debt to replace it. This creates downward pressure on the money supply. The best way to understand both Quantitative Easing and Quantitative Tightening is to look at the Total Assets held by the FED. In the following chart we've added labels to the chart available from Federal Reserve Economic Data (FRED®) to show when QE (QE1 in November of 2008, QE2 in November of 2010, QE3 in

September of 2012) and QT (QT1 in November of 2018) occurred. At the same time the FED also began raising interest rates (Federal Funds Rate). This creates similar forces to decreasing the money supply in that higher interest rates tends to cause people (and businesses) to be more reluctant to use debt to expand purchases thus reducing overall demand. In this particular instance it appears that the FED has been more aggressive in raising rates than in lowering holdings. As we can see from the above chart QT has been much more gradual (as promised by the FED) than QE was. But if we look at the chat below we see that interest rates were being raised rather aggressively in 2018 which caused the stock market to stumble in late 2018 at which point the FED stopped raising interest rates but continued with Quantitative Tightening.

QUANTITATIVE TRAIT LOCUS = ЛОКУС КОЛИЧЕСТВЕННОГО ПРИЗНАКА – Quantitative Trait Locus (QTL) is a genomic region which governs a phenotype by interaction with other genes. / Под Локусом, от Латинского слова Locus, понимается место локализации определённого гена на генетической карте хромосомы.

QUANTITATIVE VARIATION = КОЛИЧЕСТВЕННАЯ ВАРИАЦИЯ (или КОЛИЧЕСТВЕННАЯ ИЗМЕНЧИВОСТЬ) – Quantitative Variation is a variation for characters caused by multiple genes or polygenes. / свойства (characters) . Под Изменчивостью понимается разнообразие признаков и свойств у особей и групп особей любой степени родства. Присуща всем живым организмам. Различают изменчивость:- наследственную и ненаследственную; индивидуальную и групповую; качественную и количественную; направленную и ненаправленную. Наследственная изменчивость обусловлена возникновением мутаций, ненаследственная – воздействием факторов внешней среды. Явления наследственности и изменчивости лежат в основе эволюции.

QUANTUM = КВАНТУМ (или КВАНТ) – Quantum:- in insurance:- Latin for Amount. Where an insured or reassured makes a claim it must first be established whether the insurer or reinsurer is legally liable to pay the claim, i.e. it must be shown the relevant loss is covered under the insurance or reinsurance. If the insurer or reinsurer is liable to pay the claim it must then be established how much is the insurer must pay. For example, there may be deductions for an excess, under insurance or depreciation. / В страховании под Квантом, от Латинского слова Quantum, означающее Сколько, понимается .

QUARANTINABLE DISEASES = КАРАНТИННЫЕ БОЛЕЗНИ (или ПОДКАРАНТИННЫЕ БОЛЕЗНИ) – Quarantinable Diseases:- (French:- quarante – forty):- Infectious and notifiable diseases that carry a mandatory isolation period (quarantine) for infected parties. Such diseases can be spread as a result of trade and transportation.

QUARANTINE = КАРАНТИН – (1) Quarantine is the official confinement of regulated articles for observation and research or for further inspection, testing and/or treatment. Quarantine is restricted or prohibited intercourse due to contagious disease. Quarantine is a precaution against contagion and infection:- Isolation, (French:- Quarante – Forty) originally lasting forty days, to prevent the introduction of diseases and pests. A restraint placed on an operation to protect the public against a health hazard. A ship may be quarantined so that it cannot leave a protected point. During the quarantine period, the Q flag is hoisted. The period during which a vessel, its equipment, cargo, crew or passengers, suspected to carry or carrying a contagious disease is detained in isolation to prevent the spread of such a disease. Quarantine (of a biological control agent) is the official confinement of biological control agents subject to phytosanitary regulations for observation and research, or for further inspection and/or testing. Quarantine is a control or restraint upon the import, export or transportation of plants, animals or produce goods such as seeds and soil, designed to prevent the spread of disease or pest. / Карантинные вредители и болезни. Под Карантином, от Итальянского словосочетания Quaranta Giorni, означающее Сорок Дней, понимается система мер для предупреждения распространения инфекционных заболеваний из эпидемического очага (запрещение или ограничение выезда или въезда, выявление и изоляция больных и лиц, соприкасавшихся с ними, и другие меры) или из эпизоотичного очага (запрещение ввода, вывода и перегруппировок восприимчивых животных, изоляция больных животных и другие меры). В случае с Карантином Растений это относится к системе государственных мероприятий, предупреждающей проникновение из-за рубежа опаснейших вредителей, возбудителей болезней и сорняков сельскохозяйственных культур и их распространение. Задачами карантинной службы являются проверка и обеззараживание растительных материалов, прибывающих из-за границы (внешний карантин растений), контроль за перевозкой растительных материалов внутри страны (внутренний карантин растений).

(2) Quarantine:- the main task of the anti-virus quarantine is to safely store infected files in order to prevent their being accidentally run and performing malicious actions. The samples from the quarantine can be sent to the virus lab, or they can be restored to their original location, at the user's own risk.

QUARANTINE AREA = АРЕАЛ КАРАНТИНА (или ПОДКАРАНТИННЫЙ АРЕАЛ) – Quarantine Area is an area within which a quarantine pest is present and is being officially controlled.

QUARANTINE PEST = КАРАНТИННЫЙ ВРЕДИТЕЛЬ (или ПОДКАРАНТИННЫЙ ВРЕДИТЕЛЬ) – Quarantine Pest is a pest of potential economic importance to the area endangered thereby and not yet present there, or present but not widely distributed and being officially controlled. As relates to the US/Canada Greenhouse Certification Program, quarantine pests are identified by each importing country and are listed as prohibited pests in the importing country's plant quarantine import requirements (export summary). Quarantine pests are those that are of potential economic importance to the area endangered, and are not present, or present but not widely distributed and being officially controlled. Quarantine Pest is a pest of potential economic importance to the area endangered thereby and not yet present there, or present but not widely distributed and being officially controlled. Quarantine Pests (French:- quarante – forty) are pests that carry or spread quarantinable diseases, or which can themselves be termed quarantinable diseases. / Карантинный Вредитель это вредитель, имеющий потенциальное экономическое значение для уязвимого ареала (ареала, подвергаемого опасности), в котором он пока отсутствует или присутствует, но распространение его ограничено и находится под официальным контролем.

QUARANTINE STATION = КАРАНТИННАЯ СТАНЦИЯ (или СТАНЦИЯ КАРАНТИНА) – Quarantine Station is the official station for holding commodities in quarantine.

QUART = КВАРТА – Quart is a measure of volume; in the United States a liquid quart is 32 fluid ounces or approximately 946 milliliters; in Canada and Britain, a quart is 40 fluid ounces, or approximately 1 137 milliliters. / Под Квартой, от Латинского слова Quarta (Pars), означающее Четверть, понимается единица объёма (ёмкости, вместимости), применяемая в США, Великобритании и других странах. 1 кварта = 1/4 галлона = 2 пинтам. Американская кварта для жидкостей = 0.946 3 $дм^3$, для сыпучих веществ = 1.101 2 $дм^3$. Прежняя Русская мера жидкостей – кружка – также иногда называется квартой. В Польше 1 кварта = 1 литру.

QUARTATION = КВАРТОВАНИЕ (или СОКРАЩЕНИЕ ПРОБЫ) – Quartation is the process in which silver is separated from gold by dissolving it out with nitric acid, more commonly referred to as Nitric Acid Parting.

QUARTER = СКУЛА – Quarter (maritime term):- that portion of a vessel's side near the stern.

QUARTER–BLOOD WOOL = НА ЧЕТВЕРТЬ КРОВНАЯ ШЕРСТЬ – Quarter-Blood Wool is one of the grades in the standards for wool.

QUARTERING SEA = ВОЛНА С РАКОВИНЫ – Quartering Sea (maritime term):- a sea on the quarter (coming from a side of the stern). / Волна С Раковины или волна с кормовых курсовых углов (105–165° и 195–255°).

QUARTERLY CHARTS = ПОКВАРТАЛЬНЫЕ ГРАФИКИ – In technical analysis, the term Quarterly Charts is used to describe those charts that are constructed of quarterly bars or candles. Each quarterly bar or candle contains the Open, High, Low, and Close that occurred during each quarter. Quarterly charts are also available on selected government and industry reports. These reports may contain only one value for each quarter. / В техническом анализе биржевых рынков, термин Поквартальные Графики используется для описания таких графиков, которые строятся на основе поквартальных штрихов или свечей. Каждый поквартальный штрих или свеча содержит цены Открытия, Максимума, Минимума и Закрытия, имевших место в течение каждого квартала. Поквартальные графики могут также встречаться в определённых отчётах правительства и отраслевых отчётах. Эти отчёты могут содержать только одно значение по каждому кварталу.

QUARTERLY DIVIDEND = ПОКВАРТАЛЬНЫЙ ДИВИДЕНД – Quarterly Dividend is a form of dividend payment particularly common in the USA where dividends are paid quarterly rather than annually.

QUARTERLY REPORT = ПОКВАРТАЛЬНЫЙ ОТЧЁТ – Quarterly Report:- in Germany, listed stock corporations deciding to become a member of the Prime Standard of Deutsche Börse AG undertake to publish quarterly reports in addition to an annual report. These reflect the period under review and increase transparency of company developments. Quarterly reports must at least include a balance sheet, statement of income, statement of cash flows and some additional information on business activities and the company. Many companies which are not listed in the Prime Standard publish quarterly reports on a voluntary basis. These reports, however, vary considerably in scope and content. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

QUARTERMASTER/HELMSMAN = СТАРШИНА РУЛЕВОЙ/РУЛЕВОЙ – Quartermaster/Helmsman is an able-bodied seamen entrusted with the steering of a vessel when entering or leaving a harbor. He is also involved with the use and upkeep of navigational equipment.

QUARTERS = КАЮТЫ – Quarters are living compartments. Accommodations. / Жилые помещения на судне.

QUARTER SAWING = РАДИАЛЬНАЯ РАСПИЛОВКА (или РАСПИЛОВКА НА ЧЕТВЕРТИНЫ или ЧЕТВЕРТИ, или РАДИАЛЬНЫЙ ПРОПИЛ) – Quarter Sawing:- lumber is produced by first quartering the log and then sawing perpendicular (90-degree angle) to the growth rings. Quarters awing produces relatively narrow boards, nearly all vertical-grained, and creates more waste boosting the cost significantly. Quarter-sawn boards are popular for decorative applications such as cabinet faces or wainscoting. They will expand and contract less than boards sawn by other methods. / радиально распиленное (quarter-sawn). В деревообработке под Распиловкой или Распиливанием понимается процесс последовательного раскроя пилами стволов на круглые сортименты (брёвна, кряжи), брёвен на пиломатериалы и пиломатериалов на заготовки. Различают распиловку:- относительно направления древесных волокон – продольную и поперечную, относительно годичных слоёв – тангенциальную (по касательной к годичным слоям) и радиальную. При раскрое врёвен на брусья и доски различают:- распиловку вразвал, при которой вначале формируется толщина обрезных досок, а затем их ширина; распиловка с брусовкой, при которой бревно раскраивается на двухкантный брус по высоте, соответствующий ширине обрезных досок, и боковые доски заданной толщины, а затем брус раскраивается на доски нужной толщины, а боковые доски обрезаются по ширине. Для выработки досок тангенциальным или радиальным пропилами распиловку производят специальными способами (развально-сегментным, брусово-сегментным, секторным). Пиломатериал, полученный ориентированной распиловкой круглых лесоматериалов или брусьев с преимущественным направлением пропилов, близкий к радиусам годичных слоёв древесины.

QUARTER SAWN = РАДИАЛЬНО РАСПИЛЕННОЕ (или РАСПИЛЕННОЕ НА ЧЕТВЕРТИНЫ, или РАСПИЛЕННОЕ НА ЧЕТВЕРТИ) – Quarter Sawn:- wood twists and cups less and wears more evenly.

QUARTERS BILL = ВАХТЕННОЕ РАСПИСАНИЕ В 4 СМЕНЫ – Quarters Bill (maritime term):- a vessel's station bill showing duties of crew.

QUARTZ FIBER = КВАРЦЕВОЕ ВОЛОКНО – Quartz Fiber is a pure silica that has been melted and drawn into glass-like fibers. Used for heat resistance and high dielectric strength. Quartz fibers were first applied in particle physics experiments for detectors that operated at extremely high radiation levels. The superior radiation hardness of high-purity quartz was the driving consideration at that time. However, it turned out that these fibers have many other interesting and beneficial aspects, which derive from the fact that the Cherenkov effect forms the basis of the signals in quartz-based detectors. / твёрдость (hardness). Эффект Черенкова (Cherenkov effect), в честь Советского физика Павла Алексеевича Черенкова (1904–1990).

QUASI–CORPORATIONS = КВАЗИКОРПОРАЦИИ – Quasi-Corporations:- unincorporated enterprises that function as if they were corporations. For the purposes of allocation to sectors and sub-sectors they are treated as if they were corporations, i.e. separate units from those to which they legally belong. Three main types of quasicorporation are recognised in the accounts:- unincorporated enterprises owned by government which are engaged in market production, unincorporated enterprises (including partnerships) owned by households and unincorporated enterprises owned by foreign residents. The last group consists of permanent branches or offices of foreign enterprises and production units of foreign enterprises which engage in significant amounts of production in the territory over long or indefinite periods of time.

QUAY = ПРИЧАЛ – Quay is a cargo-discharging wharf. Quay is a pier, wharf or other structure built along a shore for landing, loading and unloading boats or ships. A structure attached to land to which a vessel is moored. The part of a wharf which is intended for the mooring of vessels. Quay:- a projection alongside the boundaries of a harbour to provide accommodation for ships to lie alongside for loading or unloading of cargo. / Под Причалом понимается совокупность сооружений и устройств для стоянки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Причальные сооружения (набережные, пирсы) оборудуют тумбами для закрепления судовых швартовов и отбойными приспособлениями (привальными брусьями, кранцами и другими), предохраняющими причал и борта судна от повреждений при навале. На причале располагают грузоподъёмные механизмы, склады и прочее. Причал, комплекс сооружений и устройств, предназначенных для подхода, швартовки, стоянки, обработки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Различают грузовые, пассажирские, судоремонтные и другие причалы. Под Пристанью понимается специально оборудованное место на внутренних водных путях для стоянки речных судов у берега. Предназначена для посадки и высадки пассажиров, перегрузочных и других операций. Пристани бывают стационарными и плавучими. Под Пристанью понимается небольшой порт на внутренних водных путях, имеющий обычно 1–2 причала.

QUAYAGE = ПРИЧАЛЬНЫЙ СБОР (или СБОР ЗА ПОЛЬЗОВАНИЕ ПРИЧАЛОМ) – Quayage is the charge for using a berth alongside a wharf.

QUAYSIDE CONTAINER CRANE = БЕРЕГОВОЙ КОНТЕЙНЕРНЫЙ КРАН (или ПРИЧАЛЬНЫЙ КОНТЕЙНЕРНЫЙ КРАН) – Quayside Container Crane offers fast loading and unloading to meet the demands of macro-scale vessels.

QUEBEC = КЭБЭК – Quebec (pronunciation:- kay-BECK) or Q is international nautical signal flag meaning:- (i) International:- Ship meets health regs; request clearance into port. (ii) Navy:- Boat recall; all boats return to ship. Meaning:- my vessel is healthy and I request free practique. Boat recall; all boats return to ship. With one or more numerals, number of boat which is to return. International Meaning:- Ship meets health regulations; request clearance into port.

QUEEN ANNE COLLAR = ВОРОТНИК В СТИЛЕ КОРОЛЕВЫ АННЫ – Queen Anne Collar is a collar that rises high at the back of the neckline, cupping the sides of the neck then sculpting low across the chest to outline a bare yoke.

QUENCH = ГАСИТЕЛЬ (или ТУШИТЕЛЬ, или ЗАКАЛОЧНАЯ СРЕДА, или ЗАКАЛОЧНАЯ ВАННА, или ДУШИРУЮЩЕЕ УСТРОЙСТВО, или СПРЕЙЕР) – Quench is:- (1) a box filled with water into which fabric is run after singeing to prevent sparks or fires. (2) See also Cabinet, and Quenching.

QUENCHING = ГАШЕНИЕ (или ТУШЕНИЕ) – Quenching is the cooling of fiber filaments after extrusion by carefully controlled airflow. See also Crossflow Quench, Inflow Quench, and Outflow Quench. / Экструзия или Выдавливание (Extrusion).

QUENCHING OIL = ЗАКАЛОЧНОЕ МАСЛО (или МАСЛО ДЛЯ ЗАКАЛКИ, или ЗАКАЛИВАЮЩЕЕ МАСЛО) – Quenching Oil:- (also called Heat Treating Oil) a high-quality, oxidation-resistant petroleum oil used to cool metal parts during their manufacture, and is often preferred to water because the oil's slower heat transfer lessens the possibility of cracking or warping of the metal. A quenching oil must have excellent oxidation and thermal stability, and should yield clean parts, essentially free of residue. In refining terms, a quenching oil is an oil introduced into high temperature vapors of cracked (see also Cracking) petroleum fractions to cool them.

QUENCH SPACER = ОТСЕК ГАШЕНИЯ – Quench Spacer:- the 'quiet' zone below the spinneret in which there is no quench airflow. Quench spacer distance is important in controlling fiber orientation and birefringence.

QUESTIONED TRADE = СПОРНАЯ ТОРГОВЛЯ (или СДЕЛКА ПОД ВОПРОСОМ) – Questioned Trade:- indicates a trade in which, during the comparison process, one participant is discovered to be incorrectly identified.

QUESTIONNAIRE = ВОПРОСНИК (или АНКЕТА) – Questionnaire is a tool used to obtain information on any given subject from a survey. / Под Анкетой, от Французского слова Enquête, означающая буквально Расследование, понимается опросный лист для получения каких-либо сведений о том, кто его заполняет, или для получения ответов на вопросы, составленные по определённой программе.

QUETSCH = ОТДЕЛОЧНЫЙ (или ОТЖИМНОЙ) КАТОК – Quetsch:- the nip rollers of a padding machine. / Ролики остановочного механизма партионной сновальной машины.

QUEUE TIME = ВРЕМЯ ОЖИДАНИЯ (или ВРЕМЯ В ОЧЕРЕДИ, или ВРЕМЯ ПРОЛЁЖИВАНИЯ) – Queue Time is an amount of time before set-up or processing of a job.

QUICK DISCONNECT COUPLING = МУФТА БЫСТРОГО РАЗЪЕДИНЕНИЯ (или ОТСОЕДИНЕНИЯ) – Quick Disconnect Coupling is a coupling which can quickly join or separate a fluid line without the use of tools or special devices. / без использования инструментов или специальных устройств.

QUICK ORDER = ШУСТРОЕ РАСПОРЯЖЕНИЕ – Quick Oder:- xxxxx. Also known as Fill Or Kill Order. Instant execution on order placement. Activate single click order entry to eliminate order confirmation for quick order placement. / Известно также как Распоряжение На Исполнение Или Отмену (Fill Or Kill Order).

QUICK RATIO = БЫСТРОЕ СООТНОШЕНИЕ (или БЫСТРЫЙ КОЭФФИЦИЕНТ) – Quick Ratio is the current assets less inventories divided by the current liabilities. Like the current ratio, it is a key measure of liquidity. It measures the company's short-term ability to pay its bills. By excluding the value of inventory from the value of current assets, it takes into account the fact that a common cause of business problems is the inability to sell the right products. If the products are wrong, the value of inventory will include products that may be unsaleable, except at a heavily discounted price. It is generally accepted that this measure should approximate 1.0. If it is substantially below this figure then suppliers and bankers will be concerned about the company's ability to pay its bills. If it is substantially above this figure, then the company's current assets are at an inefficient level. It is also known as the Acid Test Ratio and Quick Asset Ratio. Quick Ratio is similar to Current Ratio but considered a more reliable measurement of liquidity as it deducts inventory, which is much slower to liquidate. Also known as Acid Test Ratio.

QUICK RESPONSE = ШУСТРЫЙ ОТКЛИК (или БЫСТРЫЙ ОТВЕТ, или БЫСТРАЯ РЕАКЦИЯ) – Quick Response:- a consumer-driven system of replenishment in which high-quality products and accurate information flow through a paperless (EDI) system between all distribution points from the manufacturing line to the retail checkout counter. Distributors, carriers and suppliers act as trading partners and focus on improving the total supply system.

QUICK RESPONSE CODE = КОД ШУСТРОГО ОТКЛИКА – QR Code (short for the Quick Response Code) is a two-dimensional matrix bar code that is used to identify products. It can store up to 4 296 alphanumeric or 7 089 numeric characters. Depending on the level of error correction applied, it can restore from seven to 30% of the missing data. Created by Japanese Denso Wave, Inc. and standardized by ISO, Japanese Industrial Standard (JIS), JEIDA and AIM, QR codes are increasingly used to identify the URL of a company's Web site so that mobile phone users can photograph the code and retrieve information about the organization. Some companies have created billboard-sized QR codes for this purpose. To promote the use of its Android phone visual search application, in 2009, Google sent more than 100 000 custom-coded QR codes to US establishments. It suggested they place the code in a prominent location for 'mobile tagging'. See also Bar Code. The QR Code is used to mark products as well as identify establishments. It is recognizable by its four squares with dots in the middle and holds up to 4 296 alphanumeric and 7 089 numeric characters. QR codes can contain a phone number, text message, plain text or a URL (examples (photos) above are the URL www.computerlanguage.com). QR codes are identified by the four squares with dots in the middle (red arrows), used for alignment. The horizontal and vertical lines (highlighted in yellow) that alternate light and dark are also alignment symbols. Taking a picture of the QR bar code in the restaurant's window (top) with a mobile tagging app downloads reviews and other information. QR Codes are two dimensional barcode (datamatrix) that is designed to have its contents decoded at a high speed. The acronym QR is derived from the term Quick Response. The company Denso Wave originally spawned the term 'QR' as the creator intended that such barcodes and their contents were to be decoded at high speed electronically. QR Codes originated within the technology hungry country of Japan, and have only recently began to become popular within the Middle East and Europe. Barcodes that you see on any commercial

product are extremely beneficial as their reading speed, supreme accuracy and their functionality are key. As barcodes reached their peak and began getting used worldwide, the need for more data and character types to be stored was inevitable. Developers began tying to expand on the current amount of bars within the barcode and how their positioning resides to allow further data capacities. The need for smaller barcodes also was another defining factor in QR Codes development. Such developments failed as reading and printing implications caused more problems than solutions. The 2D barcode was then born. QR Codes first hit mainstream when they were initially used for tracking parts by vehicle manufacturers. After a while, companies began to see a newscope for where QR Codes could be used elsewhere within the world. The most commercial use for QR Codes is in the telecommunications industry where the mobile phone seems to be the biggest driver of their popularity. With the technology of mobile phones constantly expanding, especially within mobile internet, QR Codes seemed the perfect solution to quickly and efficiently bring mobile phone users onto the mobile web. QR Codes can be used to store all kinds of data including URLs (Universal Resource Locator) or as most people know them; web addresses. This then allowed offline publications such as:- magazines, papers, business cards, buses, signs, T-shirts. Or basically any medium that can accept the print of a QR Code to advertise their online product which would then direct the user to there preferred channel, i.e. website. Take a mobile phone such as the iPhone; nearly ever mobile phone has a digital camera in todays world. The camera, along with decoding software can be used to capture a picture of the QR Code, of which the QR Code software decoder can then transform the data held with the QR Code to a meaningful action for the mobile phone:- (i) connect to a web address; (ii) download a MP3; (iii) dial a telephone number; and/or (iv) prompt your email client with a sender address. This can all be done within a matter of milliseconds making the transformation from a users mobile phone to the mobile web instantaneous. The Japanese standard for QR Codes, devised by Denso Wave, is JIS X 0510, which was released in January of 1999. The corresponding ISO International Standard, ISO/IEC 18004, was then approved in June of 2000. The standard was then updated back in 2006 (ISO/IEC 18004:2006). QR Codes are capable of handling of sorts of data, including numbers, alphabetic characters, Kanji, Kana, Hiragana, symbols, binary and control codes. A total of 7 089 characters can be encoded in one symbol alone. QR Code Data Capacities:- (i) Numeric only – max 7 089 characters; (ii) alphanumeric – max 4 296 characters; (iii) binary (8 bits) – max 2 953 bytes; and/or (iv) kanji, full-width Kana – max 1 817 characters. Barcodes vs. QR Codes:- QR Codes have become more popular than the typical barcode as the typical barcode can only hold a maximum of 20 digits, whereas the QR Code can hold up to 7 089 characters. This makes the use and diversity of QR Codes much more appealing than their older counter part, the barcode. Partially part of the reason QR Codes can hold more data, is because if you compare a typical barcode to a QR-Code, you can see one major difference; barcodes only span horizontally whereas QR Codes can span both horizontally and vertically. Statistic – QR Codes are capable of encoding the same amount of data in approximately one-tenth the space of a traditional barcode. Such minute QR Codes are called Micro QR Codes. Position:- a great feature of QR Codes is that you do not need to scan them from one particular angle. QR Codes are capable of omnidirectional (360 degree's) high-speed reading. QR Codes scanners are capable of determining the correct way to decode the content within the QR Code due to the three specific squares that are positioned in the corners of the symbol. QR Code scanner uses three corners as markets, regardless of position scanned. QR Codes can be combined into one large symbol. One symbol can then be divided into 16 separate symbols making the data capacity extremely large. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Кью.Ар. (QR) Код – это матричный код (двухмерный штрихкод), изначально разработанный для применения в автомобильной промышленности. Сегодня QR Коды становятся всё более популярными и широко используются в рекламных баннерах, журналах, транспорте и бэйджах для обеспечения быстрого и простого доступа к определённой информации. У QR Кода довольно большая ёмкость по сравнению с обычным штрихкодом:- в нём может помещаться 7 089 цифровых или 4 296 буквенно-цифровых символов. И этого более чем достаточно, чтобы сохранить текст или URL. А как насчёт вредоносных QR Кодов? Да, вы можете с помощью вашего смартфона сосканировать QR Код, а он перенаправит вас на URL с вредоносным файлом (APK или JAR). Такие QR Коды существуют и пользуются всё большим спросом. Сегодня люди, которые пользуются смартфонами, часто ищут программное обеспечение для своих устройств с помощью обычного компьютера. Если пользователь находит что-то интересное, то для того, чтобы загрузить это в смартфон, он должен вручную ввести URL в браузер своего телефона. Это не очень удобно, поэтому такие веб-сайты имеют QR Коды, которые легко сканируются. Известно, что сегодня многие вредоносные программы для мобильных устройств (особенно SMS-троянцы) распространяются через сайты, на которых всё ПО – вредоносное. А киберпреступники стали использовать вредоносные QR Коды – так сказать, для удобства пользователей. Использование QR Кодов для распространения вредоносного ПО было предсказуемым. И пока эта технология популярна, киберпреступники будут продолжать её применять.

QUICK TENDER = БЫСТРЫЙ КОНКУРС – Quick Tender is the tender procedure used by the Eurosystem for fine-tuning operations. Quick tenders are carried out within a time frame of one hour and are restricted to a limited set of counterparties.

QUILL = ПАТРОН (или ШПУЛЯ) – Quill is a light, tapered tube of wood, metal, paper, or plastic on which the filling yarn is wound for use in the shuttle during weaving. / Уточный Патрон или Шпуля. , на которой намотана уточная пряжа .

QUILLING = МОТКА НА ШПУЛИ – Quilling is the process of winding filling yarns onto filling bobbins, or quills, in preparation for use in the shuttle for weaving. Quilling is the operation of winding yarn on filling bobbins, preparatory to their going to the loom shuttle. / процесс намотки уточных пряж на , или шпульки (quills), .

QUILT = ПИКЕ – Quilt is a fabric construction, usually thinner and less resilient than a comforter, most often used as a bed covering for added warmth. It consists of a layer of printed cotton muslin fabric, known as the Quitt Top, and backing fabric, also made of printed or solid cotton muslin fabric, with a layer of cotton, wool, or synthetic batting between. All three layers are sewn together with fine quilting (running) stitches that usually create a design of its own. Quilted bed coverings filled with down feathers are called Eiderdowns or Comforters. A patchwork quitt has a patchwork quitt top. See also Batting, Patchwork, and Quilting. Quilt is a fabric used to cover beds, somewhat like a comforter. A patchwork piece.

QUILTING = ПИКЕ – Quilting is a fabric construction in which a layer of down or fiberfill is placed between two layers of fabric, and then held in place by stitching or sealing in a regular, consistent, all-over pattern on the goods. Stitching that joins the fashion fabric, a batting or interlining, and a backing fabric. The stitches form a slightly puffy, raised design, usually in a geometric or other decorative pattern. Quilting also is a generic term for the process of making a Quilt from beginning to end. Or the actual act of sewing the layers of a quilt together, either by hand or by machine. Also refers to the finished lines of sewn thread that make up the quilting design. Quilting is a fabric construction consisting of a layer of padding, frequently down or fiberfill, sandwiched between two layers of material and held in place by stitching or sealing in a regular pattern across the body of the composite. See also Pinsonic® Thermal Joining Machine. Quilting Fabric is usually either novelty or calico fabric and 100% cotton. / втачивание (stitching). Под Пике, от Французского слова Piqué, от Piquer, означающее Простёгивать или Прострачивать Материал, понимается шёлковая или хлопчатобумажная ткань с продольными рельефными узкими рубчиками (или выпуклыми геометрическими узорами) на лицевой стороне. Из пике шьют блузки, воротнички, платья и другое.

QUILTING = СТЁЖКА (или СТРОЧКА) – Quilting is the sewing of a padding or insulating material between two pieces of fabric to prevent the shifting of the contained material. Quilting is:- (1) the formation of a large planar fabric by joining small pieces of fabric together. (2) The formation of a fabric by stitching through two pieces of fabric which are separated by a non-woven web. (3) A bonding technique used for nonwovens in which the fibers are connected (bonded) by stitches sewn or knitted through the web. Quilting is the process of stitch bonding a batting or composite. Quilting is a stitching through two or more layers of fabric to form a design or pattern. The most common quilting design today is a diamand pattern, but quilting stitches (usually a short running stitch) may also be dane in abstract, pictorial, geometric, floral, or random patterns. Quilting stitches often are used to outline patchwork or applique designs on a quitt. See also Applique, Patchwork, and Quilt.

QUILTING PROCESS = ПРОЦЕСС СТЁЖКИ (или ПРОЦЕСС СТРОЧКИ) – Quilting Process – A Brief Overview:- quilts or duvets are types of bedding or bed covering that consist of a quilt top, batting, and a fabric backing. All these three layers of a quilt are attached together through the process of quilting. Quilting is a form of sewing done either by hands, sewing machine, or by quilting machines. When done by quilting machine, it is called Longarm Quilting. The quilting process uses a needle and thread to join two or more layers of material together to make a quilt. Basic Process of Quilting:- the basic or the traditional process of quilting has the following steps. Selection of patterns, fabrics and batting. Batting is the cotton, wool, or synthetic fibers in sheets that are used as filling for quilts or bed coverings. Measuring and cutting of fabrics according to the size given in pattern so as to make blocks. Piecing the blocks together to make the quilt top. Piecing is the process of sewing pieces of fabric together, along a common sized edge in order to form a larger, whole piece of fabric. To arrange the layers – the quilt top, batting and backing – so that a quilt sandwich is formed. Quilting by hand or machine through all layers of the quilt sandwich. Trimming the excess batting from the edges. Sewing the binding to the front edges of the quilt with machine and hand-stitching the binding to the quilt backing. Binding is a strip of fabric used to cover the raw edges of the quilt sandwich in order to finish the quilt off. Quilts are sometimes hung on the walls just like the wall carpets. In such a case, the quilting process includes making and attaching the hanging sleeve. Decorating the Quilts:- complex designs and patterns are often used to decorate the quilts. The scheme of embellishing the quilt, however, depends upon the visualization and creativity of the quilter. With technologies like computer-aided-designs (CAD) getting popular, many quilting softwares have also been introduced in the market that help in visualizing and planning the quilt patterns and designs. The quilter can use a variety of threads including multicolored threads as well as metallic threads to add richness to the quilt. On the other hand, the stitches can even be made invisible by using nylon thread or polyester thread or by stitching in the seam line. Many types of decorated quilts are made by the skilled quilters that include applique quilt, block quilt, embroidered quilt, among many others. Majority of the quilt tops are made by piecing many smaller patches of fabric that are popularly known as Patchwork Quilt, in which the patterns are created by combining individual blocks. On the contrary, while making whole cloth quilts, emphasis is placed on elaborate quilting on a single piece of fabric. For further decorating the quilts, polished chintz, satin fabrics, or other shiny fabrics are often used in whole cloth quilts. Machine Quilting:- machine quilting is either done by a sewing machine or a Longarm quilting machine. When done with the help of sewing machine, the layers are tacked together by laying the top, batting and backing out on a flat surface and either pinning, using large safety pins, or tacking the layers together before quilting is done. The layers to be quilted are placed on a special frame. The frame contains bars on which the layers are rolled. Thus, the layers remain together without the need for basting or pinning. These frames are used with an industrial sewing machine mounted on a platform. The platform rides along tracks so that the machine can be moved across the layers on the frame. The longarm quilting machine holds and keeps the quilt stationary on rods while the machine head moves the needle across the quilt. When quilting with sewing machines, the fabric has to be moved through the machine. Longarm Quilting Process:- in longarm quilting, a longarm sewing machine sew together the quilt top, batting and backing into a finished quilt. The longarm sewing machine is 10 to 14 feet in length and consists of an industrial sewing machine head, a 10-to-14 feet long table that is sufficient to make a king size quilt, and a number of rollers on which the fabric layers are positioned. The table of the machine has a flat region on which a layer of thin, clear plastic lies for placing patterns and other designs to be followed by the quilter. The longarm quilting machine completes up to 3 500 stitches/minute and therefore it takes much lesser time than hand quilting or a traditional quilting machine. The hand-guided machine head has handles. On these handles, the quilter can guide the machine along the fabric in order to sew the pre decided design. The computer-guided machine head is attached to a computer system that lets the quilter to choose a design to be sewn onto the fabrics. With selection of the design, the machine will sew the chosen design onto the quilt without any assistance by the quilter. The longarm quilter is often referred to as the ‘Longarmer’. The longarm machine can be used from the front or the back of the machine. The process can be carried out without basting. Basting is temporarily holding quilt top, batting, and backing together with the help of thread, pin etc. so as to allow quilting. They are placed onto the machine by pinning the layers to large canvas leaders and then each layer is rolled separately onto the roller bars. The longarm is then positioned over the layers which makes it ready to be quilted. Most of the times, the quilt top is ‘floated’ on the carriage system allowing it to be manipulated easily in any direction over the surface of the quilt. Since most quilts are made without back stitching therefore, it is important to make sure that the seams are secure and that they do not begin to pull out when crossing with another seam. It is more so important where multiple seams merge together as is the case with eight pointed star. Types of Longarm Quilting:- based on the method of selecting and creating designs, there are two key styles of quilting done by longarm quilting machines – pantograph designs and customized designs. Pantograph Designs:- these are pre designed patterns that span the length of the longarm table. The longarmer takes the pantograph design and place it beneath the plastic layer on the table and then traces this design using the laser found on the machine head. The design can be repeated in rows to create an all-over design on the quilt top. This is a relatively fast and easier method of quilting. Customized Designs:- here each block or area of the quilt is individually designed depending upon the requirements of the end user or the customer. Many sewing styles are adopted for the purpose, such as meandering, feathers and motifs. Meandering involves an all over fill-in design and requires lesser attention to detail and as such can be done quickly. Feathers and motifs require more attention to details and alignment and therefore can be time-consuming which results in expensive quilts. Based on the styles, quilting can be further categorized into the following types. Edge to Edge Quilting:- it is a continuous line design carried on from one edge of the quilt to the other edge, and repeated from top to bottom of the quilt. It is an economical method of quilting for the purpose of making utility quilts. It provides a balanced proportion of stitching without highlighting any particular area of the design. Creative Quilting:- most of the patch work quilting is creative quilting. It may include edge to edge work all over the body of the quilt with separate designs stitched around the border; medium size stipple meander of various styles; small quantities of ditch stitching; open grid work; some inset motifs etc. Heirloom Quilting:- it is a more detailed version of creative quilting which may include fine stippling; grids and open cross hatching; large quantities of ditch stitching; free form interpretive designs having feathers, flowers and other intricate meander designs; a good quantity of or small, inset motifs. Max Quilting:- quilting to the ‘Max’ is the extended form of Heirloom category. In it, stitching is extremely close and can involve extensive stops and starts. Grids, circles and other line designs, including creative free form and thread painting, where the designs are stitched very close to each other. Trapunto:- it is a dimensional design in a quilt by which closely sewn lines of stitching are stuffed with batting to make them appear 3-dimensional, or raised from the surface and is commonly used in whole cloth quilts. Trapunto, from the Italian for ‘to embroider’, is a method of quilting that is also called Stuffed Technique. A puffy, decorative feature, trapunto utilizes at least two layers, the underside of which is slit and padded, producing a raised surface on the quilt. The style originated in Italy before the XIV century. Trapunto is often confused with the relatively similar techniques used in making traditional whole cloth Provençal quilts

that were developed from the XVII century onwards in France. / Найлан[T3] (Nylon[TM]). Пантограф (Pantograph). Трапунто (Trapunto – торговое название Жаккардово Пике):- .

QUININE = ХИНИН (или КИНИН) – Quinine is an alkaloid, found in the bark of the Cinchona tree, is used to treat malaria, a tropical parasitic disease carried by mosquitoes. Quinine is an essential bitter ingredient of certain drinks, e.g., Indian tonic water, where it can be recognized by its blue fluorescence under ultra-violet (black) light illumination. Structure of Quinine. / Под Хинином понимается алкалоид, содержащийся в коре хинного дерева (Цинхона (Cinchona)); применяется в медицине как противомалярийный препарат. Под Кининами, понимаются:- (i) то же, что цитокинины – группа гормонов растений, производные азотистого основания пурина. Повышают скорость деления клеток; способствуют дифференцировке растительных клеток, выращиваемых в культуре. Основной представитель – Кинетин. (ii) Биологически активные вещества (пептиды) животных и человека, образующиеся в крови. Оказывают многообразное действие – расслабляют мышцы сосудов, повышают проницаемость капилляров, участвуют в передаче болевых ощущений и другом. Основной представитель – Брадикинин.

QUINTAL = КВИНТАЛ (или КИНТАЛ, или КАНТАЛ, или ЦЕНТНЕР) – (1) Quintal is a traditional unit of weight in France, Portugal, and Spain. Abbreviation:- q. Quintal is also the generic name for a historic unit used in commerce throughout Europe and the Arab world for more than 2000 years. The unit began as the Latin centenarius, meaning comprised of 100 because it was equal to 100 Roman pounds. The centenarius passed into Arabic as the cantar or qintar and then returned to Europe through Arab traders in the form quintal. The German zentner and British hundredweight are familiar forms of this same unit in Northern Europe. The traditional French quintal equaled 100 livres or 48.95 kilograms or 107.9 pounds, but today the word Quintal in France usually means a larger metric unit. The Spanish quintal is 100 libras or about 46 kilograms or 101 pounds. The Portuguese quintal is larger; it is equal to 128 libras or 58.75 kilograms or about 129.5 pounds. Kwintal is the English pronunciation given in standard English dictionaries, but Kintal (closer to the Spanish pronunciation) and Kantal (closer to the French) are also used. / Кинтал – это традиционная мера веса в Испании, Португалии и Франции. Обозначение:- к (q). Кинтал является обобщённым названием для исторической меры, использовавшейся в торговле по всей Европе и в Арабском мире в течение более 2000 лет. Эта мера происходит от Латинского слова Цэнтэнариуса (Centenarius), обозначающее Состоящий Из Ста, потому, что эта мера была равна 100 Римским фунтам. Со временем цэнтэнариус перекочевал в Арабские языки как кантар (cantar) или кинтар (qintar), а затем вернулся в Европу с Арабскими торговцами, но уже в форме квинтала (quintal). Немецкий центнер и Британский хандредвейт являются близкими разновидностями этой же самой меры в Северной Европе. Метрический квинтал равен 100 килограммам или 0.1 тонны. Традиционный Французский квинтал равен 100 фунтам или ливрам (livres) или 48.95 килограммам или 107.9 фунтам, но сегодня слово квинтал во Франции означает обычно немного большую метрическую меру. Испанский кинтал (quintal) равен 100 фунтам или либрам (libras) или приблизительно 46 килограммам или 101 фунту. Португальский кинтал (quintal) немного больше, он равен 128 фунтам или либрам (libras) или приблизительно 58.75 килограммам или приблизительно 129.5 фунтам. В Английском произношении квинтал (kwintal) распространён в большинстве Английских справочников, но также используются кинтал (kintal; ближе к Испанскому произношению), и кантал (kantal; ближе к Французскому произношению).

(2) Quintal is a common metric unit of weight or mass equal to 100 kilograms or approximately 220.462 3 pounds. Notice that the metric ton is roughly equal to its non-metric predecessors, but the metric quintal is about twice the size of the traditional quintal. / Квинтал – это распространённая метрическая мера веса или массы, равная 100 килограммам или приблизительно 220.462 3 фунтам. Заметьте, что метрическая тонна лишь приблизительно равна своим не метрическим предшественникам, но метрический квинтал в два раза больше традиционного квинтала.

QUITCLAIM = ОТКАЗ ОТ ПРАВА – Quitclaim is a legal instrument used to release one person's right, title or interest to another without providing a guarantee or warranty of title. / Юридический инструмент, используемый для реализации права, титула или интереса одного лица перед другим, без обеспечения гарантией или ручательством (warranty) титула.

QUORUM = КВОРУМ – (1) Quorum is a minimum number of people who have to be present at a meeting for it to go ahead and the decisions made by it to be valid. Usually, the quorum for a members' meeting is noted in a company's articles of association. The minimum number of members of an organized body legally competent to transact business in the absence of other members. Quorum is the minimum number of people which can attend a meeting (such as a Board Meeting) in order for the meeting to be official and for business to be properly conducted. For example, a Board of 5 persons may specify that a quorum for a meeting is 3 persons. Hence, if only 2 people show up, the meeting would not continue. / Под Кворумом, от Латинского слова Quorum, понимается установленное законом или уставами организаций или компаний число участников собрания, заседания, необходимое для принятия правомочных решений. Минимальное число человек, которые должны присутствовать на собрании для того, чтобы оно состоялось, а принятые им решения считались бы действительными (легитимными). Минимальное число участников организованного мероприятия или предприятия, которое в праве на всех законных основаниях проводить или осуществлять какие-либо операции при отсутствии остальных участников. Кворум – минимальное число людей, которые должны присутствовать на собрании для того, чтобы определённые решения вступили в силу. Кворум может требоваться на собрании совета директоров, акционеров, законодательных и других собраниях по любому решению, чтобы оно имело юридическую силу.

(2) Quorum is the percentage or proportion of voting shares required to be represented in person or by proxy to constitute a valid shareholders meeting, or the number of directors required to be present for a valid meeting of the board.

QUOTA = КВОТА – (1) Quota is an amount of something, e.g., goods, allowed to one person, or company, normally fixed by a body in authority. In general, any proportional share or part (such as a percentage). Proportional share of a total amount or quantity authorized by or demanded from a government. / Под Квотой, от позднелатинского слова Quota, в зависимости от контекста понимаются:- (i) доля участников картеля в производстве, сбыте или вывозе (или экспорте) продукции, в соответствии с которой между ними распределяется прибыль; (ii) величина налога, взимаемого с единицы обложения; и (iii) доля, часть, норма чего-либо допускаемого, например, привозная (или импортная) квота.

(2) Quota:- in taxation, sums to be paid by each local government or municipality and by each individual within that jurisdiction, based on a percentage of total revenues to be collected, and determined by the amount of spending to be financed.

(3) Quota:- a quantitative restraint imposed by an importing country on an exporting country, or established by agreement between the trading partners, which is designed to limit shipments of a product from the exporting to the importing country. A control system for imports, exports or production by specifying certain limitation. In the international trade, quotas on imports are a basic means of enforcing protectionism; by limiting purchases from abroad, excessive use of foreign currency reserves is prevented, and domestic industries are protected. Quotas may also be imposed on exports to ensure that adequate supplies of a product are available to

domestic industries at low prices. The quantity of goods that may be imported without restriction or additional duties or taxes during a set period of time.

QUOTAS AND QUOTA SYSTEM = СИСТЕМА КВОТ И КВОТИРОВАНИЯ – Quotas And Quota System:- absolute quotas permit a limited number of units of specified merchandise to be entered or withdrawn for consumption during specified periods. Tariff-rate quotas permit a specified quantity of merchandise to be entered or withdrawn at a reduced rate during a specified period. Quotas are established by the US Presidential Proclamations, Executive Orders or other legislation. The Quota System, a part of the US Customs' Automated Commercial System, controls quota levels (quantities authorized) and quantities entered against those levels. Visas control exports from the country of origin. Visa authorizations are received from other countries and quantities entered against those visas are transmitted back to them. Control of visas and quotas simplify reconciliation of other countries' exports and US imports.

QUOTA SHARE = ДОЛЯ КВОТЫ (или ВЫДЕЛЕНИЕ КВОТЫ) – Quota Share is the basic form of participating treaty whereby the reinsurer accepts a stated percentage of each and every risk within a defined category of business on a pro rata basis. Participation in each risk is fixed and certain.

QUOTA SHARE REINSURANCE = КВОТНОЕ ПЕРЕСТРАХОВАНИЕ – Quota Share Reinsurance is ideal for start-up Risk Retention Groups where the experience is less predictable or for programs which have a higher degree of volatility but which over a period of time are profitable. New Risk Retention Groups often may wish not to retain all the risk in the first year and often seek reinsurance on a quota share basis whereby a reinsurer pays the same proportion of losses that it receives in premium. For example, a 75.00% Quota Share Treaty describes an arrangement whereby a reinsurer pays 75.00% of all losses and is paid 75.00% of all premiums after commissions and expenses. The costs of acquiring and handling the business, known as Ceding Commission, are deducted from the premium passed to the reinsurer who normally also agrees to pay an additional commission based on the profits of the treaty. By reducing the amount to which the Risk Retention Group is exposed from any one loss to a level commensurate with the Risk Retention Group's capital base, the Risk Retention Group does not face financial ruin in the event of a large individual loss or series of losses. Quota Share reinsurers often pay a profit commission on underwriting profits once a certain profit level has been reached. Quota share reinsurance protects policies underwritten during a specific period until expiry or renewal, regardless of when losses occur. Form of proportional reinsurance in which a defined percentage of all risks held by the insurer in a specific line is reinsured. Quota Share Reinsurance is a form of reinsurance in which the ceding insurer cedes an agreed-on percentage of every risk it insures that falls within a class or classes of business subject to a reinsurance treaty. / Форма пропорционального перестрахования, при которой перестраховывается определённый процент всех принятых страховой компанией рисков по конкретном пределе удержания.

QUOTA SHARE TREATY = ТРАКТАТ О ВЫДЕЛЕНИИ КВОТ – Quota Share Treaty is a reinsurance treaty which provides that the reassured shall cede to the reinsurer a specified percentage of all the premiums that it receives in respect of a given section or all of its underwriting account for a given period in return for which the reinsurer is obliged to pay the same percentage of any claims and specified expenses arising on the reinsured account.

QUOTATION = РАСЦЕНКА (или КОТИРОВКА, или КУРС) – Quotation:- in the securities trade, highest price offered by a buyer and lowest price acceptable to a seller at any given time. Also known as Asked Quote, and Bid Quote. The actual price or the bid or ask price of either cash commodities or futures or options contracts at a particular time. Quotation:- the actual price or the bid or ask price of either cash commodities or futures contracts. / Под Котировкой, от Французского слова Coter, означающее Метить или Нумеровать, понимается установление курсов иностранных валют, ценных бумаг или цен товаров и сырья на бирже. Под Расценкой понимается установленная на что-нибудь цена; размер оплаты чего-нибудь. Под Курсом, от Латинского слова Cursus, означающее Бег или Движение, понимается цена, по которой покупаются и продаются акции, облигации и другие ценные бумаги.

QUOTATION = РАСЦЕНКА (или ПРЕЙСКУРАНТ) – (1) Quotation is an offer to sell goods at a stated price and under stated terms. / Предложение на продажу товаров по указанной цене и на указанных условиях. Под Прейскурантом, от Немецкого слова Preiskurant, понимается систематизированный сборник цен (тарифов) по группам и видам товаров и услуг. Прейскурант – наименование продукции и её цены.

(2) Quotation:- offer providing the price according to tariff for certain services to be provided or issued to a customer with specification on conditions for carriage. / Оферта, обеспечивающая цену согласно тарифу на определённые услуги, которые должны быть оказаны или предоставлены заказчику со спецификацией по условиям перевозки.

(3) Quotation:- in insurance, a statement of the premium that an underwriter requires to underwrite an insurance/reinsurance risk based on the information supplied by the person seeking cover, either directly or via their broker. A quotation may be conditional, e.g., it may be subject to the provision of further information, or not. If a quotation is accepted before it is withdrawn, then subject to the satisfaction of any conditions that may attach to the quotation, an insurance/reinsurance contract will be made.

QUOTATION LIST = РАСЦЕНОЧНЫЙ СПИСОК (или КОТИРОВАЛЬНЫЙ СПИСОК, или БИРЖЕВАЯ СВОДКА) – Quotation List:- publication listing the stock exchange prices of shares and bonds. / Публикация, перечисляющая цены на акции и облигации на фондовой бирже.

QUOTATIONS = РАСЦЕНКИ (или КОТИРОВКИ) – Quotations:- the price of cash transactions or futures contracts for a commodity at a specific time.

QUOTE = РАСЦЕНКА (или КОТИРОВАНИЕ, или РАСЦЕНИТЬ) – (1) Quote:- the highest bid to buy and the lowest offer to sell any asset at a given time. / Максимальное предложение на покупку и минимальное предложение на продажу любого актива в данное время.

(2) Quote is a statement by an insurer of the premium terms and conditions they will require for a particular insurance. / Котирование – изложение страховой компанией порядков и условий в отношении премии, которые потребуются для конкретного страхования.

QUOTE–DRIVEN MARKET = РЫНОК, ПРИВОДИМЫЙ В ДВИЖЕНИЕ РАСЦЕНКАМИ (или РЫНОК, ПРИВОДИМЫЙ В ДВИЖЕНИЕ КОТИРОВАНИЕМ) – Quote-Driven Market is a market where market makers set bid and ask prices and execute (buy and sell) orders. In Germany, Eurex® trading is based on this principle. Opposite:- Order-Driven Market. / Ойрэкс® или Юрэкс®.

- R -

R = AP. – (1) R is fifth letter of a NASDAQ® stock symbol specifying that the stock has rights. / Ар. (R) – пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что акция имеет права.

(2) R – declared or paid in the preceding 12 months plus stock dividend.

R = RESISTANT

R = RESTORER

R = ROMEO

R&D = RESEARCH AND DEVELOPMENT

R&O = RUST AND OXIDATION INHIBITED

RA = REGISTRATION AUTHORITY

RAA = RELIABILITY ASSURANCE AGREEMENT

RABATO = РЭБАТО – Rabato is a wide lace-edged collar of the early XVII century often stiffened to stand high at the back. Rabato, also spelled Rebato, wide, often lace-edged collar wired to stand up at the back of the head, worn by both men and women in the XVI and early XVII centuries. An example may be found in some of the portraits of Queen Elizabeth I, which often show her with a lace or gauze rabato rising up at the back of the neck in the shape of wings. The turned-back rabato was sometimes used as the support or base for a ruff, the crimped or pleated frill fashionable during the same period. The rabat collar was much smaller than the rabato, and the rabatine collar fell over the shoulders much like a cape. / большой отложной воротник.

RABBIT = КРОЛИК – Rabbit is an inexpensive fur often dyed to resemble other furs or for fashion impact. It is also called Coney, Cony, and Lapin. / Кони (Coney), Кони (Cony), и Ляпа (Lapin).

RABBIT HAIR = КРОЛИЧЬЯ ШЕРСТЬ – Rabbit Hair is the Angora Rabbit's fur. The hair of rabbits often is mixed with 'normal' fibers to give softness or an more illustrious texture to the finished fabric. Rabbit Hair (also called Rabbit Fur, Cony, Comb, Coney or Lapin) is the fur of the common Rabbit. It is most commonly used in the making of fur hats and coats, and is considered quite valuable. The hair of a rabbit can be divided into three types:- (i) guide hairs:- external hairs, long and rough; (ii) guard hairs (also called 'Barbes'):- four guard hairs surround each guide hair, sealing the coat; and (iii) down:- there are around sixty down hairs for each guide hair; they are very short and barely visible, and serve to insulate the rabbit. A selectively bred rabbit from the 1900s, the Castor Rex, has guard hairs of the same length as the down, but this is atypical. Rabbit hair is commonly considered a byproduct of the ordinary process of breeding rabbits for meat, and as such is manufactured in vast quantities in England and France; more than seventy million pelts a year in France alone. However, the quality of fur from these rabbits tends to be low, as the rabbits are slaughtered before reaching twelve weeks old and still have the infant coat. In temperate climates, the highest quality furs are obtained in winter from rabbits over five months old, when the thickness of the fur is even; at other times of year, varying degrees of hair shedding causes uneven patches in the fur. The coat is also at its thickest at this time of year. The highest quality pelts are suitable for clothing, and typically constitute less than half of all pelts collected. The hair of the Angora rabbit is plucked and used as fiber, rather than as pelts.

RAC = REGULATORY ADVISORY COMMITTEE

RACE = RESEARCH IN ADVANCED COMMUNICATIONS IN EUROPE

RACE = РАСА (или ПОРОДА) – Race is a genetically identical, sub-grouping of a pathogen Species based on an ability to overcome a particular gene, or set of genes, for resistance in a Plant host. Race is a genetically and often geographically distinct mating group within a Species; or a group of pathogens that infect a given set of Plant Varieties. / Генетически идентичное, подразделение патогенных (болезнетворных) видов, характеризующееся возможностью побеждать конкретный ген или набор генов по сопротивлению у множества растений.

RACEME = КИСТЬ (или ГРОЗДЬ) – Raceme (Latin:- Racemus = Bunch of Grapes) is an elongated cluster of pedicellate flowers on an unbranched inflorescence, with the basal flowers opening first. Raceme is a more or less conical inflorescence within flowers arising alternately from a common axis, the youngest towards the tip. / удлинённая гроздь из стебельковых цветков (расположенных на стебельке) на неветвящемся соцветии, с . В ботанике под Кистью понимается соцветие с удлинённой главной осью и цветками, развивающимися от основания к вершине (у Ландыша, Черёмухи).

RACE NON–SPECIFIC RESISTANCE = РЕЗИСТЕНТНОСТЬ К НЕСПЕЦИФИЧЕСКОЙ РАСЕ (или СОПРОТИВЛЯЕМОСТЬ К НЕСПЕЦИФИЧЕСКОЙ РАСЕ, или УСТОЙЧИВОСТЬ К НЕСПЕЦИФИЧЕСКОЙ РАСЕ) – Race Non-Specific Resistance is a resistance to all races of a pathogen. Synonymous with horizontal resistance. This form of resistance is commonly, but not necessarily, polygenic.

RACE PLATE = СКЛИЗ БАТАНА – Race Plate:- the flat part of the loom lay in front of the reed and along which the shuttle moves.

RACE–SPECIFIC RESISTANCE = РЕЗИСТЕНТНОСТЬ К СПЕЦИФИЧЕСКОЙ РАСЕ (или СОПРОТИВЛЯЕМОСТЬ К СПЕЦИФИЧЕСКОЙ РАСЕ, или УСТОЙЧИВОСТЬ К СПЕЦИФИЧЕСКОЙ РАСЕ) – Race-Specific Resistance is a resistance to some races of the pathogen but not to others. Synonymous with vertical resistance.

RACHILLA = ВТОРИЧНАЯ ОСЬ – Rachilla is the small axis below the lemma and palea, bearing the single floret. Rachilla (syn. Rhachilla, and Callus) is a diminutive axis between the rudimentary glumes, the sterile lemmas, and the fertile floret. It rarely branches. / Вторичная Ось соцветия злаков; Ось Колоска.

RACHIS = ОСЬ СОЦВЕТИЯ – Rachis is:- (1) the axis of a spike or raceme, or of a compound leaf; and/or (2) the elongated axis of a panicle.

RACK = СТЕЛЛАЖ – Rack is a metal framework in the warehouse used to store products several levels high.

RACK = XX (или РЕЙКА, или ДЕРЖАВКА, или ПОДСТАВКА, или СТОЙКА, или СЕТКА) – Rack is a warp-knitting measure consisting of 480 courses. Tricot fabric quality is judged by the number of inches per rack.

RACKED ACROSS DECKBOARDS = СЛОМАНО ПОПЕРЁК ДОСОК НАСТИЛА – Racked Across Deckboards:- output from the Pallet Design System© (PDS©) program describing the maximum load carrying capacity and deflection of a pallet where the rack frame supports the pallet only at the ends of the deckboards. See also Pallet.

RACKED ACROSS LENGTH = ВЫЛОЖЕНО ПО ДЛИНЕ (или УКЛАДКА ПО ДЛИНЕ) – Racked Across Length (RAL) is xxxxx. / Укладка По Длине (Racked Across Length (RAL)):- укладка грузовых единиц на продольные брусья или продольные доски (RAS) таким образом, чтобы продольные брусья, продольные доски и нижний настил воспринимали всю нагрузку.

RACKED ACROSS STRINGERS = СЛОМАНО ПОПЕРЁК XX – Racked Across Stringers:- output from the Pallet Design System© (PDS©) program describing the maximum load carrying capacity and deflection of a pallet where the rack frame supports the pallet only at the ends of the stringers or stringer boards. See also Pallet.

RACKED ACROSS LENGTH = ВЫЛОЖЕНО ПО ШИРИНЕ (или УКЛАДКА ПО ШИРИНЕ) – Racked Across Length (RAL) is xxxxx. / Укладка По Ширине (Racked Across Width (RAW)):- укладка на доски настила (RAD) таким образом, чтобы доски настила и нижний настил воспринимали всю нагрузку.

RACKED STITCH = XX СТЕЖОК (или ПЕТЛЯ) – Racked Stitch is a knitting stitch that produces a herringbone effect with a ribbed back. It is employed in sweaters for decorative purposes or to form the edge of garments. The racked stitch is a variation of the half-cardigan stitch; it is created when one set of needles is displaced in relation to the other set.

RACKING = СЦЕЖИВАНИЕ (или РАСТЯЖЕНИЕ, или XX) – Racking is a term referring to the side-to-side movement of the needles of the needle bed of a knitting machine. Racking results in inclined stitches and reduced elasticity. / вязальной машины.

RACKING = УКЛАДКА (или XX) – Racking is xxxxx. See also Stacking. / Укладка (Racking):- размещение единиц грузов на автономных (передвижных) стеллажах или консольных стеллажах со свободными безопорными пролётами. Смотрите также Штабелирование (Stacking).

RACK PRICE = ОПТОВАЯ ЦЕНА (или ЗАДРАННАЯ ЦЕНА) – In the US oil industry, Rack Price, the published bulk rate paid at a city loading terminal by a tanker-load buyer without a long term supply contract. See also Wholesale Price. Price charged by a supplier to a customer that buys transport truck lots at a terminal, on a free on board basis. / Под Оптовой Ценой понимается цена, по которой производственное предприятие или сбытовая организация реализуют свою продукцию. В бывшем СССР различали оптовую цену предприятия и оптовую цену промышленности на многие товары народного потребления (в лёгкой, пищевой и нефтяной промышленности). Оптовая цена используется в обороте между изготовителями товаров и оптовыми торговцами, а также оптовыми и розничными торговцами.

RACK RENT = ЗАДРАННАЯ РЕНТА – Rack Rent is a rent that would be received from a building if it were subject to an immediate open market rental review. This may be different from the rent actually being received.

RAD = РАД – Rad (rd) is a metric unit measuring radiation dose. One rad is equal to a dose of 0.01 Joule of energy per kilogram of mass (J/kg), or 100 ergs of energy per gram of mass. The SI unit of radiation dose is the Gray (Gy); one rad equals 0.01 Gray or 1 centiGray. 'Rad' is an acronym for 'radiation absorbed dose'. Rad is a unit of measure of absorbed doses of ionizing radiation, which represents absorption equal to 100 ergs of energy per gram of irradiated material. A rad is an acronym for radiation absorbed dose and is a unit of absorbed dose. / Под Радом понимается внесистемная единица поглощённой дозы ионизирующих излучений; соответствует энергии излучения 100 эрг, поглощённой веществом массой 1 грамм. Обозначение:- рад. 1 рад = 0.01 Дж/кг = $2.388 \cdot 10^{-6}$ кал/г.

RADIAL = РАДИАЛЬНОЕ – Radial:- peripheral or positioned around the edges. In the Cactaceae, a spine positioned on the periphery of an areole. / Под Радиальным, от Латинского слова Radius, означающее Луч или Радиус, понимается направленный, расположенный по радиусу, лучевой. Радиальные, то же, что Кишечнополостные.

RADIAL SYMMETRY = РАДИАЛЬНАЯ СИММЕТРИЯ – Radial Symmetry:- of flowers which can be cut into equal halves along many axes passing through the flower center. / Под Радиальной Симметрией, от Латинского слова Radius, означающее Луч или Радиус, и Греческого слова Symmetria, означающее Соразмерность, понимается .

RADIAL TIRE = РАДИАЛЬНАЯ ШИНА – Tire Construction:- the geometry of the various layers of tire fabric in the final tire. Three constructions are commonly used:- (i) Bias Tire; (ii) Radial Tire:- in a radial tire, tire fabric traverses the body of the tire at 90° to the tread direction. Atop the tire fabric are laid alternating narrow layers of fabric at low angles of 10 to 30° to the tread direction; the belt that is formed around the tire body restricts the movement of the body. (iii) Bias/Belted Tire. See also Bias Tire, Bias/Belted Tire, and Tire Construction.

RADIANT ENERGY = ЛУЧИСТАЯ ЭНЕРГИЯ – Radiant Energy is the form of energy consisting of the electromagnetic spectrum that travels at 115.890 kilometers/s (186.500 miles/s) through a vacuum, reducing this speed in denser media (air, water, glass, etc). The nature of radiant energy is described by its wavelength or frequency, although it also behaves as distinct quanta ('corpuscular theory'). The various types of energy may be transformed into other forms of energy (electrical, chemical, mechanical, atomic, thermal, radiant) but the energy itself cannot be destroyed.

RADIANT PANEL TEST = ТЕСТ В СИЯЮЩЕЙ ПАНЕЛИ – The Radiant Panel Test is a small-scale instrument used to measure combustibility and flame propagation of materials subjected to a high heat flux. The test is used to qualify building materials, most commonly industrial flooring. In some cases it is also used to qualify materials for use in public transportation, such as railroads, subways and commercial aircraft (see related story). In the radiant panel test, described by ASTM E-162, the heat source is a 12 by 18 inch electrically heated panel, which is placed in front of an inclined 6 by 18 inch specimen. The specimen is oriented so that ignition (by electric spark) is forced near the upper edge with the flame front progressing downward. The factor derived from the rate of flame front progression (ignition properties) and another relating to the rate of heat release are combined to provide a flame spread index. Provision is sometimes made for measuring the smoke evolved during the test, but more commonly, smoke generation is measured separately according to ASTM E662, the NBS smoke chamber. Radiant Panel Test is an ASTM International (formerly known as the American Society for Testing and Materials (ASTM)) standard method of test for the surface flammability of a material, using a radiant heat source. See also Flammability Tests. Radiant Panel Test is a test for the flammability of carpets or rugs in which the specimen is mounted on the floor of the test chamber and exposed to intense radiant heat from above. The rate of flame spread is assessed. / Американское Общество по Испытаниям и Материалам (АОИМ). Смотрите также Тесты На Воспламеняемость (Flammability Tests). распространение или продвижение (propagation).

RADIATING = ЛУЧЕОБРАЗНО РАСХОДЯЩЕЕСЯ (или ЛУЧЕИСПУСКАЮЩЕЕ) – Radiating:- spreading from the center. Radiating:- positioned outwards. / , от Латинского слова Radio, означающее Излучаю, .

RADIATION CLASS = РАДИАЦИОННЫЙ КЛАСС – Radiation Class:- radiation conditions calculated on the basis of the measured duration of sunshine and solar altitude for 10 day measurement periods. / Радиационные условия рассчитываются на основе .

RADICLE = КОРЕШОК – Radicle is the embryonic primary root unsheathed by the coleorhiza and the root cap, persisting only for a short time after germination. Radicle is an embryonic root. Radicle is the embryonic primary root ensheathed by the coleorhiza and the root cap, persisting only for a short time after germination. / эмбрионный первичный корень, колеоризой (корневым влагалищем) и

корневым чехликом, . эмбрионный корешок или зародышевый или корень. Под Радикалом, от Латинского слова Radix, означающее Корень, понимается сторонник коренных, решительных мер.

RADIO FREQUENCY = РАДИОЧАСТОТА – Radio Frequency (RF):- a data system made up of devices that use RF to transmit information into a host system from different locations or from 'on the job'. Radio Frequency (RF) scanning and transmission of data.

RADIO–FREQUENCY DRYING = РАДИОЧАСТОТНАЯ СУШКА – Radio-Frequency Drying:- use of radio-frequency (RF) electromagnetic radiation for drying textiles. The application of RF to wet goods results in the selective heating of the water, which has a partial polarity, because the molecule must do work to align in the RF field causing heat generation within the water droplets. Non-polar materials, i.e. fabrics, are unaffected. RF drying in very uniform and energy efficient when airflow patterns through the dryer are properly designed and controlled.

RADIO FREQUENCY GUN = РАДИОЧАСТОТНЫЙ ПИСТОЛЕТ – Radio Frequency Gun (RF Gun):- a hand-held radio frequency terminal with a screen, a keypad, and a scanner that is used by warehouse personnel to scan pallet tags and location tags.

RADIO FREQUENCY IDENTIFICATION = РАДИОЧАСТОТНАЯ ИДЕНТИФИКАЦИЯ – Radio-Frequency Identification (RFID) involves a chip with an antenna that when activated by a reader, can sendor receive information. It has several advantages over bar codes, foremost that it can be read with out a line of sight to an item, making it much easier to get automated reads and to do so in large quantities instead of one by one. Placing a reader at the entrance to a distribution center, a stockroom, or even a trash compactor will make tracking goods easier and more automated. Radio Frequency Identification (RFID) is an alternative to barcodes, an RFID is a device on an object used to transmit data to an RFID receiver. RFIDs vary in size depending on the object and hold more data than the standard barcode. They are also advantageous because the data stored on the RFID can be easily changed as they do not require line-of-site in order to transfer this data. Radio-Frequency Identification (RFID) is a technology to record the presence of an object using radio signals. It is used for inventory control or timing sporting events. RFID is not a replacement for the barcoding, but a complement for distant reading of codes. The technology is used for automatically identifying a person, a package or an item. To do this, it relies on RFID tags. These are small transponders (combined radio receiver and transmitter) that will transmit identity information over a short distance, when asked. The other piece to make use of RFID tags is an RFID tag reader. An RFID tag is an object that can be applied to or incorporated into a product, animal, or person for the purpose of identification and tracking using radio waves. Some tags can be read from several meters away and beyond the line of sight of the reader. Most tags carry a plain text inscription and a barcode as complements for direct reading and for cases of any failure of radio frequency electronics. Most RFID tags contain at least two parts. One is an integrated circuit for storing and processing information, modulating and de-modulating a radio-frequency (RF) signal, and other specialized functions. The second is an antenna for receiving and transmitting the signal. There are generally two types of RFID tags:- active RFID tags, which contain a battery, and passive RFID tags, which have no batteries. Uses:- RFID systems are used for the following:- (i) general transport (logistics), tracking a package, parcel; replacing barcodes; (ii) tracking vehicles for road toll; (iii) many countries have started using RFID chips in passports; (iv) making products harder to falsify; currently proposed for drugs; (v) tags in clothing, e.g., in Jeans; (vi) sealing for containers (for the shipping industry); not required yet; (vii) identifying animals; used for tracking pets, but also for research, for example on turtles; (viii) keys for vehicles; the vehicle key has an RFID tag inside; only the key with the right RFID tag can start the vehicle (this makes copying vehicle keys harder); also used for locking/unlocking vehicles from a distance; (ix) contact-less identity cards, for example to regulate entry into certain areas; also used for ticketing, or public transport; (x) transponder timing of sporting events; (xi) marking attendance of students.

RADIO OPERATOR = РАДИСТ (или РАДИО ОПЕРАТОР) – Radio Operator (radio department):- maintains and monitors radio, sends and receives messages. Often maintains electronic navigation equipment. Radio Operator is an officer who operates and controls the shipboard communication equipment. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

RADPC = RELATIVE AREA UNDER DISEASE PROGRESS CURVE

RAES = RETAIL AUTOMATIC EXECUTION SYSTEM

RAFFIA = РАФИЯ – Raffia:- also called Raffia Palm, is a Palm Tree, Raphia Ruffia, native to Madagascar, that has large plumelike leaves, the stalks of which yield a useful fiber. Raffia is a vegetable fiber produced from the Raffia Palm. Raffia is the fiber obtained from this plant, used for tying, weaving, etc. Raffia is an African Palm Tree (Raphia Ruffia) having large leaves that yield a useful fiber. The Raffia Palms (Raphia) are a Genus of twenty Species of Palms native to tropical regions of Africa, and especially Madagascar, with one Species (Raphia Taedigera) also occurring in Central and South America. They grow up to 16 m (52.5 ft) tall and are remarkable for their compound pinnate leaves, the longest in the Plant Kingdom; leaves of Raffia regalis up to 25 m (82.38 ft) long and 3 m (9.84 ft) wide are known. The plants are either monocarpic, flowering once and then dying after the seeds are mature, or hapaxanthic, with individual stems dying after fruiting but the root system remaining alive and sending up new stems. Raffia is the leaf fibers of this plant, used for mats, baskets, and other products. Raffia is a Palm, Raphia Ruffia, of Madagascar, having pinnate leaves that yield a strong, flexible fiber. / Рафия, Род Пальм с очень крупными (длиной до 15–20 метров) перистыми листьями. Около 30 Видов в тропиках Америки, Африки, на Маскаренских Островах. Из соцветий некоторых Видов Рафии получают сахарный сок, идущий на изготовление вина, а из листьев и их черешков – волокно (Рафия и Пиассава). Рафия (Raphia), Род Растений Семейства Пальм. Одноствольные или с многочисленными стволами Пальмы высотой 9–12 метров (м). Листья перистые, длиной до 15–20 м. Соцветия крупные (диаметр 4–5 м), ветвистые, несут пестичные и тычиночные цветки. Плоды с волокнистой оболочкой. После плодоношения Рафии отмирают (смотрите Монокарпические Растения). Около 30 Видов, в тропической Африке, на Мадагаскаре, Маскаренских Островах и в Южной Америке. Все виды Рафии содержат в листьях и черешках прочное волокно (пиассава), из которого изготовляют щётки и различные плетёные изделия; волокно из листьев так называемой Винной Пальмы, Рафии Текстильной (Raphia Textilis), Рафии Мадагаскарской (Raphia Ruffia) и других используют для технических тканей и как перевязочный материал в садоводстве.

RAFFIA STRAW = СОЛОМА РАФИЯ – Raffia Straw:- a large Palm Tree grows leaves that can be stripped and dried to create raffia strands. Like jute or hemp twine, this is a natural fiber that can be woven like straw, tied like silk ribbons, or packed like foam. Milliners, crafters, and florists enjoy using the grass-like material for a variety of projects and gifts. The creamy-brown colored lengths come from a specific palm tree that originally grew only on the island of Madagascar. Raphia farinifera actually has the largest leaves of any palm tree, so it is a logical source for fiber. The fibrous leaves are cut off and torn apart in parallel lines to yield very long strips of material. The tree is now cultivated specifically for harvest and export in East Africa, as well. Crafters value raffia for being soft, durable, and easy to dye. It can take the place of cord, grass, leaves, fabric, ribbon, stuffing, floral string, and even paper. A wide variety of hats, mats, baskets, bags, and twine are made from this natural material. Often, it is invaluable to outdoor projects because it doesn't shrink with moisture, yet is pliable enough to weave. Several examples of common applications show how versatile and creative raffia can be in embellishing gifts, centerpieces, and seasonal projects. For instance, someone can tie it around packages for an organic, rustic

touch. A ribbon effect will look especially good if the gift wrap is handmade paper with pressed flowers, brown craft paper, or earth toned tissue. Since it comes naturally dyed in every color from sea green to deep burgundy, it also dresses up unwrapped presents like a book, bag of coffee, candles, or bottle of wine. Crafters can use this material to braid together lengths of vegetables, such as garlic or onions, to create hanging autumn decorations in the kitchen. Wreaths for any time of the year can be trimmed with bows or sprays of this versatile fiber. Just as a person could arrange peat moss on top of the soil of a potted plant, she could nestle fluffy raffia around the stems in a color that complements the blossoms. When intertwined to form a loose fabric, raffia weaves into straw hats for gardening, squares for place mats, or a matte for the background of a framed photograph. Woven gift bags made from this material allow the receiver to get a subtle peak into the contents, whether they are wrapped chocolates or seashells. Shredded fiber can line Easter baskets or a tray of decorative gourds. See also Straw. / Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

RAFTER = СТРОПИЛО (или СТРОПИЛЬНАЯ НОГА) – Rafter is one of a series of structural members of a roof designed to support roof loads. / Под Стропилом понимается опора для кровли, выполненная из двух брусов, соединённых верхними концами под углом, а нижними упирающимися в стену здания.

RAG = RESTRICTED ARTICLES GUIDE

RAG DECLARATION = RESTRICTED ARTICLES GUIDE DECLARATION

RAGGED EDGES = РВАНЫЕ КРАЯ – Ragged Edges:- usually occurs where knives on automatic buttonhole machines do not clip smoothly. Sewing Room Defects. / Порок или дефект швейного производства.

RAGGED/INCONSISTENT EDGE = РВАНЫЙ/СБИВЧИВЫЙ (или НЕПОСЛЕДОВАТЕЛЬНЫЙ) КРАЙ – Ragged/Inconsistent Edge:- where the edge of the seam is either extremely ‘ragged’ or ‘rolls’ inside the stitch. Recommended Solutions to ragged/inconsistent edge:- (1) make sure the sewing machine knives are sharpened and changed often; (2) the knives should be adjusted properly in relationship to the ‘stitch tongue’ on the needle plate to obtain the proper seam width or width bite. Fabrics defect.

RAGGED STUNT = НЕРОВНАЯ ЧАХЛОСТЬ (или НЕРОВНАЯ КАРЛИКОВОСТЬ, или НЕРОВНАЯ ОСТАНОВКА В РОСТЕ, или НЕРОВНАЯ ЗАДЕРЖКА В РОСТЕ) – Ragged Stunt is a viral disease of Rice transmitted by the Brown Planthopper Nilaparvata Lugens. The diseased Rice Plants are characterized by the presence of ragged and twisted leaves, vein swellings, and nodal branches. There is delay in flowering and incomplete emergence of panicles; the panicles bear mostly unfilled grains. / , жилистые .

RAGLAN = РАГЛЭН (или РЕГЛАН, или ПАЛЬТО РЕГЛАН) – Raglan is a loose overcoat with raglan sleeves. / пальто реглан.

RAGLAN SLEEVE = РУКАВ РАГЛЭН (или РУКАВ РЕГЛАН) – Raglan Sleeve is a sleeve whose shoulder seam extends, slanted, from the neckline to the underarm.

RAG RUG = ЛОСКУТНЫЙ КОВРИК – Rag Rug is a rug woven with strips of cotton, wool, or synthetic fabrics used as the filling on a cotton or synthetic yarn warp. Rag rugs are made by hand and machine and, with the exception of some hand-made antique rag rugs, are usually the most inexpensive rugs. Rag Rug is a floor covering woven with strips of twisted rags made of cotton, wool, ьr synthetic fabrics braided, crocheted, or bound and used as the filling on a cotton or synthetic yarn warp. Rag rugs are made by hand or machine, and with the exception of some handmade antique rags, usually are the most inexpensive rugs. / как уточина .

RAG TOP = С ТРЯПОЧНЫМ ВЕРХОМ (или ЛОСКУТНЫЙ ВЕРХ, или С ТЕНТОВАННОЙ КРЫШЕЙ, или С КРЫШЕЙ ИЗ ТЕНТА, или ‘МЕШОК’) – Rag Top is a slang term for an open-top trailer or container with a tarpaulin cover. / Жаргонный термин для обозначения прицепа или контейнера с открытым верхом, прикрываемым брезентовым тентом или тентом из искусственной кожи.

RAIDER = ЗАХВАТЧИК (или НАЛЁТЧИК) – Raider is a person or firm that preys on underperforming companies against the will of their management. Individual or legal entity that acquires control over corporations without the consent of their board of directors, through public takeover bids. Person or group initiating a hostile take-over by buying quantities of the target company’s share.

RAIL = СКРЕПКА (или ПОПЕРЕЧИНА) – Rail is a fixed or removable horizontal component of a post pallet connected to the posts. See also Pallet. / Поперечина (Rail): Горизонтальная деталь стоечного поддона, соединяющая стойки поддона, жёстко закреплённая или съёмная. Смотрите также Поддон (Pallet).

RAIL CAR = ЖЕЛЕЗНОДОРОЖНЫЙ ВАГОН – Rail Car is a wheeled wagon used for the carriage of cargo by rail. See also Wagon. / Передвигаемый на колёсах вагон, используемый для перевозки грузов по железной дороге.

RAIL CONSIGNMENT NOTE = ДОРОЖНАЯ ВЕДОМОСТЬ – Rail Consignment Note is a document evidencing a contract for the transport of goods by rail. / Документ, свидетельствующий о контракте на перевозку грузов по железной дороге.

RAIL DIVISION = СУММА ЗА ПЕРЕВОЗКУ ПО ЖЕЛЕЗНОЙ ДОРОГЕ – Rail Division:- the amount of money an ocean carrier pays to the railroad for overland carriage. / Сумма денежных средств, которую океанский перевозчик выплачивает железной дороге за наземную перевозку.

RAIL GROUNDING = ВРЕМЯ НА РАЗГРУЗКУ – Rail Grounding:- the time that the container was discharged (grounded) from the train. / Время, в течение которого контейнер разгружается (сгружается) из поезда.

RAILHEAD = ЖЕЛЕЗНОДОРОЖНЫЙ ПЕРЕВАЛОЧНЫЙ ПУНКТ (или ЖЕЛЕЗНОДОРОЖНЫЙ УЗЕЛ) – Railhead:- location for loading and unloading containers at railroad terminal. / Под Железнодорожным Узлом понимается пункт, в котором сходятся или пересекаются несколько железнодорожных линий; совокупность железнодорожных станций, подходов к ним и соединительных ветвей. Основные функции:- пропуск транзитных поездов, погрузка и выгрузка грузов, передача поездов и вагонов между станциями узла, пересадка пассажиров и другие. В больших городах железнодорожные узлы иногда имеют окружную железную дорогу, соединяющую станции узла. Под Грузовым Двором понимается часть территории железнодорожной станции, где производят приём, погрузку и выгрузку грузов, их хранение. На грузовом дворе расположены склады, весы, погрузочно-разгрузочные средства, платформы и грузовые площадки (в том числе для переработки контейнеров, тяжёлых грузов).

RAIL–MOUNTED GANTRY CRANE = КОЗЛОВЫЙ КРАН НА РЕЛЬСОВОМ ХОДУ (или (КОНСОЛЬНЫЙ) ПЕРЕГРУЖАТЕЛЬ НА РЕЛЬСОВОМ ХОДУ) – A mobile gantry crane running on tracks. It is often used to transfer and stack containers within container terminals. Rail-Mounted Gantry (RMG) Crane is a specialized yard container handling machine. It can travel on rail by means of the yard power, and lift and stack containers in the yard area with the equipment of the 20’ or 40’ telescopic spreader (or twin-lift spreader if needed). Compared with the rubber-tyred gantry crane (RTG), the RMG has the advantages of being driven by electrical power, clean, bigger lifting capacity, and high gantry traveling speed with cargo. / Козловый Кран (Gantry Crane) – грузоподъёмный кран в виде

моста на жёстких опорах (козлах), передвигающийся по наземному рельсовому пути или бетонному основанию. Пролётное строение (мост) козлового крана перекрывает при движении прямоугольную пощадь, на которой производят погрузочно-разгрузочные работы (на открытых складских и монтажных площадках, а также на заводских территориях). На мосту устанавливается и передвигается грузовая тележка или таль с грузозахватным приспособлением. Применяют для обслуживания открытых складов и в строительстве. Грузоподъёмность 3–50 тонн, иногда до 800 тонн, пролёты кранов общего назначения 4–40 метров, иногда до 170 метров. Под Консольным Краном (Cantilever Crane) понимается передвижной или стационарный грузоподъёмный кран с поворотной либо неподвижной консолью, по которой передвигается грузовая тележка или таль. Передвижные консольные краны перемещаются по рельсам, расположенным один за другим. Консольный Кран (Cantilever Crane) – передвижной или стационарный грузоподъёмный кран с поворотной либо неповоротной консольной фермой, по которой передвигается грузовая тележка или таль, перемещая грузы в вертикальном и горизонтальном направлениях. У консольных кранов с неповоротной фермой грузовая тележка передвигается по консоли, подкрановый путь не занимает площади больше цеха, поэтому такие краны нашли применение на различных промышленных предприятиях. Консольные краны с поворотной фермой имеют много конструктивных вариантов. К ним относятся велосипедный кран, кран на колонне, кран-укосина, мачтовый кран и другие. Передвижные консольные краны перемещаются по рельсам, расположенным один под другим. Консольные краны широко используются на машиностроительных заводах, стройках и в портах. Грузоподъёмность консольного крана 4–10 тонн.

RAIL PIG = СЪЁМНЫЙ АВТОМОБИЛЬНЫЙ КУЗОВ (или ЖЕЛЕЗНОДОРОЖНЫЙ КОНТЕЙНЕР, или КОНТРЕЙЛЕР) – Rail Pig is a railroad-owned container (trailer). / Контейнер (прицеп), принадлежащий железной дороге. Под Контрейлером, от сочетания Латинского слова Con (Cum), означающее Вместе или Заодно, и Английского слова Trailer, означающее Волочащий или Тащущий, понимается контейнер, оборудованный колёсами с пневматическими шинами и предназначенный для перевозки грузов на железнодорожных платформах и их перемещения при помощи автотягача по шоссейным дорогам. Грузоподъёмность контрейлеров находится в диапазоне от 6 до 30 тонн. Под Контрейлером понимается контейнер, оборудованный колёсным ходом с пневматическими баллонами автомобильного типа. Предназначен для смешанных (комбинированных) автомобильно-железнодорожных, автомобильно-водных или автомобильно-водно-железнодорожных перевозок грузов. Контрейлер изготовляется, как правило, в виде автомобильного полуприцепа с закрытым или открытым кузовом (универсальным или специализированным) ёмкостью свыше 15 кубических метров ($м^3$) и грузоподъёмностью от 6 до 30 тонн (т). Буксировка по автомобильным дорогам, а также установка и снятие контрейлеров с железнодорожных платформ и специальных судов производятся автотягачами седельного типа. Контрейлеры бывают с постоянной и подкатной ходовой частью (тележкой), которая может быть одноосной, двухосной и трёхосной. Контрейлеры с постоянной ходовой частью на железнодорожных платформах крепятся специальными устройствами; контрейлеры со съёмными тележками крепления, как правило, не требуют. Разновидность контрейлеров – Стриктейнеры – контейнеры с сочленёнными кузовами. Известны также транспортные средства с комбинированной ходовой частью, приспособленной для движения по автомобильным дорогам и рельсовым путям (что достигается взаимозаменяемостью железнодорожных и автомобильных колёс или укреплением специальных стальных бандажей с ребордами на автомобильных колёсах). Их нередко называют Роудрейлерами. Массовое развитие перевозок грузов в крупнотоннажных контейнерах показало, что их применение более экономично и перспективно, чем применение контрейлеров.

RAIL RAMP = ЖЕЛЕЗНОДОРОЖНАЯ РАМПА – Rail Ramp is an inclined path used to unload rail cars or trailers. Railroad terminal where containers are received or delivered and trains loaded or discharged. Originally, trailers moved onto the rearmost flatcar via a ramp and driven into position in a technique known as ‘Circus Loading’. Most modern rail facilities use lifting equipment to position containers onto the flatcars. / и поезда загруженные или разгруженные.

RAILROAD AND RAILWAY SERVICES = УСЛУГИ ДЛЯ ЖЕЛЕЗНЫХ ДОРОГ И ЖЕЛЕЗНОДОРОЖНЫХ ПУТЕЙ – Railroad And Railway Services include electricity supplied and services rendered to railroads and interurban and street railways for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

RAILROADED = ПОД ЖЕЛЕЗНУЮ ДОРОГУ – A term Railroaded refers to the orientation of the pattern on the fabric that usually describes a vertical, sideways or horizontal stripe pattern.

RAILROAD FREIGHT STATION = ГРУЗОВАЯ ЖЕЛЕЗНОДОРОЖНАЯ СТАНЦИЯ – In the United States, a Railroad Freight Station (RFS) provides for the handling of less than container load cargo. / В Соединённых Штатах Америки, Грузовая Железнодорожная Станция (ГЖС) обеспечивает переработку грузов, доставляемых партиями меньше полной загрузки контейнера.

RAILROAD THROUGH BILL OF LADING = КОНТРЕЙЛЕРНЫЙ СКВОЗНОЙ КОНОСАМЕНТ – Railroad Through Bill Of Lading:- the railroad in the United States will issue a through export bill of lading (when goods originate in stipulated places in the United States usually in the Midwest) for delivery overseas out of US West Coast ports.

RAILS = РЕЛЬСЫ (или ПЕРЕКЛАДИНЫ, или ПОПЕРЕЧИНЫ, или ПЛАНКИ, или РЕЙКИ) – Rails are the metal bars on which the spindles of a downtwister are mounted.

RAIL TERMINAL = ЖЕЛЕЗНОДОРОЖНЫЙ ТЕРМИНАЛ – Rail Terminal:- location where railroad cars are parked and/or turn around. / Местоположение, где паркуются и/или разворачиваются железнодорожные вагоны.

RAIL YARD = ЖЕЛЕЗНОДОРОЖНЫЙ ДВОР – Rail Yard:- location where rail cars are concentrated for loading and unloading of containers. / Местоположение, где железнодорожные вагоны концентрируются для погрузки или выгрузки контейнеров. Под Грузовым Двором понимается часть территории железнодорожной станции, где производят приём, погрузку и выгрузку грузов, их хранение. На грузовом дворе расположены склады, весы, погрузочно-разгрузочные средства, платформы и грузовые площадки (в том числе для переработки контейнеров, тяжёлых грузов).

RAINCOAT = ДОЖДЕВИК (или ПЛАЩ, или НЕПРОМОКАЕМОЕ ПАЛЬТО) – Raincoat is a coat of waterproof or water-resistant material.

RAINFED FIELD = БОГАРНОЕ ПОЛЕ (или НЕОРОШАЕМОЕ ПОЛЕ) – Rainfed Field is an unirrigated field surrounded by levees and depending on rainfall for moisture supply. / Под Богарой (Богара), от Персидского слова Бехар, означающее Весна, понимаются земли в зоне орошаемого земледелия, на которых сельскохозяйственные культуры возделывают без полива. Урожайность их зависит главным образом от количества и времени выпадения осадков, температуры воздуха и других условий; поэтому на Богаре выращивают засухоустойчивые зерновые, кормовые и бахчевые растения. Богарное земледелие имеет большое экономическое значение, так как позволяет использовать неудобные для орошения участки. Распространено главным образом в предгорьях и на окраинах оазисов Афганистана, Ирана, Китая, Индии, Пакистана, Судана, Турции других

стран; на территории бывшего Союза Советских Социалистических Республик (СССР) – в республиках Средней Азии, на Юге Казахстана, в Закавказье.

RAINFED LOWLAND = БОГАРНАЯ НИЗМЕННОСТЬ (или НЕОРОШАЕМАЯ НИЗМЕННОСТЬ) – Rainfed Lowland:- bunded fields where water depth does not exceed 50 cm for more than 10 consecutive days and the fields are inundated for at least part of the season. Such fields have no access to an irrigation system, but may have on-farm rainwater conservation facilities. / сохранение (conservation).

RAINFED RICE = БОГАРНЫЙ РИС (или НЕОРОШАЕМЫЙ РИС) – Rainfed Rice is a Rice grown on leveled bunded fields to allow an accumulation of flood water on the surface during heavy rains. Grown in areas that depend entirely on rain for moisture for its water supply.

RAINFOREST = ДОЖДЕВОЙ ЛЕС – Rainforest is a complex very rich community in tropical habitats with very high rainfall, dominated by trees generally supporting many epiphytes and lianas. See also Forest. / Смотрите также Лес (Forest).

RAINGROWN COTTON = ХЛОПЧАТНИК, ВЫРАЩЕННЫЙ ЗА СЧЁТ ДОЖДЕВЫХ ОСАДКОВ – Rain-Grown Cotton is a Cotton grown in areas where rainfall is sufficient and irrigation is not needed. Cotton grown using mainly water provided by the natural cycle of rainfall rather than artificial irrigation. Also known as Dryland Cotton. / Хлопчатник, выращенный за счёт дождевых осадков, это Хлопчатник, выращенный в местностях, где дождевые осадки достаточны и ирригации не требуется. Хлопчатник, выращенный главным образом за счёт использования естественного цикла дождевых осадков, нежели искусственного орошения. Известен также как Богарный Хлопчатник или Хлопчатник с Неорошаемых Земель (Dryland Cotton).

RAINSTICK = РЭЙНСТИК (или ДОЖДЕВАЯ ПАЛКА, или ДЕРЕВО ДОЖДЯ) – Rainstick:- many traditional cultures believed the sound of falling rain that rainsticks made could produce a storm. Although that belief has faded from contemporary society, rainsticks are still used to this day. The instrument is usually made from a long, hollow tube filled with pebbles or beads. Walls of the tube are stick with iron nails, cactus needles or something similar. When the stick is turned over, it produces the sound of falling rain. Rainsticks may also be made with other common materials like paper towel rolls instead of cactus, and nails or toothpicks instead of thorns and are often sold to tourists visiting parts of Latin America, including the Southern United States. Rainstick is a musical percussive instrument made from a hollowed-out stem of a woody cactus, chiefly Echinopsis chiloensis and Eulychnia acida from Chile, filled with small pebbles or sand and sealed at both ends. Spines are inserted to make baffles within the hollow stem. Large numbers of rainsticks are exported from Chile to the United States and Europe as curiousities. / бисеринки или бусинки или шарики (beads).

RAINWEAR = НЕПРОМОКАЕМОЕ (или ДОЖДЕВИК) – Rainwear is a water-resistant or waterproof apparel, such as a raincoat car rain boots. Rainwear is waterproof or water-resistant clothing.

RAISED GRAIN = ПРИПОДНЯТОЕ РАСПОЛОЖЕНИЕ ВОЛОКОН (или ПРИПОДНЯТАЯ УЗОРЧАТОСТЬ ДРЕВЕСИНЫ) – Raised Grain:- a roughened condition of the surface of dressed lumber in which the hard latewood is raised above the softer early wood but not torn loose from it. / поверхности строганного пиломатериала, .

RAISING = ВОРСОВАНИЕ (или ОТБОЙКА ВОРСА, или ПОДНЯТИЕ ВОРСА) – Raising is the process of forming a nap on the fabric by scratching or brushing. Raising is another term for brushing, gigging, napping, or scratching. See also Napping. / поднятие ворса перпендикулярно к полотну ткани или отбойка ворса или очистка ткани щёткой (brushing), ворсовка ворсовальными шишками (gigging), ворсование или ратинирование (napping), или xxxxx (scratching). Ворсование – извлечение на поверхность ткани или трикотажа концов отдельных волокон с целью образования приподнятого (как у бобрика) или лежащего (как у байки) начёса – ворса. Ворсование выполняется на ворсовальных машинах. Рабочий орган машины – вращающийся цилиндрический барабан, на котором закреплены планки с набором ворсовальных шишек или валики, обтянутые игольчатой лентой. Ворсование повышает износоустойчивость и теплозащитные свойства тканей.

RAJAH = РАДЖЯ – Rajah:- (trade name) made from a Tussah silk or certain silk wastes. It belongs to the pongee family of silks. Made from irregular yarns, so has slubs and irregularities but thicker than Shantung. It is rather compact and strong. Has a pebble-like feel and appearance. Comes in all colors as well as natural ecru shades, but often warp and filling are different colors (irridescent effect). / , но часто основа и уточина . Раджа (на Санскрите), княжеский титул в Индии. Наиболее распространённое наименование вождя в Ведах и государя в древних памятниках – дхармашастрах и Артхашастре. В средние века Раджа – владетельный феодал, Индус по религии. В колониальной Индии почётный титул (наряду с рао, равута, рана, талукдар) некоторых крупных землевладельцев.

RAKE = НАКЛОН – Rake (maritime term):- the angle of a vessel's masts from the vertical.

RALLY = РАЛЛИ (или ПОВЫШЕНИЕ) – Rally is a period of sustained increases in the prices of stocks, bonds or indexes. This type of price movement can happen during either a bull or a bear market, when it is known as either a Bull Market Rally or a Bear Market Rally, respectively. However, a rally will generally follow a period of flat or declining prices. A rally is caused by a large amount of money entering the market, bidding up the prices. The length or magnitude of a rally depends on the depth of buyers along with the amount of selling pressure they face. For example, if there is a large pool of buyers but few investors willing to sell, there is likely to be a large rally. If, however, the same large pool of buyers is matched by a similar amount of sellers, the rally is likely to be short and the price movement minimal. Rise in market prices after a period when prices have stagnated or consistently fallen, usually followed by a further fall. See also Reaction. Rally is a brisk rise following a decline in the general price level of the market, or in an individual asset. Also known as Recovery. A brief rise in prices following either a consolidation or a correction in prices. An upward movement of prices following a decline. Rally is a quick advance in prices. / Под Ралли, от Английского слова Rally, означающее буквально Сбор или Слёт, или Повышением понимается быстрое повышение цен, последовавшее сразу же после их длительного снижения. В техническом анализе биржевых рынков, под Ралли понимается рост цен на рынке после того, как они стагнировали или существенно упали. Обычно оно сопровождается последующим падением. Смотрите также Реакция (Reaction). Поступательное движение цены вверх вслед за её снижением.

RAM = REVENUE ACCOUNTING AND MANAGEMENT SYSTEM

RAM = REVERSE–ANNUITY MORTGAGE

RAMIE = РАМИ (или РЭМИ) – Ramie is a very strong, fine and durable bast fiber of white silky color, yielded by the Boehmeria plant of the Nettle family, growing chiefly in China, where it produces on the average lengths of the stems being about 50, 30 and 20 inches respectively for the first, second and third crop. The difficulty in decorticating the fibers in proper way and cheaply, has interfered so far with employing Ramie on a large scale in the textile industry, notwithstanding its excellent qualities, among which its water absorbent property is one. About 30 per cent or more of the weight of the Ramie is lost in decorticating, which must be very carefully done or extreme degumming will make the fiber tender. Among the various processes for decorticating the stems the following are the most in

use:- (i) treating the fibers with caustic soda; (ii) Dr. Rossi's process, employing bacilli which destroy the woody matter without affecting the celluloid of the fibers (some authorities claim that this process is not efficient as the bacilli die before they remove the natural gum); (iii) the stems are steeped in 20 times their weight of water (heated to 30 centigrades) and sal ammoniac until the woody matter begins to be fermented, after which the fibers are rinsed and boiled under two atmospheric pressure in lye; and (iv) there are various processes which strip the woody matter from the fibers by mechanical means. Ramie can be spun according to the worsted, silk and flax system, producing a very good yarn which can be bleached like Cotton. In the Chinese markets five classes of raw ramie are distinguished for trading purposes, and namely:- chingma, chuma, huoma, tungma and chungma. At the present ramie is used in this country principally for gas mantles (1924). Ramie is a grass known also as Rhea, and China Grass. It belongs to the stingless nettle group, of which there are two Varieties. The first grows in tropical climates and is called Rhea, while the second type is raised in temperate climates and is known as China Grass. The fiber is strong, white, silken in luster, and, although it is a fine fiber in diameter, it possesses high tensile strength and elasticity. Although ramie is a very old fiber, technically speaking, it is still being used, in dress goods, sports clothes, tablecloths, fish lines, lining, upholstery. Decorticating ramie, method by which Ramie fiber is obtained from the plant. Ramie cannot be retted, since mechanical treatments are necessary to secure the choice fibers. These treatments are performed by hand, thus increasing the cost of production. Raw Ramie, obtained from the hand treatments, shows a mass of fibers cemented together. Further separation is necessary. Boiling of the stock must be resorted to by means of hot water. The gum that cements the fibers consists of pectose, cutose, and vasculose. The last two are removed in the caustic alkali and soap bath, at the boil, and under pressure. The pectose is then removed by washing the residue. The amount of decorticated fiber obtained from the stock taken from the stalks amounts to about 2 per cent. The amount of degummed fiber is about 1 per cent. Ramie is a bast fiber, similar to flax, taken from the stalk of a plant grown in China. Ramie is the bast fiber produced from the Asian urticaceous shrub Boehmeria Nivea or Boehmeria Tenacissima. Used to also be called 'Rhea' or 'China Grass'. The fiber is white, soft, lustrous and slightly coarser than flax (linen) when degummed and bleached. Ramie fabrics are strong, smooth and durable. Ramie is a bast fiber similar to flax obtained from the stalk of a plant grown in China, the United States, and Japan. Ramie:- (pronounced Ray-me) fabric made of Ramie, often resembling linen or silk. Ramie is the strong lustrous bast fiber of the Ramie Plant (an Asian Perenial of the Nettle Family) that is capable of being spun or woven. Ramie is one of the oldest vegetable fibers and has been used for thousands of years. It was used for Chinese burial shrouds over 2 000 years ago, long before Cotton was introduced in the Far East. Ramie is classified chemically as a cellulose fiber, just as cotton, linen, and rayon. Leading producers of ramie are China, Taiwan, Korea, the Philippines and Brazil. Ramie is a natural woody fiber resembling flax. Also known as Rhea and China Grass, it is obtained from a tall shrub grown in South-east Asia. China, Japan, and Southern Europe. The fiber is stiff, more brittle than linen, and highly lustrous. It can be bleached to extreme whiteness. Ramie fibers are long and very fine. They are white and lustrous and almost silklike in appearance. The strength of Ramie is excellent and varies from 5.3 to 7.4 grams per denier. Elastic recovery is low and elongation is poor. Ramie lends itsef to general processing for textile yarns, but its retting operation is difficult and costly, making the fiber unprofitable for general use. When combed, ramie is half the density of linen, but much stronger, coarser, and more absorbent. It has permanent luster and good affinity for dyes; it is affected little by moisture. Ramie is used as filling yarn in mixed woolen fabrics, as adulteration with silk fibers, and as a substitute for flax. The China-grass cloth use by the Chinese is made of Ramie. This fiber is also useful for rope, twine, and nets. Ramie is a strong, lustrous, natural bast fiber from a nettle-like East Indian shrub, also produced in China, Egypt, and the United States. It is used for shirts, suitings, automobile seat covers, and in blends with wool for carpets. Ramie:- The Plant:- Native to East Asia and commonly known as China Grass, Ramie (Boehmeria Nivea) is a flowering plant of the Nettle Family. Its bark has been used for millennia to make twine and thread, and spun as grass-cloth (or 'Chinese Linen'). It grows to a height of 3 meters. Yields of green plants range from 8 to 20 tons per hectare, with fiber yields of 1.5 tons reported. The Fiber:- Ramie fiber is white with a silky lustre, similar to Flax in absorbency and density but coarser (25–30 microns). One of the strongest natural fibers, it has low elasticity and dyes easily. Strands of Ramie range up to 190 cm in length, with individual cells as long as 40 cm. Trans-fiber fissures make Ramie brittle but favour ventilation. Ramie:- Not widely known outside the East Asian countries that produce it, Ramie is lightweight, silky and made for summer. Uses Of Ramie:- Coarse Ramie fibers are suitable for making twine, rope and nets. Wet-spun, it produces a fine yarn with high lustre, suitable for a wide range of garments, ranging from dresses to jeans. Fabrics of 100% Ramie are lightweight and silky, similar in appearance to linen. The Korean traditional costume, the Ramie Hanbok, is renowned for its fineness. However, since it has low elasticity and resilience, Ramie is usually blended with other textile fibers. It increases the lustre and strength of Cotton fabric and reduces shrinkage in wool blends. It is also blended with Silk. Producers:- The Ramie plant is grown for fiber mainly in China, Brazil, the Lao People Democratic Republic and the Philippines. While it is considered a promising 'ecological' fiber for use in textiles, fiber extraction and cleaning is difficult and labor-intensive. Production And Trade:- The UN FAO estimates world production of Ramie green plant at 280 000 tons in 2005, almost all of it grown in China. Most of the Ramie fiber extracted is used in producing countries, and only a small percentage reaches international markets. The main importers are Japan, Germany, France and the United Kingdom. / используется в качестве уточной пряжи . Щёлочь (Alkali). каустическая сода или едкий натр (caustic soda). Волокно Рами – лубяное волокно (bast fiber). Рами, Растение из Рода Бёмерия (Beehmeria) Семейства Крапивных. Чаще Рами называют Бёмерию Белоснежную, иначе Китайскую Крапиву, – Beehmeria Nivea или Boehmeria Nivea, или Рами Белое (иногда в качестве особого вида выделяют Рами Зелёное – Beehmeria Viridis, или Beehmeria Utilis). Рами – многолетник с мощной корневой системой и прямостоячими, цилиндрическими, неветвистыми стеблями. Цветки мелкие, однополые (растения обычно однодомные), в многоцветковых соцветиях. Рами родом из Китая. Растение издавна культивируют ради луба, дающего прочное, эластичное, длинное волокно (длиной 62–95 миллиметров (мм)); оно отличается тониной, блеском и почти не подвержено гниению. Волокно Рами идёт на изготовление высококачественных бельевых и технических тканей, рыболовных сетей, высших сортов бумаги (в частности, для денежных знаков). В тропиках собирают 3 (и больше) урожая в год. Главный поставщик Рами на мировые рынки – Китай, в меньшей степени – другие страны Южной и Восточной Азии. На сравнительно небольших площадях Рами культивируют в субтропических и тропических областях других континентов. Рами – влаголюбивое растение, требующее плодородных почв; стебли не переносят даже лёгких морозов, отмирая уже при –1 °C. В бывшем Союзе Советских Социалистических Республик (СССР) для возделывания Рами наиболее благоприятны были некоторые районы Закавказья и Средней Азии. Растение из Рода Бёмерия (Beehmeria или Boehmeria) Семейства Крапивных. Чаще Рами называют Бёмерию Белоснежную, иначе Китайскую Крапиву (Beehmeria Nivea), или Рами Белое. Иногда в качестве особого Вида выделяют Рами Зелёное (Beehmeria Viridis или Beehmeria Utilis). Рами – многолетник, культивируют ради луба. Рами относится к Роду Многолетних Трав и полукустарников Семейства Крапивных. Всего насчитывается до 100 Видов. Выращивают Белое Рами (Boehmeria Nivea) в Индии, КНР, Японии. В бывшем Союзе Советских Социалистических Республик (СССР) проводились опытные посевы. В сухих стеблях находится до 21% прочного шелковистого волокна. Китайская Крапива, Белое Рами, Белоснежная Бёмерия (на Латинском Boehmeria Nivea) – Вид Растений из Семейства Крапивных родиной из Восточной Азии. Волокно Рами обладает значительной прочностью и почти не подвержено гниению, что позволяет использовать его для выделки канатов. В прошлом волокно также широко использовалось для парусной ткани. Блеск волокна рами напоминает шёлк, оно легко поддаётся окрашиванию без потери шелковистости, поэтому может применяться в дорогих

материях. В джинсах, мягких, удобных, легко ‘дышащих’ обычно есть рами, которая порой является основной составляющей таких тканей. Рами может применяться для изготовления бумаги.

RAMIE STRAW = СОЛОМА РАМИ – Ramie Straw is a type of straw. See also Straw.

RAMP = РАМПА (или АППАРЕЛЬ, или ПАНДУС) – Ramp is the inclined area that connects to the warehouse to facilitate easier movement in and out of the warehouse by trucks and other equipment. Ramp is a rail facility where containers and highway trailers are loaded onto or off railroad flatcars. / Под Рампой понимается:- (i) устройство для сообщения между двумя различными уровнями с доступным для передвижения уклоном, например, для подъёма грузов на железнодорожную платформу, перехода поездов метрополитена с поверхности земли под землю и так далее; в дорожном строительстве – для перехода на основную магистраль в местах развязки движения в двух уровнях. (ii) Наклонная площадка для высушивания и остывания кокса после тушения. (iii) Осветительное устройство, размещаемое на полу сцены по её переднему краю. Служит для освещения сцены спереди и снизу. Под Рампой, от Французского слова Rampe, от Ramper, означающее Быть Покатым или Подниматься Отлого, понимается наклонная площадка для въезда погрузочно-разгрузочных машин в транспортные средства и склады и выезда из них. Под Пандусом понимается наклонная плоскость, заменяющая лестницу внутри или снаружи здания (сооружения). Пандус служит для въезда и выезда автомобилей в многоэтажных гаражах, для перехода на основную магистраль в местах развязки движения транспорта, для спуска и подъёма пешеходов в подземных переходах и так далее. Под Пандусом, от Французского словосочетания Pente Douce, означающее Пологий Склон, понимается наклонная площадка, служащая для подъёма автомобилей в гаражах; для въезда к расположенному над цоколем здания парадному входу; в отдельных случаях заменяет лестницы. Под Аппарелем, от Французского слова Appareil, означающее Въезд, понимается:- (i) железобетонная или мощёная платформа на уровне пола вагона для погрузки грузов в железнодорожные вагоны. Аппарель имеет спуск (пандус) до уровня подъёма к аппарелю. (ii) Устройство в виде наклонной плиты, рамы или направляющих реек для проезда (прохода) в здание, сооружение. (iii) Устройство в носовой части корабля в виде опускаемой в наклонное положение части палубы для схода личного состава и техники на берег. Под Аппарелем, от Французского слова Appareil, означающее Въезд, понимается:- (i) наклонная платформа для погрузки в вагоны или иные транспортные средства автомобилей и других машин; или (ii) плита с небольшим уклоном для проезда или прохода в здание или сооружение.

RAMPING = РАЗГОН (или ВЫХОД НА РАБОЧИЙ РЕЖИМ) – Ramping:- in reference to electricity, the time it takes for a generation unit to achieve full rated output. / По отношению к электричеству, время, необходимое для достижения генерирующим устройством полной мощности выработки.

RAN = REVENUE ANTICIPATION NOTE

RANCIDITY = ПРОГОРКЛОСТЬ – Rancidity:- oils and fats spoil by becoming rancid. This causes changes in odor and taste, which can make edible oils and fats inedible. / прогорклыми. Это вызывает изменение запаха и вкуса, .

RANDOM = СЛУЧАЙНОЕ (или ПРОИЗВОЛЬНОЕ, или БЕСПОРЯДОЧНОЕ) – Random:- arrived at by chance without the exercise of any choice.

RANDOM AMPLIFIED POLYMORPHIC DNA = СЛУЧАЙНАЯ УСЛОЖНЁННАЯ (или УСИЛЕННАЯ) ПОЛИМОРФНАЯ ДНК – Random Amplified Polymorphic DNA (RAPD) is a DNA amplification method which uses single primers. Method is restricted to primers 9 nucleotides and larger, and amplification products are generally visualized using agarose electrophoresis and ethidium bromide fluorescence. / амплификация ДНК .

RANDOMIZATION = РАНДОМИЗАЦИЯ (или РЕНДОМИЗАЦИЯ) – Randomization is a process of allocating treatments to the experimental units so that each experimental unit has an equal chance of receiving any of the treatments. It is a necessary condition for obtaining a valid estimate of the experimental error. Location of treatments by chance so as to provide unbiased estimates of treatment means and experimental error. / Рендомизация – (1) случайное распределение подопытных особей внутри группы; (2) случайное расположение, например, делянок.

RANDOMIZED COMPLETE BLOCK DESIGN = ДИЗАЙН СЛУЧАЙНЫХ ЗАКОНЧЕННЫХ БЛОКОВ (или ПРОИЗВОЛЬНЫЙ ДИЗАЙН ЗАКОНЧЕННЫХ БЛОКОВ, или ДИЗАЙН РАНДОМИЗИРОВАННЫХ ЗАКОНЧЕННЫХ БЛОКОВ) – Randomized Complete Block Design is an experimental design in which the experimental area is divided into blocks and all of the treatments are randomly arranged within each block.

RANDOM LOCATION STORAGE = ХРАНЕНИЕ С ПРОИЗВОЛЬНЫМ РАЗМЕЩЕНИЕМ – Random Location Storage is a storage method where product is stored randomly. A benefit of random storage is that it allows more productive utilization of space, however, using this strategy may decrease accuracy as like product is not necessarily together.

RANDOM SAMPLE = СЛУЧАЙНАЯ ПРОБА (или ПРОИЗВОЛЬНАЯ ПРОБА, или РЕНДОМИЗИРОВАННЫЙ ОБРАЗЕЦ) – Random Sample is a sample selected according to some chance mechanism such that every unit in the population has a known probability of being in the sample. These samples are obtained by using a random mechanism such as drawing of lots or using a table of random numbers.

RANDOM SAMPLING = ПРОИЗВОЛЬНЫЙ ОТБОР ПРОБ (или (СЛУЧАЙНЫЙ) ОТБОР ПРОБ) – Random Sampling is a scouting method that relies on continuous inspections throughout most of a Cotton field; better suited for regions with variable soils within fields.

RANDOM–SHEARED CARPET = ПРОИЗВОЛЬНО СТРИЖЕНЫЙ КОВЁР – Random-Sheared Carpet is a pile carpet with a textured face produced by shearing some of the loops and leaving others intact. See also Pile, and Shearing.

RANDOM–SHEARED RUG = ПРОИЗВОЛЬНО СТРИЖЕНЫЙ КОВРИК – Random-Sheared Rug is a pile rug in which some sections of the pile are cut and other sections are not. See also Pile, and Shearing.

RANDOM–TIP SHEARS = СТРИЖКИ ПРОИЗВОЛЬНЫХ ВЕРХУШЕК – Random-Tip Shears:- carpets and rugs with a high pile sheared at random.

RANDOM WALK = БЛУЖДАНИЕ (или ХОДЬБА НАУГАД) – Random Walk is an economic theory that market price movements move randomly. This assumes an efficient market. The theory also assumes that new information comes to the market randomly. Together, the two assumptions imply that market prices move randomly as new information is incorporated into market prices. The theory implies that the best predictor of future prices is the current price, and that past prices are not a reliable indicator of future prices. If the random walk theory is correct, technical analysis cannot work. An economic theory that price movements in the commodity futures markets and in the securities markets are completely random in character, i.e. past prices are not a reliable indicator of future prices. Theory of stock movements developed in the 1950s and 1960s, which states that share prices move in a random way, and so their movements up or down cannot be predicted. Theory that market prices move randomly around a main trend, in other words, that

the volatility is arbitrary. The Random Walk hypothesis is based on efficient market theory as a model for explaining share price movements. Put simply, the hypothesis states that the study and interpretation of past share price performance are of no use in predicting future prices. / , то есть . Теория, согласно которой рыночные цены колеблются случайным образом в пределах основной тенденции, иными словами, лихорадочность носит произвольный характер.

RANGE = ДИАПАЗОН (или РАЗБРОС) – The Range is the difference between the highest and lowest prices traded during a day (or period). The distance between the high price and the low price for a given time period. For example, the daily range is equal to the day's High minus the same day's Low. The Range is the distance the market moves from the current high to the current low during a given trading session, week, month, year, etc. The difference between the high and low price of an asset recorded during a specified time (trading session, week, month, year, etc). / Под Диапазоном, от Греческого словосочетания Dia Pason (Chordon), означающее Через Все (Струны), понимается:- (1) в музыке – звуковой объём певческого голоса, инструмента, звукоряда мелодии и тому подобного; определяется интервалом между их нижним и верхним звуками. (2) В переносном смысле – охват, объём чего-либо; широта способностей, знаний, кругозор, размах деятельности. Диапазон – это ценовой интервал, внутри которого рынок проходит от текущего максимума до текущего минимума в течение данной торговой сессии, недели, месяца, года и тому подобного. Разница между высшей и низшей ценой актива, имевших место в течение определённого времени (торговой сессии, недели, месяца, года и тому подобного). Диапазон между минимальной и максимальной ценами финансового инструмента, зафиксированными в течение определённого периода – торговой сессии, недели, месяца, года и так далее.

RANGE = ДИАПАЗОН (или РАНГ, или АМПЛИТУДА) – Range is the variation of data from highest to the lowest value. Range is the difference between the high and low prices recorded during a trading session or any given period. The range is used in technical analysis to identify chart formations.

RANGE EXPANSION = РАСШИРЕНИЕ ДИАПАЗОНА – Range Expansion:- a short period of time (normally 2–4 sessions) where the distance between the high and low of a day, or from the previous settlement price in the case of gaps, is substantially wider than normal. A measure of volatility. Often seen when a market is in breakout mode. An increase in volatility and market movement, as a market moves out of consolidation.

RANGE WOOL = ПАСТБИЩНАЯ (или РАНЖИРОВАННАЯ) ШЕРСТЬ – Range Wool is a wool produced under range conditions in the West or the Southwest. With the exception of Texas and California wools, it is usually classified as territory wool.

RANGING CLAUSE = ОГОВОРКА О БЕЗОПАСНОМ РАССТОЯНИИ – Ranging Clause is a clause in a hull policy exempting underwriters from liability under the policy (for damage received as well as for damage done) in the event that the insured ship collides with another ship while the vessels are approaching or ranging alongside each other at sea for the purpose of transferring cargo. Cover may be obtained by arrangement with the underwriters, in practice, provided they are notified, of the intention to transfer cargo in this manner, in advance. The exemption does not apply to customary transshipment in port areas involving inshore harbor craft.

RANK = БУЙНЫЙ (или ПЫШНЫЙ) – Rank is a term signifying tall, vegetative Cotton growth; often a result of late planting, excessive nitrogen fertilizer, fertile soils, or excessive moisture. Rank growth often renders Cotton plants more attractive and susceptible to late-season insects, more susceptible to boll rot, and more difficult to defoliate.

RANKING = РАНЖИРОВАНИЕ – Ranking:- rights are entered in the land register according to a certain ranking. If serveral rights are entered in one section, the ranking is determined by the sequence of entries. If several rights are entered in different sections under the same date, these rights are equal ranking. A change in rank, however, can be contractually agreed. Moreover, a specific rank can be reserved through priority rights.

RANSOMWARE = ПРОГРАММА ДЛЯ ВЫКУПА (или ХХ) – Ransomware is a particular kind of malicious software used for extortion. When activated, ransomware prevents access to a device or the data on it until the victim pays a fee.

RAP = REGULATORY ACCOUNTING PROCEDURES

RAPD = RANDOM AMPLIFIED POLYMORPHIC DNA

RAPESEED = СЕМЯ РАПСА – Rapeseed (Brassica Napus), also known as Rape, Oilseed Rape, Rapa, Rappi, Rapaseed (and in the case of one particular group of Cultivars, Canola) is a bright yellow flowering member of the family Brassicaceae (Mustard or Cabbage Family). The name derives from the Latin for Turnip, Rāpa or Rāpum, and is first recorded in English at the end of the XIV century. Older writers usually distinguished the Turnip and Rape by the adjectives round and long(-rooted) respectively. See also Brassica Napobrassica, which may be considered a variety of Brassica Napus. Some botanists include the closely related Brassica Campestris within Brassica Napus. Rapeseed was the third leading source of vegetable oil in the world in 2000. In agriculture, Canola is the name given to certain varieties of rapeseed oil, or the oil produced from those varieties. Canola is a trademark for a hybrid Variety of Rape initially bred in Canada ('Canola' being an acronym for Canadian oil, low acid). Rapeseed oil was produced in the XIX century as a source of a lubricant for steam engines. It was less useful as food for animals or humans because it has a bitter taste due to high levels of glucosinolates. Canola has been bred to reduce the amount of glucosinolates, yielding a more palatable oil. This has had the side-effect that the oil contains much less erucic acid. Rapeseed is grown for the production of animal feed, vegetable oil for human consumption, and biodiesel; leading producers include the European Union, Canada, the United States, Australia, China and India. In India, it is grown on 13% of cropped land. According to the United States Department of Agriculture, rapeseed was the third leading source of vegetable oil in the world in 2000, after soybean and oil palm, and also the world's second leading source of protein meal, although only one-fifth of the production of the leading soybean meal. World production is growing rapidly, with FAO reporting that 36 million tons of rapeseed was produced in the 2003–04 season, and estimates of 58.4 million tons in the 2010–11 season. In Europe, rapeseed is primarily cultivated for animal feed, owing to its very high lipid and medium protein content, and is a leading option for Europeans to avoid importation of genetically modified organism (GMO) products. Natural rapeseed oil contains 50% erucic acid. Wild type seeds also contain high levels of glucosinolates (mustard oil glucosindes), chemical compounds that significantly lowered the nutritional value of rape seed press cakes for animal feed. Canola, originally a syncopated form of the abbreviation 'Can.O., L-A.' (Canadian Oilseed, Low-Acid) that was used by the Manitoba government to label the seed during its experimental stages, is now a tradename for 'double low' (low erucic acid and low glucosinolate) rapeseed. Sometimes the 'Canola-quality' label is affixed to other varieties as well. The rapeseed is the valuable, harvested component of the crop. The crop is also grown as a winter-cover crop. It provides good coverage of the soil in winter, and limits nitrogen run-off. The plant is ploughed back in the soil or used as bedding. On some ecological or organic operations, livestock such as sheep or cattle are allowed to graze on the plants. Processing of rapeseed for oil production provides rapeseed animal meal as a by-product. The by-product is a high-protein animal feed, competitive with soya. The feed is mostly employed for cattle feeding, but also for pigs and chickens (though less valuable for these). The meal has a very low content of the glucosinolates responsible for metabolism disruption in cattle and pigs. Rapeseed 'oil cake' is also used as a fertilizer in

China, and may be used for ornamentals, such as Bonsai, as well. Rapeseed leaves and stems are also edible, similar to those of the related bok choy or kale. Some varieties of rapeseed (called Yóu Cài, lit. 'Oil Vegetable' in Chinese; Yau Choy in Cantonese; Cải Dầu in Vietnamese; Phak Kat Kan Khao in Thai; and Nanohana/Nabana in Japanese) are sold as greens, primarily in Asian groceries, including those in California where it is known as Yao Choy or Tender Greens. They are eaten as sag (spinach) in Indian and Nepalese cuisine, usually stir-fried with salt, garlic and spices. Rapeseed produces great amounts of nectar, and honeybees produce a light colored, but peppery honey from it. It must be extracted immediately after processing is finished, as it will quickly granulate in the honeycomb and will be impossible to extract. The honey is usually blended with milder honeys, if used for table use or sold as bakery grade. Rapeseed growers contract with beekeepers for the pollination of the crop. 'Total loss' chain and bar oil for chainsaws have been developed which are typically 70% or more canola/rapeseed oil. These lubricants are claimed to be less harmful to the environment and less hazardous to users than traditional mineral oil products, although they are currently typically 2–5x more expensive (leading some to use inexpensive cooking oil instead. Some countries, such as Austria, have banned the use of petroleum based chainsaw oil. These 'bio-lubricants' are generally reported to be functionally comparable to traditional mineral oil products with some reports claiming one or other is superior, but with no overall consensus yet evident. Rapeseed oil is used in the manufacture of biodiesel for powering motor vehicles. Biodiesel may be used in pure form in newer engines without engine damage, and is frequently combined with fossil-fuel diesel in ratios varying from 2% to 20% biodiesel. Formerly, owing to the costs of growing, crushing, and refining rapeseed biodiesel, rapeseed derived biodiesel cost more to produce than standard diesel fuel. Rapeseed oil is the preferred oil stock for biodiesel production in most of Europe, accounting for about 80% of the feedstock, partly because rapeseed produces more oil per unit of land area compared to other oil sources, such as soy beans. The majority of European cars and trucks run on diesel fuel and an estimated 66% of total rapeseed oil supply in the European Union is expected to be used for biodiesel production in the 2010–11 year. There is however concern over the use of rapeseed for use as biodiesel because rapeseed is currently grown with a high level of nitrogen-containing fertilisers, and the manufacture of these generates N_2O, a potent greenhouse gas with 296 times the global warming potential of CO_2. It has been estimated that 3–5% of nitrogen provided as fertilizer for rapeseed is converted to N_2O. Canola oil (or rapeseed oil) contains both Omega-6 and Omega-3 fatty acids in a ratio of 2:1, although flax oil is higher in Omega-3 fatty acid, as are other oils such as Chia (Salvia hispanica) oil. Canola oil's proponents claim that it is one of the most heart-healthy oils and has been reported to reduce cholesterol levels, lower serum tryglyceride levels, and keep platelets from sticking together. While only very long chain Omega-3 fatty acids have been shown to improve cholesterol levels, and these are absent from most plant foods, the body can convert some of the short chain into long chain Omega 3's. Oilseed rape has been linked with adverse effects in asthma and hay fever sufferers. Several scientific studies have identified allergens from pollen. The effects of rape pollen have been brought into question as oilseed rape is an insect pollinated (entomophilous) crop, rather than wind pollinated like grasses and trees, the usual causes of hay fever. An early study showed that relatively small amounts of pollen travel further than 200 meters from the fields of rape. More recently a study has suggested that pollen clouds might travel over longer distances. Others suggest that this is caused by the inhalation of oilseed rape dust, and that allergies to the pollen are relatively rare. Rapeseed oil contains up to 45% erucic acid. A connection has been found between erucic acid (found in rapeseed and, a much lower levels, canola oil) and autism. 'The main findings include increased levels of ... erucic acid ... Our results .... suggest some metabolic or dietary abnormalities in the regressive form of autism'. Autism spectrum disorders are the second most common serious developmental disability in the United States. In 1981 there was a serious outbreak of 'Sindrome toxico' where over 1 000 people died and 60 000 more were taken seriously ill, with 25 000 suffering long term side effects. This was attributed to Olive Oil being adulterated with rapeseed oil, and in particular the effects of high erucic acid containing rapeseed oil. This has had a long term negative impact on the use of rapeseed and canola oil in Spain. In 2008 there was another outbreak when cattle were fed Canola oil imported from France as a lubricant, where aniline had been added. Pigs metabolize fats more like humans than rats do and 'can be used as a model to evaluate the nutritional and toxicological properties of oils containing erucic acid'. Both weaned and unweaned pigs exhibit myocardial lipidosis when fed erucic acid. Bonnet macaque monkeys fed oils containing erucic acid for over a year exhibited sarcoplasmic vacuolation and myocardial fibrosis not found in the control monkeys fed peanut oil or hydrogenated peanut oil. Macaca fascicularis monkeys fed oils containing erucic acid for four months showed myocardial lipidosis, lipidosis of skeletal muscles, and 'moth eaten' looking heart fibers. Mitochondria were displaced, distorted, irregular, enlarged, with unclear cristae, and with 'amorphous or vacuolated material' in the matrix. These morphological effects were not found in the control monkeys fed lard and corn oil but are in agreement with those found in both pigs and rats fed erucic acid. Erucic acid has been found to be cardiotoxic in rats, guinea pigs, mice, hamsters, gerbils, ducklings, turkeys, pigs and squirrel monkeys. Lipidosis in the heart and other organs in animals fed erucic acid has been found in rats, gerbils, monkeys, pigs, ducklings, chickens, and turkeys. When animals were fed erucic acid, myocardial necrosis and/or myocarditis have been found in rats and rabbits, and 'hemolytic anemia and hydropericardium in guinea pigs (26); anemia, hydropericardium, ascites and heaptic fibrosis in chickens and ducks (2,17), and anemia and myocardial granulomas in turkeys (17)'. Commercial canola oil (low erucic acid content rapeseed oil) has been shown to contain unlabeled 0.56% to 4.2% trans fats. 'Trans isomers of α-linolenic acid, which are formed by deodorization of refined vegetable oils, can be found in significant amounts in edible oils'. Types and levels of trans fatty acids similar to those that have been found in processed canola have been shown to raise Low Density Lipoproteins (LDL) cholesterol levels in humans in just six weeks. 'The higher the LDL level in your blood, the greater chance you have of getting heart disease'. Worldwide production of rapeseed (including canola) has increased sixfold between 1975 and 2007. The production of canola and rapeseed 00 since 1975 has opened up the edible oil market for rapeseed oil. Since 2002 production of biodiesel has been steadily increasing in EU and USA to 6 million metric tons in 2006. Rapeseed oil is positioned to supply a good portion of the vegetable oils needed to produce that diesel. World production is thus expected to trend further upward over between 2005 and 2015 as biodiesel content requirements in Europe go into effect. Every ton of rapeseed yields about 400 kg of oil. Xxxxx. Brassica napus Linnaeus – known as Rapeseed, Rape, Oilseed Rape, and in some cultivars, Canola – is a bright yellow flowering member of the Brassicacea family (mustard or cabbage family). It is a mustard crop grown primarily for its seed which yields about forty percent oil and a high-protein animal feed. Since 1991, virtually all rapeseed production in the European Union has shifted to rapeseed 00 (double zero), with low content of erucic acid and low content of glucosinolates. The production of rapeseed in the European Union is still 'conventional', that is does not contain GMO. Worldwide Rapeseed Production (in million metric tons):- 1950s – 3.5; 1965 – 5.2; 1975 – 8.8; 1985 – 19.2; 1995 – 34.2; 2006 – 47.0. Worldwide production of rapeseed/canola rose to 47 million metric tons in 2006, of which the total EU-25 production accounts for 16 million metric tons. Top Rapeseed Producing Countries (in million metric tons):- China – 12.2; Canada – 9.1; India – 6.0; Germany – 5.3; France – 4.1; the United Kingdom – 1.9; Poland – 1.6; Australia – 0.5; and World Total – 47.0. Rapeseed oil generally contains a high level of erucic acid, which is mildly toxic to humans in large doses. Traditional and other uses have been for lamp oils, soap making, high-temperature and tenacious high-erucic acid lubricating oils, and plastics manufacturing. With the shift to rapeseed 00 in the European Union, the low erucic acid content of the resulting rapeseed oil and its specific fatty acid composition make it a highly appreciated edible oil. As the European rapeseed production is 'conventional' (that is non-GMO), the preference of the European food customer goes to rapeseed oil produced in Europe over other oils or other origins that might be produced from GMO. Rapeseed oil has also become the primary feedstock for biodiesel in Europe (estimates for 2006: more than 4.0 million tons of rapeseed oil went into biodiesel). Processing of rapeseed for oil production provides rapeseed animal meal as a by-product. The by-product is a high-protein

animal feed. The feed is mostly employed for cattle feeding, but also for hogs and poultry (though less valuable for these). The meal (from rapeseed 00) has a very low content of the glucosinolates responsible for metabolism disruption in cattle and pigs. Rapeseed is normally processed in two steps:- (i) physical pressing of the rapeseed; and (ii) subsequent hexane extraction of the remaining oil in the press-cake. Some smaller plants are only press-plants and do not apply the second step of hexane extraction. This results in a high oil content in the cake, which makes this process economically not viable because of the high price differential between rapeseed oil and rapeseed meal or cake. Higher prices have resulted from a good demand for rapeseed oil for food and for biodiesel in the European Union. EU oilseed farmers will therefore be stimulated to increase rapeseed surface. This success of rapeseed in the EU is also inspiring Eastern European countries producers to expand rapeseed production. / привоз (importation). Рапс (Brassica Napus var. Napus) – Подвид Однолетних Травянистых Растений Рода Капуста Семейства Крестоцветных, масличная и кормовая культура. В культуре известен с 4-го тысячелетия до Нашей Эры. В России – с XIX века. Озимый Рапс (слабозимостоек, плохо переносит засуху) и Яровой Рапс (или Кольза; менее требователен к климатическим условиям). Вегетационный период Озимого Рапса 270–300 суток, Ярового Рапса – 80–110 суток. Опыление перекрёстное. Лучшие почвы – богатые питательными веществами суглинки. Выращивают для получения пищевого и технического (в мыловаренной, текстильной и других промышленных отраслях) масла (в семенах Озимого Рапса содержится 45–50%, Ярового Рапса – 32–35% масла), используют в производстве маргарина и на корм сельскохозяйственным животным (жмых после удаления гликозидных соединений). Озимый Рапс ценен и как кормовое растение (300 и более ц/га зелёной массы). Рапс – отличный медонос. За 25–30 дней цветения с каждого гектара пчёлы собирают до 90 кг мёда. Возделывают в лесостепи Украины, в Сибири, Казахстане и других районах бывшего СССР. Урожайность семян 10–30 ц/га. Сорта – Дублянский, Немерчанский 2268 и другие. Предшественники – занятой пар, озимые зерновые. Вносят навоз (20 т/га) и минеральные удобрения (100–140 кг/га NPK). Высевают рядовым (междурядья 15 см) и широкорядным (45 см) способами, норма посева семян 8–12 кг/га, глубина – 2–4 см. Уборка урожая раздельным способом и прямым комбайнированием. Осваиваются интенсивные технологии возделывания Рапса. Вредители – Рапсовый Пилильщик, Рапсовый Листоед, Рапсовый Цветоед, Земляные Блошки и другие, повреждающие Капустовые. Болезни – альтернариоз, ложная мучнистая роса. Рапсовое Масло – растительное жирное масло, получаемое из семян Рапса. Применяется главным образом в мыловарении, текстильной, кожевенной промышленности, для производства олиф, после рафинирования – для производства маргарина. Рапсовое масло – высококалорийный продукт, широко используется в натуральном виде для приготовления маргаринов и майонезов, в консервном и косметическом производстве, как аналог оливкового масла. С точки зрения физиологии питания человека рапсовое масло имеет преимущество перед другими растительными маслами, так как содержит в оптимальном соотношении все физиологически важные кислоты. В состав рапсового масла входит значительное количество глицеридов насыщенных жирных кислот, которые улучшают обмен веществ в организме человека, уменьшают тромбообразование, снижают риск сердечнососудистых заболеваний и регулируют содержание холестерина в крови. Масло рапса привлекает всё большее внимание, как источник возобновляемого сырья для химической промышленности и энергетики. Спектр его использования для технических целей чрезвычайно широк – от употребления в качестве исходного материала для химического синтеза до применения в виде смазочных средств и перспективного вида топлива. Рапсовый шрот (жмых), получаемый после измельчения из семян масла – высокобелковый корм для животных. Он близок к соевому шроту по содержанию белка (35–39%), не уступая по сбалансированности аминокислотного состава. Рапсовый Листоед (Entomoscelis Adonidis) – жук семейства Листоедов, опасный вредитель Растений Семейства Капустовых. Распространён в Евразии и Северной Америке; в бывшем СССР – на Юге Европейской части, Кавказе, Сибири и Средней Азии. Рапсовый Клоп – Насекомое Семейства Щитников; вредитель Рапса и других Крестоцветных Растений в Евразии. Тёмный с продольной беловатой или красноватой полосой, длиной 5–7 мм. Питается соком Растений. Рапсовый Пилильщик (Athalia Rosae) – Насекомое Отряда Перепончатокрылых Семейства Настоящих Пилильщиков. Вредитель Рапса и других Крестоцветных Растений в Евразии и Северной Африке. Красно-жёлтый, длиной 7–8 мм. Питается (личинки) листьями. Рапсовый Цветоед или Рапсовый Пыльцеед или Рапсовая Блестянка (Meligethes Aeneus) – Жук Семейства Блестянок. Вредитель семенников Крестоцветных Растений Семейства Капустовых. Распространён широко. Чёрный, с металлическим блеском, длиной 1.5–2.7 мм. Питается бутонами и цветками. Рапс (Brassica napus olifera) так же, как и Горчица, относится к семейству Крестоцветных (Cruciferae). Растение Однолетнее бывает озимым (обладает высокой продуктивностью 45 ц/га) и яровым (20–25 ц/га – относительно неприхотлив). Характеристика семян и масла Рапса:- семена Рапса – мелкие, неправильной округлой формы, могут иметь серо-чёрный или чёрный цвет. Масса 1 000 штук семян Рапса колеблется от 1.7 до 5.0 кг; объёмная масса семян около 636 кг/м^3. В семенах Рапса содержится (%):- масла – 40–45, белка 18–22 (белки хорошо сбалансированы по аминокислотному составу, 5% из общего количества аминокислот приходится на долю серосодержащих аминокислот), клетчатки 6–7, фосфолипидов 0.2–1.2, которые характеризуются повышенным содержанием негидратируемых форм. Для Рапса характерно высокое содержание пигментов группы хлорофиллов (10–150 мг/кг). В зависимости от Сорта содержание тиогликозидов (гликозинолатов) в семенах колеблется в пределах 0.5–6.0%. По жирно-кислотному составу особенность традиционных Сортов, как уже было сказано выше, – высокое содержание эруковой кислоты (до 50%), в новых сортах оно снижено до 0-следы. Рапсовое масло – богатый источник незаменимых полиненасыщенных кислот – линолевой (21%) и линоленовой (до 9%). Для пищевых целей и для производства маргарина желательно иметь масло без эруковой кислоты или с минимальным её содержанием, в то время как для технических целей желательно высокое её содержание. Рапсовое масло находит широкое применение в каучуковой и сталелитейной промышленности. Химические производные эруковой кислоты известны как эрукамиды, используются для придания свойств эластичности и скользкости полиэтиленовой пленке. Кроме того, эруковую кислоту с помощью озона превращают в брасилиновую и пеларгоновую кислоты, которые используют для производства нейлонов, пластификаторов, модифицированных каучуков, фармацевтических препаратов, ароматических веществ и так далее. Семена Рапса обладают высокоэффективными ферментами:- липазой, мирозиназой, липосигеназой, фосфолипазами. При определённых условиях тиогликозиды расщепляются с образованием ряда соединений, обладающих разными физиологическими свойствами вплоть до токсических. Например, изотиоцинаты вызывают раздражение слизистой оболочки, обладают слабой антибиотической активностью. Их количество, переходящее в масло, в значительной степени зависит не только от их исходного содержания в масле, но и от технологии переработки семян. К семенам, предназначенным для получения пищевых масел, предъявляют требования по содержанию в них эруковой кислоты и тиогликозидов. Содержание эруковой кислоты в триглицеридах масла семян не должно превышать 5%, а тиогликозидов 3%. В настоящее время масло из семян Рапса в основном извлекают на экстракционных заводах. В связи с увеличением производства семян Рапса и переходом на рыночные отношения некоторое количество семян перерабатывается на прессовых заводах малой мощности. Рентабельность работы таких предприятий ниже, чем экстракционных заводов, из-за больших потерь масла, его низкого выхода, более высокой стоимости переработки 1 тонны семян. Жмых и шрот, получаемые из семян Рапса, содержат до 37–40% ценного белка. Рапсовые жмыхи и шроты используются в качестве питательных добавок при составлении комбикормов, которые, кроме того, служат богатым источником снабжения скота органическим фосфором и кальцием. Однако использование рапсовых жмыхов и шротов в качестве кормов ограничено ввиду содержания в них некоторого количества глюкозидов горчичного масла. Рапс – известная

масличная и кормовая культура Семейства Крестоцветных. Растение возделывают с незапамятных времен – в культуре Рапс известен ещё за 4 тысячелетия до Нашей Эры. Родиной Рапса одни исследователи считают Европу (Швеция, Нидерланды, Великобритания), а другие – Средиземноморье. Вполне возможно, что из Средиземноморья культура Рапса распространилась в Индию, где Рапс выращивают с древних времён. Скорее всего, в Индию растение завезено Английскими и Голландскими колонизаторами. Рапс был среди первых растений, окультуренных человеком. Ссылки на его использование или использование близких растительных сородичей имеются в самых ранних рукописях Европейской и Азиатской цивилизаций. Есть, например, мнение, что Рапс возделывался ещё 4 000 лет тому назад в Индии. Древние цивилизации в Азии и вдоль Средиземноморья использовали рапсовое масло для освещения, потому что оно давало бездымное пламя. Трудности точного установления времени введения Рапса в культуру заключается в том, что термином ‘Рапс’ могут быть обозначены различные Виды Семейства Капустных – Рапс, Сурепица, Горчица. В последние годы появился новый термин – ‘Кэнолэ’, – Рапс, улучшенный Канадскими селекционерами. В Европе Рапс стал известен в XIII столетии, а возделывать его начали в конце XVII века, вначале в Бельгии и Голландии, затем – в Германии, Швеции, Швейцарии, Польше, России. Например, в Швеции история культивирования Рапса прослеживается до времен Линнея, то есть до середины XVIII века. Этот великий учёный ещё в 1749 отметил небольшой масштаб возделывания и переработки семян Рапса и выступал за расширение посевов Рапса. В те времена рапсовое масло использовалось как в питании, так и для освещения жилищ. Тем не менее промышленное использование Рапса было довольно ограниченным до развития паровой энергии, когда было обнаружено, что рапсовое масло лучше, чем любой другой смазочный материал, прилипает к металлическим поверхностям, контактирующим с водой и паром. Точное время появления Рапса в России не установлено, однако известно, что в 1830 впервые семена Рапса были отправлены из России за границу. В 1875 была издана монография Николая Петровича Мельникова ‘Маслоэкстракционное Производство’, в которой перечислялись маслоэкстракционные заводы России. Заводы эти перерабатывали, в частности, семена Рапса и производили масло, используемое (в чистом виде или чаще в смеси с минеральным маслом) для смазки, в качестве лампадного масла и для подобных целей. В начале XX века посевная площадь под Рапсом на территории бывшего СССР достигала 300 000 га, страна вывозила (или экспортировала) 175 000 тонн семян Рапса. Затем был спад в выращивании Рапса, а в конце XX века вновь обратились к данной культуре. Свойства современных сортов Рапса позволяют культивировать его в зонах с различным климатом, в том числе и северных районах России. Рапс на семена выращивают в Уральском, Западно-Сибирском, Центральном, Восточно-Сибирском, Волго-Вятском, Поволжском и других экономических районах России. Улучшение качества рапсового масла вызвало во всём мире резкое увеличение спроса на него. Объём производства рапсового масла был выше объёма производства подсолнечного уже в 1985 и за 30 лет увеличился более чем в 8 раз, достигнув в 1999 12.7 миллионов тонн. Рапсовое масло по объёмам производства стало третьим в мире после пальмового и соевого. Почти четверть производства приходится на Китай. В мировой торговле рапсовое масло, включая горчичное, по объёму привоза (или импорта) и вывоза (или экспорта) стоит на четвёртом месте после пальмового, соевого и подсолнечного. Ныне во многих странах Рапс возделывается, прежде всего, как масличная культура. Кэнольное масло широко потребляется в пищу во многих странах мира для жарения, салатов, изготовления маргарина и тому подобного. По вкусовым качествам оно приравнивается к оливковому, пользуется спросом и считается одним из лучших растительных масел. Оно долго сохраняет прозрачность, не приобретает неприятного запаха под воздействием воздуха, как, например, соевое. В США кэнольное масло с 1985 имеет официальный статус безопасности для потребления его человеком. В семенах Рапса содержится 35–50% жира, 18–31% хорошо сбалансированного по аминокислотам белка, 5–7% клетчатки. По содержанию жира и сумме жира и белка Рапс превосходит Сою, не уступает Подсолнечнику и Горчице. Вместе с тем в связи со значительной насыщенностью мирового рынка пищевыми жирами возрастает спрос на непищевое использование Рапса в будущем. В последнее время большое внимание уделяется проблемам производства жидкого топлива из растительных источников, в частности для северных районов, может быть использовано рапсовое масло. С ужесточением норм на токсичность выхлопных газов автомобилей биотопливо из рапсового масла может стать одним из вариантов решения этой проблемы. Рапс находит также применение в качестве кормовой культуры – используется на зелёную массу, сенаж и травяную муку в чистом виде и в смеси с другими растениями. Кроме того, Рапс – хорошая пастбищная культура для свиней и овец, так как он быстро растёт и богат белком, в состав которого входит сера. Выпас овец на посевах Рапса снижает их заболеваемость и увеличивает выход шерсти и мяса. Рапс – зелёное удобрение и отличный медонос – с 1 га посевов Рапса пчёлы собирают до 90 кг меда. После переработки семян на масло Рапс даёт достаточно полноценные по количеству и качеству белка жмыхи и шроты. Его белок, как и белок Сои, близок по составу к белку яиц, молока и коровьего масла. Жмых, очищенный от семенной оболочки, которая снижает его перевариваемость, приближается по своему качеству к жмыху Сои. К середине XIX века Рапс вместе с другими масличными растениями (Сурепка и Горчица) был довольно распространённой культурой на территории Европы. Площадь под ним только в Германии составляла до 300 000 га. Именно рапсовое масло стало востребованным как техническое, пока не научились получать техническое масло из нефти. Из Германии Рапс, по-видимому, через Польшу и Западную Украину, где он и сейчас широко культивируется, попал в Россию под названием ‘репное семя’. Уже в 1870 посевы Рапса в России достигли 28 000 га, а в течение последних 30 лет площади Рапса составляют 387 000 га. В России Рапс начали возделывать в начале XIX века, главным образом в Пензенской и Нижегородской Губерниях. Падение цен на хлеб и повышенный спрос на технические масла стимулировали быстрое развитие в России культуры Рапса, прежде всего для вывоза (или экспорта). В конце XX века вместе со смягчением хлебного кризиса и повышением спроса мирового рынка на Русское зерно, в основном на Пшеницу, начали сокращаться посевы Рапса и в России. Вместе с тем Рапс ещё некоторое время удерживался на Украине, занимая площадь до 40 000 га и оставаясь основной масличной культурой. В те времена Подсолнечник занимал на Украине всего 10 000 га. В 1930-е Рапс получил относительно широкое распространение в Великобритании, США и Новой Зеландии, несколько позже – в ряде стран Запада и Востока, прежде всего в Китае. Жмых Рапса использовали на корм скоту, а зелёную массу используют на приготовление силоса. Отведение под Рапс рекордных площадей и исключительно высокие урожаи позволили довести мировое производство семян Рапса в 1999 до 42.5 миллионов тонн. Особенно высокие сборы Рапса в Китае, Индии, Канаде и странах ЕС – Франции, Дании, Великобритании. Ведущие мировые производители Рапса сегодня – Китай, Канада и Индия. Эти три страны производят 57% мирового урожая. В Восточной Европе наибольшие урожаи Рапса собирают в Польше и Чехии (по 1.1 миллиона тонн). Главными регионами мира по выращиванию Рапса являются:- Азия – 46.8% мирового производства, Европа – 30.3, Северная Америка – 19.2%. В странах СНГ выращивают всего 0.18 миллиона тонн в год, в том числе в России – 0.11, в Украине – 0.02 и в Беларуси – 0.02 миллиона тонн. В России площади под Рапсом неуклонно сокращаются. Отсутствуют рациональные технологии выращивания культуры, нет эффективных пестицидов и материально-технической базы для переработки семян. В зависимости от конкретных природных условий отдельных стран и регионов выращивают яровой (однолетний) или озимый (двулетний) Рапс. Озимый Рапс очень требователен к климату, морозостойкость его невелика. Еще большую опасность представляет для этого Рапса засуха или избыток тепла в зимние месяцы. Яровой Рапс (Кольза) менее требователен к климатическим условиям, но в сравнении с озимым Рапсом менее урожаен и уступает ему в масличности. В континентальном климате Восточной Европы возделывание озимого Рапса является рискованным делом. В большинстве регионов России, Беларуси, Украины и других

стран СНГ целесообразнее выращивать яровой Рапс. Улучшение качества производимого рапсового масла вызвало во всём мире резкое увеличение спроса на него. В мировой торговле рапсовое масло, включая горчичное, по объёму привоза (или импорта) и вывоза (или экспорта) стоит на четвёртом месте после пальмового, соевого и подсолнечного. В настоящее время во многих странах Рапс возделывается, прежде всего, как масличная культура. Кэнольное масло широко используется в пищу во многих странах мира. В состав Рапса входит большое количество ненасыщенных жирных кислот, которые играют большую роль в регулировании жирового обмена, снижая уровень холестерина, возможность тромбообразования и ряда других заболеваний, в том числе опухолевых. В жирах животного происхождения они не встречаются или присутствуют в незначительных количествах. Кроме того, есть данные, что рапсовое масло содержит вещества, обладающие устойчивостью к облучению. В целом по сумме незаменимых аминокислот Рапс не уступает Сое, Подсолнечнику и Горчице. Рапсовое масло с высоким содержанием эруковой кислоты с успехом используется во многих отраслях промышленности – в металлургии, например, оно применяется для закалки стали. Рапсовое масло устойчиво к низкой температуре и используется как смазка в реактивных двигателях. Обладая способностью при температуре 160–250 °C присоединять серу и образовывать каучукообразную массу, известную под названием ‘фактис’, рапсовое масло также используется как сырье для производства эластичных материалов. Солома Рапса и створки стручков пригодны для производства фурфурола, и целлюлозы. Кроме того, рапсовое масло применяют в лакокрасочной, косметической, мыловаренной, полиграфической, кожевенной, химической и текстильной промышленности. Химический состав:- семена Рапса имеют своеобразный химический состав, отличающий их от семян большинства других масличных растений. Этот необыкновенный химический состав касается, главным образом, двух свойств – присутствия эруковой кислоты в глицеридах и фосфолипидах и присутствия глюкозидов, содержащих серу, в белковой части семян, плюс присутствие мирозиназы – фермента, способного расщеплять тиоглюкозиды. В семенах рапса традиционных сортов содержится 42–52% эруковой кислоты к сумме жирных кислот масла и 4–8% глюкозинолатов в пересчёте на сухое обезжиренное вещество. Примечание:- присутствие эруковой кислоты может рассматриваться как негативная или как возможная особенность семян Рапса, в зависимости от намеченного пути использования выработанного из этих семян масла (для пищевых и технических целей). Получены данные, что эруковая кислота, которая содержится в маслах, полученных из семян семейства крестоцветных, оказывает на организм отрицательное воздействие, в первую очередь на метаболизм липидов в некоторых органах. Кормление рапсовым маслом, богатым эруковой кислотой, вызывало у животных и птицы некротические изменения в миокарде, отклонения в ряде биохимических процессов, нарушения в деятельности почек, цирроз печени. Тиогликозиды масла вызывают раздражение слизистых оболочек пищеварительного тракта, дыхательных путей и нарушения деятельности щитовидной железы. Тиогликозиды также вызывают коррозию оборудования, при гидрировании масла снижают эффективность и срок действия катализатора.

RAPHE = ШОВ (или СЕМЕННОЙ ШОВ, или СЕМЕННОЙ РУБЧИК) – Raphe is:- (1) the ridge connecting the two ends of an anatropous ovule. (2) A seamlike joining of the two lateral halves of an organ, as in the ridge of tissue along the side of an ovule, which indicates the position of the vascular bundles supplying the developing seed.

RAPHIDE = РАФИДА – Raphide (Raphis) is a needle-shaped crystal found in some plant cells, usually a crystal of calcium oxalate as a metabolic byproduct. The irritatingly sharp crystals discourage predation by herbivores.

RAPID GENERATION ADVANCE = УЛУЧШЕНИЕ УСКОРЕННОЙ ГЕНЕРАЦИИ – Rapid Generation Advance (RGA) is a part of a breeding procedure wherein the segregating populations are grown at very close spacing, high temperature, and short days to shorten growth duration, thus making possible several generations per year. The duration from F_2 to F_5 which generally takes about 4 years can be shortened to 2 years.

RAPID RESPONSE = СТРЕМИТЕЛЬНАЯ РЕАКЦИЯ (или ПОГРУЖЕНИЕ, или ЗАТОПЛЕНИЕ) – Rapid Respomse is one type of the casualty. In many instances a casualty’s condition will deteriorate rapidly without the intervention of a salvor. Instant response is essential. This means mobilising and deploying experienced salvage personnel and specialised equipment – pumps, generators, firefighting systems, anti-pollution boom and other vital items. Speed is of the essence and helicopters often play a role in transporting the salvage team and essential equipment to the casualty. / Это один из типов несчастных случаев.

RAPIER LOOM = РАПИРНЫЙ ТКАЦКИЙ СТАНОК – Rapier Loom is a type of loom without shuttles. Method of inserting weft yarn:- two bands at the center of the fabric receive and pass on the weft yarn. The catch method is the most popular method, and is further broken down into two types, the band method and the pole method. Characteristics:- A very versatile loom, but it is noisy and there is a limit to its operation at high speed. Rapier Looms are the looms in which either a double or single rapier (thin metallic shaft with a yarn gripping device) carries the filament through the shed. In a single rapier machine, the yarn is carried completely across the fabric by the rapier. In the double machine, the yarn is passed from one rapier to the other in the middle of the shed. See also Weft Insertion. Rapier Looms:- Insertion of weft by rapier is a mechanically modern and refined version of the primitive method of fabric production in which the weft was secured in a slot of a stick. At present version of the gripper head which are attached to rapiers which are flexible tapes or rigid rods. Mr. Johann Gabler can be regarded as the father of modern rapier technology he has built a rapier device on a cotton weaving machine in 1922. Scope of Rapier:- (i) Single rapier loom can insert weft only on alternate rapier traverse; (ii) In many cases this is modified to achieve a higher rapier velocity in the early and late parts of the movement and thus a over maximum velocity halfway through the movement; (iii) Due to high rate of insertion the possibility of yarn breakages rate may increase; and (iv) Additionally, it is necessary to control the weft by passing it trough an effective tension arrangement so that the weaving tension will be more uniform, this can also occurred weft break. Features of Rapier Loom:- (1) An useful feature of rigid rapiers is that they can be simultaneously inserted in two sheds one above the other, for producing double plush and certain carpets. (2) Rapier loom may have various types according to the weft insertion mechanism and number of pick such as insertion of double pick, insertion of single pick, two phase rapier etc. (3) In all rapier looms to-and-fro-movement of the rapiers is derived initially either from a linkage mechanism or from a cam. The use of linkage mechanism has the advantages of simplicity reliability and is cheap, quite and consumers less energy than a cam mechanism but it does not provide any dwell to the rapiers. (4) The only two phase rapier in commercial operation is the saurer of width 2 x 185 cm or 2 x 220 cm having weft insertion rate is about 1 200 mpm. (5) The rigid rapier is driven from the centre and has a rapier head at each end.In one cycle of 360 degree the rapier inserts one pick alternately in the right hand and the left hand fabrics, the picks being inserted and beaten up in opposite phase. (6) In Gabler system of weft insertion the rapier system is combined with air jet picking system. (7) Gabler system rapier may be single sided or double sided. The machine include on Gabler system Draper DSL, Gusken etc.Those operating on dewas system include Dornier, Picanol, Novo pignon SACM, Gunne, Smit, Sommet, Sulzer-Ruti etc. Integrating the features of rapier looms of Model SJ758 and other imported and domestic rapier looms, Model SJ736-III rapier loom is specially designed for weaving of light, medium and heavy fabrics and check designs, it adopts automatic pick finder and electronic color selector. Features of Rapier Loom:- Control Panel:- The loom is controlled by the control panel with a micro-computer, the lcd display provides a very user-friendly human-machine interface, which shows the production statistic data of each shift and provides the weft color programming function. Weft Color Selection:- The machine adopts electronic color selector up to 8 colors, and the color selection pattern is programmed directly on the machine control panel. Wefting:- Wefting mechanism adopts 6-lever

wefting structure and can ensure the adjustment of the rapier entry and exit time and ensure stable wefting and insertion motion. This machine adopts 4 levers, short connectors and short sley to complete the beating motion, the rock shaft adopts 110 mm (diameter) seamless tube to ensure the beating strength and can be suitable for high-speed motion and weaving of heavy and high density fabrics. The rapier transmission box adopts the advanced helix umbrella gears to ensure stable transmission. The tension device adopts 3-rear-beam tension structure, which is specially designed for balancing the warp tension of high-density weaving and can improve the quality of the weaving fabrics. Pick Finding Mechanism:- The machine adopts electronic let-off mechanism with a high-accuracy step motor and the optimized mechanical take-up system for stable and accurate pick finding motion. The pick finding motion is very stable and proved to be very successful and reliable. The adoption of two pressing rollers on the fabric winding roller enables the worker to unload the fabric from the fabric roller without stop. The frequent adoption of bearings for the major moving parts provides better performance and easier maintenance. Suggestions:- Some of the disadvantages of rapier loom if may reduced then this machine will be more effective for weaving. Advantages of Rapier Loom Over Conventional Loom:- (1) The rapier loom doesn't require dynamic forces or anything like the magnitude as those involved in the conventional loom. (2) The weft insertion rate in a rapier loom is very much influenced by the method of weft control. (3) Weft insertion rate is very high rather than any conventional loom. (4) It can occur double pick at a time by double picking insertion system. Here is no need to cut the weft selvedges and no weft wastage. (5) Weft insertion rate is very high rather than any conventional loom Rigid rapiers has a useful features that they can be simultaneously inserted in two sheds one above the other, for producing double plush and certain carpets. (6) Looms that use rigid rapiers eliminate entirely the need to assist the rapier head through the warp shed, this is a un doubted advantages. Looms without shuttles. Rapier weaving today exists in diversified forms. During the last two decades the developments in rapier weaving have been carried out in a rapid continuous way. Rapier weaving machine produces top-quality fabrics from spun yarns such as cotton-wool, camel hair, silk, synthetic fibers and fancy yarns. Today's rapier weaving machine has become fast and exceptionally flexible. It offers a choice of various reed widths, shedding motions, selvedges and filling insertion colors. This makes it suitable for weaving an extended range of articles:- fashion fabrics, shirting, denim, suiting, industrial or furnishing fabrics, in one to eight or twelve filling colors or yarns, with a maximum weight of 500 g/m^2. Today's rapier weaving machine is designed with modern electronics, with total automation of weaving and central microprocessor control system, also ensuring maximum reliability, amazing user-friendliness, ease-of operation, shorter style changing time, excellent fabric quality, low energy consumption, and optimized insertion cycle for unequalled industrial speed. Rapier Looms vary greatly in both the general strategies of their design, such as the choice of method used to transfer the weft between the rapiers and the types of rapier used – rigid, flexible or telescopic – and in details of mechanism used. These machines find preferential use in the production of with fashion-appeal compared to other methods of weft insertion which are mainly suitable for weaving staple items with limited fashion-appeal. Ease of multicolor weft insertion is fully exploited by rapier looms – many can insert up to 12 colors in any pick-at-will patterning sequence, including their ability to deal with a wide range of yarns and fabric types. The positive rapier drives enables heavy or otherwise difficult yarns to be inserted. The rigid rapier system of weft insertion has the advantage of positive thread transfer in the centre of the shed without any need for guiding the rigid rapiers through the shed and without making contact with the warp thread. However this is at the cost of occupying more floor space, which causes reed width of the rigid rapier to be limited. The flexible rapier system of weft insertion has the reputation of being most adaptable and most applicable. The outstanding feature of flexible rapier machine is its significant increase in weft insertion rate, greater reed width (460 cm), versatility and adaptability. In the last 15 years or so the design of the rapier machine has been revolutionized by new innovations, engineering walkthroughs, automation in processes, introduction of computer technology, electronics and CAD-CAM systems (short for the computer-aided design – computer-aided manufacturing systems). The weaving industry on the whole has entered a new era of electronics, microprocessors, information technology and their application to the production of woven fabrics. Incorporation of electronic devices and system to weaving machines has become almost inseparable part of the machine. Developments, particularly of microprocessors, have revolutionized the design of the rapier weaving machines, including the weft propulsion technology. The weft insertion elements have been made smaller and lighter in weight. History Of Rapier:- the development of shuttleless loom, starting with the rapier loom, goes back to 1844, when John Smith of Salford was granted a patent to eliminate the shuttle. Subsequent patents were taken out by Phillippe and Maurice in 1855, W.S. Laycock in 1869, W. Glover in 1874. Rigid rapiers were invented in 1870 and perfected by O. Hallensleben in 1899. The main breakthrough came in 1922 when John Gabler invented principle of loop transfer in the middle of the shed. Flexible rapiers of the type used today were proposed in 1925 by R.G. Moya of Barcelona, based on a Spanish patent applied for in 1924. In 1939, another inventor, R. Dewas, introduced the novel idea of grasping the weft at its tip by the giver or a carrier rapier, and then transferring it to the taker or a receiver, in the middle of the shed. In the period up to the beginning of the World War 2 many patents were applied for, but it was only in the 1950s and 1960s that rapier weaving finally become commercialized and since then has made highly significant progress in achieving the present weft insertion rate of 1 500 m/min plus. Versatility In Color Insertion By Electronic Insertion:- The weft color selectors of today's rapier weaving machine are microprocessor controlled, compact sized ones and can be available in 16, 12, 8, 4 or 2 colors. Picanol developed the Quick Step filling presenter, operates with independent module, each consisting of an electronically controlled stepper motor with presenter needle. The color and weave pattern are microprocessor or jacquard controlled. After the left gripper has taken the presented yarns, the Quick Step needle returns to an intermediary position, so the course of the filling yarn is straight and the tension of the yarn is low and remains constant. The Quick Step filling presenter has several advantages. It is monitored by the machine microprocessor, so the timing for the presentation of the filling yarn is perfectly synchronized with the machine speed and the weave pattern. The filling presenter also provides the ideal position for rethreading. The modules of the Quick Step are interchangeable and there are no mechanical drives, so no maintenance or lubrication is required. Dornier offers the Electronic Color Selector (ECS), and the electronic filling tension device with integrated filling stop motion (EFC), are based on state-of-the-art stepping motor technology and are controlled by an external CAN-bus (short for the controller area network bus). Advantages of the system are:- (i) It is monitored by weaving machine microprocessor so timing for presenting for filling yarn is perfectly synchronized with machine speed and weave pattern; (ii) The course of filling yarn is low and remains constant; (iii) The filling presenter also provides ideal position for re threading; and (iv) The modules of quickstep are interchangeable. Picking Speed:- In Jacquard weaving upto 12 weft colors give a wide variety of patterning option. The G6500 offers a machine speed of upto 700 (revolutions per meter) rpm and a maximum weft insertion rate of 1 620 m/min. Secure Filling Transfer:- During center transfer from the left-hand to the right-hand rapier, the filling is positively controlled and thus securely transferred. The filling is released after the rapier has exited the shed in the open shed position and under absolutely control conditions. In Dornier rapier weaving machine, the highest peak yarn tension is extremely low due to the low rapier speed and positive control. Soft thread clamps with hard metal inserts and precision controlled transfer enable even coarse filament yarns of 2 200 dtex with 450 filaments to be securely clamped and inserted. Versatility Of Rapier Gripper:- A new generation rapiers capable of handling even the most difficult of yarns, typical of the latest trends in fashion fabrics. The rapiers are lightweight and compact and mounted at the centre of gravity on the ribbons to reduce wear to the minimum and guarantee maximum accuracy in movement. It facilitates the processing of the widest range of yarn types and counts – from fine silk yarns through glass rovings to the coarsest effect yarns. The count range lies between 0.77 tex and 3 333 tex. The weft exchange also takes place in slow speed, thus making life far easier for those involved in adjusting the machine setting and at machine start-up. Today's rapier weaving machine has become fast and exceptionally flexible. It offers a choice

of various reed widths, shedding motions, selvedges and filling insertion colors etc. The weft color selectors of today's rapier weaving machine are microprocessor controlled, compact sized ones and can be available in up to 16 colors. The maximum weft insertion rate achieved is 1 620 m/min. The versatile rapier head van handle a count range lies between 0.77 tex and 3 333 tex. Rapier head has become smaller, lighter and able to free-flight. Filling insertion system is microprocessor controlled and synchronized with other mechanisms. Shedding mechanism has become more versatile. Let-off and take-up mechanism is synchronized with other mechanisms so that minimum start-up marks produced in fabric in large diameter of take-up roll. Drive mechanism to reed and rapier provides minimum acceleration to the filling so that minimum filling breaks occur. Fully programmable high speed selvedge formation devices such as Moto leno, Disco leno, Power leno and ELSY are developed to cope up with high speed rapier machines. Rapier Loom:- two bands at the center of the fabric receive and pass on the weft yarn. The catch method is the most popular method, and is further broken down into two types, the band method and the pole method. A very versatile loom, but it is noisy and there is a limit to its operation at high speed. / уточина. в 1844 Дьжон Смис (John Smith) из Солфорда (Salford), Великобритания. Филипэ энд Морис (Phillippe and Maurice) в 1855, ДаблЮ.Эс. Лэйкок (W.S. Laycock) в 1869, и ДаблЮ. Главё (W. Glover) в 1874. О. Халенслибэн (O. Hallensleben) в 1899. Йохан Габля (Johann Gabler). RARE–EARTH ELEMENT = РЕДКОЗЕМЕЛЬНЫЙ ЭЛЕМЕНТ – Rare-Earth Element is any of a large family of chemical elements consisting of Scandium (atomic number 21), Yttrium (atomic number 39), and 15 elements from Lanthanum to Lutetium (atomic numbers 57–71). They form a series of 17 chemically similar metals, all but one of which occur in nature. Often they are called simply Rare Earths, but this is a misnomer because the term earth properly is applied to the oxide of a metal rather than to the element itself. The rare-earth elements are not even particularly rare, though for a long time they were thought to be. The 17 rare-earth elements are:- Scandium (Sc), Yttrium (Y), Lanthanum (La), Cerium (Ce), Praseodymium (Pr), Neodymium (Nd), Promethium (Pm), Samarium (Sm), Europium (Eu), Gadolinium (Gd), Terbium (Tb), Dysprosium (Dy), Holmium (Ho), Erbium (Er), Thulium (Tm), Ytterbium (Yb), and Lutetium (Lu). Until the mid-XX century, there was not much use for pure rare-earth elements or compounds except Cerium and Lanthanum; mixtures of the rare earths, however, had found metallurgical and other uses. By the 1970s three of these elements, Yttrium, Gadolinium, and Europium, were being used in the red phosphors for color television. In the periodic table of the elements, the rare-earth elements comprise three members of Group IIIb and all 14 members of one of two series of elements generally written apart from the main table. This long series is known collectively as the lanthanide series because it directly follows lanthanum in a different form of the table. The rare-earth elements all have certain common features in the electronic structure of their atoms, which is the fundamental reason for their chemical similarity. The aqueous chemistry of all the rare earths is very similar and changes only slightly in progressing along the lanthanide series. Because of this similarity, it is difficult to separate individual rare earths. In the few cases in which the rare-earth ion can be oxidized or reduced to another valency, however, chemical separations can be carried out readily. Also, artificial mixtures of elements far apart in the series can be separated easily. All of these elements form trivalent compounds, and in the crystal lattices (the regular arrangement of atoms in the solid forms) of such compounds, one rare-earth ion readily replaces another. The rare-earth metals when heated react strongly with nonmetallic elements to form very stable compounds. They are never found as the free metals in the Earth's crust. Pure minerals of individual rare earths do not exist in nature; all their minerals contain mixtures of the rare-earth elements. Promethium is never found in the Earth's crust since it has no stable isotopes and is produced only by nuclear reactions; it can, however, be obtained in quantity from the fission products formed in nuclear reactors. The chemical properties of scandium differ sufficiently from those of other rare-earth elements for it to have become segregated from them by the action of geological processes. Scandium seldom is associated with the rare earths in minerals. / Редкоземельные Элементы (РЗЭ) – химические элементы, расположенные в III группе периодической системы Менделеева:- скандий Sc (Z=21), иттрий Y (Z=39), лантан La (Z=57) и лантаноиды (Z=58–71). Характерная особенность РЗЭ – их совместное присутствие в природе и близость химических свойств. РЗЭ – металлы серебристо-белого цвета, тускнеющие на воздухе из-за образования оксидной плёнки.

RARE EARTH METALS = РЕДКОЗЕМЕЛЬНЫЕ МЕТАЛЛЫ – Rare Earth Metals or rare earth elements are a collection of seventeen chemical elements located at the bottom of the periodic table. They are key elements in the manufacture of high technology components, hybrid cars, etc. Rare earth metals are not radioactive, but rare earth deposits are known to contain thorium, a radioactive element, which makes their mining and refining highly toxic to the environment. Rare earth metals include:- scandium, yttrium, lanthanum, cerium, praseodymium, neodymium, promethium, terbium, dysprosium among others. A complete list of rare earth elements can be found here. These metals are not rare in the sense of being scarce, but they are found scattered and in low concentration to be economically exploitable forms. / Под Редкоземельными Металлами или Редкозмельными Элементами понимаются химические элементы побочной подгруппы III группы периодической системы Менделеева:- иттрий, лантан и лантаноиды, скандий. Распространены в земной коре сравнительно редко, образуют нерастворимые оксиды (устаревшее – земли) – отсюда название. Серебристо-белые металлы, тускнеющие на воздухе из-за образования плёнки оксида. Химически активны. В природе встречаются совместно. Например, минерал монацит – источник редкоземельных элементов цериевой группы и тория. В литературе обозначаются:- РЗМ, РЗЭ и TR (от Латинского словосочетания Terra Rara).

RAROC = RISK–ADJUSTED RETURN ON CAPITAL

RASCHEL = РАШЭЛЬ (или РАШЕЛЬ) – Raschel is a knit made on a Raschel machine, a warp knitting machine that can use bulky yarns to form designs imitating crochet or net. Raschel fabrics are normally coarser than other types of warp knits, but a wide range of fabrics can be made. / Рашэльные ткани обычно более грубые, нежели другие типы основовязаных трикотажных полотен, но может быть сделан широкий диапазон тканей.

RASCHEL KNIT = РАШЕЛЬНОЕ ВЯЗАНОЕ ИЗДЕЛИЕ (или РАШЕЛЬНЫЙ ТРИКОТАЖ, или ФАНГОВЫЙ ОСНОВОВЯЗАЛЬНЫЙ ТРИКОТАЖ) – Raschel Knit is a warp knitted fabric in which the resulting knit fabric resembles hand crocheted fabrics, lace fabrics, and nettings. Raschel warp knits contain inlaid connecting yarns in addition to columns of knit stitches. Raschel Knits are produced from spun or filament yarns of different weights and types. Most raschel knits can be identified by their intricate designs, the open-space look of crochet or lace, and an almost three-dimensional surface effect design. Raschel knits are used for a diverse group of products, including lace and lace trims, sweaters, thermal underwear, swimsuits, blankets, and tennis nets. Raschel Knits have a lacelike, open construction, with a heavy, textured yarn held in place by a much finer yarn. Raschels can be made in a variety of types, ranging from fragile to coarse, and usually have limited stretch. The Raschel Knitting Machine was developed in the XIX century as an inexpensive way to produce lace. The machine was named after the very popular XIX century French actress Elisabeth Rachel Félix – better known as Mademoiselle Rachel – who was known for wearing lace. Her name was altered to the German spelling as the Raschel knitting machine was refined in Germany. Raschel knits range widely in style and use. They are warp knits of a heavier weight than the warp knits made on a tricot machine. Raschel knits are also often characterized by vertical chains of stitches on which a pattern is created. Uses:- depending on the weight and style, uses for raschel knits range from sheer lace to coats. Raschel machines may have one or two sets of needles and up to thirty guide bars. / в честь Французской актрисы Элизабэт 'Элиза' Рашэль Феликс (Elisabeth 'Eliza/Élisa' Rachel Félix) также Элизабэт-Рашэль Феликс (Elizabeth-Rachel

Félix), лучше известную только как Мадмуазель Рашэль (Mademoiselle Rachel) (родилась 1821-Февраль-21 – умерла 1858-Январь-03). Крошэ, от Французского слова Crochet, означающее Крючок, . Рашельные машины (или Рашель машины) могут иметь один или два комплекта игл и до тридцати направляющих гребёнок. Рашэль Машина или Вертелка – фанговый основотрикотажный станок для получения фасонных и узорчатых изделий.

RASCHEL KNITTING = РАШЭЛЬНОЕ ВЯЗАНИЕ (или РАШЭЛЬНЫЙ ТРИКОТАЖ, или ФАНГОВЫЙ ОСНОВОВЯЗАЛЬНЫЙ ТРИКОТАЖ) – Raschel Knitting:- warp knitting resembling tricot but usu. coarser and with openwork patterns. See also Knitting. Raschelmaschine, after Rachel (Elisabeth 'Eliza/Élisa' Rachel Félix (also Elizabeth-Rachel Félix), better known only as Mademoiselle Rachel (February 21, 1821 – January 03, 1858)) French actress. Raschel Knitting, a type of warp knitting, produces an openwork fabric resembling crochet. Bulkier and less elastic than some other types of warp knitting, Raschel knit fabric is often used in outerwear. Raschel knitting machines produce a wide selection of fabrics ranging from mesh bags and net fabrics such as mosquito netting, chemical fiber garments and technical and medical net textiles to lace curtains and edgings, veils, narrow tapes and blankets. Raschel knitting is an industrial knitting process and is not done by hand. Knitted fabric falls into two categories:- weft knit and warp knit fabric. Warp knit fabric consists of a series of wales, or parallel ridges, running lengthwise through the material. Warp knitting machines contain beds of latch needles; each loops its own thread in the knitting process, creating rows of stitches linked in a zigzag pattern. The fabric is knitted vertically instead of in the usual horizontal rows, and a separate strand of yarn is required for every column of stitches. The front of the fabric contains angled vertical stitches, while the back consists of horizontal floats called laps or underlaps. Raschel knitting and tricot knitting are the two most common types of warp knitting. Raschel knitting machines produce both flat and tubular warp knit fabrics that resemble crochet and lace fabrics. Raschel knit material can contain inlaid yarns in addition to the vertical rows of stitches. The fabrics are similar to tricot knitting but more open and with a coarser texture. Warp knit fabrics have greater dimensional stability than weft knit materials and are less likely to sag, nor do they ravel as easily. Raschel warp knit machines generate fabrics in more diverse textures and designs than tricot warp knit machines. Some materials are single-faced; others are reversible. Raschel knitting machines use a wide variety of yarns, ranging from smooth, tightly-spun yarns to novelty yarns. The resultant fabrics vary greatly from lightweight lace to heavy chenille, from fancy embroidery to coarse texture. They tend to have little stretch and hold their shapes well. When machine sewing Raschel knit fabric, use a roller foot; stop and raise the foot periodically to allow the fabric to resettle itself. Use a stitch length of eight to ten stitches per inch. Sew seams with overlock stitching, and reinforce them to prevent stretching. Avoid making buttonholes if possible. Raschel Knitting is a type of warp knitting that produces fabric similar to tricot but usually of coarser texture and with openwork patterns. Raschel Knitting is a versatile type of warp knitting made in plain and Jacquard patterns; the latter can be made with intricate eyelet and lacy patterns and is often used for underwear fabrics. Raschel fabrics are coarser than other warp-knit fabrics, but a wide range of fabrics can be made. Raschel knitting machines have one or two sets of latch needles and up to thirty sets of guides. Raschel is a type of warp knitting in which plain and Jacquard fabrics can be made. / Жакяр (Jacquard). в честь Французской актрисы Элизабэт 'Элиза' Рашэль Феликс (Elisabeth 'Eliza/Élisa' Rachel Félix) также Элизабэт-Рашэль Феликс (Elizabeth-Rachel Félix), лучше известную только как Мадмуазель Рашэль (Mademoiselle Rachel) (родилась 1821-Февраль-21 – умерла 1858-Январь-03). Крошэ, от Французского слова Crochet, означающее Крючок, . Рашэль или Рашэльное – тип основного вязания, в котором могут быть сделаны полотняные и Жаккардовые ткани.

RATCHET = ПРОПОРЦИОНАЛЬНОЕ ИЗМЕНЕНИЕ (или ХРАПОВИК, или ТРЕЩЁТКА, или СОБАЧКА) – Ratchet:- a provision often found in a terms sheet. A ratchet gives an investor certain rights especially when additional equity capital is raised in a 'down-round', i.e. at a lower valuation than before. Examples of these terms include so-called 'Full Ratchet' anti-dilution adjustments, super-multiple participating liquidation preferences and short-time frame mandatory redemption. With respect to anti-dilution protection, investors may require an adjustment to the number of shares they purchased previously in the event the company sells additional shares in the future at a price per share lower than the share price paid by the institutional investor. This can occur through an adjustment to the conversion price of the convertible equity security purchased by the investor, i.e. lowering the conversion price so the investor is entitled to more shares when he converts.

RATE = КУРС (или СТАВКА) – Rate is an arithmetic expression of the variation over time of a quantity or of the relationship between two quantities at a given time. Rates are usually expressed as a percentage relationship between a quantity and a base period. When used to express the price of goods or services, e.g., the Wage Rate. The term rate does not have a relative connotation, but is simply the price charged for a good or service. The price of one currency in terms of another, typically used for dealing purposes. / , например, Ставка Зарплаты или Оклада (Wage Rate). Под Курсом, от Латинского слова Cursus, означающее Бег или Движение, понимается цена, по которой покупаются и продаются акции, облигации и другие ценные бумаги.

RATE = СТАВКА – (1) A carrier must establish Rates for the transpor-tation of goods, other than household goods, under which the liability of the carrier is lim-ited to a value established in a written or elec-tronic declaration. 49 USC §14706(c)(1)(A) (2005; 49 USC is short for the United States Code:- Title 49). Rates have to be reasonable under the circumstances surrounding the transporta-tion. Id; §13710(A)(2) (2005).

(2) In insurance, Rate is the premium expressed as a percentage of the sum insured or limit of indemnity. / В страховании под Ставкой понимается премия, выраженная в процентах от страховой стоимости или лимита возмещения (лимита компенсации).

RATE AGREEMENT = СОГЛАШЕНИЕ О СТАВКАХ – Rate Agreement:- group of carriers who discuss rates and common problems with options to file independent tariffs.

RATE BASE = БАЗА СТАВКИ (или БАЗА РАСЧЁТА) – Rate Base:- the value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods:- fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

RATE BUREAU = ТАКСИРУЮЩЕЕ БЮРО – Rate Bureau:- a carrier group that assembles to establish joint rates, to divide joint revenues and claim liabilities, and to publish tariffs. Rate bureaus have published single line rates, which were prohibited in 1984.

RATED FLOW = РАСЧЁТНЫЙ ПОТОК (или НОМИНАЛЬНЫЙ ПОТОК) – Rated Flow is the maximum flow that the power supply system is capable of maintaining at a specific operating pressure.

RATED PRESSURE = РАСЧЁТНОЕ ДАВЛЕНИЕ (или НОМИНАЛЬНОЕ ДАВЛЕНИЕ) – Rated Pressure:- the qualified operating pressure which is recommended for a component or a system by the manufacturer.

RATEMAKING AUTHORITY = ТАКСИРУЮЩЕЕ (или РАСЧИТЫВАЮЩЕЕ) ВЕДОМСТВО – Ratemaking Authority is a utility commission's legal authority to fix, modify, approve, or disapprove rates, as determined by the powers given the commission by a State or Federal legislature.

RATE OF CHANGE = УРОВЕНЬ ИЗМЕНЕНИЯ (или ТЕМП ИЗМЕНЕНИЯ) – Rate Of Change is a momentum oscillator that measures the percent change in price from one period to the next. The plot forms an oscillator that fluctuates above and below the zero line as the rate-of-change moves from positive to negative. The oscillator can be used as any other momentum oscillator by looking for higher lows, lower highs, positive and negative divergences, and crosses above and below zero for signals. A refinement of Momentum – Rate of Change is designed to fluctuate as a percentage around the zero line. / Осциллятор момента, который измеряет процентное изменение цены от одного временного периода к другому.

RATE OF EXCHANGE = ОБМЕННЫЙ КУРС (или КУРС ОБМЕНА, или СТАВКА ОБМЕНА) – The amount of currency of one nation that may be purchased on a specific date with a specified amount of the currency of another nation. Rate Of Exchange is a rate at which one currency may be converted into another. Generally, one unit of the home currency is expressed in terms of another currency. For example, an American bank may quote the exchange rate between the Dollar and the Yen as the number of Dollars needed to buy one Yen. Also knowns as Currency Exchange Rate, Exchange Rate, and Foreign Exchange Rate.

RATE OF RETURN = УРОВЕНЬ ОТДАЧИ (или СТАВКА ОТДАЧИ) – The Rate Of Return is the relationship between the annual income generated by an investment and the present value of the investment. In stocks and bonds, the amount of money (in the form of interest or a dividend) returned to investors on their investments. Normally expressed as a percentage of the amount invested. Also known as Yield.

RATE OF SHEAR = ВЕЛИЧИНА СДВИГА (или КОЭФФИЦИЕНТ СДВИГА, или СТАВКА СДВИГА, или СКОРОСТЬ СДВИГА) – Rate of Shear is the difference between the velocities along the parallel faces of a fluid element divided by the distance between the faces. / Величина Сдвига:- разница между скоростями вдоль параллельных лицевых поверхностей жидкого элемента, разделённая на расстояние между этими лицевыми поверхностями.

RATE SHEET = ЛИСТ СТАВОК (или СПИСОК СТАВОК, или ПРЕЙСКУРАНТ) – Rate Sheet is a schedule of warehouse or transportation charges for a client. / Лист Ставок:- перечень (или список) складских или перевозочных сборов для клиента.

RATIN = РАТИН (или ХХ) – Ratin is a rough bulky fabric usually woven loosely in plain weave from ratin yarns, namely nubbly ply yarns of various fibers made by twisting under tension a thick and thin yarn.

RATINÉ = РАТИНЕ (или РАТИН) – Ratiné is:- (1) a plain-weave, loosely constructed fabric having a rough, spongy texture which is imparted by the use of nubby plied yarns. It is made from worsted, cotton, or other yarns. (2) A variant of spiral yarns in which the outer yarn is fed more freely to form loops that kink back on themselves and are held in place by a third binder yarn that is added in a second twisting operation. / Ратине – ткань с ратиновой отделкой. Ратин – пальтовая шерстяная ткань, лицевая сторона которой имеет подвитой ворс. Ратин – (от Французского слова Ratine), шерстяная ткань с характерной поверхностью, образуемой короткими завитками густого ворса. Поверхность ратина получают путём отделки ворсовой ткани на ратинирующей машине. Ткань пропускают между 2 трущимися плитами. В зависимости от материала поверхности верхней плиты (волосяная щётка, плюш, мягкая резина или сукно), направления и амплитуды движения плиты, давления её на ткань получаются рисунки из ворса. Ворсинки закатываются, образуя шарики, свёртываются в виде узелков, косичек или укладываются волнами, а затем фиксируются путём термообработки. Ратинирование, помимо улучшения внешнего вида, придаёт ворсу большую стойкость к истиранию и используется при изготовлении высококачественных тканей для пальто, например, драп-ратин.

RATING = РЭЙТИНЬГ (или ТАКСАЦИЯ, или ПОКАЗАТЕЛЬ ОЦЕНКИ) – (1) Rating:- standard assessment of the creditworthiness of countries, companies and their bonds by specialized agencies such as Standard & Poor's, Moody's Investors Service Ltd or Fitch Ratings Ltd. In general, a borrower with a high credit rating will be able to obtain capital at more favorable rates (lower interest rates). By contrast, borrowers with a low credit rating must pay a higher interest rate due to the higher probability of default (credit risk). Credit standing of an individual, firm, bank or state, or of securities issued by them. Awarded by banks or specialized rating agencies, e.g., Moody's, Standard & Poor's, etc. / , например, Стэндод энд Поз (Standard & Poor's), Мудиз Инвэстоз Сёвис Лимитид (Moody's Investors Service Ltd) или Фитч Рэйтиньгз Лимитид (Fitch Ratings Ltd). и прочие . Под Рэйтиньгом понимается индивидуальный числовой или буквенный показатель оценки достижений в чём-либо.

(2) Rating:- grade assigned to, e.g., bonds or preferred stocks, by an official agency such as Moody's or Standard & Poor's, in order to guide investors. In the stock market, evaluation of a corporation or a security issued by a corporation, particularly with respect to solvency and profitability. Also known as Valuation. / Сорт, присваиваемый, например, облигациям или привилегированным акциям, официальным агентством, таким как Мудиз Инвэстоз Сёвис Лимитид (Moody's Investor Service Ltd) или Стэндод энд Поз (Standard & Poor's) с тем, чтобы инвесторы могли ориентироваться в их благонадёжности или ценности.

(3) Rating:- classifying test entries based on degree of Plant damage, number of insects, etc, by expressing on a numerical scale, usually 0–9. It is relative estimate.

RATING BUREAU = РЭЙТИНЬГОВОЕ БЮРО (или БЮРО ТАКСАЦИИ, или БЮРО ОЦЕНКИ) – Rating Bureau is an organization that classifies and promulgates and in some cases compiles data and measures hazards of individual risks in terms of rates in a given territory. / Организация, которая классифицирует и провозглашает, а в некоторых случаях и компилирует данные и оценивает опасности конкретных рисков во взятой территории на условиях ставок или оценок.

RATIO = СООТНОШЕНИЕ (или ОТНОШЕНИЕ) – In finance, Ratio is the relationship between two numbers or sets of numbers in a balance sheet or other financial statement which gives an indication of a company's profitability, solvency and liquidity. The ratio is calculated by dividing one number by another. There are three main types of ratios:- profitability ratios, short-term liquidity ratios, and long-term liquidity ratios. Also known as Multiplier. See also Acid-Test Ratio, Capital Output Ratio, Current Ratio, Debt Coverage Ratio, Debt Ratios, Leverage Ratios, Liquidity Ratios, Loan Ratio, and Price-Earnings Ratio. / Известен также как Произведение. Под Отношением понимается частное от деления одной величины на другую. Под Коэффициентом, от Латинских слов Co, означающее Совместно, и Efficiens, означающее Производящий, понимается множитель, обычно выражаемый цифрами. В статистике под коэффициентом понимается показатель, выраженный относительными величинами. Коэффициенты отражают:- вариацию величин признака (например, коэффициент ритмичности), взаимосвязь качестенно различных явлений (например, коэффициент плотности населения), скорость развития какого-либо явления (так называемые коэффициенты динамики), степень использования денежных, материальных или трудовых ресурсов (например, коэффициент эффективности), частоту возникновения явления (например, коэффициент рождаемости). Используются Коэффициент Материалоёмкости, Коэффициент Мощности, Коэффициент Полезного Действия (КПД), Коэффициент Полных Затрат, Коэффициент Прямых Затрат, Коэффициент Сменности Оборудования.

RATIO ANALYSIS = АНАЛИЗ СООТНОШЕНИЙ – Ratio Analysis:- the use of a ratio to compare the relative strength between any two entities. For example, an individual stock divided by the S&P 500 index can determine whether that stock is outperforming or underperforming the stock market as a whole. A rising ratio indicates that the numerator in the ratio is outperforming the denominator. Trend analysis can be applied to the ratio line itself to determine important turning points.

RATIO CALL SPREAD = СООТНОСИТЕЛЬНАЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПОКУПКУ (или ПРОПОРЦИОНАЛЬНАЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПОКУПКУ, или XX) – Ratio Call Spread:- when to use:- usually entered when market is near A and user expects a slight to moderate rise in market but sees a potential for sell-off. One of the most common option spreads, seldom done more than 1:3 (two excess shorts) because of upside risk. Profit characteristics:- maximum profit, is equal to B – A – net cost of position (for call-vs.-call version), realized if market is at B at expiration or B – A + net credit of position (if long option premium is less than premium collected from the sale of two or more options). Loss characteristics:- loss limited on downside (to net cost of position in call-vs.-call, or no loss if position established at a credit) but open-ended if market rises. Rate of loss, if market rises beyond strike price B, is proportional to number of excess shorts in position. Decay characteristics:- depends on the net time value purchased or sold via this strategy. If more time value sold than bought, then time value decays works to the benefit of the holder of this strategy. Category:- precision. Long call A, short calls B. For example, long 1 call @ A; short 2 calls @ B. / Одна из стратегий торговли опционами. Когда она используется? Обычно к ней прибегают тогда, когда рынок находится вблизи некоей цены A, и при этом делец ожидает рост рынка от незначительного до умеренного, но при этом видит и возможный потенциал для распродаж. Данная стратегия является наиболее распространённой среди курсовых разниц по опционам, редко когда случается более 1:3 (две лишние продажи) из-за возможного риска повышения цены на рынке. Характеристики прибыли:- максимальная прибыль, равная Сходная Цена B – Цена A – Чистый Расход по Позиции (для версии опцион на покупку против опциона на покупку), достигается лишь в том случае, если рынок находится на уровне сходной цены B по истечении срока действия или в случае, когда Сходная Цена B – Цена A + Чистый Кредит Позиции (если премия за опцион на покупку меньше премии, полученной от продажи двух или более опционов). Характеристики убытка:- убыток ограничен, когда цена на рынке движется вниз (до Чистого Расхода по Позиции для версии опцион на покупку против опциона на покупку, или без убытка, если позиция открыта при кредите); но убыток не ограничен, в случае если цена на рынке растёт. Ставка убытка, если цена на рынке превышает сходную цену B, пропорциональна числу лишних продаж в позиции. Характеристики истощения:- зависит от чистой временной стоимости, приобретённой или проданной посредством данной стратегии. Если большая временная стоимость продана, нежели куплено, то истощения временной стоимости работает в пользу держателя данной стратегии. Категория:- точность. Покупка опциона на покупку со сходной ценой A, продажа опционов на покупку со сходной ценой B. Например, покупка 1 опциона на покупку со сходной ценой A (long 1 call @ A); продажа 2 опционов на покупку со сходной ценой B (short 2 calls @ B).

RATIO HEDGE = СООТНОСИТЕЛЬНЫЙ ХЭДЬЖ (или ПРОПОРЦИОНАЛЬНОЕ ХЭДЬЖИРОВАНИЕ) – Ratio Hedge:- the number of options compared to the number of futures contracts bought or sold in order to establish a hedge that is neutral or Delta neutral. / Число опционов, сопоставимое с числом фьючерсных контрактов, купленных или проданных, в соответствии с которым основывается хэдьж, являющийся нейтральным или нейтральным по Дельте.

RATIONAL–COMPREHENSIVE DECISION–MAKING = РАЦИОНАЛЬНО–ВСЕОБЪЕМЛЮЩЕЕ ПРИНЯТИЕ РЕШЕНИЯ – Rational-Comprehensive Decision-Making is a theoretical model of how public policy decisions are (or perhaps ought to be) taken. All possible options or approaches to solving the problem under study are identified and the costs and benefits of each option are assessed and compared with each other. The option that promises to yield the greatest net benefit is selected. The main problem with rational-comprehensive approaches is that it is often very costly in terms of time and other resources that must be devoted to gathering the relevant information. Often the costs and benefits of the various options are very uncertain and difficult to quantify for rigorous comparison. The costs of undertaking rational-comprehensive decision-making may themselves exceed the benefits to be gained in improved quality of decisions.

RATIO PUT SPREAD = СООТНОСИТЕЛЬНАЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПРОДАЖУ (или ПРОПОРЦИОНАЛЬНАЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПРОДАЖУ, или XX) – Ratio Put Spread:- when to use:- usually entered when market is near B and you expect market to fall slightly to moderately, but see a potential for sharp rise. One of the most common option spreads, seldom done more than 1:3 (two excess shorts) because of downside risk. Profit characteristics:- maximum profit in amount of B – A – net cost of position (for put-vs.-put version), realized if market is at A at expiration, or B – A + net credit of position (if long option premium is less than premium collected from the sale of two or more options). Loss characteristics:- loss limited on upside (to net cost of position in put-vs.-put version, or no loss if position established at a credit) but open-ended if market falls. Rate of loss, if market falls below strike price A, is proportional to number of excess shorts in position. Decay characteristics:- dependent on the net time value purchased or sold via this strategy. If more time value sold than bought, then time value decays work to the benefit of the holder. Category:- precision. Long put B, short puts A. For example, long 1 put @ B; short 2 puts @ A. / Одна из стратегий торговли.

RATIO SPREAD = СООТНОСИТЕЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или ПРОПОРЦИОНАЛЬНАЯ КУРСОВАЯ РАЗНИЦА, или КУРСОВАЯ РАЗНИЦА СООТНОШЕНИЯ, или СПРЭД СООТНОШЕНИЯ) – Ratio Spread:- this strategy, which applies to both puts and calls, involves buying or selling options at one strike price in greater number than those bought or sold at another strike price. Ratio spreads are typically designed to be delta neutral. Back Spreads and Front Spreads are types of ratio spreads. Any spread where the number of long market contracts and the number of short market contracts are unequal. A Ratio Spread involves buying different amounts of similar options with differing strike prices. The purchase of an in-the-money option is financed by the selling of more out-of-the-money options. Conversely, the out-of-the-money options are financed by selling less of an in-the-money option. / соотносительная (или пропорциональная) курсовая разница (ratio spread).

RATIO VERTICAL SPREAD = СООТНОСИТЕЛЬНАЯ (или ПРОПОРЦИОНАЛЬНАЯ) ВЕРТИКАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или ВЕРТИКАЛЬНАЯ КУРСОВАЯ РАЗНИЦА СООТНОШЕНИЯ, или ВЕРТИКАЛЬНЫЙ СПРЭД СООТНОШЕНИЯ) – The Ratio Vertical Spread:- in other words, if two traders were trading with each other and one put on a Backspread, the other trader would have on a Ratio Vertical Spread. Obviously, those traders would have very different opinions as to the market at that particular point in time. To be honest, I'm not a great fan of this type of spread, but I want to give you a sense of how to look at the other side of a trade. Also, occasionally this trade does set up nicely, and when it does there are some nice profits to be made. Let's start off with a definition. Definition:- A Ratio Vertical Spread is a Delta neutral options position that consists of more short options than long options on the same underlying stock. It can be established with either Calls or Puts in the same expiration month and is sometimes just referred to as a Ratio Call Spread or a Ratio Put Spread, respectively. There is also a Calendar or Diagonal Ratio Vertical Spread which has more options being sold in a far month than are being bought in a near month. These spreads are not very popular because the margin requirements are quite large. This is due to the fact that the long options would expire before the shorts, and therefore, the shorts are

not covered for margin purposes and are considered to be naked. As I've mentioned in previous articles, since the crash of 1987 most indexes and many stocks trade with a reverse or negative vertical skew. That means that OTM Puts will generally trade with a higher implied volatility (IV) than OTM Calls. This implies that we should sell the lower strike and buy the higher strike. Since we want to make the spread Delta neutral, it will set up much better with Puts than with Calls. To make a Ratio Vertical Spread Delta neutral, the ratio of short to long options is usually somewhere in the neighborhood of 2:1 or 3:2. Ratios greater than 3:1 should be avoided. Let's look at an example, of a Ratio Put Spread; With XYZ @ USD55.30, and the Oct 50 Put @ USD2.80 with a delta of –29, and the Oct 55 Put @ USD4.10 with a Delta of –46. If we sell 30 of the 50's and buy 20 of the 55's, we'll have a position that is net short 50 Deltas, which is close enough to be considered Delta neutral. It's calculated as follows:- –30 x –29 + 20 x –46 = –50. Of course if you're really a stickler you could have used a ratio of 30 to 19 which would have produced a delta of only –4. Now that's neutral! Also note, that the net cost of putting on this position is a credit of USD200, calculated as –30 x USD280 + 20 x USD410 = –USD200. For practice, you might want to try drawing a graph of a Ratio Call Spread. Try it and if you have trouble just send me an email. It is very important to be able to draw these graphs because a number of characteristics of the spreads become apparent just by looking. In this case, we can immediately see:- (i) there is limited gain potential on the upside; (ii) there is the possibility of a huge loss on the downside. (It would be unlimited, but the stock cannot go below 0.); and (iii) the best place for the stock to end up at expiration is where the 2 diagonal lines meet, which is the strike price of the short options. The maximum value of this position at expiration is at a stock price of USD50. At that point the 55 Put is worth USD5, but since it cost USD4.10, the profit is 20 x (5 – 4.10) x 100 = USD1 800. In addition, the 50 Put is worthless, but we took in a credit of USD2.80 so the profit on that option is 30 x 2.80 x 100 = USD8 400. The total profit is therefore USD10 200. As the stock declines from that point the position will lose USD1 000 for each USD1 move. So when the stock moves down 10.2 points to USD39.80, the entire profit will be eliminated. Further declines will result in an overall loss. On the other hand, if the stock price increases from USD50, the value of the position will lose USD2 000 for each USD1 move. When it gets to USD55, the position will have a small profit of USD200, which is the amount of the original credit taken in. Above USD55, both options become worthless, so the profit on the position is just the original credit of USD200. Let's look at the Greeks and see what else we can determine about this type of spread. Price:- since the position was put on delta neutral, we know a small move up or down in the price of the stock should not have much of an impact in the value of the spread initially. However, since the gamma of the position is negative, we want the price of the stock to not move very much. Time:- this position has positive theta, so time is working for you. To get the maximum benefit from the theta you probably would want to put this position on within 60 days or less to expiration. Volatility:- this position has negative vega, so a decrease in IV is helpful, which implies that it should be put on when volatility is high and expected to come in. So we see that a Ratio Put Spread is used when there is a reverse vertical skew and volatility is high and expected to return to normal levels. For maximum results, the options that are sold are at the strike price of where you think the stock will be at expiration. The long options should be a strike or 2 higher than that. As far as which expiration month to choose, you could use either the current front month or the one following. If you're able to put the position on for a small credit or even a small debit, there's no risk to the upside. I am sure that if not for the unlimited downside risk and the large margin requirement, this would be a more commonly used strategy. Ratio Vertical Spread is an option spread that creates profit from volatile circumstances. A small amount of closertothemoney options are bought than fartherfromthemoney options. Refer to Backspread. See also Front Spread. / попробуйте начертить график . Смотрите также Фронтальная Курсовая Разница или Фронтальный Спрэд (Front Spread).

RATLINE = ВЫБЛЕНКА – Ratline (maritime term):- a short length of small rope 'ratline stuff' running horizontally across shrouds, for a ladder step.

RATOON = РЕТОНЬО (или РАТЧУН, или ПОВТОРНАЯ, или КОРНЕВОЙ ОТПРЫСК, или ОТВОДОК, или ОТРОСТОК ОТ КОРНЯ) – Ratoon:- new tillers that grow from the stubble of harvested plants and may bear grains. These new tillers constitute the ratoon crop.

RATOON COTTON = ХЛОПЧАТНИК РЕТОНЬО (или ПОВТОРНЫЙ ХЛОПЧАТНИК, или ОТРАСТАЕМЫЙ ХЛОПЧАТНИК, или МНОГОЛЕТНИЙ ХЛОПЧАТНИК, или ХЛОПЧАТНИК МНОГОЛЕТНИК) – Ratoon Cotton is a Cotton regrown from left-over root stock from a pervious season. A Cotton crop in which the stalks are cut down after harvest, but the crown and rootstock are left in the ground to regrow the following season. For pest and disease reasons, this form of cropping is not used in most countries. Also known as Stub Cotton. Crop that is cut back or cropped and is left to grow again for another season. The ratooning process for example for Cane is usually repeated three times so that three economical crops are taken from one original planting. / У сельскохозяйственной культуры Хлопчатника после сбора урожая стебли обрезаются под корень, но корневую шейку и корни подвоя оставляют в земле для последующего роста из них нового стебля в следующем сезоне. Во многих странах по причинам воздействия насекомых вредителей и болезней эта форма воспроизводства Хлопчатника не используется. Известен также как Срезанный Под Корень Хлопчатник (Stub Cotton). Растения, которые срезаны под корень или обработаны, и оставлены для дальнейшего роста в следующем сезоне. Процесс возобновления, например для тростника, обычно повторяется три раза; таким образом, с одного посева можно собрать три экономных урожая.

RATOON CROPPING = ВОЗДЕЛЫВАНИЕ РЕТОНЬО (или ВЫРАЩИВАНИЕ РЕТОНЬО) – Ratoon Cropping is a cultivation of growth from stubble after a crop has been harvested to develop another crop. Conducted in level bunded fields where water is readily available for irrigation.

RATTAIL = КРЫСИНЫЙ ХВОСТИК – Rattail (or Rat's-Tail) is a narrow, round cord used for trimming and for macramé. See also Macramé. / Крысиный Хвостик, когда речь идёт о косичке или верёвочке. Смотрите также Макраме (Macramé).

RATTAIL FRINGE = БАХРОМА У КРЫСИНОГО ХВОСТИКА – Rattail Fringe is a decorative edging made of rattail in which the rattail forms loops across the edging. See also Rattail.

RATTEEN = РАТИН (или ЭПОНЖ, или БУКЛЕ) – Ratteen is a coarse woolen fabric. Ratteen or Rateen, a woolen fabric with a distinctive surface consisting of short curls of dense pile. The surface is produced by finishing the pile fabric on a special machine, which runs the cloth between two friction plates. The pattern resulting on the fabric's surface is determined by the material from which the upper plate is made (hair brush, plush, soft rubber, or cloth), the direction and amplitude of the plate's movement, and the amount of pressure the plate applies on the cloth. The fibers are rolled into balls, coiled into small knots or locks, or formed into waves. They are then fixed by heat treatment. In addition to improving the appearance of the fabric, the process imparts to the pile greater wear resistance. It is used in the manufacture of high-quality fabrics for overcoats. Ratteen is a coarse, loosely woven fabric of cotton, wool, rayon, etc, with a nubby or knotty surface. Ratteen is a thick, twilled woolen cloth. From French Ratiné, from Old French Rastin, from Raster, To Scrape, ultimately from Latin Rādere. Ratteen is a loosely woven fabric made with nubby or knotty yarns. / Под Ратином, от Французского слова Ratiné, понимается шерстяная ткань с характерной поверхностью, образуемой короткими завитками густого ворса. Поверхность ратинов получают путём отделки ворсовой ткани на ратинирующей машине. Ткань пропускают между 2 трущимися плитами. В зависимости от материала поверхности верхней плиты (волосяная щётка, плюш, мягкая резина или сукно), направления и амплитуды движения плиты, давления её на ткань получаются рисунки из ворса. Ворсинки

закатываются, образуя шарики, свёртываются в виде узелков, косичек или укладываются волнами, а затем фиксируются путём термообработки. Ратинирование, помимо улучшения внешнего вида, придаёт ворсу большую стойкость к истиранию и используется при изготовлении высококачественных тканей для пальто (например, драп-ратин).

RAU = RAJENDRA AGRICULTURAL UNIVERSITY

RAVC = RETURN AFTER VARIABLE COST

RAVEL = СНОВАЛЬНОЕ БЁРДО (или НИТЕРАЗДЕЛИТЕЛЬНЫЙ ГРЕБЕНЬ) – Ravel is a type of comb or rail with projecting teeth for separating and guiding warp ends.

RAVELING = РАСПУСКАНИЕ (или РАСПУТЫВАНИЕ, или РАЗДЕЛЕНИЕ) – Raveling is the process of undoing or separating the weave or knit of a fabric.

RAVELLED STITCH = ЗАПУТАННЫЙ (или СПУТАННЫЙ, или РАЗДЕЛЁННЫЙ, или РАСПУТАННЫЙ) СТЕЖОК (или ПЕТЛЯ) – (1) Ravelled Stitch:- caused by feed dog cuts on thread, skipped stitches and unbalanced tensions. Machinery defects, and namely – Sewing Machines and Attachments. (2) Ravelled Stitches:- can result from partial severance of thread. Machinery defects, and namely – Work Handling Equipment. / Порок или дефект от машинного оборудования.

RAW COTTON = НЕОБРАБОТАННЫЙ ХЛОПОК (или СЫРОЙ ХЛОПОК) – Raw Cotton (gin output) contains cotton fiber as well as small plant parts and field trash that are not removed by the ginning process. The cotton fiber at this stage has a coating of oils and waxes that make it hydrophobic. Raw fiber is suitable for making nonwovens to be used in industrial products where absorbency and aesthetics are not important. In some cases, fabrics made with raw fiber can be wet processed in the same manner as woven and knitted fabrics. / выработка (output).

RAW COTTON PRICE = ЦЕНА НА НЕОБРАБОТАННЫЙ ХЛОПОК (или ЦЕНА НА СЫРОЙ ХЛОПОК) – Raw Cotton Price:- in the Cotton industry of the United States, there are several different Cotton price series, each of which represents a different time and space dimensions in the market. All price series, ranging from US farm prices to international prices, are linked by common fundamental demand and supply factors. See also Farm Price, Futures Price, International Price, Mill Price, and Spot Price.

RAW EDGES = НЕОБРАБОТАННЫЕ КРАЯ – Raw Edges:- an exposed edge of fabric due to poor folder adjustment. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

RAW FIBERS = НЕОБРАБОТАННЫЕ ВОЛОКНА (или СЫРЫЕ ВОЛОКНА) – Raw Fiber is a textile fiber in its natural state, such as silk 'in the gum' and cotton as it comes from the bale. Textile fibers in their natural state before any manufacturing activity has taken place; for example, cotton as it comes from the bale. / Текстильные волокна в их естественном виде перед тем как они подверглись бы любому процессу переработки; например, хлопковое волокно, которое извлекается из кип.

RAW GERMPLASM = СЫРАЯ ГЕРМОПЛАЗМА – Raw Germplasm:- genetic material that has been derived from plants or native populations or parental material of unproven genetic status. Much selection pressure must be applied to such materials in order to derive superior performing varieties. Specifically defined as F_4, S_3, or earlier; coefficient of inbreeding equivalent to that of F_4, S_3, or lower.

RAW INVENTORIES = СЫРЬЕВЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ – Raw Inventories is the total value of raw material inventories on hand at the end of the period.

RAW MATERIAL = СЫРОЙ МАТЕРИАЛ – Raw Material is a material or substance used in the primary production or manufacturing of a good. Raw materials are often natural resources such as oil, iron and wood. Before being used in the manufacturing process raw materials often are altered to be used in different processes. Raw materials are often referred to as Commodities, which are bought and sold on commodities exchanges around the world. Raw materials are sold in what is called the Factor Market. This is because raw materials are factors of production along with labor and capital. Raw materials are so important to the production process that the success of a country's economy can be determined by the amount of natural resources the country has within its own borders. A country that has abundant natural resources does not need to import as many raw materials, and has an opportunity to export the materials to other countries. / Под Сырьём или Сырыми Материалы понимаются предметы труда, подвергшиеся ранее воздействию труда и подлежащие дальнейшей переработке, например, добытая руда или полученное после джинирования хлопковое волокно. В экономике под Предметами Труда понимается всё то, что подвергается обработке, на что направлен труд человека. Они даны природой, например, нефть, руда, уголь, или же являются продуктами труда – сырым материалом, например, древесина, металл, хлопок и так далее. Сырьё или Сырой Материал – предмет труда, на добычу или производство которого был затрачен труд (железная руда на металлургическом заводе, хлопок на текстильной фабрике, зерно на мукомольном предприятии и так далее). По происхождению различают промышленное и сельскохозяйственное сырьё. Промышленное сырьё подразделяется на искусственное (заменители кожи, синтетические смолы и пластмассы и так далее) и минеральное (графит, нефть, руды металлов, уголь и тому подобное). Сельскохозяйственное сырьё подразделяют на растительное и животного происхождения.

RAW NATURAL GAS = НЕОЧИЩЕННЫЙ ПРИРОДНЫЙ ГАЗ (или НЕОБРАБОТАННЫЙ ПРИРОДНЫЙ ГАЗ) – Raw Natural Gas is a mixture containing methane plus all or some of the following:- ethane, propane, butane, pentanes, condensates, nitrogen, carbon dioxide, hydrogen sulphide, helium, hydrogen, water vapor and minor impurities. Raw natural gas is the gas found naturally in the ground prior to processing. / Смесь, содержащая метан плюс все или некоторые из следующих составляющих:- этан, пропан, бутан, пентаны, конденсаты, азот, углекислый газ, сульфид водорода, гелий, водород, водяной пар и малозначительные примеси. Неочищенный природный газ относится с газу, найденному в естественных условиях в подземных залежах до того, как будет пущен в переработку.

RAW RICE = ГРУБЫЙ РИС (или НЕОБРАБОТАННЫЙ РИС) – Raw Rice is a dehulled and milled Rice not subjected to steaming or parboiling.

RAW SILK = ШЁЛК–СЫРЕЦ (или НЕОБРАБОТАННЫЙ ШЁЛК) – (1) Silk is a natural protein fiber, some forms of which can be woven into textiles. The best-known type of silk is obtained from the cocoon of silkworm larvae reared in captivity (sericulture). In silk manufacture, the first operation is reeling. The cocoons, having been sorted for color and texture, are steamed or placed in warm water to soften the natural gum. They are then unwound; each cocoon may give from 2 000 to 3 000 ft (610–915 m) of filament, from 4 to 18 strands of which are reeled or twisted together to make an even thread strong enough to handle. This is called Raw Silk. Formerly a hand process, this work is now done in Europe and in some parts of the Orient in factories on simple machines called Filatures. Raw Silk:- animal fiber produced by certain insects as building material for cocoons and webs. In commercial use it refers almost entirely to filament from cocoons produced by the caterpillars of several moth species of the genus Bombyx, commonly called Silkworms. Silk is a

continuous filament around each cocoon. It is freed by softening the cocoon in water and then locating the filament end; the filaments from several cocoons are unwound at the same time, sometimes with a slight twist, to form a single strand. In the process called Throwing, several very thin strands are twisted together to make thicker, stronger yarn. Silk was discovered in China sometime before 2700 BC, and the secret of its production was closely guarded for millennia. Along with jade and spices, silk was the primary commodity traded along the Silk Road beginning about 100 BC. Since World War II, nylon and other synthetic fibers have replaced silk in many applications (e.g., parachutes, hosiery, dental floss), but silk remains an important luxury material for clothing and home furnishings. More than 50% of the world's silk is still produced in China. Untreated silk as reeled from a cocoon. A fine lustrous fiber composed mainly of fibroin and produced by certain insect larvae to form cocoons, especially the strong, elastic, fibrous secretion of silkworms used to make thread and fabric. Raw Silk is a continuous silk containing no twist that has been drawn off of cocoons. The fibers are often un-degummed. Raw Silk is a term used incorrectly for wild silk. Raw silk is the silk fiber before it has been processed in any way. Kaw silk is coated with a glue-like substance called Sericin. The sericin is removed in later processing and is not silk. Raw Silk:- continuous filaments of silk, with no twist, which have been reeled from cocoons but are unprocessed and still containing sericin. / Виды (Species). первой операцией является разматывание. Найлан^{T3} (Nylon^{TM}) и другие . грена, гренаж . Сырьём для шёлковой промышленности являются шёлк-сырец и химические нити. Наибольшее распространение получили химические нити:- искусственные (ацетатные и вискозные) и синтетические (полиамидные, полиэфирные и другие). Шёлк-сырец обладает рядом свойств, сообщающих высокие физико-механические и потребительские свойства тканям и трикотажным полотнам. Нити шёлка-сырца обладают приятным блеском, зависящим от породы коконов, условий выкормки шелкопряда и условий обработки. Натуральный шёлк обладает плохой теплопроводностью и является плохим проводником электричества, поэтому его часто используют в качестве изоляционного материала в электропромышленности. Он также обладает высокой гигроскопичностью, хорошими механическими свойствами; относительная разрывная нагрузка в зависимости от линейной плотности нитей и некоторых других особенностей коконов изменяется в пределах 26–38 сантиНьютонов на текс (сН/текс). Кручение натурального шёлка и химических нитей проводится с целью придания им определённых полезных свойств, обеспечивающих их дальнейшую переработку в текстильные изделия с высокими эксплуатационными показателями и своеобразными внешними эффектами. Шелкокрутильное производство по сравнению с крутильными производствами других отраслей текстильной промышленности имеет ряд особенностей:- (i) разнообразие выпускаемых кручёных изделий; (ii) сочетание механических процессов (перематывание, трощение и кручение) с химической обработкой (замачивание, эмульсирование, сушка, запаривание); (iii) сравнительно большая длительность и прерывность производственного процесса (до 12 переходов); и (iv) разнообразие конструкций и типов используемых крутильных машин и другие. Кручёный шёлк производится в широком ассортименте:- (i) по назначению – для ткацкого и трикотажного производств, технических целей (изоляционный, хирургический), широкого потребления (галантерейный, парфюмерный, швейный); (ii) по направлению крутки – S и Z; (iii) по степени крутки – слабой (α_T = 1 … 11), средней (α_T = 20 … 24, муслин), сильной (α_T = 56 … 76, креп); и (iv) по характеру крутки – однокруточный, двухкруточный, многокруточный. Различают три вида расположения нити в сечении (структуры):- (i) Стержневая структура – одна или несколько нитей в процессе кручения поочерёдно становятся осевыми, а остальные располагаются вокруг них по винтовым линиям. Структура устойчива, но необходимо сохранять постоянство натяжения скручиваемых нитей. (ii) Трубчатая структура – все элементарные нити располагаются по винтовым линиям и ни одна из них не является осевой. Все нити натянуты одинаково, и структура устойчива при небольшом числе скручиваемых элементов. При пяти сложениях может уже возникнуть стержневая структура. (iii) Штопорная структура – центральная нить или несколько нитей натянуты намного больше, а остальные на неё (или на них) навиты. Натуральный шёлк поступает на шелкопрядильные предприятия преимущественно в мотках. Мотки шёлка-сырца обладают заклеенностью, поэтому их необходимо подготовить к разматыванию. Подготовка шёлка-сырца к разматыванию включает замачивание мотков, их отжим, расщипывание и расправку, сушку. Замачивание шёлка-сырца необходимо для размягчения серицина в склеенных местах мотков и снижения электризации. Нити после замачивания становятся мягкими и гибкими. Эмульсия для замасливания шёлка-сырца состоит из воды, мыла, масла или жиров, глицерина, антисептических и антистатических веществ. В результате замачивания шёлка-сырца ухудшаются разрывные характеристики и снижается связность. Для уменьшения вредного действия замачивания делают следующее:- (i) эмульсируют шёлк-сырец при разматывании коконов путём нанесения эмульсии на нить или добавления эмульсии в таз кокономотальных машин; (ii) получают шёлк-сырец на жёстких паковках непосредственно на кокономотальных машинах; и (iii) эмульсируют нити шёлка-сырца на мотальных машинах первого перехода крутильного производства. Масса замоченного шёлка-сырца примерно в 3–4 раза больше массы сухого материала, избыточную влагу отжимают в центрифугах. После отжима влаги мотки расщипывают. Расщипывание необходимо для расправки мотков и разъединения нитей в местах их склейки. Шёлк-сырец следует расщипывать и расправлять не позднее чем через 3 часа после замачивания, эту операцию проводят вручную. Расщипывание требуется выполнять внимательно и аккуратно, иначе мотки могут ещё больше запутаться, что увеличит обрывность при перематывании. Затем мотки сушат. Сушить мотки можно в естественных условиях в специальных камерах или при повышенной температуре (32–38 °C), используя подогретый воздух, подаваемый снизу. Сушка в естественных условиях способствует лучшему сохранению свойств шёлка-сырца, но требуется больше времени.

(2) Fabric or yarn made from untreated silk. Raw Silk:- this is a slightly nubby fabric with random flecks in a natural, off-white color. It has a somewhat rough texture and a gentle drape. Also known as Silk Noil.

RAW–STOCK DYEING = КРАШЕНИЕ СЫРЬЯ – Raw-Stock Dyeing is the dyeing of fibers before spinning into yarn. It is synonymous with fiber-dyed. See also Fiber-Dyed.

RAW SUGAR = САХАР СЫРЕЦ – Raw Sugar is the residue left after sugar cane has been processed to remove molasses and refine the sugar crystals. Because raw sugar contains contaminants such as molds and fibers, it is (in the US) purified. Raw Sugar or Natural Brown Sugar is a semi-finished product in cane sugar or beet sugar production. Raw sugar has a yellow to brown color because the syrup has not been removed completely from the sugar crystals. This sugar still contains vitamins, minerals and other impurities giving additional aroma. Raw sugars are popular in wholefood cooking because of their relative high portion of vitamins, minerals and trace elements. So-called Raw Sugars comprise yellow to brown sugars made by clarifying the source syrup by boiling and drying with heat, until it becomes a crystalline solid, with minimal chemical processing. Raw Sugar is a type of light brown coarse sugar containing the natural molasses present in sugarcane. Types of raw sugar include demerara, muscovado, and turbinado. (i) Demerara (also spelled as 'Demerera') is used as the generic name of a type of specialty raw cane sugar often used in home baking and in sweetening coffee and tea. Demerara is normally brown in color – the natural color of cane sugar. Demerara has a coarse texture due to its large crystals. It takes its name from the Demerara colony in Guyana, the original source of this type of sugar, which is produced today mainly in Mauritius. Demerara is a type of unrefined sugar with a large grain. Its color is pale to golden yellow. It comes from pressed sugar cane which is then steamed for the juice to form thick cane syrup. The syrup is dehydrated to form large golden brown crystals. As it is not refined much, it is rich and creamy. The sugar was first made in a colony in Guyana. Mass production later moved to Mauritius. Another type is London demerara which is refined sugar with added molasses. It is a crunchy type of sugar. In cooking, demerara is known for

changing the texture or color of recipes. In the United States, demerara is known as Turbinado Sugar, produced in Hawai'i. (ii) Muscovado is a type of unrefined brown sugar with a strong molasses flavor. Also known as 'Barbados Sugar' or 'Moist Sugar', it is very dark brown and slightly coarser and stickier than most brown sugars. Unlike most other brown sugars, which are made by adding molasses to refined white sugar, muscovado takes its flavor and color from its source, sugarcane juice. It offers good resistance to high temperatures and has a reasonably long shelf life. This unrefined sugar goes well with coffee and other beverages, and was one of the most prominent export commodities of the Philippines, especially from the Negros region from the 1800s until the late 1970s. It is commonly used in baking recipes and making whiskey. (iii) Turbinado sugar, also known as Turbinated Sugar, is made from sugar cane extract. It is produced by crushing freshly cut sugar cane; the juice obtained is evaporated by heat, then crystallized. The crystals are spun in a centrifuge, or turbine (thus the name), to remove excess moisture, resulting in the characteristic large, light brown crystals. Turbinado sugar is similar in appearance to brown sugar but paler, with larger crystals, and in general the two can be exchanged freely in recipes. Turbinado sugar differs from refined white sugar in that it is obtained or crystallized from the initial pressing of sugar cane. Turbinado and demerara sugars are the same. United Kingdom recipes tend to call for demerara, while in the United States, they are apt to use the term turbinado. In the United States, most turbinado sugar is produced in Hawaii and is often sold as an organic product. The popular Hawaiian product sold in the United States is produced on Maui and marketed under the name brand 'Sugar in the Raw'. Sugar In The Raw is a natural, unrefined sugar made from sugar cane grown in Maui. Juice is extracted from the sugar cane, and then crystallized through evaporation. These crystals are rinsed with a very small amount of water to remove just enough stickiness to make the product free flowing. We pack this turbinado sugar and market it as Sugar In The Raw. Raw Sugar futures are traded on the New York Board of Trade (NYBOT®). / НАЙБЭТ® (NYBOT®). Фьючерсы на сахар сырец были предметом торговли в Нью Йоркской Палате Торговли (Нью Йоркском Табло Торговли, если быть более точными), ныне Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.).

RAW WOOD = НЕОБРАБОТАННАЯ ДРЕВЕСИНА – Raw Wood is a wood which has not undergone processing or treatment. / Необработанная Древесина – это древесина, не прошедшая переработку или обработку.

RAW WOOL = ШЕРСТЬ–СЫРЬЁ (или СЫРАЯ ШЕРСТЬ) – Raw Wool is a wool in the grease, as shorn from the sheep. Same as Grease Wool. / Шерсть-Сырьё – грязная, немытая рунная шерсть.

RAY FLORET = КРАЕВОЙ ЦВЕТОЧЕК (или ЯЗЫЧКОВЫЙ ЦВЕТОЧЕК) – Ray Floret is one of the outer tubular flowers of a composite flower head when different from those of the center.

RAY FLOWER = КРАЕВОЙ ЦВЕТОК (или ЯЗЫЧКОВЫЙ ЦВЕТОК) – Ray Flower is one of the outer irregular florets, typically with a single tongue-shaped corolla, on flower heads of some Species of Compositae (Sunflower Family). / трубчатых цветков сложного цветка. Краевой Цветок в соцветии сложноцветных. Язычковый Цветок соцветия сложноцветных – один из внешних иррегулярных (неправильных) цветочков, типично с единственным венчиком (corolla) в форме язычка, на цветочных головках или головках цветка (flower heads) некоторых Видов Сложноцветных (Семейства Подсолнечников).

RAYON FIBER = ВОЛОКНО РЭЙОН (или ГИДРАТЦЕЛЛЮЛОЗНОЕ ВОЛОКНО) – Rayon is a manufactured, regenerated cellulosic fiber. It is produced from naturally occurring polymers, so it is neither a truly synthetic fiber nor a natural fiber; it is a semi-synthetic fiber that usually has a high-luster quality, giving it a bright shine. Some major rayon fiber uses include apparel (e.g., blouses, dresses, jackets, lingerie, linings, scarves, suits, ties, hats, socks), furnishings (e.g., bedspreads, blankets, window treatments, upholstery, slipcovers), industrial uses (e.g., medical surgery products, nonwoven products, tire cord) and other uses (e.g., yarn, feminine hygiene products, diapers). Rayon is a manufactured fiber composed of regenerated cellulose, derived from wood pulp, cotton linters, or other vegetable matter. Rayon is a generic term, coined in 1924, for artificial textile material composed of reconstituted, regenerated, and purified cellulose derived from plant sources. Developed in the late XIX century as a substitute for silk, this first semi-synthetic fiber is sometimes misnamed 'Artificial Silk'. The first practical steps toward producing a synthetic fiber were represented by attempts to work with the highly flammable nitrocellulose, produced by treating cotton cellulose with nitric acid. In 1884 and 1885 in London, Joseph Wilson Swan exhibited fibers made of nitrocellulose that had been treated with chemicals in order to change the material back to nonflammable cellulose. Swan did not follow up the demonstrations of his invention, so that the development of rayon as a practical fiber really began in France, with the work of Louis-Marie-Hilaire Bernigaud, comte de Chardonnet, who is frequently called the father of the rayon industry. In 1889 Chardonnet exhibited fibers made by squeezing a nitrocellulose solution through spinnerettes, hardening the emerging jets in warm air, and then reconverting them to cellulose by chemical treatment. Manufacture of Chardonnet silk, later known as Rayon, the first commercially produced man-made fiber, began in 1891 at a factory in Besançon. Although Chardonnet's process was simple and involved a minimum of waste, it was slow, expensive, and potentially dangerous. In 1890 another French chemist, Louis-Henri Despeissis, patented a process for making fibers from cuprammonium rayon. This material was based on the Swiss chemist Matthias Eduard Schweizer's discovery in 1857 that cellulose could be dissolved in a solution of copper salts and ammonia and, after extrusion, be regenerated in a coagulating bath. In 1908 the German textile firm J.-P. Bemberg began to produce cuprammonium rayon as Bemberg (trademark) silk. A third type of cellulose – and the most popular type in use today – was produced in 1891 from a syrupy yellow liquid that three British chemists, Charles Cross, Edward Bevan, and Clayton Beadle, discovered by the dissolution of cellulose xanthate in dilute sodium hyroxide. By 1905 Courtaulds Ltd, the British silk firm, was producing this fiber, which became known as Viscose Rayon (or simply Viscose). In 1911 the American Viscose Corporation began production in the United States. Modern manufacture of viscose rayon has not changed in its essentials. Purified cellulose is first treated with caustic soda (sodium hydroxide). After the alkali cellulose has aged, carbon disulfide is added to form cellulose xanthate, which is dissolved in sodium hydroxide. This viscous solution (viscose) is forced through spinnerettes. Emerging from the holes, the jets enter a coagulating bath of acids and salts, in which they are reconverted to cellulose and coagulated to form a solid filament. The filament may be manipulated and modified during the manufacturing process to control lustre, strength, elongation, filament size, and cross section as demanded. Rayon fiber remains an important fiber, although production has declined in industrial countries because of environmental concerns connected with the release of carbon disulfide into the air and salt by-products into streams. It has many properties similar to cotton and can also be made to resemble silk. In apparel, it is used alone or in blends with other fibers in applications where cotton is normally used. High-strength rayon, produced by drawing (stretching) the filaments during manufacture to induce crystallization of the cellulose polymers, is made into tire cord for use in automobile tires. Rayon is also blended with wood pulp in paper making. New name for artificial silk in the United States. The American Society for Testing and Materials (ASTM) defines Rayon as:- a generic term for filaments made from various solutions of modified cellulose by a pressing or drawing the cellulose solution through an orifice and solidifying it in the form of a filament. The US Federal Trade Commission defines Rayon as:- a manufactured fiber composed of regenerated cellulose, as well as manufactured fibers composed of regenerated cellulose in which the substituents have replaced not more than 15 per cent of the hydrogens of the hydroxyl groups. Thus, rayon is a man-made cellulosic fiber, a regenerated fiber. The cellulose base for the manufacture of rayon is obtained from wood pulp or cotton linters, which are the short brown fibers left on the cotton seed after the first-time ginning on the plantation, or at the community gin. Wood pulp for rayon also comes from pine, spruce or hemlock chips. Rayon fibers, like cotton, leave an ash when burned. About 66 per cent of all cellulosic

fibers are produced by the viscose method; about 32 per cent by the acetate method, with the cuprammonium method supplying the remainder. The name Rayon was coined in 1924 by Mr Kenneth Lord of the firm of Galey & Lord, Inc., now a division of Burlington Industries, Inc. It has been a true household word for years. A man-made fiber made from regenerated cellulose. Rayon is the first successful man-made fiber, rayon was originally called Artificial Silk. It is made from cellulose and is weak when wet. Rayon is soft and comfortable and dyes well, but is weakened by exposure to sunlight. Because of its low wet strength, rayon may shrink or stretch unless treated. Two main processes are used in this country to produce rayon:- viscose process and cuprammonium process. Several different modifications of these types of rayon are being made and consist of the following. See also Cellulose. Rayon is a manufactured fiber composed of regenerated cellulose, derived from wood pulp, cotton linters, or other vegetable matter. Today, various names for rayon fibers are taken from different manufacturing processes. The two most commonly used production methods for rayon are the cuprammonium process and the viscose process. Rayon has a silky feel, lustrous appearance, good draping qualities and dyes well. Rayon is used for tops, skirts, shirts and dresses. Rayon Fiber is a manufactured fiber composed of regenerated cellulose, as well as manufactured fibers composed of regenerated cellulose in which substituents have replaced not more than 15% of the hydrogens of the hydroxyl groups. Rayon fibers include yarns and fibers made by the viscose process, the cuprammonium process, and the now obsolete nitrocellulose and saponified acetate processes. Generally, in the manufacture of rayon, cellulose derived from wood pulp, cotton linters, or other vegetable matter is dissolved into a viscose spinning solution. The solution is extruded into an acid-salt coagulating bath and drawn into continuous filaments. Groups of these filaments may be made in the form of yarns or cut into staple. Characteristics:- Rayon yarns are made in a wide range of types in regard to size, physical characteristics, strength, elongation, luster, handle, suppleness, etc. They may be white or solution dyed. Strength is regulated by the process itself and the structure of the yarn (see also Polynosic Fiber). Luster is reduced by including delustering materials, such as titanium dioxide pigments, in the fiber when it is extruded. The suppleness of the yarn is controlled by the number of filaments in the yarn, the denier or gauge of the individual filaments or fibers, and the fiber cross-section. End Uses:- Rayon is used in draperies, bedspreads, upholstery, blanket, dish towels, curtains, throw rugs, tire cord, industrial products, sport shirts, slacks, suitings, dress goods, and linings and in blends with other fibers to enhance functional and aesthetic qualities, e.g., with polyester in permanent-press fabrics. Rayon is a generic term for man-made fibers composed of regenerated cellulose derived from trees, cotton and woody plants. Characteristics:- high absorbency, bright or dull luster, pleasant feel or hand, good draping qualities, ability to be dyed in brilliant colors and superior strength. The Manufacturing Process of Rayon:- for a very long period of human history, man depended on natural elements to make fibers for clothing. These were natural fibers. However, with the technological advances many man made synthetic fibers were developed. Man-made fibers have two main categories:- one that are made from natural products (cellulosic fibers) and the other that are synthesized from chemical compounds (noncellulosic polymer fibers). Rayon fiber is a natural-based material made from the cellulose of wood pulp or cotton fiber. In fact, they are made from reformed or regenerated cellulose. As such, they are identified as regenerated cellulose fibers. History of Rayons:- the invention of rayon can be related to the invention of an apparatus in 1840 that drew synthetic filaments through small holes. In 1855, Georges Audemars, a Swiss chemist, discovered how to make cellulose nitrate. Later in 1884, Count Hilaire de Chardonnet made the first man made fibers from nitrocellulose. He came to be known as the 'Father Of Rayon'. He got the original French patent and also won financial support through which, he established the world's first rayon factory. Subsequently, other scientists developed more cost-effective ways of making many other types of rayon. The US Federal Trade Commission (FTC) officially recognized man made textile filaments in 1925 when it allowed the use of the name, 'Rayon' for yarns obtained from cellulose or its derivatives. Till now, it was known as Artificial Silk or Imitation Silk. With the production and types of man made fibers increasing and given various trademarks, the FTC again made a rule in 1937 that any fiber or yarn produced chemically from cellulose must be designated as rayon. However, confusion prevailed among the masses because at least four different types of rayon with some similar and some different properties came into being. It was because of the fact that there were basically two groups of rayon:- one consisting of regenerated pure cellulose and the other of a cellulose compound. These different compositions gave different properties. Therefore, in 1952, the FTC ruled that there would be two categories of cellulose fibers- rayon fiber (pure cellulose) and acetate fiber (cellulose compound). Production of Rayon Filament:- the Basic Method:- the basic method of producing rayon filament is similar to the natural silk manufacturing process followed by the silk worms who transform the cellulose of mulberry trees into two fine filaments. A liquid substance of cellulose is forced through a metal cap or nozzle called Spinneret. The spinneret is perforated with small holes through each of which, a filament is extruded. The extruded filament gets solidified by a liquid bath as it comes from the spinneret. The number of holes in the spinneret vary from 1 to 20 000 and filaments of equal size are produced simultaneously. Subsequently, these filaments are combined by twisting to make rayon yarn of required diameter. Types of Rayon:- there are basically two types of rayons – viscose rayon and high-wet-modulus (HWM) rayon – categorized on the basis of two principal methods of making rayon. As the two methods differ in specific features of manufacture so the two fibers differ in important characteristics. However, both, the viscose fiber and high-wet-modulus fiber are classified as regenerated rayons because the original raw material (cellulose) is changed chemically into another form, which is then changed (regenerated) into cellulose again. Purified cellulose in fiber form is produced due to these changes. Viscose Rayon:- the Viscose Process for Manufacturing Rayon:- viscose rayon is made from cotton linter or wood pulp generally obtained from pine, spruce, or hemlock trees. Cotton linter is the residue cotton fiber which cling to cotton seed after the ginning process. Wood chips or cotton fibers are treated to make sheets of purified cellulose, resembling white blotters. The cellulose sheets are then soaked in sodium hydroxide (caustic soda), producing sheets of alkali cellulose. The resultant substance is broken up into fluffy white flakes or grains known as Cellulose Crumbs. These crumbs are aged in metal containers for 2 to 3 days under controlled temperature and humidity. Liquid carbon disulfide is added to the aged crumbs which turns the cellulose into cellulose xanthate, light orange-colored crumbs. The cellulose xanthate is dissolved in a weak solution of caustic soda, resulting into a thick viscose solution that appears like honey in color and consistency. The viscose is aged, filtered and vacuum treated to remove air bubbles which cause the filament to break. The viscose solution is then forced through a spinneret into sulfuric acid which coagulates the cellulose of the soluble cellulose xanthate to produce pure regenerated cellulose filaments. If staple fiber is to be produced, a large spinneret with large holes is used. If filament fiber is being produced, then a spinneret with smaller holes is used. After extrusion from spinneret, the viscose rayon fibers are processed into filament or spun staple yarns by one of several methods. There are basically three methods of such processing:- Pot, or Box Spinning; Spool Spinning; and Continuous Spinning. In Pot Spinning, the filaments are removed from the coagulating bath by passing over a series of godet wheels and are stretched thereon under controlled tension. This stretching reduces the diameter of the filaments and makes them more uniform in size. It also make the filaments more strong. The filaments are then put into a rapidly spinning cylinder called Topham Box, resulting in a cake-like strings that stick to the sides of the Topham Box. After removing the cake, it is thoroughly washed, treated to remove any residual chemical substances, bleached, rinsed, dried, and wound on cones or spools. In Spool Spinning, the filaments may be drawn from the coagulating bath over guides and rollers and wound on perforated spools. A washing solution is forced through the spools' holes to cleanse filaments which are then bleached, rinsed, dried, and wound on cones or spools or put in skeins. In Continuous Spinning, upon extrusion from the spinneret, the filaments may be carried in one continuous process over the godet wheels through a series of reels as they are washed, purified, bleached, dried, twisted, finished and wound onto desired package. After treatment with textile chemicals, various weaving processes are carried out to produce rayon fabrics. Different varieties of yarns such as monofilament yarns, multifilament yarns, spun yarns etc permit the

manufacturing of a wide variety of fabrics. Spun rayon yarns can be used for making fabrics similar to cotton fabrics, linen fabrics or wool fabrics. Rayon filament yarns can make fabrics resembling silk fabrics. Finally, various finishing processes are carried out to enhance the appearance of these fabrics and to improve their serviceability. Most common finishes include calendaring for smoothness, embossing for decorative effects, flame resistance, napping (spun rayons only) for softness and warmth, preshrinking for greater dimensional stability, stiffening, water resistance, wrinkle resistance etc. High-Wet-Modulus (HWM) Rayon – The Differences in Manufacturing Process:- viscose rayon has its own limitations. It loses up to 70% of its strength when wet. In fact, in 1950s, when first developed, rayon was used in industrial products and home furnishings only and not for clothing. This was due to the fact that viscose rayon fibers were too weak as compared to other fibers intended to be used in apparel making. In 1960, commercial production was started for a rayon that had similar strength as of cotton fabrics and retained most of the strength, even when wet. It was high-wet-modulus (HWM) rayon. It is also known as Modified Rayon. The process for manufacturing high-wet-modulus rayon is almost similar to that for making viscose rayon but with a few exceptions:- (i) initially, when the purified cellulose sheets are bathed in a caustic soda solution, a weaker caustic soda is used while making HWM rayon. (ii) Alkali crumbs or the viscose solution, neither of the two are aged in the HWM process of making rayon. (iii) When making HWM rayon, the filaments are stretched to a greater degree than when making viscose rayon. Rayon is the generic term applied to filaments made from modified cellulose solutions by extrusion through orifices. Rayon Fiber is a manufactured fiber composed of regenerated cellulose as well as manufactured fibers composed of regenerated cellulose in which the substituents have replaced not more than 15% of the hydrogen molecules of the hydroxyl group. Rayon yarns may be white or solution dyed. The process itself and the structure of the yarn regulate their strength. Rayon (viscose) is a fabric made from rayon, namely any of a group of smooth textile fibers made from regenerated cellulose by extrusion through minute holes. A manufactured fiber composed of regenerated cellulose in which substituents have replaced not more than 15 percent of the hydrogens of the hydroxyl group. The first chemical fibers produced in Japan are Rayon Fibers. The rayon fibers are produced from wooden pulp as a raw material and are constituted of cellulose just as cotton and flax fibers. Rayon fibers are superior in moisture and water absorbency, and are dyeable deeply and colorfully with a variety of dyestuffs. Woven and knitted fabrics are superior in drapability and can represent the beautiful silhouette. Thus the rayon fabrics are reevaluated as fashion clothing. There are two types of rayon fibers, i.e. filament yarns and staple fibers. Filament yarns are used for fabrics for women's clothing and linings. In addition, flat filament yarns are used for raw materials for caps and hats and handicraft yarns. Staple fibers are used for fabrics for women's clothing, curtain, textile wall-covering, wet tissue, wrapping paper for cakes, etc. Furthermore, staple fibers with enhanced tenacity are also produced and are used for backing cloth for automotive leather-like decorative products. End-Uses:- (i) For clothing:- Fabrics for Women's & children's wear, Blouses, Interlinings, Lingerie, Accessories for Japanese Dresses, etc. (ii) For home furnishings and bedding:- Curtain, Textile Wall Coverings, Upholstery, Blankets, Bedclothes, etc. (iii) For industrial uses:- Substrate Cloth for Leather-like Products, Backing Cloth for Adhesive Tape. (iv) For other uses:- Wet Tissue, Diapers for Babies, Cosmetic Puff, Wrapping Paper for Cakes and Medicines, Tea Bags, Caps and Hats, Handicraft Yarn, Furoshiki (Square Fabric for Wrapping Things), Bags, Footwear, etc. Features:- (i) Abundant in moisture absorbency, easily dyeable with a variety of dyestuffs and beautiful colors and patterns are freely obtainable. (ii) Because rayon fibers are friendly with other types of fibers, they are frequently used as blended and union cloth. They are suitable for a variety of fabrics. (iii) Most suitable for underwear, linings, and summer wear thanks to the dry tactile feeling to the human skin. (iv) In addition to the normal rayon fibers, other rayon filament yarns and rayon staple fibers are available with enhanced tenacity. The former is used mainly for tire cord yarns and the later is used for the substrate cloth for coated fabrics. Care Instructions:- (i) Rayon fibers are rather weakened by wetting; and (ii) please avoid hard rubbing and squeezing during the laundering. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Дьжосэф Вилсан Сван (Joseph Wilson Swan). Кенэс Лод (Kenneth Lord) из фирмы Галей Энд Лод, Инк. (Galey & Lord, Inc.), ныне подразделение Болиньтчэн Индэстриз, Инк. (Burlington Industries, Inc.). В 1855 Швейцарский химик Жорж Одемар (Georges Audemars). Чуть позже, в 1884, Граф Илер дё Шардонэ (Count Hilaire de Chardonnet) произвёл . Щёлочь (Alkali). каустическая сода или едкий натр (caustic soda). щелочная целлюлоза или алкалицеллюлоза (alkali cellulose). Экструзия или Выдавливание (Extrusion). Закалка или Упрочнение (Hardening). с работы Люи-Мари-Илер Бэрниго, графа из Шардонэ (Louis-Marie-Hilaire Bernigaud, comte de Chardonnet), который часто упоминается в качестве отца гидратцеллюлозной индустрии. Выработка Шардонэшного шёлка, прозванного позднее гидратцеллюлозой (rayon), первого коммерчески производимого искусственного волокна, началось в 1891 на фабрике в Безансоне (Besançon). Несмотря на то, что Шардонэшный процесс был лёгким и сопровождался минимумом отходов, он был длительным, дорогостоящим и потенциально опасным. В 1890 другой Французский химик, Люи-Ори Дэпэсси (Louis-Henri Despeissis), запатентовал процесс. Этот материал был основан на открытии Швейцарского химика Матиаса Эдуарда Швайца (Matthias Eduard Schweizer) от 1857 . Немецкая текстильная фирма Йот.-Пэ. Бэмбэрг (J.-P. Bemberg). Искусственное волокно, сделанное из регенерированной целлюлозы. Первоначально оно именовалось как Искусственный Шёлк (Artificial Silk). Рэйон – торговое название вискозного, ацетатного, медноаммиачного и нитратного волокна или искусственного шёлка, полученного химическим путём из целлюлозы или на базе целлюлозы. Под Гидратцеллюлозой понимается одна из структурных модификаций целлюлозы – твёрдое вещество белого цвета. Получают осаждением природной целлюлозы из растворов, омылением эфиров целлюлозы и так далее. Отличается от природной целлюлозы большей гигроскопичностью и повышенной реакционной способностью, лучшей накрашиваемостью. Из гидратцеллюлозы состоят вискозное и медно-аммиачные волокна, целлофан. Производство гидратцеллюлозного (вискозного) волокна и гидратцеллюлозной плёнки (целлофан) осуществляется в широком промышленном масштабе. Гидратцеллюлоза – одна из структурных модификаций целлюлозы. Получают осаждением природной целлюлозы из растворов, омылением эфиров целлюлозы и так далее. Отличаются от природной целлюлозы большей гигроскопичностью и повышенной реакционной способностью, лучшей накрашиваемостью. Производство гидратцеллюлозного (вискозного) волокна и гидратцеллюлозной пленки (целлофан) осуществляется в широком промышленном масштабе.

RAYS = СЕРДЦЕВИННЫЕ ЛУЧИ – Rays:- strip of cells extending radially within a tree and varying in height from a few cells in some species to 100 mm (4") which cause an appealing grain pattern. / виды (species). Полоса/участок клеток, . На поперечном разрезе некоторых пород хорошо видны невооружённым глазом светлые, часто блестящие, направленные от сердцевины к коре линии – сердцевинные лучи. Сердцевинные Лучи имеются у всех пород, но видны лишь у некоторых. Особенно хорошо сердцевинные лучи видны у дуба, бука, платана. Сердцевинные лучи служат для прохода в поперечном направлении по стволу воды, воздуха и органических веществ, вырабатываемых деревом. Сердцевина находится внутри первого годичного слоя, в центре ствола и проходит по всей его длине. Она представляет собой рыхлую ткань, которая легко разрушается живыми организмами, состоит в основном из живых клеток, образующаяся за счёт деления клеток верхушечной образовательной ткани при росте дерева в высоту. Сердцевина не применяется в строительстве.

RB = RELAY BROADCAST

RB = RICE BUG

RBOB = REFORMULATED GASOLINE BLENDSTOCK FOR OXYGEN BLENDING

RBOB GASOLINE = ГАЗОВЫЙ БЕНЗИН РЕФОРМУЛИРОВАННОЙ ГАЗОВОЙ БЕНЗИНОВОЙ СМЕСИ ДЛЯ СМЕШИВАНИЯ С КИСЛОРОДОМ – New York Harbor RBOB Gasoline (Physical) futures are an outright gasoline contract between a buyer and a seller. The contract:- (i) is based on the largest single volume refined product sold in the United States - gasoline - which accounts for almost half of national oil consumption; and (ii) trades in a highly diverse market, with hundreds of wholesale distributors and thousands of retail outlets, resulting in intense competition and price volatility. Things to know:- (i) based on delivery at petroleum products terminals in New York Harbor, the major East Coast trading center for imports and domestic shipments from refineries in the New York harbor area or from the Gulf Coast refining centers; (ii) traded via open outcry and electronically on CME Globex®; (iii) trading at settlement is available for the front two months except on the last trading day and is subject to the existing TAS rules; and (iv) option types:- American-style, calendar spread, crack spread, average price, European-style. About New York Harbor RBOB Gasoline:- The New York Harbor RBOB Gasoline conforms to industry standards for reformulated regular gasoline blendstock for blending with 10% denatured fuel ethanol (92% purity) as listed by the Colonial Pipeline for fungible F grade for sales in New York and New Jersey. RBOB is a wholesale non-oxygenated blendstock traded in the New York Harbor barge market that is ready for the addition of 10% ethanol at the truck rack. To ensure that the terms and conditions of the gasoline futures contract continue to mirror the cash market, the Exchange maintains close contact with federal and state officials and continues to evaluate changes in the regulations. Along with the futures contracts, options contracts, calendar spread options contracts, crack spread options contracts, and average price options contracts provide a slate of flexible, liquid financial instruments. Exotic options contracts are offered as well, under the calendar spread option, average price option, crack spread option, European ‘look alike’ option, and conventional gasoline vs. RBOB option. NYMEX® also lists for trading a series of gasoline swap futures contracts based on crack spreads and location differentials, including European and average price options. Transactions in these contracts can also be consummated off-exchange and submitted for clearing through CME ClearPort clearing. RBOB Gasoline:- RBOB (Reformulated Gasoline Blendstock for Oxygen Blending) gasoline is a reformulated regular wholesale non-oxygentated blendstock that is ready for the addition of 10% denatured fuel ethanol (92% purity) at the truck rack. It is traded at the New York Harbor barge market. RBOB gasoline futures are traded at the NYMEX® under ticker symbol RB. Contract size is 42 000 gallons (1 000 barrels) quoted in US Dollars and Cents per gallon. Delivery dates are all calendar months. Contract settlement is by physical delivery. / Глобэкс® (Globex®). Реформулированную Газовую Бензиновую Смесь для Смешивания с Кислородом (РБССК).

RBPS = RESTRICTIVE BUSINESS PRACTICES

RCBD = RANDOMIZED COMPLETE BLOCK DESIGN

RCC = RTGS SYSTEM COMMUNICATION COMPONENT

RCE = REQUEST FOR CONTINUED EXAMINATION

RCI = RICE CROPPING INTENSITY

RCIA = RETAIL CREDIT INSTITUTE OF AMERICA

RCMM = REGISTERED COMPETITIVE MARKET MAKER

RCPC = REGIONAL CHECK PROCESSING CENTER

RCS = REGULAR CATALOG SHOW

RDA = RURAL DEVELOPMENT ADMINISTRATION

RDA–CES = RURAL DEVELOPMENT ADMINISTRATION – CROP EXPERIMENT STATION

RDC = RETAIL DISTRIBUTION CENTER

rDNA = RECOMBINANT DNA

RDV = RICE DWARF VIRUS

RE = РЭ (или КАС.) – Re:- in Latin, In The Matter Of. / В Русском языке Латиноязычное ‘Рэ’ более всего подходит к сокращению ‘Кас’ от Касательно.

RE = REAPER

RE = REUNION

REACH STACKER = СТАКЕР С РАМОЙ ЗАХВАТА СВЕРХУ (или ШТАБЕЛЁР С РАМОЙ ЗАХВАТА СВЕРХУ) – Reach Stacker is a heavy hoist machine that stacks containers. / Мощный грузоподъёмник для штабелирования контейнеров. Под Штабелёром понимается передвижная машина для подъёма и перемещения штучных грузов при укладке их в штабель. Груз захватывается специальным устройством и перемещается по конвейеру на высоту до 6 метров и более. Штабелёры применяют для механизации погрузочно-разгрузочных и складских работ. Самоходный штабелировочный конвейер называется Стакером. Под Стакером, от Английского слова Stacker от Stack, означающее Складывать Штабелями, понимается самоходный штабелировочный конвейер, скребковый (для штабелирования коротких лесоматериалов на лесных складах) или ленточный (для гравия, песка, руды, угля и тому подобных сыпучих материалов). Передвигается по уширенной рельсовой колее. Высота штабеля, укладываемого стакером – до 35 метров. Иногда стакер назвают Отвалообразователем.

REACH TRUCK = ГРУЗОВИК (или ПОДЪЁМНИК, или ШТАБЕЛЁР) С ВЫДВИЖНЫМИ ВИЛАМИ – The Reach Truck is a narrow-aisle (8–10”) lift truck specially designed for racked pallet storage. It is also known as a Stand-Up Reach, Straddle Reach, or Double-Deep Reach. The reach truck is designed with outriggers in front and telescoping forks controlled by a hydraulic mechanism. This mechanism allows you to pick up the load and pull it back over the outriggers in order to reduce the overall truck and load length. It is helpful for turning down a narrow aisle. The reach truck has a mechanism that allows for extended reach in order to store pallets two-deep in a double deep rack. Reach Truck:- industrial trucks equipped with a telescoping fork arrangement that permits the stacking of loads double deep. For storage depths greater than two, there is at least one example in Europe where the fork unit mechanically disengages from the mast allowing it to run into the rack on narrow rails under its own power which is derived from the truck via an umbilical cord. Applications like this can be considered a very special case of a drive-in type storage rack.

REACTION = РЕАКЦИЯ – Reaction is a fall in market prices after a period of continuous price rises. See also Rally. Reaction is the downward price movement tendency of a commodity after a price advance. A downward price movement after a price advance. Reaction is a reversal in the movement of a security’s price. Reaction is most often associated with a downward movement in the price of a security after a period of upward movement, as investors sell off shares or decrease the volume of buy orders for fear of the security being overvalued. Reactions are likely to be mild and lead to a slight increase or decrease in price, rather than a large change

in value. A reaction is similar to a correction but lacks the same intensity. Reactions are generally considered to be positive for the overall health of the market, since unending price increases can cause inflation or result in an even larger price drop if a company doesn't meet expectations. A reaction is likely to prevent events such as runs or high volume sell offs at later dates. / Движение цен вниз после их роста.

REACTION HIGH = МАКСИМУМ РЕАКЦИИ – Reaction High:- an intermittent peak that forms as a security fluctuates. Whether a security is trending up, trending down or moving sideways, intermittent peaks and troughs form due to changes in supply and demand. Defining reaction highs usually depends on the minimum criteria set for time intervals and price movements.

REACTION LOW = МИНИМУМ РЕАКЦИИ – Reaction Low:- an intermittent trough that forms as a security fluctuates. Whether a security is trending up, trending down or moving sideways, intermittent peaks and troughs form due to changes in supply and demand. Defining reaction lows usually depends on the minimum criteria set for time intervals and price movements.

REACTION RALLY = ПОВЫШЕНИЕ ВО ВРЕМЯ РЕАКЦИИ (или РАЛЛИ ВО ВРЕМЯ РЕАКЦИИ) – Reaction Rally:- after a decline, an advance that does not surpass the high from which the decline began is known as a Reaction Rally. A reaction rally, also referred to as a Retracement, typically retraces from 1/3 to 2/3 of the previous decline.

REACTION RATE = СКОРОСТЬ РЕАКЦИИ – Reaction Rate is a measure of how fast a chemical reaction occurs. Many factors affect reaction rates. One very big factor is temperature. Although the range is large, many reaction rates approximately double for each 10 °C temperature rise. For example, a reaction may be 4 times as fast at 50 °C as it is at 30 °C. This is the reason that many dye processes are done at high temperature.

REACTION SPINNING = ПРЯДЕНИЕ В РЕЗУЛЬТАТЕ РЕАКЦИИ – Reaction Spinning is a process in which an initial prepolymer is formed and then extruded into a reagent bath where polymerization and filament formation occur simultaneously. Spandex fibers can be made by this process. See also Spinning.

REACTIVE DYE = РЕАКТИВНЫЙ КРАСИТЕЛЬ (или АКТИВНЫЙ КРАСИТЕЛЬ) – Reactive Dye is a dye which attaches to the fiber by forming a covalent bond; also called Fiber Reactive Dye. Reactive dyes are known for their bright colors and very good to excellent lightfastness and washfastness, though poor resistance to chlorine bleach. There are several broad classes of reactive dyes. Most are intended for cellulose fibers, but some are intended specifically for wool. The most popular reactive dye family for textile artists is the Procion® MX family. Other reactive dye families reasonably available to art dyers include Procion® H, Procion® H-E, Remazol®, and Cibacron® F (equivalents to the MX, H, H-E and some of the Remazol® lines are available from many dye manufacturers; note that Procion®, Remazol® and Cibacron® are trade names of specific companies). Reactive dyes may be more expensive than other dye families suitable for the same fibers, especially when very dark or dull colors are considered. They are the newest class of textile dyes, first introduced commercially, for cellulosic fibers, in 1956, one hundred years after the development of the first synthetic dye. Within a family, the range of colors available as 'pure' dyes (as opposed to mixtures) is typically quite small – a dozen or fewer. Against this, reactive dyes of the same family can generally be mixed to produce a very wide range of colors, while retaining good application characteristics and brightness. The reactivity among families varies widely, so some are easily applied at room temperature, some at boiling temperature and others at intermediate temperature. All types are suitable for exhaust dyeing, and many types are suitable for pad-batch (see also Padding) dyeing and for printing. Apart from cost, the biggest commercial drawbacks to reactive dyes are that they require large amounts of electrolyte (salt) in most processes, and extensive rinsing and hot washing after dyeing to remove unfixed and hydrolyzed dye. Reactive Dyes:- these were introduced in 1956. Intended primarily for cellulosic fibers, they contain reac tive groups which allow the dyes to combine chemically with cellulose and thus become an integral part of the fiber molecule. The compounds employed are multinuclear diamines, e.g., Congo red (prepared from bisdiazotised benzidine and naphthionic acid). Salt is added during the dyeing process. Reactive Dyes:- one third of dyes used for cellulose fibers today are reactive dyes. They are mostly applied according to the pad-batch and continuous processes for woven fabric, while batch processes are the most common for knitted fabric, loose stock and yarn. In batch dyeing, dye, alkali (sodium hydroxide or sodium carbonate or bicarbonate) and salt are added to the dye bath in one step, at the start of the process, or stepwise. In the stepwise process the alkali is added only after the dye has absorbed to the fiber. Its amount is determined by the reactivity of the system and the desired depth of shade (cold dyers are applied at lower pH compared to warm and hot dyers). Salt is added to improve bath exhaustion:- the concentration employed depends on the substantivity of the dye and on the intensity of the shade. Higher concentrations are required for deep shades and low-affinity dyes. After dyeing, the liquor is drained off and the material is rinsed and then washed off with the addition of auxiliaries. In pad dyeing processes dye and alkali can be added together to the dye liquor or in separate steps into two separate padders (or other types of application systems). When all the chemicals are applied in one step, the stability of the pad liquor is important. In fact with increasing reactivity of the dye there is a risk that the dye, after a long dwell time in the pad box, is hydrolysed by the alkali, before reacting with the fiber. For this reason dye and alkali are commonly metered separately into the padder. In addition, pad boxes are now constructed so that the liquor volume is as low as possible, so that it is replaced on average within 5 minutes. Among semi-continuous processes the cold pad-batch is by far the most important one for reactive dyes. After the textile has been padded with dye and alkali, it is rolled up into batches. Fixing takes place during storage. In continuous processes, padding, fixing, washing-off and drying are carried out in the same process line. Fixation is commonly achieved either by dry-heating or by steaming. The following processes are commonly used:- (i) pad-steam processes (one common method is the pad-dry-pad-steam process which includes dye application by padding – intermediatee drying – alkali application by padding – dye fixation with saturated steam – washing – drying); and (ii) pad-dry thermofix processes (dye and alkali are padded at the same time; then the material can be dried and fixed in a single step or it can be thermofixed after an intermediate drying stage). In all cases, after fixation the material is always carefully washed off in open width or in a rope washing machine to remove completely the hydrolysed colorant and is then dried. In pad-dry thermofix processes, urea is usually added to the padding liquor to act as a solvent for the dye during fixation. Urea melts at 115 °C and binds water above 100 °C. It can therefore be used as solvent for the dye in dry heat. A recently developed dyeing process is now available that does not require the addition of urea. Reactive Dyes react with fiber molecules to form a chemical compound. These dyes, they are either applied from alkaline solution or from neutral solutions which are then alkalized in a separate process. Sometimes heat treatment is also used for developing different shades. After dyeing, the fabric is washed well with soap so as to remove any unfixed dye. Reactive dyes were originally used for cellulose fibers only but now their various types are used for wool, silk, nylon, acrylics and their blends as well. Reactive Dyes are generally applied at pH values of between 5 and 6, depending on the depth of shade, in the presence of ammonium sulphate and specialised levelling agents (amphoteric substances, which form complexes with the dye at low dye bath temperatures and then break down as the dyeing temperature increases). The dyeing method may include a temperature hold step at 65–70 °C, during which the dye bath is maintained at this temperature for 30 minutes in order to allow the dye to migrate without fiber reaction. When dyeing of the very highest fastness is required, the fiber is rinsed under alkali conditions (pH 8–9 with ammonia) to remove unreacted dyestuff. / Найлан^{T3} (Nylon^{TM}). (Procion®), (Remazol®) и (Cibacron®). хлорный отбеливатель (chlorine bleach). Реактивные Красители, активные красители, класс красителей, разработанных в

1952–55. Реактивные красители в процессе крашения образуют ковалентные химические связи с гидроксильными группами в случае целлюлозных волокон, а также аминогруппами (и некоторыми другими) в случае белковых и полиамидных волокон. В молекулах реактивных красителей различают хромофорную систему (хромофор), благодаря которой реактивные красители обладают ярким и интенсивным цветом, и реакционную группу, обеспечивающую химическую реакцию красителя с волокном. Промышленное применение уже получили реактивные красители с самыми различными (более 25) реакционным группами. Часто в качестве реакционной группы служит моно- или дихлор-симм-триазин; тогда реактивный краситель вступает в реакцию замещения с ионизированной целлюлозой (ZO^-) по схеме. Хромофорами (ХС) в реактивных красителях служат преимущественно азокрасители, а также антрахиноновые красители и фталоцианиновые красители. Производятся реактивные красители всех цветов; они отличаются яркостью и хорошей устойчивостью окрасок; широко применяются в крашении и печатании изделий из хлопка, регенерированной целлюлозы, шерсти, натурального шёлка и полиамидного волокна. Активные Красители – органические красители (моноазокрасители, фталоцианиновые, антихиноновые и другие), молекулы которых содержат атомы или атомные группировки, взаимодействующие с функциональными группами волокна с образованием прочных ковальных связей. Образуют яркие окраски, устойчивые к мокрым обработкам. Применяются для крашения целлюлозных волокон, шерсти, натурального шёлка, реже – полиамидных волокон.

REACTIVE POWER = РЕАКТИВНАЯ МОЩНОСТЬ – Reactive Power is the mathematical product of voltage and current consumed by reactive loads. Examples of reactive loads include capacitors and inductors. These types of loads when connected to an ac voltage source will draw current, but since the current is 90o out of phase with the applied voltage they actually consume no real power in the ideal sense. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность. Под Реактивной Мощностью понимается мощность, которая характеризует скорость накопления энергии в конденсаторах и катушках индуктивности, а также обмен энергией между отдельными участками цепи и, в частности, генератором и приёмником. В цепях синусоидального тока реактивная электрическая мощность Q участка равна произведению:- $Q = U \cdot I \cdot \sin \varphi$, где I – действующий ток, U – действующее напряжение, sin φ – синус угла сдвига фаз между ними. Единица реактивной электрической мощности – вар. Реактивная Мощность – величина, характеризующая нагрузки, создаваемые в электротехнических устройствах колебаниями энергии электромагнитного поля.

READING DEVICE = СЧИТЫВАЮЩЕЕ УСТРОЙСТВО – In the European Union's banking, Reading Device is a physical device allowing at least the balance of an European Electronic Purse (EEP) to be read and displayed. May be owned and operated by the card holder personally. May also be integrated into Purchase and Load Devices.

READY–TO–WEAR = ГОТОВОЕ–К–ОДЕВАНИЮ – Ready-To-Wear is a term used in the fashion industry. It was developed to distinguish between manufactured items of clothing and those made from fabrics sold by the yard to the consumer. The term is sometimes shortened to r-t-w. See also Prêt-À-Porter. / Под Прэт-А-Портэ, от Французского словосочетания Prêt-À-Porter, означающее буквально Готовое Платье, понимается готовая к носке одежда ширпотреб (широкого потребления).

REAL ECONOMY = РЕАЛЬНАЯ ЭКОНОМИКА – Real Economy is the physical side of the economy dealing with goods, services and resources. This side is concerned with using resources to produce the goods and services that make the satisfaction of wants and needs possible. / Под Реальной Экономикой подразумевается физическая сторона экономических сделок с товарами, услугами и ресурсами. Эта сторона соотносится с использованием ресурсов для производства товаров и услуг, которые производят удовлетворение возможных требований и нужд.

REAL ESTATE = НЕДВИЖИМОСТЬ – In the United States, Real Estate is land and anything fixed, immovable, or permanently attached to it such as appurtenances, buildings, fences, fixtures, improvements, roads, shrubs and trees (but not growing crops), sewers, structures, utility systems, and walls. Title to real estate normally includes title to air rights, mineral rights, and surface rights which can be bought, leased, sold, or transferred together or separately. Also called Real Property or Realty. Also known as Premises. A piece of land, including the air above it and the ground below it, and any buildings or structures on it. Real Estate is a legal term (in some jurisdictions, notably in Australia, Canada, the United Kingdom, and the United States) that encompasses land along with anything permanently affixed to the land, such as buildings, specifically property that is fixed in location. Real estate is often considered synonymous with real property (also sometimes called Realty), in contrast with personal property (also sometimes called Chattel or Personalty Under Chattel Law or Personal Property Law). However, in some situations the term 'real estate' refers to the land and fixtures together, as distinguished from 'real property', referring to ownership rights of the land itself. The terms real estate and real property are used primarily in common law, while civil law jurisdictions refer instead to immovable property. In legal terms, Real Estate refers to immovable property. In banking business this includes land, buildings and similar property rights (such as heritable building rights). / Под Недвижимостью понимаются земельные и другие естественные угодья, находящиеся в собственности физических и юрижических лиц, иные вещные права на землю, а также всякое иное имущество, прикреплённое к земле и прочно связанное с ней (заводы, здания, сооружения и так далее). Недвижимость противопоставляется движимости.

REAL ESTATE FUND = ФОНД, СПЕЦИАЛИЗИРУЮЩИЙСЯ НА НЕДВИЖИМОСТИ (или ФОНД ПО НЕДВИЖИМОСТИ, или ФОНД ИНВЕСТИЦИЙ В НЕДВИЖИМОСТЬ) – Real Estate Fund is a mutual fund which invests in real estate. Can be either open-ended or closed-ended. The fund assets of open-ended real estate funds are securitized in the form of certificates. The number of buyers is unlimited. Incoming funds are invested primarily in commerical property, buildings and own building projects. Closed-ended real estate funds are only available to a limited number of investors and are 'closed' to new capital once a certain capital amount has been subscribed. Investment fund whose assets are placed in buildings and/or vacant land, the overriding principle being to spread risks geographically and to invest in a number of diverse properties. / Инвестиционный фонд, активы которого размещаются в здания и/или в пустующую землю, главенствующим принципом которого является расширить риски географически и инвестировать в ряд разнообразного имущества.

REAL ESTATE INVESTMENT TRUST = ИНВЕСТИЦИОННЫЙ ТРАСТ, СПЕЦИАЛИЗИРУЮЩИЙСЯ НА НЕДВИЖИМОСТИ (или ТРЕСТ КАПИТАЛОВЛОЖЕНИЙ В НЕДВИЖИМОСТЬ) – Real Estate Investment Trust is an organization similar to an investment company in some respects but concentrating its holdings in real estate investments. The yield is generally liberal since Real Estate Investment Trusts are required to distribute as much as 90% of their income. See also Investment Company. Real Estate Investment Trust is a corporation or trust that uses the pooled capital of many investors to purchase and manage income property (equity REIT)

and or mortgage loans (mortgage REIT). REITs are traded on major exchanges just like stocks. The Real Estate Investment Trusts (REITs) are joint stock companies which serve the primary business purpose of buying, selling, renting or leasing real estate. They must pay a high portion of earnings (at least 80%) to their shareholders. REITs are the preferred investment vehicle for real estate in the US REITs are also on the rise in Europe.

REAL ESTATE LIEN = УДЕРЖАНИЕ НЕДВИЖИМОСТИ (или ПРАВО УДЕРЖАНИЯ НЕДВИЖИМОСТИ) – Real Estate Lien is a claim against real estate. Real Estate Lien is a lien on the real estate. Charge on real property. Lien:- any of a variety of encumbrances attaching to real or personal property, either voluntarily, as in the case of securing a loan to acquire property, or involuntarily, as in the case of a money judgment awarded by a court that encumbers the judgment debtor's property until the judgment is satisfied. An encumbrance resulting from a taxing authority securing unpaid taxes or an encumbrance placed on property for nonpayment of workers or material suppliers in a construction project. See also Lien, and Mechanic's Lien.

REAL ESTATE LOAN = ССУДА НА НЕДВИЖИМОСТЬ – Real Estate Loan is a home construction loan provided as a long-term loan secured through the entry of a land charge or mortgage within the lending limit.

REAL ESTATE MORTGAGE INVESTMENT CONDUIT = ИНВЕСТИЦИОННЫЙ КОНДУИТ ПО ЗАКЛАДНЫМ НА НЕДВИЖИМОСТЬ – Real Estate Mortgage Investment Conduits (REMICs) direct principal and interest payments from underlying mortgage-backed securities to classes with different principal balances, interest rates, average lives, prepayment characteristics and final maturities. Unlike traditional pass-throughs, the principal and interest payments in REMICs are not passed through to investors pro rata; instead, they are divided into varying payment streams to create classes with different expected maturities, different levels of seniority or subordination or other differing characteristics. The assets underlying REMIC securities can be either other Mortgage-Backed Securities (MBS) or whole mortgage loans. REMICs allow issuers to create securities with short, intermediate and long-term maturities – flexibility that allows issuers to expand the MBS market to fit the needs of a variety of investors. See also Ginnie Mae® Platinum Securities, Government National Mortgage Association, and Mortgage-Backed Securities. / Смотрите также Дьжини Мэй® (Ginnie Mae®), .

REAL GDP = REAL GROSS DOMESTIC PRODUCT

REAL GROSS DOMESTIC PRODUCT = РЕАЛЬНЫЙ ВАЛОВОЙ ВНУТРЕННИЙ ПРОДУКТ – In the United States, Real Gross Domestic Product (GDP) is the total value of goods and services produced within the borders of the United States, regardless of who owns the assets or the nationality of the labor used in producing that output. (In contrast, Gross National Product (GNP) measures the output of the citizens of the US and the income from assets owned by US entities, regardless of where located.) The growth of output is measured in real terms, meaning increases in output due to inflation have been removed. Source:- US Department of Commerce; Bureau of Economic Analysis. Frequency:- Quarterly. Availability:- Data are typically released during the final week of the month. The first or advance estimate is released during the final week of the month immediately following the end of a calendar quarter. Reason:- The Federal Reserve's primary goal is sustained growth of the economy with full employment and stable prices. Real GDP is the most comprehensive measure of the performance of the US economy. By monitoring trends in the overall growth rate as well as the unemployment rate and the rate of inflation, policy makers are able to assess whether the current stance of monetary policy is consistent with that primary goal. In the United States, Real Gross Domestic Product (GDP) is GDP adjusted for inflation. Real GDP provides the value of GDP in constant Dollars, which is used as an indicator of the volume of the nation's output. / выработка (output).

REAL INTEREST RATE = РЕАЛЬНАЯ ПРОЦЕНТНАЯ СТАВКА – Real Interest Rates are the interest rates adjusted for the expected erosion of purchasing power resulting from inflation. Technically defined as nominal interest rates minus the expected rate of inflation. Compare Nominal Interest Rates. Actual interest rate minus current inflation rate, a more accurate indicator of the likely yield of an investment. Interest rate calculated by subtracting the (annual) inflation rate from the stated (or nominal) interest rate. Real Interest Rate is a return on an investment after factoring out inflation. / Процентная ставка, рассчитываемая посредством вычитания среднегодичной ставки инфляции из заявленной (или номинальной) процентной ставки.

REAL LACE = НАСТОЯЩЕЕ КРУЖЕВО – Real Lace is the hand-made lace. See also Lace.

REAL NATIONAL DISPOSABLE INCOME = РЕАЛЬНЫЙ НАЦИОНАЛЬНЫЙ РАСПОЛАГАЕМЫЙ ДОХОД – Real National Disposable Income is a Gross National Disposable Income adjusted for changes in prices and in the terms of trade.

REAL POWER = РЕАЛЬНАЯ МОЩНОСТЬ – Real Power is the rate at which work is performed or that energy is transferred. Electric power is commonly measured in Watts or kiloWatts. The term real power is often used in place of the term power alone to differentiate from reactive power. Also called Active Power. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность. Под Активной Мощностью понимается среднее за период значение мощности переменного тока; характеризует среднюю скорость преобразования электромагнитной энергии в другие формы (механическую, световую, тепловую и так далее). Измеряется в Ваттах. Для синусоидального тока равна произведению действующих (эффективных) значений тока I и напряжения U на косинус угла сдвига фаз между ними:- $P = I \cdot U \cdot \cos \varphi$.

REAL PROPERTY = РЕАЛЬНАЯ СОБСТВЕННОСТЬ (или ХХ) – Real Property means land, inducing land improvements, structures, and appurtenances thereto, but excluding movable machinery and equipment.

REAL TIME = РЕАЛЬНОЕ ВРЕМЯ – (1) Real Time:- information is updated and saved instantaneously.

(2) Real Time:- in banking, the transmission, processing or settlement of a funds or security transfer instruction on an individual basis at the time it is initiated. / В банковской сфере передача, обработка или расчёт по средствам или инструкции по переводу ценных бумаг на индивидуальной основе в то время, когда это инициировано.

REAL–TIME GROSS SETTLEMENT = ВАЛОВЫЕ РАСЧЁТЫ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Real-Time Gross Settlement:- in a real-time system, a transfer (of a payment or securities) will reach its destination within minutes (if not seconds) of being debited from the sending participant's account. In a gross settlement system, each transfer is handled individually. In a real-time gross settlement (RTGS) system, execution of each transaction or payment order will be handled individually when received, and acknowledgement will be sent to the participants in real-time. Fedwire, CHAPs, and TARGET are examples of RTGS payment

systems. / В системе валовых расчётов в режиме реального времени (ВРРРВ). являются примеры платёжных систем ВРРРВ. ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

REAL–TIME GROSS SETTLEMENT SYSTEM = СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Real-Time Gross Settlement (RTGS) System is a settlement system in which processing and settlement take place on an order-by-order basis (without netting) in real time (continuously). See also TARGET.

REAL TIME TRADING = ТОРГОВЛЯ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Real Time Trading is a trading during a market day in which tick data is gathered and analyzed usually with bar charts and a host of other indicators.

REAL YIELD = РЕАЛЬНАЯ ДОХОДНОСТЬ – Real Yield is the yield on an investment after inflation has been allowed for. Often approximated as the difference between the yield realised and the rate of inflation over the corresponding period.

REAMING = РАЗВЁРТЫВАНИЕ (или РАСКРУЧИВАНИЕ) – Reaming:- further plying of a two-ply yarn with a singles yarn. Reaming is not the same as plying three singles yarns in one operation.

REAR = ВЫВОДИТЬ (или РАЗВОДИТЬ) – Rear:- to raise or multiply organisms such as Insects.

REASON CODE FOR BATCH REJECTION = КОД ПРИЧИНЫ ОТКАЗА (или НЕПРИЗНАНИЯ, или НЕПРИЯТИЯ, или ОТКЛОНЕНИЯ) ПАРТИИ – Reason Code For Batch Rejection:- in a SWIFT message, a coded information describing the reason why a receiver has rejected a batch. / Закодированная информация в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), описывающая причину того, почему получатель отклонил партию. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REASON CODE FOR REJECTION = КОД ПРИЧИНЫ ОТКАЗА – Reason Code For Rejection:- in a SWIFT message, a coded information describing the reason why a receiver has rejected a transaction. / Закодированная информация в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), описывающая причину того, почему получатель отклонил операцию. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REASON CODE FOR RETURN = КОД ПРИЧИНЫ ВОЗВРАТА (или КОД ПРИЧИНЫ ВОЗРАЖЕНИЯ) – Reason Code For Return:- in a SWIFT message, a coded information describing the reason why a receiver has returned a transaction. / Закодированная информация в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), описывающая причину того, почему получатель возразил операции. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REASSEMBLED PALLET = ОТРЕМОНТИРОВАННЫЙ ПОДДОН (или ПЕРЕБРАННЫЙ ПОДДОН) – Reassembled Pallet or Remanufactured Pallet is a pallet made with reclaimed components or parts with new fastenings. / Отремонтированный Поддон – поддон, имеющий отремонтированные детали, или часть деталей, или часть изготовленных вновь деталей.

REBATE = УСТУПКА (или ВОЗВРАТ ЧАСТИ ПЛАТЕЖА) – Rebate is a reduction in the price charged to a client for purchases made over a given period, usually in proportion to volume, in the form of an amount paid back or credit. Sum of money returned to a payer because he or she has paid too much, for example, a tax rebate. Rebate or Abatement, in the United Kingdom (1850's), is the name sometimes given to a discount allowed for prompt payment; it is also sometimes used to express the deduction that is occasionally made at the custom-house from the duties chargeable upon such goods as are damaged, and for loss in warehouses. This allowance is regulated by the act 3 & 4 Will. 4. c. 52 § 32. No rebate is made from the duties charged on coffee, currants, figs, guinea-grains, lemons, opium, oranges, raisins, pepper, tobacco, and wine. See also Abatement. Rebate is a partial refund following a purchase. / Денежная сумма, возвращаемая плательщику вследствие того, что он заплатил слишком много, например, возврат части уплаченного налога.

(1) Rebate is an illegal form of discounting or refunding that has the net effect of lowering the tariff price. / Незаконная форма дисконтирования или возврата части денежных средств, которая в конечном итоге имеет чистый эффект снижения тарифной цены.

(2) In insurance, Rebate is a reduction of a premium. / В страховании, уменьшение премии.

(3) Rebate is that part of a transport charge which the carrier agrees to return. / Та часть транспортных расходов, которую перевозчик соглашается вернуть. Рабат (Rebate):- в торговом мореплавании – скидка с тарифа, представляемая линейными судовладельцами грузоотправителям за отправку ими своих грузов только на судах судовладельца.

(4) Rebate:- the interest rate that a securities lender pays the borrower on cash collateral.

(5) Rebate:- for a bill of exchange, a discount that is offered if the bill is paid before maturity.

(6) Rebate:- the portion of interest on short sale proceeds that is paid out to the borrower of a bond as an incentive for them to borrow the stock from a specific source. When a short sale takes place, the short seller often borrows a security through a lender (who acts as an intermediary), who in turn borrows the security from an owner of custodian. The short sale's proceeds are then returned to the lender, who then invests the proceeds and earns interest on them. Certain short sellers might demand a portion of this interest, in order for them to do business with that particular lender.

(7) In a short-sale transaction, Rebate is the portion of interest or dividends earned by the owner (lender) of shares that are paid to the short seller (borrower) of the shares. The lender and borrower usually negotiate the rate at which the short seller will be compensated.

(8) In an options transaction, Rebate is the amount paid to the holder of the option if the option expires worthless. The rebate is pre-negotiated and is usually a portion of the premium paid by the option holder.

REBCO = RUSSIAN EXPORT BLEND CRUDE OIL

REBOZO = РЭБОСО (или МАНТИЛЬЯ) – Rebozo is a long scarf worn chiefly by Mexican women. / длинный шарф, одеваемый главным образом Мексиканскими женщинами. Прикрывание лица плащом.

RECALL = ОТЗЫВ – Recall is a demand by a securities lender that a borrower return securities lent in an open transaction.

RECAPTURE = ВЗЯТИЕ ОБРАТНО – Recapture is the action of a ceding company taking back from a reinsurer insurance previously ceded.

RECC MODEL = RICE ECONOMY CLIMATE CHANGE MODEL

RECEIPT = ПРИХОДНЫЙ ОРДЕР (или КВИТАНЦИЯ О ПОЛУЧЕНИИ, или РАСПИСКА В ПОЛУЧЕНИИ) – Receipt is a note stating that money has been paid or that goods have been received, such as a wharfinger receipt. Written acknowledgement issued by the recipient confirming the acceptance of money or something of value for the payment of a debt or obligation. A debtor making a payment is entitled to a receipt as evidence. Written document issued by a creditor or seller indicating that a debtor has fulfilled its obligations, or that the buyer has paid for a good or service. Also known as Acknowledgement. / Известно также как Подтверждение (Acknowledgement).

RECEIPTS = ПОСТУПЛЕНИЯ (или ПРИХОДЫ, или ПРИЁМНИКИ) – Receipts:- purchases of fuel.

RECEIVABLE DAYS = ДНИ ПОСТУПЛЕНИЙ (или ДНИ ПРИЧИТАЕМОГО К ПОЛУЧЕНИЮ) – Receivable Days:- xxxxx. See also Accounts Receivable. Days Receivable:- a measure of the average time a company's customers take to pay for purchases, equal to accounts receivable divided by annual sales on credit times 365.

RECEIVABLES = ПОСТУПЛЕНИЯ – Receivables are the amounts due from customers for goods or services already provided. Also known as Debtors. Amounts owed to an entity. They may be current (accounts receivables) or non-current (long-term receivables). In general, that which is due and collectable. The total amounts due on goods sold, services rendered or money loaned. In bank balance sheets, unsecured current account loans (overdrafts). The opposite of Deposits. Also known as Advances. See also Accounts Payable, and Accounts Receivable. / Смотрите также Кредиторская Задолженность или Счета К Оплате (Accounts Payable) и Дебиторская Задолженность или Счета К Получению (Accounts Receivable).

RECEIVABLE/SALES = ПОСТУПЛЕНИЕ/ПРОДАЖИ (или К ПОЛУЧЕНИЮ/ПРОДАЖИ) – Receivable/Sales:- xxxxx. See also Accounts Receivable/Sales.

RECEIVABLE TURNOVER = ОБОРОТ ПОСТУПЛЕНИЙ (или ОБОРАЧИВАЕМОСТЬ ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ) – Receivable Turnover:- xxxxx. See also Accounts Receivable Turnover. Accounts Receivables Turnover:- an efficiency ratio, accounts receivable turnover tells the analyst how effectively the company manages the credit extended to customers. The measure is a good indication of the average time needed to convert receivables into cash. The metric relies on information from the income statement (sales) as well as the balance sheet (receivables). Calculation:- Accounts Receivable Turnover = Net Sales on Credit / Average Receivables. Explanation:- when calculating this metric, it's preferred to use a monthly average of receivables, and only include sales on credit terms. Typically, most companies require retail credit customers to repay balances in 30 to 60 days. This translates into accounts receivable turnover ratios that are between 6 and 12. If this ratio falls too low, it can indicate problems collecting money from customers. When drawing conclusions about the relative performance of a company, benchmark comparisons should be made with competitors in the same industry. Example:- last year, Company A had an average monthly accounts receivable of USD3 867 000 and revenues of USD29 611 000. Using the above formula, accounts receivable turnover is:- = USD29 611 000 / USD3 867 000, or 7.66. Based on this information, we know Company A's average repayment term would be 365 days / 7.66 or 47.6 days.

RECEIVAL AND DELIVERY = ПРИНЯТО И ПОСТАВКА – Receival And Delivery:- export cargo is received into the port and import cargo is delivered to truck or rail. / Вывозной (или экспортный) груз, полученный в порту, и привозной (или импортный) груз, поставленный до грузовика или железнодорожного транспортного средства.

RECEIVED FOR SHIPMENT BILL OF LADING = ОТМЕТКА В КОНОСАМЕНТЕ О ПОЛУЧЕНИИ ДЛЯ ОТГРУЗКИ – Received For Shipment Bill is a bill of lading (B/L) containing an acknowledgement by the carrier that the cargo covered has been received by it, e.g., at a container yard, for shipment on board a vessel. A 'received for shipment' bill of lading can be, and often is, converted to a 'shipped' bill of lading by subsequent notation acknowledging that the cargo covered has been shipped on board a vessel. Validated at time cargo is received by ocean carrier to commence movement but before being validated as Onboard. Can be issued on the carrier's actual receipt or taking custody of goods, if requested goods are not yet necessarily loaded on board a vessel or other conveyance. This form of bill of lading would usually be switched to an on board bill of lading or added as an on board notation upon the actual loading of goods on board a vessel or other conveyance. A Received For Shipment Bill of Lading is paperwork that shows when an ocean carrier confirms the time of receiving the contents or cargo to initiate the transport of the contents. This occurs before the content or cargo is gets on the transports such as airplane, vessel, train or truck.

RECEIVED LETTER OF LADING = ОТМЕТКА В КОНОСАМЕНТЕ О ПОЛУЧЕНИИ – Received Letter Of Lading:- words stamped onto a bill of lading to indicate that the shipowner has received the goods for shipment. It does not indicate that the goods have already been shipped. / Слова, проштампованные в коносаменте для указания того, что владелец судна получил товары для отгрузки. При этом она не подразумевает того, что товары уже отгружены.

RECEIVER = ЛИКВИДАТОР (или УПРАВЛЯЮЩИЙ КОНКУРСНОЙ МАССОЙ) – Receiver is an official into whose hands a company with financial difficulties is placed, to ensure that, as far as possible, the creditors are paid. The person appointed to 'receive' and administer the rents and profits, or other moneys, accruing to an estate or business undertaking which is administered or wound-up under the supervision of the court. Official Receivers are officials permanently employed to act in that capacity in bankruptcy proceedings or the winding-up of joint-stock companies. In relation to corporations means a person appointed either by a court or by an individual under a power contained in a statute, or an instrument, to investigate the affairs of a company which has run into financial difficulties. A Receiver is the person appointed by a judge to take charge of the property, business, etc of another person, to run the business, collect the receivables, etc with the purpose of fulfilling the objective for which such receivers are appointed. A person appointed by the court or pursuant to a debt instrument, to take charge of the assets of an insolvent person or business and preserve them for sale and distribution to creditors. A receiver may also be appointed to take charge of property while that property is the subject of ongoing litigation. Person named by a bankruptcy court to act as the agent for a debtor in bankruptcy. The receiver has the authority to help reorganize the company or to liquidate its assets to satisfy the obligations to creditors. See also Bankruptcy Trustee, and Liquidator.

RECEIVER = ПОЛУЧАТЕЛЬ – (1) Receiver is an enterprise that receives goods/services. / Предприятие, которое получает товары/услуги.

(2) In cotton futures trading, Receiver is the clearing member who stops the delivery notice and is responsible to receive and pay for the cotton. There shall be two categories of receivers:- Interim Receiver and Ultimate Receiver. / В торговле фьючерсами на хлопок, Клиринговый Член, который останавливает Уведомление о Поставке и становится ответственным за получение и оплату

хлопка. Встречаются две категории Получателей:- Промежуточный или Временный Получатель (Interim Receiver) и Конечный Получатель (Ultimate Receiver).

(3) Receiver is the party receiving a SWIFT message as identified by its registered SWIFT address in the header of the message. / Сторона, получающая сообщение Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), в соответствии с её зарегистрированным в СВМФДС адресом, указываемым в заголовке сообщения. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

(4) The Receiver of the message currently being referred to.

RECEIVER = ПРИЁМНИК (или ПОЛУЧАТЕЛЬ, или СБОРНИК, или РЕСИВЁР) – Receiver is the portion of a photometric instrument that receives the viewing beam from the specimen, including a collector such as an integrating sphere, if used, often the monochromator or special filters, the detector, and associated optics and electronics.

RECEIVER OF WRECK = ПРИЁМЩИК ОСТАТКОВ КАРАБЛЕКРУШЕНИЙ (или УПРАВЛЯЮЩИЙ ОСТАТКАМИ КАРАБЛЕКРУШЕНИЙ) – In the United Kingdom, Receiver Of Wreck is an official who is responsible to the Department of Trade for all wreckage that is salved on the coastline, or which is found at sea and is brought to a British port. / Официальное лицо в Соединённом Королевстве, отвечающее перед Департаментом Торговли за все остатки кораблекрушений, выброшенные морем на берег, или которые найдены в море и перевезены в Британский порт.

RECEIVER'S CORRESPONDENT = КОРРЕСПОНДЕНТ ПОЛУЧАТЕЛЯ – Receiver's Correspondent:- in a SWIFT message, financial institution which holds the receiver's settlement/reimbursement account. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) финансовое учреждение, которое держит счёт получателя для расчётов/рамбурсирования. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

RECEIVER'S CORRESPONDENT ACCOUNT = КОРРЕСПОНДЕНТСКИЙ СЧЁТ ПОЛУЧАТЕЛЯ (или СЧЁТ КОРРЕСПОНДЕНТА ПОЛУЧАТЕЛЯ) – Receiver's Correspondent Account:- in a SWIFT message, the receiver's settlement/reimbursement account at the receiver's correspondent. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) счёт получателя для расчётов/рамбурсирования у корреспондента получателя. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

RECEIVERSHIP = КОНКУРСНОЕ УПРАВЛЕНИЕ (или ВНЕШНЕЕ УПРАВЛЕНИЕ) – Receivership:- when a company is sick (financially speaking) and cannot meet its payment obligations to its creditors it can be placed into 'receivership' by the courts. This means that a court-appointed receiver (often this will be a well-known accounting firm) will manage the affairs of the company for an interim period of time during which the receiver will consider proposals from various stakeholders to rescue the company. During this period, the company is allowed to continue doing business, albeit with certain restrictions. Some companies will emerge from receivership and prosper while others may simply be liquidated.

RECEIVER'S TRANSACTION CHARGE = СБОР ЗА ТРАНЗАКЦИЮ С ПОЛУЧАТЕЛЯ (или СБОР ЗА ОПЕРАЦИЮ С ПОЛУЧАТЕЛЯ) – In banking, Receiver's Transaction Charge is a charge levied on the receiver's side in respect of a specific transaction. / Сбор в банковском обслуживании, взимаемый со стороны получателя в отношении конкретной операции.

RECEIVING BANK = ПОЛУЧАЮЩИЙ БАНК (или БАНК ПОЛУЧАТЕЛЬ) – Receiving Bank:- in the nationwide Automated Clearing House (ACH) system, a bank or other depository institution eligible to receive electronic credit and debit entries from another bank, the Originator of an ACH transaction, for posting to a customer's account. Also called Receiving Depository Financial Institution (RDFI). See also Receiver (3). Receiving Bank is a bank which receives money via electronic transfer. Receiving Bank is a bank appointed on an issue of shares to the public to receive and process the application forms for the shares, process and clear cheques, allocate the shares and send out share certificates. The bank will enter into a receiving bank agreement, in the form of a letter of instruction, with the company or the investment bank on behalf of the company, setting out the bank's responsibilities. / Смотрите также Получатель (3) (Receiver (3)).

RECEIVING OFFICE = ПОЛУЧАЮЩАЯ КОНТОРА – In the United States, a Receiving Office (RO) is the national Office of the USPTO (short for the United States Patent and Trademark Office) or the intergovernmental organization with which an international application has been filed.

RECEIVING PARTY = ПОЛУЧАЮЩАЯ СТОРОНА – Receiving Party is the entity receiving the capacity and/or energy transmitted by the Transmission Provider to the Point(s) of Delivery.

RECEIVING REPORT = ОТЧЁТ О ПРИХОДЕ (или ОТЧЁТ О ПОСТУПЛЕНИИ) – Receiving Report is a record of the condition of all inbound stock as it arrives.

RECEIVING TALLY = УЧЁТ ПРИХОДА (или ПЕРЕЧЕНЬ ПРИХОДА, или ПОДСЧЁТ ПОСТУПЛЕНИЯ) – Receiving Tally:- a list of all the inbounds received in an effort to ensure accuracy.

RECEPTACLE = ЦВЕТОЛОЖЕ (или РЕЦЕПТАКУЛА) – Receptacle is enlarged apex of a flower stalk bearing the parts of a flower or the florets of a composite flower. In ferns, a main stem on which sporangia arise. / Цветоложе – это увеличенный апекс (верхушка) цветоножки (flower stalk), несущий части цветка или отдельных цветочков (florets) сложного цветка. У папоротников, основной стебель, на котором произрастают спорангии. Под Цветоложем понимается обычно укороченная стеблевая часть цветка, на которой расположены околоцветник, тычинки и пестик. Под Цветоложем (Receptaculum) понимается ось цветка, на которой располагаются чашечка, венчик, тычинки и пестик. Междоузлия сильно укорочены или совсем не развиты, рост в длину ограничен. Наиболее длинные оси характерны для примитивных цветков, например, для некоторых видов магнолии.

RECEPTIVE = РЕЦЕПТИВНОЕ (или ВОСПРИИМЧИВОЕ) – Receptive:- when the plant's physiological or physical status allows the entrance or growth of a foreign body. / , от Латинского слова Receptum, означающее Взятое или Принятое, .

RECEPTOR = РЕЦЕПТОР – Receptor is a protein molecule, usually on the cell surface, that is able to receive and interpret an external signal. / В физиологии под Рецепторами, от Латинского слова Receptor, означающее Принимающий, понимаются окончания чувствительных нервных волокон или специализированной клетки (сетчатки глаза, внутреннего уха и другие), преобразующие раздражения, воспринимаемые извне (экстероцепторы) или из внутренней среды организма (интероцепторы), в нервное возбуждение, передаваемое в центральную нервную систему.

RECESSION = РЕЦЕССИЯ (или СПАД) – (1) Recession is a term referring to a phase in the economic cycle marked by weakened, stagnating or slightly negative economic growth. It is a milder form of economic contraction than a depression. Recession is the stage in a trade cycle during which the decline in economic activity accelerates, causing investment values to fall, companies to have to deal with adverse trading conditions, and unemployment to rise and so income and expenditure to fall. A recession may end in a depression unless there is a recovery. Recession is a significant decline in general economic activity extending over a period of time. Usually declared after two consecutive quarters of declining gross domestic products. Downturn in the business cycle, representing a mild form of depression and a marked slowdown or decline in economic growth. In the United States, a decline in the gross national product for two consecutive quarters is considered to be the beginning of a recession. A period of no or negative economic growth and high unemployment. September 20, 2010:- The Business Cycle Dating Committee of the National Bureau of Economic Research (headquartered in Cambridge, MA, USA) met yesterday by conference call. At its meeting, the committee determined that a trough in business activity occurred in the US economy in June 2009. The trough marks the end of the recession that began in December 2007 and the beginning of an expansion. The recession lasted 18 months, which makes it the longest of any recession since World War II. Previously the longest postwar recessions were those of 1973–75 and 1981–82, both of which lasted 16 months. In determining that a trough occurred in June 2009, the committee did not conclude that economic conditions since that month have been favorable or that the economy has returned to operating at normal capacity. Rather, the committee determined only that the recession ended and a recovery began in that month. A recession is a period of falling economic activity spread across the economy, lasting more than a few months, normally visible in real GDP, real income, employment, industrial production, and wholesale-retail sales. The trough marks the end of the declining phase and the start of the rising phase of the business cycle. Economic activity is typically below normal in the early stages of an expansion, and it sometimes remains so well into the expansion. The committee decided that any future downturn of the economy would be a new recession and not a continuation of the recession that began in December 2007. The basis for this decision was the length and strength of the recovery to date. The committee waited to make its decision until revisions in the National Income and Product Accounts, released on July 30 and August 27, 2010, clarified the 2009 time path of the two broadest measures of economic activity, real Gross Domestic Product (real GDP) and real Gross Domestic Income (real GDI). The committee noted that in the most recent data, for the second quarter of 2010, the average of real GDP and real GDI was 3.1 percent above its low in the second quarter of 2009 but remained 1.3 percent below the previous peak which was reached in the fourth quarter of 2007. The stage in the economic cycle at which activity declines, growth slows down or there is an actual net drop in production, employment and income. The NBER's (the short for the US National Bureau of Economic Research) Business Cycle Dating Procedure:- The National Bureau's Business Cycle Dating Committee maintains a chronology of US business cycles. The chronology identifies the dates of peaks and troughs that frame economic recessions and expansions. A recession begins when the economy reaches a peak of activity and ends when the economy reaches its trough. Between trough and peak, the economy is in an expansion. Expansion is the normal state of the economy; most recessions are brief. However, the time that it takes for the economy to return to its previous peak level of activity or its previous trend path may be quite extended. According to the NBER chronology, the most recent peak occurred in February 2020, ending a record-long expansion that began in June 2009, and inaugurating a recession. The NBER's traditional definition emphasizes that a recession involves a significant decline in economic activity that is spread across the economy and lasts more than a few months. In our modern interpretation of this definition, the committee treats the three criteria – depth, diffusion, and duration – as at least somewhat interchangeable. That is, while each criteria needs to be met individually to some degree, extreme conditions revealed by one criterion may partially offset weaker indications from another. For example, in the case of the February 2020 peak in economic activity, the committee concluded that the drop in activity had been so great and so widely diffused throughout the economy that the downturn should be classified as a recession even if it proved to be quite brief. In choosing the dates of business-cycle turning points, we follow standard procedures to assure continuity in the chronology. Because a recession must influence the economy broadly and not be confined to one sector, we emphasize economy-wide measures of economic activity. We view real gross domestic product as the single best measure of aggregate economic activity. This concept is measured two ways by the US Bureau of Economic Analysis (BEA) – from the product side and from the income side. Because the two measures have strengths and weaknesses and differ by a statistical discrepancy, we consider real GDP and real gross domestic income (GDI) on an equal footing. The committee also considers carefully total payroll employment as measured by the Bureau of Labor Statistics (BLS). The traditional role of the committee is to maintain a monthly chronology of business cycle turning points. Because the BEA figures for real GDP and real GDI are only available quarterly, the committee considers a variety of monthly indicators to determine the months of peaks and troughs. The committee places particular emphasis on two monthly measures of activity across the entire economy:- (1) personal income less transfer payments, in real terms, which is a monthly measure that includes much of the income included in real GDI; and (2) payroll employment from the BLS. Although these indicators are the most important measures considered by the NBER in developing its monthly business cycle chronology, the committee does not hesitate to consider other indicators, such as real personal consumption expenditures, industrial production, initial claims for unemployment insurance, wholesale-retail sales adjusted for price changes, and household employment, as it deems valuable. There is no fixed rule about which other measures contribute information to the process or how they are weighted in the committee's decisions. The committee's approach to determining the dates of turning points is retrospective. We wait until sufficient data are available to avoid the need for major revisions. In particular, in determining the date of a peak in activity, and thus the onset of recession, we wait until we are confident that, even in the event that activity began to rise again immediately, we feel confident that a recession has occurred. As a result, we tend to wait to identify a peak until a number of months after it has actually occurred. / Под Рецессией, от Латинского слова Recessus, означающее Отступление, понимается фаза экономического цикла, характеризующаяся слабым, но неуклонным ухудшением экономических показателей, в первую очередь снижением валового внутреннего продукта (ВВП). Также во время рецессии растет безработица, сокращается объём инвестиций в основной капитал, незначительно падает общий уровень жизни населения, особенно тех, кто получает зарплату или доходы от бизнеса (в отличие от получателей государственных выплат и рантье, чье положение не ухудшается). В некоторых странах различные органы государственного управления официально сообщают о наступлении рецессии при определённых обстоятельствах. Например, в США Комитет Делового Цикла (Business Cycle Dating Committee; поддерживает хронологию деловых циклов в США) Национального Бюро Экономических Исследований (The National Bureau of Economic Research) определяет рецессию как 'значительное снижение деловой активности по всей экономике на протяжении нескольких месяцев, обычно выражающееся в ухудшении показателей реального ВВП, реального дохода, занятости, промышленного производства и розничной торговли'. В Великобритании рецессия фиксируется Национальной Статистической Службой при снижении ВВП в течение двух кварталов подряд. Существует распространённая в среде экономистов и деловой прессе шутка, объясняющая отличие рецессии от экономической депрессии:- 'Если твой сосед потерял работу, то это рецессия, если ты потерял работу, то это депрессия'. С определением рецессии связан известный парадокс:- учитывая, что данные по квартальному изменению ВВП в развитых странах публикуются с большой задержкой, а впоследствии могут быть существенно пересмотрены, официальное сообщение о наступлении рецессии часто делается через несколько месяцев после того, как она уже закончилась. На момент объявления о наступлении рецессии экономика страны находится либо в состоянии сильного кризиса, либо на стадии нового подъёма. Соответственно, официальные данные о рецессии

представляют по большей части исторический интерес и не отражаются на поведении экономических субъектов. Поэтому значимую роль в принятии экономических решений правительством и предпринимателями играет прогнозирование колебаний ВВП, основанное на косвенных показателях и не отличающееся высокой точностью. При этом в современной экономической науке нет единого мнения относительно причин возникновения рецессии и способов её ускоренного преодоления. Экономистами выделяется несколько видов рецессий – по условной форме графика изменения ВВП. V-рецессия характеризуется относительно сильным и быстрым падением ВВП (не достигающим, впрочем, уровня депрессии) с явно выраженным единичным провалом и последующим быстрым восстановлением до прежнего уровня. U-рецессия отличается относительно долгим и стабильным (без движений вверх–вниз) пребыванием ВВП на низком уровне с последующим быстрым восстановлением. В ходе W-рецессии происходит краткосрочный 'отскок' графика роста ВВП в положительную область в середине рецессии, то есть она похожа на две V-рецессии подряд. Наконец, под L-рецессией понимается быстрое падение ВВП с последующим долгим плавным восстановлением. Рецессия – нередкое явление в экономике развитых стран. В США только после Второй Мировой Войны наблюдалось более десяти рецессий, в Великобритании – не менее пяти. С ростом глобализации начинают происходить глобальные рецессии, затрагивающие одновременно несколько стран, например, в 1998, в 2000–01 и 2008–09. 2020-Июнь-08 (Понедельник):- Национальное Бюро Экономических Исследований (НБЭИ) сообщило, что экономика США уже в Марте 2020 оказалась в состоянии рецессии, спровоцированной Коронавирусом. Таким образом, самый длительный период роста Американской экономики насчитывал 128 месяцев. Ничего подобного не наблюдалось с 1854. Комитет бюро также установил, что пик квартальной экономической активности пришёлся на IV квартал 2019. Месячный пик (Февраль 2020) произошёл в следующем квартале в соответствии с методикой бюро. Обычно рецессия фиксируется после спада ВВП в течение двух кварталов. Однако на этот раз специалисты бюро пришли к выводу, что пандемия и ответные меры изоляции привели к спаду экономики с другими характеристиками и динамикой, чем предыдущие рецессии. 'Беспрецедентные масштабы сокращения занятости и производства, а также его широкий охват во всей экономике, требуют обозначения этого эпизода как рецессии', – отмечается в сообщении НБЭИ.

(2) Recession is a complete draining of flood water from the land. / Под Рецессией, от Латинского слова Recessus, означающее Отступление, понимается .

RECESSIVE GENE (RECESSIVE ALLELE) = РЕЦЕССИВНЫЙ ГЕН (РЕЦЕССИВНЫЙ АЛЛЕЛЬ) – Recessive Gene (Recessive Allele) is a gene the expression of which is either partially or entirely suppressed when a dominant allelic gene is present. Recessive gene is the alternate form of the dominant gene. / Под Рецессивностью, от Латинского слова Recessus, означающее Отступление, понимается форма взаимоотношений двух аллельных генов, при которой один из них – рецессивный – оказывает менее сильное влияние на соответствующий признак особи, чем другой – доминантный.

RECIPROCAL CROSS = РЕЦИПРОКНОЕ СКРЕЩИВАНИЕ (или ВЗАИМНОЕ СКРЕЩИВАНИЕ, или ОБОЮДНОЕ СКРЕЩИВАНИЕ) – Reciprocal Cross is a set of crosses between two parents where either is used as male or female, or where the source of male and female gametes are reversed, e.g., A x B and B x A. / Под Реципрокными Скрещиваниями, от Латинского слова Reciprocus, означающее Взаимный или Возвращающийся или Обратный, понимается система двух скрещиваний, при которой каждая из генотипически различных родительских форм используется один раз в качестве материнской и другой – в качестве отцовской. Применяют в генетических исследованиях и в селекции. Под Реципрокными Скрещиваниями понимаются скрещивания индивидов двух линий или пород, при которых каждый из родителей в одной комбинации используется в качестве материнского, а другой в качестве отцовского. Гибриды, полученные в результате реципрокного скрещивания называются Реципрокными Гибридами. При реципрокном скрещивании тип наследования того или иного признака одинаков независимо от того, вносится ли он матерью или отцом; исключение составляют две формы наследования признаков – сцепленного с полом и цитоплазматического. Реципрокное скрещивание применяется, когда наследование какого-либо ценного признака или свойства связано с цитоплазмой или когда имеются различия в репродуктивной способности гибридов в зависимости от того, в качестве материнского или в качестве отцовского берётся этот или иной родитель.

RECIPROCAL CURRENCY (SWAP) ARRANGEMENTS = ОБОЮДНЫЕ ДОГОВОРЁННОСТИ О ВАЛЮТЕ (СВОПАХ) – In the United States, Reciprocal Currency (Swap) Arrangements are the short-term reciprocal arrangements between a Federal Reserve Bank and individual foreign central banks. By drawing on a swap the foreign central bank obtains Dollars that can be used to conduct foreign exchange intervention in support of its currency or to lend to its domestic banking system to satisfy temporary liquidity demands. For the duration of the swap, the Federal Reserve Bank obtains an equivalent amount of foreign currency along with a commitment from the foreign central bank to repurchase the foreign currency at a preset exchange rate. / откупая иностранную валюту по ранее установленному обменному курсу.

RECIPROCAL DEFENSE PROCUREMENT MEMORANDA OF UNDERSTANDING = ОБОЮДНЫЙ МЕМОРАНДУМ О ВЗАИМОПОНИМАНИИ В ВОПРОСАХ ОБЕСПЕЧЕНИЯ (или ДОСТИЖЕНИЯ) ОБОРОНЫ (или ЗАЩИТЫ) – Reciprocal Memoranda Of Understanding (MOU) are broad bilateral umbrella MOUs that seek to reduce trade barriers on defense procurement. They usually call for the waiver of 'buy national' restrictions, customs and duties to allow the contractors of the signatories to participate, on a competitive basis, in the defense procurement of the other country. These agreements were designed in the late 1970s to promote rationalization, standardization, and interoperability of defense equipment within NATO (short for the North Atlantic Treaty Organization). At that time, the MOU's were also intended to reduce the large defense trade advantage the United States possessed over the European allies. The first agreements were signed in 1978.

RECIPROCAL OF EUROPEAN TERMS = В ОБРАТНОМ ПОРЯДКЕ К ЕВРОПЕЙСКИМ – Reciprocal Of European Terms:- quoting exchange rates in terms of how many units of the foreign currency equal one US Dollar. Also known as Dollar Terms. Opposite of European Terms. One method of quoting exchange rates, which measures the US Dollar value of one foreign currency unit, i.e. US Dollars per foreign units. See also European Terms. / Единственный метод котирования обменных курсов, который соизмеряет стоимость в Долларах США за одну единицу иностранной валюты, то есть количество Долларов США за иностранные единицы валют.

RECIPROCITY = ВЗАИМНОСТЬ (или ОБОЮДНОСТЬ, или ВЗАИМОЗАВИСИМОСТЬ) – Reciprocity is the practice by which governments extend similar concessions to each other. Reciprocity:- the reduction of a country's import duties or other trade restraints in return for comparable trade concessions from another country. Reciprocity includes the lowering of customs duties on imports in return for tariff concessions from other countries; the negotiated reduction of a country's import duties or other trade restraints in return for similar concessions from another country. Reciprocity is a traditional principle of GATT (short for the General Agreement on Tariffs and Trade) trade negotiations that implies an approximate equality of concessions accorded and benefits received among or between participants in a negotiation. In practice this principle applies only in negotiations between developed countries. Because of the frequently wide disparity in their economic capacities and potential, the relationship between developed and developing countries is generally not one of equivalence. The concept of 'relative reciprocity' has emerged to characterize the practice by developed countries

to seek less than full reciprocity from developing countries in trade negotiations. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

RECLAIMED TEXTILE FIBERS = РЕГЕНЕРИРОВАННЫЕ ТЕКСТИЛЬНЫЕ ВОЛОКНА (или ПОВТОРНО ВОСТРЕБОВАННЫЕ ВОЛОКНА) – Reclaimed Textile Fibers are the fibers made into fabric (whether sold comrnercially or not) and then converted back into fiber. Most reclaimed textile fibers are wool and other natural fibers because it is extremely difficult to reclaim man-made fibers. See also Reprocessed Fibers, and Reused Fibers.

RECLAIMED WASTES = ВОЗВРАТНЫЕ ОТХОДЫ (или ПРЯДОМЫЕ УГАРЫ) – Reclaimed Wastes:- certain wastes are reclaimed by cleaners. One such machine used for this purpose is known as a Willow. Picker Waste and Card Fly are sometimes cleaned by a Willow in order to increase the value of the fiber. Such cleaned wastes are known as Willowed Picker and Willowed Fly. The Willow Machine does not remove all seed, hence these cleaned wastes require permit or treatment certificate. Also known as Cleaned Wastes.

RECLAIMED WOOL = ВОССТАНОВЛЕННАЯ ШЕРСТЬ (или РЕГЕНЕРИРОВАННАЯ ШЕРСТЬ) – Reclaimed Wool is a wool that is reclaimed from new or old fabrics.

RECLAMATION = МЕЛИОРАЦИЯ (или ОСВОЕНИЕ) – Reclamation is the reclaiming of desert, marshy, or submerged areas or other wasteland for cultivation or other use. Reclamation is the act or process of restoring land for cultivation or use. Land Reclamation, usually known as Reclamation, and also known as Land Fill (not to be confused with a Landfill), is the process of creating new land from ocean, riverbeds, or lake beds. The land reclaimed is known as Reclamation Ground or Land Fill. In a number of other jurisdictions, including parts of the United States, the term 'Reclamation' can refer to returning disturbed lands to an improved state. In Alberta, Canada, for example, reclamation is defined by the provincial government as 'The process of reconverting disturbed land to its former or other productive uses'. In Oceania it is frequently referred to as Land Rehabilitation. Land reclamation can be achieved with a number of different methods. The most simple method involves simply filling the area with large amounts of heavy rock and/or cement, then filling with clay and dirt until the desired height is reached. The process is called 'Infilling' and the material used to fill the space is generically called 'Infill'. Draining of submerged wetlands is often used to reclaim land for agricultural use. Deep cement mixing is used typically in situation in which the material displaced by either dredging or draining may be contaminated and hence needs to be contained. The creation of new land was for the need of human activities. Agriculture was a drive for land reclamation before industrialisation. In South China, farmers reclaimed paddy fields by enclosing an area with a stone wall on the sea shore near river mouth or river delta. The species of Rice that grow on these grounds are more salt tolerant. Another use of such enclosed land is creation of fish ponds. It is commonly seen on the Pearl River Delta and Hong Kong. These reclamation also attracts species of migrating birds. A related practice is the draining of swampy or seasonally submerged wetlands to convert them to farmland. While this does not create new land exactly, it allows commercially productive use of land that would otherwise be restricted to wildlife habitat. It is also an important method of mosquito control. Even in the post-industrial age, there have been land reclamation projects intended for increasing available agricultural land. For example, the village of Ogata in Akita, Japan, was established on land reclaimed from Lake Hachirogata (Japan's second largest lake at the time) starting in 1957. By 1977, the amount of land reclaimed totalled 172.03 square kilometers (66.42 sq mi). Land Reclamation might involve razing a strip mall and planting crops. / Под Мелиорацией, от Латинского слова Melioratio, означающее Улучшение, понимается совокупность организационно-хозяйственных и технических мероприятий по коренному улучшению земель с неблагоприятными водными и воздушными режимами, химическими и физическими свойствами, подверженных вредному механическому действию ветра или воды. Виды мелиорации:- орошение, осушение, химическая мелиорация, агролесомелиорация. Обеспечивает устойчивые урожаи, способствует рациональному использованию земли. В бывшем Союзе Советских Социалистических Республик (СССР) долговременная программа мелиорации, повышения эффективности использования мелиорированных земель в целях устойчивого наращивания продовольственного фонда страны была утверждена Октябрьским Пленумом Центрального Комитета Коммунистической Партии Советского Союза (ЦК КПСС) в 1984.

RECLAMATION = РЕКЛАМАЦИЯ – Reclamation is the act of returning something to a former, better state. Most people involved in reclamation want to reclaim something out of a sense of moral or environmental duty. Since Re means again, it makes sense that a reclamation involves restoring something to its former glory, especially something that has gone to the dogs. Anything that's fallen on hard times is a good candidate for reclamation. Reclamation is the act or process of reclaiming. / В Гражданском Праве под Рекламацией, от Латинского слова Reclamatio, означающее Громкое Возражение или Неодобрение, понимается претензия покупателя (заказчика) к продавцу (подрядчику, поставщику) по поводу ненадлежащего качества вещи, требование об устранении недостатков, снижении цены, возмещении убытков. Смотрите также Претензия.

RECLASSIFICATION OF FINANCIAL ASSETS = ПЕРЕКЛАССИФИКАЦИЯ ФИНАНСОВЫХ АКТИВОВ – Reclassification Of Financial Assets is Amendments to IAS 39 (short for International Accounting Standard No. 39) Financial Instruments:- Recognition and Measurement and IFRS 7 (short for International Financial Reporting Standards) Financial Instruments:- Disclosures – Amendments to IAS 39:- Introduction:- Reclassifications:- An amendment to the Standard, issued in October 2008, permits an entity to reclassify non-derivative financial assets (other than those designated at fair value through profit or loss by the entity upon initial recognition) out of the fair value through profit or loss category in particular circumstances. The amendment also permits an entity to transfer from the available-for-sale category to the loans and receivables category a financial asset that would have met the definition of loans and receivables (if the financial asset had not been designated as available for sale), if the entity has the intention and ability to hold that financial asset for the foreseeable future. Measurement:- Reclassifications:- An entity:- (a) shall not reclassify a derivative financial instrument into or out of the fair value through profit or loss category while it is held or issued; (b) shall not reclassify any financial instrument out of the fair value through profit or loss category if upon initial recognition it was designated by the entity as at fair value through profit or loss; and (c) may, if a financial asset is no longer held for the purpose of selling or repurchasing it in the near term (notwithstanding that the financial asset may have been acquired or incurred principally for the purpose of selling or repurchasing it in the near term), reclassify that financial asset out of the fair value through profit or loss category if the requirements in paragraph 50B or 50D are met. An entity shall not reclassify any financial instrument into the fair value through profit or loss category after initial recognition. 50B:- A financial asset to which paragraph 50(c) applies (except a financial asset of the type described in paragraph 50D) may be reclassified out of the fair value through profit or loss category only in rare circumstances. 50C:- If an entity reclassifies a financial asset out of the fair value through profit or loss category in accordance with paragraph 50B, the financial asset shall be reclassified at its fair value on the date of reclassification. Any gain or loss already recognised in profit or loss shall not be reversed. The fair value of the financial asset on the date of reclassification becomes its new cost or amortised cost, as applicable. 50D:- A financial asset to which paragraph 50(c) applies that would have met the definition of loans and receivables (if the financial asset had not been required to be classified as held for trading at initial recognition) may be reclassified out of the fair value through profit or loss category if the entity has the intention and ability to hold the financial asset for the foreseeable future or until maturity. 50E:- A financial

asset classified as available for sale that would have met the definition of loans and receivables (if it had not been designated as available for sale) may be reclassified out of the available-for-sale category to the loans and receivables category if the entity has the intention and ability to hold the financial asset for the foreseeable future or until maturity. 50F:- If an entity reclassifies a financial asset out of the fair value through profit or loss category in accordance with paragraph 50D or out of the available-for-sale category in accordance with paragraph 50E, it shall reclassify the financial asset at its fair value on the date of reclassification. For a financial asset reclassified in accordance with paragraph 50D, any gain or loss already recognised in profit or loss shall not be reversed. The fair value of the financial asset on the date of reclassification becomes its new cost or amortised cost, as applicable. For a financial asset reclassified out of the available-for-sale category in accordance with paragraph 50E, any previous gain or loss on that asset that has been recognized in other comprehensive income in accordance with paragraph 55(b) shall be accounted for in accordance with paragraph 54. Effective date and transition:- Reclassification of Financial Assets (Amendments to IAS 39 and IFRS 7), issued in October 2008, amended paragraphs 50 and AG8, and added paragraphs 50B–50F. An entity shall apply those amendments from 2008-July-01. An entity shall not reclassify a financial asset in accordance with paragraph 50B, 50D or 50E before 2008-July-01. Any reclassification of a financial asset made in periods beginning on or after 2008-November-01 shall take effect only from the date when the reclassification is made. Any reclassification of a financial asset in accordance with paragraph 50B, 50D or 50E shall not be applied retrospectively to reporting periods ended before the effective date set out in this paragraph. Effective interest rate:- if an entity revises its estimates of payments or receipts, the entity shall adjust the carrying amount of the financial asset or financial liability (or group of financial instruments) to reflect actual and revised estimated cash flows. The entity recalculates the carrying amount by computing the present value of estimated future cash flows at the financial instrument's original effective interest rate. The adjustment is recognised as income or expense in profit or loss. If a financial asset is reclassified in accordance with paragraph 50B, 50D or 50E, and the entity subsequently increases its estimates of future cash receipts as a result of increased recoverability of those cash receipts, the effect of that increase shall be recognised as an adjustment to the effective interest rate from the date of the change in estimate rather than as an adjustment to the carrying amount of the asset at the date of the change in estimate. Amendments to IFRS 7:- Significance of financial instruments for financial position and performance:- Statement of financial position:- Reclassification:- 12:- If the entity has reclassified a financial asset (in accordance with paragraphs 51–54 of IAS 39) as one measured:- (a) at cost or amortised cost, rather than fair value; or (b) at fair value, rather than at cost or amortised cost, it shall disclose the amount reclassified into and out of each category and the reason for that reclassification. 12A:- If the entity has reclassified a financial asset out of the fair value through profit or loss category in accordance with paragraph 50B or 50D of IAS 39 or out of the available-for-sale category in accordance with paragraph 50E of IAS 39, it shall disclose:- (a) the amount reclassified into and out of each category; (b) for each reporting period until derecognition, the carrying amounts and fair values of all financial assets that have been reclassified in the current and previous reporting periods; (c) if a financial asset was reclassified in accordance with paragraph 50B, the rare situation, and the facts and circumstances indicating that the situation was rare; (d) for the reporting period when the financial asset was reclassified, the fair value gain or loss on the financial asset recognized in profit or loss or other comprehensive income in that reporting period and in the previous reporting period; (e) for each reporting period following the reclassification (including the reporting period in which the financial asset was reclassified) until derecognition of the financial asset, the fair value gain or loss that would have been recognised in profit or loss or other comprehensive income if the financial asset had not been reclassified, and the gain, loss, income and expense recognised in profit or loss; and (f) the effective interest rate and estimated amounts of cash flows the entity expects to recover, as at the date of reclassification of the financial asset. Effective date and transition:- Reclassification of Financial Assets (Amendments to IAS 39 and IFRS 7), issued in October 2008, amended paragraph 12 and added paragraph 12A. An entity shall apply those amendments from 2008-July-01. / МСБУ 39 (сокращение для Международного Стандарта Бухгалтерского Учёта № 39) – .

RECLINATE = ОТКЛОНЁННОЕ НАЗАД – Reclinate:- curved backwards.

RECLINING = НАКЛОННОЕ (или НЕПЕРПЕНДИКУЛЯРНОЕ) – Reclining:- sprawling on the ground or leaning against something.

RECOGNISED ACTUARIAL PRACTICE = ПРИЗНАВАЕМАЯ АКТУАРНАЯ ПРАКТИКА – Recognised Actuarial Practice is a practice or practices that are generally recognized within the actuarial profession as appropriate to complete professional services under an International Actuarial Standard of Practice (IASP) or the applicable professional standards of practice adopted by the IAA member organization in the applicable reporting jurisdiction.

RECOMBER NOIL = ОЧЁС ПОСЛЕ ПОВТОРНОГО ГРЕБНЕЧЕСАНИЯ – Recomber Noil:- the shorter staple fibers obtained in a recombing treatment; as many as five recombings may be used and each successive combing will produce some fibers which are not of the desired staple length needed for manipulation into finished, spun yarn.

RECOMBINANT = РЕКОМБИНАНТ – Recombinant is one of the progeny formed as a result of genetic recombination.

RECOMBINANT DNA = РЕКОМБИНАНТНАЯ ДНК – Recombinant DNA is a DNA molecule composed of segments from different individuals or Species and formed by a combination of in vitro and in vivo manipulations, typically in Bacteria. Genetically engineered DNA brings together new combinations of genes not found in nature.

RECOMBINANT DNA TECHNOLOGY = ТЕХНОЛОГИЯ РЕКОМБИНАНТНЫХ ДНК – Recombinant DNA Technology (syn. gene cloning, plasmid engineering, genetic engineering, biotechnology, gene therapy). The techniques by which genetic recombination is carried out in vitro and in vivo. It entails the breakage and rejoining of DNA molecules from different organisms and the production and isolation of the modified DNA or fragments thereof.

RECOMBINANT INBRED LINES = РЕКОМБИНАНТНЫЕ ИНБРЕДНЫЕ ЛИНИИ (или РЕКОМБИНАНТНЫЕ ИНЦУХТИРОВАННЫЕ ЛИНИИ) – Recombinant Inbred Lines (RIL):- used for mapping purposes. They are the product of an initial cross between two parent lines and the subsequent selfing to produce homozygous lines. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

RECOMBINATION = РЕКОМБИНАЦИЯ – Recombination is a formation of new combinations of genes by genetic exchange as a result of crossing over in the heterozygous genotypes. The natural process of exchanging DNA fragments between different DNA molecules. Occurs in both prokaryotes and eukaryotes, but by slightly different process. Eukaryotic recombination occurs predominantly during meiosis and gives rise to gametes of nonparental gene combinations. / В генетике под Рекомбинацией, от Латинских слов Re, приставка, указывающая:- (i) на повторное, возобновляемое действие; или (ii) на противоположное, обратное действие, противодействие, например, реабсорбция, и Combinatio, означающее Соединение, понимается появление новых сочетаний генов, ведущих к новым сочетаниям признаков у потомства. У высших организмов рекомбинация осуществляется при независимом расхождении хромосом в мейозе, при обмене участками гомологичных (парных) хромосом – кроссинговере; у многих микроорганизмов – в результате обмена участками молекул нуклеиновых кислот.

RECOMBINATION FREQUENCY = ЧАСТОТА РЕКОМБИНАЦИИ – Recombination Frequency is a number of recombinants in the total progeny, computed as a measure of the distance between loci on a genetic map that is equal to the number of recombinants out of the total number of progeny.

RECOMMENDATION = РЕКОМЕНДАЦИЯ – Recommendation (crop production) is an advice in terms of operations, times, equipment, and materials for crop production, presented as worthy of acceptance. / Под Рекомендацией, от позднелатинского слова Recommendatio, понимается:- (1) письменный или устный благоприятный отзыв. (2) Совет, указание.

RECOMMENDED PRACTICE = РЕКОМЕНДУЕМАЯ ПРАКТИКА – Recommended Practice:- a class 3 International Actuarial Standard of Practice (IASP). Actuaries would be expected to follow a recommended practice unless there was a sound and defensible reason for not doing so. Actuaries who do not follow the recommended practice should be prepared to give good account as to why it was felt appropriate not to follow the standard and should disclose the material aspects where they have departed from it. A Member Association may choose to raise the recommended practice to a stronger form of standard in the local context.

RECOMMENDED RATE = РЕКОМЕНДОВАННАЯ СТАВКА – Recommended Rate is the amount of fertilizer materials required for application to a field expressed in kilograms nitrogen (N), phosphoric acid (P_2O_5) and potash (K_2O) per hectare or number of bags of FM (short for the fertilizer material) per hectare.

RECOMMENDED VARIETY = РЕКОМЕНДОВАННАЯ РАЗНОВИДНОСТЬ – Recommended Variety is the Variety that has the desirable traits and attributes for a particular environment and can be expected to produce and grow well in that environment, recommended by competent authority/agency for cultivation in that environment.

RECONCILED BILL OF LADING = СВЕРОЧНЫЙ КОНОСАМЕНТ – Reconciled Bill Of Lading (B/L) is the B/L set which has completed a prescribed number of edits between the shippers instructions and the actual shipment received. This produces a very accurate B/L.

RECONCILIATION OF MOVEMENTS IN SHAREHOLDERS' FUNDS = ВЫВЕРКА ИЗМЕНЕНИЙ В ФОНДАХ АКЦИОНЕРОВ – Reconciliation Of Movements In Shareholders' Funds:- in the United Kingdom, this statement overlaps somewhat with the statement of total recognised gains and losses (STRGL), because naturally everything in the STRGL affects shareholders' funds and therefore has to appear in this reconciliation. However, it also includes issues or redemptions of shares during the year. The information in the reconciliation could be picked up from the company's balance sheet, but it is convenient to have a separate statement summarising the movements. Also known as Statement Of Changes In Stockholders' Equity in the United States. Reconciliation Of Movements in Shareholders' Funds is a financial statement bringing together the performance of an organization in a financial period, as shown in the statement of total recognized gains and losses , ... Shareholders Fund is equity plus accumulated profits. Reconciliation is the adjusting of the difference between two items (e.g., balances, amounts, statements, or accounts) so that the figures are in agreement. Often the reasons for the differences must be explained. One example would be reconciling a checking account (bringing the checking ledger and bank balance statement into agreement). Reconciliation is an adjustment of an account, such as an individual's own record of a bank account, to match more authoritative information. / строка баланса (item).

RECONDITIONING = ПРИВЕДЕНИЕ В ИСПРАВНОЕ СОСТОЯНИЕ (или ВОССТАНОВЛЕНИЕ) – Reconditioning:- all activities connected with restoring and or adjusting the packaging of a product. In such manner that it can be presented to the customer in the requested form.

RECONSIGNMENT = ПЕРЕАДРЕСАЦИЯ – Reconsignment is the act of changing the original bill of lading as to consignee before cargo is tendered for delivery. Changing the destination or consignee of a shipment while it is in transit. Changing the consignee or destination on a bill of lading while shipment is still in transit. Diversion has substantially the same meaning. / до того как груз будет передан для участия в конкурсе для поставки.

RECONSTITUTED FIBERS = ВОССОЗДАННЫЕ ВОЛОКНА – Reconstituted Fibers are fibers made from recovered waste polymer or blends of virgin polymer and recovered waste polymer.

RECONVERTING BANK = РЕКОНВЕРТИРУЮЩИЙ БАНК – The term 'Reconverting Bank' means:- (i) the bank that creates a substitute check; or (ii) if a substitute check is created by a person other than a bank, the first bank that transfers or presents such substitute check.

RECORD = ЗАПИСЬ – Record:- a string of bytes which is retrieved as a whole from the card and referenced by a record number.

RECORDATION FORM COVER SHEET = ТИТУЛЬНЫЙ ЛИСТ ФОРМЫ ПРОТОКОЛИРОВАНИЯ – Recordation Form Cover Sheet:- the United States Patent and Trademark Office (USPTO) form that trademark owners use to record trademark assignments (changes in ownership of marks for applications and registrations) and a trademark owner's change of entity name. The form is PTO-TM-1594. It may be submitted in hard copy to the following address:- Mail Stop Assignment Recordation Services, Director of the US Patent and Trademark Office, PO Box 1450, Alexandria, VA 22313-1450 The United States. Locate the current fee schedule at How to Pay Fees to determine the current fee for assignment recordation (Trademark Services Fee Code 8521).

RECORD COPY = ЭКЗЕМПЛЯР (или КОПИЯ) ЗАПИСИ – Record Copy is an original copy of an international application filed under the Patent Cooperation Treaty maintained by the International Bureau of the World Intellectual Property Organization (WIPO).

RECORD DATE = ДАТА РЕГИСТРАЦИИ (или ДАТА ЗАПИСИ) – Record Date is the date on which an investor must be a registered owner of a company's stock to be entitled to the dividend. The record date is generally 15–20 days prior to the payable date. The board of directors announces the record and payable dates and the dividend rate on the declaration date. The date on which investors must be registered as shareholders of a company in order to receive a declared dividend or, among other things, to vote on company affairs. See also Ex-Dividend, and Transfer. Record Date is the date for determining the shareholders entitled to vote at a meeting, receive dividends, or participate in any corporate action. The date on which the shareholder must officially own the security in order to be entitled to the dividend. After the record date, the security is exdividend.

RECORD NUMBER = НОМЕР ЗАПИСИ – Record Number is a sequential number assigned to each record, which uniquely identifies the record within its elementary file (EF). / Последовательный номер, присваиваемый каждой записи, который в единственном роде идентифицирует запись внутри элементарного файла (ЭФ).

RECOURSE = РЕГРЕСС (или РЕГРЕССНЫЙ ИСК, или ОБРАТНОЕ ТРЕБОВАНИЕ) – Recourse defines the rights of a holder in due course of a negotiable instrument to force prior endorsers to meet their legal obligations by making payment on the instrument if it is dishonored by the maker, drawee or acceptor. A right claim against the guarantors of a loan or draft or bill of exchange. The right of a person to whom a bill of exchange, check, note or other negotiable instrument has been endorsed to recover payment from the endorser if the original borrower defaults. / Под Регрессом, от Латинского слова Regressus, означающее Обратное Движение,

понимается . Регрессный Иск или Обратное Требование, требование лица, исполнившего обязательство за должника либо за какое-либо другое лицо, о возмещении уплаченной денежной суммы. Например, в страховании лицо, ответственное за причинённый вред, обязано по регрессному иску страховой компании возместить выплаченные застрахованному лицу денежные суммы.

RECOVERABLE RESOURCES = ИЗВЛЕКАЕМЫЕ РЕСУРСЫ – Recoverable Resources:- hydrocarbon reserves that can be produced with current technology including those not economical to produce at present. In oil and gas industry, the portion of a field's total estimate reserves that can actually be recovered from the field using currently available technology. Recoverable reserve estimates are dependent on factors such as reservoir pressure and the density of strata. / Все те ресурсы углеводородов, которые могут быть извлечены с помощью текущих технологий, и включающие все те, которые в настоящий момент времени весьма затратны с точки зрения их извлечения. В нефтегазовой отрасли, часть совокупных расчётных запасов месторождения, которая может быть фактически извлечена из месторождения с применением существующих в настоящее время технологий. Показатель извлекаемых запасов зависит от таких факторов, как давление в продуктивном пласте и плотность залегания пластов.

RECOVERIES = ВОЗВРАТЫ – Recoveries means check losses that were written off by the bank but subsequently recouped. Write offs do not include checks that are immediately charged back to a customer's account that has funds to cover the loss.

RECOVERY = ВОЗМЕЩЕНИЕ – Recovery:- money received by an insurer in respect of a loss, thus reducing the loss, by way of subrogation, salvage or reinsurance. In insurance, an amount recovered from a third party responsible for a loss on which a claim has been paid. / В страховании под Возмещением понимается сумма, взысканная с третьей стороны, ответственной за убыток, претензия по которому была оплачена.

RECOVERY = ВОССТАНОВЛЕНИЕ – (1) Recovery is a capacity of a material or construction to return to its original position (elastic deformation). See also Elastic Recovery. / Смотрите также Упругое Восстановление (Elastic Recovery).

(2) Recovery is an upward price movement after a decline. Also known as Rally. Usually describes a price advance following a decline. Recovery is an advance in prices following a decline. / Обычно описывает процесс повышения цены вслед за её падением.

(3) Recovery:- Plants that have the ability to grow after being exposed to unfavorable seasonal conditions or after being attacked by pest or disease.

(4) Recovery is the ability of a fabric to return to its original shape after being stretched. This term is used most often in reference to stretch fabrics. A quality stretch fabric will recover promptly. Recovery may also be used in reference to knit fabrics because they have varying amounts of stretchability.

RECREATIONAL SURFACES = РЕКРЕАЦИОНАЛЬНЫЕ ПОВЕРХНОСТИ (или ПОВЕРХНОСТИ ДЛЯ РАЗВЛЕЧЕНИЯ или ОТДЫХА) – Recreational Surfaces are the manufactured surfaces providing consistent properties, durability, and special characteristics as needed for the specific application. Included are artificial turf, pool decks, indoor-outdoor carpeting, tennis court surfaces, etc. Most types of constructions (knit, woven, tufted, and nonwoven), and most polymer types find use in this market. The polyolefins are particularly prominent in these applications.

RE–CROPPING INTERVAL = ИНТЕРВАЛ МЕЖДУ ПОВТОРНЫМ ВОЗДЕЛЫВАНИЕМ – Re-Cropping Interval is a period of time between crops (particularly related to time after residual herbicide use).

RECRYSTALLIZATION = РЕКРИСТАЛЛИЗАЦИЯ – Recrystallization:- if meat is frozen rapidly at low temperatures (e.g., –27 °C), small ice crystals are produced. If the meat rises to a higher temperature (e.g., –10 °C), the ice crystals grow larger, i.e. they recrystallize. As of a certain size, they can rupture the cell walls of the meat. These 'perforated' cell walls lose substantially more cell juices than cell walls which are not damaged. The result is a loss of juice, also known as 'Drip Loss'. / Рекристаллизация, процесс образования и роста (или только роста) одних кристаллических зёрен (кристаллитов) поликристалла за счёт других той же фазы. Скорость рекристаллизации резко (экспоненциально) возрастает с повышением температуры. Рекристаллизация протекает особенно интенсивно в пластически деформированных материалах. При этом различают 3 стадии рекристаллизации:- (i) первичную, когда в деформированном материале образуются новые неискажённые кристаллиты, которые растут, поглощая зёрна, искажённые деформацией, (ii) собирательную – неискажённые зёрна растут за счёт друг друга, вследствие чего средняя величина зерна увеличивается, и (iii) вторичную рекристаллизацию, которая отличается от собирательной тем, что способностью к росту обладают только немногие из неискажённых зёрен. В ходе вторичной рекристаллизации структура характеризуется различными размерами зёрен (разнозернистость). Рекристаллизация устраняет структурные дефекты, изменяет размеры зёрен и может изменить их кристаллографическую ориентацию (текстуру). Рекристаллизация переводит вещество в состояние с большей термодинамической устойчивостью:- при первичной рекристаллизации – за счёт уменьшения искажений, внесённых деформацией, при собирательной и вторичной рекристаллизации – за счёт уменьшения суммарной поверхности границ между зёрнами. Рекристаллизация изменяет все структурно-чувствительные свойства деформированного материала и часто восстанавливает исходные структуру, текстуру и свойства (до деформации). Иногда структура и текстура после рекристаллизации отличаются от исходных, соответственно отличаются и свойства. Рекристаллизация широко используется в технологии металлов и сплавов для управления формой зёрен, их размерами, текстурой и свойствами.

REC/SPEC = RENEWABLE ENERGY CREDIT/SOLAR RENEWABLE ENERGY CREDIT

RECTANGLE = ПРЯМОУГОЛЬНИК – Rectangle is a continuation chart pattern where prices move sideways between two different levels for a period of time and then continue moving in the direction of the previous trend. A sideways trading pattern where the market consolidates. Two horizontal trendlines can be drawn parallel to each other over the tops of the market resistance and the bottoms of market support. / В техническом анализе биржевых рынков .

RECTISPINUS = С ПРЯМЫМИ ШИПАМИ (или РЭКТИСПИНУС) – Rectispinus:- with straight spines. / , от Латинского слова Rectus, означающее Простой или Прямой, .

RECURRENT PARENT = РЕКУРРЕНТНЫЙ РОДИТЕЛЬ (или РОДИТЕЛЬСКАЯ ФОРМА, С КОТОРОЙ ГИБРИД СКРЕЩИВАЕТСЯ ВНОВЬ) – Recurrent Parent is the parent to which successive backcrosses are made in backcross breeding. / Родительская форма, с которой гибрид скрещивается вновь. Под Рекуррентным Родителем, от Латинского слова Recurrens, родительный падеж Recurrentis, означающее Возвращающийся, понимается .

RECURRENT SELECTION = РЕКУРРЕНТНАЯ СЕЛЕКЦИЯ (или ПЕРИОДИЧЕСКАЯ СЕЛЕКЦИЯ, или ВОЗВРАТНАЯ СЕЛЕКЦИЯ) – Recurrent Selection is a method of breeding designed to concentrate favorable genes scattered among a number of

individuals. / Под Рекуррентной Селекцией, от Латинского слова Recurrens, родительный падеж Recurrentis, означающее Возвращающийся, понимается .

RECURRING STORAGE = ПОВТОРЯЮЩЕЕСЯ ХРАНЕНИЕ – Recurring Storage:- an amount charged to a client for monthly storage; it is based on the amount of product stored in the warehouse on the first day of the month or specified by the contract.

RECURVED = ПОНИКАЮЩЕЕ (или ЗАКРИВЛЁННОЕ, или СОГНУТОЕ ВНИЗ, или ОТОГНУТОЕ НАЗАД) – Recurved:- bent, curved or curled downwards or backwards. Recurved:- bent backward. / Например, серёжка – колосовидное соцветие на поникающей оси.

RECYCLED FIBER = РЕЦИРКУЛИРОВАННОЕ (или РЕЦИКЛИРОВАННОЕ) ВОЛОКНО (или ВТОРИЧНО ПЕРЕРАБОТАННОЕ ВОЛОКНО) – Recycled Fiber spun into useable yarn count to create a casual look. See also Reclaimed Textile Fibers, Reprocessed Fiber, and Reused Fiber. Manufacturers incorporate recycled fiber in their products.

RECYCLING = XX – Recycling:- a pallet, container or reel that has been used, discarded, salvaged, repaired and which passes through a cycle again.

RED = REFUNDING ESCROW DEPOSIT

RED = RENEWABLE ENERGY DIRECTIVE

RED = КРАСНОЕ – Red:- a color whose hue resembles that of blood or of the ruby or is that of the long-wave extreme of the visible spectrum.

REDACTED PUBLICATION = ОТРЕДАКТИРОВАННАЯ ПУБЛИКАЦИЯ – Redacted Publication:- a patent application publication that omits material that was present in the specification or claims of the nonprovisional patent application filed in the United States Patent and Trademark Office (USPTO).

RED CROSS SCHEME = СХЕМА С КРАСНЫМ КРЕСТОМ – Red Cross Scheme:- this is a scheme that uses a charitable entity to disguise a transfer of funds offshore. For example, USD1 000 000.00 is donated to a charitable organization. The charitable organization then remits a portion of the 'donation' to an account offshore and retains a portion of the initial donation. The orchestrator takes a USD1 000 000.00 donation and also has the benefit of transferring a portion of the 'donation' to the orchestrator's offshore account.

REDDENING OF BLUE DRESS = ПОКРАСНЕНИЕ СИНЕГО ПЛАТЬЯ – Reddening Of Blue Dress:- Garment:- blue taffeta dress; Fabric Construction:- (i) Count:- 200 x 64; (ii) Warp:- 100/40 bright acetate rayon; (iii) Filling:- same as warp. Complaint:- the dress turned reddish in shade in various areas. Analysis:- from a general examination it was evident that this defect was due to so-called 'Gas Fading'. Many acetate dyestuffs, particularly some blues and mixtures containing those blues, are subject to change, generally to a reddish shade, when exposed to certain atmospheric gases present in varying amounts in almost any locality. Considerable progress has been made in the development of special dyestuffs which are resistant to gas fading and to the introduction of chemical inhibitors which, if properly applied, eliminate or reduce to a minimum the tendency to gas-fade. When certain dyers exercise extreme care in dyestuff selection and in the application of inhibitors and subject representative dye lots to constant testing, they have offered guarantees against gas fading, usually charging a premium for this extra quality of performance. Other dyers and finishers, as well as converters, will merely guarantee the use of selected colors or inhibitors, also check-testing the dyed goods regularly; but they do not assume responsibility if any complaints arise. / Уточина:- такая же как основа.

REDDING OF SHIRT COLLAR = ПОКРАСНЕНИЕ РУБАШЕЧНОГО ВОРОТНИЧКА – Redding Of Shirt Collar:- Garment:- man's new tan sport shirt; Fabric Construction:- (i) Count:- 120 x 54: (ii) Warp:- 120/40 dull acetate rayon; (iii) Filling:- 18/1 50% 2-in. 3-den. dull viscose rayon 50% 2-in. 3-den. dull acetate rayon. Complaint:- collar points turned reddish before shirt was worn. Analysis:- inspection showed that the slight change in shade was confined to those sections of the collar where the plastic collar stays had been inserted. It was found in laboratory tests that the tan color of the shirting could be made to redden slightly by exposure to nitric oxide. The collar stays had a marked odor, and it was assumed that the color change was caused by some decomposition of the celluloid stays after they had been in contact with the shirt and was not to be accounted for through any fault of the fabric or the dyestuff. The shirt manufacturer later advised that this finding was evidently correct since he made up a number of garments from the same lot of fabric but used a different lot of stays and had no further complaints. / Уточина:- 18/1 .

REDDISH = КРАСНОВАТОЕ – Reddish:- tinged with red.

REDEEMABLE SHARES = ВЫКУПАЕМЫЕ АКЦИИ (или АКЦИИ С ОБРАТНЫМ ВЫКУПОМ) – In the United Kingdom, Redeemable Shares come with an agreement that the company can buy them back at a future date – this can be at a fixed date or at the choice of the business. A company cannot issue only redeemable shares. See also Cumulative Preference Shares, Ordinary Shares, Preference Shares, and Shares. In the United States, Redeemable Shares are shares subject to purchase by the corporation on terms set forth in the articles of incorporation.

REDELIVERY = ПЕРЕОТПРАВКА (или ВОЗВРАТ) – Redelivery is a return of a shipment to the party who originally delivered it to the carrier (aircargo). Return of a charter vessel or equipment to the owners. / В перевозках авиационных грузов .

REDEMPTION = ВЫКУП (или ПОГАШЕНИЕ, или ИЗЪЯТИЕ) – Redemption is a repayment of a debt owed to the creditor. Repayments can be made in equal instalments (annuity), in varying instalments or in a lump sum. The term applies to bond and loan repayments. In securities trading, bonds (fixed-income securities such as bonds or medium-term notes) are redeemed by the borrower in accordance with the terms of issue for the respective security. Paying off or cancelling of a debt. 'Redemption' and 'Payment' are used interchangeably and refer to the payment of what a bond or note is worth in cash (currency) or via check or credit to an account as requested by the bond's owner or co-owner or by a person legally entitled to make such a request according to governing regulations and law. Repayment of an outstanding loan or debenture stock by the borrower. Maturity of a debt security when the nominal value becomes due and payable to the holder. Types of redemptions include maturities, calls, and sinking fund redemptions. Redemptions may be partial. Redemption also referred to as Withdrawals. Redemption is the return to an investor of the capital value of a bond or other security. Redemption may take place on a fixed date or on one of a series of specified dates. The bond may include an option for the borrower to choose the date or for the lender to choose. The capital amount repaid may be fixed or index-linked. / Выкуп – выплата (repayment) долга, причитающегося кредитору. Выплаты могут производиться равными частями (аннуитет), различными частями или единовременно в виде сводной суммы. Термин применяется к выплатам по облигациям и займам. При торговле ценными бумагами, облигации (ценные бумаги с фиксированным доходом, такие как облигации или среднесрочные ноты (или билеты)) выкупаются заёмщиком в соответствии с порядками выпуска соответствующей ценной бумаги. Выкуп – расплата или аннулирование долга. Выкуп или Оплата (Payment) используются взаимозаменяемо и относятся

к оплате суммы, в которую оценивается облигация или нота наличными (валюта) или посредством чека или кредита на счёт, как это будет запрошено владельцем облигации или совладельцем или лицом, юридически правомочным подавать такой запрос в соответствии с действующими предписаниями и законодательством. Выкуп – выплата заёмщиком невыплаченного займа или ценной бумаги, представляющей собой долговое обязательство. Выкуп – погашение долговой ценной бумаги, когда номинальная стоимость становится должной и уплачиваемой держателю. Типы выкупа включают погашения (maturities), покупки (calls) и выкупы вложенных фондов. Выкупы могут быть частичными. Выкуп относится также к Отзывам (Withdrawals). Выкуп – отдача вкладчику капитальной стоимости облигации или иной ценной бумаги. Выкуп может иметь место на фиксированную дату или в одну из серий указанных дат. Облигация может включать возможность для заёмщика или для ссудодателя выбирать дату. Уплачиваемая сумма капитала может быть фиксированной или увязанной к индексу.

REDEMPTION BY THE DRAWING OF LOTS = ВЫКУП (или ПОГАШЕНИЕ) РАСПИСЫВАНИЕМ (или ЗАИМСТВОВАНИЕМ) ЛОТОВ – Redemption By The Drawing Of Lots is one of the ways in which bonds are redeemed. In this case, there is no single fixed redemption date. Instead, the borrower redeems the bond in regular lots or instalments, mostly after several redemption-free years have elapsed, but still within the term. The numbers to be redeemed are determined by drawing as in a lottery. The serial letters or final digits of the bonds are usually taken to designate the lots. Redemption also referred to as Withdrawals.

REDEMPTION DATE = ДАТА ВЫКУПА (или ДАТА ПОГАШЕНИЯ, или ДАТА ИЗЪЯТИЯ) – Redemption Date is the date when the stock/security is redeemed or paid out in cash to the investor.

REDEMPTION GRACE PERIOD = БЕСПЛАТНЫЙ ПЕРИОД ВЫКУПА (или БЕСПЛАТНЫЙ ПЕРИОД ИЗЪЯТИЯ) – Redemption Grace Period (RGP):- problems and complaints relating to deletion of domain-name registrations are very common. Businesses and consumers are losing the rights to their domain names through registration deletions caused by mistake, inadvertence, or fraud. Current procedures for correcting these mistakes have proven inadequate. To move toward a solution to these problems Internet Corporation for Assigned Names and Numbers (ICANN) developed the RGP. How It Works:- now, the 'delete' of a domain name (whether inside or outside of any applicable grace period) will result in a 30-day Deleted Name Redemption Grace Period. This grace period will allow the domain name registrant, registrar, and/or registry time to detect and correct any mistaken deletions. During this 30-day period, the deleted name will be placed on REGISTRY-HOLD, which will cause the name to be removed from the zone. (The domain name will not function/resolve.) This feature will help ensure notice to the registrant that the name is subject to deletion at the end of the RGP, even if the contact data the registrar has for the registrant is no longer accurate. During the Redemption Grace Period, registrants can redeem their registrations through registrars. Registrars would redeem the name in the registry for the original registrant by paying renewal fees, plus a service charge, to the registry operator. Any party requesting redemption would be required to prove its identity as the original registrant of the name. After the 30-day period when the domain name can be redeemed, there is a 5-day period when the domain essentially is pending deletion. This timeframe is implemented to facilitate notice to all registrars before a domain is finally deleted. / Бесплатный Период Изъятия (БПИ (RGP)) или Период Отсрочки Аннулирования Регистрации Имени Домена:- проблемы и жалобы, относящиеся к удалению регистрации доменного имени, довольно часты. Физические и юридические лица теряют право на доменное имя из-за удаления регистрации, вызванного ошибкой, небрежностью или обманом. Процедуры по исправлению этих ошибок, действующие в данный момент, оказались неэффективными. Для разрешения этих проблем КИРИН разработала механизм использования RGP. Он функционирует следующим образом:- теперь 'удаление' доменного имени (в пределах или за пределами любого льготного периода) приведёт к 30-дневному периоду отсрочки аннулирования регистрации имени домена. Этот льготный период предоставит владельцам регистрации, регистраторам и (или) реестрам время для обнаружения и исправления любых ошибочных операций удаления. На время этого 30-дневного периода, удалённое имя будет переведено в состояние REGISTRY-HOLD, что приведёт к удалению имени из зоны. (Доменное имя не будет функционировать, а его разрешение в IP-адрес станет невозможным.) Даже в том случае, когда имеющиеся у регистратора контактные данные данного владельца регистрации неточны, данная функция поможет обратить внимание владельца регистрации на то, что имя подлежит удалению по истечении периода RGP. Во время периода отсрочки аннулирования регистрации имени домена владельцы регистрации могут восстановить регистрацию через регистратора. Регистраторы восстановят имя в реестре для владельца регистрации посредством оплаты за продление срока регистрации и услуги оператора реестра. Любой запрос на отсрочку аннулирования регистрации будет требовать идентификации личности владельца регистрации имени. После 30-дневного периода возможного восстановления доменного имени будет предоставлен 5-дневный период, во время которого домен ожидает удаления. Эти временные рамки были введены, чтобы помочь всем регистраторам заметить, что домен подлежит удалению, пока он не удалён окончательно.

REDEMPTION PRICE = ЦЕНА ВЫКУПА (или ЦЕНА ПОГАШЕНИЯ, или ЦЕНА ИЗЪЯТИЯ) – (1) Redemption Price is a price at which mutual fund shares are redeemed by mutal fund companies. The redemption price is calculated from the net asset value of the fund assets divided by the number of fund shares outstanding. The difference between the Redemption Price and the Issue Price is the front-end load. Redemption also referred to as Withdrawals. Redemption Price is the price at which forms of indebtedness, e.g., bills of exchange or bonds may be redeemed before maturity, at the option of the issuing company. Redemption value also applies to the price the company must pay to call in certain types of preferred stock. See also Callable.

(2) Redemption Price (R) or Redeemable At (100 + k)%:- means that £N nominal of the stock/security is paid back as a cash amount £C equal to £N*R or equivalently £N*(100+k)/100. A stock redeemable at 105% means you get back £1.05 for every £1 of nominal. In that case R = 1.05 and k = 5.

REDEMPTION YIELD = ДОХОДНОСТЬ ПРИ ВЫКУПЕ (или ДОХОДНОСТЬ ПРИ ПОГАШЕНИИ) – Redemption Yield:- the internal rate of return or, equivalently, the money weighted rate of return to an investor buying the stock.

REDEMPTION YIELD/GROSS REDEMPTION YIELD = ДОХОДНОСТЬ ПРИ ВЫКУПЕ (или ПОГАШЕНИИ)/БРУТТО ДОХОДНОСТЬ ПРИ ВЫКУПЕ (или ПОГАШЕНИИ) – Redemption Yield/Gross Redemption Yield:- the gross redemption yield (the word Gross is often omitted), or yield to maturity, is the rate of return at which the discounted value of all future payments of interest and capital is equal to the 'dirty' price of the bond. The net redemption yield allows for taxation of the amounts received by the investor.

RED HERRING = КРАСНАЯ СЕЛЁДКА (или ПРЕДВАРИТЕЛЬНЫЙ ПРОСПЕКТ ЭМИССИИ, или ОТВЛЕКАЮЩИЙ МАНЁВР) – Red Herring:- on Wall Street, an initial prospectus for a share issue, circulated before the price has been fixed and the issue has been ratified by the appropriate regulating authority. In the United States, a preliminary registration statement that must be filed with the Securities and Exchange Commission (SEC) describing a new issue of stock (Initial Public Offering (IPO)) and the prospects of the issuing company. There is no price or issue size stated in the red herring, and it is sometimes updated several times before being called the final prospectus. It is known as a Red Herring because it contains a passage in red that states the company is not attempting to sell their shares before the registration is approved by the SEC. See also Prospectus. / Вол Стрит (Wall Street).

REDINGOTE = РЭДИНГОТ (или СЮРТУК) – Redingote is a fitted outer garment such as a double-breasted coat with wide flat cuffs and collar worn by XVIII century men; a woman's lightweight coat open at the front; a dress with a front gore of contrasting material. / двубортный пиджак или пальто. Дамское платье в талию.

REDISCOUNT = ПЕРЕУЧЁТ (или ПОВТОРНОЕ ДИСКОНТИРОВАНИЕ) – Rediscount:- literally to discount again. To sell or discount a negotiable instrument which has already been discounted once. For example, the Swiss commercial banks are able to rediscount bills which they have already discounted at the Swiss National Bank.

REDISTRIBUTION = ПЕРЕРАСПРЕДЕЛЕНИЕ – Redistribution (water) is the process of soil water movement to achieve an equilibrium energy state throughout the soil profile.

RED KERNELS = КРАСНАЯ ЗЕРНОВКА (или КРАСНЫЕ ЯДРА) – Red Kernels mean brown Rice kernels that have red bran covering the kernels wholly or partly. / К Красной Зерновке (Красным Ядрам) относятся ядра бурого Риса, целиком или частично покрытые семенными и плодовыми оболочками (после снятия цветковых плёнок), имеющими окраску от розовой с коричневым или серым оттенками до красной или буро-коричневой с красным оттенком. Красная Зерновка или Красные Ядра:- это примеси Риса особого сорта с красными плодовыми оболочками. Такой Рис съедобен, но считается, что он ухудшает качество крупы. Её труднее обрабатывать – нужна более сильная шлифовка, чтобы удалить оболочку. Именно она часто остаётся в виде красноватых или коричневых полосок и точек на зёрнышках. Разрешается, чтобы таких полос было не более одной или чтобы они занимали не менее четверти поверхности зерна. Для здоровья такая примесь не опасна.

RED LABEL = КРАСНЫЙ ЯРЛЫК – Red Label is a label required on shipments of flammable articles. / Ярлык или знак опасности, требуемый при отправках легко воспламеняющихся изделий.

REDLINING = РАЗГРАНИЧЕНИЕ КРАСНЫМ ЦВЕТОМ – In the United States, Redlining is a practice in which certain areas of a community are eliminated from eligibility for mortgages or other loans, either intentionally or unintentionally, allegedly because the area is considered a poor investment risk.

RED RICE = КРАСНЫЙ РИС – Red Rice, Oryza Sativa is an annual grass, adapted to an aquatic habitat, that reproduces by seed. The first seedling (primary) leaf is green, cylindrical, and lacks a blade. The second leaf has a sheath, blade, ligule, and auricles. Leaves have short, stiff hairs on their upper and lower surfaces. The mature plant has round, hollow, jointed culms, and rather flat, sessile leaf blades. The leaves have short, stiff hairs on their upper and lower leaf surfaces. The plants tiller profusely, becoming brushier than white Rice Plants. Panicles are loose and open and droop slightly. The grain shatters easily when ripe. The many types include those with short, medium, or long grains; those with straw-colored, red, or black hulls; and those with short or long awns on the spikelet. Red Rice is a Rice kernel that has a red seed coat frequently found in African Rice Oryza Glaberrima or some Oryza Sativa Cultivars. Red Rice is whole or broken kernels of Rice on which the bran is distinctly red in color. Whole or large broken kernels of Rice on which there is an appreciable amount of red bran. / Целиковая или крупная битая зерновка (целые или крупные битые ядра) Риса, на которой имеется заметное количество плёнчатого околоплодника красного цвета. Голый Рис (Oryza Glaberrima) или некоторые Разновидности Посевного Риса (Oryza Sativa). пластинка листа (blade). колосок (spikelet). Красный Рис – самый питательный вид Риса, его зёрна очень твёрдые и варятся дольше обычного. Снижает уровни холестерина в крови.

REDs = REFUNDING ESCROW DEPOSITS

RED SMUDGE = КРАСНОВАТАЯ ЯЗВА – Red Smudge is a dark reddish discoloration usually associated with Durum Wheat. It usually affects the entire bran portion of the kernel. Discoloration is not superficial and cannot be removed through abrasion. Red smudge is caused by infections of the Fungus Pyrenophora Tritici-Repentis, which also causes the leaf disease tan spot. / Под Красноватой Язвой у Пшеницы Дурум подразумевается изменение цвета с появлением тёмнокрасного оттенка. Обычно, она распространяется на всю околоплодниковую часть ядра. Красноватая Язва вызывается инфекциями . и не может быть удалена процессом истирания.

RED STAINS = КРАСНЫЕ РАЗВОДЫ (или КРАСНЫЕ ПОТЁКИ) – Red Stains:- Garments:- women's blue spun-rayon dresses; Fabric Construction:- (i) Count:- 102 x 52; (ii) Warp:- 22/1 S 50% 2-in. 1%-den. dull viscose rayon 50% 2-in. 3-den. dull acetate rayon; (iii) Filling:- same as warp, but Z twist. Complaint:- small, round, red stains were found in dresses after they were removed from boxes in which they were shipped. Analysis:- examination of several of the dresses showed that, in addition to isolated round, faint, reddish stains in various parts of the garments, there were similar distinct red areas behind each of the leather buttons down the front and on the sleeves. Chemical tests showed that the buttons gave an acid reaction, probably as a result of the method of finishing the leather used. Further tests confirmed the fact that the particular blue dyestuff used on the fabric turned red in the presence of acid. The less pronounced stains were apparently due to areas of contact with the buttons when the dresses were folded. Obviously this was not the fault of either the converter or the dyer, since it is not unreasonable or uncommon for some blue dyestuffs to turn red in the presence of acid, and in normal usage such exposure to acid could not be anticipated. As a further problem, the converter was anxious to know whether the stains could be eliminated to make the garments usable. Additional tests showed that merely exposing the reddened areas to ammonia fumes, without actually wetting the fabric restored the blue color. By then substituting different buttons, the dresses were made salable. / Уточина:- такая же как основа.

RED STREAKS = КРАСНЫЕ ЗАТАСКИ (или КРАСНЫЕ ПОЛОСКИ, или КРАСНЫЕ ЧЕРТЫ) – Red Streaks:- Fabric:- underwear French crepe; Construction:- (i) Count:- 150 x 04; (ii) Warp:- 75/50 bright acetate rayon; (iii) Filling:- 75/30/35 semidull viscose rayon; Finish:- plain dyed white. Defect:- small bright-red streaks running fillingwise throughout piece. Analysis:- on casual examination it appeared that the short red streaks were due to unremoved fugitive tint on t lie filling yarn or to staining by the dyer. Microscopic analysis, however, revealed the presence of a number of short, single, red-cotton fibers woven into the filling. In other places the streaks were apparently mark-offs from these red fibers produced during wet processing. It was possible to eliminate the defect by stripping with sodium hydrosulphite solution. This would not be done in normal processing by the finisher and, under the circumstances, it would necessitate extra handling and a small additional charge for this treatment. It was subsequently determined that several pieces of these goods had been woven on looms with red-cotton plush facing on the race plates. The contamination was due to some of the red-cotton fibers' coming out and being trapped in the fabric during weaving. In cases in which the goods were finished in medium and dark shades, the contaminating fibers were not visible. / Уточина:- 75/30/35 . Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

REDUCED ALLOTMENT = УМЕНЬШЕННОЕ РАЗМЕЩЕНИЕ (или НЕПОЛНОЕ РАЗМЕЩЕНИЕ) – Reduced Allotment:- corresponds to the term 'Rationing'. Only arises when there are more bidders for a security than securities available in a share issue. Share allotments are then reduced, i.e. allocated; see also Oversubscription. Allotments may also be reduced or rationed on a stock exchange if, for instance, there is a high number of buyers or sellers for shares offered or bid for. The share price quotation is then

either marked 'ratG', meaning that bids at the current price and limited and unlimited bids were only partly carried out, or 'ratB', meaning that sell orders at the current price and lower limited and unlimited sell orders were only partly carried out.

REDUCED COSTS = ПРИВЕДЁННЫЕ ЗАТРАТЫ – Reduced Costs are some costs can be reduced by decreasing the handling, distribution, storage and updating of printed material. Environmental impact is also reduced through this reduction in paper. Availability of electronic information can also reduce the amount of time staff spend on responding to phone calls and letters requesting information. / Приведённые Затраты, экономическая категория, отражающая величину (в стоимостном выражении) полных затрат общественного труда (текущих и единовременных) на производство продукции. Численно приведённые затраты равны сумме полных текущих затрат (включая амортизацию) и части капитальных вложений, соответствующей их нормативу. Приведённые затраты используются в планировании при выборе вариантов капитальных вложений, размещения производства и так далее.

REDUCED TILLAGE = РЕДУЦИРОВАННАЯ ОБРАБОТКА (ПОЧВЫ) (или УМЕНЬШЕННАЯ ОБРАБОТКА (ПОЧВЫ)) – Reduced Tillage is a tillage sequence in which the primary operation is performed in conjunction with planting procedures in order to reduce or eliminate secondary tillage operations. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

REDUCED ZONE = РЕДУЦИРОВАННАЯ ЗОНА (или УМЕНЬШЕННАЯ ЗОНА) – Reduced Zone is a portion of a flooded soil devoid of free oxygen.

REDUCER = РЕДУКТОР – Reducer is a connector having a smaller line size at one end than the other. / Под Редуктором, от Латинского слова Reductor, означающее Отводящий Назад или Приводящий Обратно, понимается:- (1) механизм, входящий в приводы машин и служащий для снижения угловых скоростей ведомого вала с целью повышения крутящих моментов. В редукторах применяют зубчатые передачи, цепные передачи, червячные передачи, а также используют их в различных сочетаниях – червячные и зубчатые, цепные и зубчатые и тому подобные. Существуют комбинированные приводы, в которых редукторы компонуют с вариатором. Редукторы используют в транспортных, грузоподъёмных, обрабатывающих и других машинах. (2) Устройство для снижения и поддержания постоянным давления рабочей среды (газа, пара или жидкости) на выходе из баллона или другой ёмкости с более высоким давлением, одновременно выполняющее функции предохранительного и запорного клапана. Редукторы устанавливают в аппаратах для газовой сварки, в хлораторах воды, сатураторах и тому подобном, они могут быть использованы также в различных аппаратах для осуществления дополнительных операций смешения, подогрева, охлаждения и тому подобного. Основной элемент редуктора – Редукционный Клапан, связанный с гибкой плоской мембраной, на которую с одной стороны действует винтовая пружина, а с другой – давление газа или жидкости. Различают редукторы прямого и обратного действия, в которых соответственно действие пружины совпадает с направлением давления среды или противоположно ему. В зависимости от рода рабочей среды, для которой редукторы предназначены, редуктор называют кислородным, ацетиленовым, водородным и так далее. Конструктивно редуктор выполняется одно- или двухкамерными, осуществляющими одно- или двухкратное понижение давления.

REDUCING AGENT = ВОССТАНАВЛИВАЮЩИЙ АГЕНТ (или ВОССТАНОВИТЕЛЬ) – Reducing Agent is a chemist's term for any chemical that causes gain of electrons by another chemical with which it reacts; the reducing agent is itself oxidized (see Oxidizing Agent) in the process. Many reducing agents are used in dyeing processes. They include thiourea dioxide, sodium bisulfite, sodium formaldehyde sulfoxylate, sodium hydrosulfite and others. They are often used in discharge and stripping processes, and are used for converting insoluble vat or sulfur dyes to the soluble form. Solid-chemical reducing agents are often flammable. / диоксид тиомочевины (thiourea dioxide), , формальдегид сульфоксилат натрия (sodium formaldehyde sulfoxylate).

REDUCING (or REDUCTIVE) BLEACH = ВОССТАНАВЛИВАЮЩИЙ ОТБЕЛИВАТЕЛЬ (или РЕДУЦИРУЮЩИЙ ОТБЕЛИВАТЕЛЬ или РЕДУКТИВНЫЙ ОТБЕЛИВАТЕЛЬ) – Reducing (or Reductive) Bleach is a bleach or decolorizing compound that is based on a reducing agent. This type of bleach is typically used for discharge or stripping. Usually they are not harmful to fibers, though some processes require temperature or pH that may damage fibers. Wool is often bleached with reducing bleaches. Thiourea dioxide and sodium hydrosulfite are two compounds that find use as reductive bleaches. / Восстанавливающий Отбеливатель или Редуцирующий (или Редуктивный) Отбеливатель:- отбеливатель или . диоксид тиомочевины (thiourea dioxide).

REDUCTION CLEARING = РЕДУКЦИОННАЯ ОЧИСТКА – Reduction Clearing is the removal of disperse dye on the surface of fabric by use of a reducing agent. Fine particles of disperse dye often remain on the surface of dyed fabric. These particles can cause wash fastness problems, yet are hard to fully remove by washing alone. For polyester, a mixture of about 2 grams per liter each of sodium hydrosulfite and sodium carbonate is used at about 70 degrees Celsius for about 20 minutes. Dye inside the fiber is not effected by this treatment. Reduction Clearing is the removal of unabsorbed disperse dye from the surface of polyester at the end of the dyeing or printing process by treatment in a sodium hydroxide/sodium hydrosulfite bath. A surface-active agent may be employed in the process.

REDUCTION DIVISION = РЕДУКЦИОННОЕ ДЕЛЕНИЕ – Reduction Division is a nuclear division where the chromosomes are reduced from the diploid to the haploid number.

RED WHEAT = КРАСНОЗЁРНАЯ ПШЕНИЦА – Red Wheat in particular was transplanted to North America by Russian Mennonites between 1874 and 1884. The Russian Mennonites were a religious nationality who emigrated to the United States and Canada because of increasing controls levied by tsarist Russia. This people sustained themselves on agriculture and the fertile lands of the Crimea peninsula. The Mennonites were not native to Russia either, emigrating there from northern Germany and the Netherlands, after the start of the Protestant Reformation in pursuit of a secluded farming community. The USDA followed this introduction of a new crop by also introducing types of red Wheat from Eastern Europe in 1900. The industry itself hit a major boom after the Industrial Revolution when new machines provided much needed efficiency in harvesting and processing the Wheat. Both Canada and the United States now comprise the greatest bloc of Wheat trade in the world, and from this competition between the two countries has emerged. In the United States, there are several classes of Red Wheat:- (i) Hard Red Spring Wheat contains the highest protein content (1 316.5%) making it an excellent bread Wheat with superior milling and baking characteristics. Hard red spring Wheat is grown mostly in Montana, the Dakotas, and Minnesota. This Wheat is seeded in the spring and may have either a hard or a soft endosperm. Subclasses are Dark Northern Spring, Northern Spring, and Red Spring Wheats; (ii) Hard Red Winter Wheat is the class of Wheat used mostly for bread and all-purpose flour. This Wheat is fall-seeded, has medium to high protein content (10–13.5%), and can have either hard or soft endosperm. Hard red winter Wheat accounts for more than 40% of the US Wheat crop and half of US Wheat exports. This Wheat is produced in the Great Plains, between the Mississippi River and the Rocky Mountains, and from Texas to the Dakotas and Montana. It has a wide range of protein and good milling and baking qualities. The flour is used to produce bread, rolls, some sweet goods, and all-purpose flour; and (iii) Soft Red Winter Wheat is seeded in the fall, has a low to medium protein content

with soft endosperm, and is used to make cakes, pastries, flat breads, and crackers. It is grown east of the Mississippi and has no subclasses. Ohio is the leading producer of soft red winter Wheat followed by Arkansas, Illinois, and Missouri. Ohio Wheat is known for making higher-quality flour than that coming from any other soft red winter wheat-producing state. See also Wheat. / эндосперм (endosperm).

REECE POCKET = XX КАРМАН – Reece Pocket is an inset pocket with the both lips finished by an upstanding welt that may be from 3/8 to 1 wide. One lip pockets are called 'Welt Pockets'.

REED = БЁРДО – Reed is the comblike device through which the warp ends are drawn after leaving the heddles and the harnesses. Reeds are usually made of fine, pressed-steel wire, and the spaces between these wires are known as Reed-Splits or Reed-Dents. The reed prevents the warp ends from gnarling or tangling with one another; it keeps the warp ends level, straight, and true and serves as a control for the ends being fed in evenly to the newly woven cloth. The reed by its to-and-fro action beats the loose filling pick, lying in the shed of the loom, into its proper place in the woven goods. The reed is parallel with the whip roll and lease rods, and is at right angles to the selvages. Reed dents = reed splits:- the spaces between the reed wire. Reed is a comb-like device on a loom that separates the warp yarns and also beats each succeeding filling thread against that already woven. The reed usually consists of a top and bottom rib of wood into which metal strips or wires are set. The space between two adjacent wires is called a Dent (or Split) and the warp is drawn through the dents. The fineness of the reed is calculated by the number of dents per inch. The more dents to the inch, the finer the reed. Reed:- this frame, located directly in front of the harnesses, swings forward to batten the last filling inserted against previous fillings. See also Battening. / уточная нить. Зубья бёрда . Battening = Приколачивание Утка К Опушке Ткани.

REEDINESS = РАССЕЧКИ (БЁРДОМ) (или (ПРОБИРАНИЕ, или ПРОБОРКА ОСНОВНЫХ НИТЕЙ В БЁРДО (REEDING))) – Reediness is characterized by a general grouping of warp ends drawn through individual dents of the reed with a fine crack showing up in between such groups. This is caused by:- (i) insufficient tension difference between the shed lnes during beat up; (ii) excessive warp tension; and (iii) late shedding. Reediness:- these are very fine cracks or lines between groups of warp threads, caused due to excessive warp tension, late shedding, use of coarse reed with more number of ends per dent, bent reed wires, improper spacing of reed wires, wrong drawing, and insufficient troughing of shed, i.e. tension difference between top and bottom shed lines during beat up. / Рассечки Бердом (Reed Marks) – порок в виде полос, расположенных по длине ткани. Рассечка Бёрдом – разреженные полосы, идущие вдоль ткани; они возникают вследствие сдвига основных нитей, например при погнутости зубьев бёрда. Под Рассечкой понимается распространённый порок в виде раздвинутых нитей основы из-за нарушения плотности зубьев бёрда. Растяжки (reediness):- порок основы; ряд ясно видимых продольных нитей поперёк полотна. Примечание:- этот порок часто вызывается неправильной гребёнкой или вследствие неправильного вытягивания нитей или обработки.

REEDING = ПРОБИРАНИЕ – (1) Reeding:- yarn slippage not apparent except under test. Will reduce the life of the zipper. Closure defects, and namely – Metal Zippers and Nylon Spiral Zippers:- Tare and Cord Defects. / Порок или дефект застёжки. Найлан[T3] (Nylon[TM]).

(2) Same as for metal zippers. Reeding:- yarn slippage not apparent except under test. Will reduce the life of the zipper. Closure defects, and namely – Nylon Spiral Zipper:- Tape and Cord Detects. / Порок или дефект застёжки. Найлан[T3] (Nylon[TM]).

REED MARKS = ОТМЕТИНЫ ОТ БЁРДА (или БЁРДОЧНЫЕ ЖЕЛОБА, или БЁРДОЧНЫЕ ПАЗЫ, или ПАЗЫ СВОЛОЧКИ, или РАССЕЧКИ БЁРДОМ) – Reed Marks are actual streaks or marks in the warp direction of cloth and found in all woven goods, but more particularly in lengthweight cottons, some silks, and certain rayon fabrics. Reed marks may be caused by the following:- wornout reed, loose reed wires, bent wires of the reed, wrong draws, incorrect reeding, and warp which may be given to much tension on the loom. Reed marks may be obliterated in finishing of the material. In hand or power weaving, intentional reed marks will appear. Mockleno, canvas weave, basket weaves, the Swedish lace weave, grouped warp threads to make undulating twill effects, texture weaves which employ several kinds of yarns in the warp arrangement, and others, are enhanced for final effect by the system or grouping resorted to in the reeding-in of the warp in the loom. Reed Marks is a fabric defect consisting of warpwise light and heavy streaks in a woven fabric, caused by bent, unevenly packed, or weak reed wires. Reed Mark:- damaged reed. Woven fabric defect. Reed Mark:- warp way gap on the fabric, which is caused due to reed (Mostly occurs due to damaged reed). Weaving defect. Reed Marks:- damaged reed surface, improper denting and wide dent spacing, non-opening of shed avoid high warp tension. Any problem related reed generates reed marks. Reed Mark is a warp-way crack or disturbance of the structure in a woven fabric, caused by a reed misdraw or a damaged or defective reed. A ready cloth shows irregular spacing between groups of warp yarns across the width of the fabric caused by a damaged or defective reed or too late reed shedding. Reed Mark:- in woven fabrics, a crack between groups of warp ends, either continuous or at intervals. Reed Mark:- a crack between groups of warp ends, either continuous or at intervals, which can happen due to damaged reed or improper spacing of dents. Reed Marks:- a warp way crack caused by a damaged or defective reed. Mending:- non mendable. Reed Mark:- it is a pronounced mark caused due to damaged or defective reed. This produces grouping of warp ends in fabrics producing fine cracks. Higher warp tension resorting to late shedding and the use of coarser reed are the causes for this defect. Reed Marks:- a pronounced warp way crack caused by a damaged or defective reed. / Порок или дефект ткачества. Рассечки Бердом (Reed Marks) – порок в виде полос, расположенных по длине ткани. Рассечка Бёрдом – разреженные полосы, идущие вдоль ткани; они возникают вследствие сдвига основных нитей, например при погнутости зубьев бёрда. Под Рассечкой понимается распространённый порок в виде раздвинутых нитей основы из-за нарушения плотности зубьев бёрда. Незастилистая Ткань (Reed Marked Fabric) или 'Голый Товар' – суровая ткань полотняного переплетения, на которой очень резко выделяются основные нити парочками. Рассечки Бёрдом (Reed Mark):- порок основы; раздвинутые нити основы из-за нарушения плотности зубьев бёрда. Примечание:- этот порок часто вызывается повреждённым бёрдом или дефектом бёрда.

REED MISDRAW = XX – Defect Name:- Reed Misdraw. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Reed Misdraw:- This defect is caused by an end being misdrawn into a dent next to the one designated. Severity:- Minor.

REED STREAK = XX ОТ БЁРДА – Reed Streak:- a warp wise defect attributable to a bad reed like uneven reed space, bent reed wire, slant wire, damaged reed wire etc.

REEDY = XX (или НЕГИБКАЯ, или НЕЗАСТИЛИСТАЯ, или РАССЕЧЁННАЯ БЁРДОМ) – Defect Name:- Reedy. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Reedy:- This condition can be caused by the wrong reed, wrong reed-draw arrangement, wrong loom setting, or a combination of any or all three. The effect is open streaks following the pattern of the reed wires. This is also referred to as 'Poor Cover'. Severity:- Major.

REEDY WARP = НЕГИБКАЯ (или НЕЗАСТИЛИСТАЯ) ОСНОВА (или РАССЕЧЁННАЯ БЁРДОМ ОСНОВА) – Reedy Warp:- xxxxx. See also Reed Mark. Fabrics defect.

REEF = РИФИТЬ (или ЗАРИФЛЯТЬ, или БРАТЬ РИФЫ) – Reef (maritime term):- to reduce the area of a sail by making fast the reef points (used in rough weather).

REEFER = БУШЛАТ (или ХХ) – Reefer is a close-fitting usually double-breasted jacket or coat of thick cloth. / двубортный жакет.

REEFER = ИЗОТЕРМИЧЕСКИЙ – Reefers are similar to dry containers, with the exception that they include a built in refrigeration unit to keep perishable goods cold or frozen. Refrigerated and heated containers are equipped with a mechanical refrigeration unit capable of transporting cargo at temperatures from –25 °C to +25 °C, accurate to a tenth of a degree. Benefits:- (i) containers which have a built in refrigeration unit to keep perishable goods cold or frozen; (ii) as well as keeping goods cool, these containers are often used to keep goods from freezing in harsh climates; (iii) reefers maintain cargo between a wide range of temperatures; (iv) fully water resistant; (v) all reefers have bottom air delivery; (vi) choice of power supply – 171–440 Volts / 50–60 Hertz; (vii) reefer plugs to ISO standard; and (viii) CFC free (short for the free of chlorofluorocarbons; harmful chemicals that eat away at the ozone) – environmentally friendly. Reefer is a refrigerated container. Reefer is a container with temperature controls. Used to keep perishable goods such as meat and fruit frozen or chilled. See also Refrigerated Container. / Контейнер с регулированием температурного режима перевозимого в нём груза. Используется для безопасной перевозки скоропортящихся грузов, таких как замороженное или охлаждённое мясо и фрукты. Смотрите также Рефрижераторный Контейнер (Refrigerated Container). Под Рефрижератором, от Латинского слова Refrigero, означающее Охлаждаю, понимается транспортное средство с холодильной установкой (автомобиль, поезд, судно) для перевозки скоропортящихся грузов при пониженных температурах, достигаемых искусственным охлаждением. В качестве рефрижераторов используются специальные автомобили (изотермический автомобиль), поезда (изотермический вагон), суда. Под Холодильным Транспортом понимают охлаждаемые и изотермические транспортные средства для перевозки пищевых продуктов при температурах ниже температуры окружающей среды. Дальность перевозки и вид груза определяют вид и грузоподъёмность транспортного средства, а также влияют на выбор охлаждающей системы. Автомобильный холодильный транспорт обеспечивает транспортирование продуктов с распределительных холодильников на предприятия торговли и общественного питания, а также их перевозку с производственных холодильников на распределительные и из сельскохозяйственных районов в промышленные центры. При внутригородских перевозках замороженных продуктов обычно используют Изотермические Автомобили. Для перевозки продуктов по железным дорогам служат вагонные секции, рефрижераторные поезда и автономные изотермические вагоны, а также цистерны-термосы для перевозки молока, термоизолированные вагоны для перевозки живой рыбы и прочие. Водный холодильный транспорт включает рефрижераторные суда морских и речных пароходств и производственно-транспортные суда, плавучие базы и заводы флота рыбной промышленности. При транспортировании пищевых продуктов различными видами транспорта широко используют охлаждаемые и изотермические контейнеры массой брутто 10–30 тонн (т). Изотермический Автомобиль, автомобиль, кузов которого снабжён слоем изоляционных материалов, ограничивающих теплообмен между внутренней и наружной поверхностями. Изотермические свойства кузова характеризуются коэффициентом теплопередачи (k). Изотермические автомобили в зависимости от значения k бывают двух категорий:- с обычной изоляцией (k не превышает 0.7 Вт/(м^2·К)), то есть (~ 0.6 ккал/(ч·м^2°С)); с усиленной изоляцией (k не превышает 0.4 Вт/(м^2·К)), (~ 0.35 ккал/(ч·м^2°С)). Изотермические автомобили подразделяются на автомобили-ледники и автомобили-рефрижераторы, применяемые для перевозки скоропортящихся грузов, а также отапливаемые автомобили. Тип автомобиля выбирается в зависимости от вида груза и его упаковки, температуры наружного воздуха и продолжительности перевозки. Грузоподъёмность изотермического автомобиля составляет от 0.2 до 20 тонн (т). Изотермический Вагон, предназначается для перевозки скоропортящихся грузов (мясо, рыба, фрукты и т.д.), требующих при транспортировке постоянных и достаточно низких температур. Первые изотермические вагоны были построены в России в 1862. К 1917 насчитывалось около 6 000 разнотипных малогрузных 2-осных вагонов. В 1926 на Брянском Локомотивостроительном Заводе начался серийный выпуск 4-осных изотермических вагонов грузоподъёмностью до 30 тонн (т), затем до 49 т. По назначению изотермические вагоны разделяются на универсальные, пригодные для перевозок большинства скоропортящихся грузов, и специализированные – для перевозки живой рыбы, молока, минеральной воды, вина; по способу охлаждения они разделяются па вагоны-ледники, охлаждаемые льдосоляной смесью, и вагоны-рефрижераторы (от Латинского слова Frigero, означающее Охлаждаю), оборудованные компрессорными холодильными установками. В ряде стран применяется охлаждение при помощи сухого льда, жидкого азота и другого. Для перевозок скоропортящихся продуктов в зимнее время изотермические вагоны оборудуют приборами отопления. В изотермических вагонах поддерживается постоянная температура; для большинства охлаждённых грузов до 5 °С, для мороженых не выше –6 °С, для продуктов быстрой заморозки до –20 °С. Льдосоляное охлаждение малоэффективно, поэтому с 1964 строительство вагонов-ледников было прекращено. С 1954 на железных дорогах бывшего Союза Советских Социалистических Республик (СССР) эксплуатировались рефрижераторные поезда из 18 и 20 грузовых вагонов и секции из 4, 5 или 10 вагонов. С 1966 применялись автономные рефрижераторные вагоны с полной автоматизацией работы оборудования.

REEFER = ТЕРМОС (или ИЗОТЕРМИЧЕСКОЕ СУДНО) – Reefer or Refrigerator Ship is a vessel designed to carry goods requiring refrigeration, such as meat and fruit. A reefer ship has insulated holds into which cold air is passed at the temperature appropriate to the goods being carried. / Изотермическое или Рефрижераторное Судно – судно, разработанное для перевозки грузов, требующих охлаждения, таких как мясо и фрукты. Изотремическое судно имеет изолированные трюмы, в которые подаётся холодный воздух при температуре, соответствующей перевозимым товарам.

REEFER BOX = ИЗОТЕРМИЧЕСКИЙ СУНДУК – Reefer Box is an insulated shipping container designed to carry cargoes requiring temperature control. It is fitted with a refrigeration unit which is connected to the carrying ship's electrical power supply.

REEFER CARGO = ИЗОТЕРМИЧЕСКИЙ ГРУЗ – Reefer Cargo is a cargo requiring temperature control. / Изотермический Груз – груз, требующий управления температурным режимом во время перевозки и временного хранения.

REEFER CONTAINER = ИЗОТЕРМИЧЕСКИЙ КОНТЕЙНЕР – Reefer Container:- in order to ensure that perishable goods (fruit, vegetables, meat, fish or flowers) arrive at their destination in a fresh state they are transported in reefer containers. A differentiation is made between Integrated Containers with an integral cooling unit and which merely have to be connected to a power source, and Insulated Containers. The latter do not have their own cooling system and are cooled using cold air on board the ship. If a connection to a static cooling system is not possible (e.g., during lorry transport) a mobile cooling unit is required (clip-on unit). A container ship or container terminal can be equipped with a certain number of reefer plugs, e.g., CT Altenwerder (Hamburg, Germany) has 2 040 connections for reefer containers. Once the ship has been loaded the cooling units are connected to the power source using the reefer connections. The operating temperature ranges from +29 °C to –30 °C. The electric current is 300–500 Volts. See also Reefer. Reefer Container is a thermal container with refrigerating machinery (mechanical compressor unit, absorption unit, etc) to control the temperature of cargo. See also Refrigerated Container. Reefer Containers or refrigerated containers are used to transport goods requiring temperature-controlled conditions in transit, such as fruit, vegetables, dairy products and meat. It is fitted with a refrigeration unit which is connected to the carrying ship's electrical power supply. Specific dimensions and capacity of reefer containers

(refrigerated containers) may vary depending on the container manufacturer, the age of the container and the container owner. / Си.Ти. Альтэнвэрда (CT Altenwerder).

REEFER PLUG = ЭЛЕКТРИЧЕСКИЙ РАЗЪЁМ ДЛЯ ПОДКЛЮЧЕНИЯ ИЗОТЕРМИЧЕСКОГО КОНТЕЙНЕРА – Reefer Plug is an electrical outlet on ship or a terminal providing electrical current for maintaining temperature. / Под Электрическим Разъёмом или Штепсельным Разъёмом понимается электромеханическое устройство, предназначенное для быстрого соединения/разъединения одного или нескольких (до нескольких десятков) электрических проводов (соединяющих, например, отдельные блоки телевизора, электрической машины и так далее). Состоит из вилки, содержащей цилиндрические или ножевые контакты, и розетки с контактными гнёздами.

REEL = RESPONSIBLE LIVELIHOOD ENHANCED ENVIRONMENT

REEL = МОТОВИЛО (или МОТАЛЬНАЯ МАШИНА, или КАТУШКА) – Reel is:- (1) a revolving frame on which yarn is wound to form hanks or skeins. (2) The frame on which silk is wound from the cocoon. (3) A linen yarn measure of 72 000 yards. (4) The large wheel in a horizontal warper onto which the warp sections are wound in the indirect system of warping. (5) A spool of large capacity used to wind yarn or wire. / Мотальная Машина для размотки пряжи в мотки.

REELED SILK = РАЗМОТАННЫЙ ШЁЛК – Reeled, or Filament Silk is the highest quality yarn and is very white and shiny. Cocoons are inspected and sorted, as only those with a perfect shape can be used for the reeling procedure. Cocoons are soaked in warm water to soften the gummy sericin. The silken strand from a single cocoon is too fine to use alone, so individual filaments of 6–20 cocoons are unraveled at the same time, traveling through a very small eye. The softened sericin dries, hardens and binds the strands together to become one thread the size of a human hair. The majority of reeled silks supply large industrial looms. Reeled Silk is a long strand made of silk reeled from a number of cocoons and not twisted or spun. See also Doupioni.

REELING = РАЗМОТКА (или КОКОНОМОТАНИЕ) – Reeling is the process of winding silk filaments onto a wheel directly from cocoons. Reeling:- in silk fiber production, the process of unwinding the cocoon.

REEMBROIDERED LACE = ПОВТОРНО ВЫШИТОЕ КРУЖЕВО – Reembroidered Lace is a lace with designs outlined in embroidery stitching. See also Embroidery.

RE–ENGINEERING = РЕИНЖЕНЕРИЯ – Re-Engineering is an approach to improving business operations through reinventing, reevaluating, redesigning and redoing.

REEVE = ПРОПУСКАТЬ (или ПРОВОДИТЬ) – Reeve (maritime term):- to pass the end of a rope through any lead such as a sheave or fair; lead.

REEXAMINATION PROCEEDING = ПРОИЗВОДСТВО ПО ДЕЛУ ПОВТОРНОЙ ЭКЗАМЕНАЦИИ (или ПРОИЗВОДСТВО ПО ДЕЛУ ПОВТОРНОЙ ЭКСПЕРТИЗЫ) – Reexamination Proceeding:- at any time during the enforceability of a patent any person may file a request for the United States Patent and Trademark Office (USPTO) to conduct a second examination of any claim of the patent on the basis of prior art patents or printed publications which that person states to be pertinent and applicable to the patent and believes to have a bearing on the patentability. In order for the request for reexamination to be granted, a substantial new question of patentability must be present with regard to at least one patent claim. The request must be in writing and must be accompanied by payment of a reexamination request filing fee as set forth in 37 CFR 1.20(c) (CFR:- short for the US Code of Federal Regulations).

RE–EXPORTED CONSIGNMENT = ПОВТОРНО ВЫВЕЗЕННАЯ КОНСИГНАЦИЯ (или РЕЭКСПОРТИРУЕМАЯ КОНСИГНАЦИЯ) – Re-Exported Consignment is a consignment that has been imported into a country from which it is then exported. The consignment may be stored, split up, combined with other consignments or have its packaging changed (formerly country of re-export).

REEXPORTS = ОБРАТНЫЕ ВЫВОЗЫ (или РЕЭКСПОРТ) – In the European Union, Re-Exportation is a Customs treatment of non-Community goods that are taken out of the customs territory. Reexport means an actual shipment or transmission of items subject to the US Export Administration Regulations (EAR) from one foreign country to another foreign country. For purposes of the EAR, the export or reexport of items subject to the EAR that will transit through a country or countries, or be transshipped in a country or countries to a new country, or are intended for reexport to the new country, are deemed to be exports to the new country. In addition, for purposes of satellites controlled by the US Department of Commerce, the term Reexport also includes the transfer of registration of a satellite or operational control over a satellite from a party resident in one country to a party resident in another country. Re-exports:- raw material imported and then exported as finished articles. Re-exports are foreign goods exported in the same state as previously imported, from the free circulation area, premises for inward processing or industrial free zones, directly to the rest of the world and from premises for customs warehousing or commercial free zones, to the rest of the world. To import goods from one country and to then export them to another. In the United States, (1) for export control purposes:- the shipment of US origin products from one foreign destination to another. (2) For statistical reporting purposes:- exports of foreign-origin merchandise which have previously entered the United States for consumption or into Customs bonded warehouses for US Foreign Trade Zones. / вывоз (exportation). Под Реэкспортом подразумевается перепродажа товаров, ранее привозных (или импортированных) из других стран, как правило, без обработки. Реэкспорт (Re-export):- (i) вывоз из страны ранее привозных (или импортированных) в неё товаров, чаще всего сырьевых, для перепродажи другим странам. Товары могут повторно вывозиться (или реэкспортироваться) как в неизменном виде, так и после незначительной обработки, например, переупаковки, сортировки, исключающей их переработку. Различают Реэкспорт с завозом в страну (Прямой Реэкспорт) и без завоза в страну (Косвенный Реэкспорт), когда закупленные за границей товары отправляются непосредственно в третьи страны; и (ii) таможенный режим, при котором иностранные товары, ввезённые на таможенную территорию страны, не должны быть на ней выпущены в свободное обращение. При несоблюдении этого условия режим реэкспорта не применяется. Если товары заявляются таможенному органу в качестве предназначенных только для реэкспорта, то при их ввозе на таможенную территорию ввозные пошлины, налоги не взимаются и меры экономической политики не применяются. При вывозе этих товаров с таможенной территории страны ввозные таможенные пошлины, налоги не взимаются или возвращаются и меры экономической политики не применяются.

REF = REFINERY

REFCORP = RESOLUTION FUNDING CORPORATION

REFERENCE = КАССАЦИЯ (или ВОПРОС НА РАССМОТРЕНИЕ, или КАСАТЕЛЬСТВО, или СПРАВКА) – Reference is the submission of a matter in dispute to an arbitrator for his award. / Предъявление материалов или обстоятельств в споре с арбитром по его решению.

REFERENCE ASSET = АКТИВ ДЛЯ ССЫЛКИ (или СПРАВОЧНЫЙ АКТИВ) – Reference Asset is an asset, such as a corporate or sovereign debt instrument, that underlies a credit derivative. / Актив, такой как корпоративный или суверенный (самостоятельный) долговой инструмент, который предполагает под собой кредитовый производный инструмент.

REFERENCE CURRENCY = ВАЛЮТА ДЛЯ ССЫЛКИ (или СПРАВОЧНАЯ ВАЛЮТА) – Reference Currency is a currency in which an investor thinks and calculates. Currency in which the performance of an investment fund is measured.

REFERENCE EXCHANGE RATE = ОБМЕННЫЙ КУРС ДЛЯ ССЫЛКИ (или СПРАВОЧНЫЙ ОБМЕННЫЙ КУРС) – Reference Exchange Rate shall mean the exchange rate which is used as the basis to calculate any currency exchange and which is made available by the payment service provider or comes from a publicly available source.

REFERENCE FOR RETURN = ССЫЛКА ПО ВОЗВРАТУ – Reference For Return:- in a SWIFT message the unique reference generated by the sender of a returned transaction. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REFERENCE FOR THE ACCOUNT OWNER = ССЫЛКА ДЛЯ ВЛАДЕЛЬЦА СЧЁТА – Reference For The Account Owner:- in a SWIFT message the reference which identifies the transaction to the account owner. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REFERENCE FOR THE BENEFICIARY = ССЫЛКА ДЛЯ БЕНЕФИЦИАРА – Reference For The Beneficiary:- in a SWIFT message the reference which enables the beneficiary to identify the transaction. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REFERENCE INDEX = ИНДЕКС ДЛЯ ССЫЛКИ (или СПРАВОЧНЫЙ ИНДЕКС) – Reference Index is a securities index serving as a base of comparison for the performance of an individual security, portfolio or investment fund. See also Benchmark.

REFERENCE INTEREST RATE = ПРОЦЕНТНАЯ СТАВКА ДЛЯ ССЫЛКИ (или СПРАВОЧНАЯ ПРОЦЕНТНАЯ СТАВКА) – Reference Interest Rate shall mean the interest rate which is used as the basis to calculate any applicable interest and which comes from a publicly available source and may be checked by both parties to a payment service contract.

REFERENCE NUMBER = НОМЕР ДЛЯ ССЫЛКИ (или СПРАВОЧНЫЙ НОМЕР) – Reference Number shall mean a set of data announced in advance or a unique number used by the payment service provider that allows the unambiguous identification of a payment transaction.

REFERENCE RATES = КУРСЫ ДЛЯ ССЫЛКИ (или СПРАВОЧНЫЕ КУРСЫ) – Reference Rates:- prior to the introduction of the Euro, exchange rates of the DM against 17 currency were quoted in Germany each trading day in the official fixing. Since 1999 the ECB publishes daily Euro reference rates against 28 currencies which are calculated in the concertation procedure between central banks within and outside the Euro System as the average of buy and sell rates. They do not necessarily reflect actual transaction rates but merely serve as a reference. The purpose of these reference rates is that they have an 'official character', i.e. are used in annual financial statements or for statistical purposes. In addition, the banks of the German Savings Banks Association, together with the co-operative banking sector and some commercial banks, quote non-official fixing rates from their interbank trading at 01 pm each day. Reuters then publishes average buy and sell rates (EuroFX System). Again, these rates are not necessarily actual transaction rates. The big banks take a different approach by posting fixing rates (01 pm) or continually updated rates from interbank trading on their websites. While these may vary from bank to bank, they are derived from actual market prices. Euro foreign exchange Reference Rates (all currencies quoted against the Euro (base currency)) are usually updated by the European Central Bank (ECB) by 03:00 pm CET (UTC+1). They are based on a regular daily concertation procedure between central banks across Europe and worldwide, which normally takes place at 02:15 pm CET. / Ройтас (Reuters).

REFERENCE SPECIMEN = СПРАВОЧНЫЙ ОБРАЗЕЦ (или ЭТАЛОННЫЙ ОБРАЗЕЦ) – Reference Specimen(s) is(are) the individual specimen(s) from a specific population conserved in a reference culture collection and, where possible, in publicly available collection(s).

REFERENCE STANDARD = СПРАВОЧНЫЙ СТАНДАРТ (или СТАНДАРТ ДЛЯ ССЫЛКИ, или СТАНДАРТ ДЛЯ СРАВНЕНИЯ, или ЭТАЛОН ДЛЯ СРАВНЕНИЯ) – Reference Standard is a physical standard used to calibrate a group of laboratory standards.

REFERENCE VALUE FOR MONETARY GROWTH = СПРАВОЧНАЯ СТОИМОСТЬ ДЛЯ МОНЕТАРНОГО РОСТА – In the European Union, Reference Value For Monetary Growth:- in order to assess monetary developments, the Governing Council has announced a reference value for the broad monetary aggregate M3. This reference value refers to the rate of M3 growth that is deemed to be compatible with price stability over the medium term. The reference value is derived in a manner that is consistent with and serves the achievement of the Governing Council's definition of price stability on the basis of medium-term assumptions regarding trend real GDP growth and the trend in the velocity of circulation of M3. Substantial or prolonged deviations of M3 growth from the reference value would, under normal circumstances, signal risks to price stability over the medium term. However, monetary policy does not react mechanically to deviations of M3 growth from the reference value. See also M3.

REFERENCE VARIETY = ЭТАЛОННАЯ РАЗНОВИДНОСТЬ (или СОРТ СРАВНЕНИЯ, или СПРАВОЧНАЯ РАЗНОВИДНОСТЬ) – A Reference Variety of a grain is a variety currently listed as registered in Canada by the Agriculture and Agri-Food Canada (AAFC), the federal Department of Agriculture.

REFERENDUM = РЕФЕРЕНДУМ – Referendum is a vote taken by the general public to decide an important legislative or policy issue directly (rather than having the issue decided by a representative assembly or other legislative agency). Referendum:- the referral of a question to voters to be resolved by balloting. In agriculture, for example, marketing quotas, acreage reduction, or marketing agreements. / Под Референдумом, от Латинского слова Referendum, означающее То, Что Должно Быть Сообщено, понимается всенародное голосование, проводимое в связи с принятием новой конституции, других важных законов или внесением в них изменений. Проведение референдума (всенародного голосования) предусмотрено законами многих стран.

REFINANCING = РЕФИНАНСИРОВАНИЕ – Replacing an existing loan with a new one at a lower interest rate and/or for a longer repayment term, and using part or all of the proceeds from the new loan to pay off the balance of the old one. Also, replacing corporate bonds or stocks with new ones, usually at a lower interest rate or with a lower dividend. New securities are sold by a company and the money is used to retire existing securities. Object may be to save interest costs, extend the maturity of the loan, or both. Also known as Refunding in the United States. Raising of funds by a bank to finance its own lending business. / выплата (repayment). Под

Рефинансированием или Реинвестированием понимается повторное или дополнительное вложение в данной отрасли или стране капитала, как правило иностранной, за счёт полученной прибыли. После Второй Мировой Войны широко практикуется капиталистическими монополиями, особенно Американскими, в развивающихся странах в неоколониалистических целях, а также для преодоления протекционистских барьеров и проникновения на рынки замкнутых экономических группировок или отдельных стран.

REFINANCING AGREEMENT = СОГЛАШЕНИЕ О РЕФИНАНСИРОВАНИИ – Refinancing Agreement is an arrangement to provide funding to replace existing financing, the most common being a refinance of a home mortgage. / Соглашение О Рефинансировании – это договорённость обеспечить фондирование (выделение фондов) в замен существующего финансирования, самым общепринятым является рефинансирование закладной на дом.

REFINER = ПЕРЕРАБОТЧИК (или НЕФТЕПЕРЕРАБОТЧИК, или НЕФТЕПЕРЕГОННОЕ ПРЕДПРИЯТИЕ) – Refiner is a company engaged in purchasing and refining crude oil into manufactured petroleum products such as gasoline, diesel fuel, jet fuel, lubricating oils, etc. A refiner sells these products to its parent company's marketing division, or to other marketers. / Компания, вовлечённая в приобретение и перегонку нефти в готовые нефтепродукты, такие как бензин (газолин), дизельное топливо, реактивное топливо, смазочные масла и прочие. Нефтепереработчик реализует эти продукты отделу сбыта своей материнской компании, или иным участникам рынка. Переработчик – специалист, занимающийся промышленной переработкой сырья. Под Рафинёром, от Французского слова Raffineur, от Латинского слова Raffiner, означающее Делать Более Тонким или Очищать, понимается аппарат непрерывного действия для размола (между вращающимися дисками с ножами) волокнистых материалов (главным образом целлюлозы) для получения бумажной массы.

REFINER–DISTRIBUTOR = ПЕРЕРАБОТЧИК–ДИСТРИБУТОР (или СБЫТОВОЕ ПЕРЕРАБАТЫВАЮЩЕЕ ПРЕДПРИЯТИЕ, или СБЫТОВОЕ НЕФТЕПЕРЕРАБАТЫВАЮЩЕЕ ПРЕДПРИЯТИЕ) – Refiner-Distributor is a company that acts as a wholesaler of gasoline, heating oil, or other products which operates its own refinery; may also retail and buy additional supplies to supplement its own refining output. / Компания в нефтегазовой отрасли, действующая в качестве оптового продавца бензина (gasoline), печного бытового топлива (heating oil) или иных продуктов, которыми оперирует её собственное предприятие по переработке (нефтеперегонный завод (НПЗ)). Она может также торговать и в розницу и даже докупать дополнительные виды продукции для пополнения выработки своей собственной продукции нефтеперегонки.

REFINERY = ЗАВОД ДЛЯ РАФИНИРОВАНИЯ (или РАФИНИРОВОЧНЫЙ ЗАВОД, или АФФИНАЖНЫЙ ЗАВОД) – Refinery is a processing plant usually associated with a smelter that produces high purity metal.

REFINERY = ПРЕДПРИЯТИЕ ПО ПЕРЕРАБОТКЕ (или ПРЕДПРИЯТИЕ ПО ОЧИСТКЕ) – Refinery:- crude oil in the state it is produced is not usable for most purposes. Although it can be burned directly in power generation plants, it cannot be used in cars or trucks. To optimise the use of crude oil, it needs to be refined into several other products; this happens in a refinery. The market demand for oil products will not only dictate the optimal output of a refinery, but also, the type of crude which will be used and processed to produce the required output. Crude oil is a mixture of many different hydrocarbons and small amounts of impurities. The composition of those raw materials can vary significantly depending on its source. Petroleum refineries are complex plants where the combination and sequence of processes is usually very specific to the characteristics of the raw materials (crude oil) and the products to be produced. A refinery takes crude oil and separates it into different fractions, then converts those fractions into useable products, and these products are finally blended to produce a finished product. These finished products are the fuels and chemicals used every day. In a refinery, portions of the outputs from some processes are fed back into the same process, fed to new processes, fed back to a previous process or blended with other outputs to form finished products. One example of that can be seen in the chart below. However, refineries are different regarding their configuration, process integration, feedstock, feedstock flexibility, products, product mix, unit size and design and control systems. In addition, differences in owner's strategy, market situation, location and age of the refinery, historic development, available infrastructure and environmental regulation are amongst other reasons for the wide variety in refinery concepts, designs and modes of operation. The environmental performance can also vary from refinery to refinery. The production of a large number of fuels is by far the most important function of refineries and will generally determine the overall configuration and operation. Nevertheless, some refineries can produce valuable non-fuel products such as feedstocks for the chemical and petrochemical industries. Examples are mixed naphtha feed for a steam cracker, recovered propylene, butylene for polymer applications and aromatics manufacture. Other specialty products from a refinery include bitumen, lubricating oils, waxes and coke. In recent years, the electricity boards in many countries have been liberalised allowing refineries to feed surplus electricity generated into the public grid. Refining crude oil into usable petroleum products can be separated into two phases and a number of supporting operations. The first phase is desalting of crude oil and the subsequent distillation into its various components or 'fractions'. A further distillation of the lighter components and naphtha is carried out to recover methane and ethane for use as refinery fuel, LPG (propane and butane), gasoline blending components and petrochemical feedstocks. This light product separation is done in every refinery. The second phase is made up of three different types of 'downstream' processes:- combining, breaking and reshaping fractions. These processes change the molecular structure of hydrocarbon molecules either by breaking them into smaller molecules, joining them to form larger molecules, or reshaping them into higher quality molecules. The goal of those processes is to convert some of the distillation fractions into marketable petroleum products through any combination of downstream processes. Those processes define the various refinery types, of which the simplest is the 'Hydroskimming', which merely desulphurises and catalytically reforms selected outputs from the distillation unit. The amounts of the various products obtained are determined almost entirely by the crude composition. If the product mix no longer matches the market requirements, conversion units have to be added to restore the balance. Market demand has for many years obliged refineries to convert heavier fractions to lighter fractions with a higher value. These refineries separate the atmospheric residue into vacuum gasoil and vacuum residue fractions by distillation under high vacuum, and then feed one or both of these outputs to the appropriate conversion units. Thus, by inclusion of conversion units, the product slate can be altered to suit market requirements irrespective of the crude type. The number and the possible combinations of conversion units are large. The simplest conversion unit is the thermal cracker by which the residue is subjected to such high temperatures that the large hydrocarbon molecules in the residue convert into smaller ones. Thermal crackers can handle virtually any feed, but produce relatively small quantities of light products. An improved type of thermal cracker is the coker, in which all the residue is converted into distillates and a coke product. In order to increase the degree of conversion and improve product quality, a number of different catalytic cracking processes have evolved, of which fluid catalytic cracking and hydrocracking are the most prominent. Recently, residue gasification processes have been introduced within refineries, enabling them to eliminate heavy residues completely and to convert them into clean synthetic gas for refinery use and production of hydrogen, steam and electricity via combined cycle techniques. In petroleum industry, an installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol, additives and oxygenates. In oil industry, Refinery is a plant, usually comprising distillation units and a variety of additional specialist units, for the manufacture of so-called refined products from crude oil. Major refined products include naphtha, gasoline, gasoil (heating oil), jet fuel, low sulfur and high sulfur fuel oil. In copper and lead, a refinery is a plant which further

purifies metal produced in a smelter. In zinc, it is a plant which produces purer metal than could be produced in a smelter. In aluminum, it denotes a plant which refines bauxite into alumina. Refinery is a plant used to process crude oil or metals. An oil refinery separates the fractions of crude oil and converts them into usable products. A metals refinery removes impurities, bringing the metal up to designated purity specifications. / выработка (output). В нефтяной отрасли, Нефтеперерабатывающий или Нефтеперегонный Завод, как правило, состоящий из перегонных установок и различных дополнительных специализированных установок, на которых производятся, так называемые продукты переработки сырой нефти. К основным продуктам нефтепереработки относятся нафта (технологический бензин), бензин, газойль (печное бытовое топливо), авиационный керосин, малосернистый и сернистый мазут. В производстве меди и свинца, рафинировочный завод – это предприятие, на котором металлы и сплавы (обычно в жидком виде), полученные на плавильном предприятии, проходят дополнительную очистку с целью удаления примесей для повышения качества и получения ценных сопутствующих элементов. Применяют пирометаллургические, химические и электролитические методы рафинирования. В производстве цинка рафинировочный завод производит металл более высокой чистоты, чем может быть получен на плавильном заводе. В производстве алюминия, обогатительный завод – это завод, перерабатывающий боксит в окись алюминия. Рафинирование благородных металлов называется аффинажем. Нефтеперегонный Завод для нефти и Аффинажный Завод для благородных металлов. Десульфурация (обессеривание). Под Очисткой нефтепродуктов понимается освобождение нефтепродуктов от нежелательных или недопустимых в товарном продукте компонентов (азотистых, кислородных и сернистых соединений, а также смол). Иногда в задачу очистки входит выделение из нефтепродуктов содержащихся в них твёрдых углеводородов (депарафинизация), асфальто-смолистых веществ (деасфальтизация). Основные виды очистки нефтепродуктов – адсорбционная, гидроочистка, контактная, селективная, сернокислотная, щелочная очистка. Под Перегонкой нефти понимается разделение нефти на основные части, или фракции. Перегонка нефти – начальный процесс переработки нефти, основанный на том, что при нагреве нефти образуется паровая фаза, отличающаяся по составу от жидкости. При перегонке нефти получают бензин, дизельное топливо, керосин, легроин и тому подобное. Остаток после перегонки нефти – мазут – используют как сырьё для производства смазочных масел, парафина, гудрона, кокса и других нефтепродуктов. В промышленности перегонка нефти осуществляется на непрерывно действующих трубчатых установках.

REFINERY GAS = НЕФТЕЗАВОДСКОЙ ГАЗ (или ЗАВОДСКОЙ ГАЗ) – Refinery Gas includes a mixture of non-condensable gases mainly consisting of ethane, hydrogen, and methane obtained during distillation of crude oil or conversion of oil products (e.g., cracking) in refineries. This also includes gases that are returned from the petrochemical industry. Also known as Still Gas. / Нефтезаводской газ представляет собой смесь, например, .

REFINERY THROUGHPUT = ПРОПУСКНАЯ СПОСОБНОСТЬ ПЕРЕРАБОТКИ (или ОБЪЁМ ПЕРЕРАБОТКИ) – Refinery Throughput is volumes of oil despatched to drying and desalination facilities. / Под Пропускной Способностью Переработки или Объёмом Переработки понимаются объёмы нефти, направленной на установку электрообезвоживания и обессоливания (ЭЛОУ).

REFINERY UTILIZATION = ИСПОЛЬЗОВАНИЕ ПРЕДПРИЯТИЕМ ПО ПЕРЕРАБОТКЕ – Refinery Utilization:- represents average crude oil consumed in fuel and asphalt refineries for the year, expressed as a percentage of the refineries' average annual crude unit capacity.

REFINERY YIELD = ВЫХОД ГОТОВОЙ ПРОДУКЦИИ ПРИ ПЕРЕГОНКЕ (или ВЫХОД ФРАКЦИЙ ПРИ ПЕРЕРАБОТКЕ, или ПРОИЗВОДИТЕЛЬНОСТЬ ОЧИСТКИ) – Refinery Yield (expressed as a percentage) represents the percent of finished product produced from the input of crude oil and the net input of feedstock. It is calculated by dividing total net production of finished products by the sum of crude oil and net unfinished input.

REFINING = ПЕРЕГОНКА (или ОЧИСТКА) – Refining is a series of processes for converting crude oil and its fractions to finished petroleum products. Following distillation, a petroleum fraction may undergo one or more additional steps to purify or modify it. These refining steps include; thermal cracking, catalytic cracking, polymerization, alkylation, reforming, hydrocracking, hydroforming, hydrogenation, hydrogen treating, hydrofining, solvent extraction, dewaxing, deoiling, acid treating, clay filtration, and deasphalting. Refined lubricating oils may be blended with other lube stocks, and additives may be incorporated, to impart special properties. Refining:- a series of processes through which the crude oil is converted into a petroleum product. Such processes include:- thermal cracking, catalytic cracking, polymerization, alkylation, reforming, hydrocracking, hydroforming, hydrogenation, hydrogen treating, solvent extraction, dewaxing, de-oiling, acid treating, clay filtration and deasphalting. Refining:- Petroleum is a complex mixture of organic liquids called Crude Oil and Natural Gas, which occurs naturally in the ground and was formed millions of years ago. Crude oil varies from oilfield to oilfield in color and composition, from a pale yellow low viscosity liquid to heavy black 'treacle' consistencies. Crude oil and natural gas are extracted from the ground, on land or under the oceans, by sinking an oil well and are then transported by pipeline and/or ship to refineries where their components are processed into refined products. Crude oil and natural gas are of little use in their raw state; their value lies in what is created from them:- fuels, lubricating oils, waxes, asphalt, petrochemicals and pipeline quality natural gas. An oil refinery is an organized and coordinated arrangement of manufacturing processes designed to produce physical and chemical changes in crude oil to convert it into everyday products like petrol, diesel, lubricating oil, fuel oil and bitumen. As crude oil comes from the well it contains a mixture of hydrocarbon compounds and relatively small quantities of other materials such as oxygen, nitrogen, sulphur, salt and water. In the refinery, most of these non-hydrocarbon substances are removed and the oil is broken down into its various components, and blended into useful products. Natural gas from the well, while principally methane, contains quantities of other hydrocarbons – ethane, propane, butane, pentane and also carbon dioxide and water. These components are separated from the methane at a gas fractionation plant. Petroleum Hydrocarbon Structures:- petroleum consists of three main hydrocarbon groups:- (i) Paraffins:- these consist of straight or branched carbon rings saturated with hydrogen atoms, the simplest of which is methane (CH_4) the main ingredient of natural gas. Others in this group include ethane (C_2H_6), and propane (C_3H_8). (ii) Hydrocarbons:- with very few carbon atoms (C_1 to C_4) are light in density and are gases under normal atmospheric pressure. Chemically paraffins are very stable compounds. (iii) Naphthenes:- naphthenes consist of carbon rings, sometimes with side chains, saturated with hydrogen atoms. Naphthenes are chemically stable, they occur naturally in crude oil and have properties similar to paraffins. (iv) Aromatics:- aromatic hydrocarbons are compounds that contain a ring of six carbon atoms with alternating double and single bonds and six attached hydrogen atoms. This type of structure is known as a Benzene Ring. They occur naturally in crude oil, and can also be created by the refining process. The more carbon atoms a hydrocarbon molecule has, the 'heavier' it is (the higher is its molecular weight) and the higher is its the boiling point. Small quantities of a crude oil may be composed of compounds containing oxygen, nitrogen, sulphur and metals. Sulphur content ranges from traces to more than 5 per cent. If a crude oil contains appreciable quantities of sulphur it is called a Sour Crude; if it contains little or no sulphur it is called a Sweet Crude. The Refining Process:- every refinery begins with the separation of crude oil into different fractions by distillation. The fractions are further treated to convert them into mixtures of more useful saleable products by various methods such as cracking, reforming, alkylation, polymerisation and isomerisation. These mixtures of new compounds are then separated using methods such as fractionation and solvent extraction.

Impurities are removed by various methods, e.g., dehydration, desalting, sulphur removal and hydrotreating. Refinery processes have developed in response to changing market demands for certain products. With the advent of the internal combustion engine the main task of refineries became the production of petrol. The quantities of petrol available from distillation alone was insufficient to satisfy consumer demand. Refineries began to look for ways to produce more and better quality petrol. Two types of processes have been developed:- (i) breaking down large, heavy hydrocarbon molecules; and (ii) reshaping or rebuilding hydrocarbon molecules. Distillation (Fractionation):- because crude oil is a mixture of hydrocarbons with different boiling temperatures, it can be separated by distillation into groups of hydrocarbons that boil between two specified boiling points. Two types of distillation are performed:- atmospheric and vacuum. Atmospheric Distillation takes place in a distilling column at or near atmospheric pressure. The crude oil is heated to 350–400 °C and the vapour and liquid are piped into the distilling column. The liquid falls to the bottom and the vapour rises, passing through a series of perforated trays (sieve trays). Heavier hydrocarbons condense more quickly and settle on lower trays and lighter hydrocarbons remain as a vapour longer and condense on higher trays. Liquid fractions are drawn from the trays and removed. In this way the light gases, methane, ethane, propane and butane pass out the top of the column, petrol is formed in the top trays, kerosene and gas oils in the middle, and fuel oils at the bottom. Residue drawn of the bottom may be burned as fuel, processed into lubricating oils, waxes and bitumen or used as feedstock for cracking units. To recover additional heavy distillates from this residue, it may be piped to a second distillation column where the process is repeated under vacuum, called Vacuum Distillation.This allows heavy hydrocarbons with boiling points of 450 °C and higher to be separated without them partly cracking into unwanted products such as coke and gas. The heavy distillates recovered by vacuum distillation can be converted into lubricating oils by a variety of processes. The most common of these is called Solvent Extraction. In one version of this process the heavy distillate is washed with a liquid which does not dissolve in it but which dissolves (and so extracts) the non-lubricating oil components out of it. Another version uses a liquid which does not dissolve in it but which causes the non-lubricating oil components to precipitate (as an extract) from it. Other processes exist which remove impurities by adsorption onto a highly porous solid or which remove any waxes that may be present by causing them to crystallise and precipitate out. Reforming:- reforming is a process which uses heat, pressure and a catalyst (usually containing platinum) to bring about chemical reactions which upgrade naphthas into high octane petrol and petrochemical feedstock. The naphthas are hydrocarbon mixtures containing many paraffins and naphthenes. In Australia, this naphtha feedstock comes from the crudes oil distillation or catalytic cracking processes, but overseas it also comes from thermal cracking and hydrocracking processes. Reforming converts a portion of these compounds to isoparaffins and aromatics, which are used to blend higher octane petrol. (i) Paraffins are converted to isoparaffins. (ii) Paraffins are converted to naphthenes. (iii) Naphthenes are converted to aromatics, e.g., (a) catalyst heptanes → toluene + hydrogen ($C_7H_{16} \rightarrow C_7H_8 + 4H_2$); (b) catalyst cyclohexane → benzene + hydrogen ($C_6H_{12} \rightarrow C_6H_6 + 3H_2$). Cracking:- cracking processes break down heavier hydrocarbon molecules (high boiling point oils) into lighter products such as petrol and diesel. These processes include catalytic cracking, thermal cracking and hydrocracking, e.g., a typical reaction:- catalyst ($C_{16}H_{34} \rightarrow C_8H_{18} + C_8H_{16}$). Catalytic Cracking is used to convert heavy hydrocarbon fractions obtained by vacuum distillation into a mixture of more useful products such as petrol and light fuel oil. In this process, the feedstock undergoes a chemical breakdown, under controlled heat (450–500 °C) and pressure, in the presence of a catalyst – a substance which promotes the reaction without itself being chemically changed. Small pellets of silica – alumina or silica – magnesia have proved to be the most effective catalysts. The cracking reaction yields petrol, LPG, unsaturated olefin compounds, cracked gas oils, a liquid residue called Cycle Oil, light gases and a solid coke residue. Cycle oil is recycled to cause further breakdown and the coke, which forms a layer on the catalyst, is removed by burning. The other products are passed through a fractionator to be separated and separately processed. Fluid Catalytic Cracking uses a catalyst in the form of a very fine powder which flows like a liquid when agitated by steam, air or vapour. Feedstock entering the process immediately meets a stream of very hot catalyst and vaporizes. The resulting vapours keep the catalyst fluidised as it passes into the reactor, where the cracking takes place and where it is fluidised by the hydrocarbon vapour. The catalyst next passes to a steam stripping section where most of the volatile hydrocarbons are removed. It then passes to a regenerator vessel where it is fluidised by a mixture of air and the products of combustion which are produced as the coke on the catalyst is burnt off. The catalyst then flows back to the reactor. The catalyst thus undergoes a continuous circulation between the reactor, stripper and regenerator sections. The catalyst is usually a mixture of aluminium oxide and silica. Most recently, the introduction of synthetic zeolite catalysts has allowed much shorter reaction times and improved yields and octane numbers of the cracked gasolines. Thermal Cracking uses heat to break down the residue from vacuum distillation. The lighter elements produced from this process can be made into distillate fuels and petrol. Cracked gases are converted to petrol blending components by alkylation or polymerisation. Naphtha is upgraded to high quality petrol by reforming. Gas oil can be used as diesel fuel or can be converted to petrol by hydrocracking. The heavy residue is converted into residual oil or coke which is used in the manufacture of electrodes, graphite and carbides. This process is the oldest technology and is not used in Australia. Hydrocracking can increase the yield of petrol components, as well as being used to produce light distillates. It produces no residues, only light oils. Hydrocracking is catalytic cracking in the presence of hydrogen. The extra hydrogen saturates, or hydrogenates, the chemical bonds of the cracked hydrocarbons and creates isomers with the desired characteristics. Hydrocracking is also a treating process, because the hydrogen combines with contaminants such as sulphur and nitrogen, allowing them to be removed. Gas oil feed is mixed with hydrogen, heated, and sent to a reactor vessel with a fixed bed catalyst, where cracking and hydrogenation take place. Products are sent to a fractionator to be separated. The hydrogen is recycled. Residue from this reaction is mixed again with hydrogen, reheated, and sent to a second reactor for further cracking under higher temperatures and pressures. In addition to cracked naphtha for making petrol, hydrocracking yields light gases useful for refinery fuel, or alkylation as well as components for high quality fuel oils, lube oils and petrochemical feedstocks. Following the cracking processes it is necessary to build or rearrange some of the lighter hydrocarbon molecules into high quality petrol or jet fuel blending components or into petrochemicals. The former can be achieved by several chemical process such as alkylation and isomerisation. Alkylation:- olefins such as propylene and butylene are produced by catalytic and thermal cracking. Alkylation refers to the chemical bonding of these light molecules with isobutane to form larger branched-chain molecules (isoparaffins) that make high octane petrol. Olefins and isobutane are mixed with an acid catalyst and cooled. They react to form alkylate, plus some normal butane, isobutane and propane. The resulting liquid is neutralised and separated in a series of distillation columns. Isobutane is recycled as feed and butane and propane sold as liquid petroleum gas (LPG), e.g., catalyst isobutene + butylenes → isooctane ($C_4H_{10} + C_4H_8 \rightarrow C_8H_{18}$). Isomerisation:- isomerisation refers to chemical rearrangement of straight-chain hydrocarbons (paraffins), so that they contain branches attached to the main chain (isoparaffins). This is done for two reasons:- (i) they create extra isobutane feed for alkylation; and (ii) they improve the octane of straight run pentanes and hexanes and hence make them into better petrol blending components. Isomerisation is achieved by mixing normal butane with a little hydrogen and chloride and allowed to react in the presence of a catalyst to form isobutane, plus a small amount of normal butane and some lighter gases. Products are separated in a fractionator. The lighter gases are used as refinery fuel and the butane recycled as feed. Pentanes and hexanes are the lighter components of petrol. Isomerisation can be used to improve petrol quality by converting these hydrocarbons to higher octane isomers. The process is the same as for butane isomerisation. Polymerisation:- under pressure and temperature, over an acidic catalyst, light unsaturated hydrocarbon molecules react and combine with each other to form larger hydrocarbon molecules. Such process can be used to react butenes (olefin molecules with four carbon atoms) with iso-butane (branched paraffin molecules, or isoparaffins, with four carbon atoms) to obtain a high octane

olefinic petrol blending component called Polymer Gasoline. Hydrotreating And Sulphur Plants:- a number of contaminants are found in crude oil. As the fractions travel through the refinery processing units, these impurities can damage the equipment, the catalysts and the quality of the products. There are also legal limits on the contents of some impurities, like sulphur, in products. Hydrotreating is one way of removing many of the contaminants from many of the intermediate or final products. In the hydrotreating process, the entering feedstock is mixed with hydrogen and heated to 300–380 °C. The oil combined with the hydrogen then enters a reactor loaded with a catalyst which promotes several reactions:- (i) hydrogen combines with sulphur to form hydrogen sulphide (H_2S); (ii) nitrogen compounds are converted to ammonia; (iii) any metals contained in the oil are deposited on the catalyst; and (iv) some of the olefins, aromatics or naphthenes become saturated with hydrogen to become paraffins and some cracking takes place, causing the creation of some methane, ethane, propane and butanes. Sulphur Recovery Plants:- the hydrogen sulphide created from hydrotreating is a toxic gas that needs further treatment. The usual process involves two steps:- (i) the removal of the hydrogen sulphide gas from the hydrocarbon stream; and (ii) the conversion of hydrogen sulphide to elemental sulphur, a non-toxic and useful chemical. Solvent extraction, using a solution of diethanolamine (DEA) dissolved in water, is applied to separate the hydrogen sulphide gas from the process stream. The hydrocarbon gas stream containing the hydrogen sulphide is bubbled through a solution of diethanolamine solution (DEA) under high pressure, such that the hydrogen sulphide gas dissolves in the DEA. The DEA and hydrogen mixture is the heated at a low pressure and the dissolved hydrogen sulphide is released as a concentrated gas stream which is sent to another plant for conversion into sulphur. Conversion of the concentrated hydrogen sulphide gas into sulphur occurs in two stages:- (1) Combustion of part of the H_2S stream in a furnace, producing sulphur dioxide (SO_2) water (H_2O) and sulphur (S) ($2H_2S + 2O_2 \rightarrow SO_2 + S + 2H_2O$); and (2) Reaction of the remainder of the H_2S with the combustion products in the presence of a catalyst. The H_2S reacts with the SO_2 to form sulphur ($2H_2S + 2O_2 \rightarrow 3S + 2H_2O$). As the reaction products are cooled the sulphur drops out of the reaction vessel in a molten state. Sulphur can be stored and shipped in either a molten or solid state. Refineries And The Environment:- air, water and land can all be affected by refinery operations. Refineries are well aware of their responsibility to the community and employ a variety of processes to safeguard the environment. The processes described below are those used by the Shell refinery at Geelong in Victoria, but all refineries employ similar techniques in managing the environmental aspects of refining. Air:- preserving air quality around a refinery involves controlling the following emissions:- (i) sulphur oxides; (ii) hydrocarbon vapours; (iii) smoke; and (iv) smells. Sulphur enters the refinery in crude oil feed. Gippsland and most other Australian crude oils have a low sulphur content but other crude's may contain up to 5 per cent sulphur. To deal with this refineries incorporate a sulphur recovery unit which operates on the principles described above. Many of the products used in a refinery produce hydrocarbon vapours. The escape of vapours to atmosphere are prevented by various means. Floating roofs are installed in tanks to prevent evaporation and so that there is no space for vapour to gather in the tanks. Where floating roofs cannot be used, the vapours from the tanks are collected in a vapour recovery system and absorbed back into the product stream. In addition, pumps and valves are routinely checked for vapour emissions and repaired if a leakage is found. Smoke is formed when the burning mixture contains insufficient oxygen or is not sufficiently mixed. Modern furnace control systems prevent this from happening during normal operation. Smells are the most difficult emission to control and the easiest to detect. Refinery smells are generally associated with compounds containing sulphur, where even tiny losses are sufficient to cause a noticeable odour. Water:- aqueous effluent's consist of cooling water, surface water and process water. The majority of the water discharged from the refinery has been used for cooling the various process streams. The cooling water does not actually come into contact with the process material and so has very little contamination. The cooling water passes through large 'interceptors' which separate any oil from minute leaks etc, prior to discharge. The cooling water system at Geelong Refinery is a once-through system with no recirculation. Rainwater falling on the refinery site must be treated before discharge to ensure no oily material washed off process equipment leaves the refinery. This is done first by passing the water through smaller 'plant oil catchers', which each treat rainwater from separate areas on the site, and then all the streams pass to large 'interceptors' similar to those used for cooling water. The rainwater from the production areas is further treated in a Dissolved Air Flotation (DAF) unit. This unit cleans the water by using a flocculation agent to collect any remaining particles or oil droplets and floating the resulting flock to the surface with millions of tiny air bubbles. At the surface the flock is skimmed off and the clean water discharged. Process water has actually come into contact with the process streams and so can contain significant contamination. This water is treated in the 'sour water treater' where the contaminants (mostly ammonia and hydrogen sulphide) are removed and then recovered or destroyed in a downstream plant. The process water, when treated in this way, can be reused in parts of the refinery and discharged through the process area rainwater treatment system and the DAF unit. Any treated process water that is not reused is discharged as Trade Waste to the sewerage system. This trade waste also includes the effluent from the refinery sewage treatment plant and a portion of treated water from the DAF unit. As most refineries import and export many feed materials and products by ship, the refinery and harbour authorities are prepared for spillage from the ship or pier. In the event of such a spill, equipment is always on standby at the refinery and it is supported by the facilities of the Australian Marine Oil Spill Centre at Geelong, Victoria. Land:- the refinery safeguards the land environment by ensuring the appropriate disposal of all wastes. Within the refinery, all hydrocarbon wastes are recycled through the refinery slops system. This system consists of a network of collection pipes and a series of dewatering tanks. The recovered hydrocarbon is reprocessed through the distillation units. Wastes that cannot be reprocessed are either recycled to manufacturers (e.g., some spent catalysts can be reprocessed), disposed of in EPA-approved facilities off-site, or chemically treated on-site to form inert materials which can be disposed to land-fill within the refinery. Waste movements within the refinery require a 'Process liquid, Sludge and Solid waste disposal permit'. Wastes that go off-site must have an EPA (short for the US Environmental Protection Agency) 'Waste Transport Permit'. Petroleum Refining is the process of separating the many compounds present in crude petroleum. This process is called Fractional Distillation where the crude oil is heated; the various of the compounds boil at different temperatures and change to gases; and are later recondensed back into liquids. Fossil Fuels. The principle which is used is that the longer the carbon chain, the higher the temperature at which the compounds will boil. Boiling Points and Hydrocarbons:- the crude petroleum is heated and changed into a gas. The gases are passed through a distillation column which becomes cooler as the height increases. See the figure on the left. When a compound in the gaseous state cools below its boiling point, it condenses into a liquid. The liquids may be drawn off the distilling column at various heights. Although all fractions of petroleum find uses, the greatest demand is for gasoline. One barrel of crude petroleum contains only 25–35% gasoline. Transportation demands require that over 50% of the crude oil be converted into gasoline. To meet this demand some petroleum fractions must be converted to gasoline. This may be done by 'cracking' – breaking down large molecules of heavy heating oil; 'reforming' – changing molecular structures of low quality gasoline molecules; or 'polymerization' – forming longer molecules from smaller ones. Conversion Oil Refining. For example if decane is heated to about 500 °C the covalent carbon-carbon bonds begin to break during the cracking process. Many kinds of compounds including alkenes are made during the cracking process. Alkenes are formed because there are not enough hydrogens to saturate all bonding positions after the carbon-carbon bonds are broken. Refining is a chemical process. Crude oil is mainly made up of hydrocarbons – chains of carbon atoms and hydrogen atoms. The chemical bonds that link these chains together can be broken up and linked in different ways. In fact, the hydrocarbon compound is the most versatile on the chemical charts. It can make an estimated 2.5 million possible combinations. Longer, heavier molecules can be transformed into lighter ones and vice versa. But crude oil is far from pure. It can also contain substances that need to be removed because they would damage an engine or other machinery. In the refinery, we remove sulphur,

nitrogen, oxygen, water and other trace substances and then dispose of them safely. Vaporizing The Crude Oil:- the first step in separating oil into useful products involves heating it to a about 350 °Celsius. It is then pumped into a fractioning tower. If you have ever seen an oil refinery from a distance, these are the tall, slender towers that jut up above the horizon. The vaporized oil rises up the tower through trays with holes in them. As the gas cools, its components condense back into several distinct liquids. Lighter liquids like kerosene and naptha, a product used in chemicals processing, collect near the top of the tower, while heavier ones like lubricants and waxes fall through weirs to trays at the bottom. Demand for gasoline is high, so we use the flexibility of the hydrocarbon compound to turn some of the heavier components from the fractioning tower into gasoline. Reforming and alkylation are two such processes. Cracking is another. It breaks large hydrocarbon molecules down into smaller ones, making the end product runnier. It's a process developed by the UK BP heritage company Amoco, and it's standard practice for oil companies today. After distillation, gasoline and other engine fuels go on for further processing elsewhere in the refinery. They will leave the refinery by pipeline or truck, having been transformed from a raw material into fuels with marketable octane ratings and specific engine properties. / Щел (Shell). Би.Пи. (BP) Амоко (Amoco). Перегонка – процесс разделения жидких смесей на отличающиеся по составу фракции, основанный на различии температур кипения компонентов смеси; то же, что Дистилляция. Перегонка Нефти – разделение нефти на составные части (фракции) по их температурам кипения в целях получения товарных нефтепродуктов или их компонентов. Перегонка нефти – начальный процесс переработки нефти на нефтеперерабатывающих заводах, основанный на том, что при нагреве нефти образуется паровая фаза, отличающаяся по составу от жидкости (смотрите Дистилляция). Фракции, получаемые в результате перегонки нефти, обычно представляют собой смеси углеводородов. С помощью методов многократной перегонки нефтяных фракций удаётся выделить некоторые индивидуальные углеводороды. Перегонка нефти осуществляется методами однократного испарения (равновесная дистилляция) или постепенного испарения (простая перегонка, или фракционная дистилляция); с ректификацией и без неё; в присутствии перегретого водяного пара – Испаряющего Агента; при атмосферном давлении и под вакуумом. При равновесной дистилляции разделение нефти на фракции происходит менее чётко по сравнению с простой перегонкой. Однако в первом случае при одной и той же температуре нагрева в парообразное состояние переходит большая часть нефти. В лабораторной практике в основном применяется простая перегонка нефти с ректификацией паровой фазы на установках периодического действия. В промышленности используется перегонка нефти с однократным испарением в сочетании с ректификацией паровой и жидкой фаз. Такое сочетание позволяет проводить перегонку нефти на установках непрерывного действия и добиваться высокой чёткости разделения нефти на фракции, экономного расходования топлива на её нагрев. Применение водяного пара приводит к снижению температурного режима, увеличению отбора нефтяных фракций и повышению концентрации высококипящих компонентов в остатке. На промышленных установках перегонка нефти вначале проводится при атмосферном давлении, а затем под вакуумом. При атмосферной перегонке нефть нагревается не выше 370 °С, так как при более высокой температуре начинается расщепление углеводородов – Крекинг, а это нежелательно из-за того, что образующиеся непредельные углеводороды резко снижают качество и выход целевых продуктов. В результате атмосферной перегонки нефти отгоняются фракции, выкипающие примерно от 30 до 350–360 °С, и в остатке остаётся Мазут. Из нефтяных фракций, выкипающих до 360 °С, получаются различные виды топлив (бензины, топлива для реактивных и дизельных двигателей), сырьё для нефтехимического синтеза (бензол, этилбензол, ксилолы, этилен, пропилен, бутадиен), растворители и другие. Дальнейшая перегонка мазута проводится под вакуумом (остаточное давление 5.3–8 кН/м^2, или 40–60 миллиметров ртутного столба (мм рт.ст.)), чтобы свести к минимуму крекинг углеводородов. В бывшем Союзе Советских Социалистических Республик (СССР) на ряде нефтеперерабатывающих заводов производительность установок атмосферно-вакуумной перегонки нефти была доведена до 8 миллионов тонн нефти в год. История, сведения о перегонке нефти смотрите в статье Нефть. Очистка Нефтепродуктов – удаление из нефтепродуктов (дистиллятов и остатков от перегонки нефти) нежелательных компонентов, отрицательно влияющих на эксплуатационные свойства топлив и масел. К таким компонентам относятся сернистые и азотистые соединения, асфальтово-смолистые вещества и другие. В промышленности применяются химические, физико-химические и каталитические методы очистки. Химическая очистка производится путём воздействия различных реагентов на удаляемые компоненты очищаемых продуктов. Наиболее простым способом является очистка 92–98 %-ной серной кислотой и олеумом, применяемая для удаления непредельных и ароматических углеводородов, асфальтово-смолистых веществ, азотистых и сернистых соединений, и очистка щёлочами (растворами едкого натра и кальцинированной соды) – для удаления некоторых кислородных соединений, сероводорода и меркаптанов. Для удаления сернистых соединений применяют плюмбит натрия и некоторые другие реагенты. Физико-химическая очистка производится с помощью растворителей, избирательно удаляющих нежелательные компоненты из очищаемого продукта. Неполярные растворители (сжиженные газы – пропан и бутан) применяются для удаления из остатков после переработки нефти (гудронов и полугудронов) асфальтово-смолистых веществ, попициклических (тяжёлых) ароматических углеводородов (процесс деасфальтизации). Полярные растворители (фенол, фурфурол и другие) используются для удаления полициклических ароматических и нефтено-ароматических углеводородов с короткими боковыми цепями, непредельных углеводородов, сернистых и азотистых соединений, смолистых веществ из масляных дистиллятов и деасфальтизата. Кетоны в смеси с толуолом, хлорпроизводные углеводородов в смеси с бензолом и другие полярные и неполярные растворители и их смеси используются в процессе депарафинизации для удаления твёрдых углеводородов из рафинатов (продуктов селективной очистки масляных дистиллятов и остатков). Удаление твёрдых парафинов производится кристаллизацией их из растворов очищаемого продукта. Для очистки дизельных топлив, керосинов, тяжёлых бензинов и маловязких нефтяных масел применяют также карбамидную депарафинизацию, основанную на комплексообразовании нормальных парафиновых углеводородов с карбамидом (мочевиной). При адсорбционной очистке из нефтепродуктов удаляются непредельные углеводороды, смолы, кислоты и другие, а также полициклические ароматические и нафтеноароматические углеводороды. Адсорбционную очистку осуществляют при контактировании нагретого продукта с тонкодисперсными адсорбентами (Контактная Очистка) или фильтрацией продукта через зёрна адсорбента. Избирательная адсорбция при помощи молекулярных сит (Цеолитов) позволяет выделить нормальные парафины из лёгких бензиновых и керосино-газойлевых фракций. Каталитическая Очистка:- гидрогенизация в мягких условиях (гидроочистка) применяется для удаления сернистых, азотистых и кислородных соединений, которые переходят в углеводороды и легко удаляемые соединения (сероводород, аммиак, воду). Гидрогенизация в жёстких условиях используется при депарафинизации масляного сырья. В этом случае происходит деструкция твёрдых углеводородов с образованием низкомолекулярных и низкозастывающих углеводородов. При жёстких режимах гидрирования можно также получать масла с высоким индексом вязкости. В технологии очистки нефтепродуктов широко применяется эффективная аппаратура, позволяющая использовать автоматизацию:- экстракционные колонны, центробежные экстракторы, роторно-дисковые контакторы, вакуум-фильтры, инжекторные смесители и другие.

REFINING = РАФИНИРОВАНИЕ (или АФФИНАЖ, или ОЧИСТКА) – Refining is the separating and purifying of precious metals from other metals. Refining:- refining is the final procedure for removing (and often recovering as by-products) the last small amounts of impurities left after the major extraction steps have been completed. It leaves the major metallic element in a practically pure state for commercial application. The procedure is accomplished in three ways: refining by fire, by electrolytic, or by chemical methods. (i) Fire

Refining:- iron, copper, and lead are fire-refined by selective oxidation. In this process, oxygen or air is added to the impure liquid metal; the impurities oxidize before the metal and are removed as an oxide slag or a volatile oxide gas. The basic oxygen furnace (BOF) is a vessel used to convert pig iron, of about 94 percent iron and 6 percent combined impurities such as carbon, manganese, and silicon, into steel with as little as 1 percent combined impurities. The BOF is a large pear-shaped unit that can be tilted to charge and pour. Molten blast-furnace iron and steel scrap are charged into the furnace; then it is turned to an upright position and a lance inserted to blow high-tonnage oxygen gas into the bath. Oxidation reactions occur rapidly, with silicon and manganese oxidizing first and combining to form an oxide slag, then carbon oxidizing to carbon monoxide gas and burning to carbon dioxide as it leaves the furnace mouth. These reactions are strongly exothermic and keep the vessel up to its reaction temperature without any external heat or fuel being added. Converter-produced blister copper and blast-furnace lead also are treated by fire refining, with both processes depending on the weaker affinity for oxygen of the metals than the impurities they contain. Molten copper in a small reverberatory-type furnace has compressed air blown into it through steel pipes below the surface. This oxidizes zinc, tin, iron, lead, arsenic, antimony, and sulfur; the sulfur goes off as sulfur dioxide gas, while the other impurities form an oxide slag that is skimmed off. Lead is refined in much the same way, with compressed air blown into a molten lead bath and the major impurities of tin, antimony, and arsenic oxidizing in that order, rising to the surface as skims and being scraped off. Other fire-refining operations use fractional distillation. By this method, zinc metal of 98-percent purity can be upgraded to 99.995-percent purity. The main impurities in blast-furnace zinc are lead and cadmium, with lead boiling at 1 744 °C (3 171 °F), zinc at 907 °C (1 665 °F), and cadmium at 765 °C (1 409 °F). In the first stage zinc and cadmium are boiled off, leaving liquid lead, and in the second stage cadmium is boiled off to leave special high-purity zinc metal. (ii) Electrolytic Refining:- this method gives the highest-purity metal product as well as the best recovery of valuable impurities. It is used for copper, nickel, lead, gold, and silver. The metal to be refined is cast into a slab, which becomes the anode of an electrolytic cell; another sheet of metal is the cathode. Both electrodes are immersed in an aqueous electrolyte capable of conducting an electric current. As a direct current is impressed on the cell, metal ions dissolve from the anode and deposit at the cathode. The insoluble sludge left in the cell is treated to recover any valuable by-product metals. (iii) Chemical Refining:- an example of chemical refining is the nickel carbonyl process, in which impure nickel metal is selectively reacted with carbon monoxide gas to form nickel carbonyl gas. This gas is then decomposed to give high-purity nickel metal. / Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). электролитическое рафинирование или электролитический аффинаж благородных металлов (electrolytic refining) Под Рафинированием металлов понимается очистка первичных (черновых) металлов от примесей. В основе методов рафинирования (пирометаллургического, химического и электролитического) лежит различие свойств плотности и другого. Рафинирование благородных металлов называется Аффинажем. Под Аффинажем, от Французского слова Affinage, от Affiner, означающее Очищать, понимается получение благородных металлов высокой чистоты. Разновидность рафинирования металлов. Под Очисткой понимается отрасль обрабатывающей металлургии, связанная с извлечением металлов из руд и их очисткой от примесей.

REFINING MARGIN = ВЫГОДА ОТ ПЕРЕРАБОТКИ (или МАРЖА ОТ ПЕРЕГОНКИ, или СТОИМОСТЬ ПЕРЕРАБОТКИ, или МАРЖА ОТ ОЧИСТКИ) – Refining Margin is the net difference in value between the products produced by a refinery and the CIF value of the crude oil used to produce them, taking into account the marginal refinery operating costs. Refining margins will thus vary from refinery to refinery and depend on the cost and characteristics of the crude used, its yield and the value of its products (and hence its location).

REFLECTANCE = КОЭФФИЦИЕНТ ОТРАЖЕНИЯ (или ОТРАЖАТЕЛЬНАЯ СПОСОБНОСТЬ, или АЛЬБЕДО, или ХХ) – Reflectance:- the ratio of the intensity of reflected radiant flux to that of the incident flux. In popular usage, it is considered as the ratio of the intensity of reflected radiant energy to that reflected from a defined reference standard.

REFLECTANCE = ОТРАЖАЕМОСТЬ – Reflectance (Rd); the whiteness of the light that is reflected by the cotton fibers. See also Color. / Количество света, отражённое поверхностью испытуемой пробы хлопкового волокна, выраженное в процентах.

REFLECTION = ОТРАЖЕНИЕ (или ОТОБРАЖЕНИЕ, или РЕФЛЕКСИЯ) – Reflection:- of radiant energy (in the case of color, light), the process by which radiant energy is returned from a material or object. / Под Рефлексией, от Латинского слова Reflexio, означающее Обращение Назад, понимается .

REFLECTIVE = ОТРАЖАТЕЛЬНОЕ (или ОТРАЖАЮЩЕЕ) – Reflective:- specialty ink or transfers that are generally used for safety applications. Reflective material reflects a bright image back at the source of light. A wonderful application for Children's clothing. The Apparel Search Company thinks that it should be a requirement on Children's outerwear and shoes.

REFLECTIVE INSULATION TECHNOLOGY = ТЕХНОЛОГИЯ ОТРАЖАТЕЛЬНОЙ ИЗОЛЯЦИИ – Reflective Insulation Technology:- all materials emit energy by thermal radiation as a result of their temperature. The amount of energy or radiant heat reflected depends on the surface temperature. The higher the surface temperature is, the greater the reflection will be. Reflective Insulation Technology has been used by the US National Aeronautics and Space Administration (NASA) since the earliest satellites, and continues to be used today as the primary space suit insulation to protect every astronaut in space from the extreme temperatures of outer space. The technology is effective in temperatures as high as 120 degrees C (250 degrees F) to as low as –273 degrees C (–400 degrees F).

REFLEXED = ЗАВЁРНУТОЕ – Reflexed:- abruptly curved backwards. / , от Латинского слова Reflexus, означающее Отражённый или Повёрнутый Назад, .

REFLUX = ОТТОК (или ОТЛИВ) – Reflux:- to cause to flow back or return; especially:- to heat (as under a reflux condenser) so that the vapors formed condense to a liquid that flows back to be heated again.

REFORM = РЕФОРМА (или ПРЕОБРАЗОВАНИЕ) – Reform is a movement that attempts to institute improved social and political conditions without revolutionary change. / Под Реформой, от Французского слова Réforme от Латинского слова Reformo, означающее Преобразовываю, понимается преобразование, изменение, переустройство какой-либо стороны общественной жизни (порядков, институтов, учреждений), не уничтожающие основ существующей социальной структуры. Формально – нововведение любого содержания, однако реформой обычно называют более или менее прогрессивное преобразование.

REFORMING = РИФОРМИНГ – Reforming is a refining process using controlled heat and pressure with catalyst to rearrange hydrocarbon molecules in the naphtha (or naphtha-type) feed, thereby converting paraffinic and naphthenic type hydrocarbons (low-octane gasoline boiling range fractions) into higher octane stocks suitable for blending into finished gasoline. Since the process' product, reformate, is richer in aromatics than its feed, naphtha, this process is also used to produce aromatic petrochemicals (benzene, toluene and xylene). In oil refinery process, the use of heat and catalysts to effect the rearrangement of certain hydrocarbon molecules without altering their composition appreciably; for example, the conversion of low-octane naphthas or gasolines into high-octane number products. / (бензол, толуол и ксилол). Под Риформингом, от Английского слова Reforming, от Reform, означающее Переделывать или Улучшать, понимается промышленный процесс переработки нефтепродуктов, главным образом бензиновых и лигроиновых фракций нефти, с целью получения высокооктановых автомобильных бензинов

(октановое число 90–95), ароматических углеводородов (бензола, ксилолов, толуола) и технического водорода. Каталитический риформинг осуществляется при 470–540 °C под давлением 0.7–3.5 МПа в присутствии платинового катализатора (платформинг), алюмомолибденового катализатора – гидроформинг; термический риформинг проводят при температуре около 550 °C и давлении 5–7 МПа.

REFORMULATED GASOLINE BLENDSTOCK FOR OXYGEN BLENDING = ГАЗОВЫЙ БЕНЗИН РЕФОРМУЛИРОВАННОЙ ГАЗОВОЙ БЕНЗИНОВОЙ СМЕСИ ДЛЯ СМЕШИВАНИЯ С КИСЛОРОДОМ – Reformulated Blendstock For Oxgenate Blending (RBOB):- Motor gasoline blending components intended for blending with oxygenates to produce finished reformulated motor gasoline. Gasoline is one of the most widely-known and used commodities worldwide. It is primarily utilized for fuels, but can be also used for various reasons like a solvent to dilute paints. While we refer to the liquid as gasoline here in the States, many other parts of the world know it by the term petrol, or sometimes petrogasoline. From a chemical standpoint, this low-density fuel is very volatile, not only because of its natural makeup, but also because of the numerous additives that can be mixed in. Some of these additives include lead, ethanol, and dye. Gasoline itself was not invented, but rather, is a byproduct of the petroleum industry, namely from the production of kerosene and refining of crude oil. It was thrust into popularity with the introduction of automobiles, which had the option of using various fuel sources, but ultimately decided upon gasoline for its strong combustion properties. Since then, numerous ways have been invented to improve the quality of gasoline as it is refined from crude oil all over the world. Gasoline can be a particularly nasty thorn in a consumer's side, due to prices at the pump being highly volatile as the prices of crude are known for their dramatic price swings over small periods of time. From an investment standpoint, the term petrol or gasoline, refers to Reformulated Gasoline Blendstock for Oxygen Blending (RBOB), which is simply the term given to unleaded gas futures. Seasonally, gas futures tend to dip in the winter months, November and December, and reach their peaks between April and May. Because the United States is the largest consumer of gasoline, how our nation uses gasoline can have a major impact on global prices. Physical Properties Of RBOB Gasoline:- As mentioned above, gasoline is a natural byproduct of crude oil. For every three barrels of crude oil refined, approximately two barrels of gasoline can be salvaged. Refining this essential fuel can be done in a variety of different ways, with the most popular being forms of 'cracking'. Cracking is a process where hydrocarbon molecules are broken up by heat and pressure, into lighter molecules. There are various forms of this process, including thermal cracking (the most popular), and catalytic cracking. Other production/refining methods include polymerization, alkylation, and isomerization. New York Harbor RBOB Gasoline:- Reformulated Gasoline Blendstock for Oxygen Blending (RBOB) Futures:- Trading Unit:- 42 000 US gallons (1 000 barrels). Price Quotation:- US Dollars and cents per gallon. Trading Hours (All times are New York time):- Open outcry trading is conducted from 10:05 AM until 02:30 PM. Electronic trading is conducted from 06:00 pm until 05:15 pm via the CME Globex® trading platform, Sunday through Friday. There is a 45-minute break each day between 05:15 pm (current trade date) and 06:00 pm (next trade date). Trading Months:- 12 consecutive months on a rolling basis, starting with the January 2006 contract month. Trading at Settlement (TAS):- Trading at settlement is available for the front two months except on the last trading day and is subject to the existing TAS rules. Trading in all TAS products will cease daily at 02:30 pm Eastern Time. The TAS products will trade off of a 'Base Price' of 100 to create a differential (plus or minus) in points off settlement in the underlying cleared product on a 1 to 1 basis. A trade done at the Base Price of 100 will correspond to a 'traditional' TAS trade which will clear exactly at the final settlement price of the day. Minimum Price Fluctuation:- USD0.0001 (0.01¢) per gallon (USD4.20 per contract). Maximum Daily Price Fluctuation:- USD0.25 per gallon (USD10 500 per contract) for all months. If any contract is traded, bid, or offered at the limit for five minutes, trading is halted for five minutes. When trading resumes, the limit is expanded by USD0.25 per gallon in either direction. If another halt were triggered, the market would continue to be expanded by USD0.25 per gallon in either direction after each successive five-minute trading halt. There will be no maximum price fluctuation limits during any one trading session. Last Trading Day:- Trading terminates at the close of business on the last business day of the month preceding the delivery month. Settlement Type:- Physical. Delivery:- FOB seller's facility in New York harbor ex-shore. All duties, entitlements, taxes, fees, and other charges paid. Requirements for seller's shore facility:- capability to deliver into barges. Delivery may also be completed by pipeline, tanker, book transfer, or inter- or intra-facility transfer. Delivery must be made in accordance with applicable federal, state, and local licensing and tax laws. Delivery shall comply with all state laws related to oxygen content. Complete delivery rules and provisions are detailed in Chapter 191 of the NYMEX® Rulebook. Delivery Period:- Deliveries may only be initiated the day after the fifth business day and must be completed before the last business day of the delivery month. Alternate Delivery Procedure (ADP):- An alternate delivery procedure is available to buyers and sellers who have been matched by the Exchange subsequent to the termination of trading in the spot month contract. If buyer and seller agree to consummate delivery under terms different from those prescribed in the contract specifications, they may proceed on that basis after submitting a notice of their intention to the Exchange. Exchange of Futures for Physicals (EFP):- The commercial buyer or seller may exchange a futures position for a physical position of equal quantity by submitting a notice to the Exchange. EFPs may be used to either initiate or liquidate a futures position. Grade and Quality Specifications:- Generally conforms to industry standards for reformulated regular gasoline blendstock for oxygen blending (RBOB) with 10% denatured fuel ethanol (92% purity) as listed by the Colonial Pipeline for fungible F grade for sales in New York and New Jersey. RBOB is a wholesale non-oxygentated blendstock traded in the New York Harbor barge market that is ready for the addition of 10% ethanol at the truck rack. Month – Reid Vapor Pressure (RVP) pounds per square inch – Volatile Organic Compounds (VOC) Percentage Reduction:- (i) January – 15.0 max – N/A; (ii) February – 15.0 max – N/A; (iii) March – 13.5 max – N/A; (iv) April – N/A – 23.4 min; (v) May – N/A – 23.4 min; (vi) June – N/A – 23.4 min; (vii) July – N/A – 23.4 min; (viii) August – N/A – 23.4 min; (ix) September 01–15 – N/A – 23.4 min; (x) September 16–30 – 13.5 max – N/A; (xi) October – 13.5 max – N/A; (xii) November – 15.0 max – N/A; and (xiii) December – 15.0 max – N/A. Margin Requirements:- Margins are required for open futures positions. Trading Symbol:- RB; RBT (TAS Code). 2015-March-25 (US Energy Information Administration (EIA)):- Gasoline specification changes and price effects:- While the vernal equinox on March 20th marks the first official day of spring, the transition from winter-grade gasoline to spring-grade gasoline, an intermediate step in the shift to summer-grade gasoline, began much earlier. The transition occurs along the gasoline supply chain, from refineries to retail outlets, and affects spot, wholesale and retail gasoline prices because the cost to manufacture spring and summer-grade gasoline is higher than the cost to manufacture gasoline used in the winter. Federal and state environmental regulations specify the properties of finished gasoline that can be sold at retail stations across the United States. Many specifications, like octane rating, remain constant from season to season. However, Reid Vapor Pressure (RVP), a measure of how easily petroleum liquids evaporate, changes to accommodate seasonal temperature variations that affect both the performance of gasoline in an internal combustion engine and emissions. In the winter, higher RVP ensures that gasoline combusts easily at very low temperatures; in the spring and summer, a lower-RVP gasoline prevents vapor lock, when too much vapor may prevent an engine from starting, and reduces evaporative emissions into the atmosphere that contribute to smog. The diverse specifications for finished gasoline create the need for different types of Blendstock for Oxygenate Blending (BOB), the petroleum component of gasoline that is produced by refineries and blended with ethanol to produce the finished gasoline that is sold at retail stations. BOBs include RBOB, which is used to make the reformulated gasoline that is required in regions with high smog levels, and is optional elsewhere. CBOB, the most common, is the basis for the conventional gasoline that is sold in regions that do not require reformulated gasoline. CARBOB is used to make gasoline that meets the specifications defined by the California Air Resources Board; and AZBOB is used to make gasoline that meets the specifications required by the state of Arizona. The more stringent specifications for reformulated gasoline, as

well as for gasoline sold in California and Arizona, increase the manufacturing cost compared with conventional gasoline. The cost increment increases as the RVP specification decreases, and during the spring and summer, the extra cost to produce RBOB causes its spot price to move higher than the spot price of CBOB. The timing of the shifts from winter-grade to spring-grade gasoline and from spring to summer-grade gasoline vary by region. The transition happens earlier in areas of the country where temperatures warm earlier in the calendar year, like southern California. In addition, because of the length of the gasoline supply chain, refineries begin manufacturing spring and summer-grade gasoline well before the date by which regulations require it be available at retail stations. US Gulf Coast (USGC) refineries, which supply a substantial amount of gasoline to the US Northeast, begin manufacturing the lower-RVP spring-grade gasoline needed in the Northeast well before the date by which that gasoline must be available at retail stations. The lower-RVP gasoline blendstock must move through the distribution system (pipelines and terminals) to the retail station before the lower-RVP retail requirement deadline arrives. As a result, the spot prices for CBOB and RBOB in USGC reflect the more-costly spring gasoline sooner than RBOB and CBOB prices in New York Harbor. Since petroleum product pipeline systems closely monitor and control the quality and composition of the products being shipped, pipelines play an important role in the RVP transition. Petroleum product pipelines have shipping calendars divided into cycles, and the pipelines determine the maximum RVP allowed into their system during a given cycle depending on individual system needs. Pipeline RVP transitions run ahead of deadlines for transitions at the retail level, allowing the supply chain to adjust. Spot gasoline prices for a particular region are strongly linked to the predominant delivery system into the region. Thus, spot prices in most major markets will move in accordance with the pipeline RVP changes. Spot prices for gasoline blendstocks are often volatile during the winter-to-spring-to-summer transition. Market participants may lower prices for higher-RVP blendstock that remains in inventory in order to move it out of inventory before the RVP changeover. The opposite may also happen when supplies of higher-RVP blendstock run short before the changeover date. Once the RVP change has occurred, spot prices typically return to an equilibrium level, absent other changes in the market. Periods of market volatility can occur several times over the course of a transition period as pipeline RVP specifications step down from winter through to summer. The RVP transition's impact on price is easily and readily apparent in California gasoline markets, due to the state's unique gasoline specification and distribution system. In California, pipelines require the RVP of gasoline to transition from the December–January specification of 15 pounds per square inch (psi), to 13.5 psi in February and March, and down to 5.99 psi from April to October. During the transition months, spot prices for gasoline in California (Los Angeles and San Francisco) before the specification change typically are lower than prices after the RVP change. As noted in EIA analysis, changes in crude prices and spot gasoline prices will be mostly passed through to retail gasoline prices over the course of two weeks. However, the increased cost for lower-RVP gasoline occurs over a longer period, the timing of which varies by geography and is different than the price pass-through examined in previous EIA analysis. So, while springtime for US gasoline markets arrived ahead of the March 20 vernal equinox, the full impact on retail prices will take time to appear.

REFORMULATED MOTOR GASOLINE = РЕФОРМУЛИРОВАННЫЙ МОТОРНЫЙ ГАЗОВЫЙ БЕНЗИН (или РЕФОРМУЛИРОВАННЫЙ АВТОМОБИЛЬНЫЙ БЕНЗИН, или РЕФОРМУЛИРОВАННЫЙ АВТОМОБИЛЬНЫЙ ГАЗОЛИН) – Fuel whose physical or chemical property specification has been changed. Reformulated Motor Gasoline is a finished motor gasoline formulated for use in motor vehicles, the composition and properties of which meet the requirements of the reformulated gasoline regulations promulgated by the US Environmental Protection Agency under Section 211(k) of the Clean Air Act. This category includes Oxygenated Fuels Program Reformulated Gasoline (OPRG) but excludes Reformulated Gasoline Blendstock for Oxygenate Blending (RBOB). / но исключает Реформулированную Бензиновую Смесь для Смешивания с Кислородом (РБССК).

REFORWARDING CHARGE = СБОР ЗА КОНЕЧНУЮ ДОСТАВКУ – Reforwarding Charge:- charges paid or to be paid for subsequent surface or air transport from the airport of destination by a forwarder, but not by a carrier under the Air Waybill (aircargo). / В перевозках авиационных грузов, сборы, которые были оплачены или подлежат оплате, за последующую перевозку груза по суше или по воздуху из аэропорта назначения экспедитором (forwarder), но не перевозчиком (carrier) по Грузовой Авианакладной или Авиагрузовой Накладной (Air Waybill).

REFRACTION = РЕФРАКЦИЯ (или ПРЕЛОМЛЕНИЕ) – Refraction is the change of direction or speed of light as it passes from one medium to another. Refraction is a change in the direction of light determined by change in the velocity of the light in passing from one medium to another. / Под Рефракцией света, от позднелатинского слова Refractio, означающее Преломление, в широком смысле понимается то же, что и Преломление Света, то есть изменение направления световых лучей при изменении показателя преломления (ПП) среды, через которую эти лучи проходят. В силу исторической традиции термином Рефракция чаще пользуются, характеризуя распространение оптического излучения в средах с плавно меняющимся от точки к точке ПП (траектории лучей света в таких средах – плавно искривляющиеся линии), а термином Преломление чаще называется резкое изменение направления лучей на границе раздела двух однородных сред с разными ПП. В ряде разделов оптики традиционно используют именно термин Рефракция. К ним относятся атмосферная оптика, очковая оптика, оптика глаза и так далее. Рефракция глаза – характеристика глаза как оптической системы; оптическая сила глаза при покое аккомодации. Основные преломляющие элементы – роговая оболочка и хрусталик, оптическая сила которых варьирует от 52.59 до 71.30 диоптрии, составляя в среднем 59.92 диоптрии. Если оптическая сила глаза и его размеры соответствуют друг другу (Нормальная Рефракция, или Эмметропия), параллельные лучи света, проникающие в глаз, фокусируются в центре сетчатки – в области жёлтого пятна; в этом случае на сетчатке получается чёткое изображение рассматриваемого предмета – обязательное условие хорошего зрения. При нарушениях рефракция возникают близорукость или дальнозоркость. Рефракция глаза изменяется с возрастом:- она меньше нормальной у новорождённых, в пожилом возрасте может снова уменьшаться (так называемая Старческая Дальнозоркость). Лечение аномалий рефракции медикаментозными средствами невозможно; при её нарушениях применяется коррекция зрения оптическими линзами (подбор очков).

REFRACTIVE INDEX = ПРЕЛОМЛЯЕМЫЙ УКАЗАТЕЛЬ (или ПОКАЗАТЕЛЬ ПРЕЛОМЛЕНИЯ) – Refractive Index:- also called Index of Refraction, measure of the bending of a ray of light when passing from one medium into another. If i is the angle of incidence of a ray in vacuum (angle between the incoming ray and the perpendicular to the surface of a medium, called the Normal; and r is the angle of refraction (angle between the ray in the medium and the normal), the refractive index n is defined as the ratio of the sine of the angle of incidence to the sine of the angle of refraction; i.e. n = sin i / sin r. Refractive index is also equal to the velocity c of light of a given wavelength in empty space divided by its velocity v in a substance, or n = c/v. Some typical refractive indices for yellow light (wavelength equal to 589 nanometers (10^{-9} meter)) are the following:- air, 1.000 2; water, 1.333; crown glass, 1.517; dense flint glass, 1.655; and diamond, 2.417. The variation of refractive index with wavelength is the source of chromatic aberration in lenses. The refractive index of X-rays is slightly less than 1.0, which means that an X-ray entering a piece of glass from air will be bent away from the normal, unlike a ray of light, which will be bent toward the normal. The equation n = c/v in this case indicates, correctly, that the velocity of X-rays in glass and in other materials is greater than its velocity in empty space. See also Index Of Refraction.

REFRACTORY FIBER = ПРЕЛОМЛЯЕМОЕ ВОЛОКНО (или РЕФРАКТОРНОЕ ВОЛОКНО) – Refractory Fiber:- oxide or non-oxide, amorphous or crystalline, manufactured fiber generally used for applications at temperatures greater the 1 063 °C in both

oxidizing and nonoxidizing atmospheres, i.e. Al_2O_3, ZrO_2, $Al_2O_3 \cdot SiO_2$. Refractory Ceramic Fibers (RCFs) are synthetic, vitreous, noncrystalline, aluminum silicate-based fibers. They are produced by melting kaolin clay, or a mixture of alumina (Al_2O_3) and silica (SiO_2), and then spinning or blowing the melt to form elongated particles at least 3 times longer than wide (aspect ratio >3). Up to 20% of zirconia (ZrO_2), and about 1–5% of other metallic oxides (TiO_2, Cr_2O_3, Fe_2O_3, MgO, etc) are sometimes added in the process to produce specialty RCFs (e.g., zirconia RCF) for specific high-temperature applications. Fiber diameters and lengths vary within the products; the average diameters of most RCFs produced in the United States are 2.0–3.5 microns but can range from <1 micron to about 12 microns. Under some use conditions at temperatures above 1 000 degrees C, crystalline silica may be generated from manufactured RCF products.

REFRIGERATED CONTAINER = РЕФРИЖЕРАТОРНЫЙ КОНТЕЙНЕР – Refrigerated Container:- recommended for delicate cargo. Bottom-air delivery system ensures refrigerated cargo reaches its destination in optimum condition. Refrigerated Container is a container capable of maintaining a given temperature inside the container, either heated or cooled, usually with mechanical machinery. Refrigerated Container is the controlled temperature container suitable for chilled or frozen cargoes. Refrigerated container can be a porthole (must be fitted with or to refrigerating equipment) or an integral (has built-in refrigeration equipment). Also known as Reefer Container. / Под Рефрижератором, от Латинского слова Refrigero, означающее Охлаждаю, понимается транспортное средство с холодильной установкой (автомобиль, поезд, судно) для перевозки скоропортящихся грузов при пониженных температурах, достигаемых искусственным охлаждением. В качестве рефрижераторов используются специальные автомобили (изотермический автомобиль), поезда (изотермический вагон), суда.

REFRIGERATED WAREHOUSE = СКЛАД ХОЛОДИЛЬНИК (или РЕФРИЖЕРАТОРНЫЙ СКЛАД) – Refrigerated Warehouses often require more detailed tracking of product and special billing procedures. Handling charges often involve a table of decreasing charges based on volume. Often each transaction is subject to a minimum charge. And, storage charges are generally billed based on anniversary dates. Refrigerated Warehouse is a warehouse that is used to store perishable items requiring controlled temperatures. Refrigerated Warehouse is the temperature controlled warehouse that serves well for storage of food and other perishable products. / Склад, который используется для запаса скоропортящихся изделий, требующих контролируемых температур.

REFRIGERATION COMPRESSOR = РЕФРИЖЕРАТОРНЫЙ КОМПРЕССОР (или ХОЛОДИЛЬНЫЙ КОМПРЕССОР) – Refrigeration Compressor is a special type of compressor typically used for refrigeration, heat pumping and air conditioning. They are made to turn low-pressure gases into high-pressure and high-temperature gases. The three main types of refrigeration compressors are screw compressors, scroll compressors and piston compressors.

REFRIGERATION TON = РЕФРИЖЕРАТОРНАЯ ТОННА – Refrigeration Ton (RT) is a unit of power used in refrigeration engineering. One ton of refrigeration is intended to be the power required to freeze one short ton of water at 0 °C in 24 hours. This is assumed to be exactly 12 000 Btu per hour (Btu/h or 'Btuh'), which is equivalent to 200 Btu/min, 3.516 853 kiloWatts, 4.716 2 horsepower, or 0.839 6 (kilogram) Calorie per second (Cal/s). The symbol RT seems to be in wide use for this unit, but it is also used for the register ton.

REFRIGERATOR OIL = РЕФРИЖЕРАТОРНОЕ МАСЛО (или ХОЛОДИЛЬНОЕ МАСЛО) – Refrigerator Oil is the lubricant added to the working fluid in an expansion-type cooling unit which serves to lubricate the pump mechanism. / Холодильное Масло – нефтяное смазочное масло для холодильных машин.

REFUGE CROPS = ПОЖНИВНЫЕ СЕЛЬСКОХОЗЯЙСТВЕННЫЕ КУЛЬТУРЫ (или РЕФУГИЕ, или СИЛЬНО ВЕТВЯЩИЕСЯ, или ПОКРОВНЫЕ, или ПОДПОКРОВНЫЕ СЕЛЬСКОХОЗЯЙСТВЕННЫЕ КУЛЬТУРЫ) – Refuge Crops, such as Lucerne or Soybean, Sorghum are grown to allow populations of Heliothis to breed without selection pressures. Refuge crops are required to be grown with transgenic Cotton. Refuge crops are not subject to the normal spray regime and can harbour beneficials. / Рефугие сельскохозяйственные культуры, такие как, Люцерна или относящиеся к Семейству Соевых Бобов, Сорго, выращиваются с тем, чтобы позволить размножаться популяциям Табачной Совки (Heliothis) без давления отбора. Рефугие сельскохозяйственные культуры нужны для выращивания совместно с трансгенным Хлопчатником. В отношении рефугих сельскохозяйственных культур не распространяется нормальный режим опрыскивания или побегов и они могут укрывать полезные сельскохозяйственные культуры.

REFUGIA = XX – In Cotton Insect management, Refugia is an area used to maintain the production of susceptible Insect populations. A refugia is a crop or host area that is left untreated with an insecticide or type of technology so that adults that are resistant to the chemical or chemical class in question will have a high probability of mating with the higher number of refugia-produced, susceptible adults, thus producing susceptible offspring. For example, to preserve the effectiveness of Bt Cotton, a certain acreage of non-Bt Cotton must be set aside to produce enough Bt-susceptible adult Bollworms and Tobacco Budworms to mate with a high enough proportion of the Bt-produced resistant individuals to maintain a population of Budworms and Bollworms susceptible to Bt Cotton.

REFUND = ВОЗВРАТ (или ПОГАШЕНИЕ) – Refund is the repayment to the purchaser of the total charge or a portion of that charge for unused carriage. / Выплата приобретателю всей или части сбора за неиспользованную перевозку.

REFUSAL = ОТКАЗ – Refusal is a forbidding entry of a consignment or other regulated article when it fails to comply with phytosanitary regulations. / Отказ – запрещающий ввоз товара или иного регулируемого изделия, если он не соответствует фитосанитарным предписаниям.

REGAIN STANDARD = ВЛАЖНОСТЬ (или ПОГЛОЩАТЕЛЬНАЯ СПОСОБНОСТЬ) СТАНДАРТНАЯ (или ВЛАЖНОСТЬ НОРМИРОВАННАЯ) – Regain Standard:- for example, raw cotton – 8.5%; cotton yarn – 7.0–7.5%; silk – 11%; wool – 17%; viscous – 13%; Nylon™ – 4%; and polyester – 0.4%. It is the one which is adopted for business purpose and it is generally very close to the standard Regain. See also Standard Moisture Regain. / Нормированная Влажность:- например, для хлопкового волокна – 8.5% (в бывшем СССР – 8.8%), хлопковой пряжи – 7.0–7.5%, натурального шёлка – 11.0%, шерсти – 17.0% (в бывшем СССР – 16.0%), вискозы (или искусственного шёлка) – 13.0% (в бывшем СССР – 16.0%), льна – в бывшем СССР – 12.0%, Найлан[T3] (Nylon™) – 4.0%, и полиэфира (или полиэстера) – 0.4%. Xxxxx. Смотрите также Стандартный Запас Влаги (или Нормированная Влагопоглощательная Способность) (Standard Moisture Regain). Нормированная Влажность – условная влажность, норма которой устанавливается в нормативно-технической документации на конкретный род сырья или продукции.

REGENERATED CELLULOSE = РЕГЕНЕРИРОВАННАЯ ЦЕЛЛЮЛОЗА (или ВОССТАНОВЛЕННАЯ ЦЕЛЛЮЛОЗА) – Regenerated Cellulose is a material which begins as cellulose but at some stage in the chemical processing takes the form of another chemical compound, then appears again in its completed state as cellulose. Viscose and cuprammonium rayons are regenerated cellulose. Regenerated Cellulose is a class of materials manufactured by the conversion of natural cellulose to a soluble cellulosic derivative and subsequent regeneration, typically forming either a fiber (via polymer spinning) or a film (via polymer casting).

REGENERATED FIBER = РЕГЕНЕРИРОВАННОЕ ВОЛОКНО (или ВОССТАНОВЛЕННОЕ ВОЛОКНО) – Regenerated Fiber:- these are fibers created by modified natural fibers. The cellulose regenerated fibers include rayon and acetate. The protein-regenerated vegetable fibers include soybean (soylon), peanut (ardil), and corn (vicara). The protein-regenerated animal fibers include casein (aralac), gelatin, and albumin. Regenerated Fibers:- cellulose (natural polymer) contained in the wood pulp or cotton is once solved with chemicals and then regenerated into fibers. Cuprammonium fibers, polynosic fibers, and rayon fibers are the regenerated fibers. / Сойлон (Soylon), Ардил (Ardil), Викора (Vicara). Аралак (Aralac). Волокно Хлопковое Регенерированное:- к регенерированному волокну относят волокно, полученное на хлопкозаводах после обработки волокнистого улюка 1-го и 2-го типов на регенерационной машине. Регенерированное волокно характеризуется большой массовой долей пороков и сорных примесей, а также неравномерностью по длине, повышенной массовой долей короткого волокна (пуха) и пониженной штапельной длиной на 2–6 мм по сравнению с длиной хлопкового волокна данного сорта Хлопчатника. Регенерированное волокно в зависимости от разрывной нагрузки делят на два сорта:- I-й и II-й. Регенерированное волокно должно соответствовать следующим нормам:- (1) Разрывная Нагрузка:- для I-го Сорта – 3.8 cH (3.9 гс) и более, для II-го Сорта – 3.7 cH (3.8 гс) и менее; (2) Массовая Доля Пороков И Сорных Примесей:- для I-го Сорта – 10.0%, для II-го Сорта – 20.0%; и (3) Нормированная Влажность:- для I-го Сорта – 9.0%, для II-го Сорта – 12.0%.

REGENERATION = РЕГЕНЕРАЦИЯ (или ПЕРЕРОЖДЕНИЕ) – Regeneration is the growth of whole Plants from cultured cells or calli. / В биологии под Регенерацией, от позднелатинского слова Regeneratio, означающее Возобновление или Возрождение, понимается восстановление организмом утраченных или повреждённых органов и тканей, а также восстановление целого организма из его части. В большей степени присуща Растениям и Беспозвоночным Животным, в меньшей – позвоночным. Регенерацию можно вызвать экспериментально.

REGIMENTALS = МУНДИР (или ОБМУНДИРОВАНИЕ) – Regimentals:- a regimental uniform; military dress.

REGIMENTAL STRIPES = МНОЖЕСТВЕННЫЕ ПОЛОСЫ (или МНОЖЕСТВЕННЫЕ ПОЛОСКИ) – Regimental Stripes:- a stripe pattern with colors originating from British regiments. Most often used in neckwear. Also called Regimentals. See also Stripe. In Britain, Regimental Stripes have been continuously used in tie designs at least since the 1920s. Some reports say that British school, college, university, and regimental ties date back to the 1880s. In Commonwealth countries, necktie stripes run from the left shoulder down to the right side. Some say this choice was made because the stripe runs from a person's heart down to their right (sword) hand. In Commonwealth countries, normally only people affiliated with a regiment (or university, school or organization) will wear a necktie affiliated with that regiment (or university, college, school, or other organization). When Brooks Brothers introduced similar striped ties in the United States around the beginning of the XX century, they had their stripes run from the right shoulder to the left side, in part to distinguish them from British regimental (and organizational, school and university) striped neckties. / Брукс Бразёз (Brooks Brothers).

REGINNED COTTON = ПОВТОРНО ДЖИНИРОВАННЫЙ ХЛОПОК (или ПОВТОРНО ОЧИЩЕННЫЙ ХЛОПОК) – Reginned Cotton is Cotton that has passed through the ginning process more than once, and has also already been baled. It may go through the ginning again for additional cleaning, blending or the removal of foreign material. Any Cotton stock or lot that has been ginned more than once because of faulty staple.

REGINNED MOTE FIBER = ПОВТОРНО ДЖИНИРОВАННОЕ ВОЛОКНО УЛЮКА – Reginned Mote Fiber is a fiber removed by re-ginning machines from the gin motes.

REGIONAL BANKS = РЕГИОНАЛЬНЫЕ БАНКИ – Regional Banks are banks which (can) conduct all banking activities but whose branch network is restricted to certain regions. The banking statistics of the Deutsche Bundesbank classify the regional banks together with the commercial banks. / Региональные Банки – банки, которые могут оказывать/оказывают все виды банковской деятельности, но чья сеть филиалов ограничена определёнными регионами. Банковская статистика от Немецкого банка Дойчэ Бундэсбанк (Deutsche Bundesbank) классифицирует региональные банки совместно с коммерческими банками.

REGIONAL CHECK PROCESSING CENTER = РЕГИОНАЛЬНЫЙ ЦЕНТР ОБРАБОТКИ ЧЕКОВ – In the United States, the Regional Check Processing Center (RCPC) is a Federal Reserve check processing operation that clears checks drawn on depository institutions located within a specified area. RCPCs expedite collection and settlement of checks within the area on an overnight basis. / на однодневной расчётной основе.

REGIONAL CONSERVATION CENTER = РЕГИОНАЛЬНЫЙ ЦЕНТР СОХРАНЕНИЯ (или РЕГИОНАЛЬНЫЙ ПРОСВЕТИТЕЛЬНЫЙ ЦЕНТР ПО ОХРАНЕ ПРИРОДЫ) – Regional Conservation Center is a national or international center located in a broad geographic area that assumes the responsibility for conserving germplasm in that area through collection, rejuvenation, and storage. The regional center also handles the distribution of conserved stocks. It cooperates with the genetic resources center in overall preservation of a crop or crops.

REGIONAL FIRMS ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ РЕГИОНАЛЬНЫХ ФИРМ – Regional Firms Advisory Committee keeps the board informed of the policy needs, preferences and concerns of regionally based firms, as well as its views on the operation of the exchange market place. Its members are principals of New York Stock Exchange member firms headquartered outside metropolitan New York. / за пределами метрополитенского ареала Нью Йорка.

REGIONAL FUND = РЕГИОНАЛЬНЫЙ ФОНД – Regional Fund is the investment fund which invests in a specific geographic region or economic area. / Региональный Фонд – инвестиционный фонд, который вкладывает свои денежные средства в конкретный географический регион или конкретную экономическую зону.

REGIONAL INTERNET REGISTRY = РЕГИОНАЛЬНЫЙ ИНТЕРНЕТ–РЕЕСТР – The Regional Internet Registry (RIR):- there are currently five RIRs:- AfriNIC, APNIC, ARIN, LACNIC and RIPE NCC. These non-profit organizations are responsible for distributing and managing IP addresses on a regional level to Internet service providers and local registries. / Региональный Интернет-Реестр (РИР):- в настоящий момент существует пять РИР:- AfriNIC, APNIC, ARIN, LACNIC и RIPE NCC. Эти некоммерческие организации отвечают за распределение IP-адресов на региональном уровне поставщикам услуг Интернета и местным реестрам, а также за управление этим адресным пространством.

REGIONAL PLANT PROTECTION ORGANIZATION = РЕГИОНАЛЬНАЯ ОРГАНИЗАЦИЯ ПО ЗАЩИТЕ РАСТЕНИЙ – Regional Plant Protection Organization (RPPO) is an intergovernmental organization with the functions laid down by Article IX of the IPPC (short for the International Plant Protection Convention).

REGIONAL PROCESSOR = РЕГИОНАЛЬНЫЙ ПРОЦЕССОР – Regional Processor:- the node of the SWIFT II system which is primarily responsible for input message validation and output message queues. / Узел в системе СВМФДС II (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи II; SWIFT II; (The Society for Worldwide Interbank Financial Telecommunication II)), который несёт первичную ответственность за подтверждение входящего сообщения и постановку в

очередь исходящего сообщения. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REGIONAL STANDARDS = РЕГИОНАЛЬНЫЕ СТАНДАРТЫ – Regional Standards are standards established by a Regional Plant Protection Organization for the guidance of the members of that organization. / Региональные Стандарты – это стандарты, установленные Региональной Организацией по Защите Растений, которыми должны руководствоваться члены этой организации.

REGIONAL TRANSMISSION EXPANSION PLANNING PROTOCOL = ПРОТОКОЛ ПО РЕГИОНАЛЬНОМУ ПЛАНИРОВАНИЮ РАСШИРЕНИЯ ПЕРЕДАЧИ – Regional Transmission Expansion Planning Protocol is the process by which PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) – US regional transmission organization) recommends specific transmission facility enhancements and expansions based on reliability and economic criteria. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

REGIONAL TRANSMISSION GROUP = РЕГИОНАЛЬНАЯ ГРУППА ПО ПЕРЕДАЧЕ – Regional Transmission Group is a voluntary organization of transmission owners, transmission users, and other entities approved by the Commission to efficiently coordinate transmission planning (and expansion), operation, and use on a regional (and interregional) basis. / передача электроэнергии или электропередача.

REGISTERED AGENT = ЗАРЕГИСТРИРОВАННЫЙ АГЕНТ – In the United States, Registered Agent is a person or entity designated to receive important tax and legal documents on behalf of the corporation. The Registered Agent must be located and available at a legal address within the specified jurisdiction at all times. Failure to maintain a Registered Agent in the jurisdiction in which the corporation is registered, may result in the forfeiture of the corporate status. Also known as Resident Agent.

REGISTERED BOND = ИМЕННАЯ ОБЛИГАЦИЯ (или ЗАРЕГИСТРИРОВАННАЯ ОБЛИГАЦИЯ) – Registered Bond is a bond whose ownership is recorded on the bond and on the records of the issuing organization or their agent. A bond that is registered on the books of the issuing company in the name of the owner. It can be transferred only when endorsed by the registered owner. See also Bearer Bond and Coupon Bond.

REGISTERED COMPETITIVE MARKET MAKER = ЗАРЕГИСТРИРОВАННЫЙ СОЗДАТЕЛЬ КОНКУРЕНТНОГО РЫНКА – Registered Competitive Market Maker:- identifies New York Stock Exchange (NYSE®) floor members with a specific Exchange-imposed obligation to enhance the quality of NYSE® markets by injecting their own or their firms' capital into difficult market-making situations. At the request of an Exchange official, an Registered Competitive Market Maker (RCMM) must make a bid or offer that narrows an existing quote spread or improves its depth. An RCMM may also be asked to assist a commission broker or floor broker in executing a customer's otherwise unexecutable order. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

REGISTERED DEBT SECURITIES = ЗАРЕГИСТРИРОВАННЫЕ ДОЛГОВЫЕ ЦЕННЫЕ БУМАГИ – Registered Debt Securities are debt claims against the government for which no debt securities are issued, but which are only certified by entry in the Federal Debt Register.

REGISTERED IDENTIFICATION NUMBER = ЗАРЕГИСТРИРОВАННЫЙ ИДЕНТИФИКАЦИОННЫЙ НОМЕР – Registered Identification Number (RN #) is a number issued by the US Federal Trade Commission (FTC) to the US businesses that manufacture, import, distribute, or sell products covered by the Textile, Wool, and Fur Acts. Businesses can use this number on product labels in lieu of the company name.

REGISTERED LIEN = ЗАРЕГИСТРИРОВАННОЕ УДЕРЖАНИЕ (или ЗАРЕГИСТРИРОВАННОЕ ПРАВО УДЕРЖАНИЯ, или ЗАРЕГИСТРИРОВАННОЕ ПРАВО ОБРАЩЕНИЯ ВЗЫСКАНИЯ НА ЗАЛОГ) – Registered Lien is a lien on movable property without transfer of title to the pledgee. Instead the lien (pledge) is entered in a register, and the pledged item itself remains the property of the pledgor. Applied to the pledging of airplanes, livestock, and ships as collateral.

REGISTERED OFFICE = ЗАРЕГИСТРИРОВАННАЯ КОНТОРА (или ЗАРЕГИСТРИРОВАННЫЙ ОФИС) – In the United States, Registered Office is the official address of a corporation. Typically, this address is the same as that of the registered agent. See also Principal Office. Registered Office is the statutory address of a corporation. In states requiring the appointment of a Registered Agent, it is usually the address of the Registered Agent.

REGISTERED OWNER = ЗАРЕГИСТРИРОВАННЫЙ СОБСТВЕННИК (или ЗАРЕГИСТРИРОВАННЫЙ ХОЗЯИН) – Registered Owner is the individual or organization who owns a security. Investors who elect to hold their shares directly, rather than through a brokerage are considered 'registered owners'. Share positions for registered owners will appear on the books of the registrar/depositary.

REGISTERED REPRESENTATIVE = ЗАРЕГИСТРИРОВАННЫЙ ПРЕДСТАВИТЕЛЬ – Registered Representative is the person, normally employed by a brokerage firm or broker/dealer, who acts as an account executive for customers to buy and sell securities. The term registered means the individual has passed qualifying securities examinations and is registered with the US Securities And Exchange Commission (SEC). Describes full-time New York Stock Exchange (NYSE®) member organization sales persons who have met the NYSE's background and industry knowledge requirements. Also known as Account Executive, Customers' Broker, or similar title. / (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Зарегистрированный Представитель:- сотрудник брокерской фирмы, имеющий лицензию на осуществление посреднических операций в срочной биржевой торговле. Часто называется Брокером.

REGISTERED RETIREMENT SAVINGS PLAN = ЗАРЕГИСТРИРОВАННЫЙ ПЕНСИОННЫЙ СБЕРЕГАТЕЛЬНЫЙ ПЛАН – Registered Retirement Savings Plan (RRSP) is the Canadian tax shelter for all taxpayers. An RRSP is simply a special type of investment account held at a bank, brokerage house or financial institution. Cash deposited to an RRSP is tax deductible (within certain limitations) and income and gains realized in an RRSP are NOT taxed until funds are withdrawn. An RRSP is similar to an off-shore holding company that all Canadians can take advantage off (but stupidly, very few do). It allows tax payers to not only plan for retirement but it gives them a vehicle that they can use to manage their investments and income, e.g., they can put money in good times and take some out in lean times. / В Канаде, Зарегистрированный Пенсионный Сберегательный План – план с налоговыми льготами. Имеет сходную концепцию с Индивидуальным Пенсионным Планом в США.

REGISTERED SECURITY = ИМЕННАЯ ЦЕННАЯ БУМАГА (или ЗАРЕГИСТРИРОВАННАЯ ЦЕННАЯ БУМАГА) – Registered Security is a security which is made out in the name of the owner and can be transferred only by assignment. It differs from instruments made out to order, such as bills of exchange, checks, promissory notes, registered shares, etc, which name a beneficiary and are

transferable by endorsement. Security issued in the name of the purchaser, entered in the books of the issuing organization or of its transfer agent in the name of the purchaser, and bearing the purchaser's name. The opposite of Bearer Security. Registered Security:- where the person recorded in the company's register (usually a secure computer database) as the owner receives the cash flows from the security. The piece of paper/certificate for the security does not entitle you to legal ownership of the security. / В противоположность Ценной Бумаге На Предъявителя (Bearer Security).

REGISTERED SEED = ЗАРЕГИСТРИРОВАННОЕ СЕМЯ (или СЕМЯ, ИМЕЮЩЕЕ РОДОСЛОВНУЮ) – Registered Seed:- the progeny of foundation seeds normally grown to produce certified seed. Registered Seed:- class of certified seed generally produced from foundation seed, but which may also be produced from breeder seed.

REGISTERED SHARE = ИМЕННАЯ АКЦИЯ (или ЗАРЕГИСТРИРОВАННАЯ АКЦИЯ) – A Registered Share is registered in the owner's name, and this is listed in the company's share register. Thanks to this transparency on ownership, stock corporations know who their shareholders are, making it easier to carry out investor relations work. For stock corporations that are planning a direct listing (listing of the original shares) on the world's largest stock exchange, the New York Stock Exchange (NYSE®), a necessary prerequisite is that their shares are issued as registered shares. Opposite:- Bearer Shares. A special form of registered shares in Germany are registered shares with limited transferability:- their ownership cannot be transferred without the consent of the company. A share made out in the name of the owner who is entered in the company share register. The opposite of Bearer Share. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Акция, выпущенная на имя владельца, которое занесено в реестр акционеров компании. В противоположность Акции На Предъявителя (Bearer Share).

REGISTERED SHARE WITH RESTRICTED TRANSFERABILITY = ИМЕННАЯ АКЦИЯ С ОГРАНИЧЕННОЙ ВОЗМОЖНОСТЬЮ ПЕРЕДАЧИ – Registered Share With Restricted Transferability is a registered share which can only be transferred subject to restrictions and the permission of the company concerned. Its purpose is to provide better protection against an undesired change in the distribution of the share capital. Special form of registered share that cannot be transferred to a third party without the issuer's consent.

REGISTERED TONNAGE = РЕГИСТРОВАЯ ВМЕСТИМОСТЬ (или РЕГИСТРОВЫЙ ТОННАЖ) – Registered Tonnage:- a commercial ship is measured by its cargo capacity in tons, with each ton occupying 100 cubic feet. The cubic capacity of all enclosed spaces is thus measured and the ship's tonnage determined. / Под Регистровой Вместимостью судна понимается объём внутренних помещений судна, измеряемый в регистровых тоннах. 1 рег.т = 100 фут^3 = 2.831 685 м^3. Различают:- (i) валовую регистровую вместимость (все помещения), служащую для расчётов сборов в портах и так далее; и (ii) чистую регистровую вместимость (помещения для груза и пассажиров), характеризующую коммерчески эксплуатируемые помещения. Регистровая Вместимость судна, регистровый тоннаж судна, объём внутренних помещений гражданского судна. Регистровая вместимость служит характеристикой размеров судна и исчисляется в регистровых тоннах (1 регистровая т = 100 куб. футов = 2.83 м^3). Различают регистровую вместимость валовую (объём всех судовых помещений, кроме некоторых балластных цистерн и другого) и чистую (объём помещений для груза и пассажиров). Регистровая вместимость удостоверяется мерительным свидетельством, которое выдаётся классификационным обществом. Порядок определения регистровой вместимости устанавливается международными или местными правилами обмера судов (например, Панамского или Суэцкого Канала). От регистровой вместимости зависят взимаемые с судна сборы и пошлины (за пользование причалами, за лоцманские услуги и так далее).

REGISTERED VARIETY = ЗАРЕГИСТРИРОВАННЫЙ СЕЛЕКЦИОННЫЙ СОРТ (или ЗАРЕГИСТРИРОВАННАЯ РАЗНОВИДНОСТЬ) – A Registered Variety is a Variety of grain registered under the authority of the Canada Seeds Act and listed on the Variety Order List.

REGISTER OF MORTGAGE HOLDERS = РЕЕСТР ВЛАДЕЛЬЦЕВ ЗАКЛАДНЫХ – Register Of Mortgage Holders is a list kept by the Office of Land Register in Swiss communities in which each holder of a lien on real estate (or each mortgagor and creditor under a mortgage note) can ask to be entered. / Под Регистром или Реестром, от средневекового Латинского слова Registrum, означающее Перечень или Список, от Латинского слова Regero, означающее Вношу или Записываю, понимается .

REGISTER PRINTING = РЕГИСТРОВОЕ ПЕЧАТАНИЕ – Register Printing is a method of printing the same design on both sides of the fabric to give it additional definition and clarity of color. Also called Duplex Printing.

REGISTER TON = РЕГИСТРОВАЯ ТОННА – Register Ton (RT or rt) is a unit used traditionally to measure the cargo capacity of a merchant ship. During the Middle Ages, merchant ships were rated by the number of tuns of wine they could carry. Today the merchant marine ton is defined to be exactly 100 cubic feet, or approximately 2.831 6 cubic meters. This unit is often called the Register Ton, since it is recorded in official registers of ships. The symbol RT seems to be in wide use for this unit, but it is also used for the refrigeration ton. The unit of measurement for the internal capacity of a vessel whereby one register ton equals 100 cubic feet (cu ft or ft^3) or 2.831 685 cubic meters (cu m or m^3). Abbreviation:- ton reg. Also known as Vessel Ton. The Register Ton is a unit of volume used for the cargo capacity of a ship, defined as 100 cubic feet (2.832 m^3). It is often abbreviated RT or GRT for gross registered ton (The former providing confusion with the refrigeration ton). It is known as a Tonneau De Mer in Belgium, but, in France, a Tonneau De Mer is 1.44 cubic meters (50.85 cu ft). Register Ton is a unit of interior capacity of ships. / Под Регистровой Тонной понимается единица измерения, в которой измеряется внутренняя регистровая вместимость судна (объём внутренних помещений судна). 1 регистровая тонна (рег. т) = 100 кубическим футам (фут^3) = 2.831 685 кубическим метрам (м^3). Обозначение:- рег. т (ton reg).

REGISTRAR = РЕГИСТРАТОР – (1) Registrar is the agent who maintains records of ownership of all stock and bonds issued by a company/issuer. Usually a trust company or bank charged with the responsibility of keeping a record of the owners of a corporation's securities and preventing the issuance of more than the authorized amount. See also Transfer. / Регистратор – агент, поддерживающий записи о владении всех акций и облигаций, выпущенных компанией/эмитентом. Как правило, трастовая компания или банк, несущие ответственность за хранение записи о владельцах ценных бумаг корпорации и предотвращающие выпуск, большего количества ценных бумаг, нежели было предусмотрено перед эмиссией. Смотрите также Передача (Transfer).

(2) Registrar:- domain names ending with .aero, .biz, .com, .coop, .info, .museum, .name, .net, .org, and .pro can be registered through many different companies (known as 'Registrars') that compete with one another. A listing of these companies appears in the Accredited Registrar Directory. The registrar you choose will ask you to provide various contact and technical information that makes up the registration. The registrar will then keep records of the contact information and submit the technical information to a central directory known as the 'Registry'. This registry provides other computers on the Internet the information necessary to send you e-mail or to find your web site. You will also be required to enter a registration contract with the registrar, which sets forth the terms under which your registration is accepted and will be maintained. / Регистратор:- доменные имена, заканчивающиеся на .aero, .biz, .com, .coop, .info, .museum, .name, .net, .org и .pro можно зарегистрировать в различных компаниях (известных как

‘Регистраторы’), конкурирующих друг с другом. Список этих компаний можно найти в каталоге аккредитованных регистраторов. Выбранный регистратор попросит предоставить различную контактную и техническую информацию, что, собственно, и составляет саму регистрацию. Затем регистратор сохранит записи контактной информации и отправит техническую информацию в центральный каталог, известный как ‘Реестр’. Этот реестр предоставляет компьютерам, подключенным к Интернету, информацию, необходимую для отправки вам электронной почты или для возможности поиска вашего веб-сайта. Необходимо также заключить с регистратором договор, определяющий условия, на которых регистрация принимается и поддерживается.

REGISTRATION = РЕГИСТРАЦИЯ – (1) In the United States, a Registration is the social security number or employer identification number, names, and addresses appearing on the face of a bond. Also referred to as Inscription. On paper savings bonds issued or replaced on or after 2006-August-01, the first five digits of the Social Security number or Employer Identification number will be masked and replaced with asterisks. This is being done to protect your privacy and to prevent the information from being used for identity theft. The format or legal title showing a security’s ownership. Before a public offering may be made of new securities by a company, the securities must be registered under the US Securities Act of 1933. A registration statement is filed with the Securities And Exchange Commission (SEC) by the issuer. It must disclose pertinent information relating to the company’s operations, securities, management and purpose of the public offering. Before a security may be admitted to dealings on a national security exchange, it must be registered under the Securities Exchange Act of 1934. The application for registration must be filed with the exchange and the SEC by the company issuing the securities. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

(2) Registration is an official record of an existing line or Variety, clone, or seed stock in a given area with its specific characters and qualities fully noted. / свойства (characters) .

(3) Federal Registration of trademarks involves the establishment of rights in a mark based on legitimate use of the mark. Although federal registration of trademarks is not required to use a trademark, owning a federal trademark registration has several advantages, including notice to the public of the registrant’s claim of ownership of the mark, a legal presumption of ownership nationwide, the exclusive right to use the mark on or in connection with the goods or services set forth in the registration, the ability to bring an action concerning the mark in federal court, the use of the US registration as a basis to obtain registration in foreign countries, and the ability to file the US registration with the US Customs Service to prevent importation of infringing foreign goods. / привоз (importation).

(4) Registration is a provisioning the Personal Trusted Device (PTD) with a service certificate that is related to a public-private key pair residing on the PTD.

REGISTRATION AUTHORITY = РЕГИСТРИРУЮЩИЙ ОРГАН (или ОРГАН РЕГИСТРАЦИИ) – Registration Authority (RA) is an entity responsible for the identification and authentication of subjects of certificates, but which does not sign or issue certificates.

REGISTRATION NUMBER = РЕГИСТРАЦИОННЫЙ НОМЕР – In the US patent law, a Registration Number:- a registered patent attorney/agent is assigned a registration number that they must include on patent correspondence and forms when representing others before the United States Patent and Trademark Office (USPTO); individual applicants do not have a registration number and should leave this field blank on patent forms.

REGISTRY = КЛАССИФИКАЦИОННОЕ СВИДЕТЕЛЬСТВО – Registry (maritime term):- the ship’s certificate determining the ownership and nationality of the vessel.

REGISTRY = РЕЕСТР (или БАЗА КОНФИГУРАЦИИ СИСТЕМЫ) – (1) Registry is a database integrated into certain operating systems which store information, including user preferences, settings and license information, about hardware and software installed on a user’s computer. / Реестр – иерархическая база данных, в которой операционная система централизованным образом хранит всю системную информацию, в частности, конфигурацию вычислительной системы, значения различных параметров, сведения об установленных программах и так далее. Изменения в реестре производятся пользователем в окне редактирования реестра. Разработчики программного обеспечения настоятельно рекомендуют перед внесением каких-либо изменений в реестр сделать его резервную копию. Некорректные изменения в реестре могут привести к полной потере данных или повреждению файлов. Под Реестром, от Польского слова Rejestr от позднелатинского слова Regestrum или Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень или список; или (ii) книга для регистрации дел, документов, имущества и тому подобного.

(2) The ‘Registry’ is the authoritative, master database of all domain names registered in each Top Level Domain. The registry operator keeps the master database and also generates the ‘zone file’ which allows computers to route Internet traffic to and from top-level domains anywhere in the world. Internet users don’t interact directly with the registry operator; users can register names in TLDs including .biz, .com, .info, .net, .name, .org by using an Internet Corporation for Assigned Names and Numbers (ICANN)-Accredited Registrar. / Реестр – официальная, головная база данных всех доменных имен, зарегистрированных в каждом домене верхнего уровня. Оператор реестра поддерживает главную базу данных и создает ‘файл зоны’, который позволяет компьютерам маршрутизировать Интернет-трафик между доменами верхнего уровня по всему миру. Пользователи Интернета напрямую не взаимодействуют с оператором реестра; пользователи могут зарегистрировать имена в ДВУ, включая .biz, .com, .info, .net, .name, .org, у аккредитованных Корпорацией Интернета по Распределению Имён и Номеров (КИРИН) регистраторов.

REGISTRY KEYS = КЛЮЧИ РЕЕСТРА – Registry Keys are the individual entries in the Registry. The value of the keys is changed every time a new program is installed or configuration settings are modified. Spyware often changes registry key values in order to take control of parts of the system. These changes can impair the regular function of the computer. / Ключ Реестра – запись в реестре компьютера, уникальный идентификатор, присваиваемый определённой части информации, хранящейся в реестре.

REGISTRY SERVICES EVALUATION PROCESS = ПРОЦЕСС ОЦЕНКИ УСЛУГ РЕЕСТРА – The Registry Services Evaluation Process (RSEP) is (Internet Corporation for Assigned Names and Numbers) ICANN’s process for evaluating proposed gTLDregistry services or contractual modifications for security, stability or competition issues. / Процесс Оценки Услуг Реестра (ПОУР) используется Корпорацией Интернета по Распределению Имён и Номеров (КИРИН) для оценки предлагаемых услуг реестров рДВУ, а также изменений в контрактах по соображениям безопасности, стабильности или свободы конкуренции.

REGRESSION = РЕГРЕССИЯ – Regression is the dependence of one variable on one or more other variables. / (1) В теории вероятностей и математической статистике под Регрессией, от Латинского слова Regressus, означающее Возвращение или Обратное Движение, понимается зависимость среднего значения какой-либо величины от некоторой другой величины или от нескольких величин. (2) Регрессия – возврат взрослого животного к ювенильным формам поведения.

REGRESSION LINE = ЛИНИЯ РЕГРЕССИИ – Regression Line is a straight or curved line that indicates the nature of a regression on a graph with the dependent variable on the Y axis and the independent variable on the X axis. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

REGRESSIVE TAX = РЕГРЕССИВНЫЙ НАЛОГ – Regressive Tax is a tax that tends to take a larger percentage of the incomes of lower income citizens than it takes from the incomes of higher income citizens. Examples:- a poll tax, a flat percentage tax on only the first so many Dollars of income (like the social security tax) or a sales tax on consumption items of common necessity (like groceries). See also Progressive Tax.

REGROUPAGE = РАЗГРУППИРОВАНИЕ (или РАЗГРУППИРОВКА) – Regroupage is the process of splitting up shipments into various consignments (degroupage) and combining these small consignments into other shipments (groupage).

REGROWTH = ПОВТОРНЫЙ РОСТ (или ОТРАСТАНИЕ, или ВОЗОБНОВЛЕНИЕ РОСТА) – Regrowth:- The resumption or continuation of growth that may occur after application of a harvest-aid chemical. Not to be confused with second growth, the resumption of growth and production after cutout in regions with a long growing season. See also Second Growth.

REGULAR = ПРАВИЛЬНОЕ (или РЕГУЛЯРНОЕ) – Regular:- made from evenly, symmetrically arranged parts.

REGULAR FLOWER = ПРАВИЛЬНЫЙ ЦВЕТОК (или РЕГУЛЯРНЫЙ ЦВЕТОК) – Regular Flower is a radially symmetrical flower in which similar parts are equal in size, form or extent of fusion. / радиально симметричный цветок, в котором .

REGULARIZATION = РЕГУЛЯРИЗАЦИЯ – Regularization:- procedures required to replace an old share of stock with a new one, e.g., new shares issued to replace shares of a company acquired through merger or acquisition. / Регуляризация:- процедуры, требуемые при замене старой акции уставного капитала компании на новую, например, новые акции, эмитированные с целью замены акций компании, приобретённой посредством слияния и поглощения.

REGULAR–MILLED WHITE RICE = ОБЫЧНЫЙ ОБРУШЕННЫЙ БЕЛЫЙ РИС – Regular-Milled White Rice is the Rice that has the hull and bran layers removed. It is sometimes called Milled Rice, Milled White Rice, Polished or Polished White Rice. The hulls, bran layers and germ have all been removed. Most white Rice is enriched, giving it a nutritional value similar to brown Rice. Regular Milled White Rice characteristics:- (i) versatile; (ii) neutral taste; and (iii) can lose taste and texture when overcooked. Applications:- (i) Long Grain:- (a) entrees and side dishes; (b) casseroles; and (c) foodservice products; (ii) Medium and Short Grain:- (a) breakfast cereals; (b) desserts and puddings; (c) snack and rice cakes; and (d) pet food.

REGULAR WAREHOUSE = ОБЫЧНЫЙ СКЛАД – Regular Warehouse is a processing plant or warehouse that satisfies exchange requirements for financing, facilities, capacity, and location and has been approved as acceptable for delivery of commodities against futures contracts. See also Licensed Warehouse.

REGULAR WAY DELIVERY = ПОСТАВКА ОБЫЧНЫМ СПОСОБОМ (или ОБЫЧНЫЙ СПОСОБ ПОСТАВКИ) – Regular Way Delivery:- unless otherwise specified, securities sold on the New York Stock Exchange are to be delivered to the buying broker by the selling broker and payment made to the selling broker by the buying broker on the third business day after the transaction. Regular delivery for bonds is the following business day. See also Transfer.

REGULATED AREA = РЕГУЛИРУЕМЫЙ АРЕАЛ (или ПОДКОНТРОЛЬНЫЙ АРЕАЛ) – Regulated Area is an area into which, within which and/or from which plants, plant products and other regulated articles are subjected to phytosanitary regulations or procedures in order to prevent the introduction and/or spread of quarantine pests or to limit the economic impact of regulated non-quarantine pests.

REGULATED ARTICLE = РЕГУЛИРУЕМОЕ ИЗДЕЛИЕ (или ПОДКОНТРОЛЬНЫЙ ПРЕДМЕТ) – Regulated Article is any plant, plant product, storage place, packaging, conveyance, container, soil and any other organism, object or material capable of harbouring or spreading pests, deemed to require phytosanitary measures, particularly where international transportation is involved. / К Регулируемым Изделиям или Подконтрольным Предметам относятся любое растение, растительные продукты, место хранения, упаковка, транспортное средство, контейнер, почва и любой другой организм, объект или материал, способный служить местом укрытия или распространения вредителей, в отношении которых требуется принятие фитосанитарных мер, особенно в тех случаях, когда дело касается международных перевозок.

REGULATED ENTITY = ПОДКОНТРОЛЬНОЕ ЛИЦО – Regulated Entity:- in reference to electricity, collectively, any entity or entities who provide any regulated transmission services. See also Regulated Transmission Services. / По отношению к электричеству, любое юридическое лицо или группа лиц, предоставляющих услуги подачи электроэнергии. Смотрите также Услуги Подачи Электроэнергии на Договорных Условиях или Подконтрольная Подача Электроэнергии (Regulated Transmission Services).

REGULATED MARKET = РЕГУЛИРУЕМЫЙ РЫНОК (или ПОДКОНТРОЛЬНЫЙ РЫНОК) – In Germany, the Regulated Market is a trading segment for shares and bonds established in 1987 under the Stock Exchange Admission Regulations. The Regulated Market and the Official Market together constitute the officially regulated part of the market. The admission requirements for the Regulated Market are not as strict as for the Official Market. Prices are determined by independent brokers. For investors, there are no other major differences compared to the Official Market. Regulated Market or Exchange is a market or exchange that is regulated and/or supervised by a Regulatory Authority.

REGULATED NON–QUARANTINE PEST = РЕГУЛИРУЕМЫЙ НЕКАРАНТИННЫЙ ВРЕДИТЕЛЬ (или ПОДКОНТРОЛЬНЫЙ НЕКАРАНТИННЫЙ ВРЕДИТЕЛЬ) – Regulated Non-Quarantine Pest is a non-quarantine pest whose presence in plants for planting affects the intended use of those plants with an economically unacceptable impact and which is therefore regulated within the territory of the importing contracting party. / Регулируемый Некарантинный Вредитель или Подконтрольный Некарантинный Вредитель это некарантинный вредитель, присутствие которого на растениях, предназначенных для посадки, оказывает экономически неприемлемое воздействие на использование этих растений по предназначению и, вследствие этого, контролируется на территории привозящей (или импортирующей) договаривающейся стороны.

REGULATED PEST = РЕГУЛИРУЕМЫЙ ВРЕДИТЕЛЬ (или ПОДКОНТРОЛЬНЫЙ ВРЕДИТЕЛЬ) – Regulated Pest is a quarantine pest or a regulated non-quarantine pest. / К Регулируемому Вредителю или Подконтрольному Вредителю относится карантинный вредитель или подконтрольный некарантинный вредитель.

REGULATED TRANSMISSION SERVICES = УСЛУГИ ПОДАЧИ ЭЛЕКТРОЭНЕРГИИ НА ДОГОВОРНЫХ УСЛОВИЯХ (или РЕГУЛИРУЕМАЯ ПОДАЧА ЭЛЕКТРОЭНЕРГИИ) – Regulated Transmission Services:- in reference to electricity, the following services:- (a) the conveyance of electricity through the grid and the control and monitoring of electricity as it is conveyed through the

grid (including any services that support such conveyance, control or monitoring or the safe operation of the grid); (b) the planning, maintenance, augmentation and operation of the grid; (c) the provision, installation, commissioning, testing, repair, maintenance and reading both of meters that are used to measure the delivery of electricity to customers and of other meters that are used to measure the flow of electricity into or through the grid; (d) until the commencement of the second regulatory period, transmission connection services; (e) the provision of ancillary services that are provided using assets which form part of the grid; (f) billing, collection and customer service for customers purchasing (or seeking to purchase) any of the services referred to in paragraphs (a), (b), (c) and (e) and for persons purchasing (or seeking to purchase) any transmission connection services; and (g) those services provided by the system operator under the grid rules. See also Transmission Connection Services. / По отношению к электричеству, следующие услуги:- (a) подача электричества в энергосистему и контроль и наблюдение за параметрами электричества, подаваемого в энергосистему (включая любые услуги по поддержанию такой подачи, контролю и наблюдению за безопасностью работы самой энергосистемы); (b) планирование, обслуживание, наращивание и управление этой энергосистемой; (c) поставка, установка, ввод в эксплуатацию, тестирование, ремонт, обслуживание и контроль за показаниями счётчиков, как измеряющих параметры подачи электричества клиентам, так и используемых для контроля входящего и проходящего через эту энергосистему электротока; (d) до наступление второго контрольного периода, услуги по обеспечению переключений при подаче электроэнергии; (e) предоставление вспомогательных услуг, которые обеспечиваются использованием мощностей, являющихся частью энергосистемы; (f) выставление счетов, приём платежей и информационное обслуживание текущих и потенциальных потребителей любых услуг, указанных в пунктах (a), (b), (c) и (e), а также текущих и потенциальных потребителей услуг по обеспечению переключений при подаче электроэнергии; и (g) услуги, предоставляемые оператором системы согласно регламенту энергосистемы. Смотрите также Услуги по Обеспечению Переключений при Подаче Электроэнергии (Transmission Connection Services).

REGULATED WOOD PACKAGING MATERIAL = РЕГУЛИРУЕМЫЙ ДРЕВЕСНЫЙ УПАКОВОЧНЫЙ МАТЕРИАЛ (или ПОДКОНТРОЛЬНЫЙ ДРЕВЕСНЫЙ УПАКОВОЧНЫЙ МАТЕРИАЛ) – Regulated Wood Packaging Material (RWPM) is a wood packaging material other than manufactured wood materials, loose wood packing materials, and wood pieces less than 6 mm thick in any dimension, that are used or for use with cargo to prevent damage, including, but not limited to, dunnage, crating, pallets, packing blocks, drums, cases, and skids.

REGULATION = ПРЕДПИСАНИЕ (или ЦИРКУЛЯР) – Regulation is a principle rule, or law designed to control or govern. / Под Циркуляром, от Немецкого слова Zirkular, понимается ведомственный правовой акт, содержащий определённые предписания подчинённым органам.

REGULATION = РЕГУЛЯЦИЯ (или РЕГУЛИРОВАНИЕ) – Regulation is the government function of controlling or directing economic entities through the process of rulemaking and adjudication. / , от Латинского слова Regulo, означающее Привожу В Порядок или Устраиваю, понимается .

REGULATION CC = ПРЕДПИСАНИЕ СИ.СИ. – In the United States, Regulation CC means the Federal Reserve Board regulation implementing the Expedited Funds Availability Act and Check Clearing for the XXI Century Act. The regulation specifies funds-availability schedules with which banks must comply and procedures for returning checks. It also contains rules related to substitute checks.

REGULATION S = ПРЕДПИСАНИЕ ЭС. – Regulation S clarifies the conditions under which offers and sales of securities outside the United States are exempt from the Securities and Exchange Commission (SEC) registration requirements. Regulation S was adopted by the SEC in 1990 in conjunction with the adoption of Rule 144A. These measures, taken together, significantly enhance the liquidity of a private placement or global offering. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

REGULATIONS CFTC = ПРЕДПИСАНИЯ КТСФ – Regulations CFTC are the regulations adopted and enforced by the US Commodity Futures Trading Commission (CFTC) in order to administer the Commodity Exchange Act. / Предписания, принимаемые и проводимые в жизнь Комиссией США по Торговле Сырьевыми Фьючерсами (КТСФ), в соответствии с исполнением Акта о Сырьевой Бирже (Commodity Exchange Act).

REGULATION T = ПРЕДПИСАНИЕ ТИ. – The US federal regulation governing the amount of credit that may be advanced by brokers and dealers to customers for the purchase of securities. See also Margin. In the United States, the Securities Exchange Act of 1934 granted the Federal Reserve Board (FRB) power to set initial, maintenance, and short sale margin requirements on all securities traded on a national exchange for purposes of regulating the securities credit extended by exchange members. Pursuant to this authority, the FRB established Regulation T (Reg T), the rules governing the percentage of equity value a broker/dealer was allowed to lend on exchange-traded securities. Although securities markets have a long history of Federal margin regulation, not until 1992, when the US Congress extended the FRB's margin setting authority to include the levels of margin on stock index-futures contracts, was a Federal regulator responsible for setting margin levels for futures products. Initial margin requirements in the equity market determine the maximum loan value of a security. For example, if the initial margin requirement were set at 40 percent, an investor could post a marginable security as collateral and borrow up to 60 percent of the security's value. Alternatively, if the investor were to buy the security on margin, the investor would be required to deposit at least 40 percent of the value of the security in a margin account to complete the margin transaction. In contrast to Reg T margin requirements, margin requirements in equity derivative markets are collateral requirements designed to ensure contract performance. From an economic perspective, there is no extension of credit in equity derivative markets. The legal profession may have a difference of opinion. Historically, Reg T required that long options be paid for in full (a 100 percent margin requirement). Under recently adopted Reg T rule changes, long-options will be eligible to receive collateral value, but not until the NYSE® modifies its rules to accommodate this change. Thus, historically, it was legally impossible to obtain a loan using options as collateral. However, from a legal point of view, options apparently are viewed as an extension of credit. As near as I can tell, the legal argument is as follows:- the writer of the option is extended credit by the option purchaser because the purchaser is subject to the risk of contract performance. The legal interpretation that performance risk is an extension of credit to the option writer apparently was the argument used to assert legal jurisdiction over equity option margin requirements under Sections 7 and 8 of the 1934 Securities and Exchange Act (please consult your own securities attorney before acting on this historical interpretation). Regardless of the legalities, from an economic standpoint, the margin requirements on a written options satisfy a prudential function and are not related to any economic extension of credit. Despite differences in their form and function, the margin requirements on equity derivative contracts affect the cost of taking positions and implicitly define the maximum amount of return leverage that can be obtained in such contracts. See also Regulation U, and Securities Credit. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

REGULATION U = ПРЕДПИСАНИЕ Ю. – Regulation U:- Credit by Banks or Persons other than Brokers or Dealers for the Purpose of Purchasing or Carrying Margin Stocks (12 CFR 221). This description should not be interpreted as a comprehensive statement of the regulation. Rather, it is intended to give a broad overview of the regulation's requirements. The full regulation is available on the

Government Printing Office web site. Regulation U sets out certain requirements for lenders, other than securities brokers and dealers, who extend credit secured by margin stock. Margin stock includes any equity security registered on a national securities exchange, such as the New York Stock Exchange (NYSE®) or the American Stock Exchange; any over-the-counter (OTC) security trading in the Nasdaq® Stock Market's National Market; any debt security convertible into a margin stock; and most mutual funds. The regulation covers entities that are not brokers or dealers, including commercial banks, savings and loan associations, federal savings banks, credit unions, production credit associations, insurance companies, and companies that have employee stock option plans. Regulation U has covered securities credit extended by commercial banks since 1936. Two significant events occurred in 1968 and 1998. First, in 1968 the Federal Reserve Board adopted Regulation G to cover securities credit extended by lenders other than banks, brokers, and dealers. Regulation G was merged into Regulation U in 1998. Second, in 1968 the Board received the authority to publish a list of OTC stocks that were subject to Regulation U to the same extent as exchange-traded stocks. In 1998, the Board ceased publication of its OTC list in favor of reliance on the listing standards for the Nasdaq® Stock Market's National Market. A general description of the regulation, by section, follows. Section 221.1 Authority, purpose, and scope:- states that the regulation imposes credit restrictions on persons, other than brokers or dealers, that extend credit for the purpose of buying or carrying margin stock if the credit is secured directly or indirectly by that stock or any other margin stock. Section 221.2 Definitions:- defines key terms used in the regulation. Four terms are highlighted here:- (i) Margin Stock is any equity security trading on a national securities exchange; any OTC security trading in the Nasdaq® Stock Market's National Market; any debt security convertible into a margin stock or carrying a warrant or right to subscribe to or purchase a margin stock; any warrant or right to subscribe to or purchase a margin stock; or any security issued by an investment company registered under section 8 of the Investment Company Act of 1940 (with certain exceptions). (ii) Indirectly Secured includes any arrangement with a customer under which (1) the customer's right or ability to sell, pledge, or otherwise dispose of margin stock owned by the customer is in any way restricted while the credit remains outstanding or (2) the exercise of such right is or may be cause for accelerating the maturity of the credit. (iii) Purpose Credit is any credit for the purpose, whether immediate, incidental, or ultimate, of buying or carrying margin stock. (iv) Maximum Loan Value is the percentage of current market value assigned by the Board under section 221.7 (the supplement) to specified types of collateral. The maximum loan value of margin stock is stated as a percentage of its current market value and has been set at 50 percent since 1974. Options, including puts, calls, and combinations thereof, have no loan value, unless they are publicly traded. Publicly traded options qualify as margin stock. All other collateral has good faith loan value. Section 221.3 General requirements:- states that no lender shall extend any purpose credit, secured directly or indirectly by margin stock, in an amount that exceeds the maximum loan value of the collateral securing the credit. However, a lender may continue to maintain any credit initially extended in compliance with the regulation regardless of a reduction in the customer's equity resulting from a change in market price or a change in the status of the security securing an existing purpose credit. In addition, no lender may arrange for the extension of any purpose credit, except upon the same terms and conditions under which the lender itself may extend purpose credit. The borrower and the lender may be required to complete the form G-3 or U-1 statement of purpose for each extension of credit. A commercial bank is always subject to Regulation U when it extends credit secured by margin stock. A nonbank lender becomes subject when it meets one of two threshold tests for the amount of margin-stock-secured credit extended or outstanding – specifically, if USD200 000.00 or more in such credit was extended in the most recent calendar quarter; or if at any time in the most recent quarter the amount of margin-stock-secured credit outstanding was USD500 000.00 or more. A nonbank lender must register with the Federal Reserve Bank in whose District it is located by filling out and submitting form G-1 (available by calling the local Federal Reserve Bank or via the Board's web site) within thirty days of the end of the calendar quarter in which one of the two threshold tests is met and must file annual reports (form G-4) thereafter. Form G-1 is a simple four-page form that requires the registrant-lender to provide the following information:- Name of registrant; Address of registrant; Principal lines of business; Form of business (corporation or partnership, for example); Names of personnel responsible for maintaining records regarding the regulation; Purpose of credit extended; and Balance sheet. Section 221.4 Employee stock option, purchase, and ownership plans:- states that a company or its affiliate (known as a Plan-Lender) may extend credit without regard to the margin requirements to its employees to purchase company stock under an eligible employee stock option, purchase, or ownership plan. In addition, any nonbank lender may extend purpose credit to an employee stock ownership plan (ESOP) qualified under section 401 of the Internal Revenue Code without regard to the margin requirements of Regulation U. A similar exemption for bank loans to ESOPs is found in section 221.6. If the lender is a nonbank lender extending credit under this section, it must still comply with the registration requirements and file annual reports, but it need not obtain the statement of purpose for each extension of credit. Section 221.5 Special-purpose loans to brokers and dealers:- provides exemptions from the 50 percent maximum loan value limitations of Regulation U if the borrower is a broker or dealer and the loan meets one of the specific exemptions. Section 221.6 Exempted transactions:- stipulates that a bank may extend and maintain purpose credit without regard to the 50 percent loan value limitations of Regulation U if such credit is extended to any bank, any foreign banking institution, an ESOP, or any plan-lender. Section 221.7 Supplement:- Maximum loan value of margin stock and other collateral:- states that the maximum loan value of any margin stock is 50 percent of its current market value. The maximum loan value of nonmargin stock and all other collateral except options is its good faith loan value. An option has no loan value unless it is traded on an exchange, in which case it qualifies as margin stock. The following paragraphs review key aspects of Regulation U:- What responsibilities does a lender take on once it registers with a Federal Reserve Bank as a nonbank lender? Regulation U has three important post-registration requirements for nonbank lenders:- (i) the nonbank lender must obtain from the borrower, and complete, a purpose statement (form G-3) for each loan secured by margin stock; (ii) the nonbank lender must adhere to margin requirements (currently 50 percent) for purpose loans secured by margin stock; and (iii) the nonbank lender must file an annual report of margin-stock-secured lending (form G-4) as of each June 30. What are the responsibilities of a bank lender under Regulation U? Regulation U has two important requirements for bank lenders:- (i) the bank lender must obtain from the borrower, and complete, a purpose statement (form U-1) for each loan secured by margin stock if the loan exceeds USD100 000.00; and (ii) the bank lender must adhere to margin requirements (currently 50 percent) for all purpose loans secured by margin stock. What is a nonpurpose loan under Regulation U? A nonpurpose loan is a loan made for any purpose other than purchasing or carrying margin stock. What are the requirements of Regulation U for a nonpurpose loan? If the loan is secured directly or indirectly by margin stock, form G-3 or form U-1 must be completed as described above. If the loan is not secured directly or indirectly by margin stock, no form need be completed. Regulation U places no restriction on the amount of credit that may be extended on nonpurpose loans secured by margin stock. What are forms G-3 and U-1? Forms G-3 and U-1 are often referred to as 'Purpose Statements'. Each is a two-page form wherein the borrower must disclose (1) the use to which the loan proceeds will be put, (2) the amount of the loan, and (3) the collateral for the loan. The collateral need not be listed for nonpurpose loans. The form must be signed by both the borrower and the lender. The form is not filed with the Federal Reserve, but it must be kept in the lender's records for at least three years after the termination of the credit. What is a plan-lender? A plan-lender is a corporation, other than a commercial bank, that extends credit to its employees, under an employee stock option plan approved by the shareholders, to purchase stock of that corporation, its subsidiaries, or its affiliates. Loans extended under such a plan may be for any amount up to 100 percent of the current market value of the stock. A G-3 purpose statement is not required for these loans, but a plan-lender must still comply with the registration requirements and file annual reports. Does Regulation U contain any special rules for employee stock ownership plans (ESOPs)? ESOPs qualified under section 401 of the

Internal Revenue Code are entitled to exempt credit. A lender may extend purpose credit to an ESOP without regard to the margin requirements of Regulation U. If the lender is a nonbank lender, it must still comply with the registration requirements and file annual reports. Under Regulation U, what reports must a nonbank lender file with the Federal Reserve Bank? The registration form, form G-1, is discussed above, under section 221.3. An annual report, form G-4, must be filed within thirty days of June 30. This form will be supplied by the Reserve Bank before June 30. The statement of purpose, form G-3, should be maintained in each borrower's file. When a lender wants to deregister and is eligible to do so, form G-2, the deregistration statement, must be filed with the Reserve Bank. When is a nonbank lender eligible to deregister? A registered nonbank lender may deregister if, during the preceding six calendar months, no more than USD200 000.00 of credit secured by margin stock is outstanding. What is the effect of deregistering? If a nonbank lender is eligible to deregister and does so by filing a form G-2, the lender ceases to be subject to the requirements of Regulation U when the deregistration is approved by the Federal Reserve Board. Of course, if the lender extends margin-stock-secured credit above the threshold amount, it would again have to register with the Federal Reserve. A nonbank lender may choose to remain registered with the Federal Reserve even though it is eligible to deregister. Where can a lender get more information? Forms G-1, G-2, G-3, G-4, and U-1 as well as the full text of Regulation U are available electronically. Forms and a copy of the regulation can also be obtained by contacting the Federal Reserve Bank serving your District. The US federal regulation governing the amount of credit that may be advanced by a bank to its customers for the purchase of listed stock. See also Margin. Regulation U:- the Federal Reserve Board regulation that governs loans by banks for the purchase of securities on margin. Regulation U limits the amount of leverage a bank or brokerage can extend to a borrower for the purposes of puchasing stocks, mutual funds and other market-traded securities. Regulation U is designed to mitigate the adherent risk that exists when using leverage, especially when too much leverage is granted to an individual or business. By limiting the margin amount, Regulation U aims to limit the potential losses that both borrowers and banks or lenders can sustain in instances where leverage can lead to very large losses relative to the physical capital extended. In the United States, Regulation T (Reg T) was subsequently followed by Regulation U, the rules that extend Reg T margin requirements to bank security lending; Regulation G, the rules that govern securities lending by all other domestic lenders; and Regulation X, the guidelines for the extension of securities credit by foreign lenders. Until the introduction of exchange-traded equity option in 1973, the Federal Reserve Board (FRB) did not exercise its authority to establish uniform margin requirements for stock options. See also Regulation T, and Securities Credit. Big money managers often borrow money to make more investments. This practice is called 'Using Leverage' and it can dramatically increase profits. But did you know that you can do the same thing with a margin account through your broker? There are, however, limits on how much you can borrow, and these and other requirements are set forth in the Federal Reserve Board's Regulation U. Basically, Regulation U governs transactions by banks and other lenders that extend credit for the purpose of purchasing or carrying margin stock, when the credit is to be secured by margin stock. Here's the part that you need to know about:- Regulation U specifies the amount a bank or other lender can loan to its customers for the purchase or carrying of listed equity stocks, most mutual funds, over-the-counter securities, and convertible debt securities, such as convertible bonds, rights, and warrants. Specifically, banks cannot extend more credit than the 'maximum loan value' of the collateral. Regulation U currently provides that the 'maximum loan value' for margin stock is 50 percent of the stock's current market value. Note that, while the margin requirement can be changed, it hasn't been changed in the last ten years. So, if you want to borrow USD50 000.00 for the purchase of margin stock and secure the loan with margin stock, then the market value of the margin stock at the time of the loan must be at least USD100 000.00. What happens if the market value changes? Nothing. Once the loan is made in compliance with Regulation U, the loan will not be affected by a subsequent change in the margin stock's value. Note that different requirements can apply to lines of credit secured by margin stock. So, what's the point of a margin requirement? While the use of leverage is a common investment practice that can be important to maximizing profits, it can also backfire. You may have heard of large money managers who 'blew up' the funds under their management by using leverage recklessly – and these people are the professionals! The government does not want this to happen to less experienced individual investors. In addition, the potential impact on the market could be devastating. For these reasons, Regulation U keeps the practice in check. / (НЙФБ® (или Эн.Уай.Эс.И.® (NYSE®))). НЭЗДЭК® (NASDAQ®) .

REGULATORY ADVISORY COMMITTEE = РЕГУЛИРУЮЩИЙ СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ – Regulatory Advisory Committee advises on issues of regulation, self-regulation, and regulatory systems as they directly or indirectly affect the New York Stock Exchange (NYSE®), the securities industry, and capital markets. In addition, the committee advises the board on the role of regulation in business and government. The committee also provides counsel to NYSE® staff on the implications of regulatory trends and developments. / (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)).

REGULATORY AUTHORITIES = РЕГУЛИРУЮЩИЕ ОРГАНЫ ВЛАСТИ – (1) Regulatory Authority is a governmental or statutory body (not being a Self-Regulatory Organisation (SRO)) with responsibility for securities and/or commodities and futures regulation.

(2) In banking, Regulatory Authorities are the national bodies, which require the collection of information on cross-border payments. / В банковском обслуживании, национальные структуры, требующие сбор информации по трансграничным платежам.

REGULATORY PYRAMID = ПИРАМИДА РЕГУЛИРОВАНИЯ – Regulatory Pyramid:- a network of safeguards that surrounds the securities industry – from individual brokerages all the way up to the US Congress.

REGULATORY REPORTING INFORMATION = ОТЧЁТНАЯ ИНФОРМАЦИЯ ДЛЯ РЕГУЛИРУЮЩИХ ОРГАНОВ – In banking, Regulatory Reporting Information is an information on cross-border payments, which has to be reported to relevant bodies.

REIMBURSEMENT = РАМБУРСИРОВАНИЕ (или ВОЗМЕЩЕНИЕ) – (1) Reimbursement:- an arrangement by which a party is repaid for payments made according to the instructions of another party. Reimburse:- to repay or compensate (someone) for (money already spent, losses, damages, etc). For example:- your fare will be reimbursed after your interview. / Рамбурс – возмещение исполняющему банку средств, выплачиваемых им по аккредитиву. Под межбанковским Рамбурсом понимается процесс возмещения, когда банк эмитент уполномочивает банк, не участвующий в аккредитиве (рамбурсирующий банк), произвести рамбурсирование (предоставить возмещение) по требованию исполняющего банка или выступающего от его имени другого банка (рекламирующего банка). Рамбурсирующий банк в соответствии с полученными от банка эмитента инструкциями и/или полномочиями (рамбурсными инструкциями) может принять на себя (выставить) самостоятельное рамбурсное обязательство – обязательство по отношению к рекламирующему банку оплатить его рамбурсное требование, если указанные в обязательстве условия выполнены. Если рамбурсное обязательство выставлено, рамбурс является подтверждённым. При проведении операций, связанных с межбанковскими рамбурсами, могут применяться Унифицированные Правила для Межбанковских Рамбурсов по Документарным Аккредитивам Международной Торговой Палаты, редакция 1996, Публикация № 525, для чего в тексте рамбурсных инструкций и аккредитивов должна быть сделана соответствующая оговорка. При авизовании аккредитивов и рамбурсных инструкций по системе SWIFT в соответствующих форматах 7 категории, указанные правила применяются без специальных оговорок об этом, если только в тексте сообщения не сказано об ином. Рамбурс – межбанковский платёж в пользу рекламирующего банка, осуществляемый банком рамбурсирующим, в рамках выданного им

рамбурсного обязательства либо в рамках инструкций полученных от банка эмитента аккредитива, покрывающий рамбурсное требование рекламирующего банка.

(2) Reimbursement:- payment of an amount of money related to the amount of loss to or on behalf of the insured upon the occurrence of a defined loss. / Оплата денежной суммы, связанной с суммой ущерба или от имени застрахованного лица при возникновении определённого ущерба.

REIMBURSEMENT BANK = БАНК ПО РАМБУРСИРОВАНИЮ (или БАНК ПО ВОЗМЕЩЕНИЮ) – Reimbursement Bank is a bank providing cover for a payment order (ISO term). In a SWIFT message, paying bank to negotiating bank. / Банк, обеспечивающий покрытие по платёжному поручению. В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Рамбурсирующий Банк – банк, производящий рамбурсирование (предоставляющий возмещение) согласно инструкциям банка эмитента.

REIMBURSING BANK = РАМБУРСИРУЮЩИЙ БАНК (или ВОЗМЕЩАЮЩИЙ БАНК) – In a letter of credit transaction, the bank with which the issuing bank maintains an account and which is authorized by the issuing bank to charge that account to pay claims received from the negotiating bank for documents that have been presented. Reimbursing Bank:- In letter of credit (L/C) arrangements, the bank (often, but not always the issuing bank) that serves as a source of funds for payment to the L/C's beneficiary. / Рамбурсирующий Банк – банк, производящий рамбурсирование (предоставляющий возмещение) согласно инструкциям банка эмитента. Рамбурсирующий Банк – банк, уполномоченный банком эмитентом аккредитива либо выпустить рамбурсное обязательство в пользу рекламирующего банка и удовлетворяющего рамбурсные требования при условии выполнения последним всех условий такого обязательства, либо осуществлять платежи в пользу рекламирующего банка против его простых рамбурсных требований без принятия на себя каких-либо обязательств.

REINFORCEMENT FABRICS = ТКАНИ ДЛЯ УКРЕПЛЕНИЯ (или УСИЛЕНИЯ) – Reinforcement Fabrics:- most reinforcement fibers, as supplied by the manufacturer, have a small amount of size on their surface, designed to reduce filament damage and facilitate handling during weaving. Fabrics woven from these fibers and supplied untreated are described as loomstate. (i) Carbon fibers are supplied with a size finish (normally epoxy or polyester based) which both aids processing and enhances compatibility with commonly used thermosetting matrices. Fabric woven from glass rovings which have a bonding agent applied by manufacturers are supplied, like carbon fiber fabrics, in loomstate only. (ii) In the case of glass or aramid fibers, it is necessary to remove the protective size applied by the manufacturer, and, in most cases, to treat the fabric with specific chemical finishes to enhance matrix compatibility. See also Geotextiles. Reinforcement Fabrics:- fabric system used in the construction of steep slopes and retaining walls. By stabilizing the soil mass, they reduce the stress on the retaining wall with corresponding decrease in load-bearing requirements for the wall design. In slope reinforcement, the stabilization permits steeper slope construction than would be possible based on soil properties. Woven fabrics and other reinforcements are used in conjunction with resins (the matrix) to produce composite materials which combine the strengths and overcome the weaknesses of two (or more) materials to produce very strong materials, the most common ones being GRP/FRP (Glass/Fiber Reinforced Plastic) and carbon fiber. On their own these fabrics do not posses strength much beyond that of any woven fabric, but once they are combined with resin to make a finished product, their strength can be astonishing. As a supplier of advanced composites, our range of conventional 'staples' of composites manufacture limited but we do make a point of stocking high performance woven E-Glass and also powder-bound chopped strand mat, which unlike conventional chopped strand mat, is suitable for use with epoxy resin systems. This is particularly important considering the preference for using epoxy moulds when creating epoxy parts.

REINSTATEMENT = ВОССТАНОВЛЕНИЕ – (1) In the United States, a Reinstatement is the returning a corporation that has been administratively dissolved or had its certificate of authority revoked, to good standing on a state's records.

(2) Reinstatement:- putting a lapsed policy back in force.

(3) Reinstatement:- the payment of a claim under some forms of insurance reduces the principal amount of the policy by the amount of the claim. Provision is usually made for a method of reinstating the policy to its original amount.

REINSTATEMENT CLAUSE = ОГОВОРКА О ВОССТАНОВЛЕНИИ – Reinstatement Clause:- when the amount of reinsurance coverage provided under a treaty is reduced by the payment of a reinsurance loss as the result of one catastrophe, the reinsurance cover is automatically reinstated usually by the payment of a reinstatement premium.

REINSTATEMENT OF COVER = ВОССТАНОВЛЕНИЕ КОВЁРА – Reinstatement Of Cover is the restoration of cover following its exhaustion as a result of a loss by payment of an additional (reinstatement) premium. Many reinsurances provide for one or more automatic reinstatement of covers.

REINSTATEMENT PREMIUM = ПРЕМИЯ ЗА ВОССТАНОВЛЕНИЕ – In reinsurance, Reinstatement Premium is a pro rata reinsurance premium is charged for the reinstatement of the amount of reinsurance coverage that was reduced as the result of a reinsurance loss payment under a catastrophe cover.

REINSURANCE = ПЕРЕСТРАХОВАНИЕ – (1) Reinsurance is the practice whereby one party called the Reinsurer in consideration of a premium paid to him agrees to indemnify another party, called the Reinsured, for part or all of the liability assumed by the latter party under a policy or policies of insurance which it has issued. The reinsured may be referred to as the Ceding Company, or Direct Writing Company, or the Original or Primary Insurer. Insurance by one insurance company of all or part of a risk accepted by it with another insurance company which agrees to reimburse the insurance company for the portion of the claim insured. A contract under which a reinsurer agrees to pay specified types and amounts of underwriting loss incurred by an insurer or another reinsurer in return for a premium. Reinsurance serves to 'lay-off' risk. Reinsurance may be proportional or non-proportional and may take the form of a cover in respect of an individual risk exposure (see facultative risk) or cover in respect of multiple risk exposures (see treaty). Reinsurance accounts for more than half of Lloyd's total business. Insurance for insurance companies which spreads the risk of the direct insurer. Includes various forms such as facultative, financial, non-proportional, proportional, quota-share, surplus and treaty reinsurance. What is Reinsurance? When you look at the risks that insurers take on, it is not surprising that they themselves might want to have insurance. When insurers insure a risk again, it is called Reinsurance. A third of all business carried out at Lloyd's is reinsurance. Reinsurance is an extension of the concept of insurance, in that it passes on part of the risk for which the original insurer is liable. Reinsurance contracts are slightly more specialist than insurance contracts but for the most part they work in exactly the same way – it is just that the 'insured' is another insurer, known as the 'Reinsured'. A contract of reinsurance is between the insurer and reinsurer only and legally there is no direct link between the original insured and any reinsurer. The original insurer is still the one who must pay any claim from the insured – the insurer must then make its own separate claim against the reinsurer. Reinsurance is important for a number of reasons, including:- (i) Protecting against large claims:- in the case of a fire in a large oil refinery, for example, or a large city

hit by an earthquake, insurers will spread the risk by reinsuring part of what they have agreed to insure with other reinsurers so that the loss is not so severe for any one insurer. (ii) Avoiding undue fluctuations in underwriting results:- insurers want to ensure a balanced set of results each year without peaks and troughs. They can therefore get reinsurance which will cover them against any unusually large losses. This keeps a cap on the claims the insurer is exposed to having to pay itself. (iii) Obtaining an international spread of risk:- this is important when a country is vulnerable to natural disasters and an insurer is heavily committed in that country. Insurance may be reinsured to spread the risk outside the country. (iv) Increasing the capacity of the direct insurer:- sometimes insurers want to insure a risk but are not able to do so on their own. By using reinsurance, the insurer is able to accept the risk by insuring the whole risk and then reinsuring the part it cannot keep for itself to other reinsurers. Like the direct insurance market, reinsurance usually involves specialist brokers who have expert knowledge of the market and access to reinsurance underwriters on behalf of their clients. Assumption by one insurance company of all or part of risk originally undertaken by another insurance company. The purpose of reinsurance is to spread risks underwritten by direct insurers, which remain responsible to the insured. The direct insurer thus assigns part of its risk to the other insurance company, or reinsurer, in exchange for a reinsurance premium.

(2) Reinsurance:- a contract of indemnity against liability by which the insurance company procures another insurance to insure against loss or liability by reason of the original insurance.

REINSURANCE CONTRACT = КОНТРАКТ ПЕРЕСТРАХОВАНИЯ (или ДОГОВОР ПЕРЕСТРАХОВАНИЯ) – Reinsurance Contract is an insurance contract issued by one insurer (the reinsurer) to compensate another insurer (the cedant) for losses on one or more contracts issued by the cedant. / Контракт Страхования (или Договор Страхования), заключённый одним страховщиком (перестраховщиком) с целью компенсации убытков другого страховщика (цедента) по одному или более контрактам, заключённым данным цедентом (cedant).

REINSURANCE TO CLOSE = ПЕРЕСТРАХОВАНИЕ ПЕРЕД ЗАКРЫТИЕМ – Reinsurance To Close (RITC) is a reinsurance agreement under which members of a syndicate for a year of account to be closed are reinsured by members who comprise that or another syndicate for a later year of account against all liabilities arising out of insurance business written by the reinsured syndicate. A reinsurance which closes a year of account by transferring the responsibility for discharging all the liabilities that attach to that year of account (and any year of account closed into that year) plus the right to any income due to the closing year of account into an open year of account of the same or a different syndicate in return for a premium. Where a reinsurance to close is effected between members of the same syndicate the reserves of the closing year of account constitute the premium for a reinsurance to close. This premium must be equitable as between the members of the two years of account concerned which means that neither the reinsured nor the reinsuring members should expect to profit from the transaction at the time it is concluded. Where a reinsurance to close is effected between members of different syndicates the managing agent of the reinsuring members will want to make a profit from the transaction for those members and will set the reinsurance to close premium accordingly. This usually involves a loading on the reserves of the closing year of account.

REINSURER = ПЕРЕСТРАХОВЩИК – Reinsurer is an insurer that accepts all or part of the liabilities of the ceding company in return for a stated premium. See also Cedent, and Ceding company. The party that has an obligation under a reinsurance contract to compensate a cedant if an insured events occurs. Reinsurer is an underwriter of reinsurance. If the reinsurance is underwritten at Lloyd's the reinsurer(s) will be one or more syndicates. If the reinsurance is not underwritten at Lloyd's the reinsurer(s) will be one or more insurance companies. Some reinsurances may be underwritten by both syndicates and insurance companies. Reinsurer is an insurer or reinsurer assuming the risk of another under contract. / Лойдз (Lloyd's).

REINVEST = ПОВТОРНО ИНВЕСТИРОВАТЬ (или РЕИНВЕСТИРОВАТЬ) – Reinvest:- funneling of profits back into a company to enhance its operations. An individual stockowner can also reinvest by designating that dividends paid on stock will be used to purchase additional shares of that stock.

REINVESTMENT = ПОВТОРНОЕ ИНВЕСТИРОВАНИЕ (или РЕИНВЕСТИРОВАНИЕ) – In the United States, Reinvestment:- when proceeds from a Series H bond that has reached final maturity (30 years from date of issue) are used to 'buy' a Series HH bond with a current issue date.

REINVESTMENT DISCOUNT = СКИДКА ПРИ ПОВТОРНОМ ИНВЕСТИРОВАНИИ (или СКИДКА ПРИ РЕИНВЕСТИРОВАНИИ) – Reinvestment Discount:- for dividend-paying funds, discounts are granted on reinvested dividend amounts. In many cases, investors pay no, or only a discounted, front-end load. The size of the reinvestment discount is published together with the dividend announcement. Reinvestment Discount is a discount on the issuing price granted by investment funds to customers reinvesting income proceeds to acquire fund units of the same type.

REISSKILOMETER = РАЙСКИЛЁМЭТА (или КИЛОМЕТРОВ ДО РАЗРЫВА) – Reisskilometer (RKM) or Breaking-Kilometer:- this can be expressed by the 'Length of yarn in km' at which yarn will break of its own weight'. This is equivalent to breaking load in g/tex. RKM is the short expression for 'Reisskilometer' – 'Breaking-Kilometer', which is the unit out of date. For example:- a Cotton-yarn with 15 RKM means, it would break of its own weight, if you wind off 15 km of the yarn and hang it up in 15 km. Nowadays it is common practice, to use the unit centi-Newton per Tex (cN/Tex) or gram-force per Tex (gf/Tex). RKM and cN/Tex or gf/Tex are practically the same. Note:- the coarser the yarn, the higher the value should be. / Километров До Разрыва (КДР).

REISSUE = ПОВТОРНАЯ ЭМИССИЯ (или ПЕРЕВЫПУСК) – In the United States, a Reissue is the cancellation and retirement of a bond and the issuance of a new bond or bonds of the same series, same issue date, and same total face amount. Reissue is a transaction requested in order to change bonds' registrations, that is, to re-register savings bonds. Note:- situations for which Series I bonds may be reissued are more limited than for Series EE and other savings bonds.

REISSUE APPLICATION = ЗАЯВКА НА ЗАМЕНУ (или ЗАЯВКА НА ПЕРЕИЗДАНИЕ) – Reissue Application is an application for a patent to take the place of an unexpired patent that is defective in one or more particulars (items or details).

REISSUING CERTIFICATES = ПЕРЕВЫПУЩЕННЫЕ СЕРТИФИКАТЫ – Reissuing Certificates:- the term 'reissue' refers to when a new certificate is issued to substitute for a previously issued certificate. The reissue may be the result of the Authorized Certification Official (ACO) errors or at the request of an exporter for various reasons. The original certificate must be recovered. Only ACOs at the issuing office (accountability point) can reissue completed or partially completed certificates because of changes in the information (such as extensive changes in a critical block or erasures prohibited by the foreign country).

REIT = REAL ESTATE INVESTMENT TRUST

REJECTED GRADES = ЗАБРАКОВАННЫЕ СОРТА – Rejected Grades are defined in the Off-Grades of Grain and Grades of Screenings Order. The term is not used in grading eastern grain. Numerical grades of western grain may be graded rejected only because of stones. If the stones are removed, the Rejected designation is dropped. / Сорта Высевок (Grades of Screenings).

REJECTION = ОТКАЗ (или ОТКЛОНЕНИЕ, или ЗАБРАКОВКА, или ОТБРАКОВКА) – (1) In banking, a Rejection is a refusal to execute a direct debit instruction. Rejection is initiated by the debtor's bank or by an Automated Clearing House (ACH).

(2) Rejection is a non-acceptance of, e.g., cargo. / Отказ от приёмки, например, груза. Отклонение – заключение о том, что совокупность, партия или какое-то количество продукции или услуги не соответствуют критериям приёмки. Примечания:- (i) При отгрузке продукции термин Отклонение означает в более мягком смысле неприёмку партии по условиям контракта, например партию можно отнести к другому классу, для неё можно снизить цену. Обычно указывают решение о размещении отклонённой партии, например, возврат поставщику. (ii) В том случае, если отклонение не было квалифицировано как окончательное, можно повторно предъявить партию на контроль после корректирующих действий.

REJECTS = ОТБРОСЫ (или БРАК, или ОТБРАКОВКА) – Rejects:- off-grades thrown to one side by the wool grader; fleeces with excessive black fibers, kemp, dead fibers, vegetable matter, etc. / Брак (Rejects):- изделия и работы, продажа (сдача) которых потребителю не допускается из-за наличия в них дефектов. В зависимости от наличия дефектов – устранимых и неустранимых различают Брак Исправимый и Окончательный (Неисправимый). Наряду с абсолютным показателем брака исчисляется его доля в общем объёме готовых изделий, деталей, работ. В стоимостном выражении абсолютная величина брака исчисляется как сумма затрат на производство окончательного (неисправимого) брака и исправление бракованных изделий. К браку относят стоимость окончательно забракованной продукции, стоимость материалов, полуфабрикатов деталей, испорченных при переналадке оборудования сверх установленных норм, а также затраты на исправление брака и затраты, превышающие установленные нормы расхода на гарантийный ремонт. Брак Коммерческий – нарушения правил оформления перевозочных документов, платежных документов, таможенных деклараций и тому подобного, в результате которых либо эти документы утрачивают юридическую силу, либо возникают различные трудности при выдаче груза (вплоть до его полной конфискации), при взаимных расчётах грузоотправителей и грузополучателей; нарушение сроков доставки груза, засылка, порча, утрата груза и так далее.

REJOINDER = ПОВТОРНОЕ ВОЗРАЖЕНИЕ (или ОТВЕТ НА КРИТИКУ, или ВОССОЕДИНЕНИЕ) – Rejoinder:- the rejoining (returning to active consideration) of claims previously withdrawn from consideration to due to an election requirement (see Restriction).

REJUVENATE = ОБНОВЛЯТЬ (или ОМОЛАЖИВАТЬ) – Rejuvenate:- to regrow a Variety or stock of seed when the supply has been exhausted, lost, or destroyed.

REKA CHECK = ЧЕК РЭКА – Reka Check is a voucher created by the Schweizerische Reisekasse (Swiss Travel Fund), sold at a discount by many companies and associations to employees or members for the purpose of promoting family tourism within Switzerland. Accepted as payment medium by many Swiss railway and transport enterprises, hotels and other establishments in the tourist field. / Ваучер, созданный Швейцарским Фондом Путешествий или, как это звучит на Немецком языке по месту регистрации, Швайцэришэ Райзэкассэ (Schweizerische Reisekasse), продаваемый с дисконтом многими компаниями и ассоциациями служащим или участникам с целью продвижения семейного туризма внутри Швейцарии. Принимается в качестве платёжного средства многими Швейцарскими железнодорожными и транспортными предприятиями, гостиницами и иными заведениями в сфере туризма.

RELATED COMPANIES = СВЯЗАННЫЕ КОМПАНИИ (или ВЗАИМОСВЯЗАННЫЕ КОМПАНИИ) – Related Companies are branches, subsidiaries, associates or parents. / Филиалы (branches), дочерние предприятия (subsidiaries), ассоциаты или зависимые лица (associates) или материнские компании (parents).

RELATED IMPORT OR EXPORT CREDIT = ВЗАИМОСВЯЗАННЫЙ ПРИВОЗНОЙ ИЛИ ВЫВОЗНОЙ КРЕДИТ (или ВЗАИМОСВЯЗАННЫЙ ИМПОРТНЫЙ ИЛИ ЭКСПОРТНЫЙ КРЕДИТ) – Related Import Or Export Credit is a trade credit between related companies, included in direct investment.

RELATED MATERIAL = РОДСТВЕННЫЕ ПРИМЕСИ (или СВЯЗАННЫЕ ОСТАТКИ) – In the Rice industry, Related Material is all by-products of a paddy kernel, such as the outer glumes, lemma, palea, awn, embryo, and bran layers. See also Unrelated Material. / В рисовой отрасли, под Родственными Примесями или Связанными Остатками понимаются все побочные продукты нешелушеной зерновки (нешелушеных ядер), такие как зародыш или эмбрион (embryo), ость колоса (awn), колосковые чешуйки (outer glumes), цветковая чешуя (lemma) и внутренняя цветковая чешуя (palea), слои околоплодника (bran layers). Смотрите также Неродственные Примеси или Несвязанные Остатки (Unrelated Material).

RELATED PARTY = СВЯЗАННАЯ СТОРОНА (или ВЗАИМОСВЯЗАННАЯ СТОРОНА) – Related Party:- a party is related to an entity if:- (i) directly, or indirectly through one or more intermediaries, the party:- (a) controls, is controlled by, or is under common control with, the entity (this includes parents, subsidiaries and fellow subsidiaries); (b) has an interest in the entity that gives it significant influence over the entity; (c) has joint control over the entity. (ii) The party is an associate of the entity. (iii) The party is a joint venture in which the entity is a venturer. (iv) The party is a member of the key management personnel of the entity or its parent; (v) The party is a close member of the family of any individual referred to in (i) or (iv). (vi) The party is an entity that is controlled, jointly controlled or significantly influenced by, or for which significant voting power in such entity resides with, directly or indirectly, any individual referred to in (iv) or (v). (vii) The party is a post-employment benefit plan for the benefit of employees of the entity, or of any entity that is a related party of the entity and of any entity upon such plans. The following are not related parties:- (i) two entities simply because they have a director or other member of key management personnel in common, notwithstanding (iv) and (vi) in the definition of 'related party'. (ii) Two venturers simply because they share joint control over a joint venture. (iii) (a) Providers of finance, (b) trade unions, (c) public utilities, and (d) government departments and agencies, simply by virtue of their normal dealings with an entity (even though they may affect the freedom of action of an entity or participate in its decision-making process). And (iv) a customer, supplier, franchisor, distributor, or general agent with whom an entity transacts a significant volume of business, merely by virtue of the resulting economic dependence. In new accounting standard, the definition of Related Party has been expanded by adding:- (i) parties with joint control over the entity; (ii) joint ventures in which the entity is a venturer; and (iii) post-employment benefit plans for the benefit of employees of an entity, or of any entity that is a related party to that entity and of any entity under the control of such plans. Also known as Affiliate. / Известна также как Аффилят (Affiliate).

RELATED PARTY TRANSACTION = ТРАНЗАКЦИЯ СО СВЯЗАННОЙ СТОРОНОЙ (или ОПЕРАЦИЯ СО СВЯЗАННОЙ СТОРОНОЙ) – A Related Party Transaction is a transfer of resources, services or obligations between related parties, regardless of whether a price is charged.

RELATED REFERENCE = ВЗАИМОСВЯЗАННАЯ ССЫЛКА – Related Reference is a field name in a SWIFT message:- the identification of a transaction to which the current transaction is related. / Это название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial

Telecommunication (SWIFT)):- . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

RELATED SHADES = СВЯЗАННЫЕ ОТТЕНКИ – Related Shades are the colors of similar tone in the same or different depths.

RELATIVE GROWTH RATE = ОТНОСИТЕЛЬНАЯ СКОРОСТЬ РОСТА (или ОТНОСИТЕЛЬНАЯ СТАВКА РОСТА) – Relative Growth Rate (RGR):- the increase in Plant material per unit of material in a specified time.

RELATIVE HIGH = ОТНОСИТЕЛЬНЫЙ МАКСИМУМ – Relative High:- in technical analysis, each time the stock moved higher, it could not reach the level of its previous relative high price. The stock makes a relative high equal to the most recent relative high. / Показатели максимальных значений котировок в последовательности всех котировок графика.

RELATIVE HUMIDITY = ОТНОСИТЕЛЬНАЯ ВЛАЖНОСТЬ – Relative Humidity is a measure of the dryness or dampness of air; is defined as the part or fraction of invisible water, in the form of vapor, actually present in air as compared with the maximum moisture the air can hold at a given temperature and atmospheric pressure. It is expressed as a percentage. It is also defined as the ratio of the pressure exerted by the water vapor in the air (called the Partial Pressure Of Water Vapor) to the pressure of saturated water vapor at the same temperature. When air is saturated with water vapor, its relative humidity is said to be 100 percent; if it contains three-fourths as much water vapor, its relative humidity is 75 percent. A relative humidity of zero signifies that the air contains no water vapor. The ratio of the actual pressure of the water vapor in the atmosphere to the saturation vapor pressure at the same temperature. The ratio is usually expressed as a percentage. Relative Humidity is derived from the ratio of absolute moisture content to saturation content. Depending on its temperature, air can absorb different quantities of water vapor until it is saturated (100% relative humidity). Absolute humidity (moisture content) is the quantity of water actually present in the air and is measured in grams per cubic meter (g/m^3). Relative humidity expresses as a percentage the quantity of water vapor the air has at a specific temperature, relative to its saturation content. If, for instance, air at 20 °C has an absolute humidity of 12.1 it will have a relative humidity of 70%. If air has reached its saturation content at 20 °C, it has absorbed 17.3 g/m^3 of water. The ratio of the actual pressure of existing water vapor to the maximum possible pressure of water vapor in the atmosphere at the same temperature. It is expressed in term of percentage. Relative Humidity is the ratio of the amount of water vapor in the air at a specific temperature to the maximum moisture-holding capacity of the air at that temperature. Relative Humidity is the ratio of the actual vapor pressure of moisture in air to the saturation vapor pressure at ambient temperature. Relative Humidity is the ratio, expressed as a percentage, of the pressure of water vapour actually present in the atmosphere to the saturation pressure at the same temperature and at the same total pressure. / Под Относительной Влажностью понимается отношение упругости водяного пара, содержащегося в воздухе при той же температуре, выражаемое в процентах. Под Абсолютной Влажностью понимается количество водяного пара в граммах, содержащегося в одном кубическом метре воздуха. Под Удельной Влажностью понимается отношение массы водяного пара в некотором объёме воздуха (в граммах) ко всей массе воздуха в этом объёме (в килограммах). Относительная Влажность:- количество воды, содержащееся в воздухе при определённой температуре. Оно вычисляется относительно максимального количества воды, которое может содержаться в воздухе при данной температуре.

RELATIVE LOW = ОТНОСИТЕЛЬНЫЙ МИНИМУМ – Relative Low:- in technical analysis, each time the stock moved lower, it could not reach the level of its previous relative low price. The stock makes a relative low equal to the most recent relative low. / Показатели минимальных значений котировок в последовательности всех котировок графика.

RELATIVE MOLECULAR MASS = ОТНОСИТЕЛЬНАЯ МАЛЕКУЛЯРНАЯ МАССА – Relative Molecular Mass (RMM) is a proper modern term instead of molecular weight. 'Relative' is used because the mass is in proportion to one twelfth the mass as carbon-12. / Под Молекулярной Массой или Молекулярным Весом понимается масса молекулы, выраженная в единицах атомной массы. Равна сумме масс всех атомов, из которых состоит молекула. Величины молекулярной массы используются в химических, физических и химико-технических расчётах.

RELATIVE PLATING EFFICIENCY = ОТНОСИТЕЛЬНАЯ ЭФФЕКТИВНОСТЬ ПОСАДКИ (или ОТНОСИТЕЛЬНАЯ ЭФФЕКТИВНОСТЬ ПОКРЫТИЯ) – Relative Plating Efficiency is a percentage of inoculated cells which give rise to colonies, relative to a control.

RELATIVE STRENGTH ANALYSIS = АНАЛИЗ ОТНОСИТЕЛЬНОЙ СИЛЫ – Relative Strength Analysis is a form of technical analysis where the performance of a share price is assessed relative to the market as a whole or a suitable market sector.

RELATIVE STRENGTH INDEX = ИНДЕКС ПО ОТНОСИТЕЛЬНОЙ СИЛЕ – Relative Strength Index (RSI) is a very popular momentum oscillator developed by Welles Wilder. RSI compares upward and downward movements in closing price. Indicator of technical analysis used to determine overbought or oversold conditions. A popular oscillator developed by Welles Wilder, Jr. and described in his self-published 1978 book 'New Concepts in Technical Trading Systems'. Relative Strength Index (RSI) is plotted on a vertical scale from 0 to 100. Values above 70 are considered overbought and values below 30, oversold. When prices are over 70 or below 30 and diverge from price action, a warning is given of a possible trend reversal. Indicator that measures the price behaviour of a particular share relative to the market as a whole. It indicates whether a share is outperforming or underperforming the market index. Relative Strength Index (RSI):- developed by J. Welles Wilder, the RSI compares the magnitude of an instrument's gains to its losses over a set period (usually 14 days). This is a momentum oscillator and provides information such as overbought or oversold conditions and divergence between price and indicator. Welles Wilder is a developer of the RSI indicator and the Directional Movement Indicator (DMI) system. Relative Strength Index (RSI) is an indicator invented by J. Welles Wilder and used to ascertain overbought/oversold and divergent situations. / В техническом анализе биржевых рынков, . Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. Результатом этой деятельности стали многочисленные статьи в специализированных журналах для биржевых торговцев и инвесторов, а также книги, и частности, книга Новые Концепции в Технических Системах Торговли (New Concepts in Technical Trading Systems). Вайлдё разработал систему Дэлтца Плас (Delta Plus), технические индикаторы ADX, ART, DMI, RSI, параболическую систему SAR, и другие. В 1980-е он основал общество Дэлтца Сосайэти Интёнэшэнэл (Delta Society International), помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

RELATIVE VISCOSITY = ОТНОСИТЕЛЬНАЯ ВЯЗКОСТЬ – Relative Viscosity:- a ratio of the viscosity of the polymer in solution to that of the solvent expressed as time of efflux of the solution divided by the time of efflux of the solvent at constant temperature. / Относительная Вязкость – отношение динамических вязкостей испытуемой жидкости и воды.

RELAXED YARN = ОСЛАБЛЕННАЯ ПРЯЖА – Relaxed Yarn is the yarn treated to reduce tension and produce more uniform shrinkage or torque. Relaxation produces more uniform dyeing characteristics in regular filament yarns of nylon or polyester. / филаментная (комплексная) пряжа (filament yarn). Найлан^{T3} (Nylon^{TM}).

RELAY = ПЕРЕДАВАЕМЫЙ (или СМЕНА, или ПОСМЕННО) – (1) Relay:- common practice in the less-than-truckload industry, in which one driver takes a truck for 8 to 10 hours, then turns the truck over to another driver, pony express style.

(2) Relay:- marine shipment that is transferred to its ultimate destination port after having been shipped to an intermediate point.

(3) Relay:- to transfer containers from one ship to another when both vessels are controlled by the same network (carrier) manager. / Для передачи контейнеров с одного судна на другое, когда оба судна контролируются одним и тем же сетевым управляющим (перевозчика).

RELAY CONTAINER = ПЕРЕДАВАЕМЫЙ КОНТЕЙНЕР (или ПЕРЕКЛАДЫВАЕМЫЙ КОНТЕЙНЕР) – Relay Container is a container arriving on one vessel into a port and reloading onto another vessel to reach its ultimate destination. / Контейнер, прибывающий на одном судне в какой-то порт и перегружаемый на другое судно для дальнейшего движения к конечному пункту назначения.

RELAY CROPPING = ПОСМЕННОЕ ВОЗДЕЛЫВАНИЕ (или ПОСМЕННОЕ ВЫРАЩИВАНИЕ) – Relay Cropping is a growing two or more crops in sequence, planting the succeeding one after the flowering but before the harvest of the former.

RELEASE = ВЫПУСК – (1) Release is an action by the Customs to permit goods undergoing clearance to be placed at the disposal of the persons concerned. Authorization for entry after clearance of a consignment. Release (of a consignment) is an authorization for entry after clearance. / Разрешение на ввоз после таможенной очистки партии груза.

(2) Release (into the environment) is the intentional liberation of an organism into the environment. See also Establishment, and Introduction.

RELEASE = ВЫПУСК (или РАЗРЕШЕНИЕ НА ОТПУСК) – (1) Release:- once a load has been authorized to be stowed, a transfer of stowage information within the computer takes place. This information is then used by the stowage department to assign a specific ship position to a container. A signification by Customs that proper entry has been made on an import shipment and the cargo can be delivered to principals.

(2) Release is the authorization to ship.

RELEASED VALUE NOT EXCEEDING = СТОИМОСТЬ РЕАЛИЗАЦИИ, НЕ ПРЕВЫШАЮЩАЯ – Released Value Not Exceeding:- usually used to limit the value of goods transported. The limitation refers to carrier liability when paying a claim for lost or damaged goods.

RELEASE OF MORGAGE = РЕАЛИЗАЦИЯ ЗАКЛАДНОЙ – Along with the deed of release, the Release Of Mortgage is the second possibility to relinquish real property liens. As a result, the assignee releases the collateral and can no longer use it as the basis to satisfy claims. The release of mortgage is a deed in which the deletion of the mortgage or land charge from the land register is approved and which can be used to release the owner from the real property lien.

RELIEF = РЕЛЬЕФ – Relief is the difference in elevation between the high and low points of the field. / Под Рельефом, от Французского слова Relief, от Латинского слова Relevo, означающее Поднимаю, понимается совокупность неровностей суши, дна океанов и морей, разнообразных по очертаниям, размерам, происхождению, возрасту и истории развития. Слагается из положительных (выпуклых) и отрицательных (вогнутых) форм. Рельеф образуется главным образом в результате длительного одновременного воздействия на земную поверхность эндогенных (внутренних) и экзогенных (внешних) процессов. Рельеф изучает геоморфология.

RELIEVING TACKLE = АВАРИЙНЫЕ РУМПЕЛЬ–ТАЛИ – Relieving Tackle (maritime term):- a tackle of double and single blocks rove with an endless line and used to relieve the strain on the steering engine in heavy weather or emergency.

RELSET® PROCESS = ПРОЦЕСС РЭЛСЭТ® – Relset® Process is a process of Richen, Inc., for continuous heat-setting of carpet or other heavy yarns. Individual ends are continuously fed into a heat-setting chamber and withdrawn into take-up cans or fed to winders. / Ричэн, Инк. (Richen, Inc.).

RELYING PARTY = ДОВЕРЯЮЩАЯ СТОРОНА – Relying Party is a recipient of a certificate who acts in reliance on that certificate and/or digital signatures verified using that certificate.

REMAINING USEFUL LIFE = ОСТАЮЩИЙСЯ ПОЛЕЗНЫЙ СРОК СЛУЖБЫ (или ОСТАТОЧНЫЙ ПОЛЕЗНЫЙ РЕСУРС) – Remaining Useful Life:- an opinion (based on data, observations, history, records, exposure, etc) of the number of years before a fluid, system or component will require replacement or reconditioning.

REMAZOL® = РЭМАЦОЛЬ® – Remazol® is a family of vinyl sulfone reactive dyes; tradename of Dystar of Germany. / винилсульфоновый краситель (vinyl sulfone dye). Торговое название Дистар (Dystar) из Германии.

REMEDIES = САНКЦИИ – Remedies are the special rights a party has when another party defaults or breaches an agreement. Remedies include lawsuits or injunctions to stop an action that may harm a party. / Специальные права, которыми одна сторона вправе воспользоваться в случае несостоятельности или нарушения другой стороной заключённого между ними соглашения. Санкции включают в себя выставление исков или введение запретов с целью остановки действия, которое может нанести вред данной стороне. Под Санкцией, от Латинского слова Sanctio, означающее Строжайшее Постановление, понимаются:- (i) мера воздействия, важнейшее средство социального контроля; различают:- (a) негативные санкции, направленные против отступлений от социальных норм, и (b) позитивные санкции, стимулирующиеодобряемые обществом, группой отклонения от норм; формальные санкции налагаются официальным общественным или государственным органом, неформальные санкции – реакция членов группы, друзей и так далее; (ii) государственная мера, применяемая к нарушителю установленных норм и правил; (iii) часть правовой нормы, содержащая указание на меры государственного воздействия в отношении нарушителя данной нормы; (iv) в международном праве – мера воздействия, применяемая к государству при нарушении им своих международных обязательств или норм международного права; или (v) утверждение чего-либо высшей инстанцией, разрешение.

REMIC = REAL ESTATE MORTGAGE INVESTMENT CONDUIT

REMITTANCE = ПЕРЕЧИСЛЕНИЕ – Remittance is a transfer of money from one account to another (non-cash transactions). Sum of money forwarded from one person or one entity to another, either by cash or by negotiable instrument, usually in payment of an invoice

for goods or services purchased. / Под Перечислением, от Латинского слова Remitto, означающее Отсылаю, понимается перевод денегжных средств с одного счёта на другой (безналичные операции). Сумма денежных средств, направляемая от одного физического лица или одного юридического лица другому, либо наличными либо оборотным инструментом, как правило в оплату счёта-фактуры за приобретённые товары или услуги.

REMITTANCE INFORMATION = ИНФОРМАЦИЯ О ПЕРЕЧИСЛЕНИИ – Remittance Information is an information supplied by the creditor to be passed to the debtor. It is a field name in a SWIFT message:- an information from the 'Ordering Party' to the 'Beneficiary Customer', about the reason for the payment. / Информация, предоставленная кредитором, которая должна быть передана дебитору. В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) информация от 'Стороны Распорядителя' (или 'Инструктирующей Стороны' (ordering party)) 'Заказчику Выгодоприобретателю' ('Beneficiary Customer') о причине данного платежа. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REMITTING BANK = БАНК ДЛЯ ПЕРЕЧИСЛЕНИЯ (или БАНК РЕМИТЕНТ) – In a draft collection transaction, Remitting Bank is the first bank in the chain of collection, i.e. the principal's or seller's bank. Also known as Collecting Bank. Remitting Bank is the bank to which the principal has entrusted the handling of a collection. / Банк, которому принципал (доверитель) поручает осуществить операцию по инкассо. банк доверителя (принципала) или продавца. , то есть . Известен также как Инкассирующий Банк (Collecting Bank). Под Ремитентом, от Латинского слова Remitto, означающее Отсылаю, понимается лицо, на имя которого выписана тратта (переводный вексель). Банк Ремитент – банк, которому экспортёр передаёт отгрузочные документы на инкассо и поручает выпуск инкассового поручения и отправку документов в представляющий банк.

REMNANT SEED = ОСТАТОЧНОЕ СЕМЯ (или ОСТАВШЕЕСЯ СЕМЯ) – Remnant Seed is a seed that is in excess and remains after sowing for a given test.

REMOTE ACCESS = ДИСТАНЦИОННЫЙ ДОСТУП (или ОТДАЛЁННЫЙ ДОСТУП) – (1) Remote Access is the ability to access and use digital information from a location off-site from where the information is physically located. / Возможность доступа и использования цифровой информации из иных мест, нежели места расположения сайта, на котором данная информация размещена непосредственно.

(2) A term Remote Access describes connection to an Real-Time Gross Settlement (RTGS) system which is not located in the home country of the credit institution. / Термин описывает подключение к системе Валовых Расчётов в Режиме Реального Времени (ВРРРВ), которая располагается в иной стране, а не в стране расположения кредитной организации.

REMOTE ACCESS PAYMENT INSTRUMENT = ИНСТРУМЕНТ ОПЛАТЫ С ДИСТАНЦИОННЫМ ДОСТУПОМ (или ИНСТРУМЕНТ ОПЛАТЫ С ОТДАЛЁННЫМ ДОСТУПОМ) – Remote Access Payment Instrument means an instrument enabling a holder to access funds held on his/her account at an institution, whereby payment may be made to a payee and normally requires a personal identification code and/or any other similar proof of identity. The remote access payment instrument includes in particular payment cards (whether credit, debit, deferred debit or charge cards) and cards having phone- and home-banking applications. This definition does not include cross-border credit transfers.

REMOVAL = УДАЛЕНИЕ (или УСТРАНЕНИЕ, или ПЕРЕМЕЩЕНИЕ) – Removal was a provision of the New York Standard Fire Policy in which the insurer agreed to cover the cost of removing covered property from the path of a fire. Presently, property policies express the agreement in terms of 'preservation of property' from imminent danger of damage from any covered peril. Not to be confused with Debris removal.

REMOVAL RATING = РЭЙТИНЬГ УДАЛЕНИЯ – A term Removal Rating refers to the statistical probability of the filter's ability to remove a certain size particle when challenged under controlled conditions. This should not be confused with the actual pore size of a filter. There are two types of ratings:- nominal and absolute. These terms are misused to a great extent in filter claims and marketing literature which can mislead the consumer. See also Absolute Filtration Rating, Filtration, and Nominal Filtration Rating.

RENAISSANCE LACE = РЕНЕССАНСНОЕ КРУЖЕВО (или КРУЖЕВО ЭПОХИ ВОЗРОЖДЕНИЯ) – Renaissance Lace is a lace made of woven strips of fabric joined by flat stitches. See also Battenberg Lace.

RENEGOTIABLE RATE = ПЕРЕСМАТРИВАЕМАЯ СТАВКА – Renegotiable Rate is a type of variable rate involving a renewable short-term 'balloon' note. The interest rate on the loan is generally fixed during the term of the note, but when the balloon comes due, the lender may refinance it at a higher rate. In order for the loan to be fully amortized, periodic refinancing may be necessary.

RENEWABLE ENERGY = ВОЗОБНОВЛЯЕМАЯ ЭНЕРГИЯ – Renewable Energy:- naturally occurring energy sources that are continually replenished. Examples of renewable energy are solar, water and wind. / Возникающие естественным путём источники энергии, которые постоянно пополняются. Примерами возобновляемой энергии служат энергия ветра, воды и солнца.

RENEWABLE ENERGY CREDIT/SOLAR RENEWABLE ENERGY CREDIT = КРЕДИТ НА ВОЗОБНОВЛЯЕМУЮ ЭНЕРГИЮ/КРЕДИТ НА СОЛНЕЧНУЮ ВОЗОБНОВЛЯЕМУЮ ЭНЕРГИЮ – Renewable Energy Credit/Solar Renewable Energy Credit (REC/SPEC):- A Renewable Energy Credit (REC) is a non-tangible energy commodity that represents proof that one MegaWatt-hour (MWh) of electricity was generated from an eligible renewable energy source. A REC is sometimes referred to as a Green Tag or a Renewable Energy Certificate. Solar Renewable Energy Credits (SRECs) are RECs that are specifically generated by solar energy. A renewable, or 'green', energy source, such as a wind farm, is credited with one REC for every one MWh of electricity it produces. RECs represent the environmental attributes of the power produced from a green energy source and are sold separately from the electricity commodity. The actual electricity is fed into the electrical grid, and the accompanying REC can then be sold or traded on the open market. The owner of the REC can claim to have purchased green power. Why does this matter? More and more states are passing legislation requiring that a certain amount of the electricity produced be from renewable sources, such as solar, wind, hydro (water), or biomass. RECs are used to keep track of the amount of renewable energy being produced, and to track who is using or buying it.

RENEWABLE ENERGY DIRECTIVE = ДИРЕКТИВА ПО ВОЗОБНОВЛЯЕМОЙ ЭНЕРГИИ – Renewable Energy Directive (RED) is the EU directive legislating binding mandates of 20% for the share of renewable energy in all member states' energy mix by the year 2020, with a specific mandate of 10% for the renewable energy share in transport fuels.

RENEWABLE FUEL STANDARD = СТАНДАРТ НА ВОЗОБНОВЛЯЕМОЕ ТОПЛИВО – Renewable Fuel Standard (RFS and RFS2) is a standard in the United States for the use of renewable fuel use in the transport sector in the Energy Act (EISA). RFS2 is a revision of the RFS program for 2010 and beyond.

RENEWAL = ВОЗОБНОВЛЕНИЕ – In insurance, Renewal is a continuation of a policy for a further term, on payment of a fresh premium.

RENEWAL = НОВАЦИЯ (или ОБНОВЛЕНИЕ) – Renewal:- the extension of the term of coverage of an expired policy, commonly by replacement with another policy effective on the date of expiration of the previous policy. The act or process of transforming or extending a credit agreement, whereby the old debt is cancelled by the establishment of a new one, e.g., in current accounts by striking and acknowledging a balance. / , например, . В гражданском праве под Новацией, от позднелатинского слова Novatio, означающее Изменение или Обновление, понимается соглашение сторон о замене одного заключённого ими обязательства другим.

RENEWAL CERTIFICATE = СВИДЕТЕЛЬСТВО ОБ ОБНОВЛЕНИИ (или СЕРТИФИКАТ ОБ ОБНОВЛЕНИИ) – Renewal Certificate is a short form certificate which is used to renew a policy. It refers to the original policy, keeping all of its provisions, but does not restate all of its insuring agreements, exclusions, and conditions.

RENEWAL COUPON = КУПОН НА ВОЗОБНОВЛЕНИЕ – Renewal Coupon:- the last section on the coupon sheet exchangeable for new interest and dividend coupons. Once all dividend or interest coupons have been redeemed, the holder of a security receives a new coupon sheet upon presentation of the renewal coupon. If the securities are held in safe custody, this is done automatically by the bank of the holder of the securities. Certificate attached to the coupon sheet of share or bond and exchangeable for a new set of coupons. Also known as Talon in Germany. / Сертификат, прикреплённый к купонному листу акции или облигации и обмениваемый на новый комплект купонов. В Германии известен также как Талон (Talon).

RENIFORM = ПОЧКООБРАЗНОЕ (или ПОЧКОВИДНОЕ) – Reniform:- an oval with the ends curved around in the same direction like a kidney. / , от Латинского слова Ren, означающее Почка, .

RENIFORM LEAF = ПОЧКОВИДНЫЙ ЛИСТ (или ПОЧКООБРАЗНЫЙ ЛИСТ) – Reniform Leaf is a simple kidney-shaped leaf. / Почковидный Лист – лист с округлой листовой пластинкой, имеющей тупую выемку у основания, например, у Копытня европейского (Asarum europaeum).

RENOUNCEABLE RIGHTS = РЕНОНСИРУЕМЫЕ ПРАВА (или ОТКАЗЫВАЕМЫЕ ПРАВА) – Renounceable Rights:- an issue of rights where the offeree can choose to take up the rights offered, let them lapse, or trade them on the market. See also Rights Issue.

RENT = РЕНТА – (1) Rent is the price paid (per unit of time) for the temporary use of a durable good (especially land and/or buildings) that the user does not own.

(2) Rent is abbreviated expression for the specialized economists' term economic rent, which refers to the amount of any payment to the owner of a factor of production (land, labor or capital) that is above and beyond the minimum payment that would have been necessary to motivate that owner not to transfer it to some other use. Thus the economic rent in a sales transaction would be the difference between the payment actually received and the second-best price the owner could otherwise be getting for using that factor of production in some other application.

RENTAL = АРЕНДНАЯ ПЛАТА – Rental:- the amount payable by the user of a fixed asset to its owner for the right to use that asset in production for a specified period of time. It is included in the output of the owner and the intermediate consumption of the user. / выработка (output).

RENTAL PALLET = АРЕНДНЫЙ ПОДДОН – Rental Pallet is a pallet owned by a third party, different from the actual pallet user.

RENTS = РЕНТА – Rents:- the property income derived from land and sub-soil assets. It should be distinguished in the current system from rental income derived from buildings and other fixed assets, which is included in output. / выработка (output). Под Рентой, от Немецкого слова Rente, понимается доход, не связанный с предпринимательской деятельностью и регулярно получаемый:- (i) землевладельцем в форме земельной ренты со сдаваемого в аренду земельного участка; или (ii) рантье в форме процента с предоставляемого в ссуду капитала.

RENT–SEEKING BEHAVIOR = ПОВЕДЕНИЕ В ПОИСКАХ РЕНТЫ – Rent-Seeking Behavior is the expenditure of resources in order to bring about an uncompensated transfer of goods or services from another person or persons to one's self as the result of a 'favorable' decision on some public policy. The term seems to have been coined (or at least popularized in contemporary political economy) by the economist Gordon Tullock. Examples of rent-seeking behavior would include all of the various ways by which individuals or groups lobby government for taxing, spending and regulatory policies that confer financial benefits or other special advantages upon them at the expense of the taxpayers or of consumers or of other groups or individuals with which the beneficiaries may be in economic competition.

RE–ORDER POINT = ТОЧКА ПОВТОРЕНИЯ ЗАКАЗА – Re-Order Point:- inventory reaches a specific point based on demand where it is set for replenishment.

REORGANIZATION = РЕОРГАНИЗАЦИЯ – Reorganization:- restoring the economic and financial viability of a company through such measures as tighter control over its financial operations, reducing the capital stock (share capital) or raising new capital resources. Restructuring of a corporation's financial assets under Chapter 11 of the US Bankruptcy Act to return the company to profitability. Also known as Reform. See also Liquidation. / Под Реорганизацией понимается преобразование, перестройка, изменение структуры и функций учреждений, организаций и других.

REP = РЕПС – Rep or Repp is a heavy filling-wise corded fabric, heavier than poplin. It may be silk, rayon, man-made fibers, cotton, wool, or a mixture. The fabric may be solid or striped. It is used for ties, robes, draperies, and upholstery, and in lighter weights for blouses and trimmings. Rep or Repp is a plain-weave fabric with prominant rounded crosswise ribs. Has a pronounced narrow cylindrical rib in the filling direction – less distinct than bengaline; more distinct than poplin. Sometimes a very distinct rib is alternated with a small rib. It is similar to poplin but heavier in cotton. Can be dyed, printed, or white. Frays badly. Difficult to press (may flatten rib). / в направлении уточины – . Репс – плотная ткань из шерстяной, шёлковой или хлопчатобумажной пряжи полотняного переплетения с мелким поперечным или продольным рубчиком на поверхности, образованным за счёт разницы в толщине основы и утка. Шерстяной и хлопчатобумажный репс применялся в XIX веке для декоративных целей, шёлковый – для мужской и женской одежды только в городской среде, так как был достаточно дорогим.

REPACK = ПЕРЕУПАКОВКА – Repack:- packaging material differently than how it arrived. Example:- making a pallet of 60 cartons into 3 pallets of 20 cartons.

REPACK ORDER = ПЕРЕУПАКОВОЧНЫЙ ЗАКАЗ – Repack Order is:- (1) an order requiring special packaging, as for export. (2) A small order for a number of items requiring a breakdown of large cases.

REPAIR = РЕМОНТИРОВАТЬ (или ВОССТАНАВЛИВАТЬ) – Repair:- to remake in order to use again.

REPAIRED PALLET = ВОССТАНОВЛЕННЫЙ ПОДДОН – Repaired Pallet is a pallet with new or used components replacing damaged components (See ISO 18613 [3]). / Восстановленный Поддон:- Поддон, имеющий заменённые на новые или отремонтированные детали (стандарт ISO 18613 [3]).

REPARATION = РЕПАРАЦИЯ – (1) Reparation is a situation in which the ICC requires a railroad to repay users the difference between the rate the railroad charges and the maximum rate the ICC permits when the ICC finds a rate to be unreasonable or too high. / В международном праве под Репарацией, от Латинского слова Reparatio, означающее Восстановление, понимается:- (i) вид материальной международно-правовой ответственности. Состоит в возмещении государством причинённого им ущерба в денежной или иной форме. Выплата репараций обычно предусматривается в мирном договоре; или (ii) восстановление объектов от повреждений.

(2) Reparation:- this term is used in conjunction with the US Commodity Futures Trading Commission's customer claims procedure to recover civil damages.

REPATRIATION = РЕПАТРИАЦИЯ – Repatriation is the act of returning assets invested in other countries to the funds' country of origin. / Акт возврата в страну происхождения фондов, инвестированных за рубежом. Под Репатриацией, от позднелатинского слова Repatriatio, означающее Возвращение На Родину, понимаются:- (i) возвращение на родину военнопленных и гражданских лиц, оказавшихся за её пределами вследствие войны, а также эмигрантов; (ii) возвращение в страну облигаций займов, размещённых среди иностранных держателей за границей, осуществляемое путём скупки этих облигаций выпустившим их государством или его гражданами.

REPAYMENT = ВЫПЛАТА – Repayment of a debt or bond issue, either at the due date or in advance by drawings or repurchase of a specified number or series of bonds. Also known as Redemption in the United Kingdom. / Выплата по долгам или выпущенным облигациям, либо в надлежащую (причитающуюся) дату, либо заранее (авансом) посредством выписывания или откупа определённого количества или серий облигаций. В России известна также как Погашение.

REPEAT = РАППОРТ (или ПОВТОР, или ПОВТОРЕНИЕ) – Repeat is the distance covered by a single unit of a pattern that is duplicated over and over, measured along the length of a fabric. / Раппорт (от Французского слова Rapport, от Rapporter, означающее Приносить Обратно) – повторяющаяся часть (мотив) рисунка (узора) на ткани, трикотаже, вышивке, ковре и тому подобном. Обычно порядок переплетения нитей повторяется как по ширине, так и по длине ткани в каждом последующем раппорте. Число нитей основы, после которого начинают повторяться в прежнем порядке все предыдущие переплетения основных нитей, называется Основным Раппортом. По аналогу раппорт называется Уточным. Прямоугольник, составленный из основных и уточных нитей, число которых равно соответствующим раппортам, называется раппортом переплетения ткани.

REPEATABILITY = ПОВТОРЯЕМОСТЬ – Repeatability is:- (1) the closeness of agreement between the results of successive measurements of the same test specimen, or of test specimens taken at random from a homogeneous supply, carried out on a single laboratory, by the same method of measurement, operator, and measuring instrument, with repetition over a specified period of time. This is the most important aspect of sample presentation technique and one of the most important specifications for a color instrument. (2) The ability to create and replicate a formula in a consistent manner as defined by a defined tolerance.

REPEATED DNA SEQUENCE = ПОВТОРЯЕМАЯ ПОСЛЕДОВАТЕЛЬНОСТЬ ДНК – Repeated DNA Sequence is a sequence of nucleotides that occurs more than once in a genome. Repeated sequences may be present in a few to many millions of copies. The individual repeated sequence may be only a few nucleotides in length up to several kilobases.

REPELLANTS = РЕПЕЛЛЕНТЫ – Repellants (в словаре Repellent) are chemicals that prevent Pest damage to living organisms or materials by rendering them unattractive, unpalatable, or offensive. / Под Репеллентами, от Латинского слова Repello, означающее Отгоняю или Отталкиваю, или Антифидантами понимаются химические препараты из группы пестицидов для отпугивания вредных насекомых от растений (которыми они питаются), животных и человека.

REPELLENCY = РЕПЕЛЛЕНТНОСТЬ (или ОТТАЛКИВАНИЕ) – Repellency is the ability of a fabric to resist such things as wetting and staining by water, stains, soil, etc. Repellency is the ability to resist wetting and staining by oils, water, soils, and other materials. / развод (или потёк (stain)). Под Репеллентностью, от Латинского слова Repello, означающее Отгоняю или Отталкиваю, понимается .

REPLACEMENT = ЗАМЕНА (или ЗАМЕЩЕНИЕ) – (1) Indicating that a subject is interchangeable with another subject, but which differs physically from the original subject in that the installation of the replacement subject requires extra machining or provisions in addition to the normal application and methods of attachment.

(2) Where an insurer agrees to replace irreparably damaged or stolen goods with goods of a similar type and quality under a contract of indemnity instead of paying a cash sum to the insured.

(3) In the United States, Replacement is an issuance of a new bond when a bond is reported lost, stolen, destroyed, mutilated, or not received.

REPLACEMENT BEEF HEIFERS = РЕМОНТНЫЕ ТЁЛКИ МЯСНОЙ ПОРОДЫ (или РЕМОНТНЫЕ НЕТЕЛИ МЯСНОЙ ПОРОДЫ) – Replacement Beef Heifers:- the female Cattle that have not yet calved and are intended solely for breeding to produce calves intended for meat production. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

REPLACEMENT BEEF HEIFERS ON PASTURE = РЕМОНТНЫЕ ТЁЛКИ МЯСНОЙ ПОРОДЫ НА ПАСТБИЩЕ (или РЕМОНТНЫЕ НЕТЕЛИ МЯСНОЙ ПОРОДЫ НА ПАСТБИЩЕ) – Replacement Beef Heifers on Pasture is the replacement beef heifers maintained on pasture and receiving the majority of their diet from grazing. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

REPLACEMENT CLAUSE = ОГОВОРКА О ЗАМЕНЕ (или ОГОВОРКА О ЗАМЕЩЕНИИ) – Replacement Clause is a clause found in a marine cargo policy on machinery which provides that in the event of damage the insurer's liability shall be limited to the cost of replacing and fitting any damaged part. A clause limiting underwriters' liability for damage to machinery cargo. / Оговорка, ограничивающая ответственность расписчиков или, так называемых, андеррайтеров (underwriters) за повреждение частей или всего машинного оборудования.

REPLACEMENT COST = СТОИМОСТЬ ЗАМЕНЫ (или СТОИМОСТЬ ЗАМЕЩЕНИЯ) – The cash value representing what it would cost to replace the specific property without deduction for depreciation. Replacement Cost is the amount that would be paid for an item if ordered from the factory today. This cost is rarely used to compute cost of goods sold as it does not reflect the cost of the current inventory. However, it is commonly used to compute retails and commissions as it results in a consistent environment.

REPLACEMENT COST INSURANCE = СТРАХОВАНИЕ ПО СТОИМОСТИ ЗАМЕНЫ (или СТРАХОВАНИЕ ПО СТОИМОСТИ ЗАМЕЩЕНИЯ) – Replacement Cost Insurance covers property, both building and contents, on the basis of full replacement cost without deduction for depreciation on any loss sustained, subject to the terms of the co-insurance clause.

REPLACEMENT DAIRY HEIFERS = РЕМОНТНЫЕ ТЁЛКИ МОЛОЧНОЙ ПОРОДЫ (или РЕМОНТНЫЕ НЕТЕЛИ МОЛОЧНОЙ ПОРОДЫ) – Replacement Dairy Heifers:- female dairy Cattle that have not yet calved and intended solely for breeding and future milk production. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

REPLACEMENT DAIRY HEIFERS ON PASTURE = РЕМОНТНЫЕ ТЁЛКИ МОЛОЧНОЙ ПОРОДЫ НА ПАСТБИЩЕ (или РЕМОНТНЫЕ НЕТЕЛИ МОЛОЧНОЙ ПОРОДЫ НА ПАСТБИЩЕ) – Replacement Dairy Heifers on Pasture are the replacement dairy heifers maintained on pasture and receiving the majority of their diet from grazing. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

REPLACING LOST CERTIFICATES = СЕРТИФИКАТЫ, ЗАМЕНЯЮЩИЕ ПОТЕРЯННЫЕ – In the United States, Replacing Lost Certificates:- a certificate may be ‘replaced’ when an exporter has lost the original certificate and the shipment is not available for inspection. Only the Authorized Certification Officials (ACOs) at the issuing office (accountability point) can replace an original certificate that cannot be recovered.

REPLANTING = ПЕРЕСАДКА – Replanting:- in agriculture and gardening, transplanting or replanting is the technique of moving a plant from one location to another. Most often this takes the form of starting a plant from seed in optimal conditions, such as in a greenhouse or protected nursery bed, then replanting it in another, usually outdoor, growing location. Botanical transplants are used infrequently and carefully because they carry with them a significant risk of killing the plant. Something has a variety of applications, including:- (i) extending the growing season by starting plants indoors, before outdoor conditions are favorable; (ii) protecting young plants from diseases and pests until they are sufficiently established; and (iii) avoiding germination problems by setting out seedlings instead of direct seeding. Different species and varieties react differently to transplanting; for some, it is not recommended. In all cases, avoiding transplant shock – the stress or damage received in the process – is the principal concern. Plants raised in protected conditions usually need a period of acclimatization, known as Hardening Off. Also, root disturbance should be minimized. The stage of growth at which transplanting takes place, the weather conditions during transplanting, and treatment immediately after transplanting are other important factors. See also Planting. Replanting:- to plant (something) again or in a new place: separated and replanted the perennials. / Закалка или Упрочнение (Hardening).

REPLENISHMENT = ПОПОЛНЕНИЕ (или ВТОРИЧНОЕ НАПОЛНЕНИЕ) – Replenishment is a refilling of a picking location. Completion of stock. Replenishment is the process of moving the inventory of an item from a reserve storage location to the primary picking location or to another mode of storage in which picking is performed.

REPLICATED TRIAL = ПОВТОРНЫЙ ОПЫТ (или ПОВТОРЯЕМЫЙ ОПЫТ, или ВОСПРОИЗВОДИМЫЙ ОПЫТ) – Replicated Trial is a trial where treatments are repeated more than once in the experiment.

REPLICATE/REPLICATION = ПОВТОРЯТЬ (или ВОСПРОИЗВОДИТЬ)/РЕПЛИКАЦИЯ (или ПОВТОРЕНИЕ, или ВОСПРОИЗВЕДЕНИЕ, или ПОВТОРНОСТЬ) – Replicate/Replication:- (1) the assignment of a treatment to more than one experimental unit. It provides a means by which to measure experimental error, which is necessary for detecting real differences between treatments. (2) The process of producing complete copies of the genetic material (DNA or RNA) of a cell or virus. / Под Репликацией, от позднелатинского слова Replicatio, означающее Повторение, или Ауторепродукцией или Аутосинтезом или Редупликацией понимается удвоение молекул ДНК (у некоторых вирусов РНК) при участии специальных ферментов. Репликацией называется также удвоение хромосом, в основе которого лежит репликация ДНК. Репликация обеспечивает точное копирование генетической информации, заключённой в молекулах ДНК, и передачу её от поколения к поколению. Под Репликацией, от позднелатинского слова Replicatio, означающее Повторение, от Латинского слова Replico, означающее Обращаюсь Назад или Повторяю), или Редупликацией или Ауторепродукцией понимается аутосинтез, протекающий во всех живых клетках процесс самовоспроизведения (самокопирования) нуклеиновых кислот, генов, хромосом. В основе механизма репликации лежит ферментативный синтез дезоксирибонуклеиновой кислоты (ДНК) или рибонуклеиновых кислот (РНК), осуществляемый по матричному принципу. Предложенная в 1953 Американским молекулярным биологом, генетиком и зоологом Дьжеймзом Дюи Вотсэном (James Dewey Watson; 1928–) в соавторстве с Британским молекулярным биологом, биофизиком и специалистом в области нейрологии Фронсисом Хари Камтчэном Криком (Francis Harry Compton Crick; 1916–2004) модель строения ДНК – так называемая двойная спираль – с одной стороны, объяснила, каким образом записана генетическая информация в молекуле ДНК (смотрите Генетический Код), с другой – позволила понять и экспериментально изучать химические механизмы удвоения генетического материала. Строгая специфичность спаривания азотистых оснований в молекуле ДНК обусловливает комплементарность последовательностей оснований в двух цепях и обеспечивает высокую точность репликации. Пара гуанин–цитозин стабилизируется тремя водородными связями, пара аденин–тимин – двумя, что резко снижает вероятность неправильного спаривания оснований. Согласно Вотсэну и Крику, процесс репликации ДНК предусматривает:- (1) разрыв водородных связей и расплетение нитей двойной спирали; (2) синтез на одиночных нитях комплементарных цепей. В результате из одной двухцепочечной ДНК возникают две подобные молекулы, причём в каждой из дочерних молекул одна полинуклеотидная цепь родительская, а другая – синтезированная заново (полуконсервативный механизм репликации). Репликация ДНК – многоэтапный генетически контролируемый процесс, в котором участвуют ферменты ДНК-полимераза, ДНК-лигаза, ДНК-метилаза и другие. Репликация двухцепочечной ДНК имеет фиксированные начало и конец, ориентированное направление. Прерывистый синтез новых цепей начинается в том месте, где расплетаются комплементарные цепи родительской ДНК. В начале каждого из синтезированных отрезков цепей ДНК находится ‘затравочная’ цепочка РНК из 50–100 нуклеотидов. С участием ДНК-полимеразы на РНК наращиваются фрагменты цепей ДНК (в каждом около 1 000 нуклеотидов). Затем затравочная РНК уничтожается рибонуклеазой, а синтезированные фрагменты ДНК соединяются в длинные цепи при помощи фермента полинуклеотидлигазы. У Вирусов и Фагов, имеющих однонитевую ДНК, репликация идёт особым образом. После внедрения в клетку хозяина одноцепочечной ДНК, которую называют (+)-цепью, на ней, как на матрице, синтезируется комплементарная ей (–)-цепь. На образовавшейся двухспиральной молекуле (репликативная форма) синтезируются новые одноцепочечные (+)-цепи, включающиеся в новые вирусные частицы. По такому же принципу происходит репликация РНК-содержащих Вирусов и Фагов. Таким образом, во всех известных случаях

репликация ДНК и РНК проходит через стадию двухцепочечных молекул. У высших организмов – Эукариотов, клетки которых содержат сформированное ядро, основную генетическую функцию несут сложно организованные структуры – хромосомы, состоящие из ДНК, РНК, белков и других веществ. В интерфазе, предшествующей делению клеток (смотрите Митоз, Мейоз), осуществляется репликация ДНК и других компонентов хромосом; затем удвоенные хромосомы разъединяются и распределяются равномерно между дочерними клетками. Таким образом, вся наследственная информация в относительно неизменённом виде передаётся от клетки к клетке, от поколения к поколению.

REPLICATING PORTFOLIO = ВОСПРОИЗВОДЯЩИЙ ПОРТФЕЛЬ (или ДУБЛИРУЮЩИЙ ПОРТФЕЛЬ) – Replicating Portfolio is a portfolio of assets for which changes in value match those of a target asset. For example, a portfolio replicating a standard option can be constructed with certain amounts of the asset underlying the option and bonds. Sometimes referred to as a Synthetic Asset.

REPO = REPURCHASE AGREEMENT

REPO = РИПО – Repo or RP is short for Repurchase. In effect, it means a sale and repurchase agreement. It is a contract to sell securities for cash and then to buy them back at an agreed future date and price. Repurchase Agreement (Repo) is a contract to sell and subsequently repurchase securities at a specified date and price. Although repo in US markets goes back to 1910s, the international repo market is only about 20 years old. But in that time it has experienced impressive growth. Repo transaction is an agreement on the purchase and repurchase of a – in general fixed-income – security. The buyer of the security (lender) provides the seller (borrower) with liquidity for a specific period. For the liquidity received the seller of the security pays interest, the repo rate. Repurchase agreements are money market instruments that allow institutional investors, above all banks, to obtain funds in interbank trading and at central banks in open market transactions. In the international markets they have several uses. For securities firms it represent a relatively cheap way of financing purchases of bonds. Repo Agreement:- to buy (sell) a security while at the same time agreeing to sell (buy) the same security at a predetermined future date. The price at which the reverse transaction takes place sets the interest rate over the period (the repo rate). The most active repo market is in the United States, where the Federal Reserve sets short-term interest rates by lending securities. In a reverse repo the buyer sells cash in exchange for a security. Repos can benefit both parties. Buyers of repos often receive a better return than that available on equivalent money-market instruments; and financial institutions, particularly dealers, are able to get sub-Libor funding. A slight variation on the repo is the buy/sell back. The buy/sell back's coupon becomes the property of the purchaser for the duration of the agreement. It is preferred by credit-sensitive investors such as central banks. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Рипо (Repo) или Ар.Пи. (RP), как это произносится на Английском языке, является сокращённой формой, производной от Английского слова Repurchase, означающее Откуп. Фактически под этим термином подразумевается соглашение о продаже с последующим откупом. В настоящее время Рипо представляет собой контракт, по которому ценные бумаги сначала продаются за деньги, а затем откупаются по оговорённым заранее срокам и стоимости. Первоначально рынок Рипо сформировался в США в середине 1910-х, а на международных рынках он появился лишь в 1986 и сразу же стал завоёвывать популярность. Несмотря на то, что Рипо имеет юридическую форму соглашения, на самом деле под ним подразумевается заимствование ценных бумаг, как правило, облигаций. Сторона, занимающая деньги, – продавец получает более лучшие условия, нежели ему могли предложить при обычном заимствовании денег, так как ценные бумаги, которые как бы отдалживаются, служат в качестве обеспеченного кредита и снижают возможность потенциального неисполнения обязательств. В некоторой степени это напоминает ростовщика, который ссуживает деньги под заклад личных ценностей. Если же заёмщик обанкротится до момента возмещения займа, то займодавец сохранит владение самим обеспечением кредита (ценными бумагами), частично осуществляя зачёт требований от потери денег. Таким же образом сторона, ссуживающая облигации, также имеет своего рода гарантию в виде денег. Для компаний, работающих с ценными бумагами на международных рынках, Рипо представляет собой относительно дешёвый способ финансирования покупок облигаций. Рипо обеспечивает им снижение затрат, так как ставка финансирования для операций Рипо ниже, чем могла бы быть в таком случае при других обстоятельствах. Как правило, фирмы, работающие на рынке ценных бумаг, используют Рипо для заимствования денег у Рипо-дилеров с тем, чтобы приобрести облигации, которые в последствии они разместят на депозит у этого же дилера для выполнения соглашения со своей стороны. В тоже время Рипо позволяют дилерам ссуживать деньги таким же образом, как и при размещении денег на депозите в банке, хотя в этом случае дилеры имеют дополнительную гарантию безопасности, владея облигациями в качестве обеспечения ссуды.

REPO MARKET = РЫНОК РИПО – Repo Market is a market in which a holder of gilts or other securities can sell them to another party with an agreement to buy them back at a specified date for an agreed price. It can thus be used by market participants for secured lending. See also Repo.

REPORT = ОТЧЁТ (или РАПОРТ, или ДОКЛАД, или РЕПОРТАЖ) – Report is an actuary's oral or written communication to a principal or other intended user about the work product. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Рапортом, от Французского слова Rapport от Rapporter, означающее Приносить Обратно, понимается:- (i) устный или письменный доклад предусмотренной уставами формы при обращении военнослужащих или подчинённых к начальникам; или (ii) отчёт о выполнении задания или обязательства. Под Репортажем, от Французского слова Reportage, от Английского слова Report, означающее Сообщать, понимается информационный жанр журналистики, оперативно, с необходимыми подробностями, в яркой форме сообщающий о каком-либо событии, очевидцем или участником которого является автор.

REPORTABLE EVENT = ОТЧЁТНОЕ СОБЫТИЕ (или РАПОРТУЕМОЕ СОБЫТИЕ, или ДОКЛАДЫВАЕМОЕ СОБЫТИЕ) – In the United States, Reportable Event is a transaction, such as a savings bond redemption or reissue (re-registration), that requires Federal income tax reporting of all interest earned from the issue date of a savings bond to the date of the transaction. Savings bond redemptions ordinarily are reportable events or dispositions. A reissue transaction is a reportable event if a living owner, principal co-owner, surviving co-owner, beneficiary, or other person entitled to ownership (for example, an heir upon the death of persons named on the bond) is not named owner or principal co-owner in the new registration on the bond issued in the transaction. Reportable Event is an event that indicates that the financial condition of a pension plan is or may be deteriorating to the point that the plan may be terminated. Such events must be reported to the Pension Benefit Guaranty Corporation (PBGC).

REPORTABLE POSITIONS = ОТЧЁТНЫЕ ПОЗИЦИИ (или РАПОРТУЕМЫЕ ПОЗИЦИИ, или ДОКЛАДЫВАЕМЫЕ ПОЗИЦИИ) – Reportable Positions:- the number of open contracts specified by the US Commodity Futures Trading Commission (CFTC) when a firm or individual must begin reporting total positions by delivery month to the authorized exchange and/or the CFTC. The number of futures contracts, as determined by the US Commodity Futures Trading Commission, above which a customer must be identified daily to the exchange and to the Commission with regard to the size of his position by commodity, by delivery month, and by purpose of the trading. Reportable Level futures and/or options:- any one month number contracts gross long/short. For example, in the US cotton

market – 100 or more contracts (on 2012-April-26). Once a trader has a reportable position in a commodity, then all futures and all options positions for that trader in that commodity must be reported daily, regardless of size.

REPORTER GENE/MARKER GENE = ГЕН РЕПОРТЁР/ГЕН МАРКЁР – Reporter Gene/Marker Gene is a gene, often derived from Bacteria, which does not in itself provide a useful change in transgenic Plants but serves to identify and/or recover transformed Plants.

REPORTING = ЗАКЛЮЧЕНИЕ (или ОТЧЁТ ОБ ИНСПЕКЦИИ) – Reporting is to relate the facts, events and figures observed by the inspection company at intervals before, during and after the inspection as detailed in the mandate. The reports must enable the principal to identify without ambiguity the consignment to which the document refers. It also will differentiate between inspections, sampling, weighing, moisture determination (where applicable) and testing.

REPORTING = ОТЧЁТНОСТЬ – (1) Reporting:- drawing up of reports by companies on their business activities. / Составление отчётов компаниями о их деловой активности.

(2) Reporting of on-exchange securities trades. A requirement on the exchanges. / Отчётность по биржевым сделкам с ценными бумагами. Это требование присутствует у бирж.

REPORTING ENTITY = ПОДОТЧЁТНОЕ ЛИЦО (или ОТЧИТЫВАЮЩЕЕСЯ ЛИЦО) – Reporting Entity is an enterprise for which there are users who rely on the financial statements as their major source of financial information about the enterprise. The entity for whose financial statements the professional service is provided.

REPORTING ISSUER = ПОДОТЧЁТНЫЙ ЭМИТЕНТ (или ОТЧИТЫВАЮЩИЙСЯ ЭМИТЕНТ) – Reporting Issuer is the technical term for a public company that has 'issued' securities to the public and is thereby a reporting issuer, meaning that it has to file regular reports on its business affairs with a regulatory body such as a securities commission.

REPORTING JURISDICTION = ПОДОТЧЁТНАЯ ЮРИСДИКЦИЯ (или ЮРИСДИКЦИЯ ОТЧЁТНОСТИ) – Reporting Jurisdiction is the jurisdiction, if any, whose laws and regulations are applicable to the preparation of the financial statements of the applicable reporting entity.

REPORTING LEVEL = ПОДОТЧЁТНЫЙ УРОВЕНЬ (или УРОВЕНЬ ДЛЯ ОТЧЁТА) – Reporting Level:- sizes of positions set by the exchanges and/or the US Commodity Futures Trading Commission at or above which commodity traders or brokers who carry these accounts must make daily reports about the size of the position by commodity, by delivery month, and whether the position is controlled by a commercial or non-commercial trader.

REPORT OF CONDITION AND INCOME = ОТЧЁТ О СОСТОЯНИИ И ДОХОДАХ – In the United States, Report Of Condition And Income is a quarterly financial report that all banks, bank holding companies, savings and loan associations, Edge Act and agreement corporations, and certain other types of organizations must file with a federal regulatory agency. Informally termed a Call Report. / Неформально именуемый Отчётом по Требованию (Call Report). корпорации по Акту Эджа (Edge Act).

REPO TRANSACTION = ТРАНЗАКЦИЯ РИПО (или ОПЕРАЦИЯ РИПО) – Repo Transaction is an agreement on the purchase and repurchase of a – in general fixed-income – security. The buyer of the security (lender) provides the seller (borrower) with liquidity for a specific period. For the liquidity received the seller of the security pays interest, the repo rate. Repurchase agreements are money market instruments that allow institutional investors, above all banks, to obtain funds in interbank trading and at central banks in open market transactions. Repo Operation is a transaction when you use a loan from a bank for the purchase of desired securities. The purchased securities transferred on the bank's account serve as the collateral for your loan. Some investing banks can provide you with a loan (a loan for your investments with interest rate of, e.g., 5.9% p.a. only) up to 70% of finances required for the securities purchase. You use your own money for the remaining 30%. Repo Operation Principle:- example:- (i) purchase of securities for 100 in total (30 customer + 70 loan from a bank), i.e. repayment of the loan – 70, and remaining to customer – 30; (ii) increase in the securities price by 20%; (iii) customer collects profit – 20, i.e. customer sells for 120). / Операции Репо (Обратного Репо) – сделки по продаже (покупке) ценных бумаг с обязательством последующего выкупа (продажи) через определённый срок по заранее оговорённой цене.

REPPING = ЗЕБРИСТОСТЬ (или РУБЧАТОСТЬ) – Repping:- a bar in a fabric in which a prominent weftway rib is evident. Note:- this defect is often caused by differential relaxation of the upper and lower sheets of warp during a loom stoppage. / Рубчатость (repping):- порок утка; полосатость ткани во всю ширину из-за повышенной плотности по утку. Примечание:- этот порок часто вызывается разным натяжением верхнего и нижнего полотнищ основы во время её окончания.

REPRESENTATION = РЕПРЕЗЕНТАЦИЯ (или ПРЕДОСТАВЛЕНИЕ ИНФОРМАЦИИ, или СООБЩЕНИЕ О СУЩЕСТВЕННЫХ ОБСТОЯТЕЛЬСТВАХ) – Representation is a statement of fact or expectation. Representations made as to material facts at the time of the negotiation of the placement, amendment or renewal of cover must be true whereas representations as to a matter of expectation must be made in good faith. / Сообщение о существенном факте. Под Репрезентацией, от Латинского слова Repraesentatio, означающее Наглядное Представление или Подражание или Изображение или Своевременное Исполнение или Воображение или Обнаружение, понимается .

REPRESENTATION = ПРЕДСТАВИТЕЛЬСТВО – (1) Representation is the act of representing or the state of being represented.

(2) Representation is a body of legislators that serve on behalf of a constituency. One that represents as an example or type for others of the same classification. One that represents as a delegate or agent for another.

REPRESENTATION OF MARK = ПРЕДСТАВЛЕНИЕ (или ИЗОБРАЖЕНИЕ, или ПРЕДСТАВИТЕЛЬСТВО) ЗНАКА – Representation Of Mark is a clear depiction of the mark an applicant seeks to register. Every application must include a representation of the mark. The United States Patent and Trademark Office (USPTO) uses reprentations of marks to file marks in the USPTO search records and to print marks in the Official Gazette (eOG:T) and on registration certificates. For TEAS applications, if the mark is in standard character form, a separate page depicting the mark is not required. If the mark is special form, (i.e. includes a design or stylized lettering), the applicant must attach a digitized image of the mark in .jpg format to the electronic submission.

REPRESENTATIVE = ПРЕДСТАВИТЕЛЬ – Representative is one who stands for or acts on behalf of another. For example, a patent attorney or patent agent may represent the inventors named in a patent application.

REPRESENTATIVE OFFICE = ПРЕДСТАВИТЕЛЬСКИЙ ОФИС (или ПРЕДСТАВИТЕЛЬСКАЯ КОНТОРА) – A Representative Office is an office established by a company to conduct marketing and other non-transactional operations, generally in a foreign country where a branch office or subsidiary is not warranted. Representative offices are generally easier to establish than a branch or subsidiary, as they are not used for actual 'business' (e.g., sales) and therefore there is less incentive for them to be regulated. In banking, a Representative Office is a facility established in distant markets by a bank in order to sell the bank's services and assist

clients; these offices cannot accept deposits. / Представительство – это обособленное подразделение компании, расположенное вне места её нахождения и не являющееся юридическим лицом. Представительство осуществляет защиту и представление интересов головной компании. Оно может совершать сделки и иные правовые действия от имени головной компании. Представительство не имеет собственного баланса. Смотрите также Филиал (Branch), Материнская Компания (Parent Company), и Дочернее Предприятие (Subsidiary).

REPRESENTATIVE SAMPLE = ПРЕДСТАВИТЕЛЬНАЯ ПРОБА (или РЕПРЕЗЕНТАТИВНАЯ ПРОБА) – Representative Sample is a sample shall not be considered representative of a commodity lot unless the sample – (i) has been obtained by official personnel; (ii) is of the size prescribed in the instructions; and (iii) has been obtained, handled, and submitted in accordance with the instructions. Grades are based on samples. To ensure samples adequately reflect the entire lot of grain, proper sampling procedures must be used. Official samples are taken using continuous sampling devices. The Canadian Grain Commission (CGC) publishes a factsheet on sampling procedures, called Taking A Representative Sample.

REPRESSURING = ВОССТАНОВЛЕНИЕ ДАВЛЕНИЯ (или ПОДДЕРЖАНИЕ ДАВЛЕНИЯ) – Repressuring:- the injection of gas into oil or gas reservoir formations to effect greater ultimate recovery. / Нагнетание газа в нефтяной или газовый резервуарные образования для воздействия на более полное извлечение полезных ископаемых.

REPRICING RISK = РИСК ПЕРЕОЦЕНИВАНИЯ – Repricing Risk results from timing differences between coupon changes or cash flows from assets, liabilities, and off-balance sheet instruments. For example, long-term fixed rate securities funded by short-term rate deposits may create repricing risk. If interest rates change, then deposit funding costs will change more quickly than the securities' yield.

REPROCESSED FIBER = РЕГЕНЕРИРОВАННОЕ ВОЛОКНО (или ВОССТАНОВЛЕННОЕ ВОЛОКНО) – Reprocessed Fibers are the fibers obtained from scraps and clips of woven and felted fabrics made of previously urmsed woot that have been shredded back into fiber form and then remade into new yarns. Reprocessed fibers are usually wool fibers and must be relabeled as reprocessed wool according to Federal Trade Commission standards. Reprocessed fibers are less desirable than new or virgin fibers. See also Virgin Fiber.

REPROCESSED WOOL = РЕГЕНЕРИРОВАННАЯ ШЕРСТЬ (или ВОССТАНОВЛЕННАЯ ШЕРСТЬ) – Reprocessed Wool:- scraps and clips of woven and felted fabrics made of previously used wool. These remnants are garnetted; that is, shredded back into a fibrous state and used in the manufacture of woolens. / Регенерированная Шерсть получается путём разработки лоскута.

REPRODUCIBILITY = ВОСПРОИЗВОДИМОСТЬ – Reproducibility:- the closeness of agreement between the results of successive measurements of the same test specimen, or of test specimens taken at random from a homogeneous supply, but changing conditions such as operator, measuring instrument, laboratory, or time. The changes in conditions must be specified.

REPRODUCTION = РЕПРОДУКЦИЯ (или РАЗМНОЖЕНИЕ) – Reproduction is the sexual or asexual process or mechanism by which the species multiplies and is maintained. / Под Репродукцией, от Латинских слов Re, приставка, указывающая:- (i) на повторное, возобновляемое действие; или (ii) на противоположное, обратное действие, противодействие, например, реабсорбция, и Produco, означающее Произвожу или Создаю, понимается:- (1) воспроизведение. (2) Воспроизведение полиграфическими или другими средствами произведений изобразительного искусства (картина, рисунок, фотоснимок и тому подобное). (3) В психологии – воспроизведение удержанного в памяти. (4) В биологии – воспроизведение организмами себе подобных; то же, что Размножение – присущее всем организмам свойство воспроизведения себе подобных, обеспечивающее непрерывность и преемственность жизни. Основные способы размножения:- бесполое (в том числе вегетативное) и половое. Каждому виду организмов свойственна определённая интенсивность размножения, меняющаяся в зависимости от условий существования. (5) Под Репродукцией Семян понимается поколение семян считая от элиты. Первый пересев элитных семян называется Первой Репродукцией Семян, второй пересев – второй и так далее. Репродукция семян полевых культур после восьмой (у Кукурузы после пятой) называется Массовой Репродукцией. С возрастанием репродукции семян сортовые качества их ухудшаются вследствие механического и биологического засорения, а у сортов-популяций, кроме того, вследствие изменения состава популяции под влиянием естественного отбора. Увеличивается степень засорения трудноотделимыми семенами культурных и сорных растений, степень поражения болезнями и вредителями. Темп этих изменений замедляется при хорошо организованном семеноводстве. Семена низкокачественных репродукций периодически заменяют на семена элиты и первой репродукции.

REPRODUCTIVE PHASE = РЕПРОДУКТИВНАЯ ФАЗА – Reproductive Phase is the period of crop growth from panicle initiation to panicle maturation.

REPRODUCTIVE SYSTEM = РЕПРОДУКТИВНАЯ СИСТЕМА – Reproductive System is all the organs and structures involved in the production and delivery of gametes or reproductive cells.

REPRODUCTIVE TOXICITY = РЕПРОДУКТИВНАЯ ТОКСИЧНОСТЬ – The term 'Reproductive Toxicity' is used to describe the adverse effects induced (by a substance) on any aspect of mammalian reproduction. The definition of substances which would be considered as toxic to reproduction is given in Directive 92/32/EEC. Criteria for classification of substances on the basis of adverse effects on reproduction are given in Directive 93/21/EEC. / Репродуктивная Токсичность определяется как развитие патологического ответа со стороны репродуктивной системы на воздействие неблагоприятных факторов окружающей среды в результате её незащищенности. Токсичность может проявиться в изменениях органов репродукции и/или относящейся к ним эндокринной системы.

REPS = RE–EXAMINATION PROCESSING SYSTEM

REPUBLIC = РЕСПУБЛИКА – Republic, originally, any form of government not headed by an hereditary monarch. In modern American usage, the term usually refers more specifically to a form of government (also known as Representative Democracy) in which ultimate political power is theoretically vested in the people but in which popular control is exercised only intermittently and indirectly through the popular election of government officials and/or delegates to a legislative assembly rather than directly through frequent mass assemblies or legislation by referendum. / Под Республикой, от Латинского лова Respublica, означающее буквально Общественное Дело, понимается форма правления, при которой высшая государственная власть принадлежит выборному представительскому органу; глава государства также избирается населением или специальной избирательной коллегией. Республиканская форма не определяет классового типа государства.

REPUDIATION = ОТКАЗ – Repudiation:- denial by one of the entities involved in a communication of having participated in all or part of the communication. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

REPURCHASE AGREEMENT = СОГЛАШЕНИЕ ОБ ОТКУПЕ – Repurchase Agreement (Repo):- in the United States, a transaction in which the Federal Reserve enters into an agreement with a primary dealer to acquire securities from the dealer for a specified principal amount at an agreed-upon interest rate and to return the securities on a specified future date. The maturity date may be the next day or many days later, with the maximum length set by the Federal Open Market Committee (FOMC). These transactions permit the Federal Reserve to increase the supply of Federal Reserve balances for the length of the agreement. The Federal Reserve frequently arranges Repurchase Agreements (Repos or RPs) to add Federal Reserve balances temporarily. In these transactions, it acquires a security from a primary dealer under an agreement to return the security on a specified date. Most repurchase agreements have an overnight term, although short-term repurchase agreements with maturities of two to thirteen days are also arranged to address shortages in Federal Reserve balances that are expected to extend over several days. Longer-term repurchase agreements are used to address more-persistent needs. The Federal Reserve accepts Treasury, federal agency, and mortgage-backed securities guaranteed by federal agencies as collateral for its repurchase agreements. Repurchase Agreements (Repos) are agreements by which the Fund purchases a security and obtains a simultaneous commitment from the seller to repurchase the security at an agreed upon price and date. The Fund's custodian, or a duly appointed subcustodian, will hold the securities underlying any repurchase agreement in a segregated account or such securities may be part of the Federal Reserve Book Entry System. The market value of the collateral underlying the repurchase agreement will be determined on each business day. If at any time the market value of the collateral falls below the repurchase price of the repurchase agreement (including any accrued interest), the Fund will promptly receive additional collateral, so that the total collateral is in an amount at least equal to the repurchase price plus accrued interest. Arrangement by banks and other institutions to borrow short-term funds, usually for one day, by transferring securities to the lender, with the agreement that the borrower will repurchase them. Also known as Repo. Repurchase Agreement is an agreement in which the borrower (repo seller) transfers assets, such as securities, in exchange for an amount of money to a lender (repo buyer). At the same time, it is agreed that the borrower will repurchase the securities at a specific or indeterminate time in exchange for the payment of the repurchase price. The repurchase price is comprised of the purchase price plus the repo rate, which is arranged at the closing of the repurchase agreement. The commercial purpose is to regularly provide liquidity or cash financing to the borrower. Synonym:- Repo Agreement. An agreement between a seller and a buyer, usually in US government securities, in which the seller agrees to buy back the security at a later date. A deal in which an institution lends or 'sells' another institution a security and agrees to buy it back at a future date. Legal ownership does not change under a 'repo' agreement. It was previously treated as a change of ownership in the UK financial account but under the System of National Accounts (SNA) is treated as a collateralised deposit. The acceptance of securities (such as equity paper) by a bank or financing institution for a limited period, with the depositor or a third party undertaking to repurchase the relevant securities after a stipulated period. In the United States, Repurchase Agreement is an agreement by which, for example, the Federal Reserve purchases a security for immediate delivery and receives interest at a specific rate from a government securities dealer, with an agreement to sell the security back at the same price by a specific date (usually within 15 days). This arrangement allows the Federal Reserve to inject reserves into the banking system on a temporary basis to meet a temporary need and to withdraw these reserves as soon as that need has passed. A contract to sell securities and subsequently to repurchase them at a specified price and typically at a specified time. Repos, which are typically executed on US Government securities, are usually very short term. Repurchase Agreement is an agreement to sell an asset and to repurchase it at a specified price on a pre-determined future date or on demand. Such an agreement is similar to collateralised borrowing, except that in this case ownership of the securities is not retained by the seller. Repurchase transactions are included in M3 in cases where the seller is a monetary financial institution (MFI) and the counterparty is a non-MFI resident in the Euro area. See also M3. / Система Национальных Счетов (СНС). откуп – откупщик. Известно также как Рипо (Repo). Соглашение об Откупе – соглашение о продаже актива и его откупе по указанной цене в заранее предопределённую дату в будущем или по требованию. Такое соглашение аналогично заимствованию, обеспеченному закладом, за исключением того, что владение ценными бумагами не сохраняется за продавцом. Операции откупа включались в состав денежной массы М3 в тех случаях, когда продавцом являлось монетарное финансовое учреждение (МФУ), а встречной стороной – нерезидент этого МФУ в зоне Евро. Смотрите также М3 (M3).

REPURCHASE PRICE = ЦЕНА ОТКУПА – Repurchase Price:- the amount at which an investment fund is obligated to repurchase fund units to the debit of the fund's assets. It equals the net asset value less any redemption charges and (in the case of some international investment funds) the expenses incurred in connection with the sale of investments. Also known as Redemption Price.

REQUESTED EXECUTION/PROCESSING DATE = ДАТА ЗАПРОШЕННОГО ИСПОЛНЕНИЯ/ОБРАБОТКИ – Requested Execution/Processing Date:- in banking, a date provided by the sender on which the Entry Point Financial Institution (or an Automated Clearing House (ACH) acting on behalf of the Entry Point Financial Institution) should initiate the transaction. If no date is specified or the date is not a banking business day, the transaction will be executed at first opportunity.

REQUEST FOR CONTINUED EXAMINATION = ЗАПРОС НА ПРОДОЛЖАЕМУЮ ЭКЗАМЕНАЦИЮ (или ХОДАТАЙСТВО О ПРОДЛЕНИИ ЭКСПЕРТИЗЫ) – Request For Continued Examination (RCE) is a request filed in an application in which prosecution is closed (e.g., the application is under final rejection or a notice of allowance) that is filed to reopen prosecution and continue examination of the application; requires the filing of a submission and payment of a fee – see 37 CFR 1.114 (CFR:- short for the US Code of Federal Regulations).

REQUEST FOR EXTENSION OF TIME TO FILE A STATEMENT OF USE = ЗАПРОС НА ПРОДЛЕНИЕ СРОКА НА ПОДАЧУ ЗАЯВЛЕНИЯ ОБ ИСПОЛЬЗОВАНИИ (или ХОДАТАЙСТВО О ПРОДЛЕНИИ ВРЕМЕНИ НА ПОДАЧУ ПРОТОКОЛА ОБ ИСПОЛЬЗОВАНИИ) – Request For Extension Of Time To File A Statement Of Use:- Extension Request is a sworn statement signed by the owner or a person authorized to sign on behalf of the owner, stating that the applicant still has a bona fide intention to use the mark in commerce, and needs additional time to use the mark in commerce. A filing fee per class of goods/services must accompany the Extension Request. The Extension Request, if granted, gives the owner an additional six (6) months to either:- (i) use the mark in commerce and file a Statement of Use; or (ii) file another Extension Request. You may continue to file Extension Requests every six (6) months. However, you must use the mark and file a Statement of Use within three (3) years of the issue date of the Notice of Allowance. The United States Patent and Trademark Office (USPTO) will not register a mark if, after thirty-six (36) months of the issue date of the Notice of Allowance, a Statement of Use has not been filed.

REQUEST/OFFER = ЗАПРОС/ОФЕРТА – Request/Offer:- a negotiating approach whereby requests are submitted by a country to a trading partner identifying the concessions another seeks through negotiations. Compensating offers are similarly tabled and negotiated by delegates of the countries involved.

REQUEST TO REINSTATE AN APPLICATION = ЗАПРОС НА ВОССТАНОВЛЕНИЕ ЗАЯВКИ (или ХОДАТАЙСТВО О ВОССТАНОВЛЕНИИ ЗАЯВКИ) – Request to Reinstate an Application:- if an application is abandoned due to a USPTO (short for the United States Patent and Trademark Office) office error, an applicant may file a request to reinstate the application, instead of a petition to revive. There is no fee for a request for reinstatement. You must file a request for reinstatement within two months of the issue date

of the notice of abandonment. You must include a true copy of the document that was timely submitted, and a copy of an acceptable form of proof of receipt in the USPTO.

REQUIRED RESERVE BALANCE = САЛЬДО ТРЕБУЕМОГО РЕЗЕРВА (или ОСТАТОК ТРЕБУЕМОГО РЕЗЕРВА) – In the United States, Required Reserve Balance is that portion of its required reserves that a depository institution must hold in an account at a Federal Reserve Bank. This portion is the difference between the institution's reserve requirement and its vault cash.

REQUIRED RESERVE RATIO = СООТНОШЕНИЕ С ТРЕБУЕМЫМ РЕЗЕРВОМ (или КОЭФФИЦИЕНТ ТРЕБУЕМОГО РЕЗЕРВА) – Required Reserve Ratio is the percentage of reservable liabilities that depository institutions must set aside in the form of reserves.

REQUIRED RESERVES = ТРЕБУЕМЫЕ РЕЗЕРВЫ – In the United States, Required Reserves are the funds that a depository institution is required to maintain in the form of vault cash or, if vault cash is insufficient to meet the requirement, on deposit (in the form of a balance) maintained directly with a Federal Reserve Bank or indirectly with a pass-through correspondent bank. Required amount varies according to required reserve ratios set by the Board of Governors and the volume of reservable liabilities held by the institutions.

REQUIRED RESPONSE = ТРЕБУЕМАЯ ОТЗЫВЧИВОСТЬ – Required Response is a specified level of effect for a treatment.

REQUIREMENT TRANSACTIONS = ТРЕБУЕМЫЕ МЕРОПРИЯТИЯ (или ТРЕБУЕМЫЕ ТРАНЗАКЦИИ) – Requirement Transactions:- in reference to electricity, longer-term transactions for firm power delivery. / По отношению к электричеству, долгосрочные мероприятия по бесперебойной поставке электроэнергии.

REREFINING = ПОВТОРНАЯ ПЕРЕГОНКА (или ПОВТОРНАЯ ОЧИСТКА) – Rerefining is a process of reclaiming used lubricant oils and restoring them to a condition similar to that of virgin stocks by filtration, clay adsorption or more elaborate methods.

REREGISTRATION = ПЕРЕРЕГИСТРАЦИЯ – Reregistration:- since the passage of Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) amendments in 1988, the Environmental Protection Agency (EPA) has been conducting a comprehensive review of older pesticides (those initially registered before November 01, 1984) to consider their health and environmental effects and to make decisions about their future use. The EPA examines health and safety data for these pesticide active ingredients and determines whether they are eligible for reregistration. To be eligible, a pesticide must have a substantially complete data base, and must not cause unreasonable risks to human health or the environment when used in accordance with its approved label directions and precautions. FIFRA, as amended in 1996 by the Food Quality Protection Act, requires that all pesticides meet new safety standards. The EPA must be able to conclude, with 'reasonable certainty', that no harm will come to infants, children, or other sensitive individuals exposed to pesticides. All pesticide exposures (from food, drinking water, and home and garden use) must be considered in determining allowable levels of pesticides in food. The cumulative risks of pesticides and other compounds with common mechanisms of toxicity also must be considered. See also Reasonable Certainty Of No Harm, and Risk Cup.

RESCHEDULING AGREEMENT = СОГЛАШЕНИЕ О РЕСТРУКТУРИЗАЦИИ (или СОГЛАШЕНИЕ О ПЕРЕСМОТРЕ СРОКОВ) – Rescheduling Agreement is an agreement reached with borrowers, usually heavily indebted developing countries, to lengthen maturities, defer loan principal payments or reduce the interest rate of existing debt, especially by transforming short-term credits into medium- or long-term lendings. See also Moratorium.

RESCISSION = РАСТОРЖЕНИЕ – (1) Rescission:- repudiation of a contract. A party whose consent to a contract was induced by fraud, misrepresentation or duress may repudiate it. A contract may also be repudiated for failure to perform a duty.

(2) Rescission:- with respect to a directors and officers (D&O) liability insurance policy, a declaration by an insurer that the policy was never in effect, the result being that coverage for a claim, when tendered by a corporate organization to an insurer, is not covered. Rescission most often occurs under two circumstances:- (i) when the signer of an application for D&O liability coverage had knowledge of a potential claim and intentionally concealed such knowledge; and (ii) when the application for coverage or an important attachment to it (e.g., a financial statement) contains information that is materially false, such that if correct information were provided to the insurer, it would not have entered into the contract of insurance. In recent years, D&O insurers have increasingly rescinded coverage on these two bases. Rescission is the termination of an insurance contract by the insurer when material misrepresentation has occurred. / Прекращение контракта страхования страховщиком в случае, когда имеет место существенное заблуждение.

RESCRIPTIONS = РЕСКРИПЦИИ – The Swiss Treasury Notes issued by the Federal Government and Treasury Bills issued by the cantons and communities. They can run for up to 4 years. Generally employed by public authorities to raise funds temporarily. Used in part also to achieve cyclical or capital market objectives, e.g., if the Confederation sells sterilization rescriptions to the banks in order to mop up liquidity. Such rescriptions can sometimes be pledged by the bank with the Swiss National Bank for short terms (repurchase agreements) or discounted like other rescriptions during their remaining life of three months. / Швейцарские Казначейские Ноты (или Билеты), выпущенные Федеральным Правительством, и Казначейские Векселя, выпущенные кантонами и общинами. Срок их погашения достигает до 4 лет, например, . у Швейцарского Национального Банка на короткие сроки (соглашения об откупе) или . Слово Рескрипции заимствовано из Французского языка. Рескрипции:- (1) долговые обязательства, выпущенные Французским правительством во время первой революции; и (2) письменные поручения на выдачу или на приём денег, ордера. Под Рескриптом, от Латинского слова Rescriptum, понимается предписание или законодательный ответ на что-либо.

RESEARCH = ИССЛЕДОВАНИЕ – Research is a planned inquiry into the nature of, reason for, and consequences of any particular set of circumstances; whether these circumstances are experimentally controlled or recorded as they occur. The purposes of research are:- (a) to discover new facts, (b) to revise, verify, or modify accepted conclusions in the light of newly discovered facts, (c) to find practical application of such new facts, and (d) to gather benchmark data and information. / Под научным Исследованием понимается процесс выработки новых знаний и один из видов познавательной деятельности. Оно характеризуется объективностью, воспроизводимостью, доказательностью, точностью; имеет два уровня – теоретический и эмпирический. Наиболее распространённым является деление исследований на прикладные и фундаментальные, качественные и количественные, комплексные и уникальные.

RESEARCH AND DEVELOPMENT = (НАУЧНЫЕ) ИССЛЕДОВАНИЯ И (ОПЫТНО–КОНСТРУКТОРСКИЕ) РАЗРАБОТКИ – Research And Development (R&D) is the activity that aims to discover or invent new products or services. It covers pure scientific and technical research, applied research, product improvement and technological innovation. In the balance sheet, Research And Development costs are expensed as incurred. Research and development equipment with alternative future uses are capitalized and depreciated over the useful life. Research is a planned activity aimed at discovery of new knowledge with the hope of developing new or improved products and services. Development is the translation of research findings into a plan or design of new or improved products and services. / и технологическая инновация. Под научным Исследованием понимается процесс выработки новых

знаний и один из видов познавательной деятельности. Оно характеризуется объективностью, воспроизводимостью, доказательностью, точностью; имеет два уровня – теоретический и эмпирический. Наиболее распространённым является деление исследований на прикладные и фундаментальные, качественные и количественные, комплексные и уникальные. В Российской Федерации очень часто для аналогичных целей используется термин Научно-Исследовательские И Опытно-Конструкторские Работы (НИОКР).

RÉSEAUX IP EUROPÉENS NETWORK COORDINATION CENTRE = СЕТИ ИП ЕВРОПЕЙЦЕВ КООРДИНАЦИОННЫЙ ЦЕНТР РАБОЧЕЙ СЕТИ – Réseaux IP Européens (RIPE) is an open and voluntary organization, which consists of European Internet service providers. The RIPE NCC acts as the Regional Internet Registry (RIR) for Europe and surrounding areas, performs coordination activities for the organizations participating in RIPE, and allocates blocks of IP address space to its Local Internet Registries (LIRs), which then assign the addresses to end-users. The Réseaux IP Européens Network Coordination Centre (RIPE NCC) is the Regional Internet Registry (RIR) for Europe, the Middle East and parts of Central Asia. It is headquartered in Amsterdam. An RIR oversees the allocation and registration of Internet number resources (IPv4 addresses, IPv6 addresses andautonomous system numbers) in a specific region. The RIPE NCC supports the technical and administrative coordination of the infrastructure of the Internet. It is a not-for-profit membership organization with over 10 000 (as of March 2014) members located in over 70 countries in its service region. Any individual or organization can become a member of the RIPE NCC. The membership consists mainly of Internet service providers (ISPs), telecommunication organizations, educational institutions, governments, regulatory agencies, and large corporations. The RIPE NCC also provides technical and administrative support to Réseaux IP Européens (RIPE), a forum open to all parties with an interest in the technical development of the Internet. History:- The RIPE NCC began its operations in April 1992 in Amsterdam, Netherlands. Initial funding was provided by the academic networks Réseaux Associés pour la Recherche Européenne (RARE) members, EARN and EUnet. The RIPE NCC was formally established when the Dutch version of the Articles of Association was deposited with the Amsterdam Chamber of Commerce on 12 November 1997. The first RIPE NCC Activity Plan was published in May 1991. The RIPE NCC supports the development of the Internet through technical coordination of the Internet infrastructure in its service region and beyond. It undertakes many activities in this area, including:- (i) Allocation and registration of Internet number resources (IP addresses and autonomous system numbers). The allocation of IP addresses is important for several reasons. Public addresses need to be unique; if duplicate internet addresses existed on a network, network traffic could be delivered to the wrong host. The RIRs make sure that public addresses are given to one organization. The RIPE NCC does this for its own service region. Worldwide, IANA assigns blocks of addresses to the RIRs and they distribute these to end users via the LIRs (normally ISPs). Beside making sure that IP addresses and AS Numbers are only allocated to one user, the shortage of IPv4 addresses makes it important that the remaining addresses are allocated in an organized manner. For many years, the RIPE NCC has followed strict guidelines on how to assign IPv4 addresses according to policy developed by the RIPE Community, as outlined in the RIPE Document ripe-498. As the last /8 block has been assigned from IANA to all the RIRs, the RIPE NCC will only have new IPv4 addresses available for allocation for a certain amount of time. (ii) Development, operation and maintenance of the RIPE Database. (iii) Development, operation and maintenance of the RIPE Routing Registry. (iv) Operation of K-root, one of the world's root name servers. (v) Coordination support for ENUM delegations. (vi) Collection and publication of neutral statistics on Internet development and performance, notable via the RIPE Atlas global measurement network and RIPEstat, a web-based interface providing information about IP address space, Autonomous System Numbers, and related information for hostnames and countries. The RIPE NCC consists of:- (i) Members:- members can directly influence the RIPE NCC's activities and services. Members are responsible for nominating and electing candidates to the RIPE NCC Executive Board and for accepting the RIPE NCC Charging Scheme and approving the RIPE NCC Financial Report each year. Members also give input to, and feedback on, the activities carried out and the services provided by the RIPE NCC. (ii) Executive Board:- RIPE NCC members nominate and elect the Executive Board. The Board consists of between three and five members and is responsible for appointing the RIPE NCC's Managing Director, for the overall financial situation of the RIPE NCC and for keeping records that allow the financial situation of the organization to be evaluated at any time. (iii) RIPE NCC Staff:- staff members perform the activities of the RIPE NCC, provide services to its members and provide administrative support to RIPE. Réseaux IP Européens is a forum open to all parties with an interest in the technical development of the Internet. Although similar in name, RIPE and the RIPE NCC are separate entities. However, they are highly interdependent. The RIPE NCC provides administrative support to RIPE, such as the facilitation of RIPE Meetings and giving administrative support to RIPE Working Groups. / Рэзо И.Пе. Эропеа (или РИПЭ; Réseaux IP Européens (RIPE)). Рэзо Асосье пур ля Рэшэрш Эропеэнн (Эр.А.Эр.Э. или РАРЭ; Réseaux Associés pour la Recherche Européenne (RARE)). Сети ИП Европейцев – открытая организация с добровольным членством, состоящая их Европейских поставщиков услуг Интернета. RIPE NCC действует как региональный Интернет реестр (RIR, РИР) для Европы и близлежащей территории, осуществляет координацию деятельности организаций-членов RIPE, а также распределяет блоки пространства IP-адресов среди местных реестров Интернета (LIR, МРИ), которые, в свою очередь, назначают адреса конечным пользователям. RIPE NCC (аббревиатура от словосочетаний Французских слов Réseaux IP Européens и Английских слов Network Coordination Centre) – один из пяти региональных Интернет-регистраторов (Regional Internet Registries, RIRs), выполняющих распределение Интернет-ресурсов, а также связанную с этим регистрацию и координацию деятельности, направленную на глобальную поддержку функционирования Интернета. RIPE NCC функционирует как ассоциация локальных Интернет-регистраторов (Local Internet Registry (LIR)), каждая из которых платит членский взнос. В роли LIR обычно выступают крупные Интернет-провайдеры или корпорации. Выделение Интернет-ресурсов происходит согласно процедурам RIPE NCC, формализованным в соответствующих документах. Документы, устанавливающие процедуры работы с ресурсами, принимаются собранием членов RIPE – открытого тематического форума, проходящим дважды в год. Перед вынесением документов на голосование производится работа над проектами документов в рабочих группах и обсуждение проектов в открытых почтовых рассылках RIPE. Сотрудники RIPE NCC подчёркивают, что RIPE NCC – это не RIPE. RIPE NCC – это некоммерческая организация с бюджетом, штатом сотрудников, офисом и уставом. RIPE – это открытый форум, принять участие в работе которого может любой желающий. RIPE NCC руководит Аксель Паулик (Axel Pawlik), который является Управляющим Директором. Существует также и Совет Директоров (RIPE NCC Executive Board), в который входят пять директоров, выбираемых Общим Собранием (RIPE NCC General Meeting). Работу именно RIPE координирует Роб Блоксайэл (Rob Blokzijl). Офис RIPE NCC находится в Амстердаме, Нидерланды.

RESEDA = РЕЗЕДА (или БЛЕДНО–ЗЕЛЁНОЕ, или РЭСИДА) – Reseda:- a grayish green color.

RESERVABLE LIABILITIES = РЕЗЕРВИРУЕМЫЕ ОБЯЗАТЕЛЬСТВА – Reservable Liabilities:- in the United States, those obligations on a depository institution's balance sheet that are subject to reserve requirements. Transaction deposits, nonpersonal time deposits, and Eurocurrency liabilities are all subject to reserve requirements. However, the required reserve ratios for nonpersonal time deposits and Eurocurrency liabilities are zero.

RESERVE ASSETS = РЕЗЕРВНЫЕ АКТИВЫ – Reserve Assets:- the UK official holdings of gold, convertible currencies, Special Drawing Rights, changes in the UK reserve position with the International Monetary Fund (IMF) and European currency. They include

units acquired from swaps with the European Monetary Co-operation Fund (EMCF). Reserve Assets are those external assets that are readily available to and controlled by monetary authorities for meeting balance of payments financing needs, for intervention in exchange markets to affect the currency exchange rate, and for other related purposes such as maintaining confidence in the currency and the economy and serving as a basis for foreign borrowing. The major published components are monetary gold, International Monetary Fund (IMF) special drawing rights (SDRs), reserve position in the IMF, and other reserve assets.

RESERVE BASE = РЕЗЕРВНАЯ БАЗА – Reserve Base is the sum of the balance sheet items (in particular liabilities) which constitute the basis for calculating the reserve requirement of a credit institution.

RESERVE CURRENCY = РЕЗЕРВНАЯ ВАЛЮТА – Reserve Currency is a foreign currency held by a central bank in order to fund foreign trade. 2013-March-06:- the International Monetary Fund (IMF) confirmed that the AUD (Australian Dollar) and CAD (Canadian Dollar) will appear as reserve currency within three months. This emphasizes the spiraling demand for additional reserve currencies and the New Zealand Dollar has the best chance to join the list, according to experts. Australia and Canada both have resource based economies that have been benefiting from the growing demand for raw materials in Asia and other regions, which have given both countries the opportunity to emerge from the global financial crisis in much better shape than either the US or Europe, according to The Wall Street Journal. The best chance to join the Canadian and Australian Dollar this year has the New Zealand Dollar which looks in the long term more reliable. If the IMF adds it to the list of reserve currencies, the international system calculations will be more transparent and there will be an opportunity to make more accurate long-term forecasts. Russia is with Australia and Canada in the same group of the resource focused economies. But Russian Rouble is not as ready as it seems to become a reserve currency, as it is subject to external influence. For the situation to be clearer, the Russian central bank needs to decide whether it should let the rouble float freely or continue to regulate it. If the Central Bank continues to regulate it, rouble's chances to become a reserve currency will increase. The IMF holds report figures of the global reserve holdings in a database known as the COFER (short for the Composition of Foreign Exchange Reserves reporting) mainly in just five currencies, deemed by many investors to be among the world's safest:- US Dollars, Euros, British Pounds, Japanese Yen and Swiss Francs. Convertible currency or equivalents, such as the US Dollar or Special Drawing Rights, used by governments to settle balance of trade deficits. Reserve Currency is a foreign currency held by central banks and other major financial institutions as a means to pay off international debt obligations, or to influence their domestic exchange rate. A large percentage of commodities, such as gold and oil, are usually priced in the reserve currency, causing other countries to hold this currency to pay for these goods. Holding currency reserves, therefore, minimizes exchange rate risk, as the purchasing nation will not have to exchange their currency for the current reserve currency in order to make the purchase. In 2011, the US Dollar was the primary reserve currency used by other countries. As a result, foreign nations closely monitored the monetary policy of the United States in order to ensure that the value of their reserves is not adversely affected by inflation. / Зэ Вол Стрит Дьжонэл (The Wall Street Journal). Обратимая валюта (конвертируемая валюта) или эквиваленты, такие как Доллар США или Специальные Права Заимствования (Special Drawing Rights), используемые правительствами для взаиморасчётов при дефицитах торгового баланса. Под Резервной Валютой понимается иностранная валюта, накапливаемая центральным банком страны для международных расчётов. Обычно в роли резервной валюты выступает обратимая валюта.

RESERVE DYEING = КРАШЕНИЕ РЕЗЕРВОВ – Reserve Dyeing is a method for dyeing fabric to give pattern comprises clamping the fabric in certain configurations such as a folded configuration and applying dyestuffs which diffuse differentially between the clamps. See also Dyeing. Reserve Dyeing is:- (1) a method of dyeing in which one component of a blend or combination fabric is left undyed. The objective is accomplished by the use of dyes that have affinity for the fiber to be colored but not for the fiber to be reserved. (2) A method of treating yarn or fabric so that in the subsequent dyeing operation the treated portion will not be dyed. / Сродство (Affinity).

RESERVE FOR BAD DEBTS = РЕЗЕРВ НА БЕЗНАДЁЖНЫЕ ДОЛГИ – Reserve For Bad Debts is a reserve set aside in the books of a business to provide for the normal or expected amount of bad debt losses which may be incurred over a period of time. Also known as Provision For Doubtful Accounts (Del Credere). / Известен также как Обеспечение Под Сомнительные Счета (Дэль Крэдэрэ) (Provision For Doubtful Accounts (Del Credere)).

RESERVE MARGIN = РЕЗЕРВНЫЙ ЗАПАС (или ЗАПАС РЕЗЕРВА) – Reserve Margin (operating) is the amount of unused available capability of an electric power system at peak load for a utility system as a percentage of total capability.

RESERVE RATIO = СООТНОШЕНИЕ С РЕЗЕРВОМ – Reserve Ratio is a ratio defined by the central bank for each category of balance sheet items included in the reserve base. The ratios are used to calculate the reserve requirement.

RESERVE REQUIREMENTS = РЕЗЕРВНЫЕ ТРЕБОВАНИЯ (или ТРЕБОВАНИЯ К РЕЗЕРВАМ) – In the United States, Reserve Requirements have long been a part of our nation's banking history. Depository institutions maintain a fraction of certain liabilities in reserve in specified assets. The Federal Reserve can adjust reserve requirements by changing required reserve ratios, the liabilities to which the ratios apply, or both. Changes in reserve requirements can have profound effects on the money stock and on the cost to banks of extending credit and are also costly to administer; therefore, reserve requirements are not adjusted frequently. Nonetheless, reserve requirements play a useful role in the conduct of open market operations by helping to ensure a predictable demand for Federal Reserve balances and thus enhancing the Federal Reserve's control over the federal funds rate. Requiring depository institutions to hold a certain fraction of their deposits in reserve, either as cash in their vaults or as non-interest-bearing balances at the Federal Reserve, does impose a cost on the private sector. The cost is equal to the amount of forgone interest on these funds – or at least on the portion of these funds that depository institutions hold only because of legal requirements and not to meet their customers' needs. The burden of reserve requirements is structured to bear generally less heavily on smaller institutions. At every depository institution, a certain amount of reservable liabilities is exempt from reserve requirements, and a relatively low required reserve ratio is applied to reservable liabilities up to a specific level. The amounts of reservable liabilities exempt from reserve requirements and subject to the low required reserve ratio are adjusted annually to ref lect growth in the banking system. Changes in reserve requirements can affect the money stock, by altering the volume of deposits that can be supported by a given level of reserves, and bank funding costs. Unless it is accompanied by an increase in the supply of Federal Reserve balances, an increase in reserve requirements (through an increase in the required reserve ratio, for example) reduces excess reserves, induces a contraction in bank credit and deposit levels, and raises interest rates. It also pushes up bank funding costs by increasing the amount of non-interest-bearing assets that must be held in reserve. Conversely, a decrease in reserve requirements, unless accompanied by a reduction in Federal Reserve balances, initially leaves depository institutions with excess reserves, which can encourage an expansion of bank credit and deposit levels and reduce interest rates. Funds which a bank must set aside to meet its cash liabilities to depositors. The minimum reserves to be maintained for checking accounts and time deposits are specified by law. In the United States, Reserve Requirements are the requirements set by the Federal Reserve Board of Governors for the amounts that certain financial institutions must set aside in the form of reserves. Reserve requirements act as a control on the expansion of money and credit and may be raised or lowered within limits specified by law (lowering reserve requirements allows more bank lending and money growth; raising

requirements, less lending and money growth). The minimum amount of cash and liquid assets as a percentage of demand deposits and time deposits that member banks of the US Federal Reserve are required to maintain. In the United States, Reserve Requirement is the minimum percentage of their customers' total demand deposits (checking account balances) that banks are legally required to keep on hand in cash or as deposits in their accounts at the regional Federal Reserve bank. In the United States, the Federal Reserve's Board of Governors is empowered to set the reserve requirement for member banks at its discretion. This power provides one of the Fed's more powerful policy tools for influencing the banks' willingness and ability to extend or call in loans, and thus to influence the size of the money stock and the level of prevailing interest rates. Lowering the reserve requirement is expansionary. Lowering the reserve requirement increases the bankers' availability of funds to make more loans, thus tending to expand the money stock and (in the short run at least) to lower interest rates and encourage both consumers and investors to buy more. Raising the reserve requirement represents a contractionary move by the Fed. Raising the reserve requirement restricts the bankers' ability to make more loans, and those banks that were already operating just barely above the old reserve requirement will probably be forced to call in some of their existing loans to meet the tougher new requirement, thus tending to shrink the money stock, raise interest rates, and thus reduce the volume of purchasing on credit in the economy as a whole. Reserve Requirement is the minimum amount of reserves a credit institution is required to hold with the Eurosystem. Compliance is determined on the basis of the average of the daily balances over a maintenance period of around one month. / Фэд (Fed).

RESERVES = РЕЗЕРВЫ – (1) In the United Kingdom. Reserves:- in accounting, an amount of money set aside from profits and other company funds transferred from surplus or unidivided profits to a special liability account. Reserves serve an important safety function and are used for self-financing. Funds or assets held by an economic unit to meet anticipated needs, or for legal or contractual reasons. Commonly used to denote assets or means of payment that are set aside to pay future debts, but which are not allocated to any specific purpose, unlike provisions. See also Hoarding, and Savings. Reserves are part of equity but reported separately from the company's share capital. Reserves serve as a source of self-financing for the company and strengthen its equity base. The purpose of reserves is, for instance, to cover losses or fund future investments. German Stock Corporation Law requires that 5 percent of net profit (net income) be annually allocated to statutory reserves until statutory reserves and capital reserves combined amount to 10 percent of share capital. Open reserves are reported in the balance sheet under the position 'Shareholders' equity'. Retained earnings are undistributed (retained) earnings, whereas capital reserves arise when shares are issued above their nominal value. Hidden reserves are not reported but are substantive. In the United States, a depository institution's vault cash (up to the level of its required reserves) plus balances in its reserve account (not including funds applied to its required clearing balance). Also known as Stockholders' Equity Other Than Common Stock in the United States. These include the profit and loss account (accumulated profits), share premium account, and revaluation reserve. / Денежные средства или активы, удерживаемые хозяйствующим субъектом для удовлетворения . Под Резервами, от Французского слова Réserve от Латинского Reservo, означающее Сберегаю или Сохраняю, понимаются:- (i) запас чего-либо на случай надобности; или (ii) источник, откуда черпаются новые средства, силы.

(2) Reserves:- amount required to be carried as a liability in the financial statements of an insurer or reinsurer to provide for future commitments under outstanding policies and contracts. The amount of money that has been set aside by an insurer or reinsurer to meet outstanding claims, incurred but not reported losses and any associated expenses.

(3) Reserves are those quantities of petroleum which are anticipated to be commercially recovered from known accumulations from a given date forward. All reserve estimates involve some degree of uncertainty. The uncertainty depends chiefly on the amount of reliable geologic and engineering data available at the time of the estimate and the interpretation of these data. The relative degree ofuncertainty may be conveyed by placing reserves into one of two principal classifications, either proved or unproved. Unproved reserves are less certain to be recovered than proved reserves and may be furthersub-classified as probable and possible reserves to denote progressively increasing uncertainty in their recoverability. The intent of the Society of Petroleum Engineers (SPE) and World Petroleum Council (WPC, formerly World Petroleum Congresses) in approving additional classifications beyond proved reserves is to facilitate consistency among professionals using such terms. In presenting these definitions, neither organization is recommending public disclosure of reserves classified as unproved. Public disclosure of the quantities classified as unproved reserves is left to the discretion of the countries or companies involved. Estimation of reserves is done under conditions of uncertainty. The method of estimation is called Deterministic if a single best estimate of reserves is made based on known geological, engineering, and economic data. The method of estimation is called Probabilistic when the known geological, engineering, and economic data are used to generate a range of estimates and their associated probabilities. Identifying reserves as proved, probable, and possible has been the most frequent classification method and gives an indication of the probability of recovery. Because of potential differences in uncertainty, caution should be exercised when aggregating reserves of different classifications. Reserves estimates will generally be revised as additional geologic or engineering data becomes available or as economic conditions change. Reserves do not include quantities of petroleum being held in inventory, and may be reduced for usage or processing losses if required for financial reporting. Reserves may be attributed to either natural energy or improved recovery methods. Improved recovery methods include all methods for supplementing natural energy or altering natural forces in the reservoir to increase ultimate recovery. Examples of such methods are pressure maintenance, cycling, waterflooding, thermal methods, chemical flooding, and the use of miscible and immiscible displacement fluids. Other improved recovery methods may be developed in the future as petroleum technology continues to evolve. Recoverable portion of resources available for use based on current knowledge, technology and economics. Reserves:- crude oil and natural gas contained in underground rock formations called reservoirs and saleable hydrocarbons extracted from oil sands, shale, coalbeds and other nonrenewable natural resources that are intended to be upgraded into synthetic oil or gas. Net proved reserves are the estimated quantities that geoscience and engineering data demonstrate with reasonable certainty to be economically producible in the future from known reservoirs under existing economic conditions, operating methods and government regulations and exclude royalties and interests owned by others. Estimates change as additional information becomes available. Oil-equivalent reserves are the sum of the liquids reserves and the oil-equivalent gas reserves. See also Barrels Of Oil-Equivalent, and Oil-Equivalent Gas. The company discloses only net proved reserves in its filings with the US Securities and Exchange Commission. Investors should refer to proved reserves disclosures in Chevron's Annual Report on Form 10-K for the year ended December 31, 2017. The calculated quantity of hydrocarbons or minerals which can be extracted profitably from a deposit, classified according to the level of confidence that can be placed in the data. Standard classifications are:- possible reserves, probable reserves, proved reserves or measured reserves, and recoverable reserves. / Шеврон Корпорэйшэн (Chevron Corporation). Расчётное количество углеводородов или иных полезных ископаемых, которое может быть извлечено из залежа экономически целесообразным способом; классифицируется по степени надёжности занесения данных. Ниже приводится стандартная классификация:- вероятные резервы, возможные резервы, доказанные резервы или подсчитанные резервы, и извлекаемые резервы.

RESERVING AGENT = РЕЗЕРВИРУЮЩИЙ (или СБЕРЕГАЮЩИЙ) АГЕНТ (или РЕЗЕРВ) – Reserving Agent, also called Restraining Agent; a dye bath auxiliary that is typically used to prevent one fiber in a blend from taking up dye intended for the other fiber, or to equalize the uptake. When blends are dyed, one fiber may be truly dyed while the other is stained (colored, but with very

poor fastness). Reserving agents can be used to significantly reduced the undesired staining. In blends such as woolnylon, reserving agents can act to reduce the dye uptake by the nylon, so that the nylon and wool ultimately are colored similarly. / , именуемый также Замедляющий Агент (Restraining Agent), . Найлан^{T3} (Nylon^{TM}). Под Резервами понимаются составы для защиты ткани от окрашивания в тех местах, на которых они наносятся.

RESERVOIR = РЕЗЕРВУАР – Reservoir is a container for storage of liquid in a fluid power system. In power, Reservoir is a structure (usually a dam) which stores water for later use in the production of electricity. / В энергетике, сооружение (как правило, плотина), которая удерживает воду для дальнейшего использования в производстве электроэнергии. Под Резервуаром, от Французского слова Réservoir от Латинского слова Reservo, означающее Сберегаю или Сохраняю, понимается наземное или подземное вместилище для хранения жидкостей и газов. Широко распространены железобетонные и металлические резервуары, реже – деревянные, каменные, из полимерных и других материалов. В зависимости от назначения и вида хранимого вещества резервуары подвергают тепло- и гидроизоляции, а их внутренние стенки облицовывают, например, кислотоупорными материалами. Резервуар – ёмкость для хранения жидкостей или газов. Резервуары устраивают надземные, наземные и подземные, изготовляют металлическими, железобетонными и деревянными (для временной эксплуатации), по форме – цилиндрическими, призматическими и сферическими. Наиболее распространены вертикальные цилиндрические резервуары. В зависимости от назначения и вида хранимого вещества резервуары подвергают тепло- и гидроизоляции, а их внутренние стенки облицовывают (например, кислотоупорными материалами). Резервуары оборудуют подогревателями, предохранительными и другими клапанами, арматурой, приёмо-раздаточными устройствами, приспособлениями для очистки, уровнемерами и тому подобным. Смотрите также Газгольдер, Газовое Хранилище, Нефтехранилище.

RESERVOIR = РЕЗЕРВУАР (или ПЛАСТ) – In oil industry, Reservoir is a naturally occurring geological formation containing hydrocarbon. / В нефтяной отрасли, возникшая естественным образом геологическая формация, содержащая углеводород. Пласт – слой (геологический), геологическое тело, основная форма залегания осадочных горных пород, отражающая их последовательное отложение. Имеет более или менее однородный состав и ограничен двумя приблизительно параллельными поверхностями (верхняя – кровля и нижняя – подошва). Толщина пласта, или мощность, намного меньше его протяжённости (от долей метров (м) до нескольких м). Каждый вышележащий пласт (при нормальном, не нарушенном залегании) является более молодым по отношению к нижележащему. Пласты могут слагаться также метаморфическими породами. Применительно к магматическим породам и рудам, если они залегают в виде плоского тела, говорят о пластовой залежи.

RESERVOIR FILTER = РЕЗЕРВУАРНЫЙ ФИЛЬТР – Reservoir Filter is a filter installed in a reservoir in series with a suction or return line. Also known as Sump Filter. See also Filter.

RESIDENTIAL SECTOR = ЖИЛИЩНЫЙ СЕКТОР (или СЕКТОР НАСЕЛЕНИЕ) – In some energy reports, Residential Sector is an energy-consuming sector that consists of living quarters for private households. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a variety of other appliances. The residential sector excludes institutional living quarters. The Residential Sector is defined as private household establishments which consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. / В некоторых отчётах по энергетике, энергопотребляющий сектор, состоящий из жилых кварталов частных владений. К основным целям применения электроэнергии этим сектором относятся обогрев помещений, нагрев воды, кондиционирование воздуха, освещение, охлаждение, приготовление пищи и использование различной техники и приборов. Жилой сектор не включает в себя жилые кварталы, принадлежащие организациям и предприятиям.

RESIDENCE = РЕЗИДЕНЦИЯ – (1) Residence is a country with which an entity has the strongest connection, expressed as the location from which it engages in economic activities and transactions on a significant scale. Each entity is a resident of one and only one country. / .

(2) Residence:- xxxxx. / Под Резиденцией, от позднелатинского слова Residentia, от Латинского слова Resideo, озанчающее Остаюсь На Месте или Пребываю, понимается местопребывание правительства, главы государства или других лиц, занимающих высшие административные посты.

RESIDENTS = РЕЗИДЕНТЫ – Residents:- these comprise general government, individuals, private non-profit-making bodies serving households and enterprises within the territory of a given economy. Private persons and legal entities living in a given country or territory and treated as residents under fiscal, currency control and other legislation. / Частные персоны и юридические лица, проживающие в данной стране или территории и ответственные в качестве резидентов за исполнение фискального законодательства, законодательства по валютному контролю и иному законодательству. Под Резидентом, от Латинского слова Residens, родительный падеж Residentis, означающее Остающийся На Месте или Сидящий, понимаются:- (i) представитель колониальной державы в протекторате; (ii) представитель разведки одной страны в другом гусударстве, направляющий работу агентурной сети; или (iii) в средние века иностранный дипломатический представитель, постоянно находившийся в данной стране. Резидент, от Французского слова Resident, от Латинского слова Residens, означающее Остающийся На Месте или Пребывающий, понимается:- (1) в средние века иностранный дипломатический представитель, постоянно находившийся в данной стране; (2) представитель метрополии в протекторате; (3) представитель разведки, постоянно проживающий в иностранном государстве.

RESIDUAL = ОСТАТОЧНОЕ – Residual:- the remainder of a chemical or a quality after the original application, or in statistical analysis of variance, the remainder when all true values are subtracted from observed or calculated values or values due to known sources of variation. Residual:- a property of a substance, such as a pesticide, that allows it to remain in an area for a long time.

RESIDUAL DIRT CAPACITY = ОСТАТОЧНАЯ ГРЯЗЕЁМКОСТЬ – Residual Dirt Capacity is the dirt capacity remaining in a service loaded filter element after use, but before cleaning, measured under the same conditions as the dirt capacity of a new filter element.

RESIDUAL EFFECT = ОСТАТОЧНЫЙ ЭФФЕКТ – Residual Effect is the effect of chemical fertilizers, herbicides, insecticides, or fungicides that remains in the following crop season without fresh application of the chemical.

RESIDUAL FUEL OIL = МАЗУТ (или МАЗУТОВЫЕ ФРАКЦИИ, или ОСТАТОЧНОЕ ДИЗЕЛЬНОЕ ТОПЛИВО) – Residual Fuel Oil:- the topped crude of refinery operation, includes No. 5 and No. 6 fuel oils as defined in ASTM Specification D396 and Federal Specification VV-F-815C; Navy Special fuel oil as defined in Military Specification MIL-F-859E including Amendment 2 (NATO Symbol F-77); and Bunker C fuel oil. Residual fuel oil is used for the production of electric power, space heating, vessel bunkering, and various industrial purposes. Imports of residual fuel oil include imported crude oil burned as fuel. Heavy fuel oil produced from the residue in the fractional distillation process rather than from the distilled fractions. This covers all residual (heavy) fuel oils, including those

obtained by blending. Kinematic viscosity is above 10 cSt at 80 °C. The flash point is always above 50 °C and density is generally more than 0.90 kg/l. Two grades are available depending on uses:- (i) Low Sulphur Content – heavy fuel oil with sulphur content lower or equal to than 1%, and (ii) High Sulphur Content – heavy fuel oil with sulphur content higher than 1%. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). Они относятся ко всем остаточным (тяжёлым) мазутам, в том числе полученным посредством смешивания. Кинематическая вязкость свыше 10 сСт при 80 °C. Температура вспышки всегда превышает 50 °C, а плотность, как правило, более, чем 0.90 кг/л. В зависимости от использования бывают двух сортов:- (i) С Низким Содержанием Серы – тяжёлый мазут с содержанием серы ниже или равным 1%, и (ii) С Высоким Содержанием Серы – тяжёлый мазут с содержанием серы свыше 1%. Слово Мазут было заимствовано из Тюркского языка. Оно означает густую жидкость тёмно-коричневого цвета, остаток после отгона от нефти бензина, керосина и фракций дизельного топлива. Плотность мазута составляет 0.89–1.00 г/см^3, теплота сгорания 39.4–40.7 МДж/кг. Мазут применяют как жидкое котельное топливо, а также для производства битумов, кокса и моторных топлив. Под Мазутом (происхождение слова из Тюркского языка) понимается остаток после перегонки нефти при атмосферном давлении (отгонки бензина, керосина и дизельного топлива). Мазут – густая тёмная жидкость; плотность 890–1 000 кг/м^3, низшая теплота сгорания около 40 МДж/кг. Применяется как сырьё для крекинга, в качестве котельного топлива, для получения смазочных масел. Остаток после отбора масляных фракций называется гудроном. Марки мазута различаются по вязкости, температуре вспышки, зольности, температуре застывания и прочему. Остаток после перегонки нефти – Мазут – используют как сырьё для производства смазочных масел, парафина, гудрона, кокса и других нефтепродуктов. Мазут (Тюркский язык), остаток после отгона от нефти бензина, лигроина, керосина и фракций дизельного топлива. В зависимости от химического состава и свойств мазут может быть использован как жидкое котельное топливо, для получения дистиллятных и остаточных смазочных масел, для крекинга или гидрирования с целью получения моторного топлива (бензина, дизельного топлива), для производства битумов, кокса и других целей. Свойства мазута:- плотность при 20 °C 890–1 000 килограммов на кубический метр (кг/м^3), теплота сгорания 38–42 МегаДжоулей на килограмм (МДж/кг) (9 100–10 000 килокалорий на килограмм (ккал/кг)); вязкость условная 5–15° при 50 °C; поверхностное натяжение 0.03–0.04 Дж/м^2 (30–40 эрг/см; 40 °C); теплота испарения 170–210 кДж/кг (40–50 ккал/кг); содержание серы 0.8–3.5%, смол до 60%, золы 0.1–0.5%. Наименьшую зольность должен иметь мазут, используемый в качестве топлива для газовых турбин (при этом в золе должно быть не более 0.001% ванадия и 0.000 5% натрия, особенно опасных в коррозионном отношении элементов).

RESIDUAL HERBICIDES AND RESIDUALS = ОСТАТОЧНЫЕ ГЕРБИЦИДЫ И ОСТАТКИ – Residual Herbicides And Residuals are herbicides that have a time-span of impact (i.e. injure or kill germinating weed seedlings) on plant growth well after the application of the herbicide. Different herbicides have different time-spans of impact, (different residual effects), can remain in the soil profile for long periods of time, and can be moved around in the soil by irrigation, rainfall events or groundwater movement. See also Persistent Herbicide. / Смотрите также Персистентный Гербицид или Стойкий Гербицид (Persistent Herbicide).

RESIDUAL OIL, FEEDSTUFFS CONTAINING = СОДЕРЖАЩЕЕ КОРМОВЫЕ ПРОДУКТЫ ОСТАТОЧНОЕ МАСЛО – Residual Oil, Feedstuffs Containing:- pressing residues arising from oil extraction from oil-bearing seeds/fruits.

RESIDUAL PURCHASE PRICE FINANCING = ФИНАНСИРОВАНИЕ ПОД ОСТАТОЧНУЮ ЗАКУПОЧНУЮ СТОИМОСТЬ (или ЦЕНА ПОКУПКИ НА ОСНОВЕ ОСТАТОЧНОГО ФИНАНСИРОВАНИЯ) – Residual Purchase Price Financing:- instalment (hire-purchase) loan obtained by the buyer for financing medium-term investment after downpayment. Mostly with ownership reserved by the bank. / Заём в рассрочку (заём в аренду с выкупом).

RESIDUAL RESTRICTIONS = ОСТАТОЧНЫЕ ОГРАНИЧЕНИЯ – Residual Restrictions are the quantitative restrictions that have been maintained by governments before they became contracting parties to GATT (short for the General Agreement on Tariffs and Trade) and, hence, permissible under the GATT ‘Grandfather Clause’. Most of the residual restrictions still in effect are maintained by developed countries against the imports of agricultural products. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

RESIDUAL SHRINKAGE = ОСТАТОЧНАЯ УСАДКА – Residual Shrinkage is a term describing the amount of shrinkage remaining in a fabric after finishing, expressed as a percentage of the dimensions before finishing. Residual Shrinkage is the amount of shrinkage remaining in a fabric or gannent after all manufacturing processes are completed. More than residual shrinkage is undesirable, but common because in many fabrics the removal of residual shrinkage is not always included as patt of the finish.ing process. Because fabrics often have residual shrinkage, it is important to preshrink before cutting fabrics used in hon3e sewing. See also Preshrunk.

RESIDUAL SUPPLIER = ПОСТАВЩИК ОСТАТКОВ – Residual Supplier is a country which furnishes supplies to another country only after the latter has obtained all it can from other preferred sources.

RESIDUAL TORSION = ОСТАТОЧНОЕ СКРУЧИВАНИЕ (или ОСТАТОЧНОЕ СВИВАНИЕ) – Residual Torsion is the number of revolutions made by a specific length of steel cord when one end is held in a fixed position and the other allowed to turn freely.

RESIDUAL VALUE = ОСТАТОЧНАЯ СТОИМОСТЬ – The Residual Value of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.

RESIDUE = (НЕФТЯНОЙ) ОСТАТОК – Residue is the heavy residual liquid from the atmospheric distillation of crude oil is called Atmospheric Residue. If such residue is further distilled under vacuum a still heavier residual liquid results, which is called Vacuum Residue. The heavy liquid from cracking operations is called Cracked Residue. Residue:- the individual streams in this category may be:- (i) Atmospheric Distillates – distillates from atmospheric distillation of crude oil; (ii) Atmospheric Residues – residues from atmospheric distillation of crude oil; (iii) Vacuum Distillates – distillates from vacuum distillation of atmospheric residue; (iv) Vacuum Residues – residues from vacuum distillation of atmospheric residue; (v) Cracked Distillates – distillates of streams derived from cracking processes; (vi) Cracked Residues – residues of streams derived from cracking processes; and (vii) Reformer Residues – residues of streams derived from distillation of reformer processes. Analytical data on heavy fuel oil streams are scarce, since they are blended into heavy fuels normally because they have no commercial value in any other use and consequently have not been fully characterized. See also Heavy Fuel Oil. / Тяжёлая остаточная жидкость после атмосферной дистилляции сырой нефти, называемая Атмосферным Остатком. Если такой остаток перегоняется далее под вакуумом, то в результате образуются ещё более тяжёлые остаточные жидкости, называемые Вакуумным Остатком. Тяжёлая жидкость после процесса крекирования называется Остатком Крекинга.

RESIDUE = ОСТАТОК – Residue is the Plant part left after the economically useful part has been harvested.

RESIDUE PROCESSING = ПЕРЕРАБОТКА ОСТАТКОВ (или ОБРАБОТКА ОСТАТКОВ) – Residue Processing:- operations that cut, crush, or otherwise break (fracture) residues in a step preparatory to tillage, harvesting, or planting operation. / Послеуборочное измельчение и удаление растительных остатков.

RESILIENCE = УПРУГОСТЬ (или ЭЛАСТИЧНОСТЬ, или УПРУГАЯ ДЕФОРМАЦИЯ, или УДАРНАЯ ВЯЗКОСТЬ) – Resilience is the power of recovery to original shape and size after removal of the strain which caused the deformation. A fiber may possess this quality to spring back to its original state after being crushed or wrinkled. Resilience is sometimes referred to as Memory. Resiliency is the ability of a fabric to spring back to its original shape after being twisted, crushed, wrinkled, or distorted in any way. Resiliency is the ability of a fabric to return to its original shape after compressing, bending, or other deformation. Resiliency is an ability of a fiber or fabric to spring back when crushed or wrinkled. / Работа деформации, соответствующая пределу упругости.

RESIN = СМОЛА (или КАМЕДЬ, или РЕЗИНА) – Resin is a solid or pseudo-solid organic polymeric material, usually of high molecular weight, that exhibits a tendency to flow when subjected to stress. Many resins are two part catylized polymeric systems, typically thermosetting. Resin is the name commonly applied to synthetic chemical compounds polymerized on the fabric or yarn to give wash-and-wear and durable press properties, crush resistance, dimentional stability, and hand to fabrics. Resins are the high-molecular-weight organic compounds, usually divided into the 'thermoplastic' types, which soften on the application of heat, and the 'thermosetting' types, which form permanently hard materials that do not soften on reheating. The former are familiar in the textile industry, by virtue of their use in obtaining special finishes and in manufacturing such fibers as Vinyon, polystyrene, nylon, or Orion. The latter – particularly the urea and melamine formaldehyde types – are perhaps best known for their application in effecting stabilization and crease resistance in woven fabrics. Resin is an ingredient of coatings which acts as a binder and gives the coating physical properties such as hardness and durability. Resin is:- (1) a general term for solid or semi-solid natural organic substances, usually of vegetable origin and amorphous and yellowish to brown, transparent or translucent, and soluble in alcohol or ether but not in water. (2) Any of a large number of manufactured products made by polymerization or other chemical processes and having the properties of natural resins. / твёрдость (hardness). Найлан^{T3} (Nylon^{TM}). Под Резиной, от Латинского слова Resina, означающее Смола, или под Вулканизатом понимается эластичный материал, образующийся в результате вулканизации каучука. На практике получают из резиновой смеси, содержащей, помимо каучука и вулканизующих агентов, наполнители, пластификаторы, стабилизаторы, порообразователи и другие компоненты. Основная масса резин используется в производстве шин (свыше 50%) и резинотехнических изделий (около 22%). Мировое производство около 20 миллионов тонн в год. Смолы бывают природными и синтетическими. Природные смолы, вырабатываемые некоторыми растениями, являются сложными по химическому составу веществами. Они затвердевают на воздухе, растворяются в органических растворителях и не растворяются в воде. Образуются главным образом тропическими растениями (копайский бальзам, шеллак и другие); в умеренной зоне – преимущественно растениями семейства сосновых (канифоль). Ископаемые природные смолы – копал, янтарь. Природные смолы применяются в производстве клеёв, лаков, политур и другого, но их применение сокращается в связи с их заменой синтетическими продуктами. Синтетические смолы, синтетические полимеры небольшой молекулярной массы (олигомеры), которые в результате отверждения превращаются в неплавкие и нерастворимые продукты. Они используются в производстве герметиков, клеёв, лаков, пластмасс, для отделки бумаги, тканей и другого. Под Камедями или Гумми понимаются высокомолекулярные углеводы, главная составная часть соков и выпотов, выделяемых рядом растений при механических повреждениях и некоторых заболеваниях; содержатся также в некоторых водорослях. Используют в промышленности как клей, стабилизатор эмульсий и суспензий, для производства искусственного волокна и другого, а также в медицине в виде слизей как обволакивающее средство.

RESIN FINISH = СМОЛЯНАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Resin Finish is a finish made of synthetic awsins applied to fabrics to irnpart certain characteristics such as wrinkle and crease resistance. See also Finishing.

RESIN POCKET = СМОЛЯНОЙ КАРМАН (или СМОЛИСТОЕ ВКЛЮЧЕНИЕ) – Resin Pocket:- an apparent accumulation of excess resin in a small, localized section visible on cut edges of molded surfaces, or internal to the structure and nonvisible.

RESIN–RICH AREA = ОБОГАЩЁННЫЙ СМОЛОЙ АРЕАЛ – Resin-Rich Area is a localized area filled with resin and lacking reinforcing material.

RESIN STAIN = СМОЛЯНОЙ РАЗВОД (или СМОЛЯНОЙ ПОТЁК) – Resin Stain:- spots of resin chemical on fabric. Finishing defect. / пятна . Порок или дефект заключительной отделки.

RESIN–STARVED AREA = ОБЕДНЁННЫЙ СМОЛОЙ АРЕАЛ – Resin-Starved Area is a localized area which has insufficient resin, usually identified by low gloss, dry spots, or fiber showing on the surface. / , сухие пятна, или .

RESIN TRANSFER MOLDING = ЛИТЬЁ С ПЕРЕНОСОМ СМОЛЫ – Resin Transfer Molding (RTM) is a process whereby catalyzed resin is transferred or injected into an enclosed mold in which fibrous reinforcement has been placed.

RESIN–TREATED = ПРОПИТАННОЕ СМОЛОЙ – Resin-Treated:- usually, a term descriptive of a textile material that has received an external resin application for stiffening or an internal fiber treatment (especially of cellulosics) to give wrinkle resistance or permanent press characteristics. Resin-Treated:- a finishing process associated with the application of synthetic chemical compounds to the fabric to provide wrinkle-resistance, wash-and-wear characteristics, or an improved hand.

RESIST = РЕЗИСТ (или ЗАЩИТНЫЙ СЛОЙ) – Resist:- in dyeing (and some other processes), something applied to fabric to prevent dye from coloring it. Resists such as waxes used in batik simply prevent dye from gaining access to the fiber. Tie-dyeing and shibori employ what amount to mechanical resist methods to limit dye access. Chemical resists allow the dye to gain physical access to the fiber, but prevent fixation of the dye to the fiber. These include sulfites such as sodium bisulfite, as a resist for vinyl sulfone dyes, citric acid as a resist for many reactive dyes for cellulosic fibers, and sulfamic acid as a resist for acid dyes on wool. / винилсульфоновый краситель (vinyl sulfone dye).

RESISTANCE = РЕЗИСТЕНТНОСТЬ (или СОПРОТИВЛЯЕМОСТЬ, или УСТОЙЧИВОСТЬ) – Resistance is the inherent ability of an Animal or Plant body to resist (oppose, counteract) untoward circumstances such as Insect attack, diseases, toxic agents, or infection.

RESISTANCE = СОПРОТИВЛЕНИЕ – (1) Resistance is a property of an electric conductor by which it opposes a flow of electricity and dissipates electrical energy away from the circuit, usually as heat. Resistance is the characteristic of materials to oppose the flow of electricity in an electric circuit. / Под электрическим Сопротивлением понимается величина, характеризующая противодействие электрической цепи (или её участка) электрическому току. Электрическое сопротивление обусловлено преобразованием электрической энергии в другие виды энергии. При необратимом преобразовании, преимущественно в теплоту, электрическое сопротивление называют активным сопротивлением. Электрическое сопротивление, обусловленное передачей энергии электрическому или магнитному полю и обратно, называют реактивным сопротивлением.

(2) Support and Resistance:- the foundation of all classical technical analysis is support and resistance: the behavior of buyers and sellers at key price levels. Trend theory is based on the performance of price at key support and resistance levels. Chart patterns similarly identify the behavior of buyers in relation to support and resistance. A resistance level is the price level at which sellers are expected to enter the market in sufficient numbers to take controlfrom buyers. When price makes a new High and then retreats, sellers who missed the previous peak will be inclined to sell when price returns to that level. Afraid of missing out a second time, they may enter the market in numbers sufficient to overwhelm buyers. The resulting correction will reinforce market perceptions that price is unlikely to move higher and establish a resistance level. In technical trading, a price area where new selling will emerge to dampen a continued rise. A price level at which there is a large enough supply of a stock available to cause a halt in an upward trend and turn the trend down. Resistance levels indicate the price at which most investors feel that prices will move lower. A price area where new selling will emerge to dampen a continued rise. In technical analysis, a price area which is deemed to contain prices at or below. This may be because of previous prices rising to and falling back down from the area or from the use of resistance lines drawn on a graph. Various mathematical formulas are also used to predict areas of resistance. Resistance is where sellers will take control of prices and prevent them from rising further. A level above which prices have had difficulty penetrating. An area of price advance failure where sellers have previously capped a rally. This level will continue to encourage selling until it can be penetrated, upon which the broken resistance will become support. A price point at which prices hit an invisible barrier. The opposite of Support. Resistance:- price levels where sellers have shown a better-than-average willingness to sell. In technical analysis, the price level where selling is expected to emerge. / В техническом анализе биржевых рынков, под Сопротивлением подразумевается некая горизонтальная линия в графике колебания цен, проводимая на уровне предыдущих важных максимумов и формирующая верхнюю границу торгового диапазона. В установившемся торговом диапазоне рынок обычно встречает сопротивление на уровне предыдущих важных максимумов, то есть на его верхней границе. При этом у самой границы может быть определёна некая зона сопротивления, отгораживаемая ещё одной параллельной линией и определяемая по концентрации предыдущих относительных минимумов и максимумов.

RESISTANCE = СОПРОТИВЛЯЕМОСТЬ – Resistance:- the ability to tolerate conditions harmful to other strains of the same Species. Can refer to Cotton Varieties bred more tolerant to pests or diseases, or Weeds and Insects resistant to pesticides. See also Pesticide Resistance. / Виды (Species).

RESISTANCE LEVEL = УРОВЕНЬ СОПРОТИВЛЕНИЯ – A Resistance Level is the price level at which sellers are expected to enter the market in sufficient numbers to take control from buyers. When price makes a new High and then retreats, sellers who missed the previous peak will be inclined to sell when price returns to that level. Afraid of missing out a second time, they may enter the market in numbers sufficient to overwhelm buyers. The resulting correction will reinforce market perceptions that price is unlikely to move higher and establish a resistance level. Resistance levels, once penetrated, frequently become support levels and vice versa. stockholders who sell when price approaches a resistance level will be disappointed if price penetrates the level and continues to rise. They will be inclined to buy if price returns to near the support level, fearing that they may miss out a second time. The resistance level thus becomes entrenched as a support level. In technical analysis, a Resistance Level is the level at which a price trend is halted either temporarily or totally. See also Ceiling, and Floor. The Resistance Level is stronger every time that price respects the resistance line and/or if high volumes are traded at that level.

RESISTANCE LINES = ЛИНИИ СОПРОТИВЛЕНИЯ – In visual analysis, Resistance Lines are drawn by connecting the tops of prices on a chart and then extending the lines into the future. These areas a deemed to provide resistance to price moving up and above the support line. / В техническом анализе биржевых рынков, Линии Сопротивления вырисовываются на графиках посредством соединения максимальных значений цен с дальнейшим их проецированием на будущий период. Считается, что эти зоны обеспечивают сопротивление при движении цен вверх и выше линии поддержки.

RESISTANCE MANAGEMENT PLAN = ПЛАН УПРАВЛЕНИЯ РЕЗИСТЕНТНОСТЬЮ – Resistance Management Plan (RMP):- growers of Bollgard 3 Cotton and Bollgard II Cotton are required to practice preventative resistance management as set out in the Bollgard II Resistance Management Plan (RMP). Compliance with the RMP is required under the grower terms and conditions of the Bollgard II Technology User Agreement and under the conditions of registration of the Bollgard II technology. / .

RESISTANCE RISK MANAGEMENT PLAN = ПЛАН УПРАВЛЕНИЯ РИСКОМ РЕЗИСТЕНТНОСТИ – Resistance Risk Management Plan (RRMP) is part of Monsanto's stewardship protocol for reporting compliance with its Bollgard 3 and Bollgard II product registration to the Australian Pesticides and Veterinary Medicines Authority (APVMA). An RRMP is a mitigation plan that must be in place for every incidence of grower noncompliance with the Resistance Management Plan (RMP). Designed to protect the longevity of the technology for the entire industry, RRMPs are aimed at mitigating resistance development risk resulting from a non-compliance with the RMP. / Монсэнто (Monsanto).

RESISTANCE TO PESTICIDES = УСТОЙЧИВОСТЬ К ПЕСТИЦИДАМ (или РЕЗИСТЕНТНОСТЬ К ПЕСТИЦИДАМ) – Resistance To Pesticides is the ability of populations of pests to survive doses of a pesticide which are normally lethal.

RESISTANCE ZONE = ЗОНА СОПРОТИВЛЕНИЯ – Resistance:- a price level where selling pressure has overcome buying pressure and prices turn downward. Commonly thought of as indicating oversold or overbought conditions. Usually identified on a chart by a price high or series of high points, above the market, where prices previously met resistance or ran into resistance and stopped rising. Resistance Zone consists of minimum market rates that are difficult to penetrate in an upward direction due to chart technical considerations. Price level or zone above the current price range, where combined selling power is sufficient to halt a further price advance. / В техническом анализе биржевых рынков, Зона Сопротивления – это диапазон цен, отгораживаемый двумя параллельными линиями и определяемый по концентрации предыдущих относительных минимумов и максимумов в пределах общей границы сопротивления.

RESISTANT = РЕЗИСТЕНТНОЕ (или УСТОЙЧИВОЕ) – Resistant:- possessing the ability to resist or counteract.

RESISTANT = СОПРОТИВЛЯЕМОСТЬ – Resistant:- the ability to tolerate conditions harmful to other strains of the same species. Can refer to Cotton Varieties bred more tolerant to pests or diseases, or weeds and insects resistant to pesticides. See also Pesticide Resistance. / Способность переносить условия, пагубные для иных Разновидностей этих же Видов. Может относиться к выведенным Селекционным Сортам Хлопчатника с большей переносимостью воздействия вредных Насекомых или болезней, или сопротивляемости Сорняков и Насекомых к пестицидам. Смотрите также Сопротивляемость Пестицидам (Pesticide Resistance).

RESISTANT CHECK = УСТОЙЧИВАЯ ПРОВЕРКА – Resistant Check:- xxxxx. See also Standard Check.

RESISTANT POPULATIONS = РЕЗИСТЕНТНЫЕ ПОПУЛЯЦИИ (или НЕВОСПРИИМЧИВЫЕ ПОПУЛЯЦИИ, или УСТОЙЧИВЫЕ ПОПУЛЯЦИИ) – Resistant Populations:- whereby the repeated use of one herbicide, or other herbicides with the same mode of action, has removed susceptible plants but has allowed the survivors to grow and multiply, producing a resistant population of plants.

RESISTANT VARIETY = УСТОЙЧИВАЯ РАЗНОВИДНОСТЬ (или УСТОЙЧИВЫЙ СОРТ) – Resistant Variety:- the infection process, colonisation and/or the production of spores by the pathogen is impeded by some aspect of the host plant's anatomy and/or physiology. Plant resistance may be manifest as smaller spots, fewer spots/leaf, reduced spore production, etc. Resistant Variety is a Variety which has genetic resistance to an adverse factor or pest. It is genetically able to suppress or retard the activity of a pathogen or Insect. A Variety which has genetic resistance to or tolerance for all adverse factors or Pests. / Процесс заражения, колонизация и/или производство спор патогенном сдерживается некоторыми аспектами анатомии и/или физиологии растения хозяина. Сопротивляемость растений может быть выражена в виде маленьких пятен, малочисленных пятен/листа, уменьшенного производства спор и тому подобного.

RESIST DYEING = ПРОЧНОЕ КРАШЕНИЕ (или КРАШЕНИЕ РЕЗЕРВОВ) – Resist Dyeing is a widely used method of applying colors or patterns to fabric. A substance that is impervious to the dye blocks its access to certain areas of the fabric, while other parts are free to take up the dye color. Tie-dyeing involves pinching areas of cloth and tying them tightly with thread before dyeing. Removal of the thread reveals small circular marks in the original fabric color. Complex patterns can be built up by repeating the process using another dye color. In applied resist-dyeing, the pattern is marked on to the cloth with a substance such as paste or wax. After dyeing and removal of the resist substance, the pattern is revealed in the original fabric color. This process can be repeated several times. See also Dyeing, and Reserve Dyeing. Resist Dyeing (Resist-Dyeing) is a term for a number of traditional methods of dyeing textiles with patterns. Methods are used to 'resist' or prevent the dye from reaching all the cloth, thereby creating a pattern and ground. The most common forms use wax, some type of paste, or a mechanical resist that manipulates the cloth such as tying or stitching. Another form of resist involves using a chemical agent in a specific type of dye that will repel another type of dye printed over the top. The most well-known varieties today include Tie-Dye and Batik. / строчка с защипами (pinching) – порок.

RESISTOR = РЕЗИСТОР – Resistor is two-terminal electric circuit component that offers opposition to an electric current. Resistors are normally designed and operated so that, with varying levels of current, variations of their resistance values are negligible. See also Resistance. / Под Резистором понимается элемент электрической цепи (в виде законченного изделия), основное функциональное назначение которого – оказывать известное активное сопротивление электрическому току с целью регулирования (или ограничения) силы тока и напряжения. В радиоэлектронных устройствах резисторы нередко составляют более половины (до 80%) всех деталей. Некоторые резисторы применяют для измерения температуры (у резистора такого типа ярко выраженная зависимость сопротивления от температуры – терморезистор) или в качестве эталона сопротивления – меры. Выпускаемые промышленностью резисторы характеризуются номинальным значением сопротивления (от 0.1 Ом до 1 ТОм), допустимым отклонением от него (от 0.25 до 20%) и максимальной мощностью рассеяния (обычно от сотых долей до сотен Вт). По материалу токопроводящей части (резистивного элемента) резистора и его конструктивному исполнению различают металлические, полупроводниковые (ПП), керметные, проволочные, плёночные и другие резисторы. Существуют резисторы как с постоянным сопротивлением, так и с переменным; значение переменного сопротивления может изменяться в результате механического перемещения движка (реостат) либо вследствие нелинейной зависимости между силой тока и напряжением (например, варистор). Под Резистором, от Латинского слова Resisto, означающее Сопротивляюсь, понимается радио- или электротехническое изделие, основное функциональное назначение которого оказывать известное активное сопротивление электрическому току. Резисторы характеризуют номинальным значением сопротивления (0.1 Ом – 10 ТОм), допустимым отклонением от него (0.25–20%) и максимальной мощностью рассеяния (от сотых долей Вт до нескольких МВт).

RESIST PRINTING = ПЕЧАТАНИЕ РЕЗЕРВОВ (или ПРОЧНОЕ ПЕЧАТАНИЕ, или ПРОЧНАЯ НАБИВКА) – Resist Printing is a printing method in which the design can be produced:- (1) by applying a resist agent in the desired design, then dyeing the fabric, in which case, the design remains white although the rest of the fabric is dyed; or (2) by including a resist agent and a dye in the paste which is applied for the design, in which case, the color of the design is not affected by subsequent dyeing of the fabric background. Resist Printing is a printing similar to resist dyeing. In resist printing, the fabric is coated with a paste that protects it from colors in certain areas. See also Printing. Resist Printing, any of various methods of coloring cloth in a pattern by pretreating designed areas to resist penetration by the dye. To obtain a two-color pattern on goods already dyed in one color, a dye paste is applied in the desired design; the paste contains a substance resistant to a second dye, which is then applied to the cloth, developing color only in the areas not covered by the paste. Batik and tie-dyeing are examples of resist printing. In stencil printing, the design parts not intended to take color are covered with paper, woven fabric, or metal while the dye is passed over the surface. Resist Printing is a method of printing textiles by roller printing a pattern in resist paste on a white fabric, placing the fabric in a dye bath, and subsequently removing the resist to leave a white pattern on a colored ground. / Резервная Печать – получение белого или цветного узора на текстильном материале. Производится перед крашением. При белой резервной расцветке на ткань наносится печатный резервирующий состав, содержащий химические вещества (например, воск), препятствующие окрашиванию ткани в местах нанесения рисунка. Для получения цветного узора в резервирующий состав вводится краситель.

RESIST SALT = СТОЙКАЯ СОЛЬ – Resist Salt is an oxidizing agent added to dye baths or print pastes to prevent reduction damage to dyes. Under some conditions, especially where air is excluded, such as in steam fixation of dye, some of the dye may be decomposed by reduction (often the fiber itself acting as the reducing agent). Resist salts, such as sodium mnitrobenzene sulfonate, generally used in alkaline conditions, or sodium chlorate, generally used in acid conditions, may be added to prevent this. Resist salts are also sometimes applied to fabric before printing with discharge pastes to protect the ground color dye and/or improve the sharpness of edges of the discharge. This term is a bit misleading:- don't confuse resist salts with chemicals used to keep dye from fixing to the fiber. / или загусткам (print pastes) щелочное (Alkaline).

RESIST STREAKS = СТОЙКИЕ ЗАТАСКИ (или XX ПОЛОСКИ, или XX ЧЕРТЫ) – Resist Streaks:- Fabric:- satin underwear fabric; Construction:- (i) Count:- 250 x 104; (ii) Warp:- 55/20 bright acetate rayon; (iii) Filling:- 75/30/35 bright viscose rayon; Finish:- plain dyed navy. Defect:- short sections of the viscose-rayon filling resisted dyeing. Analysis:- it was impossible to eliminate the resist spots on the rayon yarn by any means which would not be harmful to the acetate. Although chemical tests were not made to try to identify the material responsible for the dye resist, it was eventually ascertained that the mill had purchased this yarn with the understanding that it was of inferior quality and could be used for white or light shades only. The yarn manufacturer had knowledge of this defect, which he attributed to insoluble salt deposits. The converter to whom the gray goods had been sold, however, ignored the mill's classification of 'for white only' and had attempted to dye a number of pieces in dark shades at his own risk. Under the circumstances, neither the weaver nor the yarn supplier would assume any responsibility for this defect. / Уточина:- 75/30/35 . Затаск от печати, не более 2 сантиметров (см). Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

RESOLUTION = РЕЗОЛЮЦИЯ – Resolution is the formal statement of any item of business that has been voted upon. / Под Резолюцией, от Латинского слова Resolutio, означающее Разрешение, понимается:- (i) решение, принимаемое собранием, съездом, конференцией; (ii) надпись на служебном документе, сделанная должностным лицом и содержащая принятое им решение.

RESOURCE = РЕСУРС – In reference to electricity, Resource is the amount of available generating capacity, or purchased power. / По отношению к электричеству, количество свободной генерируемой мощности или приобретённой электроэнергии.

RESOURCES = РЕСУРСЫ – Resources are the available material means for pursuing human goals or desired objectives. In national accounting, available goods, capital or services. Resources:- estimated quantities of oil and gas resources are recorded under Chevron's 6P system, which is modeled after the Society of Petroleum Engineers' Petroleum Resource Management System, and include quantities classified as proved, probable and possible reserves, plus those that remain contingent on commerciality. Unrisked resources, unrisked resource base and similar terms represent the arithmetic sum of the amounts recorded under each of these classifications. Recoverable resources, potentially recoverable volumes and other similar terms represent estimated remaining quantities that are expected to be ultimately recoverable and produced in the future, adjusted to reflect the relative uncertainty represented by the various classifications. These estimates may change significantly as development work provides additional information. At times, original oil in place and similar terms are used to describe total hydrocarbons contained in a reservoir without regard to the likelihood of their being produced. All of these measures are considered by management in making capital investment and operating decisions and may provide some indication to stockholders of the resource potential of oil and gas properties in which the company has an interest. / Шеврон Корпорэйшэн (Chevron Corporation). В национальном бюджетном процессе, доступные товары, капитал или услуги. Под Ресурсами, от Французского слова Ressource, означающее Вспомогательное Средство, понимаются денежные средства, ценности, запасы, возможности, источники средств, доходов. Например, природные ресурсы или экономические ресурсы.

RESOURCES AND USES = РЕСУРСЫ И РАСХОДОВАНИЕ – The term Resources refers to the side of the current accounts where transactions which add to the amount of economic value of a unit or sector appear. For example, wages and salaries are a resource for the unit or sector receiving them. Resources are by convention put on the right side, or at the top of tables arranged vertically. The left side (or bottom section) of the accounts, which relates to transactions that reduce the amount of economic value of a unit or sector, is termed uses. To continue the example, wages and salaries are a use for the unit or sector that must pay them.

RESPIRABLE FIBER–SHAPED PARTICULATES = ВДЫХАЕМЫЕ ЧАСТИЧКИ В ФОРМЕ ВОЛОКОН – Respirable Fiber-Shaped Particulates (RFP) are airborne particulates fulfilling the following dimensional conditions:- length > 5 μm and diameter < 3 μm and length/diameter ratio of > 3:1.

RESPIRATION = РЕСПИРАЦИЯ (или ДЫХАНИЕ) – Respiration is a process of releasing energy by oxidizing molecules such as glucose to carbon dioxide. Respiration produces useful reactive molecules, such as ATP (adenosine triphosphate) which activates many cellular processes by transfer of its terminal phosphate group. Respiration is a breathing. Even after it has been harvested, fruit undergoes ripening processes. Bananas, for instance, absorb O_2 from the ambient atmosphere, convert starch to sugar and release CO_2, ethylene, water vapor and heat. This ripening process is also known as Respiration. Respiration is:- (i) the process by which living organisms obtain energy through oxidation of carbohydrates to produce carbon dioxide; (ii) the metabolic process by which a plant (or animal) oxidizes its food and provides energy for assimilation of breakdown products; and (iii) the process by which cells or tissues obtain oxygen. / Под Респирацией, от Латинского слова Respiro, означающее Выдыхаю или Дышу, понимается . Под Дыханием понимается совокупность процессов, обеспечивающих поступление в организм кислорода и удаление углекислого газа (внешнее дыхание), а также использование кислорода клетками и тканями для окисления органических веществ с освобождением энергии, необходимой для их жизнедеятельности (так называемое клеточное, или тканевое, дыхание). У Одноклеточных Животных и Низших Растений обмен газов при дыхании происходит путём диффузии через поверхность клеток, у Высших Растений – через межклетники, пронизывающие всё их тело. У Многоклеточных Животных (и Человека) внешнее дыхание осуществляется специальными органами дыхания, а тканевое – обеспечивается кровью.

RESPIRATION HEAT = ТЕПЛОТА РЕСПИРАЦИИ – Respiration Heat is a heat produced by fruit and vegetables during ripening (fruit respiration); depends on the level of ripeness of the product and the ambient temperature (and possibly the composition of the atmosphere). Respiration Heat is a heat which is released during respiration.

RESPIRING GOODS = РЕСПИРИРУЮЩИЕ ТОВАРЫ – Respiring Goods are generally goods of vegetable origin, for example fruits, for which ripening or degradation processes are taking place. These take air (or gases) from the atmosphere surrounding them and give off CO_2, water vapor and heat to their environment.

RESPONSE = ОТЗЫВЧИВОСТЬ (или ОТВЕТ) – Response is the reaction of a plant or group of plants to a treatment, e.g., application of fertilizer, stimulus, or water loss. / Отзывчивость или Чувствительность на обработку.

RESTATED ARTICLES OF INCORPORATION = ПЕРЕСМОТРЕННЫЕ ПОЛОЖЕНИЯ ОБ ИНКОРПОРАЦИИ (или ПЕРЕСМОТРЕННЫЙ УЧРЕДИТЕЛЬНЫЙ ДОГОВОР) – In the United States, Restated Articles Of Incorporation is the document that combines all currently operative provisions of a corporation's articles of incorporation and amendments thereto.

RESTING ORDER = ОЖИДАЮЩЕЕ РАСПОРЯЖЕНИЕ (или ОЖИДАЮЩЕЕ ПОРУЧЕНИЕ) – Resting Order is a limit order to buy at a price below or to sell at a price above the prevailing market that is being held by a floor broker. Such orders may either be day orders or open orders. An order away from the market, waiting to be executed. Resting Order is an order to buy (sell) at a price below (above) the current market price. Alternative term for an Order Good-Till-Cancelled.

RESTITCHED SEAMS = ПЕРЕСТЁГАННЫЕ ШВЫ – Restitched Seams:- where there is a 'splice' on the stitch line. If this occurs on Topstitching, then the seam does not appear to be 1st quality merchandise. Caused by (i) thread breaks or thread run-out during sewing; or (ii) cut or broken stitches during a subsequent treatment of the finished product (i.e. stone washing). Minimizing restitched seams:- (1) use a better quality sewing thread; this may include going to a higher performance thread designed to minimize sewing interruptions; (2) insure proper machine maintenance and sewing machine adjustments; (3) make sure sewing machines are properly maintained and adjusted for the fabric and sewing operation; and (4) observe sewing operators for correct material handling techniques. Fabrics defect.

RESTORER GENE = ГЕН ВОССТАНОВИТЕЛЬ – Restorer Gene is the gene that restores fertility to an otherwise sterile Plant.

RESTORER LINE = ЛИНИЯ ВОССТАНОВИТЕЛЯ – Restorer Line is a pollinator Variety used to pollinate a male sterile line to produce F_1 progeny which are male fertile and thus produce seeds on selfing. An inbred line that permits restoration of fertility to the progeny of male sterile lines to which it is crossed. / В генетике под Линией, от Латинского слова Linea, понимаются

размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

RE–STOW = ПЕРЕУКЛАДКА – Re-Stow:- a container which requires unloading and reloading to the same vessel during the stevedoring sequence of events. / Контейнер, который требует выгрузки и обратной загрузки на то же самое судно в течение последовательности событий перевалочных работ.

RESTRAINT SYSTEMS = СИСТЕМЫ СДЕРЖИВАНИЯ (или ОГРАНИЧИТЕЛЕЙ, или ЗАМЕДЛЕНИЯ) – Restraint Systems:- an end use for textile fibers; restraint systems are devices such as air bags, seat belts, and shoulder harnesses for passenger protection in automobile, trucks, airplanes, etc.

RESTRICTED ARTICLES = ОГРАНИЧЕННЫЕ ИЗДЕЛИЯ (или ИЗДЕЛИЯ С ОГРАНИЧЕНИЯМИ) – Restricted Articles:- the articles which are handled only under certain conditions. / Изделия, которые обрабатываются только при определённых условиях.

RESTRICTED ARTICLES GUIDE = ПОСОБИЕ ПО ОГРАНИЧЕННЫМ ИЗДЕЛИЯМ (или ПОСОБИЕ ПО ИЗДЕЛИЯМ С ОГРАНИЧЕНИЯМИ) – Restricted Articles Guide (RAG) is an International Air Transport Association(IATA) publication on the rules and regulations governing the packing, markings, labelling of hazardous goods, and their conditions of acceptance and carriage by airfreight.

RESTRICTED ARTICLES GUIDE DECLARATION = ДЕКЛАРАЦИЯ ПО ПОСОБИЮ ПО ОГРАНИЧЕННЫМ ИЗДЕЛИЯМ (или ДЕКЛАРАЦИЯ ПО ПОСОБИЮ ПО ИЗДЕЛИЯМ С ОГРАНИЧЕНИЯМИ) – RAG Declaration is a declaration, in duplicate, must be completed and signed by the supplier (forwarders are not authorized to sign), describing in details the goods dispatched and certifying that consignment complies in every respect with the regulations; one copy travels with the AWB on the carrying plane.

RESTRICTED CARGO = ОГРАНИЧЕННЫЙ ГРУЗ (или ГРУЗ С ОРГАНИЧЕНИЯМИ) – Restricted Cargo is the hazardous goods, or goods classified as such, admitted for carriage under special rules and regulation only. See also IMO (short for the International Maritime Organization) Code and RAG (short for the Restricted Articles Guide).

RESTRICTED ENDORSEMENT = ОГРАНИЧЕННЫЙ ИНДОССАМЕНТ (или ОГРАНИЧИТЕЛЬНЫЙ ИНДОССАМЕНТ) – Restricted Endorsement is an indorsement (or sometimes, endorsement) is the legal act authorizing the transfer of a financial instrument in accordance with the terms of the instrument. For example, when the person to whom a check is made payable signs the check, you are authorizing the entity making the payment (e.g., a bank) to pay the check proceeds to you. If the payee does not want to receive the proceeds immediately, then he or she may indorse the check over to the bank in which the payee has an account, and direct the bank to deposit the funds into the account of his or her choosing. A restricted indorsement places restrictions on how the next holder can apply the funds. For example, if a person wants to deposit the proceeds of a check into a specific account, the payee may indorse the check with the restriction 'for deposit only into my XXXXXXXXXXXX account'. Without the restrictive indorsement, the paying bank can theoretically issue cash to the account holder, or credit the account holder's account or accounts of the bank's choosing (although as a practical matter, this is generally not done). The endorser of an instrument bearing a 'not to order' clause is liable to the direct endorsee only and not to persons who (despite said clause) obtain it through subsequent endorsement. Restrictive Endorsement is an endorsement which limits further negotiability of a negotiable instrument. For example, the words 'accounts payee Only' on the face (in the United Kingdom) or 'For deposit only' on the back (in the United States) of a check block its cashing over the counter and (generally) endorsement to another party. Also called Endorsement Limiting Further Endorsement. / Когда лицо, берущее обязательство по данному векселю или чеку, оставляет за собой право по данному документу (векселю или чеку). Документ (вексель) с надписью, которая исключает передачу его другому лицу. Ограничительный Индоссамент (restrictive endorsement) – индоссамент, в результате которого вексель прекращает своё существование в качестве оборотного финансового инструмента. Типовая формулировка ограничительного индоссамента:- 'Заплатить только лицу ...'. Ограничительный Индоссамент, ограничительная передаточная надпись. Подпись на оборотной стороне чека, определяющая специальные условия перевода суммы, указанной на чеке. Наиболее распространённым типом ограничительного индоссамента является надпись 'только для вклада', означающая, что чек должен быть депонирован на счёт предъявителя чека (получателя платежа) и не может быть обналичен. Ограничительный Индоссамент – индоссамент на передаточном векселе, ограничивающий право индоссата на его переучёт. Ограниченный Индоссамент:- когда лицо, берущее обязательство по данному векселю, чеку, оставляет за собой право по данному документу (чеку, векселю).

RESTRICTED ENTRY INTERVAL = ОГРАНИЧИВАЕМЫЙ ИНТЕРВАЛ ВХОДА – Restricted Entry Interval is the mandatory period of time a person must wait between application of a chemical and entry to the treated area.

RESTRICTED SECURITIES = ОГРАНИЧЕННЫЕ В ОБРАЩЕНИИ ЦЕННЫЕ БУМАГИ – (1) Restricted Securities:- shares of stock in a corporation that are not freely transferable. See also Stock Legend.

(2) Restricted Securities are securities which were originally sold in private placements and which have not been registered under the Securities Act of 1933 (the 1933 Act). Such securities generally have been considered illiquid by the staff of the Securities and Exchange Commission (SEC), since such securities may be resold only subject to statutory restrictions and delays or if registered under the 1933 Act. Securities not registered with the US Securities And Exchange Commission and therefore of limited negotiability only. A security not registered with the Securities and Exchange Commission under the 1933 Securities Act and, therefore, may not be sold publicly in the United States. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

(3) Securities that, in Australian Securities Exchange's (ASX's) opinion, should be treated as restricted securities. Example:- ASX is likely to treat as restricted securities, those securities held by a current director or promoter (or their associates) in an entity that has been removed from the official list that were on issue at the time the entity was removed. ASX is also likely to restrict such securities sold by a current director, promoter or their associates. Securities issued by an entity in consideration of, or in connection with, its (or a related party's) acquisition of any of the following:- (i) an interest in a mining exploration area or similar tenement or interest; (ii) an interest in intangible property that is substantially speculative or unproven, or has not been profitably exploited for at least 2 years, and which entitles the entity to develop, manufacture, market or distribute the property; (iii) an interest in an asset which, in ASX's opinion, cannot readily be valued; and (iv) an interest in an entity the substantial proportion of whose assets (held directly, or through a controlled entity) is property of the type mentioned in this paragraph.

(4) Securities issued by an entity in consideration of, or in connection with, a service provided to the entity (or to a related party) in relation to either of the following:- (i) the entity's formation, promotion, or listing; or (ii) the entity's offering of securities to the public.

(5) Securities issued for cash (or equivalent) if the person received the cash (or equivalent) for the assets or services mentioned in (3) or (4).

(6) Securities issued to a holder of restricted securities in substitution for them as part of a reorganization of capital.

(7) Securities issued under a bonus issue in relation to restricted securities.

(8) Securities issued on the conversion of restricted securities.

(9) Securities that partly paid restricted securities become when the holder pays any of the outstanding amount.

RESTRICTED STOCK UNIT = ОГРАНИЧЕННЫЕ ПАЕВЫЕ ДОЛИ – Restricted Stock Unit (RSU):- RSUs are sometimes used in place of stock options insofar as they achieve similar purposes, i.e. providing a benefit to the holder in the event of a stock appreciation. An RSU is a grant of company shares, but the shares are not issued at the time of the grant. After an RSU holder meets any vesting (or performance) requirements, the company then issues the shares, or possibly a cash equivalent. Many prefer them to options because of preferred tax treatment and they more closely mirror true ownership of shares. RSU plans vary from company to company.

RESTRICTED SURPLUS = ОГРАНИЧИВАЕМЫЙ ИЗЛИШЕК – In the United States, a portion of Retained Earnings not legally available for the payment of dividends. Among the circumstances giving rise to such restriction:- dividend arrearages in Cummulative Preferred stock, a shortfall in the minimum Working Capital ratio specified in an Indenture, or simply a vote by the Board of Directors. Also called Restricted Retained Earnings. Also known as Undistributable Reserves in the United Kingdom. Restricted Surplus is part of the Dividends, Earnings and Investor Relations subjects. Restricted Surplus is a portion of a company's retained earnings not legally available for dividend payment.

RESTRICTED TRANSFERABILITY (OF SHARES) = ОГРАНИЧЕННАЯ ПЕРЕВОДИМОСТЬ (АКЦИЙ) – Restricted Transferability (Of Shares) is a restriction on the transferability of shares as defined in the issuing company's articles of association.

RESTRICTED–UNIVERSE CENSUS = ПЕРЕПИСЬ ОГРАНИЧЕННОГО ПРОСТРАНСТВА – Restricted-Universe Census:- this is the complete enumeration of data from a specifically defined subset of entities including, for example, those that exceed a given level of sales or generator nameplate capacity. / полный пересчёт данных от .

RESTRICTION = РЕСТРИКЦИЯ (или ОГРАНИЧЕНИЕ) – (1) In the US patent law, a Restriction:- if two or more independent and distinct inventions are claimed in a single application, the examiner may require the applicant to elect (designate) a single invention to which the claims will be restricted (limited to). This requirement is known as a Requirement For Restriction (also known as a Requirement For Division). Such requirement will normally be made before any action on the merits; however, it may be made at any time before final action (final rejection). / Под Рестрикцией, от позднелатинского слова Restrictio, означающее Ограничение, понимается:- (1) ограничение производства, продажи и вывоза (или экспорта) товаров, проводимое монополиями (международными картелями) с целью взвинчивания цен и получения монопольных прибылей; или (2) ограничение банками и государством размеров кредита в целях предотвращения утечки золотых запасов за границу, избежания краха банка. Существует также Кредитная Рестрикция.

(2) Restriction is a phytosanitary regulation allowing the importation or movement of specified commodities subject to specific requirements. / привоз (importation).

RESTRICTION ENDONUCLEASE = ЭНДОНУКЛЕАЗА РЕСТРИКЦИИ (или РЕСТРИКЦИОННАЯ ЭНДОНУКЛЕАЗА, или РЕСТРИКТАЗА, или ЭНДОНУКЛЕАЗА ОГРАНИЧЕНИЯ) – Restriction Endonuclease is an enzyme that is able to cleave DNA at or near the point where a specific base sequence occurs. / Рестрикция, от позднелатинского слова Restrictio, означающее Ограничение, .

RESTRICTION FRAGMENT LENGTH POLYMORPHISM = ПОЛИМОРФИЗМ РЕСТРИКЦИОННЫХ ФРАГМЕНТОВ (или ПОЛИМОРФИЗМ ОГРАНИЧЕНИЯ ДЛИНЫ ФРАГМЕНТА) – Restriction Fragment Length Polymorphism (RFLP) is a difference in sequence between samples of DNA detected as differing fragment sizes produced after treatment of the DNAs with a specific restriction endonuclease. / Рестрикция, от позднелатинского слова Restrictio, означающее Ограничение, .

RESTRICTION MAP = РЕСТРИКТАЗНАЯ КАРТА (или КАРТА ОГРАНИЧЕНИЯ) – Restriction Map is a diagrammatic representation of a linear or circular DNA molecule which shows the positions at which one or more restriction enzymes would make cuts. / Рестрикция, от позднелатинского слова Restrictio, означающее Ограничение, .

RESTRICTION SITE = САЙТ РЕСТРИКЦИИ (или САЙТ ОГРАНИЧЕНИЯ, или УЧАСТОК ОГРАНИЧЕНИЯ, или РЕСТРИКТАЗНЫЙ САЙТ) – Restriction Site is a DNA base sequence recognized by a restriction endonuclease. / Сайт Рестрикции, от позднелатинского слова Restrictio, означающее Ограничение, – нуклеотидная последовательность, узнаваемая и расщепляемая рестрикционной эндонуклеазой.

RESTRICTIVE BUSINESS PRACTICES = ОГРАНИЧИТЕЛЬНЫЕ ДЕЛОВЫЕ ПРАКТИКИ – Restrictive Business Practices:- actions in the private sector, such as collusion among the largest international suppliers, designed to restrict competition so as to keep prices relatively high. Agreement made between two companies that aims to make restrictions regarding the supply of their goods, on such things as price, quantities, processes, geographical area, etc. On the whole, restrictive practices are assumed by the law to be against the public interest.

RESTRIKE = ПЕРЕВЫПУСК – Restrike is a modern replica of previously issued coins. Governments and their mints can choose to restrike a previous issue rather than introduce new coinage. A coin or medal freshly minted from an original die at a time after the first issue. An official Restrike is a genuine coin struck by the original mint, but with a retrospective date. The word restrike is often euphemistically and dishonestly used for fakes. To economise on the use of dies, it is common practice at most mints to keep using the previous year's dies into the new year, and this is not normally regarded as restriking. To be considered as a restrike, there would normally be a noticeable gap in production, or a formal announcement that the date would be frozen on an indefinite basis.

RESUMPTION = ВОЗОБНОВЛЕНИЕ (или ПРОДОЛЖЕНИЕ) – Resumption is the reopening the following day of specific futures and options markets that also trade during the evening session at the Chicago Board of Trade. / в Чикагской Палате Торговли (или в Чикагском Табло Торговли, если быть более точными).

RESURGENCE = ВОЗРОЖДЕНИЕ (или ВОЗВРАЩЕНИЕ К АКТИВНОЙ ЖИЗНЕДЕЯТЕЛЬНОСТИ) – Resurgence is the occurrence of significantly more damage or more Insects in an insecticide-treated crop after insecticide application.

RETAIL = РОЗНИЦА (или РОЗНИЧНАЯ ТОРГОВЛЯ) – (1) Retail:- a sale of goods or services to the general public. / Продажа товаров и услуг обычному населению. Под Розничной Торговлей понимается часть внутренней торговли, реализующая товары и услуги населению. Сеть розничной торговли:- универмаги, универсамы, специализированные магазины, предприятия общественного питания и так далее. Розничная Торговля, составная часть внутренней торговли, заключительная фаза обращения предметов личного потребления, где происходит реализация товаров и услуг в обмен на денежные доходы населения. В социалистических странах розничная торговля призвана обеспечивать комплексное и качественное обслуживание населения, способствовать рациональному использованию внерабочего времени трудящихся. В бывшем Союзе Советских Социалистических Республик (СССР) основные социальные формы розничной торговли – государственная и кооперативная торговля, где всё более отчётливо проявлялись общие для социалистической торговли закономерности (планомерная организация и концентрация хозяйственной деятельности, централизация управления) и тенденции развития (рациональное сочетание универсализации и специализации и другие). В систему розничной торговли входила также колхозная торговля. Розничная торговля осуществлялась в городах в основном специальными государственными торгующими организациями Министерства Торговли СССР и Союзных республик, на селе – потребительской кооперацией; имела разветвлённую сеть предприятий:- универмаги, универсамы, специализированные магазины, палатки, киоски и так далее. В 1973 насчитывалось около 700 000 предприятий государственной и кооперативной торговли с общим количеством занятых свыше 4 миллионов человек. Всё большее распространение получали торговля по заказам населения, развозная торговля, продажа товаров в кредит, посылочная торговля и другая. Внедрялись прогрессивные формы и методы торговли (самообслуживание и другое), высокопроизводительное торговое оборудование, совершенствовалась технология доставки и продажи товаров, применялись современные методы и средства управления (автоматизированные системы управления и так далее). В 1974 розничный товарооборот государственной и кооперативной торговли СССР (включая общественное питание) возрос более чем в 8 раз по сравнению с 1940 и составил 195 миллиардов Рублей. Розничная торговля зарубежных социалистических стран наряду с общими принципами организации имела свои особенности. В Германской Демократической Республике (ГДР), Венгерской Народной Республике (ВНР), Народной Республике Болгария (НРБ) и ряде других стран получили развитие объединения государственных универмагов и крупных предприятий кооперативной торговли. В развитых капиталистических странах розничная торговля производится крупными частными фирмами и средними и мелкими торговцами. 1950–70-е отмечены интенсивным процессом монополизации розничной торговли, концентрации и централизации торгового капитала, тесно связанного с промышленным и банковским капиталом. Высокого уровня развития достигли цепные многофилиальные системы, супермаркеты, гипермаркеты, суперсторы, универсальные магазины, торговые центры, посылочная торговля, а также продажа товаров в кредит и по каталогам.

(2) In reference to electricity, Retail is a sale of electricity to the ultimate users. Retail:- sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category. / По отношению к электричеству, продажа электроэнергии конечным потребителям.

RETAIL AUTOMATIC EXECUTION SYSTEM = АВТОМАТИЧЕСКАЯ СИСТЕМА РОЗНИЧНОГО (или ЧАСТНОГО) ИСПОЛНЕНИЯ – Retail Automatic Execution System:- Chicago Board of Options Exchange, Inc. (CBOE®). It has been reported in Computerworld that analysts and market specialists consider the CBOE® to be the leading technology purveyor among financial exchanges. The Public Automated Routing (PAR) system is the latest evidence of this tradition of technology leadership that includes the 1986 introduction of the Retail Automatic Execution system (RAES) for expediting small orders from retail customers and the 1991 implementation of Market Maker Terminals (MMTs), which enable market makers to record and disseminate trade information via handheld computer terminals. / СИБО® (CBOE®).

RETAIL BANKING = БАНКОВСКОЕ ОБСЛУЖИВАНИЕ ПОТРЕБИТЕЛЬСКОГО (или РОЗНИЧНОГО) СЕКТОРА (или БАНКОВСКОЕ ОБСЛУЖИВАНИЕ НАСЕЛЕНИЯ) – Retail Banking:- bulk bank business where the main emphasis is on service for individuals rather than business and institutions. The main objective of retail banking is to provide low-cost banking services in line with customers' needs by offering standardized products and simplifying sales processes. Also known as Consumer Banking. Retail Banking is a term for private client banking, also mass-market banking. Opposite:- Wholesale Banking. / Рутинный банковский бизнес.

RETAIL CUSTOMER = РОЗНИЧНЫЙ ЗАКАЗЧИК – Retail Customer is a customer that does not qualify as an eligible contract participant under Section 1a(12) of the US Commodity Exchange Act. An individual with total assets that do not exceed USD10 million, or USD5 million if the individual is entering into an agreement, contract, or transaction to manage risk, would be considered a retail customer.

RETAIL DISTRIBUTION CENTER = РОЗНИЧНЫЙ РАСПРЕДЕЛИТЕЛЬНЫЙ ЦЕНТР – Retail Distribution Center (RDC) which replenishes to stores.

RETAILERS = РОЗНИЧНЫЕ ТОРГОВЦЫ – Retailers are defined as those establishments that sell merchandise, generally without transformation, and attract customers using methods such as advertising, point-of-sale location, and display of merchandise. A store retailer has a selling place open to the public; merchandise on display or available through sales clerks; facilities for making cash or credit card transactions; and services provided to retail customers. Retailers also sell online (via the Internet).

RETAIL INVESTOR = РОЗНИЧНЫЙ ИНВЕСТОР (или МЕЛКИЙ ВКЛАДЧИК КАПИТАЛА) – Retail Investor is an individual who purchases a relatively small amount of shares. / Лицо, которое приобретает относительно малые количества акций.

RETAIL OUTLET = РОЗНИЧНАЯ ТОЧКА (или ПУНКТ РОЗНИЧНОЙ ПРОДАЖИ) – In the US gas industry, Retail Outlet is a general term for a gas station. Retail outlets may be owned and operated by individual dealers, or may be directly owned and operated by a petroleum marketer. In addition to selling gasoline, retail outlets typically offer a variety of other goods and services, such as convenience goods and car washes.

RETAIL PRICE = РОЗНИЧНАЯ ЦЕНА – (1) Retail Price is a price set for items sold to the general public. The last mark-up in the cost to bring an item to a particular consumer store. Please note, many items will have a suggested retail price set by a manufacturer. This price does in no way constitute a products' value as 'suggested retail prices' are often overlooked by retailers and priced according to market and/or trends. / Розничные Цены, цены, по которым товары и услуги реализуются населению и другим потребителям. Розничные цены при социализме, планомерно воздействуя на спрос, стимулируют производство товаров, выступают как один из факторов повышения уровня реальных доходов трудящихся (смотрите Реальные Доходы Населения). В Союзе Советских Социалистических Республик (СССР) потребительские товары и услуги реализуются главным образом по фиксированным государственным розничным ценам. Небольшая часть сельскохозяйственной продукции продаётся по ценам, складывающимся на колхозном рынке под влиянием спроса и предложения товаров, и по ценам комиссионной торговли, устанавливаемым потребительской кооперацией по договорённости с производителями. Государственные розничные цены

определяются исходя из общественно-необходимых затрат труда на производство и реализацию товаров. Основные элементы розничной цены:- издержки производства и обращения товаров и прибыль производственных предприятий и торгово-сбытовых организаций. Цены на алкогольные напитки, табачные изделия и некоторые другие товары включают также налог с оборота. Общий уровень розничных цен и его изменения определяет Совет Министров СССР. На новые виды товаров и услуг цены устанавливаются государственными органами ценообразования (применительно к сложившемуся уровню розничных цен на аналогичные товары и услуги с учётом различий в их качестве и потребительских свойствах):- на основные непродовольственные товары – на едином для всей страны уровне, на основные продовольственные товары, а также мебель, стекло, бензин и лесоматериалы – с дифференциацией по поясам (смотрите Дифференцирование Цен). На некоторые виды товаров и услуг розничные цены устанавливаются республиканскими и местными органами ценообразования. Если при этом возникают необоснованные различия в ценах, то они устраняются путём координации розничных цен, осуществляемой Государственным Комитетом Цен при Совете Министров СССР. На отдельные сельскохозяйственные товары (картофель, овощи и другие) устанавливаются сезонные розничные цены. Потребительские товары устаревших фасонов и моделей или частично утратившие своё качество вследствие длительного хранения и по другим причинам продаются по сниженным ценам. Розничные цены фиксируются в прейскурантах. Политика розничных цен Советского государства подчинена интересам развития социалистической экономики и повышения уровня жизни трудящихся. В 1947–54 государственные розничные цены на товары народного потребления ежегодно снижались. В последующие годы Советское государство планомерно осуществляет политику стабильности уровня государственных розничных цен, снижения цен на отдельные виды товаров по мере накопления товарных ресурсов в условиях непрерывного увеличения денежных доходов населения через оплату по труду и общественные фонды потребления. В зарубежных социалистических странах наряду с общими закономерностями формирования и динамики розничных цен существуют особенности организации и методологии планирования цен. На основе обобщения коллективного опыта страны-члены Совета Экономической Взаимопомощи (СЭВ) разрабатывают мероприятия по сближению методологии внутреннего ценообразования. При капитализме розничные цены подвержены стихийным колебаниям под влиянием изменения конъюнктуры рынка, соотношения спроса и предложения. В условиях государственно-монополистического капитализма они используются как инструмент перераспределения национального дохода в пользу монополий. Различают несколько видов розничных цен. Цены, установленные государством, охватывают ограниченную номенклатуру товаров. Фиксированные и рекомендованные цены, уровень которых определяется промышленными монополиями, играют важную роль в осуществлении ими контроля над сбытом товаров массового производства. Это, как правило, монопольные цены, обеспечивающие получение монопольной прибыли. Цены со свободной калькуляцией складываются в зависимости от соотношения спроса и предложения. Их структура:- оптовая цена, уплачиваемая розничными торговыми предприятиями оптовым фирмам, плюс торговая накидка. С конца 1960-х в капиталистических странах наблюдается инфляционный рост розничных цен, особенно усилившийся в 1970-е, отрицательно сказывающийся на реальных доходах трудящихся. В 1950–74 прирост Индекса Потребительских Цен составил в Соединённых Штатах Америки (США) 105%, в Великобритании 230%, во Франции 250%; в Японии он достиг 304%, причём подавляющая часть этого прироста приходится на 1970-е.

(2) Retail Price:- in the US oil industry, the price of retail petroleum as it is purchased by the consumer at the pump. In Canada, this is the same price as is usually posted on pump price street signs, and invariably includes all taxes, including the Goods and Services Tax (GST). GST is approximately 3–4 cents per liter, depending upon the actual pump price. FuleFacts sometimes refers to Ex-Tax pump price, which is the pump price, less taxes. Also known as Pump Price, and Retail Markets. / Под Розничными Ценами понимаются цены, по которым товары и услуги реализуются населению. В основе розничных цен лежат издержки производства и обращения товаров, прибыль производственного предприятия и торгово-сбытовых организаций. Розничные цены могут быть временными, едиными и поясными. Они подвержены резким стихийным колебаниям под влиянием коньюнктуры рынка.

RETAIL PRICE INDEX = ИНДЕКС ПО РОЗНИЧНЫМ ЦЕНАМ – Retail Price Index (RPI):- published monthly based on a selection of goods and services which measures increases and decreases in prices. It is used to calculate the indexation allowance for capital gains, although the allowance has been frozen on 05 April 1998 (in the United Kingdom). Also used to increase personal allowances and tax bands, unless the government overrules the increase. / Индекс Розничных Цен (ИРЦ) – один из показателей инфляции, используемый в Соединённом Королевстве. Отражает изменение во времени общего уровня цен на товары и услуги, приобретаемые для непроизводственного потребления. В отличие от ИПЦ корзина для расчёта индекса включает цены на недвижимость. Индекс рассчитывается как отношение текущей стоимости фиксированного в предыдущий период набора товаров и услуг к его стоимости в предыдущий период.

RETAINED CORRESPONDENCE = НЕРАСПРЕДЕЛЁННАЯ КОРРЕСПОНДЕНЦИЯ – Retained Correspondence is a correspondence from the bank to the customer retained at the bank at the customer's written instructions. Mail retained in this manner is handed out or forwarded to the customer only at his request. Also known as Correspondence Held By Bank.

RETAINED EARNINGS = НЕРАСПРЕДЕЛЁННЫЕ ЗАРАБОТКИ – Retained Earnings:- in the United States, balance of profits or losses remaining at the end of a fiscal year, after taxes and dividends have been paid. Retained earnings are carried forward to the next fiscal year, and are a major source of funds for a company to expand without incurring more debt. Also known as Surplus, and Undistributed Profits. That part of a company's post-tax earnings not distributed to shareholders, and thus retained by the firm to finance the day-to-day running of the company and any future expansion. Retained earnings are added to reserves and hence appear on the firm's balance sheet. Also known as Profit And Loss Account Reserve in the United Kingdom. The final component of shareholder equity, Retained Earnings, represents the increase in equity value from the accumulated reinvestment of the company's profits (net income). When a business earns a profit, it can distribute some or all of these profits to its shareholders as dividends. The portion that is not paid out as dividends is reinvested in the company and called Retained Earnings. Since net income represents the firm's residual income after all expenses, it belongs to the firm's owners and any portion retained by the businesses represents an increase in shareholders' equity. Another way to think about this accounting relationship is that when net income is reinvested in a business, it increases the company's assets. Since no external party provided the funds to increase these assets, there is no increase in liabilities to external parties. Consequently, the owners must have a claim on the increased assets, and the owners' equity account increases to balance the increase in assets. Profits a company keeps for its operations, after paying taxes and dividends. Retained Earnings:- actually the accumulation of assets. Term referring to the reinvestment of interest, dividends and similar income from securities that is not distributed, but rather reinvested immediately in new securities of the same class. Generally speaking, the term refers to the retention or non-distribution of profits and their allocation to a company's reserves. Retained Earnings:- the category of retained earnings shows all earnings (after-tax profit) from the overall operations of a corporation less any amount allocated to general and special reserves, which is established as a capital cushion to cover operational and financial risks of the corporation. Retained Earnings is a balance sheet item which shows the total, accumulated net profit (or loss) of a company since the date it was founded

LESS any profits which might have been paid out by way of dividends. Many startup companies will show negative retained earnings, i.e. accumulated losses since inception.

RETAINED EARNINGS AVAILABLE FOR DISTRIBUTION = НЕРАСПРЕДЕЛЁННЫЕ ЗАРАБОТКИ, ДОСТУПНЫЕ ДЛЯ РАСПРЕДЕЛЕНИЯ – Retained Earnings Available For Distribution represents, in most cases, the maximum amount that an SBIC may distribute to investors, excluding permitted returns of capital. For Small Business Investment Companies (SBICs) that have received financial assistance from the US Small Business Administration (SBA) in a form other than debentures, the term 'investors' encompasses SBA as well as private investors. In some instances, SBA is entitled to receive payments from Retained Earnings Available for Distribution on a priority basis, and must receive these payments before any amounts may be distributed to investors or transferred to private capital. Dividends on 4 percent preferred stock issued by Section 301(d) Licensees are an example of such payments. In other cases, SBA may be entitled to receive payments from Retained Earnings Available for Distribution in proportion to any distributions received by private investors. Profit Participation on Participating Securities is an example of this type of payment. For most Licensees, Retained Earnings Available for Distribution is computed by subtracting unrealized depreciation on Loans and Investments from Undistributed Net Realized Earnings (excluding any restricted amounts). Unrealized depreciation and unrealized appreciation are not netted in this computation.

RETAINED OWNERSHIP = НЕРАСПРЕДЕЛЁННОЕ ВЛАДЕНИЕ – Retained Ownership involves vertically integrating the cow-calf operation by retaining calves beyond weaning, thus carrying them into the next phase of preparation for the market place. Backgrounding, grazing, and feeding through a feedlot are all retained ownership strategies.

RETAINED PROFIT = НЕРАСПРЕДЕЛЁННАЯ ПРИБЫЛЬ – Retained Profit is a profit remaining to a firm after the distribution of dividends and profit-sharing bonuses. Retained profit is generally used for the long-term expansion of the business, and is sometimes referred to as Undistributed Profit. Retained Profit is the value of the proportion of profit accruing to stockholders that has been retained for the future expansion of the business. Therefore it equals earnings less dividends.

RETALIATION = ОТВЕТНАЯ МЕРА (или ОТПЛАТА, или ВОЗМЕЗДИЕ) – Retaliation:- action taken by a country whose exports are adversely affected by the raising of tariffs or other trade restricting measures by another country. The GATT (short for the General Agreement on Tariffs and Trade) permits an adversely affected contracting party (CP) to impose limited restraints on imports from another CP that has raised its trade barriers (after consultations with countries whose trade might be affected). In theory, the volume of trade affected by such retaliatory measures should approximate the value of trade affected by the precipitating change in import protection. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

RETARDATION = РЕТАРДАЦИЯ (или ЗАМЕДЛЕНИЕ) – Retardation is a force causing container and cargo to move front to rear, side to side. / Сила, вызывающая движение контейнера и груза спереди назад и/или из стороны в сторону. Под Ретардацией, от Латинского слова Retardatio, означающее Замедление, понимается задержка развития действия.

(2) Retardation:- xxxxx. / Ретардация (в биологии), более поздняя закладка органа и замедленное его развитие у потомков по сравнению с предками. Зависит от начала функционирования органа и, следовательно, от условий среды, в которых проходит индивидуальное развитие организма – его онтогенез. Сравните с Акцелерация, Гетерохрония.

RETARDER = РЕТАРДЕР (или ЗАМЕДЛИТЕЛЬ) – Retarder is a chemical added to a dye bath to reduce the rate at which dye attaches to the fiber; also called Leveling Agents. A retarder may be required to prevent a dye from attaching to fibers so quickly that it would be very difficult to achieve level dyeing. Retarders are often used with acid dyes. They may work by quickly attaching to the fiber thereby temporarily keeping the dye from attaching, or by quickly attaching to the dye, temporarily keeping the fiber from attaching to the dye. Simple chemicals such as sodium sulfate may act as retarders for some dyes in some conditions. There are many retarders on the market that are proprietary mixtures of chemicals, often formulated to be companions for specific dye families. Reserving agents can be thought of as a special class of retarder. The availability to art dyers of retarders is limited. Retarder is a chemical that, when added to the dyebath, decreases the rate of dyeing but does not affect the final exhaustion.

RETAYNE = ЗАКРЕПИТЕЛЬ (или ДЕРЖАТЕЛЬ) – Retayne is a cationic dye fixing agent. Used on cotton fabrics to improve wet fastness of direct dyes and to color paper pulp. Is helpful as an after treatment for reactive dyes where washing facilities are not adequate for complete washout, though tends to lower light fastness qualities.

RETENDER = ПОВТОРНЫЙ КОНКУРС – Retender is the right of a holder of certain futures contracts, who has received a notice of intention to deliver from the clearinghouse, to offer the notice for sale on the open market, thus offsetting his obligation to take delivery under the contract. In specific circumstances, some exchanges permit holders of futures contracts who have received a delivery notice through the clearing organization to sell a futures contract and return the notice to the clearing organization to be reissued to another long; others permit transfer of notices to another buyer. In either case, the trader is said to have retendered the notice. / При определённых обстоятельствах некоторые биржи разрешают держателям фьючерсных контрактов, получившим через клиринговую организацию уведомление о поставке, продать фьючерсный контракт и вернуть это уведомление в клиринговую организацию для того, чтобы оно было перенаправлено другому покупателю, а какие-то биржи разрешают передачу уведомлений другому покупателю. В любом случае, о торговце говорится, что он подал уведомление для участия в повторном конкурсе.

RETENDERER = УЧАСТНИК ПОВТОРНОГО КОНКУРСА – In cotton futures trading, Retenderer is a stopper of a Delivery Notice who retenders the contract during the same delivery period in which he stopped the notice. The retenderer does not take possession of the duplicate samples. / В торговле фьючерсами на хлопок Останавливающий Уведомление о Поставке, который в течение того же периода поставки, в который он остановил данное уведомление, подаёт контракт для участия в повторном конкурсе. Участник повторного конкурса не берёт во владение дубликатные образцы.

RETENTION = (СОБСТВЕННОЕ) УДЕРЖАНИЕ – Retention is the amount of any loss or combination of losses that would otherwise be payable under an insurance/reinsurance contract which the insured/reassured must bear itself before the insurer or reinsurer becomes liable to make any payment under that contract. Compare deductible and excess. An insured or reassured may be able to insure its retention with another insurer/reinsurer. Amount of risk which the policyholder or insurer does not insure or reinsure but keeps for its own account. Retention is the net amount of risk which the ceding company or the reinsurer keeps for its own account or that of specified others. Retention:- there are two applications for generated profits:- (i) distribution to shareholders or (ii) retention in the company. / Сумма риска, которую владелец полиса или страховщик не застраховывает или не перестраховывает, а оставляет это на свой собственный риск. Удержание – количество ценных бумаг, выделенных данному инвестиционному банкиру, члену синдиката, за вычетом ценных бумаг, сохраняемых у управляющего синдиката для удовлетворения запросов организаций-инвесторов и для распределения между компаниями – членами группы продавцов, которые не являются членами синдиката.

RETENTION GUARANTEE = ГАРАНТИЯ УДЕРЖАНИЯ – Retention Guarantee supports an obligation to account for retention money paid by the beneficiary to the principal/applicant. Banks advise that the retention guarantee explicitly stipulates that is does not come into effect until the retention money has been received by the principal/applicant.

RETENTION MONEY GUARANTEE = ГАРАНТИЯ УДЕРЖАНИЯ ДЕНЕГ – Retention Money Guarantees:- contracts may allow the beneficiary to retain a proportion of the contract value once substantial completion of the contract has taken place and the beneficiary may be prepared to release this retention money to the applicant against the presentation of a guarantee. Duration of the guarantee depends on the underlying contract terms and may extend for a period after completion of the contract.

RETENTION OF TITLE = УДЕРЖИВАНИЕ ПРАВОВОГО ТИТУЛА – Retention Of Title is a legal arrangement under which a seller of goods delivers these goods 'on consignment' into someone's custody but ownership remains with the seller until he is paid. Retention of title allows the seller to repossess the goods whenever desired and to establish a claim against the custodian if the goods are sold or used without being paid for.

RETEST = ПОВТОРНЫЙ ТЕСТ – Retest:- in screening for resistance, re-evaluating in subsequent tests an entry selected in the mass screening test. / повторное вычисление в .

RETESTCROSS = СКРЕЩИВАНИЕ ПРИ ПОВТОРНОМ ТЕСТЕ – Retestcross is a cross made between a cytoplasmic male sterile line and a test Variety (identified to be a restorer in the testcross) to recheck the potentialities of the F_1 to give normal seed set upon selfing.

RETESTCROSS NURSERY = ПИТОМНИК ПО СКРЕЩИВАНИЮ ПРИ ПОВТОРНОМ ТЕСТЕ – Retestcross Nursery is a breeding nursery to evaluate the retestcross F_1s and corresponding male parents. / с целью высчитать .

RETICULATE = СЕТЧАТОЕ – Reticulate:- a net-like or criss-cross pattern, often of leaf veins. Reticulate:- in the form of a network; net-veined. / часто жилки листьев. Под Ретикулярным (Reticularis), от Латинского слова Reticulum, означающее Сеточка, понимается .

RÉTICULE = РЭТИКЮЛЬ (или РИДИКЮЛЬ) – Réticule is a woman's drawstring bag used especially as a carryall. / Дамская сумка.

RETIREMENT = УХОД НА ПЕНСИЮ (или ВЫХОД НА ПЕНСИЮ) – Retirement is the point where a person stops employment completely. A person may also semi-retire by reducing work hours. Many people choose to retire when they are eligible for private or public pension benefits, although some are forced to retire when physical conditions don't allow the person to work any more (by illness or accident) or as a result of legislation concerning their position. In most countries, the idea of retirement is of recent origin, being introduced during the XIX and XX centuries. Previously, low life expectancy and the absence of pension arrangements meant that most workers continued to work until death. Germany was the first country to introduce retirement in the 1880s. Nowadays most developed countries have systems to provide pensions on retirement in old age, which may be sponsored by employers and/or the state. In many poorer countries, support for the old is still mainly provided through the family. Today, retirement with a pension is considered a right of the worker in many societies, and hard ideological, social, cultural and political battles have been fought over whether this is a right. In many western countries this right is mentioned in national constitutions. / Уход на Пенсию определяется как процесс, заключающийся 'в отделении индивида от рабочей роли – то есть роли, выполняемой за плату, – и в приобретении роли человека, удалившегося от дел'. При этом наиболее часто подчеркиваемым аспектом является отделение индивида от работы, за которую полагается денежное вознаграждение, или, иначе говоря, его вытеснение или уход с рынка труда. Этот выход из рядов рабочей силы может быть принудительным или добровольным, в зависимости от условий ухода на пенсию. Главными факторами, влияющими на решение уйти на пенсию (или выйти в отставку), являются состояние здоровья и годовой доход, причём фактор здоровья более важен до 62 лет, а экономические факторы выходят на первое место после достижения этого возраста. Ранний выход на пенсию, заметно участившийся в 1970-е, зависит от соотношения этих факторов, а именно, состояния здоровья и достаточности постпенсионного дохода. Из тех, кто уходит на пенсию в положенный срок (65 лет), большинство поступает так ещё и по соображениям экономической выгоды. То есть, многим наёмным работникам и служащим выход на пенсию в 65 лет даёт право на получение полного пенсионного пособия, а также полных выплат по социальному страхованию. Те, кто продолжает работать, выбирая вариант частичных пенсионных выплат или позднего ухода на пенсию, могут поступать так в силу того, что считают свой доход недостаточным для нормальной жизни на одно только полное пенсионное пособие. Какой-то незначительный процент пожилых людей продолжает работать ради собственного удовольствия, хотя большинство тех, кто может позволить себе уйти на пенсию, именно так и поступают. Относительно малое число рабочих отправляют на пенсию в установленный срок вследствие принудительного увольнения, предусмотренного условиями трудового договора. Динамичные экономические факторы, такие как уровень безработицы и инфляции, влияют (либо положительно, либо отрицательно) на выбор времени и вариантов ухода на пенсию.

RETIREMENT PLAN BONDS = ОБЛИГАЦИИ ПЕНСИОННОГО ПЛАНА (или ОБЛИГАЦИИ С ПЛАНОМ УХОДА НА ПЕНСИЮ) – In the United States, Retirement Plan Bonds:- nontransferable accrual-type US savings securities issued as an investment option for individuals eligible to make tax-deductible contributions to a 'Keogh' (H.R. 10) retirement account. These bonds were first issued in January 1963 after enactment of the Self-Employed Individuals Tax Retirement Act of 1962. The sale of these bonds was terminated 1982-April-30. Regulations governing these securities are in Title 31 Code of Federal Regulations Part 341, also published as Department of the Treasury Circular, Public Debt Series No. 1-63. / Кио (Keogh).

RETRACEMENT = ОТСКОК – Retracement:- a decline that retraces a portion of a previous advance, or an advance that retraces a portion of a previous decline. Retracements typically cover 1/3 to 2/3 of the previous move, and a retracement of more than 2/3 typically signals a trend reversal. A price movement in the opposite direction of the previous trend. Usually a price correction but may be a rise in price when the previous trend has been down. A counter-trend price move following a trend in the market. Generally thought of in terms of a Fibonacci retracement where a specific price target is expected based on the length of the initial trend. A reversal within a major price trend. A Retracement is a technical term used to identify a minor pullback or change in the direction of a financial instrument, such as a stock or index. Retracements are temporary in nature and do not indicate a shift in the larger trend. Key Takeways:- (i) A retracement is a minor pullback or change in the direction of a financial instrument, such as a stock or index; (ii) The term, used by technical analysts to analyze the price of securities, refers to a short-term change in a stock's price relative to an overarching trend; (iii) Once a retracement is over, there should be a continuation of the previous trend; and (iv) Retracements are not the same as reversals – with the latter, the price of the security must breach support or resistance levels. Understanding a Retracement:- A retracement refers to the temporary reversal of an overarching trend in a stock's price. Distinct from a reversal, retracements are short-term periods of movement against a trend, followed by a return to the previous trend. The chart below illustrates the share price of General Electric Co. It is showing that the stock is in a downtrend. However, there are points on the chart that indicate that the price is rising, which would be considered a retracement. A retracement by itself does not say much. However, when combined with other technical indicators it can help a trader identify if the current trend is likely to continue or if a significant reversal is

taking hold. (Note:- A retracement should be used with other technical indicators and never alone. If not used correctly, it could cause the analysis to be misguided.) Retracement vs. Reversal:- It is essential to determine the difference between a reversal and a short-term retracement. A retracement is not easy to identify because it can easily be mistaken for a reversal. Even worse is if a reversal is mistaken for a retracement. The chart below shows the S&P 500® during 2018 when a significant uptrend took place between April and October. There are three retracements identified on the chart, although there were a series of smaller ones as well, as the S&P 500® was rising to record highs. What is most important is that the retracements never breached the uptrend. However, in October what appeared to be a retracement became a reversal after the index did finally fall below the uptrend, leading to a sharp decline. Again, it is important to remember that a retracement is a minor or short-term pullback in the price of a stock or index. What is key is that the stock does not breach a critical level of support or resistance nor breach the uptrend or downtrend. Should the price fall below or rise above support or resistance, or violate an uptrend or downtrend, then it is no longer considered a retracement but a reversal. See also Consolidation, and Pullback. / Xxxxx Ко. (General Electric Co.). В техническом анализе биржевых рынков, Откат .

RETRANSMISSION = РЕТРАНСЛЯЦИЯ – Retransmission:- vendors of the electronic trading system retransmit past market data each evening. The retransmitted data is used to construct the charts on such systems. By retransmitting the data, each user is assured of receiving updated and accurate information. Vendors retransmit the data in the form of tick, 1-, 5-, 15-, 30-, 45-, 60-minute, daily, weekly, monthly, quarterly, semi-annual, yearly bars and candles. The type and quantity of the retransmitted data varies from contract to contract. The more active contracts typically receive the most transmitted data. The time and sales data files are relatively large since they contain each trade for each contract on the system. For this reason, the amount of time and sales data that is available at any given time may be limited to several days. The duration of the charts that are constructed from time and sales data (tick, 1-9 minute bars or candles) is limited by the amount of time and sales data available in the system. For example:- with 2 days of time and sales data in the system, a 1-minute chart can display enough bar or candle data to scroll through several screens; whereas a 9-minute chart may display only 1/9th of the number of bars or candles. / Разработчики электронных торговых систем каждый вечер переправляют пользователям этих систем исторические данные по рынку. Эти переправляемые данные используются для построения графиков такими системами. Каждый пользователь системы обеспечивается получением дополненной и точной информации благодаря этой передаче данных. Разработчики рассылают данные в формате попунктных, 1-, 5-, 15-, 30-, 45-, 60-минутных, посуточных, поненедельных, помесячных, поквартальных, пополугодовых, погодовых штрихов и свечей. Тип и количество переправляемых данных различны для каждого конкретного контракта. По наиболее активным контрактам обычно переправляется и большее количество данных. Файлы с данными о времени и продажах весьма значительны в объёмах, поскольку они содержат все сделки по каждому контракту, используемые системой. По этой причине объём данных о времени и продажах, произошедших в течение любого времени, может быть ограничен до объёма информации по нескольким дням. Временной период графиков, выстраиваемых с использованием данных о времени и продажах (для попунктных, 1-9 минутных штрихов или свечей), может быть ограничен объёмом данных о времени и продажах, доступных на данный момент системе. Например, при 2-дневном объёме системных данных о времени и продажах 1-минутный график может отражать достаточный объём данных по штрихам или свечам для их отображения на нескольких экранах; в то время как 9-минутный график отразит лишь 1/9-ю часть штрихов или свечей.

RETROACTIVE DATE = ДАТА С ОБРАТНОЙ СИЛОЙ – Retroactive Date is a date on a 'claims made' liability policy which triggers the beginning of insurance coverage. A retroactive date is not required. If one is shown on a policy, any claim made during the policy period will not be covered if the loss occurred before the retroactive date.

RETROCEDANT = РЕТРОЦЕДЕНТ – Retrocedant:- a reinsurer that is reinsured under a retrocession. Retrocedent is the ceding reinsurer in a retrocession. / Перестраховщик, который перестраховался по ретроцессии.

RETROCESSION = РЕТРОЦЕССИЯ – Retrocession is a reinsurance of reinsurance. Example:- Company 'B' has accepted reinsurance from Company 'A', and then obtains for itself, on such business assumed, reinsurance from Company 'C'. This secondary reinsurance is called a Retrocession. The transaction whereby a reinsurer cedes to another reinsurer all or part of the reinsurance it has previously assumed. A reinsurance of a reinsurer by another reinsurer. It serves to 'lay-off' risk. Technically, the primary insurance companies are said to cede insurance business when they sell part of their policy portfolio to reinsurance companies. The share of the insurance portfolio that is retained in the primary insurance company is referred to as the Retention Ratio. The ceding insurance company may, in turn, buy part of the insurance policies that are ceded by other insurance companies. The reinsurance companies that buy insurance policies from primary insurers may sell, or retrocede, part of those insurance portfolios to other reinsurance companies, while the retrocessionaires in turn buy insurance portfolios from its peers in the reinsurance industry. Hence, the global reinsurance market provides additional diversification of risk exposures across the international insurance community. Amount of the risk accepted by the reinsurer which is then passed on to other reinsurance companies. Assignment by a bank of part of the commission received to another bank or to an agent (intermediary) which has participated in the transaction. Retrocession is common in bond underwriting and syndicate operations.

RETROCESSIONAIRE = РЕТРОЦЕССИОНАРИЙ – Retrocessionaire is the reinsurer under a retrocession. Retrocessionaire is a reinsurer of a reinsurer. / Перестраховщик по ретроцессии.

RETROREFLECTOR = РЕТРОРЕФЛЕКТОР (или СВЕТОВОЗВРАЩАЮЩИЙ ОТРАЖАТЕЛЬ, или ОБРАТНЫЙ ОТРАЖАТЕЛЬ) – Retroreflector:- a reflecting surface or device from which, when directionally irradiated, the reflected rays are preferentially returned in directions close to the opposite of the direction of the incident rays, this property being maintained over wide variations of the direction of the incident rays. Most commonly used in highway signage materials. A Retroreflector (sometimes called a Retroflector or Cataphote) is a device or surface that reflects light back to its source with a minimum of scattering.

RETRORSE = ОБРАЩЁННОЕ НАЗАД (или ОБРАЩЁННОЕ ВНИЗ, или ОТОГНУТОЕ НАЗАД, или ОТОГНУТОЕ ВНИЗ) – Retrorse:- bent or curved backward or downward.

RETROSPECTIVE RATING = РЕТРОСПЕКТИВНЫЙ РЭЙТИНЬГ – In reinsurance, Retrospective Rating is a plan or method which permits adjustment of the final reinsurance ceding commission or premium on the basis of the actual loss experience under the subject reinsurance treaty – subject to minimum and maximum limits.

RETROVIRUS = РЕТРОВИРУС – The term Retrovirus has several different unrelated meanings, including:- (1) malicious applications which try to disable, delete or deactivate antivirus systems; (2) a computer virus which attempts to disinfect and repair files damaged by a different computer virus; (3) a computer virus which attempts to run itself by exploiting vulnerabilities in the parser of the antivirus program, file compression program or other program which reads the virus into memory. Not to be confused with the phase 'retro virus' which could mean a modern computer virus that makes use of old techniques to replicate. See also Virus.

RETTING = МОЧКА (или ЗАМОЧКА) – Retting is the process in flax production that weakens the fibers in the flax plant. Several retting methods are used:- (i) Dew or Grass Retting:- small bundles of the uprooted flax plants are left outdoors for 3–5 weeks. (ii) Pond

Retting:- small bundles are left submerged for 4–8 days. Many books refer to an unpleasant stench as a side effect of this process. (iii) Stream Retting:- small bundles are anchored in a body of moving water. This is the quickest and the cleanest of the processes. Apparently efforts are underway to perfect a process using enzymes to replicate the dew process. Retting occurs in flax fiber production after 'rippling' and before 'breaking'. Retting is the removal, usually by soaking, of the outer woody portion of the flax plant to gain access to the fibers. This may be done by several methods:- pool, dew, tank, and chemical.

RETURN = ВОЗВРАТ – Return:- in banking, in case of a single direct debit included in a batch can not be processed by the debtor's bank for technical reasons, e.g., account blocked or frozen, this direct debit is returned to the creditor's bank without debiting the debtor's account.

RETURN = ПОСТУПЛЕНИЕ (или ОТДАЧА, или РЕНТАБЕЛЬНОСТЬ) – Return is the total percentage gain or loss of an index or investment over a specified time period. Return is the profit made on an investment. Return is a measure of the profitability of an investment used to compare different forms of investment. It is generally expressed in percent per year and refers to the actual annual return of the capital employed. Income from the investment (e.g., interest, dividends, realized capital gains) and any share price changes are measured relative to the capital employed. Bond yields (net yield) are calculated according to the following formula:- (Nominal Interest Rate x 100) / Purchase Price + (Redemption Price – Purchase Price) / Residual Maturity. / Поступление – это образовавшаяся от инвестирования прибыль.

RETURNABLE/REUSABLE PALLET = ВОЗВРАЩАЕМЫЙ/ПОВТОРНО ИСПОЛЬЗУЕМЫЙ ПОДДОН – Returnable/Reusable Pallet is a pallet designed to be used for more than one trip.

RETURN AIR TEMPERATURE = ТЕМПЕРАТУРА ОБРАТНОГО ВОЗДУХА – Return Air Temperature is a temperature of the air which is drawn off from the refrigerated hold/container. The return air temperature is controlled during refrigeration.

RETURN AUTHORIZATION = САНКЦИОНИРОВАНИЕ ВОЗВРАТА (или РАЗРЕШЕНИЕ НА ВОЗВРАТ) – Return Authorization is a permission given to a carrier or consignee to return product to Logistics Depot.

RETURN AUTHORIZATION NUMBER = НОМЕР САНКЦИОНИРОВАНИЯ ВОЗВРАТА (или НОМЕР РАЗРЕШЕНИЯ НА ВОЗВРАТ) – Return Authorization Number:- this is usually a number supplied by the client authorizing the return of product from a consignee to Logistics Depot, i.e. the remote procedure call (RPC) or the return merchandise authorization (RMA).

RETURN CARGO = ВОЗВРАТНЫЙ (или ОТКАЗНОЙ) ГРУЗ – Return Cargo is a cargo to be returned to original place of receipt. / Груз, который должен быть возвращён в первоначальное место его получения.

RETURN CARGO = ОБРАТНЫЙ ГРУЗ – Return Cargo is a cargo which enables a ship to return loaded to the port or area where her previous cargo was loaded.

RETURNED CHECK = ВОЗВРАЩЁННЫЙ ЧЕК (или ОТКАЗНОЙ ЧЕК) – Returned Check means a check that a paying bank returns unpaid to the bank of first deposit.

RETURNED WITHOUT ACTION = ВОЗВРАЩЕНО БЕЗ РАССМОТРЕНИЯ – Returned Without Action:- in the United States, for export control purposes:- the return of an export license application without action because the application is incomplete, additional information is required, or the product is eligible for a general license.

RETURN INDEX = ИНДЕКС ПО ПОСТУПЛЕНИЯМ (или ИНДЕКС ПО ОТДАЧЕ) – A Return Index takes into account the reinvestment of net dividends. It is calculated and disseminated at the same frequency as the price index. / Индекс По Поступлениям или Индекс По Отдаче принимает в расчёт реинвестицию чистых дивидендов. Он рассчитывается и распространяется с той же самой частотой, что и индекс по ценам (price index).

RETURN LINE = ОБРАТНАЯ ЛИНИЯ (или ОБРАТНАЯ МАГИСТРАЛЬ) – Return Line is a location in a line conducting fluid from working device to reservoir.

RETURN LINE FILTRATION = ФИЛЬТРАЦИЯ НА ОБРАТНОЙ МАГИСТРАЛИ – Return Line Filtration:- filters located upstream of the reservoir but after fluid has passed through the system's output components (cylinders, motors, etc). See also Filtration.

RETURN ON ASSETS = ПОСТУПЛЕНИЯ ПО АКТИВАМ (или ОТДАЧА ПО АКТИВАМ, или РЕНТАБЕЛЬНОСТЬ АКТИВОВ) – In analysing shares as investments, return on assets is calculated to show how much profit a company is making on the assets used in its business. Return On Assets = (Earnings Before Interest & Tax / Total Assets) x 100 = %. Return On Assets is an indication of overall financial performance from the viewpoint of the company assets. Often used to compare effective use of assets in the business vs. investing those same assets in another product, service or vehicle (stocks, bonds, etc). Return On Assets describes the return we make on the average assets employed during the year. It is calculated as income before taxes and minority interests plus interest expenses as a percentage of average assets.

RETURN ON ASSETS RATIO = СООТНОШЕНИЕ С ПОСТУПЛЕНИЯМИ ПО АКТИВАМ (или КОЭФФИЦИЕНТ ОТДАЧИ ПО АКТИВАМ, или ПРИБЫЛЬНОСТЬ АКТИВОВ) – Return On Assets Ratio:- fiscal year earnings from total operations (not including extraordinary items) divided by the total assets, expressed as a percentage. Data taken from the 10K report. / (не включающие экстраординарные строки баланса).

RETURN ON AVERAGE EQUITY = ПОСТУПЛЕНИЯ ОТ/ПО УСРЕДНЁННЫХ СОБСТВЕННЫХ СРЕДСТВ – Return On Avearge Equity:- earnings attributable to ordinary shareholders divided by average ordinary shareholders' funds. In %.

RETURN ON AVERAGE TOTAL ASSETS = ПОСТУПЛЕНИЯ ОТ/ПО УСРЕДНЁННЫХ СУММАРНЫХ АКТИВОВ – Return On Average Total Assets:- earnings attributable to ordinary shareholders divided by weighted average total assets. In %.

RETURN ON CAPITAL EMPLOYED = ПОСТУПЛЕНИЯ ОТ КАПИТАЛОВЛОЖЕНИЙ (или ПОСТУПЛЕНИЯ ОТ ВЛОЖЕННОГО (или ЗАДЕЙСТВОВАННОГО) КАПИТАЛА) – Return On Capital Employed is the operating profit expressed as a percentage of the capital employed. Thus it is a key measure of the profitability of the 'core' business. Therefore it is a key measure of the effective management of the core business. The normal range is 13% to 25%. Return On Capital Employed:- a profit before interest, taxation, special items, tax effected at the company's effective tax rate as a percentage of capital employed. Return On Capital Employed (ROCE) is a ratio calculated by dividing earnings (adjusted for after-tax interest expense and noncontrolling interests) by average capital employed. / строка баланса (item).

RETURN ON EQUITY = ПОСТУПЛЕНИЯ ПО СОБСТВЕННЫМ СРЕДСТВАМ (или ОТДАЧА ПО СОБСТВЕННОМУ КАПИТАЛУ, или РЕНТАБЕЛЬНОСТЬ СОБСТВЕННОГО КАПИТАЛА) – Return On Equity (RoE) is a measure of a copmany's earnings situation showing a company's profit in a financial year relative to the equity employed. Net income as a percentage of time-weighted

shareholders' equity. Earnings expressed as a percentage of equity capital. In analysing shares as investments, Return On Equity is calculated to show the return the company has made for shareholders on their investment. Shareholders' equity normally excludes intangible assets such as goodwill and is calculated by deducting total liabilities and intangibles from total assets. Return on equity = (After-tax profits / Shareholders' equity) x 100 = %.

RETURN ON EQUITY RATIO = СООТНОШЕНИЕ С ПОСТУПЛЕНИЯМИ ПО СОБСТВЕННЫМ СРЕДСТВАМ (или КОЭФФИЦИЕНТ ОТДАЧИ ПО СОБСТВЕННОМУ КАПИТАЛУ, или КОЭФФИЦИЕНТ РЕНТАБЕЛЬНОСТИ СОБСТВЕННОГО КАПИТАЛА) – Return On Equity Ratio:- last twelve months earnings from total operations (not including extraordinary items) divided by the most recent quarter common stock equity. / Заработки за последние двенадцать месяцев от всех операций (но, не включающие экстраординарные строки баланса), разделённые на собственные средства в обыкновенном уставном капитале за самый последний квартал.

RETURN ON INVESTMENT = ПОСТУПЛЕНИЯ ОТ ИНВЕСТИЦИОННОЙ ДЕЯТЕЛЬНОСТИ (или ОТДАЧА ОТ КАПИТАЛОВЛОЖЕНИЙ, или РЕНТАБЕЛЬНОСТЬ ИНВЕСТИЦИЙ) – Return On Investmet:- investment result as a percentage of average invested assets. Invested assets include investments, funds held by ceding companies, net cash equivalents and net reinsurance assets. Average invested assets are calculated as opening balance plus one half of the net asset turnover. Ratio of a company's total earnings before interest, taxes and dividends to its total capital (common stock and preferred stock plus debt). Usually expressed as a percentage. Return On Investment (ROI) is useful in comparing different firms in terms of profitability. Also known as Return On Invested Capital (ROIC). Return On Invested Capital (ROIC) is measured as (net income + interest expense + depreciation expense) / closing (equity + minority interest + long-term financial obligations). Return On Investment (ROI) is ratio measure of the profits achieved by a firm through its basic operations. An indicator of management's general effectiveness and efficiency. The simplest version is the ratio of net income to total assets.

RETURN ON OPERATING REVENUES = ПОСТУПЛЕНИЯ ПО ОПЕРАЦИОННОЙ ВЫРУЧКЕ (или ОТДАЧА ПО ОПЕРАЦИОННОЙ ВЫРУЧКЕ) – Return On Operating Revenues:- measure of profitability in the Life & Health Business Group:- the operating result (operating income excluding realised gains and losses) as a percentage of operating revenue (premiums earned and net investment income) plus other revenues.

RETURN ON SALES = ПОСТУПЛЕНИЯ ОТ ПРОДАЖ (или ОТДАЧА ОТ ПРОДАЖ, или РЕНТАБЕЛЬНОСТЬ ПРОДАЖ) – In analysing shares as investments, Return On Sales is calculated to show how much profit a company is making on its operations as a percentage of its sales. Return On Sales = (Earnings Before Interest & Tax / Sales Revenue) x 100 = %. Also known as Profit Margin. Return on Sales is another term for Net Profit.

RETURN ON STOCKHOLDERS' EQUITY = ОТДАЧА ОТ СРЕДСТВ АКЦИОНЕРОВ – Return On Stockholders' Equity is a ratio calculated by dividing earnings by average Chevron Corporation stockholders' equity. Average Chevron Corporation stockholders' equity is computed by averaging the sum of the beginning-of-year and end-of-year balances. / Шеврон Корпорэйшэн (Chevron Corporation).

RETURN ON TOTAL ASSETS = ОТДАЧА НА СОВОКУПНЫЕ АКТИВЫ – Return On Total Assets is a ratio calculated by dividing earnings by average total assets. Average total assets is computed by averaging the sum of the beginning-of-year and end-of year balances.

RETURN ON TOTAL REVENUES = ПОСТУПЛЕНИЯ ОТ ВСЕЙ ВЫРУЧКИ (или ОТДАЧА ПО ВСЕЙ ВЫРУЧКЕ) – Return On Total Revenues:- measure of profitability in the Financial Services Business Group:- the operating result (operating revenues less the sum of acquisition costs, claims and claim adjustment expenses and operating costs) as a percentage of operating revenues (premiums earned and net investment income plus trading revenues and fees and commissions).

RETURNS OF CAPITAL = ПОСТУПЛЕНИЯ ОТ КАПИТАЛА (или ОТДАЧИ ОТ КАПИТАЛА) – Returns Of Capital are:- (i) dividends; (ii) share buybacks; (iii) reduction in capital; (iv) distributions in specie; or (v) any return of assets to shareholders leading to a reduction in shareholders' funds.

RETURN PREMIUM = ВОЗВРАЩАЕМАЯ ПРЕМИЯ – Return Premium is a premium payable back to the insured as a result of a change in policy cover or declaration adjustment to reflect reduced exposure or sums insured.

RETUSE = ИМЕЮЩИЙ ВЕРХУШКУ С НЕБОЛЬШИМ ВДАВЛЕНИЕМ – Retuse:- a rounded termination with a small notch forming two small lobes.

REUSABLE PALLET = ПОВТОРНО ИСПОЛЬЗУЕМЫЙ ПОДДОН (или МНОГООБОРОТНЫЙ ПОДДОН) – Reusable Pallet is a pallet intended for multiple cycles of use. See also Pallet. / Многооборотный Поддон (Reusable Pallet):- поддон, предназначенный для многократного применения. Смотрите также Поддон (Pallet).

REUSED WOOL = ПОВТОРНО ИСПОЛЬЗОВАННАЯ ШЕРСТЬ (или ВОССТАНОВЛЕННАЯ ШЕРСТЬ) – Reused Wool:- these are cleaned and shredded into fibers again, and then blended to make utility fabrics. See also Shoddy. Reused Wool is the old wool that has been made into a wool product and used by consumers, then cleanecl, garnetted, and remade into merchandise. It must be labeled reused wool.

REUSE OF COLLATERAL = ПОВТОРНОЕ ИСПОЛЬЗОВАНИЕ ОБЕСПЕЧЕНИЯ – Reuse Of Collateral is a party's pledging or transferring to another party collateral that was pledged or transferred to it. The term rehypothecation is generally used to refer to pledging collateral that was pledged. Also known as Rehypothecation.

REUTERS (HOLDINGS PLC) = РОЙТАС (ХОЛДИНЬГЗ ПИ.ЭЛ.СИ.) – Reuters is the world's largest international multimedia news agency, providing investing news, world news, business news, technology news, headline news, small business news, news alerts, personal finance, stock market, and mutual funds information available on Reuters.com, video, mobile, and interactive television platforms. In October 1851 Paul Julius Reuter, a German-born immigrant, opened an office in the City of London which transmitted stock market quotations between London and Paris via the new Calais-Dover cable. Two years earlier he had used pigeons to fly stock prices between Aachen and Brussels, a service which operated for a year until the gap in the telegraph link was closed. Reuters, as the agency soon became known, eventually extended its service to the whole British press as well as to other European countries. It also expanded the content to include general and economic news from all around the world. The reputation of its service was enhanced by a succession of reporting scoops. For example, in 1865 Reuters was first in Europe with news of President Lincoln's assassination in the United States. As overland telegraph and undersea cable facilities developed, the business expanded beyond Europe to include the Far East in 1872 and South America in 1874. In 1883 Reuters began to use a 'column printer' to transmit messages electrically to London newspapers and in 1923 pioneered the use of radio to transmit news internationally. In 1927 it introduced the teleprinter to distribute news to London newspapers. In 1925 the Press Association, the UK press agency, took a majority holding in Reuters Ltd and

in 1939 the company moved its corporate headquarters to 85 Fleet Street, London. Recently, in 2005 the corporate headquarters were moved to Canary Wharf, London. During both World Wars, Reuters came under pressure from the British government to serve British interests. In 1941 Reuters deflected this pressure by restructuring itself as a private company. The new owners, the British national and provincial press, formed the Reuters Trust, with independent trustees. The Trust preserves Reuters independence and neutrality. The principles of the Trust were maintained and the power to enforce them was strengthened when Reuters became a public company in 1984. Reuters continued to modernise rapidly in the latter half of the XX century. The introduction of a succession of computerised products for international traders transformed the business. The Stockmaster service (1964), which transmitted financial data internationally, quickly proved a success and began this transformation. In 1973 a further innovative development was the launch of the Reuter Monitor which created an electronic marketplace for foreign exchange. This service expanded to carry news and prices covering securities, commodities and money and was further enhanced in 1981 with the launch of the Reuters Monitor Dealing Service. Following a dramatic increase in profitability, Reuters was floated as a public company in 1984 on the London Stock Exchange and on NASDAQ® in the United States. On listing, the Company had a market capitalization of some £700 million. Subsequently, Reuters made a series of acquisitions including Visnews (1985 – renamed Reuters Television), Instinet (1986), TIBCO (formerly Teknekron) and Quotron (both in 1994). Reuters continued to grow rapidly, widening the range of its business products and expanding its global reporting network for media, financial and economic services. Recent key product launches include Equities 2000 (1987), Dealing 2000-2 (1992), Business Briefing (1994), Reuters Television for the financial markets (1994), 3000 Series (1996) and the Reuters 3000 Xtra service (1999). In 1995, Reuters established its 'Greenhouse Fund' to take minority investments in a range of start-up technology companies, initially in the United States. In July 1999 TIBCO Software completed an IPO on NASDAQ®; Reuters retains a substantial proportion of the shares. Reuters announced in early 2000 a range of major initiatives designed to accelerate its use of internet technologies, open new markets and migrate its core business to an internet-based model. In May 2001 Instinet completed an IPO on NASDAQ®; Reuters retains the majority of the shares. In October 2001 Reuters completed the largest acquisition in its history, strengthening its presence in the US equities marketplace with the purchase of most of the assets of Bridge Information Systems. In 2002, the financial markets slumped into their most severe downturn for over fifty years. Reuters revenues started to decline and, for the first time since its flotation in 1984, the company recorded a pre-tax loss for the year. Early in 2003, the company announced a three year programme – Fast Forward – to make Reuters more competitive, less complex, more focused on customer service and more efficient, with a target of achieving total cost savings of £440 million over four years. Reuters acquired Multex.com, Inc, a provider of company financial information, to underline its renewed commitment to being a content company. New, easier-to-use versions of 3000 Xtra and Bridge Station were offered to customers and the Reuters Market Data System was established as the market standard in trading room systems. February 2004 saw Reuters reduce its stake in TIBCO Systems Inc. (TSI) to 8.8%, through a combination of public offering and a sale of shares back to TSI, for aggregate net proceeds of c.£311 million. This contributed to a 51% increase in Reuters Group Operating Profit to £197 million. Instinet returned to profit for the first time in three years. The company introduced two key new products:- (i) Reuters Trader, a new real time price data and news service for traders and salespeople, to replace the old 2000 series products; and (ii) Reuters Knowledge, an in-depth company information and consensus estimates service for investment bankers and research professionals. 2007-May-17:- The Thomson Corporation and Reuters Group PLC announce that they are in discussions for the combination of their two businesses. Canadian business information company Thomson will take over Reuters in an £8.7bn deal, after the Reuters Founders Share Company, which has a veto on any potential buyout, agreed that the acquisition would not challenge Reuters' editorial independence. The two companies announced this morning that the takeover has been formalized along the same lines as previously indicated, with Thomson paying 691p a share for Reuters in a combination of cash and its own shares. The new company will be known as Thomson Reuters Corporation, although Reuters' financial information and newswire business will continue to operate under its historic name. Thomson announced its takeover in May with a deal that when closed will see Reuters shareholders get 352-1/2 pence in cash and 0.16 of one Thomson share for each Reuters share held. 2008-March-27 – Shareholders of Thomson Corporation voted Wednesday in favor of its takeover of Reuters Group PLC which is worth 17 billion Canadian Dollars (USD17 billion), Canadian Press reported. The vote was 99 percent in favor of the deal, the biggest in the history of the Canadian-based specialized data company. Reuters shareholders were to vote on the deal at a separate meeting in London and are also expected to endorse the transaction. The takeover has already secured regulatory approval and is scheduled to close on April 17. 2008:- The Thomson Corporation and Reuters Group PLC combine to form Thomson Reuters. See also The Thomson Corporation. / Ройтас Холдиньгз Пи.Эл.Си. (Reuters Holdings PLC). НЭЗДЭК® (NASDAQ®) . город Кале (Calais), Франция. Ройтас Груп Пи.Эл.Си. (Reuters Group PLC). В Октябре 1851 Пауль Юлиус Ройта (Paul Julius Reuter), иммигрант, родившийся в Германии, открыл офис в Лондонском Сити. ТЧИБКО Систэмз Инк. (Ти.Эс.Ай.) (TIBCO Systems Inc. (TSI)). Тчэкнэкрон (Teknekron), Куотчрон (Quotron). Смотрите также За Томсэн Корпорэйшэн (The Thomson Corporation).

REVALUATION = РЕВАЛЬВАЦИЯ – (1) Revaluation is an increase in the external value of a currency in terms of other currencies. In a system of fixed or bloc-linked exchange rates, revaluation is effected through legal or official increases in the parity of a currency against the other currencies or the key currency (formerly against gold). In the case of flexible or floating exchange rates, appreciation is the result of a rise in the exchange rate on the currency market in response to supply and demand. In general, setting a new value on something. Currency Revaluation is an upward adjustment in the value of a nation's currency relative to other currencies. It differs from currency appreciation in that it is achieved by deliberate action on the part of monetary authorities. The opposite of Devaluation. Also known as Appreciation. / Ревальвация валюты – изменение стоимости национальной валюты по отношению к другим валютам, основанное на решении правительства, а не на рыночных колебаниях. Термин Ревальвация, как правило, относится к увеличению стоимости валюты, а Девальвация (devaluation) – к её снижению. Под Ревальвацией, от Латинских слов – приставки Re..., указывающей на Противодействие или действие, Противоположное (Обратное) выраженному корнем слова, и Valeo, означающее Имею Значение или Стою, понимается официальное повышение золотого содержания денежной единицы страны или фактическое повышение её валютного курса. Одно из средств государственно-монополистического регулирования экономики капиталистических стран. По механизму воздействия на экономику ревальвация противоположна девальвации. До конца 1960-х ревальвация была сравнительно редким явлением в международной валютной практике. Это объясняется тем, что страна, осуществляющая ревальвацию своей валюты, ставит себя в менее выгодное положение в области внешней торговли, притока иностранных капиталов и международного туризма по сравнению с другими странами. Ревальвация, повышая курс валюты данной страны по отношению к валютам других стран, вызывает повышение цен вывозимых (или экспортируемых) товаров в иностранной валюте и тем самым снижает конкурентоспособность страны на мировом рынке, сдерживает вывоз (или экспорт) её товаров. Понижая выраженные в национальной валюте цены привозных (или импортных) товаров, ревальвация приводит к повышению спроса на них и увеличению привоза (или импорта), складывающиеся курсовые соотношения между ревальвированной валютой данной страны и валютами других стран делают для иностранных собственников невыгодным вложения капитала в этой стране, так как при обмене валют они получат меньшую сумму в местной валюте. И наоборот, для страны, ревальвировавшей свою валюту, становится более выгодным вывоз (или экспорт) капитала, так как возникает возможность более дешёвой покупки иностранной валюты. В области международного туризма ревальвация приводит к сокращению доходов от притока иностранных туристов, так как поездки в данную страну обходятся

для них дороже, и, наоборот, стимулирует поездки за рубеж отечественных туристов, для которых иностранная валюта становится дешевле. Правительства капиталистических стран используют ревальвацию для борьбы с инфляцией. Именно как антиинфляционную меру провели ревальвацию своих валют Федеральная Республика Германия (ФРГ) в 1969 и 1971, Нидерланды, Швейцария, Австрия и ряд других стран в 1971 и 1973. Ограничивая приток в страну иностранных и главным образом спекулятивных, блуждающих в поисках более прибыльного приложения капиталов, ревальвация позволяет в известной мере сдерживать увеличение денежной массы в обращении и на этой основе замедлять рост внутренних цен. Снижение в результате ревальвации затрат на привоз (или импорт) также ограничивает рост внутренних цен. Ревальвация осуществляется и с целью сдерживания роста активного сальдо торгового баланса. Такая ревальвация иногда проводится под нажимом других стран или международных валютно-финансовых организаций. Так, в Декабре 1971 правительство Японии под нажимом Соединённых Штатов Америки (США) ревальвировало Иену с целью выравнивания торгового баланса между двумя странами. В начале 1970-х с применением в ряде капиталистических стран ‘плавающих’, колеблющихся (отклоняющихся от установленного паритета под влиянием спроса и предложения) курсов валют некоторые капиталистические страны прибегали к фактической ревальвации своих валют в форме повышения их рыночного курса, не изменяя официально их золотого содержания. Так, введение в Феврале 1973 ‘плавающего’ курса Японской Иены означало фактическую ревальвацию Иены к Доллару США на 16.25%.

(2) In accounting, asset or inventory Revaluation is an adjustment made to reflect a loss in the value of fixed assets or inventory. Practice whereby a company puts a new value on its fixed assets, because nominal values and real values of such assets as property and machines have changed.

REVENUE = ВЫРУЧКА – IAS 18 (short for International Accounting Standard No. 18) – Revenue – The primary issue in accounting for revenue is determining when to recognise revenue. Revenue is recognised when it is probable that future economic benefits will flow to the entity and these benefits can be measured reliably. This Standard identifies the circumstances in which these criteria will be met and, therefore, revenue will be recognised. It also provides practical guidance on the application of these criteria. Revenue is the gross inflow of economic benefits during the period arising in the course of the ordinary activities of an entity when those inflows result in increases in equity, other than increases relating to contributions from equity participants. This Standard shall be applied in accounting for revenue arising from the following transactions and events:- (a) the sale of goods; (b) the rendering of services; and (c) the use by others of entity assets yielding interest, royalties and dividends. The recognition criteria in this Standard are usually applied separately to each transaction. However, in certain circumstances, it is necessary to apply the recognition criteria to the separately identifiable components of a single transaction in order to reflect the substance of the transaction. For example, when the selling price of a product includes an identifiable amount for subsequent servicing, that amount is deferred and recognised as revenue over the period during which the service is performed. Conversely, the recognition criteria are applied to two or more transactions together when they are linked in such a way that the commercial effect cannot be understood without reference to the series of transactions as a whole. For example, an entity may sell goods and, at the same time, enter into a separate agreement to repurchase the goods at a later date, thus negating the substantive effect of the transaction; in such a case, the two transactions are dealt with together. Revenue shall be measured at the fair value of the consideration received or receivable. Fair value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm’s length transaction. The amount of revenue arising on a transaction is usually determined by agreement between the entity and the buyer or user of the asset. It is measured at the fair value of the consideration received or receivable taking into account the amount of any trade discounts and volume rebates allowed by the entity. Sale of goods:- Revenue from the sale of goods shall be recognised when all the following conditions have been satisfied:- (a) the entity has transferred to the buyer the significant risks and rewards of ownership of the goods; (b) the entity retains neither continuing managerial involvement to the degree usually associated with ownership nor effective control over the goods sold; (c) the amount of revenue can be measured reliably; (d) it is probable that the economic benefits associated with the transaction will flow to the entity; and (e) the costs incurred or to be incurred in respect of the transaction can be measured reliably. Rendering of services:- When the outcome of a transaction involving the rendering of services can be estimated reliably, revenue associated with the transaction shall be recognised by reference to the stage of completion of the transaction at the balance sheet date. The outcome of a transaction can be estimated reliably when all the following conditions are satisfied:- (a) the amount of revenue can be measured reliably; (b) it is probable that the economic benefits associated with the transaction will flow to the entity; (c) the stage of completion of the transaction at the balance sheet date can be measured reliably; and (d) the costs incurred for the transaction and the costs to complete the transaction can be measured reliably. The recognition of revenue by reference to the stage of completion of a transaction is often referred to as the Percentage Of Completion Method. Under this method, revenue is recognised in the accounting periods in which the services are rendered. The recognition of revenue on this basis provides useful information on the extent of service activity and performance during a period. When the outcome of the transaction involving the rendering of services cannot be estimated reliably, revenue shall be recognised only to the extent of the expenses recognised that are recoverable. Interest, royalties and dividends:- Revenue shall be recognised on the following bases:- (a) interest shall be recognised using the effective interest method as set out in IAS 39, paragraphs 9 and AG5–AG8; (b) royalties shall be recognised on an accrual basis in accordance with the substance of the relevant agreement; and (c) dividends shall be recognised when the shareholder’s right to receive payment is established. Revenue is the total amount of money received by a firm from sales of its products and/or services, gains from the sales or exchange of assets, interest and dividends earned on investments, and other increases in the owner’s equity except those arising from capital adjustments. / МСБУ 18 (сокращение для Международного Стандарта Бухгалтерского Учёта № 18) – .

REVENUE BOND = ОБЛИГАЦИЯ ПОД ВЫРУЧКУ – Revenue Bond is a municipal bond supported by the revenue from a specific project, such as a toll bridge, highway or local stadium. Revenue bonds are municipal bonds that finance income-producing projects and are secured by a specified revenue source. Typically, revenue bonds can be issued by any government agency or fund that is run in the manner of a business – those entities having both operating revenues and expenses. Revenue bonds differ from general obligation bonds (GO bonds) that can be repaid through a variety of tax sources. Also called a Municipal Revenue Bond. For example, if a revenue bond is issued to build a new toll road, the tolls that are collected from motorists who drive on the road would be used to pay off the bond (after the building expenses had been paid). A primary reason for using revenue bonds is that they allow the municipality to avoid reaching legislated debt limits. An agency that is run solely on tax Dollars, such as a public school, cannot issue revenue bonds, since these entities would be unable to pay off the bond using revenues from the specific project. Generally, revenue bonds mature in 20 to 30 years and are issued in USD5 000.00 units. Some revenue bonds have staggered maturity dates and do not mature at the same time (these are known as Serial Bonds). Unlike general obligation bonds, which are backed by the full faith and credit of the municipality, revenue bonds carry a higher risk of default. In the United States, Revenue Bond is a type of municipal bond backed by revenue from the project the bond finances.

REVENUE EXPENDITURE = ТРАТА ВЫРУЧКИ (или ВЛОЖЕНИЕ ВЫРУЧКИ) – Expenditures will be treated as Revenue Expenditures if it is incurred for the following purposes:- (i) expenditure for purchasing floating assets, i.e. assets meant for resale at a

profit or for being converted into saleable goods, such as the cost of goods, raw materials and stores; (ii) expenditures incurred by maintaining assets in proper working order, e.g., repairs to plant and machinery, building furniture and fittings, etc; and (iii) expenditures incurred for meeting day to day expenses of carrying on a business, e.g., salaries, rent, rates, taxes, stationery, postage, etc. The following is a list of the usual items of Revenue Expenditures:- expenses incurred for the ordinary administration and carrying on the business; expenses for repairs, renewals and replacement of permanent assets; cost of goods for resale; cost of raw materials and stores acquired for consumption in course of manufacturing; wages paid for manufacture of products for sales; expenses for the manufacture and distribution of the finished goods; loss from wear and tear and obsolescence of assets; depreciation of lease; interest on loans borrowed for business; loss from sale of fixed assets; fees for renewal of patent rights, etc; up-keep and maintenance of motor car and van; maintenance of fan and lights; and book value of assets discarded or totally damaged or destroyed by fire or other reasons. Revenue Expenditure is an expenditure incurred in the course of earning revenue, in maintaining capital and on the acquisition of goods for resale. Revenue Expenditure is expenditure concerned with the costs of doing business on a day to day basis. When companies make a revenue expenditure, the expense provides immediate benefits, rather than long term ones. This is contrasted with capital expenditures, which are long term investments intended to help a business grow and thrive. It is sometimes said that businesses have to spend money to make money. Businesses use their revenues both to amass capital which can be used in the long term, and to cover immediate expenses. Revenue expenditures include things like maintenance, wages and salaries, and costs for utilities. The revenue expenditure consists of expenses which must be covered immediately to keep the business running and which provide immediate benefits. Companies break their expenses into revenue expenditures and capital expenditures so that they can see how they are using their funds and they can assess whether or not they are operating efficiently and effectively. Routinely high revenue expenditure can make it difficult for a business to build up capital, which means that it cannot make long term investments and it may not be prepared in the event of a crisis situation. For example, if a restaurant is spending most of its earnings compensating employees, paying suppliers, and performing maintenance, it may be in trouble if the freezer system goes down and needs to be replaced. At times, a calculated capital expenditure can cut down on revenue expenditure. To borrow the restaurant example again, the owners might sit down and realize that buying a building in which to operate would be cheaper than renewing a lease. Thus, they might make the decision to expend capital for that purchase in the interests of cutting down operating costs and establishing a long term presence. The new building will also be an investment itself; the restaurant now has an asset it can sell or rent if it needs to. Certain revenue expenditures may be deductible for tax purposes. It is recognized that a portion of business revenue applied to immediate expenses should not be taxed and business can claim such expenses as deductions. For example, a business is not required to pay taxes on the money it uses to pay payroll taxes. The rules for deductions are very complex and for a large business it may be necessary to consult an account to get accurate information and advice so that taxes will be filed properly.

REVENUES = ВИДЫ ВЫРУЧКИ (или ВЫРУЧКА ПО ВИДАМ) – In the United States, in accounting, proceeds from sales, services and certain other types of gross income for certain types of businesses. For utility and telecommunications companies, total amounts billed for services rendered. In the advertising industry, total commissions and fees received by an agency. For real estate companies, total income from rental, construction, interest and property sales. For financial institutions and intermediaries, amount of premiums, commissions or brokerage fees received. Revenues and sales are a measure of the volume of business activity of an economic unit. Also known as Operating Revenues, or Turnover in the United Kingdom. Monetary value of goods and services provided by a firm. Revenue is all income generated by the business, including sales of products, sales of services and earnings from investments. In general practice, the term is interchangeable with delivered sales. See also Sales. Sales of products, merchandise, and services; and earnings from interest, dividend, rents. / и дальней связи, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). В бухгалтерском учёте, поступления от продаж, . деловой активности хозяйствующего субъекта.

REVENUE TON = РАСЧЁТНАЯ ТОННА (или ТОННА ВЫРУЧКИ) – Revenue Ton (RT) is a unit used for billing in the shipping industry. The size of a shipment in revenue tons is the number of metric tons or the number of cubic meters in the shipment, whichever is larger. Revenue Ton (RT):- number of tons which freight is paid for per ton. Revenue Ton (RT) is a ton on which the shipment is freighted. If cargo is rated as weight or measure (W/M), whichever produces the highest revenue will be considered the revenue ton. Weights are based on metric tons and measures are based on cubic meters. RT = 1 MT or 1 CBM. Unit for which freight is paid; per ton or cubic meter.

REVENUE TONNE–KILOMETER = ВЫРУЧКА ТОННО–КИЛОМЕТР – Revenue Tonne-Kilometer One tonne of revenue freight carried one kilometer. Usually used interchangeably with freight tonne-kilometer but can include passenger weight for total revenue.

REVERSAL = ОТМЕНА – (1) Reversal is a transaction from the acquirer, and/or acceptor, to the card issuer informing the card issuer that the previously initiated transaction cannot be processed as instructed, i.e. is undeliverable, unprocessed, or cancelled by the receiver.

(2) Reversal:- a recall of funds from the creditor to the debtor relating to a previous settlement. A reversal instruction is initiated by the creditor. / Отзыв фондов у должника, осуществляемый кредитором, в отношении предыдущего расчёта. Инструкция об отмене инициируется кредитором.

REVERSAL = РАЗВОРОТ – Reversal:- a change in direction in prices. There are specific reversal patterns that traders look for, but a reversal can come from a standard pivot point as well that is less dramatic. / Смена направления в движении цен. Имеются специфические модели разворота (specific reversal patterns), которые высикиваются торговцами, а разворот, меж тем, может произойти также из стандартной опорной точки (standard pivot point), что само по себе может оказаться не менее драматичным.

REVERSAL AMOUNT = ЗНАЧЕНИЕ РАЗВОРОТА – In point & figure charts, the Reversal Amount is the number of boxes required to be retraced to cause a reversal, and thus, a move to the next column and opposite direction. When a smaller reversal amount is set for the same data, reversals will be more frequent, and longer-term price trends will be more difficult to identify. Increasing the reversal amount removes columns corresponding to less significant trends. / В техническом анализе биржевых рынков, .

REVERSAL DAY = РАЗВОРОТНЫЙ ДЕНЬ (или ДЕНЬ РАЗВОРОТА) – Reversal Day:- One Day reversal is the starting point for most reversal patterns. After an extended rally the stock gaps higher at the open to trade at a new high on a positive news announcement. As the session proceeds volume expands significantly but by the close the entire rally disappears and the stock closes lower. One Day reversals are by definition one day events and as such technical targets are not implied but if you look at every major reversal pattern you will quickly see that it all began with a one day reversal. For a bottom, buy at the next day's open and place your stops just beneath the prior low. Edwards and Magee suggest waiting for the next key reversal in the opposite direction. However, I would look for the first challenge of a major resistance area that fails for a retest. This could be a moving average, trendline, horizontal support or prior gap. The rules for a key reversal top are to sell on the open following the reversal and to place stops just above the prior day's high. Key reversal days are one of the most overrated patterns in technical analysis. Reversal Day:- a sharp reversal pattern

that occurs during a trend. In an uptrend, prices open above the previous day's close, make a new high and then close below the previous day's low. In a downtrend, prices open below the previous day's close, make a new low and then close higher than the previous day's high. The greater the price range and volume on the key reversal day, the more reliable the signal. Also known as Key Reversal Day. / В техническом анализе биржевых рынков, . Это сутки, когда достигается новый максимум при тенденции к росту, а затем происходит разворот и рынок закрывается ниже цены закрытия предыдущего дня; или когда достигается новый минимум при тенденции к падению, а затем происходит разворот и рынок закрывается выше цены закрытия предыдущего дня. Зачастую это бывают ложные сигналы, и их нельзя рассматривать в качестве серьёзного индикатора рынка.

REVERSAL HIGH DAY = ДЕНЬ РАЗВОРОТА НА МАКСИМУМЕ – Reversal Days or Key Reversal Days. A Reversal High Day is a day that makes a new high and reverses to close below the previous day's close (or, in the bottom 25% of the day's range). Such bars are common, and should not even be considered as reversal days unless they occur in established uptrends or downtrends, specifically. / В техническом анализе биржевых рынков, . Это день, когда достигается новый максимум при тенденции к росту, а затем происходит разворот и рынок закрывается ниже цены закрытия предыдущего дня.

REVERSAL–INSIDE DAY = ДЕНЬ РАЗВОРОТА ВНУТРИ ПРЕДЫДУЩЕГО ДИАПАЗОНА – Reversal-Inside Day:- a two-period chart pattern that suggests a potential reversal or deceleration of the current trend. The relationship of the two periods has the follow characteristics:- (i) the High is lower than the previous day's High; (ii) the Low is higher than the previous day's Low. The resulting pattern is a large bar or candlestick with a smaller bar or candlestick nestled completely inside. This basic definition of the outside day does not take into consideration the relationship of the closing levels. The significance of the inside day depends of the prior price action, support, resistance and other aspects of technical analysis. These patterns are not really bullish or bearish, but can foreshadow a significant move or breakout. Although the example provided uses daily data, this pattern can also be applied to intraday, weekly or monthly data. / В техническом анализе биржевых рынков, .

REVERSAL LOW DAY = ДЕНЬ НИЖНЕГО РАЗВОРОТА – Reversal Days or Key Reversal Days. A Reversal Low Day is a new low that reverses to close above the previous day's close (or, in the top 25% of the day's range). Such bars are common, and should not even be considered as reversal days unless they occur in established uptrends or downtrends, specifically. / В техническом анализе биржевых рынков, . Это день, когда достигается новый минимум при тенденции к падению, а затем происходит разворот и рынок закрывается выше цены закрытия предыдущего дня.

REVERSAL–OUTSIDE DAY = ДЕНЬ РАЗВОРОТА С ПРЕВЫШЕНИЕМ ПРЕДЕЛОВ ПРЕДЫДУЩЕГО ДИАПАЗОНА – Reversal-Outside Day:- a two-period chart pattern that suggests a potential reversal or deceleration of the current trend. The relationship of the two periods has the follow characteristics:- (i) the High is higher than the previous day's High; (ii) the Low is lower than the previous day's Low. The resulting pattern is a smaller bar or candlestick totally encompassed by a larger bar or candlestick. The significance of the outside day depends of the current trend, prior price action, support, resistance and other aspects of technical analysis. An outside day at resistance might be considered bearish, while an outside day at support might be considered bullish. This basic definition of the outside day does not take into consideration the relationship of the closing levels. Generally, the larger the range and higher the volume, the more significant is the pattern. Although the example provided uses daily data, this pattern can also be applied to intraday, weekly or monthly data. / В техническом анализе биржевых рынков, .

REVERSAL PATTERN = РАЗВОРОТНАЯ МОДЕЛЬ (или МОДЕЛЬ РАЗВОРОТА) – In technical analysis, Reversal Pattern is a chart pattern that occurs before an existing trend reverses direction. For example, a Head And Shoulders reversal pattern marks a change in trend. A break below neckline support indicates that the Head And Shoulders pattern is complete and the prior uptrend has reversed. Reversal Patterns:- these patterns break out in a direction opposite to the previous trend. They mark a change in direction of the price of the stock. After pausing to consider their investment strategies, investors decide to reverse an existing trend in a stock's price. Examples of this type of pattern include head-and-shoulders tops and bottoms, double-bottoms or -tops, triple-bottoms or -tops, ascending triangles, descending triangles, and symmetrical triangles. / В техническом анализе биржевых рынков, .

REVERSAL SPIKE = РАЗВОРОТНЫЙ ШИП – Reversal Spike:- market turns that happen very quickly with little or no transition period. Spikes often occur when a market has become very overextended in one direction, when a sudden piece of adverse news causes a sudden reversal. Reversal spike highs (also known as Blowoffs) and lows (also known as Selling Climaxes) can signal a reversal or deceleration of a trend, but unfortunately they are very difficult to forecast. / В техническом анализе биржевых рынков, .

REVERSAL STRATEGY = РАЗВОРОТНАЯ СТРАТЕГИЯ (или СТРАТЕГИЯ РАЗВОРОТА) – When is the Reversal Strategy most likely to succeed? When the market is likely to trend, which, is often in the first hour, shortly after the open, or the final hour just prior to the close. This is because the market rarely goes dead shortly after the open. To my dictum about taking the reversal trade quickly, I offer these suggestions:- One, you must reverse on a market order – not a limit order. There simply isn't time to pick your price. I once had a client who insisted on getting back in on a limit order. By insisting on his fill, he had to settle for nothing when the market soared out of sight. He ruined a perfectly good and profitable strategy by insisting on a price. Two, you must reverse without hesitation. When the market is ready to run, the window of opportunity may be a minute or less. You simply don't have time to watch the market for a while. A corollary of this rule is that you cannot let previous losses influence your ability to reverse. Three, in deciding to reverse, you must watch the market carefully. There are often definite signs that the market is ready to run. Four, you must identify the market conditions before you reverse. If you reverse on a non-trending day, you will simply get whipsawed and lose more money. Five, you may want to double on the reversal, for this is often a powerful trade and the losses will be recouped quickly. The nice thing about the reverse-and-double strategy is that you only need one-half the move to recoup 100 percent of the losses on the previous trade. Six, you must not reverse on every trade. The rule concerning market orders is perhaps the most important to remember. When you buy or sell at the market you can almost always find someone to take the other side. What do you care if you pay up to get a position if it is about to run in your direction? There are times when you do have the luxury to pick and choose your price carefully, but not when you have exited a losing position and want to reverse. I know the prices on the screen may seem inviting, but chances are the rally or break is already underway and there simply isn't any trading taking place at that price. As in football, where a winning touchdown can often be accomplished in the final 15 seconds, creating a new winner in the game, a few precious moments can make all the difference in the futures market. Knowing that you should reverse and doing it are different. That's why you want to think about this strategy before the reversal situation presents itself. After all, you have just taken a loss when you reverse, and you may indeed be setting yourself up for more losses. This is an emotional situation. But if you are to trade like a professional, you must be able to quickly extricate yourself from a difficult situation and try to take corrective action. The tendency is to want to 'watch' the market a bit after taking a loss. This is a mistake. The reason is simple. If the market soars out of sight when you are waiting to get up the courage to take the trade, you have missed the move! Chances are, it is not coming back – nor, for that matter, would you want it to. If the market again retreated, the move probably wouldn't be any good. Once mastered, of course, this strategy, in which you must risk throwing good money after bad, will stand you in good stead. Successful trading involves overcoming your own personal shortcomings – not beating the market. Winning traders know what they must do to win. Having control over their emotions and taking intelligent risks is the key to winning.

Since the reversal trade is, in part, an attempt to undo the damage created by the first losing entry, you must monitor the trade carefully. You are striving to accomplish two goals at once. One, you are trying to win back the money you just lost. Two, you are trying to capture the short-term trend and earn a profit. As with any trade, you must be waiting to grab the profit that the market gives – not the one you want or feel entitled to. A word of caution:- good things tend to be short-lived in the futures market. When you reverse – especially when you double – and the market runs your way, be wary of the initial euphoria you will experience. This is the time to be cautious, not reckless. Nail down the profit and congratulate yourself for the presence of mind to trade yourself out of a difficult situation. Relatively few futures traders have the courage to implement this strategy.

REVERSE CONVERSION = ОБРАТНАЯ КОНВЕРСИЯ – Reverse Conversion:- with regard to options, a position created by buying a call option, selling a put option, and selling the underlying instrument (for example, a futures contract). See also Conversion. Transaction comprised of three commodity contracts, including a short futures contract, a short put option and a long call option. The delivery month must be the same for all three commodity contracts and the strike price must be the same for the two option components.

REVERSE CONVERTIBLE BOND = ОБРАТНО КОНВЕРТИРУЕМАЯ ОБЛИГАЦИЯ – Reverse Convertible Bond is a bond where redemption is linked to the way a share price develops. Either the bond is repaid at 100% at maturity or the investor receives the number of shares specified in the sales prospectus. As a 'premium' for accepting the risk of having to accept shares, the investor is paid an attractive rate of interest compared with that on a normal bond.

REVERSE CRUSH SPREAD = ОБРАТНАЯ КУРСОВАЯ РАЗНИЦА В ОТНОШЕНИИ ОТЖИМА (или ОБРАТНЫЙ СПРЭД НА ОТЖИМ) – A Reverse Crush Spread is a an opposite strategy to the crush spread. In this strategy the speculator buys (long) futures contracts on soybean oil and soybean meal (output) and sells (short) futures contracts on soybean (input). This is a speculative, not a hedging, strategy. The sale of soybean futures and the simultaneous purchase of soybean oil and meal futures. See also Crush Spread. / Продажа фьючерсов на Соевые Бобы и одновременное приобретение фьючерсов на масло и шрот из Соевых Бобов. Смотрите также Курсовая Разница В Отношении Отжима или Спрэд На Отжим (Crush Spread).

REVERSED PIECES = ПЕРЕВЁРНУТЫЕ ИЗДЕЛИЯ – Reversed Pieces:- where piece is sewn with face side opposite from specification; where part cut for one side of garment sewn in other. Sewing Room Defects. / Порок или дефект швейного производства.

REVERSE LOGISTICS = ЛОГИСТИКА ПО ОБРАТАМ – Reverse Logistics is a rather general term. In its broadest sense, reverse logistics stands for all operations related to the reuse of products and materials. The management of these operations can be referred to as Product Recovery Management (PRM). PRM is concerned with the care of products and materials after they have been used. Some of these activities are, to some extent, similar to those occurring in the case of internal returns of defective items due to unreliable production processes. Reverse logistics refers however to all logistics activities the collection, disassembly and processing of used products, product parts and/or materials in order to ensure a sustainable (environmentally-friendly) recovery. Reverse Logistics is the logistics needed to plan return of product or a load. This may include a return order, transportation, and put-away.

REVERSE MUTATION = ОБРАТНАЯ МУТАЦИЯ (или ВОЗВРАТНАЯ МУТАЦИЯ) – Reverse Mutation is the process whereby the original state is restored for an inherited or mutant gene or chromosome.

REVERSE PREFERENCES = ПЕРЕСМАТРИВАЕМЫЕ (или ВОЗВРАЩАЕМЫЕ) ПРЕФЕРЕНЦИИ – Reverse Preferences:- tariff advantages once offered by developing countries to imports from certain developed countries that granted them preferences. Reverse preferences characterized trading arrangements between the European Community and some developing countries prior to the advent of the Generalized System of Preferences (GSP) and the signing of the Lome Convention.

REVERSE REPO TRANSACTION = ТРАНЗАКЦИЯ ОБРАТНАЯ РИПО – Some investing banks provide loans using Reverse Repo Transactions, where your securities are used as collateral securing loans. Interest rates (repo rates) start, e.g., at 5.9% p.a.. The product is especially suitable for clients who own a large quantity of shares. Provided loans can be used for making additional investments or for unspecified purposes. The maximum amount of a loan is 70% of the market value of securities (depending on the issue and the repayment period). Example of using Reverse Repo Transactions:- a client owns, e.g., 5 000 CEZ shares and needs a short-term loan. The market value of CEZ shares is CZK1 300 per share. The bank can offer the client a loan in the maximum amount of (5 000 x 1 300) x 0.7 = CZK4 550 000.

REVERSE REPURCHASE AGREEMENT = ОБРАТНОЕ СОГЛАШЕНИЕ ОБ ОТКУПЕ – Reverse Repurchase Agreement:- when the Federal Reserve needs to absorb Federal Reserve balances temporarily, it enters into reverse repurchase agreements with primary dealers. These transactions involve selling a Treasury security to a primary dealer under an agreement to receive the security back on a specified date. As in repurchase agreement transactions, these operations are arranged on an auction basis. When the Federal Reserve transfers the collateral (usually a Treasury bill) to the dealer, the account of the dealer's clearing bank at the Federal Reserve is debited, and total Federal Reserve balances decline. When the transaction unwinds, the account of the dealer's clearing bank is credited and total balances increase. Every business day, the Federal Reserve also arranges reverse repurchase agreements with foreign official and international accounts. These institutions have accounts at the Federal Reserve Bank of New York to help manage their US Dollar payments and receipts. The Federal Reserve permits these institutions to invest cash balances overnight through these agreements. A contract to purchase securities and subsequently to resell them at a specified date and price. Also known as Reverse Repo. A transaction – the opposite of a Repurchase Agreement – in which the Federal Reserve enters into an agreement with a primary dealer to sell securities from the System portfolio for a specified principal amount at an agreed-upon interest rate and to receive the securities back from the dealer on a specified future date. The maturity date may be the next day or many days later, with the maximum length set by the Federal Open Market Committee (FOMC). These transactions permit the Federal Reserve to decrease the supply of Federal Reserve balances for the length of the agreement. Similar transaction to a repurchase agreement (repo) in which the dealer buys the bonds instead of selling them, so that in essence they are acting as security on the bank loan. / Известно также как Обратное Рипо (Reverse Repo).

REVERSE SPLIT = ОБРАТНОЕ ДРОБЛЕНИЕ (или КОНСОЛИДАЦИЯ, или ПРОЦЕДУРА, ОБРАТНАЯ ДРОБЛЕНИЮ) – Reverse Split is a restructuring of the capital stock of a company by combining several of the old shares into one new share or preferred (preference) stock and common stock into a single share category. See also Split. / Консолидация или Процедура, Обратная Дроблению – сокращение количества акций, находящихся в обращении за счёт увеличения номинала акций посредством трансформации определённого числа ценных бумаг в одну. Общая сумма капитала не изменяется, а количество акций сокращается. Смотрите также Дробление Акций (Stock Split).

REVERSE STOCKINETTE FABRIC = ТКАНЬ ИЗНАНОЧНАЯ СТОКИНЭТ (или ТКАНЬ ИЗНАНОЧНАЯ ГЛАДЬ) – Reverse Stockinette Fabric:- purling pops the stitch heads to the 'front' of this fabric, while knitting pops the heads to the 'back' of this fabric.

When reverse stockinette is knitted flat – when it is made on alternating sides of the fabric (purl the back, then knit the front) the result is all the arms aligned on the back, and all the heads aligned on the front. See also Stockinette Fabric.

REVERSE STOCK SPLIT = ОБРАТНОЕ ДРОБЛЕНИЕ АКЦИЙ (или КОНСОЛИДАЦИЯ АКЦИЙ, или ПРОЦЕДУРА, ОБРАТНАЯ ДРОБЛЕНИЮ АКЦИЙ) – Reverse Stock Split:- a decrease in the corporation's total number of outstanding shares accompanied by a proportionate increase in the value per share. The shareholder must surrender their certificates in a reverse split, and new ones will be issued to them. For example, a 1 for 2 reverse stock split – if the holder owned 10 shares valued at USD25.00 per share, after the split they will own 5 shares valued at USD50.00 per share. Reverse Stock Split is a stock split which reduces the number of outstanding shares and increases the per-share price proportionately.

REVERSE TAKE–OVER = ОБРАТНОЕ ПОГЛОЩЕНИЕ – Reverse Take-Over (RTO):- a way of going public. A public company can take over another company by issuing a large number of shares to the shareholders of the target company. This may result in the new shareholders owning more shares than the original controlling shareholders – hence a change of control. Hence, this is referred to as a Reverse Takeover. Although the smaller company has technically taken over the larger one, the larger one's owners are now in charge. Example:- I have a public company with 1M shares which are trading at CAD1. You have a private company which you are prepared to sell to me for CAD3M. I buy your company but the currency I use to pay for your company is shares in my company, i.e. 3M shares (= CAD3M). So now you own 3M shares in 'my' company, i.e. 3/4 of the total. So, it really isn't 'my' company anymore. It's yours now because YOU control it. Although my company took yours over, you're really the one in control – hence 'reverse' take over. Reverse Takeover is the process by which a smaller, listed company usually a shell takes over a larger private company, but in effect the larger company ends up in control. It is a supposedly easier route to listing for the private company. The private company can be said to have 'reversed into' the public company and the public company has 'taken over' the other.

REVERSE TRANSACTION = ОБРАТНАЯ ТРАНЗАКЦИЯ (или ОБРАТНАЯ ОПЕРАЦИЯ) – Reverse Transaction is an operation whereby the central bank buys or sells assets under a repurchase agreement or conducts credit operations against collateral.

REVERSE TRANSCRIPTASE = ОБРАТНАЯ ТРАНСКРИПТАЗА (или РЕВЕРТАЗА) – Reverse Transcriptase is an enzyme that is able to synthesize DNA from RNA. Often found in tumor viruses. / Под Ревертазой понимается фермент, участвующий в процессе обратной транскрипции, то есть синтезе ДНК на матрице РНК. В этом случае перенос генетической информации осуществляется не от ДНК к РНК, как обычно, а от РНК к ДНК. Был открыт в 1970 в РНК-содержащих опухолеродных вирусах. Ревертаза или Обратная Транскриптаза, фермент класса трансфераз, осуществляющий обратную транскрипцию, то есть синтез молекул ДНК на РНК, как на матрице.

REVERSE YIELD GAP = ОТРЫВ ОБРАТНОЙ ДОХОДНОСТИ (или ХХ) – Reverse Yield Gap:- the long-dated gilt yield minus the equity yield.

REVERSIBLE BONDED FABRIC = ТКАНЬ, СКРЕПЛЁННАЯ ИЗНАНКОЙ – Reversible Bonded Fabric is a bonded structure in which two face fabrics are bonded together so that the two sides may be used interchangeable. There are limitations to the fabrics that may be used because of increased fabric stiffness resulting from bonding.

REVERSIBLE FABRIC = ДВУХЛИЦЕВАЯ ТКАНЬ (или ВЫВОРОТНАЯ ТКАНЬ) – Reversible Fabric is a fabric that can be used on either side. Generally, the term reversible is applied to two quite different fabrics joined together by such methods as laminating or double cloth construction. Reversible fahrics frequentiy are used for coats, less frequently for other garments. See also Double Cloth, and Laminating.

REVERSIBLE MUTATION = ОБРАТИМАЯ МУТАЦИЯ – Reversible Mutation is a mutation that can be restored to the original state.

REVERSIBLE PALLET = ОБРАТИМЫЙ ПОДДОН (или ДВУХЛИЦЕВОЙ ПОДДОН) – Reversible Pallet is a pallet with identical top and bottom decks. Reversible Pallet is a double-deck pallet with top and bottom decks, either of which can take the same payload. / Обратимый Поддон:- плоский двухнастильный поддон, каждый настил которого используют для размещения груза.

REVERSION = РЕВЕРСИЯ – Reversion is the changing of essential plant nutrient elements from soluble to less soluble forms as a result of interaction with, or reactions in, the soil. / Под Реверсией, от Латинского слова Reversio, означающее Возврат или Возвращение, понимается:- (1) то же, что Атавизм. (2) Переход мутированного гена в исходный, дикий, тип (обратная, или возвратная, мутация). (3) У Растений с различными генотипичными компонентами (например, у Химер) – появление побегов, свойственных одному из компонентов. Реверсия:- 1) то же, что Атавизм. (2) У растений с различными генотипическими компонентами (Пестролистные Растения, Химеры) – появление побегов, соответствующих одному из компонентов. (3) В генетике – переход мутировавшего гена в ген исходного или дикого типа (обратная, или возвратная, мутация). Реверсия, как и прямые мутации, могут быть спонтанными или индуцированными искусственно различными мутагенами. Изучение реверсии на Бактериях, Фагах и других микроорганизмах существенно углубило представления о механизмах мутагенеза. Смотрите также Супрессия.

REVERSION INTEREST = ПРОЦЕНТ РЕВЕРСИИ (или ХХ) – Reversion Interest is the interest of a freeholder or long term leaseholder, to whom the property will revert on expiry of a lease.

REVOCABLE LETTER OF CREDIT = ОТЗЫВНЫЙ АККРЕДИТИВ – With a Revocable Letter of Credit (L/C), the issuing bank has the right to revoke its commitment to honor the draft drawn upon it without prior warning. An irrevocable L/C is much preferred to the revocable L/C because, once the irrevocable L/C is accepted by the seller, it cannot be amended in any way or cancelled by the buyer or the buyer's bank without all parties' approval. A Revocable Letter of Credit is subject to possible recall or amendment at the option of the applicant, without the approval of the beneficiary. With a Revocable L/C, the issuing bank has the right to revoke its commitment to honor the draft drawn upon it without prior warning. An irrevocable L/C is much preferred to the revocable L/C because, once the irrevocable L/C is accepted by the seller, it cannot be amended in any way or cancelled by the buyer or the buyer's bank without all parties' approval. A letter of credit which can be cancelled or altered by the drawee (buyer) after it has been issued by the drawee's bank. / выданный банком трассата. Аккредитив может быть отзывным или безотзывным. Каждый аккредитив должен ясно указывать, является ли он отзывным или безотзывным. При отсутствии такого указания аккредитив является безотзывным. Безотзывный аккредитив составляет твёрдое обязательство банка эмитента, когда предусмотренные по аккредитиву документы представлены исполняющему банку или банку эмитенту и соблюдены все условия аккредитива:- (i) если аккредитив предусматривает платёж по предъявлении, – платить по предъявлении документов, указанных в аккредитиве; (ii) если аккредитив предусматривает платёж с рассрочкой, – платить в сроки, определяемые в соответствии с условиями аккредитива; (iii) если аккредитив предусматривает акцепт:- банком эмитентом – акцептовать переводные векселя (тратты), выставленные бенефициаром на банк эмитент, и оплатить их по наступлении срока платежа; другим банком трассатом – акцептовать переводные векселя (тратты), выставленные бенефициаром на банк эмитент, и оплатить их по наступлении срока платежа в случае, если банк трассат, указанный в аккредитиве, не акцептует выставленные на него переводные векселя

(тратты) или оплатить переводные векселя (тратты), акцептованные, но не оплаченные таким банком трассатом по наступлении срока платежа; и (iv) если аккредитив предусматривает негоциацию, – негоциировать без оборота на трассантов и/или добросовестных держателей переводные векселя (тратты), выставленные бенефициаром, и/или документы, представленные в соответствии с аккредитивом. Отзывный аккредитив может быть изменен или аннулирован банком эмитентом в любой момент без предварительного уведомления бенефициара. Безотзывный аккредитив не может быть ни изменен, ни аннулирован без согласия банка эмитента, подтверждающего банка (если имеется) и бенефициара. Отзывный Аккредитив – аккредитив, который может быть изменён или аннулирован банком эмитентом в любой момент без предварительного уведомления бенефициара.

REVOCABLE STOCK EXCHANGE ORDERS = ОТЗЫВНЫЕ РАСПОРЯЖЕНИЯ ДЛЯ ФОНДОВОЙ БИРЖИ – Revocable Stock Exchange Orders are the unconditional, limited orders which are considered valid until revoked, i.e. until the end of the current month or, if given at month's end, until the close of the following month. The principal can extend or revoke the order at any time. / , то есть .

REVOCATION = ОТМЕНА – (1) In banking, Revocation is a process to claim for reimbursement of direct debit after settlement.

(2) In banking, a Revocation instruction is initiated by the debtor or his the debtor's bank.

REVOCATION OF ANTIDUMPING DUTY ORDER AND TERMINATION OF SUSPENDED INVESTIGATION = ОТМЕНА РАСПОРЯЖЕНИЯ ОБ АНТИДЕМПИНГОВОЙ ПОШЛИНЕ И ПРЕКРАЩЕНИЕ ПРИОСТАНОВЛЕННОГО РАССЛЕДОВАНИЯ – Revocation Of Antidumping Duty Order And Termination Of Suspended Investigation:- an antidumping duty order may be revoked or a suspended investigation may be terminated upon application from a party to the proceeding. Ordinarily the application is considered only if there have been no sales at less than fair value for at least the two most recent years. However, the US International Trade Administration may on its own initiative revoke an antidumping duty order or terminate a suspended investigation if there have not been sales at less than fair value for a period of 3 years.

REVOLUTE = ЗАКРУЧЕННОЕ НАЗАД (или ЗАКРУЧЕННОЕ ВНИЗ) – Revolute:- rolled backward from margin or apex.

REVOLVING CREDIT = ВОЗОБНОВЛЯЕМЫЙ КРЕДИТ – Revolving Credit:- linding made by a bank that is automatically renewed at the start of each period or as soon as the sum is repaid. For example, a bank may arrange to lend a customer a certain amount each month. It will stop borrowing above that limit once it is reached, but allow borrowing to go on at the start of the next month. Revolving Credit is a credit which can be automatically renewed without additional negotiation. Also known as Revolver in the United States. / Кредит, который может быть возобновлён автоматически без дополнительных переговоров. Возобновляемый Кредит или Револьверный Кредит – соглашение между банком и клиентом, обычно компанией, по которому банк обязуется предоставлять кредит вплоть до оговорённой максимальной суммы в течение определённого периода, обычно года или более. После того как заёмщик выплатит часть ссуды, средства, равные выплаченной сумме, вновь могут быть взяты взаймы в соответствии с условиями соглашения. В дополнение к процентам, приносимым векселями, банк взимает плату за обязательство поддерживать доступные средства. Помимо этого может потребоваться компенсационный баланс (compensating balance). Потребительские банковские операции:- ссудный счёт, по которому ежемесячно должны уплачиваться суммы, меньшие полной суммы займа, и если выплаты остатка переносятся на более поздний срок, то взимается дополнительная плата. Также договорённость, согласно которой займы разрешаются вплоть до определённого предела и на определённый период времени, обычно один год, и за обязательство по предоставлению средств взимается плата. Называется также Открытым Кредитом (Open-End Credit) или Револьверной Кредитной Линией (Revolving Line of Credit).

REVOLVING LETTER OF CREDIT = ВОЗОБНОВЛЯЕМЫЙ АККРЕДИТИВ (или РЕВОЛЬВЕРНЫЙ АККРЕДИТИВ) – Revolving Letter Of Credit (L/C) is a single L/C that covers multiple-shipments over a long period. Instead of arranging a new L/C for each separate shipment, the buyer establishes a L/C that revolves either in value (a fixed amount is available which is replenished when exhausted) or in time (an amount is available in fixed installments over a period such as week, month, or year). L/Cs revolving in time are of two types:- in the cumulative type, the sum unutilized in a period is carried over to be utilized in the next period; whereas in the non-cumulative type, it is not carried over. Revolving Letter Of Credit is a letter of credit that reverts to its original amount at specified intervals, e.g., monthly, thereby preventing drawing too much in any one period. Revolving Letter of Credit:- letters of credit from a financial institution are useful for many things. Many businesses keep them open 'just in case' the need for capital arises. Unlike a loan, the funds from a letter of credit aren't advanced immediately. A business must request the funds from the bank, at which time, it will receive funds and make payments as stated in the loan documents. Revolving Letter Of Credit is a letter of credit authorizing drafts up to a specified amount and permitting additional drafts to be drawn up to the amount of accepted drafts previously paid off. / , например, . Аккредитив может быть Возобновляемым или Револьверным. По такому аккредитиву по мере его использования (выплат) сумма аккредитива (квота) автоматически восстанавливается без внесения изменений в его условия, о чём делается специальная оговорка. Квота может восстанавливаться сразу после каждой выплаты по аккредитиву либо с определённой периодичностью в пределах установленной общей суммы лимита и срока для представления документов по аккредитиву. Револьверный аккредитив с указанной периодичностью использования квоты (платёж раз в месяц, раз в квартал и другой) может быть кумулятивным или некумулятивным. Если аккредитив обозначен как 'кумулятивный', то квота, не использованная в течение какого-либо периода, переносится на следующий период и может быть использована дополнительно к квоте следующего периода. Квота, не использованная в течение указанного в некумулятивном аккредитиве периода, на следующий период не переносится. Аккредитив, разрешающий частичные отгрузки, но не содержащий специальную оговорку о возобновлении его суммы, не является револьверным. Возобновляемый или Револьверный Аккредитив – аккредитив покрывающий поставки партиями через определённые промежутки времени, и используемый в рамках оговорённых частичных сумм, периодически возобновляемых в течение срока действия аккредитива. В случае с револьверным аккредитивом возможны две следующие принципиальные схемы:- (i) суммы неиспользованных в срок, или частично использованных долей могут быть добавлены к остающимся суммам; и (ii) срок использования своевременно невостребованных сумм истекает, и они не могут быть добавлены к последующим.

REVOLVING LINE OF CREDIT = ВОЗОБНОВЛЯЕМАЯ КРЕДИТНАЯ ЛИНИЯ – Revolving Line Of Credit is a line of credit extended to a business or a consumer in the form of a credit card, checking account cash reserve or other credit arrangement. A revolving line of credit is good for a specified period of time, but does not have a fixed repayment schedule. The ceiling declines automatically as the borrower uses the line of credit, which is replenished as soon as borrowed funds are repaid. / выплата (repayment) .

REVOLVING SPINNING RING = ВРАЩАЮЩЕЕСЯ ПРЯДУЩЕЕ КОЛЬЦО – Revolving Spinning Ring is a driven ring that rotates in the direction of the traveler on a ring spinning frame. Since both the ring and the yarn package turn when this ring system is used, productivity is increased.

REVOLVING UNDERWRITING FACILITIES = ЦЕННЫЕ БУМАГИ С ПРОДЛЕВАЕМОЙ ПОДПИСКОЙ – Revolving Underwriting Facilities (RUFs) are the short- to medium-term securities traded on the Eurocommercial paper market. The lead manager acts as the sole placing agent. Renewed after expiry if necessary. See also Note Issuance Facility.

THE REWARD PLAN = ПЛАН ВОЗНАГРАЖДЕНИЯ – Reward Plan:- the company Share Reward Plan, a closed plan approved by shareholders on listing or IPO (Initial Public Offering) and adopted for the purpose of rewarding employees who contributed to the company's development and growth over the period leading up to listing or IPO (Initial Public Offering).

REWARD–TO–RISK RATIO = СООТНОШЕНИЕ ВОЗНАГРАЖДЕНИЯ С РИСКОМ (или СТЕПЕНЬ РИСКА) – Reward-To-Risk Ratio is a calculation equal to the potential reward divided by the potential risk of a position. A long position entered at 100 with potential reward estimated at 120 and potential risk of 90 would have a reward-to-risk ratio of 20:10, or 2 to 1. Generally, a higher reward-to-risk ratio is a more appealing trade. For a long position, potential reward might be based on breakout projections, resistance levels or retracement estimates. Potential risk might be based on support levels, stop or loss requirements.

RE–WORK = ПЕРЕРАБОТКА – Re-Work:- unloading the cargo from one container into another container due to defective equipment or the freight's requiring rehandling or weight adjustment, or improper blocking and bracing.

REWORKED WOOL = ВТОРИЧНО ПЕРЕРАБАТЫВАЕМАЯ ШЕРСТЬ – Reworked Wool is a wool that has been previously used. Also called Shoddy and Mungo. / Шоди (Shoddy) и Манго (Mungo).

REX® = РЭКС® – The German REX® (Rentenindex or Kursindex, in German) is an index expressing the daily trend on the market for German government bonds. It is calculated once daily by Deutsche Börse on the basis of 30 representative fixed-income bonds and treasury notes. It is determined daily on the basis of the cash prices on the Frankfurt Stock Exchange. The REXP® (Performanceindex), by contrast, as a performance index captures price changes and interest income and thus measures investment performance. It corresponds to the international standard total return indices. The REX® index offers a representative cross-section of the market for German government bonds that carry a fixed coupon and have a remaining time to maturity of between 0.5 and 10.5 years. The index is determined on the basis of synthetic bonds with fixed maturities and fixed coupons, and is divided into ten maturity sub-indices and three coupon class sub-indices. The index is calculated once per day on the basis of traded price data from the Frankfurt Stock Exchange. REX® tracks the 30 German government bonds market. It comprises all bonds, including treasury bonds issued by the Federal Republic of Germany, the 'German Unity' Fund (Fonds Deutsche Einheit) and the former Treuhand (Treuhandanstalt) with fixed income and residual maturity of between 0.5 and 10.5 years. These have interest rates of 6, 7.5 and 9 percent. The weighting of each individual bond is determined based on the market share of each maturity in the past few decades. This creates a hypothetical index with a residual maturity of around five and a half years, and a coupon of around 7.5 percent. As a price index, REX® does not reflect the yields that an investor would achieve with a long-term investment in REX®; it simply reflects the price level applicable to the market in each case (although the interest rate can be determined from this). REX® is calculated using exchange prices actually traded; it and its ten sub-indices are calculated once a day. REX® calculations are based on the cash settlement prices of all fixed-income bonds and treasury bonds issued by the Federal Republic of Germany, the 'German Unity' Fund and the former Treuhand with residual maturity of between 0.5 and 10.5 years. The bonds have to meet a minimum nominal volume in order to qualify for the REX® indices; the current minimum is €500 million. To find out how an investment performs overall in REX®, including the interest income accrued, refer to REXP®. This is a performance index which shows bondholders' investment success. There are a range of other indices apart from REX® and REXP® which are used as barometers, but predominantly as underlyings and benchmarks. REX® and REXP® are registered trademarks of Deutsche Borse AG. Base Value and Base Date:- 100 on 1987-December-30. Calculation Frequency:- once a day. REXP® is a symbol for REX® (Performance). / Рэнтниндэкс (Rentenindex) или Курсиндэкс (Kursindex). Тройханданштальт (Treuhandanstalt). Немецкий индекс РЭКС® был запущен в обращение Немецкой Биржей АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG) 11 Июня 1991, а базовое значение индекса в 100 было расчитано 30 Декабря 1987. В настоящее время рассчитывается раз в день. Индекс РЭКСП® был запущен в обращение Немецкой Биржей 27 Апреля 1992.

REYNOLDS NUMBER = ЧИСЛО РЭЙНОЛДЗА (или ЧИСЛО РЕЙНОЛЬДСА) – Reynolds Number is a numerical ratio of the dynamic forces of mass flow to the shear stress due to viscosity. Flow usually changes from laminar to turbulent between Reynolds Number 2 000 and 4 000. Reynolds Number was named by Arnold Sommerfeld in 1908 after Osborne Reynolds (1842-August-23–1912-February-21) was a British prominent innovator, physicist and engineer from Manchester. The most prominent dimensionless group that emerges from these analyses is the Reynolds Number, named after Osborne Reynolds who made several important contributions to fluid mechanics. One problem Reynolds investigated experimentally is the transition of flow from the orderly kind that we call 'Laminar Flow' to the more chaotic type of flow termed 'Turbulent Flow'. Reynolds published the results of his study in 1883 in an article (1) that is regarded as one of the most important contributions in the field of fluid mechanics. This study changed the way in which knowledge about the transition between the two types of flows, namely, laminar and turbulent, is organized. It was known from earlier studies that turbulent flow occurs in conduits of large cross-sectional dimensions and flows at high velocities, whereas laminar flow occurs in slow flows in conduits of relatively small cross-sectional dimensions. The role of viscosity and density in affecting the type of motion was not as well-characterized. In laminar flow, the pressure drop for flow is linear in the average velocity of the fluid, as we learned earlier, whereas in turbulent flow Reynolds observed that it was approximately proportional to $V^{1.72}$, where V is the average velocity, in his experiments. The actual dependence of the pressure drop on the velocity for turbulent flow in circular tubes is more complicated. For instance the roughness of the interior pipe wall in contact with the fluid profoundly affects the pressure drop, even if it is so minute as not to be visible to the naked eye. Through careful experimentation, Reynolds established that the change in the nature of the flow occurs when a certain combination of the parameters in the flow crosses a threshold. Later, this combination was named the 'Reynolds Number'. For flow in a circular tube of diameter D at an average velocity V, the Reynolds Number Re is defined as follows:- $Re = DV\rho/\mu$, here, ρ is the density of the fluid, and μ is the dynamic viscosity of the fluid. The ratio is termed the kinematic viscosity. For circular tubes, the transition from laminar to turbulent flow occurs over a range of Reynolds numbers from approximately 2 300 to 4 000, regardless of the nature of the fluid or the dimensions of the pipe or the average velocity. All that matters is that this specific combination of the parameters, known as the Reynolds number, fall in the range indicated. So, when the Reynolds number is below 2 300, we can expect the flow to be laminar, and when it is above approximately 4 000, the flow will be turbulent. In between these two limits, the flow is termed 'transition flow'. We can ascribe a certain physical significance to the Reynolds number. This is most conveniently seen by recasting this group after multiplying both the numerator and the denominator by the average velocity V. $Re = \rho V^2/\mu(V/D)$. In this form, we see that the denominator represents a characteristic shear stress in the flow, because it is the product of the viscosity of the fluid and a characteristic velocity gradient obtained by dividing the average velocity by the diameter of the tube. The numerator, in contrast, describes an inertial stress; recall that the larger the density, the more massive a material is, and mass is a measure of inertia. This is the reason for calling the product ρV^2 a characteristic inertial stress. Thus, we can think of the Reynolds number as the ratio of two characteristic stresses in the flow. Re = Inertial Stress / Viscous Stress. Stress is force per unit area. Therefore, it is common to express the physical significance of the Reynolds number as follows. Re = Inertia Force / Viscous Force. We

see now that the nature of the flow in a tube, whether laminar or turbulent, depends on the relative importance of the inertia force in comparison with the viscous force. At relatively low values of the Reynolds number, the viscous force is relatively more important, and disturbances in the flow are damped out by viscosity. Thus, it is difficult for disturbances to grow and sustain themselves. On the other hand, at relatively large values of the Reynolds number, the damping of disturbances by viscosity is less effective, and inertia is more important, so that disturbances can perpetuate themselves. This is the basic reason why the Reynolds number serves as a measure for determining whether the flow is laminar or turbulent. Notice that the use of the diameter in the definition of the Reynolds number is an arbitrary choice. It is perfectly legitimate to use the radius of the tube instead of the diameter when performing dimensional analysis, so that the resulting Reynolds number would have been defined using the radius of the tube instead of its diameter, but the value at which transition would occur would have to be altered appropriately. It is for this reason that everyone has agreed on a single convention to avoid confusion. You might wonder why we did not use the length of the tube in defining the Reynolds number. This is because the typical velocity variation in this flow is across the cross-section of the tube, not along its length. Thus, if we had used the length L, the entity μ(V/L) would not be representative of the shear stress in this flow. Reynolds number for the steady motion of a sphere through a fluid. When we performed dimensional analysis on the drag experienced by a sphere of diameter d_p moving at a velocity V through a fluid with viscosity μ and density ρ, we encountered a Reynolds number in that problem as well. It is defined as:- $Re = d_pV\rho/\mu$. We found that the drag coefficient, which is a dimensionless drag, depends on this Reynolds number. The flow past a sphere is more involved than that in a tube. At high Reynolds number, a boundary layer, in which viscous effects are important, forms on the sphere, and outside of this boundary layer, viscous effects are relatively unimportant, and the flow is dominated by inertia. We shall learn a little more about this topic later in the course when we discuss boundary layers. / Арнольд Зомафэльд (Arnold Sommerfeld). Число Рэйнолдза или Число Рейнольдса – безразмерная величина, являющаяся одной из основных характеристик течения вязкой жидкости и равная отношению сил инерции к силам вязкости:- $Re = \rho vl/\mu$, где ρ – плотность жидкости, v – характерная скорость (например, скорость потока), l – характерный линейный размер (например, диаметр трубы), μ – коэффициент вязкости жидкости. Число Рэйнолдза является критерием подобия потоков вязкой жидкости. Название по имени Английского физика и инженера Озбона Рэйнолдза (или Осборна Рейнольдса) (Osborne Reynolds, 1842–1912). Число Рейнольдса – один из подобия критериев для течений вязких жидкостей и газов, характеризующий соотношение между инерционными силами и силами вязкости:- $Re = \rho vl/\mu$, где ρ – плотность, μ – динамический коэффициент вязкости жидкости или газа, v – характерная скорость потока, l – характерный линейный размер. Так, при течении в круглых цилиндрических трубах обычно принимают l = d, где d – диаметр трубы, а v = $v_{ср}$, где $v_{ср}$ – средняя скорость течения; при обтекании тел l – длина или поперечный размер тела, а v = $v_{¥}$, где $v_{¥}$ – скорость невозмущённого потока, набегающего на тело. Названо по имени Озбона Рэйнолдза. От числа Рейнольдса зависит также режим течения жидкости, характеризуемый критическим числом Рейнольдса $Re_{кр}$. При R < $Re_{кр}$ возможно лишь ламинарное течение жидкости, а при Re > $Re_{кр}$ течение может стать турбулентным. Значение $Re_{кр}$ зависит от вида течения. Например, для течения вязкой жидкости в круглой цилиндрической трубке $Re_{кр}$ = 2 300.

RF = RADIO FREQUENCY

RF = ROCKEFELLER FOUNDATION

RFAC = REGIONAL FIRMS ADVISORY COMMITTEE

RF GENE = FERTILITY RESTORER GENE

RFID = RADIO–FREQUENCY IDENTIFICATION

RFLP = RESTRICTION FRAGMENT LENGTH POLYMORPHISM

RHEOLOGICAL PROPERTIES = РЕОЛОГИЧЕСКИЕ СВОЙСТВА – Reological Properties are the properties of viscous substances including polymers that deal with deformation and flow. Includes viscosity and flow rate measurements. / Под Реологическими Свойствами, от Греческих слов Rhéos, означающее Поток или Течение, и Logos, означающее Слово или Учение, понимаются свойства вязких субстанций, включая полимеры, .

RHEOLOGY = РЕОЛОГИЯ – Rheology is the study of the deformation and flow of matter in terms of stress, strain, temperature, and time. The rheological properties of a grease are commonly measured by penetration and apparent viscosity. It is used in the wider sense to mean that branch of physics which is concerned with the deformation of materials. Deformation (D) is a movement of parts or particles of a material body with regard to one another such that the continuity of the body is not destroyed. If under the action of finite forces the deformation of the body increases with time continuously and irreversibly, the material is said to flow (f). Plastic flow occurs only when the forces exceed a certain limit, indicated by the yield point of the material. Viscous flow occurs under the action of any forces however small, albeit at a reduced rate of deformation, which rate vanishes with the forces. The deformation of a body is produced by loads (P), which together with the reactions from supports and the body-forces constitute the external forces. When the forces are removed, part of the deformation will always be recovered. This part is elastic, and is called Strain (e). From this definition it follows that we cannot determine the strain from a loading diagram in which the total deformation is recorded, but can upon unloading, when we see how much deformation is recovered. The recovery from deformation is a manifestation of the property of elasticity; accordingly all strain is elastic. In general all strain vanishes when the load is removed. However, as a result of certain manufacturing

processes (e.g., the rolling of mild steel, the setting of concrete or hardening of cheese) a body may become self-strained, when internal stresses are present in the absence of external forces. In every case there is no strain without stress. In contradistinction, while nascent viscous and plastic deformations are accompanied by stresses, these deformations do not disappear with the removal of the load and accordingly there will be stressless deformations. The investigation of these different kinds of deformations in relation to the stresses by which they are accompanied is the subject of rheology. It should be noted that there are stressless volume changes resulting from variations of temperature or of moisture content of such materials as wood, concrete and earth which, when not resisted, are not accompanied by stresses, even in the nascent state. While they do not form part of the subjectmatter of rheology, they must be taken into account in rheological observations. / Под Реологией, от Греческих слов Rhéos, означающее Поток или Течение, и Logos, означающее Слово или Учение, понимается учение, изучающее процессы, связанные с необратимыми остаточными деформациями и течением различных вязких и пластических материалов (Неньютоновских жидкостей, дисперсных систем и других). Реология – наука о деформациях и текучести вещества. Реология рассматривает процессы, связанные с необратимыми остаточными деформациями и течением разнообразных вязких и пластических материалов (неНьютоновских жидкостей, дисперсных систем и других), а также явления релаксации напряжений, упругого последействия и так далее. Термин Реология ввёл Американский учёный Юдьжин Кук Бинэм (Eugene Cook Bingham; 1878–1945), которому принадлежат ценные реологические исследования жидкостей и дисперсных систем. Официально термин Реология принят на 3-м Симпозиуме По Пластичности (1929, США), однако отдельные положения реологии были установлены задолго до этого. Реология тесно переплетается с гидромеханикой, теориями упругости, пластичности и ползучести; в ней широко пользуются методами вискозиметрии. В основу реологии легли законы Английского учёного Сэра Айзэка Ньютчэна (или Исаака Ньютона (Sir Isaac Newton); 1643–1727) о сопротивлении движению вязкой жидкости, Навье-Стокса уравнения (Французский инженер и учёный Клёд Люи Мари Ори Навье (Claude Louis Marie Henri Navier; 1785–1836) и Английский физик Сэр Дьжодьж Гейбриэл Стокс (Sir George Gabriel Stokes; 1819–1903)) движения несжимаемой вязкой жидкости, работы Дьжеймза Клока Мэксвэла (James Clerk Maxwell; 1831–1879), Сэра Вилъйэма Томсэна (Sir William Thomson; 1824–1907; более известный как Лорд Келвин (The Lord Kelvin)) и других. Значительный вклад внесён Русскими учёными:- Дмитрием Ивановичем Менделеевым (1834–1907), Николаем Павловичем Петровым (1836–1920), Фёдором Николаевичем Шведовым (1840–1905) и Советскими учёными Петром Александровичем Ребиндером (1898–1972), Михаилом Павловичем Воларовичем (1900–1987), Георгием Владимировичем Виноградовым (1910–1988) и другими. С проблемами реологии приходится встречаться в технике:- при разработке технологии разнообразных производственных процессов, при проектных работах и конструкторских расчётах, относящихся к самым различным материалам:- металлам (особенно при высоких температурах), композиционным материалам, полимерным системам, нефтепродуктам, глинам и другим грунтам, горным породам, строительным материалам (бетонам, силикатам и другим), пищевым продуктам и так далее. В реологии существует несколько подразделов. Теоретическая Реология (Феноменологическая Реология, или Макрореология) может рассматриваться как часть механики сплошных сред, она занимает промежуточное положение между гидромеханикой и теориями упругости, пластичности и ползучести. Она устанавливает зависимости между действующими на тело механическими напряжениями, вызываемыми Деформациями, и их изменениями во времени. При обычных в механике сплошных сред допущениях об однородности и сплошности материала теоретическая реология решает разные краевые задачи деформирования и течения твёрдых, жидких и иных тел. Основное внимание обращается на сложное реологическое поведение вещества, например, когда одновременно проявляются вязкие и упругие свойства или вязкие и пластические. Общее реологическое уравнение состояния вещества пока не установлено, имеются уравнения лишь для отдельных частных случаев. Для описания реологического поведения материалов пользуются механическими моделями, для которых составляют дифференциальные уравнения, куда входят различные комбинации упругих и вязких характеристик. Реологическими моделями пользуются при изучении механических свойств полимеров, внутреннего трения в твёрдых телах и других свойств реальных тел. Экспериментальная Реология (Реометрия) определяет различные реологические свойства веществ с помощью специальных приборов и испытательных машин. Микрореология исследует деформации и течение в микрообъёмах, например в объёмах, соизмеримых с размерами частиц дисперсной фазы в дисперсных системах или с размерами атомов и молекул. Биореология исследует течение разнообразных биологических жидкостей (например, крови, синовиальной, плевральной и других), деформации различных тканей (мышц, костей, кровеносных сосудов) у человека и животных.

RHEOTROPISM = РЕОТРОПИЗМ – Rheotropism:- bending, growth or movement of a part under the influence of a water current. See also Tropism. / Смотрите также Тропизм (Tropism). Под Реотропизмом, от Греческих слов Rhéos, означающее Поток или Течение, и . Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов. Под Реотропизмом, от Греческих слов Rhéos, означающее Поток или Течение, и Tróрos, означающее Направление или Поворот, понимается свойство корней многих Растений при росте их в токе воды изгибаться или навстречу току (Положительный Реотропизм), или по направлению тока (Отрицательный Реотропизм). Характер реотропической реакции корней зависит от состава питательного раствора, поэтому иногда считают, что реотропизм – частный случай хемотропизма. В то же время, учитывая высокую чувствительность Растений к всевозможным механическим воздействиям (смотрите Тропизмы), реотропизм можно считать и одним из специфических проявлений травмотропизма в его слабой форме.

RHINESTONE = ГОРНЫЙ ХРУСТАЛЬ – Rhinestone is a faceted pie of glass (the glass is cut with faces that reflect light). Rhinestones are used in costume jewelry or as decoration on clothing or trimming. Rhinestones are also called Diamantes.

RHIZOBIA = РИЗОБИЯ – Rhizobia is a Bacteria capable of living symbiotically in roots of legumes from which they receive energy and often utilize molecular nitrogen. / в корнях .

RHIZOCYLINDER = РИЗОЦИЛИНДР – Rhizocylinder is the Plant root plus the adjacent soil that is influenced by the root. / корень растения плюс .

RHIZOID = РИЗОИД (или РИЗОИДНОЕ, или КОРНЕВИДНОЕ) – Rhizoid is a filamentous root-like structure on a pteridophyte (fern) prothallus. / Ризоид – нитевидная корнеобразная структура на заростке птеридофитов (Папоротников). Под Ризоидами, от Греческих слов Rhiza, означающее Корень, и Éidos, означающее Вид, понимаются нитевидные образования у Мхов, заростков Папоротниковидных, Лишайников, некоторых Водорослей и Грибов, выполняющие функцию корня. Под Ризоидами понимаются нитевидные образования из одной или нескольких клеток, расположенных в ряд, у Мхов, Лишайников, некоторых Водорослей и Грибов (например, у Rhizopus), служащие для прикрепления к субстрату и поглощения из него воды и питательных веществ. По внешнему виду Ризоиды напоминают корневые волоски. У Маршанциевых Мхов имеются особые, так называемые Язычковые Ризоиды, состоящие из мёртвых клеток, по которым вода передвигается, как по фитилю.

RHIZOME = РИЗОМА (или КОРНЕВИЩЕ, или ПОДЗЕМНЫЙ ПОБЕГ) – Rhizome is an underground stem – distinguished from a root by the presence of buds and scales – which is capable of creeping and producing new shoots. An underground stem, usually horizontal, producing leafy shoots and roots. Rhizome is an underground stem from which roots, aerial stems or leaves can arise directly. Hence:- Adj. rhizomatous – producing or possessing rhyzomes. / из корня . Под Ризомой, от Греческого слова Rhiza, означающее Корень, и . Под Корневищем (Rhizoma) понимается подземный многолетний побег травянистых растений. Различают:- (i) Эпигеогенные Корневища (надземные побеги после отмирания листьев втягиваются в почву придаточными корнями – Гравилат, Копытень, Медуница) и (ii) Гипогеогенные Корневища (побег растёт в почве, имея лишь чешуевидные листья, а зеатем его верхушка выходит на поверхность, образуя ассимилирующие побеги, – Купена). Корневища могут ветвиться и формировать куртину надземных побегов. В узлах или на междоузлиях корневища развиваются придаточные корни. По длине корневища растения делят на:- (i) Длиннокорневищные Растения, у которых корневище служит в основном для расселения и вегетативного размножения, и (ii) Короткокорневищные Растения, у которых корневища служат в основном вместилищем запасных веществ – главным образом крахмала. У некоторых видов корневища клубневидно утолщены (переходные формы к клубню – Канна, Норичник – или к луковице – Зубянка, Петров Крест). У ряда растений корневище нарастает верхушкой, а основание его постепенно отмирает. У некоторых растений корневища съедобны (Канна, Лотос, Рогоз, Тростник), у других – ядовиты (Касатик Разноцветный), у третьих используются как лекарственное сырьё (Бадан, Валериана, Родиола Розовая). Многие корневищные растения – злостные трудно искореняемые сорняки (Пырей и многие другие). Корневище:- специальный модифицированный стебель, иногда толстый и мясистый, но не всегда. Он лежит вблизи поверхности почвы (но не у эпифитов) и образует корни и наземные органы – листья и цветки. Можно отличить корневище от корня по наличию узлов, чешуевидных листьев или почек. Подземный Стебель, как правило, горизонтальный, производящий новые густолиственные побеги и корни.

RHIZOPLANE = РИЗОПЛАН – Rhizoplane is the external surface of Plant roots. See also Rhizosphere. / Ризоплан – поверхность корней растения. внешняя поверхность корней растения.

RHIZOSPHERE = РИЗОСФЕРА – The biologically active zone surrounding plant roots that includes the root surface and the adjacent soil. A 3-dimensional site of intense microbial activity stimulated by substances exuded from the root. Rhizosphere is the zone of soil where the microbial population is altered both quantitatively and qualitatively by the presence of Plant roots. / Ризосфера – прикорневая зона растения. наличием корней растения. Под Ризосферой, от Греческих слов Rhiza, означающее Корень, и Sphâira, означающее Область или Шар, понимается прилегающий к корням растений слой почвы (2–3 миллиметра) с повышенным содержанием микроорганизмов. Микробы переводят трудноусвояемые растениями соединения в легкоусвояемые, вступают в симбиоз с Растением (Клубеньковые Бактерии, микориза). Ризосфера, слой почвы (2–3 миллиметра (мм)), прилегающий к корню Растения и характеризующийся повышенным содержанием микроорганизмов. Состав микрофлоры ризосферы зависит от типа почвы, экологических условий, возраста Растения. На поверхности корня обитают микроорганизмы преимущественно из эпифитной микрофлоры семени – это так называемая Ризоплана. Влияние микроорганизмов ризосферы многообразно. Они переводят некоторые трудноусвояемые растениями соединения в легкоусвояемые, синтезируют биологически активные вещества, вступают в симбиоз с Растением (смотрите Клубеньковые Бактерии, Микориза), выделяют токсины, участвуют в процессе денитрификации и другое; некоторые представители микрофлоры паразитируют на Растениях.

RHO = РО – Rho is a ratio that measures option risks. It explains the impact of changes in the interest rate of the underlying instrument on the option price. Rho represents the rate at which the price of a derivative changes relative to a change in the risk free rate of interest. Rho measures the sensitivity of an option to a change in interest rate. Rho is a measure of an option's sensitivity to a change in interest rates; this will impact on both the future price of the option and the time value of the premium. Its impact increases with the maturity of the option. Rho measures an option's sensitivity to a change in interest rates. This will have an impact on both the future price of the option and the time value of the premium. Its impact increases with the maturity of the option. / В анализе ситуации в биржевой торговле опционами название буквы Ро (прописная – Р, строчная – ρ) Греческого алфавита было использовано для обозначения ставки, по которой цена производного инструмента изменяется относительно риска вольной процентной ставки. Ро измеряет чувствительность опциона к изменению процентной ставки.

RHOMBOID = РОМБОИДНОЕ (или РОМБОИДАЛЬНОЕ, или РОМБОВИДНОЕ) – Rhomboid:- diamond-shaped. / Под Ромбическим (Rhombic), от Греческих слов Rhómbos, означающее Параллелограмм С Равными Стронами, и Éidos, означающее Вид, понимается .

RHODIUM = РОДИЙ – Rhodium; chemical symbol Rh. Its specific gravity is 12.44 and its melting point is 1 966 °C. / Под Родием, от Греческого слова Rhódon, означающее Роза (растворы солей родия имеют розовато-красный цвет), Латинское название Rhodium (символ Rh), понимается химический элемент VIII группы Периодической Системы Менделеева. Атомный номер 45, атомная масса 102.905 5. Относится к платиновым металлам. Родий – серебристо-голубоватый металл, твёрдый и тугоплавкий; плотность 12 410–12 420 кг/м^3, $t_{пл}$ 1 960–1 963 °C. Химически очень пассивен. В природе родий встречается вместе с платиной и другими платиновыми металлами. Получают родий в основном из полупродуктов аффинажа платины. Применяют для гальванических покрытий, изготовления тиглей для плавки лазерных кристаллов, а также в сплавах с платиной (катализаторы, термопары, химическая посуда, фильеры для производства стекловолокна и так далее); идёт на покрытие зеркальных поверхностей в астрономических приборах.

RHS = RICE HULL STOVE

RIARS = REGIONAL INTEGRATED AGRICULTURAL RESEARCH SYSTEM

RIEPT = RED INTERNACIONAL DE EVALUACION DE PASTOS TROPICALES

RIB = ПУЧОК (или ЖИЛКА) – Rib is a leaf vein. A ridge of plant-tissue thicker than its surroundings. A raised surface running vertically, sometimes spiraling, and in the Cactaceae bearing a row of areoles along its summit. Morphologically, a rib is composed of a continuous line of fused tubercles, which in some cases may be discerned as bulges in the structure. / пучок (жилка) листа. , иногда по спирали, и в Кактусовых (Cactaceae). Под Жилками понимаются:- (i) система проводящих пучков в листьях и других органах Высших Растений, исключая Мхи; и (ii) полые трубчатые утолщения пластинки крыла у Насекомых, в которых расположены ответвления трахей и нервов; образуют каркас крыла. Расположение жилок (жилкование) – важный систематический признак.

RIB = РЕБРО – (1) Rib is the ridge of a fruit.

(2) Rib is a reinforcing structure used to keep strength or rigidity without increasing thickness of each section and to prevent warping of wide flat areas of pallets. Pallet. / Ребро жёсткости (Rib):- укрепляющий элемент, применяемый для обеспечения жёсткости и

прочности поддона без увеличения толщины каждой секции и предотвращающий деформацию плоской поверхности поддона. Смотрите также Поддон (Pallet).

RIB = РУБЧИК – Rib is a straight, ridged, or corded effect that usually moves vertically or horizontally on a fabric.

RIBBED = РЕБРИСТОЕ (или РУБЧАТОЕ) – Ribbed:- having prominent ribs.

RIBBED CUFF = РЕБРИСТАЯ (или РУБЧАТАЯ) МАНЖЕТА (или ОБШЛАГ) – Ribbed Cuff is a close-fitted knit finish in ribbed pattern tot the open end of a sleeve.

RIBBING = РЕБРЕНИЕ (или РИБАНА) – (1) Ribbing is the rib knit that is used at wrists, waists, and necklines of plain or patterned knit garments.

(2) Ribbing is a corded effect in a woven fabric that can be either lengthwise, crosswise, or diagonal.

RIBBON = ЛЕНТА (или ТЕСЬМА) – Ribbon is a fillet or narrow woven fabric of varying widths, commonly one-quarter to three inches, having selvage edges, chiefly or rayon, silk, or velvet, and used for braiding, decoration, trimmings, etc. Ribbon is a narrow fabric made in several widths and a variety of weaves and used as a trimming. Ribbon is a narrow, woven fabric with two finished edges. Both natural and man-made fibers are used in making ribbon. It is available in many patterns and colors and in such fabric constructions as velvet, satin, and grosgrain. See also Grosgrain, Satin, and Velvet. Ribbon is a flat or tubular narrow closely woven fabric (as of silk or rayon) used for trimmings or knitting.

RIB KNIT = ЛАСТИК (или РИБАНА, или РЕБРИСТЫЙ ТРИКОТАЖ) – Rib Knit is a basic stitch used in weft knitting in which the knitting machines require two sets of needles operating at right angles to each other. Rib knits have a very high degree of elasticity in the crosswise direction. This knitted fabric is used for complete garments and for such specialized uses as sleeve bands, neck bands, sweater waistbands, and special types of trims for use with other knit or woven fabrics. Lightweight sweaters in rib knits provide a close, body-hugging fit. Rib Knit is a double-knit fabric in which the wales or vertical rows of stitches intermesh alternately on the face and the back. In other words, odd wales intermesh on one side of the cloth and even wales on the other. Rib-knit fabrics of this type have good elasticity, especially in the width. A term Rib Knit refers to a pattern in which vertical stripes of stockinette stitch alternate with vertical stripes of reverse stockinette stitch. These two types of stripes may be separated by other stripes in which knit and purl stitches alternate vertically. A 1 x 1 rib has one rib up and one down. A 2 x 1 rib has two ribs up and one down, similar to a Poor Boy Knit. Rib Knit:- this knit has tremendous stretch across the grain a 1 x 1 rib has one rib up and one down. A 2 x 1 rib has two ribs up and one down, similar to a Poor Boy Knit. A 3 x 1 rib has three ribs up and one down. Rib Knit is a knit that consists of groups of alternate plain and purl stitches (the reverse of a plain knit with loops showing). Rib knit fabrics are stretchier and have a snugger fit than plain knits. Rib knit is frequently used at wrists, waists, and necklines of plain or patterned knit garments where it is called Ribbing. / бисерные стежки (purl stitches) при обмётке петли. Ластик (или Рибана (Ribana or Rib or Rib Knit)):- (i) чередованием в ряду лицевых и изнаночных петель. В связи с перекручиванием соединительных протяжек изнаночные столбики заходят за лицевые, в результате чего лицевая и изнаночная стороны полотна кажутся образованными лицевыми столбиками. Порядок чередования может быть различным. (ii) Более низкой распускаемостью. Полотно распускается только в направлении обратном вязанию. (iii) Более высокой растяжимостью. Для устранения остаточной деформации полотна ластик изготавливают из хлопчатобумажной пряжи с добавлением эластана. Поверхностная плотность этого полотна выше, чем у кулирной глади. Обычно полотно переплетения ‘ластик’ используется для отделки изделий.

RIBONUCLEIC ACID = РИБОНУКЛЕИНОВАЯ КИСЛОТА – Ribonucleic Acid (RNA) is an extremely long single-stranded linear polymer, made (transcribed) as a secondary copy of the gene sequences in DNA and also found as the primary genetic material in some Viruses, e.g., Tobacco mosaic Virus. RNA is found in cells as three basic types:- (i) mRNA – copies of gene sequences to be translated into proteins; (ii) tRNA – transfer RNA specifying and collecting one of 20 individual amino acids for insertion into proteins; and (iii) rRNA – ribosomal RNA associated with proteins in ribosomes, the sub-cellular mechanisms responsible for building proteins from the mRNA sequence. Ribonucleic Acid (RNA):- (1) occurs in three major forms – as messenger RNA, transfer RNA, and ribosomal RNA. Some RNA molecules are the genetic molecules of viruses (e.g., Tobacco mosaic virus and HIV) and viroids. Some RNA molecules may have enzymatic activity (see Ribozymes). (2) Any of various nucleic acids that yield ribose as one product of hydrolysis, that are found in the cytoplasm and sometimes in the nucleus. (3) Required for the synthesis of proteins in all living systems It consists of a linear array of the nucleotides cytidine-, guanosine-, adenosine-, and uridine-s’-monophosphates. / информационная рибонуклеиновая кислота (иРНК; messenger Ribonucleic Acid (mRNA)). Под Рибонуклеиновой Кислотой (РНК) понимаются высокомолекулярные соединения, тип нуклеиновых кислот. Образованы нуклеотидами, в которые входят аденин, гуанин, урацил, цитозин и сахар рибоза (в ДНК вместо урацила – тимин, а вместо рибозы – дезоксирибоза). В клетках всех живых организмов участвуют в реализации генетической информации. Три основных вида:- (i) матричные или информационные РНК (messenger RNA или mRNA); (ii) транспортные РНК (transfer RNA или tRNA); и (iii) рибосомальные РНК (ribosomal RNA или rRNA). У многих вирусов (так называемых РНК-содержащих) – вещество наследственности. Рибонуклеиновые Кислоты (РНК), тип нуклеиновых кислот, имеющих универсальное распространение в живой природе; содержат в качестве углеводного компонента рибозу, а в качестве азотистых оснований аденин и гуанин (пуриновые основания) и урацил и цитозин (пиримидиновые основания). В небольших количествах в состав рибонуклеиновых кислот входят также некоторые другие производные пурина и пиримидина. Рибонуклеиновые кислоты – линейные полинуклеотиды с длиной цепи от нескольких десятков до десятков тысяч нуклеотидов (молекулярная масса от $10–20\cdot10^3$ до $5–6\cdot10^6$), причём каждая индивидуальная рибонуклеиновая кислота имеет определённую последовательность нуклеотидов. В организме рибонуклеиновые кислоты находятся главным образом в виде комплексов с белками – рибонуклеопротеидов. Рибонуклеиновые кислоты играют важнейшую биологическую роль во всех живых организмах, участвуя в реализации генетической информации и биосинтезе белков. Макромолекулярная структура рибонуклеиновых кислот представлена в основном однонитчатыми полинуклеотидными цепями, которые образуют двуспиральные участки по принципу комплементарности оснований. Многие Вирусы содержат рибонуклеиновые кислоты в качестве единственного нуклеинового компонента. В таких РНК-содержащих Вирусах рибонуклеиновые кислоты могут служить матрицей для биосинтеза не только РНК, но и ДНК (обратная транскрипция). Биосинтез рибонуклеиновых кислот осуществляется (главным образом в клеточном ядре) из рибонуклеозид-трифосфатов под действием ферментов полимераз на матрице дезоксирибонуклеиновых кислот (ДНК-зависимые РНК-полимеразы) или у некоторых Вирусов на матрице рибонуклеиновых кислот (РНК-зависимые РНК-полимеразы). В клетках Бактерий, Животных и Растений различные типы рибонуклеиновых кислот выполняют неодинаковые биологические функции и различаются по строению и метаболизму. Важнейшие Типы РНК следующие:- (1) Рибосомные Рибонуклеиновые Кислоты (рРНК) входят в состав рибосом и составляют основную массу клеточных рибонуклеиновых кислот; представлены рибонуклеиновые кислоты с константами седиментации 23 S, 16 S и 5 S. Полностью установлена первичная структура (то есть последовательность нуклеотидов) для 5 S РНК, почти полностью – для 16 S РНК и частично для 23 S РНК кишечной палочки. Размеры и структура рибосомных рибонуклеиновых кислот у организмов разных Видов неодинаковы. Их биологическая роль

не вполне выяснена, целостность их молекул необходима для биосинтеза белков в рибосомах. (2) Транспортные Рибонуклеиновые Кислоты (тРНК):- имеют константу седиментации около 4 S и молекулярную массу около 25 000, то есть являются сравнительно низкополимерными (около 80 нуклеотидных остатков); содержат относительно много метилированных и других минорных оснований. Их биологическая роль заключается в присоединении активированных аминокислотных остатков и переносе (транспорте) их на рибосомы, то есть к месту синтеза полипептидных цепочек. Для каждой аминокислоты имеются свои специфические тРНК (обычно более одной). Все тРНК имеют сложную, частью двуспиральную, макромолекулярную структуру, изображаемую в виде клеверного листа. Они содержат участки, присоединяющиеся к рибосоме, триплет нуклеотидов (антикодон), присоединяющийся к кодону мРНК, и концевой участок, присоединяющий аминокислотный остаток. Первичная структура более 60 тРНК установлена полностью. (3) Информационные, или Матричные, Рибонуклеиновые Кислоты (иРНК, или мРНК) представляют собой наиболее разнородную группу и играют роль матриц при биосинтезе белков в процессе трансляции (считывания нуклеотидного кода и перевода его в определённую последовательность аминокислот в полипептидных цепях белков). Все виды рибонуклеиновых кислот синтезируются в клетках на матрице ДНК, образуя последовательность рибонуклеотидов, комплементарную последовательности дезоксирибонуклеотидов в ДНК (процесс транскрипции). В клеточном ядре обнаружены гигантские молекулы – предшественники мРНК, большая часть которых распадается внутри ядра и только сравнительно небольшая часть молекулы переходит в цитоплазму и образует собственно мРНК. Быстро распадающаяся в клеточном ядре рибонуклеиновая кислота, вероятно, играет регуляторную роль. Обнаружены также некоторые другие типы рибонуклеиновой кислоты, например, низкополимерная относительно стабильная ядерная РНК, роль которой пока неясна. Смотрите также статьи Белки, Молекулярная Генетика, Нуклеиновые Кислоты, Рибосомы и литературу при них.

RIBOZYME = РИБОЗИМ – Ribozyme is an enzyme made entirely of RNA.

RIB STITCH = РЕБРИСТЫЙ (или РУБЧАТЫЙ) СТЕЖОК (или ПЕТЛЯ) – Rib Stitch:- a weft knit identified by vertical ribs on both sides of the fabric. A very resilient stitch. Combined with the tuck stitch, it is called Rib-And-Tuck Stitch.

RIB STITCH KNIT = ТРИКОТАЖ С РЕБРИСТЫМ (или РУБЧАТЫМ) СТЕЖКОМ (или ПЕТЛЁЙ) – Rib Stitch Knits have stitches drawn to both sides of the fabric, which produces columns of wales on both the front and back of the fabric. Rib stitch produces fabrics that have excellent elasticity. Rib knits are used for the 'ribbing' which is usually found at the lower edges of sweaters, on sleeve cuffs, and at necklines. They are also used for a variety of different kinds of garments.

RIB WEAVE = РЕПСОВОЕ ПЕРЕПЛЕТЕНИЕ – Rib Weave is a basic weave pattern which is characterized by prominent ribs in the weft. In this type of weave, the warp yarns and the filling yarns are of different widths. Usually the filling yarns are fatter than the warp yarns. It creates a series of horizontal ribs. Rib weave has a substantially higher number of yarns per inch only in one direction. Several yarns are grouped together to form one. The resulting fabrics of rib weave are abrasion resistant and have tear strength. See also Weave. Rib Weave is a plain weave that forms ridges in a fabric through the way in which it is woven or by the use of thicker yarns for the filling than those used tot the warp. See also Filling, Warp, and Weaving. Rib Weave is one of the plain weave variations, which is formed by using:- (i) heavy yarns in the warp or filling direction, or (ii) a substantially higher number of yarns per inch in one direction than in the other, or (iii) several yarns grouped together as one. Rib fabrics are all characterized by having a slight ridge effect in one direction, usually the filling. Such fabrics may have problems with yarn slippage, abrasion resistance, and tear strength. Examples of this construction include broadcloth, poplin, taffeta, faille, shantung, and cord fabric. / основные пряжи и уточные пряжи . устойчивы к истиранию и . поплин, тафта, фай, . Под Репсом или Репсовым Переплетением понимается производное полотняного переплетения, полученное усилением в одном направлении перекрытий полотняного переплетения, то есть удлинением в одном направлении одиночных перекрытий полотна. Усиление может происходить или в направлении основы, или в направлении утка. В первом случае репсы носят название основных, во втором – уточных. Обозначаются репсы простой дробью, числитель которой показывает величину основного настила, а знаменатель – уточного настила на одной нити в пределах раппорта, с добавлением слова Основный или Уточный. В основном репсе величина перекрытий на первой основной нити соответствует значениям числителя и знаменателя, например, у основного репса 2/2 первая основная нить сначала перекрывает две уточные нити, а затем перекрывается двумя уточными нитями. Вторая основная нить переплетается с уточными нитями в противоположенном порядке. Таким образом, у основного репса раппорт по утку равен сумме числителя и знаменателя дроби, обозначающей переплетение, а раппорт по основе равен 2, как у базового полотняного переплетения В уточном репсе в соответствии с дробью, обозначающей переплетение, располагаются перекрытия на первой уточной нити, а вторая переплетается с основными нитями в противоположенном порядке. Раппорт по утку у уточного репса равен 2, а раппорт по основе будет равен сумме числителя и знаменателя дроби. Репсовое переплетение образует на поверхности ткани мелкий рельефный рубчик. Ткань, выработанная основным репсом, будет иметь на поверхности поперечный рубчик, а ткань, выработанная уточным репсом, – продольный рубчик. Для получения большей рельефности рубчиков на поверхности ткани для основных репсов используется более толстый уток и увеличивается плотность ткани по основе. Для уточных репсов, наоборот, применяют более толстые нити основы и большую плотность ткани по утку. Лицевая и изнаночная стороны ткани у репсов одинаковы. Из-за повышенной плотности ткани по одной из систем вторая система почти не видна. Варьируя толщину нитей утка (потребуется механизм смены утка) в основных репсах, можно получить ткань с различной высотой рубчика. Основный и уточный репсы могут иметь в раппорте настилы неодинаковой величины, например, основный репс 2/3 и уточный репс 4/2. Репсовое переплетение, у которого числитель или знаменатель обозначающей его дроби равен 1, называется полурепсом, например, полурепс 1/4. Так как репсы являются производными полотняного переплетения, то условия заправки и выработки их такие же. Все они могут быть выработаны на двух ремизках. Основные репсы, имеющие большую плотность по основе, вырабатываются при рассыпной проборке в 4 или 6 ремизок. При выработке уточного репса нити каждого рубчика пробираются в свой зуб бёрда, а при выработке основного репса – по 2 или 4 нити в зуб. Уточное репсовое переплетение применяется при выработке фланели и бумазеи некоторых артикулов. Оно служит для удлинения уточных перекрытий, что необходимо при создании тканей с начёсом. Основное репсовое переплетение широко применяется для выработки кромок ткани. Репсовое Переплетение – ближайший родственник полотняного – получается путём переплетения нескольких нитей основы или утка как если бы это была одна нить. Репсовое переплетение называют основным, если поверхность ткани составляют настилы из основной нити, которые перекрывают одновременно несколько уточных. Уточное репсовое переплетение образуется наоборот – в том случае, когда уточные нити перекрывают одновременно несколько основных. Репсовые Переплетения образуются путём усиления (удлинения) основных или уточных перекрытий полотняного переплетения. При этом несколько нитей основы или утка переплетаются как одна нить, в результате чего раппорт рисунка увеличивается по усиливаемой системе. Различают репс основной и уточный. В основном репсе основные нити могут перекрывать две, три и более уточных нитей, создавая на ткани поперечный рубчик. Поверхность ткани в этом случае образуется из настилов основных нитей, уток же остаётся внутри и не виден ни с лицевой, ни с изнаночной стороны. В уточном репсе уточные нити перекрывают несколько основных, рубчик при этом получается продольным. В

зависимости от количества перекрываемых нитей ширина рубчика может меняться. В тканях репсового переплетения система нитей, образующая длинные перекрытия, создающие застил, должна быть из более тонких, легко изгибающихся нитей и иметь повышенную плотность с тем, чтобы полностью закрывать нити противоположной системы, более толстые, редко расположенные.

RICE = РИС – Worldwide there are more than 40 000 different varieties of Rice, though only a small number offer the quality acceptable to be grown commercially in the United States (US). In the US, these Varieties can be divided into long, medium, and short grain. Limited waxy Rice and Arborio is produced, as well as some aromatic and specialty varieties. The primary differences in these Rices is their cooking characteristics and, in some cases, a subtle flavor difference. From a nutritional standpoint they are equal and indeed can often (with the exception of waxy Rice or Arborio) be interchanged in recipes. Forms of Rice:- the influx of convenience foods has brought consumers Rice in bags, cans and cartons. Rice can be purchased cooked or uncooked, canned, dehydrated and frozen. Few foods are packaged so extensively and are offered in so many combinations as Rice. To meet the many special requirements of packaged foods, Rice undergoes varying degrees of processing, including regular-milled, parboiled, precooked, and brown. Rice is the most important food in the world. Around 500 million tons of paddy is produced, providing the main source of nutrition for three quarters of the Earth's population. Rice vaieties are devided into two types:- (i) Indica, an elongated thin and slightly flattened grain that remains separate and is firmer cooking; and (ii) Japonica, a broad, thick, short, round grain which tends to be sticky and soft cooking. Since ancient times, Rice has been the most commonly used food grain for a majority of the people of the world. A member of the Grass Family, Gramineae, Rice, Oryza Sativa L., can be grown successful under climatic condition ranging from tropical to temperate with cycle of 3–7 months. The span of one cycle varies depending on its type and the growing environment. Rice is growing requires an extensive irrigation system and properly leveled fields. A uniformity leveled field enables each Rice kernel to absorb the same amount of moisture from the field. This uniform moisture level runs too high, the Rice may spool faster. In general, the milled Rice family could be broken down into three main categories or types:- (i) Long Grain:- approximately 6–8 mm long, about 3–4 times longer than thick. The endosperm is hard and vitreous, when cooked it is dry and granular. The best long grain varieties come from Thailand, Southern US, India, Pakistan, Indonesia and Vietnam. (ii) Medium Grain:- approximately 5–6 mm long, but thicker than long grain Rice. The endosperm is soft and chalky. It releases about 15% starch into water during cooking. Medium grain Rice is mainly grown in China, Egypt and Italy. (iii) Short Grain or Round Grain:- approximately 4–5 mm long, only 1.5–2 times longer than thick. The endosperm is soft and chalky. It cooks in much same way as medium grain Rice. This variety is grown in subtropical areas like California, Egypt, Italy, Japan, Korea, Spain and Portugal. Types shall be based on the length-width ratio of kernels of Rice that are unbroken and the width, thickness, and shape of kernels that are broken, prescribed in the US Federal Grain Inspection Service (FGIS) instructions. Rice (Oryza Sativa L.) which consists of more than 50.0 percent of kernels of brown Rice, and which is intended for processing to milled Rice. Rice is two Species in the Poaceae (True Grass) Family, Oryza Sativa and Oryza Glaberrima. These Plants are native to tropical and subtropical Southern and Southeastern Asia and in Africa. Rice provides more than one fifth of the calories consumed by humans in their global diets. Rice is a monocarpic annual plant, growing to 1–1.8 m tall, occasionally more depending on the variety and soil fertility. The grass has long, slender leaves 50–100 cm long and 2–2.5 cm broad. The small wind-pollinated flowers are produced in a branched arching to pendulous inflorescence 30–50 cm long. The seed is a grain (caryopsis) 5–12 mm long and 2–3 mm thick. Rice is a staple for a large part of the world's human population, especially in East and Southeast Asia, making it the most consumed cereal grain. Rice is the world's third largest crop, behind Maize (Corn) and Wheat. Rice cultivation is well-suited to countries and regions with low labor costs and high rainfall, as it is very labor-intensive to cultivate and requires plenty of water for irrigation, much like the licorice crops found in Eastern Europe. Rice can be grown practically anywhere, even on steep hillsides. Although its Species are native to South Asia and certain parts of Africa, centuries of trade and exportation have made it commonplace in many cultures. World production of Rice has risen steadily from about 200 million tons of Paddy Rice in 1960 to 600 million tons in 2004. Milled Rice is about 68% of Paddy Rice by weight. In the year 2004, the top three producers were China (31% of world production), India (20%), and Indonesia (9%). World trade figures are very different, as only about 5–6% of Rice produced is traded internationally. The largest three exporting countries are Thailand (26% of world exports), Vietnam (15%), and the United States (11%), while the largest three importers are Indonesia (14%), Bangladesh (4%), and Brazil (3%). Rice is a common name for the Genus Oryza, an extremely important crop grown in the Asian arc and other parts of the world as the staple diet of the people. Rice, edible starchy cereal grain and the plant by which it is produced. Roughly one-half of the world population, including virtually all of East and Southeast Asia, is wholly dependent upon Rice as a staple food; 95 percent of the world's Rice crop is eaten by humans. The cultivated Rice Plant, Oryza Sativa, is an Annual Grass of the Gramineae Family. It grows to about 1.2 meters (4 feet) in height. The leaves are long and flattened, and its panicle, or inflorescence, is made up of spikelets bearing flowers that produce the fruit, or grain. Many cultures have evidence of early Rice cultivation, including China, India, and the civilizations of Southeast Asia. However, the earliest archaeological evidence comes from Central and Eastern China and dates to 7 000–5 000 BCE. With the exception of the type called Upland Rice, the plant is grown on submerged land in the coastal plains, tidal deltas, and river basins of tropical, semitropical, and temperate regions. The seeds are sown in prepared beds, and when the seedlings are 25 to 50 days old, they are transplanted to a field, or Paddy, that has been enclosed by levees and submerged under 5 to 10 cm (2 to 4 inches) of water, remaining submerged during the growing season. The harvested Rice kernel, known as Paddy, or Rough, Rice, is enclosed by the hull, or husk. Milling usually removes both the hull and bran layers of the kernel, and a coating of glucose and talc is sometimes applied to give the kernel a glossy finish. Rice that is processed to remove only the husks, called Brown Rice, contains about 8 percent protein and small amounts of fats and is a source of thiamine, niacin, riboflavin, iron, and calcium. Rice that is milled to remove the bran as well is called White Rice and is greatly diminished in nutrients. When white Rice forms a major portion of the diet, there is a risk of beriberi, a disease resulting from a deficiency of thiamine and minerals. Parboiled white Rice is processed before milling to retain most of the nutrients, and enriched Rice has iron and B vitamins added to it. Rice is cooked by boiling. It is eaten alone and in a great variety of soups, side dishes, and main dishes in Oriental, Middle Eastern, and many other cuisines. The by-products of milling, including bran and rice polish (finely powdered bran and starch resulting from polishing), are used as livestock feed. Oil is processed from the bran for both food and industrial uses. Broken Rice is used in brewing, distilling, and in the manufacture of starch and Rice flour. Hulls are used for fuel, packing material, industrial grinding, fertilizer manufacture, and in the manufacture of an industrial chemical called Furfural. The straw is used for feed, livestock bedding, roof thatching, mats, garments, packing material, and broomstraws. In the 1960s, the so-called Green Revolution, an international scientific effort to diminish the threat of world hunger, produced improved strains of numerous food crops, including that known as Miracle Rice. Bred for disease resistance and increased productivity, this variety is characterized by a short, sturdy stalk that minimizes loss from drooping. Poor soil conditions and other factors, however, inhibited its anticipated widespread success. The principal rice-producing countries are China, India, Japan, Bangladesh, Indonesia, Thailand, and Myanmar (Burma). Other important producers are Vietnam, Brazil, South Korea, the Philippines, and the United States. In the late XX century the world Rice crop averaged between 800 billion and 950 billion pounds annually and was cultivated on an average of about 358 million acres (145 million hectares). See also Wild Rice. The Asian cultivated Rice, Oryza Sativa, is one of the most important crops feeding more than a third of global population. In spite of the studies for several decades, the origin and domestication history of Rice varietal groups, Japonica and Indica, have not been fully unveiled. Genetic information of ancient Rice remains is essential for direct and

exclusive insight into the domestication history of Rice. We performed ancient DNA analysis of 950- to 2 800-year-old Rice remains excavated from Japan and Korea. We found the presence of both Japonica- and Indica-type Varieties in the Yayoi period and the middle ages of Japan and the middle part of Korea Peninsula 2 000 years ago. It is popularly considered that Japonica has been exclusively cultivated in Northern part of East Asia including Japan and Korea. Our result disclosed unexpectedly wide diversity of Rice varieties in archaic East Asia. The present results from ancient Rice DNA reveal an exclusive insight for the domestication history of Rice which is not provided as far as contemporary Rice. / вывоз (exportation). Виды (Species). Посевной Рис (Oryza Sativa L.), состоящий из более, чем 50% зерновки (ядер) бурого Риса, предусмотренный для переработки в обрушенный Рис. С античных времён Рис. (i) Длиннозёрный (Long Grain). (ii) Среднезёрный (Medium Grain). (iii) Короткозёрный (Short Grain) или Круглозёрный (Round Grain). В семействе Poaceae (True Grass) Рис бывает двух Видов:- Посевной Рис (Oryza Sativa) и Голый Рис (Oryza Glaberrima). потребляемая злаковая зерновая культура (consumed cereal grain). эндосперм (endosperm). Под Рисом (Oryza) понимается Род Однолетних и Многолетних Травянистых Растений Семейства Мятликовых, крупяная культура. Около 25 Видов, в основном в тропиках и субтропиках Австралии, Южной и Восточной Азии, Америки, Африки. В культуре в тропиках, субтропиках и тёплых районах умеренного пояса (до 90% посевов в Азии) однолетний Посевной Рис (Oryza Sativa) – одно из древнейших продовольственных растений Земли. Культура Рис возникла в Юго-Восточной Азии более 7 000 лет назад. Древнейшие очаги рисосеяния – Индия (предположительно родина Риса), где Рис возделывают уже несколько тысячелетий, и Китай. На территории бывшего Союза Советских Социалистических Республик (СССР) (Закавказье и Средняя Азия) Рис выращивают с III–II веков до Нашей Эры, в Европе – с VIII века Нашей Эры, в Америке – с XV–XVI веков. В Западной Африке выращивают также Голый или Африканский Рис (Oryza Glaberrima). Зерно некоторых дикорастущих Видов, например, Точечного Риса (Oryza Punctata), Короткоязычкового Риса (Oryza Breviligulata), произрастающих в Африке, используется в пищу местным населением. Посевной Рис – яровое теплолюбивое и очень влаголюбивое растение. Выращивают при орошении (на рисовых оросительных системах) или в районах с большим количеством осадков (не менее 1 800–2 000 мм в год). Для прорастания семян верхний слой почвы увлажняют; в фазы кущения, выхода в трубку и вымётывания метёлки на участках (чеках) создают слой воды переменной глубины от 15 до 25 см; перед уборкой воду сбрасывают. Вегетационный период Риса 90–165 суток. Самоопылитель. Лучшие почвы – чернозёмы, каштановые, пойменные. Рис – основная зерновая культура для большей численности населения земного шара. Из зерна – крахмал, крупа, масло (из зародышей), спирт; из соломы – бумага, картон, плетёные изделия. Наибольшие посевные площади Риса в Бангладеше, Вьетнаме, Индии, Индонезии, Китае (КНР), США, Таиланде. В бывшем СССР Рис выращивают в Северном Кавказе, Нижнем Поволжье, Приморском Крае, республиках Средней Азии, Казахстане, на Юге Украины. Площади посева в 1985 0.7 миллиона га, средняя урожайность 38.3 ц/га. Сорта – Авангард, Дунай, Зерноградский, Краснодарский 424, Крос 358, Кулон, Лазурный, Малыш, Солнечный, Солярис, Узрос 7, Узрос 59 и другие. Новые короткостебельные сорта Спальчик и Старт формируют урожайность 70–100 ц/га. Селекция культуры направлена на выведение раннеспелых неполегающих сортов, устойчивых к пирикуляриозу, с повышенной холодостойкостью, а также на получение гибридного Риса, высокобелковых сортов и сортов с удлинённой зерновкой. Рис возделывают в рисовых севооборотах; предшественники – многолетние травы и занятой пар (после них Рис выращивают 2–3 года подряд). Удобрения (кг/га):- 60–150 N, 90 P_2O_5 и 60 K_2O. Оросительная норма 12–20 тысяч $м^3$/га воды. Высевают Рис обычным рядовым способом; норма посева семян 2.5–3 ц/га; глубина посева 1.5–2 см. Убирают раздельным способом и прямым комбайнированием, предварительно обрабатывая десикантами. Внедрены в производство интенсивные технологии возделывания и уборки Риса, разработаны интенсивные рисовые севообороты, в которых эта культура занимает 62.5% площади пашни. Вредители – Рисовый Комарик, Ячменный Минёр, Прибрежная Мушка, Рисовая Пьявица и другие; болезни – пирикуляриоз, гниль всходов, гельминтоспориоз, нематодные болезни. Корневая система Риса мочковатая длиной 30–40 сантиметров (до 1 метра) с наличием воздухоносных полостей и малым количеством корневых волосков. Стебель – соломина. Лист состоит из влагалища и линейно-ланцетной узкой пластинки зелёного, красноватого или фиолетового цвета. Соцветие – метёлка. Одноцветковые колоски. Цветок состоит из двух широких цветковых чешуй с остью у остистых форм, окрашенных в красный, жёлтый или бурый цвета, двух околоцветниковых плёнок – лодикулей, односемянной завязи и шести тычинок. Плод Риса – плёночная зерновка, округлая и широкая у Японского, длинная и узкая у Индийского, на изломе белая, стекловидная, полустекловидная или мучнистая. 1 000 зерновок вести 26–45 грамм. Вредители Риса:- Комарик Рисовый, Минёр Ячменный, Мушка Прибрежная, Пьявица Рисовая, Трипсы и другие. Болезни Риса:- Пирикуляриоз, Гниль Всходов, Гельминтоспориоз, Нематодные Болезни и другие. Из отрубей Риса получают высококачественное масло, но их скармливают и скоту. Рис – это общее название группы очень разнообразных злаков. Известно более 150 агросортов Риса. Он может быть тонкий и продолговатый, короткий и кругленький, белый, чёрный, красный, фиолетовый и жёлтый с прожилками. Возделывание Риса требует влажного климата, кропотливого труда, настойчивости и знания законов природы. Произрастая во влажном климате Рис, как продукт лечебного питания избавляет от излишней влаги:- снимает отёки, выводит из организма избыток жидкости и слизи. Восточная философия утверждает, что регулярное употребление Риса в пищу наделяет человека такими качествами как спокойствие, терпимость, устойчивость в постоянно меняющихся жизненных обстоятельствах. Современная наука объясняет это наличием в Рисе больших количеств витаминов группы В. А как известно именно эти витамины способны питать и укреплять нервную систему. Правда, все вышесказанное имеет отношение только к цельному, неочищенному Рису. Ведь вся ‘полезность’ Риса содержится в его оболочке, которая удаляется при производстве белого Риса. В цельном Рисе совсем мало натрия и жира и очень много железа и других минералов. Энергия Риса нейтральная, он является гипоаллергенным и по своим свойствам и подходит практически любому человеку. Рис укрепляет витальность (жизненную силу человека) и поэтому различные оздоровительные методики рекомендуют употреблять цельный Рис 5–6 раз в неделю. Перед приготовлением цельный Рис нужно обязательно перебрать, промыть и замочить в воде комнатной температуры на 2–4 часа. А при чувствительности пищеварительной системы, Рис лучше замачивать на всю ночь. Процесс замачивания облегчает усвоение Риса и улучшает его белковую составляющую. Можно готовить Рис с другими злаками из расчета 2/3 – риса и 1/3 – других злаков. При острой диарее – столовую ложку цельного Риса поджарить на сухой сковородке, остудить, жевать до получения пасты и выплюнуть. Продукты из Риса:- (i) Рисовое Молоко – подходит для соусов, на нём можно готовить каши. (ii) Рисовый Сироп (Мальт) – оздоравливает дыхательную и пищеварительную систему. Натуральный подсластитель, готовится из сброженного цельного Риса. (iii) Сладкое Рисовое Вино – Мирин – оригинальный Японский продукт, не существующий более нигде. В XV–XVI веках Мирин был популярен в виде алкогольного напитка для женщин – сладкий саке. Сегодня Мирин широко используется в качестве приправы. Мирин состоит из аминокислот, сахара, алкоголя (спирт) – всё это подчеркивает вкус продуктов. Используется также вместо коричневого сахара для приготовления гранолы. (iv) Рисовый Уксус – идеально подходит для приготовления суши. Рисовый уксус имеет мощные антибактериальные свойства. Рисовый уксус может быть Японского или Китайского производства. Японский – неострый и сладковатый. Предпочтителен для приготовления суши. Китайский – чуть более кислый и острый. Рисовый уксус гораздо мягче обычного.

RICE BLAST = ПИРИКУЛЯРИОЗ РИСА – Rice Blast is a fungus disease of Rice which is characterized by the presence of spindle-shaped lesions. The lesion develops a grayish center and a brownish margin. The disease can have different forms:- leaf blast, node blast, or neck blast. Rice Blast, caused by a Fungus, causes lesions to form on leaves, stems, peduncles, panicles, seeds, and even

roots. So great is the potential threat for crop failure from this disease that it has been ranked among the most important plant diseases of them all. Other grasses, including Crabgrass, are infected with closely related Fungi (Magnaporthe Grisea, Magnaporthe Poae, Magnaporthe Rhizophila and Magnaporthe Salvinii), which cause nearly identical symptoms on their respective hosts. Symptoms and Signs:- the symptoms of Rice blast include lesions that can be found on all parts of the plant, including leaves, leaf collars, necks, panicles, pedicels, and seeds. A recent report shows that even roots can become infected. However, the most common and diagnostic symptom, diamond shaped lesions, of Rice blast occur on the leaves, whereas lesions on the sheaths are relatively rare. Rice Leaves:- the symptoms on leaves may vary according to the environmental conditions, the age of the plant, and the levels of resistance of the host Cultivars. On susceptible Cultivars, lesions may initially appear gray-green and water-soaked with a darker green border and they expand rapidly to several centimeters in length. On susceptible Cultivars, older lesions often become light tan in color with necrotic borders. On resistant Cultivars, lesions often remain small in size (1–2 mm) and brown to dark brown in color. Rice Collars:- the collar of a Rice Plant refers to the junction of the leaf and the stem sheath. Symptoms of infection of the collars consist of a general area of necrosis at the union of the two tissues. Collar infections can kill the entire leaf and may extend a few millimeters into and around the sheath. The Fungus may produce spores on these lesions. Rice Necks And Panicles:- the neck of the Rice Plant refers to that portion of the stem that rises above the leaves and supports the seed head or panicle. Necks are often infected at the node by the Rice blast Fungus and infection leads to a condition called Rotten Neck or Neck Blast. Infection of the necks can be very destructive, causing failure of the seeds to fill (a condition called Blanking) or causing the entire panicle to fall over as if rotted. The Rice blast fungus can also infect the panicles as the seeds form. Lesions can be found on the panicle branches, spikes, and spikelets. The lesions are often gray brown discolorations of the branches of the panicle, and, over time, the branches may break at the lesion. Rice Seeds:- the Fungus has often been isolated from the pedicels of the seeds. Seeds are not produced when pedicels become infected, a condition called Blanking. Symptoms of Rice blast on seeds themselves consist of brown spots, blotches, and occasionally the classic diamond-shaped lesion often seen on leaves. The process and the time during which infection of seeds by spores of the pathogen occurs has not been fully described but recent information shows that the fungus can infect seeds by infecting the florets as they mature into seeds, and it is believed that this is the main way seed infection develops. Pathogen Biology:- the Fungus that causes Rice blast is called Magnaporthe Oryzae (formerly Magnaporthe Grisea). It is an ascomycete because it produces sexual spores (ascospores) in structures called Asci, and is classified in the newly erected Family Magnaporthaceae. The asci are found within specialized structures called Perithecia. The mycelium of Magnaporthe Oryzae is septate and the nuclei within the mycelium and spores of this fungus are haploid. Sexual Reproduction:- the sexual, or teleomorphic, stage of the Rice blast pathogen can be produced in the laboratory if isolates of opposite mating type are paired, but has not been found in the field in the United States. As an ascomycete, it produces hyaline, fusiform shaped (spindle-shaped with tapering ends) ascospores with three septa. The asci are unitunicate. This Fungus is considered to be heterothallic with a bipolar mating system (mating controlled by two different alleles at a single locus) with additional genes controlling the sexual cycle. Based on recent phylogenetic, molecular and morphological data, isolates of the Fungus from Rice and closely related isolates from other grasses like Eragrostris Curvula, Eleusine Coracana, Lolium Perenne, and Setaria Spp. are taxonomically described as Magnaporthe Oryzae, while isolates from Digitaria Sanguinalis (Crabgrass) are distinct and should be described as Magnaporthe Grisea. Asexual Reproduction:- the asexual stage of Magnaporthe Oryzae is described by the name Pyricularia Oryzae (formerly called Pyricularia Grisea) and it is the most common spore form of the Fungus in the USA. These spores, called Conidia, are produced abundantly on lesions and in culture on specialized stalks, called Conidiophores. The conidia are usually three-celled, and produced on the apex of a conidiophore. Sporulating colonies on agar plates may take on a fleecy grayish appearance. Under favorable conditions, the Fungus sporulates in the center of the lesions on susceptible Cultivars. It can also sporulate on seed lesions. It rarely sporulates on the most resistant cultivars. Spores are produced on infected leaf, collar, panicle, and seed, on conidiophores that extend beyond lesion surfaces; the conidiophores and spores en-masse may give the lesions a dusty gray appearance. Conidia are produced after several hours of high humidity and are easily released or liberated near mid-day, especially under windy conditions. The Infection Process:- infection of Rice occurs when conidia are deposited on Rice tissues, and germinate by producing a germ tube and an appressorium. The appressorium is a melanized structure, and from it develops an infection peg which penetrates the tissue. After penetration, the primary infection hypha grows rapidly and ramifies within susceptible tissues. Growth within tissues of resistant cultivars is often inhibited. Disease Cycle and Epidemiology:- plant diseases are often severe during periods of warm temperatures and high moisture. In the United States, Rice is grown in Arkansas, California, Florida, Louisiana, Mississippi, Missouri, and Texas. In the United States, Rice is planted mechanically as seed, while in many other countries, Rice seedlings are grown in beds and transplanted manually or by machine. Throughout the world, Rice is normally grown partially submerged in water in paddies, although in some regions Rice is grown as upland Rice in much the same way as wheat. Generally, Rice blast is favored by moderate temperatures (24 °C) and periods of high moisture that are 12 hours or longer, conditions readily attainable in flooded Rice fields. The overwintering sources of spores that comprise the primary inoculum consist of grasses, volunteer plants, infested refuse, and infested seed on the soil surface after mechanical planting. Infested seeds left on the soil surface can readily produce spores of P. Oryzae for more than several weeks after planting, well after seedlings have emerged. In the greenhouse, the fungus also sporulates on the dead or dying coleoptiles of plants grown from infected seeds. Spores produced as the primary inoculum on the overwintering tissues produce the initial infections on young seedlings when the spores that are deposited on leaves, germinate and invade leaf tissues. Disease severity is often correlated with the amount of infested material. For example, in Arkansas, the first visible lesions often appear approximately 45 to 55 days after planting, but the disease is much more severe in plots receiving the highest amounts of primary inoculum found on infested seeds. Lesions on the young seedlings appear within a few days after infection. These secondary lesions produce more spores and these spores are readily wind disseminated to nearby healthy leaf tissues. The secondary cycles can be repeated many times during the growing season, with the potential for very high amounts of disease within the crop. The number of cycles and the number of spores that are produced on each individual lesion can be influenced by many factors, including the temperature, rainfall, the depth of the water in the paddy, the amount of nitrogen used to fertilize the Rice, and the level of genetic resistance in the cultivar that is infected. Generally, the leaf phase of the disease is most severe when daily temperatures are moderate, and when Rice is over-fertilized, or if it is being grown in flood waters below the recommended depths. Under these conditions conducive to disease, very high incidences of disease have been recorded on susceptible Cultivars such as Newbonnet and RT7015 in comparison to Cultivars genetically resistant to the fungus. The amount of disease at the end of the vegetative phase of the growing season influences the amount of disease during the reproductive phase. Spores produced near the end of the growing season may infect the collar of the flag leaf producing symptoms called Collar Rot. They may also infect the neck when it emerges from the infected collar upon which the head will be supported to produce a condition called Rotten Neck or Neck Blast. Yield losses are significantly correlated with the extent of rotten neck. Research has shown a 0.5% loss in yield for every 1% of rotten neck. Infections of the neck are generally considered the most deleterious phase of the disease because infection at this location can reduce seed set on the entire panicle. In addition, the fungus can infect the panicle, the branches on the panicle, and the peduncles upon which the seeds are carried on these branches. Finally, new information shows that the seed also can be infected. Infections of the neck, panicle and branches of the panicle are usually relatively nondescript grayish discolorations of the tissues. Disease Management:- the successful management of Rice blast results from a comprehensive series of recommendations that employ several different

management strategies involving techniques within each strategy as outlined below. Cultural strategies to manage this disease include useful techniques that Rice producers are urged to follow. Crop rotation is one simple and effective technique that is highly recommended simply because it provides a mechanism that separates viable spores in crop residue from the newly emerging seedlings. A second technique that Rice producers are urged to consider is to fertilize each of the different Cultivars properly. Overuse of nitrogen fertilizers, as shown above, increases the amount of Rice blast in their fields while often failing to significantly increase yields. A third technique that is often overlooked or difficult to employ in some fields is maintaining a proper flood level for the Rice to grow. Rice blast is known to be more severe in fields or parts of fields in which the water in paddies falls below recommended levels. Thus, Rice blast is often severe in fields that were not rotated, are under-irrigated, and are over-fertilized. Finally, using high quality and disease-free seed is always highly recommended because infested seeds left on the soil surface provide inoculum from which epidemics develop. Genetic resistance is a strategy that has long been the mainstay of successful Rice production in the United States, even though the Fungus has shown genetic variability for virulence. In the United States, many Rice Cultivars contain genes that confer resistance to one or more of the individual Races of the Fungus found regionally, and many also contain a high level of resistance to the Fungus that is conferred by many other genes. The major difficulty in controlling Rice blast with genetic resistance is that there are many Races of the pathogen, and Cultivars containing a single gene conferring resistance to a specific Race of the pathogen often become susceptible over time with the development of new races that can infect plants with that specific resistance gene. For example, a mutation of an 'avirulence' gene in the blast Fungus that produces an elicitor that induced the expression of resistance in the host with the Pi-ta gene for resistance has led to the formation of a new race capable of infecting plants that carry that important resistance gene, simply because the plant did not recognize the new race of the pathogen. In this way, the new race of the Fungus has eluded resistance, which means that the Cultivars containing this important resistance gene are very susceptible to the new Race, even though they remain resistant to the other Races of the Fungus. A third strategy that has long been viewed as a last resort for Rice blast is the use of chemical fungicides to control the disease. There are two basic techniques that can be used to manage diseases with the chemical fungicide strategy. The first technique uses seed treatments to prevent infection of the seedlings after germination. The second technique uses fungicides to prevent infection of leaves and panicles during the growing season by making one or two applications of fungicides to the foliage to protect the panicles when they are emerging from the boot. This technique attempts to reduce the incidence of Rice blast on the panicle necks and panicles. Both techniques have been used to manage Rice blast but neither one is considered to be highly successful. In addition, the use of foliar fungicides applied by airplanes can be very expensive. Managing Rice blast requires vigilance and careful integration of many strategies and techniques learned in all parts of the world by the individual rice producer. A single mistake can result in crop failure from this one important plant disease. Significance of the Disease:- Rice is the staple food crop for a large part of the human population in the world today. Rice blast is by far the most important disease of the many diseases that attack rice. It is found wherever Rice is grown, it is always important, and it is always a threat. Failures of entire Rice crops have resulted directly from Rice blast epidemics. The challenge for research continues to be to produce high quality food, in ever-increasing amounts at a lower costs, all while in the presence of an unforgiving and unrelenting pathogen. All of the plant disease management strategies and techniques that have been generated through research have been brought to bear against Rice blast, but often with limited success. Rice blast has never been eliminated from a region in which Rice is grown, and a single change in the way in which Rice is grown or in the way resistance genes are deployed can result in significant disease losses even after years of successful management. This disease is a model that demonstrates the seriousness, elusiveness, and longevity of some plant diseases. Rice blast has been widely studied throughout the world. Many investigators have considered it to be a model disease for the study of genetics, epidemiology, molecular pathology of host parasite interactions and biology. Recent advances in understanding the genes that govern the avirulence (resistance) and virulence (susceptibility) interactions have been made with rice blast, and each advance has helped us to understand how other plant diseases work. It is also important to note that the entire genomes of the Rice blast Fungus and Rice have been sequenced and that M. Oryzae is the first plant pathogenic fungus to have its genome sequenced and released to the public. / Возбудитель – Piricularia Oryzae. Под Пирикуляриозом Риса понимается болезнь, вызываемая паразитическими Грибами. На листьях, стеблях, метёлках и семенах пятна различной формы и окраски. Стебли ломаются, семена щуплые. Пирикуляриоз Риса – опасное заболевание Риса, вызываемое Несовершенным Грибом Piricularia Oryzae. Распространён во всех рисосеющих районах мира. Проявляется образованием пятен различной формы и окраски на листьях, листовых влагалищах, стеблевых узлах, метёлках и семенах. Поражённые листья отмирают, стебли ломаются, метёлки преждевременно засыхают или образуют щуплые семена. Наибольший вред приносит пирикуляриоз Риса во время колошения-цветения. Потери урожая 15–40%. Значительно снижается и качество зерна. При эпифитотии растения гибнут. Возбудитель болезни в период вегетации имеет несколько поколений, распространяется с помощью конидий, зимует в форме мицелия на послеуборочных остатках (1–3 года) и в семенах. Развитие пирикуляриоза Риса происходит при высокой влажности воздуха (не ниже 88%) и температуре 15–35 °С. Возможна передача инфекции с поливной водой. Резерватором возбудителя пирикуляриоза Риса могут быть также дикие формы Риса и другие злаки. Меры борьбы:- возделывание устойчивых сортов; запашка пожнивных остатков; сжигание стерни на участках с сильным развитием болезни; обработка заражённых посевов и протравливание семян Риса фунгицидами.

RICE BRAN = РИСОВЫЙ ОКОЛОПЛОДНИК (или ОТРУБИ РИСА) – The nutritious outer layers of the brown Rice grain and the germ are removed from the grain during milling. This is called Rice Bran. It contains the concentrated goodness of the brown Rice grain. Rice bran is sold in supermarkets as a granulated food or to food manufacturers as a nutritious ingredient in some manufactured foods such as crispbreads and breakfast cereals. It is also a valuable ingredient in high quality livestock feeds and other animal and industrial products. The percentage of Rice Bran in Paddy Rice ranges from 10% to 12%. There is no clear distinction between the bran layer and endosperm. The harder the Rice is milled, the more bran is generated. Obviously some of the endosperm is going into the bran and so the properties unique to Rice bran are diluted as the Rice is milled harder. Rice Bran is a very nutritional product. It contains a higher content of protein and its protein has a better amino acid profile that the proteins found in rice and most plant sources. Rice Bran contains about 16% to 18% oil. Rice bran oil is loaded with vitamin E components. It is exceptionally high in Tocopherols and Tocotreinols. Rice bran is also high in oryzanol. Studies have shown that Rice bran and Rice bran oil lower cholesterol levels and improve cardiovascular health. Rice bran also contains high levels of vitamin B, and other vitamins, minerals, and essential fatty acids. Unfortunately, Rice bran goes rancid soon after milling. Lipase enzyme attacks the oil once the bran structure has been destroyed, and free fatty acid levels build up very quickly. The bran quickly develops a bad taste and odor. In the mid 1980s, a USDA Research group in California developed a method to stabilize the bran. A simple dry heat extruder is used to reach a temperature of about 270 F for a short period of time. This temperature deactivates the lipase enzyme. The temperature range is critical. Too low and the lipase is not deactivated, too high and vitamin E components are destroyed. The vitamin E components prevent oxidative rancidity over a long period of time. The process is relatively simple and when done properly, the bran is safe from both enzymatic and oxidative rancidity. Unfortunately, stabilized bran does not have a particularly great taste, and has not yet become popular in the human market. Sage V Foods (when founded as Comet Rice Ingredients) was involved in the original technology and has been stabilizing bran for over ten years. Rice Bran – coarse outer bran layers, the embryo (germ), and small bits of the starchy endosperm. It is an ingredient in cereals, mixes, and vitamin concentrates, and non-food grades of bran are used in livestock feeds.

Stabilized Rice Bran characteristics:- 25% dietary fiber. Applications:- (i) multi-grain breads; (ii) hot and ready-to-eat cereals; (iii) baked goods; (iv) baking mixes; (v) vitamin concentrates; and (vi) health/natural foods. Rice Bran Oil characteristics:- (i) high-quality cooking oil; and (ii) excellent balance of fatty acid. Applications:- (i) cooking oil; and (ii) ingredient. / К Отрубям Риса относятся грубые наружные слои околоплодника (перикарпий), эмбрион (зародыш), и маленькие частицы крахмалистого (мучнистого) эндосперма. Они являются ингредиентом в хлебных злаках, смесях, витаминных концентратах, а не пищевые сорта отрубей используются на корм домашнего скота. Отруби являются побочным продуктом мукомольного производства. Они состоят из оболочек зерна и неотсортированной муки. Отруби являются хорошим кормом для сельскохозяйственных животных всех видов.

RICE BRAN OIL = МАСЛО ИЗ РИСОВОГО ОКОЛОПЛОДНИКА (или МАСЛО ИЗ ОТРУБЕЙ РИСА) – Rice Bran Oil is a high quality cooking oil extracted from rice bran. / Масло из рисового околоплодника (отрубей риса) является высококачественным маслом для приготовления пищи, полученным методом отжима из рисового околоплодника (отрубей риса).

RICE BUG = РИСОВЫЙ ЖУК – Rice Bug is an Insect that sucks the sap of the developing grains, causing serious Rice crop losses. The Species of Rice Bugs of major economic significance are Leptocorisa Acuta, Leptocorisa Oratorius, and Leptocorisa Chinensis. The nymphs and adults are difficult to recognize in the Rice field because of their color. The freshly hatched nymphs are tiny and green but become brownish as they grow. Both nymphs and adults feed on Rice Plants.

RICE FLOUR = РИСОВАЯ МУКА – Small broken Rice grains are ground to produce a fine powder called Rice Flour. This is extensively used for baby food manufacture, baking applications and as a bulking agent and flavor carrier in many manufactured food products. Rice Flour is ground milled or brown Rice. It is non-allergenic, making it valuable as a Wheat substitute for those allergic to gluten and Wheat flour products. It can also be extruded to produce Rice pasta, chips and other snacks, as well as breakfast cereals. Rice Meal/Flour characteristics:- (i) may be white or brown; and (ii) excellent thickening properties. Applications:- (i) baby foods; (ii) extruded snacks, crackers; (iii) baked goods; (iv) baking mixes; (v) dietetic specialties; (vi) soups; (vii) multi-grain breads; (viii) soups, stews, sauces; (ix) binders/extenders for meats, sausage; (x) thickeners for sauces, gravies; and (xi) carrier for seasonings. / Meal = Сечка (дорблёные частички зерновки). Мука – пищевой продукт, полученный размолом зерна. Под Поставом понимается машина для разового размола зерна различных культур в муку и кормовые продукты; общее название различных машин для первичной и окончательной обработки зёрен крупяных культур (шелушения, шлифования и полирования). Рабочие органы постава – жернова, барабаны из абразивной массы и тому подобного с насечёнными на их поверхности бороздками. На мукомольных заводах поставы вытеснены вальцовыми станками.

RICE GALL MIDGE = РИСОВАЯ ГАЛЛИЦА (или РИСОВОЕ ГАЛЛООБРАЗУЮЩЕЕ МЕЛКОЕ ДВУКРЫЛОЕ НАСЕКОМОЕ) – Rice Gall Midge:- the Asian Rice Gall Midge, Orseolia Oryzae, is a serious pest of Rice in South and Southeast Asia. The adult Gall Midge is about the size of a mosquito. Gall Midge attack starts in the seedbed and continues until the booting stage, but most of the damage is limited to the vegetative growth stages. The damage changes Rice tillers into tubular galls, which dry without bearing panicles. New tillers are initiated as the older ones are infested, causing profuse tillering and stunting of the plants. A related Species, Oryza Oryzinova, is prominent in Africa. / Под Галлицами понимается Семейство Насекомых Отряда Двукрылых. Длиной 1–5 миллиметров. Около 4 000 Видов, в бывшем СССР насчитывалось около 500. Личинки ряда Видов, развиваются в тканях Растений, вызывая образование галлов (отсюда название). Некоторые, например, Гессенская Муха вредят культурным растениям и лесу.

RICE HULL = РИСОВАЯ ШЕЛУХА (или РИСОВАЯ ЛУЗГА, или РИСОВАЯ СЕМЕННАЯ КОЖУРА, или РИСОВАЯ КОЛОСКОВАЯ ЧЕШУЯ) – Rice Hull:- this hard, protective shell on the grain is high in silica and is inedible for humans. The removal of the hulls is the first stage of rice milling. Whole unground rice hulls are used for animal bedding, stockfeeds, fruit juice extraction and horticultural purposes. Ground and processed hulls are used in stockfeeds, potting mixes, pet litter and industrial ashes. Rice Hulls are the outer covering or husk layer that encloses the rice kernel. Hulls are inedible, but can be burned as a source of fuel for power plants or rice mills, used as a mulch, or a component in abrasives or other products. / К Рисовой Шелухе относится наружное покрытие или слой кожицы, который окружает зерновку риса (рисовое ядро).

RICE LEAFFOLDER = РИСОВАЯ ОГНЁВКА – Rice Leaffolder:- this Insect, Cnaphalocrocis Medinalis Guenee, is known to occur in all Rice-growing countries of Asia. The full grown larva is yellowish green with a dark brown head. The damage is caused by the larvae which fold the leaf blades into a tubular shape and feed on green leaf tissue within the tubular structures. / Под Огнёвками понимается Надсемейство Дневных Бабочек. Крылья в размахе обычно 1–3 сантиметра (см), иногда до 5 см и более. Около 10 000 Видов. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 1 300 Видов, главным образом в пустынях и степях. Некоторые Виды – Вредители сельскохозяйственных культур:- Луговой Мотылёк, Мучная, Подсолнечниковая, Южная Огнёвка и другие.

RICE PADDY = РИС ПАДИ (или НЕОБРУШЕННЫЙ РИС, или ЦЕЛЬНЫЙ РИС) – Rice Paddy is:- (1) the prepared irrigated ricefield with the bund that is puddled for wet Rice growing. (2) Rough brown Rice (caryopsis) is called Paddy.

RICE PLANT = РАСТЕНИЕ РИС – The cultivated Rice Plant (Oryza Sativa L. (L. = Linnaeus)) belongs to the Tribe Oryzeae under the Sub-Family Pooideae in the Grass Family Gramineae (Poaceae). Biosystematists recently divided the Genus Oryza into several Sections and placed Oryza Sativa under series Sativa in Section Sativae. Oryza Sativa is indigenous to Asia. Oryza Sativa is a Diploid Species with 24 chromosomes. Its genomic formula is AA. The Rice Plant may be characterized as an Annual Grass, with round, hollow, jointed culms, rather flat, sessile leaf blades, and a terminal panicle, Under favorable conditions, the plant may grow more than one year. As other taxa in the Tribe Oryzeae, Rice is adapted to an aquatic habitat. While the ensuing description is based on the ubiquitous Oryza Sativa L., the morphologic terms can also apply to the cultivated Species of Africa, Oryza Glaberrima Steud. (2n = 24). Oryza Glaberrima differs from Oryza Sativa mainly in a lack of secondary branching on the primary branches of the panicle and in minor differences related to pubescence on the lemmas and length of the ligule. Oryza Glaberrima is strictly an annual. Seedling Morphology:- the grains of Rice Varieties that lack dormancy germinate immediately upon ripening. In dormant varieties, a rest period precedes germination and special procedures such as heat treatment (50 °C for 4–5 days) or mechanical dehulling are needed to break dormancy in freshly harvested samples. The coleorhiza enveloping the radicle protrudes first if germination occurs in an aerated environment such as a well-drained soil. If the grain is submerged in water, the coleoptile emerges ahead of the coleorhiza. The primary seminal root (radicle) breaks through the coleorhiza shortly after the latter appears and is followed by two or more secondary seminal roots, all of which develop lateral roots. Seminal roots are later replaced by the secondary system of adventitious roots. The coleoptile, which encloses the young leaves, emerges as a tapered cylinder. Its color varies from colorless, pale green to green, or pale purple to purple. The length of the axis between the coleoptile and the point of union of the root and culm is called the Mesocotyl. The elongation of the mesocotyl elevates the coleoptile above the ground. The coleoptile later ruptures at the apex and the first seedling (primary) leaf emerges. The primary leaf is green and cylindrical and has no blade. The second leaf that follows is differentiated into sheath, blade, ligule, and auricles. Vegetative Organs:- the Rice Plant varies in size from dwarf mutants only .3 to .4 m tall to floating

Varieties more than 7 m tall. The great majority of commercial varieties range from 1 to 2 m in height. The vegetative organs consist of roots, culms, and leaves. A branch of the plant bearing the culm, leaves, roots and often a panicle is a tiller. (1) Roots:- the roots are fibrous, possessing rootlets and root hairs. The seminal roots are sparsely branched and persist only for a short time after germination. The secondary adventitious roots are produced from the underground nodes of the young culms and are freely branched. As the plant grows, coarse adventitious prop roots often form in whorls from the nodes above ground level. Some of the adventitious roots are positively geotropic, while others may be diageotropic. In floating Varieties, fine branched roots form from the higher nodes on the long culm below the water surface. Adventitious roots arise in both nodes and internodes and are usually found in the earlier formed ones. (2) Culm:- the jointed stem of Rice, called a Culm, is made up of a series of nodes and internodes. The node (nodal region) bears a leaf and a bud. The bud is inserted in the axil between the nodal septum and the base of the sheath pulvinus. The bud may give rise to a tiller. Adventitious roots appear in the axis at the base of the internode. The septum inside the node separates two adjoining internodes. The mature internode is hollow, finely grooved, and glabrous on the outer surface. The nodal septum and internode may be differentially pigmented. The internodes of a culm vary in length, generally increasing from the lower internodes to the upper ones. The lower internodes at the base of the culm are short and thickened into a solid section. A visually detectable internode (more than 5 mm long) is considered as elongated. The internodes also vary in cross-sectional dimension, the lower ones being larger in diameter and thickness than the upper ones. Tillers arise from the main culm in an alternate pattern. The primary tillers originate from the lowermost nodes and give rise to secondary tillers. The latter give rise to tertiary tillers. (3) Leaves:- the leaves are borne on the culm in two ranks, one at each node. The leaf consists of the sheath and blade. The leaf sheath is continuous with the blade. It envelops the culm above the node in varying length, form, and tightness. A swelling at the base of the leaf sheath just above the point of its insertion on the culm is the sheath pulvinus. The sheath pulvinus is usually above the nodal septum and is frequently mistermed the node. The blades are generally flat and sessile. Varieties differ in blade length, width, area, shape, color, angle, and pubescence. The uppermost leaf below the panicle is the flag leaf. The flag leaf generally differs from the others in shape, size, and angle. Varieties also differ in leaf number. The upper surface of the blade has many ridges formed by the parallel veins. The most prominent ridge on the lower surface is the midrib. Auricles are small, paired, ear-like appendages borne on either side of the base of the blade. At the junction of the blade and sheath on the inside is a membranous, glabrous or ciliate ligule. The ligule varies in length, color, and shape from variety to variety. The junction of the sheath and blade is the collar or junctura. The collar often appears as a raised region on the back of the leaf. The sheath pulvinus, auricles, ligule and collar on the same plant may be differentially pigmented. When pigmented, the dorsal, ventral and lateral parts of the collar may slightly differ in color. The auricles may not persist on older leaves. The main culm bears the largest number of leaves. The leaf number on a tiller decreases progressively with the rise in tillering order. The first rudimentary leaf at the base of the main culm is a bladeless, 2-keeled bract, the prophyllum. The margins of the prophyllum clasp the young tiller with its back against the parent culm. The prophyllum is also present between each secondary tiller and its tertiary tiller. Floral Organs:- the floral organs are modified shoots. The terminal shoot of a rice plant is a determinate inflorescence, the panicle. A spikelet is the unit of the inflorescence. The spikelets are pediceled on the branched panicle. The spikelet consists of the two sterile lemmas, the rachilla and the floret. A floret includes the lemma, palea and the enclosed flower. The flower consists of six stamens and a pistil, with the perianth represented by the lodicules. (1) Panicle:- the panicle is borne on the uppermost internode of the culm which is often mistermed a peduncle. The extent to which the panicle and a portion of the uppermost internode extend beyond the flag leaf sheath determines the exsertion of the panicle. Varieties differ in degree of exsertion. The nearly solid node between the uppermost internode of the culm and the axis of the panicle is the panicle base. This node generally does not bear a leaf or a dormant bud but may give rise to the first 1–4 panicle branches. The panicle base often appears as a ciliate ring and is used as a dividing point in measuring culm length and panicle length. The region about the panicle base is often called the Neck. The panicle axis (rachis) is the main axis of the inflorescence, extending from the panicle base to the apex, It is continuous and hollow except at the nodes where the panicle branches are borne. The swellings in the axils of the panicle where the branches are borne are the panicle pulvini. The panicle has a racemose mode of branching in which each node on the main axis gives rise to the primary branches and each of which in turn bears the secondary branches. The secondary branches bear the pediceled spikelets. The primary branches may be arranged in a single or paired fashion. Varieties differ greatly in the length, shape, and angle of the primary branches, and in the weight and density (number of spikelets per unit of length) of the panicle. (2) Spikelets:- the spikelet is borne on the pedicel which is morphologically a peduncle. The apex of the pedicel below the sterile lemmas is expanded into a lobed facet of varying size, shape, and margin. Stapf and other systematists (cf. Chevalier 1937) considered the spikelet of Oryza as comprising three fiowers, two of which were reduced in development. Thus, the enlarged, cup-like apex is homologous with a pair of true glumes and may be termed the rudimentary glumes. A spikelet consists of a minute axis (rachilla) on which a single floret is borne in the axils of 2-ranked bracts. The bracts of the lower pair on the rachilla, being always sterile, are the sterile lemmas (‘glumes’, ‘empty glumes’, ‘outer glumes’). The upper bracts or the flowering glumes consists of the lemma (fertile lemma) and palea. The lemma, palea, and the included flower form the floret. The sterile lemmas are generally shorter than the lemma and palea, seldom exceeding one-third the length of the latter. The sterile lemmas may be equal or unequal in size, the upper one generally being larger. The lemma is the larger, indurate (hardened), 5-nerved bract which partly envelops the smaller, 3-nerved palea. The middle nerve or keel may be ciliate or smooth. The extended tips of the lemma and the palea are the apiculi. The apiculi may be separated into lemmal apiculus and paleal apiculus. The awn is a filiform extension of the keel of the lemma. The surface of the lemma and the palea may be pubescent or glabrous. In some varieties, a pair of lateral nerves on each side of the central nerve of the lemma may fuse to form a knob-like mucro on either side of the lemmal apiculus. During natural shattering or the threshing process, the spikelet is separated from the pedicel at the junction of the lower sterile lemma and the facet rudimentary glumes). The base of the lower sterile lemma as is disarticulates from the pedicel is horizontal or oblique in appearance. The relative degree of development of the abscission layer between the sterile lemmas and tile facet is reported to be associated with the ease of shedding. Some varieties are threshed by the fracture of the pedicel rather than by disarticulation. (3) Flower:- the flower proper consists of the stamens and pistil. The six stamens are composed of 2-celled anthers borne on slender filaments. The pistil contains one ovule. The short style bears the bifurcate, plumose stigma. The lodicules are two wale-like, transparent, fleshy structures located at the base of the flower adnate to the palea. They represent the reduced perianth (calyx and corolla), At anthesis, the lodicules become turgid and thrust the lemma and palea apart, allowing the elongating stamens to emerge above or outside the open floret. Anther dehiscence may coincide with the opening of the lemmas, or immediately precede or follow it. The lemma and palea close after the pollen grains are shed from the anther sacs. The Rice fruit is a caryopsis in which the single seed is fused with the wall of the ripened ovary (pericarp), forming a seed-like grain. The grain is the ripened ovary, with the lemma, palea, rachilla, sterile lemmas, and the awn, if present, firmly adhered to it. The lemma and palea and their associated structures such as the sterile lemmas, rachilla, and the awn whenever present constitute the hull or husk. The dehulled Rice grain (caryopsis) is called Brown Rice because of the brownish pericarp. Red Rice owes its trade name to the red pericarp and/or the red tegmen. The tip of the caryopsis is somewhat oblique, corresponding to the larger size of the lemma than that of the palea. The surface of the caryopsis has ridges which correspond to those of the lemma and palea. The caryopsis is enveloped by the pericarp. The pericarp is fibrous and varies in thickness. Next to the pericarp are two layers of cells representing the remains of the inner integuments, the tegmen or seed coat (often mistermed the testa). The embryo lies on the ventral side of the spikelet next to the lemma. The remaining part of the caryopsis is the endosperm which

provides nourishment to the germinating embryo. The hilum is a dot adjacent to the embryo marking the point of attachment of the caryopsis to the palea. Another scar at the tip of the caryopsis marks the base of the style. The embryo contains the embryonic leaves (plumule) and the embryonic primary root (radicle). The plumule is enclosed by the coleoptile and the radicle ensheathed by the coleorhiza; these form the embryonic axis, The embryonic axis is bounded on the inner side by the scutellum (cotyledon) which lies next to the endosperm. The coleoptiles is surrounded by the scutellum and the epiblast, the vascular trace which is fused with the lateral parts of the scutellum. The endosperm is enclosed by the aleurone layer which lies beneath the tegmen. The white starchy endosperm consists of starch granules embedded in a proteinaceous matrix. In the waxy (glutinous) varieties, the starch fraction is composed almost entirely of amylopectin and stains reddish-brown with weak potassium iodide-iodine solution. In the common, non-waxy (non-glutinous) types, the starch fraction contains amylase in addition to amylopectin and stains dark blue with potassium iodide-iodine solution. The starchy endosperm also contains sugars, fats, crude fiber, and inorganic matter. Chalky white spots often appear in the starchy endosperm. Soft textured, white spots occurring in the middle part on the ventral side (side on which the embryo lies) are called White Bellies. A white chalky region extending to the edge of the ventral side and. toward the center of the endosperm is called a White Core. A long white streak on the dorsal side is called the White Back. During the process of milling and polishing, the hull is first removed from the grain (trade name:- rough Rice or Paddy) in a sheller. The pericarp, tegmen, embryo; aleurone layer, and a small portion of the starchy endosperm are then removed as the bran. In the US Rice trade, the coarse outer bran layers, the embryo (germ) and small bits of endosperm constitute the Rice bran. The Rice polish (white bran) refers to the inner layers of the bran removed during polishing. The bulk of the starch endosperm remains as the total milled Rice (polished Rice). In US trade terms, total milled Rice is separated into head Rice (whole kernels), second heads (broken kernels at least half as long as a whole one), screenings (broken pieces about 1/4 to 1/2 the length of a whole kernel), and brewers' Rice (broken pieces which can pass through a 5½/64-inch sieve). The corresponding trade terms proposed by the Food and Agriculture Organization of the United Nations (FAO) are:- whole Rice or head Rice (whole or nearly whole kernels), big brokens or second heads (broken kernels equal to or greater than half the length of a whole kernel), medium brokens (broken pieces between 1/2 and 1/4 the length of a whole kernel), small brokens (broken pieces which are smaller than 1/4 of a kernel but do not pass a sieve with perforations of 1.4 mm. or 0.055 inch), chips (small chips or particles of a kernel which can pass through a sieve having perforations of less than 1.47 mm) and split kernels (pieces caused by a longitudinal splitting of the kernel). Rough Rice in the United States yields about 20 percent hulls, 8 percent bran, 2 percent polish, and 70 percent milled Rice. Actually, the relative proportions of the above components vary greatly among rice varieties of any particular geographic region. Parboiled Rice is rough Rice which has been subjected to a steam or hot water treatment prior to milling. Parboiling increases the percentage of head rice and the vitamin content of milled Rice. Enriched Rice is a blend containing ordinary milled Rice and a small percentage of milled Rice heavily fortified with thiamin, niacin, and iron phosphate to raise the vitamin and iron content slightly above the level present in brown Rice. When the yellowcolored riboflavin is added to the enriching agents, white pigments such as calcium oxide, talc, and titanium dioxide are also included in the enriching mixture to make the finished product appear white. Growth Stages of the Rice Plant:- the vegetative phase of the Rice plant begins with grain germination which is signified by the emergence of the radicle or coleoptile from the germinating embryo. This is followed by the pre-tillering stage during which seminal and lateral roots and the first few leaves develop while the contents of the endosperm are absorbed by the growing seedling. The tillering stage starts with the appearance of the first tiller from the axillary bud in one of the lowermost nodes. The increase in tiller number continues as a sigmoid curve until the maximum tiller number is reached, after which some tillers die and the tiller number declines and then levels off. The visible elongation of lower internodes may begin considerably earlier than the reproductive phase or at about the same time. The reproductive phase may begin before the maximum tiller number is reached, or about the period of the highest tillering activity, or thereafter. This phase is marked by the initiation of the panicle primordium of microscopic dimensions in the main culm. Panicle development continues and the young panicle primordium becomes visible to the naked eye in a few days as a hyaline structure 1–2 mm long with a fuzzed tip. The developing spikelets then become distinguishable. The increase in the size of the young panicle and its upward extension inside the upper leaf sheaths are detectable as a bulge in the rapidly elongating culm, often called the Booting Stage. When the auricles of the flag leaf are directly opposite the auricles of the next lower leaf, meiosis is usually .occurring in the microsporocytes (pollen mother cells) and macrosporocytes of the panicle. This is followed by panicle emergence from the flag leaf sheath, commonly called Heading. Anthesis or blooming begins with the protrusion of the first dehiscing anthers in the terminal spikelets on the panicle branches. Pollination and fertilization follow. The development of the fertilized egg and endosperm becomes visible a few days following fertilization. Grain development is a continuous process, but agronomic terms such as the milk stage, soft dough stage, hard dough stage, and fully ripe stage are often used to describe the different stages. As the grains ripen, the leaves become senescent and turn yellowish in an ascending order. The non- functioning leaves and culm tissues are termed dead straw. in some varieties, the culms and upper leaves may remain green when the grains are fully ripe. Under favorable growth conditions, new tillers may grow from the stubble of the harvested plants. The second and subsequent harvests from the crop are called the first and second ratoon crops, respectively. Rice Plant is an Annual Grass in the Genus Oryza with round, hollow, jointed culms, rather flat, sessile leaf blades, and a terminal panicle. See also Rice. Rice has been found in archaeological sites dating to 8000 bc, although the date of Rice domestication is a matter of continuing debate. Two Species of domesticated Rice, Oryza Sativa (Asian) and Oryza Glaberrima (African) are grown globally. Numerous traits separate wild and domesticated Rices including changes in:- pericarp color, dormancy, shattering, panicle architecture, tiller number, mating type and number and size of seeds. Genetic studies using diverse methodologies have uncovered a deep population structure within domesticated Rice. Two main groups, the Indica and Japonica Subspecies, have been identified with several subpopulations existing within each Group. The antiquity of the divide has been estimated at more than 100 000 years ago. This date far precedes domestication, supporting independent domestications of Indica and Japonica from pre-differentiated pools of the wild ancestor. Crosses between Subspecies display sterility and segregate for domestication traits, indicating that different populations are fixed for different networks of alleles conditioning these traits. Numerous domestication quantitative trait loci (QTLs) have been identified in crosses between the Subspecies and in crosses between wild and domesticated accessions of Rice. Many of the QTLs cluster in the same genomic regions, suggesting that a single gene with pleiotropic effects or that closely linked clusters of genes underlie these QTL. Recently, several domestication loci have been cloned from rice, including the gene controlling pericarp color and two loci for shattering. The distribution and evolutionary history of these genes gives insight into the domestication process and the relationship between the Subspecies. The evolutionary history of Rice is complex, but recent work has shed light on the genetics of the transition from wild (Oryza Rufipogon and Oryza Nivara) to domesticated (Oryza Sativa) Rice. The types of genes involved and the geographic and genetic distribution of alleles will allow scientists to better understand our ancestors and breed better Rice for our descendents. / Под Рисом (Oryza) понимается Род Однолетних и Многолетних Травянистых Растений Семейства Мятликовых, крупяная культура. Около 25 Видов, в основном в тропиках и субтропиках Австралии, Южной и Восточной Азии, Америки, Африки. В культуре в тропиках, субтропиках и тёплых районах умеренного пояса (до 90% посевов в Азии) однолетний Посевной Рис (Oryza Sativa) – одно из древнейших продовольственных Растений Земли. Культура Рис возникла в Юго-Восточной Азии более 7 000 лет назад. Древнейшие очаги рисосеяния – Индия (предположительно родина Риса), где Рис возделывают уже несколько тысячелетий, и Китай. На территории бывшего Союза Советских Социалистических Республик (СССР) (Закавказье и Средняя Азия) Рис выращивают с III–II веков до Нашей Эры, в

Европе – с VIII века Нашей Эры, в Америке – с XV–XVI веков. В Западной Африке выращивают также Голый или Африканский Рис (Oryza Glaberrima). Зерно некоторых дикорастущих Видов, например, Точечного Риса (Oryza Punctata), Короткоязычкового Риса (Oryza Breviligulata), произрастающих в Африке, используется в пищу местным населением. Посевной Рис – яровое теплолюбивое и очень влаголюбивое растение. Выращивают при орошении (на рисовых оросительных системах) или в районах с большим количеством осадков (не менее 1 800–2 000 мм в год). Для прорастания семян верхний слой почвы увлажняют; в фазы кущения, выхода в трубку и вымётывания метёлки на участках (чеках) создают слой воды переменной глубины от 15 до 25 см; перед уборкой воду сбрасывают. Вегетационный период Риса 90–165 суток. Самоопылитель. Лучшие почвы – чернозёмы, каштановые, пойменные. Рис – основная зерновая культура для большей численности населения земного шара. Из зерна – крахмал, крупа, масло (из зародышей), спирт; из соломы – бумага, картон, плетёные изделия. Наибольшие посевные площади Риса в Бангладеше, Вьетнаме, Индии, Индонезии, Китае (КНР), США, Таиланде. В бывшем СССР Рис выращивают в Северном Кавказе, Нижнем Поволжье, Приморском Крае, республиках Средней Азии, Казахстане, на Юге Украины. Площади посева в 1985 0.7 миллиона га, средняя урожайность 38.3 ц/га. Сорта – Авангард, Дунай, Зерноградский, Краснодарский 424, Крос 358, Кулон, Лазурный, Малыш, Солнечный, Солярис, Узрос 7, Узрос 59 и другие. Новые короткостебельные сорта Спальчик и Старт формируют урожайность 70–100 ц/га. Селекция культуры направлена на выведение раннеспелых неполегающих Сортов, устойчивых к пирикуляриозу, с повышенной холодостойкостью, а также на получение гибридного Риса, высокобелковых сортов и сортов с удлинённой зерновкой. Рис возделывают в рисовых севооборотах; предшественники – Многолетние Травы и занятой пар (после них Рис выращивают 2–3 года подряд). Удобрения (кг/га):- 60–150 N, 90 P_2O_5 и 60 K_2O. Оросительная норма 12–20 тысяч $м^3$/га воды. Высевают Рис обычным рядовым способом; норма посева семян 2.5–3 ц/га; глубина посева 1.5–2 см. Убирают раздельным способом и прямым комбайнированием, предварительно обрабатывая десикантами. Внедрены в производство интенсивные технологии возделывания и уборки Риса, разработаны интенсивные рисовые севообороты, в которых эта культура занимает 62.5% площади пашни. Вредители – Рисовый Комарик, Ячменный Минёр, Прибрежная Мушка, Рисовая Пьявица и другие; болезни – пирикуляриоз, гниль всходов, гельминтоспориоз, нематодные болезни. Корневая система Риса мочковатая длиной 30–40 сантиметров (до 1 метра) с наличием воздухоносных полостей и малым количеством корневых волосков. Стебель – соломина. Лист состоит из влагалища и линейно-ланцетной узкой пластинки зелёного, красноватого или фиолетового цвета. Соцветие – метёлка. Одноцветковые колоски. Цветок состоит из двух широких цветковых чешуй с остью у остистых форм, окрашенных в красный, жёлтый или бурый цвета, двух околоцветниковых плёнок – лодикулей, односемянной завязи и шести тычинок. Плод Риса – плёночная зерновка, округлая и широкая у Японского, длинная и узкая у Индийского, на изломе белая, стекловидная, полустекловидная или мучнистая. 1 000 зерновок вести 26–45 грамм. Вредители Риса:- Комарик Рисовый, Минёр Ячменный, Мушка Прибрежная, Пьявица Рисовая, Трипсы и другие. Болезни Риса:- Пирикуляриоз, Гниль Всходов, Гельминтоспориоз, Нематодные Болезни и другие. Из отрубей Риса получают высококачественное масло, но их скармливают и скоту. Рис (Oryza), Род Однолетних и Многолетних Растений Семейства Злаков. В Роде 19 Видов. Произрастают в тропиках. Культурный Вид – Рис Посевной (Oryza Sativa), подразделяемый на Подвиды Ssp. Brevis и Ssp. Communis (Индийская и Японская ветви), распространён также в субтропиках и более тёплых районах умеренного пояса. В Западной Африке выращивают Рис Голый (Oryza Glaberrima). Остальные виды дикорастущие, размножаются самосевом. Некоторые из них, например, Рис Точечный (Oryza Punctata), Рис Короткоязычковый (Oryza Breviligulata), произрастающие в Африке, имеют большое значение в питании местного населения. Рис Посевной – Однолетнее Растение. Корневая система его мочковатая, длина 30–40 сантиметров (см) (до 1 метра (м)), отличается от корней других Злаков наличием воздухоносных полостей и малым количеством корневых волосков, которые у взрослого растения при постоянном затоплении почти полностью отмирают. Стебель – соломина, высотой от 50 см до 2 и даже 3–5 м (у глубоководных форм). Обычно Рис формирует 3–5 продуктивных стеблей, а при редком посеве и обильном питании – 50 и более. У неполегающих Сортов стебель очень прочный. Лист состоит из влагалища и линейно-ланцетной узкой пластинки зелёного, красноватого или фиолетового цвета. Соцветие – метёлка, длина 10–30 см. Одноцветковые колоски расположены преимущественно на веточках 2-го порядка. Цветок состоит из 2 широких цветковых чешуй с остью у остистых форм, окрашенных в красный, жёлтый или бурый цвета, 2 околоцветковых плёнок – лодикулей, односемянной завязи и 6 тычинок. Плод Риса – плёнчатая зерновка, округлая и широкая у Японского, длинная и узкая у Индийского, на изломе белая, стекловидная, полустекловидная или мучнистая; 1 000 зерновок весит 26–45 граммов (г). Рис Посевной – яровое растение. Вегетационный период от 90 до 165 суток (сут). Культура требовательна к теплу. Семена начинают прорастать при температуре почвы 10–12 °С; наиболее благоприятная температура для роста и развития 22–27 °С. Выращивают Рис при орошении или в условиях очень большого количества осадков (не менее 1 800–2 000 миллиметров (мм) в год). В отдельные периоды вегетации потребность в воде неодинакова. Для прорастания семян верхний слой почвы только увлажняют. В фазы кущения, выхода в трубку и вымётывания метёлки создают слой воды переменной глубины (от 5 до 25 см), в период восковой спелости зерна воду сбрасывают с чеков (обвалованные участки полей). Рис произрастает на чернозёмных, каштановых, болотных и других почвах с небольшой водопроницаемостью. Особенно благоприятны пойменные почвы. Рис – основная зерновая культура для большей части населения земного шара. Из его крупы приготовляют разнообразные блюда, которые у многих народов заменяют хлеб. Зерно Риса перерабатывают на спирт, крахмал, пиво. Из рисовой соломы делают ценные сорта бумаги, верёвки, шляпы, циновки и другое. Отруби скармливают скоту; из них получают высококачественное масло. Рис – одна из древнейших сельскохозяйственных культур. Место происхождения её точно не установлено, однако, по мнению Русского и Советского учёного – Николая Ивановича Вавилова (1887–1943) и других учёных, рисосеяние возникло в Индии несколько тысячелетий назад, о чём свидетельствует произрастание здесь диких Видов этого Рода, а также промежуточных форм между диким и культурным Рисом. Древнейшим очагом культуры Риса является Китай, где его выращивали ещё в 5-м тысячелетии до Нашей Эры. В Африке это растение начали возделывать за 2 тысячи лет до Нашей Эры, в Европе только с VIII века Нашей Эры (на Пиренейском Полуострове), хотя Рис был известен Европейцам значительно раньше. На Американский континент Рис завезли в XV–XVI веках, в США его стали культивировать в XVII веке. На территорию СССР – в Закавказье и Среднюю Азию – рисосеяние проникло во II–III веках до Нашей Эры. В Австралии промышленная культура Риса появилась в XX веке. Мировая посевная площадь под Рисом (миллионов гектаров (га)):- 102.6 в 1948–52, 123.5 в 1961–65, 134.6 в 1970, 134 в 1973. Основные поставщики его – страны Азии, где сосредоточено более 90% посевов. Особенно велики площади под Рисом в Индии (более 36 миллионов га), Китае (более 33 миллиона га); в США эта культура занимает 0.7 миллиона га, в Европейских странах – около 0.5 миллионов га (1973). Мировой валовой сбор зерна 321.3 миллионов тонн (т); средний урожай 24 центнера с одного гектара (ц/га); наиболее высокие урожаи получают в Австралии, Испании – до 70 ц/га, Японии, Греции, Арабской Республике Египет (АРЕ), США – более 50 ц/га, в Индии значительно ниже – 16–18 ц/га (1973). Посевы Риса в бывшем Союзе Советских Социалистических Республик (СССР), в тысячах гектаров (тыс. га):- 95 в 1960, 217 в 1965, 350 в 1970, 462 в 1973. Валовой сбор зерна 1.76 миллиона тонн (т), средний урожай 38.2 (в Таджикистане 42.5, в Казахстане 40.1) центнеров с одного гектара (ц/га), в передовых хозяйствах 60–65 ц/га (1973). Лучшие сорта:- Краснодарский 424, Дубовский 129, Кубань 3, Донской 163, Приморский 10, УзРОС 263, Узбекский 5 и другие. На 1974 районировано 89 Сортов Риса (Советской селекции и местных). Общее направление селекции Риса в СССР –

выведение высокопродуктивных (не менее 80–90 ц/га зерна) раннеспелых низкорослых Сортов, обладающих групповой устойчивостью к болезням и вредителям, с зерном, технологические качества которого соответствуют мировым стандартам. Рис выращивают на рисовых оросительных системах в рисовых севооборотах. Перед посевом и в подкормку вносят минеральные удобрения:- 60–150 килограммов на один гектар (кг/га) N, 90 кг/га P_2O_5, 60 кг/га K_2O. Основной способ посева – рядовой, норма высева семян – 5.5–7 миллионов всхожих зёрен на 1 га, глубина заделки 1.5–2 см. В некоторых странах (Индия, Китай и другие) распространена пересадочная культура Риса. При уходе за посевами основное внимание уделяют правильному режиму орошения (наиболее рациональный – укороченное затопление), уничтожению Сорняков гербицидами (группы 2.4-Д), Водорослей – 10%-ным раствором медного купороса, соблюдению пищевого режима (подкормки). Убирают Рис раздельным способом и прямым комбайнированием (смотрите Зерноуборочный Комбайн) с предварительной обработкой десикантами. Вредители:- Рисовый Комарик, Минёр Ячменный, Мушка Прибрежная, Пьявица Рисовая, Трипсы и другие; болезни:- пирикуляриоз, гниль всходов, гельминтоспориоз, нематодные болезни.

RICE POLISH (WHITE BRAN) = (БЕЛЫЙ ОКОЛОПЛОДНИК), ОСТАВШИЙСЯ ПОСЛЕ ШЛИФОВКИ (или ПОЛИРОВКИ) РИСА – Rice Polish (White Bran):- inner layers of the bran removed during polishing. / (Белый Околоплодник), оставшийся после шлифовки (полировки) Риса – внутренние слои околоплодника, удалённые в процессе шлифовки (полировки).

RICE PROCESSING = ОБРАБОТКА РИСА (или ПЕРЕРАБОТКА РИСА) – Rice Processing is the milling, polishing, and grading of rough Rice. The processing of Rice by parboiling.

RICE STALK = ЧЕРЕШОК РИСА (или СТЕБЕЛЬ РИСА) – Rice Stalk is the stem or culm portion of the plant. / Стеблевая или соломенная часть растения.

RICE STARCH = РИСОВЫЙ КРАХМАЛ – Rice Starch is the major component of milled Rice. From the endosperm of the grain, it makes up 90 to 93% of the milled dry weight. It is used as a thickener in making sauces and desserts, and can be hydrolyzed to make a sweet syrup. Rice Starch characteristics:- (i) excellent thickening properties; (ii) no off-taste; (iii) can be hydrolyzed; and (iv) no-hygroscopic. Applications:- (i) thickening sauces/gravies; (ii) freeze/thaw applications; and (iii) fat mimetic. / Рисовый Крахмал является главным компонентом обрушенного Риса. Из эндосперма (endosperm) зерна, он сотавляет от 90 до 93% обрушенного сухого веса. Он используется как наполнитель при производстве соусов и десертов, и может быть подвергнут гидролизу для получения сладкого сиропа.
