CLUSTER SPIKELETS = РАСТУЩИЕ ГРОЗДЬЯМИ КОЛОСКИ – Cluster Spikelets (CL) are spikelets that show a clumped arrangement on the primary or secondary panicle branches with two or more spikelets per branch. Bunched arrangement of spikelets in groups of 10–48 is termed 'Super Clustering'.

CLUTCH = КЛАТЧ (или СУМКА КОНВЕРТ, или МУФТА) – Clutch is a clutch bag. / .

CLUTCH = СЦЕПНАЯ МУФТА (или СЦЕПЛЕНИЕ, или МУФТА СЦЕПЛЕНИЯ) – Clutch is a mechanical device which engages and disengages power transmission especially from driving shaft to driven shaft. In the simplest application, clutches connect and disconnect two rotating shafts (drive shafts or line shafts). In these devices, one shaft is typically attached to an engine or other power unit (the driving member) while the other shaft (the driven member) provides output power for work. While typically the motions involved are rotary, linear clutches are also possible. In a torque-controlled drill, for instance, one shaft is driven by a motor and the other drives a drill chuck. The clutch connects the two shafts so they may be locked together and spin at the same speed (engaged), locked together but spinning at different speeds (slipping), or unlocked and spinning at different speeds (disengaged). / Сцепление или Сцепная Муфта, механизм транспортных машин для передачи крутящего момента от двигателя внутреннего сгорания к коробке передач. Сцепление обеспечивает кратковременное разъединение вала двигателя и вала трансмиссии, безударное переключение передач и плавное трогание машины с места. В зависимости от числа ведомых дисков различают одно-, двух- и многодисковые сцепления. Устанавливаемые в автомобилях сцепления обычно представляют собой одно- или двухдисковую муфту, диски которой сжаты пружинами. Для обеспечения мягкости включения сцепления и уменьшения крутильных колебаний трансмиссии между фрикционными накладками дисков часто устанавливают плоские пружины, а крепление дисков к их ступицам производят через упругую муфту с витыми пружинами (смотрите Демпфер) и тому подобное. Выключение сцепления осуществляется педалью через рычажную или гидравлическую передачу, а в тяжёлых машинах с помощью сервопривода (смотрите Исполнительный Механизм). Выключение может быть автоматическим при переключении передач. В качестве сцепления используют также многодисковые масляные муфты (в мотоциклах), нормально разомкнутые (в тракторах), гидродинамические или гидродинамические в сочетании с фрикционными (в автомобилях), а иногда электромагнитные муфты с ферромагнитной смесью (обычно в автомобилях для инвалидов). Под Муфтой, от Немецкого слова Muffe или Голландского слова Mouwtje, в технике понимаются устройства для постоянного или временного соединения валов, труб, стальных канатов, кабелей и тому подобного. Различают Соединительные Муфты, которые в зависимости от выполняемой функции обеспечивают прочность соединения, герметичность, защищают от коррозии и тому подобного (смотрите Кабельная Муфта, Соединение Труб), и Муфты Приводов машин и механизмов, которые передают вращательное движение и вращающий момент с одного вала на другой вал, обычно соосно расположенный с первым, или с вала на свободно сидящую на нём деталь (шкив, зубчатое колесо и тому подобное) без изменения вращающего момента. Кроме того, муфты приводов выполняют другие важные функции:- компенсацию небольших монтажных отклонений, разъединение валов, автоматическое управление, бесступенчатое регулирование передаточного отношения, предохранение машин от поломок в аварийном режиме и так далее. Муфты применяют для передачи как ничтожно малых, так и значительных моментов и мощностей (до нескольких тысяч килоВатт (кВт)). Различные способы передачи вращающего момента, разнообразие функций, выполняемых муфтами, обусловили большой типаж конструкций современных муфт. Наиболее распространённые из них стандартизованы. Передача момента в муфте может осуществляться механической связью между деталями, выполняемой в виде неподвижных соединений или кинематических пар (Муфта С Геометрическим Замыканием); за счёт сил трения или магнитного притяжения (Муфта С Силовым Замыканием); сил инерции или индукционным взаимодействием электромагнитных полей (Муфта С Динамическим Замыканием). По характеру работы и основному назначению различают муфты следующих типов:- постоянные соединительные; управляемые (сцепные), позволяющие соединять и разъединять валы через систему управления; самоуправляемые (автоматические), соединяющие и разъединяющие валы в процессе работы автоматически в зависимости от изменения режима; предохранительные, разъединяющие валы при опасном нарушении нормальных условий работы машины; муфты скольжения, передающие момент лишь при частоте вращения ведомого вала, меньшей частоты вращения ведущего вала. Постоянные соединительные муфты выполняются с геометрическим замыканием и делятся на несколько типов. Жёсткие Некомпенсирующие, или Глухие, Муфты соединяют валы без возможности относительного их перемещения. Жёсткие Компенсирующие Муфты допускают небольшие отклонения от соосного расположения валов. Среди них наиболее распространены Зубчатые Муфты. Жёсткие Подвижные Муфты допускают значительные отклонения от соосности. Например, широко распространены Асинхронные Шарнирные Муфты (смотрите Карданная Передача), которые допускают перекос осей до 45°, но не допускают поперечных и продольных смещений осей; Сдвоенные Шарнирные Муфты, то есть сочетание двух одинарных и так далее. Постоянное передаточное отношение при любых углах между осями соединяемых валов обеспечивается Синхронными Шарнирными Муфтами, которые передают движение посредством шариков. Такие муфты применяют, например, в приводе передних ведущих колёс автомобиля. К синхронным муфтам относятся также Плавающие, или Крестовые Муфты, называемые также Кулачково-Дисковыми Муфтами, конструкции которых допускают значительные поперечные смещения осей валов и компенсацию небольших перекосов и осевых смещений. Как компенсирующие используются также Упругие и Упруго-Демпфирующие Муфты. К этой группе относятся Втулочно-Пальцевые Муфты, широко применяемые для соединения вала электродвигателя с валом приводимой машины, а также муфты более совершенной конструкции – Муфты С Торообразной Оболочкой и другие. Управляемые, или Сцепные, Муфты, выполняемые с геометрическим и силовым замыканием, также отличаются большим разнообразием. Группу муфт с геометрическим замыканием составляют Кулачковые, Зубчатые и другие муфты, отличающиеся компактностью конструкции, но не допускающие включения на быстром ходу при большой разности угловых скоростей сцепляемых полумуфт. Этого недостатка лишены зубчатые муфты с синхронизаторами. Такие муфты обеспечивают безударное включение на холостом ходу, так как сначала в соприкосновение входят фрикционные поверхности и происходит выравнивание скорости вращения полумуфт в процессе скольжения перед введением в зацепление зубьев. Муфты с синхронизаторами используют в автомобильных коробках передач. К управляемым муфтам с силовым замыканием механической связью относятся Муфты Трения, или Фрикционные, которые допускают включение на ходу и под нагрузкой. Конструкция этих муфт может быть выполнена с одним или несколькими дисками, с цилиндрическими или коническими поверхностями трения, с механическим, пневматическим, гидравлическим или электромагнитным управлением. Такие муфты применяют в автоматических системах, так как они

позволяют осуществлять дистанционное управление. Группу муфт с силовым замыканием электромеханической связью составляют муфты с жидкой или порошкообразной ферромагнитной смесью, в которых при прохождении электрического тока в катушке возбуждения возникает магнитный поток, в результате ферромагнитная смесь, заполняющая зазор между полумуфтами, намагничивается, что обеспечивает сцепление смеси с поверхностями полумуфт. Эти муфты широко используются в копировальных металлообрабатывающих станках и других рабочих машинах. Силовое замыкание электромагнитной связью осуществляется в синхронных электроиндукционных муфтах, которые имеют магнитопроводы с разделёнными полюсами на обеих полумуфтах. Вращающий момент между валами передаётся при прохождении через катушку возбуждения тока и возникновении при этом силы магнитного притяжения между полюсами полумуфт. Самоуправляемые, или Автоматические, Муфты включаются и выключаются в зависимости от изменения режима работы машины. К ним относятся:- Однооборотные Муфты, срабатывающие в определённом положении через каждые один или несколько оборотов вала (применяются в прессах и молотах для остановки ползуна в верхнем положении); Обгонные Муфты, или Муфты Свободного Хода, передающие момент только при одном направлении вращения ведущей полумуфты относительно ведомой и проворачивающиеся при обратном направлении вращения (применяются в велосипедах, автоматических трансмиссиях автомобилей, станках и тому подобном); Центробежные Муфты, включающиеся и выключающиеся в зависимости от скорости вращения ведущей полумуфты (используются в качестве пусковых в приводах, а также как Предохранительные Муфты, ограничивающие скорость вращения приводимой машины, и тому подобного); Муфты Предельного Момента, которые наиболее часто используются как предохранительные, отключающие машину при опасном увеличении вращающего момента. Функции предохранительных выполняют муфты и других типов, допускающие проскальзывание и имеющие соответствующую конструкцию и характеристику. Муфты Скольжения выполняются с динамическим замыканием механической связью (Гидродинамические Муфты Скольжения) или с электрической связью (Электроиндукционные Асинхронные Муфты Скольжения). Такие муфты передают момент только при отставании ведомой полумуфты от ведущей, то есть при наличии скольжения. Конструктивно гидродинамическая муфта выполнена как замкнутая система с жидким рабочим телом. Такие муфты используют в качестве пусковых, управляемых и предохранительных, в гидродинамических передачах. Электроиндукционные асинхронные муфты работают за счёт сил магнитного взаимодействия, возникающих при скольжении ведущей полумуфты, имеющей катушку возбуждения и магнитопровод с разделёнными полюсами, относительно ведомой полумуфты, выполненной со сплошным магнитопроводом. Эти муфты используются в качестве управляемых, пусковых, иногда как вариаторы скорости.

CLUTCH BAG = СУМКА КОНВЕРТ (или ХХ) – Clutch Bag is a woman's small usually strapless handbag.

CMC (L:C) COLOR DIFFERENCE = ЦВЕТОВОЕ РАЗЛИЧИЕ ПО КИЦ (ЭЛ.:СИ.) – CMC (L:C) Color Difference is the color difference calculated by use of the formula developed by the Colour Measurement Committee (CMC) of the Society of Dyers and Colourists of Great Britain. Discussion:- based on the lightness, hue, chroma version of CIELAB, it incorporates chroma and hue-angle correction terms for improved visual spacing and variable weighting factors for lightness (l) and chroma (c) relative to hue for improved correlation depending on type of judgment (acceptability, perceptibility) and application (textiles, others). CMC reports the equivalent of D E as a weighted function of the ratio of L:Ch as Performance Factor (PF). Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / МКОЛАБ (CIELAB). Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

CME® = CHICAGO MERCANTILE EXCHANGE®

CME GROUP INC. = СИ.ЭМ.И. ГРУП ИНК. – CME Group is a trademark of CME Group Inc.. CME Group is a combined entity formed by the 2007 merger of the Chicago Mercantile Exchange® (CME®) and the Chicago Board of Trade (CBOT®). We provide the widest range of benchmark futures and options products available on any exchange, covering all major asset classes. Together, we offer our customers and the global marketplace more than 250 years of exchange expertise, and we are dedicated to ongoing innovation and unsurpassed customer service. Specifically, we offer futures and options based on interest rates, equity indexes, foreign exchange, commodities, energy, and alternative investment products such as weather and real estate. Three quarters of our trading volume comes from trades made electronically on our CME Globex® electronic trading platform. We serve customers around the world with a global product line, virtually around-the-clock electronic trading and strategic alliances with other exchanges. We also offer a number of programs and products designed specifically to appeal to a global audience. Customers from more than 80 countries trade our products. CME Clearing matches and settles our trades and guarantees the creditworthiness of every transaction that takes place in our markets. The new CME Group Web site, http://www.cmegroup.com, launched 2008-January-19. In response to customers' requests for additional time to become familiar with the new site, the http://www.cme.com and http://www.cbot.com sites will remain online. CME Group offers a suite of options on our standard crude oil, petroleum products, natural gas, coal, and electricity futures, supported by the safety and security of the world's largest regulated derivatives marketplace. Options on futures offer traders additional tools to express their opinion in a market, as well as flexibility in managing price risk as a form of insurance. The holder of an options contract has the right, but not the obligation, to buy (a call option) or sell (a put option) the underlying futures contract at a specific price and time, allowing participation in favorable price moves. If the market moves against the options position, the holder can let it expire worthless, with the only cost being the premium paid. Options can be used alone or in combination with futures contracts resulting in strategies to fit any risk profile, time horizon or cost consideration. As the world's largest and most diverse derivatives marketplace, CME Group is where the world comes to manage risk. CME Group exchanges offer the widest range of global benchmark products

across all major asset classes, including futures and options based on interest rates, equity indexes, foreign exchange, energy, agricultural commodities, metals, weather and real estate. CME Group brings buyers and sellers together through its CME Globex® electronic trading platform and its trading facilities in New York and Chicago. CME Group also operates CME Clearing, one of the largest central counterparty clearing services in the world, which provides clearing and settlement services for exchange-traded contracts, as well as for over-the-counter (OTC) derivatives transactions through CME ClearPort. These products and services ensure that businesses everywhere can substantially mitigate counterparty credit risk in both listed and over-the-counter derivatives markets. Because energy markets are highly responsive to overarching global economic and geopolitical influences, they present a unique risk management tool for commercial and institutional firms as well as a unique, exciting and potentially rewarding opportunity for individuals who seek to profit by correctly anticipating price changes. And there is no better marketplace to execute against those opportunities than CME Group, the world's largest and most diverse derivatives marketplace. In 2008, NYMEX® became part of CME Group. This brought together, under a single marketplace, the most extensive and liquid complex of energy contracts in the world, including Light Sweet Crude Oil (WTI), Natural Gas (Henry Hub), petroleum and electricity products. Many of our contracts are benchmarks that set the price for these resources worldwide. From the world's largest industrial companies to financial institutions and individual traders, everyone in our diverse universe of participants has equal access to market opportunities. And those same participants clear an average daily volume of 1.5 million energy contracts every day on CME Globex®, through CME ClearPort or on our New York trading floor. As the world's leading and most diverse derivatives marketplace, CME Group is where the world comes to manage risk. CME Group exchanges offer the widest range of global benchmark products across all major asset classes, including futures and options based on interest rates, equity indexes, foreign exchange, energy, agricultural commodities, metals, weather and real estate. CME Group brings buyers and sellers together through the CME Globex® electronic trading platform and trading facilities in New York and Chicago. CME Group also operates CME Clearing, one of the largest central counterparty clearing services in the world, which provides clearing and settlement services for exchange-traded contracts, as well as for over-the-counter derivatives transactions through CME ClearPort. CME was founded in 1898 as a not-for-profit corporation. In 2000, CME demutualized and became a shareholder-owned corporation. As a consequence, we adopted a for-profit approach to our business, including strategic initiatives aimed at optimizing contract volume, efficiency and liquidity. In 2002, Chicago Mercantile Exchange Holdings Inc. (CME Holdings) completed its initial public offering of its Class A common stock, which is listed on the NASDAQ Global Select Market under the symbol 'CME'. In 2007, CME Holdings merged with CBOT Holdings, Inc. and was renamed CME Group. In connection with the merger, we acquired the CBOT exchange. CBOT is a leading marketplace for trading agricultural and US Treasury futures as well as options on futures. In 2008, we merged with NYMEX Holdings, Inc. and acquired NYMEX and COMEX. On NYMEX, customers primarily trade energy futures and options contracts, including contracts for crude oil, natural gas, heating oil and gasoline. On COMEX, customers trade metal futures and options contracts, including contracts for gold, silver and copper. We launched CME Clearing Europe in 2011. In 2012, we acquired The Board of Trade of Kansas City, Missouri, Inc. (KCBT) and its hard red winter wheat product line and effective December 2013, KCBT operations were transferred to CBOT. In April 2013, we purchased the non-controlling interest in CME Group Index Services from Dow Jones & Company (Dow Jones) resulting in an increase in our ownership to 27% of the S&P/Dow Jones Indices LLC (S&P/DJI) joint venture with S&P Global, Inc. (formerly known as McGraw-Hill), originally established in 2012. In 2013, CME Group began operating CME Ventures LLC (CME Ventures), which makes minority stake investments in early stage technology companies whose innovative products and services may impact CME Group's business in the longer term. In 2013, we also began offering repository services and now offer global trade repository services in the United States, United Kingdom, Canada and Australia. In April 2014, we launched CME Europe Limited, our UK exchange. Our business has historically been subject to the extensive regulation of the US Commodity Futures Trading Commission (CFTC). As a result of our global operations, we are also subject to the rules and regulations of the local jurisdictions in which we conduct business, including the Bank of England, the Financial Conduct Authority (FCA) and the European Securities and Markets Authority (ESMA). Additionally, our US clearing house has been designated as systemically important, which carries with it enhanced regulatory oversight of certain of our risk-management standards, clearing and settlement activities, including additional oversight by the Federal Reserve. CME Group is where the world comes to manage risk. Through its exchanges, CME Group offers the widest range of global benchmark products across all major asset classes, including futures and options based on interest rates, equity indexes, foreign exchange, energy, agricultural products and metals. CME Group provides electronic trading globally on its CME Globex platform. The company also offers clearing and settlement services across asset classes for exchange-traded and over-the-counter derivatives through its clearinghouses CME Clearing and CME Clearing Europe. CME Group's products and services are designed to provide businesses around the world with the means to effectively manage risk. We also provide hosting, connectivity and customer support for electronic trading through our co-location services. Our CME Direct platform offers side-by-side trading of exchange-listed and privately negotiated markets. We provide clearing and settlement services for exchange-traded contracts, as well as for cleared swaps, and provide regulatory reporting solutions for market participants through our global repository services in the United States, United Kingdom, Canada and Australia. Finally, we offer a wide range of market data services – including live quotes, delayed quotes, market reports and a comprehensive historical data service. Clearing member firms are continually monitored and examined to assess their outstanding risk, capital adequacy and compliance with customer protection rules and regulations. We utilize a combination of risk management capabilities to assess our clearing firms and their account exposure levels for all asset classes 24 hours a day throughout the trading week. The company operates two clearing houses:- CME Clearing (a division of CME) and CME Clearing Europe. Our integrated clearing function is designed to ensure the safety and soundness of our markets by serving as the counterparty to every trade, becoming the buyer to each seller and the seller to each buyer, and limiting counterparty credit risk. The clearing house is responsible for settling trading accounts, clearing trades, collecting and maintaining performance bond funds, regulating delivery and reporting trading data. CME Clearing marks open positions to market at least twice a day, and requires payment from clearing firms whose positions have lost value and makes payments to clearing firms whose positions have gained value. For select cleared-only markets, positions are marked-to-market daily, with the capacity to mark-to-market more frequently as market conditions warrant. The CME ClearPort front-end system provides access to our flexible clearing services for block transactions and swaps. Superior Trading Technology and Distribution:- We strive to provide the most flexible and scalable platforms to support the operational and capacity needs of the business along with the delivery of innovative technology solutions to the marketplace. Our CME Globex electronic platform is the trading engine for our central limit order book markets, and is available on a global basis nearly 24 hours a day throughout the trading week. The CME Globex platform is accessible through a wide variety of vendor provided and custom built trading systems that benefit from our open application programming interface approach. For privately negotiated markets, we offer brokers and customers the CME Direct platform for arranging, executing, recording and risk-managing trades. CME Direct includes CME One for mobile access, CME Messenger for instant-message capabilities and CME Straight-Through Processing. CME Straight-Through Processing enables direct connectivity for trade information directly with customer order management and risk management systems and is designed to reduce errors and improve efficiency. In 2016, 88% of our contract volume was conducted electronically. Together, our platforms offer:- certainty of execution; vast capabilities to facilitate complex and demanding trading; direct market access; fairness, price transparency and anonymity; convenience and efficiency; and global distribution, including connectivity through high-speed international telecommunications hubs in key financial centers or order

routing to our global partner exchanges. We also offer co-location services at a data center facility, which houses our trading match engines for all products traded on the CME Globex electronic trading platform. The service provides the lowest latency connection for our customers. The offering is made available to all customers on equal terms. We derived 2% of our revenues from our co-location business in each of the last three years. Headquartered in Chicago, State of Illinois (IL), the United States of America. In a world of increasing volatility, CME Group is where the world comes to manage risk across all major asset classes – interest rates, equity indexes, foreign exchange, energy, agricultural commodities, metals and alternative investments like weather and real estate. Built on the heritage of CME®, CBOT®, COMEX® and NYMEX®, CME Group is the world's largest and most diverse derivatives exchange, encompassing the widest range of benchmark products available. CME Group brings buyers and sellers together on the CME Globex® electronic trading platform and on trading floors in Chicago and New York. We provide you with the tools you need to meet your business objectives and achieve your financial goals. And CME Clearing matches and settles all trades and guarantees the creditworthiness of every transaction that takes place in our markets. / Чикагская Палата Торговли (Чикагское Табло Торговли, если быть более точными; СИБАТ® (CBOT®)). инновация . CMR CONSIGNMENT NOTE = ТОВАРНО–ТРАНСПОРТНАЯ НАКЛАДНАЯ ДПГ (или КОНСИГНАЦИОННАЯ НОТА СЭ.ЭМ.ЭР.) – CMR Consignment Note is a legal contractual document between consignor, road transport operator and consignee, which standardises the conditions governing the contract for international road transport, particularly with respect to documents to be used and the carrier's liability with the aim of facilitating international road transport and international trade. To use the CMR note, at least one of the countries involved in the international transport (of origin or of destination) should be a Contracting Party to the CMR Convention.

CMR CONVENTION = СЭ.ЭМ.ЭР. КОНВЭНСЬЁН (или КОНВЕНЦИЯ ДПГ) – CMR Convention is the Convention on the Contract for the International Carriage of Goods by Road (CMR) or, in French, Convention Relative au Contrat de Transport International de Marchandise par Route (CMR) is a United Nations convention signed in Geneva, Switzerland on 1956-May-19. The convention came into force on 1961-July-02, and has been ratified by a majority of European states. It was as amended by the CMR Protocol of Geneva on 1978-July-05. The convention relates to various legal issues concerning transportation of cargo, predominantly by lorries, by road. On 2008-May-27 seven countries signed an Additional Protocol to CMR Convention which will provide the legal framework for the electronic CMR consignment note (e-CMR). The United Nations Economic Commission for Europe (UNECE) expects that the electronic CMR consignment note, known as 'e-CMR', will lead to streamlined procedures and securer data exchange, in particular by reducing the scope of error in dealing with identification and authentication of signatures. To date, the Additional Protocol has been signed by Belgium, Finland, Latvia, Lithuania, the Netherlands, Norway, Sweden and Switzerland; expected to sign in the near future are Albania, Armenia, Hungary, Montenegro, Russia, Slovakia and the United Kingdom. The convention will come into force on the ninetieth day after five countries have deposited their instruments of ratification or accession. / Конвенция о Договоре Международной Дорожной Перевозки Грузов (ДПГ) или, как это звучит на Французском по месту подписания, Конвэнсьён Рёлатив о Контра дё Транспор Этэрнасьёналь дё Маршандиз пар Рут (Сэ.Эм.Эр.) (Convention Relative au Contrat de Transport International de Marchandise par Route (CMR)) – конвенция Организации Объединённых Наций, подписанная 1956-Май-19 в Женеве, Швейцария. Конвенция вступила в силу 1961-Июль-02, и была ратифицирована большинством Европейских государств. Она была дополнена Женевским Протоколом ДПГ от 1978-Июль-05. Эта конвенция относится к различным юридическим аспектам, касающимся перевозки грузов, главным образом, грузовиками, по дорогам.

COA = COST OF ACQUISITION

COACERVATION = КОАЦЕРВАЦИЯ – Coacervation is the collection of colloidal particles into droplets held together by electrostatic attraction. This term for the equilibrium state of colloidal systems was introduced in 1929.

COACH BOLT = УКРЕПЛЁННЫЙ БОЛТ (или XX) – Coach Bolt is a bolt with square or other shape under the head to prevent turning when located. See also Pallet. / Укреплённый Болт (Coach Bolt):- болт с четырёхгранной или другой формы шайбой под головкой, предохраняющей вращение болта при ввинчивании. Смотрите также Поддон (Pallet).

COAGULATION = КОАГУЛЯЦИЯ – Coagulation:- (Latin:- coagulare – to congeal) Clotting of a colloid solution, for example, protoplasma. Coagulation is the precipitation of particles from a suspension in a liquid, usually resulting in formation of a gel. / Под Коагуляцией, от Латинского слова Coagulatio, означающее Свёртывание или Сгущение, понимается слипание коллоидных частиц при их сталкивании в процессах Броуновского движения, перемешивания или направленного перемещения в силовом (например, электрическом) поле. Коагуляция играет важную роль при очистке природных и сточных вод, извлечении ценных продуктов из отходов производства, выделении каучука из латекса, получении пищевых продуктов. Коагуляция – укрупнение частиц в дисперсных системах; ведёт к выпадению из коллоидного раствора хлопьевидного осадка или к застудневанию. В случае золей коагуляция может происходить при введении коагулянтов, например, электролитов. Применяется в разнообразных технологических процессах (примеры:- очистка воды от мелких частиц ила, глин и Бактерий; выделение каучука из латекса; получение сливочного масла). Коагуляция играет важную роль в биологических и геологических явлениях. Под Коагуляцией понимается слипание частиц коллоидной системы при их столкновениях в процессе теплового (Броуновского) движения, перемешивания или направленного перемещения во внешнем силовом поле. В результате коагуляции образуются агрегаты – более крупные (вторичные) частицы, состоящие из скопления более мелких (первичных). Первичные частицы в таких скоплениях соединены силами межмолекулярного взаимодействия непосредственно или через прослойку окружающей (дисперсионной) среды. Коагуляция сопровождается прогрессирующим укрупнением частиц (увеличением размера и массы агрегатов) и уменьшением их числа в объёме дисперсионной среды – жидкости или газа. Различают быструю и медленную коагуляции. При быстрой коагуляции почти каждое соударение частиц эффективно, то есть приводит к их соединению; при медленной коагуляции соединяется часть сталкивающихся частиц. В жидкой среде, например, при коагуляции золей, укрупнение частиц до известного предела (приблизительно до размера 10–4 сантиметра (см)) не сопровождается их оседанием или всплыванием. Это скрытая коагуляция, при которой система сохраняет седиментационную устойчивость. Дальнейший рост частиц приводит к образованию сгустков или хлопьев (флокул), выпадающих в осадок (Коагулят, Коагель) или скапливающихся в виде сливок у поверхности; это явная коагуляция. В некоторых случаях при коагуляции во всём объёме дисперсионной среды возникает рыхлая пространственная сетка (коагуляционная структура) и расслоения системы не происходит (смотрите Гели). Если коллоидные частицы – капельки жидкости или пузырьки газа, то коагуляция может завершиться их слиянием, Коалесценцией. Коагуляция – самопроизвольный процесс, который, в соответствии с законами термодинамики, является следствием стремления системы перейти в состояние с более низкой свободной энергией. Однако такой переход затруднён, а иногда практически невозможен, если система агрегативно устойчива, то есть способна противостоять укрупнению (агрегированию) частиц. Защитой от коагуляции при этом может быть электрический заряд и (или) адсорбционно-сольватный слой на поверхности частиц, препятствующий их сближению (подробнее смотрите Коллоидные Системы). Нарушить агрегативную устойчивость можно, например, повышением температуры (термокоагуляция), перемешиванием или встряхиванием, введением коагулирующих веществ (Коагулянтов) и другими видами внешнего воздействия на систему. Минимальная концентрация введённого вещества, электролита или неэлектролита, вызывающая коагуляцию в системе с жидкой дисперсионной средой, называется Порогом Коагуляции. В полидисперсных системах, где частицы имеют разную величину, можно наблюдать ортокинетическую коагуляцию – налипание мелких частиц на более крупные при их оседании или всплывании. Слипание однородных частиц называется Гомокоагуляцией, а разнородных – Гетерокоагуляцией или Адагуляцией. Гетерокоагуляция часто происходит при смешении дисперсных систем различного состава. Коагуляция может наступить без какого-либо внешнего воздействия на коллоидную систему (Автокоагуляция) как результат физических или химических изменений, происходящих при её старении. Иногда коагуляция обратима; в благоприятных условиях, особенно при введении поверхностно-активных веществ, понижающих поверхностную межфазную энергию и облегчающих диспергирование, возможен распад агрегатов на первичные частицы (Пептизация) и переход коагеля в золь. Коагуляция играет важную роль во многих технологических, биологических, атмосферных и геологических процессах. Так, при нагревании биополимеров (белков, нуклеиновых кислот) и при некоторых других воздействиях на них, например, изменении pH, наблюдается их коагуляция. Явления коагуляции во многих биологических дисперсных системах (например, крови, лимфе) важны в связи с вопросами их агрегативной устойчивости.

Очистка природных и сточных вод от высокодисперсных механических примесей, борьба с загрязнением воздушного пространства аэрозолями, выделение каучука из латекса, получение сливочного масла и других пищевых продуктов – характерные примеры использования коагуляции в практических целях. Нежелательна коагуляция при получении и хранении суспензий, эмульсий, порошков и других дисперсных систем промышленного или бытового назначения. Под Коагулянтами или Коагулирующими Агентами, от Латинского слова Coagulo, означающее Вызываю Свёртывание или Вызываю Сгущение, понимаются вещества, введение которых в жидкую среду, содержащую мелкие частицы какого-либо тела, вызывает Коагуляцию, то есть слипание этих частиц. Под действием коагулянтов образуются крупные скопления слипшихся частиц, выпадающие в виде хлопьев или комков в осадок (коагулят). Эффективными коагулянтами для систем с водной дисперсионной средой являются соли поливалентных металлов (алюминия, железа и других). В качестве коагулянтов используют также водорастворимые органические высокомолекулярные соединения (полимеры), особенно полиэлектролиты. В отличие от неорганических коагулянтов, их иногда называют Флокулянтами (смотрите Флокуляция), ххххх. Коагулянты применяют для выделения ценных промышленных продуктов из отходов производства в различных технологических процессах, а также при очистке воды от природных и бытовых загрязнений. В медицине под коагулянтами подразумевают средства, повышающие свёртываемость крови, такие как викасол, раствор желатина, некоторые препараты, получаемые из крови (тромбин, фибриноген), и другие.

COAGULATION BATH = КОАГУЛЯЦИОННАЯ ВАННА – Coagulation Bath is a liquid bath that serves to harden viscous polymer strands into solid fibers after extrusion through a spinneret. Used in wet spinning processes such as in rayon or acrylic fiber manufacture. / Экструзия или Выдавливание (Extrusion). Коагуляционная Ванна:- коагуляция вискозы – выделение ксантогената целлюлозы из раствора вискозы под действием коагулянтов – солей щелочных и щелочно-земельных металлов.

COAL = УГОЛЬ – Coal is a combustible black or brownish-black sedimentary rock normally found in layers or veins called Coal Beds or Coal Seams. Coal is composed primarily of carbon with variable quantities of other elements: sulfur, hydrogen, oxygen and nitrogen. Coal has multiple uses. It is used to generate electricity, in metallurgical applications (manufacture of steel), residential and commercial space heating, in pencils (graphite) and as a lubricant. Types of coal ranked from low to high (based on their level of organic metamorphism) include: peat, lignite, bituminous coal, sub-bituminous coal, anthracite, and graphite. Coal is a exchange-traded commodity. Central Appalachian coal (US) is traded at the NYMEX® and at the ICE Futures Europe®; Richards Bay coal (Africa), CSX Coal (US), Powder River Basin coal (US), Rotterdam coal (Europe), Newcastle coal (Asia) and FOB Indonesia Sub-bituminous coal (Asia) are traded at the ICE Futures Europe®. Black or brown rock, formed under pressure from organic fossils in prehistoric times, that is mined and burned to produce heat energy. Coal is an organic sedimentary rock that forms from the accumulation and preservation of plant materials, usually in a swamp environment. Coal is a combustible rock and along with oil and natural gas it is one of the three most important fossil fuels. Coal has a wide range of uses; the most important use is for the generation of electricity. Coal forms from the accumulation of plant debris, usually in a swamp environment. When plant debris dies and falls into the swamp the standing water of the swamp protects it from decay. Swamp waters are usually deficient in oxygen, which would react with the plant debris and cause it to decay. This lack of oxygen allows the plant debris to persist. In addition, insects and other organisms that might consume the plant debris on land do not survive well under water in an oxygen deficient environment. To form the thick layer of plant debris required to produce a coal seam the rate of plant debris accumulation must be greater than the rate of decay. Once a thick layer of plant debris is formed it must be buried by sediments such as mud or sand. These are typically washed into the swamp by a flooding river. The weight of these materials compacts the plant debris and aids in its transformation into coal. About ten feet of plant debris will compact into just one foot of coal. Plant debris accumulates very slowly. So, accumulating ten feet of plant debris will take a long time. The fifty feet of plant debris needed to make a five-foot thick coal seam would require thousands of years to accumulate. During that long time the water level of the swamp must remain stable. If the water becomes too deep the plants of the swamp will drown and if the water cover is not maintained the plant debris will decay. To form a coal seam the ideal conditions of perfect water depth must be maintained for a very long time. If you are an astute reader you are probably wondering:- ‘How can fifty feet of plant debris accumulate in water that is only a few feet deep?’ The answer to that question is the primary reason that the formation of a coal seam is a highly unusual occurrence. It can only occur under one of two conditions:- (1) a rising water level that perfectly keeps pace with the rate of plant debris accumulation; or, (2) a subsiding landscape that perfectly keeps pace with the rate of plant debris accumulation. Most coal seams are thought to have formed under condition #2 in a delta environment. On a delta large amounts of river sediments are being deposited on a small area of Earth’s crust and the weight of those sediments causes the subsidence. For a coal seam to form perfect conditions of plant debris accumulation and perfect conditions of subsidence must occur on a landscape that maintains this perfect balance for a very long time. It is very easy to understand why the conditions for forming coal has occurred only a small number of times throughout Earth’s history. The formation of a coal requires the coincidence of highly improbable events. Plant debris is a fragile material compared to the mineral materials that make up other rocks. As plant debris is exposed to the heat and pressure of burial it changes in composition and properties. The ‘rank’ of a coal is a measure of how much change has occurred. Sometimes the term ‘organic metamorphism’ is used for this change. Based upon composition and properties coals are assigned to a rank progression that corresponds to their level of organic metamorphism. The basic rank progression is summarized in the table below:- (i) Peat; (ii) Lignite; (iii) Sub bituminous coal; (iv) Bituminous coal; and (v) Anthracite. Electricity production is the primary use of coal in the United States. Most of the coal mined in the United States is transported to a power plant, crushed to a very small particle size and burned. Heat from the burning coal is used to produce steam, which turns a generator to produce electricity. Most of the electricity consumed in the United States is made by burning coal. Coal has many other uses. It is used as a source of heat for manufacturing processes. For example, bricks and cement are produced in kilns heated by the combustion of a jet of powdered coal. Coal is also used as a power source for factories. There it is used to heat steam and the steam is used to drive mechanical devices. A few decades ago most coal was used for space heating. Some coal is still used that way but other fuels and coal-produced electricity are now used instead. Coke production remains an important use of coal. Coke is produced by heating coal under controlled conditions in the absence of air. This drives off some of the volatile materials and concentrates the carbon content. Coke is then used as a high carbon fuel for metal processing and other uses where an especially hot-burning flame is needed. Coal is also used in manufacturing. If coal is heated the gases, tars and residues produced can be used in a number of manufacturing processes. Plastics, roofing, linoleum, synthetic rubber, insecticides, paint products, medicines, solvents and synthetic fibers all include some coal-derived compounds. Coal can also be converted into liquid and gaseous fuels; however, these uses of coal are mainly experimental and done on a small scale. Coal is a black or brownish-black solid combustible substance formed by the partial decomposition of vegetable matter without access to air. The rank of coal, which includes anthracite, bituminous coal, subbituminous coal, and lignite, is based on fixed carbon, volatile matter, and heating value. Coal rank indicates the progressive alteration from lignite to anthracite. Lignite contains approximately 9 to 17 million Btu per ton. The contents of subbituminous and bituminous coal range from 16 to 24 million Btu per ton and from 19 to 30 million Btu per ton, respectively. Anthracite contains approximately 22 to 28 million Btu per ton. / Под Каменным Углем понимается твёрдое горючее полезное ископаемое растительного происхождения более высокой степени углефикации, чем бурый уголь. С её возрастанием снижается выход летучих веществ (от 45 до 9% на горючую массу). Плотная порода чёрного, иногда серо-

чёрного цвета с блестящей полуматовой или матовой поверхностью. Удельная теплота сгорания (горючей массы) каменного угля 30–36 МДж/кг, содержание углерода 75–97%. Наиболее ценны коксовые (спекающиеся, металлургические) угли, имеющие максимальную теплоту сгорания. Каменный уголь используется в коксохимическом производстве и как энергетическое топливо, а также для полукоксования (швелевания), газификации, получения жидкого топлива, смазочных масел, пластмасс и другого. Под Каменным Углем понимается ископаемый уголь средней степени углефикации. Он содержит в горючей массе 75–97% углерода, 9–45% летучих веществ. Теплота сгорания каменного угля составляет 30.1–36.6 МДж/кг (7 200–8 750 ккал/кг). В СССР подразделялся по выходу летучих веществ и спекаемости на следующие марки:- Газово-Жирные (ГЖ), Газовые (Г), Длиннопламенные (Д), Жирные (Ж), Коксово-Жирные (КЖ), Коксовые (К), Отощённо-Спекающиеся (ОС), Слабоспекающиеся (СС), Тощие (Т). Каменный уголь является энергетическим топливом и сырьём для получения жидкого топлива марки Г–ОС – коксохимическое сырьё. Ископаемый Уголь является твёрдым горючим полезным ископаемым, продуктом преобразования высших и низших растений, содержащий до 50% минеральных примесей и влагу. Залегает обычно в виде пластов и линз мощностью от долей метра до 200 метров среди осадочных пород. Состав:- органическая масса, минеральные примеси и влага. Ископаемый уголь подразделяется на:- гумолиты (бурые, каменные угли и антрациты) и сапропелиты. Гумолиты или гумусовые – продукт преобразования остатков высших растений в болотных условиях. Гумолиты подразделяются на бурые, каменные угли и антрациты. Сапропелиты – продукт преобразования остатков низших растений и простейших микроорганизмов, накопившихся в условиях озёрных или лагунных фаций. Важнейшие характеристики ископаемых углей – содержание углерода, водорода, кислорода, выход летучих веществ, спекаемость, зольность (количество минеральных примесей), теплота сгорания. Эти свойства углей определяются их петрографическим (микрокомпонентным) составом, генетическим типом и степенью углефикации. Выход летучих веществ у сапропелитов составляет 60–90%, первичного дёгтя свыше 50%. Сапропелиты используются в качестве сырья для получения жидкого топлива. Разведанные мировые запасы ископаемого угля по данным за 1984 составляли 3 705 миллиардов тонн, сосредоточены главным образом в Австралии (341 миллиард тонн), Китае (548 миллиардов тонн), на территории бывшего СССР (419 миллиардов тонн), США (1 570 миллиардов тонн). На тот момент ископаемые угли составляли 87.5% прогнозных ресурсов ископаемого топлива Земли; в мировом топливо-энергетическом балансе ископаемые угли занимали около 25%. В бывшем СССР исходя из физических, химических и технологических свойств различали следующие марки угля:- антрацит (А), бурый (Б), газовый (Г), газовый жирный (ГЖ), длиннопламенный (Д), жирный (Ж), коксовый (К), коксовый жирный (КЖ), отощённый спекающийся (ОС), полуантрацит (ПА), слабоспекающийся (СС) и тощий (Т). Каменный Уголь, крупность частиц которого обычно не превышает 6 миллиметров, назвается Штыбом, от Немецкого слова Staub, означающее Пыль. Под Бурым Углем понимается горючее ископаемое растительного происхождения, представляющее собой переходную форму от торфа к каменному углю (ископаемый уголь низкой степени углефикации). Содержит 55–78% углерода. Технологические группы бурого угля в зависимости от содержания влаги:- Б1 (свыше 40%), Б2 (30–40%), Б3 (менее 30%). Выход летучих веществ 40–65% (на горючую массу), теплота сгорания горючей массы 22.6–31 МДж/кг. Бурый уголь используют как энергетическое топливо, для полукоксования (швелевания) и в газогенераторных установках, а также в качестве сырья для химической промышленности. Под Фюзеном, от Французского слова Fusain, понимается составная часть ископаемого угля, залегающая линзами и слоями в угольных пластах. Характерно волокнистое строение, шелковистый блеск, низкая механическая прочность; не спекается. Фюзен подобен древесному углю.

COALESCE = СРАСТАТЬСЯ (или СОЕДИНЯТЬСЯ) – Coalesce:- to come together, e.g., two or more lesions coalesce to form a large spot or lesion.

COALESCED FILAMENTS = СРОСШИЕСЯ ЭЛЕМЕНТАРНЫЕ НИТИ – Coalesced Filaments are the filaments stuck together by design or accident during the extrusion process. / Экструзия или Выдавливание (Extrusion).

COALESCENCE = КОАЛЕСЦЕНЦИЯ (или СРАЩЕНИЕ, или СОЕДИНЕНИЕ) – Coalescence is a merging of two or more substances into a larger substance, i.e. coalesced filaments. / Под Коалесценцией, от Латинского слова Coalesco, означающее Соединяюсь или Срастаюсь, понимается слияние капель жидкости или пузырьков газа при их соприкосновении. Происходит при выпадении атмосферных осадков в виде дождя и росы, разрушении пен и эмульсий, нанесении лакокрасочных покрытий методом распыления.

COALESCENT = КОАЛЕСЦЕНТНОЕ (или СРОСШЕЕСЯ) – Coalescent:- growing together.

COALESCOR = КОАГУЛЯТОР (или КОАЛЕСКОР) – Coalescor is a separator that divides a mixture or emulsion of two immiscible liquids using the interfacial tension between the two liquids and the difference in wetting of the two liquids on a particular porous medium. / от Латинского слова Coalesco, означающее Соединяюсь или Срастаюсь, понимается . Коагулятор (Coalescer) – аппарат для коагуляции. Коагулятор:- (1) то же, что Коагулянт (смотрите Коагулянты). (2) В химической технологии аппарат для коагулирования (смотрите Коагуляция) высокодисперсных (коллоидных) систем. Коагулянты или Коагулирующие Агенты, от Латинского слова Coagulo, означающее Вызываю Свёртывание или Вызываю Сгущение, вещества, введение которых в жидкую среду, содержащую мелкие частицы какого-либо тела, вызывает Коагуляцию, то есть Слипание этих частиц. Под действием коагулянтов образуются крупные скопления слипшихся частиц, выпадающие в виде хлопьев или комков в осадок (Коагулят). Эффективными коагулянтами для систем с водной дисперсионной средой являются соли поливалентных металлов (алюминия, железа и других). В качестве коагулянтов используют также водорастворимые органические высокомолекулярные соединения (полимеры), особенно Полиэлектролиты. В отличие от неорганических коагулянтов, их иногда называют фФлокулянтами (смотрите Флокуляция). Коагулянты применяют для выделения ценных промышленных продуктов из отходов производства в различных технологических процессах, а также при очистке воды от природных и бытовых загрязнений. В медицине под Коагулянтами подразумевают средства, повышающие свёртываемость крови, такие как викасол, раствор желатина, некоторые препараты, получаемые из крови (тромбин, фибриноген), и другие.

COALITION = КОАЛИЦИЯ – Coalitions are either buy-side or sell-side and are generally groups of buyers or sellers who agree to channel procurement through a single marketplace. They operate a marketplace without having a third party, neutral Net market as the hub. Many claim to be neutral – that anyone can join – but, by the nature of their partnership their first audience is either buyers or sellers. The advantage of coalitions, particularly buy-side coalitions, is they can do a lot of transactions, which creates marketplace liquidity. However, the problem with coalitions is they have several challenges to overcome – political challenges, both from regulators and relationships between powerful companies, as well as technology challenges of integrating legacy systems. Due to the complexity of these issues, none are operational yet. If they do in fact successfully overcome these obstacles and operationalize, we expect they will conduct a large number of transactions because they can force their suppliers to go through this marketplace to conduct the transactions. / Под Коалицией, от позднелатинского слова Coalitio, означающее Союз, может пониматься:- (i) политический или военный союз государств, договорившихся о совместных действиях в тех или иных вопросах международных отношений,

например, антигитлеровская коалиция государств во Второй Мировой Войне; или (ii) соглашение нескольких политических партий об образовании правительства из представителей этих партий, так называемое коалиционное правительство.

COAMING = КОМИНГС (или ЗАКЛЮЧИНА) – Coaming (maritime term):- the raised frame work around deck openings, and cockpit of open boats (hatch coaming). / (комингс люка).

COARSE END = УТОЛЩЁННАЯ ПРОДОЛЬНАЯ НИТЬ (или ГРУБАЯ ПРОДОЛЬНАЯ НИТЬ) – Coarse Ends are the ends that are too irregular in diameter or have too much foreign matter in them to make a smooth, uniform yarn. (1) Defect Name:- Coarse End. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Coarse End:- This end, being twice the size of the regular ends, is the unwanted result of two bobbins of roving running in spinning in what commonly is referred to as Doubling. Severity:- Minor. (2) Defect Name:- Coarse End. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Coarse End:- This end, being twice the size of the regular ends, is the unwanted result of two bobbins of roving running in spinning in what commonly is referred to as Doubling. Severity:- Major. (3) Defect Name:- Coarse End. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Coarse End:- This is a slightly coarse end that would not have been noticeable had it not been accentuated by sueding. Severity:- Minor. See also Coarse Thread. Coarse End (crude through defect):- this means that there are a warp diameter is significantly larger than the diameter of the warp fabric normal. Fabric Weaving Defect. Coarse End is the warp yarn that has a diameter too large, too irregular or that contains too much foreign material to make an even, smooth fabric. Coarse End:- a larger than normal diameter warp end. Synonym Heavy End. Compare Fine End. / Порок или дефект набивки тканей. Грубая Нить; Толстая Нить (coarse end; thick end):- порок основы, при котором нить в основе более толстая, чем смежная пряжа основы. Примечание:- этот порок вызывается использованием в основе пряжи несоответствующей линейной плотности. Утолщённые Нити Основы от трёхкратной до пятикратной толщины включительно; Двойники. Размер порока – до 3 м. распространённые по всему куску.

COARSE FILLING = УТОЛЩЁННАЯ УТОЧИНА – Coarse Filling:- a weft yarn of substantially greater thickness than that of the adjacent weft yarns. This defect is caused by variation in the linear density of the weft yarn. See also Coarse Pick, and Coarse Thread. / Смотрите также Утолщённая Поперечная Нить (Coarse Pick), и Утолщённая Нить (Coarse Thread). Утолщённые Нити Утка от трёхкратной до пятикратной толщины включительно, идущие по всей ширине. Размер порока – за каждое место.

COARSE GRAINS = ГРУБЫЕ ЗЁРНА – Coarse Grains:- defined as Barley, Maize, Oats, Sorghum and other coarse grains in all countries except Australia, where it includes Triticale and in the European Union where it includes Rye and other mixed grains. Coarse Grains are Corn, Barley, Oats, grain Sorghum, and Rye. Millet is also included in the statistics of some foreign countries. These are generally considered feed grains.

COARSE PICK = УТОЛЩЁННАЯ ПОПЕРЕЧНАЯ НИТЬ – Coarse Picks are the picks that are faulty and show up to poor advantage in the body of the cloth. (1) Defect Name:- Coarse Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Coarse Pick:- Two coarse picks are inserted into consecutive sheds. Severity:- Major. (2) Defect Name:- Coarse Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Coarse Pick:- A single coarse pick is inserted. Severity:- Major. (3) Defect Name:- Coarse Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Coarse Pick:- Consists of three picks of coarse filling. Severity:- Major. (4) Defect Name:- Coarse Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Coarse Pick:- The filling yarn inserted is coarser than specified. Severity:- Major. See also Coarse Thread. Coarse Pick (coarse weft defects):- this means that there are a weft is significantly larger than the diameter of the normal fabric weft diameter. Fabric Weaving Defect. Coarse Pick:- in woven fabrics, one or more picks of larger diameter than the normal filling yarn in the fabric. Synonym Thick Filling. Coarse Pick is the filling yarn that is too large and imperfect to appear to advantage in the final cloth. Coarse Pick:- it is due to one or more picks of diameter larger than the normal filling yarn in the fabric. See also Coarse Filling. / уточная пряжа. Порок или дефект набивки тканей. Нить Утка Низкого или Высокого Номера (Coarse Pick; Coarse Weft; Thick Pick):- порок утка; уточная нить значительно большей или меньшей толщины, чем смежная уточная пряжа. Примечание:- этот порок вызван использованием в утке пряжи несоответствующей линейной плотности. Утолщённые Нити Утка от трёхкратной до пятикратной толщины включительно, идущие по всей ширине. Размер порока – за каждое место.

COARSE–TEXTURED SOIL = КРУПНОТЕКСТУРИРОВАННАЯ ПОЧВА – Coarse-Textured Soil is a sandy, loamy sand, or sandy loam soil.

COARSE THREAD = УТОЛЩЁННАЯ НИТЬ – Coarse Thread is a yarn larger in diameter than other yarns being used in the fabric.

COARSE WOOL = ГРУБАЯ ШЕРСТЬ – Coarse Wool is a wool that has a Blood grade of 1/4 or Common OR a numerical count grade of 44’s, 45’s, or 48’s, OR a micron count above 31. Coarse wool may have as few as 1 to 5 crimps per inch.

COARSE YARN = УТОЛЩЁННАЯ ПРЯЖА (или ГРУБАЯ ПРЯЖА) – Coarse Yarn (coarse yarn faults):- this means that the yarn has a diameter larger than the fabric to the normal yarn diameter. Defect Name:- Coarse Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Double Knit Fabrics. Description:- Coarse Yarn:- This is the result of one feed of yarn being much coarser than normal for the fabric. The result is barré. Severity:- Major. Fabric Printing Defect. Coarse Yarn is the yarn of substantially and unacceptably greater thickness than that of the adjacent yarns. Note:- this defect is caused by variation in the linear density of the yarn, which is otherwise of the correct nominal linear density. Note:- this defect is caused by the accumulation of undrafted waste fiber into the yarn during spinning. / Порок или дефект набивки тканей вследствие порока прядения.

COASTAL CARRIER = КАБОТАЖНЫЙ ПЕРЕВОЗЧИК (или БЕРЕГОВОЙ ПЕРЕВОЗЧИК) – Coastal Carrier:- water carriers that provide service along coasts serving ports on the Atlantic or Pacific Oceans or on the Gulf of Mexico.

COASTAL SERVICES = КАБОТАЖНЫЕ СЛУЖБЫ (или БЕРЕГОВЫЕ СЛУЖБЫ) – A term Coastal Services refers to domestic shipping services between ports around the country. Also known as Cabotage. / Относятся к внутреннему судоходству между портами одного государства. Известны также как Каботаж (Cabotage).

COASTWISE = КАБОТАЖНАЯ (или ПРИБРЕЖНАЯ) – Coastwise:- water transportation along the coast. Domestic shipping routes along a single coast.

COAT = КИТЕЛЬ (или КУРТКА, или ПИДЖАК, или ПАЛЬТО, или ВЕРХНЕЕ ПЛАТЬЕ) – Coat is an outer garment worn on the upper body and varying in length and style according to fashion and use.

COATDRESS = ПЛАТЬЕ ПАЛЬТО (или ВЕРХНЕЕ ПЛАТЬЕ) – Coatdress is a dress styled like a cost usually with a front buttoning from neckline to hemline.

COATED FABRICS = ПОКРЫТЫЕ ТКАНИ (или ТКАНИ С ПОКРЫТИЕМ) – Coated Fabrics are the fabrics that have been coated with a lacquer, varnish, rubber, plastic resin of polyvinyl chloride or polyethylene, or other substance to make them longer lasting or impervious to water or other liquids. Coated Fabric is a fabric to which a substance such as lacquer, plastic, resin, rubber, or varnish has been applied in firmly adhering layers to provide certain properties, such as water impermeability. / Ткани с Покрытием – гарнитоль, дерматин, клеёнка, ледерин и тому подобные.

COATED FLEECES = ПОКРЫТЫЕ РУНО – Coated Fleeces:- some wool producers coat their fleeces that cut down on the amount of vegetable matter and weathering.

COATED MILLED RICE = ГЛАЗИРОВАННЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Coated Milled Rice shall be Rice which is coated, in whole or in part, with substances that are safe and suitable as defined in the regulation issued pursuant to the Federal Food, Drug, and Cosmetic Act at 21 CFR 130.3(d) (21 CFR is short for the Code of Federal Regulations:- Title 21).

COATING = НАНЕСЕНИЕ ПОКРЫТИЯ – Coating is the application of a semi-liquid material such as rubber, polyvinyl chloride, or polyurethane to one or both sides of a textile material. Once the coating has been dried (and cured, if necessary), it forms a bond with the fabric. There are the following types of coating:- (i) Calender Coating; (ii) Cast Coating; (iii) Dip Coating; (iv) Direct Coating; (v) Roller Coating; and (vi) Transfer Coating. Coating:- coat, covering. Cloth for coats. Coating is a term used to describe a fabric suitable for outerwear, such as coats, as in coating fabric. Also, something applied to a finished fiber or fabric, such as a rubber coating to make a fabric impervious to water. Coating suggests a thicker layer of the substance than does the word finish. A rubber-coated fabric is probably more resistant to water than one that has been treated with a water-resistant finish. / Coating = Покрытие Изолирующим Слоем. Существуют следующие типы нанесения покрытия:- (i) Нанесение Покрытия Валиком (Roller Coating); (ii) Нанесение Покрытия Каландрованием (Calender Coating); (iii) Нанесение Покрытия Окунанием (Dip Coating).

COATING OF STEEL FILAMENT = ПОКРЫТИЕ СТАЛЬНОЙ (ЭЛЕМЕНТАРНОЙ) НИТИ – Coating Of Steel Filament:- xxxxx. See also Composition Of Coating, Mass Of Coating, and Thickness Of Coating.

COAT OF MAIL = XX (или КОЛЬЧУГА, или КОЛЬЧАТАЯ БРОНЯ) – Coat Of Mail is a garment of metal scales or chain mail worn as armor.

COB = CLOSE OF BUSINESS

COBALT = КОБАЛЬТОВОЕ (или КОБАЛЬТ) – Cobalt:- cobalt blue. / кобальтовая синь (пигмент).

COBALT BLUE = КОБАЛЬТОВО–ГОЛУБОЕ (или КОБАЛЬТОВАЯ СИНЬ, или КОРОЛЕВСКИЙ ГОЛУБОЙ) – Cobalt Blue:- a strong greenish blue.

COBLDN = CLOSE OF BUSINESS LONDON

COC = CARRIER OWNED CONTAINER

COC = COST OF CONTROL

COCCINEUS = КОККИНЭУС (или АЛОЕ, или ЯРКО–КРАСНОЕ, или ШАРЛАХОВОЕ) – Coccineus (-a):- scarlet-colored.

COCHINEAL = КОШЕНИЛЬ – Cochineal is a red anthroquinone dye (carminic acid) made from a domesticated scale Insect (Dactylopius Coccus) and related Species that live on Prickly Pear Cacti (Opuntia Species). Carminic acid is produced by the scale Insect as an effective repellent for other Insects such as Ants. This dyestuff was used in pre-Hispanic Mexico for dying textiles. Although superceded by synthetic aniline dyes such as alizarin from the 1870's onwards, cochineal is still an important food colorant and used for dying textiles in folk art. Carmine is a precipitated form of cochineal. Structure of carminic acid Cochineal bottle. / Червецы Карминоносные. Кошениль – красная краска, добываемая из высушенных насекомых – тлей Coccus cacti. Под Кошенилью понимаются несколько Видов Насекомых Подотряда Кокцидовых, из самок которых добывают красную краску – кармин. Наиболее известны 3 Вида Кошенилей:- (i) Армянская (длина самцов 2–4 миллиметра (мм), самок 10–12 мм), (ii) Мексиканская и (iii) Польская.

COCKLED FABRIC = МОРЩИНИСТАЯ ТКАНЬ (или СМОРЩЕННАЯ ТКАНЬ) – Cockled Fabric (wrinkle fabric defect):- on the knitted fabric, this defect is, those with wrinkles, shrink or swell can not be flat in the cutting table fabric. Reason for this phenomenon may be due to the distortion of the yarn without rules, it may be due to yarn tension in the knitting process is not balanced, it may be due to the yarn fabric finishing processes in the degree of response heterogeneity. Fabric Printing Defect. / Порок или дефект набивки тканей. раскрой (cutting).

COCKLED OR PUCKERED = МОРЩИНИСТОЕ (или СПУТАННОЕ) ИЛИ СМОРЩЕННОЕ – Cockled or Puckered:- if the knitted fabric is Cockled or Puckered, it is due to uneven stitches or uneven yarn size. Knitted fabric defect, and namely:- stitch defect.

COCKLED YARN = МОРЩИНИСТАЯ (или СМОРЩЕННАЯ) ПРЯЖА (или ПРЯЖА С СУКРУТИНАМИ) – Cockled Yarn (kink yarn defects):- this refers to a certain number of fibers in the root of the yarn look too curly and not tell the fiber direction. Produce this situation is due to a number of yarn fiber is too long relative to the drawing roller, leading to the first release of a drawing roller before and after the fibers have been put on a drawing roller clamp fibers, and so fibers will break and curl. Kink yarn in the fabric looks like a small twist. Fabric Printing Defect. Cockled Yarn is a spun yarn in which some fibers do not lie parallel to the other fibers but instead are curled and kinked, forming a rough and uneven surface on the yarn. The general cause is fiber overcut to the extent that the drafting rolls catch and hold both ends of the fiber at the same time while attempting to draft, resulting in slippage or breakage. See also Overcut. Cockled Yarn:- small slub-like irregularities in the yarn that are readily extensible and that cause loop distortion. Note:- this defect is often caused by the unintentional introduction of stretch into some fibers during drafting and the subsequent relaxation of these fibers to form loops or crimps in the yarn. Defect Name:- Cockled Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Cockled Yarn:- This fabric is constructed of a 100% cotton warp and 100% polyester filling. What appear to be tiny slubs is the result of polyester fibers that are too long for the roll settings on the spinning frame. This results in the fibers being caught by succeeding draft rolls before being turned loose by preceding ones; the fibers are stretched and then released to snap and curl (cockle). Severity:- Minor. / сукрутина (kink) – дефект пряжи. Порок или дефект набивки тканей. Пряжа С Сукрутинами (cockled yarn):- порок пряжи в тканых полотнах в виде небольших утолщений в виде петель на пряже, которые легко растягиваются. Примечание:- этот порок часто возникает вследствие заработки в ткань эластика или пряжи повышенной крутки с натяжением и последующим её ослаблением, в результате чего образуется петля.

COCKLES = СУКРУТИНЫ (или МОРЩЕНИЯ) – Cockles:- in yarns, irregular thick, uneven, lumps. Fabrics defect.

COCKLING = МОРЩИНИСТОСТЬ (или ГОФРЕННОСТЬ) – Cockling is a crimpiness or pucker in yarn or fabric usually caused by lack of uniform quality in the raw material used, improper tension on yarn in weaving, or weaving together yarns of different numbers. Cockling:- an irregular three-dimensional effect in a fabric which prevents it from lying flat. Note:- this defect is caused by stitch distortion, uneven yarn relaxation or shrinkage. / Морщинистость или Гофренность – порок ткани. Морщинистость (cockling):- порок ткани в виде объёмного эффекта в полотне, который не даёт ему быть гладким. Примечание:- этот порок возникает в результате деформации петли, неравномерной релаксации нитей, усадки или некачественной платировки текстурированных нитей. Стяжка; Гофрирование; Безусадочная Неровность (cockling; corrugation; sanforize roughness):- порок заключительной отделки ткани; извитость, морщинистость, волнистость или шагреневость ткани, демонстрирующие деформацию структуры. Примечание:- этот порок вызван противоусадочной отделкой при подаче полотна с опережением, при которой усадка ткани выше, чем положено при конструировании или слабым контролем над влагосодержанием.

COCKPIT = КОКПИТ (или РУБКА, или КАБИНА) – Cockpit (maritime term):- the well of a sailing vessel, especially a small boat, for the wheel and steersman. / для и рулевого.

COCKTAIL DRESS = ПЛАТЬЕ ДЛЯ КОКТЕЙЛЯ (или ВЫХОДНОЕ ПЛАТЬЕ) – Cocktail Dress is a dress worn for a special social occasion in the evening, such as a party or dance; is a dress that is suitable for formal social occasions; a formal dress for wearing to parties or other evening social events. / Платье Для Коктейлей – короткое нарядное платье; надевается на приёмы, выходы в гости и тому подобное во второй половине дня.

COCOA = КАКАО – Cocoa is a highly prized commodity. Cocoa derived products include cocoa powder, cocoa butter, and cocoa liquors. Cocoa is largely used in the production of chocolate, but other ingredients like cocoa butter can be used in the manufacture of soap and cosmetics. The main varieties of cocoa beans include Criollo, Forastero and Trinitario. Cocoa is traded at the NYMEX® under ticker symbol CJ, and at the ICE under ticker symbol CC. Contract size is 10 Metric Tons quoted in Dollars per Metric Ton. Cocoa is also traded at the NYSE Liffe London under ticker symbol C. Contract size is 10 Tons quoted in Pounds Sterling per ton. Cocoa means Cocoa beans which are whole seeds of the Cocoa Tree (Theobroma Cacao L.). The Cacao tree apparently originated in the foothills of the Andes in the Amazon and Orinoco basins of South America. It was introduced into Central America by the ancient Mayas, and cultivated in Mexico by the Toltecs and later by the Aztecs. Cacao bushes will grow in a very limited geographical zone, of approximately 10 degrees to the north and south of the Equator. Nearly 70% of the world crop is grown in West Africa. Cocoa was an important commodity in Pre-Columbian Mesoamerica. Spanish chroniclers of the conquest of Mexico by Hernán Cortés relate that when Montezuma II, Emperor of the Aztecs, dined he took no other beverage than chocolate, served in a golden goblet and eaten with a golden spoon. Flavored with vanilla and spices, his chocolate was whipped into a froth that dissolved in the mouth. No fewer than 50 pitchers of it were prepared for the emperor each day, and 2000 more for nobles of his court. Chocolate was introduced to Europe by the Spaniards and became a popular beverage by the mid 1500s. They also introduced the Cacao Bush into the West Indies and the Philippines. It was used in alchemical processes, where it was known as Black Bean. The Cacao Plant was first given its name by Swedish natural scientist Carl von Linné (1707–78), who called it Theobroma Cacao or Food of the Gods. Cocoa beans, cocoa butter and cocoa powder are traded on two world exchanges:- London (London International Financial Futures and Options Exchange (LIFFE)) and New York (New York Board of Trade® (NYBOT®)). The London market is based on West African Cocoa and New York on Cocoa predominantly from South East Asia. Cocoa is the world's smallest soft commodity market. The futures price of Cocoa butter and Cocoa powder is determined by multiplying the bean price by a ratio. The combined butter and powder ratio has tended to be around 3.5. If the combined ratio falls below around 3.2, production ceases to be economically viable and some factories cease extraction of butter and powder and trade exclusively in Cocoa liquor. The Coffee, Sugar, & Cocoa Exchange (CSCE) is the world's premier forum for Cocoa futures and options trading. As an exchange, the CSCE does not participate in Cocoa price determination. Rather, it provides a visible, free market setting where members can conduct futures and options transactions subject to Exchange rules and regulations. Since all futures and options contracts are standardized (with delivery months and locations, quantity and grade constant), only price is negotiable. The Exchange environment allows prices to reach their natural levels – an important economic function known as Price Discovery. Currently, the Ivory Coast is the world's leading Cocoa producing nation. Ghana and Indonesia rank next among major world producers, followed by Brazil, Nigeria and Malaysia. Cocoa is the dried and partially fermented fatty seed of the Cacao tree from which chocolate is made. In the United States, Cocoa often refers to Cocoa powder, the dry powder made by grinding Cocoa seeds and removing the Cocoa butter from the dark, bitter Cocoa solids. A Cocoa pod has a rough leathery rind about 3 cm thick (this varies with the origin and variety of pod). It is filled with sweet, mucilaginous pulp called 'Baba De Cacao' in South America, enclosing 30 to 50 large almond-like seeds (beans) that are fairly soft and pinkish or purplish in color. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). шлифование (grinding). Карл фон Линнэй (Carl von Linné, 1707–1778), Шведский естествоиспытатель. Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)) и Нью Йоркской Палаты Торговли (Нью Йоркского Табло Торговли, если быть более точными). НАЙБЭТ® (NYBOT®). Какао или Шоколадное Дерево является вечнозелёным деревом рода Тэоброма. Произрастает в тропических лесах Америки. Культивируется в тропиках обоих полушарий. Семена Какао содержат алкалоид теобромин, применяемый в медицине, а также до 50% жиров. Их используют для получения какао-масла, применяемого в кондитерской промышленности, для приготовления лечебных свечей, мазей, губной помады; а также для получения шоколада и порошка какао.

COCOA = КАКАОВОЕ – Cocoa:- a medium brown.

COCOM = COORDINATING COMMITTEE ON MULTILATERAL EXPORT CONTROLS

COCOON = КОКОН – Cocoon (Silk) is the oval casing of filament silk, or brin, spun by the silkmoth larvae or caterpillar, the silkworm, to protect itself when it changes into a chrysalis. The silkworm extrudes through the silk glands in its head a viscose fluid building up round itself layer upon layer crossing the filaments in a figure of eight. Color of cocoons ranges from white to yellow, golden yellow and brown. The color is contained in the sericin, and is removed during the degumming process. The cocoon grading system in France has become the standard for Europe and India. They are sorted into nine different grades:- (i) Good Cocoons:- perfect for mechanical reeling; (ii) Pointed Cocoons:- no good for mechanical reeling; (iii) Cocalons:- larger than normal; (vi) Duppions:- double cocoons; (v) Soufflon:- loose or transparent; (vi) Perforated:- pierced or broken; (vii) Good Choquettes:- containing dead chrysalis; (viii) Bad Choquettes:- rotten cocoons; and (ix) Calcinated:- containing petrified chrysalis. Cocoon is a covering of silk or similar fibrous material spun by the larvae of moths and other insects as protection during their pupal stage. / (vi) Двойники или Двойниковые Коконы (Duppions):- двойные коконы – коконы, завитые двумя или большим числом гусениц; механического разматывания. Под Коконом, от Французского слова Cocon, понимается защитное образование куколок многих насекомых. Обычно кокон сплетён гусеницей из вырабатываемой ею двойной шёлковой нити (шёлковичный кокон), иногда построен из слизи. Коконы тутового, дубового и некоторых других шелкопрядов служат сырьём для получения натурального шёлка. В яйцевых коконах дождевых червей, пиявок, пауков и некоторых моллюсков развиваются яйца.

CO–CRACKING = СОВМЕЩЁННЫЙ КРЕКИНГ – Co-Cracking is a petrochemical process in which the C_4 stream from an ethylene plant is recycled into the feedstock. / Нефтехимический процесс, при котором поток углеводородов C_4 от установки получения этилена снова поступает в подаваемое сырьё.

COD = CARRIED ON DOCKET

COD = CASH ON DELIVERY

COD = CHEMICAL OXYGEN DEMAND

COD = COLLECT ON DELIVERY

CODA = CASH OR DEFERRED ARRANGEMENT

CODABAR = КОДАБАР (или КОДОВЫЙ ШТРИХ, или ВСПОМОГАТЕЛЬНЫЙ ШТРИХОВОЙ (КОД)) – Codabar is a variable length barcode that can encode 16 data characters including 0–9, plus the symbols '–', '$', ':', '/' , '.', '+'. Codabar is used primarily for numeric data. / Кодабар это штриховой код различной длины, который может закодировать 16 параметров данных, включая числа 0–9, а также символы '–', '$', ':', '/' , '.', '+'. Кодабар используется, в основном, для числовых данных. Под Кода от Итальянского слова Coda, означающее Хвост, понимается добавочный .

CODATA = COMMITTEE ON DATA FOR SCIENCE AND TECHNOLOGY

CODE = КОД – (1) Code is a system of characters or symbols. Coded messages are of particular importance for electronic data exchange and payment operations for reasons of secrecy and cost savings. See also PIN Code. / Система условных знаков или символов. Под Кодом, от Французского слова Code от Латинского слова Codex, означающее Сборник или Свод, понимается совокупность знаков (символов) и система определённых правил, при помощи которых информация может быть представлена (закодирована) в виде набора таких символов для передачи, обработки и хранения (запоминания). Конечная последовательность кодовых знаков называется Словом. Для записи кодовых символов чаще всего используются цифры и числа (0; 1; …; 57; 927; 1 587 и так далее), либо знаки (например, – (минус), + (плюс), · (точка) и другие). Каждому кодовому символу ставится в соответствие некоторый элементарный физический сигнал, подлежащий передаче или обработке. Коды используют в банковском и военном деле, вычислительной технике, телеграфии и других отраслях экономики и сферах деятельности.

(2) In computing terms, a Code:- while some viruses and malware are complete programs, others are simply pieces of code. Code is nothing more than written computer language that provides a specific set of instructions for your computer to follow. When programmers write out a piece of code, it is referred to as Source Code. Object Code is the term used for code that has been successfully compiled. Executable Code is code that is ready for activation and use.

CODE 3 OF 9 = КОД 3 ИЗ 9 – Code 3 Of 9:- this barcode is an alphanumeric barcode allowing upper case letters and numbers. Each character consists of nine elements. 3 of the nine elements are wide, hence the name '3 of 9'.

CODE 93 = КОД 93 – Code 93 is an alpha-numeric barcode allowing upper case letters and numbers. BarCode/VBX will convert lower case letters to upper case before encoding them.

CODE 128A = КОД 128ЭЙ. – Code 128A:- code 128 is a variable length barcode capable of encoding the entire 128 character ASCII character set. Code 128 allows three subsets, A, B and C. This subset (A) allows all standard upper case alpha-numeric keyboard characters plus control characters.

CODE 128 AUTO = КОД 128 АВТО – Code 128 Auto:- code 128 is a variable length barcode capable of encoding the entire 128 character ASCII character set. Code 128 allows three subsets, A, B and C. This version, 'Code 128 Auto', automatically selects the subset that will produce the smallest barcode.

CODE 128B = КОД 128БИ. – Code 128B:- code 128 is a variable length barcode capable of encoding the entire 128 character ASCII character set. Code 128 allows three subsets, A, B and C. This subset (B) allows all standard upper case alpha-numeric keyboard characters and lower case alpha characters.

CODE 128C = КОД 128СИ. – Code 128C:- code 128 is a variable length barcode capable of encoding the entire 128 character ASCII character set. Code 128 allows three subsets, A, B and C. This subset (C) includes a set of 100 digit pairs from 00 to 99 inclusive. This allows double density numeric digits, two digits per barcoded character.

CODE OF LINER CONDUCT = КОДЕКС ПОВЕДЕНИЯ ЛАЙНЕРОВ – Code Of Liner Conduct is a convention drafted under the auspices of the United Nations Conference on Trade and Development (UNCTAD) which provides that all shipping traffic between two foreign countries is to be regulated as far as the quantities of shipments are concerned on the following percentages – 40% for owners of the country of origin, 40% for owners of country of destination, and 20% for owners of the country which is neither the origin nor the destination. Code Of Liner Conduct is a convention drafted under the auspices of the United Nations Conference on Trade and Development (UNCTAD) regulating shipping traffic between countries on the basis of quantity of shipments. According to the Code, all shipping traffic between two foreign countries is to be regulated in a pattern whereby 40% will be assigned to owners of the country of origin, 40% for owners of country of destination, and 20% for owners of the country which is neither the origin nor the destination. The convention on a Code of Conduct for Liner Conferences, which was concluded in Geneva, Switzerland on 06 April 1974 under the auspices of the United Nations, known as the UNCTAD Code, or simply The Code is due to come into force in the near future. This became possible after the European Economic Community (EEC) council has decided for the EEC countries to ratify the code-though under certain important reservations. The demand for imposing some type of control on the activities of liner conferences in order to prevent abuses of the excessive market power of conferences and/or to minimize the effects of such abuses on the shippers and the trade, is almost as old as the liner conference system itself. Main features of the code:- (i) elimination of conference power to decide at discretion, on the conference membership; (ii) the freight and volume sharing provisions, also the provisions which establish equal rights for all member lines in the decision making procedures of a conference; (iii) abolishment of the secrecy which surrounded conference agreements, tariffs and other related documents; (iv) protection of shippers' interests – Consultation – Freight rate determination; (v) criteria and procedures for freight rate determination; and (vi) the provisions for settlement of disputes. One of the most important criticism against the code, is to the effect that it introduces rigid cargo sharing, by which bilaterism is enforced in the liner trades. As a consequence, the same argument goes on, century old commercial practices and arrangements, freely formulated to the best interest of both carriers and shippers, will be destroyed to the detriment of the world liner trades. Realities are quite different. The code does not inforce bilaterism, since it safeguards the right of third flag carriers to participate in all linertades. / домогательство (abuse). Под Кодексом, от Латинского слова Codex, понимается систематизированный единый законодательный акт, регулирующий какую-либо однородную область общественных отношений.

CODING = КОДИРОВАНИЕ – Coding is the process by which the sequence of nucleotides within a certain area of RNA determines the sequence of amino acids in the synthesis of a particular protein.

CODING REGION = КОДИРУЮЩАЯ ОБЛАСТЬ (или КОДИРУЮЩИЙ РЕГИОН) – Coding Region:- a DNA sequence which when transcribed contributes to the production of the mature RNA, which may or may not be translated to produce a protein. Coding regions can include complete or truncated open reading frames (excluding introns) which may be translated to produce a protein or peptide or which may be intentionally engineered to be untranslatable, for example as with antisense constructs or ribozymes.

CO–DOMINANCE = КО–ДОМИНАНТНОСТЬ (или СО–ДОМИНАНТНОСТЬ, или КО–ДОМИНИРОВАНИЕ, или КО–ПРЕОБЛАДАНИЕ) – Co-Dominance:- the situation in which both alleles at the locus influence the phenotype of the heterozygote resulting in a new phenotypic class.

CODON = КОДОН – Codon is:- (1) arrangement of three nucleotides in mRNA controlling the insertion of an amino acid into a polypeptide. (2) The coding unit, consisting of three adjacent nucleotides, which codes for a specific amino acid. / информационной рибонуклеиновой кислоте (иРНК; messenger Ribonucleic Acid (mRNA)). Под Кодоном или Триплетом понимается единица генетического кода; состоит из 3 последовательных нуклеотидов в молекуле ДНК или РНК. Последовательность кодонов в гене определяет последовательность аминокислот в полипептидной цепи белка, кодируемого этим геном.

CODPIECE = ГУЛЬФИК – A Codpiece (from Middle English:- Cod, meaning 'Scrotum') is a covering flap or pouch that attaches to the front of the crotch of men's trousers and usually accentuates the genital area. It was held closed by string ties, buttons, or other methods. It was an important item of European clothing in the XV and XVI centuries, and is still worn in the modern era in performance costumes for rock music and metal musicians and in the leather subculture while an Athletic cup protects in a similar fashion.

COE = COST OF EQUITY

COE = COUNCIL OF EUROPE

COE = CUP OF EXCELLENCE

COEFFICIENT OF CORRELATION = КОЭФФИЦИЕНТ КОРРЕЛЯЦИИ – Coefficient Of Correlation is the ratio of the covariance of two variables to the product of the standard errors of two variables; the square root of the coefficient of determination. This value indicates how one variable is related to another. Coefficient Of Correlation is a measure of the degree of association between two variables and is computed as the ratio of the covariance of the two variables to the product of their standard errors. Values vary between –1 and +1. / ; квадратный корень из коэффициента детерминации (или смешанной корреляции). Под Коэффициентом, от Латинских слов Co, означающее Совместно, и Efficiens, означающее Производящий, понимается множитель, обычно выражаемый цифрами.

COEFFICIENT OF CUBICAL THERMAL EXPANSION = КОЭФФИЦИЕНТ КУБИЧЕСКОГО ТЕРМИЧЕСКОГО (или ТЕПЛОВОГО) РАСШИРЕНИЯ – Coefficient Of Cubical Thermal Expansion:- increase in volume of a material caused by an increase in temperature. Cubical Thermal Expansion is the increase in volume of a body due to increase in temperature. Coefficient of Cubical Thermal Expansion is the increase in volume of a body per unit volume per degree centigrade rise of temperature.

COEFFICIENT OF FRICTION = КОЭФФИЦИЕНТ ТРЕНИЯ – Coefficient of Friction is the number obtained by dividing the friction force resisting motion between two bodies by the normal force pressing the bodies together. See also Friction. / Коэффициент Трения – отношение силы трения двух тел к нормальной силе, прижимающей эти тела друг к другу. Коэффициент Трения, отношение силы трения F к реакции T, направленной по нормали к поверхности касания, возникающей при приложении нагрузки, прижимающей одно тело к другому:- $f = F/T$. Коэффициент трения – характеристика, применяемая при выполнении технических расчётов, характеризующих фрикционное взаимодействие двух тел (смотрите Внешнее Трение). В зависимости от вида перемещения одного тела по другому различают:- Коэффициент Трения При Сдвиге – скольжении и Коэффициент Трения При Качении. В свою очередь, при скольжении в зависимости от величины тангенциальной силы (смотрите Внешнее Трение) различают Коэффициент Неполного Трения Скольжения, Коэффициент Трения Покоя и Коэффициент Трения Скольжения. Все эти коэффициенты трения могут изменяться в широких пределах в зависимости от шероховатости и волнистости поверхностей, характера плёнок, покрывающих поверхности. Для протяжённого контакта они мало изменяются с изменением нагрузки. В зависимости от величины коэффициент трения скольжения пары трения делят на 2 группы:- фрикционные материалы, имеющие большой коэффициент трения – обычно 0.3–0.35, редко 0.5–0.6, и антифрикционные, имеющие коэффициент трения без смазки 0.15–0.12, при граничной смазке 0.1–0.05. Сопротивление свободному качению твёрдого тела (например, колеса) характеризуют коэффициентом сопротивления перекатыванию $f_k = T \cdot r_d / l_k$ (см), где T – нормальная составляющая реакции колеса на опору; r_d – динамический радиус качения; l_k – нормальная нагрузка на колесе. Если на колесо действуют ведущий или тормозной моменты, то коэффициент сцепления y колеса с дорожным покрытием определяется равенством:- $y = T_x / l_k$, где T_x – неполная сила трения скольжения, возникающая между катящимся колесом и дорогой. Коэффициенты f_k и y существенно зависят от природы трущихся тел, характера покрывающих их плёнок и скорости качения. Обычно для металлов (сталь по стали) f_k = 0.001–0.002 см. При движении автомобиля со скоростью 80 км/час коэффициент трения колёс по асфальту f_k = 0.02 см и резко возрастает с увеличением скорости. Коэффициент сцепления y на сухом асфальте доходит у автомобильных колёс до 0.8, а при наличии плёнки воды снижается до 0.2–0.1.

COEFFICIENT OF REGRESSION = КОЭФФИЦИЕНТ РЕГРЕССИИ – Coefficient Of Regression is a numerical measure of the rate of change of the dependent on the independent variable.

COEFFICIENT OF SLIDING FRICTION = КОЭФФИЦИЕНТ СКОЛЬЗЯЩЕГО ТРЕНИЯ – Coefficient Of Sliding Friction:- dimensionless factor indicated by the Greek letter μ. This factor is used to determine the force required to overcome the friction which is produced by a specific material combination constantly sliding under the influence of a pulling force. The coefficient of sliding friction is important in load securing, since the sliding friction of a load with a specific material combination (load/loading area) must be overcome before the load slides. The greater the friction, the less effort is required in securing the load.

COEFFICIENT OF VARIATION = КОЭФФИЦИЕНТ ВАРИАЦИИ – Coefficient Of Variation (CV) is a relative measure of variation estimated as the ratio of the standard deviation to the sample mean. It affords a valid comparison of small and large things and is independent of the unit of measurement. When the variance is the error variance, it is used to indicate the degree of precision of a given experiment.

COEFFICIENT OF VARIATION OF MASS = КОЭФФИЦИЕНТ ВАРИАЦИИ МАССЫ – (1) Coefficient Of Variation Of Mass (CVm) with a cut length of approximately 1 cm. This is the CV most often quoted in yarn specification and commercial transactions. It is the effective CV used for calculating the index of irregularity.

(2) Coefficient Of Variation Of Mass with a cut length of 1 m (CVm(1m)), simulating the CV you would have got from cutting the yarn into 1 m sections and weighing those sections. The same applies to CVm(10m) and CVm(100m). It should be noted that as the cut length increases, the irregularity reduces.

COELESTINA = НЕБЕСНОЕ – Coelestina (-us, -um):- pale (sky) blue.

COFC = CONTAINER ON FLAT CAR

COFFEE = КОФЕ – Coffee is a brewed beverage with a dark, acidic flavor prepared from the roasted seeds of the Coffee Plant, colloquially called Coffee Beans. The beans are found in Coffee cherries, which grow on trees cultivated in over 70 countries, primarily in equatorial Latin America, Southeast Asia, South Asia and Africa. Green (unroasted) Coffee is one of the most traded agricultural commodities in the world. Coffee can have a stimulating effect on humans due to its caffeine content. It is one of the most-consumed beverages in the world. Coffee has played a crucial role in many societies. The energizing effect of the Coffee bean plant is thought to have been discovered in the northeast region of Ethiopia, and the cultivation of Coffee first expanded in the Arab world. The earliest credible evidence of Coffee drinking appears in the middle of the XV century, in the Sufi shrines of Yemen in Southern Arabia. From the Muslim world, Coffee spread to India, Italy, then to the rest of Europe, to Indonesia, and to the Americas. In East Africa and Yemen, it was used in religious ceremonies. As a result, the Ethiopian Church banned its secular consumption, a ban in effect until the reign of Emperor Menelik II of Ethiopia. It was banned in Ottoman Turkey during the XVII century for political reasons, and was associated with rebellious political activities in Europe. Coffee berries, which contain the Coffee seeds or 'beans', are produced by several Species of small evergreen bush of the Genus Coffea. The two most commonly grown are the highly regarded Coffea Arabica, and the 'Robusta' form of the hardier Coffea Canephora. The latter is resistant to the devastating Coffee leaf rust (Hemileia vastatrix). Once ripe, Coffee berries are picked, processed, and dried. The seeds are then roasted to varying degrees, depending on the desired flavor. They are then ground and brewed to create Coffee. Coffee can be prepared and presented in a variety of ways. An important export commodity, Coffee was the top agricultural export for twelve countries in 2004, and it was the world's seventh-largest legal agricultural export by value in 2005. Some controversy is associated with Coffee cultivation and its impact on the environment. Many studies have examined the relationship between Coffee consumption and certain health conditions; whether the overall effects of Coffee are ultimately positive or negative has been widely disputed. The method of brewing Coffee has been found to be important to its health effects. The first reference to 'Coffee' in the English language is in the form Chaoua and dates to 1598. In English and other European languages, Coffee derives from the Ottoman Turkish Kahve, via the Italian Caffè. The Turkish word in turn was borrowed from the Arabic:- Qahwah. Arab lexicographers maintain that qahwah originally referred to a type of wine, and gave its etymology, in turn, to the verb qaha, signifying 'to have no appetite', since this beverage was thought to dull one's hunger. Several alternative etymologies exist that hold that the Arab form may disguise a loanword from an Ethiopian or African source, suggesting Kaffa, the highland in southwestern Ethiopia as one, since the plant is indigenous to that area. However, the term used in that region for the berry and plant is bunn, the native name in Shoa being būn. Several species of shrub of the genus Coffea produce the berries from which Coffee is extracted. The two main species commercially cultivated are Coffea Canephora (predominantly a form known as 'Robusta') and Coffea Arabica. Coffea Arabica, the most highly regarded species, is native to the southwestern highlands of Ethiopia and the Boma Plateau in southeastern Sudan and possibly Mount Marsabit in northern Kenya. Coffea Canephora is native to western and central subsaharan Africa, from Guinea to the Uganda and southern Sudan. Less popular species are Coffea Liberica, excelsa, stenophylla, mauritiana, and racemosa. All Coffee plants are classified in the large family Rubiaceae. They are evergreen shrubs or small trees that may grow 5 m (15 ft) tall when unpruned. The leaves are dark green and glossy, usually 10–15 cm (4–6 in) long and 6 cm (2.4 in) wide. The flowers are axillary, and clusters of fragrant white flowers bloom simultaneously and are followed by oval berries of about 1.5 cm (0.6 in). Green when immature, they ripen to yellow, then crimson, before turning black on drying. Each berry usually contains two seeds, but 5–10% of the berries have only one; these are called Peaberries. Berries ripen in seven to nine months. Coffea Arabica is predominantly self-pollinating, and as a result the seedlings are generally uniform and vary little from their parents. In contrast, Coffea Canephora, Coffea Excelsa, and Coffea Liberica are self-incompatible and require outcrossing. This means that useful forms and hybrids must be propagated vegetatively. Cuttings, grafting, and budding are the usual methods of vegetative propagation. On the other hand, there is great scope for experimentation in search of potential new strains. The traditional method of planting Coffee is to put 20 seeds in each hole at the beginning of the rainy season; half are eliminated naturally. A more effective method of growing Coffee, used in Brazil, is to raise seedlings in nurseries that are then planted outside at six to twelve months. Coffee is often intercropped with food crops, such as Corn, beans, or Rice during the first few years of cultivation. Of the two main species grown, Arabica Coffee (from Coffea Arabica) is generally more highly regarded than Robusta Coffee (from Coffea Canephora); Robusta tends to be bitter and have less flavor but better body than Arabica. For these reasons, about three-quarters of Coffee cultivated worldwide is Coffea Arabica. Robusta strains also contain about 40–50% more caffeine than Arabica. For this reason, it is used as an inexpensive substitute for Arabica in many commercial Coffee blends. Good quality Robusta beans are used in some espresso blends to provide a full-bodied taste, a better foam head (known as Crema), and to lower the ingredient cost. However, Coffea Canephora is less susceptible to disease than Coffea Arabica and can be cultivated in lower altitudes and warmer climates where Coffea Arabica will not thrive. The Robusta strain was first collected in 1890 from the Lomani River, a tributary of the Congo River, and was conveyed from Zaire to Brussels to Java around 1900. From Java, further breeding resulted in the establishment of robusta plantations in many countries. In particular, the spread of the devastating Coffee leaf rust (Hemileia vastatrix), to which Coffea Arabica is vulnerable, hastened the uptake of the resistant robusta. Coffee leaf rust is found in virtually all countries that produce Coffee. Over 900 species of insect have been recorded as pests of Coffee crops worldwide. Of these, over a third are beetles, and over a quarter are bugs. Some 20 species of nematodes, 9 species of mites, several snails and slugs also attack the crop. Birds and rodents sometimes eat Coffee berries but their impact is minor compared to invertebrates. In general, Arabica is the more sensitive species to invertebrate predation overall. Each part of the Coffee plant is assailed by different animals. Nematodes attack the roots, and borer beetles burrow into stems and woody material, the foliage is attacked by over 100 species of larvae (caterpillars) of butterflies and moths. Mass spraying of insecticides has often proven disastrous, as the predators of the pests are more sensitive than the pests themselves. Instead, integrated pest management has developed, using techniques such as targeted treatment of pest outbreaks, and managing crop environment away from conditions favoring pests. Branches infested with scale are often cut and left on the ground, which promotes scale parasites to not only attack the scale on the fallen branches but in the plant as well. In 2009 Brazil was the world leader in production of green Coffee, followed by Vietnam, Indonesia and Colombia. Arabica Coffee beans are cultivated in Latin America, eastern Africa, Arabia, or Asia. Robusta Coffee beans are grown in western and central Africa, throughout southeast Asia, and to some extent in Brazil. Beans from different countries or regions can usually be distinguished by differences in flavor, aroma, body, and acidity. These taste characteristics are dependent not only on the Coffee's growing region, but also on genetic subspecies (varietals) and processing. Varietals are generally known by the region in which they are grown, such as Colombian, Java and Kona. 2007 Top twenty green Coffee producers:- Brazil (2 249 010 tons), Vietnam (961 200 tons), Colombia (697 377 tons), Indonesia (676 475 tons), Honduras (355 000 tons), Ethiopia (325 800 tons), India (288 000 tons), Mexico (268 565 tons), Guatemala (252 000 tons), Peru (225 992 tons), Côte d'Ivoire (170 849 tons), Uganda (168 000 tons), Costa Rica (124 055 tons), Philippines (97 877 tons), El Salvador (95

456 tons), Nicaragua (90 909 tons), Papua New Guinea (75 400 tons), Venezuela (70 311 tons), Madagascar (62 000 tons), Thailand (55 660 tons); World (7 742 675 tons or 117 319 thousands bags). The Coffee, Sugar & Cocoa Exchange is the world's premier forum for Coffee futures and options trading. Coffee beans are shipped and warehoused in natural fiber bags, and Coffee sales are usually accomplished through the use of inspected samples offered by importers and brokers. The supply of Coffee is affected by weather conditions, the health of the Coffee trees, and harvesting practices. Historically, weather has played a major role in determining world supply. For example, production increases after recovery from the 1953 Brazilian frost induced big price declines; likewise, a Brazilian frost in 1975 and drought in 1985 caused a sharp drop in Coffee production and similarly dramatic increases in Coffee prices. The internal policies of the governments of producing countries with regard to number of trees planted, price support programs and world export quotas have also impacted the amount of Coffee available for world trade. For instance, the collapse of an international agreement among the majority of Coffee producers and consumers in the summer of 1989 was followed by a price decrease from USD1.30/pound to USD0.98/pound in under a month. Coffee is a widely consumed beverage prepared from the roasted seeds – commonly referred to as Beans – of the Coffee plant. It is usually served hot but can also be served cold. A typical 7 fluid ounce (ca. 207 mL) cup of Coffee contains 80–140 milligrams of caffeine depending on the method of preparation. Some people drink Coffee 'black' (plain), while others sweeten their Coffee, and/or add milk, cream or artificial creamer. Coffee represents 71% of all the United States caffeine consumption followed by soft drinks and tea. Coffee, along with tea and water, is one of the most popular beverages world-wide, its volume amounting to about a third that of tap water in North America and Europe. In 2003, Coffee was the world's sixth largest agricultural export in terms of value, behind Wheat, Maize, Soybeans, Palm Oil and Sugar. The history of Coffee can be traced at least as early as the IX century, in the highlands of Ethiopia. From there it spread to Egypt and Yemen, and by the XV century had reached Persia, Egypt, Turkey, and northern Africa. Coffee was at first not well received. In 1511, it was forbidden for its stimulating effect by conservative, orthodox imams at a theological court in Mecca. However, the popularity of the drink led these bans to be overturned in 1524 by an order of the Ottoman Turkish Sultan Selim I. In Cairo, Egypt, a similar ban was instituted in 1532, and the coffeehouses and warehouses containing Coffee beans were sacked. From the Muslim world, Coffee spread to Europe, where it became popular during the XVII century. The Dutch were the first to start the large scale importation of Coffee into Europe, and eventually smuggled out some seedlings in 1690, as the Arabs were not allowed to export the plants or unroasted seeds. This led to Coffee growing in Java, which was owned by the Dutch. In 1538, Leonhard Rauwolf, a German physician, having returned from a ten-year trip to the Near East, gave this description of Coffee:- 'A beverage as black as ink, useful against numerous illnesses, particularly those of the stomach. Its consumers take it in the morning, quite frankly, in a porcelain cup that is passed around and from which each one drinks a cupful. It is composed of water and the fruit from a bush called Bunnu'. When Coffee reached the American colonies, it was initially not as successful as it had been in Europe, as colonists found it a poor substitute for alcohol. However, during the Revolutionary War, the demand for Coffee increased to such an extent that dealers had to hoard their scarce supplies of it and raise prices dramatically; part of this is due to the reduced availability of tea from British merchants. Americans' taste for Coffee grew during the early XIX century, following the War of 1812, which had temporarily cut off access to tea imports, and high demand during the American Civil War as well as many advancements in brewing technology cemented the position of Coffee as an everyday commodity in America. There are two main species of the Coffee plant, Coffea Arabica being the older one. Coffee is thought to be indigenous to south-western Ethiopia, specifically from Kaffa, from which it may have acquired its name. While more susceptible to disease, it is considered by most to taste better than the second species, Coffea Canephora (Robusta). Robusta, which contains about 40–50% more caffeine, can be cultivated in environments where Arabica will not thrive and probably originated in Uganda. This has led to its use as an inexpensive substitute for Arabica in many commercial Coffee blends. Compared to Arabica, Robusta tends to be bitter and has little flavor, with a telltale 'burnt rubber' or 'wet cardboard' aroma and flavor. Good quality Robustas are used in some espresso blends to provide a better 'crema' (foamy head), and to lower the ingredient cost. In Italy, many espresso blends are based on dark-roasted Robusta. The large industrial roasters use a steam treatment process to remove undesirable flavors from Robusta beans for use in mass-marketed Coffee blends. Other species include Coffea Liberica and Coffea Esliaca, believed to be indigenous to Liberia and Southern Sudan respectively. Arabica Coffees were traditionally named by the port they were exported from, the two oldest being Mocha, from Yemen, and Java, from Indonesia. The modern Coffee trade is much more specific about origin, labeling Coffees by country, region, and sometimes even the producing estate. Varietal is a botanical term denoting a taxonomic category ranking below species, a designation more specific than Arabica or Robusta and unrelated to the Coffee's place of origin. Coffees consisting entirely of beans from a single varietal, bourbon, for example, are generally referred to as such, along with a reference to their place of origin (as in:- Rwanda Blue Bourbon). Coffee aficionados may even distinguish auctioned Coffees by lot number. Most Arabica Coffee beans originate from one of three growing regions:- Latin America, East Africa/Arabia and Asia/Pacific. Beans from different countries or regions usually have distinctive characteristics such as flavor (flavor criteria include terms such as 'citrus-like' or 'earthy'), aroma (sometimes 'berry-like' or 'flowery'), body or mouthfeel, and acidity. Acidity refers to a tangy or clean-tasting quality, typically present in washed or wet processed Coffees. It does not refer to a Coffee's pH level. Black Coffee has a pH of around 5. These distinguishing taste characteristics are dependent not only on the Coffee's growing region, but also on its method of process and genetic subspecies or varietal. A Peaberry, (also sometimes called a 'Caracoli' Bean) is a Coffee bean that develops singly inside the Coffee cherry instead of the usual pair of beans. This situation occurs 5–10% of the time. Since flavor is concentrated when only a single bean is grown inside the cherry, these beans (especially Arabica) are highly prized. Coffee is bought and sold by roasters, investors and price speculators as a tradable commodity. Coffee futures contracts for Grade 3 washed Arabicas are traded on the New York Mercantile Exchange under ticker symbol KC, with contract deliveries occurring every year in March, May, July, September, and December. Higher and lower grade Arabica Coffees are sold through other channels. Futures contracts for Robusta Coffee are traded on the London Liffe exchange and, since 2007, on the New York ICE exchange. Coffee has been described by many, including historian Mark Pendergrast, as the world's 'second most legally traded commodity'. However, this claim has been recently refuted by Pendergrast among others after further research. / привоз (importation). виды (species). Обжиговые Печи (Roasters). разведение или распространение (propagation). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). Термин Кофе, от Арабского Кахва, относится к:- (i) кофейному дереву; или (ii) продукту, получаемому обжариванием и измельчением семян (зёрен) кофейного дерева. Кофе содержит кофеин, сахар, азотистые, минеральные и другие вещества. Кофейное Дерево относится к роду вечнозелёных деревьев и кустарников семейства мареновых. Существует порядка 40 видов, произрастающих в тропиках и субтропиках Африки и Азии. Культивируются всего 4–5 видов. Семена кофейного дерева (кофейные зёрна) используют для получения кофеина и кофе. Некоторые виды кофейных деревьев относятся к декоративным. Под Кофеином понимается алкалоид, содержащийся в семенах кофейного дерева, листьях чайного куста, орехах кола и других. Он оказывает возбуждающее действие на центральную нервную и сердечно-сосудистую системы. Кофеин применяется как стимулирующее средство, при отравлении наркотиками и другим.

COFFEE, SUGAR AND COCOA EXCHANGE, INC. = БИРЖА КОФЕ, САХАРА И КАКАО, ИНК. – Coffee, Sugar and Cocoa Exchange (CSCE) is a commodities exchange formed in 1979 for trading coffee, sugar and cocoa futures. The exchange has its roots in the 1882 Coffee Exchange, which added sugar in 1914 and Cocoa in 1979. In 1998, the CSCE became a subsidiary of the New York Board of Trade, where it traded both futures and options. Since 2007, NYBOT® has been a wholly-owned subsidiary of Intercontinental

Exchange (ICE). The ICE operates several exchanges, trading platforms and clearing houses using an electronic trading platform. Coffee, sugar and cocoa are considered soft commodities because they are grown, not mined. Trading in soft commodities generally depends on supply and demand in markets just like hard commodity trading. See also New York Board Of Trade. Much of the Coffee is traded on the Coffee, Sugar, and Cocoa Exchange, now a subset of the New York Board of Trade, and on the London, Tokyo and Brazilian commodity exchanges. 1882:- Coffee Exchange (CE) is formed by a group of Coffee merchants to trade Coffee futures. In 1914, the Coffee Exchange expanded to include sugar futures, and, in 1916, it changed its name to the New York Coffee and Sugar Exchange. On September 28, 1979, it merged with the New York Cocoa Exchange (which in turn had been founded in 1925) to form today's Coffee, Sugar & Cocoa Exchange, Inc. (CSCE). In 1998, CSCE merged with the New York Cotton Exchange as subsidiaries of the New York Board of Trade (NYBOT®). The CSCE operates as an independent unit of NYBOT® trading futures and options on Coffee, sugar and Cocoa and the S&P Commodity Index. Trading is by open outcry, from 08:00 am to 02:45 pm, Monday through Friday. In January 2007, NYBOT® merged with IntercontinentalExchange (ICE) and became a wholly owned subsidiary of ICE. The Coffee, Sugar and Cocoa Exchange (CSCE®) is a leading exchange for futures and options trading on Coffee, sugar and Cocoa. The New York-based commodity exchange trading futures and options. The CS&CE shares the trading floor at the Commodities Exchange Center (CEC). CEC:- in New York, the location of five futures exchanges:- the COMEX®, the Coffee, Sugar and Cocoa Exchange (CSCE®), the New York Mercantile Exchange (NYMEX®), the New York Cotton Exchange (NYCE®), and the New York Futures Exchange (NYFE®). The Coffee, Sugar and Cocoa Exchange (CSCE®) was the product of a 1979 merger between the New York Coffee and Sugar Exchange (founded in 1882) and the New York Cocoa Exchange (founded in 1925). In 1998, CSCE® and New York Cotton Exchange (NYCE®) entered into a merger agreement to form the New York Board of Trade (NYBOT®), which was to occur in several stages. On June 10, 2004 when the merger was completed, the CSCE's and NYCE's contract market designations were extinguished and transferred to NYBOT®. / Биржа Кофе (БК; Coffee Exchange (CE)) была образована в Нью Йорке, США в 1882 группой коммерсантов, специализировавшихся на Кофе, для торговли фьючерсами на Кофе. В 1914 она расширила свою деятельность, включив в торговлю фьючерсы на сахар; и в этой связи, спустя пару лет, в 1916 она изменила своё название на новое – Нью Йоркская Биржа Кофе и Сахара (New York Coffee and Sugar Exchange). В таком виде она просуществовала 63 года. 28 Сентября 1979 биржа объединилась с Нью Йоркской Биржей Какао (New York Cocoa Exchange), создав при этом новую биржу – Биржа Кофе, Сахара и Какао, Инк (БКСК® (CSCE®)). Спустя короткое время эта биржа превратилась в ведущую мировую сырьевую биржу, торговавшую фьючерсами и опционами на фьючерсы на Какао, Кофе и сахар, а также новыми – на масло, молоко, сыр и этанол. В 1998 биржа стала дочерним предприятием Нью Йоркской Палаты Торговли (Нью Йоркского Табло Торговли, если быть более точными; НАЙБЭТ® (NYBOT®)). А с 2007 НАЙБЭТ®, в свою очередь, превратилась в полностью владеемое дочернее предприятие биржи (Intercontinental Exchange (ICE)). КОМЭКС® (COMEX®), Биржа Кофе, Сахара и Какао (CSCE®), .

COFFERDAM = КОФФЕРДАМ (или КЕССОН) – Cofferdam is the space between two bulkheads set close together, especially between fuel tanks (two walls separated to use for drainage or safety). It's a void space between two bulkheads. Cofferdams are located either side of the engine-room space and are used as part of the collision bulkhead. An empty space between two bulkheads or two decks separating tanks, the engine room or other compartments from each other. Cofferdam is an empty space on board of a vessel between two bulkheads or two decks separating oil tanks from each other and/or the engine room or other compartments. / машинное отделение. Под Коффердамом, от Голандского слова Kofferdam, понимается узкий, непроницаемый для газов отсек на судне, разделяющий соседние помещения. Коффердамы изолируют, например, жилые помещения от цистерн для жидкого топлива. На танкерах грузовые цистерны отделены коффердамами от носовых помещений и машинного отделения; при перевозке грузов с низкой температурой вспышки коффердамы заполняют водой. Под Кессоном, от Французского слова Caisson, означающее Ящик, понимается ящик для частичного осушения подводной части судна с целью ремонта или осмотра. Представляет собой деревянный или металлический ящик, внутренняя сторона которого имеет лекальный вырез по форме обвода осушаемого участка на корпусе судна.

COFR = CERTIFICATE OF FINANCIAL RESPONSIBILITY

COGAS = COST OF GOODS SOLD

COGENERATOR = ГЕНЕРАТОР КОМБИНИРОВАННОЙ ВЫРАБОТКИ ТЕПЛОВОЙ И ЭЛЕКТРИЧЕСКОЙ ЭНЕРГИИ (или СОГЕНЕРАТОР) – Cogenerator is a generating facility that produces electricity and another form of useful thermal energy (such as heat or steam), used for industrial, commercial, heating, or cooling purposes. Cogenerators use the waste heat created by one process, for example during manufacturing, to produce steam which is used, in turn, to spin a turbine and generate electricity. Cogenerators may also be Qualifying Facilities (QFs). To receive status as a qualifying facility (QF) under the Public Utility Regulatory Policies Act (PURPA), the facility must produce electric energy and 'another form of useful thermal energy through the sequential use of energy', and meet certain ownership, operating, and efficiency criteria established by the Federal Energy Regulatory Commission (FERC). / Генерирующая станция, которая производит электричество и иные формы полезной тепловой энергии (такие как тепло или пар), используемые в промышленных, коммерческих целях, а также с целью отопления или охлаждения. Генераторы комбинированной выработки используют тепло, выделяемое одним процессом, например процессом производства, для производства пара, который, в свою очередь, используется для вращения турбины и генерации электричества. Генераторы комбинированной выработки могут также относиться к Квалификационным Системам (КС). Для получения статуса .

COGM = COST OF GOODS MANUFACTURED

COGSA = CARRIAGE OF GOODS BY SEA ACT

COHESION = КОГЕЗИЯ (или СЦЕПЛЕНИЕ, или СВЯЗНОСТЬ) – (1) Cohesion is that property of a substance that causes it to resist being pulled apart by mechanical means. Cohesion is the tendency of a substance to cling together; the mutual attraction among molecules or particles comprising a substance that allows it to cling together as a continuous mass. / Под Когезией или Сцеплением, от Латинского слова Cohaesus, означающее Связанный или Сцепленный, понимается сцепление (притяжение) молекул (атомов, ионов) в физическом теле. Обусловлена межмолекулярным взаимодействием; наиболее сильно в твёрдых телах и жидкостях. Под Когезией или Сцеплением понимается притяжение между частицами одного и того же твёрдого тела или жидкости, приводящее к объединению этих частиц в единое тело. Причиной когезии являются силы межмолекулярного взаимодействия, водородной связи и (или) химической связи. Силы когезии наиболее велики в твёрдых телах. Когезия, сцепление молекул (атомов, ионов) физического тела под действием сил притяжения. Это силы межмолекулярного взаимодействия, водородной связи и (или) химической связи. Они определяют совокупность физических и физико-химических свойств вещества:- агрегатное состояние, летучесть, растворимость, механические свойства и так далее. Интенсивность межмолекулярного и межатомного взаимодействия (а, следовательно, Силы Когезии) резко убывает с расстоянием. Наиболее сильна когезия в твёрдых телах и жидкостях, то есть в конденсированных фазах, где расстояние между молекулами (атомами,

ионами) малы – порядка нескольких Å. В газах средние расстояния между молекулами велики по сравнению с их размерами, и поэтому когезия в них незначительна. Мерой интенсивности межмолекулярного взаимодействия служит плотность энергии когезии. Она эквивалентна работе удаления взаимно притягивающихся молекул или атомов на бесконечно большое расстояние друг от друга, что практически соответствует испарению или сублимации вещества.

(2) Cohesion is the force that holds fibers together during yarn manufacturing or processing. It is usually a function of lubricant (type and amount) and fiber crimp.

COHESIVE RESISTANCE = РЕЗИСТЕНТНОСТЬ К СЦЕПЛЕНИЮ (или УСТОЙЧИВОСТЬ СЦЕПЛЕНИЯ, или СОПРОТИВЛЯЕМОСТЬ СЦЕПЛЕНИЯ) – Cohesive Resistance is a resistance of an object against slipping on a surface (a function of cohesion and friction).

COIF = КОЙФ (или КАМИЛАВКА, или ЧЕПЕЦ) – Coif is a close-fitting cap; a hood-like cap worn under a veil by nuns; a protective usually metal skullcap formerly worn under a hood of mail; a white cap formerly worn by English lawyers and especially by serjeants-at-law.

COIL = БУХТА – Coil (maritime term):- to lay down rope in circular turns.

COIL BOX CONTAINER = КОНТЕЙНЕР ДЛЯ ОБШИТЫХ МОТКОВ (или БУНТОВ) – Coil Box Container is a special container for transporting coils. They handle greater line loads and are equipped with coil wells and special load securing features.

COIL CONTAINER = КОНТЕЙНЕР ДЛЯ МОТКОВ (или ВИТКОВ) – Coil Containers are built like flats or flatracks, i.e. they consist of a container floor and flat or frame-like end walls. The container floor has cargo troughs for accommodating coils/rolls of steel sheet. / , то есть они состоят из пола и стен контейнера или .

COILING = СВЁРТЫВАНИЕ СПИРАЛЬЮ (или СМАТЫВАНИЕ, или НАВИВКА) – Coiling is the process of laying down a sliver, top or tow into successive layers within which circular spirals are regularly arranged. Coiling is the depositing of sliver into cylindrical cans in helical loops. This arrangement permits easy removal for further processing.

COIL NOT SECURELY ATTACHED TO FABRIC = ЗАВИВКА (или СПИРАЛЬ), НЕНАДЁЖНО ПРИКРЕПЛЁННАЯ К ТКАНИ – Coil Not Securely Attached To Fabric:- due to improper stitching or to mechanical damage to stitching. Slight irregularities of stitch pattern are not serious but, if more than one consecutive convolution is not secured, failure early in life of garment is likely. Closure defects, and namely – Nylon Spiral Zipper:- Coil Defects. / ненадлежащее втачивание (stitching). Порок или дефект застёжки. Найлан (Nylon).

COILS = МОТКИ (или ВИТОК, или БУНТ (ПРОВОЛОКИ), или БУХТА (ТРОСА)) – Coils are the products such as steel sheets, wide strip, steel piping or wire which are coiled into rolls. Coils weighing up to 35 t are transported.

COIL YARN = ВЕРЁВОЧНАЯ (или ВИТАЯ, или ЗАВИТАЯ) ПРЯЖА – Coil Yarn is a textured yarn that takes on a coil or spiral configuration when further processed. A coil yarn can be either a torque yarn or a nontorque yarn. A coil yarn can be formed by the false twist or edge crimp methods. Some bilateral fibers become coiled on further processing. See also Textured Yarns.

COIN = МОНЕТА – Coin is a usually flat piece of metal stamped and issued by governmental authority for use as money. Coin is a small, flat, round piece of metal or plastic used primarily as a medium of exchange or legal tender. They are standardized in weight, and produced in large quantities at a mint in order to facilitate trade. They are most often issued by a government. Coins are usually metal or alloy, or sometimes made of synthetic materials. They are usually disc shaped. Coins made of valuable metal are stored in large quantities as bullion coins. Other coins are used as money in everyday transactions, circulating alongside banknotes. Usually the highest value coin in circulation (i.e. excluding bullion coins) is worth less than the lowest-value note. In the last hundred years, the face value of circulation coins has occasionally been lower than the value of the metal they contain, for example due to inflation. If the difference becomes significant, the issuing authority may decide to withdraw these coins from circulation, possibly issuing new equivalents with a different composition, or the public may decide to melt the coins down or hoard them (Gresham's law). Exceptions to the rule of face value being higher than content value also occur for some bullion coins made of copper, silver, or gold (and, rarely, other metals, such as platinum or palladium), intended for collectors or investors in precious metals. Examples of modern gold collector/investor coins include the British sovereign minted by the United Kingdom, the American Gold Eagle minted by the United States, the Canadian Gold Maple Leaf minted by Canada, and the Krugerrand, minted by South Africa. While the Eagle, Maple Leaf, and Sovereign coins have nominal (purely symbolic) face values; the Krugerrand does not. Historically, a great quantity of coinage metals (including alloys) and other materials (e.g., porcelain) have been used to produce coins for circulation, collection, and metal investment:- bullion coins often serve as more convenient stores of assured metal quantity and purity than other bullion. History:- the first coins were developed independently in Iron Age Anatolia and Archaic Greece, India and China around the VII and VI centuries BCE. Coins spread rapidly in the VI and V centuries BCE, throughout Greece and Persia, and further to the Balkans. Standardized Roman currency was used throughout the Roman Empire. Important Roman gold and silver coins were continued into the Middle Ages (see Gold Dinar, Solidus, Aureus, Denarius). Ancient and early medieval coins in theory had the value of their metal content, although there have been many instances throughout history of the metal content of coins being debased, so that the inferior coins were worth less in metal than their face value. Fiat money first arose in medieval China, with the jiaozi paper money. Early paper money was introduced in Europe in the later Middle Ages, but some coins continued to have the value of the gold or silver they contained throughout the Early Modern period. The penny was minted as a silver coin until the XVII century. The first circulating United States coins were cents (pennies), produced in 1793, and made entirely from copper. Silver content was reduced in many coins in the XIX century (use of billon), and the first coins made entirely of base metal (e.g., nickel, cupronickel, aluminium bronze), representing values higher than the value of their metal, were minted in the mid XIX century. An oxhide ingot from Crete. Late Bronze Age metal ingots were given standard shapes, such as the shape of an 'ox-hide', suggesting that they represented standardized values. Coins were an evolution of 'currency' systems of the Late Bronze Age, where standard-sized ingots, and tokens such as knife money, were used to store and transfer value. In the late Chinese Bronze Age, standardized cast tokens were made, such as those discovered in a tomb near Anyang. These were replicas in bronze of earlier Chinese currency, cowrie shells, so they were named Bronze Shell. Most coins presently are made of a base metal, and their value comes from their status as fiat money. This means that the value of the coin is decreed by government fiat (law), and thus is determined by the free market only in as much as national currencies are used in domestic trade and also traded internationally on foreign exchange markets. Thus, these coins are monetary tokens, just as paper currency is:- they are usually not backed by metal, but rather by some form of government guarantee. Some have suggested that such coins not be considered to be 'true coins'. Thus, there is very little economic difference between notes and coins of equivalent face value. Coins may be in circulation with fiat values lower than the value of their component metals, but they are never initially issued with such value, and the shortfall only arises over time due to inflation, as market values for the metal overtake the fiat declared face value of the coin. Examples are the pre-1965 US dime, quarter, half dollar, and Dollar (nominally containing slightly less than a tenth,

quarter, half, and full ounce of silver, respectively), US nickel, and pre-1982 US penny. As a result of the increase in the value of copper, the United States greatly reduced the amount of copper in each penny. Since mid-1982, United States pennies are made of 97.5% zinc, with the remaining 2.5% being a coating of copper. Extreme differences between fiat values and metal values of coins cause coins to be hoarded or removed from circulation by illicit smelters in order to realise the value of their metal content. This is an example of Gresham's law. The United States Mint, in an attempt to avoid this, implemented new interim rules on December 14, 2006, subject to public comment for 30 days, which criminalized the melting and export of pennies and nickels. Violators can be fined up to USD10 000 and/or imprisoned for up to five years. / Под Монетой, от Латинского слова Moneta, первоначально означающее один из эпитетов Юноны (Juno Moneta), при храме которой в Риме в III до Нашей Эры находился монетный двор, понимается денежный знак, изготовленный из металла (золота, серебра, меди и медных сплавов; в новейшее время – различных сплавов меди, никеля, алюминия). Является средством обращения и платежа (смотрите также Деньги). Овальная или круглая форма монеты, как наиболее удобная для обращения, всегда была господствующей; исключения редки. В монетах различают лицевую (Аверс) и оборотную (Реверс) стороны и обрез (Гурт). На каждой монете имеется изображение (герб, имя, титул, изображение правителя) и легенда, содержащая название города, государства, год чеканки, наименование монеты. Монета почти одновременно появилась в Малоазийском государстве Лидия (рубеж VIII–VII веков до Нашей Эры) и в Древней Греции – на Острове Эгина (VII век до Нашей Эры). В средневековой Европе и на Руси собственная монетная чеканка возникла в IX–X веках. Национальные монеты постепенно вытеснили из обращения Римские, Византийские, Арабские монеты и подражания им. С образованием единого национального Русского государства (начало XVI века) сложилась единая монетная система. По реформе 1534 началась чеканка общегосударственной монеты – Копейки. Монеты появляются с развитием товарно-денежных отношений и торговли. В отличие от товаров, обращавшихся в качестве эквивалента (скот, зерно, раковины и другие), и слитков металла монета стала универсальным платёжным средством, так как качество и вес металла в монетах удостоверялись государством (государственным штемпелем). Выпуск монет является исключительным правом суверенной власти. В феодальной Европе право чеканки монет имел любой суверенный феодал (вплоть до нетитулованного дворянина), в новое и новейшее время – национальные государства (смотрите Монетная Регалия). Нарушение монетного права всегда рассматривалось как тягчайшее преступление, не только уголовное, но и политическое. Изображения на монетах (в ранний период только на её лицевой стороне) являются государственной эмблемой. Монета была обязательным платёжным средством внутри государства, выпустившего её. Однако отдельные монеты обращались далеко от места их чеканки (например, Римские серебряные монеты за пределами империи, Арабские Дирхемы в IX–XIII веках в Восточной Европе). Основы монетного дела определяются монетной системой, принятой в государстве:- законодательно определяются вес монет при чеканке (законное отклонение от принятого веса называется Ремедиум), выбор металла, основного для данной системы, относительная стоимость монетных металлов по отношению друг к другу (рацио) и другие. Нередко, в рабовладельческом обществе и особенно в средние века, происходила порча монет (уменьшение государственной властью веса или пробы монеты при сохранении её прежней номинальной стоимости), за счёт которой обогащались правители, чеканившие монеты. С появлением бумажных денег роль монет как основного платёжного средства сходит на нет. Важное значение как сокровища сохраняют монеты из драгоценных металлов. В XX веке монета повсеместно является разменным денежным знаком с условным, по отношению к бумажным денежным знакам, курсом. Монеты из золота и серебра выпускаются редко и не имеют серьёзного экономического значения. В большинстве случаев это памятные (или юбилейные) монеты. Первая Советская монета была отчеканена в бывшем СССР в 1921, а имевшие ранее хождение монеты чеканятся с 1961. В 1965 в СССР выпущен памятный Рубль, посвященный 20-летию Победы в Великой Отечественной Войне 1941–45, в 1967 отчеканены юбилейные монеты достоинством 10, 15, 20 и 50 Копеек и 1 Рубль в ознаменование 50-летия Великой Октябрьской Социалистической Революции, в 1970 – памятный Рубль в ознаменование 100-летия со дня рождения Владимира Ильича Ленина. Наука, изучающая монеты, называется Нумизматикой. Об изображениях на монет и о монетах как художественном произведении смотрите Медальерное Искусство. Монетная Единица или Монетная Стопа – весовое количество чистого денежного металла, установленное для денежной единицы, лежащей в основе монетной системы данной страны. Монетная единица путём деления на кратные части развёртывается в Масштаб Цен. В большинстве стран существует десятичная система такого деления (1:10:100). В некоторых странах – квартальная (1:2:4). В России с 1897 до 1914 золотой Рубль содержал 0.774 23 грамма (г) чистого золота; десятичная система (1 Рубль, 10 Копеек, 1 Копейка) сочеталась с квартальной (1 Рубль, 50 Копеек, 25 Копеек). Золотое содержание Советского Рубля с 01 Января 1961 было установлено в 0.987 412 г чистого золота. Монетный Паритет:- (1) законодательно установленное содержание валютного металла в монете. (2) Соотношение денежных единиц различных стран в соответствии с количеством законодательно установленного в монетах чистого золота (серебра). В условиях Золотого или Серебряного Монометаллизма для стран, имевших одинаковые денежные системы, монетный паритет определялся соотношением золотого (серебряного) содержания их денежных единиц (например, до 1-й Мировой Войны 1914–18 Американский Доллар содержал 1.504 63 грамма (г) чистого золота, а Английский Фунт Стерлингов – 7.322 382 г чистого золота. Монетный паритет Фунта к Доллару составлял 4.866 56). Для стран, имевших различные денежных системы, монетный паритет устанавливался в соответствии с рыночной стоимостью золота и серебра. При обращении полноценных монет и размене банкнот на золото монетный паритет являлся основой, на которой складывался Валютный Курс. Последний колебался вокруг монетного паритета в зависимости от спроса и предложения на валюту данной страны в пределах Золотых Точек. В условиях обращения неразменных банкнот понятие монетный паритет практически потеряло значение. Монетные Конвенции и Союзы – соглашения между государствами о стандартизации веса и пробы монет и их взаимном приёме. Монетные конвенции и союзы создавались ещё в средние века. Известны конвенции Германских государств:- Австро-Южно-Германской Конвенции (1753, 1837), Северо-Германской Конвенции (1836, 1838), Австро-Германский Монетный Союз (1857), которыми определялись вес и проба монет, устанавливались общие для стран-участниц монеты, формами монетных соглашений являлись Латинский Монетный Союз (1865–1926) и Скандинавский Монетный Союз (1872–1924).

COINAGE PREROGATIVE = МОНЕТНАЯ РЕГАЛИЯ (или ПРЕРОГАТИВА НА МОНЕТНОЕ ДЕЛО) – Coinage Prerogative is the right to mint coins used as legal tender. Other terms are right of coinage and coinage monopoly. / право на монетное дело или изготовление монет и монополия на чеканку монет. Монетная Регалия – монопольное право государства на чеканку и выпуск монет в обращение. На основе монетной регалии государство осуществляет монетное законодательство, определяет наименование, материал, пробу, вес, размер монет, их внешние отличительные признаки, ремедиум и так далее. Монетное Дело – изготовление (чеканка) монет. Первоначально монетное дело находилось в руках частных лиц (в России – 'Ливцов', 'Серебряников'). В дальнейшем было монополизировано государством и стало производиться на государственных заводах – Монетных Дворах. В бывшем СССР разменная монета чеканилась на Монетном Дворе Министерства Финансов СССР в Ленинграде:- (i) нейзильберовая достоинством в 1 Рубль, 50, 20, 15, 10 Копеек и (ii) латунная достоинством в 5, 3, 2 и 1 Копеек. В древнем мире монеты изготовлялись из чистого золота и серебра (Греция) или их сплава (Лидия). В дальнейшем в монетный металл стали добавлять лигатуру из меди. Увеличение количества лигатуры сверх установленной нормы приводило к порче монет. В условиях Золотого (а также Серебряного) Монометаллизма чеканились полноценные монеты –

стоимость содержавшегося в них металла равнялась их нарицательной цене. С развитием капитализма в большинстве стран была достигнута определённая стандартизация Пробы валютных металлов. При чеканке неполноценных разменных монет медь и серебро были постепенно вытеснены никелевыми и бронзовыми сплавами. Монетный Устав – установленные государственным законом правила, регламентирующие порядок чеканки монеты в стране. Монетный устав определяет характер чеканки (свободная или закрытая), пробу валютного металла, вес, тип и легенду выпускаемых монет, ремедиум при чеканке, правила изъятия монеты из обращения и так далее. Меняется с изменением денежных систем. При Золотом Стандарте монетный устав регламентировал выпуск полноценных и неполноценных (разменных) монет. В условиях бумажноденежного обращения определяет порядок выпуска в обращение только неполноценных монет. Нарушение монетного устава (например, подделка монет) карается законом. Монетный Доход – доход государства от чеканки монет. Представляет собой разницу между номинальной стоимостью неполноценной монеты и рыночной стоимостью содержащегося в ней металла (за вычетом издержек по чеканке). Монетный доход составлял важную статью государственных доходов в рабовладельческом и феодальном обществе. Он увеличивался за счёт порчи монет. Так, весовое содержание Русского Серебряного Рубля в XIV–XVIII веках изменялось 9 раз и было снижено почти в 12 раз. Кроме того, снижалась проба рубля с 84 до 70 частей чистого серебра в монете. Монетный доход даёт лишь чеканка неполноценных разменных (билонных) монет. В России разменная серебряная монета достоинством в 1 Рубль содержала в себе серебра только на 60–70 Копеек, а в 20 Копеек – лишь на 7–7.6 Копеек; номинальная стоимость медной монеты превышала рыночную более чем в 4 раза. В современных капиталистических странах удельный вес разменных монет в общей массе денег в обращении относительно невелик (в США, например, менее 1/10). В связи с этим монетный доход не играет существенной роли в доходах буржуазного государства.

COINCIDENTAL DEMAND = СОВПАДАЮЩИЙ СПРОС (или СОВПАДАЮЩАЯ ПОТРЕБНОСТЬ) – Coincidental Demand:- the sum of two or more demands that occur in the same time interval.

COINCIDENTAL PEAK LOAD = СОВПАДАЮЩАЯ (или СОГЛАСОВАННАЯ) ПИКОВАЯ НАГРУЗКА – Coincidental Peak Load is the sum of two or more peak loads that occur in the same time interval.

COIN GOLD = МОНЕТНОЕ ЗОЛОТО – Coin Gold is a gold alloy, usually with a minimum fine gold content of 900, prepared for making coins, usually with silver or copper, to improve durability.

COINSURANCE = СОСТРАХОВАНИЕ – Coinsurance may refer to either of the following situations:- (i) where two or more insurers underwrite the same risk with several liability such that each insurer is not bound to follow the decisions of any co-insurer unless it has agreed to do so; and (ii) where the insured acts as its own insurer for a specified proportion of the sum insured. Where two or more parties share the same insured risk. A reinsurer is not a co-insurer with the original insurer. Arrangement by which a number of insurers and/or reinsurers share a risk. In property insurance, a clause under which the insured shares in losses to the extent that he is underinsured at the time of loss. In health insurance, a provision that the insured and insurance company will shared covered losses in agreed proportion. In health insurance, the preferred term is Percentage Participation. Although there is no coinsurance clause as such in the ocean marine policy, losses are settled as though a 100 percent coinsurance clause existed. Thus, if an insured takes out coverage equal to 50 percent of the true replacement cost of the goods, only 50 percent of any partial loss may be recovered.

COINVENTOR = СОИЗОБРЕТАТЕЛЬ (или СОАВТОР) – In the US patent law, Coinventor is an inventor who is named with at least one other inventor in a patent application, wherein each inventor contributes to the conception of the invention set forth in at least one claim in a patent application. / В патентном праве США, Соизобретатель – изобретатель, который указан в заявке на патент, по крайней мере, ещё с одним изобретателем. В заявке на патент каждый из изобретателей вносит что-то своё в концепцию изобретения, что выражено в, по крайней мере, одном составляющем данной заявки.

COIR = КОЙР (или КОКОСОВОЕ ВОЛОКНО) – Coir (in the UK, 1840's), a species of yarn manufactured out of the husk of Cocoa nuts. The husks being steeped in water, the dry dusty substance mixed with the fibers is separated. These are afterwards spun into yarn, and manufactured into cordage, that is deemed by some superior to that made of hemp. The goodness of coir depends on the fineness of the filaments, and on their being of a bright yellow color. About 3 000 000 lbs. weight are annually exported from Ceylon, principally to Calcutte, and other ports in the East Indies. It is also prepared the Maldive Islands, and many other places; and is very extensively used throughout the East. Coir (from Malayalam Kayaru = Cord) is a coarse fiber extracted from husk, the fibrous outer shell of a Coconut. Coir:- a coarse, short fiber extracted from the outer shell of Coconuts, coir is found in ropes, mattresses, brushes, geotextiles and automobile seats. Uses Of Coir:- White Coir spun into yarn is used in the manufacture of rope and, thanks to its strong resistance to salt water, in fishing nets. Brown Coir is used in sacking, brushes, doormats, rugs, mattresses, insulation panels and packaging. In Europe, the automobile industry upholsters cars with pads of brown Coir bonded with rubber latex. Geotextiles made from Coir mesh are durable, absorb water, resist sunlight, facilitate seed germination, and are 100% biodegradable. Coir peat, a residue of milling, is gaining economic importance as mulch, soil treatment and a hydroponic growth medium. Producers:- The Coir industry is fully developed only in India and Sri Lanka, but economically important in Brazil, Indonesia, the Philippines and Vietnam. Coconuts are typically grown by small-scale farmers, who use local mills for fibre extraction. Production And Trade:- Globally, about 500 000 tons of Coir are produced annually, mainly in India and Sri Lanka. Its total value is estimated at USD100 million. India and Sri Lanka are also the main exporters, followed by Thailand, Vietnam, the Philippines and Indonesia. Around half of the Coir produced is exported in the form of raw fiber. Smaller quantities are exported as yarn, and as mats and matting. See also Abaca. Coir:- The Plant:- Coir is extracted from the tissues surrounding the seed of the Coconut Palm (Cocos Nucifera), which is grown on 10 million ha of land throughout the tropics. There are two types of Coir:- brown fiber, which is obtained from mature coconuts, and finer white fiber, which is extracted from immature green Coconuts after soaking for up to 10 months. The Fiber:- Coir fibers measure up to 35 cm in length with a diameter of 12–25 microns. Among vegetable fibers, Coir has one of the highest concentrations of lignin, making it stronger but less flexible than Cotton and unsuitable for dyeing. The tensile strength of Coir is low compared to Abaca, but it has good resistance to microbial action and salt water damage.

COKE = КОКС – Coke (petroleum) is a residue high in carbon content and low in hydrogen that is the final product of thermal decomposition in the condensation process in cracking. This product is reported as marketable coke or catalyst coke. The conversion factor is 5 barrels (42 US gallons each) per short ton. / Под Коксом, от Немецкого слова Koks, понимается твёрдый углеродистый остаток, образующийся при нагревании различных топлив (каменного угля, торфа и других органических веществ) до 950–1 050 °C без доступа воздуха. В чёрной металлургии наиболее распространён каменно-угольный кокс, применяемый в качестве топлива в доменных печах и вагранках. Содержание углерода в коксе – 96–98%, низшая теплота сгорания – около 29 МДж/кг. Нефтяной и электродный пековый кокс применяют для изготовления угольных и графитированных электродов, реже – как топливо. Коксик – остающаяся после сортировки кокса мелочь размерами кусков ниже допускаемых в доменной плавке. Коксик используется при агломерации и выплавке ферросплавов, а также как топливо.

COKING = КОКСОВАНИЕ – Coking is the undesirable accumulation of carbon (coke) deposits in the internal combustion engine or in a refinery plant. The process of distilling a petroleum product to dryness. Coking is a thermal process for decomposing heavy and compact residual products into lighter products (gasoil and naphtha) and petroleum coke. Coking is a process by which heavy crude oil fractions can be thermally decomposed under conditions of elevated temperatures and pressure to produce a mixture of lighter oils and petroleum coke. The light oils can be processed further in other refinery units and blended to meet product specifications. The coke can be used either as a fuel or in other applications such as the manufacturing of steel or aluminium. / Коксование это термический процесс, направленный на разложение более тяжёлых и плотных остаточных продуктов на более лёгкие (газойль и нафта) и нефтяной кокс. Коксование – химическая переработка топлива нагреванием до 900–1 050 °C без доступа воздуха для получения кокса (70–80%), коксового газа (15–25%) и жидких побочных продуктов (около 3%), являющихся ценным химическим сырьём. Коксование каменных углей осуществляется в коксовых печах в несколько стадий. Путём коксования остаточных продуктов нефтепереработки получают нефтяной кокс. Под Коксованием понимаются промышленные методы термической переработки природных топлив с целью получения кокса (coke). Коксование каменного угля осуществляется нагреванием без доступа воздуха до 900–1 100 °C, при этом образуются побочные продукты – каменно-угольная смола и коксовый газ. Коксование нефтепродуктов осуществляется при 420–560 °C и давлении до 0.65 МПа. Под Коксом, от Немецкого слова Koks, понимается твёрдый углеродистый остаток, образующийся при нагревании различных топлив (каменного угля, торфа и других органических веществ) до 950–1 050 °C без доступа воздуха. В чёрной металлургии наиболее распространён каменно-угольный кокс, применяемый в качестве топлива в доменных печах и вагранках. Содержание углерода в коксе – 96–98%, низшая теплота сгорания – около 29 МДж/кг. Нефтяной и электродный пековый кокс применяют для изготовления угольных и графитированных электродов, реже – как топливо. Коксик – остающаяся после сортировки кокса мелочь размерами кусков ниже допускаемых в доменной плавке. Коксик используется при агломерации и выплавке ферросплавов, а также как топливо. Коксовая Печь – технологический агрегат для превращения каменного угля в кокс. Состоит из камеры коксования и отопительных простенков, в которых сжигается газ. Камера коксования расположена вертикально. Сверху через отверстия, закрываемые крышками, в камеру загружается уголь. Торцы камеры закрываются съёмными дверями для выдачи кокса. На практике ряд коксовых печей (обычно несколько десятков) объединяют в батарею. В качестве топлива используются доменный, генераторный или коксовый газ и их смеси. Для подогрева воздуха и газа коксовые печи оборудуются регенераторами. Коксохимия – область химии в химической промышленности, занимающаяся переработкой природных топлив (главным образом каменного угля) в кокс и другие ценные продукты методом коксования. Коксовый Газ – горючий газ, получаемый при коксовании каменного угля. Содержит в среднем 55–60% (по объёму) водорода, около 25% метана, 5–7% оксида углерода и прочее. Низшая теплота сгорания 17.2–18.8 МДж/м^3. Применяется в качестве топлива промышленных печей, для бытового газоснабжения и в качестве исходного сырья в химической промышленности. Коксующиеся Угли – угли, из которых в условиях промышленного коксования можно получать технически ценный кокс. При нагревании переходят в пластическое состояние и спекаются. Сухая Перегонка – перегонка твёрдых топлив (например, каменного и бурого угля) нагреванием без доступа воздуха до температуры 500–550 °C (полукоксование (швелевание)), а также до 950–1 050 °C (коксование); при этом образуются горючие газы, смола и обогащённый углеродом остаток (полукокс, кокс). Коксование, промышленный метод переработки природных топлив (главным образом каменного угля) путём нагревания до 950–1 050 °C без доступа воздуха. Основной продукт коксования – Кокс. Коксование возникло в XVIII веке, когда истребление лесов для получения древесного угля, первоначально шедшего на выплавку чугуна, стало угрожающим и потребовалось заменить этот уголь минеральным топливом. В 1735 в Великобритании была проведена первая доменная плавка на коксе. Кокс выжигался в кучах, подобно тому как до этого выжигался древесный уголь. В конце XVIII века было освоено коксование в полузакрытых, а с 1830 – в закрытых камерах, причём выделяющиеся летучие продукты сжигались. С 1870-х начинают использовать летучие продукты; совершенствуются методы обогрева печей для коксования. К началу XX века процесс коксования оформился в современном виде, и в дальнейшем происходило лишь его совершенствование. Коксование углей протекает в несколько стадий. При нагревании до 250 °C из угля испаряется влага и выделяются продукты разложения – CO и CO_2. Затем (300 °C) выделяется небольшое количество лёгкой смолы и образующейся при расщеплении кислородных соединений, входящих в состав угля, так называемой Пирогенетической Влаги. Приблизительно при 350 °C уголь размягчается, переходя в тестообразное, пластическое состояние. В расплаве происходит интенсивное разложение угля с выделением так называемых Первичных Продуктов (Первичного Газа и Первичного Дегтя), имеющих сложный состав. Тяжёлые углеродистые остатки от разложения угля спекаются при температуре около 500 °C, образуется твёрдый пористый продукт – Полукокс (смотрите Полукоксование). При дальнейшем нагревании полукокс теряет остаточные летучие вещества, главным образом водород, и претерпевает усадку, вызывающую его растрескивание. Выше 700 °C полукокс полностью превращается в кокс. Первичные же продукты разложения, соприкасаясь с раскалёнными стенками и сводом печи, а также с коксом, подвергаются пиролизу и превращаются во Вторичные Продукты. В составе газа преобладающим становится H_2 (50% по объёму) и CH_4 (25% по объёму), органические продукты ароматизируются. Вторичные продукты улавливаются и используются как ценное сырьё для химической промышленности (смотрите Коксохимия). В коксовой печи коксование протекает послойно, причём температура слоёв снижается от нагретых (выше 1 000 °C) стенок печи к середине загрузки. Соответственно этому и состав слоёв (начиная от стенок) меняется в последовательности кокс – полукокс – уголь в пластическом состоянии – сухой уголь – сырой уголь. Коксование считается законченным, когда все увеличивающиеся по толщине слои кокса сойдутся в середине печи. К концу коксования вследствие усадки образовавшийся ‘Коксовый Пирог’ оказывается разделённым пополам швом-разрывом, идущим параллельно стенкам камеры, а каждая половина ‘Пирога’ – расчленённой на более или менее крупные куски трещинами, проходящими перпендикулярно стенке. Коксование длится 13–18 часов (ч). Готовый кокс выдаётся из печи коксовыталкивателем и поступает в тушильный вагон, где раскалённый кокс охлаждают (тушат) водой или инертным газом (‘мокрым’ или ‘сухим’ способом). Техника коксования непрерывно совершенствуется:- увеличивается размер камер печи и механизируется их обслуживание; вводится загрузка печей высушенной и подогретой (до 200 °C) шихтой. Разрабатываются и принципиально новые, непрерывные методы коксования, основанные на формовании в потоке брикетов из угля, переведённого в пластическое состояние, и последующей прокалке брикетов.

COLA = COST OF LIVING ADJUSTMENT

COLBERTISM = КОЛЬБЕРТИЗМ – Colbertism is an economic and political doctrine of the XVII century, created by Jean-Baptiste Colbert, the French minister of finance under Louis XIV. Colbertism is a variant of mercantilism and is more a collection of economical practices than a true current of economic thought. Colbert’s central principle was that the wealth and the economy of France should serve the state. Drawing on the ideas of mercantilism, he believed state intervention was needed to secure the largest part of limited resources. To accumulate gold, a country always had to sell more goods abroad than it bought. Colbert sought to build a French economy that sold abroad and bought. The idea of mercantilism was first described by the French finance minister, Jean-Baptiste Colbert. Colbert’s idea was a ‘favorable balance of trade’ in which goods were exported for gold, versus an ‘unfavorable balance of trade’ in which gold would flow out of the country. Colbert also intended to get rid of internal tariffs, and to tax the nobility, but failed.

Name given to the mercantilist policies of Jean-Baptiste Colbert (1619–1683), France's minister of finance under Louis XIV. See also Mercantilism. / Название, данное меркантилистическим политикам Жана Баптиста Кольбера (Jean-Baptiste Colbert; 1619–1683), генерального контролёра (министра) финансов Франции с 1665 при Луи XIV. Он проводил политику, ставшую одной из разновидностей меркантилизма, заключавшуюся в создании крупных мануфактур, увеличении вывоза и сокращении ввоза промышленной продукции с целью повышения роста государственных доходов. Смотрите также Меркантилизм (Mercantilism).

COLD CHAIN = ЦЕПОЧКА ХОЛОДА – Cold Chain is the unbroken chain from manufacture through to the consumer in which the prescribed cooling temperature is constantly maintained.

COLD CRANKING SIMULATOR = УСТРОЙСТВО, МОДЕЛИРУЮЩЕЕ ХОЛОДНЫЙ ЗАПУСК (или ИМИТАТОР ХОЛОДНОГО ЗАПУСКА) – Cold Cranking Simulator is an intermediate shear rate viscometer that predicts the ability of an oil to permit a satisfactory cranking speed to be developed in a cold engine.

COLDCUT = XX – Coldcut (Label):- processing can be employed only when using coated fabrics that will naturally resist fray. It is used only for printed large format poster labels as it allows very large scale labels to be processed.

COLD–INDUCED BLOWING = ВЗДУТИЕ ВСЛЕДСТВИЕ ВОЗДЕЙСТВИЯ ХОЛОДОМ – Cold-Induced Blowing is a bulging on cans caused by the canned product increasing in volume when the temperature falls below freezing point. / Припухлость (вздутие) банок, вызванное .

COLD ROLLED STEELS = ХОЛОДНОКАТАНЫЕ СТАЛИ – Cold Finished Steels are just that:- the final rolling is done when the steel is cold (room temperature), the whole operation bathed in oil, so the finished product is unoxidized, the grey of the actual steel, and as smooth as the rollers that do the processing. Cold Rolled Steels provide excellent press formability, surface finish, and thickness and flatness tolerances. Steel companies manufacture three groups of low- or ultra-low-carbon grades to meet a variety of customer formability requirements:- CS Type B, DS Type B, EDDS, and EDDS+. They also produce HSLA steels and structural steel grades for those applications that require specified strength levels. Cold rolled steels can also be specified as dent resistant or bake hardenable for applications that require dent resistance after forming and painting. Each grade can be processed with several surface finishes depending on customer requirements. Lubricants can be applied to enhance formability and to avoid at-press lubrication. Cold rolled steels have the following features:- (i) Excellent Surface Appearance:- cold rolled steels have manufacturing controls in place assuring consistent surface quality to satisfy customer requirements; (ii) Formability:- cold Rolled Steels can be used to produce parts containing simple bends to parts with extreme deep drawing requirements; (iii) Paintability:- due to stringent surface roughness controls, Cold Rolled Steels are readily paintable using essentially any paint system; and (iv) Weldability:- cold rolled steels can be joined using virtually any accepted welding practice. Standard grades for cold rolled steels are:- (i) Commercial Steel (CS Type B):- may be moderately formed; a specimen cut in any direction can be bent flat on itself without cracking; (ii) Drawing Steel (DS Type B):- DS Type B is made by adding aluminum to the mol steel and may be used in drawing applications; (iii) Extra Deep Drawing Steel (EDDS):- Interstitial Free (I-F) steels are made Drawing Steel by adding titanium and/or niobium to the molten steel after vacuum degassing and offer excellent drawability; and (iv) Extra Deep Drawing Steel Plus (EDDS+):- Interstitial Free (I-F) steels are made by adding titanium and/or niobium to the molten steel after vacuum degassing and offer excellent drawability. Surface Finish:- cold rolled steels are manufactured with a matte finish obtained by rolling with specially roughened rolls on the cold mill and the temper mill. This finish helps to maintain effective lubrication during metal forming and improves the appearance of painted surfaces. Non-standard matte finishes can be provided that optimize the opposing effects of surface roughness on painted part appearance and lubrication during press forming. Surface Protection and Lubrication:- to prevent rusting in transit and storage, cold rolled steels can be supplied with a rust protective oil film or press forming lubricants. A pre-applied press forming lubricant provides uniform lubrication and eliminates the housekeeping problems. A dry film (acrylic/polymer) lubricant can also be supplied by further processing the cold rolled product through a coil coating facility. These specialty organic coatings are easily removed with a mild alkaline cleaner. Formability and Mechanical Properties:- the formability of all steel products is a result of the interaction of many variables, the main ones being the mechanical properties of the steel, the forming system (tooling) used to manufacture parts, and the lubrication used during forming. Tight control over chemical composition, hot rolling parameters, amount of cold reduction, annealing time and temperature, and the amount of temper rolling allow the production of high-quality cold rolled steel products to meet customers requirements. Commercial Steel (CS Type B) should be used for moderate forming or bending applications. CS Type B products are produced from aluminum-killed continuously cast slabs and, unless otherwise specified, have a carbon content of less than 0.15%. To prevent the occurrence of fluting or stretcher strains during forming, CS products are tempered as a normal step in the mill processing. For more severe forming applications, Drawing Steel Type B (DS Type B) should be used. DS Type B has a controlled carbon content (< 0.06%) and is produced in such a manner that parts formed from DS Type B Steel should not exhibit stretcher strain. Extra Deep Drawing Steel (EDDS) or Extra Deep Drawing Steel plus (EDDS+) should be used for the most demanding forming applications. These steels (also known as Interstitial Free or I-F Steels) are produced from a vacuum degassed, titanium stabilized grade. EDDS and EDDS+ have the lowest carbon content available (< 0.010%) and have been specially formulated to be most ductile products. For high strength or structural applications, cold rolled steels are also available in yield strengths up to 50 ksi (345 MPa). (ksi is one thousand psi (pounds-force per square inch)). Paintability:- cold rolled steels can be easily painted using a variety of paint systems provided proper care is taken in preparing the material. Prior to painting, the surface should be carefully cleaned with either a solvent or alkaline cleaner. Cleaning should be followed by a pre-treatment prior to painting. Zinc or iron phosphates give good results on cold rolled steels. Mild abrasion prior to pre-treating may also be used to enhance mechanical bonding of the paint. Cold rolled steels can be in general supplied as pre-painted or pre-primed. / прокатка (rolling). волочение или протяжка или раскатка или вытяжка (drawing). Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

COLD–ROLLED STRIPS = ХОЛОДНОКАТАНЫЕ ШТРИПСЫ – Cold-Rolled Strips are flat cold-rolled products in widths of up to 650 mm and thicknesses of 0.1–6 mm. Can be made from any type of steel and is available with any required surface treatment. Cold-rolled strips are available in the form of rings or strips (bars). The advantage of cold-rolled strips and sheets over hot-rolled and cold re-rolled sheets is the greater degree of accuracy of dimensions. / или штрипсов (прутков (bars)). Под Штрипсами, от Английского слова Strip, означающее Полоса, понимаются стальные полосы, используемые в качестве заготовки для производства сварных труб.

COLD–SETTING ADHESIVE = ЗАТВЕРДЕВАЮЩЕЕ НА ХОЛОДЕ СВЯЗУЮЩЕЕ – Cold-Setting Adhesive is an adhesive that sets at temperatures below 20 °C (68 °F). Most of the adhesives used in bookbinding fall into this category. Cold-Setting Adhesive is a synthetic resin that can harden at normal room temperature without the addition of a hardener. / .

COLD TOLERANCE = ХОЛОДОСТОЙКОСТЬ – Cold Tolerance is an ability of a plant to grow and develop normally under cold conditions. Tolerance for low temperature in a plant.

CO–LEAD MANAGER = СОВЕДУЩИЙ УПРАВЛЯЮЩИЙ – Co-Lead Manager is a term used to indicate a bank that jointly underwrites an issue. The individual banks assume at least some of the function of the lead manager.

COLEOPTILE = КОЛЕОПТИЛЬ – Coleoptile is the cylinder-like, protective membrane of certain species that protects the plumule as it emerges through the soil. The coleoptile is photoperiod-sensitive and stops growth when exposed to light, allowing the plumule to break through and continue growth. Coleoptile (syn. Sheathing Leaf, and First Leaf):- the cylinder-like, protective covering that encloses the young plumule. It persists only for a short time after germination. / Под Колеоптилем, от Греческих слов Koleós, означающее Ножны, и Ptilon, означающее Перо, понимается первый после семядоли лист злаков. Бесцветный, зелёный или красноватый плёнчатый колпачок; защищает почечку при прорастании; на поверхности разрывается и пропускает растущее ‘пёрышко’ (первый зелёный лист) и следующие листья.

COLEORHIZA = КОЛЕОРИЗА (или КОРНЕВОЕ ВЛАГАЛИЩЕ) – Coleorhiza is a transitory membrane or sheath covering the emerging radicle (root apex) in some species. It serves the same function for the root as the coleoptile does for the plumule. Coleorhiza is the sheath covering the radicle. / (корневой апекс или корневая верхушка) у некоторых видов. Под Колеоризой, от Греческих слов Koleós, означающее Ножны, и Rhiza, означающее Корень, понимается корневое влагалище, окружающее в виде чехла первичный корень зародыша (в семени растения). Характерна для злаков, имеется у Эвкалиптов. Основная функция – разрыв покровов зерновки при набухании и первичное всасывание питательных веществ.

COLIFORM = КОЛИФОРМ (или КИШЕЧНОЙ ФОРМЫ) – Coliform is a general term for a group of bacteria. It has special significance in public health because they inhabit the intestinal tract of humans and animals.

COLLAPSE = КОЛЛАПС (или РАЗРУШЕНИЕ, или СПЛЮЩИВАНИЕ, или СЛИПАНИЕ) – Collapse is an inward structural failure of a filter element which can occur due to abnormally high pressure drop (differential pressure) or resistance to flow. / Слипание полимера. Под Коллапсом, от Латинского слова Collapsus, означающее Упавший, понимается острая сосудистая недостаточность, сопровождающаяся падением кровяного давления в артериях и венах. Коллапс Гравитационный (в астрономии), катастрофически быстрое сжатие звезды под действием сил тяготения (гравитации).

COLLAPSE PRESSURE = ДАВЛЕНИЕ РАЗРУШЕНИЯ (или ДАВЛЕНИЕ СЛИПАНИЯ) – Collapse Pressure:- the minimum differential pressure that an element is designed to withstand without permanent deformation.

COLLAPSE YARN = ОСЛАБЛЯЕМАЯ (или СПЛЮЩЕННАЯ) ПРЯЖА – Collapse Yarn is (usually) an over spun single, dried under tension (see also Blocking) that is then knit or woven. When the item is moistened, the yarn returns to its original elastic state. See also Balanced Yarn.

COLLAPSIBLE BOX PALLET = СКЛАДНОЙ ЯЩИЧНЫЙ ПОДДОН – Collapsible Box Pallet is a box pallet with sides hinged to the deck. / Складной Ящичный Поддон – ящичный поддон со сплошными, решетчатыми или сетчатыми складными стенками.

COLLAPSIBLE CAGE PALLET = СКЛАДНОЙ КЛЕТЬЕВОЙ ПОДДОН (или СКЛАДНОЙ СЕТЧАТЫЙ ПОДДОН) – Collapsible Cage Pallet is a cage pallet with sides hinged to the deck.

COLLAPSIBLE CONTAINER = СКЛАДНОЙ КОНТЕЙНЕР – Collapsible Container is a container which can be easily folded, disassembled and reassembled. / Под Складным Контейнером понимается контейнер, который может быть легко сложен, разобран и снова собран.

COLLAPSIBLE FLAT RACK = СКЛАДНАЯ ПЛОСКАЯ ПОДСТАВКА (или ПЛАТФОРМА СО СКЛАДНЫМИ ТОРЦАМИ) – Collapsible Flat Rack is a specialised flat rack on which either/both ends can collapse to accommodate odd-sized cargo (® Flat Rack). Flat with end walls that can be folded in when empty. The end walls are unlocked and folded down onto the loading area. In this state, the flats can be stacked. Three of the ‘folded’ flats take up about the same space as a standard container. / Под Платформой понимается грузовой вагон открытого типа с небольшими бортами; с расширением специализации вагонов применяются платформы для большегрузных контейнеров, двухъярусные платформы для перевозки легковых автомобилей и другие.

COLLAPSIBLE POST PALLET = СТОЕЧНЫЙ СКЛАДНОЙ ПОДДОН – Collapsible Post Pallet is a post pallet with posts hinged to the deck. / Стоечный Складной Поддон – стоечный поддон со складными стойками.

COLLAR = ВОРОТНИК (или ШЕЙКА, или ГОРЛОВОЙ ПОДШИПНИК, или ВОРОТНИЧОК, или ХОМУТ, или ЧЕКА, или ЗАКРЕПА) – (1) Collar:- two or more thicknesses of fabric attached to the neckhole opening to provide a firm and neat-appearing finish.

(2) Collar (Banded):- the visible or panel portion of the collar is cut separately and attached to the neckband portion. This is normal dress shirt construction.

(3) Collar (Convertible):- the panel or visible portion of the collar and the neckband portion are cut as one piece, but folded once along the length to produce the appearance of a banded collar.

(4) Collar (Lined):- a collar made by placing a piece of interlining between the two pieces of body fabric.

(5) Collar (One Piece):- a collar constructed from a single piece of fabric with the center fold forming the outer edge.

(6) Collar (Padding):- attaching the under-collar to canvas with several rows of blindstitching.

(7) Collar (Sandwich):- a collar which has the top-collar inserted between the canvas and the under-collar.

(8) Collar (Topstitched):- a collar with an added row of stitching along the folded edges. / втачивание (stitching).

(9) Collar (two-piece):- a collar formed by joining two identical pieces, inverting and sometimes topstitching along the folded edges.

(10) Collar is a band, strip, or chain worn around the neck; a short necklace; clerical collar.

COLLAR = ЗАФИКСИРОВАННЫЙ ДИАПАЗОН КОЛЕБАНИЙ (или ОПЦИОН НА УДЕРЖИВАНИЕ В ПРЕДЕЛАХ, или ОПЦИОН НА ВЕРХНИЙ И НИЖНИЙ ПРЕДЕЛЫ, или ОПЦИОН НА ЗАФИКСИРОВАННЫЙ ДИАПАЗОН КОЛЕБАНИЙ) – For over-the-counter markets, Collars provide price protection by limiting extreme market movements, forcing price to move within a defined range. Costless collars are partially ‘paid for’ by giving up a portion of a favorable price change. No cash premium is involved for costless or fair priced collars. Collars offer floor protection on commodity sales prices. In exchange, one has to give up some potential to benefit from favorable price moves by selling a cap. If asset prices move within the specified collar or range of commodity prices, one will sell the commodity at prevailing market prices and no payments are made. However, if the asset price falls below the collars’ lower limit, the one will be reimbursed for the shortfall. Correspondingly, if the asset price for the commodity exceeds the collars’ upper limit or if it falls below the collar’s lower limit, then one must pay the difference. In many ways, collars are similar to

swaps, but the former allows for greater flexibility through some market responsiveness. Collar is a compound option position consisting of a put and a call option in order to establish a fixed floor and ceiling. Also known as Fence, Min-Max, and Window. Collar is:- (1) a protective options strategy that is implemented after a long position in a stock has experienced substantial gains. It is created by purchasing an out of the money put option while simultaneously writing an out of the money call option. Also known as Hedge Wrapper. The purchase of an out-of-the money put option is what protects the underlying shares from a large downward move and locks in the profit. The price paid to buy the puts is lowered by amount of premium that is collect by selling the out of the money call. The ultimate goal of this position is that the underlying stock continues to rise until the written strike is reached. (2) A general restriction on market activities. An example is a circuit breaker which is meant to prevent extreme losses (or gains) once an index reaches a certain level. Collars can protect you against massive losses, but they also prevent massive gains. A Collar is a combination of a long (short) cap and short (long) floor, struck at different rates. Collar is a combination of the purchase of a cap and the sale of a floor or vice versa. The aim of this strategy is to reduce the premium for the purchased option by the premium for the sold option. If, for example, a borrower wants to hedge the floating interest rate to be paid on a loan by purchsing a cap, the premium payable can be reduced by selling a floor. The disadvantage of this strategy is that the borrower does not profit fully from falling interest rates. Collar is a supply contract between a buyer and seller of a commodity, whereby the buyer is assured that he will not have to pay more than some maximum price, and whereby the seller is assured of receiving some minimum price. This is analogous to an option fence. Also known as Range Forward. Collar:- the simultaneous purchase of an out-of-the-money call and sale of an out-of-the-money put (or cap and floor in the case of interest rate options). The premium from selling the put reduces the cost of purchasing the call. The amount saved depends on the strike rate of the two options. If the premium raised by the sale of the put exactly matches the cost of the call, the strategy is known as a Zero Cost Collar. When used to hedge an outright position in the underlying, this locks the hedger into a range of values; this hedging strategy is known as a Cylinder. Simultaneous purchase of a Cap and a Floor. Collar is a term used to describe an options strategy in which both Call Options and Put Options are used to put a ‘collar’ around an investment position. For example, by simultaneously writing near-the-money calls and buying near-the-money puts, one can lock in a share price range (until the options expire) regardless of the market’s vagaries. Collar is a lower limit. For example on a benefit, a contribution, benefit growth or a funding level. / одновременное приобретение убыточного опциона на покупку и продажа убыточного опциона на продажу (или cap и floor как в случае с опционом на процентную ставку). Премия от продажи опциона на продажу снижает стоимость приобретения опциона на покупку. Вырученная в виде разницы сумма зависит от сходных цен этих двух опционов. . ; эта стратегия хэдьжирования называется Цилиндр (Cylinder).

COLLAR = КОЛЬЕРЕТКА – Collar (label) – a removable identification collar for baby bottles. The collar has a planar portion having a wall defining a hole therethrough. The collar is placed over the neck of a bottle with the neck passing through the hole and the collar is maintained on the bottle by a standard nipple cap. The collar has a flange connected to the planar portion whereby a portion thereof is adapted to receive a gummed label. A raised ridge conforming closely to the periphery of a gummed label is provided to prevent infants from readily removing the label. A Wine Collar is a wine accessory that fits around the neck of a wine bottle. When in place it absorbs any drip that may run down the bottle after pouring. This is beneficial for preventing stains to surfaces that the bottle comes in contact with such as table cloths or counter tops. Wine collars are also called Drip Rings or Drip Collars. There are two branded wine collars one called a Drip Dickey, and the other called a ‘Winewoggle’ both are registered trademarks with the US Patent and Trademark Office. Designs for this simple accessory have varied for over a hundred years. In 1872, W.R. Miller was issued a patent for a ‘drip cup’, which formed a circular gutter that would catch the fluid. The most recognized wine collar today is typically a plastic or silver ring with an interior lining of red or black felt. When slipped over the neck of the bottle the felt absorbs the drip. / Кольеретки – этикетки особой формы, наклеиваемые на горлышко бутылок. Кольеретки не несут большой информационной нагрузки, а выполняют в основном назначение эстетического оформления бутылок; они применяются вместе с основной этикеткой на бутылках для алкогольных, безалкогольных напитков и пива, самостоятельного значения не имеют. На кольеретке могут быть указаны наименование напитка, изготовитель, год изготовления или информационные знаки. Иногда на кольеретках вообще отсутствует информация. Под Кольереткой, от Французского слова Collerette, означающее Воротничок, понимается дополнительная этикетка, наклеиваемая не на цилиндрическую основную часть бутылок, а на их горлышко или, вернее, ‘плечики’ и содержащая какое-либо уточнение или пояснение относительно качества напитка (вина, водки, коньяка, ликёра и так далее), например, ‘Выдержанный’, ‘Марочное’, ‘Экстра’ и тому подобное. Наличие кольеретки уже само по себе свидетельствует о более высоком классе продукта, ибо таких наклеек нет на ординарных напитках. На вывозных (или экспортных) товарах всегда есть кольеретки, содержащие дополнительную рекламную информацию. В то же время безалкогольные напитки и пиво иногда снабжаются только одними кольеретками, без основной этикетки:- так поступают с серийными фруктовыми водами, приготовленными на эссенциях, где достаточно одного лишь наименования:- ‘Апельсиновая’, ‘Яблочная’, ‘Грушевая’ и так далее, что означает одновременно и название напитка, и основную эссенцию, идущую на его производство. То же самое относится и ко всем категориям светлого пива, выпускаемого по единой технологии. На кольеретках в таких случаях пишут:- ‘Жигулевское’ (Москва), ‘Жигулевское’ (Петербург), ‘Рижское’ (Рига), ‘Рижское’ (Таллинн), ‘Рижское’ (Москва), то есть обозначается лишь сорт и место производства, без указания на сам продукт, поскольку кольеретка серийных, массовых, ординарных напитков не обязана включать всю ту информацию, которая присуща основным этикеткам.

COLLAR = СЪЁМНЫЙ БОРТИК – Collar is a collapsible wooden container or bin which transforms a pallet into a box. Collar is a collapsible wooden container or bin which transforms a pallet into a box. Collar is a detachable frame with solid, slatted or mesh sides which may be fitted to a pallet or to another collar to retain the load. Note:- collars can be rigid, collapsible or completely foldable. / Складной деревянный контейнер или ларь, который превращает поддон в ящик. Съёмный Бортик (Collar):- съёмная рама со сплошными, решетчатыми или сетчатыми стенками, которую можно крепить к поддону или другому бортику для удержания груза. Примечание:- съёмный бортик может быть жёстким, частично или полностью складным.

COLLAR = ШЕЙКА (или ВОРОТНИЧОК, или ХОМУТ) – Collar (syn. Junctura, Neck, Leaf Cushion) is the joint between the leaf sheath and blade. The collar usually differs in color from the leaf sheath and blade. Collar is the joint between the leaf sheath and leaf blade.

COLLAR TRANSACTION = ТРАНЗАКЦИЯ С ИСПОЛЬЗОВАНИЕМ ОПЦИОНА НА ЗАФИКСИРОВАННЫЙ ДИАПАЗОН КОЛЕБАНИЙ (или ТРАНЗАКЦИЯ С ОПЦИОНОМ НА ВЕРХНИЙ И НИЖНИЙ ПРЕДЕЛЫ) – Collar Transaction:- a collar is a combination of a cap and a floor where one party is the floating rate or floating commodity price payer on the cap and the other party is the floating rate or floating commodity price payer on the floor. Collar Transactions:- you can use a collar to rein in profits you haven’t yet realized, but you might have to give up future gains in return. A collar is a spread strategy designed to protect unrealized profits on stock you already own. You purchase a protective put on your long stock position, and offset the cost of that put by writing a call that is covered by your long stock position. The collar spread is also known as a Fence for the protection it provides. In most cases, both the long put and the short call are out-of-the-money. If the call you write is less expensive than the put you buy, you’ll pay more premium than you receive, and will establish a debit collar. If the put you buy is less expensive than the call you write, you’ll receive more

premium than you pay, and will establish a credit collar. Investor Objectives:- a collar is most often used as a protective strategy. If you hold a stock that has made significant gains, you might want to lock in those gains, protecting your position against a future drop in price. Writing a covered call can fully or partially offset the cost of purchasing a protective put. Just as with other spread strategies, the risk you face with a collar is limited – and, in return, so is the potential profit. For example, say you purchased 100 shares of LMN Corporation at USD15 two years ago, and its current market price is USD30. (1) 100 Shares x USD15 Per Share = USD1 500 Original Cost. If you purchase a 25 put, you'll have the right to sell those shares at USD25 before expiration, locking in a USD10 profit on each share, or a total of USD1 000. Suppose that put costs you USD275, or USD2.75 per share. Let's say you also write a 35 call with the same expiration month, and receive USD250 in premium, or USD2.50 per share. (2) USD275 Put Price Paid – USD250 Call Price Received = USD25 Net Cost. Rule of Thumb:- call and put options move in opposition. Call options usually rise in value as the underlying market prices go up. Put options usually rise in value as the market prices go down – but time decay and a change in volatility also have an effect. If the price of LMN rises above USD35 at expiration, your call most likely will be exercised. You'll receive USD3 500 for your shares, or a USD2 000 profit, but you'll miss out on any further gains the stock may have. Since the put you purchased cost more than the call you wrote, your net cost is USD25 – less than one tenth of the price of the protective put alone. It would cost you only USD25 to ensure that you could sell at a minimum profit of USD10 per share, or USD1 000 per contract. In most cases, a collar works best if you have a neutral to bearish market forecast for a stock that has behaved bullishly in the past, leaving you with unrealized gains you'd like to protect. Some investors use collars as income-producing strategies by selling them for a credit. While that approach can be profitable, it also requires time and attention to manage the strategy. Your Options At Expiration:- when executing a collar, it's important to define your range of return, or the strike prices for both the put you purchase and the call you write. The strike price of the protective put should be high enough to lock in most of your unrealized profit. The strike price of the covered call should be high enough to allow you to participate in some upward price movement, but not so far out-of-the-money that the premium you receive does little to offset the cost of your protective put. Depending on the direction the stock moves, your choices at expiration of the legs of your collar vary:- (i) If The Price Of The Stock Rises Above The Strike Price Of The Short Call:- if assigned, you can fulfill your short call obligation and sell your shares at the strike price. You'll lock in profits over what you initially paid for the stock, but you'll miss out on any gains above the strike price. Alternately, you could close out your position by purchasing the same call you sold, quite possibly at a higher price than what you paid for it. This may be worth it if the difference in premiums is less than the additional profit you anticipate you'll realize from gains in the stock's value, or if one of your goals is to retain the stock. (ii) If The Price Of The Stock Remains Between Both Strikes:- you can let your put expire unexercised, or sell it back, most likely for less than what you paid, since its premium will have decreased from time decay. Your short call will probably expire unexercised, which means you keep the entire premium. Depending on whether your collar was a credit or debit spread, you'll retain your initial credit as a profit, or debit as a loss. (iii) If The Price Of The Stock Falls Below The Strike Price Of The Long Put:- by exercising your put, you can sell your shares at the strike price. Your short call will probably expire unexercised, and you keep all of the proceeds from the sale of the call. Commissions and Fees:- as with stock transactions, options trades incur commissions and fees charged by your brokerage firm to cover the cost of executing a trade. You'll pay fees when opening a position as well as when exiting. The amount of these charges varies from brokerage firm to brokerage firm, so you should check with yours before executing any transaction. Be sure to account for fees when calculating the potential profit and loss you face. You should also keep in mind that spread transactions that require two legs mean you may face double commissions at entry. And it also helps to consider that any strategy that ends with an unexercised option, such as a covered call, means – if you're not assigned – you won't pay any commissions or fees at exit.

COLLATED NAIL = XX (или СКРЕПЛЁННЫЙ ГВОЗДЬ) – Collated Nail is a nail in a loose reel held temporarily together by connecting wires or strips in order to feed automatic pneumatic or electric nailing tools. See also Pallet. / Скреплённый Гвоздь (Collated Nail):- гвоздь, временно свободно удерживаемый с помощью проволоки или ленты, для подачи в автоматические, пневматические или электрические гвоздезабивные инструменты. Смотрите также Поддон (Pallet).

COLLATERAL = ОБЕСПЕЧЕНИЕ (или ЗАЛОГ) – Collateral is a property that is offered to secure a loan or other credit and that becomes subject to seizure on default. Also known as Security. An asset or third-party commitment that is accepted by the lender to secure an obligation of the borrower. Collateral is an asset, also known as Security, pledged to a lender to reduce the risk of a loan. Collateral usually refers to real estate, motor vehicles, caravans or cash like deposits. Collateral is not required for unsecured credit facilities. Security for a credit or other liability, usually in the form of something readily convertible into cash, e.g., bonds, goods, shares, etc. Collateral is an asset that is delivered by the collateral provider to secure an obligation to the collateral taker. Collateral arrangements may take different legal forms; collateral may be obtained using the method of title transfer or pledge. Typically, government securities and cash are used as collateral in the context of over-the-counter (OTC) derivatives transactions. See also Pledge, and Title Transfer. Securities or other property or title to property pledged by a borrower and deposited with a creditor as security for a debt. Collateral:- assets pledged (e.g., by credit institutions with central banks) as a guarantee for the repayment of loans, as well as assets sold (e.g., to central banks by credit institutions) under repurchase agreements. / Ценные бумаги или иное имущество или права владения и пользования на имущество, заложенные заёмщиком и размещённые у кредитора в качестве обеспечения долгового обязательства. , например, . В Гражданском Праве под Залогом понимается способ обеспечения исполнения обязательств, состоящий в передаче должником кредитору денег или иной имущественной ценности, из стоимости которой кредитор имеет преимущественное право удовлетворить своё требование при неисполнении должником обязательства. Смотрите также Заклад (Pledge). В Гражданском Праве под Обеспечением исполнения обязательства понимаются меры имущественного характера, побуждающие стороны к точному и реальному исполнению обязательств. Таковым могут служить:- гарантия, задаток, залог, неустойка (пеня, штраф), поручительство и тому подобное. Под Залогом понимается способ обеспечения обязательства, при котором кредитор (залогодержатель) приобретает право в случае неисполнения должником (залогодателем) обязательства получить удовлетворение за счёт заложенного имущества (вещи) преимущественно перед другими кредиторами за изъятиями, предусмотренными законом. Залог – имущество или другие ценности, находящиеся в собственности залогодателя и служащие частичным или полным обеспечением, гарантирующим погашение займа. Один из способов, реализующих исполнение залогодателем (должником) принятых на себя обязательств. Залогодержатель (кредитор) имеет право в случае невозврата долга получить компенсацию за счет заложенного имущества. Предмет залога может быть передан залогодержателю в физической форме или в форме документально зафиксированного права на его получение в виде залогового обязательства.

COLLATERAL BILL = ОБЕСПЕЧЕННЫЙ ВЕКСЕЛЬ – A Collateral Bill or Collateral Note is an instrument whose payment is secured by a pledge of collateral. Enables summary bill enforcement procedure in the case of non-performance by the debtor. Usually issued as a promissory note. / Обеспеченный Вексель или Обеспеченная Нота – это финансовый инструмент, оплата по которому гарантируется залогом обеспечения. Он позволяет упростить процедуру принудительных действий по векселю в случае неисполнения должником своих обязательств. Обычно используется как простой вексель.

COLLATERAL BOND = ОБЛИГАЦИЯ С ОБЕСПЕЧЕНИЕМ (или ОБЕСПЕЧЕННАЯ ОБЛИГАЦИЯ) – Collateral Bond:- bonds which are secured by collateral (security), such as the pledging of mortgages (collateral mortgage bonds). / Облигации, которые гарантированы обеспечением (залогом), таким как закладывание закладных (облигации с ипотечным обеспечением).

COLLATERALIZED DEBT OBLIGATION = ОБЕСПЕЧЕННОЕ ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО – Collateralized Debt Obligation (CDO) is an investment-grade security backed by a pool of bonds, loans and other assets. CDOs do not specialize in one type of debt but are often non-mortgage loans or bonds. Similar in structure to a collateralized mortgage obligation (CMO) or collateralized bond obligation (CBO), CDOs are unique in that they represent different types of debt and credit risk. In the case of CDOs, these different types of debt are often referred to as 'Tranches' or 'Slices'. Each slice has a different maturity and risk associated with it. The higher the risk, the more the CDO pays. Collateralized Debt Obligation (CDO) is a debt security collateralized by a variety of debt obligations including bonds and loans of different maturities and credit quality.

COLLATERALIZED LOAN = ОБЕСПЕЧЕННАЯ ССУДА (или ССУДА, ОБЕСПЕЧЕННАЯ ЗАЛОГОМ) – A Collateralized Loan or Collateral Loan is a loan secured by some asset you own. You promise to hand the asset over to the lender if you cannot repay the loan as agreed. By using a collateral loan, the lender takes less risk, and it may be easier for you to get funding. Make sure you know the essentials of collateral loans before you use one. Overview of Collateral Loans:- collateral loans are used when the lender wants some assurance that they won't lose all their money. If you pledge an asset as collateral, they can take the asset, sell it, and get their money back. Contrast this with an unsecured loan, where all they can do is ding your credit or bring legal action against you. Assets for Collateral Loans:- when using a collateral loan, you give the bank the right to take your asset if you can't repay. What assets can you use? (i) Automobiles; (ii) real estate; (iii) cash accounts; (iv) investments; (v) insurance policies; (vi) valuables and collectibles; and (vii) future payments. If you're getting a business loan, you pledge assets as part of a personal guarantee. Collateral Loan Valuation:- in general, the lender will offer you less than the value of your pledged asset. Some assets might be heavily discounted. For example, a lender might only recognize 50% of your investment portfolio for a collateral loan. That way, they improve their chances of getting all their money back in case the investments lose value. If the assets lose value for any reason, you might have to pledge more assets to keep your collateral loan. Likewise, you may be responsible for the full amount of your collateral loan, even if the bank takes your assets and sells them for less than the amount you owe. Types of Collateral Loans:- you may find collateral loans in a variety of places. In some cases, you get a collateral loan as you buy the asset used for collateral. For example, in premium financed life insurance cases, the lender and insurer often work together to provide the policy and collateral loan at the same time. There are also some collateral loans for people with bad credit. These loans are often expensive and should only be used as a last resort. They go by a variety of names, such as:- (i) car title loans; (ii) auto title loans; (iii) cash title loans; (iv) loan for title programs; and (v) motor vehicle equity lines of credit. In the United States, Collateralized Loan is a line of credit from a bank secured by collateral in the form of inventory or securities belonging to the borrower. Also known as Lombard Loan in the United Kingdom. / В Соединённых Штатах Америки, кредитная линия, гарантированная обеспечением в форме инвентаря или ценных бумаг, принадлежащих заёмщику. Известна также как Ломбардная Ссуда (Lombard Loan) в Соединённом Королевстве.

COLLATERALIZED MORTGAGE OBLIGATION = ОБЯЗАТЕЛЬСТВО ПО ОБЕСПЕЧЕННОЙ ЗАКЛАДНОЙ (или ОБЕСПЕЧЕННОЕ ОБЯЗАТЕЛЬСТВО ПО ЗАКЛАДНОЙ) – Collateralized Mortgage Obligation (CMO) is a type of mortgage-backed security that creates separate pools of pass-through rates for different classes of bondholders with varying maturities, called Tranches. The repayments from the pool of pass-through securities are used to retire the bonds in the order specified by the bonds' prospectus. Here is an example how a very simple CMO works:- the investors in the CMO are divided up into three classes. They are called either Class A, B or C Investors. Each class differs in the order they receive principal payments, but receives interest payments as long as it is not completely paid off. Class A investors are paid out first with prepayments and repayments until they are paid off. Then class B investors are paid off, followed by class C investors. In a situation like this, class A investors bear most of the prepayment risk, while class C investors bear the least. The Collateralized Mortgage Obligation (CMO) has been a prime example of financial innovation in the secondary mortgage market. Innovations such as the CMO have contributed to housing finance stability and efficiency. The CMO structure has reduced average costs of mortgage financing relative to traditional pass-through securities, and has broadened the range of potential investors in mortgage securities. A collateralized mortgage obligation is a debt instrument collateralized by mortgage pass-through certificates (in which loan servicers pass mortgage interest, required principal, and excess principal payments to investors) or individual mortgage loans. The mortgage instruments serving as CMO collateral have generally been single-family Government National Mortgage Association (GNMA), Federal Home Loan Mortgage Corporation (FHLMC), or Federal National Mortgage Association (FNMA) pass-through securities. A CMO essentially combines the mortgage pass-through security with some of the positive features of a corporate bond. The major difference between a CMO and a traditional mortgage pass-through security is the mechanism by which interest and principal are paid to those who hold the securities. The traditional passthrough pays a pro rata share of interest and principal every month to each of its holders. Because of this pro rata distribution mechanism, the major drawback of traditional mortgage pass-through securities has been uncertain cash flows associated with unpredictable prepayments on the underlying mortgages. The CMO departs radically from the pro rata distribution mechanism of traditional pass-through securities. Payments on a CMO are broken into four component categories, commonly called 'Tranches'. The first three tranches all receive scheduled interest payments. The first tranche, however, receives all scheduled and unscheduled principal payments from the underlying mortgages, until the principal owed to the first class of investors is entirely repaid. After the principal to the first class of the CMO is repaid, principal payments from the underlying mortgages are allocated sequentially to retire the remaining classes. That is, the second tranche receives only interest until the principal owed to the first tranche is paid, and the third tranche receives only interest until the principal sums owed to the first and second tranches have been repaid. The fourth tranche is an 'accrual', or 'z', bond, which receives neither interest nor principal until principal to all previous tranches has been retired. The z-tranche is a zero coupon security, which permits effective maturities of the other tranches to be shorter. Money is available for the z-tranche because those who invest in shorter tranches receive a lower (short-term) rate of interest than that (long-term) which is paid by the borrowers, given an upward-sloping yield curve. The advantages of the CMO structure are clear. The CMO converts a long-term monthly payment instrument into a series of semi-annual payment, bond-like securities with short, intermediate, and long maturities. The multiple-maturity structure reduces the degree of uncertainty of cash flows for any particular maturity class, and provides the longer maturity classes with limited call protection (because shorter tranches absorb the initial securiburden of excess principal repayments). The theory of CMOs can be adapted from the commodity bundling literature, which discusses how firms sell their goods both in individual units and in packaged bundles, but typically at different prices per unit (individual event tickets vs. season tickets, or a la carte menus vs. dinner menus). In a similar fashion, long term mortgages can be construed as bundles of short-term cash flows and long-term cash flows. The unbundling feature of CMOs broadens the range of potential investors in mortgage securities. An important assumption in the theory of CMOs is that investors have different preferred maturities and, therefore, should be willing to pay different prices for securities of different expected maturities. Recent experience in the mortgage markets supports the validity of such an assumption. In fact, the CMO's entry into the mortgage markets has been very successful in attracting 'non-traditional' investors, such as insurance companies and pension funds, to mortgages. Such investors are attracted by the broader range of investment maturities made possible by the CMO structure.

For example, insurance companies purchase heavily in the 4–6 year life tranche. Pension funds have been active in the longer tranche sector. With clients having different maturity preferences, a profit-oriented bond issuer is able to choose between the bundling strategy (traditional mortgage-backed securities) and the unbundling strategy (CMOs). Given the extent of different maturity preferences on the part of its clients, each of these strategies presents the issuer with advantages and disadvantages, which relate to the term structure of interest rates. For analytical convenience, we view the CMO as the unbundling of a traditional mortgage-backed security into a short tranche cash flow and a long tranche cash flow. The market yield for a bundled bond can be expressed as a weighted average of the yields for the short-term and long-term tranches. Hence, the spread between the longterm and short-term interest rates plays an important role in the pricing of the CMO. The analysis in the paper by Dokko, Edelstein, and Rosen shows that as the spread between long-term and short-term interest rates (the so-called 'Steepness' of the term structure of interest rates) increases (decreases), the sum of the prices of the CMO's tranches is more (less) likely to exceed the price of the underlying bundled security. During the early 1980s, while the longterm interest rate declined, prepayment rates and prepayment risk increased. CMOs were developed in response to this kind of economic environment. As discussed above, the CMO structure provides long-tranche investors with limited call protection. Modern financial asset pricing theory suggests that the required risk premium for a security is determined by the degree of co-movement between the security's returns and variables that describe the state of the economy, such as inflation and GNP. (This so-called 'Systematic Risk' with respect to the economic environment is measured by the relationship between the security return and macroeconomic variables.) The cash flows for the CMO and the pass-through security are generated by the same underlying mortgage pool. Therefore, systematic risks of the CMO and the underlying bundled mortgagebacked security will be the same for all economic state variables, except for changes in the term structure of interest rates and mortgage prepayment rates. An analysis of actual CMO data has provided support for the theory. The study utilizes data on CMOs issued by Salomon Brothers and Norwest. The data are monthly observations from November 1983 through November 1985. The research examines statistically whether the steepness of the yield curve (measured by the spread between interest rates on long-term and short-term Treasury securities) and the risk of prepayment (measured by one month lagged actual prepayment rates) affect the spread between the weighted average yield on the CMO tranches and the yield on the underlying GNMA pass-through securities. Each 100 basis point increase in the steepness of the yield curve is found to provide a 14 basis point increase in the CMO's weighted yield relative to that earned on the GNMA pass-through. Similarly, an increase in the prepayment rate leads to a significant increase in the relative yield spread. These results demonstrate that a steeper yield curve and a greater prepayment risk enhance the value of the CMO security relative to the comparable GNMA pass-through. The CMO, a relatively new financial innovation, contributes substantial value to the secondary mortgage market and the housing finance system. The two major advantages of CMOs, relative to mortgage pass-through securities, are the ability to take advantage of a positively sloping yield curve and the ability to provide limited protection against mortgage prepayment risk. The Collateralized Mortgage Obligation (CMO) is a type of asset-backed security, in this case backed by mortgage payments. Typically, such securities provide a higher return than normal fixed-rate securities but purchasers suffer prepayment risk if mortgage holders redeem their mortgages. Because the right to redeem the mortgage is effectively an embedded call, such securities have negative convexity. In theory, the CMO requires a positively sloped yield curve. Yet many CMO issues have come to market in recent periods of flat or inverted yield curves. Yields on mortgage-backed securities (MBSs) rose, and spreads between regular MBSs and Treasuries widened, as thrifts liquidated MBSs from their portfolios. In fact, spreads would be even wider, if not for the success of derivative products (CMOs) in keeping spreads stable. Spread stability is due to arbitrage opportunities: the sum of the parts is worth more than the whole. Value is also affected by the CMO's stated average life. Average life's impact is seen in the PSA (short for the Public Securities Association) factor, which shows how quickly prepayments on the underlying mortgages occur. If the collateral is a pool of GNMA 12% loans, the CMO may be priced to reflect 325% PSA. If interest rates drop to 8%, prepayments may speed up to, perhaps, 450% PSA. The CMO matures more quickly than had been expected. Performance of a CMO also depends on the classes in the issue. For example, there may be a Planned Amortization Class (PAC), whose investors do not absorb any share of early principal repayments within a given PSA range. If there are changes in prepayments, these fluctuations affect the non-PAC classes, whose values may change greatly. PAC classes command a tighter spread to Treasuries than non-PAC classes, due to prepayment protection. The residual, a CMO's equity, also absorbs prepayments. The residual provides the dealer's profit on a CMO; no profit is realized until the residual is sold. Again, the keys are the collateral, classes, original interest rate and prepayment assumptions, and current interest and prepayment rates. / Казначейки (Treasuries).

COLLATERAL MANAGEMENT = УПРАВЛЕНИЕ ОБЕСПЕЧЕНИЕМ – Collateral has been used for hundreds of years to provide security against the possibility of payment default by the opposing party in a trade. Collateral Management began in the 1980s, with Bankers Trust and Salomon Brothers taking collateral against credit exposure. There were no legal standards, and most calculations were performed manually on spreadsheets. Collateralisation of derivatives exposures became widespread in the early 1990s. Standardisation began in 1994 via the first ISDA (short for the International Swaps and Derivatives Association) documentation. In the modern banking industry collateral is mostly used in over the counter (OTC) trades. However, collateral management has evolved rapidly in the last 15–20 years with increasing use of new technologies, competitive pressures in the institutional finance industry, and heightened counterparty risk from the wide use of derivatives, securitization of asset pools, and leverage. As a result, collateral management now is very complex process with interrelated functions involving multiple parties. Collateral Management is an administration of collateral provided for risk-bearing transactions. The Idea of Collateral Management:- the practice of putting up collateral in exchange for a loan has long been a part of the lending process between businesses. With more institutions seeking credit, as well as the introduction of newer forms of technology, the scope of collateral management has grown. Increased risks in the field of finance have inspired greater responsibility on the part of borrowers, and it is the aim of the collateral management to make sure the risks are as low as possible for the parties involved. Collateral management is the method of granting, verifying, and giving advice on collateral transactions in order to reduce credit risk in unsecured financial transactions. The fundamental idea of collateral management is very simple, that is cash or securities are passed from one counterparty to another as security for a credit exposure. In a swap transaction between parties A and B, party A makes a mark-to-market (MtM) profit whilst party B makes a corresponding MtM loss. Party B then presents some form of collateral to party A to mitigate the credit exposure that arises due to positive MtM. The form of collateral is agreed before initiation of the contract. Collateral agreements are often bilateral. Collateral has to be returned or posted in the opposite direction when exposure decreases. In the case of a positive MtM, an institution calls for collateral and in the case of a negative MtM they have to post collateral. Collateral management has many different functions. One of these functions is credit enhancement, in which a borrower is able to receive more affordable borrowing rates. Aspects of portfolio risk, risk management, capital adequacy, regulatory compliance and operational risk and asset-liability management are also included in many collateral management situations. A balance sheet technique is another commonly utilized facet of collateral management, which is used to maximize bank's resources, ensure asset liability coverage rules are honoured, and seek out further capital from lending excess assets. Several sub-categories such as collateral arbitrage, collateral outsourcing, tri-party repurchase agreements, and credit risk assessment are just a few of the functions addressed in collateral management. Parties Involved:- collateral management involves multiple parties:- (i) Collateral Management Team:- calculate collateral valuations, deliver and to receive collateral, maintain relevant data, handle margin calls, and to liaise with other parties in the collateral chain; (ii) Credit Analysis Team:- sets and approves collateral

requirements for new and existing counterparties; (iii) Front Office:- establishes trading relationships and on-boards new accounts; (iv) Middle Office; (v) Legal Department; (vi) Valuation Department; (vii) Accounting & Finance; and (viii) Third Party Service Providers. Establishment of Collateral Relationship:- once a new customer is identified by the Sales department, a basic credit analysis of that customer is conducted by the Credit Analysis team. Only credit-worthy customers will be allowed to trade on a non-collateralised basis. In the next step parties negotiate and come to the appropriate agreement. In the world's major trading centres, counterparties predominantly use ISDA Credit Support Annex (CSA) standards to ensure clear and effective contracts exist before transactions begin. Important points in the collateral agreement to be covered are:- (i) base currency; (ii) type of agreement; (iii) quantification of parameters such as independent amount, minimum transfer amount and rounding; (iv) appropriate collateral that may be posted by each counterparty; (v) quantification of haircuts that act to discount the value of various forms of collateral with price volatility; (vi) timings regarding the delivery of collateral (margin call frequency, notification time, delivery periods); and (vii) interest rates payable for cash collateral. Then the collateral teams on both sides establish the collateral relationship. Key details are communicated and entered into the two collateral systems. Some initial collateral may be posted to enable the counterparties to trade immediately in small size. Once the account is fully established the counterparties can trade freely. Collateral Management Operations Process:- the responsibility of the Collateral Management department is a large and complex task. Daily actions include:- (i) Managing Collateral Movements:- to record details of the collateralised relationship in the collateral management system, to monitor customer exposure and collateral received or posted on the agreed market-to-market, to call for margin as required, to transfer collateral to its counterparty once a valid call has been made, to check collateral to be received for the eligibility, to reuse collateral in accordance with policy guidelines, to deal with disagreements and disputes over exposure calculations and collateral valuations, to reconcile portfolio of transactions. (ii) Custody, Clearing and Settlement. (iii) Valuations:- to valuate all securities and cash positions held and posted as collateral. Valuations may be done on an end-of-day or intraday basis. (iv) Margin Calls:- to notify, track, and resolve margin calls. (v) Substitutions:- to deal with requests for collateral substitutions both way. For example, one party would like to substitute one form of collateral for another. (vi) Processing:- to pay over coupons on securities promptly after receipt to collateral providers, to pay over interest on cash collateral and to monitor its receipt. The advantages and disadvantages of collateral include:- Advantages of Collateral:- (i) reduced credit risk; (ii) economic capital savings:- netting counterparty exposures reduces economic capital required to trade; (iii) diversification; (iv) improved liquidity; (v) higher profits; and (vi) higher trading efficiency. Disadvantages of Collateral:- (i) increases operational risk; (ii) legal risk; (iii) concentration risk; (iv) settlement risk; (v) valuation risk; (vi) increasing market risk; (vii) increased overhead; and (viii) reduced trading activity.

COLLATERAL MANAGEMENT SERVICE = СЛУЖБА УПРАВЛЕНИЯ ОБЕСПЕЧЕНИЕМ – Collateral Management Service is a centralised service that may handle any of a variety of collateral-related functions for a client firm, including valuation of collateral, confirmation of valuations with counterparties, optimisation of collateral usage, and transfer of collateral.

COLLATERAL SECURITY MARGIN = МАРЖА, ОБЕСПЕЧИВАЮЩАЯ БЕЗОПАСНОСТЬ (или МАРЖА В КАЧЕСТВЕ ЗАЛОГА БЕЗОПАСНОСТИ) – Collateral Security Margin:- the margin or difference between the market value of a collateral and the credit granted. This margin is demanded by the bank to cover itself against any possible decline in the value of the collateral.

COLLATERAL VALUE = СТОИМОСТЬ ОБЕСПЕЧЕНИЯ – Collateral Value is obtained by multiplying the loan-to-value ratio with the market value of an asset. The difference between 100 per cent and the loan-to-value ratio is the risk markdown which the lender works with. Collateral value is therefore the value which a lender assigns to an asset, e.g., a plot of land, and which determines the size of a possible lending, e.g., for a land charge. As a rule, collateral value should not exceed the proceeds obtainable in a long-term perspective from a sale of the collateral asset on the market.

COLLECT FREIGHT = ПРОВОЗНАЯ ПЛАТА ПО ПРИБЫТИИ (или ФРАХТ ПО ПРИБЫТИИ) – Collect Freight:- freight payable to the carrier at the port of discharge or ultimate destination. The consignee does not pay the freight charge if the cargo does not arrive at the destination. / Провозная Плата По Прибытии или Фрахт По Прибытии:- фрахт, оплачиваемый перевозчику в порту разгрузки или конечном пункте назначения. Грузополучатель на платит фрахтовый сбор, если груз не прибывает в место назначения.

COLLECTING BANK = ИНКАССИРУЮЩИЙ БАНК – Collecting Bank is the bank at which a cheque is deposited. The term 'collecting bank' means any bank handling a check for collection except the paying bank. Bank which accepts a check for credit of an account. Also known as Remitting Bank. A bank which receives the draft for collection. Collecting Bank is a bank that acts as an agent to the seller's bank (the presenting bank). The collecting bank assumes no responsibility for either the documents or the merchandise. Any bank, other than the remitting bank, involved in processing the collection. / в банк продавца (представляющий банк). Любой банк, не являющийся банком ремитентом, участвующий в операции по выполнению инкассового поручения. Инкассирующий Банк – любой банк в операции инкассо отличный от банка ремитента, вовлечённый в обработку документов. Инкассирующий Банк – банк, которому банк-ремитент посылает векселя, чеки и другие платёжные документы для оплаты (на инкассо). Инкассирующий Банк – любой банк в операции инкассо отличный отбанка ремитента, вовлечённый в обработку документов.

COLLECTION = ИНКАССО – Collection means the handling by banks of commercial and financial documents in accordance with instructions received, in order to:- (i) obtain payment and/or acceptance; or (ii) deliver commercial documents against payment and/or against acceptance; or (iii) deliver documents on other terms and conditions. Collection of outstanding debts, such as bills of exchange, cheques and securities. This service is generally offered by banks; a well-known form is collection against documents. / Инкассо означает обслуживание банками коммерческих и финансовых документов в соответствии с полученными инструкциями в целях:- (i) получения платежа и/или акцепта; или (ii) выдачи коммерческих документов против платежа и/или против акцепта; или (iii) выдачи документов на других порядках и условиях. В банковском обслуживании под Инкассо понимается одна из разновидностей банковских операций, заключающаяся в получении платежа, причитающегося кредитору, специально управомоченным на это лицом (инкассатором) по поручению и в пользу кредитора. Поставщик выписывает платёжное требование на сумму, причитающуюся ему от заказчика. Далее это платёжное требование сдаётся на инкассо в банк поставщика, пересылающий его в банк плательщика. Если плательщик акцептует это платёжное требование полностью или частично, причитающаяся сумма платежа переводится его банком на счёт поставщика. Под обеспечение сданных на инкассо расчётных документов банк выдаёт поставщику ссуду на срок нормального пробега документов. Банк инкассирует платежи по расчётным и исполнительным документам. Инкассо, от Итальянского слова Incasso, означает банковскую операцию, при которой банк по поручению клиента получает причитающиеся последнему денежные суммы на основании денежных, товарных или расчётных документов. В капиталистических странах инкассовая операция является коммерческой услугой, за её выполнение банки взимают плату, размер которой определяется характером операции и условиями получения платежа с покупателя. Банки капиталистических стран принимают на инкассо акции и облигации, а также иностранную валюту. Инкассовая операция в условиях планового социалистического хозяйства выполняет важную народно-хозяйственную функцию контроля за товарностью расчётных документов, своевременностью расчётов и аккуратностью платежей. Она является одним из средств укрепления хозрасчёта и контроля Рублём за соблюдением договорной и финансовой дисциплины

в хозяйстве. В бывшем Союзе Советских Социалистических Республик (СССР) инкассо применялось при осуществлении безналичных расчётов по акцептной форме за товары и услуги, а также использовалось при необходимости получить с должника платежи по исполнительным и приравненным к ним документам, сданным на инкассо кредитором. Учреждения банков систематически выполняли поручения предприятий-поставщиков по отправке (инкассации) их платёжных документов в банки, обслуживавшие покупателей, получению денег с плательщиков и пересылке их поставщику для зачисления на его счёт в банке. При установлении системы инкассо расчётных документов (1935) были введены единые платёжные документы:- для иногородних расчётов Платёжное Требование, для одногородних Платёжное Поручение. Каждый поставщик после отгрузки товара представлял в обслуживающее его учреждение банка платёжные требования, которые принимались на инкассо, если от даты отгрузки товара или оказания услуг прошло не более месяца. Для получения кредита под расчётные документы в пути документы должны были представляться не позднее чем через 3 рабочих дня после даты отгрузки. Инкассовые операции осуществлялись Госбанком и Стройбанком, условия и сроки расчётов регламентировались правилами и инструкциями банка; при проведении инкассовых операций банк следил за движением товарных масс в сфере обращения, за своевременностью платежей, зачислением денег на счета поставщиков и сохранностью грузов, от оплаты которых плательщик отказался. Инкассовые операции в СССР применялись также в международных расчётах. С социалистическими странами в 1955 введена система инкассо с немедленной оплатой. За проведение инкассовых операций при расчётах с капиталистическими странами Госбанк и Внешторгбанк взимали определённое комиссионное вознаграждение; расчёты между организациями СССР и социалистическими странами производились по взаимному соглашению банков бесплатно. Инкассо – работа банка с документами, полученными от экспортёра, по выполнению его инструкций, заключающихся в передаче документов импортёру против платежа или акцепта тратт или передачи документов на других условиях. Экспортёр подготавливает документы, передаваемые им на инкассо, и оформляет чёткие и полные инкассовые инструкции для банка.

COLLECTION = КОЛЛЕКЦИЯ – Collection is a gathering of different strains, varieties, or species for preservation until evaluated or multiplied. A set of varieties used and maintained by a researcher is called a Working Collection. / Под Коллекцией, от Латинского слова Collectio, означающее Собирание, понимается систематизированное собрание однородных предметов, представляющих научный, художественный, литературный и тому подобный интерес, например, коллекция картин.

COLLECTION = УРЕГУЛИРОВАНИЕ ЗАДОЛЖЕННОСТИ (или ВЗЫСКАНИЕ ЗАДОЛЖЕННОСТИ) – Collection:- a draft drawn on the buyer, usually accompanied by documents, with complete instructions concerning processing for payment or acceptance. The presentation for payment of any obligation, bill of exchange, draft or other instrument. Collection:- the business area within a credit provider that is set up to call and remind customers that their accounts are past due and the referral of a past due account to a specialist in collecting loans or accounts receivable. Presentation of an invoice or other request for payment. / Выставление счёта-фактуры или иного требования об оплате.

COLLECTION ORDER = ИНКАССОВОЕ ПОРУЧЕНИЕ (или ПЛАТЁЖНОЕ ТРЕБОВАНИЕ) – A Collection Order is a type of document in which an attempt to promote the tendering of a payment or the deliverance of some sort of information is made. Depending on the exact purpose of the document, it may be focused on urging payment of balances past due, or be a notice of some pending action that will be taken in order to complete an order or to settle a transaction in full. While a collection order is often associated with an attempt to collect a debt, the term may also refer to internal documents prepared by different types of companies and used to transfer information within a financial or other type of institution. When the collection order is in the form of a collection letter, or a letter of collection, the text of the document will usually advise a debtor that a payment on an open account is past due, and urge the debtor to submit a payment. Companies often use this form of collection order when outstanding invoices age over a certain number of days after issue, with a practice of issuing the orders as reminders at 45, 60, and 90 days after issue. The exact content of the collection order will vary, depending on the amount of time passed since the last payment was received. In some instances, the content of the letter may also include instructions on how to contact the creditor and make arrangements for paying off the past due balance. An alternative form of the collection order has to do with the transmission of data or funds within a company organization. For example, a financial institution may use a form designated as a collection order as the means of documenting the flow of receipts or payable amounts through the institution's system. Depending on the type of transactions involved, the detail found on the order may help to maintain exact records of postings that involve disbursements as well as any funds transferred between accounts. With any type of collection order, the idea is to expedite the collection of some sort of data or funds. Typically, the preparation of this type of document must be done in accordance with governmental regulations that apply in the jurisdiction in which the issuer is located. This is especially true for companies attempting to collect payments on past due invoices as well as financial institutions that are required to document all transactions that occur within the structure of those institutions. Collection Order is a written demand for payment issued by a creditor to a debtor to enforce collection. / Требование об оплате в письменной форме, выданное кредитором дебитору для проведения инкассо. Под Платёжным Требованием понимается требование, предоставляемое в банк на инкассо или для зачёта требования поставщика к покупателю об оплате отгруженных или сданных материальных ценностей, оказанных услуг или выполненных работ. Инкассовое Поручение – инструкции представляющему банку, оформляемые банком ремитентом в соответствии с инкассовыми инструкциями принципала.

COLLECTION PAPERS = БУМАГИ ПО ИНКАССО (или РАСЧЁТНЫЕ ДОКУМЕНТЫ НА ИНКАССО) – Collection Papers:- all documents (invoices, bills of lading or air waybill, etc) submitted to a buyer for the purpose of receiving payment for a shipment. / Все документы (счета-фактуры, коносамент или авиагрузовая накладная и прочие), предоставленные покупателю с целью получения оплаты за произведённую отгрузку.

COLLECTIONS SYSTEM = СИСТЕМА СБОРА ПЛАТЕЖЕЙ – The Collections System, a part of the US Customs' Automated Commercial System, controls and accounts for the billions of Dollars in payments collected by Customs each year and the millions in refunds processed each year. Daily statements are prepared for the automated brokers who select this service. The Collections System permits electronic payments of the related duties and taxes through the Automated Clearinghouse capability. Automated collections also meet the needs of the importing community through acceptance of electronic funds transfers for deferred tax bills and receipt of electronic payments from lockbox operations for Customs bills and fees.

COLLECTION WITH ACCEPTANCE = ИНКАССО С АКЦЕПТОМ – Collection With Acceptance:- release of documents only against payment = Acceptance D/P (short for the Documents Against Payment). This type of collection is rarely used in practice. The exporter gives instructions for the drawee to accept a draft due, say, 30 days after sight. However, the presenting bank may only hand over the documents to the drawee once payment of the draft has been effected. Despite the acceptance of the draft, the documents can only be released on payment. If the goods are required urgently, the drawee may have to consider payment prior to maturity. The presenting bank will not be responsible for any consequences resulting from a delay in the delivery of documents. / представляющий банк.

COLLECTIVE CUSTODY = КОЛЛЕКТИВНОЕ ДОВЕРИТЕЛЬНОЕ УПРАВЛЕНИЕ – In Collective Custody, securities owned by many different investors are held at a central securities depository. Each type of security is kept separately. Each individual securities

accountholder is a joint owner of a certain proportion of the collective securities held. Individual custody can be requested pursuant to Section 2, Sentence 1 of the German Securities Deposit Act. The safekeeping of fungible securities by category in a bank or a central depository. A record is kept of how many securities belong to the individual banks or customers, but no numbers are allocated.

COLLECTIVE INVESTMENT AGREEMENT = СОГЛАШЕНИЕ О КОЛЛЕКТИВНОМ ИНВЕСТИРОВАНИИ – Collective Investment Agreement:- legal basis for investment fund activities in Switzerland. Concluded between fund management company, custodian bank and unitholders.

COLLECTIVE MARK = КОЛЛЕКТИВНЫЙ ЗНАК – In trademark law, Collective Mark is a trademark or service mark used, or intended to be used, in commerce, by the members of a cooperative, an association, or other collective group or organization, including a mark that indicates membership in a union, an association, or other organization. / В законодательстве о товарных знаках, товарный знак или знак обслуживания, используемый или предполагаемый к использованию в коммерции членами кооператива, ассоциации или иной группы лиц или организации, включая знак, который указывает на принадлежность к союзу, ассоциации или иной организации.

COLLECTIVE ORDER = КОЛЛЕКТИВНОЕ РАСПОРЯЖЕНИЕ (или ОБОБЩЁННОЕ РАСПОРЯЖЕНИЕ) – Collective Order:- several payment orders combined on one form.

COLLECTIVE PAPER = КОЛЛЕКТИВНАЯ БУМАГА (или СГРУППИРОВАННАЯ ДОКУМЕНТАЦИЯ, или СОПРОВОДИТЕЛЬНАЯ ДОКУМЕНТАЦИЯ) – Collective Paper:- all documents (commercial invoices, bills of lading, etc) submitted to a buyer for the purpose of receiving payment for a shipment.

COLLECTIVE PROVISION = КОЛЛЕКТИВНОЕ ОБЕСПЕЧЕНИЕ (или ОБОБЩЁННОЕ ОБЕСПЕЧЕНИЕ) – Collective Provision:- allowance for accumulated impairment of loans and advances where the impairment cannot be identified as belonging to individual assets, and instead, is identified as belonging to a group of assets.

COLLECTIVE RESERVE UNIT = КОЛЛЕКТИВНАЯ РЕЗЕРВНАЯ ЕДИНИЦА (или ОБЩАЯ РЕЗЕРВНАЯ ЕДИНИЦА) – Collective Reserve Unit:- Currency Reserve Instrument (CRU), backed by gold, created by agreement among a group of nations and circulating among the participating countries, in a project designed to create new reserve instruments. The CRU was proposed and presented by French experts in 1964 when the Group of Ten studies the creation of new reserve instruments to increase international liquidity if the need arose.

COLLICULATE = БУГРИСТОЕ (или ХОЛМИСТОЕ) – Colliculate:- covered with small, rounded or hill-like elevations (colliculae), e.g., surface of seeds. / покрытое маленькими, округлыми или , например, поверхность семян.

COLLIER = УГЛЕВОЗ (или УГОЛЬЩИК) – Collier is a vessel used for transporting coal. / Под Углевозом понимается сухогрузное судно для перевозки каменного угля навалом. Углевоз относится к одному из типов навалочников.

COLLIMATED ROVING = КОЛЛИМИРОВАННАЯ РОВНИЦА – Collimated Roving is a roving that has been made using a special process (usually parallel wound), so that the strands are more parallel than in standard roving.

COLLISION = КОЛЛИЗИЯ (или СТОЛКНОВЕНИЕ) – Collision is one type of the casualty. Physical damage protection for the insured's own automobile(s) for damage resulting from a collision with another object or upset. Despite the many advances made in the area of radar and other electronic navigational aids, collisions continue to occur every year (often in fog conditions). In some cases, the force of the collision leaves the vessels firmly locked together and they cannot be separated until salvage experts decide it is safe to do so. The immediate concerns include the potential for structural failure and serious pollution. The salvage priorities include damage assessment and the speedy completion of temporary patching and other emergency repairs, in readiness for a tow to a safe haven. According to Lisbon Rules, collision means any accident involving two or more vessels which causes loss or damage even if no actual contact has taken place. / Под Коллизией, от Латинского слова Collisio, означающее Столкновение, понимается:- (1) столновение противоположных сил, стремлений, интересов, взглядов; (2) конфликт. Коллизионное Право – нормы международного частного права, которые указывают, законодательство какого государства должно быть применено к данному правоотношению.

COLLISION AVOIDANCE SYSTEM = СИСТЕМА ИЗБЕЖАНИЯ СТОЛКНОВЕНИЯ – Collision Avoidance System is an electronic system commonly used to prevent collisions in inland navigable waterways.

COLLISION CLAUSE = ОГОВОРКА О КОЛЛИЗИИ (или ОГОВОРКА О СТОЛКНОВЕНИИ) – Collision Clause is a clause in a hull policy, covering collision liability incurred by the assured. Also known as Collision Liability Clause or Running Down Clause.

COLLO = МЕСТО (или КОЛЛО) – Collo (pl. colli) is internationally used word meaning an item of freight (crate, box, bale, bag, bundle, etc). / Колло – международно используемое слово, означающее предмет фрахта (ящик, коробка, кипа, мешок, пакет, и тому подобное).

COLLUSION = СГОВОР – Collusion is a secret understanding between two or more parties to control production or prices in a market. See also Cartel. / Секретная договорённость между двумя или более сторонами о контроле производства и цен на рынке. Смотрите также Картель (Cartel).

COLLUVIAL = КОЛЛЮВИАЛЬНОЕ – Colluvial:- pertaining to colluvium, a deposit of soil and rock material at the base of a slope.

COLLUVIUM = КОЛЛЮВИЙ – Colluvium is a mixture of weathered materials moving by gravity and deposited at the foot of a slope (as opposed to Alluvium). / Под Коллювием, от Латинского слова Colluvio, означающее Беспорядочная Груда или Скопление, понимается обломочный материал, накопившийся на склонах гор или у их подножий путём перемещения с расположенных выше участков под влиянием силы тяжести (осыпи, обвалы, оползни) и движения оттаивающих, насыщенных водой продуктов выветривания в областях распространения многолетнемёрзлых горных пород.

CO–LOADING = ДОЗАГРУЗКА – Co-Loading is the loading, on the way, of cargo from another shipper, having the same final destination as the cargo loaded earlier. / Загрузка в пути грузом от другого отправителя, но имеющего один и тот же пункт конечного назначения, что и груз, загруженный ранее.

COLONY = КОЛОНИЯ – (1) Colony is a distinguishable localized population within a species. (2) Colony (bacterial) is a mass of many bacterial cells derived from a single cell by growth on an agar plate containing nutrient medium. / Под Колонией, от Латинского слова Colonia, означающее Поселение, понимается:- (1) Страна или территория, находящаяся под властью иностранного государства (метрополии), лишённая политической и экономической самостоятельности и управляемая на основе специального режима. В эпоху домонополистического капитализма колонии – рынки сбыта и источники сырья для капиталистических метрополий. В эпоху империализма колонии, сохраняя эту роль, становятся в первую очередь сферой

приложения капитала. (2) Поселение, основанное древними народами (финикийцами, греками, римлянами) в чужих землях. (3) Поселение переселенцев из другой страны, области. (4) Сообщество земляков в чужом городе, в чужой стране; землячество. (5) В биологии – совокупность колониальных организмов. Иногда колониями называются также временные совместные поселения птиц.

COLOR = ЦВЕТ – (1) Color also spelled Colour, defined generally, the aspect of any object that may be described in terms of hue, lightness, and saturation. In physics, color is associated specifically with electromagnetic radiation of a certain range of wavelengths visible to the human eye. Radiation of such wavelengths comprises that portion of the electromagnetic spectrum known as the Visible Spectrum, i.e. light. Vision is obviously involved in the perception of color. A person can see in dim light, however, without being able to distinguish colors. Only when more light is present do colors appear. Light of some critical intensity, therefore, is also necessary for color perception. Finally, the manner in which the brain responds to visual stimuli must also be considered. The color green has a quite different meaning for a resident of a tropical rain forest than it has for a desert dweller. Even under identical conditions, the same object may appear red to one observer and orange to another. Clearly, the perception of color depends on vision, light, and individual interpretation, and an understanding of color involves physiology, physics, and psychology. An object appears colored because of the way it interacts with light. The analysis of this interaction and the factors that determine it are the concerns of the physics of color. The physiology of color involves the eye's and the brain's responses to light and the sensory data they produce. The psychology of color is invoked when the mind processes the visual data, compares them to information stored in memory, and interprets them as color. The measurement of color is known as Colorimetry. A variety of instruments are used in this field. The most sophisticated, the spectrophotometers, analyze light in terms of the amount of energy present at each spectral wavelength. It is difficult to describe the color of a specific spectral energy distribution. Since the eye perceives only a single color for any given energy distribution, it is necessary to express color measurements in a perception-related way. Several systems exist and some are outlined below. Color:- a person's recognition of an object's color is the result of a complex process involving the response of the brain to the interaction of light with the object. Numerical descriptions of these three components ((1) light source, (2) object, and (3) observer) are all that is required to calculate the description of any color with an objective set of numbers. Other factors certainly influence our perception of color, but without these three components there is no perception. By the way, blue, black, green, red are all examples of color. Color:- (1) of an object, aspect of object appearance distinct from form, shape, size, position, or gloss that depends upon the spectral composition of the incident light, the spectral reflectance of transmittance of the object, and the spectral response of the observer, as well as the illuminating and viewing geometry. (2) Perceived, attribute of visual perception that can be described by color names such as white, gray, black, yellow, brown, vivid red, deep reddish purple, or by combinations of such names. (3) Psychophysical, characteristics of a color stimulus (that is, light producing a sensation of color) denoted by a colorimetric specification with three values, such as tristimulus values. / Под Цветом понимается свойство тел вызывать определённое зрительное ощущение в соответствии со спектральным составом и интенсивностью отражаемого или испускаемого ими излучения. Основные качества цвета – цветовой тон, насыщенность и светлота. Свет разных длин волн λ возбуждает разные цветовые ощущения:- при λ около 460 нм – фиолетовые, 470 нм – синее, 480 нм – голубое, 520 нм – зелёное, 580 нм – жёлтое, 600 нм – оранжевое, 640 нм – красное; 1 нанометр (нм) = 10^{-9} метра (м). Однако цвет сложного излучения не определяется однозначно его спектральным составом.

(2) The Color of cotton fibers is primarily determined by conditions of temperature and/or humidity, Cotton lint exposure to sunlight, and Cotton varieties. Action by parasites or micro-organism, as well as technical defects in harvesting and subsequent storage and transport, may all affect the color of Cotton. In the United States, an HVI classing has been available on an optional basis to all growers since 1981. The color of cotton is measured by the degree of reflectance (Rd) and yellowness (+b). Reflectance indicates how bright or dull a sample is, and yellowness indicates the degree of color pigment. A three-digit color code is used to indicate the color grade. This color grade is determined by locating the quadrant of the color chart in which the Rd and +b values intersect. For example, a sample with an Rd value of 72 and a +b value of 9.0 would have a color code of 41–3. In cotton classification, the color grade of American upland cotton is determined using the HVI Color Chart (instrument measurement), and referenced to color grade standards that are in the custody of the USDA (the abovementioned Universal Cotton Standards used by human classers to determine official color grade). The Color of Cotton is determined by the degree of reflectance (Rd) and yellowness ($^{+}$b). Reflectance indicates how bright or dull a sample is, and yellowness indicates the degree of color pigmentation. A three-digit color code is used. The color code is determined by locating the point at which the Rd and $^{+}$b values intersect on the Nickerson-Hunter cotton colorimeter diagram for Upland cotton. The color of cotton fibers can be affected by rainfall, freezes, insects and fungi, and by staining through contact with soil, grass, or the cotton plant's leaf. Color also can be affected by excessive moisture and temperature levels while cotton is being stored, both before and after ginning. As the color of cotton deteriorates due to environmental conditions, the probability for reduced processing efficiency is increased. Color deterioration also affects the ability of fibers to absorb and hold dyes and finishes. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). (Универсальные Стандарты на Хлопок (Universal Cotton Standards)) . Цвет хлопка определяется уровнем отражаемости (Rd) и желтизны ($^{+}$b). Отражаемость сигнализирует на сколько ярким или тусклым является образец, а желтизна сигнализирует об уровне цветовой пигментации. Для описания используется трёх-цифровой цветовой код. Цветовой код определяется по расположению точки пересечения кривых Rd и $^{+}$b на диаграмме, получаемой на хлопковом колориметре Никёрсона-Хантёра для средневолокнистого хлопка. На цвет хлопкового волокна могут оказывать влияние чрезмерные дожди, заморозки, Насекомые и Грибы, а также контакты с солью, травой или листьями самого Хлопчатника. На цвет может воздействовать чрезмерная влажность или уровни температуры во время хранения хлопка как до волокноотделения (или джинирования), так и после него. Поскольку цвет хлопка ухудшается из-за условий окружающей среды, то вероятность снижения производительности при его переработке возрастает. Цвет ухудшается также и из-за способности волокон впитывать и удерживать красители и другие химикаты.

(3) Color is the actual color of the wool. In industry a bright white to cream is most desirable; canary stains, brown or black stains are undesirable. / разводы (или потёки), .

COLOR ABRASION = ИСТИРАНИЕ ЦВЕТА (или ЦВЕТОВОЕ ИСТИРАНИЕ, или АБРАЗИЯ ЦВЕТА) – Color Abrasion:- color changes in localized areas of a garment due to differential wear, such as the knees of blue jeans. Often evident in cross-dye shades of blends where durable press treatments are applied. Color abrasion is often called 'Frosting'.

COLORANTS = ОКРАШИВАЮЩИЕ СРЕДСТВА (или КРАСИТЕЛИ) – Colorants are added as an aesthetic enhancement of the product. Colorant:- dye, pigment, or other agent used to impart a color to a material.

COLOR ATLAS = ЦВЕТОВОЙ АТЛАС (или АТЛАС ЦВЕТОВ, или АТЛАС ПО ЦВЕТУ) – Color Atlas is a collection of color samples arranged according to a color order system (such as Munsell, NCS (short for Natural Colour System®, Stockholm, Sweden), DIN (short for the Deutsches Institut für Normung e.V., Berlin, Germany)). / Немецкий Институт по Стандартизации (НИС; Deutsches Institut für Normung e.V. (DIN)). Атлас Цветов – систематизированный комплект (набор) разнообразных образцов –

цветных эталонов. Предназначен для определения (спецификации, анализа) оттенков цвета предметов посредством визуального сравнения их с эталонными цветами из атласа в условиях одинакового освещения. Оценка цвета предмета сводится к подбору в атласе близкого к нему по цвету образца. Атлас цветов используется при цветовой коррекции и при выборе цвета для фона (пятая краска) при подготовке издания к печати.

COLORATUS = КОЛОРАТУС (или ОКРАШЕННОЕ, или ЦВЕТНОЕ, или ПОДКРАШЕННОЕ) – Coloratus:- colored, usually with a reddish tint.

COLOR BLEEDING = ИСТЕКАНИЕ ЦВЕТА – Color Bleeding:- poor wet fastness. Color Bleeding:- Fabric:- colored-yarn shirting; Construction:- (i) Count:- 104 x 60; (ii) Warp:- 40/1 yarn-dyed cotton (blue with red stripe); (iii) Filling:- 40/1 cotton (white); Finish:- plain Sanforized. Defect:- in the finishing of this fabric, it was found that one of the red stripes near each selvage bled and stained the adjacent ends. Analysis:- analysis showed that a single red-dyed end in the stripe nearest each selvage was composed of bright spun-viscose rayon instead of all cotton. Chemical tests showed that the rayon had been dyed with commercial direct dyestuff which was not fast to washing. This defect was obviously due to a mixing of yarns at the mill where they had been running dyed all-rayon yarns, as well as fast-dyed cotton yarns. The dyed rayon yarns were satisfactory for the particular constructions for which they were normally used, since the all-rayon goods were not being sold as washable, and the normal finishing operations would have been much less severe than those used on all-cotton shirting cloth. Woven fabric defect. Color Bleeding is the loss of color from a dyed fabric when immersed in water, dry-cleaning solvent, or similar liquid medium, with consequent coloring of the liquid medium. Compare Color Staining. / Уточина. Порок или дефект.

COLOR CHANGE = СМЕНА ЦВЕТА – Color Change:- Garment:- man's end-and-end broadcloth shirt; Fabric Construction:- (i) Count:- 80 x 72; (ii) Warp:- 40/1 combed cotton, yarn dyed; (iii) Filling:- same as warp. Complaint:- the customer claimed that the shirt changed color in laundering. Analysis:- examination of the washed shirt showed that the warp arrangement was one blue-dyed end alternating with one pink-dyed end, with the filling all pink. No fabric of this color combination had been made by the mill, but samples were obtained of head ends which represented goods delivered to this customer. One was a blue-and-white combination, and the other was a helio-and-white combination. Laboratory tests were made on these cuttings for colorfastness to laundering at 1S0 °F with soap and soda ash and 0.01% available chlorine solution. There was no evidence of any fading, color change, or staining of the white yarns. A swatch from the washed shirt was tested under the same conditions and the pink color disappeared completely, leaving the fabric blue and white. Wash tests made at 1G0 °F without the use of chlorine resulted in a reduction in the depth of the pink color and staining of the white test fabric. It was concluded that the fabric in the shirt had originally been blue and white and had apparently been 'topped' or tinted by the customer with a direct pink dyestuff which had poor colorfastness to laundering. / Уточина:- .

COLOR CHANGE IN LAUNDERING = СМЕНА ЦВЕТА ПРИ СТИРКЕ – Color Change In Laundering:- Garment:- man's green sport shirt; Fabric Construction:- (i) Count:- 120 x 50; (ii) Warp:- 100/40 dull viscose rayon; (iii) Filling:- 22/1 spun viscose-rayon slub. Complaint:- the customer claimed that the color changed from green to gray after one laundering. Analysis:- laboratory wash tests made on a file head end from the same dye lot of goods delivered to the garment manufacturer showed no appreciable change of shade or loss of color at 100 °F in standard washing formula. It was possible to duplicate the change of color from green to gray by use of chlorine bleach. These tests indicated that the garment had been subjected to bleaching during laundering, contrary to accepted practice for colored goods. Since the fabric was not represented as having been dyed with colors guaranteed to resist chlorine bleaching, and since in the laboratory a standard rayon wash test was proved to be satisfactory, the converter felt justified in not accepting responsibility for this complaint. / Уточина:- .

COLOR CONSTANCY = ЦВЕТОВОЕ ПОСТОЯНСТВО (или ПОСТОЯНСТВО ЦВЕТА, или НЕИЗМЕННОСТЬ ЦВЕТА, или ЦВЕТОВАЯ КОНСТАНТНОСТЬ) – Color Constancy is the general tendency of the colors of an object to remain constant when the color of the illumination is changed.

COLOR CONTACT = ЦВЕТОВОЙ КОНТАКТ – Color Contact:- other color spot comes on fabric. Finishing defect. / пятно. Порок или дефект заключительной отделки.

COLOR CONTAMINATION = ЦВЕТОВОЕ ЗАГРЯЗНЕНИЕ – Color Contamination is a transfer of color from one fabric to another. All bleeding and color migration should be considered defective.

COLOR–CONTAMINATED WARP YARNS = ПРЯЖА ОСНОВЫ, ЗАГРЯЗНЁННАЯ ЦВЕТОМ – Color-Contaminated Warp Yarns:- wrong color appearing in several warp yarns and over short yarn lengths. This defect may be caused by the contamination of warp yarns of, for example, one beam during warp preparation or warp dying. / Загрязнение Пряжи Основы (color-contaminated warp yarns):- порок заключительной отделки ткани в виде неправильного цвета, проявляющийся на нескольких нитях основы и на коротких участках пряжи. Примечание:- этот порок может быть вызван загрязнением пряжи основы, например, с одним навоем при приготовлении основы или её окраске.

COLOR DEFECT = ЦВЕТОВОЙ ДЕФЕКТ (или ПОРОК ПО ЦВЕТУ) – Color Defect:- any color that is not removable in wool scouring, due to urine stain, dung stain, canary yellow stain, or black fibers. / развод (или потёк), .

COLOR DIFFERENCE = ЦВЕТОВОЕ РАЗЛИЧИЕ – Color Difference is:- (1) perceived, the magnitude and character of the difference between two colors described by such terms as redder, bluer, lighter, darker, grayer, or cleaner. (2) Computed, the magnitude and direction of the difference between two psychophysical color stimuli and their components computed from tristimulus values, or chromaticity coordinates and luminance factor, by means of a specified set of color-difference equations.

COLOR–DIFFERENCE UNITS = ЕДИНИЦЫ ЦВЕТОВОГО РАЗЛИЧИЯ – Color-Difference Units are the units of size of the color differences calculated according to various equations. Such color differences cannot be accurately converted between different equations by the use of average factors.

COLORED FLECKS = ЦВЕТНЫЕ КРАПИНКИ (или ЦВЕТНЫЕ ПЯТКИ) – Colored Flecks; colored fly:- a small quantity of colored fiber unintentionally incorporated into the structure of a fabric of a different color. Note:- this defect is often caused by small amounts of colored waste fiber being spun into a yarn of another stock, or by different fibers or colors running or being knitted in close proximity without adequate precaution against contamination. Colored Flecks:- presence of colored foreign matter in the yarn. Yarn Defect. Colored Flecks:- a presence of colored foreign matter in the yarn. Causes:- cotton fibers getting contaminated during the ginning stage with leaves, immature fiber, yellow fiber, etc. Mending:- colored portion is removed from the yarn with a plucker. The resultant bare patch can be corrected by combing with metallic comb. / Цветные Пятна; Цветные Крапины (colored flecks; colored fly):- порок ткани; небольшое количество цветного волокна, непроизвольно вкраплённое в структуру ткани. Примечание:- этот порок часто вызывается небольшим количеством цветного отходового волокна, впряденного в другое волокно или разных волокон или цветов, вотканных без соответствующих мер предосторожности против загрязнения.

COLORED SPOT ON FABRIC = ЦВЕТНОЕ ПЯТНО НА ТКАНИ – Colored Spot on Fabric:- due to knots, neps, slubs, etc, present in the fabric, after dyeing, those places appears as a colored spot.

COLOR FADING = УГАСАНИЕ ЦВЕТА (или ВЫЦВЕТАНИЕ) – Color Fading:- Garment:- woman's pique dress (yellow ground, black print); Fabric Construction:- (i) Count:- 116 x 84; (ii) Warp:- 34/1 combed cotton; (iii) Filling:- same as warp. Complaint:- the customer claimed that the color faded during laundering. Analysis:- laboratory tests for colorfastness to laundering and sunlight (Fade-Ometer) showed no evidence of color fading in excess of established minimum standards. Inspection showed the presence of large stains, the outer edges of which were green, near the bottom of the dress. Careful examination disclosed the presence of several small blotches of green paint not far from the larger stains. It was concluded that the garment had come in contact with wet paint and that an attempt had been made to remove the stains through the use of some solvent, which was responsible for the large blotches outlined by greenish rings. This is typical of an unjustifiable consumer complaint in which it is difficult to believe that the owner of the garment did not know exactly what had happened. If the retailer had been one of the larger department stores, many of which have their own testing laboratories, or retain a commercial laboratory, the garment would never have been returned to the fabric manufacturer. / Уточина:- . разводы (или потёки), .

COLOR FASTNESS = УСТОЙЧИВОСТЬ ОКРАСКИ (или ЦВЕТОВАЯ СТОЙКОСТЬ) – Color Fastness:- the term used to describe the resistance of fabric to the loss of color. There are several things which can cause loss of color, the most important being washing and light. Color Fastness is a term used to describe a dyed fabric's ability to resist fading due to washing, exposure to sunlight, and other environmental conditions. Colorfastness is a resistance to fading, i.e. the property of a dye to retain its color when the dyed (or printed) textile material is exposed to conditions or agents such as light, perspiration, atmospheric gases, or washing that can remove or destroy the color. A dye may be reasonably fast to one agent and only moderately fast to another. Degree of fastness of color is tested by standard procedures. Textile materials often must meet certain fastness specifications for a particular use. Color Fastness:- that property of a dye, to retain its original hue, when handled under normal conditions when exposed to light, heat, or other conditions. / Прочность Крашения:- одной из наиболее острых проблем при выборе тканей является прочность их крашения, иными словами, устойчивость красителя к свету, сухому трению и стирке. Детальный процесс крашения является слишком широким вопросом, и его невозможно изложить кратко. Тем не менее, стоит рассмотреть различные стадии производственной линии, где можно вести красильный процесс. Крашение суконных тканей практически всегда ведётся на стадии рыхлого волокна, непосредственно перед кардочесанием, и называется крашением в волокне. Камвольные ткани можно красить на различных производственных стадиях, что может иметь воздействие как на прочность крашения, так и на графики поставок. Крашение можно вести либо перед прядением (в топсе), либо после прядения (в пряже), либо в форме готовой ткани (в полотне). Как правило, чем позднее идёт крашение шерсти, тем быстрее можно делать поставки готовой продукции.

COLORFASTNESS TO CROCKING = УСТОЙЧИВОСТЬ ОКРАСКИ К ИСТИРАНИЮ (или ПРОЧНОСТЬ ОКРАСКИ К ИСТИРАНИЮ) – Colorfastness To Crocking (AATCC Test Method 8-2001):- this test is designed to determine the amount of color transferred from the surface of colored textile materials to other surfaces by rubbing. It is applicable to textiles made from all fibers in the form of yarn or fabric whether dyed, printed or otherwise colored. Testing procedures employ white test cloth squares. Testing is usually done for both wet and dry crocking (wet is cloth that is wet with water). Color transfered to the white test cloth after rubbing, is assessed by a comparison with the Gray Scale for Staining or the Chromatic Transference Scale and a grade is assigned. Because washing, drycleaning, shrinkage, ironing, finishing, etc, may effect the degree of color transfer from the material, the test may be made before, after or before and after such treatment.

COLOR FLY = XX (или ЦВЕТОВОЙ ПУХ) – Defect Name:- Color Fly. Defect Type:- warp lines, vertical lines; and Isolated Defects. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Color Fly:- This is the result of small amounts of colored fiber being spun into yarn of another stock. This can happen in the reworking of waste or where different fibers or colors are running in close proximity without adequate precaution being taken to prevent contamination. Severity:- Minor.

COLOR GRADE = СОРТ ПО ЦВЕТУ – Color Grade:- the color of cotton fibers is primarily determined by conditions of temperature and/or humidity, cotton lint exposure to sunlight, and cotton varieties. Action by parasites or micro-organism, as well as technical defects in harvesting and subsequent storage and transport, may all affect the color of cotton. In the United States, an HVI classing has been available on an optional basis to all growers since 1981. The color of cotton is measured by the degree of reflectance (Rd) and yellowness (+b). Reflectance indicates how bright or dull a sample is, and yellowness indicates the degree of color pigment. A three-digit color code is used to indicate the color grade. This color grade is determined by locating the quadrant of the color chart in which the Rd and +b values intersect. For example, a sample with an Rd value of 72 and a +b value of 9.0 would have a color code of 41–3. In cotton classification, the color grade of American upland cotton is determined using the HVI Color Chart (instrument measurement), and referenced to color grade standards that are in the custody of the USDA (the abovementioned Universal Cotton Standards used by human classers to determine official color grade). Describes the color of cotton lint. There are 30 standard color grades, of which 15 are physical standards (held as boxed samples of the complete range of grades) and 15 are descriptive. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Универсальные Стандарты на Хлопок (Universal Cotton Standards) . Описывает цвет хлопкового волокна. Существуют 30 стандартных сортов по цвету, из которых 15 являются физическими стандартами (содержатся как эталонные образцы в коробках из полного диапазона сортов), а остальные 15 являются описательными.

COLORIMETER = КОЛОРИМЕТР – Colorimeter is:- (1) a device that specifies color by measuring the intensities of the three primary colors that compose the color under study. (2) An instrument for measuring the concentration of a known substance in solution by comparing the liquid's color with standard colors. Colorimeter is an instrument for chemical analysis of liquids by comparison of the color of the given liquid with its standard colors. / Под Колориметром, от Латинского слова Color, означающее Цвет, и Греческого слова Metréō, означающее Измеряю, понимается прибор для измерения цвета.

COLORIMETER TRISTIMULUS = ТРЁХЦВЕТНЫЙ КОЛОРИМЕТР (или ТРИСТИМУЛЬНЫЙ КОЛОРИМЕТР) – Colorimeter Tristimulus is an instrument that measures psychophysical color, in terms of tristimulus values, by the use of filters to convert the relative spectral power distribution of the illuminator to that of a standard illuminant, and to convert the relative spectral responsively of the receiver to the responsivities prescribed for a standard observer. See also Spectrocolorimeter.

COLORIMETRY = КОЛОРИМЕТРИЯ (или ЦВЕТОВЫЕ ИЗМЕРЕНИЯ) – Colorimetry is any technique for evaluating a given color in terms of standard colors. Colorimetry is the science of color measurement. / Под Колориметрией, от Латинского слова Color, означающее Цвет, и Греческого слова Metréō, означающее Измеряю, понимаются методы измерения и количественного выражения цвета, основного на определении координат цвета в выбранной системе 3 основных цветов.

COLOR INDEX = ИНДЕКС ПО ЦВЕТУ (или УКАЗАТЕЛЬ ПО ЦВЕТУ, или ЦВЕТОВОЙ ИНДЕКС) – Color Index or Colour Index is a joint publication of the Society of Dyers and Colourists in Britain and the American Association of Textile Chemists and Colorists. The Color Index contains information on dye structures, classifications, manufacturers and processes. Many 'pure' dyes, that is, dyes which are a single color, rather than a mixture, have Color Index names (for example, the reactive dye Turquoise MX-G is designated in the Color Index as Reactive Blue 140). This name is normally independent of the manufacturer. The Colour Index is a multi-volume publication, priced at about one thousand US Dollars (late 2000). Colour Index (CI):- a listing of dyes and chemical structures published by the Society of Dyers and Colourists. Each structure is assigned a name according to chemical composition. Each dye is assigned a number according to its class and shade. A correlating structure number is given when available. / Туркуаз (в переводе с Французского языка – Бирюза или Бирюзовое) Эм.Экс.-Дьжи. (Turquoise MX-G).

COLORIST = КОЛОРИСТ – Colorist is a person skilled in the art of color matching (colorant formulation) and knowledgeable concerning the behavior of colorants in a particular material; a tinter (in the American usage) or a shader.

COLOR LOSS IN CLEANING = ПОТЕРЯ ЦВЕТА ПРИ ЧИСТКЕ – Color Loss In Cleaning:- Garment:- printed waffle-pique dress, ground dyed pink; Fabric Construction:- (i) Count:- 104 x 76; (ii) Warp:- 30/1 combed cotton; (iii) Filling:- 40/1 combed cotton. Complaint:- a customer claimed that pink color disappeared when the garment was dry-cleaned. Analysis:- laboratory tests made on a file head end from the same finishing lot confirmed the fact that the pink ground color did not withstand dry cleaning with the chlorinated hydrocarbon type of solvents (carbon tetrachloride, perchlorethylene, trichlorethylene). Standard laboratory wash tests, on the other hand. proved that the color was fast to laundering. Further investigation disclosed that the dyer was using pigment colors because of their superior lightfast and washfast qualities in this particular shade. Unfortunately, these colors are applied with binders which are soluble in certain organic solvents. Inasmuch as it was understood that the fabric was sold as washable, the converter disclaimed all responsibility in cases in which garments had been dry-cleaned instead of laundered. This decision could be questioned if the consumer had stained the dress with oil, grease, or a similar material and had tried to remove the stain at home with the usual household drycleaning solvents, but apparently that type of complaint was not common enough to warrant a change in the method of dyeing these goods. / Уточина:- . развод (или потёк).

COLOR MANAGEMENT = УПРАВЛЕНИЕ ЦВЕТОМ – Color Management:- deals with ensuring that the colors developed by a company's design team are successfully reproduced on the garments that wind up on the retail floor.

COLOR MATCH = СОВПАДЕНИЕ ЦВЕТОВ (или ПОДБИРАТЬ (или ПОДГОНЯТЬ, или СОЧЕТАТЬ, или СОРАЗМЕРЯТЬ) ЦВЕТ) – Color Match is:- (1) condition existing when colors match within a specified or agreed tolerance. Sometimes called Commercial Color Match. (2) Condition existing when colors are indistinguishable; a normal observer is usually implied. Sometimes called an Exact Color Match.

COLOR MATCHING = ПОДБОР ЦВЕТОВ (или ЦВЕТОВОЕ РАВЕНСТВО, или ЦВЕТОВОЕ СОГЛАСОВАНИЕ, или ПОДГОНКА (или ПРИГОНКА, или СОГЛАСОВАНИЕ) ЦВЕТА) – Color Matching is a procedure for providing, by selection, formulation, adjustment, or other means, a trial color that is indistinguishable from, or within specified tolerances of, a specified standard color under specified conditions.

COLOR–MATCHING FUNCTIONS = ФУНКЦИИ ПОДБОРА ЦВЕТОВ (или ФУНКЦИИ ЦВЕТОВОГО СОГЛАСОВАНИЯ, или ФУНКЦИИ СООТВЕТСТВИЯ ЦВЕТА, или ФУНКЦИИ СОВПАДЕНИЯ ЦВЕТА) – Color-Matching Functions:- the amounts, in any trichromatic system, of the three-reference color stimuli needed to match by an additive mixture monochromatic components of an equal energy spectrum.

COLOR MEASUREMENT = ЦВЕТОВОЕ ИЗМЕРЕНИЕ (или ИЗМЕРЕНИЕ ЦВЕТА) – Color Measurement is a physical measurement of light radiated, transmitted, or reflected by a specimen under specified conditions and mathematically transformed into standardized colorimetric terms that can be correlated with visual evaluations of color relative to one another. Although the term 'color measurement' is normally used, color itself cannot be measured.

COLOR NOT AS SPECIFIED ON ORIGINAL ORDER = ЦВЕТ НЕ ТАКОЙ, КАКОЙ СПЕЦИФИЦИРОВАН В ПЕРВОНАЧАЛЬНОМ ЗАКАЗЕ – Color Not As Specified On Original Order:- self explanatory. Thread defects, and namely – Dyeing. / Порок или дефект ниток.

COLOR NOT FAST = ЦВЕТ НЕ СТОЙКИЙ – (1) Color Not Fast:- fastness must be suitable to the garment but not necessarily to the same degree as the garment material. Fastness to laundering and dry cleaning must be sufficient to not stain other parts of garment. Can be determined only by testing. Damage from lack of fastness will be apparent only after consumer use. Closure defects, and namely – Metal Zippers and Nylon Spiral Zippers:- Tare and Cord Defects. / развод (или потёк). Порок или дефект застёжки. Найлан (Nylon).

(2) Same as for metal zippers. Color Not Fast:- fastness must be suitable to the garment but not necessarily to the same degree as the garment material. Fastness to laundering and dry cleaning must be sufficient to not stain other parts of garment. Can be determined only by testing. Damage from lack of fastness will be apparent only after consumer use. Closure defects, and namely – Nylon Spiral Zipper:- Tape and Cord Detects. / развод (или потёк). Порок или дефект застёжки. Найлан (Nylon).

COLOR NOT MATCHING THREAD PREVIOUSLY SHIPPED = ЦВЕТ, НЕ ПОДХОДЯЩИЙ РАНЕЕ ОТГРУЖЕННЫМ НИТКАМ – Color Not Matching Thread Previously Shipped:- self explanatory. Thread defects, and namely – Dyeing. / Порок или дефект ниток.

COLOR ORDER SYSTEMS = СИСТЕМЫ ЗАКАЗА ЦВЕТОВ (или СИСТЕМЫ ПОРЯДКА ЦВЕТА) – Color Order Systems:- a rational method or plan of ordering and specifying all object colors, or all within a limited domain, by means of a set of material standards selected and displayed so as to represent adequately the whole set of object colors under consideration.

COLOR OUT = ЦВЕТ ЗАКОНЧИЛСЯ (или ОТСУТСТВИЕ ЦВЕТА) – Color Out:- colors missing from an area of design in a printed fabric. Note:- this defect is often caused by a blocked screen or a faulty color supply. Color Out:- the result of color running low in reservoir on printing machine. Defect Name:- Color Out. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Color Out:- This is the result of color running low in the reservoir. Severity:- Major. / Под Непропечатанным Рисунком понимается распространённый порок, выраженный в виде отсутствия в некоторых местах изображения деталей рисунка или нечётком изображении рисунка. Непропечатанный Рисунок (color out):- порок заключительной отделки ткани в виде отсутствия в некоторых местах изображения деталей рисунка или слабоокрашенных изображений рисунка в зоне узора в набивных полотнах. Примечание:- этот порок возникает при засорении сетчатого шаблона или неправильной подаче краски.

COLOR PERCEPTION = ЦВЕТОВОСПРИЯТИЕ (или ВОСПРИЯТИЕ ЦВЕТА, или ОЩУЩЕНИЕ ЦВЕТА) – Color Perception is the subjective impression of color, as modified by the conditions of observation and by mental interpretation of the stimulus object.

COLORS = ФЛАГ – Colors (maritime term):- the national ensign.

COLOR SMEAR = ЦВЕТОВОЙ МАЗОК – Color Smear:- color smudged intended design area. Note:- this defect is often caused by incorrect viscosity of the printing paste, a maladjusted machine, or a poorly set or damaged doctor blade. Color Smear:- the result of color being smeared during printing. Defect Name:- Color Smear. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Color Smear:- This is the result of the color being smeared out of the engraved design. Severity:- Major. / Расплыв Краски (color smear):- порок заключительной отделки ткани; краска, вышедшая за пределы зоны набивного рисунка. Примечание:- этот порок возникает из-за низкой вязкости печатной пасты, неправильной регулировки машины, ненадёжной фиксации или сломанной ракли.

COLOR SPACE = ЦВЕТОВОЕ ПРОСТРАНСТВО – Color Space is a geometric space, usually of three dimensions, in which colors are arranged systematically.

COLOR SPECIFICATION = ЦВЕТОВАЯ СПЕЦИФИКАЦИЯ (или СПЕЦИФИКАЦИЯ ПО ЦВЕТАМ) – Color Specification is a notation or set of three color-scale values used to designate a color in a specified color system. Practical color specifications may include color tolerances as well as target color designation, measuring instrument, instrument settings, measurement procedures and sample preparation procedures.

COLOR SPOT = ЦВЕТОВОЕ ПЯТНО (или XX) – Defect Name:- Color Spot. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Color Spot:- This is the result of one beam of a slasher set being spotted with indigo. The spot is spread out according to the proportion of that beam to the total number of beams in the set. In this case, one of eight. Severity:- Major.

COLOR STAIN = ЦВЕТОВОЙ РАЗВОД (или ЦВЕТОВОЙ ПОТЁК) – Color Stain:- type of a stain occurring on the fabric due to color. Dyeing defect. / Порок или дефект крашения.

COLOR STAINING = ЦВЕТОВОЙ РАЗВОД (или ЦВЕТОВОЕ ОКРАШИВАНИЕ) – Color Staining:- the undesired pickup of color by a fabric:- (1) when immersed in water, dry-cleaning solvent, or similar liquid medium, that contains dyestuffs or coloring material not intended for coloring the fabric, or (2) by direct contact with other dyed material from which color is transferred by bleeding or sublimation. Compare Color Bleeding, and Crocking. Fabrics defect.

COLOR STIMULUS = ЦВЕТОВОЙ СТИМУЛ (или ПОБУДИТЕЛЬ, или РАЗДРАЖИТЕЛЬ, или ВОЗБУДИТЕЛЬ) – Color Stimulus:- a radiant flux capable of producing a color perception. / Цветовой Стимул – это видимое излучение с определённым спектральным распределением мощности, которое попадая в глаз может вызывать различные ощущения цвета в зависимости от условий наблюдения этого стимула.

COLOR STRIPPER = ЦВЕТОВОЙ ЧИСТИЛЬЩИК (или ЦВЕТОВОЙ СНИМАТЕЛЬ, или СМЫВАТЕЛЬ КРАСКИ, или СДИРАТЕЛЬ КРАСКИ, или СЪЁМНИК КРАСКИ, или СНИМАТЕЛЬ КРАСКИ) – Color Stripper is a chemical used to remove some or all of the dyestuffs from a fiber, yarn, or fabric so that a dyeing defect can be corrected, a shade lightened, or another color applied.

COLOR SUBLIMATION = ЦВЕТОВАЯ СУБЛИМАЦИЯ – Color Sublimation:- color migration due to steam. Finishing defect. / Порок или дефект заключительной отделки.

COLOR TEMPERATURE = ЦВЕТОВАЯ ТЕМПЕРАТУРА – Color Temperature:- of a light source, the temperature, usually expressed in Kelvins, of a full radiator (perfect, theoretical black substance that when heated would not affect the ‘color’ of the light emitted) which emits light of the same chromaticity as the source. For example average daylight color temperature is often expressed as D65, for 6 500 degrees Kevin. / Под Цветовой Температурой понимается эффективная величина, равная температуре абсолютно чёрного тела, при которой отношение энергетических яркостей для двух длин волн его спектра равно отношению этих же величин для спектра исследуемого источника света. Цветовая Температура описывает спектр света, который отражается от ‘абсолютно чёрного тела’ в зависимости от температуры его поверхности. Абсолютно чёрным называется тело, которое поглощает любой падающий свет, ни отражая его, ни пропуская. Примерным аналогом излучения абсолютно чёрного тела в быту может служить нагретый металл или камень:- говорят, что они накалены (до ‘красного каления’), когда они достигают определённой температуры, и доведены до ‘белого каления’ при значительно более высоких температурах. Аналогично, абсолютно чёрные тела при различных температурах покажут светимость различной цветовой температуры. Несмотря на название, свет, который может казаться белым, необязательно содержит полный видимый спектр. Заметьте, что 5 000 K производит примерно нейтральный свет, тогда как 3 000 K и 9 000 K порождают свет, спектр которого смещён в оранжевую и синюю стороны, соответственно. При нарастании цветовой температуры распределение цвета становится более холодным. Это может показаться интуитивно непонятным, но следует из того факта, что более короткие длины волн несут свет более высокой энергии. Почему цветовая температура является полезным описанием света для фотографов, если они никогда не имеют дела с абсолютно чёрными телами? К счастью, такие источники света, как дневной свет или вольфрамовые лампы накаливания, создают спектры света, практически аналогичные светимостям абсолютно чёрных тел, хотя другие источники, такие как флуоресцентные или большинство продающихся энергосберегающих ламп, существенно от них отличаются. Поскольку фотографы никогда не используют термин ‘цветовая температура’ применительно к настоящим абсолютно чёрным телам, этот термин подразумевает ‘коррелированную цветовую температуру’, с соответствующей окраской источника света.

COLOR TOLERANCE = ЦВЕТОВОЙ ДОПУСК (или ДОПУСК ПО ЦВЕТУ) – Color Tolerance is the permissible color difference between sample and specified color (Standard).

COLOR TOLERANCE SET = КОМПЛЕКТ ЦВЕТОВЫХ ДОПУСКОВ (или НАБОР ДОПУСКОВ ПО ЦВЕТУ) – Color Tolerance Set is a group of colored standards, usually seven painted chips, arranged on a single card, one exhibiting a desired color, and two each exhibiting the limits of the permissible range of color variation in each of the color attributes. Normally the set is arranged as the acceptable limits in lightness to darkness, redness to greenness, yellowness to blueness.

COLOR VARIATION = ЦВЕТОВАЯ ВАРИАЦИЯ (или ВАРИАЦИЯ ПО ЦВЕТУ) – Color Variation in acrylic fabric due to improper dye leveling. Possible Cause:- acrylics crease easily. Creasing can cause unleveled penetration of dyes. Major defect. Fabric with unleveled dyeing can not be used for originally intended solid shade products. Dyeing defect.

COLOR VARIATION IN YARN = ЦВЕТОВАЯ ВАРИАЦИЯ В ПРЯЖЕ – Color Variation In Yarn:- Possible Cause:- lack of agitation in the dye bath. This is a major defect. The yarn was supposed to be uniformly blue in color. Dyeing defect.

COLPA = КОЛЬПА – Colpa is a traditional Irish measure, originally a unit of livestock equal to one cow or horse or 6 sheep. Later adapted to specify a quantity of land which can support a horse or a cow for a year, approximately equal to an Irish acre of good land.

COLPUS = КОЛЬПУС (или КОЛЬПА) – Colpus:- an elongated aperture or groove with a length/breadth ratio > 2 in the wall of pollen grains. Hence:- colpate = grooved. / жёлоб или паз (groove).

COLREG = CONVENTION ON INTERNATIONAL REGULATIONS FOR PREVENTING COLLISIONS AT SEA

COLTS = CONTINUOUSLY OFFERED LONGER–TERM SECURITIES

COMA = КОМА – Coma:- a tuft of hair, usually terminal, especially on a seed tip. A tuft of leaves or bracts. / Под Комой, от Греческого слова Kōma, означающее Глубокий Сон, понимается:- (1) угрожающее жизни состояние, характеризующееся полной утратой сознания, нарушением кровообращения, дыхания, обмена веществ, отсутствием рефлексов. Наблюдается при инсульте, сахарном диабете, гепатитах, уремии, эпилепсии, отравлениях (в том числе алкоголем) и так далее. Глубокая кома относится к терминальным состояниям. (2) искажение изображения в оптических системах, из-за чего точка предмета принимает вид несимметричного пятна.

COMBED = ГРЕБЕННАЯ – Combed:- in industrial yarn preparation. During the combing process, fibers are combed to make them parallel in the sliver, and short fibers are removed. Combed yarn is yarn made of combed, long staple cotton, hard or slack twist, and used for hosiery, underwear, sewing thread, laces, and fine cotton fabrics. Combed yarns, those made from fibers that have been both carded and combed in process of manufacture from raw stock to finished spun yarn. / чулочно-носочные изделия (hosiery). Гребенная пряжа по способу прядения относится к гребенному прядению.

COMBED = ГРЕБНЕЧЁСАНЫЕ – The term ‘Combed’ means fabrics containing cotton, other vegetable textile fibers or wool or fine animal hair, in which such fibers are combed, whether or not containing other fibers. See also Not Combed.

COMBED COTTON = ГРЕБНЕЧЁСАНЫЙ ХЛОПОК – Combed Cotton is a cotton that has had the short fibers and impurities removed. It is a superior process to the more common treatment called ‘Carding’ because the yarns have less fibers projecting from them.

COMBED SLIVER = ГРЕБЕННАЯ ЛЕНТА – Combed Sliver is combed for producing fine and superfine counts from cottons upto 50 Ne. Carded sliver is passed through pre-comber draw frame, lap former and comber to remove fibers shorter than a pre-determined length and deliver sliver predominantly rich in long fibers. In the process nep content is also reduced significantly. Percentage of noils extracted at the comber and output rate is determined by carrying out a waste-cum production test. The loose, untwisted strand or ropelike form of cotton fibers produced by the combing machine from stock taken from the delivery end of the ribbon lapper machine. With some short fibers removed from the stock prior to the combing operation the sliver naturally will be even, uniform in fiber length, and may possess a luster. Combed Sliver, when compared with carded sliver, is stronger, cleaner, more parallel, and has a greater tensile strength. Combed Sliver is a continuous band of untwisted fiber, relatively free of short fibers and trash, produced by combing card sliver. / выработка (output). Лента с удалёнными из неё более короткими волокнами, взятая из накопителя до операции гребнечесания, обычно более равномерная, однородная по длине волокна и может иметь блеск. При сравнении с кардной лентой, гребенная лента более прочная, чистая, с более параллельно ориентированным волокном и имеет большую прочность при удлинении. Гребенная Лента состоит из хорошо распрямлённых и разъединённых волокон, но она неравномерна по линейной плотности. Поэтому дальнейшая обработка ленты на ленточных машинах производится с целью выравнивания ленты по линейной плотности путём сложения с последующим вытягиванием (два перехода ленточных машин).

COMBED FIBERS = ГРЕБЕННЫЕ ВОЛОКНА (или ГРЕБНЕЧЁСАНЫЕ ВОЛОКНА) – Combed Fibers are the fibers that have combed. This process removes the short fibers. When drawn off, the fiber is called Top. / Top = Мычка или Лента гребенного чесания.

COMBED SLIVER = ГРЕБЕННАЯ ЛЕНТА (или ЛЕНТА ГРЕБЕННОГО ПРОЧЁСА) – Combed Sliver is a continuous band of untwisted fiber, relatively free of short fibers and trash, produced by combing card sliver.

COMBED YARN = ГРЕБЕННАЯ ПРЯЖА – Combed Yarns are the yarn that has undergone the combing process so that all the fibers are straight and parallel. This process creates a smoother, stronger, and more compact yarn that is excellent for weaving. Combed yarn is extremely soft and is stronger than other yarns and is more expensive. Combed Yarn is a yarn produced from combed sliver. See also Combing. Combed Yarns are the cotton yarns that have been carded and combed. They are cleaner, smoother, and more lustrous and more expensive than carded yarns. Combed yarns are usually made in the finer counts. / Гребенная Пряжа – пряжа, произведённая из гребенной ленты. Смотрите также Гребнечесание (Combing).

COMBER = COMBER NOIL

COMBER = ГРЕБНЕЧЁСАЛЬНАЯ МАШИНА – Comber is a type of carding machine that performs fine work, especially used for high-quality yarns. In converting the ribbon laps from the ribbon lapper machine into sliver, it brings the fibers of cotton parallel, cleans out the impurities, and extracts a large proportion of the short fibers. Also known as Combing Machine. / В прядильном производстве, машина, предназначенная для очищения ленты от коротких волокон, оставшихся после трепания и кардочесания волокон и сорных примесей и пороков, а также для большей параллелизации волокон. Холстики с лентосоединительной машины устанавливают на раскатывающие валики. Раскатывающие валики подают холстик в зону чесания его гребенным барабанчиком и верхним гребнем (comber). Машина работает циклически, каждый цикл работы осуществляется за один оборот гребенного барабанчика. Полный цикл включает четыре периода, которые выполняются последовательно один за

другим, но с некоторым сдвигом во времени. В первом периоде работы машины происходит чесание передних кончиков волокон бородки, зажатой в тисках. Холстик заправлен в питающие цилиндры, и конец зажат между нижней и верхней губками тисков. Гребенной барабанчик, вращаясь, прочёсывает своими гребнями бородку волокон, выступающих из зажима тисков. На барабанчике по образующей установлено 14–17 гребней в зависимости от марки машины, которые в совокупности составляют гребенной сегмент. Первые гребни имеют более толстые и редко посаженные иглы, последующие гребни с более тонкими и чаще посаженными иглами. При чесании бородки гребенным барабанчиком все незажатые тисками короткие волокна вычёсываются и попадают в гребенной очёс. Длинные волокна, зажатые в тисках, распрямляются иглами гребней и ориентируются вдоль продукта. Одновременно с этим они очищаются от сорных примесей и пороков волокна. Вычёсываемые короткие волокна и сорные примеси снимаются с игл гребенного барабанчика вращающейся щёткой, которая направляет их по пневмоканалу к трубе с сетчатой поерхностью. Внутри трубы вентилятором создаётся разрежение и гребенной очёс оседает на её поверхности. Пыль и мелкие сорные примеси, не задержанные сеткой, попадают на поверхность фильтра, установленного на выходе воздуха из машины в цех. Труба периодически поворачивается и выводит очёс в виде слоя волокон на конвейер. Для повышения интенсивности чесания бородки гребенным барабанчиком тиски вместе с верхним гребнем отходят назад, а после прохождения последнего гребня в бородке они перемещаются вперёд к отделительному прибору. Во время прочёсывания бородки гребенным барабанчиком отделительные цилиндры и отделительные валики медленно вращаются и выводят прочёс на приёмный лоток. При этом задний отделительный валик перекатывается по цилиндру, смещаясь в сторону тисков, прочёс, выведенный в лоток, поступает в воронку. Во втором периоде работы происходит соединение прочёсанных передних концов бородки с задними концами волокон ранее отделённой порции, находящейся в отделительном приборе. После чесания бородки гребенным барабанчиком отделительные цилиндры и валики начинают вращаться в обратном направлении, подавая прочёс назад из лотка в машину. Длина подачи прочёса назад меньше, чем длина прочёса, выведенного в первом периоде. Тиски и верхний гребень перемещаются вперёд к отделительному прибору. Питающие цилиндры вращаются и подают часть холстика, перед тисками образуется напуск. При движении тисков и верхнего гребня к отделительному прибору тиски раскрываются (за счёт подъёма верхней губки), под действием упругих сил бородка распрямляется на определённую величину и передние концы волокон бородки накладываются на волокна, находящиеся в отделительном приборе. Цилиндры и валики отделительного прибора начинают вращаться, захватывают кончики вновь прочёсанных волокон бородки и соединяют их с задними концами волокон ранее отделённой порции. Волокна бородки при этом натягиваются и нанизываются на иглы верхнего гребня, который в этот момент опускается. Начинается третий период работы машины. В третьем периоде происходит отделение волокон из бородки и чесание задних концов отделяемой порции волокон. Отделительные цилиндры, продолжая выводить прочёсанные волокна, увеличивают свою скорость, а тиски и верхний гребень продолжают перемещаться с другой скоростью к отделительному прибору. Тиски, продвигаясь вперёд, подают в зажим отделительных цилиндров все новые и новые волокна. Отделительный прибор, захватив волокна за передние кончики, вытаскивают их из общей массы, происходит чесание задних концов этих волокон верхним гребнем. Так как скорость вывода прочёсанных волокон выше скорости перемещения тисков и верхнего гребня к отделительному прибору, в момент чесания задних концов волокон происходит и утонение продукта. Тиски, продвигаясь вперёд, подходят на минимальное расстояние к отделительному прибору. При движении тисков питающие цилиндры продолжают вращаться и подают оставшуюся длину холстика. Тиски в этом периоде открыты, а верхний гребень опущен и его иглы находятся в продукте, поэтому перед ним образуется напуск определённой длины. В четвёртом периоде работы машины идёт подготовка бородки к чесанию передних кончиков волокон в новом цикле работы машины. Тиски движутся назад и закрываются, зажимая бородку. Верхний гребень и тиски удаляются от отделительного прибора, и продукт разделяется на две части:- одна из них остаётся в зажиме отделительных цилиндров – это полностью прочёсанные волокна; другая часть остаётся в зажиме тисков – это волокна, которые в следующем цикле будут прочёсываться гребенным барабанчиком. При подъёме верхнего гребня под действием упругих сил напуск распрямляется и длина бородки, выступающей из тисков, будет более вытянутой. Порции волокон, прочёсанные в каждом цикле и соединённые вместе, образуют ватку-прочёс, которая собирается в приёмном лотке. Ватка-прочёс протаскивается через лентоформирующую воронку выпускными валиками, превращаются в ленту и поступает на питающий столик. У гребнечёсальной машины имеются и свои недостатки. В процессе отделения формируется порция, неравномерная по толщине, и при соединении этих порций в ленту наблюдаются периодические колебания линейной плотности по длине. Поэтому необходимо соединять несколько лент на питающем столике машины для снижения этих колебаний. Кроме того, в приёмном лотке не посередине выпуска, а со сдвигом от середины устанавливается лентоформирующая воронка, а лентоформирующий лоток имеет асимметричную форму. Недостатком машины является также неполное использование времени цикла на основной процесс гребнечесания. Всего чесание гребенным барабанчиком и верхним гребнем занимает примерно 42% времени, а остальное время (58%) цикла затрачивается на подготовительные операции. На машине осуществляется и неточная рассортировка волокон по длине. Попадание длинных волокон в очёс объясняется недостаточно плотным зажимом волокон в тисках и отделительном приборе, неполным и неравномерным распрямлением волокон. Попадание коротких волокон в гребенную ленту объясняется разрывом волокон при чесании, неполным вычёсыванием коротких волокон гребенным барабанчиком. Гребнечёсальная Машина предназначена для чесания волокнистого материала из натуральных и химволокон при подготовке к прядению. На гребнечёсальной машине производится тщательная очистка материалов от сорных примесей, коротких и спутанных волокон и формирование гребенной ленты из распрямлённых и параллелизованных волокон периодичным или непрерывным способом (в зависимости от вида гребнечёсальной машины).

COMBER NOIL = ГРЕБЕННОЙ ОЧЁС – Finest Qquality Comber Noil Of Two Categories:- unbleached and bleached. (1) Unbleached Comber Noil:- This quality product is produced from the cotton waste sourced from spinning mills that meets certain specification and criteria. Comber Noil is produced when cotton is combed in comber machine to remove short fibers. Comber Noil is a derived by product of the yarn spinning industry. Short fibers are removed from the processed yarn when cotton is combed to remove short fibers through a more scientific combing process. This extracted waste is named as comber noil. It is very much Trash Free. As for as the specification of the comber is considered:- Length – 15–21 mm, strength – 18, trash – 0.005%, micronaire – 2.5–3.5. (2) Bleached Comber Noil:- We produce and supply bleached comber noil of superior quality to our clients. Bleached comber noil has specific uses in making cotton balls, cotton buds and cotton pads. It has a good demand in cosmetic industry. The best part is bleached comber noil is highly hygienic. It is of great demand industries that seeks hygiene. All waste is collected by pneumatic waste collection system and converted into bales. As all preparatory machines used the selected spinning mills meets the state of the art criteria, the quality of comber noil is very good. We supply and export world class quality yarn that matches with Uster 5% level. It is mainly due to best variety of cotton. we take special care in tracing contamination during selection of cotton beyond doubt. Comber Noils or Comber or Noils are the fibers produced by, or removed from, the combing process of textile fibers. Since the Cotton was extra-long staple (ELS) Cotton, combed sliver was used for ring and compact spinning systems. The combed cotton was spun into N_e 140, N_e 160 and N_e 170 yarns spun with 4.0 twist multiplier. The processing steps and machinery used are shown in Figure 1, including the branching to combing and to the compact and ring spinning frames. Regarding to combing process, all the cotton varieties and new promising

crosses were combed at 18% noil to extract the short fiber, except the Giza 77 x Pima S_6, the percentage of comber noil is 12%. This is the maximum percentage we have, meaning that the short fiber is very low and is more fiber uniform. Comber Noil is the shorter fibers separated from longer fibers in combing. See also Noil. Waste Generated In Processing:- The composition of the waste generated depends on the type of operation viz. cleaning, parallelizing drawing, combing (a process to remove short fibers), and in the final stage of twisting and forming a yarn (fiber fly). The amenability to cleaning of cotton fibers dictated by the initial trash content, fiber length and maturity, also decides the type and quantity of waste released in each mechanical operation. As far as fiber wastes are concerned, Card waste and comber waste. Comber Noil:- Comber noil is regarded more as a by-product of yarn manufacture during combing, an operation designed to remove short floating fibers in a sliver. It is a relatively trash-free waste generated in large quantity. The operation of combing is carried out to produce combed yarns unlike carded yarns (where this operation is avoided) of high quality devoid of shorter fibers for special down-stream processing. To make the parallelized sliver further aligned, bereft of short and floating fibers, the comber removes about 15–18% of the fibers from the sliver. This is the place in mechanical processing of cotton, wherein, bulk of waste of shorter fibers is produced. For a cotton to be used to prepare combed yarn, the virgin material has to be of certain characteristics. Table-1 enumerates the characteristics of both the virgin material as well as comber waste generated. Since combing is done both in the forward and backward directions to achieve better cohesiveness and longitudinal alignment without floats, the penetration of combs and number of passages decide the fibre parameters and extent of noils removed. A study on the distribution of the length of fibers prevalent in Comber noil led to an interesting inference that, about 2/3 of the comber waste contained fibers less than 15 mm length while 1/3 of the fraction was above that category. As already noted, being trash free, and essentially consisting of short opened fibers, these are either alone or in blends with virgin cotton used to prepare rotor/OE yarns and further converted into fabrics in handloom as well as in power loom. Bleached Comber Noil:- In order to make comber noil as a marketable commodity, the material has to be cleaned, got rid of the wax content and color. Therefore, scouring and bleaching are the two processes carried out to improve its grade. While scouring is a process to remove natural impurities including wax and pectin, traditionally it is carried out by treating with low concentration of NaOH at high temperature. To comply with eco regulations, nowadays enzymatic treatment either with a single enzyme or a cocktail of enzymes is carried out to get the desired impact. Bleaching is a process to get rid of the residual color and to make the noil white. Again, conventionally, the bleach used to contain chlorine. However, the modern practice is to bleach using peroxide solution due to environmental considerations of effluent. More recently, a single bath enzymatic scouring and peroxide bleaching has been developed to achieve the output with less water and chemical, keeping the impact of the treatment to the environment to the minimum. The chemical composition of bleached comber noil is given in Table-2. Comber Noil As A Marketable Commodity:- Comber noil is sold as a compressed bale of weight 100 kg (for internal consumption) and 170 kg (for export) in India. The open-end yarn industry, in India, predominantly uses this as raw material for spinning rotor yarns of lower counts; while the combed yarns are consumed by the ring spinning industry for producing high value finer count yarns. As the comber noils have found their applications in other value-added products such as sanitary napkins and other personal care items and also in the manufacture of regenerated cellulose, the raw material got diverted into these sectors. As a result, the primary user viz. the OE yarn industry has found it to be increasingly difficult to source good quality noil both due to non-availability as well as a spurt in the raw material cost. This has put the OE yarn industry in quandary which was encouraged to add more and more rotors in the country due to easy access to raw material. The bleached noil, due to its increased accessibility to chemical reagents (low DP combined with no wax), purity and high cellulose content, is being favourably exploited by the Cellulose industry for manufacture of regenerated cellulose. Chemical Composition Of Comber Noil:- Cellulose – 98–99%; Solubles (water, ether etc) – 1.0%; Ash – 0.40%; and Degree Of Polymerisation – 1 500. Particularly, the small-scale manufacturers and the handloom industry find it hard to source noil at affordable prices since 2005. The export of noil to other countries has also added to this misery in good measure. There are no authentic reports about how much noil is being produced worldwide nor what is the quantity transacted by different processing countries. In India annually about 0.25 million metric tonnes of comber noil is produced. An indirect guestimate of comber noil production/ availability globally could be around 5 million bales worth USD1 500 mn. Application of Comber Noil for Diversified Value Addition:- As noted already, unbleached ,cleaned comber noil is used to manufacture OE yarns which could further be value added by producing knits. Cleaned and bleached comber noil with its major constituent being pure cellulose, is used as raw material for cellulose manufacture and more recently in cotton nonwovens and bio-degradable cotton nonwoven based composites. In this section, a brief account is being provided on the application of comber noil for the manufacture of diversified products from low value – high volume (OE yarns) to high value – low volume cellulose and modified celluloses and nonwovens. (i) Open-End Yarns (OE Yarns):- Cleaned comber noil either alone or in mix with virgin cotton of a desired proportion as desired by the final quality of the product, is used in a OE spinning process to produce rotor yarns. Blends of comber noil and virgin cotton in different proportions were processed and OE yarns produced. From the quality of the yarns, it could be judged that addition of noil in the blend up to 25–35% did not significantly alter the mechanical behavior, although presence of virgin fibers in higher proportion enhanced the tenacity of the yarn which otherwise was found to be weaker. If comber noil is alone used to produce OE yarns, then the counts were found to be medium-coarse. Since the majority of fibers were less than 15 mm, this explains the coarser count, and that the yarn strength was marginally lower although the speed of production did not get affected. Knitted garments could be produced successfully by using those OE yarns. (ii) Absorbent Cotton:- Cotton Balls:- Apart from textiles and garments, one of the most sought-after value-added-product prepared after minimal processing is absorbent cotton or referred to as surgical cotton in medical parlance. Comber noil is cleaned, bleached, and carded to make it completely hydrophilic, free from other external agents including organic trash. The treated material is softened and sterilized (if need be) and carded (depending on the application) and compressed and baled (for easy transportation). Another form of the treated material is made into a ball, essentially for wiping. For the material produced from Comber noil, the average length of the staple is about 15 mm. The salient features of this product are its inertness, lack of irritation and softer to skin, highly absorbing and retaining fluid within its body without the skin/body feeling the damp, a characteristic of cotton. For medical applications, the product should satisfy the parameters prescribed in Indian/British Pharmocopia standards. A schematic diagram (figure-2) given below illustrates the preparation of absorbent cotton from noil. Since the production capacity could be smaller (150 mt/year), it is suitable for a small and medium enterprise establishment. Being classified as medical textiles, it is considered as a high value – low volume enterprise, with minimal processing. (iii) Cotton-Based Non-Woven:- Cotton non-woven preparation by using comber noil has received considerable attention by researchers in the recent past. Earlier the use of cotton in non-woven was restricted to 2%, whereas poly propylene, polyester, and other synthetic fibers used to occupy 98% of applications. The presence of foreign matter, wax, and variation in quality from batch to batch used to be referred to as hindrance in using cotton. Moreover, some of the bonding mechanisms used in the preparation of non-woven suited more to synthetic fibers. With the advent of hydro-entanglement /spun-laced/ spun-bonding technology cotton has found its application in non-woven for use in a variety of value-added-products. Non-woven, in general, possesses the advantage of high economic efficiency in production retaining the desired performance capability. Another advantage is its ability to form light weight fabrics. Cotton is preferred in special applications of skin contact as well as medical purposes due to its high absorbency, breathability, high wet strength, non-allergic, soft and its ability to hold but prevent passage of fluids. It becomes a preferred material for applications in high temperature due to its excellent resistance to heat, dimensional stability, and high strength at these temperatures (175 °C). For preparation of hydro-entangled non-woven, comber noil is employed as raw material. A batt prepared with noil either using air laying

system or needle punching, is subjected to varying water pressures to make a non-woven that could be converted to wipes, pads, gauzes and cosmetic applications. Hydroentanglement has the added advantage that scouring could be avoided prior to bleaching as water jet is able to remove the waxy material in cotton. (iv) Pulp And Paper:- Comber noil after removal of organic trash and other non-cellulosic impurities could be used for pulping and converted to high value paper for use in currency, security paper etc. A dissolving grade pulp is prepared before converting the pulp to paper in conventional machines. Due to severe eco-regulations, the process of pulping and bleaching has to ensure all the norms prevalent in the region and also a fool-proof effluent management programme. Cellulose from cotton waste such as comber noil and others, were preferred to wood pulp due to their purity and fibers in pulp exhibited higher tenacity and E modulus. (v) Regenerated Cellulose:- What has been described so far concerned applications that predominantly depended on the form of the fiber, its length, short fiber content, tenacity, and maturity. Conversion of cellulose waste such as comber noil and linters to regenerated fibers relies on the quality (amount of foreign material, Degree of polymerization) and quantity of cellulose present (cellulose content) to be dissolved and regenerated. Traditionally, regenerated cellulose known as Viscose Rayon, is produced by dissolving cellulose in suitable solvent, carbon-di-sulphide, and extruded into filaments/staple fibers. This has environmental issues related to release of CS2, a toxic gas. Improvements in this process led to production of 'LYOCELL' fibers, which also has problems with the solvent (N. methyl morpholine oxide) and also fibrillation of cellulose. More recently use of ionic liquids to dissolve cellulose and then extrusion into fiber/filament has resulted in improved quality of regenerated cellulose fibers. Figure 3, below describes the process sequence in a schematic diagram for regenerated cellulose production by using comber noil. The choice of hydrolysis depends upon the molecular order of the starting material. The degree of polymerization of the starting material and the selection of a suitable ionic liquid are crucial factors that determine the quality of cellulose produced. These fibers produced from waste cotton lint exhibited highest thermal decomposition temperature indicating higher stability associated with high crystallinity of the material. These fibers had roughly round cross sections, relatively smooth surface and rod- like longitudinal morphology. Regenerated cellulose fibers had higher tenacity and Young's modulus than conventional:- 'TENCEL' fiber. (vi) Micro Crystalline Cellulose:- Microcrystalline cellulose is obtained by treating cotton with acids at desired temperature thereby hydrolyzing the chain, decreasing its degree of polymerization in a controlled manner. The final product, the purest form of cellulose produced, is used as a filler for capsules and its hardness and high binding capacity enables the active component (medical formulation) to be bound into a compact tablet. The tablet produced by using comber noil was found to disintegrate quickly in a fluid medium, enabling the release of active component at the desired source. MCC prepared from cotton (be it waste cotton, comber noils, linters, post-consumer waste) meets all the specifications of USP norms with respect to chemical identity and proved to be a good additive for tablet preparation. (vii) Nano Cellulose:- Nano cellulose has received concerted attention by researchers due to its very specific attributes such as very large specific surface area, low weight/volume ratio. The methods of production include treatment of cotton noils/linters with acid (hydrolysis) and centrifugation to Nano-size cellulose fibers/powder. Alternately, fibrillation at very high speed also results in Nano fibrils after ensuring the starting material to be highly de-crystallized (treating cotton with alkali hydroxides or ethylene di amine or zinc chloride). A novel method of nano cellulose production is by producing Nano fibers by applying an electric field on a fluid jet and the process is known as Electrospinning. Cotton fibers by dissolving in suitable solvents such as trifluoro acetic acid could be converted into a fluid before subjecting to an electric field. The output is a mat of uniform thickness of Nano fibers which could be used in various areas such as industrial filters etc. Production of nano cellulose powder/ nano mat of fibers is a surer way of adding very high value to a material considered as low value (comber waste) by either chemical or mechanical action. (viii) Bacterial Cellulose:- Bacterial cellulose is a cellulose product with high purity, mechanical strength, liquid absorbing capability, biocompatibility, biodegradability with fairly high strength and crystallinity. A material with high cellulose content but with low lignin content is eminently suitable for bacterial cellulose production. The dis-advantage in bacterial cellulose production is its high production cost. In order to minimize cost, efforts are being made to use novel microbial strains as well as use cotton waste as raw material. The bacterial cellulose is conventionally produced by using cotton in culture media for saccharification in Gluconacetobacter Xylinus. The conversion rate into bacterial cellulose could be enhanced first by treating cotton waste in a suitable ionic liquid prior to introducing the culture. The water holding capacity of the product is around 99.5%, and the thickness about 2.8 mm with fairly high strength of 0.48 Newtons. Entrepreneurship in Value Addition to Comber Noil:- As already noted, though comber noil is extracted as a byproduct during mechanical processing of cotton bale, the good amount of useful fibers that could be recovered from this socalled waste material has generated huge interest not only among researchers but also in building entrepreneurship. Since a lot of avenues for value addition to this cellulose fiber has been discussed in the preceding section, it is necessary to rigorously analyze the economic benefits of the process of value addition before venturing into any business activity. The non-recurring investment in land, building and machinery, and annually recurring expenses towards water, electricity, chemicals, labor as well as in setting up a fool-proof effluent treatment mechanism has to be thoroughly examined before making a judicious choice about the plausible route for value addition. Preparation of absorbent cotton from comber noil (referred to as cotton-wool in some circles) is considered as one of the viable value addition endeavour capable of running a successful business venture. With rising awareness about health care and increasingly available medical facilities even in every nook and corner of the country, the demand for surgical cotton is rapidly growing at the rate of 8–10% in India alone. It has been reported that a plant capacity of 100 tons per annum could be profitably set up with a capital investment of about USD75 000.00 and with a working capital of double the amount. The costs of land and building are not considered here as they vary from place to place. A Rate of Return (ROR) on investment of about 30–33% is also envisaged in such a plant. More improved project reports prepared recently with innovative modern processing technologies are available for further consultation. Price Of Row Material And Value Added Product (India; 2020):- Comber Noil – 0.75–1.35 USD/kg; Bleached Comber Noil – 2.00–2.50 USD/kg; Cotton Linter – 1.00–1.50 USD/kg; Bleached Linter – 1.50–2.50 USD/kg; Absorbent Cotton – 2.25–2.75 USD/kg; Open–End Yarn – 3.00–5.00 USD/kg (depends on quality); Viscose – 1.50–2.25 USD/kg; Pilp-Paper Grade – 1.25 USD/kg; Pulp-Dissolving Grade – 1.50 USD/kg; Cotton Linters Pulp – 1.50–1.75 USD/kg; Viscose Grade Pulp – 1.00–1.20 USD/kg; and High End Paper – 1.75–2.00 USD/kg. Future Outlook:- Resource use-efficiency, resource conservation and waste management and containment have become the operating buzz words of any industrial activity in recent years. Textile industry is no exception to this Mantra. The comber noil generated during processing of a compressed bale has served the Open-End-Yarn industry as a veritable raw material with profitability. Many more new, exciting but unexplored business activities are waiting to be taken up and benefits reaped in coming times using this excellent cellulosic reserve. As many new ventures start springing up, the availability and price of noil would become dearer and unaffordable especially for the conventional processors as well as for small and medium enterprises. Adoption of efficient processing routes and tools and modern methods of management and a continually upgrading human resource would be the key ingredients for a successful venture using this invaluable cellulosic raw material. Comber Noil is a by-product of the yarn spinning process, produced when cotton is combed in comber machine to remove short fibers. Noil consists of shorter fibers and neps. Flat Strips (F/S) collected from carding machines during processing in spinning mill are recycled by recycling machine before pressing by bale press machine. Comber Noils were collected from comber machine and pressed to form bale of comber noil. Unused packages of roving were processed at rovematric frame to collect untwisted roving wastes and pneumafil wastes were collected from ring frame directly without any further processing. / Короткие волокна, отделённые от более длинных волокон в процессе гребнечесания. Смотрите также Очёс (Noil). Гребенные Очёсы с каждого выпуска гребнечёсальной машины направляются на конвейер и поступают в пневмопровод, идущий в цех по переработке отходов. На

гребнечёсальной машине в гребенной очёс выделяется сравнительно много волокон (до 16–18%), в очёсе, разумеется, должны быть только короткие волокна. Поэтому можно считать, что в процессе гребнечесания происходит рассортировка волокон по длине. Количество гребенного очёса, или, как говорят, процент гребенного очёса, будет тем меньше, чем меньше разводка, меньше длина питания, лучше распрямлены волокна перед гребнечесанием. Поэтому перед гребнечесанием продукт подготавливают, пропуская через вытяжной прибор для распрямления волокон. На процент гребенного очёса влияет величина – доля питания в первом периоде:- с увеличением доли питания процент гребенных очёсов уменьшается, то есть если питающий цилиндр продвигает бородку на определённую величину перед отделением, то в гребенной очёс будут попадать более короткие волокна.

Parameters of Virgin Cotton and Comber Noil Extracted from the Virgin Cotton		
Parameters	**Cotton**	**Comber Noil**
2.5% Span Length, mm	28.0 – 32.5	15.0 – 21.0
Micronaire Value	3.8 – 4.2	2.5 – 3.5
Tenacity, g/tex	24 – 28	17 – 19
Short Fiber Content	10	8 – 10
Immature Fiber Content, %	Less than 10	18 – 21
Neps and Seed Coat Fragments	150 and 10	Significantly higher than virgin cotton

COMBER WASTE = ОТХОДЫ ГРЕБНЕЧЕСАНИЯ – Comber Waste is the waste from the comber machine consists of fiber and the remaining flects and small pieces of foreign matter removed from slivers. / удалённые из лент . В зависимости от физико-механических свойств отходов и области их использования отходы делятся на шесть групп. Первую и вторую группы составляют прядомые отходы, третью группу – ватные, четвёртую – низкосортные, пятую – обтирочные, и шестую – кустарные. В первой группе отходов около 35% приходится на мычку и колечки, 30% – на гребенной очёс. Во второй группе около 60% приходится на орешек и трёпальный пух и около 30% – на кардный очёс. Установлено, что нецелесообразно хлопковое волокно низших сортов добавлять к обычным сортировкам, а наиболее рационально использовать это волокно в смеси с прядильными отходами при производстве пряжи большой линейной плотности (от 83.3 до 333 текс), которая может быть использована для производства мебельных, портьерных, тарных тканей, тканей для рукавиц, тентов, чехлов, а также для производства байки, фланели. Пряжу из отходов и низкосортного хлопкового волокна вырабатывают на оборудовании аппаратной (или суконной) системы прядения, которая стала заменяться более прогрессивной технологией на основе безверетённых способов формирования пряжи и эффективной очистки засорённых сортировок.

COMBI = КОМБИ (или КОМБИНИРОВАННОЕ) – (1) Combination passenger/cargo vessel. Combi is a vessel specifically designed to carry both containers and conventional cargoes. / Под Комбинированным Судном понимается грузовое судно, на котором в целях сокращения порожних рейсов предусмотрена перевозка грузов с резко отличающимися транспортными характеристиками. К комбинированным судам относят нефтерудовозы, универсальные нефтесухогрузные суда и другие.

(2) Combi or Combination (in air transport) is an airplane capable of simultaneously carrying passengers and cargo on the main deck.

COMBINATION = КОМБИНАЦИЯ – Combination:- puts and calls held either long or short with different strike prices and/or expirations. Types of combinations include straddles and strangles. / Удерживаемые опционы на продажу или покупку, будь-то купленные или проданные, с разными сходными ценами и/или разными датами прекращения признания (экспирации). К одним из типов комбинаций относятся одновременные разнонаправленные операции (или стрэдлы (straddles)) и операции по ограничению ценового диапазона (или стрэнглы (strangles)).

COMBINATION CARRIER = КОМБИНАЦИОННЫЙ ПЕРЕВОЗЧИК – Combination Carrier (in air transport) is a commercial operator (scheduled and chartered) that carries both passengers and cargo on revenue flights. Most do so on passenger airplanes with cargo in the lower hold, but many of the world's largest cargo carriers also operate freighters in addition to passenger airplanes.

COMBINATION CHARGE = КОМБИНАЦИОННЫЙ (или СОВОКУПНЫЙ, или СМЕШАННЫЙ) СБОР – Combination Charge is an amount which is obtained by combining two or more charges.

COMBINATION CHASSIS = КОМБИНАЦИОННОЕ ШАССИ – Combination Chassis is a chassis which can carry either one forty foot or thirty foot container or a combination of shorter containers, e.g., 2 x 20 foot. / Шасси, которое может перевозить либо один сорока-футовый, либо тридцати-футовый контейнер, либо комбинацию более коротких контейнеров, например, два двадцатифутовых.

COMBINATION CONTAINERSHIP = КОМБИНАЦИОННЫЙ КОНТЕЙНЕРОВОЗ (или СМЕШАННЫЙ КОНТЕЙНЕРОВОЗ) – In addition to cell holds for the accommodation of containers, other distinctive means of handling cargo are present in the same hull:- roll-on roll-off, palletized cargo handling through side ports, or the capability for transporting bulk commodities in the lower holds.

COMBINATION FABRIC = КОМБИНАЦИОННАЯ ТКАНЬ – Combination Fabric is a fabric containing:- (i) different fibers in the warp and filling (e.g., a cotton warp and a rayon filling), (ii) ends of two or more fibers in the warp and/or filling, (iii) combination yarns, (iv) both filament yarn and spun yarn of the same or different fibers, or (v) filament yarns of two or more generic fiber types. Combination fabrics may be either knit or woven. They should not be confused with blend fabrics. Although blend fabrics also contain more that one fiber, the same intimately blended spun yarn is present in both warp and filling. / уточина.

COMBINATION JOINT RATE = КОМБИНАЦИОННАЯ СОВМЕСТНАЯ СТАВКА (или СМЕШАННАЯ СОВМЕСТНАЯ СТАВКА) – Combination Joint Rate is a joint rate which is obtained by combining two or more published rates (aircargo). / В перевозках авиационных грузов .

COMBINATION PASSENGER AND CARGO SHIP = КОМБИНАЦИОННОЕ ГРУЗОПАССАЖИРСКОЕ СУДНО – Combination Passenger And Cargo Ship is a ship with a capacity for 13 or more passengers. / Суда с вместимостью 13 или более пассажиров. Под Грузопассажирским Судном понимается грузовое судно, имеющее помещения для 12 пассажиров и более, или пассажирское судно с трюмами для коммерческого груза. Требования к непотопляемости и составу спасательных средств грузопассажирских судов аналогичны требованиям, предъявляемым к пассажирским судам. Под Грузопассажирским Судном понимается судно, оборудованное для одновременной перевозки грузов и пассажиров. Грузовое судно, перевозящее более 12 пассажиров, Международной Конвенцией об Охране Человеческой Жизни на Море рассматривается как пассажирское и к нему предъявляются повышенные требования в отношении живучести. Однако строгого деления на пассажирские и грузовые суда нет, так как вместе с пассажирами почти всегда перевозятся багаж, почта и другие грузы. Обычно грузопассажирскими называются суда, у которых грузовые функции преобладают над пассажирскими. К грузопассажирским судам относятся и грузопассажирские паромы. Пассажировместимость современных грузопассажирских судов до 1 200 человек,

грузоподъёмность 500–17 000 тонн, грузовместимость 1 000–20 000 м^3 (в том числе рефрижераторных помещений 400–1 500 м^3, скорость 24–37 км/ч (13–20 узлов), силовая установка обычно дизельная или паротурбинная.

COMBINATION PATENT = КОМБИНАЦИОННЫЙ ПАТЕНТ – Combination Patent is a patent granted for an invention that unites existing components in a novel way.

COMBINATION RATE = КОМБИНАЦИОННАЯ СТАВКА (или СОВОКУПНАЯ СТАВКА, или СМЕШАННАЯ СТАВКА) – Combination Rate is a rate made up of two or more factors, separately published. Combination Rate:- using two or more published rates to calculate a freight rate.

COMBINATION UTILITY = КОМБИНАЦИОННАЯ УСТАНОВКА (или КОМБИНИРОВАННАЯ УСТАНОВКА, или СМЕШАННАЯ УСТАНОВКА) – Combination Utility is an utility which provides both gas and electric service. / Установка, которая обеспечивает поставку как газа, так и электроэнергии.

COMBINATION WEAVE = КОМБИНАЦИОННОЕ ПЕРЕПЛЕТЕНИЕ (или ПРОИЗВОДНОЕ ПЕРЕПЛЕТЕНИЕ) – Combination Weaves:- one of the most common methods of producing new or novel weave effects in a fabric is by combining two or more weaves as a whole. In this method of amalgamating weaves, one or more repeats of each weave are joined together, instead of combining the weaves pick and pick or end and end. As twill, basket, satin, corkscrew or other weaves produce entirely distinct effects in a fabric, a large filed is opened by this method for the production of new effects. In the formation of combination weaves there are two important points that should be taken into consideration. In the first place, the yarns with which the cloth is to be woven, whether woolen, worsted, silk, or cotton, must be uniform in structure, as woolen yarn is so constructed that it is not eslecially adapted for developing weave effects, the surface of the yarn being too rough and fibrous. Simple combinations and good colorings are the essential points in woolens. In worsted or cotton fabrics, a large diversity of fancy weaves may be used, since the yarns are comparatively smooth (the fibers being laid in parallel order) and are thus excellently adapted for bringing out every detail of the weave. Silk is a still more suitable yarn for developing weave effects. The second point, to which it is especially desired to call attention, is that however widely the weaves that are to be combined may differ in respect to the effects that they produce in the cloth, they must be somewhat similar as regards the number of interlacings of the warp and filling, otherwise they cannot be made to weave together evenly. When desiring to form new effects by the method of combining two or more weaves, this latter fact should constantly be borne in mind, as it is absolutely essential to the satisfactory weaving of the cloth. / уточина. Производные Переплетения – это мелкоузорчатые переплетения, построение которых производится видоизменением главных переплетений с сохранением основных признаков базового переплетения. Соответственно числу главных переплетений, производные переплетения делятся на три группы:- (i) производные полотняного переплетения (репс, рогожка, панама); (ii) производные саржевого переплетения (усиленная, сложная, ломаная, ломаная со сдвигом, ромбовидная, зигзагообразная, теневая и криволинейная саржи); и (iii) производные сатинового переплетения (усиленный и теневой сатины).

COMBINATION YARN = КОМБИНИРОВАННАЯ ПРЯЖА (или КОМБИНАЦИОННАЯ ПРЯЖА) – Combination Yarns are obtained from the combined texturing of different yarns, for example, acetate and capron, by twisting textured yarns with different structures and properties, or by twisting ordinary composite or high-tensile yarns with staple fibers. Combination Yarn is a plied yarn containing two or more yarns that vary in fiber composition, content, and/or twist level; or plied yarn composed of both filament yarn and spun yarn. A Combination Yarn is produced with two or more yarns having the same or different fibers or twist, e.g., one yarn may have a high twist, the other, little or no twist. / Комбинированная Нить (Combination Yarn) – текстильная нить, состоящая из комплексных нитей и пряжи или из мононитей и пряжи или из комплексных нитей, различающихся по химическому составу и структуре, или из различной по волокнистому составу и структуре пряжи.

COMBINED BILL OF LADING = КОМБИНИРОВАННЫЙ КОНОСАМЕНТ (или СМЕШАННЫЙ КОНОСАМЕНТ) – Combined Bill of Lading is a bill of lading that covers not only carriage of cargo on an ocean going vessel but all or other stages and/or forms of carriage, e.g., carriage of the cargo by rail, road or barge from the shipper's premises to an ocean port of shipment, from that port to an ocean port of discharge and from that port of discharge by rail, road or barge to the consignee's premises. The issuer of such a bill of lading generally accepts primary responsibility as carrier for all stages and forms of carriage. Also known as Combined Transport Bill, House To House Bill, and Multimodal Transport Bill. Bill of lading that covers cargo moving over various transports. What is 'Combined Bill of Lading'? If the exporter's location is far away from the loading port, he can move the cargo to nearest Container Freight Station (CFS). If a cargo is shipped from a CFS, goods is moved from CFS to nearest sea port after customs clearance. The carrier accepts the goods at exporter's location and issues Bill of Lading. Here the carrier moves cargo either by road or rail to nearest sea port and ship via sea to final destination. Since the carrier moves the cargo by using two or more modes of transport, this bill of lading is called Combined Bill of Lading. / порта разгрузки по железнодорожным, автомобильным транспортом или баржей до помещений консигнатора (получателя). Коносамент, который обеспечивает перевозку груза различными видами транспорта.

COMBINED CYCLE = КОМБИНИРОВАННЫЙ ЦИКЛ – Combined Cycle (CC) is an electric generating technology in which electricity is produced from otherwise lost waste heat exiting from one more gas (combustion) turbines. The exiting heat is routed to a conventional boiler or to a heat recovery steam generator for utilization by a steam turbine in the production of electricity. This process increases the efficiency of the electric generating unit. Combined Cycle (CC):- a generating unit generally consisting of a gas-fired turbine and a heat recovery steam generator. Electricity is produced by a gas turbine whose exhaust is recovered to heat water, yielding steam for a steam turbine that produces still more electricity.

COMBINED–CYCLE GAS TURBINE = ГАЗОВАЯ ТУРБИНА С КОМБИНИРОВАННЫМ ЦИКЛОМ – Combined-Cycle Gas Turbine (CCGT) is an energy-efficient gas turbine system where the first turbine generates electricity from the gas produced during fuel combustion. The hot gases pass through a boiler and then into the atmosphere. The steam from the boiler drives the second electricity generating turbine.

COMBINED CYCLE UNIT = УСТАНОВКА КОМБИНИРОВАННОГО ЦИКЛА – Combined Cycle Unit is an electric generating unit that consists of one or more combustion turbines and one or more boilers with a portion of the required energy input to the boiler(s) provided by the exhaust gas of the combustion turbine(s).

COMBINED FEDERAL CAMPAIGN = КОМБИНИРОВАННАЯ ФЕДЕРАЛЬНАЯ КАМПАНИЯ – Combined Federal Campaign (CFC) is an annual government-wide campaign for charitable contributions from Federal employees. The mission of the CFC is to promote and support philanthropy through a program that is employee focused, cost-efficient, and effective in providing all federal employees the opportunity to improve the quality of life for all. CFC is the world's largest and most successful annual workplace charity campaign, with almost 200 CFC campaigns throughout the country and overseas raising millions of dollars each year. Pledges made by Federal civilian, postal and military donors during the campaign season (September 1st to December 15th) support eligible non-profit organizations that provide health and human service benefits throughout the world. The Director of the Office of Personnel Management (OPM) has designated responsibility for day-to-day management of the program and to its CFC office. A 'Combined'

Campaign:- by 1961, President Kennedy had determined that the program was well-enough established that the President's Committee on Fund Raising within the federal service could be abolished. He did so and assigned the program to John W. Macy, Jr., Chairman of the Civil Service Commission, by Executive Order 10927. Work on overcoming problems with the program continued. Serious consideration began to be given to both a system of payroll deduction and the possible consolidation of solicitation efforts into a single campaign. There was strong interest on the part of representatives of the voluntary agencies in payroll deduction. However, there was not agreement at this stage on the part of all participants about the desirability of melding the separate identities of the fundraising organizations by consolidation into a single campaign. In 1964, the first 'combined' campaigns, officially called 'Combined Federal Campaigns, or CFC' were conducted as experiments in six cities, consolidating all drives into one. The result was a substantial increase in contributions, ranging from 20% to 125%, and a highly favorable response within the federal community:- agency managers were pleased with having to deal only with a once-a-year effort; federal employees responded with favor to the single solicitation. By 1971 all campaigns had become 'combined'. President Nixon announced on March 03, 1971, that the CFC would be the uniform fundraising method for the federal service. Another major change at the time was the introduction of payroll deduction as a form of charitable contribution. This was made possible only by a truly combined, once-a-year campaign, and greatly increased the size of contributions. Despite continued skepticism about whether the consolidated character of the CFC suited the fundraising philosophies of some of the major CFC participants, contributions grew dramatically:- from USD12.9 million in 1964 to USD82.8 million in 1979. Expansion:- up through the 1970's, the Combined Federal Campaign (CFC) was a relatively non-controversial program in terms of the charities allowed to participate. Growth in the number of participating national charities was slow – from 23 in 1969 to only 33 in 1979. In the late 1970's, public policy advocacy groups, legal defense funds, and other organizations succeeded through lower court litigation in entering the CFC. The case that opened the doors to these types of groups was Natural Resources Defense Council v. Campbell in which the United States District Court for the District of Columbia ruled that the definition of a human health and welfare charity was too vague and ordered the Office of Personnel Management (OPM) to allow various groups to participate in the CFC. OPM, the successor organization to the US Civil Service Commission, assumed regulatory authority over the CFC in 1978. Significant changes to the CFC regulations in April, 1980 went a long way toward expanding participation in the CFC and resolving a number of other problems. Regulations issued in 1982 by OPM Director Donald Devine also addressed CFC organization. They formally recognized the role and responsibilities of the local groups of Federal officials that manage the campaigns – Local Federal Coordinating Committees (LFCC's) – and introduced the concept of Principal Combined Fund Organizations (PCFO's) – local federated fundraising organizations appointed by LFCC's to administer the local campaigns. Responding to a court order permanently enjoining OPM from excluding legal defense and advocacy groups from the CFC because of their 'indirect' support of health and welfare or their lobbying/advocacy activities, Director Devine in April 1984 opened the CFC to basically any 501(c)(3) charity and permitted write-in designations. In July 1985, however, the Supreme Court upheld President Reagan's Executive Orders, holding that the exclusion of advocacy, legal defense and other non-health-and-welfare groups is constitutional, as long as it is done even-handedly, without discrimination for or against any particular political viewpoint. In 1986, OPM revised its regulations consistent with the President's Orders. Under the Hoyer-Hatfield Amendment to the Continuing Resolution for FY 1986, however, Congress declared that OPM could not issue the regulations in final form and implement them. Congress directed OPM to either disregard the content of the 1982 and 1983 Executive Orders or reissue the regulations used in the campaigns in 1984 and 1985. OPM reissued the 1984 regulations and administered the 1986 and 1987 CFC under these interim rules. The 1990s:- starting in the fall of 1986 and continuing throughout 1987, the Office of Personnel Management (OPM) met with various interested parties including local federal officials and representatives of the voluntary agencies and the federations. During the course of these discussions OPM identified six areas of immediate concern:- the Director of OPM convened a task force composed of three private sector individuals, chaired by OPM's General Counsel. The task force was to consider relevant information on the design and operation of the Combined Federal Campaign (CFC) and provide the Director with its opinions on the future direction of the CFC. Before the task force could present its report to the Director, the Congress, at the request of various national charities, adopted permanent legislation for the CFC in the Treasury, Postal Service, and General Government Appropriations Act for FY 1988 (P.L. 100-202). This legislation attempted to deal with some of the major problems that OPM had identified during the course of the meetings and discussions during the past year and a half. Public Law 100-202 required OPM to review the formula for distributing undesignated contributions based on the experience of the 1988, 1989, and 1990 CFC's. In 1990, OPM conducted eight public meetings around the country to hear from all interested parties, especially federal employees, on this topic. Final regulations were published in August, 1991 that provided for undesignated funds to be distributed to organizations in the same proportion as they received designations. In addition, three new general designation options for all participating organizations, all national/international organizations, and all local organizations were created. They have since been removed. A fourth general designation option for all international organizations was mandated by congressional legislation and still exists today. These regulations were effective with the 1992 campaign. As a result of audits of local campaigns conducted by OPM's Office of the Inspector General and to reflect the experience of the previous eight campaigns, CFC regulations were revised in November, 1995. Eligibility and public accountability criteria for participating charities remains consistent with congressional guidelines. However, several administrative changes were made. Some of the more important revisions include:- (i) more clearly defining the scope and meaning of workplace solicitations in the federal government; (ii) identification of the circumstances where the Director may authorize solicitations of federal employees in the workplace outside of the CFC; (iii) clarification of procedural requirements for charitable organizations seeking participation in the CFC; (iv) expanding local eligibility by defining and enumerating criteria for organizations that provide services on a statewide basis; (v) removing all general designation options not required by statute; and (vi) expanding the solicitation methods and the pool of potential donors. The 1999 Combined Federal Campaign currently consisted of 387 regional campaigns and the 1998 campaign receipts were USD206.4 million. The CFC Today – A Time for Transformation:- the CFC today is known to be the most inclusive workplace giving campaign in the world with the number of participating charities estimated at over 20 000 nonprofit charitable organizations worldwide. The charities supported through the CFC range from nascent community groups to large, well-known charities. Partnerships with nonprofit organizations are a core part of the CFC structure. In each of the 320 CFC areas throughout the country, local and national nonprofit organizations collaborate closely with committees of volunteer Federal employees to design marketing strategies for the campaign and to process the receipt and distribution of Federal employee contributions to the charities they choose. CFC also directly involves participating nonprofit organization leaders in the design of new policies and programs that are shaping the future of the Combined Federal Campaign. These partnerships are promoting greater direct giving from Federal employees to local and national nonprofits while helping nonprofit organizations use these contributions to leverage financial resources from other sources. CFC campaigns are delineated geographically along county lines. While the structure of the campaign and parameters of responsibility established in the early 1980's remains essentially the same, an emerging trend is for greater collaboration among campaigns through the merging of local campaign operations and other arrangements. Each campaign is managed by a volunteer group of Federal employees who work with experienced nonprofit executives in their communities to generate contributions and distribute them to eligible charities. This partnership provides an opportunity for Federal workers to become involved in their communities and adds great value to the Combined Federal Campaign for both Federal employees and the participating nonprofit organizations. The increase in the number of participating charities over the past decade has been great. The number of participating

national Federations increased from 3 to 27 and the number of national and international charities has grown to over 1 600. Many federations also operate a network of local affiliated federations which participate in the CFC locally. Today, the vast majority (75%) of the charities that participate in the campaign as national organizations do so as members of national Federations. While it is estimated that the total number of CFC participating charities in the country exceeded 20 000 in 2004, national organizations and Federations alone received over 45% of the USD256 million recorded in campaign contributions in 2004. Contributions have also increased steadily. Despite dramatic downsizing in the Federal workforce during the 1990's, the amount received in donor contributions rose steadily – with half of the nearly USD5 billion in contributions raised since results were recorded in 1964 received in the last ten years since 1990. This upward trend in giving continues strong. In 2001 alone following the September 11 terrorist attacks, Federal donor's contributions rose by 8% over 2000 for a total of USD241 million, the largest increase in 12 years. By 2004, contributions increased to USD256 million. New opportunities abound with the use of new technology. What seemed impossible just a few years ago is now entirely possible and will be more commonplace five years from now. The proliferation of this technology campaign-wide presents a rare strategic occasion for the CFC to become an even more efficient campaign in the future. The CFC Program is endeavoring to bring these advances to donors as well. For example, nonprofits are lending their expertise in web-based philanthropy to bring new efficiencies to giving in the Federal workplace through the use automated giving. Without doubt, the ability to apply web-based technology while preserving donor trust, in involvement and ownership represent among the greatest challenges facing the CFC as it moves into the XXI Century. / против Кэмпбэла (Campbell). Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004).

COMBINED HEAT AND POWER = КОМБИНИРОВАННАЯ ВЫРАБОТКА ТЕПЛА И ЭЛЕКТРОЭНЕРГИИ – Combined Heat And Power (CHP) is a system in which the heat associated with electricity generation is also used for space heating or process heat. In this way the overall efficiency of the process in terms of the proportion of the energy in the biomass fuel that is made use of is increased considerably. Also known as Co-generation.

COMBINED–HEAT–AND–POWER PLANT = ТЕПЛОЭЛЕКТРОЦЕНТРАЛЬ (или ТЕПЛОФИКАЦИОННАЯ ЭЛЕКТРОСТАНЦИЯ) – Combined Heat And Power (CHP) Plant is a power station system that uses both gas and the heat/steam generated to produce electricity. Also known as Cogeneration. Combined Heat-And-Power (CHP) Plant is a plant designed to produce both heat and electricity from a single heat source. This term is being used in place of the term Cogenerator that was used by the US Energy Information Administration in the past. Combined-Heat-and-Power (CHP) better describes the facilities because some of the plants included do not produce heat and power in a sequential fashion and, as a result, do not meet the legal definition of cogeneration specified in the US Public Utility Regulatory Policies Act (PURPA). / Под Теплоэлектроцентралью (ТЭЦ) понимается паротурбинная электростанция, вырабатывающая и отпускающая потребителям одновременно 2 вида энергии:- электрическую энергию и теплоту (получаемую в результате частичного использования отработанного пара). ТЭЦ оборудуют преимущественно теплофикационными турбинами. Комбинированная выработка электрической и тепловой энергии на ТЭЦ позволяет значительно улучшить использование сжигаемого топлива, повысить кпд электростанции и снизить себестоимость энергии. В бывшем Союзе Советских Социалистических Республик (СССР) мощность отдельных ТЭЦ достигала 1.5–1.6 ГигаВатт (ГВт) при часовом отпуске тепла до 16–20 ТерраДжоулей (ТДж).

COMBINED NOMENCLATURE = КОМБИНИРОВАННАЯ НОМЕНКЛАТУРА – In the European Union, Combined Nomenclature is a systematic list of goods descriptions based on the Harmonized System, serving for the purposes of the Common Customs Tariff, external trade statistics, and other Community policies. / Номенклатура – классифицированный перечень.

COMBINED PUMPED–STORAGE PLANT = КОМБИНИРОВАННАЯ ГИДРОАККУМУЛИРУЮЩАЯ (или НАПОРНАЯ–САМОТЁЧНАЯ) ЭЛЕКТРОСТАНЦИЯ – Combined Pumped-Storage Plant is a pumped-storage hydroelectric power plant that uses both pumped water and natural streamflow to produce electricity.

COMBINED RATIO = КОМБИНИРОВАННОЕ СООТНОШЕНИЕ – Combined Ratio:- the claims and expenses of an insurer/reinsurer for a given period divided by its premium for the same period. It is normally expressed as a percentage with any figure in excess of 100% signifying a technical underwriting loss. The combination of the non-life claims ratio and the expense ratio. Combined Ratio is a measure of an insurer's underwriting profitability based on the ratio of net incurred claims plus net operating expenses to net earned premiums. A combined ratio of 100% is break even (before taking into account investment returns). A ratio less than 100% is an underwriting profit.

COMBINED STRESS = КОМБИНИРОВАННОЕ НАПРЯЖЕНИЕ – Combined Stress:- the combination of axial and bending stresses acting on a member simultaneously, such as occurs in the bottom chord (usually tension plus bending) of a truss. / в нижнем пояске (bottom chord) .

COMBINED TILLAGE OPERATIONS = КОМБИНИРОВАННЫЕ ОПЕРАЦИИ ПО ВСПАШКЕ (или КОМБИНИРОВАННЫЕ ОПЕРАЦИИ ПО ОБРАБОТКЕ ПОЧВЫ) – Combined Tillage Operations:- the simultaneous operation of two or more different types of tillage tools or implements (subsoiler-lister, lister planter, or plow planter) to simplify control or reduce the number of trips over the field. / сеялка точного высева (planter). Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

COMBINED TRANSACTIONS = КОМБИНИРОВАННЫЕ ТРАНЗАКЦИИ (или КОМБИНИРОВАННЫЕ ОПЕРАЦИИ) – Combined Transactions:- these transactions are understood to refer to various combinations of forward, spot and options transactions. Due to the diversity of possible variations, the risk structures arising in a specific instance cannot be dealt with in detail within the scope of this brochure. Note that closing out individual elements of a combined transaction substantially alters the risk profile of the position as a whole, i.e. of the elements remaining open. Before investors conclude a transaction of this nature or close out individual elements of it, they should therefore make detailed enquiries about the specific risks involved. Combined Transactions are understood to mean the conclusion of two or more options transactions on the same underlying instrument. In such cases the options differ at least in respect of type (call or put), quantity, striking price, expiry date and/or the position taken (long, short). / , то есть .

COMBINED TRANSPORT = КОМБИНИРОВАННАЯ ПЕРЕВОЗКА (или СМЕШАННАЯ ПЕРЕВОЗКА) – Combined Transport arises if the carrier has indicated a place of receipt and/or a place of delivery on the front hereof in the relevant spaces. Combined transport consists of a port-to-port carriage and inland transport. Intermodal Transport where the major part of the journey is by one mode such as rail, inland waterway or sea and any initial and/or final leg carried out by another mode such as road. See also Intermodal Transport, and Multimodal Transport. The terms Combined Transport and Intermodal Transport are often used interchangeably to describe the carriage of goods by two or more modes of transport. In the European Union, Combined Transport is defined as intermodal transport where the major part of the European journey is by rail, inland and waterways or sea and any initial or final legs carried out by road are as short as possible. Intermodal Transport has been defined as the movement of goods in one and

the same loading unit or road vehicle, which uses successively two or more modes of transport without handling the goods themselves in changing modes. Transport where the major part of the journey is by f. inst. sea and any pre-/on-carriage is carried out by another mode such as road. Shall mean a transport of goods where at least for a leg of the operation different means of transport is used than the one initially applied, e.g., by road, rail, air, waterways, sea, etc or a combination of those, e.g., roll-on-roll-off. If a TIR Carnet is in use, it shall cover the operation carried out only for the leg by road and in a country with which a TIR transit operation can be established. / , например, . Под Смешанной Перевозкой понимается перевозка пассажиров и грузов при помощи нескольких видов транспорта (железнодорожного, речного и так далее). В отличие от прямой перевозки одним видом транспорта

COMBINED TRANSPORT BILL OF LADING = КОНОСАМЕНТ ДЛЯ КОМБИНИРОВАННОЙ ПЕРЕВОЗКИ – Combined Transport Bill Of Lading, this document provides for the carriage of goods though more than one mode of transport in one unit load. Provides a combined transport by at least two different modes of transportation from a place from which the goods are taken to a place designated for delivery. Transport document providing for a combined transport by at least two different modes of transport from a place at which the goods are taken to a place designated for delivery under the responsibility of the carrier.

COMBINED TRANSPORT DOCUMENT = ТРАНСПОРТНЫЙ ДОКУМЕНТ НА КОМБИНИРОВАННУЮ ПЕРЕВОЗКУ – Combined Transport Document is a negotiable or non-negotiable document evidencing a contract for the performance and/or procurement of performance of combined transport of goods.

COMBINED TRANSPORT OPERATOR = ОПЕРАТОР КОМБИНИРОВАННОЙ ПЕРЕВОЗКИ – Combined Transport Operator is a party who undertakes to carry goods with different modes of transport. / Сторона, которая берётся обеспечить транспортировку товаров различными видами транспорта.

COMBINED USE TABLE = КОМБИНИРОВАННАЯ ТАБЛИЦА ИСПОЛЬЗОВАНИЯ – Combined Use Table is a table of the demand for products by each industry group or sector, whether from domestic production or imports, estimated at purchaser's prices. It displays the inputs used by each industry to produce their total output and separates out intermediate purchases of goods and services. This table shows which industries use which products. Columns represent the purchasing industries:- rows represent the products purchased. / выработка (output).

COMBINED YARN = КОМБИНИРОВАННАЯ ПРЯЖА (или СМЕШАННАЯ ПРЯЖА) – Combined Yarn:- xxxxx. See also Combination Yarn. A Combination Yarn is produced with two or more yarns having the same or different fibers or twist, e.g., one yarn may have a high twist, the other, little or no twist.

COMBING = ГРЕБНЕЧЕСАНИЕ – Combing is a step subsequent to carding in cotton and worsted system processing which straightens the fibers and extracts neps, foreign matter, and short fibers. Combing produces a stronger, more even, more compact, finer, smoother yarn. The Combing process is an additional step beyond carding. In this process the fibers are arranged in a highly parallel form, and additional short fibers are removed, producing high quality yarns with excellent strength, fineness, and uniformity. Combing is a method of treating cotton, worsted, and certain other fibers in the comber machine. The process removes all fibers below a certain staple length; it combs those that are to be retained and sets them in a uniform, parallel order ready for further manipulation. Combing takes out practically all foreign matter such as dirt, neps, shives, and other minute particles. Combing is vital for the manufacture of fine yarns, and it can be done to coarses yarns when high quality is necessary. Combing, however, as mill costs run, is rather expensive because the percentage of waste is high. It is resorted to only in the case of high-grade yarn for the better fabrics on the market today. Combing is an operation in the worsted system of fiber preparation that removes the short fibers (see also Noil, and Second Cuts) and foreign impurities. The long fibers are straightened and laid parallel. See also Wool Combs, and Worsted Preparation. / и инородные примеси. Сущность Гребнечесания заключается в разъединении, распрямлении и ориентации волокон, их рассортировке по длине, а также в вычесывании мелких и цепких примесей. Цель гребнечесания – производство более равномерной, плотной и гладкой пряжи малой линейной плотности. Гребнечесание осуществляется в результате относительного смещения гребней и волокон, один конец которых чаще всего зажат. Последнее обеспечивает большую интенсивность воздействия гребней, чем кардной гарнитуры, и в этом заключается главное отличие от кардочесания. В хлопкопрядении используется два вида гребнечесания:- (i) чесание гребнями бородки волокон, зажатой в тисочном зажиме, и (ii) чесание волокон при протаскивании их через гребень отделительной парой, которая выводит волокна из бородки. Гребнечесание осуществляется в два этапа. Вначале прочёсываются одни концы волокон, а затем другие. При этом чесание средней части волокон повторяется. В прядильном производстве Гребнечесание является этапом подготовки (preparation) волокна к прядению. Процесс формирования холста специальной холстообразующей машиной путём сложения лент. В отличие от кардной системы прядения в гребенной применяется двойное чесание волокнистого материала – сначала на чёсальной машине, а затем на гребнечёсальной, которая обладает более высокой интенсивностью воздействия на волокнистый материал. Чесание на гребнечёсальной машине обеспечивает удаление самых мелких и цепких сорных примесей и пороков волокон, а также коротких волокон. Пряжа, выработанная по гребенной системе, имеет блеск, более прочная и гладкая, плотная, чистая по сравнению с пряжей кардной системы прядения. В гребенной системе прядения применяются те же машины, что и в кардной, за исключением дополнительных машин – лентосоединительной и гребнечёсальной. В связи с особенностью состава смеси гребенной системы, а именно использование в смесях только тонких волокон большой длины, изменяются технологические параметры заправки машин, например, на кардочёсальных машинах снижают скоростной режим, исключают из зоны предварительного чесания расчёсывающие пары, не устанавливают двух приёмных барабанов. Устанавливают такие режимы машин, при которых волокно меньше повреждается. Чесание волокнистых материалов – разделение клочков волокон на отдельные волокна, удаление сорных примесей и коротких волокон, перемешивание волокон и формирование волокнистой ленты или ровницы. Различают гребенное и кардное чесание. Гребенное чесание используется только в гребенном прядении. Выполняется на гребнечёсальных машинах, снабжённых игольчатыми гребнями. Кардочесание используется в различных системах прядения, а также в производстве нетканых материалов и валяльно-войлочных изделий. При кардочесании волокна пропускаются между рабочими органами машины, покрытыми кардолентой или пильчатой лентой.

COMBING IN OIL = ГРЕБНЕЧЕСАНИЕ В ЗАМАСЛОВАННОМ ВИДЕ (или ГРЕБНЕЧЕСАНИЕ В МАСЛЕ) – Combing In Oil:- the preparing and combing of wool to which oil has been added to facilitate the manipulation of the fibers.

COMBING MACHINE = ГРЕБНЕЧЁСАЛЬНАЯ МАШИНА – The web of fibers is eventually condensed into a continuous, untwisted, rope-like strand called a Sliver, (pronounced slyver). These slivers then continue to a Combing Machine. Here, the fibers shorter than half-inch and impurities are removed from the cotton. This process makes the sliver smoother so more uniform yarns can be produced. The drawing or pulling of this sliver is next. The sliver is drawn out to a thinner strand and given a slight twist to improve strength, then wound on bobbins (spools wound with the thread-like product for storage). Having completed this process, it is now called Roving. See also Comber. / Гребнечёсальная Машина предназначена для чесания волокнистого материала из натуральных и химических волокон при подготовке к прядению. На гребнечёсальных машинах производится тщательная очистка материала от сорных

примесей, коротких и спутанных волокон и образование гребенной ленты из распрямлённых и параллелизованных волокон периодическим или непрерывным способом (в зависимости от вида гребнечёсальной машины). Поток волокон равномерно . Эти ленты затем поступают в гребнечёсальную машину. Гребнечёсальные Машины, применяемые в хлопкопрядении, являются машинами периодического действия. Кроме гребнечесания на машине осуществляются формирование ватки-прочёса из отдельных порций продукта, прошедшего гребнечесание, формирование ленты, вытягивание лент в вытяжном приборе, сложение их и укладка гребенной ленты в таз. В большинстве случаев гребнечёсальные машины для хлопка бывают односторонними на несколько выпусков. Гребнечёсальная машина имеет 8 выпусков, работающих от одного привода. На каждом выпуске установлен холстик, и выходящие ленты, огибая направляющие штыри, поступают на питающий столик, где они укладываются параллельно, образуя два потока по 4 ленты. Каждый поток лент поступает в вытяжной прибор, состоящий из двух вытяжных пар и работающий с вытяжкой. Каждая лента, вытянутая в вытяжном приборе, соединяется с другими лентами своего потока в воронке, уплотняется плющильными валиками и укладывается лентоукладчиком в таз. Таким образом, на гребнечёсальной машине с 8 выпусками вырабатываются две гребенные ленты, линейная плотность, каждой из которых, составляет 3–4.5 текс. Гребнечёсальная Машина предназначена для чесания волокнистого материала из натуральных и химволокон при подготовке к прядению. На гребнечёсальной машине производится тщательная очистка материалов от сорных примесей, коротких и спутанных волокон и формирование гребенной ленты из распрямлённых и параллелизованных волокон периодичным или непрерывным способом (в зависимости от вида гребнечёсальной машины).

COMBING WOOL = ГРЕБЕННАЯ ШЕРСТЬ (или ШЕРСТЬ ДЛЯ ГРЕБНЕЧЕСАНИЯ) – Combing Wool:- wools having sufficient length and strength to comb. According to industry standards, the length of fibers for strictly fine combing must be over 2.75 in, with an increase in length as the wool becomes coarser. Combing Wool is the long-staple strong-fibered wool found suitable for combing and used especially in the manufacture of worsteds. / Гребенная Шерсть – шерсть длиной от 2 дюймов или 51 мм и более.

COMBINING ABILITY = КОМБИНАЦИОННАЯ СПОСОБНОСТЬ (или СПОСОБНОСТЬ К СОЧЕТАЕМОСТИ) – Combining Ability is the ability of a genotype (inbred, pureline, or synthetic/composite) to transfer its desirable traits to its crosses. General combining ability is the average performance of a strain in a series of crosses; specific combining ability is a deviation in a cross from performance predicted on the basis of general combining ability of the parents.

COMBI SHIP = КОМБИНИРОВАННОЕ СУДНО – Combi Ship is a ship designed to carry both conventional and containerized cargo.

COMB–TOOTH HARROW = ГРЕБНЕ (или ГРЕБЕНЧАТО)–ЗУБОВАЯ БОРОНА – Comb-Tooth Harrow is a cultivating implement with spikes or teeth resembling a comb.

COMBUSTION = ГОРЕНИЕ – Combustion is a chemical reaction, specially oxidation, accompanied by the production of light and heat. / Под Горением понимается экзотермическая химическая реакция, протекающая в условиях её прогрессирующего самоускорения и интенсивного тепло- и массообмена между реагирующей системой и окружающей средой. Часто сопровождается ярким свечением (пламенем).

COMBUSTION TURBINE = ТУРБИНА XX – Combustion Turbine (CT) is a generating unit in which a combustion turbine engine is the prime mover.

ComEd = THE COMMONWEALTH EDISON COMPANY

COMED CONTROL AREA = COMMONWEALTH EDISON CONTROL AREA

COMEX® = COMMODITY EXCHANGE, INC.

COMFORT = КОМФОРТ (или УДОБНОСТЬ) – Comfort is a performance parameter of apparel referring to wearability. Encompasses such properties as wicking, stretch, hand, etc.

COMFORTER = ВЯЗАНЫЙ ШАРФ (или КАШНЕ, или УТЕШИТЕЛЬ) – Comforter is a long narrow usually knitted neck scarf.

COMFORT LETTER = УСПОКОИТЕЛЬНОЕ (или КОМФОРТНОЕ) ПИСЬМО – In financial transactions, Comfort Letter is a parent company's notification of its intention to support the obligations of its subsidiary(s). / В финансовых сделках, уведомление материнской компании о своём намерении поддерживать обязательства своего дочернего предприятия или предприятий.

COMFORT STRETCH = КОМФОРТНОЕ РАСТЯГИВАНИЕ (или НАТЯЖКА) – Comfort Stretch is the term given to the freedom of movement experienced in the wearing of a garment that contains spandex, or has stretch engineered into a yarn through mechanical stretch construction.

COMING AROUND = ПОВОРАЧИВАТЬСЯ (или XX) – Coming Around (maritime term):- to bring a sailing vessel into the wind and change to another tack. One who is influenced to a change of opinion.

COMING INTO LINE = ВСТУПЛЕНИЕ В ЛИНИЮ – At Corporation of Lloyd's, Coming Into Line is a biannual procedure currently undertaken in June and November each year which requires members to demonstrate that they have sufficient eligible assets to meet their current underwriting liabilities and to support future underwriting before they may underwrite for the next following year of account. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

COMITÉ EUROPÉEN DE NORMALISATION = КОМИТЕ ЭРОПЕЭНН ДЁ НОРМАЛИЗАСЬЁ (или ЕВРОПЕЙСКИЙ КОМИТЕТ ПО СТАНДАРТИЗАЦИИ, или ЕВРОПЕЙСКИЙ КОМИТЕТ ПО НОРМАЛИЗАЦИИ) – The European Committee for Standardization (ECS, or in French, Comité Européen de Normalisation (CEN)) was founded in 1961 by the national standards bodies in the European Economic Community and EFTA countries. Now CEN is contributing to the objectives of the European Union and European Economic Area with voluntary technical standards which promote free trade, the safety of workers and consumers, interoperability of networks, environmental protection, exploitation of research and development programmes, and public procurement. Headquartered in Brussels, Belgium. The European Committee for Standardization (ECS, or in French, Comité Européen de Normalisation (CEN)), is an association of the national standards organizations of 18 countries of the European Economic Communities (EEC) and the European Free Trade Association (EFTA). ECS membership is open to the national standards organization of any European country which is, or is capable of becoming, a member of the EEC or EFTA. ECS develops voluntary standards in building, machine tools, information technology and in all sectors excluding the electrical ones covered by the European Committee for Electrotechnical Standardization (abbreviation in French:- CENELEC). ECS is involved in accreditation of laboratories and certification bodies as well as quality assurance. / Европейский Комитет по Стандартизации (ЕКС) или, как это звучит на Французском языке по месту регистрации, Комите Эропеэнн дё Нормализасьё (Сэ.Ё.Эн. или СЭН; Comité Européen de Normalisation (CEN)). Обозначение . , а также заверка качества.

COMITÉ EUROPÉEN DE NORMALISATION ELECTROTECHNIQUE = КОМИТЕ ЭРОПЕЭНН ДЁ НОРМАЛИЗАСЬЁ ЭЛЕКТРОТЭКНИК' (или ЕВРОПЕЙСКИЙ КОМИТЕТ ПО СТАНДАРТИЗАЦИИ В СФЕРЕ ЭЛЕКТРОТЕХНИКИ) – Comité Européen de Normalisation Electrotechnique (CENELEC), the European Committee for Electrotechnical Standardization, was created in 1973 as a result of the merger of two previous European organizations:- CENELCOM (the European Committee for the Coordination of Electrotechnical Standards in the European Economic Community) and CENEL (the European Committee for the Coordination of Electrical Standards). Nowadays, CENELEC is a non-profit technical organization set up under Belgian law and composed of the National Electrotechnical Committees of 30 European countries. In addition, 8 National Committees from neighbouring countries are participating in CENELEC work with an Affiliate status. CENELEC's mission is to prepare voluntary electrotechnical standards that help develop the Single European Market/European Economic Area for electrical and electronic goods and services removing barriers to trade, creating new markets and cutting compliance costs. The European Committee for Electrotechnical Standardization or in French, Comité Européen de Normalisation Electrotechnique (CENELEC). CENELEC's mission is to prepare voluntary electrotechnical standards that help develop the Single European Market/European Economic Area for electrical and electronic goods and services removing barriers to trade, creating new markets and cutting compliance costs. Headquartered in Brussels, Belgium. The European Committee for Electrotechnical Standardization (abbreviation in French:- CENELEC), is a non-profit-making international organization under Belgian law. CENELEC seeks to harmonize electrotechnical standards published by the national organizations and to remove technical barriers to trade that may be caused by differences in standards. CENELEC members include:- Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. / Европейский Комитет по Стандартизации в сфере Электротехники (ЕКСЭ) или, как это звучит на Французском языке по месту регистрации, Комите Эропеэнн дё Нормализасьё Электротэкник' (СЭНЭЛЕК; Comité Européen de Normalisation Electrotechnique (CENELEC)). Обозначение .

COMITÉ INTERNATIONAL DES TRANSPORTS FERROVIAIRES = КОМИТЕ ЭНТЭРНАСЬЁНАЛЬ ДЭ ТРАНСПОР ФЭРОВЬЕР (или МЕЖДУНАРОДНЫЙ КОМИТЕТ ПО ЖЕЛЕЗНОДОРОЖНЫМ ПЕРЕВОЗКАМ) – Comité International Des Trasnports Ferroviaires (CIT) or International Rail Transport Committee is an association of some 216 railway undertakings and shipping companies which provide international passenger and/or freight services. 130 organizations are members in their own right, 80 organizations are linked indirectly by being members of CIT associate members. The CIT is an association under Swiss law (Article 60 et seq. ZGB (Swiss Code of Civil Law)). The CIT works closely with the OSJD on joint projects to make transport law regimes for traffic between Europe and Asia interoperable. Membership of the CIT:- The following may join the CIT as full members:- (i) undertakings which provide international rail transport under the terms of COTIF or under other international sets of regulations; and (ii) undertakings which make use of CIT documentation or services. Associations of undertakings with a legal personality may join the CIT as associate members provided their own members:- (i) provide international rail transport; or (ii) provide services in connection with international rail transport; or (iii) make use of CIT documentation or services. The CIT works closely with numerous international organisations in carrying out its tasks and concludes agreements to work together as appropriate. Headquartered in Bern, Switzerland. / Международный Комитет по Железнодорожным Перевозкам (МКЖП; или Комите Энтэрнасьёналь дэ Транспор Фэровьер (Сэ.И.Тэ.); Comité International des Transports Ferroviaires (CIT)) – международная неправительственная ассоциация, цели которой – развитие международного права в области железнодорожных перевозок на основе заключённых конвенций; разработка дополнительных правовых статей и материалов, связанных с решением споров по международным перевозкам; контроль за соблюдением правил перевозок грузов, багажа, пассажиров; стандартизация проездных документов. Основана в 1902. Штабквартира в Берне, Швейцария. Полноправными членами МКЖП являются 134 компании из 43 стран Европы, Азии и Африки. В качестве полноправных членов в МКЖП могут вступить предприятия, которые осуществляют международные железнодорожные перевозки в соответствии с Конвенцией о Международных Железнодорожных Перевозках (КОМЖП или так называемая КОТИФ (COTIF – сокращение от Convention Relative aux Transports Internationaux Ferroviaires)). Комитет сотрудничает, прежде всего, с ОТИФ, МСЖД, Комитетом по Внутреннему Транспорту Европейской Экономической Комиссии ООН, ОСЖД (OSJD) и другими международными организациями. Официальные языки – Французский и Немецкий. Основными Целями МКЖП Являются:- (i) гармонизация, единообразное применение и реализация международного железнодорожного транспортного права, прежде всего КОТИФ; (ii) разработка Правил перевозок грузов, форм накладных, а также приложений к КОТИФ; и (iii) стандартизация правовых отношений между участниками рынка железнодорожных перевозок (клиентами, железнодорожными предприятиями и владельцами инфраструктуры). Руководящим органом МКЖП является Генеральная ассамблея. Она определяет политику и подход к стратегическому управлению МКЖП. Председатель (Chairman) МКЖП – Жан-Люк Дюфорно (Jean-Luc Dufournaud) (Директор по Правовым Вопросам (Directeur de l'Ethique et de la Déontologie) Национального Общества Французских Железных Дорог (Société Nationale des Chemins de fer Français (SNCF))). Генеральный Секретарь (Secretary General) МКЖП – Чезаре Бранд (Cesare Brand). С 01 Февраля 2010 Российская Федерация присоединилась к КОТИФ на условиях применения Единых правовых предписаний к Договору о Международной Железнодорожной Перевозке Грузов (ДМЖПГ; или (Сэ.И.Эм.) Contrat de Transport International Ferroviaire des Marchandises (CIM)) на участках железнодорожной инфраструктуры от причала паромного комплекса Балтийск до припортовой железнодорожной станции Балтийск Калининградской Железной Дороги (2.84 км), а также от причала паромного комплекса Усть-Луга до припортовой железнодорожной станции Лужская Октябрьской Железной Дороги (1.745 км). В 2015 Российская Федерация присоединилась к КОТИФ также участком железнодорожной инфраструктуры в районе порта Кавказ, что активнее позволит развивать железнодорожно-паромное сообщение с Турцией на линии Кавказ – Самсун. После прохождения всех внутригосударственных процедур нормы КОТИФ и Единых правовых предписаний к Договору о Международной Железнодорожной Перевозке Грузов (ДМЖПГ), которые являются Приложением к КОТИФ, стали частью Российской правовой системы, в связи с чем возникла необходимость практического использования норм и документов, применяемых в сфере действия ДМЖПГ. В целях наиболее эффективного применения указанных документов для документального обеспечения перевозок грузов с использованием железнодорожно-паромного сообщения Усть-Луга – Балтийск – Зассниц Президентом РЖД, ПАО было принято решение о вступлении РЖД, ПАО в члены МКЖП. Кроме того, РЖД, ПАО является одним из основных разработчиков нормативной базы для использования унифицированной накладной ДМЖПГ/СМГС, разработанной в рамках совместного проекта ОСЖД и МКЖП 'Транспортно-Правовая Интероперабельность ДМЖПГ/СМГС'. С 01 Мая 2010 Российские Железные Дороги, ПАО считается действительным членом МКЖП, имеет доступ и право использования всех руководящих документов МКЖП, регулирующих применение международного железнодорожного транспортного права в сфере действия КОТИФ, а также возможность практически использовать действующие нормы ДМЖПГ. В программе деятельности МКЖП развитие тесного сотрудничества с РЖД, ПАО является одним из основных направлений. В ходе заседания Генеральной Ассамблеи МКЖП в 2011 РЖД, ПАО официально принято в состав одного из рабочих органов МКЖП – Комиссии ДМЖПГ. В качестве приоритетных проектов можно отметить:- (i) развитие перевозок с использованием унифицированной железнодорожной накладной ДМЖПГ/СМГС, в том числе и транзитом по Российским Железным Дорогам из/в Китая и Монголии; (ii) организация перевозок с участием железнодорожно-паромного сообщения Усть-Луга – Балтийск – Зассниц, а также рассмотрение возможности осуществления перевозок по накладной ДМЖПГ в железнодорожно-паромном

сообщении между портами Кавказ и Самсун (Турция); для реализации данного проекта в рамках МКЖП создана Рабочая группа 'Мультимодальность', в работе которой принимают участие специалисты РЖД, ПАО, Дэ.Бе. Шэнька (DB Schenker), МОМПЖД (OTIF), судоходных компаний; и (iii) сотрудничество в области международного пассажирского сообщения в части гармонизации норм Договора о Международной Железнодорожной Перевозке Пассажиров (ДМЖПЖ или Сэ.И.Ве.; Contrat de Transport International Ferroviaire des Voyageurs (CIV)) и СМПС. Указанные направления сотрудничества имеют практическое значение для РЖД, ПАО в связи с активной интеграцией в международный транспортный рынок и развитием ряда международных проектов, в том числе в части гармонизации транспортного права, развития международного железнодорожно-паромного сообщения и международных пассажирских перевозок, а также установления взаимодействия с железнодорожными перевозчиками, действующими в сфере ДМЖПГ и ДМЖПЖ.

COMMAND AND CONTROL SERVER = КОМАНДНЫЙ И КОНТРОЛЬНЫЙ СЕРВЕР – Command and Control Server (C&C Server) is a computer used to coordinate the actions of computers infected by a bot, rootkit, worm or other forms of malicious software (malware) that rely on another computer for instructions and updates. A C&C server may tell infected computers what sorts of information to steal, provide targeting information for infected computers to attack or infected, update existing or install new malware on infected computers and so forth. A C&C server may (or may not) also serve as a drop zone for infected computers to upload stolen information. A C&C server does not have to run the same operating system as the computers it controls. Often, a C&C server will be run on a web server that has itself been compromised or has been purchased using stolen credit cards.

COMMENSAL = КОММЕНСАЛ – Commensal:- from the Latin prefix Com- (With, Together, Jointly) + the Latin adjective Mensalis (Of The Table). Commensal people eat together at the same table. (i) Living in a relationship in which one organism derives food or other benefits from another organism without hurting or helping it. Commensal bacteria are part of the normal flora in the mouth. (ii) An intimate relationship. The Norway rat, roof rat, and house mouse are considered commensal rodents because of their intimate relationships with humans. Commensal:- literally 'eating at the same table'- an organism that lives on or with another without harming it. See also parasite, symbiosis. / Под Комменсализмом, от позднелатинского слова Commensalis, означающее Сотрапезник, понимается форма сожительства особей разных видов, при которой один организм (комменсал) живёт за счёт другого, не причиняя ему вреда, например, рыбы-прилипалы, прикрепляясь к акулам, пользуются ими для передвижения.

COMMENSALISM = КОММЕНСАЛИЗМ – Commensalism is the interaction between two species in which one species is benefited while the other is unaffected. See also Amensalism. / Под Комменсализмом, от позднелатинского слова Commensalis, означающее Сотрапезник, понимается форма сожительства особей разных видов, при которой один организм (комменсал) живёт за счёт другого, не причиняя ему вреда, например, рыбы-прилипалы, прикрепляясь к акулам, пользуются ими для передвижения. Смотрите также Аменсализм (Amensalism). Комменсализм, сотрапезничество, нахлебничество, сожительство животных разных видов, характеризующееся тем, что один из них (Комменсал) постоянно или временно живёт за счёт другого, не причиняя ему вреда (сравните Аменсализм). При комменсализме один из организмов может использовать другой для защиты, как средство передвижения или питаться за его счёт. В зависимости от характера взаимоотношений животных, которым свойствен комменсализм, их делят на три группы:- (1) Комменсал ограничивается использованием пищи организма другого вида; например, в извивах раковины, занятой раком-отшельником, обитает кольчатый червь из рода Nereis, поедающий остатки пищи рака. (2) Комменсал прикрепляется (временно или постоянно) к организму другого вида, который в этом случае называется Хозяином; например, рыба-прилипало своим спинным плавником, превращённым в присоску, прикрепляется к коже акул и других крупных рыб, пользуясь ими для передвижения; морские гидроиды, поселяющиеся на коже рыб и питающиеся их экскрементами; некоторые ракообразные (например, морские жёлуди), живущие на коже китов и на раковинах моллюсков. (3) Комменсал поселяется во внутренних органах хозяина; например, инфузории опалины, живущие в задней кишке лягушек; некоторые жгутиконосцы, обитающие в кишечнике млекопитающих. Из комменсализма, характеризующегося поселением комменсала в органах хозяина, мог возникнуть Паразитизм. Из комменсализма мог выработаться и Симбиоз. Однако комменсализм не является обязательной переходной ступенью к паразитизму или симбиозу; эти формы взаимоотношений организмов могли возникнуть в процессе исторического развития организмов и независимо от комменсализма.

COMMERCE = КОММЕРЦИЯ – Commerce (in the UK, 1840's), from Latin Commutatio Mercium, is simply, as its name imports, the exchange of commodities for commodities.

COMMERCE CONTROL LIST = ПЕРЕЧЕНЬ СДЕЛОК, ПОДЛЕЖАЩИХ КОНТРОЛЮ – In 1991, the US Bureau of Export Administration published the new Commerce Control List (CCL) which replaced the former Commodity Control List. The CCL includes all items – commodities, software and technical data – subject to Bureau of Export Administration (BXA) export controls and incorporates not only the national security controlled items agreed to by CoCom (the 'core' list), but also items controlled for foreign policy and other reasons. The list adopts a totally new method of categorizing commodities and is divided into 10 general categories:- (i) materials, (ii) materials processing, (iii) electronics, (iv) computers, (v) telecommunications and cryptography, (vi) sensors, (vii) avionics and navigation, (viii) marine technology, (ix) propulsion systems and transportation equipment, and (x) miscellaneous. CoCom was dissolved in March 1994. / (v) средства дальней связи и криптографии, (vi) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). КоКам (CoCom).

COMMERCIAL = КОММЕРЧЕСКИЙ (или КОММЕРСАНТ) – Commercial:- an entity involved in the production, processing, or merchandising of a commodity. Commercial:- a futures trader (normally a company) that has a legitimate business need to hedge price risk in the futures markets. For purposes of the Commitments of Traders Report data, this trader group holds reportable positions in the market, thus making them large traders. See also Commitments Of Traders Report, and Non-Commercials. The Commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. The utility may classify commercial service as all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. / включая гостиницы (hotels), гостиницы для автотуристов (motels), рестораны, . Под Коммерсантом, от Французского слова Commerçant, от Латинского слова Commercium, означающее Торговля,:- в странах, где существует торговое право как самостоятельная отрасль (Бельгия, Испания, Франция, ФРГ, ряд Латиноамериканских и других государств Романо-Германской системы права), купец, лицо, занимающееся частной торговлей, самостоятельный предприниматель, действующий в торговом обороте от своего имени на профессиональной основе в виде обычного промысла с использованием профессиональных знаний и опыта. Статус и сделки коммерсанта в этих странах регулируются специальными правилами, отличающими деятельность коммерсанта от участия в торговом обороте лиц, ими не являющихся. В праве государств с единой системой частного права (США, Англии, Италии, Нидерландов, Швейцарии, стран Английской системы права и других) обычно отсутствует формально-юридическое понятие Коммерсант и торговой сделки, так как торговое право здесь является частью гражданского. Однако здесь имеются отдельные нормы, содержащие правила о деятельности лиц, осуществляющих хозяйственную деятельность

как промысел; специально регулируются права и обязанности сторон в сделках, заключаемых такими лицами. Единообразный Торговый Кодекс США, в отличие от других стран этой группы, содержит общее понятие Коммерсант (ст. 2-104) и регулирует сделки с участием коммерсанта. Английский Закон о продаже товаров 1979 (разд. 14) содержит специальные гарантии для продавца, действующего 'в порядке профессиональной деятельности'. Нормы, содержащие правила о Коммерсанте, есть в Швейцарском обязательственном законе, Гражданском Кодексе Италии 1942 и другом. Коммерсантами могут быть индивидуальные или коллективные лица. Индивидуальные Коммерсанты – физические лица, являющиеся собственниками предприятия, действующие как предприниматели. Коллективные Коммерсанты – торговые товарищества, являющиеся в большинстве стран юридическими лицами. В собственности торгового товарищества могут находиться одно или несколько предприятий. В отдельных случаях Коммерсантом особого вида признаётся государство. Коммерсант – в праве развитых зарубежных стран понятие, означающее предпринимателя вообще. Например, согласно Статьи 2-104 Единообразного Торгового Кодекса США Коммерсант – это тот, кто совершает операции с определёнными товарами либо по роду своих занятий должен обладать особыми знаниями или опытом в отношении операций и товаров, являющихся предметом сделки; коммерсантом признаётся и тот, кто использует услуги посредников (агентов, брокеров), обладающих подобными знаниями, опытом.

COMMERCIAL ALLOWANCE = КОММЕРЧЕСКОЕ ОТЧИСЛЕНИЕ (или КОММЕРЧЕСКАЯ УСТУПКА) – Commercial Allowance is the commercial moisture regain plus a specific allowance for finish used in calculating the commercial or legal weight of a fiber shipment. / коммерческая влагопоглощательная способность (moisture regain).

COMMERCIAL AVIATION = КОММЕРЧЕСКАЯ АВИАЦИЯ – Commercial Aviation:- transport of persons or cargo via air routes operated as a business enterprise (aircargo). / В перевозках авиационных грузов, перевозка пассажиров или груза по авиа маршрутам, осуществляемая в качестве бизнес предприятия.

COMMERCIAL BANK = КОММЕРЧЕСКИЙ БАНК – Commercial Bank is a bank that offers a broad range of deposit accounts, including checking, savings, and time deposits, and extends loans to individuals and businesses. Commercial banks can be contrasted with investment banking firms, which generally are involved in arranging for the sale of corporate or municipal securities, and broker-dealer firms, which buy and sell securities for themselves and others. / Под Коммерческим Банком понимается банк, предоставляющий кредиты промышленным, торговым и другим предприятиям преимущественно за счёт привлечённых в виде вкладов (депозитов) денежных средств.

COMMERCIAL BILL OF EXCHANGE = КОММЕРЧЕСКИЙ ПЕРЕВОДНЫЙ ВЕКСЕЛЬ – Commercial Bill of Exchange is used for the short-term financing of goods or service transactions. Pursuant to § 364 (2) of the German Civil Code, bills receivable exist alongside the original purchase price claim. Also known as Trade Bill.

COMMERCIAL DOCUMENTS = КОММЕРЧЕСКИЕ ДОКУМЕНТЫ – Commercial Documents means documents of title or other similar documents, invoices, transport or shipping documents, or any other documents whatsoever not being financial documents. See also Financial Documents. / Коммерческие Документы означают товараспорядительные или иные подобные документы, счета-фактуры, транспортные или отгрузочные документы, или любые другие документы, не являющиеся финансовыми документами. Смотрите также Финансовые Документы (Financial Documents).

COMMERCIAL GENERAL LIABILITY COVERAGE PART = КОММЕРЧЕСКАЯ ЧАСТЬ ПОКРЫТИЯ ОБЩЕЙ ОТВЕТСТВЕННОСТИ – Commercial General Liability (CGL) Coverage Part:- general liability coverage which may be written as a monoline policy or part of a commercial package. CGL now means commercial general liability forms which have replaced the earlier comprehensive general liability forms. The latest forms include all sublines, provide very broad coverage, and two variations are available, Occurrence, and Claims Made, coverage.

COMMERCIAL GRAIN STOCKS = КОММЕРЧЕСКИЕ ЗАПАСЫ ЗЕРНА – Commercial Grain Stocks:- domestic grain in store in public and private elevators at important markets and grain afloat in vessels or barges in lake and seaboard ports.

COMMERCIAL INVOICE = КОММЕРЧЕСКИЙ СЧЁТ–ФАКТУРА – A Commercial Invoice is a document used in foreign trade. It is used as a customs declaration provided by the person or corporation that is exporting an item across international borders. Although there is no standard format, the document must include a few specific pieces of information such as the parties involved in the shipping transaction, the goods being transported, the country of manufacture, and the Harmonized System codes for those goods. A commercial invoice must also include a statement certifying that the invoice is true, and a signature. Commercial Invoice is a document produced by the shipper/seller of goods which contains an accurate description of the merchandise and the country of origin. All items are itemised and with actual price. Represents a complete record of the transaction between exporter and importer with regard to the goods sold. Also reports the content of the shipment and serves as the basis for all other documents about the shipment. A document stating the values of the transaction between the buyer and seller. Commercial Invoice is a bill for the goods from the seller to the buyer. These invoices are often used by governments to determine the true value of goods for the assessment of customs duties and are also used to prepare consular documentation. Governments using the commercial invoice to control imports often specify its form, content, number of copies, language to be used and other characteristics. See also Consular Invoice, Customs Invoice, Final Invoice, Invoice, Preliminary Invoice, Pro-Forma Invoice, and Provisional Invoice. / Счёт на товары от продавца покупателю. Эти счета-фактуры часто используются государственными ведомствами для определения истинной стоимости товаров при начислении таможенных пошлин, а также при подготовке консульской документации. Государственные ведомства, использующие коммерческие счета-фактуры для контроля за привозом (или импортом), часто определяют их форму, содержание, количество копий, язык, на котором они должны оформляться, и иные параметры. Смотрите также Консульский Счёт-Фактура (Consular Invoice), Таможенный Счёт-Фактура (Customs Invoice), Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), Замещаемый Счёт-Фактура (Pro-Forma Invoice), и Условный Счёт-Фактура (Provisional Invoice).

COMMERCIAL LETTER OF CREDIT = КОММЕРЧЕСКИЙ АККРЕДИТИВ (или ТОВАРНЫЙ АККРЕДИТИВ) – Commercial Letters Of Credit have been used for centuries to facilitate payment in international trade. Their use will continue to increase as the global economy evolves. Letters of credit used in international transactions are governed by the International Chamber of Commerce (ICC) Uniform Customs and Practice for Documentary Credits. The general provisions and definitions of the International Chamber of Commerce are binding on all parties. Domestic collections in the United States are governed by the Uniform Commercial Code. A commercial letter of credit is a contractual agreement between a bank, known as the Issuing Bank, on behalf of one of its customers, authorizing another bank, known as the Advising Bank or Confirming Bank, to make payment to the beneficiary. The issuing bank, on the request of its customer, opens the letter of credit. The issuing bank makes a commitment to honor drawings made under the credit. The beneficiary is normally the provider of goods and/or services. Essentially, the issuing bank replaces the bank's customer as the payor. Elements of a Letter of Credit:- (i) a payment undertaking given by a bank (issuing bank); (ii) on behalf of a buyer (applicant); (iii)

to pay a seller (beneficiary) for a given amount of money; (iv) on presentation of specified documents representing the supply of goods; (v) within specified time limits; (vi) documents must conform to terms and conditions set out in the letter of credit; and (vii) documents to be presented at a specified place. Commercial Letter Of Credit is a letter of credit intended to act as the vehicle of payment for goods sold by one party to another. / Аккредитив предназначен для использования в качестве средства платежа за товары, проданные одной стороной другой.

COMMERCIAL LINES = КОММЕРЧЕСКИЕ ЛИНИИ – At Corporation of Lloyd's, Commercial Lines is an insurance which is sold to firms. This term is used in contrast to personal lines. Line is the proportion of an insurance or reinsurance risk that is accepted by an underwriter or which an underwriter is willing to accept. When it refers to a line that is entered on a slip it is commonly expressed as a percentage of the limit of indemnity.

COMMERCIALLY CLEAN = КОММЕРЧЕСКИ ЧИСТЫЕ – Shipments are defined as Commercially Clean when meeting the commercially clean specifications listed in the export grade determinant table upon following the Determination of commercially clean procedures. Dockage is not reported for commercially clean shipments. See also Not Commercially Clean. Commercially Clean shipments are shipments of grain whose dockage falls within allowed limits and is of a type normally present after standard commercial cleaning. / у которого докедж (легко отделяемые примеси).

COMMERCIAL MASS = КОММЕРЧЕСКАЯ МАССА – Commercial Mass is the mass obtained by adding to the oven-dry mass of the material the mass corresponding to the conventional allowance and any additions specified in the BISFA (short for the Bureau International Pour La Standardisation Des Fibres Artificielles or The International Bureau for the Standardization of Man-made Fibres; headquartered in Brussels, Belgium) methods. See also Mass.

COMMERCIAL MEANS OF TRANSPORT = КОММЕРЧЕСКИЕ СРЕДСТВА ПЕРЕВОЗКИ – Commercial Means Of Transport:- any vessel (including lighters and barges, whether or not shipborne, and hydrofoils), hovercraft, aircraft, road vehicle (including trailers, semi-trailers and combinations of vehicles) or railway rolling stock, which is used for the transport of persons for remuneration or for the industrial or commercial transport of goods, whether or not for remuneration. Customs formalities applicable to commercial means of transport are dealt with in Annex A.3. to the Kyoto Convention. The Annex covers commercial means of transport which are used in international traffic. The definition of 'commercial means of transport' in that Annex includes normal spare parts, accessories and equipment, as well as lubrication oils and fuel contained in the normal tanks, when carried with the commercial means of transport. In some countries, the term 'conveyance' is used with the same meaning as 'Commercial Means Of Transport'.

COMMERCIAL MOISTURE REGAIN = КОММЕРЧЕСКОЕ УВЛАЖНЕНИЕ (или КОММЕРЧЕСКАЯ ВЛАГОПОГЛОЩАТЕЛЬНАЯ СПОСОБНОСТЬ, или КОНДИЦИОННАЯ ВЛАЖНОСТЬ) – Commercial Moisture Regain is an arbitrary value adopted as the moisture regain to be used in calculating the commercial or legal weight of a fiber shipment.

COMMERCIAL OFF–THE–SHELF = XX – Commercial Off-The-Shelf (COTS) is an acquisition term refering to commercially available ready to use products that require no customization in order to meet performance requirements.

COMMERCIAL OPERATION = КОММЕРЧЕСКАЯ ОПЕРАЦИЯ – Commercial Operation begins when control of the loading of the generator is turned over to the system dispatcher.

COMMERCIAL PAPER = КОММЕРЧЕСКАЯ БУМАГА – Commercial Papers (CPs) are used for the financing of companies' short-term capital requirements. CPs are issued mainly by first-class industrial borrowers. Placement and trading are conditional on the issuer having an excellent rating. As a rule, the securities have high nominal values, reduced by the discounted interest payments. Maturities are mostly under one year and are determined individually by the issuer. Short-term, unsecured promissory note issued by an industrial or commercial firm, a financial company, or a foreign government. Commercial Paper is a negotiable written instrument promising immediate or short-term payment of a given amount. Commercial paper serves as a quick and safe way for economic entities to transfer notes receivable and payable without handling funds. Commercial paper is a negotiable instrument, because it carries with it a legal obligation to pay, giving it a high probability of being honored. As a note receivable, commercial paper may be pledged by its owner as collateral to secure a loan from a third-party lender. Bills of exchange, promissory notes, checks and warrants are all forms of commercial paper as defined above. Commercial Paper refers to promissory notes issued by corporations to finance their short-term credit needs. Commercial Paper is a generic term for short term debt issued by companies. (The terms Paper or Notes are often used when referring to short term debt.) Commercial paper is a single name form of short-term borrowing used by large companies. It comes in the form of bearer documents for large denominations which are issued at a discount and redeemed at par. Short-term promissory notes issued in bearer form by large corporations, with maturities ranging from 5 to 270 days. Since the notes are unsecured, the commercial paper market generally is dominated by large corporations with impeccable credit ratings. Short or intermediate term negotiable promissory notes issued by highly reputable companies or institutions to raise cash. Although commercial paper is unsecured, it is backed by the issuer's good credit standing and is therefore negotiable. In the United States, commercial paper is traded in the money market. Interest rates are published monthly in the Federal Reserve Bulletin and tend to be lower than those on ordinary bank loans. The term applies to notes and acceptances originating from commercial transactions (the transfer and movement of goods). They are usually notes or acceptances with a definite maturity date received by a business enterprise in payment for goods sold or services rendered. Interest on commercial paper is paid with a discount deducted which is equal to the prevailing market rate for commercial paper. Commercial Papers:- unsecured promissory notes or obligations of relatively low risk and short maturity of 3 to 6 months, issued by highly rated large corporations who usually maintain backup credit lines with their banks to ensure payment at maturity; notes, bills, and acceptances arising out of commercial, industrial or agricultural transactions of short-term maturity, self liquidating and used as trade financing instruments for non-speculative purposes. Commercial papers are available in a wide range of denominations, can be either discounted or interest bearing, and usually have a limited or nonexistent secondary market. Embodies a short-term money claim in the form of a promissory note issued by an industrial or financial company. Depending on the market situation, commercial papers offers a higher return than other forms of fixed-interest investment. This is an unsecured promissory note for a specific amount and maturing on a specific date. The commercial paper market allows companies to issue short term debt direct to financial institutions who then market this paper to investors or use it for their own investment purposes. Commercial Paper is a short-term debt instrument, generally supported with a standby borrowing arrangement with a commercial bank. Typically only the safest, highest credit grade companies can issue commercial paper. / К Коммерческим Бумагам относятся высококлассные необеспеченные краткосрочные бумаги, продаваемые с помощью дилеров ведущими корпорациями.

COMMERCIAL REGISTER = КОММЕРЧЕСКИЙ РЕЕСТР – In Germany, Commercial Register is the official register of all fully-qualified traders, as defined by the Commercial Code, in a local court district. The Commercial Register is filed with the respective local court and makes information about the legal structure of companies available to the public. The Register is divided into Sections A and B. While individual enterprises and commercial partnerships (OHG, KG) are listed in Section A, joint-stock companies (AG, GmbH) are entered in Section B. This registration procedure either validates a legal status (certifying what already existed prior to entry) or creates

a new legal status (which comes into force by virtue of the entry). Official register of companies which engage in a trade, manufacturing or another type of commercial business. In Switzerland, the Commercial Register (Handelsregister (HR)) is an official register of various company types and provides information about trade name, purpose, liability, corporate bodies and representational powers of the registered companies. The register contains, inter alia, information about the following company types:- (i) Sole Proprietorships (Einzelunternehmen); (ii) General Partnerships (Kollektvigesellschaften); (iii) Limited Partnerships (Kommandigesellschaften); (iv) Corporations or Public Limited Companies (Aktiengesellschaften); (v) Corporation with Unlimited Partners (Kommanditaktiengesellschaften); (v) Limited Liability Companies (Gesellschaften mit beschränkter Haftung); (vi) Cooperatives (Genossenschaften); (vii) Associations (Vereine); (viii) Foundations (Stiftungen); (ix) Investment Companies with Variable Capital (SICAV); (x) Limited Partnerships for Collective Investment; (xi) Investment Companies with Fixed Capital (SICAF); (xii) Public-Law Institutes; and (xiii) Branch Offices. What does registration in the commercial register mean? For some company types (e.g., Aktiengesellschaft, Gesellschaft mit beschränkter Haftung, cooperative, foundation) registration in the commercial register is a requirement for their existence. Other companies (e.g., sole proprietorship, general partnership, limited partnership, association, public-law institute) exist, in principle, irrespective of registration in the commercial register. They are, however, required to register upon initiation of business if they conduct trade, manufacturing or any other business in a commercial manner (Art. 934 para. 1 CO). In the case of sole proprietorships, Art. 36 HRegV (Commercial Register Ordinance) stipulates a gross annual turnover of at least CHF100 000 as an additional requirement. Companies registered in the commercial register enjoy some legal protection of their respective company name pursuant to Art. 946 and Art. 951 CO (Swiss Code of Obligations). Which commercial registry office is responsible? The commercial registers are managed at a cantonal level. Registration needs to be made in the commercial register of the canton in which the company has its headquarters. Potential branch offices need to be registered at the respective branch seat. What is the procedure for registration in the commercial register? Registration in the commercial register requires a written application form with certified signatures as well as supporting documents (which differ depending on legal form). The details specifying the registration procedure are set forth in the Swiss Code of Obligations (CO) and, in particular, in the Commercial Register Ordinance (HregV). Is information registered in the commercial register publicly available? The information and registration documents of the commercial registers are publicly available. Commercial register extracts or copies of filed supporting documents can be requested against a fee. All new entries, changes and cancellations are also published in the Swiss Official Gazette of Commerce. What does the Federal Commercial Registry Office (FCRO) do? The Federal Commercial Registry Office in Berne keeps a central register of all business names registered in Switzerland (Zefix). This is where inquiries can be made to find out whether a business/trade name already exists in Switzerland. / Официальный реестр компаний, которые вовлечены в торговлю, производство или иной тип коммерческой деятельности. Под Реестром, от Польского слова Rejestr от позднелатинского слова Regestrum или Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень или список; или (ii) книга для регистрации дел, документов, имущества и тому подобного. Под Регистром, от позднелатинского слова Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень, список или учётный документ, имеющий правовое значение; или (ii) название специального органа, осуществляющего функции надзора в специальной области управления.

COMMERCIAL REGISTRY = КОММЕРЧЕСКАЯ РЕГИСТРАТУРА (или КОММЕРЧЕСКИЙ РЕГИСТР) – Commercial Registry is an office which licenses businesses, publishes announcements and provides information relating to registered companies. / Офис, который лицензирует различные виды деятельности, публикует заявления и обеспечивает информацией, касающейся зарегистрированных компаний. Под Регистром, от позднелатинского слова Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень, список или учётный документ, имеющий правовое значение; или (ii) название специального органа, осуществляющего функции надзора в специальной области управления. Под Реестром, от Польского слова Rejestr от позднелатинского слова Regestrum или Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень или список; или (ii) книга для регистрации дел, документов, имущества и тому подобного.

COMMERCIAL RISK = КОММЕРЧЕСКИЙ РИСК – Commercial Risk is:- (1) financial risk assumed by a seller when extending credit without any collateral or recourse. (2) All risks other than the Political Risk. Commercial Risks arise from foreign banks, companies or project companies. Typical commercial risks include the buyer's, borrower's or guarantor's insolvency or unwillingness to pay its debt. Factors considered assessing of the commercial risks of the transaction include:- (i) export transaction/project; (ii) line of business; (iii) financing; (iv) risk-sharing/coverages; (v) securities; (vi) environmental aspects; (vii) buyer's country; and other aspects involved, if any. Further information about commercial risks:- (i) corporate/buyer risk; (ii) project risk; and (iii) bank risk. Risk of foreign purchaser's ability to pay. With respect to Eximbank guarantees, Commercial Risks cover nonpayment for reasons other than specified Political Risks. Examples are insolvency or protracted default. Commercial Risk is the risk that a debtor will be unable to pay its debts because of business events, such as bankruptcy. Commercial Risks refer to potential losses arising from the trading partners or the market. It is important secure that the trading partners are reliable. In addition, it is important to take into account the trading partner's possible insolvency or unwillingness to pay. The choice of payment method is of utmost importance. Choosing Trade Finance products and using the general Incoterms 2010 delivery clauses will diminish or eliminate many risks related to trading. For example, when a tailored product is manufactured and paid, we recommend you choose advance payment or documentary credit as the method of payment. Examples of how commercial risks can become reality:- (i) your trading partner cannot deliver or pay the products/services as agreed; (ii) your trading partner does not want to act in accordance with the agreement; and (iii) you have differences in interpreting the trade agreement.

COMMERCIAL SECTOR = КОММЕРЧЕСКИЙ СЕКТОР – In some US energy reports, Commercial Sector is an energy-consuming sector that consists of service-providing facilities and equipment of:- businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social, or fraternal groups. The commercial sector includes institutional living quarters. It also includes sewage treatment facilities. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a wide variety of other equipment. This sector includes generators that produce electricity and/or useful thermal output primarily to support the activities of the above-mentioned commercial establishments. / В некоторых отчётах США по энергетике, энергопотребляющий сектор, который состоит из предприятий, предоставляющих услуги, а также потребляющего оборудования частного бизнеса, Федеральных, региональных и местных органов власти, а также других частных и общественных организаций, таких как религиозные, общественные группы и общины. Коммерческий сектор включает в себя места общего пользования. Он также включает в себя канализацию и очистные сооружения. Наиболее распространённые цели использования энергии в этом секторе включают в себя обогрев помещений, подача горячей воды, кондиционирование воздуха, освещение, охлаждение, приготовление пищи и использование широкого спектра различного оборудования. Этот сектор включает в себя генераторы, производящие электричество и/или полезное тепло для поддержания деятельности всех вышеперечисленных коммерческих структур.

COMMERCIAL SET = КОММЕРЧЕСКИЙ КОМПЛЕКТ (или КОМПЛЕКТ ТОВАРОРАСПОРЯДИТЕЛЬНЫХ ДОКУМЕНТОВ) – Commercial Set is a set of four negotiable documents that represents and takes the place of the goods themselves in the financing of

the cargo sales transaction. Commercial Set is a full set of documents required to satisfy the requirements of letter of credit or documentary collection transactions. A commercial set usually includes bill of lading (or air waybill), commercial invoice, and certificate of insurance.

COMMERCIAL SILVER = КОММЕРЧЕСКОЕ СЕРЕБРО – Commercial Silver is a silver that is .999 fine (99.9%) or higher, usually sold and shipped in 1 000 oz bars.

COMMERCIAL STANDARDS = КОММЕРЧЕСКИЕ СТАНДАРТЫ – Commercial Standards are the recorded voluntary standards of the trade. The US Bureau of Standards issues Commercial Standards which are not laws, but are important as accepted voluntary benchmarks of performance and quality by the industry. These standards are usually referred to by number, and spell out test procedures and minimum performance guidelines.

COMMERCIAL STOCKS = КОММЕРЧЕСКИЕ ЗАПАСЫ – Commercial Stocks:- commodity in storage in public and private elevators or warehouses at important markets and afloat in vessels or barges in harbors and ports. / Товары на хранении в публичных или частных элеваторах или складах в значимых рынках и в плавающих судах или баржах в заливах и портах.

COMMERCIAL WEIGHT = КОММЕРЧЕСКИЙ ВЕС – (1) Commercial Weight:- in natural fibers is the dry weight of fibers or yarns plus the commercial moisture regain. / коммерческая влагопоглощательная способность.

(2) Commercial Weight:- in manufactured fibers is the dry weight of staple spun yarns or filament yarns after scouring by prescribed methods, plush the commercial moisture regain. / филаментная (комплексная) пряжа (filament yarn) коммерческая влагопоглощательная способность.

COMMERCIAL ZONE = КОММЕРЧЕСКАЯ ЗОНА (или ЗОНА ТОРГОВЛИ) – Commercial Zone is the area surrounding a city or town to which rate carriers quote for the city or town also apply; the US Interstate Commerce Commission (ICC; it was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations) defines the area.

COMMINGLED YARN = СМЕШАННАЯ ПРЯЖА (или СОЕДИНЁННАЯ ПРЯЖА) – Commingled Yarn:- in aerospace textiles, two or more continuous multifilament yarns, the filaments of which have been intermixed with each other without adding twist or otherwise disturbing parallel relationship of the combined filaments. Usually consists of a reinforcing yarn, such as graphite or glass, and a thermoplastic matrix yarn.

COMMINUTION = ИЗМЕЛЬЧЕНИЕ – Comminution is the chopping up material, such as biomass, into small fragments.

COMMISSION = КОМИССИЯ – (1) Commission, or Factorage, the allowance given to factors by the merchants and manufacturers, etc who employ them:- it is a percentage on the goods they purchase or sell on account of their principals; and varies in different countries, and as it refers to different articles. It is customary for factors, as observed in the previous article, to insure the debts due to those for whom they sell for an additional, or del credere, commission, generally averaging from 1-1/2 to 2 per cent. Factorage or commission is also frequently charged at a certain rate per cask, or other package, measure, or weight, especially when the factor is only employed to receive or deliver:- this commission is usually fixed by special agreement between the merchant and factor. See also Factorage. Commission is a compensation paid for work performed, generally based on the volume of the transaction or expressed as percentage of the profit. What is difference between a Fee and Commission? A Commission is compensation received by a broker or insurance agent paid by the insurance company and is a percentage of the insurance premium, or a percentage of a portion of the insurance premium. A fee, on the other hand, is a fixed Dollar amount (not a set percent of the premium) and can be paid either by the party buying the insurance or by the insurance carrier. Often, clients with large premiums, or complex risks negotiate with their broker to provide services, including the placement of insurance for a flat fee. The insurance is than placed 'net of' or without commission. Many people feel that this is a more transparent method of broker compensation and eliminates broker bias to higher premiums or carriers which pay a higher commission. In certain circumstances, both a fee and a commission are charged. This usually occurs when the broker is providing services which are not property compensated by the commission in the policy. When a fee is charged in addition to a commission, it should be disclosed who the fee is being paid to, and for what service. / Компенсация, выплачиваемая за выполненную работу, обычно формируемая по объёму сделки или выраженная в качестве процента от данной прибыли. В гражданском праве под Комиссией, от Латинского слова Commissio, означающее Поручение, понимается договор, по которому одна сторона (комиссионер) обязуется по поручению другой стороны (комитента) за вознаграждение (комиссионное вознаграждение) заключить с третьим лицом сделку от своего имени, но в интересах и за счёт комитента.

(2) Commission is a fee charged by a broker for executing an order. Commission is the brokerage fee for entering and liquidating a futures or options contract. The broker's basic fee for executing a transaction such as purchasing or selling securities, assets or property as an agent. The fee that an advisor or a fund manager may receive for the buying or selling of securities. / Комиссия – вознаграждение, взимаемое брокером за исполнение распоряжения.

(3) Commission is the charge made by a commission house for buying and selling commodities; or the fee charged by a futures broker for the execution of an order. Note:- when capitalized, the Commission usually refers to the US Commodity Futures Trading Commission.

(4) Remuneration paid by the insurer to its agents, brokers or intermediaries, or by the reinsurer to the insurer, for costs in connection with the acquisition and administration of insurance business. In reinsurance, a Commission is the primary insurance company usually pays the reinsurer its proportion of the gross premium it receives on a risk. The reinsurer then allows the company a ceding or direct commission allowance on such gross premium received, large enough to reimburse the company for the commission paid to its agents, plus taxes and its overhead. The amount of such allowance frequently determines profit or loss to the reinsurer.

COMMISSION AGENT = КОМИССИОННЫЙ АГЕНТ – Commission Agent is a businessman who buys or sells goods or securities for the account of a third party but in his own name. A commission agent must observe a prudent businessman's professional obligations of due care and dilligence, notify the principal of the order's execution without delay and thus specify the name of the counterparty to the transaction. This obligation is waived when the agent transacts business in his own name.

COMMISSION BROKER = КОМИССИОННЫЙ БРОКЕР – Commission Broker is someone who gets paid by the brokerage company for which he works for each order of securities he executes on a customer's behalf. The commission structure can encourage unethical behavior by unscrupulous commission brokers. For example, a dishonest commission broker may engage in a practice called Churning, which means executing multiple trades in a customer's account for the sole purpose of generating more commissions. The additional trades do not benefit the customer. A broker who charges a flat fee for his or her services rather than earning a commission based on order size has more incentive to put the customer's best interest first. A flat-fee broker will not have an incentive to push a customer into certain securities because they are paying a high commission. Instead, he or she will have an incentive to get the

customer into the best-performing investments so the customer will be loyal to that broker and be a steady source of business. Commission Broker is an agent who executes the public's order for the purchase or sale of securities or commodities. / Агент, который исполняет распоряжения от широкой публики по приобретению или продаже ценных бумаг или различных видов сырья.

COMMISSION BUSINESS = КОМИССИОННОЕ ДЕЛО (или КОМИССИОННЫЙ БИЗНЕС) – Commission Business:- transactions in goods or securities are executed in one's own name, but at the instructions of a third party, called the Principal. The executor of these transactions is called the Commission Agent. Banks receive orders from their clients to conduct transactions on the stock exchanges; these are in the form of commission business.

COMMISSION FEE = КОМИССИОННОЕ ВОЗНАГРАЖДЕНИЕ – Commission Fee is a fee charged by a broker for executing a transaction. Also known as Brokerage Fee. / Сбор, взимаемый брокером за исполнение сделки. Известно также как Брокерское Вознаграждение (Brokerage Fee).

COMMISSION HOUSE = КОМИССИОННЫЙ ДОМ – Commission House is a brokerage or merchant firm which buys and sells futures contracts for customer accounts. A commission house generates income by charging a commission on the transactions that are made on behalf of the customers. Also known as a Futures Commission Merchant (FCM). Services might include transactions such as buying and selling bonds, stocks or commodities. More specifically, a commission house gets paid for executing orders, arranging settlement, or servicing margin accounts on behalf of their clients. They typically use omnibus accounts to do this. Commission House is an organization that trades commodities and/or futures and options contracts for customer accounts in return for a fee. See also Futures Commission Merchant. Commission Houses are the brokerage firms which buy and sell futures contracts for customers. Their earnings come from commissions charged on trades. / Организация, которая торгует сырьём и/или фьючерсными и опционными контрактами за счёт заказчиков, но за вознаграждение. Смотрите также Торговец Фьючерсами за Комиссию (Futures Commission Merchant).

COMMISSION INTERNATIONALE DE L'ECLAIRAGE = КОМИСЬО ЭТЭРНАСЬЁНАЛЬ ДЁ Л'ЭКЛЕРАЖ (или МЕЖДУНАРОДНАЯ КОМИССИЯ ПО ОСВЕЩЕНИЮ) – The International Commission on Illumination – also known as the CIE from its French title, the Commission Internationale de l´Eclairage – is devoted to worldwide cooperation and the exchange of information on all matters relating to the science and art of light and lighting, colour and vision, photobiology and image technology. With strong technical, scientific and cultural foundations, the CIE is an independent, non-profit organization that serves member countries on a voluntary basis. Since its inception in 1913, the CIE has become a professional organization and has been accepted as representing the best authority on the subject and as such is recognized by ISO as an international standardization body. The CIE is a technical, scientific and cultural non-profit organization whose objectives are:- (i) to provide an international forum for the discussion of all matters relating to the science, technology and art in the fields of light and lighting and for the interchange of information in these fields between countries; (ii) to develop basic standards and procedures of metrology in the fields of light and lighting; (iii) to provide guidance in the application of principles and procedures in the development of international and national standards in the fields of light and lighting; (iv) to prepare and publish standards, reports and other publications concerned with all matters relating to science, technology and art in the fields of light and lighting; and (v) to maintain liaison and technical interaction with other international organizations concerned with matters related to the science, technology, standardization and art in the fields of light and lighting. It is important to note that in these objectives light and lighting embraces such fundamental subjects as vision, photometry and colorimetry, involving natural and man-made radiations over the UV, the visible and IR regions of the spectrum, and application subjects covering all usage of light, indoors and out, including environmental and aesthetic effects, as well as means for the production and control of light and radiation. From 1999 onwards also the optical, visual and metrological aspects of the communication, processing and reproduction of images, using all types of analogous and digital imaging devices, storage media and imaging media are covered by CIE. The CIE publishes Standards, Technical Reports and Recommendations, prepared by the Technical Committees and the Proceedings of the Sessions and Symposia. More than 200 such publications have been issued, attesting to the activity of the Technical Committees. Joint publications include the CIE/IEC International Lighting Vocabulary and CIE/ISO Standards. In addition to Technical Publications, CIE News is published quarterly. This gives regular up-dates on the progress of the technical programme and forthcoming meetings together with news on administrative matters and topics of general interest in the world of light and lighting. A number of administrative documents are also available including the CIE Roster, which gives information on the terms of reference for the Divisions and their Technical Committees with contact details for the Officers of the Commission, the National Committees and the Divisions. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination is the international authority on light, illumination, color, and color spaces. It was established in 1913 as a successor to the Commission Internationale de Photométrie and is today based in Vienna, Austria. The CIE has eight active divisions, each of which establishes technical committees to carry out its program under the supervision of the division's director:- (i) Vision and Color; (ii) Measurement of Light and Radiation; (iii) Interior Environment and Lighting Design; (iv) Lighting and Signalling for Transport; (v) Exterior Lighting and Other Applications; (vi) Photobiology and Photochemistry; (vii) General Aspects of Lighting (Inactive); and (viii) Image Technology. Milestones:- In 1924 it established the standard photopic observer defined by the spectral luminous efficiency function V(λ), followed in 1951 by the standard scotopic observer defined by the function V'(λ). Building on the Optical Society of America's report on colorimetry in 1922, the CIE convened its eighth session in 1931, with the intention of establishing an international agreement on colorimetric specifications and updating the OSA's 1922 recommendations based on the developments during the past decade. The meeting, held in Cambridge, United Kingdom, concluded with the formalization of the CIE 1931 XYZ color space and definitions of the 1931 CIE 2° standard observer with the corresponding color matching functions, and standard illuminants A, B, and C. In 1964 the 10° CIE standard observer and its corresponding color matching functions as well as the new standard daylight illuminant D6500 were added, as well as a method for calculating daylight illuminants at correlated color temperatures other than 6 500 Kelvin. In 1976, the commission developed the CIELAB and CIELUV color spaces, which are widely used today. Based on CIELAB, color difference formulas CIEDE94 and CIEDE2000 were recommended in the corresponding years. / Международная Комиссия по Освещению (МКО) или, как это звучало по месту её первоначальной регистрации, Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)), была создана в 1913. МКО является наиболее авторитетным органом в мире в вопросах, входящих в компетенцию светотехнической подотрасли. МКО разрабатывает нормы, рекомендации, стандарты по технике всех видов освещения. Документы МКО являются обязательной базой для разработки национальных норм освещения. Основные задачи МКО:- (i) составление документации для разработки международных и национальных норм; (ii) быть международным центром дискуссий по всем вопросам светотехники, центром по обмену опытом между странами; (iii) разработка основных стандартов и методов измерения совместно с Международной Организацией по Стандартизации (МОС, так называемой ИСО); (iv) составление и публикация норм, докладов, касающихся всех вопросов светотехники; информация о деятельности МКО и её структур; выпуск печатных изданий; и (v) обеспечение связей и технического сотрудничества с другими международными организациями. Структура МКО:- все страны – члены МКО представлены в Генеральной Ассамблее МКО, которая избирает Правление МКО. Работа МКО распределена по семи направлениям, которые ведут 7 отделений МКО:- (i) Зрение и Цвет; (ii)

Измерение Света и Излучения; (iii) Освещение Помещений и Проектирование Освещения; (iv) Освещение и Сигнализация для Транспорта; (v) Освещение Открытых Пространств и Другие Применения Освещения; (vi) Фотобиология и Фотохимия; и (vii) Общие Аспекты Освещения. В каждом отделении создаются Технические Комитеты (ТК) для решения определённой задачи. Программа работы ТК составляется таким образом, чтобы поставленная задача была решена за 4 года. Результат работы ТК должен быть оформлен Техническим Отчётом (публикация МКО). В каждой стране МКО представлена Национальным Комитетом, содействующим осуществлению целей и задач МКО и реализующим результаты деятельности МКО на национальном уровне. Российский Национальный Комитет МКО (РНК МКО) продолжает работу бывшего Советского НК МКО, созданного в 1939. В СССР и в Российской Федерации РНК МКО традиционно действует на базе Всероссийского Научно-Исследовательского Светотехнического Института (ВНИСИ) имени Сергея Ивановича Вавилова – головного научного института светотехнической подотрасли. Председателями НК МКО в разное время были руководители ВНИСИ:- Т.К. Глазунов (с 1960 по 1969), В.Г. Барышников (с 1970 по 1972), П.В. Пляскин (с 1972 по 1986) и Г.Р. Шахпарунянц (с 1986 по 2008). В настоящее время Президентом Российского Национального Комитета (РНК МКО) является А.Г. Шахпарунянц, Генеральный Директор ВНИСИ. Представителями в отделениях МКО являются руководители и видные специалисты научно-исследовательских организаций, промышленных предприятий и других структур, функционирующих в светотехническом секторе экономики России. Участие национального комитета в качестве члена МКО даёт России преимущественное право на получение различной информации о новейших достижениях в мировой светотехнике и приоритетных направлениях её развития с учётом использования высоких технологий, в том числе, затрагивающие актуальные вопросы экологии и энергосбережения. Российские специалисты-светотехники национального комитета успешно работают в семи отделениях МКО, созданных по важнейшим направлениям светотехники. Практическим результатом этой деятельности явилось внедрение в отечественную практику прогрессивных норм искусственного освещения, передовых технологий и организация производства современных и эффективных средств освещения многих престижных объектов различного назначения не только в России, но и за рубежом. Материалы и стандарты МКО были использованы во многих работах Российских научно-исследовательских организаций, в том числе при разработке ГОСТ по Осветительныи Приборам и других нормативных документов. Международная Комиссия По Освещению (Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE))) – международная организация, занимающаяся разработкой стандартов в области освещения. Эта аббревиатура входит в название ряда цветовых пространств, представляющих собой математические модели восприятия цвета человеком. Каждое из них определяется тремя координатными осями, с помощью которых можно уникальным образом описать цвет в восприятии конкретного наблюдателя при заданном освещении.

COMMISSION MERCHANT = КОМИССИОНЕР (или ФАКТОР, или КОМИССИОННЫЙ КОММЕРСАНТ) – Commission Merchant is the member or member firm which carries the futures contract for the customer. They need not be a Clearing Member. One who makes a trade, either for another member of an exchange or for a non-member client, but who makes the trade in his own name and becomes liable as principal to the other. See also Futures Commission Merchant.

COMMITMENT = ОБЯЗАТЕЛЬСТВО – (1) Commitment:- if an excess of buyers forces price to rise, some buyers will be deterred by the higher prices and withdraw, and more sellers may be enticed into the market. The rate of withdrawal/entry in response to changing prices is referred to as the Commitment (or Eagerness) of the party in control. If buyers are strongly committed they will not deterred by rising prices and will continue to bid the price up, with little profit-taking. Likewise, if sellers are committed they will not be deterred by lower prices and will continue to sell the stock down. The market provides a number of clues as to the commitment of buyers and sellers:- (i) the position of closing price relative to the previous close; (ii) the position of closing price relative to the range; (iii) expanding or contractingranges; (iv) gaps between consecutive ranges; and (v) volume traded. Made when a trader assumes the obligation to accept or make delivery by entering into a futures contract. See also Open Interest. Commitment:- the number of open or outstanding contracts for which an individual or entity is obligated to the exchange because that individual or entity has not yet made an offsetting sale or purchase, an actual contract delivery, or, in the case of options, exercised the option. / Исполняется, когда торговец принимает на себя обязательство акцептовать или осуществить поставку для исполнения фьючерсного контракта. Смотрите также Открытый Интерес (Open Interest).

(2) Total value of all notes representing financial obligations outstanding, including money, loans, debt, etc.

(3) Commitment is a guarantee to provide service for a specific period.

COMMITMENT COMMISSION = КОМИССИЯ ЗА ОБЯЗАТЕЛЬСТВО – Commitment Commission is a fee charged by banks (usually on a quarterly basis) for credit lines granted but not drawn on during the agreed loan period. / Вознаграждение, взимаемое банками (обычно на поквартальной основе) за предоставленную, но не задействованную в течение оговорённого периода ссуды кредитную линию.

COMMITMENTS OF TRADERS REPORT = ОТЧЁТ ОБ ОБЯЗАТЕЛЬСТВАХ ТОРГОВЦЕВ – Commitments of Traders Report (COT) is a weekly report from the US Commodity Futures Trading Commission (CFTC) providing a breakdown of each Tuesday's open interest for markets in which 20 or more traders hold positions equal to or above the reporting levels established by the CFTC. Delayed release date may be due to a Federal holiday. Open interest is broken down by aggregate commercial, non-commercial, and non-reportable holdings. Reports are available in both a short and long format. The short report shows open interest separately by reportable and nonreportable positions. For reportable positions, additional data is provided for commercial and non-commercial holdings, spreading, changes from the previous report, percents of open interest by category, and numbers of traders. The long report, in addition to the information in the short report, groups the data by crop year, where appropriate, and shows the concentration of positions held by largest four and eight traders. Supplemental reports show aggregate futures and option positions of Commercial, Noncommercial, and Index Traders in 12 selected agricultural commodities. The Commitments Of Traders Report released by the CFTC shows a breakdown of the open interest in a specific market of the reportable and non-reportable traders holding open positions as of the report date. This data is used to track the net-positions of large speculators, commercials, and the small traders. The COT Myths:- some traders view the COT (commitments of traders) reports as a bible, still others view it as old data, and of very little use. A lot of this depends on one's time frame and trading perspective. What I am going to try to do today is debunk some of the myths and misnomers regarding these reports help and everyone glean the useful knowledge that rests in these reports. These reports are issued every Friday by the CFTC and come in two basic types futures only and futures plus options. For my purposes, I stick with the futures plus options version. Over the years much has been written about these reports. Some hold the view that options are only traded by small accounts and small investors. My experience here at the Chicago Board of Trade has largely dispelled that myth entirely. Options are used by institutions, large traders and commercial entities with nearly the same regularity as futures contracts. This allows the inclusion of the professional option sellers into the analysis. Basically, I look for the most complete picture of the marketplace. While nothing will ever give a total and complete view, ignoring thousands of positions will not give an accurate view. The next thing is looking to see who these participants are, and what we can glean from them. The commercials are the most vaunted of the group, as they in

some respects ‘are’ the markets that we trade. In many cases this is very true, the agricultural markets, the energy markets especially, these show a supply and demand picture. When we move into other markets like currencies and precious metals things become a bit more nebulous. So, to compensate for this I pull out some different tools to go along with the rest of the COT reports. More on that later. The large speculators or ‘the funds’ are the next largest group. These guys are here for one reason and one reason only, and that is to make money for their investors. These help provide the market with volatility and liquidity. These are key to any post modern COT analysis, as their participation in the market is growing every day. The next group to look at is the non reportables. This group basically contains everybody else that doesn’t fit into the two other groups. Now that we know the players involved, we need to make some sense out of what they are doing. The first clue is to look into their motivations in being in the marketplace and each group's general level of sophistication and organization. The commercials are certainly sophisticated in their market knowledge and use of techniques. The commercials main goal, in my view, is to use the markets to facilitate their businesses and to cut down on price risk. In my experience, following them in terms of speculative trading, the commercials represent, in some markets, a very good idea where the markets are most likely going, over time. Keep in mind by their very nature commercials are not very good market timers. They are, however not equipped some great foretelling power or other mystical power. Lesson:- Just Because The Commercials Do Something Does Not Mean You Have To. The funds are often on very much the opposite side of the commercials. If one follows the view that commercials are always right, it would stand to reason that the funds would always be wrong. Hmmm ..... if this were the case these funds would not be in business very long, let alone see the huge cash inflows into them. We shouldn’t confuse trading with making money. The purpose of the commercials trading accounts is to lock up risk, not to be profitable in the futures market. Remember the commercial position is only one of several indicators and they are not market timers! The most important thing to remember about the funds is:- in order to make or take profits, they must exit the market. So if you see a market having had a big price run up, and huge fund long positions, it may be subject to sell offs. A lot of funds use moving average/trend following techniques, and this can lead to unusually large price swings. Lesson:- Don’t Get Caught In The Way Of A Fund Exit. If You Are On The Wrong Side, It Hurts. The non reportables are the folks left over after the big guys. This group contains who? You, me, small hedgers (farmers, small coin dealers) and the like. If you look at this overall group, and follow the majority, you will see that the majority is wrong a great deal of the time across most markets. Does this mean we should just grab a COT report and do the opposite of the non-reportables with reckless abandon? No. Don’t confuse price levels and trade viability with indicators. Lesson:- If You Find Yourself With The Majority On The Non Reportables, You Should Think About Your Position Carefully. I take this information and quantify it, and call the FuturesOne Power Index. COT reports are just one element of trading. The most important elements are to decide on your time frame and price levels when trading. If you time frame is short, these reports are less important than if your time frame is longer or has some degree of flexibility in it. As traders we all have to make choices, and not just bullish and bearish. We have to choose between markets, number of contracts, and what approach to take. Then, we must decide on a risk level and stick with it. No one indicator is every going to provide a holy grail, just some things will work better than others, at different times. Here are some things that I think look rather interesting from last week’s COT reports. Corn:- this market has a classic COT report contradiction going on. The Commercials and the non reportables are both short. This doesn’t happen very often, especially in a big market like corn. The funds have shown a solid desire for ownership. The last time I saw this was in the sugar when it was trading at about 8.00. Sugar doubled in price over the next year. Copper:- Yes, this stuff has been oft to the races for quite a while now. The COT numbers have become friendly to the upside through this corrective period. It seems to me there may be more upside here than anyone ever dreamed of. Commitments of Traders Report (COT) is a weekly report from the CFTC providing a breakdown of each Tuesday’s open interest for markets in which 20 or more traders hold positions equal to or above the reporting levels established by the CFTC. Open interest is broken down by aggregate commercial, non-commercial, and non-reportable holdings. See also Commercial, and Non-Commercials.

COMMITTEE = КОМИТЕТ – Committee is a group of people officially delegated to perform a function. / Комитет – это группа людей, официально делегированная на исполнение функций. Под Комитетом, от Французского слова Comité, от Латинского слова Committo, означающее Поручаю, понимается коллегиальный руководящий орган, образуемый для проведения специальных мероприятий или руководства чем-либо.

COMMITTEE FOR INTERNATIONAL COOPERATION BETWEEN COTTON ASSOCIATIONS = КОМИТЕТ ПО МЕЖДУНАРОДНОМУ СОТРУДНИЧЕСТВУ МЕЖДУ ХЛОПКОВЫМИ АССОЦИАЦИЯМИ – Committee for International Cooperation between Cotton Associations (CICCA). This committee was organized in 1975, in response to the cotton contract crisis of 1973–75 with the following purposes:- (1) Provide opportunity for cooperation between recognized raw cotton associations; (2) Maintain trading practice standards; (3) Ensure proper performance of contracts and lessen the circumstances leading to technical disputes; (4) Counter attempts to evade compliance with arbitration awards; (5) Provide a forum for the general discussion of matters of importance to the international cotton trade; (6) Make representations on behalf of the world cotton trade and channel its views to government agencies and other organizations; and (7) Promote recognition of the vital role performed by international cotton traders to both producers and consumers of cotton worldwide. CICCA is currently composed of 12 national cotton associations connected with the cotton arbitration authorities of their respective countries. CICCA maintains reciprocal observer status arrangements with the International Cotton Advisory Committee (ICAC), International Textile Manufacturers Fed. (ITMF), the United Nations Conference on Trade and Development (UNCTAD), and the International Institute for Cotton (IIC). In these Forums, CICCA works to preserve trading ethics and the sanctity of cotton contracts to ensure sound trading and proper performance of contracts. Particular importance is attached to the preservation of fair and effective arbitration systems that will ensure equitable awards, which can be enforced in a court of law, if necessary. Currently, CICCA membership comprises these national cotton associations:- Belgium – Association Cotonniere de Belgique, Brazil – Bolsa de Mercadorias de Sao Paulo, Egypt, Arab Republic of – Cotton Exporters Association in ARE, France – Association Francaise Cotonniere, Germany, West – Bremer Baumwollboerse, Italy – Associazione Cotoniera Italiana, Japan – The Japan Cotton Traders’ Association, Netherlands – Da Vereeniging Voor den Katoenhandel, Poland – Gdynia Cotton Association, Spain – Centro Algodoneira Nacional, United Kingdom – The Liverpool Cotton Association, Ltd., USA – American Cotton Shippers Association.

THE COMMITTEE OF 300 = КОМИТЕТ ИЗ 300 (или КОМИТЕТ ТРЁХСОТ) – The Committee of 300 governs the world via a three city state empire, in which the cities pay no taxes and obey their own laws:- (i) City of London Corporation – financial power center, established in 1067; (ii) District of Columbia – military power center, established in 1871; and (iii) Vatican City – religious power center, sovereign in 1929. The Committee of 300 uses a network of roundtable groups, think tanks and secret societies which control the world’s largest financial institutions and governments. The most prominent of these groups include:- Chatham House, Bilderburg Group, Trilateral Commission, Council on Foreign Relations, Ditchley Foundation, Club of Rome, RAND Corporation, PNAC, and of course Freemasonry. Western Europe, excluding the German Empire, was united by the House of Guelph in 1815. The German Empire was conquered in 1918 along with the Russian Empire and the Ottoman Empire following World War I. The thousand year war between the Guelph’s and Ghibelline’s finally concluded with the Axis defeat in WWII, and the introduction of nuclear weapons, since then the world has been under monopolist control. The victors of WWII play off the Germanic race as losers in that ideologically staged war. The Germanic race was in fact spectacular winners, crushing the mighty Japanese Empire and recapturing control over the Holy

Land. Communism was allowed to spread through Eastern Europe and Asia, proving to be a superior method of conquering peoples than warfare. Communism in the forms of socialism, Outcome Based Education and slanted mass media has spread through the western world converting people by suggestion to Marxist-Leninist ideology. Following WWII in 1946 the Tavistock Institute was established in London with a grant from the Rockefeller Foundation. Tavistock's pioneer work in behavioral science along Freudian lines of 'controlling' humans established it as the world centre of foundation ideology. 'All Tavistock and American foundation techniques have a single goal – to break down the psychological strength of the individual and render him helpless to oppose the dictators of the World Order. Any technique which helps to break down the family unit, and family inculcated principles of religion, honor, patriotism and sexual behavior, is used by the Tavistock scientists as weapons of crowd control'. The inevitability of a WWIII is looking more and more painfully obvious, and in the western world war is still glorified by many. The most popular movies are war movies, the most popular video games are war video games. Albert Pike, the only Confederate military figure to be honored with an outdoor statue in the District of Columbia, had this to say in 1871 about the future WWIII:- 'The war must be conducted in such a way that Islam and political Zionism mutually destroy each other. Meanwhile the other nations, once more divided on this issue will be constrained to fight to the point of complete physical, moral, spiritual and economical exhaustion'. Descendents of the Tribe of Levi control the financial and religious arms of the empire. This includes the entire banking system and the political systems of the world. The Rothschild family is the most powerful banking family in the world; they are also related to other powerful Levites including the Cohen's and the Levy's. Descendents of the Tribe of Joseph act as monarchs to the English speaking world, while descendents of the Tribe of Judah act as monarchs to the Spanish speaking world. The world secret religion is the Cult of Amun. Without knowing it Jews, Christians and Muslims all around the world are honoring Amun at the end of their prayers. Amun = Amon = AMEN. Amun represents the essential and hidden, the power elite thrive on keeping the masses in the dark. The Alumbrados were a Gnostic secret society preaching the Mystery Babylonian religion and worship of Lucifer, the great deceiver. These crypto-Kabbalist Jewish mystics infiltrated the Vatican through Pope Callixtus III and Pope Alexander VI, both of the House of Borgia, as agents of the Crown of Aragon. In 1527 Ignatius of Loyola managed to escape persecution from the Inquisition with help from Pope Paul III of the Black Nobility Farnese family. Loyola claimed was he raising a Militia to defend the Papacy which would lead to absolute control of Military and Politics, and absolute control of a One World Church. In 1534 the Society of Jesus was founded with Ignatius of Loyola its first Superior General. Funding came from Francis Borgia the great-grandson of both Pope Alexander VI and King Ferdinand II of Aragon. Francis Borgia later became the 3rd Superior General of the Society of Jesus. The Society of Jesus went on to become the successors of the Order of Montesa who had inherited the possessions of the Aragonese branch of the Knights Templar. The penultimate Master of the Order of Montesa, Francisco Lanzol de Romani, was succeeded by his cousin Pedro-Luis de Borja who was the half-brother of Francis Borgia. The Lutheran reformation movement was used by the Rosicrucians, and later the Jesuits, to subvert the public and restrict the real social-political effects of the Reformation on societies in Europe. The Reformation was led by Martin Luther and was funded by Frederick III of Saxony, of the House of Wettin. The Rosicrucians, like the Alumbrados, were a Gnostic secret society preaching the Mystery Babylonian religion and worship of Lucifer. Rosicrucianism and its Kabbalist doctrine was the precursor of the Invisible College, the Royal Society and modern day speculative Freemasonry. After the suppression of the Jesuits in 1773, the Illuminati were founded by Jesuit student Adam Weishaupt on Walpurgis Night in 1776. Weishaupt's greatest supporter was Ernest II, Duke of Saxe-Gotha-Altenburg of the House of Wettin. The purpose of this Jesuit controlled Bavarian Illuminati was to protect the Society of Jesus' financial interests, to exact revenge on the Monarchs who forced the Jesuits suppression, to subvert the English Masonic movement and to re-establish the Society of Jesus. They achieved this by planning the French Revolution, which led to the Napoleonic Wars. The Jesuits were restored in 1814 after the abdication of Napoleon who was in truth a tool of the Jesuits. Napoleon had this to say about the Society of Jesus while in exile on the island of St Helena:- 'The Jesuits are a military organization, not a religious order. Their chief is a general of an army, not the mere father abbot of a monastery. And the aim of this organization is POWER. Power in its most despotic exercise. Absolute power, universal power, power to control the world by the volition of a single man .... The General of the Jesuits insists on being master, sovereign, over the sovereign. Wherever the Jesuits are admitted they will be masters, cost what it may .... Every act, every crime, however atrocious, is a meritorious work, if committed for the interest of the Society of the Jesuits, or by the order of the general'. The hexagram is the most powerful and evil sign in Satanism and of all the occult world. The hexagram is used mainly in witchcraft to summon demons from the world. The word 'Hex' which means to place a curse on someone, originated from this sign. The Hexagram is a six sided star, made up of a six sided hexagon surrounded by six equilateral triangles. Each equilateral triangle found within the Hexagram is 60° by 60° by 60°. The Hexagram represents 666 and is the 'Mark of the Beast' referred to in the Bible. As they say 'The Devil is in the details'. The Westside hand gesture or 'Triad Claw' signals the letters M & W, which symbolize 666 from the three V's. The letter V is 'waw' in Hebrew and 'vav' in Gematria and is the 6th letter in both. The Sign of the Horns or El-Diablo hand gesture is a variation of the 'Triad Claw' with the two attached fingers bent down. The A-ok hand gesture is also a representation of the number 666; with the middle finger, ring finger, and little finger representing the top part of the six's. The index finger and thumb represent the circular part of the six's. Astrologically Saturn represents darkness, misfortune, death and fear. Saturday is named after the Roman god Saturn, the Ancient Greeks referred to this god as Cronus. The symbol of Saturn/Cronus is the sickle. Saturday is the 6th day of the week in western cultures and Saturn is the 6th planet from the Sun. Saturn had six children with his wife Ops, the 6th of these children was Jupiter or as the Greeks knew him, Zeus. The sickle of Saturn and hammer of Thor (Jupiter/Zeus) combined is represented in the the symbol of Communism. The core of the control over Planet Earth's populace lies in ancient cults. These cults are still in existence to this day. Following the most ancient religions mixed with sexual worship. The main cults are the worship of the Planet Saturn (El), Moon (Isis), Venus (Lucifer) & Sun (Ra). Child/Human Trafficking is one of the fastest growing crimes in the world. Child/human trafficking is a 12 billion dollar a year industry and is the world's second largest criminal enterprise, after drugs. Saturn = Satan = El = Moloch. The power elite of this world worship Saturn and appease him with child sacrifices just as they have for hundreds of years. The most public of these displays is the 'Cremation of Care' ceremony held annually at Bohemian Grove, where the members sacrifice a child to their god Moloch. The Committee of 300 controls the world economy via the City of London Corporation. The City of London Corporation is made up of 108 Livery Companies, the Worshipful Company of Fuellers and the Worshipful Company of Mercers are two of the most prominent. The Bank of International Settlements (BIS) controls the worldwide banking system including the Federal Reserve System and the European Central Bank. The International Monetary Fund (IMF) and the World Bank work to indebt developing nations making them subservient to the developed nations of the world. The Groups of 7, 20 and 30 act as financial regulators and middlemen servicing Central Banks and Investment Banks. These regulators are unelected and empower the Financial Terrorists at the expense of the masses. Finally, the Investment Banks and financial services corporations gamble with their clients money with the reassurance that any losses will be paid by taxpayers. Among them:- Bank of America, Bank of China, The Bank of New York Mellon Corporation, Banque Populaire, Barclays Bank PLC, BNP Paribas, Citigroup Inc., Commerzbank, Crédit Agricole, Credit Suisse Group AG, Deutsche Bank AG, Dexia, Goldman Sachs Group, Inc., HSBC Holdings PLC, ING Groep NV, JPMorgan Chase & Co., Lloyds Banking Group, Mitsubishi UFJ, Mizuho, Morgan Stanley, Nordea, Royal Bank of Scotland, Santander, Société Générale, State Street, Sumitomo Mitsui, UBS AG, Unicredit Group and Wells Fargo. 'Three hundred men, all of whom know one another, direct the economic destiny of Europe and choose their successors from among themselves' (Walter Rathenau, 1909, founder of the mammoth German General Electric Corporation). The Committee of 300 is a product of the

British East India Company's Council of 300. The East India Company was chartered by the British royal family in 1600. It made vast fortunes in the opium drug trade with China and became the largest company on earth in its time. Today, through many powerful alliances, the Committee of 300 rules the world and is the driving force behind the criminal agenda to create a 'New World Order', under a 'Totalitarian Global Government'. There is no need to use 'they' or 'the enemy' except as shorthand. We know who 'they', the enemy, is. The Committee of 300 with its 'aristocracy', its ownership of the US Federal Reserve banking system, insurance companies, giant corporations, foundations, communications networks, presided over by a hierarchy of conspirators – this is the enemy. Secret societies exist by deception. Each is a hierarchy with an inner circle at the top, who deceives those below with lies, such as claiming a noble agenda; thus, duping them into following a web of compartmentalized complicity. The inner circle of the Committee of 300 is the Order of the Garter, headed by Queen Elizabeth Windsor II. It is interesting to note that the Windsor's changed their name from the Germanic Saxe-Coburg-Gotha during WWI, because of anti-German sentiment. The enemy is clearly identifiable as the Committee of 300 and its front organizations, such as, the Royal Institute for International Affairs (Chatham House), the Club of Rome, NATO, the United Nations, the Black Nobility, the Tavistock Institute, CFR, ... and all its affiliated organizations, the think tanks and research institutions controlled by Stanford and the Tavistock Institute of Human Relations and last, but certainly not least, the military establishment. The Committee of 300 is the ultimate secret society made up of an untouchable ruling class, which includes:- the Queen of the United Kingdom (Elizabeth II), the Queen of the Netherlands, the Queen of Denmark, the royal families of Europe. These aristocrats decided at the death of Queen Victoria, the matriarch of the Venetian Black Guelphs that, in order to gain world-wide control, it would be necessary for its aristocratic members to 'go into business' with the non-aristocratic but extremely powerful leaders of corporate business on a global scale, and so the doors to ultimate power were opened to what the Queen of England likes to refer to as 'The Commoners'. Through their illicit banking cartel, they own the stock of the Federal Reserve, which is a private for profit corporation that violates US Constitution and is a root of the problem. The decadent American families of the unholy partnership, thoroughly corrupted and wallowing in tainted opium money, went on to become what we know today as the Eastern Liberal Establishment. Its members, under the careful guidance and direction of the British Crown, and subsequently, its foreign policy executive arm, the Royal Institute for International Affairs (RIIA), now known as Chatham House, located in England (across St. James's Square from the Astors), ran the United States from top to bottom through their secret upper-level, parallel government, which is tightly meshed with the Committee of 300, the ultimate secret society. That secret, all-powerful government is now more in control of the United States than ever before. In the Committee of 300, which has a 150-year history, we have some of the most brilliant intellects assembled to form a completely totalitarian, absolutely controlled 'new' society only it isn't new, having drawn most of its ideas from the Clubs of Cultus Diabolicus. It strives toward a One World Government rather well described by one of its late members, H.G. Wells, in his work commissioned by the Committee which Wells boldly called:- 'The Open Conspiracy – Blue Prints for a World Revolution'. Most of the Committee of 300's immense wealth arose out of the opium trade with China and India. Obscene profits went straight into the royal coffers, and into the pockets of the nobility, the oligarchs and plutocrats, and made them billionaires. The ordinary people of China, India, and England profited nothing from 'opium revenues'. In the same way the people of South Africa, black and white, never profited from the gold mining industry, whose revenues were piped directly into the City of London banks and Merchant banks. The Committee of 300 is responsible for the phony drug wars here in the US. These phony drug wars were to get us to give away our constitutional rights. Asset forfeiture is a prime example, where huge assets can be seized without trail and no proof of guilt needed. Also the Committee of 300 long ago decreed that there shall be a smaller-much smaller-and better world, that is, their idea of what constitutes a better world. The myriads of useless eaters consuming scarce natural resources were to be culled by up to 99%. Industrial progress supports population growth. Therefore the command to multiply and subdue the earth found in Genesis had to be subverted. This called for an attack upon Christianity; the slow but sure disintegration of industrial nation states; the destruction of billions of people, referred to by the Committee of 300 as 'surplus population', and the removal of any leader who dared to stand in the way of the Committee's global planning to reach the foregoing objectives. Not that the US government didn't know, but as it was part of the conspiracy, it helped to keep the lid on information rather than let the truth be known. Queen Elizabeth II, is the head of the Committee of 300. The Committee of 300 looks to social convulsions on a global scale, followed by depressions, as a softening-up technique for bigger things to come, as its principal method of creating masses of people all over the world who will become its 'welfare' recipients of the future. The current criminal agenda of the Committee of 300 is further evidenced by recently leaked Club of Rome documents, as they describe how they will use drugs to help stifle resistance to their New World Order scheme:- '… having been failed by Christianity, and with unemployment rife on every hand, those who have been without jobs for five years or more, will turn away from the church and seek solace in drugs. By then, full control of the drug trade must be completed in order that the government of all countries who are under our jurisdiction have a monopoly in place which we will control by controlling supplies reaching the market …. Drug bars will take care of the unruly and the discontented. Would-be revolutionaries will be turned into harmless addicts with no will of their own …'. The crowned cobras of Europe and their Eastern Liberal Establishment families will not tolerate any true war against drugs. The war on drugs, which the Bush administration was allegedly fighting, was for the legalization of all types and classes of drugs. Such drugs are not solely a social aberration, but a full-scale attempt to gain control of the minds of the people of the United States. At present, this is the principal task of the Committee of 300. Nothing has changed in the opium-heroin-cocaine trade. It is still in the hands of the same 'upper class' families in Britain and the United States. It is still a fabulously profitable trade where what appear to be big losses through sometimes seizures of drug shipments are actually small interlopers trying to break into the preserves of the drug trade hierarchy, who sit in paneled board rooms in New York, Hong Kong and London over port and cigars and congratulate another success in the eradication of 'competitors'. Included in the Committee of 300 membership are:- the old families of the European Black Nobility, the American Eastern Liberal Establishment (in Freemason hierarchy and the Order of Skull and Bone), the Illuminati, or as it is known by the Committee 'MORIAH CONQUERING WIND', the Mumma Group, the National and World Council of Churches, the Circle of Initiates, the Nine Unknown Men, Lucis Trust, Jesuit Liberation Theologists, The Order of the Elders of Zion, the Nasi Princes, International Monetary Fund (IMF), the Bank of International Settlements (BIS), the United Nations (UN), the Central, British Quator Coronati, Italian P2 Masonry – especially those in the Vatican hierarchy, the Central Intelligence Agency, Tavistock Institute selected personnel, various members of leading foundations and insurance companies, the Hong Kong and Shanghai Bank, the Milner Group-Round Table, Cini Foundation, German Marshall Fund, Ditchley Foundation, NATO, Club of Rome, Environmentalists, The Order of St. John of Jerusalem, One World Government Church, Socialist International, Black Order, Thule Society, Anenherbe-Rosicrucianists, The Great Superior Ones, ... and literally hundreds of other organizations. In the case of John F. Kennedy, the assassination was carried out with great attendant publicity and with the utmost brutality to serve as a warning to world leaders not to get out of line. Pope John Paul I was quietly murdered because he was getting close to the Committee of 300 through Freemasons in the Vatican hierarchy. His successor, Pope John Paul II, was publicly humiliated as a warning to cease and desist – which he has done. As we shall see, certain Vatican leaders are today seated on the Committee of 300. The Committee of 300 appears to base much of its important decisions affecting mankind on the philosophy of Polish aristocrat, Felix Dzerzinski, who regarded mankind as being slightly above the level of cattle. As a close friend of British intelligence agent Sydney Reilly (Reilly was actually Dzerzinski's controller during the Bolshevik Revolution's formative years), he often confided in Reilly during his drinking bouts. Dzerzinski was, of course, the beast who ran the Red Terror apparatus. He once told Reilly, while the two were on a drinking binge,

that, ‘Man is of no importance. Look at what happens when you starve him. He begins to eat his dead companions to stay alive. Man is only interested in his own survival. That is all that counts. All the Spinoza stuff is a lot of rubbish’. The roots of the East India Company (chartered by Queen Elizabeth I on December 31, 1600 and dissolved in 1873) sprout from the European Black Nobility. The Black Nobility are the oligarchic families of Venice and Genoa, who in the XII century held the privileged trading rights (monopolies). The first of three crusades, from 1063 to 1123, established the power of the Venetian Black Nobility and solidified the power of the wealthy ruling class. The Black Nobility aristocracy achieved complete control over Venice in 1171, when the appointment of the doge was transferred to what was known as the Great Council, which consisted of members of the commercial aristocracy, a complete triumph for them. Venice has remained in their hands ever since, but the power and influence of the Venetian Black Nobility extends far beyond its borders, and today, is felt in every corner of the globe. In 1204 the oligarchic family parceled out feudal enclaves to their members, and from this epoch dates the great building-up of power and pressure until the government became a closed corporation of the leading Black Nobility families. It is important to note that the European Black Nobility is responsible for the insidious entanglements of numerous secret societies, lodges, and organizations, which are backed with high finance and powerful political connections. Such organizations include:- Trilateral Commission, Bilderberg Group (German version of CFR), Council on Foreign Relations (CFR), United Nations (founded by CFR), Illuminati order Skull & Bones (inner circle of the CFR), International Monetary Fund (IMF), World Bank, Bank of International Settlement (BIS), Club of Rome, Chatham House (formally the Royal Institute of International Affairs – RIIA), Round Table, Tavistock Institute for Human Studies (England’s psychological warfare think tank), Associated Press, Reuters (Rothschild owned news monopoly used for brainwashing the masses), ... and many others, all of which, whether they are dupes or adapts, work in favor of Great Britain’s aristocracy and their one world government agenda. Although there is a wide cross-section, all roads lead to the Queen of England. The technique for keeping their illicit scheme secret is compartmentalization. Only the people in the inner circle, who are part of the capstone at the top of the pyramid, know the entire extent of the fraud. Adepts are few and dupes many. Typically, the dupes are told lies that their involvement is benevolent; thus, they become unwitting accomplices in crime. This is why it is imperative to expose this diabolical ring of power. Illicit secret societies cannot withstand the light of day. Once exposed, the cabal and their minions will fall like a house of cards. The European Black Nobility earned its title through dirty tricks, so when the population revolted against the monopolies in government, as anywhere else, the leaders of the uprising were quickly seized and brutally hanged. They use secret assassinations, murder, the bankrupting of opposing citizens or companies, kidnapping and rape. All the families listed are connected with the House of Guelph, one of the original Black Nobility families of Venice from which the House of Windsor and thus the present Queen of the United Kingdom, Elizabeth II, descends. What are the goals of the secret elite group, the inheritors of Illuminism (Moriah Conquering Wind), the Cult of Dionysius, the Cult of Isis, Catharism, Bogomilism? This elite group that also calls itself the OLYMPIANS (they truly believe they are equal in power and stature to the legendary gods of Olympus, who have, like Lucifer their god, set themselves above our true God) absolutely believe they have been charged with implementing the following by divine right:- (1) A One World Government – New World Order with a unified church and monetary system under their direction. Not many people are aware that the One World Government began setting up its ‘church’ in the 1920’s/1930’s, for they realized the need for a religious belief inherent in mankind to have an outlet and, therefore, set up a ‘church’ body to channel that belief in the direction they desired. (2) The utter destruction of all national identity and national pride. (3) The destruction of religion and more especially the Christian religion, with the one exception, their own creation mentioned above. (4) Control of each and every person through means of mind control and what Brzezinski call ‘technotronics’ which would create human-like robots and a system of terror beside which Felix Dzerzinski’s Red Terror will look like children at play. (5) An end to all industrialization and the production of nuclear generated electric power in what they call ‘the post-industrial zero-growth society’. Exempted are the computer and service industries. United States industries that remain will be exported to countries such as Mexico where abundant slave labor is available. Unemployables in the wake of industrial destruction will either become opium-heroin and or cocaine addicts, or become statistics in the elimination process we know today as Global 2000. (6) Legalization of drugs and pornography. (7) Depopulation of large cities according to the trial run carried out by the Pol Pot regime in Cambodia. It is interesting to note that Pol Pot’s genocidal plans were drawn up here in the United States by one of the Club of Rome’s research foundations. It is also interesting that the Committee is presently seeking to reinstate the Pol Pot butchers in Cambodia. (8) Suppression of all scientific development except for those deemed beneficial by the Committee. Especially targeted is nuclear energy for peaceful purposes. Particularly hated are the fusion experiments presently being scorned and ridiculed by the Committee and its jackals of the press. Development of the fusion torch would blow the Committee’s conception of ‘limited natural resources’ right out of the window. A fusion torch properly used could create unlimited untapped natural resources from the most ordinary substances. Fusion torch uses are legion and would benefit mankind in a manner which is as yet not even remotely comprehended by the public. (9) Cause by means of limited wars in the advanced countries, and by means of starvation and diseases in Third World countries, the death of 3 billion people by the year 2000, people they call ‘Useless Eaters’. The Committee of 300 commissioned Cyrus Vance to write a paper on this subject of how best to bring about such genocide. The paper was produced under the title the ‘Global 2000 Report’ and was accepted and approved for action by President Carter, for and on behalf of the US Government, and accepted by Edwin Muskie, then Secretary of State. Under the terms of the Global 2000 Report, the population of the United States is to be reduced by 100 million by the year 2050. (10) To weaken the moral fiber of the nation and to demoralize workers in the labor class by creating mass unemployment. As jobs dwindle due to the post industrial zero growth policies introduced by the Club of Rome, demoralized and discouraged workers will resort to alcohol and drugs. The youth of the land will be encouraged by means of rock music and drugs to rebel against the status quo, thus undermining and eventually destroying the family unit. In this regard The Committee of 300 commissioned Tavistock Institute to prepare a blueprint as to how this could be achieved. Tavistock directed Stanford Research to undertake the work under the direction of Professor Willis Harmon. This work later became known as ‘The Aquarian Conspiracy’. (11) To keep people everywhere from deciding their own destinies by means of one created crisis after another and then ‘managing’ such crises. This will confuse and demoralize the population to the extent where faced with too many choices, apathy on a massive scale will result. In the case of the United States, an agency for crisis management is already in place. It is called the Federal Emergency Management Agency (FEMA), whose existence I first disclosed in 1980. (12) To introduce new cults and continue to boost those already functioning which includes rock ‘music’ gangsters such as the filthy, degenerate Mick Jagger’s ‘Rolling Stones’ (a gangster group much favored by European Black Nobility) and all of the Tavistock created ‘rock’ groups which began with ‘The Beatles’. To continue to build up the cult of Christian fundamentalism begun by the British East India Company’s servant, Darby, which will be misused to strengthen the Zionist state of Israel through identifying with the Jews through the myth of ‘God’s Chosen People’ and by donating very substantial amounts of money to what they mistakenly believe is a religious cause in the furtherance of Christianity. (13) To press for the spread of religious cults such as the Moslem Brotherhood, Moslem fundamentalism, the Sikhs, and to carry out experiments of the Jim Jones and ‘Son of Sam’ type of murders. It is worth noting that the late Ayatollah Khomeini was a creation of British Intelligence Military Intelligence Division 6, commonly known as M16, as I reported in my 1985 work, ‘What Really Happened in Iran’. (14) To export ‘religious liberation’ ideas around the world so as to undermine all existing religions but more especially the Christian religion. This began with ‘Jesuit Liberation Theology’ which brought about the downfall of the Somoza family rule in Nicaragua and which is today destroying EI Salvador, now 25 years into a ‘civil war’, Costa Rica and Honduras. One very active entity engaged in so-called Liberation Theology is the Communist oriented Mary Knoll Mission. This accounts for the extensive

media attention to the murder of four of Mary Knoll's so-called Nuns in El Salvador a few years ago. The four nuns were Communist subversive agents and their activities were widely documented by the government of El Salvador. The United States press and news media refused to give any space or coverage to the mass of documentation in possession of the Salvadorian government, documentation which proves what the Mary Knoll Mission nuns were doing in the country. Mary Knoll is in service in many countries, and played a leading role in bringing Communism to Rhodesia, Mozambique, Angola and South Africa. (15) To cause a total collapse of the world's economies and engender total political chaos. (16) To take control of all Foreign and domestic policies of the United States. (17) To give the fullest support to supranational institutions such as the United Nations (UN), the International Monetary Fund (IMF), the Bank of International Settlements (BIS), the World Court and, as far as possible, make local institutions of lesser effect by gradually phasing them out or bringing them under the mantle of the United Nations. (18) Penetrate and subvert all governments, and work from within them to destroy the sovereign integrity of nations represented by them. (19) Organize a world-wide terrorist apparatus and negotiate with terrorists whenever terrorist activities take place. It will be recalled that it was Bettino Craxi who persuaded the Italian and US governments to negotiate with the Red Brigades kidnapers of Prime Minister Moro and General Dozier. As an aside, General Dozier is under orders not to talk about what happened to him. Should he break that silence, he will no doubt be made 'a horrible example of' in the manner in which Kissinger dealt with Aldo Moro, Ali Bhutto and General Zia ul Haq. (20) Take control of education in America with the intent and purpose of utterly and completely destroying it. Much of these goals, which I first enumerated in 1969, have since been achieved or are well on their way to being achieved. Of special interest in the Committee of 300 program is the core of their economic policy, which is largely based on the teachings of Malthus, the son of an English country parson who was pushed to prominence by the British East India Company upon which the Committee of 300 is modeled. Malthus maintained that man's progress is tied to the earth's natural ability to support a given number of people, beyond which point earth's limited resources would rapidly be depleted. Once these natural resources have been consumed, it will be impossible to replace them. Hence, Malthus observed, it is necessary to limit populations within the boundaries of decreasing natural resources. It goes without saying that the elite will not allow themselves to be threatened by a burgeoning population of 'useless eaters', hence culling must be practiced. As I have previously stated, 'culling' is going on today, using the methods mandated in the 'Global 2000 Report'. (Dr. John Coleman, former British Intelligence Officer, The Conspirator's Hierarchy:- The Committee of 300, http://www.coleman300.com) Xxxxx. The Committee of 300 now call themselves 'World Government Founders for the New World Order (NWO)'. The group that claims to have started the American, French and Russian revolutions state they have issued a March 31st (2012) deadline to the Committee of 300, according to their spokesman 'Alexander Romanoff'. In addition, Prince Harry has been in touch with the group and has agreed to take over control of the British Royal family from Queen Elizabeth. There are signs, such as the resignation of over a dozen senior bankers and the announcement of a USD15 trillion fraud in the UK and a USD6 trillion fraud in Italy, that these warnings have been taken seriously. The Italian case is especially noticeable because one of the people 'arrested' was former Prime Minister Silvio Berlusconi. In addition a meeting is scheduled this week between a White Dragon Society representative and a representatives of the dragon family in mainland Asia to discuss the creation of a meritocratically staffed economic planning agency. It can also now be disclosed that, Greece, Ireland, Portugal, and Spain, ... have all told the banks they are not going to pay back any of their loans because the loans were made illegally. This is one of the reasons why Moody's downgraded 114 financial institutions including, Bank of America, Citibank, Deutsche Bank AG, Goldman Sachs, etc. These are the institutions that own the Federal Reserve Board and the Federal Reserve Board is going to be shut down soon, according to Pentagon sources. In other words these countries are going to 'default', and for a change it will be the bankers and not the average citizens, who will pay the price. The resignation of the heads of, the World Bank, Credit Suisse, the Bank of India, 'planned resignation' of the head of Goldman Sachs, ... is just the beginning of a complete dismantling of the Khazarian banking monopoly. All money created through fraud is now going to be deleted from the global financial computer systems, according to officials involved in the take-down. The USD6 trillion fraud case in Italy is noteworthy because it is the one of the first such cases major corporate propaganda media outlets have reported worldwide. Italian newspapers have also now started reporting on the Neil Keenan lawsuit against, the Davos World Forum, Berlusconi, the UN etc, ... accusing them of a USD1 trillion theft. The arrest of 8 people is a further concrete sign of action being taken against the P2 Freemason lodge. This means that people who were hitherto above the law and above institutions like the Vatican and the United Nations are no longer immune from arrest. The announcement in the UK Upper House by Lord Blackheath that USD15 trillion had been stolen from a member of the 'Indian-Chinese' royal family by, Federal Reserve Board Chairman Ben Bernanke, US Treasury secretary Timothy Geithner, 'Yusuke Horiguchi' (we are making enquiries about this individual), ... is another sign of big change. The most interesting aspect of the Upper House testimony was the reference to a 'Lord Sassoon'. The Sassoons are one of the families that profited from both the Opium wars and the colonization of Japan and it is interesting to see their name finally appear in the spotlight. Lord Sassoon has, as the testimony makes clear, already committed perjury in relation to the USD15 trillion case. He is expected to be arrested and questioned soon. In the US, as well change continues under the surface. The pentagon has already decided that a major purge of Khazarian Satanist influence and control of corporations, banks and professional organizations will take place. Among the organizations expected to experience high profile arrests are, the American Medical Association, the American Dental Association, the Psychiatric and Psychology Associations, the Bar Association, the Chambers of Commerce, the Washington DC beltway. Particular attention is going to be directed at the Pharmaceutical and chemical companies as well as satanic corporations like Microsoft and Monsanto, according to the Pentagon sources. Rahm Emmanuel, Karl Rove, Paul Wolfowitz, Donald Rumsfeld, J. Rockefeller, the Bushes, various 'Neocons', ... are also due for arrest, according to multiple sources. The proof of these claims of course, can only be made if these promised arrests actually take place. Until then skepticism remains the order of the day. In Japan there is more credible evidence of change. The top power brokers in Japan have decided that a revolution will take place. They are pushing for Osaka Major Toru Hashimoto to be the leader of the new regime in this country. It is particularly noteworthy that two bitter, but extremely influential, rivals among the power-brokers both support Hashimoto. The Zionist flunkies are also trying to co-opt Hashimoto and make him one of their tools. This will not be allowed to happen. Ruling Democratic Party of Japan power-brokers Ichiro Ozawa (a Rockefeller servant) and former Prime Minister Yukio Hatoyama (a Freemason working for European royal families) will be bringing a large group of MP's to China in March in search for financial and other support. It has already been concluded they will return from this trip empty-handed. There is much more this writer knows but has been asked to remain silent about. However, there will be proof and detail from this week's meetings available in next week's report .... See also Bilderberg Group. / Ротшильд. Алыгзэндё (Alexander). Рокэфэлё (Rockefeller). COMMITTEE OF EUROPEAN SECURITIES REGULATORS = КОМИТЕТ ЕВРОПЕЙСКИХ РЕГУЛЯТОРОВ ЦЕННЫХ БУМАГ – Committee of European Securities Regulators (CESR) is a Committee, established by the European Commission in June 2001 in the light of the recommendation of the Report of the Committee of Wise Men on the Regulation of European Securities Markets, and composed of representatives from the national authorities regulating the securities markets. As the level 3 body of the revised European regulatory approach, it advises the European Commission on securities policy issues and helps to ensure a more consistent implementation of Community legislation in the Member States. It also improves coordination among European securities regulators.

COMMITTEE OF GOVERNORS OF THE CENTRAL BANKS OF THE MEMBER STATES OF THE EUROPEAN ECONOMIC COMMUNITY = КОМИТЕТ УПРАВЛЯЮЩИХ ЦЕНТРАЛЬНЫХ БАНКОВ ГОСУДАРСТВ ЧЛЕНОВ ЕВРОПЕЙСКОГО ЭКОНОМИЧЕСКОГО СООБЩЕСТВА – Committee of Governors of the central banks of the Member States of the European Economic Community:- a Committee created in May 1964 on the basis of Article 105(2) of the EEC Treaty to foster cooperation among central banks. In 1994 its tasks were taken over by the newly established European Monetary Institute (EMI) and the Committee was dissolved.

COMMITTEE ON MONETARY, FINANCIAL AND BALANCE OF PAYMENTS STATISTICS = КОМИТЕТ ПО МОНЕТАРНОЙ, ФИНАНСОВОЙ СТАТИСТИКЕ И СТАТИСТИКЕ БАЛАНСА ПЛАТЕЖЕЙ – The Committee on Monetary, Financial and Balance of Payments statistics (CMFB):- set up by Council Directive in 1991 to play a co-ordinating role in the compilation and use of statistics by the statisticians of the European System of Central Banks (DG Statistics of the European Central Bank (ECB) and the Statistics Departments of EU National Central Banks) on the one hand and the European Statistical System (Eurostat and the network of European National Statistical Institutes) on the other. Committee on Monetary, Financial and Balance of Payments Statistics (CMFB):- a Committee established by Council Decision 91/115/EEC of 25 February 1991, as amended by Council Decision 96/174/EC of 26 February 1996, bringing together statisticians from the national statistical institutes, Eurostat, the NCBs and the ECB. The CMFB advises the Commission on a range of statistical matters, in particular statistical aspects of the excessive deficit procedure, and promotes co-operation and co-ordination of statistical work at the European level.

COMMITTEE ON UNIFORM SECURITY IDENTIFICATION PROCEDURES = КОМИТЕТ ПО УНИФИЦИРОВАННЫМ ПРОЦЕДУРАМ ИДЕНТИФИКАЦИИ ЦЕННЫХ БУМАГ – The Committee on Uniform Security Identification Procedures (CUSIP®) is the numbering system used in the United States to identify issuers and issues of securities. The CUSIP® system originated from the American Bankers Association's Committee on Uniform Security Identification Procedures. Numbers are assigned by the CUSIP® Service Bureau, which is operated by Standard & Poor's. Committee on Uniform Security Identification Procedures (CUSIP®) number is a unique identification number that is assigned to stock and bond certificates. The acronym CUSIP historically refers to the Committee on Uniform Security Identification Procedures, which was founded in 1964, during the paper crunch in Wall Street. This 9-character alphanumeric code identifies any North American security for the purposes of facilitating clearing and settlement of trades. The CUSIP distribution system is owned by the American Bankers Association and is operated by Standard & Poor's. The CUSIP Service Bureau acts as the National Numbering Association (NNA) for North America, and the CUSIP serves as the National Securities Identification Number for products issued from both the United States and Canada. In the 1980s there was an attempt to expand the CUSIP system for international securities as well. The resulting CINS (CUSIP International Numbering System) has seen little use as it was introduced at about the same time as the truly international ISIN system. CINS identifiers do appear in the ISIDPlus directory (International Securities Identification Plus Directory is a comprehensive database of global security identifiers, cross-referencing more than one million issues. The database is co-produced by Standard & Poor's and SIX Telekurs), however. CUSIP® is a registered trademark of the American Bankers Association. CUSIP Global Services (CGS) is managed on behalf of the American Bankers Association by Standard & Poor's. / Бюро Услуг Си.Ю.Эс.Ай.Пи. (CUSIP Service Bureau), которое управляется компанией Стэндод энд Поз (Standard & Poor's).

COMMIXTURE = ВПЕРЕМЕШКУ (или В АССОРТИМЕНТЕ) – Commixture is a mixture of two or more cargoes which cannot be separated into the relevant consignments.

COMMODE = КОМОД (или ВЫСОКИЙ ЧЕПЕЦ, или УДОБНОЕ) – Commode is a woman's ornate cap popular in the late XVII and early XVIII centuries. / .

COMMODITIES DERIVATIVE FINANCIAL INSTRUMENT = ПРОИЗВОДНЫЙ ФИНАНСОВЫЙ ИНСТРУМЕНТ НА СЫРЬЁ – Commodities Derivative Financial Instrument:- (i) in general, the term Commodities Derivative Financial Instrument means any contract or financial instrument with respect to commodities (other than a share of stock in a corporation, a beneficial interest in a partnership or trust, a note, bond, debenture, or other evidence of indebtedness, or a section 1256 contract (as defined in section 1256 (b))), the value or settlement price of which is calculated by or determined by reference to a specified index. (ii) Specified Index:- the term Specified Index means any one or more or any combination of:- (a) a fixed rate, price, or amount, or (b) a variable rate, price, or amount; which is based on any current, objectively determinable financial or economic information with respect to commodities which is not within the control of any of the parties to the contract or instrument and is not unique to any of the parties' circumstances.

COMMODITIES DERIVATIVES DEALER = ДИЛЕР ПРОИЗВОДНЫХ НА СЫРЬЁ (или ДЕЛЕЦ ПО ДЕРИВАТИВАМ НА СЫРЫЕ МАТЕРИАЛЫ) – The term Commodities Derivatives Dealer means a person which regularly offers to enter into, assume, offset, assign, or terminate positions in commodities derivative financial instruments with customers in the ordinary course of a trade or business.

COMMODITY = СЫРЬЁ (или СЫРОЙ МАТЕРИАЛ, или ПРЕДМЕТЫ ТРУДА) – (1) A Commodity is a product for which there is demand and which is sold without qualitative differentiation across a market. The term commodity generally refers to physical goods that constitute the building blocks of more complex products. Commodity prices are determined as a function of the market as a whole. Commodities can be traded in two separate, but related, markets:- the cash (spot) market and the futures market. The cash market refers to the trading of physical commodities. In a cash market transaction the price agreed upon (spot price) and the exchange of the products occur in the present. The futures market deals with the trading of future obligations to make or take delivery at a future date, instead of the actual commodity. They are traded on commodity exchanges. For dangerous and hazardous cargo, the correct commodity identification is critical. In the narrowest sense and according to the economical categorization used in national accounting, non-financial commodities are defined as 'essential raw materials' that come from the primary sector, which includes agriculture and mining. In the widest sense, the term 'commodities' also contains semi-finished products used by producers and consumers, although a significant proportion of the value of such products has been added by the manufacturing sector through the activities of slaughterhouses, pulp mills and copper smelters, refineries, etc, e.g., meat, paper pulp and refined copper. Electricity as well as modern commodities like bandwidth, and so called Negative Commodities such as emissions credits or weather events, are not the subject of this work. Raw materials such as gold, orange juice, or pork bellies. Traders in commodities buy and sell contracts (also called Futures) for such materials. As defined by the US Commodity Futures Trading Commission, specifically enumerated agricultural commodities, all other goods and articles, except onions, and all services, rights, and interests in which contracts for future delivery are

presently, or in the future may be, dealt. An article of commerce or a product that can be used for commerce. In a narrow sense, products traded on an authorized commodity exchange. The types of commodities include agricultural products, metals, financial instruments and indexes, foreign currencies, petroleum, to name a few. A Commodity, as defined in the US Commodity Exchange Act, includes the agricultural commodities enumerated in Section 1a(4) of the Commodity Exchange Act and all other goods and articles, except onions as provided in Public Law 85-839 (7 USC § 13-1; 7 USC is short for the United States Code:- Title 7), a 1958 law that banned futures trading in onions, and all services, rights, and interests in which contracts for future delivery are presently or in the future dealt in. Commodity is a type of plant, plant product, or other article being moved for trade or other purpose. Commodity:- a product identified with specific clients, i.e. paper. Raw materials that can be bought and sold. Commodity is any physical product traded on a futures exchange. A fungible product (each unit is the same). / Под Сырьём понимается тип растения, растительного продукта или другого изделия, перевозимого в торговых или иных целях. Под Сырьём или Сырыми Материалами понимаются предметы труда, подвергшиеся ранее воздействию труда и подлежащие дальнейшей переработке, например, добытая руда или полученное после джинирования хлопковое волокно. В экономике под Предметами Труда понимается всё то, что подвергается обработке, на что направлен труд человека. Они даны природой, например, нефть, руда, уголь, или же являются продуктами труда – сырым материалом, например, древесина, металл, хлопок и так далее. Сырьё или Сырой Материал – предмет труда, на добычу или производство которого был затрачен труд (железная руда на металлургическом заводе, хлопок на текстильной фабрике, зерно на мукомольном предприятии и так далее). По происхождению различают промышленное и сельскохозяйственное сырьё. Промышленное сырьё подразделяется на искусственное (заменители кожи, синтетические смолы и пластмассы и так далее) и минеральное (графит, нефть, руды металлов, уголь и тому подобное). Сельскохозяйственное сырьё подразделяют на растительное и животного происхождения.

(2) In economics, Commodity is any tangible good that is traded. A specification of goods/product types, e.g., toys, electronics or welding machinery.

(3) Commodity is raw materials and foods, especially such goods as Cocoa, Coffee, Cotton, Jute, Potatoes, tea, etc, which may also be traded.

COMMODITY BOX RATE = СТАВКА ПЕРЕВОЗКИ СЫРЬЯ В СУНДУКЕ – Commodity Box Rate is a rate classified by commodity and quoted per container. A freight rate classified by commodity and offered per container.

COMMODITY CHANNEL INDEX = ИНДЕКС ПО СЫРЬЕВОМУ КАНАЛУ – Commodity Channel Index (CCI):- Introduction:- developed by Donald Lambert and featured in Commodities magazine in 1980, the Commodity Channel Index (CCI) is a versatile indicator that can be used to identify a new trend or warn of extreme conditions. Lambert originally developed CCI to identify cyclical turns in commodities, but the indicator can successfully applied to indices, exchange-traded funds (ETFs), stocks and other securities. In general, CCI measures the current price level relative to an average price level over a given period of time. CCI is relatively high when prices are far above their average. CCI is relatively low when prices are far below their average. In this manner, CCI can be used to identify overbought and oversold levels. Calculation:- the example below is based on a 20-period Commodity Channel Index (CCI) calculation. The number of CCI periods is also used for the calculations of the simple moving average and Mean Deviation. CCI = (Typical Price – 20-period SMA of TP) / (0.015 x Mean Deviation); Typical Price (TP) = (High + Low + Close) / 3; Constant = 0.015. There are four steps to calculating the Mean Deviation. First, subtract the most recent 20-period average of the typical price from each period's typical price. Second, take the absolute values of these numbers. Third, sum the absolute values. Fourth, divide by the total number of periods (20). Lambert set the constant at 0.015 to ensure that approximately 70 to 80 percent of CCI values would fall between –100 and +100. This percentage also depends on the look-back period. A shorter CCI (10 periods) will be more volatile with a smaller percentage of values between +100 and –100. Conversely, a longer CCI (40 periods) will have a higher percentage of values between +100 and –100. Interpretation:- CCI measures the difference between a security's price change and its average price change. High positive readings indicate that prices are well above their average, which is a show of strength. Low negative readings indicate that prices are well below their average, which is a show of weakness. The Commodity Channel Index (CCI) can be used as either a coincident or leading indicator. As a coincident indicator, surges above +100 reflect strong price action that can signal the start of an uptrend. Plunges below –100 reflect weak price action that can signal the start of a downtrend. As a leading indicator, chartists can look for overbought or oversold conditions that may foreshadow a mean reversion. Similarly, bullish and bearish divergences can be use to detect early momentum shifts and anticipate trend reversals. New Trend Emerging:- as noted above, the majority of CCI movement occurs between –100 and +100. A move that exceeds this range shows unusual strength or weakness that can foreshadow an extended move. Think of these levels as bullish or bearish filters. Technically, CCI favors the bulls when positive and the bears when negative. However, using a simple zero line crossovers can result in many whipsaws. Although entry points will lag more, requiring a move above +100 for a bullish signal and a move below –100 for a bearish signal reduces whipsaws. The chart below shows Caterpillar, Inc. (CAT at NYSE®; on 2010-July-28) with 20-day CCI. There were four trend signals within a seven month period. Obviously, a 20-day CCI is not suited for long-term signals. Chartists need to use weekly or monthly charts for long-term signals. The stock peaked on 11 January and turned down. CCI moved below –100 on 22 January (8 days later) to signal the start of an extended move. Similarly, the stock bottomed on 08 February and CCI moved above +100 on 17 February (6 days later) to signal the start of an extended advance. CCI does not catch the exact top or bottom, but it can help filter out insignificant moves and focus on the larger trend. CCI triggered a bullish signal when CAT surged above 60 in June. Some traders may have considered the stock overbought and the reward-to-risk ratio unfavorable at these levels. With the bullish signal in force, focus would have been on bullish setups with a good reward-to-risk ratio. Notice that the stock retraced around 62% of the prior advance and formed a falling flag by the end of June. The subsequent surge above the flag trend line provided another bullish signal with CCI still in bull mode. Overbought/Oversold:- identifying overbought and oversold levels can be tricky with the Commodity Channel Index (CCI), or any other momentum oscillator for that matter. First, CCI is an unbound oscillator. Theoretically, there are no upside or downside limits. This makes an overbought or oversold assessment subjective. Second, securities can continue moving higher after an indicator becomes overbought. Likewise, securities can continue moving lower after an indicator becomes oversold. The definition of overbought or oversold varies for the Commodity Channel Index (CCI). ±100 may work in a trading range, but more extreme levels are needed for other situations. ±200 is a much harder level to reach and more representative of a true extreme. Selection of overbought/oversold levels also depends on the volatility of the underlying security. The CCI range for an index ETF, such as SPY, will be usually be smaller than for a most stocks, such as Google. The chart above shows Google (GOOG) with CCI (20). Horizontal lines at ±200 were added using the advanced indicators options. From early February to early October (2010), Google exceeded ±200 at least five times. The red dotted lines show when CCI moved back below +200 and the green dotted lines show when CCI moved back above –200. It is important to wait for these crosses to reduce whipsaws should the trend extend. Such a system is not fool proof though. Notice how Google kept on moving higher even after CCI became overbought in mid September and moved below –200. Bullish Bearish Divergences:- divergences signal a potential reversal point because directional momentum does not confirm price. A bullish divergence occurs when the underlying security makes a lower low and CCI forms a higher low, which shows less downside momentum. A bearish divergence forms when the

security records a higher high and CCI forms a lower high, which shows less upside momentum. Before getting too excited about divergences as great reversal indicators, note that divergences can be misleading in a strong trend. A strong uptrend can show numerous bearish divergences before a top actually materializes. Conversely, bullish divergences often after appear in extended downtrends. Confirmation holds the key to divergences. While divergences reflect a change in momentum that can foreshadow a trend reversal, chartists should set a confirmation point for CCI or the price chart. A bearish divergence can be confirmed with a break below zero in CCI or a support break on the price chart. Conversely, a bullish divergence can be confirmed with a break above zero in CCI or a resistance break on the price chart. The chart above shows United Parcel Service (UPS) with 40-day CCI. A longer timeframe, 40 versus 20, was used to reduce volatility. There are three sizable divergences over a seven month period, which is actually quite a few for just seven months. First, UPS raced to new highs in early May, but CCI failed to exceed its March high and formed a bearish divergence. A support break on the price chart and CCI move into negative territory to 0 confirm this divergence a few days later. Second, a bullish divergence formed in early July as the stock moved to a lower low, but CCI formed a higher low. This divergence was confirmed with a CCI break into positive territory. Also notice that UPS filled the late June gap with a surge in early July. Third, a bearish divergence formed in early September and this was confirmed when CCI dipped into negative territory. Despite a CCI confirmation, price never broke support and the divergence did not result in a trend reversal. Not all divergences produce good signals. Conclusions:- CCI is a versatile momentum oscillator that can be used to identify overbought/oversold levels or trend reversals. The indicator becomes overbought or oversold when it reaches a relative extreme. That extreme depends on the characteristics of the underlying security and the historical range for CCI. Volatile securities are likely to require greater extremes than docile securities. Trend changes can be identified when CCI crosses a specific threshold between zero and 100. Regardless of how CCI is used, chartists should use CCI in conjunction with other indicators or price analysis. Another momentum oscillator would be redundant, but On Balance Volume (OBV) or the Accumulation Distribution Line can add value to CCI signals. Using with SharpCharts:- CCI is available as a SharpCharts indicator that can be placed above, below or behind the price plot of the underlying security. Placing CCI directly behind the price makes it easy to compare indicator movements with price movements. The default setting is 20-periods, but this can be adjusted to suit analysis needs. A shorter timeframe makes the indicator more sensitive. A longer timeframe makes it less sensitive. Members can click the green arrow next to 'advanced options' to add horizontal lines to mark overbought or oversold levels. Two lines can be added by separating the numbers with a comma (200, –200). Suggested Scans:- (i) CCI Oversold in Uptrend:- this scan reveals stocks that are in an uptrend with oversold CCI turning up. First, stocks must be above their 200-day moving average to be in an overall uptrend. Second, CCI must cross below –200 to show the indicator rising from oversold levels; and (ii) CCI Overbought in Downtrend:- this scan reveals stocks that are in a downtrend with overbought CCI turning down. First, stocks must be below their 200-day moving average to be in an overall downtrend. Second, CCI must cross above +200 to show the indicator falling from overbought levels. The Commodity Channel Index (CCI) highlights overbought and oversold markets and likely turning points. Developed by Donald Lambert, the Commodity Channel Index (CCI) is an indicator designed to identify cyclical turns in commodities. It may also be applied to stocks or bonds. Commodity Channel Index (CCI) is an oscillator used in technical analysis to help determine when an investment vehicle has been overbought and oversold. The Commodity Channel Index, first developed by Donald Lambert, quantifies the relationship between the asset's price, a moving average (MA) of the asset's price, and normal deviations (D) from that average. It is computed with the following formula:- CCI = (Price – MA) / (0.015 x D). The CCI has seen substantial growth in popularity amongst technical investors; today's traders often use the indicator to determine cyclical trends in not only commodities, but also equities and currencies. The CCI, when used in conjunction with other oscillators, can be a valuable tool to identify potential peaks and valleys in the asset's price, and thus provide investors with reasonable evidence to estimate changes in the direction of price movement of the asset. CCI measures the variation of an instrument's price from its mean. High/low values indicate that prices have moved too far from their mean. The usual range is ±100 and anything outside this is overbought or oversold. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Кэтёпилар Инк. (Caterpillar Inc.; Си.Эй.Ти. (CAT)). В техническом анализе биржевых рынков Индекс по Сырьевому Каналу (ИСК (CCI)) отражает отклонение цены инструмента от среднего значения. Максимальные/минимальные значения указывают на то, на сколько цены слишком сильно отклонились от среднего значения. Нормальным диапазоном считается ±100, а цены, выходящие за пределы этого диапазона считаются завышенными или заниженными.

COMMODITY CLASS = КЛАСС СЫРЬЯ – Commodity Class is a category of similar commodities that can be considered together in phytosanitary regulations.

COMMODITY CODE = КОД СЫРЬЯ – Commodity Code is a code describing a commodity or a group of commodities pertaining to goods classification. This code can be carrier tariff or regulating in nature.

COMMODITY CONTRACT = СЫРЬЕВОЙ КОНТРАКТ (или КОНТРАКТ НА СЫРЬЁ) – Commodity Contract:- any futures contracts, options on commodities or on futures contracts, and any other interests or instruments designated as commodity contracts which are based on any commodity (for example, Cocoa, Coffee or Cotton) and traded at the exchange. Defined as contracts that have a return, or a portion of their return, linked to the price of, or to a price index of, a commodity such as a precious metal (other than gold), petroleum, lumber or agricultural products. Derivatives that have a return, or a portion of their return, linked to the price of precious metals (other than gold) were reported separately from other commodity-linked contracts. All derivatives transactions involving a commodity or commodity index exposure, whether or not they involved a joint exposure in commodities and any other risk category (ie foreign exchange, interest rate or equity), were to be reported in this category.

COMMODITY CONTROL LIST = ПЕРЕЧЕНЬ СЫРЬЯ, ПОДЛЕЖАЩЕГО КОНТРОЛЮ (или СЫРЬЕВОЙ КОНТРОЛЬНЫЙ СПИСОК) – The US Office of Export Administration (OEA) maintains the Commodity Control List (CCL), which includes all commodities subject to US Department of Commerce export controls. The CCL does not include those commodities exclusively controlled for export by another department or agency of the US Government. For example, arms, ammunition, and implements of war are controlled for export by the Office of Munitions Control, US Department of State. See also Commerce Control List. Export Commodity Control List:- listings of items that require validated export licenses by the US Department of Commerce for the purpose of shipping goods to other countries.

THE COMMODITY CREDIT CORPORATION = КОРПОРАЦИЯ ПО КРЕДИТАМ НА СЫРЬЁ – The Commodity Credit Corporation (CCC) is the US Government-owned and operated entity that was created to stabilize, support, and protect farm income and prices. CCC also helps maintain balanced and adequate supplies of agricultural commodities and aids in their orderly distribution. The Commodity Credit Corporation (CCC) was originally incorporated October 17, 1933, under a Delaware charter with a capitalization of USD3 million. It was initially managed and operated in close affiliation with the Reconstruction Finance Corporation, which funded its operations. On July 01, 1939, CCC was transferred to the US Department of Agriculture and later reincorporated under the Commodity Credit Corporation Charter Act (62 Stat. 1070; 15 USC 714) on July 01, 1948 as a Federal corporation within the USDA. The Commodity Credit Corporation (CCC) is a division of the Farm Service Agency (FSA), an agency of the United States Department of Agriculture (USDA). Commodity Credit Corporation (CCC) is a federally owned and operated corporation within the USDA that was created to stabilize, support, and protect farm income and prices through loans, purchases, payments, and other operations. The CCC

functions as a financial institution (revolving fund) through which all money transactions are handled for agricultural price and income support and related programs. The CCC helps maintain balanced, adequate supplies of agricultural commodities and helps in orderly distribution. Under recent authority, the CCC also finances the Conservation Reserve Program, the Environmental Quality Incentives Program, and the Wetlands Reserve Program. The CCC does not have any operating personnel or facilities; personnel and facilities of the Farm Service Agency are used to carry out CCC activities. It is managed by a Board of Directors (USDA employees) subject to the general supervision and direction of the USDA. The CCC is authorized capital stock of USD100 million and the authority to borrow up to USD30 billion. Its specific powers are found at 15 USC Â§Â§ 714(c). As a revolving fund, the CCC is viewed as having a permanent appropriation that allows the funds to be obligated or expended without further action by Congress up to its borrowing limit, once authorized by the authorization committee. The Commodity Credit Corporation (CCC) is a division of the Agricultural Stabilization and Conservation Service (ASCS – an agency of the US Department of Agriculture), established on 1933-October-17, that supervises the government's farm loan and subsidy programs and assists American agriculture. Major operations include price support programs, foreign sales, and export credit programs for agricultural commodities. The US Department of Agriculture/Foreign Agriculture Service (USDA/FAS) provides US agricultural exporters with short-and intermediate-term financing support through the CCC Credit Guarantee Programs. These programs protect US exporters or US financial institutions against risk if the importer's foreign bank fails to make payment, and are designed to help developing nations make the transition from concessional financing to cash purchases. The CCC is the US government corporation controlled by the Department of Agriculture which provides financing and stability to the marketing and exporting of agricultural commodities. The Commodity Credit Corporation (CCC) is a Government-owned and operated entity that was created to stabilize, support, and protect farm income and prices. CCC also helps maintain balanced and adequate supplies of agricultural commodities and aids in their orderly distribution. CCC was incorporated October 17, 1933, under a Delaware charter with a capitalization of USD3 million. It was initially managed and operated in close affiliation with the Reconstruction Finance Corporation, which funded its operations. On July 01, 1939, CCC was transferred to the United States Department of Agriculture (USDA). It was reincorporated on July 01, 1948, as a Federal corporation within USDA by the Commodity Credit Corporation Charter Act (62 Stat. 1070; 15 USC 714). Basic Responsibilities:- the CCC Charter Act, as amended, aids producers through loans, purchases, payments, and other operations, and makes available materials and facilities required in the production and marketing of agricultural commodities. The CCC Charter Act also authorizes the sale of agricultural commodities to other government agencies and to foreign governments and the donation of food to domestic, foreign, or international relief agencies. CCC also assists in the development of new domestic and foreign markets and marketing facilities for agricultural commodities. Organization:- CCC is managed by a Board of Directors, subject to the general supervision and direction of the Secretary of Agriculture, who is an ex-officio director and chairperson of the Board. The Board consists of seven members, in addition to the Secretary, who are appointed by the President of the United States by and with the advice and consent of the Senate. All members of the Board and Corporation officers are USDA officials. CCC has no operating personnel. Its price support, storage, and reserve programs, and its domestic acquisition and disposal activities are carried out primarily through the personnel and facilities of the Farm Service Agency (FSA). Other USDA Agencies:- the Agricultural Marketing Service (AMS) occasionally uses CCC authority to acquire various commodities for domestic and foreign food assistance programs. Export sales (except for tobacco and peanuts) and foreign assistance disposal of CCC-controlled stocks are administered through the General Sales Manager of the Foreign Agricultural Service (FAS). The Natural Resources Conservation Service administers several conservation programs under the auspices of CCC. Officers of CCC, directly or through officials of designated USDA agencies, maintain liaison with numerous other governmental and private trade operations. CCC's commodity programs must be approved by the Board of Directors and/or the Secretary of Agriculture. Financing:- CCC has an authorized capital stock of USD100 million held by the United States, with the authority to have outstanding borrowings of up to USD30 billion at any one time. The fiscal year 1988 Appropriation Act increased the statutory borrowing authority to USD30 billion. Funds are borrowed from the US Treasury and may also be borrowed from private lending agencies and others. CCC reserves a sufficient amount of its borrowing authority to purchase at any time all notes and other obligations evidencing loans made by such agencies and others. All CCC-issued bonds, notes, debentures, and similar obligations are subject to approval by the Secretary of the Treasury. Reservation of borrowing authority for these purposes has not been required for many years. Interest on borrowings from the Treasury (and on capital stock) is paid at a rate based upon the average interest rate of all outstanding marketable obligations (of comparable maturity date) of the US government as of the preceding month. Interest may also be paid on other notes and obligations at a rate prescribed by CCC and approved by the Secretary of the Treasury. Support Activities:- commodity support operations, handled primarily through loan, purchase and payment programs, include those for wheat, corn, oilseeds, cotton (upland and extra long staple), rice, tobacco, milk and milk products, barley, oats, grain sorghum, mohair, honey, peanuts, and sugar. Farmers may receive basic nonrecourse commodity loans on most of these commodities at a designated rate per unit (loan rate) by pledging and storing a quantity of a commodity as collateral. Proposals for support programs usually are prepared by FSA offices in the form of a docket – a group of documents covering economic and other factors upon which the proposal is based, total funds required, proposed method of support, conditions of eligibility, basic operating provisions, and other information relative to the proposal. When the Board of Directors and/or the Secretary of Agriculture approves a program proposal, USDA releases a public announcement, usually a press release. Program regulations are published in the Federal Register, and detailed operating instructions are sent to personnel in charge of administering the program in Washington, DC, and field offices. FSA county office personnel assist farmers in the preparation of program participation documents and keep them informed of program details. Inventory Operations:- CCC is authorized to transport, store, process, and dispose of various agricultural commodities and their products. CCC provides storage adequate to fulfill its program needs by contracting with commercial warehouses to store agricultural commodities in county and terminal locations. In carrying out support programs, CCC acquires its inventory in two principal ways:- (1) Collateral Acquisition:- if a producer does not redeem the commodity by loan repayment time, CCC takes title and possession of the commodity that was pledged as collateral for the nonrecourse marketing assistance loan. Nonrecourse loans are defined as loans for which producers have the option of either repaying the principal and interest or forfeiting (delivering) the collateral (the commodity) to CCC in full settlement of the loan. Settlement of the loan is then based on the loan rate and the associated quantity and quality of the commodity involved. In lieu of securing a loan from CCC, a producer may be eligible for a loan deficiency payment (LDP). Market loan repayment and LDP provisions are intended to prevent delivery of loan collateral to CCC. These provisions considerably reduce the Federal government's acquisition of stocks that might otherwise occur, which could make US-produced commodities less competitive in world markets. (2) Purchases:- support for milk and milk products is carried out through purchases of butter, cheese, and nonfat dry milk from processors and handlers. There are no CCC support programs for processed products, other than dairy products, and sugar – raw cane sugar and refined beet sugar. Many commodities, such as wheat, corn, and oats are stored in raw, bulk form by CCC and require considerable processing before they can be used for food. Commodities and products acquired through direct purchases either go immediately into available outlets or are placed in CCC's inventory. CCC is authorized to contract for the use of privately owned facilities in carrying out its activities. CCC has no authority to acquire personal property except for ADP equipment. It may rent or lease office space necessary for its business. CCC is prohibited from acquiring real property, or any interest in property, except for the purpose of protecting its financial interests and for providing adequate storage to carry out its programs. Disposal Operations:- the sale, donation, or transfer of CCC-owned commodities is handled by FSA's Kansas City Commodity Office

(KCCO), 9200 Ward Parkway, Kansas City, MO; mailing address PO Box 419205, Kansas City, MO, 64141-6205. KCCO makes sales at fixed prices or through competitive bids. Information on CCC-owned commodities available for sale, or barter (if authorized), is contained in a CCC Sales List issued by USDA at the end of each month and effective for the following month. In pricing commodities for unrestricted domestic use, CCC-owned commodities generally are sold at the market price, as CCC determines, but not less than the current county loan repayment rate in effect at time of sale, adjusted for location, applicable quality factors, plus reasonable carrying charges. Commodities in danger of loss or waste through deterioration or spoilage are exempted from the minimum price restriction. For further information on the sale of CCC-owned commodities, contact: Warehouse and Inventory Division, Farm Service Agency, 1400 Independence Avenue, SW, Washington, DC 20250-0553. Domestic Food Assistance Programs:- CCC is authorized to donate food commodities acquired through price-support programs or from purchases in the commercial marketplace to the Bureau of Indian Affairs, and federal, state, and private agencies. The commodities are used in the United States for school lunch programs, summer camps for children, and in the assistance of needy persons. They are also used in charitable institutions, including hospitals, to the extent needy persons are served. In most instances, arrangements are made to process the commodities into food. CCC also provides surplus dairy products to the armed services and to veterans' hospitals without charge, except for the cost of packaging. CCC also donates food acquired through support programs to federal penal and correctional institutions and state correctional institutions for minors, except where service is provided on a concessionary basis. CCC makes available to the Secretary of the Interior grain acquired through support operations to be used as feed for migratory waterfowl for the purpose of preventing crop damage. The Secretary of the Interior may also requisition CCC-owned grain for feeding starving migratory birds, and any state may requisition CCC-owned grain upon the finding of the Secretary of the Interior that resident game birds and other resident wildlife are threatened with starvation. CCC makes available farm commodities or products in areas of acute economic distress, and in connection with certain major disasters, as determined by the President of the United States. Export Programs:- CCC promotes exports of US agricultural commodities through sales, payments, export credits, and other related activities. Currently, CCC makes available export credit guarantees and export bonuses to promote exports. The Foreign Agricultural Service (FAS) administers these programs for CCC:- the Export Credit Guarantee Program (GSM-102), the Intermediate Export Credit Guarantee Program (GSM-103), the Supplier Credit Guarantee Program (SCGP), and the Facility Guarantee Program (FGP). The GSM-102 and 103 programs make it possible for foreign buyers to purchase US agricultural commodities from private US exporters, with US banks providing financing to importers' banks on commercial terms. The banks finance the export of the commodities, and CCC guarantees repayment to the US banks. GSM-102 and 103 operate mainly in countries where credit is necessary to increase or maintain US exports and where private financial institutions may be unwilling to provide financing without CCC's guarantee. Under the SCGP, CCC guarantees a significant percentage of the payments due when exporters extend short-term financing directly to private importers for the purchase of US agricultural products. Credit terms may be up to 180 days, and CCC's guarantee covers the US exporter. Under the FGP, CCC extends credit guarantees to US banks for financing export sales of US capital goods and services to improve agriculture-related facilities in emerging markets, such as storage, processing, and handling facilities. Sales of capital goods and services must be linked to projects which primarily benefit US agricultural exports. Export Enhancement Program:- the Export Enhancement Program (EEP) helps products produced by US farmers meet the competition from other countries that subsidize farm products exports, especially the European Union. Under the program, USDA pays cash to US exporters as a bonus, allowing them to sell US agricultural products in targeted countries at prices which match those of subsidizing competitors and are below those the exporter pays to acquire them. Dairy Export Incentive Program:- the Dairy Export Incentive Program (DEIP) helps exporters of US dairy products meet prevailing world prices for certain designated dairy products and destinations. Under DEIP, USDA pays cash to US exporters as bonuses, and it allows them to sell the dairy products at prices which match those of competing competitors and which are below the exporter's costs of acquisition. The United States, as part of its World Trade Organization commitments resulting from the Uruguay Round Agreement on Agriculture, has established annual export subsidy ceilings. The ceilings are by commodity and entail maximum permitted quantities and maximum budgetary expenditures for export subsidies. Market Access Program:- under the Market Access Program (MAP), USDA uses funds or commodities from CCC to encourage the development, maintenance and expansion of commercial export markets for agricultural commodities. This is done through cost-share assistance to eligible trade organizations that implement a foreign market development program. FAS administers MAP through cooperative agreements between CCC and nonprofit agricultural trade commodity groups. For information on export sales programs, contact: General Sales Manager, Foreign Agricultural Service, USDA, Washington, DC 20250. This agency was managed by and operated in close affiliation with the Reconstruction Finance Cooperation up to 1939-July-01 as an agency of the United States. On that date, the CCC was transferred to and made part of the US Department of Agriculture, pursuant to the President's Reorganization Plan 1. The Commodity Credit Corporation (CCC) is a wholly owned government corporation created in 1933 to 'stabilize, support, and protect farm income and prices' (federally chartered by the CCC Charter Act of 1948 (PL 80-806)). The CCC is authorized to buy, sell, lend, make payments and engage in other activities for the purpose of increasing production, stabilizing prices, assuring adequate supplies, and facilitating the efficient marketing of agricultural commodities. The CCC, which has no staff, is essentially a financing institution for USDA's farm price and income support commodity programs, commodity export credit guarantees, and agricultural export subsidies. The programs funded through CCC are administered by employees of the Farm Service Agency and the Foreign Agricultural Service. The CCC has the authority to borrow up to USD30 billion from the US Treasury to carry out its obligations. Net losses from its operations subsequently are restored through the congressional appropriations process. It issues payments in the form of Commodity Certificates. History:- CCC was incorporated October 17, 1933, under a Delaware charter pursuant to Executive Order 6340 issued the previous day by President Franklin Delano Roosevelt. It had a capitalization of USD3 million subscribed by the Secretary of Agriculture and the Governor of the Farm Credit Administration. It was initially managed and operated in close affiliation with the Reconstruction Finance Corporation, which funded its operations. On July 01, 1939, CCC was transferred to the United States Department of Agriculture (USDA). The Secretary of Agriculture was granted the authority to exercise all rights of ownership of the Corporation's by Executive Order 8219 of 1939. It was reincorporated on July 01, 1948, as a federal corporation within USDA by the Commodity Credit Corporation Charter Act (62 Stat.1070; 15 USC 714). The 1996 farm bill (PL 104-127) expanded the CCC mandate to include funding for several conservation programs (including the Conservation Reserve Program) and made conservation one of the purposes of the CCC. Basic Responsibilities:- the CCC Charter Act, as amended, aids producers through loans, purchases, payments, and other operations, and makes available materials and facilities required in the production and marketing of agricultural commodities. The CCC Charter Act also authorizes the sale of agricultural commodities to other government agencies and to foreign governments and the donation of food to domestic, foreign, or international relief agencies. CCC also assists in the development of new domestic and foreign markets and marketing facilities for agricultural commodities. Organization:- CCC is managed by a Board of Directors, subject to the general supervision and direction of the Secretary of Agriculture, who is an ex-officio director and chairperson of the Board. The Board consists of seven members, in addition to the Secretary, who are appointed by the President of the United States by and with the advice and consent of the Senate. All members of the Board and Corporation officers are USDA officials. The president of the CCC is the Under Secretary for Farm and Foreign Agricultural Services, and the executive director is the Administrator of the Farm Service Agency. CCC has no operating personnel. Its price support, storage, and reserve programs, and its domestic acquisition and disposal activities are carried out primarily through the personnel and facilities of the Farm

Service Agency (FSA). Its overseas surplus disposal and commodity export credit guarantee activities are carried out by personnel of the Foreign Agricultural Service, particularly the General Sales Manager. In the United States, The Commodity Credit Corporation (CCC) is the USDA agency responsible for directing and financing major USDA 'action programs', including price support, production stabilization, commodity distribution, and related programs. CCC also directs and finances certain agricultural export activities. CCC activities are implemented by the Farm Service Agency or the Agricultural Stabilization and Conservation Service. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). вывозной (или экспортный) кредит (export credit). COMMODITY EXCHANGE = БИРЖА СЫРЬЯ (или СЫРЬЕВАЯ БИРЖА) – A Commodity Exchange is an institution, organization, or association that serves as a market for trading various commodities and derivatives products. Exchanges also serve as a clearing house for the transfer and settlement of the physical commodities underlying most futures contracts. Most commodity exchanges across the world trade in agricultural products and other raw materials such as Wheat, Barley, Sugar, Maize (Corn), Cotton, Cocoa, Coffee, milk products, pork bellies, oil, metals, etc, as well as in contracts based on them. These contracts can include spot prices, forwards, futures and options on futures. Other sophisticated products may include interest rates, environmental instruments, swaps, or ocean freight contracts. Organized market for trading in raw material products, comparable to the stock exchange for corporate stocks. Commodity exchanges typically deal in futures, which provide the opportunity of hedging. Spot or actual commodity transactions may also take place on some exchanges, but most traders never intend to take delivery of the underlying commodity. Also known as Mercantile Exchange. Leading commodity exchanges:- Australia Securities Exchange (ASX; Sidney, Australia); Bolsa de Mercadorias & Futuros (BM&F; Sao Paulo, Brazil); Chicago Board of Trade (CBOT®; CME Group; Chicago, IL, USA); Chicago Mercantile Exchange® (CME®; CME Group; Chicago, IL, USA); Commodity Exchange (COMEX®; CME Group; New York, NY, USA); Dalian Commodity Exchange (DCE; Dalian, China); Dubai Mercantile Exchange (DME; Dubai, UAE); ICE Futures Canada® (Winnipeg, Manitoba, Canada); ICE Futures Europe® (London, UK); ICE Futures US® (New York, NY, USA); The Intercontinental Exchange (ICE®; Atlanta, GA, USA; Kansas City Board of Trade (KC; Kansas City, MO, USA); London International Financial Futures Exchange (LIFFE; NYSE Euronext; London, UK); London Metal Exchange (LME; London, UK); Minneapolis Grain Exchange (MGEX; Minneapolis, MN, USA); New York Mercantile Exchange (NYMEX®; CME Group; New York, NY, USA); Shanghai Futures Exchange (SHFE; Shanghai, China); Singapore Mercantile Exchange (SMX; Singapore); Tokyo Commodity Exchange (TOCOM; Tokyo, Japan); Tokyo Grain Exchange (TGE; Tokyo, Japan); and Zhengzhou Commodity Exchange (ZCE; Zhengzhou, China). Exchanges specializing in commodities or raw materials and the relevant contracts. The major commodities exchanges are located in Chicago and New York, the United States, and London, the United Kingdom. Commodity Exchange, also called Futures Market, or Futures Exchange, organized market for the purchase and sale of enforceable contracts to deliver a commodity such as Wheat, gold, or Cotton or a financial instrument such as US Treasury bills or Eurodollars at some future date. Such contracts are known as Futures and are bought and sold by means of a competitive auction process on the commodity exchange. The financial instruments known as options and indexes are also traded on commodity exchanges. The largest commodity exchange is the Chicago Board of Trade. The seller of a futures contract on a commodity exchange does not normally intend to deliver the actual commodity, nor does the buyer intend to accept delivery; each will, at some time prior to the date of delivery specified in the contract, cancel out his obligation by an offsetting purchase or sale. The parties merely wish to engage in the assumption or delegation of the risk involved in a change in price. Commodity exchanges are thus ancillary to the markets in which commodities are actually bought and sold; commodity exchanges in effect provide insurance against the risk of price changes by transferring that risk to speculators who are willing to assume it. Commodity exchanges also provide a basis for the determination of prices at which commodities are actually traded. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). СИБАТ® (CBOT®). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). ТЧОКОМ (TOCOM).

COMMODITY EXCHANGE ACT = АКТ О СЫРЬЕВОЙ БИРЖЕ – The Commodity Exchange Act of 1936 prescribed speculative position limits for agricultural commodities in order to prevent commodities futures markets from becoming overly speculative. Source:- Report No. 421, US House of Representatives 74th Congress, Accompanying the Commodity Exchange Act, March 18, 1935 – 'The fundamental purpose of the measure is to insure fair practice and honest dealing on the commodity exchanges and to provide a measure of control over those forms of speculative activity which too often demoralize the markets to the injury of producers and consumers and the exchanges themselves'. These limits were very effective in preventing excessive speculation and commodity price bubbles. The Commodity Futures Trading Commission (CFTC) on 1981-October-16 mandated that all commodities futures should be covered by speculative position limits. Then, throughout the 1980s and the 1990s, financial futures gained in popularity until they came to dwarf commodities futures in terms of volume and Dollar value of open interest. This meant that the CFTC was devoting most of its time and resources to regulating financial futures and not commodity futures. There is no threat of excessive speculation in financial futures because every participant in that market is an Investor/Speculator. Financial futures only need position limits in order to prevent a single Speculator from manipulating the market. Source:- 'Speculative Position Limits', CFTC Website http://www.cftc.gov/industryoversight/marketsurveillance/speculativelimits.html#P8_883 – 'In general, position limits are not needed for markets where the threat of market manipulation is non-existent or very low. Thus, speculative position limits are not necessary for contracts on major foreign currencies and other financial commodities that have highly liquid and deep underlying cash markets. A contract market may impose, for position accountability provisions in lieu of position limits for contracts on financial instruments, intangible commodities, or certain tangible commodities, which have large open interest, high daily trading volumes, and liquid cash markets'. Commodities futures are the only markets where two distinct classes of market participants transact – Physical Hedgers and Speculators. Speculative position limits in the commodities futures markets are needed not only to prevent manipulation but to ensure that Physical Hedgers remain dominant. Somehow it appears that during this time period the CFTC lost sight of the crucial differences between financial futures and commodities futures. The CFTC began to equate excessive speculation with manipulation and they came to believe that position limits were only necessary to prevent manipulation. The Commodity Exchange Act clearly does not consider 'excessive speculation' and 'manipulation' to be the same thing. If it did, then it would not mention them separately and propose different remedies for each. Physical commodity producers and consumers are capable of manipulating the market and the CFTC has to provide strong oversight to make sure that this does not happen. But because Physical Hedgers are not Speculators, they can never make the market excessively speculative. It seems clear that Congress saw the dangers of excessive speculation in the commodities futures markets, and that is why they prescribed a specific remedy of speculative position limits. And for decades regulators recognized the inherent value of speculative position limits and set them at levels that truly were a limit to speculation. As commodities futures markets grew in terms of volume and open interest, the size of a position that a Speculator would need to manipulate the market grew as well. Since the CFTC has recently been focused on preventing manipulation and not excessive speculation, the CFTC has raised speculative position limits for agricultural commodities several times in the last decade. By raising speculative position limits the CFTC has allowed speculation to increase and become excessive. In 1991 the CFTC started to give commercial exemptions from position limits to swaps dealers for the purposes of hedging their over-the-counter swaps transactions. The rationale was that, like a physical commodity producer or consumer, these swaps dealers had an exposure that they were trying to offset and that they were not entering into these large positions for the purpose of manipulating prices. Since the CFTC did not see the potential for manipulation (which was

their focus), the CFTC allowed these swaps dealers virtually unlimited access to the futures markets on par with what bona fide Physical Hedgers enjoy. In so doing, the CFTC has opened a loophole for unlimited speculation. If a Speculator wants to take a large futures position for which they would normally face a speculative position limit, they can get around that by going to a Wall Street Bank and entering into a swap contract. These Wall Street Banks offer swaps on solitary commodities, which means they become a surrogate for Speculators wanting to circumnavigate position limits. As an example, a Speculator that wants to take a USD500 million position in Wheat (clearly outside speculative position limits) can do so via a single commodity index (Wheat) swap. This has opened up a loophole that allows unlimited speculation through swaps. There is clearly a big difference between a bona fide Physical Hedger who is trying to reduce price risk and a Wall Street Bank that is not in the physical commodities business at all and is simply serving as a conduit for Speculators. Note finally that the inclusion of swaps dealers in the commercial category of the CFTC's 'Commitments of Traders' reports has made these reports essentially meaningless. One can no longer look at the commercial category to gauge the amount of speculation present in the marketplace. This has left regulators and policymakers without the ability to accurately assess the level of speculation present in the commodities futures markets. In 1998 the CFTC codified a practice they had been engaged in for several years that basically allowed commodities futures exchanges in 'large and liquid' commodities futures markets to replace speculative position limits with position accountability limits. Position accountability limits do not actually limit Speculators in the size of the positions they can take. Instead, they represent a threshold after which the futures exchange is supposed to watch the Speculator's position with greater vigilance in order to prevent manipulation. Since exchanges get paid based on the volume of futures contracts that are traded and Speculators trade much more frequently than Physical Hedgers, the exchanges have a strong incentive to set the position accountability limits as high as possible and then to only intervene if there is manipulation taking place. The prevailing attitude is that manipulation is bad for business but speculation is great for business. Since the largest US futures exchanges are now publicly traded for-profit corporations who are promising earnings growth to their shareholders, they cannot be relied upon to combat excessive speculation. The CFTC sets federal speculative position limits for enumerated agricultural commodities, but the exchanges set all other position limits. In WTI crude oil, for instance, the NYMEX® has replaced speculative position limits with position accountability limits except in the last three days prior to expiration. So effectively, there are no limits for WTI crude oil. Foreign Boards of Trade like the Intercontinental Exchange (ICE) are happy to comply with NYMEX's position limits because there essentially are none. There is only one class of commodities futures market participant that can be counted upon to always buy and sell based on supply and demand and always strengthen price discovery: the Physical Hedgers. That is why speculative position limits are necessary in order to ensure that they remain dominant. To repair the damage to the price discovery function and to bring food and energy prices down to levels that more accurately reflect supply and demand, Congress should take action to undo the changes made to speculative position limits. The US Commodity Exchange Act, 7 USC § 1, et seq. (7 USC is short for the United States Code:- Title 7), provides for the federal regulation of commodity futures and options trading. See also Commodity Futures Modernization Act. One of the primary purposes of the Commodity Exchange Act is to prevent the manipulation of prices. Manipulations 'exert a vicious influence and produce abnormal and disturbing temporary fluctuations of prices that are nor responsive to actual supply and demand and discourage not only … justifiable hedging but disturb the normal flow of actual consignments'. 'If hedgers find that they are frequently forced to buy back their short contracts at a price far above true supply and demand as dictated by a sufficiently powerful holder of long contrcats, the market will lose its userfulness as a hedging medium'. Although the term Manipulation is not defined in the Commodity Exchange Act, the term is not so vague and indefinite that the statute is void. An artificial or manipulated price is created whenever the manipulator makes the market price of a commodity, or of a futures contract, behave in some manner in which it would not behave if left to adjust itself to uncontrolled or uninspired supply and demand. Manipulation is … any and every operation or transaction or practice, the purpose of which is not primarily to facilitate the movement of the commodity at prices freely responsive to the forces of supply and demand; but, on the contrary, is calculated to produce a price distortion of any kind in any market either in itself or in its relation to other markets. If a firm is engaged in manipulation it will be found using devices by which the prices of contracts for some one month in some one market may be higher than they would be if only the forces of supply and demand were operative; or using devices by means of which the price or prices of some month or months in a given market may be made lower than they would be if they were freely responsive to the forces of supply and demand. Any and every operation, transaction, (or) device, employed to produce those abnormalities of price relationship in the futures markets, is manipulation. Manipulation may cause the price to go up or down, or manipulation may apply a 'brake' on the price movement which would have normally occurred, thereby causing the price to remain static or preventing the price from moving to the extent that it would normally have moved. This latter type of manipulation is sometimes referred to 'as stabilization. But in terms of market operations stabilization is but one form of manipulation. And market manipulation in its various manifestations is implicitly an artificial stimulus applied to (or at times a brake on) market prices, a force which distorts those prices, a factor which prevents the determination of those prices by free competition alone'. Such 'manipulation ... undertaken purely for the purpose of 'protecting the market', probably occurs only at times of serious crises when large financial interests have too much at stake to permit the market to become completely demoralized'. In the past several years, price manipulation has been attempted on a large scale in several commodities including eggs, soybeans, oats, and potatoes. Some of the main forms of manipulation are:- (i) corners; (ii) buying or selling in a manner calculated to produce an abnormal effect upon prices, frequently in a concentrated fashion and in relatively large lots; and (iii) issuing false reports of conditions that affect or tend to affect prices. Commodity futures exchanges are a vital part of the complex agricultural marketing system in the United States. The exchanges provide facilities for hedging by farmers, processors, and other persons engaged in handling agricultural commodities. In addition, the exchanges provide a continuous market for buyers and sellers of agricultural commodities and afford a basis for pricing agricultural commodities sold throughout the country. The economic utility of commodity exchanges is, however, dependent upon the determination of futures prices by legitimate supply and demand conditions. Manipulation of commodity futures prices is a nefarious practice which inflicts severe injustice on legitimate users of the futures markets and disrupts the normal flow of agricultural commodities. The Commodity Exchange Act reflects the congressional purpose to foster the commodity exchanges as an important part of our agricultural marketing system and to free the exchanges from manipulation and other pernicious practices. Trading limits, registration, and suspension of trading privileges are among the means used to effectuate that purpose. In view of the trading limits established under the Act, which impede individual manipulative activities, the detection of joint manipulative ventures is of increasing importance in the administration of the Act. Persons engaged in a joint manipulative venture are generally skillful in concealing the existence of a conspiracy. 'The picture of conspiracy as a meeting by twilight of a trio of sinister persons with pointed hats close together belongs to a darker age'. Effective administration of the Act requires administrative alertness to unfair practices on commodity exchanges, and vigorous enforcement of the statutory provisions in administrative and judicial proceedings. A proceeding of this character generally has its foundation in intricate marketing transactions, and voluminous economic data must be carefully considered and evaluated by the administrative agency, and in the event of judicial review, by the courts. A significant objective of any disciplinary proceeding is the determent of subsequent violations. If manipulation and other unfair practices can be prevented, the exchanges will continue to perform a useful function in the agricultural marketing system of the nation. Federal act passed in 1936 establishing the Commodity Exchange Authority and placing futures trading in a wide range of commodities under the regulation of the government. 1922-September-21:- The Grain Futures Act, predecessor to the Commodity Exchange Act, is enacted. The provisions of the Grain Futures Act, including the requirements for designation as a contract

market, are similar to those of the Future Trading Act. Unlike the Future Trading Act, the Grain Futures Act is based on the interstate commerce clause and bans off-contract-market futures trading rather than taxing it. The Grain Futures Administration is formed as an agency of the US Department of Agriculture (USDA) to administer the Grain Futures Act. The Grain Futures Act also creates the Grain Futures Commission, which consists of the Secretary of Agriculture, the Secretary of Commerce, and the Attorney General. The authority to suspend or revoke a contract market designation is vested in the Grain Futures Commission. 1936-June-15 – The Commodity Exchange Act is enacted. The Commodity Exchange Act replaces the Grain Futures Act and extends Federal regulation to a list of enumerated commodities that includes cotton, rice, mill feeds, butter, eggs, and Irish potatoes, as well as grains. All references to 'grains' in the Grain Futures Act are changed to 'commodities'. The Grain Futures Commission becomes the Commodity Exchange Commission and continues to consist of the Secretary of Agriculture, the Secretary of Commerce, and the Attorney General. The Commodity Exchange Act grants the Commodity Exchange Commission the authority to establish Federal speculative position limits, but not the authority to require exchanges to set their own speculative position limits. The Commodity Exchange Act, among other things, also requires futures commission merchants to segregate customer funds that are deposited for purposes of margin, prohibits fictitious and fraudulent transactions such as wash sales and accommodation trades, and bans all commodity option trading. The option ban remains in effect until 1981. 1940-October-09 – The Commodity Exchange Act is amended to add fats and oils (including lard, tallow, cottonseed oil, peanut oil, soybean oil, and all other fats and oils), cottonseed meal, cottonseed, peanuts, soybeans, and soybean meal to the list of regulated commodities. 1947-February-01 – Responsibility for administering the Commodity Exchange Act is transferred to the Commodity Exchange Authority, an agency of USDA. 1947-December-19 – The Commodity Exchange Act is amended to enable the Secretary of Agriculture to submit to Congress (pursuant to a congressional subpoena issued two days earlier) and make public the names, addresses, and market positions of large traders (which the Commodity Exchange Act normally requires be kept confidential). Shortly thereafter, the Secretary submits and publishes 35 000 large trader reports. 1954-August-28 – The Commodity Exchange Act is amended to add wool (as opposed to wool tops) to the list of regulated commodities. 1955-June-16 – The Commodity Exchange Act is amended to grant the Commodity Exchange Authority the authority to issue investigative subpoenas prior to filing a formal administrative proceeding. 1955-July-26 – The Commodity Exchange Act is amended to add onions to the list of regulated commodities. 1955-August-05 – The Commodity Exchange Act is amended to allow the Commodity Exchange Authority to set the level of registration and renewal fees for futures commission merchants and other registrants. Prior to this, these fees were fixed legislatively at USD10.00. 1956-July-24 – The Commodity Exchange Act is amended to allow for the exemption from speculative position limits of anticipatory hedges (i.e. long hedges of anticipated needs for a commodity by processors or manufacturers). On the same day, the Bank Holding Company Act of 1956 makes some technical amendments to the Commodity Exchange Act. 1968-February-19 – In the first major commodities legislation since 1936, the Commodity Exchange Act is amended to, among other things, add livestock and livestock products (e.g., live cattle, pork bellies) to the list of regulated commodities and institute minimum net financial requirements for futures commission merchants. The 1968 amendments also enhanced the enforcement provisions of the Act in various ways, including enhanced reporting requirements, increases in criminal penalties for manipulation and other violations of the Act, and a provision allowing for the suspension of contract market designation of any board of trade that fails to enforce its own rules. 1968-July-23 – The Commodity Exchange Act is amended to add orange juice to the list of regulated commodities. In 1936, US Congress enacted the Commodity Exchange Act (CEA) to rename and expand the scope of the original Grain Futures Act to include not only grain but various other commodities, including cotton, butter, and eggs. The exchanges that traded these commodities opposed the regulation of their markets as unnecessary, and, in what became a typical objection to the various proposed expansions of the markets regulated by the CEA, predicted dire consequences if these markets were regulated. Experience, however, proved such fears to be unfounded. Congress also strengthened the anti-manipulation provisions of the Act. The Commodity Exchange Act (1936) (P.L. 74-765, 49 Stat. 149) is the successor to earlier legislation that had proved ineffective in stopping the manipulation of commodity prices. Although the Commodity Exchange Act was itself later found to be a flawed mechanism for regulating the commodity markets (and was supplemented by legislation in the 1970s), it has played an important historical role. Prior to the act's adoption in 1936, Congress had adopted the Futures Trading Act of 1921, which required all commodity futures trading to be conducted on an exchange licensed as a contract market by the federal government. This requirement was designed to allow federal scrutiny of the trading of commodity futures and to stop the so-called 'Bucket Shops' that were essentially betting parlors for speculation in commodity prices. After World War I, the US agricultural sector experienced a recession. That economic downturn was blamed, in part, on speculative excesses occurring in the trading of commodity futures. The Futures Trading Act was the result of a massive investigation of the grain trade by the Federal Trade Commission (FTC) conducted in the wake of the recession. The FTC's massive report found that many abuses were occurring in the industry. Congress confirmed that finding in its own hearings on the Futures Trading Act. In 1922, in Hill v. Wallace, the Supreme Court declared the Futures Trading Act unconstitutional because it was improperly based on the taxing powers of Congress. A manipulation in grain prices that occurred just after this Supreme Court finding spurred the reenactment of the Futures Trading Act, with a different name, under the commerce powers of Congress. The new act, called the Grain Futures Act, was held to be constitutional by the Supreme Court in Chicago Board of Trade v. Olsen (1923). Commodity prices declined dramatically during the Great Depression, which followed the stock market crash of 1929. Newly elected President Franklin D. Roosevelt requested legislation for the regulation of securities and commodity futures as a part of his New Deal reforms. The commodity futures legislation, however, took a route different from that of the federal securities laws because the agriculture committees in Congress, rather than the banking committees, had jurisdiction over the exchanges that traded futures contracts. During the hearing on this legislation, Congress found numerous abuses, including what were described as speculative 'orgies' and manipulations by large speculators that were thought to be driving down commodity prices. One of the more rapacious of these speculators was Arthur Cutten, a Chicago trader who was responsible for several massive attacks on the commodity markets before moving to New York. There he became equally famous for his manipulations of the securities markets. A sensational price collapse in wheat and corn in 1933 on the Chicago Board of Trade and a dramatic drop in cotton prices in 1935 overcame industry resistance to legislative reforms, allowing the adoption of the Commodity Exchange Act in 1936. Goals and Functions of the Act:- the Commodity Exchange Act prohibited the manipulation of commodity futures prices and carried forward the requirement contained in the 1922 Grain Futures Act that commodity futures trading on 'regulated' commodities be traded only on licensed contract markets. Fraud was prohibited and brokerage firms handling customer orders (referred to in the industry as 'futures commission merchants') were required to register with the federal government. The Commodity Exchange Act was to be administered by a Commodity Exchange Commission composed of the attorney general and the secretaries of agriculture and commerce, a structure carried over from the Grain Futures Act. Day-to-day regulatory responsibility was delegated to the Grain Futures Administration, later renamed the Commodity Exchange Authority, a bureau within the Department of Agriculture. Unlike the legislation adopted in the securities industry, no authority was given to the government to control the level of margins in the futures industry. Rather, the government was given the authority to limit the size of speculative positions by individual traders or those acting in concert with each other. The Commodity Exchange Act also sought to stop commodity options trading on regulated commodities because such instruments were viewed to be highly speculative. Experience Under the Act:- the Commodity Exchange Act did not prove to be effective in stopping either manipulations or speculative abuses. A flaw in its provisions allowed the trading of options and futures on unregulated commodities, in other words, those not listed in the Commodity Exchange Act. The act

could not be amended rapidly enough to keep up with the expansion of trading in options and futures on those unregulated commodities. This led to large losses in the early 1970s, when unregulated commodity options firms collapsed, causing losses to many unsophisticated customers. A large run-up in commodity prices during that period also raised concerns in Congress. The result was the enactment of the Commodity Futures Trading Commission Act, which created the Commodity Futures Trading Commission (CFTC), an independent federal agency intended to function like the Securities and Exchange Commission (SEC), the forceful regulator for the securities industry. The CFTC assumed the powers of the Commodity Exchange Commission and was given broad new powers, including the authority to impose civil penalties of up to USD100 000 for each violation of the Commodity Exchange Act or CFTC rules. New classes of registrants were added, including commodity trading advisers and commodity pool operators. The latter were pools of customer funds that were traded in commodity futures. The CFTC very quickly encountered a number of problems, including the renewed fraudulent sale of commodity options to unsophisticated customers. This problem was handled by suspending commodity options trading until the exchanges allowed options trading under regulated conditions. The CFTC was also soon clashing with the SEC, as financial innovations led to futures trading on financial instruments regulated by the SEC. Such financial instruments included stock index futures and futures on fixed income instruments such as government securities. An agreement between the agencies, enacted into law, settled this dispute by drawing a boundary between their jurisdictions. That solution, however, was not long lasting. The SEC blamed the stock market crash of 1987 on the destabilizing effects of futures trading on stock indexes. The development of over-thecounter derivatives instruments such as swaps led to other clashes between the SEC and CFTC on how those instruments should be regulated. These clashes intensified when several large institutions suffered big losses from trading those instruments during the early 1990s. A long-running debate then arose over how those instruments should be regulated. After some vacillation, the CFTC decided to deregulate the commodity markets except where retail customers are involved. That program was enacted into law through the Commodity Futures Modernization Act. This act amended the Commodity Exchange Act to free institutional traders from regulatory restrictions in their derivative transactions, provided that their counter party was also an institution. Observers criticized the 2000 legislation, however, after the failure of the Enron Corporation in 2001. Enron had used the provisions of the 2000 act to escape regulation of its broad-based commodity trading activities. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). заслуживающий доверия или действительный (bona fide) . пузырь (bubble). Федеральный законодательный акт, принятый в 1936, устанавливающий Управление по Сырьевым Биржам и размещающий торговлю фьючерсами на широкий спектр сырьевых позиций под регулирование правительством.

COMMODITY EXCHANGE AUTHORITY = УПРАВЛЕНИЕ ПО СЫРЬЕВЫМ БИРЖАМ – 1936-July-01 – The Commodity Exchange Administration is formed within the USDA to succeed the Grain Futures Administration and administer the Commodity Exchange Act. 1938-December-22 – The Commodity Exchange Commission promulgates the first Federal speculative position limits for futures contracts in grains (then defined as Wheat, Corn, Oats, Barley, flaxseed, grain sorghums, and Rye), following an extended public comment period and hearings on the record. 1940-August-26 – The Commodity Exchange Commission establishes a Federal speculative position limit for cotton futures contracts. 1942-February-23 – The Commodity Exchange Administration is merged with other agencies to form the Agricultural Marketing Administration. The organization is now known as the Commodity Exchange Branch of the Agricultural Marketing Administration. 1942-December-05 – The Agricultural Marketing Administration is merged into the Food Distribution Administration, with the Commodity Exchange Branch renamed the Compliance Branch. 1943-March-26 – The Food Distribution Administration is consolidated with three other agencies to form the Administration of Food Production, which is renamed the War Food Administration on 1943-April-19. Several more reorganizations in USDA affect the regulatory organization for commodity futures trading over the next few years. 1947-February-01 – Responsibility for administering the Commodity Exchange Act is transferred to the Commodity Exchange Authority, an agency of USDA. 1956-June-18 – The Commodity Exchange Authority issues a complaint charging Vincent W. Kosuga, Sam S. Siegel, and National Produce Distributors with manipulating and/or attempting to manipulate three onion futures contract months. The complaint charges the respondents with one attempted upward manipulation (of the November 1955 contract), one attempted price stabilization manipulation (of the November and December 1955 contracts), and one successful downward manipulation. The March 1956 futures contract, the subject of the alleged downward manipulation, fell from near USD2 per 50-lb. bag in late 1955 to 15 cents on the last trading day in March 1956. On 1960-June-03, a USDA Judicial Officer found that the respondents performed the attempted stabilization and successful downward manipulation, but did not find sufficient evidence for the upward manipulation. Following the issuance of the complaint, Congress held hearings to consider banning onion futures trading. 1962-June-13 – The Commodity Exchange Authority publishes the first monthly Commitments of Traders report, replacing the annual reports that had been published in previous years. A regulatory agency of the US Department of Agriculture established to administer the Commodity Exchange Act prior 1975. The Commodity Exchange Authority was the predecessor of the Commodity Futures Trading Commission.

COMMODITY EXCHANGE COMMISSION = КОМИССИЯ ПО СЫРЬЕВЫМ БИРЖАМ – The Commodity Exchange Commission is a commission consisting of the Secretary of Agriculture, Secretary of Commerce, and the Attorney General, responsible for administering the Commodity Exchange Act prior to 1975.

COMMODITY EXCHANGE, INC. = БИРЖА СЫРЬЯ, ИНК. (или СЫРЬЕВАЯ БИРЖА, ИНК.) – New York, 1933:- Commodity Exchange, Inc. (COMEX®) is formed and introduces first futures contract on a non-agricultural commodity – silver. The COMEX®, NYMEX's Division, lists futures and options on aluminum, copper, gold, and silver. The COMEX® Division lists futures and options on gold, silver, copper, aluminum, and the FTSE Eurotop 100® stock index and futures on the Eurotop 300®. FTSE, FT-SE, and Footsie are trade and service marks of London Stock Exchange Ltd. and The Financial Times Ltd. and are used by FTSE International Ltd (FTSE) under license. Eurotop is a registered trademark of Amsterdam Exchanges NV (AEX) or its subsidiaries and is used by FTSE under license. All copyright in the index values and constituent list vests in FTSE International Ltd. The FTSE Eurotop 300 is calculated by FTSE International Ltd in conjunction with Amsterdam Exchanges and the Institute of Actuaries and the Faculty of Actuaries in accordance with a standard set of ground rules. FTSE and AEX accept no liability in connection with the trading of any contract on the Index. The NYMEX® and COMEX® Divisions have more than 200 years of combined trading experience in the physical commodity markets. NYMEX® was founded in 1872 as the Butter and Cheese Exchange of New York; COMEX® was founded on July 05, 1933, in the Depression-era merger of four older commodities futures exchanges – the National Metal Exchange, the Rubber Exchange of New York, the National Raw Silk Exchange, and the New York Hide Exchange. Its origin goes back to the New York Iron and Metal Exchange, established in 1882. The COMEX® Division gold futures contract, which serves as a world pricing benchmark, began trading in 1974 when the ban on the private ownership of gold was lifted. The Commodity Exchange in New York, a division of NYMEX®. Commodity Exchange Inc. (COMEX®) was founded in New York in 1933. It became the leading gold futures and options exchange after its gold futures contract was launched on 31 December 1974 – the date after which Americans were again permitted to hold gold after more than 40 years. Options on gold futures were then launched in 1982. COMEX® also trades silver. Its precious metals volume exceeds that of all other futures exchanges put together and it attracts world-wide participation, with many traders in Europe, the Middle East and East Asia remaining in their offices until COMEX® closes. This gives COMEX unique liquidity, which in turn is much of the reason for its success. Trading hours reflect this and the exchange has opened progressively earlier to suit overseas clients.

Trading hours futures and options:- 08:20 am to 02:30 pm New York time. After hours futures trading is also available on the NYMEX ACCESS[SM] electronic trading system, beginning at 04:00 pm on Monday to Thursday and concluding at 07:00 am the following day. On Sundays the electronic session begins at 07:00 pm. All times are New York time. In 1994, COMEX® merged with the New York Mercantile Exchange (NYMEX®) and is officially the COMEX® division of NYMEX®, but it is always referred to as COMEX®. COMEX® Futures:- The COMEX® gold futures contract was launched on 31 December 1974. The COMEX® gold futures contract is based on 100 ounces of gold. Prices are quoted in multiples of ten cents per ounce, or USD10 per contract. COMEX® futures are listed on the current calendar month and the next two months and every February, April, June, August, October and December in a 23 month period. The June and December contracts are listed out to 60 months to provide expanded trading opportunities for hedgers and speculators. Last day of trading for a gold futures contract is the third last business day of the delivery month. Delivery is made in registered depository receipts issued by exchange-approved depositories in New York. Deliverable gold must be cast in one 100-ounce or three one kilobars by an exchange-approved refiner and assayed at no less than 995 fineness. Turnover on the exchange is usually eight to nine million contracts annually, but in 1999 rose to 9.58 million. Open Interest is published daily. It indicates the number of contracts which have not been fulfilled, either by making or taking delivery or by liquidation. The level of open interest is an important signpost to both liquidity and the activity in a given trading month. COMEX® Options:- COMEX® launched options on gold futures in 1982. The option provides the right to buy (call) or sell (put) a COMEX® gold futures contract at the stated price on or before the expiration date. The contract is based on 100 ounces of gold. Trading is conducted in the nearest six of the following contract months: February, April, June, August, October and December. Additional contract months of January, March, May, July, September and November are listed for trading a period of two months. A 24-month option is added on a June-December cycle. Each option is an American option, which can be exercised at any time up to expiration. Expiration is on the second Friday of the month prior to the delivery month of the underlying futures contract. On the first trading day of any option contract month 13 strike prices are listed for each put and call. Strike price increments are USD10 for futures prices below USD500, USD20 for prices between USD500 and USD1 000 and USD50 for prices above USD1 000. New strike prices are added in accordance with futures price movements. Turnover was usually one to two million contracts annually through the 1990s, but reached 2.8 million in 1999. The New York Commodity Exchange, Inc. (COMEX®) now a division of NYMEX® (the New York Mercantile Exchange). The contracts in the COMEX® gold market consist of 100 ounces each, and the actively traded contracts are the even months of the year. COMEX® (Commodity Exchange, Inc.), one of the exchanges that shared 4 World Trade Center with NYMEX®, had traditionally looked down on NYMEX® for being smaller and for having the toxic reputation from the potato bust. With NYMEX's energy trading boom, it became much larger and wealtheir than COMEX®. On August 03, 1994, the NYMEX® and COMEX® finally merged under the NYMEX® name. By the late 1990s, there were more people working on the NYMEX® floor than there was space for them. In 1997, the NYMEX® moved to a new building on the Southwestern portion of Manhattan, part of a complex called the World Financial Center. On August 03, 1994, the COMEX® merged with NYMEX®, and now operates under the NYMEX® name and is the world's largest commodities futures exchange. Now, the NYMEX® operates in a trading facility and office building with two trading floors in the World Financial Center in downtown Manhattan. COMEX®, originally known as Commodity Exchange, Inc., is a division of the New York Mercantile Exchange (NYMEX®). The main focus of COMEX® is options trading that have to do with precious metals. Some examples of the metals future trading that occurs on the exchange are aluminum, copper, silver, and gold. Based in New York City in the United States, COMEX® provides investment opportunities to investors all over the world. The Commodity Exchange Inc. was first established in New York in 1933. During the first forty years of existence, COMEX® focused on trading copper, silver, and aluminum. This began to change in 1974, after changes in laws in the United States made it possible for US investors to once again hold gold as an investment and asset. On 31 December 1974, the exchange launched its first gold futures contract. Within a very short period of time, COMEX® became the leader in gold futures transactions. In 1982, options on gold futures were added. During the decade of the 1980's, COMEX® and the New York Mercantile Exchange began to discuss the possibility of a merger. The two exchanges officially became a single entity on 03 August 1994. The operating structure for COMEX® has remained intact, with the formerly independent exchange now functioning as a division of the NYMEX®. The combined exchange currently operates two trading floors at the World Financial Center in the downtown section of Manhattan. Administrative offices are also housed in the Center. Because of the world wide investor base for COMEX®, it is not unusual for traders in Asia and the Middle East to monitor activity on the exchange until closing each business day. In response to this trend, COMEX® has over the years adjusted the hours of operation to more accurately reflect the world wide nature of the client base and open earlier in the day in order to accommodate investors in a wider range of times zones around the world. This type of activity has led to the exchange continuing to grow in both total value traded and the number of active traders. Critics of COMEX® have said that the market is often manipulated and that there isn't enough physical gold and silver, for example, to back up the paper contracts. The COMEX® nickname of 'CRIMEX' has been cited in print since at least 2005, when it was used by Russell 'Rusty' McDougal (a blogger on the Investor's Daily Edge). Gold Delivery Problems:- as of 2009, holders of COMEX® gold futures contracts have experienced problems taking delivery of their metal. Along with chronic delivery delays, some investors have received delivery of bars not matching their contract in serial number and weight. The delays cannot be easily explained by slow warehouse movements, as the daily reports of these movements show little activity. Because of these problems, there are concerns that COMEX® may not have the gold inventory to back its existing warehouse receipts. As a result of the CFTC's March 2010 Metals Hearings, position limits will likely be imposed on Comex® Precious Metals Futures Contracts, according to CFTC Commissioner Bart Chilton, in order to avoid continued charges of unfair concentration and manipulation. The Silver Market:- Some Call it CRIMEX (posted on June 24, 2009 by Russell McDougal – who has written 143 investment articles on Investors Daily Edge):- the silver market is showing signs of bullish strain and an incredible opportunity is being presented to you. I'm a staunch silver advocate and it's time for an update right now. Silver stands to outperform gold as the long term precious metal bull market continues to unfold.The price of silver, along with gold, is kept under wraps by officials of the New York COMEX® market, aka CRIMEX. The old boy network which runs CRIMEX have whipsawed the market in their desired direction for decades and profited accordingly. These actions are government sanctioned because precious metals are competition to un-backed fiat money. State mandated fiat is so weak and poorly designed that it cannot stand competitors. 1933:- The Commodity Exchange, Inc. (COMEX®) is founded from the merger of the National Metal Exchange, the Rubber Exchange of New York, the National Raw Silk Exchange, and the New York Hide Exchange (the oldest of these exchanges was founded in 1882). By the 1970s, COMEX® becomes an exchange that primarily trades gold, silver, and copper futures. Since 1994, COMEX® has operated as a subsidiary of the New York Mercantile Exchange (NYMEX®), which in turn became a subsidiary of the CME Group in 2008. The Commodity Exchange Inc. was established in New York in 1933. In its early years, the COMEX's main focus was trading copper, silver and aluminum. When the United States changed the laws about individual ownership of gold in 1974, the COMEX® thrived as the place to trade gold. Gold's Debut:- with the launch of gold futures on December 31, 1974, the COMEX® very quickly dominated gold future transactions. Options on gold futures were introduced in 1982. Merger:- the COMEX® and the New York Mercantile Exchange started discussions of merging in the 1980s. The two exchanges officially became one on August 03, 1994. Business:- it has remained business as usual in operating structure for COMEX®. It currently functions as a division of the New York Mercantile Exchange (NYMEX®). Potential:- traders, investors, hedge funds and countries monitor activity on the COMEX® each business day. It continues to grow and prosper with increased activity, volume and interest. Significance:- traded on the COMEX® are:- COMEX® miNY gold futures, COMEX® miNY silver

futures, E-mini copper futures, gold futures, silver futures, gold options, silver options and copper options. / Биржа Сырья, Инк. или Сырьевая Биржа, Инк. (сокращённо – КОМЭКС® по первым буквам Англоязычных слов названия; Commodity Exchange (COMEX®)) была основана 05 Июля 1933 в Нью Йорке, США. Её создание состоялось за счёт слияния четырёх более старых бирж сырьевых фьючерсов:- Национальная Биржа Металлов (National Metal Exchange), Нью Йоркская Биржа Каучука (Rubber Exchange of New York), Национальная Биржа Шёлка-Сырца (National Raw Silk Exchange) и Нью Йоркская Биржа Шкур (New York Hide Exchange; самая старая из них основанная ещё в 1882) в одну новую. На момент создания она представила своим торговцам первый фьючерсный контракт на несельскохозяйственное сырьё. Им был фьючерс на серебро. В 1980-е НАЙМЭКС® и КОМЭКС® начали обсуждать возможность объединения, которое реально состоялось 03 Августа 1994, когда биржи объединились под одним названием – НАЙМЭКС®, и КОМЭКС® фактическа стала Подразделением НАЙМЭКС® (NYMEX's Division). В настоящее время КОМЭКС® по-прежнему котирует фьючерсы и опционы на фьючерсы на алюминий, золото, медь и серебро.

COMMODITY FORWARD = ФОРВАРД НА СЫРЬЁ (или СЫРЬЕВОЙ ФОРВАРД, или ФОРВАРДНЫЙ КОНТРАКТ НА СЫРЬЁ) – Commodity Forward (or Non-Delivarable Forward (NDF) in OTC market):- a forward commits the buyer/seller to buy/sell certain amount of the underlying asset (commodity) on the defined day at a pre-defined price. In the case of the commodity NDF offered by us, only the difference between the pre-defined price and the reference price is settled. The reference price is the price which is defined and officially published every business day for example by the London Metal Exchange. Terms of Service:- (i) accounts in the relevant currencies (USD, EUR – subject to the commodity type); (ii) Master Agreement on Treasury Trades; (iii) minimum amount of the deal is 1 lot; and (iv) Agreement on Financial Collateral Account. Commodity Forward is a forward contract to exchange a commodity or commodity index at a set price at a future date. Commodity Forward is a product to secure commodity risk. A Commodity Forward is intended for:- (i) corporate entities; (ii) national citizens and foreigners; (iii) clients who demand security for commodity risk resulting from possible negative development for the client of a specific commodity. Characteristics of a Commodity Forward:- (i) the agreed fixed forward price of a commodity is compared with the closing price of the commodity published on the dates agreed when the transaction is arranged (these dates are usually the end/s of the reference period/s); (ii) the difference in the prices, for the given amount of commodity, is paid by the party in the disadvantageous position, usually 2–5 working days after the end/s of the reference period(s); (iii) the counterparties may agree on early termination of the Commodity Forward over the course of its duration; (iv) in the event of early termination of the Commodity Forward, settlement is implemented of its market value in terms of a one-off payment and termination of the whole transaction and all future obligations; and (v) level of settlement, for the given reference period:- PA = NA * abs(CSP – P), where:- PA – level of settlement, NA – agreed amount of commodity, CSP – closing price (Cash Settlement Price), P – agreed fixed price. Settlement of the transaction is always financial, never physical. Modification:- (i) Quanto:- modification of the product, which has the underlying commodity quoted in another currency than the settlement currency; (ii) Basket:- modification of the product where the underlying asset is several types (a basket) of commodities; and (iii) Deferred Fixing of a Fixed Price:- modification of the product in terms of which the specific value of the fixed price is not known on the date the transaction is arranged. The value is determined on the basis of average daily fixings ascertained over the course of a determined future period. Risk:- (i) profit or loss from commodity transactions is influenced by the movement of prices of the commodity in question; (ii) possible loss is given by the fact that the client, in terms of individual reference periods, finds himself or herself in a disadvantageous position, i.e. the payment he or she makes has a higher value than the payment made by the bank; (iii) in this case, the client pays the bank an amount equal to the difference between these two payments; (iv) if the transaction was concluded for hedging purposes, the client then understands this loss as the cost of hedging; and (v) hedging protects the client against such a significant change in the price of commodities, which would cause him or her serious financial problems. Advantages of a Commodity Forward concluded at some investing bank:- (i) the client has the possibility to secure a future transaction from a substantial change in commodity prices on the market that could cause financial problems; (ii) the transaction is always concluded by telephone with a client transaction dealer; (iii) the client receives confirmation of the concluded transaction containing the agreed parameters of the transaction; and (iv) at some investing bank, a team of experienced professionals is at your disposal; they will propose an optimal strategy and are able to respond flexibly to developments on the market. A Commodity Forward allows you to hedge commodity risk arising from a possible negative price development of a specific commodity on the market.

COMMODITY FUND = СЫРЬЕВОЙ ФОНД – Commodity Fund is an investment fund which mainly invests its assets in commodity bills, e.g., grain contracts, or tradable commodities. / Инвестиционный фонд, который инвестирует свои активы главным образом в купчии на сырьё, например, контракты на зерно или торгуемые рода сырья.

COMMODITY FUTURES EXCHANGE = БИРЖА ФЬЮЧЕРСОВ НА СЫРЬЁ (или БИРЖА СЫРЬЕВЫХ ФЬЮЧЕРСОВ) – Commodity Futures Exchange is an exchange at which futures contracts are entered into in standardized units, in terms of quantity and quality, of widely used natural products. The Chicago Board of Trade, founded in 1848, is the oldest futures exchange for commodities and financial contracts and also has the highest trading volume. Trading at the German commodity futures exchange, which is located in Hanover, commenced in 1998.

THE COMMODITY FUTURES MODERNIZATION ACT OF 2000 = АКТ ОБ УСОВЕРШЕНСТВОВАНИИ СЫРЬЕВЫХ ФЬЮЧЕРСОВ ОТ 2000 – The Commodity Futures Modernization Act of 2000 (CFMA):- the purposes of this Act are:- (i) to reauthorize the appropriation for the Commodity Futures Trading Commission; (ii) to streamline and eliminate unnecessary regulation for the commodity futures exchanges and other entities regulated under the Commodity Exchange Act; (iii) to transform the role of the Commodity Futures Trading Commission to oversight of the futures markets; (iv) to provide a statutory and regulatory frame work for allowing the trading of futures on securities; (v) to clarify the jurisdiction of the Commodity Futures Trading Commission over certain retail foreign exchange transactions and bucket shops that may not be otherwise regulated; (vi) to promote innovation for futures and derivatives and to reduce systemic risk by enhancing legal certainty in the markets for certain futures and derivatives transactions; (vii) to reduce systemic risk and provide greater stability to markets during times of market disorder by allowing the clearing of transactions in over-the-counter derivatives through appropriately regulated clearing organizations; and (viii) to enhance the competitive position of United States financial institutions and financial markets. Section 5(c) of the Commodity Exchange Act as amended by the Commodity Futures Modernization Act of 2000 (CFMA), provides that boards of trade that were designated contracts markets on the date of the enactment of the CFMA (December 21, 2000) were to be considered designated contracts markets under the Commodity Exchange Act as of that date. The contract markets having a designation date followed by an asterisk are those that were deemed to be designated at the time of adoption of the CFMA. The original date when an exchange was designated as a contract market by the CFTC or, prior to 1975, by the Secretary of Agriculture is indicated in parentheses. 2000-September-14 – The Commodity Futures Trading Commission (CFTC) and Securities and Exchange Commission (SEC) announce an agreement providing for joint jurisdiction over security futures products, that is, single stock futures and futures on narrow-based stock indices. Under the agreement, which will be incorporated into the Commodity Futures Modernization Act of 2000 (CFMA), the CFTC retains exclusive jurisdiction over futures contracts on broad-based stock indices. (CFTC Press Release 4447-00, September 14, 2000) 2000-November-22 – The CFTC

approves rules implementing the New Regulatory Framework. These rules are later superseded by passage of the Commodity Futures Modernization Act of 2000 and most new rules were subsequently withdrawn. (CFTC Press Release, 4475-00, November 22, 2000). 2000-December-21 – President Clinton signs into law the Commodity Futures Modernization Act of 2000, which, among other things, reauthorizes the Commission for five years, overhauls the Commodity Exchange Act to create a flexible structure for the regulation of futures and options trading, clarifies Commission jurisdiction over certain retail foreign currency transactions, and repeals the 18-year-old ban on the trading of single stock futures. On the same day, the CFTC withdraws most of the New Regulatory Framework; however, the amendments to Regulation 1.25 concerning investment of customer funds by futures commission merchants and derivatives clearing organizations are made effective immediately with some technical corrections. The amendments permit investment of customer funds in new types of instruments, such as money market mutual funds. (CFTC Press Release 4479-00, December 15, 2000; CFTC Press Release 4481-00, December 21, 2000) 2001-February-05 and 2001-February-08 – In light of the Commodity Futures Modernization Act's clarification of the CFTC's jurisdiction over retail foreign currency trading, the CFTC issues an advisory and a revised consumer alert addressing the offering of foreign currency trading opportunities to the retail public. The advisory explains how firms may lawfully offer foreign currency trading opportunities and the consumer alert warns the public of the risks of foreign currency trading and of foreign currency scams. (Advisory on Foreign Currency; CFTC Press Release 4489-01, February 08, 2001) 2001-April-18 – For the first time since the passage of the Commodity Futures Modernization Act, the CFTC uses its newly-clarified authority to file a complaint charging fraud and the offering of illegal futures contracts against a firm soliciting retail investors to trade foreign currency contracts. Over the next several years, the CFTC filed similar complaints against dozens of firms that solicit retail investors to trade foreign currency. (CFTC Press Release 4508-01, April 19, 2001) 2001-July-09 – The CFTC approves the application of EnergyClear Corporation for registration as a derivatives clearing organization under the Commodity Exchange Act. This is the first new derivatives clearing organization that is not affiliated with a trading facility to be granted registration by the Commission since the passage of the Commodity Futures Modernization Act. Derivatives clearing organizations for the existing futures exchanges were grandfathered in under the Commodity Futures Modernization Act. (CFTC Press Release 4540-01, July 11, 2001) 2001-August-01 – The CFTC kicks off implementation of the Commodity Futures Modernization Act by adopting new rules for the various types of exchanges (with different levels of regulatory oversight) created by the Act. These types of exchanges include designated contract markets, derivatives transaction execution facilities, exempt boards of trade, and exempt commercial markets. (CFTC Press Release 4547-01, August 01, 2001). The Commodity Futures Modernization Act of 2000 (CFMA), Pub. L. No. 106–554, 114 Stat. 2763, reauthorized the Commodity Futures Trading Commission (CFTC) for five years and overhauled the Commodity Exchange Act (CEA) to create a flexible structure for the regulation of futures and options trading. Significantly, the CFMA codified an agreement between the CFTC and the Securities and Exchange Commission to repeal the 18-year-old ban on the trading of Single Stock Futures. In 2000, US Congress enacted the Commodity Futures Modernization Act (CFMA). The CFMA overhauled the regulatory framework for financial and energy derivatives under the Commodity Exchange Act (CEA). Consistent with the recommendations of the President's Working Group, the CFMA sought to clarify the exclusion of various financial derivatives from the scope of the CEA, and to establish a tiered regulatory system for the commodities and derivatives within the scope of the CEA, with the degree of regulation dependent upon the type of product (such as financial, agricultural, energy or metals), the type of market (such as designated exchanges, bilateral negotiation, multilateral negotiation, or electronic exchange), and the type of participant in the marketplace (such as retail customer, sophisticated player, or speculator). Generally, the CFMA subjects markets that restrict trading to professional traders or commercial participants and trade in products that are less susceptible to manipulation to less regulation than markets with a broader range of participants or with commodities in finite supply. The CFMA resolved the longstanding concern regarding the legal enforceability of over-the-counter (OTC) derivatives that were not traded on an approved exchange. The CEA now provides that no swap agreement between eligible contract participants shall be unenforceable under the CEA or any other law based on a failure to comply with any exclusion or exemption from any provision of the CEA. A significant number of provisions in the CFMA address issues related to the regulatory treatment of a variety of financial instruments. Most of these complex provisions are not directly relevant to the issue of the regulation of energy contracts under the CEA. Accordingly, this report examines the provisions of the CFMA only insofar as they relate to or are entangled with issues regarding the regulation of energy contracts, such as those involving crude oil. / Бил Клынтчэн (Bill Clinton). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

COMMODITY FUTURES TRADING COMMISSION = КОМИССИЯ ПО ТОРГОВЛЕ СЫРЬЕВЫМИ ФЬЮЧЕРСАМИ – The US Congress created the Commodity Futures Trading Commission (CFTC) in 1974 as an independent agency with the mandate to regulate commodity futures and option markets in the United States. The agency's mandate has been renewed and expanded several times since then, most recently by the Commodity Futures Modernization Act of 2000. In 1974 the majority of futures trading took place in the agricultural sector. The CFTC's history demonstrates, among other things, how the futures industry has become increasingly varied over time and today encompasses a vast array of highly complex financial futures contracts. Today, the CFTC assures the economic utility of the futures markets by encouraging their competitiveness and efficiency, protecting market participants against fraud, manipulation, and abusive trading practices, and by ensuring the financial integrity of the clearing process. Through effective oversight, the CFTC enables the futures markets to serve the important function of providing a means for price discovery and offsetting price risk. The CFTC's mission is to protect market users and the public from fraud, manipulation, abusive practices and systemic risk related to derivatives that are subject to the Commodity Exchange Act, and to foster open, competitive, and financially sound markets. Futures contracts for agricultural commodities have been traded in the United States for more than 150 years and have been under Federal regulation since the 1920s. When the CFTC was created in 1974 with the enactment of the Commodity Futures Trading Commission Act, most futures trading took place in the agricultural sector. Over the years, the futures industry has become increasingly varied and complex. Significant dates in the history of futures regulation before the creation of the CFTC and significant dates in CFTC history from 1974 to the present are given here. Headquartered in Washington, DC, The United States of America. Regional Offices in:- Chicago, IL, Kansas City, MO, and New York, NY. Congress created the agency in 1974 to protect against fraud related to the sale of commodity and financial futures. The CFTC is an operationally independent regulatory commission of the US Government, accountable to, and subject to the oversight of, US Congress. By law, the five commissioners are appointed by the President with the consent of the Senate. Each CFTC Commissioner holds office for a term of five years. Not more than three commissioners may be members of the same political party. The President also appoints one of the commissioners as chairman, with the consent of the Senate. The President may replace the chairman at any time and the former chairman may complete his or her term as a CFTC Commissioner should he/she choose to do so – which seems unlikely. The criteria for removal of a commissioner are not set out in statute. However, case law regarding independent regulatory agencies suggests that the President has the power to remove a commissioner for 'cause' such as neglect of duty or malfeasance in office. The US Commodity Exchange Act (CEA) prohibits any CFTC Commissioner or employee from accepting employment or compensation from any person, exchange, or clearinghouse subject to regulation by the CFTC and from participating, directly or indirectly, in any contract market operations or transactions subject to CFTC regulation. The CFTC may consult with any department or agency of the government. In specific instances, the consultation process is established by law. For example, the CFTC may not designate a board of trade as a Designated Contract Market (DCM) or

register a derivatives transaction execution facility (DTEF) in US Government-issued or guaranteed securities until the shorter of 45 days after the CFTC provides a copy of the application to Treasury, and the Federal Reserve or the CFTC receives comments from those agencies. The CFTC's budget is part of the federal budget that is prepared by the President and submitted to Congress. The budget is subject to review and recommendation at several levels, including House and Senate committees, and must be adopted by Congress annually. The budget has not kept pace with the growth in the futures market. The CFTC Chairman has testified about the commission's need for more resources and the Administration and US Congress are considering the agency's need for more resources. Federal law provides federal employees with immunity from individual liability for torts committed in the scope of their employment. In order to insulate CFTC staff from individual liability for possible violation of constitutional or statutory duties that are not shielded by statute, the CFTC has adopted indemnification rules. The CFTC is accountable for its conduct to US Congress primarily through reporting to House and Senate committees. In general, these committees handle, in the first instance, the reauthorization, budget, and funding decisions for the CFTC, as well as bills affecting the CEA. By law, the CFTC is subject to reviews and audits by the government. The CFTC is also required to deliver a written report to Congress within 120 days after the end of each fiscal year detailing CFTC operations of that fiscal year. In addition, CFTC operations are subject to ongoing review by an independent SEC Office of Inspector General (OIG) with offices in the CFTC headquarters. It has four staff members. OIG conducts and supervises audits and investigations of programs and operations of the CFTC and reviews existing and proposed legislation and regulations. OIG recommends policies to promote economy, efficiency and effectiveness in CFTC programs and operations and to prevent and detect fraud and abuse. OIG keeps the Chairman of the CFTC and Congress informed about any problems, deficiencies and the progress of corrective action in programs and operations. The CFTC must comply with the Administrative Procedures Act (APA), which requires administrative agencies to give affected parties notice of proposed actions, and an opportunity to make submissions prior to a decision being made and provide written decisions setting out its findings of fact, conclusions of law, and the reasons for its decisions. Additionally, the APA creates the right of judicial review over agency actions. A person suffering legal wrong because of an administrative agency's action, or adversely affected by its decision, is entitled to a judicial review of the action. The CFTC also has extensive rules of procedure to ensure fairness in the conduct of hearings and other administrative activities. Independent federal regulatory agency created by US Congress under Commodity Futures Trading Commission Act in 1974 to regulate and oversee futures trading and the operation of organized futures exchanges in the United States under the Commodity Exchange Act. The CFTC monitors the futures and options on futures markets in the United States. 1974-October-23–24 – Congress passes the Commodity Futures Trading Commission Act of 1974, and it is signed by President Gerald Ford. The bill overhauls the Commodity Exchange Act and creates the Commodity Futures Trading Commission (CFTC or Commission), an independent agency with powers greater than those of its predecessor agency, the Commodity Exchange Authority. For example, while the Commodity Exchange Authority only regulated agricultural commodities enumerated in the Commodity Exchange Act, the 1974 act granted the CFTC exclusive jurisdiction over futures trading in all commodities. 1975-April-15 – Four of the first five CFTC members, including the CFTC's first Chairman, are sworn in. 1975-April-21 – Authority for the regulation of futures trading is transferred from the Commodity Exchange Authority, an agency in the Department of Agriculture, to the CFTC. 1975-July-18 – The CFTC authorizes exchanges to continue trading futures contracts on a number of commodities previously unregulated under the Commodity Exchange Act. Effectively, this action brings under Federal regulation all commodities for which a futures contract is actively traded. 1975-September-11 – The CFTC approves the first futures contract on a financial instrument – the Chicago Board of Trade Government National Mortgage Association (Ginnie Mae) certificates futures contract. 1975-November-26 – The CFTC approves the first futures contract on US government debt – the Chicago Mercantile Exchange 90-Day US Treasury bill futures contract. 1976-May-25 – The New York Mercantile Exchange declares a default in its May Maine potato contract. After an extensive investigation, the CFTC brings manipulation charges against both the long and short position holders. 1977-April-28 – The CFTC asks the US District Court in Chicago to order seven members of the Hunt family of Dallas, and a related company, to liquidate positions that exceed the three million bushel speculative position limit for Soybean futures on the Chicago Board of Trade. 1977-August-02 – The CFTC approves the first futures contract on long-term US government debt – the Chicago Board of Trade US Treasury bond futures contract. 1977-November-23 – The CFTC declares a market emergency in the December Coffee 'C' futures contract on the New York Coffee and Sugar Exchange (which merged with the New York Cocoa Exchange to form the Coffee Sugar and Cocoa Exchange in 1979 and has now become part of ICE Futures US®), resulting in an orderly reduction of the open interest in that contract. This is one of several emergencies in coffee futures during the late 1970s. 1978-June-01 – The CFTC suspends most commodity options transactions in the United States because of pervasive fraud in so-called 'London Options' and dealer options on physical commodities. 1978-September-30 – The Futures Trading Act of 1978 is signed into law by President Carter. The act renews the CFTC's regulatory authority for four years, requires the CFTC to maintain communication with the Securities and Exchange Commission, the Department of the Treasury, and the Federal Reserve Board, and makes some technical changes to the Commodity Exchange Act. 1979-January-02 – The CFTC adopts the first rules to govern the operations of commodity pool operators (CPO) and commodity trading advisors (CTA) in a new Part 4 of its rules. 1979-January-04 – The CFTC announces a temporary moratorium on entry into the leverage contract business in gold and silver bullion and bulk coins. 1979-March-16 – In an emergency action, the CFTC votes to prohibit further trading in the Chicago Board of Trade March Wheat futures contract, the first time the Commission orders a market closed in the interest of preventing a price manipulation. 1979-September-12 – The US Court of Appeals for the Seventh Circuit affirms the CFTC's authority to act during market emergencies, and concludes that judicial review of the Commission's determination of such an emergency would thwart the purpose for which Congress granted the CFTC emergency powers. 1980-January-06 – In an emergency action, the CFTC orders the suspension of futures trading for two days for Wheat, Corn, Oats, Soybean meal, and Soybean oil on four exchanges after President Carter announces an embargo on the sale of certain agricultural goods to the Soviet Union that includes substantial amounts of grain. 1980-March-28 – After careful consideration of a host of market factors, the CFTC votes not to use its emergency powers to order a suspension of trading in silver futures as prices plummet. 1981-May-29 – As required by Public Law 96-276, the CFTC transmits to Congress a report on events in the silver market during late 1979 and early 1980, and on issues involving futures contracts on financial instruments. 1981-September-08 – The CFTC adopts a comprehensive set of regulations to govern exchange-trading of options on futures contracts under a controlled and monitored three-year pilot program. 1981-September-22 – The CFTC grants registration to the National Futures Association as a self-regulatory futures association and approves its articles, bylaws, and rules. NFA begins to hire staff and commences operations on 1982-October-01. 1981-October-16 – The CFTC adopts Regulation 1.61 (now part of CFTC Regulation 150, 17 CFR 150 (17 CFR is short for the Code of Federal Regulations:- Title 17)) requiring exchanges to establish speculative position limits in all futures contracts. 1981-December-07 – The CFTC and the Securities and Exchange Commission jointly announce a basic jurisdictional agreement on the regulatory responsibility of each agency for a variety of financial instruments, in particular stock index futures. This agreement was known as the Shad-Johnson Accord and later became part of the Commodity Exchange Act. 1981-December-08 – The CFTC approves the first futures contract settled in cash at expiration, the Eurodollar contract on the Chicago Mercantile Exchange. 1982-February-16 – The CFTC approves the first futures contract based on a stock index, the Value Line Index Average traded on the Kansas City Board of Trade. 1982-August-31 – The CFTC approves the first options on futures contracts since its announcement of the exchange-traded options pilot program. The contracts include options on sugar futures on the Coffee Sugar and Cocoa Exchange;

options on gold futures on the MidAmerica Commodity Exchange (later acquired and eventually closed by the Chicago Board of Trade) and Commodity Exchange, Inc. (now a part of the New York Mercantile Exchange); and options on Treasury bond futures on the Chicago Board of Trade. 1983-January-06 – The CFTC approves the first options based on stock index futures contracts: an option for the New York Stock Exchange Composite Index futures contract on the New York Futures Exchange, Inc. and an option on the Standard & Poor's 500 (S&P 500) Index futures contract on the Chicago Mercantile Exchange. 1983-January-11 – President Reagan signs the Futures Trading Act of 1982, renewing the CFTC's mandate to regulate futures trading for four more years and clarifying Commission jurisdiction in a number of areas. Among other things, this act codified the Shad-Johnson Accord (which gave the CFTC jurisdiction over broad-based stock index futures and banned single-stock and narrow-based stock index futures), and required the CFTC to act on new contract proposals and rule amendments within specified time periods (365 days for new contracts and 180 days for rule amendments). 1983-July-29 – The CFTC adopts final rules governing introducing brokers (IB) and associated persons (AP) of introducing brokers, commodity pool operators, and commodity trading advisors – new registrant categories created by the Futures Trading Act of 1982. Concurrently, the Commission authorizes the National Futures Association to perform registration processing functions for introducing brokers and their associated persons, the first time NFA is authorized to perform registration functions. 1984-February-27 – The CFTC adopts final rules to govern temporary licenses for associated persons and a new system of statutory disqualifications for all registrants. Concurrently, the National Futures Association is authorized to grant temporary licenses in appropriate cases. Effective 1985-September-30, following NFA's adoption of rules in this area, the CFTC authorizes NFA to take adverse action against registrants, subject to appeal to the CFTC. 1984-April-18 – The CFTC's Office of the General Counsel issues a letter to the Toronto Futures Exchange stating that the Commission will not take any enforcement action if the TFE's stock index futures contract on the Toronto Stock Exchange Composite 300 Stock Index is offered and sold in the United States. Since then, Commission staff has issued many similar letters regarding other foreign stock index futures contracts. 1984-August-29 – The CFTC approves amendments to Chicago Mercantile Exchange rules that allow it to establish a trading link with the Singapore International Monetary Exchange, the first trading and clearing link between a domestic and a foreign exchange. 1984-September-28 – The CFTC submits 'A Study of the Nature, Extent and Effects of Futures Trading by Persons Possessing Material, Nonpublic Information' to its Congressional oversight committees. 1984-October-28 – The CFTC approves the first options on domestic agricultural commodity futures contracts on six exchanges. 1984-December-03 – The CFTC authorizes the National Futures Association to perform registration processing functions for futures commission merchants, commodity pool operators, commodity trading advisors, and their respective associated persons. 1984-December-31 – The Federal Reserve Board, the Securities and Exchange Commission, and the CFTC submit to Congress 'A Study of the Effects on the Economy of Trading in Futures and Options'. 1985-February-15 – The CFTC approves the first option on a physical commodity – Amex Commodity Corporation's physical gold bullion option contract. 1985-February-28 – The CFTC ends its silver investigation, alleging that Nelson Bunker Hunt, William Herbert Hunt, and other individuals and firms manipulated and attempted to manipulate silver prices in 1979 and 1980. 1985-March-20 – Volume Investors, Inc., a clearing member at COMEX®, defaults on a margin call on options on gold futures. The default affects the funds of 100 customers, mostly local traders, and causes the Commission to consider numerous changes to its rules. Ultimately, improved surveillance, early warning, and margining procedures are developed. 1985-April-17 – The CFTC adopts Regulation 4.5, 17 CFR 4.5 (17 CFR is short for the Code of Federal Regulations:- Title 17), which excludes certain otherwise regulated persons from the commodity pool operator definition upon the filing of a notice of eligibility, subject to certain limits on trading. Effective 2003-August-08, trading limits have been removed. Most of the notices filed under the regulation are filed by registered investment companies. 1986-April-29 – The CFTC terminates the pilot program started in 1981 for exchange-traded commodity option contracts not based on domestic agricultural commodities. With the successful completion of the pilot program, non-agricultural options continue to trade according to CFTC regulations. 1986-September-23 – The CFTC, the Securities and Exchange Commission, and the United Kingdom Department of Trade and Industry announce the signing of a Memorandum of Understanding (MOU), which will enhance cooperation and mutual assistance in securing compliance with and enforcement of securities and commodities laws in both countries. Since then, the Commission has entered into information-sharing and enforcement MOUs with many other foreign regulators. 1986-November-10 – President Reagan signs the Futures Trading Act of 1986, reauthorizing the CFTC for three years. 1987-January-06 – The CFTC votes to end the pilot program in options on agricultural futures contracts and physical commodities, and to continue to allow trading of options on futures in those commodities. 1987-July-23 – The CFTC adopts final rules to permit the offer and sale of foreign futures and options in the United States and to apply the same customer protection rules to the offer and sale of foreign futures and options as to the offer and sale of domestic futures and options. These rules include a requirement (repealed on 1996-March-12) that foreign options trading must be approved on a case-by-case basis. 1987-October-19 – In the biggest one-day price plunge in stock market history, no CFTC-regulated systems fail and no firms default on obligations. 1987-November-09 – The CFTC releases an interim report on stock index futures and related stock market activity during October 1987; a follow-up report was released on 1988-January-08, and a final staff report on 1988-February-01. 1988-May-16 – The President's Working Group on Financial Markets (Working Group), composed of the CFTC, the Securities and Exchange Commission, the Treasury Department, and the Federal Reserve Board, presents its report on the October 1987 stock market break to President Reagan. 1988-July-20 – The CFTC approves the offer and sale of the first foreign option contracts in the United States – options to be traded on the SIMEX, the SFE, and the Montreal Exchange. 1988-August-25 – The CFTC approves the ACC gold bullion warrants – options on physical gold bullion, the first warrants contract approved by the CFTC. 1988-October-18 – The CFTC approves proposals to amend daily price limits and trading halt provisions for stock index futures and option contracts traded on the Chicago Mercantile Exchange, the Chicago Board of Trade, the Kansas City Board of Trade, and the New York Futures Exchange. These proposals were based on recommendations by the Working Group. 1988-November-22 – The CFTC approves the Chicago Board of Trade futures contracts in long-term UK gilts, the Japanese Stock Index (TOPIX), and long-term Japanese government bonds, and the Chicago Mercantile Exchange Nikkei Stock Average futures contract. These are the first domestic futures contracts based on foreign stock indices and foreign government debt instruments. 1989-January-20 – The news media report the disclosure of a two-year undercover investigation of the Chicago trading pits conducted by the Federal Bureau of Investigation in cooperation with the CFTC and the Department of Justice. The CFTC takes a number of market integrity actions in the following months. 1989-February-02 – The CFTC unanimously approves rules proposed by the Chicago Mercantile Exchange for the basic Globex system, the first international electronic trading system. Trading begins in June 1992. 1989-July-11 – The Chicago Board of Trade institutes an emergency action concerning the July 1989 CBOT® soybean futures contract. CBOT® requires all large traders to reduce their positions prior to the expiration of the July contract. The contract expires in an orderly manner. 1989-July-17 – The CFTC approves final rules addressing the regulation of hybrid instruments that combine characteristics of commodity options with debt, preferred equity, or depository interests and, at the same time, approves a policy statement concerning swap transactions and rules establishing an exemptive framework for certain hybrid instruments with limited commodity option components. 1989-November-17 – The CFTC releases a major economic analysis of 'dual trading' prepared by its Division of Economic Analysis. 1990-June-06 – The CFTC and the Commission des Operation de Bourse (COB) of France sign two agreements that provide the most comprehensive structure of information sharing and cooperation yet achieved between financial regulatory authorities in different countries. 1990-November-15 – The CFTC, in a move toward closer worldwide cooperation among regulatory authorities, adopts ten general principles intended to assist regulators and

developers of screen-based trading systems in addressing areas of common concern. The ten principles were drafted by a CFTC-chaired working group of the International Organization of Securities Commissions (IOSCO). IOSCO also adopts the ten principles. 1991-January-17 – Prior to and during the Persian Gulf War, the CFTC works closely with the US Department of Energy to ensure that futures markets have ample access to cash market information about crude oil production and to ensure that the markets perform their price discovery and risk shifting functions in an orderly manner. The Commission reported to Congress that it found no evidence that the sharp rises in energy prices were caused by manipulation or excessive speculation. 1991-September-04 – The CFTC released a year-long staff study analyzing the performance of the Corn, Wheat, and Soybean futures contracts traded at the CBOT®, 'An Analysis of the Delivery-Point Provisions of the CBOT's Corn, Wheat and Soybean Futures Contracts'. November 1991 – The CFTC and the Securities and Exchange Commission concurrently approve proposed rule changes by the Options Clearing Corporation (OCC) and the Chicago Mercantile Exchange intended to improve coordination in the clearance and settlement of futures and options. The rule changes expand the existing cross-margining programs between the OCC and CME® to permit clearing members to include intermarket futures and option positions held in certain non-proprietary accounts. July 1992 – The CFTC approves final rules which exempt commodity pool operators and commodity trading advisors of pools sold exclusively to certain highly accredited investors from specific disclosure, reporting, and recordkeeping requirements. Fiscal Year 1992 – The CFTC implements initiatives to eliminate unnecessary paperwork. As a result of this initiative, market reports from exchanges are now sent electronically to the Commission. 1992-October-28 – President George Herbert Walker Bush signs the CFTC's reauthorization legislation, the Futures Trading Practices Act of 1992 (FTPA), expanding the CFTC's regulatory authority and reauthorizing the agency until October 1994. The Futures Trading Practices Act, among other things, granted the Commission the authority to exempt over-the-counter (OTC) derivative and other transactions from CFTC regulation and provided for registration of local traders. 1993-January-22 – Using new exemptive authority granted in the Futures Trading Practices Act, the CFTC exempts certain swap agreements and hybrid instruments from regulation under the Commodity Exchange Act. 1993-February-26 – A bomb placed by terrorists explodes in the basement of the World Trade Center, disrupting futures trading in New York and causing the temporary relocation of the CFTC's New York office. 1993-April-09 – The CFTC adopts rules requiring the registration of floor brokers and ethics training for all individual registrants, as mandated by the Futures Trading Practices Act. The Commission also adopts rules permitting the suspension of registrants charged with felonies under authority granted by the Futures Trading Practices Act. 1993-April-20 – Under Futures Trading Practices Act exemptive authority, the CFTC exempts from regulation certain contracts for the deferred purchase or sale of specified energy products. 1993-July-22 – The CFTC approves final rules prohibiting the practice of dual trading by floor brokers, unless an exemption is explicitly granted by the CFTC, in contract markets that trade in excess of a threshold level of 8 000 contracts a day. Fiscal Year 1993 – The CFTC approves 46 new futures and option contracts, breaking the previous record. 1993-October-25 – The CFTC releases a report entitled 'OTC Derivative Markets and Their Regulation', the first of several required by the Futures Trading Practices Act. January 1994 – In response to a recommendation in the CFTC's OTC Derivative Markets Report, the President's Working Group on Financial Markets expands its charter to encompass new developments in financial markets, including the growth of OTC derivatives. 1994-January-10 – The CFTC files an administrative complaint against two former Chicago Board of Trade members, Anthony Catalfo and Darrell Zimmerman, alleging that the respondents engaged in a scheme to manipulate Treasury bond futures and put options on the CBOT®. On 1994-September-26, an administrative law judge issues a default order against both respondents finding that they committed the violations as alleged. April 1994 – The CFTC releases another report mandated by the Futures Trading Practices Act, 'A Study of the Global Competitiveness of US Futures Markets'. 1994-June-20 – in response to concerns over cattle market volatility, the CFTC releases a report entitled, 'The Live Cattle Futures Market, April to June 1994:- Review of Market Fundamentals and Analysis of Large Trader Positions and Activity'. In September 1994, the CFTC releases a follow-up report entitled, 'An Analysis of Intraday Trading of Beef Packers in Live Cattle Futures'. 1994-June-28 – The CFTC approves final rules permitting registrants to provide to customers a 'generic' risk disclosure statement that will satisfy risk disclosure requirements applicable to both domestic and foreign commodity futures and options transactions. 1994-November-29 – The CFTC releases separate studies on audit trails, computerized trading, and penalties as required by the Futures Trading Practices Act of 1992. December, 1994 – The CFTC, in coordination with the Securities and Exchange Commission, files and simultaneously settles, for a fine of USD10 million, an administrative complaint against BT Securities, a subsidiary of Bankers Trust. The Commission's complaint alleges that BT Securities committed fraud in its over-the-counter (OTC) derivatives transactions with Gibson Greetings. 1994-December-21 – The CFTC approves Phase I of new risk assessment rules which require futures commission merchants to maintain and file organization charts showing major affiliated persons, policies and procedures governing risk management, and consolidated financial statements. 1995-April-21 – President Clinton signs a bill reauthorizing the CFTC through the year 2000, but otherwise making no amendments to the Commodity Exchange Act. 1995-May-01 – A new Commitments of Traders report is introduced that reflects, for each market, the combined futures and futures-equivalent option positions of traders identified through the CFTC's and the exchanges' large trader reporting systems. 1995-May-17 – Representatives of regulatory bodies from 16 countries, responsible for supervising the world's leading futures exchanges, issue a Declaration at a meeting in Windsor, England hosted by the UK Securities Investment Board (SIB) and the CFTC. The Windsor Declaration outlines the steps the representatives propose to take to strengthen the supervision of the international futures markets. 1995-June-29 – The CFTC adopts comprehensive revisions to rules governing disclosure by commodity pool operators and commodity trading advisors. The changes are designed to increase the clarity and comprehension of disclosure to investors. 1995-October-10 – The CFTC launches its Internet website, http://www.cftc.gov. 1996-February-29 – The CFTC's Division of Trading and Markets issues a no-action letter to permit the Deutsche Terminboerse (DTB) (predecessor to Eurex®) to install and utilize DTB computer terminals in the United States in connection with the purchase and sale of certain futures and options contracts, the staff's first consideration of a request to place computer terminals of an off-shore exchange in the United States. 1996-March-12 – The CFTC eliminates the requirement for case-by-case approval of the offer and sale of foreign option contracts in the United States, subject to existing restrictions for options on foreign stock index futures and foreign sovereign debt futures. 1996-March-15 – The CFTC announces that it is one of 14 international futures regulators that are the founding signatories of a Declaration on Cooperation and Supervision of International Futures Exchanges and Clearing Organizations. 1996-July-10 – A CFTC order imposes a USD600 000 civil monetary penalty against Fenchurch Capital Management Inc of Chicago, on charges of market manipulation and cornering of the cheapest-to-deliver note deliverable against the Chicago Board of Trade ten-year Treasury note futures contract. Fiscal Year 1996 – The CFTC approves a record 92 new futures and option contracts. 1996-December-19 – The CFTC notifies the Chicago Board of Trade that the delivery terms of its corn and soybean futures contracts do not satisfy the statutory objectives of Section 5a(a)(10) of the Commodity Exchange Act of 'permit(ting) the delivery of any commodity ... at such point or points and at such quality and locational price differentials as will tend to prevent or diminish price manipulation, market congestion, or the abnormal movement of such commodity in interstate commerce' and gives the CBOT® 75 days to respond. 1997-February-25 – in Dunn v. CFTC, the US Supreme Court rules that foreign currency options are 'transactions in foreign currency' for purposes of the Treasury Amendment exclusion to the Commodity Exchange Act, and, thus, that the CFTC has no jurisdiction over such transactions. The Commodity Futures Modernization Act of 2000 will endeavor to clarify CFTC jurisdiction over retail transactions in foreign currency futures and options. 1997-February-28 – The CFTC approves final rules for fast-track approval of new contracts and contract amendments. These rules provide for approval of

many new contracts within ten days and further provide that rule amendments and certain new contracts are to be approved within 45 days. At this time, under the Commodity Exchange Act, the Commission legally has 365 days to act on applications for new contracts and 180 days to act on proposed rule amendments. 1997-November-07 – The CFTC orders the Chicago Board of Trade to change the delivery specifications for its corn and soybean futures contracts pursuant to Section 5a(a)(10) of the Commodity Exchange Act. The Commission notes that the CBOT® can propose alternate specifications that meet the requirements of the Act. 1997-December-04 – The Securities and Exchange Commission vetoes the Chicago Board of Trade's proposed futures and futures options on the Dow Jones Transportation Average and the Dow Jones Utilities Average, stating that these contracts are too narrow-based to meet the requirements of the 1982 Shad-Johnson Accord. This is the only time the SEC exercised its veto power under the Accord. A court decision subsequently overturns the SEC veto and the CFTC approves the contracts on 1999-October-27. 1998-February-13 – The CFTC adopts amendments to its risk disclosure rules to eliminate requirements that futures commission merchants and introducing brokers provide institutional investors and certain other sophisticated market participants with standardized risk disclosure statements, while continuing to require such risk disclosure statements for retail customers. 1998-May-07 – The CFTC issues a 'concept release' seeking public comments to assist it in reexamining its approach to the over-the-counter (OTC) derivatives market. After an extended public comment period and much discussion among the members of the Working Group, Congress passes legislation (part of an October 1998 appropriations bill) temporarily preventing the CFTC from taking further action. Congress eventually creates legal certainty for OTC derivatives in the Commodity Futures Modernization Act of 2000. 1998-May-07 – The CFTC approves the Chicago Board of Trade's new corn and soybean futures contracts with delivery specifications that supersede those ordered by the CFTC on 1997-November-07. 1998-May-11 – The CFTC enters into a settlement with Sumitomo Corporation to resolve allegations of manipulating the copper market in 1995 and 1996 that includes a civil monetary penalty of USD150 million. 1998-June-11 – The CFTC permits futures-style margining of commodity options traded on regulated futures exchanges. 1999-March-23 – The CFTC approves for the first time an order exempting certain cleared swap agreements from most provisions of the Commodity Exchange Act and Commission regulations. The order applies to certain swap agreements submitted for clearing through SwapClear, a swaps clearing organization developed by the London Clearing House Limited. 1999-June-25 – The Chicago Board of Trade, Chicago Mercantile Exchange, and New York Mercantile Exchange petition the CFTC pursuant to Section 4(c) of the Commodity Exchange Act for exemptive relief from certain statutory requirements in three areas:- (i) the contract market designation procedures for new contract submissions; (ii) the contract market rule review procedures; and (iii) pertinent provisions of the Act that would otherwise prevent the immediate adoption and implementation of trading rules and procedures for a contract listed by a contract market that are comparable to those of a competing foreign exchange. The CFTC requests public comment on this petition. The concerns raised in this petition are eventually addressed by the Commodity Futures Modernization Act of 2000. 1999-November-04 – The CFTC staff issues a report comparing the global competitiveness of US futures and option markets to their counterparts abroad. The report, 'The Global Competitiveness of US Futures Markets Revisited', updates a 1994 CFTC study, using the same methodology as the earlier study. 1999-November-09 – The Working Group issues a report unanimously calling for legislation creating greater legal certainty for over-the-counter (OTC) derivatives. 1999-November-17 – The CFTC approves final rules that permit futures exchanges to list new contracts for trading pursuant to exchange certification – without prior Commission approval. This addresses one of the requests in the 1999-June-25 petition for exemptive relief of the Chicago Board of Trade, Chicago Mercantile Exchange, and New York Mercantile Exchange. 2000-February-22 – The CFTC transmits to Congress a staff report, 'A New Regulatory Framework', which recommends changes to the CFTC's regulatory structure. The report details changes that will lessen the regulatory burdens on US futures markets by creating a more flexible regulatory framework. At the same time, the framework provides the over-the-counter (OTC) markets with greater legal certainty. Much of this framework will be incorporated into the Commodity Futures Modernization Act of 2000. 2000-March-06 – The CFTC permits use of electronic signatures in lieu of handwritten signatures by customers of futures commission merchants, clients of commodity trading advisors, and commodity pool participants. 2000-March-28 – The Commission participates in the first annual international Internet Surf Day, organized by the International Organization of Securities Commissions (IOSCO), which targets futures and securities fraud and abuse on the Internet. This Surf Day includes the participation of approximately 220 individuals from 21 regulators in 18 countries. The second Surf Day takes place on 2001-April-23. 2000-September-14 – The CFTC and Securities and Exchange Commission announce an agreement providing for joint jurisdiction over security futures products, that is, single stock futures and futures on narrow-based stock indices. Under the agreement, which will be incorporated into the Commodity Futures Modernization Act of 2000, the CFTC retains exclusive jurisdiction over futures contracts on broad-based stock indices. 2000-November-22 – The CFTC approves rules implementing the New Regulatory Framework. These rules are later superseded by passage of the Commodity Futures Modernization Act of 2000 and most new rules were subsequently withdrawn. 2001-February-05 and 2001-February-08 – In light of the Commodity Futures Modernization Act's clarification of the CFTC's jurisdiction over retail foreign currency trading, the CFTC issues an advisory and a revised consumer alert addressing the offering of foreign currency trading opportunities to the retail public. The advisory explains how firms may lawfully offer foreign currency trading opportunities and the consumer alert warns the public of the risks of foreign currency trading and of foreign currency scams. 2001-April-18 – For the first time since the passage of the Commodity Futures Modernization Act, the CFTC uses its newly-clarified authority to file a complaint charging fraud and the offering of illegal futures contracts against a firm soliciting retail investors to trade foreign currency contracts. Over the next several years, the CFTC filed similar complaints against dozens of firms that solicit retail investors to trade foreign currency. 2001-July-09 – The CFTC approves the application of EnergyClear Corporation for registration as a derivatives clearing organization under the Commodity Exchange Act. This is the first new derivatives clearing organization that is not affiliated with a trading facility to be granted registration by the Commission since the passage of the Commodity Futures Modernization Act. Derivatives clearing organizations for the existing futures exchanges were grandfathered in under the Commodity Futures Modernization Act. 2001-August-01 – The CFTC kicks off implementation of the Commodity Futures Modernization Act by adopting new rules for the various types of exchanges (with different levels of regulatory oversight) created by the Act. These types of exchanges include designated contract markets, derivatives transaction execution facilities, exempt boards of trade, and exempt commercial markets. 2001-August-13 and 2001-August-21 – The CFTC and the Securities and Exchange Commission adopt the first sets of rules to enable the trading of single stock futures and futures on narrow-based stock indexes. Additional rules are adopted in subsequent months. 2001-August-21 – The CFTC orders Avista Energy, Inc. to pay USD2.1 million to settle CFTC charges of manipulating electricity futures; several former Avista employees (who each subsequently settle with the CFTC) and a NYMEX® floor broker (who is found liable in September 2004) are also charged with participating in the manipulative scheme. 2001-August-22 – The CFTC adopts new rules for derivatives clearing organizations, further implementing the Commodity Futures Modernization Act. 2001-September-11 – The CFTC's New York office in the World Trade Center is destroyed in a terrorist attack; fortunately all Commission employees escape without serious injury. The trading floor of the New York Board of Trade (NYBOT®) is also destroyed and trading is disrupted on other exchanges. NYBOT® soon resumes trading on a back-up trading floor it has maintained since the 1993 World Trade Center bombing and eventually moves into permanent space in the NYMEX® building. 2002-January-11 – The CFTC issues an Order pursuant to Section 409 of the Federal Deposit Insurance Corporation Improvement Act, added by the Commodity Futures Modernization Act, concerning the multilateral clearing activities of NOS Clearing ASA, a Norwegian clearing house, in connection with transactions entered into on the International

Maritime Exchange. This is the first time the CFTC uses its authority under that section to determine that supervision by a foreign financial regulator, in this case the Norwegian Banking, Insurance and Securities Commission, of a multilateral clearing organization for over-the-counter (OTC) derivative instruments satisfies appropriate standards. Accordingly, NOS Clearing ASA may act as a multilateral clearing organization for OTC derivative instruments in the same manner as a derivatives clearing organization or a registered securities clearing agency. 2002-March-11 – The CFTC releases a report on its own responses and those by industry participants to the terrorist attacks on 2001-September-11. 2002-April-29 – After several months in temporary quarters following the September 11, 2001 attacks, the CFTC New York office moves into its new permanent space at 140 Broadway. 2002-June-21 – The CFTC issues 'Report on the Study of the Commodity Exchange Act and the Commission's Rules and Orders Governing the Conduct of Registrants Under the Act', also known as the Intermediaries Study, pursuant to Section 125 of the Commodity Futures Modernization Act. 2002-July-01 – The CFTC restructures its staff organization to facilitate the implementation of the Commodity Futures Modernization Act. Under the restructuring, the functions previously performed by the Division of Trading and Markets and the Division of Economic Analysis are performed by two new divisions and one new office:- the Division of Market Oversight, the Division of Clearing and Intermediary Oversight, and the Office of the Chief Economist. 2002-July-09 – President George Walker Bush issues an executive order creating the Corporate Fraud Task Force; the chairman of the CFTC is a member. 2002-August-21 and 2002-September-09 – The CFTC and Securities and Exchange Commission adopt the final rules necessary to permit domestic trading in single stock futures, concerning margin and the treatment of customer funds, respectively. 2002-November-08 – Trading in single stock futures is launched on two new exchanges – OneChicago and NQLX. 2002-December-19 – Dynegy Marketing and Trade and West Coast Power LLC pay USD5 million to settle CFTC charges of attempted manipulation and false reporting of prices. During 2003 and early 2004, many energy companies settle similar claims under the Commodity Exchange Act that they intentionally reported false natural gas price and volume information to energy reporting firms in an attempt to affect prices of natural gas contracts. Some of the subsequent settlements are for USD20 million or more. 2003-February-05 – The CFTC and the Federal Energy Regulatory Commission hold a joint conference on 'Credit Issues in the Energy Market:- Clearing & Other Solutions'. 2003-March-12 – The CFTC charges the bankrupt Enron Corporation and a former Enron vice president with manipulating prices in the natural gas market. Enron also is charged with operating an illegal, undesignated futures exchange and offering illegal lumber futures contracts through Enron Online, its Internet trading platform. Enron settles in May 2004 and the trader settles in July 2004. 2003-July-15 – The CFTC approves exchange rules implementing a common clearing link between the Chicago Board of Trade and Chicago Mercantile Exchange. 2003-August-26 – The CFTC and the National Futures Association announce new rules to combat fraud in the retail off-exchange foreign currency market. Fiscal Year 2003 – The CFTC approves or (in most cases) accepts the exchange self-certification of a record 348 new futures and option contracts during fiscal year 2003. While about 200 of these new contracts are single stock futures, the number of new non-single stock futures contracts easily exceeds the old record of 92 new contracts set in fiscal year 1996. 2003-November-18 – The CFTC joins other members of the President's Corporate Fraud Task Force in undercover 'Operation Wooden Nickel' to prosecute individuals and companies allegedly stealing millions of Dollars through sales of illegal foreign currency futures contracts. 2004-February-04 – The CFTC designates the US Futures Exchange, LLC, also known as Eurex US, as a contract market for the automated trading of futures and options on futures contracts. This is the first designated contract market to be owned by a foreign futures exchange. 2004-April-14 – The CFTC releases a Spanish-language consumer protection advisory on commodity scams. 2004-May-13 – Enron Corporation receives the bankruptcy court's permission to enter into a settlement with the CFTC that provides for a USD35 million civil monetary penalty. Collection is considered unlikely in light of the bankruptcy. 2004-June-30 – In CFTC v. Zelener, the US Court of Appeals for the Seventh Circuit finds that certain foreign currency transactions were spot transactions rather than futures contracts, and, thus, outside of CFTC jurisdiction. 2004-August-30 – The CFTC announces that it has completed its seven-month investigation of the sharp upward movement in prices in the natural gas market that occurred in late 2003. The CFTC states that its investigation did not uncover evidence that any entity or individual engaged in activity with an intent to cause an artificial price in natural gas in late 2003. 2004-October-12 – The CFTC announces its participation, through a partnership with 19 other Federal agencies, in the launching of a new financial education website and toll-free hotline number. The mymoney.gov website and the +1-888-mymoney toll-free hotline were established to provide Americans easy access to information that can help them better understand their money:- how to save it, invest it, and manage it wisely to meet important personal goals. 2005-February-10-11 – The CFTC and the Committee of European Securities Regulators (CESR) hold a two-day roundtable on cross-border derivatives issues which is attended by 60 market participants and senior regulators. The purpose of the roundtable is to hear the issues affecting those actively involved in transatlantic business in exchange-traded derivatives and related transactions, and to establish key areas where improvements can be made. On 2005-March-31, the CFTC and CESR release a Communiqué requesting comment on a proposed work program to facilitate the conduct and supervision of a trans-Atlantic derivatives business. The final communiqué is issued on 2005-June-28. 2005-April-06 – The CFTC holds a roundtable on commodity pool operators and the commodity pool industry that focuses on the growth, innovation, and regulation of the commodity pool industry and the challenges and issues faced by the industry. 2005-April-29 – The CFTC's Office of the Chief Economist releases a staff research report, 'Price Dynamics, Price Discovery and Large Futures Trader Interactions in the Energy Complex', which finds that managed money traders (MMTs or hedge funds) do not change their positions as frequently as other participants, particularly including hedgers. The staff found that there is a significant negative correlation between MMT positions and other participants' positions (including the largest hedgers). Results suggest that MMT traders provide liquidity to large hedgers and not the other way around. 2005-October-12 – The CFTC and the Federal Energy Regulatory Commission enter into a memorandum of understanding regarding the sharing of information and the confidential treatment of proprietary energy trading data, pursuant to the Energy Policy Act of 2005. 2005-October-18 – Refco, Inc, the parent company of Refco LLC, a large futures commission merchant, files for Chapter 11 bankruptcy, eight days after the company announced that its chairman, Philip R. Bennett, has hidden USD430 million in bad debts from the company's auditors and investors, and only two months after the company's initial public offering. The futures commission merchant is not included in the bankruptcy filing and is subsequently sold to Man Financial. During this time, CFTC auditors and attorneys are actively engaged in re-confirming that Refco LLC's customer funds on deposit remain uncompromised and that the capital requirements of Refco LLC continue to be met. 2006-January-04 – The CFTC announces the filing and simultaneous settlement of charges against Shell Trading US Company (STUSCO) and Shell International Trading and Shipping Co. (STASCO), two companies whose ultimate parent is Royal Dutch Shell, and Nigel Catterall, who was the chief trader on behalf of STUSCO, for engaging in prearranged trades on the New York Mercantile Exchange (NYMEX®) on five occasions between November 2003 and March 2004. The settlement also directs STASCO to pay a USD200 000 civil penalty and Catterall to pay a USD100 000 civil penalty. 2006-February-15 – The CFTC holds a public hearing to discuss issues related to self-regulation and self-regulatory organizations in the US futures industry. 2006-June-21 – The CFTC publishes in the Federal Register a request for comment as part of a comprehensive review of its commitments of traders (COT) reports. The COT reports are weekly reports, published by the CFTC, showing aggregate trader positions in certain futures and option markets. The CFTC receives a record 4 659 comment letters in response to this notice. 2006-June-27 – The CFTC holds a public hearing on the issue of what constitutes a 'board of trade, exchange, or market located outside the United States', as that phrase is used in Section 4(a) of the Commodity Exchange Act. 2006-June-28 – The CFTC announces the filing of a civil enforcement action in the US District Court for the Northern

District of Illinois against BP Products North America, Inc. (BP), a subsidiary of BP PLC (formerly British Petroleum), alleging that BP manipulated the price of February 2004 TET physical propane by, among other things, cornering the market for February 2004 TET physical propane. The CFTC also charges BP with attempting to manipulate the price of April 2003 TET physical propane by attempting to corner the April 2003 TET physical propane market. 2006-September-18 – Amaranth Advisors, LLC, a large hedge fund, reports that it has lost USD6 billion of its capital, primarily due to losses on seasonal inter-month spread positions in futures and other derivatives on natural gas. Amaranth sells its natural gas and some other positions to JPMorgan Chase and Co. and Citadel Investment Group, LLC the next day. Amaranth subsequently announces that it will close. 2006-October-31 – Following a public hearing on 2006-June-27, the CFTC issues a Statement of Policy that, among other things, affirms the use of the staff no-action process for foreign boards of trade that seek to provide direct access for US persons to their electronic trading systems. 2006-November-17 – The CFTC and the UK Financial Services Authority (FSA) sign a memorandum of understanding concerning consultation, cooperation, and the exchange of information related to market oversight. The MOU establishes a framework for the CFTC and FSA to share information that the respective authorities need to detect potential abusive or manipulative trading practices that involve trading in related contracts on UK and US derivatives exchanges in order to provide the regulators with a more complete view of these markets for oversight purposes. 2007-January-05 – The CFTC begins publishing a new weekly commitments of traders report, entitled 'COT – Supplemental'. The new report shows aggregate futures and options positions of index traders, as well as noncommercial and commercial traders in 12 selected agricultural commodities. 2007-February-01 – The CFTC moves to strengthen futures exchange governance by issuing a guidance calling for increased public representation at key levels of decision making, including boards of directors. This guidance is issued in light of a recent trend in which US futures exchanges have become publicly held for-profit corporations rather than mutually-owned non-profit organizations. 2007-May-07 – The CFTC and the North American Securities Administrators Association (NASAA) issue a joint investor alert to warn of the dangers facing retail investors who are lured into foreign currency (forex) trading frauds. In the alert, the regulators caution investors that off-exchange forex trading by retail investors is at best extremely risky, and at worst, plagued by outright fraud. 2007-June-05 – The CFTC approves an exchange traded credit derivative contract based on the Chicago Mercantile Exchange's North American Investment Grade High Volatility Credit Index. This product is based on an index or bundle of reference entities. On the same day, the CFTC also issues an exemptive order to allow the Options Clearing Corporation to clear similar products to be traded on the Chicago Board Options Exchange. 2007-July-12 – The Chicago Mercantile Exchange and the Chicago Board of Trade announce the completion of their merger forming the world's largest futures exchange, the CME Group. 2007-July-25 – The CFTC charges the hedge fund Amaranth and its former head energy trader, Brian Hunter, with attempting to manipulate the price of natural gas futures on 2006-February-24 and 2006-April-26. The CFTC also alleges that Amaranth tried to cover up the conduct by making false statements to the New York Mercantile Exchange. The following day, the Federal Energy Regulatory Commission issues an order to show cause in the same matter. 2007-July-26 – The CFTC charges Energy Transfer Partners, LP and three of its subsidiaries with attempting to manipulate the price of physical natural gas at the Houston Ship Channel (HSC) delivery hub during September and November 2005 and with attempting to manipulate the October 2005 and December 2005 HSC monthly index prices of natural gas published by Platts in its Inside FERC's Gas Market Report (Inside FERC). The CFTC alleges that the conduct was designed to benefit basis swap positions established on the IntercontinentalExchange (ICE). The prices of the basis swaps were based in part on the Inside FERC index prices. On the same day, the Federal Energy Regulatory Commission issues an order to show cause in the same matter. On 2008-March-17, ETP and its subsidiaries agree to pay USD10 million in civil monetary penalties to settle these charges. 2007-September-18 – The CFTC holds a hearing to examine trading on regulated exchanges and Exempt Contract Markets (ECMs) as part of an ongoing review of energy futures trading. 2007-October-24 – The CFTC delivers to Congress a report that includes recommendations to increase the oversight of some trading activity on ECMs. 2007-October-25 – BP Products North America, Inc (BP) agrees to pay a total of USD303 million in sanctions to settle charges of manipulation and attempted manipulation in the propane market. 2008-February-13 – The CFTC announces the establishment of a new Energy Markets Advisory Committee to provide a public forum to examine emerging issues related to the energy markets and the CFTC's role in these markets under the Commodity Exchange Act. 2008-March-11 – The CFTC and the SEC enter into a mutual cooperation agreement to enhance coordination and facilitate review of new derivative products. 2008-April-22 – The CFTC holds a roundtable discussion on the agricultural markets. The roundtable is designed to gather information about whether the futures markets are properly performing their risk management and price discovery roles. 2008-May-22 – Congress enacts the Food, Conservation, and Energy Act of 2008. The Act reauthorizes the CFTC until 2013 and gives the agency additional regulatory and enforcement tools necessary to continue to effectively oversee the futures industry, particularly transactions in energy products and foreign currency. 2008-May-29 – The CFTC announces a number of initiatives to increase transparency of the energy futures markets including:- (i) expanded international surveillance information for crude oil trading; (ii) several steps to gather additional information from and improve transparency in the energy futures markets; and (iii) the continuation of a nationwide investigation of the crude oil markets. 2008-June-03 – The CFTC announces several policy initiatives aimed at addressing concerns in the agricultural futures markets raised at its April 22nd roundtable in Washington, DC. These include, among other things:- (i) measures to obtain more information from index traders and swap dealers; (ii) the development of a new monthly publication on trader data for agricultural and other markets, beginning in July 2008; and (iii) the disclosure of an investigation into Cotton futures trading. 2008-June-10 – In light of the recent rise in crude oil and other commodity prices and the influx of new investors into commodity futures markets, the CFTC announces the formation of an interagency task force to evaluate developments in commodity markets. The task force includes staff representatives from the CFTC, the Federal Reserve, the Department of the Treasury, the Securities and Exchange Commission, the Department of Energy, and the Department of Agriculture. 2008-June-11–12 – The CFTC hosts an international manipulation enforcement conference that is focused on global trading in the energy markets. Participants include senior enforcement officials from 10 countries. 2008-June-17 – The CFTC announces that Commission staff has amended the 'no-action relief letter' under which ICE Futures Europe® is permitted direct access to US customers. The amended letter conditions direct access on ICE Futures Europe's adoption of equivalent US position limits and accountability levels on its West Texas Intermediate (WTI) crude oil contract, which is linked to the NYMEX® crude oil contract. 2008-July-22 – The Interagency Task Force on Commodity Markets releases a staff report offering a preliminary assessment of fundamental and market factors affecting the crude oil market. The ITF's Interim Report on Crude Oil studied fundamental supply and demand factors and the roles of various market participants, and it found that fundamental supply and demand factors provide the best explanation for the recent crude oil price increases. 2008-July-24 – The CFTC charges Optiver Holding BV, two of its subsidiaries, and three employees, charging them with manipulation and attempted manipulation of New York Mercantile Exchange (NYMEX®) Light Sweet Crude Oil, New York Harbor Heating Oil, and New York Harbor Gasoline futures contracts during March 2007. 2008-August-11 – The CFTC forms the Retail Foreign Currency Fraud Enforcement Task Force which is charged with investigating and litigating fraud in the off-exchange retail foreign currency market. 2008-September-11 – The CFTC releases a staff report with Commission recommendations on activities of swap dealers and commodity index traders. The report's findings and recommendations are based on information obtained from the June 2008 special call that Commission staff issued to quantify key components of the over-the-counter (OTC) swap and commodity index markets. 2008-November-13 – The CFTC, the Board of Governors of the Federal Reserve, and the Securities and Exchange Commission (SEC) enter into a Memorandum of Understanding (MOU) to establish a framework for

consultation and information sharing on regulatory issues related to central counterparties for credit default swaps. 2008-December-23 – The CFTC announces that the CME Group has certified a proposal to clear certain OTC credit default swaps through the CME® clearing organization. 2009-February-04 – The CFTC announces the launch, on a six-month trial basis, of a new monthly report:- 'This Month in Futures Markets'. 2009-March-09 – The CFTC announces the formation of the Subcommittee on Convergence in Agricultural Commodity Markets, a new Subcommittee of the CFTC's Agricultural Advisory Committee. The Subcommittee on Convergence will identify the causes of poor cash-futures convergence in select agricultural commodity markets and advise the CFTC on actions to remedy the situation. 2009-March-23 – The CFTC approves final rules and rule amendments that increase the Commission's oversight of exempt commercial markets (ECMs). The rules implement provisions of the CFTC Reauthorization Act of 2008, which created a new regulatory category – ECMs with significant price discovery contracts (SPDCs) – and subjected these electronic trading facilities to additional regulatory and reporting requirements. 2009-July-27 – The CFTC issues an order finding that the Henry Financial LD1 Fixed Price contract – a natural gas contract traded on the IntercontinentalExchange, Inc. (ICE®), an ECM – performs a significant price discovery function. This Order represents the Commission's first use of its new regulatory authority over ECMs with respect to their SPDCs. 2009-July-28, 2009-July-29, and 2009-August-05 – The CFTC holds three public hearings to discuss speculative position limits and exemptions in energy markets. 2009-August-19 – The CFTC withdraws two no-action letters that provided relief for two commodity pool operators/commodity trading advisors from federal agricultural speculative positions limits. 2009-September-04 – The CFTC begins disaggregating the data in its weekly Commitments of Traders (COT) reports and begins releasing, on a quarterly basis, data collected from an ongoing special call on swap dealers and index traders in the futures markets. Rather than breaking traders into two broad categories:- commercial and noncommercial, the new COT reports break the data into four categories of traders:- Producer/Merchant/Processor/User; Swap Dealers; Managed Money; and Other Reportables. 2009-October-16 – The CFTC and SEC issue a joint report identifying areas where the agencies' regulatory schemes differ and recommending actions to address those differences. The report includes 20 recommendations to enhance enforcement powers, strengthen market and intermediary oversight and improve operational coordination. 2010-January-14 – The CFTC votes at an open meeting to publish in the Federal Register a proposal to set position limits for futures and option contracts in the major energy markets. 2010-March-25 – The CFTC holds an open meeting to examine the trading of futures and options in the precious and base metals markets. 2010-April-03 – The CFTC Launches a new web site along with supporting web 2.0 components. 2010-April-29 – The CFTC issues an order filing and simultaneously settling (for a civil monetary penalty of USD25 million among other things) charges that Moore Capital Management, LP, and various affiliated companies attempted to manipulate the settlement prices of platinum and palladium futures contracts on the New York Mercantile Exchange. 2010-May-06 – Major stock indexes and stock index futures experience a brief but severe drop in prices, falling more than 5% in a matter of minutes, only to recover a short time later. Some individual securities experience more volatility than the stock indexes. 2010-May-18 – The staffs of the CFTC and the SEC release preliminary findings related to the unusual market events on 2010-May-06. 2010-May-24 – The newly formed Joint CFTC-SEC Advisory Committee on Emerging Regulatory Issues holds its first meeting. 2010-June-14 – The CFTC approves the first futures contracts based on motion picture box office receipts after finding that the terms and conditions of Media Derivatives, Inc's proposed Weekend Motion Picture Revenue futures and options contracts do not violate the Commodity Exchange Act or CFTC regulations. However, the Dodd-Frank Act contains provisions that ban futures contracts based on motion picture box office receipts. 2010-July-21 – President Obama signs the Dodd-Frank Wall Street Reform and Consumer Protection Act ('Dodd-Frank Act'). Title VII of the Dodd-Frank Act amends the Commodity Exchange Act to establish a comprehensive new regulatory framework for swaps and security-based swaps. The legislation is enacted to reduce risk, increase transparency, and promote market integrity within the financial system by, among other things:- (i) providing for the registration and comprehensive regulation of swap dealers and major swap participants; (ii) imposing clearing and trade execution requirements on standardized derivative products; (iii) creating robust recordkeeping and real-time reporting regimes; and (iv) enhancing the Commission's rulemaking and enforcement authorities with respect to, among others, all registered entities and intermediaries subject to the Commission's oversight. On the same day, the CFTC releases a list of 30 areas of rulemaking to implement the Dodd-Frank Act. 2010-August-16 – The CFTC sanctions ConAgra Trade Group, Inc. (CTG) USD12 Million for causing a non-bona fide price to be reported in the NYMEX® Crude Oil futures contract. On 2008-January-02, CTG was the first to purchase NYMEX® crude oil futures contracts at the then-historic price of USD100. As a result of CTG's effort to be the first to trade at the USD100 level, CTG caused a non-bona fide price to be reported, according to the CFTC order. Commodity Futures Trading Commission (CFTC), the regulatory body in the US covering futures markets. Commodity Futures Trading Commission (CFTC) is the United States government's regulatory agency for all US future markets. The commission is comprised of five commissioners, one of whom is designated as chairman, all appointed by the US President, subject to Senate confirmation. The Commodity Futures Trading Commission (CFTC) is independent of the Cabinet departments. Website:- http://www.cftc.gov. / 1974-Октябрь-23–24 – 38-й Президент США Дьжерэлд Рудолф Фод (President Gerald Rudolph Ford Jr.; 1913–2006) подписал . Амэкс (Amex). , от Латинского слова Affirmo, означающее Утверждаю, . заслуживающий доверия или действительный (bona fide). сохранение (conservation). домогательство (abuse). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Комиссия по Торговле Сырьевыми Фьючерсами (КТСФ) или Комиссия по Торговле Фьючерсами на Сырьё является независимым федеральным контролирующим агентством, учреждённым в 1974 Конгрессом США в соответствии с Актом о Комиссии по Торговле Сырьевыми Фьючерсами с целью надзора за торговлей фьючерсами и деятельностью организованных бирж фьючерсов в Соединённых Штатах Америки в соответствии с Актом о Сырьевой Бирже. КТСФ контролирует в Соединённых Штатах рынки фьючерсов и опционов на фьючерсы. Комиссия по Торговле Сырьевыми Фьючерсами (КТСФ (CFTC)) была создана Конгрессом США в 1974 как независимое правительственное агентство с задачей регулирования рынков фьючерсов и опционов в Соединённых Штатах. С момента учреждения Комиссии, её устав неоднократно обновлялся и расширялся (самой недавней добавкой является Акт о Модернизации Сырьевых Фьючерсов от 2000 (CFMA)). КТСФ защищает экономическую целостность фьючерсных рынков США и усиливает их конкурентоспособность и эффективность, путём укрепления их деловой честности, защиты участников рынка от манипуляций, злоупотреблений и мошенничества, а также путём обеспечения должного выполнения процесса клиринга. Комиссия возглавляется пятью уполномоченными, назначенными Президентом Соединённых Штатов и утверждёнными Сенатом. Некоторые из Требований КТСФ:- (i) все фирмы и частные лица, занимающиеся бизнесом на любой фьючерсной бирже США, обязаны быть зарегистрированы в КТСФ. Регистрация проводится через Национальную Фьючерсную Ассоциацию (НФА (NFA)); (ii) только компании, являющиеся Фьючерсными Комиссионными Коммерсантами (ФКК (FCM)), имеют право заключать договор брокерского обслуживания с клиентами и аккумулировать их финансовые средства; ФКК должны гарантировать все сделки своих клиентов (в биржевой торговле контрагентом каждого покупателя или продавца фьючерсного контракта является клиринговая палата, состоящая из брокерских компаний, являющихся Фьючерсными Комиссионными Коммерсантами (ФКК). Как представитель клиринговой палаты в текущей торговле, ФКК оплачивает все сделки своих клиентов); (iii) финансовые средства клиентов должны быть размещены в сегрегированных счетах, отдельных и независимых от средств ФКК; (iv) компании ФКК обязаны иметь и поддерживать минимальный чистый капитал своих собственных средств в размере, равном 4% от всех клиентских счетов, размещённых на сегрегированных счетах. При расчёте этого капитала в активы не включается дебиторская задолженность, что существенно повышает ценность показателя чистого капитала. Если чистый капитал приближается к 6% сегрегированных средств, то ФКК становится предметом разбирательства и каждодневного надзора. (v) В согласии с клиринговыми требованиями, клиентские счета должны пересчитываться в конце каждого торгового дня для коррекции текущего баланса. Также существуют другие правила по ежедневной отчётности, предназначенные для нормального рыночного обращения и предупреждения манипуляций, злоупотребления и мошенничества. (vi) Инвесторы должны быть немедленно информированы, в письменной форме (электронной или обычной почтой), о любой новой активности на их счётах. Если никакой активности не происходит, клиенты должны получать отчёты ежемесячно (большинство Фьючерсных Комиссионных Коммерсантов (ФКК) предоставляют своим клиентам возможность доступа к их счетам онлайн, в любое время). (vii) Зарегистрированные лица обязаны оглашать существование рыночного риска и предоставлять перспективным клиентам необходимую информацию о результатах прошлой деятельности. (viii) Все

зарегистрированные лица должны проходить периодические лицензионные экзамены и обучение нормам этики. (ix) Все зарегистрированные компании должны применять этичные методы предложения услуг и осуществлять внутренний контроль над сотрудниками; и многие другие. Регистрация в КТСФ требует от компании подчинения правилам КТСФ в отношении размещения Ваших инвестиционных средств, ведения Вашего счёта, отчётности и так далее. Это исключит возможность злоупотребления Вашими средствами. Для того чтобы проверить регистрационный статус рассматриваемой Вами компании, воспользуйтесь системой BASIC (сокращение для Background Affiliation Status Information Center) на сайте НФА. Американские брокеры, зарегистрированные в КТСФ, обязаны следовать строгим правилам поведения при обслуживании клиентов и работе с потенциальными клиентами. Эти правила созданы с целью того, чтобы не позволить брокеру злоупотреблять отсутствием у Вас достаточной информации и Вашим доверием. Например, брокерам запрещено обещать клиентам какие-либо точные нормы прибыли или не ознакомлять клиентов с риском, заключающимся в торговле фьючерсами. Также запрещены определённые методы предложения услуг, при которых клиента заманивают открыть счёт, не взирая на отсутствие у клиента знания основных принципов фьючерсной торговли. Существует множество других правил, которые принуждают брокеров действовать согласно высоким этическим стандартам. С другой стороны, брокеры, не являющиеся резидентами США и предлагающие свои услуги лицам также не являющимся резидентами США, не обязаны регистрироваться в КТСФ и следовать этим правилам. Мы рекомендуем Вам связаться с брокером, предпочтительно являющимся резидентом США, зарегистрированным в КТСФ и обладающим опытом работы во фьючерсной индустрии. Как было упомянуто ранее, информация обо всех зарегистрированных брокерах доступна на вэбсайте НФА для того, чтобы Вы могли проверить регистрационный статус интересующего Вас брокера.

COMMODITY ITEM RATE = СТАВКА ПО КОНКРЕТНОМУ РОДУ СЫРЬЯ – Commodity Item Rate:- specific description number required in air transport to indicate that a specific freight rate applies.

COMMODITY–LINKED BOND = УВЯЗЫВАМАЯ К СЫРЬЮ ОБЛИГАЦИЯ – Commodity-Linked Bond is a bond whose redemption value is linked to the price of a commodity. Typically, issuers whose income stream is closely tied to commodity earnings issue these bonds. Commodity-Linked Bond is a bond in which payment to the investor is dependent to a certain extent on the price level of a commodity, such as crude oil, gold, or silver, at maturity.

COMMODITY OPTION = СЫРЬЕВОЙ ОПЦИОН – Commodity Option is an over-the-counter (OTC) option, provision to deliver or receive a specific commodity or commodity index at an agreed price at a set date in the future. An option on a commodity or a futures contract. Commodity Option:- a transaction in which one party grants to the other party (in consideration for a premium payment) the right, but not the obligation, to purchase (in the case of a call) or sell (in the case of a put) a specified quantity of a commodity at a specified strike price. The option can be settled either by physically delivering the quantity of the commodity in exchange for the strike price or by cash settling the option, in which case the seller of the option would pay to the buyer the difference between the market price of that quantity of the commodity on the exercise date and the strike price.

COMMODITY–ORIENTED RESEARCH = ИССЛЕДОВАНИЕ, ОРИЕНТИРОВАННОЕ НА СЫРЬЁ – Commodity-Oriented Research is a research focused on a given agricultural product.

COMMODITY PEST LIST = СПИСОК ВРЕДИТЕЛЕЙ СЫРЬЯ – Commodity Pest List is a list of pests occurring in an area which may be associated with a specific commodity.

COMMODITY POOL = СЫРЬЕВОЙ ПУЛ – Commodity Pool is a venture, usually a limited partnership, in which funds contributed by a number of investors are combined for the purpose of trading futures. Also known as Commodity Fund and Futures Fund. An investment trust, syndicate, or similar form of enterprise operated for the purpose of trading commodity futures or option contracts. Commodity Pool is an enterprise in which funds contributed by a number of persons are combined for the purpose of trading futures or options on futures for profit. The concept is similar to a mutual fund in the securities industry. Also referred to as a Pool. / Инициатива ряда лиц, объединивших определённые средства для торговли фьючерсами или опционами на фьючерсы с целью получения прибыли. Концепция, аналогичная взаимному фонду в индустрии ценных бумаг. Также используется в отношении Пула (Pool).

COMMODITY POOL OPERATOR = ОПЕРАТОР СЫРЬЕВОГО ПУЛА – Commodity Pool Operator acts as a general partner of commodity pools. Commodity Pool Operators hire independent Commodity Trading Advisors to handle daily trading decisions. Responsible for the pool's administration, structure, and selecting and monitoring the traders who conduct transactions using the fund's money. A person or entity, required to be registered with the Commodity Futures Trading Commission under the Commodity Exchange Act, who operates or solicits funds, securities or property for a commodity pool. Commodity Pool Operators (CPOs):- invest 'pooled' funds of multiple participants in commodity futures or options. Investors in CPOs share in profits and losses on a pro-rata basis. The CPO either makes its own trading decisions on behalf of the pool or it engages a CTA to do so. CPOs are often CTAs offering their strategy in a pooled vehicle or invest in a separate managed futures program. Commodity Pool Operator is a person engaged in a business similar to an investment trust or a syndicate and who solicits or accepts funds, securities, or property for the purpose of trading commodity futures contracts or commodity options. The CPO either itself makes trading decisions on behalf of the pool or engages a Commodity Trading Advisor to do so. / Физическое лицо или фирма, которые должны быть зарегистрированы в Комиссии по Торговле Сырьевыми Фьючерсами в соответствии с Актом о Сырьевой Бирже, и которые действуют или обращаются средствами, ценными бумагами или собственностью для сырьевого пула.

COMMODITY PRICE INDEX = ИНДЕКС ПО СЫРЬЕВЫМ ЦЕНАМ (или ИНДЕКС ПО ЦЕНАМ НА СЫРЬЁ) – Commodity Price Index is an index or average, which may be weighted, of selected commodity prices, intended to be representative of the markets in general or a specific subset of commodities, e.g., grains or livestock. / , например, зерновых или живого скота.

COMMODITY RATE = СТАВКА ПО СЫРЬЮ – Commodity Rate is a rate applicable on a specific commodity between certain specified points. A rate published to apply to a specific article or articles. Specific Commodity Rate is a rate applied to a specific class of commodity or single commodity. An example is flowers. / Ставка, публикуемая для применения к специфическому изделию или изделиям.

COMMODITY RESEARCH BUREAU INDEX = ИНДЕКС ОТ ИССЛЕДОВАТЕЛЬСКОГО БЮРО ПО СЫРЬЮ – Commodity Research Bureau (CRB) Index is an unweighted geometric average of some important commodities. It averages prices across 17 commodities and across time. The index tracks agriculturals, energy, grains, industrials, livestock, and precious metals. CRB (Commodity Research Bureau) is the world's oldest, leading commodities and futures research, data, and analysis firm. Commodity Research Bureau Index (CRB Index) is an index that measures the overall direction of commodity sectors. The CRB was designed to isolate and reveal the directional movement of prices in overall commodity trades. Generally commodity prices move opposite to bond prices. This is because inflation causes commodities to increase in price while devaluating the price of bonds. This is one of the reasons that the CRB is so closely watched by both bond and commodity traders. Bridge/CRB® is a service mark of Bridge Information Systems. / Индекс от Си.Ар.Би. (CRB Index). Брыдьж (Bridge).

COMMODITY SWAP = СВОП НА СЫРЬЁ (или СЫРЬЕВОЙ СВОП) – Commodity Swap is a swap in which one of the payment streams for a commodity is fixed and the other is floating. Usually only the payment streams, not the principal, are exchanged, although physical delivery is becoming increasingly common. Commodity swaps have been in existence since the mid-1980s and enable producers and consumers to hedge commodity prices. The consumer is usually a fixed payer and the producer a floating payer (receiving fixed), thereby hedging against falls in the price of the commodity. If the floating-rate price of the commodity is higher than the fixed price, the difference is paid by the floating payer, and vice versa. Swaps are done in oil, natural gas, metals and some agricultural products, although futures are more common in agricultural markets. Swaps allow users to hedge risks which cannot be offset by the use of futures contracts. This could be a geographical or quality basis risk, or it could arise from the maturity of a transaction. Liquidity in commodity swap markets varies greatly – from the very liquid, equivalent to an active futures market (e.g., European jet fuel) to the relatively illiquid, where the swaps provider is assuming an unusual or unique risk. Commodity Swap is a contract with one or both payments linked to the performance of a commodity price or a commodity index. It involves the exchange of the return on one commodity or commodity index for another, and the exchange of a commodity or commodity index for a floating or fixed interest rate. A transaction in which one party pays periodic amounts of a given currency based on a fixed price and the other party pays periodic amounts of the same currency based on the price of a commodity, such as gold or natural gas, or a futures contract on a commodity, e.g., WTI Oil on the New York Mercantile Exchange; all calculations are based on a notional quantity of the commodity. / , например, .

COMMODITY TRADING ADVISOR = СОВЕТНИК ПО ТОРГОВЛЕ СЫРЬЁМ – Commodity Trading Advisor (CTA) is a person who, for pay, regularly engages in the business of advising others as to the value of commodity futures or options or the advisability of trading in commodity futures or options, or issues analyses or reports concerning commodity futures or options. The CTA receives a flat management fee (1–2% per year) based on assets under management. In addition, the CTA can earn an incentive fee on a new high water mark (20–25% of profits). Commissions generally cover the fixed costs of trading and reward advisors and intermediaries, including introducing brokers (IBs), trading managers and investment consultants. Directs trading in the managed accounts of a commodity pool. Professional money managers who manage client assets on a discretionary basis, using global futures markets as an investment medium. Commodity Trading Advisor (CTA) is a person or entity who, for pay, trades accounts for individual clients or for commodity pools and/or who provides analysis, reports or advice concerning futures and options trading. See also Managed Futures. A person or entity who, for compensation or profit, directly or indirectly advises others as to the advisability of buying or selling futures or commodity options. Providing advice includes exercising trading authority over a customer's account. Advising indirectly includes exercising trading authority over a customer's account as well as providing recommendations through written publications or other media. Being a Commodity Trading Advisor (CTA) requires more than just a successful trading program. Too often, young CTAs fail by focusing entirely on trading returns while neglecting business and operational requirements that are necessary to become a viable, long-term enterprise. Others struggle because they have not adequately addressed issues that are of great importance to potential investors. Registration Requirements:- to avoid confusion, it is a good idea to visit the US National Futures Association (NFA) Web site at http://www.nfa.futures.org and carefully review the Registration section for guidelines on CTA and Commodity Pool Operator (CPO) registration prior to accepting client assets. You are not required to register as a CTA until you hold yourself out to the public as a CTA and/or have 15 or more clients. However, you may wish to do so before passing this threshold since it may be easier to raise assets as a registered entity. Should you wish to combine or 'pool' investor assets, you would be required to register immediately as a CPO. A number of exemptions are currently available to CTAs and CPOs from the NFA that offer relief from reporting requirements at varying levels based upon certain requirements being met. Chief among these requirements is the financial qualification of the clients. In some cases, CTAs and CPOs may decide to limit their clients to a certain type, such as Qualified Eligible Participant (QEP) to maximize relief and thereby lessen workload and administrative cost burden. To avoid potentially harmful errors or misunderstandings, seek guidance from the NFA, counsel or a compliance consultant to gain a complete understanding of the requirements for obtaining applicable exemptions, as well as the relief they afford. Disclosure Documents:- the Compliance section of the NFA Web site gives guidance on issues pertaining to CTAs and CPOs. Disclosure Documents:- A Guide for CPOs and CTAs is available for download and discusses the requirements CPOs and CTAs must meet, presents a break-even analysis and sample performance table and describes the review and approval process used by NFA's Disclosure Document Review Team. CTAs may not solicit without a disclosure document. Although you may draft your own disclosure document, it is better to enlist the help of counsel in order to ensure that all required disclosures are made. Remember that a well-written disclosure document not only informs clients and potential clients of material facts and risk factors, it may also limit CTA liability by virtue of having disclosed those factors. Performance Reporting:- performance records must be calculated in accordance with CFTC rules. For information on proper calculation methodology, download the Sample Performance Calculation from the Compliance section of the NFA Web site. You may also seek guidance from qualified accounting/audit firms or administrators. Remember that the CTA is always responsible for the accuracy of its performance record, even if it utilizes an outside party to do the calculations. A person who advises others as to the value of or advisability of buying or selling futures contracts or options or trades on the customer's behalf. A Commodity Trading Advisor (CTA) trades other people's money. A CTA is generally required to be registered with the US Commodity Futures Trading Commission. Commodity Trading Advisors (CTAs) are responsible for the actual trading of managed futures programs. By and large, CTAs can be characterized by the school of price analysis they subscribe to:- Technical or fundamental analysis. CTAs that are mostly technical in nature rely on past market data such as price and volume in formulating their price forecasts and views on the markets. In contrast, there are CTAs that mainly rely on fundamental analysis. This involves evaluating the underlying factors that affect the supply and demand dynamics of futures markets. No one type of analysis is necessarily superior to the other, and there are many CTAs that combine the two. The largest group of CTAs fall into the systematic trend-following space. / Физическое или юридическое лицо, которые оплачивают счета, торгуют по поручению конкретных клиентов или товарных пулов и/или обеспечивают анализом, отчетами или советом в отношении торговли фьючерсами и опционами.

COMMON = ОБЫКНОВЕННАЯ (или ГРУБАЯ) – Common:- one of the US Grades of wool. It is next to the coarsest grade, and derives its name because it presumably comes from sheep of common ancestry. / :- один из сортов шерсти в США. Он является следующим сортом для .

COMMON AGRICULTURAL POLICY = ОБЩАЯ СЕЛЬСКОХОЗЯЙСТВЕННАЯ ПОЛИТИКА – The Common Agriculture Policy (CAP) is a set of regulations by which members states of the European Union seek to merge their individual agricultural programs into a unified effort to promote regional agricultural development, fair and rising standards of living for the farm population, stable agricultural markets, increased agricultural productivity and methods of dealing with food supply security. Two of the principal elements of the CAP are the variable levy (an import duty amounting to the difference between the European Union (EU) target farm prices and the lowest available market prices of imported agricultural commodities) and export restitutions, or subsidies, to promote exports of farm goods that cannot be sold within the EU at the target prices. Common Agricultural Policy (CAP) is the EU's comprehensive system of production targets and marketing mechanisms designed to manage agricultural trade within the EU and with the rest of the world. Common Agricultural Policy (CAP) is the system of support for agriculture in the European Union (EU). Proposed in 1960,

expenditure under CAP represents about 44% of the EU budget, however it is currently under major reform and is being replaced by single farm payments. CAP included import tariffs, minimum prices, and subsidies to farmers. Common Agricultural Policy (CAP) is the European Union's agricultural policy, first defined in Article 39 of the Treaty of Rome signed in 1957. / Общая Сельскохозяйственная Политика (ОСП) – сельскохозяйственная политика Европейского Союза (ЕС), впервые определённая в Статье 39 Римского Трактата, подписанного в 1957.

COMMON CARRIER = ОБЩЕСТВЕННЫЙ ПЕРЕВОЗЧИК – Common Carrier is a carrier who offer their ships as general ships for the transit of goods of any shipper. Common Carrier holds himself out for hire to the general public. Must post rates and cannot discriminate against customers whose cargo he is equipped to carry. An individual partnership or corporation that transports persons or goods for compensation. Common Carrier is a transportation company which provides service to the general public at published rates. One who offers to transport merchandise for hire and must accept shipments from anyone who wishes to use his/her services. Common carriers must abide by different rules and laws than private or contract carriers who transport only the goods of those with whom they have made agreements. / по найму (for hire) .

COMMON COST = ОБЩАЯ СЕБЕСТОИМОСТЬ – Common Costs are types of business expenses that have some impact on companies in general, without the ability to assign those expenses to a specific aspect of a company operation. Generally, a common cost will provide benefits that are related to a number of functions within the company setting, making it impossible to charge that expense to a specific department, project, or even product. Sometimes known as an Indirect Expense or a Joint Cost, a common cost is normally accounted for in the general operations of a business with the accounting process recognizing that the cost provides benefits for the overall business, not just one segment or aspect. One of the easiest ways to understand the underlying concept of the common cost is to consider the salary and benefits paid to the engineer of a train. Without the engineer, the train will not travel and as a result there will be no passengers to ride the train. In order to be able to make use of the train as a revenue-generating asset, the railway must employ the engineer, even if there are currently no passenger bookings for the route. In this scenario, the salary and benefits of the engineer are a common cost that ultimately benefits the ability of the railway to offer services and generate revenue, and has an effect on the overall function of the company as a result. While a common cost involves an expense that has some effect on the business operation as a whole, this does not mean companies will not take steps to control the amount of these types of expenses. Just like any other type of expense, a common cost maybe fixed, meaning that the amount does not change from one accounting period to the next. At other times, a common cost may be considered flexible or variable, and subject to review in terms of finding ways to eliminate waste and keep that cost within a certain range. Even with a fixed common cost, companies will often compare different options in terms of how to go about lowering that fixed cost in upcoming periods. Managing these costs can help improve the bottom line of a business and allow the company to be stronger financially and also compete more effectively in the marketplace. All types of business operations experience some form of common cost. The exact nature of these types of expenses will vary, depending on the particulars of the business model. Fortunately, generally accepted accounting principles allow for the identification of this type of expense and provide specific guidelines for posting the expenses within the accounting records maintained by a company, making the task of tracking the expenses much easier. Common Cost is a cost that a company cannot directly assign to particular segments of the business; a cost that the company incurs for the business as a whole. Common Cost is the Expense a firm incurs as a whole, and which cannot be assigned directly to any particular department, product, or segment of the business. Common Cost is the expense chargeable in accounting to the business as a whole : cost assigned to several departments or operation. Common Costs are the costs that must be allocated among two or more functional areas. / Под Себестоимостью Продукции понимается полная себестоимость, денежное выражение текущих затрат предприятия на производство и реализацию продукции. Фабрично-заводская себестоимость продукции слагается из цеховой себестоимости и общезаводских расходов. Себестоимость продукции – часть стоимости, включающая затраты на потреблённые средства производства и на оплату труда. Экономическая основа себестоимости продукции – издержки производства. Себестоимость продукции – один из важнейших качественных показателей эффективности производства, обеспечивающий контроль затрат живого и овеществлённого труда и ограждающий результаты хозяйственной деятельности предприятия. Отношение чистого дохода (прибыли) к себестоимости продукции выражает рентабельность производства. В практике планирования исчисляется себестоимость всей продукции (по экономическим элементам затрат) и себестоимость единицы изделия (по статьям и калькуляции). Себестоимость продукции – основа ценообразования, определения уровня оптовых цен.

COMMON EXTERNAL TARIFF = ОБЩИЙ ВНЕШНИЙ ТАРИФ (или ЕДИНЫЙ ВНЕШНИЙ ТАРИФ) – Common External Tariff is the uniform tariff adopted by a customs union to be assessed on imports entering the union territory from countries outside the union. Abbreviation:- CET or CXT. Import tariff charged by all members of a trading community, e.g., the European Union, on goods being imported from non-member countries. / Обозначение:- .

COMMON GAP = ОБЫЧНЫЙ ОТРЫВ (или ОБЫЧНОЕ РАСХОЖДЕНИЕ, или ОБЫЧНЫЙ РАЗРЫВ, или ОБЫЧНЫЙ ПРОМЕЖУТОК, или ОБЫЧНЫЙ ЗАЗОР) – Common Gap:- it is also known as Area Gap, Pattern Gap or Temporary Gap. They tend to occur when trading is bound between support and resistance level on a short span of time and market price is moving sideways. One can also see them in price congestion area. Usually, the price moves back or goes up in order to fill the gaps in the coming days. If the gap is filled, then they offer little in the way of forecasting significance. Common Gaps are the last type of gap we'll mention. These generally occur in illiquid trading instruments. They are just a gap that means nothing in a technical analysis sense. Common Gaps occur within a trading range or shortly after a sharp move as a reaction. These gaps do not signify the beginning or continuation of a move, but rather represent anomalies. For instance, if a security has declined 20% in a week and gaps up, it would be considered a common gap and not likely to signify a change in trend. Or, if a trading range develops between 20 an 30, and a gap forms in the middle, it is probably a common gap. See also Breakaway Gap, Continuation Gap, Down Gap, Exhaustion Gap, Gap, Runaway Gap, and Up Gap. / Обычный Разрыв происходит в пределах торгового диапазона и не особенно важен.

COMMON GROUP = ОБЩАЯ ГРУППА – Common Group:- in a SWIFT message, the category 'n', common to all categories. The group contains the following message types:- n90 Advice of Charges, Interest and Other Adjustments; n91 Request for Payment of Charges, Interest and Other Expenses; n92 Request for Cancellation; n93 Information Service Message; n95 Queries; n96 Answers; n98 Proprietary Message; n99 Free Format. The 'n' represents the category, which aids internal routing. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). и Прочих Расходов; категория 'n' является общей для всех категорий. Данная группа содержит следующие типы сообщений:- . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

COMMON INVENTOR = ОБЫЧНЫЙ (или ОБЩИЙ) ИЗОБРЕТАТЕЛЬ – Common Inventor is an inventor whose name is listed on multiple patent applications or granted patents, making the inventions at least partially the work of the same person.

COMMON LAW = ОБЫЧНОЕ ПРАВО (или ОБЩЕЕ ПРАВО) – Common Law is ancient customs and precedents that have been recognized by the courts and given the force of law. It is in itself a complex system of both civil and criminal precedents, although it is greatly modified and extended by statute law and equity. It is unwritten and has come down over the centuries in the recorded judgments of courts. Law that derives its force and authority from precedent, custom and usage rather than from statutes, particularly with reference to the laws of England and the United States. Common Law is legally binding rules or principles of justice developed in the course of history from the gradual accumulation of rulings by judges in individual cases, as differentiated from the kind of statute law embodied in special legal codes or statutes enacted by legislative assemblies or imposed by executive decrees. The importance of the common law heritage is particularly great in the legal systems of Great Britain and of most former British colonies, including the United States. / В Великобритании под Общим Правом понимается сложившаяся в XIII–XIV веках на основе местных обычаев и обобщения практики Королевских судов система права, основанная на прецеденте. Она сохраняет своё значение и по сей день, несмотря на многочисленные реформы судебной системы и права. Под Прецедентом, от Латинского слова Praecedens от Praecedentis, означающее Предшествующий, понимается случай, имевший место ранее и служащий примером или оправданием для последующих случаев подобного рода. Под судебным прецедентом понимается решение, вынесенное судом по конкретному делу, обоснование которого считается правилом, обязательным для других судов при решении аналогичных дел. Он лежит в основе, так называемого прецедентного права – системы права в Великобритании, во многих штатах США и некоторых других странах.

COMMON LAW RIGHTS = ПРАВА ПО ОБЩЕМУ ПРАВУ – Common Law Rights are property or other legal rights that do not absolutely require formal registration in order to enforce them. Proving such rights for a trademark in court can be very difficult, requires meticulous documentation, and places a heavy burden on the individual. Active the US Federal registration of trademark can provide a higher degree of legal protection and readily-demonstrated evidence of ownership of a mark.

COMMON MARKET = ОБЩИЙ РЫНОК – A Common Market has a common external tariff and may allow for labor mobility and common economic policies among the participating nations. The European Community is the most notable example of a common market. The opposite of Free Trade Area. A Common Market (as opposed to a Free Trade Area) has a common external tariff and may allow for labor mobility and common economic policies among the participating nations. The European Union is the most notable example of a common market. See also European Economic Community. Common Market is a Group formed by countries within a geographical area to promote duty free trade and free movement of labor and capital among its members. European community (as a legal entity within the framework of European Union) is the best known example. Common markets impose common external tariff (CET) on imports from non-member countries. / Смотрите также Европейское Экономическое Сообщество (European Economic Community).

COMMON MARKET ORGANISATION FOR SUGAR = ОРГАНИЗАЦИЯ ОБЩЕГО РЫНКА ДЛЯ САХАРА – Common Market Organisation (CMO) For Sugar:- the common organisation of the sugar market (CMO) in the European Union was established in 1968 to ensure a fair income to community sugar producers and self-supply of the Community market. At present the CMO is governed by Council Regulation (EC) No. 318/2006 (the basic regulation) which establishes a restructuring fund financed by sugar producers to assist the restructuring process needed to render the industry more competitive.

COMMON MESSAGE SWITCH = УСТРОЙСТВО ОТКЛЮЧЕНИЯ ОБЩИХ СООБЩЕНИЙ – Common Message Switch handles virtually all orders, and reports between member firms and New York Stock Exchange (NYSE®) and American Stock Exchange® (AMEX®) trading floors. Common Message Switch, designed and operated by Securities Industry Automation Corporation (SIAC), simplifies firms' order-delivery report procedures, and eliminates equipment and communications line duplication. / и полами торговли Нью Йоркской Фондовой Биржи (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)) и Американской Фондовой Биржи® (АФБ® или АМЭКС® (AMEX®)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

COMMON MONETARY AGREEMENT = СОГЛАШЕНИЕ ОБ ОБЩЕЙ МОНЕТАРНОЙ ПОЛИТИКЕ (или СОГЛАШЕНИЕ О ЕДИНОЙ ВАЛЮТЕ) – Lesotho, South Africa and Swaziland are members of the Common Monetary Agreement (CMA) under which they apply uniform exchange control regulations to ensure monetary order in the region. Funds are freely transferable among the three countries and Lesotho and Swaziland have free access to South African capital markets. Lesotho also uses the South African currency, the Rand. The CMA was formed in 1986 as a result of the renegotiation of the Rand Monetary Agreement (RMA) which was originally formed in 1974 by the same member countries.

COMMON NAME = ОБЩЕЕ НАЗВАНИЕ – (1) Common Name (chemical) is a generic name for a chemical compound.

(2) Common Name (plant) is a name that a weed is commonly know by. A weed may be known by several common names.

COMMON OPERATIONAL SYSTEMS = ОБЩИЕ ОПЕРАЦИОННЫЕ СИСТЕМЫ – Common Operational Systems are the systems that have been established jointly by the European Central Bank (ECB) and the national central banks (NCBs) to make it easier to carry out decentralized operations. They encompass common information systems, applications and procedures and are organized according to a 'hub and spoke' approach, with the hub located at the ECB.

COMMON POINT = ОБЩИЙ ПУНКТ (или СОВМЕСТНЫЙ ПУНКТ) – Common Point is a point reached by two or more transportation lines. / Пункт, занимаемый двумя или более транспортными линиями.

COMMON SHAREHOLDERS = ОБЫКНОВЕННЫЕ АКЦИОНЕРЫ – Common Shareholders are residual claimants because they have the rights to the firm's assets after debtholders and preferred shareholders have been paid. This says that common stock is the riskiest of these securities since it is last in line in its claim on the firm's assets. As the riskiest asset, it also should have the highest return.

COMMON SHARES = ОБЫКНОВЕННЫЕ АКЦИИ – Common Share is the standard for of ownership in an incorporated company. Common shares allow the holder to vote his/her shares. Each share gets one vote at a meeting of shareholders. Each share entitles the holder to participate, pro-rata, in profits of the company. Hence, Common shares are usually voting, participating shares. Common Shares is a class of shares that has no special features and possesses no greater rights than any other shares. Common Shares are the securities representing equity ownership in a corporation, providing voting rights, and entitling the holder to a share of the company's success throughdividends and/or capital appreciation. In the event of liquidation, common shareholders have rights to a company's assets only after bondholders, other debt holders, and preferred shareholders have been satisfied. Typically, common shareholders receive one vote per share to elect the company's board of directors (although the number of votes is not always directly proportional to the number of shares owned). The board of directors is the group of individuals that represents the owners of the corporation and oversees major decisions for the company. Common shareholders also receive voting rights regarding other company matters such as stock splits and company objectives. In addition to voting rights, common shareholders sometimes enjoy what are called 'Preemptive Rights'. Preemptive rights allow common shareholders to maintain their proportional ownership in the company in

the event that the company issues another offering of stock. This means that common shareholders with preemptive rights have the right but not the obligation to purchase as many new shares of the stock as it would take to maintain their proportional ownership in the company. Also called Junior Equity or Common Stock. / Обыкновенные Акции:- акции, которые позволяют получать дивиденды, определяемые по итогам хозяйственной деятельности года и дают право голоса на собрании акционеров.

COMMON STOCK = ОБЫКНОВЕННЫЙ УСТАВНЫЙ КАПИТАЛ – In the United States, Common Stock can be sold with and without a par value. Par value has little real economic significance. Most firms set a very low par value. Many states do not allow a firm to sell shares at a price below par value, so there is a strong incentive to set par value low, so it does not become a constraint on the company. See also Preferred Stock. Common Stock is a kind of ownership in a corporation that entitles the investor to share any profits remaining after all other obligations have been met. Securities that represent an ownership interest in a corporation. If the company has also issued preferred stock, both common and preferred have ownership rights. Common stockholders assume the greater risk, but generally exercise the greater control and may gain the greater award in the form of dividends and capital appreciation. The terms common stock and capital stock are often used interchangeably when the company has no preferred stock. American term for corporate shares which are not preferred over any other with regard to dividend payments; usually the only class of stock with voting rights. One of two types of stock an investor may purchase in a company. Most stock is common stock. Investors who purchase it have voting rights at the company's annual stockholders' meeting. Common Stockholders are not guaranteed dividends, buy they may receive higher dividends during the company's prosperous periods. If a company fails or liquidates, common stockholders are paid after bondholders and preferred stockholders. See also Preferred Stock. Also known as Ordinary Share in the United Kingdom. Common Stock is a security that represents ownership in a corporation. Holders of common stock exercise control by electing a board of directors and voting on corporate policy. Common stockholders are on the bottom of the priority ladder for ownership structure. In the event of liquidation, common shareholders have rights to a company's assets only after bondholders, preferred shareholders and other debtholders have been paid in full. In the United Kingdom, these are called Ordinary Shares. If the company goes bankrupt, the common stockholders will not receive their money until the creditors and preferred shareholders have received their respective share of the leftover assets. This makes common stock riskier than debt or preferred shares. The upside to common shares is that they usually outperform bonds and preferred shares in the long run. Common Stock is a capital stock having no preferences generally in terms of dividends, voting rights or distributions. See also Preferred Stock. Securities representing equity ownership in a corporation, usually providing voting rights, and entitling the holder to a share of the company's success through dividends and/or capital appreciation. In the event of liquidation, common stock holders have rights to a company's assets only after bond holders, other debt holders, and preferred stock holders have been satisfied. Security representing equity ownership in a corporation. Holders of common stock have the right to elect directors and collect dividends. Common stock claims are subordinate to the claims of bond holders, preferred stock holders and general creditors.

COMMON STOCK EQUITY = СОБСТВЕННЫЕ СРЕДСТВА В ОБЫКНОВЕННОМ УСТАВНОМ КАПИТАЛЕ – Common Stock Equity:- amount of shareholder's equity attributable to common stock. This figure is taken from the annual or quarterly reports. Common stock equity generally consists of the following items:- common stock (all issues) at par value, capital surplus or additional paid-in capital, and retained earnings or earned surplus (net of foreign exchange gains/losses). / строка баланса (item).

COMMON STOCK ISSUED AND FULLY PAID = ОБЫКНОВЕННЫЙ КАПИТАЛ, ВЫПУЩЕННЫЙ И ПОЛНОСТЬЮ ОПЛАЧЕННЫЙ – In the United States, Issued Stock is the total number of a company's shares that have been sold and are held by shareholders. Issued stock can be held both by insiders and by the general public. Common Stock is a stock issued without special privileges or restrictions – general or ordinary stock – is embraced in the term common stock Unless special stock of some kind is issued by the company, all its stock is common stock. The owner of common stock has the right to attend and vote at all meetings of stockholders, to share in the profits of the business, and on the dissolution of the company, to have his due proportion of the final assets. Issued And Outstanding Stock, this is stock actually subscribed for and the subscriptions accepted by the company, and, usually, for which stock certificates have been duly made out and delivered to the subscribers. It is a liability of the company and the subscriptions or the cash and property received should be an equivalent asset. Fully paid stock is a stock which has been subscribed, issued, and fully paid is termed full paid stock, and the words 'Full-paid and Non-assessable' should always appear plainly printed upon the face of its certificates. Common Stock is the most frequently issued class of stock; usually it provides a voting right but is secondary to preferred stock in dividend and liquidation rights. Common Stock is securities that represent equity ownership in a company. Common shares let an investor vote on such matters as the election of directors. They also give the holder a share in a company's profits via dividend payments or the capital appreciation of the security. Units of ownership of a public corporation with junior status to the claims of secured/unsecured creditors, bondholders and preferred shareholders in the event of liquidation. Also known as Called Up Share Capital in the United Kingdom.

COMMON TARIFF = ОБЩИЙ ТАРИФ (или ОБЫЧНЫЙ ТАРИФ) – Common Tariff is a tariff published by or for the account of two or more transportation lines as issuing carriers.

COMMON USER TERMINAL = ТЕРМИНАЛ ОБЫКНОВЕННОГО ПОЛЬЗОВАТЕЛЯ (или ТЕРМИНАЛ ОБЩЕГО ПОЛЬЗОВАНИЯ) – Common User Terminal is a shared wharf facility with no priority rights of use, i.e. operates on a first come, first served basis. / , то есть .

COMMONWEALTH = СОДРУЖЕСТВО – Commonwealth is a free association of nations including the United Kingdom and most of the sovereign independent states (that has no charter, treaty or constitution) belonging to the former British Empire and their territories. The Commonwealth is the successor to the British Empire, and includes countries on the seven continents. Its members enjoy special privileges granted by the former colonial power. The return to convertibility of the European currencies, the liberalization of international trade and the decline of Great Britain have weakened the monetary and commercial ties among the Commonwealth nations. The association promotes cooperation, consulting and mutual assistance among members. The British Commonwealth includes 48 members and 2 special members. / и большинство суверенных независимых государств () . Содружество (до 1947 – Британское Содружество), объединение в составе Великобритании и её бывших колоний, получивших независимость. Оформлено Вестминстерским Статутом 1931. В современном виде Содружество представляет собой объединение государств:- бывших доминионов, признающих главой государства Английского Короля, и ряда иных стран с разными формами правления, имеющих собственного главу государства, например, Гана, Кения, Шри Ланка. Содружество (ранее – Британское Содружество Наций), объединение в составе Великобритании и её бывших колоний, получивших независимость. В Содружество, которое было юридически оформлено Вестминстерским Статутом 1931, первоначально вошли Великобритания и её доминионы Канада, Австралийский Союз, Новая Зеландия, Южно-Африканский Союз, Ньюфаундленд и Ирландия, имевшие равный правовой статус и объединявшиеся 'общей верностью Британской короне'. Создание Содружество объяснялось желанием Английской буржуазии противопоставить эту 'свободную ассоциацию суверенных наций' Британской Империи, состоявшей из колоний, протекторатов и вассалитетов. В первоначальном виде Содружество представляло собой личную унию, так как

главою государства в каждом доминионе считался Английский Король, представляемый назначавшимся им Генерал-Губернатором. После 2-й Мировой Войны 1939–45 Содружество претерпело существенные изменения, монархический характер его был утрачен в 1949, когда Индия, провозгласившая себя республикой, пожелала остаться в его составе. Затем некоторые страны вышли из Содружества. В современном виде Содружество – объединение государств бывших доминионов, признающих главой государства Английского Короля, и ряда иных стран с разными формами правления, имеющих собственную главу государства (например, Гана, Кения, Шри Ланка). Некоторая видимость общности интересов стран Содружества поддерживается с помощью проведения регулярных конференций Премьер-Министров стран Содружества, Министров Финансов, играющих чисто консультативную роль, и путём создания ряда постоянных комитетов. Государства, входящие в Содружество, поддерживают между собой обычные дипломатические отношения через Высоких Комиссаров, имеющих ранг Послов (назначаются правительствами соответствующих государств). Дипломатические отношения между странами Содружества и другими государствами осуществляются в обычном порядке. Содружество не выступает как таковое на международной арене. Связи, существующие между входящими в него странами, носят скорее символический характер. Каждая страна Содружества пользуется безоговорочным правом одностороннего выхода из Содружества (было осуществлено Бирмой в 1948, Ирландской Республикой в 1949 и ЮАР в 1961). Особое положение Великобритании в Содружестве определяется не юридическими нормами, а экономическими, финансовыми и политическими отношениями между Великобританией и соответствующими странами.

COMMONWEALTH EDISON CONTROL AREA = ОБЛАСТЬ КОНТРОЛЯ СООБЩЕСТВОМ ЭДЭСЭНА – In the United States, the Commonwealth Edison Control Area or the ComEd Control Area means the electric power system(s) consisting of all of Commonwealth Edison's transmission and generating facilities in which a common automatic generation scheme is applied in:- (i) matching the power output of the generators within the system(s) and capacity and energy purchased from outside entities; and (ii) maintaining scheduled interchange and frequency with other Control Areas while providing sufficient generating capacity to maintain operating reserves. These facilities are owned, controlled, or operated by the transmissions provider and are used to provide service under the Commonwealth Edison Open Access Transmission Tariff. The ComEd Control Area is recognized by the North American Electricity Reliability Council (NERC). / В Соединённых Штатах Америки Зона Контроля Сообществом Эдэсэна или Зона, Контролируемая СоЭд означает энергетическую систему или системы, состоящие из всех передающих и генерирующих установок Сообщества Эдэсэна, в которых используется обычная автоматическая схема генерации, заключающаяся в следующем:- (i) соответствии выработки электроэнергии от генераторов внутри системы или систем, и мощности и энергии, приобретаемой у сторонних предприятий; и (ii) поддержании планируемого взаимообмена и частоты с другими Зонами Контроля, при обеспечении достаточной генерируемой мощности для поддержания эксплуатационных резервов. Эти установки принадлежат, контролируются и обслуживаются сетевой компанией и используются для обеспечения подачи по Тарифу Свободного Доступа к Передаче Сообщества Эдэсэна. Зона, Контролируемая СоЭд, признаётся Северо-Американским Советом по Надёжности Поставок Электричества (САСНПЭ).

THE COMMONWEALTH OF INDEPENDENT STATES = СОДРУЖЕСТВО НЕЗАВИСИМЫХ ГОСУДАРСТВ – On 1991-December-08 in Viskuli, the residence of the Belarusian Government in Belovezhskaya forest preserve, the leaders of the Republic of Belarus, Russian Federation and Ukraine have signed the Agreement on establishment of the Commonwealth of Independent States (CIS). On 1991-December-21 in Alma-Ata the heads of eleven sovereign states (except the Baltic states and Georgia) have signed the Protocol to the above Agreement, in which they stressed that the Azerbaijan Republic, Republic of Armenia, Republic of Belarus, Republic of Kazakstan, Kyrgyz Republic, Republic of Moldova, Russian Federation, Republic of Tajikistan, Turkmenistan, Republic of Uzbekistan and Ukraine on equality basis established the Commonwealth of Independent States. The participants of the meeting have unanimously adopted the Alma-Ata Declaration, which confirmed the devotion of the former union republics to cooperation in various fields of external and internal policies, and announced the guarantees for implementation of international commitments of the former Soviet Union. later, in December 1993 the Commonwealth was joined by Georgia. Thus, at present the CIS comprises 12 young sovereign states – former soviet republics. The CIS performs its activities on the basis of the Charter, adopted by the Council of Heads of States on 1993-January-22, which stipulates the goals and principles of the Commonwealth, rights and obligations of the countries, which established it voluntarily. In the document they stated, that the Commonwealth was formed on the basis of sovereign equality of all its members and that the member states were independent and equal subjects of the international law. The CIS, the Charter stated, serves further development and strengthening of relations of friendship, good neighborhood, inter-ethnic accord, trust and mutual understanding and cooperation between states. The Commonwealth is not a state, it does not have supranational powers. In September 1993 the heads of states signed the Treaty on establishment of the Economic Union, in which they developed the concept of transformation of economic interaction within the Commonwealth, taking into consideration the current realities. The Treaty was based on the necessity of formation of the common economic space on the principles of free movement of goods, services, workers, capitals; elaboration of concerted money and credit, tax, price, customs and foreign economic policies; rapprochement of the methods of management of economic activities, creation of favorable conditions for development of direct production links. Countries' interaction within the CIS is accomplished through its coordinating institutions: Council of Heads of State, Council of Heads of Government, Councils of Foreign Ministers, Defense Ministers, Border Troops Commanders, Interparliamentary assembly, Executive Committee, the latter being legal successor of the Executive Secretariat, and the Interstate Economic Committee of the Economic Union, etc. The Commonwealth of Independent States (CIS) was established on 1991-December-08 as an association of 11 republics of the former Soviet Union. The members include:- Armenia, Azerbaijan, Belarus', Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. Georgia is presently an observer. The Baltic states did not join. / 08 Декабря 1991 в Вискулях – резиденции Беларуского Правительства в Беловежской Пуще – руководители Республики Беларусь, Российской Федерации и Украины подписали Соглашение о создании Содружества Независимых Государств (СНГ). 21 Декабря 1991 в Алма-Ате главы одиннадцати суверенных государств (кроме Прибалтийских государств и Грузии) подписали Протокол к этому Соглашению, в котором подчеркнули, что Азербайджанская Республика, Республика Армения, Республика Беларусь, Республика Казахстан, Кыргызской Республика, Республика Молдова, Российская Федерация, Республика Таджикистан, Туркменистан, Республика Узбекистан и Украина на равноправных началах образуют Содружество Независимых Государств. Участники встречи единодушно приняли Алма-Атинскую Декларацию, подтвердившую приверженность бывших союзных республик к сотрудничеству в различных областях внешней и внутренней политики, провозгласившую гарантии выполнения международных обязательств бывшего Союза ССР. Позднее, в Декабре 1993, к Содружеству присоединилась Грузия. Содружество Независимых Государств действует на основании Устава, принятого Советом глав государств 22 Января 1993. Содружество основано на началах суверенного равенства всех его членов. Государства-члены Содружества являются самостоятельными и равноправными субъектами международного права. Содружество Независимых Государств служит дальнейшему развитию и укреплению отношений дружбы, добрососедства, межнационального согласия, доверия, взаимопонимания и взаимовыгодного сотрудничества между государствами. Содружество Независимых Государств не является государством и не обладает наднациональными полномочиями. В Сентябре 1993 главы государств Содружества

Независимых Государств подписали Договор о создании Экономического Союза, в котором заложена концепция трансформации хозяйственного взаимодействия в рамках Содружества Независимых Государств с учётом сложившихся в нём реалий. В основе Договора лежит понимание его участниками необходимости формирования общего экономического пространства, основанного на свободном перемещении товаров, услуг, рабочей силы, капиталов; выработки согласованной денежно-кредитной, налоговой, ценовой, таможенной, внешнеэкономической политики; сближения методов регулирования хозяйственной деятельности, создания благоприятных условий для развития прямых производственных связей. Взаимодействие стран в рамках Содружества Независимых Государств осуществляется через его координирующие институты:- Совет Глав Государств, Совет Глав Правительств, Межпарламентскую Ассамблею, Исполнительный Комитет, который является правопреемником Исполнительного Секретариата СНГ и Межгосударственного Экономического Комитета Экономического Союза, и другие. Изначально соглашение об образовании в качестве ассоциации Содружества Независимых Государств (СНГ) было подписано 08 Декабря 1991 тогдашним руководством 11 бывших республик Советского Союза, среди которых были Беларусь, Казахстан, Россия и Украина. Позже оно превратилось в ассоциацию, состоящую из Азербайджана, Армении, Беларуси, Казахстана, Кыргызстана, Молдовы, России, Таджикистана, Туркменистана, Узбекистана и Украины. Грузия состояла в статусе обозревателя, а бывшие Балтийские республики СССР вообще не примкнули к СНГ. Исполнительный Комитет СНГ расположен в Минске, Беларусь. Вступление в СНГ Грузии было оформлено решением глав государств от 03 Декабря 1993, принятым в связи с обращением главы грузинского государства Эдуарда Шеварднадзе от 08 Октября 1993. 12 Августа 2008 Михаил Саакашвили (Mikheil Saakashvili; 1967–), Президент Грузии заявил о выходе страны из СНГ. Парламент Грузии 14 Августа 2008 принял постановление о прекращении действия в отношении Грузии ‘Соглашения о Создании Содружества Независимых Государств’. МИД Грузии 18 Августа 2008 направил Исполнительному Комитету СНГ ноту, в которой сообщалось о решении Грузинского Парламента и о выходе Грузии из СНГ. Формальная процедура выхода Грузии из СНГ завершилась 18 Августа 2009. Тем не менее она оставалась участником 75 многосторонних соглашений со странами СНГ и выходить из них не собиралась. 22 Июня 2009 Парламенте Грузии заявил о выходе станы из Межпарламентской Ассамблеи (МПА) СНГ. В соответствии с механизмом выхода из МПА, членство в ассамблее прекращается через полгода после поступления такого заявления. С 22 Января 2010 Грузия перестала быть членом Межпарламентской Ассамблеи СНГ. Таким образом, Грузия окончательно разорвала все отношения с СНГ.

COMMUNAUTÉ ÉCONOMIQUE DES ÉTATS DE L’AFRIQUE CENTRALE = КОММЮНОТЭ ЭКОНОМИКЬ ДЭЗ ЭТА ДЁ Л’ЯФРИКЬ САНТРАЛЬ (или ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО ГОСУДАРСТВ ЦЕНТРАЛЬНОЙ АФРИКИ) – La Communauté Économique des États de l’Afrique Centrale (CEEAC) is the French name of the Economic Community of Central African States. See also Economic Community of Central African States. / Экономическое Сообщество Государств Центральной Африки (ЭСГЦА) или, как это звучит на Французском языке по месту расположения, Коммюнотэ Экономикь дэз Эта дё л’Яфрикь Сантраль (Сэ.Ё.Ё.А.Сэ; la Communauté Économique des États de l’Afrique Centrale (CEEAC)). Экономическое Сообщество Государств Центральной Африки (Economic Community of Central African States).

COMMUNAUTÉ ÉCONOMIQUE DES PAYS DES GRANDS LACS = КОММЮНОТЭ ЕЭКОНОМИКЬ ДЭ ПЭЙИ ДЭ ГРАН ЛЯК (или ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО БЕРЕГОВЫХ СТРАН ВЕЛИКИХ ОЗЁР – La Communauté Économique des Pays des Grands Lacs (CEPGL) is the French name of the Economic Community Of The Great Lakes Countries. See also Economic Community Of The Great Lakes Countries. / Экономическое Сообщество Береговых Стран Великих Озёр (ЭСБСВО) или, как это звучит на Французском языке по месту создания, Коммюнотэ Экономикь дэ Пэйи дэ Гран Ляк (Сэ.Ё.Пэ.Жэ.Эл.; La Communauté Économique des Pays des Grands Lacs (CEPGL)). Смотрите также Экономическое Сообщество Береговых Стран Великих Озёр (Economic Community Of The Great Lakes Countries).

COMMUNISM = КОММУНИЗМ – (1) Communism is any ideology based on the communal ownership of all property and a classless social structure, with economic production and distribution to be directed and regulated by means of an authoritative economic plan that supposedly embodies the interests of the community as a whole. Karl Marx is today the most famous early theoretician of communism, but he did not invent the term or the basic social ideals, which he mostly borrowed and adapted from the less systematic theories of earlier French utopian socialists – grafting these onto a philosophical framework Marx derived from the German philosophers Hegel and Feuerbach, while adding in a number of economic theories derived from his reinterpretation of the writings of such early political economists such as Adam Smith, Thomas Malthus, and David Ricardo. In most versions of the communist utopia, everyone would be expected to co-operate enthusiastically in the process of production, but the individual citizen’s equal rights of access to consumer goods would be completely unaffected by his/her own individual contribution to production – hence Karl Marx’s famous slogan ‘From each according to his ability; to each according to his need’. The Marxian and other XIX century communist utopias also were expected to dispense with such ‘relics of the past’ as trading, money, prices, wages, profits, interest, land-rent, calculations of profit and loss, contracts, banking, insurance, lawsuits, etc. It was expected that such a radical reordering of the economic sphere of life would also more or less rapidly lead to the elimination of all other major social problems such as class conflict, political oppression, racial discrimination, the inequality of the sexes, religious bigotry, and cultural backwardness – as well as put an end to such more ‘psychological’ forms of suffering as alienation, anomie, and feelings of powerlessness. / Немецкие философы Геог Вильхэльм Фридрихь Хейгель (Georg Wilhelm Friedrich Hegel; 1770–1831) и Людвихь Андреас фон Фойабах (Ludwig Andreas von Feuerbach; 1804–1872). ранние политические экономисты, такие как Британцы Эдэм Смис (Adam Smith; 1723–1790), Томэс Робэт Малфэс (Thomas Robert Malthus; 1766–1834), и Дэйвид Рикадо (David Ricardo; 1772–1823). Под Коммунизмом, от Латинского слова Communis, означающее Общий, понимается:- (i) общественный идеал, впитавший в себя гуманистические начала человеческой цивилизации, извечные стремления людей к всеобщему благополучию, полному социальному равенству, свободному всестороннему развитию; или (ii) концепции, учения, политические движения, разделяющие и обосновывающие этот идеал, выступающие за реализацию его на практике; (iii) Общество, конкретный тип организации общественной жизни, отвечающий тому или иному пониманию коммунистического идеала; в социально-философской теории марксизма формация, следующая за капитализмом, вторая, высшая по сравнению с социализмом ступень этой формации, конечная цель коммунистического движения. Представления о коммунизме как обществе всеобщего благополучия и полного социального равенства и первые попытки их практической реализации прослеживаются с глубокой древности – коммунистические черты в идеальном государстве Платона; некоторые монашеские ордена и религиозные секты в средние века и эпоху Возрождения; различные концепции утопического (в том числе ‘распределительного’ и ‘казарменного’) коммунизма в XVII – первой половине XIX веков (Итальянский философ Томмазо Кампанелля (Tommaso Campanella; 1568–1639), Французский историк и политический мыслитель Габриэль Бону дё Мабли (Gabriel Bonnot de Mably; 1709–1785), Французский утопический социалист Этьен Кабэ (Étienne Cabet; 1788–1856), Английский социалист-утопист Робэтч Оэн (Robert Owen; 1771–1858), Французский утопический социалист Фросуа Мари Шарль Фурье (François Marie Charles Fourier; 1772–1837), Французский утопический социалист Клёд Ори дё Рувруа, граф из Са-Симу (Claude Henri de Rouvroy, comte de Saint-Simon; 1760–1825)) и попытки их реализации (‘трудовые коммуны’ Оэна, фаланстеры Фурье, крестьянские трудовые коммуны в России и другие). Наиболее последовательную и глубокую разработку коммунизм как общественный идеал и тип

социального устройства общества получил в трудах основателя научного коммунизма, диалектического и исторического материализма и научной политической экономии Немца Карла Хайнрихя Маркса (Karl Heinrich Marx; 1818–83), основоположника марксизма Немца Фридрихя Энгельса (Friedrich Engels; 1820–95), основатель коммунистической партии Советского Союза (КПСС) и Советского государства Россиянина Владимира Ильича Ленина (1870–1924), в созданной ими теории научного коммунизма. Опираясь на исследования объективной логики всемирной истории, они пришли к выводу, что в поступательном движении человечества в процессе смены общественно-экономических формаций за капитализмом с естественно-исторической необходмостью последует установление такого общественного строя, в котором всеобщее благополучие и равенство, свободное развитие личности будут достигнуты на основе высочайшего развития материального производства, преодоления частной и утверждения общественной собственности. Коммунизм позволит преодолеть отчуждение человека от созданных им материальных и духовных ценностей, существенные различия между классами и социальными группами, между городом и деревней, умственным и физическим трудом, добиться полного удовлетворения разумных потребностей людей. Переход к высшей фазе коммунизма в представлении Маркса, Энгельса, Ленина связан с коренным изменением характера труда, который станет непосредственно общественным и превратится в первую жизненную потребность, что откроет возможность целостного человеческого развития. Формой урегулирования общественных отношений при коммунизме будут общечеловеческие ценности, общепринятые нормы нравственности и справедливости, соблюдение которых станет привычкой. Организация общества будет строиться на началах общественного самоуправления. Развёрнутое определение сущности коммунизма сформулировано Марксом в ‘Критике Госткой Программы’:- ‘На высшей фазе коммунистического общества, после того как исчезнет порабощающее человека подчинение его разделению труда; когда исчезнет вместе с этим противоположность умственного и физического труда; когда труд перестанет быть только средством для жизни, а станет сам первой потребностью жизни; когда вместе с всесторонним развитием индивидов вырастут и производительные силы и все источники общественного богатства польются полным потоком, лишь тогда можно будет совершенно преодолеть узкий горизонт буржуазного права, и общество сможет написать на своём знамени:- Каждый по способностям, каждому по потребностям!’. Классики марксизма не претендовали на то, чтобы дать детальную картину коммунистического будущего. В их представлении коммунизм – открытая перспектива, естественноисторическая направленность развития цивилизации, а не завершённое идеальное состояние. Коммунизм – не только социально-политическая теория и определённый социальный проект устройства общества будущего, но и новая философия человеческого бытия. Поэтому необходимо чётко различать исторически преходящее экономическое и социально-политическое содержание, а тем более извращённые, псевдомарксистские трактовки коммунистического идеала от социальной, антропологической, экзистенциальной и культурной проблематики, составляющей подлинное ядро коммунистической идеологии:- понимание коммунизма как ‘завершённого гуманизма’ (Карл Маркс), как совокупности условий для всестороннего свободного и творческого развития личности. В настоящее время (1991) представления о будущем человеческого общества разрабатываются в многообразных концепциях посткапиталистического, постиндустриального общества (теория ‘информационного общества’ и другое), в различных альтернативных идеологиях, движениях и социальных проектах (альтернативное движение, экосоциализм, коммунитарное сообщество, некоторые самоуправляющиеся группы производителей и потребителей и так далее), ориентированных на то, чтобы жить и производить по-новому, на основе посткапиталистических общественных ценностей. Система этих ценностей предусматривает разрыв с логикой капиталистического типа развития, преодоление экономического фетишизма, превращение на деле человека в самоцель общественного развития. Основу этих концепций составляет формирующаяся система ценностей, имеющая множество точек соприкосновения с коммунистическим идеалом.

(2) The specifically Marxist-Leninist variant of socialism which emphasizes that a truly communist society can be achieved only through the violent overthrow of capitalism and the establishment of a ‘dictatorship of the proletariat’ that is to prepare the way for the future idealized society of communism under the authoritarian guidance of a hierarchical and disciplined Communist Party.

(3) A world-wide revolutionary political movement inspired by the October Revolution (Red Oktober) in Russia in 1917 and advocating the establishment everywhere of political, economic, and social institutions and policies modeled on those of the Soviet Union (or, in some later versions, China or Albania) as a means for eventually attaining a communist society.

COMMUNITY = СООБЩЕСТВО – Community is the populations of species living in a common ecosystem.

COMMUNITY REINVESTMENT ACT = АКТ О РЕИНВЕСТИРОВАНИИ РАЗЛИЧНЫХ ОБЩИН (или АКТ ОБ ОБЩИННОМ РЕИНВЕСТИРОВАНИИ) – In the United States, Community Reinvestment Act (CRA) enacted by the US Congress in 1977, the CRA encourages banks to help meet the credit needs of their communities for housing and other purposes, particularly in neighborhoods with low or moderate incomes, while maintaining safe and sound operations.

COMMUTATION = КОММУТАЦИЯ (или ПЕРЕКЛЮЧЕНИЕ, или ЗАМЕНА ПЕРИОДИЧЕСКИХ ПЛАТЕЖЕЙ ЕДИНОВРЕМЕННОЙ ВЫПЛАТОЙ) – Commutation is a transaction in which policyholders or insurers surrender all rights and are relieved from all obligations under an insurance or reinsurance contract in exchange for a single current payment. Commutation is the termination of a reinsurance contract by agreement of the parties on the basis of one or more lump sum payments by the reinsurer which extinguish its liability under the contract. The payment made by the reinsurer commonly relates to incurred losses under the contract. / Под Коммутацией, от Латинского слова Commutatio, означающее Изменение или Перемена, понимается .

COMMUTATION CLAUSE = ОГОВОРКА О КОММУТАЦИИ – In reinsurance, Commutation Clause is a clause in a reinsurance agreement, which provides for estimation, payment and complete discharge of all future obligations for reinsurance losses incurred regardless of the continuing nature of certain losses such as unlimited medical and lifetime benefits for Workers’ Compensation.

COMPACI = COMPETETIVE AFRICAN COTTON INITIATIVE

COMPACTA = КОМПАКТНОЕ (или СПЛОЧЁННОЕ, или УПЛОТНЁННОЕ, или СЖАТОЕ, или СПРЕСОВАННОЕ, или СПЛОШНОЕ) – Compacta:- compacted, compressed. / – компактное, сжатое. , от Латинского слова Compactus, означающее Коренастый или Плотный или Сжатый или Толстый, понимается .

COMPACT CORD = КОМПАКТНЫЙ КОРД – A Compact Cord is a cord comprising a number of filaments twisted in the same direction and with the same lay length with a minimum cross-sectional area.

COMPACT DISC = КОМПАКТНЫЙ ДИСК – A Compact Disc (CD) is the electronic data storage media.

COMPACTED SOIL = СЛИТАЯ ПОЧВА – Compacted Soil is a soil set hard and dry.

COMPACTED YARN = ПЛОТНАЯ ПРЯЖА – Compacted Yarns are the air-jet interlaced yarns. Since the entanglement serves only as a substitute for twist, the degree of interlace or tangle is not as great as in air-jet bulked yarns.

COMPACTION = УПЛОТНЕНИЕ (или УКАТЫВАНИЕ) – (1) Compaction is the increasing soil bulk density and decreasing porosity by application of mechanical forces to the soil. Damage to soils caused by trafficking when they are moist or wet. / пористость или рыхлость (porosity). Повреждение, вызванное движением транспорта по увлажнённой или мокрой почве.

(2) In textile, the Compaction process is a compressive treatment of knitted fabrics is a simple process whereby the lengthwise stitches of the fabric are mechanically compacted. In a typical setup, the untreated knitted fabric such as Jersey, pique, interlock and fleece, supported by the plasma coated main roll, is introduced into a converging passage, firmly gripped and conveyed into a treatment cavity, where the compaction takes place. Underneath the tungsten-carbide coated retarder are photo-etched micro-grooves which hold back the fabric and process it with hundreds of individual treatment zones. The force thus delivered provides high levels of compaction. The Walton curve with its springlike action combined with the individual treatment zones at the retarder assures a compacting effect, which is characteristic of the technology, resulting in uniform and even compaction. Special Features:- (i) residual shrinkages in fabrics can be reduced or eliminated as determined; (ii) low investment costs; (iii) high speed operation up to 45 m/min; (iv) easy control and reproducibility of results; (v) low maintenance costs; and (vi) fabric bulk and softness. The compactor is used as a compacting unit with:- (i) winder for intermittent or nonstop operation; (ii) fabric entry; (iii) a separate steamer; and (iv) if required, an inspection table. The compactor is used in combination with an equalizing frame with which, for instance, single Jersey can be finished as follows:- (i) steamed; (ii) glued; (iii) selvedge-dried; (iv) selvedge-cut; and (v) inspected and rolled up. The compactor is used 'online' after a stenter, which offers the following advantages:- (i) convenient size of compactor (length 1.5 m); and (ii) high production speed while compaction remains uniform. See also Intermingling. Compaction/Compacting is a technique utilized to control shrinkage in fabric. / Дьжози (Jersey), пикь (pique). кривая Волтчэн (Walton curve). жёлоб или паз (groove). уплотнитель или увязчик (compactor).

COMPACTOR = УПЛОТНИТЕЛЬ (или УВЯЗЧИК) – Compactor is a machine developed by Fabric Research Laboratories which is used to compact fabrics or to produce warp-stretch fabrics by means of forced crimp and/or shrinkage of the warp yarn.

COMPACTOR CREASES = ЗАЛОМЫ ОТ XX (или СКЛАДКИ ОТ XX, или МОРЩИНЫ ОТ XX, или НАЖИМ ВАЛЬЯНОМ, или ЗАСЕЧКИ ОТ XX, или ЗАВАЛЫ ОТ XX, или ДОЛЕВЫЕ ПОЛОСЫ ОТ XX) – Defect Name:- Compactor Creases. Defect Type:- Finishing Defects. Fabric Type:- Single Knit Fabrics. Description:- Compactor Creases:- These occurred during compacting, which is a mechanical process designed to reduce shrinkage and give stability to the fabric. This fabric is passed through the compactor in flat tube form, and wrinkles on the folded selvage were compressed into hard creases. Severity:- Major.

COMPACT SPINNING PROCESS = КОМПАКТНЫЙ ПРОЦЕСС ПРЯДЕНИЯ – Compact Spinning Process is a term generally referring to a spinning process carried out using any one of the several small spinning machines of compact design offered by equipment vendors as 'packaged' units in which spinning and subsequent processing (drawing, crimping, cutting, etc) are linked.

COMPANIES' CREDITORS ARRANGEMENT ACT = АКТ О ДОГОВОРЁННОСТИ КРЕДИТОРОВ КОМПАНИЙ – The Companies' Creditors Arrangement Act (often referred to as the 'CCAA' or the 'CC, double A') is a Federal Act (Canadian) that allows financially troubled corporations the opportunity to restructure their affairs, e.g., through a formal Plan of Arrangement. The CCAA allows a company to avoid bankruptcy and allows the creditors to receive some form of payment for amounts owing to them. The CCAA is restricted to larger corporations with amounts owing to creditors in excess of CAD5 million. Corporations that do not reach this CAD5 million figure can utilize the Division I Proposal under the Bankruptcy and Insolvency Act. The CCAA also allows a company, if it so chooses, to address its shareholders in addition to its creditors. When the shareholders of a company are impacted by the Plan of Arrangement, they are often given the opportunity to vote on the Plan.

COMPANION CELL = КЛЕТКА КОМПАНЬОН (или КЛЕТКА СПУТНИК) – Companion Cell is the one of the elongated parenchyma cells lying next to and supposedly associated physiologically with the sieve tube in many seed plants, developing with the sieve tube in the same mother cell, sometimes extending the full length of the sieve tube, and readily identified by its small size and denser protoplasm. / Клетка Спутник ситовидных трубок.

COMPANION VIRUS = ВИРУС КОМПАНЬОН (или ВИРУС СПУТНИК) – Companion Viruses replicate by exploiting the precedence hierarchy according to which the operating system executes program files based on their filename extensions. For example, under MS-DOS files with the extension .BAT (batch files) are executed before those with the extension of .COM which, in turn, are executed before those of an extension of .EXE. Companion viruses can create standalone files containing their viral code, but have a higher-precedence file extension or rename the 'targeted' file with a lower-precedence filename extension so the file containing the viral code is executed before transferring control to the original program file (or activating its payload). Another example of a companion virus on today's Windows platforms is one that exploits the search order of DLL libraries. For example, if the malware copied itself as a DLL to an application's directory, it would take precedence over the DLL with the same name in the system directory, or in one of the directories specified by the PATH environment variable. Companion Virus is a computer virus in the DOS/Windows environment that takes advantage of the fact that .COM and .EXE are two valid executable extensions for program files, and .COM takes precedence. For example, if CHKDISK were typed in at the command line, a bogus CHKDISK.COM file would be executed before the legitimate CHKDISK.EXE. In many cases, the companion virus also runs the legitimate .EXE so that the system appears normal. See also Virus. The Dangers Of The Companion Virus:- it's amazing yet unsettling to know that a computer virus can infect the files on your system without altering a single byte. In fact, this is done quite frequently in a number of different ways. The most common method is employed by the companion virus, also known as the Spawning Virus or the Cluster Virus. Instead of modifying the existing files in your system like most viruses, it creates new ones and sends them off to spread the malicious code. The companion virus works by seeking all files with extensions ending in EXE. It then creates a matching file that ends in the COM. extension, which is specifically reserved for the malicious code. Though it is possible for EXE. and COM. files to have similar names, the instance is very rare. In most cases, this is merely an indication of this deceptive infection. When this does occur, the companion virus typically will not the modify the existing COM. file. How The Companion Virus Works:- here is an example of how this infection operates:- The companion virus is downloaded on your computer and unknowingly executed. When the time comes to spread the infection, it searches the system and finds a file labeled MGM.EXE. From there it creates a matching file that contains the virus and labels it MGM.EXE. This file is typically placed in a directory with the EXE. file though it can also be inserted into any directory along a number of different paths. When you access the MGM.EXE file, the operating system executes the MGM.COM file instead. The virus is then executed and proceeds to infect other files on the system. The companion virus is very sophisticated and may take several steps towards hiding it's presence. At times, the infection attempts to conceal the extra files by storing them in a different directory, applying hidden attributes that are invisible to normal commands. It can effectively conceal these files when active in system memory while distributing itself to other areas of the computer to spread the infection. Finding The Virus:- while the companion virus is somewhat of a nuisance, it's easily detected because of the presence of the additional COM. files. Your computer should have a map of the hard drive that enables you to ensure the integrity of these files. By analyzing it you will be able to determine what should actually be on the hard drive. From there you can locate the virus and safely remove it yourself. If analyzing the map of your hard drive sounds like too much trouble, you can elude the hassle by

installing a reliable anti-virus program on your computer. The scanner will thoroughly comb the files and directories of your system in search of companion viruses and many other security threats. Keep in mind that an integrity checking program that only seeks out modifications in existing files and will not be able to detect such a complex virus. Similar to most computer infections, the best defense against a companion virus is prevention. You can protect yourself by remaining cautious of the sites you visit on the internet and never downloading the attachment of an unsolicited email. A Companion Virus is a computer virus that stores itself in a file that is named similar to another program file that is commonly executed. When that file is executed, the virus will infect the computer or perform malicious steps such as deleting the files on your computer hard drive. The first known companion virus was the Globe Virus, which was first detected in 1992. / Например, под файлами Эм.Эс.-ДАС (MS-DOS) с расширением датБЭТ (.BAT) бэтч фаилз (batch files) датКАМ (.COM),расширения датИ.Экс.И. (.EXE). ДАС/Виндоуз (DOS/Windows). Вирусы-Компаньоны или Вирусы-Спутники – формально являются файловыми вирусами. Не внедряются в исполняемые программы. Такие вирусы используют особенность системы ДАС (DOS), позволяющую программному файлу с тем же названием, но другим расширением действовать с разными приоритетами. Под приоритетом понимают присваиваемый задаче, программе или операции признак, определяющий очередность их выполнения вычислительной системой. Большинство таких вирусов создают даткам (.com) файл который обладает более высоким приоритетом нежели дати.экс.и. (.exe) файлы с тем же самым названием. При запуске файла по имени (без указания расширения) будет запущен файл с расширением даткам (.com). Такие вирусы могут быть резидентными и маскировать файлы-двойники.

COMPANY = КОМПАНИЯ (или АКЦИОНЕРНОЕ ОБЩЕСТВО) – In the United Kingdom, Company is an enterprise that has been legally incorporated to produce certain goods or services, or to transact any other type of business. Also known as Corporation in the United States. General term for any business enterprise or firm. The most common forms of companies are the corporation, the partnership and the sole proprietorship. A Company is an association or collection of individuals people or 'warm-bodies' or else contrived 'legal persons' (or a mixture of both). Company members share a common purpose and unite in order to focus their various talents and organize their collectively available skills or resources to achieve specific, declared goals. Companies take various forms such as:- (i) voluntary associations which may be registered as a nonprofit organization; (ii) a group of soldiers; (iii) business entity with an aim of gaining a profit; and (iv) financial entities and banks. A company or association of persons can be created at law as legal person so that the company is itself can accept Limited liability for civil responsibility and taxation incurred as members perform (or fail) to discharge their duty within the publicly declared 'birth certificate' or published policy. Because companies are legal persons, they also may associate and register themselves as companies – often known as a Corporate Group. When the company closes it may need a 'death certificate' to avoid further legal obligations. Meaning and Definition:- a Company can be defined as an 'artificial person', invisible, intangible, created by or under Law, with a discrete legal entity, perpetual succession and a common seal. It is not affected by the death, insanity or insolvency of an individual member. Etymology:- the English word has its origins in the Old French military term compaignie (first recorded in 1150), meaning a 'body of soldiers', originally taken from the Late Latin word companio 'companion, one who eats bread with you', first attested in the Lex Salica as a calque of the Germanic expression gahlaibo (literally, 'with bread'), related to Old High German galeipo 'companion' and Gothic gahlaiba 'messmate'. By 1303, the word referred to trade guilds. Usage of company to mean 'business association' was first recorded in 1553 and the abbreviation 'co.' dates from 1769. (The equivalent French abbreviation is 'cie'.) United States of America:- in the US, a company may be a 'corporation, partnership, association, joint-stock company, trust, fund, or organized group of persons, whether incorporated or not, and (in an official capacity) any receiver, trustee in bankruptcy, or similar official, or liquidating agent, for any of the foregoing'. In the US, a company is not necessarily a corporation. United Kingdom:- in English law and in the Commonwealth realms a company is a body corporate or corporation company registered under the Companies Acts or similar legislation. Common forms include:- (i) private companies limited by guarantee:- companies without share capital, often non-profit entities; (ii) private company limited by shares:- the commonest form of company; and (iii) public limited companies:- companies, usually large, which are permitted to (but do not have to) offer their shares to the public, for example on the stock exchange. In Britain a partnership is not legally a company, but may sometimes be referred to informally as a company. It may be referred to as a Firm. Types:- (1) a Company Limited by Guarantee:- commonly used where companies are formed for non-commercial purposes, such as clubs or charities. The members guarantee the payment of certain (usually nominal) amounts if the company goes into insolvent liquidation, but otherwise they have no economic rights in relation to the company. This type of company is common in England. A company limited by guarantee may be with or without having share capital. (2) A Company Limited by Shares:- the most common form of company used for business ventures. Specifically, a limited company is a 'company in which the liability of each shareholder is limited to the amount individually invested' with corporations being 'the most common example of a limited company'. This type of company is common in England and many English-speaking countries. A company limited by shares may be:- (i) a publicly traded company; or (ii) a privately held company. (3) A Company Limited by Guarantee With a Share Capital:- a hybrid entity, usually used where the company is formed for non-commercial purposes, but the activities of the company are partly funded by investors who expect a return. This type of company may no longer be formed in the UK, although provisions still exist in law for them to exist. (4) A Limited-Liability Company:- 'A company – statutorily authorized in certain states – that is characterized by limited liability, management by members or managers, and limitations on ownership transfer', i.e. L.L.C.. LLC structure has been called 'Hybrid' in that it 'combines the characteristics of a corporation and of a partnership or sole proprietorship'. Like a corporation it has limited liability for members of the company, and like a partnership it has 'flow-through taxation to the members' and must be 'dissolved upon the death or bankruptcy of a member'. (5) An Unlimited Company With or Without a Share Capital:- a hybrid entity, a company where the liability of members or shareholders for the debts (if any) of the company are not limited. In this case doctrine of veil of incorporation does not apply. Less common types of companies are:- (7) Companies Formed by Letters Patent:- most corporations by letters patent are corporations sole and not companies as the term is commonly understood today. (8) Charter Corporations:- before the passing of modern companies legislation, these were the only types of companies. Now they are relatively rare, except for very old companies that still survive (of which there are still many, particularly many British banks), or modern societies that fulfill a quasi regulatory function (for example, the Bank of England is a corporation formed by a modern charter). (9) Statutory Companies:- relatively rare today, certain companies have been formed by a private statute passed in the relevant jurisdiction. Note that 'Ltd after the company's name signifies limited company, and PLC (public limited company) indicates that its shares are widely held'. In legal parlance, the owners of a company are normally referred to as the 'Members'. In a company limited or unlimited by shares (formed or incorporated with a share capital), this will be the shareholders. In a company limited by guarantee, this will be the guarantors. Some offshore jurisdictions have created special forms of offshore company in a bid to attract business for their jurisdictions. Examples include 'segregated portfolio companies' and restricted purpose companies. There are however, many, many sub-categories of types of company that can be formed in various jurisdictions in the world. Companies are also sometimes distinguished for legal and regulatory purposes between public companies and private companies. Public companies are companies whose shares can be publicly traded, often (although not always) on a regulated stock exchange. Private companies do not have publicly traded shares, and often contain restrictions on transfers of shares. In some jurisdictions, private companies have maximum numbers of shareholders. / Общий термин для любого коммерческого предприятия или фирмы. Наиболее распространёнными формами компаний являются общество или корпорация, товарищество или партнёрство и индивидуальное

предпринимательство. Акционерное Общество (АО), форма централизации капитала и вместе с тем основная организационная форма капиталистического предприятия. Акционерные Общества возникли в период первоначального накопления капитала (Английская Ост-Индская Компания в 1600, Голландская Ост-Индская Компания в 1602), получили широкое распространение в эпоху домонополистического капитализма и стали господствующей формой капиталистических предприятий и главной формой капиталистических монополий при империализме. С развитием капиталистического способа производства возникает противоречие между тенденцией ко всё большему расширению предприятий и ограниченностью индивидуальных капиталов; организация новых предприятий требует громадных капиталовложений, значительно превышающих как собственный капитал отдельного капиталиста, так и те заёмные средства, которые он может привлечь. Это противоречие разрешается путём образования акционерных обществ, которые объединяют индивидуальные капиталы капиталистов-пайщиков (акционеров) в один ассоциированный капитал. Громадная централизация капитала в акционерном обществе позволяет организовать крупные предприятия, требующие капитальных вложений, которые не по силам отдельным капиталистам. Акционерное общество становится господствующей формой капиталистического предприятия сначала в области железнодорожного транспорта и кредита (акционерные банки), затем, по мере развития тяжёлой промышленности с высоким удельным весом основного капитала в совокупном капитале промышленных предприятий, по мере роста концентрации и монополизации промышленности акционерные общества становятся господствующей формой крупного предприятия во всех отраслях, кроме сельского хозяйства. Удельный вес акционерных обществ в общем числе промышленных предприятий Соединённых Штатов Америки (США) за период с 1904 по 1939 повысился с 23.6 до 51.7%, а в продукции промышленности – с 73.7 до 92.6%. На долю акционерных обществ в США приходилось 69% в 1947, а в 1962 – 78% совокупной выручки всех предприятий. На протяжении прошедших десятилетий XX века число акционерных обществ и их капиталы значительно увеличились. В США за время с 1909 по 1963 число действующих акционерных обществ возросло с 262 000 до 1 323 000, а их совокупные активы увеличились за 1926–63 с 262 миллиардов до 1 480 миллиардов Долларов. В Англии за 1884–1962 число акционерных обществ возросло с 9 000 до 428 000, а их капиталы – с 0.5 миллиарда до 9.2 миллиардов Фунтов Стерлингов. В Германии в 1938 на долю крупных акционерных обществ с капиталом свыше 100 миллионов Марок каждого приходилось 0.5% общего числа акционерных обществ и 26% общей суммы их капитала, а в ФРГ в 1962 удельный вес таких крупных акционерных обществ достиг 2.7% общего числа и 53% совокупного капитала акционерных обществ. В эпоху империализма акционерное общество становится важнейшим орудием господства монополий, широко используется в процессе сращивания промышленного и банковского капиталов и образования монополистических объединений, а также при внедрении вывозимого из развитых капиталистических стран капитала в хозяйство других стран. С развитием государственно-монополистического капитализма акционерные общества становятся формой государственных, а также смешанных государственно-частнокапиталистических предприятий. Владимир Ильич Ленин (1870–1924) впервые раскрыл значение акционерных обществ в эпоху империализма, показав, что они служат важным орудием господства финансовой олигархии, которая посредством контроля над акционерными обществами распоряжается огромными чужими капиталами и средствами и присваивает подавляющую часть прибавочной стоимости. Вскрытое Лениным значение акционерных обществ полностью подтвердилось за последние полвека, но сам механизм господства финансовой олигархии чрезвычайно усложнился в главных империалистических странах, особенно после 2-й Мировой Войны 1939–45. Распыление акций среди большого числа акционеров позволяет узкому кругу заправил командовать в акционерных обществах. Представляемые на общее собрание акционерных обществ акции достигают 30–40% их общего количества. Для получения большинства голосов обычно требуется не свыше 15–20% акций. Привлечение в акционерное общество капиталов посредством облигационных займов позволяет ещё более снизить долю группы владельцев контрольного пакета акций в совокупном функционирующем капитале акционерного общества. В практике акционерных обществ, особенно в США и Англии, имеют место разного рода юридические махинации, посредством которых достигается снижение величины контрольного пакета. Большинство или значительная часть так называемых привилегированных акций наделяется некоторыми преимуществами (первоочерёдность получения дивиденда и его стабильность), но не даёт права голоса, которое присваивается только обыкновенным акциям:- в результате контрольный пакет, состоящий лишь из обыкновенных акций, уменьшается во много раз по сравнению со всей величиной акционерного капитала. В других капиталистических странах контрольный пакет нередко создаётся с помощью крупных банков, которые на общих собраниях акционеров предъявляют находящиеся у них в залоге или временно скупленные на бирже акции. В США группа Дьжей.Пи. Моргэн (J.P. Morgan) длительное время полностью контролировала стальной трест Юнайтид Стэйтс Стил Корпорэйшэн (United States Steel Corporation) с акционерным капиталом, составлявшим 1.25 миллиарда Долларов, владея лишь 4% акций корпорации (1955). В гигантской монополии Амэрикэн Тэлэфон энд Тэлиграф Кампэни (American Telephone and Telegraph Company) с акционерным капиталом в 14 миллиардов Долларов её 48 миллионов акций распылены среди 1.4 миллиона держателей. Контроль осуществляется Моргэнами и Рокфеллерами (Rockefellers), которые вместе с другими финансовыми группами в 1950-х владели всего 2.5% всех акций. Решающее значение для усиления власти финансовой олигархии имеет Система Участия. Одно акционерное общество (патронирующее, или ‘общество-мать’) приобретает контрольные пакеты других акционерных обществ (дочерних обществ), эти, в свою очередь, – третьих обществ и так далее. В результате господствующая в акционерном обществе ‘матери’ группа с помощью одного контрольного пакета хозяйничает не только в патронирующем акционерном обществе, но во всей системе подчинённых ему акционерных обществ. Наряду со ступенчатой схемой система участия выражается в переплетении контрольных пакетов (взаимное владение пакетами двух и более акционерных обществ) и ещё больше усиливается с помощью Контрольных или Держательских Акционерных Общество (смотрите Холдиньг Компания), которые учреждаются специально для приобретения контрольных пакетов других акционерных обществ, причём банковские или промышленные монополии организуют нередко многоступенчатые пирамиды холдиньга. На основе системы участия широко распространяется Личная Уния заправил акционерных обществ. Многие из ведущих монополистов, а при государственно-монополистическом капитализме и их менеджеров (управляющих) совмещают десятки постов в правлениях разных корпораций и банков, сменяя их иногда на руководящие должности в правительстве и вновь возвращаясь в сферу частнокапиталистических монополий. Ведущие монополисты привлекают в число своих менеджеров крупных отставных чиновников, штатских и военных, бывших министров, генералов и адмиралов, которые обеспечивают им прямые связи с государственным аппаратом, в особенности – преимущественное получение военных заказов по сильно завышенным ценам. С развитием системы участия акционерное общество действует либо как юридически единое предприятие (трест – для промышленности, банк-гигант с сетью филиалов – для банковских монополий), либо как монополия, которая состоит из юридически самостоятельных акционерных обществ и основана на системе участия. Крупнейшие промышленные, транспортные, банковские и другие монополии имеют преимущественную форму Концернов, представляя собой в производственных, хозяйственных и финансовых отношениях единое целое. Концерн может, однако, являться и формой объединения разнородных промышленных и иных предприятий, которые контролируются одной группой магнатов для присвоения большей части доходов этих предприятий, без их производственного и хозяйственного объединения. Наконец, на основе системы участия образуются ‘сверхконцерны’ или финансово-монополистические группы. Они охватывают не

отдельные разнородные крупные предприятия или банки, а распространяют свой контроль на многие разноотраслевые промышленные, транспортные, банковские, страховые монополии. Система участия позволяет обходить законодательные ограничения вроде антитрестовского законодательства в США или запрещения банкам открывать свои филиалы в других штатах. Развитие акционерных обществ, способствуя гигантской концентрации производства, централизации капиталов и монополизации экономики капитализма, резко усиливает основное противоречие капитализма – между общественным характером производства и частнокапиталистической формой присвоения. В акционерных обществах происходит своеобразное '... упразднение капитала как частной собственности в рамках самого капиталистического способа производства', причём экспроприация распространяется '...с непосредственного производителя на самих мелких и средних капиталистов... Но эта экспроприация в пределах самой капиталистической системы выражается в антагонистической форме, в форме присвоения общественной собственности немногими' (Карл Маркс). С развитием акционерных обществ главная роль в организации и в руководстве производственно-хозяйственным процессом переходит от капиталиста-собственника к наёмным высшим служащим. Апологеты империализма извращённо изображают акционерное общество как орудие так называемой демократизации капитала, а владение акциями мелкой буржуазией, служащими и рабочими как путь приобщения их к благам капитализма. Тезис о 'демократизации капитала' через акционерное общество является одной из основ мифа о 'трансформации' капитализма в 'народный' капитализм. В действительности же, как писал Владимир Ильич Ленин, 'демократизация' владения акциями означает, что '... на деле растёт власть (и доход) тузов-миллионеров над капиталом 'мелкоты''. Ограбление рядовых акционеров заправилами акционерных обществ, главным образом магнатами финансового капитала, имеет в своей основе имманентные законы капиталистического хозяйства и усиливается финансовыми, юридическими и коммерческими махинациями действительных хозяев акционерных обществ. Этой основой являются разделение прибыли на предпринимательский доход и ссудный процент, тенденция снижения средней прибыли и средней нормы процента при росте монопольной прибыли и, наконец, оценка каждого регулярного нетрудового дохода величиной ссудного процента, то есть по цене Фиктивного Капитала. Его самым типичным и широко распространённым выражением являются Ценные Бумаги – Акции, Облигации, Закладные Листы. Они имеют номинальную (обозначенную на них) цену и рыночную, или курсовую (которая складывается на фондовой бирже). Так, если на акцию в 100 Долларов выплачен дивиденд в 7.26 Доллара, а ссудный процент держится на уровне 3%, то курс акций составит 242 Доллара (7.26 / 3 x 100). На практике дивиденд капитализируется из несколько большей величины, скажем 3.3% (иначе рантье предпочел бы купить 3%-ные облигации). Следовательно, курс практически окажется 220 Долларов (7.26 / 3.3 x 100). Если при организации нового акционерного общества вкладывается 10 миллионов Долларов при норме прибыли в 7.2% и указанной норме процента 3.3%, то его акции номинальной стоимостью в 10 миллионов Долларов будут реализованы по курсовой цене около 22 миллиона Долларов. Разница в 12 миллионов Долларов составляет Учредительскую Прибыль, которая присваивается учредителями акционерного общества, а также банками, выпускающими на рынок новые акции. В условиях монополий, при наличии монопольной прибыли в результате слияния ранее самостоятельных акционерных обществ учредительская прибыль резко повышается. Так, при монопольной прибыли в 14.52% курсовая цена акций достигнет 44 миллиона Долларов, а учредительская прибыль составит 34 миллиона Долларов. Присвоение её может происходить и иным способом – выпуском акций не на сумму действительно вложенного в акционерное общество капитала, а на сумму их курсовой 'стоимости'. В таком случае акционерный капитал устанавливается в 22 миллиона Долларов, акции будут продаваться по номиналу, из них акции на 12 миллионов Долларов (или выручка от них) достанутся учредителям. Такая форма присвоения учредительной прибыли именуется 'Разводнением Капитала', что фиктивно (не абсолютно, а лишь относительно) снижает величину прибыли и соответственно размеры подоходного налога. По этой и другим причинам 'разводнение' производится и действующими акционерными обществами. Таким же способом заправилы акционерных обществ могут обеспечить и присвоение будущей, ещё не существующей монопольной прибыли или её ожидаемого прироста. Для этого выпускаются привилегированные акции с первоочередной, но в то же время предельной выплатой дивиденда в 4–6% в предельной номинальной сумме, допускаемой сложившимся уровнем прибыли. Так, при вложенном в акционерное общество капитале 10 миллионов Долларов и прибыли в 726 000 Долларов выпускаются и реализуются привилегированные акции с предельным дивидендом в 6% на 12.1 миллионов Долларов, а сверх того выпускаются ещё обыкновенные акции, например, на 3 миллиона Долларов, которые остаются у учредителей. С ростом монопольной прибыли курсовая цена обыкновенных акций стремительно увеличивается, и весь прирост достаётся их владельцам. Так, на их долю из прибыли в 1 452 000 Долларов остаётся 726 000 Долларов или дивиденд в 24% и их курсовая цена достигнет 7-кратной величины номинала, а при 3 миллионах Долларов прибыли доля владельцев обыкновенных акций подскочит до 2 274 000, дивиденд превысит 70%, а курсовая цена достигнет 20-кратной величины. Хотя акционерные общества выплачивают в виде дивиденда не всю, а лишь часть балансовой прибыли, дивиденды составляют огромные суммы, а по отношению к номинальной сумме обыкновенных акций дивиденды в 60–100% и даже более стали характерны для тех крупнейших корпораций США, которые (например, Дьженерэл Мотоз Кампэни (General Motors Company), ДюПо дё Нэмур, Инк. (или ДюПант ди Нэмоаз, Инк. (DuPont de Nemours, Inc.)) или Элуминэм Кампэни оф Амэрика (Aluminum Company of America)) имеют особо выгодное для их хозяев соотношение привилегированных и обыкновенных акций. Соответственно курс последних достигает 30–40-кратной величины к номинальной цене, а в отдельных случаях даже 100-кратных размеров. Для маскировки этих гигантских доходов и курсовых цен обыкновенные акции в течение ряда лет многократно раздроблялись и мажорировались и были со 100 Долларового номинала доведены до 5 Долларов, до 1.67 и даже до 1 Доллара, а биржевые котировки 1.67 или 1-Долларовой акции достигли 50–100 Долларов и выше. Юридические махинации фактических хозяев акционерных обществ переплетаются и дополняются их бухгалтерскими манипуляциями. Хозяева акционерного общества в бухгалтерском отчёте и 'внутреннем' балансе выводят действительные прибыли (или убытки), но в публикуемом балансе показывают прибыль в нужных им размерах. Разница же между действительной и видимой в публикуемом балансе прибылью образует скрытые резервы (при убыточности – скрытые убытки). Буржуазная литература, признавая наличие скрытых резервов в акционерных обществах, превозносит 'предусмотрительность' их хозяев, противопоставляя последних массе акционеров, безразличных к судьбе акционерных обществ и 'готовых' лишь сорвать побольше дивидендов. Под этим углом зрения буржуазная 'наука о частном предприятии' разработала 'финансовую политику предприятия' (акционерного общества), его 'дивидендную политику', обобщая практику акционерных обществ и обучая ей будущих заправил и менеджеров. Как показал Владимир Ильич Ленин, в публикуемом балансе получает в конечном счёте отражение глубочайшее противоречие эпохи империализма – между магнатами финансового капитала и всё сильнее эксплуатируемыми массами трудящихся и непосредственное противоречие между фактическими хозяевами акционерных обществ и ограбляемыми рядовыми акционерами (смотрите также Коммерческая Тайна). Чем выше прибыль акционерного общества, тем большая её часть направляется в резервные капиталы ('явные резервы') и тем меньшая – на выдачу дивиденда. Резервные капиталы, которые обычно по уставам акционерного общества предназначаются на покрытие убытков и другие определённые цели; давно превзошли свои уставные пределы у ведущих монополий. Поэтому направление растущей части видимой прибыли на увеличение функционирующих капиталов акционерного общества производится под видом 'нераспределённой прибыли', которая достигла в балансах монополий США

2–4-кратных размеров акционерного капитала. К этому добавляется завышенная амортизация, представляющая собой форму скрытых резервов. Явные резервы и амортизация стали у ведущих монополий США главным источником увеличения функционирующих основных капиталов для расширенного воспроизводства. ‘Чистая’, за вычетом подоходного налога, видимая прибыль достигает по отношению к сумме акционерных и резервных капиталов 15–28%, амортизация же – 50–60% оценки основных функционирующих капиталов, и в результате подавляющая часть потребности в увеличении капитала удовлетворяется за счёт обоих внутренних источников, то есть по существу за счёт монопольной прибыли (смотрите Самофинансирование). Всё это даёт монополиям возможность, используя лишь 40–50% чистой видимой прибыли, выплачивать по обыкновенным акциям (при отсутствии привилегированных) огромные дивиденды. При наличии же привилегированных акций с предельным дивидендом в 4–6% хозяева монополий получают по обыкновенным акциям гигантские дивиденды в 60–100 и более процентов. ‘Дивидендная политика’ крупных акционерных обществ направлена на поддержание устойчивого биржевого курса акций, с некоторой тенденцией к его повышению. Наряду с крупными явными резервами устойчивость дивиденда укрепляет биржевой курс акций и повышает кредитоспособность акционерных обществ, что расширяет возможность кредитования и финансирования. В то же время всё это служит огромному личному обогащению хозяев акционерных обществ. Например, у трёх крупных акционерных обществ США Дьженерэл Мотоз Корпорэйшэн, ДюПо дё Нэмур и Элуминэм Кампэни оф Амэрика небольшие и даже ничтожные по номиналу контрольные пакеты обыкновенных акций, составлявшие в 1955 общую сумму в 216 миллионов Долларов, ‘стоили’ по биржевому курсу 8 миллиардов Долларов. Эти миллиардные фиктивные капиталы представляют для хозяев ‘финансовых империй’ реальное богатство и реальные доходы, так как выражают реальный контроль над миллиардными активами (свыше 10 миллиардов Долларов у тех же корпораций). По сравнению с этим Тантьемы в 2–3 миллиона Долларов в год потеряли значение для подлинных хозяев монополий и предоставляются ими своим высшим служащим – менеджерам, президентам и вице-президентам корпораций, то есть ‘низшему’ слою современной крупной буржуазии. Так разоблачается несостоятельность пресловутой теории ‘революции управляющих’ (смотрите Технократические Теории). Этот характерный для современного капитализма слой действительно руководит производственно-хозяйственным процессом гигантских монополистических объединений. Командные же позиции занимают по-прежнему, но теперь ‘незримо’ над ними стоящие действительные хозяева финансово-монополистических групп, которые распоряжаются колоссальными капиталами и присваивают львиную долю прибавочной стоимости всё более изощрёнными способами финансового контроля и тёмных махинаций. Хозяева монополий извлекают огромные доходы не только от владения контрольными пакетами, но и посредством биржевой спекуляции на движении курсов акций ‘своего’ предприятия. Размер фиктивного капитала, при ведущей тенденции к его возрастанию, подвержен резким колебаниям на различных фазах экономического цикла, раздуваясь при подъёмах, сжимаясь во время кризисов. Курс акций растёт при повышении или даже слухах о повышении дивиденда, колеблется под влиянием политических событий или сознательных биржевых манипуляций заправил банковских и промышленных монополий. Именно они во всех случаях присваивают огромные спекулятивные доходы за счёт капиталистов-рантье и ограбления мелких держателей акций (смотрите Биржа). Вся деятельность акционерных обществ, начиная с их учредительства, органически связана с безудержной спекуляцией и огромными паразитическими доходами. В капиталистическом хозяйстве нет чёткой грани между нормально действующими и ‘дутыми’ акционерными обществами, организуемыми лишь для того, чтобы сбыть побыстрее и подороже акции легковерной ‘публике’, пока ещё не выяснились мошеннические проделки учредителей. Так, в горнодобывающей промышленности при слабой разведанности месторождений быстрый рост курсов, учреждаемых акционерных обществ, может и обогатить и разорить первых покупателей акций. Например, известный политический деятель США Хёбёт Клак Хувё (или Герберт Гувер; Herbert Clark Hoover; 1874–1964) разбогател на многолетнем учредительстве горнодобывающих акционерных обществ, а их акционеры потеряли 322 миллиона Долларов. Крупным источником личного обогащения хозяев акционерных обществ являются разные коммерческие махинации, к числу которых относятся поставки хозяевами ‘своему’ акционерному обществу по завышенным ценам материалов, оборудования, продажа по раздутой ‘стоимости’ патентов или прав на разработку месторождений и тому подобного. Завышенные цены либо списываются на текущие расходы, то есть уменьшают текущую прибыль акционерного общества, либо ‘погашаются’ за счёт его скрытых резервов, то есть замаскированной прибыли предшествующих лет. Одним из способов обогащения монополистических магнатов, стоящих во главе акционерных обществ, являются финансовые реорганизации акционерных обществ. Новые заправилы проводят двоякую операцию:- увеличивают акционерный капитал путём выпуска новых акций и уменьшают прежний акционерный капитал, формально на сумму вызвавших банкротство убытков, фактически же в значительно больших размерах. Разница образует невидимые на балансе скрытые резервы, из чего новые хозяева акционерных обществ извлекают выгоды. Возможности финансовых и коммерческих махинаций подлинных хозяев сильно возрастают при системе участий. Патронирующее или Контрольное Акционерное Общество юридически, сверх номинальной цены своего контрольного пакета в дочернем акционерном обществе, не отвечает за его деятельность. Между ними заключаются любые сделки, продиктованные личными интересами подлинных хозяев. Таким путём, например, все прибыли могут быть искусственно сосредоточены в головном акционерном обществе, использованы хозяевами в своих интересах, а дочернее предприятие доведено до частичного или полного банкротства. Акционерные общества в России возникли ещё в дореформенное время. К 1861 было 120 акционерных обществ (без железнодорожных) с 100 миллионами Рублей капиталов (из них 35 миллионов Рублей в промышленности). К 1881 число акционерных обществ увеличилось до 635, их капиталы до 840 миллионов Рублей. Крупные акционерные капиталы и ещё большие облигационные займы железнодорожных акционерных обществ имели правительственную гарантию и относились в России к сфере производительного государственного кредита. Во время экономического подъёма 1890-х число акционерных обществ удвоилось, их капиталы достигли 2.4 миллиардов Рублей, в том числе капиталы промышленных акционерных обществ утроились до 1.5 миллиардов Рублей. К 1914 2 235 акционерных обществ имели капитал 4.7 миллиарда Рублей, из них 1 621 промышленные акционерные общества – 3.2 миллиарда Рублей. Акционерные общества занимали в дореволюционной России доминирующее положение в фабрично-заводской промышленности (60% её продукции) и были в среднем намного крупнее, чем в США и в Германии. Акционерные общества в бывшем Союзе Советских Социалистических Республик (СССР) были образованы в 1920-х при переходе к новой экономической политике (НЭП) и представляли тогда одну из форм управления Советской промышленностью, торговлей и банками при совместном участии в управлении нескольких хозяйственных организаций. С 1929 30 эта форма стала заменяться формами государственных объединений, трестов и торгов. После 2-й Мировой Войны в некоторых странах народной демократии Советским Союзом и правительствами этих стран были совместно на паритетных началах организованы акционерные общества. Целью их являлось развитие важных промышленных отраслей при участии и помощи СССР. С достижением этой цели совместные акционерные общества были ликвидированы, а доля в них Советского Союза передана им на льготных условиях заинтересованным правительствам. Акционерное Общество в гражданском праве:- гражданское право буржуазных государств рассматривает акционерное общество как вид товарищества, отличительными особенностями которого являются:- признание его юридическим лицом; имущественная ответственность исключительно в пределах принадлежащего ему имущества; разделение капитала на части – Акции. Процесс учреждения и порядок деятельности акционерных обществ детально

регламентированы законодательством всех капиталистических стран (например, во Франции Закон О Торговых Товариществах 1966, в Федеративной Республике Гкрмания (ФРГ) Закон Об Акционерных Обществах 1967, в Англии Закон О Компаниях 1967). Образование акционерного общества начинается с выработки учредителями устава акционерного общества, который должен быть оформлен в виде удостоверенного судом или нотариусом акта, причём законодательство предусматривает не только форму устава, но и его содержание. В Английском праве вместо устава составляются два документа:- (i) Меморандум Компании (термин Акционерное Общество отсутствует в Английском праве) – регулирует внешние отношения компании; и (ii) Внутренний Регламент – взаимоотношения пайщиков и компании. Кроме выработки устава для возникновения акционерного общества в большинстве капиталистических стран необходимо размещение всего основного (акционерного) капитала, при этом определённая, указанная в законе, часть его должна быть оплачена. Размер основного капитала акционерного общества определяется его Уставом (поэтому он называется Уставным Капиталом). Так как одной из функций основного капитала является защита интересов кредиторов, закон запрещает выпуск акций по цене ниже номинала, предписывает обязательную оплату части установленной законом стоимости акций и так далее. Уменьшение размера основного капитала ниже предусмотренного законом уровня рассматривается как основание для ликвидации акционерного общества. Право большинства капиталистических государств (за исключением права Англии и США) устанавливает минимальный размер основного капитала. Увеличение его размера осуществляется выпуском новых акций или увеличением предусмотренного уставом размера каждой ранее выпущенной акции. Основной капитал может быть образован объявлением публичной подписки на акции или распределением акций между учредителями (последний метод становится всё более распространённым). В Англии, в зависимости от способа образования Паевого Капитала, различают два вида компаний – публичные и частные (число частных компаний значительно превышает число публичных). Членство в акционерном обществе связано с приобретением акционером личных и имущественных прав. К Личным Правам относится право на участие в общих собраниях, на членство в руководящих органах акционерного общества. К Имущественным Правам относятся право па получение годовой прибыли в форме дивиденда и право на получение части имущества акционерного общества в случае его ликвидации, если после удовлетворения требований кредиторов остаётся имущество для распределения между акционерами. Следующей стадией учреждения акционерного общества является проведение первого собрания будущих акционеров, на котором избираются органы общества. Акционерное общество считается возникшим с момента обязательной регистрации его в торговом реестре. В качестве органов акционерного общества право Англии и США предусматривает Общее Собрание и Правление (Совет Директоров), имеются также Ревизоры (Аудиторы). По праву ФРГ, акционерное общество должно иметь общее собрание, правление, наблюдательный совет и ревизоров. Во Франции акционерному обществу предоставляется право иметь либо общее собрание, правление (административный совет) и ревизоров (комиссаров), либо общее собрание, директорат, наблюдательный совет и комиссаров. Правление акционерного общества – орган, в компетенцию которого входит управление делами акционерного общества и представительство по его делам вовне. Обычно правление назначается общим собранием акционеров, в ФРГ – наблюдательным советом. Во Франции в акционерном обществе с наблюдательным советом, последний назначает директорат. Хотя законодательство всех капиталистических государств закрепляет функции управления и представительства акционерного общества за правлением, фактически эти функции правление передаёт одному или нескольким членам правления. Наблюдательный Совет как орган акционерного общества известен праву ФРГ, Франции, Японии; он не только контролирует деятельность правления, но и решает вопросы управления акционерным обществом. В ФРГ наблюдательному совету присвоены и некоторые функции представительства вовне. Общее собрание акционеров лишь формально является основным органом акционерного общества. Сужение компетенции общего собрания в законодательном порядке, возможность голосования по доверенности лишают рядового акционера возможности воздействовать на деятельность акционерного общества. Общие Собрания созываются правлением и, как правило, по его инициативе; однако они могут быть также созваны по требованию акционеров, представляющих установленную в законах долю основного капитала. Законодательство всех стран предусматривает избрание общим собранием акционеров ревизоров, в задачи которых входит проверка отчётов правления, книг акционерного общества, инвентаря, ценных бумаг и так далее. Деятельность акционерного общества прекращается:- по истечении срока, на который оно создано; по решению общего собрания акционеров, принятому квалифицированным большинством, установленным законодательством; в силу объявления общества несостоятельным; по постановлению соответствующих органов государственной власти. По законодательству множества капиталистических стран сосредоточение акций в руках одного акционера не является основанием для прекращения акционерного общества. Во Франции объединение всех акций в руках одного акционера также не влечёт за собой прекращения существования общества, но любое заинтересованное лицо может потребовать прекращения деятельности общества, если такое положение будет продолжаться более одного года.

COMPANY CLOSING ACCOUNT = ПОДВЕДЕНИЕ ИТОГОВ ПО СЧЕТАМ КОМПАНИИ (или ЗАКРЫВАЮЩИЙ СЧЁТ КОМПАНИИ) – Company Closing Account:- in accounting, this account is used to record the close of the prior fiscal year. After the prior year is closed, the balance remaining in the account should be zero (0).

COMPANY GUARANTEE = ГАРАНТИЯ КОМПАНИИ (или КОМПАНЕЙСКАЯ ГАРАНТИЯ) – Company Guarantee is a letter of guarantee from a company relieving the carrier of responsibility associated in the release of goods without an original Bill of Lading. This practise should be exercised with extreme caution, and cannot be recommended. Company Guarantee is a letter of guarantee from a company indemnifying the carrier of responsibility associated with the release of goods in lieu of a bill of lading. / Гарантия Компании – гарантийное письмо (или письмо о гарантии) от компании, .

COMPANY ISSUED OPTIONS = ОПЦИОНЫ, ЭМИТИРОВАННЫЕ КОМПАНИЕЙ (или ОПЦИОНЫ, ВЫПУЩЕННЫЕ КОМПАНИЕЙ) – Company Issued Options are options issued by the company that give the holder the right to acquire a certain number of fully paid ordinary shares at a stipulated price at any time in the future up to the expiry date. While a company issued option can be listed on the exchange, it does differ slightly from other options you may see. If you exercise the company option, new shares are issued and the company collects the full agreed price of the share from the option holder.

COMPANY OPTIONS = ОПЦИОНЫ КОМПАНИИ (или КОМПАНЕЙСКИЕ ОПЦИОНЫ) – Company Options:- a contract by which an entity is bound to issue new securities, usually at a set exercise price, if the option holder wishes to take the new shares. Differences Between Company Options and Exchange Traded Options:- Company Options are issued by companies for the purpose of raising funds. They give shareholders an opportunity to buy new shares at a fixed price on or before a predetermined date. This gives the company the ability to raise funds for future projects. The exercise of company issued options results in an increase in the company's capital. The terms and conditions are determined solely by the company. All company options are call options. Exchange traded options (ETOs) are traded over existing shares. Their exercise results in a transfer of ownership of the underlying shares, and not in an increase in the company's capital. The company is not a party to the contracts traded. An example of a company option is (AEEO) Aura Energy Limited, option expiring on 31-December-2008:- the company option is traded like shares. If you type in the code (AEEO) in the share price section of the Australian Securities Exchange (ASX) website's prices search page it will give you the current price (20

minute delayed feed). Please note that the company option will cease trading normally around five business days before the expiry date listed. Details of the company option can be obtained from the share registry, or the company itself. You can find the contact details on the by typing the stock code (AEE) on the ASX website's share prices search page. How to find a list of company options? You can find a list of company options on the Trading Room website. Click on the 'Quotes & Charts' tab at the top then click on the 'Code lookup' link. Under the drop down menu next to 'Security Group' you will see Company Option. Leave the other fields as is, and hit 'search'. This will give you a list of company options. Again it is important to be aware that the last traded date is different to the expiry date. It generally is about five days before this. / Под Опционами Компании понимается контракт, посредством которого данное юридическое лицо обязуется выпустить новые ценные бумаги, обычно по установленной цене исполнения, если владелец опциона пожелает взять эти новые акции.

COMPANY SECRETARY = СЕКРЕТАРЬ КОМПАНИИ (или КОМПАНЕЙСКИЙ СЕКРЕТАРЬ) – Company Secretary is a person required to be appointed under the Corporations Law and usually having the responsibility for all the record-keeping within the company. Someone who is responsible for ensuring that his or her company complies with company law. / Секретарь Компании – лицо, в отношении которого существует требование о назначении в соответствии с Законом о Корпорациях, и, как правило, отвечающее за сохранность всех записей, связанных с данной компанией.

COMPARATIVE ADVANTAGE = СРАВНИТЕЛЬНОЕ ПРЕИМУЩЕСТВО (или ОТНОСИТЕЛЬНОЕ ПРЕИМУЩЕСТВО) – Comparative Advantage describes the ability of a person, company or country to produce a good or service at a lower cost relative to other goods and services. Even though a country may have an absolute advantage over another country, it still will be better off specializing in the good or service in which it has a comparative advantage and trading for goods and services it doesn't produce as efficiently. State of being more efficient in one activity than in another, relative to a different country, e.g., country is able to produce cars twice as efficiently as another, but produces aeroplanes ten times more efficiently. In a free market, this country would export aeroplanes and import cars and it is said that, in the production of aeropanes, it has a comparative advantage over the other. Comparative Advantage is the ability of one economic actor (an individual, a household, a firm, a country, etc) to produce some particular good or service at a lower opportunity cost than other economic actors can. That is, the economic actor with a comparative advantage can produce the particular good or service by giving up less value in other goods or services that he could otherwise produce with his labor and resources than the other economic actors would have to give up in producing that same good or service. This perhaps can be made clearer by a hypothetical example:- Suppose both individual A and individual B are able to produce two valuable goods called 'Widgets' and 'Whatsits'. For Mr. A, producing one widget requires ten hours of labor and producing one whatsit requires thirty hours of labor. For Mr. B, producing one widget requires five hours of labor and producing one whatsit requires ten hours of labor. (To keep the example simple, let us assume that both Mr. A and Mr. B each use up precisely the same amount of capital and materials when they are making the same product.) Since every hour of labor devoted to making widgets is an hour that cannot be used for making whatsits, and since there are only so many hours of working time available per month, both Mr. A and Mr. B face trade-offs in allocating their working time between the two possible activities:- making more widgets means making fewer whatsits and vice versa. But the precise numerical trade-offs the two face are different. For Mr. A, every additional whatsit he produces 'costs' him the three widgets he could otherwise have made in the necessary thirty hours. For Mr. B, every additional whatsit he produces 'costs' him the two widgets he could otherwise have made in the necessary ten hours of labor. Because Mr. B only has to give up two widgets per whatsit, while Mr. A has to give up three widgets per whatsit, Mr. B is said to have a 'comparative advantage' in whatsit making. (By the same token, Mr. A has a 'comparative advantage' in widget making, since he only gives up 1/3 of a whatsit for every widget he makes, whereas Mr. B gives up 1/2 of a whatsit for each widget.) Note that an economic actor can display a comparative advantage in the production of a particular good even when the other actor happens to have an absolute advantage in producing the same good. In our particular example, Mr. B is evidently much more efficient in making both products than Mr. A is. (In any given period of time, Mr. B can produce twice as many widgets or three times as many whatsits as Mr. A can.) Thus Mr. B has an absolute advantage in making both products, but Mr. A nevertheless still has a comparative advantage in widget making. This is because any actor's comparative advantage depends only upon the relationship between that single actor's own levels of productivity for two goods under consideration, while absolute advantage depends only upon the relationship between two actors' levels of productivity for the same single good under consideration. The distinction between comparative and absolute advantage is important because it is comparative advantage (and not absolute advantage) that determines the amount of the potential gains in output from specialization and trade between the two actors. And this leads us to the Principle of Specialization According to Comparative Advantage:- total production of goods will be increased if each economic actor devotes more of his scarce resources to producing the good(s) in which he has a comparative advantage and less of his scarce resources to producing the good(s) in which he has a comparative disadvantage. In our example, if Mr. A works 180 hours a month producing only widgets (the area of his comparative advantage), he can produce 18 widgets. If Mr. B works 180 hours a month producing only whatsits, he can produce 18 whatsits. If the two actors can agree to trade goods at any exchange ratio ('price') that is somewhere between the (different) opportunity cost ratios of the two actors (in our example, anything between two whatsits per widget and three whatsits per widget), then both actors will be able to have more of both goods ('be better off') with specialization than would be possible without specialization, even if one actor has an absolute advantage over the other in production of both goods. Mr. A will not voluntarily plan to trade away any of his widgets for less than 1/3 of a whatsit each because he can make the whatsits himself at that price, but he will come out ahead if Mr. B will give him more than 1/3 whatsit per widget. Mr. B will not voluntarily plan to trade away any of his whatsits at a price of more than 1/2 whatsit per widget because he can make widgets for himself at that price, but he will be ahead of the game if Mr. A will swap him at less than 1/2 whatsit per widget. Thus there is plenty of room for the two to bargain out a deal that is beneficial to both. (Through trade, each can have at least the same amount of widgets and whatsits that he would enjoy if each produced both products for his own consumption – plus the added benefit of the hours saved via specialization, that can be enjoyed either directly in the form of extra leisure time or indirectly by using the hours saved to produce still more of these or other goods.) However, if some kind of legal or illegal coercion (or perhaps extreme moral pressure from public opinion in a very traditional society) is exerted to fix an exchange ratio for the two goods that is not within the bargaining range between the opportunity cost ratios of the two actors, then either:- (i) trade will not take place at all between them (because one actor would be worse off than if he produced both goods for himself and hence will not voluntarily agree to specialize so as to trade on such terms); and (ii) an 'exploitive' division of labor (such as slavery, serfdom, corvee, etc) will somehow be imposed involuntarily so as to benefit one actor by assigning him all the gains from specialization and then some, at the expense of worsening the condition of the other 'involuntarily specialized' actor. A principle based on the assumption that an area will specialize in producing goods for which it has the greatest advantage or the least comparative disadvantage. / сравнительно неблагоприятные условия.

COMPATIBILITY = СОВМЕСТИМОСТЬ – Compatibility is the characteristic of a substance that allows it to be mixed in a formulation without undesirably altering the characteristics or effects of the individual components.

COMPATIBILITY CHARACTERISTICS = ХАРАКТЕРИСТИКИ СОВМЕСТИМОСТИ – Compatibility Characteristics:- interrelationships between the transport properties of products in relation to each other and in relation to the environment.

COMPATIBLE = СОВМЕСТИМОЕ (или СХОДНОЕ, или СООБРАЗНОЕ) – Compatible:- said of plants with morphologic and genetic traits enabling them to cross-pollinate, bud, or graft easily to produce progenies.

COMPATIBLE SHRINKAGE = СООБРАЗНАЯ (или СХОДНАЯ, или СОВМЕСТИМАЯ) УСАДКА – Compatible Shrinkage is a term used for bonded fabrics to indicate that the face fabric and lining have similar shrinkage. This is necessary to avoid puckering. / Puckering = Растяжение ткани с внешним видом посадки. Это необходимо для избежания сморщивания.

COMPENSATING PRODUCTS = КОМПЕНСИРУЮЩИЕ ПРОДУКТЫ – Compensating Products are products resulting from processing under the inward or outward processing procedure. Main compensating products are those for the production of which the arrangements were authorised, whilst secondary compensating products are necessary by-products of the processing operation.

COMPENSATION = КОМПЕНСАЦИЯ – (1) Compensation includes all employee benefits. Employee benefits are all forms of consideration paid or payable by the entity, or on behalf of the entity, in exchange for services rendered to the entity. It also includes such consideration paid on behalf of a parent of the entity in respect of the entity. Compensation includes:- (i) short-term employee benefits, such as wages, salaries and social security contributions, paid annual leave and paid sick leave, profit sharing and bonuses (if payable within twelve months of the end of the period) and non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees; (ii) post-employment benefits such as pensions, other retirement benefits, post-employment life insurance and post-employment medical care; (iii) other long-term employee benefits, including long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not payable wholly within twelve months after the end of the period, profit sharing, bonuses and deferred compensation; (iv) termination benefits; and (v) equity compensation benefits. / Под Компенсационными Выплатами понимаются любые возмещения работникам и служащим дополнительных расходов, связанных с выполнением их трудовых обязанностей. К таковым могут относиться, например, квартирные и суточные при командировках или единовременные и подъёмные пособия при переводе на работу в другую местность.

(2) Compensation:- usually a sum of money paid in lieu of something lost.

(3) Within GATT (short for the General Agreement on Tariffs and Trade), Compensation is the principle that any country that raises a tariff above its ‘bound rate’ or otherwise impairs a trade concession must lower other tariffs or make other trade concessions to compensate countries whose exports are affected. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

(4) Compensation:- The Cotton Plant’s response to fruit loss in terms of new growth, added development, or adjusted fruit retention. The nature of the compensatory response is related to the age and growth stage of the plant, and the actual mechanism is associated with carbon partitioning and the dynamics of resource allocation within the plant.

COMPENSATION OF EMPLOYEES = КОМПЕНСАЦИЯ РАБОТНИКАМ – Compensation Of Employees is made up of two components:- (i) wages and salaries payable in cash or in kind:- these include the values of any social contributions, income taxes, etc, payable by the employee even if they are actually withheld by the employer and paid on behalf of the employee; and (ii) the value of social contributions payable by employers:- these may be the actual social contributions payable by employers to Social Security schemes or to private funded social insurance schemes to secure social benefits for their employees; or imputed social contributions by employers providing social benefits through unfunded schemes. Compensation of employees is not payable in respect of unpaid work undertaken voluntarily, including the work done by members of a household within an unincorporated enterprise owned by the same household. Compensation of employees excludes any taxes payable by the employer on the wage and salary bill (e.g. payroll tax, fringe benefits tax). Compensation Of Employees:- total remuneration payable to employees in cash or in kind. Includes the value of social contributions payable by the employer. Compensation of employees reflects the total remuneration in cash or in kind paid to employees and comprises wages and salaries and the value of social contributions paid by employers. They typically form the largest part of value added. Combined with estimates of labour input they provide the basis for a number of important statistics including unit labour costs and average earnings; which play an important role in many countries in monetary policy and cross country comparisons of labour costs. It’s important to note that compensation of emplo-yees does not represent the entire costs of labour within production. Mixed income, which reflects the income paid to the owner(s) or members of the same household who contribute unpaid labour inputs in unincorporated enterprises owned by households, also contains a labor component. Comparability:- all countries follow the 1993 SNA (short for the System of National Accounts) and so comparabi-lity is generally very good across all countries. Some care should be taken in interpreting labour costs by activity however, especially in a cross-country context. In some countries, and notably in some sectors, the shares of self-employed in the labour force may be significant and, so, differences in the shares of compensation of employees across countries may reflect institutional differences, for example tax incentives to be self-employed or otherwise. This can also have implications in a temporal context. For example systematic declines in the contribution of compensation of employees to value added may reflect a move by individuals to become self-employed rather than a decline in the share of labour overall; this can be both through push and pull mechanisms. For example squeezes on wages and salaries and social benefits (push) or tax incentives (pull).

COMPENSATORY INTEREST = КОМПЕНСАЦИОННЫЙ ПРОЦЕНТ – Compensatory Interest is the interest charged when certain goods are diverted to free circulation. / Процент, выплачиваемый в тех случаях, когда определённые товары изымаются на время из свободного обращения.

COMPETITION = КОНКУРЕНЦИЯ (или СОРЕВНОВАНИЕ) – (1) Competition is one of the most important concepts in economics, yet when examined closely, it turns out to be one of the most elusive concepts to nail down in practice. A market in some particular good or service is said by economists to be ‘competitive’ if a substantial number of buyers and sellers trade in the good or service independently and thus no single buyer or seller is so ‘weighty’ in the marketplace as to significantly influence the going price of the good or service by his/her individual decisions about how many units he personally will buy or sell. The practical problems (and disagreements) in assessing whether a particular market is ‘competitive’ or not arise when you look at the real world and try to specify the geographic boundaries of the market and the breadth or narrowness of the definition of the good on which you are focussing. Billy-Bob Motors may have the only Ford dealership in town, giving him a ‘monopoly’ in some very narrow sense – but local car buyers will be quick to travel to other Ford dealerships in any of a number of other cities or towns if Billy-Bob tries to take advantage of his monopoly by jacking up the price and then word gets around (perhaps through advertising) that there are noticeable advantages in the deals offered on Fords elsewhere. The bigger the price differential and the lower the transportation costs between seemingly distinct market areas, the larger the effective market area really becomes. Similarly, dealerships in Chevrolets, Plymouths, Volkswagens, Toyotas, Nissans, Volvos, Fiats, Hyundais, and Hondas are not selling exactly the same products as Ford dealerships (even Fords come in various models), but they sell very close substitutes for Fords that many buyers will turn to if the price of a new Ford at Billy-Bob’s seems out of line. Used car dealers, estate sale auctions, bankruptcy liquidators and ordinary citizens selling their old cars through newspaper ads provide still other sources of supply for slightly less close substitutes for a brand new Ford. Even taxis, bus

systems, rent-a-car agencies, subway systems, railroads, tractors, motorcycles, motorscooters, mopeds, bicycles, roller skates, dog-sleds and 'shanks' mare' constitute partial substitutes for Ford ownership as a method of getting around from point A to point B and thus have a 'competitive' restraining effect on pricing in the local market for Fords (which may be seen as only a part of some much broader market in means of personal transportation). The bottom line – competitiveness in markets is a matter of degree, and the observer's assessment of the degree of competitiveness in concrete instances will be heavily influenced by the observer's initial assumptions about the geographic extent of the market area and the breadth or narrowness of his definition of the good or class of goods that constitute equivalent products. State of rivalry among buyers and sellers for the supply and demand of goods and services, for production resources and for capital. Perfect, or atomistic, competition in the Classical School of economic thought was a concept based on ideal supply and demand conditions and does not exist anywhere. Perfect competition is a theoretical concept that is mainly used to illustrate economic principles. Imperfect competition as we know it is replete with exceptions and aberrations, but it reflects economic reality. Over the years, economic theorists have gradually adopted a highly relative concept of competition based on the observation and evolution of economic reality. Competition can only be defined based on the characteristics and conditions applicable to a given economy; it therefore refers to the extent to which buyers and sellers can exert control over prices in a given situation or economy. Control reflects the natural rivalry among actors who seek to maximize profits, and who work within an institutional framework that ensures a minimum of fair play. Fair play can be assured only by adequate government restrictions on cartels and monopolies, unfair trading practices and the power of the private sector, and by the independence of government from the private sector. / Билы-Баб Мотоз (Billy-Bob Motors). Фоды (Fords). Аналогично этому дилерство по Щевролэйам (Chevrolets), Плымэсам (Plymouths), Фольксвагэнам (Volkswagens), Тойотам (Toyotas), Ниссанам (Nissans), Вольво (Volvos), Фиатам (Fiats), Хёндэям (Hyundais), и Хондам (Hondas). Под Несовершенной Конкуренцией, насколько мы знаем, понимается насыщенная с исключениями и аберрациями, но всё же отражающая экономическую реальность. С годами экономические теоретики xxxxx обсервация (наблюдение) и эволюция экономической реальности. Под Конкуренцией, от позднелатинского слова Concurrentia, понимается антагонистическая борьба между частными товаропроизводителями за более выгодные условия производства и сбыта товаров, за получение наивысшей прибыли. Она порождается частной собственностью на средства производства и выступает как механизм стихийного регулирования общественного производства. Для домонополистического капитализма характерна свободная конкуренция, главным образом путём сбивания цен; при империализме свободную конкуренцию сменяет монополия. Однако, господство монополий не устраняет, а обостряет конкурентную борьбу, которая ведётся между монополиями, внутри них, между ними и отдельными немонополизированными предприятиями, между империалистическими державами. В этой борьбе широко используются различные формы неценовой конкуренции, под которыми скрываются методы сбыта, техническое превосходство и другие.

(2) Competition is the active acquisition of limited resources by an organism which results in a reduced supply, and consequently reduced growth, of the organisms in a common environment. Competition is a rivalry between two or more organisms for a limiting factor in the environment.

COMPETITIVE ABILITY = СПОСОБНОСТЬ КОНКУРИРОВАТЬ (или КОНКУРЕНТОСПОСОБНОСТЬ) – Competitive Ability is the success of one species or a variety to produce a greater proportion of offspring in the next generation at the expense of another.

COMPETITIVE BIDDERS = КОНКУРЕНТОСПОСОБНЫЕ ПОКУПАТЕЛИ (или КОНКУРИРУЮЩИЕ ПОКУПАТЕЛИ) – Competitive Bidders:- in the United States, one of two categories of bidders on Treasury securities:- competitive and noncompetitive. Competitive bidders are usually financial institutions.

COMPETITIVE IMPORTS = КОНКУРЕНТНЫЕ ПРИВОЗЫ – Competitive Imports are the imported products that are also produced domestically. See also Import Barriers; Import Quota; Imports; and Import Substitution.

COMPETITIVE TRADER = КОНКУРИРУЮЩИЙ ТОРГОВЕЦ – Competitive Trader is a member of the exchange who trades in stocks on the floor for an account in which the member firm has an interest. Also known as Registered Trader.

COMPETITOR = КОНКУРЕНТ (или СОПЕРНИК) – Competitor is an organism which competes with pests for essential elements (e.g., food, shelter) in the environment. / (например, пище, укрытию) в окружающей среде.

COMPILATION = КОМПИЛЯЦИЯ (или ПОДБОРКА) – Compilation is a presentation of financial statement data without the accountant's assurance as to conformity with generally accepted accounting principles (GAAP). / Под Компиляцией, от Латинского слова Compilatio, означающее Ограбление или Похищение, понимается составление сочинений на основе чужих исследований или чужих произведений без самостоятельной обработки источников; работа составленная таким методом.

COMPLEMENT = ЛИЧНЫЙ СОСТАВ – Complement is the number of officers and crew employed upon a vessel for its safe navigation and operation.

COMPLEMENTARY DNA = КОМПЛЕМЕНТАРНАЯ ДНК (или ВЗАИМОДОПОЛНЯЮЩАЯ ДНК) – Complementary DNA (cDNA) is DNA synthesized by reverse transcriptase from an mRNA template. / Комплементарная ДНК (кДНК) – ДНК, синтезированная информационная рибонуклеиновая кислота (иРНК; messenger Ribonucleic Acid (mRNA)).

COMPLEMENTARY GENES = КОМПЛЕМЕНТАРНЫЕ ГЕНЫ (или ВЗАИМОДОПОЛНЯЮЩИЕ ГЕНЫ) – Complementary Genes are two or more genes, neither of which when alone is capable of producing a phenotypic effect, but which 'complement' each other and work as a team to produce an effect.

COMPLEMENTARY RNA = КОМПЛЕМЕНТАРНАЯ РНК (или ВЗАИМОДОПОЛНЯЮЩАЯ РНК) – Complementary RNA (cRNA) is a synthetic RNA produced by transcription from a specific DNA single-stranded template. / Комплементарная РНК (кРНК) – синтетическая РНК, .

COMPLEMENTS = ДОПОЛНЕНИЯ (или ДОПОЛНИТЕЛЬНЫЕ ЦВЕТА) – Complements:- these are colors that are opposite one another on the hue circle. / Под Дополнительными Цветами понимаются цвета, которые при смешивании дают в глазу ощущение белого цвета, например, сине-зелёный и красный, оранжевый и синий, зелёно-жёлтый и фиолетовый.

COMPLETE = СОВЕРШЕННЫЙ (или ЗАКОНЧЕННЫЙ, или ПОЛНЫЙ, или АБСОЛЮТНЫЙ) – Complete – with all parts – of a flower with sepals, petals, stamens and pistils. / чашелистики (sepals), , тычинки (stamens) и .

COMPLETE FERTILIZER = ПОЛНОЕ УДОБРЕНИЕ – (1) Complete Fertilizer:- used formerly to denote a fertilizer containing appreciable amounts of N, P, and K; it now includes secondary and micronutrients essential to plant growth. (2) Complete Fertilizers is a classification of fertilizer materials guaranteed to contain three of the major required elements, namely, N, P, and K.

COMPLETE HEADING = ПОЛНОЕ ВЫМЁТЫВАНИЕ (или ПОЛНОЕ ВЫБРАСЫВАНИЕ МЕТЁЛКИ, или ПОЛНОЕ КОЛОШЕНИЕ, или ПОЛНОЕ ВЫКОЛАШИВАНИЕ) – Complete Heading:- when all panicles of a plant (or a plot of plants) have emerged.

COMPLETELY KNOCKED DOWN = ПОЛНОСТЬЮ РАЗОБРАННЫЕ – Completely Knocked Down:- parts and subassemblies being transported to an assembly plant.

COMPLETELY KNOCKED DOWN CARS = ПОЛНОСТЬЮ РАЗОБРАННЫЕ АВТОМОБИЛИ – Completely Knocked Down (CKD) Cars:- for the purposes of customs, cars are not transported fully assembled, or are partially dismantled after being assembled. Final assembly of the vehicles is subsequently carried out once they reach their destination. CKD transportation makes it possible to avoid high import duties (100% and more).

COMPLETELY RANDOMIZED DESIGN = ПОЛНОСТЬЮ РАНДОМИЗИРОВАННЫЙ ДИЗАЙН (или ПОЛНОСТЬЮ СЛУЧАЙНЫЙ ДИЗАЙН) – Completely Randomized Design (CRD) is an experimental design in which no blocking technique is employed and treatments could be randomly assigned to any experimental plot. It is appropriate only for cases with homogeneous experimental units.

COMPLETE TILLAGE = ПОЛНАЯ ВСПАШКА (или ПОЛНАЯ ОБРАБОТКА ПОЧВЫ) – Complete Tillage is a tillage sequence made up of one broadcast, primary tillage operation and one or more broadcast, secondary tillage operations, plus one or more cultivation, either broadcast or strip. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

COMPLETION CODE = КОД ЗАВЕРШЕНИЯ (или КОД ПОЛНОТЫ ИСПОЛНЕНИЯ) – Completion Code is a part of the response from any component on a given command. It indicates whether the command was successful or not. In the latter case the completion code indicates the reason why it was not successful.

COMPLEX GREASE = КОМПЛЕКСНАЯ ПЛАСТИЧНАЯ СМАЗКА (или КОМПЛЕКСНАЯ КОНСИСТЕНТНАЯ СМАЗКА) – Complex Grease is a lubricating grease thickened by a complex soap consisting of a normal soap and a complexing agent. See also Grease. / комплексными мылами, состоящими из нормального мыла и комплексообразующего агента (или комплексообразователя).

COMPLEX WEAVE = СЛОЖНОЕ ПЕРЕПЛЕТЕНИЕ (или КОМПЛЕКСНОЕ ПЕРЕПЛЕТЕНИЕ) – Complex Weaves include multiple plane, pile, inlaid, Jacquard, dobby, and gauze (or leno) weaves. / Жакяр (Jacquard).

COMPLIANCE = ИСПОЛНЕНИЕ ПРАВИЛ (или СОБЛЮДЕНИЕ ПРАВИЛ) – The purpose of 'Compliance' is to ensure that all banking activities accord with law, regulations, custom and practice and internal policies. Banks' compliance departments are also intended to avoid disadvantages to customers and conflicts of interest between transactions for customers, for the investment services firm or staff members and infringements of insider rules. Compliance is an important element of corporate governance. It refers to the company's behavior in accordance with laws, guidelines and voluntary codices.

COMPLIANCE = ПОДАТЛИВОСТЬ – Compliance is the ability of a fiber to yield under stress; the ratio of the change in strain to the change in stress that produces it; the reciprocal of the textile modulus.

COMPLIANCE DEPARTMENT = ПРАВОВОЙ ОТДЕЛ (или ОТДЕЛ ПО СОБЛЮДЕНИЮ ПРАВИЛ) – A Compliance Department is a department which oversees activities and makes sure they comply with laws, statutes, regulations and directives.

COMPLIANCE PROCEDURE = ПРОЦЕДУРА ИСПОЛНЕНИЯ ПРАВИЛ (или СОБЛЮДЕНИЯ ПРАВИЛ) – Compliance Procedure (for a consignment) is the official procedure used to verify that a consignment complies with stated phytosanitary requirements.

COMPONENT = КОМПОНЕНТ – (1) Component is the uniquely identifiable product that is considered indivisible for a particular planning or control purpose, and/or which cannot be decomposed without destroying it. A component for one organization group may be the final assembly of another group, e.g., electric motor. / В единственном роде идентифицируемый продукт, который рассматривается неделимым в целях конкретного планирования или контроля, и/или не может быть расчленён без его разрушения. Компонент для одной организационной группы может быть конечно собранным продуктом для другой группы, например, электродвигатель. Под Компонентом, от Латинского слова Componens, означающее Составляющий, понимается составная часть, элемент чего-либо.

(2) Component:- the smallest element of a contract containing a specific identifiable and separable feature that contains all of the economic features of a stand-alone contract.

COMPONENT TECHNOLOGY = ТЕХНОЛОГИЯ КОМПОНЕНТОВ (или КОМПОНЕНТНАЯ ТЕХНОЛОГИЯ) – Component Technology is the cultural techniques used in the management of a cropping pattern. These include choice of variety, time, and methods of tillage and crop establishment, fertilization, field-level water management, pest management, and harvesting.

COMPOSED OF = СОСТОЯЩЕЕ ИЗ (или СОСТАВЛЕННОЕ ИЗ) – Composed Of (used when defining the scope of a claim) is a transitional phrase that is interpreted in the same manner as either 'consisting of' or 'consisting essentially of', depending on the facts of the particular case (context).

COMPOSITE = СВОДНОЕ (или КОМПОЗИТ, или СОСТАВНОЕ) – (1) Composite:- in plant breeding, said of a population developed by putting together several individuals with distinct genotypes.

(2) Composite is a flower head composed of many small flowers, characteristic of Asteraceae. / цветочная головка или головка цветка (flower head) . Сводный, например, о цветке. , от Латинского слова Compositio, означающее Связывание или Составление, . Сложноцветные или Астровые растения.

(3) In textile, Composite is:- (1) an article or substance of two or more constituents, generally, with reinforcing elements dispersed in a matrix or continuous phase. (2) Hard or soft constructions in which the fibers themselves are consolidated to form structures rather than being formed into yarns. Rigidity of these constructions is controlled by the density, the modulus of the load-bearing fibers, and the fraction of fusible fibers. Strength is controlled by adhesion and shear-yield strength of the matrix unless fibers are bonded in a load-transferring matrix. (3) A structure made by laminating a nonwoven fabric with another nonwoven, with other materials, or by impregnating a nonwoven fabric with resins.

COMPOSITE DAX® = СВОДНЫЙ ДАКС® – Composite DAX® (CDAX®) comprises all domestic companies in the Prime and General Standard market segments. The index represents the performance of the German stock market in its entire breadth, i.e. all companies

listed on the Frankfurt Stock Exchange. See also DAX®, and Deutscher Aktienindex. / Сводный ДАКС® (DAX®) (КДАКС® (CDAX®)). Дойча Акциэниндэкс (Deutscher Aktienindex).

COMPOSITE FABRIC = КОМПОЗИТНАЯ ТКАНЬ – Composite Fabric is an engineered fabric made from two or more components. One component is often a strong fiber such as fiberglass, Kevlar®, or carbon fiber that gives the material its tensile strength, while another component (often called a Matrix) is often a resin, such as polyester or epoxy that binds the fibers together. / Под Композитной Тканью понимается инженерная ткань, сделанная из двух или более компонентов. Один компонент часто является крепким волокном, таким как стекловолокно, Кэвла® или Кевлар® (Kevlar®), или . Композитная Ткань представляет собой материал, состоящий из переплетённых волокон. В зависимости от типа переплетения варьируются свойства ткани. Используются в качестве армирующего наполнителя композитного материала.

COMPOSITE FIBERS = КОМПОЗИТНЫЕ ВОЛОКНА – Composite Fibers are the fibers composed of two or more polymer types in a sheath-core or side-by-side (bilateral) relation.

COMPOSITE SAMPLE = ОБЪЕДИНЁННАЯ ПРОБА – A Composite Sample is composed of a number of distinct portions, each obtained in a prescribed manner from consecutive samples. The portions are blended to make the composite. / В России, совокупность всех точечных проб, отобранных из партии зерна.

COMPOSITE VARIETY = СВОДНАЯ РАЗНОВИДНОСТЬ (или КОМПОЗИТНАЯ РАЗНОВИДНОСТЬ) – Composite Variety is a variety consisting of a number of components, such as inbred lines, all types of hybrids, populations, etc. A stage in the process of creating new varieties. To have common characters, such as similar growth period, degrees of resistance to lodging or to a pathogenic agent. The stability of the composite variety is limitless. The term is used whenever the plant involved is not to be extended. / свойства (characters) .

COMPOSITION ARRANGEMENT = ДОГОВОРЁННОСТЬ О КОМПОЗИЦИИ (или КОМПРОМИССНОЕ СОГЛАШЕНИЕ) – Composition Arrangement is an agreement under which a debtor who cannot pay all creditors in full pays each of them the same fixed percentage of the amount owed. The purpose of composition arrangements is to enable the business to liquidate its debts without compromising its chances for recovery and to avoid bankruptcy. While a bankruptcy judgment acknowledges the insolvency of a debtor (person or business) and seeks to arrive at a settlement among the creditors, a composition arrangement is reached between the debtor and its creditors and is usually the first procedure adopted. Also known as Composition With Creditors. See also Bankruptcy, Liquidation, and Reorganization. / Под Композицией, от Латинского слова Compositio, понимается возмещение вреда за причинённый ущерб. Улажение спора.

COMPOSITION OF COATING = СОСТАВ ПОКРЫТИЯ – Composition Of Coating is the quantity of each of the components expressed as a percentage of the total mass of the coating.

COMPOST = КОМПОСТ – Compost is the organic residues or a mixture of organic residues and soil that have been piled, moistened, and allowed to undergo biological decomposition. Compost is decomposed vegetation, used to improve the soil in gardens. / Под Компостами, от Немецкого слова Kompost, от Латинского слова Compositus, означающее Составной, понимаются органические удобрения, смесь навоза с торфом, землёй, фосфоритной мукой и тому подобным, разложившаяся под влиянием микроорганизмов. Применяют под различные сельскохозяйственные культуры. Содержат азот, калий, фосфор, микроэлементы. По эффективности равноценны навозу. Компостирование – способ обезвреживания нечистот, отбросов.

COMPOUND = СЛОЖНОЕ (или КОМПАУНД, или СОСТАВНОЕ, или СОЕДИНЁННОЕ) – (1) Compound:- with two or more like parts. Of leaves with several similar parts or lobes forming the whole. Of a flower head with outer ray florets forming ‘petals’ surrounding the inner disc flowers, as in Asteraceae. Compound:- composed of several similar parts. / цветочная головка или головка цветка (flower head) цветочки (florets). У сложных листьев, формирующихся из нескольких аналогичных частей или .

(2) Compound:- (1) chemically speaking, a distinct substance formed by the combination of two or more elements in definite proportions by weight and possessing physical and chemical properties different from those of the combining elements. (2) In petroleum processing, generally connotes fatty oils and similar materials foreign to petroleum added to lubricants to impart special properties. Compound:- composed of several similar parts. / Компаунды полимерные, литая изоляция, композиции на основе термореактивных олигомеров или мономеров; предназначены для пропитки (с целью изоляции) обмоток трансформаторов, дросселей электрических машин, изделий радиотехнической и электронной аппаратуры, а также для заполнения промежутков (заливки) между деталями радиотехнических и электронных устройств, в электрических машинах и аппаратах. Основное преимущество литой изоляции – возможность получения электротехнических изделий в виде малогабаритных блоков любой конфигурации, не требующих дополнительной обработки. К числу полимерных компаундов относят также имеющие ограниченное применение композиции на основе термопластических материалов (битумов, масел, канифоли, церезина и других); эти полимерные компаунды представляют собой твёрдые или воскообразные массы, которые перед употреблением переводят в жидкое состояние нагреванием. Для приготовления полимерных компаундов в качестве олигомеров чаще всего используют эпоксидные смолы, полиэфирные смолы, жидкие кремнийорганические каучуки, а в качестве мономеров – исходные продукты для синтеза полиакрилатов и полиуретанов. Наибольшее распространение получили эпоксидные полимерные компаунды. В состав полимерных компаундов, помимо мономеров и олигомеров, могут входить также пластификаторы, наполнители, ускорители отверждения или инициаторы полимеризации, пигменты. К неотверждённым полимерным компаундам предъявляются следующие требования:- отсутствие летучих компонентов; минимальная усадка при отверждении или полимеризации; низкая вязкость, обеспечивающая пропиточные и заливочные свойства; достаточно большая жизнеспособность. Отверждённые полимерные компаунды должны обладать высокими диэлектрическими () и прочностными показателями. Отверждение полимерных компаундов осуществляют при повышенных или обычных температурах.

COMPOUND ANNUAL GROWTH RATE = СОВОКУПНАЯ ГОДОВАЯ СТАВКА РОСТА – Compound Annual Growth Rate (CAGR):- measured in percentage points, is the effective annual rate of increase (using compound interest calculations) of an investment over time. It is similar to the IRR – Internal Rate of Return of an investment. These are built in to many time-value-of-money programs, including the financial functions in popular spreadsheets such as 1-2-3 and Excel as well as many calculators and on-line web-based calculators.

COMPOUND DUTY = СЛОЖНАЯ ПОШЛИНА (или КОМБИНИРОВАННАЯ ПОШЛИНА, или МНОГОКОЛОННАЯ ПОШЛИНА) – Compound Duty is a tax imposed on imported merchandise based on a percentage of value and also on the net weigth or number of pieces, etc. / Налог, взимаемый по привозу (или при импорте) товарной продукции, и основанный на проценте к её стоимости, а также на нетто весе или количестве штук и прочем.

COMPOUNDED OIL = КОМПАУНДИРОВАННОЕ МАСЛО – Compounded Oil is a petroleum oil to which has been added other chemical substances.

COMPOUNDED OPTION = УСЛОЖНЁННЫЙ ОПЦИОН – Compounded Options are options on options. There are four main types of compounded options:- a call on a call, a put on a call, a put on a call and a put on a put. Compounded options have two strike prices and two exercise dates. These exotic options provide the opportunity to enter in a weather derivative contract on a specified date paying a small up-front fee and avoiding possible future risks. Compounded options are not so often dealed in the weather derivatives market but they represent an alternative approach to be hedge within certain characteristics. These are options on options. The underlying asset is an option rather than a tangible commodity or security. Compound Option is an option on an option, permitting the purchaser to buy (or sell) an option on an underlying at a fixed price over a predetermined period. Usually sold on interest rate instruments (e.g., captions or floortions), or currencies. They are also used as components of more complex trades. Compound options are often bought to protect against increases in standard option prices during periods of high volatility. The upfront premium for a compound option is less than for a normal European-style option but if the option is exercised, the overall cost will be greater. Due to their greater flexibility the cost, if both options are exercised, is greater than a conventional option. Compound options can also be constructed on options other than European style options (e.g., barrier options) or portfolios of options (e.g., compound on a cylinder). Indeed compound options on compound options, otherwise known as Installment Options are common (often as part of more complex structures). An installment option requires the holder to pay fixed amounts of premium (installment) at certain installment dates to benefit from the right of exercise of the underlying option. At any point that holder can elect to let the installment payments lapse and loses any right of exercise. / Усложнённый Опцион – опцион на опционы. Соответствующим активом в таком опционе является другой опцион, а не реальное сырьё или ценная бумага.

COMPOUNDING = КОМПАУНДИРОВАНИЕ (или СМЕШЕНИЕ) – Compounding:- the addition of fatty oils and similar materials to lubricants to impart special properties. Lubricating oils to which such materials have been added are known as Compounded Oils.

COMPOUND INTEREST = СЛОЖНЫЙ ПРОЦЕНТ – Compound Interest is the interest upon interest, where accrued interest is added to the principal sum, and the whole treated as new principal, for the calculation of the interest for the next period. Compound Interest is the interest on interest. For example, if a loan accumulates interest that is not paid, then interest is charged on the original principal plus accumulated interest. Compounding can result in a geometric growth in the value of a investment or loan. The future value of an investment is calculated by the formula FV = PV·(1 + i)**n which shows that growth is non-linear. Interest which is accrued on previous interest that has become due and been added to the principal amount. Compound Interest:- an interest that is calculated on the original principal plus all interest accrued to that point in time. Since interest is paid on interest as well as the amount borrowed, the effective interest rate is greater than the nominal interest rate. The compound interest rate method is often used by banks and savings institutions in determining interest they pay on savings deposits 'loaned' to the institutions by the depositors. / Сложные Проценты:- проценты, насчитываемые не только на первоначальную величину, но и на проценты, уже наращенные на неё за предыдущий срок.

COMPOUND INTEREST EFFECT = ЭФФЕКТ СЛОЖНОГО ПРОЦЕНТА – Compound Interest Effect is the additional increase in the value of an investment due to the reinvestment of regular income ('interest on interest'). The positive effect becomes particularly pronounced over longer investment periods.

COMPOUND LEAVES = СЛОЖНЫЕ ЛИСТЬЯ – Compound Leaves have a fragmented blade, with divisions reaching the midrib. Sometimes each one of these fragments is similar to a single leaf. They are called Leaflets. Compound Leaves are leaves divided into two or more leaflets. / Сложные Листья – листья, разделённые на два или более листочков (leaflets). Сложный Лист, например лист Конского Каштана или большинства Бобовых, напротив, разделён на листочки, каждый из которых обычно снабжён собственным маленьким черешочком. Различают два основных типа сложных листьев – перистосложные и пальчатосложные. В перистосложных листьях листочки расположены по обе стороны главной оси, или рахиса, представляющего собой продолжение черешка. Все листочки пальчатосложного листа отходят от верхушки черешка, и рахис у них отсутствует. Листочки типичных сложных листьев снабжены сочленением. Сложные Листья имеют листовую пластинку из нескольких листочков, которые прикрепляются к черешку или главной жилке короткими черешками. Эти листочки, в отличие от простых листьев, при листопаде опадают по одному. Но разница между простыми и сложными листьями не всегда отчётливо выражена. Сложные листья по типу прикрепления листочков к черешку разделяются на:- (i) пальчатосложные – листовые пластинки прикрепляются к одному центру; и (ii) перистосложные – листовые пластинки прикрепляются по всей длине черешка. В перистых выделяют:- (a) парноперистосложные – у которых к основному черешку прикреплено парное число листочков; и (b) непарноперистосложные – заканчивающиеся непарным листочком на конце черешка.

COMPRADORE = КОМПРАДОР – Compradore is a local advisor or agent employed by a foreign party or company who acts as an intermediary in transactions with local inhabitants. / Под Компрадором, от Испанского слова Comprador, означающее Покупатель, понимается местный советник или агент, нанятый иностранной стороной или компанией, который действует как посредник в операциях с местными жителями.

COMPREHENSIVE = ВСЕСТОРОННЕЕ (или ВСЕОБЪЕМЛЮЩЕЕ, или ПОЛНОЕ) – Comprehensive is the traditional name for physical damage coverage for losses by fire, theft, vandalism, falling objects and various other perils. On Personal Auto Policies this is now called Other Than Collision coverage. On commercial forms, it continues to be called Comprehensive Coverage.

COMPREHENSIVE AND PROGRESSIVE AGREEMENT FOR TRANS–PACIFIC PARTNERSHIP = ВСЕСТОРОННЕЕ И ПРОГРЕССИВНОЕ СОГЛАШЕНИЕ ДЛЯ ТРАНС–ТИХООКЕАНСКОГО ПАРТНЁРСТВА – Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) is a trade agreement between Australia, Brunei, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, and Viet Nam. It was signed in March 2018 and came into force for the first six countries in December 2018.

COMPREHENSIVE ECONOMIC AND TRADE AGREEMENT = ВСЕСТОРОННЕЕ ЭКОНОМИЧЕСКОЕ И ТОРГОВОЕ СОГЛАШЕНИЕ – Comprehensive Economic and Trade Agreement (CETA) is a trade agreement between the European Union and Canada. CETA was signed in October 2016 and is in provisional application as of April 2017. Full ratification and implementation is still pending.

COMPREHENSIVE GENERAL LIABILITY POLICY = ВСЕСТОРОННИЙ ПОЛИС ПО СТРАХОВАНИЮ ОБЩЕЙ ОТВЕТСТВЕННОСТИ – Comprehensive General Liability Policy is a policy covering a variety of general liability exposures, including Premises and Operations (OL&T or M&C), Completed Operations, Products Liability, and Owners and Contractors Protective. Contractual Liability and Broad Form coverages could be added. In most jurisdictions the Comprehensive General Liability Policy has been replaced by the newer Commercial General Liability (CGL) forms which include all the standard and optional coverages of the earlier forms.

COMPREHENSIVE PERSONAL LIABILITY POLICY = ВСЕСТОРОННИЙ ПОЛИС ПО СТРАХОВАНИЮ ЛИЧНОЙ ОТВЕТСТВЕННОСТИ – Comprehensive Personal Liability Policy is a personal liability contract. It provides personal liability coverage for the individual and family needs arising out of numerous personal activities and situations, such as the ownership of residential property, ownership of pets, sports activities, and many other everyday activities.

COMPRESS = КОМПРЕСС – Compress (in the United States) is a Cotton warehouse having high-powered presses (compresses) much like a gin press for compressing the ordinary gin bale, making it dense and more compact to save space in shipping.

COMPRESSA = КОМПРЕССИОННОЕ (или СЖАТОЕ, или СДАВЛЕННОЕ) – Compressa:- flattened or pressed together. / Под Компрессионным, от Французского слова Compresse, от Латинского Compressus, означающее Сжатый, понимается .

COMPRESSED = СЖАТОЕ (или СДАВЛЕННОЕ) – Compressed:- flattened laterally.

COMPRESSED AIR = СЖАТЫЙ ВОЗДУХ – Compressed Air is an air at any pressure greater than atmospheric pressure.

COMPRESSED GAS = КОМПРИМИРОВАННЫЙ ГАЗ (или СЖАТЫЙ ГАЗ) – Compressed Gas is a gas at pressures required for transportation along trunk pipelines. / Компримированный Газ это газ, сжатый до давления, необходимого для его транспортировки по магистральным трубопроводам.

COMPRESSED NATURAL GAS = КОМПРИМИРОВАННЫЙ ПРИРОДНЫЙ ГАЗ (или СЖАТЫЙ ПРИРОДНЫЙ ГАЗ) – Compressed Natural Gas (CNG):- is an alternative fuel for cars, trucks and buses. Unlike LPG (liquefied petroleum gas), it is composed of methane and not of propane and butane. Thanks to a long-established and cutting edge technology, Italy is the first European market for natural gas for vehicles, with over 1 billion cubic meters consumed in 2016 and about 1 million vehicles currently in circulation. Using CNG as a fuel has many advantages over traditional fuels. From an environmental point of view CNG vehicles would reduce emissions of CO_2 by about 40%, nitrogen oxides by about 94%, and particulate matter by about 95% with respect to the vehicles replaced, thus significantly lowering emissions. Investing in natural gas as an automotive fuel would have major economic repercussions on a national level and let both families and business save money. Snam (Società Nazionale Metanodotti; Snam is Europe's leading gas utility) believes in CNG as an alternative fuel for road transport and promotes a series of initiatives to foster the use of CNG on an even larger scale. For this reason Snam will invest around 150 million Euros over the next 5 years to facilitate CNG-refueling-plant development. This will increase the number of existing methane gas stations, improve service quality, and ensure a more balanced distribution of stations througout the country. Among most relevant initiatives there are:- (i) letter of intent with api group for the development of methane service stations across Italy; (ii) memorandum of understanding with FCA and Iveco for the development of natural gas as an environmentally friendly vehicle fuel; and (iii) framework agreement with Eni for the development of methane gas stations in Italy. CNG' Economic Benefits:- A further development of methane for vehicle usage will produce a direct benefit of 1.5 billion Euro for Italian produced natural gas technology and more than 1 billion Euro in overall infrastructure investments for the development of methane filling stations, with significant benefits also to employment. Consumers will also enjoy overall savings estimated at up to 800 million Euro in five years' time. As of today, the natural gas road transport sector already has an annual turnover of 1.7 billion Euro and employs 20 000 people. In addition, the savings generated by the use of natural gas vehicles and the short lead times associated with the development of a proven, safe and reliable technology provide an opportunity for value creation for families, enterprises and public administration. Energy For The Future:- Providing Italy with natural gas infrastructure and technologies could engender further positive outcomes. For instance, it may foster biomethane, a fuel with a footprint similar to the electric. In detail, it may promote an increase in domestic production of gas with positive effects on the agro-food sector, as biomethane is obtained from the processing of agricultural and agro-industrial by-products. Xxxxx. Natural Gas Fuel Basics:- Natural gas is an odorless, gaseous mixture of hydrocarbons – predominantly made up of methane (CH_4). It accounts for about 30% of the energy used in the United States. About 40% goes to electric power production and the remaining is split between residential and commercial uses, such as heating and cooking, and industrial uses. Although natural gas is a proven, reliable alternative fuel that has long been used to power natural gas vehicles, only about two-tenths of 1% is used for transportation fuel. The vast majority of natural gas in the United States is considered a fossil fuel because it is made from sources formed over millions of years by the action of heat and pressure on organic materials. Alternatively, renewable natural gas (RNG), also known as Biomethane, is produced from organic materials – such as waste from landfills and livestock – through anaerobic digestion. RNG qualifies as an advanced biofuel under the Renewable Fuel Standard. Because RNG is chemically identical to fossil-derived conventional natural gas, it can use the existing natural gas distribution system and must be compressed or liquefied for use in vehicles. Like fossil-derived natural gas, renewable natural gas – which is produced from decaying organic materials – must be compressed or liquefied for use as a transportation fuel. CNG And LNG As Alternative Transportation Fuels:- Two forms of natural gas are currently used in vehicles: compressed natural gas (CNG) and liquefied natural gas (LNG). Both are domestically produced, relatively low priced, and commercially available. Considered alternative fuels under the Energy Policy Act of 1992, CNG and LNG are sold in units of gasoline or diesel gallon equivalents (GGEs or DGEs) based on the energy content of a gallon of gasoline or diesel fuel. Compressed Natural Gas:- CNG is produced by compressing natural gas to less than 1% of its volume at standard atmospheric pressure. To provide adequate driving range, CNG is stored onboard a vehicle in a compressed gaseous state at a pressure of up to 3 600 pounds per square inch (psi). CNG is used in light-, medium-, and heavy-duty applications. A CNG-powered vehicle gets about the same fuel economy as a conventional gasoline vehicle on a GGE basis. One GGE equals about 5.66 pounds of CNG. Liquefied Natural Gas:- LNG is natural gas in its liquid form. LNG is produced by purifying natural gas and super-cooling it to –260 °F to turn it into a liquid. During the process known as Liquefaction, natural gas is cooled below its boiling point, removing most of the extraneous compounds found in the fuel. The remaining natural gas is primarily methane with small amounts of other hydrocarbons. Because of LNG's relatively high production cost as well as the need to store it in expensive cryogenic tanks, the fuel's widespread use in commercial applications has been limited. LNG must be kept at cold temperatures and is stored in double-walled, vacuum-insulated pressure vessels. LNG is suitable for trucks that require longer ranges because liquid is denser than gas and, therefore, more energy can be stored by volume. LNG is typically used in medium- and heavy-duty vehicles. One GGE equals about 1.5 gallons of LNG. Natural Gas Production:- Between 80% and 90% of the natural gas used in the United States is domestically produced. Natural gas is primarily made up of methane, with low concentrations of other hydrocarbons, water, carbon dioxide, nitrogen, oxygen, and some sulfur compounds. Conventional Natural Gas Production:- Natural gas is primarily extracted from gas and oil wells. Gas trapped in subsurface porous rock reservoirs is extracted via drilling. Additionally, advances in hydraulic fracturing technologies have enabled access to large volumes of natural gas from shale formations. Renewable Natural Gas Production:- Chemically identical to conventional natural gas, renewable natural gas (RNG), also known as biomethane, is produced from decaying organic materials. Like conventional natural gas, RNG can be compressed (CNG) or liquefied (LNG) for use in vehicles. Learn more about CNG and LNG. Natural Gas Benefits and Considerations:- Whether produced via conventional or renewable methods, the advantages of natural gas as an alternative fuel include its domestic availability, established distribution network, relatively low cost, and emissions benefits. Renewable natural gas (RNG) and conventional natural gas, must be compressed (CNG) or liquefied (LNG) for use in vehicles. Like any alternative fuel, there are some considerations to take into account when contemplating

the use of natural gas. Energy Security:- In 2017, the United States (US) consumed approximately 19.8 million barrels of petroleum per day, about 19% of which was imported. Because transportation accounts for nearly three-fourths of total US petroleum consumption, using US transportation fuels like natural gas can have a direct impact. This not only supports the US economy but helps diversify the US transportation fleet and reduce the impact of international supply disruptions. All of this adds to our nation's energy security. Vehicle Performance:- Natural gas vehicles (NGVs) are similar to gasoline or diesel vehicles with regard to power, acceleration, and cruising speed. The driving range of NGVs is generally less than that of comparable gasoline and diesel vehicles because, with natural gas, less overall energy content can be stored in the same size tank. Extra natural gas storage tanks or the use of LNG can help increase range for larger vehicles. In heavy-duty vehicles, dual-fuel, compression-ignited engines are slightly more fuel-efficient than spark-ignited dedicated natural gas engines. However, a dual-fuel engine increases the complexity of the fuel-storage system by requiring storage of both types of fuel and the integration of diesel aftertreatment devices. Lower Emissions:- All new vehicles are equipped with effective emission control systems and must meet the same emissions standards, regardless of fuel type. Consequently, tailpipe emissions from natural gas vehicles are comparable to those of gasoline and diesel vehicles equipped with modern emissions controls. According to Argonne National Laboratory's Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET) model, light-duty vehicles running on conventional and shale natural gas can reduce life cycle greenhouse gas emissions by 15% (84% if running on RNG). In addition, because CNG fuel systems are completely sealed, the vehicles produce no evaporative emissions. Natural gas produced via renewable methods offers additional benefits. Renewable natural gas (RNG) is essentially biogas – the gaseous product of the decomposition of organic matter – that has been processed to purity standards. Capturing biogas from landfills and livestock operations reduces emissions by preventing methane release into the atmosphere. Methane is 25 times stronger than carbon dioxide as a greenhouse gas. Additionally, producing biogas through anaerobic digestion reduces odors and produces nutrient-rich liquid fertilizer. Infrastructure and Vehicle Availability:- A wide variety of new, heavy-duty natural gas vehicles are available from US original equipment manufacturers (OEMs). Although the number of available light-duty natural gas vehicles from OEMs is limited, there are several options to consider. For availability, see the Alternative Fuel and Advanced Vehicle Search. Fleets and consumers also have the option of reliably converting existing gasoline or diesel vehicles for natural gas operation using qualified system retrofitters. Qualified system retrofitters can also economically, safely, and reliably convert many vehicles for natural gas operation. It is critical that all vehicle and engine conversions meet the emissions and safety regulations and standards instituted by the US Environmental Protection Agency, the National Highway Traffic Safety Administration, the National Fire Protection Agency's NFPA 52 Vehicular Gaseous Fuel Systems Code, and state agencies like the California Air Resources Board. Although the United States has an extensive natural gas distribution system in place, vehicle fueling infrastructure is limited. For this reason, many fleets choose to install their own natural gas fueling infrastructure, which can be costly, or partner with other fleets to establish shared infrastructure. Partnering on infrastructure this way has many benefits, such as reduced payback period and higher throughput, which often translates to lower fuel costs. Compressed Natural Gas Fueling Stations:- Unlike gasoline or diesel stations, compressed natural gas (CNG) stations are not 'one size fits all'. Building a CNG station for a retail application or a fleet requires calculating the right combination of pressure and storage needed for the types of vehicles being fueled. Making the right choices about the size of compressor and the amount of storage at the station will impact the cost of fuel and range for vehicles. Types Of Stations:- There are two types of CNG infrastructure:- time-fill and fast-fill. The main structural differences between the two systems are the amount of storage capacity available and the size of the compressor. These factors determine the amount of fuel dispensed and the time it takes for CNG to be delivered. Most CNG stations include one of these two system types, but 'combination fill' stations include both types. (i) Fast-Fill:- Generally, fast-fill stations are best suited for retail situations where vehicles arrive randomly and need to fill up quickly. For a station serving light-duty vehicles, the space needed to store the equipment measures about the size of a parking space. Fast-fill stations receive fuel from a local utility line at a low pressure and then use a compressor on site to compress the gas to a high pressure. Once compressed, the CNG moves to a series of storage vessels so the fuel is available for a quick fill-up. CNG can also be delivered via dispensers alongside gasoline or other fuel dispensers. Drivers fueling light-duty vehicles at a fast-fill station experience similar fill times to a conventional gasoline fueling station – less than 5 minutes for a 20 gallon equivalent tank. Large truck and bus stations will fill at twice that rate. CNG at fast-fill stations is often stored in the vessels at a high service pressure (4 300 psi) so the dispenser can deliver it to a vehicle quickly. The dispenser uses sensors to calculate pressure and measure the number of GGEs delivered to the tank, taking temperature into account. (ii) Time-Fill:- Time-fill stations are used primarily by fleets and work best for vehicles with large tanks that refuel at a central location every night. At a time-fill station, a fuel line from a utility delivers CNG at a low pressure to a compressor on site. Unlike fast-fill stations, vehicles at time-fill stations are generally filled directly from the compressor, not from fuel stored in high pressure vessels. The size of the compressor needed depends on the size of the fleet. Although there is a small buffer storage tank, its purpose is not to fill vehicles, but to keep the compressor from turning off and on unnecessarily – wasting electricity and causing undue wear and tear on the compressor. The storage tank is sometimes used to 'top off' vehicle tanks during the day. The time it takes to fuel a vehicle depends on the number of vehicles, compressor size, and the amount of buffer storage. Vehicles may take several minutes to many hours to fill. The advantage of using a time-fill station is that the heat of compression is less, and this results in a fuller fill than a fast-fill station can provide. Another advantage is that a fleet manager can control when the vehicles are filled, such as during off-peak hours (like at night) when electricity rates are lower. Time-fill stations are carefully architected based on the intended use. For example, a transit bus company may need a larger compressor that can deliver 8 to 9 gallons per minute, while a refuse truck company can make do filling trucks at 3 gallons per minute using a smaller compressor. A consumer application may require far less – such as less than half a gallon per hour. These differences account for the large variance in the cost of installation. (iii) Combination-Fill:- Combination-fill stations include both the fast-fill and time-fill components in one system. The vehicles connected to the time-fill posts are filled directly from the compressor, usually overnight. Vehicles at the fast-fill dispensers are filled from the storage vessels or from the compressor, depending upon need. This design gives a fleet flexibility. Combination-fill stations typically cost more to build than the previous two station types. A combination-fill station can also be a revenue source if the fast-fill dispensers are made available to the public. Natural Gas Vehicles:- Natural gas powers more than 160 000 vehicles in the United States and roughly 15.2 million vehicles worldwide. Natural gas vehicles (NGVs) are good choices for high-mileage, centrally fueled fleets. In many cases, CNG can provide adequate range for the required vehicle application. For vehicles that travel long distances, liquefied natural gas (LNG) is a good choice. The advantages of natural gas as a transportation fuel include its domestic availability, widespread distribution infrastructure, and reduced greenhouse gas emissions compared to conventional gasoline and diesel fuels. CNG and LNG are considered alternative fuels under the Energy Policy Act of 1992. The horsepower, acceleration, and cruise speed of NGVs are comparable with those of equivalent conventional vehicles. Also, compared with conventional diesel and gasoline vehicles, NGVs offer other air-quality benefits. There are light-, medium-, and heavy-duty NGVs available from original equipment manufacturers, as well as medium- and heavy-duty vehicle options available through qualified system retrofitters. Qualified system retrofitters can also economically, safely, and reliably convert many vehicles for natural gas operation with aftermarket conversion systems. Types of Natural Gas Vehicles:- There are three types of NGVs:- (i) Dedicated:- These vehicles are designed to run only on natural gas; (ii) Bi-Fuel:- These vehicles have two separate fueling systems that enable them to run on either natural gas or gasoline; and (iii) Dual-Fuel:- These vehicles have fuel systems that run on natural gas but use diesel fuel for ignition assistance. This configuration is traditionally limited to heavy-duty vehicles. Light-duty

vehicles are typically equipped with dedicated or bi-fuel systems, while heavy-duty vehicles use dedicated or dual-fuel systems. CNG vehicles store natural gas in tanks where it remains in the gaseous state. More fuel can be stored onboard a vehicle using LNG because the fuel is stored as a liquid, therefore making its energy density greater than that of CNG. This makes LNG well-suited for Class 7 and 8 trucks requiring a greater range. Often, the fuel choice is determined by factors such as vehicle application needs and the required driving range. The driving range of NGVs is generally less than that of comparable diesel or gasoline vehicles because of the lower energy density of natural gas. Extra storage tanks can increase range, but the additional weight may displace cargo capacity. Xxxxx. What Is The Difference Between Compressed Natural Gas (CNG) And Liquefied Natural Gas (LNG)? Both compressed natural gas (CNG) and liquefied natural gas (LNG) are ways of making natural gas available when it wouldn't otherwise be. CNG is used to power vehicles, mostly buses and trucks. To make it usable as a transportation fuel, the natural gas needs to be compressed to more than 3 000 pounds per square inch (psi), which shrinks its volume to 1 percent of what it would have been at normal atmospheric pressure. CNG has both pluses and minuses. One advantage is it is a lot cleaner than gasoline and diesel fuel. CNG-powered vehicles emit a lot less carbon monoxide, nitrogen oxides – a primary component of smog – and particulates, which can trigger a range of health problems. But CNG has much lower energy density than liquid fuels. A gallon of CNG has only a quarter as much energy as a gallon of gasoline. The low energy density and the pressure of the highly compressed gas requires CNG vehicles to have big, bulky fuel tanks, which means that CNG is practical mainly for bus and truck fleets that refuel in central locations. And that, in turn, means that CNG use for transportation is still rare. In 2014, only 0.12 percent of the natural gas consumed in the United States was used to power vehicles, according to the Energy Information Administration. LNG is a way of transporting natural gas long distances when pipelines aren't an option – across oceans, for example. Producing LNG involves compressing and cooling natural gas to around minus 260 degrees Fahrenheit. That process converts the gas to a liquid and cuts its volume to 1/600th of the original, making it possible to ship the LNG in special tankers. Once it gets to its destination, the LNG can be unloaded at a receiving terminal and regasified – turned back into a gas. It can then be delivered through local pipelines to customers. The infrastructure for LNG – for cooling and compressing, shipping and regasifying – can be extensive and expensive. Producing and transporting LNG is also very energy intensive. These factors make it difficult for LNG to compete with US domestic natural gas supplies given the recent dramatic increase in shale gas production. US imports of LNG, which grew steadily in the late 1990s, peaked in 2007, and are now at their lowest level since 1987. They represent just 0.2 percent of US natural gas consumption. Still, LNG has continued to play an important role in providing gas in some regions in specific times of the year – in New England during the winter, for example. And, as a new paper from the Conservation Law Foundation shows, more strategic use of existing LNG infrastructure can help avoid the need for expensive new natural gas pipelines. More broadly, natural gas has played an important role in the electric utility sector by lowering electricity costs, reducing carbon pollution, and helping the country move to more renewable energy. Natural gas provided more than 27 percent of US electricity in 2014, up from 22 percent in 2007, while coal-fired generation fell from about half to 39 percent over that same period. For the transportation sector, natural gas can address needs more effectively – with lower carbon emissions – through electrification than through CNG. While a natural gas-powered Honda Civic emits about 15 percent less global warming pollution than a conventional Civic, for example, using natural gas to generate electricity for a plug-in vehicle can deliver carbon emissions savings of as much as 40 percent. But overly relying on natural gas in the electric sector – for electric vehicles or many other uses – could be a problem. A UCS (short for the Union of Concerned Scientist) analysis from earlier this year showed how dramatically expanding the use of natural gas for electricity generation would threaten the economy, public health and the climate. And our just-released analysis of state reliance on natural gas for power plants found that two-thirds of US states may be putting electric ratepayers at risk by failing to diversify their electricity mixes. Investing more in such clean energy resources as solar, wind and energy efficiency will be critical for managing overreliance on natural gas, even as utilities move away from coal. Many aspects of the Environmental Protection Agency's new Clean Power Plan will help make that happen, creating incentives for states to prioritize clean energy over natural gas as they look to clean up their fuel mixes. Natural gas – CNG, LNG, or natural gas in other applications – will continue to have a role to play in many facets of our economy. But we need to make sure that the role it plays moves the country toward a future where it's complementing clean energy resources, not competing with them. / Снам (Snam; сокращение от Сочета Национале Метанодотти (Società Nazionale Metanodotti)). Ивеко (Iveco) Эни (Eni). Хонда Сивикъ (Honda Civic). Сжатый Природный Газ (СПГ) или, как его называют в России, Компримированный Природный Газ (КПГ):- Природный газ сжимают, чтобы сократить его объём. Но КПГ как топливо ещё и гораздо экологичнее нефти. И в России постепенно он должен нефть заменять. 'Компримировать' – Сжимать:- Природный газ, как и любой другой, может быть сжат при помощи компрессора. При этом занимаемый им объём значительно уменьшается. Природный газ традиционно сжимается до давления 200–250 бар, что приводит к сокращению объёма в 200–250 раз. Газ компримируют (сжимают) для транспортировки по магистральным газопроводам, для поддержания правильного давления внутри пласта (пластового давления) во время закачки под землю, а ещё получение КПГ является промежуточной ступенью при производстве сжиженного природного газа (СПГ). Экология И Цена:- Кроме того, компримированный природный газ (КПГ) используется в качестве газомоторного топлива вместо нефтепродуктов, так как имеет ряд преимуществ, главные из которых – высокая экологичность и дешевизна. С тех пор как в 1860 был сконструирован первый двигатель внутреннего сгорания на светильном газе, мировой рынок транспорта, работающего на газомоторном топливе, постоянно развивается. Это обусловлено тем, что за счёт использования газа решаются проблемы экологии и дефицита обычного моторного топлива. Энергетической стратегией России предусмотрено, что к 2020 газовые виды топлива должны заменять до 10–12 миллионов тонн нефтепродуктов ежегодно. Будущее Автомобильного Топлива:- В настоящее время в России расширяется парк автомобилей, работающих на КПГ (на данный момент (2018) оценивается примерно в 90 000 единиц). Увеличивается и количество автомобильных газонаполнительных компрессорных станций (АГНКС), заправляющих транспорт компримированным природным газом:- в 58 регионах России действует 246 станций. Безусловным лидером национального газомоторного рынка является компания Газпром. В собственности Газпрома находится 210 АГНКС, более 10 лет Газпром занимается популяризацией в России газомоторного топлива. Компримированный Природный Газ (КПГ, или Сжатый Природный Газ, на Английском языке Compressed Natural Gas (CNG)) – сжатый природный газ, используемый в качестве моторного топлива вместо бензина, дизельного топлива и пропана. Он дешевле традиционного топлива, а вызываемый продуктами его сгорания парниковый эффект меньше по сравнению с обычными видами топлива, поэтому он безопаснее для окружающей среды. Компримированный природный газ производят путём сжатия (компримирования) природного газа в компрессорных установках. Хранение и транспортировка компримированного природного газа происходит в специальных накопителях газа под давлением 200–220 бар. Также используется добавление к компримированному природному газу биогаза, что позволяет снизить выбросы углерода в атмосферу. Сжатый природный газ как топливо имеет целый ряд преимуществ:- (i) Метан (основной компонент природного газа) легче воздуха и в случае аварийного разлива он быстро испаряется, в отличие от более тяжёлого пропана, накапливающегося в естественных и искусственных углублениях и создающего опасность взрыва; (ii) Не токсичен в малых концентрациях; (iii) Не вызывает коррозии металлов; (iv) Компримированный природный газ дешевле, чем любое нефтяное топливо, в том числе и дизельное, но по калорийности их превосходит; (v) Низкая температура кипения гарантирует полное испарение природного газа при самых низких температурах окружающего воздуха; (vi) Природный газ сгорает практически полностью и не оставляет копоти, ухудшающей экологию и

снижающей коэффициент полезного действия (КПД); (vii) Отводимые дымовые газы не имеют примесей серы и не разрушают металл дымовой трубы; (viii) Эксплуатационные затраты на обслуживание газовых котельных также ниже, чем традиционных. Ещё одной особенностью сжатого природного газа является то, что котлы, работающие на природном газе, имеют больший КПД – до 94%, не требуют расхода топлива на предварительный его подогрев зимой (как мазутные и пропан-бутановые).

COMPRESSIBILITY = СЖИМАЕМОСТЬ (или ОБЪЁМНАЯ УПРУГОСТЬ) – Compressibility:- a compound that enhances some property of, or imparts some new property to, the base fluid. In some hydraulic fluid formulations, the additive volume may constitute as much as 20 percent of the final composition. The more important types of additives include anti-oxidants, anti-wear additives, corrosion inhibitors, viscosity index improvers, and foam suppressants. A term Compressibility refers to the ease of reducing the bulk of fabric, carpet, batting, or other material. May be high or low, soft or hard. / , противоизносные присадки, . Под Сжимаемостью или Объёмной Упругостью понимается способность твёрдых, жидких и газообразных тел под действием всестороннего внешнего давления изменять свой объём обратимым образом, то есть так, чтобы после прекращения действия внешнего давления восстанавливался первоначальный объём тела. Характеристиками сжимаемости служат:- Модуль Объёмной Упругости K = V(dp/dV) и Коэффициент Сжимаемости k = –(1/V)(dV/dp) = 1/K, V – объём тела, p – внешнее давление. Сжимаемость, способность вещества изменять свой объём под действием всестороннего давления. Сжимаемостью обладают все вещества. Если вещество в процессе сжатия не испытывает химических, структурных и других изменений, то при возвращении внешнего давления к исходному значению начальный объём восстанавливается. У твёрдых тел, имеющих поры, трещины и другие неоднородности структуры, практически обратимая сжимаемость может наблюдаться только при достаточно высоком давлении (например, у горных пород при давлении большем 2–5 килобар (кбар); 1 кбар = 108 Ньютонов на квадратный метр (Н/м^2)). Обычно сжимаемостью (объёмной упругостью) называется обратимое изменение занимаемого веществом объёма V под равномерным гидростатическим давлением p. Величину сжимаемости характеризует коэффициент сжимаемости (ß, который выражает уменьшение единичного объёма тела при увеличении p на одну единицу:- ß = – (1 / V) (ΔV / Δp) = (1 / p) (Δp / Δp), где ΔV и Δp – изменения объёма V и плотности r при изменении p на величину Δp. K = 1/b называют Модулем Объёмной Упругости (Модулем Объёмного Сжатия, Объёмным Модулем), для твёрдых тел K = Eμ/ (3 (3μ – E)), где E – модуль нормальной упругости (Модуль Юнга), μ – модуль сдвига. Для идеальных газов K = p при любой температуре T. В общем случае сжимаемость вещества, а следовательно K и b, зависит от p и T. Как правило, b убывает при увеличении p и растёт с T. Часто сжимаемость характеризуют относительной плотностью d = r/r_0, где r_0 – плотность при 0 °C и p = 1 атм. Сжатие может происходить как при постоянной температуре (изотермически), так и с одновременным разогревом сжимаемого тела (например, в адиабатном процессе). В последнем случае значения K будут большими, чем при изотермическом сжатии (для большинства твёрдых тел при обычной температуре – на несколько %). Для оценки сжимаемости веществ в широком диапазоне давлений используют уравнения состояния, выражающие связь между p, V и T. Определяют сжимаемость непосредственно по изменению объёма тел под давлением (смотрите Пьезометр), из акустических измерений скорости распространения упругих волн в веществе, из экспериментов по ударному сжатию, дающих зависимость между r и p при максимальных полученных в эксперименте давлениях. Сжимаемость находят также из измерений параметров кристаллической решётки под давлением, производимых методом Рентгеновского структурного анализа. Сжимаемость можно определить с помощью измерения линейной деформации твёрдого тела под гидростатическим давлением (по так называемой Линейной Сжимаемости). Для изотропного тела коэффициент линейной сжимаемости (1 / L) (ΔL / Δp) ≈ (1/3) ß, где L – линейный размер тела. Сжимаемость газов, будучи очень большой при давлениях до 1 кбар, по мере приближения их плотности к плотности жидкостей становится близкой к сжимаемости жидкостей. Последняя с ростом p уменьшается сначала резко, а затем меняется весьма мало:- в интервале 6–12 кбар b уменьшается примерно так же, как в интервале от 1 атм (10^{-3} кбар) до 1 кбар (примерно в 2 раза), и при 10–12 кбар составляет 5–10% от начального значения. При 30–50 кбар модули K жидкостей по порядку величины близки к K твёрдых тел. Для твёрдых тел при 100 кбар Dr/r_0 >> 15–25%. Для отдельных веществ, например, щелочных металлов, Dr/r ~ 40%, для большинства других металлов ~ 6–15%. Линейная сжимаемость анизотропных веществ зависит от кристаллографических направлений (во всяком случае, до давлений в десятки кбар), причём вдоль направлений со слабым межатомным взаимодействием она может в 8–10 раз превосходить сжимаемость по направлениям, вдоль которых в кристаллической решётке имеет место более сильная связь; изменение параметра решётки в этих направлениях в определённом интервале p может быть даже положительным (теллур, селен). Сжимаемость – важнейшая характеристика вещества, которая позволяет судить о зависимости физических свойств от межатомных (межмолекулярных) расстояний. Знание сжимаемости газов (паров), жидкостей и твёрдых тел необходимо для расчёта работы тепловых машин, химико-технологических процессов, действия взрыва, аэро- и гидродинамических эффектов, наблюдающихся при движениях с большими скоростями, и так далее. Примеры сжимаемости различных веществ приведены в статье Высокое Давление.

COMPRESSION FABRIC = КОМПРЕССИОННАЯ (или СЖИМАЕМАЯ) ТКАНЬ – Compression Fabric is a high tenacity stretch fabric which, when in a close fitting garment, provides muscles with a firm compression fit that lessons vibrations, reduces fatigue, and keeps muscles energized. The fabric is usually made in a knit construction, using a series of gradient fibers with an open knit inner surface to create a moisture transfer environment.

COMPRESSION FAILURE = КОМПРЕССИОННОЕ НАРУШЕНИЕ (или ТРЕЩИНЫ ОТ ДЕФОРМАЦИИ ПРИ СЖАТИИ) – Compression Failure is a deformation of the wood fibers resulting from excessive compression along the grain either in direct end compression or in bending. In surfaced lumber, compression failures may appear as fine wrinkles across the face of the piece. / Под Компрессией, от Латинского слова Compressio, означающее Сжатие, понимается силовое воздействие на тело, приводящее к уменьшению занимаемого им объёма, а также к повышению давления и температуры.

COMPRESSION MOLDING = КОМПРЕССИОННОЕ ФОРМОВАНИЕ – Compression Molding:- a mold that is open when the material is introduced and that shapes the material by the pressure of closing by heat.

COMPRESSION RATIO = СООТНОШЕНИЕ С КОМПРЕССИЕЙ (или СТЕПЕНЬ СЖАТИЯ, или КОЭФФИЦИЕНТ УПЛОТНЕНИЯ) – Compression Ratio:- in an internal combustion engine, the ratio of the volume of combustion space at bottom dead center to that at top dead center. / Степень Сжатия в двигателе. Степень Сжатия, отношение объёма рабочего тела в начале сжатия к объёму его в конце сжатия в цилиндре двигателя внутреннего сгорания. С увеличением степени сжатия рабочее тело (горючая смесь в карбюраторных двигателях, воздух в дизелях) в конце хода сжатия занимает меньший объём, давление и температура его повышаются и процесс сгорания протекает быстрее и с меньшими потерями тепла. Повышение степени сжатия увеличивает мощность и улучшает топливную экономичность двигателя, однако оно ограничивается стойкостью топлива по отношению к детонации. Степень сжатия карбюраторных двигателей 6.5–9.5, дизелей 16–21.

COMPRESSION STRETCH = КОМПРЕССИОННАЯ РАСТЯЖИМОСТЬ – Compression Stretch is the name given to the expansive stretch that is created by the spandex fibers used in the development of a compression fabric.

COMPRESSOR = КОМПРЕССОР – Compressor is a device which converts mechanical force and motion into pneumatic fluid power. / Под Компрессором понимается машина для сжатия воздуха или газа до избыточного давления не ниже 0.015 Мпа. По устройству различают:- (i) Объёмные Компрессоры (поршневые и ротационные), в которых сжатие газа происходит при уменьшении замкнутого объёма; (ii) Лопаточные Компрессоры (центробежные и осевые), в которых силовое воздействие на газ осуществляется вращающимися лопатками; и (iii) Струйные Компрессоры, принцип действия которых подобен струйным насосам. Компрессоры также подразделяют по роду сжимаемого газа (воздушные, кислородные и другие), по создаваемому давлению (низкого давления – до 1 Мпа, среднего – до 10 Мпа, высокого – выше 10 МПа), по подаче и другим признакам. Мощность компрессора достигает десятков МВт (центробежные и осевые компрессоры), а подача 20 000 кубических метров в минуту ($м^3$/мин) (осевые компрессоры). Компрессор, устройство для сжатия и подачи воздуха или другого газа под давлением. Степень повышения давления в компрессоре более 3. Для подачи воздуха с повышением его давления менее чем в 2–3 раза применяют воздуходувки, а при напорах до 10 килоНьютонов на квадратный метр ($кН/м^2$) (1 000 миллиметров водяного столба (мм вод.ст.)) – вентиляторы. Компрессоры впервые стали применяться в середине XIX века, в России строятся с начала XX века. Основы теории центробежных машин были заложены математиком, механиком и физиком Швейцарского происхождения Лионхардом Ойля (или Эйлером; Leonhard Euler 1707–1783), теория осевых компрессоров и вентиляторов создавалась благодаря трудам Русского учёного в области механики, основоположника современной гидроаэродинамики Николая Егоровича Жуковского (1847–1921), Русского и Советского учёного в области теоретической механики и одного из основоположников современной гидроаэродинамики Сергей Алексеевича Чаплыгина (1869–1942) и других учёных. По принципу действия и основным конструктивным особенностям различают компрессоры поршневые, ротационные, центробежные, осевые и струйные. Компрессоры также подразделяют по роду сжимаемого газа (воздушные, кислородные и другие), по создаваемому давлению рн (низкого давления – от 0.3 до 1 $МН/м^2$, среднего – до 10 $МН/м^2$ и высокого – выше 10 $МН/м^2$), по производительности, то есть объёму всасываемого $V_{вс}$ (или сжатого) газа в единицу времени (обычно в кубических метрах в минуту ($м^3$/мин)) и другим признакам. Компрессоры также характеризуются частотой оборотов n и потребляемой мощностью N. Поршневой Компрессор в основном состоит из рабочего цилиндра и поршня; имеет всасывающий и нагнетательный клапаны, расположенные обычно в крышке цилиндра. Для сообщения поршню возвратно-поступательного движения в большинстве поршневых компрессоров имеется кривошипно-шатунный механизм с коленчатым валом. Поршневые компрессоры бывают одно- и многоцилиндровые, с вертикальным, горизонтальным, V- или W-образным и другим расположением цилиндров, одинарного и двойного действия (когда поршень работает обеими сторонами), а также одноступенчатого или многоступенчатого сжатия. Действие одноступенчатого воздушного поршневого компрессора заключается в следующем. При вращении коленчатого вала 1 соединённый с ним шатун 2 сообщает поршню 3 возвратные движения. При этом в рабочем цилиндре 4 из-за увеличения объёма, заключённого между днищем поршня и крышкой цилиндра 5, возникает разрежение и атмосферный воздух, преодолев своим давлением сопротивление пружины, удерживающей всасывающий клапан 9, открывает его и через воздухозаборник (с фильтром) 8 поступает в рабочий цилиндр. При обратном ходе поршня воздух будет сжиматься, а затем, когда его давление станет больше давления в нагнетательном патрубке на величину, способную преодолеть сопротивление пружины, прижимающей к седлу нагнетательный клапан 7, воздух открывает последний и поступает в трубопровод 6. При сжатии газа в компрессоре его температура значительно повышается. Для предотвращения самовозгорания смазки компрессоры оборудуются водяным (труба 10 для подвода воды) или воздушным охлаждением. При этом процесс сжатия воздуха будет приближаться к изотермическому (с постоянной температурой), который является теоретически наивыгоднейшим (смотрите Термодинамика). Одноступенчатый компрессор, исходя из условий безопасности и экономичности его работы, целесообразно применять со степенью повышения давления при сжатии до b = 7–8. При больших сжатиях применяются многоступенчатые компрессоры, в которых, чередуя сжатие с промежуточным охлаждением, можно получать газ очень высоких давлений – выше 10 $МН/м^2$. В поршневых компрессорах обычно предусматривается автоматическое регулирование производительности в зависимости от расхода сжатого газа для обеспечения постоянного давления в нагнетательном трубопроводе. Существует несколько способов регулирования. Простейший из них – регулирование изменением частоты вращения вала. Ротационные Компрессоры имеют один или несколько роторов, которые бывают различных конструкций. Значительное распространение получили ротационные пластинчатые компрессоры, имеющие ротор 2 с пазами, в которые свободно входят пластины 3. Ротор расположен в цилиндре корпуса 4 эксцентрично. При его вращении по часовой стрелке пространства, ограниченные пластинами, а также поверхностями ротора и цилиндра корпуса, в левой части компрессора будут возрастать, что обеспечит всасывание газа через отверстие 1. В правой части компрессора объёмы этих пространств уменьшаются, находящийся в них газ сжимается и затем подаётся из компрессора в холодильник 5 или непосредственно в нагнетательный трубопровод. Корпус ротационного компрессора охлаждается водой, для подвода и отвода которой предусмотрены трубы 6 и 7. Степень повышения давления в одной ступени пластинчатого ротационного компрессора обычно бывает от 3 до 6. Двухступенчатые пластинчатые ротационные компрессоры с промежуточным охлаждением газа обеспечивают давление до 1.5 $МН/м^2$. Принципы действия ротационного и поршневого компрессоров в основном аналогичны и отличаются лишь тем, что в поршневом все процессы происходят в одном и том же месте (рабочем цилиндре), но в разное время (из-за чего и потребовалось предусмотреть клапаны), а в ротационном компрессоре всасывание и нагнетание осуществляются одновременно, но в различных местах, разделённых пластинами ротора. Известны другие конструкции ротационного компрессора, в том числе винтовые, с двумя роторами в виде винтов. Для удаления воздуха с целью создания разрежения в каком-либо пространстве применяют роторные водокольцевые вакуум-насосы. Регулирование производительности ротационного компрессора осуществляется обычно изменением частоты вращения их ротора. Центробежный Компрессор в основном состоит из корпуса и ротора, имеющего вал 1 с симметрично расположенными рабочими колёсами. Центробежный 6-ступенчатый компрессор разделён на три секции и оборудован двумя промежуточными холодильниками, из которых газ поступает в каналы 12 и 13. Во время работы центробежного компрессора частицам газа, находящимся между лопатками рабочего колеса, сообщается вращательное движение, благодаря чему на них действуют центробежные силы. Под действием этих сил газ перемещается от оси компрессора к периферии рабочего колеса, претерпевает сжатие и приобретает скорость. Сжатие продолжается в кольцевом диффузоре из-за снижения скорости газа, то есть преобразования кинетической энергии в потенциальную. После этого газ по обратному направляющему каналу поступает в другую ступень компрессора и так далее. Получение больших степеней повышения давления газа в одной ступени (более 25–30, а у промышленных компрессоров – 8–12) ограничено главным образом пределом прочности рабочих колёс, допускающих окружные скорости до 280–500 метров в секунду (м/сек). Важной особенностью центробежных компрессоров (а также осевых) является зависимость давления сжатого газа, потребляемой мощности, а также коэффициент полезного действия (кпд) от его производительности. Характер этой зависимости для каждой марки компрессора отражается на графиках, называемых Рабочими Характеристиками. Регулирование работы центробежных компрессоров осуществляется различными способами, в том числе изменением частоты вращения ротора, дросселированием газа на стороне всасывания и другими. Осевой Компрессор имеет ротор 4, состоящий обычно из нескольких рядов рабочих лопаток 6. На внутренней стенке корпуса 2 располагаются ряды

направляющих лопаток 5. Всасывание газа происходит через канал 3, а нагнетание через канал 1. Одну ступень осевого компрессора составляет ряд рабочих и ряд направляющих лопаток. При работе осевого компрессора вращающиеся рабочие лопатки оказывают на находящиеся между ними частицы газа силовое воздействие, заставляя их сжиматься, а также перемещаться параллельно оси компрессора (откуда его название) и вращаться. Решётка из неподвижных направляющих лопаток обеспечивает главным образом изменение направления скорости частиц газа, необходимое для эффективного действия следующей ступени. В некоторых конструкциях осевых компрессоров между направляющими лопатками происходит и дополнительное повышение давления за счёт уменьшения скорости газа. Степень повышения давления для одной ступени осевого компрессора обычно равна 1.2–1.3, то есть значительно ниже, чем у центробежных компрессоров, но кпд у них достигнут самый высокий из всех разновидностей компрессоров. Зависимость давления, потребляемой мощности и кпд от производительности для нескольких постоянных частот вращения ротора при одинаковой температуре всасываемого газа представляют в виде рабочих характеристик. Регулирование осевых компрессоров осуществляется так же, как и центробежных. Осевые компрессоры применяют в составе газотурбинных установок (смотрите Газотурбинный Двигатель). Техническое совершенство осевых, а также ротационных, центробежных и поршневых компрессоров оценивают по их механическому кпд и некоторым относительным параметрам, показывающим, в какой мере действительный процесс сжатия газа приближается к теоретически наивыгоднейшему в данных условиях. Струйные компрессоры по устройству и принципу действия аналогичны струйным насосам. К ним относят струйные аппараты для отсасывания или нагнетания газа или парогазовой смеси. Струйные компрессоры обеспечивают более высокую степень сжатия, чем струйные насосы. В качестве рабочей среды часто используют водяной пар.

COMPRESSOR STATION = КОМПРЕССОРНАЯ СТАНЦИЯ – Gas loses pressure as it travels over long distances. A Compressor Station, usually a gas turbine engine, is an installation which recompresses the gas to the required pressure. / Под Компрессорной Станцией понимается комплекс агрегатов для получения сжатого воздуха или газа на промышленных предприятиях, магистральных трубопроводах и строительных объектах. Сжатый воздух и газ при этом используются как энергоноситель или как сырьё для получения различной продукции (например, кислорода из воздуха, аммиака из азотно-водородной смеси). По суммарной подаче установленных компрессоров компрессорные станции в странах бывшего СССР условно делят на малые (до 100 м^3/мин), средние (100–500 м^3/мин) и большие (свыше 500 м^3/мин).

COMPRISING = ВКЛЮЧАЮЩЕЕ (или СОСТОЯЩЕЕ) – Comprising (used when defining the scope of a claim) is a transitional phrase that is synonymous with (means the same thing as) ‘including’, ‘containing’ or ‘characterized by’; is inclusive or open-ended and does not exclude additional, unrecited elements or method steps. Comprising is a term of art used in claim language which means that the named elements are essential in describing the invention.

COMPROMISED TOTAL LOSSES = ПОЛНЫЕ УБЫТКИ ПО КОМПРОМИССУ (или ПОЛНАЯ ГИБЕЛЬ ПО КОМПРОМИССУ) – Compromised Total Losses:- this term is used where hull underwriters agree to a compromised settlement for total loss of ship, in circumstances where neither an actual loss, nor a constructive total loss may be claimed, but the value of the ship when repaired does not justify the cost of repairs. This type of settlement is not subject to any basic rules, but usually applies to policies where the insured value of the ship is higher than her market value.

COMPULSORY STOCKPILE BILL = ВЕКСЕЛЬ НА НЕПРИКОСНОВЕННЫЕ ЗАПАСЫ – Compulsory Stockpile Bill:- promissory notes eligible for discounting by the Swiss National Bank and issued by companies which under Swiss federal law are required to maintain stocks of certain essential raw materials and foodstuffs.

COMPULSORY STOCKPILE CREDIT = КРЕДИТ НА НЕПРИКОСНОВЕННЫЕ ЗАПАСЫ – Compulsory Stockpile Credit is a credit granted in Switzerland for the financing of the mandatory stockpiles of essential raw materials and foodstuffs maintained in accordance with the Federal Law on Economic Planning for War and Emergencies of 1955-September-30. In order to facilitate the financing of stocks and reduce the costs involved, the Swiss Federal Government is fully liable to the lending banks for the repayment of credit extended. See also Compulsory Stockpile Bill. / выплата (repayment) .

COMPUTER = КОМПЬЮТЕР – A Computer is a device capable of performing a series of arithmetic or logical operations. A computer is distinguished from a calculating machine, such as an electronic calculator, by being able to store a computer program (so that it can repeat its operations and make). / Компьютер – то же, что ЭВМ (электронная вычислительная машина); термин, получивший распространение в научно-популярной и научной литературе, является транскрипцией Английского слова Computer, что означает Вычислитель.

COMPUTER–AIDED–DESIGN = ДИЗАЙН С ПОМОЩЬЮ КОМПЬЮТЕРА (или КОНСТРУИРОВАНИЕ С ПОМОЩЬЮ КОМПЬЮТЕРА) – Computer-Aided-Design (CAD) software that allows the design of the ‘right’ pallet at the best value. See also Pallet Design System© (PDS©).

COMPUTER–ASSISTED OPERATIONS RESEARCH FACILITY = ИССЛЕДОВАТЕЛЬСКАЯ УСТАНОВКА ПО ОПЕРАЦИЯМ, ПОДДЕРЖИВАЕМЫМ КОМПЬЮТЕРОМ – Computer-Assisted Operations Research Facility (CAORF) is a MarAd R&D facility located at US Merchant Marine Academy, Kings Point, New York.

COMPUTER ASSISTED TRADING SYSTEM = ПОДДЕРЖИВАЕМАЯ КОМПЬЮТЕРОМ СИСТЕМА ТОРГОВЛИ – Computer Assisted Trading System (CATS) is an automated exchange system developed for the Toronto Stock Exchange in 1977. CATS was one of the first technologies allowing for a full automation of the price-setting process in a stock exchange. This technology was implemented in several other stock exchanges in the 1980s. In some cases, it was used as an assistance to open-outcry, but in others it allowed for a full dismantlement of the open-outcry insititution. The Paris Bourse purchased this system in the early 1980s and implemented it as CAC (Cotation Assistée en Continu). CATS handled the process of order matching and price setting through a ‘double auction’ algorithm. It is credited for having been the first system to allow for a full automation of the price setting process in a centralized, order-driven stock market. / Парижская Биржа или, как это звучит на Французском языке по месту расположения, Пари Бурс (Paris Bourse) приобрела эту систему в начале 1980-х и обеспечивает её функционирование под обозначением ТПК (Текущее и Последующее Котирование) или, как это звучит на Французском языке по месту расположения, Сэ.А.Сэ (Котасьён Ассистэ ан Континю; CAC (Cotation Assistée en Continu)).

COMPUTER–BASED TERMINAL = ТЕРМИНАЛ НА БАЗЕ КОМПЬЮТЕРА (или КОМПЬЮТЕРНЫЙ ТЕРМИНАЛ) – Computer-Based Terminal is a network interface device, provided and operated by the user, consisting of both hardware and software.

COMPUTERIZED TRADING RECONSTRUCTION SYSTEM = КОМПЬЮТЕРИЗИРОВАННАЯ СИСТЕМА ВОСПРОИЗВЕДЕНИЯ ТОРГОВЛИ – Computerized Trading Reconstruction System is a Chicago Board of Trade computerized surveillance program that pinpoints in any trade the traders, the contract, the quantity, the price, and time of execution to the nearest minute. / Компьютерная

программа надзора в Чикагской Палате Торговли (Чикагском Табло Торговли, если быть более точными), отслеживающая по любой сделке торговцев, контракт, количество, цену и время исполнения сделки с точностью до минуты.

COMSAT = COMMUNICATIONS SATELLITE CORPORATION

CONAIR CONTAINER = КОНТЕЙНЕР КОНЭА – A Conair Container 40’ x 8’ x 8’6” is used to transport controlled-temperature cargoes to Europe. Temperature (with range of –21 °C – +15 °C) can be controlled to within 1/4 degree Celcius accuracy. Thermal container served by an external cooling system (e.g., a vessel’s cooling system or a Clip On Unit), which regulates the temperature of the cargo. Conair is a brand name often used for Insulated Container. Refrigerated containers without their own refrigeration unit. Conair refrigerated containers, also called Insulated Containers or Porthole Containers, do not have their own refrigeration unit. They are thus reliant on an external supply of cold air. This is achieved by refrigeration units of various types, permanently installed on the ship, permanently installed in the terminal or clip-on units for individual containers. Porthole containers are thermally insulated and have two sealable openings on the end walls (the portholes) through which cold air can be blown into the container and warm air can be extracted. The cold air is forced through the lower opening into the container, then distributed throughout the load via the T-bar floor, and subsequently flows through the load to the top of the container and is extracted through the upper opening. / Контейнер Конэа (Conair Container). , например, .

CONCEALED DAMAGE = СКРЫТОЕ ПОВРЕЖДЕНИЕ – Concealed Damage is a damage to the contents of a package bearing no indication of having been opened. Damage that is not evident from viewing the unopened package. Concealed Damage is a damage to product that is not obvious until the product is examined or the condition becomes apparent during storage or transfer. / Под Повреждением понимается одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

CONCEALED LOSS = СКРЫТЫЙ УБЫТОК – Concealed Loss is a loss from a package bearing no indication of having been opened.

CONCEALMENT = СОКРЫТИЕ (или УТАИВАНИЕ) – Concealment is deliberate suppression by a proposer for insurance of a material fact relating to the risk, usually making the contract null and void.

CONCENTRATE = КОНЦЕНТРАТ – In mining industry, Concentrate is the product of a physical concentration process, such as flotation or gravity concentration, which involves separating ore minerals from unwanted wasted rock. Concentrates require subsequent processing (such as smelting or leaching) to break down or dissolve the ore minerals and obtain the desired elements, usually metals. / Плавка или Выплавка или Плавление (Smelting). В горнодобывающей промышленности под Концентратом, от новолатинского слова Concentratus, означающее Концентрированный или Сосредоточенный, понимается продукт обогащения полезных ископаемых (рудный концентрат) или химической переработки сырья (химический концентрат), в котором содержание полезных компонентов выше, чем в исходном сырье. Концентраты, отвечающие определённым стандартным требованиям по содержанию полезных компонентов и примесей, а также влаги, крупности зёрен и так далее, называются кондиционными; они отправляются с обогатительной фабрики для непосредственного использования (например, графитовые, слюдяные, тальковые, угольные концентраты), последующей металлургической (концентраты металлов) или химической (концентраты минеральных удобрений) переработки. Промежуточные (черновые) концентраты подвергаются доводке, а содержащие несколько ценных компонентов (коллективные концентраты) подвергаются разделению.

CONCENTRATED LOAD = СОСРЕДОТОЧЕННАЯ НАГРУЗКА – (1) Concentrated Load:- loading centered on a certain point (such as from roof-mounted equipment) as opposed to being equally distributed along the length of a member. / В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям.

(2) Concentrated Load:- concentrated over an area of less than 50 % of the pallet top deck. / Сосредоточенная Нагрузка или Сосредоточенный Груз:- груз, размещённый на площади, составляющей менее 50% площади верхнего настила поддона.

CONCENTRATING = ОБОГАЩЕНИЕ (или КОНЦЕНТРАЦИЯ) – Concentrating is the process of separating milled ore into two streams; one greatly enriched in the valuable mineral (concentrate) and another of waste material (tailings). Concentration is a vital economic step in the production process because it reduces the volume of material which must be transported to and processed in a smelter and refinery. / Под Концентрацией, от новолатинского слова Concentratio, от Латинских слов Con (Cum), означающее С или Вместе, и Centrum, означающее Средоточие или Центр, понимается:- (1) сосредоточение, скапливание, собирание кого-либо, чего-либо в каком-либо месте или вокруг одного центра, например, концентрация войск, концентрация сил. (2) Относительное количество данного компонента в системе (смеси, растворе, сплаве). Массовая концентрация – размерная физическая величина, равная отношению массы компонента к объёму системы. Единица концентрации в СИ – кг/м^3. Под Обогащением полезных ископаемых понимается совокупность процессов первичной переработки минерального сырья (руд, угля и прочего) для получения технически ценных или пригодных для дальнейшей металлургической, химической и другой переработки продуктов путём удаления пустой породы и разделения минералов. Способы обогащения полезных ископаемых основаны на разделении минералов по их плотности (гравитационное обогащение), магнитной восприимчивости (магнитное обогащение), смачиваемости поверхностей (флотация) и так далее. В результате обогащения полезных ископаемых получаются концентраты, поступающие в дальнейшую переработку, и отходы обогащения (хвосты). Обогащение полезных ископаемых производится на обогатительных фабриках, включающих помимо обогатительных операций процессы рудоподготовки и обезвоживания.

CONCENTRATION = КОНЦЕНТРАЦИЯ – Concentration is the quantity of active ingredient expressed as mass per unit volume, or an amount of a substance based on its proportion to the whole or a specified amount and expressed as mass per unit volume of the

resulting solution or mixture, e.g., gram per liter (g/l), parts per million (ppm). / Под Концентрацией, от новолатинского слова Concentratio, означающее Скапливание или Сосредоточение, понимается:- (1) Собирание кого-либо, чего-либо в каком-либо месте, например, концентрация войск или сил. (2) В химии – количество вещества, содержащееся в единице массы (или объёма) раствора, смеси, сплава. Может быть выражена в процентах, числом частиц в единице объёма.

CONCEPT = КОНЦЕПТ (или ПОНЯТИЕ) – Concept is an idea or design. / Под Концептом, от Латинского слова Conceptus, означающее Понятие, понимается:- (1) формулировка, умственный образ, общая мысль, понятие. (2) В логической семантике – смысл имени.

CONCESSIONAL SALES = ХХ ПРОДАЖИ – Concessional Sales are the credit sales of a commodity in which the buyer is allowed more favorable payment terms than those in the open market.

CONCISE FINANCIAL REPORT = КРАТКИЙ ФИНАНСОВЫЙ ОТЧЁТ – Concise Financial Report:- in Australia, unless a shareholder has requested in writing that a Company send the full Annual Report, Section 314 of the Corporations Act 2001 allows a company to send a Concise Financial Report in substitution for its Annual Report. A concise report for a financial year consists of:- (a) a concise financial report for the year drawn up in accordance with Accounting Standards AASB 1039; (b) the directors' report for the year; (c) a statement by the auditor:- (i) that the financial report has been audited, and (ii) whether, in the auditor's opinion, the concise financial report complies with the accounting standards made for the purposes of paragraph (a); (d) a copy of any qualification in, and of any statements included in the emphasis of matter section of, the auditor's report on the financial report; (e) a statement that the report is a concise report and that the full financial report and auditor's report will be sent to the member free of charge if the member asks for them. Under AASB 1039 a concise financial report must include:- (a) a balance sheet as at the end of the financial year; and (b) include the following financial statements:- (i) profit and loss statement for the financial year, and (ii) a statement of cash flows for the financial year. Each financial statement must be presented as in the financial report, in accordance with other Accounting Standards, except for the omission of cross- references to notes to the financial statements in the full financial report. The financial statements must be accompanied by discussion and analysis to assist the understanding of members. / (a) бухгалтерский баланс на конец финансового года; и (b) :- (i) отчёт о прибылях и убытках за финансовый год, и (ii) отчёт о движении денежных средств за финансовый год.

CONCOLOROS = ОДНОЦВЕТНОЕ – Concoloros:- colored uniformly throughout, the same color on both sides. / Имеющий одинаковую окраску и узор на двух сторонах (о крыле бабочки).

CONCRETE BED = БЕТОННАЯ ГРЯДА (или БЕТОННАЯ ГРЯДКА) – Concrete Bed is a plant bed, usually in a screenhouse, which has concrete sides.

CONCURRENT INDICATORS = СОВПАДАЮЩИЕ ИНДИКАТОРЫ – Concurrent Indicator is an economic indicator that provides information on the current state of the economy. That is, a coincident indicator does not show which way the economy is heading, but where it is at present. For example, coincident indicators move up when GDP is growing and down when GDP is shrinking. A common example is personal income. It is also called a Concurrent Indicator. See also Lagging Indicators, and Leading Indicators. Concurrent Indicators are the market indicators showing the general direction of the economy and confirming or denying the trend implied by the leading indicators. / Смотрите также Запаздывающие Индикаторы (Lagging Indicators).

CONCURRENT USE = КОНКУРЕНТНОЕ ИСПОЛЬЗОВАНИЕ (или ОДНОВРЕМЕННОЕ ИСПОЛЬЗОВАНИЕ) – Concurrent Use is the simultaneous use of digital information by more than one user; often used as a measure of limitations on the use of a digital information. / Одновременное использование цифровой информации более, чем одним пользователем. Часто используется в качестве меры ограничений на использование цифровой информации.

CONDENSATES = КОНДЕНСАТЫ – Condensates:- very high API crude oil, which in its natural state is in gaseous form but which condenses to liquid upon production. The Organization of the Petroleum Exporting Countries (OPEC) has for many years argued over the precise definition of condensates, since it does not include them in individual countries' crude production quotas. The heavier natural gas components, such as hexane, iceptane, pentane and so forth, which are liquid under atmospheric pressure. Also known as Naphtha, and Natural Gasoline. Liquid hydrocarbon mixtures recovered from non-associated gas reservoirs. They are composed of C_4 (butane, etc) and higher carbon number hydrocarbons. They normally have an API (short for the American Petroleum Institute) between 50° and 85°. Condensate:- Hydrocarbons that are in a gaseous state at reservoir conditions, but condense into liquid as they travel up the well bore and reach surface conditions. / Нефть с очень высоким показателем тяжести по АИН (API), которая в природных условиях находится в газообразном состоянии, однако конденсируется в жидкость в процессе добычи. ОСЭН или ОПЭК (OPEC), в Англоязычном произношении, много лет не могла согласовать точное определение конденсатов, поскольку не включала их в выделяемые отдельным странам квоты на добычу нефти. Жидкие углеводородные смеси, восстановленные из . Они состоят из C_4 (бутановых, etc) углеводородов и углеводородов с высоким числом углеродов. Под Конденсатом, от Латинского слова Condensatus, означающее Сгущённый или Уплотнённый, понимается:- (i) жидкость, образующаяся при конденсации газа или пара; или (ii) газовый конденсат, представляющий собой продукт, выделенный из природного газа, в виде смеси жидких углеводородов, содержащих более 4 атомов С в молекуле. (ii) в нефтяной геологии – жидкая в условиях земной поверхности часть газоконденсата, состоящая из легкокипящих (полностью выкипающих до 300 °С) углеводородов преимущественно метанового ряда; ценное моторное топливо.

CONDENSATION = КОНДЕНСАЦИЯ – Condensation is a process in which vapor molecules cohere to each other and change to liquid. / Под Конденсацией, от позднелатинского слова Condensatio, означающее Сгущение или Уплотнение, понимается переход вещества из газообразного состояния в жидкое или твёрдое. Конденсация возможна только при температурах ниже критической температуры. При постоянной заданной температуре конденсация идёт до тех пор, пока не установится равновесное давление (насыщение), зависящее только от температуры. Под Конденсацией водяного пара в атмосфере понимается переход водяного пара, содержащегося в атмосферном воздухе, в жидкое или твёрдое состояние с образованием капелек и кристаллов облаков и туманов, а также с выделением воды или льда на наземных предметах. Происходит на ядрах конденсации при охлаждении воздуха до точки росы, в результате его адиабатического подъёма или теплообмена с земной поверхностью.

CONDENSATION POLYMERIZATION = КОНДЕНСАЦИОННАЯ ПОЛИМЕРИЗАЦИЯ (или ПОЛИКОНДЕНСАЦИЯ) – Condensation Polymerization is a polymerization process yielding a product in which the repeating unit has fewer atoms that the monomer or monomers. Generally, the separation of water or some other simple substance occurs as a result of the reaction, e.g., ethylene glycol in polyester production. / Конденсационная Полимеризация или Поликонденсация – процесс полимеризации, .

CONDENSER = КОНДЕНСОР – Condenser is a machine to collect ginned lint into a smooth, endless batt. In the cotton gin, a perforated or screened drum device designed to collect lint cotton from the conveying airstream, at times into a batt. / В первичной

обработке хлопка-сырца под Конденсором, от Латинского слова Condenso, означающее Сгущаю или Уплотняю, понимается машина для сбора джинированного волокна в .

CONDITION = КОНДИЦИЯ (или СОСТОЯНИЕ) – Condition:- in grease wool, the amount of yolk and foreign impurities it contains. A fleece having a 'heavy condition' would have a large amount of shrinkage.

CONDITIONALLY RENEWABLE = УСЛОВНО ВОЗОБНОВЛЯЕМЫЙ – Conditionally Renewable:- a contract of health insurance that provides that the insured may renew the contract to a stated date or an advanced age, subject to the right of the insurance company to decline renewal only under conditions defined in the contract. / Контракт страхования жизни (договор страхования жизни), который предполагает, что застрахованное лицо может возобновить данный контракт (договор) к отмеченной дате или в наступаемом возрасте, но при этом страховая компания в праве отклонить возобновление только по тем условиям, которые определены в этом контракте (договоре).

CONDITIONAL RESPONSE = УСЛОВНАЯ ОТЗЫВЧИВОСТЬ – Conditional Response is a plant's response to quantitative or qualitative reactions.

CONDITIONAL SALES CONTRACT = КОНТРАКТ НА УСЛОВНЫЕ ПРОДАЖИ – Conditional Sales Contract means a contract:- (i) for the sale of an aircraft, aircraft engine, propeller, appliance, or spare part, under which the buyer takes possession of the property but title to the property vests in the buyer at a later time on:- (a) paying any part of the purchase price; (b) performing another condition; or (c) the happening of a contingency; or (ii) to bail or lease an aircraft, aircraft engine, propeller, appliance, or spare part, under which the bailee or lessee:- (a) agrees to pay an amount substantially equal to the value of the property; and (b) is to become, or has the option of becoming, the owner of the property on complying with the contract.

CONDITIONED STATE = КОНДИЦИОННОЕ СОСТОЯНИЕ – Conditioned State:- a sample is in the 'conditioned state' or 'conditioned' for testing purposes when it has been kept in the atmosphere for testing until moisture equilibrium has been reached. Equilibrium shall be considered to have been attained when the mass of the well-opened sample shows no progressive change between successive hourly weighings. In the case of certain fibers, preconditioning is necessary to ensure that moisture equilibrium is reached by absorption.

CONDITIONED WEIGHT = КОНДИЦИОННЫЙ ВЕС – In the Cotton industry, Conditioned Weight is the over-dry weight from the conditioning oven of fiber, yarn, or fabric plus the standard commercial moisture regain added to the dry weight. / стандартная коммерческая влагопоглощательная способность, добавленная к сухому весу. В хлопковой отрасли, Кондиционный Вес приравнивается к нетто весу при влажности хлопкового волокна 8.5%. Иными словами, расчётная масса, приведённая к нормированной влажности.

CONDITIONING = КОНДИЦИОНИРОВАНИЕ (или КЛИМАТИЗИРОВАТЬ, или УВЛАЖНЕНИЕ, или ПАСПОРТИЗАЦИЯ, или ЗАМАСЛОВКА) – (1) In textile industry, Conditioning is a process of allowing textile materials (staple, tow, yarns, and fabrics) to reach hygroscopic equilibrium with the surrounding atmosphere. Materials may be conditioned in a standard atmosphere (65% RH, 70 °F) for testing purposes or in arbitrary conditions existing in manufacturing or processing areas. Conditioning is the process of bringing a textile material into moisture equilibrium with the standard atmosphere for testing. Conditioning is the process by which the moisture content of a textile material is brought to moisture equilibrium by exposure to specific atmospheric conditions of temperature and relative humidity. Conditioning is a finishing process of sizing a fabric after dyeing to give it a hand. / В текстильном производстве, Кондиционирование – доувлажнение пряжи после прядения до нормального процента влажности. Кроме того при испытаниях текстильной продукции под Кондиционированием понимается выдерживание образцов в стандартных условиях температуры и относительной влажности в течение минимального периода времени.

(2) Conditioning is the exposure of a wood to the influence of a prescribed atmosphere for a stipulated period of time, or until a stipulated relation is reached between material and atmosphere. / .

CONDITIONS = УСЛОВИЯ – (1) Conditions:- anything called for as requirements before the performance or completion of something else.

(2) Conditions are the contractual stipulations which are printed on a document or provided separately.

(3) Conditions:- for securities, these include certain characteristics of the instrument, such as interest rate, issue price, maturity and repayment.

(4) Conditions are stipulations written in a policy, with which a policyholder must comply. Failure to do so may result in insurers refusing to pay a claim.

CONDITIONS OF CARRIAGE = УСЛОВИЯ ПЕРЕВОЗКИ – Conditions Of Carriage are the general terms and conditions established by a carrier in respect of the carriage (aircargo). / В перевозках авиационных грузов, это относится к генеральным порядкам и условиям, устанавливаемым перевозчиком в отношении самой перевозки.

CONDITIONS OF CONTRACT = УСЛОВИЯ КОНТРАКТА – Conditions Of Contract are the terms and conditions shown on the Air Waybill (aircargo). / В перевозках авиационных грузов, это относится к порядкам и условиям, отображённым в Авиа Накладной (Air Waybill).

CONDOMINIUM = КОНДОМИНИУМ – A Condominium is a multiple-unit dwelling in which there is separate and distinct ownership of individual units and joint ownership of common areas. For example, in an apartment house, the individual owners would each own their own apartments while all the owners of the separate apartments would together own the parts of the building common to all of them, such as the entrances, laundry rooms, elevators, and hallways. The building is managed by the condominium association, either directly or through a professional manager. The owners of the individual units are jointly responsible for the costs of maintaining the building and common areas, but they are individually responsible for the maintenance expenses of their particular units.

CONDOMINIUM OWNERSHIP = КОНДОМИНИУМНАЯ СОБСТВЕННОСТЬ – Condominium Ownership:- an individual who purchases a unit in a condominium receives title to such unit in fee simple, owning it outright. The owner has all legal rights incident to ownership, including the right to sell, absent a Restrictive Covenant limiting its use. Title to a condominium also encompasses ownership of the land and common areas with the remaining unit owners. The individual owner has certain rights, such as use of the common areas, and certain obligations, such as paying his or her share of the expenses incurred for maintenance or improvements of the common areas, regardless of whether the individual owner approves of the upkeep or improvements. The size of the share of operating, maintaining, and improving costs of a building and common areas to be borne by an individual unit owner depends on the size of that owner's unit, usually measured by the number of rooms in the unit. The three basic instruments used in the purchase of a condominium are a deed to the unit; a declaration of condominium; and the bylaws of the condominium association, the membership of

which is comprised of the units' owners. An individual buying a condominium receives a deed, which must be duly recorded in the appropriate county office. Such deed ordinarily describes the individual unit, the building in which the unit is located, and the property upon which the building is constructed. Generally it will also embody all limitations or restrictions imposed on the use of the unit and any other details agreed upon by the purchaser and seller. The deed cannot contain any provision that is contrary to the rules of the condominium or declaration of condominium. The declaration of condominium is the official record of the owner's rights and duties pursuant to receiving title to the condominium. It also states precisely what portions the owner of a unit owns and must maintain. State statute prescribes what must be included in the declaration of condominium. These requirements vary from one state to another, but a declaration of condominium must ordinarily contain the following:- (a) a legal description of the land and buildings of the condominium, which is essentially the same information contained in the deed; (b) a description of each unit, including the address, size, number of rooms, and exact location within the building; (c) a description of the common areas and any restrictions upon the use thereof; (d) the pecuniary worth of each unit of the condominium and of the land under it, as well as the percentage of shares in the common areas assigned to each unit owner, usually based upon the number of rooms in his or her unit; (e) the number of votes assigned to each unit. The declaration of condominium must also state the procedure for making decisions concerning repairs, improvements, and similar costs, as well as provisions for amendment of the declaration or for ending the condominium arrangement. The number of votes assigned to each unit owner is in proportion to that owner's percentage share. A declaration must also provide the procedures for owners' payments of fees and other costs and sanctions imposed for failure to pay them. Condominium unit owners must adhere to the regulations set forth in the bylaws. The bylaws of a condominium – the rules and regulations by which the condominium association governs itself – are generally drafted by the developers of the condominium or the original purchasers of the individual units. The bylaws ordinarily establish procedures for electing the officers or board members of the condominium association, conducting meetings, and handling routine building maintenance and insurance for the common areas. They prescribe any restrictions that may be imposed on the sale of individual units and penalties for violation of the rules. A condominium unit may be purchased for cash; however, the more common procedure is for a mortgage to be obtained to help finance it. Since each unit is owned individually, if an owner defaults on mortgage payments or property taxes, no other unit owner is liable. Also known as Flat Property. / Кондоминиум – совладение.

CONDOR = КОНДОР – In option strategy, Condors, like Butterflies, require you to have an opinion on direction and a price target. Unlike butterflies, you can target a range in which you think the stock will be at expiration. Where a butterfly requires you to sell two options at a central strike price (which also is your price target), a condor could be profitable if the stock expires along a range of prices because it involves selling at two different strike prices. 'Butterflies are very pretty and symmetrical; (condors) can be big and gawky. They look like they have trouble even getting up in the air', says Marty Kearney, Senior Instructor at CBOE® Options Institute. The advantage of a condor compared to a butterfly is it allows you to take a directional play, but it gives you a larger range where you may do pretty well. Like a butterfly, a condor is composed of either all calls or all puts. Again, if we take our USD63 stock, but this time we think it will be somewhere between USD70 and USD75 at expiration, a condor can let us maximize profit while limiting risk. To do this, we can buy a 65–70 bull call spread by buying the 65 call and selling the 70 call, and then selling a 75–80 bear call spread by selling the 75 call and buying the 80 call. Profit is maximized if we expire between USD70–USD75 and our wings give us protection should we miss our mark. Again, our maximum loss is the cost of the condor, plus commissions. / СИБО® (CBOE®). продать два опциона по центральной сходной цене (которая также является Вашей ценовой целью), .

CONDUCTING TISSUE = ПРОВОДЯЩАЯ ТКАНЬ – Conducting Tissue:- xylem and phloem are called the Conducting Tissues. Xylem is meant to conduct water and mineral salts upward from root to the leaf and give mechanical strength to the plant body. Except wood parenchyma all other xylem elements are lignified thick walled and dead. Phloem as a whole is meant to conduct prepared food material from leaf to the storage organs and the growing regions. Conducting Tissue is another name for Vascular Tissue.

CONDUCTOR = ПРОВОДНИК – Conductor is usually a metallic substance capable of transmitting electricity with little resistance. The best conductor at normal temperature ranges is silver. The most common is copper. Some other recently discovered substances called super conductors actually have zero resistance at extremely low temperatures. / Под электрическими Проводниками понимаются тела (вещества), обладающие способностью хорошо проводить электрический ток. Проводники содержат большое число носителей тока. В проводниках 1-го рода (металлах и сплавах) носителями тока являются электроны, в проводниках 2-го рода (электролитах) – ионы. Проводники – вещества, хорошо проводящие электрический ток благодаря наличию в них большого количества подвижных заряженных частиц. Делятся на:- ионные (электролиты), электронные (металлы, полупроводники) и смешанные, где имеет место движение как электронов, так и ионов (например, плазма).

CONE = COST OF NEW ENTRY

CONE = КОНУС (или КОНУСНАЯ КАТУШКА) – Cone is a conical package of yarn, usually wound on a disposable paper core. In textile industry, cone is a bobbin upon which yarn is wound prior to weaving. / В текстильной отрасли под Конусом или Конусной Катушкой понимается разновидность бобин, на которую производится намотка пряжи, прежде чем она попадает в ткачество.

CONES = УПОРНЫЕ ГОЛОВКИ (или КОНУСЫ) – Cones are the devices for facilitating the loading, positioning and lashing of containers. Devices for facilitating the positioning of containers. The cones insert into the bottom corner castings of the container. / Устройства для обеспечения позиционирования контейнеров. Упорные головки входят в нижние угловые отливки контейнера.

CONEY WOOL = КРОЛИЧЬЯ ШЕРСТЬ (или XX) – Coney Wool (in the UK, 1840's), the fur of Rabbits. This article is extensively used in the hat manufacture; and besides the large supplies raised at home, a great deal is imported. The imports usually range from about 300 000 to about 500 000 skins a year.

CONF = КОНФ – Conf is an abbreviation used to denote Swiss government bonds (derived from the Latin name Confoederatio Helvetica that is the official name of Switzerland). / Под Конфом понимается обозначение, используемое для ссылки на Швейцарские правительственные облигации. Данное слово было образовано от Латинского словосочетания Конфэдерацио Эльвэтика (Confoederatio Helvetica) – официального названия Швейцарии.

CONFEDERATION = КОНФЕДЕРАЦИЯ – Confederation is a form of government in which the major geographical subdivisions of the country have their own governmental organizations that retain numerous independent rights of policy-making and decision that may not be overridden by the central government, and in which the central government's rights of policy-making and decision are severely restricted. The distinction between a federation and a confederation is not always easy to make, but generally speaking, confederations assign much more limited powers to the central government than do federations – typically only national defense and foreign relations, plus a few other minor functions. One practical criterion often used as the key to distinguishing federations from confederations is that in the latter the central government does not have direct taxing or enforcement authority over individual citizens but rather must depend upon the regional governments to provide its revenues and give effect to its laws governing individuals. / Под Конфедерацией, от позднелатинского слова Confoederatio, означающее Объединение или Союз, понимается:- (i) форма государственного

устройства, при которой государства, образующие конфедерацию, полностью сохраняют свою независимость, имеют собственные органы государственной власти и управления; они создают специальные объединённые органы для координации действий в определённых целях (военных, внешнеполитических и тому подобных). Исторически в форме конфедерации была создана Швейцария; или (ii) название каких-либо общественных или иных организаций, например, Всеобщая Конфедерация Труда во Франции.

CONFERENCE = КОНФЕРЕНЦИЯ – (1) Conference:- defined in the 1984 Shipping Act as:- ... an association of ocean common carriers permitted, pursuant to an approved or effective agreement, to engage in concerted activity and to utilize a common tariff; but the term does not include a joint service, consortium, pooling, sailing or transshipment arrangement. It is basically a group of steamship companies offering equitable freight rates, standardised shipping practices and regularly scheduled services between designated ports. These arrangements are given anti-trust immunity as authorized by the 1984 Shipping Act. An association of ship owners operating in the same trade route who operate under collective conditions and agree on tariff rates. Conference is a group of steamship companies offering equal freight rates, standardised shipping practices and regularly scheduled service between designated ports. In the United States, these arrangements are given anti-trust immunity as authorised by the Shipping Act of 1984. Association of ship owners operating in specific areas and routes, who agree to operate under collective conditions of carriage and rates whereby a tariff is published governing same. Conference is an affiliation of shipowners operating over the same route(s) who agree to charge uniform rates and other terms of carriage. A conference is 'closed' if one can enter only by the consent of existing members of the conference. It is 'open' if anyone can enter by meeting certain technical and financial standards. Conference members are common carriers. / Под Конференцией, от позднелатинского слова Conferentia от Confero, означающее Собираю В Одно Место, понимается собрание, совещание представителей каких-либо организаций, групп, государств, а также отдельных лиц, учёных для обсуждения определённых (часто теоретических) вопросов.

(2) Group of Carriers allowed by the US Federal Maritime Commission to determine rate levels, service and rules of a given trade route bound together by a common tariff or certain geographical area.

CONFERENCE CARRIER = КОНФЕРЕНЦИАЛЬНЫЙ ПЕРЕВОЗЧИК (или ПЕРЕВОЗЧИК ЧЛЕН КОНФЕРЕНЦИИ) – Carrier that belongs to the Conference. Conference Carrier is an ocean carrier who is a member of an association known as a Conference. The purpose of the conference is to standardize shipping practices, eliminate freight rate competition, and provide regularly scheduled service between specific ports.

CONFERENCE CERTIFICATE = СЕРТИФИКАТ УЧАСТНИКА КОНФЕРЕНЦИИ – Conference Certificate is a certificate declaring that the carrier is a member of the conference. / Сертификат, декларирующий о том, что данный перевозчик является членом данной конференции.

CONFIDENCE LEVEL = УРОВЕНЬ ДОВЕРИЯ – Confidence Level:- within the value-at-risk concept framework, the confidence level reflects the probability a potential loss will occur within a specified interval.

CONFIDENTIALITY = КОНФИДЕНЦИАЛЬНОСТЬ (или СЕКРЕТНОСТЬ) – Confidentiality is the property that information is not made available or disclosed to unauthorized individuals, entities or processes. The characteristic of that data which are not to be disclosed to those not authorized to see them. The treating of information as private and not for distribution beyond specifically identified individuals or organizations, nor used other than for specifically identified purposes. Confidentiality is a holding information in strict confidence. Authorized Certification Officials are to hold in strict confidence the information in export certificates to protect buyers and exporters. / Под Конфиденциальным, от Латинского слова Confidentia, означающее Доверие, понимается доверительный, секретный.

CONFINED RELEASE = ОГРАНИЧЕННЫЙ ВЫПУСК – Confined Release is a release of plants into the environment under specific terms and conditions intended to minimize establishment and spread into, and interaction with the environment of the plants and any progeny derived from them.

CONFIRMATION = КОНФИРМАЦИЯ (или УТВЕРЖДЕНИЕ) – (1) Confirmation is an irrevocable undertaking of the confirming bank to honor or negotiate. / Под Конфирмацией, от Латинского слова Confirmatio, означающее Утверждение, или Миропомазанием понимается:- (1) христианское таинство (в католицизме и православии). Смотрите также в статье Таинства. (2) В протестантизме торжественный публичный акт (не рассматривающийся как таинство) приобщения юношей и девушек (14–16 лет) к церковной общине, сопровождается чтением 'Исповедания Веры' и особой молитвой.

(2) Confirmation is a subsequent signal that validates a position stance. Traders and investors sometimes look for more than one signal or require validation before acting. For example, confirmation of a trend change may entail an advance past the previous reaction high. For an indicator such as MACD, confirmation of a divergence may be a subsequent moving average crossover. A secondary signal from either a separate technical indicator or subsequent price movement that confirms a meaningful technical event has occurred. / МЭКДИ (MACD) .

(3) Confirmation is a memorandum to the other party describing all the relevant details of the transaction. / Меморандум для другой стороны, описывающий все относящиеся к данной сделке сведения.

(4) Confirmation:- the OTC (over-the-counter) market's master agreement establishes that the parties intend to be legally bound by the terms of each transaction from the moment they agree to those terms, including oral agreement. The parties are, however, obligated to enter into a confirmation as soon as practicably possible, in writing (including by facsimile transmission) or by an exchange of telexes or electronic messages.

CONFIRMATION NUMBER = НОМЕР КОНФИРМАЦИИ (или НОМЕР УТВЕРЖДЕНИЯ) – In the US patent law, a Confirmation Number is a four-digit number that is assigned to each newly filed patent application. The confirmation number, in combination with the application number, is used to verify the accuracy of the application number placed on correspondence filed with the Office of the United States Patent and Trademark Office (USPTO) to avoid misidentification of an application due to a transposition error (misplaced digits) in the application number. The Office recommends that applicants include the application's confirmation number (in addition to the application number) on all correspondence submitted to the Office concerning the application.

CONFIRMATION OF LETTER OF CREDIT = УТВЕРЖДЕНИЕ АККРЕДИТИВА – Confirmation of Letter of Credit (L/C) is the first payment obligation undertaken independently by the bank for the beneficiary beyond the issuing bank. Functions:- undertaking the credit risks of the issuing bank for the exporter so as to help exporter receive payments in advance upon complying presentation; it can be divided into two forms:- open confirmation and silent confirmation. Features:- (i) Reduction of Risks and Acceleration of the Capital Turnover:- confirmation of L/C can help exporters prevent the risks from the issuing bank, the country risk of issuing bank and the foreign exchange control risks; (ii) Double Guarantee:- apart from the conditional payment undertaking made by the issuing bank, the

exporters can get additional conditional payment undertaking from the bank, placing the exporters under double payment guarantee; and (iii) Payment Collection Guarantee:- the exporters upon presentation that comply with the L/C's requirements and approval of the bank, can gain the non-recourse payments or payments promises. Charges (only to familiarize on a Chinese sample):- 2‰ of the confirmed amount, with minimum of RMB500, charged quarterly. The fee will rise subject to the degree of risks of the relevant countries or banks. Target Customers:- (i) exporters who wish to obtain payment confirmation from a bank other than the issuing bank; and (ii) exporters who wish to obtain non-recourse funds after presentation of documents even if the issuing bank has a good credit standing. Application Qualifications:- (1) Basic Requirements:- (i) legally approved and registered with annually checked business license and other documents effectively proving its legal status and business scope; (ii) having a loan card; (iii) having an account opening permit and having opened a settlement account at the bank; (iv) having the export and import operation qualifications; and (v) no blemished credit records in the bank and/or other financial institutions. (2) The issuing bank is a financial institution granted with credit and having a good credit standing. Process:- (i) the bank provides confirmation upon the request of the issuing bank or exporter (beneficiary) when advising the L/C; (ii) the exporter presents the complying documents to the bank and the bank makes non-recourse payments or irrevocable payments promises to the exporter after examination and approval; and (iii) the bank mails the documents to the foreign issuing bank to claim reimbursement and will confirm the payment after the foreign payment received.

CONFIRMATION PROCESS = ПРОЦЕСС КОНФИРМАЦИИ (или ПРОЦЕСС УТВЕРЖДЕНИЯ) – Confirmation Process is the procedure for verifying trade details with a counterparty. This is generally done by exchanging via fax or mail a document (i.e. a confirmation) identifying the trade details and any governing legal documentation and verifying the accuracy of the information provided by the counterparty (i.e. matching).

CONFIRMATION STATEMENT = УТВЕРЖДАЮЩАЯ ВЫПИСКА – Confirmation Statement is a statement sent by a Futures Commodity Merchant to a customer when a futures or options position has been initiated. The statement shows the price and the number of contracts bought or sold. Sometimes combined with a Purchase and Sale Statement.

CONFIRMED LETTER OF CREDIT = ПОДТВЕРЖДЁННЫЙ АККРЕДИТИВ (или УТВЕРЖДЁННЫЙ АККРЕДИТИВ) – A Confirmed L/C is confirmed through a bank in the exporter's country, giving the exporter an additional guarantee of payment from a second bank (i.e. confirming bank) in addition to the guarantee of the buyer's foreign bank. An unconfirmed L/C, on the other hand, is not confirmed by a bank in the seller's country, resulting in less certainty and slower payment. First Letter of Credit- a letter of credit is commonly needed in business transactions requiring substantial payment for goods or services. Instead of requesting an advance payment, the seller may require that the buyer obtain a letter of credit for the balance of the payment to be owed at the time of full delivery. A buyer must work with a bank to obtain the first letter of credit. This requires a full credit application similar to the credit application for a loan. If the seller is approved for the letter of credit the bank documents that they are willing to pay the seller the stated amount if the buyer defaults at the time of payment. The terms of the letter of credit will typically structure the payment as a loan for the buyer. If the buyer is unable to make the payment to the seller at the time when the funds are due then the bank will issue the payment as a loan to the buyer. Upon receiving the letter of credit, the buyer also agrees to the bank's loan terms. Terms of the loan if required will included a stated interest rate and payment schedule as well as other disclosures regarding repayment. If the seller is satisfied with the first letter of credit they may accept it as an unconfirmed letter of credit. Unconfirmed letters of credit require the support of only one lending bank. Obtaining a Second Letter of Credit:- obtaining the second letter of credit confirms the first letter of credit and qualifies it as a confirmed letter of credit. The process for obtaining a second letter of credit is the same as the first letter of credit. The buyer will have to find a second bank to back their purchase in the case of defaulted payment. The buyer will need to go through the same letter of credit process again to be approved for a second letter of credit. The structuring of the funds for the second letter of credit will typically take into consideration the terms of the first letter of credit as well. In some cases, the seller may only require that the second letter of credit represent a percentage of the total due since it is in addition to the credit offered by the first bank. A Confirmed Letter of Credit is issued by a foreign bank with its validity confirmed by a domestic bank. An exporter with a confirmed letter of credit from the buyer is assured payment from the domestic bank in case the foreign buyer or the foreign bank defaults. A Confirmed L/C is confirmed through a bank in the exporter's country, giving the exporter an additional guarantee of payment from a second bank (i.e. confirming bank) in addition to the guarantee of the buyer's foreign bank. An Unconfirmed L/C, on the other hand, is not confirmed by a bank in the seller's country, resulting in less certainty and slower payment. Confirmed Letter of Credit:- when an LC is issued, the Issuing Bank may request the Advising Bank to add its confirmation on the LC. By agreeing to add the confirmation, the Advising Bank will become the Confirming Bank and undertakes to pay the beneficiary (seller) if all the terms and conditions of the LC are complied with. Confirmed Letter of Credit:- a confirmed letter of credit is a letter of credit with a second guarantee obtained by a borrower in addition to the first letter of credit. A confirmed letter of credit is typically used when the issuing bank of the first letter of credit may have questionable creditworthiness and the seller seeks to get a second guarantee to assure payment. If the first letter of credit is not backed by a second guarantee then it may be considered unconfirmed. A confirmed letter of credit requires the backing of more than one bank by a buyer of goods in a domestic or international transaction. A confirmed letter of credit may be required by a buyer in a transaction if the seller is not satisfied with the creditworthiness of the first letter of credit. A confirmed letter of credit adds to the credibility of the buyer and helps to decrease the risk of payment default for the seller. See also Unconfirmed Letter Of Credit.

CONFIRMED PAYMENT ORDER = ПОДТВЕРЖДЁННОЕ ПЛАТЁЖНОЕ ПОРУЧЕНИЕ (или УТВЕРЖДЁННОЕ ПЛАТЁЖНОЕ ПОРУЧЕНИЕ) – The Confirmed Payment Order according to Art. 468 of the Swiss Code of Obligations (better known as the Promise To Pay) is, like the guarantee, an irrevocable, not accessory obligation to pay. The following applies to the promise to pay:- (i) It may be subject to certain conditions (conditional confirmed payment order). The obligation to pay is limited by the fact that the conditions stipulated in the confirmed payment order must be fulfilled. (ii) The promise to pay without conditions (unconditional confirmed payment order) is a fixed obligation to pay irrevocably and unconditionally on a date specified in advance. In contrast to a surety or guarantee, a payment effected on the basis of an unconditional confirmed payment order does not represent a substitute for the non-performance of a third party, thus it does not have the character of a payment guarantee in case of non-payment.

CONFIRMING = ПОДТВЕРЖДЕНИЕ – Confirming is a financial service in which an independent company confirms an export order in the seller's country and makes payment for the goods in the currency of that country. Among the items eligible for confirmation are the goods; inland, air and ocean transportation costs; forwarding fees; custom brokerage fees; and duties. Confirming permits the entire export transaction from plant to end user to be fully coordinated and paid for over time. / Подтверждением является финансовая услуга, в соответствии с которой независимая компания подтверждает заказ для вывоза (или экспорта) в стране продавца и осуществляет оплату товаров в валюте данной страны. Среди всего прочего, подходящего для подтверждения, являются сами товары; расходы на наземную, воздушную и океанскую транспортировку; вознаграждения за экспедирование; вознаграждения за услуги таможенного оформления; и пошлины. Подтверждение позволяет всей вывозной (или экспортной) сделке быть полностью скоординированной и оплаченной от момента вывоза с завода и вплоть до доставки конечному потребителю.

CONFIRMING BANK = ПОДТВЕРЖДАЮЩИЙ БАНК – Confirming Bank is the bank that adds its confirmation to another bank's (the issuing bank's) letter of credit and promises to pay the beneficiary upon presentation of documents specified in the letter of credit. Confirming Bank is the bank that adds its confirmation to a credit upon the issuing bank's authorization or request. Confirming Bank:- the correspondent bank may confirm the letter of credit for the beneficiary. At the request of the issuing bank, the correspondent obligates itself to insure payment under the letter of credit. The confirming bank would not confirm the credit until it evaluated the country and bank where the letter of credit originates. The confirming bank is usually the advising bank. / Подтверждающий Банк – банк, добавляющий к аккредитиву своё подтверждение, то есть принимающий на себя обязательства по аккредитиву наряду с банком эмитентом.

CONFLICTING MARKS = КОНФЛИКТУЮЩИЕ ЗНАКИ (или КОНФЛИКТУЮЩИЕ МАРКИ) – Conflicting Marks:- a mark that is confusingly similar that it closely resembles a registered trademark is a conflicting mark. Such a mark is likely to confuse consumers about the source of the product or service. Pursuant to 15 USCS § 1052, registration of a trademark can be refused because it is likely to conflict with a mark or marks already registered or pending before the US Patent and Trademark Offices (USPTO). When a trademark application is filed, the assigned examining attorney will search the USPTO records to determine if such a conflict exists between the mark in the application and another mark that is registered or pending before the USPTO. The principal factors considered by the examining attorney in determining whether there is a likelihood of confusion are:- (i) the similarity of the marks; and (ii) the commercial relationship between the goods or services listed in the application. Conflicting marks need not be identical, and the goods and/or services do not have to be the same. Even if the marks are similar and the goods and/or services related the mark can be considered as a conflicting mark. If a conflict exists between a mark in an application and a registered mark, the examining attorney will refuse registration on the ground of likelihood of confusion. If a conflict exists between a mark in an application and a mark in a pending application that was filed before, the examining attorney will notify the potential conflict and suspend action on the latter application. If the earlier-filed application is registered, the examining attorney can refuse registration of the mark on the ground of likelihood of confusion. See also Likelihood Of Confusion.

CONFLICT MINERALS = КОНФЛИКТНЫЕ МИНЕРАЛЫ – Conflict Minerals describe minerals listed in the US Conflict Minerals Trade Act. These include tantalite (coltan), cassiterite (tin ore), wolframite, gold, and their derivatives, by which conflicts in the Democratic Republic of Congo or neighboring states are financed.

CONFLUENT = СТОК – Confluent:- blending together or coalescing.

CONFU = CONFERENCE ON FAIR USE

CONGESTION = ПРЕСЫЩЕНИЕ (или ПЕРЕНАСЫЩЕНИЕ, или СКОПЛЕНИЕ, или ЗАТОР) – (1) Congestion is a market situation in which shorts attempting to cover their positions are unable to find an adequate supply of contracts provided by longs willing to liquidate or by new sellers willing to enter the market, except at sharply higher prices. See also Corner, and Squeeze.

(2) When prices trade at similar levels over a period of time, the chart becomes cluttered with business at these levels and is referred to as Congested. Congestion areas are often seen as providing support/resistance. They are the levels at which, rather than breaking into new ground, prices tend to bog down and become trapped. In technical analysis, a period of time characterized by repetitious and limited price fluctuations. Congestion or consolidation reflects a pattern without strong indication of a trend of commodity prices. During congestion aggressive buying and selling of commodity futures contracts occur within a limited range of price fluctuation. / ограниченными флуктуациями (колебаниями) цены. Если цены сделок остаются примерно на одном уровне в течение продолжительного времени, соответствующие графики загромождаются данными на таких уровнях, и их называют 'переполненными'. Области переполнения часто истолковывают как отражающие точки поддержки или сопротивления. Это уровни, на которых цены вместо того, чтобы перейти на качественно новый уровень, застревают и перестают реагировать на фактические колебания конъюнктуры.

(3) Port or Berth Delays. Accumulation of vessels at a port to the extent that vessels arriving to load or discharge are obliged to wait for a vacant berth. Accumulation of vessels at a port resulting in waiting time for arriving vessels to load or discharge for a vacant berth. / судно, пребывающее под погрузку или разгрузку .

CONGESTION SURCHARGE = НАДБАВКА ЗА ПРОСТОЙ (или ДОПЛАТА ЗА ПРОСТОЙ) – Congestion Surcharge is an extra charge for waiting periods at the port. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. Port Congestion Surcharge applied by shipping lines to cover losses caused by congestion and idle time for vessels serving that port. Shipping lines therefore have the right to impose a surcharge on the freight to recover revenue lost. Another factor which influences port congestion surcharge would be labour disputes. Port congestion surcharges are calculated as a percentage of the freight rate. / надбавка или доплата (surcharge).

CONGLOMERATE = КОНГЛОМЕРАТ – (1) Conglomerate is a business concern with diversified activities, created through a series of mergers and acquisitions. This form of business integration exists in capitalist economies and differs from other combinations in that the business activities are sometimes completely unrelated. Conglomerates are formed chiefly for financial reasons, e.g., to improve combined return on investment by minimizing the effects of economic fluctuations on a given division, or to make profits on the sale of companies in the conglomerate. A Conglomerate is a combination of two or more corporations engaged in entirely different businesses that fall under one corporate group, usually involving a parent company and many subsidiaries. Often, a conglomerate is a multi-industry company. Conglomerates are often large and multinational. Modernization:- conglomerates were popular in the 1960s due to a combination of low interest rates and a repeating bear/bull market, which allowed the conglomerates to buy companies in leveraged buyouts, sometimes at temporarily deflated values. Famous examples from the 1960s include Ling-Temco-Vought, ITT Corporation, Litton Industries, Textron, Teledyne, Gulf+Western, AT&T, and Transamerica. As long as the target company had profits greater than the interest on the loans, the overall return on investment of the conglomerate appeared to grow. Also, the conglomerate had a better ability to borrow in the money market, or capital market, than the smaller firm at their community bank. For many years this was enough to make the company's stock price rise, as companies were often valued largely on their return on investment. The aggressive nature of the conglomerators themselves was enough to make many investors, who saw a 'powerful' and seemingly unstoppable force in business, buy their stock. High stock prices allowed them to raise more loans, based on the value of their stock, and thereby buy even more companies. This led to a chain reaction, which allowed them to grow very rapidly. However, all of this growth was somewhat illusory. When interest rates rose to offset inflation, the profits of the conglomerates fell. Investors noticed that the companies inside the conglomerate were growing no faster than before they were purchased, whereas the rationale for buying a company was that 'synergies' would provide efficiency. By the late 1960s they were shunned by the market, and a major sell-off of their shares ensued. To keep the companies going, many conglomerates were forced to shed the industries they had purchased recently, and by the mid-1970s most had been reduced to shells. The conglomerate fad was subsequently replaced by newer ideas like focusing on a company's core competency. In other cases, conglomerates are formed for genuine interests of diversification rather than manipulation

of paper return on investment. Companies with this orientation would only make acquisitions or start new branches in other sectors when they believe this will increase profitability or stability by sharing risks. Flush with cash during the 1980s, General Electric also moved into financing and financial services, which in 2005 accounted for about 45% of the company's net earnings. GE also owns a minority interest in NBC Universal, which owns the NBC television network and several other cable networks. In some ways GE is the opposite of the 'typical' 1960s conglomerate in that the company was not highly leveraged, and when interest rates went up they were able to turn this to their advantage, as it was often less expensive to lease from GE than buy new equipment using loans. United Technologies has also proven to be a successful conglomerate. With the spread of mutual funds (especially index funds since 1976), investors could more easily obtain diversification by owning a small slice of many companies in a fund rather than owning shares in a conglomerate. Another example of a successful conglomerate is Warren Buffett's Berkshire Hathaway, a holding company which used surplus capital from its insurance subsidiaries to invest in a variety of manufacturing and service businesses. International:- the end of the First World War caused a brief economic crisis in Weimar Germany, permitting entrepreneurs to buy businesses at rock-bottom prices. The most successful, Hugo Stinnes, established the most powerful private economic conglomerate in 1920s Europe – Stinnes Enterprises – which embraced sectors as diverse as manufacturing, mining, shipbuilding, hotels, newspapers, and other enterprises. The best known British conglomerate was Hanson PLC. It followed a rather different timescale than the US examples mentioned above, as it was founded in 1964 and ceased to be a conglomerate when it split itself into four separate listed companies between 1995 and 1997. In Hong Kong, two most well-known conglomerates are the Swire Group and Jardine Matheson, both are British-owned companies that have a history of over 100 years and have business interests that span across four continents with a focus in Asia. Swire Group (or Swire Pacific) controls a wide range of businesses, including property (Swire Properties), aviation (i.e. Cathay Pacific and Dragonair), beverages (bottler of Coca Cola), shipping and trading. Jardine Matheson operates businesses in the fields of property, finance, trading, retail and hotel (i.e. Mandarin Oriental). In Japan, a different model of conglomerate, the keiretsu, evolved. Whereas the Western model of conglomerate consists of a single corporation with multiple subsidiaries controlled by that corporation, the companies in a keiretsu are linked by interlocking shareholdings and a central role of a bank. Mitsubishi is one of Japan's best known keiretsu, reaching from automobile manufacturing to the production of electronics such as televisions. In South Korea, the chaebol are a type of conglomerate owned and operated by a family. A chaebol is also inheritable, as most of current presidents of chaebols succeeded their fathers or grandfathers. Some of the largest and most well-known Korean chaebols are Samsung, LG, Hyundai Kia and SK. The era of Licence Raj (1947–90) in India created some of Asia's largest conglomerates, such as the Tata Group, Kirloskar Group, Larsen & Toubro, Mahindra Group, Sahara India, ITC Limited, Essar Group, Reliance ADA Group, Reliance Industries, Aditya Birla Group and the Bharti Enterprises. Advantages:- (i) diversification results in a reduction of investment risk. A downturn suffered by one subsidiary, for instance, can be counterbalanced by stability, or even expansion, in another division. For example, if Berkshire Hathaway's construction materials business has a bad year, the loss might be offset by a good year in its insurance business. This advantage is enhanced by the fact that the business cycle affects industries in different ways. Financial Conglomerates have very different compliance requirements from insurance or reinsurance solo entities or groups. There are very important opportunities that can be exploited, to increase shareholder value. (ii) A conglomerate creates an internal capital market if the external one is not developed enough. Through the internal market, different parts of conglomerate allocate capital more effectively. (iii) A conglomerate can show earnings growth, by acquiring companies whose shares are more discounted than its own. In fact, Teledyne, GE, and Berkshire Hathaway have delivered high earnings growth for a time. Disadvantages:- (i) the extra layers of management increase costs. (ii) Accounting disclosure is less useful information, many numbers are disclosed grouped, rather than separately for each business. The complexity of a conglomerate's accounts make them harder for managers, investors and regulators to analyze, and makes it easier for management to hide things. (iii) Conglomerates can trade at a discount to the overall individual value of their businesses because investors can achieve diversification on their own simply by purchasing multiple stocks. The whole is often worth less than the sum of its parts. (iv) Culture clashes can destroy value. (v) Inertia prevents development of innovation. (vi) Lack of focus, and inability to manage unrelated businesses equally well. Some cite the decreased cost of conglomerate stock (a phenomenon known as Conglomerate Discount) as evidential of these disadvantages, while other traders believe this tendency to be a market inefficiency, which undervalues the true strength of these stocks. A corporation that has diversified in operations usually by acquiring enterprises in widely varied industries. Conglomerate is a corporation that is made up of a number of different, seemingly unrelated businesses. In a conglomerate, one company owns a controlling stake in a number of smaller companies, which conduct business separately. Each of a conglomerate's subsidiary businesses runs independently of the other business divisions, but the subsidiaries' management reports to senior management at the parent company. The largest conglomerates diversify business risk by participating in a number of different markets, although some conglomerates elect to participate in a single industry – for example, mining. These are the two philosophies guiding many conglomerates:- (i) by participating in a number of unrelated businesses, the parent corporation is able to reduce costs by using fewer resources; and (ii) by diversifying business interests, the risks inherent in operating in a single market are mitigated. History has shown that conglomerates can become so diversified and complicated that they are too difficult to manage efficiently. Since the height of their popularity in the period between the 1960s and the 1980s, many conglomerates have reduced the number of businesses under their management to a few choice subsidiaries through divestiture and spinoffs. / Лынь-Тэмко-Ват (Ling-Temco-Vought), Ай.Ти.Ти. Груп (Reliance ADA Group), Рилайэнц Индэстриз (Reliance Industries), Адитэ Била Груп (Aditya Birla Group) и Барти Энтэпрайзиз (Bharti Enterprises). От Латинского. / флуктуации (колебания) экономики данного подразделения, или . , например, . Под Конгломератом, от Латинского слова Conglomeratus, означающее Скученный или Уплотнённый, понимается одна из современных форм монополистических объединений. Они стали возникать в 1960-е преимущественно в США. Образование конгломерата происходит путём функциональных слияний (объединение компаний, связанных в процессе производства) или путём инвестиционных слияний (объединение компаний без производственной общности). Конгломерат – корпорация, объединяющая компании, занимающиеся различными видами деятельности. Конгломераты были популярны в 1960-х, когда считалось, что они обеспечивают лучшее управление и предоставляют более надёжную финансовую поддержку и, следовательно, приносят большую прибыль, чем небольшие независимые компании. Некоторые конгломераты стали столь громоздкими, что ими было сложно управлять. В 1980- и 1990-х некоторые конгломераты продали свои подразделения и

сконцентрировались на нескольких основных областях деятельности. Большинство аналитиков считают, что акции конгломератов оценивать сложно, поскольку конгломераты заняты во многих не связанных друг с другом видах деятельности.

(2) A Conglomerate is a rock consisting of individual clasts within a finer-grained matrix that have become cemented together. Conglomerates are sedimentary rocks consisting of rounded fragments and are thus differentiated from breccias, which consist of angular clasts. Both conglomerates and breccias are characterized by clasts larger than sand (> 2 mm). Classification:- in addition to the factors described in this section, conglomerates are classified in terms of both their rounding and sorting. Texture:- paraconglomerates consist of a matrix-supported rock that contains at least 15% sand-sized or smaller grains (< 2 mm), the rest being larger grains of varying sizes. Orthoconglomerates consist of a clast-supported rock with less than 15% matrix of sand and finer particles. Metamorphic alteration transforms conglomerate into metaconglomerate. Clast Composition:- conglomerates are classified for the lithologies of the clasts:- (i) Monomict:- clasts with only a single lithology; (ii) Oligomict:- clasts of only a few different lithologies; (iii) Polymict:- clasts of many different lithologies; (iv) Intraformational:- clasts derived from the same formation in which they are found; and (v) Extraformational:- clasts derived from older rocks than the formation in which they are found. Clast Size:- conglomerates are also classified by the dominant clast size:- (i) Granule conglomerate 2–4 mm; (ii) Pebble conglomerate 4–64 mm; (iii) Cobble conglomerate 64–256 mm; and (iv) Boulder conglomerate > 256 mm. Sedimentary Environments:- conglomerates are deposited in a variety of sedimentary environments:- (i) Deepwater Marine:- in turbidites, the basal part of a bed is typically coarse-grained and sometimes conglomeratic. In this setting, conglomerates are normally very well sorted, well-rounded and often with a strong A-axis type imbrication of the clasts. (ii) Shallow Marine:- conglomerates are normally present at the base of sequences laid down during marine trangressions above an unconformity, and are known as Basal Conglomerates. They represent the position of the shoreline at a particular time and will be diachronous. (iii) Fluvial:- conglomerates deposited in fluvial environments are typically well-rounded and well-sorted. Clasts of this size are carried as bedload and only at times of high flow-rate. The maximum clast size decreases as the clasts are transported further due to attrition, so conglomerates are more characteristic of immature river systems. In the sediments deposited by mature rivers, conglomerates are generally confined to the basal part of a channel fill where they are known as Pebble Lags. Conglomerates deposited in a fluvial environment often have an AB-plane type imbrication. (iv) Alluvial:- alluvial deposits are formed in areas of high relief and are typically coarse-grained. At mountain fronts individual alluvial fans merge to form braidplains and these two environments are associated with the thickest deposits of conglomerates. The bulk of conglomerates deposited in this setting are clast-supported with a strong AB-plane imbrication. Some matrix-supported conglomerates are present, a result of debris-flow deposition on some alluvial fans. (v) Glacial:- glaciers carry a lot of coarse-grained material and many glacial deposits are conglomeratic. Tillites, the sediments deposited directly by a glacier, are typically poorly-sorted, matrix-supported conglomerates. The matrix is generally fine-grained, consisting of finely milled rock fragments. Waterlain deposits associated with glaciers are often conglomeratic, forming structures such as eskers. Examples:- a spectacular example of conglomerate can be seen at Montserrat, near Barcelona. Here erosion has created vertical channels giving the characteristic jagged shapes for which the mountain is named (Montserrat literally means ‘Jagged Mountain’). The rock is strong enough to be used as a building material – see Montserrat abbey front at full resolution for detail of the rock structure. Another spectacular example of conglomerate, the Crestone Conglomerate may be viewed in and near the town of Crestone, at the foot of the Sangre de Cristo Range in Colorado’s San Luis Valley. The Crestone Conglomerate is a metamorphic rock stratum and consists of tiny to quite large rocks that appear to have been tumbled in an ancient river. Some of the rocks have hues of red and green. Impressive conglomerate cliffs are to be seen on the east coast of Scotland from Arbroath northwards along the coastlines of the former counties of Angus and Kincardineshire. Famously picturesque Dunottar Castle sits on a rugged promontory of conglomerate jutting into the North Sea just South of the town of Stonehaven. Conglomerate may also be seen in the domed hills of Kata Tjuta, in Australia’s Northern Territory. In the XIX century a thick layer of Pottsville conglomerate was recognized to underlie anthracite coal measures in Pennsylvania. Fanglomerate:- when a series of conglomerates accumulates into an alluvial fan, in rapidly eroding (e.g., desert) environments, the resulting rock unit is often called a Fanglomerate. These form the basis of a number of large oil fields, e.g., the Tiffany and Brae fields in the North Sea. These fanglomerates were actually deposited into a deep marine environment but against a rapidly moving fault line, which supplied an intermittent stream of debris into the conglomerate pile. The sediment fans are several kilometers deep at the fault line and the sedimentation moved focus repeatedly, as different sectors of the fault moved. / Седиментарные Среды или Осаждённые Среды или Среды Осаждения (Sedimentary Environments).

CONICAL = КОНИЧЕСКОЕ – Conical:- shaped like a cone. / Под Коническим .

CONICAL FOOT = КОНИЧЕСКАЯ ОПОРА (или XX) – Conical Foot is a foot which is designed to nest in another similar foot. See also Pallet. / Коническая Опора (Conical Foot):- опора, имеющая коническую форму, помещаемая в идентичные гнёзда другого поддона. Смотрите также Поддон (Pallet).

CONICYT = COMISIÓN NACIONAL DE INVESTIGACIÓN CIENTIFICA Y TECNOLÓGICA = NATIONAL COMMISSION FOR SCIENTIFIC AND TECHNOLOGICAL RESEARCH

CONIDIA = КОНИДИЯ – Conidia:- asexual spores produced by Fungi. Conidia are often produced in large numbers and may be singlecelled or multi-celled. They are often short-lived and adapted for wind or splash dispersal. Also known as Conidium. / Под Конидией понимается бесполая спора, говоря об их множестве, бесполые споры, производимые Грибами и развивающиеся на особых выростах грибницы в органах спороношения базидиальных, несовершенных и некоторых низших Грибов. Конидии часто производятся в больших количествах и могут быть одноклеточными или многоклеточными. Часто они живут недолго и подвержены развеиванию ветром или разносу водой. В Англоязычном исполнении может встречаться также как Конидия (Conidium).

CONIDIOPHORE = КОНИДИОФОР (или КОНИДИЕНОСЕЦ) – Conidiophore is a specialized hypha on which one or more conidia are produced. / Конидиофор – гифа, на которой образуются конидии.

CONIDIUM = КОНИДИЯ – Conidium is a spore formed asexually, usually at the tip or side of a conidiophores. See also Conidia. / Под Конидией понимается бесполая спора, говоря об их множестве, бесполые споры, производимые Грибами и развивающиеся на особых выростах грибницы в органах спороношения базидиальных, несовершенных и некоторых низших Грибов. Конидии часто производятся в больших количествах и могут быть одноклеточными или многоклеточными. Часто они живут недолго и подвержены развеиванию ветром или разносу водой. В Англоязычном исполнении может встречаться также как Конидия (Conidia).

CONIFERS = ХВОЙНЫЕ – The name ‘Conifer’ comes from Latin and means ‘cone bearing’. All conifers bear their male and female reproductive organs in separate cones (strobili) rather than in flowers. Trees usually bear both male and female cones. Male cones produce pollen grains which are transported to the female cones by wind. The seeds subsequently develop within the female cones. In some genera, such as Juniperus and Podocarpus, these may be fleshy. The foliage of conifers is either needle-like (e.g., Pinus, Abies) or scalelike (e.g., Cupressus, Chamaecyparis), and most conifers, with the exception of four genera, are evergreen trees and shrubs.

The conifers belong to the group of seed plants known as the Gymnosperms. Gymnosperm literally means ‘naked seed’. This is the main characteristic which differentiates them from the more advanced flowering plants (angiosperms) which bear their seeds encased in an ovary that becomes the fruit. Other gymnosperms include ginkgo (Ginkgo biloba) and cycads. Distribution of Conifers:- the Conifers, although a small group of Plants (630 Species) are distributed on all continents except Antarctica. In the Northern hemisphere there are very extensive forests of conifers, such as in Canada, Scandinavia and Siberia, but these have only a handful of Species. More diverse are mountains further South, such as the Rocky Mountains, the Caucasus and the Himalayas. Regions exceptionally rich in Species of conifers are California, Mexico and China. Most people would not imagine that there are also many conifers in the tropics, but they often do not ‘look like’ conifers (Podocarpus) and they also do not form forests in the same way as the pines and spruces of the North. Many of these Species are also growing in high mountains. The Southern hemisphere also is rich in species, but they tend to be concentrated on the tips of continents (South America, South Africa) and on islands (New Caledonia (43 species!), New Zealand and Tasmania). There are large areas in the Southern hemisphere without conifers, as in South America and Africa , and some of these gaps are difficult to explain. We know from the fossil record that these regions often had conifers as well. Uses of Conifers:- economically, conifers are very important as they are a major source of timber. The majority of the world’s sawn timbers come from conifers. Exploitation of this resource from wild growing forests is still going on in many parts of the world, but there is an obvious trend especially in the developed world to phase this out and use more sustainable planted or seeded resources. There are many species with highly different wood properties, some of these are extremely valuable and used for fine cabinet making or expensive applications in construction. Wood from conifers is also an important source of pulp for paper and cellulose fibres such as rayon. Conifers are also very important in horticulture, especially in regions with a temperate climate. Several species have yielded hundreds of different cultivars and new ones are constantly appearing on the market. In some countries conifers have a role to play in traditional medicine and in religious ceremonies and, of course, our Christmas trees can be seen as a form of this kind of use. A few conifers even have edible seeds; well known are those of certain pines. See also Softwoods. The Conifers are cone-bearing seed plants. Most are trees; some are shrubs. They are formally the Division Pinophyta or Coniferophyta. Conifers are Gymnosperms. They are cone-bearing seed plants with vascular tissue; all living conifers are woody plants, the great majority being trees. Living conifers are all in the order Pinales. Typical examples include:- Cedars, Cypresses, Firs, Junipers, Kauris, Larches, Pines, Redwoods, Spruces, and Yews. Species of Conifers can be found in almost all parts of the world, and are often the most common plants in their habitats, as in the taiga. Conifers are of great economic value, and their wood is mainly used for timber and paper making The wood of conifers is known as Softwood, though yew wood is actually quite hard. The division Coniferae contains about 700 living species. They were the dominant land plants of the Mesozoic era. They were overtaken by the flowering plants, which first appeared in the Cretaceous, and became dominant in the Cainozoic era. Conifers were the main food of herbivorous dinosaurs, and their resins and poisons would have given protection against herbivores. / Под Хвойными понимается Подкласс (Порядок) Голосеменных Растений. Главным образом вечнозелёные деревья и кустарники, как правило, с игловидными (хвоя) или чешуйчатыми листьями и однополыми стробилами (шишками). Около 50 Родов, около 600 Видов. Многие Хвойные (Ель, Кедр, Лиственница, Сосна и другие) являются ценными лесообразующими породами. Смотрите также Древесина Мягких Пород (Softwoods). Хвойные, самый многочисленный и наиболее широко распространённый Подкласс (Coniferae, или Pinidae) Голосеменных Растений. Большей частью деревья и (реже) кустарники, нередко с конусовидной кроной, обычно вечнозелёные, но иногда (например, Лиственница) с опадающей на зиму листвой. Древесина Хвойных состоит из трахеид с окаймленными порами; древесинная паренхима неразвита или отсутствует. Годичные кольца прироста обычно хорошо выражены. В коре, а также в древесине Хвойных, как правило, имеются смоляные ходы. Первичный корень обычно сохраняется на всю жизнь, часто развиваясь в мощный стержневой корень; мелкие боковые корни большей частью содержат микоризу. Листья Хвойных обычно цельные, игловидные (хвоя), сидячие, иногда чешуевидные и пластинчатые (линейные, ланцетные и другие), с ксероморфным строением; у многих Хвойных листья в пучках на укороченных побегах. Стробилы Хвойных однополые:- мужские (микростробилы) состоят из оси, с расположенными на ней редуцированными микроспорофиллами с микроспорангиями, в которых образуются микроспоры (пыльца), у многих снабжённые воздушными мешками; женские – собраны в шишки, состоящие из оси, на которой сидят кроющие чешуи с видоизменёнными мегастробилами – так называемыми Семенными Чешуями; на верхней стороне чешуи расположены один-два или несколько семязачатков (мегаспорангиев), которые развиваются в женский гаметофит, несущий архегонии с яйцеклетками. Опыление происходит при помощи ветра. Хвойные большей частью Однодомные Растения. После оплодотворения развивается зародыш, окружённый эндоспермом и имеющий от 2 до 15 семядолей. Семена сильно варьируют по строению и форме. Вегетативное размножение у Хвойных развито очень слабо. Хвойные – древняя Группа Семенных Растений, впервые появившаяся в каменноугольном периоде; некоторые Семейства Хвойных (Лебахиевые, Вольтциевые и другие) известны только в ископаемом состоянии. Ныне живущие Хвойные относятся к 8 Семействам:- Араукариевые (Araucariaceae), Подокарповые, или Ногоплодниковые (Podocarpaceae), Головчато-Тиссовые (Cephalotaxaceae), Тиссовые (Taxaccae), Сосновые (Pinaceae), Сциадо-Питисовые (Sciadopityaceae), Таксодиевые (Taxodiaceae) и Кипарисовые (Cupressaceae). В этих Семействах около 55 Родов (600 Видов); в бывшем Союзе Советских Социалистических Республик (СССР) свыше 50 Видов, не считая введённых в культуру. Среди Хвойных много очень крупных деревьев, достигающих высоты 50–60 и даже 100 метров (Секвойядендрон, Секвойя) и диаметра 6–9 метров; некоторые Хвойные способны жить несколько тысячелетий. Есть среди Хвойных и невысокие кустарники, и стланиковые формы; Новокаледонский Вид Хвойных (Podocarpus Ustus) паразитирует на корнях других Хвойных. Многие Хвойные играют первостепенную роль в растительном покрове Земли, образуя, особенно в Евразии и Северной Америке, обширные массивы. Водоохранное, ландшафтное и народно-хозяйственное значение Хвойных велико. Хвойные – важнейшие поставщики древесины и множества продуктов её переработки, в том числе целлюлозно-бумажной массы, канифоли, скипидара, дубильных веществ и других. Семена некоторых Хвойных (Кедровой Сосны, Пинии, Араукарий и других) употребляются в пищу; из них также добывают масло. Многие Хвойные – ценные декоративные растения. Хвойные Породы, древесные, реже кустарниковые, большей частью вечнозелёные Растения с игловидными, линейными или чешуйчатыми листьями (хвоей). Известно до 400 Видов, главным образом в Северном полушарии. Наиболее распространены Роды Хвойных пород:- Сосна, Ель, Пихта, Лиственница, реже – Можжевельник, Тисс, Туя, Кипарис и другие. Сосна Обыкновенная и Сибирская, Лиственница Сибирская и Даурская, Пихта Сибирская и Кавказская образуют в бывшем СССР обширные лесные массивы.

CONING = ПРИДАНИЕ КОНИЧЕСКОЙ ФОРМЫ (или ОБРАБОТКА НА КОНУС, или ПЕРЕМАТЫВАНИЕ НА КОНУСЫ, или МЕТОД КОЛЬЦА И КОНУСА) – Coning is the transfer of yarn from skeins or bobbins or other types of packages to cones.

CONJUGATE FIBER = КОНЬЮГИРОВАННОЕ ВОЛОКНО – Conjugate Fiber is a two-component fiber with specific ability to crimp on hot or hot/wet treatment because of differential shrinkage. See also Bilateral Fiber. The term Conjugate Fibers is often used, particularly in Asia, as synonymous with bicomponent fibers. A Conjugate Fiber is provided, in which a first component that contains at least 75% by weight of an ethylene-α-olef in copolymer having a melting point of 70 to 100 °C and a second component that contains a crystalline polypropylene forma side-by-side cross section, wherein, in a fiber cross section perpendicular to a fiber axis, the first component accounts for 55 to 90% of an outer periphery of the fiber, a borderline between the first component and the second

component forms a curve bulging toward the first component, and an area ratio between the first component and the second component (first component/second component) is in a range of 70/30 to 30/70. The conjugate fiber demonstrates low-temperature processability and excellent card passability when processed into a nonwoven fabric, and can produce a bulky nonwoven fabric having excellent uniformity. / В своём поперечном сечении такое волокно напоминает рисунок на коже зебры, когда полоса из одного компонента чередуется полосой из другого компонента.

CONJUGATE YARN = КОНЬЮГИРОВАННАЯ ПРЯЖА (или СОПРЯЖЁННАЯ ПРЯЖА) – Conjugate Yarn is the yarn made from conjugate filaments.

CONNATE = СОЕДИНЁННОЕ (или СРОСШЕЕСЯ) – Connate:- of similar parts growing from one base, joined or united to a single structure.

CONNECTING CARRIER = ПРОМЕЖУТОЧНЫЙ (или ПОДКЛЮЧАЮЩИЙСЯ) ПЕРЕВОЗЧИК – An intermediary carrier utilised to connect cargo to/from mother vessel. Connecting Carrier is a carrier which has a direct physical connection with, or forms a link between two or more carriers. Also known as Feeder Service.

CONNECTION = ПОДКЛЮЧЕНИЕ (или ПРИСОЕДИНЕНИЕ, или СОЕДИНЕНИЕ, или ВКЛЮЧЕНИЕ) – Connection:- the physical connection (e.g., transmission lines, transformers, switch gear, etc) between two electric systems permitting the transfer of electric energy in one or both directions.

CONNECTION POINT = ТОЧКА ПОДКЛЮЧЕНИЯ (или ТОЧКА ПРИСОЕДИНЕНИЯ) – Connection Point is the point of connection of a user system or equipment to the grid. / Точка подключения системы или оборудования потребителей к энергосистеме.

CONNIVENT = БЛИЗКОРАСПОЛОЖЕННОЕ (или СБЛИЖЕННОЕ, или СХОДЯЩЕЕСЯ) – Connivent:- coming close together or touching without joining.

CONQ = COST OF NON–QUALITY

CONSECUTIVE SAMPLES = ПОСЛЕДОВАТЕЛЬНЫЕ ПРОБЫ – Consecutive Samples are samples taken one after another in a prescribed manner from the same lot of grain. / Последовательными пробами называются пробы, взятые одна за другой одним и тем же образом из одной и той же партии зерна.

CONSEQUENTIAL LOSS = ПОСЛЕДУЮЩИЙ УБЫТОК – Consequential Loss is a market loss to goods brought about by fear that goods may have suffered from a known casualty whereas no such loss exists in fact. A loss arising indirectly from an insured peril. / Убыток, косвенно вызываемый застрахованной опасностью.

CONSERVATION = КОНСЕРВАЦИЯ (или СОХРАНЕНИЕ) – Conservation is the preservation of materials for future use that can be propagated. / Под Консервацией, от Латинского слова Conservatio, означающее Сохранение, понимается:- (1) технические меры защиты от коррозии, применяемые для предохранения двигателей, станков и другого во время бедствия, перед длительным хранением. (2) Обработка древесины антисептическими средствами, обугливание или окрашивание её для придания стойкости против гниения. (3) Совокупность мер, обеспечивающих длительное хранение архитектурных, исторически-культурных и археологических памятников, художественных произведений, книг, документов и прочего. (4) Временная приостановка хода, развития, деятельности чего-либо, например, консервация строительства.

CONSERVATION AND OTHER DSM = СОХРАНЕНИЕ И ИНОЕ УПРАВЛЕНИЕ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (СПРОСА) – Conservation and Other DSM:- this Demand-Side Management (DSM) category represents the amount of consumer peak load reduction at the time of system peak due to utility programs that reduce consumer load during many hours of the year. Examples include utility rebate and shared savings activities for the installation of energy efficient appliances, lighting and electrical machinery, and weatherization materials. In addition, this category includes all other Demand-Side Management activities, such as thermal storage, time-of-use rates, fuel substitutions, measurement and evaluation, and any other utility-administered Demand-Side Management activity designed to reduce demand and/or electricity use.

CONSERVATION RESERVE PROGRAM = ПРОГРАММА СОХРАННОСТИ РЕЗЕРВА – Conservation Reserve Program (CRP) is a major provision of the United States' Food Security Act of 1985 and extended under the Food and Agriculture Conservation and Trade Act of 1990, the Food and Agriculture Improvement and Reform (FAIR) Act of 1996, and the Farm Security and Rural Investment (FSRI) Act of 2002 is designed to reduce erosion on 40 to 45 million acres (16 to 18 million hectares) of farm land. Under the programme, producers who sign contracts agree to convert erodible crop land to approved conservation uses for ten years. Participating producers receive annual rental payments and cash or payment in kind to share up to 50% of the cost of establishing permanent vegetative cover. The CRP is part of the Environmental Conservation Acreage Reserve Program. The 1996 FAIR Act authorised a 36.4 million acre (14.7 million hectares) maximum under CRP, its 1995 level. The maximum area enrolled in the CRP was increased to 39.2 million acres in the 2002 FSRI Act.

CONSERVATISM = КОНСЕРВАТИЗМ – (1) Conservatism is a general preference for the existing order of society and an opposition to all efforts to bring about rapid or fundamental change in that order. Conservative ideologies characteristically strive to show that existing economic and political inequalities are well justified and that the existing order is about as close as is practically attainable to an ideal order. Conservative ideologies most often base their claims on the teachings of religion and traditional morality and tend to downplay the reliability of purely rational or deductive social theories propounded by secular philosophers, economists, and other social thinkers. The specific content of 'conservatism' is highly variable across societies and over time, since the arguments necessary to defend the status quo depend upon what the status quo is in any particular country. Because American political and economic institutions were very heavily influenced by XVIII and XIX century liberal thought and because America had essentially no experience of the kind of feudal and aristocratic institutions that persisted for so long in Europe, contemporary American conservatism's content includes a much stronger commitment to free markets, individual rights, and political democracy and much less attachment to hereditary aristocracy and state-support for a particular religion than is characteristic of contemporary European conservatism. Conservatism is an investment strategy aimed at long-term capital appreciation with low risk; moderate; cautious; opposite of aggressive behavior; show possible losses but wait for actual profits. Concept which directs the least favorable effect on net income. / Под Консерватизмом, от Французского слова Conservatisme от Латинского слова Conservo, означающее Охраняю или Сохраняю, понимается приверженность к старому, отжившему и вражда к новому, передовому.

(2) In Maddox and Lilie's classification of American political ideologies, a political point of view characterized by relatively high support for activist government intervention to enforce traditional morality or social values coupled with relatively high opposition to activist government when it comes to intervening in economic or business affairs. / В классификации Мэдэкса и Лылыйа (Maddox and Lilie classification).

CONSERVATIVE = КОНСЕРВАТИВНЫЙ – Conservative:- a modest style of investing by a fund manager that wishes to achieve stable returns over a short to medium horizon. Conservative Investing is an investing strategy that seeks to preserve an investment portfolio's value by investing in lower risk securities such as fixed-income and money market securities, and often blue-chip or large-cap equities. Conservative investors have risk tolerances ranging from low to moderate. Those who have low risk tolerance are often extremely uncomfortable with the stock market and wish to avoid it entirely. However, although this strategy may protect against inflation, it will not earn any value over time. Capital preservation and current income are popular conservative investing strategies. / Умеренный стиль инвестирования управляющим фонда, который желает добиться стабильных заработков в течение от кратко- до средне-отдалённого горизонта инвестирования.

CONSERVED STOCK = КОНСЕРВИРУЕМЫЙ ЗАПАС – Conserved Stock is an accession, cultivar, or a portion or subdivision of a strain or pure line selected for maintenance at a center.

CONSERVING USE = РАЦИОНАЛЬНОЕ ПРИРОДОПОЛЬЗОВАНИЕ (или РАЦИОНАЛЬНОЕ ИСПОЛЬЗОВАНИЕ ПРИРОДНЫХ РЕСУРСОВ, или ИСПОЛЬЗОВАНИЕ СОХРАНЕНИЯ) – In the United States, Conserving Use is an approved agricultural practice or use of land authorized by the county Agricultural Stabilization and Conservation Service on cropland required to be diverted under production adjustment or conservation programs. / Служба Стабилизации и Сохранения Сельского Хозяйства (Agricultural Stabilization and Conservation Service).

CONSIGNED CAR = ОТГРУЖЕННЫЙ НА КОНСИГНАЦИЮ ВАГОН (или ОТПРАВЛЕННЫЙ НА КОНСИГНАЦИЮ ВАГОН) – A Consigned Car is a carlot of grain delivered on the basis of an arranged sales agreement between the owner of the grain and a marketing agency.

CONSIGNEE = КОНСИГНАТОР (или ГРУЗОПОЛУЧАТЕЛЬ) – In a contract of carriage, the Consignee is the person to whom the shipment is to be delivered to whether by land, sea or air. This is a difficult area of law in that it regulates the mass transportation industry which cannot always guarantee arrival on time or that goods will not be damaged in the course of transit. A further two problems are that unpaid consignors or freight carriers may wish to hold goods until payment is made, and fraudulent individuals may seek to take delivery in place of the legitimate consignees. The key to resolving such disputes lies in the documentation. The standard form of contract is a bill of lading which, in international shipping law, is simply a contract for the carriage of goods entered into between the shipper and the carrier that is not a charter party. It is always a term of that contract that the carrier must deliver the goods to a specific receiver. A straight bill of lading by land or sea, or air waybill are not documents of title to the goods they represent. They do no more than require delivery of the goods to the named consignee and (subject to the shipper's ability to redirect the goods) to no other. This differs from an 'order' or 'bearer' bill of lading which are possessory title documents and negotiable, i.e. they can be endorsed and so transfer the right to take delivery to the last endorsee. This aspect of shipping law is regulated by the Hague Rules, and the laws of individual countries, e.g., the UK Carriage of Goods by Sea Act 1992 and the US Pomerene Act 1916. There is some international dispute as to whether the consignee on a straight bill must produce the bill in order to take delivery. The US position is that the person taking delivery must prove his or her identity but, as in Hong Kong, there is no need to present the bill itself. In the UK there are conflicting obiter dicta in 'The Rafaela S' (2003) 2 Lloyd's Rep. 113 and 'The Happy Ranger' (2002) 2 AER (Comm) 23, so the matter must remain unclear even though there are serious problems, for example, arising from the everyday occurrence of cargo being discharged against letters of indemnity when original bills of lading are not yet available to be presented at the discharge port. The rights of the consignee under an air waybill are regulated by the Warsaw Convention for the Unification of Certain Rules for International Carriage by Air, 1929 and the Montreal Convention for the Unification of Certain Rules for International Carriage by Air 1999 and the relevant state laws (which may be one law chosen as the proper law by the parties, or any combination of laws representing the seller, buyer, consignor, and carrier. this is very important as per export documents. If sender sends a widget to receiver via a delivery service, sender is the consignor and receiver is the consignee. Designated person to receive the cargo from the carrier according to the Bill of Lading contract. Consignee is a person to whom something is consigned or shipped and entitled to take delivery. A person or firm named in a freight contract to whom goods have been consigned or turned over. Consignee is the party shown on the bill of lading or air waybill to whom the shipment is consigned. Need not always be the buyer, and in some countries will be the buyer's bank. See also Bill Of Lading, Order Bill Of Lading, and Notify Party. The party listed in the Bill of Lading to whom the cargo or containers is destined. A 'Consignee' is the person named in a bill of lading as the person to whom the goods are to be delivered. 49 USC §80101(1) (2005; (49 USC is short for the United States Code:- Title 49)). Consignee is the person to whom cargo is consigned as stated on the bills of lading. A Consignee is the person to whom goods are shipped. A consignee is the person who is assigned to accept or receive the goods. A consignee is also a person who is assigned to hold goods for delivery or sale by another agent or party. Individual or company to whom cargo is shipped or consigned. Consignee:- the client's customers are referred to as the Consignee. Just think of the consignee as the 'end user' or the company where Logistics Depot (company) ships the stock. A term Consignee means the person entitled to take delivery of the goods. / Американский Акт Памэрина от 1916 (US Pomerene Act 1916). 'Зэ Рэфэйля Эс.' (2003) 2 Лойдз ('The Rafaela S' (2003) 2 Lloyd's). Частное лицо или компания, в чей адрес был отгружен или отправлен товар. Под Грузополучателем понимается лицо, управомоченное на получение груза в месте назначения и несущее соответствующие обязанности, связанные с получением груза. Консигнатор – посредник, принимающий на себя обязательство исполнять поручения организации консигнационной торговли со складов, находящихся за рубежом, от своего имени, но за счёт консигнанта.

CONSIGNEE MARKS = ЗНАКИ КОНСИГНАТОРА (или ЗНАКИ ГРУЗОПОЛУЧАТЕЛЯ) – Consignee Marks:- a symbol placed on packages for export generally consisting of a square, triangle, diamond, circle, cross, etc with designated letters and/or numbers for the purpose of identification. A symbol placed on packages for export for identification purposes. Generally consisting of a circle, cross, diamond, square, triangle, etc with letters and/or numbers as well as port of discharge. / также как и порта разгрузки.

CONSIGNMENT = КОНСИГНАЦИЯ (или РЕАЛИЗАЦИЯ) – (1) Consignment is a delivery of merchandise from an exporter (the consignor) to an agent (the consignee) under agreement that the agent sell the merchandise for the account of the exporter. The consignor retains title to the goods until sold. The consignee sells the goods for commission and remits the net proceeds to the consignor. A shipment of goods to a consignee. Also known as Shipment. Form of selling in which a supplier (consignor) turns over property to a customer (consignee) for sale, but retains ownership of the property until it is sold. The consignee is generally responsible for managing the inventory of goods placed on consignment with it, and pays the consignor when the property is sold. A volume of goods to be transported from a shipper to a consignee via one or several modes of transport and specified in one single transport document such as bill of lading (B/L). Consignment is a shipment made by a producer or dealer to an agent elsewhere with the understanding that the commodities in question will be cared for or sold at the highest obtainable price. Title to the merchandise shipped on consignment rests with the shipper until the goods are disposed of according to agreement. Consignment is a quantity of plants, plant products and/or other articles being moved from one country to another and covered, when required, by a single phytosanitary certificate (a consignment may be composed of one or more commodities or lots). A wholesaler of goods may, at times,

wish to accomplish a conditional sale of its goods to a retailer. The retailer may wish to obtain certain levels of inventory that it could not otherwise finance, and the vendor may be able to obtain certain sales that it would not otherwise have by agreeing to take some level of the delay and risk associated with the resale of its goods. Sometimes, however, vendors can become confused or not even recognize the legal distinction between the two types of legal structures involved in a conditional sale:- the consignment or the 'sale or return'. Consignments:- perhaps the most familiar of these two legal forms is the transfer of goods by a vendor on 'consignment' or on 'memorandum'. A consignment is not a 'sale' in the true technical sense of the word since it does not consist of the 'passing of title from the seller to the buyer for a price' (UCC (Uniform Commercial Code) Section 2-106[1]). Rather than constituting an actual sale, in the consignment, the 'buyer' is actually an agent for the vendor with an option to take title to the goods in the event the goods are sold to a third party. Thus, technically, the goods remain the property of the vendor (consignor) until they are sold by the consignee to some third party. Until such a sale occurs, and in the absence of an agreement otherwise, the consignor has the right to terminate the consignment and retake its goods. In legal jargon, a true consignment is really an 'agency coupled with a bailment' and basically governed by the law of agency and service contracts. Sale or Return:- by comparison, a 'sale or return' is a much different legal animal. It is in fact a true sale, with the passage of title from a seller to a buyer for a price (UCC section 2-106[11]). The buyer in this type of transaction is therefore a true purchaser, unlike a mere consignee. However, the sales transaction differs from the traditional sale in that (1) it is made in contemplation of resale, and (2) it accords the buyer a right of return should the property fail to resell. For example, a book publisher might sell a number of best-sellers to a bookstore at a certain price for resale, with the bookstore free to return all unsold items for the same or a lower price at a subsequent date and time. In legal jargon, if the goods subject to the contract can be returned by the buyer, even though otherwise conforming to the contract, then the transaction is a sale or return if the goods are sold for resale (UCC Section 2326[1]). Buyer's Rights to Return Goods to Vendor:- a buyer retains the right to return the goods to the vendor under either a consignment or sale or return transaction. In a consignment, the buyer can return the goods at any time, unless the contract provides otherwise. A sale or return also provides for the buyer to be able to return the goods to the vendor. However, the buyer can only return goods that are substantially in their original condition and must return the goods 'seasonably'. Furthermore, the buyer can return either the whole or part of them in 'commercial units' of the goods (UCC Section 2-327[2][a]). Vendors' Limited Right to Return of Goods:- one key distinction between the consignment and the sale or return is in the vendor's lack of ability to cause the return of its goods in the sale or return. Unless the contract provides otherwise, the consignment 'vendor' retains title to the goods and has the legal right to have them returned at any time. By contrast, in the sale or return, the vendor has no right to the return of its goods prior to the buyer's tendering the goods back. Once again, this assumes that nothing in the agreement provides otherwise. Bankruptcy Issues Affecting Consignments and Sale or Return Transactions:- although the consignment vendor retains the right to its goods (because it has not transferred title), many a consignor has been discouraged to realize that the law requires that the consignor file a UCC-1 financing statement in order to protect those goods from the third party creditors of the consignee. In the absence of such a UCC filing, a consignor becomes a mere unsecured creditor with no rights in specific goods vis-a-vis the third party creditors or the bankruptcy estate of the buyer. Of course, in the sale or return transaction, the situation is no better for the vendor. In the sale or return, the vendor has actually transferred title to the buyer, and the buyer's right to return the goods does not mean that the vendor has the right to any particular goods in the buyers hands. Thus, in order to protect the vendor's interest in its goods, in both the consignment and the sale or return transactions from third party creditors, the vendor must obtain a security interest from the buyer, and obtain the recording of a UCCI financing statement. In order to grant such security interest priority over other creditors with a lien in the same type of goods, a vendor in either the consignment or sale or return transaction must file a UCC-1 financing statement, and give notice to such pre-existing lienholder(s)-prior to the vendor's delivery of goods to the buyer (UCC Section 9-114). Some vendors find it useful to have a security interest grant in the credit application signed by the buyer at the time of initially doing business. This way the vendor need only record a UCC-1 financing statement and give the required notices to obtain purchase money priority. If the vendor wants to be extra protective of its rights in a sale or return, it would not only provide for a grant of a security interest in the goods being sold, but would also provide specific instances of default whereby the vendor would have the right to force the buyer to return its goods in the event of default. Conclusion:- it is important for a vendor to understand the key distinctions between the consignment transaction and the sale or return. Recognizing the distinctions and drafting protective agreements around each type of transaction will provide the best foundation for a successful conditional sale transaction. A Consignment is when the goods are transported to another person while ownership remains with the sender until the goods are payed; and a shipment is everything in the hold of a transport vehicle. A shipment is how the commercial operators of a delivery see the goods. It is the seller/buyer's view of the event. A consignment is how the consignee/consignors and freight handlers see the event. (We have spent a long time defining these. Officialy UBL) uses the following definitions ...:- (i) A Shipment:- an identifiable collection of one or more goods items to be transported between the seller party and the buyer party. This information may be defined within a commercial contract. A shipment can be transported in different consignments (e.g., split for logistical purposes). (ii) A Consignment:- an identifiable collection of one or more goods items to be transported between the consignor and the consignee. This information may be defined within a transport contract. A consignment may comprise more than one shipment (e.g., when consolidated by a freight forwarder). A consignment may contain items that have different origins and therefore different certificates of origin. Consignment:- all the products of one defined type and quality, delivered to one customer against one dispatch note. A Consignment is a shipment of either one or many parcels travelling on one waybill document to a single address. A Parcel is a single item in the make up of a consignment, and while travelling on a consignment note number, may have its own unique parcel number. Consignment is a grain shipped to a third party for sale by the third party. See also On Consignment Grain. / Под Консигнацией, от Латинского слова Consignatio, означающее Документ или Письменное Подтверждение, понимается вид договора комиссии, по которому комиссионер по поручению владельца товара осуществляет его продажу со своего склада (так называемый Консигнационный Склад). Консигнация наиболее распространена во внешней торговле. Термин Консигнация заимствован в Немецком языке в начале XX века в значении особой формы продажи товаров. При этой форме владелец товаров отправляет их посреднику для продажи на определённых условиях со склада посредника. Современную консигнацию как особый коммерческий договор о продаже товаров определяют три характеристики:- (i) Первая касается условия продажи через склады посредников. Оно заключается в том, что посредник сбывает от имени продавца товар, проставленный на склад посредника продавцом. (ii) Вторая особенность – хранение товара на складе и его предпродажная подготовка осуществляются за счёт продавца. (iii) Третья особенность относится к виду продажи товаров. Это – комиссионная продажа – продажа по договору комиссии. И содержание, и особенности консигнации сопряжены в первичном значении слова. Его истоки – в Латинском слове Consignare – Ставить Печать или Регистрировать, от com- вместе + signare- подписывать, ставить знак, отмечать. Если суммировать – стороны вместе, то есть обоюдно, договорились об определённых условиях продажи. Производные понятия:- (1) Консигнант – владелец товара, дающий поручение на организацию консигнационной торговли со складов, находящихся за рубежом. (2) Консигнатор – посредник, принимающий на себя обязательство исполнять поручения организации консигнационной торговли со складов, находящихся за рубежом, от своего имени, но за счёт консигнанта. В современном определении консигнация – это договор, по которому консигнатор сбывает от своего имени товар, поставленный консигнантом на его склад. Оплата – по мере реализации в оговорённые в контракте сроки. Не проданный в эти сроки товар может быть возвращён консигнанту за его счёт. Под Консигнацией, от Латинского слова

Consignatio, означающее Подпись или Письменное Доказательство или Письменное Подтверждение, понимается разновидность договора комиссии. По договору консигнации продавец (консигнант) поставляет товар на склад торгового посредника (консигнатора), а последний обязан продать товар от своего имени и за счёт консигнанта к определённому сроку. Договор консигнации обычно используют для сбыта товаров массового спроса. На консигнацию распространяются требования Главы 51 ГК РФ о комиссии и Главы 42 ГК РФ о заёме и кредите, так как консигнация является по своей сути коммерческим кредитом с учётом следующих особенностей:- (а) нереализованный в срок товар возвращается консигнанту, если в договор консигнации не было включено условие о безвозвратности определённой части или всего товара. При условии частично возвратной консигнации по истечении установленного договором срока консигнатор обязан выкупить у консигнанта не менее установленного договором количества нереализованных товаров; (б) расчёты между сторонами осуществляются по мере реализации товаров. При просрочке платежа консигнант вправе изъять товар, а задолженность покрыть за счёт гарантий консигнатора; (в) если это установлено договором консигнации, консигнант имеет право влиять на уровень цен реализуемых товаров. но если он поднимет цену, то тем самым аннулируются условия и гарантии консигнатора по безвозвратности этого товара. Поставка (Consignment) – количество некоторой товарной продукции или услуг, представленное в одно время и сопровождаемое одним комплектом документов. Примечание:- поставка может состоять из нескольких контролируемых партий или их частей. Под Грузом (Consignment) понимается некоторое количество растений, растительных продуктов и/или другие изделия, перемещающихся из одной страны в другую и сопровождаемых (при необходимости) одним фитосанитарным сертификатом (груз может быть составлен из одного или более родов сырья или партий).

(2) Consignment is a stock of merchandise advanced to a dealer and located at his place of business, but with title remaining in the source of supply. / Запас товарной продукции, переданной дилеру без оплаты и размещённой в месте ведения им своего дела, но с правом владения этой товарной продукцией, остающимся у самого источника данной поставки.

CONSIGNMENT INSTRUCTIONS = ИНСТРУКЦИИ ПО КОНСИГНАЦИИ – Consignment Instructions are the instructions from either the shipper or the consignee to a freight forwarder, carrier or his agent, or other provider of a service, with respect to the cargo movement and associated activities. Consignment Instructions are the instructions from either the seller/consignor or the buyer/consignee to a freight forwarder, carrier or his agent, or other provider of a service, enabling the movement of goods and associated activities. The following functions can be covered:- Movement and handling of goods (shipping, forwarding and stowage).

CONSIGNMENT IN TRANSIT = КОНСИГНАЦИЯ В ТРАНЗИТЕ – Consignment In Transit is a consignment which passes through a country without being imported, and that may be subject to phytosanitary measures. Consignment in Transit is a consignment that is not imported into a country but passes through it to another country, subject to official procedures which ensure that it remains enclosed, and is not split up, not combined with other consignments nor has its packaging changed.

CONSIGNMENT INVENTORY = КОНСИГНАЦИОННЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или КОНСИГНАЦИОННЫЕ СКЛАДСКИЕ ЗАПАСЫ) – Consignment Inventory is the inventory that is in the possession of the customer, but is still owned by the supplier. Consignment inventory is used as a marketing tool to make it easier for a customer to stock a specific supplier's inventory. Read my article on Consignment Inventory.

CONSIGNMENT NOTE = КОНСИГНАЦИОННЫЙ БИЛЕТ (или РЕАЛИЗАЦИОННЫЙ БИЛЕТ, или НОТА КОНСИГНАЦИИ, или ТОВАРНО–ТРАНСПОРТНАЯ НАКЛАДНАЯ) – Consignment Note is a document prepared by a consignor and countersigned by the carrier as a proof of receipt of consignment for delivery at the destination. Used as an alternative to bill of lading (specially in inland transport), it is generally neither a contract of carriage nor a negotiable instrument. Consignment Note is a document prepared by the shipper and comprising a transport contract. It contains details of the consignment to be carried to the port of loading and it is signed by the inland carrier as proof of receipt. A Consignment Note must be completed to accompany hazardous waste when moved from any premises, including premises exempt from registration and movements between premises belonging to the same company. Exceptions are explained in the consignment note guidance below. A hazardous waste consignment note is required even if the holder of the waste does not change when being moved, which differs from duty-of-care transfer note requirements. Guidance on completing consignment notes is in two separate documents:- (i) HWR03a – consignment notes – standard and multiple collections (June 2012). This document gives you step-by-step advice on completing the five parts of a consignment note for standard and multiple collections. This includes who is responsible for completing each part and the information you must legally include. (ii) HWR03b – consignment notes – rejected consignments and movements by pipelines, ships, cross-border movements and carrier schedules (June 2012). This document provides further advice if you are involved with moving hazardous waste by pipeline, across internal UK borders or from ships. It also explains what to do if you use more than one waste carrier to move a consignment or if the waste is rejected from the site that the waste is going. How to get consignment notes:- you can download the consignment notes here (http://www.environment-agency.gov.uk/business/topics/waste/32196.aspx), or you can use your own notes. Consignment notes:- (i) Consignment Note (three parts); and (ii) Continuation Sheet for Consignment (three parts). Schedule of carriers (see consignment note guide):- Schedule of Carriers Form (six parts). Consignment Note is a shipping agreement between the consignor of a shipment and the carrier of the shipment, which records the receipt of goods for shipment to a specified destination. The consignment note also specifies the consignee of the shipment and the fee for shipment, but unlike a bill of lading, is not a document of title. Also called a Waybill.

CONSIGNMENT SAMPLE = XX (или КОНСИГНАЦИОННЫЙ ОБРАЗЕЦ) – Consignment Sample:- a selection of containers representative of the whole consignment.

CONSIGNMENT STOCKS = КОНСИГНАЦИОННЫЕ ЗАПАСЫ – (1) Consignment Stocks are the stock of goods with an external party (customer) which is still the property of the supplier. Payment for these goods is made to the supplier at the moment when they are sold (used) by this party.

(2) Consignment Stocks:- a bullion dealer may hold gold on consignment at a client's premises. It is the dealer's property until the client withdraws it and pays the prevailing price. Alternatively, it may be held by the dealer at local banks until the clients come forward to purchase and take delivery. These are gold or silver bars which are placed by an organization with a client against a guarantee of payment at the prevailing price as the metal is taken out of the stock.

CONSIGNOR = КОНСИГНАНТ (или ГРУЗООТПРАВИТЕЛЬ, или КОМИТЕНТ) – The Consignor, in a contract of carriage, is the person sending a shipment to be delivered whether by land, sea or air. Some carriers, such as national postal entities, use the term 'Sender' or 'Shipper' but in the event of a legal dispute the proper and technical term 'Consignor' will generally be used. If sender sends a widget to receiver via a delivery service, sender is the consignor and receiver is the consignee. See also Shipper. Consignor is a person who consigns something (as the goods of an individual shipment). A term Consignor means any person by whom or in whose name or on whose behalf a multimodal transport contract has been concluded with the multimodal transport operator, or any person by whom or in whose name or on whose behalfthe goods are actually delivered to the multimodal transport operator in relation to the multi modal transport contract. A person or company shown on the bill of lading as the shipper. A Consignor is the person named in a bill of

lading as the person from whom the goods have been received for shipment. 49 USC §80101(2) (2005; 49 USC is short for the United States Code:- Title 49). Consignor is the person named in the bill of lading as the one from whom the goods have been received for shipment. / Лицо или компания, указанные в коносаменте в качестве отправителя. Консигнант – владелец товара, дающий поручение на организацию консигнационной торговли со складов, находящихся за рубежом.

CONSISTENCY = КОНСИСТЕНЦИЯ (или КОНСИСТЕНТНОСТЬ) – (1) Consistency is the degree to which a semisolid material such as grease resists deformation. See also ASTM Designation D 217. Sometimes used qualitatively to denote viscosity of liquids. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Под Консистенцией, от позднелатинского слова Consistentia, означающее Состояние, понимается понятие, образующее подвижность (густоту) вязких жидкостей и 'полутвёрдых' тел (битумов, мазей, паст, теста и прочего). Под Консистенцией или Консистентностью, от позднелатинского слова Consistentia, означающее Состояние, понимается совокупность реологических свойств вязкой жидкости, вязкопластичного или вязкоэластичного тела. Понятие Консистенция, в отличие от других близких по значению реологических понятий (например, вязкость, текучесть, пластичность), не всегда имеет чёткий физический смысл. Как технологический термин 'Консистенция' обозначает подвижность (густоту) жидкообразных ('полужидких') и твёрдообразных ('полутвёрдых') продуктов и материалов. Обычно им пользуются при описании систем с переменными (в зависимости от приложенного напряжения) характеристиками течения (деформации). Иногда консистенцию оценивают качественно, сравнивая данную систему с общеизвестными продуктами:- 'консистенция мёда', 'консистенция сливочного масла' и так далее. Чаще применяют специальные приборы – Консистометры, выражая консистенцию в условных единицах или через показатели вязкости и прочности.

(2) Consistency is the uniform distribution of all the fiber characteristics within each lock and throughout the entire fleece.

CONSISTENCY = ПОСЛЕДОВАТЕЛЬНОСТЬ – Consistency is accounting postulate which stipulates that, except as otherwise noted in the financial statement, the same accounting policies and procedures have been followed from period to period by an organization in the preparation and presentation of its financial statements.

CONSISTENT USER EXPERIENCE = КОНСИСТЕНТНЫЙ (или ТВЁРДЫЙ, или ПЛАСТИЧНЫЙ) ОПЫТ ПОЛЬЗОВАТЕЛЯ – Consistent User Experience (CUE) is a similar user experience among phones of different make and type. For example, the user experience of Web shopping shall be largely similar among mobile electronic transactions (MeT) compliant phones. CUE also includes consistency of user experience when using the same core function in different usage scenarios (user authorisation, for example, shall generate the same user experience in the usage scenarios Web shopping and retail shopping.

CONSISTING ESSENTIALLY OF = СОСТОЯЩЕЕ ПО СУЩЕСТВУ ИЗ – In the US patent law, 'Consisting Essentially Of' is a transitional phrase that limits the scope of a claim to the specified materials or steps and those that do not materially affect the basic and novel characteristics of the claimed invention. For the purposes of searching for and applying prior art under 35 USC 102 and 103, absent (without) a clear indication in the specification or claims of what the basic and novel characteristics actually are, 'consisting essentially of' will be construed (understood) as equivalent to 'comprising'.

CONSISTING OF = СОСТОЯЩЕЕ ИЗ – In the US patent law, 'Consisting Of' is a transitional phrase that is closed (only includes exactly what is stated) and excludes any element, step, or ingredient not specified in the claim.

CONSOLIDATE = КОНСОЛИДИРОВАТЬ (или КОМПЛЕКТОВАТЬ) – Consolidate:- to combine two or more shipments going in the same direction or to the same destination on a single trailer. Consolidate:- to group and stuff several small shipments together in one container. / Сгруппировать и .

CONSOLIDATED ACCOUNT = КОНСОЛИДИРОВАННЫЙ СЧЁТ – Consolidated Account is an account incorporating the activity of several related entities, in which transactions among those entities have been cancelled out. Consolidated financial statements bring together all assets, liabilities and operating accounts of a parent company and its subsidiaries, as if the group were a single company with one or more divisions. All intercompany transactions are eliminated from these accounts.

CONSOLIDATED AND SEPARATE FINANCIAL STATEMENTS = КОНСОЛИДИРОВАННЫЕ И РАЗДЕЛЬНЫЕ ФИНАНСОВЫЕ ОТЧЁТЫ – IAS 27 (short for International Accounting Standard No. 27) Consolidated and Separate Financial Statements – This Standard shall be applied in the preparation and presentation of consolidated financial statements for a group of entities under the control of a parent. Consolidated financial statements are the financial statements of a group presented as those of a single economic entity. Control is the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities. A group is a parent and all its subsidiaries. A parent is an entity that has one or more subsidiaries. A subsidiary is an entity, including an unincorporated entity such as a partnership, that is controlled by another entity. A parent shall present consolidated financial statements in which it consolidates its investments in subsidiaries in accordance with this Standard. A parent need not present consolidated financial statements if and only if:- (a) the parent is itself a wholly-owned subsidiary, or is a partially-owned subsidiary of another entity and its other owners, including those not otherwise entitled to vote, have been informed about, and do not object to, the parent not presenting consolidated financial statements; (b) the parent's debt or equity instruments are not traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets); (c) the parent did not file, nor is it in the process of filing, its financial statements with a securities commission or other regulatory organisation for the purpose of issuing any class of instruments in a public market; and (d) the ultimate or any intermediate parent of the parent produces consolidated financial statements available for public use that comply with International Financial Reporting Standards. Consolidated financial statements shall include all subsidiaries of the parent. Consolidation procedures:- Consolidated financial statements shall be prepared using uniform accounting policies for like transactions and other events in similar circumstances. In preparing consolidated financial statements, an entity combines the financial statements of the parent and its subsidiaries line by line by adding together like items of assets, liabilities, equity, income and expenses. In order that the consolidated financial statements present financial information about the group as that of a single economic entity, the following steps are then taken:- (a) the carrying amount of the parent's investment in each subsidiary and the parent's portion of equity of each subsidiary are eliminated (see IFRS® 3 (International Financial Reporting Standards 3), which describes the treatment of any resultant goodwill); (b) minority interests in the profit or loss of consolidated subsidiaries for the reporting period are identified; and (c) minority interests in the net assets of consolidated subsidiaries are identified separately from the parent shareholders' equity in them. Minority interests in the net assets consist of:- (i) the amount of those minority interests at the date of the original combination calculated in accordance with IFRS® 3; and (ii) the minority's share of changes in equity since the date of the combination. Intragroup balances, transactions, income and expenses shall be eliminated in full. Minority interests shall be presented in the consolidated balance sheet within equity, separately from the parent shareholders' equity. Minority interests in the profit or loss of the group shall also be separately disclosed. Minority interest is that portion of the profit or loss and net assets of a subsidiary attributable to equity interests that are not owned, directly or indirectly through subsidiaries, by the parent. Accounting for investments in subsidiaries, jointly controlled entities and associates in separate financial statements:- This Standard shall also be

applied in accounting for investments in subsidiaries, jointly controlled entities and associates when an entity elects, or is required by local regulations, to present separate financial statements. Separate financial statements are those presented by a parent, an investor in an associate or a venturer in a jointly controlled entity, in which the investments are accounted for on the basis of the direct equity interest rather than on the basis of the reported results and net assets of the investees. When separate financial statements are prepared, investments in subsidiaries, jointly controlled entities and associates that are not classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IFRS® 5 shall be accounted for either:- (a) at cost, or (b) in accordance with IAS 39. The same accounting shall be applied for each category of investments. Investments in subsidiaries, jointly controlled entities and associates that are classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IFRS® 5 shall be accounted for in accordance with that IFRS®. Investments in jointly controlled entities and associates that are accounted for in accordance with IAS 39 in the consolidated financial statements shall be accounted for in the same way in the investor's separate financial statements. / МСБУ 27 (сокращение для Международного Стандарта Бухгалтерского Учёта № 27) – .

CONSOLIDATED BALANCE SHEET = КОНСОЛИДИРОВАННЫЙ БАЛАНСОВЫЙ ОТЧЁТ (или СВОДНЫЙ БАЛАНСОВЫЙ ОТЧЁТ) – Consolidated Balance Sheet is a balance sheet in which assets and liabilities of a parent company and its controlled subsidiaries are combined, thereby presenting balance sheet items for the parent and its subsidiaries as if they were a single firm. A group balance sheet. Consolidated Balance Sheet is a balance sheet showing the financial condition of a corporation and its subsidiaries. See also Balance Sheet. / Групповой балансовый отчёт. Балансовый отчёт, представляющий информацию о финансовом состоянии корпорации и её дочерних структур. Смотрите также Балансовый Отчёт (Balance Sheet).

CONSOLIDATED BILL OF LADING = КОНСОЛИДИРОВАННЫЙ КОНОСАМЕНТ (или СВОДНЫЙ КОНОСАМЕНТ) – Consolidated Bill Of Lading is a bill of lading (B/L) combined or consolidated from two or more B/L's. / Под Консолидированным или Сводным Коносаментом понимается коносамент, представляющий собой комбинацию или консолидацию двух или более коносаментов.

CONSOLIDATED CONTAINER = КОНСОЛИДИРОВАННЫЙ КОНТЕЙНЕР (или СКОМПЛЕКТОВАННЫЙ КОНТЕЙНЕР) – Container stuffed with several shipments from different Shippers for delivery to one or more Consignees. Container carrying goods of more than one shipper or goods for one shipper from more than one origin.

CONSOLIDATED FINANCIAL STATEMENTS = КОНСОЛИДИРОВАННЫЕ ФИНАНСОВЫЕ ОТЧЁТЫ (или СВОДНЫЕ ФИНАНСОВЫЕ ОТЧЁТЫ) – In the United States, Consolidated Financial Statements are the statements issued by legally separate but related companies that show financial position and income as they would appear if the companies were one legal entity. Such statements reflect an economic rather than a legal entity. In Australia, for example, the Corporations Act 2001 requires a company with subsidiaries to present to its shareholders group accounts, normally in the form of consolidated financial statements, when its own balance sheet is presented. Compare associated company and parent company. Also known as Group Accounts in the United Kingdom. Consolidated Financial Statements are combined financial statements of a parent company and one or more of its subsidiaries as one economic unit.

CONSOLIDATED FUND = КОНСОЛИДИРОВАННЫЙ ФОНД – In the United Kingdom, Consolidated Fund is an account of central government into which most government revenue (excluding borrowing and certain payments to government departments) is paid, and from which most government expenditure (excluding loans and National Insurance benefits) is paid.

CONSOLIDATED PACKAGES = СКОМПЛЕКТОВАННЫЕ ПАКЕТЫ (или КОНСОЛИДИРОВАННЫЕ ПАКЕТЫ) – Consolidated Packages:- group of cargo items fastened together with straps or similar devices. / Скомплектованные Пакеты или Консолидированные Пакеты – группа грузовых изделий, скреплённых вместе поясами или аналогичными устройствами.

CONSOLIDATED QUOTATION SYSTEM = КОНСОЛИДИРОВАННАЯ СИСТЕМА КОТИРОВАНИЯ – The Consolidated Quotation System (CQS) is the electronic service that provides quotation information for stock traded on the American Stock Exchange, New York Stock Exchange, and other regional stock exchanges in the United States and also includes issues traded by FINRA (short for the Financial Industry Regulatory Authority, Inc.) member firms in the third market. Nasdaq® processes this data and provides it to its subscribers as the Composite Quotation Service. The initials CQS may be used either for the exchange system or the Nasdaq® service. History:- in July 1978, the US Securities and Exchange Commission (SEC declared the Consolidated Quotation Plan effective. In August 1978, the CQS commenced full operation with the Boston, Midwest, New York, Philadelphia and Pacific Stock Exchanges reporting quotations in NYSE®-listed securities. NASDAQ® joined the CQ Plan at the end of 1978 and began to disseminate quotations over CQS in early 1979. In November 1979, the Cincinnati Stock Exchange became a CQ Plan Participant and commenced disseminating quotations in mid-1980. The Consolidated Tape Association (CTA) is the operating authority for both the Consolidated Quotation System and the Consolidated Tape System (CTS). Consolidated Quotation System (CQS) collects and disseminates, electronically, current bid and asked quotations, with volume, from and to all market centers trading listed stocks. Consolidated Quotation System is an electronic service, regulated by the Securities and Exchange Commission (SEC), containing quotation information for securities listed on the New York Stock Exchange, the American Stock Exchange, and other, regional exchanges, as well as member firms in the National Association of Securities Dealers. NASDAQ® also processes the data and provides it to subscribers under the name Composite Quotation Service. Consolidated Quotation System (CQS) is an electronic system for disseminating the bid, ask, and size for a security in each market in which the security is traded. CQS was developed in 1978 by the National Association of Securities Dealers and the organized exchanges. Consolidated Quotation System (CQS):- developed in 1978, the CQS is an electronic system that provides bid, ask and size quotes for securities that are traded on the New York Stock Exchange, American Stock Exchange, regional stock exchanges, and the third market. / НЭЗДЭК® (NASDAQ®) . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

CONSOLIDATED TAPE = КОНСОЛИДИРОВАННАЯ ЛЕНТА – Consolidated Tape is the ticker tape reporting transactions in New York Stock Exchange (NYSE®) listed securities that take place on the NYSE® or any of the participating regional stock exchanges and other markets. Similarly, transactions in American Stock Exchange® (AMEX®) listed securities, and certain other securities listed on regional stock exchanges, are reported on a separate tape. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). АФБ® или АМЭКС® (AMEX®) .

CONSOLIDATED TAPE ASSOCIATION = АССОЦИАЦИЯ КОНСОЛИДИРОВАННОЙ ЛЕНТЫ – The Consolidated Tape Association (CTA) oversees the dissemination of real-time trade and quote information in New York Stock Exchange (Network A) and NYSE Arca, NYSE MKT and other regional exchange (Network B) listed securities. Since the late 1970s, all SEC-registered exchanges and market centers that trade Network A or Network B securities send their trades and quotes to a central consolidator where the Consolidated Tape System (CTS) and Consolidated Quote System (CQS) data streams are produced and distributed worldwide. The current (in 2013-May) Participants include the BATS Exchange, BATS-Y Exchange, NASDAQ OMX BX, Chicago Board Options Exchange, Chicago Stock Exchange, EDGA Exchange, EDGX Exchange, Financial Industry Regulatory Authority, International Securities Exchange, Nasdaq® Stock Market, National Stock Exchange, New York Stock Exchange, NYSE MKT, NYSE Arca, and

Nasdaq OMX PHLX. The Plans govern the collection, processing and dissemination of trade and quote data. The New York Stock Exchange is the Administrator of Network A and NYSE MKT is the Administrator of Network B. The Plans were filed with and approved by the Securities and Exchange Commission in accordance with Section 11A of the Securities Exchange Act of 1934. Consolidated Tape Association (CTA) overseas the operations of the consolidated tape, which it developed, under a formal 'CTA Plan' filed with the Securities and Exchange Commission. CTA is an independent, industry-wide organization. The Consolidated Tape Association (CTA) oversees the dissemination of real-time trade and quote information (market data) in New York Stock Exchange (NYSE®) and American Stock Exchange (AMEX®) listed securities (stocks and bonds). It is currently chaired by Tom Knorring, the first non-NYSE® chairman elected to the position. CTA manages two Plans to govern the collection, processing and dissemination of trade and quote data:- the Consolidated Tape Plan, which governs trades, and the Consolidate Quotation Plan, which governs quotes. The Plans were filed with and approved by the Securities and Exchange Commission (SEC) in accordance with Section 11A of the Securities Exchange Act of 1934. Since the late 1970s, all SEC-registered exchanges and market centers that trade NYSE® or AMEX®-listed securities send their trades and quotes to a central consolidator where the Consolidated Tape System (CTS) and Consolidated Quotation System (CQS) data streams are produced and distributed worldwide. The CTA is the operating authority for CQS and CTS. / Эн.Уай.Эс.И. Ака (NYSE Arca), Эн.Уай.Эс.И. Эм.Кей.Ти. (NYSE MKT). Биржа Би.Эй.Ти.Эс. (BATS Exchange), Биржа Би.Эй.Ти.Эс.-Уай. (BATS-Y Exchange), НЭЗДЭК У.Эм.Экс. Бе.Экс. (NASDAQ OMX BX), Биржа И.Ди.Дьжи.Эй. (EDGA Exchange), Биржа И.Ди.Дьжи.Экс. (EDGX Exchange), . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НЭЗДЭК® (NASDAQ®) . Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). АМЭКС® (AMEX®).

CONSOLIDATED TAPE SYSTEM = СИСТЕМА КОНСОЛИДИРОВАННОЙ ЛЕНТЫ – Consolidated Tape System is under the operational guidance of the Consolidated Tape Association (CTA). Also known as Consolidated Transaction Reporting System.

CONSOLIDATED TRANSACTION REPORTING SYSTEM = КОНСОЛИДИРОВАННАЯ СИСТЕМА ОТЧЁТА ПО ТРАНЗАКЦИЯМ (или СВОДНАЯ СИСТЕМА ОТЧЁТА ПО СДЕЛКАМ) – Consolidated Transaction Reporting System receives and disseminates, electronically, listed stock last-sale prices in all markets in which they trade. Also known as Consolidated Tape System.

CONSOLIDATION = КОНСОЛИДАЦИЯ (или УКРЕПЛЕНИЕ, или ЗАТВЕРДЕВАНИЕ, или УПЛОТНЕНИЕ) – (1) Consolidation is a period where a stock's value declines. Consolidation is a choppy, counter-trend movement in prices for a small period of time following a trending move that serves the purpose of relieving the market of an overbought or oversold condition in the near term. A period of time in which an asset or market has no obvious trend. Basically a sideways range of prices after a rally or a decline. All this means is that prices are moving in a broadly sideways range after a sharp move in one direction. If the prices have risen sharply, the gains are 'consolidated', often for several days after the major move. Consolidation is a stabilization of prices on the stock exchange following a downturn or after a bull market. Consolidation in technical analysis refers to an asset oscillating between a well-defined pattern of trading levels. Consolidation is generally interpreted as market indecisiveness, which ends when the asset's price moves above or below the trading pattern. A consolidation pattern could be broken for several reasons, such as the release of materially important news or the triggering of a succession of limit orders. In financial accounting, consolidation is defined as a set of statements that presents a parent and subsidiary company as one company. Basics of Consolidation:- Periods of consolidation can be found in price charts for any time interval, and these periods can last for days, weeks or months. Technical traders look for support and resistance levels in price charts, and then use these levels to make buy and sell decisions. Key Takeaways:- (i) Consolidation is a technical analysis term used to describe a stock's price movement within a given support and resistance range for a period of time. It is generally caused due to trader indecisiveness. (ii) Consolidated financial statements are used by analysts to evaluate parent and subsidiary companies as a single company. The Differences Between Support and Resistance:- The lower and upper bounds of an asset's price create the support and resistance levels within a consolidation pattern. A resistance level is the top end of the price pattern, while the support level is the lower end. Once the price breaks through the identified areas of support or resistance, volatility quickly increases, and so does the opportunity for short-term traders to generate a profit. Technical traders believe a breakout above resistance means the price will climb further, so the trader buys. On the other hand, a breakout below the support level indicates the price is falling even lower, and the trader sells. How Consolidations Work in Accounting:- In financial accounting, consolidated financial statements are used to present a parent and subsidiary company as one combined company. A parent company may own a majority percentage of a subsidiary, with a non-controlling interest (NCI) owning the remainder. Or the parent may own the entire subsidiary, with no other firm holding ownership. To create consolidated financial statements, the assets and liabilities of the subsidiary are adjusted to fair market value, and those values are used in the combined financial statements. If the parent and NCI pay more than the fair market value of the net assets (assets less liabilities), the excess amount is posted to a goodwill asset account, and goodwill is moved into an expense account over time. A consolidation eliminates any transactions between the parent and subsidiary, or between the subsidiary and the NCI. The consolidated financials only includes transactions with third parties, and each of the companies continues to produce separate financial statements. Example of Consolidation in Accounting:- Assume XYZ Corporation buys 100% of the net assets of ABC Manufacturing for a price of USD1 million, and the fair market value of ABC's net assets is USD700 000. When an accounting firm puts together the consolidated financial statements, ABC's net assets are listed with a value of USD700 000, and the USD300 000 amount paid above the fair market value is posted to a goodwill asset account. See also Pullback, and Retracement. / Смотрите также Откат (Pullback), и Отскок (Retracement). Термин означает, что цены колеблются весьма незначительно в одном диапазоне после резкого скачка в том или ином направлении. Если скачок был совершен в направлении роста, то при консолидации размер прибыли не меняется – 'застывает' иногда в течение нескольких дней после резкого скачка. Под Консолидацией, от позднелатинского слова Consolidatio от Consolido, означающее Укрепляю или Уплотняю, понимается упрочение, укрепление чего-либо; объединение, сплочение отдельных лиц групп, организаций для усиления борьбы за общие цели.

(2) Consolidation is the statutory combination of two or more corporations to create a new corporation. Consolidation is a business combination of two or more entities that occurs when the entities transfer all of their net assets to a new entity created for that purpose. See also Merger.

(3) Conversion of outstanding, short-term debts, e.g., from a construction loan to a mortgage. / , например, .

(4) Consolidation is a process of achieving a stronger and more independent financial position for a person or an entity, by expanding its resources, reducing its debt burden, or postponing maturities that threaten its cash flow and its freedom of action.

(5) In accounting, Consolidation is a grouping the accounts of a group of companies and presenting them as a single entity. Consolidated financial statements present the earnings of a parent and subsidiary (or subsidiaries) after the date of acquisition, and reflect the results of combined activities and equity, while eliminating intercompany transactions. The companies that make up the consolidated group remain separate legal entities with their own financial statements. Combination of the separate balance sheets of a group of companies into a single group or consolidated balance sheet.

(6) Consolidation is the placing of LCL/LTL cargo from several sources into a container in order to fill the container and obtain a better per-unit cost for shipping. Consolidation is the combination of many small shipments into one container, often with more than one

destination/consignee. Effort extended to put same destination cargo together in same container for ease of delivery. Cargo containing shipments of two or more shippers or suppliers. Containerload shipments may be consolidated for one or more consignees.

(7) Consolidation is an application of heat and pressure to form composite structures.

CONSOLIDATION LOAN = КОНСОЛИДАЦИОННАЯ ССУДА (или КОНСОЛИДАЦИОННЫЙ ЗАЁМ) – Consolidation Loan:- if you owe money to several credit providers, you can combine your payments and balances into a single account with one credit provider. This can be done in several ways. For example, you can transfer several high interest credit card balances onto one card with a lower rate. Or, if you own a home, you can consolidate your debt into a low-interest home equity loan.

CONSOLIDATION OF THE PUBLIC DEBT = КОНСОЛИДАЦИЯ ГОСУДАРСТВЕННОГО ДОЛГА – In government finance, Consolidation Of The Public Debt is a conversion of part of the national debt into another form of debt maturing at a later date, to alleviate the impact on the Treasury and on the money supply of major reimbursements made simultaneously.

CONSOLIDATION POINT = ПУНКТ КОМПЛЕКТОВАНИЯ (или ПУНКТ КОНСОЛИДАЦИИ, или ПУНКТ СБОРА ГРУЗА) – Consolidation Point is a location where the consolidation of consignments takes place. / Местонахождение, где имеет место консолидация отгруженных товаров.

CONSOLIDATION THE SHARES = КОНСОЛИДАЦИЯ АКЦИЙ – Consolidation The Shares:- in the United Kingdom, a company can consolidate or subdivide its share capital if authorised to do so by the articles. A consolidation is when the shares are put together and then divided into shares of larger amounts, e.g., 200 shares of £1.00 are consolidated to create 100 shares of £2.00. To consolidate shares, a company must pass an ordinary resolution, then send the resolution and a completed form 122 to Companies House within a month of the change. The opposite of Subdivision The Shares. / В противовес Дроблению Акций (Subdivision The Shares).

CONSOLIDATOR = КОМПЛЕКТОВЩИК (или КОНСОЛИДАТОР) – Consolidator is a firm or a company which provides consolidation of cargo. A person or firm performing a consolidation service for others. The consolidator takes advantage of lower full carload (FCL) rates, and savings are passed on to shippers.

CONSOLIDATOR'S BILL OF LADING = КОНОСАМЕНТ КОМПЛЕКТОВЩИКА (или КОНОСАМЕНТ КОНСОЛИДАТОРА) – Consolidator's Bill Of Lading is a bill of lading issued by a consolidator as a receipt for merchandise that will be grouped with cargo obtained from other shippers. See also House Air Waybill.

CONSOLS = КОНСОЛИ – Consols (short for Consolidated Annuities). Issued most commonly in France and the United Kingdom, where such bonds are known as Perpetual Bonds. They were first issued in Britain in the XVIII century to consolidate the national debt. See also Perpetual Bonds. Bond issues without fixed maturities. / Выпуски облигаций без фиксированных сроков погашения.

CONSORTIUM = КОНСОРЦИУМ – (1) Group of carriers pooling resources in a trade lane to maximise their resources efficiently. Consortium is an association of independent companies formed to bid for and, if successful, to undertake a project requiring a pooling of skills and resources. A consortium is usually formed to undertake one project for common account. Also known as Banking Syndicate, or Syndicate. / Под Консорциумом, от Латинского слова Consortium, означающее Сообщество или Соучастие, понимается временное соглашение между несколькими банками или промышленными компаниями для совместного размещения займа или осуществления единого капиталоёмкого промышленного проекта. Наибольшее распространение консорциумы получили после Второй Мировой Войны.

(2) In insurance, Consortium is an agreement between a group of two or more insurers according to which each member of the group agrees to accept a proportion of all risks of a specified type that are underwritten by one or more designated members of the group which act as leading underwriters. Unlike a line slip there is usually no restriction on which Lloyd's brokers may place business with a consortium.

CONSPICUOUS ADMIXTURE = ЛЕГКО ОТДЕЛЯЕМЫЕ ПРИМЕСИ – In the Canola industry of the United States, Conspicuous Admixture is all matter other than Canola including, but not limited to, ergot, sclerotinia, and stones, which is conspicuous and readily distinguishable from Canola and which remains in the sample after the removal of machine separated dockage. Conspicuous admixture is added to machine separated dockage in the computation of total dockage. See also Inconspicuous Admixture.

CONSTANT ANNUAL PRINCIPAL AND INTEREST PAYMENT = ПОСТОЯННЫЙ ЕЖЕГОДНЫЙ ПЛАТЁЖ ОСНОВНОЙ СУММЫ ДОЛГА И ПРОЦЕНТОВ (или ОПЛАТА ПОСТОЯННОЙ ЕЖЕГОДНОЙ ОСНОВНОЙ СУММЫ И ПРОЦЕНТОВ) – Constant Annual Principal And Interest Payment is the annual payment made by a borrower consisting of an amortization of principal and an interest component. This payment remains unchanged throughout the entire repayment period. As the debt is worked down the interest payments are gradually reduced, while the principal repayment rate increases. / выплата (repayment) .

CONSTANT COSTS = ПОСТОЯННЫЕ ЗАТРАТЫ – Constant Costs:- this could have many meanings, but when stated as an assumption of an economic model, it means that cost of producing a good, per unit, is the same for all units. Also known as Fixed Costs.

CONSTANT ISSUER = ПОСТОЯННЫЙ ЭМИТЕНТ – Constant Issuer:- this term is used to describe issuers who issue securities on a regular basis owing to ongoing financing requirements, e.g., mortgage banks, central savings banks, public sector.

CONSTANT RATE OF EXTENSION DYNAMOMETER = ДИНАМОМЕТР С ПОСТОЯННОЙ СТАВКОЙ РАСШИРЕНИЯ (или ВЫТЯГИВАНИЯ) – Constant Rate Of Extension (CRE) Dynamometer is a tensile testing machine, where one clamp is stationery whilst the other is moving with a constant speed throughout the test, and where the entire testing system is virtually free from deflection.

CONSTITUENT = СУБЪЕКТ (или СОСТАВНАЯ ЧАСТЬ, или СОСТАВЛЯЮЩАЯ) – Constituent is a person who is represented politically by a designated government official or officeholder, especially when the official is one that the person represented has the opportunity to participate in selecting through voting or perhaps through other methods of indicating political confidence and support. A Senator's constituency consists of the citizenry who reside within his or her state. The constituency of a Member of the House of Representatives consists of the people who live in his or her district. The constituency of a mayor is all the people residing in the city limits. Although the core meaning of the term has to do with the relationship between the voters and their elected representatives, the term is often expanded somewhat to include other individuals or groups whose interests any official in government (whether elected or not) feels morally obligated (or compelled by the political realities of the situation) to protect or further in the policy-making process. In this extended sense of the term, farmers constitute an important 'constituency' for the Secretary of Agriculture, labor unions are an important 'constituency' for the Secretary of Labor, small businessmen are an important 'constituency' for the head of the Small Business Administration, and veterans organizations are an important 'constituency' for the head of the Veteran's Administration. In the United States, Constituent is a party to a transaction; a corporation involved in a merger, consolidation or share exchange.

CONSTITUTION FOR EUROPE = КОНСТИТУЦИЯ ДЛЯ ЕВРОПЫ – Constitution For Europe:- On 13 June 2003 the European Convention on the future of Europe adopted a draft Treaty establishing a Constitution for Europe that would supersede both the EU Treaty and the EC Treaty. The draft was submitted to the European Council meeting in Thessaloniki on 20 June 2003 and was under discussion in the Intergovernmental Conference (IGC) from September 2003 to June 2004. It was adopted by the EU Member States in June 2004 and is scheduled to be ratified by November 2006.

CONSTRAINT = СКОВАННОСТЬ (или ПРИНУЖДЕНИЕ, или ДАВЛЕНИЕ) – Constraint is a factor or climatic condition that prevents the plant from reaching its full growth or yielding capacity.

CONSTRUCTED VALUE = ОЦЕНКА ПО СОСТАВЛЯЮЩИМ – Constructed Value:- a means of determining fair or foreign market value when sales of such or similar merchandise do not exist or, for various reasons, cannot be used for comparison purposes. The 'constructed value' consists of the cost of materials and fabrication or other processing employed in producing the merchandise, general expenses of not less than 10 percent of material and fabrication costs and profit of not less than 8 percent of the sum of the production costs and general expenses. To this amount is added the cost of packing for exportation to the United States. / вывоз (exportation).

CONSTRUCTION ADHESIVE = КОНСТРУКЦИОННОЕ СВЯЗУЮЩЕЕ (или МОНТАЖНОЕ СВЯЗУЮЩЕЕ) – Construction Adhesive is any adhesive used to assemble primary building materials such as floor sheathing into components during building construction. The term is most commonly applied to elastomer-based, mastic-type adhesives. / .

CONSTRUCTION CONTRACTS = КОНТРАКТЫ НА СТРОИТЕЛЬСТВО – IAS 11 (short for International Accounting Standard No. 11) – Construction Contracts – The objective of this Standard is to prescribe the accounting treatment of revenue and costs associated with construction contracts. Because of the nature of the activity undertaken in construction contracts, the date at which the contract activity is entered into and the date when the activity is completed usually fall into different accounting periods. Therefore, the primary issue in accounting for construction contracts is the allocation of contract revenue and contract costs to the accounting periods in which construction work is performed. This Standard shall be applied in accounting for construction contracts in the financial statements of contractors. A construction contract is a contract specifically negotiated for the construction of an asset or a combination of assets that are closely interrelated or interdependent in terms of their design, technology and function or their ultimate purpose or use. The requirements of this Standard are usually applied separately to each construction contract. However, in certain circumstances, it is necessary to apply the Standard to the separately identifiable components of a single contract or to a group of contracts together in order to reflect the substance of a contract or a group of contracts. Contract revenue shall comprise:- (a) the initial amount of revenue agreed in the contract; and (b) variations in contract work, claims and incentive payments:- (i) to the extent that it is probable that they will result in revenue; and (ii) they are capable of being reliably measured. Contract revenue is measured at the fair value of the consideration received or receivable. Contract costs shall comprise:- (a) costs that relate directly to the specific contract; (b) costs that are attributable to contract activity in general and can be allocated to the contract; and (c) such other costs as are specifically chargeable to the customer under the terms of the contract. When the outcome of a construction contract can be estimated reliably, contract revenue and contract costs associated with the construction contract shall be recognised as revenue and expenses respectively by reference to the stage of completion of the contract activity at the balance sheet date. When the outcome of a construction contract cannot be estimated reliably:- (a) revenue shall be recognised only to the extent of contract costs incurred that it is probable will be recoverable; and (b) contract costs shall be recognised as an expense in the period in which they are incurred. When it is probable that total contract costs will exceed total contract revenue, the expected loss shall be recognised as an expense immediately. / МСБУ 11 (сокращение для Международного Стандарта Бухгалтерского Учёта № 11) – .

CONSTRUCTION DIFFERENTIAL SUBSIDY = ДИФФЕРЕНЦИРОВАННАЯ СУБСИДИЯ НА КОРАБЛЕСТРОЕНИЕ – Construction Differential Subsidy (CDS) is a direct subsidy paid to US shipyards building US-flag ships to offset high construction costs in American shipyards. An amount of subsidy (up to 50 percent) is determined by estimates of construction cost differentials between US and foreign yards. Program has not been funded since 1981. A program whereby the US government attempted to offset the higher shipbuilding cost in the United States by paying up to 50% of the difference between cost of US and non-US construction. The difference went to the US shipyard. It is unfunded since 1982.

CONSTRUCTION LOAN = ССУДА НА СТРОИТЕЛЬСТВО – In Switzerland, Construction Loan is a current account-type loan granted specifically for financing the construction or renovation of a building. Funds are advanced at specific stages of construction in so-called Progress Payments. Accrued interest is factored into the loan. On completion of building work, a construction loan is usually converted into a mortgage. / или реновация здания. Ссуда На Строительство – краткосрочное финансирование строительства на период с начала строительства до его завершения, но до введения объекта в действие. Ссуда выдаётся частями по мере осуществления выплат подрядчику, а проценты выплачиваются лишь по использованным средствам. По завершении строительства эта ссуда обычно заменяется долгосрочным займом.

CONSTRUCTION WORK IN PROGRESS = НЕЗАВЕРШЁННЫЕ СТРОИТЕЛЬНЫЕ РАБОТЫ – Construction Work-In-Progress is a long-term asset account in which the costs of constructing long-term assets are recorded. The account Construction Work-in-Progress will have a debit balance and will be reported on the balance sheet as part of a company's Property, Plant and Equipment. The costs of a constructed asset are accumulated in the account Construction Work-in-Progress until the asset is placed into service. When the asset is completed and placed into service, the account Construction Work-in-Progress will be credited for the accumulated costs of the asset and will be debited to the appropriate Property, Plant and Equipment account. Depreciation begins after the asset has been placed into service. Construction Work In Progress (CWIP):- the balance shown on a utility's balance sheet for construction work not yet completed but in process. This balance line item may or may not be included in the rate base. Construction Work In Progress is a general ledger account, categorized as a fixed asset, in which you record the costs directly associated with constructing an asset. Once the asset is placed in service, all costs associated with it that are stored in the construction work in progress account are shifted into whichever fixed asset account is most appropriate for the asset. The most common fixed asset account to which these costs are shifted is Buildings, since most construction projects relate to that fixed asset. However, the account is also sometimes used for machinery, and as such would store the costs associated with buying, transporting, installing, and testing machinery. While costs are being accumulated in the construction work in progress account, you should not commence depreciating an asset, because it has not yet been placed in service. Once the asset is placed in service and shifted to its final fixed asset account, you should begin depreciation. Thus, the construction work in progress is one of only two fixed asset accounts that are not depreciated. The other account that is not depreciated is the land account. The construction work in progress account is a prime target of auditors, since costs may be stored here longer than they should be, thereby avoiding depreciation until a later period.

CONSTRUCTIVE OBLIGATION = КОНСТРУКТИВНОЕ ОБЯЗАТЕЛЬСТВО (или ПОДРАЗУМЕВАЕМОЕ ОБЯЗАТЕЛЬСТВО) – Constructive Obligation is an obligation that derives from an enterprise's actions where:- (i) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain

responsibilities; and (ii) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities.

CONSTRUCTIVE TOTAL LOSS = КОНСТРУКТИВНОЕ ПОЛНОЕ ИСТРЕБЛЕНИЕ (или КОНСТРУКТИВНАЯ ПОЛНАЯ ГИБЕЛЬ) – Constructive Total Loss:- a right of marine assured to claim a total loss on the policy because (i) the property has been lost and recovery is unlikely; or (ii) an actual loss appears to be unavoidable; or (iii) to prevent an actual loss it would be necessary to incur an expenditure which would exceed the saved value of the property except, in the case of a hull policy, where the expenditure must exceed the 'insured' value expressed in the policy. To establish a claim for constructive total loss the assured must abandoned what remains of the property to underwriters and give notice of his intentions so to do. A partial loss of sufficient degree to make the cost of repairing as much or more than the property is worth or is insured for. Section 60 of the Marine Insurance Act 1906 states that, subject to any policy provision, a Constructive Total Loss arises where the subject matter of an insurance is reasonably abandoned to the insurer by the insured on account of its actual total loss appearing unavoidable or because it could not be preserved from actual total loss without an expenditure that would exceed its value. The term is sometimes used to refer to insured property, e.g., a car, which is damaged beyond economic repair. An instance in which the cost of recovering and/or repairing damaged goods would, when recovered or repaired, exceed the insured value. Subject to any express provision in the policy, there is a Constructive Total Loss where the subject-matter insured is reasonably abandoned on account of its actual total loss appearing to be unavoidable, or because it could not be preserved from actual total loss without an expenditure which would exceed its value when the expenditure had been incurred. In particular, there is a constructive total loss:- where the assured is deprived of the possession of his ship or goods by a peril insured against, and (a) it is unlikely that he can recover the ship or goods, as the case may be, or (b) the cost of recovering the ship or goods, as the case may be, would exceed their value when recovered; or in the case of damage to goods, where the cost of repairing the damage and forwarding the goods to their destination would exceed their value on arrival.

CONSUL = КОНСУЛ – Consul is a government official residing in a foreign country who represents the interests of her or his country and its nationals. / Государственный чиновник, находящийся в иностранном государстве, который представляет интересы его или её страны и граждан этой страны. Под Консулом, от Латинского слова Consul, понимается должностное лицо, назначенное в качестве постоянного представителя в каком-либо городе или районе другого государства для защиты юридических и экономических интересов своего государства и его граждан (защита прав и интересов граждан, выдача паспортов и виз, ведение актов гражданского состояния, осуществление нотариальных функций, легализация документов и тому подобное).

CONSULAR DECLARATION = КОНСУЛЬСКАЯ ДЕКЛАРАЦИЯ – Consular Declaration is a formal statement describing goods to be shipped; filed with and approved by the consul of the country of destination prior to shipment.

CONSULAR DOCUMENTS = КОНСУЛЬСКИЕ ДОКУМЕНТЫ – Consular Documents are the special forms signed by the Consul of a country to which cargo is destined. / Особые формы, подписанные Консулом страны, в которую поставляется груз.

CONSULAR INVOICE = КОНСУЛЬСКИЙ СЧЁТ–ФАКТУРА – Consular Invoice is a document, certified by a consular official, is required by some countries to describe a shipment. Used by Customs of the foreign country, to verify the value, quantity and nature of the cargo. A document produced by the shipper/seller of goods an accurate description of the merchandise and the country of origin. All items are itemized and with actual price. Consular Invoice is a document, required by some foreign countries, describing a shipment of goods and showing exact information such as the consignor, consignee, value description and value of the shipment. Certified by a consular official of the foreign country, it is used by the country's customs officials to verify the value, quantity and nature of the shipments. See also Commercial Invoice, Customs Invoice, Final Invoice, Invoice, Preliminary Invoice, Pro-Forma Invoice, and Provisional Invoice. / Документ, требуемый некоторыми иностранными государствами, предусматривающий описание отгруженной партии товаров и представляющий информацию такую как:- грузоотправитель, грузополучатель и стоимость отгруженной продукции. Сертифицированный консульскими работниками данного иностранного государства, он используется сотрудниками таможни этого же государства для сверки стоимости, количества и рода грузов. Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Таможенный Счёт-Фактура (Customs Invoice), Окончательный Счёт-Фактура (Final Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), Замещаемый Счёт-Фактура (Pro-Forma Invoice), и Условный Счёт-Фактура (Provisional Invoice).

CONSULAR OFFICERS = СОТРУДНИКИ КОНСУЛЬСТВА (или КОНСУЛЬСКИЕ СЛУЖАЩИЕ) – Consular Officers:- these are embassy officials who extend to national citizens and their property abroad the protection of the national Government. They maintain lists of local attorneys, act as liaison with police and other officials and have the authority to notarize documents.

CONSULAR VISA = КОНСУЛЬСКАЯ ВИЗА – Consular Visa is an official signature or seal affixed to certain documents by the Consul of the country of destination. / Консульская Виза – официальная подпись или печать, проставленные Консулом страны назначения на определённых документах.

CONSULATE LEGALISATION = КОНСУЛЬСКАЯ ЛЕГАЛИЗАЦИЯ – Consulate Legalisation:- some shipping documents must be presented to the Consul for legalisation either prior to or just after sailing. A Legalisation is a governmental act by which a designated public official (e.g., consular officer at an Embassy or Consulate) certifies to the genuineness of the signature and/or seal and the position of the person/official who has executed, issued, or certified (a copy of) a document. Please note that authentication services are provided by Honorary Consulates too. Authentication is provided for:- (i) private signatures, e.g., agreements, power of attorney; and (ii) transcripts and copies (stating that original and copy are identical). Please note:- (i) The Embassy does not provide translation services. The accuracy of a translation is not the responsibility of the Embassy. (ii) The Embassy is not to be held liable/responsible for the content of a document. (iii) The person asking for authentication services must provide proper ID, e.g., valid passport. For further information (e.g., fees to be paid) please contact the corresponding Embassy/Consulates. The Hague Convention and Apostille:- the 1961 Hague Convention stipulates that signatory countries (including both Austria and the United Kingdom) agrees to mutually recognize each other's 'public documents'. In other words, such documents need no prior legalization by an Embassy or Consulate of the other country. Yet, all these public documents must be authenticated by an Apostille. An apostille is an internationally recognized form of notarization and ensures that public documents issued in one country will be recognized as valid in another country. The sole function of the apostille is to certify the authenticity of the signature on the document in question; the capacity in which the person signing the document acted; and the identity of any stamp or seal affixed to the document. The apostille either must be attached as an annex to the official document or placed on the document itself by means of a stamp. An apostille is solely issued upon request. Who issues an apostille? In Austria, for example, an apostille is issued by:- (i) the Federal Ministry for European and International Affairs; (ii) the Presidents of any Civil Court of First Instances; and (iii) the Governors or Governments of the Federal Provinces. In the UK an apostille is issued by the Foreign and Commonwealth Office. / Некоторые отгрузочные документы должны быть представлены Консулу для легализации либо до, либо сразу же после отправки.

CONSULTANT = КОНСУЛЬТАНТ – Consultant is an individual licensed by the North Carolina Department of Agriculture and Consumer Services, who is trained to interpret information and make recommendations. / Под Консультантом, от Латинского слова Consultatio, означающее Совещание, понимается специалист, дающий совет.

CONSUMER = ПОТРЕБИТЕЛЬ (или ЗАКАЗЧИК) – The term Consumer means an individual who:- (i) with respect to a check handled for forward collection, draws the check on a consumer account; or (ii) with respect to a check handled for return, deposits the check into, or cashes the check against, a consumer account. People whose wants are satisfied by using goods and services. Consumer is one who consumes, i.e. one who uses a good or service to fulfill a need. In national accounting, economic unit that buys goods and services for personal use rather than for manufacturing, processing or resale. Although all economic agents are by definition consumers, in economics the term refers to individuals and households, who are the end users. / Тот, кто потребляет, то есть тот, кто использует товары или услуги для удовлетворения своих нужд. В национальном бюджетном процессе, хозяйствующий субъект, который покупает товары и услуги для личного потребления, нежели для изготовления, переработки или перепродажи.

CONSUMER ADVISORY COUNCIL = СОВЕЩАТЕЛЬНЫЙ СОВЕТ ПОТРЕБИТЕЛЕЙ – In the United States, Consumer Advisory Council (CAC) is a statutory body established by Congress in 1976. The Council, with 30 members who represent a broad range of consumer and creditor interests, advises the Federal Reserve Board on the exercise of its responsibilities under the Consumer Credit Protection Act and on other matters on which the Board seeks its advice. Group, created under the Federal Reserve Act, composed of thirty members who represent the interests of a broad range of consumers and creditors. The council meets with the Board of Governors three times a year on matters concerning consumers and the consumer protection laws administered by the Board. Consumer Advisory Council (CAC) is a legislative body established by Congress in 1976. The Consumer Advisory Council consists of 30 members who advise the Federal Reserve Board on issues involving consumer financial services such as the availability of credit and other financial issues that affect consumers. Members of the council serve a three-year term that is spread out over time. The CAC's responsibility is to advise the board on issues relating to the Consumer Credit Protection Act. Council meetings are held three times a year in Washington, DC, and are open to the public. The Consumer Credit Protection Act was initiated in 1969 and includes the Equal Credit Opportunity Act, the Fair Credit Billing Act, the Fair Credit Reporting Act and the Truth in Lending Act. The main goal of the Consumer Credit Protection Act is to protect consumers in various financial matters such as prohibiting discrimination in credit transactions, requiring credit card companies to promptly post payments and correct billing errors, and requiring lenders to inform borrowers of the terms and cost of credit in detail. In accordance with provisions of the Dodd-Frank Wall Street Reform and Consumer Protection Act, the CAC will continue to operate until July 21, 2011. On that date, the council will be dissolved and its responsibilities will be transferred to the newly founded Consumer Financial Protection Bureau.

CONSUMER CREDIT = ПОТРЕБИТЕЛЬСКИЙ КРЕДИТ – Consumer Credit is a loan extended to individuals. Consumer credit includes secured and unsecured installment and revolving credit. Form of credit extended to individuals, rather than businesses, to enable them to purchase personal or household items. Consumer credit includes all forms of installment credit and credit cards. / Форма кредита, выдаваемого скорее частным, нежели юридическим лицам, позволяющего им приобретать личные вещи и товары для дома. Потребительский кредит включает в себя все формы кредита в рассрочку и кредитные карты. Потребительский Кредит подразумевает под собой вид кредита, предоставляемого населению для оплаты потребительских товаров или услуг (в форме отсрочки платежа).

CONSUMER CREDIT PROTECTION ACT = АКТ О ЗАЩИТЕ ПОТРЕБИТЕЛЬСКИХ КРЕДИТОВ – In 1968 US Congress passed the first in a series of laws, under the Consumer Credit Protection Act, designed to shield consumers from unfair lending practices. Understanding these laws can help you avoid unnecessary worries and may even save you money. The Consumer Credit Protection Act, Pub.L. 90–321, 82 Stat. 146, enacted May 29, 1968, composed of several titles relating to consumer credit, mainly title I, the Truth in Lending Act, title II related to extortionate credit transactions, title III related to restrictions on wage garnishment, and title IV related to the National Commission on Consumer Finance. The restrictions on wage garnishment guard employees from discharge by their employers because their wages have been garnished for any one indebtedness. The Wage and Hour Division of the United States Department of Labor enforces the provisions. The informed use of credit is administered by the United States Congress and stabilizes economic acts to be enhanced with competition informed unto various financial institutions that are engaged in extension of consumer credit that would be strengthened otherwise by informed credit use.

CONSUMER LOAN = ПОТРЕБИТЕЛЬСКАЯ ССУДА (или ПОТРЕБИТЕЛЬСКИЙ ЗАЁМ) – Consumer Loan is a relatively small credit granted mostly to private individuals to acquire consumer durables or finance holidays. See also Personal Loan. / Относительно небольшой кредит, предоставляемый главным образом частным лицам, для приобретения потребительских товаров или финансирования отпуска.

CONSUMER NEWS AND BUSINESS CHANNEL = КАНАЛ НОВОСТЕЙ В СФЕРЕ ПОТРЕБЛЕНИЯ И БИЗНЕСА – On 2005-December-31, the sale by Dow Jones of its interests in the international CNBC channels took effect. From 2006-January-01, the 'A Service of NBC Universal and Dow Jones' tagline was removed from the international CNBC channels, in line with this. CNBC.com is the companion website to the financial network. It was launched in 1996 with minimal content, other than show program grids, host biographies and basic network images. The site gradually progressed alongside internet technology, giving investors more useful information such as stock quotes, news bulletins, in-depth programming information and a whole host of other data. In August 2001, CNBC.com merged with MSN's Moneycentral.com, creating 'CNBC on MSN'. This new partnership allowed the two parties to meet two objectives:- (i) provide richer content to visitors, with expanded news offerings, a wider array of stock tools (including interactive charting, free online portfolio managers) plus more in-depth market coverage; and (ii) more effectively compete with other finance related websites, such as Marketwatch.com and Yahoo! Finance. CNBC.com was relaunched on 2006-December-04. The website provides new online tools for investors, better integration of the website with daytime programming. CNBC has operated international versions of its channel since 1995, when CNBC Asia originally launched. CNBC Europe followed in 1996. On 1997-December-09, Dow Jones & Company and NBC announced the merger of their international business news channels. This resulted in a merger of CNBC Europe with Dow Jones' European Business News, and likewise of CNBC Asia with Asia Business News. From then (until January 2006) the international CNBC services carried the tagline 'A Service of NBC (Universal) and Dow Jones' (or depending on other local partners, a variation of this tagline). Correspondents from Dow Jones Newswires contribute to the channels. CNBC Europe is headquartered in London, and CNBC Asia is headquartered in Singapore. Besides CNBC Europe and CNBC Asia, the network also operates a number of local business news channels in association with other companies. These channels include Class CNBC in Italy, CNBC-e in Turkey, CNBC Arabiya in the UAE, Nikkei CNBC in Japan, CNBC-TV18 and CNBC Awaaz in India, and CNBC Pakistan in Pakistan. In Australia, CNBC is called CNBC Australia and carried programs from both the Asian, European and American networks. CNBC is an abbreviation for the Consumer News and Business Channel, its official name until 1991. CNBC is a group of cable and satellite television Business news channels from the United States, owned and operated by NBC Universal. CNBC and its international

spinoffs cover business headlines and provide live coverage of financial markets. The original CNBC channel was launched in Fort Lee, New Jersey, on 1989-April-17. Soon after, it merged in 1991 with the Financial News Network (FNN), and the name 'Consumer News and Business Channel' was dropped. Sue Herera is an original anchor at CNBC, and remains on the air co-hosting Power Lunch. Scott Cohn is an original reporter at CNBC, and remains on the air as Senior Correspondent. Some reporters from FNN joined CNBC, like Ron Insana, Bill Griffeth and Joe Kernen. At first, the network's business programming was branded 'CNBC/FNN', but that was dropped before the mid-90's. CNBC began to grow during the 1990's, taking over London based EBN (European Business News) in 1998, while ratings grew on the US channel until the new millennium's dot-com bubble burst in 2000. The new millennium also brought new changes to the network, moving it's world headquarters from Fort Lee to Englewood Cliffs, New Jersey in 2003, which features completely digital video production. Today, CNBC provides business news programming from 04 am to 08 pm, Eastern Time, while broadcasting talk shows, investigative reports, documentaries, infomercials, and other programs during the evening and early morning. A rolling ticker provides real-time updates on share prices on the NYSE®, NASDAQ®, and AMEX®, as well as market indices, news summaries, and weather updates by NBC Weather Plus. A rotating, top band of the screen rotates provides real-time updates on index and commodity prices from world markets. / Дау Дьжонз (Dow Jones) в международных каналах Си.Эн.Би.Си. (CNBC). 'Служба Эн.Би.Си Юнивёсэл и Дау Дьжонз' ('A Service of NBC Universal and Dow Jones'). Эм.Эс.Эн. (MSN). Яху! Файнэнс (Yahoo! Finance). Дау Дьжонз Энд Кампэни (Dow Jones & Company). Никкэй (Nikkei). Дау Дьжонз Ньюзвайэз (Dow Jones Newswires). обозначение . пузырь дат-кам (dot-com bubble). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®), НЭЗДЭК® (NASDAQ®), АФБ® или АМЭКС® (AMEX®) .

CONSUMER PRICE INDEX = ИНДЕКС ПО ПОТРЕБИТЕЛЬСКИМ ЦЕНАМ – In the United States, Consumer Price Index (CPI) is a measure of the average price level of a fixed basket of goods and services purchased by consumers as determined by the Bureau of Labor Statistics. Monthly changes in the CPI represent the rate of inflation. Core CPI excludes volatile components, i.e. food and energy prices. Consumer Price Index (CPI):- compiled once a month using what is called a 'Shopping Basket'. For the Euro area, the Harmonised Index of Consumer Prices (HICP) is used, with a statistical methodology that has been harmonised across countries. Consumer Price Index (CPI) is a measure of the average change in prices of goods and services purchased by city wage earner and clerical worker families. The CPI represents the total cost of a selected market basket of goods and services expressed as a percentage of the average cost of the same market basket in a selected period. A major inflation measure computed by the US Department of Commerce. It measures the average change in prices of a fixed market basket of some 385 goods and services in the previous month. In the United States, Consumer Price Index (CPI) is an index designed to measure the change in price of a fixed market basket of goods and services. The market basket of goods and services is representative of the purchases of a typical urban consumer. The index is intended to measure pure price change only; attempts are made to remove changes in price resulting from changes in quality. Source:- US Department of Labor; Bureau of Labor Statistics. Frequency:- monthly. Availability:- generally available the second week of the month immediately following the month for which data is being released; always released after the Producer Price Index. Reason:- the rate of change of the CPI is one of the key measures of inflation for the US economy. Acceleration or deceleration of inflation may signal that a change in monetary policy may be appropriate. Also known as Retail Price Index in the United Kingdom. Monthly measure of the change in the prices of a defined basket of consumer goods including food, clothing, and transport. Countries vary in their approach to rents and mortgages. Rising CPI is normally associated with expectation of higher short term interest rates and may therefore be supportive for a currency in the short term. Nevertheless, a longer term inflation problem will eventually undermine confidence in the currency and weakness will follow. Consumer Price Index (CPI) is an economic measure of the increase in the price of a basket of consumer goods. This is useful insofar as it tells consumers how much their purchasing power has declined. For example, it may cost CAD100 to buy a certain basket of consumer items. If the CPI index increases by 10%, then that same basket of goods would now cost CAD110. The Consumer Price Index (CPI) is a measure of the average change in prices over time of goods and services purchased by households. The Bureau of Labor Statistics publishes CPIs for two population groups:- (1) the CPI for Urban Wage Earners and Clerical Workers (CPI-W), which covers households of wage earners and clerical workers that comprise approximately 28 percent of the total population and (2) the CPI for All Urban Consumers (CPI-U) and the Chained CPI for All Urban Consumers (C-CPI-U), which covers approximately 89 percent of the total population and includes, in addition to wage earners and clerical worker households, groups such as professional, managerial, and technical workers, the selfemployed, short-term workers, the unemployed, and retirees and others not in the labor force. The CPIs are based on prices of food, clothing, shelter, and fuels, transportation fares, charges for doctors' and dentists' services, drugs, and other goods and services that people buy for day-to-day living. Prices are collected each month in 87 urban areas across the country from about 4 000 housing units and approximately 26 000 retail establishments-department stores, supermarkets, hospitals, filling stations, and other types of stores and service establishments. All taxes directly associated with the purchase and use of items are included in the index. Prices of fuels and a few other items are obtained every month in all 87 locations. Prices of most other commodities and services are collected every month in the three largest geographic areas and every other month in other areas. Prices of most goods and services are obtained by personal visits or telephone calls of the Bureau's trained representatives. In calculating the index, price changes for the various items in each location are averaged together with weights, which represent their importance in the spending of the appropriate population group. Local data are then combined to obtain a US city average. For the CPI-U and CPI-W separate indexes are also published by size of city, by region of the country, for cross-classifications of regions and population-size classes, and for 27 local areas. Area indexes do not measure differences in the level of prices among cities; they only measure the average change in prices for each area since the base period. For the C-CPI-U data are issued only at the national level. It is important to note that the CPI-U and CPI-W are considered final when released, but the C-CPI-U is issued in preliminary form and subject to two annual revisions. The index measures price change from a designed reference date. For the CPI-U and the CPI-W the reference base is 1982–84 equals 100. The reference base for the C-CPI-U is December 1999 equals 100. An increase of 16.5 percent from the reference base, for example, is shown as 116.500. This change can also be expressed in dollars as follows: the price of a base period market basket of goods and services in the CPI has risen from USD10 in 1982–84 to USD11.65. For further details visit the CPI home page on the Internet at http://www.bls.gov/cpi/ or contact our CPI Information and Analysis Section on +1-202-6917000. Note on Sampling Error in the Consumer Price Index:- the CPI is a statistical estimate that is subject to sampling error because it is based upon a sample of retail prices and not the complete universe of all prices. BLS calculates and publishes estimates of the 1-month, 2-month, 6-month and 12-month percent change standard errors annually, for the CPI-U. These standard error estimates can be used to construct confidence intervals for hypothesis testing. For example, the estimated standard error of the 1 month percent change is 0.04 percent for the US All Items Consumer Price Index. This means that if we repeatedly sample from the universe of all retail prices using the same methodology, and estimate a percentage change for each sample, then 95% of these estimates would be within 0.08 percent of the 1 month percentage change based on all retail prices. For example, for a 1-month change of 0.2 percent in the All Items CPI for All Urban Consumers, we are 95 percent confident that the actual percent change based on all retail prices would fall between 0.12 and 0.28 percent. For the latest data, including information on how to use the estimates of standard error, see 'Variance Estimates for Price Changes in the Consumer Price Index, January-December 2013'. These data are available on the CPI home page (http://www.bls.gov/cpi), or by using the following

link:- http://www.bls.gov/cpi/cpivar2013.pdf. Calculating Index Changes:- movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points, because index point changes are affected by the level of the index in relation to its base period while percent changes are not. A Note on Seasonally Adjusted and Unadjusted Data:- because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month. For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred, since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year--such as price movements resulting from changing climatic conditions, production cycles, model changeovers, holidays, and sales. The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data also are used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index before adjustment for seasonal variation. Seasonal factors used in computing the seasonally adjusted indexes are derived by the X-13ARIMASEATS Seasonal Adjustment Method. Seasonally adjusted indexes and seasonal factors are computed annually. Each year, the last five years of seasonally adjusted data are revised. Data from January 2009 through December 2013 were replaced in January 2014. Exceptions to the usual revision schedule were:- the updated seasonal data at the end of 1977 replaced data from 1967 through 1977; and, in January 2002, dependently seasonally adjusted series were revised for January 1987-December 2001 as a result of a change in the aggregation weights for dependently adjusted series. For further information, please see 'Aggregation of Dependently Adjusted Seasonally Adjusted Series', in the October 2001 issue of the CPI Detailed Report. Effective with the publication of data from January 2006 through December 2010 in January 2011, the Video and audio series and the Information technology, hardware and services series were changed from independently adjusted to dependently adjusted. This resulted in an increase in the number of seasonal components used in deriving seasonal movement of the All items and 64 other lower level aggregations, from 73 for the publication of January 1998 through December 2005 data to 82 for the publication of seasonally adjusted data for January 2006 and later. Each year the seasonal status of every series is reevaluated based upon certain statistical criteria. If any of the 82 components change their seasonal adjustment status from seasonally adjusted to not seasonally adjusted, not seasonally adjusted data will be used in the aggregation of the dependent series for the last five years, but the seasonally adjusted indexes before that period will not be changed. Note:- 35 of the 82 components are not seasonally adjusted for 2014. Seasonally adjusted data, including the all items index levels, are subject to revision for up to five years after their original release. For this reason, BLS advises against the use of these data in escalation agreements. Effective with the calculation of the seasonal factors for 1990, the Bureau of Labor Statistics has used an enhanced seasonal adjustment procedure called Intervention Analysis Seasonal Adjustment for some CPI series. Intervention Analysis Seasonal Adjustment allows for better estimates of seasonally adjusted data. Extreme values and/or sharp movements which might distort the seasonal pattern are estimated and removed from the data prior to calculation of seasonal factors. Beginning with the calculation of seasonal factors for 1996, X-12-ARIMA software was used for Intervention Analysis Seasonal Adjustment. In 2014, for the 2009–13 revisions, the Bureau of Labor Statistics began using X 13ARIMA-SEATS to perform the seasonal adjustment of CPI series, including Intervention Analysis Seasonal Adjustment for certain series. For the seasonal factors introduced in January 2014, BLS adjusted 31 series using Intervention Analysis Seasonal Adjustment, including selected food and beverage items, motor fuels, electricity and vehicles. For example, this procedure was used for the Motor fuel series to offset the effects of events such as the response in crude oil markets to the worldwide economic downturn in 2008. For a complete list of Intervention Analysis Seasonal Adjustment series and explanations, please refer to the article 'Intervention Analysis Seasonal Adjustment', located on our website at http://www.bls.gov/cpi/cpisapage.htm. For additional information on seasonal adjustment in the CPI, please write to the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Washington, DC 20212. If you have general questions about the CPI, please call our information staff at +1-202-6917000. / (Chris Graci). Индекс Потребительских Цен (ИПЦ) – основной индикатор инфляции. ИПЦ отражает изменение во времени общего уровня цен на товары и услуги, приобретаемые для непроизводственного потребления. Данный индекс рассчитывается как соотношение стоимости фиксированного набора товаров и услуг в текущий период к его стоимости в предыдущий период.

CONSUMER PRICE INDEX FOR FOOD = ИНДЕКС ПО ПОТРЕБИТЕЛЬСКИМ ЦЕНАМ НА ПРОДОВОЛЬСТВИЕ – Consumer Price Index For Food (CPIF):- Food and Agriculture Organization's of the United Nations (FAO's) Global and Regional Food Consumer Price Indices (CPI) measure food inflation at sub-regional (e.g., South America), regional (e.g., Americas) and global (world, all countries). The Global Food CPI covers approximately 150 countries worldwide, representing more than 90% of the world population. The aggregation procedure is based on the use of population weights. Population weights may better reflect regional food inflation and its impacts on households, while using the Gross Domestic Product (GDP) or any other measure of national income may better reflect the impact on the economy as a whole. Using GDP would also mean giving a higher weight to countries less exposed to food insecurity, because households in countries with higher GDP tend to be richer, spend a lower proportion of their income on food and benefit from an economic environment characterised by lower and less volatile consumer price inflation.

CONSUMER SECTOR = ПОТРЕБИТЕЛЬСКИЙ СЕКТОР – In national accounting, Consumer Sector is a category of economic agents which includes all individuals in the nation and its territories who buy goods for use by their household. Also known as Household Sector. / В национальном бюджетном процессе, Потребительский Сектор представляет собой категорию .

CONSUMER'S HEDGE = ХЭДЬЖ ПОТРЕБИТЕЛЯ (или ХЭДЬЖ ЗАКАЗЧИКА) – Consumer's Hedge is the purchase of futures or options on futures or both as protection against a rise in raw material prices.

CONSUMER TO CONSUMER = ОТ ПОТРЕБИТЕЛЯ ПОТРЕБИТЕЛЮ – Consumer-To-Consumer e-commerce or C2C is simply commerce between private individuals or consumers. This type of e-commerce is characterized by the growth of electronic marketplaces and online auctions, particularly in vertical industries where firms/businesses can bid for what they want from among multiple suppliers. It perhaps has the greatest potential for developing new markets. This type of e-commerce comes in at least three forms:- (i) auctions facilitated at a portal, such as eBay, which allows online real-time bidding on items being sold in the Web; (ii) peer-to-peer systems, such as the Napster model (a protocol for sharing files between users used by chat forums similar to IRC) and other file exchange and later money exchange models; and (iii) classified ads at portal sites such as Excite Classifieds and eWanted (an interactive, online marketplace where buyers and sellers can negotiate and which features 'Buyer Leads & Want Ads'). Consumer-to-business (C2B) transactions involve reverse auctions, which empower the consumer to drive transactions. A concrete example of this when competing airlines gives a traveler best travel and ticket offers in response to the traveler's post that she wants to fly from New York to San Francisco. There is little information on the relative size of global C2C e-commerce. However, C2C figures of popular C2C sites such as eBay and Napster indicate that this market is quite large. These sites produce millions of Dollars in sales every day. / иБэй (eBay) и Нэпстё (Napster). Эксайт Класыфайидз (Excite Classifieds) и иВонтид (eWanted).

CONSUMPTION = ПОТРЕБЛЕНИЕ – (1) Consumption is the use of a good or service to fulfill a need, and using up that the good or service in the process. In national accounting, final consumption is the quantity of goods or services used to fulfill the needs of domestic economic agents directly, which does not contribute to an increase in production. Intermediate consumption refers to goods or services used in the production process. / В национальном бюджетном процессе, . Потребление, использование

общественного продукта в процессе удовлетворения потребностей, заключительная фаза процесса воспроизводства. Потребление распадается на непроизводственное и производственное потребление. В зависимости от вида потребляемых благ различается потребление материальных благ, имеющих вещную форму, и потребление услуг. По способу удовлетворения потребностей потребление бывает индивидуальным и коллективным. Потребление органически связано с производством, распределением и обменом. Производство осуществляется для потребления и определяет его уровень и структуру. В свою очередь потребление активно воздействует на производство, стимулируя его развитие. При капитализме общественный продукт распределяется по капиталу, при социализме – по труду.

(2) Consumption (fuel) is the amount of fuel used for gross generation, providing standby service, start-up and/or flame stabilization.

(3) Consumption means the use of eligible cotton by a domestic user in the manufacture in the United States of cotton products.

CONSUMPTION ENTRY = ВВОЗ ДЛЯ ПОТРЕБЛЕНИЯ – The process of declaring the importation of foreign-made goods for use in the United States. Consumption Entry is a form required by US Customs for entering goods into the United States. The form contains information as to the origin of the cargo, a description of the merchandise, and estimated duties applicable to the particular commodity. Estimated duties must be paid at the time the entry is filled. / привоз (importation).

CONSUMPTION OF FIXED CAPITAL = РАСХОДОВАНИЕ ОСНОВНОГО КАПИТАЛА (или ОСНОВНЫХ ФОНДОВ, или ОСНОВНЫХ СРЕДСТВ) – In the United Kingdom, Consumption Of Fixed Capital is the amount of capital resources used up in the process of production in any period. It is not an identifiable set of transactions but an imputed transaction which can only be measured by a system of conventions.

CONSUMPTIVE USE = БЕЗВОЗВРАТНОЕ ПОТРЕБЛЕНИЕ – Consumptive Use is the water used per unit of time in plant growth by the combined processes of evaporation, transpiration, and retention in the plant.

CONTACT ADHESIVE = КОНТАКТНОЕ СВЯЗУЮЩЕЕ – Contact Adhesive is an adhesive which, while apparently dry to the touch, will adhere instantaneously to itself upon contact. The terms contact bond adhesive, or dry bond adhesive, are also used. / .

CONTACT ANGLE = КРАЕВОЙ УГОЛ (или УГОЛ КОНТАКТА, или УГОЛ СОПРИКОСНОВЕНИЯ) – Contact Angle is the angle between the surface of a liquid and the surface of a partially submerged object or the container at the line of contact. The smaller the contact angle, the greater the wettability of the solid. / Краевой Угол смачивания. Чем меньше угол контакта, тем больше смачиваемость твёрдого тела.

CONTACT DAMAGE = ПОВРЕЖДЕНИЕ ВСЛЕДСТВИЕ КОНТАКТА – Contact Damage is a damage to the ship caused by its striking nay object other than another ship or vessel (the latter being termed ‘collision’ damage). Damage to the ship caused by it being grounded or by striking rocks or submerged objects, other than in circumstances which constitute ‘stranding’. Damage to the ship’s cargo caused by any of the above circumstances or by physical touch with other cargoes or the ship’s hull etc. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

CONTACT HERBICIDE = КОНТАКТНЫЙ ГЕРБИЦИД (или ГЕРБИЦИД СПЛОШНОГО ДЕЙСТВИЯ) – Contact Herbicide is a herbicide that kills only the plant tissue at and very close to the site of application. Contact Herbicide is a herbicide that causes injury to only the plant tissue to which it is applied, or a herbicide that is not appreciably translocated within plants. / Гербициды Контактного Действия поражают растение в местах контакта с ним. Контактные Гербициды, в том числе десиканты, воздействуют только на обработанную поверхность. Отличаются быстротой воздействия и хорошей дождеустойчивостью.

CONTACT INSECTICIDE = КОНТАКТНЫЙ ИНСЕКТИЦИД (или ИНСЕКТИЦИД КОНТАКТНОГО ДЕЙСТВИЯ, или ИНСЕКТИЦИД СПЛОШНОГО ДЕЙСТВИЯ) – Contact Insecticide is an insecticide that penetrates the outer covering or cuticle of the insect and kills it. Contact Insecticide is a contact poison that kills pests on contact.

CONTACT PESTICIDE = КОНТАКТНЫЙ ПЕСТИЦИД (или ПЕСТИЦИД КОНТАКТНОГО ДЕЙСТВИЯ) – Contact Pesticide is a chemical that injures or kills insects which come into contact with it and does not have to be ingested to be harmful. / .

CONTACT POISON = КОНТАКТНЫЙ ЯД (или ЯД КОНТАКТНОГО ДЕЙСТВИЯ) – Contact Poison (contact insecticide) is a poison that kills pests on contact.

CONTACT PROTOCOL = ПРОТОКОЛ КОНТАКТА – Contact Protocol is the plan for personnel to follow regarding communicating questions, concerns, and unresolved issues about export certification.

CONTAINED COPPER = САМОРОДНАЯ МЕДЬ (или СОДЕРЖИМАЯ МЕДЬ, или ОСНОВНОСТЬ МЕДИ) – In mining industry, Contained Copper (grade) is the proportion of copper present in the ore, expressed as a percentage. / В горной (горнодобывающей) промышленности, сорт самородной или содержимой меди представляет собой пропорцию меди, содержащейся в руде, выраженную в процентах. Под Самородной Медью понимается минерал класса самородных элементов. Примеси Ag, Au, Fe. Медно-красные кристаллы, дендриты и другие выделения, сплошные массы. Твёрдость 2.5–3, плотность 8.4–8.9 г/см^3. Гидротермального и гипергенного происхождения. Входит в состав медных руд. В металлургии под Основностью понимается отношение в процентах по массе содержания основных и кислых окислов в железорудных материалах, а также в доменных, стале-плавильных и других шлаках.

CONTAINER = КОНТЕЙНЕР – A Container is a box that is used to transport product, and is widely used for international shipments. Marine containers or intermodal containers can travel on ocean liners, railroads, and on truck frames (chassis). A term Container includes any container, trailer, transportable tank, flat or pallet, or any similar article used to consolidate Goods and any connected or accessory equipment. In May 2001, Malcolm P. McLean, the ‘Father of Containerization’, died aged eighty-seven. He used to say that he had the idea of rationalizing goods transport by avoiding the constant loading and unloading from one means of transport to another way back at the end of the 1930s at the port of Hoboken, when still operating as a small-scale hauler. To start with, McLean would load complete trucks onto ships, in order to transport them as close as possible to their destination. The development of standardized containers and trailers, moved by tractors, made it possible to ship just the trailers with the containers, so saving on space and costs. Later, the trailers were also left behind and the ships transported just the containers. Shipowners were more than a little skeptical about McLean’s idea. This prompted him to become a shipowner himself and he appropriately named his company Sea-Land Inc.. At the end of the 1990s, McLean sold his company to the Maersk shipping company, but his company name lives on in the name Maersk Sea-Land. In the literature, the ‘Ideal X’ is mentioned as the first container freighter. This ship left Newark on 1956-April-26 carrying fifty-eight containers, which it transported to Houston. The first ship designed to carry only containers is the ‘Maxton’, a converted tanker, which could carry sixty containers as deck cargo. That was in 1956. Another decade passed before the first container ship moored in

Europe. The first container on German soil was set down by the ‘Fairland’ at Bremer Überseehafen on 1966-May-06. The first containers used by Sea-Land in Northern Europe were 35’ ASA containers (35’ American Standards Association containers), i.e. they were constructed to American standards. In other regions, 27’ ASA containers and other ASA dimensions were often used. Shipowners in Europe and Japan quickly recognized the advantages of the container and also invested in the new transport technology. Since American standards could only be applied with difficulty to conditions in Europe and other countries, an agreement was eventually reached with the Americans after painstaking negotiations. The resulting ISO standards provided for lengths of 10’, 20’, 30’ and 40’. The width was fixed at 8’ and the height at 8’ and 8’ 6”. For land transport within Europe, agreement was reached on a 2.50 m wide inland container, which is mainly used in combined road/rail transport operations. The majority of containers used worldwide today comply with the ISO standard, with 20’- and 40’-long containers predominating. For some years, the ISO standard has come repeatedly under pressure. As stowage factors increase for most goods, many forwarders want longer, wider and higher containers, preferably all at once. Some shipowners have given in to the pressure and containers of dimensions larger than provided for by the ISO standard are now encountered distinctly more frequently. ‘Jumbo’ containers of 45’ and 48’ in length, widths of 8’6” (2.60 m) and heights of 9’6” (2.90 m) have been in existence for some years. Efforts to build even larger containers, e.g., 24’ (7.43 m) and 49’ (14.40 m) boxes 2.60 m wide and 2.90 m high, are mostly confined to the USA. Even 53’ long containers have been approved for use for some time throughout the USA, while some states will even allow 57’. In Europe and on other continents, narrower roads are a limiting factor. Developing countries are understandably against changing the standards. Ocean going container in which articles are packed. Container is a van, flatrack, open top trailer or other similar trailer body on or into which cargo is loaded and transported without chassis aboard ocean vessels; a large rectangular or square container/box of a strong structure that can withstand continuous rough handling from ship to shore and back. It opens from one side to allow cargo to be stacked and stowed into it. Container is a weatherproof box designed for the shipment of freight, generally used for overseas shipments. The container is separable from the chassis when loaded onto vessels or rail cars. Container:- an item of equipment as defined by the International Organisation for Standardisation (ISO) for transport purposes. An enclosed permanent, reusable, non-disposable, weather-tight shipping conveyance, usually fitted with hardwood floors. A rectangular unit used for shipment, generally made of steel or aluminium; standard lengths are 20’ and 40’, 8’ wide. An enclosed, permanent, reusable, non-disposable, weather-tight shipping conveyance. Fitted with at least one door, and capable of being handled and transported by existing carrier-owned equipment, both land and sea. Container is a truck trailer body that can be detached from the chassis for loading into a vessel, a rail car or stacked in a container depot. Containers may be ventilated, insulated, refrigerated, flat rack, vehicle rack, open top, bulk liquid or equipped with interior devices. A container may be 20 feet, 40 feet, 45 feet, 48 feet or 53 feet in length, 8’0” or 8’6” in width, and 8’6” or 9’6” in height. An item of equipment as defined by the International Organization for Standardization (ISO) for transport purposes. It must be of:- (a) a permanent character and accordingly strong enough to be suitable for repeated use; (b) specially designed to facilitate the carriage of goods, by one or more modes of transport without intermediate reloading; (c) fitted with devices permitting its ready handling, particularly from one mode of transport to another; (d) so designed as to be easy to fill and empty; and (e) having an internal volume of 1 m^3 or more. The term Container includes neither vehicles nor conventional packing. Standard-sized rectangular box used to transport freight by ship, rail and highway. International shipping containers are 20 or 40 feet long, conform to International Organization for Standardization (ISO) standards and are designed to fit in ships’ holds. Containers are transported on public roads atop a container chassis towed by a tractor. Container is a metal box structure of standard design, used to carry cargo in units. Containers can be 20 or 40 foot in length. The standard measure of a container is a TEU (Twenty-foot Equivalent Unit), but can be a FEU (Forty-foot Equivalent Unit) as well. Container ships are specially designed to carry containers in slots (or cells). Containers are stacked and restrained (lashed) at all four corners by vertical posts. Some shipping lines now charter container slots on vessels operated by different companies. Also known as Freight Container. Container is the unit of packaging, e.g., carton, case, bag, bale, pallet, etc. Container is an article of transport equipment (lift-van, movable tank or other similar structure):- (i) fully or partially enclosed to constitute a compartment intended for containing goods, (ii) of a permanent character and accordingly strong enough to be suitable for repeated use, (iii) specially designed to facilitate the carriage of goods, by one or more modes of transport, without intermediate reloading, (iv) designed for ready handling, particularly when being transferred from one mode of transport to another, (v) designed to be easy to fill and to empty, and (vi) having an internal volume of one cubic meter or more. ‘Container’ shall include the accessories and equipment of the container, appropriate for the type concerned, provided that such accessories and equipment are carried with the container. The term ‘Container’ shall not include vehicles, accessories or spare parts of vehicles, or packaging or pallets. ‘Demountable Bodies’ shall be regarded as containers. Temporary admission facilities for containers are dealt with in the Istanbul Convention (Annex B.3.) and in the Customs Convention on Containers, 1972. The latter Convention also stipulates the conditions for the acceptance of containers for international transport under Customs seal. The Customs Convention on the international transport of goods under cover of TIR carnets, 1975, also deals with the use of containers in international Customs transit. A uniform, sealed, reusable metal ‘box’ in which merchandise is shipped by vessel, truck, or rail. Standard lengths include 10, 20, 30 and 40 feet (40 foot lengths are generally able to hold about 40 000 pounds). Containers of 45 and 48 feet are also used, as well as containers for shipment by air. / идея Американского транспортного предпринимателя Мэлкэма Пёсэла МэкЛына (Malcolm Purcell McLean; 1913–2001). Си-Лэнд Инк. (Sea-Land Inc.). Мэрск (Maersk). Мэкстэн (‘Maxton’), переоборудованный танкер, который мог перевозить 58 35-футовых (11 метров) прицепных вэнов (trailer vans), позже названных контейнерами (containers), в качестве палубного груза (deck cargo). Фэалэнд (‘Fairland’) в Бремерском Океанском Порту (Bremer Überseehafen) 06 Мая 1966. Дьжамбо (Jumbo). , например, короб (carton), ящик (case), мешок (bag), кипа (bale), поддон (pallet), и тому подобное. Под Контейнером понимается стандартная ёмкость, служащая для бестарной перевозки грузов различными видами транспорта. Применение контейнеров облегчает механизацию перегрузочных работ, ускоряет оборот транспортных средств, улучшает сохранность грузов, уменьшает транспортные издержки. Под Контейнером, от Английского слова Container от Contain, означающее Вмещать, понимается съёмное приспособление в виде стандартной ёмкости, служащее для перевозки грузов различными видами транспорта без перегрузки находящихся в нём грузов до склада получателя. Контейнер приспособлен для механизированной погрузки, выгрузки и перегрузки из одного вида транспорта в другой. Применение контейнеров ускоряет оборот транспортных средств, улучшает сохранность грузов, уменьшает транспортные издержки. Размеры и вместимость контейнеров соответствуют грузоподъёмности и габаритам транспортных средств. По назначению контейнеры делятся на универсальные, специализированные и специальные. В бывшем Союзе Советских Социалистических Республик (СССР) выпускались контейнеры, рассчитанные на перевозку груза от 3 до 24 тонн. Контейнерные Перевозки, современный наиболее экономичный вид транспортировки грузов, используемый как во внутренних, так и в международных сообщениях. Контейнерные перевозки выполняются различными видами сухопутного, водного и воздушного транспорта при помощи съёмных транспортных приспособлений – Контейнеров. В контейнерах можно транспортировать любые грузы, допущенные соответствующими правилами к перевозке. Контейнерные перевозки позволяют значительно сокращать транспортные издержки. Впервые в мире контейнерные перевозки были применены в России в 1889, в начале 1930-х появились универсальные контейнеры для бестарной перевозки штучных грузов на железных дорогах. В бывшем Союзе Советских Социалистических Республик (СССР) была создана мощная контейнерная транспортная система. В начале 1970-х для перевозки грузов в контейнерах было приспособлено более 1 200 железнодорожных станций и подавляющее большинство

морских и речных портов. Для транспортировки контейнеров ежесуточно использовалось свыше 8 000 железнодорожных вагонов, более 10 000 автомобилей и сотни морских и речных судов. На перегрузке контейнеров занято более 3 000 подъёмно-транспортных машин. Значительная часть контейнерных перевозок в СССР выполнялась контейнерными поездами-экспрессами, среднесуточный пробег которых превышал 1 000 километров (км). Транзитная перевозка контейнеров из Японии через СССР в страны Западной Европы и обратно занимает не более 13 суток. Развитие контейнерных перевозок определяет уровень технического прогресса в организации транспортировки грузов. В СССР планировалось дальнейшее развитие и увеличение объёма перевозок грузов в среднетоннажных и особенно в крупнотоннажных контейнерах. Для управления контейнерными перевозками в составе Министерства Путей Сообщения СССР было создано (1972) Всесоюзное Объединение По Контейнерам И Пакетным Перевозкам (Союзтрансконтейнер) с широкой сетью периферийных предприятий.

CONTAINER BOLSTER = КОНТЕЙНЕР НА БАЗЕ ПЛАТФОРМЫ – Container Bolster:- a container floor without sides or end walls which does not have the ISO corner fittings and is generally used for Ro/Ro operations. / без боковых и торцевых стенок, который .

CONTAINER BOOKING = БРОНИРОВАНИЕ КОНТЕЙНЕРА – Container Booking:- arrangements with a steamship line to transport containerized cargo.

CONTAINER/BULK CARRIER = СУХОГРУЗНЫЙ КОНТЕЙНЕРОВОЗ – Container/Bulk Carrier is often referred to as a Conbulker. These vessels are bulk carriers with hold/hatch dimensions arranged to permit stowage of containers in some holds. These may have portable cell guides. Hatch covers are strengthened to permit deck stowage of containers.

CONTAINER CELL = КОНТЕЙНЕРНАЯ ЯЧЕЙКА – Container Cell is the unit of a vessel hatch cell in which the container is loaded.

CONTAINER CHASSIS = АВТОМОБИЛЬНЫЙ КОНТЕЙНЕРОВОЗ (или СЕДЕЛЬНОЕ ШАССИ ДЛЯ ПЕРЕВОЗКИ КОНТЕЙНЕРОВ) – Container Chassis is a semitrailer chassis with tie-down corner fittings for receiving and securing a container of modular size. The 20’ chassis can be either a single or tandem axle, depending upon the load requirements. The 40’ chassis is a tandem axle unit and is usually equipped with sufficient tie down fittings to enable it to accommodate either two 20’ or one 40’ container. A vehicle specially built for the purpose of transporting containers so that the container and chassis serve as a road trailer when assembled. Container Chassis is a vehicle built for the purpose of transporting a container so that, when a container and chassis are assembled, the produced unit serves as a road trailer. / Автомобильный Контейнеровоз специализированный полуприцеп для перевозки грузов в контейнерах по автомобильным дорогам. Грузоподъёмность от 5 до 30 тонн. В бывшем Союзе Советских Социалистических Республик (СССР) наибольшую распространённость имели контейнеровозы грузоподъёмностью 5 тонн. Их широко применяли при перевозках универсальных контейнеров брутто 2.5 и 5 тонн, а также автомобильных контейнеров брутто 0.625 и 1.25 тонн. В Соединённых Штатах Америки, Японии и других странах в это же самое время широко внедрялись контейнеровозы грузоподъёмностью 20 тонн для перевозок крупнотоннажных контейнеров брутто 20 тонн. Аналогичные контейнеровозы были созданы и в СССР. Они представляют собой полуприцеп в виде низко расположенной рамной конструкции без настила для обеспечения устойчивости при перевозке контейнеров, оборудованной двухосной тележкой, и оснащённый устройствами для крепления контейнеров. Такие контейнеровозы были приспособлены для буксировки автотягачами типа МАЗ-504И. Для перевозки крупнотоннажных контейнеров брутто 30 тонн контейнеровоз оснащается трёхосной тележкой, в которой две оси являются самоуправляемыми. Погрузка и выгрузка контейнеров осуществляются подъёмным краном или автопогрузчиком. Контейнеровозом называются также грузовой автомобиль, приспособленный для перевозки контейнеров, и контейнерное судно.

CONTAINER CHECK DIGIT = СВЕРОЧНАЯ ЦИФРА КОНТЕЙНЕРА (или КОНТРОЛЬНОЕ ЧИСЛО МАРКИРОВОЧНОГО КОДА КОНТЕЙНЕРА) – Container Check Digit is the 7th digit of the serial number of a container used to check whether prefix and serial number are correct. / 7-я цифра серийного номера контейнера, используемая для проверки того, точны ли приставка (префикс) и серийный номер или нет.

CONTAINER CRANE = КОНТЕЙНЕРНЫЙ КРАН – Container Crane is a large gantry crane specially designed to stow (load) and discharge (unload) containers from a ship. Also known as Portainer Crane in the United States. Container Crane:- surprising as it may seem, the method of handling ship cargo in the early nineteen-fifties was not so different from that used during the time of the Phoenicians. The time and labor required to load and unload ships increased substantially with the size of the ship causing them to spend more time in port than at sea. In 1959, a significant event occurred. A ship’s turnaround time (the time required to load and discharge cargo) was cut from as much as 3 weeks to as little as 18 hours. Admittedly, many factors contributed to this accomplishment. One element, however, stands out as a major contributor. The development of the PACECO Container Crane, the world’s first high-speed, dockside, container handling crane. This crane has aided in the improvement of the standard of living worldwide. It played a major roll in moving large quantities of products more efficiently and at lower costs due to less handling, less damage and less pilferage. PACECO Container Crane, Alameda, State of California (CA), the United States, 1959:- the world’s first high-speed dockside container handling crane, capable of reducing ship turnaround from three weeks to 18 hours. It became a model and set the standard for future designs worldwide. In service January 07, 1959. Designed and constructed by PACECO, Inc. (Pacific Coast Engineering Company) under the leadership of then-President Dean Ramsden, Chief Engineer, Chuck Zweifel, and Assistant Chief Engineer, Murray Montgomery. The idea of shipping goods in intermodal containers (truck vans that detach from their carriage or chassis for stacking on ships or rail cars) was first developed in 1956 by Sea-Land Services Inc. of New Jersey, then known as Pan-Atlantic Steamship Company, followed by Matson Navigation Company in 1958. The new containerization concept drastically reduced the labor costs as well as the time required to unload and reload the trucks at either end of the route; additionally, the number of ship-to-shore lifts for each truck load was reduced from as many as 20 small lifts to only two heavy lifts. Containerizing also reduced pilferage and cargo damage, resulting in the additional benefit of lower insurance rates. Containerization, as a cargo handling concept, would soon prove to be a giant leap forward for those who had vision. At the time, however, the concept was a long way from being perfected or being accepted by the shipping community. One of the major problems facing the containerization concept was that during the mid-fifties most ports were not equipped to handle the heavy containers except by mobile-type revolving cranes and even then many of the cranes did not have the capacity to lift the container. These cranes, at best, were extremely inefficient in that at least two to three minutes of loading cycle was lost to poor control at the points of pickup and discharge. Since the cycle would be repeated thousands of times each year; cutting the length of the cycle would have a direct and easily measured impact on productivity. For example, if the cycle could be accomplished in two minutes rather than five minutes, the productivity would more than double. The economic implications were astounding. Knowing the economic potential, both Matson and Sea-Land proceeded to develop ship-to-shore systems independently of each other and unique to their own needs. For Sea-Land, because its ships served many ports, shipboard cranes were more cost effective. On the other hand, Matson operated a number of ships serving only a few ports. Because one crane could serve many ships, dockside cranes were more cost effective for Matson’s operation. In July of 1957, Matson’s Engineering Staff, under the leadership of Mr. Les Harlander, commissioned a study of existing crane types, to determine the state of the art and identify the type which could best meet the following requirements:- in general:- load vans (containers) between ship and

shore as rapidly as possible, to keep the turnaround time of a containership to a minimum. Specifically:- (1) Handle 24-foot vans weighing a maximum of 25 short tons; (2) Load one van and unload one van in an average time cycle of five minutes or less; (3) Be able to service deck loads on existing ships, converted container-ships, and future containerships of special design; (4) Serve either truck and/or rail traffic on shore, and provide optimum conditions for coordination of freight movement on the dock; (5) Crane components to be designed for troublefree, continuous use; (6) Hoist and control equipment so designed as to minimize operator responsiblity and fatigue; and (7) Overall scheme of crane and related equipment (lifting beams, etc) to require a minimum of operating personnel. During the course of the study, which was conducted by Don Harlander and Murray Montgomery, then employed by Vietsch Engineering, the problem was discussed with engineering staffs of several leading crane manufacturers. Pacific Coast Engineering Company, Inc. (PACECO, Inc.), a previous employer of Don Harlander, Montgomery and Vietsch, was among those consulted. The study concluded that no crane then on the market satisfactorily filled all of Matson's requirements, and that an ore-unloading type crane with a horizontal boom and through-leg trolley came closest to meeting these requirements. Design and Construction:- early in 1958, performance specifications were finalized and put out for bid. PACECO, one of eleven bidders, was awarded the contract to do the detailed engineering and final design work. Following its philosophy that the best design has the fewest number of pieces, PACECO, under the leadership of then-President Dean Ramsden, Chief Engineer, Chuck Zweifel, and Assistant Chief Engineer, Murray Montgomery (now back with PACECO), began developing conceptual drawings paying particular attention to aesthetics. Trusses, which were used by most manufacturers at that time, were replaced with all-welded box girders wherever possible. This resulted in a unique and extremely clean-looking A-frame configuration, for which PACECO later became famous. Each function was carefully analyzed and simplified to promote ease of access, operation and maintenance. The operator's cab was mounted in full view of the operation with all controls at the operators' fingertips. Every consideration was given to enhanced operator control and safety. Limit switches were placed throughout the crane's power system to prevent overloading or unsafe operation. After months of intense work and countless conferences with Matson's Engineering Manager, the final configuration was agreed upon and the order to begin construction was issued. On August 31, 1958, Matson Navigation Company commenced its containership operations in the West Coast – Hawaii Trade. On January 07, 1959, the worlds first container crane was put into service at the Encinal Terminals in Alameda, California. Previously in Matson's operation, one longshore gang handled approximately nine tons of cargo per hour using ship's burtoning gear. In comparision, this new container crane operating on a three-minute cycle, with an average container weight of twenty tons, resulted in a productivity of 400 tons per hour. At this rate, the amount of time a ship spent in port could be cut from as much as three weeks to as little as eighteen hours. The crane performed well from the outset and as a result, Matson contracted for two more cranes. PACECO, because of its experience and competitive pricing, received the contract for both cranes which were installed in 1960 at Los Angeles and Honolulu. In 1961, the International Standards Organization (ISO) formed a container section to develop a family of uniform container sizes, dimensional tolerances, basic strength requirements and corner fittings. By 1964, shipping companies the world over had become aware of the many advantages of containerization. Investors and lending institutions were committing funds for the development of new ships and port facilities. By 1966, Pan-Atlantic, now Sea-Land Services Inc., had commissioned sixteen PACECO Container Cranes. The cranes were capable of transferring containers weighing 27.5 short tons (55 000 lbs) at the unheard of rate of one every minute and a half. What followed was a virtual containerization explosion. The original container crane which PACECO built for Matson at Encinal Terminals in 1959 not only became a model, but set the standards for container crane design for dozens of manufacturers around the world. Although there have been many significant improvements, all modern container cranes are direct descendants of this first crane, and the design of later cranes has remained relatively unchanged. The original crane, which is still in operation, was modified in 1963-64 and again in 1974–75. The extended outreach, height and width enabled it to serve new, larger container ships. The modifications and the upgrading of lifting capacity from 25 to 30 short tons were accomplished with a mimimum of re-engineering. The crane, now capable of handling 20 foot and 40 foot containers, is presently owned and operated by Encinal Terminals of Alameda, California. By the end of 1980, there were at least 737 ship-toshore container-handling cranes of the PACECO type operating in over 200 ports around the world. Of the 737 cranes listed, 283 (38%) were PACECO Portainer® cranes. The success of containerization and the PACECO Container Crane not only accelerated the shipment of goods but created a demand for a different breed of ship and container terminals. To keep pace with this demand Encinal Terminals, now owned by Chengben (Peter) Wang, embarked on an ambitious modernization program in 1977 that has drawn the attention of shipping companies throughout the world. It began with the installation of a new generation PACECO Portainer® Crane, the big brother of the original (see photo left). The plan calls for the step-bystep modular expansion to a high performance PACECO MACH Transtainer® yard system with the potential of becoming a fully automated container terminal in the future. Today, Encinal has a highly competitive operation providing a complete range of shipping services fully computerized for handling containers, general cargo, non-petroleum liquids with warehouse and distribution facilities. / Г-н Лэс Хорлэндё (Mr. Les Harlander). Дан Хорлэндё (Don Harlander) и Морэй Мантгамэри (Murray Montgomery), затем нанятые на работу компанией Виэч Эньдьжиниринь (Vietsch Engineering). Президент Дин Рэмздэн (Dean Ramsden), Главный Инженер (Chief Engineer), Чак Цвайфэль (Chuck Zweifel), и Помощник Главного Инженера (Assistant Chief Engineer), Морэй Мантгамэри (Murray Montgomery). Пэн-Этлэнтик Стимщип Кампэни (Pan-Atlantic Steamship Company), ныне Си-Лэнд Сёвисиз Инк. (Sea-Land Services Inc.), 16 Контейнерных Кранов компании Пэсифик Коуст Эньдьжиниринь Кампэни, Инк. (Pacific Coast Engineering Company, Inc.) (ПЭКЭКО, Инк. (PACECO, Inc.). для Мэтсэн Навигейшэн Кампэни (Matson Navigation Company) на Энсинальских Терминалах (Encinal Terminals) в 1959. Чэньбэн (Питё) Вэнь (Chengben (Peter) Wang). Крупный козловый кран в виде берегового консольного перегружателя, специально разработанный для укладки (погрузки) и разгрузки (выгрузки) контейнеров из судна. Известен также как Кран Портэйнёр™ (Portainer™ Crane) в Соединённых Штатах Америки.

CONTAINER DEPOT = КОНТЕЙНЕРНОЕ ДЕПО (или ПАРК, или ДВОР, или БАЗА) – Container Depot (CD) is a location, other than a container yard, maintained by or on behalf of an ocean carrier at which shippers or consignees may pick up or drop off empty equipment. No loaded containers may be received at CDs and such locations may not be owned or controlled by a shipper or his agent. Storage Yard for containers. Storage location for empty containers.

CONTAINER DRY = СУХОСТЬ КОНТЕЙНЕРА – Container Dry is the water content of goods which would not negatively impact the quality of the goods being transported in the container. For any given load, this water content will be dependent on the duration of the journey and the route and may vary over different routes.

CONTAINER EQUIVALENTS = ЭКВИВАЛЕНТЫ КОНТЕЙНЕРОВ (или КОНТЕЙНЕРНЫЕ ЭКВИВАЛЕНТЫ) – Container Equivalents:- 20-foot (TEU) and 40-foot (FEU). Standard conversion recognized internationally, used to compare the number (not weight) of containers a lot can accommodate.

CONTAINER FREIGHT STATION = ГРУЗОВАЯ КОНТЕЙНЕРНАЯ СТАНЦИЯ – Container Freight Station (CFS) is a location designated by the ocean carrier for the receiving and delivering of a shipment, and for assembly and distribution of shipments into or out of steamship line containers. Most LCL cargos are either packed into or devanned at the CFS. The carrier may store empty containers at a CFS but not receive or deliver containers. Container Freight Station (CFS) means a location where the water carrier

and/or its agent is loading or unloading containers under their control. Container Freight Station (CFS) is a shipping dock where cargo is loaded (stuffed) into or unloaded (stripped) from containers. Generally, this involves less than containerload shipments, although small shipments destined to same consignee are often consolidated. Container reloading from/to rail or motor carrier equipment is a typical activity. A facility at which (export) small cargo lots are received from Shippers for loading (stuffing) into containers or at which small cargo lots (import) cargo are unloaded (stripped) from containers and delivered to Consignees.

CONTAINER FREIGHT STATION CARGO = ГРУЗ ДЛЯ ГРУЗОВОЙ КОНТЕЙНЕРНОЙ СТАНЦИИ – Container Freight Station Cargo:- loose containerisable cargo handled in a container freight station (warehouse).

CONTAINER FREIGHT STATION CHARGE = СБОР ГРУЗОВОЙ КОНТЕЙНЕРНОЙ СТАНЦИИ – The charge assessed for services performed at the loading or discharge location. Container Freight Station Charge is a charge assessed by carrier for the handling of cargo at the terminal. / месте погрузки или разгрузки.

CONTAINERIZABLE = КОНТЕЙНЕРИЗИРУЕМОЕ – Containerizable:- goods (and their packaging) must have the physical properties which ensure that they will survive transport in a container without damage as a result of climatic, mechanical and biotic conditions (depending on the route and duration of transport). These properties include the humidity, temperature and ventilation requirements of the load.

CONTAINERIZABLE CARGO = КОНТЕЙНЕРИЗИРУЕМЫЙ ГРУЗ – Containerizable Cargo is a cargo that will fit into a container and result in an economical shipment. Containerizable Cargo is a cargo that will fit into a container.

CONTAINERIZATION = КОНТЕЙНЕРИЗАЦИЯ – Containerization is a stowage of general or special cargoes in a container for transport in the various modes. Is the act of using containers for the transportation of general commodities. In a narrower sense, it is the placing of the commodities in the container in a secure manner, and the eventual removal of said commodities in an orderly manner at destination.

CONTAINERIZED = КОНТЕЙНЕРИЗИРОВАНЫ – Containerized:- an indication that goods are stowed in a container. / Отметка о том, что товары уложены в контейнере.

CONTAINER LEASE = НАЙМ КОНТЕЙНЕРА (или АРЕНДА КОНТЕЙНЕРА) – Container Lease is the contract by which the owner of containers (lessor) gives the use of containers to a lessee for a specified period of time and for fixed payments. The contract by which the owner of containers (lessor) gives the use of containers to a lessee (carrier) for a specified period of time against fixed payments.

CONTAINER LOAD = КОНТЕЙНЕРНАЯ НАГРУЗКА (или КОНТЕЙНЕРНАЯ ПАРТИЯ) – Container Load is a load sufficient in size to fill a container either by cubic measurement or by weight. Sufficient merchandise to fill a container, whether by bulk or weight.

CONTAINER LOAD PLAN = ПЛАН ЗАГРУЗКИ КОНТЕЙНЕРА – Container Load Plan is a list of cargo loaded in a specific container and possibly their sequence of loading. Container Loan Plan describes how the inside of container is stowed with cargo. Container Load Plan is a document prepared to show all details of cargo loaded in a container, e.g., weight (individual and total), measurement, markings, shipper, the origin of goods and destination, as well as location of the cargo within the container. / последовательность загрузки. , например, .

CONTAINER MANIFEST = КОНТЕЙНЕРНЫЙ МАНИФЕСТ – Container Manifest is a listing of containers with relevant information concerning the movement of those containers. Container Manifest is a document showing contents and loading sequence of a container. / последовательность загрузки контейнера.

CONTAINER MOVES = ПЕРЕНОС КОНТЕЙНЕРОВ – Container Moves:- the number of actions performed by one container crane during a certain period.

CONTAINER NUMBER = МАРКИРОВОЧНЫЙ КОД КОНТЕЙНЕРА (или НОМЕР КОНТЕЙНЕРА) – Container Number is the identification number of a container consisting of prefix and serial number and check digit. Identification number assigned to each container (MAEU 1234567 or APMU 1234567).

CONTAINER ON FLAT CAR = КОНТЕЙНЕР НА ПЛАТФОРМЕ – Rail service whereby a container is loaded onto a flat car without chassis, bogies or wheels. Abbreviation for the Railway Service COFC (Container On Flat Car). Container On Flat Car (COFC) is the form of 'piggyback' where the container is first demounted from the chassis or bogie, prior to being loaded and secured directly onto a railroad flat car. It is a piggyback without wheels. / Обозначение .

CONTAINER PACKING CERTIFICATE = СВИДЕТЕЛЬСТВО О НАПОЛНЕНИИ КОНТЕЙНЕРА (или СЕРТИФИКАТ О НАПОЛНЕНИИ КОНТЕЙНЕРА) – Container Packing Certificate is a certificate indicating correct loading of a dangerous goods container and the observance of the regulations set out in the IMDG Code (International Maritime Dangerous Goods Code). The container packing certificate is issued by the person responsible for packing the container.

CONTAINER PLATFORM = КОНТЕЙНЕР ПЛАТФОРМА – Container Platform is a container floor without sides or end walls which can be loaded by spreader directly and is generally used for Lo-Lo operations.

CONTAINER POOL = КОНТЕЙНЕРНЫЙ ПУЛ (или ОБЪЕДИНЁННЫЙ ПАРК КОНТЕЙНЕРОВ) – Container Pool:- a common supply of containers available to the shippers. Container Pool is an agreement between parties (transporters) that allows the efficient use and an available supply of containers. A common supply of containers available to the shipper as required. Where containers are stored usually inland for container availability to accounts. Carrier location holding empty containers, various points for Shipper's utilisation; an area designated for storage of empty container/equipment.

CONTAINER PREFIX = КОНТЕЙНЕРНАЯ ПРИСТАВКА (или БУКВЕННЫЙ КОД КОНТЕЙНЕРА, или ОПОЗНАВАТЕЛЬНЫЕ ЗНАКИ КОНТЕЙНЕРА) – Container Prefix is a four letter code that forms the first part of a container identification number indicating the owner of a container (APMU…./MAEU….).

CONTAINER PREMIUM = ПРЕМИЯ ЗА КОНТЕЙНЕР – Container Premium is a supplementary fees for the booking and using container. 20" Container Premium in North PRC (Yantai, Lianyugang, Dalian, Qingdao and Tianjin/Xingang). / вознаграждения за бронирование и использование контейнера.

CONTAINER SAFETY CONVENTION = КОНВЕНЦИЯ ПО БЕЗОПАСНЫМ КОНТЕЙНЕРАМ – The International Convention for Safe Containers (CSC):- adoption:- 02 December 1972; entry into force:- 06 September 1977. In the 1960s, there was a rapid increase in the use of freight containers for the consignment of goods by sea and the development of specialized container ships. In 1967, International Maritime Organization (IMO) undertook to study the safety of containerization in marine transport. The container itself

emerged as the most important aspect to be considered. IMO, in co-operation with the Economic Commission for Europe, developed a draft convention and in 1972 the finalized Convention was adopted at a conference jointly convened by the United Nations and IMO. The 1972 Convention for Safe Containers has two goals:- (i) one is to maintain a high level of safety of human life in the transport and handling of containers by providing generally acceptable test procedures and related strength requirements; and (ii) the other is to facilitate the international transport of containers by providing uniform international safety regulations, equally applicable to all modes of surface transport. In this way, proliferation of divergent national safety regulations can be avoided. The requirements of the Convention apply to the great majority of freight containers used internationally, except those designed specially for carriage by air. As it was not intended that all containers or reusable packing boxes should be affected, the scope of the Convention is limited to containers of a prescribed minimum size having corner fittings – devices which permit handling, securing or stacking. Technical Annexes:- the Convention includes two Annexes:- (i) Annex I includes Regulations for the testing, inspection, approval and maintenance of containers; and (ii) Annex II covers structural safety requirements and tests, including details of test procedures. Annex I sets out procedures whereby containers used in international transport must be safety-approved by an Administration of a Contracting State or by an organization acting on its behalf. The Administration or its authorized representative will authorize the manufacturer to affix to approved containers a safety approval plate containing the relevant technical data. The approval, evidenced by the safety approval plate granted by one Contracting State, should be recognized by other Contracting States. This principle of reciprocal acceptance of safety-approved containers is the cornerstone of the Convention; and once approved and plated it is expected that containers will move in international transport with the minimum of safety control formalities. The subsequent maintenance of a safety-approved container is the responsibility of the owner, who is required to have the container periodically examined. The Convention specifically requires that the container be subjected to various tests which represent a combination of safety requirements of both the inland and maritime modes of transport. Flexibility is incorporated in the Convention by the provision of a simplified amendment procedures (tacit amendment procedure) which makes it possible to speedily adapt the test procedures to the requirements of international container traffic. Important amendments include the 1983 amendments, which entered into force in 1984, which extended the interval between re-examination to 30 months and allowed for a choice of container re-examination procedures between the original periodic examination scheme or a new continuous examination programme. The 1991 amendments, which entered infto force in 1993 concerned Annexes I and II of the Convention. They included the addition of a new Chapter V to Annex I concerning regulations for the approval of modified containers. The 1993 amendments, adopted in 1993 (by the IMO Assembly) require ratification by two-thirds of Contracting Parties to enter into force. The amendments concern the information contained on the CSC Approval plate and also amend some of the test loads and testing procedures required by the Convention. Container Safety Convention (CSC) is an international convention for safe containers. In general, any container used for international transport must have a valid safety approval plate or 'CSC Plate'. 2012-March-30:- International Maritime Organization (IMO) has just published the International Convention for Safe Containers (CSC), 2012 Edition, which replaces the previous edition published in 1996. What's it for? The International Convention for Safe Containers (CSC) was finalized in 1972 in response to the rapid increase in the use of freight containers and the development of specialized container ships. It took effect in 1977 and applies to containers of a prescribed minimum size having corner fittings (devices which permit handling, securing or stacking). The convention has two goals:- (i) to provide test procedures and strength requirements that ensure the safety of people transporting and handling containers; and (ii) to provide uniform international safety regulations that apply to transport by vessel, by road, and by rail, in order to harmonize requirements that individual nations impose. Containers which are manufactured to meet CSC requirements have a safety approval plate – often called a 'CSC Plate' – affixed, containing technical data as prescribed by CSC. This plate is recognized by all Contracting States to the CSC. It allows containers to move in international transport without undue delay by providing all the information needed for an inspector to ensure compliance quickly and completely. Amendments to the CSC in 1983 extended the interval between required re-examinations to 30 months (where it remains today) and allowed for a choice of container re-examination procedures between the original periodic examination scheme or a new 'Approved Continuous Examination Program' (ACEP). What has changed? The previous edition of the CSC was published in 1996, following amendments adopted in 1993. IMO resolution MSC.310(88) was adopted in December 2010, and took effect at the start of 2012. The major changes are:- (i) ACEP programs now must be reviewed once every 10 years to ensure they're still viable; (ii) requirements for ACEP programs have been expanded to more clearly describe the validity of, and elements to be included in such programs; (iii) specifications for Safety Approval Plates have been updated to require conspicuous marking for containers with limited stacking or racking capacities; this is to align with the ISO 6346 standard; (iv) a new test has been added for containers being approved for operation with one door removed; and (v) a new annex III is added on control and verification, providing authorized officers with measures to assess the integrity of structurally sensitive components of containers and to decide whether a container is safe to continue in transportation. When is it available? The English version of CSC 2012 is expected to be available in late March 2012, with French and Spanish translations to follow soon after. International Convention for Safe Containers is a convention held in Geneva, Switzerland, on 02 December 1972, which resulted in setting standard safety requirements for containers moving in international transport. These requirements were ratified by the United States on 03 January 1978. Also called CSC.

CONTAINER SECTION = КОНТЕЙНЕРНАЯ СЕКЦИЯ – Container Section is a packed section of a container.

CONTAINER SERIAL NUMBER = СЕРИЙНЫЙ НОМЕР КОНТЕЙНЕРА – Container Serial Number is a seven digit serial number (6 plus 1 Check Digit) which forms the second part of a container identification number. / Семизначный (из семи цифр) серийный номер (6 плюс 1 Контрольное Число), формирующий вторую часть маркировочного кода контейнера.

CONTAINER SERVICE CHARGES = СБОРЫ ЗА ОБСЛУЖИВАНИЕ КОНТЕЙНЕРА – Container Service Charge is the charge assessed by the terminal for the positioning of containers within the terminal/yard. Charges to be paid by cargo interests according to tariff. Container Service Charges (CSCs) are the charges at a destination to be paid by cargo interests as per tariff. Charge considered accessorial and added to base ocean rate. Often covers crane lift off vessel, drayage within terminal and gate fees of port.

CONTAINER SHIP = КОНТЕЙНЕРОВОЗ (или КОНТЕЙНЕРНОЕ СУДНО) – A Container Ship is one which is designed specifically for the carriage of standard freight containers. Various types may be identified including:- (i) cellular containership; (ii) container/bulk carrier; (iii) semi containership; and (iv) ro/ro ship. Standard containers are built to conform to certain international dimensions determined from time-to-time by TC 104 (Technical Committee 104) of the International Standards Organization. Container Ships are ocean vessels that carry goods in large containers, a technique called Containerisation. Container ships are primarily used for the transportation of non-bulk cargo, generally manufactured goods, in truck-size intermodal containers. They can be divided into several categories according to their cargo carrying capacity. Main categories of container ships include Feeder, Feedermax, Panamax, New Panamax, and Ultra Large. At present, approximately 90% of non-bulk cargo around the world is transported by container ships. The modern container ships (such as Maersk E Class) have been designed to have a cargo capacity of up to 15 000 twenty-foot equivalent units (TEU). They play a dominant role in international trade. Vessel built to accommodate ocean containers. Container Ship is a ship constructed in such a way that she can easily stack containers near and on top of each other as well as on deck. A vessel designed to carry standard intermodal containers enabling efficient loading, unloading, and transport to and from the vessel. Oceangoing merchant

ship designed to transport a unit load of standard-sized containers 8 feet square and 20 or 40 feet long. The hull is divided into cells that are easily accessible through large hatches, and more containers can be loaded on deck atop the closed hatches. Loading and unloading can proceed simultaneously using giant traveling cranes at special berths. Container ships usually carry in the range of 25 000 to 50 000 deadweight tons. Whereas a general-cargo ship may spend as much as 70 percent of its life in port loading and discharging cargo, a container ship can be turned around in 36 hours or less, spending as little as 20 percent of its time in port. This ship type is the result of American design innovation. Specialized types of container ships are the LASH and Sea-Bee which carry floating containers (or lighters), and RoRo ships, which may carry containers on truck trailers. Also known as Container Vessel. / Инновация. Контейнерное Судно или Контейнеровоз, судно для перевозки грузов в контейнерах. Грузовые помещения контейнерных судов приспособлены для размещения контейнеров и их быстрой погрузки и выгрузки через большие палубные люки или отверстия в бортах. Контейнерные суда оборудуются подъёмными кранами или обслуживаются береговыми кранами. Интенсивное строительство контейнеровозов началось после 1960 в связи с развитием контейнерных перевозок различными видами транспорта и международной стандартизацией размеров контейнеров. Применение контейнеров существенно сокращает транспортные расходы, время стоянки судов под грузовыми операциями, обеспечивает сохранность грузов и ускорение их доставки. Грузоподъёмность современных морских контейнерных судов 600–40 000 тонн (т), скорость хода 22–65 километров в час (км/ч) (или 12–35 узлов). Наиболее распространены контейнерные суда с вертикальным (через грузовые люки) способом погрузки. Контейнеры размещают как в трюмах, так и на верхней палубе (в 1–4 яруса). Контейнерные суда обычно работают на постоянных линиях и обслуживаются у специализированных контейнерных причалов береговыми подъёмными кранами.

CONTAINER SIZE CODE = КОД РАЗМЕРА КОНТЕЙНЕРА – Container Size Code is an indication of 2 digits of the nominal length and nominal height. See also Size/Type ISO6346.

CONTAINER SIZE/TYPE = ТИПОРАЗМЕР КОНТЕЙНЕРА – Container Size/Type:- description of the size and type of a freight container or similar unit load device as specified in ISO6346.

CONTAINER STACK = КОНТЕЙНЕРНЫЙ ШТАБЕЛЬ – Container Stack:- two or more containers, one placed above the other forming a vertical column.

CONTAINER STUFFING LIST = ПЕРЕЧЕНЬ НАПОЛНЕНИЯ КОНТЕЙНЕРА (или СПИСОК СОДЕРЖИМОГО КОНТЕЙНЕРА) – Container Stuffing List (CSL) is a list showing how cargo is stowed in each container.

CONTAINER SWEAT = ИСПАРИНА КОНТЕЙНЕРА (или ВЫПОТЕВАНИЕ КОНТЕЙНЕРА, или ОТПОТЕВАНИЕ КОНТЕЙНЕРА) – Container Sweat is a condensation which forms on the surfaces of the container.

CONTAINER TEMPLATE = КОНТЕЙНЕРНЫЙ ТЕМПЛЕТ (или КОНТЕЙНЕРНЫЙ ШАБЛОН) – Generally, Container Template is a moveable frame that maps the size and shape of the inside of a container. If the exact dimensions of a cargo or its packing are unknown, the template can be pushed over the load in order to make sure that the correct size of container has been selected. / темплет или шаблон (template).

CONTAINER TERMINAL = КОНТЕЙНЕРНЫЙ ТЕРМИНАЛ – A Container Terminal is a facility where cargo containers are transhipped between different transport vehicles, for onward transportation. The transhipment may be between ships and land vehicles, for example trains or trucks, in which case the terminal is described as a maritime container terminal. Alternatively the transhipment may be between land vehicles, typically between train and truck, in which case the terminal is described as an inland container terminal. Maritime container terminals tend to be part of a larger port, and the biggest maritime container terminals can be found situated around major harbours. Inland container terminals tend to located in or near major cities, with good rail connections to maritime container terminals. Both maritime and inland container terminals usually also provide storage facilities for both loaded and empty containers. Loaded containers are stored for relatively short periods, whilst waiting for onward transportation, whilst unloaded containers may be stored for longer periods awaiting their next use. Containers are normally stacked for storage, and the resulting stores are known as Container Stacks. Location where loaded and/or empty containers are loaded or discharged from a vessel or from a chassis/wagon. An area designated for the stowage of cargoes in container; usually accessible by truck, railroad and marine transportation. Here containers are picked up, dropped off, maintained and housed. Facility designed to handle containers, with special-purpose equipment such as container cranes, straddle carriers and container stacking areas. / Место, в котором гружёные и/или порожние контейнеры погружаются или выгружаются из судна или шасси/вагона.

CONTAINER TYPE CODE = КОД ТИПА КОНТЕЙНЕРА – Container Type Code is two digits, the first of which indicates the category and the second of which indicates certain physical characteristics or other attributes. / Две цифры, первая из которых указывает на категорию, а вторая – на определённые физические характеристики или иные атрибуты.

CONTAINER VESSEL = КОНТЕЙНЕРНОЕ СУДНО (или КОНТЕЙНЕРОВОЗ) – A cargo ship designed to hold containerized cargoes. Container Vessel is an ocean going vessel designed specifically to handle the loading, carriage and removal of standard freight containers. Also known as Container Ship. / Контейнерное Судно или Контейнеровоз, судно для перевозки грузов в контейнерах. Интенсивное строительство контейнеровозов началось после 1960 в связи с развитием контейнерных перевозок различными видами транспорта и международной стандартизацией размеров контейнеров. Применение контейнеров существенно сокращает транспортные расходы, время стоянки судов под грузовыми операциями, обеспечивает сохранность грузов и ускорение их доставки. Грузоподъёмность современных морских контейнерных судов 600–40 000 тонн (т), скорость хода 22–65 километров в час (км/ч) (или 12–35 узлов). Наиболее распространены контейнерные суда с вертикальным (через грузовые люки) способом погрузки. Контейнеры размещают в трюмах и на верхней палубе (в 1–4 яруса). Контейнерные суда обычно работают на постоянных линиях и обслуживаются у специализированных контейнерных причалов береговыми подъёмными кранами.

CONTAINER YARD = КОНТЕЙНЕРНЫЙ ДВОР (или КОНТЕЙНЕРНОЕ ОТДЕЛЕНИЕ, или КОНТЕЙНЕРНАЯ ПЛОЩАДКА) – CY (Container Yard) Container Terminal:- (1) Place of storage containers before / after their further shipment. (2) Conditions of carriage for departure/arrival time – the cost of transportation includes services for sending from/to CY (freight, loading/unloading from the vessel, placing on the CY, does not include underwriting services / shipments to/from CY). Area adjacent to the vessel berth where containers are delivered to and received from the vessel or inland carrier. Container Yard (CY) means a location where containers may be parked, picked-up or delivered full or empty. A container yard may further be a place of loading/stuffing by a shipper or unloading/de-vanning by a receiver of cargo, and/or where water carrier accepts custody and control of cargo at origin. A facility at which full and empty containers are received from or delivered to the shippers by or on behalf of the carrier. A materials-handling/storage facility used for completely unitized loads in containers and/or empty containers. Commonly referred to as CY.

CONTAINMENT = СДЕРЖИВАНИЕ – Containment is an application of phytosanitary measures in and around an infested area to prevent spread of a pest. / Сдерживание – применение фитосанитарных мер в и вокруг инфицированного ареала для предотвращение распространения вредителя.

CONTAINMENT FACILITY = МЕСТО СДЕРЖИВАНИЯ – Containment Facility is a laboratory, greenhouse or other type of facility designed to effectively prevent the dissemination of viable transgenic plant material into the environment. Regardless of final destination, imported material may be required to initially enter a contained facility. / , парник (greenhouse) или .

CONTAMINANT = ЗАГРЯЗНИТЕЛЬ (или ЗАГРЯЗНЯЮЩЕЕ ВЕЩЕСТВО, или ЗАГРЯЗНЯЮЩАЯ ПРИМЕСЬ) – Contaminant is any foreign or unwanted substance that can have a negative effect on system operation, life or reliability.

CONTAMINANT CAPACITY = ГРЯЗЕЁМКОСТЬ (или ЁМКОСТЬ ЗАГРЯЗНИТЕЛЯ) – (1) Contaminant Capacity (Dirt, ACFTD):- the weight of a specified artificial contaminant that must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.

(2) Contaminant Capacity:- the weight of a specified artificial contaminant which must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.

CONTAMINANT FAILURE = ПОВРЕЖДЕНИЕ ИЗ-ЗА ЗАГРЯЗНИТЕЛЯ (или ОТКАЗ ИЗ-ЗА ЗАГРЯЗНИТЕЛЯ, или РАЗРУШЕНИЕ ИЗ-ЗА ЗАГРЯЗНИТЕЛЯ) – Contaminant Failure (in oil analysis) is any loss of performance due to the presence of contamination. Two basic types of contamination failure are:- (i) Perceptible – gradual loss of efficiency or performance; and (ii) Catastrophic – dramatic, unexpected failure.

CONTAMINANT LOCK = ПРОБКА ИЗ ЗАГРЯЗНИТЕЛЯ (или ЗАГРЯЗНИТЕЛЬНАЯ ПРОБКА) – Contaminant Lock:- a particle or fiber-induced jam caused by solid contaminants.

CONTAMINATED GRAIN = СОРНОЕ ЗЕРНО – A term Contaminated Grain means containing any substance in sufficient quantity that the grain is unfit for consumption by persons or animals.

CONTAMINATING PEST = ЗАГРЯЗНЯЮЩИЙ ВРЕДИТЕЛЬ – Contaminating Pest is a pest that is carried by a commodity and, in the case of plants and plant products, does not infest those commodities.

CONTAMINATION = КОНТАМИНАЦИЯ (или ЗАГРЯЗНЕНИЕ) – Contamination is a presence in a commodity, storage place, conveyance or container, of pests or other regulated articles, not constituting an infestation. See also Infestation. Contamination is a damage to goods caused by dust, dirt or staining substances. / Под Контаминацией, от Латинского слова Contaminatio, означающее Загрязнение В Результате Соприкосновения или Смешение, понимается:- (i) взаимодействие близких по значению или по звучанию языковых единиц (чаще всего слов или словосочетаний), приводящее к возникновению, не всегда закономерному, новых единиц или к развитию у одной из исходных единиц нового значения; например, контаминация словосочетаний ‘играть роль’, ‘иметь значение’ > (неправильное) ‘играть значение’. (ii) Текстологический приём, соединение текстов разных редакций одного произведения, например, некоторых произведений древне-Русской литературы.

CONTAMINATION = КОНТАМИНАЦИЯ (или ЗАСОРЕНИЕ, или ЗАСОРЁННОСТЬ) – Contamination:- this is due to mixing of different shades of fibers, foreign materials etc. during spinning stage causes visual objection in fabric. The causes of Contamination depends on:- (i) overall cleanliness of department; (ii) cleaning of machine after every doff and lot change; (iii) suction of drafting zones of gill boxes and rovings; (iv) cleaning of scrapper and scrapper plate cleaning after every lot change of doff; (v) use of curtains for partition in Ring Frame and Two for One (TFO) to separate light and dark shade during running of m/cs; (vi) overhead cleaners of ply, winding, mach-coner and ring frame; (vii) not to run contrast shades side by side of M/c. of ring frame and TFO; (viii) material should be covered with polythene sheet to avoid fly and fluff accumulation; (ix) do not use compressed air for cleaning m/cs; (x) use only vacuum cleaner; and (xi) air conditioning should not be common for dyed spinning and white spinning sections because of common ducts for return and supply air. Spinning defect. Contamination:- colored fibers with the warp or weft fibers. / Порок или дефект прядения. Под Контаминацией, от Латинского слова Contaminatio, означающее Загрязнение В Результате Соприкосновения или Смешение, понимается:- . Под Засорённостью понимается распространённый порок в виде заработанных различных примесей, резко отличающихся от основной массы полотна. Примечание:- в зависимости от вида текстильных полотен различаются засорённость кострой, репьём и растительными примесями коробочек, мёртвыми или инородными волокнами.

CONTAMINATION CONTROL = КОНТРОЛЬ КОНТАМИНАЦИИ (или БОРЬБА С ЗАГРЯЗНЕНИЕМ) – Contamination Control:- a broad subject which applies to all types of material systems (including both biological and engineering). It is concerned with planning, organizing, managing, and implementing all activities required to determine, achieve and maintain a specified contamination level.

CONTAMINATION OF FLUFF = ЗАСОРЁННОСТЬ ОПУШЁНКИ – Contamination Of Fluff:- different fibers or foreign materials get mixed during spinning, winding or in weaving preparation stage, causing visual objection in fabric. The causes are improper cleanliness, not properly cleaning the machines after each doff and lot changes, improper suction of drafting zones of gill boxes and roving, improper cleaning of scrapper and scrapper plate after every lot change of doff, not using of curtains for partition of machines running on different colors, overhead cleaners of ply winding and ring frames blowing dust on running spindles or drums, material not covered to avoid fly and fluff accumulation, use of compressed air for cleaning machines while in working or while adjacent machine is working and use of common return air ducts and running different colored fibers in the shed.

CONTANGO = ВОЗРАСТАЮЩАЯ ПОСЛЕДОВАТЕЛЬНОСТЬ (или КОНТЭНГО) – (1) Contango is a futures market situation in which prices in the succeeding delivery months are progressively higher than in the nearest delivery month. Sometimes referred to as a Carrying Charge Market. Also known as Forwardation. The opposite of Backwardation. Contango is the market situation where the price for future (forward) delivery is greater than the spot price. Contango is a condition when the front month prices are lower than the back month prices. This is normal for most markets because back months include carrying costs (interest, storage, etc). Contango is a market situation when a nearby price is lower than a further forward price. Contango is a situation where the futures price of a commodity is above the expected future spot price. Contango refers to a situation where the future spot price is below the current price, and people are willing to pay more for a commodity at some point in the future than the actual expected price of the commodity. This may be due to people’s desire to pay a premium to have the commodity in the future rather than paying the costs of storage and carry costs of buying the commodity today. When a market is ‘in contango’ when the delivery price of a particular futures contract has to converge downward to meet the futures price. If prices did not converge, it would set up an opportunity for investors to profit from arbitrage. Contango situations can be costly to investors holding net long positions since futures prices are falling. For example, assume an investor goes long a futures contract today at USD100. The contract is due in one year. If the expected future spot price is USD70, the market is in contango, and the futures price will have to fall (unless the future spot price changes) to converge with the expected future spot price. The opposite of contango is known as normal Backwardation. A market is ‘in backwardation’ when the

futures price is below the expected future spot price for a particular commodity. This is favorable for investors who have long positions since they want the futures price to rise. Normal pricing situation in commodities trading where the spot price is lower than the forward price. Contango is a situation where the futures price (or forward price) of a commodity is higher than the expected spot, or current price. In a contango situation, hedgers (commodity producers and commodity users) or arbitrageurs/speculators (non-commercial investors) are willing to pay more now for a commodity at some point in the future than the actual expected price of the commodity at that time. This may be due to a willingness to pay a premium to ensure deliverability of the commodity in the future, rather than paying the costs of storage and carry costs of buying the commodity today. A market 'in contango' may be due to expected changes in future supply and demand. For example, the expectation that the United States will eventually export natural gas via LNG (liquefied natural gas) facilities has contributed to a contango forward curve for natural gas. The opposite market condition to contango is known as Backwardation. A market is 'in backwardation' when the futures price is below the expected future spot price for a particular commodity. This may occur during periods of extreme weather, when short-term prices can rise dramatically, and long-term prices are relatively unchanged. Why does this matter? The shape of the forward curve may impact a strategic decision to lock in prices for short-term versus long-term. / Возрастающая Последовательность или Контэнго – ситуация в которой цены в последующие месяцы поставки поступательно выше нежели в ближайший месяц поставки. Иногда рассматривается как Рынок Со Сбором За Перевалку И Хранение (Carrying Charge Market). Известен также как Прогрессивность (Forwardation). В противовес Убывающей Последовательности или Бэкводэйшэн (Backwardation).

(2) Contango, also referred as Normal Carry Charge Market, is the situation where the price of a commodity for future delivery is higher than the spot price, or a far future delivery price higher than a nearer future delivery price, due to the presence of costs to carry. This situation takes place in markets under normal conditions. The opposite market condition to contango is known as Backwardation. The market is said to be in contango when the price of near delivery months of futures or physicals contracts trades at a discount to more distant months.

CONTENT PROVIDER = ПОСТАВЩИК СОДЕРЖИМОГО – The Content Provider provides goods and services to the user by hosting a content server.

CONTIGUOUS = СМЕЖНОЕ (или СОПРИКАСАЮЩЕЕСЯ, или ПРИЛЕГАЮЩЕЕ, или СОСЕДНЕЕ) – Contiguous:- touching or near each other.

CONTIGUOUS DROUGHT = ХХ ЗАСУХА (или ХХ ЗАСУШЛИВОСТЬ) – Contiguous Drought is a drought resulting from irregular precipitation patterns which cause a moisture deficit during the rainy season. / Под Засухой понимается продолжительный и значительный недостаток осадков, чаще при повышенной температуре и пониженной влажности воздуха. Вызывает снижение запасов влаги в почве и, как следствие, ухудшение роста, а иногда и гибель растений. Меры борьбы:- агротехнические (специальная обработка почвы) и мелиоративные (орошение) мероприятия, полезащитное лесоразведение.

CONTINENTALS = SECURITIES OF THE CONTINENTAL EUROPEAN COMPANIES

CONTINGENCY = УСЛОВНЫЕ СОБЫТИЯ (или НЕПРЕДВИДЕННОЕ, или НЕПРЕДСКАЗУЕМОЕ) – Contingency is a condition or situation, which exists at balance date, the ultimate outcome of which, gain or loss, is uncertain and will be confirmed only on the occurrence or non-occurrence of one or more uncertain future events which are not wholly within the control of the entity after the date of approval of the financial statements. A contingency may or may not give rise to an asset or a liability. The treatment of a contingent asset or liability will vary from inclusion as an item within the financial statements, if there is a high probability of subsequent events confirming the existence of the asset or liability, to inclusion by way of a note to the financial statements where the probability confirmation is remote. / Условие или обстоятельство, . строка баланса (item).

CONTINGENCY ORDER = УСЛОВНОЕ РАСПОРЯЖЕНИЕ (или РАСПОРЯЖЕНИЕ НА НЕПРЕДВИДЕННОЕ) – Contingency Order is an order which becomes effective only upon the fulfillment of some condition in the marketplace.

CONTINGENCY PLAN = ПЛАН НА СЛУЧАЙ ОБНАРУЖЕНИЯ – Contingency Plan is a program for control methods and strategies applied in the event that a target pest is detected.

CONTINGENCY PROCEDURES = ПРОЦЕДУРЫ ДЛЯ НЕПРЕДВИДЕННЫХ ОБСТОЯТЕЛЬСТВ (или НЕПРЕДВИДЕННЫЕ ПРОЦЕДУРЫ) – Contingency Procedures are the procedures to ensure that a minimum service is provided in the event of an operational failure, e.g., in the event of the failure of a secondary site. Contingency Procedure is an alternative to the normal procedure; triggered if an unusual but anticipated situation arises.

CONTINGENCY RESERVES = РЕЗЕРВЫ НА НЕПРЕДВИДЕННЫЕ РАСХОДЫ – Contingency Reserves are funds that a company allocates to pay for possible undesired outcomes. Some companies simply allot a percentage of each project budget for contingency reserves. Others use the expected value method, which calculates the expected cost of a variety of contingencies. Rather than setting aside funds to pay for all of them in full, the company allocates reserves according to each one's probability of occurring. This method is similar to how insurance companies calculate premiums. Step 1:- list each contingency that could increase your expenses. For example, suppose that these contingencies include having to add extra personnel to the project, outsourcing to outside contractors, failing to meet your soft deadline and experiencing equipment malfunction. Step 2:- estimate each of these contingency's costs. For example, suppose that the four contingencies would cost you, respectively, USD32 000, USD48 000, USD20 000 and USD12 000. Step 3:- estimate the probabilities of each of the contingencies occurring. For example, suppose that the contingencies have, respectively, a 5 percent, 5 percent, 10 percent and 2 percent chance of occurring. Step 4:- multiply each contingency's cost by its probability. Continuing the example, 5 percent of USD32 000 is USD1 600, 5 percent of USD48 000 is USD2 400, 10 percent of USD20 000 is USD2 000 and 2 percent of USD12 000 is USD240. Step 5:- add these values together. The sum of the values in this example is USD6 240. You would need USD6 240 in contingency reserves. Tips & Warnings:- a comprehensive risk management plan must take many contingencies into account, yet you may exclude contingencies with very low probabilities to make your calculations more manageable. Contingency Reserves are the provisions for doubtful debts. / Средства, выделяемые под сомнительные долги.

CONTINGENT COMMISSIONS = УСЛОВНЫЕ КОМИССИИ – In reinsurance, Contingent Commissions (or Profit Commission) is an allowance payable to the ceding company in addition to the normal ceding commission allowance. It is a pre-determined percentage of the reinsurer's net profits after a charge for the reinsurer's overhead, derived from the subject treaty.

CONTINGENT DEFERRED SALES CHARGE = УСЛОВНЫЙ СБОР ЗА ОТСРОЧЕННЫЕ ПРОДАЖИ – Contingent Deferred Sales Charge (CDSC) is a fee (sales charge or load) that mutual fund investors pay when selling Class-B fund shares within a specified number of years of the date on which they were originally purchased. Also known as a Back-End Load or Sales Charge. For mutual funds with share classes that determine when investors pay the fund's load or sales charge, Class-B shares carry a contingent deferred sales charge during a five- to 10-year holding period calculated from the time of the initial investment. The fee amounts to a percentage of the value of the shares being sold. It is highest in the first year of the specified period and decreases annually until the

period ends, at which time it drops to zero. As a mutual fund investor, if you were to buy and hold Class-B fund shares until the end of the specified period, you could avoid paying this type of fund's sales charge, thereby enhancing your investment return. Unfortunately, fund research indicates that mutual fund investors are holding their funds, on average, for less than five years, which often triggers the application of a back-end sales charge in a Class-B share fund investment. Contingent Deferred Sales Charge is a form of commission that is a back-end load on mutual funds that decline over time. For instance, if you sell mutual fund shares that have a Contingent Deferred Sales Charge (CDSC) after one year, you may owe a 4% charge, but if you hold for three years, the charge may decline to 2%.

CONTINGENT LIABILITY = УСЛОВНОЕ ОБЯЗАТЕЛЬСТВО (или УСЛОВНАЯ ОТВЕТСТВЕННОСТЬ) – Contingent Liability is a potential obligation that may be incurred depending on the outcome of a future event. A contingent liability is one where the outcome of an existing situation is uncertain, and this uncertainty will be resolved by a future event. A contingent liability is recorded in the books of accounts only if the contingency is probable and the amount of the liability can be estimated. Outstanding lawsuits and product warranties are common examples of contingent liabilities. For example, a company may be facing a lawsuit from a rival firm for patent infringement. If the company's legal department thinks that the rival firm has a strong case, and the company estimates that the damages payable if the rival firm wins the case are USD2 million, it would book a contingent liability of this amount on its balance sheet. If, on the other hand, the company's legal department is of the opinion that the lawsuit is frivolous and very unlikely to be won by the rival company, no contingent liability would be necessary. A potential expense, one that may or may not eventuate, depending how events turn out, but which should be provided for in properly kept accounts or budgets, eg damages from a pending lawsuit. A Contingent Liability is a potential liability … it depends on a future event occurring or not occurring. For example, if a parent guarantees a daughter's first car loan, the parent has a contingent liability. If the daughter makes her car payments and pays off the loan, the parent will have no liability. If the daughter fails to make the payments, the parent will have a liability. If a company is sued by a former employee for USD500 000 for age discrimination, the company has a contingent liability. If the company is found guilty, it will have a liability. However, if the company is not found guilty, the company will not have an actual liability. In accounting, a contingent liability and the related contingent loss are recorded with a journal entry only if the contingency is both probable and the amount can be estimated. If a contingent liability is only possible (not probable), or if the amount cannot be estimated, a journal entry is not required. However, a disclosure is required. When a contingent liability is remote (such as a nuisance suit), then neither a journal nor a disclosure is required. A product warranty is often cited as a contingent liability that is both probable and can be estimated. Additional examples and a further explanation are presented in FASB's Statement of Financial Accounting Standards No. 5, Accounting for Contingencies. Contingent Liability is a liability which will come into definite existence only on the occurrence of a specific event, e.g., bank liability arising from acceptance, guarantees and letters of credit. Contingent liabilities are not included in the balance sheet of a bank but have to be reported under supplementary notes. / , например, .

CONTINGENT ORDER = УСЛОВНОЕ РАСПОРЯЖЕНИЕ – Contingent Order is an expression used in securities trading to denote that the proceeds from the sale of certain securities must be used for the purchase of certain other securities. Price limits at which the exchange transaction must be carried out may be prescribed for the sale or purchase.

CONTINGENT PREMIUM OPTION = ОПЦИОН С УСЛОВНОЙ ПРЕМИЕЙ – Contingent Premium Option is an option for which the purchaser pays no premium unless the option is exercised. As a rule of thumb, the premium eventually paid is equal to the premium payable on a normal option divided by the option delta, hence the price increases dramatically for out-of-the-money options. Contingent options can usually be broken down into one or more binary options plus a conventional option. For example, a purchaser could synthesize a contingent call by buying a European-style call and selling enough European binary options with the same strike to pay for the premium on the call. If the options are not in-the-money at expiry, both the total premium paid and the total pay-out are zero. If they are in-the-money, the pay-out on the binary options is simply subtracted from the pay-out on the call. Further flexibility can be obtained by setting the strike for the digitals further out-of-the-money than the call. / Опцион С Условной Премией – опцион, за который его приобретатель не выплачивает премию, если только не исполняет этот приобретённый ранее опцион. .

CONTINUATION = ПРОДОЛЖЕНИЕ – In the US patent law, Continuation is a second application for the same invention claimed in a prior nonprovisional application and filed before the first application becomes abandoned or patented.

CONTINUATION CHARTS = НЕПРЕРЫВНЫЕ ГРАФИКИ (или ГРАФИКИ ПРОДОЛЖЕНИЯ) – A Continuation Chart is a chart with an artificial time series, built from the daily time series for active and expired contracts. A continuation chart takes portions of each contract going back in time, and displays those portions as one chart (one time series). It allows you to define what portions of the historical data will be used, and also allows parameters to be applied to the history. A continuation chart relies on both current and historical data (a history of expired contracts). Therefore, if a continuation chart is built for a symbol with no historical data, the chart will look exactly like the front month. A continuation chart is created by choosing the Futures Continuation tab in the Symbol Selection dialog box, choosing the symbol root, and then defining the parameters to apply to the data. With a continuation chart, you may:- (i) identify the number of contracts forward to track. If the front month of crude oil is April, using a '3' designation will track the June contract as the current contract instead. If the front month for US Treasury Bonds is September 2003, using a '3' designation will track the March 2004 contract as the current contract; (ii) explicitly use only a given month each year, e.g., a continuation chart based only on December contracts; (iii) define when the contract will roll (a number of days before the expiration date, or a number of days before the month of expiration); (iv) define whether holidays should be included in determining when the contract should roll; (v) back adjust data at roll, using the difference between the closing price on the current contract and the closing price on the next month out; and (vi) explicitly define the contract months to include in the historical data display (allows you to filter out months where trading activity is very low on certain contracts). Continuation Charts contain data for more than one contract. They follow the current lead contract through expiration, then follow the new lead contract. / Графики Продолжения содержат данные более, чем по одному контракту. Сначала они используют показатели для текущего контракта до прекращения его признания, а затем для последующего за ним нового действующего контракта.

CONTINUATION CLAUSE = ОГОВОРКА О ПРОДОЛЖЕНИИ – Continuation Clause is a clause providing for the continuation of a hull time policy beyond the natural expiry date. The clause can be used at the option of a hull assured, whose ship is on a voyage at the time the policy is due to expire, but who does not wish to renew the hull policy for a further period of time. The assured, by giving notice to the underwriters before the expiry date of the policy, can continue cover until the ship arrives at her planned destination port. An additional premium is payable on a pro rata monthly basis for the time the policy is continued.

CONTINUATION GAP = ОТРЫВ ПРОДОЛЖЕНИЯ (или РАСХОЖДЕНИЕ ПРОДОЛЖЕНИЯ, или РАЗРЫВ ПРОДОЛЖЕНИЯ, или ПРОМЕЖУТОК ПРОДОЛЖЕНИЯ, или ЗАЗОР ПРОДОЛЖЕНИЯ) – In visual analysis, a Continuation Gap forms in the middle of a move and in the same direction as the current move. These gaps signal a continuation of the preceding trend and can mark good entry points. After a short or intermediate advance, a continuation up gap is usually considered bullish and signals a renewal of the uptrend. After a short or intermediate decline, a continuation down gap is usually considered bearish and signals a renewal of the

downtrend. Also known as Measuring Gap, or Runaway Gap. See also Breakaway Gap, Common Gap, Down Gap, Exhaustion Gap, Gap, Runaway Gap, and Up Gap. Continuation Gaps occur during the ongoing trend, and signal a rush of buyers or sellers who share a common belief in the underlying stock's current direction. After identifying a continuation gap, traders should enter in the direction of the current trend or consider adding to existing positions. A stop loss should be placed at the low (in the case of a long trade) of the day of the gap. A trailing stop loss should be maintained as price moves in the trader's favor. There's a good example of the continuation gap in the SPDR Financial exchange-traded fund (XLF). As seen in 'Gap and Go' (right – a continuation gap re-confirmed this extended uptrend; this was a signal to either get onboard the move or add to an existing position), XLF began its uptrend move with a breakaway gap in January 2013. It then formed a continuation gap on March 05, when the fund opened at 17.90 vs. the previous trading day's close of 17.79. Because the gap occurred in the direction of the existing trend, it qualified as a continuation gap. As such, a trader should have gone long XLF with a stop loss at 17.90 and a profit target of 4–5%. In this case, tight risk control would be prudent because the signal comes in the wake of a significant move higher.

CONTINUATION–IN–PART = ПРОДОЛЖЕНИЕ В ЧАСТИ – In the US patent law, Continuation-In-Part (CIP) is an application filed during the lifetime of an earlier nonprovisional application, repeating some substantial portion or all of the earlier nonprovisional application and adding matter not disclosed in the earlier nonprovisional application.

CONTINUATION PATTERN = МОДЕЛЬ ПРОДОЛЖЕНИЯ – In visual analysis, Continuation Pattern is a type of chart pattern that occurs in the middle of an existing trend. The previous trend resumes when the pattern is complete. Examples include the Rectangle and Pennant continuation patterns. Continuation Pattern:- a consolidation in the market after a primary trend move. The expected market direction after a breakout of the pattern is back in the original trend direction. Sometimes called Drift Patterns. / Модель Продолжения:- в техническом анализе биржевых рынков, это различные типы фаз консолидации цен, которые происходят внутри продолжительных тенденций. Как вытекает из самого названия, предполагается, что модель продолжения завершится движением цен в том же направлении, которое предшествовало её формированию. Среди моделей продолжения различают Треугольники (Triangles), Вымпелы (Pennants) и Флаги (Flags).

CONTINUED PROSECUTION APPLICATION = ЗАЯВКА НА СУДЕБНОЕ ПРЕСЛЕДОВАНИЕ (или ПРОДОЛЖАЕМОЕ ДЕЛОПРОИЗВОДСТВО ПО ЗАЯВКЕ) – Continued Prosecution Application (CPA) is a continuation or divisional application filed in a design application under 37 CFR 1.53(d) (CFR:- short for the US Code of Federal Regulations). Note:- CPAs may no longer be filed in utility and plant patent applications, effective 14 July 2003.

CONTINUING APPLICATION = ПРОДОЛЖАЮЩАЯ ЗАЯВКА (или ЗАЯВКА О ПРОДОЛЖЕНИИ, или ХОДАТАЙСТВО О ПРОДОЛЖЕНИИ ЭКСПЕРТИЗЫ) – Continuing Application is a continuation, divisional, or continuation-in-part patent application. / Продолжающая Заявка – вторая заявка на то же самое изобретение до отказа от первой заявки, поданная тем же заявителем без внесения новых признаков с новой формулой изобретения.

CONTINUOUS AND SEMI–CONTINUOUS DYEING = НЕПРЕРЫВНОЕ И ПОЛУНЕПРЕРЫВНОЕ КРАШЕНИЕ – Continuous and Semi-Continuous Dyeing:- in continuous and semi-continuous dyeing processes, the dye liquor is applied to the textile either by impregnation (by means of foulards) or by using other application systems. Most commonly, textiles are fed continuously in open width through a dip trough filled with dye liquor. The substrate absorbs an amount of dye solution before leaving the dip trough through rollers that control the pick-up of the dye. Surplus stripped dye flows back into the dye bath. In the carpet industry (and for open goods that must pick-up and retain large volumes of liquor), thickening agents are added to the pad liquor to prevent dye migration. Moreover, special application systems are also encountered, where the dyestuff is poured, jet-sprayed, injected or applied in the form of foamed liquor. Dye fixation is usually achieved in a subsequent stage using chemicals or heat (steam or dry heat). The final operation is washing, which is usually carried out in washing machinery at the end of the same line. The only difference between continuous and semi-continuous processes is the fact that in semi-continuous dyeing the application of the dye is performed continuously by padding, while fixation and washing are discontinuous. In general, dyes with low affinity are favoured in continuous dyeing to prevent tailing (attributable to undesirable exhaustion of the padding solution) and to make washing-off of the unfixed dye easier. In continuous and semi-continuous processes the liquor ratio is not of practical importance and it is not used as a parameter. In these processes the factor to be taken into account is the wet pick-up % (grams of liquor picked up by 100 grams of substrate) and the concentration of the dye. / Непрерывное Крашение (Continuous Dyeing) и Полунепрерывное Крашение (Semi-Continuous Dyeing). плюсовочный раствор (padding solution). Агрегатный способ крашения:- крашение, сушка и отделка.

CONTINUOUS CHAMFER = XX (или СПЛОШНОЙ СКОС) – Continuous Chamfer is a chamfer along the complete length of the board. See also Chamfer, and Pallet. / Сплошной Скос:- фаска по всей длине доски настила. Смотрите также Поддон (Pallet).

CONTINUOUS CHART = НЕПРЕРЫВНЫЙ ГРАФИК – Continuous Chart:- in visual analysis, a series of linked futures contract charts that have specifically adjusted out the roll-gap in order to create a long-term chart that is more representative of the actual price swings in the market that were tradable.

CONTINUOUS CURE = ПОТОЧНОЕ ВЫДЕРЖИВАНИЕ (или НЕПРЕРЫВНАЯ ОЧЕРЕДЬ, или НЕПРЕРЫВНАЯ ВЫДЕРЖКА) – Continuous Cure is a method of curing durable press garments which uses a moving conveyor system to carry garments into and out of the curing oven. Also known as Continuous Oven.

CONTINUOUS DATA = НЕПРЕРЫВНЫЕ ДАННЫЕ – Continuous Data are observations made by measuring some attributes of subjects so that any value in a certain range is possible (c.f. discrete data).

CONTINUOUS FILAMENT = НЕПРЕРЫВНАЯ ЭЛЕМЕНТАРНАЯ НИТЬ – Continuous Filament is a long continuous, unbroken strand of fiber extruded from a spinneret in the form of a monofilament. Most manufactured fibers such as nylon, polyester, rayon, and acetate are made in continuous filament form. See also Filament. Filament is a fiber of an indefinite or extreme length such as found naturally in silk. Manufactured fibers are extruded into filaments that are converted into filament yarn, staple, or tow. / Найлан (Nylon). филаментная (комплексная) пряжа (filament yarn). мононить (monofilament).

CONTINUOUS FILAMENT YARN = ПРЯЖА ИЗ НЕПРЕРЫВНЫХ ЭЛЕМЕНТАРНЫХ НИТЕЙ – Continuous Filament Yarn is the yarn has slubs formed at randomly spaced intervals along the length of the yarn. Each filament of the yarn has a main body section extending along the length of the filament and at least one wing member extending from the main body section along the length of the filament. The wing member rises and falls in wave-like manner along the main body section only within the area of the aforementioned randomly spaced intervals. The length of the wave-like wing member within the area of the aforementioned randomly spaced interval varies from about 0.635 centimeter (0.25 inch) to about 15.2 centimeters (6 inches). The intervals between the slubs may vary in a random manner with the mean interval being about 30.5 centimeters (12 inches) to about 91.4 centimeters (36 inches). The standard deviation of the interval distance may vary from about 1/4 the mean interval distance to about 1-1/4 times the mean interval distance. See also Filament Yarn. Continuous Filament Yarn of textile utility has slubs formed at randomly spaced intervals along the length of

the yarn, with each filament having a main body section extending along the length of the filament and at least one wing member extending from the main body section along such length, the wing member of the filament rising and falling in wave-like manner along the main body section only within the area of the aforementioned randomly spaced intervals. Unlike staple fibers, (man-made) continuous filament yarn is produced by an entirely different production process in different plants and shows distinct performance characteristics; it is used for different applications. Although it is based in principle on the same cellulosic or synthetic raw material as man-made staple fibers, filament yarn is extruded in a single continuous filament and wound on a bobbin; it can be several kilometers long. Quality criteria for the raw material before extrusion are significantly higher (unevenness and impurities have to be excluded) and production quantities are significantly lower than in the staple fibers sector; filament yarn is therefore much more expensive than staple fibers. A major application of viscose filament yarn is for instance the reinforcement of car tyres, for which the strength of spun viscose staple fibers would be quite insufficient. Continuous Filament Yarn is a yarn composed of continuous filaments assembled with or without twist. / Экструзия или Выдавливание (Extrusion). филаментная (комплексная) пряжа (filament yarn) и примеси необходимо исключить) и .

CONTINUOUS FLOW DISTRIBUTION = РАСПРЕДЕЛЕНИЕ НЕПРЕРЫВНОГО ПОТОКА (или ПОСТОЯННОЕ РАСПРЕДЕЛЕНИЕ ПОТОКА) – Continuous Flow Distribution (CFD) is the streamlined distribution based on customer 'pull' (demand or requirements) instead of on sales 'push'. CFD is an integral component of lean production. Continuous Flow Distribution:- the streamline pull of products in response to customer requirements while minimizing the cost of distribution.

CONTINUOUS LOAD = ПОСТОЯННО ДЕЙСТВУЮЩАЯ НАГРУЗКА (или РАВНОМЕРНО РАСПРЕДЕЛЁННАЯ НАГРУЗКА) – Continuous Load is a sustained electrical load current for three hours or more.

CONTINUOUS LINKED SETTLEMENT = НЕПРЕРЫВНЫЙ УВЯЗАННЫЙ ВЗАИМОРАСЧЁТ (или НЕПРЕРЫВНЫЙ СВЯЗАННЫЙ РАСЧЁТ) – Continuous Linked Settlement (CLS) is an industry initiative that facilitates the exchange of currency values among member institutions through simultaneous transactions, thereby eliminating settlement risk. An innovation by CLS Bank International, CLS has fast become the standard for managing settlement risk. Our knowledge of the inside workings of the CLS initiative can give your business a clear advantage. Our CLS service proposition, currently available to key relationship clients, is designed to help you enhance liquidity management so that you can raise operational efficiencies. As an active settlement member committed to CLS from its inception, and closely involved in its development, we can give you deeper insight into the initiative. As one of the three banks involved in beta testing the member application software, and the first corporate and central bank user to join the CLS project, we welcome the opportunity to share our specialist knowledge and discuss any aspect of CLS with you. For more information on CLS, CLS Bank International or its holding company, CLS Group, visit the official CLS Group website. Continuous Linked Settlement Benefits:- you no longer have to worry about settlement risk. The world's commercial banks, non-bank financial institutions and corporate clients are benefitting through CLS. Our proven experience and expertise give our CLS clients an added advantage in both developed and emerging markets. CLS helps increase your capacity to undertake more business, increase settlement finality, reconcile accounts faster, reduce back-office processing costs and Nostro activity, as well as better protect principal values and enhance liquidity management and cash management. Our CLS offering includes:- (i) multi-currency accounts; (ii) liquidity and credit lines; (iii) intraday information; (iv) timely and efficient disbursements; (v) standard settlement instructions; (vi) reconciliation services; and (vii) access to our range of advanced cash management techniques. We are one of the leading banks in providing liquidity for UK sterling and Hong Kong dollars. Liquidity is also the strongpoint of our CLS proposition. Continuous Linked Settlement Services For Corporate Entities:- reduce your risk profile through our CLS services. You may be a fund manager or a corporate treasurer; your institution may be a pensions fund, a major retail or manufacturing entity, or a major international company with its own treasury functions. With CLS, your business has the potential to develop without increasing risks. With CLS, your FX business can grow without being hindered by increasing risks. And just as important as reduced risk are the immediate benefits that arise from reduced risk and improved payments and cash management made possible by real-time information flows. Real-time information flows are an integral part of the CLS service. Settlement in CLS takes place across all currencies within a single day, as well as early on in the European operating day, giving you greater control on intraday and end-of-day cash positions. Online Continuous Linked Settlement:- adopting innovations need not always lead to expensive technology replacements. We can offer you a flexible solution with minimal changes to your back-office systems. With our CLS proposition, you don't have to upgrade your entire back-office system. We respect the value that has been placed on existing and proven market infrastructure. Our proposition is an alternative that saves you the time and money you would otherwise spend on a major overhaul. It allows you to fully adopt a vital industry standard, without compromises. We can provide you real-time, online access to your foreign exchange trade information, including the latest status of your trades within the CLS process, resulting net cash positions for funding purposes and risk management information. Continuous Linked Settlement (CLS) is a cross-border settlement service in major global currencies provided by CLS Bank (CLSB). In the United Kingdom, the introduction of Continuous Linked Settlement (CLS) in the foreign exchange market is likely to have a significant impact on both the CHAPS (short for The Clearing House Automated Payment System operated by the CHAPS Co. (headquartered in London)) clearings. The newly created CLS Bank commenced operations in September 2002, and the Association for Payment Clearing Services (APACS; headquartered in London) estimates that this could ultimately reduce volumes in CHAPS Sterling and CHAPS Euro by 10% and 50% respectively. See also CLS Bank. CLS™ (Continuous Linked Settlement) is a banking industry initiative to remove the settlement risk associated with FX (Foreign Exchange) transactions, as it is done for securities settlement today. The service was originally created for interbank use but is now also available for non-bank Financial Institutions and Corporates, which settle large FX deals. Benefits:- (i) reduced settlement risk on your FX trade flow; (ii) enables Straight Through Processing (STP) of your FX trades; (iii) matching of your CLS trades; (iv) real-time reporting via SWIFT; and (v) payment costs lowered due to netting of payments. CLS™ is a trademark of CLS Services. The UK Payments Administration Ltd (UKPA) (previously APACS, the Association for Payment Clearing Services) is a United Kingdom trade organization that brings together all payment systems organizations and gives banks, building societies and card issuers a forum where they can work together on non-competitive issues. It covers most forms of payments within the UK including cash, credit cards, debit cards, cheques, and automated payments such as direct debits, salary payments and online/phone transactions. It has been responsible for the creation of rules regarding customer liability in cases of card and cheque fraud and starting in 2004 oversaw and guided the transition of debit cards to Chip and personal identification number (PIN). UKPA was created on the July 06, 2009, as a direct successor of the Association for Payment Clearing Services (APACS) to act as a portal company for each of the respective sectors of UK payment services such as BACS (short for Bankers' Automated Clearing Services operated by the Bacs Payment Schemes Limited), CHAPS, the Cheque and Credit Clearing Company, and other businesses. / дебитовых карт к Чипу (Chip) и Персональному Идентификационному Номеру (ПИН (PIN)).

CONTINUOUS NET SETTLEMENT = ПОСТОЯННЫЙ РАСЧЁТ САЛЬДО – Continuous Net Settlement (CNS) refers to the NSCC's (short for the National Securities Clearing Corporation) automated book-entry accounting system, which centralizes the settlement of security transactions and maintains an orderly flow of security and money balances between participants. The CNS methodology serves to match transactions to securities available, resulting in one net receive or deliver position at the end of a given day. How it

Works:- on T+3 basis, all transactions for a given NSCC member are netted by issue to net long (buy) and net short (sell) positions, and then are further netted with positions that remained open after T+3 which includes positions due to settle that day as well as fail positions. If the net position is short (i.e. securities owed by the member to NSCC), the inventory in the member's DTC (short for The Depository Trust Company) account is check for availability and if shares are available they are transferred from the member's DTC account to cover the short CNS obligation. Net long positions (i.e. securities owed by NSCC to the member), are automatically credited to the member's DTC account. A daily money settlement is debited or credited to the member's account based upon the value of all settled trades plus or minus the mark-to-market figures on any open CNS positions. Clears securities transactions, with the total settlement payable and receivable for each security balanced daily. Excess payables and receivables are adjusted to the market value of the underlying security by charges or credits to firms with unsettled transactions. Continuous Net Settlement is a method of clearing and settling securities that matches transactions to available securities and results in net receive or net deliver positions (and funds) at the end of the day (or settlement period). This method requires the use of a clearing house (e.g., the National Securities Clearing Corporation (NSCC)) and a depository (e.g., the Depository Trust Company (DTC)). Participants' positions are continuously updated as transactions settle. Continuous Net Settlement (CNS) is an automated book-entry accounting system. CNS centralizes the settlement of compared transactions and maintains an efficient flow of security and money balances. During the CNS process, there are reports that are generated which document the movements of money and securities. This system provides clearance for instruments like equities, corporate bonds, Unit Investment Trusts and municipal bonds. / , например, .

CONTINUOUS POLYMERIZATION = НЕПРЕРЫВНАЯ ПОЛИМЕРИЗАЦИЯ – Continuous Polymerization:- in polymer manufacture, linkage of the various stages of polymerization so that materials flow without interruption from the addition of raw materials to delivery of the finished polymer from the system. Extrusion as film, chip or fiber may be linked to a continuous polymerization line. Because there is no break in the process while the transition from low molecular weight to high occurs, multiple stage reaction vessels may be required and accurate process control is critical. / Экструзия или Выдавливание (Extrusion).

CONTINUOUS REPLENISHMENT = НЕПРЕРЫВНОЕ ПОПОЛНЕНИЕ – Continuous Replenishment is a system used to reduce customer inventories and improve service usually to large customers.

CONTINUOUS REPLENISHMENT PROGRAM = ПРОГРАММА НЕПРЕРЫВНОГО ПОПОЛНЕНИЯ – A system used to reduce customer inventories and improve service usually to large customers. Continuous Replenishment Program (CRP) is a program that triggers the manufacturing and movement of a product through the supply chain when the identical product is purchased by an end user.

CONTINUOUS SPINNING = НЕПРЕРЫВНОЕ ПРЯДЕНИЕ – Continuous Spinning is a system of spinning in which the fiber moves through the process without interruption, e.g., ring-spinning. / Система прядения, при которой волокно поступает в переработку непрерывно, например, кольцевое прядение.

CONTINUOUS SUBMERGENCE OR FLOOD IRRIGATION = НЕПРЕРЫВНОЕ ЗАТОПЛЕНИЕ ИЛИ ПОЛИВ ЗАТОПЛЕНИЕМ – Continuous Submergence Or Flood Irrigation is a method of applying irrigation water in which the soil is submerged from transplanting up to about 2 weeks before harvest.

CONTINUOUS SYNOPSIS RECORD = НЕПРЕРЫВНАЯ ХРОНОЛОГИЧЕСКАЯ ЗАПИСЬ (или НЕПРЕРЫВНОЕ ПРОТОКОЛИРОВАНИЕ СИНОПСИСА) – Continuous Synopsis Record, an on-board record of the history of a ship. / Синопсис – Греческое слово, означающее Обозрение.

CONTINUOUS TRADING = НЕПРЕРЫВНАЯ ТОРГОВЛЯ – Continuous Trading:- uninterrupted stock exchange trading throughout an entire trading session. On the Swiss Exchange, all incoming stock orders are entered into the order book and, where possible, matched with existing orders.

CONTINUOUS VARIATION = НЕПРЕРЫВНАЯ ВАРИАЦИЯ (или НЕПРЕРЫВНАЯ ИЗМЕНЧИВОСТЬ) – Continuous Variation is a variation of a quantitative measure observed in characters controlled by the polygenic system. / свойства (characters) .

CONTRA ACCOUNT = КОНТРСЧЁТ – (1) Contra Account:- in monetary policy, account recording the uses of funds corresponding to the resources included in the liabilities of the banking system, used to calculate the money supply. / , от Латинского слова Contra, означающее Против, понимается .

(2) Contra Account is an account considered to be an offset to another account. Generally established to reduce the other account to amounts that can be realized or collected. In accounting, reduction to the gross cost of an asset to arrive at its net cost. For example, accumulated depreciation is a contra account to the original cost of a fixed asset to arrive at book value. Also known as Valuation Allowance. Contra Account is an account which is treated the opposite of other accounts in the same category and used as an offset to another account. An example is Accumulated Depreciation which is the offset to depreciation expense. Accumulated depreciation is an asset but is credited, instead of debited like other assets, to increase the amount.

(3) Reduction of a liability to arrive at its book value, for example, a bond discount, which is a reduction in the bonds payable account.

CONTRABAND = КОНТРАБАНДА – Contraband is goods or merchandise whose importation, exportation, or possession is forbidden. Contraband:- cargo that is prohibited. The word Contraband, reported in English since 1529, from Medieval French Contrebande 'a smuggling', denotes any item which, relating to its nature, is illegal to be possessed or sold. Used for goods that by their nature, e.g., too dangerous or offensive in the eyes of the legislator (those are termed contraband in se) are forbidden, and for so-called Derivative Contrabande, i.e. goods that may normally be owned but are liable to be seized because they were used in committing an unlawful act and hence begot illegally, such as:- (i) smuggling goods; (ii) stolen goods – knowingly participating in their trade is an offense in itself, called Fencing; and (iii) the fruits of fraud, forgery etc. The word is also used as an adjective, again meaning 'distributed or sold illicitly'. Contraband is the illegal or prohibited traffic in goods. See also Smuggling. / привоз (importation). вывоз (exportation). Под Контрабандой, от Итальянского слова Contrabando, понимается незаконное перемещение через государственную границу товаров, валюты, ценностей и иных предметов, то есть перемещение их с нарушением требований таможенного законодательства. Ответственность за контрабанду установлена в большинстве стран мира. В Советском праве различали Контрабанду Административно Наказуемую и Контрабанду Уголовно Наказуемую. Административно Наказуемой Контрабандой, помимо незаконного перемещения товаров через государственную границу Союза Советских Социалистических Республик (СССР), считается также хранение, перемещение и покупка контрабандных товаров на территории СССР, незаконный вывоз, ввоз, пересылка и перевод за границу и из-за границы валюты и валютных ценностей и другого (Таможенный Кодекс СССР, Статья 100). В зависимости от обстоятельств дела такая контрабанда наказывается конфискацией предметов контрабанды, а также перевозочных и других средств, предназначенных для её совершения; взысканием приблизительной стоимости предметов контрабанды при невозможности их конфискации; штрафом. Уголовная ответственность за контрабанду предусмотрена Законом Об Уголовной Ответственности За Государственные Преступления

1958, Статья 15, а также Уголовными Кодексами (УК) Союзных республик (например, УК РСФСР (Российской Советской Федеративной Социалистической Республики), Статья 78). Состав преступления контрабанды образует незаконное перемещение товаров или иных ценностей через государственную границу СССР, совершённое с сокрытием предметов контрабанды в специальных хранилищах, либо с обманным использованием таможенных и иных документов, либо в крупных размерах, либо группой лиц, организовавшихся для занятия контрабанды, либо должностным лицом с использованием служебного положения, а равно контрабанды взрывчатых, наркотических, сильнодействующих и ядовитых веществ, оружия и воинского снаряжения. Уголовное наказание за контрабанду установлено в виде лишения свободы на срок от 3 до 10 лет с конфискацией имущества и со ссылкой на срок от 2 до 5 лет или без ссылки.

CONTRACT = КОНТРАКТ (или ДОГОВОР) – (1) Contract is a legally binding agreement between two or more competent parties fixing the precise terms and details for a voluntary exchange of goods or services over which the contracting parties possess property rights. An agreement is a legally enforceable contract if and only if:- (i) the agreement must be 'mutual' (all parties have the same understanding of the meaning of their agreement – there is a 'meeting of the minds'); (ii) the agreement must be 'voluntary' (none of the parties is agreeing under the influence of violent threats or fraudulent misrepresentation of the facts); (iii) there must be actual 'consideration' paid (that is, each party must be achieving a benefit by giving up something he controls to get something another party controls in exchange: a simple one-sided promise to give someone else a gratuitous benefit is not a contract); (iv) all parties to the agreement must be 'competent' (children and the severely mentally impaired or insane are assumed by the courts to be incapable of forming a coherent intent or determining their own best interests, so the courts will not enforce the agreements they make); and (v) the substance of the agreement must not be 'contrary to public policy' (for example, the US courts will not enforce a contract that requires one or more of the parties to commit a crime, nor will they enforce a contract by which even a legally competent adult voluntarily sells himself into life-long slavery in exchange for, say, a ten million Dollar payment to his children). A formal, legally binding agreement between two or more parties. Contract is an agreement between two or more parties that has clear economic consequences that the parties have little, if any, discretion to avoid, usually because the agreement is enforceable by law. Contracts may take a variety of forms and need not be in writing. This document is an agreement between two or more persons or organizations to do or perform or otherwise carry out certain terms, conditions and actions. It is generally a legally binding document. A legally binding agreement between two or more persons/organizations to carry out reciprocal obligations or value. An agreement enforceable by law between two or more parties stipulating their rights and obligations. Contract is an agreement to buy or sell a specified amount of a particular product. The contract specifications detail the amount and grade of the product and the date on which the contract will mature and become deliverable if it is not liquidated earlier. An agreement to buy or sell a specified commodity, detailing the amount and grade of the product and the date on which the contract will mature and become deliverable. Actual agreement between two or more parties to buy or sell commodity, security, currency or index. Contract is a binding agreement between Logistics Depot (company) and a client stating terms of the agreement, storage fees, transportation rates, and accessorial charges. / Фактическое соглашение между двумя или более сторонами о покупке или продаже товаров, ценных бумаг, валюты или индексов. Под Контрактом, от Латинского слова Contractus, понимается то же самое, что и Договор. Договор в гражданском праве, соглашение двух или более лиц (граждан или юридических лиц), направленное на установление, изменение или прекращение гражданских прав и обязанностей. Договором нередко именуют и само обязательственное правоотношение, возникшее из договора, и документ, в котором оно выражено. В зависимости от количества участников договоры делят на двусторонние или многосторонние. Если договор порождает для одной стороны только права, а для другой только обязанности, он является односторонним, если же в силу договора у каждой стороны появляются и права и обязанности, такой договор называется двусторонним. Примером одностороннего договора может служить договор займа; двусторонние договоры – это договоры купли-продажи, поставки, подряда, перевозки и другие. В Советском гражданском праве Договор – одно из важнейших оснований возникновения обязательственных правоотношений (смотрите Обязательство). Договор – средство установления и организации хозяйственных связей между социалистическими (государственными, кооперативными, включая колхозы, общественными) предприятиями и иными организациями, участниками Советского экономического оборота (смотрите Хозяйственный Договор). Договор является также основной правовой формой распоряжения личной собственностью граждан бывшего Союза Советских Социалистических Республик (СССР). В соответствии с принятым в Советском гражданском праве принципом реальности исполнения договор должен быть исполнен в натуре (продукция должна быть передана, работы выполнены и так далее). В договоре обычно включаются условия, побуждающие к реальному выполнению установленных договором обязанностей сторон:- меры имущественной ответственности (санкции) за неисполнение договора – возмещение убытков, уплата неустойки и так далее. Условия, установленные сторонами в договоре, именуются его содержанием. Существенными считаются те условия договора, которые признаны существенными по закону или необходимы для договора данного вида (например, предмет и цена в договоре купли-продажи), то есть такие условия, без которых невозможно заключение договора, а также все те условия, относительно которых по заявлению одной из сторон должно быть достигнуто соглашение (например, условие о поставке товара в определённой таре или упаковке). Договор считается заключённым, когда между сторонами в требуемой в надлежащих случаях форме достигнуто соглашение по всем существенным его пунктам. По форме заключения договоры делятся на простые и нотариально удостоверенные. Некоторые договоры подлежат регистрации в соответствующих государственных органах, например, договор купли-продажи жилого дома, если хотя бы одной из сторон договора является гражданин, должен быть нотариально удостоверен и зарегистрирован в Исполкоме местного Совета Депутатов Трудящихся. Согласие на заключение договора, выраженное стороной – инициатором его заключения, называется Предложением (Офертой), а стороной, отвечающей на предложение, – Акцептом. Если для возникновения договорного обязательства необходимо лишь достижение соглашения сторон по всем существенным его пунктам, договор именуется консенсуальным (от Латинского слова Consensuns, означающее Соглашение), например, договор купли-продажи. Если для возникновения договорного обязательства, кроме соглашения, необходима ещё реальная передача вещи, договор именуется реальным, например, договор перевозки считается заключённым, когда груз передан перевозчику. Специфическим видом договора является договор в пользу третьего лица. В силу этого договора право требовать исполнения приобретает либо и заключивший его, и третье лицо, в пользу которого заключён договор, либо только это третье лицо, само ни непосредственно, ни через представителя не участвующее в заключении договора. Например, в бывшем СССР по договору страхования жизни право требовать выплаты страховой суммы в случае наступления смерти застрахованного может только третье лицо, в пользу которого заключён договор. Вопрос о возможности изменения условий договора в пользу третьего лица без согласия этого лица решается по-разному в зависимости от вида договора. Например, при внесении вклада в сберегательную кассу на имя третьего лица это лицо рассматривается как вкладчик и внёсший вклад не имеет права ни на изменение условий договора, ни на получение вклада. При страховании жизни на случай смерти застрахованный имеет право в любое время заменить лицо, в пользу которого заключён договор. Если третье лицо отказалось от предоставленного ему по договору права, то заключивший договор может сам воспользоваться этим правом, если это не противоречит закону, смыслу договора или существу обязательства. В Советском гражданском праве порядок заключения договоров определялся Основами Гражданского Законодательства Союза ССР и Союзных Республик 1961 и Гражданскими Кодексами Союзных Республик (например, ГК

РСФСР, Статьи 160–165). Порядок заключения договора между социалистическими организациями регулируется также особыми правилами. Договор между этими организациями в установленных законом случаях может быть заключён путём принятия к исполнению заказа или наряда. Разногласия, возникающие при заключении договора, основанного на обязательном для обеих сторон плановом задании, между государственными, кооперативными (кроме колхозов) и общественными организациями, разрешаются арбитражем (третейским судом), если законом не установлено иное. В этом же порядке могут разрешаться и разногласия при заключении договора, не основанного на обязательном для обеих сторон плановом задании, если это специально предусмотрено законом или соглашением сторон (смотрите Преддоговорные Споры). Контрактация сельскохозяйственных продуктов в бывшем Союзе Советских Социалистических Республик (СССР), единая форма государственных закупок сельскохозяйственной продукции. Впервые введена в 1928–1929 и до 1933 была основной формой заготовок важнейших сельскохозяйственных продуктов. До 1958 в порядке контрактации у колхозов закупались в основном технические культуры (хлопок, волокно и семена льна, сахарная свёкла, табак, махорка, чайный лист и другие). В соответствии с решением Январского (1961) Пленума Центрального Комитета Коммунистической Партии Советского Союза (ЦК КПСС) и Постановлением ЦК КПСС и Совета Министров СССР от 25 Февраля 1961 ‘О перестройке и улучшении организации государственных закупок сельскохозяйственных продуктов’ (СП СССР, 1961, № 4, Ст. 21) Контрактация – единая форма государственных закупок продукции у колхозов, а также совхозов и других государственных хозяйств. Контрактация осуществляется на основе договоров контрактации, заключаемых государственными заготовительными организациями с сельскохозяйственными предприятиями в соответствии с планами государственных закупок сельскохозяйственной продукции и с учётом необходимости проведения сверхплановых закупок этой продукции. В условиях развитого социалистического хозяйства метод контрактации – наилучшее средство расширения и укрепления связи между сельским хозяйством и промышленностью, перерабатывающей сельскохозяйственное сырьё. Посредством контрактации Советское государство сосредоточивало в своих руках основную массу товарной продукции сельского хозяйства, что позволяло обеспечить нормальное снабжение населения продуктами питания, а промышленности – сельскохозяйственным сырьём. Переход в соответствии с решениями Мартовского (1965) Пленума ЦК КПСС к твёрдым планам закупок сельскохозяйственных продуктов на ряд лет, повышение закупочных и сдаточных цен на основные продукты создали прочные экономические и правовые гарантии нормальной хозяйственной деятельности колхозов и совхозов, укрепили их хозяйскую самостоятельность, позволили лучше определить перспективы развития производства, смелее проводить его специализацию, эффективнее использовать капитальные вложения. 24-й Съезд КПСС (1971) указал на необходимость всемерно развивать и укреплять прямые связи предприятий промышленности и торговли с колхозами и совхозами, последовательно осуществлять переход на приёмку продукции непосредственно в хозяйствах. Договоры контрактации заключаются на основе утверждаемых Министерством Заготовок СССР по согласованию с Министерством Сельского Хозяйства СССР типовых договоров. Вопросы, не урегулированные типовыми договорами, разрешаются соглашением сторон. Однако при этом нельзя устанавливать условия, противоречащие типовому договору. Сверхплановая продажа государству излишков сельскохозяйственной продукции осуществляется хозяйствами на добровольных началах, без доведения до них каких-либо дополнительных заданий. Качество продукции должно соответствовать стандартам, техническим условиям или установленным кондициям. Заготовительная организация обязана принять в обусловленные договором сроки доставленную хозяйством на приёмный пункт продукцию, обеспечить правильное определение её количества и качества, оплатить ее стоимость, а также возместить расходы по доставке в установленном порядке. Колхозы, не перешедшие ещё на прямое банковское кредитование, получают от заготовительной организации авансы под законтрактованную продукцию, которые выдаются учреждениями Госбанка СССР. Постановление Совета Министров СССР от 23 Апреля 1970 ‘Об объединении решений Правительства СССР по вопросу организации государственных закупок сельскохозяйственной продукции’ (СП СССР, 1970 № 8, Ст. 163) обязало соответствующие организации при заключении договоров контрактации учитывать не только обеспечение выполнения установленных планов закупок сельскохозяйственной продукции, но и проведение сверхплановых закупок этой продукции в размерах, требуемых для удовлетворения потребностей народного хозяйства СССР. За невыполнение сторонами условий договора контрактации предусмотрена материальная ответственность:- выплата пени и неустойки за несдачу в срок продукции или несвоевременную её приёмку, а также возмещение расходов по доставке продукции и убытков, понесённых в результате её несвоевременной приёмки. Уплата пени, неустойки и штрафа не освобождает хозяйство и заготовительную организацию от выполнения обязательств по договору. В случае отказа от приёмки кондиционной скоропортящейся продукции, предусмотренной договором контрактации, заготовительная организация возмещает хозяйству, помимо неустойки, полную стоимость продукции и расходы по её доставке в оба конца. Государственный контроль за выполнением планов заготовок и договоров контрактации сельскохозяйственной продукции осуществляется Министерством Заготовок СССР.

(2) Contract is the unit of trading for a financial and commodity futures or option. Also, actual bilateral agreement between the parties (buyer and seller) of a futures or options on futures transaction as defined by an exchange. A unit of trading in futures, similar to Round Lot in securities markets. / Контракт – единица торговли для финансовых и сырьевых фьючерсов или опционов. Также фактическое двухстороннее соглашение между сторонами (покупатель и продавец) фьючерсов или опционов на сделку с фьючерсами, как это определено биржей. Единица торговли фьючерсами, аналогичен Круглому Лоту на рынках ценных бумаг.

CONTRACT CARRIER = ПЕРЕВОЗЧИК ПО КОНТРАКТУ (или ПЕРЕВОЗЧИК ПО ДОГОВОРУ) – For-hire interstate operators which offer transportations services to certain shippers under contracts. Contract Carrier is any person not a common carrier who, under special and individual contracts or agreements, transports passengers or property for compensation. / по найму (for-hire).

CONTRACT CERTAINTY = ОПРЕДЕЛЁННОСТЬ КОНТРАКТА (или НЕСОМНЕННОСТЬ КОНТРАКТА, или НЕЗЫБЛЕМОСТЬ ДОГОВОРА) – A term Contract Certainty refers to the situation where the terms of an insurance or reinsurance contract are agreed before the inception date of the contract rather than being negotiated afterwards. / относится к ситуации, при которой порядки договора страхования или перестрахования согласованы до даты начала контракта, нежели бы обсуждены впоследствии.

CONTRACT CURRENCY = ВАЛЮТА КОНТРАКТА (или ВАЛЮТА ДОГОВОРА) – The Contract Currency is the currency in which account transactions are carried out. / Валютой Контракта служит валюта, в которой осуществляются все взаиморасчётные операции между сторонами данного контракта.

CONTRACT EXPIRATION DATE = ДАТА ПРЕКРАЩЕНИЯ ПРИЗНАНИЯ КОНТРАКТА (или ДАТА ЭКСПИРАЦИИ КОНТРАКТА) – Contract Expiration Date is the time and day in which a futures contract stops trading and the final settlement price is determined. For a market where a physical commodity must be exchanged, the exchange process will begin on the expiration date. / Дата Прекращения Признания Контракта или Дата Экспирации Контракта – время и день, в который фьючерсный контракт прекращает торговаться и определяется окончательная расчётная цена. Для рынка, на котором физическое сырьё долно быть обменено, процесс обмена начнётся в дату прекращения признания.

CONTRACT FOR CARRIAGE = КОНТРАКТ НА ПЕРЕВОЗКУ (или ДОГОВОР НА ПЕРЕВОЗКУ) – A term 'Contract For Carriage' means either a bill of lading or transportation provided under written agreement. 49 USC 13102(4) (2005; 49 USC is short for the United States Code:- Title 49).

CONTRACT FOR DIFFERENCES = КОНТРАКТ НА РАЗНИЦУ – Contract For Differences (CFD) is an agreement between two parties to exchange, at the close of the contract, the difference between the opening price and the closing price of the contract, multiplied by the number of shares specified in the contract. Also known as Swap. Contracts for differences are the financial products that give the holder exposure to underlying cash markets. Like other derivatives, they are designed for those investors who want to benefit from movements in an underlying asset, i.e. shares, but do not need any rights of ownership. A Contract For Difference (CFD) is essentially a contract between an investor and an investment bank or a spread-betting firm. At the end of the contract, the parties exchange the difference between the opening and closing prices of a specified financial instrument, including shares or commodities. CFDs do not carry votes like ordinary stock but enable investors to gain economic exposure to a listed company for a fraction of the cost of buying shares. They also escape stamp duty and can be bought in size without triggering obligations to disclose the holding. A form of synthetic dividend is normally also payable. A CFD is simply an agreement between two parties – the investor and the CFD provider – to pay each other the change in the price of an underlying asset. Depending on which way the price moves, one party pays the other the difference from the time the contract was agreed to the point where it ends. So like spread bets, CFDs involve the investor taking an opposing view to the insurer, speculating that an asset price will rise, by buying ('long' position), or fall, by selling ('short' position). Also like spread bets, CFDs incur no stamp duty as they do not involve buying an asset, only agreeing to receive or pay the movement in its price. And because you only have to put down a small deposit on trades, called 'Margin', you can make large profits – or losses – on the money you commit, from small moves in the price. So CFDs give you the advantages of owning shares without many of the inconveniences. However, they differ from spread bets in their tax treatment. A Contract For Differences (CFD) is a financial transaction in which two parties trade a floating for a fixed price differential between a prompt and a forward price. CFDs provide an opportunity to hedge the basis risk. In finance, a Contract For Difference (or CFD) is a contract between two parties, typically described as 'buyer' and 'seller', stipulating that the seller will pay to the buyer the difference between the current value of an asset and its value at contract time. (If the difference is negative, then the buyer pays instead to the seller.) In effect CFDs are financial derivatives that allow traders to take advantage of prices moving up (long positions) or prices moving down (short positions) on underlying financial instruments and are often used to speculate on those markets. For example, when applied to equities, such a contract is an equity derivative that allows traders to speculate on share price movements, without the need for ownership of the underlying shares. CFDs are currently available in the United Kingdom, Hong Kong, The Netherlands, Poland, Portugal, Germany, Switzerland, Italy, Singapore, South Africa, Australia, Canada, New Zealand, Sweden, Norway, France, Ireland, Japan and Spain. They are not permitted in the United States, due to restrictions by the US Securities and Exchange Commission (SEC) on over-the-counter (OTC) financial instruments. CFDs were originally developed in the early 1990s in London as a type of equity swap that was traded on margin. The invention of the CFD is widely credited to Brian Keelan and Jon Wood, both of UBS Warburg, on their Trafalgar House deal in the early 90s. They were initially used by hedge funds and institutional traders to hedge cost-effectively their exposure to stocks on the London Stock Exchange – mainly because they required only a small margin and (because no physical shares changed hands) avoided UK tax. In the late 1990s CFDs were introduced to retail traders. They were popularised by a number of UK companies, characterised by innovative services that made it easy to see live prices and trade in real time. The first company to do this was GNI (originally known as Gerrard & National Intercommodities); GNI and its CFD trading service GNI touch was later acquired by MF Global. They were soon followed by IG Markets and CMC Markets who started to popularise the service in 2000. It was around 2000 that retail traders realised that the real benefit of trading CFDs was not the exemption from tax but the ability to leverage any underlying instrument. This was the start of the growth phase in the use of CFDs. The CFD providers quickly expanded their offering from London Stock Exchange (LSE) shares to include indices, many global stocks, commodities, bonds, and currencies. Trading index CFDs, such as the ones based on the major global indexes, e.g., Dow Jones, NASDAQ®, S&P 500, FTSE, DAX, and CAC, quickly became the most popular type of CFD that were traded. Around 2001 a number of the CFD providers realised that CFDs had the same economic effect as financial spread betting except that the tax regime was different, so that it was tax free. Most CFD providers launched financial spread betting operations in parallel to their CFD offering. In the UK the CFD market mirrors the financial spread betting market and the products are in many ways the same. However unlike CFDs which have been exported to a number of different countries, spread betting relying on a country specific tax advantage has remained primarily a UK and Irish phenomenon. The CFD providers started to expand to overseas markets with CFDs being first introduced to Australia in July 2002 by IG Markets and CMC Markets. CFDs have since been introduced into a number of other countries; see list above. Until 2007 CFDs had been traded exclusively over-the-counter (OTC); however, on 05 November 2007 the Australian Securities Exchange (ASX) listed exchange-traded CFDs on the top 50 Australian stocks, 8 FX pairs, key global indices and some commodities. There were originally 12 brokers offering ASX CFDs, but as of 2009 there are only five. In June 2009, the UK regulator the Financial Services Authority (FSA) implemented a general disclosure regime for CFDs to avoid them being used in insider information cases. This was after a number of high profile cases where positions in CFDs were used instead of physical underlying stock to hide them from the normal disclosure rules related to insider information. Trading:- CFDs are traded between individual traders and CFD providers. There are no standard contract terms for CFDs, and each CFD provider can specify their own, but they tend to have a number of things in common. The CFD is started by making an opening trade on a particular instrument with the CFD provider. This creates a 'position' in that instrument. There is no expiry date so the position is closed when a second reverse trade is done. At that point the difference between the opening trade and the closing trade is paid as profit or loss. The CFD provider may make a number of charges as part of the trading or the open position. These may include, bid-offer spread, commission, overnight financing and account management fees. Even though the CFD does not expire, any positions that are left open overnight will be 'rolled over'. This typically means that any profit and loss is realised and credited or debited to the client account and any financing charges are calculated. The position then carries forward to the next day. The industry norm is that this process is done at 10 pm UK time. CFDs are traded on margin, and the trader must maintain the minimum margin level at all times. A typical feature of CFD trading is that profit and loss and margin requirement is calculated constantly in real time and shown to the trader on screen. If the amount of money deposited with CFD broker drops below minimum margin level, margin calls can be made. Traders may need to cover these margins quickly otherwise the CFD provider may liquidate their positions. To see how CFDs work in practice see the examples of typical CFD trades. The 'margin percentage', and 'charges' shown may vary from provider to provider, but are typical of CFD providers. Examples:- Example 1:- an Equity Based CFD Trade:- in this example we show an equity based CFD trade. The share price of Apple Inc is USD194.38. We believe that the share price will rise and so decide to take a long CFD position. Our CFD Provider is quoting a price of USD194.36 bid and USD194.42 offer. Step 1 – Opening A Position:- (i) Buy 100 Apple CFDs at offer price – 100 x USD194.42 = USD19 442.00. (ii) Margin requirement is open position x margin percentage. Typical margin for equities is 3%-15% depending on the liquidity of the underlying instrument. In our example Apple CFDs require margin of 5% – USD19 442.00 x 0.05 = USD972.10. (iii) You get charged commission of 0.1% on this transaction – USD19 442.00 x 0.001 = USD19.44. Step 2 – Overnight Financing:- to hold this position a financing charge is made each night. This is normally based on a benchmark rate per cent like LIBOR + broker margin per cent / 365. For simplicity we will assume the

price of Apple shares stayed the same until the market close and so no P&L was generated on this day – USD19 442.00 x (0.002 5 + 0.02) / 365 = USD1.20. Step 3 – Closing The Position:- (i) The next day Apple share price has risen by USD6.15. (ii) Our trade has moved in our favor and we decide to close the position and take profit. (iii) Our CFD provider is quoting USD200.50 bid and USD200.58 offer. (iv) Sell 100 Apple CFDs at bid price – 100 x USD200.50 = USD20 050.00. (v) The position is now closed and so margin requirement is now zero – USD0.00. (vi) You get charged commission of 0.1% on this transaction – USD20 050.00 x 0.001 = USD20.05. (vii) Gross profit is difference between opening position and closing the position – USD20 050.00 – USD19 442.00 = USD608. (viii) Net profit is gross profit less costs. The costs are commissions and overnight financing. In this example we have been charged commission twice, once to open the position and once to close it, and we have been charged one day overnight financing – USD19.44 + USD20.05 + USD1.20 = USD40.69. (ix) Profit & Loss (P&L) shows a profit after costs – USD608.00 – USD40.69 = USD567.31. In summary we have had to deposit USD972.10 to cover margin on this trade and made a profit of USD567.31. If the price of Apple shares had instead dropped by USD6.15, we would have sustained a loss of USD647.47 (USD608 plus commissions). Example 2:- an Index based CFD trade on the S&P 500 Index:- in this example we show an index based CFD. The S&P 500 Index is at 1 093.9. We believe that the Index will go down and so decide to take a 'short' position. Our CFD broker is quoting 1 093.7 bid and 1 094.1 offer. Step 1 – Opening A Position:- (i) Sell 10 S&P 500 CFDs at bid price – 10 x USD1 093.7 = USD10 937; (ii) Margin requirement is open position x margin percentage. Typical value for major indices is 0.5% – USD10 937 x 0.005 = USD54.68; (iii) Commission – typically no commission is charged on index CFDs. Step 2 – Overnight Financing:- to hold a position a financing charge is made, however as we are holding a short position we will instead receive the financing. The rate is normally based on a benchmark rate per cent like LIBOR, from this we subtract the broker margin and divide by 365 to get the daily financing. For simplicity lets assume the US interest rate is 4% and the broker margin is 2% – USD10 937 x (0.04 – 0.02) / 365 = +USD0.60. Step 3 – Closing The Position:- (i) The next day the S&P has dropped by 10 points to 1 083.7 bid and 1 084.1 offer. (ii) Our trade has moved in our favor and we decide to take profit and close the position. (iii) Buy back the position at the lower price – 10 x USD1 084.1 = USD10 841. (iv) The position is now closed and so margin requirement is now zero. (v) Gross profit is difference between opening position and closing the position – USD10 937 – USD10 841 = USD96.00. (vi) Net profit is gross profit less costs. In this example financing is actually positive and there are no other costs. So we get a credit of – USD0.60. (vii) Profit and Loss shows a Profit after costs – USD96.00 + USD0.60 = USD96.60. In summary we have had to deposit USD54.68 to cover margin on this trade and made a profit of USD96.60. If the S&P 500 Index had risen instead by 10 points we would have sustained a loss of USD95.40 (USD96.00 + Costs). Note that the amount of gain or loss was bigger than the margin requirement. In other words, you would have gained or lost more money than you deposited. Charges:- the contracts are subject to a daily financing charge, usually applied at a previously agreed rate linked to LIBOR or some other interest rate benchmark, e.g., Reserve Bank rate in Australia. The parties to a CFD pay to finance long positions and may receive funding on short positions in lieu of deferring sale proceeds. The contracts are settled for the cash differential between the price of the opening and closing trades. Traditionally, equity based CFDs are subject to a commission that is a percentage of the size of the position for each trade. Alternatively, a trader can opt to trade with a market maker, foregoing commissions at the expense of a larger bid/offer spread on the instrument. Margin:- traders in CFDs are required to maintain a certain amount of margin as defined by the brokerage or market maker (usually ranging from 0.5% to 30%). One advantage to traders of not having to put up as collateral the full notional value of the CFD is that a given quantity of capital can control a larger position, amplifying the potential for profit or loss. On the other hand, a leveraged position in a volatile CFD can expose the buyer to a margin call in a downturn, which often leads to losing a substantial part of the assets. CFDs allow a trader to go short or long on any position using margin. There are always two types of margin with a CFD trade:- (i) Initial Margin:- normally between 3% and 30% for shares/stocks and 0.5–1% for indices, foreign exchange and commodities; and (ii) Variation Margin:- which is then 'marked to market'. Initial margin is fixed at between 0.5% and 30% depending on the underlying product and overall perceived risk in the market at that time. For example, during and after 9/11 initial margins were massively hiked across the board to counter the explosion in volatility in the world's stock markets. Many refer to initial margin as a deposit. For example, for large and highly liquid stocks such as Vodafone the initial margin will be nearer 3%, and depending on the broker and the client's relationship with the firm the deposit maybe even lower. However, with a smaller capitalized and less liquid stock the margin is likely to be at least 10% if not a lot higher. Variation margin is applied to positions if they move against a client. For example, if a CFD trader were to buy 1 000 shares in ABC stock using CFDs at 100p and the price moved lower to 90p the broker would deduct £100 in variation margin (1 000 shares x 10p) from the client's account. Note, this is all done in real-time as the market moves lower, so called 'Marked To Market'. Conversely, if the share price moved higher by 10p the broker would credit the client's account with £100 in running profits. Variation margin can therefore have either a negative or positive effect on a CFD trader's cash balance. But initial margin will always be deducted from a customer's account and replaced once the trade is covered. Leverage:- one of the benefits (and risks) of trading CFDs is that they are traded on margin meaning that they provide the trader with leverage. Leverage involves taking a small deposit and using it as a lever to borrow and gain access to a larger equivalent quantity of assets. The margin requirements on CFDs are low meaning that only small amount of money is required to take large positions. CFD Providers:- CFDs are typically traded over-the-counter with a broker or market maker, known as a CFD Provider. The CFD provider will define the contract terms, the margin rates and what underlying instruments it is willing to trade. They trade under two different models, which can have an impact on the price of the instrument traded:- (i) Market Maker (MM):- this is the most common method, and is where the CFD provider makes the price for the CFD on underlying and takes all orders onto its own book. Most CFD providers will hedge these positions based on their own risk model, which may be as simple as buying or selling the underlying, but may also be via portfolio hedges or by consolidating client positions and offsetting one client long with another client short position. This does not affect the CFD trade as no matter what the CFD provider does with its own market risk, the contract is always between the trader and the CFD provider. The main impact is that price can be different to the underlying physical market as the CFD provider can for example take into account other client positions it is holding. This does allow the CFD provider to be very flexible in the products and trading times it offers as it allows them to easily create hybrids and hedge using alternative instruments for example to allow trading out of normal market hours. In practice, the market maker price usually matches the underlying instrument as the CFD provider would otherwise be exposed to arbitrageurs, but some CFD providers add an additional written guarantee in the contract that all CFD prices will match that of the underlying instrument. (ii) Direct Market Access (DMA) was created in response to concerns that the price in the market-maker model may not match that of the underlying instrument. A DMA CFD provider guarantees that it will do a physical trade on the underlying market to match each CFD trade on a one-for-one basis. The contract is still between the traders and the CFD provider but through this method it is guaranteed that the CFD price is the same as the underlying price and that they will not be re-quoted. They will also be able to see their order in the underlying physical market order book. DMA only works where the underlying instrument can be readily bought and sold in the quantities that match the CFD and is most commonly used for shares CFDs. DMA CFDs can be more expensive as the CFD provider needs to cover the exchange transaction fees and may not be able get economies of scale by netting client orders together. The DMA model is much more like a traditional broker model and is preferred by professional and institutional traders as it avoids conflicts of interest with the CFD provider. Corporate Actions On Equity Based CFDs:- corporate actions such as dividend payments can have an effect on the share price and hence the price of an equity based CFD. However, a person who holds a CFD position has no ownership of the underlying instrument and so would not receive the dividend payment from

the company that issued the shares. In this case the CFD provider would pay the equivalent of the dividend to anyone holding a long CFD position and deduct the equivalent from anyone holding a short position. This would be done on ex-div date as that is when the economic effect is felt on the underlying share price. The general rule is that any economic effect of a corporate action on the underlying must be reflected in the CFD. This includes dividends, stock splits, rights issues etc. However, a CFD holder will never have access to non economic corporate actions such as voting rights. Risks:- (i) Market Risk:- the main risk is market risk as the contract is designed to pay the difference between the opening price and the closing price of the underlying asset. CFDs are traded on margin, and the leveraging effect of this increases the risk significantly. Margin rates are typically small and therefore a small amount of money can be used to hold a large position. It is this very risk that drives the use of CFDs, either to speculate on movements in financial markets or to hedge existing positions elsewhere. One of the ways to mitigate this risk is the use of stop loss orders. Users typically deposit an amount of money with the CFD provider to cover the margin and can lose much more than this deposit if the market moves against them. (ii) Liquidation Risk:- if prices move against open CFD position additional variation margin is required to maintain the margin level. The CFD provider may call upon the party to deposit additional sums to cover this, and in fast moving markets this may be at short notice. If funds are not provided in time, the CFD provider may close/liquidate the positions at a loss for which the other party is liable. (iii) Counterparty Risk:- another dimension of CFD risk is counterparty risk, a factor in most over-the-counter (OTC) traded derivatives. Counterparty risk is associated with the financial stability or solvency of the counterparty to a contract. In the context of CFD contracts, if the counterparty to a contract fails to meet their financial obligations, the CFD may have little or no value regardless of the underlying instrument. This means that a CFD trader could potentially incur severe losses, even if the underlying instrument moves in the desired direction. OTC CFD providers are required to segregate client funds protecting client balances in event of company default, but cases such as that of MF Global remind us that guarantees can be broken. Exchange-traded contracts traded through a clearing house are generally believed to have less counterparty risk. Ultimately, the degree of counterparty risk is defined by the credit risk of the counterparty, including the clearing house if applicable. CFDs Compared To Other Products:- there are a number of different financial products that have been used in the past to speculate on financial markets. These range from trading in physical shares either direct or via margin lending, to using derivatives such as futures, options or covered warrants. A number of brokers have been actively promoting CFDs as alternatives to all of these products. Although no firm figures are available as trading is off-exchange, it is estimated that CFD related hedging accounts for somewhere between 20% and 40% the volume on the London Stock Exchange (LSE). A number of people in the industry back the view that a third of all LSE volume is CFD related. The LSE does not monitor the numbers but the original 25% estimate as quoted by many people, appears to have come from a LSE spokesperson. The CFD market most resembles the futures and options market, the major differences being:- (a) there is no expiry date, so no price decay; (b) trading is done off-exchange with CFD brokers or market makers; (c) CFD contract is normally one to one with the underlying instrument; (d) CFDs are not available to US residents; (e) Minimum contract sizes are small, so it's possible to buy one share CFD, low entry threshold; and (f) easy to create new instruments, not restricted to exchange definitions or jurisdictional boundaries, very wide selection of underlying instruments can be traded. (1) Futures:- futures are preferred by professionals for indices and interest rate trading over CFDs as they are a mature product and are exchange traded. The main advantages of CFDs, compared to futures, is that contract sizes are smaller making it more accessible for small trader and pricing is more transparent. Futures contracts tend to see price decay near to the expiry date compared to the price of the underlying instrument which does not occur on the CFD as it never expires and simply mirrors the underlying instrument. Futures are often used by the CFD providers to hedge their own positions and many CFDs are written over futures as futures prices are easily obtainable. CFDs don't have expiry dates so when a CFD is written over a futures contract the CFD contract has to deal with the futures contract expiry date. The industry practice is for the CFD provider to 'roll' the CFD position to the next future period when the liquidity starts to dry in the last few days before expiry, thus creating a rolling CFD contract. (2) Options:- options, like futures, are an established product, exchange traded and centrally cleared and used by professionals. Options, like futures, can be used to hedge risk or to take on risk to speculate. CFDs are only comparable in the latter case. The main advantage of CFDs over options is the price simplicity and range of underlying instruments. Compared to CFDs, option pricing is complex and has price decay when nearing expiry while CFDs prices simply mirror the underlying instrument. CFDs cannot be used to reduce risk in the way that options can. (3) Covered Warrants:- similar to options, covered warrants have become popular in recent years as a way of speculating cheaply on market movements. CFDs costs tend to be lower for short periods and have a much wider range of underlying products. In markets such as Singapore, some brokers have been heavily promoting CFDs as alternatives to covered warrants, and may have been partially responsible for the decline in volume of covered warrant there. (4) ETFs:- exchange-traded funds (ETFs) like CFDs can be used for short-term speculation, and are available over a wide variety of underlying products. In particular, indices, commodities and overseas markets, which have been seen as one of the strengths of CFDs. Also in the same way as CFDs, there are ETFs on customised groups of instruments such as sectors or baskets and an increasing number of ETFs are set up to use leverage. Compared to CFDs, ETFs are exchange-traded products and have been around longer and are a more mature product. Like other exchange-traded products, the costs are higher and access is via a traditional broker. (5) Physical Shares, Commodities and FX:- this is the traditional way to trade financial markets, this requires a relationship with a broker in each country, require paying broker fees and commissions and dealing with settlement process for that product. With the advent of discount brokers, this has become easier and cheaper, but can still be challenging for retail traders particularly if trading in overseas markets. Without leverage this is capital intensive as all positions have to be fully funded. CFDs make it much easier to access global markets for much lower costs and much easier to move in and out of a position quickly. All forms of margin trading involve financing costs, in effect the cost of borrowing the money for the whole position. This is charged daily for all open positions and makes CFDs convenient if used under around 10 weeks, an estimated point where CFD financing charge exceeds financing charge for stocks, but more expensive for long term positions. (6) Margin Lending:- margin lending also known as Margin Buying or Leveraged Equities have all the same attributes as physical shares discussed earlier, but with the addition of leverage, which means like CFDs, futures, and options much less capital is required, but risks are increased. Since the advent of CFDs, many traders have moved from margin lending to CFD trading. The main benefits of CFD versus margin lending are that there are more underlying products, the margin rates are lower, and it is easy to go short. It can be difficult and expensive to short sell using physical shares and may not be possible at all, however it is just as easy to go short as to go long with a CFD. Even with the recent bans on short selling, CFD providers who have been able to hedge their book in other ways have allowed clients to continue to short sell those stocks. Criticism:- some financial commentators and regulators have expressed concern about the way that CFDs are marketed at new and inexperienced traders by the CFD providers. In particular the way that the potential gains are advertised in a way that may not fully explain the risks involved. In anticipation and response to this concern most financial regulators that cover CFDs specify that risk warnings must be prominently displayed on all advertising, web sites and when new accounts are opened. For example the UK FSA rules for CFD providers include that they must assess the suitability of CFDs for each new client based on their experience and must provide a risk warning document to all new clients, based on a general template devised by the FSA. The Australian financial regulator ASIC on its trader information site suggests that trading CFDs is riskier than gambling on horses or going to a casino. It recommends that trading CFDs should be carried out by individuals who have extensive experience of trading, in particular during volatile markets and can afford losses that any trading system cannot avoid. There has also been concern that CFDs are little more than gambling implying that most traders lose money trading

CFDs. It is impossible to confirm what the average returns are from trading as no reliable statistics are available and CFD providers do not publish such information, however prices of CFDs are based on publicly available underlying instruments and odds are not stacked against traders as the CFD is simply the difference in underlying price. There has also been some concern that CFD trading lacks transparency as it happens primarily over-the-counter and that there is no standard contract. This has led some to suggest that CFD providers could exploit their clients. This topic appears regularly on trading forums, in particular when it comes to rules around executing stops, and liquidating positions in margin call. Although the incidence of these types of discussions may be due to traders' psychology where it is hard to internalise a losing trade and instead they try to find external source to blame. This is also something that the Australian Securities Exchange, promoting their Australian exchange traded CFD and some of the CFD providers, promoting direct market access products, have used to support their particular offering. They argue that their offering reduces this particular risk in some way. The counter argument is that there are many CFD providers and the industry is very competitive with over twenty CFD providers in the UK alone. If there were issues with one provider, clients could easily switch to another. Some of the criticism surrounding CFD trading is connected with the CFD brokers' unwillingness to inform their users about the psychology involved in this kind of high-risk trading. Factors such as the fear of losing that translates into neutral and even losing positions become a reality when the users change from a demonstration account to the real one. This fact is not documented by the majority of CFD brokers. Criticism has also been expressed about the way that some CFD providers hedge their own exposure and the conflict of interest that this could cause when they define the terms under which the CFD is traded. One article suggested that some CFD providers had been running positions against their clients based on client profiles, in the expectation that those clients would lose, and that this created a conflict of interest for the providers. Bucket Shops:- CFDs, when offered by providers under the market maker model, have been compared to the bets sold by bucket shops, which flourished in the United States at the turn of the XX century. These allowed speculators to place highly leveraged bets on stocks generally not backed or hedged by actual trades on an exchange, so the speculator was in effect betting against the house. Bucket shops, colorfully described in Jesse Livermore's semi-autobiographical 'Reminiscences of a Stock Operator', are illegal in the United States according to criminal as well as securities law. Contract For Differences (CFD) is an arrangement made in a futures contract whereby differences in settlement are made through cash payments, rather than the delivery of physical goods or securities. This is generally an easier method of settlement because losses and gains are paid in cash. CFDs provide investors with the all the benefits and risks of owning a security without actually owning it. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). CONTRACT GRADE = КОНТРАКТНЫЙ СОРТ (или ДОГОВОРНЫЙ СОРТ) – Contract Grade:- that grade of commodity that has been officially approved by an exchange as deliverable in settlement of a futures contract. See also Base Grade, Deliverable Grade and Par. Contract Grades is a quality definition established by the exchange to represent the standard type of grain acceptable for delivery against a futures contract. Included in the specification is the premium or discount for delivery of a nonstandard quality or type of grain. / Контрактный Сорт или Договорный Сорт:- тот сорт сырья, который официально утверждён биржей в качестве поставочного при взаиморасчёте по фьючерсному контракту. Смотрите также Базовый Сорт (Base Grade), Поставляемый Сорт (Deliverable Grade) и База (Par).

CONTRACTING PARTIES = ДОГОВАРИВАЮЩИЕСЯ СТОРОНЫ (или КОНТРАКТУЮЩИЕ СТОРОНЫ, или СТОРОНЫ ПО КОНТРАКТАЦИИ) – (1) Contracting Parties are the signatory countries to the GATT (short for the General Agreement on Tariffs and Trade). These countries have accepted the specified obligations and privileges of the GATT agreement. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

(2) In the patent law, Contracting Party is a country or intergovernmental organization that is a member of the Madrid Protocol.

CONTRACTING STATE = ДОГОВАРИВАЮЩЕЕСЯ ГОСУДАРСТВО – In the international patent law, Contracting State is a national office or an intergovernmental organization which is party to the Patent Cooperation Treaty.

CONTRACTION = КОНТРАКЦИЯ (или СЖАТИЕ, или СОКРАЩЕНИЕ, или СЖИМАНИЕ, или СТЯГИВАНИЕ) – Contraction (Latin:- Contrahere = Shrink) is a reduction in volume. / Под Контракцией, от Латинского слова Contractio, означающее Сжатие или Стягивание, понимается уменьшение в объёме.

CONTRACTION = УРАБОТКА (или СЖАТИЕ, или СУЖЕНИЕ, или СОКРАЩЕНИЕ, или УПЛОТНЕНИЕ, или УКРУТКА) – Contraction:- shrinkage is the contraction in the dimension of the fabric due to usage. Cotton fabric suffers from two main disadvantages of shrinking and creasing during subsequent washing. Creasing is overcome by the resin finishing whereas the shrinking is prevented by a special finishing known as Sanforising and the machine used for that purpose is known as Zero-Zero Preshrinking. See also Take-Up (Twist) or Take-Up (Yarn In Fabric). Twist Contraction and Retraction is very necessary to know for the best service on yarn spinning section. By contraction and retraction factor you will know when the textile yarn is followed a longer path for migration during twisting or how to maintain the draft setting properly. Twist Contraction or Textile Yarn:- normally before twisting, yarn contains textile fibre individually in extended state. By twisting yarn is contracted and mass per unit length increases because when yarns are twisted, the fibers in the yarn have to follow a longer path for migration. For staple fiber yarn, this phenomenon is called Contraction. For filament yarn this is called Retraction. Contraction Factor:- contraction factor indicates the factor by which the draft must be adjusted to prevent the twist contraction from decreasing the size or count of staple spun yarn. Contraction factor may be expressed as:- CY = Length of Zero Twist Yarn / Length of Twisted Yarn. The contraction factor, which ranges from 1 for no contraction to infinity for contraction to zero length. Retraction Factor of Yarn:- it represents the fractional decrease in length or increase in the linear density or twisting continuous filament yarns. Retraction factor is expressed as:- RY = Length of Zero Twisted Yarn Length/ Length of Zero Twist Yarn. / Под Сужением Полотна понимается порок в виде отклонения от заданной ширины полотна.

CONTRACT LOGISTICS = КОНТРАКТНАЯ ЛОГИСТИКА – Contract Logistics:- the contracting out of all the warehousing, transport and distribution activities or a part thereof by manufacturing companies. Contract Logistics:- the outsourcing of resource management tasks to a third-party company. Contract logistics companies handle activities such as designing and planning supply chains, designing facilities, warehousing, transporting and distributing goods, processing orders and collecting payments, managing inventory and even providing certain aspects of customer service. Examples of major contracts logistics companies include United Parcel Service, Kuehne + Nagel, Exel, Genco and DHL. Logistics management is an important component of many companies' profitability and overall success. While some companies manage their own logistics, others find it more efficient to hire specialized contract logistics companies to manage their logistics for them. Contract logistics companies often need to develop a deep understanding of how

different industries work in order to best manage the logistics of a variety of companies. / Объединённая Посылочная Служба (United Parcel Service), Кюнэ плюс Нагэль (Kuehne + Nagel), Эксэл (Exel), Дьженько (Genco) и Ди.Эйч.Эл. (DHL).

CONTRACT MARKET = РЫНОК КОНТРАКТОВ – (1) Contract Market:- a board of trade or exchange designated by the US Commodity Futures Trading Commission to trade futures or options contracts under the Commodity Exchange Act. Commonly used to mean any exchange on which futures are traded. A contract market can allow both institutional and retail participants and can list for trading futures contracts on any commodity, provided that each contract is not readily susceptible to manipulation. Also known as Designated Contract Market. See also Derivatives Transaction Execution Facility. / Палата Торговли (Табло Торговли, если быть более точными) или биржа, .

(2) Contract Market:- sometimes the futures contract itself, e.g., Cotton is a contract market. / Рынок Контрактов:- иногда это может относиться к самому фьючерсному контракту, например, Хлопок является рынком контрактов.

CONTRACT MONTH = КОНТРАКТНЫЙ МЕСЯЦ – Contract Month:- typically identifies the month and year in which a futures contract expires. The month in which delivery is to be made in accordance with the terms of the futures contract. Also known as Delivery Month. Contract Month is the month in which futures contracts may be satisfied by making or accepting delivery. Also known as Delivery Month. / Месяц, в который фьючерсные контракты могут быть удовлетворена осуществлением или приёмом поставки. Также известен как Месяц Поставки (Delivery Month).

CONTRACT MULTIPLIER = КОНТРАКТНЫЙ МНОЖИТЕЛЬ – (1) Contract Multiplier is the number used to determine the Dollar value of an index futures or options contract. See also Contract Size.

(2) The Contract Multiplier (also called Contract Size) is different for most classes of options and is determined by each exchange. In the United States, the contract size for options on shares is 100. This means that every 1 option contract gives buyer the right to buy 100 shares from the option seller. So, if you buy 10 IBM option contracts, it means that you have the right to buy 1 000 IBM shares at expiration if the price is right (10 x 100). Note:- in other countries such as Australia, the contract multiplier for stock options is 1 000, which means the every option contract you buy entitles you to 1 000 underlying share contracts. So pay attention to the contract specs before you begin option trading. This also means that the price of the option is also multiplied by the contract multiplier. For example, say in the above you purchased 10 options contracts that were quoted in the marketplace for 15c, then you would actually pay the seller USD150. This is a crucial concept to understand. If you go out and buy 5 IBM share options for 15c that have a Strike Price of USD25, then you will; Pay the option seller USD75. If you decide to exercise your right and buy the shares, you will have to buy 500 (5 x 100) (100 being the contract size) shares at the exercise price of USD25, which will cost you USD12 500. In this case, your initial investment of USD75 has given you USD12 500 exposure in the underlying security. Option trading is very attractive for the small investor as it gives him/her the opportunity to trade a very large exposure whilst only outlaying a small amount of capital. Say you bought a USD25 call option for USD1 while the underlying shares were trading at USD26. If the market rallies to USD27 the option must at least be worth USD2 because you can exercise your right at USD25. So, even though the shares only went up 3.8% you doubled your money because you can now sell back the option for USD2. Penny stocks are also known to carry this type of risk/reward profile. Penny Stocks are companies that have very low share prices. You can buy some stocks for as little as 10c. It is much more common for a penny stock to trade from 10c to 20c than it is for Microsoft to trade from USD25 to USD50! For this reason penny stock trading is becoming very lucrative for online speculators. They can still trade the stocks outright as well as making massive returns if they are correct about their view on market direction. The only drawback with penny stocks is trying to pick which stocks to buy. I'm not that familiar with trading penny stocks, however, I know of a great site that provides stock picks for penny stocks every two weeks – 'penny stock affiliate link'. They have a free trial, so you can see for yourself whether penny stock trading is for you or not. Penny stocks can be risky though – there's a reason why they're so cheap, nobody wants them! So, be careful to act on the right information. / Ай.Би.Эм. (IBM). Число, используемое для определения долларовой стоимости фьючерса на индекс или опционного контракта на фьючерсный контракт на индекс.

CONTRACT NOTE = КОНТРАКТНАЯ НОТА (или КОНТРАКТНЫЙ БИЛЕТ) – Contract Note is a confirming note, containing details of a stock exchange deal, which is sent by a broker to a client. The contract note shows:- the date and time of deal, the title of the security, the number bought/sold, the price paid/received, the total value of the deal, the stamp duty (if a purchase of shares), and the amount of commission charged by the broker. Traditionally, contract notes were posted, but are now often emailed. Contract Note is a written document confirming a transaction between two dealers or a broker and a client which details the costs, type and quantity of shares traded. Contract Note is a confirmation of trades done on a particular day on behalf of the client by a trading member. It imposes a legally enforceable relationship between the client and the trading member with respect to purchase/sale and settlement of trades. It also helps to settle disputes/claims between the investor and the trading member. It is a prerequisite for filing a complaint or arbitration proceeding against the trading member in case of a dispute. A valid contract note should be in the prescribed form, contain the details of trades, stamped with requisite value and duly signed by the authorized signatory. Contract notes are kept in duplicate, the trading member and the client should keep one copy each. After verifying the details contained therein, the client keeps one copy and returns the second copy to the trading member duly acknowledged by him.

CONTRACT OF AFFREIGHTMENT = ДОГОВОР ФРАХТОВАНИЯ (или КОНТРАКТ ФРАХТОВАНИЯ) – Contract Of Affreightment (COA) is a service contract under which a ship owner agrees to transport a specified quantity of fuel products or specialty products, at a specified rate per ton, between designated loading and discharge ports. This type contract differs from a spot or consecutive voyage charter in that no particular vessel is specified. An agreement by a steamship line to provide cargo space on a vessel at a specified time and for a specified price to accommodate an exporter or importer. Contract of transporting certain amounts of cargo within a defined period. An agreement by an ocean carrier to provide cargo space on a vessel at a specified time and for a specified price to accommodate an exporter or importer. Contract Of Affreightment is an agreement whereby the shipowner agrees to carry goods by water, or supplies a vessel for the purpose of carrying goods by sea, in return for a sum of money called Freight. There are two forms:- (1) the charter party and (2) the contract contained in the Bill of Lading. / перевозить товары по воде, или . портами погрузки и разгрузки.

CONTRACT OF INDEMNITY = ДОГОВОР О ВОЗМЕЩЕНИИ (или КОНТРАКТ О ВОЗМЕЩЕНИИ) – Contract Of Indemnity:- the great principle of the law of insurance is that it is a contract for indemnity. The underwriter does not stipulate, under any circumstances, to become the purchaser of the subject-matter insured; it is not supposed to be in his contemplation:- he is to indemnify only. Ideally, the insured should be compensated only to the extent of his loss. In practice, however, this is not always easy to attain. Thus, a policy of insurance is not a perfect contract of indemnity.

CONTRACT OF MARINE INSURANCE = ДОГОВОР МОРСКОГО СТРАХОВАНИЯ (или КОНТРАКТ МОРСКОГО СТРАХОВАНИЯ) – A Contract Of Marine Insurance may cover mixed sea and land or sea and inland waters risks, e.g., the Transit Clause under the Institute Cargo Clauses:- 'warehouse to warehouse'. The Contract Of Marine Insurance is a special (insurance)

contract of indemnity which protects against physical and other losses to moveable property and associated interests, as well as against liabilities occurring or arising during the course of a sea voyage. A Contract Of Marine Insurance is a contract whereby the insurer undertakes to indemnify the assured, in manner and to the extent thereby agreed, against marine losses, that is to say, the losses incident to marine adventure.

CONTRACTOR = ПОДРЯДЧИК – The term Contractor means any person, small business firm, or nonprofit organization that is a party to a funding agreement. / Термин Подрядчик означает любое лицо, малую деловую фирму или безприбыльную организацию, которое является стороной соглашения о финансировании. Подряд, в гражданском праве договор, по которому одна сторона (Подрядчик) обязуется за свой риск выполнить определённую работу по заданию другой стороны (Заказчика) из её или своих материалов, а заказчик обязуется принять и оплатить выполненную работу. В бывшем Советском праве разновидностями договора подряда являлись договор на выполнение проектных, научно-исследовательских и конструкторских работ, договор по бытовому обслуживанию граждан и так далее. Отношения по договору подряда регламентировались Основами гражданского законодательства 1961, ГК Союзных республик, типовыми договорами, утверждёнными Советом Министров Союзных республик, и так далее. Выполнение работ по капитальному строительству регулируется особо. Подрядчиками выступают, как правило, социалистические организации, выполняющие работы как для других организаций и предприятий, так и для отдельных граждан в порядке бытового обслуживания (изготовление мебели, ремонт квартир и так далее). В некоторых случаях подрядчиками могут быть граждане (при условии выполнения ими работы своим трудом, а также при наличии удостоверений, выданных местными финансовыми органами на право занятия незапрещёнными промыслами). По договору подряда подрядчик обязан выполнить работу в точном соответствии с заданием заказчика, доброкачественно и в обусловленный срок. Если договор заключается во исполнение обязательного для сторон планового задания, то предусмотренный планом срок является обязательным для сторон. Подрядчик должен обеспечить сохранность вверенного ему заказчиком имущества, он отвечает за всякое упущение, повлекшее за собой утрату или повреждение этого имущества. Если такие последствия возникнут случайно, убытки и риск случайной гибели имущества несёт тот, кому принадлежало имущество. Стоимость выполненной работы определяется на основе утверждённых прейскурантов или сметы, если подрядчик – социалистическая организация, или по соглашению сторон, если подрядчиком является гражданин. При наличии в работе существенных отступлений от договора либо существенных недостатков заказчик вправе требовать расторжения договора и возмещения убытков. Об обнаруженных при приёмке явных недостатках заказчик должен заявить подрядчику немедленно, а если недостатки не были явными – немедленно по их обнаружении. При соблюдении этих требований он может предъявить к подрядчику иск по поводу явных недостатков в течение 6 месяцев, а по поводу других – в течение 1 года со дня принятия работы.

CONTRACTOR LOAN = ССУДА ПОДРЯДЧИКУ – Contractor Loan is a loan to a building contractor or craftsman for the financing of working capital (materials, salaries, etc). / Ссуда строительному подрядчику или ремонтникам для финансирования оборотного капитала (материалы, оклады и тому подобное).

CONTRACT PRICE = ДОГОВОРНАЯ ЦЕНА (или КОНТРАКТНАЯ ЦЕНА) – Contract Price, the bulk rate paid at a city loading terminal, on the basis of a long term supply contract. This is usually lower than the rack price, and will differ from one wholesale customer to another. See also Wholesale Price. Contract Price is a price of fuels marketed on a contract basis covering a period of 1 or more years. Contract prices reflect market conditions at the time the contract was negotiated and therefore remain constant throughout the life of the contract or are adjusted through escalation clauses. Generally, contract prices do not fluctuate widely.

CONTRACT RECEIPTS = ДОГОВОРНЫЕ ПОЛУЧЕНИЯ (или КОНТРАКТНЫЕ ПОСТУПЛЕНИЯ) – Contract Receipts are the purchases based on a negotiated agreement that generally covers a period of 1 or more years. Contract Receipts are the Deliveries received under a contract and covering a period of one year or more.

CONTRACT REVENUE = ДОГОВОРНАЯ ВЫРУЧКА (или КОНТРАКТНАЯ ВЫРУЧКА) – In the balance sheet, Contract Revenue for research and development is recorded as earned based on the performance requirements of the contract. Non-refundable contract fees for which no further performance obligations exist and where company is not continuously involved, are recognized upon the fulfilment of the contractual performance requirements.

CONTRACT SIZE = РАЗМЕР КОНТРАКТА – (1) Contract Size in futures trading is the amount of underlying asset represented by each futures contract. Contract size, also known as Contract Multiplier, is one of the most important basic concepts to understand in futures trading. Contract size not only affects the actual amount of the underlying asset you are controlling, it also affects how volatile the price of your futures position is when taken into consideration with the minimum tick of the futures contract. In fact, not being sensitive to the contract size of the futures contracts you are trading can result in surprising and unexpected losses as well as margin calls. What is Contract Size in Futures Trading? Contract size tells you how much of the underlying asset is covered by each futures contract and is an extremely important piece of information in futures trading because you need it to work out the 'Total Contract Value' which is the first step to calculating the 'Initial Margin' requirement. Contract size is also extremely important for risk management and calculating your stop loss point and we will discuss that below. For instance, the contract size of Wheat futures is 5 000 bushels. This means that a single wheat futures contract covers the trading of 5 000 bushels of Wheat. This means that by trading a single Wheat futures contract, you are trading the price movement of 5 000 bushels of Wheat at once. By final settlement, 5 000 bushels of Wheat will exchange hands between the two parties involved in that 1 contract of Wheat futures. This is the same for Single Stock Futures where one futures contract typically covers the trading of 100 shares of the underlying stock. For Index Futures, contract size is simply the cash value per point of the index covered. For instance, the contract size for Nikkei 225 Futures traded on CME is 500 yen per point. This means that if the Nikkei 225 index is trading at 1 000 points, 1 contract of Nikkei 225 Futures will have a contract value of 500 x 1 000 = 500 000 Yen. Since there is no physical asset behind an index future, the term 'Contract Multiplier' is more commonly used than 'Contract Size'. You can get the contract size of the futures contract you wish to trade from the specifications released by the exchange or broker. How Does Contract Size Affect Your Futures Trading? Contract size affects two main areas in futures trading; Capital Outlay and Price Movement Per Tick. The bigger the contract size, the bigger the capital outlay per contract due to a bigger total contract value. A bigger contract size also results in a bigger price movement per tick, making a futures position more volatile. How Contract Size Affect Capital Outlay? Capital outlay in futures trading comes in the form of 'Initial Margin'. Initial margin is a fraction of the total contract value that is paid as goodwill deposit when entering into a futures transaction. As such, the bigger the total contract value, the more initial margin is payable for a futures position since contract value is directly affected by contract size. As such, the bigger the contract size, the higher the contract value will be and therefore, the higher the capital outlay per contract. Example of How Contract Size Affect Capital Outlay:- the S&P 500 index futures contracts traded at CME has a contract size of USD250 per point and S&P 500 E-mini index futures has a contract size of USD50 per point. Lets assume that SPAN (short for Standard Portfolio Analysis of Risk) Margin requirement is 10.5% and the S&P 500 is currently at 1 000 points. (i) Capital outlay for 1 contract of S&P 500 Index Futures:- (USD250 x 1 000) x 10.5% = USD26 250. (ii) Capital outlay for 1 contract of S&P 500 E-mini Index Futrues:- (USD50 x 1 000)

x 10.5% = USD5 250. How Contract Size Affect Price Movement Per Tick? Futures prices move in what are known as 'Ticks'. You will always see a parameter known as 'Minimum Tick' in every futures specification. This specifies the amount of money moved in a single 'tick'. For instance, if a futures contract has a minimum tick of USD0.10, it's price will move by units of USD0.10. Contract size and minimum tick work together to tell us how much the price of a futures contract will move in actual Dollars per tick. Therefore, the higher the contract size, the higher the price movement per tick given the same minimum tick, resulting in higher price volatility. Example of How Contract Size Affect Price Movement:- the S&P 500 index futures contracts traded at CME has a contract size of USD250 per point and minimum tick of 0.10 index point; and S&P 500 E-mini index futures has a contract size of USD50 per point and minimum tick of 0.25 index point. (i) Price movement per tick for S&P 500 Index Futures:- USD0.10 x 250 = USD25; and (ii) Price movement per tick for S&P 500 E-mini Index Futures:- USD0.25 x 50 = USD12.5. As we can see from the example above, the price movement per tick for the S&P 500 index futures is higher than the E-mini even though its minimum tick is lower due to its much higher contract size. Even though the S&P 500 Index Futures has a higher price movement per tick, it is actually less volatile relative to its capital outlay than its E-mini contracts. In the commodity futures market, traders who wants a smaller contract size frequently trades in futures contracts of a related commodity with a smaller contract size rather than futures contracts of the actual commodity in mind. Total Contract Size and Total Contract Value:- for futures traders trading futures positions many contracts at a time, knowing the contract size is the first step to calculating the total contract size and total contract value of the futures position. This tells you your extent of exposure and is the first step to risk management in futures trading. Calculating Total Contract Size and Total Contract Value:- assuming a near term Wheat futures contract is trading at 729.2 cents per bushel with a contract size of 5 000 bushels. You decide to go long on 5 contracts. Total Contract Size = 5 000 x 5 = 25 000 Bushels; and Total Contract Value = 729.2 x 25 000 = 18 230 000 cents or USD1 823 000. By going long on 5 contracts of the above Wheat futures, you are exposed to the trading of 25 000 bushels of Wheat with a total value of USD1 823 000. Contract Size is the actual amount of a commodity represented in a contract. / Индекс по 225 от Никкэй (Nikkei 225). Эс.ЭндПи. 500 (S&P 500). Фактическое количество сырья, предлагаемое по контракту.

(2) The Contract Size of an exchange-traded equity option is standardised at 1 000 underlying shares. To calculate the Dollar value of an index options or futures contract, a contract multiplier is applied.

(3) Contract Size:- number of options contained in a contract. Under contracts bought on SOFFEX one option hedges one share. / Количество опционов, приходящихся на один контракт. По контрактам, купленным на СОФЭКСе, один опцион хэдьжирует одну акцию.

CONTRACT SPECIFIC CHARTS = ГРАФИКИ ПО ВЫБРАННОМУ КОНТРАКТУ – Contract Specific Charts contain data for only one contract. They follow the specified contract through expiration. / Графики по Выбранному Контракту содержат данные только по одному контракту. По выбранному контракту эти данные используются вплоть до прекращения его признания.

CONTRACT TRADING VOLUME = ОБЪЁМ ТОРГОВЛИ ПО КОНТРАКТУ – Contract Trading Volume is a daily trading volume. / Объём Торговли По Контракту – объём торговли за день.

CONTRACTUAL CAPACITY = КОНТРАКТНОЕ ПОЛНОМОЧИЕ – Contractual Capacity is an ability to conduct legal transactions on the basis of effective statements of volition. A distinction is made between full contractual capacity, limited contractual capacity (in which the declarations of intent are ineffective pending confirmation) and contractual incapacity (in which the statements of volition are null and void). As a rule, individuals obtain full contractual capacity on their 18th birthday.

CONTRACTUAL LIABILITY = КОНТРАКТНАЯ ОТВЕТСТВЕННОСТЬ (или ДОГОВОРНАЯ ОТВЕТСТВЕННОСТЬ, или ОБЯЗАТЕЛЬСТВО ПО ДОГОВОРУ) – Contractual Liability is a liability assumed under any contract or agreement. Coverage is generally limited in liability policies, but in most cases may be provided for an additional premium. See also Liability, and Obligation. / Обязательство, гражданское правоотношение, в силу которого одна сторона (должник) обязана совершить в пользу другой стороны (кредитора) определённое действие (передать имущество, выполнить работу, уплатить деньги) либо воздержаться от него. Кредитор, в свою очередь, имеет право требовать от должника исполнения его обязанности. По Советскому праву сторонами обязательства являются социалистические организации и граждане; возникают обязательства, как правило, из договора, актов планирования и иных административных актов, вследствие причинения имущественного вреда, подлежащего возмещению, неосновательного приобретения или сбережения имущества и так далее. В зависимости от содержания прав и обязанностей сторон различают обязательства, направленные на:- возмездное или безвозмездное отчуждение (приобретение) имущества в собственность или оперативное управление; возмездное или безвозмездное предоставление имущества в пользование; выполнение работ и оказание услуг; охрану социалистической и личной собственности, иных имущественных прав. При наличии в обязательстве нескольких кредиторов и нескольких должников порядок его исполнения участниками определяется в зависимости от предмета обязательства и условий соглашения сторон. Если каждый из участников обязательства обязан его исполнить в определённой (равной или неравной) доле, такое обязательство называется Долевым Обязательством. Если кредитор вправе требовать от любого из должников выполнения обязательства полностью (что означает освобождение от ответственности других участников обязательства), такое обязательство называется Солидарным Обязательством. Исполнение обязательства может обеспечиваться дополнительным обязательством (смотрите Обеспечение Исполнения Обязательств). Если обязательство не исполняется добровольно, к обязанному лицу могут быть применены меры государственного принуждения (путём обращения кредитора в суд или арбитраж). Обязательство прекращается после его исполнения путём зачёта встречных однородных требований; по соглашению сторон; в связи с невозможностью исполнения обязательства, за которую должник не отвечает; ликвидацией юридического лица (должника или кредитора), если исполнение обязательства в этом случае законодательство не возлагает на другое юридическое лицо, и другому.

CONTRACTUAL SETTLEMENT = КОНТРАКТНЫЙ РАСЧЁТ (или РАСЧЁТ ПО ДОГОВОРУ) – Contractual Settlement is an arrangement whereby the customer is credited with the sale proceeds on the contractual settlement date regardless of whether the proceeds have been received. In the case of purchases, the customer's account will be debited on the contractual settlement date regardless of whether the securities have been received. If the securities or proceeds have not been received by an agreedupon date, the transaction typically will be reversed. See also Actual Settlement.

CONTRACT UNIT = ЕДИНИЦА КОНТРАКТА – Contract Unit is the actual amount of a commodity represented in a contract. See also Contract Size. / Единица Контракта:- фактическое количество сырья, предлагаемое по контракту. Смотрите также Размер Контракта (Contract Size).

CONTRACT WAREHOUSE = КОНТРАКТНЫЙ СКЛАД (или ДОГОВОРНЫЙ СКЛАД) – Contract Warehouse is a warehouse operation managed by a third party logistics (3PL) provider for a specified period of time. The 3PL manages a client's inventory and order fulfillment processes. Pricing scenarios may vary, and storage, labor and equipment resources are typically dedicated to the client for the duration of the contract. The client may or may not share in the building and equipment expense.

CONTRAFACTION = КОНТРАФАКЦИЯ (или ПОДДЕЛКА) – Contrafaction is a counterfeiting, imitating. In the French law contrafaction (contrefacon) is the illegal reprinting of a took for which the author or his assignee has a copyright, to the prejudice of the latter. See also Falsification, and Forgery. / Под Контрафакцией, от позднеЛатинского слова Contrafactio, означающее Подделка, от Латинских слов Contra, означающее Против, и Facio, означающее Делаю, понимается использование отдельными фирмами на своих товарных знаках обозначений, помещаемых на популярных товарах других фирм, в целях недобросовестной конкуренции и введения в заблуждение покупателей.

CONTRARY OPINION = ПРОТИВОПОЛОЖНОЕ МНЕНИЕ – Contrary Opinion:- a trading philosophy that tries to position against the overwhelming belief of the market in the theory that the masses are normally wrong at market extremes.

CONTRAST = КОНТРАСТ – Contrast:- objective, the degree of dissimilarity of a measured quantity such as luminance of two areas, expressed as a number computed by a specified formula. / Под Контрастом, от Французского слова Contraste, понимается:- (1) резко выраженная противоположность; и (2) отношение разности яркостей объекта и фона к их сумме. Пороговый контраст – минимальный контраст, воспринимаемый глазом. Под Контрастом, от Французского слова Contraste, означающее Резко Выраженная Противоположность, в психологии понимается субъективное преувеличение различий воспринимаемых объектов или отдельных участков поля зрения при их пространственной (‘одновременный контраст’) или временной (‘последовательный контраст’) смежности в восприятии. Так, чёрный цвет рядом с белым выглядит ещё чернее. Контраст может проявляться также в изменении цвета:- серый квадрат на красном фоне кажется зелёно-голубым, на синем – оранжевым. Наиболее резко контрастный цвет выражен на границе двух областей (‘краевой контраст’). Противоположностью контраста выступает явление Ассимиляции. Явление контраста широко применяется в различных видах искусства и литературе. Контраст фотографический, характеристика чёрно-белого фотографического изображения по соотношению яркостных свойств его самого светлого и самого тёмного участков. Наиболее употребительны следующие два способа определения фотографического контраста:- (1) через коэффициенты пропускания τ (для изображений на фотоплёнках) или коэффициенты отражения ρ (для изображений на фотобумаге) – $(\tau_{max} - \tau_{min}) / (\tau_{max} + \tau_{min})$; или, соответственно, $(\rho_{max} - \rho_{min}) / (\rho_{max} + \rho_{min})$; (2) как разность оптических плотностей $D_{max} - D_{min}$ (так называемый интервал плотностей фотографического изображения). Фотографический контраст тем больше, чем контрастнее сам объект фотографирования и чем больше коэффициент контрастности фотографического материала (если условия фотографирования выбраны правильно). Контраст – градационная характеристика чёрно-белого или цветного изображения по различию в светлоте (насыщенности цвета) его наиболее ярких и наиболее тёмных участков. Количественно выражается отношением максимального и минимального коэффициентов пропускания (отражения) света. Как правило, количественно контраст определяют как разность максимальной и минимальной оптических плотностей (интервал оптических плотностей) изображения. Играет значительную роль при оценке оригиналов, масок, фотоформ и качества печати.

CONTRASTING CLASSES = КОНТРАСТИРУЮЩИЕ КЛАССЫ – In the United States, Contrasting Classes are:- (i) Durum Wheat, Soft White Wheat, and Unclassed Wheat in the classes Hard Red Spring Wheat and Hard Red Winter Wheat; (ii) Hard Red Spring Wheat, Hard Red Winter Wheat, Hard White Wheat, Soft Red Winter Wheat, Soft White Wheat, and Unclassed Wheat in the class Durum Wheat; (iii) Durum Wheat and Unclassed Wheat in the class Soft Red Winter Wheat; and (iv) Durum Wheat, Hard Red Spring Wheat, Hard Red Winter Wheat, Soft Red Winter Wheat, and Unclassed Wheat, in the classes Hard White Wheat and Soft White Wheat.

CONTRAST RATIO = СООТНОШЕНИЕ КОНТРАСТОВ (или КОЭФФИЦИЕНТ КОНТРАСТНОСТИ, или СООТНОШЕНИЕ КОНТРАСТА (или ЧЁТКОСТИ, или РЕЗКОСТИ)) – Contrast Ratio:- in color measurement, a sample is measured over a white background, then over a black background and the ratio expressed either as a percentage (where 100% = complete opacity) or as a ratio to 1. See also Contrast, and Opacity.

CONTRIBUTED SURPLUS = ВНЕСЁННЫЙ ИЗЛИШЕК – Contributed Surplus:- that portion of shareholders’ equity which originates from sources other than earnings, such as the initial sale of stock above par value. Another source is due to the accounting for compensation expenses due to the granting of stock options.

CONTRIBUTING EXCESS = СОПУТСТВУЮЩИЙ ИЗЛИШЕК – In reinsurance, Contributing Excess:- where there is more than one reinsurer sharing a line of insurance on a risk in excess of a specified retention, each such reinsurer shall contribute towards any excess loss in proportion to his original participation in such risk. Example:- Retention USD100 000.00, Reinsurer A accepts one-half contributing share part of USD1 000 000.00 in excess of said USD100 000.00. Reinsurer B accepts remaining one-half contribution share part of USD1 000 000.00.

CONTRIBUTING SHARES = УЧАСТВУЮЩИЕ АКЦИИ – Contributing Shares are the shares that have been partly paid for. At a future date the shareholder will be required to pay the balance outstanding, unless the company is a no liability company in which case shares can be forfeited instead. Contributing Shares are also known as Partly Paid Shares. These shares are usually issued, such that part of the price that is payable immediately and a balance is then due by an instalment, or instaments payment at a future date. If the company is a no liability company the shares can be forfeited instead. Contributing shares can be bought and sold on the Australian Securities Exchange (ASX) like any other share, with the future amount owing being carried over to the new owner. Recently, a number of investors and traders were caught out when they bought shares in a company that had dramatically fallen in value to less than a cent, hoping to make a quick profit. Unfortunately the shares they bought had a AUD1 instalment due within a short time frame. A lot of people faced financial ruin because of the large numbers of shares they had bought. This clearly brings home the message that it is imperative that you know exactly what it is you are buying.

CONTRIBUTION = КОНТРИБУЦИЯ (или ОТЧИСЛЕНИЕ) – (1) By Contributions is also meant forced levy of money or property by a belligerent in a hostile country which he occupies, by which means the country is made to contribute to the support of the army of occupation. These contributions are usually taken instead of pillage. / Смотрите также Контрибуция В Натуре (Contribution In Kind). Под Контрибуцией, от Латинского слова Contributio, понимаются:- (i) платежи, налагаемые на побеждённое государство в пользу победителя. В настоящее время такая контрибуция запрещена международным правом; или (ii) принудительный денежный сбор, взимаемый неприятелем с населения оккупированной местности. Под Контрибуцией понимается:- (1) суммы, которые побеждённое государство по условиям мирного договора уплачивает победителю. (2) Принудительные денежные сборы, взимаемые неприятельскими войсками с населения оккупированной местности. Исторически оба типа контрибуции возникли на основе военного грабежа, самой ранней формой которого было присвоение военной добычи, характерное для войн рабовладельческих и феодальных эпох. Распространённой формой военного грабежа была также Дань, с юридической точки зрения являвшаяся обязательством побеждённого государства уплачивать в знак подчинения государству-победителю в течение определённого времени деньги, поставлять товары и так далее. С конца XVIII века неизменным условием мирных договоров становится контрибуция как общее обязательство побеждённого уплатить победителю определённую сумму, кроме взысканий, произведённых с населения во время войны. Контрибуция рассматривалась как одно из безусловных ‘прав’,

вытекающих из факта победы. Для новейшей истории характерно было установление связи между контрибуцией и военными расходами победителя, в покрытие которых она и взималась. К военным расходам иногда относили также ущерб, понесённый гражданским населением от разрушений, военных реквизиций и так далее. Бывший СССР с первых дней своего существования выступило против контрибуции как формы грабежа побеждённых народов и предложило всем участникам Первой Мировой Войны 1914–18 заключить мир без аннексий и контрибуции. Это требование нашло закрепление в Декрете о Мире, который провозгласил новые принципы внешней политики социалистического государства. Под давлением общественного мнения и благодаря выступлениям Советской дипломатии с разоблачением грабительской сущности контрибуции державы Антанты при разработке условий Версальского Мирного Договора 1919 вынуждены были формально отказаться от контрибуции, заменив её Репарациями. Приложение к 4-й Гаагской Конвенции 1907 'О Законах и Обычаях Сухопутной Войны', провозгласив, что 'частная собственность не подлежит конфискации' (Статья 46) и что 'грабёж безусловно воспрещается' (Статья 47), вместе с тем допускает контрибуции, взыскиваемые в ходе войны в виде взимания установленных в пользу государства налогов, пошлин и денежных сборов и сборов, необходимых для нужд армии или управления занятой областью. После Второй Мировой Войны 1939–45 благодаря твёрдой позиции бывшего СССР мирные договоры 1947 последовательно проводили принцип недопущения контрибуций. Выработанная с учётом опыта Второй Мировой Войны Женевская Конвенция 1949 о 'Защите Гражданского Населения Во Время Войны' запрещает взимание какой-либо контрибуции.

(2) In civil law, Contribution is a partition by which the creditors of an insolvent debtor divide, among themselves the proceeds of his property, proportionably to the amount of their respective credits.

(3) Contribution:- something given to create or increase business capital, in exchange for an ownership interest in the business or its profits. Contributions may be in the form of cash or assets, such as accounts receivable, buildings, land, machinery or securities of another corporation. See also Contribution In Kind. A business's after tax profit that contributes to unallocated central interest, overhead and goodwill.

(4) The principle whereby if two or more insurers indemnify the insured in respect of the same subject-matter against the same peril on behalf of the same interest, they share the loss or liability proportionately. Contribution:- when more than one policy covers the same risk, each insurer contributes by paying its rateable proportion of any loss. The term Contribution relates to circumstances where more than one party covers the risk. Each party is deemed to be liable for his proportion of the loss. If the assured recovers in full from one insurer, that insurer is entitled to recover from the other insurer for that part of the loss which should have been paid by the latter. The term is used in marine insurance, also, in relation to contributions paid by the assured in connection with salvage and/or general average.

(5) Contribution:- in contracts, when two or more persons jointly owe a debt, and one is compelled to pay the whole of it, the others are bound to indemnify him for the payment of their shares; this indemnity is called a Contribution. The subject will be considered by taking a view, (1) Of right of the creditors where there are several debtors. (2) Of the right of the debtor who pays the whole debt. (3) Of the liabilities of the debtors who are liable to contribution. (4) Of the liability of land owned by several owners, when it is subject to a charge. (5) Of the liability of owners of goods in a vessel, when part is thrown overboard to save the rest. (1) The creditor of several debtors, jointly bound to him, has a right to compel the payment by any he may choose; but he cannot sue them severally, unless they are severally bound. (2) When one of several debtors pays a debt, the creditor is bound in conscience, if not by contract, to give to the party paying the debt all his remedies against the other debtors. (3) A debtor liable to contribution is not responsible upon a contract, but is so in equity. But courts of common law, in modern times, have assumed a jurisdiction to compel contribution among sureties, in the absence of any positive contract, on the ground of an implied assumpsit, and each of the sureties may be sued for his respective quota or proportion. The remedy in equity is, however, much more effective. For example, a surety who pays an entire debt, can, in equity, compel the solvent sureties to contribute towards the payment of the entire debt. But at law he can recover no more than an aliquot part of the whole, regard being had to the number of co-sureties. (4) When land is charged with the payment of a legacy, or an estate with the portion of a posthumous child, every part is bound to make contribution. (5) Contribution takes place in another case; namely, when in order to save a ship or cargo, a part of the goods are cast overboard, the ship and cargo are liable to contribution in order to indemnify the owner of the goods lost, except his just proportion. No contribution can be claimed between joint wrong doers.

(6) Contributions:- in public law, taxes or money contributed to the support of the government.

(7) Contributions are of three kinds, namely:- first, those which arise from persons on account of their property, real or personal, or which are imposed upon their industry – those which are laid on and paid by real estate without regard to its owner; and – those to which personal property is subject, in its transmission from hand to hand, without regard to the owner.

(8) Contributions is a generic term which includes all kinds of impositions for the public benefit.

CONTRIBUTION IN KIND = КОНТРИБУЦИЯ В НАТУРЕ (или ВЗНОСЫ В ФОРМЕ МАТЕРИАЛЬНЫХ ЦЕННОСТЕЙ) – Contribution In Kind:- property, usually shares of stock in another corporation, given in exchange for capital stock in a new or existing corporation, which becomes part of the paid-in capital.

CONTRIBUTION MARGIN = КОНТРИБУЦИОННАЯ МАРЖА – Contribution Margin is the remainder from sales after covering variable expenses and, therefore, the amount remaining to cover fixed expenses and generate profits. Used to calculate Break Even Sales and Net Profit Yield from sales above the break even point. Contribution towards fixed costs. Freight revenue minus variable costs. Contribution Margin is a cost accounting concept that allows a company to determine the profitability of individual products. It is calculated as follows:- Contribution Margin = (Product Revenue – Product Variable Costs) / Product Revenue. The phrase 'contribution margin' can also refer to a per unit measure of a product's gross operating margin, calculated simply as the product's price minus its total variable costs. Consider a situation in which a business manager determines that a particular product has a 35% contribution margin, which is below that of other products in the company's product line. This figure can then be used to determine whether variable costs for that product can be reduced, or if the price of the end product could be increased. If these options are unattractive, the manager may decide to drop the unprofitable product in order to produce an alternate product with a higher contribution margin.

CONTRIBUTORY VALUE = КОНТРИБУЦИОННАЯ СТОИМОСТЬ – Contributory Value is the value of property saved by a general average or salvage act, on which the contribution by each interest to the loss is calculated. The value on which a contribution to a general average loss or salvage award is calculated. Contributory Value is the value of a ship, its cargo and freight, on which general average contributions are based.

CONTROL = БОРЬБА (или КОНТРОЛЬ) – Control (of a pest) is a suppression, containment or eradication of a pest population. Control is:- (1) (verb) to check, to have power and authority, to guide, to make available, to manage, to be reliant on another's action or

permission, to restrain, mechanism that regulates, to study the basis for comparing results, to reduce the incidence or severity of problems. (2) (noun) A check used to compare with different treatments in an experiment.

CONTROL = КОНТРОЛЬ – Control is the power to govern the financial and operating policies of an entity so as to obtain benefits from activities. Control:- this generally refers to the 'voting control' which a shareholder can exert. If a shareholder owns more than 51% of the common shares of a company, he has unequivocal voting control, i.e. she cannot be out-voted by anyone. This is true for public and for private companies (except that, in public companies there may be certain matters which require a 'majority of the minority' vote to prevent control persons from taking undue advantage of minority shareholders). In the case of public companies, a person can obtain control by owning a relatively small percentage of shares, even 10% or less. For example, if a company is widely held (i.e. it has many shareholders) it is unlikely that many shareholders will vote and those that do, usually send in their proxies allowing management to vote their shares. Hence, if only 20% of a companies shareholders decide to vote, it is possible for one shareholder to control a majority of this 20% vote.

CONTROL AREA = ЗОНА КОНТРОЛЯ (или КОНТРОЛИРУЕМАЯ ЗОНА) – Control Area:- an electric power system or combination of electric power systems to which a common automatic control scheme is applied in order to:- (i) match, at all times, the power output of the generators within the electric power system(s) and capacity and energy purchased from entities outside the electric power system(s), with the load in the electric power system(s); (ii) maintain, within the limits of Good Utility Practice, scheduled interchange with other Control Areas; (iii) maintain the frequency of the electric power system(s) within reasonable limits in accordance with Good Utility Practice; and (iv) provide sufficient generating capacity to maintain operating reserves in accordance with Good Utility Practice. Control Area is a large geographic area within a utility (or group of utilities) regulates electric power generation in order to maintain scheduled interchanges of power with other control areas and to maintain the required system frequency. / Крупная географическая зона, в пределах которой электростанция (или группа электростанций) регулирует генерацию электроэнергии для поддержания планового энергообмена с другими зонами контроля и обеспечения необходимой частоты электротока в энергосистеме.

CONTROL AREA OPERATOR = ОПЕРАТОР ЗОНЫ КОНТРОЛЯ (или ОПЕРАТОР КОНТРОЛИРУЕМОЙ ЗОНЫ) – Control Area Operator is an electric entity that operates generating capacity to meet area demand, monitors actual interchange (electric energy flowing between control areas), and can dispatch generating resources to ensure that actual interchange equals scheduled interchange. / Электроэнергетическое предприятие, которое распределяет произведённую энергию для удовлетворения спроса данной зоны, и отслеживает фактический взаимообмен (потоками электроэнергии между зонами контроля), и может перенаправлять произведённые ресурсы таким образом, чтобы фактический энергообмен соответствовал запланированному.

CONTROL BLOCK = КОНТРОЛЬНЫЙ БЛОК (или УПРАВЛЯЮЩИЙ БЛОК, или КОНТРОЛЬНЫЙ ПАКЕТ) – Control Block occurs when a shareholder holds a significant (not necessarily a majority) of the shares in the company. It often refers to the largest shareholder(s) or shareholdings. It is called a Control Block because the holder of this block of stock can effectively control decision making within the company. Often, it is the founder or chief executive officer (CEO) of a company, e.g., Bill Gates obviously holds a control block in Microsoft. / Бил Гейтс (Bill Gates) в Майкрософт (Microsoft).

CONTROLLED ACCOUNT = КОНТРОЛИРУЕМЫЙ СЧЁТ (или ПОДКОНТРОЛЬНЫЙ СЧЁТ) – Controlled Account is any account for which trading is directed by someone other than the owner. Also known as Discretionary Account, or Managed Account.

CONTROLLED AREA = КОНТРОЛИРУЕМЫЙ АРЕАЛ (или ПОДКОНТРОЛЬНЫЙ АРЕАЛ) – Controlled Area is a regulated area which an National Plant Protection Organization (NPPO) has determined to be the minimum area necessary to prevent spread of a pest from a quarantine area.

CONTROLLED ATMOSPHERE = КОНТРОЛИРУЕМАЯ АТМОСФЕРА – Controlled Atmosphere (CA):- Sophisticated, computer-controlled systems that manage the mixtures of gases within a container throughout an intermodal journey reducing decay. For example, an artificial reduction of the level of oxygen and increase in the level of carbon dioxide to extend the lifetime of goods. / снижающая загнивание или замедляющая гниение. Под Контролируемой Атмосферой понимается смесь газов (азот, водород, гелий, пары воды, фтористый водород и другие), которой заполняют рабочее пространство печей и установок для термической или химико-термической обработки металлических изделий выращивания кристаллов, варки стекла, нанесения покрытий и так далее. Различают нейтральную атмосферу (5% водорода, остальное азот), при которой исключается окисление изделий (светлая термическая обработка), и активную атмосферу (состав её зависит от технологии обработки), применяемую для обезуглероживания, науглероживания, восстановления оксидов и других видов воздействия на изделия, сопровождающихся изменением химического состава материала.

CONTROLLED TRAFFIC = КОНТРОЛИРУЕМОЕ ПЕРЕДВИЖЕНИЕ – Controlled Traffic is a tillage in which all operations are performed in fixed paths so that recompaction of soil by machinery does not occur outside the selected paths.

CONTROLLER = КОНТРОЛЁР – (1) In the United States, Controller is experienced accountant who directs internal accounting processes and procedures, including cost accounting.

(2) Controller is a person who, in the Australian Securities Exchange's (ASX's) opinion, has a substantial interest in the equity of the holder of, or a substantial economic interest in, restricted securities and each intermediate entity through which that interest occurs.

CONTROLLER OF CONTINUOUS FEEDER = КОНТРОЛЛЕР НЕПРЕРЫВНОГО ПИТАТЕЛЯ – Controller Of Continuous Feeder:- in spinning process, with the Crosrol continuous feeding system, individual machine production rates are optimized to give continuous material flow between all blowroom machines and the cards thus ensuring maximum machine utilization and opening/cleaning efficiencies. / В прядильном производстве.

CONTROL LIMIT = КОНТРОЛЬНЫЙ ЛИМИТ – (1) In Cotton industry, 'Control Limit' means the variation in micronaire readings taken on different instruments, using the same Cotton. Extreme limit of variation allowed, in all experimental measures, between the indications reached by laboratory testing when a lot is made up, and those found when the lot is controlled. The variation in Micronaire readings which is generally regarded as normal as between instruments and which must therefore be accepted unless specifically excluded by the term of the contract. / Изменение показателей Майкронэйр, которое обычно рассматривается как нормальное для измерений соответствующими приборами, и которое должно быть принято сторонами, если только это не исключено условиями контракта.

(2) In Cotton industry, 'Control Limit' means the variation in strength readings that may be commonly expected from different instruments or from the same instrument at different times, using the same cotton.

CONTROLLING INTEREST = КОНТРОЛИРУЮЩИЙ ПРОЦЕНТ – (1) Controlling Interest:- sufficient holding of voting shares in a company (more than 50%) to give a single shareholder control of the company. Legally, a director has a controlling interest if he or she

owns more than 20% of the voting shares. Controlling Interest in a corporation means to have control of a large enough block of voting stock shares in a company such that no one stock holder or coalition of stock holders can successfully oppose a motion. In theory this could mean that controlling interest would be 33.4% or 50% of the voting shares plus one. In practice, though, controlling interest can be far less than that, as it is rare that 100% of company voting shareholders actively vote. While most small corporations do not have a 2/3 vote requirement, in the opposite, most large companies especially Delaware corporations, do have a 2/3 vote requirement. A company that requires a 2/3 super-majority of shares to vote in favor of a motion can grant, in effect, veto power to a minority shareholder or block of shareholders that own more than 1/3 of the shares. Thus in some cases a single entity can essentially maintain control with only 33.4% of the outstanding shares. Ford Motor Company's former 33.9% ownership of Mazda North American Operations is an example of a controlling interest with minority shareholding that was granted by Mazda. Ownership of more than 50% of a corporation's voting shares. See also Majority Interest. Controlling Interest:- when one shareholder or a group acting in kind holds a high enough percentage of ownership in a company to enact changes at the highest level. By definition, this figure is 50% of the outstanding shares or voting shares, plus one. However, controlling interest can be achieved with less than 50% ownership of the stock if that person/group owns a significant proportion of the voting shares, because in many cases, not every share carries a vote in shareholder meetings. For the majority of large public companies (such as those that belong to the S&P 500), a shareholder with much less than 50% of the outstanding shares can still cause a lot of shake-up at the company. Single shareholders with as little as 5–10% ownership can push for their own seats on the board, or enact changes at shareholder meetings by publicly lobbying for them.

(2) Controlling Interest:- ownership of a sufficient percentage of shares to control a corporation. Control may be achieved with less than 50% of the voting stock owned individually or by a group in combination if the other shares are widely dispersed and not actively voted. Also known as Blocking Minority in the United Kingdom.

CONTROL NO. = КОНТРОЛЬНЫЙ № – In the US patent law, Control No. is an unique number assigned to a patent reexamination request when it is filed, having a 2-digit series code (90 for ex parte reexamination requests; 95 for inter partes reexamination requests), and a 6-digit control number.

CONTROL POINT = ТОЧКА КОНТРОЛЯ (или ПУНКТ ОСУЩЕСТВЛЕНИЯ РЕГУЛЯЦИИ) – Control Point is a step in a system where specific procedures can be applied to achieve a defined effect and can be measured, monitored, controlled and corrected.

CONTROL RISK = РИСК КОНТРОЛЯ – Control Risk is a measure of risk that errors exceeding a tolerable amount will not be prevented or detected by an entity's internal controls.

CONTROL STOCK = КОНТРОЛЬНЫЙ ПАКЕТ АКЦИЙ – Control Stock is:- (1) equity shares owned by major shareholders of a publicly traded corporation. These shareholders have either a majority of the shares outstanding or a portion of the shares that is significant enough to allow them to exert a controlling influence on the firm's decisions. Shareholders who control a majority of a company's shares effectively have enough voting power to dictate the firm's decisions. As such, their shares can be referred to as Control Stock. (2) In situations where companies have more than one class of common shares, shares with superior voting power or vote weighting are considered to be control stocks, relative to the inferior class. Suppose XYZ Corp. had two classes of common stock, Class A and Class B, and both types of shares carry equal claim to the firm's assets. In other words, if the firm has 100 common shares in total, 50 are Class A shares and 50 are Class B shares. Let's assume that the B shares entitle the shareholder to one vote, but the A shares entitle the shareholder to 10 votes. If you owned one Class A share, you would own 1% of the company's assets, but wield 10 votes at company meetings. An investor who owned one Class B share would have the same 1% claim to the firm's assets, but wield only one vote at company meetings. Control Stock:- shareholding held by management or individual shareholders which represents less than a majority but is nevertheless sufficient to exert a decisive influence at shareholders' meetings. / Корп. (Corp.). Под Контрольным Пакетом акций понимается количество акций, обеспечивающее их владельцу фактическое господство в акционерном обществе. При широком распространении мелких акций достаточно владеть 20–30% (иногда меньше) общего количества акций, чтобы полностью контролировать деятельность акционерного общества.

CONTROL ZONE = ЗОНА КОНТРОЛЯ – Control Zone is an area within the PJM Control Area, as set forth in the PJM Open Access Tariff and the Reliability Assurance Agreement (RAA). Schedule 16 of the RAA defines the distinct zones that comprise the PJM Control Area. PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

CONVENTION = КОНВЕНЦИЯ – Convention is a written agreement, for example on the uniform handling of specific interest and commission rates or the calculation of bank fees and charges. / Под Конвенцией, от Латинского слова Conventio, означающее Договор или Соглашение, понимается один из видов соглашений, устанавливающих взаимные права и обязанности её участников, как правило, в какой-либо специальной области. Многосторонние конвенции содержат нормы общего характера. В большинстве случаев конвенции принимаются специализированными международными организациями.

CONVENTIONAL ALLOWANCE = КОНВЕНЦИОННОЕ ОТЧИСЛЕНИЕ (или ОБЫЧНАЯ УСТУПКА) – The Conventional Allowance is an agreed percentage to be added to the oven-dry mass of the material for the calculation of commercial mass and certain other properties. This allowance is normally fixed for each fiber type and includes the moisture regain which approximately corresponds with equilibrium under the standard atmosphere and for some fibers, an allowance for substances removable during normal processing, e.g., the finish normally applied to impart the required properties to the textile material. See also Mass. / влагопоглощательная способность (moisture regain).

CONVENTIONAL CARGO = МАССОВЫЙ ГРУЗ – Conventional Cargo is a non-containerised cargo such as wood pulp, logs vehicles, scrap metal. General cargo conventionally stowed as opposed to unitized, containerized and Roll On/Roll Off cargo. Often refers to cargo that is loaded or unloaded using the ship's own equipment. Also known as Break Bulk Cargo.

CONVENTIONAL GAS = ОБЫЧНЫЙ ГАЗ – Conventional Gas is a natural gas that can be produced using recovery techniques normally employed by the oil and gas industry. The distinction between conventional and unconventional gas is becoming less clear. See also Unconventional Gas.

CONVENTIONAL GASOLINE = ОБЫЧНЫЙ БЕНЗИН – Conventional Gasoline is a finished motor gasoline not included in the oxygenated or reformulated gasoline categories. This category excludes Reformulated Gasoline blendstock for Oxygenate Blending (RBOB) as well as other blendstock. / Конечный автомобильный бензин, не включённый в категории насыщенного кислородом или реформулированного бензина. Эта категория исключает как (Reformulated Gasoline blendstock for Oxygenate Blending (RBOB)) и другие смеси.

CONVENTIONAL OIL SUPPLIES = ПОСТАВКИ ОБЫЧНОЙ НЕФТИ – Conventional Oil Supplies exclude synthetic crude oil and other hydrocarbons. / Поставки обычной нефти не предусматривают поставки синтетической нефти и иных нетрадиционных углеводородов.

CONVENTIONAL SERVICES = ОБЫЧНЫЕ УСЛУГИ – Conventional Services are the general cargo services as distinct from liner container services.

CONVENTIONAL TILLAGE = ОБЫЧНАЯ ВСПАШКА (или ОБЫЧНАЯ ОБРАБОТКА ПОЧВЫ) – Conventional Tillage is the combined primary and secondary tillage operations normally performed in preparing a seedbed for a given crop grown in a given geographical area. Conventional Tillage in Ontario, Canada generally consists of fall mouldboard or chisel plowing followed in spring by secondary tillage, usually with a feld cultivator or tandem disc. Most plowing is targeted to an operating depth of 15 cm (6 in.), since plowing deeper often results in unwanted mixing of subsoil into the seedbed. The more uniform and level a field is left after fall plowing, the greater the opportunities to reduce secondary tillage costs and improve planter or drill performance. One disadvantage is that the lack of surface residue in conventional tillage exposes fields to greater erosion risks from water and wind. On complex slopes, tillage can be responsible for causing large quantities of topsoil to move to lower slope positions (tillage erosion). / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

CONVENTION ON CONTRACTS FOR THE INTERNATIONAL SALE OF GOODS = КОНВЕНЦИЯ ПО ДОГОВОРАМ МЕЖДУНАРОДНОЙ КУПЛИ–ПРОДАЖИ ТОВАРОВ – The United Nations Convention on Contracts for the International Sale of Goods (CISG) is a multilateral treaty to which the United States and fifty-six other countries are parties (Contracting States). The CISG covers the formation of contracts for the international sale of goods and the rights and obligations of parties to these sales contracts. Its coverage is limited to only sales contracts. Therefore, it does not cover contracts ancillary to an international sales contract, such as service contracts, distribution agreements, contracts of carriage and insurance, letters of credit and dispute resolution clauses. Also expressly excluded from its coverage are issues such as validity of the contract, the property consequences of a sales contract and liability for death caused by a defect in the good sold. Promulgated in 1980, the CISG is a self-executing treaty with the preemptive force of federal law. Unless otherwise agreed, CISG applies to 'contracts for sale of goods between parties whose places of business are in different states ... when the States are Contracting States'. adopted at Vienna, Austria, on 1980-April-10. The UN Convention on Contracts for the International Sale of Goods (CISG) became the law of the United States on 1988-January-01. CISG establishes uniform legal rules governing formation of international sales contracts and the rights and obligations of the buyer and seller. The CISG applies automatically to all contracts for the sale of goods between traders from two different countries that have both ratified the CISG, unless the parties to the contract expressly exclude all or part of the CISG or expressly stipulate a law other than the CISG. 1980 – United Nations Convention on Contracts for the International Sale of Goods (CISG):- date of adoption:- 11 April 1980. Purpose:- the purpose of the CISG is to provide a modern, uniform and fair regime for contracts for the international sale of goods. Thus, the CISG contributes significantly to introducing certainty in commercial exchanges and decreasing transaction costs. Why is it relevant? The contract of sale is the backbone of international trade in all countries, irrespective of their legal tradition or level of economic development. The CISG is therefore considered one of the core international trade law conventions whose universal adoption is desirable. The CISG is the result of a legislative effort that started at the beginning of the XX century. The resulting text provides a careful balance between the interests of the buyer and of the seller. It has also inspired contract law reform at the national level. The adoption of the CISG provides modern, uniform legislation for the international sale of goods that would apply whenever contracts for the sale of goods are concluded between parties with a place of business in Contracting States. In these cases, the CISG would apply directly, avoiding recourse to rules of private international law to determine the law applicable to the contract, adding significantly to the certainty and predictability of international sales contracts. Moreover, the CISG may apply to a contract for international sale of goods when the rules of private international law point at the law of a Contracting State as the applicable one, or by virtue of the choice of the contractual parties, regardless of whether their places of business are located in a Contracting State. In this latter case, the CISG provides a neutral body of rules that can be easily accepted in light of its transnational nature and of the wide availability of interpretative materials. Finally, small and medium-sized enterprises as well as traders located in developing countries typically have reduced access to legal advice when negotiating a contract. Thus, they are more vulnerable to problems caused by inadequate treatment in the contract of issues relating to applicable law. The same enterprises and traders may also be the weaker contractual parties and could have difficulties in ensuring that the contractual balance is kept. Those merchants would therefore derive particular benefit from the default application of the fair and uniform regime of the CISG to contracts falling under its scope. Key Provisions:- the CISG governs contracts for the international sales of goods between private businesses, excluding sales to consumers and sales of services, as well as sales of certain specified types of goods. It applies to contracts for sale of goods between parties whose places of business are in different Contracting States, or when the rules of private international law lead to the application of the law of a Contracting State. It may also apply by virtue of the parties' choice. Certain matters relating to the international sales of goods, for instance the validity of the contract and the effect of the contract on the property in the goods sold, fall outside the Convention's scope. The second part of the CISG deals with the formation of the contract, which is concluded by the exchange of offer and acceptance. The third part of the CISG deals with the obligations of the parties to the contract. Obligations of the sellers include delivering goods in conformity with the quantity and quality stipulated in the contract, as well as related documents, and transferring the property in the goods. Obligations of the buyer include payment of the price and taking delivery of the goods. In addition, this part provides common rules regarding remedies for breach of the contract. The aggrieved party may require performance, claim damages or avoid the contract in case of fundamental breach. Additional rules regulate passing of risk, anticipatory breach of contract, damages, and exemption from performance of the contract. Finally, while the CISG allows for freedom of form of the contract, States may lodge a declaration requiring the written form. Relation to Private International Law and Existing Domestic Law:- the CISG applies only to international transactions and avoids the recourse to rules of private international law for those contracts falling under its scope of application. International contracts falling outside the scope of application of the CISG, as well as contracts subject to a valid choice of other law, would not be affected by the CISG. Purely domestic sale contracts are not affected by the CISG and remain regulated by domestic law. Additional Information:- becoming a party to the CISG has no financial implications for Contracting States. Moreover, its administration at the domestic level does not require a dedicated body and does not involve any reporting obligations. The CISG is accompanied by an explanatory note. The CLOUT (Case Law on UNCITRAL Texts) system contains numerous cases relating to the application of the CISG. A Digest of those cases is also available. Related Instruments:- (i) Convention on the Limitation Period in the International Sale of Goods, 1974 (amended 1980); and (ii) United Nations Convention on the Use of Electronic Communications in International Contracts, 2005. Also known as The Vienna Convention. / заявления и оговорки стран участниц. Известна также как Венская Конвенция (The Vienna Convention).

CONVENTION ON INTERNATIONAL TRADE IN ENDANGERED SPECIES OF WILD FAUNA AND FLORA = КОНВЕНЦИЯ ПО МЕЖДУНАРОДНОЙ ТОРГОВЛЕ ВЫМИРАЕМЫМИ ВИДАМИ ДИКОЙ ФАУНЫ И ФЛОРЫ – The Convention on International

Trade in Endangered Species of Wild Fauna and Flora (CITES) is an international agreement between governments. Its aim is to ensure that international trade in specimens of wild animals and plants does not threaten their survival. Widespread information nowadays about the endangered status of many prominent species, such as the tiger and elephants, might make the need for such a convention seem obvious. But at the time when the ideas for CITES were first formed, in the 1960s, international discussion of the regulation of wildlife trade for conservation purposes was something relatively new. With hindsight, the need for CITES is clear. Annually, international wildlife trade is estimated to be worth billions of dollars and to include hundreds of millions of plant and animal specimens. The trade is diverse, ranging from live animals and plants to a vast array of wildlife products derived from them, including food products, exotic leather goods, wooden musical instruments, timber, tourist curios and medicines. Levels of exploitation of some animal and plant species are high and the trade in them, together with other factors, such as habitat loss, is capable of heavily depleting their populations and even bringing some species close to extinction. Many wildlife species in trade are not endangered, but the existence of an agreement to ensure the sustainability of the trade is important in order to safeguard these resources for the future. Because the trade in wild animals and plants crosses borders between countries, the effort to regulate it requires international cooperation to safeguard certain species from over-exploitation. CITES was conceived in the spirit of such cooperation. Today, it accords varying degrees of protection to more than 30 000 species of animals and plants, whether they are traded as live specimens, fur coats or dried herbs. CITES was drafted as a result of a resolution adopted in 1963 at a meeting of members of IUCN (The World Conservation Union). The text of the Convention was finally agreed at a meeting of representatives of 80 countries in Washington, DC, the United States of America, on 03 March 1973, and on 01 July 1975 CITES entered in force. The original of the Convention was deposited with the Depositary Government in the Chinese, English, French, Russian and Spanish languages, each version being equally authentic. CITES is an international agreement to which States (countries) adhere voluntarily. States that have agreed to be bound by the Convention ('joined' CITES) are known as Parties. Although CITES is legally binding on the Parties – in other words they have to implement the Convention – it does not take the place of national laws. Rather it provides a framework to be respected by each Party, which has to adopt its own domestic legislation to ensure that CITES is implemented at the national level. For many years CITES has been among the conservation agreements with the largest membership, with now 178 Parties. The CITES Secretariat headquartered in Geneva, Switzerland. Convention on International Trade in Endangered Species of Wild Fauna and Flora:- signed at Washington, DC, on 03 March 1973; and amended at Bonn, on 22 June 1979. The Convention On International Trade In Endangered Species Of Wild Fauna And Flora (CITES) is a multinational treaty that regulates the export and re-export of listed species of wild fauna and flora. CITES provides three appendixes for listing plants. These appendixes, listed in order of their restrictiveness, are as follows:- (i) CITES Appendix I – any genus, species, subspecies, or variety, globally threatened with extinction through trade; (ii) CITES Appendix II – any taxon (the entire family – all genera and all species) that must be regulated in order to avoid the threat of extinction through trade; and (iii) CITES Appendix III – any species, subspecies, or variety listed by one country in order to enlist the cooperation of other countries to reinforce domestic conservation measures by regulating trade. / сохранение (conservation).

CONVERGENCE = КОНВЕРГЕНЦИЯ (или СХОЖДЕНИЕ, или СБЛИЖЕНИЕ) – Convergence is the process whereby the price of a derivative contract aligns with the price of the underlying financial instrument or commodity. This usually occurs at maturity. The tendency for prices of physicals and futures to approach one another, usually during the delivery month. Convergence is a term referring to cash and futures prices tending to come together (i.e. the basis approaches zero) as the futures contract nears expiration. Also known as Narrowing Of The Basis. The tendency for prices of physical commodities and futures to approach one another, usually during the delivery month. Convergence:- at expiration of a futures contract, cash prices and futures prices tend to converge (the basis approaches zero). / , то есть . Конвергенция или Схождение – тенденция к сближению цен одной к другой на физические рода сырья и фьючерсы, обычно в течение месяца поставки. В биржевом деле под Конвергенцией, от Латинского слова Convergo, означающее Приближаюсь или Схожусь, понимается тенденция к схождению наличных цен и цен фьючерсов при их прекращении признания (или экспирации); базис при этом достигает нуля.

CONVERGENCE CRITERIA = КРИТЕРИЙ КОНВЕРГЕНЦИИ (или КРИТЕРИЙ СБЛИЖЕНИЯ, или КРИТЕРИЙ ПОДХОДИМОСТИ) – Convergence Criteria:- the European countries wishing to adopt the Euro as their currency must achieve a high degree of 'sustainable convergence'. The degree of convergence is assessed on the basis of several criteria in the Treaty on European Union (Maastricht Treaty; signed on 1992-February-07), which require a country to have:- (i) a high degree of price stability; (ii) sound public finances; (iii) a stable exchange rate; and (iv) low and stable long-term interest rates. The criteria are designed to ensure that only countries with stability-oriented economic policies and a track record in price stability are admitted to Stage Three of Economic and Monetary Union (EMU). The Treaty also requires the central bank of the respective country to be independent. In May 1998 an EU summit meeting in Brussels confirmed that 11 of the then 15 EU Member States – Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland – had met the criteria for the adoption of the single currency. On 1999-January-01 these countries adopted the Euro as their common currency. Greece joined this group of countries on 2001-January-01 after fulfilling the criteria. Other Member States have since complied with the convergence criteria and also joined the Euro area – Slovenia on 2007January-01, and Cyprus and Malta on 2008-January-01. One member state, Sweden, did not fulfil all the conditions. Moreover, Denmark and the United Kingdom are 'Member States with a special status'. In protocols annexed to the Treaty establishing the European Community, the two countries were granted the right to choose whether or not to participate in Stage Three of EMU, i.e. to adopt the Euro. They both made use of this so-called 'Opt-Out Clause' by notifying the EU Council that they do not intend for the time being to move to Stage Three, i.e. they do not yet wish to become part of the Euro area. Sweden as well as nine of the 12 countries that have joined since 2004 count as members with a 'derogation' since they have not yet met all the requirements to adopt the Euro. Having a derogation means that a Member State is exempt from some, but not all, of the provisions which normally apply from the beginning of Stage Three of EMU. It includes all provisions which transfer responsibility for monetary policy to the Governing Council of the ECB. Like Sweden, the other Member States of the EU which have not yet adopted the Euro have no 'opt-out' clauses, such as those negotiated by the United Kingdom and Denmark. This implies that, by joining the EU, the new Member States commit themselves to ultimately adopting the Euro when they fulfil the convergence criteria. The ECB and the European Commission prepare reports every other year – or at the request of a Member State with a derogation – on progress made towards fulfilling the convergence criteria. These convergence reports also take account of other factors that might influence the integration of the country into the Euro area economy. The reports provide the basis for the EU Council's decision on whether to allow a new country to become part of the Euro area. Convergence Criteria:- four criteria must be met by each EU Member State before it can adopt the Euro:- a stable price level, sound public finances (a limited deficit against GDP and a limited level of debt against GDP), a stable exchange rate and low and stable long-term interest rates. Convergence Criteria is the criteria established in Article 121(1) of the EC Treaty (and developed further in Protocol No 21 annexed to the Treaty) as a basis for the assessment of whether a country may adopt the Euro. They relate to performance with regard to price stability, the government financial position, exchange rates and long-term interest rates. They also cover the compatibility of national legislation, including the statutes of NCBs, with both the Treaty and the Statute of the European System of Central Banks and of the European Central Bank.

CONVERGENT IMPROVEMENT = СХОДЯЩЕЕСЯ В ОДНОЙ ТОЧКЕ УЛУЧШЕНИЕ – Convergent Improvement:- (plant breeding) reciprocal addition to each of two inbred lines of the dominant favorable genes lacking in one line and present in the other.

CONVERSION = КОНВЕРСИЯ (или КОНВЕРТИРОВАНИЕ, или ОБРАТИМОСТЬ) – (1) Conversion:- a Delta-neutral arbitrage transaction involving a long futures contract, a long put option, and a short call option. The put and call options have the same strike price and same expiration date. Conversion is a transaction which is composed of three commodity contracts, including a long futures contract, a long put option and a short call option. The delivery month must be the same for all three commodity contracts and the strike price must be the same for the two option components. Conversion:- a position created by selling a call option, buying a put option, and buying the underlying instrument (for example, a futures contract), where the options have the same strike price and the same expiration. See also Reverse Conversion. / Под Конверсией, от Латинского слова Conversio, означающее Изменение или Превращение, понимается .

(2) FOREX, exchange of a credit balance or claim for one in a different currency. Conversion:- an exchange from one currency to another. / Под Конвертированием валюты понимается обмен валюты данной страны на иностранную валюту.

(3) Conversion:- exchange of an asset for another type of asset. / Конверсия - обмен актива одного типа на актив другого типа.

(4) Conversion:- when the conditions on the capital markets change, a bond may, under specific circumstances, be adjusted fully or partially, with regard to its individual conditions, to the changes in the capital markets. A conversion is possible in connection with the interest rate, maturity and/or repayment. Exchange of convertible bonds for shares. Exchange of one class of corporate security for another. For example, conversion of convertible bonds into stock.

(5) Conversion:- replacing an old, due or called bond issue by new bonds of the same company at different terms and conditions (debt restructuring or refinancing). / порядки и условия .

(6) Conversion:- renewal of a bank-issued medium-term loan.

(7) Conversion:- in oil industry, refinery processes whereby heavier petroleum fractions are subject to changes in size or structure of the hydrocarbon molecules, thus providing new compounds with different properties and higher average value (cracking, reforming). Also known as Upgrading.

(8) Conversion:- when trading options on futures contracts, a position created by selling a call option, buying a put option, and buying the underlying futures contract, where the options have the same strike price and the same expiration.

CONVERSION ARRANGEMENT = ОСУЩЕСТВЛЕНИЕ КОНВЕРСИИ – Conversion Arrangement is a scheme sponsored by a members' agent which allows an individual member to switch from underwriting on an unlimited liability basis to underwriting on a limited liability basis.

CONVERSION CLAUSE = ОГОВОРКА О КОНВЕРСИИ – Conversion Clause is a provision in some adjustable-rate mortgages (ARMs) that allows you to change the ARM to a fixed-rate loan at some point during the term. Conversion is usually allowed at the end of the first adjustment period. At the time of the conversion, the new fixed rate is generally set at one of the rates then prevailing for fixed-rate mortgages. The conversion feature may be available at extra cost. / Оговорка о конверсии служит положением, на основании которого в случае с некоторыми закладными с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) . для закладных с фиксированной ставкой (fixed-rate mortgages).

CONVERSION FACTOR = КОНВЕРСИОННЫЙ ФАКТОР – Numbers published by futures exchanges to determine invoice prices for debt instruments deliverable against bond or note futures contracts. A separate conversion factor is published for each deliverable instrument. Invoice Price = Contract Size x Futures Settlement Price x Conversion Factor + Accrued Interest. Conversion Factor is a factor used to equate the price of T-bond and T-note futures contracts with the various cash T-bonds and T-notes eligible for delivery. This factor is based on the relationship of the cash-instrument coupon to the required 8 percent deliverable grade of a futures contract as well as taking into account the cash instrument's maturity or call.

CONVERSION OFFER = КОНВЕРСИОННАЯ ОФЕРТА – Conversion Offer is an invitation to convert old securities into new ones or securities of another company. A company planning a takeover, for instance, offers a share conversion to the shareholders of the target company to avoid having to finance the (entire) purchase price. Share conversions can also take place in the context of mergers and, occasionally, company restructurings. 2009–10 Conversion Offer:- the Conversion Offer – the largest liability management exercise ever extended by the Inter-American Development Bank (IDB) to its borrowing shareholders – provided the option to customize adjustable rate loans' characteristics to new market rate features. The conversion offer allowed to:- (i) convert disbursed and undisbursed loan balances with adjustable rate (ADJ) under the Single Currency Facility (SCF) and Currency Pooling System (CPS) products into USD LIBOR-based or fixed-rate or any combination thereof; and (ii) dollarize existing CPS loans. The Conversion Offer had two execution dates:- August 01, 2009 and August 01, 2010, with sign-up periods ending on June 30, 2009 and June 30, 2010, respectively. By the end of the second execution date, the Conversion Offer achieved a 92 percent participation rate for a total converted amount of USD32 billion of outstanding debt. 24 borrowing countries and 44 other entities with sovereign guarantee benefited from this offer. Similarly, 88 percent of outstanding loans under the CPS product were dollarized. This benchmark operation marks a new era in the IDB's dialogue with borrowing countries on debt management issues and options to tailor debt with the IDB to meet asset/liability management objectives. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

CONVERSION PARITY = КОНВЕРСИОННЫЙ ПАРИТЕТ – Conversion Parity:- the conversion value when a convertible bond is exchanged for a share of the same company. The value is dependent on the conditions of the bond issue and the market price of the convertible bonds.

CONVERSION PREMIUM = КОНВЕРСИОННАЯ ПРЕМИЯ – Conversion Premium is the premium (agio) to be paid at conversion if the conversion price is higher than the share price. The conversion premium reflects by how many percentage points shares are more expensive if they are acquired through the purchase and subsequent conversion of convertible bonds.

CONVERSION PRICE = КОНВЕРСИОННАЯ ЦЕНА – Conversion Price is the price per share at which a convertible security, such as corporate bonds or preferred shares, can be converted into common stock. The conversion price is determined when the convertible security is issued and can be found in the bond indenture (in the case of convertible bonds) or in the security prospectus (in the case of convertible preferred shares). The conversion price is essential in determining the number of shares to be received, by computing the quotient of the principal value of the convertible security divided by the conversion price. Usually, the conversion price is set at a significant amount higher than the current price of the common stock, so as to make conversion desirable only if a company's common shares experience a significant increase in value. Conversion Price is a price specified upon issue of convertible bonds in order to calculate the conversion parity for the conversion of convertible bonds into shares or participation certificates.

CONVERSION RATIO = СООТНОШЕНИЕ С КОНВЕРСИЕЙ – (1) Conversion Ratio is the number of common shares received at the time of conversion for each convertible security. It is calculated by using this formula:- Conversion Ratio = Par Value Of Convertible Bond / Conversion Price Of Equity. The higher the ratio, the higher the number of common shares exchanged per convertible security. The conversion ratio is determined at the time the convertible security is issued and will have an impact on the relative price of the security.

(2) The Conversion Ratio is the number of warrants that must be exercised to require the transfer of the underlying instrument.

CONVERSION RIGHT = КОНВЕРСИОННОЕ ПРАВО – Conversion Right is the right, inalienably attached to a convertible bond, to request that the bond be converted into shares or participation certificates.

CONVERT = КОНВЕРТИРОВАТЬ – Convert:- transform a debt instrument, for example, a public sector loan, into another instrument, mostly with a lower interest rate, after previous announcement.

CONVERTED FABRIC = ОТДЕЛАННАЯ ТКАНЬ – Converted Fabric is a finished fabric as distinguished from greige fabric.

CONVERTER = КОНВЕРТЕР (или ПРЕОБРАЗОВАТЕЛЬ) – (1) Converter is a furnace in which metal production or refining processes are typically carried out through oxidation. / Под Конвертером, от Латинского слова Converto, означающее Изменяю или Превращаю, понимается металлургический агрегат для получения стали путём продувки воздухом или кислородом расплавленного чугуна, для переработки медных, никелевых и медно-никелевых штейнов. Конвертер – сосуд грушевидной или цилиндрической формы. Способы продувки – донная, боковая и верхняя. Для производства стали применяются главным образом так называемые кислородные конвертеры; ранее для этой цели использовались бессемеровские и томасовские конвертеры. Заливка перерабатываемого продукта в кислородный конвертер производится через горловину конвертера, выпуск готовой стали – через лётку, устроенную в шлемной части. Конвертер может поворачиваться вокруг горизонтальной оси на 360° с помощью специального привода.

CONVERTER = ОТДЕЛОЧНИК (или КОНВЕРТЁР) – Converter is an individual or organization which buys greige fabrics and sells them as a finished product to cutters, wholesalers, retailers, and others. The converter arranges for the finishing of the fabric, namely bleaching, mercerizing, dyeing, printing, etc, to the buyers' specifications. Converter is a person or a company which buys grey goods and sells them as finished fabrics. A converter organizes and manages the process of finishing the fabric to a buyers' specifications, particularly the bleaching, dyeing, printing, etc. Converter is an individual or concern engaged in the purchase of cotton or rayon gray goods for subsequent sale in the finished (dyed or printed) state. Converter (in the United States):- the term applied to a man or a firm which buys cotton, rayon, or silk goods and sells them in the finished state. / Под Конвертером, от Латинского слова Converto, означающее Изменяю или Превращаю, понимается .

CONVERTIBILITY = ОБРАТИМОСТЬ (или КОНВЕРТАБЕЛЬНОСТЬ, или КОНВЕРТИРУЕМОСТЬ) – Convertibility is the conversion of one currency into another (formerly also into gold). In the case of full conversion, the currency can be exchanged for another currency virtually without restriction, whereas certain limitations apply to partial convertibility. Ability of a currency to be legally exchanged for gold or any other foreign currency. Currency is said to be convertible if it can be used in another country to pay a debt expressed in that currency. Currency Convertibility:- the ease with which a country's currency can be converted into gold or another currency. Convertibility is extremely important for international commerce. When a currency in inconvertible, it poses a risk and barrier to trade with foreigners who have no need for the domestic currency. Government restrictions can often result in a currency with a low convertibility. For example, a government with low reserves of hard foreign currency often restrict currency convertibility because the government would not be in a position to intervene in the foreign exchange market (i.e. revalue, devalue) to support their own currency if and when necessary. Convertibility is the possibility to exchange a country's currency for foreign currencies without restrictions. The opposite of convertibility is foreign exchange control. Currencies that can be converted freely everywhere, such as the Euro or US Dollar, are called 'Hard' Currencies. / Под Обратимостью валюты или её Конвертабельностью (или Конвертируемостью) понимается возможность обмена (конверсии) валюты данной страны на валюты других стран. До конца 1950-х начала 1960-х существовал также обмен валют капиталистических стран на золото по официальному паритету.

CONVERTIBLE = ОБРАТИМАЯ (или КОНВЕРТАБЕЛЬНАЯ, или КОНВЕРТИРУЕМАЯ) – Convertible (CV):- a bond, debenture or preferred share that may be exchanged by its owner for shares of common or other stock or another security, usually of the same company, at a specific price and time in accordance with the terms of the issue.

CONVERTIBLE BOND = ОБРАТИМАЯ ОБЛИГАЦИЯ (или КОНВЕРТАБЕЛЬНАЯ ОБЛИГАЦИЯ, или КОНВЕРТИРУЕМАЯ ОБЛИГАЦИЯ) – Convertible Bond:- debt securities where the holder, in addition to the fixed interest rate, under certain circumstances has the right to convert the bond into shares of the respective company. The converted convertible bond becomes a share. Non-converted debt securuties are redeemed upon maturity. Bond that can be exchanged by its owner for shares of common or other stock of the same company at a specific price and time. Convertible Bond is a bond issued by a company that may be exchanged by the holder for a set number of that company's shares at a predetermined price. Because the bond embeds a call option on the company's equity, convertibles carry much lower rates of interest than traditional debt and are therefore a cheap way for companies to raise debt. The problem for existing shareholders is that conversion dilutes the company's outstanding shares. Typically, bonds are convertible into a company's own stock. There are however 'third party convertibles', which convert into shares of another company. Embody a money claim on the issuer (borrower). Depending on the market situation, convertible bonds can offer a higher return than other forms of fixedinterest investment. The conversion right offers the opportunity of participating directly in the success of the company. Convertible Bond is a bond that can be converted into a predetermined amount of the company's equity at certain times during its life, usually at the discretion of the bondholder. Convertibles are sometimes called 'CVs'. Issuing convertible bonds is one way for a company to minimize negative investor interpretation of its corporate actions. For example, if an already public company chooses to issue stock, the market usually interprets this as a sign that the company's share price is somewhat overvalued. To avoid this negative impression, the company may choose to issue convertible bonds, which bondholders will likely convert to equity anyway should the company continue to do well. From the investor's perspective, a convertible bond has a value-added component built into it; it is essentially a bond with a stock option hidden inside. Thus, it tends to offer a lower rate of return in exchange for the value of the option to trade the bond into stock.

CONVERTIBLE BOND ISSUE = ЭМИССИЯ ОБРАТИМОЙ ОБЛИГАЦИИ (или ЭМИССИЯ КОНВЕРТИРУЕМОЙ ОБЛИГАЦИИ) – Convertible Bond Issue is an issue whose bonds can be converted into shares or participation certificates of the issuing company under certain conditions and at specified terms.

CONVERTIBLE CURRENCY = ОБРАТИМАЯ ВАЛЮТА (или КОНВЕРТАБЕЛЬНАЯ ВАЛЮТА, или КОНВЕРТИРУЕМАЯ ВАЛЮТА) – Convertible Currency is a London market term for any currency other than Sterling, US Dollars or Canadian Dollars. A currency that can be freely exchanged for another or for gold without special authorization from the appropriate authority. Convertible

Currency is a currency that can be readily bought or sold without government restrictions, in order to purchase another currency. A convertible currency is a liquid instrument when compared to currencies tightly controlled by a central bank or other regulating authority. Developing countries or those with more authoritative governments are more likely to place restrictions on the exchange of currencies. Currencies from these countries are typically less stable, and may come from economies with high inflation rates, and are more illiquid. Convertible Currency is a currency that can be bought and sold for other currencies at will. / В начале 1980-х свободно обратимыми валютами являлись:- Доллары Канады и США, Крона Швеции, Марка Федеративной Республики Германии, Франк Франции, Фунт Стерлингов и другие.

CONVERTIBLE DEBT SECURITY = ОБРАТИМАЯ ДОЛГОВАЯ ЦЕННАЯ БУМАГА (или КОНВЕРТАБЕЛЬНАЯ ДОЛГОВАЯ ЦЕННАЯ БУМАГА, или КОНВЕРТИРУЕМАЯ ДОЛГОВАЯ ЦЕННАЯ БУМАГА) – Convertible Debt Security is an unsecured note or debenture that is classified as an equity security because it is convertible into an equity security. Convertible Debt Securities are a type of hybrid investment instrument that can be exchanged for another type of security. This exchange can be executed by either the investor or the issuer of the convertible debt security. The convertible debt security typically has features of both debt and equity instruments. One of the most frequently used forms of convertible debt securities involves the issuance of bonds by a company that can be exchanged for shares of common stock. The terms of the conversion between bonds to equities are determined at the time of the bond issuance. Investors and issuers are aware of the agreed upon price at which the debt securities can be swapped for stock at the time the convertible debt securities are issued. Why invest in convertible debt securities? An investor in convertible debt securities has an unlimited upside potential if the stock of the company appreciates. The investor is able to convert their bonds to equities and participate in any upside of stock prices. The potential upside is a strong incentive to invest in convertible debt securities. Investors in convertible debt securities are able to collect interest payments, also called Coupon Payments, as long as the instrument is held in its bond form. These payments limit the downside risk of the investment by providing an investor with a flow of predetermined cash payments. Why issue convertible debt securities? Corporations that issue convertible debt securities are using a relatively low cost means to raise capital. The coupon payments for convertible debt securities are relatively low, which is an upside for the corporation. The downside is the potential dilution in stock shares that the corporation faces if the investors in their convertible debt securities elect to convert the shares of convertible debt bonds to shares of the corporation's equity. What is the typical structure of a convertible debt security? Similar to standard bonds, the convertible debt security will have a face value, issue size, date, maturity date, value, and interest rate. Unlike typical bonds the convertible debt security will have a predetermined conversion price. When the value of a company's stock hits the conversion or predetermined share price either the issuer or the investor has the option to exercise the conversion. When the conversion is exercised, the convertible debt security is exchanged for securities at the conversion price at the predetermined conversion ratio. The conversion ratio is another factor that is determined at the issuance of the convertible debt security. For example, suppose a company issues a convertible bond at a par value of USD10 000. According to the issuance documents, the investor in the convertible bond can convert it to common stock of the company at a price of USD25 per share, i.e. conversion price. By dividing the par value of the bond by the conversion price, it's possible to determine that if converted, the bond will result in 400 shares of the company, i.e. USD10 000 / USD25 = 400 shares.

CONVERTIBLE NOTE = ОБРАТИМЫЙ БИЛЕТ (или КОНВЕРТАБЕЛЬНЫЙ БИЛЕТ, или КОНВЕРТИРУЕМАЯ НОТА) – Convertible Note is a loan made to a company at a fixed rate of interest with the right to be either redeemed (i.e. repaid by the company) for cash or converted into ordinary shares at a predetermined date or within a certain period. Convertible Note:- also Convertible Debt – this is a debt owing to a lender under which the lender has the right, under negotiated terms and conditions, to convert the debt into shares in the company at his call. / , то есть .

CONVERTIBLE PREFERREDS = ОБРАТИМЫЕ ПРЕФЫ (или КОНВЕРТАБЕЛЬНЫЕ ПРЕФЫ, или КОНВЕРТИРУЕМЫЕ ПРЕФЫ) – Convertible Preferreds are the preferred shares which carry the right for the holder to convert the shares into regular common shares under pre-negotiated terms and conditions.

CONVERTIBLE SECURITIES = ОБРАТИМЫЕ ЦЕННЫЕ БУМАГИ (или КОНВЕРТАБЕЛЬНЫЕ ЦЕННЫЕ БУМАГИ, или КОНВЕРТИРУЕМЫЕ ЦЕННЫЕ БУМАГИ) – Convertible Securities are the securities which are convertible by the holder, or automatically by their terms of issue, into equity securities. Note:- convertible securities includes company options. Convertible Security is a security which may be converted into something else (usually into shares in the same company) on specified terms. Corporate bonds or preferred stock that the holder can exchange, at his or her option, for another type of security (typically common stock) at a set price. The conversion ratio determines how many shares of common stock will be received in exchange for the convertible security at the time of conversion. Convertible Security is a security which can be converted into something on specified terms (usually a fixed interest security that can be converted into a specified number of shares on specified dates). / Выделяются два типа привилегированных акций:- кумулятивные и конвертируемые. При выпуске конвертируемых привилегированных акций должны быть определены возможность и условия их конвертации в обыкновенные акции или привилегированные акции иных типов. При выпуске конвертируемых акций необходимо установить период, пропорциональность и курс обмена. Период обмена конвертируемых акций должен быть не менее трёх лет. Курс конвертации устанавливается в момент выпуска таких акций и он немного превышает текущий рыночный курс обыкновенных акций в тот период. Поэтому если в установленный период обмена текущий рыночный курс обыкновенных акций превысит курс конвертации, владелец конвертируемой привилегированной акции имеет возможность получить дополнительный доход, обменяв свою акцию по курсу конвертации и тут же продав её по более высокому курсу. Такая возможность позволяет эмитенту устанавливать по конвертируемым привилегированным акциям дивиденд ниже, чем по другим типам привилегированных акций. Если срок обмена закончен, а владелец конвертируемой привилегированной акции не обменял её ни на какую другую акцию, она признаётся прямой (простой) привилегированной акцией. Устав может наделить владельца конвертируемой привилегированной акции правом голоса на общем собрании акционеров, при этом количество голосов должно соответствовать тому количеству обыкновенных акций, на которые обменивается принадлежащая ему привилегированная акция.

CONVEXITY = ВЫПУКЛОСТЬ (или XX, или ВЫГНУТОСТЬ) – Convexity:- the convexity of a bond is defined as the Second Macaulay Duration of the bond; where P is the dirty price of the bond and i is the gross redemption yield on the bond. / Выпуклость облигации определяется как Вторая Продолжительность (или Дюрация) Облигации по Мэколэйу (в честь Канадского экономиста Школы Институционалистов (Institutionalist School) Фрэдэрика Рабётсэна Мэколэйа (Frederick Robertson Macaulay; 1882–1970), представившего эту концепцию), где P – 'грязная' цена (с учётом надбавки), и i – брутто доходность по облигации при погашении.

CONVEYANCE = ПЕРЕПРАВКА – Conveyance means an instrument, including a conditional sales contract, affecting title to, or an interest in, property. Conveyance is the application used to describe the function of a vehicle of transfer. / Формулировка, используемая для описания функции транспортного средства перевозки.

CONVOLUTION = ИЗВИТОСТЬ (или ЗАВИТОК, или ВИТОК, или ИЗВИЛИНА, или СВЁРНУТОСТЬ, или ОБОРОТ, или ИЗОГНУТОСТЬ, или СВЁРТКА) – Convolution is:- (1) an irregular spiral or twisted condition characteristic of mature cotton fiber. It is visible under a microscopic. The finer fibers are generally more twisted than the coarser fibers. (2) Coil and curl in certain types of textured yarns which provide bulkiness to the yarn. / (2) Виток и .

COO = CHIEF OPERATING OFFICER

COOK AND BAKER (CHIEF COOK) = КОК И ПЕКАРЬ (СТАРШИЙ КОК) – Cook And Baker (Chief Cook) (steward department):- cooks and bakes. / варит и печёт.

COOKED BANANAS = СВАРЕННЫЕ БАНАНЫ (или СПЁКШИЕСЯ БАНАНЫ) – Cooked Bananas:- if upper temperature limits are exceeded, the Bananas can ripen so quickly that they burst. This is usually referred to as 'Cooked' Bananas.

COOKIE = КУКИ (или ИДЕНТИФИКАЦИОННЫЙ ФАЙЛ, СОХРАНЯЕМЫЙ У КЛИЕНТА) – Cookies are little pieces of information that the Skype software, or your internet browser, may store on your computer's hard drive. Cookies enable Skype to:- (i) recognize you or your preferences; (ii) tailor Skype web content for individual users; (iii) gain information about how people use our websites; and (iv) help us to improve our products and websites. This information may be analyzed by third parties on our behalf. The Help option on the toolbar of most browsers will tell you how to prevent your browser from accepting new cookies, how to have the browser notify you when you receive a new cookie, and how to disable cookies altogether. Please bear in mind that if you choose to disable cookies, some personalized services may not be available. Cookie is a piece of data that a website – or a third party that was commissioned or approved by the website – saves on users' hard drives and retrieves when the users revisit that site. Some cookies may use a unique identifier that links to information such as login or registration data, online 'shopping cart' selections, user preferences, websites a user has visited, etc. See also Tracking Cookies. Cookie is a small file relating to a website. / Дословный перевод этого жаргонного компьютерного термина, связанного с Интернетом, означает 'Печенюшка' (маленькое печенье); хотя эти куки можно было бы образно сравнить со следами на песке, остающимися после того, как там ступал человек. Только вот компьютерные следы остаются в компьютере пользователя под воздействием программного обеспечения, работающего на Вэб-сайте, на который заходит пользователь через свой компьютер. Куки:- каждый сайт может 'пометить' броузер пользователя, то есть записать на жёсткий диск компьютера пользователя специальную текстовую строку. Она называется куки. Фактически, это небольшой текстовый файл, который используется при обращении браузера к серверу, чтобы распознать пользователей. Этот файл не является исполняемой программой, которые потенциально могут повредить файлы и компьютерную систему пользователя. К данным, сохраняемым интернет-программами на компьютере пользователя, могут относиться, например, индивидуальные настройки по работе с каким-то конкретным сайтом. Они применяются для сохранения данных, специфичных для данного клиента, например:- имя пользователя, количество посещений сервера, регион пользователя и тому подобное. Cookie является решением одной из наследственных проблем HTTP спецификации. Эта проблема заключается в непостоянстве соединения между клиентом и сервером, как при FTP или Telnet сессии, то есть для каждого документа (или файла) при передаче по HTTP протоколу посылается отдельный запрос. Включение cookie в HTTP протокол дало частичное решение этой проблемы. Cookie это небольшая порция информации, которую сервер передает клиенту. Клиент (броузер) будет хранить эту информацию и передавать её серверу с каждым запросом как часть HTTP заголовка. Некоторые cookie хранятся только в течение одной сессии, они удаляются после закрытия броузера. Другие, установленные на некоторый период времени, записываются в файл. Обычно этот файл называется 'cookie.txt'. Сами по себе cookies не могут делать ничего, это только лишь некоторая информация, а сервер может на содержащуюся в cookies информацию. Например, в случае авторизованного доступа к чему либо через WWW, в cookies сохраняется login и password в течение сессии, что позволяет не вводить их при запросе каждого запароленного доступа. Другой пример:- cookies могут использоваться для построения персонализированных страниц. Чаще всего встречается такое – на некотором сервере Вас просят ввести свое имя, и каждый раз, когда Вы заходите на первую страницу этого сервера, Вам пишут что-то типа 'Hello, your_name!'. На использовании cookies также часто строят функцию оформления заказа в онлайновых магазинах, в частности, в Амазоне, такая своеобразная виртуальная корзина покупателя, как в обычном реальном супермаркете. Как выставлять cookies клиенту зависит от того, как они будут использоваться в дальнейшем. Это можно делать как с помощью скриптов, так и с помощью META-тагов HTML. Можно манипулировать временем жизни выставленных cookies и устанавливать место, в котором установки действительны.

COOL = ХХ (или ПРОХЛАДНОЕ, или ХОЛОДНОЕ) – Cool:- of a hue in the range violet through blue to green. / в диапазоне от фиолетового до голубого и зелёного.

COOL AND SWEET = ПРОХЛАДНОЕ И НЕИСПОРЧЕННОЕ – Cool And Sweet are terms used to describe the condition of grain which is of a normal temperature and is free from any objectionable odor. / Прохладное и Неиспорченное – эти термины используются для описания состояния зерна, имеющего нормальную температуру и неимеющего каких-либо неприятных запахов.

COOLANT = ОХЛАДИТЕЛЬ (или ХЛАДАГЕНТ, или ХОЛОДИЛЬНЫЙ АГЕНТ) – Coolant is a fluid used to remove heat. See also Cutting Fluid. / Хладагент, то же, что Холодильный Агент. Холодильный Агент или Хладагент, рабочее вещество холодильной машины, которое при кипении или в процессе расширения отнимает теплоту от охлаждаемого объекта и затем после сжатия передаёт её охлаждающей среде (воде, воздуху и тому подобному). К холодильным агентам предъявляется ряд требований:- они должны иметь низкую температуру кипения при давлениях выше атмосферного (во избежание подсоса воздуха), умеренные давление и температуру конденсации, низкую температуру затвердевания и высокую критическую температуру, большую теплоту парообразования при малых удельных объёмах паров, малую теплоёмкость и высокую теплопроводность. Кроме того, желательно, чтобы холодильные агенты были взрывобезопасными, нетоксичными, негорючими, нейтральными к конструкционным материалам, инертными к смазке и так далее. В зависимости от температуры кипения при атмосферном давлении холодильные агенты подразделяют на 3 группы:- высокотемпературные (выше –10 °С), умеренные (ниже –10 °С) и низкотемпературные (ниже –50 °С). Основными холодильными агентами являются аммиак, фреоны (хладоны) и некоторые углеводороды. Аммиак относится к группе умеренных холодильных агентов. Достоинствами аммиака являются его низкая стоимость и высокие теплофизические показатели. К недостаткам относятся токсичность, взрывоопасность. Аммиак также разрушительно воздействует на медь и её сплавы. Фреоны в большинстве случаев безвредны и негорючи; насчитывается свыше 50 различных фреонов и их смесей, применяемых во всех температурных группах. Наиболее распространены фреон-12, фреон-22 (относятся к умеренным холодильным агентам) и фреон-13 (низкотемпературный холодильный агент). Углеводороды (этан, пропан, этилен) имеют низкую температуру замерзания, но взрывоопасны; применяются в крупных и средних холодильных установках в нефтехимической и газовой промышленности. В пароэжекторных и работающих на водном растворе бромистого лития (бромистолитиевых) абсорбционных холодильных машинах холодильным агентом служит вода. В холодильно-газовых машинах в качестве холодильного агента в основном используются такие газы, как гелий, водород, азот, воздух.

COOLIE HAT = ШЛЯПА КУЛЫ (или ШИРОКОПОЛАЯ КОНИЧЕСКАЯ ШЛЯПА) – Coolie Hat is a conical-shaped usually straw hat worn especially to protect the head from the heat of the sun.

COOLING DEGREE–DAYS = ГРАДУСО–ДНИ КОНДИЦИОНИРОВАНИЯ (или ГРАДУСО–ДНИ ОХЛАЖДЕНИЯ) – Cooling Degree-Days:- a measure of how warm a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit (18.3 °C). The measure is computed for each day by subtracting the base temperature (65 degrees) from the average of the day's high and low temperatures, with negative values set equal to zero. Each day's cooling degree-days are summed to create a cooling degree-day measure for a specified reference period. Cooling degree-days are used in energy analysis as an indicator of air conditioning energy requirements or use. In other words, cooling degree-days are the number of degrees per day that the daily average temperature is above a given temperature. This temperature is the point above which the consumer is assumed to use energy for space cooling. During the space-cooling season, warmer-than-normal temperatures tend to lead to increased electricity use, with increased demand for electricity often met by incremental use of oil products. See also Degree Day, Degree-Days Normals, and Heating Degree-Days. Cooling Degree Days (CDD) is a measure of how warm a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the base temperature (65 degrees) from the average of the day's high and low temperatures, with negative values set equal to zero. Each day's cooling degree-days are summed to create a cooling degree day measure for a specified reference period. Cooling degree days are used in energy analysis as an indicator of air conditioning energy requirements or use. / Градусо-Дни Кондиционирования (ГДК) или Градусо-Дни Охлаждения (ГДО):- в США мера того, насколько тепло в данном месте в течение определённого периода по отношению к базовому значению температуры, как правило, составляющему 65 градусов по Фаренгейту (18.3 °C). Значения вычисляются по каждому дню путём вычитания базовой температуры (65 градусов) из среднеарифметических значений макисмальной и минимальной суточной температуры, при этом отрицательные величины приравниваются к нулю. Ежедневные значения градусо-дней кондиционирования суммируются для определения значения градусо-дня кондиционирования для конретно выбранного периода. Градусо-дни кондиционирования используются в анализе ситуации в энергетике в качестве индикатора потребности или фактического потребления энергии, направленной на кондиционирование воздуха. Другими словами, градусо-днями кондиционирования называют количество градусов в сутки, на которое среднесуточная температура выше базовой. Эта температура служит значением, при превышении которого потребитель предположительно использует энергию для охлаждения помещения. В течение сезона кондиционирования температуры более высокие нежели базовая приводят к повышенному потреблению электричества. В свою очередь повышенный спрос на электроэнергию приводит к постепенному увеличению потребления нефтепродуктов. Смотрите также Градусо-День (Degree Day), Среднестатистические Градусо-Дни (Degree-Days Normals) и Градусо-Дни Отопления (Heating Degree-Days).

COOLING SYSTEM = СИСТЕМА ОХЛАЖДЕНИЯ (или СИСТЕМА КОНДИЦИОНИРОВАНИЯ) – Cooling System:- Energy Efficiency program promotion aimed at improving the efficiency of the cooling delivery system, including replacement, in the residential, commercial, or industrial sectors.

COONSKIN = ИЗ ШКУРЫ ЕНОТА – Coonskin:- an article, as a cap or coat, made of coonskin.

COOPER = БОЧАР (или БОНДАРЬ) – Cooper is the warehouse worker assigned to reconstruct or repair cartons, crates, boxes, etc. / Бочар или Бондарь – складской работник, в обязанности которого входят переделка или ремонт коробов, клетей, ящиков, и тому подобного. Бондарные Изделия, сосуды (бочки, буты, чаны, кадки и другие), предназначенные для хранения и транспортирования жидких, полужидких и сыпучих продуктов.

COOPERATIVE = КООПЕРАТИВ (или ОБЪЕДИНЕНИЕ) – (1) Cooperative is an organization of persons who pool their resources to buy, sell or produce more efficiently than they could individually. A cooperative is owned and managed by its members. / Под Кооперативом, от Латинского слова Cooperatio, означающее Сотрудничество, понимается организация лиц, объединивших свои возможности для покупки, продажи или производства чего-либо с большей эффективностью, чем индивидуально.

(2) In reference to electricity, Cooperative is a group organized under law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Typically, a co-op is not for profit. / По отношению к электричеству, группа, на законных основаниях организованная в энергетическую компанию, которая будет генерировать, передавать и/или распределять поставку электроэнергии в определённую зону, не обслуживаемую иной энергетической компанией. Как правило, при кооперировании не предусматривается извлечения выгоды, то есть получения прибыли.

COOPERATIVE ELECTRIC UTILITY = КООПЕРАТИВНОЕ ЭЛЕКТРИЧЕСКОЕ ПРЕДПРИЯТИЕ – Cooperative Electric Utility is an electric utility legally established to be owned by and operated for the benefit of those using its service. The utility company will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from Federal income tax laws. Most electric cooperatives have been initially financed by the Rural Electrification Administration, US Department of Agriculture (USDA).

COOPERATIVE MARKETING ASSOCIATION = КООПЕРАТИВНАЯ ХОЗЯЙСТВЕННАЯ АССОЦИАЦИЯ – In the United States, a Cooperative Marketing Association (CMA) means a cooperative marketing association, approved as specified in part 1425 of this chapter, that has executed a Cotton Cooperative Loan Agreement. § 1425.6 Approved CMAs:- (a) The Commodity Credit Corporation (CCC) of the US Department of Agriculture may approve a CMA to participate in the marketing assistance loan (MAL) and loan deficiency payment (LDP) program as:- (1) Unconditionally approved; or (2) Conditionally approved. (b) If CCC determines a CMA is in substantial but not total compliance with the requirements of this part, CCC may make the approval conditional on the CMA achieving full compliance within a reasonable period of time, as specified in the notification of conditional approval. (c) A CMA is approved to participate in the MAL and LDP program until the CMA's approval is suspended or terminated by CCC.

COOPERATOR = КООПЕРАТОР – Cooperator is a person who works closely with another in research activities.

COOPERATOR = СООПЕРАТОР – Cooperator is a plant regulatory officials designated under the Federal-State Cooperative Program that their State has entered into with USDA-APHIS-PPQ (short for the United States Department of Agriculture – Animal and Plant Health Inspection Service – Plant Protection and Quarantine). Specific plant regulatory officials are authorized by the Secretary of Agriculture to inspect and certify the phytosanitary conditions of commodities offered for export and to issue export certificates. Officials designated as cooperators must meet or exceed the basic requirements as detailed in Special Programs – Federal-State Cooperative Program.

COORDINATED TRANSPORT = СКООРДИНИРОВАННАЯ ПЕРЕВОЗКА – Coordinated Transport:- two or more carriers of different modes transporting a shipment.

COORDINATED TRIAL = СКООРДИНИРОВАННОЕ ИСПЫТАНИЕ (или СКООРДИНИРОВАННЫЙ ОПЫТ) – Coordinated Trial:- trials conducted in many places made up of the same treatments organized by a research center or a group of members with regional and national focus.

COORDINATED UNIVERSAL TIME = УНИВЕРСАЛЬНОЕ КООРДИНИРОВАННОЕ ВРЕМЯ (или ВСЕМИРНОЕ КООРДИНИРОВАННОЕ ВРЕМЯ) – Coordinated Universal Time (UTC is short for the Temps Universel Coordonné in French) is the time scale based on the second (SI), as defined and recommended by the CCIR (International Radio Consultative Committee), and maintained by Bureau International des Poids et Mesures (BIPM). For most practical purposes associated with the Radio Regulations, UTC is equivalent to mean solar time at the prime meridian (0° longitude), formerly expressed in GMT. Note 1:- the maintenance by BIPM includes coordinating inputs from time standards belonging to various national laboratories around the world, which inputs are averaged to create the international time standard (second). Note 2:- the full definition of UTC is contained in CCIR Recommendation 460-4. Note 3:- the second was formerly defined in terms of astronomical phenomena. When this practice was abandoned in order to take advantage of atomic resonance phenomena ('atomic time') to define the second more precisely, it became necessary to make occasional adjustments in the 'atomic' time scale to coordinate it with the workaday mean solar time scale, UT-1, which is based on the somewhat irregular rotation of the Earth. Rotational irregularities usually result in a net decrease in the Earth's average rotational velocity, and ensuing lags of UT-1 with respect to UTC. Note 4:- adjustments to the atomic, i.e. UTC, time scale consist of an occasional addition or deletion of one full second, which is called a Leap Second. Twice yearly, during the last minute of the day of June 30 and December 31, Universal Time, adjustments may be made to ensure that the accumulated difference between UTC and UT-1 will not exceed 0.9 s before the next scheduled adjustment. Historically, adjustments, when necessary, have usually consisted of adding an extra second to the UTC time scale in order to allow the rotation of the Earth to 'catch up'. Therefore, the last minute of the UTC time scale, on the day when an adjustment is made, will have 61 seconds. Also known as World Time, Z Time, and Zulu Time. Coordinated Universal Time (UTC), maintained by the BIPM, is the time scale that forms the basis for the coordinated dissemination of standard frequencies and time signals. The UTC scale is adjusted by the insertion of leap seconds to ensure approximate agreement with the time derived from the rotation of the Earth. These leap seconds are inserted on the advice of the International Earth Rotation and Reference Systems Service (IERS). A practical scale of time for world-wide use has two essential elements:- a realization of the unit of time and a continuous temporal reference. The reference used is TAI (from the French name Temps Atomique International (International Atomic Time)), a time scale calculated at the BIPM using data from some two hundred atomic clocks in over fifty national laboratories. The long-term stability of TAI is assured by a judicious way of weighting the participating clocks. The scale unit of TAI is kept as close as possible to the SI second by using data from those national laboratories which maintain the best primary caesium standards. TAI is a uniform and stable scale which does not, therefore, keep in step with the slightly irregular rotation of the Earth. For public and practical purposes it is necessary to have a scale that, in the long term, does. Such a scale is Coordinated Universal Time (UTC), which is identical with TAI except that from time to time a leap second is added to ensure that, when averaged over a year, the Sun crosses the Greenwich meridian at noon UTC to within 0.9 s. The dates of application of the leap second are decided by the International Earth Rotation Service (IERS). Occasionally, 1 s is added to the UTC time scale. This second is called a Leap Second. Its purpose is to keep the UTC time scale within ±0.9 s of the UT1 astronomical time scale, which changes slightly due to variations in the rotation of the Earth. The first leap second was inserted into the UTC time scale on 1972-June-30. Leap seconds are used to keep the difference between UT1 and UTC to within ±0.9 s. The table below lists all leap seconds that have already occurred, or are scheduled to occur. A leap second is a second added to Coordinated Universal Time (UTC) in order to keep it synchronized with astronomical time. UTC is an atomic time scale, based on the performance of atomic clocks that are more stable than the Earth's rotational rate. Astronomical time (UT1 (UT1 is the principal form of Universal Time)), or mean solar time, is based on the rotation of Earth, which is irregular. There are two main reasons that cause leap seconds to occur. The first reason is that the atomic second was originally defined by comparing atomic clocks to the Ephemeris second, which is slightly shorter than the mean solar second and which is no longer used. This made the atomic second slightly shorter than the mean solar second to begin with. The second reason is that the rotation of Earth varies and is gradually slowing down, so the mean solar second is gradually getting longer. All of these factors contribute to the difference between UTC and UT1. Leap seconds are added in order to keep the difference between UTC and astronomical time (UT1) to less than 0.9 seconds. The International Earth Rotation and Reference Systems Service (IERS), measures Earth's rotation and publishes the difference between UT1 and UTC. Usually leap seconds are added when UTC is ahead of UT1 by 0.4 seconds or more. At the time the corrections started in 1972, a necessary correction of ten seconds was made to UTC, and there have been leap seconds about every year and a half (on average). Leap seconds have always occurred at the end of December or the end of June, on the last second of the UTC day. The designation of the sequence of seconds is:- 23h 59m 59s; 23h 59m 60s; 00h 00m 00s. By keeping Coordinated Universal Time (UTC) within one second of astronomical time, scientists and astronomers observing celestial bodies can use UTC for most purposes. If there were no longer a correction to UTC for leap seconds, then adjustments would have to be made to time stamps and legacy equipment and software which synchronize to UTC for astronomical observations. However, adding a second to UTC can create problems for some systems, including data logging applications, telecommunication systems and time distribution services. Special attention must be given to these systems each time there is a leap second. Some proposals have been made to implement larger corrections like leap hours, which would occur much less often than leap seconds. Also, it has been suggested to stop corrections to UTC and publish the growing difference between UTC and UT1. The relatively small community that needs UT1 could then use the published values as a correction. Discussions of the future of leap seconds are ongoing at meetings of the Radiocommunication Sector of the International Telecommunication Union (ITU-R). Leap seconds and leap years are both implemented to keep our time in accordance with the position of Earth. However, leap seconds are added when needed, based on measurements, and leap years are regularly occurring events based on set rules. During leap years, an extra day is added as February 29th to keep the calendar synchronized with the precession of the Earth around the Sun. Leap years are necessary because the actual length of the year is 365.242 2 days and not 365. The extra day is added every four years to compensate for most of the partial day. However, this is a slight over-compensation, so some century years are not leap years. Only every fourth century year (those equally divisible by 400) is a leap year. For instance, 2000 was a leap year, but 1900, 1800 and 1700 were not. Universal Time (UT or Z) is the correct name for the time system previously called Greenwich Mean Time (GMT):- the standard time at longitude 0°. Universal Time is five hours later than Eastern Standard Time (EST) in the United States. It is always stated on the 24-hour clock; thus an event occurring at 1:26:15 pm Eastern Standard Time occurs at 18:26:15 UT (five hours after 13:26:15). Technically, the time shown on clocks is figured from Coordinated Universal Time (UTC), an international system of time measurement regulated by very precise atomic clocks. From time to time (either on June 30 or December 31), UTC is adjusted by the addition of a 'leap second'. This event, widely reported in the press but poorly understood by the public, keeps UTC within 0.9 seconds of mean solar time at longitude 0° as measured by the Earth's slightly uneven rotation. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Координированное Время представляет собой систему счёта времени, осуществляющую координацию атомного времени с всемирным временем, получаемым из астрономических наблюдений. Сигналы точного времени, передаваемые службами времени, соответствует шкале Всемирного Координированного Времени (ВКВ), расхождение которого с всемирным временем по международному соглашению не должно превышать 0.7 секунды.

Всемирное Время или Мировое Время представляет собой Среднее Солнечное Время начального меридиана. За начальный меридиан условно принимается меридиан обсерватории в Гринвиче, Соединённое Королевство. Среднее Солнечное Время представляет собой время, определяемое изменением часового угла среднего экватора Солнца – фиктивной точки, равномерно двигающейся по небесному экватору со средней скоростью движения истинного Солнца по эклиптике. Учёные Германии, Норвегии и Японии готовятся откорректировать Всемирное Время – среднее солнечное время на нулевом меридиане, от которого отсчитывается местное время во всех часовых поясах Земли. Работу координирует Институт Радиоастрономии имени Макса Планка (Max-Planck-Institut für Radioastronomie (MPIfR), Бонн, ФРГ. Данные для корректировки дадут радиотелескопы, расположенные в Ветцеле (Wettzell, ФРГ), Ни-Алезунде (Ny Alesund, Норвегия) и Цукубе (Tsukuba, Япония). Для обработки результатов наблюдений будет использован самый мощный в Европе суперкомпьютер Общества Макса Планка. Что такое Универсальное Координированное Время (Coordinated Universal Time (UTC); иногда его называют Время Зулу (Zulu Time), где Zulu обозначает нуль в международном коде радиообмена) и почему его надо корректировать? Для того чтобы ответить на этот вопрос, необходим небольшой экскурс в астрономию, точнее – в астрометрию. Всем со школьной скамьи известно, что нулевой меридиан, от которого начинается отсчёт часовых поясов, проходит через Королевскую Гринвичскую Обсерваторию (Royal Greenwich Observatory) в Англии. Всемирное Время – это время на меридиане Гринвича (ранее оно так и называлось – Гринвичское Среднее Время (ГСВ)). Меридианы, как известно, проходят через точки географических полюсов Земли, через них же проходит и ось вращения нашей планеты. Но ось вращения Земли из-за явлений прецессии и нутации непрерывно перемещается в теле планеты, а вместе с ней ‘гуляют’ и точки полюсов, привязанные к положению земной оси. Следовательно, вместе с полюсами меняется и положение самих меридианов. Кроме того, приливы, движение воздушных масс, притяжение Солнца и Луны делают вращение Земли неравномерным:- она то ‘спешит’, то ‘притормаживает’, как стрелка в неисправных часах. Соответственно, неравномерно вращается и нулевой меридиан. Таким образом, продолжительность суток никогда не бывает одинаковой:- они то короче, то длиннее. Конечно, речь идёт о погрешностях порядка миллисекунд, но сегодня эти миллисекунды имеют колоссальное значение (об этом – ниже). Так называемое Солнечное Время определяется по результатам астрономических наблюдений, однако на их точность влияют вышеперечисленные факторы, носящие во многом случайный характер и статистической обработке не поддающиеся. С появлением молекулярных и атомных стандартов частоты возникла принципиально новая, не зависящая от вращения Земли и движения тел Солнечной системы, физическая шкала атомного времени. В 1967 Международный Комитет Мер и Весов постановил принять за единицу измерения времени в Международной Системе Единиц (СИ) атомную секунду. Атомные часы позволили создать очень стабильную и равномерную шкалу времени. Но продолжительность суток меняется, поэтому ход атомных часов не совпадает с ходом земных. Расхождение между атомной и всемирной шкалами времени составляет примерно секунду в год. Аналогичная проблема существует и в календарном счёте времени. Год не равен целому числу суток, но мы хотим, чтобы год ‘шёл в ногу’ с календарем. Прибавляя в високосном году один день к календарю, можно поддерживать соответствие между календарем и временами года. Для согласования физической шкалы атомного времени International Atomic Time (TAI; from the French name Temps Atomique International) вначале изменяли продолжительность секунды. Секунда была ‘резиновой’, но это оказалось неудобно, поэтому была введена шкала координированного времени UTC, включающая в себя понятие ‘дополнительной секунды’, или ‘високосной’ (leap second). Международное бюро времени объявляет о введении дополнительной секунды (положительной или отрицательной), и шкала UTC – ‘всемирные часы’ смещается точно на одну секунду. Обычно это происходит 31 Декабря или 30 Июня. При этом очень важно знать, когда именно, в какой момент в шкалу всемирного времени должна быть введена эта ‘високосная секунда’ – иначе в мире настанет полный хаос в определении точного времени. Собственно, исследования общества Планка и посвящены определению этого момента. Кроме того, поскольку атомная секунда отличается от секунды UTC на дробное количество секунд атомного времени, за годы применения практики ‘високосной секунды’ между обеими шкалами накопилось приличное расхождение, которое нуждается в коррекции. То есть к дополнительной секунде будет добавлено не целое количество секунд расхождения, с тем чтобы до следующей коррекции хода ‘всемирных часов’ снова просто добавлять одну секунду. Стоит ли огород городить ради микроскопической поправки порядка 0.000 1 секунды? Очень даже стоит! По шкале UTC работают абсолютно все системы спутниковой навигации:- от GPS до ГЛОНАСС. От точности определения времени в них зависит точность определения координат:- ошибка в определения времени в одну десятитысячную секунды даст ошибку определения координат в десятки (иногда даже сотни) метров. В этой шкале работают и международная спутниковая Система Предупреждения Судов об Опасности на море (COSPAS–SARSAT Ship Security Alerting System (SSAS)) Международной Морской Организации (ММО; International Maritime Organization’s (IMO)), радиостанции службы эталонных частот, имеющие огромное значение как для служебной радиосвязи, так и для телевизионного и радиовещания. Рассинхронизация сети передающих центров, покрывающих вещанием определённую территорию, может привести к прекращению вещания или сильным искажениям сигнала. То же самое относится к системам сотовой связи. Цена секунды в современном мире существенно выросла.

COORDINATING COMMITTEE ON MULTILATERAL EXPORT CONTROLS = КООРДИНИРУЮЩИЙ КОМИТЕТ ПО МНОГОСТОРОННЕМУ (или ВСЕСТОРОННЕМУ) ВЫВОЗНОМУ (или ЭКСПОРТНОМУ) КОНТРОЛЮ – At the beginning of the Cold War, the United States and its allies implemented a new system of unilateral and multilateral export controls designed chiefly to prevent communist acquisition of Western military goods and technology. At that time a primary strategic threat was clear, and economic concerns were secondary to the foreign policy goal of containing the spread of communism and totalitarian ideology. The Cold War export control mechanisms, primarily the Export Control Act and the Coordinating Committee for Multilateral Export Controls (COCOM), remained in place for over forty years, surviving the end of the Cold War. The Cold War export controls survived despite a rapidly changing global environment which by 1991 had culminated in the disintegration of the Soviet Union, the reunification of Germany, and the collapse of the Warsaw Pact. No longer did the United States have a perceived ‘Evil Empire’, or a single common enemy of immediate threat against which it could unite its allies. CoCom was dissolved in March 1994. Coordinating Committee on Multilateral Export Controls (COCOM) is a multilateral organization that cooperated in restricting strategic exports to controlled countries. COCOM was officially disbanded on March 31, 1994. COCOM members included:- Australia, Belgium, Canada, Denmark, France, Germany, Greece, Italy, Japan, Luxembourg, Netherlands, Norway, Portugal, Spain, Turkey, United Kingdom, and United States. The Coordinating Committee on Multilateral Export Controls (COCOM) is an informal organization that cooperatively restricts strategic exports to controlled countries. CoCom controls three lists:- (i) the international industrial list (synonymous with the ‘dual use’ or ‘core’ list); (ii) the international munitions list; and (iii) the atomic energy list. The 17 CoCom members are:- Australia, Belgium, Canada, Denmark, France, the Federal Republic of Germany, Greece, Italy, Japan, Luxembourg, the Netherlands, Norway, Portugal, Spain, Turkey, the United Kingdom and the United States. CoCom controls exports at three levels, depending on the item and the proposed destination. At the highest or ‘general exception’ level, unanimous approval by CoCom members is necessary. At the next level, ‘favorable consideration’, there is a presumption of approval; the export may be made if no CoCom members objects within 30 days of submission to CoCom. At the lowest level, ‘national discretion’ (also called ‘Administrative Exception’), a member nation may approve the export on its own, but CoCom must be notified after the fact. During the Cold War, the diffusion of technological capabilities in the global economy and frequent divergence of allied views on security and foreign policy made it difficult to manage the

coordination of multilateral export policies. By the 1980s, members of the Coordinating Committee on Multilateral Export Controls (COCOM) also needed to induce more 'cooperating' countries, such as the European neutrals and several newly industrializing economies in East Asia, to adopt export control systems compatible with COCOM strictures to maintain the effectiveness of the system. These initiatives met with mixed success. The Coordinating Committee for Multilateral Export Controls (COCOM) was created in 1949 for the purpose of preventing Western companies and countries from selling strategic goods and services to the Eastern bloc countries behind the 'iron curtain'. The founding members of COCOM were the United States, Belgium, France, Italy, the Netherlands, Luxembourg, and the United Kingdom. Countries joining COCOM at later dates were Spain, Canada, Australia, Denmark, Germany, Greece, Italy, Norway, Portugal, Japan, and Turkey. Following World War II it became apparent to the West that any strategic advantage it held over the Soviet bloc countries was greatly dependent upon its technological superiority. Headquartered in an annex to the American embassy in Paris, COCOM was a small and secretive organization. One veteran diplomatic correspondent went so far as to refer to it as a 'secret annex to the Marshall Plan'. Member states would meet to update three lists of controlled items:- the International Munitions list; the International Atomic Energy list; and the third and most controversial, the International (Industrial) list. It was felt that items appearing on these lists, if acquired by the Soviets and their allies, would greatly enhance the strategic military potential of the Warsaw Pact countries. The International (Industrial) list was controversial because it included what came to be known as 'Dual Use' Items. These are, according to Robert Rudney and T.J. Anthony, 'goods, services, and technologies that have a known commercial use, as well as a known military use or a known use in weapons of mass destruction'. The controversy of 'dual use' technology continued into the late 1990s, as evidenced by the imbroglio over US companies sending telecommunication satellites into space atop missiles launched by military agencies of the People's Republic of China. COCOM's lack of success was due largely to a small overworked staff (14 staff members in the early 1980s) and general negligence on the part of its member countries. Violations were frequent because of poor enforcement, lack of stiff penalties, and because of the high profits involved. The United States, however, always considered its export policies to be in compliance with COCOM regulations. Even though COCOM never officially published a list of its 'target countries' they were undoubtedly at one time or another Afghanistan, Albania, Bulgaria, Cambodia, Czechoslovakia, Cuba, East Germany, Hungary, Laos, Mongolia, North Korea, the People's Republic of China, Poland, Romania, the Soviet Union, and Vietnam. In the United States exports to other countries are regulated by the US Bureau of Export, which is part of the US Department of Commerce. Legislative authority controlling exports includes:- The Export Control Act of 1949, which was related to the establishment of COCOM; The Battle Act of 1951, which stopped countries exporting strategic goods to the Eastern bloc from receiving US foreign aid; and the Export Administration Act of 1969, which dealt with the export of 'dual use' goods. This act was amended in 1979, 1981, and 1985. On 1994-March-30, the United States announced it would greatly ease the restrictions it had placed on the sale of computer and telecommunications equipment to countries that had comprised the Eastern bloc. With the fall of communism in the Soviet Union and other countries of Eastern Europe, the military and political threat that had fueled the creation of COCOM had largely dissipated. Export controls on certain radio and encryption technologies, however, remained in effect. On 1994-March-31, COCOM was formally dissolved. / Робэт Рудни (Robert Rudney) и Ти.Дьжей. Энсэни (T.J. Anthony). КоКам (CoCom). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

THE COORDINATING EUROPEAN COUNCIL = КООРДИНИРУЮЩИЙ ЕВРОПЕЙСКИЙ СОВЕТ – The Coordinating European Council (CEC) for the Development of Performance Tests for Fuels, Lubrications and Other Fluid is an organisation that represents the motor, oil, petroleum additive and allied industries in the development of test methods to evaluate the performance of transportation fuels, lubricants and other fluids. CEC test methods are used extensively in Europe and widely throughout the world. CEC was established over 30 years ago and now has more than 1 500 participants from over 300 companies. Representatives are able to contribute in CEC affairs at all levels. The essential objective of the CEC is to develop performance test methods on behalf of the industries it represents in a timely, quality focussed and cost effective manner and to ensure that such methods elate to market place demand. CEC also specifies reference fluids for use in engine tests and rig tests using CEC standard performance test procedures. The reference fluids data sheets are available to working group members and CEC test method holders in the form of Reference Fuels and Reference Oils Manuals. CEC is the European Fuels & Lubricants Performance Test Development Organisation. Headquartered in Brussels, Belgium.

COORDINATION TRANSACTIONS = СКООРДИНИРОВАННЫЕ ТРАНЗАКЦИИ (или СКООРДИНИРОВАННЫЕ ОПЕРАЦИИ) – In reference to electricity, Coordination Transactions are the short-term transactions undertaken primarily to maintain in the integrity of an electricity distribution system. / По отношению к электричеству, краткосрочные действия, предпринимаемые, в первую очередь, для поддержания работоспособности системы распределения электричества.

CO–OWNER = СОВЛАДЕЛЕЦ – Co-Owners are two individuals designated in the alternative on the face of a bond with their names shown, for example, as 'John Smith or Jane Smith'. The form of registration 'John Smith and Jane Smith' is not authorized. Either co-owner may cash/redeem the bond without the consent of the other co-owner. / Дьжон Смис (John Smith) и Дьжейн Смис (Jane Smith).

CO–OWNERSHIP = СОВЛАДЕНИЕ – Co-Ownership is the joint ownership of a property by two or more persons under which each retains title to a distinct part. Each co-owner can sell or pledge his portion, whereas disposal over the entire property requires the consent of all co-owners.

COP = COLOMBIAN PESO

COP = CUSTOM OF PORT

COP = ПОЧАТОК (или ШПУЛЯ) – (1) A term Cop refers to the cone of fibers that builds up on a spindle. Thread or twine wound into the shape of a hollow cylinder. In textile industry, cop is a bobbin upon which yarn is wound prior to weaving. It is recommended the use of the bobbins with rings both at top and bottom. See also Pirn. Cop is a headless tube upon which yarn or thread is wound. / Под Початком понимается паковка с пряжей или кручёной нитью, намотанной на патрон или шпулю и имеющей форму цилиндра, верхние и нижние основания которого представляют усечённый конус, что позволяет производить сматывание нити с неподвижного початка вдоль его оси. В текстильной отрасли под Шпулей понимается разновидность бобин, на которую производится намотка пряжи, прежде чем она попадает в ткачество. Рекомендуется использование фланцев на верхнем и нижнем концах шпули.

(2) Cop is a paper tube upon which thread or yarn is wound. Cop:- thread or yarn wound into the shape of a hollow cylinder with tapered ends.

(3) Cop:- filling yarn wound upon a tapered tube (generally paper). Filling yarn wound upon a cone-shaped paper tube, carried through the warp shed by the shuttle. Cop is a conical shape into which cotton or worsted weft yarn is wound over a paper tube or a bare spindle, which is with drawn after the winding. The yarn is crossing itself at sharp angles. / уточная пряжа, намотанная на .

COPAL = КОПАЛ – Copal is a resinous substance exuded from some Species of Tropical Trees and hardening in air into a glassy solid ranging in color from red to yellow or brown. / из некоторых Видов (Species) Тропических Деревьев и упрочнение на воздухе с превращением в стеклянное или стекловидное или стеклообразное (glassy) . Под Копалом, от Испанского слова Copal, понимается смола, выделяемая преимущественно тропическими деревьями семейства бобовых. Получают подсочкой деревьев или добывают из их ископаемых остатков в земле (ископаемый копал). Окраска – от бесцветной до коричневой. Широко применялся для производства лаков.

COPE = КОП (или КОУП, или РИЗА, или МАНТИЯ) – Cope:- a long enveloping ecclesiastical vestment. / .

COPENHAGEN CRITERIA = КОПЕНГАГЕНСКИЙ КРИТЕРИЙ – Copenhagen Criteria (accession criteria):- countries wanting to join the European Union (EU) must fulfil several criteria:- political criteria (stable institutions guaranteeing democracy, the rule of law, human rights and respect for minorities), economic criteria (a functioning market economy), and incorporation of the acquis communautaire (the EU's body of law). They were set by the Copenhagen European Council in June 1993 and confirmed by the Madrid European Council in December 1995.

COPIES = КОПИИ – Copies are the reproductions of all or a portion of digital information onto any one of a number of media, including computer diskette, hard-copy printout, or by exact quotation. / Под Копией, от Латинского слова Copia, означающее Множество, понимается точный список, точное воспроизведение или повторение чего-либо.

COPOLYMER = СОПОЛИМЕР – Copolymer is a polymer composed of a combination of more that one monomer (usually two). Copolymers are the basis of some manufactured fibers. Copolymer is a polymer composed of two or more different monomers.

COPPER = МЕДЬ – Copper is a chemical element in the periodic table that has the symbol Cu (in Latin, Cuprum) and atomic number 29. It is a ductile metal with excellent electrical conductivity, and finds extensive use as an electrical conductor, thermal conductor, as a building material, and as a component of various alloys. Copper has played a significant part in the history of mankind, which has used the easily accessible uncompounded metal for nearly 10 000 years. Civilizations in places like Iraq, China, Egypt, Greece and the Sumerian cities all have early evidence of using copper, and Britain and the United States also have extensive histories of copper use and mining. During the Roman Empire, copper was principally mined on Cyprus, hence the origin of the name of the metal as Cyprium, 'metal of Cyprus', later shortened to Cuprum. A number of countries, such as Chile and the United States, still have sizeable reserves of the metal which are extracted through large open mines. Nevertheless, the price of copper rose rapidly, quintupling from a 60-year low in 1999, largely due to increased demand. This metal has come in to limelight on account of high volatility in prices. Copper is a reddish-colored metal, with a high electrical and thermal conductivity (silver is the only pure metal to have a higher electrical conductivity at room temperature). In oxidation copper is mildly basic. Copper has its characteristic color because it reflects red and orange light and absorbs other frequencies in the visible spectrum, due to its band structure. Copper is malleable and ductile, a good conductor of heat and, when very pure, a good conductor of electricity. Copper has often been considered the best measure of economic health because it is used to build things – big things like houses and cars – but like so many markets in the commodities spaces, it is dependent on China. 'It is all about China', Mohr says (in April 2014). 'In 2009, because of China's infrastructure program even when the US was in recession, China rebounded very strongly because China's government put in place a massive infrastructure program, record credit expansion, and you found the volume of copper demand grew 25% in 2009 – and it has been growing quite well ever since', she says. Mohr notes that China's refined copper consumption continued to grow every year:- 11% in 2010, 8.5% in 2011, 5% in 2012 and just under 12% in 2013. However, with recent loan default problems with Chinese banks, China may pull back on some of the stimulus that has been driving construction. 'Copper is pretty fairly valued here. It is waiting for some signs (from) China', Platt says. They are trying to curb some of the rampant construction activity and rampant lending activity in the construction industry which is a big user of copper. If that happens you probably break the market further'. Streible agrees. 'I was pretty bullish until this Chinese loan default problem. They can come back to the USD3.25 range where they were stuck – it seems to be a good equilibrium level', he says (see 'Copper on hold', left). 'If copper prices start going up then the economy is really doing well because then we will be at the point where we are producing. If copper prices start going up dramatically that means somewhere they're utilizing it'. But China has been so dominant a factor that if it does rein in lending activity, copper could drop sharply. 'If we start to see China withdraw in terms of supporting further expansion of construction, then copper will get hit harder than some of the other markets', Platt says. 'I can see USD3.20 being hit on the upside and eventually seeing this market come down. If we can't get back through there it could potentially break down and see USD2.20 on the downside'. There are other factor holding down copper. 'The thing that lowered the price in the past 18 months is that we were going through a period where there is new mine supply being put in place around the world', Mohr says. 'We are not through that mine expansion. We won't get through that period of new supply until 2016, and then I would suspect a nice rally in copper prices'. Streible says, 'Copper is a good barometer, the best barometer of all your metals'. Others however, think it is now so dependent on the Chinese that it is no longer the metal with a Ph.D. This is too bad, as the stock market is no longer a measure of economic health due to the Fed's heavy hand. It would be nice to rely on one market indicator providing a clear picture. And of all the sectors out there, metals is probably the most honest – gold alone is a pretty good measure of fear and greed but the entire complex is telling a tale, which is mixed. We have come through an extraordinary period of recession and government and central bank intervention, and normal is still far off. The metals sector still may be the best gauge as to how the real economy is doing. Copper is a measure of growth and China has been providing that growth, driving copper to record highs in the midst of a global recession. Now (in May 2014) China may be pulling back, putting further pressure on copper. / Медь, на Латинском языке Купрум (Cuprum), символ Cu, химический элемент I группы периодической системы Менделеева. Атомный номер 29, атомная масса 63.546, плотность 8 920 кг/м^3, $t_{пл}$ 1 084.5 °C. Металл красного (в изломе розового) цвета, ковкий и мягкий. Хороший проводник тепла и электричества (уступает только серебру). Медь химически малоактивна; в атмосфере, содержащей CO_2, пары H_2O и другое, покрывается патиной – зеленоватой плёнкой основного карбоната (ядовит). Из минералов важны борнит, ковеллин, малахит, халькозин, халькопирит; изредка встречается в природе в виде самородной меди и в виде соединений с серой (сульфидов) или кислородом. Получают медь главным образом из обогащённых сульфидных руд. Высокая электро- и теплопроводность меди, пластичность и коррозионная стойкость определяют области её применения. Главное применение (около 50% всей добываемой меди) – производство электрических проводов и труб. Медь используется для изготовления химической аппаратуры (вакуум-аппараты, детали плазмотронов, теплообменники, трубопроводы, холодильники и тому подобное). Более 30% меди идёт на сплавы.

COPPER CONCENTRATE = МЕДНЫЙ КОНЦЕНТРАТ – Copper Concentrate is a product resulting from the processing (enriching) of copper ore.

COPPER STRIP CORROSION = КОРРОЗИЯ МЕДНОЙ ПОЛОСКИ (или КОРРОЗИЯ МЕДНОЙ ПЛАСТИНКИ) – Copper Strip Corrosion:- the gradual eating away of copper surfaces as the result of oxidation or other chemical action. It is caused by acids or other corrosive agents. / Сущность метода:- отшлифованную медную пластинку погружают в испытуемый образец, нагреваемый при температуре и в течение времени, установленных для данного класса материала. После нагревания медную пластинку

вынимают, промывают и определяют её цвет и степень тусклости сравнением с эталоном Американского Общества по Испытаниям и Материалам (АОИМ (ASTM)) по определению коррозии медной полоски. Сырая нефть содержит сернистые соединения, большинство из которых должны быть удалены при очистке. Однако сернистые соединения остаются в нефтепродукте и некоторые из них могут вызывать коррозию различных металлов. Эта коррозионная способность может не зависеть от общего содержания серы. Коррозионность зависит от типов сернистых соединений. Испытание на медной пластинке предназначено для оценки относительной степени коррозионности нефтепродуктов. Характеристики медных пластинок:- используют пластинки шириной приблизительно 12.5 мм (1/2 дюйма), толщиной от 1.5 до 3.0 мм (от 1/16 до 1/8 дюйма) и длиной приблизительно 75 мм (3 дюйма), изготовленные из листа холоднотянутой меди максимальной твёрдости с гладкой поверхностью чистотой не менее 99.9% или прутка для электрической шины. Пластинки используют повторно; их меняют, если на поверхности появляются глубокие царапины или углубления, которые невозможно устранить специальной полировкой, или поверхность деформирована. Для защиты медной полоски от контакта с руками во время окончательного полирования используют беззольную фильтровальную бумагу или одноразовые перчатки. Эталоны АОИМ по определению коррозии медной пластинки представляют собой цветные копии типичных испытательных пластинок с увеличением степени потускнения и коррозии. Для защиты пластинки помещают в пластиковый футляр.

COPPER SULFATE = СУЛЬФАТ МЕДИ (или СЕРНОКИСЛАЯ МЕДЬ) – Copper Sulfate, $CuSO_4$, also called Copper (II) Sulfate (read copper two sulfate) or Cupric Sulfate; is a copper compound sometimes used as a mordant, especially with natural dyes. Certain direct dyes are made more lightfast by after-dyeing treatment with copper sulfate.

COPPERY = МЕДИСТОЕ (или МЕДНОВАТОЕ, или ЦВЕТА МЕДИ) – Coppery:- having the reddish to brownish orange color of copper.

COPR = CENTRE FOR OVERSEAS PEST RESEARCH

COPYRIGHT = АВТОРСКОЕ ПРАВО (или ПРАВО НА КОПИЮ) – All authors must show on their copyrighted works is their name, the symbol ‘C’ in a circle, and the date of the first publication. Copyright is a legal term describing rights given to creators for their literary and artistic works. What is covered by copyright? The kinds of works covered by copyright include:- literary works such as novels, poems, plays, reference works, newspapers and computer programs; databases; films, musical compositions, and choreography; artistic works such as paintings, drawings, photographs and sculpture; architecture; and advertisements, maps and technical drawings. What rights does copyright provide? The original creators of works protected by copyright, and their heirs, have certain basic rights. They hold the exclusive right to use or authorize others to use the work on agreed terms. The creator of a work can prohibit or authorize:- (i) its reproduction in various forms, such as printed publication or sound recording; (ii) its public performance, as in a play or musical work; (iii) recordings of it, for example, in the form of compact discs, cassettes or videotapes; (iv) its broadcasting, by radio, cable or satellite; and (v) its translation into other languages, or its adaptation, such as a novel into a screenplay. Many creative works protected by copyright require mass distribution, communication and financial investment for their dissemination (for example, publications, sound recordings and films); hence, creators often sell the rights to their works to individuals or companies best able to market the works in return for payment. These payments are often made dependent on the actual use of the work, and are then referred to as Royalties. These economic rights have a time limit, according to the relevant WIPO treaties, of 50 years after the creator’s death. National law may establish longer time-limits. This limit enables both creators and their heirs to benefit financially for a reasonable period of time. Copyright protection also includes moral rights, which involve the right to claim authorship of a work, and the right to oppose changes to it that could harm the creator’s reputation. The creator – or the owner of the copyright in a work – can enforce rights administratively and in the courts, by inspection of premises for evidence of production or possession of illegally made – ‘pirated’ – goods related to protected works. The owner may obtain court orders to stop such activities, as well as seek damages for loss of financial rewards and recognition. Are ideas, methods or concepts protected by copyright? Copyright protection extends only to expressions, and not to ideas, procedures, methods of operation or mathematical concepts as such. This principle has been confirmed by the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) of the World Trade Organization (WTO) as well as the WIPO Copyright Treaty. What are rights related to copyright? A field of rights related to copyright has rapidly developed over the last 50 years. These related rights grew up around copyrighted works, and provide similar, although often more limited and of shorter duration, rights to:- (i) performing artists (such as actors and musicians) in their performances; (ii) producers of sound recordings (for example, cassette recordings and compact discs) in their recordings; and (iii) broadcasting organizations in their radio and television programs. Why protect copyright? Copyright and its related rights are essential to human creativity, by giving creators incentives in the form of recognition and fair economic rewards. Under this system of rights, creators are assured that their works can be disseminated without fear of unauthorized copying or piracy. This in turn helps increase access to and enhances the enjoyment of culture, knowledge, and entertainment all over the world. Do you need to register to be protected? Copyright itself does not depend on official procedures. A created work is considered protected by copyright as soon as it exists. According to the Berne Convention for the Protection of Literary and Artistic Works, literary and artistic works are protected without any formalities in the countries party to that Convention. Thus, WIPO does not offer any kind of copyright registration system. However, many countries have a national copyright office and some national laws allow for registration of works for the purposes of, for example, identifying and distinguishing titles of works. In certain countries, registration can also serve as prima facie evidence in a court of law with reference to disputes relating to copyright. How are copyright and related rights protected on the Internet? Two treaties were concluded in 1996 at the World Intellectual Property Organization (WIPO) in Geneva. One, the WIPO Copyright Treaty (WCT), deals with protection for authors of literary and artistic works, such as writings and computer programs; original databases; musical works; audiovisual works; works of fine art and photographs. The other, the WIPO Performances and Phonograms Treaty (WPPT), protects certain ‘related rights’ (that is, rights related to copyright):- in the WPPT, these are rights of performers and producers of phonograms. The purpose of the two treaties is to update and supplement the major existing WIPO treaties on copyright and related rights, primarily in order to respond to developments in technology and in the marketplace. Since the Berne and Rome Conventions were adopted or lastly revised more than a quarter century ago, new types of works, new markets, and new methods of use and dissemination have evolved. Among other things, both the WCT and the WPPT address the challenges posed by today's digital technologies, in particular the dissemination of protected material over digital networks such as the Internet. For this reason, they have sometimes been referred to as the ‘Internet Treaties’. Both treaties require countries to provide a framework of basic rights, allowing creators to control and/or be compensated for the various ways in which their creations are used and enjoyed by others. Most importantly, the treaties ensure that the owners of those rights will continue to be adequately and effectively protected when their works are disseminated through new technologies and communications systems such as the Internet. The treaties thus clarify that existing rights continue to apply in the digital environment. They also create new online rights. To maintain a fair balance of interests between the owners of rights and the general public, the treaties further clarify that countries have reasonable flexibility in establishing exceptions or limitations to rights in the digital environment. Countries may, in appropriate circumstances, grant exceptions for uses deemed to be in the public interest, such as for non-profit educational and research purposes. The treaties also require countries to provide not only the rights themselves, but also

two types of technological adjuncts to the rights. These are intended to ensure that rightholders can effectively use technology to protect their rights and to license their works online. The first, known as the 'anti-circumvention' provision, tackles the problem of 'hacking':- it requires countries to provide adequate legal protection and effective remedies against the circumvention of technological measures (such as encryption) used by rightholders to protect their rights. The second type of technological adjuncts safeguards the reliability and integrity of the online marketplace by requiring countries to prohibit the deliberate alteration or deletion of electronic 'rights management information':- that is, information which accompanies any protected material, and which identifies the work, its creators, performer, or owner, and the terms and conditions for its use. The WCT entered into force on 2002-March-06. For the WPPT, the date of entry into force was 2002-May-20. A number of countries have implemented the provisions of the two treaties in their national legislation. The WIPO Lex database can be consulted to search copyright laws of a wide range of countries. Which countries are party to the Internet treaties (the WIPO Copyright Treaty (WCT) and the WIPO Performances and Phonograms Treaty (WPPT))? The list of Contracting Parties to the treaties administered by WIPO are available at /treaties/en/. How do I get permission to use somebody else's work and other subject matters? You can contact the right owner. For certain types of works and other subject matter, you can get permission from a collective management organization. Collective management organizations license use of works and other subject matter that are protected by copyright and related rights whenever it is impractical for right owners to act individually. There are several international non-governmental organizations that link together national collective management organizations. How much of someone else's work can I use without getting permission? Under most national copyright laws, it is permissible to use limited portions of a work, including quotes, for purposes such as news reporting and private personal use. For further information see the national legislation available in WIPO Lex. Is computer software protected by copyright? In the 1970s and 1980s, there were extensive discussions on whether the patent system, the copyright system, or a sui generis system, should provide protection for computer software. These discussions resulted in the generally accepted principle that computer programs should be protected by copyright, whereas apparatus using computer software or software-related inventions should be protected by patent. Copyright law and patent law provide different types of protection. Copyright protection extends only to expressions, and not to ideas, procedures, methods of operation or mathematical concepts as such, whereas a patent is an exclusive right granted for an invention, which is a product or a process that provides a new way of doing something, or offers a new technical solution to a problem. Copyright protection is formality-free in countries party to the Berne Convention for the Protection of Literary and Artistic Works (the Berne Convention), which means that protection does not depend on compliance with any formalities such as registration or deposit of copies. A patent is generally granted after completing an examination procedure by a government agency. Copyright protection of computer software is established in most countries and harmonized by international treaties to that effect. The law relating to the patentability of software is still not harmonized internationally, but some countries have embraced the patentability of computer software and others have adopted approaches that recognize inventions assisted by computer software. In view of the complexity of these matters, it is recommended that you contact a practicing lawyer who is specialized in intellectual property or the intellectual property offices of those countries in which you are interested to get protection. You can find a list of URLs and a directory of national and regional intellectual property offices on our Website. Is a television format protected by copyright? Broadcasting organizations are protected as holders of related rights under the International Convention for the Protection of Performers, Producers of Phonograms and Broadcasting Organizations (Rome Convention). Broadcast content as such, as opposed to broadcast signals, can also be protected by copyright and related rights, depending on the national legislation. Television formats, however, have not been discussed at WIPO as subject of a separate international protection. Is a character protected by copyright? A character could be protected under copyright if it is an original expression of an author. Merchandising items such as toys, interactive games, books and clothing including characters can also be protected by intellectual property rights in certain circumstances, mainly copyright and trademarks, along with other areas of law. See the WIPO Report on Character Merchandising. Is a name, title, slogan or logo protected by copyright? Copyright may or may not be available for titles, slogans, or logos, depending on whether they contain sufficient authorship. In most circumstances copyright does not protect names. What is the rule concerning copyright and related rights in my country? While in some countries treaties are 'self-executive', meaning that the provisions of treaties can be directly applied as law, in general copyright and related rights are provided in national legislation of individual countries. International treaties link various national laws by ensuring that at least a minimum level of rights will be granted to creators under each national law. The treaties do not themselves grant rights, but rather require the countries that join the treaties to grant certain rights specified on a nondiscriminatory basis. Copyright laws of a wide range of countries can be consulted from the WIPO Lex database. For further information, you can also contact national copyright administrations. I have a problem with my copyright. Can you give me a legal advice? WIPO is an intergovernmental organization, which administers a number of international treaties in the field of intellectual property, and may, at their request, advise governments. WIPO has, however, no mandate to give legal advice to private persons or non-governmental bodies or entities. For advice concerning specific matters, it is recommend that you consult a practicing lawyer who is specialized in intellectual property. Legally granted property rights in intellectual works embodied in a some physical means of expression, such as print, musical score or electronic image. A Copyright is an exclusive right to reproduce an original work of authorship fixed in any tangible medium of expression; to prepare derivative works based upon the original work; and to perform or display the work in the case of musical, dramatic, choreographic and sculptural works. Copyright protection does not extend to any idea, procedure, process, system, method of operation, concept, principle or discovery, regardless of the form in which it is described, explained or embodied. Rather, copyright protection is limited only to an author's particular expression of the idea, process, concept, etc in a tangible medium. Copyright protection automatically subsists in all works of authorship from the moment of creation. The duration of copyright protection varies from country to country and can be dependent on such factors as the subject matter of the work, whether the work was made for hire, and whether the work is published. For instance, in the United States, the copyright for a work of an individual author lasts for his or her lifetime plus 50 years. However, if the work is made for hire, the copyright lasts for 100 years from the time of creation or 75 years from first publication. The exclusive rights granted to the copyright owner do not include the right to prevent others from making fair use of the owner's work. Such fair use may include use of the work for purposes of criticism, comment, news reporting, teaching or education, scholarship or research. The nature of the work, the extent of the work copied, and the impact of copying on the work's commercial value are all considered in determining whether an unauthorized use is a 'fair use'. To secure copyright protection, the work in question must be an 'original' work of authorship fixed in a tangible medium of expression. Works of authorship that fall within this definition may include:- (i) literary works (including computer programs); (ii) musical works and accompanying lyrics; (iii) dramatic works and dialogue; (iv) pantomimes and choreographic works; (v) pictorial, graphic and sculptural works; (vi) motion pictures and other audiovisual works; and (vii) sound recordings. It is important to note that the laws of many countries do not limit the type or form of work because authors are continuing to invent new ways of expressing themselves. The test for the originality of a work is usually two-pronged. First, the work of authorship must originate from the author, in the sense that it must have actually been independently created by the author and not copied from other works. Secondly, the work must contain a sufficient amount of originality so as to be more than a trivial variation over preexisting works. To be copyrightable, a work must be 'fixed in a tangible medium of expression'. A work is 'fixed' when its embodiment in a tangible medium is sufficiently permanent or stable as to permit it to be perceived, reproduced or otherwise communicated for a period of time that is not transitory. The means, manner or medium of fixation is irrelevant. Copyright registration in most countries is relatively straightforward and

inexpensive. Although copyright protection subsists from the moment the work is fixed in a tangible expression, copyright registration confers additional important benefits in some countries. In those countries with a registration system, registration may be a prerequisite to initiating legal action to stop others from infringing a copyright, and/or for recouping the costs, including attorney's fees, of enforcing those rights. In addition, in some countries, a copyright registration constitutes prima facie evidence of the validity and ownership of the copyright. Protect works of authorship, such as writings, music, and works of art that have been tangibly expressed. The Library of the US Congress registers copyrights which last for the life of the author plus 70 years. Also known as Right Of Authorship. Copyright relates to artistic creations, such as poems, novels, music, paintings, and cinematographic works. In most European languages other than English, copyright is known as Author's Rights. The expression copyright refers to the main act which, in respect of literary and artistic creations, may be made only by the author or with his authorization. That act is the making of copies of the literary or artistic work, such as a book, a painting, a sculpture, a photograph, or a motion picture. The second expression, author's rights refers to the person who is the creator of the artistic work, its author, thus underlining the fact, recognized in most laws, that the author has certain specific rights in his creation, such as the right to prevent a distorted reproduction, which only he can exercise, whereas other rights, such as the right to make copies, can be exercised by other persons, for example, a publisher who has obtained a license to this effect from the author. In the United States, Copyrights:- protect works of authorship, such as writings, music, and works of art that have been tangibly expressed. The Library of Congress registers copyrights which last for the life of the author plus 70 years. As a work of the United States Government, this glossary falls under the provisions of 17 USC § 403, which requires that works including all or part of this material in a copyrighted work contain a statement in their copyright that clearly identifies what portions of the work consist of a work of the US Government. Failure to do so could result in loss of copyright protection for the entire work. / Правообладатель. сразу или на первый взгляд (prima facie). чертёж (drawing). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Авторское Право предполагает эксклюзивное право репродукции оригинальной работы зафиксированного авторства в любом реальном способе выражения; а также используется для подготовки производных работ, основанных на оригинальной работе, и для выполнения или отражения работы в отношении литературных, музыкальных (включая стихов к ним), художественных, хореографических (включая диалоги, пантонимы) и скульптурных произведений и работ, компьютерных программ, видео и иных аудиовизуальных съёмок и работ, звукозаписи. Защита Авторского Права распространяется только на специфическое выражение авторской идеи, процесса, концепции, принципа или открытия в реальном способе их выражения. Авторское Право является разделом гражданского права, регулирующим отношения, связанные с созданием и использованием (издание, исполнение и так далее) произведений искусства, литературы и науки. Авторское право регулируется национальным правом и международными конвенциями по охране авторских прав. Авторское Право – это юридический термин, обозначающий права, предоставляемые авторам литературных и художественных произведений. Что может быть объектом авторского права? К числу произведений, охватываемых авторским правом, относятся:- такие литературные произведения, как романы, поэмы, пьесы, справочные издания, газеты и компьютерные программы; базы данных; фильмы, музыкальные и хореографические произведения; такие произведения изобразительного искусства, как картины, рисунки, фотографии и скульптуры; произведения архитектуры, а также рекламная живопись, географические карты и чертежи. Какие права предоставляет авторское право? Непосредственным авторам произведений, охраняемых авторским правом, а также их наследникам предоставляются определённые базовые права. Они являются владельцами исключительного права на использование произведения либо на предоставление права на использование произведения другим лицам на согласованных условиях. Автор произведения может разрешить или запретить:- (i) его воспроизведение в той или иной форме, например в виде печатного издания или звукозаписи; (ii) его публичное исполнение, например в театральной пьесе либо в музыкальном произведении; (iii) его запись, например на компакт-диск, кассеты или видеопленку; (iv) его воспроизведение средствами вещания – по радио, кабельной сети или через спутниковую связь; (v) его перевод на другие языки или адаптацию, например создание киносценария по мотивам романа. Многие произведения искусства и культуры, охраняемые авторским правом (например, печатные издания, звукозаписи, фильмы), необходимо довести до массового потребителя, в частности средствами связи, а для этого требуются денежные средства; поэтому часто авторы за соответствующее вознаграждение продают права на свои произведения отдельным лицам или компаниям, которые имеют все необходимое для сбыта и распространения художественной продукции. Размер такого вознаграждения зачастую зависит от объёма фактического использования произведения, а само вознаграждение в этом случае называется роялти. Срок охраны этих имущественных прав, по условиям соответствующих договоров ВОИС, ограничен сроком в 50 лет после смерти автора. Национальным законодательством могут быть предусмотрены более длительные сроки. Установленные таким образом сроки охраны предоставляют авторам и их наследникам возможность получать экономическую выгоду в течение разумного периода времени. В рамках авторского права также предусмотрена охрана личных неимущественных прав, в частности права требовать признания авторства, а также права не допускать внесения в произведение изменений, которые могут нанести ущерб репутации автора. Автор или обладатель авторского права на произведение может защищать свои права в административном или в судебном порядке путём осмотра помещений с целью обнаружения следов производства или хранения незаконно изготовленных или 'пиратских' копий с оригинала охраняемых произведений. Владелец может добиться судебного запрета на такую деятельность и требовать компенсации ущерба, понесённого в результате потери материальной выгоды, и признания авторства. Что такое смежные права? За последние 50 лет в области смежных прав произошло стремительное развитие. Эти смежные права сформировались вокруг охраняемых авторским правом произведений и предоставляют аналогичную, но зачастую более ограниченную по объёму и по срокам охрану:- (i) исполнителям (актёрам и музыкантам) на их исполнения; (ii) производителям звукозаписей (например, на кассетах и компакт-дисках) на их звукозаписи; и (iii) организациям эфирного вещания на их радио и телевизионные программы. Почему необходима охрана авторских прав? Авторское право и смежные права являются необходимыми условиями развития творчества, предоставляя авторам стимул в форме признания и справедливого материального вознаграждения. Эта система охраны прав обеспечивает авторам гарантию распространения их произведений без боязни несанкционированного изготовления копий или пиратства. а это, в свою очередь, обеспечивает более свободный доступ населения стран мира к культурным ценностям, к знаниям и развлечениям, а также гарантирует их более высокое качество. Как авторское право использует последние технические достижения? В последние десятилетия области авторского права и смежных прав очень расширились как следствие внедрения достижений науки и техники, которые, в частности, позволили разработать новые способы распространения произведений с помощью таких средств глобальной связи, как спутниковая связь и компакт-диски. Совсем недавно появилась возможность распространения произведений через Internet, что создало в области авторского права новые проблемы. ВОИС принимает самое активное участие в непрекращающейся международной дискуссии по вопросам разработки новых норм охраны авторского права в киберпространстве. Организация выполняет административные функции Договора ВОИС по авторскому праву и Договора ВОИС по исполнениям и фонограммам, (зачастую объединяемых под общим названием 'Договоры ВОИС по Internet'). В указанных договорах содержатся международные нормы, направленные на предотвращение несанкционированного доступа к творческой продукции в Internet и других цифровых сетях и её незаконного использования. Как регулируется авторское право? Охрана авторского права не

зависит от каких-либо формальностей. Считается, что охрана творческой продукции начинается с момента создания произведения. Однако, во многих странах имеются национальные ведомства по авторскому праву, а законодательство некоторых стран предусматривает возможность регистрации произведений с целью, например, идентификации их названий и установления различий между ними. У многих владельцев творческой продукции не имеется достаточных средств для защиты авторских прав в административном или судебном порядке, в особенности с учётом всё более широкого использования прав на литературные и музыкальные произведения, а также прав на исполнения. В результате, во многих странах появились и находят всё более широкое распространение организации или общества по коллективному управлению правами. Эти общества, опирающиеся на значительный опыт в административной и юридической деятельности, способны предоставлять своим членам услуги по сбору, управлению и распределению роялти, полученных за международное использование произведений кого-либо из авторов-членов общества. Автор, издательский договор, авторское свидетельство, Конвенция по Авторскому Праву. Копирайт представляет собой исключительное право воспроизводить оригинальные авторские работы, зафиксированные в любой осязаемой среде выражения, изготавливать производные работы, основанные на оригинальной работе, а также исполнять или выставлять работу в случае музыкальных, драматических, хореографических и скульптурных работ. Охрана по копирайту не распространяется на идеи, процедуры, процессы, системы, методы функционирования, концепции, принципы или открытия, независимо от формы, в которой они описаны, объяснены или воплощены. Вместо этого копирайтная охрана ограничивается конкретным авторским выражением идеи, процесса, концепции и тому подобного в осязаемой среде. Знак копирайта:- Автор или обладатель имущественных прав на произведение может поставить знак копирайта (Ст. 9 Закона РФ ‘Об Авторском Праве и Смежных Правах’). Рекомендуемое законом обозначение включает – знак © (или © Copyright), имя правообладателя (автора), год первого опубликования. Если произведения обновляются постоянно можно указать период времени через тире. После этого можно написать, что:- ‘Любое использование материалов, их подборки, дизайна и элементов дизайна может осуществляться лишь с разрешения автора (правообладателя) и только при наличии ссылки на ресурс’ или иной текст по Вашему усмотрению. Знак копирайта указывает на лицо, считающееся обладателем имущественных прав. Он ставится по желанию правообладателя. Но даже если в конце страницы не было знака и были нарушены права, можно обращаться в суд за их защитой. Охрана по копирайту:- Охрана по копирайту автоматически присутствует во всех авторских работах с момента их создания. Соглашение о Связанных с Торговлей Аспектах Прав Интеллектуальной Собственности (ТРИПС) устанавливает минимальный стандарт по сроку действия копирайтной охраны. В случае физического лица таким сроком является жизнь автора плюс 50 лет. В случае корпоративной структуры это 50 лет после окончания календарного года уполномоченной публикации или, при отсутствии публикации, после окончания календарного года создания работы. Срок действия охраны для записанных живых исполнений составляет 50 лет для исполнителя и продюсера и 20 лет для вещателя произведения. Недавно Соединённые Штаты обновили свою систему охраны копирайтных работ в рамках Акта об Электронном Копирайте в Новом Тысячелетии. К примеру, в Соединённых Штатах копирайт на работу индивидуального автора, созданную 01 Января 1978 или позднее этой даты, сохраняется в течение его (её) жизни плюс 70 лет после смерти автора. Однако если работа создана по найму, копирайт действует 120 лет с момента её создания или 95 лет с момента первой публикации, в зависимости от того, какой из этих сроков короче. Исключительные права, предоставляемые владельцу копирайта, не включают в себя право запрещать другим лицам добропорядочное использование работы владельца. К возможным видам добропорядочного использования относятся критика, комментарии, сообщение новостей, преподавание или образование и исследовательская деятельность. Сущность работы, скопированный объём и влияние копирования на коммерческую ценность работы – все эти факторы учитываются при определении того, является ли неуполномоченное использование ‘добропорядочным’. Гарантии охраны по копирайту:- Оригинальность авторского произведения является ключевым моментом копирайта. Для того чтобы гарантировать охрану по копирайту, рассматриваемое произведение должно быть оригинальной авторской работой, зафиксированной в осязаемой среде выражения. Авторские работы, подпадающие под это определение, могут включать в себя:- (i) литературные работы (в том числе компьютерные программы); (ii) музыкальные произведения и сопровождающие их тексты; (iii) драматические произведения и диалоги; (iv) пантомимные и хореографические работы; (v) изобразительные, графические и скульптурные работы; (vi) кинематографические и другие аудиовизуальные работы; и (vii) звукозаписи. Важно отметить, что законы многих стран не ограничивают тип или форму работы, поскольку авторы продолжают изобретать новые способы самовыражения. Проверка на оригинальность работы обычно состоит из двух элементов. Во-первых, авторская работа должна исходить от автора в том смысле, что должна быть действительно независимо созданной автором, а не скопированной с других работ. Во-вторых, работа должна содержать достаточный объём творчества для того, чтобы представлять собой нечто большее, чем тривиальность. Чтобы претендовать на охрану по копирайту, работа должна быть ‘зафиксирована в осязаемой среде выражения’. Работа является зафиксированной тогда, когда её воплощение в осязаемой среде достаточно постоянно или устойчиво для того, чтобы её можно было воспринимать, воспроизводить или иным образом сообщать в течение периода времени, не являющегося мимолетным. Средство, способ или среда фиксации не имеют значения. В большинстве стран регистрация копирайта относительно проста и недорога. В некоторых странах регистрация копирайта приносит важные дополнительные выгоды. Соглашение ТРИПС исключает использование таких формальностей, как регистрационная система, но некоторые члены ВТО, в том числе США, сохраняют систему регистрации работ, охраняемых копирайтом. Кроме того, в некоторых странах регистрация копирайта служит презумпцией доказательства действительности копирайта и владения им.

CORAL = КОРАЛЛОВОЕ – Coral:- a deep pink.

CORD = КОРД (или ШНУР, или КАНТ) – (1) Cord is the product formed by twisting together two or more plied yarns. See also Cabled Yarn, and Steel Cord. Cord is a heavy, round string consisting of several strands of thread or yarn twisted or braided together. See also Cording. Cord is a fabric made with ribs. A garment made of cord fabric, namely a fabric with ribs; trousers made of cord fabric. / Под Кордом, от Французского слова Corde, означающее Верёвка или Шнур, понимается кручёная нить большой прочности из химического (реже хлопкового) волокна. Используется при изготовлении авиационных, автомобильных и других покрышек, прорезиненных текстильных изделий. Под Кордом, от Французского слова Corde, означающее Верёвка или Шнур, понимается:- (1) кручёная нить большой прочности из хлопчатобумажного или химического волокна, используемая для изготовления автокорда, корд-шнура и некоторых других текстильных изделий, употребляемых в резиновой промышленности в качестве полуфабрикатов (или составных частей) резиновых изделий. (2) Шерстяная ткань особого переплетения, создающего на её лицевой поверхности продольные рубчики шириной около 3–8 мм. В зависимости от плотности и толщины корд употребляют для пошивки платьев, костюмов или пальто. Наиболее тяжёлыми и плотными кордами обивают сиденья легковых автомобилей.

(2) Cord is a rib on the surface of a fabric, e.g., corduroy and whipcord. / Корд – шерстяная ткань особого строения, создающего на её лицевой стороне поверхности продольные рубчики шириной около 3–8 миллиметров (мм). Употребляется для пошива одежды, обивки сидений легковых автомобилей.

CORDATE = СЕРДЦЕВИДНОЕ (или СЕРДЦЕОБРАЗНОЕ) – Cordate:- heart-shaped, with the point away from the stem. Cordate:- leaves of plants that are heart-shaped. / Сердцевидное – сердцеобразное, с .

CORDATE LEAF = СЕРДЦЕВИДНЫЙ ЛИСТ – Cordate Leaf:- more or less rounded at both ends and broadest below the middle, egg-shaped, e.g., Cercis canadensis. Cordate Leaf:- heart-shaped; more extended at the base than the ovate type and with a notch.

CORDED FABRIC = КОРДНАЯ ТКАНЬ (или РУБЧАТАЯ ТКАНЬ) – The term Corded Fabric (often shortened to Cord) refers to fabrics with a lengthwise rib, often woven in stripes. Any fabric with a lengthwise rib. See also Fabric, and Technical Cloth. / Кордная Прорезиненная Ткань используется для каркасов покрышек шин. Основные нити изготавливают из вискозных, полиамидных и полиэфирных комплексных нитей двойной крутки, в качестве утка применяется хлопчатобумажная пряжа. Плотность нитей по основе значительно больше (до 94 нитей на 100 мм), чем по утку (до 30 на 100 мм). Разрывная нагрузка от 120 до 250 Н на 1 нить. Для защиты бортов покрышек от повреждения о закраины обода и для придания им жёсткости и прочности применяются ткани из хлопчатобумажной пряжи или мононитей.

CORDED SELVAGE = РУБЧАТАЯ (или ФАЙЕВАЯ, или ХХ) КРОМКА – Corded Selvage:- loops in the selvage are formed by insufficient tension in weft winding, by shuttle rebounding, and by strong picking. If loops are very bid, they are driven inside the shed in the next pick Corded Selvage. See also Loopy Selvage.

CORD GIMP = ШНУРНЫЙ ГИПЮР – Cord Gimp combines cord with gimp. See also Cording, and Gimp.

CORDING = ОКАНТОВКА – Cording is a round decorative edging. The term is also used to describe white cord covered with bias strips of fabric to form welting or piping. See also Piping, and Welting. / обтачка (или кант или окантовка или рулик (piping)). Смотрите также Обшивка или Бортовка или Кайма (Welting).

CORD NOT ATTACHED TO TAPE = КОРД (или КАНТ, или ШНУР), НЕ ПРИКРЕПЛЁННЫЙ К ТЕСЬМЕ (или ЛЕНТЕ) – Cord Not Attached To Tape:- due to skipped stitches during operation of sewing cord to tape. Not readily apparent but, under strain, cord and teeth will rip away from tape and render zipper and garment unusable. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / вследствие пропущенных стежков в течение операции . Порок или дефект застёжки.

CORD OF STEEL = КОРД ИЗ СТАЛИ – Cord Of Steel or Steel Cord is the fine steel wire strand or rope for special purposes, which are made of superior high-carbon steel and whose surface is plated with brass. It is mainly applied in car tyres, light truck tyres, cargo truck tyres, heavy equipment tyres and plane tyres and other rubber framework materials. The radial tyre that uses steel cords as the reinforcing material demonstrates the merits of long service life, fast driving speed, puncture-resistant, high flexibility, being safe and comfortable and fuel-saving, etc. Raw materials:- the high-quality wire rod for steel cords produced by Japan KOBE, NIPPON and Germany SAARSTAHL is chosen. See also Steel Cord. Steel Cord:- steel is superior to any other reinforcing material in terms of resistance, tensile strength, stability, durability and creep rate. In spite of its long tradition, steel is still under continuous development and breakthroughs are constantly made. What is steel cord? Steel cord is a construction of several thin wires reinforcing the casting and at the same time keeping the tire flexible enough to resist shocks and to improve comfort. The adhesion of steel cord to rubber is possible through the brass coating of the wire, coating that reacts chemically with the sulfur of the tire's rubber. Modern technology in tire manufacture involves the use of steel in the form of cords as reinforcement in the areas of extreme stress. Using particularly high quality steel can only ensure safety on the road and high stress in the tires. Our steel cord constructions allow for highest rubber penetration and adhesion, in addition to highest durability and resistance. These characteristics ensure a safe and smooth ride for the car driver. In steel cord production, WireSolutions (company) constantly meets the challenge of maintaining the highest qualities in:- (i) Mechanical Characteristics:- tensile strength, elongation, twists; (ii) Adhesion Steel To Rubber:- coating composition, thickness and shape; and (iii) Behavior:- flexibility, compression, fatigue. These requirements are adjusted to meet the tire manufacturers' specification, according to the specific rubber composition and tire design. / литьё или отливка (casting). Японскими компаниями КОБЭ (КОВЕ) и НИППО (NIPPON) и Немецкой компанией ЗАРШТАЛЬ (SAARSTAHL).

CORDOVAN = КОРДОВСКАЯ (или КОДЭВЭН) – Cordovan is a common name in leather for the hide of an animal with the fur removed. / Кордовская (из Кордовы).

CORD THICKNESS = ТОЛЩИНА КОРДА (или ТОЛЩИНА ШНУРА) – Cord Thickness is a conventional way of expressing an average cord diameter.

CORDUROY = РУБЧАТЫЙ БАРХАТ (или ВЕЛЬВЕТ) – Corduroy is a ribbed, high-luster, cut-pile fabric with extra filling threads that form lengthwise ribs or wales. The rib has been sheared or woven to produce a smooth, velvet-like nap. The thread count varies from 46 x 116 to 70 x 250. Traditionally made of cotton, corduroy can be made of many different fibers, such as rayon and polyester blends. It is used for dresses, coats, sports jackets, sports shirts, bathrobes, slacks, and draperies. Corduroy is a strong, durable fabric with cotton ground and vertical cut-pile stripes (wales) formed by an extra system of filling yarns. The foundation of the fabric can be either a plain or twill weave. Corduroy is a narrow, all cotton fabric, the distinguishing feature of which is the perfect half-round regular ribs running warp ways through the cloth. As a fabric, it belongs to the general class of filling pile fabrics and is made of one system of warp and two of filling. The warp must be of good cotton staple to make a fine strong end. The pile filling should be of firsit-class cotton, soft spun, to blend more readily when the ribs are rubbed after being out and brushed. The warp and ground filling is woven either 1/1 2/1 or 2/2 twill, the pile pick weaves with either one, two, or three warp end, and floats over from three to 12 warp ends. The length of the float of pile filling depends upon the width of rib or cord desire'd in the fabric. The important point about the pile weave is to cause the pile filling to weave with the same two or three warp threads. This gives us lines of binding and lines of filling floats running warp ways. The velvety ribs or cords, as noted upon the face of a corduroy are created by first cutting the lines of floats of the pile filling. This operation is performed by hand with a very sharp steel knife, after which the ends of the floats are carefully brushed, and then rubbed together to the proper degree of consistency desired in ribs. Corduroy is woven with from 160 to 500 picks of filling per inch; and is afterward dyed in dark blue, tan, buff, green and olive colors, to be used in making clothing for men. It is also used for upholstery purposes, either in plain solid colors or the plain color has an elaborate floral design printed upon it. These printed patterns are usually in bright colors, such as red, yellow, light green. In Printing, the design is first engraved upon a set of copper rollers. These are set into a regular machine, and as the cloth passes over them, the color being fed to the rollers automatlcally.the design is placed upon the face of the cloth. It Is woven so as to finish from 27 to 31% inches, the 27-inch for clothing and 31%-inch for upholstery. This fabric requires a loom to be in good condition, as the beating in of such high number of picks per inch of filling is hard on the loom, and also necessitates slow production. It is usually woven on dobby or witch loom, having single or double box. A Good Weight for the-lap would be about 38 pounds and the weight per yard 14 ounces. To get the grade of cotton used for this class of cloth clean, about 42 beats should be given to every inch of cotton fed at the back of the finisher picker. In other words, every inch of cotton should be struck 42 times before it is passed by the beater. With the above speed of the beater (1 450) this would be the number of blows that every inch of cotton received. Don't forget that it is very important to remove the fly from underneath the pickers at regular intervals during the day, because, if the fly is allowed to accumulate to any great extent, it might be drawn into the already cleaned cotton passing through the

machine, and it is sometimes done as all persons working around cards know, as they have seen at various times large patches of fly on the lap of cotton. This of course requires the card to do extra work and clean and take out this dirt. It very often results in bringing up the feed roll or the licker-in of the card, if not noticed in time to remove the fly. It will be seen that it is important to keep the picker room clean at all times. It is very important to keep foreign matter, such as nails or pieces of metal, out of the cotton in the picker room, because of the liability of fires in the pickers, these being started by the foreign substance coming in contact with the quick moving beater blades and a spark being struck which ignites the cotton. This is apt to cause a bad fire if not promptly attended to. Corduroy is a filling-pile fabric with ridges of pile (cords) running lengthwise parallel to the selvage. Corduroy is a textile composed of twisted fibers that, when woven, lie parallel (similar to twill) to one another to form the cloth's distinct pattern, a 'cord'. Modern corduroy is most commonly composed of tufted cords, sometimes exhibiting a channel (bare to the base fabric) between the tufts. Corduroy is, in essence, a ridged form of velvet. The fabric looks as if it is made from multiple cords laid parallel to each other and then stitched together. The interpretation of the word as corde du roi (from French, the cord of the King) is a folk etymology. As a fabric, corduroy is considered a durable cloth. Corduroy is found in the construction of trousers, jackets and shirts. The width of the cord is commonly referred to as the size of the 'wale', i.e. the number of ridges per inch. The lower the 'wale' number, the thicker the width of the wale, e.g., 4-wale is much thicker than 11-wale. Corduroy's wale count per inch can vary from 1.5 to 21, although the traditional standard falls somewhere between 10 and 12. Wide wale is more commonly used in trousers and furniture upholstery (primarily couches); medium, narrow, and fine wale fabrics are usually found in garments worn above the waist. Corduroy is made by weaving extra sets of fiber into the base fabric to form vertical ridges called Wales. The wales are built so that clear lines can be seen when they are cut into pile. The primary types of corduroy are:- (i) Standard Wale:- 11 wales/inch, and available in many colors; (ii) Pincord/pinwale/needlecord:- pincord is the finest cord around with a count at the upper end of the spectrum (above 16); (iii) Pigment dyed/printed corduroy:- the process of coloring or printing corduroy with pigment dyes. The dye is applied to the surface of the fabric, then the garment is cut and sewn. When washed during the final phase of the manufacturing process, the pigment dye washes out in an irregular way, creating a vintage look. The color of each garment becomes softer with each washing, and there is a subtle color variation from one to the next. No two are alike. Other names are often used for corduroy. Alternative names include:- corded velveteen, elephant cord, pin cord, Manchester cloth and cords. In continental Europe, corduroy is commonly known simply as 'Manchester' or 'Cord'. Corduroy is a fabric, usually made of cotton, utilizing a cut-pile weave construction. Extra sets of filling yarns are woven into the fabric to form ridges of yarn on the surface. The ridges are built so that clear lines can be seen when the pile is cut. See also Velvet. Corduroy is a textile composed of twisted fibers that, when woven, lie parallel (similar to twill) to one another to form the cloth's distinct 'cord' pattern. Modern corduroy is most commonly composed of tufted cords, sometimes exhibiting a channel (bare to the base fabric) between the tufts. Corduroy is, in essence, a ridged form of velvet. Standard construction of the gray fabric in Japan:- 100% cotton, (1) middle wale corduroy, 21's, 200 threads per inch, 48"; and (2) feather wale corduroy, 40's, 265 threads per inch, 36". Corduroy:- cotton, rayon, and other textile fibers. Filling Pile with both plain and twill back. Made with an extra filling yarn. In the velvet family of fabrics. Has narrow medium and wide wales, also thick n'thin or checkerboard patterns. Wales have different widths and depths. Has to be cut all one way with pile running up. Most of it is ashable and wears very well. Has a soft lustre. Corduroy is a pile-filling fabric with ridges of pile running lengthwise, creating a ribbed surface. / уточные нити. В Соединённых Штатах Америки, Вельвет или Рубчатый Бархат. раскрой (cutting). Под Вельветом или Вельветином понимается плотная хлопчатобумажная или синтетическая ткань, имеющая на лицевой поверхности продольные рубчики из уточного ворса (вельвет-корд – широкие, вельвет-рубчик – узкие). Из вельвета шьют костюмы, куртки и тому подобное.

CORDUROYS = КОРДЮРУА (или КОДЮРОЙЗ, или ВЕЛЬВЕТОВЫЕ БРЮКИ) – Corduroys:- trousers of corduroy fabric, namely a durable usually cotton pile fabric with vertical ribs or wales. / от Французского словосочетания Corde Du Roi.

CORD YARN = КОРДНАЯ ПРЯЖА – Cord Yarn is a heavy ply yarn.

CORE = ОСТОВ (или КАРКАС, или СЕРДЕЧНИК, или ГИЛЬЗА, или ЖИЛА) – Core:- the internal duct and filter media support. / внутренний канал и носитель фильтровальной среды. Под Каркасом, от Французского слова Carcasse, от Итальянского слова Carcassa, в технике понимается остов (скелет) какого-либо изделия, конструктивного элемента, целого здания или сооружения, состоящий из отдельных скреплённых между собой стержней. Каркас выполняется из дерева, металла, железобетона и других материалов. Он определяет собой прочность, устойчивость, долговечность, форму изделия или сооружения. Прочность и устойчивость обеспечиваются жёстким скреплением стержней (смотрите Стержневая Система) в узлах сопряжения или шарнирного соединения и специальными элементами жёсткости, которые придают изделию или сооружению геометрически неизменяемую форму. Увеличение жёсткости каркаса нередко достигается включением в работу оболочки, обшивки или стенок изделия или сооружения. Каркас здания состоит в основном из колонн и опирающихся на них ригелей, прогонов, ферм, на которые укладываются элементы перекрытия и покрытия. Соответственно типам зданий, в которых они применяются, каркасы бывают одно- и многоярусные; одно-, двух- и многопролётные; с расположением в плане основных несущих конструкций в поперечном, продольном или в обоих направлениях. Различают каркасы зданий полные и неполные:- (i) полный каркас воспринимает все вертикальные нагрузки здания, при этом элементы каркаса расположены по всему плану здания; и (ii) неполный каркас размещается только внутри здания, где наружные стены являются несущими и участвуют совместно с каркасом в общей работе здания. По способу обеспечения общей жёсткости и устойчивости здания каркасы разделяются на Рамные Каркасы, в которых узлы сопряжений элементов колонн и ригелей конструируются жёсткими в виде рам, способных воспринимать изгибающие моменты и поперечные силы от ветровых нагрузок и собственные веса, и Связевые Каркасы – с шарнирными или частично защемлёнными узлами, где ветровые нагрузки воспринимаются жёсткими горизонтальными и вертикальными диафрагмами. Смотрите также Каркасно-Панельные Конструкции. Под Гильзой, от Немецкого слова Hülse, понимается .

CORE = СЕРДЕЧНИК – In steel tyre cord, a Core is a filament, filaments or strand that serves as an extended axis about which other elements can be wound.

CORE–BULKED YARN = ПРЯЖА С XX СЕРДЕЧНИКОМ – Core-Bulked Yarn is a bulky or textured yarn composed of two sets of filaments, one of which is straight to give dimensional stability and forms a core around and through which the other set is coiled or looped to give bulk. See also Textured Yarns.

CORE CAPITAL = КЛЮЧЕВОЙ КАПИТАЛ (или КОРЕННОЙ КАПИТАЛ) – Core Capital is defined as the sum of the stated value of outstanding common stock (common stock less treasury stock), the stated value of our outstanding non-cumulative perpetual preferred stock, paid-in capital, and retained earnings, as determined in accordance with Generally Accepted Accounting Principles (GAAP). Core capital excludes accumulated other comprehensive income (loss). Core Capital:- the minimum amount of capital that a thrift bank, such as a savings bank or savings and loan company, must have on hand in order to comply with Federal Home Loan Bank regulations. Core capital consists of equity capital and declared reserves. The minimum requirement was put in place to ensure that consumers are protected when creating financial accounts. Following the financial crisis of 2008, regulators began focusing heavily on

banks' Tier 1 capital, which consists of core capital, but can also include nonredeemable, noncumulative preferred equity. This is more stringent than normal capital ratios, which can also include Tier 2, and lesser-quality capital.

CORE COMPETENCY = КЛЮЧЕВАЯ КОМПЕТЕНЦИЯ (или КОРЕННАЯ КОМПЕТЕНЦИЯ) – Core Competency is a company's primary function considered essential to its success. / Под Ключевой Компетенцией предполагается первичная функция компании, рассматриваемая в качестве необходимой для её успеха.

CORE INFLATION = КЛЮЧЕВАЯ ИНФЛЯЦИЯ (или КОРЕННАЯ ИНФЛЯЦИЯ) – The core inflation rate is frequently quoted in the popular press and this gives the general public the impression that the 'government' doesn't care about (or track) the rise in the prices of food and energy. Actually this isn't true. The core inflation rate is simply a component of the overall inflation rate. It is used by economists because often seasonal factors will skew the inflation rate. For instance a drought might cause fruit crops to fail, causing fruit prices to rise. But this rise actually has nothing to do with inflation (i.e. price inflation caused by an increase in the money supply). It is simply a result of the forces of nature. Another example of forces of nature causing price increases is when a hurricane causes refineries or drilling rigs to shut down. This might cause a temporary decrease in oil supply and if supplies are tight it could result in a temporary increase in oil prices. Economists want to eliminate this volatility from their calculations and so they use the 'core' inflation rate to eliminate the two most volatile components from the calculation. And so for some reason when 'cub' reporters are assigned to report on inflation they choose the 'core' since it sounds cool or something and people get the idea that the government has stopped tracking the entire range of goods and is only tracking the 'core' inflation rate. But I can assure you that the Bureau of Labor Statistics is still tracking about 10 000 different items every month and it publishes this information as the CPI-U or Consumer Price Index for all Urban consumers. This is used in calculating what is commonly called the 'Inflation Rate'. This is the number that pertains more to the average consumer because it more closely resembles what you might actually spend. As you might guess since it includes 10 000 different items, some of them are food and some are energy. It also includes clothing, beverages, rent, recreation, medical care and even some strange things like bedroom furniture, college tuition, postage, telephone services, and computer software. Obviously, you aren't going to be buying bedroom furniture and computer software every month so your particular inflation rate will be somewhat different than the one calculated by the government but the numbers are weighted based upon how often the average consumer buys these items. So at least you can rest easy knowing that the two things that everyone needs (food and energy) has been included and is actually weighted much more heavily in the final calculation than bedroom furniture. This is all one big joke. Governments do this so they can keep interest rates low, so they don't have to pay a higher inflation wages to retirees, pensioners. They think the people are stupid there is no inflation it's called super hyper inflation that we have right now. Although the actual inflation rate that you see may be higher than what the government claims, it is far from hyper-inflation. During a hyperinflation you would see prices increasing at least 1% a month. Simply by looking at the price of gasoline we can see that prices are not increasing by 1% a month. According to AAA the average price of gasoline throughout the entire US in July 2015 was USD2.763. So if prices increased by even 10% since last year the price of a gallon of gas would be at least USD2.75 + USD0.27 or USD3.02 but instead gasoline was USD2.22 in July 2016. This is not a sign of hyperinflation. Core Inflation is calculated without food and energy for good reason but it isn't because it reflects real consumer's spending. Food and energy are volatile based on other factors other than FED money printing. The Core Inflation more accurately shows FED activity. If you are interested in what's actually happening to Consumers look at the Consumer Price Index for all Urban Consumers (CPI-U) which DOES include Food and Energy. Or you can look at one of the other indices such as the CPI-W. There is no good reason to exclude Food and Energy. Doing this gives an improper view of the financial reality facing the majority of Americans. The majority of the populations income is spent on Rent, Food, Energy, and Transportation. If you remove even a portion of any of the necessities than you are misrepresenting the true cost of living. If inflation was not used to determine wages and cost of living than it would not matter but it is in many cases and therefore it is essentially immoral to do so. Actually there is a very good reason to exclude them if you are an economist. They are the two most volatile components and are often affected by temporary outside forces like weather and other government actions. If you are trying to measure the effect of monetary stimulus by the FED they can mask the effects. However, an ordinary person only concerned with the effects on your own pocket then yes that number doesn't apply to you. So don't worry no one uses this number to determine your Cost of Living. The government only Talks about CPI to the public. They use this index to incorrectly calculate the amount it will pay to Pensioners. Its intentionally done, otherwise they would use CPI-W. Empirically stating Food has increased around 30% in the last few years. It is among the largest cost for a family. Weather is always inconstant. But Taken on a world economic scale, food is produced all over the world so that bad weather in one place does not necessarily mean anymore that there will be large scale run ups and down in food cost. As for oil, At one point we all though that we were at point of PEAKED OIL. But someone discovered Fracking and we find oil prices settling around USD50 a barrel. It is now so abundant, that it will provide stable oil price for an extended period. The USA has alone, has enough energy to supply the rest of the world until Fusion will be in full production, in 10 to 15 years. Just as our next small ice age starts.. Its only the uneducated government who have no working knowledge about about how weather form. Its only the particulates that are a problem. In short I am saying that the points you say about stable core prices, is no longer factual as so many factors have changed to the point that they do not accurately reflect core cost. My premise is that 5 years ago you would be right, but now too things have changed significantly. I think that you should build a new model, feed in the current information variables, and then see if those values have changed. Our biggest economic problem is the government. Its their policy's that change all factors. Actually the government is experimenting with a Consumer Price Index for the elderly called the CPI-e unfortunately it is still in the experimental stages (and has been for a very long time). I mention it in our article on Cost of Living Adjustments COLAs. I agree that it would be great if they calculated Social Security (SS) increases based on that rather than the CPI-U, especially since the CPI-e is higher than the regular CPI-U in most years. The major factor is that Seniors tend to spend more on Healthcare and so the CPI-e weights Healthcare higher than the CPI-U does. But as I said in this article, contrary to common belief, the SS and COLAs calculations are based on the CPI-I which does include Gasoline, Food, Fast Food, housing and everything else it is just that the weighting is based on the average Urban Consumer. Not rural people, not Senior Citizens, not Military Personnel they will all have slightly different inflation rates based on their personal consumption habits.

CORE MARKET = КЛЮЧЕВОЙ РЫНОК (или КОРЕННОЙ РЫНОК) – Core Market:- in gas industry, generally that part of the gas market that does not possess fuel-switching capability in the near term; typically residential, commercial and small industrial users. / В газовой отрасли в общем плане та часть рынка газа, которая не поддерживает возможности перехода с одного топлива на другое в ближайшей перспективе; как правило, этот рынок формируется жителями, коммерческими предприятиями и малыми промышленными пользователями.

CORE PRINCIPLE = КЛЮЧЕВОЙ ПРИНЦИП (или КОРЕННОЙ ПРИНЦИП) – Core Principle is a provision of the US Commodity Exchange Act with which a Contract Market, Derivatives Transaction Execution Facility, or Derivatives Clearing Organization must comply on an ongoing basis. There are 18 Core Principles for Contract Markets, 9 Core Principles for Derivatives Transaction Execution Facilities, and 14 Core Principles for Derivatives Clearing Organizations.

CORE SPINNING = ПРЯДЕНИЕ ПРЯЖИ С СЕРДЕЧНИКОМ – Core Spinning is the spinning process of making a corespun yarn. It consists of feeding the core yarn (an elastomeric filament yarn, a regular filament yarn, a textured yarn, or a previously spun yarn) into

the front delivery roll of the spinning frame and of covering the core yarn with a sheath of fibers during the spinning operation. / Система Прядения Пряжи С Сердечником позволяет прясть очень тонкую пряжу из гребенной шерсти.

CORE–SPUN YARN = ПРЯЖА, СПРЯДЕННАЯ С СЕРДЕЧНИКОМ – Core-Spun Yarn consists of a filament base yarn, with an exterior wrapping of loose fiber which has not been twisted into a yarn. Polyester filament is often wrapped with a cotton outer layer in order to provide the strength and resiliency of polyester, along with the moisture-absorbent aesthetics and dye affinity of cotton. Sewing thread as well as household and apparel fabrics are made from these yarns. Core-Spun Yarn is the yarn with filament (elastane, other elastic or inelastic) core and relatively inelastic staple fibers from a sliver twisted around the core with continuous turns in one direction. Core-Spun Yarn is the yarn made by twisting fibers around a filament or a previously spun yarn, thus concealing the core. Core yarns are used in sewing thread, blankets, and socks and also to obtain novelty effects in fabrics. / Сродство (Affinity).

CORE–TESTING = ТЕСТИРОВАНИЕ ПРОБ, ВЫСВЕРЛЕННЫХ ИЗ ТОЛЩИ КИП – Core-Testing is the coring of bales or bags of wool to determine the clean content (or 'condition') and yield.

CORE TEXTURED YARN = ТЕКСТУРИРОВАННАЯ ПРЯЖА С СЕРДЕЧНИКОМ – Core-Textured Yarn is the yarn with filament (elastane, other elastic or inelastic) core covered by one or more relatively inelastic cover yarns continuously textured together with the core entwined by the filaments with false twist turns of randomly changing directions. Core Textured Yarn is the elastic yarn with bare elastane core covered by one or more relatively inelastic cover yarns continuously textured together with the core entwined by the filaments with false twist turns of randomly changing directions.

CORE–TWISTED YARN = ПРЯЖА С КРУЧЁНЫМ СЕРДЕЧНИКОМ – Core-Twisted Yarn is the yarn with filament (elastane, other elastic or inelastic) core and one or more relatively inelastic cover yarns twisted with continuous turns in one direction.

CORE YARN = ПРЯЖА С СЕРДЕЧНИКОМ (или КЛЮЧЕВАЯ ПРЯЖА, или СТЕРЖНЕВАЯ ПРЯЖА, или ГРУНТОВАЯ ПРЯЖА) – Core Yarn is a yarn made by winding one yarn around another to give the appearance of a yarn made solely of the outer yarn. Core Yarn is the yarn in which one type of fiber is twisted or wrapped around another fiber that serves as a core. Core yarns are often used to make stretch fabrics where the core is spandex or rubber, and the outer wrapped fiber is a textured manufactured fiber such as polyester or nylon. / Найлан (Nylon).

CORIACEOUS = КОЖИСТОЕ – Coriaceous:- having a leathery texture.

CORINO DAMAGE = ПОВРЕЖДЕНИЕ XX – Corino Damage:- pin damage or fabric tear due to tension. Finishing defect. / Порок или дефект заключительной отделки. Corino – фамилия.

CORK = ПРОБКА (или ФЕЛЛЕМА, или ПРОБКОВАЯ ТКАНЬ, или ЛУБ, или КОРКА) – Cork (periderm) is specifically the soft, low density bark of the cork oak tree, composed of cambium cells. Cork contains a natural wax, suberin, which protects the tree from water loss. The stems of many succulent plants harden and go brown with age and are often referred to as 'Corky'. / У древесных растений под Коркой понимается наружный защитный слой коры на старых стеблях и корнях, состоящий из прослоек перидермы и луба. Периодически слущивается или разрушается с поверхности.

CORK FENDER = ПРОБКОВЫЙ КРАНЕЦ – Cork Fender (maritime term):- a fender made of granulated cork and covered with woven tarred stuff.

CORK SCREW = СУКРУТИНА (или ШТОПОРНОСТЬ) – Cork Screw:- one yarn is straight and other one is twisted on it. Spinning defect. Cork Screw:- one yarn is straight and other one is twisted on it. It is caused due to deposition of fibers foreign particular etc, to yarn during spinning stage which causes objection in fabric. In-sufficient tension during TFO (short for the two-for-one twister), different tension levels at parallel winding m/c. yarn released during knotting at parallel winding causes screw of yarn over other yarn gives cork-screw effect. / Порок или дефект прядения.

CORKSCREW TWIST = ШТОПОРНАЯ КРУТКА – Corkscrew Twist:- uneven tension in twisting producing a 'workscrew' effect on surface of thread. Thread defects, and namely – Spinning. Corkscrew Twist is a place in yarn or cord where uneven twist gives a corkscrew-like appearance. / Штопорная Крутка – порок кручёной пряжи. Порок или дефект прядения.

CORM = ПОБЕГ (или КЛУБНЕЛУКОВИЦА) – Corm is a flattened fleshy underground stem, often acting as a dormant resting stage, capable of producing stems from the base and top and leaves and flower stems from the top. Corm is the swollen part of the base of the stem that is capable of producing new shoots. / Клубнелуковица – сплющенный мясистый подземный стебель, часто действующий как из вершины. Клубнелуковица – увеличенный орган основания стебля, которая способна к производству новых побегов. Под Побегом (Cormus) понимается стебель с расположенными на нём листями и почками; один из основных органов высших растений. Побег – единый орган:- листья и стебли обладают единой проводящей системой и формируются из общего конуса нарастания. У однолетних растений побеги живут один сезон, у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, наземные побеги – в усики, колючки. Под Клубнелуковицей понимается подземный побег растений, похожий на луковицу, но по строению более близок к корню. Состоит из мясистой стеблевой части и плотно окутывающих её сухих листовых чешуй. Образуется у безвременника, гладиолуса, шафрана и других. Клубнелуковица:- вздутое основание стебля, обычно остающееся под землёй и хранящее питательные вещества во время периода покоя. В отличие от луковицы, на поперечном срезе отдельные листья не видны.

CORN = КУКУРУЗА – Corn is a shortened form of Indian Corn, i.e. the Indian Grain. The English word Corn originally referred to a granular particle, most commonly Cereal Grains. It is called Mielies or Mealies in Southern Africa. Hybrid Maize is preferred by farmers over conventional Varieties for its high grain yield, due to heterosis (hybrid vigor). Maize (Zea Mays L. Ssp. Mays) is a Cereal Grain that was domesticated in Mesoamerica and then spread throughout the American continents. It spread to the rest of the world after European contact with the Americas in the late XV century and early XVI century. The term Maíze derives from the Spanish form of the Arawak Native American term for the Plant. However, it is popularly called Corn in the United States, Canada, New Zealand, and Australia. Maize is one of the first crops for which genetically modified Varieties make up a significant proportion of the total harvest. In the United States and Canada, the primary use for Maize is as a feed for livestock, forage, silage or grain. Silage is made by fermentation of chopped green cornstalks. The grain also has many industrial uses, including transformation into plastics and fabrics. Some is hydrolyzed and enzymatically treated to produce syrups, particularly high fructose corn syrup, a sweetener, and some is fermented and distilled to produce grain alcohol. Grain alcohol from Maize is traditionally the source of bourbon whiskey. Increasingly ethanol is being used at low concentrations (10% or less) as an additive in gasoline (gasohol) for motor fuels to increase the octane rating, lower pollutants, and reduce petroleum use. Human consumption of corn and cornmeal constitutes a staple food in many regions of the world. Also known as Maize. / к Злаковым Зерновым (Cereal Grains). Известна также как Маис (Maize). Под Кукурузой понимается Однолетнее Травянистое Растение Семейства Злаков. Насчитывается 9 ботанических Групп:- Восковидная (ограниченные площади), Зубовидная, Крахмалистая, Крахмалисто-Сахарная, Кремнистая, Лопающаяся,

Плёнчатая (не выращивается), Полузубовидная (широко возделываются) и Сахарная. Родиной Кукурузы является Центральная и Южная Америка. В XV веке она была завезена в Европу. Из зерна Кукурузы производят комбикорма, крахмал, крупу, муку и спирт. Из зародышей Кукурузы производят кукурузное масло. Зелёная масса, силос, сено идут на корма для скота. Из сухих стеблей и стержней початков Кукурузы производят бумагу, вискозу, линолеум и другие продукты. Под Кукурузой или Маисом (Zea Mays) понимается Вид Однолетних Травянистых Растений Семейства Мятликовых, зерновая и кормовая культура. В зависимости от свойств зерна подразделяется на 7 Подвидов:- Кремнистая Кукуруза и Зубовидная Кукуруза (наиболее распространены), Лопающаяся Кукуруза, Сахарная Кукуруза, Крахмалистая Кукуруза, Восковидная Кукуруза (занимают небольшие площади), Плёнчатая Кукуруза (в производственных посевах не используется). Кукуруза – одно из древнейших культурных Растений Земли, не способное к самосеву и одичанию. Родина – Центральная и Южная Америка. Впервые введена в культуру на территории Мексики древними Майа и Ацтеками (около 5200 до Нашей Эры). Вероятным предком культурной Кукурузы считают распространённое в Мексике Сорное Растение Мексиканскую Теосинте (Euchlaena Mexicana), внешне похожую на Кукурузу. В Европу завезена в конце XV века, в России (Грузия) возделывается с XVII века. Ареал Кукурузы от 58° Северной широты до 40° Южной широты. Кукуруза – яровая теплолюбивая (семена прорастают при 10 °С, всходы переносят заморозки до 2–3 °С, осенью заморозки губительны для растения), светолюбивая и достаточно засухоустойчивая культура. Вегетационный период обычно 90–150 суток. Растение однодомное с раздельнополыми соцветиями (початком в пазухах листьев – женское соцветие и метёлкой на верхушке стебля – мужское). В початке образуются от 500 до 1 000 зёрен. При внесении органических и минеральных удобрений даёт высокую урожайность на чернозёмах, серых лесных, каштановых, дерново-подзолистых почвах. Кукуруза – растение разностороннего применения. Её используют в пищевой (мука, крупа, кукурузные хлопья и палочки, воздушная кукуруза, кукурузное масло, богатое витамином Е, и другое), крахмало-паточной, пивоваренной, спиртовой промышленности. Зерно – концентрированный корм и сырьё для комбикормовой помышленности, зелёная масса (в 1 кг её 13.6–14.6 г перевариваемого протеина и 0.183–0.393 кормовой единицы в зависимости от фазы спелости), кукурузный силос и измельчённые консервированные початки (вместе с зерном) в молочно-восковой спелости – ценные корма. Из кукурузных стеблей, стержней початков, их обёрток вырабатывают бумагу, линолеум, вискозу, изоляционные материалы, киноплёнку и другое. Рыльца пестиков применяют в медицине. Культуру широко возделывают в Бразилии, Мексике, Соединённых Штатах Америки (США), а также в странах Южной и Юго-Восточной Европы, Юго-Восточной Азии, Южной и Восточной Африки. В бывшем Союзе Советских Социалистических Республик (СССР) основные районы выращивания Кукурузы – Украина, Молдавия, Северный Кавказ, Поволжье, Центральночернозёмные районы, Урал, Сибирь, Казахстан. Урожайность зерна 20–30 ц/га, в передовых хозяйствах 50–60 ц/га, зелёной массы соответственно 170–180 ц/га и 300–600 ц/га. Сорта и гибриды:- Буковинский 3ТВ, ВИР 156ТВ, Краснодарский 360ТВ, Днепровский 247МВ, Краснодарская 1/49, Одесская 10, Казахстанская 3/67; новые перспективные сорта и гибриды:- Коллективный 270МВ, Краснодарский 613А, Юбилейный 60МВ, Днепровский 203МВ, Одесский Силосный 190МВ и другие. Кукурузу выращивают в полевых и кормовых севооборотах. Предшественники:- озимые, Зерновые, Зернобобовые, пропашные, яровая Пшеница. Удобрения:- навоз 10–15 т/га, минеральные удобрения (ц/га) – под основную вспашку по 30–60 N и P_2O_5, 30–45 K_2O, при посеве в рядки 7–10 N, 5–15 P_2O_5 и 7–10 K_2O. Посев квадратно-гнездовой или прямоугольно-гнездовой с междурядьями 60, 70, 90 и 140 см и расстоянием между гнёздами 70 см, на чистых от сорняков полях – пунктирным способом. На 1 га размещают 20 000–60 000 растений при выращивании на зерно и силос и 150 000–200 000 – на зелёный корм. Глубина посева 6–12 см. Убирают Кукурузу при полной спелости зерна, на силос – в фазу молочно-восковой спелости. Промышленность СССР выпускала комплекс машин для различных зон возделывания Кукурузы, применение которых позволяло выращивать эту культуру почти без затрат ручного труда. На основных площадях посева Кукурузы применяют интенсивные технологии выращивания, которые включают следующие элементы:- ранневесеннее выравнивание почвы, внесение гербицидов, посев, обработка почвы страховыми гербицидами, междурядные рыхления с одновременным уничтожением сорняков в рядах, уборка, послеуборочная обработка урожая и подготовка его к хранению. Ранневесеннее выравнивание почвы, которое проводят по достижении физической спелости, создаёт благоприятные условия для быстрого прогревания её весной, равномерного распределения гербицидов и появления дружных всходов. Гербициды вносят в защитные зоны будущих рядов (ленточное внесение) и тотчас же заделывают. Сеют Кукурузу, когда почва на глубине заделки семян прогреется до 10–12 °С. При посеве ряды размещают в середине обработанных гербицидами полос. При этом посевной агрегат (кукурузная сеялка) движется по следу, оставленному следоуказателем, или по направляющим бороздам окучников, которыми оборудуют культиватор, используемый для заделки гербицидов. Интенсивные технологии также включают повышенные нормы посева (70 000–90 000 растений на 1 га при выращивании на зерно). При возделывании Кукурузы на зерно с применением элементов Астраханской технологии основным звеном в системе агротехнических приёмов является нарезка щелей-направителей с одновременным внесением гербицидов в защитную зону ряда. Интенсивные технологии предусматривают строгое соблюдение технологической дисциплины (точные сроки проведения агротехнических приёмов, их высокое качество, оптимальные дозы пестицидов и удобрений и другое). Уборку Кукурузы проводят комплексные уборочные отряды, основу которых составляют комбайно-транспортные звенья. При этом поле убирают за 2–3 дня. Послеуборочную обработку початков, зерна и силосной массы (её силосование) проводят в едином процессе с уборкой, что сводит потери урожая к минимуму. По сравнению с обычными интенсивные технологии повышают урожайность зерна Кукурузы на 10–12 ц/га. Вредители Кукурузы – Проволочники и Ложнопроволочники, Подгрызающие Совки, Стеблевой Мотылёк и другие. Болезни Кукурузы – пузырчатая и пыльная головни, фузариоз, нигроспороз, бель початков и другие. Кукурузоуборочный Комбайн – сельскохозяйственная машина для уборки Кукурузы с отрывом початков от стеблей, очистки их от обёрток и измельчения листо-стеблевой массы. В бывшем СССР выпускались кукурузоуборочные комбайны производительностью 1.3–3 га/ч.

CORN CLASSES = КЛАССЫ КУКУРУЗЫ – Corn Classes:- there are three classes of Corn:- (i) Yellow Corn, (ii) White Corn, and (iii) Mixed Corn. / Классы Кукурузы:- существуют три класса Кукурузы:- (i) Жёлтая (или Жёлтозёрная) Кукуруза, (ii) Белая (или Белозёрная) Кукуруза, и (iii) Смешанная Кукуруза.

CORNER = КОРНЕР (или КОНЭ, или ЗАГОН В УГОЛ) – (1) On 1868-October-13 the CBOT adopts a rule banning ‘Corners’ (defined as ‘making contracts for the purchase of a commodity, and then taking measures to render it impossible for the seller to fill his contract, for the purpose of extorting money from him’). This is the first known regulatory attempt to deter manipulation. Corner:- achievement of control over a given commodity by one or more persons to restrict supply and create or exacerbate a shortage of that commodity for purposes of speculation. Cornering a market involves acquiring physical control over a commodity, preferably one which is essential to a large number of people. It is a means of restricting or even withholding supply while demand remains constant, resulting in higher prices for the commodity and profits for those who cornered the market, who then gradually release their inventories of the commodity, until prices fall to initial levels. Corners are rare in industrialized economies. They have been replaced by more subtle and complex forms of speculation, such as monopolies, collusion and cartels. Corner:- when one operator owns or controls an excessive amount of stocks enabling them to control the supply of material and in consequence to control the price. Corners constitute

a menace to speculative markets and do not serve any useful social function. ... They tend to disrupt the machinery of legitimate speculation and cause the greatest injustice to short sellers. Short selling is a vital necessity to any organized market, and the public derives many benefits therefrom. Deliberately to mulct the shorts is nefarious, and the sooner deliberate corners are treated as unsocial acts the better. Corners are prohibited by the Commodity Exchange Act, but the Act does not define the term. It is clear, however, that the term Corner, as applied to a futures market, 'is simply an abbreviation of the more comprehensive expression of 'cornering the shorts''. The shorts have contracted to deliver the cash commodity during a specified month, and if the cornerer acquires such control over the shorts trading in the futures market that he is able to and does compel the shorts to settle their contracts with him at a manipulated price, a corner results. A relatively small corner is also sometimes referred to as a Squeeze. 'The methods of manipulators are legion but certain patterns frequently emerge'. The cornerer generally acquires a large long futures position thereby obligating the shorts to deliver a large quantity of the cash commodity during a certain month-usually a month in which the supplies of the cash commodity are at a low level. The cornerer then frequently acquires control over part of the cash commodity, either by purchases in the cash market or by receiving delivery on his long futures contracts, so that the shorts are unable to find sufficient quantities of the cash commodity to deliver and are compelled to liquidate their futures contracts either in offsetting transactions on the exchange with the cornerer or by purchasing the cash commodity from the cornerer for the purpose of making delivery. Irrespective, however, of the method employed by the cornerer, if a controlling position is obtained in the futures market so that the shorts are forced to settle their contracts with the cornerer at a manipulated price, a corner has been achieved. One of the difficulties conjoined with a cornering operation is the disposal of the cash commodity acquired as a result of the corner. The price of the cash commodity available for delivery on the futures contracts is raised concomitantly with the price of the futures contracts inasmuch as the cash commodity is 'temporarily in extraordinary demand for the sole and only purpose of using it to meet future contracts'. The price of the cash commodity generally falls precipitously as soon as the extraordinary demand is satisfied. Hence the cornerer is frequently faced with the prospect of having to suffer serious losses in the disposal of the cash commodity, i.e. in 'burying the corpse' of the corner. It is said that the late American meatpacking industrialist Philip Danforth Armour (1832–1901) was once told that there was a large speculative short interest in December pork and was asked why he did not 'corner' that delivery. He is said to have replied, 'To commit murder is very simple, the trouble is to bury the corpse'. The latter phrase is so appropriate to the difficulties of a commodity corner that it has been universally adopted and today you will hear it said that a cotton corner does not pay because it costs too much to 'bury the corpse'. Thus the problem of 'burying the corpse' may present a dilemma to the cornerer. He is frequently forced to acquire, either by purchase or by receiving delivery through the Clearing House of the exchange, a large part of the available cash supplies of the commodity involved in the corner. He would like to dispose of the cash commodity without suffering a serious loss on his cash transactions, but if the shorts are able to obtain sufficient supplies of the cash commodity for delivery on their contracts, they can, by delivering the cash commodity, escape from the corner. If the cornerer sells the cash commodity to the shorts, the shorts will redeliver the cash commodity to the cornerer, through the Clearing House of the exchange, and the shorts will be free from the corner, but the cornerer will still be faced with the problem of 'burying the corpse'. Hence the cornerer generally demands from the shorts about the same price for the cash commodity as the price at which he will liquidate his futures position on the exchange. In the case of a group cornering enterprise, an additional reason for not selling the cash commodity at a price below the agreed upon price for liquidating the futures positions is to prevent the agreed upon price from being jeopardized. The whole price structure of cash and futures is artificially high as a result of the corner, and if any of the manipulators permit the shorts to escape at less than the agreed upon price, each manipulator may be fearful that the manipulative scheme will fail, and each manipulator may then permit the shorts to escape – either by sales of cash supplies or by offsetting futures transactions – at successively lower prices in order to obtain the maximum liquidation of his own position at the highest possible price. Any 'price cutting' by any of the joint manipulators which permits the shorts to escape from the corner at less than the agreed upon price could, therefore, be ruinous to the venture. Corners or Squeezes:- ... are at least occasionally so handled that their financial success does not depend on effecting a price increase. Because the character of corners and squeezes is not generally well understood, such cases of abnormal market influence have sometimes, perhaps often, gone unrecognized or been regarded more lightly than they deserved by people not well versed in interpretation of the market. The indications are that successful corners or squeezes in wheat may sometimes have been 'hedged'. For example, purchases of May Wheat made as part of a plan for squeezing the market may be accompanied or shortly followed by sales of later deliveries, perhaps July. These sales of the later futures would not only provide an assured means of disposing of such deliveries on May contracts as may have to be accepted, but leave the 'squeezer' indifferent to the development of bearish price influences which may wholly offset the bullish effects of his operations in May Wheat. With a corner or squeeze thus hedged, he need be in nowise concerned with the actual changes in price of May Wheat, since his profits depend merely on his ability to force a widening of the spread between May and July Wheat of which he can take advantage. Indeed he may welcome a tendency toward general Wheat price decline as an aid in obscuring the effects of his operations. That type of a 'hedged' corner of the December 1947 egg futures market was involved in Great Western Food Distributors v. Brannan. Great Western Food Distributors, Inc., purchased large quantities of December egg futures contracts and sold large quantities of January egg futures contracts so that Great Western's profit was dependent upon widening the spread between the prices of the December and January egg futures contracts. The price of December egg futures contracts was falling during most of the period of Great Western's corner, but as a result of the cornering activities of Great Western, the decline in the December futures price was not as great as would have occurred in the absence of the corner. The January futures price, however, fell to its nonnal level, widening the spread between the December and January futures prices, thereby resulting in a substantial profit to Great Western. The question of manipulative intent is relevant in determining whether a corner has been consummated in violation of the Act inasmuch as in rare instances an unintentional corner develops when the longs actually want delivery of the cash commodity and there is not enough of the cash commodity available for delivery on the contracts. However, even if a large long position is originally established because the long interest wants to receive delivery of the cash commodity, the 'long interest, no matter how built up, that allows itself to be tempted into exploiting the situation in a way to involve acute disturbance of the market becomes a cornering interest'. Moreover, in any corner case, the requisite intent is merely a general intent, rather than a 'specific' intent, and the intent may be inferred from the actions of the cornerer. Persons 'will be presumed to have intended the natural consequences of their acts. ...'. The latter form of speculation is found everywhere and at all times, and is entirely independent of any organization or any rules of commercial custom. Since Thales cornered the olive-presses of Miletus (the ancient Greek philosopher Thales (was born in Miletus in Greek Ionia), being a man of moderate means, worked his corner by securing options on the use of the presses at the next harvest season), or Joseph, still earlier, cornered the grain of Egypt, such speculation has been universal. I distinctly remember being taught the Old Testament story of Joseph (a son of Jacob) wherein Joseph had been sold by his brothers into slavery to the Egyptians back about BC 1700; how Joseph correctly interpreted two of the Pharaoh's dreams to mean that there would be seven wonderful years of plenty, followed by seven terrible years of famine; how Pharaoh made Joseph his second-in-command; how Joseph built granaries during the seven good years to store enough surplus grain to feed the Egyptian people during the subsequent seven bad years of famine. I was taught how Joseph saved the Egyptian people; that he was a great man and an extraordinary blessing to the people of Egypt. Long before the Egyptians enslaved the Hebrews, Joseph, the first and foremost Hebrew to enter Egypt, enslaved the the Egyptians. So far as I know, Joseph was the world's first economist; our first 'John Maynard Keynes'. It's fascinating to note that Joseph enslaved the Egyptians long before

the Egyptians enslaved Joseph's relatives and descendants – the Hebrew people. It's not hard to imagine that the Egyptians enslaved the Hebrews as a form of retaliation for Joseph having first enslaved the Egyptians. If the so, the Hebrew's claim of being unjustifiably enslaved by the Egyptians may be compromised. As you'll read from text in the Bible, Joseph was no hero – quite the opposite. He was a villain who contrived to enslave an entire nation. More importantly, the story of Joseph shows that it was understood at least 3 700 years ago how to manipulate an economy so as to enslave an entire nation. Corner:- to secure control of a commodity so that its price can be manipulated. Corner In Oil:- Thales's reputation for wisdom is further enhanced in a story which was related by Aristotle. Somehow, through observation of the heavenly bodies, Thales concluded that there would be a bumper crop of olives. He raised the money to put a deposit on the olive presses of Miletus and Chios, so that when the harvest was ready, he was able to let them out at a rate which brought him considerable profit. In this way, Thales answered those who reproached him for his poverty. As Aristotle points out, the scheme has universal application, being nothing more than a monopoly. There need not have been a bumper harvest for the scheme to have been successful. It is quite likely that Thales was involved in commercial ventures, possibly the export of olive oil, and Plutarch reported that Thales was said to have engaged in trade. / Филып Дэнфос Амэ (Philip Danforth Armour (1832–1901)). Грит , Инк. (Great Western Food Distributors, Inc.) против Брэнэна (Brannan). Йосэф (Joseph) (сын Яакова (Jacob)). Дьжон Мэйнад Кейнз (John Maynard Keynes). Под Корнером понимается соглашение о скупке какого-либо товара с целью последующей спекулятивной перепродажи. Они создаются и на биржах для скупки, например, акций для последующей перепродажи или для приобретения контрольного пакета акций какой-либо компании.

(2) Corner:- securing such relative control of a commodity that its price can be manipulated, that is, can be controlled by the creator of the corner.

(3) Corner:- in the extreme situation, obtaining contracts requiring the delivery of more commodities than are available for delivery. See also Congestion and Squeeze.

CORNER BLOCK = УГЛОВАЯ ШАШКА – Corner Block is a block at the corner of the pallet. See also Pallet. / Угловая Шашка (Corner Block):- шашка, расположенная в угловой части поддона. Смотрите также Поддон (Pallet).

CORNER CASTINGS = УГЛОВЫЕ ЭЛЕМЕНТЫ (или УГЛОВЫЕ ОТЛИВКИ, или НИШИ В УГЛОВЫХ ФИТИНГАХ, или ГНЁЗДА В УГЛОВЫХ ФИТИНГАХ, или ПАЗЫ В УГЛОВЫХ ФИТИНГАХ) – Corner Castings:- reinforced locking device located at the top and bottom of the corner post which provides for the lifting and securing of containers. Corner fittings located at all eight corners of the container. They are used to handle the container. Lifting gear, such as container gantries and cranes, is attached to the corner castings of the containers in order to lift them. The corner castings are used in conjunction with twist locks to secure containers when traveling on road vehicles or stack and fasten them securely to the deck of ocean-going vessel. The twist locks are placed in the corner castings and engage with the corner castings (on the floor) of the next container. Also known as Corner Fittings.

CORNER CHAMFER = ХХ (или УГЛОВОЙ СКОС) – Corner Chamfer is a chamfer on the corners of a pallet. See also Chamfer, and Pallet. / на углах поддона. Смотрите также Скос (Chamfer), и Поддон (Pallet).

CORNER FITTINGS = УГЛОВЫЕ ФИТИНГИ – Fittings located at the corners of containers providing means of supporting, stacking, handling and securing the container. Corner Fittings are the fittings located at the eight corners of containers facilitating the support, stacking, handling and securing of containers. Also known as Corner Castings.

CORNERING = ЗАГОН В УГОЛ (или БЕЗЫСХОДНОСТЬ) – A term Cornering means the speculators some times create a scarcity of a particular scrip by purchasing a large amount of shares. They create an artificial demand for a scrip. The particular scrip circulation will be controlled by the speculators. If the velocity of the scrip is more, it will lead to high prices. It is an unhealthy practice of trading.

CORNER POST = УГЛОВАЯ СТОЙКА – Corner Post:- main support in construction container. Strong support for chocking and blocking inside. Corner Posts of a container. These connect the upper corner casting of a container to the lower one and form one of the most stable parts of the container. Vertical structural post at either side of an 'end frame' of a container joining a top and a bottom corner fitting. Vertical frame components fitted at the corners of the container, integral to the corner fittings and connecting the roof and floor structures. Containers are lifted and secured in a stack using the castings at the ends. / Неподвижное звено механизма называют Стойкой.

CORNER THE MARKET = ЗАГОНЯТЬ РЫНОК В УГОЛ (или ПОДЧИНИТЬ РЫНОК) – Corner The Market:- to build a virtual monopoly in particular goods or services, so that the monopolist is able to dictate price. Corner The Market:- to attempt to purchase all of the available supply of a commodity with the intention of controlling the market and advancing the price at will, obtaining a large profit by so doing. In the securities trade, it is an attempt to purchase a company's stock available on the market and so force buyers (especially speculators who have sold short and must make purchases to cover their sales) to pay a high price. See also Corner, and Cornering.

CORNFLOWER = ВАСИЛЬКОВОЕ (или ВАСИЛЁК) – Cornflower:- blue a moderate purplish blue.

CORN–HOG RATIO = СООТНОШЕНИЕ КУКУРУЗА–БОРОВ – Corn/Hog Ratio is a feed ratio used to determine the profitability of raising livestock. The Corn/hog ratio is the price of one hundred pounds of hog (cwt) divided by the price of a bushel of Corn. The ratio is used to help farmers determine the value of a crop of Corn compared to the value of a hog that they would have to feed with the same crop of Corn. For example, if the price of a hog is USD50/cwt and the price of a bushel of Corn is USD4, the corn/hog ratio would be USD50/USD4, or 12.5. Corn is used in this feed ratio because it is a major feed type used in raising livestock. Many farmers who grow Corn could either sell the Corn itself as a commodity, or could feed it to their hogs and then sell the hogs. If Corn is more valuable than the hog then the farmer would sell the Corn and reduce the livestock inventory. If hogs are more valuable than the Corn, then the farmer would feed the Corn to the hog, thus selling less Corn on the market. See also Feed Ratio, Hog-Corn Ratio. / Смотрите также Соотношение С Кормом (Feed Ratio).

COROLLA = ВЕНЧИК – Corolla is the collective group of petals which may occur separately or fused into a cup, tube or other structure. Corolla is the ring of usually showy flower structures inside the calyx made up of separate or joined petals. The Corolla usually consists of five fused petals (4-merous corollas are rare, e.g., Ramonda Nathaliae, Bournea Sinensis, Championia Reticulata). The corolla exhibits a wide range of forms resulting from the different proportions and shapes of the tube and the limb. There is practically a continuum between flowers with a tube more than 10 cm long and those with almost none (sometimes even within a single genus or section). The tube may be narrow, gently or abruptly widening, pouched on the ventral or dorsal side, straight or curved. Some taxa have a sac or spur at the base, either dorsally (e.g., Gasteranthus, Sinningia, Nautilocalyx, Episcia, Achimenes Spp.) or ventrally (Stauranthera). The spur may hold nectar, but may also represent a structure giving strength and balance to a long-tubed flower. The limb is primarily bilabiate, with two upper and three lower lobes, but there are also cases in which four lobes form the upper lip and the fifth the lower lip (e.g., Columnea, Calcareoboea, Allocheilos). Resupinate flowers (with upside-down orientation) flowers occur in Senyumia, in Alloplectus (in the restricted sense of Clark 2005), and in many Species of Nematanthus. A regular (radially

symmetrical) limb can be sometimes found in tubular flowers (e.g., some Species of Cyrtandra, Kohleria and Sinningia), but more often in short-tubed, campanulate or flat-faced (‘rotate’) flowers. Actinomorphic corollas often have five stamens. The corolla lobes are usually rounded, less commonly pointed or fimbriate. Some Species of Columnea sect. Ortholoma bear conspicuous rod-like or filiform appendages at the sinuses (e.g., Crinum Moorei) or on the dorsal side of the corolla lobes. In Columnea Incredibilis the appendages are up to 38 mm long and completely replace the 3–4 mm long corolla lobes in function. Coloration of the corolla is extremely variable, with colors ranging from white through yellow, red, scarlet, crimson, violet, greenish, brownish to nearly black. Additional markings, stripes, dots etc, serving as nectar guides, are common. In many species of paleotropical Gesneriaceae two (often raised) yellow lines lead into the corolla mouth. Similar nectar guides are found in neotropical Gesneriaceae with whitish flowers, e.g., Drymonia, Codonanthe, Achimenes, Nautilocalyx. / Венчик – коллективная группа лепестков, которые могут возникать раздельно или слившись в чашечку (или плюску), трубочку или иную структуру. Под Венчиком понимается внутренняя часть двойного околоцветника, состоящая из отдельных или сросшихся лепестков. Часто ярко окрашенная. Защищает тычинки и пестики, иногда выделяет нектар, привлекает опылителей (Насекомых, Птиц). Важный морфологический признак в систематике Растений. Венчик:- лепестки цветка, свободные или сросшиеся в основании, или внутренний круг листочков околоцветника.

CORONA = КОРОНА (или ВЕНЕЦ) – Corona is:- (i) outgrowth of the perianth, e.g., trumpet of a daffodil; or (ii) a ring of raised fleshy tissue on the corolla around but not adnate to the base of the stamens. / мясистая (fleshy) ткань на венчике (corolla) вокруг, но не тычинок (stamens). Под Короной, от Латинского слова Corona, означающее Венец, понимается:- (1) драгоценный головной убор – знак монаршего достоинства; (2) в монархических государствах – обозначение государственной власти.

CORONAL = ВЕНОК (или ВЕНЕЦ, или ВЕНЧИК) – Coronal is a circlet for the head usually implying rank or dignity.

CORONET = ВЕНЕЦ (или ВЕНОК, или ДИАДЕМА, или КОРОНА, или ХХ) – Coronet is an ornamental wreath or band for the head usually for wear by women on formal occasions. / .

CORP. = CORPORATION

CORPORATE ACTION = КОРПОРАТИВНОЕ ДЕЙСТВИЕ (или КОРПОРАТИВНАЯ АКЦИЯ) – A Corporate Action is an action taken by an entity for the purpose of giving an Entitlement to Holders of a class of the entity’s securities. Examples of Corporate Actions include rights issues, bonus issues, dividends or other payments, or offers under a buy- back scheme. Events typically related to capital reorganization or restructuring. Corporate actions frequently require notification of and response by the beneficial owner of the security. Corporate actions include:- Bond Calls, Bonus Share Plan, Capital Gains Distribution, Cash/Stock Option Dividend, Class Action, Convertible Securities, Dividend Option, Dividend Reinvestment Plan (DRIP), Mergers/Takeovers, Mini-Tenders, Nominal Change, Optional Conversions, Options and Warrants, Placings, Proxies, Redemption, Rights Issue, Stock Bonus Issue, Stock Dividend, Stockholder Meeting Announcements, Stock Split/Par Value Change, Subdivision, Subscription, and Tender Offer. The different types of corporate actions, and the terminology used to describe them, may vary by country and market. This list identifies some common corporate actions. Some of the above actions are voluntary; such actions typically require a customer decision within a short time frame.

CORPORATE AVERAGE FUEL ECONOMY = КОРПОРАТИВНАЯ УСРЕДНЁННАЯ ЭКОНОМИЯ ТОПЛИВА – Corporate Average Fuel Economy (CAFE):- enacted by the US Congress in 1975, CAFE’s purpose is to reduce energy consumption by increasing the fuel economy of cars and light trucks. The US National Highway Traffic Safety Administration (NHTSA) has set standards to increase CAFE levels rapidly over the next several years, which will improve our nation’s energy security and save consumers money at the pump. This site contains an immense amount of information about the CAFE program including an overview, rulemaking actions, fleet characteristics data, compliance activities, summaries of manufacturers’ fuel economy performances since 1978, and related studies. December 21, 2016:- NHTSA Responds to Petitions on CAFE Civil Penalties and Harmonization. NHTSA issued two Federal Register Notices pertaining to the Corporate Average Fuel Economy (CAFE) program. Both are in response to petitions from the Alliance of Automobile Manufacturers and the Association of Global Automakers. The first postpones the effective date of an increase in civil penalties for CAFE violations. The penalties, which were previously planned to be effective starting with model year 2015, will now be effective for model year 2019 and beyond. The second grants a petition for rulemaking regarding harmonization of the CAFE program and the EPA (short for the Environmental Protection Agency) light-duty vehicle Greenhouse Gas Emissions program. The Agency will address the issues raised by the petitioners in its rulemaking process. NHTSA Brings CAFE Reports To Its Public Information Center:- December 16, 2015:- NHTSA introduces a new, innovative CAFE Management Suite that represents a shift to an automated system, allowing for streamlined uploads of fuel economy data, standardized data management, and business intelligent report capabilities. The Public Information Center (PIC) will allow the general public (researchers, analysts, the press, etc) to easily access dynamic data about the CAFE program through the CAFE PIC self-service reporting portal. The interactive CAFE PIC will provide timely, reliable fuel economy data, which can be viewed in report and/or graph format. The data can be easily sorted and filtered based on specific areas of interest to produce custom reports, which can also be downloaded as excel or pdf files. Phase 2:- Final Rule for Phase 2 fuel efficiency and GHG (short for the greenhouse gas) emissions standards for medium and heavy-duty vehicles, MY2018–2027. NHTSA and EPA issued a Final Rule for ‘Phase 2’ for medium and heavy duty vehicles to improve fuel efficiency and cut carbon pollution. The agencies estimate that the standards will save up to 2 billion barrels of oil and reduce CO_2 emissions by up to 1.1 billion metric tons over the lifetimes of MYs 2018–2029 vehicles, providing up to USD230 billion in net social benefits. History of US Fuel Economy Standards:- the US Congress first established Corporate Average Fuel Economy (CAFE) standards in 1975, largely in response to the 1973 oil embargo. CAFE standards set the average new vehicle fuel economy, as weighted by sales, that a manufacturer’s fleet must achieve. Through the Energy Policy and Conservation Act of 1975, Congress established fuel economy standards for new passenger cars starting with model year (MY) 1978. These standards were intended to roughly double the average fuel economy of the new car fleet to 27.5 mpg by model year (MY) 1985. Additionally, the Department of Transportation set the first round of CAFE standards for light trucks (i.e. pickups, minivans, and SUVs) beginning with MY 1978. CAFE standards for light trucks were increased to 22.2 mpg for MY 2007 and scheduled to increase further. No similar increases were made for passenger cars until until 2007, when historic energy legislation was passed by Congress and signed by the President. This new energy legislation, the Energy Independence and Security Act of 2007, raised the fuel economy standards of America’s cars, light trucks, and SUVs to a combined average of at least 35 miles per gallon by 2020 – a 10 mpg increase over 2007 levels – and required standards to be met at maximum feasible levels through 2030. Federal law directing increases in fuel economy became necessary because oil consumption had been steadily escalating, in large part due to the relative stagnation in CAFE standards, the doubling of annual vehicle miles traveled in the previous 25 years, and a sizable increase in the market share of less efficient SUVs and light trucks. In 2009, a historic agreement between the federal government, state regulators, and the auto industry established a National Program to implement these first meaningful fuel efficiency improvements in over 30 years and the first-ever global warming pollution standards for light-duty vehicles. The agreement grew out of the new fuel efficiency standards passed by Congress in 2007, the Supreme Court’s decision in Massachusetts v. EPA, which precipitated global warming pollution standards for vehicles under the Clean Air Act, and global warming pollution standards enacted in California and

subsequently adopted by 13 other states and the District of Columbia. The agreement provided a mechanism for automakers to build a single national fleet of new vehicles that are in compliance with federal and state requirements under both the Clean Air Act and the Corporate Average Fuel Economy (CAFE) program. While each regulatory agency with legal authority promulgates and finalizes separate standards, the National Program harmonizes the three requirements. This is achieved by coordinating the rulemaking process and promulgating final standards that ensure that compliance with one standard equates to compliance with all three standards. The National Program is comprised of three legal authorities:- (i) Department of Transportation (NHTSA):- the first CAFE standards were administered by the National Highway Traffic Safety Administration (NHTSA), a part of the US Department of Transportation. As a result of the 2007 energy legislation, NHTSA is required by statute to set fleetwide average fuel efficiency standards for each new model year at the maximum feasible level. (ii) Environmental Protection Agency (EPA):- the EPA is required to set pollution standards for new light-duty vehicles under section 202 of the Clean Air Act. Specifically, EPA is required to set standards at a level that protects public health and welfare. EPA successfully implemented automobile pollution standards covering smog-forming, toxic, and other emissions for decades. Following the Supreme Court's decision in Massachusetts v. EPA that greenhouse gases are pollutants under the Clean Air Act and the subsequent finding that those gases endanger public health, the agency was required to set global warming pollution standards for vehicles under the Clean Air Act. (iii) California Air Resources Board (CARB):- when the Clean Air Act was originally enacted, Congress provided the State of California unique authority to set vehicle standard that are more stringent than the federal standards. California enacted legislation in 2002 directing CARB to develop global warming pollution standards for light-duty vehicles, which were finalized in 2004. Other states are able to adopt the California standards in lieu of the federal standards under section 177 of the Clean Air Act. Currently, 13 other states and the District of Columbia follow the state standards, representing nearly 40% of new vehicles sold in the United States. These states are required to adopt identical standards to those established by CARB, ensuring that there are just two alternatives – a baseline federal requirement and a stronger state requirement – instead of multiple standards. Phase I of the National Program:- Model Year 2012–2016:- the first phase of the National Program was finalized in April 2010 after a 12-month regulatory process. The 2012–2016 standards were supported by automakers, state regulators, the United Auto Workers (UAW), environmental organizations and other stakeholders. Overall, phase I of the National Program represents a 23 percent improvement in new vehicle pollution standards, an average annual improvement of nearly 5 percent. The EPA established global warming pollution standards of 250 grams per mile, on average, for model year (MY) 2016 vehicles. NHTSA set fuel efficiency standards which target a new vehicle average of 34.1 miles per gallon in MY2016. These two standards reflect a harmonized level of stringency. CARB agreed to accept compliance with the National Program as compliance with its standards even though the federal standards are weaker until 2016. Phase II of the National Program:- Model Year 2017–2025:- building on the success of the first phase of the National Program, the second phase of fuel economy and global warming pollution standards for light duty vehicles covers model years 2017–2025. These standards were finalized by the US Environmental Protection Agency (EPA) and US Department of Transportation in August 2012. These new standards will reduce average global warming emissions of new passenger cars and light trucks to 163 grams per mile (g/mi) in model year 2025. This is equivalent to 54.5 miles per gallon (mpg) if the standards were met exclusively with fuel efficiency improvements. The actual Corporate Average Fuel Economy (CAFE) standard is expected to be about 49.6 mpg in 2025, with the remaining 5 miles per gallon equivalent reached through improvements to in-car air conditioners (better efficiency, reduced leaks, and use of refrigerants with a lower impact on the climate). Because CAFE compliance tests are out of date and overinflate fuel economy, the average on-road fuel economy of new cars and light trucks is expected to be 36–37 mpg by 2025. By comparison, the average of today's on-road fleet is 21 mpg. See the UCS fact sheet Translating New Auto Standards into On-Road Fuel Efficiency for more information. Benefits of Fuel Economy Standards:- these standards will reduce America's consumption of oil, save consumers money at the gas pump, and protect public health and the environment by curbing global warming pollution. They will also help spur investments in new automotive technology, creating jobs and helping sustain the recovery of the American auto industry. (1) Oil Consumption:- nearly doubling the average fuel efficiency of new cars and light trucks is the single biggest step our nation can take to reduce oil use. When taken together, the two phases of fuel economy standards will result in oil savings in 2030 of more than 3 million barrels per day. This is roughly equivalent to the US imports from both the Persian Gulf and Venezuela combined. (2) Jobs:- a June 2012 study by the Blue Green Alliance finds that the second round of standards alone will create an estimated 570 000 jobs (full-time equivalent) throughout the US economy by 2030, including 50 000 in light-duty vehicle manufacturing (parts and vehicle assembly). (3) Environment:- the two rounds of standards will reduce global warming pollution by as much as 570 million metric tons (MMT) in 2030. This is equivalent to shutting down 140 typical coal-fired power plants for an entire year. (4) Consumer Savings:- the standards will save consumers USD140 billion in 2030. When compared to a typical vehicle on the road today, a new car buyer will save more than USD8 000 over the lifetime of a new 2025 vehicle, even after paying for the more fuel-efficient technology.

CORPORATE BOND = КОРПОРАТИВНАЯ ОБЛИГАЦИЯ – Corporate Bonds are debt securities issued by companies to raise debt on capital markets. The bond terms and conditions, such as maturity, coupon and issue volume are detailed in the issue prospectus. The interest rate payable to investors by the company is determined above all by its credit rating: the weaker the issuer's credit standing, the higher the bond yield. The issuer's credit standing is indicated through the rating. A bond issued by a corporation. Corporate Bond is a debt security issued by a corporation and sold to investors. The backing for the bond is usually the payment ability of the company, which is typically money to be earned from future operations. In some cases, the company's physical assets may be used as collateral for bonds. Corporate bonds are considered higher risk than government bonds. As a result, interest rates are almost always higher, even for top-flight credit quality companies. Corporate bonds are issued in blocks of USD1 000 in par value, and almost all have a standard coupon payment structure. Corporate bonds may also have call provisions to allow for early prepayment if prevailing rates change. Corporate bonds, i.e. debt financing, are a major source of capital for many businesses along with equity and bank loans/lines of credit. Generally speaking, a company needs to have some consistent earnings potential to be able to offer debt securities to the public at a favorable coupon rate. The higher a company's perceived credit quality, the easier it becomes to issue debt at low rates and issue higher amounts of debt. Most corporate bonds are taxable with terms of more than one year. Corporate debt that matures in less than one year is typically called 'Commercial Paper'. Interest-bearing or discounted debt obligation issued by a private corporation. / Корпоративная Облигация – облигация, выпущенная корпорацией. Долговое обязательство, приносящее проценты или дисконтируемое, выпускаемое частной корпорацией.

CORPORATE FINANCE = КОРПОРАТИВНЫЕ ФИНАНСЫ – Corporate Finance is the area of finance dealing with monetary decisions that business enterprises make and the tools and analysis used to make these decisions. The primary goal of corporate finance is to maximize shareholder value. Although it is in principle different from managerial finance which studies the financial decisions of all firms, rather than corporations alone, the main concepts in the study of corporate finance are applicable to the financial problems of all kinds of firms. The discipline can be divided into long-term and short-term decisions and techniques. Capital investment decisions are long-term choices about which projects receive investment, whether to finance that investment with equity or debt, and when or whether to pay dividends to shareholders. On the other hand, short term decisions deal with the short-term balance of current assets and current liabilities; the focus here is on managing cash, inventories, and short-term borrowing and lending (such as the terms on credit extended to customers). The terms corporate finance and corporate financier are also associated with investment banking.

The typical role of an investment bank is to evaluate the company's financial needs and raise the appropriate type of capital that best fits those needs. Thus, the terms 'Corporate Finance' and 'Corporate Financier' may be associated with transactions in which capital is raised in order to create, develop, grow or acquire businesses. Corporate Finance:- procurement of the short- to long-term financial resources needed by the enterprise. Consulting and support given to companies in the field of corporate finance is an important area of banking, esp. for big banks. Corporate Finance is:- (1) the financial activities related to running a corporation. (2) A division or department that oversees the financial activities of a company. Corporate finance is primarily concerned with maximizing shareholder value through long-term and short-term financial planning and the implementation of various strategies. Everything from capital investment decisions to investment banking falls under the domain of corporate finance. Among the financial activities that a corporate finance department is involved with are capital investment decisions. Should a proposed investment be made? How should the company pay for it; with equity or with debt, or combination of both? Should shareholders be offered dividends on their investment in the company? These are just some of the questions a corporate financial officer attempts to answer on a consistent basis. Short-term issues include the management of current assets and current liabilities, inventory control, investments and other short-term financial issues. Long-term issues include new capital purchases and investments.

CORPORATE GOVERNANCE = КОРПОРАТИВНОЕ РУКОВОДСТВО – Corporate Governance:- procedures and processes according to which organisations are directed and controlled. The corporate governance structure specifies the distribution of rights and responsibilities among the different participants in the organization – such as the board, managers, shareholders and other stakeholders – and lays down the rules and procedures for decision-making. In so doing, it also provides the structure within which the organisation's operational targets are set, and specifies the means of attaining those targets and of monitoring performance. Corporate Governance (CG) designates responsible company management and company control oriented to sustainable value creation. The topics covered under this heading range from the company's ownership and capital structures, the rights and obligations of shareholders, the personnel composition and effectiveness of management bodies, to the executive management and control of the company including questions of employee co-determination, reporting and transparency as well as change of control due to a takeover. Corporate Governance:- a company is governed by its Board of Directors. Governance refers to the discipline by which a company is supervised at the highest level with respect to its obligations to its various stakeholders – investors, customers, the public, and government (taxes, environment, etc). It is the job of a corporate Board to ensure that the enterprise is properly managed. Due to many corporate scandals and corporate malfeasance, governance has become a hot topic and many securities regulators have mandated new standards. For example, in the USA, the SEC (Securities and Exchange Commission) has enacted the Sarbanes-Oxley Act (approx 2002) that requires corporations to adopt certain accounting and reporting standards. These can be very onerous and compliance can be very costly. / Акт Сорбэйнза-Акслэйя (Sarbanes-Oxley Act).

CORPORATE GUARANTEE = КОРПОРАТИВНАЯ ГАРАНТИЯ – Corporate Guarantee is a guaranty to a lender that a loan will be repaid, guaranteed by a company other than the one who took the loan. Typically, a larger company (often a parent company, or another related company) will make the guarantee on behalf of a smaller company who may not be well known or have developed a relationship with the lender. See also Company Guarantee. A Corporate Guarantee is a guarantee in which a corporation agrees to be held responsible for completing the duties and obligations of a debtor to a lender, in the event that the debtor fails to fulfill the terms of the corporate guarantee. It is also known as Debtor-Lender Contract. / Смотрите также Гарантия Компании (Company Guarantee).

CORPORATE INDICATOR = КОРПОРАТИВНЫЙ ПРИЗНАК – In the United States, Corporate Indicator is a word or an abbreviation of a word that must be included in a corporation's name to indicate that the named entity is a corporation. Valid corporate indicators include:- incorporated, corporation, limited, company, inc., corp., ltd. and co.. The list of acceptable corporate indicators will vary depending upon the jurisdiction in which the corporation is registered. / , Корп. (Corp.), .

CORPORATE KIT = КОРПОРАТИВНЫЙ НАБОР – In the United States, Corporate Kit is a binder usually containing essential items for the routine maintenance and administration of a corporation or limited liability company. Corporate kits provided by Active Filings, LLC. include, for instance, stock certificates, a corporate seal and stock ledger. / Корпорация С Ограниченной Ответственностью (КОО или Эл.Эл.Си.) (Limited Liability Corporation (LLC)).

CORPORATE OBLIGATIONS = КОРПОРАТИВНЫЕ ОБЯЗАТЕЛЬСТВА – Corporate Obligations include bonds and notes issued by corporations in order to finance longer term credit needs. / Под Корпоративными Обязательствами понимаются облигации и ноты, выпущенные корпорациями для финансирования долгосрочных нужд в кредитах.

CORPORATE PENSION FUND FOUNDATION = КОРПОРАТИВНЫЙ ФОНД ПЕНСИОННЫХ НАЧИСЛЕНИЙ (или СРЕДСТВ) – Corporate Pension Fund Foundation:- pension fund for the pooled investment of funds contributed exclusively by the employer. The invested capital can be used only for pension funds or staff welfare funds.

CORPORATE SEAL = КОРПОРАТИВНАЯ ПЕЧАТЬ – In the United States, a Corporate Seal is a device made to either emboss or imprint certain company information onto documents. This information usually includes the company's name and date and state of formation. Corporate seals are often required when opening corporate or LLC bank accounts, distributing stock or membership certificates or conducting other corporate business. Active Filings, LLC includes custom-made corporate seals as part of its corporate Kit. / Корпорация С Ограниченной Ответственностью (КОО или Эл.Эл.Си.) (Limited Liability Corporation (LLC)).

CORPORATION = КОРПОРАЦИЯ – Also referred to as Limited Liability Corporation. Corporation is a type of legal entity provided for in the laws of most modern economically developed countries that two or more investors may agree to create for the purpose of combining some of their resources and going into business together. Corporations have the status of 'artificial legal persons' and thus may own property, make contracts, be held responsible for committing crimes or torts, initiate court actions such as lawsuits, and so on. In the United States, businesses organized as limited liability corporations must indicate their status as such by including the word 'Incorporated' ('Inc.') in the name of the firm. In other countries, the same purpose is served by using the equivalent abbreviations 'Ltd.' (Limited) or 'SA' (Anonymous Society) at the end of the company's name. It is today by far the most widespread and successful form of ownership of business property in all advanced capitalist countries. The key feature of the modern business corporation that sets it apart from simple partnerships and sole proprietorships is that it provides the owners of the business with the important legal protection of 'limited liability', whereas these other forms of business organization generally do not. If a failing business enterprise that is owned as a sole proprietorship or partnership is unable to generate enough money to pay its bills, the personal liability of the owners is unlimited – that is, the unpaid creditors of the business can take legal action to seize not only any assets directly connected with the business itself but also the personal property of any individual owner as well, up to the full amount of the debt. But if a limited liability corporation goes belly up, the legal claims of the company's creditors normally can extend only to the assets actually owned by the corporation in its own name, and not to the individually-owned property of the company's shareholders. The individual owner's shares in the corporation might become worthless if the business fails, but he or she does not have to worry about the Sheriff showing up to seize the house or the car or the family bank accounts to pay off the rest of what the company's creditors are owed. Protection from personal liability makes it much safer and therefore more attractive for more individuals to use some of their savings to become part-

owners of very large business organizations. Without limited liability, even the tiniest investment would put a shareholder's entire remaining fortune at risk. During the Middle Ages and the early years of the Industrial Revolution, the corporate form of ownership for business organizations was generally available only as a very special privilege occasionally awarded by the government to a handfull of royal favorites. But changes in the legal codes of Great Britain, the United States, France and other economically progressive countries during the XIX century removed most of the practical barriers to widespread adoption of the corporate form of ownership. This made it much easier to raise capital for new business enterprises. By allowing for pooling the savings of hundreds, thousands, or even millions of individual investors at manageable levels of risk, the widespread adoption of the corporate form of business ownership made extremely large scale private investment projects practical for the first time in history, thereby contributing greatly to the modern era's historic surge in economic growth that continues up to the present day. In the United States, Corporation is an artificial entity created under and governed by the laws of the state of incorporation. In the United States, Corporation is a form of doing business pursuant to a charter granted by a state or federal government. Corporations typically are characterized by the issuance of freely transferable capital stock, perpetual life, centralized management, and limitation of owners' liability to the amount they invest in the business. Also known as Company in the United Kingdom. All bodies recognised as independent legal entities which are producers of market output and whose principal activity is the production of goods and services. A Corporation includes all bodies corporate and certain types of unincorporated bodies, but excludes certain corporate bodies. For legal purposes a corporation is treated as a separate legal person. Business organized as a separate legal entity with ownership evidenced by shares of stock. Advantages of a corporation are limited liability of owners and ability to obtain large amounts of capital through the issue of stock. Also known as Joint Stock Company, and Limited Liability Company in the United Kingdom. Corporation is a form of legal entity that makes it possible for investors to hold a stake in the capital of the company without being personally involved in company management. The investment is in the foreground, not one's own entrepreneurial activities. Another typical charactaristic is that the shareholders are only liable for the corporation's obligations up to the amount of their capital investment; they are not liable with their private wealth. In Germany, corporations include:- 'Aktiengesellschaft' (AG, Stock Corporation), 'Kommanditgesellschaft auf Aktien' (KGaA, Partnership Limited By Shares) and 'Gesellschaft mit beschränkter Haftung' (GmbH, Limited Liability Company). In the United States, a Corporation is an organization composed of one or more persons, formed and authorized by law to act as a single 'person' in a legal sense, and legally endowed with various immunities, rights and duties. Abbreviation:- Corp. / Акциэнгээльшафт (А.Ге.) (Aktiengesellschaft (AG)), Командитгээльшафт ауф Акциэн (Ка.Ге.а.А.) (Kommanditgesellschaft auf Aktien (KGaA)), Гээльшафт мит бэшрэнькта Хафтун (Ге.эм.бе.Ха.) (Gesellschaft mit beschränkter Haftung (GmbH)). выработка (output). Обозначение:- Корп. (Corp.). Под Корпорацией, от позднелатинского слова Corporatio, означающее Объединение, понимается .

(2) One of the types of corporations in Switzerland, most businesses in Switzerland are organized as corporations ('Aktiengesellschaften' – 'AG' or 'SA'). The minimum share capital is CHF100 000.00. Prior to July 1992 it was CHF50 000.00, and companies incorporated before 1985 are permitted to maintain it at that level. In general, shareholders' obligations do not extend beyond the contribution of the shares issue price. The share capital may be increased by a majority vote of the shares represented in what is called an Ordinary Share Capital Increase, or, alternatively, Out Of Authorised or Conditional Capital. When creating authorized share capital, the shareholders authorize the board of directors to issue shares up to a pre-determined amount within a period of two years. Conditional share capital is used in connection with convertible bonds or option rights; it allows the holders of conversion or option rights to automatically increase the equity by exercising their rights. The shareholders' resolution necessary to create authorized or conditional capital requires a majority of two thirds of the votes represented at the meeting and the majority of the represented nominal value of the shares (unless provided otherwise in the articles of incorporation). Authorized and conditional share capital may not exceed 50 per cent of the ordinary capital (except in the context of mergers). Also known as Company Limited by Shares. See also Limited Liability Corporation, Limited Partnership, and Partnership. / Акциэнгээльшафтэн (Aktiengesellschaften) – А.Ге. (AG) или Эс.А. (SA).

CORPORATION LAW = ЗАКОН О КОРПОРАЦИЯХ (или ЗАКОНОДАТЕЛЬСТВО О КОРПОРАЦИЯХ) – In the United States, Corporation Law is the statutory provisions of a state relating to domestic and foreign corporations.

CORPORATION OF LLOYD'S = КОРПОРАЦИЯ ЛОЙДЗ (или КОРПОРЭЙШЭН ОФ ЛОЙДЗ) – The Corporation of Lloyd's (the 'Corporation') oversees and provides services to support the market and promotes Lloyd's around the world. The senior executives of the Corporation exercise the day-to-day powers and functions of the Council and the Franchise Board. The Corporation (including its subsidiaries) had 798 employees worldwide, as at 2007-December-31. In addition to its objective to provide cost-effective services that are essential to the smooth running of the market, the Corporation strives to raise the standards and improve the performance of the market. The Corporation's work includes:- (i) determining the capital that Lloyd's members must provide to support their proposed underwriting; (ii) overseeing business activities of the market by operating a minimum standards framework and monitoring the performance of syndicates in areas such as exposure management, cycle management, claims management and operational risk management; (iii) working with the management of underperforming syndicates to improve performance and intervening directly if stronger action is required; (iv) managing financial and regulatory reporting for the Lloyd's market, including the production of Lloyd's market results and Lloyd's Financial Services Authority (FSA) return; and (v) managing and developing Lloyd's global network of licences and the Lloyd's brand. The executive of the Council of Lloyd's, Lloyd's Franchise Board and their respective committees. The Corporation does not underwrite insurance or reinsurance itself but provides the licences and other facilities that enable business to be underwritten on a worldwide basis by managing agents acting on behalf of members. See also Lloyd's. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's). Смотрите также Лойдз (Lloyd's).

CORPORATIONS LAW = ЗАКОН О КОРПОРАЦИЯХ – Corporations Law:- a national scheme of legislation dealing with the regulation of companies and the securities and futures industries. Corporations Law is a branch of commercial law that examines the nature, creation and operation of legally incorporated businesses.

CORPUS DELICTI = КОРПУС ДЭЛИКТИ – Corpus Delicti:- in Latin, The Body Of A Crime. The substance or fundamental facts of a crime. / Корпус Дэликти:- в переводе с Латинского языка 'Тело Преступления' или Состав Преступления; Предмет, Служащий Доказательством Совершения Преступления; Вещественные Доказательства; Улики.

CORRECT COVER = XX – Defect Name:- Correct Cover. Defect Type:- Pattern Defects. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Correct Cover:- Proper settings allow the warp yarn to dominate and form smooth surface of accentuated twill lines. Severity:- .

CORRECTED BILL OF LADING = ОТКОРРЕКТИРОВАННЫЙ КОНОСАМЕНТ (или КОРРЕКТИРУЕМЫЙ КОНОСАМЕНТ) – A Corrected Bill Of Lading provides updates in regards to financial or money issues. It is not an amended bill of lading that only deals with corrections. B/L requiring any update which results in money- or other financially related changes.

CORRECTION = КОРРЕКЦИЯ – (1) Correction is the act of offering an improvement to replace a mistake; setting right. Correction is a quantity that is added or subtracted in order to increase the accuracy of a scientific measure. The act of correcting. A substitution for an

error or mistake. Punishment that is intended to rehabilitate an offender. An amount or quantity of something added or subtracted so as to correct. A decline in a stock market price after a large rise. / Под Коррекцией, от Латинского слова Correctio, означающее Исправление или Поправка, понимается исправление ошибок или недостатков машин и механизмов, результатов их работы, измерений, траекторий движения и так далее. Коррекцию механизмов проводят путём изменения их расчётных конструкций или при помощи особых устройств – корректоров.

(2) Correction:- secondary trends are short-term changes in price direction within a primary trend. The duration is a few weeks or a few months. One type of secondary market trend is called a Market Correction. A correction is a short term price decline of 5% to 20% or so. A correction is a downward movement that is not large enough to be a bear market (ex post). After an advance, a decline that does not penetrate the low from which the advance began is known as a Correction. A correction usually retraces 1/3 to 2/3 of the previous advance. Also known as Retracement. Counter-trend price movements that are largely the result of profit-taking. These are technical moves that must occur, and their correction distance can often be measured prior to occurrence by Fibonacci correction ratios. A temporary decline in prices during a bull market that partially reverses the previous rally. See also Bear Market Rally. Correction is a retracement of a previous move. It can be a decline after a series of gains in price or it can be a gain in prices after a series of declining prices. A counter-trend move up or down that is generally brought about by traders taking short-term profits due to thoughts that the market was either overbought or oversold. In technical analysis, a small reversal in the market prices following a significant trending period. See also Market Correction. / Коррекция:- вторичные тенденции носят краткосрочные изменения в направлении движения цены в пределах первичной тенденции. .

CORRECTION NOTICE = УВЕДОМЛЕНИЕ О КОРРЕКЦИИ (или УВЕДОМЛЕНИЕ ОБ ИСПРАВЛЕНИИ, или УВЕДОМЛЕНИЕ О ПОПРАВКЕ) – Correction Notice:- internal documents for correction to manifest which reflect a change in the details of a shipment.

CORRELATION = КОРРЕЛЯЦИЯ – Correlation is a statistical measure of the linear relationship between two series of figures, e.g., performance of a security and the overall market. A positive correlation means that as one variable increases, the other also increases. A negative variable means that as one variable increases, the other decreases. By definition, the scale of correlation ranges from +1 (perfectly positive) to –1 (perfectly negative). A correlation of 0 indicates that there is no relationship between the two variables. Correlation is a mutual relationship between two things such that an increase or decrease of one is generally associated with an increase or decrease of the other. Linear correlation is measured by the correlation coefficient (r), which may range from –1 to +1. Correlation is a measure of the degree to which changes in two variables are related. It is normally expressed as a coefficient between plus one, which means variables are perfectly correlated (in that they move in the same direction to the same degree) and minus one, which means they are perfectly negatively correlated (in that they move in opposite directions to the same degree). In financial markets correlation is important in three areas:- (1) the model used for global asset allocation decisions, Sharpe's capital asset pricing model (CAPM), has, as its linchpin, a covariance matrix that measures correlations between markets. (2) Correlation is also central to the pricing of some options, where two-factor or multi-factor models are used. For spread options, yield curve options and cross-currency caps, estimating the correlation between the underlying assets is of primary importance, the degree of correlation between them having a direct influence on the option price. For quantos such as guaranteed exchange rate options, or differential swaps, the correlation effect is the extent to which there is a relationship between movements in the underlying and movements in the ex-change rate, which has a secondary effect on the price of the option. (3) Correlation between markets is also used to offset an option position in one market against another with similar direction and volatility. Such a strategy might be used to reduce cost – to avoid hedging the positions separately, or because implied volatility in the second market is lower – or because hedging is difficult in the first market. Correlation can be estimated historically (like volatility) but tends to be unstable, and historic estimations may be poor predictors of future realized correlations. / , например, . Под Корреляцией, от позднелатинского слова Correlatio, означающее Соотношение, понимается взаимная связь, взаимозависимость, соотношение предметов или понятий. В математической статистике, под корреляцией предполагается вероятностная или статистическая зависимость. Под Корреляцией понимается вероятностная или статистическая зависимость. В отличие от функциональной зависимости корреляция возникает тогда, когда зависимость одного из признаков от другого осложняется наличием случайных факторов. Используется для установления статистических и вероятностных закономерностей в физике, химии, технике; применяется также в теории вероятностей, кибернетике и так далее.

CORRESPONDENCE CHECK = СООТВЕТСТВУЮЩИЙ (или КОРРЕСПОНДЕНТСКИЙ) ЧЕК – Correspondence Check is a check provided with a separate tearsheet designed for writing messages to the recipient or beneficiary.

CORRESPONDENT = КОРРЕСПОНДЕНТ – Correspondent is a securities firm, bank or other financial organization that regularly performs services for another in a place or market to which the other does not have direct access. Securities firms may have correspondents in foreign countries or on exchanges of which they are not members. Correspondents are frequently linked by private wires. Member organizations of the New York Stock Exchange with offices in New York City may also act as correspondents for out-of-town member organizations that do not maintain New York offices.

CORRESPONDENT BANK = БАНК КОРРЕСПОНДЕНТ – (1) Correspondent Bank is a bank that accepts deposits of, and performs services for, another bank (called a Respondent Bank); in most cases, the two banks are in different cities. In a SWIFT message, Receiver's Correspondent and Sender's Correspondent. The foreign banks representative who regularly performs services for a bank which has no branch in the relevant center, e.g., to facilitate the transfer of funds. In the United States, this often occurs domestically due to inter state banking restrictions. A bank that, in its own country, handles the business of a foreign bank. Correspondent Bank is a financial institution that provides services on behalf of another, equal or unequal, financial institution. A correspondent bank can conduct business transactions, accept deposits and gather documents on behalf of the other financial institution. Correspondent banks are more likely to be used to conduct business in foreign countries, and act as a domestic bank's agent abroad. Correspondent banks are used by domestic banks in order to service transactions originating in foreign countries, and act as a domestic bank's agent abroad. This is done because the domestic bank may have limited access to foreign financial markets, and cannot service its client accounts without opening up a branch in another country. Credit institution acting as agent for a bank in a banking center where the latter is not represented. / , например, . Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Банк Корреспондент – банк, с которым уполномоченным банком установлены корреспондентские отношения с открытием корреспондентского(их) счёта(ов) (корреспондент со счётом) или без открытия корреспондентских счетов (корреспондент без счёта).

(2) When a transaction is initiated at a foreign branch of a bank, the home branch to which the instructions are sent is known as the Correspondent Bank.

CORRESPONDENT BANKING = КОРРЕСПОНДЕНТСКОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ – Correspondent Banking:- in bilateral correspondent banking arrangements, two financial institutions handle the sorting and processing of payments themselves,

without involving an intermediary. The term ‘Correspondent Banking Arrangements’ typically refers to arrangements in which two financial institutions employ a third party – a separate financial institution known as a ‘Correspondent’ or ‘Service-Providing’ Bank. One or both institutions forward payment instructions to the service-providing bank to sort and process. The service-providing bank holds on its books an account for each bank for which it provides correspondent banking services. The serviceproviding bank regards this as a ‘vostro’ or ‘loro’ account, while the customer bank considers it a ‘nostro’ account. Banks generally provide services to a number of fi nancial institutions, and these relationships are governed by contracts negotiated bilaterally. Correspondent banking relationships are also a well-established means of making cross-border payments. The chart (below) shows the settlement of a payment from Bank A to Bank C via a correspondent bank. Since Banks A and C do not hold accounts with each other, they use a third party, Bank B (the service-providing bank), which holds accounts for both Bank A and Bank C. In principle, there could be further banks involved on the sending and receiving sides (as intermediaries in a correspondent banking chain). The rules governing Bank A’s account with Bank B are based on a bilateral agreement. Normally, Bank A will need to have funds available in its account with Bank B for the latter to execute payments for the former. In some cases, the service-providing bank may also extend intraday and/or longer-term credit to its customer bank – again subject to a bilateral agreement. As a rule, correspondent payments are handled on a gross basis. Historically, correspondent banking arrangements were the most common form of settlement for non-cash interbank payments, both at the national level and across borders. The importance of correspondent banking has diminished in certain areas following the establishment of payment systems for the settlement of domestic payments, the development of integrated Euro payment systems and, more recently, the setting-up of payment-versus-payment (PvP) systems for the simultaneous settlement of foreign exchange transactions. Nevertheless, correspondent banking remains a key way for institutions to access payment systems as indirect participants (i.e. with a direct participant – the service-providing bank – acting on their behalf) or to settle non-standardised transactions related to international trade financing (e.g., letters of credit) which cannot be handled within payment systems. Xxxxx. Correspondent Banking Arrangements are agreements or contractual relationships between banks to provide payment services for each other. Correspondent banking relationships play an important role in the processing of payment transactions in Euro. They ensure payments flow between credit institutions, as well as allowing indirect access to payment systems, thereby representing an important link in the payment chain. Box 1 recalls some key concepts in correspondent banking. The Eurosystem has conducted surveys on correspondent banking business since 1999 in order to monitor its importance, size and development. Previous surveys have confirmed that, in the Euro area, the payment transactions flowing through such arrangements are significant when compared with the value of payment transactions processed by large-value payment systems and retail payment systems. In 2010, for instance, the daily average turnover of correspondent banking transactions reported by the service-providing banks that took part in the 2010 survey amounted to €995 billion, while the average daily turnover of payments in large-value payment systems and retail payment systems was €3,275 billion and €73 billion respectively. Correspondent banking services have been within the scope of the Eurosystem’s oversight activity since the establishment of the European Central Bank (ECB), given their relevance for the smooth functioning of payment systems. While reports on previous surveys were only distributed to the banks participating, the Eurosystem decided to publish this report on the eighth survey, conducted in 2012, in order to increase transparency in its oversight activities with regard to correspondent banking and to share the results of the survey with other interested market participants, as well as other authorities and the general public. As agreed with the banks participating, the current report does not disclose any individual bank’s data, nor does it disclose any country-specific data, in order to ensure the anonymity of the banks reporting. Correspondent Banking:- an arrangement under which one bank provides payment and other services to another. Payments through correspondents are often executed through reciprocal accounts (nostro and loro accounts), to which standing credit lines may be attached. Correspondent banking services are primarily provided across international borders. Correspondent Banking Relationships play an important role in the processing of payment transactions in Euro. They ensure that payments flow between credit institutions, as well as allowing indirect access to payment systems, thereby representing an important link in the payment chain. Given their relevance for the smooth functioning of payment systems, correspondent banking services have been within the scope of the Eurosystem’s oversight activity since the establishment of the ECB. The Eurosystem has conducted surveys on correspondent banking business since 1999 in order to monitor its importance, size and development. Participation in the surveys has always been voluntary. In principle, those banks invited to take part have been the largest in terms of general business size (based, for example, on such indicators as the size of the balance sheet, staff numbers and the size of the branch network) and/or known to be very active in providing payment services. The most recent survey (the eighth) was conducted in March 2012 and only covered banks with a daily turnover on loro accounts of at least €1 billion (24 banks located in nine Euro area countries). Since correspondent banking business in Euro is highly concentrated among the largest banks in the Euro area, the surveys are likely to have covered a very high proportion of all correspondent banking business. However, it is acknowledged that nostro account turnover may have been underrepresented, as the largest banks mostly manage loro accounts in bilateral relationships. This report presents the outcome of the eighth survey and provides some risk and policy considerations involving the regulatory framework that applies to correspondent banking. While reports on previous surveys were only distributed to the banks taking part, the Eurosystem has decided to publish this report in order to increase transparency in its oversight activities with regard to correspondent banking and to share the results of the survey with other interested market participants, as well as other authorities and the general public. The results of the eighth correspondent banking survey confirmed that correspondent banking remains an important channel for effecting payments in Euro. As in previous surveys, both the number and value of payments processed by correspondent banks were very large. For instance, the total daily turnover of Euro transactions settled through correspondent banking arrangements averaged more than €1.1 trillion (the loro transactions of the banks surveyed). However, most payments originated through correspondent banking arrangements are settled through payment systems, while payments processed solely through correspondent banking arrangements represent almost 11% of the total value (and over 1% of the total volume) of payments processed by the banks surveyed. The growth in loro turnover in 2012 follows a sharp contraction in 2010 and was primarily a result of the wholesale correspondent banking segment increasing in size. In terms of value, the wholesale correspondent banking segment is much larger than the retail correspondent banking segment. Moreover, the decrease in the volume of loro transactions in 2012 confirms the trend already witnessed in previous surveys of an outward movement of retail payments towards payment systems. The survey has also confirmed the growing concentration in correspondent banking business. This warrants the attention of payment system overseers, as the default of one of the larger and most interconnected correspondent banks might quickly trigger a domino effect on their respective customer banks and/or service-providing banks, as well as the risk of spillover to interdependent payment systems. Besides operational risk, liquidity and credit risks also pose a significant threat in correspondent banking business, with intraday credit exposures normally being uncollateralised. Risks in correspondent banking are relevant for both the prudential supervision of banks and the oversight of payment systems. Although the perspective of payment system overseers is traditionally somewhat different from that of banking supervisors, their objectives are closely interrelated. The Eurosystem has not introduced specific oversight requirements for correspondent banks so as to avoid any double regulation of banks. It has instead relied on banking supervision, working together with supervisors at various levels (European, global and national). The Eurosystem considers this cooperation between Eurosystem central banks and euro area banking supervisors to be worthwhile and therefore expects it to continue, with the aim of ensuring that risks in correspondent banking are consistently and uniformly covered in the Euro area. The prospective transfer of

supervision of Euro area credit institutions to the ECB may further facilitate such close cooperation. / Корреспондентские отношения – это традиционная форма банковских связей, которая используется в основном при обслуживании внешней торговли и включает совокупность всех возможных форм сотрудничества между банками. Увеличение объёмов международных банковских операций, расширение их видов из-за одновременного увеличения рисков с подобными операциями вызвали изменение традиционных взглядов на корреспондентские отношения. Если прежде банки отводили корреспондентским отношениям второстепенную, сугубо техническую роль, то ныне они рассматриваются банками как один из инструментов снижения рисков и, что более важно, как источник получения дополнительной прибыли. Под корреспондентскими отношениями в их современном значении следует понимать отношения, которые опосредствуют проводки между банками взаимных операций, которые они осуществляют по доверенности своих клиентов и от собственного имени. Понятие 'корреспондентские отношения' включает формы, методы и условия осуществления операций и порядок их проводки. Итак, понятие 'корреспондентские отношения' сегодня вышло за традиционные рамки только договорённости между банками о порядке осуществления взаимных операций и распространилось практически на все сферы банковской деятельности, в том числе на широкий комплекс межбанковских взаимоотношений, работу по усовершенствованию практики международных расчётов, качество банковского обслуживания клиентуры, которые являются базой для трансферта средств (валютных переводов) для небольших банков и возможность получения операционных услуг на основных финансовых рынках и кредитные линии для поддержания своих документальных операций. Для больших банков корреспондентские отношения создают возможность доступа к ресурсам региональных денежных и финансовых рынков. Корреспондентская сеть является относительно менее дорогой для банков, чем организационно-институционная форма проникновения банков в форме заграничного филиала и дочернего банка за границей, хотя её поддержание тоже не является дешевым. Корреспондентские отношения можно рассматривать с двух сторон:- когда открывается ностро-счёт и когда открывается лоро-счёт. Ностро-счёт для одного банка, а действие другого банка, в котором открывается такой счёт, является лоро-счётом. Ностро, от Латинского слова, означающее Наш. Такой счёт может быть номинирован в трёх типах валют:- (i) в валюте иностранного государства, в котором открыт этот счёт; (ii) в валюте третьей страны; и (iii) в отечественной валюте банка, которому принадлежит этот счёт. Записи по ностро-счёту отображаются:- (i) когда фактически поступают валютные средства (сообщение о кредитовании своего счёта от иностранного банка-содержателя этого счёта); и (ii) когда он производит платёж в иностранной валюте по этому счёту (присылает соответствующее сообщение в банк-содержатель счёта с требованием дебетовать этот счёт в пользу третьего лица). Вместе с тем банк – владелец счёта будет рассчитывать в отечественной валюте эквивалент такой операции и будет делать соответствующие записи для своей официальной финансовой отчётности. В связи с этим ностро-счёт также имеет название двухвалютный счёт. Ностро-счета открываются:- (i) в странах, валюты которых необходимы для торговой деятельности инвалютных торговцев самого банка на ФОРЭКСном и денежных рынках; и (ii) в тех странах, в валютах которых клиенты банка должны выполнять платежи и получать поступления. Как правило, банки не имеют желания открывать лишние ностро-счета, по крайней мере более чем это необходимо ему для предоставления услуг. Содержание счёта лоро:- Лоро (от Латинского слова Loro, означающее Их) – это депозиты по требованию этого банка, а доходы от их использования (денежный ресурс в виде процентного спрэда плюс комиссионные за операции, которые проводятся с этими счетами), как правило, превышают расходы банка получателя операционных услуг, связанных с таким счётом. Депозитные счета 'по требованию' имеют разные названия и некоторые различия в наполнении толкования в разных странах:- 'due to' (США) депозиты по требованию, которые поддерживаются иностранным банком-корреспондентом в отечественном банке; 'vostro' (ваш) поддерживаются иностранным банком в банке-резиденте в местной валюте или в валюте третьей страны, или даже в национальной валюте иностранного банка. Например, долларовый счёт Лойдз Бэньк (Lloyds Bank), который поддерживает там какой-то Российский банк, счета в Долларах коммерческих банков России, которые поддерживаются в его книгах. Крупные банки поддерживают лоро-счета многих иностранных банков со всего мира. С открытием счетов лоро можно зафиксировать начало межбанковских корреспондентских отношений. Такие счета полезные не только для банков-владельцев, но и для коммерческих банков, которые их поддерживают. При этом, имея такой счёт, первые банки-корреспонденты могут осуществлять прямые платежи в пользу других стран, получать поступления в иностранной валюте, проводить расчёты с траттами в отношении открытых аккредитивов. Технически открыть такие счета в ведущих банках не тяжело. Лоро-счета чаще всего являются прибыльными для банка, где они открыты и где они поддерживаются, поскольку дают возможность привлекать налоговые ресурсы и получать доходы в виде комиссионных за осуществление расчётов. Кроме того, наличие большой сети лоро-счетов является не только прибыльным, но и полезным, учитывая использование при выборе маршрута прохождения платежа и его оптимизации. Например, когда установленные корреспондентские отношения с ведущими банками развитых стран, которые имеют разветвленную географическую структуру корреспондентской сети, число их корреспондентов по обыкновению измеряется тысячами. Корреспондентские отношения могут устанавливаться с открытием счёта и без его открытия. Когда, корреспондентские отношения устанавливаются без открытия соответствующих счетов, по договорённости между банками, расчётные операции отображаются на счетах, открытых в других банках-корреспондентах данного банка или в банка на имя других банков-корреспондентов. Это, как правило, связано с дополнительными сложностями:- требуются дополнительные гарантии, расчёты проводятся с использованием третьих банков, которые ведут к задержкам в осуществлении платежей и к увеличению комиссионных и почтово-телеграфных расходов. Установление корреспондентских отношений между двумя банками с открытием корреспондентского счёта предусматривает заключение корреспондентского соглашения (корреспондентский договор или договор об установлении корреспондентских отношений). Это, в свою очередь, означает, что банки, обменявшись контрольными документами (альбомами образцов подписей лиц, уполномоченных подписывать банковскую документацию, ключом для идентификации телеграфной переписки или SWIFT-ключами), выполняют разнообразные операции по доверенности друг друга в пределах установленных лимитов на проводку тех или иных операций. Корреспондентский договор – соглашение между двумя или несколькими кредитными учреждениями об осуществлении платежей и расчётов по доверенности и за счёт другого. Корреспондентским соглашением, которое предусматривает открытие банками счетов один в другом, определяются:- (i) вид и валюта, в которой приоткрывается счёт, порядок начисления процентов, возможность перевода средств со счетов в другие страны, право конверсии на счетах в другую валюту; перечень поступлений и платежей, которые могут осуществляться со счетами; возможность получения и предоставление кредита в форме овердрафта или в другой форме; лимит такого кредита и защитное предостережение относительно сальдо счетов и другое; (ii) перечень учреждений и филиалов банка, которым предоставляется право осуществлять операции со счетами с указанием их точного адреса, номеров телексов и других необходимых данных (в России, например, осуществления операций с дебетом счёта (списание средств) имеет право лишь главный офис, через который осуществляются операции клиентов всех филиалов, а при зачислении средств филиала самостоятельно определяют банк-корреспондент, на счёт в котором необходимо осуществить зачисление средств); (iii) формы и порядок расчётов (порядок открытия, авизует, подтверждение и выполнение аккредитивов, условия рамбурсирование, порядок осуществления инкассовых и других расчётных операций); (iv) порядок взыскания комиссионного вознаграждения и возмещение почтовых, телеграфных и других расходов; (v) каналы связи:- по обыкновению основным каналом обмена информации является SWIFT,

дополнительным – телекс, поскольку последний менее безопасный и быстрый, а потому служит альтернативным и используется в исключительных случаях; и другие вопросы, которые представляют общий интерес. В предусмотренные договором сроки банки-корреспонденты совместно проверяют записи на корреспондентских счетах. По необходимости для удобства расчётов банки-корреспонденты открывают друг другу корреспондентские счета в разнообразных валютах. Банкам, с которыми установленны корреспондентские отношения, предоставляется альбом образцов подписей сотрудников, уполномоченных подписывать документы и корреспонденцию от лица банка, другие необходимые контрольные документы, такие, например, как устав банка, лицензия на осуществление банковских операций, учредительный договор, свидетельство о регистрации, справка о регистрации как налогоплательщика. На каждый банк, с которым установленны корреспондентские отношения, ведётся досье, или, как официально называется, юридическое дело. В нём сохраняются подлинные (первые) экземпляры распоряжений о порядке расчётов с банком-корреспондентом, соглашения об установлении корреспондентских отношений, разнообразная финансовая отчётность, предоставленная корреспондентами один другому на взаимной основе, другие документы и письма, которые касаются отношений с данным банком.

CORRESPONDENT CENTRAL BANKING MODEL = МОДЕЛЬ КОРРЕСПОНДЕНТСКОГО ОБСЛУЖИВАНИЯ ЦЕНТРАЛЬНЫХ БАНКОВ – Correspondent Central Banking Model (CCBM) is a mechanism established by the European System of Central Banks (ESCB) to enable counterparties to obtain credit from the central bank of the country in which they are based using collateral held in another country. In the CCBM, an NCB acts as custodian for the other NCBs with regard to the securities held in its domestic securities settlement system (SSS).

CORROSION = КОРРОЗИЯ (или РАЗЪЕДАНИЕ) – (1) Corrosion:- in Latin, Corrodere. Destruction of materials. When applied to metals this is an electrochemical process that can, in particular, be promoted by a good electrolyte (sea water). / Под Коррозией, от Латинского слова Корродэрэ (Corrodere) и от позднелатинского слова Коррозио (Corrosio), означающее Разъедание, понимается самопроизвольное разрушение твёрдых тел, вызванное химическими и электро-химическими процессами, развивающимися на поверхности тела при его взаимодействии с внешней средой. Особенный ущерб предприятиям и экономике приносит коррозия металлов. Самым распространённым видом коррозии является ржавление железа, в результате которого ежегодно теряется приблизительно 10% общего количества выплавляемых чёрных металлов. Процесс коррозии можно замедлить или практически устранить за счёт нанесения защитных покрытий, например, лакокрасочных; введения в среду ингибиторов, например, арсенитов, нитритов или хроматитов; и применения коррозионностойких материалов. Коррозионному разрушению подвержены также бетон, дерево, некоторые пластмассы, строительный камень и другие материалы.

(2) Corrosion is the decay and loss of a metal due to a chemical reaction between the metal and its environment. It is a transformation process in which the metal passes from its elemental form to a combined (or compound) form. Corrosion is the atmospheric oxidation of metals. That means that oxygen combines with the metal and forms a new layer. This layer can be good or bad. By far the most important form of corrosion is the rusting of iron and steel. Rusting is a process of oxidation in which iron combines with water and oxygen to form rust, the reddish-brown crust that forms on the surface of the iron. Because iron is so widely used, e.g., in building construction and in tools, its protection against rusting is important. Rusting can be prevented by excluding air and water from the iron surface, e.g., by painting, oiling, or greasing, or by plating the iron with a protective coating of another metal. Many alloys of iron are resistant to corrosion. Stainless steels are alloys of iron with such metals as chromium and nickel; they do not corrode because the added metals help form a hard, adherent oxide coating that resists further attack. Although metals like aluminum, chromium, and zinc corrode more readily than iron, their oxides form a coating that protects the metal from further attack. Rust is brittle and flakes off the surface of the iron, continually exposing a fresh surface. Thus these metals might be a better selection choice for a product that will be exposed to rusting conditions, like water and air. / Под Коррозией (металлов), от позднелатинского слова Corrosio, означающее Разъедание, от Латинского слова Corrodo, означающее Грызу, понимается разрушение металлов вследствие химического или электрохимического взаимодействия их с внешней (коррозионной) средой. В результате коррозии ежегодно теряется от 1 до 1.5% всего металла, накопленного и эксплуатируемого человечеством. В денежном выражении прямые потери от коррозии (на воспроизводство и замену вышедшего из строя оборудования) составили, по примерной оценке, в США за 1955 около 5.5 миллиардов Долларов, во Франции за 1959 около 250 миллиардов Франков. В бывшем СССР в конце 1960-х они были не ниже 5–6 миллиардов Рублей в год. Трудно учесть более высокие косвенные потери от простоев и снижения производительности оборудования, подвергшегося коррозии, от нарушения нормального хода технологических процессов, от аварий, обусловленных снижением прочности металлических конструкций, и тому подобного. В народном хозяйстве всё шире применяются всевозможные средства и методы борьбы с коррозией (смотрите Антикоррозионная Защита). Причина Коррозии:- термодинамическая неустойчивость системы, состоящей из металла и компонентов окружающей (коррозионной) среды. Мерой термодинамической неустойчивости является свободная энергия, освобождаемая при взаимодействии металла с этими компонентами. Но свободная энергия сама по себе ещё не определяет скорость коррозионного процесса, то есть величину, наиболее важную для оценки коррозионной стойкости металла. В ряде случаев адсорбционные или фазовые слои (плёнки), возникающие на поверхности металла в результате начавшегося коррозионного процесса (смотрите Пассивирование Металлов), образуют настолько плотный и непроницаемый барьер, что коррозия прекращается или очень сильно тормозится. Поэтому в условиях эксплуатации металл, обладающий большим сродством к кислороду, может оказаться не менее, а более стойким (так, свободная энергия образования окисла у Cr или Al выше, чем у Fe, а по стойкости они часто превосходят Fe). Коррозионные процессы классифицируют:- (а) по виду (геометрическому характеру) коррозионных разрушений на поверхности или в объёме металла; (б) по механизму реакций взаимодействия металла со средой (химическая и электрохимическая коррозия); (в) по типу коррозионной среды; и (г) по характеру дополнительных воздействий, которым подвергается металл одновременно с действием коррозионной среды. Виды Коррозионных Разрушений:- коррозия, захватившая всю поверхность металла, называется Сплошной Коррозией. Её делят на Равномерную и Неравномерную в зависимости от того, одинакова ли глубина коррозионного разрушения на разных участках. При Местной Коррозии поражения локальны и оставляют практически незатронутой значительную (иногда подавляющую) часть поверхности. В зависимости от степени локализации различают коррозионные пятна, язвы и точки (питтинг). Точечные поражения могут дать начало Подповерхностной Коррозии. распространяющейся в стороны под очень тонким (например, наклёпанным) слоем металла, который затем вздувается пузырями или шелушится. Наиболее опасные виды местной коррозии – Межкристаллитная (Интеркристаллитная), которая, не разрушая зёрен металла, продвигается вглубь по их менее стойким границам, и Транскристаллитная, рассекающая металл трещиной прямо через зёрна. Почти не оставляя видимых следов на поверхности, эти поражения могут приводить к полной потере прочности и разрушению детали или конструкции. Близка к ним по характеру Ножевая Коррозия, словно ножом разрезающая металл вдоль сварного шва при эксплуатации некоторых сплавов в особо агрессивных растворах. Иногда специально выделяют Поверхностную Нитевидную Коррозию, развивающуюся, например, под неметаллическими покрытиями, и Послойную Коррозию, идущую преимущественно в направлении пластической деформации. Специфична Избирательная Коррозия, при которой в сплаве могут избирательно растворяться даже отдельные компоненты

твёрдых растворов (например, обесцинкование латуней). Химическая И Электрохимическая Коррозии:- коррозия является химической, если после разрыва металлической связи атомы металла непосредственно соединяются химической связью с теми атомами или группами атомов, которые входят в состав окислителей, отнимающих валентные электроны металла. Химическая коррозия возможна в любой коррозионной среде, однако чаще всего она наблюдается в тех случаях, когда коррозионная среда не является электролитом (газовая коррозия, коррозия в неэлектропроводных органических жидкостях). Скорость её чаще всего определяется диффузией частиц металла и окислителя через поверхностную плёнку продуктов коррозии (высокотемпературное окисление большинства металлов газами), иногда – растворением или испарением этой плёнки (высокотемпературное окисление W или Mo), её растрескиванием (окисление Nb при высоких температурах) и изредка – конвективной доставкой окислителя из внешней среды (при очень малых его концентрациях). Коррозия является электрохимической, если при выходе из металлической решётки образующийся катион вступает в связь не с окислителем, а с другими компонентами коррозионной среды; окислителю же передаются электроны, освобождающиеся при образовании катиона. Такой процесс возможен в тех случаях, когда в окружающей среде существуют два типа реагентов, из которых одни (сольватирующие или комплексообразующие) способны соединяться устойчивыми связями с катионом металла без участия его валентных электронов, а другие (окислители) могут присоединять валентные электроны металла, не удерживая около себя катионы. Подобными свойствами обладают растворы или расплавы электролитов, где сольватированные катионы сохраняют значительную подвижность. Таким образом, при электрохимической коррозии удаление атома из металлической решётки (что составляет суть любого коррозионного процесса) осуществляется в результате двух независимых, но сопряжённых, связанных между собой электрическим балансом, электрохимических процессов:- (i) анодного – переход сольватируемых катионов металла в раствор, и (ii) катодного – связывание окислителем освобождающихся электронов. Отсюда следует, что процесс электрохимической коррозии можно замедлить не только путём непосредственного торможения анодного процесса, но также воздействуя на скорость катодного. Наиболее распространены два катодных процесса:- (i) разряд водородных ионов ($2e + 2H^+ = H_2$) и (ii) восстановление растворённого кислорода ($4e + O_2 + 4H^+ = 2H_2O$ или $4e + O_2 + 2H_2O = 4OH^-$), которые часто называют соответственно Водородной и Кислородной Деполяризацией. Анодный и катодный процессы с той или иной вероятностью и в той или иной последовательности протекают в любых точках металлической поверхности, где катионы и электроны могут взаимодействовать с компонентами коррозионной среды. Если поверхность однородна, то катодные и анодные процессы равновероятны по всей её площади; в таком идеальном случае коррозию называют Гомогенно-Электрохимической Коррозией (отмечая таким образом отсутствие какой-либо неоднородности в распределении вероятности электрохимических процессов в любой точке поверхности, что, конечно, не исключает термодинамической гетерогенности взаимодействующих фаз). В действительности на металлических поверхностях существуют участки с различными условиями доставки реагирующих компонентов, с разным энергетическим состоянием атомов или с различными примесями. На таких участках возможно более энергичное протекание либо анодного, либо катодного процессов, и коррозия становится гетерогенно-электрохимической. Проводимость металла очень высока, и при возникновении избыточного заряда электроны практически мгновенно перераспределяются, так что плотность заряда и электрический потенциал металла меняются одновременно по всей его поверхности независимо от того, в каких её точках электроны освободились после ухода катионов, а в каких захватываются окислителем. В частности, это означает, что от мест, где преимущественно осуществляется анодная реакция, электроны перемещаются в металле к местам протекания катодной. Соответственно раствор вблизи анодных участков принимает избыточный положительный заряд растворившихся катионов, а вблизи катодных заряжается отрицательно в результате захвата электронов растворённым окислителем. В растворе эти заряды не перераспределяются так легко, как в металле. Поэтому с повышением скорости процесса потенциал раствора в непосредственной близости от анодных участков становится всё более положительным, что затрудняет дальнейший выход из металла положительно заряженных катионов, а вблизи катодных участков – более отрицательным, что затрудняет катодный процесс. Иначе это можно представить, как вызванное протеканием тока омическое падение напряжения между прианодным и прикатодным слоями раствора, с учётом которого потенциал металла по отношению к прианодному слою оказывается несколько более отрицательным, а по отношению к прикатодному – более положительным, чем по отношению к объёму раствора. В случаях, когда такое омическое падение напряжения велико (очень высокая плотность тока, низкая электрическая проводимость раствора, большое взаимное удаление катодных и анодных участков), коррозионную систему удобнее представить в виде системы короткозамкнутых микро- или макрогальванических элементов. В остальных случаях при определении средней по площади скорости растворения металла современная теория наряду с такой моделью позволяет также представлять электрохимически гетерогенную поверхность как квазигомогенную. Тогда ей приписывают удельные анодные и катодные характеристики, равные интегрально усреднённым по площади значениям одноимённых характеристик моделируемой гетерогенной поверхности, и графически изображают их на коррозионной диаграмме в виде анодных и катодных поляризационных кривых. Эти кривые показывают, как влияет электродный потенциал на усреднённые по площади и выраженные в единицах (или логарифмах) плотности тока скорости выхода катионов и электронов с данной поверхности в данный электролит. Диаграмма может быть очень сложной, так как в реальных системах на форму кривых могут влиять многие факторы, в том числе диффузия окислителя или переходящих в раствор катионов, пассивация металла и различные нарушения пассивного состояния (смотрите Пассивирование Металлов). Анодный и катодный процессы, как было отмечено выше, связаны электрическим балансом. Электроны, оставляемые уходящими катионами, сообщают металлу отрицательный заряд, который затрудняет выход катионов в раствор, но одновременно ускоряет катодный процесс. Последний, в свою очередь, способствуя уменьшению отрицательного заряда металла, самозатормаживается, но облегчает протекание анодной реакции. Таким образом, происходит саморегулирование заряда металлической поверхности, являющееся одним из важных элементов механизма установления стационарного потенциала коррозии ($j_{ст}$), при котором катодная (K) и анодная (A) поляризационные кривые пересекаются (точка S). Хотя скорость электрохимической коррозии и зависит от потенциала, однако связь эта далеко неоднозначна, что можно видеть на следующем примере. Если при неизменных анодных характеристиках (кривая A) на поверхности металла появляются дополнительные активные катоды, то вызванное ими облегчение катодного процесса (описываемого теперь кривой K″) может привести к ускорению растворения металла (до тех пор, пока не будет достигнута плотность тока $i^*_{ст}$) со сдвигом потенциала в положительном направлении (до $j^*_{ст}$). Наоборот, при неизменных катодных характеристиках (кривая K) и появлении дополнительных анодных участков (что соответствует протеканию процесса, описываемого кривой A″) коррозия ускоряется (до $i^{**}_{ст}$) со сдвигом потенциала в отрицательную сторону (до $j^{**}_{ст}$). Однако при пропорциональном облегчении обоих процессов (кривые A″ и K″) значительное ускорение коррозии (до $i^{***}_{ст}$) возможно без изменения потенциала. Более сложные случаи наблюдаются при пассивации, а также нарушениях пассивного состояния. Коррозия В Различных Средах; Влияние Дополнительных Факторов (Воздействий):- некоторые коррозионные среды и вызываемые ими разрушения столь характерны, что по названию этих сред классифицируются и протекающие в них коррозионные процессы. Так, выделяют Газовую Коррозию, то есть Химическую Коррозию под действием горячих газов (при температуре много выше точки росы). Характерны некоторые случаи Электрохимической Коррозии (преимущественно с катодным восстановлением кислорода) в природных средах:- Атмосферная Коррозия – в чистом или

загрязнённом воздухе при влажности, достаточной для образования на поверхности металла плёнки электролита (особенно в присутствии агрессивных газов, например, CO_2, Cl_2, или аэрозолей кислот, солей и тому подобного); Морская Коррозия – под действием морской воды и Подземная Коррозия – в грунтах и почвах. Коррозия под напряжением развивается в зоне действия растягивающих или изгибающих механических нагрузок, а также остаточных деформаций или термических напряжений и, как правило, ведёт к транскристаллитному коррозионному растрескиванию, которому подвержены, например, стальные тросы и пружины в атмосферных условиях, углеродистые и нержавеющие стали в паросиловых установках, высокопрочные титановые сплавы в морской воде и так далее. При знакопеременных нагрузках может проявляться Коррозионная Усталость, выражающаяся в более или менее резком понижении предела усталости металла в присутствии коррозионной среды. Коррозионная Эрозия (или Коррозия При Трении) представляет собой ускоренный износ металла при одновременном воздействии взаимно усиливающих друг друга коррозионных и абразивных факторов (трение скольжения, поток абразивных частиц и тому подобное). Родственная ей Кавитационная Коррозия возникает при кавитационных режимах обтекания металла агрессивной средой, когда непрерывное возникновение и ‘захлопывание’ мелких вакуумных пузырьков создаёт поток разрушающих микрогидравлических ударов, воздействующих на поверхность металла. Близкой разновидностью можно считать и Фреттинг-Коррозию, наблюдаемую в местах контакта плотно сжатых или катящихся одна по другой деталей, если в результате вибраций между их поверхностями возникают микроскопические Смещения Сдвига. Утечка электрического тока через границу металла с агрессивной средой вызывает в зависимости от характера и направления утечки дополнительные анодные и катодные реакции, могущие прямо или косвенно вести к ускоренному местному или общему разрушению металла (Коррозия Блуждающим Током). Сходные разрушения, локализуемые вблизи контакта, может вызвать соприкосновение в электролите двух разнородных металлов, образующих замкнутый гальванический элемент, – Контактная Коррозия. В узких зазорах между деталями, а также под отставшим покрытием или наростом, куда проникает электролит, но затруднён доступ кислорода, необходимого для пассивации металла, может развиваться Щелевая Коррозия, при которой растворение металла в основном происходит в щели, а катодные реакции частично или полностью протекают рядом с ней на открытой поверхности. Принято выделять также Биологическую Коррозию, идущую под влиянием продуктов жизнедеятельности Бактерий и других организмов, и Радиационную Коррозию – при воздействии радиоактивного излучения. Количественная Оценка Коррозии:- скорость общей коррозии оценивают по убыли металла с единицы площади (К), например, в граммах на квадратный метр-час (г/м^2·ч), или по скорости проникновения коррозии, то есть по одностороннему уменьшению толщины нетронутого металла (П), например, в миллиметрах в год (мм/год). При равномерной коррозии $П = 8.75К/r$, где r – плотность металла в граммах на кубический сантиметр (г/см^3). При неравномерной и местной коррозии оценивается максимальное проникновение. По ГОСТу 13819–68 установлена 10-балльная шкала общей коррозионной стойкости. В особых случаях коррозия может оцениваться и по другим показателям (потеря механической прочности и пластичности, рост электрического сопротивления, уменьшение отражательной способности и так далее), которые выбираются в соответствии с видом коррозии и назначением изделия или конструкции. При подборе материалов, стойких к воздействию различных агрессивных сред в тех или иных конкретных условиях, пользуются справочными таблицами коррозионной и химической стойкости материалов или проводят лабораторные и натурные (непосредственно на месте и в условиях будущего применения) коррозионные испытания образцов, а также целых полупромышленных узлов и аппаратов. Испытания в условиях, более жёстких, чем эксплуатационные, называют Ускоренными Испытаниями. Коррозия металлов – разрушение металлов вследствие химического или электрохимического взаимодействия их с внешней (коррозионной) средой. Коррозию металлов классифицируют:- (i) по геометрическому характеру коррозионных разрушений, например, избирательная, межкристаллитная, подповерхностная, сплошная; (ii) по характеру взаимодействия металла со средой – химическая, протекающая в средах, не проводящих электрический ток (газы, нефть и так далее), и электрохимическая – в водных растворах электролитов; (iii) по типу коррозионной среды (например, атмосферная, газовая); (iv) по характеру дополнительных воздействий, которым подвергается металл одновременно с действием коррозионной среды, например, контактная коррозия, коррозия под напряжением, коррозия при трении, фреттинг-коррозия. В результате коррозии изделия теряют свои свойства вплоть до полного разрушения материала. Для предотвращения коррозии в металлы вводят компоненты, устойчивые к коррозии (так получают, например, специальные стали – нержавеющие, коррозионностойкие), наносят на поверхность металла защитные покрытия на основе других металлов (никелирование, хромирование и тому подобное), применяют окраску изделий и так далее.

(3) The Corrosion of a reinforcement mainly depends on the geometrical (cover thickness) and physical (porosity) of the covering concrete. It also depends on the aggressiveness of its environment, particularly when those geometrical or physical properties do not meet the requirements. A reinforced concrete structures is designed and built for a given service life, which is defined by the designer and is controlled by the manufacturer. For this period of time, the structure should not be so deteriorated that it does not fulfill any more its functions. The deterioration of reinforced concrete is mainly due to reinforcement corrosion The mechanism of this deterioration is to be reminded. Reinforcements corrode when they are in contact with a high amount of aggressive agents. This is the reason why, the prevention of reinforcement corrosion, in structures to be built, is obtained mainly by controlling the thickness and the quality of the concrete cover. The most important parameters, which induce reinforcement corrosion, are the cover thickness and the quality of concrete, as well as the aggressiveness of the environment. / пористость или рыхлость (porosity). Коррозия бетона и железобетона – разрушение бетона и железобетона под действием агрессивной внешней среды главным образом в результате фильтрации воды и водных растворов через бетон и их взаимодействия с компонентами бетона и арматуры. Способы защиты:- выбор стойких материалов (цементов, заполнителей), применение бетонов повышенной плотности, увеличение водонепроницаемости и стойкости бетона в агрессивной среде введением воздухововлекающих и гидрофобно-пластифицирующих добавок, нанесением лакокрасочных покрытий, пропиткой полимерами, увеличением толщины защитного слоя у арматуры, обмазкой арматуры защитными составами.

CORROSION INHIBITOR = ИНГИБИТОР КОРРОЗИИ (или ЗАМЕДЛИТЕЛЬ КОРРОЗИИ) – Corrosion Inhibitor is an additive for protecting lubricated metal surfaces against chemical attack by water or other contaminants. There are several types of corrosion inhibitors. Polar compounds wet the metal surface preferentially, protecting it with a film of oil. Other compounds may absorb water by incorporating it in a water-in-oil emulsion so that only the oil touches the metal surface. Another type of corrosion inhibitor combines chemically with the metal to present a non-reactive surface. See also Inhibitor. Corrosion Inhibitor is an additive that protects the lubricated metal parts from the chemical attacks caused by water or other contaminants. / Ингибиторы Коррозии, вещества, снижающие скорость коррозии; применяются для антикоррозионной защиты материалов, главным образом металлов. Подробнее смотрите Химические Ингибиторы.

CORRUGATED BOARD CARTON = КОРОБ ИЗ ГОФРИРОВАННОГО КАРТОНА – History Of The Corrugated Packaging:- for over a century has passed since the corrugated board into our lives and has become one of the most versatile packaging materials. His appearance was due primarily to the fact that the package was needed that would allow transporting fragile objects without risk of damage. In 1871, the American Albert L. Jones, presented in New York, US patent number 122 023, entitled ‘Enhanced paper for packaging plants’. It appeared corrugated cardboard, which proved to be a universal solution of the problem:- package out of it not only

protects fragile items from mechanical impact, but it was still light. To create the first machine to manufacture of corrugated packaging used two old cannon barrel, in effect machine drive manually. Cannon barrels were heated at first with a gas torch. Later, gas was replaced by steam heating. Barrel length of time determines the amount of corrugated packaging and corrugated boxes received as a result was small. The next steps in the history of corrugated cardboard has a patent number 154 498, registered in the United States, Oliver Long in 1874. He improved technology, Jones offered to glue corrugated paper with a smooth. So there was a two-ply corrugated board. It is primarily used for packing glass bottles. In 1883 appeared the first factory manufacture of corrugated packaging. It was opened by the company Thompson and Norris. And in 1886 the business has grown and appeared corrugated cardboard plant in the German town of Kirchberg, and in 1888 – in France. In 1895, established the first combined type machine for the production of corrugated packaging. With it carried all the processes from the unwinding roll of paper and to obtain a finished product in sheets and rolls. And few years later, in 1899, Specialist companies Thompson and Norris L. Duerden registered US patent number 620 750 and improved the manufacturing process. He suggested using a heating table, long the shipping tape and thickening under the the influence of heat the glue. Gradually increased the working speed of corrugation. If at first it was 3 meters per minute, then by 1910 it had risen to 10 meters per minute, and already in 1930 was 100 meters per minute. The speed of modern gofrirovalnyh devices up to 200 meters per minute. In Russia, corrugated board came only in the early XX century. But after the production of corrugated packaging in 1917 was discontinued. Former Soviet Union opened it for himself only in 1930. And in the mid-80s the Government adopted a decision on the full transition to corrugated packaging, which replaced the wooden boxes. Externally, after years of corrugated virtually unchanged, despite the fact that production technology greatly improved. Such packaging is still a simple and convenient solution for a wide range of products. Corrugated Board Carton is a carton made of corrugated board. Corrugated is made from papers made up from cellulose fibers, which are virgin or recycled. This makes corrugated a renewable natural resource. Corrugated board is made from a combination of two sheets of paper called Liners glued to a corrugated inner medium called Fluting. These three layers of paper are assembled in a way which gives the overall structure a better strength than that of each distinct layer. This ingenious construction forms a series of connected arches which are well known for their ability to support strong weights. This structure gives corrugated board considerable rigidity and resistance. The air circulating in the flutes also serves as an insulator which provides excellent protection against temperature variations. There are many types of corrugated, each with different flute sizes and profiles which offer many combinations designed to create packaging with different characteristics and performances. The Corrugated board is then cut and folded into an infinite variety of shape and sizes to become corrugated packaging. Corrugated is a high performance packaging material designed to pack, protect and promote products. The history of corrugated dates back to the XIX century. Corrugated was born from a new paper usage and from the increasing necessity to pack and protect goods. Thanks to its basic raw materials, and despite considerable changes, modern corrugated packaging is not so different than that of our great grandfathers. This ingenuous construction is and will remain profitable, modern, and innovative. Some important dates:- in 1856 two Englishmen, Healey and Allen obtained a patent for the first known use of corrugated. The paper was fed through a very simple hand machine made of 2 fluted rolls. The result was a nice fluted paper used as the lining in hats. 1871 – The first use of corrugated paper for packaging was by an American man, Albert L. Jones who obtained a patent for the use of corrugated paper for wrapping fragile items such as bottles. 1854 – Again in the United States, Olivier Long patented the concept of adding a liner to one side of the corrugated paper to strengthen it. 1881 – Some US manufacturers considered as the corrugated pioneers acquired the patents covering this new packaging concept. They concentrated their efforts on developing new machinery. The Thompson and Norris company created the first mechanically-driven single-facer (one liner) and introduced the first 3 European Corrugators in Europe (1883 – in London, UK; 1886 – in Kirchberg, Germany; and 1888 – in Exideuil-sur-Vienne, France). 1895 – Independant Equipment producers enter the corrugated business production. The first continuous corrugator was developed by Jefferson T. Ferres of the Sefton Manufacturing Co.. The first corrugating machines appeared at the start of the century, a century of continuous innovations and adaptation to the changing world The production of corrugated packaging showed rapid growth. It accompanied the industrial revolution and responded to the steady demand for more transport packaging. Corrugated production closely follows economic activity. Today it adapts to the constant evolution of the retail trade and its continually changing logistics requirements. Since the end of the XIX century, many changes have occurred and remarkable progress has been made in the improvement of raw materials, in the equipment, in the production processes and the printing techniques of corrugated packaging. Some examples are listed below:- (i) The number of paper grades used for the production of corrugated is continuously increasing. The choice and the quality in all different liners and fluting are improving constantly. (ii) Of course the production speed increased dramatically with the improvement of equipment. This is also true on the user side, thanks to high speed case erectors, fillers and closers. (iii) The use of computers has revolutionized the industry by permitting continuous runs and avoiding machine stops. Its impact was also considerable on packaging design and order processing. Progress of course is not over and Information Technology will drive it. (iv) In the last decade, new printing techniques brought the biggest changes. The changing role of packaging from logistics to marketing functions, the use of bar codes for product identification have both required an enhancement of the quality of graphics on corrugated packaging. Small flutes and high quality paper allow for a very high standard of graphics, which leads to new opportunities in end-use markets. (i) Single Faced Corrugated Board; (ii) Single Wall Corrugated Board (also known as Double Faced); (iii) Twin Wall Corrugated Board; and (iv) Triple Wall Corrugated Board. Corrugated packaging is a versatile, economic, light, robust, recycleable, practical and yet dynamic form of packaging. There is much more to corrugated than just a box. Daily it is providing global solutions and benefits for all sorts of applications in all spheres of daily life. Corrugated is a rigid shipping and packaging medium that can be cut and folded into an infinite variety of shapes and sizes, constructed to an almost scientific specification, even allowing direct print with high resolution graphics. This very effective form of transit packaging that provides protection, identification, economy and performance as it protects the product it packs accross the globe, is corrugated. Corrugated offers almost unlimited possible combinations of board types, flute sizes, paper weights, adhesive types, treatments and coatings. Corrugated is routinely; custom designed to meet specific customer requirements. Corrugated is a natural, environmentally friendly material with an unbeatable record for recycling and recovery. Corrugated is an extremely flexible medium that accomodates a wide range of printing options to fully support the end user requirements. Corrugated can be printed by Flexographic, litho and silk screen. This is why corrugated packaging is known as an effective sales and marketing medium – 'the silent salesman'. Corrugated Board is made from papers made up from cellulose fibers, which are virgin or recycled. This makes corrugated a renewable natural resource. Corrugated board is made from a combination of two sheets of paper called Liners glued to a corrugated inner medium called the Fluting. These three layers of paper are assembled in a way which gives the overall structure a better strength than that of each distinct layer. This construction forms a series of connected arches which are well known for their ability to support strong weights. This structure gives corrugated board considerable rigidity and resistance. The air circulating in the flutes also serves as an insulator which provides exellent protection against temperature variations. There are many types of corrugated, each with different flute sizes and profiles which offer many combinations designed to create packaging with different characteristics, strength and performances. The corrugated board is then cut and folded into an infinite variety of shape and sizes to become corrugated packaging. Corrugated Board is a high performance packaging material designed to pack, protect and promote products. Corrugated Board is engineered for stackability. It withstands top and side pressure, is crush-resistant and passes burst-strength tests. Corrugated Board offers tear, tensile and burst strength to withstand shipping pressures. Corrugated Board resists impact, drop and vibration

damage and offers uniform stacking and weight distribution. / Американец Албёт Эл. Дьжонз (Albert L. Jones), который получил патент на использование гофрированной бумаги для обёртывания хрупких изделий, таких как бутылки. 1854 – Снова в Соединённых Штатах, Олывье Лон (Olivier Long). Ти. (Jefferson T. Ferres) из Ко. (Sefton Manufacturing Co.). Бумага Обёрточная Е 8273-75 – один из самых распространённых видов упаковочных бумаг, и является самым простым и дешёвым способом упаковки. Обёрточная бумага марки Е предназначена для упаковки не пищевых продуктов, она не может использоваться как пищевая вследствие того, что сырьём для её изготовления служат бумажная макулатура, небелёная целлюлоза и волокнистые отходы целлюлозно-бумажного производства. Цена на обёрточную бумагу позволяет считать её одним из самых дешёвых упаковочных материалов, который используется в различных производственных отраслях. Помимо этого, данная продукция находит широкое применение в сфере услуг и торговле. Бумага обёрточная в рулонах используется для упаковки штучного товара разного объёма и имеет ширину от 840 до 1 260 мм. Листовая обёрточная бумага изготавливается под заказ в любом формате различными партиями. Следует учесть, что обёртка бывает различной плотности (от 40 до 120 г/м^2), что автоматически меняет не только качество, но и количество товара, который вы предполагаете купить (бумага обёрточная большей плотности (в рулоне) будет меньшей длины, чем меньшей плотности в рулоне той же массы). Бумага обёрточная в рулонах наматывается на бумажные гильзы, внутренний диаметр которых – 75 мм. Купить обёрточную бумагу в листах можно как на паллете, так и упакованную в пачки. Крафт Бумага или Мешочная Бумага (от Немецкого слова Kraft, означающее Сила) – сорт особо прочной обёрточной бумаги, применяемой для изготовления мешков и пакетов для сыпучих материалов. Самое основное свойство крафт-бумаги – высокая прочность к механическим повреждениям. Изготавливается крафт-бумага из белой целлюлозы. Являясь упаковочным материалом, крафт-бумага применяется для изготовления конвертов, мешков, пакетов и многого другого. В изделия из крафт-бумаги упаковывают продукты питания, промышленные изделия и тому подобное, она применяется везде, где нужно использовать бумагу повышенной прочности и пористости. Крафт-бумага (мешочная бумага) также характеризуется воздухопроницаемостью, преимущество перед синтетическими материалами заключается в том, что запакованная в него продукция имеет возможность дышать и потому лучше адаптируется к колебанию температуры и влажности. Крафт-бумага в рулонах также обладает способностью впитывать большое количество влаги и таким образом предохранять содержимое от отсыревания, и высокой стойкостью к раздиранию. Разные типы крафт-бумаги отличаются друг от друга не только по механическим свойствам, но и по цвету, фактуре поверхности, типу нанесенного покрытия. (i) с гофрой с одной строны; (ii) одностенный с гофрой внутри двух плоских слоёв бумаги (в России он называется трёхслойным гофрокартоном, включающим в себя два плоских слоя с использованием одного гофрированного); (iii) двухстенный картон с двумя гофрами внутри трёх плоских слоёв бумаги (в России он называется пятислойным гофрокартоном, который состоит уже из трёх плоских (а именно, двух слоёв, располагающихся снаружи и одного внутреннего) и двух гофро-слоёв); и (iv) трёхстенный картон с тремя гофрами внутри четырёх плоских слоёв бумаги. Плоский слой бумаги (liner) гофра (fluting). Определяющим признаком гофрокартона является наличие волнообразного слоя между плоскими слоями картона, склеенного силикатным клеем по линии контакта, охватывающую верхнюю и нижнюю поверхность волны гофры. Одними из главных показателей, которые характеризуют различные виды гофров можно назвать высоту гофра (h) – расстояние между его нижней и верхней точкой, и шаг гофра (t) – определяющее расстояние между двумя верхними точками, расположенными рядом. Именно сочетание этих показателей называется профиль. К назначению трёхслойного листового гофрокартона можно отнести изготовление тары и прочих упаковочных средств, которые предназначены для использования в упаковывания продукции, не воспринимающей различные статические нагрузки. Назначением пятислойного листового гофрокартона можно считать производство транспортной упаковки продукции, нуждающейся в особо повышенной защите от разных механических повреждений и различных ударов. Также картон этих марок применяется при производстве гофрированной тары больших размеров. К наиболее распространённым и удобным материалам для изготовления упаковки на сегодня относится гофрокартон – экологически чистый продукт, который обладает достаточной прочностью и низкой себестоимостью, а также легко подвергается вторичной обработке. При производстве гофрокартона для гофрирования применяется бумага с плотностью 100–140 г/кв.м, а для плоских слоёв – картон плотностью 150–230 г/кв.м, плюс клей (силикатный или крахмальный). Производство упаковки из гофрокартона подразумевает использование разных типов гофрокартона:- для ящиков берут трёх- или пятислойный гофрокартон, тонкий двухслойный идёт на вкладыши. Картонная упаковка такая прочная, что вполне сможет заменить тару из древесины для габаритных товаров, деталей, продукции в стеклянных бутылках, посуды, сувениров. Гофроупаковка широко используется при транспортировке и хранении на складах и в магазинах самых разнообразных товаров:- в неё пакуют автозапчасти и бытовую технику, продукты и напитки в стеклянных и пластмассовых емкостях и так далее. По назначению гофроупаковка делится на три категории:- транспортная, производственная и потребительская. Производство упаковки из гофрокартона для потребителей включает тару, в которой товары попадают непосредственно к покупателю, обычно это удобные в обращении коробки с названием компании-производителя, изображением и характеристиками продукции. Гофроупаковка производственного типа применяется для хранения индивидуально запакованного товара одного типа в том или ином количестве. И наконец, транспортная упаковка нужна для перевозки крупных и объёмных товаров, чаще всего она содержит дополнительные элементы:- вкладыши, амортизаторы, обечайки. На сегодняшний день гофротара является самым распространённым видом упаковки. Она находит своё применение практически во всех сферах производства. Секрет популярности такой упаковки из гофрокартона кроется, во-первых, в низкой стоимости, во-вторых, в многообразии форм и размеров и, наконец, в целом ряде преимуществ перед другими типами тары. В зависимости от того, для транспортировки и хранения какой продукции необходима гофроупаковка, используется либо трёхслойный листовой гофрокартон профилей В, С, либо пятислойный листовой гофрокартон профиля В/С. Возможность применения гофрокартона в качестве упаковки впервые была определена владельцем Американского патента по применению материала для упаковки стеклянных колб и бутылок Албётом Эл. Дьжонзом (Albert L. Jones) из Нью Йорка в 1871. Рекомендованный автором патента способ применения гофробумаги с изгибом поперёк незакреплённых гофров в дальнейшем потребовал усовершенствования. Патент США № 122 023 под названием ‘Усовершенствованная Бумага на Упаковочных Предприятиях’. 25 Августа 1874 был выдан патент № 154498 на двухслойный гофрокартон. Владелец патента Американец Оливё Лонг (Oliver Long) предлагал приклеивать к гофрированному картону плоский слой бумаги, располагая его на поверхности упаковываемого сосуда. Главным его предназначением тогда была упаковка стеклянных бутылей. В 1875 в Нью Йорке была образована компания Томпсэн Энд Норис Ко. (Thompson & Norris Co.), которая с 1882 производила двух- и трёхслойный гофрокартон. В 1882 в США была выпущена машина с механическим приводом для изготовления двухслойного гофокартона и сматывания его в рулон. 17 Января 1882 Американец Робёт Томпсэн получил патент на трёхслойный гофрокартон. Трёхслойный гофрированный картон первоначально изготовлялся путём приклеивания вручную плоского слоя в виде листов или формы заготовок. В 1883 фирма Томпсэн и Норис открыла первую в Европе фабрику по производству гофрокартона. В 1886 эта фирма построила завод по производству гофрокартона в Кирхберге, Германия, а в 1888 – во Франции. В 1895 Американец Сэфтэн (Sefton) создал первую комбинированную машину для производства гофрокартона (по патенту Томпсэна). Машины для производства гофрокартона поставлялись в Европу из Лондона. В 1899 служащий фирмы Томпсэн и Норис Л. Дуерден (Norris L. Duerden) зарегистрировал патент США № 620750 о производственном процессе. Он

использовал нагревательный стол, длинную транспортировочную ленту и ‘застуденевающий’ под воздействием жара ‘сильный’ клей. В конце XIX века Немецкие фирмы начали производить гофроагрегаты. Некие Густаф Лескэ (Gustav Leske) и Оскар Шпэалинг (Oscar Sperling) создают фирму Лейпцигский Машиностроительный Завод (Leipzig Maschinen) и Гофрокартонная Фабрика Шпэрлина (после 1910 эта фабрика обанкротилась). С начала XX столетия производство гофрированного картона охватило весь мир. С 1907 он стал известен в России (кстати, в Италии, Финляндии и Дании он появился на несколько лет позднее). Важным шагом в ходе дальнейшего совершенствования конструкции явилось внедрение в 1916 пятислойного (двухволнового) гофрированного картона, а в 1953 – семислойного (три гофрированных слоя и четыре плоских). Постепенно изменялись виды и размеры гофров. Первоначально они примерно соответствовали современному гофру A, в 1905–06 появился гофр B, в 1925 – гофр C, в 1951 – гофр E. После 1917 производство гофрокартона в России было полностью приостановлено. В середине 1980-х в бывшем Союзе Советских Социалистических Республик (СССР) решением Коммунистической Партии Советского Союза (КПСС) и правительства было принято постановление о необходимости полного ‘перехода на гофрокартонную тару’ (в основном тогда в СССР использовалась деревянная). По мнению специалистов этот ‘переход’ завершился уже после распада СССР в середине 1990-х.

CORRUGATED FASTENER = XX (или РИФЛЁНАЯ ЗАСТЁЖКА) – Corrugated Fastener is a sheet-metal-type fastener with corruga-tions of approximately 5 mm pitch and one sharpened edge. See also Pallet. / Застёжка Рифлёная (Corrugated Fastener):- застёжка из листовой стали с рифлёными складками шириной приблизительно 5 миллиметров (мм) и обрезным краем. Примечание:- рифлёные застёжки применяют в основном для предотвращения трещин. Смотрите также Поддон (Pallet).

CORRUGATED PAPER = ГОФРИРОВАННАЯ БУМАГА (или РИФЛЁНАЯ БУМАГА) – Corrugated Paper is a thick, coarse paper with a ridged or furrowed surface, such as that used in cardboard box construction.

CORRUGATION = ГОФРИРОВАНИЕ (или РИФЛЕНИЕ, или XX) – Defect Name:- Corrugation. Defect Type:- Finishing Defects. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Corrugation:- This defect is caused by the sanforizer blanket not properly controlling the compacting of the fabric during sanforization. Generally, it is caused by the blanket not being tight enough or a soft place in the blanket. When it is caused by a defective blanket, it will repeat at regular intervals. Severity:- Major.

CORRUGATION MARK = ОТМЕТИНА ОТ ГОФРИРОВАНИЯ (или ОТМЕТИНА ОТ РИФЛЕНИЯ) – Corrugation Mark is a fabric defect consisting of a crimped, rippled, wavy, pebbled, or cockled area in the fabric spoiling the uniformity of the texture.

CORRUGATIONS = ГОФРИРОВАНИЯ (или РИФЛЕНИЯ) – Corrugations:- metal sheets are deliberately corrugated in order to increase their stability. Standard containers, insofar as they are made of steel sheet are usually manufactured using sheet sheets with trapezoidal corrugations. Corrugations can also be used when making steel drums, again for the purposes of stabilization. / Под Гофрированием, от Французского слова Gaufrer, означающее Оттискивать Узор или Прессовать Складки, понимается разновидность гибки с целью придания листам волнистость с целью повышения их поперечной жёсткости. Это осуществляется с помощью штамповки или путём прокатки в валках с волнообразной образующей.

CORSELET = КОРСЭЛЕ (или НАГРУДНЫЕ ЛАТЫ, или ЩИТОК, или ПРОНОТУМ) – Corselet is a piece of armor covering the trunk but usually not the arms or the legs; a combination girdle and brassiere. / .

CORSELETTE = XX (или ПОЯС С РЕЗИНКАМИ) – Corselette is an undergarment combining girdle and brassiere. / .

CORSET = КОРСЕТ – Corset is a usually close-fitting and often laced medieval jacket; a woman’s close-fitting boned supporting undergarment that is often hooked and laced and extends from the torso to below the hips and has garters attached.

CORTEX = КОРТЭКС (или КОРА) – Cortex is a soft layer of tissue between the woody vascular tissue and epidermis, or external layer such as bark. Hence:- Adj. Cortical. The outer tissues of the stem or root between the vascular bundles and the epidermis. Cortex:- cortical cells in the wool fiber consisting of bundles of fibrils. / Под Корой, от Латинского слова Cortex, означающее Кора, понимается . Кортикальный (Cortical) – корковый, относящийся к коре больших полушарий головного мозга, надпочечников. Под Корой растений понимается многослойная периферическая ткань стеблей и корней растений, состоящая в основном из паренхимных и механических тканей. Часто содержит дубящие, лекарственные и другие вещества. Корка у древесных растений представляет собой наружный защитный слой коры на старых стеблях и корнях, состоящий из прослоек перидермы и луба. Периодически слущивается или разрушается с поверхности.

CORTICAL CELLS = КОРКОВЫЕ КЛЕТКИ – Cortical Cells:- the spindle shaped cells forming the inside structure of a fiber.

CORYMB = КОРИМБ (или ЩИТОК) – Corymb (Latin Corymbus, Greek:- Kórumbos = Summit, Head, Top, Cluster) is a flat-topped or convex inflorescence with individual pedicels (flower stalks) branching from various points on the main stem. The outer or lower flowers open first, progressing from the margin inwards, and have the longest stalks so all flowers reach a similar height. Corymb is a form of inflorescence in which the flowers form a flat-topped or convex cluster, the outermost flowers being the first to open. Corymb is an inflorescence in the form of a flat-topped flower cluster with the oldest flowers at the periphery. This type of raceme occurs in the candytuft. Corymb is a flat-topped inflorescence with the lower branches longer than the upper so that all flowers are at the same level. Corymb is an indeterminate inflorescence whose outer flowers have longer stalks than the inner flowers, so that together they form a round cluster that is rather flat on top. The outer flowers open before the inner ones. Yarrow and the hawthorn have corymbs. / Щиток – тип соцветия. Под Коримбом, от позднелатинского слова Corymbus, от Греческого слова Kórumbos, понимается . Под Щитком понимается:- (1) тип соцветия, в котором нижние цветоножки (простой щиток) или ветви (сложный щиток) длиннее верхних, а цветки располагаются в одной плоскости, например, у Тысячелистника и других. (2) Первый (семядольный) лист зародыша злаков, прилегающий к эндосперму и использующий его питательные вещества.

COSA = COMMITTEE ON SUSTAINABILITY ASSESSMENT

CO–SALE RIGHT = ПРАВО НА СОПРОДАЖУ – Co-Sale Right:- What are Co-Sale Rights? In order to prevent a situation where, following an investment, the founders jump ship and sell their shares to a third party investor, most venture financings will include a co-sale right. The co-sale right gives the investor the right to sell its shares on the same terms as the investors - usually on a pro-rata basis of its total ownership percentage in relation to the total sale. How do co-sale rights work? Co-sale rights, sometimes called Tag-Along Rights, are the right to participate in any pre-IPO (short for the Initial Public Offering) sale by the founders in proportion to the relative number of shares owned by the founders and the investors. In a company where a founder or founders controls a majority of the company, the investors will often request co-sale rights. As a practical matter, the co-sale right will limit the incentive and ability of the founders to dispose of a significant portion of their holdings in the company prior to the IPO. However, since the opportunities for separate liquidity for founders generally tend to be limited, co-sale rights are not generally viewed to be significantly disadvantageous to founders in most situations, and are less likely to be negotiated than other more meaningful terms, such as vesting on founders’ shares. When will investors use co-sale rights? Investors may wish to participate in any pre-IPO stock sale by the founders. Co-sale

rights, if exercised, will result in less money to you upon a private stock sale, and the notice and other requirements of a co-sale right may impede a sale. Nevertheless, because the investors want to use equity to direct the Company's management towards a long-term return rather than an early cash-out, they are likely to insist upon a co-sale right. How common are co-sale rights in a venture capital financing? Co-sale rights are common in venture investments and typically will offer exceptions for certain types of transfers, such as for small amounts of stock, sales or transfers to family members, or sales in the event of termination of employment or death of the founders. In addition, the co-sale rights will often be accompanied by a right of first refusal for the investors. With a right of first refusal, founders will be restricted from selling their shares to any third party without first offering the shares to the company and/or the investors. The shares will be offered on the same terms as given to the proposed third party purchaser. See also Tag Along Right.

COSIGNATURE = ПОРУЧИТЕЛЬСТВО (или СОПОДПИСЬ) – Cosignature is the joint signature. Also known as Guarantee. / Известно также как Гарантия (Guarantee).

COSIGNER = СОПОДПИСАНТ (или ПОРУЧИТЕЛЬ) – Cosigner is a term referring to a person, other than the principal borrower, who signs for a loan. The cosigner(s) assumes equal liability for the loan. / Подписант – лицо, подписывающее или подписавшее какое-нибудь официальное обращение, открытое письмо и тому подобное.

COSMETIC DAMAGE = ПОВЕРХНОСТНОЕ ПОВРЕЖДЕНИЕ – Cosmetic Damage:- the exterior packing of your commodity is often the first image the consignee sees of your company. A package showing exterior damage, although perhaps only cosmetic in nature, can cause loss of market, poor shipper/consignee relationships and may even cause the goods to be rejected and/or not be paid for even though the contents may arrive without damage. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

COSMOPOLITAN = КОСМОПОЛИТНОЕ – Cosmopolitan:- distributed world-wide. / В биологии под Космополитами, от Греческого слова Kosmopolitēs, означающее Гражданин Мира или Космополит, понимаются Виды (Роды, Семейства и тому подобные) Растений и Животных, обитающие по всему (или почти по всему) земному шару. Космополитами являются, например, Злаки, Воробьиные Птицы. Космополиты противопоставляют Эндемикам. Космополитные Растения или повсюдные (убиквитарные) – широко распространённые, например, такие, обитание которых заключает 1/3 поверхности земного шара.

COST = ЗАТРАТА (или СТОИМОСТЬ, или РАСХОД) – In the widest sense, Cost is the measure of the value of what has to be given up in order to achieve a particular objective. In everyday language, people most often use the term rather like an accountant does, as synonymous with the total money outlays actually paid out to achieve the objective, but this is not precisely what economists mean by the term. Economists are concerned with rational decision-making, and the rational decision-maker needs to estimate in advance the full range of consequences of each of the various alternative uses of his time and resources open to him, not just the portion of the costs accounted for by money outlays. For the economist, the true cost of any decision is the value of the next best outcome (of all the other possible outcomes) that is given up because of that decision. Unless otherwise specified, when economists say 'cost', they mean opportunity cost – that is, the highest valued alternative that must be sacrificed to attain something or otherwise satisfy a want. For example, the opportunity cost of a spur-of-the-moment decision to go to the movies Tuesday afternoon instead of going in to work is not just the six Dollars for the ticket plus the gasoline and wear and tear on the car to get there. It also includes (at least) the four hours' wages not earned, diminished prospects for being promoted at work, and possibly such additional consequences as future hostility from co-workers who had to take up the slack, unpleasant feelings of guilt or shame, and so on. In a more extreme vein, the opportunity cost of committing suicide is not simply the money outlay for the necessary equipment, but rather the value of the total range of future satisfactions one might otherwise be able to achieve. Cost is the amount paid to acquire resources, such as plant and equipment, fuel, or labor services. The amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction or, when applicable, the amount attributed to that asset when initially recognized in accordance with the specific requirements of other International Financial Reporting Standards (IFRSs). / Сумма уплаченных денежных средств или их эквивалентов или справедливая стоимость чего-то иного, . Расходами признаётся уменьшение экономических выгод в течение отчётного периода, происходящее в форме оттока или истощения активов или увеличения обязательств, ведущих к уменьшению капитала, не связанных с его распределением между участниками акционерного капитала. Расходы включают убытки, а также расходы, возникающие в процессе обычной деятельности компании, такие, как себестоимость продаж, заработная плата и амортизация. Стоимость, овеществлённый в товаре общественный труд товаропроизводителей. Проявляется при обмене товаров как меновая стоимость. Величина стоимости отдельного товара (индивидуальная стоимость) определяется количеством труда, затраченног на его производство, и измеряется рабочим временем. Общественная стоимость товара опредедяется общественно необходимым рабочим временем. Стоимость лежит в основе цен товаров. В товарном хозяйстве, основанном на частной собственности, стоимость складывается стихийно в процессе конкурентной борьбы.

COST AND FREIGHT = СТОИМОСТЬ И ФРАХТ – Cost And Freight or CFR (insert named port of destination) Incoterms® 2010:- this rule is to be used only for sea or inland waterway transport. 'Cost and Freight' means that the seller delivers the goods on board the vessel or procures the goods already so delivered. The risk of loss of or damage to the goods passes when the goods are on board the vessel. The seller must contract for any pay the costs and freight necessary to bring the goods to the named port of destination. When CPT, CIP, CFR or CIF are used, the seller fulfils its obligation to deliver when it hands the goods over to the carrier in the manner specified in the chosen rule and not when the goods reach the place of destination. This rule has two critical points, because risk passes and costs are transferred at different places. While the contract will always specify a destination port, it might not specify the port of shipment, which is where risk passes to the buyer. If the shipment port is of particular interest to the buyer, the parties are well advised to identify it as precisely as possible in the contract. The parties are well advised to identify as precisely as possible the point at the agreed port of destination, as the costs to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the specified point at the port of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. The seller is required either to deliver the goods on board the vessel or to procure goods already so delivered for shipment to the destination. In addition, the seller is required either to make a contract of carriage or to procure such a contract. The reference to 'procure' here caters for multiple sales down a chain ('string sales'), particularly common in the commodity trades. CFR may not be appropriate where goods are handed over to the carrier before they are on board the vessel, for example goods in containers, which are typically delivered at a terminal. In such circumstances, the CPT rule should be used. CFR requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import pay any import duty or carry out any import customs formalities. Formerly was known as abbreviation CNF or C&F. Cost And Freight (CFR), whereby the quoted price for physical material includes all costs incurred in shipping the metal to the customer's location but not including insurance. 'Cost and Freight' (CFR), a term of INCOTERMS® 2000, means that the seller, term of INCOTERMS® 2000, delivers when the goods pass the ship's rail

in the port of shipment. The seller must pay the costs and freight necessary to bring the goods to the named port of destination but the risk of loss of or damage to the goods, as well as any additional costs due to events occurring after the time of delivery, are transferred from the seller to the buyer. The CFR term requires the seller to clear the goods for export. This term can be used only for sea and inland waterway transport. If the parties do not intend to deliver the goods across the ship's rail, the CPT term should be used. Cost and Freight (CFR):- the price generally includes the cost of transportation to the named point of debarkation. Insurance, however, is not included. Cost and Freight (C&F) is a term of sale. Seller quotes price including the cost of goods and all transportation charges to the named point of destination. / ИНКОТЁРМЗ® 2000. когда товары пересекли планширь фальшборта судна в указанном порту отгрузки. Под Фальшбортом, от Немецкого слова Falschbord, понимается лёгкий стальной пояс, выполненный как продолжение бортовой обшивки судна и расположенный выше верхней палубы. Фальшборт служит ограждением открытых частей палубы и уменьшает накат волн на неё. Стоимость И Фрахт (КАФ (CFR)).

COSTATE = РЕБРИСТОЕ (или ЖИЛКОВАТОЕ) – Costate:- ribbed; having one or more longitudinal ribs.

COST AVERAGE EFFECT = ЭФФЕКТ УСРЕДНЕНИЯ ЗАТРАТ – Cost Average Effect:- with investment plans entailing regular fixed inpayments, the result for the investor is that more fund units are purchased when prices fall, and correspondingly fewer when prices rise. The regular investment of constant amounts over a longer period has the advantage for the investor that, taken in total, he buys the units, which have different issue prices, at a more favorable average price.

COST AVERAGING = УСРЕДНЕНИЕ ЗАТРАТ (или УСРЕДНЕНИЕ ИЗДЕРЖЕК) – Cost Averaging:- the investment method in which a fixed sum is invested on a regular basis, irrespective of the market trends. Thus more shares (units) are bought when the market prices are low, and less when they are high. See also Averaging, and Dollar Cost Averaging.

COST–BENEFIT RATIO = СООТНОШЕНИЕ ЗАТРАТА–ВЫПЛАТА (или СООТНОШЕНИЕ ИЗДЕРЖЕК И ВЫГОДЫ) – Cost-Benefit Ratio, also known as Benefit-Cost Ratio, is an analytical tool used in public planning; a ratio of total measurable benefits divided by the initial capital cost.

COST DRIVERS = ТОЛКАТЕЛИ СТОИМОСТИ (или ХХ) – Cost Drivers are the economic forces that cause costs to vary across different organizations.

COSTED = COMMITTEE ON SCIENCE AND TECHNOLOGY IN DEVELOPING COUNTRIES

COST EFFECTIVE = ЭФФЕКТИВНОЕ ПО СЕБЕСТОИМОСТИ – Cost Effective:- balancing the expenses, debt, with the sale, and having a profit margin.

COST, INSURANCE AND FREIGHT = СТОИМОСТЬ, СТРАХОВАНИЕ И ФРАХТ (или ЦЕНА, СТРАХОВАНИЕ И ФРАХТ) – Cost, Insurance, and Freight (CIF):- in the context of international goods trade, CIF is one way of splitting up the costs and risks between importer and exporter under the so-called 'Incoterms®'. With CIF, the exporter bears all freight and insurance costs incurred until the goods reach the port of destination. The importer bears all costs as from that point in time at which the goods cross the ship's rail when the ship has arrived in port. Cost, Insurance, and Freight (CIF) is a term usually used in reference to ocean shipping which defines the seller's price to include the cost of goods, marine insurance, and transportation (freight) charges to the point of destination. 'Cost, Insurance and Freight' (CIF), a term of INCOTERMS® 2000, means that the seller delivers when the goods pass the ship's rail in the port of shipment. The seller must pay the costs and freight necessary to bring the goods to the named port of destination but the risk of loss of or damage to the goods, as well as any additional costs due to events occurring after the time of delivery, are transferred from the seller to the buyer. However, in CIF the seller also has to procure marine insurance against the buyer's risk of loss of or damage to the goods during the carriage. Consequently, the seller contracts for insurance and pays the insurance premium. The buyer should note that under the CIF term the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have the protection of greater cover, he would either need to agree as much expressly with the seller or to make his own extra insurance arrangements. The CIF term requires the seller to clear the goods for export. This term can be used only for sea and inland waterway transport. If the parties do not intend to deliver the goods across the ship's rail, the CIP term should be used. Cost, Insurance and Freight (CIF) is export term in which the price quoted by the exporter includes the costs of ocean transportation to the port of destination and insurance coverage. CIF (insert named port of destination) Incoterms® 2010:- this rule is to be used only for sea or inland waterway transport. 'Cost, Insurance and Freight' means that the seller delivers the goods on board the vessel or procures the goods already so delivered. The risk of loss of or damange to the goods passes when the goods are on board the vessel. The seller must contract for and pay the costs and freight necessary to bring the goods to the named port of destination. The seller also contracts for insurance cover against the buyer's risk of loss of or damage to the goods during the carriage. The buyer should note that under CIF the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have more insurance protection, it will need either to agree as much expressly with the seller or to make its own extra insurance arrangements. When CPT, CIP, CFR, or CIF are used, the seller fulfils its obligation to deliver when it hands the goods over to the carrier in the manner specified in the chosen rule and not when the goods reach the place of destination. This rule has two critical points, because risk passes and costs are transferred at different places. While the contract will always specify a destination port, it might not specify the port of shipment, which is where risk passes to the buyer. If the shipment port is of particular interest to the buyer, the parties are well advised to identify it as precisely as possible in the contract. International Chamber of Commerce™:- The parties are well advised to identify as precisely as possible the point at the agreed port of destination, as the costs to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the specified point at the port of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. The seller is required either to deliver the goods on board the vessel or to procure goods already so delivered for shipment to the destination. In addition the seller is required either to make a contract of carriage or to procure such a contract. The reference to 'procure' here caters for multiple sales down a chain ('string sales'), particularly common in the commodity trades. CIF may not be appropriate where goods are handed over to the carrier before they are on board the vessel, for example goods in containers, which are typically delivered at a terminal. In such circumstances, the CIP rule should be used. CIF requires the seller to clear the goods for dxport, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. Cost, Insurance and Freight (CIF):- a transaction where the seller must pay the costs, freight and insurance to bring the goods to the port of destination. Maritime transport only. Risk is transferred to the buyer once the goods have crossed the ship's rail. Cost, Insurance and Freight (CIF), whereby the quoted price for physical material includes all costs incurred in shipping the metal to the customer's location including insurance. Cost, Insurance and Freight (CIF):- a CIF price includes the cost of material together with transport and insurance costs to the final specified destination. Cost, Insurance, and Freight (CIF):- the price includes the cost of goods, insurance, and all transportation charges to the point of destination. / Международная Торговая Палата™ (или Международная Палата Коммерции™ (International Chamber of Commerce™)). ИНКОТЁРМЗ® 2010. когда товары пересекли планширь фальшборта судна в указанном порту отгрузки. Под Фальшбортом, от Немецкого слова Falschbord, понимается лёгкий стальной пояс, выполненный как продолжение бортовой обшивки судна и расположенный выше верхней палубы.

Фальшборт служит ограждением открытых частей палубы и уменьшает накат волн на неё. Стоимость, Страхование И Фрахт (СИФ (CIF)). Во внешней торговле термин 'Цена, Страхование и Фрахт' (ЦСФ) или 'Cost, Insurance and Freight' (CIF) на Английском языке, вид договора купли-продажи или поставки, связанного с доставкой товара водным путём. Цена товара включает его стоимость, расходы по страхованию и перевозке от порта отправления до порта назначения.

COST OF CAPITAL = СТОИМОСТЬ КАПИТАЛА – Cost Of Capital is the rate of return needed to entice investors to provide financial capital to the business. See also Weighted Cost Of Capital.

COST OF CARRY = ЗАТРАТЫ ПО ХРАНЕНИЮ И ОБСЛУЖИВАНИЮ (или ЦЕНА ХРАНЕНИЯ И ОБСЛУЖИВАНИЯ) – A cost that is factored into the pricing of derivatives instruments such as futures contracts. It reflects the cost of holding the underlying shares over the life of the futures contract, less the amount that the shareholder would receive in dividends on those shares during this time. Cost Of Carry is the cost of holding a physical commodity over a period of time. The main elements are funding costs, storage and insurance. See also Carrying Charge. Cost Of Carry:- the cost of financing an asset. If the cost is lower than the interest received, the asset has a positive cost of carry; if higher, the cost of carry is negative. The cost of carry is determined by the opportunities for lending the asset and the shape of the yield curve. So a bond, for example, would have a positive cost of carry if short-term rates (financing rates) were lower than the bond's yield or (and) if the cost could be mitigated by lending out the securities. / Смотрите также Накладные Расходы (Carrying Charge).

COST OF GOODS SOLD = СЕБЕСТОИМОСТЬ РЕАЛИЗОВАННОЙ ПРОДУКЦИИ (или СЕБЕСТОИМОСТЬ ПРОДАННЫХ ТОВАРОВ) – Cost Of Goods Sold is the amount of cost relieved from inventory to generate the Delivered Sales for a particular period. This includes inbound freight costs if these freight costs are also included in the inventory figure instead of being expensed. Cost of Goods Sold is the cost of the goods sold during the accounting period. It equals the cost of manufacturing (labor, materials and manufacturing overheads) adjusted for changes in the value of inventories. Cost of Goods Sold (CoGS):- these are the direct costs of producing the product which a company sells including such items as materials and labor that go directly into producing the shipped goods. These costs are usually shown directly under revenues on an income statement as the first costs associated with producing the revenues that are recorded.

COST OF GOODS SOLD/SALES (%) = СЕБЕСТОИМОСТЬ ПРОДАННЫХ ТОВАРОВ/ПРОДАЖ (%) – Cost of Goods Sold/Sales (%) is the Cost of Goods Sold expressed as a percentage of the value of sales.

COST OF LIVING = ПРОЖИТОЧНЫЙ МИНИМУМ – Cost Of Living:- in national terms, the amount of money an individual must spend in order to buy food and accommodation and to maintain a given standard of living. Cost Of Living is the cost of maintaining a certain standard of living. Changes in the cost of living over time are often operationalized in a cost of living index. Cost of living calculations are also used to compare the cost of maintaining a certain standard of living in different geographic areas. Differences in cost of living between locations can also be measured in terms of purchasing power parity rates. / Под Прожиточным Минимумом понимается минимум средств, необходимых для поддержания жизнедеятельности трудящегося и восстановления его рабочей силы.

COST OF LIVING ADJUSTMENT = ПЕРЕОЦЕНКА СУММЫ ПРОЖИТОЧНОГО МИНИМУМА – Cost of Living Adjustment (COLA) is an automatic adjustment of salaries to keep up with changes in the price level. Cost Of Living Adjustment (COLA) is an adjustment made to Social Security and supplemental security income in order to adjust benefits to counteract the effects of inflation. COLAs are generally equal to the percentage increase in the consumer price index for urban wage earners and clerical workers (CPI-W) for a specific period. For example, if Kevin received USD10 000 last year for Social Security benefits and COLAs for this year were 4.1%, then his benefits for this year would be USD10 410. During the 1970s, inflation was really high, and as a result compensation related contracts, real estate contracts and government benefits, led to the popularized usage of COLAs to protect against inflation. Also known as Sliding Wage Scale in the United Kingdom. Cost-Of-Living Adjustment (COLA):- employment contracts, pension benefits, and government entitlements (such as Social Security) can be tied to a cost-of-living index, typically to the Consumer Price Index (CPI). A Cost of Living Allowance (COLA) adjusts salaries based on changes in a cost-of-living index. Salaries are typically adjusted annually. They may also be tied to a cost-of-living index that varies by geographic location if the employee moves. In this later case, the expatriate employee will likely see only the discretionary income part of his salary indexed by a differential CPI between the new and old employment locations, leaving the non-discretionary part of the salary (e.g., mortage payments, insurance, car payments, ...) unmodified. Annual escalation clauses in employment contracts can specify retroactive or future percentage increases in worker pay which are not tied to any index. These negotiated increases in pay are colloquially referred to as cost-of-living adjustments or cost-of-living increases because of their similarity to increases tied to externally-determined indexes. Cost of living allowance is equal to the nominal interest minus the real interest rate. / Автоматическое регулирование заработной платы с целью соответствия изменению уровня цен.

COST OF LOST SALES = СТОИМОСТЬ ПРОДАЖ ЗАВАЛИ – Cost Of Lost Sales:- the forgone profit companies associate with a stockout. / Прибыль, которую компании ассоциируют с распродажей запасов завали, и которую они уже и не рассчитывали получить.

COST OF NEW ENTRY = СТОИМОСТЬ НОВОГО ВВОДА – Cost of New Entry (CONE):- in regard to the electric power grid, CONE is the cost to develop and bring into service any new piece of equipment. However, it is generally used in reference to building a new generating unit. This is critical for long-term ISO (independent system operator) planning to ensure reliable power supplies. It is also a factor in determining capacity prices in markets such as PJM (Pennsylvania, New Jersey, Maryland), NYISO (New York), and ISO-NE (New England). CONE is sometimes used as the price of capacity, in Dollars per kiloWatt-month that is needed to attract sufficient new capacity. Why does this matter? CONE is a driver of long-term energy prices, especially as the grid evolves with the building of new natural gas plants to replace retiring coal plants. / Пи.Дьжей.Эм. (PJM).

COST OF PRODUCTION = СЕБЕСТОИМОСТЬ ПРОДУКЦИИ (или ЗАТРАТЫ ПО ПРОИЗВОДСТВУ) – Cost Of Production is a term used to refer to the sum of the cost of materials, fabrication and/or other processing employed in producing the merchandise sold in a home market or to a third country together with appropriate allocations of general administrative and selling expenses. Cost of production (COP) is based on the producer's actual experience and does not include any mandatory minimum general expense or profit as in 'constructed value'. / Под Себестоимостью Продукции понимается полная себестоимость, денежное выражение текущих затрат предприятия на производство и реализацию продукции. Фабрично-заводская себестоимость продукции слагается из цеховой себестоимости и общезаводских расходов. Себестоимость продукции – часть стоимости, включающая затраты на потреблённые средства производства и на оплату труда. Экономическая основа себестоимости продукции – издержки производства. Себестоимость продукции – один из важнейших качественных показателей эффективности производства, обеспечивающий контроль затрат живого и овеществлённого труда и ограждающий результаты хозяйственной деятельности предприятия. Отношение чистого дохода (прибыли) к себестоимости продукции выражает рентабельность

производства. В практике планирования исчисляется себестоимость всей продукции (по экономическим элементам затрат) и себестоимость единицы изделия (по статьям и калькуляции). Себестоимость продукции – основа ценообразования, определения уровня оптовых цен.

COST OF TENDER = ИЗДЕРЖКИ ПО КОНКУРСУ – Cost Of Tender:- the total of various charges incurred when a commodity is certified and delivered on a futures contract. / Сумма различных сборов на сертификацию и поставку сырья по фьючерсному контракту.

COST–PASS–THROUGH = ПЕРЕКЛАДЫВАНИЕ ЗАТРАТ – Cost-Pass-Through:- a cost-share system where the partial cost of a pallet is passed-through from the purchaser to the receiver of the pallet.

COST–PER–TRIP = ЗАТРАТА НА ПОЕЗДКУ – Cost-Per-Trip:- average cost of pallet use for a single one-way trip.

COSTS = ЗАТРАТЫ (или ИЗДЕРЖКИ) – Costs:- amount, usually expressed in monetary terms, which must be spent to acquire or produce a good or service. The determination and analysis of costs is fundamental to the management of a business and the assessment of its competitiveness. / Сумма, отображаемая обычно в денежном выражении, которая должна быть потрачена для приобретения или производства товара или оказания услуги. Установление и анализ затрат является основой управления бизнесом и определения его конкурентоспособности.

COSTS OF MANUFACTURE = ЗАТРАТЫ ПО ИЗГОТОВЛЕНИЮ (или СЕБЕСТОИМОСТЬ) – Costs Of Manufacture:- in the context of dumping investigations, the costs of manufacture (COM) is equal to the sum of the materials, labor and both direct and indirect factory overhead expenses required to produce the merchandise under investigation.

COST TO CARRY = ЗАТРАТА К ПОСТАВКЕ – Cost To Carry:- costs associated with holding the physical commodity until the determined delivery date. These costs include storage and insurance of the commodity before it gets delivered. The price of a commodity in a cash market differs from the price of the same commodity in the futures market as a direct consequence of the difference in timing of its delivery. Therefore, under normal market conditions, the spot price would be lower than the futures price due to the cost to carry. In the same manner, the near-month futures price would be lower than the futures price of the distant expiring contract of the underlying commodity. This is referred as Normal Carry Charge Market or Contango. Under abnormal circumstances such as shortage of supply of a commodity in the short term, the contango can be reduced or even reversed. In this case the spot price can become higher than the futures price. This process is known as Backwardation. / затраты, ассоциируемые с удерживанием физического сырья до предопределённой даты поставки. Эти расходы включают хранение и страхование сырья до того момента, пока он не будет поставлен. Цена сырья на наличном рынке отличается от цены такого же сырья на рынке фьючерсов, поскольку .

COST TO INCOME RATIO = СООТНОШЕНИЕ ЗАТРАТ С ДОХОДОМ (или СООТНОШЕНИЕ РАСХОД ПРИХОД) – Cost To Income Ratio:- operating expenditure, excluding insurance risk related payments, and indirect taxes, divided by total income excluding unrealized gains and losses on the insurance investment portfolio. In %. The Cost-To-Income Ratio is a key financial measure, particularly important in valuing banks. It shows a company's costs in relation to its income. To get the ratio, divide the operating costs (administrative and fixed costs, such as salaries and property expenses, but not bad debts that have been written off) by operating income. The ratio gives investors a clear view of how efficiently the firm is being run – the lower it is, the more profitable the bank will be. Changes in the ratio can also highlight potential problems:- if the ratio rises from one period to the next, it means that costs are rising at a higher rate than income, which could suggest that the company has taken its eye off the ball in the drive to attract more business. Cost/Income Ratio measures the proportion of bank's income that is consumed by its operating costs. Cost/Income Ratio is the ratio between operating expenses and operating income. It is a measure of how costs are changing compared to income. It is one of the main key performance indicators of a bank's efficiency:- the lower the ratio the more efficient the bank.

COST TRADE–OFF = XX (или ЗАТРАТНЫЙ РАЗМЕН, или ОБМЕН ШИЛА НА МЫЛО) – Cost Trade-Off:- the interrelationship among system variables in which a change in one variable affects other variables' costs. A cost reduction in one variable may increase costs for other variables, and vice versa. Cost Tradeoff:- a situation where the relationship between costs causes other cost(s) to rise when one cost is lowered.

COSTUME = КОСТЮМ (или ПЛАТЬЕ, или ОДЕЖДА) – Costume is an outfit worn to create the appearance characteristic of a particular period, person, place, or thing; a person's ensemble of outer garments, especially a woman's ensemble of dress with coat or jacket.

COT = COMMITMENT OF TRADERS

COT = КАТ (или XX) – Cot is the covering material used on various fiber-processing rolls, especially drawing rolls. Leather, cork, rubber, and synthetic materials are frequently employed. / покрывающий материал, используемый .

COTA = COLLECTIF D'ÉCHANGES POUR LA TECHNOLOGIE APPROPRIÉE

COTATION ASSISTÉE EN CONTINU QUARANTE = КОТАСЬЁН АСИСТЭ АН КОНТИНЮ КАРАТ (или СОРОКОВКА ОТ ПОМОГАЮЩЕГО И НЕПРЕРЫВНОГО КОТИРОВАНИЯ) – CAC (Cotation Assistée en Continu) is an electronic trading system implemented at the Paris Bourse, the French stock exchange, in the late 1980s. It was introduced in 1986 for the handling of less liquid equities, and in 1989 it was operational for all listed stocks. The acronym is also used to refer to the CAC 40® which is a stock index provided by the Paris Bourse. Curiously, the acronym does also fit the name of the early Parisian Stockbrokers' Association, the 'Compagnie des Agents de Change'. The CAC system is in fact a version of an earlier system that was developed by the Toronto Stock Exchange in the mid-1970s:- CATS (Computer Assisted Trading System). In the early 1990s the Paris Bourse developed an upgraded technology known as NSC (Nouveau Système de Cotation), which served as a technological platform for the Euronext initiative. CAC, like CATS, was an order-driven market platform that handled the process of order matching and price setting through a double auction algorithm. It allowed for a full automation of quotation in a centralised, order-driven exchange (which eventually may translate into the disappearance of the open outcry). Cotation Assistée en Continu Quarante is the CAC 40®, the most widely-used indicator of the Paris market, reflects the performance of the 40 largest equities listed in France, measured by free-float market capitalisation and liquidity. Its movements are closely correlated with trends in the market as a whole. It serves as the underlying for futures and options traded on Liffe, NYSE Euronext's leading international derivatives business and it serves as an underlying for ETF's and structured products. The Cotation Assistée en Continu Quarante (CAC 40®) index is the main benchmark for Euronext Paris. Tracking a sample of Blue Chip stocks, its performance is closely correlated to that of the market as a whole. The index contains 40 stocks selected among the top 100 market capitalization and the most active stocks listed on Euronext Paris, and is the underlying asset for options and futures contracts. The base value is 1 000 at 1987-December-31. The Conseil Scientifique is the Supervisor and responsible for setting the rules and the periodical selection. The day-to-day management is carried out by Euronext Indices. The CAC 40® Index only includes shares issued

by companies deemed to be representative of the Euronext Paris equity market. The index consists of:- (i) companies with Euronext Paris as market of reference; and (ii) companies with a market of reference that is not Euronext Paris who qualify based on:- (a) the significant presence (relative to the size of the group) of business assets and/or head-office activities in France and/or employment of significant numbers of staff in France; or (b) significant trading volumes on related derivative products in Paris; or (c) history of inclusion in indices (including takeovers), in so far (a) and/or (b) are applicable for the candidate stock. From this eligible stocks universe, the 100 largest capitalizations are selected. 'Holding' companies are excluded. The list of candidate stocks is made up of the 40 most representative stocks in term of free float adjusted capitalization and turnover. Weighting:- based on free-float adjusted market capitalization. The free-float is rounded up to the next multiple of 5%. Capping:- yes (15%). Review of composition:- quarterly. Effective date of the review:- in principle, the effective date is fixed two weeks (minimum) after the Conseil Scientifique meeting. Review of free float:- annual review (excepted special cases) based on the available information at end August. The effective date is the 3rd Friday of September. Review of capping factor:- annual review (as of free float reviews) at the same effective date, barring exceptional circsonstances. Review of number of shares:- quarterly review (excepted special cases) at the 3rd Friday of March, June, September and December cycle. Calculation frequency:- continuously, every 15 seconds. Base level and base date:- 1 000.00 at 1987-December-31. Base value of capitalization:- 370 437 433 957.70 (the base capitalization of the index was expressed on FRF on 1987-December-31). Other linked products:- Futures (CAC 40®), Options (PXA), Warrants and Certificats. Other linked indices:- CAC 40 Net Total Return (PX1NR) and CAC 40 Gross Total Return (PX1GR), Volatility Index (VCAC), CAC High Dividend (CACHD), CAC 40 Leverage (CACLV), CAC 40 XBear (CACXB) and Short(CACSH), CAC 40 Covered Call (CACCC), CAC 40 Protective Put (CACPP). The CAC 40® (short for the Cotation Assistée en Continu Quarante in French) Index is a narrow-based, modified capitalization-weighted index of 40 companies listed on the Paris Bourse. The index was developed with a base level of 1 000.00 as of 1987-December-31. As of 2003-December-01 the index has become a free float weighted index. Cotation Assistée en Continu Quarante (CAC 40®) is a benchmark French stock market index. The index represents a capitalization-weighted measure of the 40 most significant values among the 100 highest market caps on the Paris Bourse (now Euronext Paris). It is one of the main national indices of the pan-European stock exchange group Euronext alongside Brussels' BEL20, Lisbon's PSI-20 and Amsterdam's AEX. The CAC 40® takes its name from the Paris Bourse's early automation system Cotation Assistée en Continu (Continuous Assisted Quotation). Its base value of 1 000.00 was set on 1987-December-31, equivalent to a market capitalization of 370 437 433 957.70 French Francs. In common with many major world stock markets, its all-time high to date (6 922.33 points) was reached at the peak of the dot-com bubble in September 2000. In 2003-December-01, the index's weighting system switched from being dependent on total market capitalization to free float market cap only, in line with other leading indices. The CAC 40® index composition is reviewed quarterly by an independent Index Steering Committee (in French:- Conseil Scientifique). If any changes are made, they are effected a minimum of two weeks after the review meeting. At each review date, the companies listed on Euronext Paris are ranked according to free float market capitalization and share turnover over the prior 12 months. From the top 100 companies in this ranking, forty are chosen to enter the CAC 40® such that it is 'a relevant benchmark for portfolio management' and 'a suitable underlying asset for derivatives products'. If a company has more than one class of shares traded on the exchange, only the most actively traded of these will be accepted into the index (generally this will be the ordinary share). The CAC 40® is a market value-weighted index. The number of issued shares (used to calculate the market cap and hence the index weight) of a company is reviewed quarterly, on the third Friday of March, June, September and December. Since December 2003, the index weightings of companies in the index have been capped at 15% at each quarterly index review, but these range freely with share price subsequently. A capping factor is used to limit the weights to 15% (if necessary), and is reviewed annually by the Index Steering Committee on the third Friday of September. The CAC 40® index is an index weighted by free-float market capitalization that measures the performance of 40 equities listed on Euronext's regulated markets in Paris. The CAC 40® index is designed to reflect the general trends in the trading of shares listed on Euronext Paris. It is made up of shares issued by 40 companies selected among the 100 largest and most traded stocks on Euronext in such a way that it is not only a suitable underlying asset for derivatives products, but also a relevant benchmark for portfolio management. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). пузырь (bubble). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). Парижская Биржа (или Пари Бурс (Paris Bourse)) (ныне Оронэкст Пари (Euronext Paris)). Индекс по Сороковке от Помогающего и Непрерывного Котирования или, как это звучит на Французском языке, Котасьён Асистэ ан Континю Карат (Сэ.А.Сэ. 40® или КАК 40®; Cotation Assistée en Continu Quarante (CAC 40®)) является важнейшим фондовым индексом во Франции. Индекс вычисляется как среднеарифметическое, взвешенное по капитализации значение стоимости акций 40 крупнейших компаний, акции которых торгуются на бирже Euronext Paris. 31 Декабря 1987 было установлено первоначальное значение индекса, составившее 1 000.00 пунктов. Начиная с 01 Декабря 2003 при подсчёте капитализации учитываются лишь акции, находящиеся в свободном обращении (free float). Индекс вычисляется каждые 15 секунд в рабочие дни биржи с 09:00 до 17:30 по Центрально-Европейскому Времени (Central European Time (CET); UTC +1). Индекс Сэ.А.Сэ. 40® или КАК 40® (CAC 40®) – широкобазисный индекс обыкновенных акций на Парижской Бирже (Paris Bourse); базируется на ценах акций 40 из 100 крупнейших компаний, зарегистрированных в официальном перечне компаний на форвардном сегменте рынка; имеет базис 1 000.00. Подобен Промышленному Индексу от Дау Дьжонз (Dow Jones Industrial Average). Существуют также индекс фьючерсных и индекс опционных контрактов, основанные на базе индекса CAC 40®.

COTHURNUS = КОТУРН (или КОУТЁНЭС) – Cothurnus is a high thick-soled laced boot worn by actors in Greek and Roman tragic drama. Also called Cothurn. / обувь высокого покроя на толстой подошве и шнурках. Башмаки трагических (драматических) актёров.

COTIF = CONVENTION RELATIVE AUX TRANSPORTS INTERNATIONAUX FERROVIAIRES

THE COTLOOK® A INDEX = ИНДЕКС А ОТ КОТЛУК® – The Cotlook® A Index is a proxy for the world price of cotton. It is an average of the cheapest five quotations from a selection of the principal Upland Cottons (currently 19) traded internationally. For a more detailed description visit the Cotlook, Ltd website (http://www.cotlook.com). Recently, the A Index has changed emphasis by representing offering prices based on CFR Far Eastern main ports terms. As of 2008-August-01, the 'A' Index quote reported in the above table will be based on CFR Far Eastern quotes. Quotes prior to 2008-August-01, were based on CIF North Europe values. The Cotlook® A Index is average of cheapest 5 quotations from a current selection of the 15 styles of principal Upland Cottons of Middling 1-3/32" quality traded internationally. Cash price for cotton from 15 different countries or areas are used to form this index. The Cotlook® A Index began life almost 50 years ago, representing the average level of offering prices for the most competitive and widely traded cotton. In its infancy the Index was a measurement of shippers' offers to mills of 1-1/16" lint, but this was changed at the beginning of the 1981/82 season to 1-3/32", to reflect the prevalence of that staple on the international cotton market (grade was also changed from SM to Middling, so as to capture the widest possible spectrum of growths in the Index calculation). More recently, given the further gain in the amount of 1-1/8" cotton traded in the international market, and the Index's purpose of being representative of the bulk of the cotton traded, it was announced that the staple length to be taken into consideration for the 2015/16 Index will be adjusted to 1-1/8". In contrast to some other fiber quality parameters, for which environment can be an important factor, staple length is determined primarily by genetics. The type of cottonseed planted, and inherent qualities therein, are crucial when attempting to produce a crop of longer staple lint. Thus, the primary method for improving staple length is varietal improvement in seed type. This can be achieved through

various methods, including selective breeding and improved seed technology. Several of the world's largest producers – including most of those whose cottons are taken into consideration in compiling the A Index – have increased their share of the 1-1/8" staple market in the past few decades. There are currently 19 origins from which cotton is eligible for the Index but a number of these are not exported in any volume at present. Those that are include US, Indian, Uzbek, Brazilian, West African and Greek. In the United States, the world's largest exporter of raw cotton, staple length has been increasing steadily for some time. In 2013/14, 63 percent of the crop was 36 staple or longer, and the average, beltwide staple length was 35.8. The US's reputation as a net exporter is supported by that origin's rigorous industry standards (for instance, low contamination and consistency when packing and transporting bales), which has stood it in good stead with spinners. However, a factor which cannot be overlooked today is the high frequency of 1-1/8" staple cotton in the US crop, which makes it especially desirable for spinners wanting cotton for the production of the medium and medium higher counts of cotton yarn. The accompanying chart demonstrates the consistent improvement in US staple length since the turn of the century. The crop in India has also improved in terms of staple length. The main drivers are cited by industry members as the introduction of new hybrid or genetically modified (GM) seeds and good farming practices (achieved mainly through investment and education in the sector). Type J-34, for example, which had been classified by the government as 24.5 to 25.5 mm staple length as recently as two seasons ago, was in 2014 classified as being between 27.5 and 32 mm. This type, as well as many others, has been boosted by the large-scale introduction of GM seeds, which now account for the vast majority of the Indian crop. The emphasis placed on 1-1/8" varieties in the Minimum Support Price levels for 2014/15 is indicative of the shift, and even electronic markets have reflected the prevalence of longer staple lint in the Indian marketplace, with the country's two major futures trading platforms, ACE and MCX, running contracts based on 28.5 and 29.0 mm, respectively. In 2013/14, over half of India's bumper crop was 1-1/8" cotton, and as the volume of India's production has increased, so has the output of 1-1/8" lint. As the world's second largest exporter, India does significantly influence the volume of 1-1/8" cotton available in the international marketplace. In Uzbekistan, the general volume of production has declined slightly, owing to the transfer of land less suited to cotton production to other agricultural products. At the same time, however, varietal improvements and investments in ginning have increased the proportion of the crop which is 1-1/8" staple. In 2006/07, Bukhara 8, a longer staple upland variety, was considered an 'experimental' seed type, and was planted on only around 50 000 hectares (ha). In 2013/14, the area planted to that variety had grown to almost 120 000 ha, and similar expansion is observed for several seed types now used as standard in the Uzbek crop. In 2013/14, the proportion of Uzbekistan's crop which was classed as 36 mm was 70 percent, compared with 63 percent in 2005/06. The pace of this improvement may not be as dramatic as in some other origins, but it still represents a steady transition which has seen the Uzbek crop come to be considered as a premium staple fiber on the international stage. Significantly, a new range of geneticallyengineered seed types that will offer even better technical parameters, including staple, is under development. Cotton seed varietal developments have brought about general improvement in fiber parameters in Brazil, including staple length. In 2008/09, almost 23 percent of the crop was 1-3/32", 31 percent was 1-1/8" and almost 40 percent was longer, according to HVI classing data. Two seasons later, the comparable percentages were 22.3 percent, 35.8 percent and 37 percent. Data for subsequent years show that cotton above 1-1/8" staple has increased from 73 percent in 2010/11 to over 94 percent in 2013/14 in Mato Grosso, from less than 48 to over 92 percent in Mato Grosso do Sul and from 68 to 80 percent in Bahia. In 2013/14, the proportion of 1-1/8" and longer fell sharply in Goiás, to less than 40 percent, with a corresponding rise in the 1-3/32" category; in the three previous years, the proportion of 1-1/8" in the state was above 70 percent. The African Franc Zone has long been a producer of 1-1/8" lint, and Chad and Cameroon in particular have increased the proportion of their output of 1-1/8" and 1-5/32" in recent years. The introduction of types such as Pleb and A51 has contributed to the general improvement of staple length, owing primarily to the genetic advantages of those seeds. In Greece, almost all of the cotton produced now is 1-1/8" staple, but this change has only been apparent in the past ten years or so. The adoption of new seed varieties, including genetically modified seeds which are resistant to pests and herbicides, has been the root of staple improvement. This has coincided with the decline of the domestic textiles sector, which has been winding down since the early 2000s. Consumption has fallen dramatically. In consequence, the importance of export markets has risen, and the cotton produced has therefore increasingly, been geared to meeting overseas markets quality requirements. Given the steady shift to 1-1/8" cotton in these and other growths which are eligible for the A Index, the timing seems right for a switch to be made to this parameter, so as to maintain the Index's position as a reliable barometer of world market values. The Cotlook® A Index is published daily by a private company Cotlook Ltd, Liverpool, The United Kingdom. This index is intended to represent the level of competitive offering prices for cotton delivered to the Far Eastern and North European ports on the international raw cotton market. This index was first introduced in 1966. The A Index has been published by the trade group Cotlook since the 1960s and is considered to be representative of a 'world cotton price'. This price index is based on daily surveys of cotton merchants and describes an average of export prices offered by international cotton merchants for shipment to spinning mills in the Far East, where the majority of the world's cotton is spun into yarn. Only 'medium grade' cotton fiber can be included in the average that is the A Index, and there are currently 16 different Cotton Varieties from around the world that are eligible. However, with certain restrictions, only the five least expensive eligible Varieties are used to derive the A Index. The rationale behind the use of the cheapest values in the average is that the cheaper options could be expected to be more heavily traded. Therefore, an average of the cheaper varieties prices could be more reflective of transactions in the global market. The A index tends to be higher than the New York Nearby for two reasons:- (1) the quality of the cotton represented by the A Index is slightly higher than the quality represented by New York futures; and (2) the A Index prices include shipments to the Far East. A Index is a proxy for the world price of cotton. It is an average of the cheapest five quotations from a selection of the principal Upland Cottons (currently 19) traded internationally. For a more detailed description visit the Cotlook Ltd. website. In August 2004, A Index changed emphasis by representing offering prices based on CFR Far Eastern main ports terms. / Котлук Лимитид (Cotlook Ltd) (или Ливэпул Котчэн Совисиз, Эл.ти.ди. (Liverpool Cotton Services, Ltd)), Ливерпул, Соединённое Королевство, издателем Котчэн Аутлук (Cotton Outlook). Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Индекс А от Котлук® (зарегистрированный Ливерпулской компанией Котлук Лимитид (Cotlook Limited)) является среднеарифметическим значением для 5 самых дешёвых из 15 предлагаемых разновидностей хлопкового волокна Среднего качества со штапельной длиной волокна 1-3/32 дюйма. При формировании этого индекса используются цены на наличный хлопок из 15 различных стран или регионов. Индекс А от Котлук® (The Cotlook® A Index) предназначен для хлопка, который классифицируется как Средний (Мидлинь) 1-3/32". Индекс высчитывается просто как среднее арифметическое пяти самых дешёвых котировок текущего дня из шестнадцати отобранных для Индекса сортов хлопка. Например, нижеперечисленные сорта были отобраны для 2001/02 Индекса А:- Мемфис Восточный, Калифорния/Аризона, Турецкий Измир/Анталия, Африканский 'Франк Зона', Индийский H-G/Mech-1, Бразильский, Китайский тип 329, Мексиканский, Пакистанский 1503, Сирийский, Танзанийский тип 2 RG, Греческий, Испанский, Австралийский, Узбекский, Парагвайский.

THE COTLOOK® B INDEX = ИНДЕКС Б ОТ КОТЛУК® – The Cotlook® B Index is published daily by a private company Cotlook Ltd, Liverpool, The United Kingdom. This index is intended to represent the level of competitive offering prices for cotton delivered to the Far Eastern and North European ports on the international raw cotton market. This index was first introduced in 1972. The Cotlook® B Index is average of cheapest 3 of 9 styles of Strict Low Middling 1-1/16" quality so marked, taking nearer shipment when two are quoted. Cash price for cotton from 9 different countries or areas are used to form this index. / Котлук Лимитид (Cotlook Ltd) (или

Ливэпул Котчэн Совисиз, Эл.ти.ди. (Liverpool Cotton Services, Ltd)), Ливерпул, Соединённое Королевство, издателем Котчэн Аутлук (Cotton Outlook). Индекс Б от Котлук® (зарегистрированный Ливерпулской компанией Котлук Лимитид) был введён в обращение в 1972. Он является среднеарифметическим значением для 3 самых дешёвых из 9 предлагаемых разновидностей хлопкового волокна качества Строго Низкого Среднего со штапельной длиной волокна 1-1/16 дюйма. При формировании этого индекса используются цены на наличный хлопок из 9 различных стран или регионов. С 01 Августа 2008, то есть начиная с сезона 2008/09 Индекс Б был выведен из обращения. Индекс Б от Котлук® (The Cotlook® B Index) предназначен для хлопка, в основном применяемого в производстве низкономерной пряжи. Индекс представляет собой среднее арифметическое трёх самых дешёвых котировок текущего дня из восьми выборочных сортов:- Орлеан/Техас SLM 1-1/32", Аргентинский сорт С-1/2, Бразильский тип 5/6, 1-1/16", Турецкий Адана Станд. I RG, Узбекский SLM 1-1/16", Китайский тип 527, Пакистанский Афзал 1-1/32", Индийский J-34, 1-1/32". В связи с тем, что качество и наличие хлопка из разных стран меняется, изменения (дополнения или исключения) вносятся в перечень отобранных сортов. Однако, следует заметить, что такого рода изменения в перечень вносятся только после предварительного предупреждения.

COTLOOK LIMITED = КОТЛУК ЛИМИТИД – Cotton Outlook is published by Cotlook Limited, an independent Merseyside-based company that has been engaged in publishing cotton news for around 80 years. Cotton Outlook is run and staffed by people who have no trading interest in raw cotton, and has thus won a world-wide reputation for accuracy and impartiality. For over 25 years it has compiled and published the Cotlook A Index of raw cotton values. The A Index is widely regarded as the reliable barometer of world cotton values, and is referred to by the major international cotton organizations, such as the International Cotton Advisory Committee, and for many years has been used as a key price in US farm legislation. The Index is used in many different ways by various countries and trading organizations. At the moment Cotlook Limited is a subsidiary company of The Outlook Group Limited. Other members of the same group include Liverpool Cotton Services, which is a provider of cotton arbitration services. Cotlook Ltd (Cotton Outlook) can trace its origins back to 1923 (Reuters claim to have communications from our forerunner dated in the late XIX century but we cannot verify that), when Liverpool was one of the major international port for a range of commodities including cotton. Peak imports of over one million tons of cotton had been in the 1911/12 season. Local textile industry, benefiting from plentiful supply of raw materials was thriving. It all began with a production of regular news letter by a Liverpool cotton broker, Mr. Windle, for his clients. The original purpose was to assess factors influencing cotton coming into Liverpool, with Lancashire still a huge cotton consumer. Information was collated and published on crop sizes, shipments into Liverpool, Liverpool/Manchester cotton stocks and so on. In the post second world war years, with the decline of the Liverpool market, the publication broadened its coverage under the heading 'Cotton and General Economic Review'. In the 1960's, a telex-based daily information service was launched. As communications changed through the subsequent years, Cotlook services became available by different means, first by fax, then by email, and now via their website. The Cotlook® A Index was created in 1966. The initial published value was 31.05 cents per pound. It was initially a CIF Liverpool price but quickly changed to a CIF Northern Europe value. As from March, 2003, the substantive A Index has been quoted C/F main Asian ports. From 1988 onwards, a 'Dual Index System' has operated, in that two Indices are quoted from as early as practicable every spring, one showing nearby values, the other reflecting forward shipment prices, with the nearby Index withdrawn on July 31 each year. In the late 1970's, Cotlook Memphis was opened, to expand our coverage of the US market. In 2004, Cotlook invested in its Chinese joint venture, Beijing Cotton Outlook (in partnership with the China National Cotton Exchange and the China Cotton Association). Cotlook has direct employees in the United Kingdom, the United States of America, China and India and a worldwide network of correspondents and agents. Today, the Cotlook Indices are acknowledged by the trading fraternity, governments, and international organizations such as the United Nations Committee on Trade and Development (UNCTAD) and the International Cotton Advisory Committee (ICAC), as accurate measures of the fluctuation of international raw cotton values. Several producing countries incorporate the indices, or elements thereof, into national farm or marketing legislation. Cotlook Ltd is not engaged in cotton trading. Cotlook's role is to monitor and report the A Index impartially and accurately. The Cotlook® A Index is compiled solely by the staff of Cotlook, who are barred from engaging in any trading activity in cotton. Their integrity has been proven over the four decades in which the A Index has been compiled. Cotton Outlook is not linked with the International Cotton Association in any way, apart from some of its staff are members of the Association. Cotlook is short for Cotton Outlook, our traditional weekly news journal, which is circulated in over 100 countries. Cotlook is wholly owned by The Outlook Group Limited, PLC (was founded on 18 March 1957) which in turn is owned by its working directors. Cotlook's sister companies within the Group are engaged in arbitration and consultancy services. Cotlook Ltd is the leading commercial provider of international cotton market information and analysis and is the source of the Cotlook® A Index. The company's origins stretch back over eighty years and its staff have developed an unrivalled reputation for their expertise, impartiality and integrity. Cotlook Ltd offers services in English, Spanish, Portuguese and Russian. Also, its services are available in Chinese via Beijing Cotton Outlook. Established in 2004, Beijing Cotton Outlook is a joint venture between the China Cotton Association, the umbrella organization of the China Cotton industry, the China National Cotton Exchange (CNCE), the body responsible for spot auctions of government reserves and e-trading for forward delivery, and Cotlook Limited. Beijing Cotton Outlook, with full access to Cotlook's resources, is a vehicle for providing unrivalled information in Chinese to China's domestic cotton and textile industries. Cotlook publishes Beijing Cotton Outlook's comprehensive information about developments in China in other languages. The A Index began as a CIF Liverpool value in the days when the UK still retained a sizeable spinning industry. It later became a CIF North Europe value, as the industry in the UK fell into decline. Most recently (with effect from 2004-August-01) the A Index has changed emphasis by representing offering prices based on C/F Far Eastern main ports terms. An Index based on C/F Far Eastern values has been compiled and published since March 2003 and has typically shown a small discount on the North European A, which is logical, given that, today, more cotton is being traded in Far Eastern markets. Today, the Cotlook A Index is compiled from the cheapest five offering prices to mills of a basket of growths (currently 19), on the assumption that these are likely to be the cottons most frequently traded on the day in question. The mechanism of averaging the cheapest quotations has been proved to be a reliable method of calculating the Index over its forty-year existence. The North European A Index value, and its companion B Index (for 'coarser count' cottons), now referred to as the A (NE) and the B (NE) will continue to be calculated until 2008-July-31. The Cotlook Indices are calculated from the prices at which cotton is offered to the final consumers, i.e. mills. Cotlook indicates a representative quotation for each component of each Index. If evidence of offers is slim, a component may be denoted as 'nominal' or withdrawn. Offering prices are monitored each UK business day and are published, together with the day's indices at about 02:30 pm (14:30) UK time. From January 19, 2015, the Cotlook® A Index will be published at 14:30 hours UK time as usual for subscribers. The Index will become publicly available 16 hours later. Since the quotations are intended to reflect the competitive level of offering prices, not the level at which business has been arranged, a mill buyer would normally expect to succeed with bids that were slightly lower. It is from these daily quotations that the Cotlook® A Index and the North European indices are calculated. Today, the Cotlook® Indices are acknowledged by the trading fraternity, governments, and international organizations such as UNCTAD and ICAC, as accurate measures of the fluctuation of international raw cotton values. Several producing countries incorporate the indices, or elements thereof, into national farm legislation. Cotlook Limited and its predecessors have been monitoring world cotton prices for some eighty years. In 1966, the Cotlook® A Index was introduced. It has gone through many changes over the years, to reflect changing patterns of trade and cotton qualities. It began as a SM 1-1/16" value but is today a Middling 1-3/32" price. The bulk of the world's major Cotton crops produce cotton that falls into this quality category and it

is therefore the most representative quality of the cottons traded internationally. Certain markets are admittedly dependent on higher quality description to meet their spinning requirements. These cottons include Australian, Californian, some Central Asian and some West African. But the price differentials between such cottons tend to be wide, since other factors come into play, such as even-running quality, nep content, strength and bale packaging, amongst many others. Californian Acala SJV and some Australian cottons command a significant premium over other competing origins. These premiums are typically well established and familiar to most buyers and sellers of cotton. They are fully reported by Cotlook in our Cottonquotes service. This service also reports prices for lower grade cottons, as well as extra-long staple cotton values. Use of a Middling quality gives the broadest possible scope to the growths eligible for the A Index and therefore assures its reliability as the prime indicator of world cotton prices. The international cotton market is dependent on the New York futures market, which is, without a doubt, the principal tool for hedging price risk and price discovery. However, only US cotton is tenderable against the New York contract and, at times, history has demonstrated that divergences can arise between New York, which is subject to speculative influences, and actual cotton values. This is where the Cotlook® A Index has played a vital role in portraying price trends over the years. The A Index and New York tend, over the long term, to move in a similar direction but there have been significant deviations, with New York sometimes trading above or below the Index. The Cotlook® A Index is a price barometer and is proved to have become a useful indicator of where values are on the day. For part of any year (starting in about March through to July 31), two values are produced, one to reflect nearby shipment offers, the other to indicate Northern Hemisphere new crop values. The Cotlook® A Index has long been regarded as the recognized barometer of world prices. It is used by the United Nations Committee on Trade and Development (UNCTAD) as a component of its agricultural price measure. It has been used since the nineteen seventies as the preferred price measure by the International Cotton Advisory Committee (ICAC), the 'United Nations of cotton', as the device by which that body follows price developments. The ICAC has developed a price-forecasting model which attempts to predict the season's average level of the Cotlook® A Index as a guide to its member countries. Since 1985, the Cotlook® A Index has been the principal ingredient of the US Commodity Credit Corporation's Upland 'marketing loan' (whereby US farmers borrow money from the government with their cotton as collateral, and repay the loan at a lower rate, if a value based on the Cotlook® A Index is below the loan value). Since 1990, the US 'competitive adjustment procedures' have used the Cotlook® Indices in order to determine additional payments to US domestic mills and exporters. These values refer to North European prices, i.e. the A (NE) and B (NE) Indices. The second of these procedures, known as 'Step 2', will be withdrawn as from 2006-July-31. Following the break-up of the Soviet Union, Uzbekistan's Ministry for Foreign Economic Relations and equivalent bodies in the other Central Asian republics have all determined their export selling prices by reference either to the Cotlook® A Index or an average of the A Index and its Uzbek component. The A Index has also been used to establish prices payable to farmers in some of those countries. The Cotlook® A Index is difficult to use as a hedging device but there are banks and other organizations that offer specialised trading products whereby the Cotlook® A Index can be used a hedge. The foregoing are a few examples of how the A Index is used. Reference to the A Index in establishing prices can be found in many other countries, stretching from Latin America to China. In China, several studies conducted by Beijing University on behalf of the government have employed the A Index in one way or another. Apart from weekly reports in our Cotton Outlook, some of which contain yarn price information, we also publish the Cotlook Yarn Index. The Index is designed to monitor movement in yarn prices and is derived by calculating an average from a set of FOB prices for ring spun carded 20's and 30's from six origins (weighted to reflect exports of all yarns from each individual country) and is expressed as a percentage of the comparable value for July 2000. / Котлук Лимитид (Cotlook Ltd) (или Ливэпул Котчэн Совисиз, Эл.ти.ди. (Liverpool Cotton Services, Ltd)), Ливерпул, Соединённое Королевство, издателем Котчэн Аутлук (Cotton Outlook). Котлук (Cotlook) – сокращение от Котчэн Аутлук (Cotton Outlook), Аутлук Груп Лимитид, Пи.Эл.Си. (Outlook Group Limited, PLC). Виндл (Windle). Ройтас (Reuters). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо) . Индекс А от Котлук® (Cotlook® A Index). Название компании Котлук Лимитид (Cotlook Limited) было взято как производное от двух слов Cotton Outlook с добавлением типичного окончания Limited для обозначения статуса компании с ограниченной ответственностью. Она была зарегистрирована в 1982. До того времени она действовала под названием Liverpool Cotton Services. флуктуация (колебание). Компания Котлук Лимитид продолжала и далее регулярно пересматривать базовую структуру Индекса А от Котлук® и его составных компонентов. В самом начале нового тысячелетия наблюдалась общая тенденция увеличения штапельной длины производимого хлопкового волокна и спрос на него на ключевых потребительских рынках мира. Преобладающие изменения коснулись тенденции увеличения штапельной длины в 1-3/32" до нормы в 1-1/8''. По этой причине компания Котлук Лимитид в Августе 2014 приняла решение внести изменения в параметры штапельной длины Индекса А с начала публикации этого индекса для сезона 2015/16. Таким образом, Индекс А от Котлук®, начиная с сезона 2015/16, будет отражать хлопок с общими качественными характеристиками такими же, как и сегодня, но со штапельной длиной 1-1/8''. О других изменениях в качественных параметрах Индекса А и его составных компонентах компания на тот момент не заявляла. Индексы от Котлук® – почти пятьдесят лет Котчэн Аутлук публикует котировки на условии СИФ (стоимость товара, страхование, фрахт) на сырьё из основных регионов происхождения. Индекс впервые был опубликован в 1966, а с 1973 его вычисление производится ежедневно. Географической базой наших котировок является СИФ Порт Северной Европы, а качественной основой Индекса А является Средний (Мидлинь) 1-3/32". Каждый рабочий день в Соединённом Королевстве Котчэн Аутлук публикует приблизительно в 14:30 по местному времени обширный перечень предлагаемых цен на основные выращиваемые сорта хлопка. Цены выводятся редакторской коллегией, члены которой не вовлечены ни в какие торговые операции. Цены выражены в центах США за 1 фунт веса СИФ платежа по документам по прибытию судна в Северо-Европейский порт, включая комиссионные агента. Поскольку котировки предназначены отражать конкурентный уровень предлагаемых цен, а не уровень на котором заключена сделка, потребитель обычно надеется заключить сделку по цене немного ниже котировки. На основе дневных котировок вычисляются Индексы А и Б. В настоящее время индексы признаны торговыми кругами, правительствами и международными организациями, такими как:- Конференция Организации Объединённых Наций по вопросам торговли и развития и Международный Совещательный Комитет по Хлопку. Некоторые страны включили Индексы или отдельные его компоненты в своё государственное фермерское законодательство. Двойная Система Индексов:- по двойной системе индексов два индекса (один представляет котировки на ближайшие отгрузки текущего сезона, а другой – форвардные котировки следующего сезона) публикуются параллельно с момента поступления форвардных цен до конца торгового сезона, который длится до 31 Июля. После этого, существующий Текущий Индекс исчезает, а Форвардный Индекс становится новым Текущим Индексом. С этого момента только новый текущий индекс публикуется до ранней весны следующего года, когда начинает поступать информация о новых форвардных котировках (на Октябрь/Ноябрь и более поздние поставки) будущего сезона. Вновь вводится новый Форвардный Индекс. Дата начала публикации нового Форвардного Индекса не указывается в связи с тем, что это зависит от условий рынка. Котировки на хлопок из Южного Полушария игнорируются в вычислениях Индекса, независимо от того указаны они в перечне цен или нет.

COTO = CASH OR TITLE OPTION

COTRANSFORMATION = КОТРАНСФОРМАЦИЯ (или СОТРАНСФОРМАЦИЯ) – Cotransformation is the simultaneous transformation of an organism with two or more genes, one or more of which is silent (non-selected) while at least one gene confers antibiotic resistance or another identifiable or selectable trait.

COT REPORT = COMMITMENTS OF TRADERS REPORT

COTS = COMMERCIAL OFF–THE–SHELF

COTTA = СТИХАРЬ (или ХХ) – Cotta:- a waist-length surplice.

COTTAGE STEAMER = КУСТАРНЫЙ ИСПАРИТЕЛЬ – Cottage Steamer is a chamber used for batch steaming of printed or dyed textiles. Cloth is looped on 'poles' on a special cart which fits into the steamer for processing.

COTTED = СПУТАННОЕ (или КРАЯ РУНА, ПРИОБРЕТШИЕ МАТОВОСТЬ) – Cotted:- a fleece that contains fibers that are matted (or felted) together.

COTTON = ХЛОПОК (или ХЛОПЧАТНИК) – Cotton is a soft, staple fiber that grows in a form known as a boll around the seeds of the Cotton Plant. The fiber most often is spun into yarn or thread and used to make a soft, breathable textile, which is the most widely used natural-fiber cloth in clothing today. It is of medium strength and dyes well. See also American-Egyptian Cotton, Cotton Plant, Egyptian Cotton, Peruvian Cotton, Pima Cotton, Sea Island Cotton, Supima®, Upland Cotton. Cotton is a natural, renewable and biodegradable resource; cotton is the largest natural fiber in the global fiber, textile and apparel economy, now representing roughly 80 percent of all natural fibers consumed. Cotton represents hundreds of billions of Dollars of economic activity and globally employs hundreds of millions of people from field to fabric. Cotton is a soft, white vegetable (cellulosic) fiber obtained from the seed pod of the Cotton Plant, a member of Mallow Family (Gossypium). Cotton is produced in about 75 countries. The two principal types of Cotton grown in the United States are Upland Cotton (Gossypium Hirsutum) and American Pima Cotton (Gossypium Barbadense). Upland Cotton is grown throughout the Cotton Belt, accounting for about 99 percent of US Cotton production. The types of Cotton grown, or once grown, in the United States are as follows:- (i) Upland Cotton; and (ii) Extra-Long Staple (ELS) Cotton:- (a) American Pima Cotton, and (b) Sea Island Cotton. Cotton is a general term used variously to refer to the Cotton Plant (Genus Gossypium); agricultural crop; harvest product; white fibers (lint) ginned (separated) from the seed; baled produce; and yarn or fabric products. Cotton is classified as upland or extra long staple depending on fiber length. Cotton is a food, feed, and fiber. A soft, white fibrous substance composed of eliptical cells surrounding the seeds of various freely branching tropical plants. Cultivated Cotton is a Perennial Shrub, Genus Gossypium. There are two major Species in current production:- (i) Gossypium Hirsutum, commonly known as Upland Cotton; and (ii) Gossypium Barbadense or Pima Cotton. Fiber yielded by the seed pod of the Gossypium shrub, grown in sub-tropical countries, showing about 130 different Varieties. The fiber is either white or yellowish, in many cases turning into reddish brown, the average length varying between 0.89 and 1.61 (2) inches. Under microscope the Cotton fiber is similar to a twisted ribbon and consists chiefly of cellulose. Cotton:- The Plant:- The Cotton fiber grows on the seed of a Variety of Plants of the Genus Gossypium. Of the four Cotton Species cultivated for fiber, the most important are Gossypium Hirsutum, which originated in Mexico and produces 90% of the world's Cotton, and Gossypium Barbadense, of Peruvian origin, which accounts for 5%. World average Cotton yields are around 800 kg per hectare. The Fiber:- Cotton is almost pure cellulose, with softness and breathability that have made it the world's most popular natural fiber. Fiber length varies from 10 to 65 mm, and diameter from 11 to 22 microns. It absorbs moisture readily, which makes Cotton clothes comfortable in hot weather, while high tensile strength in soap solutions means they are easy to wash. Almost pure cellulose, Cotton is the world's most widely used natural fiber and still the undisputed 'king' of the global textiles industry. Uses Of Cotton:- An estimated 60% of Cotton fiber is used as yarn and threads in a wide range of clothing, most notably in shirts, T-shirts and jeans, but also in coats, jackets, underwear and foundation garments. Cotton is also used to make home furnishings, such as draperies, bedspreads and window blinds, and is the most commonly used fibre in sheets, pillowcases, towels and washcloths. Its is made into specialty materials suitable for a great variety of applications:- fire-proof apparel, Cotton wool, compresses, gauze bandages, sanitary towels and Cotton swabs. Industrial products containing Cotton include bookbindings, industrial thread and tarpaulins. Producers:- Cultivated in around 80 countries, Cotton is one of the world's most widely produced crops and uses about 2.5% of the world's arable land area. Cotton is fundamental to the economies of many developing countries, particularly in West and Central Africa, where around 10 million small farmers depend on the sector for their income. Production And Trade:- The world produces around 25 million tons of Cotton every year. Six countries – China, Brazil, India, Pakistan, the USA and Uzbekistan – account for more than 80% of total production. From a net exporter, China has become a major purchaser of raw Cotton, with imports of 3.2 million tons in 2006, mainly from the world's leading Cotton exporter, the United States. Less Pesticide, More Income From Cotton:- With 'Cotton ecosystem analysis', Asian farmers learn to study pests close up in their fields and use insecticides only when necessary. Cotton is king in Asia. China, India and Pakistan alone account for almost 60% of the global Cotton harvest and more than 70% of the world's Cotton growers. Cotton in Asia is predominantly a crop of the poor, providing the main source of income of more than 100 million low-income, small scale farmers. Cotton processing provides jobs for millions of factory workers, many of them women. Little wonder, therefore, that Cotton production is an important part of rural development strategies in many Asian countries. But Cotton production often involves intensive use of pesticides, mainly insecticides, which can pose a serious hazard to the health of farmers and consumers, agro-biodiversity, drinking water and ecosystems. In Asia, the use of synthetic pesticides – many of them classed as 'highly hazardous' and banned in developed countries – increased exponentially with the introduction of improved Cotton varieties and hybrids, which are higher yielding but also more susceptible to pests than traditional cultivars. As pests developed resistance, pesticides become less effective and farmers began applying them with greater frequency, aggravating the economic, environmental and social costs. In the late 1990s, insecticides accounted in some Asian countries for an estimated 40% of the cost of Cotton production, which not only limited profitability but forced many farmers to take out ruinous, high-interest loans to pay for them. Alternative Strategies:- But there is also good news. Phytosanitary standards in international trade, growing consumer awareness, and concern over the degradation of natural resources have all prompted a growing number of Cotton producing countries in Asia to limit pesticide use and adopt alternative strategies for protecting those valuable cotton plants against pests. One successful approach is Integrated Pest Management (or IPM), a knowledge-based strategy that seeks to reduce the use of pesticides by preventing pests from becoming a threat. It trains farmers to monitor their field for potential outbreaks and use a combination of biological, cultural and – when necessary – chemical controls to manage pest damage by the most economical means, and with the least possible hazard to people and the environment. IPM proved itself during the 1980s, when Indonesia faced widespread pest outbreaks in its Rice fields, provoked by massive overuse of subsidized pesticides. While the government sharply reduced the distribution of the chemicals, the UN Food and Agriculture Organization (FAO) supported the creation nationwide of Farmers' Field Schools (FFS), where small groups of farmers joined participatory open-air training sessions to learn IPM techniques. The result was a general reduction in pesticide use, by as much as 50% in some areas. The approach was applied to Cotton in 1999, when FAO and the European Union launched a five-year regional programme covering Bangladesh, China, India, Pakistan, the Philippines and Vietnam. The programme developed 'Cotton ecosystem analysis', in which participants meet once a week during the Cotton season and, in small groups, make detailed

observations of two study plots – an IPM plot and a ‘farmer practice’ plot. By comparing notes and drawings of what they observe, the farmers become better decision makers and field managers, discovering, for example, that not all pests and not all pest population levels require control at all. ABC Of IPM:- Integrated Pest Management uses a variety of practices to reduce the need for chemical pest control. They include:- (i) Cultural:- e.g., using pest-resistant local crop varieties, crop rotations and intercropping; (ii) Mechanical:- heat sterilizing soils, culling insect pests by hand or machine; (iii) Biological:- using natural products for pest control, enhancing pest predator populations; and (iv) Biotechnological:- using pheromones for a more targeted and effective pest control. Higher Yields, Profitability:- Strengthening farmers’ ecological knowledge and control over management of their fields has had important economic and social benefits. In India, farmers in one area reduced the seasonal application of active pesticide ingredients from more than 1000 ml to just 250 ml per hectare. Economic evaluation showed that the gross margin income of Cotton farmers practising IPM rose by as much as 23% thanks to higher yields and reduced spending on pesticides. In Pakistan, 12% of trained FFS farmers escaped from poverty thanks to higher crop profitability. At the same time, reducing farmers’ exposure to pesticides led to a 50% drop in cases of acute poisoning among field workers at some of the project sites. IPM may have a role even in fields sown with genetically modified BT Cotton, which contains a gene that produces the Bacillus Thuringiensis (BT) toxin fatal to some species of caterpillars. BT Cotton was introduced to reduce the need for chemical pest control, and it is generally accepted that it has contributed to a significant reduction in insecticide use. However, recent outbreaks of secondary pest infestations, such as mealy bugs in North India, have led to government calls for farmers to revert to pesticides. Furthermore, the effectiveness of BT Cotton depends on preventing development of resistance in Bollworm, the most serious Cotton pest – that is why it is mandatory, but practically impossible on small plots, for farmers growing BT Cotton to plant 20% of their land with the non-BT hybrid. By addressing the emergence of previously unproblematic insects, IPM management can add significant value and sustainability to the achievements of BT Cotton. Cultivated Cotton is a perennial shrub from the Genus Gossypium. There are two major Species in current production – predominantly Gossypium Hirsutum, commonly known as Upland Cotton, and some Gossypium Barbadense. See also Gossypium Barbadense, Gossypium Hirsutum, Pima Cotton and Upland Cotton. Cotton No. 2:- Cotton of US origin only, of certain minimum standards of basis grade and staple length (strict low middling staple length:- 1 2/32nd in) to be delivered at the following delivery points:- Galveston (TX), Houston (TX), New Orleans (LA), Memphis (TN), Greenville/Spartanburg (SC). Exchanges:- ICE Futures US® and NYMEX®. Cotton is a white or yellowish white vegetable fiber from a plant related to the hollyhock, and grown in the United States, Russia, China, India, and other countries. Cotton is the name of the fiber and also the fabric made from the fiber. Different types of Cotton plants produce Cotton of higher or lower quality, usually associated with staple length and fineness of the fiber. Certain names for these plants are occasionally seen in advertising – Sea Island, Egyptian, and Pima – to indicate quality of the fiber. Cotton is a plant of the Genus Gossypium, which yields fiber for the manufacture of durable and permanent fine papers and cellulose derivatives. The boll of the cotton plant is a capsule that bursts open when ripe, allowing the seed and attached lint (hairs) to be easily picked. The cotton fiber is removed from the seed by the ginning process. See also Cotton Linters. Fiber from the seed pod of the cotton plant, the use of cotton dates back more than 5 000 years. Quality depends on the length of the fiber, longer being better, and fiber lengths vary from less than one-half inch to more than two inches. A white, brownish-white, or bluish-white, soft, fibrous substance that surrounds the seeds of certain plants of the mallow family, called Gossypium. Cotton is the most important and versatile fiber known to man-kind. It is used in inner wear, outerwear, accessories, decorative materials in the home, and in industry. Cotton means upland Cotton and extra long staple Cotton meeting the definition in the definitions of Upland Cotton and Extra Long Staple (ELS) Cotton in this glossary, respectively, and excludes Cotton not meeting such definitions. / Хлопок – это продовольствие, пища и волокно. Супима® (Supima®). НАЙМЭКС® (NYMEX®). Виды (Species). Культивируемый Хлопчатник является Многолетним Кустарниковым Растением Рода Госсипиум из Семейства Мальвовых (Просвирниковых) – Семейства Двудольных Растений. В текущем производстве находятся две Разновидности Хлопчатника – преобладающий Госсипиум Хирсутум, общеизвестный как средневолокнистый хлопок, и в меньшей мере – Госсипиум Барбадэнсэ. Смотрите также Госсипиум Барбадэнсэ (Gossypium Barbadense), Госсипиум Хирсутум (Gossypium Hirsutum), Хлопчатник Пима (Pima Cotton) и Нагорный Хлопчатник (Upland Cotton). Хлопчатник:- систематическое положение:- Семейство Malvaceae Juss., Род Gossypium L., Вид Gossypium Hirsutum L. (Хлопчатник Обыкновенный). Биология и морфология:- 2n=52. Многолетнее растение, используемое в однолетней культуре, высотой от 40–45 сантиметров до 1.5–2 метров. Форма куста раскидистая, компактная, пирамидальная, колончатая. Стебель мощный и тонкий, опушенный или неопушенный, зелёный или приобретающий антоциановую окраску к осени. Выделяют три основных типа ветвления стебля:- моноподиальный, симподиальный и нулевой. Моноподиальное ветвление характерно для диких и рудеральных форм Хлопчатника, произрастающих в тропиках в виде деревьев или низкорослых кустарников. Хлопчатник, выращиваемый в однолетней культуре, имеет симподиальное ветвление. Первая плодовая ветвь закладывается в пазухе 3–10-го листа по главному стеблю. Моноподии встречаются в количестве 2–3, но могут и отсутствовать. Растения с ветвлением нулевого типа представляют эволюционно самую молодую группу, возникшую в виде спонтанной мутации. Симподии у них не образуются, а все почки в пазухах листьев главного стебля развиваются по типу цветковых. Формы с нулевым типом ветвления относятся к интенсивному типу и отличаются высокой скороспелостью. Листья крупные, пальчато-лопастные, с прилистниками, очередные, черешковые. Окраска листовой пластинки светло-зелёная, тёмно-зелёная, с антоцианом или без него. Поверхность листовой пластинки гладкая или морщинистая, с опушением и без опушения. Цветок крупный, с двойным околоцветником. Чашечка сросшаяся, 5-зубчатая, с подчашием, которое состоит из трёх крупных, сильно рассечённых прицветников. Венчик из пяти раздельных лепестков, сросшихся только у основания. Цветёт цветок всего один день, окраска лепестков утром жёлтая (кремовая) с лиловыми пятнами у основания, вечером – красновато-фиолетовая. Тычинок много, расположены они в два круга, тычинки внутреннего круга срастаются в одну трубочку, которая окружает пестик, наружные тычинки редуцированы. Пестик крупный, рыльце находится над тычиночной колонкой. Пыльники светло-жёлтые или кремовые. Пыльца крупная, липкая, ветром не переносится. Плод – коробочка. Размеры варьируют от грецкого ореха до небольшого яблока. Форма округлая, овально-яйцевидная, продолговатая, с носиком и без носика, с 3–5 дольками, иногда 6–7 долек. В дольке 6–9 семян с опушением, с подпушком или без подпушка. Вес зрелого хлопка-сырца одной коробочки варьирует у разных сортов от 4 до 12 граммов. Число коробочек на одном растении может быть от 2–3 до 30–40. Семена покрыты короткими и длинными волоконцами, до 15 000 волоконец на одном семени. Дикорастущие формы Хлопчатника имеют волоски всего до 10 мм длины, у промышленных сортов – 29–38 мм, выход от веса хлопка-сырца – 32–37%. После снятия волокна зрелые семена без подпушка тёмно-коричневые, почти чёрные. Окраска подпушка – белая, серая, буроватая, зеленая, изумрудная. Масса 1 000 семян от 85 до 140 грамм, форма семян продолговатая, яйцевидная, округлая. Экология:- теплолюбивое растение. Оптимальная температура для роста и развития 25–30 °C. Если она ниже 25 °C, развитие начинает замедляться, а при температуре ниже 17 °C происходит угнетение растений. В то же время, некоторые дикие виды (Gossypium Sturtii) могут переносить кратковременные заморозки до 5–10 °C. При температуре выше 40 °C пыльца становится стерильной, много завязей на растениях не оплодотворяется и опадает. Хлопчатник – растение короткого дня. Селекционные сорта Хлопчатника, созданные в широтах, отдалённых от экватора, имеют слабую фотопериодическую реакцию. Период вегетации скороспелых сортов составляет 125–130 дней. Хлопчатник – сравнительно нетребовательная культура по отношению к питательным веществам и влаге, с поздневесенними сроками сева, поэтому его можно размещать после

большинства культур (озимые колосовые, многолетние травы, Кукуруза на силос и зерно, Подсолнечник, Сахарная Свёкла и другие), но лучшими являются Многолетние Травы (Люцерна) и озимая Пшеница. Новые Российские Сорта развивают небольшую вегетативную массу по сравнению со Средне-Азиатскими. В условиях юга России хлопчатник менее требователен к почвенному питанию. На формирование 100 кг урожая хлопка-сырца он потребляет:- 4.1 кг N, 1.6 кг – P_2O_5, 2.5 кг – K_2O. Таким образом, при средней урожайности 1.5–2.0 тонн с 1 гектара (га) хлопка-сырца, Хлопчатник выносит меньше питательных элементов, чем озимая Пшеница при её средней урожайности 3–4 т с 1 га. Избыток азота может вызывать ‘жирование’ растений (чрезмерное развитие вегетативной массы), что в свою очередь ведёт к затягиванию сроков вегетации и осложнению уборки. Очень важно сбалансировать азотное питание фосфорным на первых этапах развития растений, когда происходит переход от вегетативного роста к репродуктивному развитию. С увеличением фосфора возрастает число коробочек и уменьшается рост растений. Некоторый избыток фосфора способствует старению растения, в результате которого коробочки быстрее раскрываются. От применения калийных удобрений следует воздержаться лишь на солонцеватых почвах. Оптимальная pH = 6.0–7.3. В Краснодарском и Ставропольском краях Хлопчатник можно возделывать на богаре, без полива. В этом отношении он является экономически выгодной культурой, так как более эффективно, чем другие культуры, использует летние осадки в Июле и Августе. Практически 80% возможного для хлопководства массива земель на юге России может обходиться, при высокой агротехнике и соответствующих сортах, без затрат на ирригацию. Распространение:- род Gossypium смог приспособиться в течение миллионов лет эволюции к самым различным условиям обитания – от влажных тропиков в Центральной и Южной Америке, до крайне засушливых полупустынных и горных районов субтропиков. Основное количество диких видов сосредоточено в зоне субтропиков, но культивируется Хлопчатник во многих странах с умеренным климатом – в Южных районах Аргентины и Австралии, в Северной Корее, в Северо-Восточных и Северо-Западных районах Китая, на Северном Кавказе, в Болгарии и Румынии, в Италии и Испании. В настоящее время Хлопчатник вызревает на полях России и Украины, расположенных на 47° Северной широты. Прядение длинных волокон шерсти и льна намного древнее хлопкопрядения, которое вследствие небольшой длины волокон требовало более совершенной техники. В Шумере и древнем Египте хлопка не знали, ткани делали из льняного волокна. Во времена Геродота хлопок в Вавилоне не употреблялся; в долине Нила он стал известен лишь в 500 году до Нашей Эры. Наиболее древние (3000 лет до Нашей Эры) хлопчатобумажные ткани были обнаружены при раскопках в Катхияваре (Индия). В Китай культурный Хлопчатник попал из Индии ещё в древности, но не нашёл применения, потому что Китай всегда был страной шёлка. Хлопчатник сажали как декоративное растение. В конце первого тысячелетия нашей эры Хлопчатник был в изобилии ввезён в Китай, и в XI веке начал широко возделываться. В Египет в XVI веке хлопок ввозился с острова Кипр и из Сирии. Хлопкосеяние в дельте Нила было начато в конце XVIII века. В Америке Ацтеки производили хлопчатобумажные ткани и окрашивали их краской из кошенили. Хлопководство в Соединённых Штатах Америки (США) ведёт свою историю со времени выведения ‘аплэндов’ (нагорного). Интенсивность выведения сортов для хлопкового пояса (Cotton Belt) была первоначально очень высокой. В 1906 насчитывались сотни сортов, но только 25 проявили устойчивость к Вертициллёзному Вилту (Verticillium Dahliae Kleb.) и Фузариозу (Fusarium Oxysporum ssp. Vasinfectum Atk.). Из всего огромного разнообразия (35 видов) Хлопчатника используется 5 видов. Хлопчатник Мексиканский (Gossypium Hirsutum) – Нагорный, или так называемый Аплэнд (Upland), занимает 90% мировых площадей. На втором месте тонковолокнистый Перуанский Хлопчатник – Gossypium Barbadense, он занимает около 8% хлопковых площадей. Возделывается в основном в Египте, Средней Азии, Судане, Индии, Бразилии и Перу. Даёт самое длинное, нежное и прочное волокно. Из него изготовляют особо ценные ткани – бархат, батист, парашютную ткань, авиационный корд, нитки и так далее. Gossypium Tricuspidatum (близкий к предыдущим) возделывается в небольшом количестве в странах Южной Америки. Эти три вида имеют 2n=52. В Африке и Азии с древнейших времён используются так называемые гузы (2n=26), дающие более короткое и грубое волокно по сравнению с Американскими Видами, но они хорошо приспособлены для выращивания в Индии, Судане, Китае, широко возделывались ранее в Средней Азии. Площади под ними составляют около 2%, в основном в Индии. На мировом рынке волокно гуз (Gossypium Herbaceum и Gossypium Arboreum) ценится за его ‘шерстистость’, упругость, прочность, гигроскопичность. Раны, обрабатываемые ватой из гуз, заживают быстрее. Эти виды обладают рядом очень ценных качеств – устойчивостью к болезням, засухе, сосущим вредителям, имеют слабо раскрывающуюся коробочку, повернутую вниз, (волокно не намокает во время осенних дождей). Хлопководство России было основано на гузах, а потом на так называемых заводских смесях. Культура Хлопчатника в Средней Азии существовала с VI века до Нашей Эры. В бывшем Союзе Советских Социалистических Республик (СССР) коротковолокнистые сорта Азиатского Хлопчатника были заменены средневолокнистыми. В 2004 году районировано 12 сортов Хлопчатника:- АС 4, АС 5, АС 6, АС 7, Лиманский, Михайловский, Пионер, ПОСС 1, ПОСС 2 и другие. Селекционные учреждения:- Прикаспийский НИИ Аридного Земледелия, Прикумская Опытно-Селекционная Станция Ставропольского НИИСХ. Участвуют в селекционных программах ВНИИ Растениеводства имени Николая Ивановича Вавилова и компания Русский Хлопок, ООО. Хозяйственное Значение:- основное прядильное растение. Возделывается для получения волокна, из которого текстильная промышленность вырабатывает широкий ассортимент бытовых и технических тканей. Семена Хлопчатника, содержащие 20–28% масла, используются в маслобойной промышленности и служат источником ценного белка. Из отходов хлопкоочистительной и маслобойной промышленности производят глицерин, олифу, целлюлозу, линолеум и другие изделия. У культурных форм Хлопчатника волокно в основном белое, но некоторые сорта имеют цветное волокно, окраска которого может быть коричневой, зелёной, кремовой. Технологические свойства хлопкового волокна характеризуют следующие показатели:- длина, тонина, крепость, разрывная длина, эластичность, извитость, зрелость. Длина волокна изменяется от 20 до 60 мм. Тонина волокна косвенно характеризуется линейной плотностью (метрическим номером), то есть длиной волоконцев в 1 грамме волокна в метрах. Чем выше этот показатель, тем тоньше волокно. Важный показатель качества волокна – его крепость, или разрывная нагрузка. Она определяется усилием, которое нужно затратить, чтобы разорвать одно волоконце при его растягивании. Разрывная нагрузка колеблется у различных сортов и форм в пределах 4–7 грамм. Пониженную разрывную нагрузку имеет недозрелое волокно, особенно из коробочек, раскрывшихся после заморозка. Суммарно показатели технологических свойств волокна принято характеризовать его промышленным типом. Различают 7 промышленных типов волокна, каждый из которых имеет определённые нормативы длины, тонины и разрывной нагрузки волокна. Волокно 1–3 типов дают сорта тонковолокнистого Хлопчатника, волокно 4–7 типов – средневолокнистого. Наиболее ценные и прочные ткани изготовляют из волокна первых трёх типов, но потребность промышленности в нём невелика. Больше всего (около 70% общего количества) необходимо волокно 5-го типа. Это основной тип волокна, из него вырабатываются ткани массового потребления. При оценке различных сортов Хлопчатника важнейшим показателем служит выход волокна. Его определяют как отношение массы чистого волокна к массе хлопка-сырца, выраженное в процентах. Условно выход волокна подразделяется на низкий – ниже 30%, средний – от 30 до 35% и высокий – выше 35%. Выход волокна обуславливается массой 1 000 семян и индексом. Индекс волокна – масса волокна (в граммах) со 100 семян. При подготовке семян к посеву сначала отделяются длинные волокна на джинах (агрегаты для первичной переработки хлопка-сырца), затем проводится делинтирование – отделение коротких волокон (подпушка). Химическое делинтирование позволяет придать семенам необходимую сыпучесть и позволяет отказаться от протравливания. Посев узкорядный или широкорядный (ширина междурядий 60, 90, 105 см).

Общемировая тенденция заключается в увеличении густоты стояния растений на единицу площади по мере продвижения культуры на север. Глубина заделки семян составляет 4–6 см, предпочтительней – 4–5 см. Оптимальная густота стояния к уборке урожая для новых Российских сортов составляет (при междурядьях 60–70 см):- для более плодородных почв Краснодарского Края – 80 000–100 000 растений на 1 га, на более бедных почвах до 120 000 растений на 1 га. Норма семян составляет 12–14 кг на 1 га при использовании сеялок точного высева. Все посевы Хлопчатника 1990-х на юге России убирались вручную. При комбайновой уборке поле должно быть ровным, и у растений должны быть убраны листья. Для этого используется дефолиация. Обычно используется хлорат магния как дефолиант, и при увеличении дозировки – как десикант. Урожайность составляет 1.5–2.0 т с 1 га. Хлопок – растительное волокно, сырьё для изготовления пряжи для вязания и ткачества, известное в Индии с VII века до Нашей Эры. Через Арабский мир хлопок попал в Палестину, Египет, Андалусию, Сицилию. До конца VIII века в Европу ввозился только в виде готовых изделий. Впервые производство хлопчатобумажных тканей в Европе было открыто в 1772 в Англии.

COTTON–4 = ХЛОПКОВАЯ 4 (или ХЛОПКОВАЯ ЧЕТВЁРКА) – In the World Trade Organization (WTO), Cotton-4:- West African coalition seeking cuts in cotton subsidies and tariffs. WTO members (4):- Benin, Burkina Faso, Chad, and Mali. / Хлопковая Четвёрка или Хлопковая 4 .

COTTON ANTHRACNOSE = АНТРАКНОЗ ХЛОПЧАТНИКА – Cotton Anthracnose is a serious disease caused by the Fungus Glomerella Gossypii which infest all the above-ground parts of the plant. It causes lesions and cankers on the leaves, stem, and bolls and is sometimes lethal. Also known as Boll Rot. / Антракноз Хлопчатника – серьёзная болезнь, вызываемая Грибом Гломэрэлла Госсипии (Glomerella Gossypii), который инфицирует все надземные части растения. Он вызывает поражения на листьях, стебле, коробочках, и в некоторых случаях вызывает летальный исход. Известна также как Коробочная Гниль (Boll Rot).

COTTON APHID = ХЛОПКОВАЯ ТЛЯ – Cotton Aphid (Aphis Gossypii), the Aphid Species most commonly associated with outbreaks on Cotton in the Southeast; has many generations per year and is often resistant to various classes of insecticides; typically subject to heavy mortality via predation and parasitism. Also known as Melon Aphid. Aphids are slow-moving, soft-bodied Insects. Adult Cotton Aphids are approximately 1/10 of an inch long and roughly pear shaped. They may possess wings or may be wingless. Cotton Aphids have two color phases:- yellowish or dark green. The Cotton Aphid has two projections which arise from the upper side of the abdomen. These small tubes are called Cornicles and are used to excrete defensive secretions. Both the adult and immature stages (called Nymphs) of the Cotton Aphid have stylet like mouthparts, which they use to suck juices from the host plant. Consequently, Cotton Aphids are sometimes referred to as Plant Lice. Aphis Gossypii, Family; an aphid that sucks the juice of cotton, cucurbis, okra, and citrus plants. The Cotton Aphid (Aphis Gossypii) excretes honeydew rich in melezitose (ca. 30–40%). Their droplets tend to be larger than those produced by Whiteflies. Whiteflies (Bemisia Spp.), also excrete honeydew, but as trehalulose-rich (ca. 40–50%) droplets. / Хлопковые Тли, Насекомые Семейства Настоящих Тлей Отряда Равнокрылых, повреждающие Хлопчатник. Наиболее вредоносна Бахчевая, или Хлопковая, Тля (Aphis Gossypii). Бескрылые самки (самцы отсутствуют) с яйцевидным телом, длиной 1.25 – 2.1 миллиметров (мм), жёлтой или зелёной окраски, соковые трубочки чёрные. После перезимовки питаются Сорняками. При температуре около 12 °C начинают размножаться, отрождая 20–60 личинок, которые через 10–15 суток (сут) превращаются во взрослых особей. В начале лета появляются крылатые самки, перелетающие на посевы Хлопчатника, Клещевины, Бахчевых и других сельскохозяйственных культур. Насекомые высасывают сок из листьев, которые скручиваются и засыхают; Растения замедляют рост и уменьшают плодообразование вследствие углеводного голодания. Осенью вредитель склеивает и загрязняет волокно, способствуя развитию на нём Сапрофитных Грибов. Хлопчатник повреждают также Люцерновая, или Акациевая, Тля (Aphis Laburni), Большая Хлопковая Тля (Acyrthosiphon Gossypii). Хлопковые Тли распространены в районах хлопководства; в бывшем Союзе Советских Социалистических Республик (СССР) – в основном в Средней Азии и Казахстане. Меры борьбы:- уничтожение Сорняков, уборка растительных остатков, обработка Хлопчатника инсектицидами – сайфосом, карбофосом и другими. Дынная или Арбузная Тля (Melon Aphid). Виды (Species). мелицитоз . Белокрылки (Whiteflies (Bemisia Spp.)).

COTTON BOARD = СОВЕТ ПО ХЛОПКУ – Based in Memphis, Tennessee, the Cotton Board is the oversight and administrative arm of the Cotton Research & Promotion Program, representing US Upland Cotton. To fund the Program, the Cotton Board collects a per-bale assessment of all Upland Cotton harvested and ginned in the United States, as well as an importer assessment for all Upland Cotton products imported into the United States. To conduct the Program, the Cotton Board contracts with Cotton Incorporated to carryout the actual research and promotion activities for US producers and importers of cotton. While Cotton Incorporated is consumer and trade focused, it is a charged function of the Cotton Board's mission to keep US producers and importers of cotton informed on the innovative developments stemming from the Cotton Research & Promotion Program. By the mid-1960s, cotton had lost many of its traditional markets to the new 'easy-care' synthetic fibers. Realizing this, US Upland Cotton producers conceived a self-help research and promotion program. In a referendum, producers voted to set up a per-bale assessment system to fund the program, built in safeguards to protect their investments and, with the passage of the Cotton Research & Promotion Act of 1966, joined together to begin battling synthetic competitors and re-establishing markets for cotton. Today, due to the success of the Program, cotton is the best selling fiber in the United States and one of the best selling fibers in the world. Congressional passage of the Cotton Research & Promotion Act of 1966 established the Cotton Board to administer and oversee the Cotton Research & Promotion Program. The Act also directed the Cotton Board to contract with a separate organization to conduct the actual research and promotion activities. The original contracting organization was called the Cotton Producer's Institute. It had operated as a subsidiary of the National Cotton Council since 1961. However, in 1970, the Cotton Producer's Institute was separated from the Council and became and individual, non-profit entity renamed as Cotton Incorporated. Based in Memphis, Tennessee, the Cotton Board oversees the Cotton Research & Promotion Program. This includes setting broad policy for the Program, reviewing and approving Cotton Incorporated's annual plan and budget, collecting the per-bale assessment that funds the program, serving as industry liaison with USDA and informing producers and importers of Program activities. The Cotton Board has regional communication managers (RCMs) located strategically throughout the Cotton Belt and an importer representative in the New York area. In the United States, Cotton Board is a quasi-governmental organization whose members are appointed by the Secretary of Agriculture from nominees of cotton producer organizations. Established in 1967 by the Cotton Research and Promotion Act, the board receives and disburses grower assessments to finance the Cotton Incorporated program. Headquartered in Memphis, State of Tennessee (TN), the United States. / Катэн Инкорпорэйтид (Cotton Incorporated). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

COTTON BRIDGE = МАРШРУТ ТРАНСПОРТИРОВКИ ХЛОПКА – Cotton Bridge is a term associated with rail movement of cotton from an inland point to rail ramp at load port. / Термин, связанный с железнодорожной перевозкой хлопка из какого-то наземного пункта до железнодорожной рампы в порту погрузки.

COTTON BURS = СТВОРКИ КОРОБОЧКИ ХЛОПЧАТНИКА – Cotton Burs:- mature Cotton bolls remaining after the lint and seeds have been removed. See also Bur. / Створки Коробочки Хлопчатника – зрелые коробочки Хлопчатника, остающиеся после того, как волокно с семенами было снято с куста. Смотрите также Створка Коробочки (Bur).

COTTON CHOICES™ = ВЫБОРЫ (или ОТБОРЫ) ХЛОПЧАТНИКА[Т3] – Cotton Choices™ is the name of the program that offers growers different ways to pay for their Monsanto traits. Cotton Choices™ gives growers flexibility in managing cash flow and production risks. You can choose how and when you pay for your Bollgard 3/Roundup Ready Flex, Bollgard II/Roundup Ready Flex or Bollgard II technology. / Монсэнто (Monsanto). Болгар 3/Раундап Рэди Флэкс (Bollgard 3/Roundup Ready Flex).

COTTON CLASSING = КЛАССИФИКАЦИЯ ХЛОПКА (или КЛАССИРОВКА ХЛОПКА) – Cotton Classing:- A High-Volume Instrument (HVI) measures fiber properties including fiber strength, length uniformity, micronaire, trash, and color. These values are attached to each bale, and fiber is priced and purchased based on these properties.

COTTON CLERK = ХЛОПКОВЫЙ КЛЕРК – Cotton Clerk means a person approved by the Commodity Credit Corporation (CCC) of the US Department of Agriculture (USDA) to assist producers in preparing loan and loan deficiency documents.

COTTON COMMERCIAL BANK = ХЛОПКОВЫЙ КОММЕРЧЕСКИЙ БАНК – Cotton Commercial Bank (in the United States) means the bank designated as the financial institution for a Cooperative Marketing Association (CMA) or loan servicing agent.

COTTON COMPRESS = ХЛОПКОВЫЙ ПРЕСС – Cotton Compress is the equipment which forms the ginned raw cotton into a bale. The first compression, primarily to modified flat or universal bale dimensions, is perfomed at the gin. Further compression of flat or modified flat bales is performed at cotton warehouse locations. / Хлопковый Пресс – оборудование, которое формует джинированный хлопок-сырец, а точнее хлопковое волокно, хлопковый линт и хлопковый улюк в кипы. Первое прессование, главным образом для modified flat или универсальных размеров кипы, производится на хлопкоочистительном предприятии. Дальнейшее прессование flat или изменённых flat кип производится в местах размещения складов с хлопком.

COTTON COUNCIL INTERNATIONAL = МЕЖДУНАРОДНЫЙ СОВЕТ ПО ХЛОПКУ – The Cotton Council International (CCI) is the overseas operations service of the US National Cotton Council of America. Established in 1956, CCI's primary objective is to develop markets for US exports. CCI programs are operated in close cooperation with the Foreign Agricultural Service, the United States Department of Agriculture (USDA), and trade groups in the United States and abroad. Headquartered in Washington, DC, the United States. The Cotton Council International (CCI) is the overseas operations service of the NCC. CCI's primary objective is developing Foreign markets for US cotton. CCI operates or supervises country programs and conducts a number of special projects. The country programs emphasize cooperative advertising and sales promotion for products made with US cotton, market research, public relations, and fashion campaigns. Special projects include technical assistance in processing and finishing, foreign tours by the Maid of Cotton, study trips for foreign spinners to observe US cotton production and marketing, missions of US trade and Government officials to importing countries, advertising in international textile trade publications, and preparation and distribution of special materials, such as a US Cotton Handbook. Two centrally located regional offices enable CCI to service its market promotion activities more effectively abroad. CCI's European office is located in Brussels and its Asian/Far East office is located in Hong Kong. CCI programs are supported by the US Department of Agriculture's Foreign Agricultural Service (FAS) as well as by the US Cotton industry and are operated in close cooperation with FAS and trade groups in the United States and abroad.

COTTON COUNT = ХЛОПКОВАЯ НУМЕРАЦИЯ (или НУМЕРАЦИЯ ХЛОПКА, или ХЛОПКОВОЕ ЧИСЛО, или ХЛОПКОВЫЙ НОМЕР) – (1) The Cotton Count (CC) expresses the number of hanks required to make a pound of yarn. A hank of cotton is equal to 840 yards. So 1 cc = 840 yards of cotton, the coarsest cotton yarn. A 3 cc yarn would then be one third as course and would be expressed as 3/1 cc show that it is a single strand. Likewise plies are designated by two numbers separated by a slash such as 4/2 cc. This equals 3 360 yards (4 x 840) of two-ply yarn. This yields 1 680 yards of yarn per pound (3 360/2). An 8/4 cc yarns would yield the same number of yards per pound, but would be a 4 plies of finer yarn. So a Number 8 four-ply yarn is the same diameter as a Number 4 two ply yarn. For yarn, a numbering system based on the number of 840-yard lengths in a pound. The higher the number the finer the yarn. A single strand of N10 yarn is expressed as 10s or 10/1 or 1-10. A 10s yarn has 8 400 yards to the pound; a pound of 20s yarn is 16 800 yards long. Cotton Count is the yarn numbering system based on length and weight originally used for cotton yarns and now employed for most staple yarns spun on the cotton, or short-staple, system. It is based on a unit length of 840 yards, and the count of the yarn is equal to the number of 840-yard skeins required to weigh 1 pound. Under this system, the higher the number, the finer the yarn. See also Yarn Number. For Yarn, Cotton Count is a numbering system based on the number of 840-yard lengths in a pound. The higher the number the finer the yarn. A single strand of #10 yarn is expressed as 10s or 10/1. A 10s yarn has 8 400 yards to the pound; a pound of 20s yarn is 16 900 yards long.

(2) For woven cloth (or fabric), Cotton Count is the number of warp ends and filling picks per inch. If a cloth (or fabric) is 68 x 72, there are 68 ends and 72 picks per inch in the fabric. An End is a warp yarn or thread that runs lengthwise or vertically in cloth (or fabric). The ends interlace at right angles with filling yarn (Picks) to make woven fabric. / Для тканого полотна (или ткани) Хлопковая Нумерация представляет собой число продольных нитей основы и уточных поперечных нитей на дюйм. Если полотно (или ткань) отмечена как 68 x 72, то она имеет 68 продольных нитей и 72 поперечные нити на дюйм ткани. Продольная нить – это пряжа или нить основы, которая .

(3) For knitted fabric, Cotton Count indicates the number of wales and courses per inch. A course is a crosswise row of loops or stitches, similar to the filling of woven fabric. A wale is a lengthwise series of loops in a knitted fabric. / Для трикотажных тканей Хлопковая Нумерация указывает число колонок (wales) или рядов (courses) петель на дюйм. или стежков, аналогичных . уточина тканой ткани.

COTTON DISEASES = БОЛЕЗНИ ХЛОПЧАТНИКА (или ЗАБОЛЕВАНИЯ ХЛОПЧАТНИКА) – Cotton Diseases:- both plant and boll are susceptive to disease. Plants are affected by Fungus, microscopic Worms, or improper nutriment-anthracnose, root rot, rust, wilt, and other troubles. The boll is affected by the Boll Weevil, Pink Bollworm, Leaf Worm, Cotton Fleahopper, Cotton Louse, and others. Havoc wrought by disease often runs into hundreds of thousands of Dollars. There are a range of diseases affecting Cotton in many countries, e.g., Alternaria, Bacterial Blight, Farm Hygiene, Fusarium Wilt, Premature Senescence, Seedling Diseases, Seed Treatments and Vericillium Wilt. / Болезни Хлопчатника:- как растение, так и коробочка чувствительны к болезням. На растения воздействуют Грибы (Fungus), микроскопические Черви (microscopic Worms), или ненадлежащая подкормка-антракноз (improper nutriment-anthracnose), корневая гниль (root rot), ржавчина (rust), вилт (wilt), и иные проблемы. На коробочку оказывают воздействие Коробочный Долгоносик (Boll Weevil), Розовый Коробочный Червь (Pink Bollworm), Листовой Червь (Leaf Worm), Хлопковая Блоха (Cotton Fleahopper), Хлопковая Вошь (Cotton Louse), и другие. Опустошение, наносимое болезнью часто оборачивается убытками в сотни тысяч Долларов. Во многих странах мира существует целый спектр болезней, воздействующих на Хлопчатник, например, Альтернариоз (Alternaria), Бактериоз (Bacterial Blight), Фермерская Гигиена (Farm Hygiene), Фузариозный Вилт (Fusarium Wilt), Преждевременное Увядание (Premature Senescence), Болезни

Всходов (Seedling Diseases), Протравливание Семян (Seed Treatments), и Вертициллиозный Вилт (Vericillium Wilt). Нигроспороз – болезнь Хлопчатника, вызываемая паразитическими Грибами. Коробочки Хлопчатника полураскрыты, волокно не распушено, на них чёрные точки спороношения Гриба. Чёрная Шира .

COTTON DUST = ХЛОПКОВАЯ ПЫЛЬ – Cotton Dust is a dust generated into the atmosphere as a result of the processing of cotton fibers combined with any naturally occurring materials such as bracts, leaves, stems, and inorganic matter which may have accumulated on the cotton fibers during the growing or harvesting period. Any dust generated from the processing of cotton through the weaving of fabric in textile mills and dust generated in other operations or manufacturing processes using new or waste cotton fibers ot cotton fibers by-products from textile mills is also considered cotton dust. Cotton Dust means dust present in the air during the handling or processing of cotton, which may contain a mixture of many substances including ground up plant matter, fiber, bacteria, fungi, soil, pesticides, non-cotton plant matter and other contaminants which may have accumulated with the cotton during the growing, harvesting and subsequent processing or storage periods. Any dust present during the handling and processing of cotton through the weaving or knitting of fabrics, and dust present in other operations or manufacturing processes using raw or waste cotton fibers or cotton fiber byproducts from textile mills are considered cotton dust within this definition. Lubricating oil mist associated with weaving operations is not considered cotton dust. / такими как прицветнички или прилистники (bracts), листья (leaves), стебли (stems) .

COTTON EXCHANGE = БИРЖА ХЛОПКА – In the United States, Cotton Exchange is a membership organization which provides facilities where cotton futures contracts are bought and sold. As of 1986, there were two such exchanges:- (i) the New York Cotton Exchange, and (ii) the Chicago Rice and Cotton Exchange. The basis grade for the New York contract is Strict Low Middling 1-1/16-inch cotton; the basis grade for the Chicago contract is Strict Low Middling Light Spotted 31/32-inch cotton, largely produced in Texas and Oklahoma.

COTTON FABRIC = ХЛОПКОВАЯ ТКАНЬ (или ХЛОПЧАТОБУМАЖНАЯ ТКАНЬ) – Cotton Fabric:- a woven fabric made of cotton yarns or yarns produced from a blend of cotton and chemical fibers or obtained by weaving cotton and chemical or mixed threads. The use of cotton fiber and the hand production of yarn and fabric from cotton was widespread in India and China many centuries before the BC. Cotton fabrics did not become known in Western Europe until the Crusades. Cottage production began in Europe in the XIV century, mostly for fabrics with a linen warp and cotton weft; cotton fabrics were frequently imported from the East Indies. In the 1770's, as a result of improvements in the spinning frame, machine production of cotton fabrics was initiated in Great Britain. However, the fabrics produced were fairly coarse and thick, and fine cottons continued to be imported. The first cotton textile plant was built in Manchester, Great Britain, in the late XVIII century. The production of cotton fabrics in Russia began later than other sectors of the textile industry, such as the weaving of linen and felted wool fabrics. Comparatively large cotton enterprises emerged in the second half of the XVIII century and early XIX century – first chintz printing plants, then weaving, and later spinning plants. The first chintz printing factory appeared in 1755 as a privileged, monopoly enterprise of English merchants. It used imported cotton fabrics and Russian linens manufactured in small shops and in the villages. After the reform of 1861 the small shops were turned into factories producing various types of cotton fabrics. The growth rate in the production of cotton fabrics was quite high. Nonetheless, in 1913, Russia had one of the lowest outputs of cotton fabrics among the developed countries. In the USSR the volume of cotton fabric production in 1975 was approximately 6.6 billion sq.m – about 75 percent of the total volume of fabrics produced. The range of available cotton fabrics includes approximately 2 500 types. Fabrics are distinguished by structure, appearance, and purpose. All the basic types of weave are used in the production of cotton fabrics. Gray, bleached, mercerized, single-color dyed, printed, color-woven, mélange, and raised fabrics are produced. Condensed yarn is used for napped fabrics, and fancy yarns with thickened sections and loops are used to produce various special effects. Cotton fabrics are hygienic, strong, and resistant to wear, washing, and the effect of light, but they do not have required elasticity, that is, they stretch and become very wrinkled. Cotton fabrics are classified as domestic or industrial, depending on their purpose. Domestic fabrics account for approximately 80 percent of all cotton fabrics, including apparel (for undergarments, shirts, dresses, and suits), moisture-absorbing, and decorative fabrics. Cotton fabrics for undergarments are produced primarily from carded and combed yarn, mostly with a plain weave. Heavy fabrics (100–165 g per sq.m), such as bleached coarse calicoes and linens, are used for men's underwear and sheets; lightweight fabrics (70–100 g per sq.m), such as madapollam and calico, are used for women's and children's undergarments. Napped fabrics, such as flannel, are also used for children's underwear. Shirt fabrics, such as poplin, piqué, and rep, are produced with basic and small-figured weaves using carded and combed cotton and cotton-viscose yarn (75 percent cotton and 25 percent viscose fiber), as well as viscose threads in the weft. Shirt fabrics weigh 100–250 g per sq.m. Cotton dress fabrics, such as chintz, satin, plaids, and cotton flannellette, are produced with all types of weaves. The yarns may be cotton or cotton-viscose, carded or combed; viscose and acetate threads are used as well. The weight may range from 60 to 270 g per sq.m, depending on the intended seasonal use. Cotton suit fabrics, such as knits, felted fabrics, and cotton diagonals, are made with plain, twill, and combination weaves from single and twist cotton and blended yarns containing up to 25 percent Kapron (polyamide) or Lavsan fibers. Their weight is 170–450 g per sq.m. Moisture-absorbing cotton fabrics are used for face and terry-cloth towels and for handkerchiefs. Towels are made from carded yarn and weigh 150–380 g per sq.m. They hold moisture well because of the high hygroscopicity of the yarn and because of the waffle or pile weave used. Handkerchiefs are made from combed yarn with a plain weave. Decorative fabrics (tapestry, napped, and other types) are used to upholster furniture and manufacture drapes. They are made from twist yarns using plain, small-figured, and large-figured weaves, sometimes in combination with viscose yarn. In addition to the cotton fabrics mentioned above, factories produce gauze, various types of industrial fabrics, packing and packaging fabrics, flannelette and summer blankets, bedspreads, and tablecloths. See also Fabric, and Textile Industry. / Хлопчатобумажная Ткань, текстильная ткань из хлопчатобумажной или смешанной (выработанной из смеси хлопка и химических волокон) пряжи, а также полученная переплетением хлопчатобумажных и химических (или смешанных) нитей. Использование Хлопчатника и ручное изготовление пряжи и ткани из хлопка были распространены в Индии и Китае за много столетий до Нашей Эры. В Западной Европе хлопчатобумажные ткани стали известны лишь во время крестовых походов. С XIV века в Европе изготовляли кустарным способом в основном полубумажные ткани (основа льняная, уток хлопчатобумажный); часто хлопчатобумажные ткани привозились из Ост-Индии. В 1770-х в Великобритании благодаря усовершенствованию прядильной машины было начато машинное производство хлопчатобумажных тканей. Но поскольку это были ещё довольно грубые, толстые ткани, продолжался ввоз тонких хлопчатобумажных тканей. Первая хлопчатобумажная фабрика была построена в конце XVIII века в Манчестере (Великобритания). В России производство хлопчатобумажных тканей возникло позже других отраслей текстильной промышленности (суконной, полотняной и другой). Сравнительно крупные хлопчатобумажные предприятия, сначала ситценабивные, затем ткацкие и позднее прядильные, возникли во 2-й половине XVIII и начале XIX веков. Первая ситценабивная фабрика появилась в 1755 как монопольное и привилегированное предприятие Английских купцов; она работала на привозных хлопчатобумажных тканях и на Русских полотнах, изготовлявшихся на мануфактурах и в деревнях. После реформы 1861 хлопчатобумажные мануфактуры стали превращаться в фабрики, выпускавшие различные хлопчатобумажные ткани. Темпы роста выпуска хлопчатобумажных тканей были довольно высокие. Тем не менее по объёму их производства Россия занимала (в 1913) одно из последних мест среди развитых стран. В бывшем Союзе Советских Социалистических Республик (СССР) объём производства хлопчатобумажных тканей составлял (в 1975) ~ 6.6 миллиардов

квадратных метров ($м^2$) (около 75% от общего объёма выпуска тканей). Ассортимент хлопчатобумажных тканей насчитывает около 2 500 артикулов. Ткани различаются по структуре, внешнему оформлению и назначению. Для выработки хлопчатобумажных тканей применяются все основные виды ткацких переплетений (смотрите Переплетение Нитей). Выпускаются суровыми, отбелёнными, мерсеризованными (смотрите Мерсеризация), гладкокрашеными, набивными, пестротканые, меланжевыми, ворсованными. Для получения ворсованных тканей используют аппаратную пряжу, для получения внешних эффектов – фасонные нити (с утолщениями, петлями и тому подобным). Хлопчатобумажные ткани гигиеничны, имеют высокую прочность, стойкость к истиранию, стирке, воздействию света, но не обладают необходимой упругостью, то есть вытягиваются и сильно мнутся. По назначению хлопчатобумажные ткани разделяются на бытовые и технические (смотрите Ткань Техническая). Около 80% хлопчатобумажных тканей составляют бытовые ткани:- одёжные (бельевые, сорочечные, платьевые, костюмные и другие), влаговпитывающие и декоративные. Бельевые Хлопчатобумажные ткани вырабатываются в основном из кардной и гребенной пряжи, главным образом полотняным переплетением. Тяжёлые ткани (масса 1 $м^2$ 100–165 граммов (г)) – отбелённые бязи и полотна – используются для мужского и постельного белья, лёгкие ткани (масса 1 $м^2$ 70–100 г) – мадаполам, миткаль и другие – для женского и детского белья. Для детского белья выпускаются также ткани с начёсом – фланели и другие. Сорочечные Хлопчатобумажные Ткани (поплин, пике, репс и другие) вырабатываются главными и мелкоузорчатыми переплетениями из кардной и гребенной хлопчатобумажной и хлопко-вискозной пряжи (75% хлопка и 25% вискозного волокна), а также с использованием в утке вискозных нитей. Масса 1 $м^2$ 100–250 г. Платьевые Хлопчатобумажные Ткани (ситец, сатин, шотландка, байка и другие) вырабатываются всеми видами ткацких переплетений из хлопчатобумажной и хлопко-вискозной кардной и гребенной пряжи, а также с использованием вискозных и ацетатных нитей. В зависимости от сезонного назначения имеют массу 1 $м^2$ 60–270 г. Костюмные Хлопчатобумажные Ткань (трико, сукно, диагональ и другие) изготовляются полотняным, саржевым и комбинированными переплетениями из одиночной и кручёной хлопчатобумажной и смешанной пряжи, содержащей до 25% капронового или лавсанового волокна. Масса 1 $м^2$ 170–450 г. Влаговпитывающие Хлопчатобумажные Ткани применяют для полотенец (лицевых, махровых) и носовых платков. Полотенца вырабатывают из кардной пряжи. Масса 1 $м^2$ 150–380 г. Обладают хорошей влагоёмкостью благодаря высокой гигроскопичности пряжи и использованию вафельного или ворсового переплетения. Носовые платки изготовляют из гребенной пряжи полотняным переплетением. Декоративные Хлопчатобумажные Ткани (гобеленовые, ворсовые и другие) используются для обивки мебели и изготовления портьер. Вырабатываются из кручёных нитей полотняным, мелко- и крупноузорчатым переплетениями (иногда с использованием вискозной пряжи). Кроме перечисленных хлопчатобумажных тканей, вырабатываются также марля, технические ткани различного назначения, тарные и упаковочные ткани, а также байковые и летние одеяла, покрывала и скатерти. Смоттрите также Текстильная Промышленность, и Текстильная Ткань.

COTTON FIBER = ХЛОПКОВОЕ ВОЛОКНО (или ХЛОПОК–ВОЛОКНО, или ВОЛОКНО ХЛОПЧАТНИКА) – Cotton is a seed hair fiber of the Plant belonging to Gossypium, the botanical Genus of the Mallow Family. After flowering, an elongated capsule or boll is formed in which the cotton fibers grow. Once the fibers grow completely, the capsule bursts and fibers come out. A cotton capsule contains about 30 seeds and each seed hosts around 2 000 to 7 000 seed hairs (fibers). Depending on the cotton type and growing conditions, the color of the fiber is usually creamy white or yellowish. The average fiber length of different kinds of cotton varies from 22 to 50 mm, and its diameter, from 18 to 25 μm. The higher quality fibers are known as Long-Staple Fibers or Extra-Long Staple. The cotton fiber is structurally built up into concentric zones and a hollow central core known as the Lumen. The mature fiber essentially consists of (from outside to inside) – the cuticle, i.e. the outermost layer, the primary cell wall, the secondary wall and the lumen. Cotton contains nearly 90% of cellulose and around 10% of non-cellulosic substances, which are mainly located in the cuticle and primary wall of the fiber. Also known as Cotton Fiber, and Cotton Lint. Cotton Fiber is a unicellular, natural fiber composed of almost pure cellulose. As taken from plants, the fiber is found in lengths of 3/8 to 2 inches. For marketing, the fibers are graded and classed for length, strength, and color. Cotton is a cellulose fiber collected from the Perennial Shrub from the Genus Gossypium; predominantly Gossypium Hirsutum (Upland or Long-Staple Cotton), but also some Gossypium Barbadense (Pima or Extra-Long Staple Cotton). A vegetable fiber consisting of unicellular hairs attached to the seed of the Cotton Plant. Most Cotton is colored a light to dark cream, and its chemical composition is almost pure cellulose. Colored Cottons in shades of tan, greens, blue, and rust are also less commonly available. A distinct feature of the mature fiber is its spirality or twist. Cotton is a unicellular, natural fiber that grows in the seed pod of the Cotton Plant. Fibers are typically 1/2 inch to 2 inches long. The longest staple fibers, longer than 1 1/2 inch, including the Pima and Egyptian Varieties, produce the highest quality cotton fabrics. The botanical name of American Upland Cotton is Gossypium Hirsutum and has been developed from Cottons of Central America. Upland Varieties represent approximately 97% of US production. Each Cotton fiber is composed of concentric layers. The cuticle layer on the fiber itself is separable from the fiber and consists of wax and pectin materials. The primary wall, the most peripheral layer of the fiber, is composed of cellulosic crystalline fibrils. The secondary wall of the fiber consists of three distinct layers. All three layers of the secondary wall include closely packed parallel fibrils with spiral winding of 25–35° and represent the majority of cellulose within the fiber. The innermost part of Cotton fiber – the lumen – is composed of the remains of the cell contents. Before boll opening, the lumen is filled with liquid containing the cell nucleus and protoplasm. The twists and convolutions of the dried fiber are due to the removal of this liquid. The cross section of the fiber is bean-shaped, swelling almost round when moisture absorption takes place. / коробочка (capsule). , то есть . Волокно Коротковолокнистое, Длинноволокнистое и Экстра Длинноволокнистое – хлопковое волокно с коротким, длинным и экстра длинным штапельком. Из хлопкового волокна вырабатывают:- пряжу, кручёные нити, кручёные изделия, бельевые, костюмные, платьевые, рубашечные, технические ткани и ткани для обуви, а также швейные нитки, шнуры, трикотажные и другие изделия, нетканые материалы, вату и другое. Хлопок, волокна, покрывающие семена Хлопчатника. При его созревании плоды (коробочки) раскрываются и из них собирают так называемый хлопок-сырец (волокно с неотделёнными семенами). При переработке от семян отделяют хлопок-волокно (волокна длиной более 20 миллиметров), пух или линт (волокна длиной менее 20 миллиметров) и подпушек (волокна длиной менее 5 миллиметров). Из хлопка вырабатывают вату, нити, ткани, трикотаж и другое. Пух и подпушек хлопка применяют в химической промышленности как сырьё для изготовления искусственного волокна и нитей, лаков, плёнки и тому подобного. Элементарное зрелое хлопковое волокно представляет собой одну клетку – плоскую сужающуюся к концам ленту, закрученную по спирали. В поперечнике выделяются первичная, вторичная (80% от массы) стенки и внутренний канал. В первичной стенке фибриллы расположены более хаотично, чем во вторичной. Хлопковое волокно содержит до 96% целлюлозы. Под Хлопком понимаются волокна, покрывающие семена Хлопчатника. При созревании Хлопчатника собирают так называемый хлопок-сырец (волокно с неотделёнными семенами). В процессе первичной обработки на хлопкоочистительных заводах от семян последовательно отделяют хлопок-волокно, то есть волокна длиной в основном более 20 миллиметров (мм), пух (линт) – волокна длиной менее 20 мм, и подпушек (делинт) – короткий волокнистый покров длиной менее 5 мм. На долю хлопка-волокна приходится около 1/3 от общей массы хлопка-сырца. Хлопок – наиболее дешёвый и распространённый вид текстильных волокон; в мировом производстве последних он занимает около 50%. В Русской технической литературе до 2-й половины XIX века вместо слова Хлопок использовался термин Хлопчатая Бумага, сохранившийся до наших дней в слове Хлопчатобумажный (хлопчатобумажная промышленность, хлопчатобумажная ткань и другие). В современной технической литературе вместо слова Хлопок используют обычно термины Хлопок-Волокно и Хлопок-

Сырец. На прядильные фабрики хлопок поступает спрессованным в кипы призматической формы. В массе спрессованного хлопка, кроме волокон, пригодных для переработки, содержатся различные пороки хлопка и сорные примеси, наличие которых снижает качество хлопка, так как осложняет процесс прядения, уменьшает выход пряжи и ухудшает её внешний вид. Их количество в хлопковом волокне зависит главным образом от способа сбора хлопка-сырца, его первичной обработки, а также от Разновидности Хлопчатника и условий его произрастания. Пороки хлопка неодинаковы по степени вредности и могут быть разбиты на 3 группы:- (i) Волокнистые Пороки:- жгутики (уплотнённые и спутанные пучки волокон), а также сплющенные скопления незрелых волокон. Эти пороки разъединяются на волокна разрыхлительно-трёпальными и чёсальными машинами прядильного производства; в основном переходят в пряжу и лишь частично выпадают в угары (отходы). (ii) Балластные Пороки:- незрелые и раздавленные семена, сорные примеси (частицы листьев, коробочек, веток Хлопчатника и тому подобные). В процессе прядения происходит их выделение в угары, что снижает выход пряжи и удорожает её стоимость. (iii) Особо Вредные Пороки:- частицы кожицы семян с волокнами и пухом, а также узелки (очень мелкие скопления спутанных волокон). Они трудноотделимы от хлопка, а их наличие вызывает повышенную обрывность нитей на прядильных машинах и портит внешний вид вырабатываемых изделий. В зависимости от вида Хлопчатника, с которого получен хлопок, и по важнейшему качественному признаку – тонине (толщине волокна) хлопок подразделяют на два вида:- средневолокнистый и тонковолокнистый (имеет более длинное и тонкое волокно). В бывшем Союзе Советских Социалистических Республик (СССР) доля тонковолокнистого хлопка в общем объёме производства составляла около 10% (в 1976). Для его получения использовали Советские Сорта тонковолокнистого Хлопчатника. Советский хлопок как средневолокнистый, так и тонковолокнистый в зависимости от величины разрывной нагрузки и степени зрелости делился на семь сортов:- отборный (0), 1-й, 2-й, 3-й, 4-й, 5-й и 6-й. В свою очередь хлопок 0–4-го сортов подразделялся на восемь типов в зависимости от его относительной разрывной нагрузки и штапельной длины. Хлопковое волокно 5-го и 6-го сортов на типы не подразделялось. Основную массу хлопка перерабатывают в пряжу и лишь небольшую часть хлопка и пуха используют для изготовления медицинской, одёжной и мебельной ваты, различных изделий – прокладок, фильтров и другого. Пух и подпушек хлопка применяют также в химической промышленности как сырьё, из которого вырабатывают искусственные волокна и нити, плёнки, лаки, пластмассы, взрывчатые вещества и так далее. Из хлопчатобумажной пряжи изготовляют разнообразные текстильные изделия:- ткани, трикотаж, нетканые материалы, швейные нитки, шнуры, канаты, сети и другие. Некоторые текстильные изделия вырабатывают также из смеси хлопка с химическими и натуральными волокнами. Хлопковое Волокно – натуральная тонкая, протяжённая, гибкая и прочная нить, развивающаяся на поверхности семян Хлопчатника, пригодная для изготовления пряжи и текстильных изделий. Относится к текстильным волокнам растительного происхождения и состоит в основном из хлопковой целлюлозы. Получают на хлопкоочистительных заводах при джинировании хлопка-сырца. Большая часть хлопкового волокна идёт для производства пряжи, из которой текстильная промышленность вырабатывает различные хлопчатобумажные ткани (сатин, батист, зефир, вуаль, поплин и так далее). Структура хлопкового волокна (по Клингу и Малю):- воскопектиновый слой; наружный слой первичной стенки; внутренний фибриллярный слой первичной стенки; рыхлые прослойки; фибриллярные пучки; отдельная фибрилла; пучок фибрилл вторичной стенки. Зрелое хлопковое волокно представляет собой сплюснутую трубочку длина 31–41 мм, диаметр 15–25 мк. Поперечный срез имеет форму сплющенную (у незрелого), бобовидную, эллипсовидную или почти круглую (у зрелого). Хлопковое волокно скручено вокруг продольной оси. Витки, неточно называемые извитками, идут попеременно в обоих направлениях. Диаметр неодинаков на протяжении всей длины; наибольший у основания. Хлопковое волокно содержит (в %):- целлюлозы 90.35–94.6; воды – 7; веществ, экстрагируемых водой – 0.5; инкрустирующих веществ – 0.75; жира и воска – 0.4; азотистых веществ – 0.5; золы – 0.12. Стенка волокна имеет слоистое строение. Несмотря на то, что волокно состоит в основном из прозрачных веществ (целлюлозы, жира, воска), оно непрозрачное, так как содержит различные мельчайшие включения. Волокно кажется белым из-за отражения света неровной поверхностью первичной стенки. Первые сорта хлопкового волокна белее, низкие сорта – темнее, с желтоватым или коричневатым оттенком. Хлопковое волокно имеет следующие физикомеханические и технологические свойства:- линейную плотность волокна, зрелость хлопкового волокна, разрывную нагрузку волокна и так далее Они зависят от количества и структуры целлюлозы. ГОСТом 3279-76 было установлено семь сортов хлопкового волокна в зависимости от степени зрелости и разрывной нагрузки. По показателям штапельной массодлины волокна, относительное разрывной нагрузки и линейной плотности хлопковое волокно подразделяли на восемь типов:- I–III тип имеют сорта тонковолокнистого Хлопчатника, а IV–VIII – средневолокнистого Хлопчатника. В процессе первичной обработки хлопка-сырца волокно может получить механические повреждения. Кроме того, существуют пороки волокна. Качество хлопкового волокна по влажности, содержанию пороков и сорных примесей должно отвечать установленным стандартам. На хлопкоочистительных заводах хлопкове волокно запрессовывают в кипы прямоугольной формы, которые перевозят автомобильным, железнодорожным и водным транспортом. В настоящее время Хлопковое Волокно является важнейшим, наиболее распространённым, сравнительно дешёвым текстильным волокном. Оно достаточно прочное, тонкое и гигроскопическое. Хлопковое волокно развивается на поверхности семян Хлопчатника. Из хлопчато-бумажной пряжи вырабатывают бытовые ткани для белья, одежды и другого, технические ткани, разнообразный трикотаж, швейные нитки, а из хлопка – вату, гигиенические изделия, нетканые полотна и другое. Хлопок-Волокно или Хлопковое Волокно получают из коробочек Хлопчатника. Качество зависит от длины волокна:- чем волокна длиннее, тем хлопок лучше и дороже. Известно много сортов хлопчатобумажных тканей:- Индийский гур, гаман, Французский бомбазин, дрогет, жаконет, тонкий Английский кембрик, наиболее распространены ситец, сатин, бязь, фланель и другие.

COTTON FLOWERING = ЦВЕТЕНИЕ ХЛОПЧАТНИКА – Cotton Flowering:- Cotton is a Perennial Shrub that produces flowers over an extended period of time while conditions are favorable. Moisture, temperature, Insect damage and boll load all affect the amount of flowering. The cotflower is a very transient stage in fruit development lasting only 2–3 days. See also Boll, and Square. / Хлопчатник – это Многолетнее Кустарниковое Растение, цветущее в течение длительного периода времени при наличии благоприятных условий. Влажность, температура, повреждения Насекомыми и избыток коробочек оказывают воздействие на количество соцветий. Цветение Хлопчатника является весьма кратковременной стадией развития самого плода этого растения, которая длится 2–3 дня. Смотрите также Коробочка (Boll) и Подцветник (Square).

COTTON FUTURES ACT = АКТ О ФЬЮЧЕРСАХ НА ХЛОПОК – 1914-August-18:- The Cotton Futures Act, which imposes a prohibitive tax on cotton futures contracts that do not meet certain regulatory requirements, is enacted. 1915-October-13 – The Supreme Court declares the Cotton Futures Act unconstitutional on the grounds that it was a revenue bill that originated in the Senate rather than the House of Representatives. 1916-August-11 – A new version of the Cotton Futures Act is enacted that addresses the constitutional concerns, but is otherwise similar to the 1914 act. First cotton futures were designated and effected (accordingly) at the following US commodity exchanges:- (i) Board of Trade of the City of Chicago – 1936-September-13 and 1936-September-14; (ii) New Orleans Cotton Exchange – 1936-September-08 and 1936-September-13; and (iii) New York Cotton Exchange – 1936-September-11 and 1936-September-13.

COTTON GIN = ХЛОПКОВЫЙ ВОЛОКНООТДЕЛИТЕЛЬ (или ХЛОПКОВЫЙ ДЖИН) – Cotton Gin:- Gin is short for engine, all fiber from the field flows through the cotton gin. Today's modern cotton gins dry and clean the cotton – removing field trash and plant parts like sticks and stems – before performing the primary job of removing fiber from the seed. See also Gin.

COTTON GRADE = СОРТ ХЛОПКА – Cotton Grade is a measure of the color, foreign matter present, and the preparation of a given lot of raw cotton.

COTTON INCORPORATED = КАТЭН ИНКОРПОРЭЙТИД – Cotton Incorporated (CI) is a private corporation established in 1971 as the sales-oriented marketing and research organization representing US cotton growers. CI's objectives are to increase producer's profits and to expand the sale of products containing cotton. Headquartered in New York, NY, the United States.

COTTON INSECTS = НАСЕКОМЫЕ ХЛОПЧАТНИКА – Cotton Insects:- these Pests include among others the Boll Weevil, Pink Bollworm, Cotton Flea Hopper, Cotton Louse, and Leaf Worm. Also known as Cotton Pests. / Насекомые Хлопчатника:- эти вредители включают среди прочих .

COTTON KNITS = ХЛОПКОВЫЙ ТРИКОТАЖ (или ХЛОПЧАТОБУМАЖНЫЕ ТРИКОТАЖНЫЕ ИЗДЕЛИЯ) – Cotton Knits are made by the same methods as other knits, although they often are of finer gauge than wool and man-made fiber knits. They are the traditional underwear fabric, but recently have become popular for shirts, dresses, and sportswear. Many cotton knits today include some man-made fiber to reduce shrinkage and give the knit greater stability.

COTTON LINTERS = ХЛОПКОВЫЙ ЛИНТ (или ХЛОПКОВЫЙ ПУХ) – Cotton Linters are fine, silky fibers which adhere to the seeds of the Cotton Plant after ginning. These curly fibers typically are less than 1/8 in (3 mm) long. The term also may apply to the longer textile fiber staple lint as well as the shorter fuzzy fibers from some Upland Species. Linters are traditionally used in the manufacture of paper and as a raw material in the manufacture of cellulose. In the UK, linters are referred to as 'Cotton Wool'. This can also be a refined product (absorbent cotton in US usage) which has medical, cosmetic and many other practical uses. The first medical use of cotton wool was by Dr. Joseph Sampson Gamgee at the Queen's Hospital (later the General Hospital) in Birmingham, England. See also Linters. Cotton Linters are the Cotton fibers that are too short for yarn or fabric manufacturing. Cotton Linters are the short fibers adhering to cotton seed after the operation of ginning (seed removal and cleaning). These fibers are cut from the seed in a series of passes through cutting blades, and are therefore referred to as, 'First-Cut Linters', 'Second-Cut Linters', 'Mill Run', etc. Linters are used in the manufacture of cotton fiber content paper and cellulose derivatives. / Доктор Дьжоузиф Сэмпсэн Гамдьжи (Dr. Joseph Sampson Gamgee). Код ТН ВЭД:- 1404 20 000 0. Под хлопковым Линтом или Пухом понимаются короткие и грубые волокна, снимаемые с семян Хлопчатника после отделения хлопка-волокна. Различают хлопковый пух 1-го и 2-го съёма (first-cut linters и second-cut linters, соответственно). Хлопковый линт или пух используют для изготовления ваты, прокладочных, изоляционных материалов, фильтров и других целей. Пух Хлопковый или Линт – короткие волокна, остающиеся на семенах Хлопчатника после отделения нормального волокна. Содержание пуха – 4–8% от массы семян. Снимается с семян после волокноотделения в 2–3 приёма (для увеличения съёма и разделения по качеству). Используется как сырьё для получения ваты, искусственного волокна, плёнок, лаков, взрывчатых веществ и так далее.

COTTON LOAN PROGRAM = ПРОГРАММА ЗАИМСТВОВАНИЯ ДЛЯ ХЛОПКА – The Cotton Loan Program is technically part of the USDA's marketing assistance program authorized by current federal farm bill legislation. The loan program establishes a government floor or support price for cotton at the loan rate of 52 cents per pound. In previous decades, the CCC loan program operated by the USDA essentially buying up all cotton when prices were below the loan rate, effectively supporting grower prices at the loan rate. The 'Loan Rate' terminology exists because the program is designed as a financial operation:- growers receive a non-recourse 'Loan' from the USDA valued at the loan rate times their bales of cotton, with the latter as collateral. If post-harvest market prices exceed the loan rate, growers can redeem their cotton, pay off the CCC loan (plus storage) and sell it. If prices are below the loan rate, growers simply forfeit their cotton to the USDA and keep the loan. The implications of this were that the government would collect large quantities of cotton when prices were low, so beginning in the 1980s, additional provisions were added to move this cotton directly to the world market while still maintaining the price support system. What follows is a description of how the loan program currently operates. The linked USDA bulletin at http://www.fsa.usda.gov/pas/publications/facts/nonrec03.pdf provides much more detail on how these programs work. Description:- The cotton loan expands the domestic price support system (described above) by taking account of world prices. A British company called Cotlook Ltd calculates and publishes an index of world cotton prices called the Cotlook® A Index (referred to by USDA as the Far East or FE price). The A Index is the average of the five lowest price quotes of the following world cotton descriptions (all middling, 1-3/32"):- Memphis Territory; California-Arizona; Mexico; Central America; Paraguayan; Turkish; Uzbekistan; Pakistani 1503; Indian H-4; Chinese Type 329; West African; Tanzanian; Greek; Syrian; and Australian. USDA takes the A Index and, on a weekly basis, calculates the official adjusted world price (AWP). The AWP adjusts the A Index for the average cost differences of transportation and handling from the United States to Asia, and the average quality differences for US base grade (strict low middling, 1-1/16") cotton. The current AWP calculation is shown below in Table.

Table. Adjusted World Price Determined by USDA, as of 2/11/2020	
A Index of World Prices (Far East price, cents per lb)	89.57
Adjustment to US location and grade (cents per lb)	–19.25
Adjusted World Price (AWP, cents per lb)	70.32
US Average Loan Rate (cents per lb)	52.00
Loan Deficiency Pmt. Rate (= max {Loan – AWP, 0}) (cents per lb)	0.00

The AWP then reflects the value of US cotton on the world market, i.e. roughly what an exporter or foreign buyer would bid for US cotton. It is also what it costs a merchant to redeem a grower's crop from the CCC loan. The loan deficiency payment (LDP) calculated above is roughly the difference between the USDA loan rate and what the grower would get by selling it on the world market. (Note:- The LDP is sometimes called a 'POP' payment by growers; 'POPing your cotton' means applying for an LDP.) The current cotton loan program is designed to keep the 52 cent support price effective, so when world prices are low, the program pays the LDP to sell their cotton on the world market in lieu of putting their cotton in the loan program. The LDP shrinks to zero in years when the A Index of world prices are high enough to result in an AWP in the mid-50s or higher, as shown in this graph. Conversely, the LDP increases as the AWP falls below 52 cents per pound, also shown graphically. Growers actually have several alternatives to receive payments in the situation of low world prices:- (1) forward contract prior to harvest, and apply to USDA for an LDP while still maintaining beneficial interest (Note:- A producer retains beneficial interest in a quantity of a commodity if he has:- control of the commodity, risk of loss; and title to the commodity. For loans, a producer must retain beneficial interest in the commodity from the time of harvest through the date the loan is redeemed or CCC takes title to the commodity. For LDP's, a producer must retain beneficial interest in the commodity from the time of harvest through the date the LDP is requested. Once beneficial interest in a commodity is lost, the commodity remains

ineligible for a loan or an LDP even if a producer regains control, risk of loss, and title.); (2) apply for an LDP (while still maintaining beneficial interest) during the harvest period then sell the cotton (Note:- New cotton producers should carefully note that cotton in the loan does not require payment of storage costs if market prices are below the loan rate. Free storage costs in those circumstances means that cotton in the loan will be more attractive to merchants. Therefore, when prices are below the loan rate, if you take the LDP and opt out of the loan before you've sold your cotton, you may get lower bids for your cotton than otherwise would have. Furthermore, you will have to pay storage.); or (3) forgo the LDP, store the cotton under the USDA loan program, and receive the loan rate (and the obligation to pay storage and accrued interest). Alternatives (1) and (2) both require monitoring of weekly LDP rates and diligence on the part of growers to make sure that their forward contracts or cash sales do not disqualify them from applying for the LDP. Under Alternative (3) there are three alternative choices for cotton that is in the loan:- (A) forfeiture to the USDA (in which case the grower keeps the loan value less any storage and accrued interest; (B) redemption, or taking the cotton back out of the loan, paying off the loan at the loan rate (plus accrued interest to that point) or the AWP, whichever is lower, and selling it on the world market; or (C) 'selling equities', i.e. making an equity sale to a merchant. (Note:- The term 'Equity Offer', also known as 'Selling Equities' should not be confused with so-called 'Equity Contracts'. Merchants use equity contracts to bid for cotton before it is put into the loan.) Choice (A) would generally only be made as a last resort. Choice (B) would generally be made if the AWP was less than the loan rate plus accrued interest costs. In that case, the grower would realize a net gain, which is called a marketing loan gain (MLG). The MLG incentive is exactly that of the LDP:- to move US cotton into the world market. Regarding Choice (C), equity bids from merchants to growers is a common practice, especially in West Texas. Equity offers are calculated by merchants based on the estimated MLG, trends in US and world prices, the time remaining until expected loan redemption by the merchant, the expected cost of carrying the cotton, and the level of the Step 2 payment. It is presently unknown as to the ultimate effect of Step 2 payment elimination, but it will probably result in a several cent reduction in the equity bids from merchants. Growers with cotton in the loan should evaluate any equity bids to their expected MLG under Choice B. Eligibility:- There are a number of eligibility requirements for marketing assistance loans and loan deficiency payments which are related to the producer, the commodity, or other commodity program provisions. One important concept already mentioned is beneficial interest. In addition to maintaining beneficial interest, the cotton pledged as collateral for a non-recourse loan must satisfy USDA's minimum grade and quality requirements. Lastly, the sum of marketing loan gains and loan deficiency payments for all crops during a crop year is limited to USD75 000 per person. Your local USDA-FSA office has the final word on eligibility requirements.

COTTON LOBE = СЕМЯДОЛЯ ХЛОПЧАТНИКА (или СЕМЕНОДОЛЯ ХЛОПЧАТНИКА, или ВСХОДЫ ХЛОПЧАТНИКА, или ОТДЕЛЬНЫЕ ПРОРОСТКИ ХЛОПЧАТНИКА) – Cotton Lobe:- a rounded projection generally of a leaf, hence lobed. Also known as Cotyledon, Seed Leaf, and Seed Lobe. Partial rounded portion of a leaf or other organ, separated from the whole by a deep indentation that does not break the continuity of the structure. Any segment of an organ, especially if rounded. Any division of an organ not completely separated from the next. A part into which a leaf is divided. / Известна также как Семядоля (Cotyledon).

COTTON LOCK = ХЛОПКОВАЯ ДОЛЬКА (или ГНЕЗДО КОРОБОЧКИ ХЛОПЧАТНИКА) – Cotton Lock:- examining the number of locks in bolls is another way to look into a crop's past. Although genetics influence the number of locks per boll, environment is also a factor. The fact that 3-, 4- and 5-lock bolls can be found on the same plant demonstrates lock number is not determined entirely by genetics. If a crop is stressed in June, the lock number is reduced to four per boll or even three. These locks are smaller and contain less seed and lint than those from five-lock bolls. Lock number is determined early in the growing season before pinhead, and mostly in June. Analyzing cotton stalk stubble and locks per boll can be helpful in managing your next crop. The major, individual, internal section of a Cotton boll in which seed and lint development take place; four or sometimes five locks per boll are typical. Seed cotton from a section of a Cotton boll. There may be three, four, or five locks in a Cotton boll. / Хлопок-сырец, содержащийся в каждой отдельной створке коробочки Хлопчатника. Смотрите также Семядоля Хлопчатника (Cotton Lobe).

COTTON MODULE BUILDER = ОБРАЗОВАТЕЛЬ ХЛОПКОВОГО МОДУЛЯ (или ФОРМИРОВЩИК ХЛОПКОВОГО МОДУЛЯ) – For centuries cotton has been picked by hand. Hand picking is done in the less progressive cotton growing regions of the world. It is very inefficient and no longer practiced in modernized countries. Today's modern cotton harvesters can cover up to 6 to 8 rows at a time and can harvest more than 80 000 kilograms of seed cotton a day. These new cotton harvesters are a major improvement over the hand methods of the past. Prior to the development of the module builder, most cotton picked by machines was dumped into cotton trailers and hauled to a cotton gin (a place where seed and fiber are mechanically separated). This system became inefficient when the trailers were filled faster than the gin could process the cotton and the cotton pickers had to cease harvesting while waiting for trailers to empty. This challenge was met with the invention of the module builder in 1972. This implement allows cotton to be dumped from the picker onto the ground and be compressed hydraulically to form a module (tightly pressed stack) of cotton. Each module holds 12–14 bales. This module can be left in the field for storage and later be hauled directly to the gin or transported by a module mover to the gin's storage yard. The use of these builders allows the pickers to continue harvesting, unimpeded by ginning problems or delays. At the moment there are the following types of module builders:- (i) Electromechanical Module Builder and (ii) Hydraulic Module Builder. A machine that compacts seed cotton into modules in the field for storage prior to ginning. The Cotton Module Builder is a machine used in the harvest and processing of cotton. The module builder has helped to solve a logistical bottleneck by allowing cotton to be harvested quickly and compressed into large modules which are then tarped and temporarily stored at the edge of the field. The modules are later loaded onto trucks and transported to a cotton gin for processing.

COTTON OPENER = ХЛОПКОВЫЙ КИПОРАЗБОРЩИК – In the opener, the stock is taken care of by a series of cylinder-bar spur-teeth set in the rapidly revolving cylinder. The cotton is flung, by means of centrifugal force, against an iron grid many times. This loosens up the stock. There is a strong current of air blown through which aids in the opening of the cotton. Much foreign matter is removed in this treatment. The dirt is thrown out through grid spaces and is carried off. The lint gradually works its way along a channel and finally passes between two large rollers, which compress it into a sheet of cotton batting. This sheet or lap is rolled into a large roll about two feet in diameter and about 40 inches in width. When the cotton has arrived at the lap stage, it is ready for doubling and blending. Plants making the higher types and grades of yarn find it vitally important to have the strength and evenness accurate. To insure this in the finisher picker, four laps are fed into the machine, one on top the other, in layer form. Thus, the four laps come out of the picker as a well-blended whole, and the final lap is made up of the component fibers of the four laps that were fed in. This picker is also known as a Scutcher, and the treatment the stock receives in going through, in addition to the blending of the cotton, gets out additional particles of foreign matter. As evener laps result from this treatment, the cotton is more attractive, cleaner, and better to handle. The lap then is fed from the Opener Room into the Card Room by means of a mono-rail conveyer. The fibers, of course, are not parallel at all and are in the same condition as they came from the grids of the opener machine. See also Bale Opener.

COTTON PESTS = ВРЕДИТЕЛИ ХЛОПЧАТНИКА – Cotton Pests:- these Pests consist of four Groups (Bollworms, Leafworms, Chewing Pests and Sucking Pests) and include among others the following:- (1) Bollworms:- false African and American Cotton Bollworm (Helicoverpa Armigera), Cotton Bollworm (Helicoverpa Zea), Pink Bollworm (Pectinophora Gossypiella), Spiny Bollworm (Earias Insulana and Earias Biplaga), Spotted Bollworm (Earias Vittella), Tobacco Bollworm (Heliothis Virescens), Tobacco Worm

(Heliothis Larva), Beet Armyworm (Spodoptera Exigua); (2) Leafworms:- Cotton Leafworm (Spodoptera Littoralis); (3) Chewing Pests:- Boll Weevil (Anthonomus Grandis), Spider Mite (Tetranychus Spp.), Jassid Nymph (Empoasca Spp.); (4) Sucking Pests:- Cotton Aphids (Aphis Gossypii), Silverleaf Whitefly (Bemisia Argentifolii), Tobacco Whitefly (Bemisia Tabaci), Lygus Bugs (Tarnished Plant Bug (Lygus Lincolaris), Pale Legume Bug (Lygus Elisus and Taylogus Vosseleri), Stink Bugs (Nezara Viridula and Chlorochroa Spp.), Cotton Stainers (Dysdercus Spp.); and also Cotton Fleahopper (Pseudatomoscelis Seriatus) and Cotton Louse. Also known as Cotton Insects. / Эти Вредители принадлежат к четырём Группам Насекомых (Коробочные Черви, Лиственные Черви, Грызущие Вредители и Сосущие Вредители) и включают среди прочих следующих Насекомых Вредителей (Insect Pests):- (1) Коробочные Черви:- Африканский и Американский Хлопковый Коробочный Червь (Helicoverpa Armigera), Хлопковый Коробочный Червь (Helicoverpa Zea), Розовый Коробочный Червь или Хлопковая Моль (Pectinophora Gossypiella), Шиповатый Коробочный Червь (Earias Insulana и Earias Biplaga), Пятнистый Коробочный Червь (Earias Vittella), Табачный Коробочный Червь (Heliothis Virescens), Гусеница Табачной Совки (Heliothis Larva), Гусеница Карадрины или Наземной Малой Совки (Spodoptera Exigua); (2) Листовые Черви:- Хлопковый Листовый Червь или Хлопковая Совка (Spodoptera Littoralis); (3) Жующие Вредители:- Коробочный Долгоносик или Хлопковый Долгоносик (Anthonomus Grandis), Паутинный Клещ (из Семейства Tetranychus), Jassid Nymph/Нимфы Яссид/Цикадки (из Семейства Empoasca); (4) Сосущие Вредители, питающиеся соком Растений:- Хлопковая Тля (Aphis Gossypii), Магнолиевая Белокрылка (Bemisia Argentifolii), Табачная Белокрылка (Bemisia Tabaci), Растительноядный Клоп-Слепняк (Tarnished Plant Bug; или Лигус Линеоларис (Lygus Lineolaris)), Бледный Бобовый/Клубеньковый Клоп (Pale Legume Bug; или Лигус Элисус (Lygus Elisus) и Тайлогус Воссэлэри (Taylogus Vosseleri)), Вонючие Клопы:- из Семейства Зелёных Овощных Клопов (Nezara Viridula) и Хвойных Щитников (Chlorochroa), Хлопковые Красноклопы (так называемые Клопы-Солдатики) (из Семейства Dysdercus); а также Сборщик Хлопковых Блох/Хлопковые Наездники (Pseudatomoscelis Seriatus) и Хлопковая Вошь. Известны также как Хлопковые Насекомые Вредители (Cotton Insects). Sp. – Specie – Вид. Spp. – Species (plural) – Виды.

COTTON PICKER = ХЛОПКОКОМБАЙН (или ХЛОПКОУБОРОЧНАЯ МАШИНА, или ХЛОПКОСОБИРАТЕЛЬ) – As the mechanical Cotton Picker moves through the field, the Cotton Plants are guided through the picker head (a unit that contains the picking components). The seed cotton, or locks, in the bur encounter revolving barbed spindles attached to a picking bar (a vertical bar that contains 18 to 20 spindles) attached to a rotating drum. The locks are grabbed by the barbed spindle and pulled from its bur. The rotating drum then moves the picking bar toward the doffer. A doffer is a series of curricular, rubber lined pads, stacked 18 to 20 high, that remove cotton from the spindle. The seed cotton and spindles pass through the doffer where the cotton is removed or doffed from the spindle to fall to the picker door (a side component of the picker with channeling to facilitate the movement of cotton). An air vacuum created by a fan then sucks the cotton away from the door and blows it into the basket. The spindle now continues on its rotation passing through the moistener pads (small finned pads stacked 18 to 20 high, which add water and/or moistening agent to the spindles) where they are lubricated to assist in cleaning them. This sequence repeats itself continually while the Cotton is being picked. Spindle type cotton pickers harvest most of the Cotton grown in the United States. In the United States, three mechanical systems are used to harvest cotton. Cotton picking machines use rotating spindles to pick (twist) the seed cotton from the burr. Doffers then remove the seed cotton from the spindles and drop the seed cotton into the conveying system. Cotton stripping machines use rollers equipped with bats and brushes to knock the open bolls from the plants into a conveyor. A third kind of harvester uses a broadcast attachment similar to a grain header on a combine. All harvesting systems uses air to elevate the seed cotton into a basket where it is stored until it can be dumped into a boll buggy, trailer or module builder. Cotton fields are harvested twice during the harvesting season. The first picking takes place when 70–80 per cent of bolls are open, while the second picking occurs when all bolls are open. Beside that seed cotton moisture content must be lower than 10% to prevent quality deterioration, if cotton is going to be stored for some days before ginning. Weather and soil conditions during the harvesting season play a very important roll. Precipitation occurrences and rainfall amounts prevent harvesting process for a time period depended upon the amount of rain, the type of soil, the temperature, the wind velocity etc. Thus, within the harvesting season the days suitable for harvesting are restricted more or less every year according to the rainfall occurrence affecting the machine capacity. Moreover, wet crop results very often in the clogging of the machine causing damages and delays in harvesting. Additionally, wet ground causes wheel slippage, destroying the synchronization between picking speed and machine velosity and this in turn leads to stripping of unopened bolls and to excessive damage of the Cotton Plants. / Комбайн для обдирки (stripping) или уборки (picking) хлопка. из створок коробочки (burr). Последовательность повторяется постоянно . Составные части хлопкоуборочного комбайна:- Кабина (Cab), Бункер (Basket), Вертикальные Шпиндели (Spindles), Шпиндельный Барабан Приёмной Камеры (Spindle Picker Bar Drum), Кустоподъёмник (Plant Lifter), Приёмная Камера (Picker Bar), Съёмники (Doffers), Зона Съёма Хлопка (Picking Zone), Рабочая Зона (), Всасывающий Воздуховод (Suction Duct), Вентилятор (Fan), Подушка Увлажнителя (Moistener Pad). Хлопкоуборочная машина собирает хлопок-сырец из раскрывшихся коробочек Хлопчатника. Имеются хлопкоуборочные машины механического, пневматического и комбинированного (пневмо-механического) действия. В хлопкопроизводящих республиках бывшего Советского Союза использовались 2- и 4-рядные навесные хлопкоуборочные машины комбинированного действия с вертикальными шпиндельными вращающимися барабанами для уборки Хлопчатника, посеянного с междурядьями 90 и 60 сантиметров. Шпиндели барабанов, вращаясь, наматывают на себя хлопок, который затем транспортируется в бункер. Рабочие органы хлопкоуборочной машины приводятся в действие от вала отбора мощности трактора. Ширина захвата хлопкоуборочной машины 1.2–3.6 метра. Производительность таких машин составляла до 2 гектаров в час (га/ч). Если Картофель, Лён, зерновые и большинство других возделываемых культур созревают на больших массивах практически одновременно, то Хлопок поспевает в течение всего сезона. Сначала раскрываются коробочки, растущие в нижней части куста, затем расположенные выше, и так ярус за ярусом. В зависимости от Сорта Хлопчатника, агротехники и погодных условий период его созревания растягивается на 60–80 дней. Осенью на кустах можно найти и спелый хлопок-сырец, и полураскрытые, и закрытые коробочки, и даже завязи и цветы. Текстильные свойства хлопка зависят от поры его созревания и сбора. Чтобы получить первосортное сырье, нужно вовремя убрать хлопок. Поэтому хлопкоуборочная машина в отличие от зернового комбайна, убирающего весь урожай подчистую, должна очень бережно обращаться с растениями, извлекать волокна только из раскрывшихся коробочек. Повреждение куста или неполный сбор оборачивается потерей части урожая. Вот почему перед конструкторами первых хлопкоуборочных машин стояла очень трудная задача – создать механизм, способный соперничать с человеческими пальцами. В бывшем Союзе Советских Социалистическх Республик (СССР) работы начались в 1929, когда известный авиаконструктор Александр Александрович Пороховщиков построил оригинальную аэродинамическую машину. Куст Хлопчатника проходил между нагнетательным и всасывающим соплами. Хлопок выдувался из раскрывшихся коробочек и всасывался в другое сопло, откуда транспортировался в приёмник. Хорошая по замыслу машина Пороховщикова на испытаниях оказалась малоэффективной:- она снимала лишь небольшую долю созревшего хлопка и много коробочек сбивала на землю. Несмотря на неудачу Пороховщикова, пневматические машины в начале 1930-х всё-таки получили распространение, правда, в ручном варианте. В 1931 из США было выписано 80 машин, сделанных на базе трактора Фармол (Farmol), которые действовали по принципу пылесоса. Так или иначе, а разработка и испытания новых образцов техники продолжались. В 1939 году решением Совнаркома в Ташкенте, Узбекистан был образован филиал ВИСХОМа, ставший основным конструкторским и

исследовательским центром. Исследования, испытания, разработка новых моделей развернулись ещё в больших масштабах. Новые образцы машин создавались даже в годы Великой Отечественной Войны. В 1946 филиал ВИСХОМа был реорганизован в Государственное Специальное Конструкторское Бюро (ГСКБ) по Хлопкоуборке. В 1948 коллектив ГСКБ под руководством Михаила Никитовича Маркова разработал вертикально-шпиндельную машину СХМ-48, которая как бы подвела итог двум десятилетиям поисков Советских конструкторов. На сравнительных испытаниях с другими машинами СХМ-48 показала более высокое качество работы и её приняли к серийному производству на Ташкентском заводе Ташсельмаш. В 1950 труд её создателей был отмечен Государственной Премией СССР. Хлопкоуборочная машина, машина для сбора хлопка-сырца из раскрывшихся коробочек Хлопчатника. В СССР серийное производство хлопкоуборочных машин начато в 1949. Сначала выпускались 1- и 2-рядные машины, а с 1968 – 4-рядные (4-row models). По конструкции рабочих органов различают пневматические, пневмомеханические и механические хлопкоуборочные машины. Пневматические хлопкоуборочные машины собирают хлопок всасывающей воздушной струёй, создаваемой нагнетателем. Пневмомеханические хлопкоуборочные машины действуют на кусты Хлопчатника воздушной струёй и механически шпинделями. Механические хлопкоуборочные машины имеют рабочие органы – цилиндрические и конические шпиндели или 4-гранные призматические зубчатые стержни. Во время работы механической хлопкоуборочной машины её горизонтальные шпиндели, вращаясь и перемещаясь в направлении своих осей, вводятся в кусты Хлопчатника между ветвями и наматывают на себя хлопок. Такие машины наиболее распространены в США. Вертикальные шпиндели хлопкоуборочной машины, вращаясь, при входе в зону обработки куста перемещаются перпендикулярно своим осям. Они не вводятся в кусты, а прижимаются к ним сбоку со стороны междурядий, в которых располагаются шпиндельные барабаны. Собранный шпинделями хлопок снимается с них щёточными съёмниками и по всасывающему и нагнетательному воздуховодам вентилятором подаётся в опрокидывающийся бункер, приспособленный для выгрузки хлопка в транспортные средства бестарной перевозки. Хлопкоуборочные машины собирают хлопок в 2 приёма:- в 1-й – при раскрытии на кустах 50–60% коробочек, во 2-й – при дополнительном раскрытии 20–30% коробочек. Выпускавшиеся в СССР 4-рядные вертикально-шпиндельные навесные машины ХН-3,6 (производительность на 1-м сборе – 1.42 га/ч, на 2-м сборе – 1.88 га/ч; ширина захвата 3.6 м; агрегатировалась с трактором МТЗ-50Х; обслуживавший персонал – механик-водитель) и 14ХВ-2,4А (производительность на 1-м сборе – 0.9 га/ч, на 2-м сборе – 1.2 га/ч; ширина захвата 2.4 м; агрегатировалась с трактором Т-28Х-4; обслуживавший персонал – механик-водитель) были рассчитаны для работы в междурядьях соответственно 90 и 60 см в районах орошаемого хлопководства. Конструкция и технологическая схема работы их аналогичны.

COTTON PLANT = РАСТЕНИЕ ХЛОПЧАТНИК – Cotton Plant:- there are several Species of ‘wild Cotton’ (Cotton that grows uncultivated) in the world. They have been found in Australia, Africa, Arizona, Central America, Lower California, Brazil, Mexico and other tropical countries and islands. Because of problems related to their refinement, they are not economically feasible to use. Through genetic assistance and breeding, today’s Cottons have evolved from these ‘wild’ sources and are more processing friendly. Currently, there are five prominent types of Cotton being grown commercially around the world. They are Egyptian, Sea Island, American Pima, Asiatic and Upland. Because of their need for a long, sunny growing period with at least 160 frost free days they are grown between latitudes 45 degrees North and 30 degrees South. The major producing countries within this region are the United States, Peoples Republic of China, India, Pakistan and Republic of Uzbekistan. Also, Brazil, Australia, Egypt, Argentina, Turkey, Greece, Syria and others produce significant, but lesser amount. In the United States there are fourteen major Cotton growing states that produce Upland Cotton. They are Alabama, Arizona, Arkansas, California, Georgia, Louisiana, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas and Virginia. Some Cotton is also grown in Florida, Kansas and New Mexico. American Pima Cotton is grown in Arizona, California, New Mexico and Texas. All of these states form a region in the United States known as the Cotton Belt and have three things in common, lots of sunshine, water and fertile soil, very important to growing a good Cotton crop. Cotton plants have a general time frame in which they grow and produce after planting (introducing the seed to moist soil). With ideal conditions, the planted cotton seed will germinate (to begin to grow) or sprout and emerge in about five to ten days. The first 2 leaves that are visible on the young Cotton plant are seedling leaves called Cotyledons (cot-a-lee-dons). They are useful for absorbing sunlight into the plant. The sunlight is then converted through a process known as Photosynthesis, into nourishing carbohydrates that will help the plant grow. In about two to four weeks they turn over the photosynthetic task to true leaves (leaves produced subsequent to the cotyledons) which continue the feeding process for the duration of the plants life. The plant continues to grow, adding leaves and height, and in approximately five to seven weeks, small flower buds called Squares (a small flower bud covered with fringed leaf-like parts called Bracts) will appear on the cotton plant. As this square develops, the bud swells and begins to push through the bracts until it opens into an attractive flower. Within three days, the flower will pollinate (the transfer of pollen from the anther to the stigma of the same or another flower) itself, change from a creamy white or yellow color to a pinkish red, and then wither and fall, exposing a small, green, immature Cotton boll (a segmented pod containing 32 immature seeds from which the Cotton fibers will grow). This boll is considered a fruit because it contains seeds. As the fibers continue to grow and thicken within the segmented boll, it enlarges until it becomes approximately the size of a small fig. Now, the Cotton fibers have become mature and thickened with their primary growth substance, cellulose (a carbohydrate, the chief component of the cell wall in most plants). An average boll will contain nearly 500 000 fibers of cotton and each plant may bear up to 100 bolls. In about 140 days after planting or 45 days after bolls appear, the Cotton boll will begin to naturally split open along the bolls segments or carpels and dry out, exposing the underlying cotton segments called Locks. These dried carpels are known as the Bur, and it’s the bur that will hold the locks of Cotton in place when fully dried and fluffed, ready for picking. The growth cycle of the various Cotton Species vary in length, but the sequence of fruit production remain the same. Weather, insects and moisture can adversely affect optimum conditions for plant growth and it is the farmer’s responsibility to adjust to these conditions to optimize yield. See also Cotton. The tree like plant has a height of 12 to 18 feet, the fibers are greenish in cast and rather coarse, the flowers are purplish. The perrenial plants lasts from five to six years while staple is fine, silken and of good length; in fact, it is never used as a field crop. Its cultivation in India is likely more ancient than that of any other nation. / Виды (Species). (называемыми прицветничками (bracts)). именуемые семядолями (cotyledons). рыльце (stigma). , но последовательность плодоношения . Хлопчатник, Род Многолетних Трав и Кустарников Семейства Мальвовых. 35 Видов в Австралии, Азии, Америке и Африке. Одна из основных технических культур. Для получения волокна длиной до 43 миллиметров, покрывающего семена, выращивают в однолетней культуре Хлопчатник Мексиканский (свыше 70% мировой продукции хлопка-волокна), Хлопчатник Индокитайский, Хлопчатник Перуанский (к нему относятся сорта бывшего Советского тонковолокнистого Хлопчатника, Египетского и Из Морских Островов (или Си Айлэнд (Sea Island))) и другие. Из семян Хлопчатника получают хлопковое масло (22–29%). Родина хлопководства – Индия (с третьего тысячелетия до Нашей Эры). Многолетнее кустарниковое Растение Рода Госсипиум из Семейства Мальвовых – Семейства Двудольных Растений. Хлопчатник (1890–1907) принадлежит к Семейству Мальвовых (Malvaceae Family), к Роду Gossypium, который имеет чрезвычайно много Видов и Разновидностей древесных, кустарных и травянистых, многолетних, двухлетних и однолетних. Листья Хлопчатника переменные, с длинными черешками, чаще 3–5-лопастные, хотя нередко встречаются и цельнокрайные, и вообще, разнообразных форм и величин. Цветок его состоит из венчика, с 3–5 широкими и сросшимися лепестками, и пятизубчатой чашечки, окружённой трёхлопастной обёрткой, которая во много раз длиннее чашечки. (Смотрите Таблицу

Технические Растения (Фигура 2)). Плод Хлопчатника – коробочка, иногда более круглая, в других овальная, 3–5-раздельная, с семенами внутри неё, покрытыми на поверхности пушком – хлопком. Семя Хлопчатника, покрытое плотной кожурой, содержит в себе зародыш – состоящий из корешка и двух семенных долей. По причине громадного разнообразия Видов Хлопчатника и очень лёгкой изменчивости и перехода, как различных Видов, так и отдельных органов в другие, при изменении климата, почвы, культуры и так далее, как в естественных условиях, так и при культуре двух или нескольких Видов на близком расстоянии, – путём перекрёстного опыления получаются всё новые и новые Разновидности. Поэтому все попытки ботаников классифицировать и подразделить Род Gossypium по научным и строго определённым Видам вовсе не удаются. Линней считал всего от 3 до 6 Видов Хлопчатника, Парлаторе до 7, Декандоль до 13. Некоторые насчитывали уже до 42, 52 и даже до 88. Другие опять, как, например, М.Дж. Ватс, признают только два Вида:- Американский и Азиатский, которые физиологически смешаться вовсе не могут, следовательно, представляют два Вида резко обособленных. Ройль основных Видов признаёт четыре, и его классификация считается вполне удовлетворительной. Типичными представителями являются следующие Виды Хлопчатника:- (1) Gossypium Herbaceum – или Хлопчатник Травянистый, он же считается и Ост-Индским – Gossypium Indicum, или Азиатским. Этот Вид Хлопчатника очень распространён в Индии, Китае, Японии и у нас в Средне-Азиатских владениях – под именем Местного производится в Туркестане, почти исключительно в Бухаре, Хиве, и в Закавказье под именем Каракоза – чёрная коробочка – более всего культивируется в Эриванской Губернии. Это самый низкорослый, наиболее стойкий Вид – культивируется дальше всех на Севере, однолетний. Стебли его редко достигают в наших широтах до 2 аршин высоты, коробочки круглые и мелкие, цветок жёлтого цвета, с красным пятном внутри, семена мелкие, круглые и покрыты сверху коротким, серого цвета пушком. Волокно (хлопок) – белого цвета, самое короткое и грубое – шерстистое, как его называют. Длина волокна колеблется от 0.65 и до 1.10 дюйма. (2) Gossypium Arboreum – Древовидный, самый высокорослый, от 15 до 20 футов высоты, многолетний, с красными цветами, с чёрными голыми семенами и жёлтым волокном высокого качества – длиной от 1.40 до 1.50 дюйма. Сюда же, вероятно, относятся Бразильские и Перуанские Сорта; в последнем чёрные, голые семена, как бы сросшиеся вместе, образуют конусовидную массу. Цветы жёлтые. Встречаются только под тропиками. (3) Gossypium Barbadense, он же Gossypium Maritimum – Приморский, или Приморских Островов – или так называемый в Америке Sea Island (Си Айлэнд или Из Морских Островов). Многолетний с жёлтыми цветами, с чёрными голыми семенами и с длинным, самого высокого качества волокном, от 1.60 до 2.20 дюйма. Стебли достигают от 6 до 15 футов высоты. Только недавно, менее 100 лет тому назад, путём долгих усилий в Америке сделался однолетним. Культивируется в очень ограниченных размерах в Америке, именно почти исключительно только по берегам и островам Южной Каролины, Джорджии и Флориды. К нему же относится длинноволокнистый бурый Египетский хлопок, но длина волокна этого последнего короче, от 1.40 до 1.50 дюйма. (4) Gossypium Hirsutum – Косматый, или Волосистый, или, так называемый в Америке, Нагорный (Upland), можно назвать суходольным (в противоположность Приморскому Sea Island). Этот Вид, называемый нередко Зелёносемянным или Мексиканским Видом, достигает до 6–7 футов высоты – самый важный Вид и самый распространённый и в Северной Америке, и у нас в Средней Азии и в Закавказье. Однолетний с белыми цветами, которые на Солнце становятся розовыми, семена серые, если не зеленоваты, покрытые обильно пушком. Длина волокна в разных районах различная – колеблется от 0.95 до 1.40 (New Orleans) – самый длинный сорт. Вот главнейшие типичные и наиболее известные в торговле Виды хлопка. Сортов же хлопка насчитывается бесчисленное множество (смотрите ниже Хлопчатобумажное Производство). Родина Хлопчатника достоверно неизвестна, но она была где-нибудь под тропиками, где и теперь встречаются ещё некоторые представители этого Рода в диком состоянии, откуда уже путём культуры Хлопчатник распространён до 40 и более градусов по обе стороны экватора. Ранее всего Хлопчатник был известен в Индии, затем в Китае, Японии и Египте. В этих странах культура его считается уже известной, по крайней мере, до 4 тысяч лет. При открытии Америки, Хлопчатник был найден в Мексике, а по другим данным, и в других частях Америки. Но культура эта нигде не могла иметь большого значения до тех пор, пока не были найдены средства более лёгкого и дешёвого способа очистки хлопка от семян. На фигуре 1 показано первобытное орудие для очистки хлопка от семян в Индии, так называемая ‘Чурка’, состоящее из двух вальков, причём верхний неподвижный, а нижний вращающийся рукояткой. Хлопок с семенами подаётся между валиками, валик захватывает волокно и протаскивает его на другую сторону, а семена, не могущие пройти между валиками, отрываются и падают впереди. При этой операции два-три сменных рабочих могли очистить в день от 15 до 20 фунтов, не более, чистого хлопка. Поэтому и в Америке, хотя хлопководство было известно более 200 лет, но до 1793, именно до изобретения пильного коттон-джина – пильной машины – Илая Витни (Whitney), которая чрезвычайно ускорила и удешевила эту работу (при тех же 2 –3 рабочих, как и при ‘чурке’, стали получаться сначала десятки, а после 100 и более пудов в день при одной машине, смотря по числу пил, то есть по размерам машины и по двигателю, приводящему машину в работу, как, например, руки рабочих, сила животных, вода и так далее) – до этого момента о крупном и дешёвом производстве хлопка не могло быть и речи. С этого же времени хлопководство стало быстро и повсеместно развиваться, как никакая другая отрасль промышленности в мире. Площадь посевов Хлопчатника в Америке за последние годы приблизительно равна 10 миллионам десятин. Следовательно, средний урожай хлопка в Америке около 15 пудов с десятины. За последние 40–50 лет из семян Хлопчатника добывается масло, а остающийся после этого продукт, жмых, идёт на корм рогатому скоту, как молочному, так и мясному. Одна тонна этих семян даёт следующие продукты:- (i) короткого волокна – 70 фунтов; (ii) кожуры семян – 910 фунтов; (iii) масла (51 галлон) – 382 фунта; (iv) жмыхов – 600 фунтов; и (v) песка и прочих примесей – 38 фунтов; всего 2 000 фунтов. Раньше семена и жмыхи шли на удобрение полей, но в настоящее время это считается гораздо менее выгодным. Кожура (оболочка) семян также шла прежде на топливо, но теперь они являются суррогатом сена и вместе с жмыхами идут, главным образом, на корм скота. Это составляет ещё не менее 1/6 стоимости хлопка, то есть не менее 150 миллионов Российских Рублей, и в штатах хлопководства за последнее время сильно развивается скотоводство. Благодаря этим именно факторам, в связи с необыкновенным удешевлением производства хлопка путём машин, Американцы сумели расширять свои посевы хлопка даже и в 1895 и 1896, когда цены на хлопок падали даже ниже 4 Рублей за пуд (пд.) его в Америке. Из других стран хлопководство более широко развито в Ост-Индии, где хлопка получается ежегодно до 35 миллионов пд., в Китае – до 20 миллионов и в Египте – около 15 миллионов пд.. В первых двух странах дело поставлено плохо:- урожаи и по количеству получаются очень плохие, и по качеству. В Египте же, наоборот, всё дело находится в руках Англичан, и урожаи по количеству получаются самые высокие, до 30–34 пд., в среднем, на десятину и, следовательно, более чем вдвое выше против Америки, а хлопковое волокно превосходных качеств. Точно так же сравнительно очень большие успехи сделало хлопководство за последние 20 лет и в России, в Средней Азии и в Закавказье, именно с начала 1880-х, когда Тимофей Саввич Морозов (1823–1889) стал выписывать семена Хлопчатника из Америки и высылать их для опытных посевов в Туркестан и в Закавказье. Сначала дело шло неособенно удачно, так как выписывались, по незнанию, семена самые неподходящие. Так, например, для наших резко выраженных континентальных – знойных и сухих – районов, выписывались семена Sea Island – Gossypium Maritimum, то есть семена, исключительно пригодные для приморского климата, или семена New Orleans, то есть хотя из Вида Upland – вернее, Gossypium Hirsutum, но опять самые Южные и самые нежные и поздно созревающие. Но дело вскоре выяснилось и было налажено. Урожаи стали получаться удовлетворительные по количеству и небывалого прекрасного качества. Хлопок сразу обратил на себя внимание, и у нас в Туркестане и в Закавказье появились фирмы:- Ярославская Большая Мануфактура, Лев Герасимович Кноп (или

Йохан Людвиг Кноп (Johann Ludwig Knoop)), Акціонерное Общество Бумажныхъ Мануфактуръ Израэля Кальмановича Познанскаго Въ Лодзи, Товарищество Мануфактуръ Николая Николаевича Коншина Въ Серпухове, Торгово-Промышленное Товарищество ‘Владимир Алексеев’, Егор Филиппович Миндер и другие. В настоящее время один Туркестан даёт уже более 5 миллионов пд., Хива и Бухара около 1.5 миллиона пд. и Закаспийский Край – 300 тысяч пд.. Закавказье даёт ежегодно около 700 тысяч пд., именно Эриванская Губерния около 500 тысяч, и 200 тысяч, остальные губернии – Елисаветпольская, Бакинская, Кутаисская и Тифлисская. Средняя урожайность хлопка у нас в Туркестане и в Закавказье колеблется по годам от 15 до 20 пд. на десятину. (Но нужно при этом заметить, что сравнительно более высокие урожаи хлопка в России, а также и в Египте, получаются при искусственном орошении, тогда как в Америке без орошения, и притом дело ведётся чересчур экстенсивно.) Средние цены около 8 Российских Рублей. Следовательно, за весь наш хлопок около 7 миллионов пд. по 8 Рублей мы получаем до 56 миллионов Рублей. Однако, такие итоги получаются у нас только благодаря высокой покровительственной пошлине, наложенной на заграничный хлопок и достигающей в настоящее время 3 Рубля на пуд, а иначе наше не окрепшее ещё хлопководство было бы давно и окончательно задавлено Американским. Стоимость производства десятины хлопка в Туркестане и Закавказье определяется в среднем около 70 Рублей:- именно, в Туркестане от 40 до 80 Рублей, а в Закавказье от 60 до 100 Рублей. Но нельзя не сознаться, что наше хлопководство находится ещё, можно сказать, только в зародыше. Начать с того, что у нас и в Туркестане очень мало, а в Закавказье ещё почти вовсе нет рядовых посевов, следовательно почти нет конной обработки полей летом, всё делается руками, всё обходится очень дорого, и рабочих рук, в силу этого, не хватает, масса земель через это пустует, так как производство хлопка обходится очень дорого. Семена Хлопчатника, в особенности в Туркестане, всё ещё идут в большом количестве вместо дров на топливо, а в то же время слышатся жалобы на перепроизводство хлопка, на дороговизну хлебов, а в особенности кормов, и даже угрожают, что ‘вскоре скот кормить будет нечем’. Иногда, как мы видели в Америке, при правильной и экономной утилизации семян Хлопчатника – скотоводство в штатах хлопководства год от году развивается всё больше и больше, причём, по самому скромному расчёту, 400 тысяч голов крупного рогатого скота откармливаются ежегодно на маслобойных заводах исключительно семенами Хлопчатника, причём жмыхи даются, как интенсивный корм, а оболочки семян вместо сена, именно в количествах как 1 к 3 – 4 – 5 и 6 фунтов (фн.) Хлопчатника, для успешного его производства требует прежде всего тепла, и притом тепла интенсивного и продолжительного, не менее, как в течение 6, лучше 7 и 8 месяцев без морозного времени. Хлопчатник – ‘дитя Солнца’, говорят Американцы, так как он для своего созревания требует от 3 000–4 000° тепла, и притом ещё условие, чтобы в период его созревания не было частых и обильных дождей, иначе он и при этой сумме тепла может не вызреть. Поэтому, например, многие местности в Закавказье, даже самые тёплые, как, например, Батум, Сухум, Сочи или Ленкорань, по причине чрезмерного обилия дождей и, вообще, влаги в этих пунктах, в особенности осенью, в период созревания хлопка, являются совершенно непригодными для его культуры. В местностях же менее тёплых и с более коротким периодом безморозного времени в году, как, например, Тифлис, Дербент, Закаталы, Нуха и другие, избыток дождей и, вообще, избыток влаги осенью, когда желательна, если не особенно теплая, то, по крайней мере, наиболее сухая погода, может затормозить созревание хлопка, затянуть его до наступления осенних заморозков, причём урожай хлопка неизбежно сильно сократится по количеству, и может пострадать его качество, так как даже самые незначительные морозы в – 1.5 и – 2° уже убьют Хлопчатник и приостановят его дальнейшее развитие. То же самое нужно иметь в виду и в отношении выбора почв для Хлопчатника. При обилии тепла, как, например, у нас в Ферганской Области или в Закаспийском Крае, Хлопчатник можно возделывать с успехом почти на всяких почвах, хотя бы и очень плотных, так как и на них здесь Хлопчатник успеет дозреть и дать хороший урожай и, следовательно, дело будет обеспечено. И наоборот, при климатических условиях менее благоприятных, то есть где и теплоты меньше, и ветры бывают частые и сильные, и дожди выпадают неожиданно обильные и продолжительные – в таких случаях, если и можно заниматься успешно хлопководством, то не иначе, как только на почвах самых рыхлых и тёплых или с ясно выраженными уклонами, или, если хлопок орошается, то и при искусственно устроенном дренаже. Следовательно, вообще говоря, для Хлопчатника предпочтительны почвы рыхлые, тёплые, плодородные, чистые от Сорных Трав и защищённые от сильных и холодных ветров. Имея в виду такие требования Хлопчатника в отношении почв, обработку под посев его необходимо производить плугом и с осени, чтобы дать почве лучше разрыхлиться и чтобы лучше её очистить от сорных трав. Общее правило – что чем местность жарче, суше, и чем меньше опасности в отношении дождей осенью, тем глубина пахоты без всякого риска может и должна быть глубже, и наоборот, чем местность прохладнее, чем меньше шансов на полное вызревание Хлопчатника, чем вегетативный период короче и дожди осенью бывают вероятнее, тем пахота должна быть мельче. Точно так же должны быть приняты в соображение и тот или другой физический и химический составы почв, то есть почвы более плотные, а следовательно, богатые и более холодные, более глинистые и иловатые должны, при прочих равных условиях, пахаться мельче, и наоборот, почвы более рыхлые, тёплые, менее плодородные, с ясно выраженными уклонами, в особенности на Юг, смело можно и должно пахать глубже. За среднюю нормальную глубину пахоты в Закавказье и в Туркестане нужно принять 4 вершка (верш.), так как, при меньшей глубине пахоты главный стержневой корень Хлопчатника быстро доходит до плотного не паханного слоя и, не имея возможности при плотных почвах дальше развиваться вертикально, сейчас же искривляется под прямым углом и идёт уже в горизонтальном направлении. Это обстоятельство всегда более или менее неблагоприятно отражается на урожае, именно, прежде всего на выносливости такого экземпляра в отношении засухи, что отражается, в свою очередь, на плодоношении, а следовательно, и на сборе хлопка. Такие растения, обыкновенно, сильно вытягиваются вверх, дают сравнительно мало боковых ветвей, а на них, между тем, почти весь урожай. Но, с другой стороны, пахать и глубже 4 вершков также в большинстве случаев опасно, так как главный корень при этом проникнет глубоко в почву, и это даст возможность развиться и всему растению пышно и роскошно, то есть куст получится слишком высокий – до 5–6 футов (фт.), а это уже почти всегда не даёт Хлопчатнику вполне дозреть. Но так или иначе, а чем рыхлее будет разработана почва и чем она будет чище от Сорных Трав, тем во всяком случае лучше и тем шансов на успех будет больше. Посев Хлопчатника производится, обыкновенно, и в Америке, и в Средней Азии, и в Закавказье в Апреле:- в некоторых, наиболее тёплых местностях его начинают с конца Марта, а в Северных, более прохладных районах, продолжают до Мая, иногда даже в течение всего Мая, а в исключительных случаях и в Америке (например, по берегам Реки Миссисипи), и у нас в Закавказье, по Араксу, как, например, на Муганской степи, посевы приходится производить иногда после спада вод, после разлития рек и когда орошенные почвы успеют подсохнуть, даже и в Июне. Нечего и говорить, что такие исключения крайне нежелательны. Вообще говоря, к посеву приступают после последних весенних утренников, когда температура воздуха и почвы сделается выше, чтобы возможно было получить быстрые и дружные всходы, чтобы они не были заглушены ещё Сорными Травами. В Восточном Закавказье, например, это лучшее время для посева бывает, обыкновенно, между 10 и 20 Апреля. Сеять раньше - опасно, так как всходы могут быть захвачены последним утренником. Но и запоздать с посевом также весьма нежелательно, так как это поведёт к соответственному запозданию созревания и уборки хлопка, и следовательно, является новый риск от ранних осенних заморозков. Посев Хлопчатника должен быть рядовым для того, чтобы он был правильным и равномерным, в смысле пользования им равномерно и почвой, и светом, и всем пространством поля, что решительно не удаётся никогда при разбросном посеве. Кроме того, при рядовых посевах только и возможно применение обработки полей при помощи животных. В Америке, при

площади посевов, достигающей в настоящее время до 10 миллионов десятин, уже давно нет Хлопчатника, посеянного в разброс. У нас же, в Туркестане рядовых посевов ещё очень мало, а в Закавказье их почти вовсе нет, за исключением казённых опытных и показательных полей. Между тем как рядовые посевы и конная или быками произведённая обработка междурядий в течение лета дают возможность всё это сделать часто вдвое и втрое дешевле, своевременнее и лучше. При посевах же вразброс всё приходится работать руками и ручными орудиями – всё это обошлось бы чрезвычайно дорого. В то же время, частое поверхностное разрыхление почвы крайне необходимо, дабы уничтожать корки на поверхности почвы, уменьшать испарение влаги из почвы, предупреждать растрескивание почвы и поддерживать её, вообще, в рыхлом и деятельном состоянии, чтобы увеличить в неё доступ воздуха, света и тепла и тем способствовать скорейшему росту, более обильному плодоношению и раннему созреванию Хлопчатника. Словом, это необходимейшее условие успеха дела вообще, а при искусственном орошении производства Хлопчатника, как это практикуется у нас в Средней Азии и в большинстве случаев в Закавказье, это ещё более важно, как увидим далее, ряды Хлопчатника делаются, обыкновенно, не менее, как на 1, 1 1/4 и 1 1/2 аршина (арш.), смотря по почве, то есть по богатству её, по длине вегетационного периода и количеству тепла, на которое можно рассчитывать. Минимальные расстояния в 1 арш. делаются с таким расчётом, чтобы была возможность обрабатывать все эти посевы лошадью или быками, а 3/4 арш. бывает, обыкновенно, достаточно вполне и для хороших почв и хорошего Хлопчатника, могущего дать 25–30 пудов чистого хлопка на десятину. Делать ряды большие против указанных размеров вовсе не следует, так как в большинстве случаев, ряды эти, при не особенно буйном развитии Хлопчатника, могут не заполниться, и следовательно, получатся в итоге нежелательные пустоты. Самые большие расстояния и самые высокие гребни делаются в Америке для Хлопчатника Sea Island, требующего и больше пространства, и главное, больше тепла для созревания. Поэтому в рядах нужно оставлять куст от куста при окончательном прореживании всходов на 4–6 и не более 8 вершков расстояния. Для ускорения созревания, а следовательно, и для успеха дела, необходимо, скорее, расстояния между рядами делать больше, до 5/4 аршина, а в рядах растения оставлять ближе одно от другого, не более как на 4–6 вершков; тогда вся плантация будет лучше, равномернее освещаться Солнцем, будет лучше, обильнее плодоносить и скорее созревать. В сухом климате, как Туркестан, Закаспийский Край или в Закавказье – Эриванская, Бакинская и Елисаветпольская губернии, где вообще очень жарко и сухо, посев Хлопчатника делается по гладкому полю в лунки или борозды, дабы поле меньше подвергалось высыханию, а Хлопчатник – выгоранию. В Америке же, где в штатах хлопководства выпадает 40 и более дюймов дождей в год, все посевы Хлопчатника непременно делаются на гребнях более или менее высоких, чтобы предупредить подтопление и заболачивание растений. То же самое необходимо делать и у нас в Кутаисской Губернии, такой же обильной дождями. В Туркестане за последние годы входит в практику ещё иной способ посева, именно гнездовой, то есть посев в шахматном порядке, или в квадрат, и таким образом является возможность обработки поля конными орудиями вдоль и поперек, и, следовательно, ручную обработку довести до минимума. Способ этот в мало населённых районах имел бы громадное преимущество, где хлопководство тормозится именно недостатком рабочих рук. Но испытание этого способа посева Хлопчатника в Закавказье, на Опытном Поле в Караязе, показывает, что урожаи при этом против обыкновенных рядовых посевов получаются меньшие, именно, при гнездовом посеве оказывается очень трудно определить наивыгоднейшую густоту посева, или, что то же, расстояния рядов. На посев десятины Хлопчатника достаточно 2–3 пудов семян. Для рядовых посевов Хлопчатника и Кукурузы существуют однорядные и одноконные Американские сеялки (Фигура 2), которые открывают борозды, высевают семена и прикатывают их катком. Всё это делается одновременно и одним человеком с лошадью или мулом. В Тифлисе такие сеялки стоят 50 Российских Рублей. При посевах же Хлопчатника в разброс, как это делается в Закавказье, сеют нередко так же густо, как хлеба, высевая от 6 до 10 пудов на десятину, и результаты таких посевов получаются самые слабые. Удобрение Хлопчатника также является одним из важных факторов успеха хлопководства. Американцы благодаря удобрениям и тщательной отборке семян Хлопчатника на посев достигли того, что даже многолетние Виды Хлопчатника, как Gossypium Barbadense, или тот же знаменитый Sea Island – сделался уже однолетним и даёт очень хорошие урожаи и по количеству. Точно так же и относительно Вида Gossypium Hirsutum, или Американского Upland, если он и заходит так сравнительно далеко на Север, то опять благодаря, главным образом, удобрениям, которые вообще ускоряют рост и созревание, в особенности – фосфорно-кислые. Калийные же удобрения признаются в Америке специфическими предупредительными средствами против разных болезней Хлопчатника, но так как, обыкновенно, наилучшие результаты удобрения дают в смеси, то есть фосфорно-кислых с азотистыми и калийными, то и в этих случаях преимущество даётся опять фосфорно-кислым, соответственно количеству которых определяются количества и остальных. Важное значение придаётся также всем удобрениям органическими веществами, богатым гумусом, зелёным удобрениям, в особенности всякими Бобовыми Растениями, а также удобрению навозом, но последний для Хлопчатника должен быть старым и хорошо перепревшим, а иначе при этом удобрении созревание замедлится, в особенности, если применяется один навоз без фосфорно-кислых удобрений. Точно так же и в Египте признано, что лучшим предшествующим и самым распространённым растением Хлопчатника являются Бобовые Растения – Клевер, Люцерна. У нас же в Закавказье и в Средней Азии, если применяются удобрения под Хлопчатник, то только навоз, и обыкновенно с хорошим успехом. Минеральные же удобрения пока вовсе не применяются. Наиболее простым и удачным плодосменом – где он применяется, часто может быть следующий:- (1) Хлопчатник, (2) Кукуруза и (3) мелкие зерновые хлеба. В случаях применения навозного удобрения лучше Кукурузу поставить впереди, а Хлопчатник вторым. (4) Поле может быть занято каким-нибудь однолетним Бобовым или оставаться под паром. В искусственно орошаемых районах Хлопчатник, обыкновенно, орошается или сейчас же после посева, или перед самым посевом. В последнем случае, для скорости прорастания семян их нередко приходится сутки или двое предварительно мочить в воде. Первое правило искусственной поливки вообще, а Хлопчатника в особенности – поливать его как можно осторожнее и умереннее, так как всякая поливка прежде всего охлаждает и уплотняет почву, после чего, обыкновенно, на поверхности её, в особенности на Солнце, получается плотная корка, появляются трещины в почве, усиленно развиваются Сорные Травы, а всё это идёт в ущерб, как мы видели уже, развитию Хлопчатника. Поэтому после каждой поливки необходимо при первой же возможности, как только почва подсохнет достаточно, чтобы на ней возможно было работать – произвести сплошную конную обработку всего политого поля, чтобы разрыхлить почву и предупредить усиленное испарение влаги из неё, предупредить появление трещин, корки и Сорных Трав. Но с поливкой нужно быть осторожным, в особенности в конце лета и в начале осени, когда уже жары спадают, дни становятся всё короче, по ночам всё холоднее, а поздно политая плантация задерживает созревание Хлопчатника, коробочки его очень плохо раскрываются, а тут в Сентябре или Октябре уже можно опасаться заморозков; последняя поливка Хлопчатника должна быть окончена примерно месяца за два до первых морозов осенью. В общем, Хлопчатник в Закавказье и в Туркестане поливается всего от 2 до 4 раз, причём количество воды, потребной для этого, колеблется от 300 до 800 кубов на десятину. Но не меньше, чем с последней поливкой, необходима крайняя осторожность и с остальными поливками. Поэтому большим преимуществом в этом отношении пользуются те местности Закавказья, где благодаря обилию дождей весной в период посевов, именно в Апреле и Мае – удаётся посев Хлопчатника сделать вовсе без поливки. При этом почва остаётся более тёплой, рыхлой, менее засорённой. Посев Хлопчатника и поливка – две важнейшие и самые деликатные операции при культуре Хлопчатника. После появления всходов, приступают к прореживанию их руками, с тем, чтобы их оставить не больше того числа и при тех расстояниях, о

которых сказано выше. Весь дальнейший уход за Хлопчатником сводится к полотью Сорных Трав:- ручному – в рядах и конному – в междурядьях, к мотыжению всей почвы плантации и к поливке. Иногда делается ещё так называемая чеканка – срезывание или обламывание верхушек стеблей, а иногда и боковых ветвей Хлопчатника с целью усиления плодоношения и ускорения созревания. Операция очень дешёвая, и если сделана вовремя – не позднее появления первых цветов Хлопчатника, то даёт хорошие результаты. В течение лета, а в особенности, незадолго до начала созревания Хлопчатника обыкновенно появляются различные болезни. В болезнях этих различают, главным образом, две причины:- физиологические, происходящие от неправильного питания растений, или грибные болезни – от Грибков, причиняющих больший или меньший вред, а иногда и смерть. Из таких болезней наиболее важной и в Америке, и у нас в России, является ржавчина, или порча, как называют её в Америке – rust, или blight, которая выражается в красноте или побурении листьев, а затем в увядании их, а иногда и верхушек стеблей, и в опадении их. Раньше болезнь эта считалась также за грибную, но в настоящее время она объясняется физиологическими причинами и предупреждается в Америке удобрениями, в особенности калийными, и улучшенной обработкой почвы. Болезнь эта очень редко наблюдается на новых сильных и богатых почвах. Но аналогичное явление, именно краснота листьев Хлопчатника, наблюдается кое-где за последние годы и в Америке, и у нас в Эриванской Губернии при появлении на нижней стороне листьев паучков Tetranychus Telarius или близких им Видов, которые, высасывая сок листьев, также вызывают красноту или побурение их. Местами и по временам и эта причина также производит значительный вред Хлопчатнику. Другая болезнь, часто встречающаяся на Хлопчатнике – опадение плодов или цветочных завязей, чаще всего проявляется при всех резкостях температуры, как, например, при сильной и продолжительной засухе, или при чрезмерном обилии дождей, или ещё чаще при резких переходах из одной крайности в другую, или, например, при очень густых посевах, при чрезмерной поливке и так далее. Из грибных болезней на Хлопчатнике наиболее опасной является недавно появившаяся болезнь в Америке, так называемое, the wilt disease of Cotton – увядание Хлопчатника, которая пока ещё точно не определена, но Грибок этот признается очень близким к такому же Грибку – Neocosmosporavasinfecta Atk., встречающемуся в Америке на одном из Горошков, так называемом, Cowpea – Коровьем Горошке (Vigna Catjang). Грибок этот уже успел причинить громадные опустошения, в особенности на самом дорогом Хлопчатнике в Америке, на знаменитом Sea Island – в Южной Каролине, и даже заставил многих хозяев, самых выдающихся в этом деле – вовсе оставить эту культуру. Полагают, что споры этого Грибка находятся в почве, откуда они проникают через корень растения в стебель, распространяются по всему растению и убивают его. Лучшим средством против этой болезни считаются пока наиболее устойчивые сорта Хлопчатника, в особенности некоторые из Египетских, которые страдают от этой болезни очень мало. Из Червей на Хлопчатнике наиболее опасными являются так называемые:- (1) Плодовый Червь (Boll Worm) – Holiothis Armiger Hübn., который пробуравливает отверстия в плодах и выедает содержимое, и (2) Хлопковый Червь (the Cotton Worm) – Aletia Argillacea Hübn. Этот последний у нас в России пока вовсе не встречается, а первый по годам причиняет у нас довольно значительные опустошения. В Америке известно ещё много различных вредных Насекомых, причём некоторые из них причиняют громадные опустошения, как, например, the Mexican Cotton Boll Weevil – Anthonomus Grandis Boh. Но для нас они пока практического интереса не представляют. Хлопчатник начинает созревать в Августе, а к уборке его приступают в Сентябре, именно когда зрелого хлопка наберётся больше. Уборка производится руками в два–три и более приёмов, начиная с нижней части куста, затем переходя к средней и верхушечной. Лучшая часть хлопка и семян получается с нижней, а в особенности средней части куста, где и коробочки получаются крупнее и лучше развиты, и семена лучше вызревшие, и волокно по качеству лучшее, то есть наиболее длинное, шелковистое и прочное. Эти же семена, как ранее созревающие, необходимо всегда отбирать на посев, как дающие лучшие урожаи по количеству и качеству продукта. Отбирают семена Хлопчатника на посев из лучшей части урожая плантации, лучшие экземпляры Хлопчатника, и с них уже – лучшие плоды и семена на посев. Это именно тот путь, которым достигнуты наилучшие во всех отношениях результаты по хлопководству в Америке. Уборка хлопка с поля – работа очень простая, но, в то же время, очень продолжительная и, в итоге, дорогая. Средняя стоимость уборки и у нас, и в Америке по 1 копейке с фунта хлопка с семенами. Работа эта легко производится женщинами и даже малолетними детьми. Смотря по количеству урожая хлопка, и при той или иной ловкости и усердии рабочих – в день собирают у нас 1–2–3, а в Америке иногда 6–7–8 и даже, говорят, иногда более пудов. Но при такой работе собирается масса всякого сора, коробочек, листьев и даже веток. При снятии хлопка-сырца необходимо следить за тем, чтобы он был сухим и всегда сортировался по уборкам и по качеству, иначе он много теряет в своей ценности, а сложенный сырым в большие кучи – в амбарах может даже иногда подвергнуться самовозгоранию. После окончания уборки, и когда хлопок высохнет – в конце осени или зимой, его пускают на машины, так называемые, катэн дьжины, для очистки хлопка от семян. Катэн дьжин, Фигура 3 (правая сторона), представляет собой деревянный ящик (лучше видно на Фигуре 4), в котором вращаются два цилиндрических вала, из которых на переднем насажены круглые пилы, а на заднем щётки. Над этими двумя валами находится ящик, дно которого состоит из колосниковой решётки, в отверстиях которой и вращаются пилы при работе джина. Работа состоит в том, что хлопок с семенами падает в ящик, пилы захватывают его снизу своими зубьями, проталкивают сквозь решётку и при вращении (в 300 оборотов в минуту) передают его сзади их находящимся щёткам, которые работают в 3–4 раза быстрее, то есть со скоростью 1 000–1 200 оборотов и более, и образуют такую сильную тягу, что волокна хлопка быстро отлетают от них и в открытом помещении разлетаются во все стороны. Но в настоящее время почти во всех джинах имеются особые приспособления, так называемые конденсеры, которые собирают все эти хлопья вместе и выпускают их в виде бесконечного полотна, как это видно на Фигуре 4. Семена же Хлопчатника, которые не могли пройти вместе с хлопком через отверстия решётки джина, отрываются от волокна и падают в передней части джина. Для облегчения подачи хлопка в ящик джина имеются ещё так называемые фидеры, или питатели, то есть приспособления, в которые сваливается хлопок, а оттуда он уже автоматически падает в ящик, то есть в камеру джина. Лучшие и самые большие джины, стоящие до 1 000 Рублей дают до 150 пудов чистого хлопка в сутки. Последние операции с хлопком – прессовка его, обшивка и увязка. Прессов для хлопка различных систем, как и джинов, самых разнообразных, множество, начиная от самых примитивных ящиков с винтом, изображённым на Фигуре 3 с левой стороны, – и кончая самыми усовершенствованными и новейшими с гидравлическими, керосиновыми и паровыми моторами. Последней новинкой в этом отношении в Америке являются прессы, дающие вместо обыкновенных тюков, прямоугольных, – свёртывающиеся и развёртывающиеся цилиндрические тюки (Фигура 5) с высокой прессовкой, доводящей до 40 фунтов веса кубического фута. Такие тюки являются как бы застрахованными от воды и огня, занимают меньше места и в вагонах, и на пароходах и так далее. Наконец, последнее слово техники и экономии в этом отношении представляют собой целая батарея джинов; на Фигуре 6 их изображено только 4, но бывает и до 15; при них пресс, хлопковый элеватор, очиститель и распределитель хлопка – и все это почти совершенно автоматически действующее. На рисунке Фигуры 6 видно, как с одной стороны хлопок с семенами возами подвозится к элеватору, а затем уже вскоре очищенный, спрессованный, увязанный взвешивается на весах и отвозится или в склады, или на пароход, или в вагоны железных дорог. Батарея эта при 15 джинах по 70 пил, каждый даёт в течение 12 часов работы до 75 000 фунтов, или около 150 тюков хлопка, или, следовательно более 2 000 пудов. Первым потребителем хлопка на мировом рынке является Англия, вторыми Соединённые Штаты. Но, принимая во внимание, какими гигантскими шагами развиваются хлопчатобумажные фабрики в Америке за последние годы, в особенности в Южных штатах – в штатах хлопководства, – не

подлежит никакому сомнению, что в самом близком будущем те же Соединённые Штаты, которые являются в настоящее время не только первыми, но и далеко опередившими все остальные страны, взятые вместе по производству хлопка-сырца, будут первыми же и по потреблению его, и к тому же, пользуясь очень дешёвым сырым материалом, производящимся бок о бок с фабриками, будут ещё более сильным конкурентом всему миру и в снабжении хлопковыми товарами. Хлопчатник (Gossypium), Род Многолетних Растений Семейства Мальвовых. Деревья, Кустарники, Травы. В роде 35 Видов, произрастающих в тропических и субтропических районах Азии, Америки, Африки, Австралии. Выращивают как прядильные растения культурные формы в основном 4 Видов:- (i) Хлопчатник Африкано-Азиатский, Травянистый, Гуза (Gossypium Herbaceuin) – в странах Азии, заменён или заменяется более ценными сортами других Видов; (ii) Хлопчатник Индо-Китайский, Древовидный (Gossypium Arboreum) – в Индии, Пакистане, Бангладеш, Бирме, Китае и других; (iii) Хлопчатник Мексиканский, Обыкновенный, так называемый Аплэнд (или Нагорный) (Gossypium Hirsutum) – в бывшем СССР, США, Бразилии, Мексике и других главных хлопкосеющих странах; (iv) Хлопчатник Перуанский (Gossypium Barbadense) – в АРЕ (сорта Египетского Хлопчатника), Судане, бывшем СССР (сорта Советского тонковолокнистого Хлопчатника), США (сорта типа Си Айлэнд) и других. Дикие Виды:- Gossypium Anomalum и Gossypium Capitis-Viridis произрастают в саваннах Африки, Gossypium Stocksii и Gossypium Areyasianum – в Аравии, Gossypium Davidsonii и Gossypium Trilobum – эндемики Северной Америки, Gossypium Sturtii и Gossypium Robinsonii – из Австралии, и другие. Ботаническое Описание:- корневая система культурных форм Хлопчатник – мощная, стержневая, проникает в почву до 2.4–2.6 метров (м), но основная масса активных корней расположена в слое 0–50 сантиметров (см). Стебель прямой, ветвящийся, высотой 70–200 см. Из пазух его нижних листьев развиваются прямые и удлинённые ростовые (моноподиальные) ветви, из пазух верхних листьев (обычно с 3–6-го узла) – коленчато-изогнутые плодовые (симподиальные) ветви с одним (предельный тип) или несколькими (непредельный тип) междоузлиями разной длины – укороченными, средними, длинными и очень длинными, из которых формируются 8–10 и более цветочных почек. На ростовых ветвях появляются плодовые ветви 2-го порядка. У некоторых сортов цветочные почки располагаются непосредственно на главном стебле. Листья очередные, тонкие или кожистые, преимущественно зелёные (могут быть жёлто-зелёные и красноватые), 3–7-лопастные, с прилистниками; нижние – овально-сердцевидные, без прилистников. Цветок обоеполый, крупный, с 5 кремовыми, жёлтыми или белыми (у некоторых видов с красным пятном) лепестками; окраска лепестков меняется при увядании, становясь оранжевой, красной, лиловой. Тычинки сросшиеся в колонку, пестик 3–5-лопастной, завязь 3–5-гнёздная. Плод – коробочка диаметром 1.5–4.5 см, с 25–35 семенами, раскрывается 3–5 створками. Семя яйцевидной или грушевидной формы, длина 0.6–1.5 см и диаметром в широкой части 0.5–0.8 см; покрыто длинными преимущественно белыми волосками, используемыми в качестве волокна (есть формы с цветным волокном – коричневым, зеленоватым и другим), и часто коротким подпушком, или линтом; 1 000 семян весит 80–160 граммов (г). Биологические Особенности:- вегетационный период Хлопчатника 110–145 суток. Всходы появляются на 7–10-е сутки после посева, первая плодовая ветвь – на 35–40-е сутки после всходов, ещё через 25–30 суток раскрывается первый цветок (цветёт один день) и через 50–60 суток – первая коробочка. Хлопчатник – теплолюбивое растение. За период вегетации для него нужна сумма среднесуточных температур 2 000–3 000 °C (градусов по Цельсию). Семена прорастают при температуре 14–16 °C, всходы погибают при 1–2 °C, оптимальная температура для роста и развития 25–30 °C. Снижение её до 17 °C и увеличение свыше 40 °C угнетает культуру (опадают бутоны, цветки и коробочки). Хлопчатник требователен к условиям увлажнения, питания и освещения. Транспирационный коэффициент его в условиях Средней Азии в среднем 600–800. За вегетационный период Хлопчатник потребляет 6 000–8 000 кубических метров на один гектар ($м^3$/га) воды. Среднесуточный расход воды хлопковым полем (в $м^3$/га); до цветения 32.5–62.5, в начале цветения 80, в период массового цветения и плодообразования 97.5–105, в начале созревания коробочек 47.5. Средний вынос питательных веществ на 1 тонну (т) хлопка-сырца (волокно, не очищенное от семян) около 45 килограммов (кг) N, 16 кг P_2O_5 и 48 кг K_2O. Наибольшее количество азота, фосфора и калия Хлопчатник потребляет в период бутонизация – плодообразование. Лучшие почвы – лёгкие суглинистые серозёмы. Засоленные почвы малопригодны для выращивания Хлопчатника, их предварительно мелиорируют. Дикие и полудикие формы культивируемых Видов – относительно засухоустойчивые кустарники или небольшие деревья (от 1 до 12 м), с тонкими плодовыми ветвями, мелкими листьями, цветками, коробочками и семенами; волокно редкое и короткое, почти всегда бурого или сероватого цвета. Хозяйственное Значение:- Хлопчатник – одна из основных технических культур. В мировом производстве текстильного волокна хлопок занимает более 50%. Хлопковое волокно (выход его из хлопка-сырца 25–40%) перерабатывают в пряжу, которую используют для изготовления различных тканей, в том числе технических, а также корда для автопокрышек, сетей и ремней, обмотки для проводов. Хлопковое масло (в семенах его 22–29%) употребляют в пищу, из него изготавливают маргарин, глицерин, мыло, стеарин, смазочные материалы. Отходы, получаемые при очистке семян и в маслобойной промышленности, применяют для производства целлюлозы, спирта, лаков, линолеума, киноплёнки, картона, изоляционных материалов. Жмых и шрот скармливают скоту, мука из них после удаления алкалоида госсипола (ядовит) может быть использована для извлечения пищевого белка. Из листьев Хлопчатника получают уксусную, яблочную, лимонную и другие органические кислоты, стебли пригодны для изготовления строительных теплоизоляционных плит. Хлопчатник – хороший медонос (медопродуктивность 1 га посева – до 300 кг мёда). История Культуры:- Хлопчатник – одно из древних прядильных растений. Родина хлопководства – Индия, где в долине Инда уже в период Хараппской Цивилизации (3-е тысячелетие до Нашей Эры) выращивали Хлопчатник и изготовляли пряжу из его волокна. Сведения о возделывании Хлопчатник в Египте относятся к I веку до Нашей Эры. Первые сообщения об использовании в Китае волокна дикорастущего Хлопчатника датируются II веком Нашей Эры, введение его в культуру – VII–IX века. В X веке Хлопчатник был завезён из Африки в Испанию, где вскоре в Барселоне возникло прядильное производство. На территории Соединённых Штатов Америки (США) колонисты стали сеять Хлопчатник с начала XVII века, хотя коренное население Америки выращивало эту культуру уже в 3–2-м тысячелетиях до Нашей Эры. В Средней Азии Хлопчатник возделывают с VI–V веков до Нашей Эры, в Закавказье с VII–IV веков до Нашей Эры. Районы выращивания Хлопчатника в бывшем Союзе Советских Социалистических Республик (СССР):- Средняя Азия (наибольшие площади в Узбекистане), Азербайджан, южные районы Казахстана. Возделывают сорта Советского Хлопчатника – средневолокнистого (относятся к Хлопчатнику Мексиканскому) и тонковолокнистого (к Хлопчатнику Перуанскому). На 1975 районировано 22 сорта. Лучшие из них:- средневолокнистые – 108-Ф, Ташкент-1 (вилтоустойчивый), 149-Ф, 133 и другие, тонковолокнистые – 9647-И, 8763-И, С-6030, 5595-В. Основные направления селекции культуры:- создание сортов, устойчивых к вилту и особенно к комплексу других болезней и вредителей, не содержащих госсипола в семенах, с равномерно окрашенным чисто белым волокном, приспособленных к машинной уборке. Технология Выращивания:- Хлопчатник высевают в хлопково-люцерновых севооборотах, в которых 2–3 поля занимают Люцерной, 6–8 полей Хлопчатником, одно Кукурузой или Сорго с подсевом Сидератов – Клевера Персидского (Шабдара), Гороха и других. Подготовка почвы:- уборка стеблей (гуза-паи) Хлопчатника предыдущего посева, промывные и предпахотные поливы, вспашка зяби, предпосевная обработка (боронование, дискование, перепашка или культивация с боронованием, планировка поверхности). Под Хлопчатник вносят 200–250 кг/га N, 100–185 кг/га P_2O_5 и 200–250 кг/га K_2O, из них под зяблевую вспашку используют 25–30% азотных туков, 60–70% фосфорных и 50% калийных; остальные удобрения вносят перед севом, во время сева (припосевное удобрение) и в подкормку. Высевают Хлопчатник, когда почва прогреется до 14–16 °C. Способы сева:-

широкорядный (междурядья 60–90 см), квадратно-гнездовой (по схеме 60–60 см по 6–8 семян в гнездо), пунктирный и частогнездовой (междурядья 60–90 см, расстояния между семенами или гнёздами 15–30 см). Норма высева опушённых семян 80–120 кг/га, оголённых семян для пунктирного способа сева 20–30 кг/га; глубина заделки 4–5 см. Уход за посевами:- вегетационные поливы (2–11 поливов, оросительная норма от 2 000 до 9 000 $м^3$/га воды), прореживание (в гнёздах оставляют 2–3 растения, на 1 погонный метр рядка 3–6), рыхления междурядий, уничтожение сорняков (применяют гербициды), подкормки, чеканка, перед уборкой дефолиация. Убирают Хлопчатник хлопкоуборочными машинами и вручную при раскрытии коробочек; курак – куракоуборочными машинами, волокно из него выделяют хлопкоочистителями. Вредители Хлопчатника:- Озимая и Хлопковая Совки, Хлопковые Тли, Карадрина, Паутинный Клещ. Болезни:- вилт, корневая гниль, гоммоз.

COTTON PRODUCT = ХЛОПКОВЫЙ ПРОДУКТ – Cotton Product means any product containing cotton fibers that result from the use of a bale of cotton in manufacturing.

COTTON PURIFICATION = ОЧИСТКА ХЛОПКА (или ОЧИЩЕНИЕ ХЛОПКА) – Cotton Purification is a removal of oils, waxes, and color bodies from cotton fibers.

COTTON QUALITY = КАЧЕСТВО ХЛОПКА – Cotton Quality:- those characteristics of the cotton fiber that affect processing performance and/or the quality of the various end products. While there are numerous factors that affect quality, the seven most important are fiber length, length uniformity, strength, fineness, maturity, color, and trash content. Their relative importance depends upon the product that is to be made and the type of processing equipment that is to be used. The traditional classification system, which rlies primarily on human sight and touch, assesses each of these factors except length uniformity and strength. USDA's new, instrument based classification system, which has been gradually introduced over the past decade is scheduled to entirely replace the traditional classification system in 1991, assesses all seven factors. Cotton Quality:- three major components of cotton quality (grade, staple, and micronaire) are included in official USDA cotton quality classifications. Added fiber properties, including length uniformity and strength, are also recognized as important and are increasingly being measured by instrument testing. Instruments are gradually replacing sight and touch methods in measuring cotton quality. Grade depends on the color, trash content, and preparation (smoothness) of the cotton sample. There are 44 Upland Cotton grades and 10 grades of extra-long staple cotton. The Official Cotton Standards of the United States for American Upland Cotton, also called Universal Standards, are periodically renewed and approved by major foreign cotton-consuming countries. Thirty-one official standards exist for US Cotton staple, ranging from less than 13/16 inch to 1-3/4 inches. Micronaire is an airflow measurement that indicates fiber fineness and maturity.

COTTON RUST = РЖАВЧИНА ХЛОПЧАТНИКА – Cotton Rust:- pest type:- disease; crops affected:- Cotton; scientific name:- Puccinia Cacabata. Symptoms:- true rust on Cotton is quite distinct from the 'rust' caused by potash deficiency. Cotton rust first appears as small, yellowish spots or pustules on leaves, bracts, green bolls, and/or stems. These spots enlarge, developing orange to reddish centers. Later, large orange pustules appear on the lower leaf surface and discharge orange spores. Several lesions on a leaf may cause it to shed. Rust lesions will also weaken stalks, stems and petioles, causing breakage. Wild gramma grass is an alternate host for this fungus. A rainfall followed by 12–18 hours of high humidity is needed in June or early July for this disease to develop. Disease Cycle:- this is a fungus and spores are produce in pustules and spread primarily by wind. Cotton rust is not widespread across cotton growing areas; but in local areas, e.g., West Texas, it can be severe and reduce yields by as much as 50%. Control Measures:- the most effective control of rust on cotton has been to apply an appropriate fungicide before the cotton is infected, i.e. preventative. A potash defiincy in Cotton, which causes bronzing and marginal browning of the leaves. Later, the leaves becom reddish-brown and die; the bolls are dwarfed, do not open and contain inferior fiber. / болезнь Хлопчатника . ; коробочки карликовые; .

COTTONSEED = СЕМЯ ХЛОПЧАТНИКА (или ХЛОПКОВОЕ СЕМЯ) – Cottonseed:- the seed of the Cotton plant, separated from its fibers. The seeds constitute 40 percent to 55 percent of the seed Cotton (depending on the amount of trash) and are processed into oil meal, linters, and hulls, or are fed directly to cattle. The Cotton seeds removed during ginning are shipped to Cotton oil mills. The Cottonseed is continually conveyed away from the gin stand by screw type conveyors and removed from the gin building by pneumatic conveying systems. Once outside the gin building, the cottonseed either goes into an overhead storage unit equipped with hopper bottoms to facilitate the loading of trailers or large buildings called Seed Houses. The seed is sent by truck or rail either to be fed as whole seed to dairy cattle or to a cottonseed oil mill where it is processed to produce cottonseed oil (used for human consumption), cottonseed meal and hulls (used for animal feed), and linters (used for paper or as chemical cellulose raw material to produce other products). The seed of Cotton from which the lint has been removed. Cottonseed Oil is extracted from the seed through a crushing process. Cottonseed Meal and Cottonseed Hulls, coproducts from the seedcrushing operation, are used as livestock feed. The Cotton-seed consists of two parts:- (i) the hull, from which the staple cotton lint and linters arise, and (ii) the kernel, from which the oil and meal are obtained. The nutritive value of cottonseed products depends on proportions of husks and lint. The husk is sometimes separated from the kernel before crushing, but often the whole seed is extracted for oil. Undecorticated oilcake is much richer in fiber and lower in protein. The term 'Egyptian Cotton Cake' refers to the undecorticated cake of black seeds, and 'Bombay Cotton Cake' is the term used for the undecorticated cake of white seeds. The cotton fibers of white seeds cover the whole surface and are very difficult to remove; if the cottonseed cake is broken, the fibers can be seen. For every ton of lint in seed cotton there are approximately 1.7 tons of cottonseed. One ton of seed yields about 200 kg of oil, 500 kg of cottonseed meal and 300 kg of hulls. The residual oil in hydraulic-press cake is usually between 4% and 8%, in screw-press cake between 3% and 5%, and in solvent-extracted meal less than 3%. Seed removed from the cotton lint at the gin. The seed is crushed in order to extract the oil from the meal and hulls that are used separately and in combination as livestock, poultry, and fish feed and as a fertilizer. Also known as Cotton Seed. Cottonseed is a seed of the Cotton plant, constituting about two-thirds of the weight of unginned cotton, and separated from the lint during ginning. The seed of cotton after the lint has been removed. It is a source of cottonseed oil, the residue is used as a stock feed. / Хлопковые Семена . зерновка (ядро; kernel). Семя:- у культурного Хлопчатника семена крупные, яйцевидной или неправильно грушевидной формы, тёмно-коричневой окраски. Длина семени 12–14 миллиметров (мм), диаметр в широкой части – 6–8 мм. Вес 1 000 семян в среднем равен 90–110 граммов (г), но доходит и до 160 г. Дикие виды имеют значительно более мелкие семена.

COTTONSEED CAKE = ЖМЫХ ИЗ СЕМЯН ХЛОПЧАТНИКА – Cottonseed Cake:- the solid residue left after the extraction of oil from cotton seeds. It should contain more than 36% protein and is sold according to its nitrogen and protein content. / Жмых из Семян Хлопчатника или Жмых из Хлопковых Семян или Хлопковый Жмых – твёрдый остаток, образующийся после экстракции масла из семян Хлопчатника на маслобойных заводах. Как правило, он содержит более 36% протеина и продаётся благодаря наличию в нём азота и протеина (белка).

COTTONSEED FEED = КОРМ ИЗ СЕМЯН ХЛОПЧАТНИКА – Cottonseed Feed:- a stock and poultry feed consisting of cottonseed meal and cottonseed hulls. It is sold according to its protein content which is usually between 22 and 36%. / на маслобойных заводах. Корм из Семян Хлопчатника или Корм из Хлопковых Семян или Хлопковый Корм – .

COTTONSEED HULLS = ШЕЛУХА СЕМЯН ХЛОПЧАТНИКА (или КОЖУРА СЕМЯН ХОПЧАТНИКА) – Cottonseed Hulls are used mostly in the southern area of the United States. They are low in protein, calcium, phosphorus and energy and high in fiber.

Cottonseed hulls are palatable and are used as a roughage for cattle, especially in areas where good quality forages are scarce. They occasionally are included in grain mixes to increase the bulk density and crude fiber content. They can be helpful in supporting fat test in low fiber or low roughage rations. The outer covering of the cottonseed. It is part of the residue after the extraction of the oil and used extensively for a stock feed. Cottonseed hulls supply no digestible protein but contain 43.7% digestible nutrients; they are fed with protein rich feeds, often cottonseed meal. Cottonseed Hulls are the parts of the cottonseed head that is left after the cotton and meal have been extracted and are normally considered to be a very low quality feed for ruminants. The results of two recent trials have shown that they are capable of supporting moderate growth rates in sheep. When a small amount of by-pass protein was added to the diet of cottonseed hulls + urea + 50 g lucerne + vitamins/minerals, the growth rate of lambs exceeded 130 g/day (567) and wool growth was increased from 6 to 9 g/day. Cottonseed hulls have frequently been included in complete diets for young, growing and lactating cattle. They make up about half the weight of ginned seeds. This crushed outer covering of the seed is taken out at the oil mill. Used chiefly for cattle fodder, but also for cellulose. Cottonseed Hulls are used primarily as feed for livestock. Hulls differ from meal, however, in that they are a roughage rather than a protein supplement. In feeding value, hulls are comparable to good quality grass hay and can serve as a practical supplement to pastures. Hulls are easy to store and handle, require no grinding, and can be fed with less waste than hay. They are an excellent carrier for cottonseed meal and grain. In feedlots, especially when used with high-concentrate rations, they effectively prevent digestive disturbances. Some cottonseed processing mills market a mixture of meal and hulls as an excellent winter cattle feed supplement. It is usually referred to as 80:20 hull meal mix (80% hulls, 20% meal). Throughout the cotton producing area hulls are commonly more economical than alternative roughages. They are seldom shipped outside that area because their bulk, relative to value, makes long shipments too costly unless the hulls have been pelleted to increase the bulk density. Several industrial uses for cottonseed hulls have been developed. A plastic, containing hulls as a major ingredient, has been used in producing several small parts of textile machinery. Hulls are often incorporated in the mud used in drilling oil wells. They can also be used in the production of furfural, which is a selective solvent used in making synthetic rubber, in petroleum refining, and in the manufacture of certain types of plastics. Industrial use of raw materials such as hulls requires a reasonably stable supply at a relatively low cost. The supply of hulls has varied quite widely with changes in government programs controlling cotton acreage. Demand for hulls also varies considerably with changes in the availability of other roughage feeds, resulting in wide price variations. For this reason industrial use of hulls has not been as great as the potential indicated by their physical and chemical characteristics. Cottonseed Hulls:- the crushed outer covering of cottonseed removed at an oil mill. ... Used mainly for adding bulk to cattle rations. / на маслобойных заводах. Шелуха из Семян Хлопчатника или Хлопковая Шелуха составляет приблизительно половину веса семян, оставшихся после джинирования. Она выделяется в маслоэкстракционном производстве после обработки самих семян с целью получения масла. Используется, главным образом, на корм крупнорогатому скоту, а также в производстве целлюлозы.

COTTONSEED MEAL = ШРОТ ИЗ СЕМЯН ХЛОПЧАТНИКА (или ХЛОПКОВЫЙ ШРОТ) – Cottonseed Meal is the second most valuable product of cottonseed, usually accounting for over one-third of total product value. It may be sold in the form of meal, cake, flakes, or pellets. Cottonseed meal is used principally as feed for livestock and is usually sold at a 41% protein level. Its major value is as a protein concentrate. One of the essentials of a ration is good quality protein which is necessary to build muscles, nerves, blood, internal organs, hair, and skin. Meat, milk, and wool – the major products of the livestock industry – are all rich in protein. Most farm grains and roughages are deficient in the protein necessary for animal maintenance, growth and development. Cottonseed meal, a leading protein supplement, provides the protein necessary to overcome this deficiency and also conserves available supplies of grain and roughages. It furnishes three to six times the protein of most grains and 10 to 20 times that of the lower quality roughages. When used only in the amount necessary to balance a ration, one pound of meal will save two and a half to three pounds of grain. In addition to its high protein content and high energy value, cottonseed meal is higher in phosphorous than any of the other vegetable proteins. Cottonseed meal may be used to some extent in the rations of all classes of livestock. It is sufficient as a sole source of protein for mature ruminants such as beef cattle and sheep and can provide much of the protein for dairy cows. Since it is a natural protein source its nitrogen is effectively utilized and there is little danger of excess ammonia being produced in the rumen or stomach of these cud-chewing animals as sometimes occurs when feeding synthetic protein materials. High quality cottonseed meal, used correctly as an ingredient of properly formulated swine and poultry rations, improves economy and efficiency. Cottonseed meal usage depends on conditions under which livestock are being fed. On the farm and in the feedlot, meal may be mixed with grains, roughages, and other feed ingredients that are available. For cattle or sheep on the range or on pasture, meal is commonly fed in pelleted form as the only supplement to grass. Where forage is inadequate, a meal and roughage mixture is often fed as a supplement. Most swine and poultry rations used today are complete, manufactured feeds. Cottonseed meal is used by many feed manufacturers as one of the sources of protein in such feeds. The US National Cottonseed Products Association maintains an extensive file on current knowledge of feeding cottonseed meal to all classes of livestock. Research has been done to determine the potential for cottonseed protein in industrial markets where proteins are used in coatings, sizings, adhesives, emulsifiers, and water-based putties and paints. A limited quantity of cottonseed meal is used directly as fertilizer – either alone or in mixtures with other ingredients. Cottonseed meal is an excellent organic source of nitrogen, phosphorus, potash, and many minor plant food elements. Its nutrients are released slowly which prevents waste and ensures long-lasting growth and beauty. Its organic matter improves soil texture and reduces watering costs. It is safe to use in liberal amounts without danger of burning and improves soil acidity required by many plants. Cottonseed meal is especially favored for use on lawns, flower beds, and gardens. It is also used in the growth media recipes of many commercial mushroom producers. Cottonseed Meal is a byproduct of cotton manufacturing. As a fertilizer, it is somewhat acidic in reaction. Nutrient content varies slightly but generally contains 7 percent nitrogen, 3 percent phosphorus (P_2O_5), and 2 percent potash (K_2O). Nutrients from cottonseed meal is readily available to plants in warm soils, and it poses little danger of burning. For general garden use, apply 2 to 5 pounds per 1 000 square feet. The nitrogen is slowly made available and is not rapid enough for many vegetables without adding nitrogen from another source. Cottonseed meal is frequently used for fertilizing acid-loving plants such as Azaleas, Camellias, and Rhododendrons. Cottonseed Meal is an excellent protein supplement for cattle. The limitations on effective utilization of this product in rations for swine and poultry are of minor significance for ruminant animals. Cottonseed meal can be used safely and profitably in pig rations. Rations containing up to 0.01% free gossypol can be used without the addition of iron salts. On the basis of a typical analysis this means that the safe upper limit for a good screw-press or prepress solvent meal is about 20% and for direct solvent-extracted meal about 5%. Over these levels, iron must be added in a 1:1 weight ratio to free gossypol. Cottonseed meal can also be used in rations for growing chickens if the free gossypol does not exceed 0.03%. Below this level, iron (2:1 iron to free gossypol) will completely overcome the depressing effect. As cottonseed is low in lysine, it may be necessary to make up for this deficiency by adding lysine. Prepress solvent-extracted meal may be used in layer feed if the gossypol has been inactivated with iron (4:1 iron to free gossypol), if the free gossypol content is not above 0.4%. The residue of cottonseed kernels from which oil has been pressed. Usually containing the portions of the fiber, hull and oil left after processing the seed; used for stock feed and fertilizer. Cottonseed Meal is a high protein by-product from the extraction of oil from whole cottonseed. There are two different processing methods used to extract the oil from the cottonseed, and they differ in the amount of oil (fat) they leave in the meal. The amount of oil left in the meal affects its energy value. Cottonseed meal is palatable and commonly is used in cattle rations in the southern and western US Solvent extracted cottonseed meal is the more common of the two types. Cottonseed meal contains gossypol. Under typical conditions, though, even high-producing cows will not

consume enough cottonseed meal to suffer from gossypoltoxicity. Cottonseed meal is used as a protein supplement and can replace all of the soybean meal in the ration. Cotton Cake is ground after the oil has been taken from the seed. A greenish-yellow powder, rich in nitrogen, is obtained, which is used for fertilizer, cattle feed, and other purposes. Cottonseed Meal is a greenish-yellow powder obtained by grinding the cake after the oil has been expressed from cotton seed. It is rich in nitrogen and is used for feeding cattle, as a fertilizer, etc. / на маслобойных заводах. лизин (lysine). остатки ядер хлопкового семени (residue of cottonseed kernels). Шрот из Семян Хлопчатника или Шрот из Хлопковых Семян или Хлопковый Шрот получается по схеме форпрессование – экстракция из предварительно обработанных и обрушенных семян Хлопчатника. Хлопковый шрот является кормовым продуктом и используется для производства комбикормов и кормления сельскохозяйственных животных. В зависимости от способа обработки хлопковый шрот вырабатывается двух видов:- (1) Обыкновенный Хлопковый Шрот и (2) Тостированный Хлопковый Шрот; которые в свою очередь подразделяют на I Сорт и II Сорт. По органолептическим и физико-химическим показателям хлопковый шрот должен соответствовать следующим требованиям:- I Сорт:- по цвету – от жёлтого до коричневого, по запаху – свойственный хлопковому шроту без постороннего запаха (плесени, затхлости, бензина, горелости); II Сорт:- по цвету – от жёлтого до тёмно-коричневого, по запаху – свойственный хлопковому шроту без запаха бензина. Содержание нитритов и нитратов в хлопковом шроте не должно превышать норм, утверждённым Главным Ветеринарным Управлением Госагропрома СССР. Хлопковый шрот упаковывают в целые, чистые и сухие мешки или отпускают без тары (насыпью). Для предотвращения самовозгорания и порчи хлопковый шрот должен охлаждаться перед хранением или отгрузкой в зимние месяцы до температуры не выше 35 °C, а в летние месяцы его температура должна быть не более чем на 5 °C выше температуры окружающего воздуха. Хлопковый шрот хранят в помещениях, не зараженных вредителями хлебных запасов, хорошо проветриваемых, защищённых от воздействия прямого солнечного света и источников тепла. Температурами заложенного на хранение шрота необходимо проверять систематически дистанционными термометрами или термоштангами. При повышении температуры необходимо провести охлаждение шрота:- (а) перекачкой шрота с одного участка на другой, и (б) в сухую и холодную погоду открывать окна, двери и включать вентиляционные приспособления. Шрот является побочным продуктом маслоэкстракционного производства. После получения из семян масла остаются скорлупа и раздавленные зёрна. А шрот получается посредством дальнейшего измельчения оставшейся массы зёрен и представляет собой порошок зеленоватого цвета, богатый азотом и протеином, и используется в производстве удобрений, в качестве корма крупно-рогатого скота и для других целей. Шрот, измельчённые семена масличных растений после экстрагирования из них жира, побочный продукт маслоэкстракционного производства. Концентрированный корм для сельскохозяйственных животных, содержит большое количество протеина. Под Шротом, от Немецкого слова Schrot, означающее Мелкие Куски или Обрезки, понимаются отходы маслодельного производства, получаемые после экстракции жира из измельчённых масличных семян с помощью растворителей (бензин, дихлорэтан и другие). Шрот используется для кормления сельскохозяйственных животных.

COTTONSEED OIL = МАСЛО ИЗ СЕМЯН ХЛОПЧАТНИКА (или ХЛОПКОВОЕ МАСЛО) – Cottonseed Oil has properties that make it a very desirable oil for development of trans-free products. Cottonseed oil contains sufficient saturated fatty acids (about 25–26%, consisting of:- palmitic ≈22%, stearic ≈3%, myristic ≈1%) to make it a relatively stable vegetable oil without partial hydrogenation as well as enough unsaturates (leic ≈22%, linoleic ≈52%, and linolenic usually <1%) to make it a heart healthy oil. Palmitic acid is usually associated with the beta-prime crystal form of cottonseed oil, which is desirable in most solid shortening products because it promoted a smooth workable consistency, usually referred to as Plasticity. Cottonseed oil is a good source of the essential fatty acid, linoleic, and like other vegetable oils it is essentially cholesterol-free. More importantly, cottonseed oil is currently available in sufficient quantities to satisfy commercial food processing needs in a variety of applications. Edible fats and oils usage can be separated into four product categories with very distinctive differences which provide optimum performance for specific food products:- liquid oils, shortenings, margarines, and specialty products. Cottonseed oil currently is used successfully in many applications, primarily as baking or frying fats or as salad or cooking oils, and has long been preferred by fried-snack makers. Cottonseed oil can continue to function as the preferred oil in all of the categories, as explained here. Oil used primarily for cooking oil, shortening, and salad dressing. It is also used extensively in producing snack foods such as crackers, cookies, and chips. While most Cottonseed Oil is used for food, limited quantities enter the production of inedible products. Usually, these consist of off-grade oil or of the soapstock that is a by-product of the refining process. Both crude oil and soapstock are used to produce fatty acids which in turn enter livestock feed and a wide range of industrial products such as soaps, emulsifiers, pharmaceuticals, insecticides, fungicides, cosmetics, rubber, plastics, and finishes for leather, paper, and textiles. With advances in science and technology, such uses may be expected to expand. The use of cottonseed oil for agricultural pesticide applications instead of water or petroleum based oils has created a modest new market for cottonseed oil. This has been partially the result of improvements in spray nozzle design. Low volume and ultra low volume spray technology involves the uniform application of only a few pints of pesticide over an entire acre of land. The oil helps the chemical adhere to the target. This allows for less total use of chemicals and thereby reduces environmental concerns regarding pesticide applications. Another use of the crude oil is as an insect attractant in specialty insect baits such as mole cricket bait. Since cottonseed oil is an edible product it is ideal for use in dust control applications in the food, feed and bedding industries. The oil extracted from cottonseed, graded and used for human and animal consumption. Within the grades of crude, prime and choice, there are, e.g., crude cottonseed oil, prime summer white cottonseed oil, and choice summer yellow cottonseed oil. Cottonseed Oil is the oil produced from cottonseed by one of three methods:- hydraulic press, screw press or solvent extraction (v. extraction), the latter being the leading process used. Crude cottonseed oil is obtained as a result of this extraction; its chief qualities and specifications are listed in Rules 144 through 152 of the National Cottonseed Products Association Trading Rules. This crude oil must be refined in order to be edible, a process involving warming the oil and adding sodium hydroxide. This chemical combines with a portion of the oil to form soap stock or foots which is separated from the oil by centrifugation. Refining removes the darker coloring material present, and leaves a clear yellow oil. To improve its color further, refined cottonseed oil is bleached by warming and the addition of a special bleaching clay which is separated from the oil after combining with coloring materials. Degree of bleaching depends on end-product desired. The oil may also be subjected to winterizing, to prevent its turning cloudy at 40–50 degrees F or solidifying at about 32 degrees F. In this process, the oil is subjected to cooling, solidifying the stearine which is separated from the liquid fraction by a filter press. The stearine is used in shortening and margarine; the liquid fraction is winter-yellow cottonseed oil, which is deodorized for use as salad or cooking oil or in mayonnaise and salad dressing. Oil used in shortening and margarine is also hydrogenated by the addition of pure hydrogen gas to the oil at high temperature in the presence of a. catalyst. Hydrogenation is controlled, to achieve desired melting point and consistency for either shortening or margarine. Refined cottonseed oil is classified by grades and specifications in the Trading Rules of National Cottonseed Products Association (Rules 155 through 165). One of the frequently exported grades of cottonseed oil is Prime Bleachable Summer Yellow (PBSY), which must produce, after bleaching, an oil of a light color (AOCS 2.5), and which has not yet been winterized. Non-winterized oil is indicated by the term winter in the grade, (e.g., Prime Winter Yellow Cottonseed Oil). Although most cottonseed oil is used for food, small quantities of offgrade oil or soapstock are used for the production of emulsifiers, pharmaceutical products, etc. The oil is shipped from the US, either in bulk (in tankers or in the tanks of dry cargo vessels), or in drums. It is included as one of the commodities eligible for GSM-4 and the CCC Barter Program. Cottonseed products and by-products other than oil:- the following are used in animal feed:- (1) cottonseed hulls, roughage product of cottonseed oil manufacture; (2) cottonseed

cake, the solid residue left after extraction of oil from cottonseed, and pressed into cakes; (3) cottonseed meal, ground cottonseed cake; (4) solvent extracted flakes, product obtained after solvent extraction; (5) cottonseed feed, cottonseed meal and hulls; (6) whole pressed cottonseed, the result of pressing the unhulled cottonseed in order to extract the oil; contains the entire cottonseed except for the oil; (7) ground whole pressed cottonseed, the product of grinding whole pressed cottonseed, A food product made from cottonseed is cottonseed flour, obtained by grinding cottonseed, which has been rolled and cooked and from which the oil has been expressed, v. extraction. Cottonseed Oil is a valuable fixed oil expressed from the seeds of the Cotton plant. It is a pale yellow, practically odorless and tasteless, oily liquid. Extensively used in the manufacture of margarine, hydrogenated fats, and cooking oil, etc. / , например, . Масло из Семян Хлопчатника или Масло из Хлопковых Семян или Хлопковое Масло – . Хлопковое растительное масло получают на маслобойных заводах двумя способами:- (i) прессовым способом или (ii) способом экстракции. Растительное или Жирное Растительное Масло относится к растительным жирам, поучаемым из семян или плодов растений отжимом или экстрагированием. Оно обладает плотностью 0.9–0.98 г/см^3, цвет от светло-жёлтого до тёмно-бурого. Бывают твёрдые, но чаще жидкие. Различают высыхающие растительные масла (конопляное, льняное), невысыхающие растительные масла (касторовое, кокосовое), и полувысыхающие (подсолнечное, хлопковое). Многие растительные масла являются важнейшими пищевыми продуктами. Основная питательная ценность растительных масел определяется высоким содержанием в них:- (i) стеринов (до 1 000 мг% в кукурузном, до 300 мг% в подсолнечном); (ii) токоферолов (100 мг% и более в соевом и кукурузном, до 60 мг% в подсолнечном); (iii) триглицеридов высших жирных кислот (до 80–90% в льняном, до 40–50% в подсолнечном); и (iv) фосфатидов (до 3 000 мг% в соевом, до 1 400 мг% в подсолнечном). В технике растительные масла используются для производства лаков, мыл, олифы, топлива и других материалов. Хлопковое Масло относится к растительному жирному маслу, получаемому из семян Хлопчатника (Gossypium) прессованием или экстракцией. Специфический компонент хлопкового масла – пигмент госсипол (ядовитое вещество), содержание которого определяет цвет и качество масла. Нерафинированное хлопковое масло – жидкость красно-бурого, иногда почти чёрного цвета со своеобразным запахом и горьким вкусом; рафинированное – соломенно-жёлтого цвета, применяется для производства олифы. Рафинированное хлопковое масло применяется в пищу, для производства консервов, маргарина, кулинарных жиров и другого. Химический состав и свойства хлопкового масла зависят от сорта Хлопчатника, а также от района и условий его возделывания. Содержание жирных кислот в хлопковом масле:- 40–48% линолевой, 30–35% олеиновой, 20–22% пальмитиновой, до 2% стеариновой, до 1.3% арахиновой, 0.3–0.4% миристиновой. Хлопковое масло имеет иодное число 100–116, кинематическую вязкость при 20 °С 66.6·10^{-6} м^2/сек. Хлопковое Масло получают из семян Хлопчатника прессовым и экстракционным способами. Выработка хлопкового масла составляет более 20% в общем объёме производства растительных масел в нашей стране. Особенностью хлопковых семян является содержание в них специфичного пигмента (госсипола), который придаёт маслу интенсивный коричневый и бурый цвет. Госсипол обладает ядовитыми свойствами, поэтому в пищу хлопковое масло используют только после рафинации. Рафинированное хлопковое масло подразделяют на рафинированное недезодорированное и рафинированное дезодорированное. Рафинированное дезодорированное хлопковое масло подразделяют на высший и первый сорта, а рафинированное недезодорированное – на высший, первый и второй. Для пищевых целей предназначается рафинированное масло высшего и первого сортов. Рафинированное хлопковое масло имеет светло-жёлтый цвет и не содержит отстоя, запаха и постороннего привкуса. В состав глицеридов хлопкового масла входит около 22% пальмитиновой кислоты, которая имеет высокую температуру плавления. При понижении температуры до 10–12 °С происходит расслоение масла на фракции с выделением твёрдых глицеридов. Отделяя жидкую фракцию путём фильтрации или отпрессования, получают так называемое Салатное Хлопковое Масло. Твёрдая фракция хлопкового масла используется при производстве маргарина, кулинарных и кондитерских жиров. Хлопковое Масло:- хлопок-сырец даёт на выходе 25–40% волокна, а остальная масса приходится на семена, которые большей частью служат для изготовления масла. Хлопковое масло в них составляет 22–29%. Этот продукт используется в химической и косметической промышленности, из него приготавливают твёрдые растительные жиры, маргарин, олифу, стеарин, глицерин, лаки, краски, туалетное и хозяйственное мыло, мыльные порошки и многие другие товары. Он также – источник высококачественного белка. У свежевыжатого масла – неприятные запах и вкус, но после обработки и рафинирования – становится светло-жёлтым продуктом с приятным вкусом. Его используют при заправке салатов со свежими, квашенными и маринованными овощами. Оно используется в винегретах,отдельных видах теста и существенно повышает вкусовые качества таких продуктов, как баклажанная икра и плов. Оно содержит чрезвычайно полезные для человека кислоты – линолевую, олеиновую, пальмитиновую, арахиновую, миристинвую и стеариновую. Кроме того, в хлопковом масле содержится вещество, которое способствует понижению артериального давления, укреплению кровеносных сосудов, регулированию деятельности нервной системы. Преимущественная особенность хлопкового масла – повышенный процент содержания витамина Е (токоферола), необходимого для нормального функционирования половых желез, и положительно влияющего на жировой обмен. Его рекомендуют принимать во время лечения атеросклероза. Применяемое в домашних косметических целях оно способно омолодить и укрепить кожу, особенно – на руках, а в неочищенном виде способствует заживлению ожогов.

COTTONSEED PIGMENT GLAND = ПИГМЕНТНАЯ ЖЕЛЕЗА СЕМЕНИ ХЛОПЧАТНИКА – The Cottonseed Pigment Gland has been shown to possess a rigid, thick wall inclosing a gelatinous suspension of the gland pigments. The gland wall consists of five to eight irregularly shaped, curved plates,which appear to be composed of cellulose impregnated with pectin, hemicellulose, and other unidentified uronic acid derivatives. The glands are heavily incrusted with cutin. The pigment glands have been shown to be resistant to the action of most reagents except water and polar organic liquids of low molecular weight. Their reaction to water consists in the immediate rupture of the wall along one or more of the seams between the plates, followed by expulsion of the gland contents as finely divided suspended particles. Water-miscible, polar organic liquids of low molecular weight affect the glands very much more slowly than water; and the extremely slow action of other organic liquids has been shown to be attributable to their slight moisture content. The existence of a highly resistant pigment gland wall has been proposed to explain the anomaly of the relative stability of reactive polyphenolic pigments in cottonseed. The sensitivity of the glands to moisture has been proposed to explain various changes observed during maturation of cottonseed as well as changes which occur during the storage of moist cottonseed. See also Gland, Gossypol, and Kernel. Cottonseed Pigment Glands, produced from whole cottonseed meal and defatted cottonseed meal by the gland flotation process, have been investigated as a raw material for the production of gossypol. Methods based on the previously reported properties of gossypol and cottonseed pigment glands have been developed for the relatively rapid isolation of gossypol from pigment glands. Extraction of gossypol from pigment glands with acetone followed by precipitation of gossypol acetic acid from the extract was found to be the preferable method for obtaining pure gossypol in good yields. The precautions which must be applied in order to produce gossypol on a large scale by the acetone-acetic acid method are discussed together with methods for the purification and preservation of gossypol. 1950–51:- Cottonseed differs from other oilseeds in that it contains dark spots, which are scattered throughout the kernel. The spots are actually Pigment Glands. They contain nearly all the pigments of the seed and have been the cause of many troubles to millers who process cottonseed into oil and meal, the old standby products of the cottonseed industry. The amounts and kinds of pigments in the glands and the number of unbroken glands that remain in the meal after processing determine how highly colored the oil will be and how great the food value of the meal. The glands are the only parts of cottonseed that as yet have no commercial value.

Research on the nature and properties of the glands by Charlotte H. Boatner and others at the Southern Regional Research Laboratory led to the development of a novel method of processing cottonseed. The application of the process on a commercial scale will open the door to new products. The tiny pigment gland, no larger than a pinpoint, is not the insignificant nonentity its appearance would indicate. Seeds of every species of cotton contain pigment glands. The naked eye sees them merely as black spots. Under the microscope they appear brilliantly and variously colored, from yellow through orange and red to purple. Their size and shape are generally related to one another:- Small ones are 558 almost spherical; large ones are more elongated. They are so small that all the glands in a single seed make up only 1 to 3 percent of its total weight. Many years before the Southern Laboratory existed, two of the early investigators who examined cottonseed described some of the properties of the pigment glands. Heinrich von Bretfeld in 1887 and Thomas Franz Hanausek in 1903 described the presence in cottonseed of a water-sensitive membrane which surrounded a greenish-black opaque secretion. More than 40 years later, Dr. Boatner and her assistants found that the outer structure of the pigment gland is a more or less rigid wall, rather than a membrane. They also learned that the wall is exceedingly strong, so strong, in fact, that it was not broken when a cottonseed kernel was rolled out into a flake a few thousandths of an inch thick by applying thousands of pounds of pressure to the rolls. The wall, they discovered, actually is made up of 5 to 8 irregularly shaped and curved plates, fitted together to give the appearance of a baseball cover. The plates, held together by one of Nature's cements, formed the tiny gland which contained the cottonseed pigments. The walls will break the instant the glands are placed in water – a fascinating thing to watch under the microscope. The material inside a gland becomes cloudy the instant water comes in contact with it, indicating that the water has entered the gland and caused a precipitation of the water-insoluble pigments. Immediately thereafter, the contents of the gland are expelled through ruptures in the walls with a force that resembles jet propulsion. The jetlike streams are usually yellow, but occasionally they are red or purple. The streams consist of finely divided particles, which dance up and down and to and fro, exhibiting what botanists call the Brownian movement. Organic liquids, such as methanol (wood alcohol), ethanol (grain alcohol), isopropanol, acetone, and dioxane, also rupture the glands, but not in the spectacular manner of water. When water is added to the organic liquids, the speed of rupturing is increased in proportion to the amount added. The hydrocarbons, hke hexane (light gasoline) and certain chlorinated hydrocarbons, which will extract the oil from the seed tissue, do not affect the glands or their contents. Dr. Boatner's Group discovered that the walls of the glands are extremely resistant toward the action of certain solvents and also that they are lighter in weight than the rest of the seed. It occurred to one of her assistants that it should be possible to separate the tiny glands. To do so, they prepared what became known in their laboratory as the 'cottonseed cocktail'. Very thin cottonseed flakes and a mixture of solvents that would not cause breakage of the walls of the glands were violently agitated in a blender of the kind frequently used to mix fruit juices. The density of the solvent mixture was adjusted to a value between the density of the glands and that of the other seed tissue. When the mixture was allowed to settle in the mixer, the little black glands rose as if by magic to the top, and the yellow meal settled to the bottom. The oil of the seed was dissolved in the solvent. This method of separating the glands by causing them to float was called the gland-flotation process. The other products, meal and oil, which result from application of this method of processing are actually superior in many ways to those produced by older methods. The third product, the pigment glands, is entirely new. Prepilot-plant and a pilot-plant operation of this invention provided large enough quantities of separated glands and gland-free meal for studies of their chemical, physical, and physiological properties. Of the whole pigment gland, 40 to 50 percent by weight is wall, 35 to 50 percent is a yellow pigment called Gossypol, and 0.05 to 3 percent is a purple pigment called Gossypurpurin. The presence of the two pigments explains the colors, which are caused by variations in the relative amounts of each pigment inside the gland. Back in 1886, an English chemist named Longmore first isolated the yellow pigment gossypol from cottonseed. Obtaining even a very small quantity of gossypol from cottonseed has always been a time-consuming task. The development of the flotation process made it possible to get large quantities of pigment glands and, from them, equivalently large quantities of gossypol. Three chemists, Leah E. Castillon, Catherine M. Hall, and Dr. Boatner, devised the simple and relatively rapid method, now available to industry, that will separate pure gossypol from cottonseed pigment glands in yields as high as 60 to 70 percent of the total amount present. Although Cottonseed Meal has long been accepted as an excellent feed for cattle, it can be fed in only very limited quantities to other farm animals. For many years the reason for the differences in the amounts of the meal that could be fed animals was thought to be the presence of gossypol. After it was found that all the gossypol and the gossypurpurin of the seed are contained in the pigment glands, the glands were tested to determine their physiological activity in animals. The work was done through the cooperative efforts of scientists at the Southern Laboratory and nutrition experts in the laboratories of several commercial firms and universities. Dr. Edward Eagle of Swift & Co. added small amounts of pigment glands to diets of rats, mice, guinea pigs, and rabbits. The glands were deadly to all the test animals in relatively small doses, but when he fed gossypol to his experimental animals he found that much larger quantities fed over much longer periods were necessary to kill them. At the nutrition laboratories of the Ralston-Purina Company, separated pigment glands, added to the basal soybean diet of chickens, caused a definite slowing of growth. The same effect was noted upon feeding cottonseed that had been extracted by an organic solvent such as hexanc to remove the oil without materially affecting the glands or their contents. The pale yellow gland-free meal obtained by the flotation process produced excellent growth in chicks. The experiments make it apparent that the toxic components of raw cottonseed are confined to the pigment glands. Feeding laying hens cottonseed meal, processed by the older methods, in the past resulted in the development of objectionable color in eggs during cold storage. No discolored whites and very few dark-colored yolks were found in stored eggs laid by hens fed on the new type of cottonseed meal. The excellent feed value of the gland-free meal is not entirely the result of being essentially free of pigment glands, but also because it is not heated to high temperatures during processing. That fact has stimulated extensive research on the production of better meals. The present methods, screw pressing and hydraulic pressing, arc used in the investigations. The effect of changes in the processing conditions on the quality of meals is now being studied. Industrial cottonseed mills, as well as Government and university nutrition experts, are cooperating in the undertaking. The oil that is extracted from the seed by use of the gland-flotation process is very light in color and can be refined and bleached by the methods used for ordinary crude cottonseed oils. So far, we have been talking principally about only one of the pigments in cottonseed. Chemists at the Southern Laboratory found several others in the tiny pigment glands. One is gossypurpurin, the purple one which we have mentioned. Gossyfulvin, an orange pigment, and gossycaerulin, a blue pigiiient, were also discovered and named by the chemists. Indirect evidence points to the presence of 10 and possibly more pigments in oils and meals prepared by different methods. They have not yet been separated in pure form, and the quantities are so exceedingly small they may defy isolation for a long time. The Utilization of gland-free cottonseed flour in markets from which old-process meal has been excluded, mainly for feeding chicks and swine, and as a source of high-quality industrial protein, can result in a larger income for the cotton planter and processor. Separated pigment glands, an entirely new product, can be the source of further revenue. They represent a source of new raw materials, particularly gossypol, which offers many possibilities for further research. If practical uses can be found for the glands or the pigments, the gland-flotation process makes it possible to produce 90 000 to 100 000 tons of glands and 20 000 to 30 000 tons of gossypol annually from our cottonseed. Catherine Hall Pominski is a chemist in the oil and oilseed division of the Southern Regional Research Laboratory in New Orleans. Since 1944, she has been engaged in investigations of the physical, chemical, and physiological properties of the pigments of cottonseed. Leah E. Castillon is a graduate of Nevocomb College, Tulan e University, and a native of Louisiana. She has been engaged in research on the pigments of cottonseed since 1945, as a chemist in the protein and. carbohydrate division of the Southern Laboratory. Joseph M. Dechary is a native Louisianian and has been working on the nutritive value of

cottonseed meal since his employment as a chemist by the Southern Laboratory in 1948. All the gossypol and gossypurpurin of the cottonseed kernel are segregated in the Pigment Glands, and they constitute the only detectable pigments in the glands of four varieties of seed of Gossypium Hirsutum which were examined. The gossypol content of the glands is relatively constant, this pigment constituting up to approximately 50% of the weight of the glands, whereas the gossypurpurin content is relatively low and variable. On the basis of the direct correlation observed between the amounts of glands and of gossypol in the kernels, it is suggested that the gland content is the principal factor which determines the gossypol content of the cottonseed kernel. A yellow pigment has been detected in solution in the oil of the extraglandular tissue of the kernel. This pigment has been obtained free of gossypol, gossypurpurin, and the yellow decomposition product of gossypurpurin. Partial characterization of the extraglandular pigment has shown it to be relatively stable and to differ from every pigment previously detected in cottonseed. On the basis of the distribution and properties of the pigments of cottonseed, methods for their extraction and estimation have been developed. / Доктор Шарлэт Эйч. Ботнё (Dr Charlotte H. Boatner). Хайнрихь фон Брэтфэльд (Heinrich von Bretfeld) в 1887 и Доктор Томэс Франз Хэнозэк (Thomas Franz Hanausek) в 1903. в 1886, Английский химик по имени Лонмо (Longmore). Три химика – Лиа И. Кэстилон (Leah E. Castillon), Кэсрин Эм. Хол (Catherine M. Hall) и Доктор Ботнё. Доктор Эдвод Игл (Dr. Edward Eagle) из Свифт Энд Ко. (Swift & Co.). Ролстэн-Пьюрина Кампэни (Ralston-Purina Company). COTTON SHRUB = КУСТ ХЛОПЧАТНИКА – Cotton Shrub:- the root is that organ of a plant body that typically lies below the surface of the soil (compare with stem). Root:- The usually underground portion of a plant that lacks buds, leaves, or nodes and serves as support, draws minerals and water from the surrounding soil, and sometimes stores food. Cotton Shrubs can grow up to 3 m (10 ft) high. The leaves are broad and lobed, with three to five (or rarely seven) lobes. The seeds are contained in a capsule called a Boll, each seed surrounded by downy fibers called Lint. Same as Cotton Plant. A woody plant of relatively low height, having several stems arising from the base and lacking a single trunk. Erect bushy mallow plant or small tree bearing bolls containing seeds with many long hairy fibers. A woody plant, typically with several main stems, that at maturity does not attain tree height (5 m). / коробочка (capsule). Каждый куст Хлопчатника имеет мощную стержневую корневую систему, проникающую в почву до 2.4–2.6 метров; стебель прямой, ветвящийся, высотой 70–200 сантиметров. На ветвях кустарника формируются 8–10 и более цветочных почек, перерастающие впоследствии в цветки и, так называемые коробочки. В коробочках формируются семена, покрытые преимущественно белыми волосками, используемыми в качестве волокна.

COTTON SPINNING MILLS WASTE = ХЛОПКОВЫЕ ОТХОДЫ ПРЯДИЛЬНОГО ПРОИЗВОДСТВА – Cotton Spinning Mills Waste:- (i) Comber Noils; (ii) Pneumafils; (iii) Rovings; (iv) Carding Waste; (v) Flat Strip; and (vi) Droping. Some mills utilize waste cotton from other textile mills to manufacture yarn (ending in a spinning operation) that can be used to make the heads of mops. / В разряд хлопковых отходов прядильного производства входят:- (i) (Comber Noils); (ii) Пух с Фильтров или Пневмопух (Pneumafils); (iii) Концы Ровницы или Ровничные Концы (Rovings); (iv) Отходы Кардочесания (Carding Waste); (v) Шляпочный Очёс (Flat Strip); и (vi) Выпад (Droping). Лента(ы) (Sliver(s):- Кардная или Чёсальная Лента (Carded Sliver) и Гребенная Лента (Combed Sliver), Ровница (Roving) и Концы Ровницы или Ровничные Концы (Rovings), Пух с Фильтров или Пневмопух (Pneumafil), Отходы Нити (Thread Waste).

COTTON SPINNING SYSTEM = СИСТЕМА ПРЯДЕНИЯ ХЛОПКА (или СИСТЕМА ХЛОПКОПРЯДЕНИЯ) – Cotton Spinning System is the process originally developed for spinning cotton, applied now also to other staple fibers. Cotton Spinning is the production processes used to make yarn from cotton fibers. Synthetic fibers may also be processed by cotton spinning, both mixed with natural fibers and alone, which makes it possible to widen the assortment of cotton fabrics available and improve their appearance and quality. Three systems of spinning are used, depending on the requirements of the yarn and the length, weight-to-length ratio, and other properties of the cotton fiber:- card, card and comb, and condenser spinning. Card spinning is used to produce yarn of average weight-to-length ratio from medium-fine cotton fiber. The system uses only the carding process. The raw material is first fed to opening scotching units; from there the cotton in the form of a loosened mass, sometimes pressed into a lap, or roll, is delivered to a flat card. Here, the layer of fibers is formed into sliver, which is doubled and stretched on the two rollers of a drawing frame to achieve an even thickness and straighten out the fibers. The sliver is then fed to roving frames, where it is thinned by being drawn out, twisted, and, in the form of roving, wound onto bobbins, which are then passed to ring frames. When pneumatic spinning frames are used, the sliver is fed directly to the spinning frames from the drawing frames. Card and comb spinning is usually used to produce the finest yarn or yarn of average weight-to-length ratio but of higher quality from medium-fine and fine cotton fiber. The fibers are combed on a flat card and then on a combing machine, where adhering contaminants are removed and a significant number of short fibers are separated from the contaminants. The combing machines are usually fed laps produced by sliver lap machines. The need for additional transfers to prepare the sliver for combing makes card and comb spinning more expensive than card spinning. After carding, the combed sliver is made more uniform on several rollers of drawing frames and then processed into roving and yarn. Condenser spinning is used to produce thick yarn from low grades of cotton and from cotton waste. The yarn obtained is thicker, looser, fluffier, and less uniform than yarn produced by card spinning. The raw material is worked by beaters and openers, then blended and loosened some more on a picker. The picked material is fed to a carding machine, which usually includes two roller cards. The cotton is separated lengthwise into narrow slivers and rolled into roving on the roving carriage of the second card of the carding machine; the roving is then fed to the spinning frame. Promising lines of development in cotton spinning include the use of spindleless spinning frames, the combining of equipment into single units, and the construction of automatic production lines. See also Spinning. / Процесс первоначально разработанный для прядения хлопка, а сейчас применяемый и к другим штапельным волокнам. Хлопкопрядение, совокупность технологических процессов, используемых для переработки хлопковых волокон в пряжу. В хлопкопрядении используются также химические волокна (как в смеси с хлопковыми, так и в чистом виде), что позволяет расширить ассортимент хлопчатобумажных изделий, улучшить их внешний вид, повысить качество. В зависимости от требований, предъявляемых к пряже, а также длины, линейной плотности и других свойств хлопковых волокон в хлопкопрядении используют кардную, аппаратную или гребенную системы прядения (смотрите Прядильное Производство). Кардная Система Прядения применяется для выработки пряжи средней линейной плотности из средневолокнистого хлопкового волокна. В этой системе используется только кардное чесание волокнистых материалов. Сырьё поступает на разрыхлительно-трёпальные установки, с которых хлопок в виде разрыхлённой массы, иногда спрессованной в холст (рулон), поступает на шляпочную чёсальную машину. На этой машине из выходящего тонкого слоя волокон (называется Ватка-Прочёс) формируется лента, которая для выравнивания по толщине и лучшего распрямления волокон подвергается сложению и вытягиванию на двух переходах ленточных машин. Затем лента поступает на ровничные машины, где она утоняется вытягиванием, скручивается и в виде ровницы наматывается на катушки, подаваемые далее на кольцевые прядильные машины. При использовании пневмомеханических прядильных машин на них поступает лента непосредственно с ленточных машин. Гребенная Система Прядения обычно используется для выработки наиболее тонкой пряжи или пряжи средней линейной плотности, но повышенного качества, из средневолокнистого и тонковолокнистого хлопкового волокна. В этой системе прядения волокна прочёсываются на шляпочной чесальной машине, а затем на гребнечёсальной машине, где они очищаются от цепких сорных

примесей и пороков и из них удаляется значительное количество коротких волокон. Питание гребнечёсальных машин обычно осуществляется холстиками, которые получают на лентосоединительных или на лентохолстоформирующих машинах. Необходимость применения дополнительных переходов для подготовки лент к гребнечесанию удорожает переработку хлопка по гребенной системе прядения по сравнению с кардной. После чесания гребенная лента выравнивается на нескольких переходах ленточных машин, затем перерабатывается в ровницу и пряжу. Аппаратная Система Прядения применяется для выработки толстой пряжи из хлопка низких сортов и хлопчатобумажных угаров (отходов). Пряжа, полученная по этой системе, более толстая, рыхлая и пушистая, а также менее равномерная по сравнению с пряжей, полученной по кардной системе. Сырьё обрабатывают на трёпальных и разрыхлительных машинах, а затем смешивают и дополнительно разрыхляют на щипальной машине. Расщипанная смесь поступает на чёсальный аппарат, в состав которого обычно входят 2 валичные чёсальные машины. На ровничной каретке последней чёсальной машины аппарата осуществляется разделение ватки-прочёса в продольном направлении на узкие ленточки и скатывание (сучение) их в ровницу, которая затем поступает в прядильную машину. В хлопкопрядении перспективно использование безверетённых прядильных машин, агрегатирование оборудования и создание автоматических поточных линий. Смотрите также Прядение (Spinning). Получение Пряжи:- Технологическая Схема Прядения:- для получения пряжи из массы волокон хлопок должен пройти несколько операций обработки. На прядильные фабрики хлопок поступает в спрессованном виде. После предварительной обработки на заводах первичной обработки хлопок очищают от крупных сорных примесей и семян. Однако в нём содержится ещё большое количество мелких примесей, а также повреждённые (короткие) волокна. Отдельные волокна в этой массе хлопка перепутаны, сцеплены между собой в виде клочков или с сорными примесями. Поэтому в задачу всех операций хлопкопрядения входит последующая очистка, рыхление и смешивание волокон, а затем расчёсывание их с целью параллелизации, выравнивания и формирования постепенно утоняющего продукта (холста, ленты и ровницы), чтобы на заключительной стадии скрутить ленточку из параллельно расположенных волокон и получить пряжу заданных свойств. На первой стадии обработки происходит рыхление хлопка, смешивание и очистка. Для этого масса хлопка из кипы подаётся питающими решётками разрыхлительных агрегатов к рабочим органам. Здесь на хлопок воздействуют иглы или крупные, легко удаляемые примеси. Сорные примеси через колосниковые решётки попадают в угарные камеры, а разрыхленная масса хлопка пневматическими или механическими питателями попадает к следующим секциям разрыхлительно-трёпального агрегата. С разрыхлительно-трёпального агрегата хлопок выходит в виде холста – уплотнённого слоя хлопка в виде рулона. Холст должен иметь определённую толщину. Волокна хлопка в холсте находятся в хаотическом состоянии в виде клочков и, кроме того, в хлопке содержится ещё определённое количество мелких, трудноудалимых сорных примесей. Следующая операция, которая происходит на чёсальной машине, называется чесанием. На машину хлопок поступает в виде холста или разрыхлённой массы (бесхолстовое питание). На чёсальной машине масса волокна подвергается воздействию сначала зубьев пильчатой ленты и валиков, а затем тонких игл гарнитуры рабочих органов машины. В результате этого происходит расчёсывание клочков хлопка на отдельные волокна с одновременной очисткой от цепких примесей и коротких волокон. После чесания из частично параллелизованной тонкой ватки (прочёса) волокон формируется лента, представляющая собой длинный рыхлый круглый полуфабрикат диаметром 1–3 см. В ленте волокна расчёсаны, почти не связаны между собой, но не распрямлены и слабо ориентированы относительно оси ленты. Сама лента по толщине неравномерна. Для распрямления волокон и выравнивания ленты производят сложные нескольких лент, а затем утонение сложенного продукта до толщины первоначальных лент. В результате сложения происходит выравнивание лент, так как утолщённые участки складываются в утонёнными. При последующем утонении продукта происходит распрямление волокон и ориентация их относительно оси ленты. Утонение происходит за счёт вытягивания продукта, когда он проходит через пары прижатых друг к другу цилиндров (вытяжных пар) и скорость предыдущей пары меньше последующей. Задача следующего перехода – утонить нить до размеров, пригодных для выработки пряжи. Эту операцию осуществляют на ровничных машинах, где на вытяжном приборе происходит утонение продукта. Продукт ровничного перехода называется Ровницей. Это тонкая ленточка, которой для придания минимальной прочности даётся слабая подкрутка. Последняя заключительная операция изготовления пряжи происходит на прядильных машинах. Здесь продукт – ровница – вытягивается до толщины пряжи, скручивается, и получается тонкая и прочная пряжа. Процесс прядения осуществляется либо на кольцевых прядильных машинах с веретёнами и бегунками, либо на безверетённых пневмомеханических машинах. Описанная последовательность переработки хлопка в прядильном производстве называется кардной (обычной). По этой системе вырабатывается большая часть хлопчатобумажной пряжи. Существует ещё гребенная, аппаратная и меланжевая системы. Кардная и гребенная системы имеют по два способа прядения:- кольцевой и пневмомеханический. Аппаратную систему в настоящее время начинают заменять кардной, в которой используются роторные пневмомеханические или аэродинамические прядильные машины. Меланжевая система в принципе повторяет кардную, но имеет дополнительные переходы, связанные в крашением хлопка.

COTTON SQUARE = ПОДЦВЕТНИК ХЛОПЧАТНИКА – Cotton Square is the unopened Cotton flower bud with its surrounding bracts. / Подцветник Хлопчатника – нераскрывшийся бутон цветка Хлопчатника с его окружающими прицветничками (неправильно называемыми прицветниками).

COTTON STAPLE = ШТАПЕЛЁК ХЛОПКА (или ХЛОПКОВЫЙ ШТАПЕЛЁК) – Cotton Staple:- the average length of fibers in a given Cotton. It is not a mathematical average but is the length of a selected portion of the fibers which, although containing fibers of various lengths, by custom is assigned to a sample or bale as a whole. The staple of different kinds of Cotton varies from less than one-half to more than two inches.

COTTON STORAGE DEFICIT AREA = АРЕАЛ ДЕФИЦИТА РАЗМЕЩЕНИЯ ХЛОПКА – Cotton Storage Deficit Area means a State, County, or group of contiguous counties within a State, where the production of Cotton for the area based on the most recent estimate from the USDA (short for the United States Department of Agriculture), National Agricultural Statistics Service exceeds the combined approved inside storage capacity less carry-in stocks, of warehouses that have entered into a Cotton Storage Agreement with the Commodity Credit Corporation (CCC) of the US Department of Agriculture.

COTTON SUITING = КОСТЮМНАЯ ТКАНЬ ИЗ ХЛОПКА – Cotton Suiting is a cotton fabric which has enough body to tailor well. Used for suits, slacks, and skirts. See also Suiting. / Используется для костюмов, широких брюк и юбок.

COTTON SYSTEM = ХЛОПКОВАЯ СИСТЕМА – Cotton System is a process originally used to manufacture cotton fiber into yarn and now used extensively for producing spun yarns of manmade fibers, including blends. The major manufacturing steps in the cotton system include opening of the fiber bales, picking, carding, combing (for combed yarns), drawing, roving, and spinning. The combing step is included after carding when combing yarns are made. Cotton System is a process originally used for manufacturing cotton fiber into yarn, and now also used extensively for producing spun yarns of manufactured fibers, including blends. Processing on the cotton system includes the general operations of opening, picking, carding, drawing, roving, and ring or mule spinning in the production of carded yarns. For combed yarns, three steps, culminating in combing, are included after the carding operation. There have been many

modifications of this process, especially in recent years for the so-called 'Long Draft', or 'Casablancas', system. The cotton system is also proving to be the basis of many hybrid systems for handling wool yarns and for manufacturing other long-staple yarns.

COTTON THREAD = ХЛОПКОВАЯ НИТЬ – Cotton Thread:- formerly the most common thread, but difficult to find today. It is usually made in two types. A plain thread with a dull surface is called Basting Thread. Mercerized cotton thread has a shiny surface that enables it to slide smoothly through fabric and is suggested for general purpose sewing. Polyester thread has replaced cotton thread to a large extent. See also Mercerization. / Нить Для Смётывания (Basting Thread).

COTTON WASTE = ХЛОПКОВЫЕ ОТХОДЫ – Cotton Waste:- lint and other yarn refuse which accumulates during the manufacturing process. The softer parts are used for padding, and the harder, coarser pieces for paper manufacture. Waste from the carding machine is used by some mills. Varying percentages are mixed with regular cotton in making part-waste Osnaburg(s) (a coarse cotton cloth, often made with part waste (PW), of plain weave, medium to heavy in weight, and resembling crash. It is named for the city of Osnabrück, Germany) and other materials. Waste is divided into two main groups, spinnable and nonspinnable. The types not suitable for spinning include picker wastes, sweepings, and thread wastes. Spinnable cotton waste is often mixed with new fiber stock such as cotton, wool, and the various man-made fibers. / В разряд хлопковых отходов входят Очёс:- Гребенной Очёс, (Noil:- Comber Noil = Comber, (Recomber's Noil), (Stripping), Шляпочные Очёсы (Flat(s) = Flat Strips), Пух (Fly), Пух с Фильтров или Пневмопух (Pneumafil). (1) Отходы, выделившиеся в процессе переработки хлопка-сырца из технологических и транспортных машин, после соответствующей переработки пригодные для использования в качестве сырья в текстильной и лёгкой промышленности. Волокнистые отходы подразделяются на отходы улюкосодержащие (motes) и отходы пухосодержащие (fly). В Товарной Номенклатуре Внешнеэкономической Деятельности (ТН ВЭД) отходы хлопка выделяют в отдельную группу 5202, в которую входят:- гребенные угары (очёсы); очёски, снятые с цилиндров машин после чесания и гребнечесания; разорванные волокна, отделённые в процессе вытягивания; обрезки ленты или ровницы; пух с машины; спутанная пряжа и другие угары от пряжи; пряжа и волокна, полученные в результате расщипывания лоскута.

(2) Waste management is one of the biggest problems faced by the cotton ginning industry. Ginning one bale (227 kg) of spindle harvested seed cotton lint contributes between 37 and 147 kg of waste. The general makeup of cotton gin waste consists of sticks, leaves, burs, soil particles, other plant materials, mote and cotton lint. Slight differences in the proportions of the components are usually found between varying mechanical harvest methods. A portion of the fermentable sugars in cotton gin waste is in the stems. There is also cotton fibers (98.5% cellulose) in the waste matter that will contribute to the total amount of potential glucose. A survey of six cotton gin plants in Texas by Schacht and LePori (1978) found that cotton lint accounts for about 11.1% of cotton gin waste. The other components surveyed by the authors were 48.6% burs, 8.4% sticks, and 32.1% fine particles (defined as particles passing through a 20 cm by 20 cm sieve with 5 mm holes spaced 1.5 mm apart). As a whole, cotton gin waste should be considered a lignocellulosic substrate, i.e. a material primarily consisting of cellulose, hemicellulose, and lignin. In order to exploit cotton gin waste for its fermentable sugars, the chemistry must be understood. Several researches has explored other ways to utilize cotton gin by-products as livestock feed, gardening compost, and raw materials for building products. In spite of these efforts, most of the waste generated by the gins is discarded back onto the fields, at a cost to the gin, where it becomes a soil additive. The USDA developed a patented system known as the COBY (Cotton Byproducts) process. In the COBY process, byproducts from the ginning operation are treated with gelatinized starch and other additives, and then they are further processed with heat, pressure, grinding, and/or blending. Processing biomass waste streams into fuel pellets could provide a renewable source of energy that could potentially be a viable source of revenue for cotton gins and other industries producing vast amounts of waste biomass. / Шахт и ЛеПори (Schacht and LePori). Невозвратные производственные потери хлопковых материалов, образующиеся при переработке хлопка-сырца. состоят из черешков (sticks) листьев, самих листьев (leaves), створок коробочек (burs или burrs), частиц почвы (soil particles) и прочих . шлифование (grinding).

COTTON WASTES FROM TEXTILE MILLS = ХЛОПКОВЫЕ ОТХОДЫ ТЕКСТИЛЬНЫХ ПРЕДПРИЯТИЙ – Cotton Wastes From Textile Mills:- upon arrival at the textile mill, the raw cotton lint contains dust and dirt; twigs and pieces of larvae; and seeds which the gin failed to remove. In the course of manufacture, raw cotton lint may be subjected to any number of cleaning processes. Some mills use several Pickers known by various trade names such as an Opener, a Breaker, and Intermediate, and a Finisher Picker. Others have a composite Picker combining the several cleaning operations. See also Card Waste, Comber Waste, Picker Waste, Reclaimed Wastes, Rovings, Slivers, Spinning Wastes, and Sweepings. / Концы Ровницы или Ровничные Концы (Rovings), Концы Ленты (Slivers).

COTTON WEAVING MILLS WASTE = ОТХОДЫ ХЛОПКОТКАЦКОГО ПРОИЗВОДСТВА – Cotton Weaving Mills Waste:- threads, cloth cut piece, rags, cuttings, loom ends, etc. Thrums are the waste yarns from weaving. / В разряд хлопковых отходов ткацкого производства попадают (Selvedge(s)/Selvage).

COTTON–WRAPPED POLYESTER (CORE) THREAD = НИТЬ С ПОЛИЭСТЕРНЫМ (СЕРДЕЧНИКОМ), ОБЁРНУТАЯ ХЛОПКОМ – Cotton-Wrapped Polyester (Core) Thread is a type of polyester thread made with a polyester core wrapped with cotton, theoretically giving the thread characteristics of both fibers.

COTTY WOOL = ШЕРСТЬ С БОЛЬНОЙ ОВЦЫ (или КУПАНАЯ ШЕРСТЬ) – Cotty Wool is a wool that has matted or felted on the sheep's back. Caused by insufficient wool grease being produced by the sheep, usually due to breeding, injury, or sickness. This type of defective wool is more common in the medium to coarse wools. The fibers cannot be separated without excessive breakage in manufacturing.

COTYLEDON = СЕМЯДОЛЯ (или СЕМЕНОДОЛЯ, или КОТИЛЕДОН) – The Cotyledons serve a dual role in germination. Before they unfold, they supply stored food to the germinating seedling. After the cotyledons unfold, they produce chlorophyll, become green, and produce energy through photosynthesis. The apical meristem emerges at the base of the cotyledons, and all further vegetative and reproductive growth of the plant occurs through the meristems. A Cotyledon is the seed leaf, the primary leaf of the embryo and the first leaf observed above the soil surface. Cotyledon is the first (seed leaves) of the Cotton Plant. See also Seed Leaf. The Cotton seed emerges from the soil with two cotyledonary leaves, which have a seed coat to protect them as they traverse the 3–4 centimeter distance. The cotyledonary leaves may be located directly opposite to one another or parallel to each other. The cotyledonary leaves reach their maximum size soon after emerging from the soil. They cease to grow in size as the true leaves start to emerge. The cotyledonary leaves drop at about 40 days and within about 3–4 days of each other. Cotyledonary leaves and true leaves vary in shape and size. The true leaves are 5–6 pointed and palmatedly lobed, while the cotyledonary leaves have the same width from base to the end and round corners. The cotyledonary leaves, some times also called Seed Leaves or First Green Leaves, are always two in number and located either on opposite sides of the stem or parallel to each other. Cotyledonary leaves reach their maximum size in about 10 days. The cotyledonary leaves form the first node on the main stem of the plant, which is considered to be 'node zero'. Node numbers are counted above the cotyledonary node. True or normal leaves grow in a spiral arrangement around the stem. The number of true leaves corresponds to the number of branches (including empty nodes) plus fruiting points. The leaf axil on the plant gives rise

to a branch, a sub-branch or a fruiting form. Cotyledon is the first embryonic leaf or leaves in the seed. In some Plants the cotyledons remain underground in the seedcoat. Cotyledon:- in dicotyledonous Plant Species, the initial growth stage characterized by the presence of 'seed leaves'. These leaves were initially contained in the seed and provide food for seed germination. Cotyledon is a leaf of the embryo of a seed plant, which, upon germination, either remains in the seed or emerges, enlarges, and becomes green. The seed leaf of the embryo of a Plant. Cotyledon is a first leaf developed by the embryo in seed plant. In most dicotyledon seeds, they are thickened and are storage sites of reserve food for use by the germinating seedling. Also known as Seed Leaf. / Первые листочки Хлопчатника, развившиеся из зародыша. Смотрите также Семядоля или Лист Семени (Seed Leaf). Под Семядолями понимаются первые листья зародыша семенных растений. Нередко содержат запасные питательные вещества, например, у Бобовых, Тыквенных. У Голосеменных Растений от 2 до 15 семядолей, у Двудольных – 2, у большинства Однодольных – 1. Семядоли или Семенодоли или Котиледон (Cotyledones) – первые листья растений, формирующиеся в семени на ещё не дифференцированном теле развивающегося зародыша. Семядоли часто резко отличаются по форме, внутреннему строению и иногда по функции от последующих листьев, возникающих на конусе нарастания побега. У Голосеменных Растений от 15 до 2 семядоли, у Двудольных – 2, у большинства Однодольных – 1. При надземном прорастании семян Двудольных (например, Фасоль) семядоли выступают над почвой, зеленеют и некоторое время выполняют функции зелёных листьев. У Гороха, Дуба, Грецкого Ореха и других семядоли при прорастании остаются в семени и отмирают после израсходования запасов питательных веществ. При прорастании семян многих Однодольных Растений влагалищная часть семядоли выступает из семени, а её верхушка некоторое время остаётся в эндосперме, функционируя как орган всасывания. Эту же функцию выполняет и остающийся в семени злаков щиток, который многие ботаники считают семядолей.

COTYLEDONARY NODE = СЕМЯДОЛЬНЫЙ УЗЕЛ – Cotyledonary Node:- Opposite nodes at the base of the plant where cotyledons (seed leaves) attach to the plant. When counting first fruiting node, the cotyledonary node is counted as node zero.

COTYLEDONOSIS = ПУПОЛИСТНИК – Cotyledonosis:- poisoning of livestock in Southern Africa by Plants in the Genera Tylecodon and Cotyledon Spp. containing cumulative bufadienolidecardiac glycosides. Clinical signs include exercise intolerance, paresis, paralysis, torticollis, paralysis of the lower jaw and tongue, dysphagia, drooling of saliva, abdominal pain, convulsions and death within a few hours. No significant necropsy lesions. Secondary poisoning occurs in dogs and humans who eat meat from diseased animals. Also known as Krimpsiekte. See also Krimpsiekte. / Смотрите также Xxxxx (Krimpsiekte).

COUGR = CERTIFICATE OF GOVERNMENT RECEIPTS

COULOMB = КУЛОН – Coulomb (C) is the SI unit of electric charge. One Coulomb is the amount of charge accumulated in one second by a current of one Ampere. Electricity is actually a flow of charged particles, such as electrons, protons, or ions. The charge on one of these particles is a whole-number multiple of the charge e on a single electron, and one Coulomb represents a charge of approximately $6.241\ 506 \cdot 10^{18}$ e. The Coulomb is named for a French physicist, Charles-Augustin de Coulomb (1736–1806), who was the first to measure accurately the forces exerted between electric charges. Coulomb is the practical unit of electric charge transmitted by a current of one Ampere for one second. It is the charge carried by 6.241 8 x 1 018 electrons. Named for the French physicist Charles-Augustin de Coulomb (1736–1806). / Под Кулоном понимается:- (1) единица количества электричества (электрического заряда) СИ. Кулон (Ампер-секунда) равен количеству электричества, проходящему через поперечное сечение проводника при токе силой 1 Ампер (А) за время 1 секунду (с). Названа в честь Французского инженера и физика Шарля-Огюстэна дё Кулёмба (1736–1806; Charles-Augustin de Coulomb). Обозначение:- Кл. 1 Кл ≈ $3 \cdot 10^9$ единиц СГСЭ = 0.1 единицы СГСМ. (2) Единица потока электрического смещения (потока электрической индукции) СИ сквозь замкнутую поверхность, образуемую содержащимися во внутреннем пространстве свободным зарядом 1 Кл. 1 Кл = $4\pi \cdot 3 \cdot 10^9$ единиц СГСЭ = 0.4π единицы СГСМ.

COUNCIL = СОВЕТ – Council is a body of people elected or appointed to serve in an administrative, legislative, or advisory capacity.

COUNCIL OF EUROPE = СОВЕТ ЕВРОПЫ – The Council Of Europe (COE) was established on 1949-May-05 to encourage unity and social and economic growth among members, which currently (1995) include:- Austria, Belgium, Cyprus, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Liechtenstein, Luxembourg, Malta, the Netherlands, Norway, Portugal, San Marino, Spain, Sweden, Switzerland, Turkey and the United Kingdom. The Council of Europe was founded on 1949-May-05 by the Treaty of London. The Treaty of London or the Statute of the Council of Europe was signed in London on that day by ten states:- Belgium, Denmark, France, Ireland, Italy, Luxembourg, the Netherlands, Norway, Sweden and the United Kingdom. Many states followed, especially after the democratic transitions in central and eastern Europe during the early 1990s, and the Council of Europe now includes all European states except Belarus, Kazakhstan, Vatican City and the states with limited recognition. The Council of Europe (French:- Conseil de l'Europe) is one of the oldest international organisations working towards European integration, having been founded in 1949. It has a particular emphasis on legal standards, human rights, democratic development, the rule of law and cultural co-operation. It has 47 member states with some 800 million citizens. It is distinct from the European Union (EU) which has common policies, binding laws and only twenty-seven members. The two do however share certain symbols such as their flag. Its statutory institutions are the Committee of Ministers comprising the foreign ministers of each member state, the Parliamentary Assembly composed of MPs from the Parliament of each member state, and the Secretary General heading the secretariat of the Council of Europe. The Commissioner for Human Rights is an independent institution within the Council of Europe, mandated to promote the awareness of and respect for human rights in the member states. The best known bodies of the Council of Europe are:- (i) the European Court of Human Rights, which enforces the European Convention on Human Rights, and (ii) the European Pharmacopoeia Commission, which sets the quality standards for pharmaceutical products in Europe. The Council of Europe's work has resulted in standards, charters and conventions to facilitate cooperation between European countries and further integration. The seat of the Council of Europe is in Strasbourg, France, with English and French as its two official languages. The Committee of Ministers, the Parliamentary Assembly and the Congress also use German, Italian, and Russian for some of their work. / Имеющий штаб-квартиру в Страсбурге, Франция, Совет Европы ныне (2011) насчитывает 47 стран-членов, охватывая практически всю территорию Европы. Созданный 05 Мая 1949 десятью странами (Бельгия, Дания, Ирландия, Италия, Люксембург, Нидерланды, Норвегия, Соединённое Королевство, Франция, и Швеция), он трудится над установлением на всём континенте единых демократических принципов, вытекающих из Европейской Конвенции о Правах Человека и иных документов в этой сфере. Парламентская Ассамблея (the Parliamentary Assembly) – совещательный орган Совета Европы, состоящий из 318 представителей (и такого же числа их заместителей), назначаемых национальными парламентами 47 стран-членов. Страны члены Совета Европы:- Австрия, Азербайджан, Албания, Андорра, Армения, Бельгия, Болгария, Босния и Герцеговина, Венгрия, Германия, Греция, Грузия, Дания, Ирландия, Исландия, Испания, Италия, Кипр, Латвия, Литва, Лихтенштейн, Люксембург, Македония (Бывшая Югославская Республика Македония), Мальта, Молдова, Монако, Нидерланды, Норвегия, Польша, Португалия, Россия, Румыния, Сан Марино, Сербия, Словакия, Словения, Соединённое Королевство, Турция, Украина, Финляндия, Франция, Хорватия, Черногория, Чешская Республика, Швейцария, Швеция, и Эстония. Основной целью, которую преследует Совет Европы, является превращение континента в единое демократическое и правовое пространство,

где уважаются фундаментальные ценности:- права человека, демократия и верховенство права. Среди других целей СЕ:- (i) защита прав человека, плюралистической демократии и верховенства права; (ii) пропаганда и развитие культурной самобытности и разнообразия Европы; (iii) поиск решений общих проблем, стоящих перед Европейскими странами; и (iv) укрепление демократической стабильности путем поддержки политических, законодательных и конституционных реформ.

COUNCIL OF LLOYD'S = СОВЕТ ЛОЙДЗ – The Council Of Lloyd's was constituted as the governing body of Lloyd's by Lloyd's Act 1982. It currently comprises 6 external members, 6 working members and 6 nominated members and is empowered to make byelaws governing the conduct of insurance business at Lloyd's. Since 2003 the Council has acted by Lloyd's Franchise Board as regards the development and direction of the implementation of the commercial policy of the Lloyd's franchise and the direction and regulation of the business of insurance of Lloyd's. / Совет Лойдз был .

COUNCIL OF THE ENTENTE = СОВЕТ СОГЛАШЕНИЯ (или СОВЕТ АНТАНТЫ) – The Council Of The Entente was established on May 29, 1959, by the heads of state of Côte d'Ivoire, Upper Volta (present-day Burkina Faso), Dahomey (present-day Benin), and Niger. Togo became a member in 1966. Ostensibly, the Council of the Entente coordinated the regulations and statutes of member states governing finance, justice, labor, public service, health, and communications. The Council of the Entente also initiated steps toward forming a customs union, integrating development plans and creating a development fund, the Solidarity Fund (later known as the Loan Guaranty Fund). Each member state was to contribute 10 percent of government revenues to the fund. Côte d'Ivoire, the leader of the Council of the Entente and by far the wealthiest member state, was to receive only a small portion of the redistributed funds; other members were entitled to larger shares. In fact, by 1988 Côte d'Ivoire had never touched its share. The Council of the Entente helped Houphouët-Boigny achieve his long-term regional foreign policy objectives. First, by allying himself with three desperately poor countries that could be expected to maintain close ties with France for years to come, he built a broader base to counter Senegal's attempts to isolate Côte d'Ivoire and reestablish some sort of federation of West African francophone states that would presumably be centered at Dakar. The demise of the Mali Federation in 1960 appeared to vindicate Houphouët-Boigny's strategy. He subsequently enlisted the Council of the Entente states to isolate the government of Ghana, which had supported a massive antigovernment protest in the Sanwi area of Côte d'Ivoire and was linked to a plot to overthrow Niger's President Hamani Diori. After Ghana's President Kwame Nkrumah was ousted in a 1966 coup, Houphouët-Boigny sought diplomatic support from the Council of the Entente states in his feud with President Ahmed Sékou Touré of Guinea. Sékou Touré routinely accused Houphouët-Boigny of harboring Guinean exiles; he also threatened to send troops across Côte d'Ivoire to Ghana to restore Nkrumah, by then a refugee in Guinea, to power. By the mid-1980s, populist and nationalist sentiments surging within the Council of the Entente member states threatened Côte d'Ivoire's staid leadership of the alliance. Togo, which was surrounded by radical states, remained a staunch ally; however, Burkina Faso and Benin increasingly criticized Houphouët-Boigny's conservativism and strengthened their ties with Libya and Ghana. As a result, the Council of the Entente's value as an instrument of Ivoirian foreign policy diminished. Five member states (Benin, Burkina Faso, Cote d'Ivoire, Niger, Togo) with the goal of promoting economic, social and political coordination. The Conseil de l'Entente (Council of Accord or Council of Understanding) is a West African regional co-operation forum established in May 1959 by Côte d'Ivoire, Niger, Upper Volta and Dahomey, and joined in 1966 by Togo. The body grew out of the short-lived Sahel-Benin Union, itself created by the four original Council members as a partial successor to the dissolved French regional colonial federation of French West Africa. Since 1966 the Council has possessed a permanent administrative Secretariat based in Abidjan, the largest city of Côte d'Ivoire. A Mutual Aid and Loan Guarantee Fund exists to assist poorer members from a common pool. / от Французского слова Отот (Entente), означающее Соглашение. Стратегия Уфот-Буаньи (Houphouët-Boigny). Президент Нигера Амани Дьори (Hamani Diori). После Президента Ганы Кваме Энкрума (Kwame Nkrumah). Президент Гвинеи Амэд Секу Туре (Ahmed Sékou Touré). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Пять государств участников (Бенин, Буркина Фасо, Кот д'Ивуар, Нигер, Того), объединившиеся с целью содействия экономической, социальной и политической координации.

COUNCIL OF THE EUROPEAN UNION = СОВЕТ ЕВРОПЕЙСКОГО СОЮЗА – The Council is the EU's main decision-making body. Like the European Parliament, the Council was set up by the founding treaties in the 1950s. It represents the member states, and its meetings are attended by one minister from each of the EU's national governments. Which ministers attend which meeting depends on what subjects are on the agenda. If, for example, the Council is to discuss environmental issues, the meeting will be attended by the Environment Minister from each EU country and it will be known as the 'Environment Council'. The EU's relations with the rest of the world are dealt with by the 'General Affairs and External Relations Council'. But this Council configuration also has wider responsibility for general policy issues, so its meetings are attended by whichever Minister or State Secretary each government chooses. Altogether there are nine different Council configurations:- (i) General Affairs and External Relations; (ii) Economic and Financial Affairs (ECOFIN); (iii) Justice and Home Affairs (JHA); (iv) Employment, Social Policy, Health and Consumer Affairs; (v) Competitiveness; (vi) Transport, Telecommunications and Energy; (vii) Agriculture and Fisheries; (viii) Environment; and (ix) Education, Youth and Culture. Each minister in the Council is empowered to commit his or her government. In other words, the minister's signature is the signature of the whole government. Moreover, each minister in the Council is answerable to his or her national parliament and to the citizens that parliament represents. This ensures the democratic legitimacy of the Council's decisions. Up to four times a year the presidents and/or prime ministers of the member states, together with the President of the European Commission, meet as the 'European Council'. These 'summit' meetings set overall EU policy and resolve issues that could not be settled at a lower level (i.e. by the ministers at normal Council meetings). Given the importance of European Council discussions, they often continue late into the night and attract a lot of media attention. The Council has six key responsibilities:- (i) to pass European laws – jointly with the European Parliament in many policy areas; (ii) to co-ordinate the broad economic policies of the member states; (iii) to conclude international agreements between the EU and other countries or international organizations; (iv) to approve the EU's budget, jointly with the European Parliament; (v) to develop the EU's Common Foreign and Security Policy (CFSP), based on guidelines set by the European Council; and (vi) to co-ordinate co-operation between the national courts and police forces in criminal matters. Most of these responsibilities relate to the 'Community' domain – i.e. areas of action where the member states have decided to pool their sovereignty and delegate decision-making powers to the EU institutions. This domain is the 'first pillar' of the European Union. However, the last two responsibilities relate largely to areas in which the member states have not delegated their powers but are simply working together. This is called 'Intergovernmental Co-operation' and it covers the second and third 'pillars' of the European Union. The Council of the European Union (EU) is the legislative body. The members of the Council are composed of the competent ministers of the EU participating countries. Council of the European Union (EU Council) is an institution of the European Community. It is made up of representatives of the governments of the Member States, normally the ministers responsible for the matters under consideration (therefore often referred to as the Council of Ministers). The EU Council meeting in the composition of the ministers of finance and economy is often referred to as the Economic and Financial Affairs (ECOFIN) Council. In addition, the EU Council may meet in the composition of the Heads of State or Government for decisions specified in the Treaty. See also European Council. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Совет Европейского Союза (ЕС) является законодательным органом. Члены Совета формируются из компетентных министров участвующих в ЕС стран.

COUNCIL ON FOREIGN RELATIONS = СОВЕТ ПО ИНОСТРАННЫМ ОТНОШЕНИЯМ – Roots in the Council on Foreign Relations:- the origins of the Marshall Plan are in fact to be found in the 'War and Peace Study Groups' instituted by the Council on Foreign Relations (CFR) in 1939. On 1939-December-06 the Rockefeller Foundation granted the Council nearly USD50 000 to finance the first year of the project. Well over 120 influential individuals (academics and business leaders), at least 5 cabinet levels departments and 12 separate government agencies, bureaux or offices were involved in this. There were altogether 362 meetings and no less than 682 separate documents produced. I find it frankly astonishing that virtually none of the British academic scholarship on this period even acknowledges the existence of the CFR, let alone the War and Peace Study Groups. Evidence is surely required to show that they had no influence, if that is what scholars believe. The plan which Marshall presented in his speech had already been outlined in the proposals of a CFR study group of 1946 headed by the lawyer Charles M. Spofford and David Rockefeller, entitled 'Reconstruction in Western Europe'; and the specific proposal for unifying the Western European coal and steel basin as a bulwark against the USSR was made by John Foster Dulles in January 1947. To trace the origin of the movement for European unification, however, requires that we go back to 1946-May-08 and an address given at Chatham House by a Pole named Joseph Retinger. In this talk he outlined a plan for a federal Europe in which the states would relinquish part of their sovereignty. At the time, Retinger was secretary general of the Independent League for European Co-operation (ILEC), run by the Belgian Prime Minister Paul van Zeeland. During the war Retinger worked closely with van Zeeland and other exile leaders who would become prominent in the Bilderberg network, (including Paul Rijkens, whom we will meet again shortly). (3) Out of these connections was born in 1942–43 the Benelux customs union, a kind of prototype of the Common Market. The ideas adumbrated by Retinger were not new: there is a whole history of such projects for European unification and for even larger global schemes. One might just note here the assumption of the need for a 'great power' status as well as the almost taken-for-granted racism which informed Retinger's thinking:- 'The end of the period during which the white man spread his activities over the whole globe saw the Continent itself undergoing a process of internal disruption ... there are no big powers left in continental Europe ... (whose) inhabitants after all, represent the most valuable human element in the world (Retinger 1946, p. 7)'. Shortly after this speech, Retinger was invited by the US Ambassador, Averell Harriman, to the USA to secure American support for ILEC. 'I found in America a unanimous approval for our ideas among financiers, businessmen and politicians. Mr Leffingwell, Senior Partner in JPMorgan's (bank), Nelson and David Rockefeller, Alfred Sloan (Chair of General Motors), Charles Hook, President of the American Rolling Mills Company, Sir William Wiseman, (British SIS and) Partner in Kuhn Loeb (New York investment bank), George Franklin and especially my old friend Adolf Berle Jr (CFR), were all in favor, and Berle agreed to lead the American section (of ILEC). John Foster Dulles also agreed to help (Pomian 1972, p. 212)'. Thus was formed the European Movement (whose first congress at the Hague in 1948 is – the origin of the Council of Europe), which received substantial contributions from US government secret funds as well as private sources via the American Committee for a United Europe (ACUE). The names mentioned above are significant in the present context:- Leffingwell preceded John McCloy and David Rockefeller as CFR chair, 1946–53, and had been a CFR director since 1927, while Franklin was executive director of the CFR 1953–57 and was later a Trilateral Commission Co-ordinator:- also, incidentally an in-law of the Rockefellers. US funding for the European Movement extended beyond 1952, most of it going to the European Youth Campaign, initiated by John McCloy, whose own career virtually personifies the Atlantic ruling class as a whole:- a corporate lawyer of relatively humble origins, he became, through his contacts at Harvard, assistant Secretary of War 1941–45 and first President of the World Bank (IBRD), which he revamped to suit the interests of Wall Street; and then US High Commissioner for Germany 1949–52 (where, among other things, he enabled Krupp to regain control of his steel companies, advising on the establishment of the Krupp-Stiftung, modelled on the Ford Foundation – he was connected to Adenauer through his German wife, whose sister married Lewis Douglas, JPMorgan financier and later US ambassador to Britain), after which he became a director of both the Chase Manhattan Bank and the Ford Foundation in 1953. He was also an active member of the Bilderberg Group, becoming chair of the Council on Foreign Relations itself. As for ACUE, its chair was William Donovan (who ran OSS – forerunner of the CIA during the war) and its vice-chair was Allen Dulles (who was a leading figure in the CFR War and Peace Study Group during the early part of the war, and later the director of the CIA); and it was run in Europe by another CIA executive, Thomas W. Braden. Council on Foreign Relations (CFR):- funded largely by the Rockefeller Foundation, the CFR is a major force in the USA behind economic globalisation that first became very active during the last war, issuing many confidential memoranda to the US government. President Franklin D. Roosevelt was closely associated with it – literally. When governor of New York state, he had a town house next door to its headquarters in New York City. At that time, it set out a vision of huge areas of the globe (a 'Grand Area') that it was perceived would be necessary to come under effective US economic and military control, in order to ensure materials for US industries, following the defeat of Germany and Japan. It called for centralised world wide financial institutions and was a major force that led to the Bretton Woods conference in New Hampshire USA in 1944, which set up the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development now known as the World Bank. A CFR brainchild, the Marshall Plan helped Europe reconstruct after World War II, but it also ensured the Americanisation of Europe as European political and economic elites became wedded to their American counterparts with no significant economic or political development taking place without US approval. Today many meetings are forums where foreign diplomats can freely express their ideas to council members – '... Participants are assured that they may speak openly, as it is the tradition of the Council that others will not attribute or characterise their statements in public media or forums or knowingly transmit them to persons who will'. Familiar line? Even major summits of international importance are staged in secret such as the Middle East/North Africa Economic Summit co-chaired by Bill Clinton (CFR member) and Boris Yeltsin in Casablanca in 1994 – no mainstream media reports on that. The council claims '... no affiliation with the US government ...' but it just so happens that Clinton and almost all his cabinet members were apparently listed as CFR members. Other members are David Rockefeller, Secretary of State Colin Powell, Vice President Dick Cheney, Jesse Jackson, Pat Buchanan, Katherine Graham (publisher of the Washington Post) and a number of other well known presenters and newspeople in ABC, CBS, and NBC (e.g., Dan Rather, Robert McNeil, Jim Lehrer, Tom Brokaw, and David Brinkley). There are many others including Alan Greenspan head of the Federal Reserve Bank, previous head Paul Volcker, plus the usual array of big corporate bosses from Chrysler, Coca Cola, General Motors, Ford, AT&T, American Express, Exxon, Shell, Mobil, etc. The Council on Foreign Relations (CFR) is an independent, nonpartisan membership organization, think tank, and publisher dedicated to being a resource for its members, government officials, business executives, journalists, educators and students, civic and religious leaders, and other interested citizens in order to help them better understand the world and the foreign policy choices facing the United States and other countries. Founded in 1921, CFR carries out its mission by maintaining a diverse membership, with special programs to promote interest and develop expertise in the next generation of foreign policy leaders; convening meetings at its headquarters in New York and in Washington, DC, and other cities where senior government officials, members of Congress, global leaders, and prominent thinkers come together with CFR members to discuss and debate major international issues; supporting a Studies Program that fosters independent research, enabling CFR scholars to produce articles, reports, and books and hold roundtables that analyze foreign policy issues and make concrete policy recommendations; publishing Foreign Affairs, the preeminent journal on international affairs and US foreign policy; sponsoring Independent Task Forces that produce reports with both findings and policy prescriptions on the most important foreign policy topics; and providing up-to-date information and analysis about world events and American foreign policy on its website, http://www.cfr.org. The Council on Foreign Relations takes no institutional position on policy issues and has no affiliation with the US government. All statements of fact and

expressions of opinion contained in its publications are the sole responsibility of the author or authors. Headquartered in New York, NY, USA. / План Машэла (Marshall Plan). Фонд Рокэфэлё (Rockefeller Foundation). Чарлз Эм. Спафод (Charles M. Spofford) и Дэйвид Рокэфэлё (David Rockefeller), Дьжан Фастё Далэс (John Foster Dulles) в Январе 1947. Дэйвид Рокэфэлё (David Rockefeller), Государственный Секретарь Колын Павэл (Secretary of State Colin Powell), Вице Президент Дик Чэйни (Vice President Dick Cheney), Дьжеси Дьжяксэн (Jesse Jackson), Пэт Бьюкэнэн (Pat Buchanan), Кэсрин Грээм (Katherine Graham (издатель Вошиньтэн Пост (publisher of the Washington Post)) и ряд других хорошо известных presenters и людей из новостей с каналов Эй.Би.Си. (ABC), Си.Би.Эс. (CBS), и Эн.Би.Си. (NBC) (например, Дэн Разо (Dan Rather), Робэт МэкНил (Robert McNeil), Дьжим Лэрэр (Jim Lehrer), Там Брока (Tom Brokaw), и Дэйвид Брынкли (David Brinkley)). Есть много других, включая таких как Алэн Гринспэн (Alan Greenspan), глава Федерального Резервного Банка (head of the Federal Reserve Bank), предшествовавший глава Пол Волкё (head Paul Volcker), плюс обычное множество боссов больших корпораций, таких как Крайсло (Chrysler), Кокэ Кола (Coca Cola), Дьженерэл Мотоз (General Motors), Фод (Ford), Эй.Ти.ЭндТи. (AT&T), Амэрикэн Экспрэс (American Express), ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)), Щел (Shell), Мобл (Mobil) и прочие. прокатка (rolling). Трилатеральный (Trilateral), от Латинского слова Trilaterus, означающее Трёхсторонний, от Tri, в сложных словах означающее Три, и Latus, родительный падеж Lateris, означающее Сторона. На протяжении 60 лет Совет по Иностранным Отношениям (СИО) (Council on Foreign Relations (CFR)) консультировал Государственный Департамент США. В каждом конфликте он определяет цели войны в интересах своих членов и вне всякого демократического контроля. Он также участвует в написании официального отчёта каждый раз, когда необходимо осудить ошибки прошлого и восстановить репутацию. Финансированием Совета занимается около 200 транснациональных компаний. В его состав входит 4 200 членов, в большинстве своём являющихся представителями правящей верхушки. Деловая элита за закрытыми дверями занимается разработкой внешнеполитической концепции Соединённых Штатов Америки. Во время Первой Мировой Войны (1914–1918) Президент Вудроу Вилсэн (Woodrow Wilson) назначает передового журналиста Волтэ Лыпмэна (Walter Lippmann) на пост Заместителя Министра Обороны. Ему поручают создание секретной группы из 125 лучших университетских преподавателей, названной 'Расследование', для изучения возможностей распространения в мире либерализма под прикрытием Первой Мировой Войны. Лыпмэн работает в тесном сотрудничестве со Специальным Советником Президента Полковником Эдводом Мэндэлом Хаусом (Edward Mandell House). Они подготавливают итоговый отчёт, названный 'Цели Войны и Её Предложения по Порядкам Мира' (The War Aims and Peace Terms its Suggests). Он послужит базой для знаменитых четырнадцати пунктов Вилсэна. Этот ход часто определяют как идеалистический (делать добро Человечеству без его ведома) в противовес реализму (защищать свои собственные интересы, не заботясь о главных принципах). По сути, Вилсэн занимается и тем и другим:- он намеревается расширять демократию, но оставляет за собой право завоевать Мексику или аннексировать Гаити. Сегодня неоконсерваторы призывают следовать этой традиции:- они желают демократизировать Ближний Восток, одновременно осуществляя бомбардировки Афганистана и Ирака. В конце Первой Мировой Войны Вилсэн направляется в Европу, чтобы лично участвовать в Мирной Конференции в Версале. Его сопровождают пять личных помощников, среди которых присутствует и Полковник Хаус, который берёт с собой 23 члена группы 'Расследование'. Американская делегация навязывает партнёрам свою методику работы:- они запрещают обсуждать мирные соглашения до тех пор, пока страны не определят, каким будет этот мир. Она также делится своими планами по созданию мира, открытого коммерции без таможенных ограничений и правил. По сути, эти планы отражают то, что впоследствии будет названо глобализацией. Она также выступает за создание Лиги Наций, целью которой было бы предотвращение войн. Этот проект был во многом исправлен Европейцами, и в, конечном итоге, отклонён Конгрессом США, который тем самым высказал свое неодобрение Вилсэну. Британская и Американская делегации решают создать за рамками Мирной Конференции Академию, которая объединила бы оба государства. Её цель заключалась бы в продолжении деятельности 'Расследования', что способствовало бы разработке совместной долгосрочной концепции в области внешней политики. В конечном итоге, этот Англо-Американский институт по иностранным отношениям разделился на два независимых отдела, один из которых расположился в Лондоне, другой – в Нью Йорке. Тем временем, Государственный Секретарь США Илайхью Рут (Elihu Root), организовавший вторжения в Кубу, Гондурас и Доминиканскую Республику и, несмотря на это, получивший Нобелевскую Премию Мира, со своей стороны организовал Совет по Иностранным Отношениям (СИО) (Council on Foreign Relations (CFR)). Организация не работала должным образом, несмотря на то, что в её состав входило около ста человек. 'Расследование' решило объединиться с СИО для создания Американской составляющей механизма. Между тем Англичане создали свой Королевский Институт по Международным Делам (КИМД) (Royal Institute for International Affairs (RIIA)) в Чэтэм Хаус (Chatham House). Правила функционирования СИО и Чэтэм Хаус такие же, как во всех исследовательских учреждениях:- участникам предлагается работать над заданными целями за пределами организации и под вымышленными именами. К тому же в то время в СИО и Чэтэм Хаус могли работать только мужчины, являющиеся гражданами США и Великобритании. Но характер этих двух организаций развивался в Великобритании, повернутой к своей Империи, и в Соединённых Штатах, склонных к изоляционизму, по-разному. Эти различия проявляются в заголовках выпускаемых ими журналов:- Иностранные Дела (Foreign Affairs) принадлежал СИО, а Международные Дела (International Affairs) – КИМД. За период, предшествовавший Второй Мировой Войне (1939–1945), количество сотрудников СИО в Нью Йорке увеличилось с 300 до 663 человек. Здесь были представители всех политических течений, разумеется, за исключением изоляционистов. СИО щедро финансируется частными жертвователями, в особенности Фондом Каниги За Международный Мир (Carnegie Endowment for International Peace), а не федеральным правительством, консультантом которого он является. Филиалы СИО открываются ещё в 8 крупных Американских городах. К концу 1930-х Совет расходится во мнениях по поводу того, какую

позицию принять в отношении Японского милитаризма и Немецкого фашизма. В этих целях Директор СИО Хэмилтэн Эф. Армстрон (Hamilton F. Armstrong) и Секретарь Элэн Вэлш Далэс (Allen Welsh Dulles) публикуют небольшую, но звучную статью 'Можем ли мы сохранять нейтралитет?'. С момента вторжения в Польшу в 1939, то есть за два года до того, как Белый Дом принял решение о вхождении в войну, СИО начал изучать цели войны. Экспертные работы будут продолжаться до окончания военных действий. Сотни учёных составляют для Госдепартамента США сборник Исследования Войны и Мира (War and Peace Studies), состоящий из 682 докладов. Исследования финансируются Фондом Рокэфэлё (Rockefeller Foundation):- эти выплаты достигают суммы 350 000 Долларов США. Сборник послужит основанием для созыва Конференций в старинном особняке Дамбартэн Окс (Dumbarton Oaks) в пригороде Вашингтона и Сан Франциско (San Francisco) (создание Организации Объединённых Наций (ООН)). По окончании военных действий Элэн Вэлш Далэс, служивший во время войны в Управление Стратегических Служб (Office of Strategic Services (OSS)), назначен Президентом СИО. Первая инициатива Совета заключается в том, чтобы воспользоваться итогами войны в угоду администрации Президента США Хэри Эс. Тчрумэна (Harry S. Truman; с 1945 по 1953). На сей раз чаша терпения переполняется. Выдающиеся историки протестуют против монополизации исторических исследований клубом частных интересов, подвластным федеральному правительству США. СИО, по сути дела, является единственным учреждением, имеющим доступ к правительственным архивам и имеющим возможность писать официальную историю, не опасаясь опровержений. Количество сотрудников СИО продолжает расти и быстро достигает количества тысячи человек. Для того, чтобы включить в состав организации представителей всех ячеек общества, руководители СИО решают включить в него менее обеспеченных людей:- профсоюзных руководителей Американской Федерации Труда и Конгресса Промышленных Организаций (АФТ/КПО) (American Federation of Labor and Congress of Industrial Organizations (AFL/CIO)). В действительности статья была написана послом Дьжодьжем Эф. Кенэном (George F. Kennan) по его возвращении из Москвы. Он считает, что коммунизм преследует в своей политике экспансионистские цели, и уверяет, что он в скором времени будет представлять ещё большую угрозу, чем III Рейх. Что-то вроде паранойи овладевает Советом, многие сотрудники которого неверно толкуют статью как объявление о неизбежном военном нападении со стороны Советского Союза. Как бы то ни было, Хэри Эс. Тчрумэн (Harry S. Truman) поручает Кенэну разработку Акта о Национальной Безопасности (National Security Act), который основывает систему секретных служб государства (общевойсковой штаб, действующий на постоянной основе в мирное время, Центральное Разведывательное Управление (ЦРУ) и Совет Национальной Безопасности). Естественно, на руководящие должности этих секретных служб приходят люди из СИО, в частности, Дин Ачэсэн (Dean Acheson), Чарлз Болэн (Charles Bohlen), Эйвэрэл Хэримэн (Averell Harriman), Робэт Лавэт (Robert Lovett) и Дьжан МэКлой (John McCloy). Как следствие, эти учреждения используют СИО для того, чтобы предупредить возвращение политики изоляционизма и мобилизовать элиту общества на поддержку Плана Машэла. Тем временем, изменения, начатые администрацией Президента Тчрумэна, когда на место Кенэна пришел его Заместитель Пол Нитцэ (Paul Nitze) и когда холодная война переходит от простой политики сдерживания к непрямому противостоянию, являются реакцией на первое испытание Советским Союзом атомной бомбы. Эти изменения проводятся без участия СИО. В 1950-е Совет работает над ядерной доктриной. В этих целях в 1954 и 1955 создаются рабочие группы. Собрания этих групп проводятся под руководством молодого преподавателя, близкого к военно-промышленному комплексу, Хэнри Эй. Кисиньдьжё (Henry A. Kissinger). После испытания Китаем атомной бомбы в 1964 СИО начинает выступать за поддержание политики открытости с этой страной. Президент Ричод Никсэн (Richard Nixon; с 1969 по 1974) одобряет данную концепцию и сообщает об этом в журнале Иностранные Дела (Foreign Affairs). Впоследствии она будет внедряться Госсекретарем его администрации – Кисиньдьжё. Именно в это время Фонд Фода также становится спонсором СИО, который нанимает блестящих университетских преподавателей:- Збигнева Бжежиньски (Zbigniew Brzezinski) и Стэнлы Хафмэна (Stanley Hoffman). Как и в случае Второй Мировой Войны, по окончании войны во Вьетнаме СИО пишет её 'официальную' историю, под которой поставили подписи 22 очень влиятельные особы. Как и в 1945, Американская элита сама решает, какие преступления должны быть признаны и оправданы, а какие должны быть скрыты и забыты. Президента Никсэна отправляют в отставку, а все остальные прикидываются, что извлекли уроки из прошлого, дабы иметь возможность перевернуть страницу и ещё раз заявить о намерениях следовать доброй воле. Дэйвид Рокэфэлё (David Rockfeller) из Чэйс Мэньхэтэн Бэньк (Chase Manhattan Bank) (впоследствии ставший Дьжей.Пи. Моргэн Чэйс (JP Morgan Chase)) в 1970 становится Президентом СИО. Он робко открывает доступ в Совет женщинам и набирает молодые кадры. Он также создаёт пост Исполнительного Директора, который доверяет бывшему Госсекретарю при Президенте Дьжими Картё (Jimmy Carter; с 1977 по 1981) – Сайрасу Ар. Вэнцу (Cyrus R. Vance), а также Международный Консультативный Совет, в котором Франция представлена Мишэлем Рокяром (Michel Rocard), а Канада – Брайэном Малрони (Brian Mulroney). После распада Советского Союза СИО определяет новую политическую линию страны, публикуя в Иностранных Отношениях (Foreign Relations) статью Сэмьюэла Хантиньгтэна (Samuel Huntington) 'Война Цивилизаций' (La Guerre des Civilisations). В настоящее время Президентом Совета по Иностранным Отношениям является бывший дипломатический Советник Президента Дьжодьжа Боша Старшего Ричод Эн. Хас (Richard N. Haass), который при Боше Младшем стал Заместителем Государственного Секретаря Колына Эл. Павэла (Secretary of State Colin L. Powell). Его считают одним из наставников Кандэлызэ Райс (Condoleezza Rice). Председателем СИО является Питэ Дьжи. Питэсэн (Peter G. Peterson), банкир, близкий к семье Бошей. Ежегодное финансирование Совета, осуществляемое более 200 транснациональными компаниями, выливается в сумму более 7 миллионов Долларов США. В его состав входит 4 200 сотрудников и 50 исследователей. Журнал Иностранные Дела (Foreign Affairs) продаётся по всему миру и его тираж составляет 125 000 экземпляров. На протяжении последних 60-лет СИО разрабатывала долгосрочные стратегии Госдепартамента США, устанавливая согласие внутри Американской элиты (за исключением представителей изоляционистской концепции) вне всякого демократического контроля. В зависимости от конкретных интересов своих членов, Совет определял цели всех конфликтов, в которые вступали Соединённые Штаты Америки. В данной системе, война не вписывается в формулу 'продолжение политики иными средствами' Клёузэвица (Clausewitz), но является способом продвижения свободного рынка. Параллельно этому, определением стратегий войны занимается Рэнд Корпорэйшэн (Rand Corporation) в качестве Советника Департамента Обороны. СИО также составил согласованную национальную историю, которая распространяет миф о бескорыстности политики вмешательства и отвергает те страдания, которые принесли Соединённые Штаты Америки остальному миру. СИО, наконец, занимается распространением Американской политической модели путём привлечения в свои ряды руководителей других государств.

COUNT = НОМЕР (или ДЕЛЕНИЕ, или СЧЁТ, или ПОДСЧЁТ) – (1) Count is a system for measuring the fineness or thickness of yarn by spinners, weavers and knitters, count is essentially a numerical expression indicating the mass per unit length or length per unit mass of a yarn. In Scotland the term is known as Grist. In all other English speaking countries the term 'count' is used. Count is a numerical designation of yarn size indicating the relationship of length to weight. Also known as Count Of Yarn, Yarn Number, and Yarn Size. Count is the number given to a yarn of any material, usually indicating the number of hanks per pound of that yarn. May also refer to the fineness to which a fleece may be spun. There are at least three definitions. In raw wool, a number used to indicate fineness. In worsted yarn, the number of 560-yard skeins weighing one pound (Bradford method). In woolen yarn, the number of 256-yard skeins weighing one pound (Yorkshire method). Count is a numerical designation of yarn size indicating the relationship of length

to weight. See also Yarn Number. / Номер Пряжи. Единица линейной нумерации пряжи из гребенной шерсти:- номер один – № 1 или 560 ярдов в 1 фунте, номер десять – № 10 или 5 600 ярдов в 1 фунте и так далее.

(2) Count is the number of warp yarns (ends) and filling yarns (picks) per inch in a woven fabric, or the number of wales and courses per inch in a knit fabric. For example, a fabric count of 68 x 52 indicates 68 ends per inch in the warp and 52 picks per inch in the filling. Count:- in woven cloth, the number of ends and picks per inch, as, for example, '92 x 68', meaning 92 warp yarns per inch and 68 filling yarns per inch. In spun yarns, 'count' is used synonymously with the term 'size' and is based on the weight of the yarn for a specified length. Count:- the count of cloth – the number of ends and picks per inch in a woven fabric. If a cloth is 64 x 60, it means their are 64 ends and 60 picks per inch in the fabric. A cloth that has the same number of ends and picks per inch in woven goods is called a Square Cloth. For example, 80-square percale, has 80 ends and 80 picks per inch. Pick Count is the term that is synonymous with texture or number of filling picks per inch. / уточные пряжи (поперечные нити) на дюйм в тканой ткани. Например, перкаль 80 в квадрате (80-square percale) имеет 80 нитей по основе и 80 нитей по утку на один дюйм. Плотность Ткани – число нитей по основе и утку на дюйм (во всём мире, кроме бывшего Союза Советских Социалистических Республик (СССР) – на 10 сантиметров). Плотность Ткани – свойство ткани, определяющее её прочность, внешний вид и другие качества, характеризуемое содержанием волокнистого материала в единице объёма. Плотность ткани выражается обычно числом нитей основы на единицу ширины и числом нитей утка на единицу длины – так называемая абсолютная плотность ткани по основе и утку. При различной линейной плотности (тонине) нитей пользуются относительной плотности ткани, которая выражается так называемым коэффициентом заполнения – линейным, поверхностным или объёмным, представляющими собой отношение линейных размеров, поверхности или объёма, занятых нитями, к общей ширине, длине, поверхности или объёму ткани. Относительная плотность ткани определяется в основном видом переплетения нитей в ткани. При нормальной плотности ткани около 40–50% её объёма занято нитями.

COUNTER CHECK = УЧЁТНЫЙ ЧЕК (или ПОДМЕННЫЙ ЧЕК) – Counter Checks, often called Starter Checks, are given to customers by bank tellers. They are primarily used when a person opens up a new checking account. A bank also gives counter checks to customers when they run out of regular checks. Counter checks have a high rate of fraud, and institutions should be careful when accepting them. Description:- a counter check is a blank check that does not contain a check number, a person's name or address. Many counter checks also do not have an account number pre-printed on them. Counter checks do have the bank's routing number on the bottom of the check. Uses:- if a customer runs out of checks and needs one immediately, the bank may provide the customer with a counter check. Sometimes the bank imprints the customer's account number on the bottom, other times the customer must write it in. When a person opens a new checking account, the bank generally gives the customer a small book of counter checks. It may contain approximately five to 10 counter checks and are often called Starter Checks. These checks do contain the customer's account number and the bank's routing number but the customer's name and address is not printed on them. Process:- when a customer uses a counter check, the customer must fill in his name and address. He can also fill in his phone number, driver's license number or Social Security number. The customer must also choose a check number for each check written, which is handwritten at the top of the check. As soon as a customer opens a checking account, the bank typically orders official checks for the customer. When these arrive, the customer should destroy any remaining counter checks and begin using the official checks. The official checks have the customer's name and address printed on them. They also have the bank's routing number, checking account number and are in sequential check number order. Problems:- many retail places will not accept counter checks because they are not official checks. Typically, counter checks are accepted for payments by utility companies and loan companies. Many recipients of counter checks feel that there is a higher risk involved when accepting these types of checks because the person does not have an established account yet. Some banking institutions, including Post Office Employees Federal Credit Union, are offering preprinted checks to avoid this problem. In the United States, a Counter Check is a bank check given to customers who have run out of checks or whose checks are not yet available. It is often left blank, and is used for purposes of withdrawal. / В Соединённых Штатах Америки Учётным или Подменным Чеком понимается банковский чек, предоставленный заказчикам, у которых закончились чеки или чьи чеки пока ещё не готовы. Он часто предоставляется в виде незаполненного бланка и используется с целью снятия наличных со счёта.

COUNTERFOIL = КОРЕШОК – Counterfoil is a document kept as a record of a transaction, often attached to (and then detached from) a bond, certificate or check. The stub that remains behind after a check or receipt has been torn out of the book. Shows details of the check made out, e.g., number, date, amount, recipient, etc. Also known as Stub. / , например, .

COUNTER GUARANTEE = ВСТРЕЧНАЯ ГАРАНТИЯ (или УЧЁТНАЯ ГАРАНТИЯ) – Counter Guarantee:- an undertaking given by a cargo assured to an underwriter agreeing to reimburse the underwriter in the event that the issue of the underwriter's guarantee to pay a general average contribution results in payment in excess of the amount properly due under the policy. Counter Guarantee is back-to-back guarantee given by an obligor to indemnify a surety in a three-party contract (such as a performance bond). A counter guarantee is cashed in the unexpected event the obligor fails in the performance of a contract and the obligee calls upon the surety to honor the bond (guaranteed by the surety on behalf of the obligor). Also called Counter Indemnity. Bank can issue the Bank Guarantees which you may need for your financial or commercial transactions. These guarantees are subject to counter-guarantees such as blocked account, pledge or other. In some cases counter guarantee is a pledge of a deposit, in bank's investment fund, equal to 1.5 times the amount of the guarantee. Most of leading banks has a guarantee fee not exceeding 1% p.a. on the amount of the guarantee. Counter Guarantee is a guarantee taken by the bank from the bank's customer which ensures that the bank's customer is liable for any expenses including costs of attorney, any interest on delayed payment, taxes and other levies in case of invocation of the bank guarantee. It is a sort of security for the bank. It is always a good practice for a bank to take counter guarantee from its customer. / Контр-Гарантия – обязательство банка контргаранта, выдаваемое банку гаранту, возместить ему любые суммы, выплаченные последним по гарантии в пользу бенефициара. Встречная Гарантия может предоставляться в качестве встречного обеспечения банку от имени экспортёра или же на случай необоснованного изъятия предоставленного им обеспечения или потери его вследствии политических перемен. Гарантия может использоваться также в обеспечение предоплаты и обязательств на время предложения, поставки и гарантийного периода. Годовой взнос составляет 1–3% от суммы гарантии. Помимо этого взимается сбор на обслуживание в размере 0.3–0.8%.

COUNTERMARK = КОНТРОЛЬНОЕ КЛЕЙМО (или УЧЁТНЫЙ ЗНАК) – Countermark is any sign or symbol, distinct from the mark, placed on a bale as identification. / Любой знак или символ, отличающийся от марки, размещенный на кипе для идентификации.

COUNTERPART = ВСТРЕЧНАЯ СТОРОНА – Counterpart:- in a double-entry system of accounting each transaction gives rise to two corresponding entries. These entries are the counterparts to each other. Thus the counterpart of a payment by one sector is the receipt by another.

COUNTERPART = ДВОЙНИК (или ПАРА, или ХХ) – Counterpart is a Plant Variety (or Varieties) that represents the closest appropriate genotype to the transgenic Plant in question and is a suitable control taking into account the breeding history of the

transgenic Plant. In some instances, it may be appropriate to use a transgenic progenitor Plant as a counterpart in addition to, or as a substitute for, a non-transgenic counterpart.

COUNTERPART = ВСТРЕЧНАЯ СТОРОНА (или ХХ) – In the US patent law, a Counterpart is an application filed in a foreign patent office that is substantially similar to (like) the patent application filed with the United States Patent and Trademark Office (USPTO) and is based upon some or all of the same invention. The two applications would generally have the same applicant.

COUNTERPARTY = КОНТРАГЕНТ (или ВСТРЕЧНАЯ СТОРОНА) – Counterparty is the opposite party in a bilateral agreement, contract, or transaction with whom a deal is made. In the retail foreign exchange (or Forex) context, the party to which a retail customer sends its funds; lawfully, the party must be one of those listed in Section 2(c)(2)(B)(ii)(I)-(VI) of the US Commodity Exchange Act. / Встречная Сторона в двухстороннем соглашении, контракте или сделке, с которой было принято взаимное решение о его исполнении. Под Контрагентом, от Латинского слова Contrahens, означающее Договаривающийся, понимается одна из сторон контракта (договора).

COUNTERPARTY CREDIT LIMITS = ЛИМИТЫ КРЕДИТОВ КОНТРАГЕНТАМ – Counterparty Credit Limits are the limits set by a trading party to restrict the amount of its credit exposure to different counterparties.

COUNTERPARTY RISK = РИСК (ВИНЫ) КОНТРАГЕНТА (или РИСК ВСТРЕЧНОЙ СТОРОНЫ) – Counterparty Risk is the risk to each party of a contract that the counterparty will not live up to its contractual obligations. Counterparty risk as a risk to both parties and should be considered when evaluating a contract. In most financial contracts, counterparty risk is also known as Default Risk. Because A is a counterparty to B and B is a counterparty to A both are exposed to this risk. For example if Joe agrees to lends funds to Mike up to a certain amount, there is an expectation that Joe will provide the cash, and Mike will pay those funds back. There is still the counterparty risk assumed by them both. Mike might default on the loan and not pay Joe back or Joe might stop providing the agreed upon funds. Counterparty Risk:- a loss that a bank would incur if a business partner were to become insolvent. A Counterparty Risk, also known as a Default Risk, is a risk that a counterparty will not pay what it is obligated to do on a bond, credit derivative, trade credit insurance or payment protection insurance contract, or other trade or transaction when it is supposed to. Financial institutions may hedge or take out credit insurance of some sort with a counterparty, which may find themselves unable to pay when required to do so, either due to temporary liquidity issues or longer term systemic reasons. Large insurers are counterparties to many transactions, and thus this is the kind of risk that prompts financial regulators to act, e.g., the bailout of the US insurer AIG. On the methodological side, counterparty risk can be affected by wrong way risk, namely the risk that different risk factors be correlated in the most harmful direction. Including correlation between the portfolio risk factors and the counterparty default into the methodology is not trivial, see for example Brigo and Pallavicini. Counterparty Risk is the risk that the other party to an agreement will default. In an options contract, the risk to the option buyer that the option writer will not buy or sell the underlying as agreed. Counterparty Risk:- (1) in options, the risk that the option holder will not exercise the option. This may be good if the price moves in the option writer's favor, but counterparty risk is small in that situation. (2) More generally, the risk that one party in a contract will default or otherwise not fulfill his/her obligations. Counterparty risk can be diminished when one party mandates a co-signer or highly-rated guarantor. Counterparty Risk is the risk that a party to a transaction will fail to fulfill its obligations. The term is often applied specifically to swap agreements in which no clearinghouse guarantees the performance of the contract. Counterparty Risk is the risk that the person or institution with whom you have entered a financial contract – who is a counterparty to the contract – will default on the obligation and fail to fulfill that side of the contractual agreement. In other words, counterparty risk is a type of credit risk. Counterparty risk is the greatest in contracts drawn up directly between two parties and least in contracts where an intermediary acts as counterparty. For example, in the listed derivatives market, the industry's or the exchange's clearinghouse is the counterparty to every purchase or sale of an options or futures contract. That eliminates the possibility that the buyer or seller won't make good on the transaction. The clearinghouse, in turn, protects itself from risk by requiring market participants to meet margin requirements. In contrast, there is no such protection in the unlisted derivatives market where forwards and swaps are arranged. Counterparty Risk is the risk that the other party in an agreement will default. In an option contract, the risk to the option buyer that the writer will not buy or sell the underlying as agreed. In general, counterparty risk can be reduced by having an organization with extremely good credit act as an intermediary between the two parties. / Майк (Mike). Дьжоу (Joe). Эй.Ай.Дьжи. (AIG). Убыток, который может понести банк в случае если его деловой партнёр станет неплатёжеспособным. Риск Контрагента является разновидностью кредитного риска, который касается ситуаций текущих финансовых взаимоотношений с партнёром. Например, он может возникать при расчётах с ценными бумагами как риск расчётов – достоверности того, что другие участники рынка не смогут осуществить расчёт по соглашению, или риск того, что клиринговая палата не сможет выполнить гарантий по расчётам за соглашениями в связи с невыполнением своих обязательств отдельными участниками. Международный банк должен давать полноценную оценку кредитного риска контрагентов перед заключением с ними соглашений, которые могут быть связаны с важной экспозицией потерь. С этой целью он должен получить от контрагентов и оценить следующие виды информации:- (i) при начальной кредитной оценке:- (a) данные о материально значащих финансовых и партнёрских отношениях контрагента с другими сторонами; (b) конкретные торговые и инвестиционные стратегии и распределение активов; (c) описание операционного процесса, в том числе процедуры оценки, обработки и урегулирование соглашений; (d) информацию о стратегиях управления рисками, процедуры управления рисками, методы измерения риска; и (ii) на постоянной основе:- (a) состояние счёта капиталов; (b) финансовое состояние; (c) склонность к рыночному риску; (d) оценки риска ликвидности активов и риска привлечения средств для поддержания ликвидности; и (e) материально значащие события. Объём, качество и своевременность предоставленной информации должны быть постоянно действующими факторами, которые учитываются при определении объёмов и условий долговых обязательств.

COUNTERTRADE = ВСТРЕЧНАЯ ТОРГОВЛЯ – Countertrade is an umbrella term for several sorts of trade in which the seller is required to accept goods or other instruments of trade or trade, in partial or whole payment for its products. This type of trade fulfills financial, marketing, or public policy objectives of the trading parties. For example, a company might trade by bartering because it or its trading partner lacks foreign exchange. Forms include:- barter, buy-back or compensation, counterpurchase, offset requirements, swap, switch or triangular trade, evidence or clearing accounts. In counterpurchase, one of the most common forms of countertrade, exporter agrees to purchase a quantity of goods from a country in exchange for that country's purchase of the exporter's product. The goods being sold by each party are typically unrelated but are equivalent in value. Another form of this practice is contractually linked, parallel trade transactions that each involve a separate financial settlement. For example, a countertrade contract may provide that the exporter will be paid in a convertible currency as long as the exporter or another entity designated by the exporter agrees to purchase a related quantity of goods from the importing country. In offset, the exporter agrees to use goods and services from the buyer's country in the product being sold. Offsets may be direct or indirect, depending on whether the goods and services are integral parts of the product. In a direct offset, a manufacturer selling a product uses a component that is made in the purchasing country. In an indirect offset, the exporter would buy products that are peripheral to the manufacture of its product. In a compensation or buy-back deal, exporter of heavy equipment, technology, or even entire facilities agrees to purchase a certain percentage of the output of the facility.

Barter arrangements in international commerce are not as common, because the parties' needs for the goods of the other seldom coincide and because valuation of the goods may be problematic. This type of countertrade occurs without money exchanging hands as merchandise is traded directly for other merchandise or services. Barter might occur by swapping or by switching. Swapping is a simple swap of one good for another. Switch trading is a complicated form of barter, involving a chain of buyers and sellers in different markets to barter. Xxxxx. Explain these terms of Countertrade:- barter, counterpurchase, buyback, offsets, clearing agreement, and switch trading. (1) Barter is a one-time direct and simultaneous exchange of products of equal value (i.e. one product for another). (2) Counterpurchase occurs when there are two contracts or a set of parallel cash sales agreements, each paid in cash. Unlike barter, a counterpurchase involves two separate transactions – each with its own cash value. (3) A Buyback requires a company to provide machinery, factories, or technology and to buy products made from this machinery over an agreed-on period. (4) In an Offset, a foreign supplier is required to manufacture/assemble the product locally and/or purchase local components as an exchange or the right to sell its products locally. (5) A Clearing Agreement is a clearing account barter with no currency transaction required. With a line of credit being established in the central banks of the two countries, the trade in this case is continuous, and the exchange of products between two governments is designed to achieve an agreed-on value or volume of trade tabulated or calculated in nonconvertible 'clearing account units'. (6) Switch trading involves a triangular rather than bilateral trade agreement. A third party is necessary to dispose of the merchandise, and this party pays hard currency for the unwanted merchandise at a considerable discount. Given that countertrade is a fact of life which is not going to go away, is there any valid argument from a theoretical standpoint for this method of doing business? From a theoretical standpoint, there is probably no valid argument for countertrade. This method is cumbersome and costly, making additional and unnecessary costs inevitable. As explained by Bruce Fitzgerald ('Countertrade Reconsidered', Finance & Development (June 1987): 46-49), 'countertrade requirements, like any trade restrictions, increase the cost of doing business. These costs cannot be passed into the international market but must be borne within the country imposing the requirements'. Xxxxx. The term Counter-Trade covers a multitude of different trade relations. These range from straight barter – say, oil for machinery – to complex industrial co-operation agreements between Western companies and Eastern European state agencies and of late, for transacting trade deals between developing countries intending to save the outflow of foreign exchange. Different Types of Counter-Trade:- (1) Barter:- goods and/or services are exchanged against other goods and/or services of equivalent value, and no money changes hands between the buyer and seller. In the simplest case, the goods being offered in payment are delivered to the exporter, and he tries to sell them. Often a third party – typically a specialist in this type of operation – agrees to take the goods and pay their value, less a discount, to the exporter. In a barter trade deal, the goods may come direct from the importer or from an exporting company in his country with which he has an arrangement. Barter is generally described as being the earliest form of trade in history. Before money was invented, people traded by swapping goods. This simple idea lies at the base of many modern counter-trade techniques, although the detailed procedures adopted are more sophisticated, and typically involve actual or notional transfers of money as well as exchanges of goods and services. Government-to-government clearing account arrangements often closely resemble barter deals in their practical operation and effects, but governments prefer to use other terms to describe them such a bilateral agreements and clearing accounts. Nowadays, pure barter arrangements are relatively rare, although when concluded, they can cover transactions of considerable worth. Often such agreements are concluded on a government-to-government basis, and the motives for entering into them may be more political than economic or commercial. Barter deals struck for commercial reasons include those in which commodity traders swap deliveries of equivalent products for delivery to their respective customers in different locations around the world, hence achieving savings on transportation costs. (2) Counter-Purchase:- the seller undertakes to buy goods from the importer or from a company nominated by the importer, or agrees to arrange for their purchase by a third party. The value of the counter-purchased goods is an agreed percentage of the price of the goods originally exported. This type of agreement is the most widely used of all the counter-trade techniques. It is found particularly in the key industrial sectors – machine tools, transport supplies, and chemical and metallurgical products, for instance. Separate contracts are concluded for the original export sale and for the counter-purchase. The second agreement sets out the general agreements to buy and the time period for performance. Usually, it does not specify the goods to be bought. Its entry into force should be linked with performance of the initial contract. Failure of the exporter to carry out his counter-purchase obligations is sanctioned by a penalty clause. (3) Buy-Back:- under such a scheme, an exporter of equipment agrees to buy the products produced by that equipment. This type of arrangement has developed rapidly since the late 1960s, mainly in long and mediumterm projects, such as the supply of turnkey factories and mining materials. Buy-backs are often known in the US as direct compensation agreements. It is essential that the buy-back agreement should contain precise particulars of the products to be bought – amount, type and delivery periods, for instance. A particular problem for the exporter is that he cannot control the production and quality of the products that he is obliged to buy. (4) Offset:- the popularity of offset, a trading technique practiced by governments, has been increasing in recent years. Offset agreements usually cover government acquisitions concerning military and major civil procurements. In the civil sector, commercial aircraft and telecommunications deals frequently involve offset trading. Typically, offset agreements are demanded in cases where countries are seeking to squeeze the maximum benefit from their investment in high-value areas. Purchases frequently are tied to requirements by the importing country for domestic content. Such demand may cover co-production arrangements involving transfers of advanced skills and technology, and include investment in manufacturing plant and undertakings to train and employ local technicians and other personnel. Offset arrangements may be divided into two sub-categoriesdirect offset and indirect offset. Direct offset involves co-production arrangements based on transfers of production technology to the importing country. Such deals are used by the importing state as a tool for industrial development, domestic employment generation and as a means to finance payment balances. Indirect offset occurs when the selling country agrees to purchase unrelated products from the country of the purchasing government. Such arrangements help the buying country – typically a Third World state – to claw back some of the cost of the imports. Direct offsets are most often extracted by the governments of industrialized countries and Third World states at a relatively advanced stage of development. The technique is popular and frequently used by the governments of Australia and New Zealand. Implications of Counter-Trade:- counter-trade is one of the trading tools which not only alleviates the problem of foreign exchange shortages faced by developing countries, but which also helps to increase bilateral trade, especially amongst these countries. But most important of all, by linking exports to imports, governments can select the volume and nature of imports entering their countries. This serves the purpose of obtaining only those imports considered desirable to the development strategy of the nations. In the case of the Malaysian palm oil sector in particular, the adoption of a counter-trade arrangements is not only targeted at locking-in specific markets (namely India and the US) for a fixed amount of Malaysian palm oil intake, but also to generate additional export revenue for the palm oil industry through the development of new users coupled with new applications/uses for palm oil. Conclusion:- in the era of increasing globalization and trade liberalization, new and innovative methods for doing businesses must be adopted to stay ahead of the competition. To merely depend on the conventional mode of doing business will not be adequate to expand the export market for palm oil products as Malaysia is poised to see increased production of palm oil in the coming years. Counter-trade, therefore, is one good example of innovative methods of trading, especially when dealing with or influenced by countries facing foreign exchange (forex) difficulties or are influenced by the policies of government, which restrict the outflow of muchneeded hard currency. In fact, involvement in countertrade is a form of smart partnership that mutually benefits not only Malaysia,but also the counterpart countries as in the case of China, PR and India. Whilst Malaysia was able to export a fixed quantum

of palm oil to these markets, these countries in return successfully managed to sell their goods and services, which otherwise would not have easily made their way into Malaysia arising from the competitive nature of these products/services. Xxxxx. Countertrading refers to a category of international trade in which an exporter agrees to accept payment in the form of goods or services. There are many forms of countertrading, ranging from simple barter agreements to complex offset deals that involve the exporter agreeing to compensatory practices with respect to the buyer. Countertrading commonly takes place between private companies in developed nations and the governments of developing countries, although countertrading also occurs between developed nations. It has become popular as a means of financing international trade to reduce risks or overcome problems associated with various national currencies. Types of Countertrade Transactions:- Barter involves the exchange of goods or services of equal value without the use of currency. If the exchange does not take place simultaneously, then some financing is usually involved. Although bartering is the oldest and simplest form of countertrading, it is not often used in modem corporate countertrading. It is difficult to structure and inefficient, because it requires matching needs between buyers and sellers. In some cases a barter may be accepted by an exporter as substitute payment when financing arrangements fall through. The exporter may use the services of a trading company to find a market for the bartered goods if it has no need for them. Variations on the simple barter include the closed-end barter, which involves finding a third party who will purchase the goods as part of the agreement. In a deferred barter, there is a delay between the two shipments of goods or performances of services. When barters do occur, they are usually for one-time, spot transactions and are covered under one contract. They typically include some form of financing to cover delays in shipments and differences in the value of the goods or services being exchanged. Countries that are attempting to increase their hard currency earnings may impose restrictions, such as higher export tariffs, designed to reduce barters and other countertrading in marketable commodities. Buybacks are a more complicated form of countertrading that involve two separate contracts. Buybacks typically take place between a private corporation from a developed country and the government (or government agency) of a developing nation. Under the first contract of a buyback arrangement, the exporting private corporation agrees to provide a production facility or other type of capital goods to the developing nation. Then, under the second contract, the developing nation repays the exporting private corporation with output produced at the facility or derived from the originally exported capital goods. The exporter, in effect, buys back the output of the facility it has constructed. Buybacks are used to finance direct investment in developing countries. They are popular because they meet the needs and objectives of both parties. From the developing country's viewpoint, buybacks expand the country's export base, provide employment, and help it meet its goals for industrialization and development. From the point of view of a private corporation, the buyback may help it gain a market presence in the country and provide it with a source of products it can use or sell. If the particular output of the facility is not needed by the corporation, it can involve a third party to help it meet its countertrade obligations. Buyback Agreements often extend beyond the simple exchange of capital goods or production facilities and their related output. In order to win the contract for a specific facility, the private corporation may agree to provide the developing nation with a variety of other types of assistance, including loans, technology transfer, personnel training, plant operation, and joint ventures. Such arrangements can be attractive to corporations for a variety of strategic and marketing reasons. A Compensation Trade is one in which an exporter and importer agree to make reciprocal purchases of specific goods. The exchange is covered under a single contract. It may or may not take place simultaneously. Each delivery is invoiced in an agreed currency, with payments going either to the supplier or to a clearing account. A third party may be involved to fulfill the purchase commitment of one of the parties. Two countries that enter into cooperation contract agree to continuous purchases of goods and services from each other. The master agreement may include a series of buyback subcontracts, under which the exporter is paid with products derived from the original export. Another variation of a cooperation contract involves the sale of technical expertise to a joint venture by the exporter, who is then repaid by sales from the joint venture. A Counterpurchase involves two linked transactions that are covered by two separate contracts. Under one of the contracts, the sale of goods between an exporter and importer is negotiated and paid for in a specified currency. The second contract obligates the exporter to purchase goods from the importer at a specified value over a period of time. Unlike buybacks, counterpurchases involve hard currency. The primary contract usually takes the form of a standard export contract without making reference to any counterpurchase obligations. The secondary contract then binds the exporter to counterpurchase goods from the importer and usually contains provisions designed to protect the exporter. These provisions may allow the exporter to transfer its counterpurchase obligations to a third party. The secondary contract also would typically contain a clause that specifies if the primary sale is canceled, then the exporter is freed from any counterpurchase obligations. A side agreement called a Protocol typically links the two contracts. Offsets originally referred to compensatory transactions involving military equipment and aircraft. Offsets may also involve large civilian transactions. They are a common form of countertrade between two industrialized nations. Offsets may involve a range of compensatory practices that the exporter of military equipment must perform in order to realize the sale of the goods involved. There are two types of Offset Deals, direct and indirect. Under a direct offset, the exporter agrees to perform compensatory practices directly related to the product being exported. These practices may include the coproduction or subcontracting of all or part of the goods in the buyer's country. Licensed production is another compensatory practice that involves the overseas production of goods based on the transfer of technical information under arrangements made between a US manufacturer and a foreign government or producer. Technology transfer may also be a part of the offset agreement, taking a variety of forms ranging from research and development conducted abroad to technical assistance provided to a subsidiary or joint venture in the buyer country. With an indirect offset agreement, the compensatory practices required of the exporter are not related to the goods originally sold abroad. Indirect offsets may involve counterpurchases or buybacks involving unrelated products. They may require the exporter to use or promote the buyer country's services in other areas, such as tourism and travel. Offset Agreements are used by buyer nations to increase employment. Such arrangements also help them achieve their goals in the areas of industrial and export development. Offset trade typically occurs between two governments or between a private corporation and a government. A Switch Trade (also known as a Switch Deal) involves a third party to a countertrade agreement who agrees to assume the countertrade obligations of one of the parties. For example, an exporter may have agreed to counterpurchase goods for which it has no use, simply for the sake of completing the original sale. The exporter may switch its obligation to pay the importer to a third party, who is known as a switch trader, who then acquires the goods from the importer at a discount. The switch trader then sells the goods for hard currency, which is used to meet the exporter's payment obligation to the original importer. Under such agreements the size of the switch trader's discount depends on the importer's need for hard currency. History of Modern Countertrading:- throughout history countertrading and barter occurred whenever there was a shortage of money, or before money even existed. In modern times, countertrading arose as a means of conducting international trade when money was scarce, currencies couldn't be converted, or they were subject to inflationary and deflationary swings in value. In Germany between the two World Wars and after World War II, money was scarce and countertrading and barter became a way of conducting international trade. Eastern European countries followed Germany's lead and employed countertrading to overcome the problems of their own nonconvertible currencies. It was a practice that was favored by the centrally planned Eastern European economies. In the 1990s Eastern Europe and the countries of the former Soviet Union began countertrading with Western nations to overcome difficulties associated with their currencies. Countertrading became more important in international trade in the 1970s as a result of the oil price increases. It expanded greatly in the 1980s and by the middle of the decade had spread to nearly every country of the world. In the United States military offsets were the most common form of countertrading, accounting for an estimated 80 percent of all US countertrade in 1984. It is

difficult to estimate how much international trade is accounted for by countertrading because many deals are made confidentially or in secret. In 1985 it may have accounted for 10 percent of all international trade. During the second half of that decade, interest in countertrading softened as oil prices fell and the international business climate improved. At that time oil was the most countertraded of all the commodities. Countertrading in the 1990s:- countertrading is firmly established as a method of financing international trade. For developing countries that have hard currency shortages or whose national currencies are not readily convertible to other types of foreign exchange, countertrading offers a means of financing imports. By marketing their import potential to companies in developed nations, developing countries also benefit by finding new export markets. Suppliers in developed countries who are willing to countertrade have found that it provides them with a competitive edge. By being flexible in the type of payment they are willing to receive, companies that are willing and able to countertrade have a stronger position in competitive bidding for projects involving emerging markets in developing countries. Many such companies are eager to find outlets for their products in emerging markets such as China and Mexico. Emerging markets in developing countries typically experience swings in the values of their currencies, and they often have strict currency and import controls. Such countries often have to allocate their foreign exchange resources according to a prioritized list of projects and products they wish to import. Countertrading provides a way around such controls. In the case of low-priority imports, suppliers are more likely to win a contract if they are willing to accept some form of countertrade instead of hard currency. Countertrading can also protect supplier corporations from swings in currency values. In the case of Eastern Europe and the countries of the former Soviet Union, countertrading has played an important role in their international trade in the 1990s. Many of these countries have inconvertible currencies, making it difficult to conduct international trade without some form of countertrading. In Russia, for example, the country's banking system has been unable to provide traditional export financing. The most popular form of countertrade with Russia has been buybacks, in which exporters have accepted payment in the form of products derived from the original export. One of the most publicized countertrades involved Pepsico and the Soviet Union. In exchange for bottles of Pepsi, the company received profits in Stolichnaya vodka and oceangoing freighters and tankers. As part of the deal Pepsico provided the necessary technology as well as new labels and packaging. While the US government does not officially promote countertrading, official interest in countertrading grew in the 1990s. The Financial Services and Countertrade Division at the US Department of Commerce provides advice to business firms interested in countertrading. The Business Information Service for the Newly Independent States at the US Department of Commerce is a source of information on countertrading with the countries of the former Soviet Union. Historically, countertrading has expanded when international economies have been sluggish. A global scarcity of hard currency contributed to the growth of countertrading in the 1990s. One expert estimated that countertrading accounted for 40 percent of the world economy in the mid 1990s. / Брус Фицджеролд (Bruce Fitzgerald). ПэпсиКо (PepsiCo). выработка (output). Встречная Торговля – это своего рода зонтичный термин для обозначения нескольких видов торговли, в которой продавцу требуется акцептовать товары или иные инструменты торговли или заключать дополнительно новую сделку в обмен на часть или весь платёж за свою продукцию. Этот тип торговли преследует цели финансовой, маркетинговой или общественной политики торгующих сторон. Например, компания может прибегнуть к бартеру за неимением у неё или у её торгового партнёра иностранной валюты. К числу встречной торговли относятся:- бартер, выкуп или обратный выкуп, или компенсация, встречная покупка, зачёт требований, мена или своп, переуступка или трёхсторонняя торговля, свидетельские или клиринговые счёта. При встречной покупке, одной из наиболее простых форм встречной торговли, экспортёр соглашается приобрести определённое количество товаров из страны в обмен на приобретение этой страной продукции экспортёра. Эти проданные друг другу товары, как правило, ничем не связаны между собой, за исключением одного – их стоимость равна одна другой. Несколько иной формой этой практики являются связанные контрактом параллельные торговые сделки, каждая из которых предусматривает отдельный финансовый взаиморасчёт. Например, контракт при встречной торговле может предусматривать то, что экспортёру будут производиться выплаты в конвертируемой валюте до тех пор, пока этот экспортёр или иное лицо, обозначенное этим экспортёром, соглашается приобретать соответствующее количество товаров из привозящей (или импортирующей) страны. При зачёте, экспортёр соглашается воспользоваться товарами и услугами из страны покупателя, в которую экспортёр продал свою продукцию. Зачёты могут быть прямыми или непосредственными и косвенными в зависимости от того, являются ли эти товары и услуги неотъемлемой частью этой продукции. При прямом или непосредственном зачёте, производитель, продающий свою продукцию, использует компонент или составную часть, которая будет производиться в покупающей стране. При косвенном зачёте, экспортёр купил бы побочные продукты, полученные или произведённые в покупающей стране с помощью его поставленной продукции. При сделках с компенсацией или выкупом, экспортёр тяжёлого машиностроения, технологии или даже целой производственной линии соглашается приобретать определённый процент продукции, получаемой с помощью его оборудования. Бартерные соглашения в международной торговле не такие уж и простые, поскольку интерес одной из сторон к товарной продукции другой стороны проявляется очень редко, и, к тому же, оценка стоимости этой продукции может вызвать некоторые затруднения. Этот вид встречной торговли осуществляется без денежных взаиморасчётов, а точнее, без встречных оплат, поскольку за поставленные товары или оказанные услуги предоставляется встречная продукция. Бартер может проявляться в форме мены или своппинга и переуступки. Мена или Своп или своппинг является простым обменом одного товара на другой. Сделка с переуступкой – это более сложная форма бартера, включающая в себя цепочку покупателей и продавцов из различных рынков продукции.

COUNTER TRANSACTION = ВСТРЕЧНАЯ ТРАНЗАКЦИЯ (или ВСТРЕЧНАЯ ОПЕРАЦИЯ) – Counter Transaction:- securities transactions conducted at the bank counter where physical securities are handed to the customer against immediate payment in cash. In this case the investor himself is responsible for the safekeeping and administration of the securities and for redeeming attached interest and dividend coupons. Upon presentation of the interest or dividend coupons, the amount is paid out to the investor in cash. / физические ценные бумаги .

COUNTER–TREND TRADING = ТОРГОВЛЯ В ПРОТИВОВЕС ТЕНДЕНЦИИ – In technical analysis, Counter-Trend Trading is the method by which a trader takes a position contrary to the current market direction in anticipation of a change in that direction. / В техническом анализе биржевых рынков метод, с помощью которого торговец занимает позицию, противоположную текущему на данном рынке направлению движения цен в ожидании изменения в выбираемом только им направлении.

COUNTERVAILING DUTY = КОМПЕНСАЦИОННАЯ ПОШЛИНА – Countervailing Duty:- in the European Union, Customs duties imposed on imports from specific countries in addition to the normal or preferential duty; such duties can be introduced where a subsidy is granted by the export country, provided such imports cause or threaten to cause material injury to Community producers of like products. An extra duty imposed on an imported product by an importing country (or group of countries, as in the case of the EU) to compensate for subsidies deemed to be illegal which are given to the manufacturer of the product in the exporting country. Countervailing Duty is an extra charge that a country places on imported goods to counter the subsidies or bounties granted to the exporters of the goods by their home governments. The duty is allowed by the Code on Subsidies and Countervailing Duties negotiated at the Tokyo Round, if the importing country can prove that the subsidy would cause injury to domestic industry. US countervailing duties can only be imposed after the International Trade Commission has determined that the imports are causing or threatening to cause material injury to a US industry. Countervailing Suty is an additional levy imposed on imported goods to offset export subsidies

provided by the exporting country. An additional duty imposed to offset export grants, bounties or subsidies paid to foreign suppliers in certain countries by the government of that country for the purpose of promoting export. The duty is allowed by the Code on Subsidies and Countervailing Duties negotiated at the Tokyo Round, if the importing country can prove that the subsidy would cause injury to domestic industry.

COUNTER–VALUE PAYMENT = КОМПЕНСАЦИОННЫЙ ПЛАТЁЖ (или ОПЛАТА УЧЁТНОЙ СТОИМОСТИ) – Counter-Value Payment is a transaction denominated in one currency and the instruction that the equivalent amount in another currency is to be paid to the beneficiary.

COUNT OF CLOTH = ЧИСЛО ПОЛОТНА (или НОМЕР ТКАНИ, или КОЛИЧЕСТВО НИТЕЙ ПО ОСНОВЕ И УТКУ) – Count Of Cloth is the number of warp ends and picks per inch in a woven fabric. If a cloth is 68 x 72, it means there are 68 ends and 72 picks per inch in a woven fabric. A cloth that has the same number of ends and picks per inch in woven goods is called a Square Cloth. 80-square percale, for example, has 80 warp ends and 80 picks per inch. See aso Average Count Of Cloth. Count Of Cloth is the sley and pick of a cloth. If a cloth is said to count 80 X 100 it means 80 sley and 100 pick. The first number given always indicates the sley and the second number the pick. A cloth is said to be square when the sley and pick are equal.

COUNT OF YARN = ЧИСЛО ПРЯЖИ (или НОМЕР ПРЯЖИ) – Count Of Yarn is a standard measure of the fineness of yarn, either calculated by number of specified lengths per specified weight, as for cotton, linen or wool (thus, the higher the yarn number, the finer the yarn); or calculated by number of specified weights per specified length, as nylon, rayon or silk (thus, the higher the number the thicker the yarn). A number indicating the size or fineness of a yarn. Count Of Yarn is a size of yarn as distinguished by its weight and fineness. This term is applied to cotton, wool, and spun yarns. A number indicating the mass per unit length or the length per unit mass of yarn. Counts of Yarn or Numbers of Yarn:- ehe relationship of length to weight in determining the size of yarn. Although the term 'Numbers' is used quite extensively the more universal term 'Counts' will be given preference in this book. Counts Of Twisted Or Ply And Cable Yarns:- When single yarns are twisted together to form a ply yarn the result is a heavier yarn than the counts divided by the number of ends twisted together, owing to the contraction in twisting. This can be proved by twisting 2 yarns together to a certain length, weighing them, and comparing the weight with the weight of single yarns of similar length of the original counts. For calculation purposes, however, a cotton ply yarn composed of 2 or more yarns of equal counts is regarded as being the size of the single yarns divided by the number of strands ; thus a yarn composed of two strands of 60's twisted together is considered equal to one of 30's single; a yarn composed of three strands of 60's is considered equal to one of 20's single, but the more twist there is put into a yarn the more it will contract in length and the coarser will be the actual counts. Ply yarns which are composed of single strands of equal size of yarn are indicated by the number of strands which are twisted together and the counts of the single yarns written afterwards; thus 2/40's means 2 yarns of 40's twisted together, 3/100's means 3 yarns of 100's twisted together. These yarns would be equal to single yarns composed of 20's and 33.33's respectively. Cable yarns are composed of 2 or more ply yarns twisted together to form a fancy yarn. A 4/2/50's cable yarn would be composed of 4 ends of 2/50's twisted together, making in all 8 ends of 50's yarn, and would be equal to a single yarn of 6-1/4 counts. Unless used for fancy yarns for special purposes 2 single yarns of unequal counts are seldom or never used, as equal single yarns combined make the best ply yarns. / Найлан^{T3} (Nylon^{TM}). Номер Пряжи – стандартная мера тонины пряжи, рассчитывается либо (i) посредством числа спецификационных длин на спецификационный вес как, например, в случае с хлопком, льном или шерстью (таким образом, чем выше номер пряжи, тем она тоньше); либо (ii) числом спецификационных весов на спецификационную длину как, например, в случае с Найлан^{T3} (Nylon^{TM}), . Номер, указывающий вес для определённой длины или длину для определённого веса пряжи.

COUNTRY–CODE NAMES SUPPORTING ORGANIZATION = ОРГАНИЗАЦИЯ ПО ПОДДЕРЖКЕ ИМЁН ПО КОДУ СТРАНЫ – The Country-Code Names Supporting Organization (ccNSO) is in the process of being established, with the ccNSO Assistance Group preparing the recommendations that are currently under discussion. Upon completion, the purpose of the ccNSO is to engage and provide leadership in activities relevant to country-code top-level domains (ccTLDs). This is achieved by (1) Developing policy recommendations to the Internet Corporation for Assigned Names and Numbers (ICANN) Board, (2) Nurturing consensus across the ccNSO's community, including the name-related activities of ccTLDs; and (3) Coordinating with other ICANN SO's, Committees, or constituencies under ICANN. The ccNSOselects one person to serve on the board. ccTLD – Country Code Top Level Domain. Two letter domains, such as .uk (United Kingdom), .de (Germany) and .jp (Japan) (for example), are called Country Code Top Level Domains (ccTLDs) and correspond to a country, territory, or other geographic location. The rules and policies for registering domain names in the ccTLDs vary significantly and ccTLD registries limit use of the ccTLD to citizens of the corresponding country. Some ICANN-accredited registrars provide registration services in the ccTLDs in addition to registering names in .biz, .com, .info, .name, .net and .org, however, ICANN does not specifically accredit registrars to provide ccTLD registration services. For more information regarding registering names in ccTLDs, including a complete database of designated ccTLDs and managers, please refer to http://www.iana.org/cctld/cctld.htm. / Организация по Поддержке Имён по Коду Страны (ОПИкс ()) находится в процессе формирования; группа содействия ОПИкс подготавливает рекомендации, которые обсуждаются в настоящее время. По завершении этого процесса основной целью ОПИкс станет участие и руководящая роль в деятельности, связанной с национальными доменами верхнего уровня (ccTLD, нДВУ). Это будет осуществляться следующими способами:- (1) разработка рекомендаций по политике для Правления Корпорации Интернета по Распределению Имён и Номеров (КИРИН); (2) формирование общего мнения в сообществе ОПИкс, включая деятельность, связанную с нДВУ; (3) согласование действий с другими организациями поддержки, комитетами или группами КИРИН. ОПИкс выбирает одного директора в состав Правления. ccTLD, нДВУ – Национальный домен верхнего уровня. Домены, состоящие из двух букв, например .uk (Соединённое Королевство), .de (Германия) и .jp (Япония), называются национальными доменами верхнего уровня (ccTLD, нДВУ) и соответствуют стране, территории или другому географическому положению. Правила и политики регистрации доменных имен в нДВУ значительно разнятся, и реестры нДВУ ограничивают использование нДВУ только жителями соответствующей страны. Некоторые аккредитованные КИРИН регистраторы предоставляют услуги регистрации в нДВУ помимо регистрации имен в доменах .biz, .com, .info, .name, .net и .org. Однако КИРИН не осуществляет аккредитацию регистраторов специально для предоставления услуг регистрации в нДВУ. Дополнительную информацию о регистрации имён в нДВУ, включая полную базу данных назначенных имён и управляющих нДВУ, смотрите на странице http://www.iana.org/cctld/cctld.htm.

COUNTRY DAMAGE = ПОВРЕЖДЕНИЕ ВНУТРИ СТРАНЫ – In Cotton industry, Country Damage is the damage or deterioration of the fiber caused by the absorption of excessive moisture, dust or sand from the exterior because it has been:- (i) exposed to the weather; or (ii) stored on wet or contaminated surfaces, prior to loading to containers or the vessel. Country damage does not include:- (i) any internal damage; or (ii) any other contamination; or (iii) any damage which takes place after loading to containers or vessel. Marine term referring to damage to baled or bagged goods, e.g., cotton caused by excessive moisture from damp ground or exposure to weather, or by grit, dust or sand forced into the insured property by windstorm or inclement weather. Country Damage is a damage to cotton caused by moisture, dust or sand affecting bales that have either been exposed to the weather or stored on wet or contaminated ground. Damage to cotton in bales caused by poor methods of bailing, discoloration, etc. This term is used in Marine

Cargo insurance of cotton. Damage to cotton caused by moisture, dust or sand affecting bales that have either been exposed to the weather or stored on wet or contaminated ground. Damage to baled or bagged goods prior to loading on a vessel, caused by the absorption of excessive moisture or deterioration from grit, dust or sand due to inclement weather. / Повреждение хлопка в кипах происходит в результате ненадлежащих методов ответственного хранения, изменения цвета и тому подобного. Этот термин используется в отношении хлопка при Морском Страховании Груза. Повреждения, вызванные увлажнением, запылением или воздействием песка на кипы, которые были либо незащищены от воздействия погодных условий, либо размещены на мокрой или загрязненной поверхности. Повреждения, возникшие в процессе транспортировки хлопка и вызванные, в основном, чрезмерным увлажнением, намоканием или загрязнением хлопка. . , например, . Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

COUNTRY OF EXPORT DESTINATION = СТРАНА КОНЕЧНОГО НАЗНАЧЕНИЯ ВЫВОЗА (или СТРАНА КОНЕЧНОГО НАЗНАЧЕНИЯ ЭКСПОРТА) – Country Of Export Destination is the country of destination for exports is the country where the goods are to be consumed, further processed, or manufactured, as known to the shipper at the time of exportation. If the shipper does not know the country of ultimate destination, the shipment is credited to the last country to which the shipper knows that the merchandise will be shipped in the same form as when exported. / вывоз (exportation).

COUNTRY OF ORIGIN = СТРАНА ПРОИСХОЖДЕНИЯ – (1) Country Of Origin is the country in which the goods have been produced or manufactured, according to certain Customs criteria. Country Of Origin is the country where the merchandise was grown, mined, or manufactured, in accordance with national Customs Regulations. In instances where the country of origin cannot be determined, transactions are credited to the country of shipment. Certain foreign trade reports show country subcodes to indicate special tariff treatment afforded some imported articles. / особый режим тарифов.

(2) Country Of Origin (of a consignment of plants) is a country where the plants were grown.

(3) Country Of Origin (of a consignment of plant products) is a country where the plants from which the plant products are derived were grown.

(4) Country of Origin (of regulated articles other than plants and plant products) is a country where the regulated articles were first exposed to contamination by pests.

COUNTRY OF PROVENANCE = СТРАНА ОТПРАВКИ – Country Of Provenance is the country from which goods or cargo are sent to the importing country. The country from which cargo is shipped to the importing country.

COUNTRY RISK = СТРАНОВОЙ РИСК – Country Risk is a collection of risks associated with investing in a foreign country. These risks include political risk, exchange rate risk, economic risk, sovereign risk and transfer risk, which is the risk of capital being locked up or frozen by government action. Country risk varies from one country to the next. Some countries have high enough risk to discourage much foreign investment. Country risk can reduce the expected return on an investment and must be taken into consideration whenever investing abroad. Some country risk does not have an effective hedge. Other risk, such as exchange rate risk, can be protected against with a marginal loss of profit potential. The United States (US) is generally considered the benchmark for low country risk and most nations can have their risk measured as compared to the US. Country risk is higher with longer term investments and direct investments, which are investments not made through a regulated market or exchange. Country Risk is the risk attached to a borrower by virtue of its location in a particular country. This involves examination of economic, political and geographical factors. Various organizations generate country risk tables. See also Transfer Risk. Investments in countries where political conditions are unstable are exposed to special risks. These can very quickly result in wide price fluctuations. Those risks include, for example, foreign exchange restrictions, transfer risks or standstill agreements. / в широкой флуктуации (колебании) цены. При кредитовании иностранных контрагентов у кредитной организации могут возникать страновой риск и риск неперевода средств. Страновой риск (включая риск неперевода средств) – риск возникновения у кредитной организации убытков в результате неисполнения иностранными контрагентами (юридическими, физическими лицами) обязательств из-за экономических, политических, социальных изменений, а также вследствие того, что валюта денежного обязательства может быть недоступна контрагенту из-за особенностей национального законодательства (независимо от финансового положения самого контрагента).

COUNTRY–SPECIFIC FUND = ФОНД ПО ВЫБРАННОЙ СТРАНЕ – Country-Specific Fund is an investment fund which invests primarily in a specific country. Country-Specific International Stock Mutual Funds are the least geographically diverse of all, as they invest solely in the companies of a single country. As you would expect, these are the most volatile of the international mutual funds. As with the regional funds, these funds tend to be well-diversified across industries. The country-specific funds should be used judiciously to over-wieght certain countries or as a speculative investment with your 'mad money' outside your regular investing portfolio. / Инвестиционный фонд, вкладывающий свои средства главным образом в какую-то конкретную страну.
