ASSIGNMENT = УСТУПКА ТРЕБОВАНИЯ (или ОТЧУЖДЕНИЕ, или ПРЕЕМСТВО) – (1) An Assignment (in Latin:- Cessio) is a term used with similar meanings in the law of contracts and in the law of real estate. In both instances, it encompasses the transfer of rights held by one party – the Assignor – to another party – the Assignee. The details of the assignment determines some additional rights and liabilities (or duties). Typically a third-party is involved in a contract with the assignor, and the contract is in effect transferred to the assignee. For example, a borrower borrows money from a local bank. The local bank receives a mortgage note and can thereafter transfer that note to a financial institution in exchange for a lump-sum of cash, thereby assigning the right to receive payment from the borrower to another entity. Mortgages and lending contracts are relatively amenable to assignment since the lendor's duties are relatively limited; other contracts which involve personal duties such as legal counsel may not be assignable. The related concept of novation is not assignment; rather than assigning only the rights to another party, novation involves the replacement of the original party with a new party or the replacement of the original contract with a new contract. Since novation creates a new contract, it requires the consent of all parties whereas assignment does not require the consent of the nonassigning party, although in the case of assignment the consent of the nonassigning party may be required through a contractual provision. Procedure:- the assignment does not necessarily have to be in writing; however, the assignment agreement must show an intent to transfer rights. The effect of a valid assignment is to extinguish privity (in other words, contractual relationship, including right to sue) between the assignor and the third-party obligor and create privity between the obligor and the assignee. Liabilities and Duties:- unless the contractual agreement states otherwise, the assignee typically does not receive greater rights than the assignor, and the assignor may remain liable to the original counterparty for the performance of the contract. The assignor often delegates duties in addition to rights to the assignee, but the assignor may remain ultimately responsible. However, in the United States there are various laws which limit the liability of the assignee, often in order to facilitate credit, since assignees are typically lenders. Notable examples include a provision in the Truth in Lending Act and provisions in the Consumer Leasing Act and the Home Ownership Equity Protection Act. In other cases, the contract may be a negotiable instrument in which the person receiving the instrument may become a holder in due course, which is similar to an assignee except that issues such as lack of performance by the assignor may not be a valid defense for the obligor. As a response to this, the United States Federal Trade Commission promulgated Rule 433, formally known as the 'Trade Regulation Rule Concerning Preservation of Consumers' Claims and Defenses', which 'effectively abolished the (holder in due course) doctrine in consumer credit transactions'. In 2012, the FTC reaffirmed the regulation. Assignment of Contract Rights:- assignment of rights under a contract is the complete transfer of the rights to receive the benefits accruing to one of the parties to that contract. For example, if Party A contracts with Party B to sell Party A's car to Party B for USD10, Party A can later assign the benefits of the contract, i.e. the right to be paid USD10 – to Party C. In this scenario, Party A is the obligee/assignor, Party B is an obligor, and Party C is the assignee. Such an assignment may be donative (essentially given as a gift), or it may be contractually exchanged for consideration. It is important to note, however, that Party C is not a third party beneficiary, because the contract itself was not made for the purpose of benefitting Party C. When an assignment is made, the assignment always takes place after the original contract was formed. An Assignment only transfers the rights/benefits to a new owner. The obligations remain with the previous owner. Compare Novation. When assignment will be permitted:- the common law favors the freedom of assignment, so an assignment will generally be permitted unless there is an express prohibition against assignment in the contract. Where assignment is thus permitted, the assignor need not consult the other party to the contract. An assignment cannot have any effect on the duties of the other party to the contract, nor can it reduce the possibility of the

other party receiving full performance of the same quality. Certain kinds of performance, therefore, cannot be assigned, because they create a unique relationship between the parties to the contract. For example, the assignment of a legal malpractice claim is void since an assignee would be a stranger to the attorney-client relationship, who was owed no duty by the attorney and would imperil the sanctity of the highly confidential and fiduciary relationship existing between attorney and client. Torts are not assignable as public policy, and various statutes may prohibit assignment in certain instances. In addition, the Restatement (Second) of Contracts lists prohibitions in §317(2)(a) based upon the effect to the nonassigning party (obligor), with similar prohibitions in the Uniform Commercial Code §2-210. For example, UCC 2-210(1)(a) states the following:- '(a) Subject to paragraph (b) and except as otherwise provided in Section 9-406 or as otherwise agreed, all rights of the seller or the buyer may be assigned unless the assignment would materially change the duty of the other party, increase materially the burden or risk imposed on that party by the contract, or impair materially that party's chance of obtaining return performance. A right to damages for breach of the whole contract or a right arising out of the assignor's due performance of its entire obligation may be assigned despite an agreement otherwise'. Requirements for an Effective Assignment:- for assignment to be effective, it must occur in the present. No specific language is required to make such an assignment, but the assignor must make some clear statement of intent to assign clearly identified contractual rights to the assignee. A promise to assign in the future has no legal effect. Although this prevents a party from assigning the benefits of a contract that has not yet been made, a court of equity may enforce such an assignment where an established economic relationship between the assignor and the assignee raised an expectation that the assignee would indeed form the appropriate contract in the future. A contract may contain a non-assignment clause, which prohibits the assignment of specific rights, or of the entire contract, to another. However, such a clause does not necessarily destroy the power of either party to make an assignment. Instead, it merely gives the other party the ability to sue for breach of contract if such an assignment is made. However, an assignment of a contract containing such a clause will be ineffective if the assignee knows of the non-assignment clause, or if the non-assignment clause specifies that 'all assignments are void'. Two other techniques to prevent the assignment of contracts are rescission clauses or clauses creating a condition subsequent. The former would give the other party to the contract the power to rescind the contract if an assignment is made; the latter would rescind the contract automatically in such circumstances. Requirement of a Writing:- there are certain situations in which the assignment must be in writing:- (i) Assignment of wages; additionally, statutes may prohibit this assignment; (ii) Assignment of any interest in real property; (iii) Assignment of choses in action worth over USD5 000; and (iv) Assignment as collateral for a loan or debt. For more information about contractual writing requirements see Statute of frauds. Compare:- Delegation:- a parallel concept to assignment is delegation, which occurs when one party transfers his duties or liabilities under a contract to another. A delegation and an assignment can be accomplished at the same time, although a non-assignment clause may also bar delegation. Remedies:- legal remedies may be available if the nonassigning party's rights are affected by the assignment. Revocability:- assignments made for consideration are irrevocable, meaning that the assignor permanently gives up the legal right to take back the assignment once it has been made. Donative assignments, on the other hand, are generally revocable, either by the assignor giving notice to the assignee, taking performance directly from the obligor, or making a subsequent assignment of the same right to another. There are some exceptions to the revocability of a donative assignment:- (i) the assignment can not be revoked if the obligor has already performed; (ii) the assignment can not be revoked if the assignee has received a token chose (chose being derived from the French word for 'thing', as in a chose of action) – a physical object that signifies a right to collect, such as a stock certificate or the passbook to a savings account; (iii) the assignment can not be revoked if the assignor has set forth in writing the assignment of a simple chose – a contract right embodied in any form of token; and (iv) Estoppel can prevent the revocation of a donative assignment if the assignee changed their position in reliance on the assignment. Finally, the death or declaration of bankruptcy by the assignor will automatically revoke the assignment by operation of law. Breach and Defenses:- a cause of action for breach on the part of the obligor lies with the assignee, who will hold the exclusive right to commence a cause of action for any failure to perform or defective performance. At this stage, because the assignee 'stands in the shoes' of the assignor, the obligor can raise any defense to the contract that the obligor could have raised against the assignor. Furthermore, the obligor can raise against the assignee counterclaims and setoffs that the obligor had against the assignor. For example, suppose that A makes a contract to paint B's house in exchange for USD500. A then assigns the right to receive the USD500 to C, to pay off a debt owed to C. However, A does such a careless job painting the house that B has to pay another painter USD400 to correct A's work. If C sues B to collect the debt, B can raise his counterclaim for the expenses caused by the poor paint job, and can reduce the amount owed to C by that USD400, leaving only USD100 to be collected. When the assignor makes the assignment, he makes with it an implied warranty that the right to assign was not subject to defenses. If the contract had a provision that made the assignment ineffective, the assignee could sue the assignor for breach of this implied warranty. Similarly, the assignee could also sue under this theory if the assignor wrongfully revoked the assignment. Successive Assignments:- occasionally, an unscrupulous assignor will assign exactly the same rights to multiple parties (usually for some consideration). In that case, the rights of the assignee depend on the revocability of the assignment, and on the timing of the assignments relative to certain other actions. In a quirk left over from the common law, if the assignment was donative, the last assignee is the true owner of the rights. However, if the assignment was for consideration, the first assignee to actually collect against the assigned contract is the true owner of the rights. Under the modern American rule, now followed in most US jurisdictions, the first assignor with equity (i.e. the first to have paid for the assignment) will have the strongest claim, while remaining assignees may have other remedies. In some countries, the rights of the respective assignees are determined by the old common law rule in Dearle v Hall. Earlier donative assignees for whom the assignment was revocable (because it had not been made irrevocable by any of the means listed above) have no cause of action whatsoever. Earlier donative assignees for whom the assignment was made irrevocable can bring an action for the tort of conversion, because the assignment was technically their property when it was given to a later assignee. Later assignees for consideration have a cause of action for breaches of the implied warranty discussed above. The passing of beneficial rights from one party to another. Assignment is an act which involves transfer of rights, title, and interest for the purpose of assigning goods by endorsement of the bill of lading. The transfer of a claim by written contract between the creditor (assignor) and the party acquiring the claim (assignee). Also known as Cession. Notice to an option writer that an option holder has exercised the option and that the writer will now be required to deliver (receive) under the terms of the contract. The process by which the seller of an option is notified of the buyer's intention to exercise the rights associated with the option, thereby requiring the seller to take either an opposing short position, in the case of a call, or an opposing long position, in case of a put. Designation by a clearing organization of an option writer who will be required to buy (in the case of a put) or sell (in the case of a call) the underlying futures contract or security when an option has been exercised, especially if it has been exercised early. Term for the formal assignment of a stock, bond, or other transferable property or right. The owner or holder signs the assignment form on the reverse of the instrument, leaving the name of the new owner and the date of transfer blank. Assignment is:- (1) the transfer of an individual's rights or property to another person or business. Essentially, an assignment is the transfer of ownership. An example of an assignment is when a person sells his or her car, thereby transferring the title to another. (2) A notice received by an option writer stating that the option sold has been exercised by the purchaser of the option. When assigned, the option writer has an obligation to complete the requirements of the option contract. If the option was a call (put) option, then the writer would have to sell (buy) the underlying security at the stated strike price. The transfer to another of one's own legal interests or rights. / , от Латинского слова Affirmo, означающее Утверждаю, . Обозначение для надлежащей уступки акции, облигации или иной

передаваемой собственности или права. Владелец или держатель подписывает форму уступки на обороте этого инструмента, указывая имя нового владельца и дату передаточного бланка. Под Уступкой Требования понимается передача кредитором принадлежащего ему права требования другому лицу. Известна также как Цессия (Cession). В гражданском праве под Отчуждением понимается передача имущества в собственность другого лица. Оно является одним из способов осуществления собственником правомочия распоряжения своим имуществом. Различаются возмездное отчуждение (купля-продажа) и безвозмездное отчуждение (дарение).

(2) Assignment is a term commonly used in connection with a bill of lading. It involves the transfer of rights, title and interest in order to assign goods by endorsing the bill of lading.

(3) Assignment is the document making the transfer of a right. The right transferred may be an interest in the subject-matter of insurance, in the contract of insurance, or in policy moneys due to the insured. In insurance, the passing of beneficial rights from one party to another. The passing of beneficial rights from one party to another. A policy or certificate of insurance cannot be assigned after interest has passed, unless an agreement to assign was made, or implied, prior to the passing of interest. An assignee acquires no greater rights than were held by the assignor, and a breach of good faith by the assignor is deemed to be a breach on the part of the assignee. The Institute Time Clauses (Hulls) incorporate a clause which terminates the policy automatically if, amongst other things, the ship changes ownership or management unless the underwriters agree in writing to continue the insurance. This effectively restricts free assignment of a hull time policy. If underwriters do agree to the assignment an endorsement signed by the assignor, showing the date of assignment must be attached to the policy. The assignment is still subject to the restrictions above.

(4) Assignment is a transfer of ownership of a patent application or patent from one entity to another. Record assignments with the United States Patent and Trademark Office (USPTO) Assignment Services Division to maintain clear title to pending patent applications and patents.

(5) Assignment is a transfer of ownership of a trademark application or trademark registration from one entity to another. The USPTO recommends recording assignments with the USPTO Assignment Services Division to maintain clear title to pending trademark applications and registrations. For information on how to record an assignment.

(6) Assignment is a transfer of all or part of the contractual rights and/or obligations to another party.

(7) Especially the transfer of property to be held in trust or to be used for the benefit of creditors.

(8) Assignment is the document by which such an interest or right is transferred.

ASSIGNMENT CREDIT = КРЕДИТ ПОД УСТУПКУ ТРЕБОВАНИЯ (или ПРЕЕМСТВЕННЫЙ КРЕДИТ) – Assignment Credit is a credit granted against the fiduciary assignment (with full rights, not merely a pledge) of one or several receivables to a bank. Lending on the security of accounts receivable.

ASSIGNMENT FOR SECURITY = УСТУПКА ПО ЦЕННОЙ БУМАГЕ – Assignment For Security is a form of loan collateral similar to a guarantee but not expressly regulated by law. Loans can be secured by assigning claims and other rights of the borrower to the lending bank. In addition, a claim the borrower has on a third party can be assigned to the bank through a deed. This deed of assignment is made between the creditor of this claim, known as the Assignor, and the bank or another secured party, known as the Assignee, without the participation of the debtor of the claim. The deed is valid in informal form. In addition to this silent assignment, there is an open assignment in which the third party debtor is informed about the assignment. A distinction is also made between the assignment of individual claims and a blanket or global assignment. While, in the case of a blanket assignment, the borrower assigns different outstanding debts, yet future claims are only deemed to be assigned once these claims have been submitted to the bank, in the case of global assignments, all current and future claims on specific third party debtors are assigned, and thus deemed to be assigned as soon as they arise.

ASSIGNMENT IN BLANK = БЛАНКОВАЯ УСТУПКА (или БЛАНКОВАЯ ПЕРЕУСТУПКА) – Assignment In Blank is a term for the formal assignment of a stock, bond, or other transferable property or right. The owner or holder signs the assignment form on the reverse of the instrument, leaving the name of the new owner and the date of transfer blank. Assigned In Blank:- the common term is signed in blank; a formal assignment of a stock or bond or of other property in which the space for the name of the new owner is left blank. A stock certificate or a registered bond assigned in blank should not be received from a stranger without proper identification and satisfactory evidence of the genuineness of the assignment and attestation. / Документ о передаче права собственности на акцию или именные облигации, в котором оставлено свободное место для внесения впоследствии имени нового владельца. Бланк передачи права на акцию расположен на оборотной стороне сертификата акции или именных облигаций. Сертификаты акций или именные облигации, переуступленные по бланку, становятся инструментом на предъявителя, поскольку право собственности переходит путём простой поставки. Они не должны покупаться у неизвестного лица без должного определения принадлежности и подтверждения подлинности подписи передавшего их лица и свидетелей. Купленный по поручению клиента, но зарегистрированный на имя номинального владельца сертификат передаётся путём заполнения бланка передачи. Бланковая Уступка – передача ценной бумаги, при которой владелец актива не указывает на документе дату сделки и имя нового владельца.

ASSIGNMENT OF DEBT = УСТУПКА ДОЛГА (или ПЕРЕУСТУПКА ДОЛГА) – Assignment of Debt (cession) is a contractual transfer of a claim from one creditor to another. The new creditor (assignee) takes the place of the former creditor (assignor). In banking business, claims are often assigned as a means of securing loans.

ASSIGNMENT OF PROCEEDS = УСТУПКА ПОСТУПЛЕНИЙ (или ПЕРЕУСТУПКА ВЫРУЧКИ) – Assignment of Proceeds is a legal mechanism by which the beneficiary of a letter of credit (L/C) may pledge the proceeds of future drawings to a third party. Assigning proceeds involves giving the letter of credit to a bank, which will hold the L/C until drawn upon, along with irrevocable instructions to the bank to disburse proceeds, when generated, in a specified way, e.g., 'pay 75% of each drawing to XYZ Company'. The bank will acknowledge the assignment to the assignee but has no obligation actually to pay any funds to the assignee unless the L/C is drawn upon by the beneficiary and payment is received from the issuing or confirming bank. An assignment of proceeds is not an assignment or transfer of the letter of credit and the assignee acquires no rights to perform under the L/C in order to generate funds. / , например, .

ASSIGNOR = УСТУПАЮЩИЙ (или ПЕРЕУСТУПАЮЩИЙ, или ОТЧУЖДАЮЩИЙ, или ПРЕДШЕСТВЕННИК) – (1) Assignor is one who assigns his rights to another. The person who transfers title or interest to a third party. Individual who transfers a title, claim, property, interest, or right to another person. Also known as Cedent. / Тот, кто уступает своё право другому. Лицо, которое передаёт своё право владения (титул) или долю третьей стороне. Лицо, которое передаёт своё право владения (титул), требование (претензию), имущество, долю или право другому лицу. Известен также как Цедент (Cedent).

(2) Assignor is the owner of record of a patent application, patent, trademark application or trademark registration who is transferring (assigning) ownership to another entity (assignee).

ASSIMILATES = АССИМИЛЯТЫ – Assimilates:- building blocks of carbohydrates manufactured by the leaves of the rice plant.

ASSIMILATION = АССИМИЛЯЦИЯ (или УСВОЕНИЕ) – Assimilation is:- (1) the utilization of inorganic and organic substances in cell synthesis. (2) Uptake of CO_2 by a leaf or canopy during the day time or plant foods utilized in building up a protoplasm and cell walls of the plant. (3) Computer modeling of the rice crop growth. / Под Ассимиляцией, от Латинского слова Assimilatio, понимаются:- (1) уподобление, слияние, усвоение; (2) в этнографии, слияние одного народа с другим с утратой одним из них своего языка, культуры, национального самосознания. Во многих странах в условиях национального и религиозного воздействия происходит насильственная ассимиляция. В бывшем СССР происходил процесс естественной ассимиляции, когда отдельные малые народы, преодолев экономическую и культурную обособленность, постепенно сливались с более крупными этническими общностями. (3) В лингвистике, уподобление одного звука другому, предшествующему (прогрессивная ассимиляция:- Польское слово Sfora из Swora) или следующему за ним (регрессивная ассимиляция:- Русское слово Свадьба из Сватьба). (4) В биологии, то же, что анаболизм, в более узком смысле – усвоение питательных веществ живыми клетками (фотосинтез, корневая абсорбция и так далее).

ASSOCIATE = АССОЦИАТ (или ЗАВИСИМОЕ ЛИЦО) – Company R is an associate of enterprise N if N, its subsidiaries and its other associated enterprises own not more than 50 per cent of the shareholders' or members' voting power in R and if N and its subsidiaries have a direct investment interest in R. Thus company R is an associate of N if N and its subsidiaries own between 10 and 50 per cent of the shareholders' voting power in R. An Associate is an entity in which the investor has significant influence, but which is neither a subsidiary nor a joint venture of the investor. Significant influence is the power to participate in the financial and operating policy decisions of the investee, but not to control those policies. It is presumed to exist when the investor holds at least 20 per cent of the investee's voting power and not to exist when less than 20 per cent is held; these presumptions may be rebutted if there is clear evidence to the contrary. Also known as Equity Investment in the United States.

ASSOCIATED COMPANY = АССОЦИИРОВАННАЯ КОМПАНИЯ (или ЗАВИСИМАЯ КОМПАНИЯ) – One company may be associated with another company if certain types of arrangements exist between the two bodies. Companies may also be considered to be associated when one company has an equity interest in the other. / Одна компания может быть ассоциирована с другой компанией, если между этими двумя структурами имеются договорённости определённых типов. Компании могут рассматриваться в качестве ассоциированных, когда одна из компаний имеет долю в акционерном капитале другой компании.

ASSOCIATED GAS = ПОПУТНЫЙ ГАЗ – Associated Gas is the natural gas that can be developed for commercial use, and which is found in contact with oil in naturally occurring underground formations. Natural gas associated with oil accumulations, which may be either dissolved in the oil or may form a cap of free gas above the oil. Natural gas present in a crude oil reservoir, either separate from or in solution with the oil. / Природный газ, присутствующий в резервуаре с сырой нефтью, либо в свободной форме, либо растворённый в самой нефти. Углеводородные газы, сопутствующие нефти и выделяющиеся из неё при сепарации.

ASSOCIATED PERSON = АССОЦИИРОВАННОЕ ЛИЦО (или ЗАВИСИМОЕ ЛИЦО) – Associated Person is a person associated with any futures commission merchant, introducing broker, commodity trading advisor, commodity pool operator, or leverage transaction merchant as a partner, officer, employee, consultant, or agent. Also, any person occupying a similar status or performing similar functions, in any capacity that involves:- (i) the solicitation or acceptance of customers' orders, discretionary accounts, or participation in a commodity pool (other than in a clerical capacity); or (ii) the supervision of any person or persons so engaged. Associated Person is an individual who solicits or accepts (other than in a clerical capacity) orders, discretionary accounts, or participation in a commodity pool, or supervises any individual so engaged, customers, or customer funds (or who supervises persons performing such duties) on behalf of a Futures Commission Merchant, an Introducing Broker, a Commodity Trading Adviser, or a Commodity Pool Operator, or an Agricultural Trade Option Merchant, and who is registered with the Commodity Futures Trading Commission under the Commodity Exchange Act. / Категория лиц, ассоциированных с фирмами или иными юридическими лицами, которые должны быть зарегистрированы в соответствии с Актом о Сырьевой Бирже.

ASSOCIATED PETROLEUM GAS = ПОПУТНЫЙ НЕФТЯНОЙ ГАЗ – Associated Petroleum Gas (APG) is a mixture of various gaseous hydrocarbons, dissolved in crude oil, which separate out in the production and refining processes (mainly consist of propane and butane). Associated petroleum gas can be used as a fuel and for production of various chemicals. / Попутный Нефтяной Газ (ПНГ) это смесь различных газообразных углеводородов, растворённых в нефти, которые выделяются в процессе добычи и перегонки. Он состоит, главным образом, из пропана и бутана. Попутный нефтяной газ применяется в качестве топлива и для получения различных химических веществ. К Попутным Нефтяным Газам относятся углеводородные газы (бутан, пропан, этан и другие), растворённые в нефти, сопутствующие нефти и выделяющиеся из неё при сепарации. Они являются ценным сырьём для нефтехимической и химической промышленности.

ASSOCIATED PRESS = ЭСОШИЭЙТИД ПРЭС (или АССОЦИИРОВАННАЯ ПРЕССА) – The Associated Press (AP) is the essential global news network, delivering accurate, insightful news from every corner of the world, 24 hours a day. Since its founding in 1846, AP has been the first to report many of history's most important moments, and every day, AP journalists, photographers and videographers file news from the front lines of the world's biggest stories. AP's reporting, photography, audio and video are published and broadcast by the world's leading newspapers, TV channels, apps, radio stations, websites and magazines – in fact, over half the world's population sees AP news content on any given day. As a leader in the field of journalism, AP fights for freedom of the press and the public's right to know. Its reporters take great risks to file in-depth stories from countries where the press is otherwise restrained, and in the United States, AP aggressively uses the Freedom of Information Act to advocate for transparency and accountability in government. With more experience reporting and delivering news than any other agency, a well-earned reputation for independence and accuracy, and a fierce commitment to the people's right to know, AP is the definitive source for trusted news. AP's History:- the Associated Press has been breaking news since it was created in 1846. That year, five New York City newspapers got together to fund a pony express route through Alabama in order to bring news of the Mexican War north more quickly than the US Post Office could deliver it. In the decades since, AP has been first to tell the world of many of history's most important moments, from the assassination of Abraham Lincoln and the bombing of Pearl Harbor to the fall of the shah of Iran and the death of Pope John Paul. More than 30 AP journalists have given their lives in this pursuit of the news. 'I go with Custer and will be at the death', AP reporter Mark Kellogg wrote before Custer's final stand against the Sioux. And so he was. One reason for AP's longevity has been its ability to adapt quickly to new technologies. When it was founded, words were the only medium of communication. The first private sector organization in the US to operate on a national scale, AP delivered news by pigeon, pony express, railroad, steamship, telegraph and teletype in the early years. In 1935, AP began sending photographs by wire. A radio network was formed in 1973, and an international video division was added in 1994. In 2005, a digital database was created to hold all AP content, which has allowed the agency to deliver news instantly and in every format to the ever expanding online world. Today, AP news moves in digital bits that travel nearly as quickly as the news itself

unfolds, to every platform available, from newspaper to tablets. AP's video division is now the world's leading video news agency. Often called the 'Marine Corps of Journalism' – always first in and last out – AP reports history in urgent installments, always on deadline. AP staff in 280 locations in more than 100 countries deliver breaking news that is seen or read by half the world's population on any given day. It remains a not-for-profit cooperative, owned by 1 500 US newspapers, which are both its customers and its members. A Board of Directors comprised of publishers, editors, and broadcast and radio executives oversee the cooperative. In 2003, AP moved from its long-time headquarters at Rockefeller Center to its current global headquarters, on the West Side of Manhattan, where it could integrate its all-format news department in one space. In the process of that move, AP established a Corporate Archives, which has since been carefully documenting the story of AP from its beginnings. In old AP periodicals we discovered the story of correspondent Frank Martin's 13-day hike from Ledo, China in 1944 to link up with Gen. 'Vinegar Joe' Stillwell's forces in Burma. The road was strewn with the skeletons of 30 000 refugees, Martin noted. At one point he encountered a tribe of Naga headhunters singing 'Old MacDonald Had a Farm, E-I-E-I-O'. The tribe had been taught the song by a missionary, after which they cut off his head. On occasion, the findings have been flattering. During the Civil Rights era, newspaper editors concerned that AP reporting of racial tensions might upset their readers pressured AP to identify blacks as 'Negroes'. Other historical findings reinforced AP's remarkable role as eyewitness to history, such as when AP correspondent Joseph I. Gilbert borrowed President Lincoln's handwritten text of the Gettysburg Address so he could copy it. Gilbert's account of Lincoln's speech stands as the most accurate version of what Lincoln said that day. Even in this digital age, AP remains the definitive source for reliable news across the globe. While the company has gone from distributing news via pony express to instantaneous digital transmission, its news values and mission remain the same. 'The people of the AP are part of the fabric of freedom', said former board chairman Frank Batten. 'They are the honest messengers, mostly anonymous, far from the limelight, often at risk and always committed to getting out the news as thoroughly and as accurately as possible'. About the AP Corporate Archives:- the AP Corporate Archives is the official repository for all records of enduring historical value created by AP, regardless of format. The records span the years 1848 to the present and are organized into 40 record groups totaling 2 000 linear feet. They include personal papers, organization, editorial and governance records, wire copy, photographs, recordings, artifacts, oral histories, film, video and rare books. Headquartered in New York, State of New York, the United States of America. The Associated Press (AP) is an American multinational nonprofit news agency headquartered in New York City. The AP is owned by its contributing newspapers, radio, and television stations in the United States, all of which contribute stories to the AP and use material written by its staff journalists. The AP staff is represented by the Newspaper Guild union, which operates under the Communication Workers union, which operates under the The American Federation of Labor and Congress of Industrial Organizations (AFL–CIO; national trade union center). As of 2005, the news collected by the AP was published and republished by more than 1 700 newspapers, in addition to more than 5 000 television and radio broadcasters. The photograph library of the AP consists of over 10 million images. The Associated Press operates 243 news bureaus and it serves at least 120 countries, with an international staff located worldwide. Associated Press also operates The Associated Press Radio Network, which provides newscasts twice hourly for broadcast and satellite radio and television stations. The AP Radio also offers news and public affairs features, feeds of news sound bites, and long form coverage of major events. Many newspapers and broadcasters outside the United States are AP subscribers, paying a fee to use AP material without being contributing members of the cooperative. As part of their cooperative agreement with The Associated Press, most member news organizations grant automatic permission for the AP to distribute their local news reports. For example, on page two of every edition of The Washington Post, the newspaper's masthead includes the statement, 'The Associated Press is entitled exclusively to use for re-publication of all news dispatches credited to it or not otherwise credited in this paper and all local news of spontaneous origin published herein'. The AP employs the 'inverted pyramid formula' for writing that enables the news outlets to edit a story to fit its available publication area without losing the story's essential meaning and news information. Cutbacks at longtime US rival United Press International, most significantly in 1993, left the AP as the primary nationally oriented news service based in the United States, although UPI still produces and distributes news stories and photos daily. Other English-language news services, such as Reuters and the English-language service of Agence France-Presse, are based outside the United States. History:- Associated Press is a not-for-profit news cooperative formed in the spring (May) of 1846 by five daily newspapers in New York City to share the cost of transmitting news of the Mexican-American War by boat, horse express and telegraph. The venture was organized by Moses Yale Beach (1800–68), second publisher of the New York Sun, and agreed to by the Herald, the Courier and Enquirer, the Journal of Commerce and the Express. Some historians believe that the Tribune joined at this time; documents show it was a member in 1849. The New York Times became a member shortly after its founding in September 1851. Initially known as the New York Associated Press (NYAP), the organization faced competition from the Western Associated Press (1862), which criticized it for monopolistic practices in gathering news and setting prices. An investigation completed in 1892 by Victor Lawson, editor and publisher of the Chicago Daily News, revealed that several principals of the NYAP had entered into a secret agreement with United Press, a rival organization, to share NYAP news and the profits of reselling it. The revelations led to the demise of the NYAP and in December 1892, the Western Associated Press was incorporated in Illinois as the Associated Press. An Illinois Supreme Court decision (Inter Ocean Publishing Co. v. Associated Press) in 1900 – that the AP was a public utility and operating in restraint of trade – resulted in AP's move from Chicago to New York City, where corporation laws were more favorable to cooperatives. When the Associated Press was founded, news became a salable commodity. The invention of the rotary press allowed the New York Tribune in the 1870s to publish 18 000 papers per hour. During the Civil War and Spanish-American War, there was a new incentive to print vivid, on-the-spot reporting. Melville Stone, who had founded the Chicago Daily News in 1875, served as AP General Manager from 1893 to 1921. He embraced the standards of accuracy, impartiality, and integrity. The cooperative grew rapidly under the leadership of Kent Cooper (served 1925–48), who built up bureau staff in South America, Europe and (after World War II), the Middle East. He introduced the 'telegraph typewriter' or teletypewriter into newsrooms in 1914. In 1935, AP launched the Wirephoto network, which allowed transmission of news photographs over leased private telephone lines on the day they were taken. This gave AP a major advantage over other news media outlets. While the first network was only between New York, Chicago and San Francisco, eventually AP had its network across the whole United States. In 1945, the Supreme Court of the United States held in Associated Press v. United States that AP had been violating the Sherman Antitrust Act by prohibiting member newspapers from selling or providing news to nonmember organizations as well as making it very difficult for nonmember newspapers to join the AP. The decision facilitated the growth of its main rival United Press International, headed in 1935–55 by Hugh Baillie. AP entered the broadcast field in 1941 when it began distributing news to radio stations; it created its own radio network in 1974. In 1994, it established APTV, a global video newsgathering agency. APTV merged with WorldWide Television News in 1998 to form APTN, which provides video to international broadcasters and websites. In 2004, AP moved its world headquarters from its longtime home at 50 Rockefeller Plaza to a huge building at 450 West 33rd Street in Manhattan – which also houses the New York Daily News and the studios of New York's public television station, WNET (channel 13, also referred to as Thirteen, is a non-commercial educational, public television station licensed to Newark, New Jersey, USA). In 2009, AP had more than 240 bureaus globally. Its mission – 'to gather with economy and efficiency an accurate and impartial report of the news' – has not changed since its founding, but digital technology has made the distribution of the AP news report an interactive endeavor between AP and its 1 400 US newspaper members as well as broadcasters, international subscribers and online customers. The Associated Press began diversifying its news gathering capabilities and by 2007 AP was

generating only about 30% of its revenue from United States newspapers. 37% came from the global broadcast customers, 15% from online ventures and 18% came from international newspapers and from photography. Web Resource:- the AP's multi-topic structure has resulted in web portals such as Yahoo! and MSN posting its articles, often relying on AP as their first source for news coverage of breaking news items. This and the constant updating evolving stories require has had a major impact on the AP's public image and role, giving new credence to the AP's ongoing mission of having staff for covering every area of news fully and promptly. The AP is also the news service used on the Wii's News Channel (Wii (/wi:/) is a home video game console released by Nintendo on November 19, 2006). In 2007 Google announced it was paying for Associated Press content displayed in Google News. In late 2009 Google stopped displaying or hosting AP content on its news website due to a dispute over their licensing agreement. In mid 2010 Google announced an extension of this agreement has been agreed, allowing AP content to appear again. / Рокэфэлё (Rockefeller). Зэ Эсошиэйтид Прэс (Эй.Пи.) (The Associated Press (AP)). Ройтас (Reuters).

ASSOCIATE MEMBERSHIP = АССОЦИИРОВАННОЕ ЧЛЕНСТВО – Associate Membership is a Chicago Board of Trade (CBOT®) membership that allows an individual to trade financial instrument futures and other designated markets. / К Ассоциированному Членству в биржевой торговле относится, например, членство в Чикагской Палате Торговли (Чикагском Табло Торговли, если быть более точными; СИБАТ® (CBOT®)), позволяющее данному лицу торговать фьючерсами на финансовые инструменты или на других обозначенных рынках.

ASSOCIATES = АССОЦИАТЫ (или ЗАВИСИМЫЕ ЛИЦА) – Associates:- long-term equity investments accounted for by the equity method.

ASSOCIATION DES CONSTRUCTEURS EUROPÉENS D'AUTOMOBILES = АССОЦИАЦИЯ ЕВРОПЕЙСКИХ ИЗГОТОВИТЕЛЕЙ АВТОМОБИЛЕЙ (или АСОСЬЯСЬЁ ДЭ КОСТРЮКТЭР ЭРОПЕЭНН Д'ОТОМОБИЛЬ) – Association des Constructeurs Européens D'Automobiles (ACEA) represents Europe's car, van, truck and bus manufacturers. The European Automobile Manufacturers' Association (ACEA) represents the 15 Europe-based car, van, truck and bus makers. ACEA works with a variety of institutional, non-governmental, research and civil society partners – as well as with a number of industry associations with related interests. ACEA has permanent cooperation with the European Council for Automotive R&D (EUCAR), which is the industry body for collaborative research and development. ACEA has close relations with the 29 national automobile manufacturers' associations in Europe, and maintains a dialogue on international issues with automobile associations around the world. ACEA is an advocate for the automobile industry in Europe, representing manufacturers of passenger cars, vans, trucks and buses with production sites in the EU. ACEA's mission is to:- (i) Define and advocate the common interests, policies and positions of the European automobile industry; (ii) Engage in dialogue with the European institutions and other stakeholders in order to advance understanding of industry-related issues, and to contribute to effective policy and legislation at both European and global levels; (iii) Act as a portal for expert knowledge on vehicle-related regulation; (iv) Communicate the role and importance of the industry, using reliable data and information; (v) Monitor activities that affect the automobile industry, cooperating with the other stakeholders involved; and (vi) Undertake strategic reflection on the increasingly global challenges of mobility, sustainability and competitiveness. The automotive industry is one of the most regulated sectors in Europe. This regulatory framework consists of around 80 EU Directives and over 70 international UNECE regulatory agreements, mostly covering technical issues and standardization. Through its member companies, ACEA taps into a wealth of technical, regulatory and practical expertise in the following priority fields:- (i) Competitiveness, Market and Economy; (ii) Environment and Sustainability; (iii) International Trade; (iv) Research and Innovation; (v) Safety; and (vi) Transport Policy. The ACEA office is located in Brussels, Belgium. See also European Automobile Manufacturers Association. European Automobile Manufacturers' Association (ACEA) represents the 14 Europe-based car, van, truck and bus manufacturers: BMW Group, DAF Trucks, Daimler, Fiat Chrysler Automobiles, Ford of Europe, Hyundai Motor Europe, Iveco, Jaguar Land Rover, PSA Group, Renault Group, Toyota Motor Europe, Volkswagen Group, Volvo Cars, and Volvo Group. European Automobile Manufacturers Association or Association des Constructeurs Europeens D'Automobiles (ACEA):- represents Europe's car, van, truck and bus manufacturers, and works with a variety of institutional, non-governmental, research and civil society partners – as well as with a number of industry associations to ensure the economic environmental and social sustainability of the automobile industry. Who We Are:- ACEA represents Europe's car, van, truck and bus manufacturers. The European Automobile Manufacturers' Association (ACEA) represents the 15 Europe-based car, van, truck and bus makers. ACEA works with a variety of institutional, non-governmental, research and civil society partners – as well as with a number of industry associations with related interests. ACEA has permanent cooperation with the European Council for Automotive R&D (EUCAR), which is the industry body for collaborative research and development. ACEA has close relations with the 29 national automobile manufacturers' associations in Europe, and maintains a dialogue on international issues with automobile associations around the world. What We Do:- ACEA is an advocate for the automobile industry in Europe, representing manufacturers of passenger cars, vans, trucks and buses with production sites in the EU. ACEA's mission is to:- (i) define and advocate the common interests, policies and positions of the European automobile industry; (ii) engage in dialogue with the European institutions and other stakeholders in order to advance understanding of industry-related issues, and to contribute to effective policy and legislation at both European and global levels; (iii) act as a portal for expert knowledge on vehicle-related regulation; (iv) communicate the role and importance of the industry, using reliable data and information; (v) monitor activities that affect the automobile industry, cooperating with the other stakeholders involved; and (vi) undertake strategic reflection on the increasingly global challenges of mobility, sustainability and competitiveness. The automotive industry is one of the most regulated sectors in Europe. This regulatory framework consists of around 80 EU Directives and over 70 international UNECE (short for the United Nations Economic Commission for Europe organized in 1947) regulatory agreements, mostly covering technical issues and standardisation. Through its member companies, ACEA taps into a wealth of technical, regulatory and practical expertise in the following priority fields:- (i) Competitiveness, Market and Economy; (ii) Environment and Sustainability; (iii) International Trade; (iv) Research and Innovation; (v) Safety; and (vi) Transport Policy. Headquartered in Brussels, Belgium. / Ассоциация Европейских Изготовителей Автомобилей (АЕИА). ASSOCIATION OF AMERICAN RAILROADS = АССОЦИАЦИЯ АМЕРИКАНСКИХ ЖЕЛЕЗНЫХ ДОРОГ – The Association of American Railroads (AAR):- America's freight railroads operate the safest, cleanest, most efficient and most environmentally sound rail system in the world – and at the Association of American Railroads we're committed to keeping it that way. AAR members include the major freight railroads in the United States, Canada and Mexico, as well as Amtrak. Our membership organization oversees a 140 000-mile rail network and sets new standards for innovation, safety and technology. Our mission is to work with elected officials and leaders in Washington, DC on critical rail transportation issues to ensure that the railroads meet America's transportation needs today and in the future. The AAR is the standard setting organization for North America's railroads. The primary focus is the interoperability of rolling stock, including locomotives, and their components. Our subsidiaries, Transportation Technology Center (TTCI) is the world's leading research, development and testing facility that develops next-generation advancements in safety and operation efficiency. Railinc Corporation, AAR's information technology hub, uses one of the world's largest data networks to help customers track shipments. The AAR's Railroad Research Foundation (RRF) manages many of the government's rail research programs in the safety and security, communications and train control areas as well as infrastructure improvement programs. Freight railroads meet our nation's transportation needs today and will have an even more positive impact in the future. AAR members are committed to continuing to provide the affordable, efficient transportation our customers depend on. Railroads are environmentally sensitive, energy efficient, and work tirelessly to build and expand our economy. Anything less is unacceptable because America's future depends on us. Headquartered in Washington, DC, the US. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ASSOCIATION OF OFFICIAL AGRICULTURAL CHEMISTS = АССОЦИАЦИЯ ЭКСПЕРТОВ В ОБЛАСТИ ХИМИИ СЕЛЬСКОГО ХОЗЯЙСТВА – The Association of Official Agricultural Chemists (AOAC) was founded in 1884 as the Association of Official Agricultural Chemists, under the auspices of the US Department of Agriculture (USDA), to adopt uniform methods of analysis for fertilizers. In 1885, a Convention establishing AOAC as an independent organization was held in Philadelphia, Pennsylvania, USA. Its membership was restricted to analytical chemists in state and federal government positions only – a membership requirement that remained for nearly 100 years. The early years of AOAC were strongly influenced by Dr. Harvey W. Wiley, a founder of the Association who served as President and Secretary. In 1885, Dr. Wiley oversaw the publication of the AOAC Methods of Analysis, a 49-page bulletin of methods for analysis of fertilizers and precursor to the Official Methods of Analysis (OMA). By 1887, the publication had grown to include methods for feeds and dairy products as well as fertilizers. Dr. Wiley's interest and concern for the adulteration of foods and drugs led to the study and adoption of official methods for foods in 1889. His research, and that of other AOAC volunteers, led directly to the passage of the 1906 Federal Pure Food and Drug Act. By 1912, AOAC was publishing the Official and Provisional Methods of Analysis of the AOAC. When the US Food and Drug Administration (FDA) was established as a separate agency from the USDA in 1927, sponsorship of the Association passed to FDA, which was now responsible for regulatory activities and because AOAC methods are so important to regulatory work. The 1950s were an exciting era of rapid expansion for AOAC. New food legislation was passed and the need for new methods and techniques for regulatory purposes spurred rapid expansion of government laboratory facilities and participation in AOAC. As in the 1890s, AOAC was in the forefront of methods development and validation, and it was during this period that AOAC established itself as a recognized leader in the process of evaluating analytical methods. In 1965, to recognize the expansion of AOAC's scope of interest beyond agricultural topics, the Association's name was changed to the Association of Official Analytical Chemists. The Association also began looking toward independence from the FDA. With funding secured from federal, state, and industry sources, AOAC became a truly independent organization in 1979. The 1970s also brought about provisions for membership by scientists from outside the United States. Another significant change was the increased participation and acceptance of non-official (non-government) scientists. Although non-government scientists had always been allowed and encouraged to participate in collaborative studies and to hold methods development positions, it was 1987 before full voting membership was extended to industry scientists. Today, over 60% of AOAC International members are working in industry laboratories. In 1980, the formation of geographically defined chapters, called Sections, was approved. AOAC's first Sections were established in North America, beginning with the Pacific Northwest Section in 1981. The Sections program expanded internationally with the founding of the Europe Section in 1989. By 1991, the Association had long ceased to be limited to regulatory (Official) analytical chemists in the United States. During the 1980s and 1990s, the attention of the analytical community – particularly the segment focused on foods – had changed dramatically from chemical to microbiological food contaminants. Additionally, as a result of expansion of international trade, there was increasing demand for quality control of laboratories and international laboratory accreditation. Consequently, in that year, the name of the Association was changed to AOAC International. The new name retained the initials by which the Association had been known for over 100 years, while eliminating reference to a specific scientific discipline or profession, and reflecting the expanding international membership and focus of AOAC as the 'Association of Analytical Communities'. To attain the vision of 'worldwide confidence in analytical results', AOAC serves the communities of analytical sciences by providing the tools and processes necessary for community stakeholders to collaborate and, through consensus building, develop fit-for-purpose methods and services for ensuring quality measurements. This is AOAC's mission. Leveraging the knowledge, experience, and expertise of more than 3 000 members with one-third of its members outside the United States, AOAC has developed a proven model to achieve its mission and vision and bring value to the analytical communities that it serves. What do we mean by an AOAC community? An AOAC community is a group of analytical scientists in a specific area who share AOAC's vision of worldwide confidence in analytical results and who are brought together by a leader or 'champion' to do together what they cannot do alone. Representatives of a community include scientific experts from various government agencies, industry, trade associations, international organizations, and academia. Stakeholders of a community work through consensus to prioritize methods needs, establish performance criteria for the methodology, and drive the development and validation of the best and most needed methods. The validation is conducted according to established and internationally recognized AOAC validation guidelines. This fact and recognition brings tremendous value to those who come to AOAC to validate methods. With over 120 years of methods validation experience, we know how to do validation and have the ability to facilitate the development and approval of methods that promote trust and confidence in analytical results, thereby facilitating and promoting interstate and international trade, public trust in manufacturers' products, and public safety and security. Because confidence in analytical results also depends on other complementary tools, the community may opt to have AOAC qualify the laboratories doing the analyses, train the analysts, and provide proficiency testing samples. Under the auspices of AOAC International, communities engage in open communication and decision-making based on consensus, sharing resources both financial and expertise, and preventing duplication of efforts. The result:- Only those methods that are of utmost importance to the communities are adopted. The methods that result from the communities' work are accepted internationally and are used by regulatory and industry scientists alike for many purposes, including public health and safety, regulation, trade, monitoring, and

quality control. AOAC has a number of communities in various stages of development, including food safety and security, agricultural materials, marine and freshwater toxins, dietary supplements, food allergens, disinfectants, and biological threat agents. Our legal name since 1992 is AOAC International. In 1884 the organization was established as the Association of Offical Agricultural Chemists, our heritage. Later on, the name changed to the Association of Offical Analytical Chemists, a reflection of our membership. Subsequently, the membership changed to include microbiologists, food science personnel as well as chemists. We also became an organization of international influence and membership, so, it was decided to change to the current legal name ... AOAC International. You will see a 'tag line' used frequently ... The Association of Analytical Communities. This is merely a statement to encompass all the scientific disciplines involved in doing the work of the Association, not a legal name. As the 'Association of Analytical Communities', AOAC International is committed to being a proactive, worldwide provider and facilitator in the development, use, and harmonization of validated analytical methods and laboratory quality assurance programs and services. AOAC also serves as the primary resource for timely knowledge exchange, networking, and high-quality laboratory information for its members and customers. To meet these goals, AOAC has two methods validation programs, the AOAC® Official Methods℠ Program® and the AOAC® Performance Tested Methods℠ Program. AOAC is focusing very closely on streamlining its methods review process and providing new methods in areas of increasing international interest, including dietary supplements, genetically modified organisms (GMOs), and biological threat agents such as Bacillus Anthracis. International laboratory accreditation as a requirement for participation in the global marketplace has given AOAC International an opportunity to undertake a leadership role in developing criteria for laboratory accreditation. Members of the AOAC Laboratory Accreditation Criteria Committee (ALACC) have provided laboratory managers with the guidance they need to meet ISO 17025 requirements. The AOAC® Laboratory Proficiency Testing℠ Program is also playing a key role by providing laboratories with a means for proving the accuracy and reliability of their test results to both their customers and accrediting bodies. Laboratories must depend on the results from a proficiency-testing program to maintain their business. The AOAC® Laboratory Proficiency Testing℠ Program has earned the confidence of its customers by being among the first accredited proficiency testing programs. The program is the only one of its kind in the United States. AOAC also provides a number of key publications, hosts technical meetings and conferences, and offers training courses in the areas of laboratory management, quality assurance, accreditation, statistics, and measurement uncertainty. Publications include the Journal of AOAC International, a scientific, bimonthly online and print publication containing peer-reviewed articles; Inside Laboratory Management, a bimonthly magazine, which keeps members up-to-date with the latest association news and highlights of activities related to AOAC analytical communities and contract efforts; and the Official Methods of Analysis of AOAC International (OMA), the compendium of methods adopted by AOAC International, which contains over 3 000 methods, is distributed throughout the world, and is considered the most authoritative volume in its field. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ASSOCIATION OF OIL PIPE LINES = АССОЦИАЦИЯ НЕФТЕПРОВОДОВ (или АССОЦИАЦИЯ ЛИНИЙ ПРОКАЧКИ НЕФТИ) – The Association of Oil Pipe Lines (AOPL) represents the interests of owners and operators of America's liquid pipelines. Liquid pipelines bring crude oil to the nation's refineries and important petroleum products to our communities, including all grades of gasoline, diesel, jet fuel, home heating oil, kerosene, propane, and biofuels. AOPL members also transport carbon dioxide to oil and natural gas fields, where it can be used efficiently to enhance production. As a trade association, AOPL:- (i) represents common carrier crude and petroleum product pipelines, as well as carbon dioxide pipelines, before Congress, regulatory agencies, and the courts; (ii) provides coordination and leadership on key industry issues, including pipeline rates and services, pipeline safety initiatives, pipeline security, and the industry's Environmental and Safety Initiative; and (iii) acts as an information clearinghouse for the public, media, and pipeline industry regarding liquid pipeline issues. AOPL represents the liquid pipeline industry in multiple capacities. AOPL monitors proceedings and keeps its members informed on developments of interest regarding the legislative, regulatory, and judicial bodies of the states and of the United States. Its primary focus is the Federal Energy Regulatory Commission (FERC), the Congress, the Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA), and the Department of Homeland Security (DHS). Association staff engages regularly with key legislative and regulatory officials and staff, coordinates advocacy before these bodies, and facilitates member company meetings with these officials. Additionally, AOPL testifies before Congressional committees and submits public comments on behalf of its members. The Association also represents its members' interests in administrative and judicial proceedings affecting the industry, most particularly before the FERC, PHMSA, DHS and the US Courts of Appeals. AOPL has also served as a reliable point of contact for government during natural disasters like hurricanes. Liquid pipelines play a vital transportation role in the economy of the United States, its commerce, and its national defense. AOPL helps educate policymakers, the press, and the general public about the industry. AOPL provides a venue for members to exchange ideas and discuss methods to improve transportation services offered by pipelines, thus better serving the public, economic, and national defense interests of the United States. AOPL also offers a forum where members can discuss and seek solutions to industry problems, such as methods to improve safety, the environment, security, and other matters of industry and public interest. The Association conducts a number of events, including conferences for member company leaders and educational and training workshops for member company staff. There is ongoing work in committees regarding Government Relations, FERC Relations, Legal, Tariff, and Accounting issues, and industry work groups addressing other topical issues. In 1998, the US liquid pipeline industry launched a joint Environmental and Safety Initiative (ESI) under the auspices of AOPL and the American Petroleum Institute's (API) Pipeline Committee. The purpose of the initiative is to make further improvements in spill and accident prevention. The ESI provides a mechanism for leadership of AOPL and the API Pipeline Committee to address priority issues that impact pipeline safety and environmental performance. A key feature of the ESI is the Performance Excellence Team (PET), which seeks to promote inter-company learning to improve pipeline safety and spill performance and provide methods and opportunities for information sharing. PET has supported PHMSA's initiatives to gather more data on its Accident Report Form and provide detailed, constructive, and practical responses on regulatory proposals and operations issues. The PET strives to effect changes that will continue to improve industry performance. The PET's Data Mining Team manages a Pipeline Performance Tracking System (PPTS) which compiles information on the industry's safety record so industry and regulators will have a benchmark by which they can measure future performance. Using the PPTS, PET develops lessons from historical data, provides a 'state of the industry' pipeline spill performance update, and benchmarks participating company performance against the industry as a whole. Headquartered in Washington, DC, the United States. Established in 1947, AOPL is a nonprofit organization whose membership is comprised of owners and operators of liquid pipelines. AOPL members carry nearly 85% of the crude oil and refined petroleum products moved by pipelines in the United States. America depends on the network of more than 168 000 miles of liquid pipelines to safely and efficiently move energy and raw materials to fuel our nation's economic engine. Pipelines are a vital part of our country's infrastructure and have been quietly serving the nation for decades. Our transportation system – cars, delivery trucks, airplanes, trains, and more – could not run without pipelines transporting fuel from producing areas to refineries, and from refineries to distribution points. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products and other energy liquids and chemicals throughout the United States.

ASSOCIATION OF SOUTHEAST ASIAN NATIONS = АССОЦИАЦИЯ НАЦИЙ ЮГО–ВОСТОЧНОЙ АЗИИ (или АССОЦИАЦИЯ ГОСУДАРСТВ ЮГО–ВОСТОЧНОЙ АЗИИ) – ASEAN was established in 1967 to promote political, economic and social cooperation

among its six member countries:- Indonesia, Malaysia, Philippines, Singapore, Thailand and Brunei. The Association of Southeast Asian Nations or ASEAN was established on 1967-August-08 in Bangkok by the five original Member Countries, namely, Indonesia, Malaysia, Philippines, Singapore, and Thailand. Brunei Darussalam joined on 1984-January-08, Vietnam on 1995-July-28, Lao PDR and Myanmar on 1997-July-23, and Cambodia on 1999-April-30. The ASEAN Declaration states that the aims and purposes of the Association are:- (i) to accelerate economic growth, social progress and cultural development in the region; and (ii) to promote regional peace and stability through abiding respect for justice and the rule of law in the relationship among countries in the region and adherence to the principles of the United Nations Charter. 2007 member countries:- Brunei Darussalam, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam. A loose economic and geopolitical affiliation that includes Singapore, Brunei, Malaysia, Thailand, the Philippines, Indonesia, and Vietnam. Future members are likely to include Burma, Laos, and Cambodia. The Association of Southeast Asian Nations (ASEAN) is a political, economic, and cultural organization of countries located in Southeast Asia. Founded in 1967, its aim is to foster cooperation and mutual assistance among members. The countries meet annually every November in summits. Association of Southeast Asian Nations:- an association of nations dedicated to economic and political cooperation in southeastern Asia and who joined with the United States to fight against global terrorism. Is the trading bloc which encompasses many countries located in the Far East. Formed in 1967 with the intention of building trade and other links among its six members:- Brunei, Indonesia, Malaysia, the Philippines, Singapore and Thailand. Association of Southeast Asian Nations. Eight ASEAN members are members of the WTO – Brunei, Cambodia, Indonesia, Malaysia, Myanmar, the Philippines, Singapore and Thailand. The other ASEAN members – Laos and Vietnam – are negotiating WTO membership. / Ассоциация Государств Юго-Восточной Азии (АГЮВА; Association of Southeast Asian Nations (ASEAN)) была основана в 1967 с целью экономического, социального, культурного и политического сотрудничества. В первоначальный состав вошли:- Индонезия, Малайзия, Сингапур, Таиланд и Филиппины. В 1984 в состав ассоциации был принят Бруней.

ASSOCIATION TECHNIQUE DE L'INDUSTRIE EUROPÉENNE DES LUBRIFIANTS = АСОСЬЯСЬЁ ТЭКНИКЬ ДЁ ЛЯ'ДУСТРИ ЭРОПЕЭНН ДЭ ЛЮБРИФЬЁ (или ТЕХНИЧЕСКАЯ АССОЦИАЦИЯ ЕВРОПЕЙСКОЙ ОТРАСЛИ СМАЗОЧНЫХ МАТЕРИАЛОВ) – Association Technique de l'Industrie Européenne des Lubrifiants (ATIEL) or Technical Association of the European Lubricant Industry represents manufacturers and marketers in the European lubricants industry. It seeks to enhance the reputation of the lubricants industry by providing expert advice to regulators, industry partners and end-consumers and promoting superior standards of technology and lubricants performanc. ATIEL is a European Economic Interest Grouping (EEIG) representing the combined knowledge and experience of leading European and international engine oil manufacturers and marketers. Its collective expertise in engine lubricants technology has helped establish best practices and quality standards for both vehicle manufacturers and consumers. By drawing on the technical know-how of its membership, it promotes consensus on key technical issues, ensuring that engine oils continue to contribute to improved wear protection, deposit control, lower emissions and fuel economy. Our Mission Statement:- (i) To be recognised as Europe's leading authority on the technical, social responsibility and legislative aspects of lubricants; and (ii) To engage and be influential with all relevant stakeholders. Aims:- Promote the dialogue on technical concerns and issues reflected in regulations, specifications and relevant self-imposed codes, between its members and the automotive manufacturing industries and their professional bodies, and relevant administrative bodies; monitor technical issues concerning product performance needs and environmental legislation; develop, coordinate and adopt common positions of its members; inform relevant bodies. Structure:- General Meeting; Executive Committee; Technical Council; Technical Committees. The ATIEL membership encompasses the majority of leading European oil companies plus international lubricant companies with an official European presence, representing extensive experience in the manufacture and marketing of engine oils. Membership entitles a company or organisation to representation at the General Assembly and on the key ATIEL Committees and participation in its Special Task Forces. Founded in 1976. Headquartered in Brussels, Belgium. ATIEL represents the combined knowledge and experience of Europe's leading engine oil manufacturers. It promotes cross-industry dialogue on automotive lubricant technical issues and develops credible strategies in response to the changing demands of engine technology. With its combined expertise in lubricants technology ATIEL has established industry best practices and quality standards that address the technical needs of Original Equipment Manufacturers (OEMs) and consumers. By providing data and expertise it supports industry partners in the development of appropriate lubricant specifications and test procedures. It monitors current and future technical issues, regulatory programmes and market trends to facilitate scientifically sound responses and enable the European oil industry to react to market needs. Through its global member companies ATIEL helps to promote European standards around the world. International links with organisations such as the American Petroleum Institute also provide a forum for joint cooperation on global issues and developments. ATIEL's membership encompasses all of the major European oil companies. It brings together a diverse range of manufacturers and marketers with long experience and expertise in engine oil development. Current membership represents the interests of the following:- BP Castrol, CEPSA Lubricantes SA, Chevron, Eni, ExxonMobil, Fuchs, GALP, Kuwait Petroleum (Q8), Lotos Oil, LUKOIL, Neste Oil, ORLEN OIL, PETRONAS, REPSOL, Shell, SK Lubricants, Statoil Lubricants, Total, UEIL (Union Indépendante de l'Industrie Européenne des Lubrifiants), Valvoline. ATIEL is registered in Brussels as a European Economic Interest Group (EEIG), and is a non-commercial, non-profit making, non-political organisation. ATIEL acts as a European focal point for technical issues relating to the performance and environmental demands of engine oils. Its objective is to ensure that lubricant development is aligned to the requirements of European engine technology. By drawing on the extensive technical know-how of its membership it establishes industry consensus on key technical issues. This provides valuable input to OEM development programmes and supports cohesive responses to changes in legislation, lubricant specification and hardware design. ATIEL promotes interaction between European automotive technical bodies including ACEA (vehicle manufacturers), CEC (engine test development) and ATC (additive manufacturers). Its technical working groups address critical issues including exhaust emissions, fuel economy, oil drain intervals, chemical composition, base oil substitution, biofuels and used oil management. This work is key to the development of robust specifications that ensure engine oils continue to contribute to improved engine wear protection and deposit control, lower emissions and fuel economy. ATIEL has established working groups to address specific technical issues and maintain ongoing liaison with technical and engineering consultants, partner industry associations and OEMs. Through proactive engagement these working groups develop and promote better understanding of how future regulatory trends, engine design changes and the needs of emerging markets impact the supply of appropriate lubricants. Their work plays a valuable role in discussions with OEMs about changes to engine oil specifications. For example, ATIEL working groups have addressed issues around the future availability of base oils for Low SAPS (sulphated ash, phosphorus and sulphur) lubricants, engine technology trends, the application of ACEA specifications in developing markets and the impact of biofuels. The extensive study on Low SAPS lubricants has raised awareness of the potential consequences of these formulations on different aspects of engine oil performance including wear protection, cleanliness and oil drain intervals. ATIEL also undertakes engine testing to support the development of robust interchange guidelines for Group III base oils, in response to their growing importance and use in engine oils that meet the latest OEM specifications. ATIEL has a pivotal role in agreeing quality standards for engine oils that meet ACEA requirements. Initiatives such as the ATIEL Code of Practice have been fundamental in setting standards and providing quality guarantees for both OEMs and consumers. ATIEL members include many international companies, which helps to promote ACEA sequences beyond European markets. Through an active involvement in the CEC, ATIEL also plays a role in the setting of engine and

bench test standards, ensuring that lubricant specifications are relevant to real-life applications. Supporting robust, technically sound specifications helps to streamline the lubricant development process. Establishing development protocols, common quality standards and test procedures ensures that appropriate, consistent high-quality lubricants are readily available to end-users across both European and global markets. The ATIEL Code of Practice is accepted industry-wide as best practice for the development and manufacture of crankcase lubricants conforming to ACEA standards. Some 80 companies marketing lubricants in Europe have signed letters of conformance to the Code of Practice guidelines. This ensures product quality and consistency, and provides a benchmark for auditing lubricant development and production processes. The Code of Practice defines the base oils, and procedures for sourcing them, used to formulate lubricants. It is designed to aid the continuous improvement of engine oils, and to ensure the validity of performance claims made for them. / Ассоциация А.Тэ.И.Ё.Эль. (ATIEL) представляет совокупность знаний и опыта ведущих Европейских производителей моторного масла. Ассоциация способствует межотраслевому диалогу по автомобильным смазкам и разрабатывает надёжные стратегии в условиях меняющихся потребностей производства двигателей. Благодаря накопленным знаниям по технологии смазочных материалов, А.Тэ.И.Ё.Эль. (ATIEL) заложила передовой опыт индустрии и стандарты качества, отвечающие техническим потребностям производителей оборудования и потребителей. Предоставляя информацию и знания, ассоциация поддерживает промышленных партнёров в разработке соответствующих смазочных материалов и методик испытаний. Ассоциация отслеживает текущие и будущие технические вопросы, регулятивные программы и рыночные тенденции, содействуя научно обоснованным ответным мерам и способствуя своевременной реакции Европейской нефтяной промышленности на потребности рынка. Вместе с глобальными компаниями-членами ассоциации, А.Тэ.И.Ё.Эль. (ATIEL) способствует продвижению Европейских стандартов по всему миру. Международные связи с такими организациями как Американский Институт Нефти обеспечивают площадку для совместного сотрудничества по глобальным вопросам и разработкам. Членами А.Тэ.И.Ё.Эль. (ATIEL) являются все крупные Европейские нефтяные компании. Ассоциация объединяет широкий спектр производителей и продавцов с большим опытом и знаниями в разработке моторного масла. Действующие члены представляют интересы следующих компаний:- BP Castrol, CEPSA Lubricantes, Chevron, Eni, ExxonMobil, Fuchs, GALP, Kuwait Petroleum (Q8), Lotos Oil, LUKOIL, Neste Oil, ORLEN OIL, PETRONAS, REPSOL, Shell, SK Lubricants, Statoil Lubricants, Total, UEIL (Независимый Союз Европейской Отрасли Смазочных Материалов (Union Indépendante de l'Industrie Européenne des Lubrifiants)), Valvoline. А.Тэ.И.Ё.Эль. (ATIEL) зарегистрирована в Брюсселе в качестве Европейской Группировки по Экономическим Интересам (EEIG) и является некоммерческой, неприбыльной, неполитической организацией. А.Тэ.И.Ё.Эль. (ATIEL) действует как Европейский координационный центр по техническим вопросам, связанным с эксплуатационными показателями и экологическими требованиями к моторным маслам. Её цель заключается в обеспечении разработки смазочных материалов с учётом требований Европейских производителей двигателей. Опираясь на обширные технические знания своих членов, ассоциация устанавливает согласованность промышленных действий по основным техническим вопросам. Это вносит ценный вклад в программы развития производителей и позволяет согласованно реагировать на изменения в законодательстве, спецификации смазочных материалов и разработку аппаратного обеспечения. А.Тэ.И.Ё.Эль. (ATIEL) содействует процессу взаимодействия между Европейскими автомобильными техническими организациями, таких как Ассоциация Европейских Изготовителей Автомобилей (АЕИА) (или Асосьясьё дэ Кострюктэр Эропеэнн Д'Отомобиль (А.Си.Э.А.) (Association des Constructeurs Europeens de L'Automobile (ACEA)), CEC (Европейский Координационный Совет по Разработке Методов Испытания Смазочных Материалов и Топлив Для Двигателей) и Технический Комитет по Присадкам (ТКП) (Additive Technical Committee (ATC)) к нефтепродуктам в Европе. Технические рабочие группы ассоциации исследуют важнейшие вопросы, включая выбросы выхлопных газов, расход топлива, интервалы замены масла, химический состав, замещение базового масла, биотопливо и управление отработанными маслами. Эта работа имеет ключевое значение для разработки надёжных спецификаций, благодаря которым моторные масла помогают улучшить защиту двигателя от износа, антинагарные свойства, понизить уровень выбросов и экономить топливо. Ассоциация А.Тэ.И.Ё.Эль. (ATIEL) создала рабочие группы для решения конкретных технических вопросов и поддержания постоянной связи с техническими консультантами, ассоциациями-партнёрами индустрии и производителями оборудования. Благодаря активному участию в решении проблем эти рабочие группы способствуют лучшему пониманию того, как будущие нормативные тенденции, изменения конструкции двигателя и развивающиеся рынки влияют на обеспечение соответствующими смазочными материалами. Их работа играет важную роль в дискуссии с производителями об изменениях спецификаций моторных масел. Например, рабочие группы А.Тэ.И.Ё.Эль. (ATIEL) занимаются вопросами будущей пригодности базовых масел для смазочных материалов по спецификации Low SAPS (сульфатная зола, фосфор и сера), тенденциями производства двигателей, применением спецификаций АЕИА (ACEA) на развивающихся рынках, воздействием биотоплива на окружающую среду. Широкое исследование смазочных материалов Low SAPS повысило информированность о потенциальных результатах применения этих составов для различных аспектов эксплуатации моторного масла, включая защиту от износа, чистоту и интервалы слива масла. Ассоциация А.Тэ.И.Ё.Эль. (ATIEL) также проводит испытания двигателей для разработки надёжных принципов замены базовых масел Группы III, в условиях их растущего значения и применения в моторных маслах, которые соответствуют последним спецификациям производителей оборудования. А.Тэ.И.Ё.Эль. (ATIEL) играет ключевую роль в согласовании стандартов качества для моторных масел, отвечающих требованиям АЕИА (ACEA). Такие инициативы, как Кодекс Отраслевой Практики А.Тэ.И.Ё.Эль. (ATIEL), заложили фундамент в подготовке стандартов и предоставлении гарантий качества, как для производителей оборудования, так и для потребителей. В ассоциацию А.Тэ.И.Ё.Эль. (ATIEL) входят многие международные компании, которые способствуют продвижению требований АЕИА (ACEA) за пределы Европейского рынка. Благодаря активному участию в CEC, ассоциация А.Тэ.И.Ё.Эль. (ATIEL) также принимает участие в подготовке стандартов двигателей и стендовых испытаний, обеспечивая реальное применение спецификаций смазочных материалов. Поддержка надёжных, технически обоснованных спецификаций помогает упростить процесс разработки смазочных материалов. Создание протоколов разработки, общих стандартов качества и процедур испытаний гарантирует доступность высококачественных смазочных материалов для конечных пользователей на Европейских и мировых рынках. Кодекс Отраслевой Практики А.Тэ.И.Ё.Эль. (ATIEL) широко распространён в промышленности в качестве передовой технологии для разработки и производства моторных смазочных материалов, соответствующих стандартам АЕИА (ACEA). Около 80 компаний, продающих смазочные материалы в Европе, подписали документы соответствия с основными принципами Кодекса Отраслевой Практики. Это гарантирует качество и совместимость продукции и предоставляет ориентир для контроля разработки и производства смазочных материалов. Кодекс Отраслевой Практики определяет базовые масла, и процедуры подбора их поставщиков, применимые для разработки смазочных материалов. Он предназначен для содействия непрерывному улучшению моторных масел, а также обеспечивает обоснованность гарантий качества для них. А.Тэ.И.Ё.Эль. (ATIEL) является одной из наиболее авторитетных ассоциаций производителей и продавцов смазочных материалов в мире. А.Тэ.И.Ё.Эль. (ATIEL) постоянно поддерживает профессиональный диалог с ассоциациями автопроизводителей Ассоциация Европейских Изготовителей Автомобилей (АЕИА) (или Асосьясьё дэ Кострюктэр Эропеэнн Д'Отомобиль (А.Си.Э.А.) (Association des Constructeurs Europeens de L'Automobile (ACEA)) и поставщиков присадочных технологий Технического Комитета по Присадкам (ТКП) (Additive Technical Committee (ATC)). Основными направлениями деятельности А.Тэ.И.Ё.Эль.

(ATIEL) являются обмен опытом и знаниями, координация технических вопросов, связанных с эксплуатационными показателями и экологическими требованиями к моторным маслам, содействие процессу взаимодействия между Европейскими автомобильными техническими организациями, совершенствование существующих и выработка новых стандартов качества смазочных материалов, а также продвижение Европейских стандартов по всему миру. Разработанный ассоциацией Кодекс Отраслевой Практики широко распространён в промышленности в качестве свода рекомендаций для разработки и производства смазочных материалов, соответствующих стандартам АЕИА (ACEA). Ассоциация А.Тэ.И.Ё.Эль. (ATIEL) основана в 1985, зарегистрирована в Брюсселе, Бельгия в качестве Европейской Группировки по Экономическим Интересам (EEIG). Она является некоммерческой, неприбыльной, неполитической организацией, в состав которой входит 20 крупнейших Европейских и международных нефтяных компаний. Одной из основных целей А.Тэ.И.Ё.Эль. (ATIEL) является обеспечение разработки смазочных материалов с учётом требований Европейских производителей двигателей. Членами Ассоциации являются Aramco, BP, CEPSA Lubricantes, Chevron, Eni, ExxonMobil, Fuchs, GALP, Gazprom Neft, Gulf, Idemitsu, Kuwait Petroleum (Q8), Lotos Oil, LUKOIL, MOL, Neste Oil, ORLEN OIL, PETRONAS, REPSOL, Shell, SK Lubricants, Tatneft, Total, UEIL (Независимый Союз Европейской Отрасли Смазочных Материалов (Union Indépendante de l'Industrie Européenne des Lubrifiants)), Valvoline, VECO.

ASSP SYSTEM = AUTOMATED SEAVAN SHIPMENT PLANNING SYSTEM

ASSUMED LIABILITY = ПРИНЯТЫЕ ОБЯЗАТЕЛЬСТВА (или УСЛОВНОЕ ОБЯЗАТЕЛЬСТВО, или ПЕРЕХОДЯЩЕЕ ОБЯЗАТЕЛЬСТВО) – Assumed Liability is a liability which would not rest upon a person except that he has accepted responsibility by contract expressed or implied. Also known as Contractual Liability.

ASSUMED NAME = ДОПУСКАЕМОЕ НАИМЕНОВАНИЕ – In the United States, Assumed Name is a name other than the true name, under which a corporation or other business organization conducts business. Also referred to as a Fictitious Name, a Trade Name or 'Doing Business As' (d/b/a).

ASSURANCE = СТРАХОВАНИЕ – Assurance is a term interchangeable with insurance but generally used in connection with life cover as assurance implies the certainty of an event and insurance the probability. An equivalent term to insurance, commonly used in the life insurance business. / Равнозначный термин для термина страхование, используемый, как правило, в сфере страхования жизни.

ASSURED = ЗАСТРАХОВАННОЕ ЛИЦО (или ЗАСТРАХОВАННЫЙ, или СТРАХОВАТЕЛЬ) – Assured is another name for an insured. In the United Kingdom the Assured is a person (or people) who has entered into a life assurance contract with a life office and is the policyholder. The person on whose life the policy is taken out is known as the Life Assured. The assured and the life assured are often the same person but not always. In the United States the expression insured is used. In life insurance, the insured is the person (or people) who has entered into a contract and on whose life the policy is written. On the death of the insured the face amount of the policy passes to the beneficiary. A party who is a potential beneficiary of an insurance contract. The synonym Insured is more commonly used. Assured:- the party who is entitled to receive money under a life insurance contract on the happening of a stated contingency or event. A contingency in the case of whole life assurance would be death, and in the case of an endowment policy the stated event would be survival beyond the policy term. The assured is also sometimes referred to as the Insured. Also known as Insured.

ASTA = AIRPORT SURFACE TRAFFIC AUTOMATION

ASTA = AMERICAN SEED TRADE ASSOCIATION

ASTA = AMERICAN SOCIETY OF TRAVEL AGENTS

AST&L = AMERICAN SOCIETY OF TRANSPORTATION AND LOGISTICS

ASTERN = ЗАДНИЙ ХОД – Move in a reverse direction. Astern is a backward direction in the line of a vessel's fore and aft line; behind a vessel. If a vessel moves backwards it is said to move astern. The opposite to Ahead.

ASTERN = ЗА КОРМОЙ – Behind a vessel. Astern:- the bearing of an object 180 degrees from ahead (behind).

ASTM = AMERICAN SOCIETY FOR TESTING AND MATERIALS

ASTM D2670 PIN AND V–BLOCK TEST = ИСПЫТАНИЕ XX ПО АОИМ ДИ.2670 – ASTM D2670 Pin and V-Block Test:- ASTM Test Method D2670 is for measuring the antiwear properties of liquid lubricants. The load is applied to the jaws and maintained by a toothed wheel. The wear is a function of the number of the tooth which needs to be engaged to keep the load constant for a fixed time. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). противозносные свойства жидких смазок.

ASTM D5302 SEQUENCE VE = АОИМ ДИ.5302 ПОСЛЕДОВАТЕЛЬНОСТЬ ВИ.И. – ASTM D5302 Sequence VE:- ASTM Test Method D 5302, the Sequence VE gasoline engine test, has been correlated with vehicles used in stop-and-go service prior to 1988, particularly with regard to sludge and valve train wear. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

ASTM D5533 SEQUENCE IIIF = АОИМ ДИ.5533 ПОСЛЕДОВАТЕЛЬНОСТЬ IIIЭФ. – ASTM D5533 Sequence IIIF:- ASTM Test Method D 5533, the Sequence IIIE gasoline engine test, has been correlated with vehicles used in high-temperature service prior to 1988, particularly with regard to oil thickening and valve train wear. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

ASTRAKHAN = АСТРАХАНСКАЯ – Astrakhan:- the term was used to name the wool from karakul Lambs. Nowadays, it is also used to describe a fabric woven or knitted to similar to this wool. It is curly and heavy. Connected to:- Karakul.

ASTRAKHAN CLOTH = АСТРАХАНСКОЕ ПОЛОТНО – Astrakhan Cloth is a thick knit or woven fabric with loops or curls on the face. The base yarns are usually cotton or wool and the loops are made with fibers such as mohair, wool, and certain manufactured fibers. The face simulated the pelt of the Astrakhan lamb. Astrakhan is a cloth with a usually wool, curled, and looped pile resembling karakul, namely the tightly curled glossy coat of the newborn lamb of a breed of hardy fat-tailed sheep from Uzbekistan with a narrow body and coarse wiry fur. Poor grades often have cotton warp or back. Good grades woven with a pile weave and cut. Cheap grades are knitted. Resembles Astrakhan fur. Deep pile with curled loops. Durable and warm.

ASTRAY FREIGHT = ЗАПУТАВШИЙСЯ ГРУЗ (или ЗАБЛУДИВШИЙСЯ ГРУЗ) – Astray Freight is a freight bearing marks indicating owner and destination, but separated from the waybill.

ASTRINGENT = ВЯЖУЩЕЕ (или ТЕРПКОЕ) – Astringent:- with a soapy or medicinal aroma because of the presence of saponium or other chemicals. / saponis (мыло).

ASTROQUARTZ® = ЭСТРОКВОТЦ® (или АСТРОКВАРЦ®) – Astroquartz® Products:- Astroquartz® is a registered trademark of JPS Industries Inc. (the world's leading manufacturer of high strength fiberglass, Astroquartz®, and aramid fabrics and reinforcements; headquartered in Anderson, State of South Carolina (SC), the United States). Astroquartz® II & Astroquartz III® Properties:- Astroquartz®, Astroquartz II® and Astroquartz III® are composed of identical raw materials. Through improved manufacturing and handling technologies Astroquartz II® and Astroquartz III® represents a stronger, cleaner products with unparalleled quality, standards, and specifications. Such innovation gives new flexibility to your design opportunities. Properties of Astroquartz® Fibers:- (i) Tensile Strength - Virgin Single Filament – 6.0 GPa (870 ksi); (ii) Tensile Strength - Impregnated Strand on 20 End Roving (ASTM D-2343) – 3.6 GPa (530 ksi); (iii) Young's Modulus – 72 GPa (10 msi); (iv) Poisson's Ratio – 0.16; (v) Density – 2.2 g/cm^3; (vi) Silica Content (exclusive of yarn binder) – 99.99%; (vii) Fiber Diameter - Astroquartz II® – 9 µm; and (viii) Fiber Diameter - Astorquartz III® – 14 µm. Physical Properties of Fused Quartz:- (i) Mechanical:- (a) Density – 2.2 g/cm^3 or 0.79 lb/m^3; and (b) Hardness (Mohs Scale) – 7. (ii) Electrical:- (a) Dielectric Constant (Dk) - 1 MHz – 3.70; (b) Dielectric Constant (Dk) - 10 GHz – 3.74; (c) Dissipation Factor (Df) - 1 MHz – 0.000 1; and (d) Dissipation Factor (Df) - 10 GHz – 0.000 2. (iii) Thermal:- (a) Linear Expansion Coefficient – 0.54 x 10^{-6}; (b) Specific Heat @ 20 °C (J/gK) – 7.5 x 10^2; (c) Thermal Conductivity (W/mK) – 1.38; (d) Strain Point (Log_{10} n = 14.6) – 1 070 °C (1 958 °F); (e) Annealing Point (Log_{10} n = 13) – 1 220 °C (2 084 °F); and (f) Softening Point (Log_{10} n = 7.6) – 1 700 °C (3 092 °F). Note:- n = Viscosity in Poise. (iv) Optical:- (a) Refractive Index @ 15 °C – 1.458 5; (b) Dispersion – 67; and (c) Field of Transparency (µm) – 0.2 to 4.0. Astroquartz® Applications and Design Considerations:- Astroquartz® fabrics offer better solutions to high heat, high strength problems. The aerospace industry relies on Astroquartz® fiber products made from pure fused silica (99.99% SiO_2) to produce an outstanding reinforcement material for high temperature and ablative space and missile applications. Astroquartz® products are recommended when low dielectric loss properties are required, such as microwave transmission in radome and antenna applications. There are five basic design variables to consider when choosing Astroquartz® fabrics:- (1) Thickness:- quartz and composite fabrics are available in thicknesses ranging from 0.003" to 0.027". (2) Weight:- the weight for Astroquartz® fabrics range from two to twelve ounces per square inch. (3) Construction:- construction determines the number of warp yarns/denier (in themachine direction) and filling yarns/denier (in the crossmachine direction) per inch of the fabric, thereby helping determine thethickness, weight, and drapability, and overall performance of the fabric. (4) Yarn Size:- yarn size is a major factor in determing the weight and thickness of the fabric. The yarn size and twist and ply counts will also play a large roll in determining the overall strength of the woven fabfic. For specific applications, one yarn may be selected over another to take advantage of the fabric's performance characteristics. (5) Finish:- most industrial applications require that Astroquartz® fabric be coated with a coupling agent to assist resin wet out and to improve the strength of the fiber to resin interface, thereby affecting the mechanical performance characteristics of the final part. For finish or after weaving treatment compatibility with specific resins for specific application please contact JPS technical or customer service. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.). (b) Твёрдость (Hardness).

ASTROQUARTZ II® CHOPPED FIBER = АСТРОКВАРЦ II® НАРЕЗАННОЕ (или РУБЛЕНОЕ, или ПРЕРЫВИСТОЕ) ВОЛОКНО – Astroquartz II® Chopped Fiber is made by cutting continuous filaments of high purity, extremely fine pure quartz fibers to a predetermined length. Fiber composition is 99.99% SiO_2 (silica) exclusive of binder. Because of their high strength plus excellent ablative, electrical, and high temperature characteristics, Astroquartz II® chopped fibers are used widely in reinforced plastics, molding compounds, and as a ceramic reinforcement. Type 556 Chopped Fiber:- Fiber Lengths* from 1/8" to 1":- standard Binder Astroquartz II® chopped fiber with an aminosilane binder compatible with epoxy, phenolic and some polyimide resins. Note:- * Due to the nature of the cutting process, cut lengths may vary slightly. Standard Packaging:- 1 lb packages packed loosely in clear polyethylene bags. / Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.).

ASTROQUARTZ II® ROVING = РОВНИЦА АСТРОКВАРЦ II® – Astroquartz II® Roving is made from continuous filaments of pure fused silica nine microns in diameter. Fiber composition is 99.99% SiO_2 (silica) exclusive of binder. Standard 20 end roving equivalent to 20 ends of 150 1/0 contains 4 800 nine micron diameter filaments. The fiber density is 2.2 g/cm^3. Astroquartz II® roving has a fiber tensile strength of 0.5 MSI (according to the Test Method – ASTM D-234). Property Data (according to the Test Method – ASTM D-578; in the following format:- Type – End Count (+0–1) – Binder (0.3–0.6% loss on ignition (LOI)) – Yds/Lb (±10%) – Strength (Tensile, min. avg., uncoated roving)):- (i) 552 – 20 – 9 779/9 989 – 750 – 65 lbs; (ii) 552 – 12 – 9 779/9 989 – 1250 – 40 lbs; (iii) 552 – 8 – 9 779/9 989 – 1 875 – 25 lbs; (iv) 552 – 6 – 9 779/9 989 – 2 500 – 20 lbs. Astroquartz II® roving is available with an end count less than 20, please consult your JPS Industries Inc. for details. Other finishes are also available. Standard Packaging:- (i) Inside Diameter – 3 in; (ii) Length – 11 in; (iii) Traverse – 10 in; (iv) Waywind – 3 in; (v) Wind Direction – Forward; (vi) Type Build – Straight; and (vii) Maximum OD – 7 OD. Approximate Net Weight:- 9779 Binder – 2.2 lbs. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.).

ASTROQUARTZ II® SEWING THREADS = ШВЕЙНЫЕ НИТКИ АСТРОКВАРЦ II® – Astroquartz II® Sewing Threads are made from high purity extremely fine continuous filaments of pure fused silica that is capable of extended exposure to 2 000 °F. Fiber composition is 99.99% SiO_2 (silica) exclusive of binder. Unless otherwise specified, Astroquartz II® sewing threads are supplied coated with Teflon. With 9855 Teflon Coating (20 ± 4%; in the following format:- Type – Approximate Diameter (in) – Breaking Strength (Typical (lb) – Minimal (lb); Test Method – ASTM D-578) – Approximate Yield (Uncoated – Coated; ±10%)):- (i) Q-12 – 0.014 – (15 – 12) – (3 660 – 2 925); (ii) Q-18 – 0.017 – (24 – 19) – (2 440 – 1 950); (iii) Q-24 – 0.022 – (30 – 25) – (1 830 – 1 460); and (iv) Q-27 – 0.024 – (30 – 25) – (– – 1 030). American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.).

ASTROQUARTZ® MAT STYLE NO. 550 = СТИЛЬ КЛУБКА АСТРОКВАРЦ® № 550 – Astroquartz® Mat Style No. 550:- (1) Specifications:- (i) Length – 1 000 mm (39.37 in); (ii) Width – 500 mm (19.69 in); (iii) Area – 0.5 m^2 per sheet (5.38 ft^2); (iv) Thickness – 5 mm (0.2 in); (v) Weight – 78 g/m^3 (2.3 oz/yd^3); and (vi) Density – 0.016 g/cm (1 lb/ft – approximately). (2) Handling:- Astroquartz® s/550 mat is impregnated with a polyvinyl alcohol binder in the manufacturing operation. This provides a stable mat which can be handled, cut, or fabricated to exact dimensions and can be installed with ease. The binder can be removed by heating to 900 °F for 1 hour, or at 500 °F for 24 hours. Binder content on the Astroquartz mat is between 4% and 5% by weight. Cut sheets of approximately 500 mm x 500 mm (20 in x 20 in) are also available with an area of approximately 2.8 ft per sheet. / Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.).

ASTROQUARTZ® YARN = ПРЯЖА АСТРОКВАРЦ® – Astroquartz® Yarn is made from extremely fine continuous filaments of 99.99% pure fused silica, exclusive of binder, capable of extended heat exposure to 2 000 °F. With more than five times the yarn yield of high silica leached yarn, Astroquartz® yarn has a higher tensile strength and abrasion resistance. As a result, high production efficiencies are now possible in the production of high temperature flexible insulation. Astroquartz® yarn is widely used in the form of braided insulation in thermocouple wire, coaxial cables, space separators, hoop wire, and heating elements. Property Data (in the following format:- Type – Approximate Diameter (in) – Approximate Breaking Strain (lb; according to the Test Method – ASTM D-578) – Approximate Yield (yd/lb)):- (i) 300 2/0 – 0.008 – 3 – 15 000; (ii) 300 2/2 – 0.012 – 6 – 7 500; (iii) 300 2/4 – 0.018 – 10 – 3 750; and (iv) 300 2/8 – 0.020 – 24 – 1 875. Astroquartz® yarns are available with an amino-silane binder system, compatible with phenolic, epoxy, and some polyimide resins. Heavier or lighter count yarns can also be manufactured. Please consult JPS Industries Inc. for price and delivery. Standard Packaging:- yarns are available on standard milk bottle packages for plied yarns and double flanged packages for twisted single yarn. Net yarn weights range from a minimum of 1 lb/pkg to a maximum of 2.5 lb/pkg. Fiber Characteristics:- (1) Astroquartz II® (Astroquartz II® filaments are 9 µm in diameter, similar to an E-glass 'G' filament), Number of Filaments:- (i) 300 1/0 – 120 filaments; (ii) 300 2/0 – 240 filaments; and (iii) 300 2/2 – 480 filaments. (2) Astroquartz III® (each filament is 9 µm in diameter, equivalent to an E-glass 'K' filament), Number of Filaments:- (i) 125 1/0 – 120 filaments; and (ii) 125 2/0 – 240 filaments. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Эстроквотц® (или Астрокварц®) (Astroquartz®) товарный знак компании Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.).

ASV = ALKALI SPREADING VALUE

ASX = AUSTRALIAN SECURITIES EXCHANGE

ASX = AUSTRALIAN STOCK EXCHANGE

ASYMMETRICAL = АСИММЕТРИЧНОЕ (или НЕСИММЕТРИЧНОЕ) – Asymmetrical:- parts not equal or symmetrically arranged.

ASYMMETRIC ALGORITHM = АСИММЕТРИЧНЫЙ АЛГОРИТМ – Asymmetric Algorithm is a cryptographic algorithm employing a public key and a private key. Together these form an asymmetric key set.

ASYMMETRIC PALLET = АСИММЕТРИЧНЫЙ ПОДДОН – Asymmetric Pallet is a flat pallet which does not have the same design on either side of one or other deck centre line. / Асимметричный Поддон:- плоский поддон, одно- или двухнастильный плоский поддон, детали настила которого с одной стороны до центра не симметричны деталям настила противоположной стороны.

ASYMPTOMATIC = БЕССИМПТОМНОЕ – Asymptomatic:- without symptoms. An asymptomatic infection is one where the pathogen is present but there are no apparent symptoms indicating its presence.

ASYNAPSIS = АСИНАПСИС – Asynapsis is a failure of pairing of homologous chromosomes during meiosis.

AT = AIR TRAFFIC

AT = AUSTRIA

AT = ПО – In English, @ is formally called 'Commercial At' or 'At-Sign' and has been used for a long time in the sense 'at a price of ... (each)':- 'Abc 43k@7.86Δ0.09'. Eventually it also took on the locative sense of the word 'At'. Other linguists will argue that the @ sign is a more recent development, appearing sometime in the XVIII century as a symbol used in commerce to indicate price per unit, as in '2 chickens @ 10 pence'. While these theories are largely speculative, in 2000 Giorgio Stabile, a professor of the history of science at La Sapienza University in Italy, discovered some original XIV century documents clearly marked with the @ sign to indicate a measure of quantity – the 'Amphora', meaning 'Jar'. The amphora was a standard-sized terra cotta vessel used to carry wine and grain among merchants, and, according to Stabile, the use of the @ symbol (the upper-case 'A' embellished in the typical Florentine script) in trade led to its contemporary meaning of 'at the price of'. / Актив, количество, цена, изменение и объём приобретения актива в бегущей строке экономических обзоров – тикерной ленте (ticker tape) – Abc 43k@7.86Δ0.09, означая, что была совершена сделка по 43 000 акциям компании Abc по цене 7.86 с повышением котировки на 0.09 в сравнении с предыдущей котировкой.

AT = 'СОБАЧКА' (или НА) – While in the English language, @ is referred to as the 'At Sign', other countries have different names for the symbol that is now so commonly used in e-mail transmissions throughout the world. Many of these countries associate the symbol with either food or animal names. For example, in:- (i) Afrikaans – in South Africa, it is called Aapstert, meaning 'Monkey's Tail'; (ii) Arabic – the @ symbol does not appear on Arabic keyboards, only keyboards in both Arabic and English. The Arabic word for @ is fi, the Arabic translation of at; (iii) Bosnian, Croatian and Serbian – in these countries, it is referred to as the 'Crazy I'; (iv) Cantonese – in Hong Kong it is generally referred to as 'The At Sign', just as in England and America; (v) Catalan – in Catalonia, it is called Arrova, a unit of weight; (vi) Czech – in the Czech Republic, it is called 'Zavinac', meaning 'Rollmop', or 'Pickled Herring'; (vii) Danish – it is called 'Alfa-Tegn', meaning 'Alpha-Sign' or 'Snabel-A', meaning 'Elephant's Trunk' or grisehale, meaning 'Pig's Tail'; (viii) Dutch – since English is prominent in the Netherlands, the English 'At' is commonly used. However, the Dutch also call it 'Apenstaart', meaning 'Monkey's Tail', apestaartje, meaning 'little monkey's tail' or slingeraap, meaning 'Swinging Monkey'; (ix) French – in France, it is called 'Arobase' the name of the symbol. It is also referred to as un a commercial, meaning 'Business A', a 'Enroule', meaning 'Coiled A', and sometimes 'Escargot', meaning 'Snail' or 'Petit Escargot', meaning 'Little Snail'; (x) German – in Germany, it is called 'Affenschwanz', meaning 'monkey's tail' or 'Klammeraffe', meaning 'Hanging Monkey'; (xi) Greek – in Greece, it is called 'Papaki', meaning 'Little Duck'; (xii) Hebrew – it is 'Shablul' or 'Shablool', meaning 'Snail' or a 'Shtrudl', meaning 'Strudel'; (xiii) Hungarian – in Hungary, it is called a 'Kukac', meaning 'Worm' or 'Maggot'; (xiv) Italian – in Italy it is called 'Chiocciola', meaning 'Snail' and a 'Commerciale', meaning 'business a'; (xv) Japanese – in Japan, it is called 'Atto Maaku', meaning 'at mark'; (xvi) Mandarin Chinese – in Taiwan it is called 'Xiao Lao-Shu', meaning 'Little Mouse', 'Lao Shu-Hao', meaning 'mouse sign', 'At-Hao', meaning 'At Sign' or 'Lao Shu-Hao', meaning 'Mouse Sign'; (xvii) Norwegian – in Norway, it is called either 'Grisehale', meaning 'pig's tail' or 'Kro/Llalfa', meaning 'Curly Alpha'. In academia, the English term 'At' is widely used; (xviii) Polish – in Poland, it is called 'Malpa', meaning 'Monkey'. It is also called 'Kotek', meaning 'Little Cat' and 'Ucho S'wini', meaning 'Pig's Ear'; (xix) Portuguese – in Portugal it is called 'Arroba', a unit of weight; (xx) Romanian – in Romania, it is called 'La', a direct translation of English 'At'; (xxi) Russian – Russians officially call it a Kommercheskoe, meaning 'Commercial A', but it is usually called 'Sobachka', meaning 'Little Dog'; (xxii) Spanish – like in Portugal, in Spain it is called 'Arroba', a unit of weight; (xxiii) Swedish – the official term in Sweden is 'Snabel-a', meaning 'Trunk-a', or 'a with an elephant's trunk'; (xxiv) Thai – there is no official word for it in Thai, but it is often called 'Ai Tua Yiukyiu', meaning 'the wiggling worm-like character'; and (xxv) Turkish – in Turkey, most e-mailers call it 'Kulak', meaning 'Ear'. The @ sign or at-sign was probably adopted into the computer world around 1970 under the operating system Tenex, and used for e-mail on the early Internet as well as for programming. In 1972, Ray Tomlinson sent the first electronic message, now known as E-Mail, using the @ symbol to indicate the location or institution of the e-mail recipient. Tomlinson, using a Model 33 Teletype device, understood that he needed to use a symbol that would not appear in anyone's name so that there was no confusion. The logical choice for Tomlinson was the 'at sign', both because it was unlikely to appear in anyone's name and also because it represented the word 'at', as in a particular user is sitting @ this specific computer. However, before the

symbol became a standard key on typewriter keyboards in the 1880s and a standard on QWERTY keyboards (ehe name comes from the first six letters (keys) appearing in the top letter row of the keyboard, read left to right:- Q-W-E-R-T-Y.) in the 1940s, the @ sign had a long if somewhat sketchy history of use throughout the world. Linguists are divided as to when the symbol first appeared. Some argue that the symbol dates back to the XVI or XVII centuries when Latin scribes adapted the symbol from the Latin word 'Ad', meaning 'At', 'To' or 'Toward'. The scribes, in an attempt to simplify the amount of pen strokes they were using, created the ligature (combination of two or more letters) by exaggerating the upstroke of the letter 'd' and curving it to the left over the 'a'. / в Каталонии называлась Аррова (Arrova). В электронном адресе, abc@xyz.com = пользователь abc на сайте xyz.com. ; (iii) в Боснийском, Сербском и Хорватском языках – в этих странах, он именуется как 'Сразу И' (Crazy I); (vi) в Чешском языке – в Чешской Республике, он именуется 'Завинач' (Zavinac), означающий 'завиток' (rollmop) или 'маринованая селёдка' (pickled herring); (vii) в Датском (Danish) языке – он именуется 'Алфа-Тайн' (Alfa-Tegn), означая 'Знак Альфа', или 'Снэйбл-е' (Snabel-a), означая 'хобот слона' или Грисэаля (Grisehale), означая 'свиной хвост'; (viii) в Нидерландском (Dutch) языке – поскольку Английский в Нидерландах весьма распространённый язык, и Английское 'На' или 'Эт' (At) повсюду используется, хотя, в Нидерландском языке его также произносят как 'Апэнстарт' (Apenstaart), означающее 'обезьяний хвост' ('monkey's tail'), Апэнстарче (Apenstaartje), означающее 'маленький обезьяний хвостик' (little monkey's tail) или Слинераап (Slingeraap), означающий 'переворачивающаяся обезьяна' (swinging monkey); (ix) во Французском языке – во Франции, этому символу дали наименование Аробас (Arobase), означающее Испанскую меру веса 'Арроба' или 'Аррова' (Arroba или Arrobe). Он также относится к (Un A Commercial), означающему (business a), A Анруль (A Enroule), означающему 'a, свёрнутую в кольцо' (coiled a), и иногда к Эскарго (Escargot), означающему 'улитку' (snail) или Пёти Эскарго (Petit Escargot), означающему 'маленькую улитку' (little snail); (x) в Немецком – в Германии, он именуется как Аффэншванц (Affenschwanz), означающий 'балбес' или 'обезьяний хвост' (monkey's tail) или Клямэхафэ (Klammeraffe), означающий 'висящая обезьяна' ('hanging monkey') и используемый для обозначения скоб или зажимов; (xi) в Греческом – в Греции, он именуется 'Папаки' (Papaki), означающий 'утёнок' (little duck); (xiii) в Венгерском – в Венгрии, он именуется 'Кукац' (Kukac), означающий 'червь' (worm) или 'личинка' (maggot); (xiv) в Итальянском – в Италии он именуется Киоччёла (Chiocciola), означающий 'улитка' (snail) и A коммэрчале (A commerciale), означающий 'коммерческая A' (business a); (xv) в Японском – в Японии, он именуется Атто Мааку (Atto Maaku), означающий 'на значке' ('at mark'); (xvii) в Норвежском – в Норвегии, он именуется либо как 'Грисэаля' (Grisehale), означающий 'свиной хвост' (pig's tail), либо как 'Керу Скрос Эль.Эль.Алфа' (Kro/Llalfa), означающий 'завитая альфа' (curly alpha). В академиях широко используется Английский термин 'Эт' (at), означающий 'на'; (xviii) в Польском – в Польше, он именуется Малпа (Malpa), означающий 'обезьяну' (monkey). Он может также именоваться Котэк (Kotek), означающий 'котёнок' (little cat) и Ухо Сфини (Ucho S'wini), означающий 'свиное ухо' (pig's ear); (xix) в Португальском языке – в Португалии, он именуется Ароба (Arroba), единица веса; (xxiii) в Шведском языке – официальным термином в Швеции является Снабель-а (Snabel-a), означающий 'a с хоботом' (trunk-a), или 'a с хоботом слона' (a with an elephant's trunk); (xxiv) .

ATA = ACCREDITED TAX ADVISOR

ATA = ACTUAL TIME OF ARRIVAL

ATA = AIR TRANSPORT ASSOCIATION OF AMERICA

ATA = AMERICAN TRUCKING ASSOCIATION

ATA CARNET = А.ТЭ.А. КАРНЭ (или КНИЖКА ВД) – An international Customs document which, issued under the terms of the ATA Convention, and the Istanbul Convention incorporates an internationally valid guarantee and may be used, in lieu of national Customs documents and as security for import duties and taxes, to cover the temporary admission of goods and, where appropriate, the transit of goods. It may be accepted for controlling the temporary exportation and reimportation of goods but, in this case, the international guarantee does not apply. The ATA carnet may not, in principle, be used for the temporary admission of means of transport. Instead of 'import duties and taxes' the ATA Convention uses the term 'Import Duties', giving it the same scope as the glossary gives to the former expression. Customs document used for the temporary exportation, transit and temporary exportation, transit and temporary admission of goods for specific purpose, e.g., for displays, exhibitions and fairs as professional equipment and as commercial samples. See also Admission Temporaire – Temporary Admission Carnet. The Anglo-French term ATA Carnet is derived from Admission Temporaire/Temporary Admission. Carnet is a French word long used in English to refer to particular customs documents, presumably resulting from the frequent trade between the United Kingdom and France. Specifically, a carnet is a customs document that allows the item it covers to be imported without paying a customs duty (tax) on it. The ATA Carnet is used for goods that are going to be imported temporarily, and excuses the holder from all taxes that would normally apply. The Customs Cooperation Council (now known as the World Customs Organization) first adopted ATA Carnet conventions in 1961, which are now issued according to an agreement administered by the International Chamber of Commerce in conjunction with the World Customs Organization and the relevant entities of member nations, which actually issue the carnets. In many nations, the national chamber of commerce is the issuing body. In the United States, carnets are issued by the United States Council for International Business (USCIB), the business advocacy group that represents American business interests to the United Nations. Over 150 000 ATA Carnets are issued annually, by 65 participating countries. Various other countries, especially smaller ones, are known to accept ATA Carnets without actually committing to the international guarantee to do so, and without issuing their own. A modified ATA Carnet, which does not cover exhibition goods, is used for trade between the United States and Taiwan:- the TECRO/AIT Carnet (named for the Taipei Economic and Cultural Representative Office, in the United States, and the American Institute in Taiwan). ATA Carnets cannot be used for perishable goods, but the conceivable range of goods that could be covered is otherwise theoretically limitless. The three categories of goods for which such carnets are issued are goods brought into the country for exhibitions or fairs; professional equipment; and commercial samples. What those categories have in common is that all such goods are being brought into the country for some commercial purpose other than their sale or rent, and will be brought back out of the country as a result. Excusing such importation from tax encourages international business activity in the country of import, and in many cases leads to increased customs revenue for the country at a later date such as if tax-free samples and demonstrations lead to sales of taxed goods. ATA Carnets are granted by the home country of the exporter, which will have various requirements. The USCIB, for instance, requires a refundable cash deposit or surety bond equal to 40 percent of the value of the goods, as collateral. Similar collateral requirements are common in other countries, and the collateral is used to pay taxes if a claim is filed against the importer because of ineligibility for an ATA Carnet or because the time frame has expired. Such claims are filed by the country of import, the country that would have been collecting the customs taxes. Other carnets include the Carnet de Passage, which is issued to motor vehicles and is typically used to distinguish (and excuse from customs duties) a vehicle that is the owner's possession from vehicles imported for sale; and the International Road Transport (TIR) carnets used to harmonize the administration of road transport across multiple countries (especially in Europe). / привоз (importation). вывоз (exportation). Смотрите также Адмисьён Тэмпорэр – Темпорэри Эдмишэн Карнэ или Книжка Временного Допуска (Admission Temporaire – Temporary Admission Carnet). В случае необходимости временно беспошлинно ввезти/вывезти товары для использования на международных выставках, ярмарках, конференциях, презентациях и других мероприятиях, необходимо обратиться в местную

торгово-промышленную палату за Книжкой Временного Допуска – международным документом о временном ввозе. Товары, подпадающие под действие Книжек Временного Допуска:- компьютеры, фото- и кинооборудование, музыкальные инструменты, экспонаты, произведения живописи, исторические музейные реликвии, профессиональное оборудование, звуковые установки, медицинское оборудование, спортивный инвентарь, балетные костюмы, транспортные средства, ювелирные изделия и многое другое. Преимущества Книжки Временного Допуска:- не требуется заполнять таможенные документы на пропускных пограничных пунктах при ввозе и вывозе; устраняется личная или финансовая гарантия со стороны экспортёра в стране импортёра товара; срок действия Книжки Временного Допуска составляет 1 год; возможность, при соответствующем оформлении Книжки Временного Допуска, посещать в течение 1 года не одну, а несколько стран.

ATA CONVENTION = КОНВЕНЦИЯ ВД – Its full name is 'Customs Convention on the ATA carnet for the temporary admission of goods' (done at Brussels, Belgium on 1961-December-06). It is an international instrument designed to facilitate the importation, irrespective of the means of transport used, of goods which are granted temporary duty-free admission. The Convention specifies a form of ATA carnet (ATA = Admission Temporaire/Temporary Admission) and conditions for its use in lieu of national Customs documents. It also sets out the minimum facilities to be accorded in relation to the use of ATA carnets. The Convention foresees that under certain circumstances ATA carnets can, optionally, be accepted for application to goods in transit. The application of ATA carnets to transborder movement (including transit, importation for home use and temporary admission) of all goods involved in the delivery of humanitarian assistance would be of considerable advantage as it means that only one and the same document would be filled in each time irrespective of the number of border crossings, differences in national Customs regulations and type of goods. Another advantage of the use of ATA carnets is that no national security for the payment of import duties and taxes has to be lodged with the countries in transit or temporary admission as this security is provided by an international guaranteeing chain. The ATA carnet may also be optionally used for temporary exportation from and re-importation into the country of issue of the carnet. However, it is important to note that the ATA carnets can never be used for importation for home use, nor for the sole use as a transit or temporary exportation document. ATA Convention is the expression commonly used to refer to the Customs Convention on the ATA carnet for the temporary admission of goods (ATA Convention) adopted by the Customs Co-operation Council of Brussels in 1961. / привоз (importation). вывоз (exportation).

ATACTIC POLYMER = АТАКТИЧЕСКИЙ ПОЛИМЕР – Atactic Polymer is a type of polymer molecule in which substituent groups or atoms are arranged randomly above and below the backbone chain of atoms, when the latter are all in the same plane, e.g., in polypropylene. See also Isotactic Polymer, Syndiotactic Polymer, and Tactic Polymer.

ATADS = AIR TRAFFIC ACTIVITY DATA BASE SYSTEM

ATAP = ANTI–TERRORISM ASSISTANCE PROGRAM

ATB = ASPHALT TREATED BASE

AT BEST (PRICE) = ПО ЛУЧШЕЙ (ЦЕНЕ) – Expression meaning 'at the lowest possible price' in the case of a purchase order and 'at the highest possible price' in the case of a selling order. The buyer or seller does not prescribe any maximum or minimum price for the execution of the order. In the case of securities with a limited market, the order is carried out at the earliest opportunity. Also known as At The Market Order. At Best is an order with no limit to sell securities at the best price offered. The sale must be completed under all circumstances. Opposite:- Cheapest. / В биржевой торговле, . , в случае с распоряжением на закупку и . Распоряжение брокеру купить или продать активы по лучшей цене. Распоряжение должно быть выполнено незамедлительно.

ATC = THE AGREEMENT ON TEXTILES AND CLOTHING

ATC = AIR TACTICAL COMMUNICATIONS

ATC = AIR TRAFFIC CONTROL

ATC = ALL TERRAIN CYCLE

ATCA = AIR TRAFFIC CONTROL ASSOCIATION

ATCAA = AIR TRAFFIC CONTROL ASSIGNED AIRSPACE

ATCBI = AIR TRAFFIC CONTROL BEACON INTERROGATOR

ATCCC = AIR TRAFFIC COMMAND AND CONTROL CENTER

ATCO = AIR TAXI COMMERCIAL OPERATOR

ATCRBS = AIR TRAFFIC CONTROL RADAR BEACON SYSTEM

ATCT = AIRPORT TRAFFIC CONTROL TOWER

ATD = ACTUAL TIME OF DEPARTURE

ATD = ANTHROPOMORPHIC TEST DEVICE

ATD = ARTIFICIAL TWEEN DECK

ATDNSHINC = ANY TIME DAY OR NIGHT SUNDAYS AND HOLIDAYS INCLUDED

ATE = AUTOMATIC TEST EQUIPMENT

ATF = AUTOMATIC TRANSMISSION FLUID

ATFI SYSTEM = AUTOMATED TARIFF FILING INFORMATION SYSTEM

ATHWARTSHIPS = НА ТРАВЕРЗЕ – Athwartships:- across the vessel, from side to side. A direction across the width of a vessel. / Направление поперёк ширины судна. Направление, перпендикулярное курсу судна или его диаметральной плоскости. Быть на Траверзе какого-либо предмета, например, маяка – находиться на линии, направленной на этот предмет и составляющей прямой угол с курсом судна.

ATHWARTSHIPS STOWAGE = ШТИВКА (или УКЛАДКА) ОТ БОРТА ДО БОРТА (или ПОПЕРЕЧНАЯ ШТИВКА, или ПОПЕРЕЧНАЯ УКЛАДКА) – Athwartships Stowage is a load stowed across the beam of the container or ship (as opposed to fore and aft stowage). In the context of load securing, it is of utmost importance whether a container is stowed athwartships or fore and aft on a ship. In the case of athwartships stowage, the greatest acceleration forces act on the actual container longitudinally rather than transversely. Load securing measures must then be taken with this in mind.

ATI = AGRICULTURAL TRAINING INSTITUTE

ATIEL = ASSOCIATION TECHNIQUE DE L'INDUSTRIE EUROPÉENNE DES LUBRIFIANTS

ATIS = ADVANCED TRAVELER INFORMATION SYSTEM

ATIS = AUTOMATIC TERMINAL INFORMATION SERVICE

ATK = AVAILABLE TONNE–KILOMETER

ATK HEL = ATTACK HELICOPTER

ATLANTIC BEEF/PIGMEAT MARKET = АТЛАНТИЧЕСКИЙ РЫНОК ГОВЯДИНЫ/СВИНИНЫ – Atlantic Beef/Pigmeat Market:- the Atlantic market consists of countries producing and trading livestock, bovine and porcine, that are Foot and Mouth Disease (FMD) free with vaccination or contain FMD free zones. Most countries parts of this market are located around the Atlantic Rim and typically trade grass fed bovine and grain fed porcine. The main countries that are part of that market are; South America, European Union, Russian Federation, North Africa, Iran, Israel, Kazakhstan, Malaysia, Peru, Philippines, Saudi Arabia, Turkey, Ukraine, Uruguay, Viet Nam, South Africa. Atlantic Beef/Pigmeat Market is the Atlantic market for production and trade of beef and pigmeat consists of countries that are Foot and Mouth Disease (FMD) free with vaccination or contain FMD free zones. Most countries in this market are located around the Atlantic Ocean and typically trade grass-fed beef and grain-fed pigmeat. See also Pacific beef/pigmeat market.

AT–LARGE ADVISORY COMMITTEE = РАСШИРЕННЫЙ СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ (или РАСШИРЕННЫЙ КОНСУЛЬТАТИВНЫЙ КОМИТЕТ) – At-Large Advisory Committee (Internet Corporation for Assigned Names and Numbers) ICANN's At-Large Advisory Committee (ALAC) is responsible for considering and providing advice on the activities of the ICANN, as they relate to the interests of individual Internet users (the 'At-Large' community). ICANN, as a private sector, non-profit corporation with technical management responsibilities for the Internet's domain name and address system, will rely on the ALAC and its supporting infrastructure to involve and represent in ICANN a broad set of individual user interests. On 31 October 2002, the ICANN Board adopted New Bylaws that establish the ALAC and authorize its supporting At-Large organizations. (Article XI, Section 2(4) of the New Bylaws.) The New Bylaws, which are the result of ICANN's 2002 reform process, went into effect on 15 December 2002. ALAC is to eventually consist of ten members selected by Regional At-Large Organizations, supplemented by five members selected by ICANN's Nominating Committee. To allow the ALAC to begin functioning immediately, the Transition Article of the Interim Bylaws provides for the Board to appoint ten members (two from each of ICANN's five regions) to an Interim ALAC. Underpinning the ALAC will be a network of self-organizing, self-supporting At-Large Structures throughout the world involving individual Internet users at the local or issue level. The At-Large Structures (either existing organizations or newly formed for this purpose) will self-organize into five Regional At-Large Organizations (one in each ICANN region – Africa, Asia-Pacific, Europe, Latin America/Caribbean, and North America). The Regional At-Large Organizations will manage outreach and public involvement and will be the main forum and coordination point in each region for public input to ICANN. / Расширенный Совещательный Комитет или Расширенный Консультативный Комитет (РКК (ALAC) Корпорации Интернета по Распределению Имён и Номеров (КИРИН) отвечает за предоставление рекомендаций по деятельности КИРИН, затрагивающей интересы индивидуальных пользователей Интернета (Расширенного сообщества). КИРИН, как частная некоммерческая корпорация, несущая ответственность за техническое управление системой доменных имен и адресов Интернета, опирается на РКК и его вспомогательную инфраструктуру для вовлечения индивидуальных пользователей в деятельность КИРИН и отражения широкого круга их интересов. 31 Октября 2002 Правление КИРИН приняло новый Устав, содержащий положения о создании РКК и наделении соответствующими полномочиями организаций Расширенного сообщества, поддерживающих этот комитет (Статья XI, раздел 2 (4) нового Устава.) Новый Устав, являющийся результатом процесса реформирования КИРИН в 2002, вступил в силу 15 Декабря 2002. В конечном итоге, в состав РКК должны входить десять членов, избираемых региональными организациями Расширенного сообщества, а также пять дополнительных членов, избираемых Комитетом по назначениям КИРИН. С целью незамедлительного начала работы РКК временная статья промежуточного Устава разрешала Правлению назначить десять членов (по два от каждого из пяти регионов КИРИН) для формирования переходного состава РКК. Основу РКК должна составлять всемирная сеть самоорганизующихся, автономных структур Расширенного сообщества, которые будут вовлекать в работу индивидуальных пользователей Интернета на разных уровнях. Структуры Расширенного сообщества (существующие организации либо новые организации, созданные для этой цели) будут объединены в пять региональных организаций Расширенного сообщества (по одной в каждом регионе КИРИН – Африка, Азиатско-Тихоокеанский регион, Европа, Латинская Америка, страны Карибского бассейна и Северная Америка). Региональные организации Расширенного сообщества будут руководить информационно-разъяснительной работой и вовлечением общественности, а также будут являться главным форумом и координационным центром в каждом регионе для получения корпорацией КИРИН предложений от общественности.

ATLAS = ALL TERRAIN LIFTER ARTICULATED SYSTEM

ATM = AIR TRAFFIC MANAGEMENT

ATM = ATMOSPHERE

ATM = AUTOMATED TELLER MACHINE

ATM OPTION = AT THE MONEY OPTION

ATMOSPHERE FOR PRECONDITIONING = АТМОСФЕРА ДЛЯ XX – Atmosphere For Preconditioning is the atmosphere used to partially dry the material before further treatment or conditioning. The atmosphere for preconditioning shall be maintained within the following limits:- (i) humidity:- 5–25%; and temperature:- not exceeding 50 °C.

ATMOSPHERIC CONDITIONS = АТМОСФЕРНЫЕ УСЛОВИЯ – In general, Atmospheric Conditions are the relative humidity, barometric pressure, and temperature existing at a given time.

ATMOSPHERIC FADING = АТМОСФЕРНОЕ ВЫЦВЕТАНИЕ (или АТМОСФЕРНОЕ ОБЕСЦВЕЧИВАНИЕ) – Atmospheric Fading:- fading can be divided into three main areas:- Sun, Ozone, and Fume. Sun Fading is the most common form of fading. Sunlight is comprised of light waves of different lengths. It is the ultraviolet waves that can damage the dye on the textile fibers, causing the colors to change or fade. Most fibers are treated with two or more dyes to produce the desired color. One of the dyes may be affected by sunlight more than the other. This would cause a change in color. If each dye is affected similarly, the overall color may appear lighter. Lighter color fibers usually fade more quickly because there is less dye to produce a color. Almost all carpets will fade eventually. Ozone and fume fading are sometimes combined together and called Atmospheric Fading. In this condition, dyes sometimes react and may change color when exposed to gaseous pollutants in the air. Fume Fading is a reaction to oxidizers of nitrogen or sulfur in the air. Ozone Fading is color change caused by ozone gas in the atmosphere. Ozone is that pleasant odor you

smell after a thunderstorm. The color change in atmospheric fading is slow and gradual, starting at the tips of the tuft and progressing toward the backing. The fibers may lighten, turn white, or change from one color to another depending on how many different dyes are affected. Color changes sometimes become apparent after cleaning and the cleaner is blamed. However, in many cases, the color change had gradually developed, but was not obvious due to the overall soil that had accumulated on the carpet. Cause:- oxidizers of nitrogen, sulfur, salt ozone in the air, and sunlight. The changing of color can be accelerated by heat and humidity. Corrective Measure:- once damage has been done to the carpet dye, there is nothing that can be done to correct. The only thing you can do is to try to inform the customer of the condition and record it on the invoice. See also Gas Fading. A method and system for compensating for atmospheric fading is used in a communication system wherein communication signals are exchanged between first and second earth stations via a satellite link, without increasing power of the satellite link. The method includes determining, at one or both of the earth stations, the signal power of a received signal and a signal-to-noise ratio of the received signal; calculating the difference in noise power spectral density in the received signal from that under clear sky conditions; calculating the downlink attenuation; determining the uplink attenuation, and commanding the transmitting earth station to increase its transmit power by an amount to compensate for the uplink attenuation. A corresponding system carries out the method. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ATMOSPHERIC PRESSURE = АТМОСФЕРНОЕ ДАВЛЕНИЕ – Atmospheric Pressure is a pressure exerted by the atmosphere at any specific location. Sea level pressure is approximately 14.7 pounds per square inch absolute. / Атмосферное Давление, гидростатическое давление, оказываемое атмосферой на все находящиеся в ней предметы. Атмосферное давление – существенная характеристика состояния атмосферы; в каждой точке атмосферы оно определяется весом вышележащего воздуха. С высотой атмосферное давление убывает; зависимость атмосферного давления от высоты выражается барометрической формулой. Измеряется атмосферное давление барометром. Атмосферное давление выражают в миллибарах (мбар), в Ньютонах на квадратный метр (Н/м^2) или высотой столба ртути в барометре в миллиметрах (мм), приведённой к 0 °С и нормальной (на уровне моря и широте 45°) величине ускорения силы тяжести. За нормальное атмосферное давление принимают 760 мм рт.ст. = 1 013.25 мбар = 101 325 Н/м^2. На высоте 5 километров (км) атмосферное давление равно приблизительно половине атмосферного давления у земной поверхности. На земной поверхности атмосферное давление изменяется от места к месту и во времени. Особенно важны непериодические изменения атмосферного давления, связанные с возникновением, развитием и разрушением медленно движущихся областей высокого давления – антициклонов и относительно быстро перемещающихся огромных вихрей – циклонов, в которых господствует пониженное давление. Отмеченные до сих пор крайние значения атмосферного давления (на уровне моря):- 808.7 и 684.0 мм рт.ст.. Однако, несмотря на большую изменчивость, распределение средних месячных значений атмосферного давления на поверхности земного шара каждый год примерно одно и то же. Среднегодовое атмосферное давление понижено у экватора и имеет минимум под 10° Северной широты (С.ш.). Далее атмосферное давление повышается и достигает максимума под 30–35° Северной и Южной широты; затем атмосферное давление снова понижается, достигая минимума под 60–65°, а к полюсам опять повышается. На это широтное распределение атмосферного давления существенное влияние оказывает время года и характер распределения материков и океанов. Над холодными материками зимой возникают области высокого атмосферного давления. Таким образом, широтное распределение атмосферного давления нарушается, и поле давления распадается на ряд областей высокого и низкого давлений, которые называются Центрами Действия Атмосферы. С высотой горизонтальное распределение давления становится более простым, приближаясь к широтному. Начиная с высоты около 5 км, атмосферное давление на всём земном шаре понижается от экватора к полюсам. В суточном ходе атмосферного давления обнаруживаются 2 максимума:- в 9–10 часов (ч) и 21–22 ч, и 2 минимума:- в 3–4 ч и 15–16 ч. Особенно правильный суточный ход оно имеет в тропических странах, где дневное колебание достигает 2.4 мм рт.ст., а ночное – 1.6 мм рт.ст.. С увеличением широты амплитуда изменения атмосферного давления уменьшается, но вместе с тем становятся более сильными непериодические изменения атмосферного давления.

ATMS = ADVANCED TRAFFIC MANAGEMENT SYSTEM

ATN = AERONAUTICAL TELECOMMUNICATIONS NETWORK

ATO = AUTHORITY TO OPERATE

ATO = AUTOMATIC TRAIN OPERATION

ATOMIC ABSORPTION SPECTROSCOPY = АТОМНАЯ АБСОРБЦИОННАЯ СПЕКТРОСКОПИЯ – Atomic Absorption Spectroscopy:- measures the radiation absorbed by chemically unbound atoms by analyzing the transmitted energy relative to the incident energy at each frequency. The procedure consists of diluting the fluid sample with methyl isobutyl ketone (MIBK) and directly aspirating the solution. The actual process of atomization involves reducing the solution to a fine spray, dissolving it, and finally vaporizing it with a flame. The vaporization of the metal particles depends upon their time in the flame, the flame temperature, and the composition of the flame gas. The spectrum occurs because atoms in the vapor state can absorb radiation at certain well-defined characteristic wave lengths. The wave length bands absorbed are very narrow and differ for each element. In addition, the absorption of radiant energy by electronic transitions from ground to excited state is essentially and absolute measure of the number of atoms in the flame and is, therefore, the concentration of the element in a sample. / метил изобутил кетон (МИБК; methyl isobutyl ketone (MIBK)).

ATOMIZATION = АТОМИЗАЦИЯ (или РАСПЫЛЕНИЕ) – Atomization is the conversion of a liquid into a spray of very fine droplets. / В технике под Измельчением понимается тонкое дробление (мельче 5 мм) какого-либо твёрдого продукта. Основные аппараты для измельчения – мельницы и бегуны. Измельчение применяют в горной, металлургической, химической, строительной, комбикормовой и других отраслях промышленности.

ATOMS = AIR TRAFFIC OPERATIONS MANAGEMENT SYSTEM

ATON = AIDS TO NAVIGATION

ATO SERVICE = AIR TRAFFIC OPERATIONS SERVICE

ATP = ACCREDITED TAX PREPARER

ATP = ADENOSINE TRIPHOSPHATE

ATP = AFTER TAX PROFIT

ATP = ARBITRAGE TRADING PROGRAM

ATP = AUTOMATIC TRAIN PROTECTION

ATPAC = AIR TRAFFIC PROCEDURES ADVISORY COMMITTEE

ATP AGEEMENT = AGREEMENT ON THE TRANSPORT OF PERISHABLES

AT PAR = ПО НОМИНАЛУ – At Par:- from the Italian 'Alla Pari' meaning 'At The Same Value'. It indicates that the price of the instrument is equal to its face or nominal value. / От Итальянского словосочетания Алла Пари (Alla Pari), означающее По Той Же Стоимости. Это указывает на то, что цена инструмента равна его лицевой или номинальной стоимости. По Номиналу, то есть по цене, равной нарицательной (указанной) стоимости ценной бумаги.

ATR = APPARENT TRANSLOCATION RATE

ATR = AUTOMATIC TRAFFIC RECORDER

ATR = AVERAGE TRUE RANGE

ATR CERTIFICATE = ADMISSION TEMPORAIRE ROULETTE CERTIFICATE

ATROPURPUREA = АТРОПУРПУРЭА (или ТЁМНО–АЛОЕ, или ТЁМНО–БАГРЯНОЕ, или ТЁМНО–ПУРПУРОВОЕ) – Atropurpurea:- deep magenta. / глубокий . Фуксин (magenta) – красная анилиновая краска.

ATS = AIR TRAFIC SERVICE

ATS = ALTERNATIVE TRADING SYSTEMS

ATS = AMERICAN TRAVEL SURVEY

ATS = AUSTRIAN SCHILLING

ATS = AUTOMATIC TRAIN SUPERVISION

ATS ACCOUNT = AUTOMATIC TRANSFER SERVICE ACCOUNT

AT SEA = НА МОРЕ (или НА ПЛАВУ) – At Sea:- in marine insurance this phrase applies to a ship which is free from its moorings and ready to sail.

ATSF RAILROAD = ATCHISON, TOPEKA AND SANTA FE RAILROAD

AT SIGHT = ПО ПРЕДЪЯВЛЕНИИ – At Sight is a note on a bill of exchange indicating that the payment is due on presentation of the bill. A phrase indicating that payment on a draft or other negotiable instrument is due upon presentation or demand. / Фраза, указывающая что платёж по тратте или иному оборотному инструменту должен быть произведён по предоставлению или по требованию.

ATT = ADVANCED TRANSPORT TELEMATICS

ATTACHMENTS = ПРИСПОСОБЛЕНИЯ – Attachments:- incorrect selection and/or adjustment for specific job intended. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или Дефект от машинного оборудования.

ATTACHMENT DATE = ДАТА ВСТУПЛЕНИЯ – Attachment Date is another term for inception date, being the date on which an insurance or reinsurance contract comes into force. / Ещё один термин для обозначения даты начала, являющейся датой, с которой договор страхования или перестрахования вступает в силу.

ATTACK = НАСТУПАТЬ (или НАПАДАТЬ, или АТАКОВАТЬ, или РАЗЪЕДАТЬ, или ПОРАЖАТЬ) – Attack:- (1) to cause growth retardation or an economic yield loss from disease, insect, bird or other pests. (2) To try to solve a problem at its source.

ATTAINABLE YIELD = ДОСТИГАЕМАЯ УРОЖАНОСТЬ – The Attainable Yield (Yt) is defined as the yield achieved in farmers' fields with best management practices including water, pest, and general crop management where nutrients are not limiting. The attainable yield varies – like the yield potential – from season to season and year to year depending on climate. The optimal economic yield is often linked to the attainable yield. The maximum attainable yield (Yt^1) in any given season could be close to the yield potential, if management is excellent and weather conditions are very favorable. For the development of site-specific fertilizer recommendations, we recommend using the attainable yield of the last 3–5 years as the yield target. In favorable rain-fed and irrigated areas, the yield target is often about 80–90% of the yield potential. In less favorable areas or seasons, this value is somewhat lower (70–80% of the yield potential). In any given region, 'Attainable Yield' (AY) is another important yield benchmark between Farm Yield (FY) and Potential Yield (PY (or PY_W)). It is defined here as the yield attained by a farmer from average natural resources when economically optimal practices and levels of inputs have been adopted while facing the vagaries of weather. Since risk of financial loss almost always forms part of a farmer's decision to invest in increased inputs, the attainable yield definition must temper 'optimum level' with 'prudent attention to risk'. As an example this could mean input investments must be expected to return a risk premium over and beyond the cost of capital. This premium is usually low in developed countries and/or where water supply is assured, but is higher in developing countries and under rainfed conditions. Of course attainable yield will reflect the economic circumstances of the crop and region – particularly grain prices relative to input costs, all measured at the farm gate. Although it is not easy to establish an appropriate attainable yield, general experience suggests that it will be ~20–30% below PY in situations where world prices and reasonable transport costs operate. Where this does not occur – for example, in much of Sub-Saharan Africa where infrastructure and institutions are weak – attainable yield (as defined above) may be much lower. Alternatively, where inputs and grain prices are heavily subsidised, it could more closely approach PY.

ATTEMPTED STOWAWAY = ПОКУСИВШИЙСЯ БЕЗБИЛЕТНЫЙ ПАССАЖИР (или ОПЫТНЫЙ БЕЗБИЛЕТНИК, или ОПЫТНЫЙ НЕЛЕГАЛЬНЫЙ ПАССАЖИР) – Attempted Stowaway is a person who is secreted on a ship, or in cargo which is subsequently loaded on the ship, without the consent of the shipowner or the master or any other responsible person, and who is detected on board the ship before it has departed from the port. / или хозямна (или капитана) или любого другого ответственного лица, и .

ATTENDED TERMINAL = ОБСЛУЖИВАЕМЫЙ ТЕРМИНАЛ – Attended Terminal is a card-accepting terminal requiring the involvement of a terminal operator/cashier. / Под Обслуживаемым Терминалом понимается терминал, принимающий карты и требующий вовлечения в это действие оператора/кассира терминала.

ATTENUATE = ОТТЯНУТОЕ (или УТОНЧЁННОЕ) – Attenuate:- gradually narrowed or tapered. / постепенно сужаемое или .

ATTENUATION = УТОНЕНИЕ (или УМЕНЬШЕНИЕ, или СМЯГЧЕНИЕ, или ИСТОЩЕНИЕ) – Attenuation, in spinning, the fibers are pulled out of a distaff or from a ball of roving into a strand of the desired diameter.

AT THE BEACH = НА ВЗМОРЬЕ – In the United Kingdom, when gas has been brought ashore to a terminal by producers but is not yet in the national transmission system, the gas is called At The Beach.

AT THE MARKET ORDER = РАСПОРЯЖЕНИЕ 'ПО РЫНКУ' (или ПОРУЧЕНИЕ 'ПО РЫНКУ') – At The Market Order is an order to buy or sell an asset at the best price obtainable at the time the order is received. At the Market Order is a term that instructs the broker to execute an order immediately at the current price at which the commodity is trading when the order enters the pit. It is also referred to as a Market Order. / Распоряжение 'По Рынку' – распоряжение купить или продать актив по лучшей цене, складывающейся на момент получения распоряжения. Известно также как Рыночное Распоряжение (Market Order).

AT THE MONEY OPTION = БЕСПРИБЫЛЬНЫЙ ОПЦИОН – This term refers to the situation where the exercise price of an option or warrant is close to the current spot price of the underlying asset. The intrinsic value of this option or warrant is therefore almost zero. An option whose strike price is equal to or approximately equal to the current market price of the underlying asset. At-The-Money Option (ATM Option):- when an option's exercise price is the same as the current trading price of the underlying commodity, the option is at-the-money. At-The-Money Option (ATM Option) is an option whose strike price is nearest the current price of the underlying deliverable. At-The-Money Option is an option with a strike price equal to the current price of the underlying futures contract. See also In-The-Money, and Out-Of-The-Money. At-the-Money refers to an option with a strike price that is equal to, or nearly equal to, the price of the underlying futures contract. / Бесприбыльный Опцион – опцион, сходная цена которого равна или почти равна текущей рыночной цене соответствующего актива.

AT THE MONEY STRIKE = БЕСПРИБЫЛЬНАЯ СХОДНАЯ – Term At The Money Strike refers to an option strike price that is equal to the current market price of the underlying asset. At The Money Strike is the strike price which is closest to the current price of the underlying asset. / Бесприбыльная Сходная цена – сходная цена опциона, равная или очень близкая к текущей цене соответствующего актива.

AT THE OPENING ORDER = РАСПОРЯЖЕНИЕ НА ОТКРЫТИЕ (или ПОРУЧЕНИЕ НА ОТКРЫТИЕ) – At The Opening Order is an investor's directive to her broker or brokerage firm to buy or sell specified securities in her account at the very beginning of the trading day. If the order cannot be executed at the opening of the market, it will be canceled. An investor might place an at-the-opening order based on something that happened after the market closed on the previous trading day that is expected to affect the stock's opening price on the following trading day. An at-the-opening order may not be executed at the security's exact opening price, but it should be within the opening range. Also known as On Open Order. / Распоряжение клиента брокеру заключить сделку по лучшей цене по открытии биржевой сессии по тому или иному активу. Известно также как Распоряжение На Открытие (On Open Order). Распоряжение на Открытие:- ценные бумаги:- распоряжение клиента брокеру совершить сделку или ограничить цену, которое должно быть полностью исполнено в момент начала торгов на бирже. Если распоряжение (или любое из его условий) не было исполнено в точности, то оно считается аннулированным. Фьючерсы/опционы:- распоряжение брокеру на открытие (market on open order), то есть контракт должен быть заключён в момент начала торгового дня, когда на бирже возникает больший разброс цен на заключаемые контракты.

ATTLA = AIR TRANSPORTABILITY TEST LOADING AGENCY

ATTORNEY = АТТОРНЕЙ (или ПОВЕРЕННЫЙ) – In the US patent law, an Attorney (may be referred to as a Practitioner or Representative) is an individual who is a member in good standing of the bar of any United States court or the highest court of any State and who is registered to practice before the Office of the United States Patent and Trademark Office (USPTO). In the United Kingdom, someone who is legally authorized to act for another, or a person practicing at the bar. In the USA, however, the term is more often used to denote a Lawyer. / В Соединённом Королевстве и Соединённых Штатах Америки под Атторнеем понимается Поверенный. Поверенный, сторона договора поручения. Полномочия поверенного удостоверяются доверенностью. Атторней:- наименование доверенного представителя, оказывающего юридические услуги доверителю.

ATTORNEY IN FACT = АТТОРНЕЙ ПО СУТИ – Attorney In Fact is a person appointed by a power of attorney to act on behalf of another person. A Lloyd's attorney in fact is a representative appointed by Lloyd's to represent Lloyd's and Lloyd's underwriters in a particular country or US state. An attorney in fact may be a natural person or a company and performs a similar role to a Lloyd's General Representative.

ATTRIBUTES OF COLOR = АТРИБУТЫ ЦВЕТА – Attributes Of Color:- (1) for the object mode of appearance, hue, lightness, and saturation. In the Munsell system, Munsell Hue, Munsell Value, and Munsell Chroma; and (2) for the illuminant or aperture mode, hue, brightness, and saturation.

ATTRITION MILLS = ПРЕДПРИЯТИЯ ПО ИСТИРАНИЮ – Attrition Mills:- machines for reducing materials into smaller particles by grinding down by friction. In the manufacture of acetate and triacetate fibers, equipment used in shredding pulp prior to acetylation. / шлифование (grinding).

ATUTC = ACTUAL TIMES USED TO COUNT

ATV = ACCURATE TRAFFIC VOLUME

ATV = ALL TERRAIN VEHICLE

ATVA = ALL–TERRAIN VEHICLE ASSOCIATION

AU = AFRICAN UNION

AU = AUSTRALIA

AUBURN = ЗОЛОТИСТО–КАШТАНОВОЕ (или КАШТАНОВОЕ, или КРАСНО–КОРИЧНЕВОЕ) – Auburn:- a moderate brown. / .

AUCHENORRHYNCHA = АУХЕНОРРИНХА – Auchenorrhyncha is a Suborder of Hemiptera in which the beak appears to rise from the inferior portion of the head and in which the tarsi have three tarsomeres.

AUCTION = АУКЦИОН – Auction:- let multiple buyers bid competitively for products from individual suppliers. Suitable for hard-to-move goods such as used capital equipment (forklifts) and surplus or excess inventory. Prices only move up, but buyers can buy below list prices while sellers sell for more than a liquidator pays. Auctions are becoming a feature of many Net markets, but some use auctions as their primary market mechanism. Examples:- AdAuction, TradeOut.com (used equipment). Auction, a public sale of goods to the highest bidder. Auctions are generally notified by advertisement, and are held in some open place. The biddings may be made either by parties present, or by the auctioneer under authority given to him; the sale is usually terminated by the fall of a hammer. / . Аукцион это способ продажи некоторых товаров, например, картин или пушнины, при котором товар или его образцы предварительно выставляют для осмотра. В форме аукциона производится принудительная продажа имущества

неплатёжеспособных должников. Аукционы широко распространены во внешней торговле. Аукцион, от Латинского слова Auctio, означающее Продажа С Публичного Торга, способ продажи некоторых товаров, например, пушнины, при котором товар (или образцы его) предварительно выставляют для осмотра. Наиболее распространён во внешней торговле. В форме аукциона производится принудительная продажа имущества неплатёжеспособных должников. Аукцион:- способ продажи отдельных видов товаров в виде публичного торга, проводимого в заранее установленном месте и в заранее обозначенное время с правом предварительного осмотра товаров. Товар на аукционе продаётся единичными образцами или партиями (лотами) тому покупателю, который предложит самую высокую цену. В процессе торга аукционист (лицо, проводящее аукцион) объявляет присутствующим потенциальным покупателям (аукционерам) о продаваемом товаре и его начальной стартовой цене. Затем аукционеры поочередно объявляют, называют повышающуюся цену, по которой они готовы купить товар. Торг продолжается до тех пор, пока не будет названа наивысшая цена. Это так называемый 'Английский' Аукцион. При 'Голландском' Аукционе торг начинается с очень высокой цены и ведётся с её понижением, пока не найдется покупатель, согласный купить по объявленной цене. Добровольный аукцион проводится по инициативе владельца товара.

AUCTION MARKET = АУКЦИОННЫЙ РЫНОК – Auction Market is a system by which securities are bought and sold through brokers on the securities exchanges, as distinguished from the over-the-counter market, where trades are negotiated. Best exemplified by the New York Stock Exchange, it is a double auction system or two-sided market. That is because, unlike the conventional auction with one auctioneer and many buyers, here we have many sellers and many buyers. As in any auction, a price is established by competitive bidding between brokers acting as agents for buyers and sellers. That the system functions in an orderly way is the result of several trading rules:- (i) the first bid or offer at a given price has priority over any other bid or offer at the same price; (ii) the high bid and low offer 'have the floor'; (iii) a new auction begins whenever all the offers or bids at a given price are exhausted; (iv) secret transactions are prohibited; and (v) bids and offers must be made in an audible voice. Also, the competitive bidding by which Treasury bills are sold. The system of trading securities through brokers or agents on an exchange. Buyers compete with other buyers while sellers compete with other sellers for the most advantageous price. Auction Market is a security exchange in which buyers make bids and sellers make offers in order to make transactions in a security. On an auction market, the current price for a share in a security is the highest price a buyer is willing to pay and the lowest price a seller is willing to accept. For example, if potential buyers for Security A enter bids of USD50, USD51, and USD52, and potential sellers enter offers of USD52, USD53, and USD54, the current share price is USD52. Only the bid/offer for USD52 is executed; others must make better bids and offers in order to conduct transactions. The New York Stock Exchange is a major auction market. Double Auction Market:- systems by which listed securities are bought and sold through brokers on the securities exchanges, as distinguished from the OTC market, where trades are negotiated. Unlike the conventional auction with one auctioneer and many buyers, double auction markets consist of many sellers and many buyers. Double Auction Market is a market in which multiple buyers compete to purchase many items that are simultaneously offered for sale. Sales are made to buyers willing to offer the highest price by sellers who are willing to offer the lowest price. The New York Stock Exchange is an example of a double auction market. / Система торговли ценными бумагами на бирже через брокеров или агентов. Покупатели конкурируют с другими покупателями, в то время как продавцы конкурируют с другими продавцами за наиболее привлекательную цену. Аукционный Рынок (ценных бумаг) – система, с помощью которой ценные бумаги покупаются и продаются через брокеров на биржах в отличие от внеучётного рынка (over-the-counter market), где торговые сделки заключаются на основе переговоров. Лучшим примером аукционного рынка является Нью Йоркская Фондовая Биржа (New York Stock Exchange), где используется двойная аукционная система (double auction system), или двусторонний рынок (two-sided market). В отличие от обычных аукционов (conventional auction), на которых существует один продавец и большое число покупателей, здесь много продавцов и много покупателей. Как и на любом аукционе, цена устанавливается с помощью конкурентных торгов между брокерами, действующими в качестве агентов покупателей и продавцов. Упорядоченное функционирование этой системы является результатом соблюдения нескольких правил ведения торгов:- (i) первая предлагаемая покупателем или запрашиваемая продавцом цена имеет приоритет перед любым другим предложением или запросом по той же цене; (ii) высокая предлагаемая покупателем цена и низкая предлагаемая продавцом цена уравниваются; (iii) новые аукционные торги начинаются тогда, когда больше не поступает запросов или предложений по данной цене; (iv) секретные сделки запрещены; (v) предложения и запросы должны делаться громко, в устной форме. Аукцион – это также конкурентное предложение цен, с помощью которого продаются казначейские векселя.

AUCTION PROCEDURE = АУКЦИОННАЯ ПРОЦЕДУРА (или ПРОЦЕДУРА АУКЦИОНА) – Auction Procedure is an auction-like public bid procedure for the issue of securities where the bidder submitting the highest bid wins the auction. There is no fixed issue price, subscribers are only given a minimum price. Depending on their interest, subscribers can submit higher bids. Securities are allotted starting from the highest to the lowest bid. A distinction is made between fixed rate tenders and variable rate tenders.

AUCTION RATE SECURITY = ЦЕННАЯ БУМАГА С АУКЦИОННОЙ СТАВКОЙ – Auction Rate Security is a debt security, typically issued by a municipality, in which the yield is reset on each payment date via a Dutch Auction. / Долговая ценная бумага, выпускаемая, как правило, муниципальными органами власти, у которой доходность пересматривается посредством Датского Аукциона на каждую дату платежа.

AUCTION REVENUE RIGHT = XX – Auction Revenue Right (ARR) is a financial instrument entitling its holder to auction revenue from Financial Transmission Rights (FTRs) based on locational marginal price (LMP) differences across a specific path in the Annual FTR Auction.

AUD = AUSTRALIAN DOLLAR

AUDIT = АУДИТ – Audit is a systematic examination of financial statements usually by an independent chartered accountant, with the objective of expressing an opinion on the truth and fairness with which the statements present the financial position, the results of operations and on whether the statements are drawn up in accordance with the relevant law and accounting standards. The auditor's opinion is customarily conveyed in the form of an audit report to those recipients of the financial statements for whose benefit he is appointed, usually the shareholders of a company. In reference to freight bills, the term audit is used to determine the accuracy of freight bills. Audit is the inspection of a business or other organization's accounting records and procedures. Done by a trained accountant from within the organization (internal audit) or by an outsider (independent audit) for the purpose of verifying the accuracy and completeness of the records. Audit is a methodical examination and review of business processes and/or business units, concluding with a detailed report of findings. Audit:- companies' financial statements are sometimes subjected to an audit by an independent accounting firm, meaning that the statements are objectively checked and verified to ensure fair and total disclosure to the stockholders. For public companies, an annual audit is mandatory. Quarterly reports are unaudited. Private firms can do what they want and seldom go to the trouble of incurring an audit and the associated audit fees. Audits are a strategic tool for managing standards. During a site or plant audit, clearly defined criteria are used to create a profile for topics pertaining to environment, safety or health, for example. / Заключение аудитора . Аудит – профессиональная оценка и проверка бухгалтерской документации

компании в целях вынесения заключения об их соответствии Общепринятым Принципам Бухгалтерского Учёта (Generally Accepted Accounting Principles).

AUDITING = АУДИТОРСКАЯ ДЕЯТЕЛЬНОСТЬ (или АУДИТОРСКАЯ ПРОВЕРКА) – Auditing is a determining the correct transportation charges due the carrier; auditing involves checking the freight bill for errors, correct rate, and weight. See also Audit. / Аудируемое лицо.

AUDIT INSPECTION = ИНСПЕКЦИЯ АУДИТА (или ПРОВЕРКА СЛУХА) – Audit Inspection is an examination to determine the reliability of prescribed quarantine procedures.

AUDIT JOURNAL = ЖУРНАЛ АУДИТА – Audit Journal is a chronological record of system activities which is sufficient to enable the reconstruction, review and examination of the sequence of environments and activities surrounding or leading to each event in the path of a transaction from its inception to the output of the final results. / выработка (output).

AUDITOR = АУДИТОР – Auditor:- the Certified Public Accountant whose role is to control the accounting and finances of a business entity and to provide information to the entity's management. The auditor's role is to verify the accounting records, cash assets and investment portfolio of the firm; to certify the completeness and accuracy of the financial statements; and to prepare reports providing information to the shareholders, managers or directors, and potential creditors and lenders.

AUDITOR'S REPORT = АУДИТОРСКИЙ ОТЧЁТ (или ОТЧЁТ АУДИТОРА) – Auditor's Report is a written communication issued by an independent certified public accountant (CPA) describing the character of his or her work and the degree of responsibility taken. An auditor's report includes a statement that the audit was conducted in accordance with generally accepted auditing standards (GAAS), which require that the auditor plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement, as well as a statement that the auditor believes the audit provides a reasonable basis for his or her opinion. See also Accountant's Report. Often called the Accountant's Opinion, it is the statement of the accounting firm's work and its opinion of the corporation's financial statements, especially if they conform to the normal and generally accepted practices of accountancy. See also Accountant's Opinion. Auditor's Report means a written report which is prepared by competent, independent, external audit personnel in accordance with the standards of the American Institute of Certified Public Accountants and the Information Systems Audit and Control Association and which (i) verifies the certifications contained in .50(B) above; (ii) contains a risk analysis of all aspects of the entity's information technology systems including, without limitation, computer operations, telecommunications, data security, systems development, capacity planning and testing, and contingency planning and testing; and (iii) contains the written response of the entity's management to the information provided pursuant to (i) and (ii) above. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Часто называемый Заключением Бухгалтера . Смотрите также Заключение Бухгалтера (Accountant's Opinion). , компьютерные операции, дальнюю связь, безопасность данных, . Аудиторский Отчёт – открытое заключение внешнего аудитора, сделанное после завершения проверки финансового состояния корпорации. Также называется Accountant's Opinion (Заключение Бухгалтера).

AUDIT TRAIL = АУДИТОРСКОЕ ОТСЛЕЖИВАНИЕ – Audit Trail:- the record of trading information identifying, for example, the brokers participating in each transaction, the firms clearing the trade, the terms and time or sequence of the trade, the order receipt and execution time and, ultimately, and when applicable, the customers involved. Reconstructs trading by explicitly aligning all member firms involved in a specific trade. Audit Trail:- for the purposes of the Benchmark-setting process, the documentation and retention of all relevant data, Submissions, other information, judgments (including the rationale for any exclusions of data), analyses and identities of Submitters used in the Benchmark-setting process for an appropriate period. System whereby each stage of a transaction is formally recorded. / Аудиторский След – пошаговая запись финансовых сделок, с помощью которой бухгалтерские данные могут быть прослежены вплоть до их источника. Правильность или подлинность записей бухгалтерского учёта могут быть подтверждены путём рассмотрения последовательности событий, в результате которых были получены соответствующие показатели.

AURANTICA = АУРАНТИКА (или ОРАНЖЕВОЕ) – Aurantica (-is, -um):- orange.

AURAT = AFRICAN UPLAND RICE ADVANCED TRIAL

AUREA = АУРЭА (или ЗОЛОТОЕ, или ЗОЛОТИСТОЕ) – Aurea (-a, -um):- golden. / , от Латинского слова Aurum, означающее Золото, понимается .

AURICLE = УШКИ (или ПРЕДСЕРДИЕ) – Auricle is:- (1) a pair of small ear-like appendages borne at the base of the leaf blade and usually arising at the sides where the ligule and the base of the collar are joined; (2) an ear-shaped appendage, usually occurring at the junction of the leaf sheath and the blade that may not be present in older leaves. Auricles:- (syn. Sickles) are a pair of small, ear-like appendages borne at the base of the blade and usually arising at the sides where the ligule and the base of the collar are joined. This structure may not persist on the older leaves. / Ушки листа.

AURICULATE = УХООБРАЗНОЕ (или УШКОВИДНОЕ, или УШКОВАТОЕ) – Auriculate:- ear-shaped.

AURICULATE LEAF = УХООБРАЗНЫЙ ЛИСТ (или УШКОВИДНЫЙ ЛИСТ) – Auriculate Leaf:- having auricle(s) – ear-shaped lobe(s) at the base of leaves or petals, e.g., Arabis caucasica.

AURON = AFRICAN UPLAND RICE OBSERVATIONAL NURSERY

AURPSS = AFRICAN UPLAND RICE PRELIMINARY SCREENING SET

AUSFTA = AUSTRALIA–US FREE TRADE AGREEMENT

AUS RICE = РИС АУС – Aus Rice is a photoperiod-insensitive, rainfed, drought-prone, lowland, or upland Rice, broadcast and transplanted during the early part of the wet season from March to September in Bangladesh and from April to August in East India. The dominant food crop of Bangladesh is Rice, accounting for about 75 percent of agricultural land use (and 28 percent of GDP). Rice production increased every year in the 1980s (through 1987) except FY 1981, but the annual increases have generally been modest, barely keeping pace with the population. Rice production exceeded 15 million tons for the first time in FY 1986. In the mid-1980s, Bangladesh was the fourth largest Rice producer in the world, but its productivity was low compared with other Asian countries, such as Malaysia and Indonesia. It is currently the world's sixth-largest producer. Highyield varieties of seed, application of fertilizer, and irrigation have increased yields, although these inputs also raise the cost of production and chiefly benefit the richer cultivators. The cultivation of Rice in Bangladesh varies according to seasonal changes in the water supply. The largest harvest is Aman, occurring in November and December and accounting for more than half of annual production. Some Rice for the Aman harvest is sown in the spring through the broadcast method, matures during the summer rains, and is harvested in the fall. The higher yielding method involves starting the seeds in special beds and transplanting during the summer monsoon. The second harvest is Aus, involving traditional strains but more often including high-yielding, dwarf varieties. Rice for the Aus harvest is sown in March or April, benefits

from April and May rains, matures during in the summer rain, and is harvested during the summer. With the increasing use of irrigation, there has been a growing focus on another Rice-growing season extending during the dry season from October to March. The production of this Boro Rice, including high-yield varieties, expanded rapidly until the mid-1980s, when production leveled off at just below 4 million tons. Where irrigation is feasible, it is normal for fields throughout Bangladesh to produce Rice for two harvests annually. Between Rice-growing seasons, farmers will do everything possible to prevent the land from lying fallow and will grow vegetables, peanuts, pulses, or oilseeds if water and fertilizer are available. See also Aman Rice.

AUSSIE BONDS = ОБЛИГАЦИИ ОЗИ – Aussie Bonds are bonds issued by foreign borrowers in Australian Dollars (AUD). / Облигации, выпущенные иностранными заёмщиками в Австралийских Долларах (AUD).

AUSTRALIAN CLEARING HOUSE (PTY LTD) = АВСТРАЛИЙСКАЯ КЛИРИНГОВАЯ ПАЛАТА (ПИ.ТИ.УАЙ. ЭЛ.ТИ.ДИ.) – The Australian Clearing House Pty Ltd, the subsidiary of the Australian Securities Exchange (ASX) which clears options and futures traded on ASX. / Австралийская Клиринговая Палата Пи.Ти.Уай. Эл.Ти.Ди., дочерняя компания Австралийской Биржи Ценных Бумаг (АБЦБ), которая производит перерасчёты по опционам и фьючерсам, торгуемым на АБЦБ.

AUSTRALIAN SECURITIES AND INVESTMENT COMMISSION = АВСТРАЛИЙСКАЯ КОМИССИЯ ПО ЦЕННЫМ БУМАГАМ И ИНВЕСТИЦИЯМ – Australian Securities and Investments Commission (ASIC) is the Government body responsible under the Corporations Law for regulating companies, company borrowings, and investment advisers and dealers. ASIC is Australia's corporate, markets and financial services regulator. We contribute to Australia's economic reputation and wellbeing by ensuring that Australia's financial markets are fair and transparent, supported by confident and informed investors and consumers. We are an independent Commonwealth Government body. We are set up under and administer the Australian Securities and Investments Commission Act (ASIC Act), and we carry out most of our work under the Corporations Act. The Australian Securities and Investments Commission Act 2001 requires us to:- (i) maintain, facilitate and improve the performance of the financial system and entities in it; (ii) promote confident and informed participation by investors and consumers in the financial system; (iii) administer the law effectively and with minimal procedural requirements; (iv) enforce and give effect to the law; (v) receive, process and store, efficiently and quickly, information that is given to us; and (vi) make information about companies and other bodies available to the public as soon as practicable. ASIC's priorities are:- (i) assist and protect retail investors and consumers in the financial economy; (ii) build confidence in the integrity of Australia's capital markets; (iii) facilitate international capital flows and international enforcement; (iv) manage the domestic and international implications of the global financial turmoil; (v) lift operational effectiveness and service levels for all ASIC stakeholders; and (vi) improve services and reduce costs by using new technologies and processes. We regulate Australian companies, financial markets, financial services organisations and professionals who deal and advise in investments, superannuation, insurance, deposit taking and credit. As the consumer credit regulator, we license and regulate people and businesses engaging in consumer credit activities (including banks, credit unions, finance companies, and mortgage and finance brokers). We ensure that licensees meet the standards – including their responsibilities to consumers – that are set out in the National Consumer Credit Protection Act 2009. As the markets regulator, we assess how effectively authorized financial markets are complying with their legal obligations to operate fair, orderly and transparent markets. We also advise the Minister about authorizing new markets. On 2010-August-01, we assumed responsibility for the supervision of trading on Australia's domestic licensed equity, derivatives and futures markets. As the financial services regulator, we license and monitor financial services businesses to ensure that they operate efficiently, honestly and fairly. These businesses typically deal in superannuation,managed funds, shares and company securities,derivatives, and insurance. We have powers to protect consumers against misleading or deceptive and unconscionable conduct affecting all financial products and services, including credit. In pursuit of its statutory aims and regulatory objectives, ASIC works closely with a range of international organisations, foreign regulators and law enforcement agencies. ASIC also works with other regulators and organizations in Australia and you may wish to consider whether or not your enquiry falls within their areas of responsibility. Headquartered in Melbourne, VIC, Australia.

AUSTRALIAN SECURITIES EXCHANGE (LIMITED) = АВСТРАЛИЙСКАЯ БИРЖА ЦЕННЫХ БУМАГ (ЛИМИТИД) – As one of the world's top 10 listed exchange groups, measured by its market capitalization, ASX Group was created through the merger of the Australian Stock Exchange Limited (ASX, or ASX Limited) and the Sydney Futures Exchange Corporation Limited (SFE, or SFE Corporation Limited). ASX Group operates under the brand, Australian Securities Exchange. The Australian Securities Exchange operates the Australian Stock Exchange Limited and the Sydney Futures Exchange and facilitates trading in securities and derivatives such as shares, futures, options and warrants. ASX also provides market data, for example share prices, and related information including stock market announcements and market education. Helping listed companies raise capital, providing opportunities for investors to build their wealth, enabling buyers and sellers to transact with confidence:- ASX plays a crucial role in sustaining the health of the Australian economy. SFE Corporation Limited provides exchange-traded and over-the-counter financial services to institutions throughout the Asia-Pacific region and globally through its operating subsidiaries Sydney Futures Exchange Limited, SFE Clearing Corporation Pty Ltd and Austraclear Limited. On 2006-July-25 SFE Corporation Limited merged with the Australian Stock Exchange Limited, making the combined entity the ninth largest listed exchange in the world which offers an integrated suite of products and services covering cash and derivatives markets. The ASX Group's origins as a national exchange go back to 1987. The Australian Stock Exchange Limited was formed in 1987 after the Australian Parliament drafted legislation that enabled the amalgamation of six independent state-based stock exchanges. Each of those exchanges brought with it a history of share trading dating back to the XIX century. In 2006 The Australian Stock Exchange merged with the Sydney Futures Exchange and originally operated under the name Australian Securities Exchange. Later, however, ASX launched a new group structure to better position it in the contemporary financial market environment. From 2010-August-01 the Australian Securities Exchange has been known as the ASX Group. ASX Group (ASX) is an umbrella brand developed to reflect the role of ASX Limited as the holding company of a group with a diverse range of market service activities linked by a common commitment to provide the infrastructure Australia needs to create a globally competitive capital market and a vibrant, robust economy. ASX Group was created by the merger of the Australian Stock Exchange and the Sydney Futures Exchange in July 2006 and is today one of the world's top-10 listed exchange groups measured by market capitalization. ASX is a multi-asset class, vertically-integrated exchange group whose activities span primary and secondary market services, including the raising, allocation and hedging of capital flows, trading and price discovery (Australian Securities Exchange); central counterparty risk transfer (via subsidiaries of ASX Clearing Corporation); and securities settlement for both the equities and fixed income markets (via subsidiaries of ASX Settlement Corporation). ASX functions as a market operator, clearing house and payments system facilitator. It also oversees compliance with its operating rules, promotes standards of corporate governance among Australia's listed companies and helps to educate retail investors. The domestic and international customer base of ASX is diverse. It includes issuers (such as corporations and trusts) of a variety of listed securities and financial products; investment and trading banks; fund managers; hedge funds; commodity trading advisers; brokers and proprietary traders; market data vendors; and retail investors. In addition to its role as a market operator, ASX relies on a range of subsidiary brands to monitor and enforce compliance with its operating rules. These subsidiaries are:- (i) Australian Securities Exchange – handles ASX's primary, secondary and derivative market services. It

encompasses ASX (formerly Australian Stock Exchange) and ASX 24 (formerly Sydney Futures Exchange). (ii) ASX Clearing Corporation – is the brand under which ASX's clearing services are promoted. It encompasses ASX Clear (formerly the Australian Clearing House) and ASX Clear (Futures) (formerly SFE Clearing Corporation). (iii) ASX Settlement Corporation – is the brand under which ASX Group's settlement services are promoted. It encompasses ASX Settlement (formerly ASX Settlement and Transfer Corporation) and Austraclear. (iv) ASX Compliance – is the brand under which services are provided to the ASX Group for the ongoing monitoring and enforcement of compliance with the ASX operating rules. This entity replaces ASX Markets Supervision. The oversight work performed by ASX's subsidiaries ensures that it provides fair and reliable systems, processes and services that instill confidence in the markets that depend on its infrastructure. Confidence in the operations of ASX is reinforced by the market supervision and regulatory role undertaken by the Australian Securities and Investments Commission (ASIC) across all trading venues and clearing and settlement facilities, as well as through the Reserve Bank of Australia's oversight of financial system stability. ASIC also supervises ASX's own compliance as a listed public company. The ASX was formed in 2006 following the merger of the Sydney Futures Exchange with the Australian Stock Exchange. Website:- http://www.asx.com.au. The Australian Securities Exchange (ASX) was created by the merger of the Australian Stock Exchange and the Sydney Futures Exchange in July 2006. It is the primary stock exchange group in Australia. On 2010-August-01, ASX launched a new brand and group structure. ASX Group became the overarching name, replacing Australian Securities Exchange, which remains as the name of the listings and trading arm of the ASX Group. ASX functions as a market operator, clearing house and payments system facilitator. It oversees compliance with its operating rules, promotes standards of corporate governance among Australia's listed companies. It has a role in the education of retail investors, providing educational materials relating to its products including free online courses. ASX offers products and services including shares; futures, exchange traded options, warrants, contracts for difference, exchange traded funds, real estate investment trusts, listed investment companies and interest rate securities. The biggest stocks traded on the ASX, in terms of their market capitalization, include BHP Billiton, Commonwealth Bank of Australia, Westpac, Telstra Corporation, Rio Tinto, National Australia Bank and Australia and New Zealand Banking Group. As at March 2010 the three largest sectors by market capitalization were financial (36%), metal and mining (22%) and consumer (13%). The major market index is the S&P/ASX 200, an index made up of the top 200 shares in the ASX. This supplanted the previously significant All Ordinaries index, which still runs parallel to the S&P ASX 200. Both are commonly quoted together. Other indices for the bigger stocks are the S&P/ASX 100 and S&P/ASX 50.

AUSTRALIAN STOCK EXCHANGE LIMITED = АВСТРАЛИЙСКАЯ ФОНДОВАЯ БИРЖА ЛИМИТИД – The Australian Stock Exchange Limited (ASX) began as six separate exchanges established in the state capitals Melbourne, VIC (1861), Sydney, NSW (1871), Hobart, TAS (1882), Brisbane, QLD (1884), Adelaide, SA (1887) and Perth, WA (1889). A further exchange in Launceston merged into the Hobart exchange. The first interstate conference was held in 1903 at Melbourne Cup time. The exchanges then met on an informal basis until 1937 when the Australian Associated Stock Exchanges (AASE) was established, with representatives from each exchange. Over time the AASE established uniform listing rules, broker rules, and commission rates. Trading was conducted by a call system, where an exchange employee called the names of each company and brokers bid or offered on each. In the 1960s this changed to a post system. Exchange employees called 'chalkies' wrote bids and offers in chalk on blackboards continuously, and recorded transactions made. The Australian Stock Exchange Limited (ASX) was formed in 1987 by legislation of the Australian Parliament which enabled the amalgamation of six independent stock exchanges that formerly operated in the state capital cities. After demutualisation the ASX was the first exchange in the world to have its shares quoted on its own market. The ASX was listed on 1998-October-14. On 2006-July-07 the Australian Stock Exchange merged with SFE Corporation, holding company for the Sydney Futures Exchange. The main Australian market place for trading equities, government bonds and other fixed interest securities. Headquartered in Sydney, Australia. See also Australian Securities Exchange. The Australian Stock Exchange Limited (ASX) was formed on 1987-April-01, through incorporation under legislation of the Australian Parliament. The formation of this national stock exchange involved the amalgamation of the six independent stock exchanges that had operated in the states' capital cities. 1987:- Launch of the Stock Exchange Automated Trading System (SEATS). It was a far cry from the original system which dated back over 100 years. During that time there had been three different forms of trading on the Australian stock exchanges. The earliest was the auction-based call system, which saw a stock exchange employee (the Caller) call the name of each listed security in turn while Members bid, offered, sold or bought the stock at each call. This system proved inadequate to handle the increased volume of trading during the mining booms. It was replaced by the 'post' system in the early 1960s, which involved stocks being quoted on 'posts' or 'boards'. 'Chalkies' were employed by the Stock Exchange and it was their function to record in chalk the bids and offers of the operators (employees of stockbrokers) and the sales made. This system stayed in place until 1987. In 1987, the all-electronic SEATS trading system (below) was introduced. It started on just a limited range of stocks; progressively all stocks were moved to it and the trading floors were closed in 1990. / Главная Австралийская рыночная площадка для торговли акциями, государственными облигациями и иными ценными бумагами с фиксированным процентом. Смотрите также Австралийская Биржа Ценных Бумаг (Australian Securities Exchange). Австралийская Фондовая Биржа (АФБ) – шесть формально независимых торговых площадок (бирж) в Аделаиде, Брисбене, Хобарте (Штата Тасмания), Мельбурне, Перте и Сиднее; связаны через Автоматизированную Систему Торговли Фондовой Биржи (АСТФБ; Stock Exchange Automated Trading System (SEATS)). Администрация находится в Сиднее. Движение цен наиболее важных Австралийских акций отслеживается через индекс по всем обыкновенным акциям (allordinaries index). Урегулирование сделок происходит в течение пяти рабочих дней после их заключения; для менее активно обращающихся акций этот срок иногда продлевается. В Октябре 1993 на бирже была введена компьютерная система Гибкого Вспомогательного Перевода Ценных Бумаг (Flexible Auxiliary Security Transfer (FAST)). SEATS работает с 10:00 до 16:00, кроме Субботы и Воскресенья; в другое время сделки можно заключать в соответствии с правилами внебиржевой торговли после закрытия биржи.

AUSTRALIA–US FREE TRADE AGREEMENT = СОГЛАШЕНИЕ О СВОБОДНОЙ ТОРГОВЛЕ МЕЖДУ АВСТРАЛИЕЙ И США – Australia-US Free Trade Agreement (AUSFTA) is a bilateral agreement negotiated between the United States and Australia that came into force on 01 January 2005. AUSFTA covers goods, services, investment, financial services, government procurement, standards and technical regulations, telecommunications, competition-related matters, electronic commerce, intellectual property rights, labour and the environment.

THE AUSTRIAN REAL–TIME INTERBANK SETTLEMENT SYSTEM = АВСТРИЙСКАЯ СИСТЕМА МЕЖБАНКОВСКИХ РАСЧЁТОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – The Austrian national central bank's (Österreichische Nationalbank (ÖNB)) operational role in the payments sector is limited to the settlement of interbank transfers. For this purpose the OeNB operates the Austrian Real-Time Interbank Settlement System (ARTIS), which is the Austrian component of TARGET. There is one main clearing system in Austria – ARTIS. ARTIS (Austrian Real Time Interbank Settlement System) is Austria's TARGET-linked RTGS system. This is operated by the Österreichische Nationalbank. The Austrian Real-time Interbank Settlement System (ARTIS) was launched in July 1997. It was adapted to meet the requirements of TARGET, successfully starting as the Austrian component of TARGET on 1999-January-01. Originally, communication within ARTIS was based on the existing electronic banking communication (EBK) system, which had been in use since 1989. When ARTIS began operation in 1999, SWIFT and direct access (ARTIS Online PC) were added as

options to access ARTIS. ARTIS consists of two components:- communication (transmission of messages) and payment order management/account management. In the 'payment order management/account management' component, the orders are processed (queue management, posting and relevant information functions, management of intraday credits) and posted into the participants' giro accounts at the OeNB. ARTIS is a system of highest integrity with various means of safeguarding the availability of the system and the correct execution of payment orders. ARTIS is designed to make system failure highly improbable. All connections in the network are doubled, so there is a backup for every single line within the system. Moreover, contingency measures are implemented as demanded by the European Central Bank (ECB). If there is a break in the connection between the participant and ARTIS (problems on the part of the participant, line problems, network problems), it is possible for participants to place their payment orders conventionally, i.e. by telex, telephone or fax. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Ёстэрайхишэ Национальбанк (Ё.Эн.Бэ.; Österreichische Nationalbank (ÖNB)). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

AUSTRIAN SHADES = АВСТРИЙСКИЕ ТЕНИ – Austrian Shades are the shades made of fabric shirred across the width of the shade. When drawn up, Austrian shades hang in graceful loops of fabric. See also Shirring.

AUTARKY = АВТАРКИЯ (или САМОДОСТАТОЧНОСТЬ, или САМОУДОВЛЕТВОРЁННОСТЬ) – Autarky is a nation or entity that is self-sufficient. A political/economic term, Autarky comes from the Greek Autarkeia - Autos, meaning Self and Arkein, meaning To Be Strong Enough or Sufficient. Autarky is achieved when an entity, such as a political state, is self-sufficient and exists without external aid. Autarky is a state of independence. For example, a country that is functional without partaking in any international trade. From an economic view, autarky involving the elimination of foreign trade has proved unsuccessful, and is more of an Utopian ideal. Autarky, an economic system of self-sufficiency and limited trade. A country is said to be in a complete state of autarky if it has a closed economy, which means that it does not engage in international trade with any other country. Historically, societies have utilized different levels of autarky. The mercantilist policies followed by western European countries from the XVI to the XVIII century, which tried to augment state power in part by limiting international trade, were autarkic. A more extensive form of autarky was pursued by Nazi Germany (1933–45), which tried to maximize trade within its own economic bloc and .... Autarky is an economic policy to have a closed economy and not allow any external trade. In practice a policy of autarky may refer to attempts to reduce a country's dependence on external trade. For example, imposing tariffs and quotes may restrict trade even if it can not be entirely abolished. In the XIX century, Japan was an example of a closed economy with virtually no contact with the outside world. Hitler pursued a policy of autarky. It was his ambition to make Germany self sufficient. However, this policy of autarky was dependent on his other policy of lebensraum which involved increasing the size of Germany through conquest. In practice Hitler never achieved autarky and depended on the import of oil, even though Germany did expand to include all occupied territories. / Под Автаркией, от Греческого слова Autárkeia, от слов Autós,означающее Сам, и Arkéō, означающее Нахожусь В Достатке или Самодостаточностью или Самоудовлетворённостью, в экономическом отношении понимается создание замкнутого самодовлеющего хозяйства в рамках отдельной капиталистической страны, ведущее к разрыву традиционных экономических международных связей. В чистом виде автаркия существовала только в докапиталистических формациях в условиях натурального хозяйства. Политика автаркии идёт вразрез с требованиями международного разделения труда. В эпоху империализма, когда все страны тесно связаны системой международных экономических отношений, имеются лишь автаркические тенденции, возникающие в результате обострения противоречий капитализма. Эти тенденции с наибольшей силой действовали в 1930-х, когда в результате мирового экономического кризиса 1929–33 произошёл разрыв ранее существовавших внешнеторговых и других экономических отношений и государства проводили политику 'разорения соседа'. В наиболее агрессивных империалистических государствах политика автаркии стала служить целям создания относительно замкнутого хозяйства, способного производить всё необходимое для ведения войны в условиях экономической блокады. Автаркия была официальной экономической теорией фашизма. После 2-й Мировой Войны автаркические тенденции (высокие заградительные пошлины) в какой-то мере были присущи некоторым замкнутым торгово-экономическим блокам (Европейское Экономическое Сообщество, Европейская Ассоциация Свободной Торговли). Автаркия – экономический режим страны, предполагающий её самообеспечение и отсутствие торгового обмена с другими странами. Введение автаркии в данном экономическом пространстве полностью исключает любые торговые обмены. В международных отношениях используется как стремление проводить изоляционную политику. Для достижения этой цели требуется строгая регламентация рынка, постоянный поиск возможностей для удовлетворения потребностей исключительно за счёт собственных средств страны. Политика автаркии отражает, как правило, нездоровое состояние экономики, основывается на болезненно обострённом чувстве патриотизма, желании избежать превращения экономики в придаток мировой экономики. Политика автаркии проводилась в разные годы разными странами (Германия, Союз Советских Социалистических Республик (СССР), Италия и другие). Автаркия противоречит закономерностям развития мировой экономики, снижает её эффективность, обусловливает хозяйственную отсталость. Автаркия (Autarky) – это система замкнутой экономической системы, с отсутствием внешних связей, где обмен с другими государствами сведён к минимуму. Государство-автаркия подразумевает свою самообеспеченность и самодостаточность, ориентированную на производство для внутреннего рынка с отсутствием привоза (или импорта), снижая тем самым внешний товарный оборот. Данная система существует всегда, когда национальные производства могут продолжать выпуск товаров без помощи международной торговли. Нужно отметить, что термин автаркии не обязательно может относиться к экономическому понятию. Существует также и военная автаркия – государство, способное к защите своего суверенитета без посторонней помощи. Суть автаркии заключается в создании независимой от других, замкнутой экономики, которая способна обеспечить всем необходимым, не прибегая к посторонней помощи других государств. Цель такой системы – не быть придатком мировой экономики, развитие идеологии, основанной на повышении чувства патриотизма. Именно эти черты автаркии способствуют низкой эффективности такой экономики. Обеспечивая всеми силами государство, данный вид экономической системы не способен концентрировать на отдельном виде производства, повышая его качество и производительность. Все это ведёт к экономической отсталости страны из-за различий в развитии с развитием мировой экономики. По своей сути политика автаркии является утопической и практически не возможна на сегодняшний день из-за развития процесса глобализации. Даже, казалось бы, современная Северная Корея, политика которой основана на идеологии чучхе (то есть полагаться только на свои силы) ещё в далёком 1994 стала активно участвовать в международной торговле. Такая экономическая система невозможна даже для развитых и богатых природными и иными ресурсами государств. Она губительна для хозяйственной деятельности и наносит непоправимый вред экономике государства, развивая отсталость в научно-техническом прогрессе,

уровень благосостояния населения, экономическую эффективность. Исторических примеров автаркии множество:- СССР, Третий Рейх, Народная Социалистическая Республика Албания, Северная Корея и так далее. Автаркия:- слово заимствовано из Греческого языка. Сфера использования – философия и экономика. Первоначально им определяли независимость от всех вещей внешнего мира или от людей:- мудрецу стоику достаточно самого себя. Затем этот смысл перенесли до уровня отношений между странами. Автаркией стали называть состояние экономического самообеспечения, независимости страны от внешних торговых и инвестиционных связей. На первый взгляд, значение слова в его уже начальном использовании оказалось оторванным от первичного смысла. Греческое Autarkhia от Auto = Авто-, Само- + Archy = Правление, Власть. Это означает, что Autarchy – форма правления с неограниченным бесконтрольным полновластием одного лица, то есть автократия. Именно так и переводится Английское слово Autarchy. Но ещё его переводят и как Автаркия – самообеспечение, как доказательство изменения первоначального смысла. На самом деле слово Автаркия произошло от Греческого Αὐτάρκεια, что означает Самодостаточный. В Русском языке слово имеет два значения Самоуправление и Самообеспечение. Смысл близок, но тем не менее в Греческом языке Управление Единовластием это другое слово – Αὐταρχία. В Английском языке ситуация похожа на ситуацию в Греческом. Есть два слова, которые часто путают – Autarchy и Autarky. Самообеспечение – это Autarky. В современной экономической лексике Автаркией обозначают экономику, ориентированную вовнутрь, на саму себя, на развитие без связей с другими странами. В этом плане автаркия – закрытая экономика, экономика, предполагающая абсолютный суверенитет. Автаркия как абсолютный экономический суверенитет страны в глобальной экономике XXI века – не реален. Идея автаркии на практике является утопической. Страны, которые пытались её осуществить, не смогли поднять экономику и выбраться из нищеты. Даже Северная Корея, часто приводимая в качестве примера автаркической страны, таковой давно уже не является – ещё в 1994 Президентом КНДР Ким Ир Сеном был объявлен отход от идеологии чучхе (стратегии опоры на свои собственные силы) и взят курс на участие в международной торговле. Причина неэффективности автаркии по сравнению с открытыми странами – специализация. Если страна производит все необходимые товары, то она не может сконцентрировать усилия только на одном, чтобы улучшить его качество или увеличить производительность его производства. Автаркия предстает не столько как понятие, отражающее существующую экономическую реальность, сколько как инструмент экономического анализа. В этом, инструментальном качестве, автаркия позволяет показать, в какой точке между двумя полюсами – открытой экономикой и автаркией – должна находиться конкретная национальная экономика с позиций устойчивого экономического роста. Доказано, например, что к полюсу Открытая Экономика должны тяготеть малые страны – они получают более ощутимые выгоды от внешних связей. Большие же страны с их огромным внутренним рынком обречены находиться ближе к полюсу Автаркия. Поэтому смысл автаркии оказывается неразрывно связан с размером страны. Автаркия:- политика экономического обособления, проводимая страной, регионом. Автаркия направлена на создание замкнутой, независимой экономики, способной обеспечить себя всем необходимым самостоятельно. Автаркия сродни натуральному хозяйству.

AUTHENTICATION = АУТЕНТИФИКАЦИЯ (или УДОСТОВЕРЕНИЕ ПОДЛИННОСТИ) – (1) Authentication is a proof by means of a signature or otherwise that a certain document or certain data is of undisputed origin and genuine. / Аутентификация или Удостоверение Подлинности – идентификация сертификата на облигацию с целью подтверждения того, что она была выпущена в рамках данного соглашения о выпуске ценных бумаг; этот факт служит подтверждением её подлинности. Также юридическое подтверждение подлинности документа, например путём сертификации и печати уполномоченного официального лица.

(2) Authentication is a verification of identity. A process by which the identity of a user accessing a network or other source of information is verified. Authentication is a generic term for a check performed to ensure that two parties are communicating with each other and not with a fraudulent third party. Successful authentication of SWIFT messages also confirms that the message content has not been changed during transmission. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

(3) Authentication is a determining that the instruction to pay is given by the genuine account holder. For cheques this is part of the pay/no pay decision, which takes place near the end of the clearing process.

(4) Authentication is a process used between a sender and a receiver to provide data origin verification.

AUTHORISATION = АВТОРИЗАЦИЯ – (1) Authorisation or authorization is a determining that the payment can be made, for example, that there are sufficient funds in the account. For cheques this is part of the pay/no pay decision, which takes place near the end of the clearing process.

(2) Authorisation is the approval or guarantee of funds given by the card issuer or, on behalf of the card issuer by the acquirer (or his agent).

AUTHORISED CAPITAL = РАЗРЕШЁННЫЙ КАПИТАЛ (или УСТАВНЫЙ КАПИТАЛ) – Authorised Capital:- the amount of share capital which a company is permitted to issue. Also known as Nominal Capital. See also Issued Capital, Paid-Up Capital, and Uncalled Capital. / Сумма акционерного капитала, на которую компания получила разрешение на выпуск. Известен также как Номинальный Капитал (Nominal Capital). Смотрите также Выпущенный Капитал (Issued Capital), Оплаченный Капитал (Paid-Up Capital) и Неоплаченный Капитал (Uncalled Capital). Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), необходимая для начала его деятельности и определённая его уставом или договором об основании предприятия, акционерного общества, компании, корпорации или иного объединения предпринимателей. Уставный капитал формируется в основном за счёт выручки от продажи акций, а также вложений частных капиталов или государственных средств. Для обозначения уставного капитала употребляются также термины Акционерный Капитал, Основной Капитал, Разрешённый Капитал. Законодательством ряда стран (Германия, Франция) устанавливается обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В Великобритании и Соединённых Штатах Америки размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с резервным капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при высоких темпах инфляции предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций. Уставный Фонд предприятий в бывшем Союзе Советских Социалистических Республик (СССР), материальные и денежные средства, безвозмездно выделяемые государством в постоянное распоряжение и управление социалистическому государственному производственному предприятию (объединению). Уставный фонд – основной источник собственных средств предприятия; из него формируются основные и оборотные средства. Большая часть уставного фонда (в промышленности примерно 4/5) сосредоточена в основных средствах. Первоначальный размер уставного фонда

определяется уставом или действующим положением предприятия (объединения). В процессе хозяйственной деятельности размер уставного фонда увеличивается, если предприятию выделяются дополнительные средства, или уменьшается (при изъятии части средств). Изменения уставного фонда в течение года осуществляются в строго определённых законодательством случаях. Основные факторы увеличения уставного фонда:- финансирование централизованных капитальных вложений, ввод в действие производственных основных фондов за счёт фонда развития производства, осуществление капитального ремонта и модернизации оборудования, а также пополнение оборотных средств. Уставный фонд может увеличиться в результате пополнения оборотных средств за счёт государственного бюджетного финансирования, прибыли предприятия или средств вышестоящей организации в порядке перераспределения, переоценки товарно-материальных ценностей по решению правительства. Уменьшение уставного фонда наступает в связи с безвозмездным изъятием части основных и оборотных средств вышестоящими органами, в результате износа, уценки товарно-материальных ценностей, понесённых невозмещённых убытков и тому подобного. Продажа (покупка) излишнего, не используемого на предприятиях оборудования, сырья и материалов увеличивает (уменьшает) сумму средств уставного фонда. Колебания в величине уставного фонда отражаются в специальных бухгалтерских счетах и в годовых отчётах предприятия. Общая сумма уставного фонда на начало и конец отчётного периода отражается в пассиве баланса предприятия (объединения) и соответствует остаточной стоимости основных фондов и наличной сумме оборотных средств.

AUTHORISED INVESTOR = УПОЛНОМОЧЕННЫЙ ВКЛАДЧИК (или АВТОРИЗОВАННЫЙ ИНВЕСТОР) – Authorised Investor is an investor must certify that he/she meets one or more of the following criteria:- (i) the investor must be a limited liability company or an unincorporated body of persons or association or a trust which must possess net assets in excess of USD1 million (or the equivalent in any convertible currency); or (ii) if an individual, such person must prove that he/she has reasonable experience in the acquisition of funds of a similar nature or risk profile or in the acquisition of property of the same kind as the property to which the Professional Investor Fund (PIF) relates or that his net worth (or joint net worth together with his/her spouse) exceeds USD1 million or the equivalent in any convertible currency; or (iii) the investor is an employee or a director of a service provider to the PIF; or (iv) a relation or a close friend of the promoters of the PIF (limited to a total of 10 persons per PIF); or (v) an entity, or part of a group, with, at least, USD5 million (or the equivalent in any convertible currency) under discretionary management or advice investing on its own account or on behalf of its clients. To ensure, as much as possible, that retail investors are excluded, before a PIF may accept any investment from an Authorised Investor, such Authorised Investor must first complete and sign an Authorised Investor Declaration form in which the prospective investor confirms that he/she has read and understood the mandatory risk warnings and in which he/she specifies which of the above-mentioned criteria he/she satisfies. For practicality purposes, the Authorised Investor Declaration forms may be completed by a duly authorised agent but signed, naturally, by the investor. Although a PIF may accept nominee investors, these will be treated on a transparent basis meaning that the Fund Manager must know the identity of the beneficial owner of the money being invested. Also known as Professional Investor, or Qualified Investor.

AUTHORISED SHARE CAPITAL = РАЗРЕШЁННЫЙ АКЦИОНЕРНЫЙ КАПИТАЛ (или УСТАВНЫЙ АКЦИОНЕРНЫЙ КАПИТАЛ) – In the United Kingdom, Authorised Share Capital is the maximum amount of share capital which the company can issue. A former requirement of the now repealed section 2(5)(a) of the Companies Act 1985 under which, before 01 October 2009, a company with share capital was required to state in its memorandum the amount of capital that the company was authorised by its shareholders to issue together with the number and nominal value of the shares into which it was divided. From 01 October 2009, the Companies Act 2006 abolished the requirement for a company to have an authorised share capital and shareholders wishing to restrict the number of shares that can be issued by a company need to address this issue in the company's articles. Authorised Share Capital is the number of stock units that a publicly traded company can issue as stated in its articles of incorporation, or as agreed upon by shareholder vote. Authorised share capital is often not fully used by management in order to leave room for future issuance of additional stock in case the company needs to raise capital quickly. Another reason to keep shares in the company treasury is to retain a controlling interest in the company. Also be called Authorised Stock, Authorised Shares or Authorised Capital Stock. Stock exchanges may require companies to have a minimum amount of authorised share capital as a requirement of being listed on the exchange. For example, the London Stock Exchange requires that a public limited company have at least £50 000 of authorised share capital to be listed. Authorised share capital may be greater than the shares available for trading. The shares that have actually been issued to the public and to the company's employees are known as Outstanding Shares. Authorised Share Capital is the maximum value of securities that a company can legally issue. This number is specified in the memorandum of association (or articles of incorporation in the US) when a company is incorporated, but can be changed later with shareholders' approval. Authorized share capital may be divided into (1) Issued Capital:- par value of the shares actually issued. (2) Paid Up Capital:- money received from the shareholders in exchange for shares. (3) Uncalled Capital:- money remaining unpaid by the shareholders for the shares they have bought. Also called Authorized Capital, Authorized Stock, Nominal Capital, Nominal Share Capital, or Registered Capital. Authorised Share Capital can be defined as the largest amount of share capital that a company can issue. This amount will be agreed on when the company is being incorporated. Again, this amount can be increased at a later date if the shareholders wish. The authorised share capital does not all have to be paid. It is the maximum value of the share capital and in some cases much of this value may remain unissued. The authorised share capital does not impose an obligation on the shareholder to pay on the winding up of the company, hence why some see authorised share capital as something of limited importance. The authorised share capital will tell you the maximum amount of share capital that the company can have and will set out the nominal value of each share. The articles of association of the company are important as they outline how much authorised share capital the company can potentially issue if changes need to be made down the line. It is common for companies to increase their share capital and if this change is required there are certain documents which will need to be filled out and submitted to the Company's Registration Office. It should also be noted that the authorised share capital can be divided into different share classes such as preferable or redeemable, each of which are subject to different rights. / В Соединённом Королевстве, Разрешённым Акционерным Капиталом считается максимальная сумма акционерного капитала, который данная компания может выпустить.

AUTHORITY = ПОЛНОМОЧНОЕ ЛИЦО (или ВЕДОМСТВО, или ВЛАСТЬ, или ПОЛНОМОЧИЕ) – Authority is the National Plant Protection Organization (NPPO), or other entity or person officially designated by the government to deal with matters arising from the responsibilities set forth in the code. / Под Ведомством понимается учреждение или совокупность учреждений, обслуживающих какую-нибудь область государственного управления, например, таможенное ведомство.

AUTHORITY TO PAY = ПОЛНОМОЧИЕ ОПЛАТИТЬ – An Authority to Pay is an advice stemming from a buyer, addressed through the buyer's bank to the seller, by way of the correspondent of the buyer's bank in the seller's country, authorizing the correspondent bank to pay the seller's draft for a stipulated amount.

AUTHORIZATION = УПОЛНОМОЧИВАНИЕ (или ВОЗЛОЖЕНИЕ ПОЛНОМОЧИЙ) – Authorization:- the commission to a certain person or body to act on behalf of another person or body. The person or body can be authorized, e.g., to issue Bills of Lading or to collect freight. / , например, .

AUTHORIZED BANK = УПОЛНОМОЧЕННЫЙ БАНК (или АВТОРИЗОВАННЫЙ БАНК) – Authorized Bank is a bank which, in addition to the central paying agency, has been given permission by public authorities or agencies to process decentralized payment transfers.

AUTHORIZED CAPITAL = РАЗРЕШЁННЫЙ КАПИТАЛ (или УСТАВНЫЙ КАПИТАЛ) – Authorized Capital is an amount of capital a company is authorized to raise through the issue of shares, as set down in the company's articles of association. Also known as Authorised Capital in the United Kingdom. / Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), необходимая для начала его деятельности и определённая его уставом или договором об основании предприятия, акционерного общества, компании, корпорации или иного объединения предпринимателей. Уставный капитал формируется в основном за счёт выручки от продажи акций, а также вложений частных капиталов или государственных средств. Для обозначения уставного капитала употребляются также термины Акционерный Капитал, Основной Капитал, Разрешённый Капитал. Законодательством ряда стран (Германия, Франция) устанавливается обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В Великобритании и Соединённых Штатах Америки размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с резервным капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при высоких темпах инфляции предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций. Уставный Фонд предприятий в бывшем Союзе Советских Социалистических Республик (СССР), материальные и денежные средства, безвозмездно выделяемые государством в постоянное распоряжение и управление социалистическому государственному производственному предприятию (объединению). Уставный фонд – основной источник собственных средств предприятия; из него формируются основные и оборотные средства. Большая часть уставного фонда (в промышленности примерно 4/5) сосредоточена в основных средствах. Первоначальный размер уставного фонда определяется уставом или действующим положением предприятия (объединения). В процессе хозяйственной деятельности размер уставного фонда увеличивается, если предприятию выделяются дополнительные средства, или уменьшается (при изъятии части средств). Изменения уставного фонда в течение года осуществляются в строго определённых законодательством случаях. Основные факторы увеличения уставного фонда:- финансирование централизованных капитальных вложений, ввод в действие производственных основных фондов за счёт фонда развития производства, осуществление капитального ремонта и модернизации оборудования, а также пополнение оборотных средств. Уставный фонд может увеличиться в результате пополнения оборотных средств за счёт государственного бюджетного финансирования, прибыли предприятия или средств вышестоящей организации в порядке перераспределения, переоценки товарно-материальных ценностей по решению правительства. Уменьшение уставного фонда наступает в связи с безвозмездным изъятием части основных и оборотных средств вышестоящими органами, в результате износа, уценки товарно-материальных ценностей, понесённых невозмещённых убытков и тому подобного. Продажа (покупка) излишнего, не используемого на предприятиях оборудования, сырья и материалов увеличивает (уменьшает) сумму средств уставного фонда. Колебания в величине уставного фонда отражаются в специальных бухгалтерских счетах и в годовых отчётах предприятия. Общая сумма уставного фонда на начало и конец отчётного периода отражается в пассиве баланса предприятия (объединения) и соответствует остаточной стоимости основных фондов и наличной сумме оборотных средств.

AUTHORIZED CERTIFICATION OFFICIAL = ОТВЕТСТВЕННОЕ ЛИЦО, УПОЛНОМОЧЕННОЕ НА СЕРТИФИКАЦИЮ – Authorized Certification Official is a public officer who is authorized by the National Plant Protection Organization (NPPO) and accredited for the signing of phytosanitary certificates, who (i) possesses the required education, experience, and training; and (ii) has written confirmation of having successfully passed an approved examination. See also Accreditation.

AUTHORIZED PERSON = УПОЛНОМОЧЕННОЕ ЛИЦО (или АВТОРИЗОВАННОЕ ЛИЦО, или ОТВЕТСТВЕННОЕ ЛИЦО) – The Authorized Person describes a person who has the right to use an account (incoming payments, outgoing payments, etc). For this purpose each authorized person has a PIN (Personal Identification Number) as well as a list of TANs (Transaction Numbers) in the case of the use of online banking.

AUTHORIZED PORT = РАЗРЕШЁННЫЙ ПОРТ (или УПОЛНОМОЧЕННЫЙ ПОРТ) – Authorized Port is a specific port identified by the importing country as to where to direct the entry of commodities. Also called Approved Port and Point Of Entry.

AUTHORIZED SHARES = РАЗРЕШЁННЫЕ АКЦИИ – Authorized Shares:- the maximum number of shares of stock that a company can issue. This number is specified initially in the company's charter, but it can be changed with shareholder approval. Generally a much greater number of shares are authorized than required, to give the company flexibility to issue more stock as needed. Also called Authorized Stock or Shares Authorized. In the United States, Authorized Shares is the maximum number of shares that a corporation may issue pursuant to its articles of incorporation. Authorized Stock:- the maximum number of shares that a corporation is legally permitted to issue, as specified in its articles of incorporation. This figure is usually listed in the capital accounts section of the balance sheet. Also known as Authorized Shares or Authorized Capital Stock. This number can be changed only by a vote of all the shareholders. Management will typically keep the number of authorized shares higher than those actually issued. This allows the company to sell more shares if it needs to raise additional funds. / Разрешённые Акции – разрешённый объём выпуска акций, уставной капитал. Максимальное число акций любого класса, которое компания может на законном основании выпустить в соответствии с уставом (articles of incorporation). Как правило, корпорации предусматривают возможность увеличить в будущем разрешённый объём выпуска акций путём голосования акционеров. Корпорация не обязана выпускать весь разрешённый объём акций и может на первом этапе держать объём выпущенных акций на минимальном уровне для того, чтобы сократить налоги и расходы. Известны также как Authorized Stock.

AUTHORIZED SIGNATURE = ПОДПИСЬ УПОЛНОМОЧЕННОГО ЛИЦА (или АВТОРИЗОВАННАЯ ПОДПИСЬ) – Authorized Signature is the signature by a person with authority and power to represent and legally bind a party to a written agreement.

AUTHORIZED USE = САНКЦИОНИРОВАННОЕ ИСПОЛЬЗОВАНИЕ (или АВТОРИЗОВАННОЕ ИСПОЛЬЗОВАНИЕ) – Authorized Use is the use of information that is expressly allowed under a Licensing Agreement. Also known as Permitted Use. / Использование информации, которая становится доступной автоматически на основании Лицензионного Договора или Соглашения. Известно также как Разрешённое Использование (Permitted Use).

AUTHORIZED USER = УПОЛНОМОЧЕННЫЙ ПОЛЬЗОВАТЕЛЬ (или АВТОРИЗОВАННЫЙ ПОЛЬЗОВАТЕЛЬ) – Authorized User is a person designated in a Licensing Agreement as having permission to access or otherwise use the digital information that is the subject matter of the agreement. Also known as Permitted User. / Лицо, указанное в Лицензионном Соглашении, как имеющее разрешение на доступ или иное использование цифровой информации, являющейся предметом этого соглашения. Известен также как Разрешённый Пользователь (Permitted User).

AUTOBILL MODULE = AUTOMOTIVE BILLING MODULE

AUTOCLAVE = АВТОКЛАВ – Autoclave is an airtight chamber that can be filled with steam under pressure or surrounded by another chamber for the steam and that is used for sterilizing, cooking or other purposes requiring moist temperatures above 212 °F or 100 °C. Used for sterilization. Autoclave is:- (1) an apparatus for carrying out certain finishing operation, such as pleating and heat setting, under pressure in a superheated steam atmosphere. (2) Apparatus for polymerizing condensation polymers such as nylon or polyester at any pressure above or below atmospheric. / Найлан (Nylon). Под Автоклавом, от Греческого слова Autós, означающее Сам, и Латинского слова Clavis, означающее Ключ, понимается герметичный аппарат для проведения многих физико-химических процессов при нагреве и повышенном давлении (что увеличивает скорость процессов), а также для стерилизации медицинских инструментов и перевязочных материалов.

AUTO CONTAINER = КОНТЕЙНЕР АВТОВОЗ – Auto Container is a container equipped for the transportation of vehicles. / Контейнер, оборудованный для транспортировки транспортных средств.

AUTOGAMY = АВТОГАМИЯ – Autogamy is a fertilization arising from self-pollination. / Под Автогамией, от Греческих слов Autós, означающее Сам, и Gámos, означающее Брак, понимаются:- (1) самоопыление и самооплодотворение у высших растений, например, у Пшеницы; или (2) самооплодотворение у одноклеточных организмов (слияние двух ядер), например, у диатомовых водорослей, некоторых простейших.

AUTOINFECTION = АУТОИНФЕКЦИЯ (или АУТОГЕННАЯ ИНФЕКЦИЯ) – Autoinfection is an infection of a host by a microorganism or virus produced within or upon the body of the same host individual. / Под Аутоинфекцией, от Греческого слова Autós, означающее Сам, и позднелатинского слова Infectio, означающее Заражение, понимается заболевание, обусловленное самозаражением микробами, находившимися в данном организме; активация дремлющей инфекции под влиянием переутомления, переохлаждения.

AUTOLEVELLER = АВТОВЫРАВНИВАТЕЛЬ – Autoleveller draw frame is an apparatus for controlling a fiber processing plant including a series of processing stages in order to supply fibrous material as a product with predetermined qualities, whereby the qualities of the product can be influenced by suitable, selectively adjustable treatment of fibrous material during its passage through the plant and whereby in at least one of the intermediate stages of the plant an ascertainable quality of the product of this stage is determined. In this intermediate stage a signal is obtained which is equivalent to the ascertainable quality and which is used for controlling the previous stages. The Autoleveller drafting arrangement comprises measuring elements for the throughpassing quantity of textile fibers both at the inlet end and the outlet end thereof. There is provided a system which at least in part is self-adjusting, in order to take account of measuring errors, and thus, to obtain an improved self-adjusting optimization of control and regulation parameters. In spinning process, Autoleveller applys to card. It can be used to feed a constant quantity of fibers to the card by means of controlling the speed of the feed roller according to batt thickness, and to improve the uniformity and unevenness quality index of the sliver. Modified model of an autoleveller with calendar roller is called Compositve Loop Autoleveller. It is used for detecting sliver fineness so as to enhance sliver count to control stability. / В прядильном производстве. outlet = припуск сверх шва.

AUTOLYSIS = АУТОЛИЗ (или САМОРАСПАД) – (1) In biology, Autolysis, more commonly known as Self-Digestion, refers to the destruction of a cell through the action of its own enzymes. It may also refer to the digestion of an enzyme by another molecule of the same enzyme. The term derives from the Greek words αυτό (Self) and λύσις (Splitting). Autolysis:- (Greek:- Autos = Self; Lucin = Separation) Self-digestion. / В биологии Аутолиз – процесс саморазрушения ткани, клетки или части клетки. Начинается под воздействием энзимов, которые вырабатываются лизосомами внутри самих клеток, обычно после того, как клетка отмирает.

(2) In medicine, Autolysis is the enzymatic digestion of cells by enzymes present within them. The cells most susceptible to autolysis tend to be dying or dead cells. / Аутолиз – разрушение тканей или клеток под действием их собственных ферментов. Аутолиз – разрушение клеток под влиянием содержащихся в них протеолитических ферментов; происходит при гибели организма или некрозе тканей, иногда наблюдается в физиологических условиях (например, при инволюции матки после родов). Аутолиз посмертный (a. postmortalis) – аутолиз после гибели организма, происходящий без участия микроорганизмов и обусловленный активацией гидролитических ферментов в условиях сдвига реакции среды в кислую сторону.

AUTOMATED BOND SYSTEM = АВТОМАТИЗИРОВАННАЯ СИСТЕМА ПО ОБЛИГАЦИЯМ – Automated Bond System (ABS) is the electronic system on the NYSE® that records bids and offers for inactively traded bonds until they are canceled or executed. Because the bid and ask prices of inactively traded bonds aren't constantly changing due to demand and supply conditions, investors looking for a quote may have difficulties. By having all inactive bonds electronically monitored, the NYSE® is able to keep a good inventory of bond prices, just in case an investor is interested in purchasing them. Automated Bond System (ABS):- processes orders in all listed nonconvertible bonds and suggests matches for possible execution. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Автоматизированная Система по Облигациям обрабатывает распоряжения по всем котируемым неконвертируемым облигациям и предлагает подходящие пары для возможного исполнения. Автоматизированная Система по Облигациям (АСО) – компьютеризованная система Нью Йоркской Фондовой Биржи (New York Stock Exchange (NYSE®)), которая регистрирует предложения на покупку и продажу неактивно обращающихся облигаций вплоть до того, как совершится сделка или не снимется заявка. До введения АСО заявки на сделки хранились в стальных ящичках, из-за чего возникли термины cabinet security (неходовая, 'кабинетная' ценная бумага) и cabinet crowd ('кабинетные инвесторы' – торговцы неходовыми облигациями).

AUTOMATED BROKER INTERFACE = АВТОМАТИЗИРОВАННЫЙ БРОКЕРСКИЙ ИНТЕРФЕЙС – Automated Broker Interface (ABI) is a part of US Customs' Automated Commercial System, permits transmission of data pertaining to merchandise being imported into US. Qualified participants include brokers, importers, carriers, port authorities, and independent data processing companies. US Customs' Automated Broker Interface (ABI), by which brokers file importers' entries electronically. Part of US Customs' Automated Commercial System, permits transmission of data pertaining to merchandise being imported into the United States. Qualified participants include brokers, importers, carriers, port authorities, and independent data processing companies referred to as Service Centers.

AUTOMATED CLEARING HOUSE = АВТОМАТИЗИРОВАННАЯ КЛИРИНГОВАЯ ПАЛАТА – Automated Clearing House (ACH) is a nationwide electronic funds transfer (EFT) system that provides for the inter-bank clearing of credit and debit transactions and for the exchange of information among participating financial institutions. The Automated Clearing House is a secure, private electronic payment transfer system that connects US financial institutions. Direct paycheck deposits is an example of electronic fund transfers that go through this network. Utilizing ACH payments is cheaper and faster than processing paper checks, both B2B and B2C e-commerce payment activities heavily rely on the ACH system and have helped give the system tremendous traction. ACH was created in the early 1970s, when the ever increasing amount of paper checks used by both businesses and consumers to pay their bills would eventually overwhelm available computer systems and not allow the efficient processing and sorting of checks. The Federal Reserve

intervened and agreed to provide the computer systems necessary to process and settle the ACH items between the financial institutions. In 1974, NACHA (National ACH Association) arose from regional ACH organizations and acted to coordinate the establishment of rules to facilitate the nationwide clearing of ACH payments. NACHA is the organization responsible for developing the rules and the standards regarding ACH transactions. In 2010, over 19.4 billion payments with a total value of more than USD31.74 trillion were processed via ACH through the Federal Reserve System. Typical ACH payments include payroll, single and recurring bill payments and Social Security benefits. In the United States, the Automated Clearing House (ACH) – a nationwide batch-oriented electronic funds transfer system governed by the NACHA (National Automated Clearing House Association). The ACH system is the primary electronic funds transfer (EFT) system used by agencies to make payments, and the Financial Management Service anticipates that agencies increasingly will use the ACH system to collect funds. Part 210 provides the regulatory foundation for use of the ACH system by agencies. It defines the rights and liabilities of agencies, Federal Reserve banks, financial institutions, and the public, in connection with ACH credit entries, debit entries, and entry data originated or received by an agency through the ACH system. The Automated Clearing House (ACH) is an organization for the automated processing of payments, which may be a part of the domestic clearing system and/or act as an entry point for cross border payments. ACH is a low-cost, low-value (deferred settlement) payment system. It was originally designed as a replacement for the check processing system in the United States. The ACH system links more than 8 000 fnancial institutions in the United States, including commercial banks, savings and loan institutions, and credit unions. Oversight responsibility for the ACH network is provided by the National Automated Clearing House Association (NACHA). NACHA sets guidelines and rules for its participating banks. ACH is a paperless, batch-based, store-and-forward payment system. Settlement is accomplished by debiting and crediting the Federal Reserve accounts of participating fnancial institutions. ACH is used primarily for low-value, non-time-sensitive payments. Most ACH payments take two days to reach the benefciary. Examples of ACH payments include pensions, dividends, and direct payroll deposit. Wells Fargo was one of the first banks in the United States to develop and employ an automated interface between SWIFT and ACH using our GlobalPay.File service. Wells Fargo is one of seven banks that have organized its own processing services as an ACH association through the Electronic Payments Network (EPN), formerly known as the New York Automated Clearing House (NYACH). In the United States, the Automated Clearinghouse (ACH) is a feature of the Automated Broker Interface which is a part of the US Customs' Automated Commercial System. The ACH combines elements of bank lock box arrangements with electronic funds transfer services to replace cash or check for payment of estimated duties, taxes and fees on imported merchandise. The Automated Clearinghouse (ACH) is an electronic payment system, developed jointly by the private sector and the Federal Reserve in the early 1970s as a more-efficient alternative to checks. Since then, the ACH has evolved into a nationwide mechanism that processes credit and debit transfers electronically. ACH credit transfers are used to make direct deposit payroll payments and corporate payments to vendors. ACH debit transfers are used by consumers to authorize the payment of insurance premiums, mortgages, loans, and other bills from their account. The ACH is also used by businesses to concentrate funds at a primary bank and to make payments to other businesses. In 2003, the Reserve Banks processed 6.5 billion ACH payments with a value of USD16.8 trillion. The use of the ACH has evolved over time. The ACH is now used to make certain payments initiated by telephone or over the Internet. In addition, merchants that receive checks at the point of sale and banks that receive bill-payment checks in the mail are increasingly converting those checks into ACH payments. In 2001, the Reserve Banks began a cross-border ACH service. Legal and operational differences between countries have presented challenges to the rapid growth of the cross-border service; however, the Reserve Banks are continuing to work with financial institutions and ACH operators in other nations to address these challenges. Depository institutions transmit ACH payments to the Reserve Banks in batches, rather than individually. ACH funds transfers are generally processed within one to two days, according to designated schedules, and are delivered to receiving institutions several times a day, as they are processed. The Reserve Banks offer ACH operator services to all depository institutions. A private-sector processor also provides ACH operator services in competition with the Reserve Banks. The Reserve Banks and the private-sector operator deliver ACH payments to participants in each other's system in order to maintain a national ACH payment system. Both the government and the commercial sectors use ACH payments. Compared with checks, ACH transfers are less costly to process and provide greater certainty of payment to the receiver. Initially, the federal government was the dominant user of the ACH and promoted its use for Social Security and payroll payments. Since the early 1980s, commercial ACH volume has grown rapidly, and in 2003 it accounted for 86 percent of total ACH volume. The Automated Clearinghouse (ACH) is the electronic clearing and settlement system for exchanging electronic transactions among participating depository institutions; such electronic transactions are substitutes for paper checks and are typically used to make recurring payments such as payroll or loan payments. The Federal Reserve Banks operate an automated clearinghouse, as do some private sector firms.

AUTOMATED COMMERCIAL SYSTEM = АВТОМАТИЗИРОВАННАЯ КОММЕРЧЕСКАЯ СИСТЕМА – The US Customs Service's Automated Commercial System (ACS) is a joint public-private sector computerized data processing and telecommunications system linking customhouses, members of the import trade community and other government agencies with the Customs computer. Trade users file import data electronically on cargo status and query Customs files to prepare submissions. Duties, taxes and fees may be paid by electronic statement, through a Treasury-approved clearinghouse bank. ACS contains the import data used by Census to prepare US foreign trade statistics. ACS began operating in 1984. US Customs' master computer system, Automated Commercial Systems. The electronic system of the US Customs Service, encompassing a variety of industry sectors, that permits on-line access to information in selected areas. / и системы дальней связи . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Хозяйская компьютерная система Таможни США, .

AUTOMATED CUSTOMER ACCOUNT TRANSFER SERVICE = АВТОМАТИЗИРОВАННАЯ СЛУЖБА ПЕРЕВОДОВ ПО СЧЕТАМ ЗАКАЗЧИКОВ – The Automated Customer Account Transfer Service (ACATS) is a system that automates and standardizes procedures for the transfer of assets in a customer account from one brokerage firm and/or bank to another. ACATS can expedite account transfers by permitting transfers to be accomplished in an automated environment. The National Securities Clearing Corporation (NSCC) developed ACATS in conjunction with the NYSE®, its Rule 412 Task Force Committee and the NASD to address the industry's need to reduce delays and inconsistencies associated with manual processing.Instruments handled by the system include equities, corporate and municipal bonds, unit investment trusts, mutual funds, options, annuities, cash and other investment products. All eligible and qualified NSCC settling members and DTC (short for the Depository Trust Company) member banks are eligible for this service. Additionally, Mutual Fund Companies are eligible to use the service but only as the contra-party to a transfer initiated by a firm (bank or broker) for the purpose of re-registering a mutual fund position to or from them directly. ACATS facilitates accurate and timely transfer of a customer's account, with the following operational advantages to users:- (i) uniform time frames, standardized reporting and automated control functions; (ii) the service debits delivering brokers the full market value of customers' securities, promoting the timely transfer of assets. For account transfers where a bank or a Fund Company is the contra-side, the assets are delivered free. (iii) ACATS provides an automated transfer initiation procedure that incorporates the industry's effort to immobilize paper documents, such as Transfer Initiation Forms (TIFs). (iv) Automated residual credit processing allows credits that accumulate after a transfer is completed, such as stock or cash dividends, to be transferred electronically from the delivering firm to the receiving firm through ACATS. (v) Through the ACATS-Fund/SERV link, users can easily re-register customers' mutual fund assets.

(vi) Through the ACATS/IPS link, users can easily re-register customers' annuity assets. (vii) Automated functionality to process partial transfers, fail clean-ups and position reclaims. The Automated Customer Account Transfer Service (ACATS) is a system that automates and standardizes procedures for the transfer of assets in customer accounts between brokers, banks, mutual funds, trusts, and other financial institutions. The National Securities Clearing Corporation (NSCC) developed ACATS in the mid-1980s in conjunction with the New York Stock Exchange and the National Association of Securities Dealers to address the industry's need to reduce delays and inconsistencies associated with manual processing of account transfers. Banks may access ACATS through a Depository Trust Corporation link or through the National Securities Clearing Corporation's Web site. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

AUTOMATED GUIDED VEHICLE SYSTEM = АВТОМАТИЗИРОВАННАЯ СИСТЕМА НАПРАВЛЯЕМЫХ (или УПРАВЛЯЕМЫХ) ТРАНСПОРТНЫХ СРЕДСТВ – Automated Guided Vehicle System is a computer-controlled materials handling system consisting of small vehicles (carts) that move along a guideway. / Компьютеризированная система транспортировки материалов, состоящая из маленьких транспортных средств (тележек), которые двигаются вдоль направляющей.

AUTOMATED MANIFEST SYSTEM = АВТОМАТИЗИРОВАННАЯ МАНИФЕСТНАЯ СИСТЕМА – The Automated Manifest System (AMS), a part of the US Customs' Automated Commercial System, controls imported merchandise from the time a carrier's cargo manifest is electronically transmitted to Customs until control is relinquished to another segment of the ACS. The electronic system allowing a manifest inventory to be transmitted to the US Customs Service data center by carrier, port authority, or service center computers.

AUTOMATED SEARCH AND MATCH = АВТОМАТИЗИРОВАННЫЙ ПОИСК И СРАВНЕНИЕ – Automated Search And Match:- researches and cross-references publicly available information on individuals, corporations, and service organizations possibly connected to a particular trading situation.

AUTOMATED STORAGE AND RETRIEVAL SYSTEM = АВТОМАТИЗИРОВАННАЯ СИСТЕМА ХРАНЕНИЯ И ВЫДАЧИ – Automated Storage And Retrieval System is an automated, mechanized system for moving merchandise into storage locations and retrieving it when needed.

AUTOMATED TELLER MACHINE = АВТОМАТИЗИРОВАННАЯ КАССОВАЯ МАШИНА (или АВТОМАТИЗИРОВАННАЯ СЧЁТНАЯ МАШИНА) – Automated Teller Machine (ATM) allows financial institutions' customers to withdraw cash and carry out other transactions without the need for a cashier or clerk. Automated Teller Machines (ATMs) or cash dispensers:- with their bank card or credit card in connection with the personal identification number (PIN), customers can access cash at ATMs around the world. Automated Teller Machine (ATM) is an unattended mechanical device that permits authorised users, typically using financial transaction cards, to access financial services including cash withdrawal. Automated Teller Machine (ATM) is a computer-controlled terminal located on the premises of financial institutions or elsewhere, through which customers may make deposits, withdrawals or other transactions as they would through a bank teller. Other terms sometimes used to describe such terminals are customer-bank communications terminal (CBCT) and remote service unit (RSU). Groups of banks sometimes share ATM networks located throughout a region of the country that may include portions of several states. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

AUTOMATIC EXERCISE = АВТОМАТИЧЕСКОЕ ИСПОЛНЕНИЕ – A provision in an option contract specifying that it will be exercised automatically on the expiration date if it is in the money by a specified amount, absent instructions to the contrary. Following options expiration, an option which is in-the-money by USD100.00 or more is exercised automatically by the clearing house, unless the holder of the option submits specific instructions to the contrary. Automatic Exercise:- automatic ascertainment and notification of a possible positive intrinsic value to the holder of the warrant on the exercise day (American-style) or on the last day of the exercise period (European-style). Automatic exercise only occurs if it is provided for in the option conditions.

AUTOMATIC GUIDED VEHICLE = АВТОМАТИЧЕСКОЕ НАПРАВЛЯЕМОЕ ТРАНСПОРТНОЕ СРЕДСТВО (или АВТОМАТИЧЕСКИ УПРАВЛЯЕМОЕ ТРАНСПОРТНОЕ СРЕДСТВО) – Automatic Guided Vehicles (AGVs) are used for driverless transport between the bridges and the container storage area. / Автоматически Управляемые Транспортные Средства (АУТС) – транспортные средства, оборудованные устройствами автоматического управления (наведения) с заданной программой движения по некоторому пути, вдоль которого расположены средства сопряжения с рабочими местами, предназначенными для автоматизированной или ручной погрузки и разгрузки материалов, инструментов, деталей или изделий. Автоматически управляемые транспортные средства используются на складах продукции, в супермаркетах и логистических центрах. Эти транспортные средства управляются оператором с помощью радиомодемов и не требуют водителей.

AUTOMATIC IDENTIFICATION = АВТОМАТИЧЕСКАЯ ИДЕНТИФИКАЦИЯ (или АВТОМАТИЧЕСКОЕ ОТОЖДЕСТВЛЕНИЕ, или АВТОМАТИЧЕСКОЕ ОПОЗНАВАНИЕ) – Automatic Identification:- a means of identifying an item, e.g., a product, parcel or transport unit by a machine (device) entering the data automatically into a computer. The most widely used technology at present is bar code; others include radio frequency, magnetic stripes and optical character recognition. / Средство идентификации изделия, например, продукта, посылки или транспортной единицы с помощью машины (устройства), заводящей данные в компьютер автоматически. Наиболее широко распространённая технология в настоящее время – это штрих код; среди прочих – опознавание по радио частоте, магнитным полосам и оптическим образом.

AUTOMATIC GENERATION CONTROL = АВТОМАТИЧЕСКИЙ КОНТРОЛЬ ГЕНЕРАЦИИ – Automatic Generation Control (AGC) is an automatic control system comprised of hardware and software. Hardware is installed on generators allowing their output to be automatically adjusted and monitored by an external signal and software is installed facilitating that output adjustment.

AUTOMATIC PILOT = АВТОРУЛЕВОЙ (или АВТОПИЛОТ, или АВТОМАТИЧЕСКИЙ ПИЛОТ) – Automatic Pilot is an instrument designed to control automatically a vessel's steering gear so that it follows a pre-determined track through the water. / В мореплавании Авторулевой или Гирорулевой представляет собой электро-навигационный прибор для автоматического удержания судна на заданном курсе. Действие авторулевого основывается на автоматическом включении рулевого устройства при отклонении судна от курса. Авторулевой работает в сочетании с гирокомпасом или иными курсоуказателями. Авторулевой удерживает судно на курсе при скорости свыше 4 узлов с погрешностью:- при состоянии моря до 3 баллов – до ±0.2°; а свыше – до ±2.5°. В авиации Автопилот, от слов Авто… и Французского Pilote, означающее Руководитель или Вожак, подразумевает под собой устройство для автоматической стабилизации и управления полётом летательного аппарата. Непрерывно поступающие сигналы текущего положения аппарата в пространстве (от чувствительных элементов, обычно от гироскопических датчиков), сигналы требуемого положения аппарата в пространстве (от специальных задатчиков режима полёта, управляемых членами экипажа или программируемых заранее) и сигналы обратной связи (от исполнительных механизмов) сравниваются в счётно-решающем устройстве автопилота. Их разности (сигналы рассогласования) после усиления поступают на соответствующие исполнительные механизмы управления рулями или двигателями. Автопилот

выполняет заданную программу полёта, освобождая лётчика от напряжённой работы по управлению самолётом в длительных полётах.

AUTOMATIC PRESS = АВТОМАТИЧЕСКИЙ ПРЕСС (или ПРЕСС–АВТОМАТ) – Automatic Press is a hydraulic press for compression molding or an injection machine that operates continuously, being controlled mechanically, electrically, hydraulically, or by a combination of any of these methods.

AUTOMATIC TELLING MACHINE = АВТОМАТИЧЕСКАЯ СЧИТАЮЩАЯ МАШИНА – Automatic Telling Machine:- computer-linked machine, usually mounted on the wall of a bank or other financial institution, which dispenses cash, statements and balances on production of a card and the provision of the correct personal identification number. Also known as Automated Teller Machine, and Cash Dispencer.

AUTOMATIC TRANSFER SERVICE ACCOUNT = СЧЁТ С УСЛУГОЙ АВТОМАТИЧЕСКОГО ПЕРЕВОДА – Automatic Transfer Service (ATS) Account is a depositor's savings account from which funds may be transferred automatically to the same depositor's checking account to cover a check written or to maintain a minimum balance.

AUTOMATIC TRANSMISSION FLUID = ЖИДКОСТЬ ДЛЯ АВТОМАТИЧЕСКИХ ТРАНСМИССИЙ – Automatic Transmission Fluid (ATF) is a fluid for automatic, hydraulic transmissions in motor vehicles.

AUTOPAY MODULE = AUTOMOTIVE PAYMENT MODULE

AUTOPOLYPLOID = АВТОПОЛИПЛОИД – Autopolyploid is a polyploid which possesses duplication of the same set of chromosomes, or more than two sets of chromosomes, coming from same species. / Под Автополиплоидией, от Греческих слов Autós, означающее Сам, Polýploos, означающее Многократный, и Éidos, означающее Вид, понимается наследственное изменение, заключающееся в кратном увеличении числа наборов хромосом в клетках растений, реже животных одного и того же вида. На основе искусственной автополиплоидии получены новые формы и сорта Гречихи, Ржи, Сахарной Свёклы и других.

AUTOPORT = АВТОПОРТ – Autoport:- reference to the Port of Brunswick's Colonel's Island Terminal AutoPort Facility. Brunswick ranks as one of the fastest growing, environmentally clean RoRo facilities in North America.

AUTORADIOGRAM = АВТОРАДИОГРАММА – Autoradiogram is the photographic record of a chromatogram that contains radioactively labeled compounds. Prepared by exposing a sensitive photographic film to the radioactive radiation by placing it in contact with the chromatogram. / Под Авторадиограммой, от Греческого слова Autós, означающее Сам, Латинского слова Radio, означающее Испускаю Лучи, и .

AUTORADIOGRAPHY = АВТОРАДИОГРАФИЯ (или РАДИОАВТОГРАФИЯ) – Autoradiography is a method used to detect radioactive substances by their property to darken film superimposed on the compounds. Can be used on whole organisms or molecules separated by molecular methods such as electrophoresis. / Под Авторадиографией, от Греческого слова Autós, означающее Сам, Латинского слова Radio, означающее Испускаю Лучи, и Греческого слова Gráphō, означающее Пишу, понимается метод регистрации распределения радиоактивных веществ в объекте. Плёнка с чувствительной к радиоактивному излучению эмульсией накладывается на поверхность (срез). Радиоактивные вещества как бы сами себя фотографируют (отсюда название). Места почернения на плёнке после проявления соответствуют локализации радиоактивных частиц. Используется в биологии, медицине и технике.

AUTOSOMES = АУТОСОМЫ – Autosomes are chromosomes not associated with sex of the bearer. / Аутосома – неполовая хромосома. Под Аутосомами, от Греческих слов Autós, означающее Сам, и Sōma, означающее Тело, понимаются все хромосомы в клетках раздельнополых животных и растений, за исключением половых хромосом.

AUTOTROPH = АВТОТРОФ (или АВТОТРОФНЫЙ ОРГАНИЗМ) – Autotroph is a cell or organism that manufactures its own food from CO_2 and other small inorganic compounds by the process of photosynthesis. / Под Автотрофами, от Греческих слов Autós, означающее Сам, и Trophē, означающее Питание или Пища, или Автотрофными Организмами понимаются организмы, синтезирующие из неорганических веществ (главным образом воды, двуокиси углерода, неорганических соединений азота) все необходимые для жизни органические вещества, используя энергию фотосинтеза (все зелёные растения – фототрофы) или хемосинтеза (некоторые бактерии – хемотрофы). Автотрофы, основные продуценты органического вещества в биосфере, обеспечивают существование всех других организмов.

AUTOTROPHIC = АВТОТРОФНОЕ – Autotrophic:- nutritionally independent of other organisms. / Автотрофное:- в плане пищи независимое от других организмов. Под Автотрофным, от Греческих слов Autós, означающее Сам, и Trophē, означающее Питание или Пища, понимается .

AUTO–WINDER = МОТАЛЬНЫЙ АВТОМАТ – In spinning process, any machine used to wind a bobbin of yarn or a cone, spindle, cheese, etc. / В прядильном производстве, любая машина, используемая для намотки пряжи на бобины или конуса, шпиндели (веретена), патроны (цилиндры), и так далее. Мотальная Машина – машина для перематывания пряжи и нитей из различных волокон в ткацком, трикотажном и крутильном производствах с целью придания паковке удобной формы, увеличения длины и повышения качества нити. Мотальная машина состоит из наматывающего механизма (включающего держатель бобины или катушки, механизм их вращения и механизм движения нитеводителя), раскладывающего механизма, контрольно-очистительного и натяжного приспособлений.

AUTOXIDATION = САМООКИСЛЕНИЕ (или АВТООКИСЛЕНИЕ) – Autoxidation is an oxidation caused atmospheric oxygen and taking place at normal temperatures.

AUXIN = АУКСИН – Auxin is a group of plant hormones such as indole acetic acid, produced by the tips of growing shoots in plants, that regulate the amount, type, and direction of plant growth by stimulating elongation of cells rather than cell division. Auxins diffusing down the stem away from the growing point produce concentration gradients that are responsible for apical dominance and phototropism. At the correct concentrations, auxins induces growth and fruit production even if the plant hasn't been pollinated, e.g., seedless watermelon. Commercially, auxins are used to promote root growth from cuttings, to promote uniform flowering, and to set fruit and prevent premature fruit drop. Synthetic auxins such as 2,4-D and 2,4,5-T stimulate uncontrolled DNA and protein synthesis and are effective herbicides. 2,4-D is still used as a herbicide but use of 2,4,5-T has been banned because it tends to be contaminated with carcinogenic dioxin. Broad-leaved weeds like dandelions are much more susceptible to auxins than narrow-leaved plants like grass and cereal crops. At extremely low concentrations, 2,4-D is used to promote growth of orchid seedlings. Auxins is a group of growth regulators or plant hormones (natural or synthetic) that may stimulate cell growth and induce cell elongation or division; often induce adventitious roots, root development, and other growth processes including seed germination. / часто придаточные корни,

корневое развитие, и . Под Ауксинами понимается группа гормонов растений. Регулируют на разных этапах жизни растения его рост, дифференцировку органов, ростовые реакции на свет и силу тяжести. По химической природе – производные индола. Основной представитель – индолилуксусная кислота.

AUXOTROPHIC = АУКСОТРОФНОЕ – Auxotrophic:- nutritionally independent of organic nutrients. / Ауксотрофное:- в плане пищи независимое от питательных веществ в органической форме. Под Ауксотрофным, от Греческих слов Áuxō, означающее Выращиваю или Увеличиваю, и Trophē, означающее Питание или Пища, понимается .

AVAILABILITIES = ЗАПАСЫ ПРЕДЛОЖЕНИЯ – Avails is a slang term, short for availabilities, and actually meaning supplies. / Запасы Предложения (Availabilities) часто используется в Английском языке в укороченной форме как Avails.

AVAILABILITY = ДОСТУПНОСТЬ – Availability is the property of no hindrance to the supply of data and processing to any party authorised to receive it.

AVAILABLE BALANCE = ДОСТУПНЫЙ ОСТАТОК (или ИМЕЮЩИЙСЯ В НАЛИЧИИ ОСТАТОК) – Available Balance:- the balance at the disposal of the account owner on the date specified. The specific formula for the calculation of the balance is dependent upon national, local, legal or bilateral agreement / conventions / requirements. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона.

AVAILABLE BUT NOT NEEDED CAPABILITY = ДОСТУПНАЯ, НО НЕНУЖНАЯ СПОСОБНОСТЬ (или МОЩНОСТЬ) – Available But Not Needed Capability is a net capability of main generating units that are operable but not considered necessary to carry load, and cannot be connected to load within 30 minutes.

AVAILABLE EQUITY = ДОСТУПНЫЕ СРЕДСТВА (или ИМЕЮЩИЕСЯ В НАЛИЧИИ СРЕДСТВА) – A term Available Equity means the amount, if any, by which total equity or the net liquidating value, as the case may be, of any account exceeds the amount of original margin required for any options or futures contracts carried in such account.

AVAILABLE–FOR–SALE FINANCIAL ASSETS = ДОСТУПНЫЕ ДЛЯ ПРОДАЖИ ФИНАНСОВЫЕ АКТИВЫ (или ФИНАНСОВЫЕ АКТИВЫ, ИМЕЮЩИЕСЯ В НАЛИЧИИ ДЛЯ ПРОДАЖИ) – Available-For Sale Financial Assets:- non-derivative financial assets that are designated as available-for-sale or are not classified as loans and receivables; held-to-maturity investments; or financial assets at fair value through profit or loss.

AVAILABLE FUNDS = ДОСТУПНЫЕ ФОНДЫ (или ИМЕЮЩИЕСЯ В НАЛИЧИИ ФОНДЫ) – Funds available for transfer or withdrawal in cash. / Фонды, доступные для перевода или снятия наличными.

AVAILABLE INVENTORY = ДОСТУПНЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или ДОСТУПНЫЕ СКЛАДСКИЕ ЗАПАСЫ) – Available Inventory is the amount of shippable product in the warehouse; does not include product designated as damaged, on hold, or pending shipment.

AVAILABLE NUTRIENT = ДОСТУПНОЕ ПИТАТЕЛЬНОЕ ВЕЩЕСТВО (или УСВОЯЕМОЕ ПИТАТЕЛЬНОЕ ВЕЩЕСТВО) – Available Nutrient is an element in the soil which can be readily absorbed and assimilated by growing plants.

AVAILABLE TONNE–KILOMETER = ДОСТУПНЫЙ ТОННО–КИЛОМЕТР – Available Tonne-Kilometer (ATK):- one tonne of available freight capacity for one kilometer. Basically, the number of tonnes that can be carried multiplied by the number of kilometers flown.

AVAILABLE WATER = ДОСТУПНАЯ ВОДА (или УСВОЯЕМАЯ ВОДА) – Available Water is a water in a soil that can be readily absorbed by plant roots. / корнями растения.

AVAILS = AVAILABILITIES

AVAL = АВАЛЬ (или ВЕКСЕЛЬНОЕ ПОРУЧИТЕЛЬСТВО) – Aval is the European term for third-party guarantee of payment on a promissory note, bill of exchange or commercial paper, with the signature of a third party other than the drawer, the drawee and any endorsers. The more guarantors for a promissory note, the more marketable the note. An aval adds another guarantor, in addition to the drawer, the drawee and any endorsers. See also Bill Guarantee. Guarantee added by a bank to an accepted time draft by endorsing the front of the draft 'per aval'. The avalizing bank becomes obligated to pay the draft at maturity if the drawee/acceptor fails to do so. / или коммерческая бумага, . обеспечения платежа по простому векселю, и любых индоссантов. банк авалист. Под Авалем, от Французского слова Aval, понимается вексельное поручительство. Аваль может быть выдан на всю или часть суммы векселя за любое ответственное лицо, будь-то акцептант, векселедатель или индоссант. Вексельное Поручительство, в силу которого авалист принимает ответственность за выполнение обязательств какого-либо обязанного по векселю лица. Кроме подписи аваль должен содержать надпись на векселе:- 'per aval', а если это переводный вексель, на нём должны быть указаны также имя, отчество, фамилия авалиста. По сравнению с гарантией аваль обладает преимуществом, заключающимся в том, что он неотделим от векселя. Кроме того, оформление аваля значительно проще, чем оформление гарантийного письма. Авалист – лицо, давшее аваль. Аваль – поручительство, гарантия, согласно которой авалист (поручившееся лицо) принимает на себя ответственность за оплату векселя перед его владельцем. Например, Петров взял деньги в долг у Сидорова и выдал ему вексель (расписку). Если третье лицо (скажем, Иванов) даёт поручительство Сидорову, гарантирует ему возврат ссуды со стороны Петрова, то такое поручительство и есть аваль. Поручительство должно быть засвидетельствовано подписью авалиста на лицевой или оборотной стороне векселя или на специальном гарантийном листе, прикрепляемом к векселю (аллонже). Аваль призван увеличивать надёжность векселя. В роли авалиста может выступать банк.

AVALIZED DRAFT = АВАЛИРОВАННАЯ ТРАТТА – Avalized Draft:- trade acceptance to which an aval has been added.

AVANT–GARDE = АВАН–ГАРД – Avant-Garde:- avant-garde fashion means 'unique crazy unwearable garments'. / .

AVAS = AUTOMATED VOICE ANNUNCIATOR SYSTEM

AVAST = СТОП – Avast is an order to stop or cease hauling (stop action at once). / В морском деле .

AVC = AUTOMATIC VEHICLE CLASSIFICATION

AVCS = ADVANCED VEHICLE CONTROL SYSTEM

AVE = AD VALOREM EQUIVALENT

AVERAGE = АВАРИЯ – Average:- if the sum insured under non-marine insurance is expressed to be 'subject to average' and that sum is less than the value of the subject matter of the insurance then any claim that is agreed under the policy will be reduced

proportionately to reflect the under insurance. Section 81 of the Marine Insurance Act 1906 say that an insured shall be his own insurer as regards any under insurance. In marine insurance the term average may also refer to one of two types of loss, general average and particular average. See also General Average, and Particular Average. Average is a marine partial loss. This can be particular average or general average. Average (in marine insurance) means:- damage particular average; damage to the goods general average; expenses voluntarily incurred to save a ship and her cargo. Any partial loss or damage, due to insured perils. In marine insurance, loss or damage. In non-marine property insurance, where average is said to apply and there has been under-insurance, the insured's claim is reducible in proportion to the under-insurance. Average is marine insurance term for losses or damages to or in respect of goods or equipment. / Любое частичное истребление или повреждение, вызванные страховыми рисками. Под Аварией или Морской Аварией понимается причинённый морской перевозке, судну, грузу или фрахту ущерб, а также расходы, понесённые для его предотвращения. Смотрите также Общая Авария (General Average), и Частная Авария (Particular Average). Авария (в таможенном деле) – вредное по своим последствиям происшествие технического, технологического или иного характера, произошедшее с транспортными средствами и (или) иными товарами, находящимися под таможенным контролем, повлекшее за собой не предусмотренные международными договорами и актами в сфере таможенного регулирования их количественные и (или) качественные изменения, которые не вызваны преднамеренными действиями собственника и (или) лица, во владении которого товары находились на момент таких изменений, за исключением естественных изменений при нормальных условиях перевозки (транспортировки) и (или) хранения, а также изменений вследствие действия непреодолимой силы. Авария:- (1) Происшествие на экономическом объекте, транспорте или на линиях коммуникации, представляющее угрозу жизни и здоровью людей либо приводящее к разрушению производственных помещений, повреждению или уничтожению оборудования, механизмов, транспортных средств, сырья и готовой продукции, а также к нарушению производственного процесса. (2) В страховании от пожара, Авария – сумма, на которую уменьшается выплата страхового возмещения вследствие недострахования. Авария может являться страховым случаем или рисковым обстоятельством. Для выяснения фактов, обстоятельств и причин возникновения аварий, повлекших существенные материальные потери или приведших к гибели людей, создаются ведомственные или правительственные комиссии с привлечением компетентных органов, а также представителей страховой компании.

AVERAGE ADJUSTER = АВАРИЙНЫЙ КОМИССАР (или ДИСПАШЕР ПО АВАРИИ, или АДЖАСТЕР ПО АВАРИИ, или ПЕРЕОЦЕНЩИК АВАРИИ) – In general average matters Average Adjusters are entrusted with the task of apportioning the loss and expenditure carried by interested parties in a maritime venture and to determine which expenses are to be regarded as average or general average. An adjuster of marine losses. In general average affairs average adjusters are entrusted with the task of apportioning the loss and expenditure over the parties interested in the maritime venture and to determine which expenses are to be regarded as average or general average. Average Adjuster is a person appointed by a shipowner to collect data, guarantees, etc, in relation to general average, and to calculate contributions due from the parties concerned to make good general average losses. The adjuster may also adjust claims on hull insurance policies for submission to underwriters. Average Adjusters are the firms specialized in the settlement of general average cases. / Оформляет Аварийный Сертификат или Диспашу (Survey Report). Диспашер составляет диспашу с расчётом убытков по авариям. Аварийный Комиссар – лицо или фирма, занимающиеся установлением причин, характера и размера убытка по застрахованным транспортным средствам и грузам. Аджастер – диспашер, специалист в области составления диспаш-расчётов по распределению убытков между судном, грузом и фрахтом в связи с общей аварией.

AVERAGE AGREEMENT = АВАРИЙНОЕ СОГЛАШЕНИЕ (или СОГЛАШЕНИЕ ОБ АВАРИИ) – Average Agreement is a document signed by cargo owners by terms of which they agree to pay any general average contribution properly due so that cargo may be released after a general average loss has occurred. / Документ, подписанный владельцами груза, по условиям которого они согласны должным образом оплатить любые взносы по общей аварии с тем, чтобы груз мог быть отпущен после произошедшего в связи с общей аварией истребления.

AVERAGE BASIS POOL = УСРЕДНЁННЫЙ ПО БАЗИСУ ПУЛ – Average Basis Pool:- the grower nominates a set number of bales in 100 bale lots (100 bales = 1 futures contract) and accepts the average basis of all bales sold within this pool. The advantage of this basis is that Force Majeure usually operates. The disadvantage is that the grower does not know the value of the basis until the merchant has set the basis on all the bales in this pool.

AVERAGE BOND = АВАРИЙНАЯ ПОДПИСКА (или ОБЯЗАТЕЛЬСТВО В ОТНОШЕНИИ АВАРИИ) – Average Bond is an agreement signed by all interested parties acknowledging their liabilities to pay a share of the loss under general average. A 'general average guarantee' is sometimes referred to (particularly in the USA) as an 'Average Bond'. / Соглашение, подписанное всеми заинтересованными сторонами, признающее их обязанности оплатить долю убытка при общей аварии. Гарантия по Общей Аварии иногда, в частности в США, относится к Обязательству в Отношении Аварии.

AVERAGE CLAUSE = ОГОВОРКА О ПРОПОРЦИОНАЛЬНОЙ ВЕЛИЧИНЕ (или ОГОВОРКА ОБ УСРЕДНЕНИИ) – Average Clause is a clause in a marine insurance policy, whereby partial losses are subject to special conditions, e.g., a franchise or deductible is to be applied to claims. / , например, . Оговорка об Усреднении:- содержится в большинстве серий стандартных страховых оговорок по судам и грузам. В полисах по неморскому страхованию в оговорке об усреднении обычно указывается, что убытки подлежат возмещению пропорционально отношению страховой суммы к страховой стоимости объекта страхования.

AVERAGE CLAUSES = АВАРИЙНЫЕ ОГОВОРКИ (или ОГОВОРКИ ОБ АВАРИЯХ) – Average Clauses are the clauses in cargo insurance policy that determine the amount of particular average loss recovery. / Оговорки в полисе страхования груза, определяющие сумму покрытия по гибели в связи с частной аварией. Аварийная Оговорка – оговорка о франшизе.

AVERAGE CONTRIBUTION = ХХ (или КОНТРИБУЦИЯ ПО АВАРИИ) – Average Contribution is a share of the general average expenses to be paid.

AVERAGE COST = УСРЕДНЁННАЯ СТОИМОСТЬ – The Average Cost (AC) is the total cost divided by the number of units produced. It is important to understand that firms maximize profits by considering the marginal cost, not the average cost. The difference between the average cost and the sales price does determine the profits per unit once the profit maximizing quantity is determined, but the profit maximizing quantity generally does not maximize profits per unit. Perfect Competition and Monopoly emphasize the roles of average cost and marginal cost curves. Total cost, fixed plus variable, divided by total output. In economics, Average Cost or Unit Cost is equal to total cost (TC) divided by the number of goods produced (the output quantity, Q). It is also equal to the sum of average variable costs (total variable costs divided by Q) plus average fixed costs (total fixed costs divided by Q). Average costs may be dependent on the time period considered (increasing production may be expensive or impossible in the short term, for example). Average costs affect the supply curve and are a fundamental component of supply and demand. AC = TC / Q. Average Cost is the current or running average of all costs of a particular item. There are several methods of computing average cost and these are limited by the method that costs are stored in the system. / выработка (output). строка баланса (item). В инвестировании:- Средняя Стоимость ценных бумаг, акций или паёв в фонде, если они приобретались по разным ценам. В

производстве:- средние издержки – сумма постоянных и переменных издержек, делённая на число единиц выпущенной продукции. Компании с относительно низкими средними издержками способны легче переносить периоды вынужденного снижения цен на продукцию под влиянием конкуренции. Данный термин также означает метод оценки товарно-материальных запасов, при котором издержки производства готовой продукции делятся на количество штук готовой продукции.

AVERAGE COUNT OF CLOTH = СРЕДНЕЕ ЧИСЛО ПОЛОТНА – Average Count Of Cloth is the average sley and average pick of a cloth. When the average sley is different from the sley, or the average pick different from the pick, the sley and pick, and average sley and average pick are usually written together as follows:- 80/110 X 100/124 ((80 X 100)/(110 X 124)). In some mills this means 80 sley X 100 pick for the ground of the cloth, and 110 sley X 124 pick average, whereas in other mills the top line indicates the average and the lower the count of the base or ground of the cloth. The relative positions, above or below the line, of the ground and average count, are matters of choice. See also Count Of Cloth.

AVERAGE CROP REVENUE ELECTION PROGRAM = ПРОГРАММА ВЫБОРА УСРЕДНЁННОЙ ВЫРУЧКИ ПО УРОЖАЮ – Average Crop Revenue Election (ACRE) Program is a new programme introduced with the 2008 US FCE Act (short for the United States Food, Conservation, and Energy Act of 2008) allowing farmers to choose revenue-based protection against yield and market fluctuations.

AVERAGE DAY TRUE RANGE = СРЕДНЕАРИФМЕТИЧЕСКИЙ ДНЕВНОЙ ИСТИННЫЙ ДИАПАЗОН – Average True Range (ATR) is a technical analysis indicator developed by J. Welles Wilder, based on trading ranges smoothed by an N-day exponential moving average. The range of a day's trading is simply high − low. True range extends it to yesterday's closing price if that was outside today's range, i.e. True Range = max(high, $close_{prev}$) − min(low, $close_{prev}$). The average true range is then an N-day exponential moving average of the true range values. Wilder recommended a 14-period smoothing. Note this is by his reckoning of EMA periods. The idea of ranges is that they show the commitment or enthusiasm of traders. Large or increasing ranges suggest traders prepared to continue to bid up or sell down a stock through the course of the day. Decreasing range suggests waning interest. / В техническом анализе биржевых рынков, среднеарифметический суточный истинный диапазон в течение нескольких дней равен разности между истинным максимумом и истинным минимумом. Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. Результатом этой деятельности стали многочисленные статьи в специализированных журналах для биржевых торговцев и инвесторов, а также книги, и частности, книга Новые Концепции в Технических Системах Торговли (New Concepts in Technical Trading Systems). Вайлдё разработал систему Delta Plus, технические индикаторы ADX, ART, DMI, RSI, параболическую систему SAR, и другие. В 1980-е он основал общество Delta Society International, помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

AVERAGE DELAY – ALL TOWS = СРЕДНЯЯ ЗАДЕРЖКА – ВСЕ БУКСИРУЕМЫЕ СУДА – Average Delay – All Tows is the average delay time, expressed in hours, for all tows which passed through a lock chamber. / прошли через шлюзовую камеру.

AVERAGE DELAY – DELAYED TOWS = СРЕДНЯЯ ЗАДЕРЖКА – ЗАДЕРЖИВАЮЩИЕСЯ БУКСИРУЕМЫЕ СУДА – Average Delay – Delayed Tows is the average delay time, expressed in hours, calculated only for tows that experienced a wait in passing through the lock chamber. / через шлюзовую камеру.

AVERAGE DELAY – DELAYED VESSELS = СРЕДНЯЯ ЗАДЕРЖКА – ЗАДЕРЖИВАЮЩИЕСЯ СУДА – Average Delay – Delayed Vessels is the average delay time, expressed in hours, calculated only for vessels that experienced a wait in to passing through a lock chamber. / через шлюзовую камеру.

AVERAGE DEPOSIT = ХХ (или АВАРИЙНЫЙ ДЕПОЗИТ) – Average Deposit is the amount to be paid, as notified by average adjusters, pending the final liquidation of a general average.

AVERAGE DIRECTIONAL INDEX = СРЕДНЕАРИФМЕТИЧЕСКИЙ НАПРАВЛЕННЫЙ ИНДЕКС – J. Welles Wilder developed the Average Directional Index (ADX) in order to evaluate the strength of the current trend, be it up or down. It's important to determine whether the market is trending or trading (moving sideways), because certain indicators give more useful results depending on the market doing one or the other. ADX is an oscillator that fluctuates between 0 and 100. Even though the scale is from 0 to 100, readings above 60 are relatively rare. Low readings, below 20, indicate a weak trend and high readings, above 40, indicate a strong trend. The indicator does not grade the trend as bullish or bearish, but merely assesses the strength of the current trend. A reading above 40 can indicate a strong downtrend as well as a strong uptrend. ADX can also be used to identify potential changes in a market from trending to non-trending. When ADX begins to strengthen from below 20 and/or moves above 20, it is a sign that the trading range is ending and a trend could be developing. When ADX begins to weaken from above 40 and/or moves below 40, it is a sign that the current trend is losing strength and a trading range could develop. ADX is derived from two other indicators, also developed by Wilder, called the Positive Directional Indicator (sometimes written +DI) and the Negative Directional Indicator (–DI). When the ADX Indicator is selected, SharpCharts plots the Positive Directional Indicator (+DI), Negative Directional Indicator (–DI) and Average Directional Index (ADX). With the Red, White and Green color scheme on SharpCharts, ADX is the thick black line with less fluctuation, +DI is green and –DI is red. +DI measures the force of the up moves and –DI measures the force of the down moves over a set period. The default setting is 14 periods, but users are encouraged to modify these settings according to their personal preferences. In its most basic form, buy and sell signals can be generated by +DI/–DI crosses. A buy signal occurs when +DI moves above –DI and a sell signal when –DI moves above the +DI. Be careful, though; when a security is in a trading range, this system may produce many whipsaws. As with most technical indicators, +DI/–DI crosses should be used in conjunction with other aspects of technical analysis. ADX combines +DI with –DI and then smooths the data with a moving average to provide a measurement of trend strength. Because it uses both +DI and –DI, ADX does not offer any indication of trend direction, just strength. Generally, readings above 40 indicate a strong trend and readings below 20 a weak trend. To catch a trend in its early stages, you might look for stocks with ADX that advances above 20. Conversely, an ADX decline from above 40 might signal that the current trend is weakening and a trading range may develop. Average Directional Index (ADX) is a part of the Directional Movement Indicator (DMI) system developed by J. Welles Wilder. The ADX line is based on the spread between the +DI and –DI lines from that same system. / В техническом анализе биржевых рынков . Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. систему SAR, и другие. В 1980-е он основал общество Delta Society International, помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

AVERAGE DIRECTIONAL MOVEMENT INDEX = СРЕДНЕАРИФМЕТИЧЕСКИЙ ИНДЕКС ПО НАПРАВЛЕННОМУ ДВИЖЕНИЮ – The Average Directional Movement Index (ADX) is a moving average of the DMI. Directional Movement Index (DMI) is an indicator developed by J. Welles Wilder for identifying when a definable trend is present in an instrument. That is, the DMI tells whether an instrument is trending or not. The scale for the DMI is from 0 to 100. Indicator developed by J. Welles Wilder to measure market trend intensity. / В техническом анализе биржевых рынков . флуктуация (колебание). Индикатор, разработанный Дьжей. Вэлзом Вилдёром Младшим (J. Welles Wilder Jr) для измерения интенсивности рыночной тенденции и, стало быть, для разграничения рынка с наличием выраженной тенденции от рынка с торговым диапазоном. При расчёте показаний ADX используют значения индикаторов направленного движения (+DI и –DI). Считается, что если ADX растёт и превышает 15, то на рынке наблюдается тенденция. Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. AVERAGE DISBURSEMENTS = ИЗДЕРЖКИ ПО АВАРИИ – Average Disbursements:- expenditure incurred by the shipowner in connection with a general average act or an act of salvage. Such expenditure, when properly incurred, is recoverable from the general average (GA) or salvage fund created by the adjuster. Hull underwriters are not liable directly for GA expenditure. The assured must recover his expenditure from the GA fund. Underwriters' liability for the GA contribution, if any, will incorporate their proportion of the GA expenditure that is included in the contribution paid by the insured.

AVERAGE FREIGHT RATE ASSESSMENT = ОЦЕНКА УСРЕДНЁННОЙ СТАВКИ ФРАХТА – Average Freight Rate Assessment (AFRA):- this is a freight billing system which is composed of the weighted average of independently owned tanker tonnage. The London Tanker Brokers' Panel determines rates for various size categories, for example:- 10,000/24,999–25,000/44,999–45,000/79,999–80,000/159,999–160,000/319,999–320,000/549,999 (long) tons DWT applicable for six months commencing each January and July. AFRA allows an assessment of a freight scale for various size tankers. AFRA can also be relevant to such matters as the calculation of demurrage for tankers. For example, in Fina Supply Ltd. v. Shell UK Ltd. (1991) the Poitou was nominated to load an oil cargo at Sullom Voe in February 1989. Under the demurrage provisions in the charterparty, the appropriate rate of demurrage was to be determined by applying the AFRA appropriate to the size of vessel actually used and to the date of presentation of the Notice of Readiness. The vessel's size fell into a range of AFRA which provided a figure of 101.8 per cent as a multiplier to be applied to the appropriate demurrage rate in the Worldscale demurrage table. The case was decided on a number of issues but is given here to show that AFPA does have relevance to commercial and legal matters such as demurrage. Xxxxx. In 1954, something called the Average Freight Rate Assessment (AFRA) system was developed by Shell Oil as a means to classify tankers of different sizes. Under the AFRA, tankers are rated according to their dead weight (DWT). DWT, which is expressed in metric tons, is defined as the maximum load by weight that a tanker can safely carry. The AFRA scale divides oil tankers into six classes as follows:- (i) General purpose tanker (10 000–24 999 (long) tons DWT); (ii) Medium range tanker (25 000–44 999 (long) tons DWT); (iii) Large range 1 (45 000–79 999 (long) tons DWT); (iv) Large range 2 (80 000–159 999 (long) tons DWT); (v) Very large crude carrier (160 000–319 999 (long) tons DWT); (vi) Ultra large crude carrier (320 000–549 999 (long) tons DWT) – so-called Supertankers. In each of the six groups, tonnage is divided into three categories:- (i) Long Term Charters; (ii) Short Term Charters; and (iii) Single Voyage Charters. The AFRA results incorporate data for oil cargoes being carried in a period from the from the 16th of one month to the 15th of the following month and are published on the first of the subsequent month. Care should be taken in confirming which monthly set of AFRA results apply to individual shipments when applying specific contractual term. Each month, AFRA subscribers receive the average freight rate assessments expressed in new Worldscale points. Also available is a breakdown of the monthly assessment; this shows average rates for the three charter categories in the five deadweight groups in US dollars per metric ton, converted to a Worldscale equivalent. A further option is an assessment of the Worldscale average single voyage rate for clean vessels for GP, MR and LR1 size ranges. AFRA results are available on a subscription basis only and all subscribers are asked to sign an undertaking that the results will not be disclosed to any other parties. Ultra large crude carriers are capable of transporting over two million barrels of oil, which was roughly enough to supply the United Kingdom for a single day in 2005. Supertankers are so large that they cannot enter most ports fully loaded. Instead, they load and unload cargo at offshore platforms. Many supertankers stay at sea for greater than 70 days at a time. The largest oil tankers ever built were 379 m in length, 68 m wide, 34 m tall, and had a capacity of over three million barrels of oil. The largest of these tankers, the TI Asia and TI Africa, were both converted into floating petroleum containment vessels when their operation and maintenance became too expensive. / Эл.ти.ди. (Fina Supply Ltd.) против Щел Ю.Кей. Эл.ти.ди. (Shell UK Ltd.). АФРА:- оценки средних ставок фрахта по судам, перевозящим нефтеналивные грузы. Составляются для разных тоннажных категорий судов и, в рамках каждой категории, – для разных видов фрахтования. При этом учитываются не более 50% от всех перевозок нефтеналивных грузов. Оценки выполняются для периода от 16-го числа месяца до 15-го числа следующего месяца, публикуются в начале предшествующего месяца и предназначены для использования в текущем месяце. АФРА относят к ставке фрахта по Мировой Шкале, выраженной в Долларах за тонну.

AVERAGE INVENTORY = УСРЕДНЁННЫЙ ИНВЕНТАРЬ – Average Inventory is the divisor used to compute Inventory Turn Rate and Gross Margin Return On Inventory (GMROI), so it is an extremely important figure. It represents the average a product, category, vendor, entire company, etc, for the specified time period and is usually stored at the item level to facilitate multiple viewing perspectives. Average Inventory is the average inventory level over a period of time.

AVERAGE IRRESPECTIVE OF PERCENTAGE = АВАРИЯ НЕЗАВИСИМО ОТ ПРОЦЕНТА ПОТЕРЬ – Broadest With Average clause. Losses by insured perils are paid regardless of percentage. / Наиболее распространённая аварийная оговорка. Убытки, вызванные страховыми рисками выплачиваются независимо от процента.

AVERAGE OPTION = УСРЕДНЁННЫЙ ОПЦИОН – Average Option:- a plain vanilla option pays out the difference between its predetermined strike price and the spot rate (or price) of the underlying at the time of expiry. The purchaser of an average option (average price, average strike, average hybrid, average ratio), on the other hand, will receive a pay-out which depends on the average value of the underlying. The average can be calculated in a number of ways (arithmetic or geometric, weighted or simple) from the spot rate on a predetermined series of dates (usually official fixing rates). An average rate (also known as Average Price) option is a cash-settled option with a predetermined (i.e. fixed) strike which is exercised at expiry against the average value of the underlying over the

option's life. In general, hedging with an average option is cheaper than using a portfolio of vanilla options, since the averaging process offsets high values with low ones and therefore lowers volatility and premium. Average rate options, also known as Asian Options, are particularly popular in the currency and commodity markets. In contrast, the strike for an average strike option is not fixed until the end of the averaging period which is typically much before the expiry. When the strike is set, the option is exercised against the prevailing spot rate. Unlike average price options, average strike options may be either cash or physically settled. In the case of an average hybrid option (also known as an Average-In/Average-Out Option), both the strike and settlement price of the option are determined using the average, where the strike averaging period typically precedes the settlement price averaging period. For the average ratio option, both the strike and settlement price of the option are determined using the average as in the hybrid case. The final payoff is determined by comparing the ratio of settlement price to strike and a fixed percent strike.

AVERAGE PICK = СРЕДНЕЕ ЗНАЧЕНИЕ УТОЧИН (или СРЕДНЕЕ ЧИСЛО УТОЧНЫХ НИТЕЙ НА ЕДИНИЦУ ДЛИНЫ В СУРОВОЙ ТКАНИ, или СРЕДНЯЯ ПЛОТНОСТЬ СУРОВОЙ ТКАНИ ПО УТКУ) – Average Pick is the average number of picks per inch in the cloth when check pegs are used.

AVERAGE REVENUE PER KILOWATT–HOUR = СРЕДНЕАРИФМЕТИЧЕСКАЯ ВЫРУЧКА ЗА КИЛОВАТТ–ЧАС (или СРЕДНЯЯ ВЫРУЧКА ЗА КИЛОВАТТ–ЧАС) – The Average Revenue per KiloWatt-Hour of electricity sold by sector (residential, commercial, industrial, or other) and geographic area (State, Census division, and National), is calculated by dividing the total monthly revenue by the corresponding total monthly sales for each sector and geographic area.

AVERAGES = СРЕДНИЕ ВЕЛИЧИНЫ (или УСРЕДНЕНИЯ, или СРЕДНЕАРИФМЕТИЧЕСКИЕ ВЕЛИЧИНЫ) – Averages:- various ways of measuring the trend of securities prices, one of the most popular of which is the Dow Jones average of 30 industrial stocks listed on the New York Stock Exchange. The prices of the 30 stocks are totaled and then divided by a divisor that is intended to compensate for past stock splits and stock dividends and that is changed from time to time. As a result, point changes in the average have only the vaguest relationship to Dollar price changes in stocks included in the average. / Дау Дьжонз (Dow Jones). В статистике Средние Величины обобщают количественные характеристики элементов массового процесса (устраняют их индивидуальные различия, выявляют общие условия и закономерности). Применяются для характеристики уровня явлений, его развития во времени, сравнения двух или нескольких уровней; производства расчётов и оценок в связи с прогнозированием, проектированием, планированием и тому подобным. Преимущественно используются:- средние арифметические, средние взвешенные, средние гармонические, средние геометрические, средние квадратичные, а также медиана и мода.

AVERAGE SAMPLE = СРЕДНЯЯ ПРОБА – In the grains industry, Average Samples represent the visual quality of a grade of grain in a specific location at the end of a time interval. Average samples are composited to create official carlot unload samples, cargo samples or submitted samples, by elevator, by port, or by inspection district. They provide a means of monitoring grade levels and specific grading factors. / В России Средняя Проба – часть объединённой пробы, выделенная для определения качества партии. Для небольших партий зерна объединённая проба одновременно является и средней пробой.

AVERAGE SLEY = СРЕДНЕЕ БЁРДО (или СРЕДНЕЕ ЧИСЛО ОСНОВНЫХ НИТЕЙ НА ЕДИНИЦУ ДЛИНЫ В СУРОВОЙ ТКАНИ, или СРЕДНЯЯ ПЛОТНОСТЬ СУРОВОЙ ТКАНИ ПО ОСНОВЕ) – Average Sley is the average number of ends per inch in the cloth when some dents contain more ends than others.

AVERAGE STIFFNESS = СРЕДНЯЯ ЖЁСТКОСТЬ – Average Stiffness is the ratio of change in stress to change in strain between two points on a stress-strain diagram, particularly the points of zero stress and breaking stress. See also Modulus.

AVERAGE STRIKE OPTIONS = ОПЦИОНЫ С УСРЕДНЁННОЙ СХОДНОЙ ЦЕНОЙ – Average Strike Options are the Asian-style options where the ultimate settlement depends on an average strike price rather than an average underlying asset price.

AVERAGE TOUGHNESS = СРЕДНЯЯ УПРУГОСТЬ – Average Toughness values for a few hardwood species. Hardwoods:- Yellow Birch, Hickory (mocker-nut, pignut, sand), Sugar Maple, Red Oak (Pin, Scarlet), White Oak (overcup), Sweetgum, Black Willow, Yellow-Poplar, etc. See also Toughness.

AVERAGE TRUE RANGE = СРЕДНЕАРИФМЕТИЧЕСКИЙ ИСТИННЫЙ ДИАПАЗОН – Developed by J. Welles Wilder, the Average True Range (ATR) is an indicator that measures volatility. As with most of his indicators, Wilder designed ATR with commodities and daily prices in mind. Commodities are frequently more volatile than stocks. They were are often subject to gaps and limit moves, which occur when a commodity opens up or down its maximum allowed move for the session. A volatility formula based only on the high-low range would fail to capture volatility from gap or limit moves. Wilder created Average True Range to capture this 'missing' volatility. It is important to remember that ATR does not provide an indication of price direction, just volatility. Wilder features ATR in his 1978 book, New Concepts in Technical Trading Systems. This book also includes the Parabolic SAR, RSI and the Directional Movement Concept (ADX). Despite being developed before the computer age, Wilder's indicators have stood the test of time and remain extremely popular. Wilder started with a concept called True Range (TR), which is defined as the greatest of the following:- (i) method 1:- Current High less the current Low; (ii) method 2:- Current High less the previous Close (absolute value); and (iii) method 3:- Current Low less the previous Close (absolute value). Calculation:- typically, the Average True Range (ATR) is based on 14 periods and can be calculated on an intraday, daily, weekly or monthly basis. For this example, the ATR will be based on daily data. Because there must be a beginning, the first TR value is simply the High minus the Low, and the first 14-day ATR is the average of the daily TR values for the last 14 days. After that, Wilder sought to smooth the data by incorporating the previous period's ATR value. Current ATR = [(Prior ATR x 13) + Current TR] / 14; (i) multiply the previous 14-day ATR by 13; (ii) add the most recent day's TR value; and (iii) divide the total by 14. Welles Wilder developed Average True Range (ATR) to measure commitment in a trending market. An indicator that measures a security's volatility. High Average True Range (ATR) values indicate high volatility and may be an indication of panic selling or panic buying. Low ATR readings indicate sideways movement by the stock. Average True Range (ATR) is a moving average of the true range. / В техническом анализе биржевых рынков . Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. Результатом этой деятельности стали многочисленные статьи в специализированных журналах для биржевых торговцев и инвесторов, а также книги, и частности, книга Новые Концепции в Технических Системах Торговли (New Concepts in Technical Trading Systems). Вайлдёр разработал систему Delta Plus, технические индикаторы ADX, ART, DMI, RSI, параболическую систему SAR, и другие. В 1980-е он основал общество Delta Society International, помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

AVERAGE HOURLY UNWEIGHTED LMP = XX – Average Hourly Unweighted LMP is an locational marginal price (LMP) calculated by averaging hourly LMP with equal hourly weights.

AVERAGING = УСРЕДНЕНИЕ – Averaging is a method whereby a smoothing of the fluctuations in price movements may be achieved by agreeing to buy or sell a specified total quantity of precious metal on the basis of average prices over an agreed period of time. Averaging is the practice of buying on a rising market to lower the average purchase price. See also Dollar Cost Averaging. / В биржевой торговле, практика покупки на растущем рынке с целью снижения усреднённой цены скупки. Смотрите также Усреднение Стоимости Доллара (Dollar Cost Averaging). Усреднение – стратегия биржевой игры, состоящая в последовательной, через определённый промежуток времени, покупке или продаже акций конкретного выпуска по мере изменения их курса. Клиенту в таком случае предоставляются определённые льготы.

AVERAGING = УСРЕДНЕНИЕ – Averaging is a method of color measurement that allows you to average several measurements into one color measurement. Averaging is recommended when measuring standards or samples with surface variation. Usually the sample is turned 90° between measurements.

AVI = AUTOMATED VEHICLE IDENTIFICATION

AVIAN INFLUENZA = АВИАН ИНФЛЮЭНЦА (или ПТИЧИЙ ГРИПП) – Avian Influenza (AI) is an infectious disease of Birds caused by type A strains of the influenza Virus. The disease, which was first identified in Italy more than 100 years ago, occurs worldwide. The quarantining of infected farms, destruction of infected or potentially exposed flocks, and recently inoculation are standard control measures. Avian Influenza (AI) is a highly contagious viral infection which can affect all Species of Birds and can manifest itself in different ways depending mainly on the ability of the Virus to cause disease (pathogenicity) on the Species affected. Avian Influenza (AI), caused by the influenza Virus Type'A', can affect several Species of food producing Birds (Chickens, Turkeys, Quails, Guinea Fowl, etc), as well as pet Birds and wild Birds with some strains resulting in high mortality rates. The Virus has also been isolated from mammalian Species including Humans, Rats and Mice, Weasels and Ferrets, Pigs, Cats, Tigers and Dogs. AI Viruses are not new. There are many descriptions of historical outbreaks of AI in domestic poultry throughout available literature. There are many strains of AI Viruses and generally can be classified into two categories:- low pathogenic (LPAI) that typically causes little or no clinical signs in Birds and highly pathogenic (HPAI) that can cause severe clinical signs and/or high mortality in Birds. The Asian origin highly pathogenic H5N1 strain of the AI Virus has attracted much attention over the last few years because of significant outbreaks globally in domestic and wild Birds. Concern is raised because of the degree of virulence not only in poultry but also in wild Birds as well as the ability to infect mammalian Species. While AI Viruses are generally highly species specific, the highly pathogenic H5N1 AI Virus has also infected Humans. Low pathogenic strains of AI H5N1 Virus exist but do not produce significant clinical signs in Birds. Avian influenza is a disease listed under the World Organisation for Animal Health (OIE) Terrestrial Animal Health Code. Notifi able avian influenza includes two particular subtypes, H5 and H7 that must be reported to the OIE as detailed in the OIE Terrestrial Animal Health Code. Where is the disease found? AI occurs worldwide and different strains are more prevalent in certain areas of the world than others. Of particular interest are outbreaks of highly pathogenic H5N1 AI that began in South-East Asia in late 2003. Over the past years, several other Asian countries have reported outbreaks and in some, the disease is now considered to be endemic (always present). Outbreaks of HPAI H5N1 have also been reported in Africa and Europe. How is the disease transmitted and spread? Several factors can contribute to the spread of AI Viruses including globalization and international trade (legally and illegally), marketing practices (live Bird markets), farming practices and the presence of the viruses in wild birds. Wild Birds normally can carry avian influenza Viruses in their respiratory or intestinal tracts and usually do not get sick. Wild Birds have historically been known as reservoirs for AI Viruses, mostly of low pathogenicity. Around the world, surveillance measures have been put in place to monitor occurrence and characteristics of AI viruses in wild Birds. In wild Birds, it is common during routine testing to find some influenza Viruses. The vast majority of these Viruses do not cause disease. In studying current HPAI H5N1 outbreaks, the exact role of wild Birds in spreading the Virus over long distances is still not fully understood in all situations. Generally, there are many uncertainties about the wild Species involved, the migratory routes used and, above all, the possibility that some Species could become permanent reservoirs of the H5N1 Virus, with carriers showing no clinical signs of the disease. AI Viruses can be spread through direct contact with secretions from infected Birds, especially faeces or through contaminated feed, water, equipment and clothing. Apart from being highly contagious among poultry, avian influenza Viruses are readily transmitted from farm to farm by the movement of domestic live Birds, people (especially when shoes and other clothing are contaminated), and contaminated vehicles, equipment, feed, and cages. Highly pathogenic viruses can survive for long periods in the environment, especially when temperatures are low. For example, the highly pathogenic H5N1 virus can survive in bird faeces for at least 35 days at low temperature (4 °C). At a much higher temperature (37 °C), H5N1 viruses have been shown to survive, in faecal samples, for six days. Other species including cats and Pigs can exceptionally become infected with the HPAI H5N1 Virus. Infections of Pigs are of concern because the Species is susceptible to infections of both avian and human influenza Viruses and this may provide the H5N1 AI Virus the opportunity to reassort or mutate. While sporadic infection with HPAI H5N1 Virus in both Species have been reported over the past three years there is no scientific evidence to suggest that either Species plays a significant role in the epidemiology of the disease or as a source of Virus to other Species. What is the public health risk associated with this disease? The disease is a zoonosis (a disease which primarily affects Animals, but causes disease in Humans). AI Viruses are highly species-specific, but have, on rare occasions, crossed the species barrier to infect humans. Transmission to humans has occurred when there is close contact with infected Birds or heavily contaminated environments. While AI caused by highly pathogenic virus strains have sometimes been shown to infect man, this disease should not be confused with seasonal human influenza, a very common human disease (generally caused by H1 and H3 Viruses). Due to the potential for human infection, it is recommended that those people working with, or in contact with poultry suspected of being infected with AI, wear protective clothing including face masks, goggles, gloves and boots. The probability for the H5N1 AI Virus to change to a form that is highly infectious for humans and that will spread readily from person to person is unknown. However, this possibility combined with the increasing resistance of the H5N1 AI virus to currently available antiviral treatment and lack of complete vaccination effectiveness make this a critical human health risk. There is no evidence to suggest that the consumption of cooked poultry or eggs could transmit the AI virus to humans. What are the clinical signs of the disease? In the mild form, signs of illness may be expressed only as ruffl ed feathers, reduced egg production, or mild effects on the respiratory system. In the severe form of the disease, the virus not only affects the respiratory tract, as in the mild form, but also invades multiple organs and tissues that can result in massive internal haemorrhaging. Some or all of the following clinical signs are evident in birds infected with a highly pathogenic strain of AI (including H5N1 strain):- (i) quietness and extreme depression; (ii) sudden drop in production of eggs, many of which are soft-shelled or shell-less; (iii) wattles and combs become swollen and congested; (iv) swelling of the skin under the eyes; (v) coughing, sneezing and nervous signs; (vi) diarrhoea; (vii) haemorrhages on the hock; (viii) a few deaths may occur over several days, followed by rapid spread and a mortality rate that can then approach 100% within 48 hours. More detailed information is available in the OIE Avian Infl uenza Technical Disease Card www.oie.int/en/animal-health-in-the-world/technicaldisease-cards/. How is the disease diagnosed? Avian influenza (AI) may be suspected on the basis of clinical signs and events leading to the disease. Laboratory tests are required to confi rm the diagnosis (OIE Terrestrial Animal Health Code and OIE Manual of Diagnostic Tests and Vaccines for Terrestrial Animals). What is being done to prevent or control this disease? Prevention and control measures It is extremely important to have early detection and warning systems and prevention measures in place as part of an effective strategy for AI. This needs to be coupled with similar efforts

placed on preparing for a potential outbreak. Around the world, surveillance measures have been put in place to detect the presence of infection in poultry according to OIE standards for the surveillance of avian influenza (OIE Terrestrial Animal Health Code). Additionally, surveillance programmes monitor the occurrence, prevalence and characterisation of AI viruses found in wild Birds. Wild Bird surveillance considers different migratory fl yways and particularly at mingling points for migrating Birds from different continents. It is essential for poultry producers to maintain biosecurity practices to prevent introduction of the Virus in their flock. Measures that are recommended at the farm level include:- (i) keep poultry away from areas frequented by wild fowl; (ii) keep control over access to poultry houses by people and equipment; (iii) do not provide elements on property that may attract wild Birds; (iv) maintain sanitation of property, poultry houses and equipment; (v) avoid the introduction of birds of unknown disease status into flock; (vi) report illness and death of Birds; and (vii) appropriate disposal of manure and dead poultry. If the disease is detected, generally a'stamping out' (culling) policy is used in the efforts to eradicate the disease. Elements included in a response effort include:- (i) humane destruction of all infected and exposed animals (OIE Terrestrial Animal Health Code); (ii) appropriate disposal of carcasses and all animal products (OIE Terrestrial Animal Health Code); (iii) surveillance and tracing of potentially infected or exposed poultry; (iv) strict quarantine and controls on movement of poultry and any at-risk vehicles; (v) thorough decontamination of infected premises; (vi) a period at least 21 days before restocking. Culling may be complemented by a vaccination policy for poultry in a high-risk area. Vaccination aims to protect the susceptible population of birds from potential infection thereby reducing the incidence or the severity of disease. Vaccination strategies can effectively be used as an emergency effort in the face of an outbreak or as a routine measure in an endemic area. Careful consideration must be given prior to implementing a vaccination policy and requires that the recommendations from the World Organisation for Animal Health (OIE) on vaccination and vaccines are closely followed (www.oie.int\downld\AVIANINFLUENZA\Guidelines on AI vaccination.pdf). Any decision to use vaccination must include an exit strategy. OIE guidelines emphasize that prevention and control measures such as surveillance and reporting of findings of NAI in wild birds and vaccination of domestic poultry should not result in unjustified trade restrictions (OIE Terrestrial Animal Health Code). Key Facts:- (i) In 1997, a highly pathogenic strain of H5N1 AI emerged in Southeast Asia and spread throughout numerous Asian, Middle Eastern, African, and European countries. It has also been associated with illness and death in humans who have had close contact with infected birds. (ii) In 2002, mortalities in wild birds due to highly pathogenic avian influenza (HPAI) were reported in Hong Kong. These were the first reported deaths of wild Birds as a result of HPAI in Asia. (iii) The first AI H5N1 case reported in Africa was in February 2006 in Nigeria. (iv) Outbreaks of highly pathogenic H5N1 AI in domestic Birds occurring in Asia, Africa and Europe mark the first time in the history of this disease where so many countries have been simultaneously affected with the loss of so many Birds.

AVIATION GASOLINE = АВИАЦИОННЫЙ БЕНЗИН – Aviation Gasoline is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of 60 °C and a distillation range usually within the limits of 30 °C and 180 °C. See also Gasoline. / точка замерзания при 60 °C.

AVIATION INSURANCE = АВИАЦИОННОЕ СТРАХОВАНИЕ – Aviation Insurance is insurance coverage geared specifically to the operation of aircraft and the risks involved in aviation. Aviation insurance policies are distinctly different from those for other areas of transportation and tend to incorporate aviation terminology, as well as terminology, limits and clauses specific to aviation insurance. Aviation Insurance was first introduced in the early years of the XX century. The first aviation insurance policy was written by Lloyd's of London in 1911. The company stopped writing aviation policies in 1912 after bad weather and the resulting crashes at an air meet caused losses on many of those first policies. The first aviation polices were underwritten by the marine insurance underwriting community. The first specialist aviation insurers emerged in 1924. In 1929 the Warsaw convention was signed. The convention was an agreement to establish terms, conditions and limitations of liability for carriage by air, this was the first recognition of the airline industry as we know it today. In 1931, Captain A.G. Lamplugh, the British Aviation Insurance Company's chief underwriter and principal surveyor, said of the new industry:- 'Aviation in itself is not inherently dangerous. But to an even greater degree than the sea, it is terribly unforgiving of any carelessness, incapacity or neglect'. Realising that there should be a specialist industry sector, the International Union of Marine Insurance (IUMI) first set up an aviation committee and later in 1933 created the International Union of Aviation Insurers (IUAI), made up of eight European aviation insurance companies and pools. The London insurance market is still the largest single centre for aviation insurance. The market is made up of the traditional Lloyd's of London syndicates and numerous other traditional insurance markets. Throughout the rest of the world there are national markets established in various countries, this is dependent on the aviation activity within each country, the US has a large percentage of the world's general aviation fleet and has a large established market. No single insurer has the resources to retain a risk the size of a major airline, or even a substantial proportion of such a risk. The catastrophic nature of aviation insurance can be measured in the number of losses that have cost insurers hundreds of millions of Dollars (Aviation accidents and incidents). Most airlines arrange 'fleet policies' to cover all aircraft they own or operate. Aviation insurance is divided into several types of insurance coverage available:- (i) Public Liability Insurance:- this coverage, often referred to as third party liability covers aircraft owners for damage that their aircraft does to third party property, such as houses, cars, crops, airport facilities and other aircraft struck in a collision. It does not provide coverage for damage to the insured aircraft itself or coverage for passengers injured on the insured aircraft. After an accident an insurance company will compensate victims for their losses, but if a settlement can not be reached then the case is usually taken to court to decide liability and the amount of damages. Public liability insurance is mandatory in most countries and is usually purchased in specified total amounts per incident, such as USD1 000 000 or USD5 000 000. (ii) Passenger Liability Insurance:- passenger liability protects passengers riding in the accident aircraft who are injured or killed. In many countries this coverage is mandatory only for commercial or large aircraft. Coverage is often sold on a 'per-seat' basis, with a specified limit for each passenger seat. (iii) Combined Single Limit (CSL):- CSL coverage combines public liability and passenger liability coverage into a single coverage with a single overall limit per accident. This type of coverage provides more flexibility in paying claims for liability, especially if passengers are injured, but little damage is done to third party property on the ground. (iv) Ground Risk Hull Insurance Not In Motion:- this provides coverage for the insured aircraft against damage when it is on the ground and not in motion. This would provide protection for the aircraft for such events as fire, theft, vandalism, flood, mudslides, animal damage, wind or hailstorms, hangar collapse or for uninsured vehicles or aircraft striking the aircraft. The amount of coverage may be a blue book value or an agreed value that was set when the policy was purchased. The use of the insurance term 'hull' to refer to the insured aircraft betrays the origins of aviation insurance in marine insurance. Most hull insurance includes a deductible to discourage small or nuisance claims. (v) Ground Risk Hull Insurance In Motion (Taxiing):- this coverage is similar to ground risk hull insurance not in motion, but provides coverage while the aircraft is taxiing, but not while taking off or landing. Normally coverage ceases at the start of the take-off roll and is in force only once the aircraft has completed its subsequent landing. Due to disputes between aircraft owners and insurance companies about whether the accident aircraft was in fact taxiing or attempting to take-off this coverage has been discontinued by many insurance companies. (vi) In-Flight Insurance:- in-flight coverage protects an insured aircraft against damage during all phases of flight and ground operation, including while parked or stored. Naturally it is more expensive than not-in-motion coverage since most aircraft are damaged while in motion. Aviation Insurance is an insurance of accident and liability risks, as well as hull damage, connected with the operation of aircraft. / (A.G. Lamplugh). Страхование рисков наступления несчастных случаев и ответственности, а также повреждения корпуса, связанного с функционированием самолёта.

AVIM = AVIATION INTERMEDIATE MAINTENANCE

AVIRULENT MICROORGANISM = АВИРУЛЕНТНЫЙ МИКРООРГАНИЗМ – Avirulent Microorganism is a plant pathogenic microorganism not capable of producing infection on the host plant avoidance. Preventing a stress, such as early-maturing rice varieties that could be harvested before the drought sets in. / Под Микроорганизмами или Микробами понимаются мельчайшие, преимущественно одноклеточные организмы, видимые только в микроскоп:- бактерии, микроскопические грибы и водоросли, простейшие (protozoan). Иногда к микроорганизмам относят вирусы. Характеризуются огромным разнообразием видов, способных существовать в различных условиях (горячие источники, дно океана, снега гор и так далее). Играют большую роль в кругообороте веществ в природе. Используются в пищевой и микробиологической промышленности (виноделие, хлебопечение, производство антибиотиков, витаминов, аминокислот, белка и другого), генной инженерии. Патогенные микроорганизмы вызывают болезни растений, животных и человека.

AVL = AUTOMATIC VEHICLE LOCATION

AVLB = ARMORED VEHICLE LAUNCHED BRIDGE

AVM = AUTOMATIC VEHICLE MONITORING

AVN = AVIATION

AVO = AVAILABLE VEHICLE OCCUPANCY

AVOCADO = АВОКАДО (или ХХ) – Avocado:- a light yellowish green.

AVOIDANCE = ОТМЕНА (или ОСПАРИВАНИЕ, или ИЗБЕЖАНИЕ) – Avoidance:- the right of an underwriter to avoid a contract of marine insurance from inception. This can occur in the event of a breach of good faith by the assured or by his broker or, in the case of a voyage policy, where the voyage does not commence within a reasonable time after acceptance of the risk by the underwriter.

AVOIDANCE OF A CONTRACT AB INITIO = ОТМЕНА КОНТРАКТА С НАЧАЛА – Avoidance Of A Contract Ab Initio:- the cancellation of an insurance or reinsurance contract from its beginning by an insurer or reinsurer on the basis of the misrepresentation and/or non-disclosure of material facts. The result is that the insurer/reinsurer has no liability under the contract but must repay the premium to the insured/reassured.

AVOIRDUPOIS POUND = ТОРГОВЫЙ ФУНТ (или ЭВЭДЭПОЙЗ ФУНТ, или ЭВЕРДЬЮПОЙС ФУНТ, или АВУАРДЮПУА ФУНТ) – Since 01 July 1959, the international Avoirdupois Pound has been defined as exactly 0.453 592 37 kg. In the United Kingdom, the use of the international pound was implemented in the Weights and Measures Act 1963. An avoirdupois pound is equal to 16 avoirdupois ounces and to exactly 7 000 grains. The conversion factor between the kilogram and the international pound was therefore chosen to be divisible by 7, and an (international) grain is thus equal to exactly 64.798 91 milligrams. The avoirdupois pound, also known as the Wool Pound, first came into general use c. 1300. It was initially equal to 6 992 Troy grains. The pound avoirdupois was divided into 16 ounces. During the reign of Queen Elizabeth, the avoirdupois pound was redefined as 7 000 Troy grains. Since then, the grain has often been an integral part of the avoirdupois system. By 1758, two Elizabethan Exchequer standard weights for the avoirdupois pound existed, and when measured in Troy grains they were found to be of 7 002 grains and 6 999 grains. The 1878 Act said that contracts worded in terms of metric units would be deemed by the courts to be made according to the Imperial units defined in the Act, and a table of metric equivalents was supplied so that the Imperial equivalents could be legally calculated. Thus defining, in UK law, metric units in terms of Imperial ones. The equivalence for the pound is given as 1 lb = 453.592 65 g or 0.453 59 kg, which would make the kilogram weigh approximately 2.204 621 3 lb. In 1883, it was determined jointly by the Standards Department of the Board of Trade and the Bureau International that 0.453 592 427 7 kg was a better approximation, and this figure, rounded to 0.453 592 43 kg was given legal status by an Order in Council in May 1898. However in 1963 a new Weights and Measures Act reversed this relationship and the pound was defined for the first time as a mass equal to 0.453 592 37 kg to match the definition of the international pound agreed in 1959. Same as 0.453 592 427 7 (0.453 592 37) kilograms. Also known as Pound. Abbreviation:- avdp. lb. / Эвэдэпойз или Эвердьюпойс или Авуардюпуа (по-Французски) или Торговый Фунт является основной единицей веса в системе Английских мер. Он равен 0.453 592 427 7 (0.453 592 37) килограмма. Известен также как Фунт (Pound). Обозначение:- торг. ф (avdp. lb). Английская система мер веса для всех товаров, кроме благородных металлов, драгоценных камней и лекарств.

AVOIRDUPOIS UNIT = ЕДИНИЦА ТОРГОВОГО ВЕСА – Avoirdupois Unit:- customary US weights. 1 Troy ounce = 1.09 ounces avoirdupois. Avoirdupois Unit:- any of the units of the avoirdupois system of weights. / Принятая в США единица веса. 1 Тройская унция = 1.09 торговых унций.

AVOIRDUPOIS WEIGHTS = ТОРГОВЫЕ ВЕСА – Avoirdupois Weights:- the common traditional system of weights in all the English-speaking countries. Until quite recently, almost all weights were stated in avoirdupois units (e.g., ounces and pounds), with only precious metals and pharmaceuticals being measured by Troy weights. The name of the system comes from the Old French phrase avoir du pois or aveir de pois, goods of weight, indicating simply that the goods were being sold by weight rather than by volume or by the piece. The system is based on the avoirdupois pound of 7 000 grains. The pound is divided into 16 ounces, each divided further into 16 drams. The avoirdupois system was introduced in England around 1300, replacing an older commercial system based on a mercantile pound (libra mercatoria) of 7 200 grains divided into exactly 15 Troy ounces. Scholars believe the avoirdupois pound was invented by wool merchants and modeled on a pound of 16 ounces used in Florence, Italy, which was an important buyer of English wool at the time. The avoirdupois weights quickly became the standard weights of trade and commerce. They continue to be used for most items of retail trade in the United States, and they remain in some use in Britain despite the introduction of metric units there. International System of Units (Le Système International d'Unités (SI)). The Avoirdupois system (abbreviation:- avdp) is a system of weights (or, properly, mass) based on a pound of 16 ounces. It is the everyday system of weight used in the United States and is still used to varying degrees in everyday life in the United Kingdom, Canada and some other former British colonies despite the official adoption of the metric system. An alternative system of mass is generally used for precious materials, Troy weight. The modern definition of the avoirdupois pound is exactly 0.453 592 37 kilograms. Etymology:- the word avoirdupois is from Anglo-Norman French aveir de peis (later avoir de pois), literally 'goods of weight' (Old French aveir, 'property, goods', also 'to have', comes from the Latin habere, 'to have, to hold, to possess property'; de = 'from'/'of', cf. Latin; peis = 'weight', from Latin pensum). This term originally referred to a class of merchandise:- aveir de peis, 'goods of weight', things that were sold in bulk and were weighed on large steelyards or balances. Only later did it become identified with a particular system of units used to weigh such merchandise. The orthography of the day has left many variants of the term, such as haberty-poie and haber de peyse. The Norman peis became the Parisian pois. In the XVII century de was replaced with du. Internationalization:- in the avoirdupois system, all units are multiples or fractions of the pound, which is now defined as 0.453 592 37 kg exactly in most of the English-speaking world since the implementation of the international yard and pound agreement of 1959. Due to the ambiguous meanings of 'weight' as referring to both mass and force, it is

sometimes erroneously asserted that the pound is only a unit of force. However, as defined above the pound is a unit of mass, which agrees with common usage. / Лё Систэм Этэрнасьёналь д'Юните (Эс.И. или, как её уже устоялось называть в России, СИ).

AVRDC = ASIAN VEGETABLE RESEARCH AND DEVELOPMENT CENTER

AVS = AVIATION STANDARDS

AW = ARUBA

AWARD = АРБИТРАЖНОЕ РЕШЕНИЕ – Award is a decision given by a court of law or by an arbitrator to conclude a dispute. The term can be used also to define the amount of damages allowed, if any, in the award. A judge in court will often state the reasoning for the decision, whereas this is rarely the case, with an arbitrator's award.

AWARE = ОСВЕДОМЛЁННОЕ (или УВЕДОМЛЁННОЕ) – In Australia, an entity becomes Aware of information if a director or executive officer (in the case of a trust, a director or executive officer of the responsible entity or management company) has, or ought reasonably to have, come into possession of the information in the course of the performance of their duties as a director or executive officer of that entity.

AWASH = ВРОВЕНЬ С ПОВЕРХНОСТЬЮ ВОДЫ – Awash:- level with the water (water ready to, or slightly covering decks). / В морском деле .

AWB = AIRWAYBILL

AWDL = AVIATION WEATHER DEVELOPMENT LABORATORY

AWDT = AVERAGE WEEKDAY DAILY TRAFFIC

AWG = AMERICAN WIRE GAUGE

AWG = ARUBAN GUILDER

AWKWARD CARGO = НЕГАБАРИТНЫЙ ГРУЗ (или ГРОМОЗДКИЙ ГРУЗ) – Awkward Cargo is a cargo of irregular size that is either containerized or un-containerized. It requires prior approval, depending on the circumstances, before confirmation of booking. / Груз необычного размера, как подвергающийся, так и не подвергающийся контейнеризации. В зависимости от обстоятельств он требует предварительного согласования и одобрения, прежде чем будет подтверждено его бронирование. Негабаритным Грузом в сфере грузоперевозок называют груз, определённые параметры которого не соответствуют стандартам грузоперевозок. Такими параметрами, в частности, являются размеры (ширина, длина, высота) и вес, в зависимости от которых различают крупногабаритные, длинномерные и тяжеловесные грузы. Для транспортировки таких грузов невозможно использование стандартных грузовых автомобилей, из-за чего негабаритные перевозки являются одними из наиболее трудоёмких и сложных процессов, выполнять которые могут только профессионалы.

AWL–LIKE LEAF = ШИЛОВИДНЫЙ ЛИСТ – Awl-Like Leaf:- tapering from the base to a sharp point, e.g., Juniperus.

AWN = ОСТЬ – Awn is a bristlelike extension of varying length originating from the lemma of the rice spikelet. Present in some varieties. Awn is a stiff, bristle-like projection on the seed head of some grasses. Awn (syn. Arista, and Beard) is a filiform extension of varying lengths from the keel (middle nerve) of the lemma. / Ость это жёсткий, похожий на щетину выступ на семенной шапке некоторых трав. Под Остью понимается:- (i) у растений (многих злаков):- тонкий, заострённый иногда колючий или перистый отросток на цветковой или (реже) колосковой чешуе. (ii) длинные и прямые волосы, тонкие у основания и утолщённые у вершины; верхний ярус волосяного покрова (шерсти) у млекопитающих животных. На уровне нижней половины ости находится подшёрсток.

AWNING STRIPES = ТЕНТОВЫЕ ПОЛОСЫ (или НАВЕСНЫЕ ПОЛОСЫ) – Awning Stripes are the stripes seen on awnings designed to protect windows from sun. Awning stripes are sometirnes used on fabric for apparel and are usttally brightly colored and at least 1" wide. Awning stripe patterns may also have a narrow stripe about 1/4" wide on each side of the main stripe.

AWO = AMERICAN WATERWAY OPERATORS

AWOL = ABSENCE WITHOUT LEAVE

AWOL = ABSENT WITHOUT LEAVE

AWOS = AUTOMATED WEATHER OBSERVING STATION

AWP = ADJUSTED WORLD PRICE

AWP = AVIATION WEATHER PROCESSOR

AWPG = AVIATION WEATHER PRODUCTS GENERATOR

AWWL = ALWAYS WITHIN INSTITUTE WARRANTIES LIMITS

AXENIC = АКСЕНИЧЕСКОЕ – Axenic:- free of all other associated life, said of organisms isolated in soil culture; germ-free. / Аксеническая – о культуре, не содержащей других живых организмов.

AXIAL FORCE = ОСЕВОЕ УСИЛИЕ – Axial Force is a push (compression) or pull (tension) acting along the length of a member, expressed in kiloNewtons (pounds). / Нажатие (сжатие) или отрыв (растяжение), действующее вдоль длины элемента или детали, выражаемое в килоНьютонах (фунтах).

AXIAL–LOAD BEARING = ПОДШИПНИК ОСЕВОЙ НАГРУЗКИ – Axial-Load Bearing is a bearing in which the load acts in the direction of the axis of rotation. See also Bearing. / Смотрите также Подшипник (Bearing).

AXIAL STRESS = ОСЕВОЕ НАПРЯЖЕНИЕ (или АКСИАЛЬНОЕ НАПРЯЖЕНИЕ) – Axial Stress is the axial force acting at a point along the length of a member divided by the cross-sectional area of a member, expressed in kiloPascals (pounds per square inch). / Осевое усилие, действующее в точке вдоль длины элемента или детали, разделённое на площадь поперечного сечения этого изделия, выражаемое в килоПаскалях (фунтах на квадратный дюйм).

AXIAL SYSTEM = ОСЕВАЯ СИСТЕМА – Axial System is the vascular elements running vertically up and down a stem, in contrast to the lateral system running horizontally or out to the margin of the stem. The axial system carries water and minerals up the stem in the xylem and carries glucose up and down the stem in the phloem. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона.

AXIAL YARN = ОСЕВАЯ ПРЯЖА – Axial Yarn:- a system of longitudinal yarns in a triaxial braid that are inserted between bias yarns. Axial Yarn is:- (1) the yarn running purely in the 0° direction of a fabric (warp direction). This yarn has no intentional crimp. (2) The system of longitudinal yarns in a triaxial braid that are inserted between bias yarns.

AXIL = ПАЗУХА – Axil is the upper notch or angle between the axis and any organ such as a leaf. Hence, 'axilliary bud' is a bud in the leaf axil. The angle between a branch or leaf and the stem axis from which it grows. Axil is the upper angle between a leaf or a branch or a stem from which it arises. / почка в пазухе листа. Угол между побегом или листом и самим стеблем (осью стебля), из которого он растёт.

AXILLARY = ПАЗУШНОЕ – Axillary:- arising in an axil.

AXILLARY BUD = ПАЗУШНАЯ ПОЧКА – Axillary Bud is a bud which originates in the leaf axil. / Под Пазушной Почкой понимается почка, формирующаяся в пазухах листьев и дающая начало ветвям.

AXLE = ОСЬ – Axle is the metal shaft through the center of wheel, supporting it. There is usually a set screw that 'locks' it in place which (sadly) can be sheared off. / Под Осью понимается деталь обычно удлинённой цилиндрической формы, служащая для поддержания вращающихся вместе с ней или вокруг неё различных деталей или механизмов машины и не передающая полезного крутящего момента. Невращающаяся ось опирается на неподвижные опоры, а вращающаяся устанавливается на подшипниках.

AXMINSTER CARPETS™ = ЭКСМИНСТЁРСКИЕ КОВРЫ™ – Axminster Carpet is a machine-woven carpet in which successive weft-wise rows of pile are inserted during weaving according to a predetermined arrangement of colors. There are four main types of Axminster looms:- Spool, Gripper, Gripper-Spool, and Chenille. Axminster is a market town and civil parish on the eastern border of the county of Devon in England, some 28 miles from the county town of Exeter. Axminster Carpets™:- among the carpets featured on this site are the only authentic Axminsters made by Axminster Carpets Limited in the town of Axminster, England. By using the original Axminster weaving process, they are made mostly from natural fibres, made in Britain and they are ravishingly, stunningly beautiful. Because some aspects of the Axminster manufacturing process cannot be patented, there are other carpet manufacturers who can make 'Axminsters', but they are not the same as the trademarked British product. Our Axminsters are natural, British and beautiful, often 100% wool, jute backed, and in many cases made on eight pitch looms, the ultimate in quality, unique to the Axminster Carpets company.

AY = ATTAINABLE YIELD

AYT = ADVANCED YIELD TRIAL

AZ = AZERBAIJAN

AZ = AZIMUTH

AZIMUTH = АЗИМУТ – Azimuth is a magnetic bearing extending from a microwave landing system navigation facility. / Под Азимутом, от Арабского слова Ас-Сумут, множественное число от Ас-Самт, означающее Направление или Путь, небесного светила, земного предмета и так далее, понимается двугранный угол между плоскостью меридиана точки наблюдения и вертикальной плоскостью, проходящей через эту точку и наблюдаемое светило, предмет и так далее. Азимут отсчитывается от направления на север по ходу часовой стрелки. Если вертикальная плоскость проходит через линию отвеса в точке наблюдения, то такой азимут называется астрономическим, если через нормаль к поверхности земного эллипсоида, – геодезическим. Азимут – одна из координат системы горизонтальных координат в астрономии. При определении так называемого магнитного азимута вместо плоскости географического меридиана берут плоскость магнитного меридиана.

AZLON FIBER = ВОЛОКНО ЭЗЛОН – Azlon Fiber is a manufactured fiber in which the fiber-forming substance consists of any regenerated naturally occurring proteins. Azlon is not currently produced in the United States. Azlon:- this term describes manufactured fibers made from regenerated natural proteins, such as casein, zein, soybean, and peanut. In a mixture with other fibers it gives the fabric a soft feeling.

AZM = AZERBAIJANI MANAT

AZO = АЗО – Azo:- referring to a chemical compound which contains two nitrogen atoms with a double bond between them (–N=N–). 'Azo' is used for a class of dyes based on (this) chemical structure. Azo dyes may be found among direct, acid, basic, reactive and disperse dye classes. Dyes with one pair of nitrogen atoms azo bonded are often called Monoazo. Those with two or three azo bonded pairs are called Disazo (not Diazo) and Trisazo, respectively. Do not confuse Azo with Azoic. / называются Дисазо (Disazo) (не Диазо (Diazo)) и Трисазо (Trisazo) красителями, соответственно. Не путайте Азо (Azo) с Азоидным (Azoic)

AZO DYES = АЗОКРАСИТЕЛИ – Azo Dyes are dyes characterized by the presence of an azo group (–N=N–) as the chromophore. Azo dyes are found in many of the synthetic dye classes. See also Dyes. Azo Dyes are synthetic colors that contain an azo group, –N=N–, as part of the structure. Azo groups do not occur naturally. Most azo dyes contain only one azo group, but some contain two (disazo), three (trisazo) or more. Azo dyes account for approximately 60–70% of all dyes used in food and textile manufacture. In theory, azo dyes can supply a complete rainbow of colors, but yellow/red dyes are more common as blue/brown dyes. The different, mainly aromatic, side groups around the azo bond help to stabilise the N=N group by making it part of an extended delocalised system. This also has the effect of making many azo compounds colored, as delocalised or conjugated systems often absorb visible frequencies of light. Aromatic azo compounds (R = R' = aromatic) are usually stable and tend to produce strong vivid colors. The general formula for making an azo dye requires two organic compounds- a coupling component and a diazo component. Since these can be altered considerably, an enormous range of possible dyes are available, especially as the starting molecules are readily available and cheap. Furthermore, the simplicity of the reactions mean that the process can be scaled up or down very easily. Energy requirements for the reaction are low, since most of the chemistry occurs at or below room temperature. The environmental impact is reduced by the fact that all reactions are carried out in water, which is easy and cheap to obtain, clean and dispose of. All these factors make azo dyes very cheap to produce. Azo dyes are much more stable than most of the natural food dyes. Azo dyes are stable in the whole pH range of foods, are heat stable and do not fade when exposed to light or oxygen. This makes azo dyes applicable in nearly all foods. The only disadvantage is that azo dyes are not soluble in oil or fat. Only when azo dyes are coupled to a fat soluble molecule, or when they are dispersed as very fine particles, oils can be colored. Toxicity:- the acute toxicity of azo dyes, as defined by the EU criteria for classification of dangerous substances, is rather low. Direct toxic levels of azo dyes will never be reached by consuming azo dye colored food. The majority of azo dyes (food and textile) have LD50 values between 250–2 000 mg/kg body weight, indicating that for a lethal dose many grams of azo dyes have to be consumed in a singe dose. As azo dyes are highly water soluble, they do not accumulate in the body, but are metabolised in the liver and excreted in the urine. As azo dyes are very strong color, foods normally are colored with dyes in levels of mg dye/kg food. To reach a lethal dose an average adult person thus need to consume over 100 kg of

azo colored food in a single day. Nevertheless some azo dyes have been banned for food use due to toxic side effects. These are not due to the dye itself, but to degradation products of the dyes. The azo linkage is the most labile portion of an azo dye molecule and may easily undergo enzymatic breakdown in mammals, including man. The azo linkage may be reduced and cleaved, resulting in the splitting of the molecule in two parts. This reaction is carried out by an enzyme named azo-reductase. It is a non-specific enzyme, found in various micro-organisms (such as in intestinal bacteria) and in all tested mammals. In mammals azo-reductases are, with different activities, present in various organs like liver, kidney, lung, heart, brain, spleen and muscle tissues. The azo-reductase of the liver, followed by the azo-reductase of the kidneys possesses the greatest enzymatic activity. After cleavage of the azo-linkage, the component aromatic amines are absorbed in the intestine and excreted in the urine. However, the polarity of azo dyes influences the metabolism and consequently the excretion. Sulphonation of azo dyes appears to decrease toxicity by enhancing urinary excretion of the dye and its metabolites. Sulphonated dyes, mainly mono-, di- and trisulphonated compounds are world-wide permitted for use in foods, cosmetics and as drugs for oral application. As several of the degradation products of the dyes have been found to be mutagenic or carcinogenic and subsequently, some dyes were no longer permitted as food dyes. Hyperactivity:- it is claimed that some food colors increase, or even cause, hyperactivity in children. This is especially claimed for azo dyes. Since the late 1970s the effects of azo dyes on hyperactivity have been studied. Most studies were non conclusive and several studies are contradictory. A main drawback for these studies is that there are no clear indicators for hyperactivity and that in many cases parental reports were used. Often parental reports are biased, which makes interpretation difficult. Also, several studies that have shown an effect on hyperactivity based on parental reports, fail to show an effect based on physiological parameters. A typical example thereof is the recent article of Bateman et al. (see references below) from 2004 and the reactions on this article published in the Lancet afterwards (references see below). In nearly all studies the azo dyes itself had no effect, but the strongest effects were observed in children receiving azo dyes and benzoic acid combinations. It is still not proven whether food colors (either azo dyes, synthetic colors or natural colors) have an effect on hyperactivity and ADHD, however, it has also not been proven that there is no effect. The strong effects which were claimed in the 1980s do not seem to be valid. But effects on certain sensitive groups of children can not be excluded. Allergies:- azo food dyes do not cause allergic reactions as such. Many azo textile dyes can cause skin hypersensitivity and allergy, but these are not used as food dyes. Azo dyes are too small to have a direct effect on the immune system and thus do not cause a direct allergic reaction. However, some azo dyes, especially tartrazine, may increase allergic reactions towards other substances (among these many drugs). Similarly tartrazine (and probably some other azo dyes) may cause increased symptoms in people with asthma and similar disorders. The exact mechanism why tartrazine increases allergic reactions or asthma is still not fully understood. / хромофор (chromophore). Под Азокрасителями понимаются красители, в молекуле которых содержится одна или несколько азогрупп (–N=N–), связывающих органические остатки (преимущественно ароматические или гетероциклические). Азокрасители с одной азогруппой называются моноазокрасителями, с двумя – диазокрасителями, с большим числом этих групп – полиазокрасителями. Азокрасители – наиболее важный и многочисленный класс органических красителей (свыше 50% общего объёма производства). Используются для крашения волокон всех типов, а также кожи, бумаги, меха, пластмасс, резины.

AZOIC DYES = АЗОИДНЫЕ КРАСИТЕЛИ (или АЗОТОЛЫ) – Azoic Dyes (or Naphthol Dyes):- Naphthol AS dyes allow colors with outstanding fastness, but their popularity has declined because of application costs and the complexity of the process for the preparation of the colorant. Dyeing with azoic colorants is a complex process which involves a number of delicate steps:- (i) preparation of the naphtholate solution by the hot solution process (the naphthol is dissolved by boiling with caustic soda) or by the cold solution process (the naphthol is solubilised with alcohol or cellosolve, caustic soda and cold water). For certain naphthols the addition of formaldehyde is also necessary to prevent the formation of free naphthol. (ii) application of the naphtholate to the fiber by batch or padding techniques; (iii) preparation of the diazotized base by reaction with sodium nitrite and hydrochloric acid (with $NaNO_2$ and HCl; this step can be avoided when using fast color salts); (iv) formation of the azoic dye into the fiber, by passing the textile, previously impregnated with the naphtholate solution, through a bath containing the diazotized base or the fast color salt (addition of buffering agents is necessary to control the pH, in order to increase the coupling capacity); and (v) after-treatment by rinsing the material to remove the excess naphthol from the fiber. The word ‘Azoic’ is the distinguishing name given to insoluble azoic dyes that are not applied directly as dyes, but are actually produced within the fiber itself. This is done with impregnating the fiber with one component of the dye, followed by treatment in another component, thus forming the dye within the fiber. The formation of this insoluble dye within the fabric makes it very fast to washing. The deposition of the free pigment on the surface of the dyed fabric produces poor rub fastness, but once the loose pigment is removed by boiling the fabric in soap the dyeing becomes one of the fastest available. Azoic Dye is a term generally applied to a class of dyes based on application method; sometimes called Naphthol Dyes. Azoic dyes are actually chemically synthesized inside the fiber, and are not truly dyes, but insoluble pigments. The soluble ‘naphthol’ component is applied to the fiber, then a solution of ‘diazo salt’ is used to develop the color. ‘Azoic’ should be used only for this type of dye, not for azo dyes in general. These dyes are used commercially, especially for reds, but are not readily available to artists. The components used can be very toxic before they react to form the pigment. Azoic Dyes are water-insoluble dyes which are formed on the fiber by coupling a water-soluble diazo compound with a water soluble coupling compound having affinity for cellulose. See also Dyes, and Naphthol Dyes. The dyes containing insoluble azo group (–N=N–) are known as Azoic Dyes. These dyes are not found in readymade form. Azoic dyes are produced by a reaction between two components. The components are:- (i) Coupling Compound (Naphthol); and (ii) Di-azo – compound or diazo base or diazo salt. The colored substance formed from this colorless compound is insoluble in water and washing fastness of this shade is excellent. Because of high degree of brightness, ease of application and excellent fastness properties (except rubbing fastness which can be improved by using certain auxiliaries) azoic combinations (naphthol and bases) are widely used in printing on cellulose fiber fabrics. Azoic dyes are used for producing bright shade of color such as orange, red, scarlet, navy blue, and black color. By this practical we acquire knowledge about the printing process of cotton fabric with azoic dyes. This practical will help us in our study life as well as job life. Especial thanks to our teacher and his assistants for great co-operation. / Сродство (Affinity). протирание или притирка (rubbing). Азотолы или Нафтолы – красители, применяемые при ледяном крашении для образования окрасок непосредственно на волокне. Азоидные Красители образуются в ходе химической реакции, проходящей внутри структуры волокна между двумя компонентами, не являющимися красителями. Нафтол – это компонент, давший азоидным красителям ещё одно название – нафтоловые. В ходе окрашивания азоидными красителями образуется пигмент. Достоинство:- невысокая стоимость окрашивания для получения различных цветов. Недостаток:- слабая устойчивость к трению.

AZOLLA = АЗОЛЛА – Azolla is a water fern that fixes nitrogen symbiotically with the blue-green alga Anabaena.

AZUKI BEANS = ФАСОЛЬ АДЗУКИ (или ФАСОЛЬ АЗУКИ) – The name Azuki is a transliteration of the native Japanese name. Japanese also has a Chinese loanword, Shōzu, which means ‘small bean’ (its counterpart ‘large bean’ (Daizu) being the soybean). The Azuki Bean (also spelled adzuki) is an annual vine widely grown throughout East Asia and the Himalaya for its small (approximately 5 mm) bean. The cultivars most familiar in northeast Asia have a uniform red color, but white, black, gray and variously mottled varieties are also known. Genetic evidence indicates that the Azuki Bean was first domesticated in the Himalaya. It was cultivated in China and Korea before 1000 BC. It was later taken to Japan, where it is now the second most popular legume after the soybean. In Chinese

cuisine, Japanese cuisine, and Korean cuisine the Azuki Bean is almost always eaten sweetened. In particular, it is often boiled with sugar, resulting in red bean paste, a very common ingredient in all three cuisines. Red bean paste is used in many Chinese foods, such as:- tangyuan, zongzi, mooncakes, baozi. It is also used as a filling for Japanese sweets such as anmitsu, taiyaki (Korean:- bungeoppang), and daifuku. A more liquid version, using Azuki Beans boiled with sugar, lotus seeds and orange peel, produces a sweet dish called red bean soup. Azuki Beans are also commonly eaten sprouted, or boiled in a hot, tea-like drink. In Japan, Rice with Azuki Beans (sekihan) is traditionally cooked for auspicious occasions. Azuki Beans are also used to produce amanattō, and as a popular flavour of ice cream. Also known as Adzuki Beans. The Adzuki Bean (Vigna Angularis) has been grown in the Far East for centuries. Like the Soybean, it most probably originated in China, and was introduced to Japan around 1000 AD. Today in Japan, Adzuki beans one of the largest crops, with annual consumption of over 120 000 metric tons. Dry Adzuki beans are small dark red, oval beans approximately 5 mm in diameter. They have a distinctive white ridge along one side. Adzuki beans are popular across Asia, particularly in Japan, and are used to make red sweet bean paste. A small, dried, russet-colored bean with a sweet flavor. Adzuki beans can be purchased whole or powdered at Asian markets. / крапчатые разновидности . Фасоль Адзуки или Бобы Адзуки, которые могут быть закуплены на Азиатских рынках в целиковом или порошковом виде. Фасоль, род одно- и многолетних трав семейства бобовых. Свыше 200 видов, в тропиках Азии, Америки и Африки. Возделывают более 20 видов – Фасоль Адзуки, лимскую, многоцветковую, обыкновенную и другие (зерно, недозрелые бобы, как декоративные).

AZURE = ЛАЗУРНОЕ (или ЛАЗОРЕВОЕ) – Azure:- the blue color of the clear sky. / голубое.

AZUREUM = АЗУРЭУМ (или ЛАЗУРНОЕ, или ЛАЗОРЕВОЕ) – Azureum:- light blue. / :- светло-синее. , от Французского слова Azur, означающее Лазурь или Синева, .

- B -

B = БИ. (или Б) – (1) B is fifth letter of a NASDAQ® stock descriptor specifying that issue is the Class B shares of the company. / НЭЗДЭК® (NASDAQ®) .

(2) B:- yellowness-blueness coordinate in certain color spaces (Hunter L,a,b & CIELAB), generally used as the difference in 'b' between a specimen and a standard reference color, normally used with 'a' or 'a' as part of the chromaticity difference. Generally, if 'b' is positive, there is more yellowness than blueness; if 'b' is negative, there is more blueness than yellowness.

B = ANNUAL RATE PLUS STOCK DIVIDEND

B = BRAVO

B = BULK POPULATION

B&I = BROADCAST AND INCORPORATED

B1, B2 (BC1, BC2) = БИ.1, БИ.2 (БИ.СИ.1, БИ.СИ.2) – B1, B2 (BC1, BC2):- the first and second backcrosses or backcross generations.

B2B = BUSINESS TO BUSINESS

B2BI = BUSINESS TO BUSINESS INTEGRATION

B2C = BUSINESS TO CONSUMER

B2G = BUSINESS TO GOVERNMENT

B/A = BANKER'S ACCEPTANCE

BA = BOSNIA AND HERZEGOVINA

BAA = BUSINESS AREA ANALYSIS

BABBITT = БАББИТ – Babbitt is a soft, white, non-ferrous alloy bearing material composed principally of copper, antimony, tin and lead. Babbitt, also called Babbitt Metal or Bearing Metal, is any of several alloys used for the bearing surface in a plain bearing. The original Babbitt alloy was invented in 1839 by Isaac Babbitt in Taunton, Massachusetts, United States. He disclosed one of his alloy recipes but kept others as trade secrets. Other formulations were later developed. Like other terms whose eponymous origin is long since deemphasized (such as Diesel Engine or Eustachian Tube), the term Babbitt metalis frequently styled in lowercase. It is preferred over the term 'White Metal', because the latter term may refer to various bearing alloys, lead- or tin-based alloys, or zinc die-casting metal. Babbitt metal is most commonly used as a thin surface layer in a complex, multi-metal structure, but its original use was as a cast-in-place bulk bearing material. Babbitt metal is characterized by its resistance to galling. Babbitt metal is soft and easily damaged, which suggests that it might be unsuitable for a bearing surface. However, its structure is made up of small hard crystals dispersed in a softer metal, which makes it a metal matrix composite. As the bearing wears, the softer metal erodes somewhat, which creates paths for lubricant between the hard high spots that provide the actual bearing surface. When tin is used as the softer metal, friction causes the tin to melt and function as a lubricant, which protects the bearing from wear when other lubricants are absent. Internal combustion engines use Babbitt metal which is primarily tin-based because it can withstand cyclic loading. Lead-based Babbitt tends to work-harden and develop cracks but it is suitable for constant-turning tools such as sawblades. Eco-Babbitt is an alloy of 90% Sn, 7% Zn, 3% Cu that is not technically a Babbitt metal. See also Solder or Solder Alloys for more information on Eco-Babbitt. / Под Баббитом, от имени Американского изобретателя Айзэка Бабита (или Исаака Баббита; Isaac Babbitt; 1799-Июль-26–1862-Май-26), понимается общее название антифрикционных сплавов на основе олова или свинца с добавками сурьмы, меди и других элементов. Применяются для заливки подшипников, работающих со смазкой при высоких нагрузках и скоростях скольжения. Характеризуются хорошей прирабатываемостью, низкой температурой заливки (300–420 °C) и малым коэффициентом трения. Баббит, антифрикционный сплав на основе олова или свинца, предназначаемый для заливки вкладышей подшипников. Некоторые марки баббитов содержат сурьму, медь, никель, мышьяк, кадмий, теллур, кальций, натрий, магний и другое. Баббит изобретён в Соединённых Штатах Америки (США) в 1839 Айзэком Бэбитом (или Баббитом; Isaak Babbitt; 1799–1862). Высокие антифрикционные свойства баббита обусловливаются его особой гвт ерогенной структурой, характеризующейся наличием твёрдых частиц в мягкой пластичной основе сплава. Баббит отличается низкой температурой плавления (300–440 °C), хорошей прирабатываемостью. Баббит на оловянной основе применяют для подшипников ответственного назначения, когда от антифрикционного материала требуются повышенная вязкость и минимальный коэффициент трения. Оловянный баббит по сравнению со свинцовым обладает более высокой коррозионной стойкостью, износоустойчивостью и теплопроводностью, а также более низким коэффициентом линейного расширения.

Свинцовые баббиты могут работать при более высокой температуре подшипника, чем оловянные. Свинцовый баббит применяют для заливки подшипников двигателей автомобилей, тракторов, прокатных станов. Свинцовокальциевый баббит применяют для заливки подшипников подвижного состава и железнодорожного транспорта.

BABUSHKA = БАБУШКИН – Babushka is a usually triangularly folded kerchief for the head (scarves).

BABY BLUE = СВЕТЛО–ГОЛУБОЕ – Baby Blue:- a pale blue.

BABY BOND = ОБЛИГАЦИЯ МАЛЮТКА (или ОБЛИГАЦИЯ МАЛОМЕРКА, или МЕЛКАЯ ОБЛИГАЦИЯ) – In the United States, Baby Bonds is a name given to the Series A-1935 savings bond, but carried over to Series B-1936, C-1937 and 1938, and D-1939, 1940, and 1941 (through April) savings bonds. A convertible or straight bond having a par value of less than 1 000.00 US Dollars. Baby Bonds are the fixed income securities issued in small denominations, generally with a maximum face value of USD5 000. The small denominations enhance the attraction of baby bonds to the average retail investor. Baby bonds are now issued mainly by municipalities, counties and states to fund expensive infrastructure projects and capital expenditures. These tax-exempt municipal bonds are generally structured as zero-coupon bonds with a maturity of between eight and 15 years. Baby bonds may also refer to a series of small denomination bonds with face value ranging from USD75 to USD1 000, issued by the US government from 1935 to 1941. These tax-exempt bonds were sold at 75% of face value and had a maturity of 10 years. In the United Kingdom, Baby Bonds refer to a type of bond launched in the late 1990s with the objective of stimulating savings for children by their parents. Parents had to make small monthly contributions for at least 10 years; in return, the child received a guaranteed minimum amount tax-free upon turning 18. Friendly society bonds that yield growing funds for a child usually over a ten-year term. / Мелкая Облигация – конвертируемое или прямое долговое обязательство, имеющее нарицательную стоимость менее 1 000.00 Долларов США, обычно от 25 до 500 Долларов. Мелкие облигации открывают мелким инвесторам доступ на рынок облигаций, а небольшим корпорациям – доступ к рынкам, на которых действуют крупные организации-инвесторы. Негативная сторона этих облигаций – высокие издержки на выпуск (по отношению к общему объёму привлечённых средств), на размещение и операции с облигациями. Кроме того, эти облигации не имеют доступа на крупный и активный рынок, который обеспечивает ликвидность обычных облигаций.

BABY COMBING WOOL = XX ШЕРСТЬ – Baby Combing Wool:- short, fine wool which is usually manufactured on the French system of worsted manufacture. This term is synonymous with French Combing Wool.

BAC = BACTERIAL ARTIFICIAL CHROMOSOME

BAC = BANKING ADVISORY COMMITTEE

BAC = BLOOD ALCOHOL CONCENTRATION

BAC = BUSINESS ADVISORY COUNCIL

BACCATE = ЯГОДОВИДНОЕ – Baccate:- like a berry. / Ягодовидное:- типа ягоды. Ягодообразные Плоды – невскрывающиеся плоды растений с сочным (Ягода) или частично сочным (Тыквина, Яблоко и некоторые другие) околоплодником.

BACCIFEROUS = ЯГОДОНОСНОЕ – Bacciferous:- bearing berries. / Ягодоносное:- плодоносящее ягоды.

BACILLUS = БАЦИЛЛА (или ПАЛОЧКА) – Bacillus is a rod-shaped bacterium. / Под Бациллами, от Латинского слова Bacillum, означающее Палочка, понимаются палочковидные Бактерии. В узком смысле Бациллы – Род Грамположительных Палочковидных Бактерий, образующих внутриклеточные споры. Большинство Бацилл – сапрофиты. Некоторые Бациллы вызывают болезни животных и человека, например, столбняк, Сибирскую язву.

BACK BEAM = ПРОМЕЖУТОЧНЫЙ НАВОЙ (или ТКАЦКИЙ НАВОЙ НА РУЧНОМ ТКАЦКОМ СТАНКЕ, или СНОВАЛЬНЫЙ ВАЛИК) – Back Beam is a beam with a defined number of ends and defined length normally intended for subsequent assembly with other back beams.

BACKBONE = МАГИСТРАЛЬНАЯ СЕТЬ (или СПИННОЙ ХРЕБЕТ) – Backbone is a central high speed network that connects smaller, independent networks. The National Science Foundation Network (NSFnet) is an example.

BACKCOATING = ПОКРЫТИЕ ИЗНАНКИ – Backcoating is the application of latex or adhesive to the back of a carpet to anchor the tufts, usually followed immediately by addition of a secondary backing material such as woven jute or nonwoven polypropylene.

BACKCROSS = ВОЗВРАТНОЕ СКРЕЩИВАНИЕ (или БЭККРОСС, или ВОЗВРАТНО СКРЕЩИВАЕМОЕ) – Backcross is:- (1) a breeding method in which a desired character such as insect resistance is transferred into an improved variety carrying it as a recurrent parent to reinforce or increase the gene frequency of the character. (2) F_1 hybrid which is again crossed to either of its parents. Backcross is the mating of a crossbred animal to one of the parental breeds. / свойство (character) . Возвратное Скрещивание или Бэккросс – такое скрещивание, при котором происходит скрещивание гибрида F_1, то есть гибрида первого поколения, с одной из родительской форм. С помощью данного метода выявляют генотип. В природе является одним из путей возникновения культурных видов растений и называется интрогрессия. Возвратное Скрещивание или Бэккросс (Backcross) – скрещивание гетерозиготных гибридов F_1 (Aa) с гомозиготными особями, сходными по генотипу с родительскими формами (AA или aa). Метод возвратного скрещивания состоит в получении потомства в ряду поколений от скрещивания гетерозиготы (детей гомозиготных родителей, генетически отличающихся друг от друга) с одним из исходных гомозиготных родителей. Смысл подобного скрещивания – замена гена (генов какого-либо комплекса) одной инбредной линии на гаплотип другой. В результате получается конгенная линия, отличающаяся от исходной только по этому гену (генам этого комплекса). Возвратное Скрещивание или Бэккросс – скрещивание гибрида первого поколения (F_1) с одной из родительских форм. Возвратное скрещивание гибрида с родительской формой, гомозиготной по рецессивному гену, называется Анализирующим Скрещиванием. Возвратное скрещивание может служить для выявления генотипической структуры особи. Смотрите также Гибридологический Анализ.

BACKCROSS BREEDING = РАЗВЕДЕНИЕ ВОЗВРАТНЫМ СКРЕЩИВАНИЕМ – Backcross Breeding is a method for developing a new variety in which a simply inherited trait is transferred through the backcross method.

BACKCROSSING = ВОЗВРАТНОЕ СКРЕЩИВАНИЕ – Backcrossing:- mating of a hybrid to one of its parents. BC_1 BC_2, etc. Symbols used to designate the first backcross generation, the second backcross generation, and so forth.

BACKCROSS NURSERY = ПИТОМНИК ДЛЯ ВОЗВРАТНОГО СКРЕЩИВАНИЯ – Backcross Nursery is frequently used in hybrid rice breeding. Breeding nursery where male sterile plants identified among the test crosses (CMS x elite maintainer line) and their backcross progenies are crossed with the male parents with the objective of transferring cytoplasmic male sterility into the nuclear

genotype of the elite maintainer line. / Питомник для разведения (или селекционный питомник), где стерильные мужские растения .

BACKCROSS PARENT/RECURRENT PARENT = РОДИТЕЛЬ ПРИ ВОЗВРАТНОМ СКРЕЩИВАНИИ/РОДИТЕЛЬ, С КОТОРЫМ СКРЕЩИВАЕТСЯ – Backcross Parent/Recurrent Parent is one of the parents of a hybrid with which the hybrid is repeatedly crossed.

BACKCROSS RATIO = СООТНОШЕНИЕ С ВОЗВРАТНЫМ СКРЕЩИВАНИЕМ – Backcross Ratio is the proportion of heterozygotes to recessive homozygotes expected in a backcross.

BACKDOOR = XX – Backdoor or Remote Access Tool/Remote Access Trojan (RAT):- a backdoor is an application allowing remote access to a computer. The difference between this type of malware and a legitimate application with similar functionality is that the installation is done without the user's knowledge. Typical backdoor functionality includes the capability to send files to the host computer and execute files and commands on it, and to exfiltrate (send) files and documents back to the attacker. Often this is coupled with key-logging and screen-grabbing functionality for purposes of spying and data theft. The term 'RAT' (short for the Remote Access Tool) can be considered a synonym to 'backdoor', but it usually signifies a full bundle including a client application meant for installation on the target system, and a server component that allows administration and control of the individual 'bots' or compromised systems.

BACKED CLOTH = ДВУХЛИЦЕВОЕ ПОЛОТНО (или ГРУНТОВАЯ ТКАНЬ, или ДВОЙНОЙ ДРАП) – Backed Cloth is a material with an extra warp or filling added for weight and warmth. Satin-weave and twill-weave constructions are frequently used in the design of backed cloth because they are relatively resistant to the passage of air. Backed Cloth is a double cloth that has two sets of fillings and one set of warps, or two sets of warps and one set of fillings. / Уточины. Ткань с двойной основой или с двойным утком – ткань, сработанная двухлицевым переплетением. Двойной Драп – ткань имеющая две основы и один уток или два утка и одну основу. Драп, от Французского слова Drap, означающее Сукно, тяжёлая, плотная шерстяная ткань сложного переплетения из пряжи аппаратного (суконного) прядения. Драп состоит обычно из 2 слоёв, благодаря чему обладает высокими теплоизолирующими свойствами. Лицевая сторона ткани часто вырабатывается из более высококачественной шерсти, чем изнанка. В зависимости от структуры и рисунка переплетения драп может быть ворсованным и неворсованным, одно- и многоцветным, с гладким лицом и рисунчатой подкладкой. Из драпа шьют зимние и демисезонные пальто. В Русском языке название 'Драп' относится только к двойным сукнам, а более легкие ткани называются сукнами.

BACK–END SYSTEM = СИСТЕМА НН – Back-End System is legacy enterprise systems that handle order processing, inventory, and receivables management for both buyers and suppliers. To deploy a digital trading platform, companies must often integrate new technologies with these older systems, which can include mainframe or ERP (short for Enterprise Resource Planning) applications.

BACK FABRIC SEAM IMPRESSION = ОТПЕЧАТОК (или ОТТИСК) ШВА ГРУНТОВОЙ ТКАНИ (или ПОДКЛАДКИ) – Back Fabric Seam Impression:- backing fabric is often used to cushion fabric being printed. If there is a joining seam in the backing fabric, an impression will result on printed fabric.

BACKFILLING = АППРЕТ (или КРАХМАЛЕНИЕ ПО ИЗНАНКЕ) – Backfilling is a solution composed of varying amounts of cornstarch, China clay, talc, and tallow that is applied to the back side of low-grade, low-cost cloth to change its hand, improve its appearance, and increase its weight.

BACK FREIGHT = ОБРАТНЫЙ ФРАХТ (или ОБРАТНАЯ ПРОВОЗНАЯ ПЛАТА, или ФРАХТ ЗА ВОЗВРАТ) – Back Freight:- payment due to the shipowner for the carriage of goods beyond the contract port owing to circumstances beyond the control of the shipowner. The owners of a ship are entitled to payment as freight for merchandise returned through the fault of either the consignees or the consignors. Such payment, which is over and above the normal freight, is called Backfreight. Back Freight is the freight for the return of cargo paid by the consignor when goods are not delivered through the consignor's own fault, or are refused by the consignee. / Обратный Фрахт (Back Freight):- фрахт, согласно которому грузовладелец оплачивает перевозчику стоимость обратной доставки груза в порт отправления, если груз не может быть доставлен в порт назначения по не зависящим от перевозчика причинам.

BACK FURROW = РАЗВАЛЬНАЯ БОРОЗДА (или РАЗВАЛОЧНАЯ БОРОЗДА) – Back Furrow is a raised ridge of soil formed when the furrow slice overlaps another slice, this ridge is slightly higher than the other ridges. / Под Бороздой понимается канавка, образованная почвообрабатывающим или другим орудием, для отвода воды с полей при избыточном увлажнении, поливе в орошаемом земледелии и для посева сельскохозяйственных культур. Борозда, канавка, образованная почвообрабатывающим или другим орудием. В зонах избыточного увлажнения служит для отвода воды с полей, в орошаемом земледелии – для полива. Бороздной посев защищает семена и всходы от выдувания.

BACK–GREIGE SEAM IMPRESSION = XX – Defect Name:- Back-Greige Seam Impression. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Back-Greige Seam Impression:- This is a seam impression from the back greige or cushion fabric affecting printing by creating a thicker substrate. Severity:- Major.

BACKGROUND CONTAMINATION = ФОНОВОЕ ЗАГРЯЗНЕНИЕ – Background Contamination is the total of the extraneous particles which are introduced in the process of obtaining, storing, moving, transferring and analyzing a fluid sample.

BACK HAUL = ОБРАТНЫЙ РЕЙС – Back Haul:- to obtain transport on the home run from B to A after having performed a full transport from A to B. The return leg of a round trip. Back Haul:- when an outbound shipment is delivered, instead of coming back empty, a load is picked up from a destination close to the final stop-off and then delivered either back to the warehouse or a consignee location near the warehouse. A Back Haul creates revenue as opposed to coming back empty which would be an expense. To haul a shipment back over part of a route it has traveled.

BACKHAUL = ОБРАТНЫЙ ТРАНЗИТ – Backhaul is a transaction that results in natural gas being 'transported' in the opposite direction of the physical flow of a transportation system. This is usually achieved by redelivering the gas at a point upstream from the point of receipt. A deviation to move cargo on the return leg of a voyage for the purpose of minimizing ballast mileage and thereby reducing transportation costs.

BACKING = ИЗНАНКА (или ПОДКЛАДКА, или ОСНОВНАЯ ТКАНЬ) – Backing is:- (1) a general term for any system of yarn which interlaces on the back of a textile material. (2) A knit or woven fabric or plastic foam bonded to a face fabric. (3) A knot or woven fabric bonded to a vinyl or other plastic sheet material. (4) See also Carpet Backing.

BACK LENGTH = ДЛИНА СПИНКИ – Back Length:- the dimension on a garment taken from the center collar attaching seam to the bottom of the garment, or in the case of a coverall, to the top of the waistband.

BACK LETTER = ГАРАНТИЙНОЕ ПИСЬМО – Where a seller/shipper issues a Letter of Indemnity in favor of the carrier in exchange for a clean bill of lading. May have only a limited value. Example:- P&I (short for Protection and Indemnity (insurance)) problems. Seller

or shipper issues a Letter of Indemnity in favor of the carrier in exchange for a clean Bill of Lading. Back letters are drawn up in addition to a contract in order to lay down rights and/or obligations between both contracting parties, which, for some reason cannot be included in the original contract. This expression is sometimes used for letters of indemnity which are drawn up if the condition of the goods loaded gives rise to remarks and, nevertheless, the shipper insists upon receiving clean Bills of Lading. Letters of indemnity are only allowed in very exceptional circumstances.

BACKLOG = НЕПЕРЕВЕЗЁННЫЕ ТОВАРЫ (или НЕ ДОСТАВЛЕННЫЕ ТОВАРЫ, или ЗАДОЛЖЕННОСТЬ, или НЕИСПОЛНЕННЫЕ ОБЯЗАТЕЛЬСТВА) – (1) Backlog:- the quantity of goods still to be delivered, received, produced, issued, etc, for which the planned or agreed date has expired. / Количество товаров, которые всё ещё должны быть поставлены, получены, произведёны, выпущены и тому подобное, по которому была просрочена запланированная или согласованная дата. Накопившиеся Заказы или Задолженность или Невыполненная Работа – стоимость невыполненных заказов, размещённых в промышленной компании. Рост или сокращение объёма накопившихся заказов компании отражает потенциал будущих продаж и доходов.

(2) The total number of customer orders which have been received but not yet been shipped. / Итоговое число заказов заказчиков, которые были получены, но всё ещё не отправлены.

BACK LOOP = ИЗНАНОЧНАЯ (или ОБОРОТНАЯ) ПЕТЛЯ – Back Loop is a knitted loop formed on the dial needles on a knitted machine.

BACK MONTHS = ПОСЛЕДУЮЩИЕ МЕСЯЦЫ (или ОТДАЛЁННЫЕ МЕСЯЦЫ, или ДАЛЬНИЕ МЕСЯЦЫ) – Back Months:- those futures delivery months with expiration or delivery dates furthest into the future; futures delivery months other than the spot or nearby delivery month. Futures delivery months other than the spot or front month. Also known as Deferred Months. On futures markets, those contracts that are being traded for the month that is furthest in the future. / Контракты с Наибольшими Сроками:- в области фьючерсной и опционной торговли – контракты, сроки исполнения которых приходятся на наиболее отдалённые от настоящего времени месяцы. Дальние Месяцы или Отдалённые Месяцы:- фьючерсные контракты или опционы на фьючерсные контракты, у которых сроки поставки являются наиболее отдалёнными на данный момент времени.

BACK OFFICE = РАСЧЁТНЫЙ ОТДЕЛ – Informal name given to the department in a broking firm that deals in matters other than the buying or selling of exchange instruments, e.g., share dividends, shareholder registrations, and payment. Back Office is where settlement of trades takes place. Also known as Backroom in the United Kingdom. Back Office is the part of a firm that is responsible for post-trade activities. Depending upon the organisational structure of the firm, the back office can be a single department or multiple units (such as documentation, risk management, accounting or settlements). Some firms have combined a portion of these responsibilities, usually found in the back office, particularly those related to risk management, into what they term a middle office function. See also Front Office. / Отдел брокерской компании, выполняющий документально и фактически взаиморасчёты между клиентом, брокерской компанией и клиринговой палатой биржи. Расчётный Отдел или Подсобка – отделы банка или брокерской фирмы, не участвующие напрямую в продажах или торговых операциях. Расчётный отдел отвечает за ведение бухгалтерской отчётности, соответствие её государственным правилам и требованиям, а также за связь между отделениями. Когда операции на фондовом рынке особенно интенсивны, обработка заказов может замедляться; ситуация называется ‘давкой’ в расчётном отделе (back office crunch).

BACK ORDER = ОТЛОЖИТЬ ЗАКАЗ – Back Order:- the process a company uses when a customer orders an item that is not in inventory; the company fills the order when the item becomes available.

BACKPACK = РАНЕЦ (или ХХ) – Backpack:- made from many varieties of fabric. However, it is typically made of a sturdy fabric to provide proper support for carrying items. Often used be students to carry books. Apparel Search viewers are often found carrying heavy back packs full of fashion magazines, scissors, fabric and thread. A camping pack, as of canvas or nylon, supported by usually aluminum frame and carried on the back. / Найлан (Nylon).

BACK PRESSURE = ПРОТИВОДАВЛЕНИЕ (или ОБРАТНОЕ ДАВЛЕНИЕ) – Back Pressure is the pressure encountered on the return side of a system. / Противодавление, давление пара или газа в конце процесса расширения в тепловом двигателе (например, паровой или газовой турбине, паровой машине). Термином Противодавление обозначают конечное давление в случае, когда расширение не заканчивается конденсацией пара. Так, в паровой турбине с противодавлением отработавший пар не конденсируется, а используется для каких-либо нужд (для целей теплоснабжения, в технологическом процессе или в другой турбине).

BACK PRICING = ЦЕНООБРАЗОВАНИЕ В ПРЕДДВЕРИИ (или ЦЕНООБРАЗОВАНИЕ НАКАНУНЕ) – Back Pricing:- fixing the price of a commodity for which the commitment to purchase has been made in advance. The buyer can fix the price relative to any monthly or periodic delivery using the futures markets. / Фиксация цены сырья, по которому обязательство закупить было выполнено предварительно. Покупатель может зафиксировать цену для любой помесячной или периодической поставки, используя рынки фьючерсов.

BACK PRIMING = ПЕРВАЯ ГРУНТОВКА (или ОСНОВА) – Back Priming:- application of paint to the back of woodwork and exterior siding to prevent moisture from getting into the wood, causing the grain to swell and the paint to peel. / .

BACK SCHEDULING = ОБРАТНЫЙ ГРАФИК – Back Scheduling is a method of obtaining a production schedule by working backwards from the required due date, in order to predict the latest start date in consistent with meeting that due date. / от требуемой надлежащей (причитающейся) даты, .

BACK–SIZING = ШЛИХТОВАНИЕ С ИЗНАНКИ (или ИЗНАНОЧНОЕ ШЛИХТОВАНИЕ) – Back-Sizing (Back-Finishing would be a more correct term) is the process by which solutions of stiffening materials, usually starches, are applied mechanically to the back of a carpet. All carpets are limp coming off the loom, some more so than others, and they require to be stiffened before they are ready for use. The amount of stiffening required depends upon the type of carpet:- Wiltons usually require least and Spool Axminsters most. Back-sizing is done for a variety of reasons, chief among which are to stiffen the carpet so that it will lie without curling up, to permit controlled stretching, and to give bulk. The process also makes some contribution to the important requirement of tuft anchorage. This is particularly important in Spool Axminster, where poor tuft anchorage is a fault inherent in the weave. No really adequate contribution can be made by back-sizing materials, but this aspect is discussed more fully later on. See also Filler.

BACK SPREAD = ОБРАТНАЯ КУРСОВАЯ РАЗНИЦА (или ОБРАТНЫЙ СПРЭД) – Back Spread is a delta-neutral ratio spread in which more options are bought than sold. A back spread will be profitable if volatility increases. See also Delta. / соотносительная (или пропорциональная) курсовая разница (ratio spread).

BACKSTITCH = СТРОЧКА (или СПЛОШНОЙ ШОВ, или НЕПРЕРЫВНЫЙ ШОВ) – Backstitch or Back Stitch and its variants stem stitch, outline stitch and split stitch are a class of embroidery and sewing stitches in which individual stitches are made backward to the general direction of sewing. These stitches form lines and are most often used to outline shapes or to add fine detail to an embroidered picture. See also Purl. Back Stitch is a stitch used in embroidery and sewing stitches. Stitches are sewn backwards to the direction of the sewing. They form lines and usually used to outline shapes or add detail to an embroidered picture. It's an especially suitable stitch for creating fine lines and details, as well as forming a foundation for combination stitches. Back Stitch is a stitch taken backwards on top of another to lock the stitch in place or for extra strength. The back stitch is often used to end a row of running stitches, but can also be used in a continuous row in the same way as a running stitch. See also Running Stitch. / Строчка в шитье.

BACKSWAMP = ХХ ЛЕСНОЕ БОЛОТО – Backswamp is a depressed marshy area on a river floodplain behind the natural levees where surface drainage is hampered by surrounding higher land.

BACK TESTING = ТЕСТИРОВАНИЕ ИСТОРИЕЙ – Back Testing is a strategy that is optimized on historical data, then applied to current data to see if the results are similar. Rarely done properly and usually resorts to a form of curve fitting. A method of testing trading systems with the use of historical data. Backtesting is a strategy that is tested or optimized on historical data and then the strategy is applied to new data to see if the results are consistent. / В техническом анализе биржевых рынков . Метод тестирования торговой системы с использованием исторических данных.

BACK–TO–BACK DOCUMENTARY CREDIT = КОМПЕНСАЦИОННЫЙ ДОКУМЕНТАРНЫЙ АККРЕДИТИВ (или КОМПЕНСАЦИОННЫЙ ДОКУМЕНТАРНЫЙ КРЕДИТ) – In the case of a Back-To-Back L/C (short for Letter of Credit), an intermediary uses the commitment of the customer's issuing bank (i.e. the customer's L/C) to collateralize issuance of the second and separate L/C by the intermediary's bank in favor of, say, the supplier. A transferable L/C, in comparison, allows the intermediary (beneficiary) to transfer once rights in part or in full to another party. The intermediary as the first beneficiary requests the issuing or advising bank to transfer the L/C to its supplier (second beneficiary). Documentary credit which is granted to another beneficiary on the basis of an existing, non-transferrable documentary credit (original credit). Commonly used by middlemen when the original credit cannot be transferred and/or the terms of the two credits are not the same. In the case of a Back-To-Back L/C, an intermediary uses the commitment of the customer's issuing bank (i.e. the customer's L/C) to collateralize issuance of the second and separate L/C by the intermediary's bank in favor of, say, the supplier. A transferable L/C, in comparison, allows the intermediary (beneficiary) to transfer once rights in part or in full to another party. The intermediary as the first beneficiary requests the issuing or advising bank to transfer the L/C to its supplier (second beneficiary). Form of credit by which a finance house acts as an intermediary between a foreign seller and a foreign buyer, concealing the identity of the seller. The seller passes to the finance house the documents relevant to the sale and the house reissues them to the buyer in its own name. / Бенефициар аккредитива может просить авизующий либо подтверждающий банк открыть под обеспечение аккредитива другой аккредитив, который в таком случае называется компенсационным (встречным, back-to-back). Приказодатель компенсационного аккредитива обязан возместить банку эмитенту уплаченные в соответствии с условиями данного аккредитива суммы, независимо от того, произведена была в его пользу оплата по первому аккредитиву или нет. Компенсационный Аккредитив (Back-to-Bank Letter of Credit) – фактически представляет собой два юридически различных аккредитива, объединённых одной сложной сделкой. В случае компенсационного аккредитива банк торгового посредника открывает аккредитив в пользу поставщика (вспомогательный аккредитив, subordinate L/C), опираясь на наличие аккредитива, открытого в пользу данного посредника (основной (или хозяйский) аккредитив, master L/C).

BACK–TO–BACK LOAN = КОМПЕНСАЦИОННАЯ ССУДА – Back-To-Back Loan:- arrangement whereby a bank brings together a borrower and a lender so that they can agree on the terms of a direct loan between the borrowing and lending parties. This may occur with or without the bank's participation or guarantee. This practice is widespread in US banking circles.

BACKUP = ДЕЛАТЬ РЕЗЕРВНУЮ КОПИЮ (или ДУБЛИРОВАТЬ, или ДУБЛИРОВАНИЕ) – Backup:- making a duplicate copy of a computer file or a program on a disk or cassette so that the material will not be lost if the original is destroyed; a spare copy. / Создание резервной копии компьютерного файла или программы на диске или кассете с тем, чтобы не потерять информацию, если оригинал будет уничтожен; или запасная копия.

BACKUP = ОБРАТНЫЙ ХОД – Backup:- market situation where a company's earnings are on the increase while the price of its stock is falling. / Ситуация на рынке, когда у компании растут доходы, в то время как стоимость её акций снижается.

BACKUP COPY = РЕЗЕРВНАЯ КОПИЯ – Backup Copy is a temporary copy of digital information made for recovery purposes. / Временный экземпляр информации в цифровом виде, сделанный с целью восстановления. Резервная Копия – запасная копия содержимого диска, программы, файла, документа, создаваемая для использования в случае повреждения оригинала.

BACK–UP LINE = РЕЗЕРВНАЯ ЛИНИЯ – A Back-Up Line is a confirmed line of credit that can be drawn upon in connection with the issue of commercial paper if market liquidity is not sufficient, or for the purpose of general corporate financing. It is one of the instruments BASF uses to ensure it is able to make payments at all times. / Бе.А.Эс.Эф. (BASF).

BACKUP WITHHOLDING = ДУБЛИРУЕМОЕ (или РЕЗЕРВНОЕ) УДЕРЖИВАНИЕ – Backup Withholding:- under certain circumstances, the US Internal Revenue Service (IRS) may require Public Debt to withhold and pay to the IRS payments due to be made to a taxpayer. Payments that may be subject to backup withholding include interest, dividends, and other miscellaneous payments. Payments are subject to backup withholding if:- (i) the bond owner doesn't provide his correct taxpayer identification number (TIN) to Public Debt in the manner required by the IRS. (ii) the IRS tells Public Debt that the bond owner provided an incorrect TIN. (iii) the IRS tells the bond owner that he's subject to backup withholding on interest or dividends because he has underreported interest or dividends on his federal income tax return. The IRS will do this only after it has mailed to the taxpayer four notices over at least a 120-day period. (iv) the bond owner is required, but fails, to certify to Public Debt that he is not subject to backup withholding. / Удержание Недоимок – система, используемая Службой Внутренних Доходов США (Internal Revenue Service (IRS)) для удержания подоходного налога с клиентов, не указавших банку своего номера и карточки социального страхования. В случае, когда налогоплательщиком не представлена форма 1099, банк или брокерская фирма должны удерживать и пересылать в IRS 20% от процентов или дивидендов, причитающихся клиенту. Чтобы избежать удержания недоимок, необходимо заполнить федеральную форму W-9 для финансовых институтов, заверяя тем самым, что ваш номер социального страхования правильный.

BACKUP WITHHOLDING TAX = ДУБЛИРУЕМЫЙ УДЕРЖИВАЕМЫЙ НАЛОГ – Backup Withholding Tax is a tax withheld from certain interest and dividend payments, and payments by a broker of the proceeds of a sale of property, usually because of a failure of the payee to furnish a proper taxpayer identification number to the payor. This tax is imposed as a collection device and is fully creditable by the taxpayer. The Economic Growth and Tax Relief Reconciliation Act of 2001 reduced the rate of backup withholding tax

for payments made prior to 2011-January-01. The rate will first be reduced to 30.5 percent for payments made after 2001-August-06 and will be further reduced to 30 percent on 2002-January-01, 29 percent on 2004-January-01, and 28 percent on 2006-January-01.

BACK WAIST LENGTH = ДЛИНА СПИНКИ – Back Waist Length:- the dimension on a body, taken from the top of the back bone at the base of the neck to the waistline.

BACKWARDATION = УБЫВАЮЩАЯ ПОСЛЕДОВАТЕЛЬНОСТЬ (или БЭКВОДЭЙШЭН) – (1) The market is said to be in Backwardation when the price of near delivery months of futures or physicals contracts trade at a premium to more distant months. Market situation in which futures prices are lower in each succeeding delivery month. A futures market in which the relationship between two delivery months of the same commodity is abnormal. Market situation in which futures prices are progressively lower in the distant delivery months. Many times this is an aggressive bull spread environment. For instance, if the cotton quotation for October is 52.16 cents per pound and that for December is 51.05 cents per pound, the backwardation for two months against October is 1.11 cents per pound. Also known as Inverted Market. The opposite of Contango. Backwardation is a market situation where prices for future delivery are lower than the spot price, caused by shortage or tightness of supply. Backwardation:- when the price for immediate delivery of a commodity is higher than the price of delivery for a future date. In a commodity market, Backwardation is the situation in which the future price is lower than the spot price, because of excessive present demand, which is expected to fall as time passes. / Ситуация на рынке, при которой цены на фьючерсы с ближайшими сроками поставки выше цен на фьючерсы с последующими сроками поставки. В большинстве случаев это состояние агрессивного бычьего спрэда. Известно также как Обратный Рынок (Inverted Market). В противоположность Возрастающей Последовательности или Контэнго (Contango). Убывающая Последовательность или Бэкводэйшэн:- (1) Структура цен на товарно-сырьевую продукцию или в операциях по обмену валюты, когда поставка в более ранние сроки производится по более высокой цене, чем поставка в более поздние сроки. Система ценообразования бэкводэйшэн возникает, когда спрос на поставки в ближайшем будущем выше, чем спрос на поставки в более поздний срок. Смотрите также Возрастающая Последовательность или Контэнго (Contango). (2) Термин Лондонской Фондовой Биржи (London Stock Exchange), относящийся к сборам и процентам, подлежащим уплате после продажи акций в короткую с отсрочкой платежа и поставки.

(2) Backwardation is the scenario where the spot price of a commodity is higher than the futures price of the same commodity. This situation arises under abnormal conditions such as shortage of supply of a commodity in the short term. The extent to which the spot price of a commodity or the spot rate of a currency, plus the cost of rent and interest, exceeds the future price or forward rate.

(3) The rate of interest paid by a bear speculator for deferring, from one account day to the next, the final settlement of shares sold during the account period. A bear who pays backwardation is speculating that the price of the stock concerned will fall in the near future. See also Contango. / Биржевая игра медведей на понижение. Смотрите также Возрастающая Последовательность или Контэнго (Contango).

BACK WARP = КОРЕННАЯ ОСНОВА – Back Warp is the warp which, along with the back filling, actually forms the second face (back) of double, triple, or quadruple fabrics. / уточина.

BACKWASHER = ГЛАДИЛКА – Backwasher is a machine used for washing wool after carding to remove all impurities. It also dries the tops after washing by passing them over steam-heated cylinders, or perforated cylinders through which hot air is forced. / Машина для промывки шерсти.

BACKWASHING = УТЮЖЕНИЕ (или ОБРАТНАЯ ПРОМЫВКА) – Backwashing is a removal of the oil which has been put into worsted stock in the blending, oiling and mixing operations when the mix was made up. / Утюжение – второй процесс очистки шерсти в форме ленты от инородных примесей на гладилке.

BACKWINDING = ПЕРЕМОТКА – Backwinding is:- (i) rewinding yarn or fiber from one type of package to another; or (ii) winding yarn as it is deknit.

BACKWRAP = ХХ (или ОДЕЖДА С ЗАПАХИВАНИЕМ СЗАДИ) – Backwrap is a wraparound garment, as a skirt, that fastens in the back.

BACS (LTD) = BANKERS' AUTOMATED CLEARING SERVICES (LTD)

BACTERIA = БАКТЕРИЯ – Bacteria:- microorganisms often composed of a single cell. Bacteria is any of numerous unicellular microorganisms of the class Schizomycetes, occurring in a wide variety of forms, existing either as free-living organisms or as parasites, and having a wide range of biochemical, often pathogenic properties. / Под Бактериями, от Греческого слова Baktērion, означающее Палочка, понимается группа микроскопических, преимущественно одноклеточных организмов. Относятся к 'доядерным' формам – прокариотам. В основу современной классификации Бактерий, по которой все Бактерии делят на Эубактерий (грамотрицательные бактерии и грамположительные бактерии, микоплазмы) и Архебактерий, положено строение их клеточной стенки. По форме клеток Бактерии могут быть Шаровидными (Кокки), Палочковидными (Бациллы, Клостридии, Псевдомонады), Извитыми (Вибрионы, Спириллы, Спирохеты); диаметр 0.1–10 мкм, длина 1–20 мкм, а нитчатых многоклеточных Бактерий – 50–100 мкм. Некоторые Бактерии образуют споры. Многие подвижны, имеют жгутики. Питаются, используя различные органические вещества (гетеротрофы) или создавая органические вещества клеток из неорганических (автотрофы). Способны расти как в присутствии атмосферного кислорода (аэробы), так и при отсутствии (анаэробы). Участвуют в круговороте веществ в природе, формировании структуры и плодородия почв, в образовании и разрушении полезных ископаемых; поддерживают запасы углекислого газа в атмосфере. Используются в пищевой, микробиологической, химической и других отраслях промышленности. Патогенные (болезнетворные) Бактерии – возбудители болезней растений, животных и человека. Полагают, что Бактерии – первые организмы, появившиеся на Земле. Основными формами Бактерий являются:- Вибрионы, Диплококки, Палочковидные, Спириллы, Стафилококки, и Стрептококки. Бактерии, большая группа (тип) микроскопических, преимущественно одноклеточных организмов, обладающих клеточной стенкой, содержащих много дезоксирибонуклеиновой кислоты (ДНК), имеющих примитивное ядро, лишённое видимых хромосом и оболочки, не содержащих, как правило, хлорофилла и пластид, размножающихся поперечным делением (реже перетяжкой или почкованием). Подавляющее число видов Бактерий имеет палочковидную форму. Однако к Бактериям относят также микроорганизмы, имеющие шаровидную, нитевидную или извитую форму. Бактерии разнообразны по своей физиологии, биохимически очень активны и распространены в почве, воде, грунте водоёмов и прочем. Бактерии не представляют единой группы, а возникли разными путями. Некоторые Бактерии (например, Нитчатые, Азотобактер и другие) близки к Синезелёным Водорослям, другие Бактерии родственны Лучистым Грибкам – Актиномицетам, Спирохеты и некоторые другие Бактерии имеют сходство с одноклеточными животными – простейшими. Бактерии участвуют в круговороте веществ в природе, некоторые из них вызывают заболевания человека, животных или растений, применяются в различных отраслях микробиологической промышленности. Науку, изучающую бактерии, называют Бактериологией. Это составная часть более

широкой дисциплины – Микробиологии, в задачу которой входит изучение всех сторон жизнедеятельности не только Бактерий, но и других микроорганизмов (Дрожжи, Плесневые Грибы, микроскопические Водоросли). Человек использовал Бактерии, ещё не зная об их существовании. С помощью заквасок, содержащих Бактерии, приготовляли кисломолочные продукты, уксус, тесто и так далее. Впервые Бактерии увидел Голландский натуралист, основоположник научной микроскопии Антони Филипс фон Лэйвенук (или Левенгук; Antonie Philips van Leeuwenhoek; 1632–1723) – создатель микроскопа, исследуя растительные настои и зубной налёт. К концу XIX – началу XX веков было выделено большое число Бактерий, обитающих в почве, воде, пищевых продуктах и тому подобном, были открыты многие виды болезнетворных Бактерий. Классические исследования Французского микробиолога и химика, основоположника современной микробиологии и иммунологии Люи Пастёра (или Пастера; Louis Pasteur; 1822–1895) в области физиологии Бактерий послужили основой для изучения у них обмена веществ. Вклад в исследование Бактерий внесли Русские и Советские микробиологи Сергей Николаевич Виноградский (1856–1953), Василий Леонидович Омелянский (1867–1928), Борис Лаврентьевич Исаченко (1871–1948), выяснившие роль Бактерий в круговороте веществ в природе, который делает возможной жизнь на Земле. Это направление в микробиологии неразрывно связано с развитием геологии, биогеохимии, почвоведения, с учением Русского и Советского учёного Владимира Ивановича Вернадского (1863–1945) о биосфере. Морфология И Систематика Бактерий:- размер, форма, строение, подвижность Бактерий. Диаметр Шаровидных Бактерий обычно равен 1–2 мкм, ширина Палочковидных форм колеблется от 0.4 до 0.8 мкм, длина равна 2–5 мкм. Реже встречаются очень крупные Бактерии. Так, Серобактерия Thiophysa macrophysa имеет 20 мкм в диаметре, нити других Серобактерий (Beggiatoa) видны невооружённым глазом. Есть также очень мелкие Бактерии, например, Bdellovibrio, паразитирующие на Бактериях обычных размеров. Некоторые Бактерии, например, возбудители плевропневмонии рогатого скота, столь мелки, что невидимы в оптический микроскоп. Шаровидные Бактерии называются Кокками, если же они располагаются попарно, – Диплококками. Если Кокки размножаются поперечным делением и после деления остаются соединёнными, образуя цепочки, то их называют Стрептококками. При делении клеток в трёх взаимно перпендикулярных направлениях образуются пакеты клеток, типичные для Сарцин. При делении Кокков в различных плоскостях возникают скопления клеток в виде грозди винограда, что характерно для Стафилококков. Палочковидные Бактерии, образующие споры, называются Бациллами. Палочковидные формы могут иметь ‘обрубленные’ или выпуклые концы и располагаются отдельно или, реже, в виде цепочки. Бактерии, образующие длинные нити, – Нитчатые Бактерии, обитают преимущественно в воде. Бактерии в форме запятой – Вибрионы, извитые формы с грубыми спиральными завитками – Спириллы, с несколькими равномерными тонкими завитками – Спирохеты. Все Бактерии имеют клеточную стенку. Она отчётливо видна при помещении Бактерий в раствор поваренной соли; при этом содержимое клетки сжимается и отстаёт от стенки – наступает Плазмолиз. У ряда Бактерий стенка окружена слизистой капсулой, присутствие которой может быть установлено при помещении таких Бактерий в раствор туши. При электронной микроскопии видно, что клеточная стенка состоит из нескольких слоёв (обычно трёх). В её состав входят мураминовая кислота, аминокислоты, липиды, глюкозамин и другие соединения. Химический состав клеточной стенки у разных систематических групп, а также у Бактерий, окрашивающихся и не окрашивающихся по Граму, различен. Большую роль в обмене веществ играет цитоплазматическая мембрана, находящаяся под клеточной стенкой. В мембране сосредоточены многочисленные ферментные системы бактериальной клетки. В цитоплазме имеются рибосомы, в состав которых входит РНК. Содержание нуклеиновых кислот у Бактерий колеблется от 10 до 22% при разном отношении РНК/ДНК (у Кишечной Палочки оно равно 2). С помощью электронного микроскопа установлено присутствие в клетке Бактерии нитей ДНК, образующих ядро, лишённое оболочки, – так называемый Нуклеоид. Строение ядра неодинаково у различных Бактерий. Так, у ‘высших’, более сложно организованных Бактерий (Myxobacteriales, Hyphomycrobiales), ядра легко могут быть обнаружены при микроскопии окрашенных препаратов в оптическом микроскопе. У многих Бактерий цитоплазма уплотнена на концах клеток и образует окрашивающиеся полярные зёрна. Клетки Бактерий содержат запасные вещества:- жировые включения, зёрна гликогена, метахроматина, гранулёзы, а также вакуоли, содержащие жидкость или газ. В отличие от Грибов, Бактерии не содержат митохондрий, что свидетельствует о более примитивном строении Бактерий. Многие Бактерии подвижны. Обычно такие формы имеют длинные жгутики, состоящие из сократительного белка. Благодаря волнообразным и спиральным движениям жгутиков клетка Бактерии перемещается. Виды с одним жгутиком на полюсе клетки называются Монотрихами, клетки, имеющие пучок жгутиков на конце, – Лофотрихами, Бактерии, у которых жгутики расположены по всей поверхности тела, – Перитрихами. У Миксобактерий, которые также подвижны, жгутиков нет, и они передвигаются в результате набухания в окружающей среде слизи, выделяемой клетками (реактивный способ движения). Жизненный Цикл:- изменение морфологии клеток Бактерий во времени даёт представление об их жизненном цикле. Так, многие аэробные и анаэробные Бактерии образуют овальные или круглые блестящие споры. Такие виды Бактерий называются Спороносными Бактериями (или Бациллами). Если споры крупные и располагаются в центре клетки, то палочка приобретает веретенообразную форму; у других видов спора располагается на конце палочки, и тогда последняя приобретает форму булавы или барабанной палочки. У многих спороносных Бактерий диаметр споры невелик, и поэтому при образовании споры сохраняется палочковидная форма Бактерии. В дальнейшем остатки вегетативной клетки разрушаются, и спора становится свободной. В каждой клетке образуется только одна спора и, следовательно, спорообразование нельзя рассматривать как размножение. Споры Бактерий очень устойчивы к действию высокой температуры и ядовитых веществ. Попав в благоприятную питательную среду, споры прорастают и из них выходят молодые палочковидные вегетативные клетки. Цикл развития Бактерий может быть различным. Так, Микобактерии размножаются как делением, так и почкованием. У Миксобактерий вегетативные клетки сжимаются, сокращаются и образуют круглые или овальные микроцисты (смотрите Циста), которые потом могут прорастать. Соединённые слизью микроцисты образуют тела шаровидной, грибовидной или коралловидной формы зелёного, розового или иного цвета. В процессе роста Бактерии могут образовывать фильтрующиеся формы, проходящие через фильтры и дающие в дальнейшем культуры, сходные или тождественные с теми, в которых они возникли. Изменчивость, Физиологические И Морфологические Свойства:- Бактерии могут подвергаться изменениям. Бактерии могут утратить подвижность, способность образовывать пигменты, давать споры, усиливать или уменьшать способность к синтезу различных органических соединений, изменять форму и строение колоний на плотных питательных средах и так далее. Эти изменения могут происходить самопроизвольно, то есть без применения соответствующих внешних воздействий. Значительно больше изменённых форм возникает в результате применения мутагенов (ультрафиолетовые лучи, ионизирующая радиация, этиленимин или другие химические вещества). Каждое свойство Бактерий связано с ДНК, то есть контролируется соответствующим геном. Благодаря успехам генетики микроорганизмов установлено местоположение многих генов в нити ДНК (смотрите Генетические Карты Хромосом). Выделив ДНК из клеток-мутантов и добавив её в культуру другого штамма, можно вызвать (в результате проникновения ДНК внутрь клеток) наследственные изменения, называются Трансформацией. С помощью мутагенов могут быть получены Мутанты, ценные в практическом отношении, в том числе образующие большее количество различных антибиотиков, аминокислот, витаминов и других биологически активных веществ. С помощью мутантов Бактерий были расшифрованы пути биосинтеза различных органических соединений. Постепенно меняя среду обитания Бактерий, можно адаптировать их к новым условиям существования. Так были получены формы, устойчивые к различным ядам,

развивающиеся при необычной температуре или реакции среды, и тому подобном; так появляются устойчивые к некоторым антибиотикам формы болезнетворных Бактерий. Систематика:- для выяснения систематического положения Бактерий определяют их размеры, морфологию клеток, характер роста чистой культуры на разных питательных средах, форму, цвет и характер поверхности колоний, вырастающих на плотных средах. Устанавливают также характер разжижения Бактерий желатины, способность их свёртывать молоко, сбраживать различные углеводы, восстанавливать нитраты, образовывать аммиак, сероводород и индол при разложении белков и тому подобное. В дальнейшем, имея характеристику выделенной культуры, определяют её систематическое положение. Бактерии подразделяют на три класса. Первый Класс – Eubacteria – объединяет Бактерий, имеющих плотную клеточную стенку и не образующих плодовых тел. В этом классе различают следующие порядки:- (1) Eubacteriales – одноклеточные Кокки, неветвящиеся Палочки и спирально извитые формы; к этому порядку относятся все неспороносные и спороносные Бактерии, фото-синтезирующие Бактерии, Спирохеты и другие; (2) Trichobacteriales – многоклеточные нитчатые Бактерии с поперечными перегородками; (3) Ferribacteriales – одноклеточные не нитчатые автотрофные Железобактерии; (4) Thiobacteriales – одноклеточные автотрофные Серобактерии. Второй Класс – Myxobacteria – объединяет Бактерий с тонкой клеточной стенкой и реактивным характером движения, образующие микроцисты и плодовые тела различной формы. К Третьему Классу – Hyphomicrobiales – относят клетки, дающие длинные нити, на концах которых образуются почки; отделившиеся почки подвижны. Современные систематики выделяют на основании эволюционных (филогенетических) данных большие группы, объединяющие родственные формы. Так, например, ветвящиеся Микобактерии не выделяются в самостоятельную группу, а объединены с Актиномицетами. Физиология Бактерий:- рост, размножение, развитие. После деления Бактерии каждая из двух дочерних бактериальных клеток начинает расти и достигает размеров материнской. В этом случае говорят о росте отдельной клетки. Размножение клеток, составляющих популяцию, приводит к увеличению общего числа клеток. В этом случае говорят о росте культуры. При росте культуры в жидкой питательной среде последняя становится мутной; чем больше клеток в культуре, тем она мутнее. Об интенсивности роста судят на основании подсчёта клеток в 1 миллилитре (мл) культуры с помощью микроскопа или определяют с помощью нефелометра степень мутности питательной среды. Определяя количество клеток в разные периоды роста культуры, можно получить кривую роста, отражающую несколько фаз:- вначале клетки не размножаются, затем начинают делиться, причём скорость размножения всё время возрастает; далее наступает фаза, для которой характерна постоянная скорость деления клеток; затем эта скорость уменьшается и наступает отмирание клеток. Для получения максимального количества клеток Бактерии выращивают в условиях так называемой Проточной Культуры; при этом из сосуда, в котором размножаются Бактерии, вытекает определённый объём культуры; одновременно в сосуд добавляется в таком же количестве свежая стерильная питательная среда. При размножении Бактерий не в проточных, а в стационарных условиях происходит изменение питательной среды и накопление в ней продуктов жизнедеятельности Бактерий, вследствие чего меняются и их физиологические особенности. Так, молодые клетки Clostridium acetobutylicum не способны образовывать ацетон; это свойство они приобретают в более старой культуре. Если спороносных Бактерий выращивать в условия проточной культуры, они будут делиться, но не будут давать спор. При выращивании бактерий на плотных питательных средах они образуют скопления клеток разных размеров, формы, цвета, называемые Колониями. Питание:- в состав клеток Бактерий входят те же биогенные элементы и микроэлементы, что и в состав клеток высших растений и животных. Это C, N, O, H, S, P, K, Mg, Ca, Cl, Fe и другие. Помимо белка, углеводов и жиров, Бактерии содержат также РНК и большое количество ДНК. Все эти вещества могут быть синтезированы только из веществ, содержащихся в окружающей среде. Как правило, через полупроницаемую клеточную стенку и цитоплазматическую мембрану внутрь Бактерии проходят только растворимые вещества. Под действием гидролитических ферментов, поступающих из бактериальных клеток наружу, происходит разложение более сложных веществ (например, крахмала, целлюлозы) с образованием растворимых продуктов (например, моносахаров), усваиваемых Бактериями. В качестве источника азота Бактерии могут усваивать белки, аминокислоты, аммонийные соли, нитраты. Разные виды Бактерий способны утилизировать различные источники азота. Ранее считали, что некоторые патогенные (болезнетворные) и молочнокислые Бактерии могут развиваться лишь в питательных средах с белками. В дальнейшем выяснилось, что источником азота для таких Бактерий могут служить аммонийные соли. Существует много видов Бактерий из разных систематических групп, которые способны усваивать не только азот тех или иных азотсодержащих веществ, но и фиксировать азот атмосферы. К таким азотфиксирующим микроорганизмам относятся Азотобактерии, Микобактерии, пурпурные фотосинтезирующие Бактерии, а также клубеньковые Бактерии (смотрите Азотфиксация). Источниками минерального питания для Бактерий служат соли P, S, Cl, K, Fe, Na, Ca; многие виды нуждаются также в микроэлементах (Mo, Mn, Cu, B, V и других). Для размножения Бактерий необходимы также факторы роста микроорганизмов, к которым относятся витамины группы B, биотин, пантотеновая кислота, фолиевая кислота и другие. Бактерии, способные синтезировать эти вещества, называются Ауксоавтотрофами. К ним относятся Псевдомоносы и многие другие неспороносные Бактерии. При выращивании Бактерий, не способных к синтезу факторов роста, их добавляют в питательную среду. Такие Бактерии называются Ауксогетеротрофами, к ним относятся, например, различные молочнокислые Бактерии. Источниками углерода для Бактерий могут служить углеводы, спирты, органические кислоты, лигнин, хитин, углеводороды, жиры и другие. Способность усваивать углерод из тех или иных источников у разных видов Бактерий варьирует, и этим пользуются для целей систематики. Бактерии, усваивающие углерод органических соединений, называются Гетеротрофными Бактериями. Бактерии, усваивающие углерод углекислого газа атмосферы, называются Автотрофными Бактериями. Виды Бактерий, использующие для фиксации углекислоты энергию солнечных лучей, называются Фотоавтотрофами. Группа Бактерий, получающих энергию в результате окисления таких неорганических веществ, как аммиак, нитриты, сера, водород и других, способных усваивать углекислоту за счёт энергии, освобождающейся при окислении указанных неорганических соединений, называются Хемоавтотрофами, а сам процесс ассимиляции двуокиси углерода, открытый выдающимся Русским микробиологом Сергеем Николаевичем Виноградским, – Хемосинтезом. Дыхание И Обмен Веществ:- синтез веществ, входящих в состав бактериальной клетки, её подвижность и другие процессы сопровождаются тратой энергии. Большинство Бактерий получает энергию путём окисления органических веществ, хемоавтотрофные – в результате окисления неорганических соединений, фотосинтезирующие Бактерии используют энергию солнечных лучей. Бактерии, способные расти только в присутствии кислорода, называются Аэробами, растущие в отсутствие кислорода, – Анаэробами. При аэробном дыхании происходит окисление органических соединений с выделением углекислого газа. Если же окисление идёт не до конца, то в среде накапливаются промежуточные продукты. Такие процессы называются Окислительными Брожениями (например, уксуснокислое брожение). Разложение органических веществ в анаэробных условиях с освобождением энергии называются Брожением. При сбраживании углеводов различными Бактериями могут образовываться:- молочная или масляная кислота, этиловый, пропиловый или бутиловый спирт, ацетон и другие вещества. Ряд биохимических процессов (гликолиз, транспорт электронов, цикл Кребса, синтез аминокислот, белков, нуклеиновых кислот и другие) протекает у Бактерий почти так же, как в клетках растений и животных. Специфическое особенности обмена веществ Бактерий – высокая биохимическая активность, способность окислять неорганические соединения серы, азота (аммиак) и другие, синтезировать белок, используя в качестве исходного продукта фенол, метан и другие углеводороды,

окислять водород, фиксировать азот атмосферы, синтезировать ферменты, разлагающие целлюлозу или лигнин, образовывать метан из углекислоты и водорода и другого – исключительно ценны в практическом отношении. Экология Бактерий:- Распространение:- Бактерии относятся к космополитам. Одни и те же виды Бактерий можно найти на всех материках, то есть почти повсеместно. Количество их в почве, воде и других средах определяют прямым подсчётом клеток в окрашенном препарате либо посевом на разные питательные среды. В 1 грамме (г) почвы содержатся сотни тысяч или миллионы Бактерий; в 1 миллилитре (мл) воды – десятки или сотни клеток. Сильное влияние на бактериальную микрофлору оказывают экологические условия. Так, окультуренные почвы не только содержат больше Бактерий, чем, например, почвы пустынь, но и различаются по видовому составу микрофлоры. Современной микробиологии известно не более 1/10 части Бактерий, существующих в природе. Применение методов капиллярной и электронной микроскопии препаратов почвы позволило обнаружить много новых видов Бактерий. Развиваясь в самых разных экологических условиях, Бактерии в процессе эволюции приспособились к ним. Так возникли термофильные Бактерии, обитающие в воде горячих источников, в разогревающихся кучах торфа или навоза, психрофильные формы, живущие при низкой температуре в воде полярных морей, галофильные Бактерии, способные размножаться в среде, содержащей до 20% поваренной соли, ацидофильные и алкалофильные Бактерии, растущие в очень кислой или сильно щелочной среде, и так далее. Широкое распространение в природе определённых источников углерода или азота привело в ходе эволюции к физиологической конвергенции, то есть появлению у представителей различных систематических групп Бактерий способности усваивать биогенный элемент из одного источника. Так, Бактерии, фиксирующие атмосферный азот, принадлежат к различным классам, порядкам и семействам; А; способностью утилизировать целлюлозу обладают многие Бактерии, далёкие в систематическом отношении. Между разными видами Бактерий, с одной стороны, и другими микроорганизмами, растениями или животными – с другой, могут существовать как антагонистические (смотрите Антагонизм), так и симбиотические (смотрите Симбиоз) отношения. Некоторые Бактерии образуют пигменты, антибиотики или органические кислоты, угнетающие жизнедеятельность других Бактерий, Грибов, Водорослей, одноклеточных и некоторых клеток многоклеточных животных. Бактериальные вирусы – Бактериофаги – проникают внутрь Бактерий и, размножаясь в них, вызывают гибель и лизис микроорганизмов. При симбиотических, то есть основанных на взаимной пользе, отношениях один вид Бактерий может потреблять продукты жизнедеятельности другого вида, накопление которых в культуральной жидкости тормозит рост последнего. В свою очередь симбионт может выделять в среду добавочные факторы роста, необходимые другому виду. Бактерии, обитающие в кишечнике животных или человека и питающиеся за счёт содержимого кишечника, образуют ферменты, необходимые для пищеварения, а также ряд веществ, крайне важных для жизни хозяина (незаменимые аминокислоты, различные витамины и другие). Роль Бактерий В Круговороте Веществ В Природе:- минерализуя растительные и животные остатки, микроорганизмы участвуют в круговороте всех химических элементов, входящих в состав живых клеток. Так, источником углерода для высших растений и хемоавтотрофных Бактерий служит углекислота атмосферы, фиксируемая в процессе фото- или хемосинтеза. Биомасса растений и животных разлагается микроорганизмами, способными утилизировать целлюлозу, пентозы, крахмал, лигнин, пектиновые вещества, в конечном итоге до углекислоты и воды. Так же велика роль микроорганизмов, в том числе Бактерий, в круговороте азота. Животные, питаясь растениями, синтезируют белок и другие азотсодержащие продукты своего тела за счёт белка растений. При минерализации животного и растительного белка гнилостные Бактерии образуют аммиак, который окисляется нитрифицирующими Бактериями в нитриты и затем в нитраты. Как аммонийные соли, так и нитраты служат источником азотистого питания для высших растений, синтезирующих при этом белки своего тела. Минерализующая способность Бактерий обеспечивает круговорот и других биогенных элементов. Разрушая органические соединения фосфора (нуклеиновые кислоты и другие), они обогащают минеральными соединениями фосфора водоёмы и почву. Под влиянием Бактерий происходит минерализация и органических соединений серы. Серные Бактерии могут окислять сероводород, серу или некоторые её соединения до серной кислоты, другие способны восстанавливать сульфаты с образованием сероводорода. Бактерии осуществляют окисление железа и марганца, отложение солей кальция, окисление метана и водорода, разрушение горных пород продуктами жизнедеятельности и другое. Всё это позволяет считать Бактерии мощными геологическими деятелями. Практическое Значение:- Бактерии служат излюбленными объектами для решения общих вопросов генетики, биохимии, биофизики, космической биологии и другого. Культуры Бактерий применяются для количественного определения аминокислот, витаминов, антибиотиков. Плодородие почв в значительной мере связано с жизнедеятельностью Бактерий, минерализующих растительные и животные остатки с образованием соединений, усваиваемых сельскохозяйственными растениями. Вместе с тем, синтезируя живое вещество клеток, Бактерии накапливают большие количества органических соединений в почве. В верхних слоях окультуренной почвы на площади в 1 гектар (га) содержится несколько тонн (т) бактериальных клеток. Живущие в почве азотфиксирующие Бактерии обогащают почву азотом. Исключительно велика роль клубеньковых Бактерий, фиксирующих газообразный азот. Заражение семян Бобовых растений нитрагином – препаратом, содержащим клетки клубеньковых Бактерий (смотрите Бактериальные Удобрения), повышает урожай растений и накопление азота в почве. С помощью Бактерий, сбраживающих пектиновые вещества, осуществляют мочку Льна, Конопли, Кенафа и других Лубяных культур. Разные виды Бактерий применяют при получении из молока кисломолочных продуктов, масла и сыра. В микробиологической промышленности с помощью соответствующих видов Бактерий получают из крахмалсодержащего или другого сырья молочную кислоту, ацетон, этиловый, бутиловый и иные спирты, кровезаменитель декстран, диацетил, антибиотики (грамицидин и другие), витамины, аминокислоты и другие. Особенно широко применяются Бактерии для получения ферментных препаратов (амилазы, протеазы и другие). В результате размножения Бактерий, образующих молочную кислоту из углеводов, квашеная капуста, силос, солёные огурцы не гниют, так как кислая реакция мешает развитию гнилостных Бактерий. Окисляющие серу Бактерии применяют для бактериального выщелачивания меди и ряда других металлов из содержащих их пород. Помещая способные усваивать газообразные углеводороды Бактерии в сосуды, зарываемые затем в почву, можно на основании роста Бактерий заключать, имеется ли в этой местности нефть или природный газ. С многими видами Бактерий приходится вести серьёзную борьбу, предохраняя от порчи и разрушения ими зерно, овощи, фрукты, все пищевые продукты, разные виды сырья, материалов и изделий (текстиль, картон, канаты, рыболовные сети, изоляция кабеля и многие другие). Многие болезни человека вызываются патогенными Бактериями. К таким болезням относятся различные эпидемические заболевания (холера, брюшной тиф, паратифы, чума, дифтерия, туляремия, бруцеллёз), а также туберкулёз, заражение крови (сепсис), проказа, сифилис и другие. У животных Бактерии вызывают сап, Сибирскую язву, туберкулёз и другие. Многие болезни как культурных, так и диких растений вызывают так называемые Фитопатогенные Бактерии (смотрите Бактериальные Болезни Растений). Борьба с болезнетворными Бактериями основывается на асептике и антисептике, на применении бактериостатических веществ и бактерицидных веществ (смотрите Антибиотики, и Химиотерапия).

BACTERIAL BLIGHT = БАКТЕРИОЗ (или БАКТЕРИАЛЬНОЕ ПОРАЖЕНИЕ, или БАКТЕРИАЛЬНЫЙ ОЖОГ) – Bacterial Blight occurs in susceptible varieties and Pima Cotton when weather conditions are hot, wet and humid. Storms and hail increase severity. The pathogen may be introduced in planting seed or carried over on infected Cotton residues from the previous season. Spots on cotyledons are circular, dark green and greasy. Spots on leaves and bracts are angular, dark green and greasy, and are more obvious

on the lower leaf surface. Spots darken and may become black with age. Large lesions may develop along leaf veins, and along stems and branches (‘black arm’). See also Pima Cotton. An important disease of Cotton in many countries, now controlled with resistant varieties and clean seed programs. Bacterial Blight:- pest type:- disease; crops affected:- Cotton, Peas, Legumes, Soybeans, Beans (all types); scientific name:- Pseudomonas Syringae, Xanthomonas Campestris. Symptoms:- this bacterial disease is primarily a leaf disease. Initial symptoms are small angular watersoaked spots on leaves. Lesion centers dry out and turn brown to black with watersoaked margins and yellow halos. Lesions may coalesce resulting in large blighted areas. Affected often drops out, giving holes and a tattered appearance to the leaves. As this disease progresses, leaf petioles and stems may become infected with black spots or cankers, resulting in premature defoliation called Black Arm or Cotton Black Leg. Black cankers may girdle the stem or branches, causing the portions above the canker to die. A white waxy crust containing the bacterium may form on old leaf spots or cankers. Bolls may also become infected, causing boll rot (Refer to ‘Boll Rots’). This is generally not a serious disease, but can cause yield reductions under heavy disease pressure. Control Measures:- resistant varieties, plant pathogen-free seed, crop rotation, avoid cultivation when foliage is wet. Dry, hot weather stops the spread of this disease. In Cotton, use growth regulators to prevent rank growth. After harvest, shred stalks as soon as possible and plow down, or otherwise incorporate, plant debris. / Псевдомонада или Псевдомонас (Pseudomonas). Пятна на семядолях (cotyledons). жилка (vein). Пятна на листьях (leaves) и прицветничках (bracts) угловатые, тёмнозелёные и . Серьёзное заболевание Хлопчатника, встречающееся во многих странах. В настоящее время сдерживается посредством выведения устойчивых селекционных сортов и с помощью программ по обеззараживанию семян.

BACTERIAL LEAF BLIGHT = БАКТЕРИАЛЬНОЕ ПОРАЖЕНИЕ ЛИСТЬЕВ (или БАКТЕРИОЗ ЛИСТЬЕВ, или БАКТЕРИАЛЬНЫЙ ОЖОГ ЛИСТЬЕВ) – Bacterial Leaf Blight (BLB) is a disease of Rice caused by the Bacteria Xanthomonas Campestris pv. Oryzae. The leaf stage of BLB is the most widespread and, therefore, causes the most damage. The early symptoms include yellow, undulating lesions along the margins of the upper portion of the leaf blades. The lesions develop rapidly parallel to the veins and extend laterally to the healthy regions. In extreme cases, a large portion of the entire leaf blade becomes infected, turns yellow or dirty white, and finally dies. / Бактерия Ксантомонада или Ксантамонас (Xanthomonas Campestris pv. Oryzae) жилкам и .

BACTERIAL LEAF STREAK = БАКТЕРИАЛЬНАЯ ПОЛОСАТОСТЬ ЛИСТЬЕВ – Bacterial Leaf Streak (BLS) is a bacterial disease of Rice caused by Xanthomonas Oryzae pv. Oryzicola. The organism attacks chiefly the parenchymatous tissue between the leaf veins and, in the early stages, remains confined to the interveinal spaces. It may enter the leaf through the stomata or through wounds which are mainly caused by storms. The symptoms manifested are the appearance of fine, interveinal, long or short lines which are water-soaked and grayish. The lesions extend and coalesce to form larger patches and become yellow from the death of cells. At this stage, the symptoms are difficult to distinguish from those of bacterial leaf blight. The disease is limited to the tropics. / Ксантомонада или Ксантамонас (Xanthomonas. между жилками листа и .

BACTERIAL STUNT = БАКТЕРИАЛЬНАЯ КАРЛИКОВОСТЬ – Bacterial Stunt occurs when soilborne Bacteria infect Cotton roots. It is most severe on heavy gray clays and is easiest to identify when soil type varies within the one field. Severity varies from season to season but the distribution in fields does not vary. Symptoms include:- (i) uniformly stunted, slow growing plants (growth picks up later in the season); (ii) symptoms of zinc deficiency; and (iii) rapid development of root-browning in seedling plants. Bacterial Stunt (also known as Early Season Growth Disorder or Galathera Syndrome) occurs in many Cotton growing areas and is usually associated with very heavy clay soils. Slow early season growth and severe stunting are often the only above-ground symptoms although the leaves of badly stunted seedlings may have symptoms of zinc deficiency:- Root browning develops rapidly in response to pathogenic Bacteria that colonise the roots and hinder their function. Colonization by mycorrhizal Fungi is slow. The disease is caused by a combination of soil properties and weakly pathogenic Bacteria that infect the roots. One of these Bacteria appears to be an undescribed Species of Pseudomonas which is relatively common in soil and widespread in the Cotton growing areas. Bacterial stunt delays the maturity of the crop and yield can be reduced by as much as 50%; although plants in some areas recover after December and yield well if the season is long enough. No direct control measures are currently available for bacterial stunt. Fertilising with zinc may be advantageous. Cover crops (e.g., winter cereal, sprayed out before sowing Cotton) have increased early season growth in fields where bacterial stunt occurs. The crop should be managed to give maximum time for recovery of growth late in the season. / (известна также как преждевременное сезонное нарушение роста или синдром Гэлэтёра) . Колонизация микоризным грибком проходит медленно. неописанными видами (species) Псевдомонада или Псевдомонас (Pseudomonas) .

BACTERICIDAL FIBER = БАКТЕРИЦИДНОЕ ВОЛОКНО – Bactericidal Fiber is a fiber used for medical applications, socks, shoe liners, etc, in which bactericides are introduced directly into the fiber matrix as opposed to fiber simply having a bactericidal finish applied.

BACTERICIDE = БАКТЕРИЦИД – Bactericide is an additive included in the formulations of water-mixed cutting fluids to inhibit the growth of bacteria promoted by the presence of water, thus preventing odors that can result from bacterial action. Bactericide is a chemical compound that kills bacteria. / Бактерициды – химические вещества, вызывающие гибель бактерий. Под Бактерицидами, от Греческого слова Baktērion, означающее Палочка, и Латинского слова Caedo, означающее Убиваю, понимаются вещества, уничтожающие Бактерии. Применяются, например, для обеззараживания питьевой воды, защиты растений и протравливания семян, предотвращения бактериального разложения удобрений в почве, как дезинфицирующие и химиотерапевтические средства, антисептики для неметаллических конструкционных материалов, клеёв, красок. В качестве бактерицидов используют иод, фенолы, хлор, хлорамины, хлорную известь, хлорфенолы, соли меди, сульфаниламидные препараты и другое. Многие бактерициды являются одновременно фунгицидами. Бактерициды, то же, что Бактерицидные Вещества. Бактерицидные Вещества, вещества, способные убивать Бактерии и другие микроорганизмы. В последнем случае говорят о фунгицидных веществах, действующих на Грибы, амёбоцидных веществах, убивающих Амёб, и так далее. К бактерицидным веществам относятся различные по химической природе соединения:- фенол, сулема, спирт, формалин, перекись водорода, антибиотики, из газов – сернистый газ, окись этилена, бромистый метил и другие. Образующиеся в крови животных и человека иммунные антитела также обладают бактерицидным действием. Вегетативные клетки Бактерий бактерицидные вещества убивают быстро; труднее добиться гибели бактериальных спор. Механизм действия бактерицидных веществ на Бактерии различен:- одни бактерицидные вещества денатурируют белок микробной клетки, другие поражают определённые ферментные системы и тому подобные. Так как не все микроорганизмы популяции одинаково чувствительны к бактерицидным веществам, при действии субмаксимальных концентраций остаётся некоторое количество переживающих микробов (явление частичной, или парциальной, бактерицидности), что может привести к появлению рас, устойчивых к определённым бактерицидным веществам. Поэтому при лечении бактерицидные вещества их следует применять в достаточно высоких дозах. В присутствии белков (гной, сыворотка, молоко и другие) активность бактерицидных веществ снижается. Бактерицидные вещества применяют для стерилизации, то есть как дезинфицирующие средства или антисептические средства, а также для химиотерапии.

BACTERIOCINS = БАКТЕРИОЦИНЫ – Bacteriocins are bactericidal substances produced by certain strains of bacteria and active against some other strains of the same or closely related species. / Под Бактериоцинами понимаются антибактериальные вещества, вырабатываемые многими видами бактерий и подавляющие жизнедеятельность бактерий других штаммов того же вида или родственных видов. Обозначаются в соответствии с названием продуцента, например, кишечная палочка образует колицины, стафилококки – стафилоцины.

BACTERIOPHAGE = БАКТЕРИОФАГ – Bacteriophage is a virus that infects bacteria, usually with destruction or lysis of the host cell. / Под Бактериофагами, от Греческих слов Baktērion, означающее Палочка, и Phágos, означающее Пожиратель, или Фагами понимаются вирусы бактерий. Способны поражать бактериальную клетку, репродуцироваться в ней и вызывать её лизис. Классический объект исследований в молекулярной генетике. Используются для фагопрофилактики и фаготерапии инфекционных болезней.

BACTERIOSTAT = БАКТЕРИОСТАТ – Bacteriostat:- doesn't necessarily mean that it kills bacteria. A stat means that it may simply be slowing growth or holding the death to growth rates of bacteria (same for fungal stats) more or less in equilibrium. Inhibits bacteria growth. / Бактериостат – препарат, останавливающий развитие бактерий, но не убивающий их.

BACTERIOSTATIC = БАКТЕРИОСТАТИЧЕСКИЙ – Bacteriostatic is a chemical or physical agent that prevents multiplication of bacteria without killing them.

BACTEROID = БАКТЕРОИД – Bacteroid is an irregular form of cells of certain bacteria. / Под Бактероидами, от Греческих слов Baktērion, означающее Палочка, и Éidos, означающее Вид, понимаются:- (1) крупные формы Клубеньковых Бактерий, образующиеся при их проникновении в корни Бобовых Растений (в клубеньках). Участвуют в фиксации азота атмосферы. (2) Неподвижные анаэробные Бактерии (палочки), не образующие спор. Обитают в полости рта, в кишечнике и половых органах человека. Патогенные виды вызывают острые воспалительные процессы.

BACTRIAN CAMEL = БАКТРИЙСКИЙ ВЕРБЛЮД (или БАКТРИАН) – The Bactrian Camel is the camel that camel hair comes from. / Под Бактрианом или Двугорбым Верблюдом понимается млекопитающее Рода Верблюдов. Длиной 2.5–3.6 метров. В диком состоянии крайне редок, в пустынях Синьцзяна и Юго-Западной Монголии (открыт Русским путешественником и исследователем Николаем Михайловичем Пржевальским (1839–88) в 1877). В Красной Книге Международного Союза Охраны Природы (МСОП) при ООН, впервые вышедшей в 1966. Одомашнен в глубокой древности. Что же касается Двугорбого или Бактрийского Верблюда, то его первоначальная родина древняя Бактрия или Восточный Туркестан; колыбель его в пустыне Шамо или Гоби, где он ещё и по сиё время встречается в диком состоянии:- на него охотятся там или ловят детёнышей и приручают их. Самоедские, Кыргызские, Татарские и Калмыцкие Верблюды точно также принадлежат к двугорбой, Бактрийской породе. Бактрийский Верблюд может достигать в высоту до двух метров и весить до 1 500 фунтов. Толстая коричневая кожа животного меняется в зависимости от времени года. В зимний период она значительно утолщается, чтобы защитить Верблюда от холода, в то время как летом она сильно линяет, что не даёт животному потеть. И у женских, и у мужских особей Верблюда на спине находятся два больших горба. Бактрийский Верблюд находится под угрозой исчезновения из-за потери мест обитания.

BAD COVER = ПЛОХОЙ ЗАСТИЛ – Bad Cover or Poor Cover:- warp yarns generally showing between the weft yarns unintentionally, or vice versa. This defect often occurs in an underset fabric, or through poor finishing. / Слабый Застил; Дефектный Застил (bad cover; poor cover):- порок ткани; пряжа основы видна между нитями утка. Примечание:- этот порок часто происходит из-за низкой плотности ткани или из-за дефектной отделки.

BAD DEBTS = БЕЗНАДЁЖНЫЕ ДОЛГИ – Bad Debts:- a debt that has not been, and is not expected to be, paid. Such losses are practically unavoidable in business (and allowances are almost always made for such instances), although some bad debts may be sold to a factoring company, which attempts to recover the debt on its own account. Uncollectable accounts receivable. They represent losses which should be written off immediately. Compare Doubtful Debts. / Безнадёжные Долги:- невзыскиваемые счета к получению или Дебиторская Задолженность (Accounts Receivable). Они представляют собой убытки, которые должны быть сразу же списаны. Сравните с Сомнительными Долгами (Doubtful Debts). Безнадёжный Долг или Плохой Долг – долг, который признан безнадёжным и подлежит списанию. Традиционно, компании и финансовые организации поддерживают резерв (reserve) для покрытия безнадёжных долгов и производят ежегодные, вычитаемые из подлежащих налогообложению сумм, взносы из дохода для пополнения этого резерва. Согласно Закону о Налоговой Реформе от 1986 (Tax Reform Act of 1986) требуется, чтобы компании и крупные банки (с активами более 500 миллионов Долларов) с 1987 в целях снижения налогообложения перешли от выделения резервов к прямым списаниям, хотя для отчётности они по-прежнему могут вносить безнадёжные долги в балансовые ведомости. Мелкие банки и финансовые организации могут продолжать использовать метод выделения резервов в целях снижения налогообложения, хотя и с более жёсткими ограничениями. Соотношение объёма списаний по безнадёжным долгам и возвращаемых на счета сумм может служить показателем того, насколько либеральной или консервативной являются кредитная политика фирмы и подход к списанию безнадёжных долгов.

BAD ODOR = ПЛОХОЙ ЗАПАХ (или НЕПРИЯТНЫЙ ЗАПАХ) – Bad Odor or Bad Odour:- a disagreeable smell that is not usually associated with the fabric. Note:- this defect is often caused by the breakdown of finishing resins, fermented starch, mildew, or the presence of other contaminants. Bad Odor:- Garments:- women's dresses; Fabric Construction:- (i) Count:- 64 x 64; (ii) Warp:- 30 1 85% l 1 -in. 1%-den. bright viscose rayon 15/r 58's wool cut VA in.; (iii) Filling:- same as warp. Complaint:- a large number of finished dresses were returned by the customer because of a pronounced 'fishy' odor. Analysis:- investigation revealed that all of this fabric had received a urea formaldehyde resin treatment to impart resistance to creasing, followed by a water-repellent finish. The combination of insufficiently cured or polymerized resin and one of the ingredients in the water-repellent formula resulted in the formation of amine compounds with a distinct fishy odor. This condition did not develop until after the goods had left the finishing plant and had been cut into a large number of garments. Fortunately, the finisher was able to expose the finished garments to a chemical-vapor treatment which eliminated the unpleasant odor. It was also possible to refinish the uncut piece goods so as to correct this condition. The development of unpleasant odors in resin-finished goods is cause for frequent complaints by garment manufacturers and consumers. In some cases the sharp odor of formaldehyde may be detected, but more often the fishy odor predominates. Thorough washing after resin application and curing is generally carried out by the finisher to remove any unpolymerized resin which may contribute toward the liberation of such odors. / Уточина:- . Неприятный Запах (Bad Odor):- порок ткани; неприятный запах, который не характерен полотну. Примечание:- этот порок возникает в результате разрушения отделочных смол, ферментного крахмала, появления плесени или присутствия других загрязнений.

BAD PLACE = ПЛОХОЕ МЕСТО – Bad Place (bad way):- for those difficult to describe the fabric defects, this is a very convenient term. The term is usually used to describe those who have been seriously damaged the fabric weaving areas. Fabric Printing Defect. / Порок или Дефект набивки тканей.

BAD SELVEDGE = НЕНАДЛЕЖАЩАЯ КРОМКА – Bad Selvedge:- improper shuttle wire tension, bent shuttle jaw, shuttle crack, more tension on selvedge yarns, late shedding resulting in rubbing of shuttle to the selvedge and improper selection of selvedge weave for the fabric being woven are the main reasons for bad selvedge. Bad Selvedge:- the defect is characterized by the appearance of curls and folds in the fabric selvedge which become very prominent after wet processing.

BAD SPLICING = ПЛОХОЕ ХХ – Bad Splicing:- improper knot less joint. Spinning defect. / Порок или Дефект прядения.

BAD TUCK–IN = ПЛОХАЯ УРАБОТКА – Bad Tuck-In:- tail of weft protrudes on face or back of the selvedge called Bad Tuck-In. Weaving defect. Bad or Improper Tuck In:- faulty setting of tuck in needle, its entry timing and exit timing, faulty break liner of projectile settings. / Порок или Дефект ткачества.

BA–ELISA = BIOTIN–AVIDIN ENZYME–LINKED IMMUNOSORBENT ASSAY

BAF = BUNKER ADJUSTMENT FACTOR

BAFFLE = ПЕРЕГОРОДКА (или ЗАСЛОНКА, или ЩИТОК, или ЭКРАН, или ЩИТ, или ДЕФЛЕКТОР) – Baffle is a device to prevent direct fluid flow or impingement on a surface. / Под Дефлектором, от Латинского слова Deflecto, означающее Отвожу или Отклоняю, понимается:- (1) вытяжное устройство, устанавливаемое на конце наружной части трубы (шахты) чаще всего для отсоса загрязнённого воздуха из различных помещений, а также железнодорожных вагонов. Иногда дефлекторы служат для подачи воздуха в помещения, например, на судах. Действие дефлектора основано на использовании энергии обдувающего его потока воздуха (ветра). Выполняется дефлектор преимущественно из листового металла (стали), реже из бетона, асбестоцемента и других материалов. Дефлектор необходимо устанавливать так, чтобы он обдувался ветром при любых его направлениях; устье трубы должно быть защищено от атмосферных осадков. Наиболее распространены дефлекторы Центрального Аэрогидродинамического Института (ЦАГИ) и ‘Шанар-Этуаль’. (2) Прибор для измерения и устранения девиации магнитных компасов.

BAFIN = BUNDESANSTALT FÜR FINANZDIENSTLEISTUNGSAUFSICHT

BAG = МЕШОК – Bags:- in the United States, the commercial wool growers have their fleeces loaded into large cloth bags for shipping to the wool mills. In Australia and New Zealand, the fleeces are packed into ‘bales’ – which load better in the ship holds for export abroad. / Под Мешком понимается Русская народная мера сыпучих тел, равная 4 четверикам (ржаная мука – 7.5 пуда, пшеничная крупчатая – 5 пудов).

BAG = МЕШОК (или СУМКА, или ХХ) – Bag is a purse; handbag.

BAGASSE = БАГАССА (или ВЫЖИМКА, или ХХ) – Bagasse:- the crushed stalks of the sugar cane after the sugar has been extracted. / Багасса – жмыхи сахарного тростника.

BAGGED CARGO = ГРУЗ В МЕШКАХ – Bagged Cargo:- various kinds of commodities usually packed in sacks or in bags, such as cement, flour, grain, milk powder, onion, sugar, etc. / Различные рода сырья, как правило, упакованные в саки или мешки, к числу которых относятся зерно, лук, мука, сахар, сухое молоко, цемент и тому подобное.

BAGGING = ЗАТАРИВАНИЕ В МЕШКИ – Bagging is:- (1) the act of covering the reproductive parts of a plant to prevent cross pollination or physical damage. This is an important process in cereal breeding. (2) Filling plastic or hemp bags with grain.

BAGGING = МЕШКОВИНА (или ДЕРЮГА) – Bagging is:- (1) a fabric woven in cylindrical or tubular form on an ordinary cam loom and used for grain bags, etc. (2) Fabric bulging caused by extension at the knees, elbows, etc, of a garment lacking dimensional stability. Bagging:- material for bags. / Мешковина – грубая прочная ткань, вырабатываемая из толстой пряжи полотняным переплетением нитей. Пряжа для мешковины изготовляется из грубостебельных (жёстких лубяных) волокон:- Джута, Кенафа, Канатника и отходов первичной обработки и чесания низкомерного льна-очёса и короткого волокна. Мешковина используется для пошивки мешков (мешочная ткань) и как паковочная ткань.

BAGGY CLOTH = МЕШКОВАТОЕ ПОЛОТНО – Baggy Cloth is a fabric that does not lie flat, caused by sections of tight or loose yarns in either the warp or the filling. See also Wavy Cloth. / или в уточине.

BAGGY SELVAGE = МЕШКОВАТАЯ (или ПРОВИСШАЯ) КРОМКА – Baggy Selvage is a selvage that is rippled and longer than the adjacent fabric. This defect is often caused by incorrect balance of fabric structure between the selvage and the body of the fabric, selvage warp yarns being woven at too low a tension, or careless handling of the fabric. See also Slack Selvage. / Обвисшая Кромка; Свободная Кромка; Слабая Кромка (baggy selvedge; loose selvedge; slack selvedge):- порок кромки ткани; кромка, которая обвисает и является более длинной по сравнению со смежной тканью. Примечание:- этот порок часто вызывается неправильным балансом структуры ткани между кромкой и основной частью ткани.

BAGHEERA = БАГИРА (или БАГИЭРА) – Bagheera is a name for an uncut pile velvet clothing fabric with a rough surface. Extraordinary restistant. Connected to:- Pile, and Velvet.

BAG SHEETING = МЕШОЧНОЕ ПРОСТЫННОЕ ПОЛОТНО – Bag Shetting:- cotton cloths made from a wide variety of fabrics. Coarse yarns, 12’s to 18’s are used. Textures range from 40 square to 60 square with a weight of 2.50 to 4.00 yards to the pound. These single-ply yarn cloths are used to make bag containers for feed, food, food-stuffs, fruit, grain, salt, sugar, and other food products.

BAGWIG = ХХ (или ПАРИК С КОСОЙ В СЕТКЕ) – Bagwig is an XVIII century wig with the back hair enclosed in a small silk bag.

BAHC = BIOSPHERIC ASPECTS OF THE HYDROLOGICAL CYCLE

BAILEE = ХРАНИТЕЛЬ – Bailee is a person who holds the property of another person (the bailor) under a contract or agreement according to which the property held is to be returned to the bailor or delivered somewhere to his order. A bailee for reward is paid for his services. Person, such as a banker, to whom goods are entrusted for safe keeping. Bailee is a person or concern having possession of property committed in trust from the owner. See also Bailment, and Bailor.

BAILEE’S CUSTOMER POLICY = ПОЛИС ДЛЯ ЗАКАЗЧИКОВ ХРАНИТЕЛЯ – Bailee’s Customer Policy is a policy providing for loss or or damages to property of bailee’s customers, payable either to bailees for their account or direct to customers.

BAILMENT = (ОТВЕТСТВЕННОЕ) ХРАНЕНИЕ – Bailment is a delivery of goods or personal property by one person (the bailor) to another (the bailee) on an express or implied contract for a particular purpose related to the goods while in possession of the bailee, who has a duty to redeliver them to the bailor. Act of placing goods into the care of someone else. The person who places the goods is the bailor and must be the rightful owner. The bailee is the person who receives the goods. See also Bailee, and Bailor. A Bailment is a

contract which allows Carrier to take possession of goods without ownership. / В гражданском праве под Хранением понимается договор, в силу которого одна сторона (хранитель) обязуется хранить имущество, переданное ей другой стороной (поклажедателем), и возвратить его в сохранности. Сохранная Расписка о принятии на ответственное хранение. Поклажа.

BAILOR = ПОКЛАЖЕДАТЕЛЬ – Bailor is a person who leaves goods with somebody (the bailee) for safe keeping. See also Bailee, and Bailment. / Сторона, передающая или сдавшая что-либо на хранение.

BAIZE = БАЙКА – Baize is a loosely woven fabric, normally made of cotton or wool, which nowadays also can contain other fibers. Originally used for school bags or as covers for the doors leading to servants' quarters in England. Baize is used for industrial purposes as well. Baize is a coarse woolen or cotton fabric napped to imitate felt.

BAK = BAKANAE

BAKANAE = БАКАНЭ – Bakanae is a Japanese word meaning 'foolish seedling', used to describe the seedborne disease that causes abnormal elongation of rice plants. Caused by the fungus Gibberella fujikuroi. Gibberellin, a growth hormone produced by the pathogen, is responsible for the abnormal plant elongation. / болезнь, возникающая от семян, которая вызывает .

BAKING SODA = ПИЩЕВАЯ СОДА (или ПЕРЕСУШИВАЮЩАЯ СОДА) – Baking Soda:- Sodium bicarbonate or sodium hydrogen carbonate is the chemical compound with the formula $NaHCO_3$. Sodium bicarbonate is a white solid that is crystalline but often appears as a fine powder. It has a slightly salty, alkaline taste resembling that of washing soda (sodium carbonate). The natural mineral form is nahcolite. It is a component of the mineral natron and is found dissolved in many mineral springs. It is among the food additives encoded by European Union, identified by the initials E 500. Since it has long been known and is widely used, the salt has many related names such as baking soda, bread soda, cooking soda, and bicarbonate of soda. In colloquial usage, its name is shortened to sodium bicarb, bicarb soda, or simply bicarb. The word Saleratus, from Latin Sal æratus meaning Aerated Salt, was widely used in the XIX century for both sodium bicarbonate and potassium bicarbonate. The term has now fallen out of common usage. See also Sodium Bicarbonate. Sodium Hydrogencarbonate is a chemical compound which appears under the form of a white powder or of crystals, with a light-saline taste and which is used in the food industry as a water softener, a baking powder, a preservative and also in medicine, in ceramics and to prevent timber mold. Sodium Hydrogencarbonate:- form recommended by the IUPAC (International Union of Pure and Applied Chemistry). Also known under the following commercial designations:- Col-Evac; Jusonin; Soda Mint. Chemical formula:- $NaHCO_3$ or $CHNaO_3$. / Смотрите также Бикарбонат Натрия или Двууглекислый Натрий или Кислый Углекислый Натрий (Sodium Bicarbonate). Гидрокарбонат Натрия $NaHCO_3$ – кислая соль угольной кислоты и натрия. Обыкновенно представляет собой мелкокристаллический порошок белого цвета. Молярная масса:- 84.007 г/моль. Плотность:- 2.20 г/см^3. Температура плавления:- 50 °C. Растворимость:- вода.

BAL = BOLERO ASSOCIATION LIMITED

BALACLAVA = БАЛАКЛАВА (или ВЯЗАНЫЙ ШЛЕМ) – Balaclava is a knit cap for the head and neck. Also called Balaclava Helmet. A Balaclava, also known as a Balaclava Helmet or Ski Mask, is a form of cloth headgear that covers the whole head, exposing only part of the face. Often, only the eyes, or eyes and mouth, are left exposed. The name 'Balaclava' comes from the town of Balaklava, near Sevastopol in Crimea, Russia. During the Crimean War, knitted balaclavas were sent over to the British troops to help protect them from the bitter cold weather. British troops required this aid, as their own supplies (warm clothing, weatherproof quarters, and food) never arrived in time. References to these hats were not written during the war itself; according to Richard Rutt in his History of Handknitting, the name 'Balaclava Helmet' first appeared much later, in 1881. This type of headgear was also known in the XIX century as an Uhlan Cap or a Templar Cap. In modern American English, when made for those serving in the armed forces, they are usually known as Helmet Liners. They are traditionally knitted from wool, and can be rolled up into a hat to cover just the crown of the head, or folded right down as a collar around the neck. Modern balaclavas can also be made from silk, cotton, polypropylene, neoprene, acrylic or polar fleece. Modern balaclavas are used in outdoor winter sports activities such as skiing, snowboarding, snowmobiling, running or winter bicycling to help protect the face from the cold wind and maintain warmth. Motorcyclists also wear one under their safety helmets for similar reasons; balaclavas also help to keep the inner lining of the helmet clean. Most commonly firefighters will wear a fire-resistant balaclava, otherwise known as a Nomex Hood, when responding to a fire call along with their self-contained breathing apparatus (SCBA) and bunker gear (protective clothing). This balaclava covers the head and neck, with an open face; typically covered by the mask portion of the SCBA. This is used to help minimize the risk of potentially fatal burns to the upper back, neck, scalp and face. In Fédération Internationale de l'Automobile sanctioned events, racing drivers must wear balaclavas made of fire-retardant material underneath their crash helmets in order to improve protection in case their car catches fire, and commonly cover the nose and mouth to reduce inhalation of smoke and fumes. Drag racing drivers usually wear balaclavas which have just two separate eye holes because of the increased fire risk. In the Indian subcontinent, balaclavas are commonly referred to as Monkey Caps, due to their typical earth tone colours, and the fact that they blot out most human facial features. Monkey caps sometimes have a small, decorative, woollen pom-pom on top. They are commonly worn by troops on Himalayan duty for protection from the cold. The United States Marine Corps has recently begun issuing balaclavas with hinged face guards as part of the Flame Resistant Organizational Gear program. The balaclava became a part of standard OMON (otryad militsii osobogo naznacheniya or special police task force in Russia) uniform as early as the Perestroyka years of the late 1980s. The original intent was to protect the identity of the officers to avoid intimidation from organized crime. Due to increased problems with organized crime of the 1990s, TV shots of armed men in black balaclavas became a staple of sorts. As the organized crime went down, however, balaclavas became an instrument of intimidation as much as identity protection, as they don't allow one to see the facial expression of the enforcement officer or identify him conclusively. Armed Russian police commonly conduct raids and searches of white-collar premises (typically in Moscow) while wearing balaclavas. Such raids have therefore come to be known in Russia as 'maski shows', an allusion to popular comic TV show of the 1990s. British Police in Kent confiscated the War on Terror board game partly due to the inclusion of a balaclava. Police said it 'could be used to conceal someone's identity or could be used in the course of a criminal act'. Some balaclava-wearing sympathisers of Pussy Riot were arrested in Marseille, France in August 2012 for being in breach of the French ban on face covering. A balaclava may also be used for concealment purposes, in the course of illegal activities by criminals, and occupationally by SWAT and Special Forces personnel. It may also be used by irregular military forces or paramilitary organizations to conceal their identities and has been used as an identifying feature in fictional representations of such groups. / Маска Балаклава – лёгкая, предназначена для защиты лица от ветра, мороза и атмосферных осадков. Балаклава ориентирована на ношение любителями экстремальных видов спорта и отдыха, а также профессионалами безопасности. Маска балаклава выполнена из тонкого трикотажного полотна, вставка из ткани винд-блок. Материал маски-балаклавы приятен на ощупь и лёгок, не провоцирует аллергические реакции. Материал маски не препятствует дыханию и не впитывает влагу. Маска балаклава предназначена для ношения под защитный шлем. Балаклава – населённый пункт на Юго-Западном побережье Крымского Полуострова, до 1957 года имел статус города, сегодня в административном отношении является частью Балаклавского Района города Севастополя, Автономная Республика Крым, Россия. Этимология:- от Татарских слов Балак, означающее Чулок или Штанина, и Балаклав (Балаклау),

означающее Натягивание Чулка или Штанины. Балаклава, от названия города Балаклавы, или Лыжная Маска – головной убор (вязаный шлем), закрывающий голову, лоб и лицо, оставляя небольшую прорезь для глаз, рта или для овала лица. Фактически соединяет в себе шапку и маску-чулок. Традиционно изготавливалась из шерсти, в настоящее время также из различных видов синтетического трикотажа. Согласно легенде, солдаты Британской армии во время Крымской Войны так сильно мёрзли под Крымским городом Балаклавой, что придумали вязаную шапку с таким же названием. Зима 1854–55 года была очень холодной, а большая часть Британских войск не получила вовремя зимнего обмундирования, жилья и питания. Балаклава представляет собой маску с отверстиями для глаз и носа. Она – популярный подшлемник или внутренняя шапка для горнолыжников и сноубордистов. Согревает лицо, так как защищает от встречного ветра. Балаклавы бывают разных расцветок, с подкладкой и без. Вариант из флиса, мембранных тканей, виндстопера используют в спорте и туризме. Балаклавы из огнеупорных материалов используются для защиты головы от открытого пламени. Существуют балаклавы для пожарных, танкистов, автогонщиков. В ряде стран подобные маски носят бойцы спецподразделений во время операций. Также балаклаву можно носить как обычную вязаную шапку, завернув её в несколько раз. Большинство террористических организаций использует балаклаву как способ сокрытия лиц своих членов. Например, организация Чёрный Сентябрь использовала зелёные балаклавы при совершении теракта на Олимпиаде в Мюнхене в 1972, а большинство терактов Ирландских ИРА и ЭТА совершены с использованием разноцветных балаклав. Известные случаи использования:- (i) во время своих антарктических экспедиций Робэт Скот (Робэт Фалкэн Скот; Robert Falcon Scott; 06 Июня 1868 – 29 Марта 1912; капитан Королевского флота Великобритании, полярный исследователь, один из первооткрывателей Южного Полюса) и Эрнэст Шэклтон (Сэр Онэст Хэнри Шэклтон (Sir Ernest Henry Shackleton); 15 Февраля 1874 – 05 Января 1922; Англо-Ирландский исследователь Антарктики) использовали балаклавы для защиты головы и лица от холода; (ii) Мексиканец Субкомандантэ Инсурхэнтэ Маркос (Subcomandante Insurgente Marcos) – Заместитель Командующего Повстанцами Маркос (предположительно 19 Июня 1957), легенда и общепризнанный символ антиглобализма, появляется на публике исключительно в кепке, надетой на балаклаву; (iii) балаклава является частью сценического костюма скандально известной Российской панк-рок-группы Пуси Райэт (Pussy Riot); и (iv) в Британском телешоу ‘Fonejacker’ главный герой, совершающий звонки-розыгрыши, носит балаклаву. Балаклава:- также шапка подобного покроя может носить название Пасамонтаньас (от Испанского слова Пасамонтаньас (Pasamontañas)) (предположительно, из-за использования таких уборов жителями Альп либо альпинистами). Такое название популярно в леворадикальных и антиглобалистских кругах, в которых пасамонтана играет роль символа повстанческой борьбы. В частности, пасамонтана – неотъемлемый атрибут имиджа Субкоманданте Маркоса (легенда и общепризнанный символ антиглобализма, появляется на публике исключительно в кепке, надетой на балаклаву). Нередко пасамонтана используется участниками радикальных демонстраций с целью скрыть свою личность.

BALANCE = БАЛАНС (или САЛЬДО, или ОСТАТОК) – Balance is a sum of debit entries minus the sum of credit entries in an account. If positive, the difference is called a Debit Balance; if negative, a credit balance. The difference between the sum of all credit items and all debit items in an account. Balance is the amount owed on a loan or credit card or the amount in a savings or investment account. Balance is the state of an account, indicating whether money is owed or owing, i.e. a debit or a credit balance. In double-entry book-keeping, the amount required to make the debit and credit figures in the books equal each other. Balance is the difference between the totals of the debit and credit entries in an account. Difference between the credit and debit items of an account, e.g., a current account. A debit balance refers to an account in which liabilities exceed the credit balance, the opposite situation is called a Credit Balance. / строка баланса (item). Под Балансом, от Французского слова Balance, означающее Весы, от Латинского слова Bilanx, означающее Имеющий Две Весовые Чаши, понимаются:- (1) равновесие, уравновешивание. (2) Количественное выражение отношений между сторонами какой-либо деятельности, которые должны уравновешивать друг друга. Под Сальдо, от Итальянского слова Saldo, означающее Остаток или Расчёт, понимаются:- (i) в бухгалтерском учёте разность между итогами записей по дебету и кредиту счетов; различают дебетовое сальдо (дебет больше кредита) и кредитовое сальдо (кредит больше дебета); или (ii) во внешнеторговых отношениях сальдо означает разность между суммой вывоза (или экспорта) и привоза (или импорта) или суммой требований обязательств. Баланс – сумма денег, которая имеется на счёте у клиента в заданный момент времени.

BALANCE AN ACCOUNT = СВОДИТЬ СЧЕТА (или САЛЬДО СЧЁТА, или ОСТАТОК НА СЧЁТЕ) – (1) To add up the debit and credit sides, and subtract the less of the two from the greater. The remainder is called the Balance. To close an account. / Подводить итог по операциям на счёте.

(2) To calculate the balance of an account accrued up to the day of such calculation, including interest. Also known as Settle An Account.

BALANCED = СБАЛАНСИРОВАННАЯ (или УРАВНОВЕШЕННАЯ) – Balanced:- a plied yarn that doesn’t twist back on itself. If you hold ~10 inches of yarn by the ends, then slowly move your hands closer together until they are ~2 inches apart, a balanced yarn will drape itself into an elongated U. An over-spun yarn will ply back on itself.

BALANCE DATE = ДАТА СДАЧИ БАЛАНСА (или ДАТА ОТЧЁТНОСТИ) – The company’s balance date as reported in the annual report. Also known as Reporting Date. / Дата Сдачи Баланса компании, которая указывается в ежегодном отчёте. Известна также как Отчётная Дата (Reporting Date).

BALANCED CLOTH = РАВНОВЕСНОЕ ПОЛОТНО (или РАВНОВЕСНАЯ ТКАНЬ) – Balanced Cloth is a term describing a woven fabric with the same size yarn and the same number of threads per inch in both the warp and the filling direction. / Равновесная Ткань:- номера пряжи и плотность по основе и по утку одинаковые.

BALANCED FUND = СБАЛАНСИРОВАННЫЙ ФОНД – The Balanced Funds, offer prospects of both moderate appreciation in share value as well as current income. The fluctuation in share price may be low. Such funds invest in stocks, corporate debts and Government paper.

BALANCED STRIPES = СБАЛАНСИРОВАННЫЕ ПОЛОСЫ – Balanced Stripes:- a pattern of stripes in which the same cotors and widths are used on both sides of the center. A blue stripe on a white ground with a narrow red stripe on each side is an example of a balanced stripe.

BALANCED TWISTS = УРАВНОВЕШЕННЫЕ КРУТКИ (или СБАЛАНСИРОВАННЫЕ КРУТКИ) – Balanced Twists:- in a plied yarn or cord, an arrangement of twist which will not cause the yarn or cord to twist on itself of kink when held in an open loop. Balanced Twist:- in a plied yarn or cord, an arrangement of twist which will not cause the yarn or cord to twist on itself or kink when held in an open loop. A single ply is twisted in a particular direction (S or Z), and several plies are twisted together in the opposite direction (Z or S) so that the final yarn structure has no net residual torque. / Уравновешенные Крутки или Сбалансированные Крутки – крутки, при которых отмотанная с початка нить и свисающая в виде U остаётся спокойно висеть, не скручивается и не даёт скрутин.

BALANCE OF PAYMENTS = САЛЬДО ПЛАТЕЖЕЙ (или ПЛАТЁЖНЫЙ БАЛАНС) – The aim of the monthly Balance Of Payments (BOP or BP) is to enable users to monitor the external flows affecting monetary conditions in the Euro area and the exchange rate. For this purpose, the information required by the European Central Bank (ECB) for monthly BOP statistics is confined to broad categories of transactions in the current and capital accounts, with the exception of investment income flows, for which a direct, portfolio and 'other' investment breakdown is required. More detail is required in the financial account, where large and variable flows affecting monetary conditions in the Euro area are likely to occur. Inward and outward direct investment is broken down into 'equity capital and reinvested earnings' and 'other capital (mainly inter-company loans)', and further between monetary financial institutions (MFIs) (excluding central banks) and other Euro area sectors. Portfolio investment, which includes a split between monetary authorities, other MFIs, general government and other sectors, covers equity and debt securities (which are further broken down) separately. Financial derivatives (only contracts between residents of the Euro area and non-residents of the Euro area are relevant here) are compiled on a net basis only, although with the same sector breakdown as the aggregate of cross-border positions (paying regard to sign) to which Euro area residents are party. By contrast, quite detailed information is required on 'other' investment, mainly transactions in currency and deposits, and loans. This category is split by sector into monetary authorities, other MFIs (with a maturity breakdown), general government and other (Euro area) sectors, with, for the latter two, a limited instrument breakdown identifying currency and deposits held with banks abroad. The monthly BOP also includes data on reserve assets. To enhance their use in monetary analysis, the monthly BOP statistics are linked to the external counterpart of broad money in the Euro area, M3. Since the BOP accounts as a whole and the consolidated MFI balance sheet must both balance, the external transactions of the MFI sector (including the Eurosystem) should mirror the external transactions of non-MFIs in the Euro area (including errors and omissions in the BOP); these in turn should equal the external counterpart in the monetary statistics. In practice, some rearrangement of the BOP statistics is necessary to bring together all external transactions of MFIs and there are some slight differences between MFI balance sheet and BOP statistics. The contribution of external transactions of Euro area non-MFIs (in the current, capital and financial accounts) to the total change in the net external position of the MFI sector can then be analysed. For the monetary presentation, the ECB requires a breakdown of the direct investment and portfolio investment accounts to isolate transactions of MFIs. The quarterly BOP statistics provide more detailed information than the monthly statistics, permitting a more in-depth analysis of external transactions. The current account contains more detail on investment income and more instrument and sector information is provided in the financial account. In addition to providing further instrument detail and adhering fully to international statistical standards, the quarterly BOP data are accompanied by a geographical breakdown of Euro area residents' external business by country, area and category of counterparty. The breakdown currently comprises Denmark, Sweden and the United Kingdom individually; the other EU Member States outside the Euro area as a group; EU institutions (such as the European Commission) and other bodies (such as the European Investment Bank), which – with the exception of the ECB, classified for statistical purposes as an MFI resident in the Euro area – are treated as resident outside the Euro area, regardless of their physical location; countries outside the European Union:- the United States, Japan, Switzerland, Canada, Brazil, China, India and Russia; offshore centers (with Hong Kong separately identified); and international organizations. The required breakdowns, together with lists of EU institutions, offshore centers and international organizations, are set out in Annex I, Table 9 of Guideline ECB/2004/15 (as amended by Guideline ECB/2007/3). The instrument and sector detail to which the geographical breakdown is applied is less complete than in the full quarterly BOP statistics, and more akin to that in the monthly BOP statistics; there is, however, no geographical breakdown of portfolio liabilities (because the manner in which these data are compiled does not permit one to be produced), nor is there a breakdown of financial derivatives or reserve assets. Euro area BOP (released monthly, between the 21st and the 29th calendar days of the second month following the end of the month to which the data relate). Euro area BOP, including a geographical breakdown; and Euro area international investment position (IIP) (released quarterly, about four months after the quarter to which the data relate). The quarterly BOP and the annual IIP statistics provide a geographical breakdown, by country or group of countries, of counterparties to the Euro area's external transactions and positions. In order to support the conduct of monetary policy and foreign exchange operations, the European Central Bank (ECB) collects monthly, quarterly and annual data to compile the BOP and IIP of the Euro area as a whole. The ECB does not use data on cross-border transactions within the Euro area, with the important exception of portfolio investment and portfolio investment income. The quarterly BOP and the end-of year IIP include a geographical breakdown of counterparties abroad. The Euro area BOP and IIP in principle correspond to transactions and positions of Euro area residents with nonresidents of the Euro area (i.e. 'the rest of the world' accounts) in the Euro area accounts. In practice, the presentation of the BOP and IIP, where the emphasis is on functional categories (direct, portfolio, etc investment) rather than on the sector of the resident counterparty, does not readily fit into institutional sector accounts and there are other issues relating to valuation and coverage. The ECB has had to address these questions in preparing to incorporate the Euro area BOP and IIP in the euro area accounts. A summary of the international transactions of a country over a period of time including commodity and service transactions, capital transactions, and gold movements. Balance Of Payments (BOP) is an accounting statement of the money value of international transactions between one nation and the rest of the world over a specific time period. The statement shows the sum of transactions of individuals, businesses and government agencies located in one nation, against those of all other nations. A summary of the transactions between residents of a country and residents abroad in a given time period. The Balance Of Payments is a statistical summary of international transactions. These transactions are defined as the transfer of ownership of something that has an economic value measurable in monetary terms from residents of one country to residents of another. The transfer may involve:- (i) goods, which consist of tangible and visible commodities or products; (ii) services, which consist of intangible economic outputs, which usually must be produced, transferred and consumed at the same time and in the same place; (iii) income on investments; and (iv) financial claims on, and liabilities to, the rest of the world, including changes in a country's reserve assets held by the central monetary authorities. Generally, a transaction is the exchange of one asset for another – or one asset for several assets – but it may also involve a gift, which is the provision by one party of something of economic value to another party without something of economic value being received in return. International transactions are recorded in the balance of payments on the basis of the double-entry principle used in business accounting, in which each transaction gives rise to two offsetting entries of equal value so that, in principle, the resulting credit and debit entries always balance. Transactions are generally valued at market prices and are, to the extent possible, recorded when a change of ownership occurs. Transactions in goods, services, income and unilateral transfers constitute the current account, and transactions in financial assets and liabilities constitute the capital account. System of recording all economic transactions of a country with the rest of the world during a specific period. The balance of payments is divided into current transactions based on the external trade in merchandise and services (including income on investments) and capital transactions (direct and portfolio investments, etc). Not a balance in the strict accounting sense, but a current account. Record of a country's economic transactions with the rest of the world in a stated period of time, usually one year. The balance of payments is divided into two major categories, the current account and the capital account. System of recording all economic transactions of a country with the rest of the world during a specific period. / выработка (output). Система учёта всех экономических сделок страны с другими странами мира в течение определённого периода. Положительное сальдо платёжного баланса. Под Платёжным Балансом понимается соотношение поступивших с произведёнными страной платежей за границей за определённый период. Активный баланс означает, что сумма поступивших платежей превышает произведённые, в противном случае платёжный баланс принято считать пассивным. Сальдо Платежей

или Платёжный Баланс – система записи всех международных экономических операций страны в течение определённого периода. В общем платёжном балансе не может быть избытка или дефицита, поскольку используется двойная система бухгалтерии. Платёжный баланс включает текущий баланс, баланс движения капиталов и золотой баланс. В этих балансах может быть избыток или дефицит. Текущий баланс отражает привоз (или импорт) и вывоз (или экспорт) товаров и услуг; баланс движения капиталов отражает движение инвестиций, а золотой баланс – движение золота. Платёжный баланс помогает оценить конкурентные позиции страны, а также предсказать силу её валюты. С точки зрения экономики страны в целом избыток по некоторым статьям платёжного баланса не обязательно нужно расценивать как позитивное явление, а дефицит – негативное; многое зависит от состояния национальной экономики и способов финансирования дефицита. Смотрите также Сальдо Торгового Баланса или Торговый Баланс (Balance of Trade).

BALANCE OF TRADE = САЛЬДО ТОРГОВОГО БАЛАНСА (или ТОРГОВЫЙ БАЛАНС) – Balance Of Trade is that part of a nation's balance of payments dealing with imports and exports, which is trade in goods and services, over a given period. If exports of goods exceed imports, the trade balance is said to be favorable; if imports exceed exports, the trade balance if said to be unfavorable. The net difference between the value of a country's exports and imports of merchandise, with exports listed on the assets side and imports on the liabilities side. The balance of trade is positive (in surplus) if exports exceed imports, and negative (in deficit) if the reverse is the case. Difference between a nation's exports and imports of goods to and from all other countries over a given period of time. Customs statistics are the primary source of information for analyzing changes in the balance of trade. They provide current information on a regular basis; in most industrial nations, monthly results are available within 30 days after the end of the reporting period. Customs statistics itemize net changes by product, contributing to analysis of trade balances by major category of essential goods and of the effects and significance of overall changes. In national accounting, the balance of trade reflects the importance of foreign trade in achieving equilibrium between sources and uses of goods and services. If the balance of trade shows a surplus, the gross national product is greater than domestic demand; conversely, in the case of a deficit, domestic demand exceeds national product. The balance on trade in goods and services. The balance of trade is a summary of the imports and exports of goods and services across an economic boundary in a given period. The balance of merchandise trade is an important part of the balance of trade. The balance of trade is specifically identified as the sum of the balance on merchandise trade and the balance on services, which is technically termed the balance on goods and services. Even though services imported exceeds services exported, this service balance deficit is outweighed by the merchandise trade balance surplus for a overall balance of trade surplus. / В национальном бюджетном процессе, . Сальдо Торгового Баланса или Торговый Баланс – чистая разность между объёмом товарного привоза (или импорта) и вывоза (или экспорта) страны за определённый период (часть текущего баланса). В торговый баланс включаются движимое имущество (автомобили), продовольствие, одежда; не включаются международные платежи за услуги и туризм. Когда страна вывозит (или экспортирует) больше, чем привозит (или импортирует), считается, что она имеет благоприятный торговый баланс; когда привоз (или импорт) больше вывоза (или экспорта), баланс считается неблагоприятным. Однако торговый баланс должен рассматриваться и в связи с общим международным экономическим положением страны. Например, страна может постоянно иметь неблагоприятный торговый баланс, который компенсируется значительным вывозом (или экспортом) услуг; её экономическое положение будет расцениваться как благоприятное. Смотрите также Сальдо Платежей или Платёжный Баланс (Balance of Payments).

BALANCE SHEET = БУХГАЛТЕРСКИЙ БАЛАНС (или БАЛАНСОВЫЙ ОТЧЁТ) – Balance Sheet is company's accounting statement that shows its assets and liabilities (and net worth) at one moment in time. It is a snapshot of the financial health of a company. It is governed by the equation:- Assets = Liabilities + Net Worth. Balance Sheet is a basic financial statement, usually accompanied by appropriate disclosures that describe the basis of accounting used in its preparation and presentation of a specified date, the entity's assets, liabilities and the equity of its owners. Also known as Statement Of Financial Condition. The Balance Sheet is a financial statement produced periodically, normally at the end of a calendar or financial year, and normally within an annual report. It showcases the company by measuring its financial health. Its production is a legal requirement in most countries. It is usually greeted enthusiastically by stockholders and investors as a measure of the worth of the company's stock, and is supplemented by other important statements:- the income statement, which shows how the company's income was generated throughout the year, and the cash flow statement. The balance sheet balances a company's current assets (cash, accounts receivable, inventory), plus fixed assets (land, buildings, plant, vehicles at cost, less depreciation), against current liabilities (accounts payable, all debt and stockholders equity). Assets must balance liabilities and stockholders' equity – assets must equal liabilities and stockholders equity. Subtracting the value of liabilities from the value of assets indicates the value of stockholders' equity. Ideally, it should be positive. Stockholders' equity consists of capital they have invested over the years and profits (net income) or internally generated capital, which is known as Retained Earnings – earnings remaining after dividends have been paid, and viewed as a source of financing. It is sometimes necessary to retain all a company's earnings, and not pay a dividend at all, rather than borrow or issue more equity to finance operations. This decision obviously plays a part in how analysts will value the stock. The balance sheet does not reveal everything about a company, neither, for example, important intangibles such as the experience of individual people, nor other vital business factors such as customers or market share. Nor does the balance sheet necessarily measure the true value of some fixed assets. A six-year-old item of equipment, for example, is entered in the balance sheet at its original cost, even though the cost of replacing it could be much higher, or substantially lower (because of new technology that might be less expensive or vastly more efficient).The balance sheet needs to be studied along with the income statement and the cash flow statement, and needs to include figures for previous years to allow for comparisons. A statement, drawn up at a particular point in time, of the value of assets owned and of the financial claims (liabilities) against the owner of these assets. The Balance Sheet provides information about the nature and amounts of investments in enterprise resources, obligations to enterprise creditors, and the owners' equity in net enterprise resources. That information not only complements information about the components of income, but also contributes to financial reporting by providing a basis for (1) computing rates of return, (2) evaluating the capital structure of the enterprise, and (3) assessing the liquidity and financial flexibility of the enterprise. A condensed financial statement showing the nature and amount of a company's assets, liabilities and capital on a given fate. In Dollar amounts the balance sheet shows what the company owned, what it owed, and the ownership interest in the company of its stockholders. See also Assets, Earnings Report. The Balance Sheet is a snapshot of a business's financial position at a single point in time. It organizes financial information about the firm's assets (things of value that it owns), liabilities (its financial obligations), and shareholder's equity on a specific date. A statement of the assets and liabilities of a business at a given time. The assets side of the balance sheet provides information on the use of funds whereas the liabilities side details the procurement of funds (financing). The Balance Sheet is organized into three parts:- (i) assets, (ii) liabilities, and (iii) stockholders' equity at a specified date (typically, this date is the last day of an accounting period). The first section of the balance sheet reports the company's assets and includes such things as cash, accounts receivable, inventory, prepaid insurance, buildings, and equipment. The next section reports the company's liabilities; these are obligations that are due at the date of the balance sheet and often include the word 'payable' in their title (Notes Payable, Accounts Payable, Wages Payable, and Interest Payable). The final section is stockholders' equity, defined as the difference between the amount of assets and the amount of liabilities. Balance Sheet is a financial statement

showing a 'snapshot' of the assets, liabilities and net worth of an individual or organization on a given date. Balance Sheet is a key account that provides the information describing the value of assets owned by the company and money owed by the company (at a particular date). A typical balance sheet consists of the following groups of data:- Stockholders' Equity (Liability); Long Term Liabilities; Fixed Assets; Current Assets; and Current Liabilities. Accordingly to the IAS 1 (short for International Accounting Standard No. 1) – Presentation of Financial Statements – titles of some of the financial statements have been changed. A 'balance sheet' is now referred to as a 'Statement Of Financial Position'. A Balance Sheet is a summarized, systematic comparison between a company's assets and its capital resources as of a certain reporting date. The assets side of the balance sheet shows how the company has used the capital resources at its disposal. The liabilities side shows where the capital has come from by reporting, on the one hand, details of the company's debts and, on the other hand, the capital attributable to the company's owners. Balance Sheet is a financial statement that reports a company's assets and liabilities as of a specified date along with the company's Stockholder's Equity (Net Worth). / Бухгалтерский Баланс является важнейшей формой бухгалтерской отчётности. Он представляет собой систему показателей, сгруппированных в сводную таблицу, характеризующих в денежном выражении состав, размещение, источник и назначение средств на отчётную дату. Бухгалтерский баланс состоит из двух частей:- (i) левая – актив, показывающая состав и размещение средств; и (ii) правая – пассив, показывающая источники образования средств хозяйствующего субъекта и их целевое назначение. Итоги активов и пассивов должны быть равны. МСБУ 1 (сокращение для Международного Стандарта Бухгалтерского Учёта № 1) – . Бухгалтерский Баланс или Балансовый Отчёт – финансовый отчёт, который называется также отчётом о состоянии дел (statement of condition) или отчётом о финансовом положении (statement of financial position), отражает состояние активов (assets), пассивов (liabilities) и капитала владельцев компании на указанную дату, обычно на конец месяца. Активы должны быть равны сумме пассивов и акционерного капитала (equity), а балансовый отчёт включает перечисление статей (счетов), составляющих две части уравнения. В отличие от отчёта о прибылях и убытках (profit and loss statement), который отражает результаты деятельности за определённый период, балансовый отчёт отражает состояние дел на некоторый момент времени. Его можно сравнить с моментальным снимком, а не с кинолентой, и он должен анализироваться в сравнении с соответствующими предыдущими балансовыми отчётами и иными текущими отчётными материалами.

BALANCING ITEM = СТАТЬЯ САЛЬДИРОВАНИЯ (или СТРОКА БАЛАНСА, или СТАТЬЯ БАЛАНСА) – In the United Kingdom, a Balancing Item is an accounting construct obtained by subtracting the total value of the entries on one side of an account from the total value for the other side. In the sector accounts in the former system of UK economic accounts the term referred to the difference between the Financial Surplus or Deficit for a sector and the sum of the financial transactions for that sector, currently designated the statistical discrepancy.

BALBRIGGAN = БАЛБРИГЭН (или ГЛАДКИЙ КУЛИРНЫЙ ТРИКОТАЖ) – Balbriggan is a knitted cotton fabric used especially for underwear or hosiery. Origin:- Balbriggan is a town in Ireland.

BALCONY BRA = ХХ (или БЮСТГАЛЬТЕР БАЛКЭНИ) – Balcony Bra, also known as Balconette Bra. Typically (but not always) you want as much support and coverage as you can get out of your bra. With a scoop or low cut neck tops, this creates a natural fashion conflict. If you are a bra wearer, you need support but you want enough support without the cups showing. Bra designers figured out a unique approach. The balcony bra solves the problem by providing more support than you usually get along the bottom and outer area of the bra cups. This effectively causes the breasts to rise and move towards the center of the chest. This also creates cleavage, which usually is desirable with a low cut neck. The balcony bra design reduces the cup coverage across the top and inner area of the breasts. This effectively helps keeps the bra cups from showing above the cut line of the top unless you are wearing something with a severe plunge. The major benefit of a balcony bra is that it provides the wearer with a solution to low cut tops without sacrificing much of the bras required performance.

BALDACHIN = БАЛДАХИН (или ПАРЧА, или БАЛДЭКЭН) – Baldachin is a rich embroidered fabric of silk and gold. Origin:- Italian baldacchino, from Baldacco = Baghdad, Iraq.

BALDRIC = ПЕРЕВЯЗЬ (или ПОЯС, или ПОРТУПЕЯ) – Baldric is an often ornamented belt worn over one shoulder to support a sword or bugle.

BALE = КИПА – (1) Bale is a bag, sack, square or oblong box, or package into which silk, staple fibers, or tow are compressed. The common shipping and storage package for these fibers. Bale is a standard bundle of agricultural merchandise such as straw, cotton or paper usually pressed or bound. The volume and weight of a bale depends on the commodity and locality. In countries where the fleece traditionally has been shipped, the fleeces are packed into bales – which load better in the ship holds for export abroad. Depending on the country, the bales weigh different amounts. Australian and New Zealand bales weigh 150 kg (330 lb), whereas South American bales weight approximately 1 000 lb (454 kg). Cotton also is shipped in 500-pound bales. Bale is a package of wool in a standard wool pack to fit order for shipment. May be farm, dumped, or unitized. Common form is the farm bale weighing between 100 and 200 kgs. Bale, a pack, or certain quantity of goods or merchandise; as a bale of silk, cloth, etc. Bales are always marked and numbered, that the merchants to whom they belong may know them, and the marks and numbers correspond to those in the bills of lading, etc. Selling under the bale, or under the cords, is a term used in France and other countries for selling goods wholesale, without sample or pattern, and unopened. / Кипа, крупная упаковочная мера текстильного сырья – хлопка, шерсти, тряпья и другого. Имеет форму четырёхгранной призмы или (реже) цилиндра. При упаковке в кипы материал прессуется на механических и гидравлических прессах для удешевления транспортировки и предохранения от пыли и влаги. Масса кипы хлопка объёмом 0.3–0.59 кубических метров ($м^3$) от 120 до 220 килограммов (кг). Кипы обшиваются тарной тканью и стягиваются проволочными кольцами.

(2) The Cotton industry has adopted a standard for a bale of cotton, 55 inches tall, 28 inches wide, and 21 inches thick, weighing approximately 500 pounds. A bale meeting these requirements is called a Universal Density Bale. Bale is a compressed and bound package of cotton lint, typically weighing about 480 lb. Bale is a package of compressed cotton lint as it comes from the gin. Including bagging and ties, a bale weighs about 500 pounds, and its dimensions vary depending on the degree of compression, 12–32 pounds per cubic foot. A bale is the form in which cotton moves in domestic and international commerce. However, cotton is bought and sold on a net weight (pound or kilogram) basis. For statistical purposes, cotton is reported in terms of running bales, in 480-pound net weight bales, or in pounds. A Running Bale is any bale of varying lint weight as it comes from the gin. To maintain comparability, bale weights are commonly converted to 480-pound net weight equivalents. A compressed and bound package of cotton lint, typically weighing about 480 lb. Cotton is domestically (in the US) and internationally traded in bales. A large compressed, bound, and often wrapped bundle of a commodity, such as cotton or hay. In the Cotton industry, a bound package of compressed Cotton lint. A basic tradable unit of lint (ginned Cotton). Bale weights vary from country to country. By convention, a 'statistical' bale weighs 480–500 lb. A basic traceable unit of lint (ginned Cotton). Bale weights can be vary from country to country. By convention, a statistical bale weighs 480 lb (218 kg). / Базовая единица учёта волокна (джинированного хлопка). Вес кип в разных странах может быть разным. В

соответствии с конвенцией, статистический вес кип определён как 480 фунтов (218 килограмм). В бывшем СССР по принятым стандартам длина (высота за рубежом) 970, ширина (толщина за рубежом) 595, высота (ширина за рубежом) 735 миллиметров (мм); масса брутто 215 килограмм (кг). Несмотря на требования стандартов, эти параметры всё равно немного отклоняются как в большую, так и в меньшую стороны.

BALE CAPACITY = КИПОВАЯ ГРУЗОВМЕСТИМОСТЬ – Bale cubic Capacity is the space available for cargo measured in cubic feet to the inside of the cargo battens, on the frames, and to the underside of the beams. In a general cargo of mixed commodities, the bale cubic applies. The stowage of the mixed cargo comes in contact with the cargo battens and as a general rule does not extend to the skin of the ship. Cubic capacity of a vessel's hold to carry packaged dry cargo such as baled or pallets. / Кубическая вместимость трюма судна для транспортировки в нём сухих грузов, упакованных в кипы или размещённых на поддонах. Под Грузовместимостью транспортного средства понимается суммарный объём помещений, используемых для перевозки грузов. У судов различают:- (i) теоретическую грузовместимость; (ii) зерновую грузовместимость для сыпучего груза; (iii) киповую грузовместимость для штучного груза; и (iv) грузовместимость для жидкого груза. Теоретическую грузовместимость определяют по теоретическим обводам. Зерновая грузовместимость меньше теоретической на объём корпусных конструкций и оборудования (набора, трубопроводов, деревянного настила, обшивки и прочего). При определении киповой грузовместимости исключают также объём между элементами набора, примыкающий к палубам, переборкам и бортам. Грузовместимость для жидкого груза равна зерновой грузовместимости за вычетом объёма, соответствующего тепловому расширению груза.

BALE DENSITY = ПЛОТНОСТЬ КИПЫ (или ПЛОТНОСТЬ (ПРЕССОВКИ) КИПЫ) – Bale Density is the unit of measurement of weight per unit volume. Normally expressed as pounds per cubic foot. Density is calculated by dividing the net bale weight by the bale volume in cubic feet. Volume is determined by multiplying bale length, width, and thickness dimensions expressed in feet. Thickness is determined by measuring from tie to across the crown of the bale. Universal Bale Density as determined by the International Standards Organization – ISO Reference No. 8115-1986 (E) is a bale with the nominal dimensions of 1 060 to 1 400 mm in length by 540 mm in width and 700–950 mm in height. / Прессование необходимо для упрощения перевозок и хранения сырья на складах фабрики.

BALE OPENER = КИПОРАЗБОРЩИК (или КИПОРАЗБИВАТЕЛЬ) – New modern automatic Bale Openers provide the simples automatic solution to bale opening. The unique construction of the machine enables ultimate reliability to be realized through simplicity of design. With the facility to operate on up to four differentbale groups of differing heights (programmable version) together with virtually unrestricted track lengths and multiple head widths at production rates of up to 1 500 kg per hour the automatic bale opener provides the perfect solution for today's modern spinning unit. The programmable version of the automatic bale opener provides the ultimate in flexibility. Together with the machines un-restricted track length users are able to lay down as many as 200 bales in four groups on each side of the machine. This enables up to four different assortments to be processed automatically at pre-selected take-off speeds and with the required production volume. Efficient bale opening must prepare the material properly for the subsequent cleaning stages, as well as making operation easy and ensuring that personnel are largely relieved of the need to intervene unnecessarily. And small tufts are essential for efficient cleaning. Small tufts offer a large surface area. Trash, dirt and dust are exposed and can be removed gently. Bale Opening means the removal of the bagging and ties from a bale of eligible upland cotton in the normal opening area, immediately before use, by a manufacturer in a building or collection of buildings where the cotton in the bale will be used in the continuous process of manufacturing raw cotton into cotton products. Its function is to remove compression caused by the baling and shipping of the cotton. Its action is revolving and tumbling as it takes the raw staple for action and delivers the stock in a loose condition at the delivery end of the machine. In addition to opening up the cotton the machine, by its action, does some cleaning. Also known as Bale Breaker. The Crosrol Automatic Bale Opener (ABO) provides the simplest automatic solution to bale opening; the unique construction of the machine enables ultimate reliability to be realized through simplicity of design. With the facility to operate on up to four different bale groups of differing heights (programmable version) together with virtually unrestricted track lengths and multiple head widths at production rates of up to 1 500 kg's per hour the Crosrol Automatic Bale Opener provides the perfect solution for today's modern spinning unit. The most important feature of any Automatic Bale Opener is reliability, only through radical design can this be truly achieved. Only the Crosrol Automatic Bale Opener can truly claim to satisfy this demand for reliability, with over 700 units in the world, trouble-free operation can be assured. / Маленькие колки (зубья) обеспечивают обхват большей поверхности. В прядильном производстве, является первым технологическим переходом в прядении хлопка и предназначен для разрыхления кип хлопка.

BALE OPENING = ВСКРЫТИЕ КИП – Bale Opening means the removal of the bagging and ties from a bale of eligible Upland Cotton in the normal opening area, immediately before use, by a manufacturer in a building or collection of buildings where the cotton in the bale will be used in the continuous process of manufacturing raw cotton into cotton products in the United States.

BALE PLUCKER = КИПОРАЗРЫХЛИТЕЛЬ (или ХОЛСТОВАЯ ТРЕПАЛЬНАЯ МАШИНА) – Bale Plucker is the machine being an initial in dividun it in blow room machinery is suitable to pluck various grades of cotton, type man-made fiber and midlength and move back and forth following turret, mean while finely pluck bales. The plucked tuft is delivered to the following unit via air flow. The detacher in stalled with double saw-toothed beaters can automatically revolve and move up and down. Spinning preparation begins with the bale plucker. A bale plucker removes fiber flocks from bales of fiber material and a flock transporting system delivers the flocks from the bale plucker to a carding machine or other processing apparatus. This machine has been fundamental in improving quality, as it enables to remove from the feeding bales, which number can be up to 100, very small tufts of material. This fact is the ideal prerequisite for a good blending in the subsequent passages. The plucking carriage can handle cotton and man-made fibers with up to 60 mm staple length. / В хлопкопрядении поступающее на фабрику спресованное в кипах хлопковое волокно прежде всего нуждается в распаковывании и последующем разрыхлении. С этой целью на начальном этапе процесса прядения после кипоразборщиков используются кипоразрыхлители – разрыхлительно-очистительные агрегаты, основной задачей которых является создание непрерывного равномерного потока разрыхлённых волокон. Процесс подготовки волокна к прядению начинается на разрыхлительно-очистительных агрегатах. Эти машины выщипывают клочки волокна из кип с волокнистым материалом и формируют холст, а система транспортировки клочков (flocks) доставляет их в виде холста от разрыхлительных агрегатов к кардочесальной машине или иным аппаратам переработки. Следующий этап разрыхления происходит на кардочёсальных и гребнечёсальных машинах, которые разделяют поступающие с холстом клочки волокна на отдельные волокна – разрыхление до волокна. Второй этап обычно называют чесанием, и в этом случае под разрыхлением понимается только первый этап разделения волокнистого материала на клочки.

BALE PRESS SYSTEM = СИСТЕМА ПРЕССОВКИ КИП – Bale Press System:- universal density up-packing press and universal density down-packing press, bale tying and handling systems.

BALE SPACE = ЗАПОЛНЯЕМОЕ КИПАМИ ПРОСТРАНСТВО – The Bale Space of a vessel is the capacity of cargo spaces under deck (including hatchways but excluding void spaces behind cargo battens and beams) expressed in cubic meters or cubic feet. See also Bale Capacity. / Смотрите также Киповая Грузовместимость (Bale Capacity).

BALING = КИПОВАНИЕ – Baling is actually packing cotton into bale form. The press box is lined with the bale covering and the ginned cotton is placed inside. When the box is about full, the cotton is subjected to pressure, made to conform to proper bale size; then the bale ties are fastened around it to make a secure bale ready for shipping. / Прессование хлопкового волокна с помощью гидравлического пресса в форму кипы (bale form). Хлопковое волокно прессуют в кипы по 160–230 килограмм. Высокая плотность прессовки, не отражаясь вредно на качестве волокна, позволяет полнее использовать грузоподъёмность и полезное пространство транспортного средства, в котором перевозится хлопок к месту назначения. Волокнистые материалы поступают на прядильные фабрики в кипах в сильно спрессованном виде. Так, объёмный вес хлопка в кипах достигает 500 кг/м^3, а шерсти – 250 кг/м^3. Прессование необходимо для упрощения перевозок и хранения сырья на складах фабрики, так как оно обеспечивает лучшее использование ёмкости железнодорожных вагонов и складских помещений фабрик. В конце XX столетия были предприняты попытки прессования хлопка и доведения объёмного веса кип примерно до 750–850 кг/м^3; как показывали исследования, при 1 000 кг/м^3 и больше волокна повреждались.

BALITBIOTECK = BALAI PENELITIAN BIOTEKNOLOGI TANAMAN PANGAN = RESEARCH INSTITUTE FOR FOOD CROP BIOTECHNOLOGY

BALITJAS = BALAI PENELITIAN TANAMAN JAGUNG DAN SEREALIA LAIN = RESEARCH INSTITUTE FOR MAIZE AND OTHER CEREALS

BALITKABI = BALAI PENELITIAN TANAMAN KACANG–KACANGAN DAN UMBI–UMBIAN = RESEARCH INSTITUTE FOR LEGUMES AND ROOT CROPS

BALITPA = BALAI PENELITIAN TANAMAN PADI = RESEARCH INSTITUTE FOR RICE

BALITTRA = BALAI PENELITIAN TANAMAN PANGAN LAHAN RAWA = RESEARCH INSTITUTE FOR FOOD CROPS IN SWAMPY AREAS

BALK = БРУС (или БАЛКА, или ОКАНТОВАННОЕ БРЕВНО) – A Balk is a log hewn or sawn to a square section, and varying in size from 11 to 18 inches square (from 279.4 to 457.2 millimeters). / Брус – это бревно, тёсаное или распиленное до квадратного сечения, и меняющееся в размере от 279.4 до 457.2 миллиметров (от 11 до 18 дюймов). В деревообработке под Брусом понимается пилёный (реже тёсаный) лесоматериал. Различают брусы двух- и четырёхкантные, чистообрезные и с обзолом. Брусы толщиной менее 100 мм и шириной не более двойной толщины называют Бруском. В строительной механике под Брусом понимается тело, у которого геометрические размеры поперечного сечения малы по сравнению с длиной. В зависимости от очертания геометрической оси различают брусы плоские (кривые, ломаные, прямые) и пространственные брусы, работающие главным образом на изгиб, называемые Балкой. Брусы обычно являются составными элементами конструкций машин и сооружений. Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов.

BALLAST = БАЛЛАСТ – Ballast:- heavy weight, usually sea water, necessary for the stability and safety of a ship not carrying cargo. Materials, usually sea water, carried as ballast in tanks improves the trim and the stability of the vessel. Heavy substances loaded by a vessel to improve stability, trimming, sea keeping and to increase the immersion at the propeller. Sea water ballast is commonly loaded in most vessels in ballast tanks, positioned in compartments right at the bottom and in some cases on the sides, called Wing Tanks. On a tanker, ballast is seawater that is taken into the cargo tanks to submerge the vessel to a proper trim. / Под Балластом, от Голландского слова Ballast, понимается груз в виде воды, песка и тому подобного, помещаемый на судно для улучшения его мореходных качеств. Балласт – груз, принимаемый на судно для обеспечения требуемой посадки и остойчивости, когда полезного груза и запасов для этого недостаточно. Различают переменный и постоянный балласт. В качестве переменного обычно используют воду (жидкий балласт), а постоянного – чугунные болванки, камень, песок и другое (твёрдый балласт). Парусные и недостаточно остойчивые суда имеют постоянный твёрдый балласт.

BALLAST BONUS = БАЛЛАСТНЫЙ БОНУС – Compensation for relatively long ballast voyage. Ballast Bonus is a special payment above the Chartering price when the ship has to sail a long way on ballast to reach the loading port. / Балластный Бонус – при фрахтовании в тайм-чартер – дополнительная единовременная сумма, которую фрахтователь соглашается заплатить судовладельцу сверх арендной платы, если судну предстоит значительный балластный переход из последнего порта разгрузки в пункт приёмки в тайм-чартер.

BALLAST MOVEMENT = БАЛЛАСТНЫЙ ПЕРЕХОД – Ballast Movement is a voyage or voyage leg made without any paying cargo in a vessel's tanks. To maintain proper stability, trim, or draft, sea water is usually carried during such movements. / Балластный Переход или Балластный Пробег – переход водного судна из порта разгрузки в порт погрузки без коммерческой загрузки, но с некоммерческим грузом (балластом). Балласт (вода, песок и тому подобное) принимается на борт для придания судну необходимой остойчивости и осадки.

BALLAST TANK = БАЛЛАСТНЫЙ БАК (или БАЛАСТНАЯ ЦИСТЕРНА) – Ballast Tank:- compartments at the bottom of a ship or on the sides which are filled with liquids for stability and to make the ship seaworthy. Any shipboard tank or compartment on a tanker normally used for carrying salt-water ballast. When these compartments or tanks are not connected with the cargo system they are called Segregated Ballast Tanks or Systems.

BALL BEARING = ШАРИКОВЫЙ ПОДШИПНИК (или ШАРИКОПОДШИПНИК) – Ball Bearing is an antifriction rolling type bearing containing rolling elements in the form of balls. See also Bearing. / Шариковый Подшипник или Шарикоподшипник – подшипник качения с шариками в качестве тел качения. Шарикоподшипник, подшипник качения, в котором телами качения являются шарики.

BALL FRINGE = КЛУБКОВАЯ (или ШАРИКОВАЯ) БАХРОМА – Ball Fringe is a trimming that consists of round fluffy balls (pompons) attached by threads to a band of fabric by which it is sewn to fabric. It is often used on curtains and upholstery.

BALLING UP = ФОРМИРОВАНИЕ КЛУБКОВ – Balling Up is a defect in which loose or frayed fibers form into a ball and are then woven into the fabric. See also Fuzz Ball.

BALLISTIC = БАЛЛИСТИЧЕСКАЯ – Ballistic is a thick woven fabric that is extremely abrasion resistant and tough; has a denier of about 2 000, and is used in apparel, packs and gear. / экстримально устойчива к истиранию .

BALL MILL = ШАРОВАЯ МЕЛЬНИЦА – Ball Mill is a standard method of reducing water-insoluble substances such as pigments or dyestuffs to a fine state of division. It consists of a cylinder, rotating on an axis, partly filled with steel balls, porcelain balls, or common pebbles. The controlling factors are size of balls, relative volumes occupied by balls and substance, type and quality of substance, and rate and time of rotation.

BALLOON = БАЛЛОН – Balloon:- the curved paths of running yarns about the take-up package during spinning, downtwisting, plying, or winding, or while they are being withdrawn over-end from packages under appropriate yarnwinding conditions. / Баллон, образуемый нитью при движении между глазком и шпулей.

BALLOON FABRIC = БАЛЛОННАЯ ТКАНЬ – Balloon Fabric is a plain-weave cloth having the same breaking strength in each direction. This fabric is made from fine (60's to 100's) combed yarn woven to constructions of 92 x 108 to 116 x 128. Vulcanized balloon fabric is used for air cells in planes and barrage balloons. / Баллонная Ткань – лёгкая, тонкая и плотная шелковая или хлопчатобумажная ткань полотняного переплетения, идущая на изготовление прорезиненных материй для аэростатов, газгольдеров, резиновых спасательных лодок и так далее.

BALLOON FREIGHT = ЛЕГКОВЕСНЫЙ ГРУЗ (или ОБЪЁМНЫЙ ГРУЗ) – Balloon Freight is a shipping term used to describe light, bulky cargo or articles.

BALLOON LOANS = КРУПНЫЕ ССУДЫ – Balloon Loans consist of a number of equal periodic payments, followed by a one – off balloon payment. The balloon payment can often represent a substantial portion of the initial loan amount. The origination of balloon loans is typically reserved for secured financing arrangements, and the balloon amount is usually sized by the originator with consideration to the expected future value of the secured object. Where the obligor has the option to return the object to the originator (e.g., a Personal Contract Plan product), and the securitisation transaction has purchased the balloon payment obligation, then the transaction may be directly exposed to residual value risk. Alternatively, if the obligor enters into a separate contract to sell the object to the supplying dealer at a predetermined price equal to the balloon amount, then the transaction is exposed to indirect residual value risk.

BALLOON PAYMENT = КРУПНЫЙ ПЛАТЁЖ – In the United States, Balloon Payment is a lump-sum payment that may be required when a mortgage loan ends. This can happen when the lender allows you to make smaller payments until the very end of the loan. A balloon payment will be a much larger payment compared with the other monthly payments you made. A large extra payment that may be charged at the end of a mortgage loan or lease. Balloon Payment is a large extra payment that may be charged at the end of a loan or lease. / Крупный Платёж или Воздушный Шар – последний платёж по задолженности, который значительно больше всех предшествующих платежей. Займы или ипотечные займы предусматривают увеличенные платежи в том случае, если некоторое прогнозируемое событие должно предоставить дополнительный источник наличности или если ожидается рефинансирование. Займы, предусматривающие увеличение суммы платежа, иногда называют частично амортизированными займами (partially amortized loans).

BALLOON SLEEVE = БАЛЛОННЫЙ РУКАВ (или РУКАВ ФОНАРИКОМ, или ПЫШНЫЙ РУКАВ) – Balloon Sleeve is a type of full sleeve. It is frequently made of lighter or transparent fabrics.

BALLOT = БЮЛЛЕТЕНЬ (или ЖЕРЕБЬЁВКА) – While in general terms a Ballot is a method of voting by marking a paper, in finance it more specifically refers to a method of allotting shares to applicants in the event a share issue is oversubscribed. All applicants are entered for the ballot and those drawn at random receive some or all of the shares applied for.

BALL WARP = ОСНОВА В КЛУБКАХ – Ball Warp:- parallel threads in the form of a twistless rope wound into a large ball. When wound mechanically with quick traverse a ball warp may be made in the form of a large cylindrical package.

BALMACAAN = БАЛМАКАН (или БАЛМЭКАН) – Balmacaan is a loose single-breasted overcoat usually having raglan sleeves and a short turnover collar. Origin:- Balmacaan, estate near Inverness, Scotland. / Балмакан – пальто свободного покроя.

BALMORAL = БАЛМОРЭЛ – Balmoral:- a laced boot or shoe; (often capitalized) a round flat cap with a top projecting all around. / Balmoral Castle = Королевский Замок в Шотландии. Ботинок на шнурках спереди с отрезной (настрочной) союзкой.

THE BALTIC AND INTERNATIONAL MARITIME COUNCIL = БАЛТИЙСКИЙ И МЕЖДУНАРОДНЫЙ МОРСКОЙ СОВЕТ (или БАЛТИЙСКИЙ И МЕЖДУНАРОДНЫЙ СОВЕТ ПО МОРСКИМ ВОПРОСАМ) – The Baltic and International Maritime Council (BIMCO) is an independent international shipping association founded in 1905, with a membership composed of ship owners, managers, brokers, agents and many other stakeholders with vested interests in the shipping industry. The association acts on behalf of its global membership to promote higher standards and greater harmony in regulatory matters. It is a catalyst for the development and promotion of fair and equitable international shipping policy. BIMCO is accredited as a Non-Governmental Organisation (NGO), holds observer status with a number of United Nations organs and is in close dialogue with maritime administrations, regulatory institutions and other stakeholders within the EU, the USA and Asia. The association provides one of the most comprehensive sources of practical shipping information and a broad range of advisory and consulting services to its members Headquartered in Bagsværd, Denmark. At the moment (2011) BIMCO is the world's largest private shipping organization with 2 720 members world-wide.

BALTIC DRY INDEX = БАЛТИЙСКИЙ СУХОГРУЗНЫЙ ИНДЕКС – The Baltic Dry Index (BDI) is a number issued daily by the London-based Baltic Exchange. The index provides an assessment of the price of moving the major raw materials by sea. Taking in 26 shipping routes measured on a timecharter and voyage basis, the index covers Handymax, Panamax, and Capesize dry bulk carriers carrying a range of commodities including coal, iron ore and grain. The BDI traces its roots to the Virginia and Baltick Coffeehouse in London's financial district in 1744. Every working day, the Baltic canvasses brokers around the world and asks how much it would cost to book various cargoes of raw materials on various routes, e.g., 100 000 tons of iron ore from San Francisco to Hong Kong, or 1 000 000 metric tons of rice from Bangkok to Tokyo. The index is made up of an average of the Baltic Supramax, Panamax, and Capesize indices. These indices are based on professional assessments made by a panel of international shipbroking companies. The index can be accessed on a subscription basis directly from the Baltic Exchange as well as from major financial information and news services such as Thomson Reuters and Bloomberg LP. A Baltic Dry Index (BDI; full name is the Baltic Exchange Dry Index) is daily index made up of 26 key dry bulk routes. The index is of crucial importance to the freight derivatives industry. This is also closely followed by charterers and shipowners. Some physical contracts – charterparties – are concluded on the basis of floating rates determined by the Baltic indices or route assessments. The Baltic Dry Index is a daily average of prices to ship raw materials. It represents the cost paid

by an end customer to have a shipping company transport raw materials across seas on the Baltic Exchange, the global marketplace for brokering shipping contracts. The Baltic Exchange Information Services Ltd (London, the United Kingdom) is similar to the New York Merc in that it is a medium for buyers and sellers of contracts and forward agreements (futures) for delivery of dry bulk cargo. The Baltic is owned and operated by the member buyers and sellers. The exchange maintains prices on several routes for different cargoes and then publishes its own index, the BDI, as a summary of the entire dry bulk shipping market. This index can be used as an overall economic indicator as it shows where end prices are heading for items that use the raw materials that are shipped in dry bulk. The index is maintained by the Baltic Exchange. The cargoes being moved are raw material commodities such as coal, steel, cement, and iron ore. The prices are determined by the buyers and sellers, and then the exchange takes 26 different routes throughout the world for various materials and averages them into one index. The index does not concern itself with finished goods or container ships, only raw materials and dry bulk specific ships are factored into the calculation. It also factors in all four sizes of oceangoing dry bulk transport vessels:- (i) ship classification:- Capemax (dead weight tons:- 100 000+, % of World fleet:- 10%, and % of Dry Bulk traffic:- 62%); (ii) ship classification:- Panamax (dead weight tons:- 60 000–80 000, % of World fleet:- 19%, and % of Dry Bulk traffic:- 20%); (iii) ship classification:- Supramax (dead weight tons:- 45 000–59 000, % of World fleet:- 37%, and % of Dry Bulk traffic:- 18% w/ Handysize); and (iv) ship classification:- Handysize (dead weight tons:- 15 000–35 000, % of World fleet:- 34%, and % of Dry Bulk traffic:- 18% w/ Supramax). The index can be quite volatile. The run up from 2005 to the end of 2007 was primarily due to Chinese demand for industrial precursors to production and its shift from coal exporter to importer. There was also a shortage of supply for dry bulk cargo ships and a large backlog at shipyards. The combination of these two factors caused a nearly 200% gain in the index. From June through October 2008, the index lost 85% of its value as demand for shipping plummeted. This is due to a simultaneous convergence of several factors. Chief among these is the rapid slowdown in the ‘global growth’ phenomenon. In addition to this, credit has been nearly impossible to get for the purchase of goods and the payment of time charters on the vessels. The BDI is one of the purest leading indicators of economic activity. It measures the demand to move raw materials and precursors to production, as well as the supply of ships available to move this cargo. Consumer spending and other economic indicators are backward looking, meaning they examine what has already occurred. The BDI offers a real time glimpse at global raw material and infrastructure demand. Unlike stock and commodities markets, the Baltic Dry Index is totally devoid of speculative players. The trading is limited only to the member companies, and the only relevant parties securing contracts are those who have actual cargo to move and those who have the ships to move it. / Томсэн Ройтас (Thomson Reuters) и Блумбёг Эл.Пи. (Bloomberg LP). для закупки товаров и .

BAM = BOSNIAN AND HERZEGOVINAN CONVERTIBLE MARK

BAMBOO FABRIC = БАМБУКОВАЯ ТКАНЬ – Bamboo Fabric is a natural textile made from the pulp of Bamboo grass, it is considered sustainable, because the bamboo plant grows quickly and does not require the use of herbicides and pesticides to thrive. However, bamboo fiber is produced through the cellulosic process. Bamboo fabric retains many of the same qualities it has as a plant, including excellent wicking ability that pulls moisture away from the skin. It also retains antibacterial qualities, reducing bacteria that often thrives on clothing, which causes unpleasant odors.

BAMBOO FIBER = БАМБУКОВОЕ ВОЛОКНО – Bamboo merely serves as a raw material for cellulose which is subsequently processed into viscose fiber. Not only Bamboo but also, e.g., Beech tree, Birch, Pine, Spruce, Stone Pine or Eucalyptus are suitable as raw materials for cellulose intended for viscose fiber production. If one took up the philosophy of the misleading ‘bamboo labeling’, all textiles containing viscose fibers could be labeled with the respective raw material, i.e. ‘xx% viscose bamboo’. Consumers can be misled not only by labeling but also by product advertising. For example, in ‘bamboo’ textiles (e.g., socks, complete sets of underwear or home textiles) wordings are found such as ‘contains the innovative, breathable natural fiber bamboo’ or ‘with natural, anti-bacterial effect’. Untreated bamboo fibers might have an antibacterial effect which, however, has not been proven so far in textile products made of viscose fibers based on bamboo as raw material. In some cases such incorrect information is traced back to fibers from PR China. Here, some man-made fiber manufacturers describe, in their product information, the viscose process leading to viscose fiber and wrongly designate the resulting product as bamboo fiber and not as viscose fiber, even though the latter would be correct. Thus customers even get in writing the wrong information that they purchase a bamboo fiber. Bamboo Fibers are cellulosic fibers produced from Bamboo Plants a type of grass. There are two methods of producing bamboo fibers namely Mechanical method and Chemical method. Mechanical methods are similar to Flax production (retting, enzyme treatment, boiling, scutching, cutting etc) and this gives Natural bamboo fibers. There are two types of Chemical methods namely Bamboo Viscose Rayon method and Bamboo Lyocell method. Bamboo Viscose Rayon method produces Bamboo fibers in the same way as Viscose Rayon production methods. Bamboo Lyocell method produces Bamboo fibers in the same way as Lyocel/Tencel production methods. But the majority of the bamboo fibers for textile application is produced by the Viscose Rayon Production methods. Bamboo Fibers and Textiles are used in bed linen, bath robes, flannels, bath mats, towels, aprons, oven gloves, tea towels, nappies, sanitary napkins, intimate apparels, include sweaters, bath-suits, blankets, underwear, swimwear, tight t-shirt, socks, bandages, mask, surgical cloths, wall paper, curtains and furnishing fabrics. Merits:- soft, silky to touch, natural sheen, drapes well, highly absorbent material, quick drying, machine washable, anti microbial properties, anti UV, breathability, bio-degradable, and odour absorption properties. Bamboo fabric is a natural textile that has been growing in popularity in recent years, both for its quality and its environmental friendliness. Bamboo fabric is made from the pulp of bamboo plants, which are actually a type of grass. The fastest growing grass species in the world, in fact, making them one of the most easily renewable natural resources we have. Aside from being more sustainable, bamboo fabric is also light and strong, with excellent wicking properties. Properties of Bamboo Fabric:- bamboo fiber is soft and comfortable against the skin, as it is naturally smooth and round even without any chemical treatment. Bamboo fiber has no sharp spurs to scratch against the skin, and people who are allergic to other natural fibers like wool or hemp will usually experience no allergic reactions from wearing clothing made of bamboo fibers. The Manufacturing of Bamboo Fabric:- bamboo fiber started being used for clothing in the XX century. Its manufacturing began in China and spread from there. In its un-spun form, bamboo fiber looks much like cotton. When processed, the bamboo becomes heavy and pulped, at which point it can be separated into threads for spinning, dying and weaving into cloth. Many companies who produce bamboo fabric employ an extensive bleaching process, but there are companies who leave the bamboo fiber unbleached. Mechanical Processing:- during the mechanical processing of bamboo, the bamboo plant is crushed into a pulp. The bamboo’s natural enzymes are used to form a mushy substance from which fibers can be combed out. These fibers can then be spun into yarn, which is then used as bamboo fabric or linen to make cloth products. The mechanical processing of bamboo fiber is very eco-friendly, and is similar to the manufacturing of flax or hemp cloth. Chemical Processing:- chemical processing is the most common form of bamboo fiber processing. Though many chemical processing methods are not environmentally friendly, there are some methods that are more eco friendly than others. Chemical processing of bamboo fibers involves ‘cooking’ the fiber using chemicals to create a kind of regenerated cellulose fiber, which can then be used for thread and woven into cloth fabric. All parts of the bamboo plant are used in the process of turning it into usable fabric. Environmentally Friendly Chemical Processing:- the Lyocell process is generally considered to be the most environmentally friendly method of manufacturing bamboo cloth fiber. This is because it is in general more sustainable than most common chemical processing methods. According to the FTC, Lyocell is defined as a cellulose fabric made by an organic solvent spinning process. The chemicals used in this processing method are non-toxic and much safer for humans than other

traditional processing chemicals. About 99.5% of the chemicals used are captured in a close-loop container, which means they can then be recycled with minimal amounts of them being released into the environment, avoiding air and water pollution. Right now, people are still in the process of the developing new manufacturing methods to add to the available 'green' options of bamboo fabric making. One of these processing methods is Greenyarn, which makes use of chemicals to form nano bamboo charcoal particles that can be woven into fabrics. Common Chemical Processing Method:- the most common chemical method of bamboo fabric manufacturing involve the use of carbon disulfide. First, the bamboo is crushed and its moisture kept at about 65%. The substance is then sulfirized by the addition of the carbon disulfide chemical. This step turns the bamboo cellulose solution into gel, which is in turn diluted using sodium hydroxide. The ensuing product is a viscous solution that gets passed through various nozzles and then place into another chemical solution and left to harden. After it has hardened, it gets converted into thread and spun into actual, usable fabric. Regardless of how it is processed, bamboo makes for a very versatile clothing material. It has antibacterial qualities, for one, which it retains even after multiple washings. This means that bacteria that tend to thrive in clothing and cause unpleasant odors tend to not be as present in bamboo fabric. Bamboo can even kill odor causing bacteria in the wearer's skin. It also has insulating qualities that help keep you warm in winter and cool in the summer. Uses:- (1) Skin Care Products:- natural sterilisation properties make it ideal for products like:- (i) bandages; (ii) masks; (iii) surgical clothes/operating gowns; and (iv) nurses' wear; (2) Bathroom Products:- excellent anti-bacterial and moisture absorption properties make it ideal for products like:- (i) bath and hand towels and bath robes; (ii) swimwear; (iii) underwear; (iv) T-shirts; and (v) children's clothes; (3) Anti UV Products:- bamboo's anti UV properties make it ideal for products like:- (i) wall paper (will not discolor); (ii) curtains; and (iii) wallpapers; (4) Anti Damp Products:- bamboo will not go moulding in damp conditions which makes it ideal for products like:- (i) curtains; and (ii) furnishing fabrics. Bamboo (Bambusa):- a giant woody grass, often reaching a height of forty feet or more, found in the tropical and subtropical regions of the Eastern Hemisphere. It also has been grown successfully in certain parts of the Southern United States. The fibers closely resemble those from straws in many of their characterisitics. Its fibers have an average length of 2.4 mm, thus standing between softwood and hardwood fibers. In part because of its luxurious softness, smooth hand, flowing and gentle drape, and easy price – at least compared with silk and cashmere – and eco friendly cachet, bamboo has gained entry throughout the fashion industry. But it has been the trumpets heralding bamboo as the latest and hottest sustainable eco-fabric that have been the most strident. And some of the hoopla is justified. Growing bamboo is a wonderfully beneficial plant for the planet and most is naturally organic bamboo. The manufacturing processes where bamboo the plant is transformed into bamboo the fabric are where the sustainability and eco-friendly luster of bamboo is tarnished because of the heavy chemicals, some of which are toxic, that are often required. Very, very little bamboo clothing would qualify as sustainable or organic clothes. Here's the scoop. Botanically categorized as a grass and not a tree, bamboo just might be the world's most sustainable resource. It is the fastest growing grass and can shoot up a yard or more a day. Bamboo reaches maturity quickly and is ready for harvesting in about 4 years. Bamboo does not require replanting after harvesting because its vast root network continually sprouts new shoots which almost zoom up while you watch them, pulling in sunlight and greenhouse gases and converting them to new green growth. And bamboo does this the natural way without the need for petroleum-guzzling tractors and poisonous pesticides and fertilizers. Bamboo the plant is wonderfully sustainable; bamboo the fabric isn't so easy to categorize. There are two ways to process bamboo to make the plant into a fabric: mechanically or chemically. The mechanical way is by crushing the woody parts of the bamboo plant and then use natural enzymes to break the bamboo walls into a mushy mass so that the natural fibers can be mechanically combed out and spun into yarn. This is essentially the same eco-friendly manufacturing process used to produce linen fabric from flax or hemp. Bamboo fabric made from this process is sometimes called Bamboo Linen. Very little bamboo linen is manufactured for clothing because it is more labor intensive and costly. Chemically manufactured bamboo fiber is a regenerated cellulose fiber similar to rayon or modal. Chemically manufactured bamboo is sometimes called Bamboo Rayon because of the many similarities in the way it is chemically manufactured and similarities in its feel and hand. Most bamboo fabric that is the current eco-fashion rage is chemically manufactured by 'cooking' the bamboo leaves and woody shoots in strong chemical solvents such as sodium hydroxide (NaOH – also known as Caustic Soda or Lye) and carbon disulfide in a process also known as Hydrolysis Alkalization Combined With Multi-Phase Bleaching. Both sodium hydroxide and carbon disulfide have been linked to serious health problems. Breathing low levels of carbon disulfide can cause tiredness, headache and nerve damage. Carbon disulfide has been shown to cause neural disorders in workers at rayon manufacturers. Low levels of exposure to sodium hydroxide can cause irritation of the skin and eyes. Sodium hydroxide is a strong alkaline base also known as Caustic Soda or Lye. In its dry crystalline form, caustic soda is one of the major ingredients of Drano. This is basically the same process used to make rayon from wood or cotton waste byproducts. Because of the potential health risks and damage to the environment surrounding the manufacturing facilities, textile manufacturing processes for bamboo or other regenerated fibers using hydrolysis alkalization with multi-phase bleaching are not considered sustainable or environmentally supportable. While specifics can vary, the general process for chemically manufacturing bamboo fiber using hydrolysis alkalization with multi-phase bleaching technology – which is the dominate technology for producing regenerated bamboo fiber – goes like this:- (i) bamboo leaves and the soft, inner pith from the hard bamboo trunk are extracted and crushed; (ii) the crushed bamboo cellulose is soaked in a solution of 15% to 20% sodium hydroxide at a temperature between 20 degrees C to 25 degrees C for one to three hours to form alkali cellulose; (iii) the bamboo alkali cellulose is then pressed to remove any excess sodium hydroxide solution. The alkali cellulose is crashed by a grinder and left to dry for 24 hours; (iv) roughly a third as much carbon disulfide is added to the bamboo alkali cellulose to sulfurize the compound causing it to jell; (v) any remaining carbon disulfide is removed by evaporation due to decompression and cellulose sodium xanthogenate is the result; (vi) a diluted solution of sodium hydroxide is added to the cellulose sodium xanthogenate dissolving it to create a viscose solution consisting of about 5% sodium hydroxide and 7% to 15% bamboo fiber cellulose; and (vii) the viscose bamboo cellulose is forced through spinneret nozzles into a large container of a diluted sulfuric acid solution which hardens the viscose bamboo cellulose sodium xanthogenate and reconverts it to cellulose bamboo fiber threads which are spun into bamboo fiber yarns to be woven into reconstructed and regenerated bamboo fabric. This gives some feel for how chemically intensive the hydrolysis-alkalization and multiphase bleaching manufacturing processes are for most bamboo fabrics that are promoted as being sustainable and eco-friendly. Newer manufacturing facilities have begun using other technologies to chemically manufacture bamboo fiber that are more benign and eco-friendly. The chemical manufacturing process used to produce lyocell from wood cellulose can be modified to use bamboo cellulose. The lyocell process, also used to manufacture TENCEL®, uses N-methylmorpholine-N-oxide to dissolve the bamboo cellulose into a viscose solution. N-methylmorpholine-N-oxide is a member of the amine oxide family. Amine oxides are weak alkalines that act as surfactants and help break down the cellulose structure. Hydrogen peroxide is added as a stabilizer and the solution is forced through spinnerets into a hardening bath which causes the thin streams of viscose bamboo solution to harden into bamboo cellulose fiber threads. The hardening bath is usually a solution of water and methanol, ethanol or a similar alcohol. The regenerated bamboo fiber threads can be spun into bamboo yarn for weaving into fabric. This lyocell processing is substantially healthier and more eco-friendly because N-methylmorpholine-N-oxide is supposedly non-toxic to humans and the chemical manufacturing processes are closed-loop so 99.5% of the chemicals used during the processing are captured and recycled to be used again. Only trace amounts escape into the atmosphere or into waste waters and waste products. Other chemical manufacturing processes for bamboo fabric are appearing such as using acetic anhydride and acetic acid with sulfuric acid as a catalyst to form acetate fiber which is then spun into a yarn. New nano-technologies are also being introduced into the

bamboo clothing industry. Green Yarn, a new startup located in Boston, is developing a bamboo clothing line made from nano-particles of bamboo charcoal. Green Yarn's 'Eco-fabric' is manufactured from 4 to 5 year old Taiwanese-grown bamboo that has been dried and burned in 800 degree C ovens until it is reduced to charcoal. The bamboo is processed – we don't know how – into fine nano particles which are then embedded into cotton, polyester or nylon fibers. This conventional fiber yarn that contains trapped bamboo charcoal nano particles is then woven into fabrics … mostly socks and blankets now. Green yarn's Eco-fabric is promoted as being anti-bacterial, anti-fungal, anti-static, de-odorizing, breathable, thermal regulating (cool in hot weather and warm in cool weather), and environmentally friendly. Obviously, a significant part of Eco-fabric's claims to sustainability depend upon the sustainability of the original cotton, polyester or nylon fibers that have been impregnated with the bamboo charcoal nano particles. In a footnote, Greenyarn mentions that the active bamboo charcoal ingredients will only remain active in the clothing for about six months of active use. Chemically-manufactured bamboo rayon has some wonderful properties which are adored by conventional and eco-aware designers and consumers:- (i) bamboo fabric has a natural sheen and softness that feels and drapes like silk but is less expensive and more durable; (ii) bamboo clothing is easy to launder in a clothes washer and dryer; (iii) because of the smooth and round structure of its fibers, bamboo clothing is soft and non-irritating, even to sensitive skin. Some people with chemical sensitivities cannot tolerate bamboo clothing. We are not sure if this intolerance is due to the intrinsic nature of bamboo but it more likely because of other chemicals added or used during the manufacturing and finishing processes of the clothing. (iv) Bamboo is naturally anti-bacterial and anti-fungal supposedly because of a bacteriostatis agent unique to bamboo plants called 'Bamboo Kun' which also helps bamboo resist harboring odors. 'Kun' is also sometimes spelled 'Kunh'. The bamboo kun in bamboo fabric stops odor-producing bacteria from growing and spreading in the bamboo cloth allowing bamboo clothing to be more hygienic and to remain fresher smelling. (v) Bamboo clothing is hypoallergenic. (vi) Bamboo is highly absorbent and wicks water away from the body 3 to 4 times faster than cotton. In warm, humid and sweaty weather, bamboo clothing helps keep the wearer drier, cooler and more comfortable and doesn't stick to the skin. (vii) The structure of bamboo fibers make bamboo fabrics more breathable and thermal regulating than cotton, hemp, wool or synthetic fabrics. (viii) Bamboo clothing is naturally more wrinkle-resistant than cotton, and while it might still require ironing after washing, bamboo fabric can be ironed at a lower temperature than cotton. Shrinkage during washing and drying is minimal at warm temperatures. (ix) Bamboo fibers and fabrics absorb dyes faster and more thoroughly than cotton, modal and viscose with better color clarity. Bamboo fabrics do not need to be mercerized to improve their luster and dye-ability like cotton requires. (x) Designers such as Kate O'Connor use bamboo fabric as an eco-friendly replacement for silk. Speaking of bamboo eco-fashion, Kate O'Connor calls bamboo fashion 'so much cheaper (than silk) and it's really good for the environment'. 'It is the perfect summer fabric' according to Kate O'Connor. Linda Loudermilk, another savvy eco-fashion designer, frequently incorporates bamboo into her eco-fashions. Amanda Shi of Avita has some of the most exciting and originally beautiful eco-fashion in bamboo. Bamboo the plant and also bamboo the fabric can rate high as an environmentally friendly and renewable resource:- (i) Bamboo grows rapidly and naturally without any pesticides, herbicides or fertilizers. (ii) Bamboo clothing (both mechanically and chemically manufactured) is 100% biodegradable and can be completely decomposed in the soil by micro-organisms and sunlight without decomposing into any pollutants such as methane gas which is commonly produced as a by-product of decomposition in landfills and dumps. (iii) Growing bamboo improves soil quality and helps rebuild eroded soil. The extensive root system of bamboo holds soil together, prevents soil erosion, and retains water in the watershed. (iv) Bamboo grows naturally without the need for agricultural tending and large diesel exhaust-spewing tractors to plant seeds and cultivate the soil. (v) Bamboo plantations are large factories for photosynthesis which reduces greenhouse gases. Bamboo plants absorb about 5 times the amount of carbon dioxide (a primary greenhouse gas) and produces about 35% more oxygen than an equivalent stand of trees. (vi) Bamboo fabrics and clothing can be manufactured and produced without any chemical additives although eco-certification such as Oeko-Tex is necessary to insure that the manufacturing and finishing processes are healthy. (vii) Currently, there are no known genetically modified organisms (GMO) variants of bamboo. Let's hope it stays that way. The Bottom Line On Bamboo:- the growing of bamboo is environmentally friendly but the manufacturing of bamboo into fabric raises environmental and health concerns because of the strong chemical solvents used to cook the bamboo plant into a viscose solution that is then reconstructed into cellulose fiber for weaving into yarn for fabric. Bamboo clothing marketers have found a variety of ways to put the most eco-friendly and sustainable face on the manufacturing of bamboo fabric. The dominant manufacturing process of hydrolysis alkalization and multi-phase bleaching is generally referred to as a rather benign process utilizing caustic soda and bleach. The chemicals used are known to create a variety of health problems and neural disorders which can be hazardous to the health of fiber manufacturing workers. If the manufacturing facility lacks adequate pollution control systems – all too common in developing countries where regulations and enforcement are nearly non-existent – then these toxic chemicals can escape into the atmosphere through air vents and smokestacks and into waterways through inadequately treated waste water disposal systems. Some bamboo fiber manufacturing facilities trumpet their sustainability and green credentials by establishing ISO 9000 Quality Management policies and ISO 14000 Environmental Management policies. This is largely a PR red herring tossed by the manufacturing facilities and marketers because these ISO standards do not mean that the facilities, their manufacturing processes or their fabrics have been certified by any of the international certification bodies such as SKAL, Soil Association, Demeter, KRAV, or OKO-tex. The International Organization for Standardization, ISO, is an international NGO that defines industrial and commercial standards. ISO 14000 gives the requirements for an Environmental Management System. This means that ISO 14000 '… is a tool for helping organizations to implement good environmental practice and to aim for continual improvement of their environmental performance' according to an ISO press release. ISO 14000 does not certify that a company's manufacturing processes are sustainable or environmentally friendly. ISO 14000 is simply a generic set of standards and tools to help businesses – any kind of business such as financial services or media companies and not just manufacturing companies – define their environmental concerns and how to meet them. ISO 14000 does not guarantee that once a company has defined their Environmental Management System that they will meet their goals. There is also no guarantee that a company's implementation of their Environmental Management System using ISO 14000 will meet the criteria for sustainability. ISO has posted an interesting introduction to ISO 14000 on YouTube. Because ISO 14000 is a very 'flexible' standard, it is impossible to know what and how a company is actually implementing their ISO 14000 Environmental Management System. Some manufacturers also boast that they have implemented ISO 9000 as if this improves their 'green' credentials. ISO 9000 is another set of generic standards and tools for defining and implementing a company's quality management system. The domain of ISO 9000 is quality management and has nothing to do with environmental issues. ISO 14000 and ISO 9000 are important and useful tools and standards but, without knowing the specifics of a company's ISO 14000 implementation, it is impossible to know if their manufacturing processes are actually sustainable and conform to environmental regulations. Also, environmental regulations, controls, enforcement and attitudes vary greatly from country to country as does transparency into what really happens within a country's manufacturing facilities. For example, getting reliable data and information from garment manufacturers in China, where most clothing is now manufactured, is very difficult. What to do? If you are thinking of purchasing bamboo clothing or any clothing that has been made outside the United States, look for certification from an independent and reliable certification company such as Oeko-Tex, Soil Association, SKAL, KRAV or similar organic or sustainable certification body. Currently, the Oeko-Tex label is the most comprehensive label for insuring that the garment is healthy for consumers but it does not certify the manufacturing processes that produced the garment as being environmentally friendly and sustainable. Some people many find our critique of the environmental and human health impact of

bamboo clothing to be harsh but we based our statements on the best research that we could find from medical research journals, trade information, patent applications and consumers' experiences. We tried contacting a number of bamboo fiber manufacturers for additional information on their manufacturing processes but we received only bland statements about how they satisfied all governmental environment regulations or just radio silence. We would be highly appreciative of any documented facts from bamboo fiber and fabric manufacturers that correct any of our findings and we promise to publish your corrections. Bamboo fabric and clothing has wonderful potential as a sustainable and environmentally friendly product if it can demonstrate that it is sustainable and friendly to the health of the planet, manufacturing and garment workers, and consumers. Analyses show that, apart from a few textiles whose production actually uses a coarse bamboo fiber, most products labeled 'bamboo' textiles do not contain bamboo but viscose fibers of various qualities. In these cases, bamboo merely serves as the raw material for the cellulose (pulp) that is processed into viscose fibers. The textile labeling law (Textilkennzeichnungsgesetz (TKG) – German Textile Labeling Act) stipulates the explicit and correct designation 'viscose'. Original Bamboo Fiber is also called as Natural Bamboo Fiber or Bio Bamboo Fiber, not Bamboo Viscose Fiber. Original bamboo fiber is the true natural fiber and belongs to bast fiber. Original bamboo fiber is directly obtained from natural bamboo by using physical and mechanical process without any chemical additive. The feeling and functional property of original bamboo fiber is similar to ramie, hemp, flax fiber etc, but anti-bacterial, deodorant and anti-UV properties from original bamboo fiber are stronger than them. The production flow of natural original bamboo fiber:- natural raw bamboo → bamboo strip → steaming of bamboo strip → crushing and decomposing → biological enzyme degumming → fiber carding → natural original bamboo fiber. Principal length of original bamboo fiber is 90 mm, it can be also cut as 38–40 mm for cotton spinning system purpose or other length according to different purpose. Original bamboo fiber's fineness is average NM1686 (around 6 dtex) due to its production flow and method. The following original bamboo fiber series products have been successfully developed and produced: pure original bamboo yarn, blended original bamboo yarn, original bamboo fabric, original bamboo socks, original bamboo towels, original bamboo beddings, original bamboo garment, original bamboo cap, original bamboo scarf, original bamboo nonwoven fabric etc. Appearance of natural original bamboo fiber is a new revolution in textile industries. Original bamboo fiber can be spun pure original bamboo yarn and blended original bamboo yarn for bast fiber spinning, wool spinning, semi-worsted spinning, silk spinning, cotton spinning system purpose. The highest count for pure original bamboo yarn can be spun Nm 48 (Ne 28), Original bamboo fiber can be made 100% weaving fabric, but composition of original bamboo fiber should be less than 50% for knitting fabric, otherwise the feeling of fabric will be hard! / Найлан (Nylon). неверную информацию, из-за которой они закупали бамбуковое волокно. Текстилькеннцайхнунгсгезетц (Тэ.Ка.Ге.; Textilkennzeichnungsgesetz (TKG) – Немецкий Акт об Этикетировании Текстильной Продукции. Очень часто в начале 2000-х Китайские изготовители текстильной продукции и особенно из махровых тканей обманывали своих потребителей, указывая на состав волокон, состоящий из бамбука. Зачастую они выдавали модальное волокно за бамбуковое волокно. Под Бамбуками или Бамбуковыми понимается Подсемейство Злаков (выделяется иногда в отдельное Семейство). Стебель – одревеснешая соломина, высота до 40 метров (м), диаметр до 30 сантиметров (см). 600 Видов (около 50 Родов), главным образом в тропиках и субтропиках; в бывшем Союзе Советских Социалистических Республик (СССР) несколько дикорастущих Видов (на Курильских Островах, Сахалине) и около 20 культивировалось на Черноморском побережье. Многие Виды цветут раз в жизни и после плодоношения погибают. Лёгкие прочные стебли Бамбуков идут на постройки и изготовление мебели.

BAN = BANK ANTICIPATION NOTES

BAN = BOND ANTICIPATION NOTE

BAN = XX – Ban is another name for a yarn creel. / ещё одно название для обозначения .

BANCA D'ITALIA REGOLAMENTO LORDO = БАНКА Д'ИТАЛИА РЭГОЛАМЭНТО ЛОРДО (или ВАЛОВЫЕ РАСЧЁТЫ БАНКА ИТАЛИИ) – BI-REL was conceived in close liaison with the banking community and came into full operation in 1998. With the setting-up of BI-REL – which increases the use of central bank money for the settlement of interbank payments – the goal of enhancing the stability of the payment system as a whole has been achieved. Similarly, the possibility of settling payments in real time has contributed to heightening the efficiency of the payment services provided by banks to their customers. The twofold objective of ensuring the orderly and smooth functioning of BI-REL and limiting the liquidity costs for intermediaries has been attained by providing the following facilities:- (i) intraday liquidity to intermediaries in the form of fully collateralised daylight overdrafts; and (ii) a queuing mechanism for temporarily uncovered payments. In BI-REL, all payments are settled continuously and individually through the centralized accounts held by intermediaries at the Banca d'Italia. The system guarantees the final and irrevocable settlement of payments. There are two main clearing systems in Italy – BI-REL and BI-COMP. BI-REL (short for Banca d'Italia Regolamento Lordo) is Italy's TARGET-linked RTGS system and is operated by the Banca d'Italia. BI-REL is the Banca d'Italia real-time gross settlement system (in Italian, Banca d'Italia Regolamento Lordo). BI-COMP is the Banca d'Italia clearing system (in Italian, Banca d'Italia Compensazione). As far as the interbank systems are concerned, the reform process implemented in 1998 envisaged the setting-up of a real-time gross settlement system for large-value payments (BI-REL) and a net settlement system for retail payments (BI-COMP). The direct management of the clearing and settlement systems allows the Banca d'Italia to closely monitor risks inherent in their functioning and ensure open and non-discriminatory access to such systems. In recent years, participation of foreign intermediaries in the Italian payment system has been facilitated by implementing remote access. With a view to improving the level of service of the retail payment instruments and reducing the opportunity costs of holding liquidity for the settlement of large-value payments, several initiatives are being implemented relating to both BI-COMP and BI-REL. / Валовые Расчёты Банка Италии БИ-РЭЛЬ (BI-REL; Банка д'Италиа Рэголамэнто Лордо (Banca d'Italia Regolamento Lordo)). Расчёты Банка Италии БИ-КОМП (BI-COMP; Банка д'Италиа Компэнсационэ (Banca d'Italia Compensazione)). является системой валовых расчётов в режиме реального времени Банка Италии . ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

BANCOMAT = БАНКОМАТ – Bancomat:- cash dispenser chain created to enable bank customers to withdraw cash up to a certain amount at all times of the day and night. Clients can use their cards and PIN codes to withdraw cash throughout most of countries of the world. Chips on electronic purses can also be loaded up to a set amount at Bancomats. Bancomat is an unattended electronic machine in a public place, connected to a data system and related equipment and activated by a bank customer to obtain cash withdrawals and other banking services. Also known as Automatic Teller Machine (ATM), Cash Machine, and Money Machine.

BAND = ПОЛОСА (или ТЕСЬМА, или ЛЕНТА, или РЕМЕНЬ, или ШНУР) – (1) Band (continuous/grown-on):- pant panels that extend to the top of the pant and are folded over without an outside band. A separate inside band lining is sewn through the pant and has an interlining.

(2) Band (pasted-on/folder-set):- a separate band sewn on the pant with stitching that shows on the outside at the top and bottom. / с втачиванием (stitching).

(3) Band (rocap):- a separate band of body fabric sewn on and turned down so the attaching seam is not visible. Inside the band is a separate lining – made from pcketing fabric – and interlining.

(4) Band:- a width-way region of the fabric that extends across the full width and is different from the rest of the fabric. It may or may not run parallel with the courses and may or may not have clearly defined edges. / Под Полосой понимается порок в виде участков, расположенных по ширине или длине полотна, отличающихся от основного фона различной линейной плотностью, интенсивностью окраски, числом нитей, высотой или плотностью ворса, размером петель. Полоса (band):- порок в виде участков расположенных по ширине или длине полотна, отличающихся от основного фона различной линейной плотностью, интенсивностью окраски, числом нитей, высотой или плотностью ворса, размером петель.

(5) Band is a close-fitting strip that confines material at the waist, neck, or cuff of clothing.

BANDANNA = БАНДАНЭ (или БАНДАНА, или ЦВЕТНОЙ ПЛАТОК) – Bandanna is a square piece of cloth that is used as a head covering or worn around the neck. Bandanna is a large figured handkerchief. Bandanas (in the UK, 1850's), silk handkerchiefs, generally red spotted with white. They were formerly manufactured only in the East Indies; but they are now manufactured of a very good quality at Glasgow and other places. Bandanna is a large often colorfully patterned handkerchief.

BAND APPLICATION = ЛЕНТОЧНОЕ ВНЕСЕНЕНИЕ – Band Application is an application of fertilizer, herbicide or insecticide applied in strips rather than the whole field, crop or soil surface. See also Broadacre Application. / Внесение удобрений, гербицидов или инсектицидов, когда они распределяются полосами, а не по всей площади поля, посева или верхнего слоя почвы. Смотрите также Обширное Применение (Broadacre Application).

BANDEAU = БАНДО (или ЛЕНТА ДЛЯ ВОЛОС, или ВОЛОСЯНАЯ ЛЕНТА) – Bandeau is a fillet or band especially for the hair; brassiere. / .

BANDED TREATMENT = ЛЕНТОЧНАЯ ОБРАБОТКА – Banded Treatment:- applied to a linear restricted strip on or along crop rows, rather than continuous over the field.

BANDING = ОПОЯСЫВАНИЕ (или ОБВЯЗКА) – Banding is a type of plastic or metal strapping that helps support a load and hold it together. Can be used to strap and secure product on a pallet or skid. Banding is a securing of cargo on a pallet generally by a steel/metal stripping.

BANDING = ШНУР (или ТЕСЬМА) – Banding is a narrow, flat fabric that is woven, knitted, or braided, and is used as is to trim an edge or folded over to bind an edge.

BANDING, HEAVY TOW = ТЯЖЁЛЫЙ БУКСИРНЫЙ ШНУР – Banding, Heavy Tow:- nonuniform distribution of filaments across towband width.

BANDLE = XX – Bandle is a coarse homespun linen made on narrow hand looms in Ireland. / Ирландская мера длины, равная 2 футам (24 дюймам или 61 сантиметру).

BANDOLIER = ПАТРОНТАШ (или БЭНДЭЛИЭ) – Bandolier is a belt worn over the shoulder and across the breast; also Bandoleer. Bandolier is a belt that is worn over the shoulder and across the body and that holds bullets. Origin:- Middle French Bandouliere, ultimately from Old Spanish Bando band, of Germanic origin; akin to Gothic Bandwo – more at banner.

BANDWIDTH = ШИРИНА ПОЛОСЫ ЧАСТОТ – Bandwidth is a measurement of the amount of data that can be transferred by a line at a time. The wider the bandwidth, the more data that can move at once. Bandwidth:- an analog measure derived from the difference between the highest and lowest frequency on a carrier wave. Also used to describe the amount of data that can be sent through a given communications circuit.

BANGKOK = БАНГКОКСКАЯ – Bangkok is a hat woven of fine palm fiber in the Philippines.

BANGLE = БРАСЛЕТ (или ЗАПЯСТЬЕ, или XX) – Bangle is a stiff usually ornamental bracelet or anklet slipped or clasped on.

BANK = БАНК – Bank is a financial institution authorised or chartered by its national regulatory authority to be designated as a bank. Bank means depository institution, including commercial bank, savings institution, or credit union. Organization which conducts banking transactions (mainly in the areas of financing, investment and payment operations) together with all accompanying services. Depending on business policy, company size and legal limitations, a bank may operate as a full-service bank or a specialized, regional, national or international institution. In most countries banks are subject to strict monitoring and controls. For SWIFT purposes, a financial institution authorised or chartered by its national regulatory authority to be designated as a bank. In the United Kingdom, strictly, all financial institutions located in the United Kingdom and recognised by the Bank of England as banks for statistical purposes up to late 1981 or as UK banks from then onwards. This category includes the UK offices of institutions authorized under the Banking Act (1987), the Bank of England, the National Girobank and the TSB Group PLC. It may include branches of foreign banks where these are recognised as banks by the Bank of England, but not offices abroad of these or of any British-owned banks. An updated list of banks appears in each February's issue of the Bank of England Quarterly Bulletin. Institutions in the Channel Islands and the Isle of Man which have opted to adhere to the monetary control arrangements introduced in August 1981 were formerly included in the sector but are not considered to be residents of the United Kingdom under the European System of National and Regional Accounts (ESA). Banks are included in the Monetary Financial Institutions (S.121/S.122) Sector. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Банк это учреждение, аккумулирующее денежные средства и накопления, предоставляющее кредит, осуществляющее денежные расчёты, учёт векселей, эмиссию денег и ценных бумаг, операции с золотом, иностранной валютой и другие функции. По функциям и характеру выполняемых операций подразделяются на коммерческие (депозитные), инвестиционные, ипотечные, сберегательные, вывозные (или экспортные), эмиссионные и другие. Национальный Жиробанк и . Банки, особые экономические институты, осуществляющие:- аккумуляцию денежных средств и накоплений, предоставление кредита, проведение денежных расчётов, выпуск в обращение определённых видов денег, эмиссию ценных бумаг и операции с ними и другие функции. Возникают в обществе на основе товарно-денежных отношений. Социально-экономическая роль банков определяется специфическим характером соответствующих общественных формаций. Банки При Капитализме:- Зачатки банкового дела существовали в рабовладельческом и феодальном обществе. Лица, которым деньги в форме драгоценных металлов передавались на хранение, а также менялы отдавали их в ссуду под проценты. Значительное развитие получил ростовщический кредит, а ростовщический денежный капитал исторически был одной из первых форм капитала. В средние века банковое дело прежде всего развивалось в торгово-промышленных городах Северной Италии. Термины Банк и Банкир происходят от Итальянского слова Banco, означающего Стол:- за столом производили свои операции менялы и ростовщики. В

дальнейшем рост и эволюция банков в Западной Европе протекали в тесной связи с развитием капитализма (о банках в России смотрите Банки в дореволюционной России). Многие методы капиталистического банкового дела получили наиболее полное развитие в Англии, самой передовой стране капитализма в XVIII–XIX веках. Банки стали привлекать крупные денежные средства промышленных и торговых капиталистов, накопления рантье и так далее. Они перешли от выдачи ссуд металлическими деньгами к кредитованию капиталистов и других заёмщиков своими долговыми обязательствами (банкнотами) и путём зачисления денег на текущий счёт клиента. Банки развиваются как особые капиталистические предприятия, организующие движение ссудных капиталов; основной целью их деятельности является извлечение прибыли. Они во многих случаях становятся акционерными обществами, что резко расширяет возможности их роста. С развитием капитализма необходимость в учреждениях, осуществляющих посредничество в кредите и платежах, неуклонно возрастает. Банки собирают свободные денежные капиталы и отдают их в ссуду на различные сроки. Они ведут текущие счета предприятий и производят расчёты между ними. Эти операции вырастают до больших размеров уже при домонополистическом капитализме и в значительной мере способствуют развитию его производительных сил. Постепенно среди многих банков выделяются наиболее крупные. Концентрация банков особенно усиливается в эпоху монополистического капитализма – империализма. Важнейшей её основой является концентрация производства и капитала в промышленности. Вместе с тем укрупнение банков в свою очередь влияет на промышленность и все сферы предпринимательской деятельности, содействуя объединению предприятий, возникновению и росту монополий. Концентрация банков возрастает как в результате особо интенсивного накопления капитала и роста крупных банков, так и в результате слияний и поглощений одних банков другими. В настоящее время в ряде капиталистических стран количество банков исчисляется десятками и даже сотнями, но фактически подавляющая часть операций сосредоточена в руках нескольких банковых монополий. Кроме того, множество мелких банков в сильнейшей степени зависит от немногих гигантов. Крупнейшие банки в различных странах имеют многочисленные отделения, разбросанные по всей стране, а нередко и за границей. В Англии много лет решающее значение в банковой системе имели 5 гигантских депозитных банков (так называемая Большая Пятёрка), а в 1968 в результате слияний их число уменьшилось до 4. В ФРГ основную роль играют 3 так называемых Гросс-Банка. В США в 1968 имелось более 14 000 формально независимых банков, но на 10 крупнейших коммерческих банков приходилось около 1/4 всех операций. Концентрация и монополизация в промышленности и банковом деле значительно меняют роль банков. От эпизодического кредитования отдельных предприятий и ведения расчётов между ними банки переходят к систематическому кредитованию определённых отраслей и предприятий, особенно к предоставлению долгосрочных ссуд (до 8–10 лет) для вложений в основной капитал. Особо тесные связи банков с промышленностью развиваются на основе эмиссионно-учредительских операций банков, то есть выпуска и размещения банками на рынке ценных бумаг (акций, облигаций) промышленных, транспортных, торговых и других акционерных обществ. Банки концентрируют крупные пакеты ценных бумаг таких обществ. Активизируются так называемые доверительные банковские операции, когда банки сами ‘по доверенности’ управляют денежными средствами клиентов, обращая их главным образом в ценные бумаги. Эти операции не отражаются в балансах банков. Они служат важным каналом для связей банков с промышленными компаниями. Всё это укрепляет позиции банков и ведёт к тому, что они превращаются в важнейший элемент структуры и опору финансового капитала. Крупные банки часто стоят в центре финансово-монополистических групп, объединяющих более или менее тесными узами под контролем финансовой олигархии ряд финансовых и промышленных компаний. Например, в центре группы Морганов в США находятся банки Моргэн Гаранти Траст Кампэни, Банкерс Траст Кампэни и Моргэн, Стэнли Энд Кампэни. Характеризуя новую роль банков в эпоху монополистического капитализма, Владимир Ильич Ленин писал:- ‘По мере развития банкового дела и концентрации его в некоторых учреждениях, банки перерастают из скромной роли посредников во всесильных монополистов, распоряжающихся почти всем денежным капиталом всей совокупности капиталистов и мелких хозяев, а также большею частью средств производства и источников сырья в данной стране и в целом ряде стран’ (Полное Собрание Сочинений, 5 Издание, Том 27, Страница 326). Конкретные формы связей и сращивания банковых и промышленных монополий развиваются и меняются, имеют особенности в отдельных странах, но главные черты и закономерности финансового капитала сохраняют всеобщий характер. Особенно усиливается роль государства в банковой системе после мирового экономического кризиса 1929–33. Буржуазные государства используют банки и кредит в своих попытках регулирования и стимулирования экономики. Большое развитие получила государственная собственность в сфере банков (национализация центральных эмиссионных и крупных коммерческих банков, создание новых специальных государственных банков, особенно для финансирования, определённых отраслей экономики, и другое). Как государственные, так и частные банки являются важнейшими. источниками финансирования правительств, в частности их военных расходов. Во всех капиталистических странах существуют сложные системы регулирования банков и надзора над ними со стороны государства. Все эти процессы отражают обострение противоречий капитализма и поиски правящими классами выхода из его растущих трудностей. Банки в развивающихся странах имеют много особенностей, а в странах, для которых характерна антикапиталистическая ориентация развития, они приобретают принципиально новые черты. Ранее в этих странах господствовали банковые монополии империалистических стран. Теперь в ряде стран получил развитие национально-частный банковый капитал. Однако важнейшим процессом является сосредоточение банков в руках государства, что при определённых условиях может поставить их на службу развития национальной экономики. Наиболее радикальные изменения произошли в 1960-х в банковых системах Бирмы, Объединённой Арабской Республики (ОАР), Сирии и некоторых других стран, где проведена демократическая национализация иностранных и частных банков и где их деятельность направлена на финансирование ключевых отраслей национальной экономики, особенно государственного сектора. Роль банков в молодых независимых государствах во многом зависит от характера государственной власти. Основные Виды Банков И Их Операции:- В капиталистической экономике действует сложная система банков, к которым также примыкают некоторые другие виды кредитно-финансовых учреждений:- страховые, инвестиционные, финансовые компании, сберегательные и строительные кассы, пенсионные фонды и другие. В совокупности они образуют кредитную систему. Собственно банки по их функциям и характеру можно подразделить на следующие типы:- центральные эмиссионные, коммерческие (депозитные), инвестиционные, сберегательные, специального назначения (ипотечные, сельскохозяйственные, внешнеторговые и так далее). По форме собственности можно выделить банки:- акционерные, банкирские дома (неакционерные), кооперативные (в США – взаимные), муниципальные и коммунальные, государственные, смешанные с участием государства, межгосударственные. Центральные Эмиссионные Банки (в США – Федеральная Резервная Система) осуществляют надзор над всей кредитной системой, являются орудиями кредитно-денежной политики государства и концентрируют временно свободные или обязательные резервы других банков, выпускают наличные деньги – Банкноты, кредитуют преимущественно государство и коммерческие банки. Инвестиционные Банки (в Англии – Банкирские Дома, во Франции – Деловые Банки) занимаются в основном эмиссионно-учредительскими операциями и производят куплю-продажу ценных бумаг. Коммерческие Банки – наиболее универсальный тип банков – занимаются широким кругом операций. Но их специфическими функциями являются приём депозитов, предоставление ссуд, проведение расчётов. Эти банки, как правило, образуют костяк всей банковой и кредитной системы страны. В послевоенный период значительную роль в капиталистическом мире играют

межгосударственные банки, в частности Международный Банк Реконструкции И Развития, Банк Международных Расчётов, Европейский Инвестиционный Банк. Операции банков делятся на пассивные и активные. Пассивными называются операции, посредством которых банки образуют ресурсы для кредитования, активными – операции, посредством которых банки используют эти ресурсы с целью извлечения прибыли (предоставление ссуд, покупка ценных бумаг и другое). Депозиты подразделяются на срочные (или сберегательные) вклады и текущие счета. Срочные вклады не могут быть изъяты без потери процента, до определённого срока или без предупреждения, с ними обычно не производятся безналичные операции. Текущие счета используются для безналичных расчётов с помощью чеков или платёжных поручений, они могут быть изъяты без предупреждения. По текущим счетам банки платят более низкий процент или совсем его не платят. Система безналичных расчётов имеет чрезвычайно важное значение для функционирования капиталистической экономики. Их объём и однотипность технических операций заставляют и позволяют широко применять механизацию и автоматизацию операций. В крупных банках всё шире внедряется электронно-счётная техника. Так, если в 1962 электронно-вычислительные машины (ЭВМ) использовались в 116 Американских банках, то в середине 1967 – в 943 банках. Банки предоставляют самые различные ссуды по срокам, характеру обеспечения и типу заёмщика, а также приобретают и держат государственные и частные ценные бумаги. Связь между пассивными и активными операциями банков сложна и своеобразна. С одной стороны, предоставление ссуд происходит за счёт денежного капитала, собираемого путём пассивных операций. С другой стороны, банковая система обладает способностью ‘создавать депозиты’ посредством зачисления суммы ссуд на счета клиентов. Эта возможность ограничивается объективными экономическими факторами, а также необходимостью поддержания ликвидности банков и, в частности, обязательностью хранения части средств на счетах в центральном банке. Возможности, пределы и последствия кредитной экспансии банков – важнейшая проблема теории банков и кредита, а также практики и государственной политики в капиталистических странах. Несомненно, что банки могут в сильнейшей мере способствовать чрезмерному разбуханию кредита в фазе циклического подъёма экономики и форсировать своей кредитной экспансией инфляцию. Экономическая Роль Капиталистических Банков:- Банки обеспечивают передачу денежного капитала из тех сфер хозяйства и общества, где он накопляется, в те сферы, где он используется. Благодаря банкам действует стихийный механизм распределения капитала по сферам и отраслям производства и происходит известное выравнивание нормы прибыли. Банки играют важную роль в экономии обществ, издержек обращения и рационализации всех процессов обращения товаров и капитала. Их функционирование тесно связано с денежным обращением. Банки продолжают быть центрами хозяйственной жизни, играть видную роль в процессах централизации и концентрации капитала, в развитии монополистической структуры экономики. Банки и кредитная система в целом позволяют финансовой олигархии использовать под своим контролем не только капиталы рантье и временно свободные денежные капиталы предприятий, но и сбережения и постепенно расходуемые доходы всех слоёв населения. Они сосредоточивают в своих руках расчёты между предприятиями и в немалой мере расчёты предпринимателей с потребителями. Усиливая обобществление производства и в то же время способствуя концентрации контроля над общественным богатством в руках узкого круга монополистов, банки обостряют противоречия капитализма. Наиболее резко эта их роль проявляется в том, что они усиливают экономические кризисы перепроизводства. Кредитуя капиталовложения и расширение продукции, банки усиливают перепроизводство, выход производства за пределы платёжеспособного спроса. В ходе самого кризиса они могут обострять его, сокращая ссуды и повышая ссудный процент. Особенно усиливают кризис частые банкротства банков. С другой стороны, банки играют важнейшую роль в проведении государственно-монополистических мероприятий, направленных на ослабление цикличности капиталистической экономики. Банки и кредит служат одним из важных факторов создания в недрах капитализма материальных предпосылок перехода к социализму, на что неоднократно указывали Карл Маркс и Владимир Ильич Ленин. Маркс пишет, что банковская система по своей формальной организации и централизации ‘... представляет собой самое искусное и совершенное творение, к которому вообще приводит капиталистический способ производства... В банковской системе, конечно, дана форма общественного счетоводства и распределения средств производства в общественном масштабе, но только форма’ (Карл Маркс и Фридрих Энгельс, Соч., 2 Изд., Т. 25, Ч. 2, С. 156). Однако по своему содержанию это общее счетоводство и распределение являются частнокапиталистическими и служат целям увеличения прибыли буржуазии. В рамках капитализма никакая банковская система не может преобразовать способ производства и организовать действительно планомерное распределение средств производства в интересах и в масштабах всего общества. Созданная капитализмом банковская система используется социалистическим государством для развития производительных сил и построения социализма. Банки При Социализме:- Банки социалистических стран обслуживают денежный оборот и кредитные отношения в социалистической экономике и осуществляют учёт и контроль за хозяйственно-финансовой деятельностью государственных и кооперативных предприятий. Основоположники научного коммунизма подвергли критике разного рода мелкобуржуазные реакционные ‘теории’ о социалистическом преобразовании общества путём изменения одной лишь кредитной системы. Карл Маркс писал ‘...кредитная система послужит мощным рычагом во время перехода от капиталистического способа производства к способу производства ассоциированного труда, – однако лишь как элемент в связи с другими великими органическими переворотами в самом способе производства’ (там же, С. 157). Использование банков в качестве рычагов социалистического переустройства общества возможно лишь при условии обобществления производства диктатурой пролетариата, создания социалистических производственных отношений. Процесс становления нового экономического строя включает в себя не только социалистическое обобществление производства, но и создание социалистической системы распределения и обмена общественного продукта, в которую входят, в частности, банки, аппарат учёта и распределения. Программные положения Карла Маркса и Фридриха Энгельса об использовании банков социалистическим государством были творчески развиты Владимиром Ильичом Лениным с учётом новых исторических условий и на основе практики Великой Октябрьской Социалистической Революции. Определяя главное направление в работе банков после социалистической революции, Ленин писал:- ‘Банковская политика, не ограничиваясь национализацией банков, должна постепенно, но неуклонно направляться в сторону превращения банков в единый аппарат счетоводства и регулирования социалистически организованной хозяйственной жизни всей страны в целом’ (Полное Собрание Сочинений, 5 Издание, Том 36, С. 220). Ленинский план социалистического преобразования банков включал, помимо национализации капиталистических банков, следующие основные элементы:- объединение национализированных банков в единый общенациональный государственный банк, увеличение сети его филиалов и распространение их по всей стране, демократизацию банковского дела, концентрацию в государственных банках всего денежного оборота страны и развитие безналичных расчётов через банки. Ленин отмечал, что только государственная монополия банковского дела позволяет социалистическому государству направлять и контролировать работу банков в соответствии с задачами планомерного развития экономики и неуклонного роста благосостояния народа, использовать их в качестве аппарата контроля за ходом выполнения народно-хозяйственного плана и для укрепления смычки между рабочим классом и крестьянством. Без крупных банков, которые становятся частью социалистического государственного аппарата, социализм был бы неосуществим. Ленинские положения о банке как аппарате учёта и контроля за хозяйственной деятельностью социалистических предприятий имеют значение для всех социалистических стран. Диктатура пролетариата использует банки, превращая их в один из мощных рычагов построения социализма. Банки при социализме

принципиально отличаются от капиталистических банков и имеют решающие преимущества перед ними. Кредитные вложения банков носят производительный и общественно полезный характер:- они используются для развития экономики и повышения уровня жизни народа. Все средства, аккумулированные банками, направляются на развитие производства, а также в сферу распределения и обращения; здесь объектом кредита не могут служить фиктивные ценности. Доходы от банковских операций используются на нужды народного хозяйства и населения. Банки не подвержены денежно-кредитным кризисам, так как социалистическая система хозяйства исключает возможность их возникновения. Объём кредитных, расчётных и кассовых операций банков растёт в соответствии с неуклонным ростом производства и обращения, способствуя осуществлению быстрыми темпами расширенного социалистического воспроизводства. Будучи аппаратом перераспределения денежных средств, банки планомерно организуют и концентрируют государственный фонд кредитования народного хозяйства, осуществляют его прямое, целевое и возвратное (краткосрочное и долгосрочное) кредитование, выдают ссуды населению на потребительские нужды, производят безвозвратное финансирование капитального строительства за счёт государственного бюджета и специальных целевых фондов. Через банки социалистические государства предоставляют кредит другим странам социалистического содружества и оказывают кредитную помощь развивающимся странам, сбросившим иго колониализма. Выполняя функцию расчётных центров социалистического хозяйства, банки организуют и производят безналичные расчёты между предприятиями за материальные ценности и услуги, а также расчёт предприятий с финансово-банковской системой. Банки осуществляют расчёты по внешнеторговым и другим экономическим взаимоотношениям с иностранными государствами. Единый эмиссионный банк социалистического государства (смотрите Государственный Банк СССР) производит эмиссионно-кассовое обслуживание социалистического хозяйства и населения и планомерное оперативное регулирование денежного обращения, концентрирует, накопляет и использует валютные фонды. Банки осуществляют экономическое стимулирование и контроль за хозяйственно-финансовой деятельностью социалистических предприятий, за ходом выполнения хозяйственных планов. Банковский контроль – одна из важных форм государственного контроля за работой предприятий. Поскольку через банки проходит весь денежный оборот народного хозяйства, они выполняют роль общегосударственного аппарата учёта и счетоводства социалистической экономики. Ведя счета предприятий и организаций, осуществляя их расчётное и кассовое обслуживание, банки способствуют сохранности денежных средств в народном хозяйстве и их экономии. Банки с помощью кредита и посредством расчётного и кассового обслуживания колхозов содействуют укреплению экономической смычки между рабочим классом и крестьянством, между государственными и кооперативными секторами социалистического производства. Банки оказывают помощь колхозам в составлении производственных и финансовых планов, в налаживании учёта и отчётности, в упорядочении их финансового хозяйства. Посредством кредитного, расчётного и валютного обслуживания внешнеторговых и других взаимоотношений между социалистическими странами банки содействуют дальнейшему упрочению их экономического сотрудничества и взаимопомощи. Для мировой социалистической системы характерны, как правило, общие черты реконструкции и развития банков. Основные из них:- ликвидация излишних звеньев банковской системы и построение её по функциональному признаку; переход от коммерческого кредита к прямому банковскому кредитованию предприятий; концентрация в общегосударственном центральном банке краткосрочного кредитования, расчётов и эмиссионно-кассового обслуживания народного хозяйства; организация безналичных межхозяйственных расчётов; осуществление кредитного планирования и планирования денежного обращения; организация экономического контроля за производственно-финансовой деятельностью предприятий через кредитные, расчётные и кассовые операции. Вместе с тем в структуре банков, в методах кредитования, расчётов и кассового обслуживания хозяйства, кредитного и кассового планирования, банковского контроля за работой предприятий в каждой социалистической стране имеются присущие ей характерные отличия. Банковская Система СССР:- Основным звеном Советской банковской системы является Государственный Банк СССР – единый эмиссионно-кассовый, кредитный и расчётный центр страны. В 1968 сеть учреждений Государственного Банка состояла из 4 115 филиалов и отделений и 76 548 сберегательных касс. Государственый Банк осуществляет все краткосрочные кредитования народного хозяйства (кроме строительных организаций), а также финансирование и долгосрочное кредитование государственных сельскохозяйственных организаций, долгосрочное кредитование колхозов и других видов кооперации. Общая сумма кредитных вложений Государственного Банка на начало 1969 составляла 98.4 миллиардов Рублей, в том числе краткосрочные кредиты – 88.9 миллиардов Рублей, или свыше 90%, а долгосрочные – 9.5 миллиардов Рублей, или менее 10%. Государственный Банк производит расчётное обслуживание народного хозяйства. Безналичный платёжный оборот, проходящий через Государственный Банк, составил в 1968 около 1 250 миллиардов Рублей. Государственный Банк осуществляет кредитное и кассовое планирование. Составление и исполнение кредитного плана производится на основе народно-хозяйственного плана и по мере его выполнения. В свою очередь кредитный план используется для активного воздействия на ход выполнения народно-хозяйственного плана, для выявления и мобилизации дополнительных внутренних ресурсов в хозяйстве. Кассовый план Государственного Банка определяет размеры его денежных оборотов. Государственный Банк концентрирует и накапливает валютные фонды страны (в виде драгоценных металлов и иностранной валюты) и производит расчёт по внешнеторговым и другим экономическим взаимоотношениям между СССР и иностранными государствами. Государственный Банк экономически стимулирует и контролирует Рублём хозяйственно-финансовую деятельность предприятий. Эффективность этого контроля обеспечивается дифференцированным подходом к предприятиям, оказанием материального поощрения хорошо работающим предприятиям в виде их льготного кредитования и применения санкции к плохо работающим предприятиям, переводом последних на особый режим кредитования. Через многочисленную сеть сберегательных касс Государственный Банк производит приём и хранение трудовых сбережений населения в форме различных вкладов, обслуживает население по операциям с государственными займами и безналичным расчётам (перечисляет со счетов вкладчиков средства на оплату коммунальных услуг и прочего). По вкладам, которые возвращаются по первому требованию их владельцев, сберкассы уплачивают проценты (либо выигрыши). Общая сумма вкладов населения на 1969 составляла 32.4 миллиарда Рублей и возросла по сравнению с 1950 в 17.5 раза, а средний размер вклада в 1968 достиг 473 Рубля и увеличился против 1950 почти в 3.5 раза. Рост вкладов свидетельствует о значительном повышении благосостояния трудящихся. Вторым звеном кредитной системы СССР является Всесоюзный Банк Финансирования Капитальных Вложений – Стройбанк. Он обслуживает капитальное строительство всех отраслей народного хозяйства, кроме сельского хозяйства (банковское обслуживание последнего осуществляет Государственный Банк). Стройбанк аккумулирует специально выделяемые хозяйственными организациями и бюджетом средства для выполнения плана капитальных вложений. За счёт этих средств Стройбанк осуществляет безвозвратное финансирование капитального строительства, предоставляя долгосрочный кредит на капитальное строительство, реконструкцию и ремонт и краткосрочный кредит строительным организациям на образование оборотных фондов. Сеть Стройбанка в 1968 состояла из 457 контор и отделений и 517 пунктов уполномоченных (при Государственном Банке). Кредитование внешней торговли СССР, валютные операции, расчёты по вывозу (или экспорту) и привозу (или импорту) товаров и оказанию услуг осуществляет Банк Для Внешней Торговли СССР (Внешторгбанк). Банковская Система Других Социалистических Стран:- Опыт СССР в создании социалистической банковской системы творчески используется другими социалистическими странами с учётом их специфических условий. В некоторых

странах (Монгольская Народная Республика (МНР), Куба, Албания) банковское обслуживание всего хозяйства, включая внешние экономические отношения страны, сосредоточено в едином государственном (национальном) банке. В Республике Куба Национальный Банк объединён с финансовыми органами и выполняет функции не только банковского, но и финансового государственного аппарата. Это связано с тем, что значительная часть промышленных предприятий находится на так называемом Полусметном Финансировании и Национальный Банк осуществляет безвозвратное финансирование за счёт государственного бюджета. В Китае банковское обслуживание хозяйства осуществляет единый общегосударственный банк (Народный Банк), но выделены специальные банки для внешней торговли страны. В Венгрии, Демократической Республике Вьетнам (ДРВ), Германской Демократической Республике (ГДР), Корейской Народно-Демократической Республике (КНДР), Румынии и Чехословакии, кроме общегосударственного банка, выделены, как и в СССР, банки для внешней торговли и банки капитальных вложений (строительные или инвестиционные). В ГДР, Болгарии и в Польше имеются также специализированные банки для обслуживания сельского хозяйства (Болгарский Промышленный Банк и Болгарский Земледельческий И Торговый Банк в Болгарии, Немецкий Крестьянский Банк в ГДР и Сельскохозяйственный Банк в Польше). В некоторых социалистических странах (ДРВ, ГДР, Югославия, Польша) для обслуживания единоличных крестьянских хозяйств используется кредитная кооперация. Особенно большое распространение имеет кредитная кооперация в Польше. В ГДР наряду с сельскохозяйственной кредитной кооперацией (крестьянские торгово-кредитные кооперативы) для обслуживания ремесленников и промысловой кооперации используется специальная форма кредитной кооперации – так называемые Ремесленно-Промысловые Банки, представляющие собой паевые товарищества ремесленников. Сберегательные кассы, обслуживающие население в СССР, МНР, Чехословакии, Кубе, Албании, Китае, входят в систему центрального государственного (национального, народного) банка. В других социалистических странах сберегательные кассы представляют собой самостоятельную систему, подчинённую Министерству Финансов страны. В Венгрии, ГДР и Румынии сберегательные кассы, кроме обычных операций, предоставляют населению ссуды на жилищное строительство и потребительский кредит. Существенно отличается своей организационной структурой и методами работы кредитная система Югославии. Она состоит из общегосударственного Народного Банка Югославии, деловых банков, сберегательных касс и кредитной кооперации. Народный банк, как правило, производит кредитное, расчётное и кассовое обслуживание не непосредственно хозяйственных организаций, а деловых банков. Последние являются хозяйственными органами, учреждаемыми предприятиями и общественно-политическими содружествами (федерацией, республиками, общинами) на паевых началах. Деловые банки (в 1968 их было свыше 170) подразделяются на инвестиционные и коммерческие. Допускается коммерческие кредитование по сделкам между предприятиями. Одна из особенностей кредитной системы Югославии – широкое использование ссудного процента в качестве регулятора кредитных вложений. Повышение Роли Банковского Кредита. В условиях проводимых с середины 1960-х в СССР и других социалистических странах экономических реформ усиливался процесс концентрации в банках государственных фондов краткосрочного и долгосрочного кредитования народного хозяйства; значительно расширялись границы банковского кредитования; совершенствовались методы кредитного и расчётного обслуживания хозяйства; активизировалось использование кредита как орудия стимулирования производства и контроля рублём, что повышало роль кредита банка в социалистическом хозяйстве. Укрепление собственной финансовой базы предприятий позволяло увеличить государственные ссудные фонды путём аккумуляции банками денежных средств, оставляемых в распоряжении предприятий. В СССР расширение границ банковского кредита осуществлялось прежде всего по линии кредитования капитальных вложений. На современном этапе коммунистического строительства банковский кредит наряду со средствами государственного бюджета становился одним из главных источников обеспечения капитальных вложений денежными ресурсами. Безвозвратное бюджетное финансирование капитальных работ по расширению и реконструкции действующих предприятий уступало место долгосрочному кредитованию. За счёт банковского кредита и предусмотренных финансовым планом собственных средств промышленности осуществлялось в соответствии с централизованным планом строительство тех новых предприятий, по которым капитальные вложения могли быть возмещены в срок до 5 лет с момента ввода предприятий в эксплуатацию. Переход от бюджетного финансирования к долгосрочному кредитованию указанных объектов был призван стимулировать ускорение ввода в эксплуатацию новых мощностей, экономически эффективное использование средств на капитальные вложения, поскольку кредитный метод предусматривал полное их возмещение в установленный планом срок. В значительно больших масштабах, чем до экономической реформы, предоставлялся банковский кредит на внедрение новой техники, механизацию, совершенствование и расширение производства, на осуществление мероприятий по повышению качества, надёжности и долговечности изделий, на затраты по выпуску новой продукции и так далее. Расширялись также границы банковского кредитования оборотных средств, прежде всего за счёт дальнейшего распространения кредитования постоянных (нормативных) затрат производства в несезонных отраслях промышленности. Это укрепляло кредитные связи Государственного Банка с ведущей отраслью экономики – тяжёлой промышленностью. Новым в кредитных отношениях Государственного Банка с промышленностью выступала замена бюджетного финансирования недостатка собственных оборотных средств банковским кредитом на срок до 2 лет. При всём многообразии конкретных форм изменений в работе банков, которые проводились в связи с экономическими реформами в разных социалистических странах, эти изменения имели следующие общие черты:- повышение роли банковского кредита в расширенном воспроизводстве основных фондов путём перехода от бюджетного финансирования к xxxxx. Банки в дореволюционной России начали создаваться с 1750-х феодально-крепостническим государством. Эти банки до середины XIX века не столько способствовали развитию капиталистических отношений, сколько укреплению крепостнического хозяйства. Основной функцией банков дореформенной России было предоставление ссуд помещикам. Такие операции проводились Банком Для Дворянства (1754–86), Государственным Заёмным Банком (1786–1860) и другими. Кредитование торговли (главным образом внешней) проводилось в неизмеримо меньших размерах. Торгово-промышленную деятельность кредитовали:- Банк при Коммерц-Коллегии (1754–82), Учётные Конторы (1797–1817), Коммерческий Банк (1818–60), а также Астраханский Банк (1764–1821). В 1-й половине XIX века система банков, оставаясь неизменной, состояла из Государственного Заёмного и Государственного Коммерческого Банков в Петербурге, Петербургской Сохранной Казны, Московской Сохранной Казны и Приказов Общественного Призрения в губернских городах. Монополизация государством кредита, господство крепостнической системы, сковывавшей возможность превращения ‘празднолежащего’ капитала в функционирующий, привели к накоплению в казённых банка больших денежных вкладов (295 миллионов Рублей серебром в 1833, 970 миллионов Рублей серебром в 1859). Помимо выдачи долгосрочных ссуд помещикам, вклады (с 1810-х годов) использовались правительством в качестве займов, составляя подавляющую часть внутреннего государственного долга. Накануне реформы 1861 правительство было вынуждено ликвидировать все перечисленные банки. Это способствовало развитию системы капиталистических банков в России. В 1860 был учреждён Государственный Банк, ставший крупнейшим коммерческим банков страны, а с 1896–97, после ликвидации бумажных денег и введения золотой валюты, – центральным эмиссионным банком России. В 1860-х учреждаются различные коммерческие и земельные банки. В России сложилась капиталистическая кредитная система. К началу 1-й Мировой Войны среди коммерческих банков центральное место занимали Государственный Банк и Акционерный Коммерческий Банк. Имелось много банков, кредитовавших в основном средние слои

торгово-промышленной буржуазии, в виде обществ взаимного кредита, а также городских общественных банков, принадлежавших местным самоуправлениям. Акционерные коммерческие банкт к 1914 вложили огромные средства в кредитование торговли, финансирование промыщленных и других предприятий. Концентрация капиталов в акционерных коммерческих банках была чрезвычайно высокой и превосходила уровень, достигнутый в главных капиталистических странах. Крупнейшие акционерные банки превратились в монополистов, хозяев внутренненго денежного рынка и Петербургской Фондовой Биржи, в главных посредников между заграничными денежными рынками и Русскими предприятиями. Они играли активную роль в образовании и укреплении синдикатов и трестов в России. Во время промышленного подъёма 1909–13 банковские монополии вложили сотни миллионов Рублей в расширение крупных предприятий, особенно тяжёлой промышленности. Напротив, в годы 1-й Мировой Войны финансирование промышленности, переключившейся на военные поставки, велось в основном Казначейством. В связи с этим паразитизм Русских банковских монополий резко усилился, они использовали свои ресурсы на финансирование военных расходов государства, разнузданную спекуляцию товарами и акциями, а также для расширения контроля над разными предприятиями. Контроль или влияние крупных банковских монополий к 1917 распространялись на 468 промышленных и непромышленных предприятий с капиталом в 2.17 миллиарда Рублей, что составляло 19% к числу всех акционерных предприятий и 44% к их капиталу. Особенно значительным было влияние банков в металлургии, машиностроении, нефтяной и цементной, сахарной и табачной промышленности, в частном железнодорожном и водном транспорте. Крупнейшие Русские банки были тесно связаны с проникавшими в Россию иностранными финансово-капиталистическими группами и важнейшими Французскими и Германскими банками. Последним принадлежала в некоторых ведущих Русских банках значительная часть их акционерного капитала. Акционерные коммерческие банки пользовались правительственной поддержкой. Учреждение новых акционерных банков жёстко ограничивалось правительством. В разное время в России действовал всего лишь 91 акционерный коммерческий банк, тогда как в других капиталистических странах – сотни, а в США – тысячи. Такая политика правительства ускоряла централизацию капиталов в существующих банках, а с наступлением империализма способствовала усилению процессов монополизации кредита. Земельный кредит в России был представлен двумя государственными банками – Дворянским и Крестьянским (на их долю в 1914 приходилось свыше 60% заложенных сельско-хозяйственных земель), 8 местными дворянскими банками, 10 акционерными земельными банками и 36 городскими кредитными обществами. Всеми земельными банками было выпущено к 1914 на 5.4 миллиардов Рублей закладных листов (вид долгосрочных облигаций, с помощью которых ипотечные банки привлекали средства капиталистов), и предоставлено долгосрочных ссуд на 5.3 миллиардов Рублей, из них свыше 3.6 миллиардов Рублей было выдано под залог сельскохозяйственных земель, в том числе до 60% получено помещиками, а 40% направлено через Крестьянский Банк на финансирование покупок помещичьих земель кулацко-зажиточной верхушкой деревни по завышенным ценам (смотрите Столыпинская Аграрная Реформа). Потребность деревенских верхов в сельскохозяйственном производственном кредите удовлетворялась так называемыми Крестьянскими Общественными Учреждениями и Земскими Кассами Мелкого Кредита, а главным образом – ссудо-сберегательными и кредитными товариществами (кредитной кооперацией). Таких учреждений и товариществ в 1914 было 18 тысяч с 645 миллионами Рублей выданных ссуд. Сберегательные кассы в России принадлежали государству, причём правительство использовало вклады (к 1914 – 1.7 миллиардов Рублей) для вложения в государственные облигации и закладные листы государственных земельных банков. В ходе Великой Октябрьской Социалистической Революции (или государственного переворота) 25 Октября (07 Ноября) 1917 Красная Гвардия и революционные солдаты овладели Государственным Банком, который перешёл в собственность Советского государства. Государственные земельные банки были упразднены Декретом Совета Народных Комиссаров (СНК) 25 Ноября (08 Декабря) 1917; Декретом Всероссийского Центрального Исполнительного Комитета (ВЦИК) от 14 (27) Декабря 1917 национализировались и сливались с Государственным Банком все частные банки, а банковское дело объявлялось государственной монополией.

BANK = ШПУЛЯРНИК (или СНОВАЛЬНАЯ РАМА, или СНОВАЛЬНАЯ КЛЕТКА) – Bank is another name for a yarn creel.

BANK BILL = БАНКОВСКИЙ ВЕКСЕЛЬ – Bank Bill is a draft or bill of exchange drawn on a bank and accepted by that bank. An important money market instrument in the United States. Also known as Banker's Acceptance.

BANK CHECK = БАНКОВСКИЙ ЧЕК – Bank Check is a check written by a bank which may be drawn on the issuing bank itself or on a third bank. Readily negotiable means of cashless payment. Also known as Banker's Draft.

BANK CLEARING = БАНКОВСКИЙ КЛИРИНГ (или БАНКОВСКИЕ РАСЧЁТЫ) – Bank Clearing is a settlement of mutual indebtedness arising from payment transfers among banks. / Расчёт взаимной задолженности, возникающей в результате осуществления платежей между банками.

BANK COMMISSION = БАНКОВСКАЯ КОМИССИЯ – In return for their services, banks receive remuneration (commission), e.g., for the purchase and sale of securities. Rates of commission vary. Fee for special services (credit commission) or for risk coverage added to interest charges in lending business.

BANK DEPOSITS = БАНКОВСКИЕ ВКЛАДЫ (или БАНКОВСКИЕ ДЕПОЗИТЫ) – Bank Deposits are the funds received by a bank from a depositor and placed in an interest-bearing or non interest-bearing account. The bank is entitled to use these funds for its own lending activities, but is required to make them available to the depositor upon demand (checking or demand deposit accounts) or at a specified time (time deposits). Checking accounts are considered as cash in the money supply (M1) because they are used in the same way as cash (checks or transfers used to make payments). Time deposits are considered as part of M2, as they are not as readily available.

BANK DRAFT = БАНКОВСКАЯ ТРАТТА – Bank Draft is a draft payable on demand and drawn by or on behalf of the bank itself; it is regarded as cash and cannot be returned unpaid. Also known as Banker's Draft. A bank instrument wherein payment of funds is guaranteed. An order issued by a seller against a purchaser; directs payment, usually through an intermediary bank. Typical bank drafts are negotiable instruments and are similar in many ways to checks on checking accounts in a bank. / закупщика; .

BANKER = БАНКИР – (1) Banker is a person involved in the business of banks and banking, or an institution that performs the same task for other institutions.

(2) Person who performs brokerage services in his capacity as owner of a banking institution or as an executive employee of a bank.

BANKER'S ACCEPTANCE = БАНКОВСКИЙ АКЦЕПТ – A Banker's Acceptance (BA or B/A) is a bill of exchange drawn on a bank. When the bank adds its acceptance to the bill of exchange, i.e. accepts it, the party drawing the bill of exchange receives an acceptance credit. As a rule, though, the accepting bank stipulates that it should discount the bill so that it earns the discount. The acceptance credit is only granted to firms with first-class creditworthiness. The banker's acceptance gives them access to an excellent and easily disposable form of loan funds. Banker's Acceptances are negotiable time drafts, or bills of exchange, that have been accepted by a bank which, by accepting, assumes the obligation to pay the holder of the draft the face amount of the instrument on the

maturity date specified. They are used primarily to finance the export, import, shipment or storage of goods. A Bankers' Acceptance is a time draft whose maturity is usually less than six months. The draft becomes a bankers' acceptance when the bank accepts it; that is, the bank upon which the draft is drawn stamps and endorses it as 'accepted'. Banker's Acceptance is a form of financing used in import/export transactions. Embody a short-term money claim in the form of a trade bill guaranteed by an American bank. Depending on the market situation, they offer a higher return than other forms of fixedinterest investment. A time draft or bill of exchange drawn on and accepted by a bank. The bank assumes an unconditional obligation to pay the face amount. Depending on the bank's creditworthiness, the acceptance becomes a financial instrument which can be discounted. Time draft that has been drawn on and accepted by a bank. In a large and active market, investors buy and sell bankers' acceptances at rates similar to, and often below, LIBOR. Rates are low due to the low risk of default on the part of a bank and the fact that there is generally an underlying trade transaction, the proceeds of which are pledged to cover the acceptance when it matures. Time draft or bill of exchange drawn on a bank and accepted by that bank. The draft is stamped 'accepted' and signed by a bank officer. By accepting the draft, the bank agrees to pay the face value of the obligation if the issuer (or drawer) fails to pay. See also Acceptance. Bills of exchange serving as money market paper in the United States and other countries, mostly denominated in US Dollars and accepted by large American banks. They bear interest for periods of 90–180 days on a discount basis and are used primarily to finance imports and exports. Abbreviation:- B/A. A draft or bill of exchange accepted by a bank where the accepting institution guarantees payment. Used extensively in foreign trade transactions. Also known as Bank Bill. Banker's Acceptances are short-term credit instruments issued by corporations to finance the import, export, transfer or storage of goods. They are termed 'accepted' when a bank guarantees their payment at maturity. These instruments reflect the obligations of both the bank and drawer to pay the face amount of the instrument at maturity. A Bankers' Acceptance is a time draft whose maturity is usually less than six months. The draft becomes a bankers' acceptance when the bank accepts it; that is, the bank upon which the draft is drawn stamps and endorses it as 'accepted'. Bankers' Acceptance involves the acceptance by a financial corporation of a draft or bill of exchange and the unconditional promise to pay a specific amount at a specified date, i.e. held for maturity. These are treated as actual financial assets even though no funds may have been exchanged. / Обозначение:- . (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Банковский Акцепт – переводный вексель, акцептованный банком.

BANKERS' AUTOMATED CLEARING SERVICES (LTD) = УСЛУГИ АВТОМАТИЗИРОВАННОГО (или АВТОМАТИЧЕСКОГО) МЕЖБАНКОВСКОГО КЛИРИНГА (ДЛЯ БАНКИРОВ) (ЭЛ.ТИ.ДИ.) – Known as Bankers' Automated Clearing Services Ltd until 1986:- The great majority of interbank electronic credits (including standing orders) are processed by BACS Ltd, although these are mainly small and medium-value items. Standing orders are used largely by individuals for the payment of regular fixed sums. After a period of decline during the early 1990s, as companies and other institutions encouraged customers to make greater use of direct debits, the total volume of such orders has been increasing over the past five years (1998–2003). BACS has also developed a separate credit transfer system for domestic Euro transactions, which operates in a similar way to its sterling direct credit service. A number of members now offer the Euro service to their corporate customers. However, the number of payments cleared through the BACS Euro scheme remains very low. BACS Ltd (known as Bankers' Automated Clearing Services Ltd until 1986) offers an Automated Clearing House (ACH) service, providing electronic bulk clearing for direct debits, standing orders and other non-urgent, automated credit transfers. In the UK payments industry, the main private sector body is the Association for Payment Clearing Services (APACS), set up in 1985. APACS is a non-statutory association providing a forum for the major banks and building societies to discuss non-competitive issues relating to money transmission. Three operational clearing companies currently fall under the APACS umbrella:- CHAPS Clearing Company; BACS Ltd; and Cheque and Credit Clearing Company Ltd. There are two retail-oriented payment clearing arrangements in the United Kingdom. The BACS system offers an ACH service handling electronic payment orders, whilst the Cheque and Credit Clearing Company processes paper items such as cheques and credit vouchers. For both these clearings there is a two-tier access structure with direct settlement members and 'indirect' participants. Settlement between direct members occurs across accounts held at the Bank of England. BACS is an ACH responsible for clearing bulk electronic transfers in both debit and credit form, and now processes the great majority of electronic interbank funds transfers in the United Kingdom. The clearing is operated by BACS Ltd. The service (which began operating in 1968 as the Interbank Computer Bureau) was established to provide a more efficient method of handling interbank transfers by means of magnetic tape rather than paper instruments, although BACS transfers are now exclusively input through telecommunications links. BACS clears sterling-denominated standing orders, direct debits and direct credits. It has also recently introduced a separate credit transfer system for domestic Euro transactions. There is no restriction on the value of individual payment instructions submitted to BACS, although in practice the vast majority of transfers processed are of low value. BACS has announced a major technology renewal program to meet the rapidly growing demand for electronic payments and to integrate the latest security methods. This program is known as 'NewBACS' and is scheduled for completion by 2005. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). двухъярусное (two-tier).

BANK FOR INTERNATIONAL SETTLEMENTS = БАНК МЕЖДУНАРОДНЫХ РАСЧЁТОВ – Bank for International Settlements (BIS) was established on 1930-May-17 by an International Agreement concluded between Belgium, Germany, France, Italy, Japan, the United Kingdom and the United States, the BIS is the world's oldest international financial organization. The Bank for International Settlements (BIS) is an international organization which fosters international monetary and financial cooperation and serves as a bank for central banks. In fulfilling its mandate, the BIS acts as:- (i) a forum to promote discussion, policy analysis and facilitate decision-making processes among central banks and within the international financial community; (ii) a center for economic and monetary research; (iii) a prime counterparty for central banks in their financial transactions; and (iv) agent or trustee in connection with international financial operations. The head office is in Basel, Switzerland and there are two representative offices:- in the Hong Kong, Special Administrative Region of the People's Republic of China and in Mexico City, Mexico. As its customers are central banks and international organizations, the BIS does not accept deposits from, or provide financial services to, private individuals or corporate entities. The BIS strongly advises caution against fraudulent schemes. An international bank headquartered in Basel, Switzerland, which serves as a forum for monetary cooperation among several European central banks, the Bank of Japan, and the US Federal Reserve System. Founded in 1930 to handle the German payment of World War I reparations, it now monitors and collects data on international banking activity and promulgates rules concerning international bank regulation. The Bank for International Settlements (BIS) was established in 1930 by intergovernmental convention. The BIS promotes co-operation among central banks. In this capacity it carries out four main functions:- (i) it holds and manages deposits from A large number of central banks throughout the world; (ii) it serves as a forum for international monetary co-operation; (iii) it acts as an agent or trustee in the execution of various international financial agreements; and (iv) it carries out research and issues publications on monetary and economic subjects. Bank for International Settlements (BIS) is international organization established in 1930 and based in Basle, Switzerland, that serves as a forum for central banks collecting information, developing analyses and cooperating on a wide range of policy-related matters. The Bank for International Settlements (BIS) is an international organization which fosters international monetary and financial cooperation and serves as a bank for central banks. The BIS fulfils this mandate by acting as:- (i) a forum to promote discussion and policy analysis among central banks and within the international financial community; (ii) a center for economic and monetary research; (iii) a prime

counterparty for central banks in their financial transactions; and (iv) agent or trustee in connection with international financial operations. The head office is in Basel, Switzerland and there are two representative offices:- in the Hong Kong Special Administrative Region of the People's Republic of China and in Mexico City. As its customers are central banks and international organizations, the BIS does not accept deposits from, or provide financial services to, private individuals or corporate entities. The BIS:- (i) aims at promoting monetary and financial stability; (ii) acts as a forum for discussion and cooperation among central banks and the financial community; and (iii) acts as a bank to central banks and international organizations. The Bank for International Settlements was established on 1930-May-17. It is the world's oldest international financial institution and remains the principal center for international central bank cooperation. The BIS was established in the context of the Young Plan (1930), which dealt with the issue of the reparation payments imposed on Germany by the Treaty of Versailles following the First World War. The new bank was to take over the functions previously performed by the Agent General for Reparations in Berlin:- collection, administration and distribution of the annuities payable as reparations. The Bank's name is derived from this original role. The BIS was also created to act as a trustee for the Dawes and Young Loans (international loans issued to finance reparations) and to promote central bank cooperation in general. The reparations issue quickly faded, focusing the Bank's activities entirely on cooperation among central banks and, increasingly, other agencies in pursuit of monetary and financial stability. Since 1930, central bank cooperation at the BIS has taken place through the regular meetings in Basel of central bank Governors and experts from central banks and other agencies. In support of this cooperation, the Bank has developed its own research in financial and monetary economics and makes an important contribution to the collection, compilation and dissemination of economic and financial statistics. In the monetary policy field, cooperation at the BIS in the immediate aftermath of the Second World War and until the early 1970s focused on implementing and defending the Bretton Woods system. In the 1970s and 1980s, the focus was on managing cross-border capital flows following the oil crises and the international debt crisis. The 1970s crisis also brought the issue of regulatory supervision of internationally active banks to the fore, resulting in the 1988 Basel Capital Accord and its 'Basel II' revision of 2001–06. More recently, the issue of financial stability in the wake of economic integration and globalization, as highlighted by the 1997 Asian crisis, has received a lot of attention. Apart from fostering monetary policy cooperation, the BIS has always performed 'traditional' banking functions for the central bank community (e.g., gold and foreign exchange transactions), as well as trustee and agency functions. The BIS was the agent for the European Payments Union (EPU, 1950–58), helping the European currencies restore convertibility after the Second World War. Similarly, the BIS has acted as the agent for various European exchange rate arrangements, including the European Monetary System (EMS, 1979–94) which preceded the move to a single currency. Finally, the BIS has also provided or organized emergency financing to support the international monetary system when needed. During the 1931–33 financial crisis, the BIS organized support credits for both the Austrian and German central banks. In the 1960s, the BIS arranged special support credits for the French Franc (1968), and two so-called Group Arrangements (1966 and 1968) to support sterling. More recently, the BIS has provided finance in the context of IMF-led stabilization programmes (e.g., for Mexico in 1982 and Brazil in 1998). Twenty-nine members with the goal of promoting cooperation among central banks in international financial settlements. The BIS offers a wide range of financial services specifically designed to assist central banks and other official monetary institutions in the management of their foreign exchange reserves. Some 140 customers, including various international financial institutions, currently make use of these services. On average, over the last few years, some 4% of global foreign exchange reserves have been invested by central banks with the BIS and as of 2009-March-31, customer placements amounted to SDR220 billion. BIS financial services are provided out of two linked trading rooms:- one at its Basel head office and one at its office in Hong Kong SAR. The Bank continually adapts its product range in order to respond more effectively to the evolving needs of central banks. Besides standard services such as sight/notice accounts and fixed-term deposits, the Bank has developed a range of more sophisticated financial products which central banks can actively trade with the BIS to increase the return on their foreign assets. The Bank also transacts foreign exchange and gold on behalf of its customers. In addition, the BIS offers a range of asset management services in sovereign securities or high-grade assets. These may be either a specific portfolio mandate negotiated between the BIS and a central bank or an open-end fund structure – the BIS Investment Pool (BISIP) – allowing customers to invest in a common pool of assets. The two Asian Bond Funds (ABF1 and ABF2) are administered by the BIS under the BISIP umbrella:- ABF1 is managed by the BIS and ABF2 by a group of external fund managers. The BIS extends short-term credits to central banks, usually on a collateralized basis. From time to time, the BIS also coordinates emergency short-term lending to countries in financial crisis. In these circumstances, the BIS advances funds on behalf of, and with the backing and guarantee of, a group of supporting central banks. The Bank's Statutes do not allow the Bank to open current accounts in the name of, or make advances to, governments. The BIS does not accept deposits from, or generally provide financial services to, private individuals or corporate entities. The BIS international financial statistics are a unique source of information on various elements of the global financial system. They include data on:- (i) the cross-border lending and borrowing of internationally active banks in key financial centers, including offshore centers (banking statistics); (ii) issuing activity in international and domestic securities markets (securities statistics); (iii) operations in over-the-counter and exchange-traded derivatives markets (derivatives statistics); (iv) effective exchange rate (EER) indices for 58 economies (effective exchange rates); (v) operations in the global foreign exchange markets (foreign exchange statistics); (vi) external debt positions of individual countries based on BIS banking and securities statistics as well as on data from other international organizations (external debt statistics); and (vii) payment and settlement systems in major financial centers (payment statistics). The International Association of Insurance Supervisors, which operates from the BIS, publishes data on the global reinsurance market. Bank for International Settlements (BIS) is based in Basel, Switzerland. It was founded in 1930 and now acts as a non-political central bank for central banks. Website:- http://www.bis.org. The Bank for International Settlements (BIS) is a joint stock corporation headquartered in Basel, Switzerland. It is wholly owned by 55 national central banks. Its tasks comprise the administration of parts of international currency reserves and at the same time the coordination and resolution of problems in international monetary and currency policy. The BIS is therefore considered to be the bank of the world's central banks. / Банк Международных Расчётов (БМР) является международной валютно-кредитной организацией, основанной 17 Мая 1930 в Базеле, Швейцария в соответствии с Планом Юнга первоначально для расчётов по репарационным платежам Германии и межсоюзническим долгам после Первой Мировой Войны. Впоследствии направления деятельности банка менялись. С начала 1960-х БМР стал координировать действия по оказанию помощи валютам, по поддержке международной валютной системы, являлся финансовым агентством Европейского Объединения Угля и Стали, Европейской валютной системы. Банк Международных Расчётов функционирует на чисто коммерческой основе как акционерное общество. Акционерами БМР являются центральные банки 30 стран (1984). Банк Международных Расчётов (БМР; Bank for International Settlements (BIS)), международный финансовый институт, созданный в 1930 в Базеле (Швейцария) центральными банками Англии, Франции, Германии, Бельгии, Италии, тремя частными банками Соединённых Штатов Америки (США) во главе с Банкирским Домом Морганов и Японскими частными банками. Учреждение БМР было предусмотрено Гаагской Конвенцией (Планом Юнга, 1930). Банку было поручено принимать и выплачивать Германские репарационные платежи, включая расчёты за поставки натурой, и оплачивать межсоюзнические долги, осуществлять операции, связанные с займом Юнга, главным образом США, и обслуживать платежи по займам Дауэса и Юнга. В связи с прекращением платежей по репарациям и военным долгам с 1931 характер деятельности банка меняется. БМР покупает и продаёт золото и иностранную валюту, принимает от центральных банков на хранение золото, предоставляет и

получает от них ссуды под залог золота или легко реализуемых краткосрочных обязательств, включая казначейские векселя, покупает и продаёт котирующиеся на бирже облигации. Банк не имеет права выпускать банкноты, оплачиваемые по предъявлению, акцептовать тратты (переводные векселя), предоставлять ссуды правительствам, приобретать контроль над предпринимательскими компаниями. В годы 2-й Мировой Войны 1939–45 в БМР хранилось золото, награбленное фашистами. В банке продолжалось сотрудничество между директорами стран антигитлеровской коалиции (Франции, Англии и США) и фашистских стран. Валютно-финансовая конференция в Бреттон-Вудсе (1944) приняла решение о ликвидации БМР, но, пользуясь поддержкой реакционных элементов стран-членов банка, он уцелел и стал расширять свои операции. Банк участвовал в проведении операций по 'Плану Маршалла', осуществлял многосторонние клиринги для Европейского Платёжного Союза, после роспуска последнего – в рамках Европейского Валютного Соглашения. БМР является финансовым агентом Европейского Объединения Угля И Стали, Международного Красного Креста, Всемирного Почтового Союза и других. БМР выступает в качестве Европейского вспомогательного органа Международного Валютного Фонда и Международного Банка Реконструкции И Развития, которому он содействует в размещении облигаций банка в Швейцарии. С начала 1960-х БМР стал центром международных соглашений империалистических держав по поддержке мировой валютной системы капитализма (смотрите Валютный Кризис). Он участвовал в кредитовании Англии и Федеральной Резервной Системы США на основе соглашений типа 'Своп' (операций по взаимному обмену валютой на срок по твёрдому курсу) (смотрите Валютный Рынок). В 1968–69 принимал участие в кредитах Франции. Являлся агентом 'Золотого Пула'. В 1951 Япония выбыла из состава БМР. В 1968 в БМР входили центральные банки всех Европейских капиталистических и социалистических стран, кроме СССР и Германской Демократической Республики (ГДР); представителем США на общих собраниях акционеров является Фёрст Нэшэнэл Сыти Банк Оф Нью Йорк. В 1970 акционерами БМР стали Япония и Канада. 75% акций БМР принадлежит центральным банкам и 25% – частным банкам и лицам, банки-учредители располагают более 50% акций. Текущими делами банка руководит Совет Директоров, в состав которого входят 8 Управляющих центральными банками Европейских стран:- Англии, ФРГ, Франции, Бельгии, Италии, Швейцарии, Швеции и Нидерландов и 5 представителей финансовых, промышленных и торговых кругов, назначаемых этой восьмёркой. БМР имеет валютно-экономический отдел, осуществляющий исследования в области международных валютно-кредитных отношений. Выпускает ежегодный обзор, в котором даёт информацию и исследования международных валютно-кредитных отношений за год, и текущий бюллетень. Акционерный капитал в 1930 был установлен в 500 миллионов золотых Франков, в Декабре 1969 увеличен до 1.5 миллиардов Франков. На 31 Марта 1969 оплаченный капитал составлял 125 миллионов золотых Франков (1 золотой Франк = 0.29 грамма (г) чистого золота); баланс составил 14.6 миллиардов золотых Франков, в том числе вклады центральных банков в золоте – 4.8 миллиардов Франков, в иностранной валюте – 6.6 миллиардов Франков, в активе – золото в слитках – 4.0 миллиарда Франков, ссуды (в большинстве краткосрочные) – 9.0 миллиардов Франков.

BANKGIROT = БАНКШИРО – In Sweden, the Bankgirot system is mainly used for credit transfers between bank accounts. By contrast with the Postgirot system, there are no separate Bankgirot accounts; instead, ordinary bank accounts are given a Bankgirot number. In other words, the Bankgirot system is an 'open' payment system in which customers can transfer payments from an account with one bank to an account with another bank. The Bankgirot is an ACH (Automated Clearing House) managed by BGC (short for the Bankgirocentralen) and owned by the banks. 20 banks are currently affiliated to it. BGC manages and develops the Bankgirot system and offers its products and services to the banks on a purely subcontractual basis. A wide range of information services relating to the processing of payments is included in the services offered to banks. The Bankgirot system mainly handles retail payments, but also processes certain large-value payments. Bankgirot payments are settled on a bilateral net basis in the RIX system, whereby payment orders between each pair of banks are calculated to a net debit or credit position. These net balances are registered in the banks' accounts at the Riksbank for settlement during the day. If one participant has liquidity problems at the time of settlement, the payment is put in a queue. The transaction is queued for no longer than 30 minutes; if the bank is still unable to settle its net position after this period, the net position is recalculated as a pair of gross payments. In this way, a bank's liquidity problems do not hinder a counterpart from settling its own obligations. Different types of payment have different settlement schedules throughout the day. After settlement, the underlying payments are sent to the receiving bank by file transfer. The Bankgirot system differs from the Postgirot system in that it only has customer relationships with the banks. These banks, whether they are shareholders of BGC or not, are charged at cost. Banks face a combination of fixed transaction fees and variable fees that decrease with the volume of transactions conducted. Partly in response to the rapid development of electronic payment delivery and processing technology, such as internet payment services, and after discussions with the Riksbank, BGC adopted in 1999 a new technical platform and new clearing procedures. The development of the new clearing platform has led to the full integration of all systems involved in the clearing and settlement cycle, namely the RIX system, BGC's clearing information system and the clearing participants' internal systems. There have been two additions to the existing communication channels:- a new internet-based information channel and a new interface between BGC and the clearing participants. These allow the participants to follow their clearing positions in real time via the internet. The system handles two types of clearing and settlement methods:- bilateral gross and net clearing and settlement. It has several clearing and settlement cycles per day, one or more for each category of payment. The number of payment services processed by the new platform is gradually increasing. The clearing and settlement of banks' cash transactions through Bank of Sweden's subsidiary, Pengar i Sverige AB (PSAB), which was previously carried out by the Riksbank, has been included in the range of services provided by the new BGC system. Also the Data Clearing System has been integrated into BGC's new technical platform. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). система Постширо (Postgirot system). Банкширосэнтрален (Бэ.Гэ.Сэ.; Bankgirocentralen (BGC)). Государственный Банк или Риксбанк (Riksbank). в системе РИКС (RIX system). Пеньгар и Свэрье А.Бэ. (Пэ.Эс.А.Бэ.; Pengar i Sverige AB (PSAB)).

BANK GUARANTEE = БАНКОВСКАЯ ГАРАНТИЯ – (1) The term Bank Guarantee refers to sureties, guarantees and standby letters of credit. The bank guarantee is an instrument which business partners can use to strengthen and/or secure an obligation in their contract. The Principal – the party who requests that the guarantee is issued – applies to his bank for a bank guarantee to be issued in favor of the Beneficiary – the party who will receive the guarantee. After examining and approving the Principal's application, the bank draws up a contract with the Principal – the Counter-Indemnity. The Counter-Indemnity states, among other things, the rights and obligations of the Principal and the bank in relation to possible payment for claims under the guarantee. Once all of this is in place, the bank then issues the guarantee. By issuing the guarantee the bank offers a security to the Beneficiary that is separate from the Principals ability or will to fulfil his part of the contract. For example, a guarantee can be issued to secure the repayment of an advance payment if delivery does not take place. Bank guarantees can also be used to secure performance under a contract. Such a guarantee does not however mean that the bank completes the project in the event of non-performance. Instead the bank's undertaking is a payment obligation. Funds are then available to the Beneficiary to enable him to, for example, complete the project with another party. In general banks issue two different kinds of guarantees:- (i) Accessory and (ii) Non-Accessory guarantees. Guarantees can be divided into two kinds – those that are linked to the underlying contract – an accessory relationship, and those that are independent or an non-

accessory relationship. The former are often referred to as 'Borgen' in Sweden. The latter category can be broken down further into Demand Guarantees and Standby Letter of Credit. A guarantee can be issued by the Principal's bank either directly to the Beneficiary (a 3-part guarantee or direct guarantee) or through a bank in the Beneficiary's country, (a local bank guarantee, a 4-part guarantee or an indirect guarantee). In the latter case, the Principal's bank (the Instructing Bank) instructs a local bank (the Issuing Bank) to issue the guarantee in favor of the Beneficiary. As security, the Instructing Bank issues a counter-guarantee in favor of a local bank, entitling it to the right to submit a claim to the Instructing Bank in the event of payment of a claim. With a direct guarantee, the Principal's bank issues the guarantee directly to the Beneficiary making this type of guarantee less expensive for the Principal as there are no foreign bank costs. Furthermore, the Issuing Bank has better control in the event of a claim under the guarantee, giving the Principal a certain amount of security. The Principal also has better control when the guarantee is eventually handed over to the Beneficiary. Certain contracts may stipulate a guarantee to be issued by the Local Bank. This is even required by law in some countries and can be common market practice. Beneficiaries may view the Local Bank guarantee as more secure, as they only need to deal with their own bank. The International Chamber of Commerce (ICC), Paris, France has compiled several sets of rules for dealing with guarantees. By referring to the ICC rules in a guarantee you define a number of the different parties rights and obligations without having to specify them in the guarantee text, thereby reducing the risk of misunderstanding and creating a simplier text. Many banks recommend the use of the ICC rules and, in particular when applicable, the rules for demand guarantees URDG 458 ICC Publication 458 and ISP98 ICC Publication 590. See also Accessory Guarantee, Demand Guarantee, and Non-Accessory Guarantee. Guarantee made by a bank that it will pay an exporter for goods shipped if a foreign purchaser defaults; the guarantee is obtained by the foreign purchaser. An assurance, obtained from a bank by a foreign purchaser; that the bank will pay an exporter up to a given amount for goods shipped if the foreign purchaser defaults. A statement issued by an importer's bank guaranteeing the payment of (L/C) drafts to the exporter or to the carrier. Types of Bank Guarantees:- advance payment bond, advance payment guarantee, ancillary guarantee or contract guarantee, bid bond or bid guarantee, bill of lading guarantee, court guarantee, duty deferment bond, facility guarantee, guarantee for warranty obligations, guarantee securing a credit line, letter of indemnity for missing bill of lading, loan guarantee, loan note guarantee, maintenance guarantee, payment guarantee, performance bond or performance guarantee, retention guarantee, retention money guarantee, standby letter of credit, steamship guarantee, surety, tender bond, tender guarantee, trade debt guarantee, VAT bonds, warranty guarantee, and other specific guarantees, such as Civil Aviation Authority and Association of British Travel Agents Bonds. Civil Aviation Authority and Association of British Travel Agents Bonds required by applicants in the travel industry to enable participation in the ATOL (Air Travel Organiser's Licencing at Civil Aviation Authority, London, UK) and ABTA LTD (the travel association, London, UK) schemes, which offer holiday protection to travellers. Valid for 18 months, normally renewable every year; to allow for an annual licence plus a six month grace period for claims if the licence is revoked or not renewed. Various guarantee formats are available from both authorities. Bank Guarantee is a guarantee assumed by a bank. Bank can issue the Bank Guarantees which you may need for your financial or commercial transactions. These guarantees are subject to counter-guarantees such as blocked account, pledge or other. In some cases counter guarantee is a pledge of a deposit, in bank's investment fund, equal to 1.5 times the amount of the guarantee. Most of leading banks has a guarantee fee not exceeding 1% p.a. on the amount of the guarantee. Bank Guarantee is an indemnity issued by a bank. / если зарубежный закупщик окажется несостоятельным; . выплата (repayment) . гарантия по обязательствам ручательства (guarantee for warranty obligations). Заверение, полученное от банка . Новые Унифицированные Правила МТП (Международной Торговой Палаты) Для Гарантий по Требованию № 758 в редакции 2010 (ICC Uniform Rules For Demand Guarantees No. 758 (v. 2010)) изменили ряд ключевых моментов, определяющих порядок выпуска и обращения банковских гарантий, а также определили нововведения, применение которых значительно расширяет возможности использования банковских гарантий как внутри одной страны, так и при осуществлении международных операций. В частности:- (i) Унифицированными Правилами № 758 (Статья 2) установлен (определён) новый участник отношений, связанных с выдачей банковской гарантии – 'Инструктирующая Сторона', по просьбе которого банк может выдавать гарантию в пользу бенефициара (не имеющего никакого отношения к основной сделке). В настоящее время резиденты России находятся в неравных условиях в сравнении с остальными участниками отношений, связанных с выдачей гарантии, так как лишены дополнительных возможностей получения банковской гарантии. Так, например, выдача банковской гарантии по просьбе принципала, как правило, связана с оформлением обеспечения по банковской гарантии, которым на практике принципал может и не располагать или не желать временно отвлекать свободные денежные средства. Следовательно, появление третьей 'инструктирующей стороны' было обусловлено самой практикой применения гарантий. Инструктирующая сторона играет роль участника, имеющего свободные ресурсы для оформления обеспечения по банковской гарантии. Отношения между 'инструктирующей стороной' и принципалом выстраиваются исходя из договорных отношений и фиксируются в договорах. (ii) Новая редакция Унифицированных Правил № 758 даёт чёткое толкование в отношении принципа 'безотзывности' гарантии и не допускает двусмысленность трактования этого термина при применении гарантии, как это определялось ранее действующей редакцией. (iii) В международной банковской практике не встречается понятие 'подтверждённая гарантия'. Данную функцию (функцию подтверждения гарантии) может выполнять резервный аккредитив. (iv) Редакцией от 2010 Унифицированных Правил МТП Для Гарантий по Требованию № 758 (Статья 33) введено новое понятие 'Переводная (Трансферабельная) Гарантия' – и даны её характерные признаки. Банковская Гарантия – обязательство банка перед бенефициаром произвести платёж в его пользу в пределах указанной суммы денежных средств в случае, если третья сторона (контрагент бенефициара) не выполняет своего обязательства перед бенефициаром, или другого события, произошедшего или не произошедшего (гарантийного случая). В международной практике часто встречается схема с 'подтверждённой' гарантией. В 'подтверждённой' гарантии участвует второй банк. Этот банк (банк контргарант) запрашивает (инициирует) другой банк (банк гарант) выпустить гарантию в пользу бенефициара против его контр-гарантии в пользу банка гаранта.

(2) Bank Guarantee is:- (1) under certain circumstances, accepted in lieu of original bill of lading to release cargo. (2) A statement issued by an importer's bank guaranteeing the payment of (L/C) drafts to the exporter or to the carrier. (3) Other forms of guarantees by banks in favour of a beneficiary. Guarantee issued by a bank to a carrier to be used in lieu of lost or misplaced original negotiable bill of lading. Protection in writing to a Carrier for performing a deviation from normal business guaranteed by a bank. May under certain circumstances be accepted in lieu of original Bill of Lading to release cargo.

BANK HOLDING COMPANY = БАНКОВСКАЯ КОНТРОЛИРУЮЩАЯ КОМПАНИЯ (или БАНКОВСКАЯ ХОЛДИНЬГОВАЯ КОМПАНИЯ) – Bank Holding Company (BHC) is the company that owns, or has controlling interest in, one or more banks. A company that owns more than one bank is known as a Multibank Holding Company. In the United States, the Board of Governors (central, governmental agency of the Federal Reserve System, located in Washington, DC) is responsible for regulating and supervising bank holding companies, even if the bank owned by the holding company is under the primary supervision of a different federal agency (the Comptroller of the Currency or the Federal Deposit Insurance Corporation). / Банковская Контролирующая Компания или Банковская Холдиньговая Компания – компания, которая владеет двумя или более банками или иными банковскими холдиньговыми компаниями. В соответствии с определением, приведённым в Акте о Банковской Холдиньговой Компании от

1956 (Bank Holding Company Act of 1956), подобные компании подлежат обязательной регистрации в Совете Управляющих Федеральной Резервной Системы (Board of Governors of the Federal Reserve System) и подпадают под регулирование зарегистрированных банковских холдиньговых компаний. Поправки к Акту от 1956 установили правила приобретения компаний (1966) и отменили преимущества, которыми пользовались холдиньговые компании, включавшие только один банк (1970), ограничив, таким образом, деятельность банковских холдиньговых компаний только банковской сферой.

BANK IDENTIFIER = БАНКОВСКИЙ ИДЕНТИФИКАТОР (или ИДЕНТИФИКАТОР БАНКА) – Bank Identifier is a code that uniquely identifies a bank, and possibly a branch as part of a financial institution. / Под Банковским Идентификатором или Идентификатором Банка понимается код, который в единственном роде идентифицирует (отождествляет) банк и возможно филиал как часть финансового учреждения.

BANK IDENTIFIER CODE = БАНКОВСКИЙ ИДЕНТИФИКАЦИОННЫЙ КОД (или КОД ИДЕНТИФИКАТОРА БАНКА) – The Bank Identifier Code (BIC) is an internationally standardized bank code used for the clear identification of financial institutions. It is used worldwide in cross-border payments and in the international exchange of messages between banks. Bank Identifier Code (BIC) is an 8 or 11 character ISO code assigned by SWIFT and used to identify a financial institution in financial transactions. The Bank Identifier Code (BIC) is a universal method of identifying financial institutions in order to facilitate automated processing of telecommunication messages in banking and related financial environments. The BIC consists of eight or eleven contiguous characters comprised of the following components:- (i) Bank Code:- 4 alphanumeric characters. So far, the Registration Authority (i.e. SWIFT) has only used alphabetic characters; (ii) Country Code:- 2-letter country code as specifed in ISO 3166; (iii) Location Code:- 2 alphanumeric characters attributed by the RA (short for Registration Authority) to identify the location of the institution within the specified country; and (iv) Branch code (optional):- 3 alphanumeric characters identifying a branch or a department of the financial institution. A universal method of identifying financial institutions in order to facilitate the automated processing of telecommunication messages in financial environments. Also known as Bank Identification Code. ISO 9362 (also known as BIC code or SWIFT code) is a standard format of Bank Identifier Codes approved by the International Organization for Standardization. It is the unique identification code of a particular Bank. These codes are used when transferring money between banks, particularly international transfers. The code is 8 or 11 characters, made up of:- (i) 4 characters – bank code; (ii) 2 characters – ISO 3166-1 alpha-2 country code; (iii) 2 characters – location code; and (iv) 3 characters – branch code, optional ('XXX' for primary office). Where an 8-digit code is given, you may assume that it refers to the primary office. The Society for Worldwide Interbank Financial Telecommunication (SWIFT) handles the registration of these codes. For this reason, Bank Identifier Codes (BICs) are often called SWIFT Addresses or Codes. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BANKING = БАНКОВСКОЕ ОБСЛУЖИВАНИЕ – In the broadest sense of the term, Banking is the business of accepting temporary responsibility for safeguarding other people's money ('deposits') and then lending out these funds (along with the bankers' own funds) in order to earn interest for the bank's own account. Banking firms thus earn their profits primarily by serving as 'financial intermediaries' who mobilize the scattered savings of many households and firms (by offering safekeeping services and paying interest on at least some kinds of accounts) and then make these pooled funds available to suitable borrowers (to business firms that want to finance proposed investment projects or perhaps to consumers who want to finance big ticket durable consumers' goods like automobiles or perhaps to governmental entities whose policy-makers have decided to spend more money than they have received in revenue collections). The bank pledges its own capital (and also buys outside deposit insurance) to guarantee that any depositor can get all his/her money back in cash no later than some contractually specified length of time after giving notice of withdrawal. The bank makes this somewhat risky guarantee even though it is quite predictable that some (hopefully small) percentage of the loans the bankers make using depositers' funds will 'turn sour' and not be repaid by the borrower. The bank's profits arise mainly from the (positive) spread between its costs of securing and servicing deposits and its revenues from fees and interest on the loans extended. (Of course banks frequently seek to make additional profits selling other financial services to their clients and customers as well, but the business of accepting deposits and making loans is the defining core of the banking business.) Not all firms engaging in 'banking' in this broad sense are officially called 'Banks'. Savings and loan associations, credit unions and other miscellaneous thrift institutions provide similar services under other names. The laws of the United States and most other developed industrial countries provide for multiple types of financial intermediary institutions whose official 'labels' normally depend upon the selected purposes for which they will loan money (business loans, consumer loans, real estate mortgages, etc), the maximum time period for which they will contract a loan (2 years? 5 years? 30 years?), and the kinds of supplementary services (checking privileges, foreign exchange, management of trusts and estates, etc) that they may provide for their customers beyond basic taking of deposits and extension of loans. From the perspective of this course, banks are mainly of interest because of their key role in determining the size of the money stock. Considerably less than half of the US money stock (M1) consists of physical cash or currency (coins and bills). Most of the money stock in the US (or any other present-day advanced industrial economy) is in the form of 'mere' ledger entries representing bank depositers' credit balances in their individual or corporate checking accounts. And, amazingly enough to the uninitiated, this means that banks are constantly creating money 'out of thin air' simply by making bookkeeping entries that assign new checking account credits to customers as they take out loans from the bank. Of course, private banks cannot simply create money out of thin air without limit and still expect to stay in business. When the bank credits a borrower's account with the amount of his new loan, it is to be expected that the borrower will very soon want to spend part or all of the money he has borrowed. After the check the borrower writes is deposited in somebody else's account in another bank, the check will soon be presented for collection at the lending bank, and they will have to have the cash on hand to pay the other bank off at that time. The more Dollars' worth of loans a bank has extended, the more cash it will have to have on hand in reserves to meet the daily flow of redemptions. Most or all of the check redemption demands coming in every day can normally be offset by the cash and checks drawn on other banks that the depositers and borrowers have brought in and deposited or paid that day, but an 'unsound' bank that extends loans with reckless abandon sooner or later will find that the flow of checks presented to it for collection greatly exceeds the flow of outside checks and cash being brought in. Once the bank's vaults are empty and the cash reserves are gone, the management must quickly (overnight!) either borrow the necessary additional cash elsewhere (probably at high interest rates) or else sell off some of the bank's assets (because of the haste, probably at fire-sale prices). When the troubled bank can no longer borrow and has no assets left that can be sold on short notice, it can no longer fulfill its ontractual guarantees to pay its obligations on demand and is therefore out of business with the banks owners and managers now subject to civil (and perhaps criminal) legal penalties (bankrupcy, suits for breach of contract, negligence, and fraud, indictments for fraud, embezzlement, etc). 'Sound' banks limit the volume of the loans they extend so that they remain in a prudent proportional relationship to the amount of instantly liquid funds they have available in 'reserves' (either as currency in the vault or as demand deposits in some other bank, such as the Federal Reserve). But bankers face a difficult trade-off. The flow of checks that will be presented for payment and the volume of new deposits and loan repayments coming in every day cannot be predicted with 100% accuracy, so the higher the fraction of its total deposit obligations the bank holds ready in reserves, the safer or 'sounder' the bank can be considered (and the more attractive the bank will seem to depositers and other potential business associates). However, reserves

do not yield any interest income to the bank; only the funds that are tied up in loans to (solvent) borrowers can contribute directly and immediately to the bank's profitability. To maximize their profits, bank management must find the best way to strike a balance between the need to maintain their 'reserve ratio' at a level high enough to limit their risks of becoming insolvent and the conflicting need to keep the highest feasible proportion of the bank's available funds loaned out at interest.

BANKING ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО БАНКОВСКОМУ ОБСЛУЖИВАНИЮ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ПО БАНКОВСКОМУ ОБСЛУЖИВАНИЮ) – Banking Advisory Committee (BAC) attends the meetings of the Accounting Regulatory Committee (ARC).

BANKING BUSINESS DAY = РАБОЧИЙ БАНКОВСКИЙ ДЕНЬ (или ОПЕРАТИВНЫЙ БАНКОВСКИЙ ДЕНЬ) – Banking Business Day is a day when financial institutions are open for conducting funds transfers activities. Banking business days can differ from country to country and within a country. / Банковский День – это синоним рабочего дня. Но рабочие дни у всех разные, а банковские – одинаковые. Платёж совершается в банковский день. Банковский день – это рабочий день, за исключением выходных, международных и государственных праздников. Банковский День – период, отведённый в банке для приёма и обслуживания клиентов, выполнения операций по кредитованию, финансированию капитальных вложений, приёму и выдачи наличных денег. Банковский День – часы рабочего дня банка, в течение которых производятся платёжные операции, датируемые этим числом, обычно с 10 до 16 часов. Банковский Рабочий День – день, в течение которого банк открыт для населения и выполняет большую часть своих банковских функций; та часть любого рабочего дня, когда банк открыт для клиентов и выполняет большую часть своих банковских функций.

BANKING CENTER = БАНКОВСКИЙ ЦЕНТР – Banking Center is a place where banks are domiciled or are represented by business offices.

BANKING SECRECY = ТАЙНА БАНКОВСКОГО ОБСЛУЖИВАНИЯ – Banking Secrecy is an obligation on the part of banks and their employees to keep customer data confidential. For example in Switzerland, the violation of banking secrecy is a public offence under Article 47 of the Swiss Banking Law. However, under the law governing criminal procedure and other legal provisions, the banks have an obligation to provide the authorities with information and testify before them. See also Bank Secrecy.

BANKING SYNDICATE = БАНКОВСКИЙ СИНДИКАТ – Banking Syndicate is a group of banks formed to underwrite a loan for a specific transaction or a given client. Loans made by a banking syndicate are called Syndicated Loans. Also known as Consortium. See also Syndicate.

BANKING SYSTEM = ПОДДЕРЖИВАЮЩАЯ СИСТЕМА (или СИСТЕМА ПОДДЕРЖАНИЯ) – Banking System:- for marine purposes the practice of always keeping more than one piece of cargo on the quay or in the vessel ready for loading or discharging in order to avoid delays and to obtain optimal use of the loading gear.

BANK NOTES = БАНКОВСКИЕ БИЛЕТЫ (или БИЛЕТЫ БАНКА, или БАНКНОТЫ) – Bank Note is a term used synonymously with paper money or currency issued by a bank. Notes are, in effect, a promise to pay the bearer on demand the amount stated on the face of the note. Today, only the Federal Reserve Banks are authorized to issue bank notes, i.e. Federal Reserve notes, in the United States. Promissory notes issued by a central bank, payable to the bearer on demand. Paper money issued by central banks, in Germany and other member countries of the European Monetary Union by the European Central Bank (ECB), and which is denominated in a round number of currency units. The banknote is legal tender and not a security. Monetary law provides for no encashment duty. Banknotes, therefore, do not entail a right, but only constitute value. In addition to banknotes, coins are also in circulation. Paper currency produced by a bank of issue that carries a promise to pay the bearer on demand the sum specified on the note. Often called simple a Note. Also known as Bill in the United States. / Банковские Билеты или Банкноты это кредитные знаки денег, выпускаемые эмиссионными банками и замещающие металлические деньги в обращении. Они представляют собой бессрочные долговые обязательства. Банковские билеты заменили обращение частных коммерческих векселей. В эпоху империализма неразменны на золото, превратились в бумажные деньги. Банковские Билеты или Банкноты, кредитные знаки денег, выпускаемые эмиссионными банками и замещающие металлические деньги в качестве средства обращения и платежа (смотрите Деньги). Необходимость выпуска банковских билетов была обусловлена развитием капиталистической промышленности, торговли и кредита. С ростом производства и товарооборота металлические деньги стали частично заменяться коммерческими векселями (долговыми обязательствами отдельных капиталистов). Однако обращение частных коммерческих векселей постепенно было заменено банковскими билетами, являвшимися векселями банкиров. Последние выпускали их в порядке учёта коммерческих векселей, причём они стали обращаться в качестве кредитных денег. Эти банковские билеты подлежали оплате по предъявлению их, поэтому банкиры должны были иметь, кроме вексельного, также и металлическое покрытие своих банковских билетов. Эмиссия банковских билетов первоначально осуществлялась любым банком, но множественность банковских билетов в обращении, полное или частичное их обесценение из-за недостаточного обеспечения и частых банкротств отдельных банкиров тормозили развитие капиталистического производства. Это требовало введения государственного регулирования эмиссионного дела. Банковские билеты, эмиссия которых регламентируется государством, впервые были выпущены при учреждении Банка Англии (1694). Они приобрели силу законного платёжного средства, то есть превратились в национальные деньги, в 1833. Во Франции банковские билеты стали видом общенациональных денежных знаков в 1800–03, в Германии (Пруссии) – в 1846, в Голландии – в 1814–30. Но во многих государствах эмиссия банковских билетов была децентрализована, а банковские билеты выпускались только крупнокупюрные. Вплоть до 2-й половины XIX века банкнотное обращение было развито слабо и обслуживало главным образом расчёты между капиталистами. С середины и в течение 2-й половины XIX века складывается система регулирования эмиссии банковских билетов, отвечающая требованиям капиталистического производства. Банковские билеты стали использоваться не только в сфере оптового оборота, но и как средство платежа при выплате заработной платы и как средство обращения в розничном товарообороте. Если в порядке учёта векселей выпускалось банковских билетов больше, чем требовалось для обращения, то излишние банковские билеты возвращались в банк, который должен был обменивать их на золото. В Англии в 1844 был принят Акт Роберта Пиля, согласно которому каждый банковский билет сверх лимита в 14 миллионов Фунтов Стерлингов должен был обеспечиваться золотом на 100%. В Германии до 1-й Мировой Войны 1914–18 золотое обеспечение банковских билетов было установлено в размере 1/3 суммы эмиссии, а после войны они обеспечивались золотом и иностранной валютой в размере 40% эмиссии. В России законом от 29 Августа 1897 было установлено, что при сумме эмиссии 600 миллионов Рублей обеспечение золотом должно составлять 50%, а сверх 600 миллионов Рублей – 100%. В Соединённых Штатах Америки (США) в 1913 банковские билеты обеспечивались золотом на 40%. Превращение банковских билетов в законное платёжное средство позволяло государству в случае необходимости использовать эмиссию банковских билетов для покрытия своих расходов. Эмиссионные банки получали разрешение выпускать банковские билеты, обеспеченные не золотом и товарными векселями, а облигациями государственных займов и освобождались от обязательства размена банковских билетов на золото. Тем самым фактически банковские билеты

превращались в государственные бумажные деньги с принудительным курсом (смотрите Бумажные Деньги). Это обычно происходило в период войн, особенно в годы 1-й и 2-й мировых войн. После 1-й Мировой Войны было восстановлено отвечающее условиям мирного развития банкнотное обращение, но размеры непокрытой золотом эмиссии банкнот были значительно увеличены (в Англии – до 260 миллионов Фунтов Стерлингов, во Франции был введён безлимитный выпуск банковских билетов), и банковские билеты стали разменяться не на золотые монеты, а на золото в слитках либо на иностранную валюту, которая, в свою очередь, обменивалась на золото. С начала мирового экономического кризиса 1929–33 во всех капиталистических странах размен банковских билетов на золото был вновь прекращён, что явилось специфическим проявлением общего кризиса капитализма в денежной сфере. Неразменные банковские билеты являются дефектными банкнотами. Они либо занимают промежуточное положение между настоящими банкнотами и бумажными деньгами (когда они выпускаются для кредитования товарооборота), либо фактически перерождаются в бумажные деньги, когда их эмиссия производится для финансирования непроизводительных расходов буржуазного государства, покрытия бюджетных дефицитов, финансирования капиталовложений. После 2-й Мировой Войны 1939–45 лишь в некоторых государствах (Бельгия, Голландия, Пакистан, Южно-Африканская Республика (ЮАР)) продолжали действовать законы, определяющие размер обязательного обеспечения банковских билетов золотом. В большинстве же капиталистических стран нормы обеспечения банковских билетов золотом совсем не установлены или имеют чисто формальное значение. Обеспечением банковских билетов в основном являются иностранная валюта и другие девизы, а также государственные ценные бумаги и в незначительной части – коммерческие векселя (например, во Франции и Федеративной Республике Германия (ФРГ) – наряду с золотом девизы, векселя и государственные ценные бумаги, в Италии – государственные ценные бумаги и девизы, в Голландии – золото и девизы). В ряде стран (Мексика, Индонезия и другие) обеспечением эмиссии банковских билетов служат также и их активы в Международном Валютном Фонде. Размена банковских билетов на золото для частных лиц не существует ни в одной стране, и лишь центральные банки могут (причём только в США) получать золото в обмен на Долларовые банковские билеты и другие Долларовые обязательства. В ряде стран введена обратимость (конвертабельность) национальных банковских билетов на валюту других стран, а во многих капиталистических странах банковские билеты либо неконвертабельны, либо их конвертабельность ограничена. В США по закону 1945 норма золотого обеспечения банковских билетов была установлена в 25%, в остальной части эмиссия обеспечивалась государственными ценными бумагами и в небольшой части векселями. В 1968 в связи с валютным кризисом и угрозой девальвации Доллара в США было полностью отменено обеспечение банковских билетов золотом. В Англии эмиссия банкнот связана в основном с регулированием государственного долга. В 1954 законом установлена максимальная сумма эмиссии банковских билетов в 1 575 миллионов Фунтов Стерлингов. По соглашению с Казначейством разрешается её превышение, однако это должно каждые 2 года подтверждаться законом. В Индии законом 1957 золото-валютное обеспечение банковских билетов фиксировано в размере 200 крор (из них золотое – 115 крор, в остальной сумме банковские билеты покрываются девизами, государственными ценными бумагами, векселями). Инфляция в современных условиях во всех капиталистических странах, как правило, осуществляется в форме эмиссии неразменных банковских билетов. В социалистических странах банковские билеты – государственные кредитные деньги, эмиссия которых осуществляется планомерно в порядке краткосрочного кредитования народного хозяйства и в соответствии с потребностями товарооборота в наличных деньгах на основе кредитных и кассовых планов. Основным обеспечением банковских билетов являются принадлежащие государству товарные массы, которые служат материальным покрытием всех выпускаемых в обращение денежных знаков. Кроме того, банковские билеты социалистических стран имеют и золото-валютное обеспечение (например, в бывшем СССР банковские билеты на 25% обеспечивались золотом и драгоценными металлами). В некоторых социалистических странах (СССР, Румыния) наряду с банковскими билетами обращаются и казначейские билеты, которые, однако, не служат источником покрытия государственных расходов и эмитируются в таком же порядке, как и банковские билеты. Банкноты, то же, что Банковские Билеты. Под Денежными Знаками понимаются бумажные деньги, неполноценные монеты и другие знаки стоимости, не имеющие собственной стоимости и замещающие в обращении золотые или серебряные деньги.

BANKNOTES IN CIRCULATION = БАНКОВСКИЕ БИЛЕТЫ В ОБРАЩЕНИИ (или БИЛЕТЫ БАНКА В ОБРАЩЕНИИ, или БАНКНОТЫ В ОБРАЩЕНИИ) – Banknotes (and coins) are said to be 'In Circulation' after being issued, usually to commercial banks, by a national central bank (NCB). The circulation figure decreases when the banknotes are sent back to an NCB. 'Banknotes in circulation' means banknotes issued minus banknotes returned. Banknotes are also 'in circulation' if they are not being used in payments, but are stored at banks or deposited in piggy banks. The NCBs store new and used banknotes. After being checked for 'fitness', i.e. that they are physically sound, and for authenticity, used banknotes can be re-issued. Unfit banknotes are shredded and counterfeits are reported to the police. Two types of banknote stocks are held by the Eurosystem:- logistical and strategic. Logistical stocks are the working stocks of the NCBs and meet the demand for banknotes in normal situations, including seasonal peak demand. They are held:- (i) to replace unfit banknotes returning from circulation; (ii) to accommodate an expected increase in circulation; (iii) to meet seasonal fluctuations in demand; and (iv) and to optimise banknote transportation between NCB branches. The bigger an NCB's network, the more stocks are required, as each branch has to meet the potential demand for all denominations at any time. Over time, there may be imbalances (surpluses or deficits) in the logistical stocks at an NCB because of people travelling from one euro area country to another and taking Euro banknotes with them. Should an NCB run short of a particular denomination it will draw on the Eurosystem Strategic Stock if the surplus logistical stocks of other NCBs are insufficient. / сезонные флуктуации (колебания) .

BANK OF CANADA RATE = СТАВКА БАНКА КАНАДЫ – Bank of Canada Rate is the central bank's official interest rate. It is like a wholesale rate for commercial banks on the 'overnight' loans. The bank rate is dictated by government policy and will in turn drive the commercial bank rates, e.g., the prime rate. / Под Банком Канады (Bank of Canada) понимается государственный акционерный центральный эмиссионный банк Канады. Основан в 1934. Является 'банком банков' страны, регулирует уровень учётного процента и нормы обязательных резервов коммерческих банков. Банк Канады выступает банкиром правительства доминиона и провинций, осуществляет кассовое исполнение их бюджетов и управляет государственным долгом, производит операции с ценными бумагами правительства на открытом рынке, представляет Канаду в международных кредитных учреждениях, совершает сделки с золотом и иностранной валютой. Банк имеет агентства в каждой провинции. В 1944 он создал дочернее общество – Банк Промышленного Развития для долгосрочного кредитования промышленности, транспорта и строительства с капиталом 25 миллионов Канадских Долларов, который принадлежит целиком федеральному правительству. Акционерный капитал и резерв банка на начало 1969 составлял 30 миллионов Канадских Долларов, баланс – 4 636 миллионов Канадских Долларов, эмиссия банкнот – 3 229 миллионов Канадских Долларов, вклады коммерческих банков – 1 114 миллионов Канадских Долларов, вклады правительства – 47 миллионов Канадских Долларов, инвестиции в Банк Промышленного Развития – 354 миллионов Канадских Долларов. Валютный запас Банка Канады и Валютного Фонда Канады составлял 3.0 миллиарда Канадских Долларов, в том числе 923 миллиона золотом, остальное – почти исключительно Доллары США.

BANK OF ENGLAND = БАНК АНГЛИИ – The Bank of England is the central bank of the United Kingdom (UK). Sometimes known as the 'Old Lady' of Threadneedle Street, the Bank was founded in 1694, nationalized on 01 March 1946, and gained independence in

1997. Standing at the center of the UK's financial system, the Bank is committed to promoting and maintaining monetary and financial stability as its contribution to a healthy economy. Core Purposes:- in pursuing its goal of maintaining a stable and efficient monetary and financial framework as its contribution to a healthy economy, the Bank has two core purposes; achieving them depends on the work of the Bank as whole. This part of the website describes and explains each core purpose and some of the work that is undertaken to achieve them. The Bank's Core Purposes are determined by Court as part of its role in setting the Bank's objectives and strategy. The Bank of England exists to ensure monetary stability and to contribute to financial stability. Core Purpose 1 – Monetary Stability:- monetary stability means stable prices and confidence in the currency. Stable prices are defined by the Government's inflation target, which the Bank seeks to meet through the decisions delegated to the Monetary Policy Committee, explaining those decisions transparently and implementing them effectively in the money markets. Core Purpose 2 – Financial Stability:- financial stability entails detecting and reducing threats to the financial system as a whole. This is pursued through the Bank's financial and other operations, including lender of last resort, oversight of key infrastructure and the surveillance and policy roles delegated to the Financial Policy Committee. In pursuit of both purposes the Bank is open in communicating its views and analysis and works closely with others, including:- (i) other central banks and international organisations to improve the international monetary and financial system; and (ii) HM Treasury and the Financial Services Authority, under the terms of the Memorandum of Understanding, to pursue financial stability. The Bank will also play its part in promoting an open and internationally competitive financial centre in the United Kingdom, using its expertise to help make the United Kingdom financial system more efficient, where such efforts would be in the public interest and provided that they do not conflict with its primary responsibilities or those of other agencies. Founded in 1694, 'The Old Lady of Threadneedle Street' has been the focal point of gold and silver trading in London for over three centuries. It is one of the most active central banks in gold and is the gold depository for many of the world's central banks. Website:- http://www.bankofengland.co.uk. The Bank of England was founded in 1694 to act as the Government's banker and debt-manager. Since then its role has developed and evolved, centred on the management of the nation's currency and its position at the centre of the UK's financial system. The history of the Bank is naturally one of interest, but also of continuing relevance to the Bank today. Events and circumstances over the past three hundred or so years have shaped and influenced the role and responsibilities of the Bank. They have moulded the culture and traditions, as well as the expertise, of the Bank which are relevant to its reputation and effectiveness as a central bank in the early years of the XXI century. At the same time, much of the history of the Bank runs parallel to the economic and financial history, and often the political history, of the United Kingdom more generally. Key moments in the Bank's history – a brief guide:- King William & Queen Mary:- when William and Mary came to the throne in 1688, public finances were weak. The system of money and credit was in disarray. A national bank was needed to mobilise the nation's resources. William Paterson:- William Paterson proposed a loan of £1 200 000 to the Government. In return the subscribers would be incorporated as the Governor and Company of the Bank of England. The Royal Charter:- the money was raised in a few weeks and the Royal Charter was sealed on 27 July 1694. The Bank started life as the Government's banker and debt-manager, with 17 clerks and 2 gatekeepers. In 1734 the Bank moved to Thread-needle Street, gradually acquiring land and premises to create the site seen today. Commercial functions:- the Bank managed the Government's accounts and made loans to finance spending at times of peace and war. A commercial bank too, it took deposits and issued notes. The XVIII Century:- during the XVIII century the Government borrowed more and more money. These outstanding loans were called the National Debt. 1781:- renewal of the Bank's Charter:- reliance on the Bank of England was such that when its charter was renewed in 1781 it was described as 'the public exchequer'. The bankers' bank:- by now the Bank was acting as the bankers' bank too. It was liable to fail if all its depositors decided to withdraw their money at the same time. But the Bank made sure it kept enough gold to pay its notes on demand. The 'Restriction Period':- by 1797 war with France had drained the gold reserves. The Government prohibited the Bank from paying its notes in gold. This Restriction Period lasted until 1821. The XIX Century:- the 1844 Bank Charter Act tied the note issue to the Bank's gold reserves. The Bank was required to keep the accounts of the note issue separate from those of its banking operations and produce a weekly summary of both accounts. The Bank Return, as it's called, is still published every week. Lender of last resort:- in the XIX century the Bank took on the role of lender of last resort, providing stability during several financial crises. The First World War (1914–18):- during the First World War the National Debt jumped to £7 billion. The Bank helped manage Government borrowing and resist inflationary pressures. Gold:- in 1931 the United Kingdom left the gold standard; its gold and foreign exchange reserves were transferred to the Treasury. But their management was still handled by the Bank and this remains the case today. Nationalisation 1946:- after the Second World War the bank was nationalised. It remained the Treasury's adviser, agent and debt manager. Financial crises:- during the 1970s, the Bank played a key role during several banking crises. The Bank was at the fore when monetary policy again became a central part of Government policy in the 1980s. Operational independence May 1997:- in May 1997 the Government gave the Bank responsibility for setting interest rates to meet the Government's stated inflation target. This was enshrined in the 1998 Bank of England Act. Managing the modern bank:- the Bank's governing body, the Court of Directors, as it's known, is made up of the Bank's Governor and 2 Deputy Governors, and 9 Non-Executive Directors (under the Banking Act 2009). / Под Банком Англии понимается государственный центральный эмиссионный банк Великобритании. Основан в 1694. В 1984 насчитывал 8 отделений в стране. В 1984 сумма баланса по эмиссионному департаменту 11.5 миллиардов Фунтов Стерлингов, по банковскому – 2.9 миллиардов Фунтов Стерлингов. Банк Англии (Bank of England) – центральный эмиссионный банк Великобритании. Учреждён в 1694 как частный акционерный банк. Был наделён правом эмиссии банкнот наряду с некоторыми другими банками страны. Первоначальный капитал банка – 1.2 миллиона Фунтов Стерлингов – принадлежал группе частных лиц, главным образом владельцам крупнейших банкирских домов. Впоследствии увеличен до 14.5 миллионов Фунтов Стерлингов. Бнак Англии превратился в основной эмиссионный институт, финансовый центр страны, в банк банков и государства. До 1-й Мировой Войны (1914–18) банкноты Банка Англии обменивались на золото. В 1946 лейбористское правительство провело национализацию Банка Англии. Акционеры получили компенсацию правительственными ценными бумагами, приносящими 12% дохода в год (столько же, сколько давали дивиденды до национализации). Банк Англии производит фидуциарную (не покрытую золотом) эмиссию в пределах сумм, периодически устанавливаемых парламентом, финансирует правительство, осуществляет кассовое исполнение государственного бюджета, хранит резервы Английских и многих иностранных центральных банков, с которыми состоит в корреспондентских отношениях, служит расчётным центром для банков страны, осуществляет валютный контроль в соответствии с валютным законодательством. В задачи Банка Англии входит контроль за кредитной деятельностью банков и регулирование денежного рынка (путём изменения учётной ставки и так называемых Операций На Открытом Рынке). Управляющий и директора Банка Англии назначаются правительством. Банк в 1969 имел 8 отделений в Англии. Сумма денежной эмиссии Банка Англии, полностью покрытой ценными бумагами, на Июль 1969 составляла 3 340 миллионов Фунтов Стерлингов против 2 248 миллионов Фунтов Стерлингов в 1960, 1 326 миллионов Фунтов Стерлингов в 1950 и 1 402 миллионов Фунтов Стерлингов в 1946.

THE BANK OF FINLAND REAL–TIME GROSS SETTLEMENT SYSTEM = СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ БАНКА ФИНЛЯНДИИ – The Bank of Finland Real-Time Gross Settlement (BOF-RTGS) System:- the Finnish interbank payment system consists of an RTGS system (BoF-RTGS), a retail payment system (PMJ) and a large-value netting system for express transfers and cheques (POPS). BoF-RTGS is used for the real-time gross settlement of central bank, customer and interbank transfers. POPS is designed as a bilateral continuous netting system. Banks participating in POPS exchange payment

messages bilaterally, without using a centralised clearing house or a clearing operator. PMJ handles all customer payments between banks, i.e. credit transfers (including salary and pension payments), direct debits and debit card transactions (including EFTPOS payments; EFTPOS short for Electronic Funds Transfer at Point of Sale)). The Finnish interbank payment system consists of an RTGS system (BoF-RTGS), a retail payment system (PMJ) and a large-value netting system for express transfers and cheques (POPS). BoFRTGS is operated by Suomen Pankki and the other two systems are operated by the banks participating in them. BOF–RTGS is the national TARGET-linked RTGS system, operated by the Bank of Finland. Suomen Pankki (Bank of Finland) is Finland's central bank and a member of the European System of Central Banks (ESCB). There are three main clearing systems in Finland – BoF-RTGS, POPS and PMJ. BoF-RTGS is Finland's TARGET-linked RTGS system, maintained by the Bank of Finland. POPS processed customer-initiated high-value and urgent payments. PMJ is the retail payment system, processing the majority of non-urgent payments. POPS and PMJ are maintained by the Finnish Bankers' Association. POPS (Pankkien On-line Pikasiirrot ja Sekit-järjestelmä) is an online interbank large-value net settlement system. The settlement method used by POPS is decided by the transfer value. Gross netting is used if the value of a payment exceeds the interbank bilateral limit. Payments below the limit are bilaterally netted, so that both banks' net positions are constantly updated throughout the day by exchanging clearing data. The Interbank Payment System (PMJ – Pankkien välinen maksuliikennejärjestelmä) is a retail clearing system operated by the major Finnish banks. PMJ uses bilateral netting, with most payment transactions being processed centrally in each bank and then exchanged in batches several times a day. The Bank of Finland Real-Time Gross Settlement (BOF-RTGS) System is a real-time gross settlement system, through which settlements are made on a real-time and gross (individual) basis. As all payments are only credited after the required reserves are available in the sending participant's account, there are no credit risks associated with the settlement system. The settlement system is part of the TARGET system, the ECB payment mechanism linking the national RTGS systems of the European Central Banks. The POPS system is a real-time, decentralized, funds transfer system, based on bilateral exchange of data. The system was developed jointly by the member banks and the Finnish Bankers' Association. The banks are also involved in the maintenance of the POPS system. PMJ is a payment system developed jointly by Finnish banks and the Finnish Bankers' Association. Transaction types:- Mass transactions such as credit transfers, direct debits and payment card transactions. PMJ is a system for retail payments with net settlement twice a day. / системы ВРРРВ (), . латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона. система Валовых Расчётов в Режиме Реального Времени Банка Финляндии (ВРРРВ-БФ) является системой валовых расчётов в режиме реального времени, . Суомэн Панкки (Suomen Pankki) – центральный банк Финляндии. Панккиэн Он-линэ Пикасиррот я Секит-яръестэльма (Пэ.О.Пэ.Эс.; Pankkien On-line Pikasiirrot ja Sekit-järjestelmä (POPS)). Панккиэн валинэн Максуликеннэяръестэльма (Пэ.Эм.Йи.; Pankkien välinen maksuliikennejärjestelmä (PMJ)). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам). взаиморасчёт или сведение (netting) .

BANK OF FIRST DEPOSIT = БАНК ПЕРВОНАЧАЛЬНОГО ДЕПОНИРОВАНИЯ – Bank Of First Deposit (BOFD) is the bank where a check is initially deposited to an account. If the check is drawn on the same bank, it is an 'on-us' check that can be settled in-house. If the check is drawn on another institution, it is presented for payment and either processed through the Federal Reserve System or cleared through private arrangements between banks. The Federal Reserve System was created because, during the financial panic of 1907, many banks failed to clear checks drawn on other banks. The industry routing numbers developed in the 1940s that appear at the bottom of checks help ensure timely payment, which is usually the same or the next business day. In the 1970s, the ACH (automatic clearinghouse) system was developed to permit the electronic conversion of checks. In the United States, Bank Of First Deposit means the depositary bank; the first bank at which a check is deposited. / В Соединённых Штатах Америки под банком первоначального депонирования понимается депозитарный банк; первый банк, в который депонируется чек.

BANK OPERATION CODE = КОД БАНКОВСКОЙ ОПЕРАЦИИ – Bank Operation Code is a code, which indicates the type of operation, e.g., credit transfer, reject, enquiry or the response to an enquiry. The bank operation code is part of the nonambiguous identification of the national direct debit scheme. For some direct debit schemes this code must be used in conjunction with a transaction code. In those cases:- (i) the bank operation code identifies the national direct debit scheme and the accounting mechanism; and (ii) the transaction code contains other relevant information:- type of underlying agreement between creditor and debtor, rejection/revocation conditions, etc.

BANK RATES = БАНКОВСКИЕ СТАВКИ – In the United States, Bank Rates are the federal funds rate is the rate that banks pay to borrow reserves from each other in the interbank market. The prime rate is the rate that banks charge for loans to their best customers.

BANK REGULATION = ПРЕДПИСАНИЕ БАНКУ – Bank Regulation is the formulation and issuance by authorized agencies of specific rules or regulations, under governing law, for the conduct and structure of banking. / Предписание Банку это формулирование и издание уполномоченными агентствами специфических правил или предписаний, согласно действующему законодательству, с целью руководствования и структурирования банковского обслуживания.

BANK RELEASE = РАЗРЕШЕНИЕ БАНКА НА ОТПУСК (или БАНКОВСКОЕ РАЗРЕШЕНИЕ НА ВЫПУСК) – Bank Release:- negotiable time draft drawn on and accepted by a bank which adds its credit to that of an importer of merchandise.

BANK RUN = НАБЕГ НА БАНК (или БЕГСТВО ИЗ БАНКА) – Bank Run is a series of unexpected cash withdrawals caused by a sudden decline in depositor confidence or fear that the bank will be closed by the chartering agency, i.e. many depositors withdraw cash almost simultaneously. Since the cash reserve a bank keeps on hand is only a small fraction of its deposits, a large number of withdrawals in a short period of time can deplete available cash and force the bank to close and possibly go out of business. Also known as Bank Panic.

BANKRUPT = БАНКРОТ – Bankrupt:- when a company becomes insolvent, i.e. it can't pay its bills and meet its financial obligations, it is said to be bankrupt. There are two variations on this definition. A company may be technically bankrupt or it may be legally bankrupt. The former means that the company has, at least temporarily, run out of cash to pay its bills and is, at the moment, bankrupt. However, it may recover by raising capital, collecting monies owed to it, or selling off various assets. When a company does not do this on its own, its creditors may, through the courts, put a company officially or legally into bankruptcy.

BANKRUPTCY = БАНКРОТСТВО – Bankruptcy is the legal state of being unable to make good on one's debts. Originally a crime the accusatory origins of the word are retained when we refer to someone as morally bankrupt ideas about and practices concerning bankruptcy have evolved over thousands of years, changing as do economic systems. Though the negative connotations of the word remain, it is now a thing that can be entered into strategically, even to the benefit of all concerned parties. In the United States, as in most countries, bankruptcy is a federal matter in fact, it is specifically mentioned in the Constitution, which gives Congress the power to adopt uniform laws on the subject of bankruptcies. Such laws form the Bankruptcy Code, Title 11 of the United States Code, which defines six types of bankruptcy. Article 7 liquidation or straight bankruptcy, for which both individuals and businesses are eligible, is the oldest and most common form of bankruptcy filing, accounting for more than half of personal bankruptcies. In such liquidations, a

bankruptcy trustee liquidates the debtor's property to create a pool of funds from which to pay the creditors. As long as the debtor is guilty of no fraud or other deceitful behavior, a certain amount of debt is forgiven regardless of the size of the pool of funds, but there are debts that cannot be discharged or reduced at all, such as child support, alimony payments, fines imposed by a court in answer to a crime, property taxes, income taxes less than three years old, and student loan payments. Certain property typical a residence and vehicle is exempt from being liquidated. Though a declaration of Article 7 bankruptcy remains on an individual's credit report for 10 years, it is such a tempting maneuver for so many victims of debt that in recent years trustees have been much more aggressive in verifying that the filer is indeed entitled to file Chapter 7 rather than Chapter 13. False filing declaring Article 7 when one is capable of filing Chapter 13 is called Abusive Filing, and is contested in order to protect creditors. Anyone who is found to have falsely filed is forced into Article 13 bankruptcy. In the case of a business, Article 7 liquidation means suspending the business's operations unless the trustee resumes them. The business is usually dismantled in the course of paying off its debts. Bankruptcy is a legal proceeding declaring that an individual is unable to pay debts. In the United States, chapters 7 and 13 of the federal bankruptcy code govern personal bankruptcy. Bankruptcy is a state of insolvency of an organization or individual, i.e. an inability to pay debts. In the United States, bankruptcy can take either of three forms:- (A) Chapter 7 is involuntary liquidation forced by creditor(s). Some companies are so far in debt that they can't continue their business operations. They are likely to 'liquidate' and are forced to file under Chapter 7. The courts take over and administers through a court appointed trustee. Their assets are sold for cash by a court appointed trustee. Administrative and legal expenses are paid first, and the remainder goes to creditors; (B) Chapter 11 is voluntary by the debtor. Unless the court rules otherwise, the debtor stays in control of the enterprise. The US Trustee, the bankruptcy arm of the Justice Department, will appoint one or more committees to represent the interests of creditors and stockholders in working with the company to develop a plan of reorganization to get out of debt; and, (C) Chapter 13 bankruptcy, a debtor proposes a 3–5 year repayment plan to the creditors offering to pay off all or part of the debts from the debtors' future income. The amount to be repaid is determined by several factors including the debtors' disposable income. To file under this chapter you must have a 'regular source of income' and have some disposable income. Like in a Chapter 7, corporations and partnerships may not file under this chapter. State of insolvency leading to the forcible dissolution of the assets of a debtor entered in the commercial register. The remaining assets are liquidated and the proceeds distributed among the creditors according to a specific plan. Legal procedure for adjusting the debts of an individual or business that cannot meet its obligations. The affairs of the insolvent party are turned over to a bankruptcy trustee or receiver under the US Bankruptcy Act. Bankruptcy may be either voluntary or involuntary. In voluntary bankruptcy, the firm or individual petitions the court for protection from its creditors. In involuntary bankruptcy, the creditors petition the court to place the firm or individual into bankruptcy. Under Chapter 7 of the US Bankruptcy Act, or liquidation, a bankruptcy trustee is appointed by the court to distribute assets among creditors. The trustee represents the interests of unsecured creditors. Under Chapter 11 reorganization, which applies to businesses, the debtor is allowed to continue operating the business and to work out a repayment schedule acceptable to its creditors. Chapter 13 applies to individuals earning regular income, who agree to make partial payment of obligations owed to creditors over a certain period. See also Composition Arrangement, Insolvency, Liquidation, Reorganization, and Schedule Of Creditors. Bankruptcy is a legal process, governed by federal statute, whereby the debts of an insolvent person are liquidated after being satisfied to the greatest extent possible by the debtor's assets. During bankruptcy, the debtor's assets are held and managed by a court-appointed trustee. / роспуск (dissolution). выплата (repayment). Под Банкротством понимается несостоятельность, отсутствие средств у юридического или физического лица и отказ в связи с этим платить по своим долговым обязательствам. Под Банкротством, от Итальянского слова Bancarotta, означающее буквально Сломанная Скамья), в гражданском праве буржуазных государств понимается отказ физического или юридического лица (компании, фирмы) платить кредиторам по своим долговым обязательствам по мотивам отсутствия средств. Банкротство – состояние неплатёжеспособности (неспособности выплатить долги) частного лица или организации. Согласно законодательству США существует два вида юридически законного банкротства:- (i) принудительное, когда один или более кредиторов подают петицию о признании должника неплатёжеспособным через суд; и (ii) добровольное, когда должник подаёт подобное ходатайство сам. В обоих случаях целью является упорядочение и улаживание долговых обязательств. Акт о Реформе Порядка Объявления Банкротства от 1978 (Bankruptcy Reform Act of 1978) снял некоторые чрезмерные ограничения старого законодательства и разрешил большую гибкость в соответствующих процедурах. Акт о Реформе Порядка Объявления Банкротства от 1984 отменил некоторые из наиболее либеральных положений (в основном касающиеся банкротства потребителей) Акта от 1978. Глава 7 Акта от 1978, касающаяся ликвидации (liquidation) предприятия, требует назначения судом доверенного посредника, имеющего широкие полномочия и компетенцию для того, чтобы сменить руководство, получить финансирование без дополнительного обеспечения и управлять предприятием должника так, чтобы не допустить убытков. Должник может вновь получить право владения у доверенного лица, лишь заполнив соответствующее долговое обязательство. Глава 11, которая относится к реорганизации (reorganization), предусматривает, что, кроме тех случаев, когда суд принимает иное решение, должник остаётся владельцем своего предприятия и продолжает управлять им. Должники и кредиторы могут работать друг с другом на весьма гибкой основе. Акт от 1978 ослабил старое правило, которое давало требованиям кредитора абсолютный приоритет (absolute priority rule) перед требованиями владельца. Он также разрешил вести переговоры относительно графика платежей, реструктурирования задолженностей и даже предоставления займов кредиторами.

BANKRUPTCY PROTECTION = ЗАЩИТА ОТ БАНКРОТСТВА – Bankruptcy Protection:- when a company is bankrupt, it may be allowed to continue with its business operations (as opposed to having it liquidated). It essentially gets a reprieve and some time to get its affairs in order. During this time, it is 'protected' from being pursued by its creditors so that it can focus on rescuing itself. To do this, a company is said to file for bankruptcy protection. In the USA, this is referred to as 'Chapter 11'. A 'receiver' may be appointed by the courts during this period. Bankruptcy Protection:- when a company becomes insolvent, i.e. it can't pay its bills and meet its financial obligations, it is said to be bankrupt.

BANKRUPTCY TRUSTEE = ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ КОНКУРСНОЙ МАССОЙ (или КУРАТОР ПО БАНКРОТСТВУ) – Bankruptcy Trustee is a person appointed by the court to represent the creditors of a business in bankruptcy. See also Receiver.

BANK SECRECY = БАНКОВСКАЯ ТАЙНА – Bank Secrecy is a bank's contractual obligation to maintain confidentiality on all facts and assessments relating to customers. Bank secrecy is restricted by statutory regulations creating an obligation to provide information, and by the customer himself, who authorises the bank to provide information. In particular, there is an unlimited obligation to provide information relating to criminal proceedings and criminal proceedings concerning tax offences. In the event of death, there are special notification duties towards the decedent's tax office. See also Banking Secrecy. / Под Банковской Тайной понимается сохранение сведений об операциях, счетах и вкладах клиентов банка и других кредитных учреждений. Обеспечение банковской тайны – обязанность кредитных учреждений, которые выдают справки об операциях, счетах и вкладах лишь в случаях, указанных в законе. В бывшем Союзе Советских Социалистических Республик (СССР) правом получать такие справки пользовались сами владельцы счетов (вкладов), их представители и вышестоящие организации, а также судебные, следственные и финансовые органы (последние – лишь по операциям и счетам юридических лиц). Уставы банков и

сберегательных касс в СССР предусматривали обязанность служащих этих учреждений хранить тайну по операциям, счетам и вкладам.

BANK'S INHOUSE FUND = ФОНД БАНКОВСКОГО УПРАВЛЕНИЯ (или ВНУТРЕННИЙ ФОНД БАНКА) – Bank's Inhouse Fund is a fund-like pool of assets. Units are offered solely to clients who already have assets under management with the bank operating the fund.

BANK SORT CODE = БАНКОВСКИЙ СОРТИРОВОЧНЫЙ КОД – Bank Sort Code:- the sort code is a number which states a bank's address for certain payment transactions. Through the use of electronic data processing (e.g., OCR-based document sorting, magnetic tape exchange and data transmission) it is intended to facilitate the efficient, fast and fully automated transfer of payments.

BANK STATEMENT = БАНКОВСКАЯ ВЫПИСКА – Bank Statement is a document from a bank giving details of all financial transactions and the balance on a particular account over a given period, usually a month. Also known as Account Statement. / Банковский документ, предоставляющий сведения о всех финансовых операциях и остатке на конкретном счёте за данный период времени, как правило, месяц. Известна также как Выписка По Счёту (Account Statement).

BANK SUPERVISION = БАНКОВСКИЙ НАДЗОР – Mostly state supervision of banks with the aim of ensuring that an economy's financial sector continues to function, counteracting problems in the banking sector and avoiding losses to banks' creditors. In Germany, banks are supervised by the Federal Financial Supervisory Authority (BaFin) in cooperation with Deutsche Bundesbank. The legal basis for this is the German Banking Act (KWG). Bank Supervision is an oversight of individual banks to ensure that they are operated prudently and in accordance with applicable statutes and regulations.

BANK TRANSFER = БАНКОВСКИЙ ПЕРЕВОД – Bank Transfer is a way of making payments at any branch of any bank into an account held in the same or any other bank. Also known as Bank Giro Credit. Movement of funds from one bank account to another within the same bank or between different banks. May be used as a means of payment, like a check or bill of exchange.

BAO = БАО – Bao is a floating Rice mixed crop of Aus and Aman Rice, i.e. early and late varieties sown during the early part of the wet season. A practice frequently used in Assam, India.

BAR = BANK ADEQUACY RATIO

BAR = БАР – Bar (b) is a metric unit of atmospheric pressure, equal to one million dynes per square centimeter, 100 kiloPascals, 750.062 torr, 1.019 72 kilograms of force per square centimeter (kgf/cm^2), or about 14.503 78 pounds per square inch (lbf/in^2 or psi). The word comes from the Greek Baros, 'weighty'. We see the same root in our word, barometer, for an instrument measuring atmospheric pressure. One bar is just a bit less than the average pressure of the Earth's atmosphere, which is 1.013 25 bar. In practice, meteorologists generally record atmospheric pressure in millibars (mb). In English-speaking countries, barometric pressure is also expressed as the height, in inches, of a column of mercury supported by the pressure of the atmosphere. In this unit, one bar equals 29.53 inches of mercury (in Hg). Bar is a unit of pressure equal to 1 million dynes per square centimeter. / Под Баром, от Греческого слова Báros, означающее Тяжесть, понимается внесистемная единица давления. Обозначение:- бар. 1 бар = 10^5 Па = 0.1 МПа = 0.986 923 атм. В метеорологии применяют миллибар (1 мбар = 100 Па = 1 гПа = 0.1 кПа), в прочностных расчётах иногда применяли гектобар (1 гбар = 100 бар = 10 МПа) и килобар (1 кбар = 100 МПа), в физике – микробар (1 мкбар = 1 дин/$см^2$ = 0.1 Па).

BAR = МЕРНЫЙ СЛИТОК – Bar is a typical gold product, either for trading or for accumulation. Bars come in a variety of shapes weights and fineness and different bars are favored in different parts of the world. See also Ingot. / Слиток:- золотой резерв Федеральной Резервной Системы (Federal Reserve System (FRS)) США хранится в виде металлических слитков. Частные инвесторы могут хранить слитки ценного металла, такого, как золото или серебро, или приобрести сертификат, дающий им право на долевое участие во владении слитком.

BAR = ПЛАНКА (или ГРЕБЁНКА) – (1) Bar or Weft Bar:- variation in weft yarn. Woven fabric defect. Bar is a band with clearly defined edges, which differs in appearance from the adjacent normal fabric. This defect is often caused by variation in weft yarn characteristics, e.g., composition, linear density, tension, twist, etc. / :- вариация по уточной пряже. Порок или Дефект ткачества. Полосатость По Утку (bar, weft bar):- порок утка в виде полосы во всю ширину ткани из-за различной плотности ткани, линейной плотности пряжи, цвета утка, крутки. Примечание:- этот порок часто вызывается изменением в характеристике уточной пряжи, например, сырьевом составе, линейной плотности, натяжении, крутке и неисправностью механизма, регулирующего плотность нитей в ткани по утку.

(2) Bar:- a general terms for a band running across the full width of the cloth due to difference in the appearance from its adjacent sites. It covers:- (i) pick bar; (ii) starting mark; (iii) tension bar or shiner; and (iv) weft bar.

BARAKAT COTTON = ХЛОПЧАТНИК БАРАКАТ – Barakat Cotton:- knowledge of Cotton planting in Sudan goes back to the XIX century when it was grown for it's first time in Eastern Sudan (Tokar area). Commercial growing started in 1905 at Zeidab Pilot Scheme in Northern Sudan. 1925 was a landmark in irrigated agricultural production in Sudan, following the establishment of Sennar dam. Since then Cotton assumes a leading role as a cash crop. The organization of Cotton production in Sudan started through establishing a large governmental administrations with the participation of farmers. After the enforcement of the Gezira Scheme Act for the year 2005 this relationship started to change and the major features of this change are the relaxation of Government strong grip. The stage is now set for different options targeting smart participation between Government, Farmers and the Private Sector. Barakat (90) is the major extra long staple (ELS) variety (33–36 mm), early maturing and high yielding. The variety is comparable to traditional Barakat in fiber characteristics, superior in both fineness and strength (34–41 HVI). The bulk is grown in Gezira (irrigated, hand picked and roller ginned). Barakat is a new long staple Cotton Variety in the Sudan. Sudanese Cotton is characterised by high spinnability and market value, it is considered as one of the main source of hard currency. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI).

BARATHEA = БАРАТЕЯ – Barathea is:- (1) a silk, rayon, or manufactured fiber necktie fabric with a broken rib weave and a characteristic pebbly appearance. (2) A fine, dress fabric with a silk warp and worsted filling, woven in a broken filling rib which completely covers the warp. (3) A smooth-faced worsted uniform cloth with an indistinct twilled basket weave of fine two-ply yarns. Barathea is mixed fabric which contains silk, rayon, cotton or wool and is closely woven. It has a typical pebbly surface. Barathea is used for dresses, neckties, trimmings, and suits. Barathea is a fabric that has a broken rib weave and a pebbly texture and that is made of silk, worsted, or synthetic fiber or a combination of these. Fabric has granular texture achieved by the short broken ribs in the filling direction. It is a rich soft-looking, fine fabric. Used in men's dress ties, cumberbunds. English in origin and originally made as a mourning cloth. / уточина. Баратея – шерстяная материя, иногда с примесью шёлка или бумаги.

BAR AVERAGE = СРЕДНЕАРИФМЕТИЧЕСКОЕ ЗНАЧЕНИЕ ШТРИХА – The Bar Average can be used in the evaluation of technical analysis. The bar average is the (High + Low + Close) / 3. / Под Штрихом, от Немецкого слова Strich, означающее Линия или Черта, понимается . В техническом анализе биржевых рынков, среднеарифметическое значение штриха может быть использовано в качестве оценивающего значения в техническом анализе биржевых рынков. Среднеарифметическое значение штриха рассчитывается как (Максимум + Минимум + Закрытие) / 3.

BARB = БОРОДКА (или НАГРУДНИК) – Barb:- a medieval cloth headdress passing over or under the chin and covering the neck.

BARBATE = БАРБАТЭ (или ОСТИСТОЕ, или БОРОДАТОЕ) – Barbate:- bearded or bearing tufts of long, weak hairs. / Остистое в ботанике. Бородатое в зоологии.

BARBED = КОЛЮЧЕЕ – Barbed:- bearing sharp, spine-like hooks which are bent backwards.

BARBED NAIL = ХХ (или КОЛЮЧИЙ ГВОЗДЬ) – Barbed Nail is a nail on which the formed portion has repetitive indentations and ridges which might or might not be symmetrical. See also Pallet. / Колючий Гвоздь (Barbed Nail):- гвоздь, имеющий резьбу в виде повторяющихся зубцов и гребней, которые могут быть симметричными или несимметричными. Смотрите также Поддон (Pallet).

BARC = BANGLADESH AGRICULTURAL REASEARCH COUNCIL

BAR CHART = ШТРИХОВОЙ ГРАФИК – Bar Chart is a type of chart consisting of four significant points:- (i) the high and (ii) the low prices, which form the vertical bar; (iii) the opening price, which is marked with a little horizontal line to the left of the bar; and (iv) the closing price, which is marked with a little horizontal line to the right of the bar. See also Candlestick Chart; and Charting. Bar Chart is a type of chart commonly used in technical analysis that shows highs, lows and closing prices. A popular way to display and analyze financial price information in graphical form. The horizontal axis of a bar chart represents the passage of time with the most recent time periods on the right side while the vertical axis represents the stock's price. A chart that graphs the open, high, low, and settlement prices for a specific trading session over a given period of time. Bar Charts are constructed of the Opening, Highest, Lowest, and Closing Price that occurred during the time interval of the bar. For example, on daily bar chart:- The Opening Price at the open of the day appears as a dash on the left side of a bar. The Highest Price reached during the day appears as the top of the bar. The Lowest Price reached during the day appears as the bottom of the bar. Closing Price at the end of the day appears as a dash on the right side of the bar. A visual representation of a period of prices, usually one day. The open, the high, the low and the close are depicted. Bar Chart is a graphical representation of price over time where each vertical line is a single trading period of equal duration. The top of the bar represents the highest price paid or offered, and the bottom of the bar represents the lowest price paid, or bid. A small tick mark to the right identifies the settlement price, or last trade of the period. Sometimes a tick market to the left is used to identify the opening trade. Bar Chart is a graph showing the high, low, and settlement prices for each trading period over time. / Под Штрихом, от Немецкого слова Strich, означающее Линия или Черта, понимается . В техническом анализе биржевых рынков Штриховые Графики строятся на значениях цен Открытия, Максимума, Минимума и Закрытия, возникавших в течение временного интервала для данного штриха. Например, для среднедневного штрихового графика:- Цена по Открытии – по открытии этого дня отражается в качестве горизонтального штриха с левой стороны на вертикальном среднедневном штрихе. Максимальная Цена, достигнутая в течение этого дня, будет вершиной вертикального среднедневного штриха. Минимальная Цена, достигнутая в течение этого дня, будет впадиной вертикального среднедневного штриха. Цена по Закрытии в конце этого дня отражается в качестве горизонтального штриха с правой стороны на вертикальном среднедневном штрихе. В штриховом графике каждый день представлен вертикальным отрезком, проведённым от дневного минимума до дневного максимума котировки акции, индекса или товара.

BARCLAY = БАКЛЭЙ (или БАРКЛЭЙ) – Barclay:- wide stripes of black on a yellow ground crossed at intervals by narrower white stripes.

BAR CLOSE = ШТРИХ ЗАКРЫТИЯ – In the charts analysis, the Bar Close is the last price received at the end of each time interval. / Под Штрихом, от Немецкого слова Strich, означающее Линия или Черта, понимается . В техническом анализе биржевых рынков, Штрих Закрытия это последняя цена, принятая в конце каждого временного интервала.

BAR CODE = ШТРИХОВОЙ КОД (или ШТРИХКОД) – Bar Code:- adjacent stripes of varying width used to represent alpha-numeric characters. These permit rapid reading by means of electronic scanners. A series of bars and spaces read by a scanning device for translation into a numeric or alphanumeric identification code that represents data in machine-readable or computerized form. A Bar Code is a font, or symbolic representation, of the numeric or alpha product code of a product which enables an electronic scanner to interpret the number without manual input, which significantly reduces errors and speeds up input. This improves the process of receiving, verifying, picking, transferring and selling goods. A series of lines of various widths and spacings that can be scanned electronically to identify a carton or individual item. A Bar Code (often seen as a single word, Barcode) is the small image of lines (bars) and spaces that is affixed to retail store items, identification cards, and postal mail to identify a particular product number, person, or location. The code uses a sequence of vertical bars and spaces to represent numbers and other symbols. A bar code symbol typically consists of five parts:- a quiet zone, a start character, data characters (including an optional check character), a stop character, and another quiet zone. A barcode reader is used to read the code. The reader uses a laser beam that is sensitive to the reflections from the line and space thickness and variation. The reader translates the reflected light into digital data that is transferred to a computer for immediate action or storage. Bar codes and readers are most often seen in supermarkets and retail stores, but a large number of different uses have been found for them. They are also used to take inventory in retail stores; to check out books from a library; to track manufacturing and shipping movement; to sign in on a job; to identify hospital patients; and to tabulate the results of direct mail marketing returns. Very small bar codes have been used to tag honey bees used in research. Readers may be attached to a computer (as they often are in retail store settings) or separate and portable, in which case they store the data they read until it can be fed into a computer. There is no one standard bar code; instead, there are several different bar code standards called symbologies that serve different uses, industries, or geographic needs. Since 1973, the Uniform Product Code (UPC), regulated by the Uniform Code Council, an industry organization, has provided a standard bar code used by most retail stores. The European Article Numbering system (EAN), developed by Joe Woodland, the inventor of the first bar code system, allows for an extra pair of digits and is becoming widely used. POSTNET is the standard bar code used in the United States for ZIP codes in bulk mailing. The following table summarizes the most common bar code standards. See also EAN. A Bar Code is the UPC code that identifies product. It consists of a series of black bars and is scannable. The bar code represents an identification number that is stored in the computer system along with other information about the product. / Под Штрихом, от Немецкого слова Strich, означающее Линия или Черта, понимается . Код использует последовательность . Штрих Код – код в виде полос разной ширины, с нанесёнными под ними цифрами. Находится на упаковке товара, непосредственно на изделии или вносится в сопроводительную документацию. Предназначен для

использования в автоматизированных системах идентификации товаров путём автоматического считывания оптическими сканирующими устройствами и преобразования в цифровые коды; используются в магазинах, на складах и так далее.

BAR CODE SCANNER = СКАНЕР ШТРИХОВЫХ КОДОВ – Bar Code Scanner is a device to read bar codes and communicate data to computer systems. / Устройство для считывания штриховых кодов и передачи данных в компьютерные системы.

BAR CODING = ШТРИХОВОЕ КОДИРОВАНИЕ – Bar Coding is a method of encoding data for electronic readability. Bar codes are a series of alternating bars and spaces affixed to products, labels, or other media, representing encoded information, which can be read by electronic reading devices. Bar codes are a series of lines of various widths and spacings that can be scanned electronically to identify a carton or individual item. Bar code scanner is a device to read bar codes and communicate data to computer systems. / Штриховое Кодирование товара – нанесение штриховых меток на товар, образующих штриховой код, по которому можно установить вид товара, его принадлежность к определённой товарной группе, качественные характеристики.

BARD = BANGLADESH ACADEMY FOR RURAL DEVELOPMENT

BAREBOAT = СУДНО БЕЗ ЭКИПАЖА (или ТОЛЬКО СУДНО) – Bareboat:- a method of chartering of the ship leaving the charterer with almost all the responsibilities of the owner.

BAREBOAT CHARTER = ФРАХТОВАНИЕ СУДНА БЕЗ ЭКИПАЖА (или БЕРБОУТ ЧАРТЕР) – Bare Boat Charter is a charter in which the bare ship is chartered without crew; the charterer, for a stipulated sum taking over the vessel for a stated period of time, with a minimum of restrictions; the charterer appoints the master and the crew and pays all running expenses. Charterer hires a vessel for a long period, appoints the master and crew, and pays all running expenses. Owners lease a specific ship and control its technical management and commercial operations only. Charterers take over all responsibility for the operation of the vessel and expenses for the duration. Bareboat Charter is a charter whereby the charterer leases the ship and provides the master and crew himself. See also Charter, Demise Charter, and Time Charter. / хозяина (или капитана) и экипаж, и оплачивает все набегающие . Смотрите также Фрахтование Судна С Экипажем или Димайз Чартер (Demise Charter), Фрахтование Судна На Время или Тайм Чартер (Time Charter), и Фрахтование Судна или Чартер (Charter). Бербоут Чартер:- разновидность димайз чартера, от которого он отличается тем, что судно сдаётся фрахтователю в аренду (обычно на несколько лет) без экипажа и судовладелец никакого участия в его формировании не принимает. В последнее время передача судна в бербоут чартер является практически продажей судна в рассрочку с внесением определённого процента договорной стоимости судна с последующей оплатой определённой суммы судовладельцу.

BARGE = БАРЖА – Barge is a flat-bottomed boat designed to carry cargo on inland waterways, usually without engines or crew accommodations. Barges can be lashed together and either pushed or pulled by tugs, carrying cargo of 60 000 tons or more. Small barges for carrying cargo between ship and shore are known as Lighters. Georgia's inland ports in Bainbridge and Columbus offer barge service, as well as Columbia Coastal via the Port of Savannah. Conveyance used to carry loose cargo or containers in small volumes. Barge is a flat bottomed vessel for a.o. canals and rivers with or without own propulsion for the purpose of transporting goods. A vessel, either motorized or towed, used to carry products in navigable waterways. The US inland river barges that carry oil products generally hold 25 000 barrels. Ocean-going barges range in size up to 120 000 barrels. See also Lighter. / Судно, самоходное или буксируемое, используемое для перевозки продуктов по судоходным водным артериям. В США внутриконтинентальные речные баржи, перевозящие нефтепродукты, обычно вмещают 25 000 баррелей. Океанские баржи, в зависимости от размера, могут вмещать до 120 000 баррелей. Смотрите также Лихтер (Lighter). Под Баржой, от Французского слова Barge, понимается несамоходное грузовое судно, перемещаемое буксиром или толкачом. По роду перевозимых грузов различают баржи сухогрузные (для песка, каменного угля, тарных грузов и другого) и наливные (для жидкого топлива, смазочных масел, воды); по району плавания – морские, рейдовые (для прибрежного плавания) и внутреннего плавания; по материалу корпуса – стальные, железобетонные, деревянные. Для перевозки на баржевозах используются баржи стандартных размеров водоизмещением от 200 до 1 300 тонн.

BARGE ABOARD CATAMARAN = БАРЖА НА БОРТУ КАТАМАРАНА – Barge Aboard Catamaran:- a way of loading cargo into large barges and then in turn loading the barges into a ship. / Способ погрузки груза, при котором он загружается сначала в крупные баржи, которые в свою очередь загружаются на борт другого корабля.

BARGE CARRIER = БАРЖЕВОЗ (или ЛИХТЕРОВОЗ) – Barge Carrier:- ships designed to carry either barges or containers exclusively, or some variable number of barges and containers simultaneously. Currently this class includes two types of vessels, the LASH and the SEABEE. Ships designed to carry barges; some are fitted to act as full containerships and can carry a varying number of barges and containers at the same time. At present this class includes two types of vessels LASH and SEA-BEE. Sea-Bee is a type of barge carrying ship, similar to the LASH vessel except it employs a heavy-lift elevator at the stern-end of the ship to lift barges on and off. / Баржевоз, судно, предназначенное для транспортировки грузов в баржах – плавучих контейнерах. Первый баржевоз был построен в 1969. Существует много проектов таких судов, но эксплуатируются в основном баржевозы двух типов:- с (i) крановой и (ii) горизонтальной грузообработкой. На баржевозы первого типа баржи поднимаются с воды, перемещаются вдоль палубы и устанавливаются в трюмы козловым краном. Такие баржевозы вмещают до 83 барж, каждая из которых имеет массу с грузом до 450 тонн. На баржевозы второго типа баржи поднимаются до уровня грузовой палубы с помощью специального кормового подъёмника и через открытые кормовые ворота перемещаются на тележках к месту установки. Вместимость этого типа до 38 барж, имеющих водоизмещение до 1 000 тонн. Известен также как Лихтеровоз.

BARGES EMPTY = БАРЖИ ПУСТЫЕ – Barges Empty is the total number of barges with no commodities or cargo which have passed through a lock chamber.

BARGES LOADED = БАРЖИ ЗАГРУЖЕННЫЕ – Barges Loaded is the total number of barges which contained commodities and/or has cargo.

BARGES TOTAL = ИТОГО БАРЖ – Barges Total is the total number of barges (loaded and empty) which have passed through the lock.

BARI = BANGLADESH AGRICULTURAL RESEARCH INSTITUTE

BARI = BIHAR AGRICULTURAL RESEARCH INSTITUTE

BARIF = BANJARBARU RESEARCH INSTITUTE FOR FOOD CROPS

BARINESS = XX – Bariness is a fabric defect characterized by textural bands or color bands in the course direction of a weft knitted fabric. Causes:- (i) use of irregular yarn having higher long term irregularities; and (ii) using different count thread. Mending:- non mendable. Knitted fabric defect. / полосы.

BARK = КОРА – Bark is the protective exterior covering of the roots, stems and branches of woody plants, exterior to the cambium and including an inner layer of secondary phloem. Bark:- the tough outer covering of the woody stems and roots of trees, shrubs, and other woody plants. It includes all tissues outside the vascular cambium. Excessive vegetation can greatly affect stripper efficiency and cause 'barky' cotton grades. Bark:- the foreign matter in stripped Cotton consists of burs, sticks, and the trash, which generally consists of fine leaf trash and soil particles. During the ginning process, sticks and fine trash are more difficult to remove than burs. Also sticks may include bark, which can contaminate the lint and result in grade reductions and losses of USD20–25/bale. Bark contamination occurs somewhere between the removal of bolls from the plant and the separation of lint and seed at the gin stand. Environmental conditions, production practices, preparation of plants for harvest, and stripper operating parameters affect the incidence of bark contamination. / состоят из створок коробочек (burs или burrs), черешков (sticks) листьев, и сора, состоящего из . Она включает все виды периферических тканей сосудистого камбия. Употребляется и как Засорённое Фрагментами Коробочки И Стеблей (Barky) для описания чистоты хлопкового волокна.

BARK CLOTH = ПОЛОТНО ИЗ КОРЫ – Bark Cloth (or Barkcloth) is a soft, thick, slightly textured fabric so named because it has a rough surface like that of a tree bark. It is usually made of densely woven cotton fibers. Historically, the fabric has been used in home furnishings, such as curtains, drapery, upholstery and slipcovers. It is often associated with 1950s and 1960s home fashions. Barkcloth:- originally, the term referred to a fabric found throughout the South Pacific and is made from the inner bark of certain trees. The bark is beaten into a paper-like fabric, then dyed or otherwise colored. Tapa cloth is one of the best known types of true barkcloth. Barkcloth is a term that also refers to a fabric, often cotton or rayon, with a somewhat crêpe-like feel that is designed to resemble true barkcloth. This fabric is used extensively for draperies, slipcovers, and other home furnishings. See also Crêpe, and Tapa Cloth. / Смотрите также Крэп (Crêpe), и (Tapa Cloth).

BARK–FREE WOOD = ОКОРЁННАЯ ДРЕВЕСИНА – Bark-Free Wood is a wood from which all bark excluding the vascular cambium, ingrown bark around knots, and bark pockets between rings of annual growth has been removed. / Древесина, с которой была удалена вся кора, за исключением сосудистого камбия, коры, вросшейся внутри вокруг сучков, и прорости между годичными кольцами роста.

BARKING = ОКОРКА – Barking is the removal of bark from wood prior to pulping. / Под Окоркой понимается удаление коры с хлыстов и сортиментов. Осуществляется окорочными станками и инструментами. Необходима для последующей химической и механической переработки древесины. Окорка – удаление коры с круглой древесины (окорка не обязательно означает, что древесина становится свободной от коры).

BARK POCKET = ПРОРОСТЬ – Bark Pocket is an opening between annual growth rings that contains bark. Bark pockets appear as dark streaks on radial surfaces and as rounded areas on tangential surfaces. / .

BARLEY = ЯЧМЕНЬ – Barley (Hordeum vulgare) is a major food and animal feed crop, a member of the Grass Family Poaceae. In 2005, Barley ranked fourth in quantity produced and in area of cultivation of cereal crops in the world (560 000 km^2). Barley can be divided by the number of kernel rows in the head. Three forms have been cultivated; two-row Barley (traditionally known as Hordeum Distichum), four-row Barley (Hordeum Tetrastichum) and six-row Barley (Hordeum Vulgare). In two-row Barley only one spikelet is fertile, in the four-row and six-row forms, all three are fertile. Two-row Barley is the oldest form, wild Barley having two rows as well. Two-row Barley has a lower protein content than six-row Barley and thus a lower enzyme content. High protein Barley is best suited for animal feed or malt that will be used to make beers with a large adjunct content. Two-row Barley is traditionally used in English ale style beers. Six-row Barley is traditional in German and American lager style beers. Four-row is unsuitable for brewing. Barley is widely adaptable and is currently a major crop of the temperate and tropical areas. / зерновка (ядро) . колосок (spikelet). Мальтоза (солодовый сахар) является дисахаридом, образованным двумя остатками глюкозы. В живых организмах образуется при расщеплении крахмала и гликогена ферментами амилазами, в больших количествах – в проращённых зёрнах (солоде) Ячменя и других зерновых. Ячмень, Род одно- и многолетних Трав Семейства Злаков. Около 30 Видов, в основном, в Америке, Африке, Евразии. Степные Травы, Сорняки; возделывают Посевной Ячмень (озимые и яровые формы) – кормовую (зерно) и продовольственную (крупа, мука, солод для производства пива, суррогат кофе) культуры. Ячмень (Hordeum), Род одно- и многолетних Травянистых Растений Семейства Злаков. Корневая система Ячменя мочковатая; основная масса её распространяется в пахотном слое, отдельные корни проникают на глубину до 1 метра (м). Стебель – полая соломина, высотой от 30–35 до 130–135 см. Лист более широкий, чем у других злаков. Соцветие – колос. Плод – зерновка, обычно называемая зерном, плёнчатая или голая, жёлтого, сероватого или коричневого цвета. Около 30 видов (по другим данным, до 50), в Евразии и Америке; в бывшем Союзе Советских Социалистических Республик (СССР) свыше 10 Видов, в Европейской части, Западной и Восточной Сибири, на Дальнем Востоке. В культуре 3 Вида:- (i) Ячмень Культурный (Hordeum Vulgare), распространённый на всех континентах; (ii) Ячмень Эфиопский (Hordeum Aethiopicum) – в Эфиопии и прилегающих к ней странах; и (iii) Ячмень Низкорослый (Hordeum Humile) – в Китае, Японии, которые часто объединяют в один сборный Вид – Ячмень Посевной (Hordeum Sativum). По биологическим особенностям Ячмень подразделяют на яровой и озимый. Вегетационный период ярового Ячменя в зависимости от сортовых особенностей и района возделывания – 55–110 суток. Это самая скороспелая зерновая культура. Ячмень – самоопылитель, цветение закрытое. Всходы появляются при 4–5 °С, молодые растения устойчивы к заморозкам. Оптимальная температура для роста и развития 15–22 °С. Озимый Ячмень менее зимостоек, чем Рожь и Пшеница, но более жаростоек и засухоустойчив. Ячмень хорошо удаётся на плодородных суглинистых почвах с нейтральной реакцией. Зерно Ячменя содержит (%):- воды 13, белка 12, углеводов 64.6, клетчатки 5.5, жира 2.1, зольных элементов 2.8. По аминокислотному составу (особенно содержанию лизина) белок Ячменя более ценен, чем белок Пшеницы. Из зерна приготовляют перловую и ячневую крупы, суррогат кофе, ячменную муку, добавляемую к пшеничной при выпечке хлеба. Ячмень – ценный концентрированный корм, используемый главным образом в свиноводстве и птицеводстве. В 100 кг зерна 121 кормовая единица и 79 кг переваримого протеина. Крупный потребитель Ячменя – пивоваренная промышленность. Продукты, извлекаемые из зерна Ячменя в форме солодовых вытяжек (мальцэкстракты), находят применение в текстильном, кондитерском и фармацевтическом производствах. В 1977 мировая посевная площадь Ячменя составляла 92.4 миллиона га, в том числе в бывшем СССР 34.5 миллиона, в КНР 14 миллионов, Канаде 4.5 миллиона, США 3.9 миллиона, Индии 3 миллиона, Австралии, Франции и Турции по 2.8 миллиона, Великобритании 2.3 миллиона. Средняя урожайность зерна 20 центнеров (ц) с 1 гектара (га) (наивысшая в Бельгии – 45.8 ц). Валовой сбор зерна 184.9 миллиона тонн. В бывшем СССР (1977) средняя урожайность зерна ярового Ячменя 15 ц с 1 га, озимого 20.5 ц, в передовых хозяйствах до 65 ц; валовой сбор зерна 52.7 миллиона тонн. Яровой Ячмень возделывали на всей земледельческой территории бывшего СССР – от Заполярья до субтропиков, в горах – до 3 500 метров над уровнем моря; озимый – в основном в Средней Азии, Закавказье, Крыму, на Северном Кавказе, Юге Украины и Молдавии. Районировано 86 селекционных сортов Ярового Ячменя (пивоваренные – Винер, Московский 121 и другие; Фуражные – Донецкий 4, Нутанс 187 и другие) и 34 сорта Озимого (Паллидум 596, Одесский 46 и другие). Ячмень – полевая культура. Лучшие предшественники Ячменя в севообороте – Пропашные (Сахарная Свёкла, Кукуруза, Картофель) и Зернобобовые культуры. Ячмень более, чем другие Зерновые

культуры, отзывчив на удобрения. Уход за посевами состоит в прикатывании для обеспечения дружных всходов и лёгком бороновании. Убирают Ячмень, предназначенный на пищевые цели, при полном вызревании, на фуражные – начиная с восковой спелости.

BARLEYCORN = ЯЧМЕННОЕ ЗЕРНО – Barleycorn is a traditional English unit of length equal to one third of an inch. Use of seeds as average units of weight or length was common in societies based on agriculture. In the Anglo-Saxon era, Barley was an important subsistence crop and barleycorns were used as units of length. Three barleycorns 'smooth and round laid end to end' were equal to the Saxon ynce (inch). Barleycorns, or grains, became the basis of all English weight systems. Barleycorn is an old English unit of length equal to 1/3 inch or about 8.5 millimeters. The custom of using seeds as units of length or weight is very common in farming societies. In Anglo-Saxon England, where Barley was a basic crop, barleycorns played this traditional role. The weight of a barleycorn, later renamed the grain, is the original basis of all English weight systems including the older Troy system and the later avoirdupois system. As a length unit, 3 barleycorns were equal to the Saxon ynce (inch). The English foot was actually defined as 12 of these ynces, that is, as 36 barleycorns. / .

BARR = BOARD ON AGRICULTURE AND RENEWABLE RESOURCES

BARRATRY = БАРАТРИЯ – Barratry, in navigation, is, in its most extensive sense, any fraudulent or unlawful act committed by the master or mariners of a ship, contrary to their duty to their owners, and to the prejudice of the latter. It appears to be derived from the Italian word Barratrare, to cheat. It may be committed by running away with a ship, wilfully carrying her out of the course prescribed by the owners, delaying or defeating the voyage, deserting convoy without leave, sinking or deserting the ship, embezzling the cargo, smuggling, or any other offence whereby the ship or cargo may be subjected to arrest, detention, loss, or forfeiture. Barratry is the fraudulent, criminal or wrongful act of the ship's captain or crew that causes loss or damage to the ship or cargo. Any wrongful act, willfully, committed, by the master, officers or crew to the detriment of the shipowner or charterer. The Institute hull clauses cover loss of or damage to the ship when it is proximately caused by barratry; except when it is excluded by the paramount exclusions in the clauses. For example, the latter would exclude barratry involving the use of an explosive or weapon of war; also barratry carried out by a seaman on strike. Negligence or fraud on the part of a ship's officers or crew resulting in injury or loss to the ship's owner. Barratry is an act committed by the master or mariners of a vessel, for some unlawful or fraudulent purpose, contrary to their duty to the owners, whereby the latter sustain injury. It may include negligence, if so gross as to evidence fraud. Fraudulent, criminal, or wrongful act by ship's captain or crew which causes loss or damage to the ship or cargo. / хозяином (или капитаном), . Мошеннические, преступные или незаконные действия капитана или экипажа судна, вызвавшие утрату или повреждение судна или груза. Действия капитана корабля или экипажа, которые привели к ущербу или повреждению . Баратрия – ущерб, нанесённый судну или грузу капитаном или командой по преступной небрежности или умышленно. Баратрия:- преднамеренный, умышленный ущерб, причинённый судну или грузу капитаном или командой судна, а также другие незаконные действия с их стороны. Обычно баратрия страхуется в клубах взаимного страхования. Баратрия – преднамеренный, умышленный ущерб, причинённый судну или грузу капитаном или командой судна, а также другие незаконные действия с их стороны.

BARRÉ = БАРЕ – Barré is a stripe-like or bar-like pattern in dyed fabric. The dye uptake of some synthetic fibers, notably nylon, can be influenced by minor variations in conditions when the fibers are made. If yarns with these variations are made into fabric, then dyed, the result may be a bar-like pattern of darker and lighter shades or slight hue differences. Sometimes nylon is dyed with disperse dyes rather than acid dyes because the former are better at covering barré. Barré is an imperfection, characterized by a ridge or mark running in the crosswise or lengthwise directions of the fabric. Barrés can be caused by tension variations in the knitting process, poor quality yarns, problems during the finishing process. Barré is an unintentional, repetitive visual pattern of continuous bars and stripes usually parallel to the filling of woven fabric or to the courses of circular knit fabric. Compare Warp Streak, Mixed Filling. Discussion:- the term Barré is sometimes used as a synonym for Warp Streaks in warp knit and woven fabrics. Barré can be caused by physical, optical, or dye differences in the yarns, geometric differences in the fabric structure, or by any combination of these differences. The term 'Barré' describes a fabric, either knit or woven, in which stripes run in crosswise directions. Barre also refers to flaws in fabric that appear as unwanted crosswise stripes of texture or color. Barré; bars:- Bands with clearly defined edges, running full width across a fabric or spirally in a tubular fabric, which differ in appearance from the adjacent normal fabric. Note:- this defect is caused by feeder variation or variation in yarn characteristics. Note:- this defect is caused by fabric coming off the knitting needles due to a failure in the yarn supply. Barré:- horizontal stripes in fabric. Possible Cause:- possibly due to lower tension in one of the feeders, loops formed in the knitting cycle initiated by that particular feeder were slightly larger than the rest thus causing an embossed appearance in the form of stripes. This is a major defect as it is easily detectable and is not an intended effect in the fabric. Knitting defect. / уточина. Найлан (Nylon). Под Баре, от Французского слова Barré, означающее Перегороженный или Загороженный или Разделённый На Полосы (по диагонали слева вниз), понимается .

BARRE = ПОЛОСАТОСТЬ (ПО ШИРИНЕ ТКАНИ) – Barre:- of the knitted fabric, this defect is characterized by the fabric or the fabric horizontal row usually some uneven tread pattern. Yarn uneven or uneven yarn tension and yarn dyes with different affinity and so may be the reason for this situation. Fabric Printing Defect. Barre occurs in circular knit. Caused by mixing yarn on feed into machine. Fabric will appear to have horizontal streaks. Knitted fabric defect. Barre is a defect characterized by bars or streaks, fillingwise in woven fabrics or coursewise in weft-knit fabrics, caused by uneven tension in knitting, defective yarn, improper needle action, or other similar factors. Barre:- an unintentional repetitive visual pattern of continuous bars and stripes usually parallel to filling of woven fabric or to the courses of circular knit fabric results into this defect. / Сродство (Affinity). Порок или Дефект набивки тканей. Полосатость:- распространённый порок трикотажного полотна в виде повторяющихся поперечных или продольных полос, вызванных различной величиной петель или линейной плотностью нитей.

BARREL = БАРРЕЛЬ (или БОЧКА) – (1) Barrel is the commercial unit of volume used to measure liquids such as beer and wine. The official US definition of the barrel is 31.5 gallons, which is about 4.211 cubic feet or 119.24 liters. This unit is the same as the traditional British wine barrel. In Britain the barrel is now defined to be 36 imperial gallons, which is substantially larger:- about 5.780 cubic feet or 163.66 liters. This unit is slightly smaller than the traditional British beer and ale barrel, which held 5.875 cubic feet or 166.36 liters. There are other official barrels, defined in certain US states; most of them fall in the general range of 30–40 gallons. A barrel of beer in the United States, for example, is usually 31 US gallons (117.35 liters). The origin of the standard symbol bbl is not clear. The 'b' may have been doubled originally to indicate the plural (1 bl, 2 bbl), or possibly it was doubled to eliminate any confusion with bl as a symbol for the bale (see above). Some web sites are claiming that 'bbl' originated as a symbol for 'blue barrels' delivered by Standard Oil in its early days; this is almost certainly incorrect because there are citations for the symbol at least as early as the late 1700s, long before Standard Oil was founded. Abbreviation:- bbl, bl, or brl. / Обозначение:- в единственном числе – bl или brl, а во множественном – bbl. Баррель, от Английского слова Barrel, означающее Бочка, является мерой вместимости и объёма в системе Английских мер. В США различают Сухой Баррель, равный 0.115 627 $м^3$ или 115.627 литрам, и Нефтяной Баррель, равный 0.158 987 3 $м^3$ или 158.987 3 литрам или 42 галлонам. Английский Сухой Баррель (для сыпучих веществ) равен 0.163

65 $м^3$ или 163.65 литрам. Бочка, старая Русская мера жидкостей, употреблявшаяся до введения метрической системы мер, равная 40 ведрам (или 491.96 литрам (л)). Бочка – транспортная тара с корпусом цилиндрической или параболической формы с обручами или зигзагами катания, с доньями.

(2) Barrel is a unit of volume measure used for petroleum and refined products. 1 barrel is equal to 42 US gallons at 60 °F, 0.158 987 3 cubic meters, or 158.987 3 liters. In the United States, there is also Dry Barrel; and it is equal to 0.115 627 cubic meters. Crude oil barrels are converted to metric tons using conversion factor 7.37 based on actual density. Barrel is a unit of liquid volume of petroleum oils equal to 42 US gallons or approximately 35 Imperial gallons. Barrel is a commercial unit of volume used to measure petroleum. By international agreement a barrel of petroleum equals 42 US gallons, which is about 158.987 liters. The symbol bo (barrel of oil) is used for this unit in the petroleum industry. The petroleum barrel originated in the Pennsylvania oilfields (the first commercial oilfields) in the late XIX century. Apparently, 40-gallon barrels were increased to 42 gallons to provide insurance aganst any spillage or underfilling. By coincidence (it seems), this unit is the same size as the traditional tierce, a wine barrel. Abbreviation:- bbl. Some sources assert that 'bbl' originated as a symbol for 'blue barrels' delivered by Standard Oil in its early days. Barrel is a volumetric unit of measure for crude oil and petroleum products. 1 barrel is 42 US gallons, 35 Imperial gallons or 159 liters. There are roughly 7.33 bbl of crude oil to a ton, but the precise conversion obviously depends on the specific gravity of the oil. Barrel is a volumetric unit of measure for crude oil and petroleum products equivalent to 42 US gallons. 1 Barrel of oil equivalent equals 1 barrel of crude oil. 1 barrel of oil equivalent equals 158.987 3 standard cubic meters of natural gas. 1 barrel of oil equivalent equals 5 612 cubic feet of natural gas. 1 barrel of oil equivalent equals 0.083 7 tons of natural gas liquids (NGLs). A Barrel (bbl) is a unit of volume measure used for petroleum and refined products. 1 barrel = 0.134 tons of oil (33 degrees API); 1 barrel = 42 US gallons; 1 barrel = 158.987 3 liters = 0.158 987 3 cubic meters. / Обозначение:- брл (bbl). Некоторые источники утверждают о том, что Англоязычное обозначение bbl возникло как обозначение для 'голубых баррелей' ('blue barrels'), поставлявшихся Американской компанией Стэндод Оил (Standard Oil) в первые дни своего существования. Баррель:- единица измерения вместимости, используемая для нефти и очищенных нефтепродуктов. 1 баррель равен 42 галлонам США при 60 °Ф или приблизительно 35 Имперальным галлонам, 0.158 987 3 кубическим метрам, или 158.987 3 литрам. В Соединённых Штатах Америки используется также Сухой Баррель, который равен 0.115 627 кубическим метрам. Нефтяные баррели пересчитываются в метрические тонны с использованием коэффициента 7.37, основанного на фактической плотности. Под Баррелем, от Английского слова Barrel, означающее Бочка, понимается единица объёма (вместимости). В Соединённых Штатах Америки (США) 1 нефтяной баррель = 42 галлонам = 0.158 987 3 кубического метра ($м^3$) = 158.987 3 литрам (л); а 1 сухой баррель = 0.115 627 $м^3$ = 115.627 л. В Великобритании 1 сухой баррель = 0.163 65 $м^3$ = 163.65 л. Единица измерения объёма сырой нефти и нефтепродуктов. 1 баррель равен 42 Американским галлонам, 35 Имперальным галлонам или 159 литрам. В одной тонне содержится приблизительно 7.33 баррелей нефти, однако, точное соотношение, естественно, зависит от удельного веса соответствующего сорта нефти. Обозначение:- брл (bbl). Под Баррелем, от Английского слова Barrel, означающее Бочка, понимается мера вместимости и объёма, применяемая в Соединённых Штатах Америки (США), Соединённом Королевстве (СК) и ряде стран, использующих Английскую систему мер. В США различают баррель сухой, равный 115.628 кубическим дециметрам ($дм^3$), и баррель нефтяной, равный 158.988 $дм^3$. Английский баррель (мера вместимости для сыпучих веществ) равен 163.65 $дм^3$.

(3) Barrel is the commercial unit of volume used to measure dry commodities such as apples. The US dry barrel, established by Congress in 1912, is 105 dry quarts, which is about 4.083 cubic feet or 115.628 liters. This is the only case in the United States customary system where a dry volume is less than the corresponding fluid volume. For certain commodities, other sizes are traditional in the United States; for example, a barrel of sugar was traditionally 5 cubic feet (about 141.58 liters). In Newfoundland, a barrel of herring held 32 Imperial gallons (145.47 liters) but a barrel of sand was only 18 Imperial gallons (81.83 liters). / В Обычной Системе Мер США.

(4) Barrel is the commercial unit of weight, varying with the commodity being measured. In the United States, for example, a barrel of flour traditionally holds 196 pounds (88.90 kg) and a barrel of beef, fish, or pork 200 pounds (90.72 kg). A barrel of cement is traditionally equal to 4 bags, which is 376 pounds (170.55 kg) in the United States and 350 pounds (158.76 kg) in Canada. In old England, a barrel of herrings was 32 pounds (14.51 kg) and a barrel of soap was 256 pounds (116.12 kg).

BARREL OF OIL EQUIVALENT = БАРРЕЛЬ НЕФТЯНОГО ЭКВИВАЛЕНТА (или БАРРЕЛЬ ЭКВИВАЛЕНТ НЕФТИ) – The Barrel Of Oil Equivalent (BOE) is a unit of energy based on the approximate energy released by burning one barrel (42 US gallons or 158.987 3 liters) of crude oil. The US Internal Revenue Service defines it as equal to $5.8 \cdot 10^6$ BTU. The value is necessarily approximate as various grades of oil have slightly different heating values. $5.8 \cdot 10^6$ $BTU_{59\ °F}$ equals 6.117 863 $2 \cdot 10^9$ J, about 6.1 GJ (HHV), or 1.7 MWh. If one considers the lower heating value instead of the higher heating value, the value for one BOE would be approximately 5.4 GJ. One BOE is roughly equivalent to 5 800 cubic feet of natural gas or 58 CCF. The USGS gives a figure of 6 000 cubic feet (170 cubic meters) of typical natural gas. A commonly used multiple of the BOE is the kilo barrel of oil equivalent (kboe or kBOE), which is 1 000 times larger. Other common multiples are the BBOe, (also BBOE), or billion barrel of oil equivalent, representing 109 barrels of oil, used to measure petroleum reserves, and million barrels per day, MMbd (or MMBD), used to measure daily production and consumption. Also used is the Mtoe, or Millions of tons of oil equivalent, a metric measurement equivalent to approximately 0.006 841 BBOE. The BOE is used by oil and gas companies in their financial statements as a way of combining oil and natural gas reserves and production into a single measure. Barrels Of Oil Equivalent (BOE) is a method of equating the energy produced by a hydrocarbon gas to a standard oil measurement. One barrel of oil has about the same heat producing capacity as 6 000 ft^3 of gas at standard conditions. Barrel of Oil Equivalent (BOE) is a term used to summarize the amount of energy that is equivalent to the amount of energy found in a barrel of crude oil. There are 42 gallons (approximately 159 liters) in one barrel of oil, which will contain approximately 5.8 million British Thermal Units (MBtus) or 1 700 kiloWatt hours (kWh). Also known as Crude Oil Equivalent (COE). This term is used frequently when exploration and production companies are reporting the amount of reserves they may have. By giving a BOE figure, analysts, investors and management can assess the total amount of energy the firm has access to, without breaking it down into barrel's of crude oil, or the cubic feet of natural gas. BOE is an abbreviation for 'barrel of oil equivalent', a commercial unit of energy. One boe is equal to about 6.119 GigaJoules (GJ) or 5.800 million Btu. A Barrel Of Oil Equivalent (BOE) is an international standard for comparing the thermal energy of different fuels. It is equal to one barrel of crude oil, or 6 000 cubic feet or 169 cubic meters of natural gas. Barrels Of Oil-Equivalent:- a unit of measure to quantify crude oil, natural gas liquids and natural gas amounts using the same basis. Natural gas volumes are converted to barrels on the basis of energy content. See also Oil-Equivalent Gas, and Production.

BARRELS PER DAY = БАРРЕЛЕЙ В СУТКИ – Barrels Per Day (B/D) is a measure of oil output, represented by the number of barrels of oil produced in a single day. For example, you might hear 'country ABC has the potential to produce five million barrels per day'. The abbreviation 'bbl/d' can also be used to represent this production measure. The barrels-per-day measure is commonly used in the oil spot markets, as prices are usually quoted in terms of dollars per barrel. One barrel of oil contains approximately 42 US gallons, or 35 Imperial gallons, and weighs approximately 0.134 tons. Barrels Per Day (b/d) is a measure of petroleum production.

Usually used to quantify an oilfield's rate of flow or a refiner's output capacity. / Как правило, употребляется для количественного обозначения дебита скважины на нефтяном месторождении или мощности выработки (выпуска) готовой продукции нефтеперегонным заводом.

BARREN = БЕСПЛОДНОЕ – Barren:- sterile or otherwise incapable of reproducing.

BARRIE EFFECT = ЭФФЕКТ БАРИ – A Barrie Effect has the appearance of a stripe with shaded edges. It is horizontal in weft knits and vertical in warp knits. The barrie effect is caused by various factors like:- (i) lack of uniformity in yarn size, color or luster; (ii) mush tension on the yarns during knitting one section of the fabric; and (iii) uneven shrinkage or other finishing defects. Knitted fabric defect.

BARRIER OPTION = БАРЬЕРНЫЙ ОПЦИОН – Barrier Options, also known as Knock-Out, Knock-In or Trigger Options, are path-dependent options which are either activated (knocked-in) or terminated (knocked-out) if a specified spot rate reaches a specified trigger level (or levels) between inception and expiry. Before termination knock-out options behave identically to standard European-style options, but carry lower initial premiums because they may be extinguished before reaching maturity. In contrast, knock-in options behave identically to European-style options only if they are activated/knocked-in and so also command a lower premium. The standard barrier options have barrier levels that are monitored continually during the lifetime of the option. Single barrier options that have a barrier level above current spot are classified as up-and-out or up-and-in options. For single barriers below spot the usual terminology is down-and-out for the knock-out barrier option, and down-and-in for the knock-in barrier option. An alternative terminology for single barrier options classifies barrier options where the barrier is out-of-the money with respect to the strike price as regular barrier options. In-the-money barrier options are further differentiated into reverse barrier options (for cases where the barrier may be breached as the underlying asset's spot rate moves deeper in-the-money) and geared barrier options (examples where the barrier is in-the-money and lies between the strike and the underlying spot rate) A double barrier option has both an upper and lower barrier. Many variations on the barrier theme are available. Barrier levels can be monitored continually, at discrete fixing times (discrete barrier options) or only at the final expiry date of the option (at-expiry barrier options). Barriers may be active only during distinct time intervals (window barrier options) or may change value at fixed points during the lifetime of the option (stepped barrier options). Barriers may need to be breached for a certain time before they are considered triggered (Parisian Barrier Options) or may allow for partial triggering depending upon how far beyond the trigger level the underlying asset is observed (Soft Barrier options). Barriers may reference a different underlying to that of the option itself – such barriers are known as Outside Barriers. Barrier Options are options whose outcome depends on the performance of the underlying during the life of the option and whether that price breaches some predetermined barrier level. Barrier Options are the exotic options that either come to life (are knocked-in) or are extinguished (knocked-out) under conditions stipulated in the options contract. The conditions are usually defined in terms of a price level (barrier, knock-out or knock-in price) that may be reached at any time during the lifetime of the option. There are four major types of barrier options:- (i) up-and-out, (ii) up-and-in, (iii) down-and-out, and (iv) down-and-in. The extinguishing or activating features of these options mean they are usually cheaper than ordinary options, making them attractive to purchasers looking to avoid high premium. Barrier Option is a family of path dependent options whose pay-off pattern and survival to the expiration date depend not only on the final price of the underlying currency but also on whether or not the underlying currency breaks a predetermined price level at any time during the life of the option. / Семейство опционов, зависящих от обстоятельств, которые возникают в процессе срока действия данных опционов. Модель окупаемости и действительность данного опциона к дате прекращения признания (дате экспирации) зависят не только от окончательной цены соответствующей валюты, но также и от того, пробивала ли или нет соответствующая валюта предопределённый ценовой уровень в любое время в течение срока действия данного опциона.

BARRIERS = БАРЬЕРЫ – (1) A Barrier Level is a defined level that causes some event to occur. The disclosure document will provide details.

(2) Barriers is a fence or similar material object that separates rats from the field. A factor that stops organisms from spreading or from cross-pollinating.

BARRIERS TO ENTRY = БАРЬЕРЫ К ВВОЗУ – Barriers To Entry are conditions or circumstances that make it very difficult or unacceptably costly for outside firms to enter a particular market to compete with the established firm or firms that are already selling the good or service involved. These barriers may derive from several causes. Legal or regulatory or other clearly political barriers to entry are historically the most common source of long-lived monopolistic or cartelized conditions in the marketplace, either through overt grants of monopoly to politically favored firms or through the enactment of laws or decrees that have the same effect indirectly by imposing such high costs or delays for qualifying for licensure, permission to import across national boundaries, or other required regulatory clearances to sell in the marketplace that new competition is effectively discouraged without being specifically prohibited. The existence of legally enforceable patent protection may give the incumbent firm a big cost or quality advantage over other potential competitors – at least as long as new and better products or production technologies have not been discovered or acquired by potential entrants. Even without political favoritism, an established firm or firms in the industry may also enjoy large initial cost advantages over new entrants due to the need for very large initial outlays in highly capital intensive industries where the available technology creates substantial economies of scale for the firm that has already made those outlays in the past. Laying out billions of Dollars up front to enter a competition where long term success is highly uncertain may involve so much risk that only slightly higher-than-average profits in the industry will be insufficient to bring in new entrants, so if the monopolist is wise enough not to jack up prices too high above marginal costs he may avoid unpleasant competition for many years. Of course if the threat of potential competition causes the monopolist to moderate his behavior in this way, the adverse welfare effects people expect from monopoly may become relatively negligible in the process. It is often suggested that extensive investment in product differentiation, years of expensive advertising, and the resulting cultivation of brand loyalty among the consumers can create difficult barriers to entry as well, although seemingly brand-loyal consumers often show a remarkable willingness to shift surprisingly quickly to new brands when they find clear evidence of superior quality or a major price advantage in doing so. Brainwashing the public does not come cheap – and it often turns out to be far from permanent! Xxxxx. A Barrier To Entry is any obstacle that prevents potential entrants from enjoying the benefits that accrue to incumbents (established firms). These obstacles may be classified as structural or strategic. The benefits that accrue to the established firms are usually defined in terms of long run abnormal profits (price set above minimum long run average cost), but may also include other advantages, for example, in research and development. The key point to emphasize about barriers to entry is that they yield rents that are only available to incumbent firms; such firms earn these rents precisely because they are established in a particular industry. Structural Barriers:- structural barriers to entry depend on the factors that determine the competitiveness of an industry (for example, demand for a product and technology). Neither incumbent firms nor potential entrants can directly determine the size of these barriers. Examples of structural barriers include economies of scale, absolute cost advantages, and product differentiation. Economies of scale are defined as the rate at which long run average costs of production fall as output is increased. The point at which these costs are minimized is the minimum efficient scale of production (MES). If the MES is very large in relation to market demand it may only be viable for one incumbent to exist in this industry. Absolute cost advantages exist when the incumbent's long run average cost is below

that of the potential entrant's for all levels of output. In other words, and unlike the case of economies of scale, the scale at which the potential entrant chooses to enter does not affect the cost disadvantage it experiences with respect to the incumbent. Exclusive access to superior technology via patents is one way in which absolute cost advantages are realized. Product differentiation means that the output of one firm is not perceived by consumers to be a perfect substitute for the output of other firms. This, too, is another type of structural barrier to entry. For example, if consumers are loyal to established brands it can be very difficult (and expensive) for potential entrants to attract customers. Other factors that influence product differentiation barriers to entry include customer inertia, switching costs, product reputation, and established dealer systems. Strategic Barriers:- the major weakness of structural barriers is that they provide little information on how incumbents would respond if entry occurred. This is important because structural barriers may not in themselves be sufficient to deter entry. For example, a new entrant may be able to undercut the monopoly price of the incumbent and force the latter to exit the industry. To overcome this problem a variety of alternative theories of barriers of entry have been developed, which are classed as strategic. Strategic barriers to entry are the actions taken by incumbents to influence the behavior of potential entrants. A key insight of such theories is that actions taken by the incumbent pre entry alter the post entry returns available to the potential entrant. Recognizing that ex post returns are less attractive than was anticipated, the potential entrant does not enter. Pricing policy and commitment are two types of strategic entry barrier that figure prominently in the literature. Limit pricing was one of the earlies theories used to examine the way in which the pricing decisions of an incumbent could deter entry. The limit price is the highest the incumbent believes it can charge without attracting entry. Two assumptions underlie this theory. First, the incumbent has exhausted economies of scale and therefore produces at the minimum of long run average cost. Second, potential entrants believe that the incumbent will maintain its output at the pre entry level even after entry. Effectively, the decision to enter will depend on whether it is profitable for the potential entrant to supply the residual demand function (that not met by the incumbent). However, the belief that the incumbent will not change output after entry has been questioned. For example, if entry occurred there is no guarantee that only the potential entrant would incur losses. Recognizing this, the incumbent may allow entry and collude in a market sharing agreement with the new entrant. Alternatively, it may be more profitable for the incumbent to sell at the monopoly price and permit entry to occur. Predatory Pricing:- predatory pricing is a strategy by which the incumbent reduces (or threatens to reduce) price to unremunerative levels when faced with actual (or potential) competition. Such a tactic is predatory because it conflicts with short run profit maximization. However, if the use of this tactic is successful, the incumbent can continue to earn monopoly profits in the long run. Predatory pricing has a long history: in the United States, for example, one of the most famous cases involved Standard Oil in 1911. The success of predatory pricing depends on a number of factors. For example, for it to be profitable, short term losses must be less than long term monopoly profits, but calculating these accurately is difficult; if the result is positive there still remains the problem of communicating the credibility of such action to a potential entrant. If the incumbent faces just one potential entrant, an aggressive pricing policy may succeed, but this outcome is less certain when a number of potential entrants are encountered: For example, while an aggressive response by the incumbent may deter the first potential entrant and all subsequent entrants, it is also possible that a sequence of costly price wars damage the financial resources of the incumbent to such an extent that the threat of an aggressive response is no longer perceived as credible by potential entrants. Commitment Strategies and Product Proliferation:- the basic premise of commitment strategies is that before entry occurs the incumbent has the opportunity to make irreversible decisions that alter the payoffs in the post entry game. These commitments affect the incumbent's response post entry while simultaneously signalling to potential entrants the desirability of entering ex ante. For example, the decision by the incumbent to invest in extra capacity will reduce its unit cost of production and this will allow it to pursue an aggressive pricing/output policy postentry. Observing this, potential entrants will realize that they cannot profitably enter the industry. Irreversible decisions involve sunk costs:- costs that cannot be recovered if the decision is made to exit the industry. Examples of these irreversible decisions include advertising, investment in large sunk production capacity, and product proliferation. Advertising is a type of promotional campaign designed to increase the demand for a product. One way in which advertising can act as a barrier to entry is by creating a cost asymmetry between the incumbent and the potential entrant. Advertising helps to create goodwill for a product:- an advertising campaign today will continue to generate demand in the future even if no further advertising expenditure is undertaken. This cumulative effect of advertising means that in order to attract the same level of demand as an incumbent, the potential entrant needs to spend more on advertising. The fact that advertising expenditure is a completely sunk cost may increase the difficulties experienced by potential entrants attempting to raise external funds to finance an advertising campaign:- In the event of unsuccessful entry, physical plant has some salvage value that can be used as security for a loan, but a failed advertising campaign has no such value. The established position of incumbents is reinforced if economies of scale in advertising are important. Such economies can arise from threshold effects (a minimum number of advertising messages are required to influence consumers) and also because as a sunk fixed cost, average costs decline as the volume of advertising increases. With large sunk capacity the incumbent incurs higher fixed costs to obtain lower marginal costs of production, and these, in turn, require larger outputs for profit maximization. Large sunk capacity commits the incumbent to a 'tough' strategy when confronted with entry because largescale output is the profit maximizing strategy irrespective of entry. Entry is deterred because the output decision of the incumbent reduces the demand available to the potential entrant. In these models, the barrier to entry is also a barrier to exit. Product proliferation is the strategic decision by an incumbent to preempt entry by creating brands that satisfy every product niche (meaning there is little demand left for a new brand) and to enter profitable market niches before a potential entrant (which rules out profitable entry). Classic examples of industries in which there is significant product proliferation include laundry detergents, bathroom soap, and toothpaste. Effects:- Judgements on the welfare effects of barriers to entry are difficult and need to take account of a variety of factors. For example, significant scale of economies will mean that only a few firms can exist in an industry and be productively efficient. The fact that high profits are being earned in a concentrated industry might indicate the abuse of monopoly power, but such profits are also consistent with incumbent firms having superior technology compared to potential entrants. The short run disadvantages of barriers to entry need to be weighed against long term benefits. For example, the existence of barriers to entry may allow incumbents to charge higher prices compared to a competitive industry and to make significant profits, but these profits may be used to finance research and development into cures for diseases. In this example, removing barriers to entry will make the industry more competitive and lead to lower prices and competitive rates of profit, but these profits may be insufficient to finance research and development. In many countries the responsibility for investigating barriers to entry and determining whether they are legal or not rests with official bodies. In the United States, for example, the Federal Trade Commission is responsible for these inquires; in the United Kingdom, investigations have been conducted by the Office of Fair Trade. / домогательство (abuse).

BARRINESS = ПОЛОСАТОСТЬ – Barriness:- bands with clearly defined edges that run full-width across a fabric, or spirally in a tubular fabric, and that differ in color, yarn characteristics or texture from the normal fabric. Note:- this defect is caused by differential dyeing effects in the areas where yarn characteristics or fabric texture vary from the normal. / Полосатость:- распространённый порок трикотажного полотна в виде повторяющихся поперечных или продольных полос, вызванных различной величиной петель или линейной плотностью нитей..

BARRISTER = БАРИСТЁ – A Barrister is a lawyer found in many common law jurisdictions who principally, but not exclusively, represents litigants as their advocate before the courts of that jurisdiction. In this regard, the profession of barrister corresponds to that

part of the role of legal professionals found in the civil law jurisdictions relating to appearing in trials or pleading cases before the courts. However, barristers, as a profession, are also known for specialising in certain areas of the law, and for giving advice in relation thereto to clients referred to them. See also Lawyer and Solicitor. / От слова Bar, означающее Барьер, отделяющий судей от подсудимых. Высшее звание адвоката в Соединённом Королевстве. Известен также как Адвокат (Lawyer) и Солиситор (Solicitor).

BARRON'S CONFIDENCE INDEX = ИНДЕКС ПО ДОВЕРИЮ ОТ БЭРЭНЗ – Barron's Confidence Index is an indicator used to gauge investors' confidence based on how much they are investing in speculative grade of bonds. When investors are more optimistic about the market, they tend to invest in high-quality bonds, but when they are worried about the market they invest in lower-quality bonds. This indicator is calculated by dividing the average yield on 10 high-grade bonds by the average yield on 10 intermediate-grade bonds. The difference between the two is used to determine investors' confidence. Weekly index prepared by the publishers of Barron's. Index compares yields of higher grade to lower grade corporate bonds. As yields on lower grade bonds fall, it shows that investors are more confident about the economy. Used for an insight into possible market sentiment about equity securities. Barron's Confidence Index means a confidence indicator calculated by dividing the average yield on high-grade bonds by the average yield on intermediate-grade bonds. The discrepancy between the yields is indicative of investor confidence. A rising ratio indicates investors are demanding a lower premium in yield for increased risk and so are showing confidence in the economy. The theory is that if investors are optimistic they are more likely to invest in the more speculative grade of bonds, driving yields downwards and the confidence index upwards. The opposite is true if investors are pessimistic. Barron's is America's premier financial magazine. It provides in-depth analysis and commentary on the markets, updated every business day online. Barron's is an American weekly newspaper covering US financial information, market developments, and relevant statistics. Each issue provides a wrap-up of the previous week's market activity, news reports, and an informative outlook on the week to come. The paper has been published by Dow Jones & Company, Inc. (New York, NY, the United States of America) since 1921. / Дау Дьжонз Энд Кампэни, Инк. (Dow Jones).

BARS = BASE ACCOUNTS RECEIVABLE SYSTEM

BARS = ПРУТКИ – Bars are long products, usually of round, square, rectangular, or hexagonal cross section and of 12- to 50-millimeter diameter or equivalent. (Since bar mills are also capable of rolling small shaped products such as angles, flats, channels, fence posts, and tees, these products are sometimes called Merchant Bars.) In rolling bars, a billet measuring, for instance, 120 millimeters square and five meters long is heated in pusher or walking-beam furnaces to 1 200 °C. There is a great variety of layouts used in bar-rolling mills. In principle, after removal of the furnace scale by water jets, a primary reduction takes place in several passes through roll stands in open, semicontinuous, or fully continuous arrangement. These can use an alternating square-diamond rolling principle on horizontal and vertical rolls, as shown in B in the figure, or a series of oval-to-round passes, as illustrated in C in the figure. Guiding the strands properly from roll gap to roll gap is an important part of this rolling technology. When using only horizontal rolls, the guides also twist the bar 90° between diamond and square passes. In a continuous arrangement of close-coupled mills – in which several roll pairs or roll sets are installed a short distance from one another and all are driven through gears by one or two motors – bars are allowed to buckle in a controlled vertical loop in order to maintain a low tension in a bar between the stands. When using an open-train arrangement, a U-shaped trough called the repeater guides and threads the strand, as indicated in G in the figure. This generates a horizontal loop, caused by the entry speed of each receiving stand being slower than the exit speed of the delivering stands. The finishing stand of a bar mill gives the bar its final shape and often a specific surface pattern, such as the protrusions on concrete-reinforcing bars. The rolling speed increases as the cross section at each successive stand decreases, and the exit speed can be as high as 15 meters per second. The hot bar is then cut by a flying shear into cooling-bed length (e.g., 50 meters), after which it is cooled, inspected, and cold-cut to shipping length. / обычно круглого, квадратного, окантованного, или . прокатка (rolling). Под Прутком понимается длинномерный металлический полуфабрикат – заготовка для получения деталей способами пластической деформации или обработки резанием. Сечение прутка – круглое (наиболее часто), шестиугольное, прямоугольное, реже трапециевидное, овальное или сегментное. Изготовляют прокаткой, прессованием, ковкой.

BARS = СТЕРЖНИ – Bars are special devices mounted on container doors to provide a watertight locking. Synonym:- Door Lock Bars.

BARTACK = СКРЕПЛЕНИЕ (или ОБТАЧКА) – Bartack:- to reinforce a seam with a bar of stitches that provides a more durable seam end. Commonly used at points of strain. / Обтачка – отдельно выкраиваемая деталь для обработки срезов, всегда повторяющая форму среза. Поэтому для обтачки не даётся, как правило, отдельная выкройка – она переснимается с конструктивной детали выкройки как отдельная деталь. Направление долевой нити обтачки и основной нити обычно совпадают. Цельнокроенная обтачка – если подлежащий обработке срез прямой, обтачку можно выкроить вместе с основной деталью и отвернуть на изнаночную сторону.

BARTER = БАРТЕР – Barter is a trading of goods or services directly for other goods or services, without using money or any other similar unit of account or medium of exchange. Although barter represents the earliest form of trade discovered by primitive man that made possible a more extensive division of labor beyond the limited bounds of a family or small clan grouping, it quickly encounters some practical limits to its efficiency as the division of labor becomes still more extensive and more specialized. Bartering requires what economists refer to as a 'Double Coincidence Of Wants'. That is, for a voluntary barter exchange to take place, it is not enough for you just to find someone who has the exact good you want to acquire – he must also happen to want to 'buy' the particular good that you have to trade for it at the same time. Finding someone whose immediate needs exactly complement your own in this precise way may take quite a lot of searching, which is costly in terms of time and effort. The primitive partial solution to this matching problem is to make one or more intermediate swaps with still other people in order to acquire some other item that will be more acceptable to the owner of the item you desire – but this will also tend to be very time-consuming. The more complex the division of labor, the more finely specialized the population's productive roles, and the more numerous the variety of goods and services produced in an economy, the more costly and cumbersome barter trading will become because the likelihood of any two people having a double coincidence of wants shrinks dramatically. History strongly suggests, in fact, that the (sometimes gradual, sometimes amazingly rapid) replacement of a barter economy by an exchange economy employing some form of money to facilitate trade is a near-absolute necessity before much economic development beyond a rather primitive tribal level can occur. Barter is the direct exchange of goods and services among people. No money is used in the exchange. Trade in which merchandise is exchanged directly for other merchandise or services without use of money. The exchange of commodities or services for other commodities or services rather than the purchase of commodities or services with money. Barter is a form of countertrade where goods and services are exchanged simultaneously without using money or similar monetary instruments. This type of trade refers to a single contract between two parties who are fully compensated by the traded nonmon etary items. This clearly distinguishes barter from other forms of countertrade that may include a third party or allow for partial monetary compensation, such as counterpurchase or buy back deals. Among all forms of trade, barter can be considered as being the simplest and oldest implementation of it. From an anthropological perspective, barter is seen as a

natural tendency of human beings distinguished from gift giving. While the latter implies trust and credit, which are necessary for future cooperation, barter is seen as a one off action with no implications for future collaboration. Through barter, companies can increase their sales volume and sell excess production or resources more easily. In international trade, barter allows circumvention of certain trade barriers such as unfavorable regulations concerning international monetary transactions or overcoming economic restrictions to trade. However, there are also some severe drawbacks related to this type of trade. Barter assumes a double coincidence of wants and needs of the organizations involved. Apart from that, barter assumes that traded goods are arbitrarily divisible in order to match their underlying value. These circumstances may not always be the case. Compared to monetary trade, barter involves negotiations for two goods and/or services and requires two simultaneously concluded and fulfilled delivery contracts. Therefore, barter can be more time consuming and expensive. It also reduces the flexibility of both companies involved to react quickly to new market conditions. As only a limited range of products can be provided by the contractual parties, goods and services may not be related to one's own business and therefore other markets have to be found where these products can be resold to third parties. This may also take time and cost money. Generally, barter transactions are not superior to monetary trade and are only implemented if external requirements and circumstances make agents prefer nonmonetary operations. At times of communist power, a bulk of transactions between Western and Eastern countries included barter. Austria played a key role as a mediator in these transactions. In 1993 43 percent of Austria's transit exports were delivered to eastern European countries and 33 percent of them to western Europe. One of the reasons for barter trade was the lack of hard foreign currency and trade barriers. Therefore the direct transaction of goods and services was favored. For trade with Third World countries, barter also played an important role because they had no cash to pay for the goods needed and imported. As a consequence, their creditworthiness was low. Therefore they gave resources in exchange in order to meet their debts and to overcome their liquidity problems. Compared to money, goods better collateralize future payments/compensations than money, because claims on property rights on physical items can more easily be enforced than claims on future cash flows. In Russia, an explosive growth of barter dealings was reported in the early 1990s. This trend has been described as re demonetization and was caused by a high rate of inflation. In the XX century many European and Latin American countries suffered from a devaluation of their currencies. As a result, people engaged in barter transactions as prices increased and trading partners lost their confidence in money. It can be said that high inflation is a driver for barter transactions that limit the effects of a devaluing currency as the intrinsic value of one good/service, in terms of other goods/services, does not change. In other words, barter locks out the exchange rate risk. Finally, organizations tend to barter if the tax system in a country does not favor their operations. In Russia, tax officials were allowed to block the bank account of those companies or individuals that were in tax arrears. Consequently, it was not possible for those people to withdraw money from their accounts and pay their debts for goods and services received. As a result, nonmonetary trade increased, which enabled circumventing this barrier to trade. Modern bartering is often conducted through bartering clubs or bartering networks, such as the Swiss Wirtschaftsring (WIR) or the International Reciprocal Trade Association (IRTA). Members of such networks pay fees in order to get listed to be considered for barter transactions. Such clubs increase the likelihood of double coincidence as they match supply and demand. Counterpurchase and buy back deals are special forms of barter that may include third parties, such as banks, which reliably arrange payment flows, and traders, who are willing to resell exchanged goods. Import certificates that give the right to import a certain value of goods increase the flexibility of barter operations. They allow separating the import and export transaction from each other. Counterpurchase, buy back, and import certificates imply cross subsidization from a foreign exporter to a domestic importer or vice versa. In the former case, the foreign exporter could generate considerable profits that cannot be realized due to low purchasing power in the domestic country. The domestic importer, in contrast, would lack purchasing power without being supported by the foreign exporter. In the latter case, a foreign importer would subsidize a domestic exporter by purchasing import certificates. Other wise the domestic exporter would not be able to sell its products at the given market price and exchange rate. Direct exchange of goods or services without the use of money. Barter is the oldest known form of trade and is still widely used in international commerce. Barter is the mutual exchange of goods and services for other goods and services without using money as a medium of exchange. It generally requires a mutual need for the items being traded. / нежели закупка сырья или услуг за деньги. Бартер – торговля товарами или услугами без использования денег. Прямой обмен товара на товар без участия денежных средств. Когда участвуют деньги, в форме ли заменителей денег, чеков, банкнот или монет, сделка называется продажей (sale). Хотя бартер обычно ассоциируется с неразвитыми экономическими системами, он часто используется в современном обществе. В условиях чрезвычайно сильной инфляции он может быть предпочтительным способом ведения торговли. В том случае, когда население не доверяет имеющейся валюте или банковской системе, бартер становится общепринятым. В международной торговле бартер может быть одним из способов ведения дел со странами, неустойчивые валюты которых в противном случае сделали бы их невыгодными партнёрами.

BAS = BASIC ACCOUNTING SYSTEM

BAS = BUSINESS AND ADMINISTRATIVE SERVICES

BAS = BACHELOR OF ARTS AND SCIENCES

BASAL = БАЗАЛЬНОЕ (или НИЖНЕЕ) – Basal:- at or referring to the base of any structure. See also Apical. Basal:- at, near, or toward the base or beginning. / Под Базальным, от Греческого слова Básis, означающее Основа, понимается основной, расположенный у основания, обращённый или относящийся к нему, например, базальная мембрана. Смотрите также Апикальное (Apical).

BASAL APPLICATION = БАЗАЛЬНОЕ ВНЕСЕНИЕ (или НИЖНЕЕ ВНЕСЕНИЕ) – Basal Application is a broadcasting or applying fertilizer into the soil before seeding or transplanting the crop.

BASAL ROOTS = БАЗАЛЬНЫЕ КОРНИ (или НИЖНИЕ КОРНИ) – Basal Roots are roots developing from basal nodes and growing into the soil.

BASAL TILLERS = БАЗАЛЬНЫЕ ПОБЕГИ (или НИЖНИЕ ПОБЕГИ, или РОСТКИ, или ОТРОСТКИ) – Basal Tillers are tillers produced from basal nodes near the soil surface; the term 'Basal' is used to differentiate the tillers produced on the upper nodes from those developing at the base. / В анатомии под Базальным, от Греческого слова Básis, означающее Основа, понимается основной, расположенный у основания, обращённый или относящийся к нему, например, базальная мембрана. Сравните с Апикальным (Apical). Под Черенком понимается отрезок зелёного или одревеснешего побега с почками, используемый для вегетативного размножения растений – укоренения, прививок. Черенки заготавливают с высококачественных растений, называемых Маточными. Полученные черенки сохраняют их свойства и признаки. Различают черенки стеблевые, листовые и корневые. Стеблевые черенки, взятые после опадения листьев, называются Зимними, а облиственные черенки – Летними или Зелёными. Зимние черенки (длиной 20–30 см) обычно заготавливают Осенью, чаще от однолетних приростов, высаживают Осенью или хранят прикопанными в подвале или в снегу и высаживают в грунт ранней Весной. Для летних черенков используют облиственные побеги, разрезая их на части длиной 5–10 см; иногда срезают часть коры с древесиной и одной почкой. Корневые черенки обычно заготавливают Осенью, разрезают на части длиной 10–15 см и хранят прикопанными в

песке или торфе; высаживают Весной. В стеблевых и корневых черенках различают морфологически нижний, или базальный, конец, образующий корни, и верний, или апикальный, образующий побеги.

BASE = БАЗА – (1) Base is the lowest or starting point from which calculations are made, especially calculations of relative stock price movements. / Под Базой, от Французского слова Base, от Греческого слова Básis, означающее Основа или Основание, понимается:- (1) основание, основа чего-либо; в архитектуре – основание, подножие колонны или столба. (2) Организация занимающаяся снабжением или обслуживанием, например, экскурсионная база. (3) Склад.

(2) Base is the home depot of container or trailer. / Внутренний (домашний) парк или депо контейнеров или грузовиков.

BASE = ОСНОВАНИЕ (или ОСНОВА, или БАЗА) – (1) Base is (general) the essential ingredient, the foundation of a construction, bottom of a plant or any part of a structure and the part of an appendage nearest the body in arthropods. / Под Основанием понимается в здании или сооружении – массив грунта (горной породы), непосредственно воспринимающий нагрузку от здания или сооружения. Различают основание естественное, когда грунты находятся в условиях природного залегания, и искусственное, когда грунты предварительно уплотнены или закреплены. Под Базой, от Французского слова Base, от Греческого слова Básis, означающее Основа или Основание, понимается:- .

(2) Base is a material which neutralizes acids. An oil additive containing colloidally dispersed metal carbonate, used to reduce corrosive wear. See also Acid, and Alkali. Chemical group or substance having the property of accepting a proton (H^+) from water to release OH^- . Base is a chemical compound that will produce pH of greater than 7 in water solutions. Alkali is often used synonymously, though this is not strictly true (all alkalis are bases, not all bases are alkalis). Essentially the 'opposite' of an Acid. By far the most common base used in dyeing is sodium carbonate (soda ash). Other bases used include sodium bicarbonate (baking soda), trisodium phosphate (TSP) and sodium hydroxide. Strong bases can cause serious skin burns. / Щёлочь (Alkali). включают бикарбонат натрия (или двууглекислый натрий, или кислый углекислый натрий (sodium bicarbonate)) (пищевая сода (baking soda)). сильное основание (strong base). трёхнатриевый фосфат (trisodium phosphate). , используемая для снижения коррозионного износа. Под Основаниями понимается класс химических соединений. Обычно основаниями называются вещества, содержащие гидроксильную группу OH и диссоциирующие в водном растворе с образованием иона OH^-. Растворимые основания называются Щёлочами. К сильным основаниям относятся полностью диссоциирующие в воде (NaOH, $Ba(OH)_2$ и другие); к слабым основаниям – диссоциирующие неполностью. По современным представлениям, понятие Основание распространяется на более широкий круг соединений. Смотрите также Кислота (Acid). В химии под Основанием понимается класс химических соединений, обычно характеризующихся диссоциацией в водном растворе с образованием иона OH^-. Растворимые в воде основания называются Щёлочами, например, NaOH. Сильные основания полностью диссоциируют в воде, слабые, например, $Mg(OH)_2$ – частично. По современной теории кислот и оснований к основаниям относится более широкий круг соединений, в частности и такие, которые не содержат ионов OH^-, например, C_6H_5N – пиридин. Основания, химические соединения, содержащие гидроксильную группу OH и способные диссоциировать в водном растворе с образованием гидроксильных ионов OH^-. По степени диссоциации различают Слабые Основания, например, NH_4OH, и Сильные Основания, например, NaOH, $Ca(OH)_2$. Хорошо растворимые в воде основания называются Щёлочами. Смотрите также Кислоты и Основания.

(3) In DNA and RNA, a Base is the general term given to adenine (A), cytosine (C), guanine (G), uracil (U), and thymine (T), the five N-containing compounds released from nucleic acids by vigorous hydrolysis.

BASE BILL = БАЗОВЫЙ СЧЁТ – Base Bill is a charge calculated through multiplication of the rate from the appropriate electric rate schedule by the level of consumption.

BASE FABRIC = ТКАНЬ ОСНОВАНИЯ – Base Fabric:- in coated fabrics, the underlying substrate.

BASE GAS = БУФЕРНЫЙ ГАЗ (или ТЕХНОЛОГИЧЕСКИЙ ГАЗ) – Base Gas:- the volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

BASE GRADE = БАЗОВЫЙ СОРТ – Base Grade is a selected grade of cotton used by cotton merchants as a basis for contracts, premiums and discounts. Also known as Basis Grade. / Выбранный сорт хлопка, используемый торговцами в качестве базы для контрактов, премий (надбавок) и скидок. Известный также как Базисный Сорт (Basis Grade).

BASE LAYER = БАЗОВЫЙ СЛОЙ – Base Layer:- the apparel in contact with your skin. The purpose of the base layer is to keep you warm/cool and dry.

BASELINE = ИСХОДНАЯ ЛИНИЯ (или ХХ) – Baseline is the set of market projections used for the outlook analysis in this report and as a benchmark for the analysis of the impact of different economic and policy scenarios. A detailed description of the generation of the baseline is provided in the chapter on Methodology in this report.

BASELOAD = БАЗОВАЯ НАГРУЗКА (или ОСНОВНАЯ НАГРУЗКА) – In reference to electricity, Baseload is the minimum amount of electric power delivered or required over a given period of time at a steady rate. The minimum continuous load or demand in a power system over a given period of time. / В отношении к электричеству, под Базовой Нагрузкой или Основной Нагрузкой понимается минимальное количество электроэнергии, гарантированно поставляемое или необходимое в течение определённого периода времени по утверждённой ставке. Минимальная постоянная нагрузка энергосистемы или потребность энергосистемы в электроэнергии в течение определённого периода времени.

BASELOAD CAPACITY = ПРОИЗВОДСТВЕННАЯ МОЩНОСТЬ (или МОЩНОСТЬ ЭНЕРГОБЛОКА) – In reference to electricity, electric generating equipment normally operated to serve loads on an around-the-clock basis. / По отношению к электричеству, оборудование, генерирующее электричество, задействованное, как правило, для круглосуточного поддержания нагрузки в номинальном режиме. Под Производственной Мощностью понимаются отрасли, предприятия, его подразделения, расчётный, максимально возможный объём выпуска продукции в единицу времени при наиболее полном использовании производственного оборудования и площадей по прогрессивным нормам, передовой технологии и организации производства. Рабочая Мощность Электроэнергетической Системы – располагаемая мощность электроэнергетической системы за вычетом мощности агрегатов, выведенных в ремонт. Располагаемая Мощность Электроэнергетической Системы – установленная мощность электроэнергетической системы за вычетом неиспользуемой мощности, обусловленной ограничениями по режимам работы оборудования электростанций и пропускной способности электрической сети. Установленная Мощность Электроэнергетической Системы – суммарная номинальная активная электрическая мощность агрегатов всех электростанций электроэнергетической системы в целом.

BASELOAD PLANT = ОПОРНАЯ ЭЛЕКТРОСТАНЦИЯ (или БАЗИСНАЯ ЭЛЕКТРОСТАНЦИЯ) – Baseload Plant is a plant normally operated to take all or part of the minimum continuous load of a system, and which consequently produces electricity at an essentially constant rate. A base load plant typically has relatively high fixed costs and low unit operating costs. Traditionally, nuclear plants have been considered as base load plants. Baseload Plant is a plant, usually housing high efficiency steam-electric units, which is normally operated to take all or part of the minimum load of a system, and which consequently produces electricity at an essentially constant rate and runs continuously. These units are operated to maximize system mechanical and thermal efficiency and minimize system operating costs. / Электростанция, обычно эксплуатируемая в целях полного или частичного обеспечения минимальной постоянной нагрузки энергосистемы; и которая, следовательно, вырабатывает электричество в целом в неизменных объемах. Эксплуатация базисной электростанции, как правило, связана с относительно высокими постоянными издержками при низких удельных эксплуатационных затратах. Обычно атомные электростанции рассматриваются в качестве базисных.

BASE METAL = ОСНОВНОЙ МЕТАЛЛ (или БАЗОВЫЙ МЕТАЛЛ) – Base Metals are metals that oxidize or corrode relatively easily, and react variably with diluted hydrochloric acid (HCl) to form hydrogen. Examples include aluminum, nickel, lead, tin and zinc. Copper is considered a base metal as it oxidizes relatively easily, although it does not react with HCl. In mining and economics, base metals are also referred to as Non-Ferrous Metals which excludes precious metals. Base metals are traded at the COMEX®, LME and SHFE (short for the Shanghai Futures Exchange; China). A metal which oxidises when heated in air, e.g., lead, copper, tin, zinc, as opposed to noble metals such as gold and platinum. Aluminum, copper, lead, nickel, and tin. Base Metal is a non-ferrous metal, excluding precious metals. / образуя водород. цветные, или, точнее, нежелезные металлы, которые исключают благородные металлы. , например, . Алюминий, медь, свинец, никель и олово. К Тяжёлым Металлам относятся:- висмут, кадмий, кобальт, медь, никель, олово, ртуть, свинец, сурьма и цинк. Лёгкие металлы:- алюминий, барий, бериллий, калий, кальций, литий, магний, натрий, рубидий, стронций, титан и цезий. Данная классификация условна:- многие металлы могут быть отнесены к разным группам одновременно. Основной Металл:- (1) Металл, являющийся основой сплава, латунь, например, является сплавом с медной основой. (2) Металл, который нужно паять, резать или сваривать. (3) После сварки – та часть металла, которая не была расплавлена. (4) Металл, который легко окисляется или растворяется с образованием ионов, в отличие от благородных металлов (Noble Metal).

BASE MONEY = ДЕНЕЖНАЯ БАЗА (или БАЗОВЫЕ ДЕНЬГИ) – Base Money (M0) or Monetary Base:- currency (banknotes and coins) in circulation plus the minimum reserves credit institutions are required to hold with the Eurosystem and any excess reserves they may voluntarily hold in the Eurosystem's deposit facility, all of which are liabilities on the Eurosystem's balance sheet. Base money is sometimes also referred to as the 'Monetary Base'. Base Money sometimes also called Highpowered Money or the Monetary Base. It comprises banknotes and coins outside central bank vaults plus credit institutions' deposits with the central bank system. Base Money is a very liquid form of currency circulating within an economy. In the United States, the monetary Base or M0 includes paper currency, coins, and the reserves that commercial banks keep on deposit with the Federal Reserve Bank. In the past, forex traders focused on money supply measures more than they typically do today. Base Money:- money which is under the direct control of the central bank, i.e. all currency in circulation, plus all bank deposits with the central bank. It approximates to the UK M0 level of money supply. / В Соединённых Штатах Америки монетарная База или M0 включает бумажные деньги, монеты, и резервы, которые коммерческие банки держат во вкладе в Федеральном Резервном Банке. В прошлом торговцы на Форэксе больше обращали внимание на меры денежного предложения, нежели сейчас.

BASE NUMBER = ЩЕЛОЧНОЕ ЧИСЛО – Base Number:- the amount of acid, expressed in terms of the equivalent number of milligrams of potassium hydroxide, required to neutralize all basic constituents present in 1 g of sample. / Щелочное Число – количество кислоты, необходимое для нейтрализации 1 грамма (г) нефтепродукта, выраженное эквивалентным количеством мг KOH.

BASE OF PERIANTH = ОСНОВАНИЕ ОКОЛОЦВЕТНИКА – Base Of Perianth:- xxxxx.

BASE OIL = БАЗОВОЕ МАСЛО – Base Oil is a base stock or blend of base stocks used in an American Petroleum Institute (API)-licensed engine oil. Base Oil:- usually refined crude oil fraction or selected synthetic base stock. Additives are mixed to them during lubricant manufacturing. Lubricant Base Oils are produced in a series of steps which are designed to enhance certain desirable properties. For paraffinic oils, these include viscosity index, oxidation resistance, thermal stability and low temperature fluidity. Starting from petroleum crude oil, the typical process for making a base oil is as follows:- (i) Separation of lighter boiling materials, such as gasoline, diesel, etc; (ii) Distillation to isolate desired base oil viscosity grades; (iii) Selective removal of impurities, such as aromatics and polar compounds; (iv) Dewaxing to improve low temperature fluidity; and (v) Finishing to improve oxidation resistance and heat stability. In general, both Solvent Refined and Hydrotreated base oils are manufactured this way, but differ in the type and severity of processes used. Group I, or conventional base oils manufactured by Solvent Refining, make up most of the base oil produced in the world today. Containing more than 0.03 wt (weight) % Sulphur and/or less than 90 wt % Saturates, they are less pure than Hydroprocessed or Synthetic base oils. Group II and III base oils are manufactured by what the API calls Hydroprocessing or Severe Hydroprocessing. With Sulphur content of less than 0.03 wt % and Saturates content of more than 90 wt %, they are more pure than Group I base oils. Petro-Canada uses a special high severity version of Hydroprocessing, called HT Severe Hydrotreating, to produce Group II, II+ and III base oils. It's also known as the HT Purity Process. / Смесь нескольких основных масел называется Базовым Маслом. Базовые масла могут состоять из основных масел одного типа или являться смесью основных масел, принадлежащих к разным группам. По типу основных масел различают:- Минеральные, Полусинтетические и Синтетические Базовые Масла. Базовое Масло – это основа товарного масла, готовая к смешению, но ещё без присадок. Сырьём для смазочных масел могут быть минеральные и синтетические базовые масла. Химический состав минеральных масел зависит от нефти, из которой произведено масло. Химический состав синтетических масел зависит от исходного сырья (мономеров) и метода синтеза. Базовые масла различаются между собой вязкостью, химическим составом и некоторыми другими свойствами. Под Базовыми Маслами понимаются нефтяные и синтетические масла без присадок, применяемые для изготовления гидравлических, моторных, приборных, трансмиссионных и других товарных масел. Производство 'Минеральных' Основных Масел:- для получения базовых масел из масляных фракций, полученных в результате вакуумной перегонки нефти, их подвергают процессам, призванным привести их физико-химические свойства в соответствие с требованиями, предъявляемыми к базовым маслам. Ряд технологических операций, результатами которых на отдельных этапах являются снижение количества ароматических углеводородов, ликвидация углеводородов с линейными углеродными цепями, ликвидация атомов серы и азота осуществляется в так называемом масляном блоке нефтеперерабатывающего завода. Отдельные задачи могут выполняться с применением разных технологий, благодаря чему можно получать (с различной производительностью) отличающиеся по качеству готовые базовые масла, а также разные виды побочных продуктов. В доступной Польскоязычной литературе, последнего десятилетия прошлого века, принято было делить схемы производства базовых смазочных масел на традиционные, модернизированные и, так называемые 'водородные' (гидропроцессы). Суть такого деления представлена ниже. Целью первого процесса масляного блока – рафинации (очистки) –

является удаление из масляных дистиллятов (или значительное уменьшение количества) многоядерных ароматических углеводородов, асфальтено-смолистых веществ и соединений с гетероатомами (иных чем углерод и водород элементов). Цель данной операции – увеличение индекса вязкости масляного дистиллята. В традиционных схемах суть процесса сводится к экстракции (вымыванию) нежелательных соединений с помощью соответствующих растворителей, таких как фурфурол, фенол или N-метил-2-пирролидон. На следующей стадии в масляном блоке осуществляется депарафинизация – масляные фракции, очищенные от ароматических соединений, подвергают процессам, направленным на удаление насыщенных линейных углеводородов (парафинов), вызывающих нежелательную потерю текучести базовых масел при высоких температурах. Депарафинизация, по традиционной схеме, заключается в охлаждении дистиллята в присутствии таких растворителей как метилэтилкетон (МЕК) или смесь дихлорэтана и дихлорметана (Di-Me), а затем отфильтровывании выпавших в осадок кристаллов. Третья и последняя операция в последовательности процессов масляного блока – это завершающая очистка, направленная на улучшение цвета и окислительной стабильности продуктов, в частности, путём дальнейшего удаления соединений серы и азота. В традиционном варианте суть процесса заключается в адсорбции нежелательных соединений на разного рода адсорбентах. Традиционная последовательность процессов масляного блока не позволяет получать высококачественные базовые масла из некоторых типов нефти. Кроме того, можно лишь в малой степени влиять на производительность, качество и структуру получаемой продукции. Модернизация традиционного цикла процессов сводится к замене традиционных процессов, в той или иной степени, более технологически продвинутыми единичными операциями, основанными на гидропроцессах. В модернизированных схемах традиционное удаление ароматических соединений путём экстракции заменяется гидрокрекингом. Тогда как при очистке растворителями повышение индекса вязкости достигается путём удаления ароматических веществ, характеризующихся низким индексом вязкости, в процессе гидрокрекинга происходит химическая конверсия этих соединений в новые соединения, характеризующиеся высоким индексом вязкости. Новейшие технологические процессы рафинации основаны на сочетании в одном процессе гидрокрекинга и изомеризации. Как результат, во время процесса проходят типичные реакции гидрокрекинга (распад многоядерных ароматических углеводородов, удаление из молекул гетероатомов, реакции гидрирования) и дополнительно реакция изомеризации, направленная на получение разветвлённых углеводородов – изопарафинов. Новейшая концепция депарафинизации, основанная на гидропроцессах, заключается в каталитической изомеризации н-парафиновых углеводородов в нужные изопарафины, индекс вязкости которых значительно выше, а температура текучести значительно ниже, чем у соответствующих н-парафинов. Кроме того, благодаря использованию гидропроцессов при депарафинизации можно эффективнее использовать сырьё для получения смазочных масел за счёт уменьшения выхода парафинового гача (побочного продукта традиционной депарафинизации). Основанная на гидропроцессах завершающая очистка называется гидрофинишингом (от Английского слова Hydrofinishing). Её результатом является полное гидрирование ненасыщенных углеводородов и стабилизация готовых продуктов. Таким образом, конечные продукты практически полностью очищены от ненасыщенных и ароматических углеводородов, благодаря чему характеризуются высокой термоокислительной стабильностью и светлым цветом. Разница технологических концепций масляных блоков влечёт за собой различие не только в качестве масляных основ, но и по типу получаемых побочных продуктов. Зависимость качества получаемой основы от выбора технологической концепции выглядит следующим образом:- с помощью традиционных процессов можно получить масляные основы I группы, модернизированный цикл позволяет получать основы I и II групп, а наиболее технологически продвинутые гидропроцессы – основы II и III групп. На масляном блоке Гданьского Нефтеперерабатывающего Завода удаление аренов и депарафинизация осуществляются традиционным способом, а завершающая очистка проходит в виде гидрофинишинга. Базовые Масла I–III Групп:- в начале 1990-х традиционный способ осуществления процессов масляного блока стал всё чаще заменяться схемами, основанными на каталитических гидропроцессах, а в связи с этим базовые масла разных производителей стали всё больше отличаться по качеству. В 1993 Американский Институт Нефти (АИН (API)) ввёл систему классификации базовых масел. Введение системы было, по сути, попыткой определения принципов взаимозаменяемости базовых масел при составлении рецептур моторных масел определённого класса и качества. В основу классификации положены три параметра, характеризующие качество базового масла:- содержание серы, содержание насыщенных углеводородов (что равносильно степени очистки от ароматических углеводородов), и значение индекса вязкости. Изначально классификация охватывала только три группы базовых масел. В первую группу (I Группу) входили масла, получаемые традиционным способом, содержащие относительно большое количество серы, с содержанием насыщенных углеводородов не более 90% и характеризующиеся низкими значениями индекса вязкости. Вторая группа (II Группа) состояла из базовых масел, получаемых с применением гидропроцессов, с более высокими значениями индекса вязкости, большим содержанием насыщенных углеводородов и меньшим содержанием серы. В первоначальном варианте классификации к третьей группе (III Группе) причислялись все остальные типы базовых масел. В 1956 в классификацию были внесены официальные изменения. Поменялись критерии отбора масел в третью группу – в неё включались исключительно базовые масла, получаемые применением гидропроцессов, с индексом вязкости выше 120. Были созданы две новые группы – четвёртая (IV Группа), охватывающая только полиальфаолефины (ПАО), и пятая (V Группа), в которую были включены все остальные базовые масла (нафтеновые, сложноэфирные, полиалкиленгликолевые и так далее). Данная классификация действует до сегодняшнего дня, её основы представлены в прилагаемой Таблице Классификации Основных Масел В Соответствии С АИН (API):-

API Group Группа По АИН	**Sulphur Wt, %** Содержание Серы, %	**Saturates Wt, %** Содержание Насыщенных Углеводородов, %	**Viscosity Index (VI)** Индекс По Вязкости (ИВ)
I	> 0.03 и/или	< 90	80–119
II	≤ 0.03 и	≥ 90	80–119
III	≤ 0.03 и	≥ 90	≥ 120
IV	Polyalpha Olefins (PAOs) / Полиальфаолефины (ПАО)		
V	Other Base Oils / Остальные Базовые Масла		

Базовые Масла IV Группы:- Полиальфаолефины (ПАО) это группа синтетических углеводородов, наиболее часто используемых при составлении рецептур смазочных материалов. Их получают путём полимеризации олефинов, а затем гидрирования полученных продуктов для получения насыщенных соединений. ПАО являются базовыми маслами, полностью смешиваемыми с маслами I–III групп. Они могут использоваться при температуре от –60 до +200 °C, а ввиду широкого диапазона вязкости (2–1 000 сСт) могут служить базовыми маслами для смазочных средств различного назначения. По сравнению с маслами Групп I и II, они характеризуются более широким диапазоном рабочих температур, повышенной стойкостью к окислению и старению, более высокими индексами вязкости, большей стойкостью к деформациям сдвига, лучшей текучестью при низких температурах и меньшей испаряемостью. При непосредственном сравнении масел III Группы и ПАО, полиальфаолефины проявляют потери текучести при более низких температурах. Базовые Масла V Группы:-

изначальной причиной возникновения интереса к базовым маслам V Группы была разработка смазочных материалов особого назначения (например, для работы при экстремально высоких или экстремально низких температурах). Сегодня они применяются очень широко. Затраты на их производство выше издержек производства масел Групп I–III, однако масла V Группы обладают гораздо лучшими эксплуатационными свойствами, неоднократно позволяющими снизить затраты на эксплуатацию машин, в которых они используются. К этому типу основных масел относятся, в частности, сложноэфирные, полиалкиленгликолевые, растительные и нафтеновые масла. Сложноэфирные базовые масла получают из карбоновых кислот и спиртов различного строения путём реакции этерификации. В результате этерификации спиртов, содержащих две гидроксильных группы, получают диэфиры, а при этерификации спиртов, чьи молекулы содержат много гидроксильных групп, получают полиэфиры. Сложные эфиры карбоновых кислот полностью смешиваемы с маслами Групп I–IV, имеют классы вязкости в диапазоне от 10 до 320 сСт (при 40 °C), пригодны для работы при температуре от –60 до +220 °C. Основные преимущества, связанные с их применением, это высокая биоразлагаемость, хорошие смазочные свойства и возможность использования в широком температурном диапазоне. Минусом является тенденция к нежелательному воздействию на эластомеры. Некоторые типы сложноэфирных масел, по сравнению с основными маслами других групп, более подвержены гидролитическому разложению в присутствии воды. Сложные эфиры фосфорной кислоты применяют в основном в качестве гидравлических жидкостей в тех случаях, когда утечка гидравлической жидкости представляет серьёзную пожарную опасность. Полиалкиленгликоли получают путём реакции субстратов, содержащих гидроксильные группы (спирты, диолы, полиолы, карбоновые кислоты) с алкиленовыми окисями. Полигликоли являются базовыми маслами с вязкостью в диапазоне 20–1 000 сСт, диапазон температур их применения составляет от –30 до +200 °C. Их основное преимущество – это прекрасные смазочные качества. В сравнении с маслами Групп I–III по своим преимуществам они похожи на сложноэфирные масла. Основным минусом является ограниченная смешиваемость с присадками и маслами других групп. Полигликоли, как и сложные эфиры, вступают в нежелательные реакции с эластомерами. Базовые масла на основании растительных масел, характеризующиеся высокой биоразлагаемостью, продолжают оставаться многообещающими субститутами других масел, однако их доля в рыночном производстве невелика. Растительные масла по своему химическому характеру являются сложными эфирами карбоновых кислот (чьи молекулы содержат свыше 15 атомов углерода) и многоатомного спирта глицерола (глицерина). Растительные масла имеют тенденцию к нежелательному изменению свойств в результате реакции с кислородом. Их окислительная стабильность уменьшается по мере увеличения в молекуле числа ненасыщенных связей (на их количество указывает йодное число). В то же время меньшее количество ненасыщенных связей в молекуле (более низкое йодное число) приводит к нежелательному росту температуры текучести масла. Рапсовое масло является одним из лучших видов сырья для производства биоразлагаемых масляных основ, поскольку обладает выгодным соотношением низкотемпературных качеств и окислительной стабильности. В результате процессов окисления возрастает вязкость смазочных материалов и образуются связи кислого характера, способствующие коррозии. По сравнению с другими базовыми маслами растительные масла обладают самой низкой окислительной стабильностью. Растительные масла характеризуются относительно низким классом вязкости (ISO VG 32 или 46), что значительно сужает поле их потенциального применения. Ввиду присутствия сложноэфирных связей, натуральные триглицериды характеризуются низкой гидролитической стабильностью, особенно при температуре выше 60 °C. Кроме способности к быстрому биоразложению, есть ещё ряд других физико-химических свойств, делающих их пригодными для использования в качестве смазочных материалов, в частности, их вязкостно-температурные и смазочные качества. Преимуществом растительных масел с точки зрения их пригодности для использования в качестве смазочных материалов является также то, что они легко смешиваются с другими базовыми маслами и присадками. Улучшение нежелательных эксплуатационных свойств растительных масел достигается путём их химической модификации. На практике растительные масла используются для производства масел для цепных пил, в качестве масел гидравлических, формовочных, для двухтактных забортных двигателей, а также как базовые масла при производстве биоразлагаемых смазок. Масла с правильно подобранным составом на основании биоразлагаемых базовых масел работают так же эффективно, как и смазочные материалы на основании базовых масел других групп. Нафтеновые масла – это тип масел, получаемых из нефти, по классификации API относимые к V группе базовых масел. Их получают из нефти, содержащей менее 55% парафиновых углеводородов (алифатических углеводородов, у которых атомы углерода образуют только простые связи). Следствием такого углеводородного состава является очень низкое значение индекса вязкости нафтеновых масел, однако отсутствие парафиновых углеводородов положительно влияет на снижение температуры текучести. Ещё одним существенным плюсом нафтеновых основ является их хорошая способность растворять присадки. Практическое значение нафтеновых масел сводится к производству электроизоляционных масел, трансмиссионных жидкостей и гидравлических масел, технологических жидкостей и смазок. Минеральные И Синтетические Масла:- деление основных масел на синтетические и минеральные широко распространено, но неоднозначно. Согласно одному из определений, Синтетическими Маслами являются только масла, получаемые в результате химического синтеза из простых молекул, однозначно определённого строения. Согласно другому, более широкому определению, это масла, получаемые из исходных материалов путём изменения структуры молекул, и их превращения в результате химических реакций в новые молекулы, отличные от веществ, встречающихся в природной среде, независимо от исходного материала подвергаемого преобразованию. Стоит отметить, что согласно первому определению синтетическими маслами являются базовые масла IV и V групп, а согласно второму – также базовые масла группы III (и даже II). Таким образом, точное и однозначное описание смазочного материала возможно только путём указания номеров групп по API, к которым можно отнести базовые масла, входящие в его состав. Минеральные Масла, то же, что Нефтяные Масла.

BASEPAIR = ПАРА ОСНОВАНИЙ (или БАЗОВАЯ ПАРА) – Basepair is:- (1) complementary pair of hydrogen-bonded bases (A = T; G = C) that links two polynucleotide strands as in DNA. (2) A unit of length in nucleic acid molecules that is equal to one base pair. (3) Abbreviated as bp.

BASE POINT PRICING = ЦЕНООБРАЗОВАНИЕ ДЛЯ БАЗОВЫХ ПУНКТОВ – Base Point Pricing is a pricing system that includes a transportation cost from a particular city or town in a zone or region even though the shipment does not originate at the basing point.

BASE PORT = БАЗОВЫЙ ПОРТ – Base Ports are ports from which standard tariff rates apply to those normally serviced directly by members.

BASE RATE = БАЗОВАЯ СТАВКА – (1) Base Rate is a minimum amount of interest a bank charges on a loan. The base rate is normally augmented in actual circumstances, according to current market pressures and the risk involved in the loan. The Base Rate is the rate at which the commercial banks lend to the public whiles the Prime Rate is the rate at which the central bank lends to the commercial banks. Base Rate:- most interest rates are linked to the Base Rate. The Bank of England meets monthly to decide what the base rate should be set at. The base rate determines how much other banks and building societies pay for loans they take out from the Bank of England. These base rates in turn affect the interest rate you pay for loans. / Ключевая Ставка центрального банка – ставка, устанавливаемая центральным банком в целях оказания прямого или опосредованного воздействия на уровень процентных

ставок в экономике в целом. Изменение ключевой ставки, как правило, является основным способом достижения целей денежно-кредитной политики. Примеры ключевых ставок, используемых ведущими центральными банками:- (i) Банк Англии – процентная ставка по резервам коммерческих банков на счетах в Банке Англии; (ii) Банк Японии – ставка по однодневным кредитам Банка Японии; (iii) Европейский Центральный Банк (ЕЦБ) – минимальная ставка на аукционах РЕПО с ЕЦБ; и (iv) Федеральная Резервная Система США – целевой уровень ставки на рынке межбанковских кредитов. Базовая Ставка:- в Великобритании – базовая процентная ставка по краткосрочным кредитам, которую банк назначает своим лучшим корпоративным клиентам. Это – Британский эквивалент Американского понятия прайм рэйт (prime rate). В Великобритании на базовую ставку ориентируются ставки многих других клиентских кредитов (ориентир стоимости кредита).

(2) Base Rate:- the currency whose value is one whenever a quote is made between two currencies.

(3) Base Rate is a rate used only for construction of other rates. Base Rate is a tariff term referring to ocean rate less accessorial charges, or simply the base tariff rate.

BASE STOCK = БАЗОВОЕ СЫРЬЁ (или БАЗОВЫЙ КОМПОНЕНТ) – Base Stock:- the base fluid, usually a refined petroleum fraction or a selected synthetic material, into which additives are blended to produce finished lubricants.

BASIC = ОСНОВНОЕ (или ЩЕЛОЧНОЕ) – Basic is a term describing substances having an alkaline nature. Bases may or may not be water soluble. / Щелочное (Alkaline).

BASIC BANK ACCOUNT NUMBER = БАЗОВЫЙ (или ОСНОВНОЙ) НОМЕР БАНКОВСКОГО СЧЁТА – Basic Bank Account Number (BBAN) is the identifier used by financial institutions in individual countries as part of a National Account Numbering Scheme(s), which uniquely identifies an account of a customer at a financial institution. (ISO 13616). The BBAN includes an explicit bank identifier. The identifier that uniquely identifies an individual account, at a specific financial institution, in a particular country. The BBAN includes a bank identifier of the financial institution servicing that account. See also International Bank Account Number. / который в единственном роде идентифицирует счёт заказчика в финансовом учреждении.

BASIC COLOR TERMS = БАЗОВЫЕ ЦВЕТОВЫЕ ПОРЯДКИ (или ОСНОВНЫЕ ЦВЕТОВЫЕ ПОРЯДКИ, или ПОРЯДКИ ОСНОВНОГО ЦВЕТА, или ПОРЯДКИ ФОНОВОГО ЦВЕТА) – Basic Color Terms:- a group of 11 color names found in anthropological surveys to be in wide use in fully developed languages:- white, black, red, green, yellow, blue, brown, gray, orange, purple, and pink.

BASIC COMMODITIES = БАЗОВЫЕ РОДА СЫРЬЯ – In the United States, Basic Commodities are the agricultural products, including Corn, Cotton, Peanuts, Rice, Tobacco, and Wheat, that are designated by legislation as price-supported commodities.

BASIC DYES = ОСНОВНЫЕ КРАСИТЕЛИ – Basic Dyes is a class of positive-ion-carrying dyes known for their brilliant hues. Basic dyes are composed of large-molecule, water-soluble salts that have a direct affinity for wool and silk and can be applied to cotton with a mordant. The fastness of basic dyes on these fibers is very poor. Basic dyes are also used on basic-dyeable acrylics, modacrylics, nylons, and polyesters, on which they exhibit reasonably good fastness. See also Dyes. Basic Dyes is a class of dyes, usually synthetic, that act as bases, and which are actually aniline dyes. Their color base is not water soluble but can be made so by converting the base into a salt. The basic dyes, while possessing great tinctorial strength and brightness, are not generally light-fast. Basic Dyes are water-soluble and are mainly used to dye acrylic fibers. They are mostly used with a mordant. A mordant is a chemical agent which is used to set dyes on fabrics by forming an insoluble compound with the dye. With mordant, basic dyes are used for cotton, linen, acetate, nylon, polyesters, acrylics and modacrylics. Other than acrylic, basic dyes are not very suitable for any other fiber as they are not fast to light, washing or perspiration. Thus, they are generally used for giving an after treatment to the fabrics that have already been dyed with acid dyes. Basic Dyes are water-soluble cationic dyes that are mainly applied to acrylic fibers, but find some use for wool and silk. Usually acetic acid is added to the dyebath to help the uptake of the dye onto the fiber. Basic dyes are also used in the coloration of paper. Basic Dyes:- the majority of the early synthetic dyes belong to this class, e.g., mauveine and magenta. Other important examples are methylene blue and the rhodamines. They include many dyes which give clear, vivid dyeings of great beauty, but many of them are easily faded by light. Partly for this reason they have now become less popular. They have a natural affinity for protein fibers, to which they are applied from a slightly acid dyebath, the dyes combining with acidic groups in the fiber. They also have an affinity for impure cellulosic fibers such as jute and hemp, but not for pure cellulose, e.g., cotton. A mordant, a substance used to impregnate the fiber and which will unite with the dye, is then required, the most common being tannic acid fixed with tartar emetic. Basic Dye:- a way of dyeing without a mordant that colors wool and silk. To use it for cotton a mordant is needed. Basic Dye:- dyes which reacts with acidic groups on fibers; sometimes called Cationic Dyes. Basic dyes are used primarily for acrylic fibers, though they can be used on some types of polyester and some types of nylon, and occasionally for protein fibers. A wide range of bright colors is available. Color fastness on acrylic is generally excellent; fastness on natural fibers is generally poor. / Найлан (Nylon). Сродство (Affinity). стойкость (fastness). Дубильная Кислота или Дигалловая Кислота (Tannic Acid). Под Основными Красителями понимаются водорастворимые органические красители, содержащие в молекуле аминогруппы и диссоциирующие с образованием окрашивающего катиона; обладают основными свойствами. По химическому строению главным образом арилметановые и азокрасители. Применяются для крашения полиакрилонитрильного волокна, бумаги, кожи, древесины. Из-за низкой светостойкости применяются главным образом в производстве нетекстильных материалов (бумаги, лент для пишущих машин и так далее).

BASIC FINISHES = ОСНОВНЫЕ ЗАКЛЮЧИТЕЛЬНЫЕ ОТДЕЛКИ – Basic Finishes are the regular processes (mechanical or chemical) applied in some form to a fabric after it has been constructed.

BASIC GENERATION SERVICE = БАЗОВАЯ УСЛУГА ПО ГЕНЕРАЦИИ – Basic Generation Service (BGS):- in electricity, the default electric generation service provided by the electric public utility to consumers who do not elect to buy electricity from a third-party supplier.

BASIC PRICES = БАЗОВЫЕ ЦЕНЫ (или БАЗИСНЫЕ ЦЕНЫ) – Basic Prices:- these prices are the preferred method of valuing gross value added and output. They reflect the amount received by the producer for a unit of goods or services minus any taxes payable plus any subsidy receivable on that unit as a consequence of production or sale, i.e. the cost of production including subsidies. As a result the only taxes included in the basic price are taxes on the production process – such as business rates and any vehicle excise duty paid by businesses – which are not specifically levied on the production of a unit of output. Basic prices exclude any transport charges invoiced separately by the producer. / выработка (output).

BASIC RATE = БАЗОВАЯ СТАВКА – Basic Rate is the manual rate, from which are taken discounts or to which are added charges to compensate for the individual circumstances of the risk. See also Base Rate (3).

BASIC RESEARCH = ОСНОВАТЕЛЬНОЕ ИССЛЕДОВАНИЕ (или БАЗОВОЕ ИССЛЕДОВАНИЕ) – Basic Research is a research that deals with fundamental principles of organisms.

BASIC SAVINGS RATE = БАЗОВАЯ СТАВКА ПО СБЕРЕЖЕНИЯМ – Basic Savings Rate is the interest rate for savings deposits with a statutory period of notice (savings book). The basic savings rate is the benchmark for all other savings interest rates, depending on the type of investment.

BASIC SERVICE RATE ADDITIONAL = ДОБАВКА К БАЗОВОЙ СТАВКЕ ЗА ОБСЛУЖИВАНИЕ – Basic Service Rate Additional (BSRA) is the charge levied by shipping companies to importers for LCL cargo, including the port charges, transport to an unpacking depot (see CFS) subsequent sorting and storage of the goods and finally loading onto a vehicle collecting the goods for delivery to the buyer.

BASIC STOCK = ОСНОВНЫЕ ЗАПАСЫ – Basic Stock:- items of an inventory intended for issue against demand during the resupply lead-time.

BASIC VEGETATIVE PHASE = ОСНОВНАЯ ВЕГЕТАТИВНАЯ ФАЗА – Basic Vegetative Phase is the juvenile growth stage of a plant that is not affected by photoperiod.

BASIDIOMYCETE = БАЗИДИОМИЦЕТ (или БАЗИДИАЛЬНЫЙ ГРИБ) – Basidiomycete is a fungi including mushrooms, puffballs, rusts and smuts with hyphae divided by septa and that produce spores on a specialized club shaped cellular structure (basidium). Basidiomycetes is a group of fungi producing sexual spores (basidiospores) on basidia See also Basidium. / половые споры . Смотрите также Базидий или Спороносец (Basidium). Под Базидиальными Грибами или Базидиомицетами понимается класс высших грибов с особыми органами размножения – базидиями. Свыше 30 000 видов. Порядки:- Агариковые, Афиллофоровые, Головнёвые грибы, Гастеромицеты и другие. Многие из них съедобны (Белый гриб, Груздь), другие ядовиты (Бледная Поганка, Красный Мухомор), некоторые вызывают болезни сельскохозяйственных культур и лесных пород.

BASIDIOSPORES = БАЗИДИОСПОРЫ – Basidiospores are sexual spores of basidiomycete fungi. / Половые споры .

BASIDIUM = БАЗИДИЙ (или СПОРОНОСЕЦ) – Basidium is a club-shaped structure on which spores are produced. / споры. Под Базидиями понимаются особые органы размножения у класса высших грибов.

BASILARIS = БАСИЛАРИС (или БАЗИЛАРИС, или БАЗИЛЯРНОЕ) – The species name ‘Basilaris’ derives from the Latin ‘Basilis’ which means ‘Basal’ and the suffix ‘-aris’. The specific name implies:- ‘from the base, basal’). Basilaris:- arising from the base.

BASIN = БАССЕЙН (или ПРУД, или ВОДОЁМ) – Basin is a lowest part of a floodplain landscape, usually saucer-shaped. / Под речным Бассейном понимается часть земной поверхности, с которой сток воды поступает в речную систему. Под Водоёмом понимается постоянное или временное скопление бессточных или с замедленным стоком вод в естественных или искусственных впадинах (водохранилища, копани, озёра, пруды и так далее). Под Прудом понимается искусственный водоём, созданный как источник воды для орошения, разведения рыбы и водоплавающей птицы, хранения воды, проведения спортивных и оздоровительных мероприятий и других целей. Площадью обычно не более 1 квадратного километра.

BASINET = БАСОНЭТ (или ШЛЕМ) – Basinet:- a light often pointed steel helmet. Basinet is a light typically pointed steel helmet often having a visor. Origin:- XIV century, from Middle English Bacinet, from Anglo-French, diminutive of Bacin.

BASING = БАЗИРОВАНИЕ (или УСТАКАНИВАНИЕ) – Basing is a period where the stock or market is ‘catching its breath’ after a decline, characterized by a flat trading range without any noticeable trend. It is common to see a basing period after a lengthy decline of the stock price. Basing may be a sign of accumulation. / В техническом анализе биржевых рынков .

BASING POINTS = БАЗИСНЫЕ ПУНКТЫ – Basing Points:- a point (location) used in construction of through rates between other points.

BASIS = БАЗИС – Basis is the differential between a spot or ‘cash’ price and the nearest equivalent futures price. Basis is normally quoted as cash minus futures price, a positive number indicates a futures discount; a negative number indicates a futures premium. Basis may also refer to price differentials of a commodity in different locations or between different products, e.g., kerosene in the physical market and gasoil in the futures market. The difference between the spot or cash price of a commodity and the price of the nearest futures contract for the same or a related commodity. Basis is usually computed in relation to the futures contract next to expire and may reflect different time periods, product forms, grades, or locations. Basis is the difference between the specific futures contract price and cash price for underlying commodity at a local delivery point. Normally, the futures price should be equal to the present cash price plus the cost of storage, insurance and interest charges necessary to carry the commodity to the delivery month of the contract. In addition, basis pricing also reflects the location (port of delivery) and the quality differential of the commodity. Basis is the difference between the spot or cash price of a commodity, security, currency or index and the futures price of the same or related underlying item. Basis is usually computed to the nearby future and may represent different time periods, product forms, grades and locations depending upon the cash and futures prices used. Basis is the difference that exists at any time between the current cash price of a commodity and the futures price of the same or a related commodity. Basis may reflect different time periods, product forms, qualities, or locations. The basis is determined by the cost of actually holding the commodity versus contracting to buy it for a later delivery, i.e. a futures contract. The basis is affected by other influences as well, such as unusual situations in supply or demand. Unless otherwise specified, the price of the nearby futures contract month is generally used to calculate the basis. Cash minus futures equals basis. See also Basis Risk; Carrying Charge; Even Basis; Over Basis; Strengthening Basis; Under Basis; and Weakening Basis. Basis is the difference between the local cash price of a commodity and the price of a specific futures contract of the same commodity at any given time. The price difference represents the costs to carry. A negative basis (cash price < futures price) reflects a normal market. Basis is the difference between simultaneous prices for Cotton futures and spot Cotton. It may be quoted by reference to any futures month. For example, the March Basis would mean the difference between the current price of March futures and the simultaneous quoted value of any given grade and staple of spot Cotton. The growth is usually quoted in terms of points on or off the applicable month trading at the New York Cotton Exchange according to the calculated difference. In futures markets, the Basis is the cash price of the underlying security minus the futures price. Basis is normally quoted as cash minus futures price. A positive number indicates a futures discount; a negative number indicates a futures premium. Basis may also refer to price differentials of a commodity in different locations or between different products, e.g., kerosene in the physical market and gasoil in the futures market. Basis is the difference between the local cash price and the underlying futures price of a commodity. Formula:- Cash Price minus Futures Price = Basis. Factors such as local supply and demand, as well as transportation and storage costs can influence basis. Basis is the difference between a cash price and a futures price of a particular commodity on a given futures exchange. It is calculated as:- Basis = Cash Price – Futures Price. Basis can be positive or negative. Basis is the difference between the futures price for a commodity and its cash price at a specifi c location. The nearby futures delivery month is usually used. / Под Базисом, от Греческого слова Basis,

означающее Основа или Основание, понимается . , например, керосин на . , то есть фьючерсный контракт. Базис в общем значении:- первоначальная стоимость плюс накладные расходы, данные о которых должны передаваться в Службу Внутренних Доходов США (Internal Revenue Service (IRS)) в случае, если инвестиции продаются и должны быть использованы при подсчёте прибылей или убытков на капитал. Если акция была приобретена за 1 000 Долларов два года назад и продаётся сегодня за 2 000 Долларов, то базис равен 1 000 Долларам, а прибыль является приростом капитала. В облигациях:- доходность облигации, получаемая инвестором к наступлению срока погашения (yield to maturity) при данной цене облигации; 10% облигации, продающиеся за 100 Долларов, имеют 10%-ный базис. В операциях с товарной продукцией:- разница между наличной ценой ценных бумаг денежного рынка (money market) с ограниченным риском и ценой фьючерсного контракта (futures contract).

BASIS ANALYSIS = БАЗИСНЫЙ АНАЛИЗ (или АНАЛИЗ БАЗИСА) – Basis Analysis is a method of determining the true or intrinsic value of a share on the basis of fundamental factors, e.g., balance sheet, income statement, management record, overall industry. Used as a gauge of future profit and dividend growth. A share trading lower than its estimated intrinsic value is classed as underpriced. / Метод определения истинной или внутренней ценности акции на основе фундаментальных факторов, например, .

BASIS CONTRACT = КОНТРАКТ С БАЗИСОМ – Basis Contract is a privately negotiated cash market contract in which the buyer and the seller initially lock in the basis but not the price level. Other terms of the contract – such as delivery time and place, premiums and discounts for grain quality – are negotiable. Basis Contract is an agreement between a producer and grain elevator (or feedlot) that specifies the cash price upon future delivery as a fixed amount in relation to the futures price (above or below), thus fixing the basis. Basis Contract is an agreement in which grain is delivered and legal title passes to the elevator. The agreement establishes the basis but not the futures price. The producer later selects the day on which he/she wishes to establish the futures price. At that time, the producer will receive the futures price minus the previously agreed upon basis. See also Delayed Payment Contract; Elevator Cash Contract; Forward Contract; Hedge-To-Arrive Contract; Minimum Price Contract; Offer Contract; and Price-Later (Delayed Price) Contract.

BASIS FORWARD CONTRACT = ФОРВАРДНЫЙ КОНТРАКТ С БАЗИСОМ (или СРОЧНЫЙ КОНТРАКТ С БАЗИСОМ) – Basis Forward Contract is a forward contract in which the sale price is set at a fixed margin with respect to a particular futures price. / Срочный контракт, в котором цена продажи устанавливается с учётом фиксированной дельты относительно конкретной цены фьючерса.

BASIS GRADE = БАЗИСНЫЙ СОРТ (или НОРМАТИВНЫЙ СОРТ) – Basis Grade is the grade of a commodity used as the standard or par grade of a futures contract. / Сорт сырья, используемый в качестве стандарта или базового сорта фьючерсного контракта.

BASIS (OF INSURANCE) CLAUSE = ОГОВОРКА О БАЗИСЕ (СТРАХОВАНИЯ) – Basis (Of Insurance) Clause is a clause that makes the declarations contained in an insurance proposal form the 'basis' of any contract of insurance that is made in consequence of the completion of that form. Such declarations are thereby converted into warranties with the result that if one of them is found to be untrue then the insurer may disclaim all liability under the relevant contract from the date of the breach, regardless as to whether the false declaration was material to the underwriting of the contract or causative of any loss. Basis of insurance clauses are not normally found in personal lines insurance contracts sold in the United Kingdom and, where they appear in other contracts, they may be qualified by the inclusion of a term in the proposal form that the declarations made in that document are true to the best of the knowledge and belief of the person making the declarations.

BASIS OF VALUATION = БАЗИС ОЦЕНКИ – To protect the insurer under an open cover where shipments may be declared and added to the insurance even after a loss a clause in the policy defines the basis to be adopted for their valuation.

BASIS POINT = БАЗИСНЫЙ ПУНКТ – A Basis Point is a unit of measurement in the market for loan finance used by the market participants in relation to interest rates and bond yields. One basis point is one percent of one percent. The system of basis points is, therefore, grounded in the decimal system (Base 10). Interest rates are frequently quoted to three or four decimal points. One basis point equals 0.01 percent, 100 basis points equal 1.0 percent. For instance, if an interest rate changes from 4.65 percent to 4.67 percent it has changed by 2 basis points. A change from 4.652 5 percent to 4.675 7 percent would represent 2.32 basis points. In relation to large principal sums, the money value of a basis point can be significant. For some transactions involving very large sums and very fine rates, even a basis point may be too large for practical purposes. In some instances hundredths or, even thousandths, of a basis point may be appropriate. For example, in a debt issue of USD5 billion a hundredth of a basis point would be worth half a million Dollars. Basis points have become established as a common terminology that is useful for expressing small differences in interest rates, and they indicate the low order of magnitude at which the financial markets work. The term is usually abbreviated in use to BP, bp, or bip. It is more convenient, for example, to talk of 25 basis points rather than 0.25 percent, which offers potential for ambiguity and confusion. Given the small changes in interest rates with which the financial markets deal, it is appropriate to have a suitably calibrated measurement. The change in money value of a bond price in relation to a one basis point change in its yield is referred to as the Basis Point Value. The term Basis Point should not be confused with Basis, which is the term used to describe the difference between a futures contract price and a spot price. Basis points are used to express a spread over a benchmark interest rate for a particular borrower. For fixed interest rates the benchmark will usually be a government bond rate and for floating (variable) interest rates a benchmark such as LIBOR (London Interbank Offered Rate) will be used. A company might, for example, arrange a 10 year floating rate loan at LIBOR+ 75 basis points. If LIBOR were 4.375 percent, this would represent a rate of 5.125 percent. The spread in basis points will remain constant but the variability of the rate will be derived from the movement of the benchmark rate, which will change. The floating rate the company pays would vary with movements in LIBOR and the rate would be changed at agreed intervals, perhaps every six months. Basis points are also used in pricing certain derivative instruments. For example, the premium for a credit default swap (CDS) will be expressed in basis points, representing the annual payment the bondholder will make to the seller of the swap, who assumes in return the default risk on the bond. The premium will be calculated as basis points of the face value of the bond. In the market for exchange traded interest rate futures contracts, the minimum interest rate movement allowable is expressed in a unit known as a Tick, which is denominated in terms of basis points of interest. The tick size will vary from contract to contract. For example, the tick size for a three month EuroDollar interest rate futures contract traded in Chicago will be one basis point, whereas for a three month Euro LIBOR futures contract traded in London the tick size will be half a basis point. The measurement of a change in the yield of a debt security. One basis point equals 1/100 of one percent. One gradation on a 100-point scale representing one percent; used especially in expressing variations in the yields of bonds. Fixed income yields vary often and slightly within one percent and the basis point scale easily expresses these changes in hundredths of one percent. For example, the difference between 12.83% and 12.88% is 5 basis points. One hundredth of a percent. Used for calculating yield differentials in interest instruments. Basis Point is a general term for one-hundredth of one per cent (1 BP = 0.01%). Used to designate differences in returns, prices, market prices, etc. A

difference of 52 basis points would therefore mean a difference of 0.52 percentage points. A term Basis Point refers to one-one hundredth of a unit, such as interest rates or exchange rates. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Базисный Пункт – минимальная единица измерения динамики доходов по облигациям и векселям. Один базисный пункт равен 0.01% дохода. Таким образом, если доход по облигации изменился с 8.00 до 8.50%, можно сказать, что он сдвинулся на 50 базисных пунктов.

BASIS PRICE = БАЗИСНАЯ ЦЕНА – Basis Price is the reference price used for establishing a physical contract. In option trading it is the price agreed for the underlying should an option be declared, more commonly referred to as the Strike Price or Exercise Price.

BASIS QUOTE = РАСЦЕНКА С УЧЁТОМ БАЗИСА (или КОТИРОВАНИЕ С УЧЁТОМ БАЗИСА) – Basis Quote:- offer or sale of a cash commodity in terms of the difference above or below a futures price, e.g., 10 cents over March cotton. / Предложение или продажа наличного сырья на условиях наличия ценовой разницы в большую или меньшую сторону по отношению к цене фьючерса на аналогичное сырьё, например, на 10 центов выше цены Мартовского фьючерса на хлопок.

BASIS RISK = БАЗИСНЫЙ РИСК – Basis Risk results from weak correlation between coupon rate changes for assets, liabilities, and offbalance sheet instruments. For example, LIBOR-based deposit rates may change by 50 basis points, while Prime-based loan rates may only change by 25 basis points during the same period. The potential that the basis underlying a transaction (hedge or arbitrage) changes over time. A change in the basis can affect the usefulness (profitability) of a such a transaction. Basis Risk is the risk that movements in the price of a futures contract do not correlate exactly with movements in the price of the underlying financial instrument or commodity. The potential that the basis underlying a transaction (hedge or arbitrage) changes over time. A change in the basis can affect the usefulness (profitability) of a such a transaction. The risk associated with an unexpected widening or narrowing of basis between the time a hedge position is established and the time that it is lifted. The uncertainty as to whether the cash-futures spread will widen or narrow between the time a hedge position is implemented and liquidated. Basis risk is the potential adverse change in the cash price – futures price relationship while a hedger maintains an open commodity futures position. If the basis remains unchanged during the time the position is open, it is considered a perfect hedge. Basis is more stable than cash prices or futures prices alone, which makes a hedged position less risky than an unhedged one. Basis risk is a risk of change or variation in the basis. Price risk inherent in forward transactions. Risk that the correlation between the price of a financial future and that of the underlying spot instrument could change so significantly as to diminish the success of the hedging transaction. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

BASIS SWAP = СВОП С БАЗИСОМ – Basis Swap is an interest rate basis swap or a cross-currency basis swap is one in which two streams of floating rate payments are exchanged. Examples of interest rate basis swaps include swapping $Libor payments for floating commercial paper, Prime, Treasury bills, or Constant Maturity Treasury rates; this is also known as a Floating-Floating Swap. A typical cross-currency basis swap exchanges a set of Libor payments in one currency for a set of Libor payments in another currency. Basis Swap is a swap whose cash settlement price is calculated based on the basis between a futures contract and the spot price of the underlying commodity or a closely related commodity on a specified date. A transaction in which one party pays periodic amounts of a given currency based on a floating rate and the other party pays periodic amounts of the same currency based on another floating rate, with both rates reset periodically; all calculations are based on a notional amount of the given currency. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

BASIS TRADING = ТОРГОВЛЯ С УЧЁТОМ БАЗИСА – Basis Trading or Cash And Carry Trade is an arbitrage position typically comprising a long cash position together with a short position in its respective futures contract, whereby the cash price plus the cost of carry of the underlying position is lower than the futures price. By convention, buying the basis is to buy cash bonds and sell futures, and selling the basis is to sell cash bonds and buy futures.

BASIS WEIGHT = БАЗИСНЫЙ ВЕС (или НОРМАТИВНЫЙ ВЕС) – In textile industry, Basis Weight is the weight of a unit area of fabric. Examples are ounces per square yard and grams per square centimeter. / В текстильной отрасли под Базисным Весом понимается вес единицы площади ткани. Примерами базисного веса служат вес, выраженный в унциях за квадратный дюйм (ounces per square yard) и в граммах за квадратный сантиметр (grams per square centimeter), текстильщики на территории бывшего Союза Советских Социалистических Республик (СССР) использовали грамм за квадратный метр.

BASKET = КОРЗИНА – A Basket is a combined selection of equities or other investment products. The selection is often structures by industry or country. / Корзина:- (1) пакет из 15 или более акций, используемых в программной торговле ценными бумагами по единой цене (program trading). (2) Пакеты ценных бумаг для программной торговли, предлагаемые Нью Йоркской Фондовой Биржей (называются ‘портфель биржевых акций’ – Exchange Stock Portfolio (ESP)) и Биржей Опционов Чикагской Торговой Палаты (называются ‘рыночная корзина ценных бумаг’ – market basket), организациям – инвесторам и индексным арбитражерам. Оба этих пакета ценных бумаг дают возможность приобрести в одной сделке все акции, составляющие Индекс по 500 Акциям от Стэндод Энд Поз (Standard & Poor’s 500 Index). Минимальный объём сделки на ESP – приблизительно 5 миллионов Долларов США, а ‘рыночная корзина ценных бумаг’ – примерно 1.7 миллиона Долларов. Корзины ценных бумаг были введены в конце 1989 для решения проблем, выявившихся при попытке организаций – инвесторов продать крупный пакет акций в ‘Чёрный Понедельник’ (Black Monday) и направить поток ценных бумаг, выбрасываемых на рынок в ходе программных торгов, на зарубежные биржи. (3) Неформальное название индексных участий (index participations) или наличного индексного участия (cash index participations (CIPS)), введённых и затем отменённых Американской и Филадельфийской фондовыми биржами в 1989. Эти документы позволяли мелким инвесторам приобретать позицию в портфеле вложений (в Индексе по 500 Акциям от Стэндод Энд Поз или во включающем 25 акций индексе, исторически связываемом со средним промышленным показателем от Дау Дьжонз) без покупки отдельных акций. Эти документы сохраняли преимущества, связанные с владением акциями, так как не имели срока истечения (как у фьючерсов или опционов), и предоставляли право на ежеквартальную выплату дивидендов. Первоначально одобренные Комиссией по Ценным Бумагам и Биржам (КЦББ; Securities and Exchange Commission (SEC)) в качестве ценных бумаг, они были отвергнуты Комиссией по Торговле Сырьевыми Фьючерсами (Commodity Futures Trading Commission (CFTC)), которая сочла их фьючерсными контрактами. Когда федеральный суд принял решение не в пользу SEC, биржи прекратили операции с ними.

BASKET STITCH = СТЕЖОК РОГОЖКОЙ (или УСИЛЕНИЕ РОГОЖКОЙ, или ВЫШИВКА РОГОЖКОЙ) – Basket Stitch:- in this knit construction, purl and plain loops are combined with a preponderance of purl loops in the pattern courses to give a basket-weave effect.

BASKET WEAVE = ПЕРЕПЛЕТЕНИЕ РОГОЖКА – Basket Weave is a variation of the plain weave. In this, two or more than two warps yarns cross alternately side-by-side with two or more than two filling yarns. This type of weave resembles a plaited basket. In basket weave the fabrics have a loose construction and a flat appearance. The weave is more pliable and stronger than a plain weave but it is not as stable. It is less smooth but have a pleasant texture surface. Basket weave is typically used in composites industry. It is

also used as outerwear, monk's cloth and drapery fabrics. Basket Weave is a variation of the plain weave in which two or more threads weave alike in both warp and weft, joined in the regular order of the plain weave. Named for the basket-like pattern of the weave. Basket Weave is a variation of the plain weave construction, formed by treating two or more warp yarns and/or two or more filling yarns as one unit in the weaving process. Yarns in a basket weave are laid into the woven construction flat, and maintain a parallel relationship. Both balanced and unbalanced basket weave fabrics can be produced. Examples of basket weave construction includes monk cloth and Oxford cloth. Basket Weave is a variation of the plain weave in which two or more warp and filling threads are woven side by side to resemble a plaited basket. Fabrics have a loose construction and a flat appearance and are used for such things as monk's cloth and drapery fabrics. Basket Weave is a variation of the plain weave in which yarns seem to approximate the woven look of a plaited basket. Two or more warp yarns ride over and under two or more fill yarns, giving a basket weave like texture. Sometimes checkered or plaid patterns are produced using a basket weave. Although it provides an attractive texture a fabric with this weave has a tendency towards bunching up, so it might not be as strong as plain weaves due to slippage or bunching. See also Weave. The Basket Weave is similar to the plain weave, except that two or more filling yarns are alternately interlaced over and under one another. The basket weave is more pliable, flatter, and stronger than the plain weave, but is not as stable. Basket Weave is one of the most important patterns in weaving. Basket weave is made with two or more filling threads passing over and under an equal number of warp threads on alternate rows. Basket Weave is made with two or more filling threads passing over and under an equal number of warp threads on alternate rows. / уточные пряжи. Сложное переплетение. Рогожка получается при одновременном 'удлинении' перекрытий полотняного переплетения в направлении основы и утка. На поверхности ткани ясно виден рисунок в виде клеток, создающий впечатление плетёного изделия. Раппорт переплетения условно обозначается дробью, которая показывает насколько увеличены одиночные перекрытия полотняного переплетения в направлении основы (числитель) и утка (знаменатель). Величина раппорта равна сумме числителя и знаменателя дроби. При величине раппорта более 12 нитей переплетение называется Панамой. Рогожка и Панама, так же как репсы, сохраняют основные признаки полотняного переплетения и могут быть выработаны в зависимости от плотности ткани по основе на 2, 4 или 6 ремизках. Каждую группу одинаково плетущихся нитей пробирают в один зуб бёрда. Рогожка – ещё одна вариация на тему полотняного переплетения. Это двойное или тройное переплетение, то есть две или три нити основы перекрывают одновременно такое же число нитей утка. Прелесть этого переплетения в том, что за счёт длинных перекрытий ткань будет оставаться мягкой даже при известном увеличении плотности нити. Рогожка представляет собой двойное или тройное полотняное переплетение, образованное усилением (удлинением) перекрытий одновременно по основе и по утку. Для получения шашек правильной формы необходимо, чтобы ткань по основе и утку имела одинаковую плотность и нити были одинаковой толщины. При одинаковом направлении крутки по основе и утку шашки выделяются рельефнее. Благодаря более длинным перекрытиям ткань может быть выработана с большой плотностью, сохраняя мягкость.

BASMATI RICE = РИС БАСМАТЫ (или РИС БАСМАТИ) – Basmati Rice is is a kind of long-grain Rice. It is known for its fragrance and its flavor. The biggest producers of Basmati Rice are India and Pakistan, it is mainly grown in Punjab. The main method of growing it is paddy field farming, that is to say fields that are put under water. The grains of Basmati Rice are longer than most other types of Rice. Cooked grains of Basmati Rice are characteristically free flowing rather than sticky. This is a characteristic of most long-grain Rice. Cooked Basmati Rice can be uniquely identified by its fragrance. Basmati Rice is available in two varieties – white and brown. Basmati Rice is also considered useful to make buriyani in most Asian countries and also to make yellow Rice. Basmati Rice is famous for its soft fluffy texture, delicate aroma, natural whiteness and exquisite flavor. Basmati (literally meaning Fragrant) is a variety of long grain Rice which is traditionally from India, Pakistan and Bangladesh. The areas of Basmati Rice production in India are in the states of Haryana, Jammu & Kashmir, Himanchal Pradesh, Punjab, Delhi, Uttarakhand and Western Uttar Pradesh. India's total Basmati production for the year 2010 was 6.5 million tons. In Pakistan, 95% of the Basmati Rice cultivation takes place in the province of Punjab, where total production was 2.47 million tons in 2010. In India, Haryana is the major Basmati Rice cultivating state, producing more than 60% of the total Basmati Rice produced in India. Basmati Rice has a typical Pandan-like (Pandanus fascicularis leaf) flavor caused by the aroma compound 2-acetyl-1-pyrroline. There are several Varieties of Basmati Rice. Traditional Indian types include Basmati 370, Basmati 385, and Basmati Ranbirsinghpura (R.S. Pura). Pakistani Varieties of Basmati Rice are PK 385, 1121 Extra Long Grain Rice, Super Kernel Basmati Rice and D-98. Scientists at Indian Agricultural Research Institute, Delhi, genetically modified Basmati to produce a hybrid semi-dwarf plant which had most of the good features of traditional basmati (grain elongation, fragrance, alkali content). This hybrid was called Pusa Basmati-1 (PB1; also called 'Todal', because the flower has awns); crop yield is up to twice as high as traditional Varieties. Fragrant Rices that are derived from Basmati stock but are not true Basmati Varieties include PB2 (also called Sugandh-2), PB3, and RH-10. List of approved Varieties:- (i) Indian Varieties:- Punjab, Safidon, Haryana, Kasturi (Baran, Rajasthan), Basmati 198, Basmati 217, Basmati 370, Bihar, Kasturi, Mahi Suganda, Pusa and Ranbir; (ii) Pakistani Varieties:- Basmati 370, Super Basmati, Super Kernal Basmati Rice, Basmati 386, Basmati 385 and Basmati 198. Adulteration:- difficulty in differentiating genuine Basmati from other types of Rice and the significant price difference between them has led fraudulent traders to adulterate Basmati Rice with crossbred Basmati Varieties and long-grain non-Basmati Varieties. In Britain, the Food Standards Agency found in 2005 that about half of all Basmati Rice sold was adulterated with other strains of long-grain Rice, prompting Rice importers to sign up to a code of practice. A 2010 UK test on Rice supplied by wholesalers found four out of 15 samples had cheaper Rice mixed with Basmati, and one had no Basmati at all. A PCR-based assay similar to DNA fingerprinting in humans allows adulterated and non-Basmati strains to be detected, with a detection limit from 1% adulteration upwards with an error rate of ±1.5%. Exporters of Basmati Rice use 'purity certificates' based on DNA tests for their Basmati Rice consignments. Based on this protocol, which was developed at the Centre for DNA Fingerprinting and Diagnostics, the Indian company Labindia has released kits to detect Basmati adulteration. Patent Battle:- in September 1997 Texas, USA company RiceTec was granted US Patent No. 5 663 484 on 'Basmati Rice lines and grains'. The patent secures lines of Basmati and Basmati-like Rice and ways of analyzing that Rice. RiceTec, owned by Prince Hans-Adam of Liechtenstein, faced international outrage over allegations of biopiracy. It had also caused a brief diplomatic crisis between India and United States with India threatening to take the matter to the World Trade Organization (WTO) as a violation of The Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS) which could have resulted in a major embarrassment for the United States. Both voluntarily and due to review decisions by the United States Patent and Trademark Office, RiceTec lost or withdrew most of the claims of the patent, including, most importantly, the right to call their Rice lines 'Basmati'. A more limited varietal patent was granted to RiceTec in 2001 on claims dealing with three strains of the Rice developed by the company. Glycemic Index:- according to the Canadian Diabetes Association, Basmati Rice has a 'medium' glycemic index (between 56 and 69), thus making it more suitable for diabetics as compared to certain other grains and products made from white flour. / Рис Басмати – у него продолговатые зёрна и неповторимый аромат. Слово Басматы (Basmati) переводится как Ароматное, Благоуханное или Пахучее.

BASQUE = БАСКЭ (или БАСКА) – Basque:- a tight-fitting bodice for women. / Баска – похожий на юбку дополнительный элемент, ранее пришивающийся к мужскому жилету, позже – к женскому лифу. Несколько удлиняет одежду от талии. Баска может быть цельнокроеной (на пиджаках, жакетах и верхней одежде) и отрезной (пришивается к юбкам, платьям и брюкам).

Существует также имитация баски в виде ремней, оборок и прочего. Одежда с баской шьётся из самых разнообразных материалов – от тончайшего и невесомого шёлка до плотной шерсти. Главное, чтобы материал хорошо держал форму. На сегодняшний день баска может выглядеть по-разному:- это может быть широкая и узкая полоса ткани, пышные банты, аккуратные крылья по бокам бёдер, объёмные воланы, а также строгие геометрические линии. История Появления:- своё легендарное шествие баска начала как элемент национального костюма Испанских Басков (отсюда и её название). По-настоящему в моду баску ввели Французы. В эпоху Королевы Виктории этот элемент стал украшением мужского костюма, а чуть позже – модным элементом в одежде и у женщин. Баска пришивалась поверх кринолина или юбки-тюрнюра. В XX веке знаменитый Испанский Баскский кутюрье Кристоваль Баленсиага Эйсагиррэ (Cristóbal Balenciaga Eizaguirre; 1895–1972) в одной из своих коллекций ключевой деталью сделал именно баску. И неслучайно! Кристобаль был родом из маленького Испанского городка Гэтэрия, который был частью страны Басков. Так он хотел подчеркнуть свои корни. Кристиан Диор (Christian Dior) в 1947, создавая свою легендарную коллекцию в стиле new look, подобрал к пышной юбке-миди жакет с цельнокроеной баской. По сей день баска – неотъемлемый элемент всех коллекций Кристиан Диор. Потом баска исчезла с подиумов, лишь изредка появляясь в коллекциях дизайнеров (в 1970-е пару раз баску на одежде демонстрировал Ив Сэн Лоран (Yves Saint Laurent)), чтобы в наши дни с блеском вернуться в модный мир.

BAST FIBER = ЛУБЯНОЕ ВОЛОКНО – Bast Fiber is soft, woody fiber obtained from stems of dicotyledonous plants (flowering plants with net-veined leaves) and used for textiles and cordage. Such fibers, usually characterized by fineness and flexibility, are also known as ‘Soft’ Fibers, distinguishing them from the coarser, less flexible fibers of the leaf, or ‘hard’, fiber group. Commercially useful bast fibers include Flax, Hemp, Jute, Kenaf, Ramie, Roselle, Sunn, and Urena. Fiber bundles are often several feet long and composed of overlapping cellulose fibers and a cohesive gum, or pectin, which strengthens plant stems. The fibers are located between the epidermis, or bark surface, and an inner woody core. In harvesting bast fibers, the plant stalks are cut off close to the base or pulled up. The fibers are usually freed from the stalk by retting but are sometimes obtained by decortication, a manual or mechanical peeling operation. The released fiber bundles, called Strands, are frequently used without additional separation, in which case they are called Fibers. Flax and ramie strands, however, are usually separated into individual fiber cells, or true plant fibers. Most bast fibers are quite strong and are widely used in the manufacture of ropes and twines, bagging materials, and heavy-duty industrial fabrics. In the late XX century, Jute, used mainly for sacking and wrapping purposes, led other fibers in world production but suffered from intense competition from synthetic fibers. Flax, traditionally valued as raw material for linen yarn and fine linen fabrics, is decreasing in importance for luxury textile applications as other fibers, both natural and man-made, become more plentiful. Bast Fiber is a fiber obtained from the stems of certain types of plants. These include Flax, Hemp, Jute, Ramie, Milkweed, and nettles. Bast Fiber is strong, soft, woody fibers, such as Flax, Jute, Hemp, and Ramie, which are obtained from the inner bark in the stems of certain plants. Any of certain strong, woody fibers used in making rope, cordage etc. Bast Fibers are cellulose vegetable fibers that come from the stem of a plant. Linen, from the stem of the flax plant, is probably the most common bast fiber used for fine textiles. Others include Ramie, Hemp and Jute. Bast Fibers are:- Banana, China Grass, Flax (linen), Hemp, Jute, Kenaf, Lime Tree, Mallow, Nettle, Paco-Paco, Ramie (Rhea), Rosella, Sunn, Urena. Bast Fiber is the name for a fiber between the pithy center of the stem and the skin. Examples are Flax, Jute, Hemp, and Ramie. Bast Fiber is a strong woody fiber obtained chiefly from the phloem of plants and used especially in cordage, matting, and fabrics. Stem (Bast) Fibers:- bast fibers are collected from the inner bark or bast surrounding the stem of the plant. These fibers have higher tensile strength than other fibers. Therefore, these fibers are used for durable yarn, fabric, packaging and paper. Jute is the most important bast fiber; it accounts for almost 7% of all natural fibers produced and is second only to cotton. Other examples of bast fibers are Flax, Kenaf, Hemp and Ramie. Jute is produced in high rainfall areas, mostly in Bangladesh, China and India. According to the International Jute Study Group, Jute (Corchorus Capsularis and Corchorus Olitorius), and similar fibers such as Kenaf (Hibiscus Cannabinus) and Roselle (Hibiscus Sabdariffa var Altissima), are mostly produced in a handful of major producing countries:- India, Bangladesh, China, Thailand, Myanmar and Nepal. Together, these account for about 95% of all jute and similar fibers. India and Bangladesh are the world’s foremost manufacturers of jute. India alone represents almost two thirds of world jute production, Bangladesh about one third and only minor amount are produced in other countries. China produces mostly kenaf while Thailand produces kenaf and roselle. Linen fabric is produced from fiber extracted from the stems of the Flax Plant. Flax seeds are used to produce linseed oil. Hemp (Genus Cannabis), a close relative of marijuana, produces a fiber that looks very much like linen and its seeds are used to make birdfeed and to extract oil. Many European countries produce small quantities of hemp, but China remains the biggest source of hemp fiber. Ramie is a perennial tree that grows well in areas with good rainfall. The main species is Boehmeria nivea, but several closely related species are also grown. The ramie plant has the appearance of a shrub and grows to a height of over 1.5 meters. The stems are usually harvested after flowering and when its color has changed from green to yellow. Leaf shedding is another indication that the crop is ready to be harvested. With good soil and suitable weather, the ramie plant can produce as many as six cuttings, i.e. harvests, a year. A ramie plant can produce fiber up to 12 centimeters in length, but requires chemical treatment for removal of the resin that causes the fibers to adhere to the main stem. / пучки волокна (fiber bundles). Лубяные Волокна получают из стеблей, листьев и плодов растений обычно в виде технических волокон. (i) Наиболее распространённое грубостеблевое влагоёмкое волокно – Джут, применяемое для изготовления мешков (сахарных и других). (ii) Кенаф – волокно, близкое по своим свойствам джуту. (iii) Наиболее тонкое стеблевое волокно – Лён, очень прочное, малорастяжимое, гигроскопичное. Из льняной пряжи вырабатывают бельевые, платьевые, тарные, технические и другие ткани. Отходы Льна (короткое волокно) служат для производства тарных тканей, верёвок и другого. (iv) Пенька – грубостеблевое волокно, получаемое из Конопли. Из пеньки изготовляют канатно-верёвочные изделия, грубые ткани и другое. Для производства канатов наряду с пенькой широко используют жёсткие листовые волокна – Абаку или Манильскую Пеньку, Сизаль и другие. Лубяная Промышленность является одной из важнейших отраслей текстильной промышленности. Её значение определяется высокими потребительскими свойствами тканей, выработанных из льняной пряжи и пряжи других лубяных волокон. Лубяные ткани, особенно льняные, находят широкое применение в быту, медицине и технике. Они обладают большой прочностью, гигроскопичностью, не боятся высоких температур при стирке и глаженьи, гигиеничны, имеют приятный блеск и белизну. В жаркую погоду в льняной одежде прохладнее. В лубяной промышленности в качестве сырья перерабатывают натуральные волокна растительного происхождения и химические волокна. К лубяным волокнам относятся Джут, Канатник, Кенаф, Лён, Манилла, Пенька, Рами, Сизаль и другие. Вместе с лубяными волокнами перерабатывают следующие химические волокна:- вискозное, лавсановое, нитроновое, капроновое (принятое в бывшем Союзе Советских Социалистических Республик (СССР) торговое название поликапроамидного волокна) и другие. Лубяными Волокнами называются лишённые живого содержимого длинные клетки в стеблях различных растений. Лубяные волокна лубяных культур используют для выработки пряжи. К лубяным культурам относятся растения, возделываемые для получения лубяного волокна из стеблей – сырья для текстильной промышленности. В мировом земледелии наибольшие площади занимают Джут, Кенаф, Конопля, Лён-долгунец. Лубяные Волокна, сильно удлинённые прозенхимные клетки механической ткани, разновидность склеренхимы. Средняя длина лубяного волокна 1–2 мм (первичные лубяные волокна, возникающие из прокамбия, 20–400 мм, вторичные – камбиального происхождения – короче). Для лубяного волокна характерны утолщённые, часто слоистые стенки (главным образом из целлюлозы), простые поры и очень узкие клеточные полости. Технические лубяные волокна состоят из слипшихся между собой элементарных волокон.

Под элементарным волокном понимается одиночное текстильное волокно, не делящееся в продольном направлении без разрушения и пригодное для изготовления пряжи и текстильных изделий. Лубяные волокна одних растений (лён, рами и другие) тонкие, гибкие, мало одревеснevшие, других (Кенаф, Джут и другие) – грубые, толстостенные, сильно одревеснevшие. Лубяные культуры, растения, возделываемые для получения лубяного волокна. Относятся к прядильным культурам. Содержат волокно в коре стебля – Джут, Лён-долгунец, Канатник, Кенаф, Кендырь, Конопля, Кроталярия, Рами и другие, и в листьях – Агавы (волокно сизаль), Новозеландский Лён, прядильный Банан (волокно Манильская пенька). Для промышленных целей выращивают Джут, Кенаф, Коноплю и Лён-долгунец. Под Лубяными Волокнами понимаются волокна, содержащиеся в стеблях, листьях и оболочке плодов различных растений и используемые в текстильной промышленности. Различают:- (i) тонкие лубяные волокна (стеблевые) – Лён и Рами, применяемые для выработки тонких и средних по поверхностной плотности тканей, кручёных нитей и других изделий; (ii) грубые лубяные волокна (стеблевые) – Джут, Кенаф, Конопля и другие, применяемые для выработки грубых тарных тканей и кручёных изделий – верёвок, шпагатов и тому подобного; (iii) жёсткие лубяные волокна (листовые) – Абака (текстильный Банан), Агава и другие, используемые для изготовления верёвок, канатов и тому подобного; (iv) плодовые лубяные волокна – Койр, добываемый из наружного покрова скорлупы орехов кокосовой пальмы и используемый для изготовления верёвок, морских канатов, плетёных изделий, циновок. Под Лубяными Культурами понимаются растения, возделываемые для получения лубяного волокна из стеблей – сырья для текстильной промышленности. В мировом земледелии наибольшие площади занимают Джут, Кенаф, Конопля, Лён-Долгунец; в бывшем Союзе Советских Социалистических Республик (СССР) – Конопля и Лён-Долгунец. Пакля – волокнистые отходы первичной обработки Льна, Пеньки и других лубяных культур, непригодные для выработки пряжи. Пакля применяется в качестве прокладочного, изоляционного, набивочного и другого материала.

BAT = BEST AVAILABLE TECHNIQUES

BATCH = ПАРТИЯ – (1) Batch is a collection of data sharing the same characteristics, which is gathered for processing as a single group. Batch is any quantity of material handled or considered as a ‘unit’ in processing, i.e. any sample taken from the same ‘batch’ will have the same properties and/or qualities. Batch is a quantity of material destined for one test. Batch is a collection or grouping of products or data which is treated as one entity with respect to certain operations, e.g., processing and production. / , например, . Под Производственной Партией понимается группа заготовок одного наименования и типоразмера, запускаемых в обработку одновременно или непрерывно в течение определённого времени. Под Партией, от Латинского слова Partio, означающее Делю или Разделяю), понимаются товары, единовременно отправленные в один адрес. Партия:- совокупность единиц одного товара, отличающихся однородностью своего состава, происхождения и тому подобного и составляющих часть груза. (Производственная) Партия – определённое количество некоторой товарной продукции или услуг, произведённое в одно время и при условиях, которые можно считать однородными. Примечание:- обстоятельства, при которых условия можно считать однородными, в большинстве случаев нельзя установить. Например, замена используемого материала или инструмента или прерывание процесса производства может привести к разным условиям.

(2) In oil industry, Batch is a measured amount in which crude oil and refined product shipments are sent through a pipeline. / В нефтяной отрасли, Партия – определённое количество нефти и очищенных нефтепродуктов, взятое за единицу измерения, при отгрузках по трубопроводам.

BATCH DYEING = СЕРИЙНОЕ КРАШЕНИЕ (или КРАШЕНИЕ ЗАМОЧКОЙ, или КРАШЕНИЕ НАКАТКОЙ) – In Batch Dyeing (also called Exhaustion Dyeing) a certain amount of textile material is loaded into a dyeing machine and brought to equilibrium with a solution containing the dye and the auxiliaries over a period of minutes to hours. The dyeing process starts with the absorption of the colorant onto the external surface of the fiber, then the diffusion and migration of the colorant through the fiber takes place. The use of chemicals and controlled temperatures accelerates and optimises exhaustion and fixation (rate/level) of the dye. When the dyeing is judged to be the right shade, the spent dye bath is drained and the textile material is washed to remove unfixed dyes and chemicals. Washing is usually carried out in the same equipment. However, separate washing machines can also be used in the case of fabric. All these operations can be carried out with different degrees of automatisation. In fully automated dyehouses all steps going from the preparation of recipes and laboratory trials to dyestuffs and chemicals feeding, material transportation, loading and unloading of the machines and control of dyeing parameters (e.g., level, heating, injection at selected speed, pH, temperature, etc) are performed under computer guidance. In a manual regime the dyestuffs and chemicals are dosed and fed to the machines manually. A manual dyeing approach used for wool is to carry out trial laboratory dyeing on a sample of the particular fiber and then to apply 5–10% less dye in the full scale dyeing. The final shade is achieved by adding additional dye in small portions to achieve the final shade. Depending on the dyestuffs, it may be necessary to cool the dye bath for each of these additions in order to promote even migration of the added dye. Shade matching is carried out by eye, the dyer comparing the dyed material with a reference pattern under standard illumination. Dyeings which are ‘overshade’ can be corrected by stripping dyestuff from the fiber using an excess of levelling agent or reducing conditions, and then adding further color to achieve the correct shade. This is a very costly and polluting practice and is only used as a last resort in most dyehouses. An important parameter in discontinuous dyeing is the liquor ratio of the equipment. This is the weight ratio between the total dry material and the total liquor. So, for example, a liquor ratio of 1:10 means 10 liters of water on 1 kg textile material. This parameter not only influences the amount of water and energy consumed in the dyeing process, but also plays an important role in the level of exhaustion of the dye and in the consumption of chemicals and auxiliaries. The liquor ratio is related to the exhaustion level of the bath through the equation:- E = K / (K + L), where:- K (affinity) = 50 to 1 000 for various dye/fiber combinations; L (liquor ratio) = 5 to 50 for various machines; and E (exhaustion) = 0.5 to 1 (50 to 100% exhaustion). From this equation it can be inferred that when L increases, E decreases and less dye is absorbed onto the fiber when the equilibrium is reached. The effect is more pronounced on low-affinity dyes. As stated earlier, the liquor ratio also has an influence on the consumption levels of chemicals and auxiliaries. Most are dosed on the basis of the amount of bath (o.w.b) rather than the weight of the fiber (o.w.f). For example, in a 1:5 bath ratio, 50 g/l of salt will mean 250 g/kg of fiber, but at 1:40 liquor ratio, the same 50 g/l of salt correspond to 2 kg/kg of fiber. Dyeing machines vary greatly in their liquor ratios, depending also on the type of substrate to be dyed and its hydrophilicity. Equipment manufacturers provide a range of nominal liquor ratios for each type of machine. This is defined as the range of liquor ratios at which the machine can be operated when it is loaded at its optimum/ maximum capacity. In each range the lowest values normally refer to synthetic fibers (PES is usually taken as reference), while the highest figures apply to cotton. This is due to the lower amount of liquor retained by synthetic fibers compared to cotton. / непрерывное крашение (continuous dyeing).

BATCH(ING) = ЗАМОЧКА (или ЭМУЛЬСИРОВАНИЕ) – Batch(ing) is a leaving goods saturated with dye solution for some period of time, typically hours, and typically at ‘room temperature’ for the dye to fix to the fiber. In commercial dyeing, batching often follows padding. In art dyeing techniques, batching is often used with direct application techniques such as tie dye, painting and printing.

BATCHING CRITERIA = КРИТЕРИЙ ФОРМИРОВАНИЯ ПАРТИИ – Batching Criteria is the condition under which transactions are collected to form a batch.

BATCHING SEQUENCE = ПОСЛЕДОВАТЕЛЬНОСТЬ РАЗБИВКИ ПО ПАРТИЯМ – Batching Sequence is the order in which shipments are sent through a pipeline. / Порядок отгрузок по трубопроводу.

BATCH LOT = СЕРИЙНАЯ ПАРТИЯ – Batch Lot:- a definite quantity of some product manufactured or produced under conditions that are presumed uniform and for production control purposes passing as a unit through the same series of operations.

BATCH PICKING = СЕРИЙНЫЙ ВЫБОР (или МАССОВЫЙ ОТБОР) – Batch Picking is a picking method whereby one stock keeping unit (SKU) is picked one time for all applicable orders and then distributed across multiple orders in a staging or packing location. Batch Picking is the picking of items from storage for more than one order at a time.

BATCH PRODUCTION = СЕРИЙНОЕ ПРОИЗВОДСТВО – Batch Production is the production process whereby products/components are produced in batches and where each separate batch consists of a number of the same products/components. / Серийное Производство – характеризуется одновременным изготовлением на предприятии сравнительно широкой номенклатуры однородной продукции, выпуск которой повторяется в течение продолжительного времени. Наиболее распространено в машиностроении и металлообработке, где занимает среднее положение между массовым производством (к которому приближается крупносерийное производство) и индивидуальным (к которому приближается мелкосерийное производство).

BATCH REFERENCE = ССЫЛКА НА ПАРТИЮ – Batch Reference is the sender's unique reference for a batch. / Ссылка На Партию это уникальная ссылка отправителя на конкретную партию.

BATHING SUIT = БАННЫЙ КОСТЮМ (или КУПАЛЬНЫЙ КОСТЮМ) – Bathing Suit is a swimsuit. / купальный костюм.

BATHROBE = БАННЫЙ ХАЛАТ – Bathrobe is a loose often absorbent robe worn before and after bathing or as a dressing gown.

BATHROBE BLANKETING = ОДЕЯЛЬНАЯ ТКАНЬ ДЛЯ БАННЫХ ХАЛАТОВ – Bathrobe Blanketing is a double-faced fabric woven with a tightly twisted spun warp and two sets of soft spun filling yarns. The fabric is thick and warm and its filling yarns are frequently napped to produce a soft surface. Today's blankets are made of spun polyester, acrylic, or polyester/cotton blends. / уточные пряжи.

BATIK = БАТИК – Batik (pronounced 'Bah-Teak') is a technique used to dye fabrics. Batiking is a relatively straightforward process that often produces beautiful results. First, melted wax is applied to the fabric in the areas that are to be free of dye. There are various methods used to apply the liquid wax, but brushing or directly pouring the wax are the most common. Once the molten wax cools, it hardens and penetrates into the fabric. Next the fabric is soaked in dye. The wax prevents dye from penetrating onto the fabric and therefore keeps those areas of fabric in their original color. To remove the wax after the dyeing process, a solvent can be used. Alternatively, the hardened wax can be pressed out with an iron; the hot surface melts the wax it is pressed through the fabric. If a multiple-colored design is desired, the process is repeated for each color. Many fabrics can be used for batiking, but plain, light colored cotton seems to work best. Cracks in the wax allow thin lines of dye to penetrate through to the fabric which gives batik its characteristic appearance. Batik is a traditional dyeing process in which portions of cloth are coated with wax and resist the dye. See also Dyes. Batik is an Indonesian fabric-dyeing technique in which wax is applied to cloth before being dipped in dye. It is common for people to use a mixture of beeswax and paraffin wax. The beeswax will hold to the fabric and the paraffin wax will allow cracking, which is a characteristic of batik. Indonesian batik used for clothing normally has an intricate pattern. Batik is a fabric printed by batik, namely an Indonesian method of hand-printing textiles by coating with wax the parts not to be dyed. Batik describes a special technique of resist dyeing which was first used in Indonesia. Before dyeing the fabric is pile-spread with wax. The waxed areas remain in the original color while the rest of the fabric adopts the dyeing color. To get the typical veined effect to the design the wax is cracked. Today, it is largely produced in an industrial way. Connected to:- Resist Dyeing. Batik is a resist-dyeing process in which portions of a fabric are coated with wax; during the dyeing process, only the uncovered areas take up dye. The process can be repeated so that several colors are used. Batik dyeing is often imitated in machine printing. / Под Батиком (Малайское происхождение слова) понимается многоцветная ткань у народов Индонезии. Рисунок наносят тонким слоем воска, материю опускают в краску, которая окрашивает не покрытые воском части ткани. Батик – (Малайский), техника росписи, а также украшенная ею многоцветная ткань. Батик основан на сочетании рисунка, наносимого на ткань непроницаемым для краски составом (при 'горячем батике' разогретый воск, при 'холодном батике' резиновый клей), с последующим окрашиванием ткани в баке или тампонами. Другие цвета наносятся повторным окрашиванием ткани после снятия частей воскового рисунка. 'Горячий батик' издавна известен у народов Индонезии (в особенности на острове Ява), Индии и других. Основные тона Индонезийского батика — индиго-синий и коричневый; традиционный орнамент весьма разнообразен и часто имеет символическое значение. В Европе батик начали применять в декоративных тканях с начала XX века. В Русском искусстве батик получил распространение с начала 1930-х (главным образом шёлковые косынки, платки, кашне и тому подобное, позднее – декоративные панно).

BATISTE = БАТИСТ – Batiste is a fabric named for Jean Baptiste, a French linen weaver. (1) In cotton, a sheer, fine muslin, woven of combed yarns and given a mercerized finish. It is used for blouses, summer shirts, dresses, lingerie, infants' dresses, bonnets, and handkerchiefs. (2) A rayon, polyester, or cotton-blend fabric with the same characteristics. (3) A smooth, fine wool fabric that is lighter than challis, and similar to fine nun's veiling. It is used for dresses and negligees. (4) A sheer silk fabric either plain or figured, similar to silk mull. It is often called 'Batiste de Soie' and is made into summer dresses. Batiste is:- (i) a sheer, woven, mercerized fabric of combed cotton or polyester/cotton resembling nainsook, only finer, with a lengthwise streak; (ii) a rayon fabric decorated with dobby woven striped and Jacquard florals; and (iii) a smooth, fine, woven fabric, lighter that challis and very similar to nun's veiling. Batiste as the name implies, is of French origin, commercially understood to mean a light translucent cloth, made from a fine quality of combed cotton, wool, polyester or linen thread, ranging in width from 32 inches to 45 inches. There is likewise a gradual variation in qualities, ranging from a comparatively coarse to a very fine fabric. Organdy, lawn and batiste differ from one another in the way they are finished. The variations of the different qualities will be more apparent when we consider their commercial value. The variety of qualities will suggest some idea of the utility of the fabric. Its uses are even more varied than are the qualities. The finer grades of batiste are used for dress goods, all kinds of lingerie for summer wear, pillow shams, etc, while the cheaper grades are extensively used for linings in washable and unwashable shirtwaists. In this article we are confining ourselves to bleached cotton batiste, reserving the linen and colored for some future discussion. Batiste is woven In the gray, that is, with yarn direct from the spinning frame, with the. exception that the warp yarn is well sized, in order to better stand the strain to which the yarn is subjected during the weaving process. We will consider, first, a very fine bleached cotton batiste, of a quality made 45 inches in width, and then a very cheap grade of bleached cotton batiste, made 32 inches in width. The analysis will readily show the vast difference in these two qualities. Batiste making in early XX century:- (i) Fine Bleached Cotton Batiste:- width of warp in leed, 47.S inches; finish at 45 inches; ends per inch in the cloth from loom, 94; ends per inch finished, 100; ends in warp, 4 500. Take-up of warp during weaving, 10 per cent; weight of fabric per yard from loom. 1.15 ounces; finished weight, 1.4 ounces. The difference In weight between fabric from loom and finished fabric is about 20 per cent, the finished goods having taken on 20 per cent of sizing material. For adding weight to cloth, China clay is used. The

proportions to use depend on the character of finish desired. China clay produces a gritty feel, which, however, may be overcome by the use of chloride of magnesium, which is a very powerful softener as well as a weighting material. Warping plan: body of warp, 1/120's combed Sea Island Cotton, selvage 2/100's cotton. Filling plan:- 98 picks of 1/200's combed Sea Island Cotton. (ii) Cheap-Grade Cotton Batiste:- width of warp in reed, 34 inches. Finish at 32 inches; ends per inch in cloth in the loom, 54; ends per inch finished, 58; ends in warp, 1 860; 54 x 1 reed. Take-up of warp during weaving, 8 per cent; weight of fabric per yard from loom, 0.84 ounce; finished weight per yard, 1 ounce; 19 per cent increase in weight Warping plan:- all 1/60's combed Sea Island Cotton Filling:- 50 picks per Inch 1/100's combed Sea Island Cotton. Production:- for a card making this class of goods should not exceed 275 pounds per week, the weight of the sliver being about 30 to 35 grains per yard. The draft for this class of goods should not be less than 150. The card sliver is taken to the comber room and doubled 14 into 1 at the sliver lap, and the laps from this machine are taken to the ribbon lap machine and doubled 0.5 into 1. The weight of a yard of lap at the front of the ribbon lap machine should be about 160 grains. These laps are put up at the comber and doubled 6 into 1. The speed of the comber for this stock should not exceed 180 nips per minute. For this weight of web a double row of teeth in the top comb would give the best results. Care should be taken to see that all needles in the top are straight and that the comber is absolutely free from dirt at all times. The table of the comber should he gone over twice a day with whitening so that the sliver being drawn over it will not stick. Batiste is a medium-weight, plain weave fabric, usually made of cotton or cotton blends. End-uses include blouses and dresses. Batiste:- cotton, also rayon and wool. Named after Jean Batiste, a French linen weaver. Light weight, soft, semi-sheer fabric which resembles nainsook, but finer. It belongs to the lawn family; almost transparent. It is made of tightly twisted, combed yarns and mercerized finish. Sometimes it is printed or embroidered. In a heavier weight, it is used for foundation garments and linings in a plain, figured, striped, or flowered design. Considered similar to nainsook but finer and lighter in weight. Now usually made of 100% polyester distinguished by slubs in filling direction. Standard construction of the gray fabric in Japan:- 65% polyester/35% cotton (1) 45's, 152 threads per inch, 47"; (2) 45's, 170 threads per inch, 47"; and (3) 45's, 186 threads per inch, 47". Batiste is a balanced, plain weave that is the softest of the lightweight opaque fabrics. It is made of cotton, wool, polyester or a blend. Lightweight opaque fabrics are very thin and light but not as transparent as sheer fabrics. The distinction between the two is not always pronounced. End uses include apparel (such as lingerie and dresses) and furnishings. Batiste is a 'plain weave' cotton, which means it's woven with one thread over, one thread under. It's similar in construction to percale, but a finer yarn is used and the weight of the fabric is lighter. This light weight (from 2 to 3 oz per sq yard) is the outstanding feature of batiste, but very advanced finishing techniques are required for the fabric to feel soft. / уточина. Батист дё Суа (Batiste de Soie). Жакяр (Jacquard). Под Батистом, от Французского слова Batiste, понимается тонкая, полупрозрачная льняная или хлопчатобумажная ткань полотняного переплетения. Из батиста шьют женское бельё, лёгкое платье. Батист – очень тонкая полупрозрачная мягкая мерсеризированная ткань, хлопчатобумажная, льняная или шёлковая, полотняного переплетения из туго скрученных нитей. Высокая прочность ткани в сочетании с лёгкостью и прозрачностью достигается за счёт скрупулезного соблюдения одинаковой толщины основы и утка при использовании любого сырья. Название ткани происходит от фамилии её создателя Франсуа Батиста из Камбре, Французского ткача, жившего в XIII веке. Настоящий батист изготавливают из отбеленных тканей в отличие от близкой по технике ткани кембрик, также известной с XIII века, сотканной из окрашенных нитей или орнаментированной в технике набойки.

BATT = ВАТИН (или НАСЛОЕНИЕ ВАТНЫХ ПРОЧЁСОВ, или ВАТНЫЙ ХОЛСТ, или ОДЁЖНАЯ ВАТА) – Batt:- sheets or rolls of carded cotton or wool or other fiber or mixtures thereof which is used for woolen spinning or for stuffing, padding, quilting, and felting. Also known as Batting. Batt is a piece of felted material used for lining or insulating items such as quilts and sleeping bags. Batting is a soft, bulky assembly of fibers, usually carded. Battings are sold in sheets or rolls and used for warm interlinings, comforter stuffings, and other thermal or resiliency applications. / Под Ватином понимается нетканое или трикотажное полотно (толщиной 3–12 мм) из хлопковой, шерстяной или полушерстяной пряжи с начёсом. Используется как утепляющая прокладка для верхней одежды. Ватин (batting) – вязаное полотно с односторонним или двусторонним начёсом. Ватин выпускается хлопчатобумажный, шерстяной, полушерстяной и заменяет вату при шитье тёплой одежды.

BATT = СБИТОЕ (или СВАЛЯВШЕЕСЯ) – Batt:- matted lint cotton. / Свалявшееся хлопковое волокно.

BATTENBERG LACE = БАТТЭНБЭРГСКОЕ КРУЖЕВО – Battenberg Lace is a lace similar to Renaissance lace with a pattern formed by tape or braid joined by bars. See also Renaissance Lace.

BATTENS = РЕЙКИ (или ОБРЕШЕТИНЫ, или БАТТЕНСЫ, или РЫБИНСЫ, или СКОБЫ, или ОКАНТОВКА, или БАТАНЫ) – Battens are the members protruding from the inside walls of a vessel's hold or a (thermal) container to keep away the cargo from the walls to provide an air passage. They may be integral with the walls, fastened to the walls or added during cargo handling. / Элементы, выступающие от внутренних стенок трюма судна или (термического) контейнера, чтобы держать груз дальше от стенок для обеспечения циркуляции воздуха. Они могут быть как заранее встроенными в стенки, так и прикреплёнными к стенкам или пристроенными в момент обработки груза, проще говоря, в момент его загрузки.

(2) Battens are parallel-sided pieces of timber from 2 to 4 inches (from 50.8 to 101.6 millimeters) thick, no more than 7 inches (177.8 millimeters) wide, and from 8 to 21 feet (from 243.84 to 640.08 centimeters) long. Battens are similar to deals, but not more than 7 inches (177.8 millimeters) wide. / Рейками являются изделия с параллельными пластями из строительного пиломатериала толщиной от 50.8 до 101.6 миллиметров (от 2 до 4 дюймов), шириной не более 177.8 миллиметров (7 дюймов) и в длину от 243.84 до 640.08 сантиметров (от 8 до 21 фута). Рейки аналогичны лагам/дильсам, за исключением того, что не превышают по своей ширине 177.8 миллиметров (7 дюймов).

BATTERY = БАТАРЕЯ – Battery is a group of two or more cells connected together to provide electrical current. Sometimes also used to describe a single cell which converts chemical energy to electrical current. / Под Батареей, от Французского слова Batterie, от Battre, означающее Бить, понимается несколько одинаковых приборов, сооружений или устройств, объединённых в определённую систему для совместного действия. Например, Коксовая Батарея – ряд печей для сухой перегонки каменного угля в кокс; Охлаждающие Батареи – оребрённые или гладкие трубы, в которых испаряется хладагент или протекает холодильный раствор, и так далее. Эффективность батареи пропорциональна числу составляющих её элементов. Электрическая Батарея – группа однотипных гальванических элементов, соединённых электрически и конструктивно для получения такого электрического напряжения или количества электричества ('ёмкости' в Ампер-Часах (А·ч) – распространённый термин), которое один элемент дать не может. При последовательном соединении суммируются электродвижущие силы (ЭДС) отдельных источников, а при параллельном – их ёмкости. При смешанном соединении повышаются и электрическое напряжение, и ёмкость батареи.

BATTERY CYCLE LIFE = ПРОДОЛЖИТЕЛЬНОСТЬ ЦИКЛОВ БАТАРЕИ – Battery Cycle Life is the number of discharge and recharge cycles that a battery can undergo before degrading below its capacity rating.

BATTERY SELF–DISCHARGE = САМОРАЗРЯД БАТАРЕИ – Battery Self-Discharge is the gradual loss of chemical energy in a battery that is not connected to any electrical load.

BATTING = ВАТИН (или или НАСЛОЕНИЕ ВАТНЫХ ПРОЧЁСОВ, или ВАТНЫЙ ХОЛСТ, или ОДЁЖНАЯ ВАТА) – Batting:- a soft, bulky assembly of fibers, usually carded. Battings are sold in sheets or rolls and used for warm interlinings, comforter stuffings, and other thermal or resiliency applications. Batting is a layer of insulation used in quilting between a top layer of patchwork and a bottom layer of backing material. It is usually made of cotton, polyester and/or wool. Batting is usually stocked in linens and domestics departments although it is used today primarily for crafts. Batting is a filling material used to stuff pillows, toys, and quilts. At one time, batting was made of cotton.

BAU BANGLADESH AGRICULTURAL UNIVERSITY

BAU = BIRSA AGRICULTURAL UNIVERSITY

BAUD = БОД – The term Baud (a measure of symbols transmitted per second) is named after Jean-Maurice-Émile Baudot. Unit of speed for data transfer; 1 baud = 1 bit/s. Abbreviation:- Bd. A unit used in engineering for measuring the rate of data transmission over telegraph or telephone lines. The baud rate is the number of times per second the signal carrying the communication varies in strength or frequency. In the days of the telegraph, the signal increased at the start of a pulse and decreased at the end, so the baud rate was 2 times the number of dots that could be transmitted per second. In recent years, when the baud has been used to represent digital data transmission, the definition has varied according to the technique used. If the signal has only two states (on or off) then the baud rate is the same as the transmission rate in bits per second. Since this was the case in early (slow) modems, in common language the baud is often used to mean the same thing as 1 bit per second. However, faster modems use signals having 4 possible states (corresponding to 2 bits per second) or 16 possible states (corresponding to 4 bits per second). For those of us who are not communications engineers, the best way to represent data transmission rates is directly in bits per second (b/s or bps), avoiding the use of the baud altogether. The baud is named for the French telegraph engineer Jean-Maurice-Émile Baudot (1845–1903), the inventor of the first teleprinter. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Термин Бод (определяет количество передаваемых в секунду символов) назван в честь Французского инженера телерафиста Жан Морис Емиль Бодо (Jean-Maurice-Émile Baudot; родился 11 Сентября 1845 – умер 23 Марта 1903), изобретателя первого в мире телепринтера. Аппарат Бодо – буквопечатающий многократный телеграфный аппарат с пятиклавишной клавиатурой, с помощью которой передача телеграмм велась в определённом ритме, указываемом тактовыми сигналами. Аппараты Бодо применялись до 1960-х, затем были вытеснены стартстопными аппаратами (телетайпами). Бод – единица скорости телеграфирования, определяется как одна элементарная посылка тока за 1 секунду, 1 бод = 1 бит/с. Бит (bit) – единица количества информации. Обозначение:- . Применявшееся в телеграфии неузаконенное специальное наименование внесистемной единицы частоты импульсов элементарных и вспомогательных посылок. Соответствует секунде в минус первой степени – $с^{-1}$. Бод, единица скорости телеграфирования, равная количеству элементарных импульсов тока, передаваемых в секунду. Названа в честь Французского изобретателя в области телеграфии Жана Мориса Емиля Бодо.

BAY = BUY ANOTHER YEARLY

BAY = ПРОЛЁТ – Bay is an area in the warehouse designated by markings on the columns or floor. Bays are the container blocks in the transverse direction. Bay numbering system:- the bay spaces for 20’ containers are numbered throughout fore to aft with odd numbers, i.e. in this case 01, 03, 05 and so on up to 75. The bay spaces for 40’ containers are numbered throughout with even numbers:- 02, 04, 06 and so on up to 74. Bay is a section of vessel in which containers are held. Bay is a row of containers running from one side of the ship to the other. To be distinguished from a hold. Bay is a vertical division of a vessel, partly indicating the stowage of containers. Bay is a vertical division of a vessel from stem to stern, used as a part of the indication of a stowage place for containers. The numbers run from stem to stern; odd numbers indicate a 20 foot position, even numbers indicate a 40 foot position. See also Row, and Tier. / Нумерация пролётов осуществляется от носа к корме судна. Смотрите также Ряд (Row), и Ярус (Tier).

BAY = ХХ (или ЛАВРЫ, или ЛАВРОВЫЙ ВЕНОК) – Bay:- a garland or crown especially of laurel given as a prize for victory or excellence. Also, a reddish brown color.

BAYADERE = БАЯДЕРКА – Bayadere is a fabric in which the pattern consists of a stripe running across the width instead of the length of the material. Such patterns are almost entirely confined to ladles and children’s dress goods, and may be composed entirely of cotton, as In the cheapest grades, of cotton and worsted in the medium, or entirely of worsted or worsted and silk in tihe best grades. Bayardere is a very broad term for stripes that run crosswise in a knit or woven fabric. Bayadere:- has brightly colored stripes in the filling direction. Crosswise rib (plain or twill weave). Often black warp. The color effects are usually startling or bizarre. Mostly produced in India. Name derived from the Bajadere dancing girl of India, dedicated from birth to a dancing life. The Bayadere costume includes the striped garment, a flimsy scarf or shawl, jeweled trousers, spangles, sequins, anklets. / в направлении уточин. Баядера, от Французского слова Bayadére, от Португальского слова Bailadeira, означающее Танцовщица, собирательное название, получившее распространение у Европейских народов в XIX – начале XX веков и обозначающее Индийских женщин, принадлежащих к кастам профессиональных исполнителей танцев. Этим названием объединялись и храмовые танцовщицы (девадаси), и танцовщицы, выступающие за плату в ресторанах, частных домах, и так далее.

BAY PLAN = ПЛАН ПРОЛЁТОВ – Bay Plan is a stowage plan that shows the locations of all the containers on the vessel. Bay Plan is a plan for the stowage of containers, in which each bay on a vessel is represented in a cross-sectional plan of the ship from bow to stern. A bay plan shows all possible positions for stowage on the vessel.

BAY–ROW–TIER SYSTEM = СИСТЕМА ПРОЛЁТ–РЯД–ЯРУС – The Bay-Row-Tier System follows a system of numerical coordinates relating to length, width and height. The stowage space of the container on board the ship is unambiguously stated in numbers and is (almost always) recorded in the shipping documents. It is then also possible to establish at a later date where the container was carried during maritime transport. Bay-Row-Tier System is a numbering system for the arrangement of containers on a vessel. In this numbering system, the bay is specified first, then the container row, which runs the length of the ship, and finally the tier (vertical layer).

BAY STORAGE = ХРАНЕНИЕ В ПРОЛЁТАХ (или ХРАНЕНИЕ В ОТСЕКАХ) – Bay Storage:- use of the bay for storage.

BAY–TIER–ROW SYSTEM = СИСТЕМА ПРОЛЁТ–ЯРУС–РЯД – Bay-Tier-Row System is a numbering system for the arrangement of containers on a vessel. In this numbering system, the bay is specified first, then the tier (vertical layer) and finally the container row, which runs the length of the ship.

BB = BACTERIAL BLIGHT

BB = BALLAST BONUS

BB = BARBADOS

BB = BAREBOAT
BB = BREAK BULK
BB&I = BASAL BROADCAST AND INCORPORATED
BBA = BACHELOR OF BUSINESS ADMINISTRATION
BBA = BALANCED BUDGET ACT (OF 1997)
BBA = BLACK BUSINESS ASOCIATION
BBA = BRITISH BANKERS ASSOCIATION
BBA = BUDGET ACTIVITY ACCOUNT
BBA = BUDGET BY ACCOUNT
BBAN = BASIC BANK ACCOUNT NUMBER
BBB = BEFORE BREAKING BULK
BBB = BETTER BUSINESS BUREAU
BBD = BARBADAN DOLLAR
BBL = BARREL
BBL = BOLERO BILL OF LADING
BBL/D = BARRELS PER DAY
BBL/SD = BARRELS PER STREAM DAY
BBQ = BONNY, BRASS RIVER AND QUA IBOE
BBSS = BROKER BOOTH SUPPORT SYSTEM
BC = BACKCROSS
BC1 = FIRST BACKCROSS GENERATION
BC2 = SECOND BACKCROSS GENERATION
BC CODE = BULK CARGO CODE
BCF = BILLION CUBIC FEET
BCF = BROADCAST CASH FLOW
BCF = BULKED CONTINUOUS FILAMENT
BCI = BETTER COTTON INITIATIVE
BCL = BACHELOR OF CANON/CIVIL LAW
BCL = BANK COMFORT LETTER
BCM = BILLION CUBIC METERS
BCM2 = BERGEN CLIMATE MODEL VERSION 2
BCn = N^{TH} BACKCROSS GENERATION
BCN = BACKCROSS NURSERY
BCO = BENEFICIAL CARGO OWNER
BCPC = BRITISH CROP PROTECTION COUNCIL
B/C RATIO = BENEFIT–TO–COST RATIO
BD = BANGLADESH
B/D = BANK DRAFT
B/D = BARRELS PER DAY
BD = BILLS DISCOUNTED
B/D = BROKER/DEALER
B/D = BROUGHT DOWN
BD1 (DR1) = FLAT BED BATCH DRYER (1–TON CAPACITY)
BD2 = WOODEN VERTICAL BIN BATCH DRYER
BDI = BALTIC DRY INDEX
BDI = BASIC DEFENSE INTERVAL
BDT = BANGLADESHI TAKA
BE = BELGIUM
BE = BEST EFFORT
BE = BEST ESTIMATE
BE = BILL OF EXCHANGE

BEACH/BORDER PRICE = ЦЕНА НА ВЗМОРЬЕ/ГРАНИЦЕ – In the United Kingdom, Beach/Border Price is a price of gas delivered to the beach or border terminal.

BEACHWEAR = ПЛЯЖНАЯ ОДЕЖДА – Beachwear is a clothing for wear at a beach.

BEACON = BOSTON EXCHANGE AUTOMATED COMMUNICATIONS AND ORDER ROUTING NETWORK

BEACON = МАЯК – (1) Beacon is a signaling or guiding device, such as a lighthouse, located on a coast. A stake, or something similar, that is used to indicate caution in an area or to aid in navigation. / Под Маяком понимается сооружение башенного типа, устанавливаемое на выступающих в море частях берега, в устьях рек, на скалах, отмелях, иногда на якорях (плавучие маяки). Маяк служит навигационным ориентиром для судов с целью опознавания берегов, для определения местонахождения судна в море, фарватера на реке, озере. Он оборудуется светооптической системой (маячными огнями, видимыми на большом расстоянии), а также другими средствами сигнализации (диафон, сирена и другие) для подачи звуковых сигналов в тумане, радиотехническими устройствами, спасательными станциями и другим.

(2) Beacon is a radio transmitter that emits a characteristic guidance signal for aircraft. / Под Радиолокационным Маяком понимается приёмо-передающая радиостанция с известным местоположением, включающаяся под действием сигналов радиолокационной станции, установленной на борту судна или самолёта, и излучающая радиосигналы, по которым определяются направление на радиолокационный маяк и расстояние до него. Под Радиомаяком понимается передающая радиостанция с известным местоположением, излучающая специальные радиосигналы, принимая которые на борту судна или самолёта можно определить направление на него (его пеленг). Он служит радионавигационным устройством или входит в радионавигационную систему. Радиомаяки подразделяются на:- (i) радиомаяки направленного действия, пеленгуемые лишь с определённых направлений (курсов, зон); и (ii) радиомаяки ненаправленного действия, пеленгуемые с любых направлений.

BEAD = БИСЕР (или БУСЫ) – Bead:- (plural) a necklace of beads or pearls.

BEADED SELVAGE = БИСЕРНАЯ (или ШИШКОВАТАЯ, или ОБРУБЛЕНАЯ) КРОМКА – Beaded Selvage:- also known as Garter Selvage, because it makes decorative little pips along the edges. See also Loopy Selvage. Beaded Selvage is a weaving defect at the selvage of excessive thickness or irregular filling loops that extend beyond the outside selvages. / Кромка, Обшитая Бисером, Тесьмой (beaded selvedge; corded selvedge):- порок кромки ткани; кромка, в которой пряжа основы плотно подогнана друг к другу, образуя тесьму. Примечание:- этот порок часто вызывается чрезмерным натяжением основы или слабым контролем над кромкой при сшивании ткани.

BEADED VELVET = БИСЕРНЫЙ БАРХАТ – Beaded Velvet is a velvet with a cut-out pattern or a velvet pile effect, made on a Jacquard loom. This fabric is used primarily for evening wear. Beaded Velvet is another name for cut velvet. / Жакяр (Jacquard).

BEADING = БИСЕРОПЛЕТЕНИЕ (или УЗКАЯ ВЫШИВКА, или ОБОДОК) – Beading is a type of lace made by the bobbin lace method. Also, an openwork lace or embroidery containing holes designed for the insertion of decorative ribbon. See also Bobbin Lace.

BEAD YARN = БИСЕРНАЯ ПРЯЖА (или ШИШКОВАТАЯ ПРЯЖА) – Bead Yarn is the yarn upon which is fastened either an actual bead or (commercially) a lump of hardened gelatine of a bead-like form.

BEAK = ХОБОТОК – Beak is the proboscis or the protruding mouthpart structure of a sucking insect. / Под Хоботком понимается сосущий или колюще-сосущий орган у членистоногих животных, например, у бабочек, клопов. Образован вытянутыми в длину ротовыми придатками.

BEAKED HULL = НАДКЛЁВАННАЯ ШЕЛУХА (или НАКЛЮНУТАЯ КОЖИЦА) – Beaked Hull:- the tip of the lemma is curved over the palea. / над плёнкой (palea).

BEAM = (ПОПЕРЕЧНАЯ) БАЛКА – Beam is a structural member loaded on its narrow face. / Строительный элемент или деталь, подвергаемая нагрузке со стороны узкой пласти. Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов.

BEAM = НАВОЙ – Beam is a cylinder usually with flanges on each end on which a defined number of ends are wound substantially parallel with identical length. See also Back Beam, Warp Knitting Beam, and Weaver's Beam. Large, horizontal cylinders or spools upon which the warp yarn is wound; set at the back of the loom so that the yarn may be fed into the loom evenly by the let-off motion. Beam is a cylinder of wood or metal, usually with a circular flange on each end, on which warp yarns are wound for slashing, weaving, and warp knitting. / В текстильном производстве под Навоем понимается катушка больших размеров (длиной 0.8–2.5 метра), на которую наматываются нити основы перед выработкой ткани на ткацком станке. Число нитей на навое равно числу нитей по ширине ткани.

(2) Beam is a large spool-like device which feeds yarns to guides and needles in a warp knitting frame. The beam rests on a beam shaft at the top of the frame.

BEAM = НАИБОЛЬШАЯ ШИРИНА СУДНА – Beam is the width of a ship. Also called Breadth. / Ширина судна.

BEAM DYEING MACHINE = МАШИНА ДЛЯ ОКРАСКИ НАВОЯ – Beam Dyeing Machine is a machine for dyeing warp yarns or fabrics that have been wound onto a special beam, the barrel of which is evenly perforated with holes. The dye liquor is forced through the yarn or fabric from inside to outside and vice versa.

BEAMING = ПЕРЕВИВКА (или НАВИВАНИЕ ОСНОВЫ НА ТКАЦКИЙ НАВОЙ, или СНОВКА) – Beaming is the operation of winding warp yarns onto a beam usually in preparation for slashing, weaving, or warp knitting. Also called Warping. / Известно также как Сновка (Warping).

BEAM KNOTTING = СВЯЗЫВАНИЕ УЗЛОВ НАВОЯ (или НАВОЙНОЕ СВЯЗЫВАНИЕ УЗЛОВ, или СВЯЗЫВАНИЕ УЗЛАМИ КОНЦОВ ОСНОВЫ) – Beam Knotting:- xxxxx. Beam Gaiting or Knotting on Loom:- the drawn weavers beams are fixed on weaving machines, threads are tied and heald shafts are coupled. This operation is called Beam Gaiting. If undrawn warp threads are directly knotted to the threads of finished beams, it is called Knotting. These operations are essential because normally weavers beam can carry only certain length of warp sheet on it and when so woven, whole length is converted to the fabric by weaving machine. Further warp length is required to be fed which can be done by knotting or gaiting other beams on weaving machine. / Knotting – (1)

Подплетина – порок ткани; (2) связывать узлом. Под Подплетинами понимается дефект суровой ткани в виде нарушения переплетения на небольшом участке из-за групповой неподработки нитей (когда концы нескольких оборвавшихся нитей основы заплетают соседние нити), причина этого порока – разладка основонаблюдателя.

BEAM ROLL = ВАЛИК НАВОЯ (или ТОВАРНЫЙ ВАЛИК) – Beam Roll:- a cylinder of wood or metal, usually with a circular flange on each end, on which warp yarns are wound for slashing, weaving, and warp knitting. See also Beam.

BEANIE = БИНИ (или КИПА, или МЕНИНГИТКА, или ЛЫЖНАЯ ШАПОЧКА) – Beanie is a small round tight-fitting skullcap worn especially by schoolboys and college freshmen. Origin:- probably from Bean (head) + -ie. / . Происхождение:- предположительно как уменьшительно-ласкательное от Башка, или Головка, (Bean).

BEAN ROOT APHID = БОБОВАЯ КОРНЕВАЯ ТЛЯ – Bean Root Aphid causes areas of poor stand establishment, stunting and uneven seedling growth. Affected patches may be circular or irregular. Careful examination of the roots reveals:- (i) a network of tunnels in the soil surrounding the taproot; (ii) small light-brown aphids feeding on the roots; (iii) small brown ants 'farming' the aphids; and (iv) tunnels collapse and the aphids and ants usually disappear after an irrigation. Areas of poor stand establishment, stunting and uneven seedling growth. Affected patches may be circular or irregular and may vary in size from a few square meters to several hundred square meters. Careful examination of the roots and surrounding soil will reveal a network of tunnels down along the taproot, small (1 mm) aphids feeding on the roots and small brown ants 'farming' the aphids. The tunnels collapse and the aphids and ants usually disappear after flood irrigation. / Бобовая Тля, Насекомое Отряда Равнокрылых Хоботных Семейства Aphididae, вредитель Сахарной Свёклы, Конских Бобов, Фасоли и других культур, то же, что Свекловичная Тля.

BEAR = МЕДВЕДЬ – Investor who speculates on a decline in prices. Bears sell instruments forward in the hope of buying them back at a lower price before delivery. Bear is a person who expects lower prices. Bear is a person who believes prices will decline and might be described as having a bearish outlook. One who anticipates a decline in prices or volatility. Bear is a trader who speculates on a decline in prices. Bears, expecting price to go down, sell assets forward in the hope of buying them back at a lower price before delivery. The opposite of Bull. Bear is the someone who expects prices to fall. Bear is someone who anticipates that prices will fall. / Все участники рынков образно делятся на две категории:- быки и медведи. Медведь – торговец или вкладчик капитала, который спекулирует на понижении цен. Медведи, ожидая понижения цен, продают биржевые активы или инструменты в надежде выкупить их обратно в ближайшем будущем перед поставкой, но по более дешёвой цене. В противоположность Быку (Bull). Медведь – лицо, которое верит в то, что цены будут снижаться. Он мог бы быть обозначен в качестве имеющего медвежий взгляд. Тот, кто принимает участие в снижении цен или лихорадочности. Медведь – тот, кто рассчитывает на то, что цены упадут. Медведь – тот, кто предвкушает, что цены будут падать. Быки и Медведи – это главные героические тотемы биржевых рынков, олицетворяющие собой две основные рыночные силы, то есть Покупателей и Продавцов. Медведь, он же торговец или инвестор, который уверен в том, что рынок будет падать. Именно он открывает короткую позицию, вызывая рост предложения и снижение цен, то есть 'бьёт лапой по добыче'. Есть ещё жадные Свиньи, которые передерживают свои позиции, чтобы прибыль увеличилась, даже когда рынок развернулся в обратном направлении. Кроме того имеются и боязливые Овцы, которые никогда не имеют собственного мнения и слепо следуют за своими гуру. Короче говоря, как только рынок начинает работать, быки покупают, медведи продают, а свиньи и овцы 'путаются у них под ногами'. Смотрите также Бык (Bull). Медведь – продавец финансовых инструментов или биржевого товара, который ожидает падения цен. Термин с противоположным значением – Бык (Bull).

BEAR CALL SPREAD = МЕДВЕЖЬЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПОКУПКУ (или МЕДВЕЖИЙ СПРЭД ПО ОПЦИОНАМ НА ПОКУПКУ) – Bear Call Spread:- the purchase and sale of call options at different exercise prices but with the same expiry date. The purchased (or long) calls have a higher exercise price than the written (or short) calls. The investor expects a fall in the price of the underlying asset. / Медвежья Курсовая Разница По Опционам На Покупку или Медвежий Спрэд По Опционам На Покупку заключается в приобретении и продаже опционов на покупку с разными сходными ценами, но с одной и той же датой прекращения признания (или датой экспирации). Приобретённые (или купленные) опционы на покупку имеют более высокую сходную цену, нежели выписанные (или проданные) опционы на покупку. Торговец или инвестор, пытающийся получить прибыль от такой операции, обычно ожидает падение цены соответствующего биржевого актива или инструмента.

BEARD = БОРОДКА – Beard:- Cotton fibers protruding from a comb where they have been laid at random, and which have been combed into a beard. / Бородка – хлопковые волокна, выступающие из зажима, в котором они были выложены случайным порядком, и которые были расчёсаны в бородку. Бородка (терминология из стандарта ИСО 4913-81):- хлопковые волокна, выступающие из гребня, которые были взяты произвольно с разных участков пробы и расчёсаны в виде бородки.

BEARDED SPRING NEEDLE = КРЮЧКОВАЯ ПРУЖИНИСТАЯ ИГЛА – Bearded Spring Needle:- the flexible hooked loop holder which is capable of enclosing the newly formed loop in order to draw it through the previously formed is called Bearded Needle. As mentioned previously, the bearded or spring needle was the first type of needle to be produced. It is the cheapest and simplest type to manufacture as it is made from a single piece of metal, in machine gauges as fine as 60 needles per inch, with the needles being pliered to ensure accurate needle spacing. See also Spring Needle. Bearded Needle is a fine steel needle for machine knitting that has a butt at one end and a long, flexible hook at the other that curves back to the shank of the needle. Also known as Spring Needle. / Смотрите также Пружинистая Игла (Spring Needle).

BEARDING = ОБРИВАНИЕ (или ХХ) – Bearding:- fuzz on loop pile carpets usually resulting from poor anchorage or fiber snagging.

BEARER BOND = ОБЛИГАЦИЯ НА ПРЕДЪЯВИТЕЛЯ – Bearer Bond:- bonds that are not registered in the owner's name. The bond is negotiable by the person who possesses it – the bearer. Interest is paid to a bearer bond holder when they submit a coupon – a detachable stub at the bottom of the bond. Bearer bonds are no longer issued. Bearer Bond is a bond that does not have the owner's name registered on the books of the issuer. Interest and principal, when due, are payable to the owner. See also Coupon Bond, and Registered Bond.

BEARER CHECK = ЧЕК НА ПРЕДЪЯВИТЕЛЯ – In the United States, a Bearer Check is payable to anyone who is in possession of the document:- this would be the case if the check does not state a payee, or is payable to 'bearer' or to 'cash' or 'to the order of cash', or if the check is payable to someone who is not a person or legal entity, e.g., if the payee line is marked 'Happy Birthday'.

BEARER INSTRUMENT = ИНСТРУМЕНТ НА ПРЕДЪЯВИТЕЛЯ – Bearer Instrument is a stock or bond payable to the person possessing it, i.e. its rights (interest, redemption) are not tied to a certain (specifically named) person. In Germany, this is the most common form of security. Bearer shares or bonds can be freely sold, given away, bequeathed or otherwise disposed of without meeting any formal requirements. Proof of entitlement is not required. Ease of handling makes bearer instruments particularly suitable for stock exchange dealings.

BEARER MORTGAGE NOTE = БИЛЕТ НА ПРЕДЪЯВИТЕЛЯ ПО ЗАКЛАДНОЙ (или ИПОТЕЧНАЯ НОТА НА ПРЕДЪЯВИТЕЛЯ) – Bearer Mortgage Note is a debt instrument, or note, made out to bearer. Whoever holds the note at any given time is the creditor. / Долговой инструмент или билет, выписанный на предъявителя. Кто бы не удерживал этот билет, тот в любое время является кредитором.

BEARER SECURITY = ЦЕННАЯ БУМАГА НА ПРЕДЪЯВИТЕЛЯ – Bearer Security is a security not registered in the owner's name and therefore payable to the bearer. Treasury bills are bearer bonds. See also Registered Security. Bearer Security is a security where the person in physical possession of the security document/certificate is entitled to the cash flows from the security (contrast with a Registered Security). A pound note is a bearer security since if you lose it the person finding it can spend it!

BEARER SHARE = АКЦИЯ НА ПРЕДЪЯВИТЕЛЯ – Bearer Shares:- many offshore financial secrecy jurisdictions permit the issuance of bearer shares by corporations chartered in their jurisdiction. The bearer (the holder, or the one with possession of) the share certificate(s) is the owner of the share(s). Only the bearer knows that he/she owns stock in the offshore corporation. Therefore, the ownership of this offshore corporation (international business corporation (IBC)) remains private. Bearer shares may be bought, sold, or exchanged in complete privacy. Shares made to the bearer, i.e. the person who holds or possesses the instrument. The opposite of Registered Share. / Акции, выпущенные на предъявителя, то есть лицо, которое удерживает или владеет данным инструментом. В противоположность Именной Акции (Registered Share).

BEAR FLAG = МЕДВЕЖИЙ ФЛАГ (или ФЛАГ МЕДВЕДЯ) – Bear Flag:- a sharp, strong volume decline on a negative fundamental development and several days of sideways-to-higher price action on much weaker volume followed by a second, sharp decline to new lows on strong volume. The vertical downtrend that precedes a flag may occur because of buyers' reactions to an unfavorable company announcement, such as a court case, or a sudden and unexpected departure of a CEO. The sharp price decrease is sometimes referred to as the 'Flagpole' or 'Mast'. / В техническом анализе биржевых рынков, .

BEARING = АЗИМУТ – The direction of an object (with reference to you, your ship, another object). Bearing is the angle between the direction of true North or South and that of the object on which the bearing is being taken. May also refer to a relative bearing between two objects. / Угол между точным направлением на Север или Юг и направлением на объект, по которому определяется азимут. Может также относиться к относительному азимуту между двумя объектами. Слово Азимут было заимствовано из Арабского языка от слова Ас-сумут (множественное число от Ас-самт), означающее Направление или Путь. В настоящее время оно может быть использовано в отношении земного предмета, небесного светила и тому подобного. Под Азимутом понимается двугранный угол (А) между плоскостью меридиана точки наблюдения и вертикальной плоскостью, проходящей через эту точку и наблюдаемый объект, светило или тому подобное. Азимут отсчитывается от направления на север по ходу часовой стрелки. Если вертикальная линия проходит через линию отвеса в точке наблюдения, то данный азимут называют Астрономическим Азимутом, а если через нормаль к поверхности земного эллипсоида – Геодезическим Азимутом. Для определения Магнитного Азимута вместо плоскости георгафического меридиана используют плоскость магнитного меридиана. Азимут – одна из координат системы горизонтальных координат в астрономии.

BEARING = ОПОРА (или НЕСУЩАЯ) – Bearing is the contact area over which one structural element, such as a truss, is supported on another structural element such as a wall. / Опоры – устройства для поддержания и прикрепления несущих конструкций сооружений. В зданиях опорами балок и ферм служат столбы, стойки, колонны и тому подобное. В мостах опорами являются устои и быки. При расчёте конструкций методами строительной механики рассматриваются не действительные опоры сооружений, а их расчётные схемы. К Несущим Конструкциям относятся конструктивные элементы, воспринимающие основные нагрузки зданий и сооружений и обеспечивающие их прочность, жёсткость и устойчивость. Несущие конструкции делятся на:- (i) вертикальные, воспринимающие главным образом сжимающие усилия (колонны, пилоны, стены, столбы); и (ii) горизонтальные, работающие преимущественно на изгиб и растяжение (балки и панели перекрытий, ригели рам, стропильные фермы и другие). Несущие конструкции здания (сооружения) в совокупности образуют его несущий остов. Изготовляют несущие конструкции из бетона, железобетона, природных и искусственных камней, кирпича, стали и дерева.

BEARING = ПОДШИПНИК – Bearing:- often Bearings. A part of a machine that allows one part to rotate or move in contact with another part with as little friction as possible. For example, 'if the bearings that allow the crankshaft to turn freely are worn out, the crankshaft cannot turn so the engine cannot run'. Bearing, in machine construction, a connector (usually a support) that permits the connected members to rotate or to move in a straight line relative to one another. Often one of the members is fixed, and the bearing acts as a support for the moving member. Most bearings support rotating shafts against either transverse (radial) or thrust (axial) loads. To minimize friction, the contacting surfaces in a bearing may be partially or completely separated by a film of liquid (usually oil) or gas; these are sliding bearings, and the part of the shaft that turns in the bearing is the journal. The surfaces in a bearing may be separated also by balls or rollers; these are known as Rolling Bearings. In the illustration, the inner race turns with the shaft. Under certain combinations of load, speed, fluid viscosity, and bearing geometry, a fluid film forms and separates the contacting surfaces in a sliding bearing; this is known as a Hydrodynamic Film. An oil film can also be developed with a separate pumping unit that supplies pressurized oil to the bearing; this is known as a Hydrostatic Film. Because shaft speed is required for the development of a hydrodynamic film, the starting friction in these bearings is higher than in ball or roller bearings. To minimize friction when metal-to-metal contact occurs, low-friction-bearing materials have been developed; among these are bronze alloys and babbitt metal. See also Ball Bearing; and Roller Bearing. Bearings are small metal balls that are placed between moving parts of a machine in order to make them move smoothly and easily over each other. For example, 'an oil seal was replaced, along with both front wheel bearings'. Bearing:- a support or guide by means of which a moving part such as a shaft or axle is positioned with respect to the other parts of a mechanism. See also Anti-Friction Bearing, Axial-Load Bearing, Ball Bearing, Clearance Bearing, Hybrid Bearing, Journal Bearing, Motor Bearing, Needle Bearing, Plain Bearing, Roller Bearing, Rolling Element Bearing, Sealed Motor Bearing, Sleeve Bearing, and Thrust Bearing. / Смотрите также Антифрикционный Подшипник или Подшипник Качения (Anti-Friction Bearing), Подшипник Осевой Нагрузки (Axial-Load Bearing), Шариковый Подшипник или Шарикоподшипник (Ball Bearing), Зазорный Подшипник (или Подшипник С Зазором (Clearance Bearing)), Гибридный Подшипник или Гидростатодинамический Подшипник (Hybrid Bearing), Радиальный Подшипник (Journal Bearing), Моторный Подшипник или Двигательный Подшипник (Motor Bearing), Игольчатый Подшипник (Needle Bearing), Подшипник Скольжения (Plain Bearing), Роликовый Подшипник или Роликоподшипник (Roller Bearing), Подшиник Качения (Rolling Element Bearing), Уплотнёный Моторный Подшипник (Sealed Motor Bearing), Подшипник Скольжения или Втулочный Подшипник или Подшипник С Вкладышем (Sleeve Bearing), и Упорный Подшипник или Подпятник (Thrust Bearing). Под Подшипником понимается опора вала или вращающейся оси, воспринимающая от них радиальные, осевые и радиально-осевые нагрузки и обеспечивающая их свободное вращение. Подшипник – распространённая деталь машин, механизмов, приборов и других устройств. По принципу работы различают:- (i) Подшипники Скольжения (Plain Bearings), в которых цапфа вала скользит непосредственно по опорной поверхности; и (ii) Подшипники Качения (Rolling Bearings), в которых между поверхностью вращающейся детали и поверхностью опоры расположены шарики или ролики.

Подшипник Скольжения может иметь цилиндрическую, коническую или шаровую форму опорной поверхности и работать в условиях полужидкостного и жидкостного трения. Простейшим подшипником скольжения является отверстие, расточенное в корпусе машины. Чаще в отверстие корпуса вставляют вкладыш из другого материала, обычно антифрикционного. Подшипники Качения обычно состоят из наружного и внутреннего колец, тел качения (шариков и роликов) и сепаратора (детали, удерживающей тела качения на определённом расстоянии одно от другого). Подшипники качения различают:- (i) по направлению воспринимающей нагрузки на радиальные подшипники (journal bearings), радиально-упорные подшипники (journal thrust bearings), упорные подшипники (или подпятники; (thrust bearings)); (ii) по форме тел качения и рабочих поверхностей колец на шариковые, шариковые сферические, роликовые цилиндрические – с короткими, длинными (игольчатыми) и витыми роликами, роликовые конические, роликовые сферические, роликовые сфероконические, в том числе самоустанавливающиеся, не чувствительные к незначительным угловым отклонениям вала; (iii) по числу рядов тел качения – одно-, двух- и многорядные; и (iv) по степени точности – подшипники пяти классов точности – 0, 6, 5, 4, 2. Подшипник, опора вала или оси, фиксирующая положение вращающейся или качающейся части механизма по отношению к другим его частям. По направлению воспринимаемых нагрузок подшипники разделяют на Радиальные Подшипники (для восприятия нагрузок, перпендикулярных к оси вала), Упорные Подшипники (для восприятия нагрузок, направленных по оси вала), а также Радиально-Упорные Подшипники (для восприятия комбинированных, преимущественно радиальных нагрузок; реже применяют упорно-радиальные подшипники – преимущественно для восприятия осевых нагрузок). По виду трения различают Подшипники Качения (получили наибольшее распространение) и Подшипники Скольжения.

BEARING STUD WALL = НЕСУЩАЯ КАРКАСНАЯ СТЕНА (или НЕСУЩАЯ СТЕНА ИЗ СТОЕК) – Bearing Stud Wall is an exterior or interior wall designed to act as a structural element by transmitting vertical loads to the foundation. / К Несущим Конструкциям относятся конструктивные элементы, воспринимающие основные нагрузки зданий и сооружений и обеспечивающие их прочность, жёсткость и устойчивость. Несущие конструкции делятся на:- (i) вертикальные, воспринимающие главным образом сжимающие усилия (колонны, пилоны, стены, столбы); и (ii) горизонтальные, работающие преимущественно на изгиб и растяжение (балки и панели перекрытий, ригели рам, стропильные фермы и другие). Несущие конструкции здания (сооружения) в совокупности образуют его несущий остов. Изготовляют несущие конструкции из бетона, железобетона, природных и искусственных камней, кирпича, стали и дерева. Самонесущая Стена – ограждающая конструкция здания, воспринимающая нагрузку только от собственного веса стен и ветровую нагрузку по всей высоте здания.

BEARISH = МЕДВЕЖИЙ – Bearish:- factors which are likely to depress prices are defined as bearish. A news item is considered bearish if it is expected to result in lower prices. The belief an asset or market will move down in price in the future. / Уверенность в том, что актив или рынок в ближайшее время будет падать в цене.

BEARISH PENNANT = МЕДВЕЖИЙ ВЫМПЕЛ – Bearish Pennant:- a sharp, strong volume decline on a negative fundamental development and several days of narrowing price consolidation on much weaker volume followed by a second, sharp decline to new lows on strong volume. / В техническом анализе биржевых рынков, .

BEAR MARKET = МЕДВЕЖИЙ РЫНОК (или РЫНОК МЕДВЕДЕЙ) – Bear Market is a long period of time when prices in the market are generally declining. It is often measured by a percentage decline of more than 20%. Bear markets occur when roughly 80% of all stocks decline for an extended period of time. 1973/74 and 1981/82 have been referred to as Bear Markets. Also known as Slump. Bear Market:- any decline in the major market index of 20% or more. A market in which prices generally are declining over a period of months or years. A period of declining market prices. A condition of the market when prices of assets are generally declining. A news item is considered bearish if it is expected to result in lower prices. The opposite of Bull Market. A market in which prices are in a declining trend. Bear Market:- this is the term used to refer to a weak, sluggish stock market. Prices and share volumes are decreasing in a Bear Market. Bear Market:- a time of weak confidence among investors who are inclined to sell shares and prices decline. Bear Market is a market in which prices are declining. Bear Market is a market where a large supply and/or small demand results in a price decline. / Медвежий Рынок – длительный период времени, в течение которого цены на рынке в общем находятся в состоянии снижения. Часто измеряется посредством процентного снижения более чем на 20%. Медвежьи рынки возникают в те моменты, когда порядка 80% всех акций снижается в течение длительного периода времени. На рынки 1973–74 и 1981–82 обычно ссылаются как на медвежьи рынки. Известен также как Падение (Slump). Под Медвежьим Рынком понимается любое снижение индекса по крупным рынкам на 20% или более. Рынок, в котором цены в большинстве своём снижаются в течение периода времени, растягивающегося на месяцы или годы. Период снижения рыночных цен. Состояние рынка, при котором цены на биржевые активы или инструменты в большинстве своём снижаются. Новостное событие также рассматривается в качестве медвежьего, если таковое способно привести рынок к более низким ценам. В противовес Бычьему Рынку (Bull Market). Медвежий Рынок – рынок, в котором цены имеют тенденцию на понижение. Медвежий Рынок – рынок с тенденцией к снижению цен. Продолжительный период падения цен акций на рынке. Рынок акций с тенденцией к снижению обычно возникает в результате ожидания спада экономической активности, а рынок облигаций с тенденцией к повышению цен вызывается ростом процентных ставок. Медвежий Рынок – рынок, на котором в течение длительного периода времени происходит снижение цен. Смотрите также Бычий Рынок или Рынок Быков (Bull Market).

BEAR MARKET RALLY = ПОВЫШЕНИЕ ЦЕН НА МЕДВЕЖЬЕМ РЫНКЕ – Secondary trends are short-term changes in price direction within a primary trend. The duration is a few weeks or a few months. One type of secondary market trend is called a Market Correction. A correction is a short term price decline of 5% to 20% or so. A correction is a downward movement that is not large enough to be a bear market (ex post). Another type of secondary trend is called a Bear Market Rally (or 'Sucker's Rally') which consist of a market price increase of 10% to 20%. A bear market rally is an upward movement that is not large enough to be a bull market (ex post). Bear market rallies occurred in the Dow Jones index after the 1929 stock market crash leading down to the market bottom in 1932, and throughout the late 1960s and early 1970s. The Japanese Nikkei 225 has been typified by a number of bear market rallies since the late 1980s while experiencing an overall long-term downward trend. A temporary rise in prices during a bear market. See also Correction. / Дау Дьжонз (Dow Jones). Японский индекс по 225 от Никкэй. Временный рост цен в течение медвежьего рынка. Смотрите также Коррекция (Correction).

BEAR PUT SPREAD = МЕДВЕЖЬЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПРОДАЖУ (или МЕДВЕЖИЙ СПРЭД ПО ОПЦИОНАМ НА ПРОДАЖУ) – Bear Put Spread:- the purchase and sale of put options at different exercise prices but with the same expiry date. The puts purchased have a higher exercise price than the puts written. The investor expects a fall in the price of the underlying asset. / Медвежья Курсовая Разница По Опционам На Продажу или Медвежий Спрэд По Опционам На Продажу заключается в приобретении и продаже опционов на продажу с разными сходными ценами, но с одной и той же датой прекращение признания (или датой экспирации). Приобретённые (или купленные) опционы на продажу имеют более высокую сходную цену, нежели выписанные (или проданные) опционы на продажу. Торговец или инвестор, пытающийся получить прибыль от такой операции, обычно ожидает падение цены соответствующего биржевого актива или инструмента.

BEARS = BONDS ENABLING ANNUAL RETIREMENT SAVINGS

BEARSKIN = XX (или КИВЕР, или ШАПКА ИЗ МЕДВЕЖЬЕЙ ШКУРЫ) – Bearskin is a military hat made of the skin of a bear. / армейская шапка, сделанная из медвежьей шкуры.

BEAR SPREAD = МЕДВЕЖЬЯ КУРСОВАЯ РАЗНИЦА (или МЕДВЕЖИЙ СПРЭД) – (1) A Bear Spread strategy implies the speculator is short (sells) the nearby commodities futures contract and is long (buys) the distant futures contract. Under normal market conditions, the speculator will profit if the price difference between contracts widens. Under an inverted market the speculator will profit if the price difference narrows. In futures, short the nearby future and long the deferred in anticipation of a decline in the general level of prices. Bear Spread is the simultaneous purchase and sale of two futures contracts in the same or related commodities with the intention of profiting from a decline in prices but, at the same time, limiting the potential loss if this expectation does not materialize. This can usually be accomplished by selling a nearby delivery and buying a deferred delivery. In most commodities and financial instruments, the term refers to selling the nearby contract month, and buying the deferred contract, to profit from a change in the price relationship. Short the nearby future and long the deferred, in anticipation of a decline in the general level of prices, with the nearby future expected to decline more than the deferred contract. See also Bull Spread. Bear Spread is the simultaneous sale of a nearby futures contract and purchase of a deferred contract, with the expectation that the nearby contract will lose relative to the deferred. A term Bear Spread usually refers to the simultaneous sale of the nearby contract month and purchase of the distant contract month. / Стратегия Медвежьей Курсовой Разницы или Медвежьего Спрэда подразумевает то, что спекулянт продаёт ближайший по месяцу поставки фьючерсный контракт на сырьё и продаёт более отдалённый фьючерсный контракт. В условиях обычного состояния рынка спекулянт получит прибыль, если разница в ценах между данными контрактами расширится. В условиях перевёрнутого рынка (inverted market) спекулянт получит прибыль, если разница в ценах сузится. В торговле фьючерсами, под Медвежьей Курсовой Разницей понимается продажа ближайшего фьючерса и покупка отсроченного фьючерса в предвкушении снижения генерального уровня цен. Медвежья Курсовая Разница – это одновременная закупка и продажа двух фьючерсных контрактов на одно и тоже или взаимосвязанное сырьё с намерением получения прибыли от снижения цен, но, в то же время, и ограничения потенциального убытка в случае, если такое ожидание не оправдается. Это может быть совершено продажей ближайшей поставки и покупки отсроченной поставки. Для большинства родов сырья и типов финансовых инструментов, данный термин относится к продаже ближайшего контрактного месяца и покупке отсроченного контрактного месяца с целью получения прибыли от ценовой взаимосвязи. Продажа ближайшего фьючерса и покупка отсроченного в предвкушении снижения генерального уровня цен с ожиданием того, что снижение цены ближайшего фьючерса окажется более сильным в сравнении с ценой отсроченного контракта. Смотрите также Бычья Курсовая Разница или Бычий Спрэд (Bull Spread).

(2) Bear Spread is a combination of the purchase of a put option with a higher strike price and the sale of a put option with a lower strike price or of the purchase of a call option with a higher strike price and the sale of a call option with a lower strike price. The combined options must be identical in terms of underlying asset and maturity. This construction can be used for a (restricted) hedge against falling prices of the underlying asset. The opportunities and risks in these combinations are limited. An option strategy with maximum profit when the price of the underlying securities decline. Bear Spread:- a Delta-negative options position comprised of long and short options of the same type, either calls or puts, designed to be profitable in a declining market. An option with a lower strike price is sold and one with a higher strike price is bought. A strategy involving the simultaneous purchase and sale of options of the same class and expiration date, but different strike prices. In a bear spread, the option that is purchased has a lower Delta than the option that is bought. For example, in a call bear spread, the purchased option has a higher exercise price than the option that is sold. When to use:- if you think the market will go down, but with limited downside. Good position if you want to be in the market but are less confident of bearish expectations. The most popular position among bears because it may be entered as a conservative trade when uncertain about bearish stance. Profit characteristics:- profit limited, reaching maximum at expiration if market is at or below strike price A. If put-vs.-put version (most common) used, break-even is at B – net cost of spread. If call-vs.-call version, break-even is at A + net premium collected. Loss characteristics:- by accepting a limit on profits, you also achieve a limit on losses. Losses, at expiration, increase as market rises to B, where they are at a maximum. With put-vs.-put version, maximum loss is net cost of spread. Decay characteristics:- if market is midway between A and B, little if any time decay effect. If market is closer to A, time decay is generally a benefit. If market is closer to B, time decay is generally detrimental to profitability. Category:- directional. Short put A, long put B. Short call A, long call B. Also known as Bear Vertical Spread. Bear Spread – use for vertical spread:- an option strategy combining the purchase and sale of two puts (bear put spread) or two calls (bear call spread) with different strikes on the same underlying security. See also Bull Spread. / В торговле опционами, под Медвежьей Курсовой Разницей или Медвежьим Спрэдом понимается комбинация приобретения опциона на продажу с более высокой сходной ценой и продажа опциона на продажу с более низкой сходной ценой или приобретение опциона на покупку с более высокой сходной ценой и продажа опциона на покупку с более низкой сходной ценой. Комбинируемые опционы должны быть идентичны в порядках соответствующего актива и погашения. Эта конструкция может быть использована для (ограниченного) хэджа против падающих цен на соответствующий актив. Возможности и риски в этих комбинациях лимитированы. Опционная стратегия с максимумом прибыли в случае, когда цена соответствующих ценных бумаг снижается. Опционная позиция с отрицательной дельтой, состоящая из покупки и продажи опционов одного и того же типа, либо опционов на покупку, либо опционов на продажу, разработанная для того чтобы извлечь прибыль на падающем рынке. Опцион с более низкой сходной ценой продаётся, а опцион с более высокой сходной ценой покупается. Стратегия, заключающаяся в одновременном приобретении и продаже опционов одного и того же класса и датой прекращения признания (или датой экспирации), но с разными сходными ценами. Опцион, который приобретается в Медвежьей Курсовой Разнице, имеет более низкую дельту, нежели опцион, который куплен. Например, в медвежьей курсовой разнице по опционам на покупку приобретаемый опцион имеет более высокую сходную цену, нежели опцион, который продаётся. При какой ситуации используется:- если Вы полагаете, что рынок уйдёт вниз, но с лимитированной нижней границей. Хорошая позиция в том случае, если Вы хотите быть в рынке, но при этом мало уверены в бычьих ожиданиях. Самая популярная позиция среди медведей, поскольку она может быть задействована в качестве консервативной торговли в тех случаях, когда имеется неопределённость в отношении медвежьей позиции. Характеристики прибыли:- прибыль лимитирована, достигая максимума при прекращении признания (или при экспирации), если рынок находится на уровне или ниже сходной цены А. Если используется версия опцион на продажу-против-опциона на продажу (наиболее обыденная), окупаемость (или самоокупаемость) в цене определяется как В – чистый расход по курсовой разнице. Если используется версия опцион на покупку-против-опциона на покупку, окупаемость (или самоокупаемость) в цене определяется как А + собранная чистая премия. Характеристики убытка:- принимая лимит по прибылям, Вы также достигаете и лимита по убыткам. Убытки, по прекращении признания (по экспирации), увеличиваются поскольку рынок подрастает до цены В, при которой они являются максимальными. В случае с версией опциона на продажу-против-опциона на продажу, максимальный убыток составляет чистый расход по курсовой разнице. Характеристики прихода в упадок:- если рынок находится на полпути между ценой А и ценой В, то незначительные, если воздействует любой временной упадок. Если рынок близок к цене А, то

временной упадок в общем является выгодой. Если рынок близок к цене В, то временной упадок в общем вреден для прибыльности. Известна также как Медвежья Вертикальная Курсовая Разница или Медвежий Веритикальный Спрэд (Bear Vertical Spread). Смотрите также Бычья Курсовая Разница или Бычий Спрэд (Bull Spread). Медвежья Курсовая Разница или Медвежий Спрэд – одна из стратегий торговли. Комбинация приобретения опциона на покупку с меньшей внутренней стоимостью и продажи опциона на покупку с большей стоимостью. Медвежья Курсовая Разница или Медвежий Спрэд – стратегия на рынке опционов, позволяющая воспользоваться падением цен на ценные бумаги или товарно-сырьевую продукцию. Лицо, играющее на понижение, может приобрести комбинацию опционов на покупку и продажу одних и тех же ценных бумаг по различным сходным ценам (strike prices), чтобы получить прибыль в случае падения цен.

BEAR TRAP = МЕДВЕЖЬЯ ЛОВУШКА – In exchange trading, Bear Trap is one of trading traps. A situation that occurs when prices break below a significant level and generate a sell signal, but then reverse course and negate the sell signal, thus 'trapping' the bears that acted on the signal with losses. A bear trap is another form of Whipsaw and relates to the Spring. A short term rising market which will resume its previous declining trend. A false breakout of chart support to the downside where prices quickly reverse, thus trapping the new sellers with losing positions. / В техническом анализе биржевых рынков, под Медвежьей Ловушкой понимается одна из ловушек торговли. Ситуация, которая возникает когда цены пробиваются ниже существенного уровня и генерируется сигнал на продажу, но затем движение цены разворачивается в обратную стону, и сигнал на продажу сводится на нет, в результате чего медведи попадают в капкан убытков, сработавший по данному сигналу. Медвежья Ловушка является ещё одной формой Подрезания (Whipsaw) и связана со Скачком (Spring). Краткосрочно растущий рынок, который возобновит свою предыдущую тенденцию на понижение. Ложный пробой графика поддержки до нижней границы, на которой цены быстро разворачиваются в обратную сторону, загоняя таким образом новых продавцов в убыточные позиции. Медвежья Ловушка – ситуация, с которой сталкиваются продавцы, играющие на понижение, когда медвежий рынок меняет направление и становится бычьим. Ожидая падения рыночных цен, медведи продолжают продавать, а когда наступит срок исполнения заключённых контрактов, они будут вынуждены покупать инструменты по повысившимся ценам, чтобы покрыть сделки.

BEAR VERTICAL SPREAD = МЕДВЕЖЬЯ ВЕРТИКАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или МЕДВЕЖИЙ ВЕРТИКАЛЬНЫЙ СПРЭД) – Bear Vertical Spread is a strategy employed when an investor expects a decline in a commodity price but at the same time seeks to limit the potential loss if this expectation is not realized. This spread requires the simultaneous purchase and sale of options of the same class and expiration date but different strike prices. For example, if call options are spread, the purchased option must have a higher exercise price than option that is sold. See also Bear Spread. / Медвежья Вертикальная Курсовая Разница или Медвежий Вертикальный Спрэд – стратегия, задействуемая в тех случаях, когда торговец или инвестор предвкушает снижение в стоимости биржевого актива, инструмента или сырья, но в то же самое время задумывается об ограничении потенциального убытка, если данное ожидание не оправдается. Эта курсовая разница требует одновременного приобретения и продажи опционов одних и тех же класса и даты прекращения признания (или экспирации), но по разным сходным ценам. Например, если речь идёт о курсовой разнице по опционам на покупку, то приобретаемый опцион должен иметь более высокую цену исполнения, нежели продаваемый опцион. Смотрите также Медвежья Курсовая Разница или Медвежий Спрэд (Bear Spread).

BEAT CLOTH = ЛОВЧИЙ ХОЛСТ (или ОБЛАВНЫЙ ХОЛСТ) – Beat Cloth is a square (typically 3 feet by 3 feet) or rectangular piece of usually light-colored cloth or synthetic sheeting (i.e. Tyvek material) with dowels at opposite ends; used to assess insect populations by catching them when plants are beaten or shaken over the device, which is normally unrolled and placed on the ground between rows. Also called a Shake Cloth or Ground Cloth. / или . окантованная штука . Ловчие Пояса, широкие полосы (15–20 см) из соломенных жгутов, плотной бумаги, рогожи, стружки и прочих материалов, накладываемые кольцами на стволы и толстые сучья деревьев для улавливания с целью уничтожения вредителей растений, которые уходят на зимовку или окукливание обычно под чешуйки старой коры. Вредителей, попавших в ловчие пояса, уничтожают механически или инсектицидами. Ловчие пояса эффективны на небольших площадях, где по каким-либо соображениям невозможен или нерентабелен химический метод борьбы.

BEATER = ТРЕПАЛО (или БИЛО, или УДАРНИК, или БАТАН) – (1) Beater is the machine which does most of the opening and cleaning work on a fiber picker and opener. Revolving at high speed, it beats against the fringe of fiber as the latter is fed into the machine. / На прядильных фабриках на стадии трепания волокна используются специальные машины. Органы трепания и характер их ударных воздействий могут быть различными в зависимости от особенностей обрабатываемого материала и содержащихся в нём примесей. Наиболее полные разрыхление и очистка материала достигается в случаях, когда он подводится под удары органов трепания в зажатом состоянии. Питающие органы подают материал в зажатом состоянии к планочному трепалу, имеющему две или три планки, называемые билами. Била наносят выступающими рёбрами удары по всей ширине подаваемого слоя материала. Материал выступает из питающих органов (цилиндр и педаль или два цилиндра) в рабочее пространство в виде бородки, которая под действием собственной тяжести, ударов бил и тока воздуха огибает нижний питающий цилиндр (педаль). В этот момент било трепала, вращающегося со скоростью, во много раз превосходящей скорость питания, ударяет по бородке, деформирует её и отделяет клочки материала, которые срываются с била и ударяются о колосники. При разрыхлении ударное воздействие с помощью колков, зубьев и игл. Батан, от Французского слова Battant, означающее буквально Бьющий, один из основных механизмов ткацкого станка; служит для продвижения (прибоя) уточной нити к опушке ткани и направления челнока (или прокладчика), вводящего уток в ткань.

(2) Beater is a machine used in the paper industry for opening pulp and combining additives.

BEATING–UP = ПРИБОЙ (или ПРИКОЛАЧИВАНИЕ) – Beating-Up is the last operation of the loom in weaving, in which the last pick inserted in the fabric is 'beat' into position against the preceeding picks, usually by a 'comb-like' device called a Reed. / Прибой или Приколачивание уточной нити к опушке ткани ударом батана. Прибой в ткачестве – продвижение уточной нити вдоль основы к опушке (краю) ткани. Одна из основных операций при формировании ткани на ткацком станке. Наиболее распространённый рабочий орган для прибоя – бёрдо; перемещающее уточную нить одновременно по всей ширине основы. Прибой на некоторых станках осуществляется непрерывно с помощью прижимов-уплотнителей утка (круглоткацкий станок), профилированных дисков (многозевные ткацкие машины).

BEAUFORT SCALE = ШКАЛА БОФОРТА – The Beaufort Scale is an empirical measure for describing wind speed based mainly on observed sea conditions. Its full name is the Beaufort wind force scale. The scale was created in 1805 by Sir Francis Beaufort, an Irish admiral and hydrographer. The scale that carries Beaufort's name had a long and complex evolution, from the previous work of others, to when Beaufort was a top administrator in the Royal Navy in the 1830s. In the early XIX century naval officers made regular weather observations, but there was no standard scale and so they could be very subjective – one man's 'stiff breeze' might be another's 'soft breeze'. Beaufort succeeded in getting things standardized. The initial scale of thirteen classes (zero to twelve) did not reference wind speed numbers, but related qualitative wind conditions to effects on the sails of a man of war, then the main ship of the Royal Navy, from 'just sufficient to give steerage' to 'that which no canvas sails could withstand'. At zero, all his sails would be up; at six, half of his

sails would have been taken down; and at twelve, all sails would be stowed away. The scale was made a standard for ship's log entries on Royal Navy vessels in the late 1830s, and was adapted to non-naval use from the 1850s, with scale numbers corresponding to cup anemometer rotations. In 1906, to accommodate the growth of steam power, the descriptions were changed to how the sea, not the sails, behaved and extended to land observations. Rotations to scale numbers were standardized only in 1923. George Simpson, Director of the UK Meteorological Office, was responsible for this and for the addition of the land-based descriptors. The measure was slightly altered some decades later to improve its utility for meteorologists. Today, many countries have abandoned the scale and use the SI-based units m/s or km/h instead, but the severe weather warnings given to public are still approximately the same as when using the Beaufort scale. The Beaufort scale was extended in 1946, when Forces 13 to 17 were added. However, Forces 13 to 17 were intended to apply only to special cases, such as tropical cyclones. Nowadays, the extended scale is only used in Taiwan and mainland China, which are often affected by typhoons. Wind speed on the 1946 Beaufort scale is based on the empirical formula:- $v = 0.836\ B^{3/2}$ m/s, where v is the equivalent wind speed at 10 meters above the surface and B is Beaufort scale number. For example, B = 9.5 is related to 24.5 m/s which is equal to the lower limit of '10 Beaufort'. Using this formula the highest winds in hurricanes would be 23 in the scale. Today, hurricane force winds are sometimes described as Beaufort scale 12 through 16, very roughly related to the respective category speeds of the Saffir-Simpson Hurricane Scale, by which actual hurricanes are measured, where Category 1 is equivalent to Beaufort 12. However, the extended Beaufort numbers above 13 do not match the Saffir-Simpson Scale. Category 1 tornadoes on the Fujita and TORRO scales also begin roughly at the end of level 12 of the Beaufort scale but are indeed independent scales. Note that wave heights in the scale are for conditions in the open ocean, not along shore. The scale starts with 0 and goes to a force of 12 as follows:- (1) Beaufort number:- 0; description:- Calm; wind speed:- 0–1 kilometers/hour (km/h) or 0–1 miles/hour (mph) and 0–0.3 meters/second (m/s) or 0–1 knots (kts); wave height:- 0 meters (m) or 0 feet (ft):- (i) sea conditions:- flat (sea surface smooth and mirror-like); and (ii) land conditions:- calm; smoke rises vertically. (2) Beaufort number:- 1; description:- Light Air; wind speed:- 1-5 kilometers/hour (km/h) or 1–3 miles/hour (mph) and 0.3–1.5 meters/second (m/s) or 1–2 knots (kts); wave height:- 0.1 meters (m) or 0.33 feet (ft):- (i) sea conditions:- ripples without crests (scaly ripples, no foam crests); and (ii) land conditions:- wind motion visible in smoke (smoke drift indicates wind direction, still wind vanes). (3) Beaufort number:- 2; description:- Light Breeze; wind speed:- 6–11 kilometers/hour (km/h) or 3–7 miles/hour (mph) and 1.5–3.3 meters/second (m/s) or 3–6 knots (kts); wave height:- 0.2 meters (m) or 0.66 feet (ft):- (i) sea conditions:- small wavelets; crests of glassy appearance, not breaking (small wavelets, crests glassy, no breaking); and (ii) land conditions:- wind felt on exposed skin; leaves rustle (wind felt on face, leaves rustle, vanes begin to move). (4) Beaufort number:- 3; description:- Gentle Breeze; wind speed:- 12–19 kilometers/hour (km/h) or 8–12 miles/hour (mph) and 3.3–5.5 meters/second (m/s) or 7–10 knots (kts); wave height:- 0.6 meters (m) or 2 feet (ft):- (i) sea conditions:- large wavelets; crests begin to break; scattered whitecaps (large wavelets, crests begin to break, scattered whitecaps); and (ii) land conditions:- leaves and smaller twigs in constant motion (leaves and small twigs constantly moving, light flags extended). (5) Beaufort number:- 4; description:- Moderate Breeze; wind speed:- 20–28 kilometers/hour (km/h) or 13–17 miles/hour (mph) and 5.5–8.0 meters/second (m/s) or 11–15 knots (kts); wave height:- 1 meters (m) or 3.3 feet (ft):- (i) sea conditions:- small waves (small waves 1–4 ft, becoming longer, numerous whitecaps); and (ii) land conditions:- dust and loose paper raised; small branches begin to move (dust, leaves, and loose paper lifted, small tree branches move). (6) Beaufort number:- 5; description:- Fresh Breeze; wind speed:- 29–38 kilometers/hour (km/h) or 18–24 miles/hour (mph) and 8.0–10.8 meters/second (m/s) or 16–20 knots (kts); wave height:- 2 meters (m) or 6.6 feet (ft):- (i) sea conditions:- moderate (1.2 m) longer waves; some foam and spray (moderate waves 4–8 ft taking longer form, many whitecaps, some spray); and (ii) land conditions:- branches of a moderate size move; small trees begin to sway (small trees in leaf begin to sway). (7) Beaufort number:- 6; description:- Strong Breeze; wind speed:- 39–49 kilometers/hour (km/h) or 25–30 miles/hour (mph) and 10.8–13.9 meters/second (m/s) or 21–26 knots (kts); wave height:- 3 meters (m) or 9.9 feet (ft):- (i) sea conditions:- large waves with foam crests and some spray (larger waves 8–13 ft, whitecaps common, more spray); and (ii) land conditions:- large branches in motion; whistling heard in overhead wires; umbrella use becomes difficult (larger tree branches moving, whistling in wires). (8) Beaufort number:- 7; description:- High Wind, Moderate Gale, Near Gale; wind speed:- 50–61 kilometers/hour (km/h) or 31–38 miles/hour (mph) and 13.9–17.2 meters/second (m/s) or 27–33 knots (kts); wave height:- 4 meters (m) or 13.1 feet (ft):- (i) sea conditions:- sea heaps up and foam begins to streak (sea heaps up, waves 13–20 ft, white foam streaks off breakers); and (ii) land conditions:- whole trees in motion; effort needed to walk against the wind (whole trees moving, resistance felt walking against wind). (9) Beaufort number:- 8; description:- Fresh Gale; wind speed:- 62–74 kilometers/hour (km/h) or 39–46 miles/hour (mph) and 17.2–20.7 meters/second (m/s) or 34–40 knots (kts); wave height:- 5.5 meters (m) or 18 feet (ft):- (i) sea conditions:- moderately high waves with breaking crests forming spindrift; streaks of foam (moderately high (13–20 ft) waves of greater length, edges of crests begin to break into spindrift, foam blown in streaks); and (ii) land conditions:- twigs broken from trees; cars veer on road (whole trees in motion, resistance felt walking against wind). (10) Beaufort number:- 9; description:- Strong Gale; wind speed:- 75–88 kilometers/hour (km/h) or 47–54 miles/hour (mph) and 20.7–24.5 meters/second (m/s) or 41–47 knots (kts); wave height:- 7 meters (m) or 23 feet (ft):- (i) sea conditions:- high waves (6–7 m) with dense foam; wave crests start to roll over; considerable spray (high waves (20 ft), sea begins to roll, dense streaks of foam, spray may reduce visibility); and (ii) land conditions:- larger branches break off trees, and some small trees blow over; construction/temporary signs and barricades blow over; damage to circus tents and canopies (slight structural damage occurs, slate blows off roofs). (11) Beaufort number:- 10; description:- Whole Gale/Storm; wind speed:- 89–102 kilometers/hour (km/h) or 55–63 miles/hour (mph) and 24.5–28.4 meters/second (m/s) or 48–55 knots (kts); wave height:- 9 meters (m) or 29.5 feet (ft):- (i) sea conditions:- very high waves; large patches of foam from wave crests give the sea a white appearance; considerable tumbling of waves with heavy impact; large amounts of airborne spray reduce visibility (very high waves (20–30 ft) with overhanging crests, sea white with densely blown foam, heavy rolling, lowered visibility); and (ii) land conditions:- trees are broken off or uprooted, saplings become bent and/or deformed, poorly attached asphalt shingles and shingles in poor condition peel off roofs (seldom experienced on land, trees broken or uprooted, 'considerable structural damage'). (12) Beaufort number:- 11; description:- Violent Storm; wind speed:- 103–117 kilometers/hour (km/h) or 64–72 miles/hour (mph) and 28.4–32.6 meters/second (m/s) or 56–63 knots (kts); wave height:- 11.5 meters (m) or 37.7 feet (ft):- (i) sea conditions:- exceptionally high waves; very large patches of foam, driven before the wind, cover much of the sea surface; very large amounts of airborne spray severely reduce visibility (exceptionally high (30–45 ft) waves, foam patches cover sea, visibility more reduced); and (ii) land conditions:- widespread vegetation damage; many roof shingles and surfaces sustain damage; gravel may be blown from flat roofs. (13) Beaufort number:- 12; description:- Hurricane-Force; wind speed:- more than 118 kilometers/hour (km/h) or more than 73 miles/hour (mph) and more than 32.6 meters/second (m/s) or more than 64 knots (kts); wave height:- more than 14 meters (m) or more than 46 feet (ft):- (i) sea conditions:- huge waves; sea is completely white with foam and spray; air is filled with driving spray, greatly reducing visibility (air filled with foam, waves over 45 ft, sea completely white with driving spray, visibility greatly reduced); and (ii) land conditions:- considerable and widespread damage to vegetation, a few windows broken, structural damage to mobile homes and poorly constructed sheds and barns; and debris may be hurled about. A windscale and sea disturbance table by which mariners grade the force of wind and height of waves, thus communicating the general condition of the sea to others by use of a wind force number. See also The Saffir-Simpson Hurricane Scale. One of the first scales to estimate wind speeds and the effects was created by Britain's Admiral Sir Francis Beaufort (1774–1857). He developed the scale in 1805 to help sailors estimate the winds via visual observations. The scale starts with 0 and goes to a force of 12 as follows:- (1) Calm – force:- 0; equivalent speed 10 meters

above ground:- 0–1 miles/hour (mph) and 0–1 knots (kts):- (i) specifications for use on land:- calm; smoke rises vertically; and (ii) specifications for use at sea:- sea like a mirror. (2) Light Air – force:- 1; equivalent speed 10 meters above ground:- 1–3 miles/hour (mph) and 1–3 knots (kts):- (i) specifications for use on land:- direction of wind shown by smoke drift, but not by wind vanes; and (ii) specifications for use at sea:- ripples with the appearance of scales are formed, but without foam crests. (3) Light Breeze – force:- 2; equivalent speed 10 meters above ground:- 4–7 miles/hour (mph) and 4–6 knots (kts):- (i) specifications for use on land:- wind felt on face; leaves rustle; ordinary vanes moved by wind; and (ii) specifications for use at sea:- small wavelets, still short, but more pronounced; crests have a glassy appearance and do not break. (4) Gentle Breeze – force:- 3; equivalent speed 10 meters above ground:- 8–12 miles/hour (mph) and 7–10 knots (kts):- (i) specifications for use on land:- leaves and small twigs in constant motion; wind extends light flag; and (ii) specifications for use at sea:- large wavelets; crests begin to break; foam of glassy appearance; and perhaps scattered white horses. (5) Moderate Breeze – force:- 4; equivalent speed 10 meters above ground:- 13–18 miles/hour (mph) and 11–16 knots (kts):- (i) specifications for use on land:- raises dust and loose paper; small branches are moved; and (ii) specifications for use at sea:- small waves, becoming larger; fairly frequent white horses. (6) Fresh Breeze – force:- 5; equivalent speed 10 meters above ground:- 19–24 miles/hour (mph) and 17–21 knots (kts):- (i) specifications for use on land:- small trees in leaf begin to sway; crested wavelets form on inland waters; and (ii) specifications for use at sea:- moderate waves, taking a more pronounced long form; many white horses are formed; and chance of some spray. (7) Strong Breeze – force:- 6; equivalent speed 10 meters above ground:- 25–31 miles/hour (mph) and 22–27 knots (kts):- (i) specifications for use on land:- large branches in motion; whistling heard in telegraph wires; umbrellas used with difficulty; and (ii) specifications for use at sea:- large waves begin to form; the white foam crests are more extensive everywhere; and probably some spray. (8) Near Gale – force:- 7; equivalent speed 10 meters above ground:- 32–38 miles/hour (mph) and 28–33 knots (kts):- (i) specifications for use on land:- whole trees in motion; inconvenience felt when walking against the wind; and (ii) specifications for use at sea:- sea heaps up and white foam from breaking waves begins to be blown in streaks along the direction of the wind. (9) Gale – force:- 8; equivalent speed 10 meters above ground:- 39–46 miles/hour (mph) and 34–40 knots (kts):- (i) specifications for use on land:- breaks twigs off trees; generally impedes progress; and (ii) specifications for use at sea:- moderately high waves of greater length; edges of crests begin to breakinto spindrift; and the foam is blown in well-marked streaks along the direction of the wind. (10) Severe Gale – force:- 9; equivalent speed 10 meters above ground:- 47–54 miles/hour (mph) and 41–47 knots (kts):- (i) specifications for use on land:- slight structural damage occurs (chimney-pots and slates removed); and (ii) specifications for use at sea:- high waves; dense streaks of foam along the direction of the wind; crests of waves begin to topple, tumble and roll over; and spray may affect visibility. (11) Storm – force:- 10; equivalent speed 10 meters above ground:- 55–63 miles/hour (mph) and 48–55 knots (kts):- (i) specifications for use on land:- seldom experienced inland; trees uprooted; considerable structural damage occurs; and (ii) specifications for use at sea:- very high waves with long over-hanging crests; the resulting foam, in great patches, is blown in dense white streaks along the direction of the wind; on the whole the surface of the sea takes on a white appearance; the 'tumbling' of the sea becomes heavy and shock-like; visibility affected. (12) Violent Storm – force:- 11; equivalent speed 10 meters above ground:- 64–72 miles/hour (mph) and 56–63 knots (kts):- (i) specifications for use on land:- very rarely experienced; accompanied by wide-spread damage; and (ii) specifications for use at sea:- exceptionally high waves (small and medium-size ships might be for a time lost to view behind the waves); the sea is completely covered with long white patches of foam lying along the direction of the wind; everywhere the edges of the wave crests are blown into froth; and visibility affected. (13) Hurricane – force:- 12; equivalent speed 10 meters above ground:- 73–83 miles/hour (mph) and 64–71 knots (kts):- (i) specifications for use on land:- no comment; and (ii) specifications for use at sea:- the air is filled with foam and spray; sea completely white with driving spray; and visibility very seriously affected. The Beaufort scale is still used today to estimate wind strengths. The scale is used in, and may be most recognizable to some from, the Shipping Forecasts broadcast on BBC Radio 4 in the United Kingdom. This scale is also widely used in China, Hong Kong, Macau and Taiwan, however with some differences between them. Taiwan uses the Beaufort scale with the extension to 17 noted above. China also switched to this extended version without prior notice on the morning of 2006-May-15, and the extended scale was immediately put to use for Typhoon Chanchu. Hong Kong and Macau however keep using Force 12 as the maximum. In the United States, winds of Beaufort 6 or 7 result in the issuance of a small craft advisory, with force 8 or 9 winds bringing about a gale warning, 10 or 11 a storm warning (or 'tropical storm warning' for 8 to 11 if related to a tropical cyclone), and anything to 12 a hurricane warning. / стеклянное или стекловидное или стеклообразное (glassy). Смотрите также Шкала Сафира-Симпсона По Мощи Ураганов (The Saffir-Simpson Hurricane Scale). прокатка (rolling). Предложенная в 1806 Английским контр-адмиралом Фрэнсисом Бофотом (Francis Beaufort; военным гидрографом и картографом, с 1829 по 1855 руководившим Гидрографической Службой Великобритании) условная шкала для оценки силы ветра в баллах по его действию на наземные предметы и по волнению моря. Она подразделяет ветер по его воздействию на наземные предметы и по волнению моря на:- (i) штиль или безветрие (0 баллов); (ii) умеренный ветер (4 балла); (iii) сильный ветер (6 баллов); (iv) буря или шторм (10 баллов); и (v) ураган (12 баллов). Бриз (breeze), от Французского слова Brise, ветер с суточной периодичностью по берегам морей и крупных озёр. Дневной бриз дует с водоёма на нагретое побережье, ночной – с охлаждённого побережья на водоём. Бризы обычно распространяются на несколько десятков километров по обе стороны от береговой линии и на высоту нескольких сотен метров. Наиболее часты бризы наблюдаются в тропиках. Ливень – кратковременные атмосферные осадки большой интенсивности (обычно дождь). Смерчь, атмосферный вихрь, возникающий в грозовом облаке и распространяющийся вниз, часто до самой поверхности Земли, в виде тёмного облачного рукава или хобота диаметром в десятки и сотни метров. Существуют недолго, перемещаясь вместе с облаком; может причинить большие разрушения. Смерчь над сушей называют также Тромбом, а в Соединённых Штатах Америки – Торнадо. Сулой, волнение в море, при котором движение частиц подобно движению на поверхности кипящей воды. Возникает при сильных ветрах, дующих против хорошо выраженных морских течений. Сулой наблюдается в проливах и устьях рек. Суховей, ветер с высокой температурой и низкой относительной влажностью воздуха в степях и полупустынях Европейской части бывшего СССР (особенно в Прикаспийской Низменности), а также в Казахстане и на Юго-Западе Сибири. Ветры, подобные суховею (сирокко, хамсин), отмечаются и в других странах. Во время суховея усиливается испарение, что при недостатке влаги в почве часто приводит к увяданию и гибели сельскохозяйственных культур. Тайфун, от Китайских слов Тай Фын, означающие Большой Ветер, местное название тропических циклонов штормовой и ураганной силы в Юго-Восточной Азии и на Дальнем Востоке. Наиболее часты с Июля по Октябрь. Ураган, от Французского слова Ouragan, ветер силой 12 баллов по Шкале Бофорта, то есть свыше 35 метров в секунду (м/с). Фён, от Немецкого слова Föhn, сухой и тёплый (часто сильный) ветер, дующий с гор в долины. Эти свойства фёна обусловлены адиабатическим нагревом воздуха при его нисходящем движении. Шквал, от Английского слова Squall, резкое кратковременное (минуты и десятки минут) усиление ветра иногда до 30–70 м/с с изменением его направления, чаще всего при грозе. Штиль, от Голландского слова Stil, безветрие или очень слабый ветер со скоростью до 0.2 м/с. Шторм, от Голландского слова Storm, буря, длительный, очень сильный ветер, свыше 9 баллов по Шкале Бофорта и скоростью более 20 м/с, наблюдается обычно при прохождении циклона. Шторм сопровождается сильным волнением на море и разрушениями на суше. Слово Цунами имеет Японское происхождение. Оно означает морские волны, возникающие главным образом в результате сдвига вверх или вниз протяжённых участков морского дна при подводных и прибрежных землетрясениях. Цунами представляет собой волну, перемещающую большое количество воды по всей глубине, вызванную воздействием на всю

толщу воды. Скорость распространения цунами от 50 до 1 000 км/ч; высота в области возникновения от 0.1 до 5 м, у побережий от 10 до 60 м и более. Цунами производят опустошительные разрушения на суше, например, 02 Марта 1933 и 11 Марта 2011 у берегов Японии. Пыльная Буря, перенос пыли и песка сильными и продолжительными ветрами, выдувающими верхние слои почвы. Типичное явление в распаханных степях, а также в полупустынях и пустынях Египта, Китая, США и других стран. Наносят значительный ущерб сельскому хозяйству. Шкала Бофорта или Бофота, условная шкала для визуальной оценки силы (скорости) ветра в баллах по его действию на наземные предметы или по волнению на море. Была разработана Английским адмиралом Фрэнсисом Бофотом (Francis Beaufort) в 1806 и сначала применялась только им самим. В 1874 Постоянный Комитет Первого Метеорологического Конгресса принял Шкалу Бофота для использования в международной синоптической практике. В последующие годы Шкала Бофота менялась и уточнялась. В 1963 Всемирной Метеорологической Организацией была принята Шкала Бофота, приведённая ниже. Шкала Бофота широко пользуются в морской навигации. Сила ветра у земной поверхности по Шкале Бофота (на стандартной высоте 10 м над открытой ровной поверхностью). Баллы Бофорта На Суше – Словесное Определение Силы Ветра На Море – Скорость Ветра (м/сек) – Действие Ветра:- (i) 0 – Штиль – 0–0.2 – Штиль; дым поднимается вертикально; зеркально гладкое море; (ii) 1 – Тихий – 0.3–1.5 – Направление ветра заметно по относу дыма, но не по флюгеру; рябь, пены на гребнях нет; (iii) 2 – Лёгкий – 1.6–3.3 – Движение ветра ощущается лицом; шелестят листья; приводится в движение флюгер; короткие волны, гребни не опрокидываются и кажутся стекловидными; (iv) 3 – Слабый – 3.4–5.4 – Листья и тонкие ветви деревьев все время колышутся; ветер развевает верхние флаги; короткие, хорошо выраженные волны; гребни, опрокидываясь, образуют стекловидную пену, изредка образуются маленькие белые барашки; (v) 4 – Умеренный – 5.5–7.9 – Ветер поднимает пыль и бумажки, приводит в движение тонкие ветви деревьев; волны удлинённые, белые барашки видны во многих местах; (vi) 5 – Свежий – 8.0–10.7 – Качаются тонкие стволы деревьев; на воде появляются волны с гребнями; хорошо развитые в длину, но не очень крупные волны; повсюду видны белые барашки (в отдельных случаях образуются брызги); (vii) 6 – Сильный – 10.8–13.8 – Качаются толстые сучья деревьев; гудят телеграфные провода; начинают образовываться крупные волны; белые пенистые гребни занимают значительные площади (вероятны брызги); (viii) 7 – Крепкий – 13.9–17.1 – Качаются стволы деревьев; идти против ветра трудно; волны громоздятся, гребни срываются, пена ложится полосами по ветру; (ix) 8 – Очень Крепкий – 17.2–20.7 – Ветер ломает сучья деревьев; идти против ветра очень трудно; умеренно высокие длинные волны; по краям гребней начинают взлетать брызги; полосы пены ложатся рядами по направлению ветра; (x) 9 – Шторм – 20.8–24.4 – Небольшие повреждения; ветер срывает дымовые колпаки и черепицу; высокие волны; пена широкими плотными полосами ложится по ветру; гребни волн начинают опрокидываться и рассыпаться в брызги, которые ухудшают видимость; (xi) 10 – Сильный Шторм – 24.5–28.4 – Значительные разрушения строений; деревья вырываются с корнем (на суше бывает редко); очень высокие волны с длинными загибающимися вниз гребнями; образующаяся пена выдувается ветром большими хлопьями в виде густых белых полос; поверхность моря белая от пены; сильный грохот волн подобен ударам; видимость плохая; (xii) 11 – Жёстокий Шторм – 28.5–32.6 – Большие разрушения на значительном пространстве (на суше наблюдается очень редко); исключительно высокие волны; суда небольшого и среднего размера временами скрываются из вида; море всё покрыто длинными белыми хлопьями пены, располагающимися по ветру; края волн повсюду сдуваются в пену; видимость плохая; и (xiii) 12 – Ураган – 32.7 и более – Воздух наполнен пеной и брызгами; море всё покрыто полосами пены; очень плохая видимость.

BEAVER = БОБРИК – Beaver is:- (1) a hat made of beaver fur or a fabric imitation; a silk hat; (2) a heavy fabric of felted wool or of cotton napped on both sides.

BEAVER CLOTH = СУКНО БОБРИК – Beaver Cloth:- generally wool. Also cotton and napped on both sides; double faced. Twill and very heavily napped, and fulled. Originally English. Made to simulate beaver fur. Thick, gives excellent wear and very warm; resembles kersey. Has a luxurious look. Has the longest nap of all the napped fabrics and usually silky in appearance. Often light colored fibers added to nap to increase shine. Mostly used for warm coats. Cotton beaver is used for caps, shoe linings, work cloths, maritime clothes and sports clothes where work is required. Beaver Cloth:- made of high-quality wool, this heavy but soft fabric has a deep nap. Beaver cloth is frequently used in overcoats. / Сукно Бобрик; хлопчатобумажная начёсная ткань для спортивных костюмов. Бобрик, грубосуконная тяжёлая толстая (свыше 4 мм) шерстяная ткань с начёсанным стоячим ворсом на лицевой стороне. Отличается хорошими теплоизоляционными свойствами и износостойкостью. Применяется для пошива верхней одежды. Бобрик – жёсткая плотная шерстяная ткань с коротким стоячим ворсом. Используется для пошива верхней одежды. Бобрик был в моде и выпускался в большом количестве в 1950-е.

BECK = ЧАН (или (КРАСИЛЬНАЯ) БАРКА, или ПРОХОДНЫЙ АППАРАТ) – Beck is a vessel for dyeing fabric in rope form, consisting primarily of a tank and a reel to advance the fabric.

BECK DYEING = КРАШЕНИЕ В ПРОХОДНОМ АППАРАТЕ – Beck Dyeing is used for dyeing long yards of fabric. The fabric is passed in rope form through the dyebath. This rope of the fabric moves over a rail onto a reel which immerses it into the dye and then draws the fabric up and forward and brings it to the front of the machine. This process is repeated many times until the desired color intensity is obtained.

BECKET = ШТЕРТ (или СТРОПКА, или СТРОП (Блока), или ПЕТЛЯ, или СЕЗЕНЬ, или ОБУХ, или КОФЕЛЬ–ПЛАНКА) – Becket (maritime term):- a rope eye for the hook of a block. A rope grommet used in place of a rowlock. Also, a small piece of rope with an eye in each end to hold the feet of a sprit to the mast. In general any small rope or strap used as a handle.

BE COPPER = МЕДЬ ЛЭ (или ЛУЧШАЯ ЭЛЕКТРОЛИТНАЯ МЕДЬ) – Best Electrolytic Copper (BE Copper); features particular electrical conductivity, good brazing properties and excellent hydrogen resistance.

BEDDING = ПОДЕЛКА ГРЯД (или НАРЕЗКА ГРЕБНЕЙ, или БОРОЗДОВАНИЕ) – Bedding is the preparing a series of flat-topped parallel ridges usually no wider than two crop rows, separated by shallow trenches usually less than the width between crop rows. / Бороздование – нарезка борозд.

BEDDING PLANTS = КЛУМБОВЫЕ РАСТЕНИЯ – Bedding Plants, as relates to the US/Canada Greenhouse Certification Program, bedding Plants are outdoor garden Plants that are grown under protection and later sold for planting in outdoor gardens. Bedding Plants include Marigolds, Petunias, and Geraniums. / Бархатцы, или Ноготки, или Календулы (Marigolds), Петунии (Petunias), и Герани (Geraniums).

BEDFORD CLOTH = БЭДФОДСКОЕ ПОЛОТНО – Bedford Cloth is a strong woven fabric with lengthwise ribs. Normally used for upholstery and riding breeches and may be made of any fiber.

BEDFORD CORD = БЭДФОДСКИЙ КОРД (или ТКАНЬ С ПРОДОЛЬНЫМ РУБЧИКОМ) – Bedford Cord is a rib-weave fabric with raised lengthwise cords produced by using stuffing threads in the warp. Since the fabric is strong and wears well, it is used for upholstery, suits, riding habits, and work clothes. Bedford Cord is a cord cotton-like fabric with raised ridges in the lengthwise direction. Since the fabric has a high strength and a high durability, it is often used for upholstery and work clothes. Bedford Cord:- wool or

worsted but worsted is more popular. Also made in cotton, silk and rayon. Lengthwise pronounced ribs that resembles corduroy. Sometimes the ribs are emphasized by stuffing. Both Bedford, England and New Bedford, Mass. claim the name. Very firm construction. Takes much hard wear. Bedford Cord is a durable cloth with lengthwise ribs made of cotton, wool, silk, rayon, or combination fibers. Mainly used for outer garments or Sportswear.

BED LINEN = БЕЛЬЕВАЯ ТКАНЬ (или ПРОСТЫННОЕ ПОЛОТНО, или ПОСТЕЛЬНОЕ БЕЛЬЁ) – Bed Linen is a term for any fabric sheeting used on a bed.

BED PLANTING = ГРЕБНЕВАЯ ПОСАДКА – Bed Planting is a method of planting in which seed is planted on beds. Often two or more seed rows are planted on each bed.

BEDS = ГРЯДЫ – Beds:- a type of mound on which furrow irrigated Cotton is grown, usually carrying 2 rows of Cotton. / Тип окучиваемой насыпи, на которой произрастает Хлопчатник, орошаемый посредством подачи воды в поливную борозду между двух рядов Хлопчатника. Под Грядой понимается общее название положительно вытянутых форм рельефа различных размеров, высоты и происхождения.

BED TICKING = ПОСТЕЛЬНЫЙ ТИК – Bed Ticking:- striped cotton goods made in twill or satin weaves. Ticking is a rugged, compact material used for mattresses and pillows. A typical layout for the fabric might be 90 x 60 in texture with warp yarns of 18's and filling yarns of 20's; width are 28 1/2, 56, 72, and 84 inches. See also Ticking. / уточные пряжи.

BEEF ALLIANCE = СИЛЬНЫЙ АЛЬЯНС – Beef Alliance is a marketing effort to secure higher market prices. An alliance usually consists of a group of producers, often using vertical Improving product quality and consistency are often goals of beef alliances.

BEEF BULLS = БЫКИ МЯСНОЙ ПОРОДЫ – Beef Bulls are the intact male beef Cattle intended for breeding (beef breeds) or slaughter (either beef or dairy breeds).

BEEF CATTLE = КРУПНЫЙ РОГАТЫЙ СКОТ МЯСНОЙ ПОРОДЫ (или КРУПНОРОГАТЫЙ СКОТ МЯСНОЙ ПОРОДЫ) – Beef Cattle are the cattle that are intended for meat production or to produce offspring intended for meat production. Excludes veal calves. See also Cattle.

BEEF CATTLE FED IN CONFINEMENT FOR SLAUGHTER = КРУПНЫЙ РОГАТЫЙ СКОТ МЯСНОЙ ПОРОДЫ, ВСКОРМЛЕННЫЙ В СТОЙЛЕ ДЛЯ УБОЯ – Beef Cattle Fed in Confinement for Slaughter (Steers and/or Heifers):- Weaned growing (including dairy breeds) confined in group pens and fed a high-energy diet ad libitum until slaughter. Sex differentiation (heifers, steers, and/or bulls intended for slaughter) should be indicated on product labeling. Also knows as Feedlot Cattle.

BEEF COWS = КОРОВЫ МЯСНОЙ ПОРОДЫ – Beef Cows are the beef breed female Cattle that have calved.

BEEF HEIFERS = ТЁЛКИ МЯСНОЙ ПОРОДЫ (или НЕТЕЛИ МЯСНОЙ ПОРОДЫ) – Beef Heifers are the female beef Cattle intended for breeding (beef breeds) or slaughter (either beef or dairy breeds) that have not yet calved. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

BEER'S LAW = ЗАКОН БЕА – Beer's Law:- the absorbence of a homogeneous sample containing an absorbing substance is directly proportional to the concentration of the absorbing substance, often used in mixture prediction of transparent materials. In optics, the Beer-Lambert Law, also known as Beer's Law or the Lambert-Beer Law or the Beer-Lambert-Bouguer Law (named after August Beer (a German physicist, chemist, and mathematician; 31 July 1825 – 18 November 1863), Johann Heinrich Lambert (a Swiss mathematician, physicist, philosopher and astronomer; 26 August 1728 – 25 September 1777), and Pierre Bouguer (a French mathematician, geophysicist, geodesist, and astronomer; 16 February 1698 – 15 August 1758)) relates the absorption of light to the properties of the material through which the light is traveling. / Закон Буге-Лямбэрта-Беа, определяет постепенное ослабление параллельного монохроматического (одноцветного) пучка света при распространении его в поглощающем веществе. Если мощность пучка, вошедшего в слой вещества толщиной l, равна I_o, то, согласно Закону Буге-Лямбэрта-Беа, мощность пучка при выходе из слоя:- $I(l) = I_o e^{-ccl}$, где c – удельный показатель поглощения света, рассчитанный на единицу концентрации с вещества, определяющего поглощение; c зависит от природы и состояния вещества и от длины волны проходящего излучения. Закон Буге-Лямбэрта-Беа открыт Французским учёным Пьером Буге (Pierre Bouguer; 1698–1758) в 1729, подробно рассмотрен Швейцарским учёным Йоханом Хайнрихём Лямбэртом (Johann Heinrich Lambert; 1728–1777) в 1760 и в отношении концентрации с проверен на опыте Немецким учёным Аугустом Беа (August Beer; 1825–1863; сочетание двух букв Немецкого алфавита EE в фамилии учёного произносится как удлинённое произношение мягкого звука Э) в 1852. Утверждение, что c – постоянная величина, имеет приближённый характер. При больших изменениях концентрации в газах и растворах c обычно начинает изменяться вследствие физико-химического взаимодействий молекул. В начале XX века Советский учёный физик Сергей Иванович Вавилов (12 (24) Марта 1891 – 25 Января 1951) экспериментально проверил независимость величины c от мощности светового пучка в широких пределах её изменения – от очень больших значений, соответствующих собранным при помощи линзы прямым солнечным лучам, до ничтожных значений, еле различимых привыкшим к темноте глазом. Оказалось, что во всех этих условиях c остаётся практически постоянным. Однако, как указал Вавилов, квантовая природа света и конечная (хотя и очень малая) длительность возбуждённого состояния молекул должны привести к тому, что при огромных мощностях светового пучка значительная часть всех молекул окажется в возбуждённом состоянии и поглощение света уменьшится. Предсказание Вавилова подтвердилось на опыте для большого числа веществ при плотностях мощности излучения, создаваемых оптическими квантовыми генераторами (лазерами).

BEET ARMYWORM = СВЕКОЛЬНЫЙ РАТНЫЙ ЧЕРВЬ (или СВЕКОЛЬНЫЙ ПОХОДНЫЙ ЧЕРВЬ, или СОВКА МАЛАЯ, или СВЕКОЛЬНЫЙ АРМЕЙСКИЙ ЧЕРВЬ) – Beet Armyworm (Spodoptera exigua) is an armyworm species whose damage to cotton is characterized by leaf skeletonizing by early instars feeding in groups, often associated with webbing and frass. Later instar larvae may feed on squares and bolls and are difficult to control with insecticides; eggs are deposited in masses; adults are migratory and do not overwinter in the Carolinas. The armyworm gets its name from its habit of 'marching' in large numbers from grasslands into crops. Beet Armyworm:- pest type:- insect; crops affected:- Cotton, Soybeans, Peanuts; scientific name:- Spodoptera Exigua; Pest Order:- Lepidoptera. Description:- Beet Armyworm larvae are up to 30 mm long; green or black with a dark head, five pairs of prolegs, and often three light colored stripes running lengthwise. On the second segment behind the head, there is a small, black spot on each side of the body. The pupal stage is about 15 to 20 mm long and light brown in color. Adult Beet Armyworm moths have wingspans of 25 to 32 mm, with forewings that are mottled gray or brown with a pale spot near the center of each wing. Eggs are white to pink, ribbed, and roughly spherical, but slightly peaked on top. Scales and hairs from the moths give the egg clusters a gray, fuzzy appearance. The yellow-striped Armyworm larvae, up to 45 mm long, are smooth-skinned, gray to jet black with a yellowish-orange stripe along each side and a pair of black triangular spots on top of most body segments. Adult moths of the yellow-striped Armyworm have wingspans of about 35 mm, with dark forewings with white and brown markings; and the hindwings are white. Egg masses are covered with scales

from the moth's body. Damage:- Armyworm outbreaks can be sudden and very severe. Damage is caused by the larval/caterpillar stage which feed on a wide variety of crops. Early instar Beet Armyworms most frequently damage the young terminal growth of Soybean seedlings. Skeletonization and profuse silk webbing gives the plants a shiny appearance. Although Soybeans can compensate for much foliage loss before bloom, severe Beet Armyworm damage will retard growth. When abundant, the caterpillars can completely defoliate a field. The yellow-striped Armyworm larvae sporadically feed on young Soybean tissue and occasionally defoliate young plants. Life Cycle:- in the southern tier of US states, the Beet Armyworm moths may be found year round. In slightly colder areas, this Insect can survive the winter as pupae in the soil, but it is not believed to overwinter as far north as NC or KY. Most states are infested by migrating moths. In the spring, soon after mating, fertilized females begin laying eggs in clusters of about 80. Approximately 600 eggs per female are deposited over a 3 to 7 day period. Moths generally die 4 to 10 days after emerging from the pupae. Eggs hatch in 2 to 3 days, and the newly emerged Beet Armyworm larvae spin loose webs around themselves, feed gregariously on the remains of the egg mass, and then attack the plant foliage. After feeding for 1 to 3 weeks, the fifth instar larvae pupate. About 1 week later, moths emerge. The entire life cycle requires only 4 to 5 weeks, so several generations can occur per year. The yellow-striped Armyworm has a similar life cycle, except some of the stages require a few more days, resulting in only 3 or 4 generations per year. Control Measures:- it is important to monitor fields for Armyworm damage. These Armyworms have few parasites, diseases, or predators to lower populations, and they are difficult to control with insecticides. Early detection is important in maintaining populations below serious levels. Younger, smaller larvae are controlled more easily. Selection of the proper insecticide is also important, when chemical control is deemed necessary. Generally, when defoliation reaches 35% before bloom or 15% after bloom, control measures are needed. Consult you local advisers concerning the best treatments in your area.

BEETLE = КОЛОТИЛЬНАЯ МАШИНА (или БИТЕЛЬНАЯ МАШИНА, или КОЛОТУШКА) – Beetle is a large wooden mallet used to help soften cellulose fibers. Often used with linen and ramie.

BEETLING = ТРАМБОВАНИЕ (или КОЛОЧЕНИЕ, или БИТЬЁ) – Beetling is a process in which round-thread linen or cotton fabric is pounded to give a flat effect. Beetled linen damask has an increased luster and a leather-like texture. Beetling is also used to give a thready or linen-like appearance to cotton. Beetling is the process of striking woven linen or ramie fabric with rollers to flatten the fibers. This leaves you with a more lustrous fabric. Beetling is a process applied to linen fabrics and to cotton fabrics made to resemble linen to produce a hard, flat surface with high lustre and also to make texture less porous. In this process, the fabric, dampened and wound around an iron cylinder, is passed through a machine in which it is pounded with heavy wooden mallets. Beetling is a finish primarily applied to linen or cotton whereby the cloth is beaten with large wooden blocks in order to produce a hard, flat surface with a sheen. It gives a linen-like appearance to cotton. / Операция давления льняных и полульняных тканей на каландрах, бительных или колотильных машинах или на катках для получения блеска, характерного для льняных тканей.

BEEZE = XX – Beeze:- piping or cording formed at lower and inside pocket welts. / обтачка или окантовка, формируемая снизу и внутри листочек кармана.

BEF = BELGIAN FRANC

BEFORE BREAKING BULK = ДО РАЗБИВКИ ГРУЗА – Before Breaking Bulk (BBB) refers to freight payments that must be received before discharge of a vessel commences. / Термин До Разбивки Груза (ДРГ) относится к платежам за фрахт, которые должны быть получены до начала разгрузки судна.

BEGINNING INVENTORY = НАЧАЛЬНЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или НАЧАЛЬНЫЕ СКЛАДСКИЕ ЗАПАСЫ, или НАЧАЛЬНАЯ ИНВЕНТАРИЗАЦИЯ) – Beginning Inventory is the inventory level and count at the beginning of a period.

BEGINNING STOCKS = ЗАПАСЫ НА НАЧАЛО СЕЗОНА – In the Cotton industry, the Beginning Stocks of Cotton are frequently reported for the marketing year or crop year beginning August 01. See also Ending Stocks.

BEIGE = БЕЖ (или БЕЖЕВЫЙ) – Beige:- a variable color averaging light grayish yellowish brown. Cloth made of natural undyed wool. / Беж или Бежевый:- различаемый цвет, представляющий собой усреднённый светлый сероватый желтоватый коричневый. Полотно, сделанное из натуральной неокрашеной шерсти.

BEIGE BOOK = БЕЖЕВАЯ КНИГА – Beige Book:- eight times a year, prior to FOMC meetings, each Federal Reserve Bank gathers anecdotal information on current economic conditions in its District through reports from Bank and Branch directors and interviews with key businesses, economists, market experts and other sources. The Beige Book summarizes this information by District and sector. Summary of Commentary on Current Economic Conditions by Federal Reserve District is commonly known as the Beige Book, this report is published eight times per year. Each Federal Reserve Bank gathers anecdotal information on current economic conditions in its District through reports from Bank and Branch directors and interviews with key business contacts, economists, market experts, and other sources. The Beige Book summarizes this information by District and sector. An overall summary of the twelve district reports is prepared by a designated Federal Reserve Bank on a rotating basis.

BEKISHE = XX (или БЭКИЦЭ) – Bekishe or Beketshe is a long coat. A Bekishe or Beketshe (Yiddish) is a long coat, usually made of black silk or polyester worn by Hasidic Jews, and by some non-Hasidic Haredi Jews. The bekishe is worn mainly on Shabbos and Jewish holidays, or at weddings and other such events. During the week, it is customary to wear a rekel, made of wool or polyester, looking like a regular double-breasted suit, only longer. Hassidic rabbis who wear a bekishe during the week will wear a more ornate version for Shabbos, often lined with velvet or some color other than or in addition to black. There are two main types of Bekishe. The Glatt (plain, lit. smooth) Bekishe is solid colored, and is usually worn for Friday night and Saturday morning prayers. For Shabbos meals, the patterned Bekishe, also known as a Tish Bekishe (Yiddish), is worn. The Tish Bekishe is also worn by some during the Shabbos afternoon prayer service and the night after Shabbos. Both can be made of silk, although nowadays it is usually polyester. Some non-Hassidic Orthodox Jews wear a Tish Bekishe at home during the Shabbos meals. Many Hassidic Rebbes, mainly of Hungarian lineage, wear Tish Bekishes with various colors, usually either, blue, silver, often with black. The Bekishe is black. The gold and blue striped garments Yerushalmi Haredim such as Toldos Aharon, Toldos Avrohom Yitzchok, Dushinsky, Neturei Karta, Shomer Emunim, Pinsk-Karlin, Karlin-Stolin, and many but not all in Breslov, as well as other non-affiliated Yerushalmi Haredim such as the Perushim are called Kaftans. Those members of these movements centred in Jerusalem or one of the Jerusalem-affiliated suburbs such as Beitar Illit, Ramat Beit Shemesh or Modi'in Illit wear these gold coats. Those who live further away, for example in Bnei Brak, Ashdod or outside of E. Israel, usually wear black bekishes like most other Hasidim, as do some of those who live in Jerusalem. The gold Kaftan is generally worn after marriage; before marriage, either a black bekishe or weekday-style clothing is worn on days when a bekishe is usually worn. Some of those who wear the gold bekishe switch to black on Shabbos afternoon before mincha; this is seen in for example Dushinsky and with many of the Prushim. Married Chabad hasidim wear a long black Kapoteh (frock coat) instead of a bekishe. The Kapoteh or 'Frack', besides its unique waist seam construction, has four buttons in the front (as opposed to six (or eight in Nadvorna – Kretschnef) on the front of a bekishe), as well as slit in the back, which is lacking on the bekishe. The Kapoteh can be made of either wool or silk. Many Hassidic Rebbes wear Samet (velvet) or Strohkes (velvet piping), symbolizing tefillin, on the bekeshe.

BELAYING PIN = КОФЕЛЬ–НАГЕЛЬ – Belaying Pin (maritime term):- a wooden or iron pin fitting into a rail upon which to secure ropes.

BELFOX = BELGIAN FUTURES AND OPTIONS EXCHANGE

BELGIAN LACE = БЕЛЬГИЙСКОЕ КРУЖЕВО – Belgian Lace or Belgium Lace is a term used for any lace made in Belgium. Originally the term described a bobbin lace worked on a machine-made net. Connected to:- Bobbin Lace.

BELGIAN LINEN = БЕЛЬГИЙСКАЯ ЛЬНЯНАЯ ПРОДУКЦИЯ – Belgian Linen is any linen produced in Belgium.

BELL–BOTTOMS = КЛЁШИ (или БРЮКИ КЛЁШ) – Bell-Bottoms:- pants with wide flaring bottoms.

BELLOWS SEAL = СИЛЬФОННОЕ УПЛОТНЕНИЕ – Bellows Seal is a type of mechanical seal which utilizes bellows for providing secondary sealing and spring-type loading. See also Seal. / Под Сильфоном, от Английского фирменного названия Sylphon, понимается тонкостенная металлическая трубка или камера с гофрированной (волнообразной) боковой поверхностью. Сильфоны изготавливают из латуни (обычно полутомпака), фосфористой и бериллиевой бронзы и нержавеющей стали. Наиболее широко сильфоны применяют в пневмо- и гидроавтоматике в качестве чувствительных элементов, реагирующих (расширением или сжатием, подобно пружине) на изменение давления газа или жидкости, действующего на дно сильфона (например, в датчиках температуры, давления), а также в качестве гибких соединений трубопроводов, компенсаторов температурных удлинений, упругих разделителей сред и тому подобного. Стенки сильфона для работы при больших разностях давлений и в агрессивных средах изготовляют 2-, 3- и 4-слойными. Уплотнение, приспособление для предотвращения или уменьшения утечки жидкости или газа через зазоры между деталями. Необходимость уплотнения определяется тем, что в местах соединения деталей даже после самой тщательной механической обработки остаются неровности, образующие зазоры. Различают уплотнения для неподвижного контакта деталей (обычно прокладки или кольца из эластичного материала) и уплотнения для подвижного контакта деталей, которое осуществляется заполнением зазоров набивкой (смотрите Сальник), смазкой, замазкой или устройством лабиринтных уплотнений.

BELLY = ‘ПУЗО’ СУДНА – Belly is a term applied to the underfloor area of an aircraft which refers to its underfloor cargo area. Each aircraft usually has fore and aft compartments which are heated and pressured. / Термин, применяемый для обозначения области самолета, находящейся под полом и в которой осуществляется перевозка грузов.

BELLYBAND = ПОДПРУГА (или БАНДАЖ) – Bellyband is a band around or across the belly, as a girth or a band.

BELLY WOOL = БРЮШИННАЯ ШЕРСТЬ (или ШЕРСТЬ С БРЮШИНЫ) – Belly Wool is a wool that grows on the belly of the sheep and occasionally extends up the side in irregular patches. It is usually an uneven, different grade from the body of the fleece. It is shorter and less desirable because of its poor lock formation, and it usually lacks the character of the body of the fleece. Belly Wool:- the short, and often weaker, fiber from the sheep’s belly. It should be skirted off. / Брюшная Шерсть – это шерсть, получаемая с брюшины Овцы. Она часто бывает неровной, как правило, короче и слабее шерсти с других частей тела. Брюшная шерсть должна расти только на брюшине. Если брюшная шерсть обнаруживается на других частях тела, это уже серьёзный недостаток. Проверяя брюшную шерсть, начинайте с верхнего участка и идите вниз, проверяя шерсть по направлению к брюшине до тех пор, пока не увидите брюшную шерсть и сравните эту точку с тем, где растёт брюшная шерсть у других Овец.

BELOW = В ТРЮМЕ – Below:- beneath the deck. / Под палубой.

BELOW PAR = НИЖЕ НОМИНАЛА – Below Par:- a share that has a market value below its nominal value at which the share was issued. The opposite of Above Par. / Акция, которая имеет рыночную стоимость ниже своей номинальной стоимости, с которой эта акция была выпущена. В противоположность Выше Номинала (Above Par).

BELOW THE LINE = НИЖЕ ЛИМИТА (или НИЖЕ ЧЕРТЫ) – Below The Line:- the financial transactions account which shows the financing of Net Lending(+) / Net Borrowing (–) (formerly Financial Surplus or Deficit). See also Above The Line.

BELOW THE MARKET = НИЖЕ РЫНКА – Below The Market:- a limit order to buy or sell a security for a specific price that is lower than the current market price. If the market does not reach these prices, the order will go unfilled.

BELT = ПОЯС (или РЕМЕНЬ, или КУШАК, или ПОРТУПЕЯ) – Belt is a strip of flexible material worn especially around the waist; a similar article worn as a corset or for protection or safety or as a symbol of distinction.

BELTING = БЭЛТИНЬ (или БЕЛЬТИНГ) – Belting is a heavy cotton, rayon, silk, or mixed fabric with large fillingwise ribs. It may be knit. Any heavyweight, fairly stiff fabric used to support the top of a skirt, a pair of pants, or line a belt to give additional support. Beltings come in various widths. / Бельтинг – (от Английского слова Belting, означающее Природный Ремень) – тяжёлая, очень плотная и прочная техническая ткань, изготавливаемая в виде приводных ремней. Применяется для транспортёрных (или конвейровых) лент и прорезиненных многослойных приводных ремней. Вырабатывается полотняным переплетением из крученой хлопчатобумажной пряжи, а более прочные сорта бельтинга – с применением химических волокон.

BELT LINE = ВЕТКА (или ПУТЬ) – Belt Line is a switching railroad operating within a commercial area. / Под железнодорожным Путём понимается комплекс сооружений и устройств, образующих дорогу с направляющей рельсовой колеёй. Состоит из верхнего строения (рельсов, шпал, стрелочных переводов, мостовых брусьев, балластного слоя), земляного полотна (насыпей, выемок) с дренажными устройствами, а также искусственных сооружений (мостов, путепроводов, тоннелей и так далее). Оборудуется сигнальными знаками (указательными и пикетными столбиками и тому подобными).

BEMBERG® = БЭМБЭРГ® (или БЭМБЁГ®) – Bemberg®:- the fabric was invented in 1918, and named after Johann Peter Bemberg (1758–1838), the German developer. In October 1926 American Bemberg began the manufacture of ‘artificial silk’, or rayon, at its new plant in Elizabethton. The parent company, J.P. Bemberg AG, was the German affiliate of Vereinigte Glanzstoff Fabriken (VGF), one of the international giants in the production of rayon. Two years later, in August 1928, VGF opened another rayon plant in the small East Tennessee town. This one, then called American Glanzstoff but known now as North American Rayon Corporation, made rayon by the viscose process, whereas Bemberg utilized the cuprammonium process. By the end of 1928 employment at the two plants exceeded 3 000 workers. Visions of economic growth encouraged government officials in Elizabethton to make concessions to VGF concerning property taxes and charges for the huge volumes of water needed to make rayon. They also promised the German industrialists that they would have an abundant supply of docile and cheap – that is, nonunion – labor. The work force soon proved anything but docile. In 1927 and 1928 there were a number of small strikes at Bemberg, which in 1927 resulted in the formation of Local 1630 of the United Textile Workers Union of America (UTW). On March 12, 1929, unorganized women workers of the American Glanzstoff plant led a walkout, and Bemberg workers struck in sympathy with their Glanzstoff compatriots. A second more violent and divisive strike began on April 15 and lasted until May 25, 1929. Labor problems dominated the history of the companies through 1930. Throughout the Great Depression the plants remained operational and, overall, continued to profit. The number of workers employed bottomed out at 2 491 in

1932 and peaked at 4 500 in 1939. During these years the international rayon market experienced highs and lows, as did the United States market. During the 1930s, though, imports of rayon declined dramatically, allowing domestic producers to increase their market shares. Both American Bemberg and American Glanzstoff – as of May 09, 1934, known as North American Rayon Corporation (NARC) – benefited from these market forces. During World War II the plants' production of rayon yarn increased, and the plants altered production to meet wartime demands. Bemberg, for instance, made parachute cloth. Employment and payrolls increased, but profits went overseas to AKU, Algemeene Kuntzijde Unie NV, the company created in 1929 by the union of the German VGF and the Dutch NV Nederlandsche Fabriek. In early 1942 the Office of Alien Property (OAP) assumed management of the factories and initiated an investigation into AKU's ownership of the Elizabethton plants and of American Enka. However, seeking to placate the Dutch, OAP did not actually seize the assets of the plants, which in part were enemy-owned. In 1947 AKU and OAP came to an agreement which provided that the Dutch corporation waive all claims to shares of outstanding stock that it or its affiliates owned in Bemberg or NARC, together with working capital, assets, and all of AKU's interest in patents, trademarks, and other industrial property of the two companies. Bemberg and North American remained under government control until their December 1948 purchase by Beaunit Mills, a New York corporation that recently had entered into the production of rayon. Beginning in 1949, the plants entered into a long period of struggle precipitated both by the failure of low-wage industries in the South to experience significant growth and by changes in the synthetic fibers market. To ensure continued profitability, Beaunit switched part of the Bemberg plant to polyester and part of the North American facility to nylon. Moreover, in 1961 Beaunit entered into a joint venture with El Paso Natural Gas to manufacture 'Nylon 66' at a new plant at Etowah. The plant became operational in 1966 but incurred significant losses for Beaunit. Increased domestic polyester production severely depressed prices by the late 1960s and led to increased foreign competition in nylon. A 1967 strike by leading tire companies compounded Beaunit's woes, and that year the company's shareholders approved a merger which resulted in the company's becoming a wholly owned subsidiary of El Paso Natural Gas. By 1967 employment at the Elizabethton plants had declined to 3 550 – down substantially from the 6 000 of 1949. The UTW local, Watauga Rayon Workers Local 2 207, continued to represent the hourly workers; their major concern was mismanagement by El Paso. By the early 1970s Bemberg was in serious financial trouble. The cuprammonium process it used produced toxic wastes that the company dumped into the Watauga River. Bemberg found it could not comply with Environmental Protection Agency orders to clean up its wastes and still turn a profit. As a consequence, in December 1970 El Paso announced that Beaunit was going to suspend all operations at the Bemberg factory. But the following March Beaunit sold the Bemberg plant, together with 140 acres of land around the plant, for USD350 000 to Abner Industries. Abner acquired an Elizabethton address and officially changed the company name to Bemberg Industries. The new president, A.A. Rosen, hired as executive vice-president Buford Goldstein, a Johnson City native who had held a similar position with Beaunit, and Rosen and Goldstein became the major investors in Bemberg. The new Bemberg continued to experience financial difficulties, though, and again was sold in 1973 to a group of investors called RG Associates, which also changed its name to Bemberg Industries. Still, the company failed to turn a profit and had to face escalating debts. On February 16, 1974, Bemberg filed a petition for bankruptcy. With Bemberg's demise, only North American Rayon remained operational. But in November 1976, El Paso announced that in 1977 Beaunit would be sold to a holding company named BEM. BEM purchased Beaunit's assets and in turn sold them to Beaunit II, an unaffiliated corporation set up for the purpose of securing those assets. The Beaunit II investment group that purchased the assets was known as TA Associates. TA continued to operate the plant under the name North American Rayon Corporation. In 1978 TA sold the company to Elizabethton businessman James Walker, who earlier had purchased the abandoned Bemberg building. North American Rayon survived and by the early 1980s was manufacturing rayon for apparel, home furnishings, and industrial products. In order to comply with environmental regulations, however, the company was faced with the prospect of building a water treatment facility. With an unstable market for rayon, NARC officials expressed doubt that profits would be large enough to finance the treatment plant. By the fall of 1985 owner Walker began negotiations with management and union officials to have the employees become company stockholders. Local 2207 voted down the proposed plan, but was instructed by the UTW international office to accept the restructuring designed to turn the workers into 'employee-owners'. The plan went into effect in December 1985, and, from that point through 1988, wages increased and employee-owners received dividends. In August 1988 North American Rayon acquired MKS Polyester, which it renamed North American Polyester. The company also contracted with the National Aeronautics and Space Administration (NASA) to make carbonized rayon for the lining of the nozzles of the solid rocket motors that boost the space shuttle into orbit. But the 1990s again ushered in hard times for North American Rayon. Increased competition from imports has hurt the company. Labor relations, seldom harmonious in the past, have continued to be poor as employees feel poorly informed about operations and plant management. In June 1996 NAR Polyester shut down, leaving 70 workers unemployed. Employment at the rayon plant was only at 700 in late 1996, and it continued to decrease until the end of the century. On February 25, 2000, an enormous fire broke out in the North American Rayon plant. It took firefighters a week to extinguish the flames. The plant immediately closed for business. A year later, in mid-February 2001, the North American Rayon plant was demolished, ending a significant era in the industrial history of Appalachian Tennessee. Bemberg is a trade name for a lining fabric made from a viscose (rayon) fiber which imitates silk very well. The lining is comparitively cheap for such a luxurious feel and is used generally in 'better end' suits and coats. Bemberg brand cupro is the gentle fiber – a pure cellulosic fiber, reborn from the linter of the cotton plant. Gentle on the earth, through its origin in a natural renewable resource. Gentle on people, through its smooth, free, elegant comfort, all year round. Gentle on the environment, through its 100% pure cellulose composition that inherently returns to its natural origins by biodegradation or clean-burning incineration. With its smooth, gentle interface on skin and fabrics, and its fresh, free comfort and elegance, Bemberg has long been the preferred fiber for fine garment linings. Today, with the growing awareness of its gentle elegance, Bemberg is becoming the fiber of choice for innerwear and outerwear, for bedding and interior furnishings, and for many other fields, around the world. Gentle, free, creative elegance and comfort come naturally, in fabrics and apparel made with Bemberg fibers. The trade name for a type of rayon yarn. Fabrics made from this yarn are frequently used for presentation flags, and for lining high quality suits and coats. Bemberg silk is a less costly, and versatile, substitute for natural silk. Bemberg's raw material is unused cotton linter. This is the short, downy fiber that enfolds the cotton seed. All impurities are removed from this tiny material, transforming it into a thread. In other words, Bemberg is made by adding human technical abilities to the natural plant material of cotton. Born from cotton, Bemberg is both gentle and functional. Each Bemberg fiber is extremely fine and has round cross section, largely free from the unevenness of natural fibers, and uniform in thickness. In addition, unlike cotton or rayon, the Bemberg fiber's surface is multiporous and free from a surface skin layer, giving it excellent color development and a smooth, silky luster. Bemberg is a breathable fiber with micro pores that quickly absorb moisture and release it to the outside. Thus Bemberg effectively reduces clinging and interior dampness. One prominent feature of Bemberg is its ability to moderate the temperature inside the garment. It feels cool in summer, warm in winter, and because it even reduces static buildup, Bemberg is comfortable to wear year round. Cool In Summer:- the amorphous region of Bemberg fibers retains moisture through which heat passes and escapes to the outside. The amount of moisture held in humid weather is twice that in dry weather. Warm In Winter:- Bemberg quickly absorbs a large amount of moisture from our bodies and generates heat. Unique technology enables the fabric to retain this heat, and thus create warmth within the garment. Releases Static:- the moisture retained in Bemberg fibers acts as a pathway for releasing static into the air. This effectively reduces problems such as small shocks and clinging. The Bemberg story begins with its original conception and creation during the mid to late XIX century, and its first commercial production in Germany by the J.P. Bemberg company in 1897. The

production process technology developed by J.P. Bemberg was introduced into Japan in 1928 and brought to commercial production at the Asahi Kasei plant in Nobeoka City, Miyazaki Prefecture in 1931, thus marking the origins and early growth of Asahi Kasei itself and the ensuing growth and development of Asahi Kasei throughout the following decades. These decades have been marked by constant refinement and continuing development at Asahi Kasei, in the production technology and the quality, functions, applications, and ecoefficiency of Bemberg fibers, which are also known generically as Cupro. Today Asahi Kasei is one of only two companies worldwide that produce cupro fibers. With its current production capacity of some 20 000 tons of Bemberg per year in filament and staple fiber, Asahi Kasei is the predominant global supplier, and the only company producing Bemberg in Japan. Bemberg from Asahi Kasei is recognized the world over as a product of many decades of unmatched refinement, quality, and performance. / Немецкий разработчик Xxxxx (Johann Peter Bemberg; 1758–1838). В Октябре 1926 Американская Xxxxx (Bemberg) начала изготовление ‘искусственного шёлка’ (‘artificial silk’), или xxxxx (rayon), на своём новом заводе в Xxxxx (Elizabethton). Материнская компания Xxxxx А.Ге. (J.P. Bemberg AG) была Немецким зависимым лицом у Xxxxx (Vereinigte Glanzstoff Fabriken (VGF)), одного из международных гигантов по производству rayon. (American Glanzstoff), но сейчас известная как Северо-Американская Xxxxx Корпорация (North American Rayon Corporation). Дьжеймз (James). торговое название медноаммиачного шёлка. Эсошиэтс (Associates). Найлан (Nylon).

BENARES = БЭНАРЭС (или БЭНАРЭССКАЯ) – Benares is a lightweight fabric from India. Named after the town of Benares (or Varanasi) it is usually woven with metallic threads. / города Бэнарэс (или Варанэси (Varanasi)).

BENCHMARK = ОРИЕНТИР (или ЭТАЛОН) – (1) In asset management, a Benchmark is a type of yardstick used to measure how the value of a portfolio has developed. Bond or share indices are often used as benchmarks. In active portfolio management, portfolio managers try to outperform or ‘beat’ the relevant benchmark. Point on an index that has a significance and is used as a reference point. Refers to a commonly used reference, usually for pricing, quality, or other performance comparison. Examples of common benchmark prices are New York Harbour Spot (wholesale gasoline), and WTI (crude oil). Also known as Leading Indicator. Reference parameter, e.g., a share index or a representative bond price or yield, used to help gauge the performance of a portfolio. The Benchmarks are prices, estimates, rates, indices or values that are:- (i) made available to users, whether free of charge or for payment; (ii) calculated periodically, entirely or partially by the application of a formula or another method of calculation to, or an assessment of, the value of one or more underlying Interests; and (iii) used for reference for purposes that include one or more of the following:- (a) determining the interest payable, or other sums due, under loan agreements or under other financial contracts or instruments; (b) determining the price at which a financial instrument may be bought or sold or traded or redeemed, or the value of a financial instrument; and/or (c) measuring the performance of a financial instrument. The yardstick that a fund manager compares the performance of their fund to, such as the All Ordinaries index which may be used as a benchmark for Australian Shares. / , например, . В переносном смысле слова под Эталоном, от Французского слова Étalon от Французского слова Stalo, означающее Образец, понимается средство измерений (или их комплекс), обеспечивающее воспроизведение и хранение размера единицы физической величины, предназначенное для поверки или метрологической аттестации других средств измерений и официально утверждённое в качестве эталона. Различают:- государственный эталон, международный эталон, первичный эталон, вторичный эталон, рабочий эталон, специальный эталон, эталон сравнения и так далее. Некое мерило или образец. Эталон – образцовая мера, образец для сравнения.

(2) Benchmark is a point of reference for measurements as in topographical surveys and land leveling.

BENCHMARKING = ОРИЕНТИРОВКА (или СВЕРКА С ЭТАЛОНОМ) – Benchmarking is the process of comparing a firm’s performance against the practices of other leading companies, in or outside of an industry, for the purpose of improving performance. Companies also benchmark internally by tracking and comparing past performance. A management tool for comparing performance against an organization that is widely regarded as outstanding in one or more areas, in order to improve performance.

BENDING LENGTH = ДЛИНА ИЗГИБА – Bending Length is a measure of fabric stiffness based on how the fabric bends in one plane under the force of gravity.

BENDING MODULUS = ИЗГИБАЮЩИЙ МОДУЛЬ (или МОДУЛЬ ИЗГИБА) – Bending Modulus:- maximum stress per unit area that a specimen can withstand without breaking when bent. For fibers, the stress per unit of linear fiber weight required to produce a specified deflection of a fiber.

BENDING MODULUS STRESS = НАПРЯЖЕНИЕ ИЗГИБАЮЩЕГО МОДУЛЯ – Bending Modulus Stress:- a specimen can withstand when bent a unit deflection. For fibers, the stress per unit of linear fiber weight required to produce a specified deflection of a fiber.

BENDING MOMENT = ИЗГИБАЮЩИЙ МОМЕНТ (или МОМЕНТ ИЗГИБА) – Bending Moment is the measure of the bending effect on a structural member due to forces acting perpendicular to the length of that member. The bending moment at a given point along a member equals the sum of all perpendicular forces, to either side of that point, times their corresponding distances from the point. It is the result of vertical forces acting on a ship as a result of local differences between weight and buoyancy. The total of these forces should be zero, otherwise change of draft will occur. At sea the bending moment will change as a result of wave impact which than periodically changes the buoyancy distribution.

BENDING RIGIDITY = ЖЁСТКОСТЬ К ИЗГИБАНИЮ – Bending Rigidity of yarns:- the bending behavior of yarn is affected by mechanical properties, arrangement and interaction between its constituent fibers and yarn geometry. In this study the yarn bending rigidity was obtained from the tensile modulus of its constituent fibers and yarn geometry and structural parameters and it was shown that the dimensionless yarn bending rigidity decreased as the ratio of tensile modulus to the shear modulus of the constituent fibers increased. Furthermore, the yarn bending rigidity decreased as the surface helix angle of the yarn increased. See also Flexural Rigidity. In engineering mechanics, Bending (also known as Flexure) characterizes the behavior of a slender structural element subjected to an external load applied perpendicularly to a longitudinal axis of the element. Bending Rigidity:- this measure of a material’s resistance to bending is calculated by multiplying the material’s weight per unit area by the cube of it’s bending length. / Жёсткость К Изгибу (Flexural Rigidity).

BENDS = УЗЛЫ (или ВЕЛЬСЫ) – Bends:- both ends (loading & discharge ports). / Оба конца (порты погрузки и разгрузки).

BENEFICIAL ARTHROPODS = ПОЛЕЗНЫЕ АРТРОПОДЫ (или БЛАГОТВОРНЫЕ ЧЛЕНИСТОНОГИЕ) – Beneficial Arthropods is a general group of insects and their cousins (predatory mites and spiders) that either consume (predator) or live within (parasite) the host insect. / Под Артроподами или Членистоногими понимается самый многочисленный тип животных. По различным оценкам – от 1 до 3 миллионов видов. Наиболее процветающая в биологическом отношении группа. Тело сегментированное, с хитиновым покровом; конечности членистые. Органы чувств хорошо развиты. Обитают в воде, в воздухе, на поверхности земли и в почве. Свободноживущие и паразитические формы. Среди членистоногих многие полезны, есть и вредные. 4

Подтипа:- Жабродышащие, Трахейнодышащие (включая Насекомых), Трилобитообразные (ископаемые) и Хелицеровые. Основные членистоногие:- Бабочка, Бокоплав, Жаброног, Жук, Клоп, Краб, Креветка, Кузнечик, Мечехвост, Муха, Оса, Морской Паук, Птицеед (Паук), Речной Рак, Рак-Богомол, Сколопендра, Скорпион, Стрекоза, Морской Таракан (Равноногий Рак), Морская Уточка.

BENEFICIAL CARGO OWNER = БЕНЕФИЦИАРНЫЙ ХОЗЯИН ГРУЗА (или ПОДЛИННЫЙ ХОЗЯИН ГРУЗА) – The actual owner of the lading who is using a consolidator. Beneficial Cargo Owner (BCO) refers to the importer of record, who physically takes possession of cargo at destination and does not act as a third party in the movement of such goods. / Фактический хозяин .

BENEFICIAL ORGANISM = ПОЛЕЗНЫЙ ОРГАНИЗМ (или БЛАГОТВОРНЫЙ ОРГАНИЗМ) – Beneficial Organism is any organism directly or indirectly advantageous to commodities, including biological control agents.

BENEFICIAL OWNER = БЕНЕФИЦИАРНЫЙ (или ПОДЛИННЫЙ) ХОЗЯИН (или СОБСТВЕННИК) – (1) Beneficial Owner is a person who does not have legal title but who enjoys the benefits of ownership. / Лицо, которое не имеет законного права собственности, но которое, тем не менее, пользуется всеми выгодами владения. Бенефициарный Собственник – лицо, пользующееся правами владельца, хотя юридически право владения принадлежит другому лицу. В случаях если акции взаимного фонда хранятся в доверенном банке или если ценные бумаги хранятся брокером ‘на номинальное лицо’ (street name), то их реальным владельцем является бенефициарный собственник, хотя в интересах безопасности или удобства юридическое право собственности принадлежит банку или брокеру.

(2) The Beneficial Owner of an asset is the person for whose benefit it is being held. Beneficial ownership arises when an asset is owned by one person (the ‘legal owner’) who has a duty to use it on behalf of another; one person holds assets as trustee for another. Securities, especially those held by private investors, are often held by brokers’ nominee companies. Like other property, securities may also be held by trustees, and it is sometimes necessary to trace ownership through a long line of holding companies and trustees to find the ultimate beneficial owner. The difficulties involved in tracing ultimate beneficial owners can make it more difficult to enforce regulations, such as those regarding takeovers. Mechanisms exist in the UK to help uncover them. For example, the Companies Act gives companies the power to demand that legal owners (whose names are shown in the register of shareholders) disclose information about beneficial owners. When a shareholding is held by a nominee such as a stockbroker, the nominee’s name appears on the register of shareholders. The real owner is known as the Beneficial Owner.

BENEFICIAL OWNERSHIP = БЕНЕФИЦИАРНОЕ (или ПОДЛИННОЕ) ВЛАДЕНИЕ – Beneficial Ownership:- this term refers to the true owner of an entity, asset, or transaction as opposed to any stated ownership provided in documents or oral representations. The beneficial owner is the one that receives or has the right to receive proceeds or other advantages as a result of the ownership. It is common practice in offshore financial secrecy jurisdictions to interpose entities, individuals, or both as stated owners. The beneficial or true owner is contractually acknowledged in side agreements, statements or by other devises. Designates the owner who receives the benefits or profits from the operation. Beneficial Ownership is enjoyed by anyone who has the benefits of ownership of a security or property, and yet does not nominally own the asset itself. / Относится к хозяину, который получает выгоды или прибыли от операции.

BENEFICIALS = ПОЛЕЗНЫЕ (НАСЕКОМЫЕ) (или БЛАГОТВОРНЫЕ (НАСЕКОМЫЕ)) – Beneficials:- Insects that are beneficial to the Cotton crop, e.g., Insects that prey on caterpillars. Insects or Spiders found in Cotton fields which prey on or parasitise cotton pests. / Паучки или другие Насекомые, обитающие на полях Хлопчатника, которые охотятся или паразитируют на хлопковых Насекомых Вредителях.

BENEFICIARY = ВЫГОДОПРИОБРЕТАТЕЛЬ (или БЕНЕФИЦИАР, или БЕНЕФИЦИАРИЙ) – (1) The Beneficiary is entitled to payment as long as he can provide the documentary evidence required by the letter of credit. The letter of credit is a distinct and separate transaction from the contract on which it is based. All parties deal in documents and not in goods. The issuing bank is not liable for performance of the underlying contract between the customer and beneficiary. The issuing bank’s obligation to the buyer, is to examine all documents to insure that they meet all the terms and conditions of the credit. Upon requesting demand for payment the beneficiary warrants that all conditions of the agreement have been complied with. If the beneficiary (seller) conforms to the letter of credit, the seller must be paid by the bank. Beneficiary is the ultimate party to be credited or paid as a result of a transfer. It is a field name in a SWIFT message:- the party designated by the ‘Ordering Party’ as the ultimate recipient of the funds. The entity to whom money is payable; or the entity for whom a letter of credit is issued; or the seller and the drawer of a draft. Beneficiary is the person in whose favor a letter of credit is issued or a draft is drawn. / Выгодоприобретатель (Beneficiary):- это название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)):- сторона, обозначенная Поручающей Стороной (Ordering Party) в качестве окончательного получателя денежных средств. Под Выгодоприобретателем или Бенефициарием или Бенефициаром, от Французского слова Bénéfice, означающее Польза или Прибыль, понимается физическое или юридическое лицо, которому предназначен денежный платёж; получатель денег. По Российскому законодательству (Федеральный Закон от 23.07.2010 № 176-ФЗ):- Выгодоприобретатель – лицо, к выгоде которого действует клиент, в том числе на основании агентского договора, договоров поручения, комиссии и доверительного управления, при проведении операций с денежными средствами и иным имуществом. Бенефициар – лицо, в чью пользу выдаётся банковское финансовое обязательство:- продавец, кредитор и прочие. Под Бенефициарием, от Латинского слова Beneficium, означающее Благодеяние, понимается выгодоприобретатель, то есть лицо, пользующееся какими-либо благами на основании договора или ином законном основании, в том числе лицо, в интересах которого осуществляется доверительная собственность, получатель денег по аккредитиву или страховому полису. Бенефициар:- (1) Наследник по завещанию. (2) Получатель компенсации по страховому полису. (3) Сторона, на имя которой выписан аккредитив (letter of credit). (4) Лицо, которому выплачивается соответствующая аннуитет (annuity). (5) Сторона, в пользу которой составлена доверенность.

(2) The Beneficiary is the individual designated by name on the bond’s face who becomes the owner only upon the death of the individual who is designated by name as the owner on the bond’s face. Bonds bearing the name of a beneficiary are registered, for example, ‘John Smith Payable on Death (POD) to Jane Smith’. ‘Jane Smith’ is the beneficiary. Designation by the owner of a life insurance policy indicating to whom the proceeds are to be paid upon the insured’s death or when an endowment matures. / полиса страхования жизни, указывающий кому .

BENEFICIARY’S FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ ВЫГОДОПРИОБРЕТАТЕЛЯ (или ФИНАНСОВОЕ УЧРЕЖДЕНИЕ БЕНЕФИЦИАРА) – Beneficiary’s Financial Institution (BFI) is the financial institution that is requested to act as the financial agent for the beneficiary. Beneficiary’s Financial Institution (BFI) is the BFI holds the account of the beneficiary. Beneficiary’s Financial Institution (BFI) is the financial institution to which the payment is to be/has been made, in favor of the beneficiary of money.

BENEFICIARY UNDER A TRUST = ВЫГОДОПРИОБРЕТАТЕЛЬ ПО ТРАСТУ (или БЕНЕФИЦИАР ПО ТРАСТУ) – In the United States, Beneficiary Under a Trust is the person for whose benefit a trust is created or who is entitled to the income from a trust.

BENEFIT = ВЫПЛАТА (или ПОСОБИЕ) – Benefits are payments or entitlements that are provided by an employer and offered to its employees. Benefits are also referred to as Company Benefits, Employee Benefits, and Fringe Benefits. In most cases, benefits are promised to an employee as part of an employment agreement. Benefits can also be extended via the government. In this situation, people are provided payments or entitlements based on being a citizen of that country. Some types of benefits include health insurance, life insurance, paid vacation and sick leave, maternity and paternity leave, 401(k) contributions, pensions, profitsharing, bonuses, and stock options. Companies also provide nonfinancial benefits like employee wellness programs, weight loss programs, and exercise facilities. In many cases, the employer will provide access to the benefit and make payments on behalf of the employee. For example, many companies will provide employees with health insurance. This usually includes providing access to the healthcare and paying a portion of the premiums on behalf of the employee. The purpose of providing these entitlements or benefits is to attract and retain employees. Typically, companies will offer benefits along with a salary as part of an employment contract. Some companies are able to secure and maintain more qualified employees because of the benefits that they offer. In many cases, the organization will increase the value of the original benefits package over time. For example, in some companies, employees are not eligible to participate in 401k profit sharing programs until they have completed two years of employment with the company. After an employee is eligible for the program, they are only partially vested in the beginning and become fully vested over time. Generally, the employer bears all or the majority of the cost for the company benefits. For benefits like paid vacation time and sick leave, the employer bears all of the cost. However, many benefits, like healthcare, require a shared cost that is split between the employer and the employee. For healthcare, the employer typically pays the major portion of the premiums, while the employee pays a smaller portion. Providing benefits to employees can be quite costly. As the cost of healthcare continues to rise in most countries, providing employees with paid vacation time, stock options, healthcare, and other benefits has become quite expensive. Therefore, most companies try to limit these expenses. If not managed properly, the costs associated with company benefits can become a financial burden for the organization. Company benefits are not always offered to all employees. The cost associated with providing benefits is a major factor influencing why benefits are not extended to all employees. Generally, company benefits are extended to employees who are considered full time and/or salaried. Although some organizations provide benefits to part time or hourly employees, these benefits are usually limited and not comparable to the benefits provided to full time employees. In most cases, part time or hourly workers are provided very few, if any, benefits at all. Cultural Influence:- Providing employees with company benefits has become customary in many countries around the world. Cultural influences and laws have a direct impact on what benefits a company can and will provide its employees. As a result, the benefits that are offered to an employee can vary significantly from one company to another. Most companies end up offering a unique package of benefits that is based on its country's customs and laws, the size and type of organization, and its financial situation. Some other factors that can directly impact which benefits a company offers an employee can include things related to the employee, like educational background, skill level, job title, and length of time the employee has worked for the company. Where a company is located has a major effect on the benefits that it offers its employees. That's because a company's location can influence which benefits it can legally provide, the company's culture, and employee expectations. This influence can be significant and tends to vary greatly by country. Countries have laws and cultural norms with different beliefs regarding basic rights and what citizens are entitled to have provided by the government. Some countries have cultures and governments where the government provides very few benefits to its citizens, while some countries have governments that provide a lot of benefits to its citizens. This has a direct impact on the benefits that a company provides to its employees. Many countries believe that their citizens are entitled to basic healthcare. Therefore, these countries will have national healthcare that provides all or a portion of the healthcare to its citizens. If a company is located in a country that provides healthcare to its citizens, then there is less burden on the company to provide healthcare benefits to its employees. In countries like Great Britain, Canada, and Botswana, the government provides all or some portion of the healthcare for its citizens. As a result, the companies that are located in these countries have less of a burden when it comes to providing basic benefits like healthcare to its employees. If the company is located in a country where the government does not provide some of these basic benefits to its citizens, then there is typically a greater burden on the company to provide these types of benefits to its employees. In the United States, there is no national healthcare. Therefore, the majority of the people have to work to get access to healthcare. In a country like this, the companies that provide employment tend to provide healthcare as part of the benefits package for employees and bear a greater cost burden. Some countries provide other benefits to their citizens like social security, pension plans, and disability insurance, which can also impact the benefits that a company offers to its employees. Similarly, a country's laws can have a significant impact on what benefits a company is required to offer its employees. In many countries, there are laws that require the companies to offer benefits like paid time off, paid sick leave, maternity leave, etc. For example, when compared to many other countries, Germany has employment and labor laws that are very favorable to employees, so companies that are located in Germany are required to offer fairly generous benefits because of the employment and labor laws in that country. These laws require the employers in Germany to provide a lot of benefits to the employee; employees are required to receive benefits like generous paid vacation and sick leave. These types of laws place a greater burden on the companies that are located in Germany versus companies that are located in other parts of the world. As stated previously, benefits are entitlements or payments that are granted to an employee via an employment contract with an employer. The types of benefits that are offered by a company are influenced by many factors, including the laws, culture, and government benefits offered in the country where it is located. Although providing employee benefits is customary, it can be quite costly and create a burden for the company. For this reason, benefits are generally not offered to all employees. However, companies will extend benefits to retain and maintain qualified employees. Any economic advantage granted by one party to another party under a contract, especially any cash flow and service provided, or any reduction of cash flows otherwise due to be received, regardless of whether there is a requirement of a prior equivalent payment.

BENEFIT CLAIM = ПРЕТЕНЗИЯ ПО ВЫПЛАТАМ – In the US patent law, Benefit Claim:- the claiming by an applicant in a nonprovisional application of a benefit of an invention disclosed in a prior-filed copending (under examination at the same time) provisional or nonprovisional application, or international application designating the United States for the purposes of securing an earlier-effective filing date for the nonprovisional application.

BENEFIT–COST RATIO = СООТНОШЕНИЕ ВЫПЛАТА–ЗАТРАТА (или СООТНОШЕНИЕ ВЫПЛАТА–СТОИМОСТЬ) – Benefit-Cost Ratio is an analytical tool used in public planning; a ratio of total measurable benefits divided by the initial capital cost. Also known as Cost-Benefit Ratio.

BENEFIT OF INSURANCE = ВЫПЛАТА ПО СТРАХОВАНИЮ – Benefit Of Insurance is a term used, e.g., in a contract of carriage, where some person such as a bailee stipulates that he shall receive the benefit of insurance effected by the owner.

BENEFIT OF INSURANCE CLAUSE = ОГОВОРКА О ВЫПЛАТЕ ПО СТРАХОВАНИЮ – Benefit Of Insurance Clause is a clause in a contract between the assured and a bailee by which the bailee of goods claims the benefit of any insurance policy effected by the

cargo owner on the goods in care of the bailee. Such a clause in a contract of carriage, issued in accordance with the Carriage of Goods by Sea Act, is void at law.

BENELUX = БЕНИЛЮКС – Benelux:- coastal region of northwestern Europe, consisting of Belgium, The Netherlands, and Luxembourg. These are together known as the Benelux Countries, from the initial letters of their names. Benelux Countries also called Low Countries that are bordered by Germany to the east and France to the south. In 1947 the three nations formed the Benelux Customs Union, which broadened over the years into what a 1960 treaty confirmed as the Benelux Economic Union. Belgium, Luxembourg and the Netherlands Economic Union. Also known as Low Countries. / Экономический Союз Бельгии, Люксембурга и Нидерландов. Известен также как Низменные Страны (Low Countries). Договор о союзе был подписан в 1958, но начал действовать в 1960. Местопребывание руководящих органов в Брюсселе, Бельгия.

BENGALINE = БЭНГАЛИН (или БЕНГАЛКА) – Bengaline is a fabric similar to faille, only heavier, with a fine weave and widthwise cords. Originally, bengalines were made of a silk, wool, or rayon warp with a worsted or cotton filling and used for dresses, coats, trimmings, and draperies. Modern bengalines are made with filament acetate or polyester warps. Also, some bengalines have fine spun warps with 2- and 3-ply heavier spun yarns for filling cord effects. Bengaline is a fabric with a crosswise, ribbed effect that once was made of silk, wool or synthetic fibers. It is now usually made from acetate and polyester. It is similar in nature to faille but generally heavier. Bengaline is a fabric with a crosswise rib made from textile fibers (as rayon, nylon, cotton, or wool) often in combination. Crosswise rib, warp faced. First made of silk in Bengal, India. Ribs are round and raised. Often has wool or cotton dilling in the ribs which doesn't show. Difficult to make bound buttonholes in it. Has a tendency to slip at the seams if too tightly fitted. Grosgrain and Petersham is bengaline cut to ribbon widths. The cloth is usually 40" wide. Cotele – a French term for bengaline made from a silk or rayon warp and worsted filling which is given a hard twist. Bengaline is a ribbed fabric similar to faille, but heavier and with a coarser rib in the filling direction. It can be made of silk, wool, acetate, or rayon warp, with wool or cotton filling. The fabric was first made in Bengal, India, and is used for dresses, coats, trimmings, and draperies. / уточина. фай (faille). Найлан (Nylon). Торговое название ткани полотняного переплетения с выпуклым рубчиком по утку. Бэнгалин, от Французского слова Bengaline, шёлковая прозрачная тонкая ткань, напоминающая Органди.

BENTHOS = БЕНТОС – Benthos are organisms living at the bottom of a water body, crawling or burrowing into the detritus and sediment; those on the surface are the epibenthos, and those beneath are the endobenthos. / Под Бентосом, от Греческого слова Bénthos, означающее Глубина, понимается совокупность организмов, обитающих на грунте и в грунте дна водоёмов. Морской бентос служит пищей многим рыбам и другим водным животным, а также используется человеком, например, водоросли, крабы, устрицы и некоторые рыбы.

BENZENE = БЕНЗИН – Benzene is a volatile, flammable, colorless liquid hydrocarbon, (C_6H_6), used as an illuminant, a solvent for fats and resins, a raw material in dye synthesis, and the hydrocarbon source for many manufactured fibers. Also known as Gasoline. / Известен также как Газовый Бензин или Газолин (Gasoline). Под Бензином, от Французского слова Benzine, понимается смесь лёгких углеводородов различного строения с $t_{кип}$ 30–205 °C; прозрачная бесцветная жидкость, плотность 700–780 кг/м^3. Бензин получают главным образом перегонкой или крекингом нефти, а также переработкой сланцев и каменных углей, природных и попутных газов. Бензин является основным видом топлива для поршневых авиа- и автодвигателей. Экстрагент и растворитель для жиров, каучуков, смол и тому подобного. Предельно допустимая концентрация в воздухе паров автомобильного и авиационного бензинов 100 мг/м^3, бензина-растворителя (нефрас-С 50/170) – 300 мг/м^3. Марки отечественного автомобильного бензина – А-72 (ранняя), А-76 (ранняя), АИ-80, АИ-92, АИ-93 (ранняя), АИ-95, АИ-98; цифры соответствуют октановому числу бензина. Марки Российского авиационного бензина – Б-100/130, Б-95/130, Б-91/115; числитель – октановое число, знаменатель – показатель сортности бензина.

BENZOATE FIBER = БЕНЗОАТНОЕ ВОЛОКНО – Benzoate Fiber is a fiber with a silk-like hand made from a condensation polymer of p-(Bhydroxyethoxy) benzoic acid. / бензойной кислоты.

BEP = BREAK–EVEN POINT

BEQUEST = ПОСМЕРТНЫЙ ДАР (или ЗАВЕЩАННОЕ, или ЗАВЕЩАТЕЛЬНЫЙ ОТКАЗ) – Bequest is the act of giving personal property or money such as stocks, bonds, jewelry and cash left to an individual or organization through the provisions of a will or estate plan. Bequests can be made to family, friends, institutions or charities. When real estate is left through a will, it is correctly called a 'Devise'. If estate taxes are a concern, individuals may opt to bequest assets to heirs indirectly through a gift in trust. Charitable gifts after death can also reduce estate taxes. When a bequest is left to a charity, it may be called a Legacy Gift. Such bequests can be important sources of fundraising for nonprofit organizations. When the bequest is intended for a specific purpose, it is called an Endowment. Bequests to charity can be made directly, or indirectly through charitable trusts. Bequest is a gift by will of personal property; a legacy. / Завещанное:- передача имущества (акции, облигации, паи взаимных инвестиционных фондов, недвижимое имущество, личная собственность) наследникам по завещанию.

BERET = БЕРЕТ – Beret is a visorless usually woolen cap with a tight headband and a soft full flat top.

BERLESE FUNNEL = ВОРОНКА БЕРЛЕЗЕ – A Berlese Funnel is a device for collecting insects. Grain suspected of being infested is placed in the funnel. The funnels used by Industry Services hold up to one kilogram of grain. The funnels are placed under lights. Insects move away from the lights down the funnel and are collected in receptacles placed under the funnels. Berlese Funnel is a collection apparatus used to catch arthropods. Made up of funnels containing a piece of screen or hardware cloth, with a light heating system mounted above and a collecting jar below provided with alcohol to catch small arthropods that escape and fall from material that is placed on the screen. A Berlese Funnel is a device that is used to extract insects from soil and litter samples. It was invented by Antonio Berlese (1863–1927; Italian entomologist) and later improved by Hugo Albert Tullgren (1874–1958; Swedish entomologist and arachnologist). Basically, it uses a heat source (in this case a light bulb) to dry the sample, forcing the insects through a screen and into a jar of preserving fluid. It is a useful tool for attaining cryptic species that would otherwise evade even the most avid collector. / Антонио Бэрлесэ (Antonio Berlese) Хъюго Албэрт Тулгрэн (Hugo Albert Tullgren).

BERMUDA BAG = БЕРМУДСКАЯ СУМКА – Bermuda Bag is a round or oval-shaped handbag with a wooden handle and removable cloth covers.

BERMUDAS = БЕРМУДЫ – Bermudas:- Bermuda shorts.

BERMUDA–STYLE OPTION = ОПЦИОН В БЕРМУДСКОМ СТИЛЕ – Bermuda-Style Options are the exotic options that combine certain features of American- and European-style options. They may be exercised on predetermined dates during the lifetime of the option or on the expiry date. See also American-Style Option and European-Style Option.

THE BERNE CONVENTION = БЕРНСКАЯ КОНВЕНЦИЯ – The Berne Convention, established in 1886, is the principal transnational convention relating purely to copyright protection. The Berne Convention is based on national treatment, and imposes minimum norms of copyright protection. Like the Paris Convention, the Berne Convention grants foreign nationals the same protection and advantages as those granted to nationals of any member country, without discrimination. The membership of the Berne Convention has increased from an initial membership of 10 to over 90 countries including nearly all leading economic countries. Under the Berne Convention, and its six subsequent amendments, copyright protection is automatic throughout all member countries without the need to comply with any formalities. See also The European Patent Convention, The Madrid Agreement, The Madrid Protocol, The Paris Convention, The Patent Cooperation Treaty, and Trade-Related Aspects of Intellectual Property Rights. Berne Convention for the Protection of Literary and Artistic Works of 1886-September-09, completed at Paris, France on 1896-May-04, revised at Berlin, Germany on 1908-November-13, completed at Berne, Switzerland on 1914-March-20, revised at Rome, Italy on 1928-June-02, at Brussels, Belgium on 1948-June-26, at Stockholm, Sweden on 1967-July-14, and at Paris, France on 1971-July-24, and amended on 1979-September-28. The expression 'literary and artistic works' shall include every production in the literary, scientific and artistic domain, whatever may be the mode or form of its expression, such as books, pamphlets and other writings; lectures, addresses, sermons and other works of the same nature; dramatic or dramatico-musical works; choreographic works and entertainments in dumb show; musical compositions with or without words; cinematographic works to which are assimilated works expressed by a process analogous to cinematography; works of drawing, painting, architecture, sculpture, engraving and lithography; photographic works to which are assimilated works expressed by a process analogous to photography; works of applied art; illustrations, maps, plans, sketches and three-dimensional works relative to geography, topography, architecture or science. It shall, however, be a matter for legislation in the countries of the Union (the countries to which this Convention applies constitute a Union for the protection of the rights of authors in their literary and artistic works) to prescribe that works in general or any specified categories of works shall not be protected unless they have been fixed in some material form. Translations, adaptations, arrangements of music and other alterations of a literary or artistic work shall be protected as original works without prejudice to the copyright in the original work. It shall be a matter for legislation in the countries of the Union to determine the protection to be granted to official texts of a legislative, administrative and legal nature, and to official translations of such texts. Collections of literary or artistic works such as encyclopaedias and anthologies which, by reason of the selection and arrangement of their contents, constitute intellectual creations shall be protected as such, without prejudice to the copyright in each of the works forming part of such collections. The works mentioned in this Article shall enjoy protection in all countries of the Union. This protection shall operate for the benefit of the author and his successors in title. Subject to the provisions of Article 7(4) of this Convention, it shall be a matter for legislation in the countries of the Union to determine the extent of the application of their laws to works of applied art and industrial designs and models, as well as the conditions under which such works, designs and models shall be protected. Works protected in the country of origin solely as designs and models shall be entitled in another country of the Union only to such special protection as is granted in that country to designs and models; however, if no such special protection is granted in that country, such works shall be protected as artistic works. The protection of this Convention shall not apply to news of the day or to miscellaneous facts having the character of mere items of press information. / Трактат о Сотрудничестве в Патентной Сфере (The Patent Cooperation Treaty), и . чертёж (drawing). Бернская Конвенция по авторскому праву; смотрите также Конвенции Международные по Охране Авторских Прав. Конвенции Международные по Охране Авторских Прав, многосторонние международные договоры, устанавливающие обязательства государств по охране авторского права на произведения, принадлежащие гражданам других участвующих в договоре стран или впервые опубликованные в этих странах. Наибольшее значение имеют Бернская Конвенция об Охране Литературных и Художественных Произведений 1886 и Всемирная (Универсальная) Женевская Конвенция об Авторском Праве 1952 (вступила в силу в 1955); её членами являются 64 государства, в том числе Венгрия, Куба, Чехословакия, Югославия. Союз Советских Социалистических Республик (СССР) участвует в этой конвенции (в редакции 1952) с 27 Мая 1973. Конвенция, разработанная под эгидой ЮНЕСКО, ставит целью обеспечить уважение прав личности и благоприятствовать развитию литературы, науки и искусства, способствовать обмену культурными ценностями и лучшему международному взаимопониманию. Она распространяется на произведения письменные, музыкальные, драматические и кинематографические, произведения живописи, гравюры и скульптуры. Государства-члены Конвенции на равных началах с произведениями своих граждан предоставляют охрану произведениям граждан других стран-участниц (независимо от места опубликования) и произведениям, впервые выпущенным в свет на территории любой другой страны-участницы независимо от гражданства авторов. При этом государства обязаны обеспечить исключительное право на перевод и охрану произведения в течение не менее чем 25 лет после смерти автора, принять все меры, необходимые для обеспечения достаточной и эффективной охраны прав авторов и других обладателей авторского права. Если законодательство какого-либо из стран-участниц требует соблюдения формальностей для охраны прав автора (как, например, в США), что эти требования считаются выполненными, если на всех экземплярах произведения помещён особый знак © с указанием обладателя авторского права и года первой публикации произведения. В СССР охране по нормам Женевской Конвенции подлежат произведения, впервые выпущенные в свет за рубежом после 27 Мая 1973 (на ранее выпущенные произведения действие конвенции не распространяется). Бернская Конвенция 1886 неоднократно пересматривалась, в том числе в Берлине (1908), Риме (1928), Брюсселе (1948), Стокгольме (1967) и Париже (1971). На 01 Января 1973 в этой конвенции участвуют 63 государства, 46 из них применяют конвенцию в редакции 1948 (СССР не участвует в Бернской Конвенции). 39 стран, участвующих как в Бернской, так и в Женевской Конвенциях, в отношениях между собой применяют только Бернскую Конвенцию. Члены Бернской Конвенции образуют Международный Союз по Охране Литературных и Художественных Произведений (так называемый Бернский Союз); его административные функции выполняет Всемирная Организация Интеллектуальной Собственности. Наряду с участием в международных конвенциях государства могут заключать между собой двусторонние соглашения об охране авторских прав. Союз Советских Социалистических Республик (СССР) имеет такие соглашения с Венгрией (действует с 01 Января 1968) и с Болгарией (действует с 01 Января 1972). По этим соглашениям каждая сторона признаёт авторские права граждан другой стороны на произведения, впервые выпущенные в свет на территории другой стороны, и предоставляет им охрану в принципе на тех же условиях, что и произведениям собственных граждан.

BERNE GAUGE = БЕРНСКИЕ ГАБАРИТЫ – The term Berne Gauge is a useful shorthand expression, used only in Great Britain, for one of the four internationally-agreed loading gauges used on the European mainland. There are two other widely-used loading gauges in Europe which are not internationally agreed, namely the British and the Scandinavian. The British, as all readers will know, is both lower and effectively in certain respects only, narrower than any of the four internationally-agreed gauges:- the Scandinavian is the same height as the highest of the international gauges but considerably wider, so that ordinary Swedish and Norwegian coaches cannot run generally in the rest of Europe. The term 'Berne Gauge' arose first from the fact that a conference was held in that city in 1913, which tried to improve on the gauge then generally accepted for vehicles in international traffic, without the need for each individual design of vehicle to be submitted to every railway over whose lines it was proposed to run it. The original (1891) gauge meant everyone accepting the then standard French loading gauge, which was the smallest in mainland Europe as to both width and height. All the other railways had very similar width requirements, and the new gauge defined was only some 50 mm wider. However,

the new gauge raised the height by some 130 mm, as an attempt to compromise between the French standard and the generally more liberal heights available elsewhere. But it took quite a long time before all French main lines conformed to it, particularly in the west of the country, and full clearance was not achieved until the late 1930s. The gauge thus defined (shown on the diagram in the main article on the preceding pages as Universal gauge) continued to be known officially as the Gabarit Passe-Partout International, or 'PPI', which translates literally as 'Pass Everywhere International Gauge'. The convention which brought it into use was signed in Berne at the end of the conference mentioned above, hence the unofficial name Berne Convention Gauge, shortened to Berne Gauge. It came into force on 01 January 1914. Berne Gauge is the most restrictive loading gauge (standard measure) or the lowest common denominator of loading gauges on the railways of continental Europe. The Berne Gauge or Berne Convention Gauge is an informal but widely-used term for the railway loading gauge considered the standard gauge in continental Europe. The term arises from the international railway conference held and consequent convention signed in Berne, Switzerland in 1912. The official name of this gauge is the Gabarit Passe-Partout International (PPI) (literally 'Pass-Everywhere International'), and it came into force in 1914. The European (Berne) loading gauge is usually 3 150 mm (10 ft 4 in) wide by 3 175 mm (10 ft 5.0 in) rising to 4 280 mm (14 ft 1 in) in the center. This is a clearance envelope (see Loading Gauge) on a curve of 250 m (820 ft 3 in) radius. Previously, international through traffic, particularly freight, had been effectively constrained to vehicles and loads consistent with the standard French (with 1 500 V DC) loading gauge, the narrowest and lowest in Mainland Europe. As a result of accepting the convention, the French embarked on a period of progressive upgrade to make their network compliant. Even after adopting the convention, significant parts of the European network operated to larger gauges, thus limiting the passing of traffic out of such areas. Although the name 'PPI' includes the characterisation as 'international' it is actually the minimum standard just in Western Europe. The contiguous rail network in North America has a minimum width of 3 250 mm (10 ft 8 in) and a minimum height of 4 620 millimetres (15 ft 2 in). The standard gauge rail network in Eastern Asia is built to a minimum width of 3 400 millimetres (11 ft 2 in), and the Chinese CRH2 as well as the Japanese 0 Series Shinkansen have a width of 3 380 millimetres (11 ft 1 in). Similarly the tracks in Sweden are built to 3 400 mm (clearance SE-A and SE-B) just as the broad-gauge network under Russian influence (on tracks with 1 520 mm). As such the Russian Velaro Sapsan and the Chinese Velaro CRH3 have widths of 3 265 millimetres (10 ft 8.5 in) while the German variant Velaro ICE 3 is built to 2 950 millimetres (9 ft 8 in) to fit in the PPI outline. Parts of the German network are built to accommodate wider trains from neighbouring countries. In a research project for ICE 4 a width of 3 300 millimetres (10 ft 10 in) was tested but not pushed into production. European Freight Network:- The success of the intermodal shipping containers led to some adaptations to allow ISO containers with a height of 2 600 millimetres (8 ft 6 in) or Hi-Cube containers with a height of 2 900 millimetres (9 ft 6 in) to be carried by rail in Western Europe. In general the deck height of flatcars was reduced to 940 mm to allow for shipping containers to fit in the 'GB' clearance in France. It was further modified so that for the minimum height of the exterior walls (3 175 mm) and the minimum height at the center (4 320 mm) a third height was added such that at a width of 2 720 mm a minimum height of 4 180 mm is ensured. This profile was dubbed 'GB+' and has a roof that is almost flat. All modern freight tracks in Western Europe are built to this size, the modern replacement for the PPI minimum international loading gauge. In comparison the central European 'GC' loading gauge allows the use traditional flatcars with a deck height of 1 100 to 1 300 mm to carry intermodal shipping containers. Trains with Hi-Cube containers can not pass from Germany into France. / Рельсовая Колея или Железнодорожная Колея – две рельсовые нити, расположенные на определённом расстоянии (называемом колеёй) одна от другой, прикреплённые к шпалам, брусьям или плитам. В бывшем Союзе Советских Социалистических Республик (СССР) были приняты железнодорожная колея нормальная (широкая) – 1 520 мм и узкие – 750 и 1 000 мм (промышленный транспорт), за рубежом – в основном 1 435 мм, а также (в некоторых странах) 1 067, 1 600 и 1 676 мм.

BERNOUILLI'S THEOREM = ТЕОРЕМА БЕРНУЛЛИ – Bernouilli's Theory:- if no work is done on or by a flowing, frictionless liquid, its energy, due to pressure and velocity, remains constant at all points along the streamline. Bernoulli's Theorem, in fluid dynamics, relation among the pressure, velocity, and elevation in a moving fluid (liquid or gas), the compressibility and viscosity (internal friction) of which are negligible and the flow of which is steady, or laminar. First derived (1738) by the Swiss mathematician Daniel Bernoulli, the theorem states, in effect, that the total mechanical energy of the flowing fluid, comprising the energy associated with fluid pressure, the gravitational potential energy of elevation, and the kinetic energy of fluid motion, remains constant. Bernoulli's theorem is the principle of energy conservation for ideal fluids in steady, or streamline, flow and is the basis for many engineering applications. Bernoulli's Theorem implies, therefore, that if the fluid flows horizontally so that no change in gravitational potential energy occurs, then a decrease in fluid pressure is associated with an increase in fluid velocity. If the fluid is flowing through a horizontal pipe of varying cross-sectional area, for example, the fluid speeds up in constricted areas so that the pressure the fluid exerts is least where the cross section is smallest. This phenomenon is sometimes called the Venturi Effect, after the Italian scientist Giovanni Battista Venturi (1746–1822), who first noted the effects of constricted channels on fluid flow. / Дьжованни Баттиста Вентури (Giovanni Battista Venturi; 1746–1822). Швейцарский математик Даниэль Бэрнули (или Бернулли) (Daniel Bernoulli; 1700-Февраль-08–1782-Март-17). Теорема Бернулли, одна из важнейших теорем теории вероятностей; является простейшим случаем так называемого Закона Больших Чисел (смотрите Закон Больших Чисел). Теорема Бернулли была впервые опубликована в труде математика – члена семьи Бернулли – Якопа Бэрнули (или Бернулли; Jacob Bernoulli; 1655–1705) 'Искусство Предположений' (Ars Conjectandi (The Art of Conjecturing)), изданном в 1713. Первые доказательства Теоремы Бернулли требовали сложных математических средств, лишь в середине XIX века Русский математик и механик Пафнутий Львович Чебышёв (1821–1894) нашёл необычайно изящное и краткое её доказательство. Точная формулировка Теоремы Бернулли такова:- если при каждом из n независимых испытаний вероятность некоторого события равна p, то вероятность того, что частота m/n появления события удовлетворяет неравенству $|m/n - p| < e$ (e – произвольно малое положительное число), становится сколь угодно близкой к единице при достаточно большом числе n испытаний. Из доказательства Чебышёва вытекает простая количественная оценка этой вероятности:- $P\{|m/n - p| < e\} > 1 - p(1 - p) / ne^2$.

BERRY = ЯГОДА – Berry is a pulpy or fleshy fruit with one or numerous seeds embedded in the pulp. Berry is a fleshy, indehiscent, usually many-seeded fruit. / Ягода (bacca, uva) – невскрывающийся, обычно многосемянный плод Растений. Все слои околоплодника (в отличие от яблока) ко времени созревания становятся сочными. Семена с плотной кожурой, предохраняющей зародыш от повреждения при прохождении через пищеварительный тракт животных. Ягоды многих Растений (Клюква, Брусника, Черника, Виноград и другие) используются в пищу, некоторые из них (например, ягоды Черники) – в медицине. Ягоды Паслёна сладко-горького, Жимолости и других – ядовиты. Ягодой часто неправильно называют плоды Земляники, Малины, Инжира и некоторых других.

BERTH = ПРИЧАЛ (или ПРИЧАЛЬНОЕ СООРУЖЕНИЕ, или РЕЙД, или ЯКОРНОЕ МЕСТО, или ЯКОРНАЯ СТОЯНКА) – A Berth is a designated location in a port or harbour used for mooring vessels when they are not at sea. Berth is the term used in ports and harbors for a designated location where a vessel may be moored, usually for the purposes of loading and unloading. Berths are designated by the management of a facility (e.g., port authority, harbor master). Vessels are assigned to berths by these authorities. Most berths are alongside a quay or a jetty (large ports) or a floating dock (small harbors and marinas). Berths are either general or specific to the types of vessel that use them. The size of the berths varies from 5–10 meters (m) for a small boat in a marina to over 400 m for the largest tankers. Following is a list of berth types that can be found in a large port:- (i) Bulk Berth:- used to handle bulk

cargo. Vessels are loaded using either excavators and conveyor belts or pipelines. Storage facilities for the bulk cargo are often alongside the berth, e.g., silos or stockpiles. (ii) Container Berth:- used to handle 20' and 40' standard intermodal containers. Vessels are loaded and unloaded by container cranes, designed specifically for the task. Alongside the quay there is often a large flat area used to store both the imported and exported containers. (iii) General Berth:- used to handle smaller shipments of general cargo. Vessels using these would usually have their own lifting gear, but some ports will provide mobile cranes to do this. (iv) Lay Berth:- sometimes designated as 'Layberth' (a) a berth used for idle (lay-up status) vessels, and (b) a berth where no loading or unloading takes place. Lay berth and lay-by berth (below) may be used somewhat interchangeably for intermediate (two to seven day) periods. (v) Lay-By Berth:- a general berth for use by vessels for short term waiting until a loading or discharging berth is available. (vi) Marina Berth:- used to allow the owners of leisure craft on and off their boats. Generally alongside pontoons and accessed by hinged bridges (in tidal locations) to the shore. (vii) Product Berth:- used to handle oil and gas related products, usually in liquid form. Vessels are loaded via loading arms containing the pipe lines. Storage facilities for the products are usually some distance away from the berth and connected by several pipes to ensure fast loading. (viii) X Berth:- suitable for nuclear-powered warships, and part of an operational Naval base or a building and refitting yard. (ix) Z Berth:- suitable for nuclear-powered warships, as a location for operational visits or stand offs. Berth is a vessel's place at anchor or at a dock. Seaman's assignment. Sufficient space for a ship to maneuver; sea room:- kept a clear berth of the reefs. A space for a ship to dock or anchor:- a steamship moored to its berth at the pier. Berth is a location in a port where a vessel can be moored, often indicated by a code or name. A location in a port where a vessel docks. Berth is the structure where a vessel is secured for the loading and unloading cargo. The Port of Savannah's Garden City Terminal maintains 7 massive container berths measuring 7 726 linear feet in length. With the construction of Container Berth 8 to commence in 2004, the Garden City Terminal will add another 2 100 linear feet to the berth's length. Berth is a vessel docking area. Any place where a ship can safely lie alongside a quay, pier or dock, at anchor or a buoy, and where she can carry out loading/discharge operations or embark and disembark passengers is called a Berth. Berth:- at a quay or wharf, location where a ship is moored to unload/load cargo. / хозяин (или капитан). Под Причалом понимается совокупность сооружений и устройств для стоянки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Причальные сооружения (набережные, пирсы) оборудуют тумбами для закрепления судовых швартовов и отбойными приспособлениями (привальными брусьями, кранцами и другими), предохраняющими причал и борта судна от повреждений при навале. На причале располагают грузоподъёмные механизмы, склады и прочее. Причал, комплекс сооружений и устройств, предназначенных для подхода, швартовки, стоянки, обработки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Различают грузовые, пассажирские, судоремонтные и другие причалы. Под Пристанью понимается специально оборудованное место на внутренних водных путях для стоянки речных судов у берега. Предназначена для посадки и высадки пассажиров, перегрузочных и других операций. Пристани бывают стационарными и плавучими. Под Пристанью понимается небольшой порт на внутренних водных путях, имеющий обычно 1–2 причала. Рейды – участки акватории, защищённые от сильного волнения, где суда могут стоять на якорях в ожидании разрешения на подход к причалам или на выход из порта. При отсутствии в порту глубоководных причалов, на рейдах также производят перегрузочные операции, для чего используют вспомогательные мелкосидящие суда – лихтеры и баржи. Под Рейдом, от Голландского слова Reede, понимается водный район у берега, используемый для якорной стоянки или перегрузки судов. Рейдом называется также внешняя часть акватории порта. Под Рейдом, от Голландского слова Reede, понимается место якорной стоянки в порту или вблизи берега. Внутренний рейд – часть ограждённой акватории порта; внешний рейд – водное пространство на подходах к порту.

BERTHA = БЕРТА (или КРУЖЕВНОЙ ВОРОТНИК) – Bertha is a wide round collar covering the shoulders. Bertha Collar is a wide, flat, round collar, often of lace or sheer fabric, worn with a low neckline in the Victorian era and resurrected in the 1940s.

BERTH CARGO = ЗАПОЛНЯЮЩИЙ ГРУЗ – Berth Cargo is a cargo taken by a ship at less than the regular line rates to fill surplus cargo space. Berth Cargo:- when a liner cargo vessel accepts extra cargo to fill the empty space remaining. / Когда линейное грузовое судно принимает дополнительный груз сверх нормы с тем, чтобы заполнить остающееся пустое пространство.

BERTHING = ШВАРТОВКА (или ПРИЧАЛИВАНИЕ) – Berthing:- to bring a ship to a berth. / Постановка судна к причалу. Швартовка Судна:- в Российской Федерации движение и стоянка судов в порту регулируются Правилами Плавания Судов на Каналах и Акваториях Портов и Правилами Технической Эксплуатации Гидротехнических Сооружений и Акваторий Портов. Движение судов по искусственным каналам возможно только при достаточном запасе воды под килем и наличии разрешения капитана порта. Скорость движения на каналах и акватории устанавливается приказом начальника порта в зависимости от технического и естественного состояния гидротехнических сооружений и грунта в порту. Швартовка судна – сложный и ответственный процесс. На судне заблаговременно подготовляют швартовные концы, брашпиль, лебедки, бросательные концы, кранцы, судовую связь и другие средства и приспособления. Палубную команду вызывают на палубу по авралу, и каждый член экипажа занимает свое место согласно расписанию. В порту причалы также заранее готовят для приёма судна. Причал освобождают для обеспечения работ, связанных со швартовкой. На причале не должно быть никаких выступающих и других частей, которые могут повлечь за собой затруднения при швартовке и даже аварию судна или причала. Причал должен иметь отбойную раму и другие защитные приспособления. Привальные брусья должны быть по всей длине сплошными. С судна подаются следующие швартовные концы:- продольные (носовой и кормовой), шпринги (носовой и кормовой) прижимные, идущие от кормы, носа или через бортовой полуклюз перпендикулярно диаметральной плоскости судна. Количество швартовных концов, необходимых для крепления судна у причала, зависит от условий стоянки и гидрометеорологической обстановки. При усилении ветра заводятся дополнительные концы. Крепление швартовных концов за береговой пал позволяет снять концы в любой последовательности. Огон последующего конца продевается снизу вверх через огоны предыдущих и после этого набрасывается на пал сверху. Подачу швартовного конца на берег производят лёгким линем с небольшой тяжёлой 'грушей' на конце, которая служит для забрасывания его на берег. Такой линь с грушей называют Бросательным Концом, или Легостью. После окончания швартовки на швартовные концы устанавливают специальные щиты, предотвращающие перебегание Крыс с берега на судно и обратно. При изменении осадки судна (погрузка, выгрузка) или уровня воды (приливы, отливы) изменяется натяжение швартовных концов, поэтому их подбирают или травят. Усиление отжимного ветра требует подачи дополнительных концов. При ухудшении погоды в плохо защищённом порту судно должно быть готово к выходу в море. На стоянке у причала нельзя производить швартовные испытания судна, связанные с работой винтов. Струи воды от винтов могут нанести вред гидротехническим сооружениям. Крен в сторону моря при подходе к свайным набережным грозит повреждением последних или самого судна. Швартовка судов друг к другу в открытом море или на открытом рейде к судну, стоящему на якоре, – операция сложная и ответственная. Все выступающие части (стрелы, трапы, шлюпки, люстры и тому подобное) должны быть убраны; все иллюминаторы задраены, особенно с того борта, которым судно швартуется; на отливные шпигаты навешены щиты; вдоль борта развешены кранцы (надувные или из автомобильных шин) – по два-три в носовой и кормовой частях судна, и особенно у выступающих частей. В рейдовых условиях и в открытом море для швартовки лучше использовать синтетические тросы или стальные с капроновыми амортизаторами. Чаще всего швартуются к правому борту судна, стоящего на якоре, так как на заднем ходу нос швартующегося судна отходит от судна, к

которому швартуются. При швартовке судов друг к другу в открытом море особое значение имеют кранцы. Для этой цели используют кранцы, изготовленные из пакетов автопокрышек, надувные резиновые кранцы, дополнительные кранцы из брёвен мягкого дерева длиной 2 м, оклетневанные 8–10-дюймовым растительным тросом. При швартовке танкеров к китобазам и китобойных судов к танкерам в качестве кранцев используют добытых китов. Три- четыре кита-кранца вдоль корпуса и надувные резиновые кранцы в районе спардека и кормы обеспечивают безопасную швартовку при ветре силой до 6–7 баллов и волнении моря до 4 баллов. Иногда практикуется парное расположение китов-кранцев. Швартовка китобойных судов к танкеру, лежащему в дрейфе, при силе ветра до 5 баллов и волнении моря 2–3 балла осуществляется с обоих бортов. На танкере развешивают мягкие кранцы. Китобойное судно, швартующееся с подветренной стороны, должно иметь не менее одного кита-кранца, а с наветренной стороны – не менее двух. Китобойное судно подходит к танкеру с кормы на параллельном курсе. На расстоянии 4–5 м подают швартовные тросы, начиная с носового. Отход осуществляется обычным порядком. При свежем ветре отходят от наветренного борта на малом ходу танкера против ветра и зыби. На китобойном судне оставляют только один носовой конец и дают ход, постепенно его увеличивая. Когда швартовный трос ослабнет, его отдают и увеличивают ход.

BERTH LINER SERVICE = ЛИНЕЙНАЯ СЛУЖБА ШВАРТОВКИ – Berth Liner Service is a regularly scheduled steamship line with regularly published schedules (ports of call) from and to defined trade areas.

BERTH TERMS = ПОРЯДКИ ШВАРТОВКИ (или УСЛОВИЯ ПРИЧАЛИВАНИЯ) – Berth Terms:- this expression is used for shipments under a charterparty. The purpose of these 'terms' is mainly to clarify which side pays for the loading and discharging costs of the cargo. The phrase 'Berth Terms' seems somewhat outdated, the more common phrases to describe the responsibilities being 'Liner Terms' and 'Gross Terms'. In the liner service it was customary for the shipowner to pay far loading and discharging (and also for stowing, trimming and securing) hence the use of the phrase 'Liner Terms'. If shipments were made on a chartered ship under the same conditions for loading and discharging expenses as applicable to regular liner ships offering a similar service, the charterparty contained a clause stating that the ship was carrying the goods under 'Berth Terms' or 'Liner Terms'. These expressions were generally not concerned with cargo handling-rates but with the cost of cargo handling on board the ship. One example of such a clause is:- 'Steamer to be loaded according to berth terms, ...' (Baltimore Berth Grain charterparty; Form C). The 'Berth Terms' and the responsibilities were not detailed for the loading port but for the discharging port there was some indication as to who would pay. The relevant clause stated:- 'Cargo to be received at destination as fast as vessel can deliver during ordinary working hours, any custom of the port to the contrary notwithstanding, but receivers of the cargo are in no case obliged to take delivery at night without their consent, and in any event the steamer must bear all extra expenses incurred by working at night…'. In this form of charter, on berth terms, the shipowner undertakes to carry out loading and discharging subject to the custom of the port or as fast as the ship can (handle the cargo) or under 'customary despatch'. Berth Terms:- shipped under rate that includes cost from end of ship's tackle at load port to end of ship's tackle at discharge port. / в порту разгрузки.

BESOM = ОБМЁТКА – Besom is an edging or reinforcement around a pocket opening.

BEST = BICOL EXPERIMENT STATION

BEST PRACTICE = ЛУЧШАЯ ПРАКТИКА – Best Practice is the methodology that determines state-of-industry performance or application. Also known as Competitive Benchmarking.

BEST LIMIT ORDER = РАСПОРЯЖЕНИЕ С ЛУЧШИМ ОГРАНИЧЕНИЕМ (или ЛУЧШЕЕ ЛИМИТНОЕ РАСПОРЯЖЕНИЕ) – Best Limit Order (BLO) is an order to buy or sell that becomes a LO at an equal price of the best bid/offer on the same side of the market.

BETA (COEFFICIENT) = БЕТА (КОЭФФИЦИЕНТ) – Beta (Coefficient) is a measure of volatility in comparison to the market as a whole. It measures risk in relation to the market or to an alternative benchmark. For example, a beta of 1.5 means that returns are expected to move 1.5 times the market's returns. Beta is referred to as an Index Of The Systematic Risk due to general market conditions that cannot be diversified away. A Beta of 1 indicates that price will move with the market. A Beta greater than 1 indicates that price will be more volatile than the market. A Beta less than 1 means that it will be less volatile than the market. A measure of how changes in a share price correlate to overall movements in the share market as a whole. Beta (Coefficient) is a measure of a security's systematic or market risk. While most stocks move in in the same direction as the stock market, the level of the Beta indicates the degree of correlation between a security and the market. The market is the benchmark and has a Beta of 1. A measure of the variability of rate of return or value of a stock or portfolio compared to that of the overall market. In securitites, Beta is a statistical measurement correlating a stock's price change with the movement of the stock market. The Beta is an indicator or statistical measure of the relative volatility of a stock, fund, or other security in comparison with the market as a whole. The Beta for the market is 1.00. Stocks with betas above 1.0 are more responsive to the market, but are also more risky investments. Stocks with a Beta below 1.0 tend to move in the opposite direction of the market. For example, if the market moves 10%, a stock with a Beta of 3.00 will move 30%; a stock with a beta of .5 will move 5%. Market risk indicator. If the average price of a share or a portfolio is above that of the market during a certain period, the Beta value is positive (larger than 1). If the average price is below that of the market, the Beta value is negative (smaller than 1). See also Alpha. Beta (Beta factor) states the extent to which the price of a share follows the performance of an index, i.e. whether the share is outperforming or underperforming the market. A share with a beta of more (less) than one reacts overproportionally (underproportionally) to changes in the index. With a Beta factor of 1.5, a rise (fall) of 10 percent in the index would lead to a rise (fall) of 15 percent in the share price; with a Beta of 0.8, the rise (fall) in the share price would be lower at 8 percent than the change in the index. In a bull market, shares with a Beta of more than one offer overproportional profit opportunities; in a bear market, shares with a beta of less than one promise smaller losses. It is assumed here that the Beta factor of the previous period will remain valid in future. The Beta of a rate or price is the extent to which that rate or price follows movements in the overall market. If the Beta is greater than one, it is more volatile than the market; if the beta is less than one, it is less volatile. / В анализе ситуации в биржевой торговле опционами название буквы Бета (прописная – B, строчная – β) Греческого алфавита было использовано для обозначения . Коэффициент Бета:- (1) показатель относительной лихорадочности акций, чувствительности расценок акций по отношению к остальным расценкам фондового рынка. Индекс по 500 Акциям от Стэндод Энд Поз имеет коэффициент Бета, равный 1. Считается, что акции с более высоким коэффициентом Бета более лихорадочны, чем рынок, а акции с более низким коэффициентом должны расти и падать медленнее, чем рынок в целом. Консервативный вкладчик капитала, желающий сохранить капитал, должен сосредоточиться на акциях с более низким коэффициентом Бета, в то время как вкладчик капитала, принимающий высокий риск, чтобы получать высокие прибыли, должен ориентироваться на акции с высоким коэффициентом Бета. Смотрите также Альфа (Alpha). (2) На Лондонской Фондовой Бирже обозначение Бета-акции (Beta-stocks) относится к ценным бумагам второго уровня (в четырёхуровневой иерархии), введённого после Большого Взрыва (Big Bang) в Октябре 1986. Это обозначение было заменено другим согласно новой системе классификации Нормального Размера Рынка (normal market size (NMS)), введённой в Январе 1991. Обозначение Альфа-акции (Alpha stocks) можно считать

эквивалентом Американских голубых фишек (blue chip). Бета-акции входят в более мелкие выпуски ценных бумаг, торговые операции с которыми совершаются реже. Смотрите также Дельта (Delta).

BETA CELLULOSE = БЕТА ЦЕЛЛЮЛОЗА – Beta Cellulose is one of the three forms of cellulose. It has a lower degree of polymerization that the alpha form. With gamma cellulose it is known as Hemicellulose. See also Alpha Cellulose, and Gamma Cellulose. / Смотрите также Альфа Целлюлоза (Alpha Cellulose), и Гамма Целлюлоза (Gamma Cellulose). Под Бета Целлюлозой понимается условное обозначение части гемицеллюлозы, которая выпадает в осадок из щелочного раствора после его подкисления уксусной кислотой.

BETAINE = БЕТАИН – Betaine or trimethylglycine is a quaternary ammonium compound with a sweet flavor found in Sugar Beet Beta Vulgaris. Used for the treatment of muscular degeneration and metabolic disorders. / Бетаин или триметилглицин является соединением четвертичного аммония со сладким вкусом. В природе встречается у Сахарной Свёклы, известной как Обыкновенная Свёкла (the Common Beet или Beta Vulgaris, на Латинском). Используется в лечении мускульной дегенерации и при метаболических растройствах. Бетаин – витаминоподобное вещество, производное холина. Пищевые источники бетаина:- шпинат, злаки, морепродукты, вино, свёкла и другие. Химическая формула:- ($(CH_3)_3N^+CH_2COO^-$). Бетаин участвует во многих биохимических процессах в организме, и имеет многостороннее физиологическое значение. Главная функция бетаина – понижение уровня гомоцистеина – потенциально токсичного агента. Спортивное питание содержит бетаин в качестве липотропного агента, который способствует окислению жиров. Исследования показали, что бетаин может усиливать аппетит и прибавлять сухую мышечную массу, таким образом, присутствуя в жиросжигающих комплексах, бетаин может защищать мышцы от разрушения. Бетаин оказывает, гепатопротективное, желчегонное действие. Активирует метаболическое метилирование в печени. Натуральный бетаин способствует длительному сохранению влаги в волосах, и поэтому используется в шампунях. Соблюдайте инструкцию производителей, не превышайте рекомендуемую дозу. Хотя бетаин и малотоксичен, практически не вызывает побочных явлений, иногда возможные такие побочные реакции как:- расстройство пищеварения, тошнота, аллергические реакции. При возникновении последних приём должен быть немедленно прекращён. Бетаин не рекомендуется принимать людям больным диабетом и беременным. Бетаины, органические, кристаллические вещества. Бетаины – внутренние соли триалкилзамещённых аминокислот. Молекула бетаина содержит положительно заряженный четвертичный атом азота и отрицательно заряженную карбоксильную группу, представляя собой, таким образом, биполярный ион. Бетаины хорошо растворимы в воде. С рядом кислот и с хлоридами тяжёлых металлов бетаины образуют нерастворимые соединения (например, золото-, платино-, свинцовохлористоводородные соли). Эту реакцию используют для их выделения. Бетаины распространены в животном и растительном мире. Их получают действием алкилгалогенидов или алкилсульфатов на аминокислоты и другими способами. Наиболее распространён бетаин гликокола ($(CH_3)_3M + CH_2COO^-$, обычно называемый просто бетаином:- бесцветное кристаллическое вещество, температура плавления 293 °C; при плавлении изомеризуется в метиловый эфир диметиламиноуксусной кислоты. Получают бетаин из мелассы – отходов свеклосахарного производства, а также синтетически – взаимодействием триметиламина и хлоруксусной кислоты. Хлорид бетаина (ацидол) применяют в медицине как заменитель соляной кислоты. Хлористоводородная соль бетаина при сухой перегонке даёт хлористый метил.

BETALAIN = БЕТАЛАИН – Betalain is a nitrogen-containing pigment characteristic of the family group Caryophyllales (Centrospermae) which includes the Cactaceae. Betalains are grouped as betacyanines (red-violet color) and betaxanthins (yellow color) and responsible for the red or violet coloration of some Cacti under environmental stress. Betalain pigments are also found in some higher Fungi. Betalains and anthocyanins never occur in the same plant. Structure of betacyanine. / , которая включает Кактусовые (Cactaceae). Centro – Колюче- или Колючко- или Колючковато- .

BETA RATING = РЭЙТИНЬГ ПО БЕТЕ – Beta Rating is the method of comparing filter performance based on efficiency. This is done using the Multi-Pass Test which counts the number of particles of a given size before and after fluid passes through a filter. In the context of filtration, the Beta Rating is a conditional ratio requirement on a filtering system that compares the number of particles of a certain size in the unfiltered and filtered fluid. A Beta rating of 1 000 at 5 microns means that there is one particle of 5 micron or greater size in the filtered fluid for every 1 000 particles of 5 micron or greater size in the unfiltered fluid.

BETA–RATIO = БЕТА–СООТНОШЕНИЕ – Beta-Ratio is the ratio of the number of particles greater than a given size in the influent fluid to the number of particles greater than the same size in the effluent fluid, under specified test conditions. See also Multi-Pass Test. The Beta Ratio equals the ratio of the number of particles of a minimum given size upstream of the filter to the number of particles of the same size and larger found downstream. Simply put, the higher the Beta Ratio the higher the Capture Efficiency of the filter.

BETA VALUE = СТОИМОСТЬ ПО БЕТЕ – Beta Value is a measure of a stock's volatility relative to movements in the whole market. Usually defined as the covariance of the return on the stock with the return on the market, divided by the variance of the market return.

BEVEL GEAR = КОНИЧЕСКАЯ ПЕРЕДАЧА (или КОНИЧЕСКАЯ (ЗУБЧАТАЯ) ПЕРЕДАЧА, или КОНИЧЕСКОЕ ЗУБЧАТОЕ КОЛЕСО, или КОНИЧЕСКАЯ ШЕСТЕРНЯ) – Bevel Gear is a straight-toothed gear with the teeth cut on sloping faces and the gear shafts at an angle (normally a right angle). See also Gear, Helical Gear. Bevel Gear is a cone-shaped gear which transmits power between 2 intersecting axels. Looking at bevel gears from the differences in helix angles, they can be generally classified into straight bevel gears, which do not have helix angles, and spiral bevel gears (including zerol bevel gears), which do have helix angles. However, because of the fact that manufacture facilities for straight bevel gears are becoming rare and the fact that straight bevel gears teeth cannot be polished, making spiral bevel gears which can be polished superior in terms of noise reduction, spiral bevel gears are likely to become more common in the future. Bevel gears can be generally classified by their manufacturing methods, namely the Gleason method and Klingelnberg method, which each have differing teeth shapes, and presently most gears use the Gleason method. Incidentally, all gears manufactured by KHK (brand of Japanese gears) use the Gleason method. Furthermore, there are also variations in gears in terms of teeth pitch (modules, etc), whether polished or not, and materials used. For example, in the case of materials, S45C of machine structural carbon steel, SCM415 of machine structual alloy steel and MC901 of engineering plastic, etc are often used, and duracon, etc are used for plastic molded parts. / метод Глисэна (Gleason method) и метод Клындьжелнбёга (Klingelnberg method). Смотрите также (Зубчатая) Передача (Gear).

BEVELING = ПОДКОС (или РАЗМАЛКОВКА) – Beveling:- if a board or lumber beam is used diagonally for load securing purposes in a container, the ends must be beveled to ensure a tight fit into the container, thus allowing forces to be transferred to the container.

BEYOND = СВЕРХ – Beyond:- used with reference to charges assessed for cargo movement past a line-haul terminating point.

BEYOND ECONOMIC REPAIR = СВЕРХ ЗАТРАТНЫЙ РЕМОНТ (или РЕМОНТ, НЕВЫГОДНЫЙ С ЭКОНОМИЧЕСКОЙ ТОЧКИ ЗРЕНИЯ) – Where the cost of repairing the insured property, e.g., a car, exceeds the market value of that property. In such circumstances the insurer will pay the insured the market value of the insured property at the date of loss, subject to the terms of the policy (assuming the insurer is not under any obligation to provide a replacement).

BF = BROUGHT FORWARD

BF = BURKINA FASO

BFI = BENEFICIARY'S FINANCIAL INSTITUTION

bfpd = BARRELS OF FLUID PER DAY

BG = BULGARIA

BGA = BLUE–GREEN ALGAE

BGL = BULGARIAN LEV

BGS = BASIC GENERATION SERVICE

BH = BAHRAIN

BHD = BAHRAINIAN DINAR

BI = BLACK IRON

BI = BURUNDI

BI = БИ – Bi:- two or twice, as a prefix. / Приставка Би (Bi) в переводе с Латинского языка означает Дву(х).

BIA = BUSINESS IMPACT ANALYSIS

BIAS = КОСОЙ СРЕЗ – Bias is a fabric cut diagonally across the warp and filling yarns. A true bias is cut on a 45° angle from the lower left to the upper right of a cloth. / уточные пряжи.

BIAS = ПОГРЕШНОСТЬ – Bias is the difference between the expectation of the test results and an accepted reference value. Bias is the total systematic error as contrasted to random error. There may be one or more systematic error components contributing to the bias. Bias is a consistent and false departure of an observed quantity from its proper value. The average error of an estimate. Prejudice, favoring one treatment over another. / Погрешность Измерения – характеристика результата измерения, представляющая собой отклонение найденного значения величины от её истинного значения. Различают:- (i) абсолютную погрешность измерения, выражаемую в единицах измеряемой величины; и (ii) относительную погрешность измерения, представляющую собой отношение абсолютной погрешности измерения к истинному значению измеряемой величины (в долях единицы, в процентах и так далее). Погрешность измерения – результат воздействия на средство измерения и измеряемую величину неблагоприятно влияющих факторов (колебаний температуры, электромагнитных помех и так далее), несовершенства метода и самого средства измерений (неточность его начальной градуировки, нестабильность во времени и другое). Различают случайные и неучтённые систематические составляющие погрешности измерения. Случайная погрешность измерения характеризуется средним квадратичным отклонением, то есть рассеиванием результата при повторных измерениях с учётом задаваемого уровня доверительной вероятности. Под Погрешностью Измерений понимаются отклонения результатов измерений от истинных значений измеряемой величины. Систематические погрешности измерений обусловлены главным образом погрешностями средств измерений и несовершенством методов измерений; случайные погрешности – неконтролируемыми изменениями условий измерений; промахи – неисправностью средств измерений.

BIAS = ПЕРЕКОС (или СКОС, или УКЛОН, или НАКЛОН, или КОСЯК, или КОСАЯ ЛИНИЯ В ТКАНИ) – Bias (reference skew; twill defect):- (1) on woven fabrics, this defect refers to the size of weft and warp yarn deflection occurs where; and (2) on knitted fabrics, this case refers to the vertical line of fabrics and fabric row size bias occurs ramp areas. Fabric Printing Defect. Defect Name:- Bias. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Bias:- A condition in wovens where the filling yarns are off-square to the warp end. In knits, the courses are off-square to the wales. Severity:- Major. See also Skew. / Порок или Дефект набивки тканей. Величина Перекоса.

BIAS/BELTED TIRE = ДИАГОНАЛЬНАЯ/РЕМЕННАЯ ШИНА – Tire Construction:- the geometry of the various layers of tire fabric in the final tire. Three constructions are commonly used:- (i) Bias Tire; (ii) Radial Tire; and (iii) Bias/Belted Tire:- this tire construction combines features of the preceding two. The first layers of fabric are identical to the bias tire. The belt is added in alternating layers at 20° to the tread direction. See also Bias Tire, Radial Tire, and Tire Construction.

BIAS FABRIC = ПЕРЕКОШЕННАЯ (или ИСКРИВЛЁННАЯ, или КОСАЯ) ТКАНЬ – Bias Fabric is a two-dimensional (2-D) textile fabric that when oriented in the XY plane contains fibers that are aligned in a different direction, i.e. 45° to the X-axis fibers.

BIAS FILLING = КОСАЯ УТОЧИНА (или КОСАЯ ПОПЕРЕЧНАЯ НИТЬ) – Bias Filling is a fabric defect in which the filling yarn does not run at a right angle to the warp. The principal cause is improper processing on the tenter frame. See also Bow.

BIAS TAPE = КОСАЯ БЕЙКА – Bias Tape is a strip of fabric cut on the diagonal between the lengthwise and crosswise grain of the fabric. Because bias tape has considerable stretch, it is used to bind edges where a certain degree of stretch is necessary for a smooth finish. Curved areas are often finished with bias tape. Bias tape can also be used for purely decorative trimming. It is available precut and packaged in a wide range of colors.

BIAS TIRE = ДИАГОНАЛЬНАЯ ШИНА – Tire Construction:- the geometry of the various layers of tire fabric in the final tire. Three constructions are commonly used:- (i) Bias Tire:- in this construction, tire fabric is laid alternately at bias angles of 25 to 40° to the tread direction. An even number of layers (or piles) is used. (ii) Radial Tire; and (iii) Bias/Belted Tire. See also Bias/Belted Tire, Radial Tire, and Tire Construction.

BIAS WEFT = КОСОЙ УТОК – Bias Weft or Skew:- a fabric condition in which the warp and weft:- yarns are straight but vary from the perpendicular to one another by a degree which is unacceptable in that fabric type. This defect is often caused by inadequate control of the fabric during open-width finishing. / Смещение Утка; Перекос (bias weft; skew):- порок заключительной отделки ткани в процессе заключительной отделки в виде неперпендикулярного расположения нитей двух систем или рядов и столбиков. Примечание:- этот порок часто вызывается отсутствием контроля над натяжением ткани во время отделки в расправленном виде.

BIAXIAL BRAID = БИАКСИАЛЬНЫЙ ШНУР – Biaxial Braid:- a braided structure with two yarn systems one running in one direction and the other in the opposite direction. See also Braid, and Triaxial Braid.

BIB = (ДЕТСКИЙ) НАГРУДНИК – Bib is the part of an pinafore garment or overalls that extends above the waist. / передник (pinafore).

BIC = BANK IDENTIFIER CODE

BIC = BANK INVESTMENT CONTRACT

BICOLOR = ДВУХЦВЕТНЫЙ – Bicolor:- with two different colors. / , от Латинского Bi- от Bis, означающее Дважды, . Под Двухцветным понимается имеющее в своей окраске два цвета или состоящее из двух частей различного цвета, например, двухцветная ткань.

BICOMPONENT FIBER = БИКОМПОНЕНТНОЕ ВОЛОКНО – A Bicomponent Fiber consists of two filaments of the same generic class but different composition which have been extruded simultaneously. This results in a continuous-filament man-made fiber composed of two related components, each having a different degree of shrinkage. Bicomponent Fiber:- Use of Sheath-core Bicomponent Fibers:- besides the sheath-core bicomponent fiber used as a crimping fiber, these fibers are widely used as bonding fibers in nonwovens industry. The sheath of the fiber is of a lower melting point than the core and so in an elevated temperature, the sheath melts, creating bonding pints with adjacent fibers – either bicomponent or mono component. The first commercial application of sheath-core binding fiber (I.C.I. Heterofil; Imperial Chemical Industries Ltd (ICI) was a British chemical company) has been in carpets and upholstery fabrics. The newest trend in bicomponent fiber production is to focus on tailoring a fiber according to the customer's needs. A considerable emphasize was put on the processing optimization (depending strictly on machinery used) and on the desired look of the final product. It appears that concentricity/eccentricity of the core plays an important role. If the product strength is the major concern, concentric bicomponent fibers are used; if bulkiness is required at the expense of strength, the eccentric type of the fiber is used. Other uses of sheath-core fibers derive from characteristics of the sheath helping to improve the overall fiber properties. A sheath-core fiber has been reported whose sheath is made of a polymer having high absorptive power for water, thereby having obvious advantages for use in clothing. Other sheath-core fibers showed better dye ability, soil resistance, heat insulating properties, adhesion etc. Production of ceramic sheath-core bicomponent fibers is another application utilizing the difference of sheath and core. The fiber precursors are first spun in a sheath-core arrangement and then cured by oxidation, UV and electron beam, heating or by chemical means. These fibers are used as a composite reinforcement. Matrix-Fibril (Biconstituent) Bicomponent Fibers:- these are also called Islands-In-The-Sea Fibers. Technically these are complicated structures to make and use. In cross section they are basically areas of one polymer in a matrix of a second polymer. These types of Bicomponent structure facilitate the generation of micro denier fibers. The 'islands' are usually a melt spin able polymer such as nylon, polyester or polypropylene. The sea or matrix can be formed by polystyrene water soluble polyesters and plasticized or saponified polyvinyl alcohol. The finer deniers that can be obtained are normally below 0.1 denier. Production of Matrix-fibril Bicomponent Fibers:- basically, these fibers are spun from the mixture of two polymers in the required proportion, where one polymer is suspended in droplet form in the second melt. An important feature in production of matrix-fibril fibers is the necessity for artificial cooling of the fiber immediately below the spinneret orifices. Different spin abilities of the two components would almost disable the spin ability of the mixture, except for low concentration mixtures (less than 20%). Use of Matrix-fibril Bicomponent Fibers:- a matrix-fibril fiber called 'Source' is produced by Allied Chemicals Ltd (an India-based company). The fiber is based on PET fibrils embedded in a matrix of Nylon 6. The presence of PET fibrils is supposed to increase the modulus of the fiber, to reduce moisture regain, to reduce the dye ability, improve the texturing ability and give the fiber a unique lustrous appearance. Bicomponent Fiber is the manufactured fiber made of continuous filaments, and made of two related components, each with different degrees of shrinkage. The result is a crimping of the filament, which makes the fiber stretchable. See also Composite Fiber, ans Multicomponent Fiber. Bicomponent Fibers can be defined as 'extruding two polymers from the same spinneret with both polymers contained within the same filament'. A close relative is 'co-spun fiber', which is a group of filaments of different polymers, but a single component per filament, spun from the same spinneret. The term 'conjugate fibers' is often used, particularly in Asia, as synonymous with bicomponent fibers. Background:- Dupont introduced the first commercial bicomponent application in the mid 1960s. This was a side-by-side hosiery yarn called 'Cantrese' and was made from two nylon polymers, which, on retraction, formed a highly coiled elastic fiber. In the 1970s, various bicomponent fibers began to be made in Asia, notably in Japan. Very complex and expensive spin packs apparently were used in the manufacturing process. These techniques were found to be technically unsatisfactory and excessively expensive. Later in 1989, a novel approach was developed using thin flat plates with holes and grooves to route the polymers. This process was very flexible and quite price effective. Producers:- worldwide, Japan and Korea led in bicomponent output with a total of 200 million pounds annually. The production (2004-April) of the US is currently around 60 million pounds with Hoechst Celanese holding the lead. Other US players in the Bicomponent sector include Foss manufacturing, International Polymers Inc. and Fiber Visions. The present production of bicomponent fibers worldwide is only a fraction of the 25 million metric tons of manmade fiber market, but the producers are confident of significant growth in the next 10 years or so. Polymers:- the polymers given below can be used as either of the components in the cross sections:- PET (polyester) – PEN polyester; Nylon 6,6 – PCT polyester; Polypropylene – PBT polyester; Nylon 6 – co-polyamides; Polylactic acid – polystyrene; Acetal – polyurethane; Soluble co polyester – HDPE, LLDPE. Production and Classification:- the main objective of producing Bicomponent fibers is to exploit capabilities not existing in either polymer alone. By this technique, it is possible to produce fibers of any cross sectional shape or geometry that can be imagined. Bicomponent fibers are commonly classified by their fiber cross-section structures as side-by-side, sheath-core, islands-in-the-sea and citrus fibers or segmented-pie cross-section types. Side-by-Side (S/S):- these fibers contain two components lying side-by-side (Fig.1). Generally, these fibers consist of two components divided along the length into two or more distinct regions. In most cases, the components must show very good adhesion to each other; otherwise, the process will result in obtaining of two fibers of different compositions. The way to connect the two components mechanically is described in patent literature and is shown in Fig.1. (h) And (i). Generally, there are several approaches for producing side-by-side bicomponent fibers:- (i) two components, either in the form of solution or melt, are fed directly to the spinneret orifices or are combined into bicomponent fibers near the orifices. (ii) Two components are first formed into multi-layered structure and slowly fed (without turbulence) in the orifices. The orifices are positioned so that they intersect the interfaces of various layers of the polymer. (iii) Two components are also formed into layered structure but the orifices do not follow exactly the interfaces, which leads to production of fibers of a wide range of compositions, varying from 100% of one component to 100% of the other through all intermediate possibilities. Two polymer components are slit-extruded into a layered film, which is then cut into stripes, drawn, cut into staple and fibrillated by a carding machine and then crimped by heat relaxation. Use of Side-By-Side Bicomponent Fibers:- side-by-side fibers are generally used as self-crimping fibers. There are several systems used to obtain a self-crimping fiber. One of them is based on different shrinkage characteristics of each component. All commercially available fibers are of this type. There have been attempts to produce self-crimping fibers based on different electrometric properties of the components; however, this type of self-crimping fiber is not commercially used. Some types of side-by-side fibers crimp spontaneously as the drawing tension is removed and others have 'latent' crimp, appearing when certain ambient conditions are obtained. Some literature mentions, 'reversible' and 'non-reversible' crimp, when reversible crimp can be eliminated as the fiber is immersed in water and reappears when the fiber is dried. This phenomenon is based on swelling characteristics of the components. Several factors are crucial to the fiber curvature development:- The difference in the shrinkage between the components, the difference between modulus of the components, the overall cross-sectional fiber shape and individual cross-sectional shapes of each component, and the thickness of the fiber. Different melting points on the sides of the fiber are taken advantage of when fibers are used as bonding fibers in thermally

bonded non-woven webs. The example of such bonding fibers is EA & ES of Chisso, Japan, with polyethylene as the low melting component (Tm = 110 °C), along with polypropylene. Side-by-side fibers have also been reported to be a base fiber for producing so called 'Splittable' Fibers, which split in a certain processing stage, yielding fine filaments of a sharp-edged cross section. One of the components could be removed by dissolving or the fiber could split by just heating and the fiber would split by a flexion action. Sheath-Core (S/C) Fibers:- sheath-core Bicomponent fibers are those fibers where one of the components (core) is fully surrounded by the second component (sheath) (Fig. 2). Adhesion is not always essential for fiber integrity. This structure is employed when it is desirable for the surface to have the property of one of the polymers such as luster, dyeability or stability, while the core may contribute to strength, reduced cost and the like. A highly contoured interface between sheath and core can lead to mechanical interlocking that may be desirable in the absence of good adhesion. Sheath-Core Fiber Production:- the most common way of production of sheath-core fibers is a technique where two polymer liquids are separately led to a position very close to the spinneret orifices and then extruded in sheath-core form. In the case of concentric fibers, the orifice supplying the 'core' polymer is in the center of the spinning orifice outlet and flow conditions of core polymer fluid are strictly controlled to maintain the concentricity of both components when spinning. Eccentric fiber production is based on several approaches:- eccentric positioning of the inner polymer channel and controlling of the supply rates of the two component polymers; introducing a varying element near the supply of the sheath component melt; introducing a stream of single component merging with concentric sheath-core component just before emerging from the orifice; and deformation of spun concentric fiber by passing it over a hot edge. Other, rather different techniques to produce sheath-core fibers are coating of spun fiber by passing through another polymer solution and spinning of copolymer into a coagulation bath containing aqueous latex of another polymer. Modifications in spinneret orifices enable one to obtain different shapes of core or/and sheath within a fiber cross-section. There is considerable emphasis on surface tensions, viscosities and flow rates of component melts during spinning of these fibers. Use of Sheath-Core Bicomponent Fibers:- besides the sheath-core bicomponent fiber used as a crimping fiber, these fibers are widely used as bonding fibers in Nonwoven industry. The sheath of the fiber is of a lower melting point than the core and so in an elevated temperature, the sheath melts, creating bonding pints with adjacent fibers – either bicomponent or monocomponent. The first commercial application of sheath-core binding fiber (I.C.I. (British company) Heterofil) has been in carpets and upholstery fabrics. The newest trend in bicomponent fiber production is to focus on tailoring a fiber according to the customer's needs. A considerable emphasis was put on the processing optimization (depending strictly on machinery used) and on the desired look of the final product. It appears that concentricity/eccentricity of the core plays an important role. If the product strength is the major concern, concentric bicomponent fibers are used; if bulkiness is required at the expense of strength, the eccentric type of the fiber is used. Other uses of sheath-core fibers derive from characteristics of the sheath helping to improve the overall fiber properties. A sheath-core fiber has been reported whose sheath is made of a polymer having high absorptive power for water, thereby having obvious advantages for use in clothing. Other sheath-core fibers showed better dyeability, soil resistance, heat-insulating properties, adhesion etc. Production of ceramic sheath-core bicomponent fibers is another application utilizing the difference of sheath and core. The fiber precursors are first spun in a sheath-core arrangement and then cured by oxidation, UV and electron beam, heating or by chemical means. These fibers are used as a composite reinforcement. Matrix-Fibril Bicomponent Fibers:- these are also called Islands-In-The-Sea Fibers. Technically these are complicated structures to make and use. In cross section, they are areas of one polymer in a matrix of a second polymer. These types of bicomponent structure facilitate the generation of micro denier fibers. The 'islands' are usually a melt spinnable polymer such as nylon, polyester or polypropylene. Polystyrene water-soluble polyesters and plasticized or saponified polyvinyl alcohol can form the sea or matrix. The finer deniers that can be obtained are normally below 0.1 denier. Production of Matrix-Fibril Bicomponent Fibers:- basically, these fibers are spun from the mixture of two polymers in the required proportion; where one polymer is suspended in droplet form in the second melt. An important feature in production of matrix-fibril fibers is the necessity for artificial cooling of the fiber immediately below the spinneret orifices. Different spinnability of the two components would almost disable the spinnability of the mixture, except for low concentration mixtures (less than 20%). Use of Matrix-Fibril Bicomponent Fibers:- a matrix-fibril fiber called 'Source' is produced by Allied Chemicals Ltd. The fiber is based on PET fibrils embedded in a matrix of Nylon 6. The presence of PET fibrils is supposed to increase the modulus of the fiber, to reduce moisture regain, to reduce the dyeability, improve the texturing ability and give the fiber a unique lustrous appearance. The fine fibers produced by this method are used in synthetic leather, specialty wipes, ultra-high filtration media, artificial arteries and many other specialized applications. Segmented Pie Structure:- this structure as shown in Fig. 4 is commonly referred to as 'Segmented Pie Structure' or 'Citrus', Alternate pie or wedges are made of nylon and polyester. The fiber contains around 16 segments. The fibers are made in to web, carded, and fiber web is passed through high-pressure jet of air or water as to split the fibers. This splitting and entanglement makes the resultant fabric more strong. Sometimes it is difficult to split individual fibers, and in that case the hollow wedge structure is used as shown in Fig. 5 and Fig. 6. Sometimes, it becomes very difficult to card this fiber because of its different modulus properties. In order to overcome this problem their structure is a ltered as in Fig. 7 and Fig. 8. Polymer Blends:- polyblends, of polymer alloys, are defined as homogenous or heterogeneous mixtures of structurally different homopolymers or copolymers. The purpose of blending is either to improve processability or to obtain materials suitable for specific needs by tailoring one or more properties with minimum sacrifice in other properties. The behavior of polyblends may be expected to depend on the individual properties of the components in the blend, their relative proportions, degree of heterogeneity and the properties of the interface between the components. Several criteria are used to define the nature of polyblends:- (i) miscibility or compatibility; (ii) phase diagrams; (iii) relative moduli of the components; and (iv) the classification also depends on the polyblend method of manufacture (melt, solution and emulsion mixing). Homogenity of Blends:- two polymers are thermodynamically compatible when their free energy of mixing is negative. Because mixing of two materials is generally endothermic and the entropy of mixing long polymer chains is small, the free energy of mixing is rarely negative. This is the reason why blending two polymers usually leads to heterogeneous blend. If the blend shows homogenity, then the behavior of the blend behaves as a single polymer. Heterogeneous Blends:- in this more common category, two polymers are segregated into spatial regions composed essentially of one or the other pure component. Usually, the two polymers are immiscible but they can be compatible. Considerable emphasis is put on the adhesion between the phases of the blend because it is crucial factor for mechanical properties of the blend. Moduli of the Components:- the theory of modulus tailoring is mainly used in matrix-fibril type of bicomponent fibers. Classification based on the relative moduli of the two components depends to a great extent on the properties and use of the blends. For example, adding of a disperse phase of higher modulus generally increases the overall modulus and is frequently used to reduce the creep of elastomers. In contrast, adding of a low modulus polymer in the blend is generally used to improve the impact resistance and elongation-to-break of rigid plastics. Rheological Aspects of Bicomponent Fiber Production:- it is essential that the viscosities of both polymer fluids are of comparable value; otherwise, the higher viscosity component will not tend to rearrange during spinning causing the distortion of the distribution of the components in the cross section of the fiber. Considerable attention should be also paid to the rate of solidification of each component. It has been shown that during high speed spinning of PP/PET sheath-core fibers that the PET component achieved higher orientation than would be obtained if the fiber was just monocomponent, while PP component orientation was decreased. This phenomenon is explained in terms of difference in activation energy of the longitudinal viscosity and solidification temperature of both polymers. Applications in Nonwovens:- bicomponent fibers made of PP/PE are important material in the nonwoven market. The main applications include:- (i) nonwoven fabrics for diapers, feminine care and adult incontinence products (as top sheet, back sheet, leg cuffs, elastic waistband,

transfer layers); (ii) air-laid nonwoven structures are used as absorbent cores in wet wipes; and (iii) used in spun laced nonwoven products like medical disposable textiles, filtration products. / Индэстриз (Industries). Найлан (Nylon). Гомогенность или Однородность Смесей (Homogenity of Blends). жёлоб или паз (groove). влагопоглощательная способность (moisture regain). outlet = припуск сверх шва Бикомпонентное Волокно – химическое волокно, формуемое с помощью фильеры, к каждому отверстию которой поступают две или более массы, различающиеся по химическому составу полимера или вязкости. Бикомпонентное волокно приобретает извитость, обусловленную различной усадкой компонентов волокна. Смотрите также Композиционное Волокно (Composite Fiber).

BICOMPONENT YARNS = БИКОМПОНЕНТНАЯ ПРЯЖА – Bicomponent Yarns are formed from two or more polymers. The orifices of the spinnerets are separated by a partition into two or more sections, and a different spinning mixture is fed to each section. The yarns formed consist of several, chemically different parts. After drawing, they are subjected to heat treatment. The polymers exhibit different degrees of shrinkage, and the yarns thus acquire a crimp, greater bulk, and a loose structure. Bicomponent Yarns are the spun or filament yarns of two generic fibers or two variants of the same generic fiber. / филаментная (комплексная) пряжа (filament yarn). Бикомпонентная Пряжа или Двухкомпонентная Пряжа.

BICONSTITUENT FIBER = ДВУХСОСТАВНОЕ ВОЛОКНО – Biconstituent Fiber is a fiber extruded from a homogeneous mixture of two different polymers. Such fibers combine the characteristics of the two polymers into a single fiber. Biconstituent Fiber is made by mixing two different man-made generic fiber materials together in their fluid stage. Afterwards they are forced through a spinneret.

BICONVEX = ДВУСТОРОННЕВЫПУКЛЫЙ (или ДВОЯКОВЫПУКЛЫЙ) – Biconvex is a convex on both sides. / выпуклый с обеих сторон.

BICORNE = БИКОРН (или ТРЕУГОЛКА) – Bicorne is a cocked hat. / Под Бикорном, от Латинского слова Bicornis, означающее Двурогий, понимается шляпа с загнутыми боковыми полями. Прозвание Бахуса, которого представляли иногда с воловьим раздвоенным рогом в руке, в знак сосуда, из какого древние пивали. Термин ‘Бикорн’ применяется к изображениям двурогих Животных:- Барана, Быка, Козерога. Одним из самых известных примеров шляпы Бикорн была шляпа, которую носил Французский император Наполеон.

BID = ПРЕДЛОЖЕНИЕ НА ПОКУПКУ – A Bid is the price at which a market participant is prepared to buy a security. Opposite:- Ask. An offer to buy a specific quantity of a commodity at a stated price. The price at which the market maker guarantees to fill a sell order. A sell order placed at the market will usually be filled at the current bid price. The Bid Price is usually less than the Ask Price. The price at which a person is ready to buy. The highest price any buyer is willing to pay for a given asset at a given time; also called Bid Price. The price a potential buyer is willing to pay for an asset. Sometimes also used in the context of takeovers where one corporation is bidding for (trying to buy) another corporation. In trading, we have the bid-ask spread which is the difference between what buyers are willing to pay and what sellers are asking for in terms of price. Bid is the price at which a dealer is willing to buy. An expression of willingness to buy a commodity at a given price. The opposite of Offer. Bid is a willingness to buy a commodity at a specified price. / Выражение намерения купить товар по данной цене. В противоположность Оферта (Offer). Предложение на Покупку:- (1) Цена, предлагаемая потенциальным покупателем, которую он готов уплатить. Термин используется торговцами, которые формируют рынок, – маркет-мэйкеры (make a market), – наиболее крупными фирмами, предлагающими цены спроса и предложения (offer prices). Маркет-мэйкеры заявляют о своей готовности покупать или продавать данную ценную бумагу в крупных объёмах и устанавливают котировки цен; маклеры-специалисты (specialist) по определённым видам ценных бумаг выполняют те же функции непосредственно на бирже. (2) Предложение цены приобретения (tender offer) при попытке поглощения (takeover). (3) Любое предложение купить по определённой цене.

BID AND ASK = ЗАКУПОЧНАЯ И ПРОДАЖНАЯ – Bid And Ask:- often referred to as a Quotation or Quote. The bid is the highest price anyone wants to pay for an asset at a given time, the asked is the lowest price anyone will take at the same time. See also Quote. Bid And Ask are the highest price and lowest price that an investor will pay for a tradable. / Закупочная и Продажная:- предлагаемая цена – это наивысшая цена, которую возможный покупатель готов заплатить в конкретный момент времени за предлагаемый объём ценных бумаг; запрашиваемая цена – самая низкая возможная цена, приемлемая для возможного продавца тех же ценных бумаг. Вместе обе цены составляют котировку (quotation); разница между этими двумя ценами составляет курсовую разницу или спрэд (spread). Несмотря на то, что изменение предлагаемых и запрашиваемых цен является общим для всех торгов ценными бумагами, термин bid and asked обычно относится к некотирующимся на бирже ценным бумагам (unlisted securities), которые продаются на внеучётном рынке (over the counter).

BID–ASK SPREAD = КУРСОВАЯ РАЗНИЦА МЕЖДУ ПРЕДЛОЖЕНИЯМИ НА ПОКУПКУ И ПРОДАЖУ (или СПРЭД МЕЖДУ ПРЕДЛОЖЕНИЯМИ НА ПОКУПКУ И ПРОДАЖУ) – The Bid/Ask Spread is also known as the Bid/Offer Spread. In the financial markets the bid price is the price at which a dealer (market maker) will buy a particular security from an investor. The ask price is the price at which the dealer will sell that security to an investor. The difference between these prices is the spread. This bid/ask spread represents the profit margin for the dealer who trades in a security after allowing for any carrying cost that may be involved if the market is not liquid. In liquid markets (continual buying and selling) where there are always buyers for the security and trades are quickly concluded, carrying costs will be negligible. However, for some securities it may take a dealer some time to find a buyer and the carrying cost will be the interest earnings foregone by the dealer by tying up money in holding the security. As a general rule, the bid/ask spread for a liquid security, such as shares in a blue chip company, will be narrower than the spread for a share in a start up company. In the latter case the spread between bid and ask prices will be wider to compensate for the additional time the dealer will be tying up money in holding the security. Bid/ask spreads are customary in all financial markets, including shares, bonds, mutual funds, and currencies. The narrowest spreads are found in the currency markets, which are the most liquid. The spreads here will be measured in basis points (hundredths of a percent), whereas the spread for an illiquid company share may be measured in full percentage points of the asset’s value. In addition to volume of trade (liquidity), the spread for a security will be determined by the volatility of the asset’s price and also the volatility of the market in general. At times of market volatility all bid/ask spreads will widen. Individual securities with a history of sharp price changes will also have a wider spread than securities with more stable price characteristics. In the stock market the bid/ask spreads for low priced shares may be wider than for higherpriced shares. The low price may be an indicator of illiquidity in the market for that share. The share prices quoted in newspapers are usually the midpoint of the spread at the previous close of business. For the investor wishing to calculate the return on a security, it is important to ensure that performance is based on an ask to bid basis. A perfectly reversible security would allow the investor to move from cash into the security and back again without loss of value. Any security with a bid/ask spread is, therefore, imperfectly reversible. The market makers are responsible for maintaining an orderly market by providing continuous buying and selling prices. This can only be done by holding inventories of the securities, which requires the market makers to tie up capital. The bid/ask spread is their means of compensation for this essential activity. In open and competitive markets there may be variations in the bid/ask spreads from dealer to dealer for particular securities, but arbitrage will ensure they converge. With an exchange traded security the client may get a better

price than the indicated bid/ask spread as the dealers may improve the transaction price within the spread. With over the counter (OTC) deals the client will only deal at the quoted spread. Bid/ask spreads are not only found in spot markets (immediate trade) but also in forward markets. Thus a bank may quote a bid/ask spread on forward exchange rates. Once again this spread will be wider for currencies that are more difficult to trade. Tourists are familiar with an everyday example of the bid/ask spread when they buy currency for foreign travel. Banks and bureaux de change quote two prices depending on whether the tourist is buying or selling the foreign currency. The difference represents the profit to the dealer. As a general rule in any transaction the dealer gets the more attractive price and the investor/purchaser the less attractive price. The bid/ask spread is a valuable source of information for investment planning, providing insight into the liquidity and potential volatility of a security. Bid-Ask Spread is a difference between the best bid price and the best ask price for a security at any given time. The bid-ask spread shows the extent to which available bid and ask offers vary. The lower the spread, the greater the consensus between participants with respect to the value of the share in question. Narrow spreads represent a high degree of market liquidity and low transaction costs. / Курсовая Разница Между Покупкой и Продажей или Спрэд Между Покупкой и Продажей:- разница между ценами спроса (bid) и предложения. Термин asked (запрашиваемая цена, цена продавца) обычно используется во внебиржевой торговле (over the counter), термин offered (запрашиваемая цена, цена продавца) – в биржевой торговле. Цена продавца и цена покупателя составляют котировку (quotation) или курс (quote).

BID BOND = ОБЯЗАТЕЛЬСТВО ПРЕДЛОЖЕНИЯ НА ПОКУПКУ – Bid Bond is a bond, guarantee, or standby letter of credit that accompanies a bid, issued for an amount that will be forfeited if the bidder wins the bid but then reneges. Expression common in export financing. A party, usually a bank, guarantees under a bid bond (on the instructions of the seller) to pay part of the bid price (about 5–10%) in case the seller, after acceptance of the bid by the buyer, is not willing or able to conclude the corresponding delivery or performance contract or provide the necessary performance guarantee. Bid Bond is used primarily in export business, with project tenders. Bid bond has purpose to secure any claims by the party inviting the tender on the tenderer in the event of withdrawal of the bid before its expiry date or if the bid is modified unilaterally – or if the tenderer, upon being awarded the contract, refuses to sign the contract or provide further guarantees on request. Guarantee amount is in general 2% to 5% of the value of the contract. This guarantee usually has short term. Quite often the party inviting tenders cannot complete the evaluation of the bids submitted within the specified time. In general the tenderers are then asked to extend the duration of their guarantees. The following associated risks should not be underestimated:- changes in the market; changes in the price structure; inflation; etc. Bid bonds often lead to other obligations, e.g., advance payment guarantees and performance bonds. In international business, 'pay or extend' claims are quite often made under guarantees. This simply extends the validity of the guarantee. Also known as Bid Guarantee, Tender Bond, and Tender Guarantee.

BIDENTATE = ДВУЗУБЧАТОЕ (или УДВОЕННОЗУБЧАТОЕ) – Bidentate:- having two teeth.

BIDIRECTIONAL FABRIC = ДВУНАПРАВЛЕННАЯ ТКАНЬ – Bidirectional Fabric is a fabric having reinforcing fibers in two directions, i.e. in the warp (machine) direction and filling (cross-machine) direction. / в направлении уточин.

BID PRICE = ПРЕДЛАГАЕМАЯ ЦЕНА ПОКУПКИ (или ЦЕНА ПРЕДЛОЖЕНИЯ НА ПОКУПКУ) – Bid Price:- in securities trading this is generally understood to be the highest price at which a market participant is willing to buy. In Germany the price addendum G stand for bid (demand), meaning that despite demand for the paper, no seller was found at the given price. Opposite:- Ask Price. The price at which someone is prepared to buy shares (opposite to offer). Bid Price is a price which a buyer offers for the purchase of securities, foreign exchange or foreign bank notes. In other words, the price or terms at which a person is willing to buy. Also known as Buying Price. The opposite of Asked Price. Bid Price is the price at which a market maker offers to buy a security. / Цена, которую предлагает покупатель за приобретение ценных бумаг, иностранной валюты или зарубежных банковских билетов. Иными словами, цена или порядки по которым лицо изъявляет желание купить. Известна также как Цена Покупки (Buying Price). В противовес Цене Xxxxx (Asked Price).

BID RATE = ПРЕДЛАГАЕМЫЙ КУРС ПОКУПКИ (или СТАВКА ПРЕДЛОЖЕНИЯ НА ПОКУПКУ) – Bid Rate:- an expression indicating the desire to buy at a certain price. / Выражение, указывающее на желание купить по определённой цене.

BIDS = BANGLADESH INSTITUTE OF DEVELOPMENT STUDIES

BIENNIAL = ДВУЛЕТНИК (или ДВУЛЕТНЕЕ) – Biennial is a Plant that typically lives two years from sowing, usually flowering in the second year. Biennial is a Plant which completes its life cycle within two years after germination. / Под Двулетними Растениями или Двулетниками понимаются Растения, живущие два вегетационного периода. В 1-й год у них развиваются лишь вегетативные органы, во 2-й – кроме вегетативных органов цветки и плоды. После плодоношения всё растение отмирает. К Двулетним Растениям относится Капуста, Морковь, Репа, Свёкла и другие культурные Растения, а также многие дикорастущие Травы (например, Лекарственный Донник, Пашенный Клевер, Лопух и другие). Под Двулетниками понимаются Растения, живущие два года. В первый год развиваются лишь вегетативные органы, а во второй, кроме того, – ещё цветки и плоды, после чего растения погибают. Двулетники – Капуста, Морковь, Репа, многие декоративные и другие Растения.

BIENNIAL WEEDS = СОРНЯКИ ДВУЛЕТНИКИ (или ДВУЛЕТНИЕ СОРНЯКИ) – Biennial Weeds are the Weeds that complete their life cycle in two years.

BIF = BANK INSURANCE FUND

BIF = BURUNDIAN FRANC

BIFAD = BOARD FOR INTERNATIONAL FOOD AND AGRICULTURAL DEVELOPMENT

BIFID = РАЗДВОЕННОЕ (или ДВУРАЗДЕЛЬНОЕ, или ДВУНАДРЕЗНОЕ) – Bifid:- cleft or divided into two parts. / расщеплённое или разделённое на две части.

BIFUNCTIONAL REACTIVE DYE = БИФУНКЦИОНАЛЬНЫЙ РЕАКТИВНЫЙ КРАСИТЕЛЬ (или ДВУХФУНКЦИОНАЛЬНЫЙ АКТИВНЫЙ КРАСИТЕЛЬ) – Bifunctional Reactive Dye is a reactive dye that has more than one type of reactive group in the molecule. These reactive dyes are designed to have the ability to react with the fiber in more than one way. This increases how much of the dye in the bath is actually fixed to the fiber, rather than being wasted through hydrolysis. Although the dye can react with the fiber in more than one way, the reaction does not happen as easily as with the popular MX family, so the temperature used is typically around 60 °C (140 °F). These dyes may be preferred to MX dyes by industrial users because of the lower waste (less effluent treatment cost) and lower reactivity, which can mean easier process control.

BIFURCATE = БИФУРКАЦИЯ – Bifurcate:- split in two. / Под Бифуркацией, от Латинского слова Bifurcus, означающее Раздвоенный, раздвоение, вилообразное разделение, например, трахеи на 2 главных бронхах.

BIG 4 = БОЛЬШАЯ 4 (или БОЛЬШАЯ ЧЕТВЁРКА) – Big 4 is the largest public accounting firms:- (i) Deloitte & Touche, (ii) Ernst & Young, (iii) KPMG, and (iv) PriceWaterhouseCoopers. The Big Four are the four largest international professional services networks in accountancy and professional services, offering audit, assurance, tax, consulting, advisory, actuarial, corporate finance and legal services. They handle the vast majority of audits for publicly traded companies as well as many private companies, creating an oligopoly in auditing large companies. It is reported that the Big Four audit all but one of the companies that constitute the FTSE 100, and 240 of the companies in the FTSE 250, an index of the leading mid-cap listing companies. This group was once known as the 'Big Eight' (Arthur Andersen (until its destruction in 2002 for its part in the Enron scandal); Arthur Young & Co.; Coopers & Lybrand (until 1973 Cooper Brothers in the UK and Lybrand, Ross Bros., & Montgomery in the US); Ernst & Whinney (until 1979 Ernst & Ernst in the US and Whinney Murray in the UK); Deloitte Haskins & Sells (until 1978 Haskins & Sells in the US and Deloitte & Co. in the UK); Peat Marwick Mitchell (later Peat Marwick, then KPMG); Price Waterhouse; and Touche Ross), and was reduced to the 'Big Six' () and then 'Big Five' by a series of mergers. The Big Five became the Big Four after the demise of Arthur Andersen in 2002, following its involvement in the Enron scandal. None of the Big Four accounting firms is a single firm – rather, they are accounting networks. Each is a network of firms, owned and managed independently, which have entered into agreements with other member firms in the network to share a common name, brand and quality standards. Each network has established an entity to co-ordinate the activities of the network. In one case (KPMG), the co-ordinating entity is Swiss, and in three cases (Deloitte Touche Tohmatsu, PricewaterhouseCoopers and Ernst & Young) the co-ordinating entity is a UK limited company. Those entities do not themselves practice accountancy, and do not own or control the member firms. They are similar to law firm networks found in the legal profession. In many cases each member firm practises in a single country, and is structured to comply with the regulatory environment in that country. In 2007 KPMG announced a merger of four member firms (in the United Kingdom, Germany, Switzerland and Liechtenstein) to form a single firm. Ernst & Young also includes separate legal entities which manage three of its four areas: Americas, EMEIA (Europe, The Middle East, India and Africa), and Asia-Pacific. Note:- the Japan area does not have a separate area management entity. These firms coordinate services performed by local firms within their respective areas but do not perform services or hold ownership in the local entities. The figures in this article refer to the combined revenues of each network of firms. In the wake of industry concentration and individual firm failure, the issue of a credible alternative industry structure has been raised. The limiting factor on the growth of additional firms is that although some of the firms in the next tier have become quite substantial, and have formed international networks, effectively all very large public companies insist on having a 'Big Four' audit, so the smaller firms have no way to grow into the top end of the market. Documents published in June 2010 show that some UK companies' banking covenants require them to use one of the Big Four. This approach from the lender prevents accounting firms in the next tier from competing for audit work for such companies. The British Bankers' Association said that such clauses are rare. Current discussions in the UK consider outlawing such clauses. In 2011,The UK House of Lords completed an inquiry into the financial crisis, and called for an Office of Fair Trading investigation into the dominance of the Big Four. It is reported that the Big Four audit all but one of the companies that constitute the FTSE 100, and 240 of the companies in the FTSE 250, an index of the leading mid-cap listing companies. In Ireland, the Director of Corporate Enforcement, in February 2011 said, auditors 'report surprisingly few types of company law offences to us', with the so-called 'Big Four' auditing firms reporting the least often to his office, at just 5pc of all reports.

BIG BAG = МЯГКИЙ КОНТЕЙНЕР (или ОГРОМНЫЙ МЕШОК, или БИГ БЭГ) – Big Bags are gaining in popularity as means of transportation, storage and handling. Fast, easy and reliable shift of ingredients is of great importance and significantly contributes to the reduction of production cost, especially in cases of frequent changes in products. More than 2.4 billion tons of cement are produced per year. About 35% to 40% of this total is filled into bags, about 10% to 20% into big bags with a capacity of 1 t to 1.5 t. Before they can be processed on the building site, these diverse containers have to be discharged into the storage or working silos near the cement mixing plant – eliminating dust as far as possible. Since the big bags are too heavy to be emptied manually, an automatic big bags emptying plant is used. The rate of big bag emptying and opening relates to the handling process on site. Generally, it takes about three minutes to handle a big bag, i.e. to transport it to the emptying point, open it, empty it and dispose of the empty big bag. So it is possible to empty about 20 or even 25 big bags an hour per station. With a capacity of one to one and a half tons, this makes a total throughput of 20 t/h to 30 t/h. he big bags are transported to the emptying station using a forklift truck or crane to lift the big bags onto the discharge hopper. There is a big bag centring device mounted on the top to fix it to the discharge position. The big bag is then lowered onto the slitting blade under its own weight, and its bottom is slit open automatically. The opening diameter is 650 mm. The big bag is gradually raised with slight vibration to empty it, then lifted off with a forklift or crane, and set aside. The effective discharge time of three minutes per big bag depends on local handling systems and the flow characteristics and quality of the product contained in the big bag. The big bag emptying units comprise a lump breaker and a pneumatic conveyor to convey the discharged product straight to storage or working silos. The big bag emptying unit can be mobile or stationary. A third version omits the pneumatic conveyor. Bulk transport vehicles are filled with a fitted screw conveyor. Also known as Jumbo Bag. See also Flexible Intermediate Bulk Container. / Затарка/растарка контейнера . должны быть разгружены в хранилище или .

BIG BANKS = КРУПНЫЕ БАНКИ – Big Banks is a term customarily applied in many countries to the category of large commercial banks operating on an international scale. / Термин, применяемый обычно во многих странах с целью выделения категории крупных коммерческих банков действующих в международном масштабе.

BIG FIGURE = БОЛЬШАЯ ФИГУРА – A term Big Figure refers normally to the first three digits of an exchange rate that dealers treat as understood in quoting. For example a quote of '30/40' on Euro Dollar could indicate a price of 1.3530/40. / Данный термин относится к первым трём цифрам обменного курса, которые рассматриваются дилерами в качестве подразумеваемых при котировании. Например, котировка '30/40' по валютной паре Евро Доллар могла бы указывать цену в 1.3530/40.

BIGGIN = ЧЕПЧИК – Biggin:- a child's cap; nightcap. / ; ночной колпак.

BIKINI = БИКИНИ – Bikini is a woman's scanty. (I do not know if scanty is a good way to put it. Lets put it this way, it has less material then a one piece bathing suit.) Known as a Two-Piece Bathing Suit; a man's brief swimsuit; a man's or woman's low-cut briefs. Swimwear.

BILABIATE = ДВУГУБОЕ – Bilabiate:- with two lips. / Двугубое:- с двумя губами.

BILATERAL = БИЛАТЕРАЛЬНОЕ (или ДВУСТОРОННЕЕ) – (1) Bilateral:- with equal sides, e.g., bilaterally symmetric. / латеральный (lateral), от Латинского слова Laterus, от Latus, родительный падеж Lateris, означающее Сторона.

(2) Bilateral is a contract term meaning both parties agree to provide something for the other. / Контрактный термин, обозначающий, что обе стороны согласны обеспечить что-то друг для друга. Под Билатеральным, от приставки Би и Латинского слова Lateralis, означающее Боковой, понимается двусторонний, двубокий, относящийся к обеим (двум) сторонам, частям чего-либо. Например, билатеральный договор, билатеральная симметрия.

BILATERAL AGREEMENT = БИЛАТЕРАЛЬНОЕ СОГЛАШЕНИЕ (или ДВУСТОРОННЕЕ СОГЛАШЕНИЕ) – Bilateral Agreement (in electricity) is an agreement between two parties for the sale and delivery of a service.

BILATERAL FIBER = БИЛАТЕРАЛЬНОЕ ВОЛОКНО (или ДВУСТОРОННЕЕ ВОЛОКНО) – Bilateral Fibers are two generic fibers or variants of the same generic fiber extruded in a side-by-side relationship. / .

BILATERALLY AGREED ACCOUNT = СЧЁТ, СОГЛАСОВАННЫЙ В ДВУСТОРОННЕМ ПОРЯДКЕ – Bilaterally Agreed Account is an account used for reimbursement under actual or implied agreement.

BILATERAL NETTING = ДВУСТОРОННИЙ ВЗАИМОРАСЧЁТ (или ДВУСТОРОННЕЕ СВЕДЕНИЕ, или ДВУСТОРОННИЙ НЭТИНЬГ) – Bilateral Netting:- agreement between two counterparties whereby the value of all in-the-money contracts is offset by the value of all out-of-the money contracts, resulting in a single net exposure amount owed by one counterparty to the other. Bilateral netting can be multi-product and encompass portfolios of swaps, interest rate options, and forward foreign exchange. Bilateral Netting is consolidating cash flows from two different contracts or instruments. System in which two companies offset their payments and receipts with each other month and then make a single payment and receipt, thus reducing paperwork and bank charges. / взаиморасчёт или сведение (netting) .

BILATERAL TRANSPORT AGREEMENT = ДВУСТОРОННЕЕ СОГЛАШЕНИЕ О ПЕРЕВОЗКАХ – Bilateral Transport Agreement is an agreement between two nations concerning their transport relation. / Соглашение между двумя странами, касающееся вопросов перевозки между ними.

BILDERBERG GROUP = БИЛДЭРБЭРЬХСКАЯ ГРУППА – The Bilderberg Group, Bilderberg conference, or Bilderberg Club is an annual, unofficial, invitation-only conference of approximately 130 guests, most of whom are people of influence in the fields of politics, banking, business, the military and media. The names of attendees are made available to the press. The conferences are closed to the public and the media, and no press releases are issued. The original conference was held at the Hotel de Bilderberg, at Oosterbeek near Arnhem in the Netherlands, from 29 May to 31 May 1954. It was initiated by several people, including Polish politician Józef Retinger, concerned about the growth of anti-Americanism in Western Europe, who proposed an international conference at which leaders from European countries and the United States would be brought together with the aim of promoting atlanticism – better understanding between the cultures of the United States and Western Europe to foster cooperation on political, economic, and defense issues. Retinger approached Prince Bernhard of the Netherlands, who agreed to promote the idea, together with Belgian Prime Minister Paul Van Zeeland, and the head of Unilever at that time, Dutchman Paul Rijkens. Bernhard in turn contacted Walter Bedell Smith, then head of the CIA, who asked Eisenhower adviser Charles Douglas Jackson to deal with the suggestion. The guest list was to be drawn up by inviting two attendees from each nation, one of each to represent conservative and liberal points of view. Fifty delegates from 11 countries in Western Europe attended the first conference, along with 11 Americans. The success of the meeting led the organizers to arrange an annual conference. A permanent Steering Committee was established, with Retinger appointed as permanent secretary. As well as organizing the conference, the steering committee also maintained a register of attendee names and contact details, with the aim of creating an informal network of individuals who could call upon one another in a private capacity. Conferences were held in France, Germany, and Denmark over the following three years. In 1957, the first US conference was held in St. Simons, Georgia, with USD30 000.00 from the Ford Foundation. The foundation supplied further funding for the 1959 and 1963 conferences. Meetings are organized by a steering committee with two members from each of approximately 18 nations. Official posts, in addition to a chairman, include an Honorary Secretary General. There is no such category in the group's rules as a 'member of the group'. The only category that exists is 'member of the Steering Committee'. In addition to the committee, there also exists a separate advisory group, though membership overlaps. Dutch economist Ernst van der Beugel became permanent secretary in 1960, upon Retinger's death. Prince Bernhard continued to serve as the meeting's chairman until 1976, the year of his involvement in the Lockheed affair. The position of Honorary American Secretary General has been held successively by Joseph E. Johnson of the Carnegie Endowment, William Bundy of Princeton, Theodore L. Eliot, Jr., former US Ambassador to Afghanistan, and Casimir A. Yost of Georgetown's Institute for the Study of Diplomacy. A 2008 press release from the American Friends of Bilderberg stated that 'Bilderberg's only activity is its annual Conference. At the meetings, no resolutions are proposed, no votes taken, and no policy statements issued' and noted that the names of attendees were available to the press. The Bilderberg group's unofficial headquarters is the University of Leiden in the Netherlands. According to the American Friends of Bilderberg, the 2008 agenda dealt 'mainly with a nuclear free world, cyber terrorism, Africa, Russia, finance, protectionism, US-EU relations, Afghanistan and Pakistan, Islam and Iran'. Historically, attendee lists have been weighted towards bankers, politicians, and directors of large businesses. Heads of state, including Juan Carlos I of Spain and Queen Beatrix of the Netherlands, have attended meetings. Prominent politicians from North America and Europe are past attendees. In past years, board members from many large publicly-traded corporations have attended, including IBM, Xerox, Royal Dutch Shell, Nokia and Daimler. The 2009 meeting participants in Greece included:- Greek prime minister Kostas Karamanlis; Finnish prime minister Matti Vanhanen; Sweden foreign minister Carl Bildt; United States Deputy Secretary of State James Steinberg; US Treasury Secretary Timothy Geithner; World Bank president Robert Zoellick; European Commission head José Manuel Barroso; Queen Sofia of Spain; and Queen Beatrix of the Netherlands. In a European Parliament session in Brussels, Mario Borghezio, an Italian member of the European Parliament, questioned the nominations of Bilderberg and Trilateral attendees for the posts of EU President and EU foreign minister. In 2009 the group had a dinner meeting at Castle of the Valley of the Duchess in Brussels on 12 November with the participation of Herman Van Rompuy, who later became the President of the European Council. Because of its secrecy and refusal to issue news releases, the Bilderberg group is frequently accused of political conspiracies. This outlook has been popular on both extremes of the ideological spectrum, even if they disagree on what the group wants to do. Left-wingers accuse the Bilderberg group of conspiring to impose capitalist domination, while some right-wing groups such as the John Birch Society have accused the group of conspiring to impose a world government and planned economy. For decades, the exclusive roster of globally influential figures who attend Bilderberg conferences has captured the interest of an international network of conspiracists, who are convinced powerful elites and secret societies are moving the planet toward a 'new world order'. Their populist worldview, characterized by a deep and angry suspicion of the ruling class rather than any prevailing partisan or ideological affiliation, is widely articulated on overnight AM radio shows and a collection of Internet websites. The video sharing website YouTube alone is home to thousands of Bilderberg-related videos. Proponents of Bilderberg conspiracy theories in the United States include individuals and groups such as the John Birch Society, political activist Phyllis Schlafly, writer Jim Tucker, political activist Lyndon LaRouche, radio host Alex Jones, and politician Jesse Ventura, who made the Bilderberg group a topic of a 2009 episode of his TruTV series Conspiracy Theory with Jesse Ventura. Other proponents include Russian-Canadian writer Daniel Estulin, British writer David Icke, and former Cuban president Fidel Castro. Denis Healey, a Bilderberg founder and, for 30 years, a steering committee member, has said:- 'To say we were striving for a one-world government is exaggerated, but not wholly unfair. Those of us in Bilderberg felt we couldn't go on forever fighting one another for nothing and killing people and rendering millions homeless. So we felt that a single community throughout the world would be a good thing'. In 2005 then-chairman Étienne Davignon discussed these accusations with the BBC:- 'It is unavoidable and it doesn't matter. There will always be people who believe in conspiracies but things happen in a much more

incoherent fashion ... When people say this is a secret government of the world I say that if we were a secret government of the world we should be bloody ashamed of ourselves'. Before the 2001 meeting, a report in The Guardian stated:- '... the press have never been allowed access and all discussions are under Chatham House rules (no quoting). Not surprisingly, such ground rules, while attracting publicity-shy financiers, have also fuelled the fantasies of conspiracy theorists'. Jonathan Duffy, writing in BBC News Online Magazine, states:- 'No reporters are invited in and while confidential minutes of meetings are taken, names are not noted... In the void created by such aloofness, an extraordinary conspiracy theory has grown up around the group that alleges the fate of the world is largely decided by Bilderberg'. Investigative journalist Chip Berlet argues that right-wing populist conspiracy theories about the Bilderberg group date back as early as 1964 and can be found in the writings of Schlafly. In Berlet's 1994 report Right Woos Left, published by Political Research Associates, he writes:- 'The views on intractable godless communism expressed by Schwarz were central themes in three other bestselling books which were used to mobilize support for the 1964 Barry Goldwater campaign. The best known was Phyllis Schlafly's A Choice, Not an Echo, which suggested a conspiracy theory in which the Republican Party was secretly controlled by elitist intellectuals dominated by members of the Bilderberger Group, whose policies would pave the way for global communist conquest'. In late August 2010, the Bilderberg group and conspiracy theories about its real purpose were featured in international news because of the visit of Estulin to Cuba on 26 August. Estulin has written two books about the Bilderberg Group in which he accuses them of manipulating the public 'to install a world government that knows no borders and is not accountable to anyone but its own self'. When in Cuba, Estulin met with Cuban president Castro, who had just written several articles for the newspaper Granma citing Estulin's work. The meeting and Estulin's writings have been given extensive coverage in the Cuban press. This coverage has, in turn, been picked up by media outlets worldwide. Some Marxists, such as the members of the US Party for Socialism and Liberation, are concerned, however, that the publicity given to Estulin and his ideas could have a disorienting effect on some in socialist and progressive movements around the world. They view Estulin's writings as anti-Marxist, truly reductive of history, and rooted in extreme right-wing conspiracy theories that lack factual support. G. William Domhoff, a research professor in psychology and sociology who studies theories of power, sees the role of social clubs such as the Bilderberg group as being nothing more than a means to create social cohesion within a power elite. He adds that this understanding of clubs such as the Bilderberg group fits with the perceptions of the members of the elite. In a 2004 interview with New Internationalist magazine, Domhoff warns progressives against getting distracted by conspiracy theories which demonize and scapegoat such clubs. He argues that the opponents of progressivism are conservatives within the corporate elite and the Republican Party. It is more or less the same people who belong to clubs such as the Bilderberg group, but it puts them in their most important roles, as capitalists and political leaders, which are visible and therefore easier to fight. Bilderberg Conference is annual three-day conference attended by about 100 of Europe's and North America's most influential bankers, economists, politicians, and government officials. The conference, held in a different Western country each year, is conducted in an atmosphere of rigid secrecy. The conference provides a private, informal environment in which those who influence national policies and international affairs can get to know each other and discuss without commitment their common problems. After each conference a private report of the meeting is circulated only to past and present participants, and in the report speakers are identified only by their country. The conferences were initiated by Prince Bernhard of The Netherlands and took their name from the hotel at Oosterbeek, The Netherlands, where the first conference was held in 1954. An international steering committee generally selects different delegates each year. Bilderberg takes its name from the hotel in Holland, where the first meeting took place in May 1954. That pioneering meeting grew out of the concern expressed by leading citizens on both sides of the Atlantic that Western Europe and North America were not working together as closely as they should on common problems of critical importance. It was felt that regular, off-the-record discussions would help create a better understanding of the complex forces and major trends affecting Western nations in the difficult post-war period. The Cold War has now ended. But in practically all respects there are more, not fewer, common problems – from trade to jobs, from monetary policy to investment, from ecological challenges to the task of promoting international security. It is hard to think of any major issue in either Europe or North America whose unilateral solution would not have repercussions for the other. Thus the concept of a European-American forum has not been overtaken by time. The dialogue between these two regions is still – even increasingly – critical. What is unique about Bilderberg as a forum is:- (i) the broad cross-section of leading citizens that are assembled for nearly three days of informal and off-the-record discussion about topics of current concern especially in the fields of foreign affairs and the international economy; (ii) the strong feeling among participants that in view of the differing attitudes and experiences of the Western nations, there remains a clear need to further develop an understanding in which these concerns can be accommodated; and (iii) the privacy of the meetings, which has no purpose other than to allow participants to speak their minds openly and freely. In short, Bilderberg is a small, flexible, informal and off-the-record international forum in which different viewpoints can be expressed and mutual understanding enhanced. Bilderberg's only activity is its annual Conference. At the meetings, no resolutions are proposed, no votes taken, and no policy statements issued. Since 1954, fifty-seven conferences have been held. For each meeting, the names of the participants as well as the agenda are made Public and available to the press. Invitations to Bilderberg conferences are extended by the Chairman following consultation with the Steering Committee members. Participants are chosen for their experience, their knowledge, their standing and their contribution to the selected agenda. There usually are about 120 participants of whom about two-thirds come from Europe and the balance from North America. About one-third is from government and politics, and two-thirds from finance, industry, labor, education and communications. Participants attend Bilderberg in a private and not an official capacity. Bilderberg is governed by a Steering Committee which designates a Chairman; members are elected for a term of four years and can be re-elected. There are no other members of the Bilderberg conference. The Chair's main responsibilities are to chair the Steering Committee and to prepare with the Steering Committee the conference program, the selection of participants. He also makes suggestions to the Steering Committee regarding its composition. The Executive Secretary reports to the Chairman. Bilderberg Group:- secret lobbying for Anti-Democratic European Superstate by Western Elite. Founded in 1954, the Bilderberg Group holds 'by invitation only' annual meetings of the rich and powerful. About two-thirds of the attendees are European, the rest American. Informally named for the site of the group's first meeting, the Hotel de Bilderberg in Oosterbeek, Netherlands. Origins of Bilderberg:- the initiative for the first convocation came from Joseph Retinger, in conjunction with Paul Rijkens, President of Unilever. Retinger has already been introduced; and the significance of Unilever needs to be examined briefly. Unilever is one of the largest and most powerful multinational corporations in the world and one of the top European capitalist companies. In the 1950's the advisory directors of Unilever were as follows (and I'm drawing attention to the links with the Rotterdam Bank and Philips, the electrical firm):- Hans Max Hirschfeld:- also on the board of Philips and Rotterdam Bank and with the Dutch Ministry of Economic Affairs during the war, and after it Commissioner for the Marshall Plan in the Netherlands; Karel Paul Van der Mandele, also on the board of Rotterdam Bank; Paul Rijkens:- also on the board of Rotterdam Bank; H.L. Wolterson:- also chair of Philips and on the board of Heldring and Pearson (linked with the Rotterdam Bank); and P.S. Frans Otten:- also President of Philips (and married to a member of the Philips family). One of the unusual features of Unilever is its bi-national structure (Stokman et al, 1985):- it is a jointly-owned AngloDutch company, with a 50/50 structure and a unitary board. This was a very useful device during the war, when operations could be shifted easily from the Netherlands to the United Kingdom. Philips had a similar arrangement under a Dutch law called the Corvo Law, whereby in an emergency it could divide itself into two parts, which it did when the Germans invaded:- one with its HQ in Germany and the other American. Both these parts got large military contracts during the war, playing a role on both sides. Unilever's financial advisers are the US investment bank Lazard Freres,

which handles the private financial affairs of many of the world's wealthy families, including the Agnellis of Fiat. (See Koenig, 1990, Reich. 1983, Business Week June 18 1984). Unilever's chief adviser on international affairs was David Mitrany, whose book, A Working Peace System, published in 1943, secured him this post. (He also worked for Chatham House). it was Mitrany who coined the term 'functionalism' to refer to the strategy of supra-national integration through a series of sectoral processes of internationalisation, designed to set in motion an autonomous logic, making inevitable further integration and ultimately making national states obsolete. In the post-war period there were three basic models for European union:- alongside the 'functionalists' (in this sense), were the 'inter-governmentalists' (e.g., Spaak) and the 'federalists' (e.g., Monnet himself). In the 1960s the functionalists used the slogan 'Atlantic Partnership' as the framework for the integration or synchronization of US and European interests. The immediate chain of events leading to the setting up of the first conference was as follows. Prince Bernhard set off for the USA in 1952 to visit his old friend Walter Bedell Smith, director of the newly-formed CIA. Smith put the organisation of the American end into the hands of Charles D. Jackson (special assistant for psychological warfare to the US President), who appointed John S. Coleman (president of the Burroughs Corporation. and a member of the Committee for a National Trade Policy), who in turn briefly became US chair of Bilderberg. Charles Jackson was president of the Committee for a Free Europe (forerunner of the Congress for Cultural Freedom (CCF) whose extensive operations financing and organising anti-Communist social democratic political intellectuals has only recently been fully documented (see Coleman 1989); and ran the CIA-financed Radio Free Europe in Germany. Earlier he had been publisher of Fortune magazine and managing director of Time/Life, and during the war was deputy head of psychological warfare for Eisenhower. At the time of Bernhard's visit he was working with a committee of businessmen on both sides of the Atlantic which approved the European Payments Union. It was thus a European initiative, and its aim was, in official bland language, to 'strengthen links' between Western Europe and the USA. A selected list of people to be invited to the first conference was drawn up by Retinger, with Prince Bernhard and Rijkens, from the European countries of NATO plus Sweden. The resulting group consisted of the Belgian and Italian prime ministers, Paul van Zeeland and Alcide de Gasperi (CDU), from France both the right wing prime minister Antoine Pinay and the Socialist leader Guy Mollet; diplomats like Pietro Quaroni of Italy and Panavotis Pipinelis of Greece; top German corporate lawyer Rudolf Miller and the industrialist Otto Wolff von Amerongen and the Danish foreign minister Ole Bjorn Kraft (publisher of Denmark's top daily newspaper); and from England came Denis Healey and Hugh Gaitskell from the Labour Party, Robert Boothby from the Conservative Party, Sir Oliver Franks from the British state, and Sir Colin Gubbins, who had headed the Special Operations Executive (SOE) during the war. On the American side, the members of the first Bilderberg assembly included:- (i) George Ball, who was head of Lehman Brothers, a former high State Department official, where he was architect of the policy of Atlantic Partnership, and later member of the Trilateral Commission. Ball was closely associated with Jean Monnet, owing to his work as legal counsel for the ECSC and the French delegation to the Schuman Plan negotiations. (ii) David Rockefeller was the key American member of Bilderberg. Space only permits the briefest sketch of his direct economic and political involvements:- head of the Chase Manhattan Bank, member of the Council on Foreign Relations, member of the Business Council, the US council of the International Chamber of Commerce, and, of course, the founder of the Trilateral Commission. (iii) Dean Rusk:- US Secretary of State 1961–69, earlier President of the Rockefeller Foundation 1952–60, having succeeded John Foster Dulles, himself an earlier Secretary of State and – this is not at all a coincidence – a close personal friend of Jean Monnet whom he had first met at Versailles in 1918 as well as of Dean Acheson, Truman's Secretary of State and the true author of the Marshall Plan. The final list was 67. Since then, the group enlarged somewhat, but the steering group remained the same size. After Retinger's death in 1960, the role of secretary was taken over by E.H. van der Beugel, who had headed the Dutch bureau for the Marshall Plan and later became president of KLM airlines and the International Institute for Strategic Studies in London. After the resignation of Prince Bernhard, the role of chair was taken by British ex-prime minister Lord Home. The status of the group and its meetings is ostensibly 'private'. Gill names it simply 'a private international relations council', but nothing could be more misleading than this name private, unless in its sense of 'secret' When political leaders gather together with a view to arriving at consensus, in conjunction with leaders of industry and finance and press magnates and leading journalists, then this is not the same kind of thing as an assembly of ordinary private citizens. The vocabulary of pluralist political science ('lobbies', 'non-governmental organisations', etc) systematically distorts the actual power relations at work in these different kinds of associations. It is even questionable whether Bilderberg meetings are really 'private' in the legal sense of non-governmental. Robert Eringer, for example, having received an official reply that 'government officials attend in a personal and not an official capacity', found that in fact officials had attended Bilderberg conferences at government expense and in their official capacity. The British Foreign Office responded to his queries by saying 'we can find no trace of the Bilderberg Group in any of our reference works on international organisations', while he later learnt that the Foreign Office had paid for British members to attend Bilderberg conferences. Van der Pijl's assessment of the role of Bilderberg seems about as accurate as the available information would allow:- 'Rather than constituting an all-powerful secret Atlantic directorate, Bilderberg served, at best, as the environment for developing ideas in that direction, and secrecy was necessary for allowing the articulation of differences rather than for keeping clear-cut projects from public knowledge. In this sense Bilderberg functioned as the testing ground for new initiatives for Atlantic unity'. But on occasions the group is known to have exerted real power. An (unnamed) German participant at the 1974 conference held six months after the Arab Israeli War at Edmond de Rothschild's hotel at Megeve in France, commented:- 'Half a dozen knowledgeable people had managed, in effect, to set the world's monetary system wolfing again (after OPEC's quadrupling of oil prices), and it was important to try to knit together our networks of personal contacts. We had to resist institutionalism, bureaucratic red-tape, and the creation of new procedures and committees. Official bodies should be put in the position of ratifying what had been jointly prepared in advance'. See also The Committee Of 300. / Щел (Shell). Ротшильд. Дэйвид Рокэфэлё (David Rockefeller). Трилатеральный (Trilateral), от Латинского слова Trilaterus, означающее Трёхсторонний, от Tri, в сложных словах означающее Три, и Latus, родительный падеж Lateris, означающее Сторона. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Дьжеймз (James). Чэйс (Chase). Эсошиэтс (Associates). 29 Мая 1954 жители тихого Нидерландского городка Оштобейк были весьма удивлены, когда к Гостинице Билдэрбэрьх (Hotel de Bilderberg) начали съезжаться роскошные лимузины. Хорошо одетые мужчины спешили укрыться за дверью отеля, стараясь не привлекать внимания местных жителей. Однако прибытие в городок такого количества солидных господ, говорящих на разных языках, не могло остаться незамеченным. Пожилая жительница Оштобейка, просившая нас не называть её имени, вспоминает:- 'Мне в 1954-м было тридцать лет, и я работала в Гостинице Билдэрбэрьх. Я запомнила день 29 Мая, так как никогда в жизни не видела столько солидных джентльменов и охраны одновременно. Всё было окутано ореолом тайны – они в течение нескольких дней не выходили из отеля и всё время сидели запершись в зале. Потом также тихо разъехались. На другой день ко мне подошёл мужчина в светлом, очень красивом костюме, попросил забыть о том, что я видела и вручил конверт, в котором лежала тысяча Гульденов. Тогда это были большие деньги…'. Судя по рассказам очевидцев и той мизерной информации, которая оказалась в распоряжении некоторых спецслужб, в Отеле Билдэрбэрьх происходило вот что. По приглашению Голландского Принца Бернарда и Президента Британо-Нидерландской корпорации Unilever Поля Рискенса (Paul Rijkens) в Нидерланды тайно прибыли самые влиятельные представители бизнеса, политики и экономики планеты. На многочасовой закрытой встрече в Гостинице Билдэрбэрьх было решено впервые в истории человечества попытаться создать так называемое теневое 'Мировое Правительство', которое негласно будет управлять основными политическими, экономическими и финансовыми процессами. Члены 'Мирового Правительства' назвали свою

организацию ‘Клуб Билдэрбэрьх’. Понтер Герке (Herke):- ‘Перед самым развалом ГДР и объединением Германии мы получили от нашего источника несколько протоколов заседаний Клуба Билдэрбэрьх, в которых говорилось о скрытом давлении на Михаила Горбачёва для скорейшего вывода Советских войск из Восточной Германии. Нами была осуществлена попытка шантажа некоторых членов ‘Мирового Правительства’ – Немцев. Однако вскоре протоколы и списки самым странным образом исчезли из наших архивов, а источник, передавший бумаги, и специалист ‘Штази’, занимавшийся ‘мировым правительством’, в течение месяца умерли ‘естественной’ смертью. Источник попал под машину, а офицер покончил жизнь самоубийством. На этом дело само собой заглохло, а вскоре ГДР прекратила существование как государство’. Майкэл Р., бывший сотрудник ЦРУ, пенсионер:- ‘Я не думаю, что наши будут что-либо ‘копать’ под этих людей, ведь среди них имеются Американцы, весьма близкие к самым высоким кругам в ЦРУ, и терять работу никто не собирается. Обратите внимание на Дьжона Марка Дойча (John Mark Deutch), бывшего главу ЦРУ, или на Дьжодьжа Робэнсэна (George Robenson), человека из Министерства Обороны США. А лично я бы вам посоветовал выкинуть этот список и забыть о Клубе Билдэрбэрьх навсегда. Жизнь – она такая:- можно случайно из окна выпасть. Ребята из Клуба Билдэрбэрьх очень серьезные’. Основное правило членов Клуба Билдэрбэрьх – полная конфиденциальность. И действительно, на сегодняшний день ни одной серьёзной утечки информации о деятельности теневых кардиналов пока не произошло. Билдэрбэрьхский Клуб – одна из ведущих мондиалистских сетевых структур, которые объединяют принадлежащих к ‘глобальной элите’ политиков, финансистов, представителей транснациональных корпораций (ТНК), секретных служб и СМИ. Непосредственными инициаторами создания клуба, первое заседание которого состоялось 29–31 Мая 1954 в Нидерландском городе Оштобейк в Отеле Билдэрбэрьх (Hotel de Bilderberg), были спецслужбы США. Ещё в конце 1940-х в целях сохранения Американского контроля над Европейской элитой на содержании ЦРУ появились такие организации, как Европейское Движение, Американский Комитет за Объединённую Европу, Европейская Молодежь и ряд других. Поскольку, однако, методы прямого вмешательства США в Европейские дела вызывали у общественности определённое недовольство, было решено обеспечить контроль над Европой через ТНК, с помощью проамерикански настроенных представителей Западно-Европейской элиты. В этих целях и был создан Альянс, прозванный позже в народе Билдэрбэрьхской Группой, планировавшийся как ‘клуб размышлений’ для представителей правящих кругов и крупнейших корпораций стран – членов НАТО. Председателем клуба стал Принц Бернард Голландский (Prince Bernhard of the Netherlands, husband of Queen Juliana since 1937, was previous to their marriage an active card-carrying member of Hitler’s black-shirted SS), супруг Королевы Юлианы (Queen Juliana), в недавнем прошлом – служивший Гитлеру офицер СС, являвшийся в начале 1950-х основным акционером нефтяной компании Ротшильдов Ройэл Дач Щел (Royal Dutch Shell). Среди 80 человек, присутствовавших на учредительном заседании Билдэрбэрьхского клуба, главную роль играли Дэвид Рокэфэлё (David Rockefeller), Глава Фонда Рокэфэлёра Хэнри Дьжей. Хайнц (Henry J. Heinz; Chair of the Board of Trustees of The Rockefeller Foundation), Президент Фонда Карнеги Дьжосэф И. Дьжонсэн (Joseph E. Johnson, President of the Carnegie Endowment); в созданный тогда же руководящий комитет вошли представители Ротшильдов, Банка Шрёдера, газеты Нью Йорк Таймс, Лондонского Королевского Института Международных Отношений и ЦРУ США. Настоящими руководителями Билдэрбэрьхской группы были Барон Эдмунд де Ротшильд (Baron Edmond de Rothschild) и Лорэнс Рокэфэлё (Laurance Rockefeller), выбиравшие членов клуба. Удивительный конгломерат евреев и их ненавистников. Какая явная беспринципность, но какими только принципами не поступишься ради получения сверхприбылей и возможности заправлять всем миром. Одной из главных целей, обозначенных сразу после образования группы, являлось создание Европейского супергосударства с собственным центральным банком и единой валютой, находящегося под ‘естественным’ контролем США. Конечная цель деятельности Билдэрбэрьхцев (Bilderbergers) формулировалась как создание транснационального правительства. Билдэрбэрьхский Клуб построен по принципу масонской ложи, его структура включает в себя три круга. Внешний круг достаточно широк и объединяет до 80% участников собраний. Члены этого круга знают только часть реальной стратегии и истинных целей организации. Второй круг, намного более закрытый, – Комитет Управления (Steering Committee), состоящий из 35 человек, знакомых с задачами группы примерно на 90%. Самый узкий круг – Совещательный Комитет (или Консультативный Комитет; Advisory Committee), состоящий примерно из десяти человек, досконально знающих подлинные цели и стратегию организации и обладающих всеми полномочиями по делам группы в период между её ежегодными заседаниями. Как писал Итальянский журнал Л’Еуропэо (L’Europeo) в 1975, ‘несмотря на пестроту своего состава, в целом Билдэрбэрьхцы – это некое суперправительство, на свой фасон перекраивающее правительства стран Запада’. В настоящее время постоянными участниками клуба являются Эдмэнд дэ Ротшильд (Edmond de Rothschild), Дэйвид Рокэфэлё (David Rockefeller), Збигниев Брежинский (Zbigniew Brzezinski), Пол Дандиз Волфовиц (Paul Dundes Wolfowitz), Хэнри Кисиндьжёр (Henry Kissinger), Ричад Холбрук (Richard Charles Albert Holbrooke), Бельгиец Этьен Давиньон (Etienne Davignon), Хэнри Дьжей. Хайнц (Henry J. Heintz), Романо Проди (Romano Prodi) и некоторые другие. Считается, что актив клуба объединяет 383 человека, треть из которых Американцы – представители аппарата Президента США, Госдепартамента, крупнейших корпораций, банков и деловых кругов. Основная часть финансовых средств, идущих от ТНК и западных секретных служб, за счёт которых осуществляется деятельность Билдэрбэрьхского клуба, поступает главным образом через подставные общества и банки, расположенные на Багамах, в Лихтенштейне, Люксембурге и Швейцарии. Имена тех, кто финансируют клуб, точно установить невозможно. Известно только, что на финансирование деятельности Билдэрбэрьхской группы тратятся астрономические суммы. Собираются члены клуба один раз в год в течение 4 дней, как правило, в Мае–Июне в разных городах, либо в замках, либо в дорогих гостиницах в условиях полной секретности. Каждое совещание, в котором участвует около 120 человек, проходит в обновлённом составе. Все обсуждения ведутся при закрытых дверях, допускаются туда только ‘свои’ журналисты. Никакая информация наружу не выходит:- на собраниях Билдэрбэрьхцев запрещено что-либо записывать; запрещено делать заявления для прессы и разглашать дискуссии, происходящие на этих встречах. Ведущие медиамагнаты либо сами присутствуют на собраниях клуба, либо присылают своих представителей и отлично осведомлены о программе совещаний (например, Нью Йорк Таймс (The New York Times), Файнэншл Таймс (Financial Times)), однако никогда не рассказывают об этом на страницах своих изданий. Известны слова Д. Рокэфэлёра, сказанные в 1993, когда он поблагодарил редакторов крупнейших Западных СМИ за то, что те на протяжении почти сорока лет хранили молчание:- ‘Нам было бы невозможно разработать наш план для всего мира, если бы он был предан огласке в те годы. Но мир устроен сложнее и готов идти к мировому правительству. Наднациональная верховная власть интеллектуальной элиты и банкиров мира, несомненно, более предпочтительна, чем национальное самоопределение, практиковавшееся в прошлые столетия. Таким образом, мы обязаны удержать прессу в неведении относительно наших убеждений, составляющих историческое будущее нашего века’. Однако скрыть деятельность Билдэрбэрьхской группы невозможно, и периодически от тех или иных членов клуба или причастных к его деятельности людей информация вырывается наружу. Одним из первых серьёзных исследований, посвящённых Билдэрбэрьхцам, стала книга бывшего агента западных спецслужб Люиса М. Гонсалес-Мата ‘Истинные Хозяева Мира’, изданная в Париже в 1979 (Luis M. Gonzales-Mata. Les vrais maitres du monde. Paris. 1979). Совсем недавно вышли книга Дэйвида Роскапфа ‘Суперкласс:- Элита Глобальной Власти и Мир, Который Они Создают’ 2008 (David Rothkopf; Superclass:- The Global Power Elite and the World They Are Making; 2008) и двухтомное исследование историков Пьера и Даниеля де Вильмарэ и Вилъйэма Ди. Волфа ‘Факты и Хроники, Скрываемые от Общественности’ 2004 (Pierre & Daniele de Villemarest,

Willam D. Wolf; Facts and Chronicles Denied to the Public. 2004). В настоящее время за деятельностью Билдэрбэрьхского Клуба активно следят независимые исследователи Англичанин Тчони Газлын (Tony Gosling), создатель сайта http://www.bilderberg.org с подробной информацией о деятельности клуба, и Американец Дьжим Такё (Jim Tucker), редактор консервативной газеты Американская Свободная Пресса (American Free Press), получающий сведения от людей, регулярно присутствующих на заседаниях клуба в качестве помощников и ассистентов, но не являющихся его членами. Сообщения Такера публикуются на сайтах http://www.prisonplanet.com/articles/ и http://www.nouvelordremondial.cc/cat/bilderberg-group/. На своих заседаниях Билдэрбэрьхская группа принимает стратегические решения по ключевым вопросам финансовой, военной и социальной политики, минуя правительственные органы ведущих стран мира. Как сказал Британский экономист Вил Хатэн (Will Hutton), на каждой встрече клуба 'консенсус является фоном, на котором принимаются политические решения во всём мире'. Так, именно на встрече Билдэрбэрьхцев в Швеции в 1973, объединившей представителей крупнейших нефтяных компаний, был одобрен специально разработанный сценарий повышения мировых цен на нефть и изложен план контроля над мировыми потоками нефтедолларов. На собраниях Билдэрбэрьхского Клуба 'избирают' будущих президентов США и премьер-министров Великобритании (подтверждается участием в Билдэрбэрьхских конференциях Била Клынтчэна (Bill Clinton) в 1991 и Тчони Блэа (Tony Blair) в 1993). В Июне 2006 на заседании Билдэрбэрьхцев в городке Каната, пригороде Канадской столицы Оттава, в центре внимания были вопросы энергетики, политики в отношении России, положение на Ближнем Востоке, 'терроризм', форсированное заселение белых стран другими расами, объединение Канады, США и Мексики в единое государство, вторжение в Иран, сокрытие разработанного топливоэкономичного автомобиля с расходом бензина 1 галлон на 200 миль, создание мирового правительства по экономической модели Средневековья. Здесь было принято решение о повышении цен на нефть до 105 Долларов за баррель (по предложению Хэнри Кисиндьжёра (Henry Kissinger)). В 2007 Билдэрбэрьхская конференция состоялась в Стамбуле, где обсуждалась проблема глобального изменения климата, геополитика на Ближнем Востоке, роль Турции в Европейском Союзе, реформы Всемирного Банка, Иранская ядерная проблема. И вновь одной из важнейших тем была разработка общей стратегии и политики Запада в отношении России, чья позиция по вопросам энергетики вызвала у представителей группы крайнее недовольство. В 2008 (с 05 по 08 Июня 2008 в Штате Вирджиния, в гостинице Вэстфилдз Мэриат (Westfields Marriott) в Шантийи, в 15 км от Аэропорта Даллеса близ Вашингтона) в числе участников Билдэрбэрьхской конференции в Шантийи были Хэнри Кисиндьжё (Henry Kissinger), Дэвид Рокэфэлё (David Rockefeller), председатель Федеральной Резервной Системы США Бэн Бёнэнки (Ben Bernanke, Chairman of the Board of Governors of the United States Federal Reserve), Кандализэ Райс (Condoleezza Rice), Рихад Пэрле (Richard Perle), Президент Европейского Центрального Банка Жон-Клёд Трихе (Jean-Claude Trichet, President of the European Central Bank), Комиссар ОБСЕ по Правам Национальных Меньшинств Норвежец Кнют Волэбекь (OSCE High Commissioner on National Minorities Knut Vollebaek), Пол Дундэс Волфовиц (Paul Dundes Wolfowitz), Генеральный Секретарь НАТО Яап де Хооп Шэфэр (Jaap de Hoop Scheffer, former Secretary General of NATO), бывший глава МИД ФРГ Йозэф Матин 'Йошка' Фиша (Joseph Martin 'Joschka' Fischer), бывший Президент Польши Александр Квасьневский (Alexandr Kwasnewsky), Министры Иностранных Дел Чехии Карэл Шварцэнбэрг (Karel Schwarzenberg) и Турции Али Бабаджян (Ali Babacan), Ирландский Генеральный Адвокат Пол Галаха (Paul Gallagher, Attorney General of Ireland; его склоняли к тому, чтобы найти способ изменить Ирландское 'нет' Лиссабонскому Договору на 'да'), Флемин Роушэ (редактор отдела культуры Датской газеты Юлянд-Постэн (Flemming Rose, Jyllands-Posten's culture editor)), прославившийся благодаря так называемой 'карикатурной войне'; как предполагают, его использовали, чтобы спровоцировать возмущение мусульман в соответствии с проектом 'Столкновение Цивилизаций') и другие лица. От России присутствовал Дмитрий Тренин из Московского Центра Карнеги. На этот раз Билдэрбэрьхцы обсуждали вопросы всеобщей чипизации Американцев, политики в отношении Ирана и цены на нефть. Собрание группы неслучайно проходило в США, где грядут президентские выборы. По некоторым данным, 06 Июня на встрече в Шантийи тайно присутствовали Хилэри Дайэн Радэм Клынтчэн (Hillary Diane Rodham Clinton) и Бэрак Эйч. Обама (Barack H. Obama). Известно точно, что в этот вечер они имели частную встречу на севере Вирджинии. Для подбора кандидатуры на роль будущего вице-президента Бэрак Обама пригласил члена Комитета Управления Билдэрбэрьхцев Дьжеймза Эй. Дьжансэна (James A. Johnson), уже выступавшего в этом качестве во время избирательных компаний Дьжона Кэри (John Kerry) и Волтёра Мандэйла (Walter Mondale). Дьжеймз Эй. Дьжансэн является Вице Председателем частного банка Пёсиас Эл.Эл.Си. (Perseus LLC; Vice Chairman of Perseus) и членом правления Голдмэн Сэкс (Goldman Sachs), Гэнэт Кампэни Инк. (Gannett Company Inc.), Таргет Корпорэйшэн (Target Corporation), Тэмпл-Инлэнд (Temple-Inland) и группы Юнайтид Хэлс (United Health), входит в состав Трёхсторонней Комиссии и Совета по Международным Отношениям.

BILGE SUMP = ДНИЩЕВЫЙ ОТСТОЙНИК (или ДНИЩЕВЫЙ КОЛОДЕЦ) – Bilge Sump is a sump at the lowest point of the hold, where water can collect and be pumped off.

BILL = БИЛЕТ – Bill is a document, issued by a bank, promising to pay someone a certain amount of money. Also known as Bank Note in the United States. / Это документ, выпускаемый банком, обещающий оплатить кому-то определённую сумму денежных средств. Известен также как Банкнота (Bank Note) в Соединённых Штатах Америки.

BILL = ВЕКСЕЛЬ – Bill is short for Bill of Exchange. Also known as Note in the United States. / В Английском языке для обозначения Русскоязычного термина Вексель достаточно часто может использоваться слово Bill, являющееся сокращением от словосочетания Bill of Exchange. В Соединённых Штатах Америки известен также как Билет, или Нота, (Note). Вексель или Счёт:- в общем значении:- (1) переводный вексель (тратта); сокращение от bill of exchange – поручение одной стороны другой выплатить некоторую сумму третьей стороне; (2) Счёт – документ, являющийся доказательством задолженности должника кредитору; обыкновенный счёт, с которым мы все знакомы; (3) Банкнота – бумажные деньги, например 5-Долларовая банкнота; (4) Купчая (bill of sale) – документ, использующийся для передачи права владения некоторыми товарами; переходит от продавца покупателю – аналогично акту о продаже недвижимости. В инвестициях:- сокращение, употребляющееся вместо due bill – долговое обязательство. Часто использовалось для оплаты остатка по сделке с ценными бумагами, когда дивиденды, проценты и иные суммы уже отражены в цене, но ещё не распределены. Например, когда акции продаются без права на дивиденды (ex-dividend) и дивиденд продавцу ещё не выплачен, тогда покупатель подписывает долговое обязательство на сумму дивидендов, причитающуюся к уплате продавцу. Долговое обязательство может прилагаться к поставленным ценным бумагам для того, чтобы передать право владения брокеру покупателя в обмен на акции или некоторую денежную сумму. В Казначейских Векселях:- в финансовом мире bill обычно называются Казначейские Векселя – краткосрочные (со сроком исполнения до одного года) дисконтные государственные ценные бумаги. Продаются они на еженедельных и ежемесячных аукционах. Выпускаются достоинством от 10 000 до 1 миллиона Долларов США. Аукцион, на котором реализуются Казначейские Векселя, отличается от двусторонних аукционов, организуемых биржами. В этом случае в ходе Голландского Аукциона (Dutch auction) Казначейство США (Treasury) принимает заявки, называемые тендерами (tender), от всех заинтересованных лиц; затем продаёт ценные бумаги лицам, предложившим наибольшую цену, в порядке убывания предложенной цены. Аукционы по трёх- и шестимесячным облигациям проводятся еженедельно, по девятимесячным и одногодичным векселям – ежемесячно. Хотя доход по векселям может лишь незначительно превышать процент инфляции,

высокий уровень безопасности вложений, вместе с высокой ликвидностью, которую обеспечивает активный вторичный рынок (secondary market), делают эти векселя популярными среди финансовых управляющих различных корпораций, а также банков и государственных учреждений. Частные лица также могут приобретать векселя напрямую, на суммы до 500 000 Долларов США, не уплачивая сборов за совершение сделки, в Федеральном Резервном Банке (Federal Reserve Bank), в Бюро Управления Федеральным Долгом (Bureau of Federal Debt) и в определённых коммерческих банках. Цены на векселя, приобретаемые таким образом, определяются путём неконкурентных ставок, когда подписчики платят среднюю цену из всех принятых предложений. Из всех государственных долговых ценных бумаг Казначейские Векселя используются наиболее широко и являются основным инструментом кредитно-денежной политики Федерального Резерва (Federal Reserve). Под Векселем, от Немецкого слова Wechsel, означающее Мена или Перевод или Перемещение, понимается ценная бумага, обособленный документ, строго предусмотренной формы, содержащий или безусловное обязательство выдавшего его лица (простой вексель), или его приказ третьему лицу (переводной вексель) произвести платёж указанной суммы поименованному в векселе лицу или предъявителю векселя в обусловленный срок. Обычно вексель выполняется на бумажном носителе. Лицо, в пользу которого выписан вексель, может, не дожидаясь наступления срока оплаты векселя, использовать его для платежей по своим обязательствам или учесть его в банке. При передаче векселя необходимо соблюдать формальности, предусмотренные вексельным законодательством. На оборотной стороне векселя делается специальная передаточная надпись (индоссамент), обеспечивающая удостоверение факта передачи векселя другому лицу. Лицо, передающее вексель, берёт на себя ответственность (перед всеми последующими владельцами) за погашение обязательства по векселю. Вексель, вид ценной бумаги, представляет собой денежное обязательство строго установленной законом формы. Является безусловным и бесспорным долговым документом. В международной торговле, а также во внутреннем обороте капиталистических стран вексель используется в качестве одного из важных средств оформления кредитно-расчётных отношений, выполняет различные по характеру функции и применяется, например, как платёжный документ, передаваемый в установленном порядке одним лицом другому взамен денежного платежа, выступает в качестве орудия кредита, а также используется для инкассирования (получения) долга. Различают 2 вида векселей:- простой и переводный (тратта). Простой Вексель – ничем не обусловленное обязательство лица, его выдавшего, об уплате означенной суммы денег по требованию или в определённый срок поименованному в векселе лицу или его приказу (то есть другому, указанному им лицу). По Переводному Векселю плательщиком обычно является не векселедатель, а третье лицо – акцептант, который при помощи акцепта принимает на себя безусловное обязательство платежа. Таким образом, переводный вексель по своей форме представляет собой документ, содержащий ничем не обусловленный приказ векселедателя плательщику (акцептанту) произвести платёж определённой денежной суммы лицу, указанному в векселе, или его приказу – по предъявлении векселя или в определённый срок. Поскольку вексель выступает в качестве орудия обращения взамен наличных денег, в процессе вексельного обращения к векселедателю и акцептанту могут присоединиться и другие лица:- индоссанты, передающие вексель по индоссаменту, авалисты, гарантирующие платёж по векселю за какое-либо другое, ответственное по векселю, лицо. В практике международных расчётов распространён, так называемый, учёт векселей, заключающийся в том, что держатель векселя может до наступления срока платежа предъявить его в банк и получить указанную в нём сумму (за вычетом учётного процента). По наступлении срока платежа банк сам предъявляет вексель к оплате. Отношения участников вексельного оборота имеют характер гражданско-правовых отношений, регулируемых специальными нормами вексельного законодательства. В большинстве стран это законодательство основано либо на Женевских вексельных конвенциях 1930, либо на Английском вексельном законе. Союз Советских Социалистических Республик (СССР) присоединился к Женевским вексельным конвенциям в 1936, постановление Центрального Исполнительного Комитета и Совета Народных Комиссаров (ЦИК и СНК) СССР от 07 Августа 1937 на территории СССР было введено в действие основанное на этих конвенциях Положение о Переводном и Простом Векселе. Вексель широко используется в расчётных и кредитных отношениях, возникающих в сфере экономического сотрудничества СССР с капиталистическими странами. Во внутреннем обороте СССР вексельное обращение ликвидировано в 1930 в связи с переходом к системе прямого целевого банковского кредитования.

BILL = СЧЁТ – (1) Bill is a list of charges to be paid on goods or services. Also known as Check in the United States.

(2) Bill is a document describing goods, most often used in dealings with customs. / Это документ, описывающий товары, чаще всего используемый при работе с таможней.

BILL BROKERS = ВЕКСЕЛЬНЫЕ БРОКЕРЫ (или БРОКЕРЫ ПО ВЕКСЕЛЯМ) – Bill Brokers (in 1844) propose and conclude bargains between merchants and others in matters of bills and exchange. They make it their business to know the state of the exchange, and the circumstances likely to elevate or depress it. They sell bills for those drawing on foreign countries, and buy bills for those remitting to them: and, from their knowledge of the mutual wants of the one class as compared with those of the other, a few of the principal brokers are able to fix the rate of exchange at a fair average, which it would not be possible to do if the merchants directly transacted with each other. Their charge as brokerage is 2s. per cent (in 1844). 'Those', says Mr. Windham Beawes, 'who exercise the function of bill brokers, ought to be men of honour and capable of their business; and the more so, as both the credit and fortune of those who employ them may, in some measure, be said to be in their hands; and, therefore, they should avoid babbling, and be prudent in their office, which consists in one sole point, that is, to hear all and say nothing; so that they ought never to speak of the negotiations transacted by means of their intervention, or relate any ill report which they may have heard against a drawer, nor offer his bills to those who have spread it'. / Г-н Xxxxx (Mr. Windham Beawes).

BILLED WEIGHT = ЗАЯВЛЕННЫЙ ВЕС (или ВЕС ПО НАКЛАДНОЙ) – Billed Weight is the weight stated in a waybill and/or freight bill of lading, i.e. the invoiced weight. / Вес, указанный в транспортной или грузовой накладной, то есть вес, выставленный для оплаты.

BILLETS = БОЛВАНКИ (или ЗАГОТОВКИ) – Billets are the feedstock for long products of small cross section. In cases when they are not directly cast by a continuous caster, they are rolled from blooms by billet mills. One method of rolling billets, which are usually 75 to 125 millimeters square, is to use a three-high mill with box passes, as shown in A in the figure. After a rectangular bloom is rolled into a square cross section at the lower rolls, it is lifted to the next pass on the upper rolls and rolled back into a rectangular one; this is turned 90° while being lowered on a roller table for another square rolling in the lower pass, and so on. In another method, alternating horizontal and vertical stands are arranged in tandem, using diamond and square passes without turning or twisting the billet (as shown in B in the figure). Billets are the semi-finished products (steel products) with a square or rectangular cross-section, edge lengths of 50 to 125 mm, rounded edges and a minimum length of approximately 1 000 mm. This are the used to produce for bars, wire rod and special profiles or for forged or drop-forged items. A Billet is a length of metal that has a round or square cross-section, with an area less than 36 sq in (230 cm^2). Billets are created directly via continuous casting or extrusion or indirectly via rolling an ingot. Billets are further processed via profile rolling and drawing. Final products include bar stock and wire. Centrifugal casting is also used to produce short circular tubes as billets, usually to achieve a precise metallurgical structure. They are commonly used as cylinder sleeves where the inner and outer diameters are ground and machined to length. Because their size is not modified significantly, they are not always

classified as semi-finished casting products. / После окантованный блюм раскатывается в квадратное сечение на . прокатка (rolling). Под Болванкой понимается выходящее из употребления название металлического слитка или заготовки, а также заготовок из других материалов. Под Заготовкой понимается предмет производства (материал, продукт и тому подобное), из которого дальнейшей обработкой получают готовое изделие.

BILL FOR COLLECTION = ВЕКСЕЛЬ НА ИНКАССО (или ВЕКСЕЛЬ ДЛЯ ПОЛУЧЕНИЯ) – Bill For Collection is a bill of exchange presented to a bank for collection (and not for discounting). The countervalue of the bill is credited to the account of the customer either immediately 'on the due date' or only 'after collection'. / либо немедленно в 'надлежащую (причитающуюся) дату', либо 'после инкассо'.

BILL GUARANTEE = ГАРАНТИЯ ВЕКСЕЛЯ – Bill Guarantee:- undertaking (generally made by signing the bill) to meet a bill of exchange in the event of the failure of the actual drawee of the bill to do so.

BILLIARD CLOTH = БИЛЬЯРДНОЕ ПОЛОТНО – Billiard Cloth is the cloth used on billiard tables. It is always dyed green. This is traditionally a very fine twilled fabric consisting of quality wool. Nowadays also other fibers are used for billiard cloth.

BILLING = ВЫСТАВЛЕНИЕ СЧЁТА–ФАКТУРЫ – Billing:- a carrier terminal activity that determines the proper rate and total charges for a shipment and issues a freight bill.

BILLION = БИЛЛИОН (или МИЛЛИАРД) – Billion is one thousand million or 10^9. / Биллион или Миллиард – одна тысяча миллионов или 10^9.

BILL OF EXCHANGE = ПЕРЕВОДНЫЙ ВЕКСЕЛЬ – A Bill Of Exchange is a written order for a certain sum of money to be transferred on a certain date from the person who owes the money or agrees to make the payment (the drawee) to the creditor to whom the money is owed (the drawer of the bill). Thus, it is the creditor, or the drawer, who actually draws, or in other words fills out, the bill of exchange as to the amount due and the date on which it is to be paid and addresses it to the debtor, the drawee. The bill of exchange has to be accompanied by an instruction letter which may be obtained from one's bank on request. Also known as Draft. See also Bill. In the United States, commonly known as a Draft. However, bill of exchange is the correct term. Payment order written by one person (the drawer) directing another person (the drawee) to pay a certain amount of money at a specified future date to a third party. It designates a named beneficiary but is transferable by endorsement. Unconditional written order by one person (the drawer) to another (the drawee) to pay, at a specified time, a certain sum of money to a designated person (the payee). Bill Of Exchange is an unconditional written order addressed by one person to another and signed by the person placing it. It requires the person, to whom it is addressed, to pay on demand or at a fixed or determinable future time, a certain sum of money to the order of a specified person or to bearer. The drawee is not liable on it until he has accepted it. Usually used in foreign transactions. A signed, written order by one company that instructs another company to pay a third party a specific amount. An order in writing from one person or firm to another requiring them to pay a certain sum to a person named therein. Bill Of Exchange is an invoice which is endorsed by a merchant bank and which can be sold to a discount house to raise short term finance. Where the endorser is an eligible bank the bill is known as an Eligible Bill Of Exchange. In the case of an eligible bill the bill of exchange is a very secure investment. Bills Of Exchange are sometimes called Drafts, but that term usually applies to domestic transactions only. The term bill of exchange may also be applied more broadly to other instruments of foreign exchange, including cable and mail transfers, traveler's checks, letters of credit, postal money orders, and express orders. The drawn Bill of Exchange, or Draft, is an order by which the drawer instructs the debtor (drawee), without stating the reason for the debt, to pay a fixed amount of money to the payee specified in the bill of exchange or to his order, whereby the drawer is liable for acceptance and redemption. In contrast, the negotiable bill of exchange (promissory note) is an undertaking to pay by which the drawer, without stating the reason for the debt, himself undertakes to pay a fixed amount of money to the payee specified in the bill of exchange or to his order. The rights represented by a bill of exchange can only be claimed by a person who can prove his right of ownership of the document. See also Draft, and Promissory Note. Bill of Exchange is an unconditional order in writing, issued by the seller (drawer) instructing the buyer (drawee) to pay the seller's bank (payee) a specified amount (normally the full invoice value) on demand (at sight) or at a fixed or determinable future time. A suitable form can be obtained from the seller's bank, or drawn up on a blank sheet of paper. Sight Draft is a bill of exchange drawn 'at sight' meaning that as soon as the drawee accepts the bill it falls due for payment. A Bill Of Exchange is a written request for payment from one person (drawer) requiring the person to whom it is addressed (drawee) to pay the payee or bearer on demand or at a fixed or determinable time. It is used as a means of financing international transactions. Bill of Exchange is:- (i) a signed, written order by one company that instructs another company to pay a third party a specific amount; (ii) an unconditional written order addressed by one person to another and signed by the person placing it. It requires the person, to whom it is addressed, to pay on demand or at a fixed or determinable future time, a certain sum of money to the order of a specified person or to bearer. The drawee is not liable on it until he has accepted it. (iii) Usually used in foreign transactions. A Bill Of Exchange is a written request for payment from one person (drawer) requiring the person to whom it is addressed (drawee) to pay the payee or bearer on demand or at a fixed or determinable time. It is used as a means of financing international transactions. / Смотрите также Тратта (Draft), и Простой Вексель (Promissory Note). Термин Вексель, от Немецкого слова Wechsel, означает вид ценной бумаги и денежное обязательство. Вексель является безусловным и бесспорным долговым документом строго установленной законом формы. Различают Простой Вексель (Promissory Note) и Переводный Вексель (Bill of Exchange) или Тратта (Draft). Передача векселя от одного лица другому оформляется передаточной надписью – индоссаментом. В международной торговле, а также во внутреннем обороте стран вексель является одним из основных средств оформления кредитно-расчётных отношений. Трассант = векселедатель, трассат = плательщик, векселедержатель = ремитент, соло-вексель, путём индоссамента, учтя вексель, переучёт векселя, 'Не Приказу' – невозможность передачи, аваль, авалист – лицо, давшее аваль, отказ а акцепте или платеже должен быть удостоверен Протестом Векселя. Под Учётом Векселя понимается покупка банком векселя до наступления срока платежа по нему. При учёте векселя банк авансирует клиенту деньги, взимая за это учётный процент. Под Учётным Процентом понимается плата, взимаемая банками при учёте векселей (центральными эмиссионными банками – официальный учётный процент). Величина учётного процента определяется средним уровнем ссудного процента, сроком и обеспеченностью учитываемого векселя. Переводный Вексель (Тратта) – ценная бумага, представляющая собой безусловное предложение векселедателя (трассанта) лицу, на которое выставлен вексель (трассату), уплатить определённую сумму денег предъявителю векселя, указанному на нём, либо другому лицу, указанному посредством передаточной надписи, в установленный срок (срочная тратта) или по предъявлению. Переводный Вексель представляет собой безусловное предложение трассанта (кредитора), адресованное трассату (должнику), уплатить третьему лицу (ремитенту) в установленный срок указанную в векселе сумму. При возникновении такого денежного обязательства трассант выступает и кредитором по отношению к должнику (трассату), и должником по отношению к ремитенту. Когда же трассант выставляет переводный вексель на трассата с предложением уплатить определённую сумму самому трассанту, последний становится одновременно и ремитентом, а вексель служит инструментом, регулирующим долговые отношения между ними.

BILL OF HEALTH = СУДОВОЕ САНИТАРНОЕ СВИДЕТЕЛЬСТВО О ПРАВЕ ПЛАВАНИЯ (или САНИТАРНОЕ УДОСТОВЕРЕНИЕ, или КАРАНТИННЫЙ СЕРТИФИКАТ) – The Bill Of Health is the certificate issued by local medical authorities indicating the general health conditions in the port of departure or in the ports of call. The Bill of Health must have visa before departure by the Consul of the country of destination. When a vessel has free pratique, this means that the vessel has a clean Bill of Health certifying that there are no questions of contagious disease and that all quarantine regulations have been complied with, so that people may embark and disembark. / контагиозная (заразная) болезнь (contagious disease).

BILL OF LADING = КОНОСАМЕНТ – Bill Of Lading (B/L) (in the UK, 1840's), is a formal receipt subscribed by the master of a ship in his capacity of carrier, acknowledging that he has received the goods specified in it on board his ship, and binding himself (under certain exceptions) to deliver them, in the like good order as received, at the place and to the individual named in the bill, or his assigns, on his or their paying him the stipulated freight, etc. When goods are sent by a ship hired by a charterparty, the bills of lading are delivered by the master to the merchant by whom the ship is chartered; but when they are sent by a general ship, – that is, by a ship not hired by charterparty, but employed as a general carrier, – each individual who send goods on board, receives a bill of lading for the same. In all cases, therefore, the bill of lading is the evidence of and title to the goods shipped. The liability of a carrier, at common law, to deliver the goods intrusted to his care, is calcelled only by 'the act of God and the king's enemies'. But to limit this responsibility, the following exception is now, invariably almost, introduced into the clause in bills of lading, binding the master to the delivery of the goods:- 'The act of God, the king's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted'. Bills of lading are not, in general, immediately given by the master on receiving the goods. The usual practice is for the master or his deputy to give a common receipt for the goods, which is delivered up on receiving the bill of lading. The latter should always be required within 24 hours after the goods are received on board. Three sets of all bills of lading are made out on stamped paper:- one of these should he remitted by the first post to the person to whom the goods are consigned, a second being sent to him by the ship; the third is retained by the shipper of the goods. The master ought always to retain copies of the bills of lading for his government. A stamp duty of 3s. is charged on all bills of lading, whether for goods exported or carried coastwise. The usual form of a bill of lading is as follows:- W.B. No. 1. a. 10.:- N.B. – SHIPPED. In good order as well conditioned, by A.B. merchant, in and upon the good ship called ... whereof C.D. is master, now in the river Thames, and bound for ..., the goods following, viz. (here describe the goods.) marked and numbered as per margin, to be delivered, in the like good order and condition, at ... aforesaid, (the act of God, the king's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted.) unto the said A.B. or his assigns, he or they paying for the said goods at the rate of ... per piece freight, with primage and average accustomed. In witness whereof, I, the said master of the said ship, have affirmed to three bills of lading, of this tenour and date; any one of which bills being accomplished, the other two are to be void. London, this ... day of ..., 1843. C.D., Master.' But in the case of ships homeward bound from the West Indies, which send their boats to fetch the cargo from the shore, the exception in the bill of lading is usually expressed as follows:- 'The act of God, the king's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, save risk of boats, so far as ships are liable thereto, excepted'. Other exceptions may be and are sometimes introduced; but the above is the general form. Transfer Of Bills Of Lading:- bills of lading are transferable either by blank or special indorsement, like bills of exchange. And whatever may be the character of the person to whom the goods are consigned, whether he be a buyer, or merely the factor, agent, or broker of the consignor, the Bonâ Fide holder of a bill of lading indorsed by the consignee is entitled to the goods, and may claim them from the master, if he can prove that he has purchased the bill for a good consideration; but unless he can do this, he is not entitled to the goods. Formerly, a factor, though he might sell, could not pledge the goods of his principal. But the hardship and inconvenience arising from this rule were such, that it was set aside by the act 6 Geo. 4. c. 94. The second section of this act declares, that any person in possession of a bill of lading shall be deemed the true owner of the goods specified in it, so as to make a sale or pledge by him of such goods or bill of lading valid, unless the person to whom the goods are sold or pledged has notice that the seller or pledger is not the actual and Bonâ Fide owner of the goods. – (See also Factor.) Delivery Under Bill Of Lading:- it being usual to sign and deliver three bills of lading, it is possible that there may be conflicting demands upon the captain by the different holders. Nothing, however, is, in such a case, required of him, except that he act with good faith, and to the best of his judgment; and that he make delivery of the goods to the person who first demands them of him, upon presentment of the bill of lading, provided the circumstances be not such as to justify a suspicion of his having unfairly got possession of it. If he act differently, he is answerable, according to the peculiarities of the case, to the person injured by his negligence; the bill of lading being not only the instructions of the merchant to him, as his carrier or servant, but his own especial agreement to deliver according to its conditions. Where several bills of lading of a different import have been signed, no regard is to be paid to the time when they were first signed by the master; but the person who first gets legal possession of one of them from the owner or shipper, has a right to the consignment; and where such bills of lading, though different upon the face of them, are constructively the same, and the master has acted Bonâ Fide, a delivery according to such legal title will discharge him from all. Bill Of Lading (B/L or BL) is a legal document signed by or for the captain/master, agents, owners of a vessel or the (common) carrier. It is written evidence of the contract of carriage by sea and/or by land. It is:- (i) a receipt of the goods (in the owner's/carrier's or his/their agent's custody); (ii) an undertaking to carry and deliver the goods safely to the place directed/agreed, dangers of the sea excepted, against; (iii) Surrender of the document where/when provisions in the document stipulate delivery to order of a named person, to order (blank) or to bearer; and (iv) it evidences the terms of the contract of carriage. Bill Of Lading (B/L) is the document which covers transport by sea. Signed by the carrier, whether a shipping line or a freight forwarder, it serves as a receipt to the consignor for the goods, as evidence of the contract of transport containing the conditions of transport, and as a document of title by which possession of the goods can be transferred. Typically a B/L is issued in a set of three signed originals or negotiables, one of which must be presented to claim the goods upon which the others become void. (i) Combined Transport/Multimodal B/L is a B/L covering transport by shipping container from an inland place prior to the loading port, to an inland place beyond the destination port. Most freight forwarders and shipping companies title their B/Ls as 'Bill of Lading for Combined Transport or Port-to-Port shipment' or similar. (ii) Congen B/L is a standard form of bill of lading used in shipments by chartered ship. (iii) Clean B/L is a bill of lading indicating that the goods were received by the carrier in good order and condition, without any clauses declaring a defective condition in the goods and/or their packing. (iv) Dirty/Foul/ Claused B/L is a bill of lading with any clauses declaring a defective condition in the goods and/or their packing. Almost invariably not acceptable to banks for presentation under L/Cs and almost always not acceptable to the buyer. See also Clean Bill of Lading. (v) House B/L is a bill of lading issued by a freight forwarder acting as a carrier. The terms and conditions of the contract may well be different to the terms and conditions contained on the shipping company's B/L, which can in extraordinary circumstances lead to legal complications should a dispute arise. (vi) Master B/L is the term used for the B/L issued by a shipping company to a freight forwarder for all of the goods covered by one or more House B/Ls on the one ship going from one loading port to one destination port. (vii) Ocean B/L is a B/L covering port-to-port shipment. Typically banks continue to use this term on L/Cs even though the majority of international shipments are containerized. See also Multimodal B/L. (viii) On Board/Shipped On Board B/L is a B/L evidencing that the goods were not only received by the carrier but were actually loaded on board in good order and condition. 'Shipped' indicates that not only were the goods on board, but that the ship has departed the port. (ix) Order B/L is a negotiable B/L, in which the goods are consigned 'to order of' a particular party, often the shipper

in which case the consignee is mostly shown simply as 'to order'. (x) Straight B/L is a non-negotiable B/L in which the goods are consigned directly to a named consignee. Said To Contain (STC):- said to contain, often placed before the description of goods on a bill of lading because the carrier does not know the nature or quantity of goods actually placed in the packages or the containers. On Board / Shipped On Board is a notation on a bill of lading, indicating that not only did the carrier receive the goods in good order and condition, but they were also placed on board the ship. A Bill Of Lading (B/L) is a commercial shipping document which serves three distinct purposes in connection with the carriage of goods. An itemised list of goods contained in a shipment. It is also a receipt from Carrier for the goods, represents the contract for carriage and serves as a document of title. Functions of the Bill Of Lading (B/L):- the B/L is often described as 'the key to the warehouse'. It enables the holder to receive the goods or to transfer and deliver the goods. The B/L has 3 main functions:- (1) B/L as a receipt for the goods shipped:- (i) The bill of lading is prima facie evidence that the goods indicated therein (quantity, condition, marks) have been shipped. This means that it would be difficult for the carrier to later dispute the quantity or condition of goods loaded; (ii) If the Hague-Visby Rules apply, the shipper is legally entitled to demand a 'Shipped onboard' B/L from the carrier after the cargo is loaded onboard the vessel. (2) Written evidence of the contract:- the bill of lading is excellent evidence of the terms of the contract between the carrier and the shipper, but is the only evidence of the terms of the contract with regard to the carrier and the sale agent holder (consignee) of the B/L. (3) Document of title:- (i) A 'negotiable'B/L means that title to the goods may be passed from one party to another by endorsement of the B/L. One of the main values of a B/L is that merchants may buy and sell the goods whilst it is in transit and without even taking actual possession of the goods; (ii) A B/L is only negotiable if it is marked 'To Order'. A 'straight-consigned' B/L is not negotiable in that title to the goods cannot pass by endorsement. A straight consigned B/L is therefore not strictly evidence of title in that title to the goods cannot pass from one seller to another by endorsement. The B/L has been used for hundreds of years, and in a bygone era more than one original B/L was issued. All original B/Ls were despatched to the discharge port so that at least one would arrive safely to enable the consignee to collect the goods. What if more than 1 party, each holding 1 original B/L, tries to claim the goods? This is not a case of 'first come, first served'. If every party appear to hold properly endorsed B/Ls, the prudent course of action would be for the freight forwarder to seek legal advice and to interplead in court. Delivery of cargo without production of the original B/L. In respect of negotiable 'To Order' B/Ls, the freight forwarder should never release cargo without production of the original B/L. To do so will amount to misdelivery and the freight forwarder will be liable for the value of the goods to the lawful holder of the B/L. He cannot limit liability. Some times in order to keep the customer happy business decision are made to release the cargo without the original B/L, in such circumstances it would be prudent for a freight forwarder to:- (i) Ask the carrier/principal for instructions; (ii) Inform shipper and ask for clarifications/instructions; and (iii) Obtain a Letter of Indemnity and/or a Bank Guarantee from the person claiming the cargo. A negotiable document by which a transportation line acknowledges receipt of freight and contracts for its movement. The surrender of the original Straight of Lading is not required by transportation lines upon delivery of the freight, exept when necessary for the purpose of identifying the consignee. A Bill of Lading is, as noted, a document derived from antiquity. In English law, this is the basis of its legal status. It has acquired its status by virtue of ancient mercantile custom. Traditionally, it has three functions, namely:- (i) as a receipt; (ii) as evidence of the contract of carriage; and (iii) as a document of title. The Bill of Lading will state, on the face of it, details of the cargo and the apparent order and condition within which it was shipped. The description is prima facie evidence of the condition of cargo as against the shipper and conclusive evidence as against third parties. The Bill of Lading is not a contract in itself but evidence of the contract. Invariably, the Bill of Lading will either incorporate the Hague or Hague-Visby Rules. A liner bill will contain, on the fact of it either the full terms or incorporate the carriers' standard terms. A Charterparty bill will expressly incorporate the Charterparty terms. The document of title has also been referred to as a 'Control Document'. It is also 'the key to the floating warehouse'. It is a thread linking a number of contracts, a sale contract, the shipping contract, the letter of credit and the pledge and other security arrangements. A document that establishes the terms of a contract between a shipper and a transportation company. It serves as a document of title, a contract of carriage and a receipt for goods. Bills Of Lading are contracts between the owner of the goods and the carrier. There are two types:- (i) a straight bill of lading is nonnegotiable; and (ii) a negotiable or shipper's order bill of lading can be bought, sold, or traded while goods are in transit and is used for letter of credit transaction. The customer usually needs the original or a copy as proof of ownership to take possession of the goods. A document that establishes the terms of a contract between a shipper and a transportation company. It serves as a document of title, a contract of carriage and a receipt for goods. The Bill of Lading (BOL) is an official document that accompanies every shipment. It serves as the contract between the party that owns the freight and the carrier. The each driver prior to vehicle departure. When a driver for an outside carrier signs the Bill of Lading, he/she accepts responsibility for the shipment. Upon arrival at the destination, the consignee or customer signs the Bill of Lading to indicate that the shipment was received and all goods are present as itemized. This customer-signed Bill of Lading then serves as a Proof of Delivery (POD) document. A Bill of Lading is a document issued by a carrier to a shipper upon acceptance of a shipment. It serves both as a receipt for goods to be shipped and as a contract stating the terms of carriage, and obliges the carrier to release the shipment upon presentation. A Bill Of Lading serves both as a shipping contract and as a receipt for the goods shipped. This is an essential document that must be obtained by the adjuster in a claim situation. It shows the date the goods were shipped, what was shipped, by whom, via what carrier, to an exact destination. It also specifies the carrier's liability. Bills of lading frequently state a Dollar limitation on the value of the cargo or specify a Dollar limit of liability. It is usually established according to some unit of measuring the property shipped, such as a specified Dollar amount per pound of cargo. The lower freight rates the carrier charges when these Dollar limitations are in effect are called Released Rates. Contract of carriage between shipper and steamship company which is the ship owner's receipt for the goods and is the document of title to them. Consignment note issued by the conisgnor as part of ocean-going and inland transportation processes which regulates the legal relationships between the loader, the consignor and the receiver of the goods that are being transported. This note may be confirmation from the consignor that the goods have been received for shipping (Received for Shipment B/L) or a confirmation that the goods have been put on board (On Board B/L, Shipped on Board B/L). This document also covers the duty of the consignor to deliver the goods to their port of destination and to hand the goods over to the legitimate owner of the bill of lading in return for the bill of lading. At the moment 3 different models are commonly used:- Bill Of Lading R 300, Bill Of Lading R 302, and Sea Waybill. Bill Of Lading (B/L or BL) is a document by which the Master of a ship acknowledges having received in good order and condition (or the reverse) certain specified goods consigned to him by some particular shipper, and binds himself to deliver them in similar condition, unless the perils of the sea, fire or enemies prevent him, to the consignees of the shippers at the point of destination on their paying him the stipulated freight. A bill of lading specifies the name of the master, the port and destination of the ship, the goods, the consignee, and the rate of freight. Bill Of Lading:- bills of lading are governed by the Bills of Lading Act. See 49 USC §§80101 to 80116 (2005; 49 USC is short for the United States Code:- Title 49). A bill of lading is basically a transportation contract between a shipper-consignor and the carrier, which terms and conditions bind the shipper and all connecting carriers. The bill of lading represents the title of the goods and serves as evidence of the carrier's receipt of goods, their condition at the time of receipt, and their nature and quantity. Id. Carmack requires motor carriers and freight forwarders to issue a receipt or bill of lading for the property received for transportation. 49 USC §14706(a)(1) (2005). However, the carrier's 'failure to issue a receipt or bill of lading does not affect the liability of the carrier'. Id. There are several forms of bills of lading:- (i) a Clean Bill of Lading; (ii) a Multimodal or Intermodal Through Bill of Lading; (iii) a Negotiable Bill of Lading; (iv) a Non-Negotiable Bill of Lading; (v) an Order Bill of Lading; (vi) a Straight Bill of Lading; (vii)

a Through Bill of Lading; and (viii) a Way Bill or a Waybill. A shipping document containing a description of the goods to be shipped. Routine business activities often involve contracts known as Bills Of Lading. A bill of lading is a document or receipt issued by a carrier when it receives goods for shipment. Usually, the receipt indicates (i) the particular vessel on which the goods have been placed; (ii) destination; (iii) cargo weight; and (iv) terms of transportation. International sales transactions usually involve sales and transportation contracts; therefore, a seller not only sells goods, but also arranges the transportation of the goods to the purchaser. Under such circumstances, a bill of lading serves as a link between the sales part of the transaction and the transportation portion of it. Typically, contracts governing carriage of goods by water are evidenced by charter parties or bills of lading. The term charter party is employed to describe three widely differing types of contracts relating to the use of vessels owned or controlled by others. Bills of lading, by contrast, usually fall into one of four categories inland, ocean, through, and air waybill and are independent of the vessel used. An inland bill of lading establishes an agreement between a shipper and a transportation company. It is used to lay out the terms for transportation overland to the exporter's international transportation company. In short, inland bills of lading are necessary for the domestic transportation of goods. An ocean bill of lading provides terms between an international carrier and an exporter. It deals with the shipment of goods to a foreign location overseas. Ocean bills of lading are usually in order form that is, they call for delivery to the order of the shipper. These bills of lading can be negotiated similarly to a draft or check. Essentially, this means that a bona fide purchaser of the bill of lading takes it free and clear of any defects that, otherwise, do not appear on its face. A thorough bill of lading covers specific terms agreed to by a shipper and carrier. It covers domestic and international transportation of export merchandise; further, it provides the details agreed upon for transportation. Finally, an air waybill is a bill of lading that establishes terms of flights for the transportation of goods, both domestically and internationally. An air waybill can be thought of as a type of through bill of lading because it may cover both international and domestic transportation of goods. Ocean shipments, by contrast, require both inland and ocean bills of lading. Some bills of lading are negotiable; others are not. But inland and ocean bills of lading may be negotiable or nonnegotiable. If it is nonnegotiable, the carrier must provide delivery to the consignee the person receiving the goods named in the document. If, however, it is negotiable, the owner of the bill of lading has the right to ownership of the goods and, thus, has the right to reroute shipment. Depending on the parties' intention, the bill of lading may solely represent ownership of the goods. But the parties may agree that a mere security interest is to be transferred only. Upon receiving the goods, a receipt is issued and later turned in for the bill of lading proper. Apart from proving receipt of the goods to be shipped, the bill of lading incorporates the terms of the contract between the carrier and shipper. As international trade expands, the quantity of goods transported by water will also continue to grow. Bills of lading will become increasingly important and provide the necessary safeguards to facilitate the expansion of the world economy. A Bill of Lading is a cargo receipt, issued and signed by a duly authorised person on behalf of the carriers. (a) A document evidencing the title to the goods described therein. (b) A contract listing the terms and conditions of carriage agreed upon between shipper and carrier. Bill of Lading (abbreviated to B/L) is one of the most important documents in the whole shipping and freight chain. It comes in various types and forms and is one of the most commonly used documents in the shipping and freight chain but also the most misunderstood and misused of documents. A bill of lading has 3 basic purposes or roles:- Evidence Of Contract Of Carriage; Receipt Of Goods; and Document Of Title To The Goods. Let's examine these roles in more detail. (1) Evidence Of Contract Of Carriage:- emphasis on the term 'Evidence'. Many people think that:- (i) a bill of lading is a contract between the seller and the buyer; or/and (ii) a bill of lading is a contract of carriage between the carrier and shipper. Both notions are incorrect. The contract between a buyer and seller was already established when the buyer placed the order with the seller and they both discussed and agreed (verbally or in writing) the what, where, when, how and how much of the transaction in detail. The contract between a shipper and the carrier was already established when the shipper or his agent made a booking with the carrier (shipping line) to carry the cargo from A to B. The B/L is the evidence of the contract of carriage entered into between the 'Carrier' and the 'Shipper' or 'Cargo Owner' in order to carry out the transportation of the cargo as per the sales contract between the buyer and the seller. (2) Receipt Of Goods:- emphasis on the term 'Receipt'. A B/L is issued by the carrier or their agent to the shipper or their agent in exchange for the receipt of the cargo. The issuance of the B/L is proof that the carrier has received the goods from the shipper or their agent in apparent good order and condition, as handed over by the shipper. (3) Document Of Title To The Goods:- emphasis on the term 'Title'. It means that the goods may be transferred to the holder of the B/L which then gives the holder of the B/L, the rights to claim the goods or further transfer it to someone else. Based on the above roles, there are several variations of the B/L (let's call it Types), important among which are as below. (1) When a B/L is issued in Original(s) to a 'named' consignee it is referred to as a 'Straight B/L' and a straight B/L is a non-negotiable and non-transferable document. Release of cargo at destination may be issued ONLY to the named consignee and only upon surrender of at least 1 of the original bills issued. This B/L satisfies roles 1 & 2 above fully and does not satisfy role 3 (Document of Title) as the document is not negotiable or transferable. (2) When a B/L is issued to a 'named' consignee but without any originals it maybe considered as a 'Seaway B/L'. This B/L is also a non-negotiable and non-transferable document. A Seaway B/L is usually issued:- (i) for inter company shipments like from ACME Company Hollywood to ACME Company in the Middle of the Australian Outback; or (ii) where the shipment takes place between two different companies but there are no negotiations required between the two either directly or via bank for release of the cargo; and (iii) the shipper doesn't need to submit an original B/L to anyone to secure his payment. Since no originals are issued in the case of a Seaway B/L no surrender is required and the release may also be termed as an Express Release and is mentioned as such on the body of the B/L and manifest. This B/L satisfies roles 1 & 2 above and does not satisfy role 3 (Document of Title) as the document is not negotiable or transferable. (3) When a B/L issued is in Original(s) and consigned 'TO ORDER' or 'TO ORDER OF SHIPPER' or 'TO ORDER OF XYZ BANK' it is termed as Negotiable B/L or Order Bill. One of the most important aspects of a B/L is that it can be used as a negotiable instrument for payments between a buyer and seller using Letter of Credits. A negotiable B/L must be treated like gold and due care must be taken not to lose it. There are several cumbersome procedures to be followed if an original B/L is lost. Another notable feature of this type of B/L is that it contains the Terms and Conditions of the Carrier on the 1st Page of the B/L. The 1st page is what we all commonly refer to as the 'Back Of The B/L'. Seaway bills issued by some carriers do not have these Terms and Conditions on the back (also known as 'Blank Back Short Form B/L'). Destination port agent may issue release of cargo only after at least 1 of the issued originals are surrendered and after checking the endorsements on the back of the B/L as it is possible for this type of B/L to be endorsed or transferred to another company. This B/L satisfies all of the above 3 roles. There are also various ways in which the B/L is termed or titled, the purpose of which is to identify the carriers responsibility in terms of the carriage. Below are some of the ways in which a B/L is termed or titled. (1) Port to Port B/L:- when a B/L is issued as a Port to Port B/L (also known as Ocean B/L), the carrier's responsibility begins at the port of loading and ends at the port of discharge and therefore the Place of Origin/Receipt or Place of Destination/Delivery should not be mentioned in the B/L. (2) Combined Transport B/L:- when a B/L is issued as a Combined Transport B/L, it involves multiple modes of transport from the Place of Receipt to Place of Delivery and all these movements are carried out as a single contract by multiple service providers under the employ of the carrier. Carrier takes responsibility for any loss or damage for the entire transport including the sea and other mode of transport. When a B/L is released as a Combined transport B/L, the boxes like 'Pre-Carriage by', 'Place of Receipt by Pre-carrier', 'Place of Delivery by On-carrier', On-Carriage by' etc will be filed in. (3) Multimodal Transport B/L:- same as Combined Transport B/L. (4) Through B/L:- similar to Combined Transport B/L except that in the case of the Through B/L, the carrier is directly responsible only for the sea leg and for the inland movement they act as an agent in arranging the inland movement. The terms on the Through B/L

issued by the carrier will specifically state this, in such a B/L. When a B/L is released as a Through B/L, the boxes like 'Pre-Carriage by', 'Place of Receipt by Pre-carrier', 'Place of Delivery by On-carrier', 'On-Carriage by' etc will be filed in. Another misconception that most people have is terming a bill as Telex Release B/L. There is no such term. Bill of Lading is a document giving the holder the right to take possession of the goods that have been shipped. Issued in ocean traffic, the bill of lading confirms (through the signature of the captain, his deputy or the shipping company or its agent) that the goods have been received for shipment, that they are to be surrendered to the legitimate owner of the bill of lading at the port of destination, and what the shipping terms are. Difference Between House Bill of Lading And Master Bill of Lading:- a Bill of Lading maybe issued as a House Bill of Lading or a Master Bill of Lading. (1) A House Bill of Lading (HBL) is issued by a Non-Vessel Operating Common Carrier (NVOCC) operator, or a Freight Forwarder to their customers. (2) A Master Bill of Lading (MBL) is issued by the Shipping Line (Carrier) to the NVOCC Operator, or Freight Forwarder. When issued for a FCL shipment (non-groupage), a HBL should always be issued on a back to back basis with a MBL which means that the HBL should be an EXACT replica of the MBL issued by the actual Shipping line in respect of all details except the shipper, consignee and notify party details which will be different in the HBL and MBL. In the HBL:- (i) the Shipper will usually be the actual shipper/exporter of the cargo (or as dictated by the L/C); (ii) the Consignee will usually be the actual receiver/importer of the cargo (or as dictated by the L/C); and (iii) the Notify could be the same as Consignee (or any other party as dictated by the L/C). In the MBL:- (i) the Shipper will usually be the NVOCC operator, or their agent or the Freight Forwarder; (ii) the Consignee will usually be the destination agent or counterpart or office of the NVOCC operator, or the Freight Forwarder; (iii) the Notify could be the same as Consignee or any other party; (iv) in the interest of the NVOCC operator and their insurance coverage/exposure, it is recommended that all the details on the HBL and MBL like vessel/voyage information, cargo description, number of containers, seal numbers, weight, measurements should remain the same; the only difference should be in the shipper, consignee and notify details; (v) unless disallowed by the L/C, the HBL is also used/treated as a negotiable document and can be considered to fulfill the roles of a bill of lading; but due care must be taken when using HBL as a negotiable document as I have come across a counter-productive and dangerous practice of consigning the HBL and MBL exactly the same which means that there are two sets of bills of lading issued by two different entities for the same cargo!; (vi) such issues have happened due to the ignorance of the NVOCC or Freight Forwarder. Difference Between a Freight Forwarder And NVOCC:- A Freight Forwarder is someone who undertakes to handle the movement of goods from point to point on behalf of the cargo owner. A NVOCC which is the abbreviation for Non-Vessel Operating Common Carrier maybe defined as a 'Carrier To Shippers' and 'Shipper To Carriers'. Most well established and experienced freight forwarders have below capabilities (either owned or outsourced):- experienced in all modes of transportation – road, rail, air and sea; able to provide cost effective and efficient cargo shipping solutions based on the customer's requirement; able to arrange storage for the cargo (usually all big forwarders have their own warehouses); able to arrange the distribution or 'forwarding' of the cargo as per the instructions of their client; have the capability to negotiate freight rates with the shipping line; able to book cargo with the shipping line as per the requirement of the client or under their own contract; process all relevant shipping documents such as certificates of origin, customs and port documentation, bills of lading and associated shipping/negotiating documentation (Eur1, Certificate of Origin, etc); issue their own approved House Bill of Lading (HBL); arrange transportation of the cargo from/to the customers premises and port; have thorough knowledge of over border cargo movement; and able to arrange customs clearance. However there are some differences which separate these two entities. The NVOCC can and sometimes do own and operate their own or leased containers whereas a Freight Forwarder does not. In certain countries like USA, the NVOCC operators are required to file their tariffs with the government regulatory bodies and create a public tariff. NVOCC is in certain areas accorded the status of a virtual 'carrier' and in certain cases accepts all liabilities of a carrier. A Freight Forwarding company can act as an agent/partner for a NVOCC whereas it doesn't happen the other way around. A traditional NVOCC does not provide above services provided by a freight forwarder, but in some cases the line between a NVOCC providing above functions and a traditional freight forwarder maybe blurred. Bill of Lading (B/L):- title of property of the goods, it is the authentic receipt delivered by carriers for the said goods shipped/to be shipped on a named vessel. A Bill Of Lading is 'indorsed in blank' simply by insertion of the name of the shipper or consignee on the reverse of the bill. The opposite of Indorsed In Full. A bill of lading is 'indorsed in full' by the shipper or consignee signing on the reverse of the bill an order to 'deliver to X or order'. / сразу или на первый взгляд (prima facie). заслуживающий доверия или действительный (bona fide). в порт разгрузки. порядки и условия перевозки. (vi) Хозяйский (или Капитанский) Коносамент. Под Коносаментом, от Французского слова Connaissement, понимается документ, содержащий условия договора морской перевозки груза. В соответствии с Конвенцией о Морской Перевозке Грузов, Гамбург, Март 1978, Коносамент – документ, который подтверждает наличие договора перевозки и принятие или погрузку груза перевозчиком и в соответствии с которым перевозчик обязуется выдать груз против этого документа. Указание в документе о том, чтобы выдать груз приказу конкретно указанного лица, или выдать приказу, или выдать предъявителю документа, представляет собой такое обязательство. Коносаменты подразделяются на:- (i) Именные; (ii) Ордерные; и (iii) Предъявительские. Коносамент – документ, выдаваемый перевозчиком либо его агентом грузоотправителю в удостоверение принятия груза к перевозке морским путём. Коносамент выполняет три основные функции:- удостоверяет принятие перевозчиком груза к перевозке, является товарораспорядительным документом (даёт право владельцу оригинала распоряжаться грузом), свидетельствует о заключении договора перевозки груза морским путём, по которому перевозчик обязуется доставить груз против представления документа. Различают следующие виды коносаментов:- именной, ордерный и на предъявителя. Именной Коносамент содержит указание о том, что товар должен быть доставлен определённому получателю с указанием его наименования и адреса. Ордерный Коносамент предполагает, что грузоотправитель может передать свои права третьему лицу, индоссировав коносамент. Коносамент на Предъявителя предполагает, что товар передаётся любому лицу – держателю коносамента. Коносамент – документ, выдаваемый перевозчиком грузовладельцу в удостоверение факта принятия груза к морской перевозке и подтверждения обязательства передать его грузополучателю в порту назначения.

BILL OF LADING CLAUSE = ОГОВОРКА О КОНОСАМЕНТЕ – Bill Of Lading Clause is a particular article, stipulation or single proviso in a Bill of Lading (B/L). A clause can be standard and can be preprinted on the B/L.

BILL OF LADING ELECTRONIC REGISTRY ORGANIZATION = ОРГАНИЗАЦИЯ ЭЛЕКТРОННОЙ РЕГИСТРАЦИИ КОНОСАМЕНТОВ – Bolero originated from a European Union funded research initiative tasked with establishing a global cross-industry solution to enable the dematerialisation of cross border trade processes. In 1995 the Bolero Association was created, quickly gaining momentum with bank, corporate and logistics membership across Europe, USA and Asia. This early initiative resulted in the Bolero 'concept' incorporating a central 'registry' for all trade related documents of title together with a draft legal agreement which would ensure that any documents sent over Bolero would have the same legal meaning as the paper document it replaced, irrespective of legal jurisdiction. The substantial interest in commercialising this concept with broad global support was realised in 1996 with the agreement by SWIFT (the bank owned co-operative specialising in secure inter-bank messaging) and TT Club (the international transport and logistics industry's leading provider of insurance and related risk management services) to create a joint venture company to build, market and support the Bolero infrastructure. The resulting joint venture company, Bolero International Limited, was incorporated in 1998. The initial Bolero infrastructure consisted of a Core Messaging Platform built by SWIFT to meet the functional

specification defined by the new Bolero entity, a Title Registry, enabling the fully electronic transfer of title, built under contract to Bolero and the Bolero Rulebook, a unique multi-party legal agreement. The Bolero service went fully live in 1999, operated and supported by SWIFT under a 10 year operating agreement established as part of the terms of the joint venture. In 2000, additional funds were raised from the venture capital markets through a funding round led by Apax Partners and Baring Private Equity Asia. In the period from 1998 to 2002, the Company was successful in creating widespread awareness of the Bolero service, establishing a number of proof points through live operation in a variety of substantial trade chains. In 2003 a new leadership team was recruited to fully commercialise the Bolero service building on the substantive early market efforts of the original Bolero management team. Working in conjunction with a number of global driver corporates and their core partner banks, the Bolero service was enhanced to include a number of additional value-added services and targeted specifically on the trade finance related processes between Corporates, Commodity Traders and their Banks. To enable corporate customers and banks to be able to speedily adopt the Bolero service to enable multi-bank trade finance automation, priority was given to the provision of 'out-of-the-box' multi-bank trade finance applications (solutions) for corporates and ease of inter-operability for banks and other trade participants. Key to this objective was for the Bolero messaging platform to be able to support a range of industry solutions deployed either as traditional software installations or as web-hosted services. In 2005 Bolero began to deliver a comprehensive suite of multi-bank trade finance applications built directly on the proven Bolero messaging infrastructure. These applications were designed and built specifically as web-based single-instance solutions delivered as a service (Software as a Service, or 'SaaS'), enabling ease of use with no infrastructure investment. During 2010, the operation of the Bolero services was successfully transitioned from SWIFT to a leading-edge commercial hosting facility in dual mirrored data-centres enabling high availability, full disaster recovery, added scalability and performance, and full SSAE 16 compliance. Today (2013), Bolero is the leading provider of Multi-Bank Trade Finance services through global adoption of its unique multi-bank messaging channel and support of a range of corporate solution options including the Bolero SaaS applications, third party trade finance applications and corporates' in-house developed applications. Bolero delivers multi-bank trade finance solutions for Corporates, Commodity Traders and Banks, particularly for 'traditional' trade finance utilizing Letters of Credit, Guarantees and Documentary Collections. Bolero provides a standardised service which requires no infrastructure investment and is designed for fast deployment and speedy realisation of value to all participants. Bolero provides a unique and highly secure multi-bank trade messaging infrastructure enabling standardised multi-bank communication for a corporate with all its partner banks whilst at the same time providing a standardised multi-bank communication channel for a bank to its corporate customers. In addition, Bolero provides comprehensive 'on-demand' web-based applications in support of the end-to-end trade finance processes to automate Export Letter of Credit, Import Letter of Credit, Guarantee Applications, Beneficiary-side Guarantees and Documentary Collections. Bolero has also deployed, in partnership with a significant global bank, a substantial supply chain finance solution for a large US retailer and its major suppliers across Asia. Most recently Bolero has delivered a unique ePresentation service providing a suite of solutions for the electronic presentation of documents as legally binding originals. Bolero acts as an independent intermediary and trusted third party bringing together corporates and banks to deliver multi-bank standardisation and to enable trade finance collaboration. Bills Of Lading Electronic Registry Organisation (BOLERO) is a pilot project funded partially by the European Union in 1994. 'Bolero.net' is the legal structure for paperless international trade launched in September 1999. It is operated by Bolero International Limited, which is a joint venture between SWIFT (Society for Worldwide Interbank Financial Transactions) and TT Club (Through Transport Mutual Insurance Association Limited). It provides services to Bolero Association Limited, which is a non-profit-making association owned by Bolero users. Headquarters are in London, the United Kingdom. See also BOLERO Association Limited, and BOLERO International Limited. Founded in 1998, with significant backing from the bank community and from the global logistics industry, Bolero was created as a neutral, trusted third party to develop an open and legally certain platform to deliver paperless trading between buyers, sellers, financial institutions and logistics service providers anywhere in the world, delivering transaction visibility, predictability, speed, accuracy and security. Today Bolero brings Corporates, Commodity Traders and their Banks together to share the benefits of collaborative Trade Finance, providing an open, neutral and secure multi-party channel designed specifically for the fully electronic communication of trade and trade finance documents and related messages. In addition Bolero delivers powerful collaborative Trade Finance solutions delivered as a global hosted service reducing the cost of deployment and substantially reducing the time to benefit. Corporates, Commodity Traders and their partner Banks are rapidly deploying Bolero solutions delivering significant reductions in cost and working capital, increased visibility and improvements in operating efficiency. Vision:- Bolero's vision is to become the dominant provider of Multi-Bank solutions and Multi-Bank channel infrastructure in support of collaborative Multi-Bank Trade Finance globally, thereby driving convergence onto a common platform for all parties in the end-to-end trade finance process. An electronic alternative to the traditional bill of lading. Bills Of Lading Electronic Registry Organisation (BOLERO) is an international organization created by some of the world's leading banks and shipping, trading, and other firms to provide secure business-to-business information over the internet. It covers all types of commercial transactions open account, documentary collection, and documentary credit. In addition to the digital bill of lading, BOLERO handles many associated documents online and aims to provide all banking, certification, commercial, customs, insurance, and transport documents electronically. Based on the open standards (such as EDIFACT and XML), it employs a patented legal infrastructure and a secure messaging system (in association with SWIFT). Its rigorous registration system accepts only those firms as members whose identity can be verified and vetted, and binds them with strict rules. The objectives of BOLERO include:- (i) development of a financial supply chain as efficient as modern physical supply chains; (ii) safe and tamperproof paperless-trading; (iii) seamless integration of shipping and manufacturing systems; (iv) complete confidentiality of transactions; (v) fast and reliable delivery of documents anywhere in the world with non-disputable (see non repudiation) proof of delivery; (vi) timely dispute resolution at reasonable cost; and (vii) transparency and visibility throughout the process. The Bill Of Lading Electronic Registry Organization (BOLERO) was organized by the Society for Worldwide International Financial Telecommunications (SWIFT), a not-for-profit European organization created by international banks to process international funds transfers and the Through Transport Club (TT Club), a mutual insurance association specializing in transportation risks. It began operation in 1999. Bolero provides a range of services to facilitate electronic commerce in cross-border transactions including secure messaging services and a title registry for documents of title for goods in transit. Bolero standards take advantage of advanced encryption technologies for security and XML document descriptions to permit further Internet-based expansion. The status of an electronic document of title within the Bolero system and under the laws of different trading nations is unclear, however. Bolero has issued a rule book which defines the rights and obligations of the users of the system against each other and Bolero. Like clearing-house rules in payments transactions, the rule book is a binding contract for its members. A document of title defines property rights, however, and the Bolero Rule Book has no authority to bind those who are not members. As a result, the lack of a traditional (paper) document of title may create problems for Bolero members if third parties try to execute on goods in transit or the interest of a party to a Bolero transction in a document of title based on the law of documents of title. Under traditional principles of documents of title law, the party in rightful possession of the document of title also owns the goods the document of title covers. Bolero has eliminated the paper document of title and substituted in its place an electronic registry to track ownership of goods in transit. No countries today have laws governing the property rights of parties with rights to goods in transit based on entries in electronic registries. Thus, until the Bolero Rule Book is given official recognition within national legal systems, there will be uncertainty surrounding the rights of transacting parties, against adverse third parties, such as executing creditors or bankruptcy trustees. Chapter

4:- The ‘Bolero Bill of Lading’:- most of the named approaches of former electronic shipping documents had some flaws that let to the failure or non-application of the provisions. As the need for fast, secure and cheaper bills of lading is an ever growing task, traders, shipping lines, banks, and international institutions seek for a final and well-established system that could solve all of the problems associated to the bill of lading. As mentioned before, the replacement of the bill’s functions as a receipt for the goods shipped and the proof of evidence of the contract between the shipper and the carrier are relatively easy to realize by electronic means. The most challenging problem that remains is to fulfil the requirement of a negotiable document of title by electronic data interchange. Chapter 2 discussed the technical basis of modern forms of electronic bills of lading. Towards the end of that chapter the ‘certification authorities’ were introduced, independent but state-controlled ‘notary publics’ that are the trustful and connecting link between seller and buyer. It was concluded that an electronic bill of lading that was signed with a digital signature issued by a certification authority could possibly withstand the critics and represent an equivalent to the traditional bill of lading. The latest attempt in electronic shipping commerce that promises to fulfil the essential functions of a traditional bill of lading is ‘Bolero’. Bolero stands for ‘Bill of Lading Electronic Registry Organization’ and was commercially launched on 1999-September-27. Bolero International Ltd. is a joint venture between SWIFT (Society for Worldwide Interbank Financial Transactions) and the TT Club (Through Transport Mutual Insurance Association Ltd.). Besides SWIFT and the TT Club, this project was partly initiated and also funded by the European Commission. Its primary objective was to set up a pilot scheme and to design a contractual framework to replicate as far as possible the electronic equivalent to a bill of lading. The masterminds of Bolero deliberately called their electronic document a ‘Bolero Bill of Lading’, and not – as could be assumed – an ‘Electronic Bill Of Lading’. That is because the Bolero Bill of Lading does not fall within the classic definition of a ‘bill of lading’ according to the maritime conventions and other relevant legislations. Therefore, in order to create the same legal relation that applies when a negotiable document of title is being issued and traded, it was necessary to enter in some sort of contractual relationship. Thus, the specific feature of Bolero is its multilateral contractual solution:- each party that wishes to trade in the electronic environment of Bolero, including carriers, shippers, consignees, banks and other bodies connected with the shipping of goods such as port authorities, needs to become a member of the ‘Bolero User Association’ first. The members must agree to observe the rules that are manifested in the Bolero Rulebook. The contractual adoption of the Bolero Rulebook between all of its users gives the Bolero system its legal effect. The Rulebook covers many diverse areas, among them general rules and definitions, the admission of members, legal relationship, disciplinary provisions, and the role and responsibility of the title registry. The last point is of major interest for the scope of this paper and will be dealt with below. In the Bolero system, the aforementioned sending and receiving of electronic messages and digital signatures is operated by the ‘Core Messaging Platform’. This service belongs to bolero.net and is responsible for all common functions between the members. In the first place, it acts like an independent certification authority and secures the international trade by receiving and transmitting the electronic messages of the Bolero users. The service relies on advanced cryptographic techniques, namely encryption and digital signatures, and thus guarantees that a message originates from the purported sender and that it remained unaltered on its way. By these means Bolero solved the problem of a lack of delivery acknowledgements on the internet. Usually, the sender cannot be sure whether his message has been received by the addressee. Under bolero.net the message sent is acknowledged immediately by a receipt of the Core Messaging Platform and is then forwarded to the receiver. When the receiver downloads the message, it automatically acknowledges receipt to Bolero which then notifies the sender that the data has been received. A unique messaging protocol is also available from the Core Messaging Platform in case of litigation to prove the actual messages that have been sent. It can therefore be concluded that the Core Messaging Platform of the Bolero system provides the requirements to accomplish the bill of lading’s function as a receipt for the goods shipped and as proof of evidence of the contract between the shipper and the carrier. 4.1. The Bolero Title Registry:- most noteworthy, however, is the establishment of the Bolero ‘Title Registry’. With this step a solution was found to the ever-existing problem of an equivalent to the bill of lading’s function as a document of title. It needs to be emphasized again that a document of title is the ‘key to the warehouse’ – without a transferable document of title the carrier can under no circumstances release the goods to the consignee. Therefore, the Bolero system needed to enable property rights in goods to be transferred in transit, and thus created a title registry, which is supported by appropriate provisions in the rulebook. The creation of a title registry corresponds to the aforementioned necessity of a trusted third party, that each user can rely on when rights and obligations in the goods are to be transferred. 4.2. Attornment and Novation:- the transfer of rights and obligations under the Bolero Rulebook is accomplished by means of attornment and novation. The legal principle of attornment is a traditional part of English Common Law and usually describes a situation where a tenant accepts and acknowledges the new landlord’s rights after the leased property has been sold. It is thus an implicitly or explicitly consent to a transfer of a right. The makers of Bolero made use of the concept of attornment for the following purpose: the carrier is the independent bailee of the shipper’s goods because he has the factual control over the goods on his ship. ‘By entering into a contract with a shipper to follow the shipper’s instructions (‘to order’) and by agreeing that the shipper can transfer his right to give instructions (transferring ‘to order’) to another party, the carrier is agreeing to do what he currently does when he issues a negotiable bill of lading’. The carrier can only take such instructions of the person who has the appropriate ‘key’. In the paper world, the ‘key’ is the negotiable bill of lading. Under the Bolero system, ‘the ‘key’ is the dominion of the shipper over the unique electronic message that the carrier has created. By advising the party with dominion over the unique electronic message that the carrier now holds the goods to that party’s order, the carrier is making what is characterized under English law as an attornment’:- the carrier acknowledges the transfer of rights in the goods to the new consignee. The second part of the transfer of rights is achieved by novation. According to the Bolero Rulebook, the new consignee acquires his rights against the carrier by novation, meaning that the carrier’s contract with the shipper is ‘extinguished and a new contract on the same terms is created between the carrier and the consignee’. Hence, the principle of novation implies that a ‘new party is substituted for the shipper or holder of the Bolero Bill of Lading and a new contract is created between the substituted party and the carrier’. To summarize, attornment and novation in the Bolero system is the acknowledgement of the carrier that it holds goods to the order of a new transferee, and a separate contract that forms the new agreement on the same terms between the carrier and the new proprietor. For all the above to take place via electronic means, the bolero.net is included as the carrier’s agent. 4.3. Privity of Contract Doctrine:- the contractual transfer of rights and obligations under the Bolero approach by means of attornment and novation also addresses the Privity of Contract Doctrine. This problem deals with the question to which extent rights and liabilities can be transferred to another party if the contract is concluded by an electronic bill of lading, i.e. whether ‘the electronic bill of lading enjoys the same status as its paper counterpart as an exception to the Doctrine of Privity of Contract’. The principle of Privity of Contract is a typical characteristic of English civil law. It states that only the parties to a contract can have rights and liabilities under it. As a result, contracts for the benefit of a third party are not recognized under English jurisdiction. In terms of contracts for the carriage of goods by sea this means that the Privity Rule would not allow the consignee any rights under a contract evidenced by a bill of lading that has been concluded between the carrier and the consignor. Therefore, the UK Bills of Lading Act 1855 provided for an exception to this rule by stating in sec. 1 that ‘every consignee of goods named in a bill of lading, and every endorsee of a bill of lading, to whom the property in the goods therein mentioned shall pass upon or by reason of such consignment or endorsement, shall have transferred to and vested in him all rights of suit, and be subject to the same liabilities in respect of such goods as if the contract contained in the bill of lading had been made with himself’. In the following way, the Privity of Contract – exception is also contained in the 1992 COGSA in an amended version. It can be found in sec. 2 (1) and sec. 3 (1), which state that all rights of suit and all liabilities are vested in that person, that can show bona fide

possession of the bill of lading or that has either taken delivery of the goods from the carrier, made demand for their delivery from the carrier, or made a claim against the carrier in respect of them, as if he had been a party to that contract. Due to these provisions third parties always had the possibility to sue the carrier subject to the terms of the initial contract. However, nowadays this issue can amount to a problem where the modern form of an electronic bill of lading is regarded to be an equivalent to the traditional paper bill. In that case the named provisions and therewith the exception would not apply, because they only refer to bills of lading. As was stated above, the COGSA 1992 recognizes electronic bills of lading in general, but the required regulations to include them in the Carriage of Goods by Sea Act have not been passed so far. Furthermore, the Contracts (Rights of Third Parties) Act confers 'no rights on a third party in the case of a contract for the carriage of goods by sea' according to its sec. 6 (5-7). Thus, a third party under a contract that is evidenced by an electronic bill of lading would have no rights whatsoever against the carrier. Conversely, the Bolero Bill of Lading offers a solution:- the transferee obtains his rights and obligations by means of an electronic message through the Title Registry in a separate contractual relationship with the carrier via the concept of novation. As this separate contract with the carrier applies directly to the new holder, there is not even the necessity for an exception to the Privity of Contract Doctrine. Therefore, the transferee of a Bolero Bill of Lading has just as many rights, obligations and liabilities as a third party to a traditional bill of lading – without the very need for an exception. Because of that the Bolero Bill of Lading is only called the functional equivalent to the paper bill of lading. The term 'electronic bill of lading' would suggest that the modern form represents exactly the same requirements like the traditional bill. Notwithstanding the above, the Bolero Bill does indeed – including such features as the Core Message Platform, the Title Registry, and legal principles suchlike attornment and novation – replicate all the functions of the bill of lading. Conclusion:- the chore that was challenged in the introduction of this dissertation was whether the modern electronic bills of lading are able to replace the traditional paper bills of lading. It was alleged that after 21 years of development not only the technical essentials but also the legal prerequisites would be fulfilled in today's international trading environment. The elaboration regarding the technical basis for electronic messages has revealed that modern forms of messages that are sent via electronic means are as secure as a paper document could almost ever be. The utilization of updated cryptographic techniques, namely the encryption and decryption of electronic documents and digital signatures, are a method of security in the highest degree. Furthermore, it was expound that the so-called certification authorities act as state-controlled and trusted third parties, offering a similar high level of security and control over the electronic bill of lading as a negotiable paper document does in the hands of its own proprietor. Turning to the aspects of legal acceptance it was concluded that the electronic bill is a document in writing under UK legislation, no matter whether it is represented on the computer display, stored on any kind of electronic or digital medium, or factually is a printout from the computer's printer. Additionally, the technical process of encryption harmonizes with the signature requirement where it is demanded. An enormous progress was also made on an EU and international level during the last decade. Numerous EU Directives and international conventions promote the use of electronic bills of lading as well as e-commerce in total. As a response, the UK lawmakers adopted the Electronic Communications Act 2000, which will take this nation a good step closer to e-commerce trade. Problems, however, emerge from a look at UK laws such as the COGSA 1992 and the Hague/Visby Rules. The former one does mention and recognize information technology and telecommunication systems in general, regulations to include electronic bills of lading into the law's application have not been passed though. A wider interpretation of the latter Hague/Visby Rules to cover electronic documents could possibly be attempted, nevertheless such an approach was already denied in the academic writings. In respect of the aforementioned argument it was important in the scope of this work to mention the Bolero Bill of Lading which achieves a functional equivalence to the traditional bill of lading. Security concerning electronic messages is guaranteed through the Core Messaging Platform that uses the same encryption methods as aforementioned. The crucial point is Bolero's contractual solution within the Title Registry:- acting as the trusted third party, the Title Registry transfers the rights in the goods from the carrier to the transferee by novation, while the carrier acknowledges the transfer of rights by attornment. This contractual relationship is just as useful as a negotiable document of title – all the rights, obligations and liabilities are by contractual means with the new consignee. He has control over the goods. This leaves the author to conclude with congratulations to the 21st birthday of the electronic trade with goods carried by sea:- 'The beauty of a contractual solution is that it can move far more quickly than legislative change in response to industry demand and certainly faster than international legislation through conventions'. Therewith, a workable solution for electronic trade has been found with the Bolero project. International trade has no time to wait for mercantile custom to approve the electronic bill of lading. / заслуживающий доверия или действительный (bona fide). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Электронная альтернатива традиционному коносаменту. Она управляется компанией , которая является совместным предприятием между Сообществом по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) и .

BILL OF LADING GUARANTEE = ГАРАНТИЯ КОНОСАМЕНТА – Bill Of Lading Guarantee supports the shipping company for any financial damages caused by the goods being delivered without the bill of lading. The guarantee is valid until the bill of lading is presented, or until the shipping company releases the bank from its liability. Also known as Steamship Guarantee.

BILL OF LADING LEGAL LIABILITY = ЮРИДИЧЕСКОЕ ОБЯЗАТЕЛЬСТВО ПО КОНОСАМЕНТУ – Policy covering the statutory minimums owed to a claimant for freight loss or damage when values for goods have not been declared, subject to terms and conditions. / порядки и условия.

BILL OF LADING NUMBER = НОМЕР КОНОСАМЕНТА – Bill Of Lading Number is the number assigned by the carrier to identify the bill of lading. US Customs' standardized Bill of Lading (B/L) numbering format to facilitate electronic communications and to make each B/L number unique. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BILL OF LADING PORT OF DISCHARGE = ПОРТ РАЗГРУЗКИ ПО КОНОСАМЕНТУ – Bill Of Lading Port Of Discharge is a port where cargo is discharged from means of transport. / Порт, в котором груз выгружается из транспортных средств.

BILL OF LADING R 300 = КОНОСАМЕНТ АР 300 – Bill Of Lading R 300 is a classic marine Bill of Lading in which the carrier is also responsible for the part of the transport actually performed by himself. See also Bill Of Lading R 302, and Sea Waybill.

BILL OF LADING R 302 = КОНОСАМЕНТ АР 302 – Bill Of Lading R 302 is a modern document for either Combined Transport or Port to Port shipments depending whether the relevant spaces for place of receipt and/or place of delivery are indicated on the face of the document. Synonyms:- Combined Transport Bill Of Lading, or Multimodal Transport Document. See also Bill Of Lading R 300, and Sea Waybill.

BILL OF LADING'S STATUS = СТАТУС КОНОСАМЕНТА – Bill Of Lading's Status represents whether the bill of lading has been input, rated, reconciled, printed, or released to the customer.

BILL OF LADING'S TYPE = ТИП КОНОСАМЕНТА – Bill Of Lading's Type refers to the type of Bill of Lading (B/L) being issued. Some examples are:- a Memo (ME), Original (OBL), Non-negotiable, Corrected (CBL) or Amended (AM) B/L.

BILL OF LADING TERMS AND CONDITIONS = ПОРЯДКИ И УСЛОВИЯ КОНОСАМЕНТА – Bill Of Lading Terms And Conditions:- the fine print on B/L; defines what the carrier can and cannot do, including the carrier's liabilities and contractual agreements.

BILL OF MATERIALS = ПЕРЕЧЕНЬ МАТЕРИАЛОВ (или СПЕЦИФИКАЦИЯ НА МАТЕРИАЛЫ) – Bill Of Materials:- a list of all parts, sub-assemblies and raw materials that constitute a particular assembly, showing the quantity of each required item.

BILL OF SALE = КУПЧАЯ – Document certificating the transfer of goods (but not real estate) to another person. Goods transferred in this way may not become the property of the receiving party but may be redeemed when the bill is paid. A Bill Of Sale confirms the transfer of ownership to certain goods to another person, i.e. in return for money paid or loaned. A Bill of Sale is a legal document made by a 'seller' to a purchaser, reporting that on a specific date, at a specific locality, and for a particular sum of money or other 'value received', the seller sold to the purchaser a specific item of personal, or parcel of real, property of which he had lawful possession. It is a written instrument which evidences the transfer of title to personal property from the vendor, seller, to the vendee, buyer. Bill of Sale is often used in the USA when selling small items and vehicles such as quadricycles. / Купчая подтверждает переход прав на определённые товары другому лицу, то есть в обмен на проплаченные деньги или в кредит. Купчая – акт приобретения в собственность имущества.

BILL PAYABLE = ВЕКСЕЛЯ К ОПЛАТЕ – Bill Payable:- a liability of an entity arising either as a result of giving a promissory note or accepting a bill of exchange drawn on it by a creditor. In accounting, bills of exchange that are held and must be paid at some future date. These are effectively liabilities. See also Bill Receivable.

BILL PORTFOLIO = ВЕКСЕЛЬНЫЙ ПОРТФЕЛЬ – Bill Portfolio:- discounted bills deposited with a bank. Also known as Bill Holdings. / Учтённые векселя депонированные в банке. Известен также как Удерживаемые Векселя (Bill Holdings).

BILL RECEIVABLE = ПОЛУЧЕННЫЕ ВЕКСЕЛЯ (или ВЕКСЕЛЯ К ПОЛУЧЕНИЮ) – Bill Receivable:- an asset of an entity arising either as a result of receiving a promissory note or drawing a bill of exchange on a debtor. In accounting, bills of exchange that are held and are due to be paid at some future date. These are effectively assets. See also Bill Payable.

BILL RENEWAL = ВОЗОБНОВЛЕНИЕ ВЕКСЕЛЯ – Bill Renewal is a prolonging the validity of a bill by postponing the expiry date. / Пролонгирование срока действия векселя посредством отсрочки даты погашения.

BILL TO PARTY = ВЫПИСАННЫЙ НА ... (или СЧЁТ ДЛЯ СТОРОНЫ) – Bill To Party:- customer designated as party paying for services.

BILLYCOCK = КОТЕЛОК (или БИЛЫКАК) – Billycock:- (British) is a felt hat with a low, rounded crown, similar to a derby. Perhaps from earlier Bullycocked, cocked in the fashion of a Swashbuckler:- Bully, gallant figure + Cock.

BIMCO = THE BALTIC AND INTERNATIONAL MARITIME COUNCIL

BIMODAL = БИМОДАЛЬНОЕ – Bimodal:- a frequency distribution having two modes. / , от Латинского слова Bi-, означающее Дву(х)-, от Bis, означающее Дважды, .

BIMODAL TRAILER = СЪЁМНЫЙ АВТОМОБИЛЬНЫЙ КУЗОВ (или ПРИЦЕП ДВОЙНОГО НАЗНАЧЕНИЯ, или ПРИЦЕП ДВОЙНОГО ИСПОЛЬЗОВАНИЯ, или КОНТРЕЙЛЕР) – Bimodal Trailer is a road semi-trailer with retractable running gear to allow mounting on a pair of rail boogies. Synonym:- Road-Rail Trailer A trailer which is able to carry different types of standardized unit loads, e.g., a chassis which is appropriate for the carriage of one FEU or two TEU's. / , например, . Под Контрейлером, от сочетания Латинского слова Con (Cum), означающее Вместе или Заодно, и Английского слова Trailer, означающее Волочащий или Тащущий, понимается контейнер, оборудованный колёсами с пневматическими шинами и предназначенный для перевозки грузов на железнодорожных платформах и их перемещения при помощи автотягача по шоссейным дорогам. Грузоподъёмность контрейлеров находится в диапазоне от 6 до 30 тонн. Под Контрейлером понимается контейнер, оборудованный колёсным ходом с пневматическими баллонами автомобильного типа. Предназначен для смешанных (комбинированных) автомобильно-железнодорожных, автомобильно-водных или автомобильно-водно-железнодорожных перевозок грузов. Контрейлер изготовляется, как правило, в виде автомобильного полуприцепа с закрытым или открытым кузовом (универсальным или специализированным) ёмкостью свыше 15 кубических метров ($м^3$) и грузоподъёмностью от 6 до 30 тонн (т). Буксировка по автомобильным дорогам, а также установка и снятие контрейлеров с железнодорожных платформ и специальных судов производятся автотягачами седельного типа. Контрейлеры бывают с постоянной и подкатной ходовой частью (тележкой), которая может быть одноосной, двухосной и трёхосной. Контрейлеры с постоянной ходовой частью на железнодорожных платформах крепятся специальными устройствами; контрейлеры со съёмными тележками крепления, как правило, не требуют. Разновидность контрейлеров – Стриктейнеры – контейнеры с сочленёнными кузовами. Известны также транспортные средства с комбинированной ходовой частью, приспособленной для движения по автомобильным дорогам и рельсовым путям (что достигается взаимозаменяемостью железнодорожных и автомобильных колёс или укреплением специальных стальных бандажей с ребордами на автомобильных колёсах). Их нередко называют Роудрейлерами. Массовое развитие перевозок грузов в крупнотоннажных контейнерах показало, что их применение более экономично и перспективно, чем применение контрейлеров.

BIN = ОБРЕШЁТКА (или ВЫГОРОДКА, или РУНДУК, или БУНКЕР, или ЛАРЬ) – Bin is a four-sided structure that is mounted on a pallet. A bin may or may not have a cover. Or, an area in the warehouse used for storage of inventory that is being staged or at rest. Bin is four-sided superstructure to be mounted on a pallet base, with or without a cover. Also known as Box or Container Bin Pallet.

BINARY OPTIONS = БИНАРНЫЕ ОПЦИОНЫ (или ДВОИЧНЫЕ ОПЦИОНЫ) – Binary Options, also known as Digital Options, or All-Or-Nothing Options, are options that have only two (hence the term binary) possible outcomes – either you're in the money or you're out of the money. Binary options can be based on a variety of underlying securities – Binary stock options, Binary commodity options, Binary Forex options and so on. We offer underlying securities from a large variety of markets, for example American market binary options, European market binary options and many more. Every binary option has a fixed payout; payouts are known before you enter the trade and are not affected by the magnitude of movement of the stock, commodity or currency pair value meaning a movement of even a fraction of a point in the direction you anticipated is enough to be in the money and vice verse. When executing a binary option trade you have to estimate whether the underlying security value is going to be higher or lower at expiration time than it is upon executing the trade:- (i) Binary call option:- if you think the price at expiration time is going to be higher than your strike price (the price at the moment you executed or entered the trade) you should place a binary call option. If indeed the expiration price is higher than the strike price for the underlying security then you're in the money and you get the pre-known profit percentage out of your trade amount. (ii) Binary put option:- if you think the price at expiration time is going to be lower than your strike price (the price at the moment you executed or entered the trade) you should place a binary put option. If indeed the expiration price is lower than the strike price for the underlying security then you're in the money and you get the pre-known profit percentage out of your trade amount. Binary

option in the money:- the term refers to trade on a binary or digital option that is said to be ‘in the money’ which means the outcome upon expiration price was in the direction you anticipated – If you placed a binary call option, meaning you estimated it will increase in value and indeed the underlying security has a higher value in expiration time (Expiration Price) than in the time of executing the trade (Strike Price). If you placed a binary put option, meaning you estimated it will decrease in value and indeed the underlying security has a lower value in expiration time (Expiration Price) than in the time of executing the trade (Strike Price). Binary option out of the money:- the term refers to trade on a binary or digital option that is said to be ‘out of the money’ which means the outcome upon expiration price was in the opposite direction than what you anticipated – If you placed a binary call option, meaning you estimated it will increase in value and instead the underlying security has a lower value in expiration time (Expiration Price) than in the time of executing the trade (Strike Price). If you placed a binary put option, meaning you estimated it will decrease in value and instead the value in expiration time (Expiration Price) is higher than in the time of executing the trade (Strike Price). Binary option Tie:- a Tie outcome at expiration time in binary options describes a situation when the strike price (price at the time of executing the trade) is equal to the price of the asset upon expiration (expiration price). Another term to describe this situation is ‘The Breakeven Point’. Binary option payout:- binary options (AKA Digital options) have an extremely high payout, ranging from 68% and reaching even a 95% payout. Each option has a different payout written next to it and is something for you to know and consider before you enter the trade. Binary options underlying assets:- when you trade binary options, you have to choose your trade between assets from 5 different categories as; binary options on commodities, currency pairs (Forex), indices, future indices and binary stock options. For over-the-counter markets of weather derivatives, binary options are options with discontinuous payoffs, which pay a predetermined amount if a certain temperature or degree day level is reached, or nothing at all. A simple example of a binary option is a Cash-or-Nothing Call. This pays off nothing if the underlying price ends up below the strike price at time T and pays a fixed amount, Q, if it ends up above the strike price. A Cash-or-Nothing Put is defined analogously to a cash-or-nothing call. It pays off Q if the underlying level is below the strike price and nothing if it is above the strike price. Another type of binary option is an Asset-or-Nothing Call. This pays off nothing if the underlying level ends up below the strike price and pays an amount equal to the underlying level itself if it ends up above the strike price. An Asset-or-Nothing Put pays off nothing if the underlying level ends up above the strike price and an amount equal to the underlying level if it ends up below the strike price. Also known as Digital Options. Binary Options, also commonly known as Digital Options, both are based on short-term projections. They are an attractive alternative to traditional trading, providing traders who have varying levels of experience with the opportunity to take a view on whether an underlying asset will rise or fall. Upon expiration, which is typically an hour later, the binary options will pay out a fixed percentage of the trading value if the traders’ prediction is correct (or ‘In the money’). This payout is based on the movement not on the magnitude of increase or decrease of the underlying asset. In a sense, binary options are contracts that have only two possible outcomes – they win or they lose. That is the main reason of why they are called Binary Options. If the underlying stock meets or exceeds its predetermined threshold or strike price, a fixed amount will be paid. There are two types of binary options – binary call options and binary put options. Binary call options gain value when the underlying security is trading at more than the strike price at expiration. There is no need to set a specific target, it is only important to identify that the underlying asset will increase in price. If the price of the underlying security goes up and exceeds the strike price of the binary options at expiration, the predetermined amount will be paid out. Conversely, binary put options gain value when the underlying security is trading at less than the strike price at expiration. Similar to the call option, the trader only needs to identify that the underlying asset will decrease in price – not identify a specific target. If the price of the underlying security trades less than the option strike price at expiration, the predetermined amount will be paid. In binary options trading, the strike price is determined by the price of the underlying security at the time the option is purchased. When the option expires, the price of the underlying asset is compared to that of the initial strike price. Following this comparison, it will be determined whether the binary options have gained value (‘in the money’) or lost value (‘out of the money’). An option is ‘in the money’ when it gains value upon expiration. In a similar vein, binary options are ‘out of the money’ when they lose value upon expiration. Binary options can also be ‘at the money’, when the strike price of the option equals the market price of the underlying security. In this instance, the option neither gains nor loses value and the payout equals the original amount traded. Binary Option:- unlike simple options, which have continuous pay-out profiles, that of a binary option is discontinuous and pays out a fixed amount if the underlying satisfies a predetermined trigger condition but nothing otherwise. Binary options are also known as Digital Options or All-Or-Nothing Options. There are two major forms:- at maturity and one-touch. At maturity binaries, also known as European Binaries or At Expiry Binaries, pay out only if the spot trades above (or below) the trigger level at expiry. One-touch binary options, also known as American Binaries, pay out if the spot rate trades through the trigger level at any time up to and including expiry. The pay-out of a one-touch binary may be due as soon as the trigger condition is satisfied or alternatively at expiry (one-touch immediate or one-touch deferred binaries). As with barrier options, variations on the theme include discrete binaries, stepped binaries, etc. Binary options are frequently combined with other instruments to create structured products, such as contingent premium options. Binary Options:- anyone interested in learning how to trade has been told the best first step is paper trading. In today’s electronic world, ‘paper trading’ means tapping into many demo programs available that don’t use real money but can help you learn the market ebbs and flows and trade using various technical tools. Another method to learn how to trade, especially forex, is to use binary options. These are an increasingly popular type of global trading tool. In fact, Google Trends data indicates that the search term ‘binary options’ has risen parabolically in the past two years, and now has exceeded the frequency of the search term ‘Forex Trading’. Along with this increase in interest is the Internet growth of white-label platforms offered for binary options. This isn’t surprising because binary options have many positives, one being the ability to put on a trade for a simple ‘yes’ or ‘no’ on whether a market will be up or down within an expiration time that can be between five and 30 minutes. Also, many trades can return more than 70%. No doubt, this kind of trading is extremely attractive. From a technical perspective these are at-the-money options with very short-term expirations. But from a risk management point of view, binary options require a win/loss ratio of 6-out-of-10 trades to break even. Binary options come in many different flavors, such as ‘one-touch’ options where a trader can anticipate that the price will touch a level. There also are range options, where a trader can take a position on whether the price will stay within a specific range. On some platforms, traders can select their own target strike prices. There are also 60-second expiration options. These are the most difficult to end up in-the-money because the price behavior in these durations is very volatile. Many firms offer binary options that basically are set, which lock in a position until expiration, although some firms allow closing the position before expiration. Yes, binary options are exciting, offering within minutes the result of a win or loss. But with any high-growth market comes challenges. For example, choosing the right broker or platform is key. As with any new instrument and industry, binary options have a ‘wild west’ aspect. Many firms that offer these platforms are licensed offshore and fall outside the stricter regulatory umbrella and standards that are common in the United States, Europe and Australia. As a result, some firms use questionable marketing tactics designed to lure customers with give-aways, such as iPhones and flat-screen TVs. The reality is most customers lose their money, and lose it quickly with these schemes. Also common are ‘bonus’ programs that match a customer’s deposit, but essentially prevent the customer from withdrawing money until 10–20 times the volume of the deposit is generated. Naive customers respond to the opportunity to trade the firm’s money, not realizing that they are trapping themselves into financial oblivion. For example, if a trader places USD10 000 and gets a USD10 000 match in one firm, they have to generate USD200 000 in trading turnover or volume before they can withdraw their capital. The result is a very low statistical probability of ever getting any money back. Therefore, unless you have a proven track record, never enter a ‘bonus’ agreement. Finally, like age-old boiler rooms,

some of these unregulated or offshore-regulated firms use deceptive practices in which their brokers use aliases. Adding insult to injury, brokers in these firms have little experience in trading the markets. They are at the core sales people who try to use the right buzz words to feign expertise. These brokers give out what are essentially whim-based trade alerts that primarily encourage trading and not profits. These warnings aside, trading binary options is a low cost way to trade and learn a market. Trading these products also provides a great opportunity to hone trading skills. It especially strengthens the understanding of fundamentals because the key to success is detecting the right direction. Binary options definitely are a great place for a new trader to begin to understand the forex market. For example, the North American Derivatives Exchange (Nadex) offers free demo accounts that you can use to get a feel of the market and familiarize yourself with various tools to keep up with it. The exchange also is regulated by the Commodity Futures Trading Commission and offers several currency pairs, including the EUR/USD, USD/JDP and USD/CAD on its platform. Further, you can trade directly with Nadex and not go through a broker. A great appeal of binary options lies in their amenability to the use of classic trend lines, resistance and support levels, candlestick charts and analysis of price patterns to find trading signals. Binaries are a craze now, but can evolve into a tool that can be used in a variety of ways to help all traders hone their craft. / На внеучётных рынках погодных деривативов бинарные или двоичные опционы представляют собой опционы с прерываемой окупаемостью (payoff), . Бинарный Опцион или Двоичный Опцион Форэкс, который также известен как Опцион Форэкс, это всего лишь один из нескольких видов опционов, к которым торговцы имеют доступ в процессе торговли на платформе для опционов. При работе с бинарными опционами ФОРЭКС для возможного получения большой прибыли необходимо сделать лишь небольшую начальную инвестицию. С другой стороны, традиционная торговля ФОРЭКС требует гораздо более крупных капиталовложений. Например, на свою инвестицию в USD300.00 можно получить USD510.00 – достаточно крупная прибыль в размере USD210.00. Одним из наиболее уникальных преимуществ бинарных опционов ФОРЭКС является отсутствие так называемого плеча (левереджа), то есть даже в том случае, если приобретённый опцион (Call или Put) до срока исполнения будет вести себя совсем не так, как планировал инвестор или торговец, в этом случае не о чем беспокоиться. Торговля бинарными опционами сегодня является достаточно простым процессом. У Вас есть возможность выбрать опцион Call или опцион Put сразу после прослушивания последних экономических новостей из промышленно развитых стран мира. Многие инвесторы с различным уровнем образования и опыта сегодня выбирают торговлю бинарными опционами. Среди тех, кто желает получить высокую прибыль за короткое время, число людей, выбравших торговлю бинарными опционами, многократно возросло. Например, при торговле долговыми обязательствами прибыль часто достигает 8%. Однако, если Вы выбрали торговлю бинарными опционами и у Вас всё получилось, то размеры потенциальных доходов могут быть поистине безграничными. Платформа для торговли бинарными опционами работает на основе сети Интернет. Это значит, что Вы имеете возможность торговать бинарными опционами с любого компьютера, из любого места и в любое время. Более того, при работе с платформой для торговли бинарными опционами существует намного меньше рисков, чем при работе с платформами, часто используемыми в ФОРЭКСе. Например, в ФОРЭКСе, если в любой момент торговли показатель поворачивается на несколько процентов не в Вашу пользу, торговая платформа ФОРЭКС автоматически закрывает все Ваши позиции. Что же касается платформы для торговли бинарными опционами, то она принимает во внимание исключительно уровень цены на заранее определённый момент исполнения опциона.

BINBURNT KERNELS = СПРЕЛАЯ ЗЕРНОВКА (или САМОСОГРЕВШАЯСЯ ЗЕРНОВКА) – Binburnt Kernels closely resemble fireburnt kernels in color. However, in cross section, the binburnt kernel maintains its dense structure and appears smooth and glossy, unlike a fireburnt kernel, which looks like charcoal in cross-section, has numerous air holes, and crumbles easily under pressure. Binburnt kernels are caused by gradual heating in storage and have not been exposed to temperatures approaching ignition. The weight of a binburnt kernel is similar to that of a sound kernel of comparable size. / доброкачественная зерновка (ядро).

BINCHE LACE = БАШСКОЕ КРУЖЕВО – Binche Lace is a lace in which hand-made lace motifs are appliqued to a machine-made net ground. The name comes from Binche, a town in Belgium, where the lace is said to have originated. / Баш (Binche).

BINDER = БАЙНДЁР (или ВРЕМЕННОЕ СОГЛАШЕНИЕ) – In lines other than life and health, a Binder is an acknowledgement (usually from the agent) that insurance applied for is in force whether or not premium settlement has yet been made or the policy issued. In life and health insurance, binders are not issued, but if premium settlement is made with the application, what is often erroneously referred to as a Binder is issued. Actually this is a conditional binding receipt. Binder is a written statement binding two parties to an agreement until a formal contract can be executed. A binder is used to secure insurance for a mortgage until a complete policy is issued. A Binder is a legal agreement that serves to effect insurance coverage for a specified period of time until the actual insurance policy can be issued. A binder can be issued by either an insurance agent or company and must provide the following information:- name of insured, type of insurance coverage, limits of insurance, covered perils and name of insurance company. / Байндёр – законное соглашение, обеспечивающее страховое покрытие в течение указанного периода времени до фактической выписки страхового полиса. Байндёр может быть выписан либо страховым агентом, либо компанией и должен содержать следующую информацию:- название страхователя, тип страхового покрытия, лимиты страхового обязательства, покрытые риски и название страховой компании.

BINDER = СВЯЗУЮЩЕЕ (или СВЯЗЫВАЮЩЕЕ, или ШПАГАТ, или СКРЕПЛЯЮЩЕЕ) – (1) Binder is an adhesive applied with a solvent or a softenable plastic melted to bond fibers together in a web or to bind one web to another.

(2) Binder is a material, usually nearly colorless, that is typically used to attach a pigment to fabric. Binders are more-or-less ‘glue’ to hold the pigment in place. Paints consist of pigments mixed with binders. Many binders used in textile paints are acrylic polymers.

(3) Binder is a strip of cardboard, thin wood, burlap, or similar material placed between layers of containers to hold a stack together.

(4) Binders are the individual hairs in a sheep’s fleece that run from one staple to another.

BINDER CONTENT = СОДЕРЖАНИЕ СВЯЗУЮЩЕГО – Binder Content is the weight of adhesive used to bond the fibers of a web together. Usually expressed as percent of fabric weight.

BINDER FIBERS = СВЯЗУЮЩИЕ (или СВЯЗЫВАЮЩИЕ, или СКРЕПЛЯЮЩИЕ, или ПЕРЕВЯЗОЧНЫЕ) ВОЛОКНА – Binder Fibers are the fibers that can act as an adhesive in a web because their softening point is relatively low compared with that of the other fibers in the material.

BINDING = ОБШИВКА (или БЕЙКА) – Binding is any narrow fabric used to enclose (bind) edges, usually raw edges. It also can be used for purely decorative purposes. Bias tape often is used as binding. See also Bias Tape. Binding is a narrow fabric used to finish raw edges. In sewing, binding is used as both a noun and a verb to refer to finishing a seam or hem of a garment, usually by rolling or pressing then stitching on an edging or trim.

BINDING ORIGIN INFORMATION = УВЯЗАННАЯ (или ПОДКРЕПЛЯЮЩАЯ, или ОБЯЗЫВАЮЩАЯ) ИНФОРМАЦИЯ О ПРОИСХОЖДЕНИИ – Binding Origin Information (BOI) is a written information issued by the customs authorities of the member states on the preferential or non-preferential origin of specific goods to be imported or exported.

BINDING RECEIPT = УВЯЗАННАЯ (или ПОДКРЕПЛЯЮЩАЯ, или ОБЯЗЫВАЮЩАЯ) РАСПИСКА – Binding Receipt is a receipt given to an applicant for life insurance when he signs the application and pays his first premium stipulating that the insurance shall go into effect immediately if the risk proves to be acceptable irrespective of the date of delivery of the policy and providing for return of the money if risk is declined. See also Binder. Binding Receipt is a proof of a temporary contract, which forces a property insurance company to provide coverage, provided that a premium is paid with the application. A Binding Receipt or Slip is ordinarily a document, slip or memorandum given to the insured, which binds the insurance company to pay insurance should a loss occur pending action upon the application and actual issuance of a policy. The purpose of a binder is to provide temporary insurance pending an inquiry by the insurer as to the character of the risk and to take the place of the policy until the latter can be issued. The issuance of a binder evidences, a complete, temporary or preliminary contract of insurance effective from that time until the issuance of the formal policy or until rejection of the risk. Under a life policy, it would establish liability upon the insurer if death occurred prior to the issuance of the policy. A binder receipt would be misnamed if it does not bind the insurer. If the insurer issues a binder receipt with terms which will negate, or neutralize the binding result of the receipt, then the insurer would have actually practiced fraud on the applicant for insurance. Binding Receipt:- once the initial payment has been made and while the pending life and health application for insurance is being investigated and either issued or rejected, a binding receipt is issued to verify receipt of payment and offer temporary coverage until final decision is made. / Смотрите также Байндер или Временное Соглашение (Binder).

BINDING TARIFF INFORMATION = УВЯЗАННАЯ (или ПОДКРЕПЛЯЮЩАЯ, или ОБЯЗЫВАЮЩАЯ, или ОБЯЗАТЕЛЬНАЯ) ИНФОРМАЦИЯ О ТАРИФЕ – Binding Tariff Information (BTI) is a written information issued by the customs authorities of the Member States on the classification of goods in the combined nomenclature or a nomenclature derived therefrom, such as the TARIC (Le Tarif Intégré de la Communauté (in French) or Integrated Tariff of the European Community). / ИТАРС (Интегрированный Тариф Сообщества) или, как это звучит на Французском языке по месту использования, Лё ТАРИК (Лё Тариф Интегре дё ля Коммюноте; Le TARIC (Le Tarif Intégré de la Communauté)).

BINDING THREADS = ПЕРЕВЯЗОЧНЫЕ НИТИ (или ГОЛОСИННИКИ, или ВЯЗКИ) – Binding Threads are the threads used to unite two or more ply into one firm (stable) structure.

BINOMIAL NAME = БИНОМИАЛЬНОЕ НАИМЕНОВАНИЕ – Binomial Name is used to describe each species according to the system devised by Linnaeus. The name consists of the capitalized name of the genus followed by the name of the individual species, e.g., Euphorbia obesa. / видов (species).

BIOASSAY = БИОАНАЛИЗ (или БИОПРОБА, или БИОЛОГИЧЕСКИЙ МЕТОД, или БИОЛОГИЧЕСКАЯ ПРОБА) – Bioassay is the measurement of the potency of any physical, chemical, and biological components by means of the response it produces in a test organism. / Под Биологическим Методом понимается метод защиты растений, использование естественных врагов сельскохозяйственных вредителей и возбудителей болезней для их уничтожения или снижения численности. Способы:- размножение в лабораториях хищных насекомых и клещей (энтомофагов) и выпуск на посевы; создание благоприятных условий для их размножения в природе; применение биопрепаратов, например, энтобактерина.

BIOCATALYSIS = БИОКАТАЛИЗ – Biocatalysis is the use of enzymes as biological catalysts for the targeted application, acceleration or control of chemical reactions. The high selectivity of enzyme catalysts allows for simplified processes and lower production costs. / Биокатализ (Biocatalysis).

BIOCHEMICAL OXYGEN DEMAND = БИОХИМИЧЕСКАЯ ПОТРЕБНОСТЬ В КИСЛОРОДЕ – Biochemical Oxygen Demand (BOD) is a standard test for estimating the degree of contamination of water supplies. It is expressed as the quantity of dissolved oxygen (in mg/liter) required during stabilization of the decomposable organic matter by aerobic biochemical action. Biochemical Oxygen Demand (BOD) is the quantity of oxygen used in the biochemical oxidation of organic matter in a specified time, at a specified temperature, and under specified conditions. / Под Биохимической Потребностью в Кислороде (БПК) понимается показатель загрязнённости воды органическими веществами:- количество кислорода (мг/л), потребляемое для полного окисления органических веществ, содержащихся в воде, в процессе её самоочищения.

BIOCIDE = БИОЦИД – Biocides:- additive designed to inhibit the growth of microorganisms in liquids. Biocide is a substance which inhibits the growth of nuisance organisms including some Algae, Bacteria, Fungi, etc. These chemical substances may be found in diverse applications ranging from active ingredients in deodorant soaps, to mouth wash, to antifouling additives in boat bottom paints. Biocides are frequently used in industrial cooling systems and air conditioning units to control biological growth (e.g., Algae, Fungi) which might impair cooling efficiency. They are also used in many manufacturing processes for purposes specific to the product end use. They can be highly toxic if discharged in improper amounts. Biocide is a broad term for man-made chemicals that are used to control Pests, Weeds, Insects and diseases caused by Fungi or Bacteria. Bactericides, fungicides, herbicides, insecticides, pesticides, rodenticides etc may all be referred to as Biocides. / Биоцид – широкий термин для искусственных химикатов, которые используются для борьбы с Вредителями, Сорняками, Насекомыми и болезнями, вызываемыми Грибами или Бактериями. Бактерициды, гербициды, инсектициды, пестициды, родентициды, фунгициды и прочие могут быть всецело отнесены к таким биоцидам. Под Биоцидами, от Греческого слова Bios, означающее Жизнь, и Латинского слова Caedo, означающее Убиваю, понимаются .

BIOCOMPONENT FIBER = БИОКОМПОНЕНТНОЕ ВОЛОКНО – A Biocomponent Fiber, or Bico, is a fiber that combines two separate polymers into a single filament. The term Conjugate Fiber is also used as a synonym. The process of making a bicomponent fiber is relatively straightforward. There are a number of patents that describe this practice. Commonly, the fiber is constructed of two component polymers divided into two or more distinct sections. Most of the time, the components demonstrate strong adhesion to one another, otherwise, the process would result in multiple fibers or different compositions. There are tremendous advantages to bicomponent fibers over homopolymers, and they are utilized throughout the nonwovens industry. These fibers are utilized for thermal bonding and can be tuned to a wide range of temperatures. Distinctive cross sections provide enhancements, including but not limited to: bulk, extremely fine fibers, high strength and surface area. Lastly, bico fibers can provide the 'best of both worlds' as it relates to the polymer, such as high strength fiber cores with low cost easily meltable outer cores. The resultant can be a recyclable material if the fiber is made of the same base polymer with different molecular weights. Bico Variations:- Basic variations of the bico fiber include core-sheath and side by side. Core and sheath are utilized as a bonding fiber, whereas the outer sheath melts at lower temperature than the core. Side-by-side fibers are utilized primarily to form self-crimping fibers to add bulk and can be utilized to make splittable fibers that yield finer fibers with distinct cross-sections. More technically advanced bicomponent fiber structures include the segmented pie and islands in the sea. Segmented pie fibers are the basis for most microfiber products. They yield very fine fibers with high

strength and high surface areas. Islands in the sea is a technique to make even finer fibers. Recycling And Reuse:- Many bico fibers utilize the same basic polymer with different melt characteristics. This configuration makes it relatively simple to recover and recycle. Bico fibers that utilize different materials in combination significantly complicate the ability of recovery, and in particular, the suitability for mechanical recycling, which is the primary method of recycling plastics. This is the same challenge faced by flexible packing, as it is common to utilize multiple polymers to create packaging films. There is no existing program anywhere in the world to provide public recovery of multipolymer materials. In general, there are several ways to recycle multipolymer fibers. The first option is to separate the different components and make them available for recycling in separated recycling streams. (This is a tall order, and perhaps one that is too logistically complicated to scale at this time.) The second option is to process the used fibers together in a compatibilization step. (Perhaps a bit more feasible than separating the components.) Lastly, there are promising technologies, including multiple formats of depolymerization, which return the polymer back to liquid state, or back to the original monomers, in a form that could be considered virgin. Ultimately, with all of the benefits bico fiber brings, particularly for nonwovens, we will see a solution to the recycling/end-of-life issue, and one of the aforementioned options, or a variation thereof, will likely play a role in this regard. The Future Of Bico Fiber:- Promising end of life technologies to address bico fibers include multiple formats of depolymerization, which return the polymer back to liquid state or back the original monomers in a form that could be considered virgin. New materials enter the market slowly, but there are advancements on the horizon. Biocomponents that utilize biorenewable materials that can be composted or chemically recycled are being developed. Compatibilizer technologies are also being developed to better facilitate utilization of dissimilar materials. Bicomponent technologies have revolutionized many fiber applications. They have made products lighter, stronger and easier to work with. As an advanced material, this fiber type is expected to grow across many end use areas including:- hygiene, textiles, automotive, home furnishings and many others to solve problems and meet customer demands.

BIOCON = BIOLOGICAL CONTROL

BIODEGRADABLE = БИОРАСПАДАЕМОЕ (или БИОРАЗЛАГАЕМОЕ, или БИОРАСЩЕПЛЯЕМОЕ) – Biodegradable:- the ability of a substance to be broken down by bacteria so that it can be returned to the environment without posing an environmental hazard. Biodegradable:- types of material subject to break down by biochemical processes.

BIODEGRADATION = БИОДЕГРАДАЦИЯ (или БИОРАСПАД, или БИОРАЗЛОЖЕНИЕ, или БИОРАСЩЕПЛЕНИЕ, или БИОДЕСТРУКЦИЯ) – Biodegradation:- the chemical breakdown of materials by living organisms in the environment. The process depends on certain microorganisms, such as Bacteria, Yeast, and Fungi, which break down molecules for sustenance. Certain chemical structures are more susceptible to microbial breakdown than others; vegetable oils, for example, will biodegrade more rapidly than petroleum oils. Most petroleum products typically will completely biodegrade in the environment within two months to two years.

BIODIESEL = БИОДИЗЕЛЬ – Biodiesel refers to a diesel-equivalent, processed fuel derived from biological sources (such as vegetable oils), which can be used in unmodified diesel-engined vehicles. It is thus distinguished from the straight vegetable oils (SVO) or waste vegetable oils (WVO) used as fuels in some modified diesel vehicles. Some vehicle manufacturers are positive about the use of biodiesel, citing lower engine wear as one of the benefits of this fuel. However, as biodiesel is a better solvent than standard diesel, it 'cleans' the engine, removing deposits in the fuel lines, and this may cause blockages in the fuel injectors. For this reason, car manufacturers recommend that the fuel filter is changed a few months after switching to biodiesel (this part is often replaced anyway in regular servicing). Most manufacturers release lists of the cars which will run on 100% biodiesel, for example, the summary list provided by Volkswagen is under the title 'Use of biodiesel in Volkswagen cars' further down the right-hand side of this page (note it is best to consult with your car manufacturer before using biodiesel for the first time). Biodiesel can also be used as a heating fuel in domestic and commercial boilers. Existing oil boilers may require conversion to run on biodiesel, but the conversion process is believed to be relatively simple. Biodiesel can be distributed using today's infrastructure, and its use and production are increasing rapidly. Fuel stations are beginning to make biodiesel available to consumers, and a growing number of transport fleets use it as an additive in their fuel. Biodiesel is generally more expensive to purchase than petroleum diesel but this differential may diminish due to economies of scale, the rising cost of petroleum and government tax subsidies. In Germany, biodiesel is generally cheaper than normal diesel at gas stations that sell both products. A variety of oils can be used to produce biodiesel. These include:- (i) virgin oil feedstock; rapeseed and soybean oils are most commonly used, soybean oil alone accounting for about ninety percent of all fuel stocks; other crops such as mustard, flax, sunflower, canola, palm oil, hemp, jatropha, and even algae show promise; (ii) waste vegetable oil (WVO); (iii) animal fats including tallow, lard, yellow grease, chicken fat, and the by-products of the production of Omega-3 fatty acids from fish oil; (iv) Sewage. A company in New Zealand has successfully developed a system for using sewage waste as a substrate for algae and then producing bio-diesel; and (v) thermal depolymerization is an important new process that reduces almost any hydrocarbon based feedstock, including non oil based feedstocks, into light crude oil. / Биодизель в большинстве случаев более дорог для закупки, нежели дизельное топливо из нефти, но .

BIODIVERSITY = БИОРАЗНООБРАЗИЕ (или БИОМНОГООБРАЗИЕ) – Biodiversity is the totality of all the species of plants and animals in an area.

BIOFUEL = БИОТОПЛИВО – Biofuels are fuels that are derived from biomass (recently living organisms such as wood) or their metabolic by-products, such as manure from cows. They are a renewable energy source, unlike other natural resources such as petroleum, coal and nuclear fuels. For the purposes of the Biofuels Sales Obligation (the obligation), the term biofuels refers to those biofuels which are used as a direct replacement for petrol or diesel in petrol or diesel engines. Biofuel is the solid, liquid or gaseous fuel that is derived from biomass. Biomass that has been processed or converted in some way into a more convenient form, principally to increase energy density. This may involve physical pre-processing simply to cut it into more manageable pieces or reduce the moisture content, or may involve thermal or chemical processing to convert it into a sold, liquid or gas. Biofuels:- in the wider sense defined as all solid, fluid or gaseous fuels produced from biomass. More narrowly, the term biofuels comprises those that replace petroleum-based road-transport fuels, i.e. ethanol or bioethanol produced from Sugar crops, Cereals and other Starchy crops that can be used as an additive to, in a blend with or as a replacement of gasoline, and biodiesel produced mostly from vegetable oils, but also from waste oils and animal fats, that can be used in blends with or as a replacement of petroleum-based diesel. / Под Биотопливом понимаются органические материалы, такие как навоз, торф и тому подобные, выделяющие при разложении тепло. Используются для обогрева парников, утеплённого грунта.

BIOFUMIGATION = БИОФУМИГАЦИЯ – Biofumigation is the use of toxic gases produced naturally in the soil by plant roots or decaying plant residues to control the spores of disease-causing fungi that are present in the soil. / Использование токсичных газов, производимых в почве естественным путём корнями растений или гниющими остатками растений, для контроля за спорами грибка, вызывающего болезни и содержащегося в данной почве.

BIOGAS = БИОГАЗ – Biogas is a mixture of methane (CH_4) and carbon dioxide (CO_2) produced by anaerobic digestion, with small amounts of other gases. The methane is a flammable gas, chemically identical to the main constituent of natural gas, and can be used

as a fuel for heat and/or electricity generation. Biogas is effectively the same as landfill gas, which is produced by the anaerobic decomposition of organic material in landfill sites.

BIOLISTICS = БИОЛИСТИКА (или БИОЛИСТИКС) – Biolistics is a process by which DNA molecules are propelled into a recipient cell using coated microprojectiles shot from a 'gene gun'. The method of propulsion may vary and ranges from electric discharge to helium blast.

BIOLOGICAL ACTIVE PRODUCTS = БИОЛОГИЧЕСКИЕ АКТИВНЫЕ ПРОДУКТЫ – Biological Active Products in context of Oeko-Tex Standard 100 are those active chemical products that are used with the intention to destroy, deter, render harmless, prevent the action of, or otherwise exert a controlling effect of any organism by chemical or biological means. When using biological active products it is distinguished between fiber materials where the biological active agents are incorporated into the fibers and a treatment of textiles with biological active products in a later processing step. Fiber materials with biological active properties are accepted for a certification according to Oeko-Tex Standard 100 (for product class IV only after 2009-January-01) when an assessment by Oeko-Tex reveals, that these fibers may be used from a humanecological point of view without any restrictions. Finishes with biological active products are accepted within a certification according to Oeko-Tex Standard 100 (for product class IV only after 2009-January-01) when a thorough assessment by Oeko-Tex from a humanecological point of view has shown that the finish carried out according to the recommendations of the manufacturer of the product are harmless to the human health. See also Active Chemical Products, Flame Retardant Products, and Oeko-Tex Standard 100. / согласно рекомендаций изготовителя продукта .

BIOLOGICAL CONTROL = БИОЛОГИЧЕСКАЯ БОРЬБА (или БИОЛОГИЧЕСКИЙ КОНТРОЛЬ) – Biological Control is the action of natural enemies – parasites, parasitoids, predators, and pathogens – in maintaining another organism's density at a lower level than it would occur in their absence. If control is facilitated by man, it is called Applied Biological Control. If not, it is called Natural Biological Control. Biological Control or Biocontrol is a pest control strategy making use of living natural enemies, antagonists or competitors and other self-replicating biotic entities.

BIOLOGICAL CONTROL AGENT = АГЕНТ БИОЛОГИЧЕСКОГО КОНТРОЛЯ (или СРЕДСТВО БИОЛОГИЧЕСКОЙ БОРЬБЫ) – Biological Control Agent is a natural enemy, antagonist or competitor, or other organism, used for pest control.

BIOLOGICAL DENITRIFICATION = БИОЛОГИЧЕСКАЯ ДЕНИТРИФИКАЦИЯ – Biological Denitrification is a loss of nitrogen from the soil due to microbial activity. Microbial reduction of oxidized inorganic nitrogen compounds serving as nominal electron acceptors in anaerobic respiratory pathways lead to nitrogen losses to the atmosphere as N_2 or N_2O.

BIOLOGICAL FACTORS = БИОЛОГИЧЕСКИЕ ФАКТОРЫ – Biological Factors are characteristics of the plant that influence the health, vitality, and quality of harvested products.

BIOLOGICAL INSECT CONTROL = БИОЛОГИЧЕСКАЯ БОРЬБА С НАСЕКОМЫМИ (или БИОЛОГИЧЕСКИЙ КОНТРОЛЬ ЗА НАСЕКОМЫМИ) – Biological Insect Control is a method of pest control that relies on beneficial enemies to reduce pest populations to tolerable levels. It involves human manipulation of natural enemies of insects.

BIOLOGICAL N_2 FIXATION = БИОЛОГИЧЕСКАЯ ФИКСАЦИЯ N_2 – Biological N_2 Fixation is the conversion of inert atmospheric N into usable form by living organisms.

BIOLOGICAL OXYGEN DEMAND = БИОЛОГИЧЕСКАЯ ПОТРЕБНОСТЬ В КИСЛОРОДЕ – Biological Oxygen Demand (BOD) is the amount of oxygen required to stabilize the demands from aerobic action in the decomposition of organic matter.

BIOLOGICAL PESTICIDE = БИОЛОГИЧЕСКИЙ ПЕСТИЦИД – Biological Pesticide or Biopesticide is a generic term, not specifically definable, but generally applied to a biological control agent, usually a pathogen, formulated and applied in a manner similar to a chemical pesticide, and normally used for the rapid reduction of a pest population for short-term pest control. / Биологические Пестициды – препараты для биологической борьбы с вредителями, которые содержат живые организмы и продукты их жизнедеятельности.

BIOLOGICAL SYSTEMS = БИОЛОГИЧЕСКИЕ СИСТЕМЫ – Biological Systems refers to cropping and livestock systems.

BIOLOGY = БИОЛОГИЯ – Biology is the study or science of living things. / Под Биологией, от Греческих слов Bios, означающее Жизнь, и Lógos, означающее Слово или Учение, понимается учение о жизни – совокупность наук о живой природе. Предметом биологии является жизнь как особая форма движения материи, законы развития живой природы, огромное многообразие форм вымерших и ныне населяющих Землю живых существ, их строении и функциях, происхождении, распространении, индивидуальном развитии, и взаимоотношениях друг с другом, неживой природой и с окружающей средой. Биология устанавливает общие и частные закономерности, присущие жизни во всех её проявлениях и свойствах (обмен веществ, размножение, наследственность, изменчивость, приспособляемость, рост, подвижность и другие). Первые систематические попытки познания живой природы были сделаны античными врачами и философами (древнегреческий врач Гиппократ (около 460 – около 370 до Нашей Эры), древнегреческий философ и учёный Аристотель (384–322 до Нашей Эры), древнегреческий естествоиспытатель Теофраст (или Феофраст или Тиртам; 372–287 до Нашей Эры), древнеримский врач Гален (Galenus; около 130 – около 200)). Их труды, продолженные в эпоху Возрождения, положили начало ботанике и зоологии, а также анатомии и физиологии человека (Андреас Везалий (Andreas Vesalius; 1514–1564) и другие). В XVII–XVIII веках в биологию проникают экспериментальные методы. На основе количественных измерений и применения законов гидравлики был открыт механизм кровообращения (Английский врач Вильэм Хави (William Harvey; 1578–1657) в 1628). Изобретение микроскопа раздвинуло границы известного мира живых существ, углубило представление об их строении. Одно из главных достижений этой эпохи – создание системы классификации растений и животных (Шведский естествоиспытатель Карл Линней (Carl von Linné; 1707–1778) в 1735). Вместе с тем преобладали умозрительные теории о развитии и свойствах живых существ (самозарождении, преформации и других). В XIX веке в результате резко возросшего числа изучаемых биологических объектов (новые методы, экспедиции в тропические и малодоступные районы Земли и другое), накопления и дифференциации знаний сформировались многие специальные биологические науки. Так, ботаника и зоология дробятся на разделы, изучающие отдельные систематические группы, развиваются эмбриология, гистология, микробиология, палеонтология, биогеография и другие. Среди достижений биологии – клеточная теория (Немецкий биолог Теодор Шванн (Theodor Schwann; 1810–1882) в 1839), открытие закономерностей наследственности (Австрийский естествоиспытатель Грегор Иохан Мендель (Gregor Johann Mendel; 1822–1884) в 1865). Подлинный переворот в биологии произвело учение Английского естествоиспытателя Чалза Робэта Дарвина (Charles Robert Darwin; 1809–1882) в 1859, который открыл движущие силы эволюции и дал материалистическое объяснение целесообразности организации живых существ. Для биологии XX века характерны 2 взаимосвязанные тенденции в изучении явлений жизни. С одной стороны, сформировалось представление о качественно различных уровнях её организации:- молекулярном (молекулярная биология, биохимия и другие науки, объединяемые понятием физико-химической биологии), клеточном (цитология), организменном (анатомия, физиология,

эмбриология), популяционно-видовом (экология, биогеография). С другой стороны, стремление к целостному, синтетическому познанию живой природы привело к прогрессу наук, изучающих определённые свойства живой природы на всех структурных уровнях её организации (генетика, систематика, эволюционное учение и другие). Поразительных успехов начиная с 1950-х достигла молекулярная биология, вскрывшая химические основы наследственности, оказавшиеся универсальными для всех организмов (строение ДНК, генетический код, матричный принцип синтеза биополимеров). Учение о биосфере (Российский учёный Владимир Иванович Вернадский (1863–1945)) как особой оболочке Земли раскрыло масштабы геохимической деятельности живых организмов, их неразрывную связь с неживой природой. Всё возрастающее практическое значение биологических исследований и методов (в том числе генетической инженерии, биотехнологии) для медицины, сельского хозяйства, промышленности, разумного использования естественных ресурсов и охраны природы, а также проникновение в эти исследования идей и методов точных наук выдвинули биологию с середины XX века на передовые рубежи естествознания. Данные биологии – естественно-научная основа материалистического познания природы и места человека в ней.

BIOMASS = БИОМАССА – Biomass is defined as any plant matter used directly as fuel or converted into other forms before combustion. Included are wood, vegetal waste (including wood waste and crops used for energy production), animal materials/wastes and industrial and urban wastes, used as feedstocks for producing bio-based products. In the context of the Outlook it does not include agricultural commodities used in the production of biofuels (e.g., vegetable oils, sugar or grains). Biomass is the organic matter that can be converted to fuel. Wood pellets are a biomass heat source. Biomass:- material that is derived from living, or recently living biological organisms. In the energy context it is often used to refer to plant material, however by-products and waste from livestock farming, food processing and preparation and domestic organic waste, can all form sources of biomass. With such a wide range of material potentially described as biomass, the range of methods to process it must be equally broad. / Под Биомассой понимается общая масса тел какой-либо группы организмов одного вида, группы видов или организмов сообщества в целом, приходящаяся на единицу площади или объёма. Обычно биомассу выражают в массе сухого вещества, реже в пересчёте на CO_2 или на органический углерод. Биомасса растений называется Фитомассой, животных – Зоомассой. По разности биомассы растений или животных, определяемых в 2 срока, и учёта за этот период потерь органического вещества на дыхание, опад, отпад и так далее, рассчитывают величину годичной продукции при определении биологической продуктивности. Биомасса всех живых организмов Земли составляет по разным оценкам от $1.8 \cdot 10^{18}$ до $3 \cdot 10^{18}$ г, причём около 90% приходится на биомассу наземных растений, то есть на автотрофные организмы. В создании биомассы Земли особенно велика роль тропических лесов. Около 8% биомассы дают обрабатываемые земли. Среди гетеротрофных организмов суши наибольшую биомассу образуют почвенные микроорганизмы (их масса в плодородной почве достигает 0.5–1.5 г/м^2). Значительна (до 150 г/м^2, иногда до 400 г/м^2) также биомасса почвенных беспозвоночных, главным образом дождевых червей. Определение биомассы важно для изучения продуктивности различных групп организмов (в том числе охотничьих животных, промысловых рыб, полезных растений и так далее), а также для прогнозирования хозяйственной деятельности человека в тех или иных природных зонах.

BIOMETRICS/BIOMETRY = БИОМЕТРИКА/БИОМЕТРИЯ – Biometrics/Biometry is the science that deals with statistics to explain biological phenomena. / Под Биометрией, от Греческих слов Bios, означающее Жизнь, и Metréō, означающее Измеряю, понимается раздел биологии, основные задачи которого – планирование количественных биологических экспериментов и обработка результатов методами математической статистики. Основы биометрии заложены в конце XIX века работами Английских учёных психолога и антрополога Сэра Фрэнсиса Гальтона (или Голтона (Francis Galton); 1822-February-16 – 1911-January-17) и математика Карла Пирсона (Karl Pearson; 1857-March-27 – 1936-April-27), одного из основателей современной статистики.

BIOMIMICRY = БИОМИМИКРИЯ – Biomimicry is the science of evaluating how plants and animals survive in their natural habitats, and applying a similar process to the design of functional apparel.

BIONOMICS = БИОНОМИЯ – Bionomics is the life history, habits, breeding, and adaptations of organisms.

BIOPESTICIDE = БИОПЕСТИЦИД – Biopesticide is a pesticide comprising a biological control control agent, which is usually pathogenic to the target species. An example of a commerically produced biopesticide is the bacterium Bacillus thuringiensis that kills only insects and not other animals. Its wide host range allows it to be marketed as a sprayable control for a variety of insects, but it may also kill unrelated desirable insects. / виды (species). Под Биопестицидом, от Греческого слова Bios, означающее Жизнь, и Латинских слов Pestis, означающее Зараза, и Caedo, означающее Убиваю, понимается .

BIO–SEQUENCE LISTINGS = СПИСКИ БИО–ПОСЛЕДОВАТЕЛЬНОСТИ (или СПИСКИ БИО–РЯДА, или СПИСКИ БИО–ПОРЯДКА) – In the US patent law, Bio-Sequence Listings is a document that must be included only if a nucleotide or amino acid sequence is part of the invention. With the Electronic Filing System (EFS), paper documents are not required for bio-sequence or subsequent bio-sequence submissions.

BIOSIS = BIOSCIENCE INFORMATION SERVICE OF BIOLOGICAL ABSTRACTS

BIOTECH = NATIONAL INSTITUTE OF BIOTECHNOLOGY AND APPLIED MICROBIOLOGY

BIOTECHNOLOGY = БИОТЕХНОЛОГИЯ – Biotechnology is:- (i) any technique that manipulates living organisms (or parts of organisms) to make or modify products, to improve plants or animals, or to develop microorganisms for specific uses. An applied biological science, e.g., recombinant DNA technology. (ii) The various industrial processes that involve the use of biological systems; the collection of microbial and other biochemical processes carried out on an industrial scale. It includes, but is not limited to, the industrial aspects of genetic engineering. Other areas of biotechnology deal with fermentation technology (antibiotics), hybridoma technology (monoclonal antibodies), and agricultural technology (plant and animal transformation). Biotechnology includes all processes and products that use living organisms, for example bacteria and yeasts, or their cellular constituents. Agricultural Biotechnology is a collection of scientific techniques, including genetic engineering, that are used to create, improve, or modify plants, animals, and microorganisms. Using conventional techniques, such as selective breeding, scientists have been working to improve plants and animals for human benefit for hundreds of years. Modern techniques now enable scientists to move genes (and therefore desirable traits) in ways they could not before – and with greater ease and precision. / , например, технология рекомбинантных ДНК. Под Биотехнологией понимается совокупность промышленных методов, использующих живые организмы и биологические процессы для производства ценных для народного хозяйства продуктов. Развивается микробиологический синтез ферментов, витаминов, аминокислот, антибиотиков и тому подобного. Перспективно промышленное получение других биологически активных веществ (гормональных препаратов, соединений, стимулирующих иммунитет, и тому подобных) с помощью методов генетической инженерии и культуры животных и растительных клеток.

BIOTIC = БИОТИЧЕСКОЕ – Biotic:- having a mode of life.

BIOTIC/ABIOTIC STRESSES = БИОТИЧЕСКИЕ/АБИОТИЧЕСКИЕ СТРЕССЫ (или БИОТИЧЕСКИЕ/АБИОТИЧЕСКИЕ НАПРЯЖЁННОСТИ) – Biotic/Abiotic Stresses are limitations imposed on development which occur because of biological (biotic) or physical (abiotic) factors.

BIOTIC ACTIVITY = БИОТИЧЕСКАЯ АКТИВНОСТЬ – Biotic Activity refers to activities evident in products of vegetable or animal origin that during transportation exert an influence on the products themselves and/or on other animal or vegetable products. Biotic activity covers biochemical, microbial and other decomposition processes, e.g., allelopathy.

BIOTIC ENVIRONMENT = БИОТИЧЕСКАЯ ОКРУЖАЮЩАЯ СРЕДА – Biotic Environment is insect pests, plant pathogens, weeds, other crop plants, small animals, and human beings make up the biotic environment.

BIOTROP = SOUTHEAST ASIA MINISTRY OF EDUCATION ORGANIZATION:- REGIONAL CENTER FOR TROPICAL BIOLOGY

BIOTROPHS = БИОТРОФЫ – Biotrophs are parasitic fungi that need a living host to complete their life cycles.

BIOTYPES = БИОТИПЫ – Biotypes are:- (i) individuals or populations of plants or animals that are morphologically alike but physiologically different; (ii) a population of insects capable of surviving on and damaging varieties that are resistant to other populations of the same insect species. Biotypes is a population within a species that has a distinct genetic variation. Biotypes often have physical lifecycle or herbicide susceptibility differences. / Под Биотипами, от Греческих слов Bios, означающее Жизнь, и Ту́pos, означающее Образец или Отпечаток или Форма, понимается .

BIP = BOOKS IN PRINT

BIPINNATELY COMPOUND LEAF = ПАРНОПЕРИСТОСЛОЖНЫЙ ЛИСТ – Bipinnately Compound Leaf:- twice pinnate, the primary leaflets are divided into secondary leaflets, also written 2-pinnate, e.g., Gleditsia triacanthos.

BIPS = BASIS POINT

BIR = BENEFIT/INVESTMENT RATIO

BIR = BEST INCREMENTAL RETURN

BIR = BUREAU OF INTERNAL REVENUE

BIRDSEYE = ПТИЧИЙ ГЛАЗ – (1) Bird's-Eye:- small localized areas in wood with the fibers indented to form small circular or elliptical figures on the tangential surface which are used for decorative purposes. Sometimes found in sugar maple but only rarely in other hardwood species. / Виды (Species). К Глазкам относятся следы неразвившихся в побег 'спящих' почек. В пилопродукции и деталях разбросанные глазки учитывают по количеству в штуках на 1 метр длины или на всей стороне сортимента. Групповые глазки измеряют по ширине и длине занимаемой ими зоны и учитывают по количеству в штуках на 1 метр длины или на всей стороне сортимента.

(2) Birdseye is a generic term describing a cloth woven on a dobby loom, with a geometric pattern having a center dot resembling a bird's eye. Originally birdseye was made of cotton and used as a diaper cloth because of its absorbent qualities, but now the weave is made from a variety of fibers or fiber blends for many different end uses. Defect Name:- Birdseye. Defect Type:- warp lines, vertical lines. Fabric Type:- Single Knit Fabrics. Description:- Birdseye:- The result of erratic and unintentional tucking caused by a malfunctioning needle. Severity:- Major. Birds-Eye is a fabric with a woven-in dobby design. The pattern has a center dot and resembles the eye of a bird. It is used in cotton diapers, pique, and wool sharkskin. See also Piqué. Birdseye (Bird's Eye):- (1) very soft, light weight, and absorbent. Woven with a loosely twisted filling to increase absorbency. Launders very well. It is also called 'Diaper Cloth' and is used for that purpose as well as very good towelling. Also 'novelty' birdseye effects used as summer dress fabrics. (2) Worsted. Smooth, clear finish. Has small diamond-shaped figures with a dot in the centre of each. Pattern suggests the eye of a bird. Fine quality suiting for men and women. / уточина. Смотрите также Пике (Piqué).

(3) Birdseye is a speckled effect on the back of a knit fabric resulting from the use of different colors on the face design. Birdseye:- in knitted fabrics, an unintentional tuck stitch. / .

(4) Birdseye:- caused by unintentional tucking from malfunctioning needle. Usually two small distorted stitches, side by side. This term should not be confused with birdseye fabric which is in fact created intentionally. Knitted fabric defect. / Порок или Дефект .

BIRDSEYE DEFECT = ДЕФЕКТ ПТИЧИЙ ГЛАЗ – Birdseye Defect or Bird's-Eye Defect:- on the knitted fabric is concerned, this means that occasionally erratic and appears contrary to tuck fabric design organization. Fabric Printing Defect. / Порок или Дефект набивки тканей.

BIRD'S MOUTH = ПТИЧИЙ КЛЮВ – A Bird's Mouth is formed when a very flat V-shape is cut into the end of a piece of wood.

BIREFRINGENCE = ДВУПРЕЛОМЛЕНИЕ (или ДВОЙНОЕ ЛУЧЕПРЕЛОМЛЕНИЕ) – Birefringence is an optical term meaning double refraction, and used in examination of manufactured fibers to measure the degree of molecular orientation effected by stretching or drawing.

BI–REL = BANCA D'ITALIA REGOLAMENTO LORDO

BIRETTA = БИРЭТЭ (или КАМИЛАВКА, или СКУФЬЯ) – Biretta is a square cap with three ridges on top worn by clergymen especially of the Roman Catholic Church. / Головной убор у Римских Католических священников.

BIS = BANK FOR INTERNATIONAL SETTLEMENTS

BISCUIT = БИСКВИТНОЕ (или БИСКВИТ, или СВЕТЛО–КОРИЧНЕВОЕ) – Biscuit:- a light grayish yellowish brown; a grayish yellow. / .

BISECT = РАССЕЧЁННОЕ НА ДВОЕ – Bisect:- a profile of plants and soil showing the vertical and lateral distribution of roots and tops in their natural position. / вертикальное и латеральное распределение корней и вершин в их естественном положении.

BISEXUAL = ДВУПОЛОЕ (или БИСЕКСУАЛЬНОЕ) – Bisexual:- said of a flower with both stamen and pistil. / с тычинкой (stamen) и .

BISFA = BUREAU INTERNATIONAL POUR LA STANDARDISATION DES FIBRES ARTIFICIELLES

BISHRINKAGE YARN = ДВУУСАДОЧНАЯ ПРЯЖА – Bishrinkage Yarn is the yarn comprising filaments with two different shrinkage properties.

BISTER = БИСТЁ (или ТЁМНО–КОРИЧНЕВОЕ) – Bister:- a grayish to yellowish brown.

BIT = БИТ – Bit:- Binary digit. Binary:- characteristic of having only two states, such as current on and current off. The binary number system uses only ones and zeros. Bit is the basic unit of all digital communications. A bit is a '1' or '0' in a binary language.

BITCOIN = БИТКОИН (или БИТОВАЯ МОНЕТА, или МОНЕТА БИТ) – Bitcoin is a digital or virtual currency that uses peer-to-peer technology to facilitate instant payments. Bitcoin is a type of alternative currency known as a Cryptocurrency, which uses cryptography for security, making it difficult to counterfeit. Bitcoin issuance and transactions are carried out collectively by the network, with no central authority. The total number of Bitcoins that will be issued is capped at 21 million to ensure they are not devalued by limitless supply. They are divisible to 8 decimal places; Bitcoin fractions are called Satoshis. Users store their Bitcoins in a digital wallet, while transactions are verified by a digital signature known as a Public-Encryption Key. The first Bitcoin specification and proof-of-concept was published in 2009 by an individual or individuals under the pseudonym Satoshi Nakamoto. Satoshi left the project toward the end of 2010, leaving the motivation behind setting up Bitcoin an enduring mystery. Bitcoins are created through a 'mining' process that involves complex number crunching by the computers in this network; this process currently creates 25 Bitcoins every 10 minutes. The limit of 21 million is expected to be reached in the year 2140, after which the total number of Bitcoins will remain unchanged. A basic premise underpinning the Bitcoin is that because it is decentralized and not issued by government, it is supposedly free from interference and manipulation, in stark contrast to the world's fiat currencies. However, these same features confer significant disadvantages on the Bitcoin. It is a complex product that is difficult to understand, making its widespread acceptance doubtful. Since it is a virtual currency, it cannot be stored in physical form. As a result, if you have not stored a backup copy of your Bitcoin holdings, your digital hoard can be wiped out by something as mundane as a computer crash. Its anonymity has also made it a favored currency for illegal activities such as tax evasion, smuggling and weapons procurement. Additionally, Bitcoin prices are very volatile thanks to rampant speculation. Bitcoin is an innovative payment network and a new kind of money. Bitcoin uses peer-to-peer technology to operate with no central authority or banks; managing transactions and the issuing of bitcoins is carried out collectively by the network. Bitcoin is open-source; its design is public, nobody owns or controls Bitcoin and everyone can take part. Through many of its unique properties, Bitcoin allows exciting uses that could not be covered by any previous payment system. Bitcoin (2014-June):- currency or commodity? Last fall we saw bitcoin receive an unusual amount of attention. The upstart crypto currency had an exponential rise from USD125 to more than USD1 125 per unit on Bitstamp, only to fall back below USD500 this spring (see 'It's a $, it's a €, it's cryptocurrency'). Additionally, the closing and bankruptcy of the Tokyo-based Mt. Gox (the largest bitcoin exchange with more than 600 000 customers) garnered substantial negative press and threatened the stability of bitcoin. In stark contrast, bitcoin also has received a great deal of positive attention within the venture capital community. Cameron and Tyler Winklevoss (the Winklevoss twins of Facebook fame) have filed to register the Winklevoss Bitcoin Trust, which will be an exchange-traded fund (ETF) to invest and trade in bitcoin. And Paypal co-founder Peter Theil has invested in BitPay, a bitcoin payment solutions company. As a result, bitcoin is becoming the new darling and target of early mover capital investment with more than USD200 million in publicly disclosed 2014 VC investments. It's important to understand that bitcoin is a global phenomenon. There are 434 bitcoin meet-up groups, with 45 751 members in 309 cities and 68 countries (www.bitcoinmeetup.com), and there are estimated 500 000 to 1 million US digital currency accounts. The bitcoin e-commerce economy is emerging with the offering of bitcoin online payment solutions connecting customers to merchants. Leading brands such as Zynga, Square and Overstock are all accepting bitcoin. Bitcoin ATMs are now appearing in multiple countries. Let's focus on this: It's a currency, that in trading, is emerging as a market of its own. Ilya Subhkankulove, founder of Bitcoin trading platform BTX Trader LLC, anticipates growth in the next three years of as high as 20 times its current size. Even Bloomberg LP has begun to cover bitcoin price action. A recent story noted, 'While bitcoin and other virtual currency markets are still nascent, they represent an interesting intersection of finance and technology. Given that Bloomberg LP sits squarely at that intersection, providing pricing for this underdeveloped market is a natural fit for us'. Time to take a good look at bitcoin:- Wikipedia defines bitcoin as:- A peer-to-peer payment system introduced as open source software in 2009 by developer Satoshi Nakamoto. The digital currency created and used in the system is also called Bitcoin and is alternatively referred to as a Virtual Currency or Crypto Currency. Is bitcoin a currency or commodity? The short answer is that it's both. From a user's behavioral point of view, bitcoin was designed as a means of exchange. Those who buy bitcoin either look to hold it and sell at higher level, or use it to exchange it for a good or service from a retail merchant. In this sense, bitcoin acts as an alternative currency. Whether bitcoin is a reliable store of value remains the risk to those who buy it. One's definition of bitcoin may not be as important as the regulators' definition. Global regulators are just beginning to define and develop regulations for bitcoin and other related virtual instruments. For example, Germany has defined them as private money and a financial instrument; Denmark considers bitcoin neither a currency nor an asset. In the United States, the IRS issued its opinion on how virtual currencies/bitcoin would be treated. For federal tax purposes, virtual currency is treated as property. How is bitcoin generated and acquired? Bitcoin ownership is not identified or established by name, but by the use of a private key linked to the blockchains. Therefore, no authority can flood the world with more bitcoins because the process of generating them, called Mining Block Chains, is a function of a very complex algorithm. This algorithm is such that when each bitcoin is created, it is exponentially more difficult to create or mine than the previous bitcoin. This means that the rate of supply of bitcoin globally will decline until the total is reached. The total amount of bitcoins in the world will be limited by this algorithm to 21 million; there are now about 12.7 million bitcoins. This technology of encoding the ownership of bitcoin is being regarded as ushering in an era of the digitization of potentially anything. Libertarians and anarchists, who want no central authority involved in the role of money, are the leading champions of bitcoin and similar alternative currencies. In fact, the term crypto-anarchists has emerged to label this political philosophy. Strategies and tactics for trading bitcoin? Currently, more than 90 percent of bitcoin accounts are in a buy-and-hold mode. Those who came on before 2013 had a chance to experience exponential gains. At its height in November 2013, bitcoin hit above USD1 000. It is now oscillating around USD500. Regardless of the investment or trading goals of bitcoin holders, they all will need to make a decision to get out and exchange it for their local currency or a service provided by a merchant. Therefore, timing entry and exit will be important. Ultimately, all bitcoin traders will need to become currency traders. Bitcoin traders have many challenges. First there is that of selecting an exchange or service to buy and sell coins. It is a virtual wild west with more than 50 bitcoin exchanges around the world. They are all relatively new. The trader has to wonder, 'is that money secure'? As a result there is an extra counterparty risk to the bitcoin trader. Surely as new security protocols evolve the risks will be minimized and other players such as wallet companies will offer simpler ways of buying and selling bitcoins. The challenges presented in trading bitcoin will, for many reasons, be much greater than trading currencies, gold or other instruments. First, bitcoin has no options market, making the discovery of the fair value more uncertain. Also, bitcoin's price action is still very sensitive to disruptions by news and internet rumors. Traders therefore will confront a reaction-diffusion herding behavior generating disruptive spikes and surges. Until volume and liquidity conditions improve, classic tools of discovering price signals using technical analysis will have little value. Bitcoin traders certainly will benefit from understanding price action in the major currencies. Clues on when to buy or sell bitcoin also can be derived by looking at how other virtual currencies or crypto cross-pairs are doing. The most appealing and liquid cryptocurrency cross-pair to trade other than bitcoin is LiteCoin/Bitcoin (LTC/BTC). Also at this early stage bitcoin trading systems are just starting to be released and are likely to be very inaccurate. The market for trading systems, and teaching how to trade bitcoin is wide open. Clearly we are witnessing the emergence of a potentially

new kind of underlying instrument that combines features of a currency and a commodity. Forex traders should keep an eye on bitcoin developments. Whether it will become an asterisk in the history of currencies or the beginning of a digital currency model is yet to be seen. Next time we will show examples of specific trading tactics for bitcoin. Bitcoin factoids:- number of bitcoin accounts:- 500 000–1 000 000 US; number of meeting groups:- 434 groups (45 751 members); number of merchants accepting bitcoin:- 60 000; leading merchants accepting bitcoin:- Zynga, Square, Overstock; VC Dollars in bitcoin startups in 2014:- USD200 million; Bitcoin price high close:- November 25, 2013 – USD1 119; Bitcoin price low close:- April 23, 2012 – USD4.91; Bitcoin price April 30, 2014 – 448.73 (BitStamp exchange); Bitcoin ETF:- Winkelvoss Bitcoin Trust (filed for ETF); Bitcoins in the world:- 14 million; maximum number of bitcoins:- 21 million; Top bitcoin exchanges:- BitStamp. Btc-e, Bitfinex. Bitcoin is controlled by all Bitcoin users around the world. Developers are improving the software but they can't force a change in the rules of the Bitcoin protocol because all users are free to choose what software they use. In order to stay compatible with each other, all users need to use software complying with the same rules. Bitcoin can only work decently with a complete consensus between all users. Therefore, all users and developers have strong incentives to adopt and protect this consensus. 2014-February-25:- Bitcoin exchange Mt. Gox disappears in blow to virtual currency:- Tokyo (Reuters):- Mt. Gox, once the world's biggest bitcoin exchange, looked to have essentially disappeared on Tuesday, with its website down, its founder unaccounted for and a Tokyo office empty bar a handful of protesters saying they had lost money investing in the virtual currency. The digital marketplace operator, which began as a venue for trading cards, had surged to the top of the bitcoin world, but critics – from rival exchanges to burned investors – said Mt. Gox had long been lax over its security. It was not clear what has become of the exchange, which this month halted withdrawals indefinitely after detecting 'unusual activity'. A global bitcoin organization referred to the exchange's 'exit', while angry investors questioned whether it was still solvent. A document circulating on the internet, and purporting to be a crisis plan for the exchange, said more than 744 000 bitcoins were 'missing due to malleability-related theft', and noted Mt. Gox had USD174 million in liabilities against USD32.75 million in assets. It was not possible to verify the document or the exchange's financial situation. Tokyo investors in the frontier electronic currency, who have endured a volatile ride in the value of the unregulated cyber-tender, said the problem was with Mt. Gox, not with the revolutionary bitcoin itself. Mt. Gox officials did not answer the telephone or respond to email requests for information. The concierge at the home of the chief executive, Mark Karpeles – an upscale apartment in the Shibuya district – said he was not answering his intercom. His mailbox was so stuffed with mail that the flap would not close. The Mt. Gox homepage was not loading, although no error message appeared. Its source code contained a line saying, 'put announce for mtgox acq here'. 'Very Angry':- 'I'm very angry', said Kolin Burges, a self-styled 'crypto-currency trader' and former software engineer who came from London for answers after Mt. Gox failed to tell him what had happened to his bitcoins, which at one point were worth USD300 000. 'It looks like that's disappeared', said Burges, one of six protesters outside the Mt. Gox office, which was as deserted as a nearby cafe that had formerly accepted bitcoins as payment. In a statement last week, Mt. Gox said it had moved office because of security issues. Some protesters carried signs saying, 'Mt. Gox, where's our money?' and 'Mt. Gox, are you solvent?' 'They prolonged this and kept telling people everything was OK', Burges said. 'A lot of people did believe that, and it's very annoying what they've done to me and up to a million others'. Six leading bitcoin exchanges – which allow users to trade bitcoins for US Dollars and other currencies – distanced themselves from the Tokyo-based exchange. 'This tragic violation of the trust of users of Mt. Gox was the result of one company's actions and does not reflect the resilience or value of bitcoin and the digital currency industry', the companies – Coinbase, Kraken, Bitstamp, BTC China, Blockchain and Circle – said in the statement. 'As with any new industry, there are certain bad actors that need to be weeded out, and that is what we're seeing today'. On Sunday, Karpeles resigned from the board of the Bitcoin Foundation, in a blow to the digital currency. Mt. Gox had once been the largest exchange handling bitcoins. Karpeles told Reuters last week, 'We know there are all kinds of criticisms made against Mt. Gox, but we believe we are doing all we can to solve problems as quickly as possible having our customers in mind'. His resignation from the foundation, the cyber currency's trade group, followed a number of technical issues, including a massive cyber attack from unknown sources that has been spamming bitcoin exchanges. Mt. Gox was a founding member and one of the three elected industry representatives on the board of the foundation. Mt. Gox, a bitcoin exchange since 2010, is a relatively old player, having grown quickly when there were few alternatives. 'Teething Problems':- Bitcoin has had a rocky ride, its Dollar value soaring and crashing more like a highly speculative investment than a store of value. And oddly for a tradable instrument, its value varies greatly depending on the exchange. The Mt. Gox bitcoin, which traded at USD828.99 before February 07, when the exchange halted withdrawals, has since plunged 83.7 percent to USD135. By contrast, coins at Bitstamp, another large exchange, have fallen 40.5 percent over the same period to USD400. While bitcoin globally has taken a beating to its value and reputation, users say the problem is with Mt. Gox, not with the virtual currency itself. 'I think the community will remain very tolerant of teething problems, or whatever you want to call them', said a Tokyo-based investor who noted he had a 'negligible' amount of bitcoins with Mt. Gox. 'The whole structure is still in its infancy, so there's just certain things that come with the territory as long as you keep people in the loop'. The Bitcoin Foundation said in a statement, 'Mt. Gox is one of several exchanges, and their exit, while unfortunate, opens a door of opportunity. This incident demonstrates the need for responsible individuals and members of the bitcoin community to lead in providing reliable services'. A commenter on the Reddit site, identified as evorhees, proudly defended bitcoin as an epochal development in finance. 'We are building a new financial order and those of us building it, investing in it and growing it will pay the price of bringing it to the world', he wrote. 'This is the harsh truth. We are building the channels, the bridges, and the towers of tomorrow's finance, and we put ourselves at risk in doing so'. Regulatory Reticence:- Japan's financial regulators, by contrast, have largely given bitcoin a shrug. 'Bitcoin is not a currency; it is an alternative to currencies, like gold', said a spokesman for the Financial Services Agency. 'We are only responsible for currencies and therefore bitcoin is not subject to our regulatory oversight'. Finance Ministry officials also said they are not in charge of regulating the virtual currency. A Bank of Japan spokesman said the central bank had nothing to add to remarks that Governor Haruhiko Kuroda made in December, when he said he was 'very interested in bitcoin'. 'In one sense, it is similar to electronic-funds transfers and the spread of electronic money', Kuroda said then. 'But there are also some differences and the price is somewhat volatile. I think each country's central bank is watching this ... but as of now I have nothing specific to report'. Other jurisdictions have been more proactive. In the United States, Alabama's securities regulator said he will issue an alert on Tuesday, cautioning consumers and investors to stop trading on bitcoin exchanges or adding to their accounts if they are having trouble redeeming the digital currency or cashing out. Karpeles himself, while insisting on his own exchange's reliability, has made no secret that bitcoin is, as he told Reuters last April, a 'high-risk investment'. 'If you buy bitcoins, you should buy keeping in mind that the value could be zero the day after'. 2014-February-25:- Website of Bitcoin exchange Mt. Gox offline:- Tokyo (AP):- The website of major bitcoin exchange Mt. Gox is offline Tuesday amid reports it suffered a debilitating theft, a new setback for efforts to gain legitimacy for the virtual currency. The URL of Tokyo-based Mt. Gox was returning a blank page. The disappearance of the site follows the resignation Sunday of Mt. Gox CEO Mark Karpeles from the board of the Bitcoin Foundation, a group seeking legitimacy for the currency. At the Tokyo office tower housing Mt. Gox, bitcoin trader Kolin Burgess said he had picketed the building since February 14 after flying in from London, hoping to get back USD320 000 he has tied up in bitcoins with Mt Gox. 'I may have lost all of my money', said Burgess, next to placards asking if Mt. Gox is bankrupt. 'It hasn't shaken my trust in Bitcoin, but it has shaken my trust in bitcoin exchanges'. A 'crisis strategy' report shared widely online that purports to be an internal Mt. Gox document says more than 740 000 bitcoins are missing from the exchange, which froze withdrawals earlier this month. It says the theft went unnoticed for several years and turned on disguised withdrawals. A theft of that magnitude would

equate to losses of USD350 million at current bitcoin prices, but in practice such a figure is highly uncertain because of Bitcoin's extreme fluctuations in value and its lack of broad acceptance as an alternative to money. The cloud hanging over Mt. Gox is a possibly fatal blow to Bitcoin, which was started in 2009 as a currency free from government controls. Supporters have said Bitcoin's cryptography makes it immune to theft or counterfeiting. On bitcoin exchanges, the currency's value has fallen to about USD470 from USD550 in the past few hours. Several bitcoin exchanges and related organizations released a joint statement that said they are working to 're-establish the trust squandered' by the failings of Mt. Gox. The bitcoin operators said funds under their control are held securely. Mt. Gox should not be considered a reflection of the value of Bitcoin or the digital currency industry, they said. A second man protesting outside Mt. Gox's office in Tokyo said he was in arbitrage, which is a type of trading, but would only gave his first name, Aaron. A security officer said no one from Mt. Gox was in the building. Tibbane, an Internet company that Karpeles is CEO of, still has its named listed on the building's directory. 'I have no idea' where they are, said Burgess. 'I'm both annoyed and worried'. Bitcoin had been inching toward broader acceptance despite wild swings in value in the past year. For most of the currency's history, each digital coin had been worth less than USD10. New bitcoins are 'mined' or generated by computers. They get harder to generate all the time, which means the inflow of fresh bitcoins keeps falling. There are about 12.4 million bitcoins in circulation today, according to Blockchain, a public registry of bitcoin transactions. The maximum number of bitcoins that can be generated is 21 million and by 2032, 99 percent of those will have been created. (2014-February-25:-) The Largest Bitcoin Exchange Was Possibly the Target of a USD350 Million Theft:- Mt. Gox, the world's largest Bitcoin trading site, has gone offline as rumors that more than 744 000 bitcoins were stolen from the service during an infiltration that went unnoticed by the service for years. As of Monday, the estimated losses are said to be worth at least USD350 million. According to a leaked document, which has not been verified but is circulating widely among Bitcoin proponents, a bug in the bitcoin wallet software allowed hackers to steal the digital currency, even from offline 'cold storage'. The 744 000 stolen bitcoins total about 6 percent of the 12.4 million currently in circulation, and about 3.5 percent of the eventual 21 million. Bitcoin values on Mt. Gox have dropped 40 percent in the past 24 hours, and prices on Bitstamp, the most prominent exchange filling the void left by Gox, is boasting prices USD100 higher on its exchange. From part of the leaked document:- Related:- Facebook's 'Gmail Killer' Is Shutting Down Because No One Used it:- The likely damage in public perception to this class of technology could put it back 5–10 years, and cause governments to react swiftly and harshly. At the risk of appearing hyperbolic, this could be the end of Bitcoin, at least for most of the public. Mt. Gox is, as of right now, offline, after suspending withdrawals earlier this month over security concerns. On Sunday, the site's chief executive stepped down from his board position on the Bitcoin foundation. A joint statement on the collapse of Mt. Gox from a handful of other prominent Bitcoin companies attempted to reassure investors that bitcoin was still a viable currency:- This tragic violation of the trust of users of Mt. Gox was the result of one company's abhorrent actions and does not reflect the resilience or value of bitcoin and the digital currency industry. There are hundreds of trustworthy and responsible companies involved in bitcoin. While the document about Mt. Gox's woes could not be confirmed as legitimate, the Bitcoin Foundation is preparing for the exchange's closure anyway. Exactly what will happen to bitcoins held by the service is unclear. / Блумбёг Эл.Пи. (Bloomberg LP). Ройтас (Reuters). Биткоин (Bitcoin) – цифровая P2P валюта с открытым исходным кодом. Биткоин представляет собой протокол и программное обеспечение, которые включают в себя:- (i) мгновенные P2P транзакции; (ii) платежи по всему миру; (iii) низкую/нулевую стоимость обработки транзакций; и (iv) многое другое. Биткоин использует P2P технологию, функционируя без центрального контролирующего органа; обработка транзакций и эмиссия производятся коллективно, усилиями сети. Благодаря своим уникальным свойствам, Биткоин открывает новые горизонты возможностей, которые не предоставляла до этого ни одна платёжная система. Программное обеспечение разрабатывается коллективно, как свободный проект с открытым исходным кодом, и распространяется под лицензией MIT. Биткоин – это цифровая валюта, протокол и программное обеспечение, которые включают в себя:- (i) мгновенные P2P транзакции; (ii) платежи по всему миру; (iii) низкую/нулевую стоимость обработки транзакций; и (iv) многое другое. Биткоин использует P2P технологию, функционируя без центрального контролирующего органа; обработка транзакций и эмиссия производятся коллективно, усилиями сети. Благодаря своим уникальным свойствам, Биткоин открывает новые горизонты возможностей, которые не предоставляла до этого ни одна платёжная система. Bitcoins легко передаются через Интернет, без необходимости доверять третьим лицам. Сделки с использование биткоина:- (i) необратимы по своей сути; (ii) быстры; полученные средства доступны к использованию в течение нескольких минут; (iii) низкая стоимость транзакций. В частности по сравнению с другими традиционными системами оплаты. Простота биткоина обеспечивается коллективным использованием открытого программного обеспечения и не может манипулироваться каким либо правительством, банком, организацией или отдельным лицом. Ограниченная эмиссия Биткоинов производится так называемыми майнерами и сам процесс майнинга обеспечивает работоспособность сети. Bitcoin является peer-to-peer валютой. Peer-to-peer означает, что никакие центральные органы не производят эмиссию новых денег и не контролируют проводимые транзакции. Эти задачи регулируются коллективно Bitcoin сетью. Bitcoin использует принципы peer-to-peer и proof-of-work в своей работе. Каждая платёжная транзакция в сети биткоин распространяется между всеми участниками сети и признаётся дейтствительной только после подтверждения другими участниками. Bitcoin (от Английских слов Bit, означающее единицу информации Бит, и Coin, означающее Монета) – пиринговая система электронной наличности, использующая одноимённую цифровую валюту, которую часто называют 'криптовалютой'. Сеть полностью децентрализована, не имеет центрального администратора или какого-либо его аналога. Биткоины могут использоваться для электронной оплаты товаров или услуг у продавцов, готовых их принимать. Есть возможность обмена на обычные деньги через специализированные площадки для торгов или обменники. Одна из особенностей – децентрализованная эмиссия новых биткоинов, которой может воспользоваться любой желающий. Но в строго ограниченных количествах и только путём использования вычислительных мощностей своего оборудования, использующихся с целью защиты платёжной системы методом proof-of-work от повторного расходования средств. Деятельность по обслуживанию системы с возможностью получить вознаграждение в форме эмитированных биткоинов и комиссионных сборов получила название 'майнинг' (от Английского слова Mining, означающее Добыча Полезных Ископаемых). В 2013 майнинг биткоинов на обычном домашнем компьютере потерял актуальность из-за массового производства специально разработанных интегральных схем, которые значительно опережают по эффективности для данной задачи видеокарты. Однако около половины биткоинов от их максимально возможного количества поступило в оборот за счёт майнинга на видеокартах и процессорах (процессоры через некоторое время были вытеснены видеокартами из-за появления соответствующего софта). Базовым элементом этой платёжной системы является программа-клиент с открытым исходным кодом. С помощью сетевого протокола прикладного уровня запущенные на множестве компьютеров клиенты соединяются между собой в одноранговую сеть. Для обеспечения функционирования и защиты системы используются криптографические методы. Биткойн-Биржа MTGOX.COM Закрылась В Интернете:- (2014-Февраль-25):- уже больше месяца MtGox.com испытывала технические сложности и ходили слухи о банкротстве компании, взломе биржи, утере почти 700 000 биткойнов. 25 Февраля поставило точку в этой детективной истории – биткойн-биржа MtGox.com закрылась в Интернете, комментариев от компании MtGox.com и её представителя Марка Карпелеса получить не удалось. Приостановила свою деятельность наиболее раскрученная биткойн-биржа MtGox. Официального заявления представителей MtGox о прекращении или банкротстве Интернет-биржи не было. Беспокойства среди приверженцев биткойна начались ещё несколько недель назад, когда начались сбои системы при выводе средств.

Реальная паника и возмущение среди держателей основной криптовалюты началась вчера, 24 Февраля. Райан Силкес, бизнесмен, ведущий расчёты биткойнами, разместил в своём блоге файл, смысл содержания которого сводится к следующему:- 'Реальность в том, что MtGox может объявить банкротство в любой момент'. В документе сообщается также о том, что биржа за несколько лет потеряла 744.4 тысячи кровных криптоединиц. В переводе на бумажный эквивалент сумма равняется примерно 370 миллионов Долларов США. Техническими неполадками в работе ресурса могли воспользоваться потенциальные кибер-мошенники. Случаи неподтверждения транзакции при состоявшемся переводе средств регламентируют возврат биткойнов. Таким образом, при переводе средств можно было с высокой долей вероятности удваивать переведённые суммы. MtGox заявляла в начале Февраля, что видит разрешение проблемы в совместных усилиях держателей и поклонников криптовалюты. Сегодня же, при полном отсутствии доступа к сайту, руководство MtGox отказывается от каких-либо комментариев. На своей странице в Твиттере биржа удалила все свои записи. Сервер MtGox находится в Токио. Новая криптовалюта была введена в обращение в 2009. Создателем биткойна является Сатоши Накамото. Полярные отношения к биткойну со стороны национальных банков различных государств определяют его высокую волатильность. 2014-Март-06:- истинный создатель биткойнов Сатоши Накамото проживает в Калифорнии, США и занимается коллекционированием игрушечных поездов. Журналу Newsweek удалось установить личность до сих пор неизвестного создателя криптовалюты биткойн, которого ранее в тематических публикациях называли Сатоши Накамото (Satoshi Nakamoto). Им оказался проживающий в Калифорнии (Темпл Сити) Дориан Прентис Сатоши Накамото (Dorian Prentice Satoshi Nakamoto). Это полное имя он взял после выпуска из Калифорнийского Технического Университета, дополнив имя Сатоши Накамото, которым пользовался с рождения. Личность 64-летнего Калифорнийца с Японским происхождением была установлена корреспондентом Newsweek Лиа Гудмэн (Leah Goodman), которая занималась его розысками два месяца. Как пишет Newsweek, Накамото признал роль в создании криптовалюты Bitcoin, но отказался поддерживать разговор на эту тему, сославшись на то, что более не занимается работой над проектом, и никак с ним не связан. Сатоши Накамото родился в Японии в 1949, и в 10-летнем возрасте с матерью переехал в Калифорнийский Темпл Сити. Он женат, хотя с женой не проживает, имеет шестерых детей. По словам Гявина Андресена (Gavin Andresen), главы разработки протокола Bitcoin Foundation, о Накамото известно лишь то, что он был причастен к секретным военным проектам. Идея биткойна, как говорит Андресен, пришла к Сатоши Накамото из соображений либертарианской ненависти к банковской системе. Сейчас отошедший от дел Накамото занят коллекционированием моделей паровозов и хранит анонимность. Тем не менее, он владеет примерно 1 миллионом монет Bitcoin, что на данный момент соответствует более чем USD600 миллионам. Система Bitcoin использует сочетание криптографии с публичными ключами и технологии пиринговых сетей, позволяющее создать виртуальный аналог золота – ресурса, запасы которого трудно пополнить и который можно обменять на валюту. Криптовалюта была создана в 2009 программистом Сатоши Накамото, который полностью исчез из Интернет-пространства в Апреле 2011. Он же создал программное обеспечение, которое позволяет людям 'добывать' монеты Bitcoin, производя на компьютере сложные математические вычисления. Процесс производства новых монет постоянно усложняется, заставляя тратить на него каждый раз все больше вычислительных ресурсов. Однако крупнейший и самый старый обменник биткойнов Mt.Gox в последнее время переживает нелёгкие времена. Японская телекомпания NHK несколько дней назад сообщила, что эта Интернет-биржа попросила Токийский Окружной Суд признать себя банкротом, так как не в состоянии покрыть долги на 6.5 млрд Йен (около USD63.6 миллионов). В России же расчёты в биткойнах не вызывали доверия у Центробанка и правоохранительных органов. Банк России в конце Января 2014 распространил заявление, согласно которому обмен биткойнов и оплата ими работ и услуг будут приравниваться к отмыванию нелегальных доходов и финансированию терроризма. А Генпрокуратура России на совместном совещании с Федеральной Службой Безопасности (ФСБ) и Министерством Внутренних Дел (МВД) согласилась с позицией Центробанка и приняла 'ряд конкретных решений, направленных на предотвращение нарушения имущественных прав граждан и организаций, связанных с использованием криптовалют'.

BITS = BROKER ITS

BITT = БИТЕНГ (или КНЕХТ, или БИТСЫ, или ШВАРТОВАЯ ТУМБА) – Bitts are a pair of vertical wooden or iron heads on board ship, used for securing mooring or towing lines. Similar to dock bollards. Bitt is a vertical cylindrical shaped fitting made of steel and securely attached to deck; usually in pair and used for fastening mooring ropes or towing lines in a figure of eight. Also known as Bollard. / Битенг, от Голландского слова Beting, означает стальную или чугунную одиночную или парную тумбу на палубе судна для закрепления буксирного троса или якорного каната, а также для уменьшения скорости движения якорной цепи при отдаче якоря. Под Кнехтом, от Голландского слова Knecht, понимается парная тумба с общим основанием на палубе судна, предназначенная для закрепления накладываемого восьмёрками швартовного (швартовный кнехт) или буксирного (буксирный кнехт) троса. Обычно кнехты пустотелые, стальные или чугунные. Кнехт, от Голландского слова Knecht, означает стальную или чугунную парную тумбу, как правило пустотелую. Он укрепляется на палубе судна или на причале и служит для закрепления буксирного или швартовного троса. Под Швартовным Устройством судна понимается совокупность приспособлений и механизмов (вьюшки, киповые планки, клюзы, кнехты, лебёдки, утки, швартовные клюзы, швартовные лебёдки или шпили, швартовы и прочие) для удержания судна во время стоянки у причала или у борта другого судна. Управление швартовными механизмами местное или дистанционное. Автоматическое потравливание или выбирание швартового троса при изменении его натяжения (например, при погрузке или разгрузке судна) позволяет избежать тяжёлой ручной работы. Швартов, от Голландского слова Zwaartouw, гибкий трос (стальной, синтетический или из растительного волокна), с помощью которого подтягивают и крепят судно к причалу или другому судну.

BITTER ENDS = КОРЕННЫЕ КОНЦЫ (или ШЛАГ ТРОСА, или ЖВАКА) – Bitter Ends are the ends of rope after a change of direction of any kind. The ends are usually joined by means of a knot, wire cable clamps, turnbuckles, shackles etc. Bitter End is that part of an anchor cable which is abaft the bitts and thus remains inboard when a ship is riding at anchor. Note:- To pay out a rope to the bitter end means to pay it all out. Bitter Ends are the final six fathoms of anchor chain before the point of attachment in the chain locker of modern US naval vessels, with these six fathoms often painted blue, white and red to warn deck hands of the end of available anchor chain. Some see the idiomatic use as a corruption of the nautical one, replacing the nautical term bitts with the unrelated term bitter ('unpleasant, arduous'). The Bitter End is the inboard end of a chain, rope, or cable, especially the end of a rope or cable that is wound around a bitt. / Конец троса, к которому крепится гак или другое приспособление для подъёма груза, называется коренным концом. Конец троса, к которому прилагается усилие для подъёма груза, называется ходовым концом.

BITUMEN = БИТУМ – Bitumen:- also called Asphalt or Tar, bitumen is the brown or black viscous residue from the vacuum distillation of crude petroleum. It also occurs in nature as asphalt 'lakes' and 'tar sands'. It consists of high molecular weight hydrocarbons and minor amounts of sulfur and nitrogen compounds. In the United States, Bitumens are exceptionally heavy hydrocarbons, either naturally occurring (e.g., Canada, Venezuela), or deriving from the residue refining process. Bitumen is a solid, semi-solid or viscous hydrocarbon with a colloidal structure, being brown to black in color, obtained as a residue in the distillation of crude oil, by vacuum distillation of oil residues from atmospheric distillation. Bitumen is often referred to as Asphalt and is primarily used for construction of

roads and for roofing material. This category includes fluidized and cut back bitumen. / В Соединённых Штатах Америки к разновидностям битума относятся исключительно тяжёлые углеводороды, либо природного происхождения (как например, в Венесуэлле и Канаде), либо образующиеся в качестве остатка в процессе переработки нефти. Битум является твёрдым, полутвёрдым или полужидким (вязким) углеводородом с коллоидальной структурой, имеет коричневый или тёмно-коричневый цвет, и выделяется в качестве остатка в процессе дистилляции сырой нефти, посредством вакуумной дистилляции остатков нефти, образовавшихся при атмосферной дистилляции. Битум часто ассоциируется с Асфальтом и используется, главным образом в прокладке автомобильных дорог и в качестве материала покрытия. Эта категория включает псевдоожиженный (флюидизированный) и твёрдый (фракционированный) битум или асфальтовый лак (битум, растворённый в нефтяном дистилляте). Битум, от Латинского слова Bitumen, означающее Смола, является твёрдой или жидкой водонерастворимой, преимущественно чёрного цвета, смесью углеводородов и их кислородных, сернистых и азотистых производных. Различают природные битумы (например, вязкие, подвергшиеся выветриванию нефти) и искусственные, получаемые главным образом из остатков от перегонки нефтей, крекинга и очистки масел (так называемые нефтяные битумы). Битум используется в дорожном строительстве, в основном в виде асфальта, а также в производстве различных электро- и гидроизоляционных материалов, таких как рубероид или других. Битум – общее название природных и получаемых искусственно сложных органических веществ, состоящих из углеводородов, их кислородных, сернистых и азотистых производных. Природные битумы входят в состав нефти (асфальт), а также каменного и бурого углей, торфа. В небольших количествах битум присутствует в осадочных горных породах. Растворим в органических растворителях (бензоле, сероуглероде, хлороформе и другом). Твёрдые битумы чёрного цвета; плотность около 1 000 кг/м^3; размягчаются при температуре 25–90 °C. Искусственный битум получают перегонкой природных битумов, например из нефтяных остатков (остаточный гудрон) или из отходов кислотной очистки смазочных масел (регенерированный гудрон). Битум применяют в дорожном строительстве, в производстве пергамина, рубероида, для изготовления изоляционных материалов (гидроизол, металлоизол), компаундов, лаков и пластмасс. Битумы:- первоначально к битумам относили только природные образования, в основном нефть и её естественные производные (чаще всего асфальт). Затем битумом стали называть также искусственные асфальтоподобные продукты, получаемые переработкой природных битумов, остатков от перегонки нефти, каменноугольной и сланцевой смол (технические битумы). Кроме того, название Битум распространили на экстракты, извлекаемые органическими растворителями из торфа, бурого угля и другого (битумы твёрдых топлив). Экстракты, извлекаемые из осадков и осадочных пород, называются Битумоидами. Битумом пользовался человек ещё в глубокой древности. Известны сооружения в междуречье Тигра и Евфрата и в Египте, которые возводились с применением битума за 3000 лет до Нашей Эры. Битумом покрывали водохранилища и хранилища для зерна, скрепляли плиты стен и полов во дворцах и храмах; битум использовали для гидроизоляции тоннеля, построенного в начале 1-го тысячелетия до Нашей Эры под Рекой Евфратом. Природные битумы подразделяются на нафтиды и нафтоиды. Нафтиды весьма широко распространены в природе – это нефть и её естественные производные:- мальты, асфальты, асфальтиты, кериты, озокериты и так далее. Мальты представляют собой вязкие сгустившиеся нефти, подвергшиеся выветриванию. Они состоят из масел (40–65%) и асфальтово-смолистых компонентов (не менее 35%). Дальнейшее изменение мальт под влиянием того же фактора приводит к образованию:- твёрдых, но легкоплавких асфальтов, содержащих 60–75% асфальтово-смолистых веществ; асфальтитов – твёрдых высокоплавких и полностью растворяющихся в хлороформе и сероуглероде продуктов, содержащих более 75% асфальтово-смолистых веществ; керитов, к которым относят также вещества, характеризующиеся лишь частичной, иногда очень слабой растворимостью в органических растворителях. К битумам иногда относят также все углеводородные в своей основе природные газы (газообразные нафтиды). Нафтоиды – нафтидоподобные продукты естественной возгонки органического вещества под влиянием магматического тепла. Они встречаются значительно реже нафтидов, ещё очень слабо изучены и не имеют промышленного значения. Технические битумы – продукты, обладающие обычно твёрдой или вязкой консистенцией и получаемые главным образом из тяжёлых нефтяных остатков, богатых асфальтово-смолистыми веществами, следующими методами:- глубокой вакуумной перегонкой тяжёлых нефтяных остатков – мазутов, гудронов и других – при 300–350 °C (остаточные битумы); окислением кислородом воздуха тяжёлых остатков от перегонки нефти (гудронов и других) при 260–280 °C (окисленные битумы); смешением окисленных битумов с неокисленными нефтепродуктами (компаундированные битумы). Основные компоненты нефтяных битумов – асфальтены, смолы и нефтяные масла. Первые обусловливают твёрдость битумов, вторые – цементацию и эластичность, третьи служат разжижающей средой для смол и асфальтенов. Наиболее важные технические показатели битумов:- (i) дуктильность, то есть способность при растягивании давать нить определённой длины (определяется по толщине нити, которая образуется в результате растяжения стандартного образца битума до разрыва); (ii) пенетрация, характеризующая вязкость битума (определяется по глубине проникновения в слой битума за 5 секунд (сек) стальной иглы под нагрузкой 1 Ньютон (Н) (0.1 килограмм силы (кгс)). Кроме того, для характеристики битумов обычно определяют (iii) температуру размягчения, (iv) температуру вспышки и (v) плотность. Промышленность изготовляет твёрдые, полутвёрдые и жидкие битумы. Жидкие битумы характеризуются (в зависимости от сорта) следующими данными:- пенетрация остатка (после отбора фракций до 360 °C) 10–30 миллиметров (мм) (25 °C); вязкость при истечении через отверстие диаметром 5 мм 5–200 сек (60 °C); температура вспышки 65–120 °C; до 225 °C должно перегоняться не более 10%, до 360 °C – не более 50%. Твёрдые нефтяные битумы применяют для получения рулонных кровельных материалов (рубероидов) и битумных мастик; полутвёрдые – в производстве гидроизоляционных материалов (гидроизол, борулин, битуминированные ткани и другие) и обмазок, строительных асфальтовых растворов, асфальтов, битумных пластиков и другого; жидкие – для дорожного строительства. Заменителями нефтяных битумов могут быть продукты термической переработки твёрдых топлив:- высококипящие фракции смол, получаемых при коксовании и полукоксовании каменных углей, каменноугольные пеки, продукты сухой перегонки каменных углей, горючих сланцев и другого. Из общего количества битумов, потребляемых в различных отраслях промышленности, свыше 90% падает на долю искусственных битумов, получаемых из нефти; их мировое производство составляет десятки миллионов тонн (т). Битумы твёрдых топлив – продукты, извлекаемые из торфа и бурых углей органическими растворителями. Главные составные части битумов твёрдых топлив – воски и смолы. Наиболее ценны из экстрагируемых продуктов воски; их характерные свойства – высокие температуры плавления, низкая электропроводность, высокая влагостойкость и способность при небольших добавках к другим веществам повышать температуру плавления. Содержание битума в битуминозных торфах составляет:- при извлечении бензолом 10–15%, бензином 6–9%. В битуминозных бурых углях (Александрийские угли бывшей Украинской Советской Социалистической Республики (УССР)) содержание продуктов, извлекаемых бензолом, достигает 14–16%. Выход битума твёрдых топлив в производственных условиях обычно составляет 80–85% от их аналитического содержания в топливе. Минимальное содержание битума в твёрдом топливе, необходимое для рентабельности процесса, 8–10%. Получение битумов твёрдых топлив состоит из следующих этапов:- подготовка топлива к экстрагированию; экстракция органическими растворителями; отгонка от экстракта основной массы растворителя; освобождение битума от остатков растворителя и воды; сплавление и разливка битума в форму. Битумы из твёрдого топлива извлекают преимущественно в периодически действующих экстракторах, объединённых в батареи. Битумы твёрдого топлива применяют в различных отраслях народного хозяйства:- в литейном деле – как один из компонентов

модельных составов при прецизионном литье (литьё по выплавленным моделям), в электротехнической промышленности как электроизоляционный материал, а также для отделки различных изделий из кожи, дерева, бумаги и другого.

BITUMINOUS COAL = БИТУМИНОЗНЫЙ УГОЛЬ – Bituminous is the most abundant rank of coal. It accounts for about 50% of the coal produced in the United States. Bituminous coal is formed when a sub bituminous coal is subjected to increased levels of organic metamorphism. It has a carbon content of between 77 and 87% on a dry ash-free basis and a heating value that is much higher than lignite or sub bituminous coal. On the basis of volatile content, bituminous coals are subdivided into low volatile bituminous, medium volatile bituminous and high volatile bituminous. Bituminous coal is often referred to as 'Soft Coal', however this designation is a layman's term and has little to do with the hardness of the rock. Bituminous Coal is the most abundant type of coal in the United States. It has a carbon content ranging from 45 to 86 percent carbon and a heat value of 10 500 to 15 500 BTUs-per-pound, much higher than lignite or sub-bituminous coal. It is used mainly to generate electricity and to make coke to manufacture steel. Central Appalachian metallurgical (met) coal is high-grade bituminous coal (high in energy content, 12 500 btu/lb, and low impurities). Central Appalachian steam coal is generally high-grade bituminous coal as well, and some can be sold as met coal. Is is traded at the NYMEX®. Bituminous Coal is the most common coal. It is dense and black (often with well-defined bands of bright and full material). Its moisture content usually is less than 20 percent. It is used for generating electricity, making coke, and space heating. Comprises five groups classified according to the following ASTM Specification D388-84, on a dry mineral-matter-free (mmf) basis for fixed-carbon and volatile matter and a moist mmf basis for calorific value:- (i) LV = low volatile bituminous coal; (ii) MV = medium volatile bituminous coal; (iii) HVA = high volatile A bituminous coal; (iv) HVB = high volatile B bituminous coal; and (v) HVC = high volatile C bituminous coal. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). , и низкие примеси). твёрдость (hardness) .

BIVALENT = БИВАЛЕНТ – Bivalent is a pair of homologous identical chromosomes derived from two parents united in the first mitotic division. / Бивалент – пара идентичных гомологичных хромосом, .

BIVOLTINE = БИВОЛЬТИННОЕ – Bivoltine:- having two generations in a year.

BIZ = BUSINESS

BJ = BENIN

BKE = BILATERAL KEY EXCHANGE

BL = BLAST DISEASE

BL(S) = BALE(S)

BL = BARREL

B/L = BILL OF LADING

BLACK = ЧЁРНОЕ – Black gets included in this glossary only because, in a way, it is a 'problem' color. In many dye families, such as reactive dyes, there is no such thing as a 'pure' black dye:- blacks are made by using mixtures of other colors, often starting with a large proportion of a navy blue. To achieve a good dark black typically takes much more dye than for strong shades of other colors. It is not unusual to see recommendations between 6% and 10% owg. Because blacks are usually mixtures, discharge of black may yield unexpected results. Coppery colors are not uncommon. Reducing agent discharge may produce different results from oxidizing agent discharge. Some dye vendors offer black dyes that are specially formulated to discharge to almost white. Sulfur dyes are extensively used commercially for black cotton fabrics. Black:- ideally, the complete absorption of incident light; the absence of any reflection. In the practical sense, any color that is close to this ideal in a relative viewing situation, i.e. a color of very low saturation and of low luminance. Black:- the achromatic color of least lightness characteristically perceived to belong to objects that neither reflect nor transmit light. Black clothing.

BLACKARM = ГОММОЗ – Blackarm is a symptom of bacterial blight in which lesions encircle stems or branches. See also Angular Leaf Spot, Bacterial Blight and Lesion. / Симптом Бактериоза, при котором происходит окаймлённое (окружённое) повреждение стеблей или побегов. Смотрите также Угловатые Пятна На Листьях (Angular Leaf Spot), Бактериоз (Bacterial Blight) и Поражение (Lesion). Под Гоммозом понимается болезнь растений, вызываемая неблагоприятными условиями среды, ранением, насекомыми и микроорганизмам. Вредоносен гоммоз косточковых (Вишня и другие) и Хлопчатника. Гоммоз проявляется в виде:- обильного выделения камеди (гумми – высокомолекулярных углеводов, являющихся составной частью соков и выпотов растений) у косточковых, серовато-маслянистых мокрых пятен на листьях, стеблях и коробочках Хлопчатника.

BLACKBOARD TRADING = ТОРГОВЛЯ С ЧЁРНОГО ТАБЛО – Blackboard Trading is the practice, no longer used, of selling commodities from a blackboard on a wall of a commodity exchange. / Больше не использующаяся практика продажи различных типов сырья с табло, располагавшемся на стене сырьевой биржи.

BLACK BOX = ЧЁРНЫЙ ЯЩИК – Black Box is a proprietary computerized trading system whose rules are not disclosed or readily accessible.

BLACK CARGO = ЗАПРЕЩЁННЫЙ ГРУЗ (или ЧЁРНЫЙ ГРУЗ) – Black Cargo is a cargo banned by general cargo workers for some reason. This ban could be because the cargo is dangerous or hazardous to health. / Груз, по каким-либо причинам запрещённый к обработке рабочими, обслуживающими генеральные грузы. Такой запрет может быть введён в связи с тем, что этот груз является опасным или вредным для здоровья.

BLACK END = ЧЁРНАЯ ПРОДОЛЬНАЯ НИТЬ – Black Thread is linen yarn discolored by oil stains; in flax spinning, yarn spoiled by oil. / масляными разводами (или потёками;).

BLACK FRIDAY = ЧЁРНАЯ ПЯТНИЦА – Black Friday:- a precipitous drop in a financial market. The original Black Friday occurred on September 24, 1869, when prospectors attempted to corner the gold market.

BLACK GANG = ШАЙКА ЧЕРНОМАЗЫХ (или МАСЛОПУПЫ, или МОТЫЛИ) – Black Gang:- Member of the engine-room force, which included the engineers, firemen, oilers, and wipers. Black Gang is a slang expression referring to the personnel in the engine department aboard ship. / Жаргонное выражение, относящееся к механикам – персоналу машинного отделения судна, именуемого на жаргоне моряков Подвалом. Шайка Черномазых – это дословный перевод термина Американского жаргона, в Русском языке этот термин соответствует жаргонным терминам Маслопупы или Мотыли.

BLACKHEAD STAGE = СТАДИЯ ЧЁРНОЙ ГОЛОВЫ – Blackhead Stage is a stage in the development of insect eggs wherein the head can be observed as black spot through the chorion.

BLACK KERNELS = ЧЁРНАЯ ЗЕРНОВКА (или ЧЁРНЫЕ ЯДРА) – Black Kernels mean parboiled Rice kernels that are black for the whole kernels, including kernels that are dark brown for the whole kernels. / К Чёрной Зерновке (Чёрным Ядрам) относятся зёрна пропаренного Риса целиком чёрного цвета, в том числе и зерновка целиком тёмно-коричневого цвета.

BLACKLIGHT = НЕВИДИМОЕ ИЗЛУЧЕНИЕ (или УЛЬТРАФИОЛЕТОВОЕ ИЗЛУЧЕНИЕ) – Blacklight is a 'longwave' ultraviolet light; wavelength typically about 365 nanometers. Blacklight lamps made with a fluorescent tube that appears very dark purple can often be found reasonably inexpensively at novelty shops and even at stationery stores where they are sold for detecting counterfeit money. Blacklight lamps are useful for detecting optical brighteners in fabrics. / Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

BLACK LIGHT CLEAR = ГАШЕНИЕ ЧЁРНОГО СВЕТА (или ГАШЕНИЕ НЕВИДИМОГО ИЗЛУЧЕНИЯ) – Black Light Clear:- printing process where specialty inks are used to design looks that are virtually colorless under normal lighting conditions but when viewed under black light emit a distinct glow (generally a blue glow).

BLACK MARKET = ЧЁРНЫЙ РЫНОК – Black Market is a market in which certain goods or services are routinely traded in a manner contrary to the laws or regulations of the government in power. Typical reasons why the market goes underground in this way include the desire by substantial numbers of buyers and sellers to evade restrictive government price controls or inconvenient rationing schemes, to avoid paying heavy taxes on the good or service in question, or simply to be able to obtain forbidden goods or services that the government does not want the people to have at all. The size and relative importance of black markets vary greatly from one country to another and from one historical period to the next within any single country. In general, the greater the extent to which the government tries to dominate and control the economy, the larger the fraction of economic activity that takes place through the black market can be expected to be. Partially offsetting this tendency of more interventionist policies to spawn ever larger black markets, the size of the black market in any given country at any given time also reflects the size and effectiveness of the bureaucratic machinery the government mobilizes to catch people who violate its economic regulations and the severity of the punishments that are routinely inflicted on those who get caught. Thus it was surely no accident that the ultra-highly regulated economic institutions of Nazi Germany, Soviet Russia, Eastern Europe and Communist China coexisted in symbiosis with gigantic regulatory and secret police establishments, extensive informer networks, crowded prison systems featuring thousands of slave labor camps, and frequent imposition of the death penalty for so-called 'Economic Crimes'. The Nazi regime was destroyed by World War II before it was old enough to undergo any very extensive modifications, but it was surely no accident that even the first very tentative and partial gestures by the various Communist regimes to abolish or restrain many of their more extreme 'police-state' practices during these last few decades quickly resulted in an enormous expansion of black market activity, despite the fact that these governments were also just beginning to loosen up their control of the economy at the same time. In the United States, government efforts to regulate and micro-manage the economy have historically been much less extensive than in Communist or socialist countries. In fact, the American commitment to the general ideal of 'free enterprise' has typically been considerably stronger than has been the case in virtually all of the more advanced industrialized Western countries. Nevertheless, we can easily identify at least a few rather large examples of the black market in the United States. First of all, the US government has typically been more ambitious and aggressive in its attempts to regulate and control economic activities during times of perceived national crisis (especially during wartime). World War II rationing and price controls were accompanied by extensive black market activity involving illegal dealings in meat, sugar, automobile parts, penicillin and other regulated commodities as well as widespread evasion of rent controls. Even in relatively normal times, however, there are important areas of black market activity in the US economy. First of all, and most clearly 'criminal' in the eyes of the general public, there is always a certain amount of illicit trade in stolen goods passed on directly (or indirectly, through 'fences') from burglars, jewel thieves, cattle rustlers, hijackers, shoplifters, light-fingered employees, and the like. In addition, black market trade remains very widespread (and probably still is growing) in certain demerit goods which remain strongly in demand, even though federal and/or state governments have sought to prohibit them entirely (narcotics and most other psychoactive recreational drugs, hard-core pornography, the services of prostitutes, false ID cards, ozone-depleting Freon for automobile air conditioners, Cuban cigars, the gall bladders of bears, products made from elephant tusks) or to monopolize the product in government hands (running of lotteries-for-profit, fully automatic firearms) or to tax them very heavily in a discriminatory fashion (moonshine whiskey, bootleg cigarettes). Heavy rates of taxation on otherwise perfectly legitimate wages, salaries, and unincorporated small business profits (currently a minimum federal tax take of 18% for income tax plus more than 15% for social security tax, even before beginning to tally up state and local income taxes and license fees) provide strong incentives for illegal working 'off the books' for cash to evade taxes, at least in low capital or temporary service occupations where government detection is unlikely and/or punishment would probably be mild (lawn care services, free-lance handymen, automobile mechanics, household servants, baby-sitters, plumbers, electricians, part-time beauticians, locksmiths, appliance repairmen, temporary day-laborers, computer consultants, tutors, etc). Putting even an approximate number on the full extent of black market activity in the US (or in any country) is very hard to do and necessarily rather imprecise, but, for what it is worth, economists who have made serious and systematic efforts at estimation claim that black market activity probably amounts to at least 10% of US GNP. In many Third World countries (which tend to put a tremendous number of detailed economic regulations on the books but have only very inefficient bureaucratic capabilities for enforcing them), black market activity is believed to produce well over half of GNP. Black Market is an illegal market. Wholly illegal market; one that is illicit and uncontrolled. Black markets deal in scarce or stolen goods, and frequently come into existence in wartime, because the goods concerned are rationed, or because the market is exceptionally high – in which case counterfeit or imitation goods often appear. Trading is often in kind, one valued commodity being exchanged for another. / Чёрный Рынок – всецело нелегальный рынок; таковым может рассматриваться незаконный и неконтролируемый рынок. На чёрных рынках продаются дефицитные или украденные товары. Очень часто они возникают в военное время вследствие того, что данные товары подлежат нормированию. Они возникают также вследствие того, что какой-то рынок исключительно высок (переоценён), и на нём начинают часто встречаться товары в виде подделок или имитации настоящего товара. Торговля на таких рынках зачастую может осуществляться в форме натурального обмена (в натуре), то есть когда один оцениваемый товар обменивается на другой. Чёрный Рынок – совокупность экономических отношений между продавцами и покупателями товаров и услуг, складывающихся в нарушение действующего законодательства. Является одним из атрибутов теневой экономики и возникает, как правило, в тех сферах, где существует жёсткое административное регулирование экономической деятельности со стороны государства.

BLACK MONDAY = ЧЁРНЫЙ ПОНЕДЕЛЬНИК – A term Black Monday refers to October 19, 1987, when the Dow Jones Industrial Average fell 508 points on the heels of sharp drops the previous week. On Monday, October 27, 1997, the Dow dropped 554 points. While the point drop set a new record, the percentage decline was substantially less than in 1987. / Дау Дьжонз (Dow Jones).

BLACK OILS = ЧЁРНЫЕ МАСЛА – Black Oils are the lubricants containing asphaltic materials, which impart extra adhesiveness, that are used for open gears and steel cables. / Чёрные Масла – смазки, содержащие асфальтические материалы, которые придают сверх адгезивность, что используется для открытых (зубчатых) передач и стальных кабелей.

BLACKOUT PERIOD = ПЕРИОД ПРИОСТАНОВКИ – In the US trademark law, Blackout Period is the period between the date the examining attorney approves the mark for publication and the date of issuance of the Notice of Allowance. The applicant may not file an Allegation of Use during this period. / В патентном праве, период между датой одобрения проверяющим поверенным знака для публикации и датой выдачи Уведомления о Разрешении.

BLACKPOINT = ПОЧЕРНЕНИЕ – Blackpoint is a discoloration on the germ end of kernels of grain caused by numerous species of fungi and bacteria. Blackpoint is found in Barley, Triticale and Wheat, although there is no separate tolerance defined for blackpoint in Barley. Kernels are susceptible during periods of rainfall or humidity above 90%, particularly during filling or maturation. Blackpoint does not usually reduce yields, but it can reduce grade and quality. Blackpoint is especially troublesome on Durum Wheat because black specks can appear in the semolina, making it undesirable for further processing. / вызываемое многочисленными видами (species) грибов и бактерий. тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы пшеницы, полученные при скрещивании её с рожью). Почернением считается изменение цвета зародышевой области зерновки (на конце зародыша у ядер зерна), вызываемое многочисленными разновидностями грибков и бактерий. могут появиться в крупке, сделав её нежелательной для дальнейшей переработки.

BLACK ROOT ROT = ЧЁРНАЯ КОРНЕВАЯ ГНИЛЬ – Black Root Rot:- pest type:- disease; crops affected:- Cotton; scientific name:- Thielaviopsis basicola. Symptoms:- this disease is often included in the 'Seedling Disease Complex'. Infection occurs at the seedling stage with roots and the portion of the hypocotyl below the soil line rotting and turning black. The disease is first noticed as patches of slow-growing cotton. Signs of this disease include swelling and blackening of the tissue at the base of the stem, and fungus growing from infection sites. In infected seedlings, the taproot turns dark brown or black and is reduced in diameter. Lateral roots are destroyed. As the plant ages, healthy tissue replaces the decayed tissue, but affected plants may be stunted, delayed in maturity, and yields reduced. Disease Cycle:- this fungus can survive for long periods of time in the soil as very resilient, dormant spores that reproduce abundantly on cotton roots. This disease requires a living host to reproduce. Each crop of cotton can lead to more spores in the soil. In the US, this disease is most prevalent in TX, MS, NM, and the San Joaquin Valley of CA. It has also become important in Australia. It is more common in clay soils and is most severe under cool, wet conditions. Control Measures:- control of this fungus has proven difficult. Best control measures have included crop rotations, using high quality seed, planting after the soil has warmed adequately, and selection of the best seed treatment fungicides. The fungus causing this disease (Thielaviopsis Basicola) is favored by relatively cool soil temperatures and is therefore most active early in the season. Affected seedlings are stunted and grow very slowly as a result of extensive blackening and damage to the root system. Where this disease is present it is important to avoid early planting and the use of legumes in the rotation. Many legume crops are also hosts of the fungus. Black root rot is widespread in irrigated cotton and is easily spread in infested soil adhering to machinery or vehicles. Black Root Rot is caused by a soilborne fungus that survives as long-lived thick-walled spores. Each crop of cotton deposits more spores in the soil, increasing the severity of the disease. Severity is also increased by cool wet conditions during the early part of the season. As the weather warms up, the plants resume growth and symptoms may no longer be visible. Black root rot is often observed first as patches of stunted, slow-growing cotton early in the season. Black root rot may increase the stand loss caused by other seedling pathogens. In subsequent seasons the patches may no longer be obvious as the pathogen spreads throughout the field. Roots of infected seedlings appear black in comparison to those of healthy plants. Lateral roots die but the tap root usually survives. Damage in seedlings is limited to the outer layers of the tap root. In some seasons the fungus infects the center of the tap root, causing an internal rot in the upper part of the root and lower stem in older plants. A seedling disease of cotton caused by a soilborne fungus, especially when conditions are cool and moist. / в верхней части корня или прикорневой части стебля (lower stem) более взрослых растений. Боковые корни (lateral roots) отмирают, но стержневой или главный корень обычно выживает. Болезнь всходов Хлопчатника, вызываемая передающимися через почву грибами, особенно в прохладные и влажные погодные условия.

BLACK ROT = ЧЁРНАЯ ГНИЛЬ – Black Rot is a rot attack on fruit. Black rot can always occur if damage to the fruit extends as far as the flesh. This is then easily transferred from an infected piece of fruit to the other fruits. Black rot is a frequent type of chilling damage occurring in pineapples.

BLACK–SCHOLES MODEL = МОДЕЛЬ БЛЭКА–СКОЛЗА – The Black-Scholes Model or Black–Scholes-Merton is a mathematical model of a financial market containing certain derivative investment instruments. From the model, one can deduce the Black-Scholes formula, which gives the price of European-style options. The formula led to a boom in options trading and the creation of the Chicago Board Options Exchange. It is widely used by options market participants. Many empirical tests have shown the Black-Scholes price is 'fairly close' to the observed prices, although there are well-known discrepancies such as the 'option smile'. The model was first articulated by Fischer Black and Myron Scholes in their 1973 paper, 'The Pricing of Options and Corporate Liabilities'. They derived a partial differential equation, now called the Black-Scholes Equation, which governs the price of the option over time. The key idea behind the derivation was to hedge perfectly the option by buying and selling the underlying asset in just the right way and consequently 'eliminate risk'. This hedge is called Delta Hedging and is the basis of more complicated hedging strategies such as those engaged in by Wall Street investment banks. The hedge implies there is only one right price for the option and it is given by the Black-Scholes formula. Robert C. Merton was the first to publish a paper expanding the mathematical understanding of the options pricing model and coined the term Black-Scholes options pricing model. Merton and Scholes received the 1997 Nobel Prize in Economics (The Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel) for their work. Though ineligible for the prize because of his death in 1995, Black was mentioned as a contributor by the Swedish academy. The Black-Scholes model of the market for a particular stock makes the following explicit assumptions:- (i) there is no arbitrage opportunity, i.e. there is no way to make a riskless profit; (ii) it is possible to borrow and lend cash at a known constant risk-free interest rate; (iii) it is possible to buy and sell any amount, even fractional, of stock (this includes short selling); (iv) the above transactions do not incur any fees or costs, i.e. frictionless market; (v) the stock price follows a geometric Brownian motion with constant drift and volatility; and (vi) the underlying security does not pay a dividend. From these assumptions, Black and Scholes showed that 'it is possible to create a hedged position, consisting of a long position in the stock and a short position in the option, whose value will not depend on the price of the stock'. Several of these assumptions of the original model have been removed in subsequent extensions of the model. Modern versions account for changing interest rates (Merton, 1976), transaction costs and taxes (Ingersoll, 1976), and dividend payout. An option pricing model initially developed by Fisher Black and Myron Scholes in 1973 for European options on shares and indices and later refined by Mr Black in 1976 for options on futures. The original closed-form solution to option pricing developed by Fischer Black and Myron Scholes in 1973. In its simplest form it offers a solution to pricing European-style options on assets with interim cash pay-outs over the life of the option. The model calculates the theoretical, or fair value for the option by constructing an instantaneously riskless hedge:- that is, one whose performance is the mirror image of the option pay-out. The portfolio of option and hedge can then be assumed to earn the risk-free rate of return. Central to the model is the assumption that market returns are normally distributed (i.e. have lognormal prices), that there are no transaction costs, that volatility and interest rates remain constant throughout the life of the option, and that the market follows a diffusion process. The model has five major inputs:- the risk-free interest rate, the option's strike

price, the price of the underlying, the option's maturity, and the volatility assumed. Since the first four are usually determined by the market, options traders tend to trade the implied volatility of the option. Black-Scholes formula is a mathematical formula for pricing options and warrants, named after the American economists Fischer Black and Myron Scholes. The formula integrates the five most important factors that influence the price of an option:- share price, strike price, remaining maturity, interest rate and volatility. The Black-Scholes Options Pricing Model typically is used to find the implied volatility of an underlying by a trial-and-error process. While the other pricing details are known or estimated – time to expiration, risk-free rate of interest and the ratio of futures price to strike price – the standard deviation of underlying price movement is unknown. For example, on June 03, 2013, the July 2014 orange juice futures were priced at 148.35. Time to expiration (382 days) equaled 1.06 years, and a riskfree rate of 0.20% was estimated. Using a strike price of 150, the standard deviation of 0.2474 was computed by the process of successive changes until the estimated call price, 14.4499, approximated the call's actual market price of 14.450. When the Black-Scholes model is used to estimate implied volatilities for equities, expected dividends are part of the underlying known values. With futures calculations, the dividend is zero. The model tends to undervalue the put at the same strike price, compared to its market price. For the July 2014 orange juice example, at the 150 strike, the put's estimated price was 15.78 versus the actual market price of 16.10. That puts are undervalued only slightly is used in one example to indicate a profitable spread trade using puts at different strike prices. On June 03, 2013, the March 2014 cotton futures were priced at 84.25. With 249 days to expiration (0.69 years), 0.20% risk-free interest rate and a strike price equal to 85, the call's market price of 4.84 was matched by using the standard deviation of the underlying equal to 0.1838. At the same time, the expected put price was 5.4728 vs. a market price of 7.460. The difference of 1.9872 option price points, or USD993.60, seemed excessive. To check the difference between expected and market prices for the put on March 2014 cotton No. 2, the Black-Scholes model was used on the July 2014 futures and options. This showed the expected put price to be 6.3438 vs. a market price of 6.520 – the usual slight undervaluation by the pricing model, with a reasonable market value for the put. The pricing analysis based on the Black-Scholes model suggested selling the March 85 put on June 03 while buying the July 85 put to protect against adverse price movements in the underlying. Closing out the trade on June 07 resulted in a net gain of USD770, summarized as follows:- (1) June 03:- (i) sell March 85 put at 7.460 for USD3 730; (ii) buy July 85 put at 6.520 for USD3 260; (2) June 07:- (i) buy March 85 put at 5.990 for USD2 995; and (ii) sell July 85 put at 6.590 for USD3 295. The net gain before transaction costs included USD735 on the March 85 put and USD35 on the July 85 strike. As price protection, the July 85 put could have moved in either direction based on a change in the underlying price of cotton futures. This example shows that the Black-Scholes model has predictive pricing uses in addition to estimating implied volatility. Black-Scholes Option-Pricing Model is a model for pricing call options based on arbitrage arguments. Uses the stock price, the exercise price, the risk-free interest rate, the time to expiration, and the expected standard deviation of the stock return. Developed by Fischer Black and Myron Scholes in 1973. Another Nobel Laureate associated with the University of Chicago was Myron Scholes, who earned his doctorate at the university. Scholes and his co-author, the late Fischer Black, derived the (eponymous option pricing) formula in 1970. They submitted the article to the Journal of Political Economy, and it was rejected without even being reviewed. Merton Miller and Eugene Fama, two financial economists at the University of Chicago persuaded the (journal's) editors to take another look, and the journal published the article in 1973, recounted an encyclopedia entry on Scholes. Fama joined Scholes this year in receiving a Nobel Prize. The timing of the journal article on pricing options was fortuitous. The bear market of 1973–74 was so financially destructive that market participants became open to the idea that perhaps there was a 'scientific and rational way to tame the markets, to use the power of mathematics to conquer risk', explained the BBC documentary, The Midas Formula. At this time, the University of Chicago already had a tradition of training graduates with the skills that would become useful in the new field of mathematical finance. Many of these graduates would later staff up Chicago's proprietary trading firms from the 1970s onward and deepen Chicago's already diverse group of financial risk-takers. The Chicago Board Options Exchange (CBOE®) 'opened for business just one month before the Black-Scholes paper appeared in print', noted Baeckelandt's CFA presentation. Mathematically trained graduates were able to turn crisis into opportunity. Stan Jonas, a derivatives expert, recounted to The Midas Formula documentarians:- 'Word of the (Black-Scholes) model began to circulate, particularly amongst people in the University of Chicago and more particularly amongst the option traders, and literally before the official publication of the model, traders had effectively started to program the model and begin to use it to trade (at the CBOE®)'. / СИБО® (CBOE®). Модель Ценообразования Опциона, изначально разработанная Фишёром Блэком (Fisher Black) и Майроном Сэмьюэлом Сколзом (Myron Samuel Scholes; родился 07 Января 1941) в 1973 для Европейских опционов на ценные бумаги и индексы, в дальнейшем приспособленная Блэком для опционов на фьючерсы. Модель Ценообразования Опционов Блэка-Сколза (Black-Scholes Option Pricing Model, OPM) – это модель, которая определяет теоретическую цену на Европейские опционы, подразумевающая, что если базовый актив торгуется на рынке, то цена опциона на него неявным образом уже устанавливается самим рынком. Данная модель получила широкое распространение на практике и, помимо всего прочего, может также использоваться для оценки всех производных бумаг, включая варранты, конвертируемые ценные бумаги, и даже для оценки собственного капитала финансово зависимых фирм. Согласно Модели Блэка-Сколза, ключевым элементом определения стоимости опциона является ожидаемая волатильность базового актива. В зависимости от колебания актива, цена на него возрастает или понижается, что прямопропорционально влияет на стоимость опциона. Таким образом, если известна стоимость опциона, то можно определить уровень волатильности ожидаемой рынком. Формула модели оценки опционов впервые была выведена Фишёром Блэком и Майроном Сколзом в 1973 в статье 'Ценообразование Опционов и Корпоративных Обязательств' (The Pricing of Options and Corporate Liabilities). Их исследования основывались на предыдущих работах Дьжака Лорэнса Тройнора (Jack Lawrence Treynor), Пола Энсони Сэмьюэлсэна (Paul Anthony Samuelson), Дьжеймза Бэнэса (James Boness), Шина Ти. Кясуфа (Sheen T. Kassouf) и Эдвода Окли Сопа (Edward Oakley Thorp) и разрабатывались в период быстрого роста опционной торговли. Чтобы вывести свою модель ценообразования опционов, Блэк и Сколз сделали следующие предположения:- (i) по базисному активу опциона call дивиденды не выплачиваются в течение всего срока действия опциона; (ii) нет транзакционных затрат, связанных с покупкой или продажей акции или опциона; (iii) краткосрочная безрисковая процентная ставка известна и является постоянной в течение всего срока действия опциона; (iv) любой покупатель ценной бумаги может получать ссуды по краткосрочной безрисковой ставке для оплаты любой части её цены; (v) короткая продажа разрешается без ограничений, и при этом продавец получит немедленно всю наличную сумму за проданную без покрытия ценную бумагу по сегодняшней цене; и (vi) торговля ценными бумагами (базовым активом) ведётся непрерывно, и поведение их цены подчиняется модели геометрического броуновского движения с известными параметрами. Вывод модели основывается на концепции безрискового хэдьжирования. Покупая акции и одновременно продавая опционы call на эти акции, инвестор может конструировать безрисковую позицию, где прибыли по акциям будут точно компенсировать убытки по опционам, и наоборот. Безрисковая хэдьжированная позиция должна приносить доход по ставке, равной безрисковой процентной ставке, в противном случае существовала бы возможность извлечения арбитражной прибыли и инвесторы, пытаясь получить преимущества от этой возможности, приводили бы цену опциона к равновесному уровню, который определяется моделью. Модель Опционного Ценообразования от Блэка-Сколза (Black Scholes Option Pricing Model (BSOPM)) – наиболее популярная модель опционного ценообразования, разработанная в 1973 Американскими экономистами Фишёром Блэком (Fisher Black), Майроном Сколзом (Myron Scholes) и Робётом Си. Мётэном (Robert C. Merton). Модель позволяет оценивать обоснованность котировок опционных

контрактов и наиболее часто используется при стандартизированном ценообразовании на торговых площадках бирж опционов. Математическая формула определения стоимости производных финансовых инструментов оказала заметное влияние на развитие финансовых рынков. В 1997 Мётэн и Сколз получили Нобелевскую Премию по Экономике. Смерть Блэка в 1995 не позволила ему разделить эту честь. В математической формуле модели, используемой для определения теоретической цены опционов, учитывается текущая цена акций в основе опциона, цена исполнения, срок до даты исполнения, уровень процентных ставок и лихорадочность акций. Формула применима к опционам на акции, по которым не выплачиваются дивиденды в течение срока действия опциона. Формула Блэка-Сколза для определения стоимости опциона на покупку:- Теоретическая Стоимость Опциона (call) = $PN(d_1) – Ee^{-rt}N(d_2)$; где d_1=, $d_2=d_1–s$, P – текущая цена акций, E – цена исполнения опциона, r – текущая процентная ставка по безрисковым активам, s – лихорадочность, приведённая к годовому стандартному отклонению (стандартное отклонение цены акций, умноженное на 260 (количество торговых сессий за год)), t – время до истечения опциона, выраженное как часть года (количество дней до даты истечения делённое на 365 дней), e – экспонента (2.7183), N(x) – кумулятивное стандартное нормальное распределение, и Ee^{-rt} – дисконтированная стоимость цены исполнения опциона. Модель Ценообразования Опциона Блэка-Сколза – модель назначения цены опциона на покупку, основанная на арбитражных аргументах. Согласно модели Блэка-Сколза премия опциона на покупку Европейского стиля находится:- (i) в прямой зависимости от цены базисного актива, лихорадочности, оставшегося срока до истечения контракта, безрисковой процентной ставки; и (ii) в обратной зависимости от цены исполнения.

BLACK SPOTS = ЧЁРНЫЕ ПЯТНА – Black Spots:- Fabric:- cotton sheeting; Construction:- (i) Count:- 68 x 72; (ii) Warp:- 30/1 carded cotton; (iii) Filling:- 40/1 carded cotton; Finish:- bleached plain white. Defect:- occasional black spots. Analysis:- microscopic and chemical analysis showed the black spots to be a tarlike deposit, apparently imbedded in the yarns. When warp and filling threads were unraveled in several places, it was found that the yarns contained slubs in those places, indicating that the tarry material was present in the raw cotton and prevented the proper drafting of the yarns. It was subsequently determined that this condition was being encountered in a great many cotton mills, and the contamination was traced to the black asphalt-type paint used on the cotton-bale straps. In the application of this paint, if the consistency is too thick in places, it does not dry thoroughly and parts of the sticky compound stain and adhere to any cotton with which they come in contact. It should be noted that some similar black stains in cotton fabrics have been traced to roof leaks or belt dressing and that only a chemical analysis can be relied upon to trace such stains to their true source. / Уточина:- 40/1 кардная хлопковая. такие разводы (или потёки) .

BLACK START = ЧЁРНЫЙ ПУСК – A term ‘Black Start’ refers to certain electric utility generating units that can start upon demand without any outside source of electric power. These are often combustion turbines that have stationary battery banks to provide backup power to energize all the controls and auxiliaries necessary to get the unit up and running. In the event of an large area-wide blackout, these units are critical to restoring the utility grid. Most utility generating units do not have black start capability.

BLACK START UNIT = УСТАНОВКА ЧЁРНОГО ПУСКА – Black Start Unit is a generating unit with the ability to go from a shutdown condition to an operating condition and start delivering power without assistance from the transmission system.

BLACK–TOP WOOL = ШЕРСТЬ С ЧЁРНЫМ ВЕРХОМ – Black-Top Wool is a wool containing a large amount of wool grease combined at the tip of the wool staples with dirt, usually from a Merino. This wool is usually fine in quality, of good character, and desirable in type, but the shrinkage is high.

BLACK WATCH = ЧЁРНЫЙ КАРАУЛ (или СЛЕД) – Black Watch is a regimental tartan of the 42nd Royal Highland Regiment. It consists of green stripes on a light blue ground.

BLACK WOOL = ЧЁРНАЯ ШЕРСТЬ – Black Wool is any wool containing non-white fibers. A fleece having only a few black fibers is rejected by a grader and goes into the black wool bag because there is no way of separating the few black fibers in the manufacturing processes. Black wool is usually run in lots that are to be dyed. Black Wool is any wool that is not white, but not necessarily black. Stock that is gray or brown in color is classed as black wool.

BLADE = ПЛАСТИНКА – Blade is the linear-lanceolate, flat sessile, and free portion of the monocot leaf. Blade is the expanded portion of a leaf or petal. The Blade is thin and expanded and is supported by a network of veins while the petiole is slender and connects the leaf to the stem. Blade (syn. Lamina) is the linear-lanceolate, flat, sessile and free portion of the leaf. It is continuous with the leaf sheath. Blades on the same plant differ in length, width, and angle of insertion. / Пластинка – расширенная часть листа или лепестка.

BLAE = БЛЭЙ (или ГЛИНИСТОЕ) – Blae:- dark blue or bluish gray (chiefly Scottish). / серо-синее.

BLANK = ЗАГОТОВКА – Blank is a blank disc of metal with milled edges used to make a coin.

BLANK CHECK = БЛАНКОВЫЙ ЧЕК (или ЧЕК БЛАНК, или ЧЕК ФОРМУЛЯР, или НЕ ДО КОНЦА ЗАПОЛНЕННЫЙ ЧЕК) – Blank Check is a check that has been signed (and possibly dated) by the drawer, but that does not specify the amount to be drawn. This is inserted by the payee on pre-agreed terms. Liability remains with the drawer.

BLANK DRAFT = БЛАНКОВАЯ ТРАТТА – Blank Draft is a draft passed on by the drawer with certain details left blank. The recipient is entitled to complete the draft himself on pre-agreed terms. Liability remains with the drawer.

BLANK ENDORSED = ИНДОССИРОВАННЫЙ НА БЛАНКЕ – Bank Endorsed is the banking term on Letters of Credit meaning not endorsed. / Банковский термин для Аккредитива, обозначающий что тот не был индоссирован.

BLANK ENDORSEMENT = БЛАНКОВЫЙ ИНДОССАМЕНТ (или БЛАНКОВАЯ НАДПИСЬ) – Blank Endorsement is a transfer notation not bearing the name of the new beneficiary (endorsee). The instrument merely contains the signature of the endorser. See also Beneficiary, Bill Of Lading, Endorsee, Endorsement, and Endorser. A bill of lading is ‘indorsed in blank’ simply by insertion of the name of the shipper or consignee on the reverse of the bill. The opposite of Indorsed In Full. A bill of lading is ‘indorsed in full’ by the shipper or consignee signing on the reverse of the bill an order to ‘deliver to X or order’. Guide To Endorsements Of Original Bills Of Lading:- the endorsement of an original BL is a legal transaction whereby the owner of the goods shipped transfers ‘title’ to those goods by signing their name or rubber stamping on the back of the original BL. Proper endorsement is one of the requirements for cargo release. The party responsible for endorsing the original BL depends on who the original BL is actually consigned to. The notify party on the OBL is not recognized in this instance. Original Bill Of Lading Consigned To Endorsement Required By:- (i) To Order Of The Shipper – must be endorsed by that shipper; (ii) To Order Of Bank – must be endorsed by that specific bank; (iii) To Order Of The Consignee – must be endorsed by the consignee; (iv) To Order – must be endorsed by the shipper; (v) Straight Consignment To Bank – must be endorsed by that specific bank; (vi) Straight Consignment To Other Than A Bank – must be endorsed by that consignee. Original Bills of Lading that are not properly endorsed as above will not be accepted for release of cargo. As an example, original BLs consigned as a straight consignment to ‘XYZ Import Company’, endorsed by the shipper and/or the notify party but not the consignee,

is not acceptable. Please note that in the presence of an Letter of Endorsement from consignee, the original BL must be endorsed by the nominated party on the letter of endorsement (LOE) to facilitate the release of the import cargo. The Endorsement should be hand signed. But ICC Publication:- ARTICLE 3 – Interpretations – A document may be signed by handwriting, facsimile signature, perforated signature, stamp, symbol or any other mechanical or electronic method of authentication. Endorsement is the act of a person who is holder of a negotiable instrument in signing his or her name on the back of that instrument, thereby transferring title or ownership. An endorsement may be made if favor of another individual or legal entity, resulting in a transfer of the property to that other individual or legal entity. There are several types of endorsements:- (i) endorsement in blank is the writing of only the endorser's name on the negotiable instrument without designating another person to whom the endorsement is made, and with the implied understanding that the instrument is payable to the bearer; (ii) collection endorsement is one that restricts payment of the endorsed instrument to purposes of deposit or collection; (iii) conditional endorsement is one that limits time at which the instrument can be paid or further transferred or that requires the occurrence of an event before the instrument is payable; and (iv) restrictive endorsement is one that directs a specific payment of the instrument, such as for deposit or collection only, and that precludes any other transfer of it. Endorsement For Collection:- endorsement by which an endorsee becomes a collection agent of the endorser. Title To And Endorsement Of A Bill Of Lading:- when bills of lading are made out, or endorsed, to a named consignee, then only that consignee can take delivery of the shipment. A B/L made out to a named consignee can be endorsed only by that consignee, not the shipper. Once a consignee has been named the original shipper no longer has any power to alter the B/L in connection with title to the shipment. If the consignee is not known at the time the shipper instructs shipment on a particular vessel then the bills of lading may also be made out to order. In this case, only the party to whom they are endorsed with the words 'deliver to …' or 'deliver to the order of …' can take delivery. This endorsement is made by the shipper who is named on the B/L. Occasionally buyers stipulate in their shipping instructions that the goods be consigned to order. A bill of lading is a negotiable instrument and can be passed from a shipper through any number of parties, each party endorsing it to assign title to the next party. The only condition is that title can be assigned only by the party shown on the bill as having title at the time. Any failure to respect this condition breaks what is known as the Chain Of Title; all purported assignments of title after such a break are invalid. Before paying for documents a buyer will therefore carefully examine the bill of lading to see that they are named on it as consignee, either on the face or on the reverse in an endorsement. In the latter case, the buyer will also make sure that the endorsements show an unbroken chain of title through to them. There is one exception to the general rule that a consignee must be named on a bill of lading to take delivery of a shipment. This is when the bill is a bearer bill. In this case, anyone holding (or bearing) the bills (or one bill of the set) can take delivery. Bills are considered bearer bills when the word bearer is entered in the space marked consignee when the bills are first made out. Alternatively a title-holder endorses the bills with the words deliver to bearer, or a named title-holder endorses the bills in blank, i.e. by stamping and signing them without naming any other party in his endorsement. Although this may be simple and convenient, it means that anyone who obtains all or any of the originals (including a thief or a buyer who has not yet made payment) can take delivery of the shipment. Bills of lading are therefore usually made out to or endorsed to a named consignee. The greatest security of all is afforded by issuing or endorsing a bill to a buyer nominated bank with an instruction to the bank to endorse and hand the bill over to the buyer when, and only when, payment has been made. Bill of Lading should be hand sign and required company stamp. A Blank Endorsement on a bill of lading is an indication that there is no specified recipient of the endorsed bill. A bill of lading is a receipt showing a list of a shipment of goods. The list contains details of the shipment and is compiled by the carrier of the goods and given to the person or company that consigns the goods. When a bill of lading contains a blank endorsement, the carrier becomes the owner of the bill and can thus claim ownership of the goods listed in the shipment. For example, a merchant may agree to carry goods for a person or company. The person or company will then stamp and sign the ocean bill of lading for the goods and make it out to order, thereby endorsing the bill of lading to the merchant. The merchant now becomes responsible for the shipment of goods, and must act as a representative to obtain and then release the delivery of the goods. The merchant also assumes responsibility for any ancillary, freight or accounting costs related to the shipment. A bill of lading acts as a contract that a shipment has arrived at its intended destination. It also acts as a transfer document, and is administered in the same way as an actual shipment. A bill of lading can be negotiated and the carrier is bound to the terms of the bill, regardless of the owner of the goods. To be valid, a bill of lading must contain a description of the goods, the weight of the shipment, the name of the shipping company, the flag of the nationality of origin of the goods, the name of the shipper, freight measurements and the notify and order party of the shipment. Blank Endorsement on B/L means just stamp and sign by the shipper/beneficiary of the document. Example:- B/L shipper:- XYZ Co. Ltd.; and Consignee:- To Order. On the back of the document:- 'Stamp of XYZ Co. Ltd + Signature' constitutes a blank endorsement. By blank endorsement the documents becomes 'bearer' document', i.e. the one holding the original document has the right on the title of goods. / Бланковый Индоссамент состоит лишь из одной подписи индоссанта. Бланковый Индоссамент – форма передачи векселя, при которой лицо, передающее вексель ставит подпись без указания лица, становящегося владельцем векселя. То есть вексель становится ценной бумагой на предъявителя. Бланковый индоссамент превращается в именной путём написания над индоссаментом:- 'Платите по приказу такого-то лица'. Бланковый Индоссамент – это передаточная надпись, сделанная на оборотной стороне индоссируемого документа, в которой не указано, приказу какого лица необходимо совершить платёж или доставить груз. Бланковый индоссамент на чеке представляет собой только подпись индоссанта. В этом случае чек может быть передан другому лицу путём простого вручения. Бланковую надпись можно превратить в именную, поставив на ней наименование лица, которому передаётся чек. Бланковый индоссамент на векселе представляет собой наименование индоссанта и его подпись. Такой вексель принято считать выставленным на предъявителя, и его можно передать другому лицу путём простого вручения либо посредством передаточной надписи. Бланковый индоссамент на векселе можно превратить в полный, сделав над передаточной надписью указание, приказу какого лица передаётся вексель. Бланковый индоссамент на коносаменте и страховом полисе представляет собой печать и подпись индоссанта. Бланковый индоссамент в таких случаях можно превратить в именной, сделав над передаточной надписью указание, приказу какого лица передаётся документ.

BLANKET = ОДЕЯЛЬНАЯ ТКАНЬ – Blanket is an unquilted bedding fabric designed primarily to provide thermal insulation.

BLANKET ASSIGNMENT = ОБЩАЯ УСТУПКА ТРЕБОВАНИЯ – Blanket Assignment is the assignment (ceding) of all present and future claims of the debtor to third parties. Also known as General Assignment. The opposite of Individual Assignment.

BLANKET BOND = ОБЩЕЕ ОБЯЗАТЕЛЬСТВО (или ЗАЩИЩЁННОЕ ОБЯЗАТЕЛЬСТВО, или КОЛЛЕКТИВНОЕ ОБЯЗАТЕЛЬСТВО) – A Blanket Bond refers to a bond covering several persons, projects, articles or properties that require performance bonds. It is an alternate term for fidelity bond. Fidelity bond is one that indemnifies an employer or business from loss due to embezzlement, larceny, or gross negligence by an employee or other person holding a position of trust. Banker's blanket bond refers to a fidelity bond purchased from an insurance broker that protects a bank against losses from a variety of criminal acts like employee fraud, robbery, burglary, and forgery. Some states require blanket bond coverage as a condition for operating a bank. It also refers to a broad insurance coverage against losses due to theft or employee dishonesty, carried by brokerages and other financial institutions. Blanket Bond is a bond covering a group of persons, articles or properties. (i) Banker's Blanket Bond is a fidelity bond purchased from an insurance broker that protects a bank against losses from a variety of criminal acts carried out by employees. Some states require

blanket bond coverage as a condition of operating a bank. Also known as a Blanket Fidelity Bond. A fidelity bond is insurance coverage against losses that occur from the dishonest acts of employees. This bond may be applied to individual employees or to job positions in the company. For example, a bank can insure a specific bank manager, or can choose to insure the position itself, so that any employee that assumes those job responsibilities is automatically covered. Some of the employee criminal acts covered by a blanket bond include robbery carried out by an employee and forgery. (ii) Commercial Blanket Bond is a type of liability coverage for employers who want to protect themselves against losses resulting from dishonest employees. Commercial blanket bonds provide blanket coverage for all of an employer's employees. These bonds contain a maximum amount that they can cover for any single loss, regardless of the number of employees involved. Commercial blanket bonds function in the same manner as position bonds in a couple of situations. Even if only one employee causes a loss, they will provide the same coverage. This also applies if the number of guilty employees cannot be determined. Blanket Bond is the insurance coverage carried by brokerages, investment bankers, and other financial institutions to protect them against losses due to employee dishonesty. Examples of things that a blanket bond might cover are forged checks, counterfeit currency, fraudulent trading, and property damage. The Blanket Bond is a form of insurance coverage that provides protection for brokerages in the event of employee error or dishonesty, as well in the case of theft. Blanket bonds are also often carried as part of the broad insurance coverage for other types of financial institutions that are responsible for managing the financial assets of individuals and corporations. There are two common forms of the blanket bond. The commercial blanket bond provides protection for an employer that is far reaching in scope and in application. A commercial blanket bond provides a maximum amount of coverage in the event of any one loss, regardless of the number of employees involved in the circumstances that created the loss. With the commercial type of blanket bond, the position of the employee or employees within the firm is not a factor. Anyone from the janitor to the president of the firm may be involved and the loss will still be covered. The second example of the blanket bond is known as a Position Blanket Bond. With the position style of blanket bond, the employer is insured against the actions of employees who hold specific positions within the firm. The amount of coverage is based on the particular position covered. In the event that several employees are involved in the loss, the blanket bond will allow for maximum coverage that is a cumulative total of the insured amount for all positions involved in the loss. Blanket bonds provide a sense of security to brokerage firms and other businesses that work with the assets of investors. Providing coverage in the event of theft or grave errors on the part of employees makes it possible for investors to recoup their losses, and for the investment firms to work through the issue and continue to operate. From this perspective, the blanket bond can be viewed as a tool that helps to ensure that the investor will be taken care of, no matter which circumstances may occur within the brokerage.

BLANKET CLOTH = ОДЕЯЛЬНОЕ ПОЛОТНО (или ПОЛОТНО ДЛЯ ОДЕЯЛ) – Blanket Cloth:- wool, worsted, cotton, blends, synthetics. Plain or twill. Soft, raised finish, 'nap' obtained by passing the fabric over a series of rollers covered with fine wire or teasels. Heavily napped and fulled on both sides. Nap lose and may pill in laundering. Named in honor of Thomas Blanket (Blanquette), a Flemish weaver who lived in Bristol, England in the XIV century, and was the first to use this material for sleeping to keep warm.

BLANKET CREDIT LINE = ОБЩАЯ КРЕДИТНАЯ ЛИНИЯ – Blanket Credit Line is a general credit available under an open-end lending agreement for a specified period. An example would be a credit line agreed between an import and an export country for granting long-term export or investment loans.

BLANKET DRIVE = ПОКРОВНЫЙ ЗАГОН – Blanket Drive is a term used when farmers form a line and move across a field or area to control pests, such as rats.

BLANKET INSURANCE = ПОЛНОЕ СТРАХОВАНИЕ – (1) Blanket Insurance is the property-liability insurance that covers more than one type of property in one location in one policy or form instead of under separate items, or one or more types of property at more than one location.

(2) Blanket Insurance is a contract of health insurance that covers all of a class of persons not individually identified. / Договор или контракт страхования здоровья, который покрывает всю группу лиц, не указанных поимённо.

BLANKET MARK = ХХ ОТМЕТИНА – Blanket Mark:- the appearance in relief form, on the fabric, of the weave (or other surface features) of the blankets used to control the fabric during certain finishing processes. This effect is caused by heat, moisture, pressure, or a combination of these which, when applied to the fabric, sets the impression of the blanket into it. See also Corrugation Mark, and Sanforizing Mark. / Вмятины От Вальяна (blanket mark):- порок заключительной отделки ткани; проявления в форме изменения рельефа на ткани во время определённых процессов отделки. Примечание:- данный порок возникает вследствие высокой температуры, влажности, давления или их совокупности, которые на ткани создают эффект вмятины.

BLANKET RATE = ОБЩАЯ (или БЛАНКОВАЯ) СТАВКА – (1) Blanket Rate is a fixed charge that covers a series of transactions or services.

(2) Blanket Rate is a rate applicable to or from a group of points.

(3) Blanket Rate is a special rate applicable to several different articles in a single shipment.

BLANKET WAYBILL = ОБЩАЯ (или БЛАНКОВАЯ) ТРАНСПОРТНАЯ НАКЛАДНАЯ – Blanket Waybill is a waybill covering two or more consignments of freight.

BLAST = ПИРИКУЛЯРИОЗ (или ЗАПАЛ, или ГНИЛЬ УЗЛА МЕТЁЛКИ, или БРУНОЗЕ) – Blast is a disease caused by the fungus Pyricularia grisea. Leaf lesions are typically spindle-shaped, wide in the center and pointed toward either end. Large lesions usually develop gray centers. The disease can have different forms:- leaf blast, node blast, or neck blast. Lesions on panicle neck nodes may result in empty panicles (often called Rice Blast), 'rotten neck' or 'neck rot' symptoms. / Под Пирикуляриозом Риса понимается болезнь, вызываемая Паразитическими Грибами. На листьях, стеблях, метёлках и семенах пятна различной формы и окраски. Стебли ломаются, семена щуплые. Пирикуляриоз Риса (Pyricularia Oryzae Br. & Cav.). Синонимы:- Magnaporthe Oryzae. Вредоносность:- Пирикуляриоз – самая вредоносная болезнь Риса, которая ежегодно наносит большой ущерб всем регионам рисосеяния. Недобор урожая может составлять 15–40%. Вредоносность заболевания проявляется в:- (i) снижении всхожести семян; (ii) гибели всходов; (iii) выпадении отдельных растений в период вегетации; (iv) образовании меньшего количества зерна в колосках; (v) формировании недоразвитых или щуплых семян. Развитие в Растениях Риса возбудителя этого заболевания оказывает стимулирующее действие на жизнедеятельность фитонематод, которые ускоряют процесс распада ткани и гибель растений. При поражении пирикуляриозом в два-три раза усиливается дыхание растений, что приводит к значительному перерасходу их пластических веществ, необходимых для формирования урожая. Кроме того, заболевание обусловливает усиленное поглощение растениями азота и уменьшает потребление фосфора и калия. Пирикуляриоз Риса входит в десятку самых страшных видов биологического оружия, которые применялись человеком. В список самых опасных видов биологического оружия, наряду с Пирикуляриозом Риса, входят Оспа, Сибирская Язва, Чума. Пирикуляриоз Риса не

действует наверняка, как, к примеру, Оспа или Ботулизм. Однако он может привести к серьёзному голоданию бедных стран, а также к финансовым и другого рода потерям и проблемам. Распространение:- в Казахстане пирикуляриоз распространён в Кызылординской и Алматинской областях; а также в Украине, в Краснодарском, Хабаровском и Приморском краях Российской Федерации; Узбекистане, Азербайджане и других регионах рисосеяния. Пирикуляриоз Риса возглавляет топ-10 наиболее фитопатогенных грибов и является одной из причин голода в странах Азии и Африки. Источники инфекции:- возбудитель болезни – Несовершенный Гриб Pyricularia Oryzae Br. et Cav. порядка Hyphomycetales. Он образует бесцветную многоклеточную грибницу, которая распространяется по межклеточникам. Конидиеносцы одиночные или собраны в пучки оливковые или дымчатые, имеют 2–4 поперечные перегородки. Конидии грушевидные или яйцевидные, двух-четырёхклеточные, светло-оливковые. Известно более 30 физиологических рас возбудителя, отличающихся своей агрессивностью к отдельным Сортам Риса. Патоген сохраняется в виде грибницы в семенах, на стерне и соломе Риса. В семенах грибница может развиваться под цветковыми и плодовыми оболочками, в эндосперме и зародыше. При сильном поражении семена теряют всхожесть. Установлено, что патоген под действием других микроорганизмов в почве обычно погибает, но хорошо перезимовывает на её поверхности. Поэтому плохо запаханная стерня всегда является основным источником инфекции. При за топлении посевов грибница патогена в стерневых остатках погибает. Кроме Риса, Гриб Pyricularia Oryzae паразитирует на Пшенице, Ячмене, Овсе, Кукурузе, Просе, Сорго, Щетиннике, а также на 30 видах дикорастущих злаков. Но особенно интенсивно он развивается на Тростнике, который часто образует целые заросли около оросительных каналов и в местах заболачивания почв. Все эти растения могут быть очагами инфекции пирикуляриоза. Благоприятные условия для развития и распространения болезни:- в период вегетации растений гриб распространяется конидиями. Прорастают они при влажности среды выше 98% и температуре от 6.6 до 40 °С. Если период увлажнения минимальный (2 ч), прорастание конидий начинается при температуре 13 °С. При 52 °С они погибают. Массовое прорастание конидий и заражение растений происходит при наличии конденсационной (капельной) влаги и температуре воздуха +13–35 °С. В дни с температурой +26–28 °С и относительной высокой влажностью воздуха пирикуляриоз может развиваться очень быстро и вызывать массовую гибель растений восприимчивых сортов. Инкубационный период болезни, в зависимости от температурных условий, длится от двух до 11 суток. Затенение растений способствует развитию заболевания. Сильнее поражаются буйно развивающиеся и густо расположенные растения, на самых плодородных участках посева, поэтому заболевание часто проявляется очагами. Продолжительная засуха способствует массовому распространению заболевания. И наоборот, заливание молодых посевов водой непосредственно после проявления болезни ограничивает её развитие. Как происходит заражение:- Симптомы:- проявляется болезнь в течение всего периода вегетации Риса, причём поражаются все надземные органы растений. В зависимости от характера поражения, различают три формы заболевания:- (1) листовую, (2) узловатую и (3) метёльчатую. Характер проявления пирикуляриоза зависит от погоды и устойчивости сорта. В условиях влажной теплой погоды на восприимчивых сортах часто обнаруживаются все формы поражения. При этом у растений устойчивых сортов обычно поражается какой-либо один орган и появляется слабое спороношение патогена. При Листовой Форме на пластинках и во влагалищах листьев появляются овальные или ромбовидные светло-бурые пятна, которые постепенно увеличиваются и достигают 3–4 см в длину и 0.5 см в ширину. С верхней стороны листьев они неровные, с красно-коричневым ободком, а с нижней стороны – тёмно-серые или почти чёрные и покрыты сизо-сероватым или дымчатым налётом. Во влагалищах с обеих сторон пятна бурые, расплывчатые, в центре без налёта. При сильном поражении влагалищ метёлки не выметываются, и растения приобретают вид опалённых. Раннее поражение листовой формой может вызывать отмирание растений, но в большинстве случаев эта форма заболевания ведёт к накоплению инфекции на полях и в последующем даёт вспышку сильного развития узловой и метёльчатой форм. Узловатая Форма характеризуется появлением на узлах и стеблях чёрно-бурых пятнышек. Сначала они небольшие, затем быстро увеличиваются и покрывают весь узел. Поражённый узел чернеет, размочаливается и покрывается грязно-серым налётом. На таких узлах образуются перетяжки и часто происходит излом стебля. У стеблей, поражённых узловатой формой, метёлки пустозерные и обычно торчат вверх. При Метёльчатой Форме наблюдается сильное поражение главной оси и боковых осей метёлки, колосковых чешуй и зерновки. Оси метёлки и, нередко, верхняя часть стебля под главной осью метёлки темнеют, размочаливаются, и по внутренней части их обнаруживается плесневидная грибница серого цвета. Нижняя часть колосовых чешуй темнеет. Зерновки в таких случаях или не образуются вовсе, или щуплые с обесцвеченной оболочкой. При позднем развитии метельчатой формы зерно может иметь внешне здоровый вид, но часто содержит инфекцию. Меры борьбы:- использование здорового семенного материала; протравливание семян системными препаратами; незагущение посевов; применение фунгицидов; глубокая вспашка с целью уничтожения растительных остатков; сбалансированное удобрение культуры при ограниченном внесении азота; соблюдение севооборотов; и борьба с сорной растительностью в посевах вдоль оросительных каналов, арыков. Эффективность препаратов:- протравливание семян препаратом Селест Топ в норме 1.0–1.8 л/т защищает посевы не только от вредителей, но и от пирикуляриоза. Применение протравителя Селест Топ позволяет сократить норму высева семян риса с 300 кг/га до 220–250 кг/га, при этом густота стояния растений будет такой же, как при высеве 300 кг/га. Этому способствует стимулирующее действие препарата на всходы Риса. Рис, протравленный Селест Топ, лучше кустится, лучше развивается корневая система, растения сильнее и лучше противостоят болезням и негативным факторам окружающей среды. По вегетации при проявлении первых признаков болезни необходимо обработать посевы фунгицидом Бим в норме 0.3–0.4 кг/га. Бим – это системный фунгицид, который проникает в растение через листовую поверхность, также может поглощаться корневой системой. Проявляет высокую эффективность против всех форм пирикуляриоза. Трициклазол, входящий в состав препарата Бим, обеспечивает наиболее длительную защиту от пирикуляриоза из всех фунгицидов, входящих в состав группы триазоловых. Пирикуляриоз Риса – опасное заболевание Риса, вызываемое Несовершенным Грибом Piricularia Oryzae. Распространён во всех рисосеющих районах мира. Проявляется образованием пятен различной формы и окраски на листьях, листовых влагалищах, стеблевых узлах, метёлках и семенах. Поражённые листья отмирают, стебли ломаются, метёлки преждевременно засыхают или образуют щуплые семена. Наибольший вред приносит пирикуляриоз Риса во время колошения-цветения. Потери урожая 15–40%. Значительно снижается и качество зерна. При эпифитотии растения гибнут. Возбудитель болезни в период вегетации имеет несколько поколений, распространяется с помощью конидий, зимует в форме мицелия на послеуборочных остатках (1–3 года) и в семенах. Развитие пирикуляриоза Риса происходит при высокой влажности воздуха (не ниже 88%) и температуре 15–35 °С. Возможна передача инфекции с поливной водой. Резерватором возбудителя пирикуляриоза Риса могут быть также дикие формы Риса и другие злаки. Меры борьбы:- возделывание устойчивых Сортов; запашка пожнивных остатков; сжигание стерни на участках с сильным развитием болезни; обработка заражённых посевов и протравливание семян Риса фунгицидами.

BLAST FURNACE = ШАХТНАЯ ПЕЧЬ (или ДОМЕННАЯ ПЕЧЬ) – Blast Furnace is a furnace where mixed charges of oxide or sulfide ores (copper, iron, lead, tin, etc), fluxes and fuels are blown with a continuous blast of hot air and sometimes oxygen-enriched air to force combustion for the chemical reduction of ores with metals to their metallic states. / Под Шахтной Печью понимается промышленная печь с вытянутым вверх рабочим пространством (шахтой) круглой (цилиндрической, конической) или прямоугольной формы. Обрабатываемый материал загружается сверху, а готовый продукт выдаётся снизу; дутьё и

газообразные продукты сгорания топлива движутся навстречу спускающемуся материалу. Применяются главным образом для получения металлов из руд (например, доменная печь), расплавления металла (вагранка), обжига огнеупорного сырья. Под Вагранкой понимается шахтная печь главным образом для плавки чугуна в литейных цехах. Иногда для подогрева воздуха вагранку оборудуют рекуператорами. Под Доменной Печью или Домной понимается шахтная печь для выплавки чугуна. Исходные материалы (шихта) – железорудный агломерат, окатыши, кокс, флюсы – подаются на колошник. Снизу (через фурмы) вводят нагретый воздух, жидкое, газообразное или пылевидное топливо. В доменной печи происходит восстановление железа из окислов и насыщение его углеродом. Продукты плавки – чугун и шлак – периодически выпускаются через лётки (отверстия) в нижней части доменной печи. Полезный объём наиболее крупной в бывшем СССР доменной печи в 1986 составлял 5 580 м^3. Кампания доменной печи (от задувки до капитального ремонта) около 10 лет. Первые доменные печи появились в России около 1630, в Европе – в середине XIV века.

BLAST NURSERY = ПИРИКУЛЯРИОЗНЫЙ ПИТОМНИК – Blast Nursery is a specially prepared nursery where many test materials of Rice are grown to determine their resistance to blast, usually at the seedling stage. The test period usually lasts for 30 days from seeding time.

BLAZER = БЛЭЙЗЁ (или БЛЭЙЗЕР, или БУШЛАТ) – Blazer is a sports jacket often notched collar and patched pockets. / спортивная фланелевая куртка.

BLAZER CLOTH = БЛЭЙЗЁРНОЕ ПОЛОТНО – Blazer Cloth is a fabric traditionally used for loosely fitting tailored jackets worn by men and women. The fabric was formerly made of wool with a satin weave.

BLAZER STRIPES = ПОЛОСКИ НА БЛЭЙЗЁРЕ (или ПОЛОСЫ НА БРОСКОЙ КУРТКЕ, или ПОЛОСЫ НА СПОРТИВНОЙ ФЛАНЕЛЕВОЙ КУРТКЕ) – Blazer Stripes are the types of stripes originally used on jackets, ultimately called blazers, because of the bright blaring colors used in the stripes. Blazer stripes are usually at least 1” wide and are vividly colored.

BLB = BACTERIAL LEAF BLIGHT

BLEACH = ОТБЕЛИВАТЕЛЬ (или ОБЕСЦВЕЧИВАТЕЛЬ) – Bleach helps the cleaning process by removing and/or decolorizing stains, i.e. whiten or lighten colors. The key mechanism is a chemical reaction that ‘cuts’ the stain molecules in smaller pieces that are more easily removed. Bleach can also acts by removing their color so that the stains become invisible. These processes may all work simultaneously on any given organic stain. Bleach is not only effective on stains but also allows achieving whiteness and dingy cleaning. Dinginess is the overall grayish appearance that white fabrics sometimes develop over time and after many wash cycles. The first mechanism of bleach action is quite similar to what enzymes do:- the larger stain molecules are broken down into smaller, more water-soluble fragments, which are more easily removed by mechanical action or through the action of other detergent ingredients. Unlike enzymes, however, the action mechanism of bleach is a self-destructive one:- the bleaching agents disappear in the course of the wash cycle. The action of bleach complements that of the surfactants and enzymes in the wash. Some soils that surfactants and enzymes may leave behind, or may only partially remove, are removed by bleach. Also, the fragmenting action of bleach makes the job of surfactants and enzymes during the wash easier. Bleach is an active molecule that can chemically reacts with different type of substrates. There are many different kinds of bleaches. When the substrate is a stain, the action of bleach is desirable. When the substrate is a dye in a fabric, the action is not desirable. Chemically speaking, the mechanism of bleaching may be oxidative or reductive; in laundry and cleaning products, oxidative bleaches are used. Oxydative beaches are compounds that release hydrogen peroxide (H_2O_2) or singlet oxygen during the wash, or they may be peroxides of organic acids also known as Peracids themselves. Hypochlorite, peroxides, peracids, singlet oxygen are very reactive chemical species; they react with certain parts of organic matter that are responsible for its color. As a result, the organic matter becomes colorless; hypochlorite/peroxide/peracid/singlet oxygen are used up in the process. Some of the reactions between bleach and organic matter result in the actual breakage of bonds in the organic matter, thereby releasing smaller molecules of organic matter that are more water soluble. Bleach is a chemical that removes color from an item. Fabrics are often bleached after manufacture and before dyeing to ensure the dyed colors are ‘true’. Household bleach is used to disinfect clothing and remove soil from whites and colorfast colors. Chlorine bleaches are the most common household bleaches, but are too strong for some colors and fabrics.

BLEACHED COTTON LINTERS = БЕЛЁНЫЙ ХЛОПКОВЫЙ ЛИНТ – Bleached Cotton Linters are the linters that have been bleached ready for further processing. / Изначально белый линт, готовый для дальнейшей переработки.

BLEACHING = БЕЛЕНИЕ (или ОТБЕЛКА, или ОТБЕЛИВАНИЕ) – Bleaching is the procedure, other than by only scouring, of improving the whiteness of textile materials. Sometimes accomplished with and sometimes without the removal of natural coloring or other extraneous substances. Bleaching is a process of whitening fibers, yarns, or fabrics by removing the natural and artificial impurities to obtain clear whites for finished fabric, or in preparation for dyeing and finishing. The materials may be treated with chemicals or exposed to sun, air, and moisture. Bleaching, a process of whitening fabric by removal of natural color, such as the tan of linen, is usually carried out by means of chemicals selected according to the chemical composition of the fiber. Chemical bleaching is usually accomplished by oxidation, destroying color by the application of oxygen, or by reduction, removing color by hydrogenation. Cotton and other cellulosic fibers are usually treated with heated alkaline hydrogen peroxide; wool and other animal fibers are subjected to such acidic reducing agents as gaseous sulfur dioxide or to such mildly alkaline oxidizing agents as hydrogen peroxide. Synthetic fibers, when they require bleaching, may be treated with either oxidizing or reducing agents, depending upon their chemical composition. Cottons are frequently scoured and bleached by a continuous system. Bleaching is any of several processes to remove the natural and artificial impurities in fabrics to obtain clear whites for finished fabric or in preparation for dyeing and finishing. Bleaching is a basic finishing process to whiten fabrics. Different chemicals are used for different fabrics. Sun, air, and moisture are good bleaches for some materials, although bleaching by this method is slower. / и искусственные примеси для получения . Беление или Отбелка – совокупность технологических (например, термических, химических) процессов, посредством которых удаляют примеси и устраняют нежелательную природную окраску различных материалов для придания им белого цвета или подготовки к крашению (воск, древесная масса, текстильные материалы и другие). Для предварительного удаления примесей материал обрабатывают хлорамином, слабыми растворами кислот или щёлочей, ферментативными препаратами и тому подобным. Собственно беление производят окислителями (гипохлорит натрия или кальция, пероксид водорода, хлорит натрия, марганцовокислый калий) или восстановителями (сернистый газ, гидросульфит, бисульфит). Для отбелки химических волокон широко применяют оптические (флуоресцентные) отбеливатели – производные бензидина, кумарона и других. Отбеливание или Беление – технологический процесс или совокупность технологических процессов (например, термических, химических), посредством которых за счёт удаления или разрушения красящих веществ повышают степень белизны материала (древесной массы, текстильных материалов и так далее). Отбеливание возможно также с помощью оптических (флуоресцентных) отбеливателей.

BLEACHING = БЕЛЬ (или ПЕПЕЛИЦА, или МУЧНИСТАЯ РОСА) – Bleaching is an indication of exposure to wet conditions at or near maturity. Bleaching is caused by alternate wetting and drying of grain which causes tiny fissures to develop throughout the kernels. The fissures are caused because the grain swells a little when it is wet and doesn't dry back to the same size. / зерновка (kernels). Под Мучнистой Росой понимается болезнь растений, вызываемая Мучнисторосяными Грибами. Она поражает многие сельскохозяйственные культуры, древесные породы. На листьях, плодах, стеблях проявляется в виде мучнисто-белого порошистого налёта. Плоды растрескиваются и загнивают. Мучнистая Роса или Пепелица или Бель, группа болезней растений, вызываемых Мучнисторосяными Грибами. Проявляется мучнистая роса обычно в начале или середине лета в виде мучнисто-белого порошистого, паутинистого или войлочного налёта, располагающегося отдельными пятнами на листьях, побегах, стеблях, черешках, плодоножках, иногда плодах. Налёт постепенно разрастается и покрывает большую часть зелёных органов, становясь буроватым с бесчисленным количеством чёрных точек. Больные листья и побеги делаются хрупкими и преждевременно засыхают, у поражённых деревьев и кустарников древесина побегов не вызревает, поэтому они зимой вымерзают. Те побеги, которые остаются живыми, дают плохой прирост во время следующей вегетации. Больные плоды обычно растрескиваются, мякоть обнажается и вскоре загнивает. Все возбудители мучнистой росы – наружные паразиты растений. Многие Мучнисторосяные Грибы – опасные паразиты сельскохозяйственных культур. Наибольший вред приносят виды:- Uncinula Necator, паразитирующий на виноградной лозе, Sphaerotheca Mors – на Крыжовнике, Erysiphe Graminis – на Хлебных Злаках, Sphaerotheca Pannosa Forma Persicae – на Персике, Erysiphe Communis – на Сахарной Свёкле, Sphaerotheca Pannosa Forma Rosae – на Розе и другие. Меры борьбы:- уничтожение поражённых остатков, обрезка и сжигание больных побегов; глубокая зяблевая вспашка, внесение фосфорно-калийных удобрений; использование более устойчивых к мучнистой росе сортов сельскохозяйственных культур; опрыскивание или опыливание растений препаратами, содержащими серу, или каратаном. Препараты серы на Крыжовнике не применяют, так как они вызывают осыпание листьев. Для борьбы с мучнистой росой Роз можно использовать бельевую соду или раствор зелёного мыла. Пепелица, болезнь растений; то же, что Мучнистая Роса. Бель Початков Кукурузы, непаразитарная болезнь. Была распространена повсеместно, особенно в Центрально-чернозёмных областях Российской Советской Федеративной Социалистической Республики (РСФСР) и лесостепи Украинской Советской Социалистической Республики (УССР) бывшего Союза Советских Социалистических Республик (СССР). На зерновках образуются развороченные трещины с выступающим эндоспермом, что связано с разной скоростью разрастания эндосперма и семенной оболочки. Болезни способствует засушливая погода в начале налива зерна, позже сменяющаяся дождями. Качество початков ухудшается, они сильно поражаются Грибами. Большая часть проростков, развившихся из больных семян, погибает. Болезнь может передаваться по наследству. Меры борьбы:- правильное хранение семенного материала, выбраковка больных початков, сохранение в почве влаги и бережное её расходование, равномерный полив, особенно во время налива зерна.

BLEACH SYSTEM = СИСТЕМА ОТБЕЛИВАНИЯ – Bleach Systems that can be used in cleaning products and how they work. Hypochlorite, hydrogen peroxide (H_2O_2), singlet oxygen and peracid are the actual, oxidative and so-called Bleach Actives. They act directly on the stains. The different types of bleaching system have different stain removal/ fabric/color care profile. Formulators choose them based on the benefits they want to achieve. Several classes of bleaches are known to improve the laundry process:- (i) Sodium hypochlorite (NaClO) releases highly reactive hypochlorite ions (ClO-) under alkaline conditions. This is the standard of excellence for stain removal but cannot be used on colored garments. Effective at low temperature and excellent at germ kill. Sodium hypochlorite are not part of a detergent formula but separate product added during the wash process or used directly or after dilution on hard surfaces. (ii) Hydrogen peroxide (H_2O_2) is one of the most common bleaching agents. The positive aspects of hydrogen peroxide include the fact that it is environmentally friendly (decomposes to O_2 and H_2O), colorless and non-corrosive. To be effective however, hydrogen peroxide requires alkaline conditions and suitably elevated temperatures of about 50 °C. Hydrogen peroxide (liquid form) can be used as such in commercial products (i.e. ACE Gentile line up for Procter & Gamble (P&G)) or associated with compounds such as borates or carbonates to form solid particles, providing opportunity to formulate hydrogen peroxide in granular detergents. Sodium perborate is one of the most widely used solid peroxygen compounds. However in the last 10 years, mainly as a result of environmental pressures – to reduce boron content of detergents – sodium perborate has slowly been replaced by sodium percarbonate. Sodium percarbonate has a greater rate of dissolution, a more environmentally friendly profile (no release of Boron). Perborate and Percarbonate are usually used in combination with a bleach activator (TAED or Tetra Acetyl Ethylene Diamine) to increase bleaching efficiency at low temperature thanks to the formation of peracetic acid by the reaction of TAED with hydrogen peroxide from percarbonate. In this case, the peracetic acid is the actual bleaching ingredient. (iii) Peracids work similarly to H_2O_2 but they are more effective than H_2O_2 at low temperatures (below 40 °C). Some peracids can be pre-formed and added to the detergent product. However, many peracids are not sufficiently stable to be added to a detergent product. They can be formed during the wash process in presence of hydrogen peroxide and a bleach activator. (iv) Bleach activators come to the rescue! They are peracid precursors. During the wash, the reaction between H_2O_2 and bleach activators produces peracids; the latter are the actual bleaching agents. A common bleach activator is TAED (short for the Tetra Acetyl Ethylene Diamine). The '-OBS' activators are hydrophobic esters of Oxy Benzene Sulfonate. They work well on dingy cleaning and food stains. (v) Catalysts work by making hydrogen peroxide or singlet oxygen more effective when reacting on stains. They are complex organic molecules with a metallic center. The catalysts are not consumed during the wash process, i.e. very small amount can make all the hydrogen peroxide present in the wash process more effective. (vi) Photobleaches are also catalysts but they don't work during the wash; instead, they work on the laundry that is hanging on the line outside to dry. Sunlight triggers the formation of singlet oxygen from the air. Singlet oxygen is the actual bleach active. / разводы (или потёки). Щелочное (Alkaline). водный раствор гипохлорита натрия. перкарбонат натрия (sodium percarbonate). Перборат Натрия (Sodium Perborate).

BLEB = ПУЗЫРЬ (или ПУЗЫРЁК, или ВОЛДЫРЬ, или РАКОВИНА) – Bleb is a blister or bubble on the face of a spinning jet, interrupting the extrusion of the filament from the spinneret hole involved. / пузырёк (или вздутие) или пузырь на поверхности экструзия или выдавливание (Extrusion).

BLEB RATE = ТЕМП СОЗДАНИЯ ПУЗЫРЕЙ – Bleb Rate is the frequency of bleb formation in an extrusion operation. / Экструзия или Выдавливание (Extrusion).

BLEEDING = ВЫСТУПАНИЕ (или ВЫПУСК, или СЛИВ, или ПРОСТУПАНИЕ) – Bleeding is the separation of some of the liquid phase from a grease.

BLEEDING = ВЫСТУПАНИЕ (или ПРОСТУПАНИЕ, или РАЗМЫВАНИЕ) – (1) Bleeding; color bleeding:- loss of colorant from a colored material in contact with a liquor, leading to an obvious coloration of the liquid, or of adjacent areas of the same or other materials. Note:- this defect is caused by poor wet fastness of the dyeing or printing. Bleeding is a term applied to yarn from which the color runs, usually staining the white or lighter colored-items nearby. Bleeding is a loss of color by a fabric or yarn when immersed in water, a solvent, or a similar liquid medium, as a result of improper dyeing or the use of dyes of poor quality. Fabrics that bleed can cause staining of white or light shade fabrics in contact with them while wet. Bleeding of red and its adsorption into the white area:- Possible Cause:- prints with reactive dyes need to be washed thoroughly with backflow. Saturation of washing bath with color can lead

to the dye adsorbing onto the uncolored fiber surface leading to a tint as shown. This is a major defect. The tint is very obvious. It fouls the appearance of the fabric. Printing defect. / могут вызвать развод или потёк . Миграция Красителя С Окрашенного Материала; Линяние Краски (bleeding; color bleeding):- порок заключительной отделки ткани в виде изменения оттенка окрашенной поверхности, образующийся при сушке ткани. Примечание:- этот порок возникает из-за непрочной устойчивости окраски окрашенного или набивного материала.

(2) Bleeding:- insufficient color fastness. Thread defects, and namely – Dyeing. / Порок или Дефект ниток, а конкретно – их крашения.

(3) Bleeding is the process of diffusion of a colored substance such as pitch from a knot through a paint or varnish coating, resulting in an undesirable staining or discoloration. / Процесс диффузии (распространения) разноцветного вещества, такого как пек из сучка, по покрытию краски или олифы, приводящий к нежелательным протравливанию или изменению цвета.

BLEND = СМЕСЬ – (1) Blend is the yarn obtained when two or more staple fibers are combined in a textile process for producing spun yarns, e.g., at opening, carding, or drawing. (2) Blend is a fabric that contains a blended yarn (of the same fiber content) in the warp and filling. In textile industry, Blend is a textile containing two or more different types fibers or different colors and grades of the same fiber. Blends:- combining of two or more types of staple fibers in one yarn to achieve color mixtures such as heather, unusual dyeing variations, or better performance characteristics. Blends of natural and man-made fibers are more important today than ever before and their number is virtually limitless. Blend is a term applied to a yarn or a fabric that is made up of more than one fiber. In blended yarns, two or more different types of staple fibers are twisted or spun together to form the yarn. Examples of a typical blended yarn or fabric is polyester/cotton. / уточина.

BLENDED YARN = СМЕШАННАЯ ПРЯЖА (или ПРЯЖА СМЕШАННЫХ ВОЛОКОН) – Blended Yarn is a strand of fibers produced from two or more constituent fibers that have been thoroughly mixed (blended) before spinning. / Смешанная Пряжа (Blended Yarn) – пряжа, состоящая из смеси двух или нескольких видов волокон.

BLENDING = СМЕСКА (или СОСТАВЛЕНИЕ СМЕСОК) – In the cotton processing, Blending is the mixing of other fibers with cotton. The resulting textile product is a compromise of unique properties or characteristics of the fibers in the blend, often providing a superior end product in some uses. Blending is the combining of staple fibers of different physical characteristics to ensure a consistent distribution of these fibers throughout the yarn. Blending:- (i) barre or streakiness is due to uneven mixing of different cottons. Hence mixing technology is a decisive factor in spinning mill technology; (ii) bigger the differences of cotton parameters like fineness, color and staple length, the greater the importance of mixing; and (iii) if the cotton has honeydew, the intenisive mixing of the rawmaterial is a precondition for an acceptable running behavior of the complete spinning mill. Trutzschler's tandem mixing concept is an ultimate solution, if the mixing requirement is very high. This principle guarantees a maximum homogeneous of the mix. Blending is the combining of staple fibers of different physical characteristics to assure a uniform distribution of these fibers throughout the yarn. / В переработке хлопка, смешивание. Составление Смески штапельных волокон с различными физическими характеристиками для .

BLENDING = СМЕШИВАНИЕ – Blending is the process of mixing lubricants or components for the purpose of obtaining the desired physical and/or chemical properties. See also Compounding.

BLENDING MACHINE = СМЕСИТЕЛЬНАЯ МАШИНА (или СМЕШИВАЮЩАЯ МАШИНА) – Blending Machine:- a group of devices or attachments that are synchronized to proportion definite amounts of various grades or qualities of stocks which are to be blended together. May be used for grades of the same type of fiber, or for a series of different fibers that are to be manipulated. The gap between the blending roller and the upright lattice, as well as the desired output (feed belt/upright lattice), are adjusted electronically. Electronical adjustment enables the required values to be entered and changed on the control panel even while the machine is running. This permits high flexibility and very easy adjustment to changes in raw materials or production conditions. Settings can be reproduced, thus meeting the needs of modern quality management. / выработка (output). Разводка между смешивающим (разрыхляющим или разравнивающим) валиком и игольчатой решёткой, а также желаемый выход (питающая лента/игольчатая решётка) регулируются с помощью электроники. Электронное регулирование позволяет вводить требуемые параметры и изменять их на панели управления даже во время работы самой машины. Это повышает уровень присопосабливаемости и значительно упрощает припасовку при изменяющемся составе сырья или условиях производства. Настройки могут быть воспроизводимыми, что само по себе удовлетворяет нужды современного управления качеством продукции. В прядильном производстве, Смесительная Машина – машина для выравнивания физико-механических свойств волокна и стабилизации процессов на последующих технологических переходах посредством смешивания волокна.

BLENDSTOCK = СЫРЬЁ ДЛЯ СМЕШИВАНИЯ – Blendstock is a component combined with other materials to produce a finished refined product. / Компонент, смешиваемый с другими материалами для получения готового очищенного продукта.

BLEND WALL = XX – The term Blend Wall refers to short run technical constraints that act as an impediment to increased biofuel use in transportation fuels.

BLIGHT = ПОРАЖЕНИЕ – Blight is:- (1) any agent causing widespread white coloring, yellowing or blackening necrosis of leaves and shoots. (2) A plant disease symptom characterized by the presence of extensive necrotic areas on plant organs.

BLIND = СКРЫТЫЙ (или НЕЗАЯВЛЕННЫЙ) – Blind is a term used in conjunction with load or lot. Blind lots are not manifested. Usually, when buying 'blind' lots/loads you will be given a general idea of contents, but it will not be a guarantee. It is common for many large retail stores to sell closeouts 'blind' simply because a detailed inventory of contents takes time and ends up costing more per item when purchasing.

BLIND COUNTS = СЛЕПЫЕ РАСЧЁТЫ (или РАСЧЁТЫ 'ВСЛЕПУЮ') – Blind Counts are used during physical inventories to prevent counter bias. The location and item code are provided to the counter, but the counter must provide the quantity of the item found in the given location without knowledge of the desired quantity according to the WMS (Warehouse Management System) or inventory records.

BLINDING = РАЗНООТТЕНОЧНОСТЬ – Blinding or Dull:- the term is used to describe a marked loss of lustre of fibers during wet processing. This defect is caused by the inclusion within the fiber of optical discontinuities, e.g., voids, or particles of dye or pigment, that scatter light, or by an alteration in the physical structure of the dye. / Разнооттеночность – порок пряжи или ткани. Под Разнооттеночностью понимается распространённый порок в виде различия оотенка или интенсивности цвета по длине и/или ширине полотна. Матирование, Блеклость (blinding; dull):- порок заключительной отделки ткани; заметная потеря блеска волокнами во время влажной обработки. Примечание:- этот порок возникает в результате образования пустот внутри волокна или частиц на волокне, рассеивающих свет.

BLIND SHIPMENT = ОТГРУЗКА 'ВСЛЕПУЮ' – A Bill of Lading wherein the paying customer has contracted with the carrier that shipper or consignee information is not given. Blind Shipping is a shipping merchandise without a return address. A Blind Shipment is a freight or parcel shipment that does not disclose the point of origin to the consignee. In other words, the name of the location where the shipment originated does not appear on any shipping documents or packaging that will be seen by the party receiving the delivery. A Common Example:- let's say Business X drop ships merchandise to its Customer Y via third party Supplier Z. Business X has a blind shipping arrangement with Supplier Z to prevent the receiver of the goods, Customer Y, from knowing about Supplier Z. Even though the shipment originates from Supplier Z's location, Supplier Z's name is intentionally left off all shipping documents, labels and packaging. On a blind shipment, Customer Y's copy of the shipping paperwork may simply display no shipper information. However, in most cases, the shipment documentation will display the name of Business X as the shipper, even though the physical shipment did not originate from Business X. This is known as Private Label Shipping and is a very common practice for blind shipments. Why Ship Blind? There are several reasons why Business X may not want Customer Y to see the name of Supplier Z. For competitive reasons, Business X may wish to keep its suppliers confidential, or it may wish to prevent Customer Y from attempting to contact Supplier Z directly, or it may just wish to avoid any confusion that may result when Customer Y sees the unfamiliar name of Supplier Z on its shipment. If blind shipments are part of your business model, get in touch with Saturn Freight. In addition to great rates, we will make sure your paperwork gets handled properly. Saturn is committed to protecting your valuable business relationships.

B LINE = ЛИНИЯ Б – B Line:- the fertile counterpart parent of a cytoplasmic male sterile A line which is used as male parent to maintain the A line. It is also known as a Maintainer Line. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

BLIPS = ОТРАЖЁННЫЕ ИМПУЛЬСЫ – Blips make trend reversals easy to spot. Before computerized charts, my strategy was based on spotting potential trend reversals that I (David Duty) would hand draw. After years of analyzing these reversals, I found an amazingly accurate and highly repetitive pattern that I named blips. Blips can be used to trade any market, from stocks to commodities to FX, and can. be spotted on most every chart. They are surprisingly basic and easy to identify. There are two kinds of blips:- (i) Top Blip indicates that price should drop; and (ii) Bottom Blip indicates price should rally. Top Blip (price should drop):- Day 1 – should have lower lows and lower highs than day 2; Day 2 – should close in the lower half of the day's range; may see a doji or spinning top candlestick pattern; and Day 3 – should have lower lows and lower highs than day 2; critical that day 3 closes lower than day 2 and preferably in the lower 25% of that day's range. Bottom Blip (price will rally):- Day 1 – should have higher highs and higher lows than day 2; Day 2 – may see a doji or spinning top candlestick pattern; and Day 3 – should have higher highs and higher lows than day 2. The blip is usually a three-day pattern. Each number next to a bar in the diagram represents day 1, day 2 and day 3. It also could represent three five-minute bars or any other time frame you like. Blips work the same on all time frames and can be especially important on weekly and monthly charts. So when I have day 1, 2 or 3, you could just as easily think of them as five-minute bars. Figure 1 (SFO 2012-July) reveals a bottom blip showing what it looked like when it formed and then what the market did following the blip. You can clearly see how a bottom blip formed, and the Japanese yen rallied for three consecutive days. A true blip formation also can develop with a fourth bar. This occurs when a blip formation has an inside bar (high and low contained in the previous bar's range) before or after the second bar. You can disregard the inside bar and still consider this a blip formation as in the Japanese yen chart in Figure 2. Identifying blips may be effective for chart analysis, but the real question with any indicator is how do I trade them? On Figure 2, I would place a sell stop order just under the low of day 3 and a protective buy stop just above day 2. If it drops on day 4 below the low of day 3, I'd say that the blip confirmed. Sometimes the blip won't confirm, and you won't get filled. Sometimes the pattern reverses, and we have what I call a blip reversal. See Figure 3. This is why it's so important to enter above the high of day 3 in a bottom blip and below the low of day 3 in a top blip. Also, it's important to use some common sense when trading blips. Often other factors like support and resistance lines and trendlines can negate a blip reversal. Look for bottom blips at support areas and top blips at resistance areas. You are going to start seeing blips on every chart. You are going to be amazed at both its simplicity and accuracy in indicating either a trend reversal or the start of a trend. In certain circumstances, it will be the continuation of the current trend. Blips can become an easy-to-spot, highly effective technical indicator to have in your trading arsenal. / Додзи (Doji).

BLISTER = ДУТИК (или ПУЗЫРЁК, или ВЗДУТИЕ) – In textile industry, Blister is a bulge resulting from separation of coating or laminating material from the base fabric.

BLISTER COPPER = ЧЕРНОВАЯ МЕДЬ – Blister Copper is the unrefined porous copper. Molten copper absorbs gases more easily than copper in solid form. During solidification, dissolved gases in such copper form small blisters in the copper. / маленькие пузырьки в меди. Под Черновыми Металлами понимаются цветные металлы с некоторым количеством примесей, полученные при плавке руд и подвергаемые в дальнейшем рафинированию.

BLISTERING = ВЗДУТИЕ (или ОБРАЗОВАНИЕ ДУТИКОВ) – Blistering is the formation of dome-shaped projections in paints or varnish films by local loss of adhesion to the underlying surface and lifting of the film. Usually caused by applying paint to a surface containing excessive moisture. It may also be caused by excessive heat, or by using paint with poor adhesive qualities. / плёнки краски или олифы.

BLN = BILLION

BLOCK = БЛОК (или РАСПОРКА, или УПОРНЫЙ БРУСОК) – (1) Block is a square or rectangular piece of material used to prevent freight from moving. / Квадратный или прямоугольный (или окантованный) кусок материала, используемый с целью предотвращения смещения грузов при транспортировке.

(2) Block is a grouping of experimental units made according to homogeneity of experimental units, sometimes called Replication. Blocking is an effective way to control experimental error. If the number of experimental units in a block is equal to the number of treatments, the block is said to be 'complete' (and is equivalent to replication). Otherwise, it is 'incomplete'.

BLOCK = БЛОК (или ПАКЕТ) – Block is a group of something, e.g., shares. A purchase or sale of a large number of shares or US Dollar value of bonds. Although the term is relative, 10 000 or more shares, or any quantity worth over USD200 000.00 is generally considered a block. A large holding or transaction of stock – popularly considered to be 10 000 shares or more. / Закупка или продажа большого количества акций или .

BLOCK = ШАШКА – Block is a rectangular, square or cylindrical deck spacer, often identified by its location within the pallet as corner block, end block, edge block, inner block, center or middle blocks. See also Pallet. Block is a short column (commonly rectangular or circular in section) underneath the top deck assembly or between the top and bottom deck assemblies which provides space for the entry of the fork arms of forklift trucks and pallet trucks. / Шашка (Block):- короткий элемент (обычно прямоугольного или круглого

сечения) под верхним настилом или между верхним и нижним настилами, образующий проём в поддоне для захода вил погрузчика или вилочной тележки.

BLOCKCHAIN = ЦЕПОЧКА БЛОКОВ – A Blockchain is a digitized, decentralized, public ledger of all cryptocurrency transactions. Constantly growing as 'completed' blocks (the most recent transactions) are recorded and added to it in chronological order, it allows market participants to keep track of digital currency transactions without central recordkeeping. Each node (a computer connected to the network) gets a copy of the blockchain, which is downloaded automatically. Originally developed as the accounting method for the virtual currency Bitcoin, blockchains – which use what's known as Distributed Ledger Technology (DLT) – are appearing in a variety of commercial applications today. Currently, the technology is primarily used to verify transactions, within digital currencies though it is possible to digitize, code and insert practically any document into the blockchain. Doing so creates an indelible record that cannot be changed; furthermore, the record's authenticity can be verified by the entire community using the blockchain instead of a single centralized authority. A block is the 'current' part of a blockchain, which records some or all of the recent transactions. Once completed, a block goes into the blockchain as a permanent database. Each time a block gets completed, a new one is generated. There is a countless number of such blocks in the blockchain, connected to each other (like links in a chain) in proper linear, chronological order. Every block contains a hash of the previous block. The blockchain has complete information about different user addresses and their balances right from the genesis block to the most recently completed block. The blockchain was designed so these transactions are immutable, meaning they cannot be deleted. The blocks are added through cryptography, ensuring that they remain meddle-proof:- The data can be distributed, but not copied. However, the ever-growing size of the blockchain is considered by some to be a problem, creating issues of storage and synchronization. Blockchains And Bitcoin:- the blockchain is perhaps the main technological innovation of Bitcoin. Bitcoin isn't regulated by a central authority. Instead, its users dictate and validate transactions when one person pays another for goods or services, eliminating the need for a third party to process or store payments. The completed transaction is publicly recorded into blocks and eventually into the blockchain, where it's verified and relayed by other Bitcoin users. On average, a new block is appended to the blockchain every 10 minutes, through mining. Based on the Bitcoin protocol, the blockchain database is shared by all nodes participating in a system. Upon joining the network, each connected computer receives a copy of the blockchain, which has records, and stands as proof of, every transaction ever executed. It can thus provide insight about facts like how much value belonged a particular address at any point in the past. Web-site Blockchain.info provides access to the entire Bitcoin blockchain. Extensions Of Blockchains:- to use conventional banking as an analogy, the blockchain is like a full history of a financial institution's transactions, and each block is like an individual bank statement. But because it's a distributed database system, serving as an open electronic ledger, a blockchain can simplify business operations for all parties. For these reasons, the technology is attracting not only financial institutions and stock exchanges, but many others in the fields of music, diamonds, insurance, and Internet of Things (IOT) devices. Advocates have also suggested that this kind of electronic ledger system could be usefully applied to voting systems, weapon or vehicle registrations by state governments, medical records, or even to confirm ownership of antiquities or artwork. Given the potential of this distributed ledger technology (DLT) to simplify current business operations, new models based on blockchain have already begun to replace the expensive and inefficient accounting and payment networks of the financial industry. Blockchain technology could free up billions of US Dollars:- A recent Goldman Sachs report suggested that it could save stock market operators up to USD6 billion a year. While banks were initially hesitant to explore these technologies because of their concerns about potential fraud, they have started looking into how the blockchain might provide generous cost savings by allowing back-office settlement systems to process trades, transfers and other transactions much faster. In fact, the first international blockchain transaction was completed on October 24, 2016. Brokered by the Commonwealth Bank of Australia and Wells Fargo & Co (WFC), the USD35 000 deal involved Australian cotton trader Brighann Cotton Marketing, which purchased 88 bales cotton from its US division in Texas and sent it to Qingdao, China. Blockchains And Tech Companies:- attracted by the idea of removing the middleman and moving towards democratization and decentralization, tech startups are adopting blockchain technology with the goal of disrupting a variety of industries. Among the startups leveraging blockchain technology for IOT devices is 21 Inc. The Silicon Valley-based startup received a total of USD116 million in funding in 2015. According to the firm, the funding will be used to embed Bitcoin mining chips into connected IOT devices and cell phones. BTCJam, a P2P lending platform headquartered in San Francisco, specializes in providing Bitcoin-based loans. Over the last year, the company has lent more than USD15 million. Storj is just one company that is currently beta-testing the concept of developing cloud storage based on a blockchain-powered network, with the goal of improving security while decreasing users' dependency on a single storage provider's centralized system. The company even offers users the opportunity to rent out storage capacity they do not need, similar to the way that property owners rent out extra rooms on Airbnb. ProofofExistence one of the first non-financial companies to utilize blockchains, is a platform for executing contracts. It uses DLT to store encrypted information, thus enabling a transaction that cannot be replicated to be linked to a unique document. Even established firms are interested. Microsoft Corporation (MSFT) has also expressed interest in blockchain technology, having recently formed a partnership with blockchain firm ConsenSys. In December 2015, Microsoft and ConsenSys announced Ethereum Blockchain as a Service (EBaaS) on Azure – Microsoft's cloud computing platform – to provide a single-click, cloud-based environment to clients and developers. In June 2016, the two companies started developing an open source, blockchain-based identity system for people, products, apps and services. Advantages Of Blockchains:- efficiencies resulting from DLT can add up to some serious cost savings. DLT systems make it possible for businesses and banks to streamline internal operations, dramatically reducing the expense, mistakes, and delays caused by traditional methods for reconciliation of records. The widespread adoption of DLT will bring enormous cost savings in three areas, advocates say:- (1) Electronic ledgers are much cheaper to maintain than traditional accounting systems; the employee headcount in back offices can be greatly reduced. (2) Nearly fully automated DLT systems result in far fewer errors and the elimination of repetitive confirmation steps. (3) Minimizing the processing delay also means less capital being held against the risks of pending transactions. In addition, some smaller number of millions will be saved by shrinking the amount of capital that broker/dealers are required to put up to back unsettled, outstanding trades. Greater transparency and ease of auditing should lead to savings in anti-money laundering regulatory compliance costs, too. Blockchain's removal of almost all human involvement in processing is particularly beneficial in cross-border trades, which usually take much longer because of time-zone issues and the fact that all parties must confirm payment processing. Blockchain systems can set up smart contracts or payments triggered when certain conditions are met. The blockchain cotton transaction mentioned above, for example, used a smart contract that automatically made partial payments when the cotton shipment reached specific geographic milestones. Financial Industry Blockchain Initiatives:- R3 CEV,a fintech innovation company, and a consortium of more than 80 of the world's biggest financial institutions is bankrolling research into methods to harness the speed, accuracy, and efficiency of the blockchain. In 2016, it successfully trialed five distinct blockchain technologies in parallel, using multiple cloud technology providers in a first-of-its-kind test, and is currently marketing its Corda, a 'financial-grade' distributed ledger platform for commercial use. In 2017, after three years of work, Goldman Sachs Group Inc. (NYSE:- GS) received a patent for the SETLcoin, which would create near instantaneous trade settlement times. In 2016, four major banks came together to develop the utility settlement coin (USC), a new digital currency whose use (mainly to buy securities) would be recorded via blockchain. Led by UBS Group AG (NYSE:- UBS), they include Bank of New York Mellon Corporation (NYSE:- BK), Deutsche Bank AG (NYSE:- DB) and Banco Santander SA (NYSE:- SAN), along with broker ICAP PLC (LON:- IAP). In 2017, six more banks joined them:- Barclays Bank, Credit Suisse Group AG (CS),

Canadian Imperial Bank of Commerce, HSBC Holdings PLC (HSBC), MUFG and State Street Corp (NYSE:- STT). The consortium is aiming for a 2018 commercial release. However, for that to happen, a USC-based system or its competitor would need to obtain the approval of commercial institutions, central banks and regulators. And, although it is clearly almost there, blockchain technology is not quite ready for prime time. Hurdles In Adopting Blockchain Technology:- the roadblocks to DLT today are not just technical. The real challenge is politics, regulatory approval, and the many thousands of hours of custom software design and front and back-end programming still required to link up the new blockchain ledgers to current business networks. Problems that still need to be addressed include:- (1) DLT must interface with other parts of the operational processes seamlessly. Blockchain should enable more rapid setup, training, and reduce problem resolution time. Achieving the efficiency gains must be easy enough/cheap enough for all parties involved to grasp and leverage. (2) Security also remains a concern. Several central banks, including the Federal Reserve, the Bank of Canada and the Bank of England, have launched investigations into digital currencies. According to a February 2015 Bank of England research report:- 'Further research would also be required to devise a system which could utilize distributed ledger technology without compromising a central bank's ability to control its currency and secure the system against systemic attack'. (3) Banks are not interested in an open-source model for identity. Both banks and regulators want to maintain close control. The development of a single digital identity passport authorizer is a critical next step. (4) Regulation is also critical in creating an open digital environment for commerce and financial transactions. Current physical certificates must be digitized to gain the full benefits of a fully electronic system. Other questions to be answered include:- Who is responsible for maintaining and managing the blockchain? Who admits new participants to the blockchain? Who validates transactions? and who determines who sees which transactions? Investing In Blockchains:- investors interested in getting on the blockchain technology bandwagon will find it is now easier than ever to do so. In 2015, the venture capital concern Digital Currency Group launched, intending to build what it refers to as 'the largest early-stage investment portfolio in the digital currency and blockchain ecosystem'. Additionally, according to a report published by the American Software-as-a-Service (SaaS) company NASDAQ Private Market, the amount of venture capital being funneled into cryptocurrency-using firms was anticipated to exceed USD1 billion. Companies have even become so interested in the technology that many have begun to play around with the idea of creating their own private blockchains. Nevertheless, blockchain startups are not without challenges. Among the most significant is the fact that most consumers simply do not understand the extremely complicated concept of blockchain technology. In order to overcome this challenge, companies will need to find ways to precisely explain what they do in easily understandable language – and how they intend to deal with issues like secure online transactions and consumer privacy. The Bottom Line:- given the incredible opportunity for decentralization, blockchain technology offers the ability to create businesses and operations that are both flexible and secure. Whether companies will succeed in deploying blockchain technology to create products and services consumers will trust and adopt remains to be seen. Nevertheless, this is definitely a space investors should watch. The demand for blockchain-based services is on the rise, and the technology is maturing and advancing at a rapid pace. The potential applications for blockchain technology are almost without limit. At the moment, several of these applications are still either in the development stage or in beta testing. With more money being poured into blockchain-based startups, consumers should not be surprised to see DLT services and products becoming more mainstream in the near future. Blockchain is a a digital ledger in which transactions made in bitcoin or another cryptocurrency are recorded chronologically and publicly. We can actually have a look at the blockchain and see evidence of what's going on. / НЭЗДЭК® (NASDAQ®).

BLOCK CIPHER = ШИФР БЛОКА – Block Cipher is a cryptographic algorithm which maps n-bit plaintext blocks to n-bit ciphertext blocks. N is called the Blocklength.

BLOCK DEPTH = ГЛУБИНА БЛОКА – Block Depth is a distance from front to back of a block of stacked unit loads. See also Stacking. / Глубина Блока (Block Depth):- расстояние, определяющее размер блока сложенных грузовых единиц, измеренное по всей длине блока. Смотрите также Штабелирование (Stacking).

BLOCKED PERIOD = ПЕРИОД БЛОКИРОВКИ – In banking, Blocked Period is a period during which certain securities are not placed freely at the owner's disposal, e.g., securities or employee shares deposited as collateral. / В банковской деятельности, период времени, в течение которого определённые ценные бумаги, не могут быть свободно размещаемыми по усмотрению владельца, например, ценные бумаги или акции работников, депонированные в качестве обеспечения.

BLOCKED SECURITIES = БЛОКИРОВАННЫЕ ЦЕННЫЕ БУМАГИ – (1) Bonds or shares (e.g., securities acquired under stock option plans) which may not be sold before a certain date. / Облигации или акции (например, ценные бумаги, приобретаемые в соответствии с планами опциона на акции), которые не могут быть проданы до определённой даты.

(2) Blocked Securities are the securities reported lost or stolen and hence barred from trading. / Ценные бумаги, отмеченные как утраченные или украденные и, следовательно, изъятые из торгового оборота.

BLOCKER = РАСКЛИНЩИК – Blocker is a frame for drying wool. This is a open frame that rests on two supports with a handle on one side. You wind the damp yarn under even tension across the frame – not trying to line anything up. Rather like winding a bobbin for weaving. After the yarn dries, you can usually slide the whole skein off of one end. Edward Worst's book 'How to Weave Linens' has directions for making a blocker. Sadly, this book is out of print.

BLOCKING = БЛОКИРОВКА (или ЗАКУПОРИВАНИЕ) – Wood or metal supports (dunnage) to keep shipments in place to prevent cargo shifting. Also known as Bracing. By Blocking a cargo, you are preventing the cargo from moving longitudinally, rail cars and rail moves are most susceptible to this type of movement. / Под Блокировкой понимается совокупность методов и средств, обеспечивающих закрепление груза в определённом состоянии. Блокировка повышает безопасность обслуживания и перевозки грузов.

BLOCKING = РАСКЛИНКА – Blocking is the process of drying a skein of wool under tension. This can be done by drying a skein on a blocker. More prosaically, it can done by winding around an upended-chair's legs or by hanging a weight in the bottom of a skein. A #2 can of tomatoes is often used as you don't get a sharp crease.

BLOCKING STAKE = БЛОКИРУЮЩИЙ ПАКЕТ АКЦИЙ – Blocking Stake is a minority stake in a company that can be used to prevent important management decisions, e.g., changes to a company's articles of association. For joint stock companies, the blocking stake is 25%.

BLOCK OF SHARES = ПАКЕТ АКЦИЙ (или БЛОК АКЦИЙ) – Block Of Shares is any larger (not precisely defined) amount of the shares of a specific company in the ownership of an individual person or another company. The purchase or sale of a block of shares – mostly over the counter – is called a Block Trade. Large number of shares of the same company owned by a single shareholder. / Крупное количество акций одной и той же компании, принадлежащее одному акционеру.

BLOCK PALLET = ПОДДОН С ШАШКАМИ – Block Pallet is a type of pallet with blocks between the pallet decks or beneath the top deck.

BLOCK PRINTING = ПЕЧАТАНИЕ БЛОКАМИ (или РУЧНАЯ НАБИВКА) – Block Printing:- wooden blocks, carved with a design standing out in relief, are made from solid pieces of wood or by bonding closely grained woods with cheaper ones. When designs include large areas, these are recessed and the space filled with hard wool felt. Fine lines are usually built up with copper strips, and other effects are obtained with copper strips interleaved with felt. To facilitate registration of successive prints, or lays, each block has several pitch pins arranged to coincide with well-defined points in the pattern. Cloth is printed on a table covered with several thicknesses of fabric or blanket, the whole covered with a thick sheet of tightly stretched synthetic rubber. The cloth to be printed is spread on the rubber, either gummed in position or pinned to a backcloth attached to the table. Color is applied evenly to the block, and the pattern is stamped on the fabric to be printed, using the handle of a small heavy hammer, or maul, to aid penetration of the paste. More color is then applied to the block and the process is repeated using the pitch pin to obtain true registration. After the fabric has been entirely printed with one color, other colors are applied in the same way until the design is complete. Although block printing is becoming too laborious and costly for commercial use, some of the most beautiful prints have been made in this way. Block Printing is the printing of fabric by hand, using carved wooden or linoleum blocks, as distinguished from printing by screens or roller. See also Printing. Block Printing is a hand-printing process in which a design is carved on a block of wood or linoleum. Dye is placed on the surface and the block is placed on the fabric, thereby transferring the dye. Every color requires a different block, making this type of printing tedious and expensive. It is now almost entirely limited to the craft field.

BLOCK SAMPLING = БЛОКОВЫЙ ОТБОР ПРОБ – Block Sampling is a group sampling of experimental units which divides the project area into a grid system of square blocks.

BLOCK STACKING = ШТАБЕЛИРОВАНИЕ БЛОКАМИ (или УКЛАДКА ШТАБЕЛЕЙ БЛОКАМИ) – Block Stacking:- A very basic form of storage, in which objects are placed on a surface (usually a flat floor) and stacked on top of one another in blocks, is known as Block Stacking. The clearance area can be various heights, up to several layers high depending on the material being stacked. A form of palletized storage, it does not require any type of storage equipment. Loaded pallets are placed directly on the floor and built up in stacks to a maximum stable storage height. Lanes are created to ensure access to the different stock keeping units (SKUs). Load strength (crushability), load weight, load stability, pallet conditions, safety limits, weather (humidity, water, wind can weaken pallets and soften loads), as well as warehousing clearance heights are the factors used to determine the maximum storage heights or stacking levels. The fact that block stacking permits warehouses to use only the Last-In-First-Out (LIFO) method limits its usefulness. Besides, floor stacking, being extremely space intensive, requires very large areas for storing large quantities of stock. Removing loads from the storage lanes creates underutilized space that remains unused until the entire lane has been cleared. Warehouse operators need to carefully plan both the lane length and depth to determine storage capacity and achieve a high level of utilization of each line. Such planning requires detailed knowledge of predicted and current stock output levels for each SKU, in order to avoid honeycombing. Xxxxx. One common method of storing stock is Floor Pallet Stacking or Block Stacking. Block stacking is a form of palletised storage that does not require any type of storage equipment, and instead loaded pallets are placed directly on the floor and built up in stacks to a maximum stable storage height. Lanes are created to ensure access to the different stock keeping units (SKUs). The maximum storage heights or stacking levels are determined by a number of different factors such as:- load strength (crushability); load weight; load stability; pallet conditions; safety limits; weather (humidity, water, wind can weaken pallets and soften loads); and warehousing clearance heights. Each of these factors needs to be considered carefully to ensure that safe stacking levels are selected. One key limitation of block stacking is that SKU's are only accessible in a Last In First Out (LIFO) method. Floor stacking is extremely space intensive and hence requires very large areas for storing large quantities of stock. When loads are removed from the storage lanes, underutilised space is created that cannot be used until the entire lane is cleared. This effect is called Honeycombing. Therefore careful attention to lane length and depth (determine storage capacity) must be taken to ensure that a high level of utilisation of each line is achieved, meaning that each line size needs to be planned based on predicted and current stock output levels for each SKU. If we look at the picture below we can see a classic example of floor stacking at a port in Melbourne. The Containers are stacked up to 7 containers in height; in this case they are restricted by safety & weather conditions and not load strength. Advantages Of Floor Stacking:- very low setup costs; and flexible. Disadvantages Of Floor Stacking:- low density storage (requires a large storage facility to store only a small amount of stock); poor ventilation of products; storage height depends on a number of variable factors; only one SKU can be effectively stored in a lane, empty pallet spaces are created that cannot be utilized effectively until an entire lane is emptied; and you have to move the top pallet to get to the pallet underneath (LIFO). / Штабелирование Блоками или Укладка Штабелей Блоками (Block Stacking):- установка штабелей на плоскости рядами с минимальным рабочим проходом между ними. Примечание:- горизонтальный проход между штабелями должен быть достаточным для перемещения грузовых единиц с помощью автопогрузчика.

BLOCK STOWAGE = ШТИВКА БЛОКАМИ – Stowing cargo destined for a specific location close together to avoid unnecessary cargo movement. A method of loading:- in Block Stowage, the goods are stowed as a single block, without leaving space of the flow of air. Thus, air can only pass around the block itself.

BLOCK TRADE = ТОРГОВЛЯ БЛОКАМИ (или ТОРГОВЛЯ ПАКЕТАМИ) – Block Trade:- a large transaction that is negotiated off a trading floor or facility and then executed on an exchange's trading facility, as permitted under exchange rules. On the ICE Futures US®, Block Trade is a permissible, noncompetitive, privately negotiated transaction either at or exceeding an exchange determined minimum threshold quantity of futures or options contracts which is executed apart and away from the open outcry or electronic markets. Exchange Rule 4.31 sets forth the requirements for executing a block trade. An Exchange for Physical (EFP)/Against Actual (AA) transactions are transactions where futures and corresponding cash positions are simultaneously exchanged. A block trade only involves futures, options on futures, or a combination of futures and options. For example, Minimum Threshold Quantity for futures contracts No. 2 on cotton is 500 lots, and for options on the contracts – 250 lots. Each party to a block trade must be an Eligible Contract Participant (ECP) as that term is defined in Section 1a(12) of the Commodity Exchange Act (Act). ECPs include, but are not limited to floor brokers, FCMs, broker/dealers, financial institutions, insurance companies, pension funds, corporations, commodity pools, investment companies and high net worth individuals which satisfy certain criteria specified in Section 1a(12) of the Act. Notwithstanding the foregoing, if the block trade is entered into on behalf of a Customer by a commodity trading advisor registered under the Act (CTA), including without limitation any investment advisor registered as such with the Securities and Exchange Commission who is exempt from regulation under the Act or CFTC regulations with total assets under management exceeding USD25 million, or by a foreign entity performing a similar role or function to a CTA or investment advisor that is subject to foreign regulation with total assets under management exceeding USD50 million, the individual Customer need not be an ECP. Exchange Rule 4.31 provides that all block trades must be executed at a price which is fair and reasonable in light of the size of such block trade, the price and size of other trades in the same contract at the relevant time; and the price and size of trades in other relevant markets, at the relevant time. In addition, the trade price must adhere to the minimum tick and price validation requirements of the market in question. Additionally, each leg of any blocked spread or combination trade must be done at a single price. It is impermissible to split the quantity of a particular leg and report different prices for such leg. Trading in large packages of securities. A Block Trade is a privately

negotiated futures, options or combination transaction that is permitted to be executed apart from the public auction market. Participation in block trades is restricted to Eligible Contract Participants as that term is defined in the Commodity Exchange Act. Rule 526 ('Block Trades') governs block trading in CME, CBOT, NYMEX and COMEX products. Block trades are permitted in specified products and are subject to minimum transaction size requirements which vary according to the product, the type of transaction and the time of execution. Block trades may be executed at any time at a fair and reasonable price. Block trade reporting, submission and minimum threshold requirements are set forth in the most current Market Regulation Advisory Notice concerning Block Trades. That notice is available on the Current Market Regulation Advisory Notices page. If you have questions concerning block trades, please contact the Market Regulation Department, CME Group at +1-312-3417970 or one of the individuals listed in the above-referenced Advisory Notices. Block Trade:- a bank with strong capital resources acquires a substantial equity position in a listed company at a fixed price from the seller and tries to place the securities with investors as quickly as possible. Block trades permit the fast monetization of large shareholdings. The shares are only offered to institutional investors. Placement is therefore possible without the need for a prospectus and with the simultaneous reduction of the risk of influencing the market price over the long term. A Block Trade is a permissible, off-exchange, privately negotiated transaction either at or exceeding an exchange determined minimum threshold quantity of futures or options contracts which is executed apart and away from the open outcry or electronic markets. Exchange Rule 4.07 (ICE Futures US, Inc.) sets forth the requirements for executing a block trade. For example, the eligible Cotton No. 2® futures and options contracts and the minimum threshold quantity requirements for block trades are as follows:- (i) futures – 500 lots; (ii) calendar spread options – 100 lots; and (iii) all other options – 250 lots. Who may participate in block trades? Each party to a block trade must be an Eligible Contract Participant (ECP) as that term is defined in Section 1a(18) of the Commodity Exchange Act (Act). ECPs include, but are not limited to floor brokers, FCMs, broker/dealers, financial institutions, insurance companies, pension funds, corporations, commodity pools, investment companies and high net worth individuals which satisfy certain criteria specified in Section 1a(18) of the Act. Notwithstanding the foregoing, if the block trade is entered into on behalf of a Customer by a commodity trading advisor registered under the Act (CTA), including without limitation any investment advisor registered as such with the Securities and Exchange Commission who is exempt from regulation under the Act or the US CFTC regulations with total assets under management exceeding USD25 million, or by a foreign entity performing a similar role or function to a CTA or investment advisor that is subject to foreign regulation with total assets under management exceeding USD50 million, the individual customer need not be an ECP. Are there any price restrictions for block trades? Exchange Rule 4.07 provides that all block trades must be executed at a price which is fair and reasonable in light of the size of such block trade, the price and size of other trades in the same contract at the relevant time; and the price and size of trades in other relevant markets, at the relevant time. In addition, the trade price must adhere to the minimum tick and price validation requirements of the market in question. (But see Question 23 below in the case of Block trades at Index Close.) Additionally, each leg of any blocked spread or combination trade must be done at a single price. It is impermissible to split the quantity of a particular leg and report different prices for such leg. Can any order which exceeds the minimum quantity threshold be executed as a block trade? No, the order must specifically be designated as a block trade by the customer. What recordkeeping and audit trail requirements are attendant to a block trade? The recordkeeping and audit trail requirements associated with a block trade are identical to the requirements associated with any other futures or options transaction. In addition, order tickets must explicitly state that the order may be executed as a block trade. What are the trading hours for block trades? Block trades for all products may be executed at anytime. For Energy Futures contracts, Block and EFS trades will be allowed until the close of the ETS on the Business Day prior to the Final Payment Date. For Energy Options contracts, Block and EOO trades will be allowed until either 04:15 pm EPT or 15 minutes prior to the Exercise Notice deadline defined in 18.04(d,) whichever is earlier, on the Exercise Day. How are block trades reported? A block trade is reported using the ICE Block application. What are the reporting requirements for block trades? Block trades in the following contracts must be reported no later than 15 minutes of execution:- (i) Energy Futures and Options*; (ii) Metals Futures and Options*; (iii) Currency Futures and Options; (iv) Credit Index Futures Contracts*; (v) NYSE Arca Gold Miners Index Futures*; and (vi) MSCI Futures and NYSE FANG+ Index (except Block at Index Close Trades**). (Notes:- *For each of these products and notwithstanding the foregoing, all block trades executed during the last ten minutes of the trading day must be reported to the Exchange no later than five minutes after the close of trading. **In the case of Block at Index Close (BIC) trades on MSCI Index Futures Contracts and NYSE FANG+ Index Futures there are separate time considerations given the time that the index value is published.) For Energy Futures and Options Contracts, Metals Futures and Options Contracts, Currency Futures Contracts, Credit Index Futures Contracts, NYSE Arca Gold Miners Index Futures Contracts, MSCI Futures Contracts and BICs on MSCI Futures Contracts, fifteen (15) minutes from the time of execution. For all other products (including the Russell Futures and Option contracts), five (5) minutes from the time of execution for single leg trades and 10 minutes from of time of execution for block trades consisting of two or more legs. For block trades executed outside of normal trading hours, the block trade must be reported to the Exchange no later than 5 minutes prior to the open of the next trading session for the particular block eligible contract. What are the procedures for entering a block trade in ICE Block? In order to submit a block trade directly into ICE Block, the party entering the transaction must have access to ICE Block or WebICE and must have received permission via the ICE Block application to enter the trades for the accounts involved in the block trade from the Clearing Member(s) carrying those accounts (see Question 12 below). In the event that a block trade is executed for an account or accounts for which the appropriate ICE Block permissioning has not been completed by the clearing member, such block trade must be submitted by notifying ICE Futures US, Inc., by email at futures-blocktrades@theice.com. Direct Entry in ICE Block:- The party submitting the block trade must enter complete block trade details into the ICE Block application within:- For Energy Futures and Options Contracts, Metals Futures and Options Contracts, Currency Futures Contracts, Credit Index Futures Contracts, NYSE Arca Gold Miners Index Futures Contracts, MSCI Futures Contracts and BICs on MSCI Futures Contracts, fifteen (15) minutes from the time of execution. For all other products, five (5) minutes from the time of execution for single leg trades and 10 minutes from of time of execution for block trades consisting of two or more legs. The party submitting the block trade should enter complete block trade details as follows:- (a) Single sided – where the seller/buyer submits a trade that is alleged to the buyer/seller. The buyer/seller must confirm the alleged block within the aforementioned reporting time period. (b) Two sided – where the seller/buyer submits and confirms for both the buy and sell side of the block. The selling/buying clearing member/authorized submitter will need to be permissioned to accept trades on behalf of the buying/selling clearing member. Two sided entry of blocks in ICE Block will automatically clear and be downloaded to PTMS. In the case of block trades involving Sugar No. 11 Futures trades executed as part of a S11/LIFFE White Sugar arbitrage transaction (see Question 20 for additional information), the submitter must also report the arbitrage premium and the details (Month/Yr) for the contract month involved in the LIFFE Sugar leg by entering that information in the 'Transaction Details' text field on the block trade submission screen in ICE Block. In the case of Block at Index Close (BIC) trades on MSCI Futures Contracts the submitter must also report the agreed upon basis and the date and time at which the basis was agreed by entering that information in the 'Transaction Details' text field on the block trade submission screen in the ICE Block application. Indirect Entry In ICE Block:- Step 1:- The party submitting the block trade must submit complete block trade details to ICE Futures US, Inc., by email at futures-blocktrades@theice.com within 15 minutes from the trade execution for all block trades involving Energy futures and options, Metals Futures and Options Contracts, Currency Futures Contracts, NYSE Arca Gold Miners Index Futures Contracts and MSCI futures contracts or five (5) minutes from the time of execution for single leg trades and 10 minutes from

of time of execution for block trades consisting of two or more legs for all other contracts. Step 2:- ICE Futures US, Inc. will enter the block transaction into ICE Block. Step 3:- Both the buying clearing member and the selling clearing member must accept or challenge the transaction within 30 minutes of the trade being reported to ICE Futures US, Inc. How do I obtain access to enter orders directly into ICE Block? In order to obtain access to ICE Block, Clearing Members, customers and third parties must have completed or must complete:- (1) an ICE Futures US, Inc. Electronic User Agreement or ICE Futures US, Inc. Broker Agreement; and (2) an ICE Futures US, Inc. Enrollment Form. In addition, Customers and third parties (brokers) must receive permission to submit a block trade directly into ICE Block from the Exchange Clearing Member(s) clearing the specific account(s) involved in the block trade. Please Note:- such permission must be received for each individual account for which the customer or third party intends to enter a block trade and must be given by the clearing member clearing the account. Clearing Members can permission customers and third parties to enter blocks and/or EFRPs (EFPs, EFSs and EOOs) for the accounts they clear through Clearing Admin. The Help Desk can be contacted at +1-770-7382101 to assist in setting up access for firms and their designated users. Must block trades be brokered by an Exchange Member or Clearing Member? No. If the clearing member(s) has so authorized, block trades may be negotiated directly between non-member 'eligible contract participants' (customers). In the event, however, customers directly negotiate block trades, the affected clearing members are responsible for the timely capture and reporting of all required information including the time of execution. Who is responsible for reporting the execution time? Either party, or broker, may report a block trade. The party or broker submitting the block trade to the Exchange is responsible for reporting the time of execution (the time the parties agreed to the block transaction). As discussed in Question 10 above, for single-sided entry of block trades, the first party or broker submitting the block trade to the alleged party must report the execution time. May spreads or combination trades be executed as block trades? Yes. Spreads and combinations may be executed as block trades provided the trade represents a unified strategy controlled by a single entity and executed for a single account or group of eligible accounts. Intra-Commodity:- Intra-commodity futures spreads, intra-commodity options spreads may be executed as block trades provided that the sum of the quantities of the legs of the transaction meets the requisite minimum quantity requirements ('MQR'). For example, the MQR for the Henry Basis Future contract ('HEN') is 25 contracts. A 15 lot September 2012 / October 2012 HEN spread may be blocked as a block trade. Please note that the 15 September 2012 and 15 October 2012 may be aggregated to satisfy the 25 lot MQR. Inter-Commodity:- Inter-commodity futures spreads, inter-commodity options spreads and inter-commodity combination transactions may be executed as block trades provided that the sum of the quantities of the legs of the transaction meets the largest MQR for the underlying products. For example, the MQR for the MISO Indiana Real Time Financial Off-Peak futures contract ('CPO') is 10 contracts and the MQR for the NYISO Zone A Financial Off-Peak futures contract ('AOP') is 78 contracts. A 50 lot September 2012 CPO/ October 2012 AOP inter-commodity spread may be blocked as a block trade. Please note that the 50 September 2012 CPO and 50 October 2012 AOP may be aggregated to satisfy the largest MQR of 78 lots (AOP). Futures/Options Combination :- Inter-commodity and intra-commodity combination block trades may be executed in all products where the option contract is eligible for block execution. In order for a combination to meet the requirements for block execution, the sum of the quantities of the options leg must satisfy the requisite MQR (please review the Intra/Inter Commodity language reflected above to determine the required MQR). While the futures leg does not need to separately satisfy the requisite MQR, the futures leg must offset the net options position of the options leg(s). Please note that the futures leg cannot be greater or less than the number of contracts required to offset the net delta of the options leg(s). For example, assume that a block combination trade for Henry Penultimate options ('PHE') and futures ('PHH') is agreed between two parties, consisting of 80 lots of December 2012 PHE USD4.00 Calls and 16 November 2012 PHH futures contracts (a 20 delta). Since the MQR for options on Henry Penultimate (PHE) is 60 lots, the options quantity complies with the MQR for the options portion of the combination trade; given the options quantity of 80 lots and the 20 Delta for the options, the future quantity of 16 lots is equal to the net delta of the options position (calculated by multiplying the options quantity by the Delta, or 80 X .2000 = 16 lots), and therefore the futures quantity complies with the volume requirement for the futures position of the combination. If the futures quantity in this example were significantly larger or smaller than 16 lots, it would not comply with the volume requirement for the futures portion of a combination block trade. May block trades be given up? Yes. Block trades may be given up. Can block trades be executed for a future or option position after Last Trading Day? Block trades for only Energy contracts may be executed up to expiration, but block trades for Agricultural and Financial products can't be executed after close of trading on the respective market on last trading day. Can orders be bunched to constitute one side of a block trade? Yes, but only if the order is entered by a single controlling entity. For example, a CTA eligible to transact blocks may bunch orders entered on behalf of multiple accounts over which the CTA exercises power of attorney, provided that the aggregate order meets the minimum quantity requirements. Two or more traders who generally act independently with respect to accounts with different beneficial ownership may not bunch their orders for purposes of meeting the block trade minimum order quantity requirements. Other than the CTA exception, brokers may not bunch orders from otherwise autonomous customers. What fees are associated with block trades? Block trade fees vary by product. Current Exchange and Clearing fees can be found at:- Energy Product Fees:- https://www.theice.com/publicdocs/futures_us/IFUS_S2F_Energy_Fees.pdf. All Other Product Fees:- https://www.theice.com/publicdocs/futures_us/Exchange_and_Clearing Fees.pdf. Can Trade at Settlement ('TAS') trades be executed as block trades? Yes, TAS trades may be executed as block trades for certain contracts. TAS blocks may be executed for those products and contract months for which both TAS and block trades are permitted. Current TAS products can be found at:- https://www.theice.com/publicdocs/futures_us/TAS_FAQ.pdf. TAS trades can be executed, and are subject to the same eligibility, minimum trade quantity and timely reporting requirements as block trades generally. TAS block trades are to be reported using the same procedures outlined above for block trades generally. What is a Sugar No. 11/ White Sugar Futures arbitrage block trade? The Exchange has established a reduced block trade minimum quantity requirement of 100 lots for Sugar No. 11 futures contracts purchased or sold as part of a Sugar No. 11/white refined arbitrage trade against the ICE Futures Europe White Sugar futures ('Refined') contracts. For each Sugar No. 11 futures contract purchased or sold as a part of the arbitrage, there must be at least one Refined contract sold or purchased. The Clearing Member(s) for each such arbitrage block transaction will be responsible for ensuring that the transaction is in fact part of a Sugar No. 11/Refined arbitrage transaction. Do block trades between accounts of affiliated parties constitute as Wash trade? The Exchange permits block trades in all futures and options contracts between accounts of affiliated parties provided that each block trade meets all of the following requirements:- (i) the block trade price must be executed at a fair and reasonable market price; (ii) each party must have a separate and independent legal bona fide business purpose for engaging in the trades; and (iii) each party's decision to enter into the block trade must be made by a separate and independent decision-maker. If the block trade(s) does not meeting all of the requirements set forth above, the transaction may constitute an illegal Wash trade prohibited by ICE US Rule 4.02(c). What restrictions are in place regarding the disclosure of block trade details? A broker negotiating a potential block trade for a customer may, with the customer's consent, disclose the customer's identity and whether the negotiation of the trade has ended, to one or more of the parties involved in negotiating the block trade. Parties involved in the solicitation or negotiation of a block trade may not disclose the terms of a block trade to non-involved parties prior to the block trade being publicly reported by the Exchange. What is a Block trade at Index Close (BIC) and for which products is it available? A Block trade at Index Close (BIC) is a type of off-exchange block trade where the price is determined as a basis to a prospective closing level of the index underlying the futures contract on a specified date. A BIC trade is not a separate futures contract. It is a way of trading existing MSCI futures

contracts. BIC trades may only be executed in the MSCI and NYSE FANG+ Index futures contracts. The minimum block size requirements for BICs are the same as the non-BIC MSCI and NYSE Fang+ Index futures block minimums shown in Table 2, Question 2. BIC Trade execution and Reporting:- (i) BIC trades must be submitted and reported to the Exchange in accordance with the procedure described in Questions 9 and 10. (ii) The 'execution time' for a BIC trade is the time at which the final price and quantity of futures contracts have been determined. A BIC trade must be reported to the Exchange by 08:30 am New York Time the following business day. (iii) Both the basis and the final outright block trade price must be 'fair and reasonable' when they each are agreed upon and determined in accordance with Exchange Rule 4.07 (a) (iii). Note that BIC trades may be priced in hundredths of an index point even though the minimum tick size in the central order book is a tenth of an index point. Please note that for the following four contracts BIC block trades may be priced in thousandths of an index point:- (i) MSCI ACWI Ex-US Index Futures; (ii) MSCI ACWI Ex-US NTR Index Futures; (iii) MSCI ACWI Index Futures, and (iv) MSCI ACWI NTR Index Futures. Example OF BIC trade:- MSCI Emerging Markets:- (i) On Monday at 01:30 pm NY time, the buyer and seller have a discussion and the dealer agrees to accept a limit order for USD15 000 000 notional value of MSCI Emerging Markets Index Futures to be filled the next trading day at the MSCI Emerging Markets index closing level plus a basis of +.26 index points. (ii) The next day's official MSCI Emerging Markets index closing level of 900.11 is available at 06:30 pm NY time on Tuesday; and (iii) The block trade is finally priced and executed at 900.37 (900.11 + .26) for 333 contracts (USD15 000 000 ÷ (USD50 * 900.37)), and reported to the Exchange before 08:30 am NY time on Wednesday (because final price determined after 04:45 pm NY time – see 'BIC Trading Details'). The BIC trade clears and settles like any block trade executed on Wednesday. Is pre-hedging or anticipatory hedging of a block trade permitted? Parties to a potential block trade may engage in pre-hedging or anticipatory hedging of the position that they believe in good faith will result from the consummation of the block trade, except for an intermediary that takes the opposite side of its own Customer order. In such instances, prior to the consummation of the block trade the intermediary is prohibited from offsetting the position established by the block trade in any account which is owned or controlled, or in which an ownership interest is held, or for the proprietary account of the employer of such intermediary. The intermediary may enter into transactions to offset the position only after the block has been consummated. It shall be a violation of Exchange Rule 4.02(h) for a Person to engage in the front running of a block trade when acting on material non-public information regarding an impending transaction by another person, acting on non-public information obtained through a confidential employee/employer relationship, broker/customer relationship, or in breach of a pre-existing duty. The Exchange may proceed with enforcement action when the facts and circumstances of pre-hedging suggest deceptive or manipulative conduct by any of the involved parties, including when an intermediary handling a Customer order acts against its Customer's best interests. This guidance only applies in the context of pre-hedging of block trades. This guidance does not affect any requirement under the CEA or Commission Regulations. Rule 4.07. Block Trading:- (a) Members may enter into privately negotiated Transactions with respect to Commodity Contracts designated by the Exchange for such purpose (hereinafter referred to as 'Block Trades'), provided that all of the following conditions are satisfied:- (i) Each party to a Block Trade must be an eligible Contract Participant as that term is defined in Section 1a(12) of the Act; provided that, if the Block Trade is entered into on behalf of Customers by a commodity trading advisor registered under the Act ('CTA'), including without limitation any investment advisor registered as such with the Securities and Exchange Commission that is exempt from regulation under the Act or CFTC regulations with total assets under management exceeding USD25 million, or by a foreign entity performing a similar role or function to a CTA or investment advisor that is subject to foreign regulation with total assets under management exceeding USD50 million, the individual Customers need not so qualify. (ii) Each buy or sell order underlying a Block Trade must:- (A) state explicitly that it is to be, or may be, executed by means of a Block Trade; and (B) be for at least the applicable minimum threshold as specified by the Exchange; provided that only a CTA, including without limitation any investment advisor registered with the Securities and Exchange Commission that is exempt from regulation under the Act or Commission regulations, with total assets under management exceeding USD25 million or a foreign entity performing a similar role or function to a CTA or investment advisor that subject to a foreign regulation with total assets under management exceeding USD50 million, may satisfy this requirement by aggregating orders for different accounts. (iii) The price at which a Block Trade is executed must be fair and reasonable in light of (A) the size of such Block Trade, (B) the price and size of other Trades in the same contract at the relevant time; and (C) the price and size of Trades in other relevant markets, at the relevant time. (iv) Block Trades shall not set off conditional orders, including but not limited to, stop orders, limit orders or market-if-touched orders, or otherwise affect orders in the regular market. (v) Block Trades executed on the Last Trading Day for any delivery month in Sugar No. 11 Futures Contract must be executed and reported before the final five (5) minutes of trading. (b) Block Trades may be executed in Exchange Futures and Options Contracts as determined by the Board and must meet the applicable minimum thresholds for such contracts as determined by the Board from time to time. (c) The parties to a Block Trade shall cause the Transaction to be reported to the Exchange in accordance with such procedure as are determined by the Exchange from time to time. (d) A Clearing Member carrying an account for which a Block Trade is executed is responsible for exercising due diligence to determine that the requirements of paragraph (a)(i) of this Rule are satisfied. (e) Block Trades may not be used to establish positions upon which a cash and carry exemption request made in accordance with Rule 6.29 is based. / ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE).

BLOCK TRAIN = МАРШРУТНЫЙ ПОЕЗД (или МАРШРУТ, или ЖЕЛЕЗНОДОРОЖНЫЙ СОСТАВ) – Block Train:- a number of railway wagons (loaded with containers), running from A to B without marshalling, transshipping or any coupling or decoupling of wagons underway. Railcars grouped in a train by destination so that segments (blocks) can be uncoupled and routed to different destinations as the train moves through various junctions. Eliminates the need to break up a train and sort individual railcars at each junction. Also known as Blocked Trains. / Известны также как Маршрутные Поезда или Маршруты (Blocked Trains). Поезд – сформированный и сцепленный железнодорожный состав из вагонов с одним или несколькими действующими локомотивами или моторными (самоходными) вагонами, имеющий установленные сигналы. Под Маршрутизацией Перевозок понимается система отправления грузов маршрутами (целым составом поезда) с одной или нескольких железнодорожных станций в пункты выгрузки, расположенные в одном районе.

BLOCK WIDTH = ШИРИНА БЛОКА – Block Width is a xxxxx. See also Stacking. / Ширина Блока (Block Width):- расстояние, определяющее размер блока сложенных грузовых единиц, измеренное слева направо. Смотрите также Штабелирование (Stacking).

BLOND = БЛОН (или БЛОНДИН, или БЕЛОКУРОЕ, или ПЕПЕЛЬНОЕ) – Blond or Blonde:- of a flaxen, golden, light auburn, or pale yellowish brown color. / , золотистое, светло-золотисто-каштановое, или .

BLOOD = КРОВНЫЙ – Blood or Blood Grade refers to the fineness of the wool, measured as low 1/4, 1/4, 3/8, and 1/2 blood. It reflects the amount of Merino blood in a breed. 'More blood' refers to a larger amount of Merino in a sheep which should produce a finer wool. See also Wool Grades.

BLOOD COUNT = КРОВНАЯ НУМЕРАЦИЯ – Blood Count is one of three system for describing grades/fineness of wool. It originally referred to the amount of Merino blood present in the sheep breed. Now it generally refers to the fineness of the fleece. The higher the

number, the shorter expected staple length and finer expected crimp. Grades include:- 'Fine' (64's–80's), 'Half Blood' (58's–62's), '3/8 Blood' (52's–56's), '1/4 Blood' (48's–50's), 'Low quarter Blood' (46's), 'Common' (44's), and 'Braid' (30's–40's).

BLOODRED = КРОВАВО–КРАСНОЕ – Bloodred:- having the color of blood.

BLOODWORM = КРОВЯНОЙ ЧЕРВЬ (или ГИЛЬМИНТ, ПАРАЗИТИРУЮЩИЙ В КРОВИ) – Bloodworm is the red aquatic larva of dipterous flies of the genus Chironomus. / Хирономусы или Звонцы – род двукрылых насекомых из семейства Комаров Звонцов.

BLOOM = БЛЕСК – Bloom is the appearance of brightness of a dyed fabric when the fabric is viewed across the top while held at eye level.

BLOOM = БЛЮМ – In metallurgy, Blooms are similar to billets except the cross-sectional area is greater than 36 sq in (230 cm^2). Blooms are usually further processed via rotary piercing, structural shape rolling and profile rolling. Common final products include structural shapes, rails, rods, and seamless pipes.

BLOOM = ЦВЕТОК – Blooms are large, showy, off-white flowers that arise from buds (squares) and typically last only one day, becoming pinkish on the second and brown on subsequent days; they usually fall from the new, developing boll on days three to five. Cotton blooms are at times attractive sites for bollworm egg deposition, western flower and other thrips, and fall armyworms. Blooms in the tops of Cotton plants (Blooming Out the Top or Bumblebee Cotton) often indicate very dry weather or that the crop is cutting out. Bloom is a flower or flowers of a seed plant. / Шмельный Хлопчатник (Bumblebee Cotton). Цветок или цветки семенных растений.

BLOOMBERG (LP) = БЛУМБЁГ (ЭЛ.ПИ.) – Michael Rubens Bloomberg was born on February 14, 1942, in Boston, Massachusetts. The son of a bookkeeper, Bloomberg put himself through Johns Hopkins University and Harvard University, where he earned a Master of Business Administration degree in 1966. His first Wall Street job was with Salomon Brothers, where he quickly climbed the ladder, becoming partner in 1972. When Salomon Brothers was bought in 1981, Bloomberg started his own company, Bloomberg LP, built around a financial information computer that revolutionized the way securities data was stored and consumed. The company was enormously successful and soon branched into the media business with more than 100 offices worldwide. As one of the wealthiest men in the world, Bloomberg chose to turn his attentions to philanthropy, with an emphasis on education, medical research and the arts. Bloomberg entered the political arena in 2002, when he won election as the 108th mayor of New York. Considered a liberal Republican, Bloomberg is pro-choice and in favor of legalizing same-sex marriage. His most popular program as mayor was establishing a 311 telephone line that put callers in contact with the city, allowing them to report crimes, trash problems, or anything else. Bloomberg was re-elected mayor in November 2005. Controversially, in 2008 Bloomberg was able to push through legislation allowing him to run for a third term as mayor, citing that the particularly difficult economic climate and his financial skills warranted his remaining in office. After spending an unprecedented amount of his own money (upwards of USD90 million) on the campaign Bloomberg secured a third four-year term in November of 2009. Bloomberg (LP) is the leading global provider of data, news and analytics. The Bloomberg Terminal™ and Bloomberg's media services provide real-time and archived financial and market data, pricing, trading, news and communications tools in a single, integrated package to corporations, news organizations, financial and legal professionals and individuals around the world. Our mission began in 1981 when Mike Bloomberg (full name, Michael Rubens Bloomberg) and four partners combined their experience on Wall Street with expertise in engineering, data analysis and computer programming. They developed the first product in the investment business where normal people without specialized training could sit down, hit a key and get an answer to financial questions. When Harvard Business School graduate Michael Bloomberg was fired from Salomon Brothers Inc. in October of 1981, he began to explore the idea of establishing his own business. Bloomberg had worked in equity trading and sales for Salomon Brothers, where he eventually was named general partner. Bloomberg also spearheaded efforts to create an in-house computerized financial system there. It was while working for the securities trader that Bloomberg first saw the need among Wall Street firms for a more sophisticated method of gathering and analyzing information. In March of 1982, Bloomberg sold off his Salomon Brothers stock and used the fresh capital to create Innovative Market Systems (IMS). He hired a team of computer programmers to begin developing an electronic information system that would grant users access to real-time securities market data via a desktop terminal. In December of that year, Merrill Lynch became IMS's first customer by ordering twenty terminals on the condition that IMS not market the machines to any Merrill Lynch competitors for five years. Impressed by the technology's potential, Merrill Lynch also bought a thirty-percent stake in IMS for USD30 million. IMS launched the Portable Bloomberg machine in 1984. By pointing out that increased sales would up the value of Merrill Lynch's stock in IMS, Bloomberg convinced Merrill Lynch to lift the five-year sales restriction, freeing IMS to begin widespread marketing of its terminals at a price of USD1 500.00 per month for a single terminal, and USD1 000.00 per month for additional machines. IMS focused on marketing its technology to pension funds, central banks, mutual funds, insurers, and other 'buy side' firms. Bloomberg changed his company's name to Bloomberg LP in 1986 and increased its user base by selling terminals to securities underwriters, trading firms, and other 'sell side' firms for the first time. International expansion efforts heated up in 1987 when the firm opened offices in both London and Tokyo. Global growth continued in 1989 with the launch of an office in Sydney, Australia. An office in Singapore opened in 1990. Bloomberg moved into Germany in 1992 by establishing a unit in Frankfurt and established a Hong Kong office in 1993. Eventually, the company established units in Brazil and India, and by the end of the 1990s, its customers spanned more than 100 countries. Technological developments throughout these years also fueled the firm's growth. For example, a new securities trading feature allowed the firm to launch the Bloomberg Trading System in 1988 – an electronic bond trading system that made the company a player in the electronic commerce arena before the term e-commerce had even been coined. The firm also launched the Bloomberg Traveler, which allowed subscribers to access Bloomberg information from remote locations. The 10 000th Bloomberg terminal was installed in 1990. Enhancements such as color monitors and video training materials, as well as e-mail and multimedia capabilities, came in the early 1990s. Bloomberg connects influential decision makers to a dynamic network of information, people and ideas. Our strength – quickly and accurately delivering data, news and analytics through innovative technology – is at the core of everything we do. With over 15 000 employees in 192 locations, we deliver business and financial information, news and insight around the world. The company was founded in 1982 and within 10 years had over 10 000 customers for the Bloomberg Professional service, a ground breaking private network with data, analytics and other financial information. In the same decade, Bloomberg launched Bloomberg News and opened offices around the world. Subscriptions to the Bloomberg Professional service skyrocketed in the next decade and the company launched Bloomberg Tradebook and Bloomberg.com. This past decade saw the development of technological advances in key products and services such as email and instant messaging that have made the Bloomberg Professional service the leading choice of more than 310 000 business and financial professionals globally. Today, Bloomberg is applying its extensive data, news and technology to offer new tools in the fields of government, law, energy and sports. The company's hallmark, innovation and a passion for getting things right, remains strong and is the inspiration behind Bloomberg's award-winning products and solutions. Bloomberg LP headquartered in New York, NY, the United States. / Блумбёг Эл.Пи. (Bloomberg LP). Мастер Делового Администрирования (Master of Business Administration). Мёрл Лынч (Merrill Lynch). Вол Стрит (Wall Street). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BLOOMER = ШАРОВАРЫ – Bloomer is a costume for women consisting of a short skirt and long loose trousers gathered closely about the ankles; (plural) full loose trousers gathered at the knee formerly worn by women for athletics; underpants of similar design worn chiefly by girls. / женское трико; женские короткие спортивные брюки.

BLOOMING = ПОБЛЁСКИВАНИЕ – Blooming is used by some people to emphasize what they are saying, especially when they are annoyed. In Great Britain, e.g., it's a blooming nuisance because it frightens my dog to death. See also Opening, 2. Someone who is blooming looks attractively healthy and full of energy. She's in blooming health.If they were blooming with confidence they wouldn't need me. Synonyms:- Glowing, Great (informal), Fine, Fantastic (informal). In the United States, Blooming is:- (i) flowering; blossoming; (ii) thriving; flourishing; (iii) (Informal) utter; complete; e.g., a blooming idiot.

BLOOMING OUT THE TOP = ЦВЕТЕНИЕ XX – Blooming Out The Top is a cotton growth state characterized by the presence of first-position blooms almost entirely in the upper canopy of the cotton plant. This occurrence may indicate premature cutout of the crop. Often called Bumblebee Cotton when this condition occurs abnormally early on short, stressed cotton. / Шмельный (или Мохнатый) Хлопчатник (Bumblebee Cotton).

BLOOM TAG = КОНЕЦ ЦВЕТКА (или ЦВЕТКОВАЯ СЕРЁЖКА) – Bloom Tag is the dried brown cotton bloom that sticks to the tip (or, at times, off to one side) of the young boll; more frequent in dry weather; sometimes provides a refuge under which young bollworms or tobacco budworms develop protected from beneficial insects and insecticides. Inexperienced scouts sometimes tend to oversample young bolls having a bloom tag. The sampling of bloom-tagged bolls should be carried out in proportion to their percentage of the total boll population.

BLOT = ПОМАРКА (или КЛЯКСА) – Blot is an area of uniform color appearing incorrectly in a printed design. Note:- this defect is often caused by color paste falling on to the fabric, or contamination from printing rollers or a screen. / Пятно (blot):- порок заключительной отделки ткани в виде загрязнённых или другого цвета мест различной величины, появляющийся на полотне с напечатанным рисунком и искажающий рисунок. Примечание:- этот порок возникает в результате попадания на полотно печатной краски с печатных валиков или сетчатого шаблона.

BLOTCH = ГРУНТ – Blotch is an offcolored area of any shape caused by grease or oil. Synonym:- Oil Spot. See also Finishing Spot. / Синоним:- Масляное Пятно (Oil Spot).

BLOTCHED WHITE = ЗАПЯТНАННОЕ БЕЛЫМ – Blotched White:- white spots that give a pie-bald appearance. / Белые пятна, которые предают пегий вид.

BLOTCH PRINTING = ГРУНТОВОЕ ПЕЧАТАНИЕ (или ГРУНТОВАЯ ПЕЧАТЬ) – Blotch Printing is a process wherein the background color of a design is printed rather than dyed. See also Printing. / При Грунтовой Печати грунтовой рисунок получается в результате прямой набивки.

BLOTCHY APPEARANCE = ЗАМАРАННЫЙ ВИД – Blotchy Appearance:- Fabric:- spun-rayon and wool-blend suiting; Construction:- (i) Count:- 90 x 44; (ii) Warp:- 30/2 25% 1%-in. 1 Mi-den. bright viscose rayon, 50% 2-in. 3-den. dull viscose rayon, 25% 58's wool cut 2 in.; (iii) Filling:- same as warp; Finish:- plain dyed tan. Defect:- general over-all blotchy appearance, with small areas appearing lighter and darker than normal. Analysis:- examination showed that this blotchy effect was due to uneven pickage and distortion of the filling threads in numerous small areas. This condition was attributed to so-called 'Finger Marks' caused by pressure of a worker's hands on the warp in the loom during weaving, with subsequent distortion resulting in uneven laying-in of the picks in the woven goods. / уточина:- .

BLOTTING = БЛОТТИНГ (или БЛОТИНЬ) – Blotting is any one of a number of techniques whereby chromatographically or electrophoretically separated DNA, RNA, or protein molecules can be transferred from the support medium, such as a gel, to another medium such as filter paper or membrane matrix. The transfer can be achieved by capillary action (southern blotting, northern blotting, western blotting) or by electrophoresis (electroblotting). / Под Блоттингом понимается метод определения содержания макромолекул в образцах путём гибридизации содержимого образцов с зондами, например, антителами.

BLOUSE = БЛУЗА (или БЛУЗКА, или КОФТОЧКА, или СВОБОДНАЯ КОФТА, или XX) – Blouse:- the word blouse is often utilized when referring to a women's shirt. Blouse is a long loose over garment that resembles a shirt or smock and is worn especially by workmen, artists, and peasants; the jacket of a uniform; a usually loose-fitting garment that covers the body from the neck to the waist and is worn especially by women.

BLOUSON = БЛУЗОН (или БЛУЗОЧКА, или КОФТОЧКА, или КУРТКА) – Blouson is a garment, as a dress, having a close waistband with blousing of material over it. / Блузон – блуза с напуском; платье с втачным поясом и лифом с напуском; платье с втачным поясом; широкая короткая куртка, снизу собранная на притачной пояс, трикотажную резинку; куртка без подкладки.

BLOW–BY = ПРОПУСК (или ПРОРЫВ, или ПРОСАЧИВАНИЕ) – Blow-By:- passage of unburned fuel and combustion gases past the piston rings of internal combustion engines, resulting in fuel dilution and contamination of the crankcase oil. / Пропуск или Прорыв или Просачивание газа.

BLOWING = ВЗДУТИЕ (или РАЗДУВАНИЕ) – Blowing is a bulging observed on the lids and bases of cans caused by the formation of gas after the sterilization process and ultimitely leading to bursting. Such bulging can be caused by high temperatures (see also Heat-Induced Blowing) or low temperatures (see also Cold-Induced) erfolgen. Blowing is the process of blowing dry steam through a cloth, to settle the fabric and take the curliness from the yarn. / Вздутие или Раздувание:- припухлость, наблюдаемая на .

BLOW–OFF = СКАЧОК (или РЫВОК) – Blow-Off:- an acceleration in prices during an established move, either up or down, that signifies the final phase of a trend. This is usually short in duration and accompanied by very heavy trading volume in preparation for an exhaustion of the market and a change of trend. See also Reversal Spike. / В техническом анализе биржевых рынков, ускорение изменения цен, будь то вверх или вниз, в течение установленного временного интервала торговли, и которое предвещает окончательную стадию тенденции. Обычно скачок или рывок краток во времени и сопровождается большими объёмами торговли перед истощением рынка и сменой тенденции.

BLOWOUT FACTOR = ФАКТОР ЗАДУВАНИЯ – Blowout Factor is the rapidity with which an animal's fiber diameter thickens with age. A bad thing.

BLOWROOM SYSTEM = СИСТЕМА РАЗРЫХЛЕНИЯ И ПРЕДВАРИТЕЛЬНОЙ ОЧИСТКИ – Blowroom System:- good opening as soon as the bale is broken, efficient precleaning and reproducible fine cleaning are the elements of the fiber-preserving concept which not only guarantees efficient cleaning, but at the same time keeps the increase in the nep count in check. Precleaners, blenders and fine cleaners remove dust at the same time, which makes complicated auxiliary machines unnecessary. Without exception, all cleaning machines operate with only one roller. This preserves fibers and reduces servicing effort as well as maintenance and operating costs.

This system leads step by step to a clean, low-nep supply of tufts to the cards. Only correct fiber preparation leads to effective carding. New modern opening lines gently open and clean the fibers in a systematic way resulting in maximum cleaning whilst preserving the natural characteristics of the fiber for carding process. With all harvesting methods, however, the cotton seed, together with the fibers, always gets into the ginning plant where it is broken up into trash and seed-coat fragments. This means that ginned cotton is always contaminated with trash and dust particles and that an intensive cleaning is only possible in the spinning mill. Nep content increases drastically with mechanical harvesting, ginning and subsequent cleaning process. The reduction of the trash content which is necessary for improving cotton grade and apperance unfortunately results in a higher nep content level. The basic purpose of Blow room is to supply:- (i) small fiber tufts; (ii) clean fiber tufts; and (iii) homogeneously blended tufts if more than one variety of fiber is used to carding machine without increasing fiber rupture, fiber neps, broken seed particles and without removing more good fibers. The above is achieved by the following processes in the blowroom:- (i) pre opening; (ii) pre cleaning; (iii) mixing or blending; (iv) fine opening; and (v) dedusting. / Смотрите также Трепание (Picking). Хорошее разрыхление ещё при разборке кип, эффективная предварительная очистка и воспроизводимость тонкой очистки являются элементами концепции бережного ухода за волокном, которая не только гарантирует эффективную очистку, но одновременно ограничивает образование узелков. Машины предварительной очистки, смесители и питатели-смесители, и машины тонкой очистки одновременно обеспыливают материал, и в дополнительных машинах отпадает необходимость. Все очистительные машины без исключения работают только одним валиком. Это щадит волокна и уменьшает время и нужду в техническом обслуживании, а также снижает расходы на содержание и операционные нужды. Эта система шаг за шагом ведёт к чистым, с низким содержанием узелков, клочкам материала для чёсальных машин. В прядильном производстве, цепочка машин, обеспечивающих кипоразрыхление, интенсивную предварительную очистку, смешивание и щадящую тонкую очистку хлопкового волокна. Волокнистые материалы поступают на прядильные фабрики в кипах в сильно спрессованном виде. Их необходимо прежде всего разрыхлить. В хлопкопрядении хлопок разрыхляют в питателях-смесителях и других разрыхлительных машинах, после чего он поступает в трёпальные машины, где происходит трепание и продолжается разрыхление хлопка. На шерстопрядильных фабриках шерсть подвергается обработке на трёпальных машинах, где одновременно с трепанием происходит и разрыхление. Шерсть вводится в трёпальную машину питающими валиками, сильно сжимающими волокна. По этим зажатым волокнам наносят сильные удары рабочие органы трёпальной машины. На льнозаводах отходы трепания обрабатывают на куделеприготовительных машинах, льняные очёсы и короткое льноволокно на фабриках разрыхляется на смесительно-рыхлительных агрегатах. Таким образом, разрыхление является одним из процессов, с которого начинается обработка волокнистого материала. Сущность процесса разрыхления заключается:- (i) в уменьшении объёмного веса волокнистого материала; и (ii) в разделении его на мелкие клочки. Процесс разрыхления можно понимать и более широко и в этом случае делить его на две стадии. В первой стадии на разрыхлительно-трёпальных машинах происходит разделение волокнистого материала на клочки (‘разрыхление до клочка’), на второй стадии – на кардочёсальных и гребнечёсальных машинах происходит разделение его на отдельные волокна (‘разрыхление до волокна’). Обычно вторую стадию называют чесанием, и тогда разрыхлением называют только первую стадию, в которой происходит разделение волокнистого материала на клочки. Первый полуфабрикат в хлопкопрядении – холст – имеет неоднородную структуру:- он состоит из клочков, соединённых между собой силами цепкости. Цель разрыхления заключается в следующем:- (i) Тщательное разрыхление обеспечивает возможность очистки волокнистого материала от непрядомых примесей. В результате разделения его на клочки и под действием наносимых ударов ослабевает связь непрядомых примесей с волокнами, и благодаря этому они сравнительно легко могут быть удалены. (ii) Разрыхление обеспечивает возможность чесания, поскольку разделение волокнистой массы на клочки подготовляет волокнистый материал ко второй стадии – чесанию, в котором происходит разделение его на волокна. Чесать неразрыхлённый материал невозможно. (iii) Хорошее разрыхление обеспечивает лучшее смешивание всех компонентов смески и перемешивание внутри неоднородных компонентов; чем мельче клочки волокнистого материала, тем в большей степени достигается смешивание. (iv) Разрыхление также необходимо для подготовки к дальнейшей обработке таких угаров (отходов), как крутые концы, рвань ровницы, сдир, лоскут, оболочки коконов после размотки и прочие. Волокна в них прочно связаны друг с другом, и без разъединения их невозможно использовать. Для разрыхления волокнистых материалов применяются два метода:- расщипывание и ударное воздействие. Так как ударное воздействие применяется и в трепании для очистки, то оба эти процесса осуществляются одновременно, когда применяется метод ударного воздействия. Однако разрыхление и трепание – разные процессы, и их ни в коем случае нельзя смешивать. При разрыхлении уменьшается объёмный вес материала и происходит его разделение на клочки, при трепании происходит очистка материала – выделение из него примесей. Разрыхление всегда сочетается с процессом смешивания. Дополнительными процессами и явлениями, сопутствующими разрыхлению, следует считать:- (a) очистку (если трепание не является одним из основных процессов), в особенности от мелких, взвешенных примесей и пыли, удаляемых вместе с пыльным воздухом; (b) смешивание, которое обычно происходит хотя бы в некоторой степени, но оно может быть и одним из основных процессов; и (c) изменение влажности, которое обычно выражается в потере влаги, в особенности, если материал очень влажный. Трепание, механическая обработка волокнистого материала (льна, хлопка, шерсти и другого) на трёпальных машинах с целью его разрыхления (разделения на мелкие клочки и пучки волокон) и очистки от посторонних примесей. Трёпальные машины бывают периодического и непрерывного действия, а основными рабочими органами этих машин являются трепала и барабаны. Трепание является одним из основных процессов прядения, а также первичной обработки лубяных волокон. Разрыхление и Трепание Волокна:- в кипах волокна сильно спрессованы и потому плотно соединены между собой и с сорными примесями. Волокна даже в одной кипе неравномерны по своим свойствам, тем более они различаются в разных партиях, составляющих смесь. Чтобы подготовить хлопок для последующей переработки, его подвергают разрыхлению, очистке, смешиванию и трепанию. Таким образом, назначение разрыхлительно-трёпального перехода в следующем:- (i) разделение спрессованной массы волокон из кип на мелкие клочки; (ii) выделение сорных примесей и волокон, не пригодных для прядения; (iii) смешивание волокон; и (iv) создание равномерного потока хлопка в виде холста или рыхлой массы. Разделение массы волокнистого материала на клочки достигается сначала расщипыванием его иглами решёток, а затем ударами рабочих органов разрыхлительно-трёпальных машин. Удаление сорных примесей происходит также ударами рабочих органов по клочкам хлопка и отсосом их воздухом. Перемешивание волокнистой массы происходит за счёт равномерной подачи компонентов смеси (хлопка из различных кип) в машины, многократным переваливанием массы хлопка в камерах машины или накладыванием нескольких слоёв один на другой. Для создания равномерного потока хлопка на трёпальных машинах имеются специальные механизмы. Требования к процессу разрыхления и трепания:- (i) высокая степень очистки хлопка от сорных примесей; (ii) хорошее смешивание волокон; (iii) отсутствие зажгучивания волокон и создание продукта (холста) большей равномерности, так как из неравномерных холстов трудно получить ленту и затем пряжу хорошего качества. Разрыхлительно-Трёпальный Агрегат:- в зависимости от характера перерабатываемого хлопка в разрыхлительно-трёпальный агрегат могут входить машины различных конструкций и в разных комбинациях. Существуют агрегаты для переработки средневолокнистого хлопка (кардная система прядения) и тонковолокнистого хлопка (гребенная система прядения). Для кардной системы прядения в настоящее время существуют два типа агрегатов:- новый однопроцессный с автоматическим питанием хлопком и старый агрегат с ручным питанием. На новом

агрегате кипы целиком загружаются в автоматические питатели, предварительно разрыхлённый хлопок попадает в смесители непрерывного действия, где смешиваются волокна различных партий, затем в наклонном чистителе и наклонном чистителе с конденсером происходит дальнейшее разрыхление и очистка хлопка от сора. Поток хлопка направляется в бункеры трёпальных машин. Рыхление хлопка на питателях-смесителях проходит следующим образом:- подготовленные 6–12 кип устанавливают около машины, затем пласты хлопка берут из каждой кипы и накладывают на питающую решётку питателя-рыхлителя, которая подводит их к движущейся наклонной игольчатой решётке. Иглы последней захватывают клочки хлопка и подводят их к разравнивающему валику, который мелкие клочки пропускает, а крупные сбрасывает обратно на решётку. Мелкие клочки, прошедшие валик, снимаются с решётки съёмным валиком. Затем они, ударяясь о колосниковую решётку, счищаются частично от крупных сорных примесей и сбрасываются на длинную смесительную решётку. Клочки хлопка, оставшиеся на колках валика, сбрасываются в камеру очистительным валиком. Пыль, выделяющаяся при этом, отсасывается вентилятором. Сбрасываемые валиком клочки попадают на новые подаваемые пласты хлопка. Следовательно, на питателе-смесителе происходит рыхление, частичная очистка и смешивание волокон хлопка. Хлопок с решётки направляется в головной питатель. На этом питателе рыхление, частичная очистка и смешивание повторяются. Из головного питателя хлопок подаётся воздухом по трубе горизонтального рыхлителя и присасывается в виде тонкого слоя к перфорированной поверхности барабана. С него волокно снимается валиком и передаётся в бункер. Далее хлопок уплотняется плющильными валиками и питающими цилиндрами и подаётся к ножевому барабану, который вращается со скоростью 700–800 оборотов в минуту. Ножевой барабан представляет собой диски, насаженные на горизонтальный вал. Под ножевым барабаном имеется решётка. Ножами мелкие клочки хлопка отделяются от бородки, под действием центробежной силы ударяются о колосниковую решётку и частично очищаются. Сорные примеси отводятся в камеру. Из помещения через отверстия заслонки засасывается воздух и разрыхлённый хлопок по трубе выводится из машины. Дальше рыхление и очистку хлопка от минеральных и растительных примесей производят на однопроцессной трёпальной машине. Хлопок подаётся в бункер, где с помощью плющильных валиков уплотняется и подаётся питающими цилиндрами к ножевому барабану. Барабан, вращаясь со скоростью 700–800 оборотов в минуту, его разрыхляет. Далее, ударяясь о колосниковую решётку, хлопок очищается от примесей. Затем посредством тяги воздуха, создаваемой вентилятором, он присасывается в виде тонкого слоя к поверхности сетчатых барабанов. С барабана хлопок снимается валиком и передаётся к питающим валикам. Последние подводят его под удары бил трепала, которые вращаются со скоростью 900–1 000 оборотов в минуту. Волокно, ударяясь о колосниковую решётку, очищается от примесей. Вентилятор через отверстия заслонки и щели засасывает воздух из помещения, который обеспечивает присасывание хлопка, поступившего в патрубок, к поверхности конденсатора. Валик сбивает его с поверхности конденсатора в бункер, где он уплотняется валиком и передаётся с помощью валика к цилиндру, который прижимает волокнистый слой к носику педали, игольчатое трепало, вращаясь по часовой стрелке, отделяет и сбрасывает клочки хлопка на колосники. Далее с помощью воздуха, создаваемого вентилятором, волокна присасываются к поверхности сетчатых барабанов. Сформированный тонкий равномерный волокнистый слой валиками уплотняется, а затем наматывается на пруток.

BLS = BACTERIAL LEAF STREAK

BLS = BUREAU OF LABOR STATISTICS

BLUCHER = БЛЮХЭР – Blucher:- a shoe with a one-piece tongue and vamp and the quarters lapped over the vamp and laced together. / ботинок (с высокими берцами) на шнурках с глухим язычком; ботинок (с высокими берцами) кроя ‘конверт’.

BLUE = ГОЛУБОЙ (или СИНИЙ) – Blue:- a color whose hue is that of the clear sky or that of the portion of the color spectrum lying between green and violet. Blue clothing; (plural) a blue costume or uniform.

BLUEBONNET = БЛЮБАНЭТ (или ВАСИЛЁК, или ГОЛУБОЙ ЛЮПИН) – Bluebonnet is a wide flat round cap of blue wool formerly worn in Scotland. / круглая плоская синяя шерстяная шапочка, которую носили раньше в Шотландии.

BLUE BOOK = ГОЛУБАЯ КНИГА – Blue Book is the report on ‘Payments and securities settlement systems in the European Union’. The aim of the Blue Book is to provide a comprehensive description of the main payment and securities settlement systems in the Member States of the European Union (EU). These descriptions cover both the domestic and cross-border aspects of the systems. The range of schemes covered is not exhaustive and the selection is not intended to indicate their relative importance. The Blue Book dates back to September 1992 when the Committee of Governors of the Central Banks of the Member States of the European Economic Community published a descriptive guide to the payment systems of the then 12 Member States of the European Community (EC). The second edition, which contained information on the 15 European Union (EU) Member States, was published by the European Monetary Institute (EMI) in April 1996. The third edition was published in June 2001. It contained revised texts and data for all 15 EU Member States, taking into account the fundamental changes which have taken place in the period from 1996 to 2000. In the institutional context, the most important changes were the establishment of the European Central Bank (ECB) with headquarters in Frankfurt am Main, Germany and the European System of Central Banks (ESCB) in June 1998, and the introduction of the single currency – the Euro – on 1999-January-01. Whithin the Euro area, i.e. those countries which have adopted the single currency, the Euro has replaced the legacy currencies in all central bank operations and in wholesale market activities. Payment and settlement systems are not static in nature. They are dynamic systems which have evolved over time and which will continue to do so. Euro banknotes and coins was introduced in January 2002 in the Member States which have adopted the Euro. This leaded to even greater integration on account of increased demand from the public for faster, safer and cheaper services. In order to allow a direct comparison of the various payment systems, the euro area chapter and the 15 country chapters follow a commonly agreed outline. Each chapter is divided into four sections:- the first section provides an overview of the institutional aspects which have an impact on payment systems and briefly describes the major parties involved. The second section deals with the payment media used by non-banks and with recent developments in the area of retail payments. The third section focuses on interbank transfer and settlement systems. The fourth section describes the various securities settlement systems.

BLUE CHIPS = ГОЛУБЫЕ ФИШКИ – Blue Chips is a stock market term used worldwide for the shares of high-turnover joint stock corporations with considerable market capitalizations. As a rule, these are the shares of large, international, well-known and highly reputed companies with strong creditworthiness. Blue chip shares are listed worldwide on the principal stock exchanges. The development of their prices is often taken as the basis for calculating indices. Blue chips are included, for example, in the DAX®, the Euro Stoxx 50 and the Dow Jones Industrial Average. Shares of companies of prime borrower standing. Common stock of leading corporations renowned for excellent management and conservative financial structure. Blue chip stock offers investors a secure investment with a dependable return. Shares, usually highly valued, in a major company known for its ability to make profits in good times or in bad, and with reduced risk or default. In Canada, Blue Chip:- this refers to companies with large market capitalizations (CAD1B+). It has nothing to do with ‘chips’ of any kind. Many people use it simply to refer to top tier, large cap, firms. / ДАКС® (DAX®, Юроу Стакс 50 (Euro Stoxx 50) и Дау Дьжонз (Dow Jones). Принятое на фондовом рынке название высоколиквидных акций известных компаний, которые имеют серьёзную репутацию и высокую капитализацию. Голубые Фишки или, на Русскоязычном

жаргоне, Голубки (от Американского биржевого жаргонного термина ‘Blue Chips’) – акции Американских компаний, входящие в состав Индекса От Дау Дьжонза. В более широком смысле – акции крупных, хорошо зарекомендовавших себя компаний с регулярно выплачиваемыми дивидендами. В России к голубым фишкам относят акции Газпрома, ЛУКойла, Мосэнерго, Норильского Никеля, Ростелекома, Сбербанка и Сургутнефтегаза. Термин Голубые Фишки связан с Американским карточным покером. В этой игре фишки голубого цвета являются самыми дорогими.

BLUE CHIP STOCK = АКЦИЯ ИЗ РАЗРЯДА ГОЛУБЫХ ФИШЕК – Blue Chip Stock:- a well known, public company that is thought to be in good financial shape and have sound fundamentals (profitability, earnings). An investment in a blue chip is regarded as a safe investment. Examples include Wal-Mart, Coca-Cola and General Electric. Stock in a company with a national reputation for quality, reliability and the ability to operate profitably in good and bad times.

BLUE DISCOLORATION = ПОСИНЕНИЕ – Blue Discoloration is a blue discoloration of wood caused by blue stain Fungi. / Синева древесины – название условное, на самом деле окрашиваться материал может практически в любой цвет:- жёлтый, коричневый, красный, зеленоватый. Но причина в любом случае только одна – поражение древесины грибковыми микроорганизмами из Семейства Ceratocystis. Появление окраски, не свойственной древесине – первый признак того, что они скоро начнёт гнить. Кроме того, посинение снижает гибкость материала, его устойчивость к механическим воздействиям. Какие факторы способствуют появлению синевы древесины? Споры грибков, вызывающих посинение древесины, распространяются в основном короедами и другими насекомыми. Однако для развития микроорганизмов необходимы особы условия. В их число входят:- (i) высокая влажность воздуха и самой древесины; (ii) температура от 10 до 20 градусов Цельсия; и (iii) застой воздушных масс, окружающих конструкцию из дерева. Многие считают, что синеть может только свежая древесина, а просушенная, в том числе промышленным способом, поражению грибками не подвержена. Это не так – при наличии благоприятных для развития грибка условий, он может появиться и на необработанном бревне, и на хорошо просушенном брусе. Как бороться с синевой древесины? Главное правило для тех, кто хочет, чтобы проблема посинения древесины обошла их древесину стороной – правильно выбирать материал. Самая низкая вероятность заражения Грибком – у зимней древесины, а самая высокая – у заготовленной осенью и весной или летом, если оно было влажным и не очень жарким. Если в партии хотя бы одно дерево содержит споры микроорганизмов, вызывающих посинение, то риск порчи остального материала очень велик.

BLUED STEEL STRAP = ВОРОНЁНАЯ СТАЛЬНАЯ ЛЕНТА – Blued Steel Strap:- a normal steel strap can be refined by heat treatment (heating, quenching, tempering). It undergoes a structural change which gives it optimal properties in terms of hardness and elasticity. Heat treatment leaves an oxide layer on the surface of the steel which is a blueish color (steel blue), hence the name.

BLUE–GREEN ALGAE = СИНЕЗЕЛЁНЫЕ ВОДОРОСЛИ – Blue-Green Algae are algae that contribute to the maintenance of soil fertility especially in ricefields. / Под Синезелёными Водорослями или Цианеями понимаются прокариоты; одноклеточные, многоклеточные (нитчатые) и колониальные организмы, преимущественно сине-зелёной окраски, обусловленной пигментами – хлорофиллом и фикоцианином. Размножение главным образом бесполое. Около 2 000 Видов, чаще в пресных водах, но могут жить в морях, океанах, почве, горячих источниках. Некоторые съедобны. О положении синезелёных водорослей в системе органического мира у биологов нет единого мнения. Ботаники относят синезелёные водоросли к водорослям, микробиологи – к бактериям и называют цианобактериями.

BLUE JEANS = ГОЛУБЫЕ ДЖИНСЫ – Blue Jeans are the pants usually made of blue denim.

BLUE PETER = СИНИЙ ПЁТР (или ГОЛУБОЙ ПЁТР) – Blue Peter is a blue signal flag with a white rectangle in the center, signifying ‘P’. When flown alone, indicates that a ship is ready to sail, requiring all crew members and passengers to return on board. Blue Peter is a rectangular flag, blue with a white square in the center, which may be displayed to indicate that a ship is ready to proceed. Blue Peter is a signal flag of blue with a white square at the centre, displayed by a vessel about to leave port. / Синий Пётр – сигнальный синий флаг с белым квадратом в центре, отображающий прописную букву ‘P’ Латинского алфавита.

BLUE SKY LAWS = ЗАКОНЫ ОТКРЫТОГО НЕБА (или ЗАКОНЫ ГОЛУБОГО НЕБА) – Blue-Sky Laws are state laws enacted to prevent the sale of securities of fraudulent enterprises by regulating the sale of corporate securities. A Blue-sky exemption enables companies with a Level-I depositary receipts program to extend the solicitation of their shares by brokers to the retail community in many states. Companies listed on a US Exchange automatically receive most Blue-sky exemptions. A popular name for laws various states have enacted to protect the public against securities fraud. The term is believed to have originated when a judge ruled that a particular stock had about the same value as a patch of blue sky. Blue Sky Laws are the laws in some US states intended to protect investors from potentially worthless share issues.

BLUE SPECKS = СИНИЕ КРАПИНКИ (или ГОЛУБЫЕ МУШКИ) – Blue Specks:- Fabric:- cotton broadcloth shirting; Construction:- (i) Count:- 144 x 76; (ii) Warp:- 80/2 combed cotton; (iii) Filling:- same as warp; Finish:- plain white. Defect:- small blue specks and short blue streaks throughout. Analysis:- under the microscope, it was evident that the blue specks were color stains, rather than foreign deposits on the fabric. Under chemical tests, the spots reacted like a dyestuff or a pigment. The short streaks had the shape and appearance of small bits of yarn, but close examination showed them to be blue stains also. Under ultraviolet light, it was found that not only did the visible specks and streaks fluoresce in a bright orange color, but scores of additional smaller specks became visible. Since a similar fluorescence was obtained with an indanthrene violet, used as a bluing agent by the dyer, it was concluded that the defect was due to poor dispersion of this pigment in the finishing operation. There was no evidence of the gray goods’ containing any such dyestuff or pigment when they were delivered to the finisher. The streaks which resembled threads were probably made by bits of lint in the finishing bath which picked up excessive color and left imprints, or mark-offs, on the fabric. / Уточина:- . цветные разводы (или потёки), .

BLUE STAINS = СИНИЕ РАЗВОДЫ (или СИНИЕ ПОТЁКИ) – Blue Stains:- Garment:- nurse’s white uniform; Fabric Construction:- (i) Count:- 162 x 114; (ii) Warp:- 70/34/7 semidull nylon; (iii) Filling:- same as warp. Complaint:- blue discoloration appeared under the arms and around the waist after one wearing. Analysis:- from the location of the stains it appeared that they might have been caused by perspiration. It was possible to duplicate this defect in the laboratory by the application of dilute acetic or lactic acids. Investigation disclosed that the nylon yarn used in this fabric had been tinted blue by the yarn manufacturer. Although alkaline scouring by the finisher removed the color from the gray goods, it was restored when subjected to acid perspiration. When the finisher was advised of this defect, he made some plant trials and found that he was able to destroy the tint permanently by special processing. The yarn manufacturer subsequently cooperated and discontinued the use of this tint. / Найлан (Nylon). Уточина:- .

BLUETOOTH™ = БЛЮТУС™ – Bluetooth™ is an wireless Personal Area Network (PAN) technology from the Bluetooth™ Special Interest Group, founded in 1998 by Ericsson, TBM, Intel, Nokia and Toshiba. It is an open standard for short-range transmission of digital voice and data between mobile and desktop devices. Bluetooth™ is a short-range radio technology designed to eliminate the need for cables between devices, for example, computer to printer connections achieved without wire and within a local area. /

Блютус[ТЗ] при дословном переводе с Английского языка означает Синий Зуб, назван в честь Короля Харальда I Синезубого, – производственная спецификация беспроводных персональных сетей (wireless personal area network (WPAN)). Bluetooth™ обеспечивает обмен информацией между такими устройствами как карманные и обычные персональные компьютеры, мобильные телефоны, ноутбуки, принтеры, цифровые фотоаппараты, мышки, клавиатуры, джойстики, наушники, гарнитуры на надёжной, недорогой, повсеместно доступной радиочастоте для ближней связи. Bluetooth™ позволяет этим устройствам сообщаться, когда они находятся в радиусе от 10 до 100 метров друг от друга (дальность сильно зависит от преград и помех), даже в разных помещениях. Слово Bluetooth™ – перевод на Английский язык Датского слова Blåtand (Синезубый). Это прозвище носил король Харальд I, правивший в X веке Данией и частью Норвегии и объединивший враждовавшие Датские племена в единое королевство. Подразумевается, что Bluetooth™ делает то же самое с протоколами связи, объединяя их в один универсальный стандарт. Хотя Blå в современных Скандинавских языках означает Синий, во времена викингов оно также могло означать Чёрный. Таким образом, исторически правильно было бы перевести Датское Harald Blåtand скорее как Harald Blacktooth, чем как Harald Bluetooth. Логотип Bluetooth™ является сочетанием двух нордических (Скандинавских) рун:- Хаглаз (Hagall) – аналог Латинской буквы H и Беркана (Berkanan) – Латинская буква B. Логотип похож на более старый логотип для Beauknit Textiles, подразделения корпорации Beauknit. В нём используется слияние отражённой K и B для Beauknit, он шире и имеет скруглённые углы, но в общем он такой же. Спецификация Bluetooth™ была разработана группой Bluetooth™ Special Interest Group (Bluetooth™ SIG), которая была основана в 1998. В неё вошли компании Ericsson, IBM, Intel, Toshiba и Nokia. Впоследствии Bluetooth™ SIG и IEEE достигли соглашения, на основе которого спецификация Bluetooth™ стало частью стандарта IEEE 802.15.1 (дата опубликования:- 2002-Июнь-14). Работы по созданию Bluetooth™ компания Ericsson Mobile Communication начала в 1994. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Первоначально эта технология была приспособлена под потребности системы FLYWAY в функциональном интерфейсе между путешественниками и системой. Компания AIRcable выпустила Bluetooth-адаптер Host XR с радиусом действия около 30 км. Принцип действия основан на использовании радиоволн. Радиосвязь Bluetooth™ осуществляется в ISM-диапазоне (Industry, Science and Medicine), который используется в различных бытовых приборах и беспроводных сетях (свободный от лицензирования диапазон 2.4–2.483 5 ГГц). В Bluetooth™ применяется метод расширения спектра со скачкообразной перестройкой частоты (Frequency Hopping Spread Spectrum (FHSS)). Метод FHSS прост в реализации, обеспечивает устойчивость к широкополосным помехам, а оборудование стоит недорого. Согласно алгоритму FHSS, в Bluetooth™ несущая частота сигнала скачкообразно меняется 1 600 раз в секунду (всего выделяется 79 рабочих частот шириной в 1 МГц, а в Японии, Франции и Испании полоса уже – 23 частотных канала). Последовательность переключения между частотами для каждого соединения является псевдослучайной и известна только передатчику и приёмнику, которые каждые 625 мкс (один временной слот) синхронно перестраиваются с одной несущей частоты на другую. Таким образом, если рядом работают несколько пар приёмник-передатчик, то они не мешают друг другу. Этот алгоритм является также составной частью системы защиты конфиденциальности передаваемой информации:- переход происходит по псевдослучайному алгоритму и определяется отдельно для каждого соединения. При передаче цифровых данных и аудиосигнала (64 кбит/с в обоих направлениях) используются различные схемы кодирования:- аудиосигнал не повторяется (как правило), а цифровые данные в случае утери пакета информации будут переданы повторно. Протокол Bluetooth™ поддерживает не только соединение ‘point-to-point’, но и соединение ‘point-to-multipoint’.

BLUISH = ГОЛУБОВАТОЕ (или СИНЕВАТОЕ, или XX) – Bluish:- somewhat blue; having a tinge of blue.

BLUSH = РОЗОВАТОЕ (или РУМЯНЕЦ, или РОЗОВОЕ) – Blush:- a red or rosy tint.

BM = BERMUDA

BM&F = BOLSA DE MERCADORIAS & FUTUROS

BMD = BERMUDAN DOLLAR

BME = BALANCING MARKET EVALUATION

BMJ = BRUSHED MICRO JERSEY

BMR = BASE MORTGAGE RATE

BMZ/GTZ = BUNDESMINISTER FUR WIRTSCHASTLICHE ZUSAMMENARBEIT/GESELLSCHAFT FUR TECHNISCHE ZUSAMMENARBEIT = FEDERAL MINISTRY FOR ECONOMIC COOPERATION/GERMAN AGENCY FOR TECHNICAL COOPERATION

BN = BLAST NURSERY

BN = BRUNEI DARUSSALAM

BND = BRUNEI DARUSSALAM DOLLAR

BNETD = BUREAU NATIONAL D’ETUDES TECHNIQUES DE DEVELOPPEMENT

BNF = BIOLOGICAL NITROGEN FIXATION

BO = BOLIVIA

BO = BRANCH OFFICE

BO = BUYER’S OPTION

BOA = BANK OF AMERICA

BOA = BASIC ORDERING AGREEMENT

BOA = BOARD OF ADJUSTMENT

BOA = BOARD OF AUDITORS

BOA = БОА (или УДАВ) – Boa is a long fluffy scarf of fur, feathers, or delicate fabric. / .

BOARD = ДОСКА – Board is a piece of lumber that is less than 38 mm (2” nominal) in smaller dimension used for sheathing, formwork, or for further manufacture into trim and shaped products, such as siding. / Разновидность пиломатериалов, которая по своему наименьшему размеру не превышает 38 мм (2” номинал) и используется для обшивки, опалубки или для дальнейшего

изготовления из неё отделочных и придающих форму продуктов, таких как 'вагонка'. Под Доской понимается плоский с двух сторон срез дерева, получаемый путём продольной распиловки бревна.

BOARD = СТУПАТЬ – Board:- to gain access to a vessel. / Взойти на судно.

BOARD BROKER SYSTEM = СИСТЕМА БРОКЕРОВ ПАЛАТЫ – Board Broker System is a system of trading in which an individual member of an exchange (or a nominee of the member) is designated as a Board Broker for a particular commodity with the responsibility of executing orders left with him by other members on the floor, providing price quotations, and maintaining orderliness in the trading crowd. A Board Broker may not trade for his own account or the account of an affiliated organization. See also Free Crowd Systems, and Specialist System.

BOARD FOOT = ДОСОЧНЫЙ ФУТ (или ФУТ ДОСКИ, или БОРДФУТ) – Board Foot (bd ft, fbm, or BF) is a unit of volume used for measuring lumber. One board foot is the volume of a one-foot length of a 'standard board' twelve inches wide by one inch thick. Thus a board foot equals 144 cubic inches, or 1/12 of a cubic foot, or approximately 2.360 liters. The number of board feet is easily computed from the dimensions of the stack, no matter how wide or thick the boards are. For example, a stack of two-by-fours 4 ft high, 4 ft wide, and 8 ft long contains 4 x 4 x 8 = 128 cubic feet, equivalent to 128 x 12 = 1 536 board feet. The symbol fbm is an abbreviation for 'foot, board measure'. MBF is an abbreviation for 1 000 board feet; the unit of trade for lumber and stumpage. Board Foot (bf or bft) is a specialized unit of measure for the volume of rough lumber (before drying and planning with no adjustments) or planned/surfaced lumber. It is the volume of a one-foot length of a board one foot wide and one inch thick. Some countries utilize the synonym Super Foot or Superficial Foot. A unit of measurement of lumber represented by a board 1 foot long, 12 inches wide, and 1 inch thick or its cubic equivalent. In areas where metric measure has been implemented, the cubic meter may be used to measure timber harvest, but 'board foot' remains the unit of measure for lumber production and sale. The basic unit of measurement for lumber. One board foot is equal to a one-inch (25.4 millimeters) board, 12 inches (304.8 millimeters) wide and one foot long (304.8 millimeters). Thus, a board ten feet (3 048.0 millimeters) long, 12 inches (304.8 millimeters) wide, and one inch (25.4 millimeters) thick contains ten board feet. Board Foot is a measure of wood, 144 cubic inches, for example, a board 1 inch thick, 12 inches wide and 1 foot long or 1 inch thick, 6 inches wide and 2 feet long. The usual measure for random length and width hardwood. Timber measurements are the most complicated and laborious of all the various measurements in use for shipping purposes. The unit of measurement in use in the United Kingdom (UK), North European countries, etc is 'a standard' of which there are many varieties, bearing no relation one to the other. In North America the unit of measurement is the 1 000 board feet; in France, Italy, Belgium, etc, the unit is the 'Stere', equivalent to the cubic metre of the metric system, while 'Petrograd standard' is almost exclusively used in the UK. See also Stere. All hardwoods are measured using a 'board foot' increment score. One board foot or 'BF' is 4/4 x 12" x 12" of surface measure. The board footage of a piece is determined by measuring thickness x width (inches) x length (feet) divided by 12. Rounding off to the nearest whole number. Example:- 6" x 8' x 1" / 12 = 4 BF. / Базовая единица измерения древесины. Один досочный фут равен гипотетической доске толщиной в один дюйм (25.4 миллиметра), шириной в 12 дюймов (304.8 миллиметров) и длиной в один фут (304.8 миллиметров). Таким образом, доска длиной в 10 футов (3 048.0 миллиметров), шириной в 12 дюймов (304.8 миллиметров) и толщиной в один дюйм (25.4 миллиметра), насчитывает 10 досочных футов. 1 бордфут = 1/12 кубического фута = 0.002 36 кубического метра.

BOARD OF DIRECTORS = СОВЕТ ДИРЕКТОРОВ – Board Of Directors is the governing body of a corporation who is elected by shareholders. The directors are responsible for selecting the officers and the supervision and general control of the corporation. Group of people who run a company. Decision-making group comprising all the directors of a company, who are legally responsible for their actions. The board of directors is specifically charged with the management of the company and in the case of a public limited company, in the United Kingdom, is elected by the shareholders at the company's Annual General Meeting (AGM). In the United States, the board of directors draws up company policy and appoints executives to run the company. Also known as The Board. An elected body or persons formed to control the planning and implementation of corporate objectives. The managers of a company, usually elected by the stockholders, who have final decision making authority for the company or corporation. Individuals elected by the shareholders of a corporation to appoint the company' chief operating officers, make broad policy decisions and declare dividends. / Физические лица, избранные акционерами корпорации для назначения руководителей компании, принятия решений о политике компании и декларирования дивидендов. Совет Директоров составляют руководители корпорации, избранные ежегодным общим собранием акционеров и уполномоченные решать определённые задачи, зафиксированные в уставе корпорации. Среди таких полномочий:- назначение руководящих работников, членов исполнительного и финансового комитетов (если таковые существуют), выпуск дополнительных акций и декларирование дивидендов. В совет директоров обычно входят высшие управляющие – работники корпорации, 'внутренние директора' (inside directors), а также члены правления, не являющиеся работниками корпорации, – 'внешние директора' (outside directors), которые дают рекомендации относительно внешней политики компании. Директора встречаются несколько раз в год и получают плату за свои услуги. В соответствии с законами, касающимися ценных бумаг, они считаются управляющим персоналом (control persons) или аффилированными лицами, а это означает, что согласно правилам их акции являются блокированными (restricted). Будучи членами правления, они не могут:- (i) покупать или продавать акции компании в течение 6 месяцев; (ii) участвовать в 'коротких' продажах акций компании, а в случае продажи собственных акций член правления должен поставить их в течение 20 дней и/или отправить сертификаты по почте в течение 5 дней; (iii) осуществлять какие-либо зарубежные или арбитражные сделки с акциями компании; и (iv) предоставлять какую-либо закрытую для общественности информацию.

BOARD OFFICERS = СЛУЖАЩИЕ СОВЕТА (или ДОЛЖНОСТНЫЕ ЛИЦА СОВЕТА, или РУКОВОДИТЕЛИ СОВЕТА) – Board Officers:- this term means the Chairman of the Board, the Vice Chairman of the Board and the Treasurer. / Этот термин означает Председателя Совета, Вице Председателя Совета и Казначея.

BOARD OF GOVERNORS = СОВЕТ УПРАВЛЯЮЩИХ – Board Of Governors is the central, governmental agency of the Federal Reserve System, located in Washington, DC, and composed of seven members who are appointed by the President and confirmed by the Senate. The Board of Governors is responsible for domestic and international economic analysis; with other components of the System, for the conduct of monetary policy; for supervision and regulation of certain banking organizations; for operation of much of the nation's payments system; and for administration of most of the nation's laws that protect consumers in credit transactions. / Совет Управляющих – управляющий орган Федеральной Резервной Системы США (Federal Reserve System (FRS) или, просто, Fed), состоящий из семи членов, известен также как Совет Федерального Резерва (Federal Reserve Board). Совет Управляющих определяет денежно-кредитную политику Федеральной Резервной Системы, регулирует банковскую деятельность, а также рост денежной массы (money supply).

BOARD OF TRADE = ПАЛАТА ТОРГОВЛИ (или ТАБЛО ТОРГОВЛИ) – Board Of Trade is any organized exchange or other trading facility for the trading of commodities. See also Contract Market. / Смотрите также Контрактный Рынок или Рынок Контрактов (Contract Market).

BOARD OF TRADE CLEARING CORPORATION = КЛИРИНГОВАЯ КОРПОРАЦИЯ ПАЛАТЫ ТОРГОВЛИ (или КЛИРИНГОВАЯ КОРПОРАЦИЯ ТАБЛО ТОРГОВЛИ) – Board Of Trade Clearing Corporation is an independent corporation that settles all trades made at the Chicago Board of Trade acting as a guarantor for all trades cleared by it, reconciles all clearing member firm accounts each day to ensure that all gains have been credited and all losses have been collected, and sets and adjusts clearing member firm margins for changing market conditions. See also Clearing House.

BOARD ORDER = НАСТОЛЬНОЕ РАСПОРЯЖЕНИЕ (или ПРИГРАНИЧНОЕ ПОРУЧЕНИЕ) – Board Order is an order to a stockbroker to buy or sell at a particular price. Also known as Market-If-Touched Order.

BOARDS LUMBER = ДОСОЧНЫЙ ПИЛОМАТЕРИАЛ – Boards Lumber:- a lumber that is less than 38 mm (2" nominal) thick and 38 mm (2" nominal) or more wide. / .

BOARDY = С ЖЁСТКИМ АППРЕТОМ – The knitted fabric becomes Boardy (a stiff or harsh hand) when the stitches have been knit very tightly. Knitted fabric defect, and namely:- stitch defect. Boardy is a term used to describe a fabric with a very stiff hand.

BOAT = ЛОДКА (или ШЛЮПКА) – Boats are open vessels, commonly wrought by oars, and of an endless variety of shapes, according to the purposes to which they are to be applied.

BOATER = КАНОТЬЕ (или ЛОДОЧНИК, или ХХ) – Boater is a stiff hat usually made of braided straw with a brim, hatband, and flat crown. / Мужская соломенная шляпка.

BOATSWAIN = БОЦМАН (или СУДОВОЙ ПАСТУХ) – Boatswain:- the highest unlicensed rating in the deck department who has immediate charge of all deck hands and who in turn comes under the direct orders of the master or chief mate or mate. Also known as Bosun. / по непосредственным распоряжениям хозямна (или капитана) или старшего помощника (на жаргоне моряков – чиф) или помощника. Известен также как Дракон (Bosun). Под Боцманом, от Голландского слова Bootsman, от Boot, означающее Лодка или Судно, и Man, означающее Человек, понимается специалист младшего командного состава экипажа судна (в ВМФ России – старшинского состава); непосредственный начальник палубной команды. В обязанности боцмана входит поддержание исправного состояния корпуса, такелажа и палубных устройств судна, руководство общесудовыми работами и обучение рядовых членов палубной команды (матросов) морскому делу, наблюдение за порядком и чистотой на судне. На крупных военных кораблях имеется один Главный Боцман и несколько обычных боцманов.

BOATSWAIN (BOSUN) = СТАРШИЙ БОЦМАН (БОЦМАН) – Boatswain or Bosun (deck department (unlicensed)):- receives working orders for deck gang from chief mate and passes them onto able seamen (AB's) and ordinaries. Tantamount to foreman, he is on deck directly supervising maintenance operations.

BOB = BOLIVIAN BOLIVIANO

BOB = BUNKER ON BOARD

BOBBIN = БОБИНА – In textile industry, Bobbin is the cylinder or spool upon which yarn or thread is wound. An option to buying lots of bobbins for your wheel is using 'Storage Bobbins'. Bobbin is a cylindrical or slightly tapered barrel, with or without flanges, for holding slubbings, rovings, or yarns. Bobbin:- (1) (a) a cylinder or spindle on which yarn or thread is wound (as in a sewing machine), or (b) any of various small round devices on which threads are wound for working handmade lace, or (c) a coil of insulated wire or the reel it is wound on. (2) A cotton cord formerly used by dressmakers for piping. / В текстильном производстве под Бобиной, от Французского слова Bobine, означающее Катушка, понимается вид паковки нити (нить наматывается на катушку без фланцев). Бобина:- (1) в текстильной промышленности вид паковки намотанной нити; в отличие от катушки, не имеет фланцев. (2) В системах батарейного зажигания двигателей внутреннего сгорания – одно из названий индукционной катушки. (3) В вычислительной технике, устройствах звукозаписи – катушка для намотки магнитной ленты. (4) В киносъёмочных аппаратах и кинопроекторах – катушка для намотки киноленты.

BOBBINET = ТЮЛЕВАЯ СЕТКА (или ТЮЛЬ, или ГАРДИННО–ТЮЛЕВОЕ, или БАБИНЭТ) – Bobbinet is a machine-made net of cotton, silk, or nylon usually with hexagonal mesh. Bobbinet is a machine-made net of cotton, silk, or nylon usually with hexagonal mesh. Origin:- blend of Bobbin and Net. / Найлан (Nylon). Машинный хлопчатобумажный тюль.

BOBBINET LACE = КРУЖЕВО БАБИНЭТ (или ТЮЛЕВАЯ СЕТКА, или ТЮЛЬ) – Bobbinet Lace:- many types of machine-made laces are made, frequently with geometrically shaped nets forming their backgrounds. Formerly made only of cotton, they are now frequently made from man-made fibre yarns. Bobbinet lace, essentially a hexagonal net, is used as a base for appliqué work for durable non-run net hosiery, and, when heavily sized, for such materials as millinery and veilings. Barmens lace has a fairly heavy texture and an angular pattern; flowing lines, heavy outline cords, and fine net backgrounds are not usually made on Barmens machines. See also Bobbin Lace, and Pillow Lace.

BOBBIN LACE = КРУЖЕВО, ПЛЕТЁННОЕ НА КОКЛЮШКАХ – Bobbin Lace is a lace made by using a pillow to hold the pins around which thread is arranged. Other names for bobbin lace are bobbinette lace and pillow lace.

BOBBIN LEAD = ОПЕРЕЖЕНИЕ КАТУШКИ – Bobbin Lead:- a single band drives the bobbin. The flyer has a friction brake. A well-known example of this would be the Ashford Traditional. Another term used is Scotch Tension.

BOBBY SOCKS = КОРОТЕНЬКИЕ НОСКИ (или НОСКИ БОББИ) – Bobby Socks are the girls' socks reaching above the ankle. Bobby – Bangladesh film actress.

BOBLS = БОБЛС (или ФЕДЕРАТИВНЫЕ НОТЫ) – In Germany, Bobls are the federal government notes with a maturity of 5 years. See also Bunds, and Schätze. The Bobl future is a standardized futures contract on a medium-term note of the Federal Republic of Germany. The Bobl future is traded on the Eurex®. The basis of the contract is a notional instrument, calculated on a basket of deliverable notes, with a coupon of six percent. The residual term to maturity of the deliverable note is between 4.5 and 5.5 years. The contract value is EUR100 000.00. / Ойрэкс® или Юрэкс®. Боблс это общепринятое сокращение от Немецкого слова Бундэсоблигационэн (Bundesobligationen), означающее Федеративная Облигация. В Германии, ноты (хотя из дословного перевода правильнее было бы называть облигации) федерального правительства со сроком погашения в 5 лет. Смотрите также Бундс или Федеративные Облигации (Bunds), и Щяцэ или Федеративные Казначейские Ноты (Schätze).

BOBTAIL = БОБТЭЙЛ – Bobtail is a slang term in energy industries. A special 'bobtail' truck is used to transport propane. 'Bobtail' trucks are designed to run on propane. The back of the 'bobtail' is much shorter than other tanker trucks used to transport gasoline or diesel.

BOBTAIL = ПЕРЕМЕЩЕНИЕ БОБТЕЙЛОМ (или ПЕРЕМЕЩЕНИЕ НА ОДНОЙ ГОЛОВЕ) – Bobtail is a movement of a tractor, without trailer, over the highway. / Перемещение тягача по шоссе без прицепа.

BOBTEX® ICS YARN SYSTEM = СИСТЕМА ХХ БОБТЭКС® – Bobtex® ICS Yarn System:- one of the recent systems of yarn production is the Bobtex® Integrated Composite Spinning (ICS). The process which produces a composite yarn that utilizes a polymer substrate with a fibrous surface. The production of this system ranges between 165 and 330 yd/min. The yarn used in this investigation was a two-component yarn, one of the early structures developed, which was found to have some favorable characteristics as well as some drawbacks. Work is going on to extend the study to the newer developments which have led to the production of three-component yarns. Bobtex® ICS Yarn System is a process for producing a simulated spun yarn by embedding individual fibers in a thermoplastic or adhesive coating on a filament yarn. Bobtex® yarns are formed according to the Integrated Composite Spinning (ICS) principle by joining staple fibers and polymer right at the extrusion stage into a composite structure which utilizes the inner polymer-matrix bonding forces to from a spun yarn, with a retained twist in consequence of the interfiber and intermolecular slip in the semimolten polymer while the yarn is produced at linear wind-up speeds from 500–1 000 ft/min in one continuous process from staple fibers and resin pellets. The process is fiber-independent, permitting conversion of natural, synthetic, or mineral staple fibers, of long or short staple in a blend with any type of thermoplastic polymer into composite Bobtex® ICS yarns which are satisfactory for numerous end uses. The implications of this Canadian invention and development are analyzed in the light of its flexibility to engineer yarn properties as well as considerations of reduced costs of spun yarn production, substantial raw-material savings, as well as increases in productivity per worker and per capital invested. After many years of intensive research and development activity, the Bobtex® ICS technology is reaching commercial status. This activity has also resulted in the Bobtex® Aerodynamic Brake Spinning (ABS) which is now in the tabora tory stage. Basically different from turbine or centrifugal forces utilizing open-end spinning systems, the Bobtex® ABS method produces 100% staple fiber yarns twisted in an axial direction by a false-twist type spindle imparting a positive twist and producing a linearly wound-up yarn package at output speeds many times faster than any hitherto known open-end systems. The Bobtex Corporation Limited, Montreal, Canada. / филаментная (комплексная) пряжа (filament yarn). Экструзия или Выдавливание (Extrusion).

BOD = BIOCHEMICAL OXYGEN DEMAND

BOD = BIOLOGICAL OXYGEN DEMAND

BODICE = КОРСАЖ (или ЛИФЧИК, или КОРСЕТ, или ЛИФ (ПЛАТЬЯ), или БАДОС) – Bodice is the part of a woman's dress (excluding the sleeves) which is above the waist. A woman's sleeveless undergarment, often laced at the front. Origin:- mid XVI century (originally bodies):- plural of body, retaining the original pronunciation. The term probably first denoted an undergarment, then known as a Pair Of Bodice, although this sense is not recorded until the early XVII century.

BODILY INJURY LIABILITY = ОТВЕТСТВЕННОСТЬ ЗА ПРИЧИНЕНИЕ ТЕЛЕСНЫХ ПОВРЕЖДЕНИЙ – Bodily Injury Liability is the liability which may arise from injury or death of another person. / Ответственность, которая может возникнуть вследствие нанесения телесных повреждений или смерти другого лица. К телесным повреждениям относятся:- вывих, перелом, размозжение, разрыв и рана.

BODY = ТЕЛО (или ТЕЛЬЦЕ, или ТУЛОВИЩЕ) – Body:- the trunk. In insects, it refers to the thorax alone, abdomen alone, or thorax and abdomen. / Под Туловищем понимается основная часть тела позвоночных животных и человека, его корпус, исключая голову, конечности и хвост (у животных).

BODY = ПЛОТНОЕ И УПРУГОЕ (или ВЯЗКОЕ, или ТЕЛЕСНОЕ, или ЗАСТИЛИСТОСТЬ) (НА ОЩУПЬ) – Body is a term applied to wool when the staple has a good 'hand' (full and with bounce). It can also refer to the fullness of a fabric. This is a subjective quality and has to do with a lack of limpness and/or stiffness. A fabric is said to have a good body when it has a full, rich, and supple hand. Body:- the compact, solid, or firm feel of a fabric.

BODYHOSE = НАТЕЛЬНОЕ БЕЛЬЁ – Bodyhose or Body Hose (singular noun):- clothing for covering the entire body:- (1) a tubular multifunction seamless garment made from hosiery material. (2) Seamless or seamed garments made from hosiery material made to cover any part of the body.

BODYMAPPING = КАРТИРОВАНИЕ ТЕЛА – Bodymapping:- the strategic placement of component materials in garment design and construction to provide the best possible movement and balance to enhance stamina or reduce fatigue for the wearer.

BODY SHIRT = НАТЕЛЬНАЯ РУБАШКА (или БАТНИК) – Body Shirt is a close-fitting shirt or blouse; a woman's close-fitting top made with a sewn-in or snapped crotch.

BODY STOCKING = НАТЕЛЬНЫЙ ТРИКОТАЖ – Body Stocking is a sheer close-fitting one-piece garment for the torso that often has sleeves and legs.

BODYSUIT = ТЕЛЬНЯШКА (или НАТЕЛЬНЫЙ КОСТЮМ) – Bodysuit is a close-fitting one-piece garment for the torso.

BOE = BARREL OF OIL EQUIVALENT

BOF RTGS SYSTEM = THE BANK OF FINLAND REAL–TIME GROSS SETTLEMENT SYSTEM

BOG = БОЛОТО (или ТРЯСИНА) – Bogs are one of North Americaэs most distinctive kinds of wetlands. They are characterized by spongy peat deposits, acidic waters, and a floor covered by a thick carpet of sphagnum moss. Bogs receive all or most of their water from precipitation rather than from runoff, groundwater or streams. As a result, bogs are low in the nutrients needed for plant growth, a condition that is enhanced by acid forming peat mosses. There are two primary ways that a bog can develop:- bogs can form as sphagnum moss grows over a lake or pond and slowly fills it (terrestrialization), or bogs can form as sphagnum moss blankets dry land and prevents water from leaving the surface (paludification). Over time, many feet of acidic peat deposits build up in bogs of either origin. The unique and demanding physical and chemical characteristics of bogs result in the presence of plant and animal communities that demonstrate many special adaptations to low nutrient levels, waterlogged conditions, and acidic waters, such as carnivorous plants. Bogs serve an important ecological function in preventing downstream flooding by absorbing precipitation. Bogs support some of the most interesting plants in the United States (like the carnivorous Sundew), and provide habitat to animals threatened by human encroachment. Bogs in the United States are mostly found in the glaciated northeast and Great Lakes regions (Northern bogs), but also in the southeast (pocosins). Their acreage declined historically, as they were drained to be used as cropland, and mined for their peat which was used as a fuel and a soil conditioner. Recently, bogs have been recognized for their role in regulating the global climate by storing large amounts of carbon in peat deposits. Bogs are unique communities that can be destroyed in a matter of days, but require hundreds, if not thousands, of years to form naturally. Xxxxx. A Bog is a mire that accumulates peat, a deposit of dead plant material – often mosses, and in a majority of cases, Sphagnum moss. It is one of the four main types of wetlands. Other names for bogs include mire, quagmire and muskeg. Frequently, as the illustration on the right shows, they are covered in Ericaceous shrubs rooted in the Sphagnum moss and peat. The gradual accumulation of decayed plant material in a bog functions as a carbon sink. Bogs occur where the water at the ground surface is acidic and low in nutrients. In some cases, the water is derived

entirely from precipitation, in which case they are termed ombrotrophic (rain-fed). Water flowing out of bogs has a characteristic brown color, which comes from dissolved peat tannins. In general the low fertility and cool climate results in relatively slow plant growth, but decay is even slower owing to the saturated soil. Hence peat accumulates. Large areas of landscape can be covered many meters deep in peat. Bogs have a distinctive group of plant and animal species, and are of high importance for biodiversity, particularly in landscapes that are otherwise settled and farmed. Distribution and Extent:- bogs are widely distributed in cold, temperate climes, mostly in boreal ecosystems in the Northern hemisphere. The world's largest wetland is the peat bogs of the Western Siberian Lowlands in Russia, which cover more than a million square kilometers. Large peat bogs also occur in North America, particularly the Hudson Bay Lowland and the Mackenzie River Basin. They are less common in the southern hemisphere, with the largest being the Magellanic Moorland, comprising some 44 000 square kilometers. Sphagnum bogs were widespread in northern Europe but have often been cleared and drained for agriculture. Bog Habitats:- there are many highly specialised animals and plants associated with bog habitat. Most are capable of tolerating the combination of low nutrient levels and waterlogging. Sphagnum moss is generally abundant, along with ericaceous shrubs. The shrubs are often evergreen, which is understood to assist in conservation of nutrients. In drier locations, evergreen trees can occur, in which case the bog blends into the surrounding expanses of boreal evergreen forest. Sedges are one of the more common herbaceous Species. Carnivorous plants such as sundews (Drosera) and pitcher plants Sarracenia purpurea have adapted to the low-nutrient conditions by using invertebrates as a nutrient source. Orchids have adapted to these conditions through the use of Mycorrhizal Fungi to extract nutrients. Some shrubs such as Myrica gale have root nodules in which nitrogen fixation occurs, thereby providing another supplemental source of nitrogen. Bogs are recognized as a significant/specific habitat type by a number of governmental and conservation agencies. They can provide habitat for mammals, such as caribou, moose, and beavers, as well as for species of nesting shorebirds, such as Siberian cranes and yellowlegs. The United Kingdom in its Biodiversity Action Plan establishes bog habitats as a priority for conservation. Russia has a large reserve system in the West Siberian Lowland. The highest protected status occurs in Zapovedniks (IUCN category IV); Gydansky[and Yugansky are two prominent examples. Bogs even have distinctive insects; English bogs give a home to a yellow fly called the Hairy Canary Fly (Phaonia jaroschewskii), and bogs in North America are habitat for a butterfly called the Bog Copper (Lycaena epixanthe). Types of Bog:- bog habitats may develop in various situations, depending on the climate and topography. One way of classifying them is based upon their location in the landscape, and their source of water. (1) Valley Bog:- these develop in gently sloping valleys or hollows. A layer of peat fills the deepest part of the valley, and a stream may run through the surface of the bog. Valley bogs may develop in relatively dry and warm climates, but because they rely on ground or surface water, they only occur on acidic substrates. (2) Raised Bog:- these develop from a lake or flat marshy area, over either non-acidic or acidic substrates. Over centuries there is a progression from open lake, to marsh, then fen (or on acidic substrates, valley bog) and carr, as silt or peat fill the lake. Eventually peat builds up to a level where the land surface is too flat for ground or surface water to reach the centre of the wetland. This part therefore becomes wholly rain-fed (ombrotrophic), and the resulting acidic conditions allow the development of bog (even if the substrate is non-acidic). The bog continues to form peat, and over time a shallow dome of bog peat develops:- a raised bog. The dome is typically a few meters high in the centre, and is often surrounded by strips of fen or other wetland vegetation at the edges or along streamsides, where ground water can percolate into the wetland. (3) Blanket Bog:- in cool climates with consistently high rainfall, the ground surface may remain waterlogged for much of the time, providing conditions for the development of bog vegetation. In these circumstances bog develops as a layer 'blanketing' much of the land, including hilltops and slopes. Although blanket bog is more common on acidic substrates, under some conditions it may also develop on neutral or even alkaline ones, if abundant acidic rainwater predominates over the ground water. Blanket bog cannot occur in drier or warmer climates, because under those conditions hilltops and sloping ground dry out too often for peat to form – in intermediate climates blanket bog may be limited to areas which are shaded from direct sunshine. In periglacial climates a patterned form of blanket bog may occur, known as String Bog. (4) Quaking Bog:- quaking bog or schwingmoor is a form of bog occurring in wetter parts of valley bogs and raised bogs, and sometimes around the edges of acidic lakes. The bog vegetation, mostly Sphagnum moss anchored by sedges (such as Carex lasiocarpa), forms a mat half a meter or so thick, floating over water or very wet peat. Walking on this surface causes it to move – larger movements may cause visible ripples of the surface, or they may even make trees sway. In the absence of disturbance from waves, the bog mat may eventually cover entire bays, or even entire small lakes. (5) Cataract Bog:- a cataract bog is a rare ecological community formed where a permanent stream flows over a granite outcropping. The sheeting of water keeps the edges of the rock wet without eroding the soil, but in this precarious location no tree or large shrub can maintain a roothold. The result is a narrow, permanently wet, sunny habitat. Uses:- (i) Industrial Uses:- after drying, peat is used as a fuel. More than 20% of home heat in Ireland comes from peat, and it is also used for fuel in Finland, Scotland, Germany, and Russia. Russia is the leading exporter of peat for fuel at more than 90 million metric tons per year. Ireland's Bord na Móna ('peat board') was one of the first companies to mechanically harvest peat. The other major use of dried peat is as a soil amendment (sold as moss peat or sphagnum peat) to increase the soil's capacity to retain moisture and enrich the soil. It is also used as a mulch. Some distilleries, notably in the Islay whisky producing region, use the smoke from peat fires to dry the barley used in making Scotch whisky. Once the peat has been extracted, it can be difficult to restore the wetland, since peat accumulation is a slow process. More than 90% of the bogs in England have been damaged or destroyed, and in 2011 plans for elimination of peat in gardening products were announced by the government of the United Kingdom. (ii) Other Uses:- the peat in bogs is an important place for the storage of carbon. If the peat decayed, carbon dioxide would be released to the atmosphere, contributing to global warming. Undisturbed, bogs function as a carbon sink. As one example, the peatlands of the former Soviet Union were calculated to be removing 52 Tg of carbon per year from the atmosphere. Peat bogs are also important in storing fresh water, particularly in the headwaters of large rivers. Even the enormous Yangtze River arises in the Ruoergai peatland near its headwaters in Tibet. Blueberries, cranberries, cloudberries, huckleberries and lingonberries are harvested from the wild in bogs. Bog oak, wood that has been partially preserved by bogs, has been used in the manufacture of furniture. Sphagnum bogs are also used for outdoor recreation, with activities including hunting and ecotourism. For example, many popular canoe routes in northern Canada include areas of peatland. Some other kinds of activity, such as All-terrain vehicles are especially damaging to bogs. Archaeology:- the anaerobic environment and presence of tannic acids within bogs can result in the remarkable preservation of organic material. Finds of such material have been made in Denmark, Germany, Ireland and the United Kingdom. Some bogs have preserved ancient oak logs useful in dendrochronology, and they have yielded extremely well preserved bog bodies, with organs, skin, and hair intact, buried there thousands of years ago after apparent Germanic and Celtic human sacrifice. Excellent examples of such human specimens are Haraldskær Woman and Tollund Man in Denmark, and Lindow man found at Lindow Common in England. At Céide Fields in County Mayo in Ireland, a 5 000 year old neolithic farming landscape has been found preserved under a blanket bog, complete with field walls and hut sites. One ancient artifact found in bogs in many places is bog butter, large masses of fat, usually in wooden containers. These are thought to have been food stores, of both butter and tallow. Bog is a peat-accumulating wetland that has no significant inflow or outflow of water and supports acidophilic vegetation, particularly sphagnum. See also Marsh, and Swamp. Bog is the type of wetland ecosystem characterized by wet, spongy, poorly drained peaty soil. Bogs can be divided into three types:- (1) typical bogs of cool regions, dominated by the growth of bog mosses, Sphagnum, and heaths, particularly Chamaedaphne (northern bogs with trees growing on them are often called Muskegs); (2) fens, dominated by grasslike plants, grasses, sedges, and reeds; and (3) tropical tree bogs, in which the peat may be formed almost

entirely from tree remains. Typical, or Sphagnum, bogs are highly acid with a pH (index of acidity–alkalinity) of less than five (seven being neutral) and are associated with waters containing no more minerals than are contained in rainwater, often the only source of water for a bog. Fens are watered with groundwater that has some dissolved minerals and that has a pH above five; that is, it is only moderately acid. Fens and bogs are often associated in one area that usually is called a Bog. Tropical bogs occur only in areas where the water is very low in minerals. They are less common than swamps but still cover extensive areas in Malaya, Indonesia, tropical South America, and Africa. Typical bogs have simple floras. Other than the Sphagnums and heaths, there are a few sedges and grasses, such as Cotton Grass; insectivorous sundews; pitcher plants; and many orchids. Desmids, a group of unicellular green algae divided into symmetrical halves, are characteristic of bogs. Animals are not common on bogs. Sphagnums are large mosses with large empty cells with pores opening to the outside that lie between the chlorophyll-bearing cells of the leaves. These empty cells readily absorb and retain water, giving a spongelike quality to the moss. Sphagnum absorbs minerals (cations) from the water, replacing them with acid (hydrogen ions), and thus makes the water around itself more acid. The saturation of the moss with water retards passage of air, so that parts of a mass of Sphagnum more than a few inches from the surface are usually anoxic. The combination of lack of oxygen, lack of minerals, and highly acid condition greatly retards the action of bacteria and fungi, the usual decay organisms. With the retardation of decomposition of the dead moss, a Sphagnum peat develops under the living plants. This is particularly the case in areas where there is a mean annual temperature of below 10 °C (50 °F), which also retards decay. Bogs are most common in parts of the world glaciated during the Pleistocene Epoch (10 000 to 2 500 000 years ago). They cover vast areas in the tundra and boreal forest regions of Canada, northern Europe, and Russia. Areas of high rainfall farther to the south, such as the wetter parts of the British Isles, also contain extensive bogs. Glacial ice created many local depressions by scouring underlying rocks and spreading an uneven deposit of till on the ground. With the melting of the ice, these depressions filled with water. If the mineral content of the water was low, the ponds so formed were colonized by Sphagnum, which converted them to bogs. Once bogs are formed, they retard the development of efficient drainage by inhibiting water movement and slowing erosion of the soil or rocks on which they rest. Thus, bogs tend to be long-lived if temperatures remain low and sufficient excess of rainfall over evaporation exists to prevent their drying out. If they do dry out, upland plants will colonize the former bog. Small lakes in glaciated regions have also often developed into bogs if they were not drained by headward erosion of stream beds or completely filled with terrestrial sediments. The lake begins to fill by the development of a floating mat of vegetation next to the shore. This may become a fen, with grasses and sedges principally involved, if the lake water has sufficient mineral content. A lake on resistant rocks, poor in minerals, will develop a floating bog mat with Sphagnum and Chamaedaphne. In larger lakes, wave action will not allow such floating mats to develop. As the mat grows into the water, it floats at the surface supported by air in the plant tissues. Upward growth shades the lower parts and these die, forming an increasingly thick floating mat, the top of which remains only a few inches above the level of the lake surface. Slow decay and mechanical disturbances break off waterlogged bits from the bottom of the mat. These sink and collect on the lake bottom so that the lake is filled from both the bottom up and the top down. The material collecting on the lake bottom is very fine, only a little denser than the water. It does not compact into a firm layer but forms a false bottom layer through which heavy objects fall to the solid original lake bottom. From the surface down, the layers are (1) floating bog, (2) clear water, (3) false bottom, and (4) true bottom. With the continued thickening of the mat there is less influence of the lake water on plant growth, and Sphagnum usually begins to invade the surface of the mat even if it was previously dominated by grasses. With the growth of the moss a true bog is formed and various heaths invade the mat, especially Chamaedaphne. With continued thickening, trees may begin to grow, the first usually being larch (Larix). Black spruce may invade in the last stages of bog development. From a distance it may be difficult to detect the original boundary between the upland and the now filled lake. During much of this process the vegetation is floating. The bog is called a Quaking Bog to indicate the instability of the surface, which will sink slightly beneath a weight. It is even possible to break through the vegetation into the water beneath. Both people and animals have drowned this way. Nonfloating bogs may also quake if the peat is thick and spongy. Ultimately, by upward and centripetal growth, the bog fills the lake completely. The original glacial basin will then contain a bottom layer of inorganic sediment combined with organic debris derived both from lake production and from terrestrial sources surrounding the lake. On top of that, a layer of false-bottom material, compacted by the weight of overlying peat, may be visible. Bog peat fills the remainder of the basin. Growth of the bog does not necessarily stop at this stage for, if rainfall is sufficient, the water-retaining properties of Sphagnum are sufficient to maintain a wet, stagnant environment above the original water table represented by the lake surface. Thus, continued upward growth of the bog plants creates a raised bog. The raised bog is similar to the ordinary bog except that it does not lie in a depression but is raised above the surroundings. A moat containing some open water typically surrounds a raised bog where water drains from the raised bog and surrounding upland. Because the moat receives upland drainage it may be a fen. The raised bog itself receives only rainwater. Because rain is very low in mineral content, the raised bog is more completely dominated by the characteristics of Sphagnum than that of the floating bog. Heaths, larches, and black spruce, which grow fairly well on the floating bog, survive only as stunted specimens around the edges of the raised bog. The peat underlying a Sphagnum bog is composed largely of partly decomposed moss. There may be some inclusion of windblown particles, pollen, and dust. The water content of peat may be as high as 90 percent. The ash content of dried peat varies from 2 to 20 percent, with lower values more usual because the higher ash amounts come from sand and clay blown into the peat when it was at the surface. Other chemical characteristics of peat underlying bogs are the absence of free oxygen; the presence of carbon dioxide at high pressure, though in small amounts; low electrolyte concentration; and high acidity. In general, temperatures in lowland tropical areas are high enough for organic decay to be too fast for large quantities of peat to accumulate. But in areas with very high rainfall and with groundwater of very low mineral content, bogs may occur. As is the case in colder regions, the bogs may fill low basins, or they may develop into raised bogs. The plants of these bogs are mainly broad-leaved evergreen trees, which may be as tall as 100 feet (30 meters). Palms and screwpines may also occur. The number of kinds of plants of these bogs is very limited in comparison with the surrounding forests, just as is the case in colder bogs. Toward the centre of the raised bogs, trees are shorter or absent. Grasses and sedges cover more of the ground and open pools of water may occur. Sphagnum does not grow in tropical bogs to any extent, and the peat is composed of the remains of seed plants. The limited number of species is caused entirely by the lack of any groundwater supply of minerals and the rapid removal, by heavy rainfall, of those that arrive in dust. / сохранение (conservation). тене (ombro). Пушица (Cotton Grass). Под Болотом понимается избыточно увлажнённый участок земли, на котором происходит накопление неразложившегося органического вещества, превращающегося в дальнейшем в торф. В более узком понимании болото отождествляют с торфяником и определяют как избыточно увлажнённый участок земли, покрытый слоем торфа глубиной не менее 30 сантиметров (в неосушенном виде); избыточно же увлажнённые земельные площади, не имеющие торфа или покрытые слоем торфа (peat) менее 30 см, называются Заболоченными Землями. Болота имеют большое хозяйственное значение. Добываемый после осушения болота торф используется как удобрение, топливо и на подстилку скоту, из него вырабатывают ряд ценных химических продуктов (аммиак, дёготь и другие), плиты из малоразложившегося торфа применяются в строительстве. Болота сосредоточены в основном в Северном полушарии, преимущественно в лесной зоне. Общая площадь под ними около 350 миллионов га. В пределах бывшего СССР болота распространены на Северной Европейской части, в Полесье, в Западной Сибири, на Камчатке и в других районах. Пионером изучения болот и природы торфа в России был первый Русский учёный-естествоиспытатель мирового значения Михаил Васильевич Ломоносов (1711–65). Академик Российской Академии Наук

Иоганн Готлиб Лэман (Lehmann; родился 04 августа 1719, Лангенбернсдорф, Саксония, Германия – трагически погиб 22 Января 1767 в Санкт Петербурге, Россия) в 1766 в своём труде ‘О Турфе и Пережигании Оного в Уголье’ дал первую классификацию торфов, выделив пять видов торфа с учётом растительных остатков в них. Г.И. Эндельман в 1810 издал книгу по осушению болот, в которой он различал торфы по горючести. Работы экспедиции Иосифа Ипполитовича Жилинского (20 Апреля 1834 – 1916) в 1873–98 по осушению болот в Полесье, Московской и других губерниях дали ценные научные сведения. Большой вклад в изучение растительности и географии болот внёс Русский ботаник, почвовед и географ Гавриил Иванович Танфильев (22 Февраля (05 Марта) 1857 – 04 Сентября 1928); первое районирование болот Европейской части России дал в 1898 Российский ботаник Александр Васильевич Фомин (02 (14) Мая 1869 – 16 Октября 1935). Развитие учения о болотах в XX веке связано с именами Российского ботаника Владимира Семёновича Доктуровского (06 (18) Ноября 1884 – 20 Марта 1935) и Российского ботаника, географа и лесоведа, Академика Академии Наук СССР Владимира Николаевича Сукачева (07 Июня 1880 – 09 Февраля 1967), опубликовавших обобщающие руководства по болотоведению. Доктуровский впервые в бывшем СССР применил пыльцевой метод изучения торфа и изучил развитие торфяников по геологическим периодам. Владимир Николаевич Сукачев, Российский геоботаник, почвовед, физико-географ, исследователь Восточной Сибири и Средней Азии Роберт Иванович Аболин (18 Мая 1886 – 27 Января 1938) и другие провели углублённые исследования Псковских болот. Большой вклад в учение о болотах внесли Д.Л. Герасимов и В.В. Кудряшов. Первый изучил географию и стратиграфию болот, в том числе детали строения торфяной толщи в связи с процессом торфообразования, второй создал оригинальную теорию роста и развития торфяников. Из зарубежных учёных вопросами болотоведения в начале XX века занимались Карл Альбэрт Вэбэр (Carl Albert Weber) в Германии, Аймо Каарло Каяндер (Aimo Kaarlo Cajander; 04 Апреля 1879 – 21 Января 1943) в Финляндии, известны Шведские работы. Несколько раньше появились работы Французских и Голландских болотоведов; особенно большое значение имела сводка о болотах (1884) рождённого в Швейцарии и ставшего пионером Американской палеоботаники Шарля Лео Лэскере (Charles Léo Lesquereux; 18 Ноября 1806 – 25 Октября 1889). Болота образуются в результате заболачивания почвы или зарастания водоёмов. В умеренном климате заболачивание происходит при близком уровне грунтовых вод; накоплению влаги способствует живой растительный покров (особенно Мхи (Moss) – кукушкин Лён и другие) и ещё больше – мёртвый, влагоёмкий растительный войлок; в почве создаются анаэробные условия и начинается заболачивание. Заболачивание водоёмов идёт разными путями. Зарастание:- на дне водоёма сначала отлагается глина или песок и оседают остатки главным образом микроскопических водных (планктон) и донных (бентос) животных и растений. Эти остатки образуют сапропель. Водоём мелеет, в нём поселяются растения, сначала погружённые (узколистные Рдесты, Роголистники и другие), затем Кувшинки с плавающими листьями или растения, стебли которых выдаются над водой (Камыш, Тростник). В донных отложениях начинают преобладать остатки растений (сапропелевый торф). От прежнего озера остаются лишь ‘окна’ воды, и водоём превращается в болото. Нарастание:- поверхность водоёма затягивается зыбким ковром (Зыбун, Сплавина), образованным корневищами трав (Осоки, Вахта и другие) или мхами. Этот ковёр нарастает с берегов и покрывает всё озеро. Механическое Заполнение:- в озёрах с торфяными берегами рыхлый торф размывается, оседает на дно. Водоём мелеет и зарастает растительностью. По характеру растительности и режиму питания растений различают:- (i) Низинные Болота; (ii) Переходные Болота (Transitional Bogs); и (iii) Верховые Болота (Raised Bogs). (1) Для Низинных Болот характерны эвтрофные растения (требовательны к минеральным элементам). Расположены в низких местах, например, в долинах рек. Средняя часть такого болота лежит на одном уровне с окраинами или ниже их, иногда поверхность наклонная. Низинные болота бывают:- намывного и грунтового питания. Первые образуются в долинах рек, по берегам озёр, богаты минеральными солями. Высокозольный торф в них перемешан с песком и илом, приносимыми речной, снеговой или дождевой водой. В умеренном климате это лесные болота (Ольха, Берёза, иногда хвойные – ‘согры’) или травяные болота – с Осоками, Тростником, Рогозом. Обширные травяные болота в дельтах Днепра, Дона, Волги, Кубани, Дуная, Амударьи называются Плавнями. На болотах намывного питания цветковые растения дают большую массу, Мхи развиты слабо. Болота грунтового питания часто образуются под склонами речных террас, в местах выхода ключей. Для них характерен мощный ковёр Мхов и слабое развитие травянистых растений. Фауна низинных болот разнообразна:- водяные Крысы, Полёвки, нередко Выдры, особенно много птиц (Кулики, болотные Курочки, Коростели и другие); в гнездовой период и при перелёте много Гусей и Уток. В южнорусских плавнях встречаются Кабан, камышовый Кот, Фламинго, Пеликаны. (2) Для Переходных Болот характерны мезотрофные растения (умеренного минерального питания):- обычна Берёза, часты Сосна, Осоки, сплошной ковёр из сфагновых Мхов (sphagnum Moss или bog Moss). (3) Для Верховых Болот характерны олиготрофные растения (нетребовательны к зольным элементам). Вода в этих болотах резко кислая, цвета чая, богата гумусовыми кислотами. Торф малозольный (1.5–4.0% золы). Расположены верховые болота обычно на водоразделах. Поверхность их в середине выпуклая, так как торф в центре болота накапливается интенсивнее, чем на периферии. Флора бедна (из деревьев – Сосна, к Востоку от Енисея – Лиственница; из кустарников – Вересковые:- Багульник, Кассандра, Клюква; из трав – Пушица влагалищная, Шейхцерия, Очеретник). Сплошной ковёр сфагновых мхов, образующих верхний слой торфа толщиной до 5 метров (м). Нарастание мха за год определяют по Росянке; она образует ежегодно на поверхности мха розетку листьев, которая потом погребается мхом и остаётся в торфе; расстояние между розетками соответствует годичному приросту мохового ковра. Другой способ определения годичного прироста торфа – по спилу у корневой шейки Сосны. Средний прирост торфа за 1 000 лет – около 1 м. Наиболее древние торфяники образовались около 1 миллиона лет назад. Различают 2 типа верховых болот:- (i) Лесные Верховые Болота покрыты низкой Сосной (восточнее Енисея – Лиственницей), в низинном ярусе – Вересковые кустарнички с Пушицей и ковёр сфагнума. (ii) Грядово-Мочежинные Верховые Болота имеют волнистую поверхность с длинными грядами (или кочками) торфа высотой до 70 см и понижениями (мочежинами) между грядами. На повышениях растительность такая же, как на лесных болотах, но Сосны здесь ниже (высотой до 1 м), часто единичны. В мочежинах редкие и низкие травы – Пушица, Шейхцерия и другие, напитанный водой и частично погруженный в неё сфагнум. В ходе образования верховое болото проходит ряд стадий, начиная с водоёма или заболоченной суши; каждая стадия оставляет слой торфа определённого ботанического состава. Фауна верховых болот бедная:- Лось, Волк (летом), Глухари, белые Куропатки, Журавли. Роль болот в ландшафте и типы их различны в разных зонах. В Арктической тундре поверхность болот разбита морочными трещинами на прямоугольники (полигоны) диаметром 5–20 м. Южнее – в типичной тундре, лесотундре и на Севере лесной зоны летом больше образуется талой воды. Замерзая зимой, она образует торфяные бугры высотой до 10 м, с постоянно мёрзлым ядром внутри (крупно- и плоскобугристые болота). В тундре заболоченность достигает 50% и больше; преобладают здесь не торфяные, а минеральные болота. В таёжной зоне Европы и Западной Сибири обычны выпуклые (верховые) сфагновые болота (sphagnum bog). Здесь площадь торфяников (в общей площади болота) наибольшая. В лесостепи торфяники эвтрофные (низинные). В степной зоне торф образуется изредка (обычно под водой); болота здесь с крупными травами – Тростником, Рогозом. В бывшем Союзе Советских Социалистических Республик (СССР) широко вели осушение, мелиорацию и освоение низинных болот под травосеяние, овощи (Капуста, Морковь), Зерновые (Овёс, Рожь), технические (Конопля, Лён) и силосные культуры. Окультурены обширные болотные долины Яхромы (Московская Область), на болотах Колхиды культивируются Цитрусовые;

был составлен проект мелиорации болот Барабинской низменности, освоены в значительной части болота Полесья. Под Трясиной понимается зыбкое, болотистое место. Под Топью понимается топкое, вязкое место.

BOGIE = ТЕЛЕЖКА (или КОЛЁСНАЯ ПАРА) – Bogie is a set of wheels built specifically as rear wheels under the container. / Колёсная Пара – один из основных узлов ходовой части вагона или экипажной части локомотива; служит для передачи веса подвижного состава на рельсы и создания силы тяги (на тяговом подвижном составе). Колёсная пара представляет собой ось с двумя наглухо насаженными на неё колёсами, которые служат для направления движения вагонов и локомотивов по рельсам. Колёсные пары обычно объединены по 2, 3 или более в тележки. Под Колёсной Парой понимается ось с двумя наглухо насаженными колёсами для направления движения подвижного железнодорожного состава по рельсам.

BOI = BINDING ORIGIN INFORMATION

BOIL = КИПЕТЬ (или КИПЯТИТЬ, или ВСКИПЯТИТЬ, или ВАРИТЬСЯ) – Boil:- in general, to heat or maintain a solution at the temperature where the vapor pressure of a liquid equals atmospheric pressure, that is, its boiling point; in dyeing sometime called 'Atmospheric Boil' to distinguish from boiling under pressure. In dyeing, unless otherwise specified, it is assumed that the solvent is water, so boiling occurs at 100 °C (212 °F), at sea level. At higher elevations the boiling point will be reduced. Dissolved solids (solutes) can increase the boiling point, but it is rare for dyeing or preparation liquors to contain enough solute to raise the boiling point by more than a few degrees. In order to get aqueous (water) solutions to a temperature higher than the normal boiling point, the pressure must be increased, using a closed vessel – a 'pressure cooker'. Closed pressure vessels are used extensively in dyeing of polyester with disperse dyes, and may be used in preparation processes such as scouring to hasten the process. Operating temperature of around 130 °C is quite common.

BOILED WOOL = ВАРЁНАЯ ШЕРСТЬ (или ОТВАРНАЯ ШЕРСТЬ, или КИПЯЧЁНАЯ ШЕРСТЬ) – Boiled Wool is a special type of fabric primarily used in berets, scarves, vests, cardigans, coats, jackets and even stuffed animals. It is created using a mechanical knitting process which involves a set pattern that is then shrunk. Boiled Wool:- thick, dense fabric that is heavily fulled to completely obscure its knitted construction.

BOILER = КОТЁЛ (или БОЙЛЕР) – Boiler is a device for generating steam for power, processing, or heating purposes or for producing hot water for heating purposes or hot water supply. Heat from an external combustion source is transmitted to a fluid contained within the tubes in the boiler shell. This fluid is delivered to an end-use at a desired pressure, temperature, and quality. Steam generating units used aboard ship to provide steam for propulsion, for heating and other auxiliary purposes. / Парогенерирующие установки, используемые на борту судна для обеспечения паром с целью приведения судна в движение, обеспечения теплоснабжения судна и иных вспомогательных целей. Под Котлом понимается устройство для получения под давлением пара или горячей воды в результате сжигания топлива, использования электрической энергии, теплоты отходящих газов или технологического процесса. По конструкции паровые котлы подразделяются на водотрубные и газотрубные, по схеме движения воды – с многократной циркуляцией и прямоточные. Паропроизводительность до 2 500 т/ч при давлении пара 25 МПа и температуре 570 °C; коэффициент полезного действия (кпд) котлов составляет в среднем 93–95%. Котельная Установка представляет собой совокупность устройств и механизмов для получения водяного пара или горячей воды за счёт сжигаемого топлива. Она состоит из котла и вспомогательного оборудования (тягодутьевые машины, дымовая труба и тому подобное). Под Котлом понимается устройство, в котором для получения пара или нагрева воды, потребляемых вне этого устройства, используется теплота, выделяющаяся при сгорании органического топлива, протекании технологического процесса, преобразовании электрической энергии в тепловую, а также теплота отходящих газов. В котёл могут входить топка, парогенерирующие поверхности, пароперегреватель, водяной экономайзер, воздухоподогреватель, каркас, обмуровка, тепловая изоляция, обшивка. Бойлер, от Английского слова Boiler, означающее Кипятильник или Котел, понимается устройство для подогрева воды в системах теплоснабжения и горячего водоснабжения. Смотрите также Водонагреватель.

BOILER AND MACHINERY POLICY = ПОЛИС НА КОТЕЛЬНОЕ И МАШИННОЕ ОБОРУДОВАНИЕ – Boiler And Machinery Policy:- an insurance against loss due to accidents to boilers, pressure vessels or other machinery including the equipment itself, as well as liability arising out of the accident.

BOILER ROOM = 'КОТЕЛЬНАЯ' – Little-known firm of brokers or dealers that sells securities over the telephone. Boiler Room is an enterprise that often is operated out of inexpensive, low-rent quarters (hence the term Boiler Room), that uses high pressure sales tactics (generally over the telephone), and possibly false or misleading information to solicit generally unsophisticated investors. / Предприятие, руководство которым зачастую осуществляется из дешёвых с низкой стоимостью аренды офисов (отсюда и термин котельная), использующее практику нагнетания ажиотажа при сделках (как правило по телефону), оперирующее заведомо ложной информацией с целью получения выгоды за счёт неискушённых инвесторов.

BOILERSUIT = КОСТЮМ КОЧЕГАРА (или РОБА, или СПЕЦОВКА) – Boilersuit:- coverall.

BOILING OFF = ОТВАРКА – Boiling Off is the operation of removing, by means of a hot, mildly alkaline liquid, the gum (seracin) which covers the raw silk fiber. Also called 'De-Gumming'. / Процесс отварки шёлка-сырца. Щелочное (Alkaline). Отварка Тканей – варка хлопчатобумажных и льняных тканей в растворах щёлочей при атмосферном или повышенном давлении с целью удаления примесей и подготовки к белению, крашению и набивке. Наиболее эффективен так называемый ходовой способ варки, выполняемый при атмосферном давлении и температуре около 90 °C, с непрерывным движением ткани в растворе, который содержит едкий натр, бисульфит натрия и силикат натрия.

BOILING POINT = ТОЧКА КИПЕНИЯ – Boiling Point is the temperature at which a substance boils, or is converted into vapor by bubbles forming within the liquid; it varies with pressure. / Точка Кипения или Температура Кипения . Температура Кипения (обозначается $T_{кип}$, T_s), температура равновесного перехода жидкости в пар при постоянном внешнем давлении. При температуре кипения давление насыщенного пара над плоской поверхностью жидкости становится равным внешнему давлению, вследствие чего по всему объёму жидкости образуются пузырьки насыщенного пара (смотрите Кипение). Температура кипения – частный случай Температуры Фазового Перехода первого рода.

BOILING RANGE = ДИАПАЗОН КИПЕНИЯ (или ИНТЕРВАЛ КИПЕНИЯ) – Boiling Range:- for a mixture of substances, such as a petroleum fraction, the temperature interval between the initial and final boiling points. / Температурные пределы кипения. Под Диапазоном, от Греческих слов Dia Pason (Chordon), означающих Через Все (Струны), понимается:- (1) в музыке – звуковой объём певческого голоса, инструмента, звукоряда мелодии и тому подобного; определяется интервалом между их нижним и верхним звуками. (2) В переносном смысле – охват, объём чего-либо; широта способностей, знаний, кругозор, размах деятельности. Под Интервалом, от Латинского слова Intervallum, означающее Промежуток или Расстояние, в музыке и акустике понимается соотношение двух звуков по высоте, то есть частоте звуковых колебаний. Кипение, переход жидкости в пар, происходящий с образованием в объёме жидкости пузырьков пара или паровых полостей. Пузырьки растут вследствие

испарения в них жидкости, всплывают, и содержащийся в пузырьках насыщенный пар переходит в паровую фазу над жидкостью. Кипение начинается, когда при нагреве жидкости давление насыщенного пара над её поверхностью становится равным внешнему давлению. Температура, при которой происходит кипение жидкости, находящейся под постоянным давлением, называется Температурой Кипения ($T_{кип}$). Строго говоря, $T_{кип}$ соответствует температуре насыщенного пара (Температуре Насыщения) над плоской поверхностью кипящей жидкости, так как сама жидкость всегда несколько перегрета относительно $T_{кип}$. При стационарном кипении температура кипящей жидкости не меняется. С ростом давления Ткип увеличивается (смотрите Уравнение Клапейрона-Клаузиуса). Предельной Температурой Кипения является Критическая Температура вещества. Температура кипения при атмосферном давлении приводится обычно как одна из основных физико-химических характеристик химически чистого вещества. Для поддержания кипения к жидкости необходимо подводить теплоту, которая расходуется на парообразование и работу пара против внешнего давления при увеличении объёма паровой фазы (смотрите Испарение). Таким образом, кипение неразрывно связано с теплообменом, вследствие которого от поверхности нагрева к жидкости передаётся теплота. Теплообмен при кипении – один из видов конвективного теплообмена. В кипящей жидкости устанавливается определённое распределение температуры:- у поверхностей нагрева (стенок сосуда, труб и тому подобного) жидкость заметно перегрета ($T > T_{кип}$). Величина перегрева зависит от ряда физико-химических свойств как самой жидкости, так и граничных твёрдых поверхностей. Тщательно очищенные жидкости, лишённые растворённых газов (воздуха), можно при соблюдении особых мер предосторожности перегреть на десятки градусов без закипания. Когда такая перегретая жидкость в конце концов вскипает, то процесс кипения протекает весьма бурно, напоминая взрыв. Вскипание сопровождается расплескиванием жидкости, гидравлическими ударами, иногда даже разрушением сосудов. Теплота перегрева расходуется на парообразование, поэтому жидкость быстро охлаждается до температуры насыщенного пара, с которым она находится в равновесии. Возможность значительного перегрева чистой жидкости без кипения объясняется затруднённостью возникновения начальных маленьких пузырьков (зародышей), их образованию мешает значительное взаимное притяжение молекул жидкости. Иначе обстоит дело, когда жидкость содержит растворённые газы и различные мельчайшие взвешенные частицы. В этом случае уже незначительный перегрев (на десятые доли градуса) вызывает устойчивое и спокойное кипение, так как начальными зародышами паровой фазы служат газовые пузырьки и твёрдые частицы. Основные центры парообразования находятся в точках нагреваемой поверхности, где имеются мельчайшие поры с адсорбированным газом, а также различные неоднородности, включения и налёты, снижающие молекулярное сцепление жидкости с поверхностью. Образовавшийся пузырёк растёт только в том случае, если давление пара в нём несколько превышает сумму внешнего давления, давления вышележащего слоя жидкости и капиллярного давления, обусловленного кривизной поверхности пузырька. Для создания в пузырьке необходимого давления пар и окружающая его жидкость, находящаяся с паром в тепловом равновесии, должны иметь температуру, превышающую $T_{кип}$. В повседневной практике (при кипячении воды в чайнике и тому подобном) наблюдается именно этот вид кипения, его называют Пузырчатым Кипением. Пузырчатое кипение происходит при небольшом превышении температуры T поверхности нагрева над температурой кипения, то есть при незначительном температурном напоре $DT = T - T_{кип}$. С увеличением температуры поверхности нагрева число центров парообразования резко возрастает, всё большее количество оторвавшихся пузырьков всплывает в жидкости, вызывая её интенсивное перемешивание. Это приводит к значительному росту теплового потока от поверхности нагрева к кипящей жидкости (росту коэффициента теплоотдачи $a = q/DT$, где q – плотность теплового потока на поверхности нагрева). Соответственно возрастает и количество образующегося пара. При достижении максимального (критического) значения теплового потока ($q_{макс}$) начинается второй, переходный режим кипения. При этом режиме большая доля поверхности нагрева покрывается сухими пятнами из-за прогрессирующего слияния пузырьков пара. Теплоотдача и скорость парообразования резко снижаются, так как пар обладает меньшей теплопроводностью, чем жидкость, поэтому q и a резко снижаются. Наступает кризис кипения, когда вся поверхность нагрева обволакивается тонкой паровой плёнкой, возникает третий, Плёночный, режим кипения. При нём теплота от раскалённой поверхности передается к жидкости через паровую плёнку путём теплопроводности и излучения. В том случае, когда жидкость не смачивает стенку (например, ртуть, легированную сталь), кипение происходит только в плёночном режиме. Все три режима кипения можно наблюдать в обратном порядке, когда массивное металлическое тело погружают в воду для его закалки:- вода закипает, охлаждение тела идёт сначала медленно (плёночное кипение), затем скорость охлаждения начинает быстро увеличиваться (переходное кипение) и достигает наибольших значений в конечной стадии охлаждения (пузырчатое кипение). Теплоотвод в режиме пузырчатого кипения является одним из наиболее эффективных способов охлаждения; он находит применение в атомных реакторах и при охлаждении реактивных двигателей. Широко применяются процессы кипения также в химической технологии, пищевой промышленности, при производстве и разделении сжиженных газов, для охлаждения элементов электронной аппаратуры и так далее. Наиболее широко режим пузырчатого кипения воды используется в современных паровых котлах на тепловых электростанциях для получения пара с высокими значениями давления и температуры. Плёночное кипение в паровых котлах недопустимо, оно может привести к перегреву стенок труб и взрыву котлов. Кипение возможно не только при нагревании жидкости в условиях постоянного давления. Снижением внешнего давления при постоянной температуре можно также вызвать перегрев жидкости и её вскипание (за счёт уменьшения температуры насыщения). Этим объясняется, в частности, явление Кавитации – образование паровых полостей в местах пониженного давления жидкости (например, в вихревой зоне за гребным винтом теплохода). Кипение при пониженном давлении применяют в холодильной технике, в физическом эксперименте (смотрите Пузырьковая Камера) и так далее.

BOILING WATER SHRINKAGE = УСАДКА ОТ КИПЯЩЕЙ ВОДЫ – Boiling Water Shrinkage is the decrease in length of a test specimen caused by a treatment in boiling water for specified time, expressed as a percentage of the length of the untreated test specimen. The lengths are measured before and after treatment under a specified pretension. See also Shrinkage. Boiling Water Shrinkage is a test designed to measure shrinkage in a cord, yarn, or high-shrinkage fiber when it is immersed in boiling water while under a tension of 0.05 grams/denier.

BOIL OFF = ОТВАРИВАТЬ (или ОТВАРКА) – Boil Off or Boiling-Off is:- (i) the process of removing sizing, wax, impurities, etc, from fabric by scouring; or (ii) the process of degumming silk. See also Scouring. Boil-Off is the process of removing impurities (as size or gum) by boiling fabrics in a scouring solution. Boil Off:- to remove size and impurities from cloth prior to dyeing, by circulating boiling caustic solution through the cloth in a kier or a boil-off machine. See also Scouring. / Отварка Тканей – варка хлопчатобумажных и льняных тканей в растворах щёлочей при атмосферном или повышенном давлении с целью удаления примесей и подготовки к белению, крашению и набивке. Наиболее эффективен так называемый ходовой способ варки, выполняемый при атмосферном давлении и температуре около 90 °C, с непрерывным движением ткани в растворе, который содержит едкий натр, бисульфит натрия и силикат натрия.

BOLD = ОТЧЁТЛИВОЕ (или ПОДЧЁРКНУТОЕ, или РЕЛЬЕФНОЕ) – Bold is a term applied well-grown wool of good character. Can you have wool with a bad character, i.e. from a bad neighborhood? I suspect that this is another one of those nebulous terms that apply to the wool's 'hand'.

BOLD GRAIN = ТОЛСТОЕ ЗЕРНО – Bold Grain is a grain that is broad in shape.

BOLERO = BILL OF LADING ELECTRONIC REGISTRY ORGANIZATION

BOLERO = БОЛЕРО – Bolero:- a loose waist-length jacket open at the front. / Болеро, от Испанского слова Bolero, – это изначально короткая облегающая безрукавка без застёжки, часть национального Испанского костюма. Сегодня определение болеро куда проще и шире – это просто укороченный жакет. Болеро появилось как часть национального мужского костюма в некоторых областях Испании. Болеро – это также танец и одновременно музыкальный жанр, зародившийся в Испании в конце XVIII столетия. Болеро Сегодня:- исторически и по определению болеро – это безрукавка. Однако современное болеро сильно видоизменилось со времен своего появления. Сегодня модные дизайнеры предлагают прекрасной половине человечества огромный выбор моделей болеро с рукавом и различными застёжками. Современные болеро могут иметь любую длину рукавов, могут завязываться спереди, застегиваться на пуговицы или крючки. Трикотажные, вязаные, хлопковые, из органзы, кружева, денима и так далее – сегодня болеро можно подобрать к любой одежде на любой вкус. Болеро подходит практически всем девушкам и женщинам, придает образу элегантность и завершенность. Болеро можно встретить в коллекциях Шанэль (Chanel), Люи Вито (Louis Vuitton), Гуччи (Gucci), Каролина Эрэра (Carolina Herrera), Оскар дё ля Рэнта (Oscar De La Renta), Поллини (Pollini) и других. Болеро отлично впишется в летний офисный стиль, придав строгость лёгкому сарафану или топу, прикрыв голые плечи. Болеро прекрасно дополнит вечернее или коктейльное платье (идеально сочетается с платьем-бюстье). Болеро также способно украсить, а при необходимости и утеплить наряд невесты или выпускницы. Кружевные, атласные, меховые болеро – прекрасное дополнение к вечернему наряду. Болеро в повседневном, casual гардеробе скроет мелкие недостатки фигуры (некрасивые плечи и предплечье) и будет незаменимо для тех женщин, которые стесняются носить слишком открытые топы или сарафаны. Трикотажные болеро хорошо носить поверх топа из более тонкого трикотажа. Можно дополнить образ шейным платком. Вязаные болеро хорошо сочетаются с водолазками и топами из хлопка. Такие болеро можно носить с джинсами, плотными леггинсами, юбками и непременно с туфлями на каблуке. В осеннее-весенний период актуальны меховые болеро, которые не только утепляют, но придают некоторый шик общему виду. Ажурное вязаное болеро придаст образу женственность и романтичность. Его можно носить как поверх трикотажного топа, так и поверх нарядного платья. Дополнить образ можно ниткой жемчуга.

BOLERO = БОЛЭРО – Bills Of Lading Electronic Registry Organisation (BOLERO) is a neutral, open platform, intended to be a cross-industry community moving world trade onto the Internet. The focus is to process trade documents fully electronically via a secure communication platform (CMP). The initial focus has been on the carrier's bill of lading through the Title Registry replicating the paper bill of lading functionality and bill of lading parties' roles. Lately, Bolero's focus has changed towards the trade settlement engine, 'SURF', Settlement Utility for Risk and Finance, which Bolero has developed together with some major banks. Maersk Line is a member of Bolero, and, to date (August 2002), has conducted a number of pilots to test functionality.

BOLERO ASSOCIATION LIMITED = БОЛЭРО ЭСОУСИЭЙШЭН ЛИМИТИД – Bolero Association Limited (BAL) is owned by its members. It was formed in 1995 and includes all Bolero users as well as cross-industry bodies that support Bolero's goal of creating the electronic alternative to paper-based trade. Headquarters are in London, the United Kingdom. The Bolero Association has an important role in representing its members and participants in dealing with the Bolero System operating company (Bolero International Limited), administering the enrolment process and the Bolero Rule Book (the governing document for all users of the Bolero System), administering member disciplinary procedures and running a number of user groups covering issues of particular interest to its members and participants. Although BAL enjoys a close working relationship with Bolero International Limited, the two companies are separate legal entities. Bolero International is jointly owned by SWIFT (short for Society for Worldwide interbank Financial Telecommunication), Through Transport Mutual Insurance Association Ltd. (TT Club), APAX Partners, Baring Private Equity Partners and Palio Portfolio Ltd. and is responsible for the operation of the Bolero System. Given its cross-industry pedigree, and that its core messaging services will be operated under contract by SWIFT, an organization with an outstanding record as a trusted third party for the banking industry, Bolero International Ltd believes that it is in an unprecedented position to gain the trust of all participants in global trade. A key starting point from which to develop this trust will be Bolero's acceptance of responsibility and liability for the provision of its services. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BOLERO BILL OF LADING = КОНОСАМЕНТ БОЛЭРО – Bills Of Lading Electronic Registry Organisation (BOLERO) Bill Of Lading:- beginning as a receipt for goods containing the contract of carriage, a bill of lading (BL or B/L) has acquired the status of 'negotiable document of title' by mercantile custom. This function enables the holder of a BL to obtain delivery, sell goods during transit, and use BL as security to facilitate payment. A BL is transferable by delivery or endorsement. Many regard this function as the most difficult to replicate electronically, since most legal regimes require 'tangible original paper document, susceptible to immediate visual verification on the spot'. However, Bolero took the challenge by offering a functionally equivalent of BL through the Title Registry, i.e. a central registry which records users' rights and obligations in relation to BBL; as well as the Core Messaging Platform and User Database, which identify users and authenticate all electronic messages exchanged within a closed system. Bolero Bill of Lading (BBL) is the 'BBL Text' (i.e. document digitally signed by the carrier with content similar to paper BL) plus 'Title Registry Record' (i.e. entries made by the Title Registry concerning BBL in accordance with users' electronic instructions). Users can transfer BBL by sending 'Title Registry Instructions' for 'Role Designations'. A carrier can create a BBL by transmitting a message (which includes BBL Text) to the Title Registry. Users undertake not to challenge the validity of digitally signed messages, as these messages are taken to satisfy the writing and signature requirements under 'any applicable requirement of law, contract, custom or practice'. INCOTERMS® 2000 also recognise the validity of electronic messages. The A8 and B8 clauses allow the replacement of a negotiable BL by an equivalent EDI message, 'where the parties have agreed to communicate electronically'. A carrier can create a transferable BBL by designating 'To Order Party' (i.e. specific endorsee) or 'Bearer Holder' (i.e. blank endorsement). / ИНКОТЁРМЗ 2000.

BOLERO INTERNATIONAL LIMITED = БОЛЭРО ИНТЁНЭШЭНЭЛ ЛИМИТИД – BOLERO International Limited:- Bills Of Lading Electronic Registry Organisation (BOLERO):- founded in 1998, with significant backing from the bank community and from the global logistics industry, Bolero was created as a neutral, trusted third party to develop a comprehensive set of standards that would remove the barriers to global, cross-enterprise business. Bolero implements and enforces these standards in an open platform to enable paperless trading between buyers, sellers, logistics, banks, agencies and customs anywhere in the world, delivering transaction visibility, predictability, speed, accuracy and security. Building on this platform, Bolero delivers applications that enable the merging of the physical and Financial Supply Chains, allowing companies to fundamentally re-engineer the way that business is done and take advantage of electronic trading. Customers and their trade partners are rapidly deploying Bolero solutions delivering significant reductions in cost and working capital, increased visibility and improvements in operating efficiency. Headquarters are in London, the United Kingdom. Bolero was founded by SWIFT, and the Through Transport Club (TT Club). In 2000 additional capital was invested in

Bolero by Apax Partners and Baring Private Equity Partners. The cross-industry ownership provides the company with a unique neutral positioning which sets it apart from other proprietary initiatives which have favored the interests of a specific company, market or country. SWIFT is the industry-owned cooperative supplying secure, standardized messaging services and interface software to 7 600 financial institutions in 200 countries. Apax Partners is one of the world's leading venture capital and private equity investment groups, managing more than USD11 billion on behalf of institutional investors worldwide. Baring Private Equity Partners is the international private equity arm of the ING Asset Management and commenced trading in 1984. The TT Club is the international transport and logistics industry's leading provider of insurance and related risk management services. Palio is a Swiss Limited Company, domiciled in Zurich, with international investments in private and public equity, convertibles and high yield debt focusing on the opportunities for capital appreciation created by the rapid convergence of technology, communication and commerce. Bolero is a neutral, open platform, intended to be a cross-industry community moving world trade onto the Internet. The focus is to process trade documents fully electronically via a secure communication platform (CMP). The initial focus has been on the carrier's bill of lading through the Title Registry replicating the paper bill of lading functionality and bill of lading parties' roles. Lately, Bolero's focus has changed towards the trade settlement engine, 'SURF', Settlement Utility for Risk and Finance, which Bolero has developed together with some major banks. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BOLILAND RICE = РИС БОЛИЛЭНД – Boliland Rice (in Sierra Leone) is a Rice grown in fields that may be flooded for 2–4 months. Bolilands are the featureless seasonal swamps. Term 'Bolilands' (from Boli being a Temne word for those lands that are flooded in the rainy season and dry and hard in the dry season and on which only grass can grow. Temne, also spelled Temen or Timni, group of some 1.6 million people of central and northwestern Sierra Leone who speak a language (also called Temne) of the Atlantic branch of the Niger-Congo family. The Temne are mainly farmers whose staple crop is Rice, supplemented by Peanuts (Groundnuts), Cotton, Cassava, and Millet; cash crops are palm kernels and kola nuts. Rice, cattle, and goats are also important.

BOLIVIA = БОЛИВИА (или БОЛИВИЙКА, или БОЛИВИЙСКАЯ) – Bolivia:- (Elysian) wool. Sometimes contains Alpaca or mohair. Twill:- usually 3 up and 3 down. A pile weave (cut) with a diagonal pattern. Pile face which varies in depth. Soft and has a velvety feel. Usually piece dyed. Usually has lines or ridges in the warp or in a diagonal direction on one side. Comes in light, medium and heavy weights.

BOLL = (СЕМЕННАЯ) КОРОБОЧКА – Boll is the capsule or pod of the Cotton plant. After flowering, an elongated capsule or boll is formed in which the Cotton fibers grow. Once the fibers grow completely, the capsule bursts and fibers come out. A Cotton capsule contains about 30 seeds and each seed hosts around 2 000 to 7 000 seed hairs (fibers). Depending on the Cotton type and growing conditions, the color of the fiber is usually creamy white or yellowish. The average fiber length of different kinds of Cotton varies from 22 to 50 mm, and its diameter, from 18 to 25 μm. The fruiting structure of a Cotton plant. It is a leathery capsule made up of separate compartments called Locks, in which Cotton seeds and lint grow. Boll:- the seed pod of the Cotton plant. It has from three to five cells, each cell containing from 6 to 11 seeds, these seeds being covered with the Cotton fibers. The seed pod of the Cotton plant which forms the bed of support for Cotton seeds that are surrounded by fibers. Boll is a name of the Cotton plant's fruiting structure. It is made up of separate compartments called Locks in which Cotton seeds and lint grow. See also Lint, Lock and Square. / коробочка (capsule). Она образуется из отдельных составляющих – тычинок, сросшихся в колонку, 3–5 лопастного пестика и 3–5 гнёздной завязи, в которых развиваются семена и волокно. Название плодоносящей структуры Хлопчатника. Она представляет собой отдельные завязи, именуемые дольками (гнёздами), внутри которых развиваются семена и волокно. Смотрите также Волокно (Lint), Долька (Lock) и Подцветник (Square). В ботанике под Коробочкой понимается сухой многосемянный (иногда односемянный) вскрывающийся плод растений, образованный двумя или несколькими плодолистиками. Коробочки встречаются у Мака, Подорожника, Тюльпана, Хлопчатника и других. Коробочкой может называться также часть спорогония мхов, содержащая споры. Коробочка (Capsula):- (1) сухой многосемянный (иногда односемянный), вскрывающийся при созревании плод, образованный двумя или несколькими плодолистиками. Коробочка вскрываются крышечкой (Подорожник, Белена), дырочками (Мак, Колокольчик), зубчиками на верхушке коробочки (Примула, Гвоздика), продольными трещинами (створками), которые образуются или вдоль перегородок (Табак, Чемерица), или по створкам (Тюльпан, Лилия, Гиацинт и другие). (2) Часть спорогония Мхов, содержащая споры; коробочки бывают цилиндрические или шаровидные. Плод у Хлопчатника – трёх-четырёх-пятистворчатая коробочка яйцевидной или шаровидной формы, в различной степени сплюснутой. У большинства сортов к моменту созревания коробочка раскрывается. Диаметр её у разных форм от нескольких миллиметров (мм) до 6–7 сантиметров (см). Вес хлопка-сырца одной коробочки варьирует у диких форм от 0.25 до 1 грамма (г), у культурного Хлопчатника может достигать 10–12 г и более. У возделываемых в бывшем Союзе Советских Социалистических Республик (СССР) сортов средневолокнистого Хлопчатника вес хлопка-сырца одной коробочки достигал 7–8 г, а у сортов тонковолокнистого Хлопчатника он был равен 3–4 г. Коробочка внутри разделена перегородками на гнёзда, снаружи прикрываемые створками. Внутри коробочки перегородки сходятся, образуя так называемый центральный семяносец, на котором образуются семена. В каждом гнезде может образоваться от 5 до 10 семян, а в коробочке в зависимости от числа гнёзд – от 15 до 50 семян. От оплодотворения до созревания коробочки проходит 50–65 дней. Созревая, коробочка усыхает, стенки её растрескиваются, и она раскрывается. Степень раскрытия зрелых коробочек – наследственный признак, имеющий очень важное хозяйственное значение. Виды и сорта Хлопчатника по этому признаку сильно различаются. Особую ценность представляют сорта, у которых коробочки хорошо раскрываются, но в то же время хлопок-сырец прочно удерживается между створками и не выпадает из коробочек. Такие сорта называются буреустойчивыми. Хлопок-сырец в этом случае легче убирать машинами. Созревание и раскрытие коробочек на растении идёт в той же последовательности, в какой формировались бутоны и раскрывались цветки. Последовательность коротких и длинных очередей в созревании отдельных коробочек обусловливает образование конусов созревания в пределах каждого куста. На растении Хлопчатника формируется значительно больше плодовых органов, чем их полностью созреет. Много бутонов и коробочек в течение вегетации опадает. У большинства современных форм средневолокнистого Хлопчатника опадает 60–70%, а у тонковолокнистого – 30–40%. В условиях Средней Азии при высокой агротехнике и нормальной густоте стояния в среднем на одном растении образуется 8–10 коробочек с хлопком-сырцом.

BOLLARD = БИТЕНГ (или КНЕХТ, или ШВАРТОВАЯ ТУМБА) – Bollard is a post, fixed to a quay or a vessel, for securing mooring ropes. An upright wooden or iron post in a boat or on a dock, used in veering or fastening ropes. A strong post (as on a wharf or quay or ship for attaching mooring lines). A thick post on a ship or wharf, used for securing ropes and hawsers. Pole (тумба), fixed to a quay (причал) or a vessel, for securing mooring lines (причальные линии или швартов). Post on wharf, ship or tug for securing lines (в Новой Зеландии). Bollard is a large circular post fitted at wharf for making fast mooring ropes; usually in pairs. Also known as Bitt. Bollard is an upright, wooden or iron post to which hawsers or mooring lines may be secured. / Битенг, от Голландского слова Beting, означает стальную или чугунную одиночную или парную тумбу на палубе судна для закрепления буксирного троса или

якорного каната, а также для уменьшения скорости движения якорной цепи при отдаче якоря. Под Кнехтом, от Голландского слова Knecht, понимается парная тумба с общим основанием на палубе судна, предназначенная для закрепления накладываемого восьмёрками швартовного (швартовный кнехт) или буксирного (буксирный кнехт) троса. Обычно кнехты пустотелые, стальные или чугунные. Кнехт, от Голландского слова Knecht, означает стальную или чугунную парную тумбу, как правило пустотелую. Он укрепляется на палубе судна или на причале и служит для закрепления буксирного или швартовного троса. Под Швартовным Устройством судна понимается совокупность приспособлений и механизмов (вьюшки, киповые планки, клюзы, кнехты, лебёдки, утки, швартовные клюзы, швартовные лебёдки или шпили, швартовы и прочие) для удержания судна во время стоянки у причала или у борта другого судна. Управление швартовными механизмами местное или дистанционное. Автоматическое потравливание или выбирание швартового троса при изменении его натяжения (например, при погрузке или разгрузке судна) позволяет избежать тяжёлой ручной работы. Швартов, от Голландского слова Zwaartouw, гибкий трос (стальной, синтетический или из растительного волокна), с помощью которого подтягивают и крепят судно к причалу или другому судну.

BOLLARD PULL = ПРОВЕРКА ТЯГОВОЙ СИЛЫ – Bollard Pull refers to a test of a tug's capability to pull, measuring how many tones of pull are being applied. / Проверка Тяговой Силы – это тест на способность буксира тянуть, измеряющий сколько тонн тянется.

BOLL COUNT = СЧЁТ КОРОБОЧЕК (или ХХ) – Boll Count:- Average number of bolls per sampled unit. May be used to indicate when a desired economic level of bolls has been set. Bolls set on sympodial nodes nearest the main-stem tend to contribute most to yield, and be of a higher quality, when they are retained.

BOLL DAMAGE = ПОВРЕЖДЕНИЕ КОРОБОЧКИ – Boll Damage from Helicoverpa Species and other Insects can provide sites of entry for weak fungal pathogens. These Fungi are not generally capable of causing boll rots by themselves. Careful examination will reveal a wound or grub hole. / Виды (Species).

BOLL DANGLE = ОБВИСАНИЕ КОРОБОЧКИ – Boll Dangle, or cavitation occurs following heat and/or water stress in plants with a full fruit load. Immature small fruit die and dry on the plant. An elongated dead patch always develops along the fruiting branch below the dead boll. The development of young bolls is 'frozen' and the immature small (up to 15 mm) boll, bracts and stalk dies and dries on the plant. An elongated dead patch also develops on the fruiting branch below where the stalk of the 'frozen' boll is attached. The condition has been attributed to cavitation and is usually associated with heat and/or water stress and plants with a full fruit load. The fungus Phomopsis sp. is frequently, but not always, present and similar symptoms may also result from insect larvae feeding on very young fruit. / Обвисание коробочки или кавитация возникает вследствие теплового воздействия и/или напряжения (недостатком) воды в растениях с полной нагрузкой плода. . Удлиннённый омертвевший очаг всегда развивается совместно с плодоносящей ветвью чуть ниже мёртвой коробочки. (до 15 мм) коробочки, прицветнички (bracts) и стебелёк или ножка (stalk) отмирают и высыхают, находясь на растении.

BOLLGARD® 3 COTTON = ХЛОПЧАТНИК БОЛГАР® 3 – Bollgard 3 (BG3) Cotton:- the third generation insect technology that kills Helicoverpa spp. pests.

BOLLGARD® COTTON = ХЛОПЧАТНИК БОЛГАР® – BOLLGARD® is the name for Monsanto's BT transgenic technology. This technology is owned by Monsanto and is protected by a labyrinth of international patents. To be able to plant transgenic seed in a given area a farmer must first receive a license for that area from Monsanto. Bollgard® Cotton is a cotton variety that has been genetically altered to express an endotoxin (Bacillus thuringiensis) that is active against some caterpillar pests, such as tobacco budworms, bollworms, and European corn borers. Also called BT Cotton. / БОЛГАР® – это зарегистрированное название для БТ трансгенной технологии компании Монсэнто (Monsanto). Эта технология принадлежит компании Монсэнто и защищена серией международных патентов. Использование трансгенных семян для посева на какой-то территории фермер, в первую очередь, должен получить от Монсэнто лицензию для конкретной территории.

BOLLGARD II® COTTON = ХЛОПЧАТНИК БОЛГАР II® – Bollgard II® Cotton, gm Cotton, contains two insecticidal genes, Cry1Ac and Cry2Ab, both derived from a common soil bacterium, Bacillus Thuringiensis (Bt). These genes encode proteins that are toxic to lepidopteran caterpillars, including the two key Helicoverpa pests of Cotton (H. Armigera and H. Punctigera). Bollgard II® Cotton Plants also contain two bacterial antibiotic resistance genes, nptII (conferring resistance to kanamycin and neomycin) and aad (conferring resistance to streptomycin and spectinomycin), and a reporter gene, uidA (enabling visualisation of plant tissues in which this gene is being expressed). The aad gene is not expressed in the gm cotton plants because the bacterial promoter that controls its expression is not active in plants. This gene was used as a marker to select for bacteria containing the modified DNA in the laboratory prior to the production of the genetically modified plants. Short regulatory sequences that control expression of the genes are also present in the gm Cottons. These are derived from Cauliflower mosaic virus (CaMV), the common soil bacterium Agrobacterium tumefaciens and Glycine max (soybean). Although two of these organisms (CaMV and A. Tumefaciens) are plant pathogens, the regulatory sequences comprise only a small part of their total genome and are not in themselves capable of causing disease. Bollgard II® Cotton was produced by particle bombardment of the Cry2Ab and uidA genes into GM INGARD® Cotton (containing the Cry1Ac, nptII and aad genes). This technique involves coating the DNA containing the genes onto very small tungsten or gold particles which are 'shot' into the Cotton tissue, followed by selection of plants that contained single, functional copies of the genes. INGARD® Cotton was produced using a disarmed plasmid vector (containing the Cry1Ac, nptII and aad genes) carried by A. tumefaciens. Bollgard II® Cotton is a Cotton Variety that has two 'stacked' (or 'pyramided') genes that each encode for the expression of separate endotoxins (Bacillus Thuringiensis; Cry1Ac and Cry2Ab proteins) that are effective against a wide spectrum of caterpillar pests and offer enhanced activity against Bollworms, compared to Bollgard®. Bollgard II® (BGII) Cotton contains traits that kill Helicoverpa Spp. pests. / Бациллус Турингиэнсис. Чешуекрылые или Бабочки (Lepidopteran). Хлопчатник ИНГАР® (INGARD® Cotton)

BOLLIE = НЕДОРАЗВИТАЯ КОРОБОЧКА (или КУРАК, или СЛЕПАЯ КОРОБОЧКА) – Bollie is a Cotton boll that is dry but not open because of weather, insect, or disease damage. Unopened bolls of Cotton that contain usable lint. Cotton taken from half-open or small bolls. / Под Кураком или Слепой Коробочкой, от Узбекского слова Кур, означающее Слепой, понимаются нераскрытые или слегка раскрытые коробочки Хлопчатника, остающиеся на растении после осенних заморозков. Образуются на периферийной, поздно зацветающей части куста. Убирают курак куракоуборочными машинами. Хлопок-сырец из курака низкого качества. Русскоязычный, а точнее Узбекскоязычный термин Курак используется в Узбекистане для определения недоразвитой, слегка раскрытой после заморозка коробочки Хлопчатника. Куракоуборочные Машины – сельскохозяйственные машины для сбора полураскрытых и нераскрытых коробочек с кустов Хлопчатника, а также остатков урожая хлопка-сырца. В бывшем Союзе Советских Социалистических Республик (СССР) выпускали куракоуборочные машины СКО-2.4, СКО-3.6 и СКО-5.4 с обогатителями собранного вороха, которые убирали одновременно 4–6 рядов с междурядьями 60 или 90 сантиметров (см). Они имели производительность 1.2–3.4 гектара за час (га/ч). Куракоуборочная Машина, машина для уборки курака. Применяют после уборки хлопкоуборочной машиной хлопка из раскрывшихся коробочек. Из курака хлопок выделяют

хлопкоочистителем. Промышленный выпуск куракоуборочных машин в бывшем Союзе Советских Социалистических Республик (СССР) был начат в 1955. До этого их изготовляли в хозяйствах или на предприятиях местной промышленности. Рабочие органы куракоуборочной машины – парные наклонные вращающиеся рифлёные валики – обрывают курак с кустов Хлопчатника, попавших между валиками. Счёсанный валиками хлопковый ворох винтовым конвейером (шнеком) и вертикальным планчатым транспортёром подаётся в приёмную камеру обогатителя, состоящего из лущильного барабана и сепаратора с тремя пильными барабанами с протирочными щётками и съёмного щёточного барабана. Отходы по скатной доске падают на землю. Обогащённый ворох после очистки или лущения (в зависимости от настройки куракоуборочной машины) шнеком и воздушным потоком вентилятора подаётся в бункер. При настройке куракоуборочной машины без обогащения и лущения ворох поступает непосредственно в бункер. Производительность машины СКО-4 до 1.5 га/ч, СКО-2 до 0.9 га/ч; ширина захвата соответственно 2.4 и 1.8 метра (м). Рабочие органы куракоуборочной машины приводятся в действие от вала отбора мощности трактора. Куракоуборочная машина:- а – технологическая схема; б – рабочий орган; в – обогатитель; 1а – уборочный аппарат; 2а – поперечный шнек; 3а – вертикальный транспортёр; 4а – обогатитель; 5а – вентилятор; 6а – бункер; 7б – кустонаправитель; 8б – рифлёные валики; 9б – шнек; 10б – редуктор; 11в – заслонка; 12в – лущильный барабан; 13в – рифлёное подбарабанье; 14в – гофрированная сетка; 15в – щиток; 16в – малые пильные барабаны; 17в – протирочные щётки; 18в – щёточный барабан; 19в – шнек; 20в – большой пильный барабан; 21в – откидной щиток.

BOLLINGER BANDS® = ПОГРАНИЧНЫЕ ПОЛОСЫ БОЛЫНДЬЖЁРА® – In technical analysis, this is an indicator tool in some internet charting services. It will display the width of Bollinger Bands® as an indicator on the chart. This indicator allows users to compare volatility and relative price levels over a period of time. It consists of three bands designed to encompass the majority of a security's price action. Prices will often meet resistance at the upper band and support at the lower band. Bollinger Bands® are the bands widen during increased volatility and contract in decreased volatility, and when broken, are an indication that the trend is powerful and may continue in that direction. / Дьжон Болындьжё (John Bollinger). В техническом анализе биржевых рынков Пограничные Полосы Болындьжёра .

BOLL LOAD = XX КОРОБОЧКИ – Boll Load:- Cotton Plant's capacity to retain and develop fruit within limits of its genetic constitution and the prevailing environmental conditions. As boll loading progresses, available resources are partitioned in favor of boll development and diverted from vegetative development. The genetic constitution governs the vegetative/boll relationship and the environment governs the available resources. The term is also used to indicate when a desired economic level of bolls (see Boll Count) have been set or when additional boll set is limited by the prevailing environmental and physiological conditions of the crop.

BOLL OPENER = АППАРАТ ВСКРЫТИЯ КОРОБОЧЕК (или ВСКРЫВАТЕЛЬ КОРОБОЧЕК) – (1) In cotton ginning, Boll Opener is a machine that is used to open raw cotton bolls by air turbulence and clean lower grades of cotton by separating dust, leaves immature bolls, etc. Boll opener reduces manpower required for sorting, by allowing dust, immature bolls, and leaves to fall below through grids with holes of different sizes for separate collection.

(2) Boll Opener is a chemical, such as ethephon or Prep™, that increases the rate and percentage of boll opening at crop maturity. Boll openers are commonly used to promote efficient mechanical harvesting.

BOLL RETENTION = УДЕРЖИВАНИЕ КОРОБОЧКИ (или XX) – Boll Retention:- Normal fertilization, growth, and development of a fruiting structure; opposite of boll abscission, abortion or shedding.

BOLL ROT = КОРОБОЧНАЯ ГНИЛЬ – Boll Rot:- Pest type:- disease; crops affected:- Cotton; scientific name:- Colletotrichum Spp., Diplodia Gossyina, Fusarium Spp., Xanthomonas Campestris. Symptoms:- numerous microorganisms, both Fungi and Bacteria, cause boll rots. Generally, the first symptoms are small, water-soaked spots on the bolls. Diplodia attacks lower bolls near maturity in warm, humid conditions. Bolls turn dark brown, then black smut-like Fungus growth covers the boll. Fusarium Spp. infect bolls which are about 35 days or older, and diseased bolls become dark brown with a white to salmon colored overgrowth. With these Fungi, the bracts are often infected first. These Fungi may also cause boll 'tight-lock'. External symptoms may be absent, but complete destruction of seed and fiber can occur. When caused by Xanthomonas Bacterium, seed may rot and lint becomes discolored; bolls have round lesions that may appear water-soaked and become sunken and dark brown or black. Disease Cycle:- the Diplodia and Fusarium soilborne Fungi that cause boll rot overwinter on plant debris. Boll rot is most common in humid areas, such as South and central Texas, but is rarely a problem in drier areas like the High Plains of TX. The boll rots are generally a problem when excessive Insect damage or excessively wet conditions exist. Control Measures:- avoid practices that promote rank growth (i.e. manage nitrogen levels and lower plant populations), keep Cotton free of Weeds, and skip-row or modified skip-row planting. Keep insect injury at low levels. Use of a plant growth regulator to limit vegetative growth may also be helpful. Timely defoliation and harvesting can be important too. Boll Rots are usually only a problem in rank, irrigated crops where the humidity within the canopy remains high. An exception is Phytophthora boll rot caused by Phytophthora Parasitica. This pathogen is able to infect mature bolls when soil containing the fungal spores is splashed up onto low bolls. Infected bolls quickly become dark brown to black and open prematurely. The lint does not fluff out and the locks frequently fall out of the boll and onto the ground. The disease is most severe when heavy rain occurs late in the season as the lower bolls are just about to open. Boll Rots are caused by a number of pathogens, including Fungi and Bacteria. Boll rots are favored by wet weather and humidity deep in the plant canopy. Boll rot caused by Alternaria Macrospora begins as small spots with dark margins. The spots enlarge and eventually may affect the whole boll. Bolls infected by Phytophthora appear dark brown to black, sometimes with areas of white mould on the surface. Locks from affected bolls often have a brown stain. They remain hard and don't fluff out. Affected bolls either don't open at all, or open prematurely, with the compact locks easily dislodged and falling to the ground. The distinctive feature of Sclerotinia boll rot is the production of black fungal structures (2 to 10 mm diameter) within and/or on the surface of the rotted bolls. A white cottony fungal growth may be present and the branch adjacent to the boll may also be affected. There are several other Fungi that can cause boll rots in Cotton. These Fungi usually require injury or a wound to allow infection to take place. These boll rots will be more afrequent in crops with rank growth. Bacterial blight of bolls is especially obvious on young, green developing bolls. Spots are circular, dark green and greasy. When spots develop under the calyx crown at the base of the boll then further boll development is prevented. Affected bolls do not open properly. Secondary fungal growth sometimes develops in old spots on mature bolls. Fungal and bacterial organisms can enter bolls in wet and cloudy weather or when the boll has been damaged by pests and cause the boll contents to rot. / Ксантомонада или Ксантомонас (Xanthomonas). макроспора (мегаспора). венчика чашечки (calyx crown). Грибковые организмы и бактерии могут попасть внутрь коробочек во влажную и прохладную погоду, или когда коробочка была повреждена насекомыми. Они вызывают загноение содержимого коробочки.

BOLL SHEDDING = ОПАДАНИЕ КОРОБОЧЕК (или XX) – Boll Shedding:- Often referred to as Abscission. Physiologically induced separation of a boll from the mother plant, usually induced by some damage to bolls or stress on the plant. Occasionally, in reference to squares or bolls, the term abortion is used in the same context.

BOLL WEEVIL = КОРОБОЧНЫЙ ДОЛГОНОСИК – The Cotton Boll Weevil (Anthonomous Grandis) is the primary insect enemy of Cotton. An adult is 1/4 to 1/2 inch long, appearing tan to dark brown or gray in color, has a hard humpback-shaped shell and the

characteristic snout accounting for about 1/4 of its length. This Pest has plagued US Cotton producers since 1892. Cotton Boll Weevil migrated from Mexico to the United States and spread rapidly through-out the Cotton Belt. Since then, it has cost America's Cotton producers more than USD15 billion – from yield losses and costs to control the Insect Pest. It can complete an entire lifecycle in three weeks, lay 200 eggs per female – each in a separate Cotton square or boll, ensuring the destruction of each – and spread rapidly, covering 40 to 160 miles per year. Anthonomus Grandis, Family Curculionidae. A Beetle that causes Cotton losses of more than USD100 million annually. The larvae feed only on Cotton, but the adults may feed on Okra, Hollyhock and Hibiscus. Native to Mexico and Central America. Boll Weevil:- Pest type:- Insect; crops affected:- Cotton; scientific name:- Anthonomous Grandis; Pest Order:- Coleoptera. Description:- the adult Weevil measures from 3–8.5 mm (about 0.25 inch) long. It is usually reddish or grayish-brown, though its color may vary to yellowish-brown or dark brown, according to its age, etc. The conspicuous snout is about half as long as the body. A distinctive characteristic is the double-toothed spur on the inner surface of each front leg. Eggs are pearly white and approximately 0.85 mm long. The soft egg shell permits the egg to fit into almost any cavity. Newly hatched larvae are inconspicuous, being only slightly larger than the eggs. The mature larvae are white, legless, and about 13 mm long. The larva head and mouthparts are brown; its body is curved and wrinkled. Pupae are white at first and become brown as they develop. Damage:- the annual Cotton crop losses due to Boll Weevil are enormous. This Pest causes more damage to Cotton in the US than any other Pest. Injury is caused by both adults and larvae. Adult Weevils use their snout to bore into the Cotton boll and feed on the Cotton fibers. Adult females oviposit into both squares and young bolls and seal the holes with excrement. Egg punctures become small, nipple-like protuberances. Larvae developing within those cavities then feed within the squares, causing the bracts to open, the color to fade to a yellowish-green, and the plant to shed the infested squares. Limited feeding on the squares and bolls by adults usually does not cause shedding, but Cotton fiber is sometimes ruined. In addition, boll-rotting Fungi may enter through egg and feeding punctures. Life Cycle:- Boll Weevils overwinter as adults sheltered under leaf litter, in weeds, and along fence rows surrounding Cotton fields. These adults begin to emerge as early as February in Southern areas and continue to emerge until early July, with peak emergence in late May and early June. In early spring, the Weevils feed on terminals of Cotton seedlings, and egg-laying doesn't begin until squares are present. Adult females make a small cavity in each square, into which they deposit a single egg. First generation females lay an average of 200 eggs, while late generations may lay only 5 eggs. Eggs usually hatch in 2–4 days. Only 3 or 4 days after the larvae hatch and begin to feed, the squares generally yellow, flare, and begin to drop. The larvae complete their development in 7–12 days and then transform into pupae within the squares. The pupae last 3–8 days before transforming into adults which remain in the squares only 1–3 days before chewing their way out. Because of the prolonged emergence of overwintering adults, distinct generations are difficult to recognize, but there are several generations per season. Control Measures:- satisfactory control of the Boll Weevil depends on a combination of cultural and chemical methods. Cultural practices include early planting; encouraging rapid seedling growth by good seed bed preparation, proper fertilization, and weed control; and selection of relatively early maturing varieties which are well adapted to your area. Those practices all promote the development of Cotton plants and set of the crop before the Weevils become abundant. Regular in-season insecticide applications are recommended to control Weevils during the major period of fruit set and boll maturity. Base these applications on weekly Weevil counts and damage. First insecticide applications are generally made when 10% of the squares are punctured. For recommended procedures and chemicals in your area, contact your local advisers. Geography:- in the XIX century, the Boll Weevil spread into the US from Mexico. It now occurs throughout the Cotton belt East of the high plains of TX and may also now be found in parts of AZ. Cotton is practically the only host plant for Boll Weevil. Boll Weevil (Anthonomous Grandis) is a small brownish to grayish Weevil that survives the winter as an adult and invades Cotton in the spring to infest one-third grown Cotton squares, causing fruit abortion via feeding or egg punctures; completes life cycle within fallen squares in 2-1/2 to 3 weeks. A major Pest of Cotton in North Carolina before the beginning of the Boll Weevil Eradication Program in 1978, which has successfully eliminated this pest. May undergo three to four generations per year in the Carolinas. Boll Weevil:- Because of the numerous overlapping generations per season (up to 10 or more), effective Boll Weevil management depends on reduction of population growth. Early-season applications of insecticide (pinhead square treatments), late-season applications (diapause treatments), and Cotton stalk destruction are recommended management practices in most regions. Timing of pinhead square treatments is typically based on crop phenology and pheromone-baited trap captures. Captures of 1–4 Weevils/trap per week will trigger control action in most states. In-season control is based on the percentage of squares damaged by Weevils. Thresholds in infested US Cotton range from 10 to 30% square damage, but a threshold of 10% square damage is widely accepted across the US. / Хлопковый Коробочный Долгоносик (Cotton Boll Weevil) или Anthonomus Grandis). Семейства (Family Curculionidae).

BOLLWORM = КОРОБОЧНЫЙ ЧЕРВЬ (или КОРОБОЧНАЯ ГУСЕНИЦА, или ХЛОПКОВАЯ СОВКА) – Cotton Bollworm:- Pest type:- Insect; crops affected:- Cotton; scientific name:- Helicoverpa Zea; Pest Order:- Lepidoptera. Description:- the larval (or caterpillar) stage is the only damaging stage of this Insect. It can be distinguished from Armyworms and Loopers by the presence of several rows of dark bumps on the back, each with one or two bristles. The five to six larval instars vary in color from light green or pink to brown or black, are lighter on the underside, and have alternating light and dark stripes that run the length of the body. The head is usually brown to orange, legs are black and the skin is coarse with many thorn-like projections. The larvae are approximately 45 mm long when full grown. All instars have five pairs of fleshy prolegs. Pupae are about 30 mm long, are about 6 mm wide, and are reddish-brown to dark brown. Adult Corn Earworm moths are robust, have a wingspan of 25–38 mm and are usually light grayish-brown to rust-tan to yellowish-olive color, with a prominent marking on the forewings. The eyes of the moths are usually green. Eggs are dome shaped and about 0.5 mm in diameter. Damage:- larvae feed on flowers, foliage, and tender pods. Soybean defoliation by Corn Earworms is a problem typically confined to some areas of the Southern US, and occasionally in Eastern states. Serious injury normally occurs on late-maturing varieties in July and August. Later in the season, Corn Earworms feed on Soybean pods and immature seeds, often causing yield loss. With heavy infestations (20 or more large worms per meter of row) most pods may be destroyed, and entire fields may be stripped of pods and foliage. Life Cycle:- the life cycle consists of four stages:- egg, larvae, pupa and adult. There are two or more generations of this Insect per year, with more generations occurring in warmer climates. Moths migrate North from Southern states in the spring. Moths prefer to fly on warm cloudy days and most likely at dusk. Each moth can live up to 10–12 days and can lay up to 2 500 eggs. Each egg is laid singly rather than in clusters. Hatched larvae feed on young plant tissue. The larvae feed for about three weeks. At maturity the larvae drop to the ground and dig or burrow a small cell into the soil, pupate and moths emerge 10–20 days later. The moths mate and begin laying eggs. Pupae that form in the fall, remain in the soil and overwinter in that stage. Control Measures:- earlier planted/maturing Soybeans generally avoid damage from this pest. Scouting Soybean fields to determine the extent of infestation is important. Chemical control is possible, but timing is critical. Insecticides are usually not applied until there are six or seven medium to large Earworms per meter of row. Applications need to be made when larvae are small to medium sized, and repeat applications may be necessary. Talk to your local advisers for control recommendations. See also Helicoverpa Armigera. Bollworm (Helicoverpa Zea), the larval or caterpillar stage of the Corn Earworm moth. Typically North Carolina's most significant Cotton Pest, primarily infesting fruit (squares, blooms, and bolls). Undergoes three to four generations annually in the Carolinas, with the first two developing primarily in field Corn and the third on Cotton, Soybeans, Peanuts, and other crops. Also called Soybean Podworm and Tomato Fruitworm, depending upon host. See also Pectinophora Gossypiella, and Pink Bollworm. / Смотрите также Хэликовэрпа Армигэра или Хлопковая Совка (Helicoverpa Armigera), Пэктинофора Госсипиэлла или

Хлопковая Моль (Pectinophora Gossypiella), и Розовый Коробочный Червь (Pink Bollworm). Гусеница выедает семена в коробочках, отсюда и название Коробочный Червь Хлопчатника. Коробочный Червь, гусеница Хлопковой Совки (Chloridea Obsoleta) – опасного Вредителя Хлопчатника, Нута, Кукурузы и других Растений.

BOLO TIE = ГАЛСТУК БОЛО – Bolo Tie is a cord fastened around the neck with an ornamental clasp and worn as a necktie. Bolo Tie is a string that is worn around the neck and is held in place by a decorative piece in the front. / галстук в виде шнурка с орнаментальным зажимом.

BOLSA DE MERCADORIAS & FUTUROS = БОЛСА ДЭ МРКАДОРИАШ И ФТУРОШ (или БИРЖА ТОВАРОВ И ФЬЮЧЕРСОВ) – The Brazilian Mercantile & Futures Exchange (BM&F) celebrated 20 years of activity on 2006-January-31. Formed in July 1985, it began trading in January 1986, and united its operations with those of the Sro Paulo Commodities Exchange (BMSP) in May 1991 and with those of the Brazilian Futures Exchange (BBF), located in Rio de Janeiro, in June 1997. On 2000-September-22, BM&F introduced its electronic trading system, called the Global Trading System (GTS), through which its members can electronically trade all the markets offered by the Exchange. On 2004-December-03, the BM&F WebTrading (WTr), an e-platform created by BM&F for trading mini contracts, was launched with the aim of reducing costs for brokerage houses, and enabling the expansion of their customer base particularly with the addition of small investors through the use of a more simplified trading interface. Website:- http://www.bmf.com.br. On 2002-April-22, the BM&F Foreign Exchange Clearinghouse initiated its activities. On the 25th of April, BM&F acquired from the Brazilian Clearing and Depository Corporation (CBLC) the rights to manage and operate a clearinghouse for government bonds, fixed-income securities and other securities issued by financial institutions. On the same date, it also acquired the Rio de Janeiro Stock Exchange (BVRJ) equity memberships from their holders and the rights to manage and operate the electronic system known as SISBEX for government bonds and other securities. On 2002-November-12, BM&F negotiated an agreement with the Brazilian Federation of Banks (FEBRABAN), and with the Centralclearing of Clearing and Settlement, in a move to cease all of the latter's activities related to registration, clearing and settlement of trades involving public and private fixed-income securities, consequentially centralizing these activities at BM&F. Then, on 2004-May-14, the BM&F Securities Clearinghouse inaugurated its activities. With these initiatives BM&F broadened its capacity to become the major clearinghouse in Latin America, providing an integrated set of asset, securities and derivatives clearing services, while at the same time offering economy of scale, competitive costs, and operating security. Moreover, the three BM&F Clearinghouses are ISO 9001 certified: The Derivatives Clearinghouse since October 1996, the Foreign Exchange Clearinghouse since June 2002, and the Securities Clearinghouse since March 2005. In terms of international recognition, it should also be mentioned here that in July of 2002 the US Commodity Futures Trading Commission (CFTC) granted an exemption under Rule 30.10 to BM&F members covering the sale of BM&F contracts to US customers. On 2002-August-29, BM&F launched the Brazilian Commodities Exchange, which united the commodity exchanges from the states of Goiás, Mato Grosso do Sul, Minas Gerais, Paraná and Rio Grande do Sul, and from the city of Uberlândia (a municipality in the state of Minas Gerais, Brazil; nickname:- Udia), transforming these exchanges into regional operation centers. BM&F renders clearing and settlement services to this new exchange. The result was the creation of an integrated domestic market for agricultural commodities with modern price discovery mechanisms and an organized marketing structure. The Brazilian Commodities Exchange opened for trading on 2002-October-22. In 2004, another regional operation center was created in the State of Ceará and a field office linked to the Paraná operation center was opened in Florianópolis (State of Santa Catarina). On 2004-January-29, the Central Bank of Brazil issued a resolution granting commodity and futures exchanges the right to constitute commercial banks in order to render settlement and custody services to the economic agents responsible for the transactions performed at those exchanges. This opened the way for the Exchange to establish the BM&F Settlement Bank which went into operation nine months later, on 2004-November-30. On 2005-September-15, the Exchange launched the BM&F Carbon Facility as part of a joint initiative with the National Ministry of Development, Industry and Foreign Trade. The focus of this initiative is to develop a Brazilian carbon market that will provide incentives for the reduction of greenhouse gas emissions. The BM&F Carbon Facility is a state-of-the-art electronic system designed for the on-line registration of projects, which have the potential to generate carbon credits in accordance with the principles established by the Kyoto Protocol. The main purpose of BM&F is to register, clear, and settle by physical delivery and cash settlement the transactions executed on the trading floor or in electronic systems, as well as develop, organize, and operate free and transparent markets for the trading of securities and/or contracts based on financial assets, indices, interest rates, foreign currencies, and commodities for immediate or deferred delivery. In addition, over-the-counter (OTC) products are registered at BM&F through an electronic system. The Brazilian Mercantile and Futures Exchange (Bolsa de Mercadorias & Futuros, BM&F) is Brazil's derivatives exchange, based in São Paulo. It was formed in 1991 with the merger of the São Paulo Commodities Exchange, created in 1971, and the Brazilian Mercantile and Futures Exchange (BM&F) established in 1985. In 1997 a second merger joined BM&F and the Rio de Janeiro-based Brazilian Futures Exchange. BM&F trades US Dollar denominated futures on feeder cattle, robusta coffee, cotton, crystal sugar, and futures and options on live cattle, Arabica coffee, corn, and soybeans. Gold futures and options are also traded. Spot price contracts are traded on Arabica coffee. Forward contracts are traded on 250-gram gold, and spot contracts on 10-gram and 0.225-gram gold. Futures and options are traded on the Ibovespa stock market index, and options on the flexible Ibovespa. BM&F trades US Dollar futures and options, flexible US Dollar options, and an array of interest rate futures and options. In 2000, the exchange joined the GLOBEX Alliance, and BM&F acquired the French NSC screen trading system. Some agricultural products continue to be traded by open outcry. Trading is conducted from Monday to Friday, from 09:00 am to 05:00 pm with after-hours sessions from 02:45 pm to 08:00 pm. After-hours transactions are cash settled on T + 2.

BOLSTER = ГНЕЗДО ВЕРЕТЕНА (или ШЕЙКА, или ВТУЛОЧКА ДЛЯ ВЕРЕТЕНА) – Bolster is a long, narrow pillow, either round or rectangular in shape, that is the width of the bed. It is used for decoration and support.

BOLSTER = ГРУЗОВАЯ ПЛАТФОРМА (или ПОДДОН) – Bolster is a flatrack container without ends. / Контейнер-платформа без бортов.

BOLSTER = ОГРАНИЧИТЕЛИ (или ГУБА, или ДЕРЖАТЕЛИ) – Bolster is a bracing of a commodity in a container. / Укрепление сырья в контейнере.

BOLSTER = УПОРНАЯ ГОЛОВКА (или ОПОРНО–СЦЕПНОЕ УСТРОЙСТВО) – Bolster is a chassis component which prevents container from shifting fore and aft. It also contains the hold down clamp device. A device fitted on a chassis or railcar to hold and secure the container. / Устройство, установленное на шасси или железнодорожном вагоне, для удерживания и крепления контейнера.

BOLT = БОЛТ – Bolt is a threaded fastener with a coarse thread and with a square or hexagonal head. Note:- a bolt is used with washers and a nut. See also Pallet. / Болт (Bolt):- элемент крепежа с круглой резьбой и с четырёх- или шестигранной головкой. Примечание:- болт применяют с гайкой и шайбой. Смотрите также Поддон (Pallet).

BOLT = КУСОК – There are about 3 common widths for Bolts of fabric:- 36", 44–45" and 54". Most apparel fabrics, calico, quilting fabric, etc will be 44–45" wide (and folded in half on the bolt), most home decor fabrics are 54" (usually on rolls). 36" is less common,

though you can find muslin, interfacing, and some more utilitarian fabrics in 36” widths. The width of each fabric should be labeled on the end of the bolt, along with the fiber, the care directions and how many yards were on the full bolt before cutting, the name of the fabric design and manufacturer. Bolt is a roll of cloth or wallpaper of a definite length. Bolt is a bundle; a compact packet; a roll of woven fabric. Examples:- bolt of canvas (40 yards), 1638; of cloth (40 yards); of fabric; of glass (molten cylindrical jet); of osiers (willow twigs), 1725; of satin, 1592; of silk (40 yards); of straw; of worsted, 1407. In quilting, Bolt is a long piece of fabric that’s usually wound on a flattened cardboard tube, making it easy for merchants to stack fabrics together horizontally or vertically for display. In textile industry, Bolt is a roll or piece of fabric of varying length. / раскрой (cutting); до нарезки ткани определённой длины по требованию заказчика (cutting) . (1) В США, условная длина торгового куска, равная 40 ярдам (36.6 метрам) для ткани или 16 ярдам (14.6 метрам) для обоев. (2) Складка куска ткани в накатку. Формирование и Первичная Упаковка Тканей:- куски должны формироваться из тканей одного сорта, артикула, цвета и рисунка. Ткани, предназначенные для промышленной переработки, должны комплектоваться в целые (без разрезов) куски или рулоны. Для розничной торговли допускается комплектовать куски и рулоны из нескольких отрезов (cuts) тканей одного артикула, сорта, цвета, рисунка, видорисунка и оттенка. Длина тканей в куске или рулоне, предназначенных для предприятий розничной торговли, в завистимости от веса ткани (поверхностной плотности) должна соответствовать нормам стандартов, как правило, от 25 до 60 метров (м), хотя могут быть и отличия, например, длина ткани в куске с разрезнымворсом должна быть от 15 до 40 м, а махровых тканей – не менее 20 м. По соглашению изготовителя с потребителем допускается формировать короткомерные куски ткани, длина которых должна быть не менее 12 м, при этом число отрезов не должно быть долее двух. Масса куска ткани должна быть не более 15 килограмм (кг). Допускается по согласованию изготовителя с потребителем масса куска ткани более 15 кг, предназначенной для розничной торговли и промпереработки при наличии средств механизации погрузочно-разгрузочных работ. Длина тканей в куске или рулоне, предназначенных для промышленной переработки, в завистимости от веса ткани (поверхностной плотности) должна соответствовать нормам стандартов, например, длина ткани весом до 100 грамм на квадратный метр (г/м^2) в куске должна быть не менее 80 м, от 101 до 200 г/м^2 – не менее 55 м, от 201 до 300 г/м^2 – не менее 35 м, и свыше 300 г/м^2 – не менее 20 м. Ткани должны быть сложены в куски или накатаны в рулоны, лицевой стороной внутрь в соответствии со следующими требованиями:- (i) ткань во всю ширину или сдвоенную или строенную складывают в кусок метровыми складками в четыре сгиба; (ii) ткань во всю ширину или сдвоенную или строенную складывают в кусок метровыми складками в три сгиба; (iii) ткань во всю ширину или сдвоенную или строенную складывают в кусок метровыми складками в два сгиба; (iii) ткань во всю ширину или сдвоенную или строенную накатывают на плоскую или круглую прокладки в кусок или рулон. Допускается по соглашению изготовителя с потребителем складывать в куски или накатывать в рулоны ткани лицевой стороной наружу при упаковке их в бумагу, целлофан или полиэтиленовую плёнку. Ткани шириной свыше 100 сантиметров (см) сдваивают или страивают (в зависимости от ширины). Ширина плоских картонных и фанерных прокладок должна быть от 170 до 250 миллиметров (мм), а длина – короче ширины ткани не более чем на 100 мм. Диаметр круглых картонных прокладок должен быть до 65 мм включительно, длина – не менее ширины ткани. Ткани должны быть сложены в куски или намотаны в рулоны плотно, ровно, без перекосов, без свисания и загиба кромок. Куски или рулоны тканей должны быть упакованы в бумагу или целлофан или полиэтиленовую плёнку. Допускается не упаковывать следующие группы тканей:- тарные и упаковочные; товарное суравьё; технические (тёмных тонов). К тканям тёмных тонов относят следующие:- чёрные, тёмно-синие, тёмно-зелёные, тёмно-коричневые и тёмно-серые. Ткани, упакованные и неупакованные в бумагу, целлофан или полиэтиленовую плёнку, перевязывают шпагатом из синтетических плёночных нитей или тесьмой из химических волокон или другим перевязочным материалом в двух местах или крестообразно (для льняных и полульняных тканей). Допускается свободный конец куска или рулона ткани крепить к верхнему слою в двух местах с помощью склеивающей ленты или стачивания без перевязывания. При упаковывании в бумагу, целлофан или полиэтиленовую плёнку торцы куска у несдвоенных тканей оставляют открытыми, у сдвоенных тканей оставляют открытым один торец с кромками.

BOM = BEGINNING OF THE MONTH

BOM = BILL OF MATERIALS

BOMBAZINE = БОМБАЗИН (или БОМБЭЗИН, или БУМАЗЕЯ) – Bombazine:- usually has silk or rayon warp and worsted filling. Imitations are made in cotton. Plain or twill. Very fine English fabric. Name comes from Latin ‘Bombycinum’ which means a silk in texture. It is one of the oldest materials known and was originally all-silk. When dyed black it is used in the mourning cloth trade. Bombazine is:- (1) a twilled fabric with silk warp and worsted filling; (2) a silk fabric in twill weave dyed black. Origin:- from Middle French Bombasin, from Medieval Latin Bombacinum, Bombycinum silken texture, from Latin, neuter of Bombycinus of silk, from Bombyc-, Bombyx. Bombazine (in the UK, 1850’s), a kind of silk stuff, originally manufactured at Milan, and thence sent into France and other countries. Now, however, it is nowhere manufactured better, or in larger quantities, than in this kingdom. / уточина. Бомбазин (на Итальянском языке) или Бомбэзин (на Английском языке) – плащёвая прорезиненная материя из гладкокрашенной или набивной хлопчатобумажной ткани.

BOMBER = БАМЭ – Bomber is a bomber jacket. / Бамэ или Бомбер – короткая куртка на молнии с эластичными вставками на манжетах и по низу изделия. Другие названия куртки-бомбера – Ball Jacket, Varsity Jacket, Letterman Jacket. Куртка шьётся из шерстяного полотна, кожи, нейлона и многих других материалов. Ширина резинки, пришитой по низу бомбера, может достигать 20 см. Бомбер может быть как с воротом, который представляет собой полукруглую эластичную вставку, так и без него. Куртка-бомбер – изначально мужской предмет гардероба. Однако на сегодняшний день она относится к вещам в стиле унисекс. Девушки с удовольствием носят бомберы не только каждый день с джинсами, но и с платьями и туфлями на каблуках на светские мероприятия и вечеринки. История Возникновения:- первые куртки-бомберы появились в 1930-е. Братья Даглэс (Douglas), открывшие свой аэроклуб, часто устраивали показательные выступления и полёты для туристов. В то время кабины самолетов были открытыми. Чтобы защитить туристов от ветра и холода, на аэродроме им выдавались специальные куртки из кожи и шлемы. Эти куртки продавались и в магазине при аэроклубе. Чуть позже братья получили военный заказ на пошив таких курток для военно-воздушных сил (ВВС). Куртки шились из лошадиных шкур, имели вязаные манжеты и воротники. В дополнение к такой куртке шёл коричневый пояс. А из-за того, что эти куртки носили лётчики, в первую очередь бомбардировщики, куртки прозвали бомберами. Для остальных лётчиков были сшиты такие же куртки, но из овчины. Позже на куртки стали нашивать эмблемы войск. В 1950-е, когда появились усовершенствованные модели самолётов, понадобился более лёгкий вариант куртки-бомбера. Именно тогда братья Даглэс создали свои лёгкие нейлоновые бомберы на ярко-оранжевой подкладке. Такая куртка в случае аварии служила дополнительным сигналом для спасателей. Лётчик при катапультировании мог вывернуть куртку на изнанку и подать сигнал спасателям. Ещё раньше, а именно в 1860-е, прототипы бомберов стали носить Американские студенты. Эти студенческие куртки были сшиты из вареной шерсти и застегивались на кнопки. В 1865 члены бейсбольной команды Гарварда украсили свою спортивную одежду, и куртки в том числе, заглавной буквой Эйч. (H). С тех пор прототип куртки-бомбера стал набирать популярность. В 1930-е бомбер могли носить лишь отличники и спортсмены. Бомбер стал символом успешности и элитарности. Спустя 20 лет студентки-модницы стали носить

куртки-бомберы своих бойфрендов. А к началу 1980-х годов эта куртку мог носить любой желающий. В 1990-е годы бомбер всё ещё оставался предметом мужского гардероба, но к двухтысячным появились и модели для женщин. Бомберы стали униформой для многих субкультур, популярных в то время. Среди них были скинхеды, рок-исполнители, рэйверы и другие. Затем интерес к бомберам на время угас. Новую жизнь в эти куртки дизайнеры вдохнули в 2008 году. Алыкзэндё МэКвин (Alexander McQueen), Диор (Dior), ВиктоЭндРолф (Victor&Rolf) предложили носить куртки-бомберы из яркой кожи, с контрастными манжетами и кнопками, а также классические военные варианты с воротником из овчины.

BOMBER JACKET = ЖАКЕТ БАМЭ – Bomber Jacket is a zippered usually leather jacket with front pockets and knitted cuffs and waistband.

BOMB OXIDATION = ОКИСЛЕНИЕ В БОМБЕ – Bomb Oxidation:- a test for the oxidation stability of a product obtained by sealing it in a closed container with oxygen under pressure. The drop in pressure of the oxygen is a measure of the amount of oxidation that has occurred. / Под Бомбой, от Немецкого слова Bombe, от Французского слова Bombe, от Итальянского слова Bomba, от Латинского слова Bombus, от Греческого слова Bómbos, означающее Гул или Шум, .

BOMBYCIDAE = БОМБИСИДЭ (или НАСТОЯЩИЕ ШЁЛКОПРЯДЫ) – Bombycidae is a Family of Moths. The best-known Species is Bombyx Mori (Linnaeus) or Silkworm, native to Northern China and domesticated for millennia. Another well known Species is Bombyx Mandarina, also native to Asia. The Family consists of 21 Genera and about 150 Species, most of which belong to the nominate Subfamily Bombycinae. The Family was recently severely restricted and currently contains only two subfamilies, the Bombycidae and Epiinae (previously the Tribe Epiini). The former Subfamilies Oberthueriinaeand Prismostictinae have been placed as subjective junior synonyms of Endromidae. The former Subfamily Phiditiinae is reinstated as a separate Family, the Phiditiidae. This list is provisional. Genera such as Apatelodes and Olceclostera are placed in the Apatelodidae, if these are considered valid. Ephoria may be a synonym of Epholca (Geometridae: Ennominae: Ourapterygini), and Epia may be one of Hadena (Noctuidae: Hadeninae: Hadenini). / Бомбисидэ или Шёлкопряды (Bombycidae) – Семейство Бабочек. Тело относительно массивное, ротовые органы рудиментарные, усики гребенчатые. Передние крылья выемчатые по внешнему краю, с серповидной вершиной. Гусеница с коротким шипообразным выростом на 8-м сегменте брюшка, передняя часть тела сужена. Куколка развивается в шёлковинном коконе. Около 20 Видов, распространённых преимущественно в тропиках. В бывшем Союзе Советских Социалистических Республик (СССР) разводился одомашненный Тутовый Шёлкопряд (Bombyx Mori); из диких Шёлкопрядов встречаются Виды Родов Theophila и Oberthueria. В XIX веке название ‘Шёлкопряды’ относилось к группе Семейств Ночных Бабочек, не питающихся во взрослой фазе:- Хохлаткам (Notodontidae), Волнянкам (Lymantriidae), Коконопрядам (Lasiocampidae), Настоящим Шёлкопрядам (Bombycidae) и некоторым другим. За несколькими Видами Бабочек из этих Семейств, часто упоминающимися в литературе, сохранилось название ‘Шёлкопряда’ – Непарный Шёлкопряд (Волнянка Lymantria Dispar), Сосновый и Сибирский Шёлкопряды (Коконопряды Dendrolimus Pini, Dendrolimus Sibiricus), Китайский и Японский Дубовые Шёлкопряды (Павлиноглазки Antheraea Pernyi, Antheraea Jamarnai). Шёлкопряды, общее название ряда Семейств Бабочек (Берёзовые Шёлкопряды, Настоящие Шёлкопряды, Походные Шёлкопряды и другие), гусеницы которых изготавливают для окукливания кокон из выделяемой ими шёлковины. Шёлкопрядами называют также Бабочек из Семейства Волнянок (например, Непарный Шёлкопряд), Коконопрядов (например, Сосновый Шёлкопряд), Павлиноглазок (например, Китайские и Японские Дубовые Шёлкопряды).

BOMBYCINUS = БОМБИСИНУС (или ШЁЛКОПРЯДНОЕ, или ШЁЛКОВОЕ) – Bombycinus:- silky. / :- шёлковое.

BOMBYX MORI = БОМБИКС МОРИ (или ТУТОВЫЙ ШЁЛКОПРЯД, или ШЁЛКОВИЧНЫЙ ЧЕРВЬ) – Bombyx Mori is the Latin name for the Silkworm:- the silk producing caterpillar that feeds on Mulberry (Morus Alba) leaves. Its cocoon is the source of fine, white silk. It is reared throughout Asia. There are several Species of Silkworm that are used in commercial Silk production, however Bombyx Mori is the most common. Bombyx Mori is native to China and was introduced into Europe and Western Asia in the VI century AD and into North America in the XVIII century. It feeds entirely on the leaves of the Mulberry Tree, so has flourished only where conditions are suitable for large numbers of leaf-bearing Mulberry Trees. Bombyx Mori has been cultivated over many centuries and is no longer known in the wild. Silkworm is a common name for Bombyx Mori, though it is not a worm but the larva or caterpillar of a moth in the Family Bombicidae. / Гусеница Тутового Шёлкопряда. Тутовый Шёлкопряд или Шёлковичный Червь, одомашненное Насекомое Отряда Чешуекрылых Семейства Настоящих Шёлкопрядов. Гусеницы завивают шёлковичные коконы. Шёлкопряды, общее название ряда Семейств Бабочек (Берёзовые Шёлкопряды, Настоящие Шёлкопряды, Походные Шёлкопряды и другие), гусеницы которых изготавливают для окукливания кокон из выделяемой ими шёлковины. Шёлкопрядами называют также Бабочек из Семейства Волнянок (например, Непарный Шёлкопряд), Коконопрядов (например, Сосновый Шёлкопряд), Павлиноглазок (например, Китайские и Японские Дубовые Шёлкопряды).

BONA FIDE = БОНА ФИДЭ – In Latin, In Good Faith, or Authentic, or Genuine, or Real, or True. It usually appears in reference to contracts, especially contracts of insurance. All parties to a contract are expected to reveal all information relevant to the contract in hand, that is, they are expected to contract in good faith. It is also used simply to mean honest or trustworthy. In good faith; without dishonesty, fraud or deceit; authentic. A term Bona Fide refers to data where the parties submitting the data have executed, or are prepared to execute, transactions generating such data and the concluded transactions were executed at arm’s-length from each other. / В переводе с Латинского, Добросовестно; Без Обмана; Честно; По Доброй Вере; заслуживающий доверия или действительный (bona fide).

BOND = ОБЛИГАЦИЯ – Bond is a financial instrument that usually pays interest to the holder, issued by governments as well as companies and other institutions, e.g., local authorities. Most bonds have a fixed date on which the borrower will repay the holder. Bonds are attractive to investors since they can be bought and sold easily in a secondary market. Special forms of bonds include deep discount bonds, equity warrant bonds, Eurobonds, and zero coupon bonds. Bond is one type of long-term promissory note, frequently issued to the public as a security regulated under federal securities laws or state blue sky laws. Bonds can either be registered in the owner’s name or are issued as bearer instruments. Bond is a fixed-interest security denominated in a round amount and issued as part of a bond issue. The individual bonds (securities) carry equal rights, with the issue conditions (interest rate, denomination, redemption terms, paying agents, guarantees, etc) uniformly specified. In contrast to bonds, medium-term notes are not issued during a specified period but continuously. Moreover, medium-term notes are not negotiable, unlike bonds which are as a rule exchange-listed. Also known as Debenture. Bond is a tradeable debt security, usually issued by a government or semi-government body to raise money. Holders of the bond have lent money for which they receive a fixed rate of interest over a set period of time. The bond is repaid with interest on the predetermined maturity date. Bonds can be traded on the sharemarket. Basically an IOU or promissory note of a corporation or municipality, usually issued in multiples of USD1 000.00 or USD5 000.00. A bond is an evidence of debt on which the issuing company usually promises to pay the bondholder a specified amount of interest for a specified length of time, and to repay the loan on the expiration date. A bondholder is a creditor of the corporation, not a part owner as is the shareholder. While the interest paid on corporate bonds is fully taxable, the interest on municipal bonds is usually exempt from federal income tax and state and local taxes

within the state of the issue. IOU or promissory note from a corporation or government representing a debt to the purchaser (bondholder) in a fixed amount and for a specified duration. Bonds are simply promises to repay borrowed money. When a corporation or government entity needs to borrow money, it will issue a bond, either directly to investors or through a brokerage, which buys the bonds at a discount and then sells them to the public. The bond issuer promises to make regular interest payments and repay the principal, either gradually, over time, or in a lump sum when the bond reaches maturity. The bondholder pays taxes on the interest payments, except when the bonds are held in retirement accounts. The owner of a bond has loaned the issuing company money at a specific percentage rate for a specified period of time. No ownership of the company is involved. A Bond is a debt obligation (often in the form of a negotiable 'note') by a borrower – typically a government. For example, the Government of Canada may issue a 10 year bond, paying interest at 6%, in denominations of CAD100. Corporations sometimes issue bonds, too. These are much riskier than bonds backed by government guarantees and are often referred to as 'Junk Bonds' and bear much higher rates of interest. Bonds often trade in the market. When prices drop, it means that the effective interest rate is higher, e.g., if a CAD100 bond paying CAD6 per year interest, trades at CAD95, the effective interest rate is 6/95 percent. Bond is internationally-used term for fixed income securities. / облигационер (владелец облигации). закупщик (владелец облигации). Под Облигацией, от Латинского слова Obligatio, означающее Обязательство, понимается ценная бумага на предъявителя, дающая владельцу право на получение годового дохода в виде фиксированного процента (в форме выигрышей или оплаты купонов). Облигации подлежат погашению (выкупу) в течение обусловленного при выпуске займа срока. Облигации выпускаются юридическими лицами и государственными учреждениями. Облигация, ценная бумага на предъявителя, предоставляющая её владельцу право на получение дохода в виде фиксированной процентной ставки. Выпустивший облигацию принимает на себя обязательство выкупить её в течение определённого срока путём выплаты владельцу облигации дохода в форме выигрышей, разыгрываемых в специальных тиражах, или оплаты купонов. В бывшем Союзе Советских Социалистических Республик (СССР) право выпуска облигаций по внутренним займам принадлежало государству (смотрите Государственные Займы). Облигация оформляет особого рода гражданско-правовое обязательство, в котором заёмщиком выступает государство, а заимодавцем – гражданин, предоставивший в распоряжение государства свои денежные средства. В обращении находились облигации 3-процентного выигрышного займа, выпущенного в 1966 на 20 лет. Доход по облигации выплачивался держателям в виде денежных выигрышей. Облигации беспрепятственно продавали и покупали сберегательные кассы (продажа – по ценам, установленным Министерством Финансов СССР, покупка у них – по нарицательной стоимости). С облигациями могут совершаться и иные сделки (хранение, дарение, завещание). К оплате облигации предъявляются в течение срока действия займа и дополнительного льготного полуторагодичного срока. По истечении срока займа облигации, не предъявленные к оплате, утрачивают силу. Облигации и выигрыши по ним были освобождены от обложения государственными налогами. В капиталистических странах облигации выпускаются акционерными обществами и государством. Являются одной из форм фиктивного капитала. Они свободно обращаются на рынке ссудных капиталов, имеют свой курс (цену), который определяется размером приносимого дохода, уровнем ссудного процента, а также предложением и спросом на облигации. Средства, мобилизованные от продажи облигаций, государство использует чаще всего на покрытие бюджетных дефицитов, вызванных огромными непроизводительными затратами и прежде всего расходами на гонку вооружений. Погашение долга, образовавшегося от продажи облигаций, а также выплата процентов по ним осуществляются главным образом за счёт налогов, взимаемых в основном с трудящихся. Источником для выплаты процентов по облигациям, выпускаемым акционерными обществами, выступает прибыль этих предприятий. Облигация:- акционерное общество вправе выпускать облигации. Облигация удостоверяет право её владельца требовать погашения облигации (выплату номинальной стоимости или номинальной стоимости и процентов) в установленные сроки. Облигации могут быть именными или на предъявителя. При выпуске именных облигаций акционерное общество обязано вести реестр их владельцев. Облигация – эмиссионная ценная бумага, закрепляющая право её держателя на получение от эмитента облигации в предусмотренный ею срок её номинальной стоимости и зафиксированного в ней процента от этой стоимости или иного имущественного эквивалента. Облигация может предусматривать иные имущественные права её держателя, если это не противоречит законодательству Российской Федерации.

BOND = ОБЯЗАТЕЛЬСТВО (или ГАРАНТИЯ) – (1) In customs, Bond is an undertaking in due legal form, by which a person binds himself to the Customs to do or not to do some specified act. / Таможня рассматривает принятое на себя обязательство как должным образом оформленную юридическую форму, посредством которой лицо обязывает себя перед таможней исполнять или не исполнять определённые действия.

(2) Bond is a contract between principal and surety to insure performance of an obligation imposed by law or regulation covering potential loss of duties, taxes and penalties for specific types of transactions. Types Of Bond:- (1) A Bid (or Tender) Bond may be required when a customer issues an open request for tenders for the supply of equipment or the performance of services. It should be remembered that the establishment of a complex competitive international tender process represents a significant investment on the part of the customer. In anticipation of receiving a number of responses and not wanting to waste time choosing a winning bidder only to have the lucky exporter refuse to take the contract, the customer will ask bidders to provide a bid bond for a small percentage (perhaps as much as 3%) of the bid price to demonstrate real commitment on the part of each bidder. This bond could be called in the event that the contract was awarded but the bidder chose not to accept it. The bid bond also evidences to the customer that the supplier making the bid has the financial resources to perform the contract, on the basis that the bank would not issue the bond unless the bank believes the supplier is creditworthy. There is a growing tendency for customers to specify that the bond could also be called if the successful exporter was awarded the contract but failed to provide an advance payment bond or a performance bond. Therefore, before providing a bid bond, it is important to ensure that you will be able to raise any required contract bonds in a form acceptable to the customer. Whilst the request for tenders might specify, say, 1% of bid price as the value of the bid bond, it is wise not to raise the bond for exactly that value but to round up the value of the bond. Consider a competitive bidding situation. You are keen to win the contract and bid at your lowest possible price; this is likely to be a precise, not a round, number. If your bid is priced at, say, £10 256 786.33 your 1% bid bond would be for £102 567.86. Now, if one of your competitors should discover the value of your bid bond, it is not difficult to calculate the probable price of your bid. You might find that the competitor then bids at £10 255 000 to win the contract on price. It is much better to round up the value of your bid bond in order to avoid this risk. A bond with a value of £105 000.00 for example, would not give too much away about your bid price and it might be worth the extra cost to increase the value of your bond in this way. (2) An Advance Payment Guarantee (APG), which tends to be called a guarantee rather than a bond, is a bond given to the customer in exchange for an advance or 'mobilisation' payment. If the contract calls for a down-payment of 25% of the contact price to be made within 30 days of signature of the contract then it will probably also require you to procure the issue of an APG for the same value in return. If your contract contains an effectiveness clause (such that a number of conditions have to be met before the signed contract comes into force) then the advance payment and receipt of the APG will probably feature in the list of conditions which have to be fulfilled. The APG should guarantee the return of the advance payment in the event that you are unable to perform the contract. Be careful that this is all done in the right order: some customers will demand the APG before handing over any money, and/or will suggest

the receipt of the APG is a condition precedent to effectiveness of the contract. You do not want to be in the position of having handed over the APG without having received any payment yet being obliged to start the contract (this has happened!). A partial safeguard in this situation is to condition the bond so that it does not become effective and cannot be drawn upon until the advance payment has been received. However, the issuing bank is unlikely to know if the advance payment has been received, so it is better either a) to arrange for a simultaneous exchange of money and bond, or b) for the APG to contain a provision that it will only become effective on receipt by the issuing bank of the advance payment together with the customer's instructions to pay it to the exporter. Another way to protect your customer's position is for the advance payment to be drawn from a letter of credit, conditional upon the presentation of the APG. Thus, the money flows one way as the bond goes the other. Of course, if you are drawing money from a bank in London and the bond is issued by a bank local to the customer then you will be faced with a difficult act of co-ordination. Ideally your APG should reduce in value by steps as each delivery or contractual milestone is achieved. Reduction mechanisms are described in Chapter 6. (2A) A variation on the theme of an APG is a Progress Payment Bond which, as its name suggests, is issued in exchange for a progress payment at an agreed milestone during construction/manufacture. If work to the value of the payments has been achieved, any requirement for a progress payment bond should be resisted, but it is not always possible to achieve this. (3) A Performance Bond is designed to allow the customer to claim guaranteed financial redress in the event that the exporter fails to perform the delivery and/or technical performance obligations defined in the contract. The contract will have set out the penalties/liquidated damages/compensation for direct losses incurred by the customer as a direct result of the failure of the exporter to perform or failure to remedy any default in accordance with the terms and conditions of the contract. The performance bond is an overt financial obligation that is over and above these contractual remedies. It is common to see a requirement for a performance bond equivalent to 10% of the contract price. The performance bond will typically be required at the time the equipment is delivered and will run for either a set period (often 12 months) or until some time after the scheduled completion or commissioning date for the project. There is a tendency for some customers to require the performance bond to be provided at the same time as the APG. This should be resisted on the two important grounds of cost (to the exporter and hence to the customer via the selling price) and inappropriateness – how can the exporter guarantee at the start of the contract the performance of equipment that may take many months or some years to deliver? If your arguments are not successful and you have to provide the performance bond at the beginning of the contract you should try to obtain some relief by having it conditioned such that it does not become effective and cannot be called until the equipment is delivered or commissioned in accordance with the terms of the contract. Of course, the wording needs to provide for the issuing bank to be advised of the occurrence of the trigger event(s). (4) A Warranty Bond is given in support of an exporter's warranty obligations, and its validity is likely to match the warranty period. It is typically issued in exchange for the expiring performance bond, although this should be specified in the wording to protect against the possibility of the customer holding both the performance and warranty bonds at the same time. Indeed, a good way to protect against this possibility is to combine the two bonds in a single document such that, for example, a 10% performance bond reduces to 5% upon completion of the contract works and then continues as a warranty bond until the end of the warranty period. This also reduces administrative costs. (5) A Retention Bond is similar to a warranty bond except that, unusually, it is a bond that might be volunteered by the exporter. If your payment terms involve a 5% or 10% payment which is retained by the customer for perhaps 12 months after delivery of equipment, it may be preferable to offer a retention bond for the equivalent value in exchange for payment at the time you supply the equipment. The customer will have the security of knowing that he can recover his money in the event of failure of your equipment (much like a performance bond) but you may achieve a cost saving if the value of holding the payment for 12 months exceeds the cost of issuing the bond. (6) An offset performance bond may be needed if, for a large project, there is a requirement to use locally sourced labour, materials or manufacturing during performance of the project, or if an investment must be made in local business. These Direct Investment Programmes (DIP) and National Investment Programmes (NIP) are important for a host government that needs overseas technology in a capital project but does not want to be seen to be favouring overseas business. It is important to have a robust mechanism for agreeing reductions to the bond value. If 'NIP' is required, the offset performance bond is likely to continue until long after the contract is complete, simply because it will take time for the exporter to seek out suitable investments, negotiate the terms of the investment, and provide suitable evidence of the benefit. Other Forms Of Guarantee:- Bonds are an expensive instrument and it is worth knowing about some alternatives. In all cases, exporters recommend looking at the value of the contract and the importance of the buyer and asking 'do we really need to issue a guarantee?' It is usual for a certain level of commercial protection to be included in the contract, in the form of penalties (Liquidated Damages) for delays etc. You will need to ensure that any additional letters/guarantees do not undermine them. Ideally, write into your contract that the sole remedies for delays and non-performance will be the liquidated damages. If your own company/group is strong, the customer may accept a Letter of Comfort or a parent company guarantee instead of a bond. Offer your own preferred wording wherever possible, and allow time to get the wordings agreed with your customer in advance of contract award so that, if you are awarded the contract, you can move quickly to sign it and get to work. A letter of comfort has no stated value, is off-balance sheet, and is intended to be morally comforting rather than legally binding. The letter of comfort might say that an ultimate holding company may assume the financial risks of default in performance of a subsidiary company under a contract or commercial agreement, by the use of such wording as 'It is our policy to ensure that our subsidiary is in a position to meet all its contractual liabilities and we will not reduce our financial interests in our subsidiary during the performance of the contract'. Of course, in a prolonged recession, the value of a letter of comfort is questionable. It is always worth checking with a lawyer that the seemingly innocuous words of your letter of comfort are indeed not inadvertently binding your parent company into some form of guarantee. A Parent Company Guarantee is a legally binding obligation from a holding company that a subsidiary will perform the contract. Ask your lawyer to draft this guarantee. It is a good idea to include the following:- (i) A clear maximum aggregated limitation of monetary liability which does not exceed the maximum aggregated limitation of monetary liability of the subsidiary under the contract – and replaces the liability of the subsidiary, i.e. it does not create a new liability in addition to that of the subsidiary; (ii) Clear expiry date; (iii) No financial or other restrictive covenants; (iv) Not assignable or transferrable to a third party; (v) Governed by English Law, disputes settled in the English Courts; (vi) If your company is exporting as part of a joint venture, then your parent company's liability should be several (i.e. relating to your part of the contract only). While it is preferable that the customer accepts your guarantee of the performance of your equipment, or a parent company guarantee, most customers require exporters to provide bonds issued by third parties. Bond Issuers:- There are two broad categories of institution which issue bonds: banks and insurance companies:- (i) On-Demand Bonds tend to be issued by banks. They are willing to issue unconditional undertakings, under which they will be required to pay simply if requested to do so, because they will have passed the risk of having to pay back to the exporter by way of an indemnity. The bank marks the bond against the exporter's overdraft / lending limit and also has to allocate its own capital to the exposure. Some banks have decided that there are more remunerative ways of using their capital than bonding lines, especially as contract bonds can be in place for a number of years. New 'Basel III' banking rules will compound this by setting ever higher ratios of bank capital to exporter exposure. Larger companies tend to arrange, and pay a fee for, committed bonding facilities. (ii) Surety Bonds are issued by insurance companies and do not impinge upon the exporter's overdraft facility. They are widely used in construction and civil engineering – and often for 100% of contract value – to guarantee that the contractual terms will be fulfilled. The bond provides financial protection for the beneficiary against loss due to the inability of the principal to discharge damages for breach of contract. Surety bonds can also be used to facilitate deferment of duty, for

example to ease the cash flow for importers and exporters of petroleum, tobacco and alcohol. A surety facility is typically put in place with a maximum limit established by reference to annual audited accounts supported by management figures and budgets. Most surety bonds are conditional; the bond only being callable if the beneficiary proves loss. The conditionality of surety bonds tends to be unattractive to overseas customers. (As this guide deals mainly with on-demand bonds, it does not really address conditional bonds issued by surety/insurance company bonds). / Контракт между принципалом и поручителем, предусматривающий обеспечение исполнения обязательства, возложенного по закону или предписанием, и покрывающий потенциальный ущерб в отношении пошлин, налогов и штрафов за определённые типы операций.

(3) Bond is an obligation of the insurance company to protect one against financial loss caused by acts of another. / Обязанность страховой компании защитить конкретное лицо от финансовых убытков, вызываемых действиями другого лица.

BOND = СВЯЗЬ (или СВЯЗУЮЩЕЕ) – Bond:- in general, of these bond types, hydrogen bonds are weakest, ionic bonds intermediate in strength, and covalent bonds are strongest. Van der Waals forces are something of a special case. See also Covalent Bond, Hydrogen Bond, Ionic Bond, Van Der Waals Forces. / , ионные связи (ionic bonds).

BOND CALLS = ОПЦИОНЫ НА ПОКУПКУ ОБЛИГАЦИИ – Bond Calls:- the right to redeem outstanding bonds prior to their scheduled maturity. / Право выкупа остающихся облигаций до их запланированного погашения.

BOND CONDITIONS = УСЛОВИЯ ВЫПУСКА ОБЛИГАЦИЙ – Bond Conditions are conditions governing the issue of a bond, in particular interest coupon, maturity, redemption, total amount, denomination.

BOND CUM WARRANT = ОБЛИГАЦИЯ С ОТДЕЛЯЕМЫМ ВАРРАНТОМ – Bond Cum Warrant is a fixed-income security that certifies the right to purchase shares through a warrant that can be separated from the bond. The shares can be drawn at previously specified conditions by presenting the warrant. The bond cum warrant itself is not exchanged, but rather it continues until it is redeemed. For bond cum warrants, there can be up to three different exchange quotes:- one price for the bond cum warrant (‘cum’), for the bond without warrant (‘ex’) and for the warrant alone. Also called a Bond With Warrant or a Warrant-Linked Bond.

BONDED = ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ (или ОБЕСПЕЧЕННЫЙ ГАРАНТИЕЙ) – Bonded:- held in bond. The storage of import goods under charge of customs viz. customs seal until the import duties are paid or until the goods are re-exported. Bonded:- the storage of certain goods under charge of customs viz. customs seal until the import duties are paid or until the goods are taken out of the country. Bonded Warehouse is a place where goods can be placed under bond. Bonded Store is a place on a vessel where goods are placed behind seal until the time that the vessel leaves the port/country again. Bonded Goods are the dutiable goods upon which duties have not been paid, i.e. goods in transit or warehoused pending customs clearance. / , то есть .

BONDED CARRIER = ТАМОЖЕННЫЙ ПЕРЕВОЗЧИК (или ПЕРЕВОЗЧИК, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ, или ПЕРЕВОЗЧИК, ОБЕСПЕЧЕННЫЙ ГАРАНТИЕЙ) – In the United States, a Bonded Carrier is a licensed transporter that can move freight through US ports of entry without paying duty on those goods or obtaining a customs release during border crossing. What does partnering with a bonded carrier mean for your supply chain? Bonded carriers provide a clear advantage in the expedited shipping process, while still adhering to customs protocol. When a bonded carrier moves freight, that load is called an In-Bond Shipment. This label would streamline the import/export process for your shipments or forwarded freight, which will save both time and money. So bonded carriers not only expedite the importing and exporting, but they also give you the piece-of-mind that your shipment(s) always adhere to customs protocol. A bonded carrier must post security to cover the following:- (i) Movement of goods to a US Customs office inland (not located at the border) for release of a shipment at a later time or place; also known as Bonded Merchandise; (ii) Movement of goods ‘in-transit’ through the United States. The bonded carrier uses the US as a corridor, or a shortcut, by starting from a point outside the United States and then transiting through the US to another point outside of the US (for example Canada to Canada); and (iii) Movement of goods into the United States for export to a foreign market (for example Mexico to Canada). Bonded Carrier is a transporter duly licensed (against a guaranty or surety) by customs to carry duty-unpaid goods. In Bond Shipments refers to imports or export shipments which have not been cleared by customs. In bond shipments to and within the US are shipments not intended to enter the US commerce. In bond shipments is a term applied to the status of merchandise admitted provisionally to the US without payment of duties or applicable taxes. An in bond shipment indicates an origin where the bond is ‘arrived’ and a destination where the bond again will be ‘arrived’ or considered ‘cancelled’. / В России Таможенный Перевозчик:- юридическое лицо, имеющее лицензию на ведение соответствующей деятельности и занимающееся перемещением товаров (грузов), находящихся под контролем таможни, или лицо, несущее ответственность за транспорт, на котором происходит перемещение грузов. Таможенный перевозчик наделён правами и обязанностями, которые он должен выполнять согласно действующему законодательству. Предприятие пользуется услугами таможенных перевозчиков, но, получив его статус, может само осуществлять перевозки, существенно экономя денежные средства. Кто Такой Таможенный Перевозчик? До того, как Россия стала участницей Таможенного Союза (01 Июля 2010), таможенным перевозчиком считалось юридическое лицо, зарегистрированное согласно законодательству Российской Федерации (РФ) и состоящее в Реестре Таможенных Перевозчиков, который вела ФТС РФ (Федеральная Таможенная Служба Российской Федерации) и региональные таможенные управления. Соответственно, можно выделить два типа таможенных перевозчиков:- (1) Общероссийские – исполняют перевозки в пределах территории России; и (2) Региональные – исполняют перевозки внутри определённого региона. Таможенному перевозчику предоставлялось свидетельство на 5 лет о включении его в соответствующий реестр. Деятельность таможенных перевозчиков регулировалась законодательными актами такими, как:- Административный Регламент по Исполнению Государственной Функции по Ведению Реестра Таможенных Перевозчиков, утверждённый ФТС РФ (Приказ № 1351 от 31 Октября 2007), и Таможенный Кодекс РФ. Всё изменилось с 01 Июля 2010. Теперь таможенным перевозчиком может стать юридическое лицо страны-участницы Таможенного Союза, соответствующее требованиям Статьи 19 Таможенного Кодекса Таможенного Союза. Отныне таможенный перевозчик реализует перевозку грузов согласно таможенной процедуры таможенного транзита, не ограничивая себя деятельностью в пределах определённой местности, то есть в зоне Таможенного Союза. Таможенный перевозчик подтверждает свой статус свидетельством о включении его в реестр таможенных перевозчиков, выдаваемое федеральным органом исполнительной власти в сфере таможенного права. Свидетельство выдаётся бессрочно, но каждый год необходимо подтверждение уплаченных таможенных платежей. Способ оплаты может быть любой:- перечисление денежных средств, выдача банковской гарантии, заключение договора поручительства. Деятельность таможенного перевозчика должна отвечать следующему законодательству:- Статьи Таможенного Кодекса Таможенного Союза с 18 по 22, 224, 367; Статьи 54, 55, 57, 58, 59, 66, 67, 68 ‘О Таможенном Регулировании в РФ’ № 311-ФЗ от 27 Ноября 2010; Регламенту Федеральной Таможенной Службы по Предоставлению Государственной Услуги по Ведению Реестра Таможенных Перевозчиков (Приказ № 1992 от 30 Сентября 2011). Когда Требуются Услуги Таможенного Перевозчика? Услуги таможенных перевозчиков могут быть обязательными и добровольными. Добровольно можно пользоваться услугами таможенного перевозчика по инициативе заинтересованного лица, уведомив при этом таможенный орган. Обязательно использовать услуги таможенного перевозчика нужно тогда, когда

на таможне отправления у должностного лица появились подозрения о несоблюдении таможенного права. Основываясь на данных о перевозимых товарах, принимая во внимание специфичность таможенной грузоперевозки, должностное лицо берёт на себя принятие решения перевозить продукцию на стадии таможенного декларирования таможенного перевозчика. Так поступает должностное лицо в отношении следующих товаров:- (i) Товары, запрещённые к импорту в РФ и экспорту из РФ, и при необходимости перевозки такой продукции между таможенными органами; и (ii) Товары, которые нельзя реализовывать без лицензии, сертификатов или подлежащие надзору со стороны государственных органов. Как Работает Таможенный Перевозчик? Отношения между отправителем, перевозчиком, получателем продукции и таможенным перевозчиком закрепляются договором. Таможенный перевозчик перевозит товар под контролем таможни, по решению таможни отправления или в связи с заинтересованностью в грузоперевозке лиц. Если таможня отправления приняла решение о грузоперевозке продукции таможенным перевозчиком, то оно обязательно для исполнения для отправителя, перевозчика, получателя и таможенного перевозчика. Издержки перевозчика, которые возникают при грузоперевозке таможенным перевозчиком, регулируются между отправителем, перевозчиком, получателем и не подлежат возмещению со стороны таможни. Перевозка продукции, которая находится под контролем таможни, будет поручена в том случае таможенному перевозчику, если таможня заранее предполагает, что простой перевозчик или его автотранспорт не смогут соблюсти законодательство в сфере таможенного права. Должностное лицо таможенного органа после того, как выяснит статус перевозимого товара и все факторы перевозки, принимает решение о перевозке подконтрольного таможне товара. Воспользоваться услугой таможенного перевозчика заинтересованным лицам можно только при условии осведомленности таможенного органа. Когда принимается решение о перевозке продукции таможенным перевозчиком или решение о дальнейшей перевозке простым перевозчиком, обязательно необходимо предусмотреть и учесть следующие факторы:- (i) Транспорт простого перевозчика должен соответствовать правилам, которые установлены для транспортных средств; (ii) Возможность оказать таможенное сопровождение продукции, товаров, транспорта, документов должностными лицами таможни; (iii) Характер продукции:- товары, которые облагаются высокой ввозной таможенной пошлиной; подакцизные товары; продукция, которая подлежит контролированию различных государственных органов. (iv) Статус продукции, то есть необходимо определить, включает ли в себя таможенный режим взимание или невзимание таможенной пошлины, акцизов, налога на добавленную стоимость (НДС), а также применение или неприменение таких мер экономической политики, как квотирование, лицензирование и другое; (v) Таможенный орган должен владеть информацией о перевозчике:- о его организационно-правовой форме, платёжеспособности, о добросовестном исполнении обязательств перед таможней, информацией о собственнике имущества, стоимости основных средств, популярности на рынке услуг перевозок, является ли перевозка основным или дополнительным видом деятельности, осуществляет перевозчик единичные или стабильные грузоперевозки и так далее; и (vi) Иные факторы, которые дают основания полагать, что товар, транспорт, документы могут быть не доставлены в таможенный орган назначения или таможенные платежи будут неоплаченными. При оплате таможенных платежей, в качестве исключения, может приниматься решение о перевозке товара таможенным перевозчиком в отношении следующих товаров:- (i) Запрещённых товаров к импорту в Россию, экспорту из России; (ii) Когда перевозка товаров должна быть осуществлена между таможенными органами; (iii) Импортные товары, требующие лицензирования; (iv) Товары, подконтрольные другим государственным органам, но если контроль не был ими осуществлён; и (v) Продукция, подлежащая сертификации. Когда перевозкой продукции занимается таможенный перевозчик, то таможенное декларирование и контролирование доставки должно исполняться в строгом соответствии с законодательными актами ФТС РФ в части применения таможенного режима транзита и доставки продукции под контролем таможни. Таможенный перевозчик может пользоваться для перевозок помимо своего транспортного средства и оборудования в виде прицепов, полуприцепов, контейнеров, аналогичным транспортом и оборудованием третьих лиц. Что Значит Статус Таможенного Перевозчика? Многие задаются вопросом, в чем отличие между разрешением участвовать в международной дорожной перевозке (МДП) и полученным статусом таможенного перевозчика? Перечислим эти различия:- (1) Таможенный перевозчик имеет право перевозить продукцию различными видами транспортировки:- железнодорожной, морской, авто- и авиа- транспортировкой, тогда как лица, получившие допуск к МДП, имеют право заниматься перевозкой только на автомобильном транспорте; (2) Таможенный перевозчик пользуется своим статусом на территориях государств, являющихся членами Таможенного Союза, тогда как, если у перевозчика есть допуск к МДП, он может заниматься грузоперевозками на территориях 55-ти государств-участников Конвенции от 1975. (3) Запись в Реестр Таможенных Перевозчиков осуществляется ФТС РФ, тогда как допуск к МДП выдаёт Ассоциация Автомобильных Перевозчиков (АСМАП) при согласовании с ФТС РФ; (4) Граница гарантийных обязательств перед таможней у таможенного перевозчика составляет не менее 200 000 Евро, а у перевозчика МДП – 60 000 Евро, что даёт возможность таможенному перевозчику не использовать таможенное сопровождение (конвоирование) дорогого и ценного товара стоимостью больше 60 000 Евро. Крупному бизнесу выгодно находиться в статусе таможенного перевозчика, так как это даёт ему определённые плюсы:- (1) Статус Таможенного Перевозчика позволяет перевозить товары по всей территории Таможенного Союза, не применяя мер по соблюдению таможенного транзита. Соответственно отсутствуют издержки на таможенные пошлины, на таможенное сопровождение, на налоги импортной продукции. Отсутствие трат на таможенное сопровождение экономит не только деньги, но и время. Регулярное отсутствие платы по налогам и таможенным пошлинам делает деятельность перевозчика проще. Перевозчик, который не имеет статуса таможенного перевозчика, обязан внести финансовые средства, заключить договор поручительства или каждый раз при осуществлении грузоперевозки предоставлять банковскую гарантию. Это очень некомфортно. Так появился ‘Институт Таможенного Перевозчика’, цель которого сделать деятельность таможенных перевозчиков доступнее. Перевозчик предъявляет на таможне свидетельство и под её контролем занимается перевозкой груза, но при этом каждый год единовременно оплачивает таможенные пошлины и налоги на сумму не менее 200 000 Евро. Возможность перевозок дорогостоящих грузов, которые в разы превышают стоимость оплаты таможенной пошлины и налогов. Например, фирма получила разрешение на таможенные грузоперевозки и оформила банковскую гарантию на 8.5 миллионов Российских Рублей, так как она имеет статус таможенного перевозчика, то может заниматься перевозкой грузов, стоимость которых превосходит данную сумму. Соответственно, если в лицензии таможенного перевозчика написана сумма обеспечения 8.5 миллионов Российских Рублей, то перевозчик может стабильно перевозить товар, стоимость которого составляет 16 миллионов Российских Рублей. Если у перевозчика нет лицензии, ему придётся оплатить размер обеспечения в 16 миллионов Российских Рублей. При каждой грузоперевозке ценного товара обычному перевозчику придётся подтверждать обеспечение в виде денежного залога, банковской гарантии или договора поручительства. (2) Возможность мультимодальных перевозок:- У таможенного перевозчика есть некое преимущество использования во время перевозок различных видов транспорта. Следовательно, он может осуществить ввоз продукции воздушным транспортом таможенного перевозчика, а далее воспользоваться автотранспортом. (3) Возможность разумного использования автопарка:- Когда происходит грузоперевозка по процедуре международной дорожной перевозки (МДП), он должен строго соблюдать соответствие его автотранспорта требованиям, выдвигаемыми теми или иными государствами. Европейские страны жёстко контролируют соблюдение экологических требований к транспорту, въезжающих на их территорию. Но если перевозчик имеет статус таможенного перевозчика, он может использовать на территории стран

Таможенного Союза далеко не новый транспорт, которым запрещён въезд в Европейские страны. Очень интересно поступают перевозчики, имеющие и статус таможенного перевозчика, и допуск к МДП. Автомобили, отвечающие Европейским стандартам (Евро 4, 5), ездят за товаром в Европейские страны, далее, к примеру, груз отгружают в Беларусь, а позже товар старым МАЗом таможенного перевозчика перевозят в место назначения в России. То есть перевозчик, эксплуатируя дорогой транспорт по дорогам Европы, сохраняет автомобили в хорошем состоянии, при этом более старых представителей автопарка он использует на перевозки внутри страны. (4) Возможность перевозок своих (и привлечённых) грузов из портов:- Перевозчикам, которые имеют свои автомобили и постоянные поставки грузов, пребывающие в морские порты, очень удобно перевозить не только свои товары, но и привлечённые товары третьих лиц. При имеющемся статусе таможенного перевозчика, перевозчик забирает из порта свой контейнер и увозит его в таможню назначения. Часто для таких перевозок используют громадные Американские грузовые машины, не годящиеся для поездок в Европейские страны. Где Получить Лицензию Таможенного Перевозчика? Многие говорят ‘лицензия таможенного перевозчика’, но действительное наименование документа – ‘Свидетельство о Включении в Реестр Таможенных Перевозчиков’. Форма такого свидетельства, подтверждающего статус Таможенного Перевозчика и порядок его использования, определена решением Комиссии Таможенного Союза (КТС) № 260 от 20 Мая 2010 ‘О формах таможенных документов’. Свидетельство выдаёт таможня страны-участницы Таможенного Союза, включающий юридических лиц в Реестр Таможенных Перевозчиков. В Российской Федерации – это ФТС РФ, в Республике Казахстан – Комитет Таможенного Контроля (КТК) Министерства Финансов Республики Казахстан, в Беларуси – Государственный Таможенный Комитет (ГТК) Республики Беларусь. Такое свидетельство выпускают в 2-х экземплярах. Один направляют компании, которая включена в Реестр Таможенных Перевозчиков или выдают представителю компании при предоставлении доверенности на получение свидетельства и паспорта. Компания, получив свидетельство, делает нужное ей количество копий, должным образом заверяет их путём проставления подписи руководителя, печати организации и выдаёт своим водителям, которые обязаны предоставлять данный документ в таможенных органах. Другой экземпляр свидетельства хранится в ФТС РФ. Информация о компании и выданном свидетельстве заносится в реестр. Что Входит В Права И Обязанности Таможенного Перевозчика? Перечислим Обязанности Таможенного Перевозчика: - (1) Обязан соблюдать все требования при перевозке грузов согласно таможенной процедуре таможенного транзита, прописанной в Таможенном Кодексе Таможенного Союза; (2) Обязан вести учёт продукции, которую перевозит согласно таможенной процедуре таможенного транзита, и предоставлять с помощью информационных технологий отчёты о перевозке такой продукции в таможенные органы. Форма отчётности должна соответствовать законам стран-участниц Таможенного Союза, несоблюдение которой может повлечь за собой исключение из Реестра Таможенных Перевозчиков; (3) Обязан соблюдать уплату таможенной пошлины, налогов, включая случаи, предусмотренные Статьями 227-228 Таможенного Кодекса Таможенного Союза; (4) Несёт обязательство о неразглашении и неиспользовании в собственных интересах, а также о непередаче третьим лицам информации, которую получил от отправителя, получателя или экспедитора груза, если такая информация несёт государственную, банковскую, коммерческую или другую тайну. (5) Обязан сообщать о всех изменениях в течение 5 рабочих дней с момента их возникновения (касается сведений, сообщённых при включении в Реестр Таможенных Перевозчиков). Перечислим Права Таможенного Перевозчика, которые весьма ограничены:- (1) Имеет право перевозить продукцию, которая находится под таможенным контролем, без таможенного сопровождения и без обеспечения оплаты таможенного платежа (залога груза или транспорта, гарантийных обязательств третьего лица, внесения на депозитный счёт определённой суммы денежных средств); (2) Имеет право получать плату денежными средствами; (3) Имеет право перевозить груз как своим транспортом, так и транспортом третьих лиц. При этом транспортные средства обязаны отвечать требованиям, установленным законодательством; (4) Право требовать справедливого распределения между сторонами издержек, которые понёс перевозчик при перевозке груза, но при условии, если это было прописано в соглашении между отправителем и перевозчиком; и (5) Право на участие при проведении действий процессуального характера:- осмотры, экспертизы. Как Происходит Включение В Реестр Таможенных Перевозчиков? Для получения статуса Таможенного Перевозчика и свидетельства о включении в реестр таможенных перевозчиков необходимо подать в ФТС РФ заявление о включении в Реестр Таможенных Перевозчиков. Заявление нужно заполнить по утверждённой форме, к нему приложить пакет документов, которые доказывают соблюдение всех необходимых условий потенциальным таможенным перевозчиком для включения его в реестр. Более подробно остановимся на условиях включения в Реестр Таможенных Перевозчиков и на перечне прилагаемых документов. Условия, необходимые для включения юридического лица в Реестр Таможенных Перевозчиков:- (1) На дату подачи заявления в таможенный орган лицо должно иметь опыт в перевозке грузов не менее двух лет. В качестве доказательств можно предоставить договоры перевозки товаров за 2 предыдущих года, включая транспортные накладные или CMR. (2) Обязательно предоставить обеспечение оплаты таможенной пошлины и налогов на денежную сумму не менее чем 200 000 Евро, но учитывая курс валют, который установлен законами страны-участницы Таможенного Союза на дату предоставления обеспечения. Компания имеет право самостоятельно выбрать любой способ обеспечения:- внесение на депозитный счёт ФТС РФ денежных средств, оформить банковскую гарантию, заключить договор поручительства. С внесением денег на депозитный счёт и заключением договора поручительства всё понятно, а вот на оформлении банковской гарантии остановимся поподробнее. Банковская гарантия и договор поручительства подтверждают обеспечение уплаты таможенной пошлины и налогов, а также являются гарантом исполнения всех взятых обязательств перед таможенным органом. В основном, участники внешнеэкономической деятельности оформляют банковскую гарантию, так как её нетрудно сделать в любом банке или в страховой компании, но при этом нужно не забывать, что такая кредитная организация обязана быть включённой в реестр юридических лиц, имеющих право выдачи банковских гарантий. Реестр, который утверждён ФТС РФ (Приказ № 1165 от 02 Июня 2011) стабильно обновляется. Письмом ФТС РФ № 01-11/109 от 12 Января 2011 утверждена форма банковской гарантии. Банковская гарантия может быть предоставлена не менее чем на 200 000 Евро (ранее – 20 миллионов Российских Рублей), учитывая курс валют на день предоставления банковской гарантии в ФТС РФ. Важно! Банковская гарантия передаётся в ФТС РФ вместе с заявлением о включении в Реестр Таможенных Перевозчиков, но если в банковскую гарантию внесены изменения, то необходимо предоставить весь пакет документов, который предоставлялся в кредитную организацию. Документы нужно предоставлять с сопроводительным письмом. Дата и входящий номер на Вашем экземпляре сопроводительного письма будет являться доказательством предоставления банковской гарантии. Необходимо учесть, что регистрация поданных документов может произойти не в день их подачи. За это время курс валют может поменяться, поэтому лучше позаботиться об этом заранее и оформить банковскую гарантию на 200 000 – 300 000 Российских Рублей больше. К примеру, курс Евро на дату предоставления банковской гарантии в ФТС РФ составляет 40 Российских Рублей за один Евро, следовательно, 200 000 Евро x 40 = 8 000 000 Российских Рублей. Прибавьте риск перемены курса валют 300 000 Российских Рублей, итого 8.3 миллиона Российских Рублей. Но, если не хватило суммы обеспечения, недостающие денежные средства вносятся на счёт ФТС РФ. (3) Разрешительные документы на грузоперевозку. Если законодательство государства-участника Таможенного Союза требует какого-либо разрешения на осуществление грузовых перевозок, то наличие такого документа строго обязательно. Например:- (i) Подразделения Ространснадзора Минтранса РФ по месту регистрации юридического лица выдаёт лицензии на перевозку грузов морскими и речными

транспортными средствами, а также удостоверения по допуску к международным автоперевозкам; и (ii) Федеральным Агентством Воздушного Транспорта Минтранса РФ выдаётся лицензия на перевозку грузов воздушным транспортом. (4) Документальное подтверждение прав собственности, хозяйственного ведения, аренды, оперативного управления перевозимым грузом и транспортными средствами, которые пригодны для перевозки товара под пломбами и печатями таможенных органов. Такими подтверждающими документами могут быть свидетельства о регистрации транспортного средства, паспорт транспортного средства (ПТС), договора аренды, договора лизинга воздушного или морского судна и так далее. (5) На дату обращения в ФТС РФ у потенциального таможенного перевозчика не должно быть задолженностей по таможенным платежам, налогам и пеней по ним. В данном случае, речь идёт о долге перед таможенным органом по неуплате налогов и таможенной пошлины по причине подачи недостоверно продекларированных данных или, если когда-либо не была произведена поставка груза, подконтрольного таможне; (6) Заявитель в течение одного года не должен быть привлечён к административной ответственности за нарушения в сфере таможенного права, в частности, по следующим статьям Кодекса Российской Федерации об Административных Правонарушениях (КоАП РФ):- (i) Статья 16.1:- предоставление недостоверных сведений таможенным органам или недостоверное декларирование; (ii) Статья 16.2:- недостоверное декларирование; (iii) Статья 16.3:- несоблюдение запретов и ограничений на ввоз, вывоз товаров; (iv) Часть 1 Статьи 16.9:- полная или частичная недоставка товаров; (v) Статья 16.11:- уничтожение, повреждение, удаление, изменение либо замена средств идентификации (пломб и печатей); (vi) Статья 16.15:- непредоставление в таможенный орган отчётности; (vii) Часть 2 Статьи 16.23:- осуществление деятельности в качестве таможенных перевозчиков, включённых в соответствующий реестр на основании недействительных документов, либо исключённых из Реестра Таможенных Перевозчиков; (viii) Часть 3 Статьи 16.23:- несообщение либо несоблюдение срока 5 дней сообщения таможенному органу об изменении сведений, указанных в заявлении о включении в Реестр Таможенных Перевозчиков. Соответственно, на дату подачи заявления о включении в Реестр Таможенных Перевозчиков у заявителя не может быть вступивших в законную силу решений по вышеуказанным статьям Кодекса Российской Федерации об Административных Правонарушениях (КоАП РФ) в течение одного года перед подачей заявления в ФТС РФ. Например, заявление зарегистрировано в ФТС РФ 01 Января 2012, следовательно, в период с 01 Января 2011 по 01 Января 2012 заявитель не должен был привлекаться по перечисленным статьям Кодекса Российской Федерации об Административных Правонарушениях (КоАП РФ). Однако, юридическое лицо может подать заявление спустя год после даты вступления в законную силу крайнего постановления об административном правонарушении. Одно постановление об административном правонарушении, вступившее в законную силу, не будет являться причиной мотивированного отказа о включении заявителя в Реестр Таможенных Перевозчиков. Если у заявителя имеется несколько административных дел, то лучше переждать один год с момента последнего, вступившего в силу, административного постановления, а затем смело подавать необходимые документы в ФТС РФ на включение в Реестр Таможенных Перевозчиков. Какие Документы Потребуются, Чтобы Стать Таможенным Перевозчиком? Юридическое лицо должно направить в ФТС РФ заявление о включении в Реестр Таможенных Перевозчиков, оформленное по утверждённой форме. К заявлению необходимо приложить пакет документов, подтверждающие сведения, указанные в заявлении, это:- (1) Учредительные документы (копия устава); (2) Выписка из Единого Государственного Реестра Юридических Лиц (ЕГРЮЛ); (3) Свидетельство о внесении записи в ЕГРЮЛ; (4) Свидетельство о постановке на учёт в налоговом органе (ИНН); (5) Разрешительные документы на перевозку грузов. Если законодательство страны-участницы Таможенного Союза требует какого-либо разрешения на осуществление грузовых перевозок, то наличие такого документа строго обязательно. Подразделения Ространснадзора Министерства Транспорта Российской Федерации (Ространснадзора Минтранса РФ) по месту регистрации юридического лица выдаёт лицензии на перевозку грузов морскими и речными транспортными средствами, а также удостоверения по допуску к международным автоперевозкам; Федеральное Агентство Воздушного Транспорта Минтранса РФ выдаёт лицензии на перевозку грузов воздушным транспортом. (6) Документы, подтверждающие право собственности, хозяйственного ведения, аренды, оперативного управления перевозимого груза и транспортных средств (свидетельство о регистрации транспортного средства, паспорт транспортного средства (ПТС), договор аренды, договор лизинга воздушного или морского судна и так далее); (7) Свидетельство о допущении транспортного средства международной перевозки к перевозке груза под таможенными пломбами и печатями, порядок выдачи которого утверждён Решением Комиссии Таможенного Союза (КТС) № 676 от 22 Июня 2011. Такое свидетельство необходимо, если на товаре имеются печати и пломбы. Свидетельство не потребуется, если перевозка осуществляется на платформе для негабаритного груза или в контейнере. (8) Оригинал платёжного поручения или банковской гарантии, свидетельствующие об оплате не менее 200 000 Евро; (9) Документы, подтверждающие наличие открытых банковских счетов; и (10) Договоры перевозки товаров за 2 предыдущих года, включая транспортные накладные или CMR. Данные документы служат доказательством наличия у заявителя опыта перевозок, который не может быть менее 2 лет. Пакет документов предоставляется в ФТС РФ в виде копий, надлежащим образом заверенных (за подписью руководителя и с проставлением печати организации), устав может быть заверен нотариально, но банковская гарантия или платёжное поручение обязательно должны предоставляться в оригиналах. Когда Включение В Реестр Таможенных Перевозчиков Считается Завершённым? Есть два способа подачи заявления в ФТС РФ. Заявление с приложенным пакетом документов можно отпустить в ящик для корреспонденции, находящийся в Приёмной ФТС РФ, по адресу:- Улица Новозаводская 11-5, Москва или направить по почте. Согласно регламенту работы ФТС РФ, пакет документов будет передан Управделами, который зарегистрирует заявление потенциального таможенного перевозчика не позднее даты, следующей за днём поступления заявления. Далее, пакет документов будет передан в одно из подразделений ФТС РФ для его рассмотрения. Срок, в течение которого заявитель должен быть внесён в реестр таможенных перевозчиков, не должен превышать 40 дней, в случае внесения изменения в банковскую гарантию – не более 15 дней. Но, как правило, ФТС РФ в эти сроки не укладывается, так как заявление должно пройти сложную процедуру согласования различных специалистов таможенной службы. Таможенное законодательство является несовершенным и постоянно меняющимся, в связи с чем и возникают различные трудности, препятствующие быстрому включению заявителей в Реестр Таможенных Перевозчиков. Есть прецеденты подачи заявлений без банковской гарантии. Для того, чтобы сократить риск издержек по оформлению банковской гарантии, компания сначала получает предварительно одобренное решение ФТС РФ, затем ей даётся 30 дней для направления в адрес таможенной службы оформленной банковской гарантии. Как пример можно привести крупную компанию, которая воспользовалась вышеприведённым правом, но оригинал банковской гарантии был направлен ФТС РФ спустя 32 дня вместо 30 заявленных. В итоге, компании был предоставлен мотивированный отказ о включении в Реестр Таможенных Перевозчиков, что повлекло за собой существенные убытки для компании и затягивание сроков включения её в реестр до 90 дней. Если бы сотрудники ФТС позвонили в компанию и напомнили о необходимости донести оригинал банковской гарантии, она не понесла бы столь ощутимый урон. Есть примеры, когда компании пытаются действовать через руководство таможенной службы, но эти методы не приводят к положительным результатам. Что Важно Помнить, Став Таможенным Перевозчиком? (1) Нельзя забывать о том, что в любой момент перевозчик может быть исключён из Реестра Таможенных Перевозчиков. Причины исключения из реестра:- (i) Если перевозчик не предоставил в ФТС РФ новое обеспечение уплаты таможенной пошлины, налогов. Примерно за полмесяца до окончания срока банковской гарантии перевозчик обязан

направить в таможенную службу новую банковскую гарантию. Если по какой-то причине на дату окончания срока банковской гарантии не готово новое обеспечение, срочно уведомите ФТС РФ. (ii) Если таможенный перевозчик не соблюдает свои обязанности и привлечён к административной ответственности за нарушения в сфере таможенного права по Статье 16.1 Кодекса Российской Федерации об Административных Правонарушениях (КоАП РФ) за предоставление недостоверных сведений таможенным органам или недостоверное декларирование по Части 1 Статьи 16.9 КоАП за полную или частичную недоставку товаров, и сумма административного штрафа превышает 250 000 Российских Рублей. Исключение составляет фактическое количество перевозок, а именно:- (a) 4 000 перевозок автотранспортом; (b) 300 перевозок воздушным транспортом; (c) 5 000 перевозок железнодорожным транспортом; и (d) 100 перевозок водным транспортом. В этом случае допускается общая сумма штрафных санкций не более 800 000 Российских Рублей. (iii) Если перевозчик по собственному желанию подаёт в ФТС РФ заявление об исключении его из реестра таможенных перевозчиков; (iv) При ликвидации юридического лица согласно действующему законодательству страны-участницы Таможенного Союза; и (v) При реорганизации юридического лица согласно действующему законодательству страны-участницы Таможенного Союза. (2) В случае внесения таможенным перевозчиком изменений в сведения, указанные в свидетельстве о включении в Реестр Таможенных пПеревозчиков, например, изменение суммы банковской гарантии, смена юридического адреса. Нужно направить в ФТС РФ документы, подтверждающие изменения, приложив просьбу внести указанные изменения в реестр. Если изменилась сумма банковской гарантии, приложите новую банковскую гарантию, если произошла смена юридического адреса – копию устава в новой редакции, Идентификационный Номер Налогоплательщика (ИНН), свидетельство о регистрации в Едином Государственном Реестре Юридических Лиц (ЕГРЮЛ), выписку из ЕГРЮЛ и так далее.

BONDED EXCHANGE = ЗАМКНУТАЯ ВАЛЮТА – Bonded Exchange is an exchange which cannot be freely converted into other currencies. / Валюта, которая не может быть свободно обменена на другие валюты.

BONDED FABRIC = СКРЕПЛЁННАЯ ТКАНЬ – Bonded Fabric is:- (1) a fabric containing two or more layers of cloth joined together with resin, rubber, foam, or adhesive to form one ply. (2) Bonded Fabric:- a fabric which is created by adhesively bonding fiber webs or a textile fabric that is made of carded web or fiber web held together by adhesives or sheet or web structures bonded together by entangling fiber or filaments (and by perforating films) mechanically, thermally or chemically. See also Nonwoven Fabric. Bonded-Fiber Fabrics are made from webs of synthetic fibers bonded together with heat or adhesives. They are cheap to produce but not as strong as woven or knitted fabrics. Bonded-fiber fabrics are mainly used for interlining. They are easy to sew, crease resistant, do not fray and are stable when washing and dry cleaning. PP Spunbonded Fabrics are chosen over conventional fabrics because they perform a multitude of functions such as absorbency, liquid repellency, resilience, and strength. To carry consumer as well as personal belongings, these materials are now being widely used as consumer goods bags and hand bags.

BONDED–FACE FABRIC = ТКАНЬ СО СКРЕПЛЁННОЙ ЛИЦЕВОЙ ЧАСТЬЮ – Bonded-Face Fabric:- the side of a bonded fabric used as the face (right side) of the cloth in a garment or other end use.

BONDED FREIGHT = НЕРАСТАМОЖЕННЫЙ ГРУЗ (или ФРАХТ, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ) – Bonded Freight is a freight moving under a bond to US Customs or to the Internal Revenue Service, and to be delivered only under stated conditions.

BONDED GOODS = НЕРАСТАМОЖЕННЫЕ ТОВАРЫ (или ТОВАРЫ, ОБЕСПЕЧЕННЫЕ ОБЯЗАТЕЛЬСТВОМ) – In the United States, Bonded Goods are the imported goods deposited in a Government warehouse until duty is paid. / Бондовые Товары (Bonded Goods):- груз на таможенном складе, представляющий собой привозные (или импортные) товары, пошлина за которые пока не уплачена и таможенные формальности не соблюдены.

BONDED WAREHOUSE = СКЛАД, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ (или СКЛАД, ОБЕСПЕЧЕННЫЙ ГАРАНТИЕЙ (ОБЕСПЕЧЕНИЯ УПЛАТЫ ТАМОЖЕННЫХ ПЛАТЕЖЕЙ И САНКЦИЙ)) – In the United States, Bonded Warehouse is a warehouse owned by persons approved by the US Treasury Department, and under bond or guarantee for the strict observance of the revenue laws; utilized for storing goods until duties are paid or goods are otherwise properly released. A Bonded Warehouse is a warehouse approved by Customs and utilised for the storage of goods until such time that duties are paid or goods are otherwise properly released. In the United States, Bonded Warehouse is one that has been approved by the US Treasury Department who, due to observance of revenue laws, has put the warehouse under bond or guarantee. A bonded warehouse can also be a warehouse utilized for the storage of merchandise that is on hold until duty is paid. A warehouse authorized by customs authorities for storage or manufacture of goods on which payment of duties is deferred until the goods enter customs territory. The goods are not subject to duties if reshipped to foreign points. Bonded Warehouse is a building or a warehouse authorized by Customs authorities for storage of goods on which payment of duties is deferred until the goods are removed. Warehouse where imported merchandise may be stored temporarily without payment of customs duties or taxes. In the United States, the temporary storage period cannot exceed three years. Also known as Customs Bonded Warehouse. Bonded Warehouse is a warehouse owned by persons approved by the relevant customs and excise authorities (for example, in the United States it is the Treasury Department), and under bond (or guarantee) for the strict observance of the revenue laws. Utilised for storing goods until duties are paid or goods are otherwise properly released. Bonded Warehouse is a warehouse under customs control where cargo in transit is kept or where cargo is kept pending customs clearance. / Склад, в котором могут быть временно размещены привезённые (или импортированные) товары без оплаты таможенных пошлин или налогов. В Соединённых Штатах Америки период временного хранения не может превышать трёх лет. В Российской Федерации такой тип складов относится просто к Таможенному Складу, организуемому и обслуживаемому независимой от таможни компанией или организацией. Известен также как Таможенный Склад, Обеспеченный Гарантией (Customs Bonded Warehouse). Гарант гарантирует надлежащее исполнение Принципалом обязательств по уплате таможенных платежей, пеней в случае неисполнения либо ненадлежащего исполнения Принципалом своих обязательств по уплате таможенных платежей. Принципалом выступает Поручитель – владелец такого склада. Бондовый Склад (Bonded Warehouse):- склад, приписанный к определённой таможне, на котором можно осуществлять хранение привезённых (или импортных) товаров, не уплачивая пошлин. Оплата таможенных пошлин производится лишь в случае отправки товаров внутрь страны. Хранение товаров на бондовом складе лимитировано определёнными сроками, по истечении которых товары переходят в доход государства.

BONDED WAREHOUSE – EXPORT = СКЛАД ДЛЯ ВЫВОЗА, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ – Bonded Warehouse – Export is a secure building or area, approved by customs, where cargo, for which export clearance has been performed, is stored. Goods are considered foreign and must go out for export. In some countries, a bonded warehouse is defined as a warehouse with customs officials onsite. In others, it is a warehouse in which customs inspect cargo prior to authorizing export clearance. Ensure the local definition is established. In some countries, some manufacturers are also granted a licence to operate a bonded warehouse in which they can store manufactured products in anticipation of export and hence suspend payment of local taxes, e.g., on cigarettes.

BONDED WAREHOUSE – IMPORT = СКЛАД ДЛЯ ВВОЗА, ОБЕСПЕЧЕННЫЙ ОБЯЗАТЕЛЬСТВОМ – Bonded Warehouse – Import is a secure building or area, approved by customs, where cargo, for which export clearance has been performed, is stored.

BOND FAILURE = НАРУШЕНИЕ СЦЕПЛЕНИЯ – Bond Failure is a rupture of adhesive bond. / Разрушение связующего сцепления.

BOND FUND = ФОНД ОБЛИГАЦИЙ – Bond Fund is the investment fund which under its by-laws invests its assets in straight and convertible bonds. / Инвестиционный фонд, который по своему уставу инвестирует свои активы в обычные (чистые или прямые) и обратимые облигации (конвертируемые облигации).

BOND–IN = НАХОДЯЩИЕСЯ ПОД ОБЯЗАТЕЛЬСТВОМ (или НАХОДЯЩИЕСЯ ПОД ГАРАНТИЕЙ, или НЕРАСТАМОЖЕННЫЕ, или ПОД ТАМОЖЕННЫМ КОНТРОЛЕМ) – Bond-In:- goods are held or transported In-Bond under customs control either until import duties or other charges are paid, or in order to avoid paying the duties or charges until a later date.

BONDING = СКРЕПЛЕНИЕ (или СВЯЗЫВАНИЕ, или КРЕПЛЕНИЕ, или СОЕДИНЕНИЕ, или СЦЕПЛЕНИЕ) – Bonding is a process for adhesive laminating two or more fabrics or fabric and a layer of plastic foam. There are two methods:- the flame method used for bonding foam and the adhesive method used for bonding face and backing fabrics. Bonding is a process of joining two or more layers of cloth with a layer of adhesive, or pressing fibers into thin webs or mats held together by adhesive, plastic, or self-bonding that melts when heat is applied. Nonwoven fabrics are made in this way. The term occasionally is used as a synonym for laminating, but this is technically incorrect. Bonding is a process for adhesive laminating of two or more fabrics or fabric and a layer of plastic by means of a bonding agent (adhesives, plastics or cohesion), or ultrasonic procedure. Bonded fabrics are commonly used in outerwear. Bonding is the technique of permanently joining together two fabrics or layers of fabrics together by a bonding agent into one package. The bonding of fibers in a single layer of material is called a Web. Special adhesives, binders, or thin slices of foam may be used as the marrying agent. Fabrics can also be bonded to ultra-thin slices of foam or other materials on the cutting tables, and make possible easier handling of fragile cloths such as delicate laces, sheer materials, or lightweight knits. Bonding is one of several processes of binding fibers into thin sheets, webs, or battings by means of adhesives, plastics, or cohesion (self-bonding). See also Bonding With Binder Fibers, Needled Fabrics, Needle Loom, Point Bonding, Print Bonding, Spray Bonding, Spray Spinning, and Stitch Bonding. Bonding:- several methods for making nonwoven materials are now firmly established, and others are being developed. In adhesive bonding, fabrics are made by forming a web of fibers, applying an adhesive, then drying and curing the adhesive. The web can be produced by a garnett machine or a conventional card, several layers being piled up to obtain the required thickness. Such webs are weak across the width, but this does not limit their use for certain end products. A more uniform product results from cross laying the web. Other machines, such as the Rando-Webber, lay down the fibers by an airstream. The fibers in the web may be stuck together in various ways. The web may be sprayed with an emulsion of an adhesive – e.g., a latex based on synthetic rubber, acrylic derivatives, or natural rubber – or, alternatively, may be carried on a mesh screen through a bath of latex, the excess being squeezed out by a pair of rollers. Adhesives may also be applied as a foam or a fine powder. Thermoplastic fibers can be incorporated in the blend and on heating will bond together, giving strength to the mass of fibers. Mechanically bonded nonwoven products (or fiber-bonded nonwovens) are webs strengthened by mechanical means. The web, sometimes reinforced by a thin cotton scrim in the middle or by texturized yarns distributed lengthwise through it, is punched by barbed needles mounted in a needle board. The fibres in the web are caught up by the needle barbs, and the resulting increased entanglement yields a compact product sufficiently strong for many purposes. Modern needle-felting or punching machines perform 900 punches per minute, and selection of appropriate needles is based on the fiber being processed and the desired product. The Arachne Machine, the best known unit for stitch bonding, operates much like a warp-knitting machine. Fibrous web is fed into the machine, and stitches are made by a series of needles placed about eight millimeters apart, giving the web longitudinal strength; lateral strength is provided by the fibre interactions. The products are attractive for many purposes and can be improved by treatment with polyester resins to increase their wear resistance and with thermosetting precondensates to reduce their tendency to pill (e.g., to form small tangles). A new device attached to the Arachne machine permits introduction of weft ends at every single course, making color effects possible. Araloop machines yield loop-pile fabric suitable for towels and floor coverings. Three sewing-knitting machines were invented in East Germany in 1958. In the Malimo machine process, warp yarns are placed on top of filling yarns and stitched together by a third yarn. The Maliwatt machine interlaces a web of fibers with a sewing thread, giving the effect of parallel seams. The Malipol machine produces a one-sided pile fabric by stitching loop pile through a backing fabric. A new British process makes double-sided terry fabric, called Terrytuft, by inserting pile yarn into a backing and knotting it into position. Webs made of yarns having a core of one polymer and an outer sheath of another material having a lower softening point may be lightly pressed and then heated to an appropriate temperature. The core yarn will ‘spot weld’ together at the junction points, binding the mass of fibers together. Products made in this way find uses as industrial fabrics, coatings, and interlinings. / уточные пряжи.

BONDING = СОЕДИНЕНИЕ (КОРОТКОЙ ПЕРЕМЫЧКОЙ) (или СВЯЗЬ) – Bonding is an electrical conducting path formed by the permanent joining of metallic parts. Intended to assure electrical continuity and the capability to safely conduct any likely current. Similar to bonding jumper or bonding conductor.

BONDING COMPANY = ГАРАНТИРУЮЩАЯ КОМПАНИЯ – Bonding Company is an organization that is prepared to undertake an agreement to make good a financial guarantee on behalf of another responsible for such guarantee. Owners of ‘arrested’ vessels may obtain such a bond to satisfy a court and to obtain release of the vessel.

BONDING WITH BINDER FIBERS = СКРЕПЛЕНИЕ ПЕРЕВЯЗОЧНЫМИ ВОЛОКНАМИ – Bonding With Binder Fibers:- specially engineered low-melting point fibers are blended with other fibers in a web, so that a uniformly bonded structure can be generated at low temperature by fusion of the binder fiber with adjacent fibers. See also Bonding.

BOND ISSUE = ОБЛИГАЦИОННЫЙ ВЫПУСК (или ВЫПУСК ОБЛИГАЦИЙ) – Medium- to long-term securities (usually fixed-interest) issued and offered for public subscription during a specified period as a means of raising capital. In many cases the borrower is given the right to repay all or part of the issue prior to final maturity upon observance of a notice period. Special forms include convertible bond issues, indexed bond issues, annuities, foreign bond issues and Eurobonds.

BOND ISSUE IN DEFAULT = НЕСОСТОЯТЕЛЬНОСТЬ ПО ОБЛИГАЦИОННОМУ ВЫПУСКУ (или ДИФОЛТ ПО ОБЛИГАЦИОННОМУ ВЫПУСКУ, или ДИФОЛТ ПО ВЫПУСКУ ОБЛИГАЦИЙ) – Bond Issue In Default:- a bond issue whose interest or planned repayments of principal are not effected as scheduled under the terms of the issue. / Облигационный выпуск, по которому в запланированное графиком время согласно условий и порядков данного выпуска не состоялись выплаты процентов или запланированные выплаты основной суммы.

BOND MARKET = РЫНОК ОБЛИГАЦИЙ – Bond Market companies and governments issue bonds to raise capital for their investments. Bonds are interest-bearing securities either with a fixed interest rate or with a floating rate and with a maturity of at least one year (from the time of issuance). Fixed-interest rate bonds make up the largest share of the bond market.

BOND OF INDEMNITY = ОБЯЗАТЕЛЬСТВО ВОЗМЕЩЕНИЯ (или ОБЯЗАТЕЛЬСТВО КОМПЕНСАЦИИ) – Bond Of Indemnity is a written instrument stating a fixed sum as a penalty, binding the parties to pay that penalty unless one or more of the parties performs a certain act.

BOND OPTION = ОПЦИОН НА ОБЛИГАЦИЮ – Bond Option:- a transaction in which one party grants to the other party (in consideration for a premium payment) the right, but not the obligation, to purchase (in the case of a call) or sell (in the case of a put) a bond of an issuer, whether sovereign or non-sovereign, at a specified strike price. The bond option can be settled by physical delivery of the bonds in exchange for the strike price or may be cash settled based on the difference between the market price of the bonds on the exercise date and the strike price. / закупить (в случае опциона на покупку) или продать (в случае опциона на продажу) . суверенного (самостоятельного) или несуверенного (несамостоятельного).

BOND PORT = БОНДОВЫЙ (или ПРИПИСНОЙ) ПОРТ – Bond Port is a port of initial Customs entry of a vessel to any country. Also known as First Port of Call.

BOND PRICE = ЦЕНА ОБЛИГАЦИИ – Bond Price:- not to be confused with Bond Yield, it is the amount an investor pays to buy a bond. Bond prices and interest rates have an inverse relationship:- when rates rise, bond prices fall; when rates decline, bond prices rise. / Это сумма, которую инвестор оплачивает при покупке облигации; её не следует путать с Доходностью Облигации (Bond Yield). Цены облигаций и процентные ставки имеют обратную зависимость:- когда процентные ставки растут, цены облигаций падают; и когда процентные ставки снижаются цены облигаций растут.

BOND RATING = РЭЙТИНЬГ ОБЛИГАЦИЙ – Bond Rating:- in Canada, government or corporate bonds are rated by companies like the Dominion Bond Rating Service as to risk. A Double-A rating, for example, would give investors an objective assessment as to how capable the issuer is of meeting its repayment obligations. It's a risk assessment.

BOND STRENGTH = ПРОЧНОСТЬ СЦЕПЛЕНИЯ – (1) Bond Strength is the unit load applied in tension, compression, flexure, cleavage, or shear, required to break an adhesive assembly, with failure occurring in or near the plane of the bond. See also Peel Adhesion. / Удельная нагрузка, прилагаемая при растяжении, сжатии, сгибании, расщеплении/раскалывании, или сдвиге, требующаяся для разрушения связующего звена/узла/устройства, с нарушением, возникающим в или вблизи плоскости сцепления.

(2) Bond Strength is the amount of force required to delaminate a piece of woven or knitted fabric from its backing.

(3) Bond Strength is the amount of force required to break the fusion points found in certain nonwovens.

(4) Bond Strength is the amount of force required to break the chemical bonds between atoms in molecules and crystalline salts.

BOND STRIP = XX – Bond Strip is a tradable security consisting of one of the payments constituting either a coupon of a coupon-bond or a redemption payment of a coupon-bond. In effect a strip is a zero coupon bond (ZCB).

BOND SYSTEM = СИСТЕМА ОБЯЗАТЕЛЬСТВ (или СИСТЕМА ГАРАНТИЙ, или СИСТЕМА ОБЕСПЕЧЕНИЯ ОБЯЗАТЕЛЬСТВОМ) – Bond System is part of US Customs' Automated Commercial System providing information on bond coverage. A Customs bond is a contract between a principal, usually an importers, and a surety which is obtained to insure performance of an obligation imposed by law or regulation. The bond covers potential loss of duties, taxes and penalties for specific types of transactions. Customs is the contract beneficiary.

BOND TRADING RING = РИНГ ТОРГОВЛИ ОБЛИГАЦИЯМИ (или АРЕНА ТОРГОВЛИ ОБЛИГАЦИЯМИ, или ТОРГУЮЩИЙ ОБЛИГАЦИЯМИ РИНГ) – Bond Trading Ring is the stock exchange ring on which bonds are traded. / Ринг или арена фондовой биржи, на котором торгуются облигации.

BOND WITH WARRANT = ОБЛИГАЦИЯ С ВАРРАНТОМ – Bond With Warrant:- a bond issued with a warrant attached which entitles the investor to purchase stock. The value of the bond and warrant are quoted separately. This type of bond is widely used in the United States and has now reached certain European markets. The securities are issued at below-market interest rates. A warrant is attached to the bond, entitling the investor to purchase stock, or, in the case of bond warrants, to buy bonds issued by the company in the future. The warrants are detached shortly after the bond issue and quoted separately on the stock exchange, leaving the rights associated with the bond intact. Also known as Warrant Bond, and Equity Warrant. / на закупку акции.

BOND YIELD = ДОХОДНОСТЬ ОБЛИГАЦИИ – Bond Yield is the amount of return an investor realizes on a bond. Several types of bond yields exist, including nominal yield, interest paid divided by the face value of the bond, and current yield, annual earnings of the bond divided by its current market price. Additionally, required yield refers to the amount of yield a bond issuer must offer to attract investors. When investors buy bonds, they essentially lend bond issuers money. In return, bond issuers agree to pay investors interest on bonds throughout their lifetime and to repay the face value of bonds upon maturity. The money that investors earn is called Yield. Investors do not have to hold bonds to maturity. Instead, they may sell them for a higher or lower price to other investors, and if an investor makes money on the sale of a bond, that is also part of its yield. Bond Yield Versus Price:- as bond prices increase, bond yields fall. For example, assume an investor purchases a bond with a 10% annual coupon rate and a par value of USD1 000. Each year, the bond pays 10%, or USD100, in interest. Its annual yield is the interest divided by its par value. As USD100 divided by USD1 000 is 10%, the bond's nominal yield is 10%, the same as its coupon rate. Eventually, the investor decides to sell the bond for USD900. The new owner of the bond receives interest based on the face value of the bond, so he continues to receive USD100 per year until the bond matures. However, because he only paid USD900 for the bond, his rate of return is USD100/USD900 or 11.1%. If he sells the bond for a lower price, its yield increases again. However, if he sells for a higher price, its yield falls. When Do Bond Yields Fall? Generally, investors see bond yields fall when economic conditions push markets toward safer investments. Economic conditions that might decrease bond yields include high rates of unemployment and slow economic growth or recession. As interest rates increase, bond prices also tend to fall. Interest Rates Versus Bond Prices:- to examine the relationship between interest rates and bond prices, imagine an investor buys a bond from ABC Corporation with a 4% coupon rate and a USD1 000 face value. Another investor waits a few weeks before buying a bond, and during that time, the issuer raises interest rates to 6%. At this point, the second investor can buy a USD1 000 bond from ABC Corporation and receive USD60 in interest per year. Meanwhile, upset that he is only earning USD40 per year, the original investor decides to sell, but to entice others to buy his bond instead of bonds directly from ABC Corporation, he lowers his price. For example, he lowers it to USD650, making its effective annual yield USD40/USD600 or 6.1%. If the bond issuer had not increased its rates, the investor might not have had to sell his bond for less than its face value. Bond Yield is the return an investor would earn if a bond was purchased and held to maturity. Usually, the longer the term of a bond, the higher the interest rate that's paid to the holder, compensating for the inflation risk of having money tied up for a long time. To determine the yield, divide the interest rate by the purchase price of the bond. / если облигация была закуплена и удерживалась до . Доходность Облигации:-

характеристика реальной финансовой эффективности инвестирования в облигацию в виде годовой ставки сложных процентов с учётом всех видов дохода от облигации.

BONNET = БАНИТ (или КАПОР, или ШАПОЧКА) – Bonnet:- (chiefly Scottish) a man's or boy's cap; a brimless Scotch cap of seamless woolen fabric (compare Tam-O'-Shanter); a cloth or straw hat tied under the chin and worn by women and children.

BONNY, BRASS RIVER AND QUA IBOE = БОННИ, БРАСС РИВЁР И КУА АЙБО – Nigeria's petroleum is classified mostly as 'light' and 'sweet', as the oil is largely free of sulphur. Nigeria is the largest producer of sweet oil in OPEC. This sweet oil is similar in composition to petroleum extracted from the North Sea. This crude oil is known as 'Bonny light'. Names (benchmarks) of other Nigerian crudes, all of which are named according to export terminal, are Qua Iboe, Escravos blend, Brass river, Forcados, and Pennington Anfan. A composite of Bonny, Brass River and Qua Iboe crudes from Nigeria. The crude oil of Nigeria is divided into two classes. They are sweet and light petroleum. It is mostly low in sulphur. Under OPEC, Nigeria is the biggest manufacturer of light crude oil. The light oil of this West African nation is alike in composition to the petroleum drilled from the North Sea. It is usually referred to as Bonny Light. You can find other grades of Nigerian black gold like Brass River, Qua Iboe, Escravos blend, Pennington Anfan etc. It is identified based on their export depot. The biggest country that imports Nigerian petroleum is the mighty United State of America. Out of the 100% of oil which the US imports yearly, Nigeria supplies about 10% of the whole US oil imports. This makes up 40% of Nigeria oil exports. It is the fifth biggest market of oil imports for the great United States of America. You can find up to 6 petroleum export depots in Nigeria. They are mainly owned by multinational oil companies. The major oil companies in Nigeria are Chevron, Shell, Mobil, Texaco, Agip etc. BP is yet to discover the potentials of Nigeria's crude oil. It is believed that shell has two oil terminals while the remaining four is owned by Chevron, Mobil and Texaco respectively. The forcados depot is owned by Shell. It has the capacity of amassing about 13 million barrels as well as the close by Bonny depot. Mobil controls the Qua Iboe depot located in Awka Ibom state Nigeria. Chevron operates the Escravos terminal situated at Delta State. It is capable of storing up to 36 million barrels. Agip runs the brass depot located in Rivers state. It has a storage capacity of up to 3 million barrels. Finally, Texaco runs the Pennington depot. Its storage capacity is not known. Crude oil sample was also collected from three selected oil wells of Qua-Ibo, Brass River and Bonny, respectively. Bonny Light oil is a high grade of Nigerian crude oil with high API gravity (low specific gravity), produced in the Niger Delta basin and named after the prolific region around the city of Bonny. The very low sulfur content of Bonny Light crude makes it a highly desired grade for its low corrosiveness to refinery infrastructure and the lower environmental impact of its byproducts in refinery effluent. Other grades of Nigerian crude oil are Qua Iboe crude oil, Brass River crude oil, and Forcados crude oil. The Bony Light is in high demand specifically by American and European refineries. It is therefore a major source of income generation from the oil rich nation. These include:- Brass river crude, Qua Iboe crude and Bonny Light crude. / Шеврон Корпорэйшэн (Chevron Corporation), Щел (Shell), Мобл (Mobil), Тэксэко (Texaco), Адьжип (Agip) и прочие. Би.Пи. (BP). Смесь сортов нефти Бонни (Bonny), Брасс Ривер (Brass River) и Куа Айбо (Qua Iboe) из Нигерии.

BONUS = БОНУС – Bonus is the term used to describe a one-off payment made to shareholders in addition to the dividend after particularly successful trading years, when exceptional profits have been earned (e.g., in the case of high book profits from the sale of property) or on special occasions (such as company anniversaries).

BONUS DIVIDEND = БОНУСНЫЙ ДИВИДЕНД – Unexpected extra dividend paid to a shareholder. Bonus Dividend is an abnormal dividend declared out of profits. If paid in cash it is regarded as an increment to the normal dividend and is unlikely to be repeated in future periods, for example an additional dividend paid in the centenary year of a company. Instead of being paid in cash, the bonus dividend may be applied to the payment, in full or in part, of amounts owing on a new share issue. The dividend may also be applied to the payment of any uncalled capital on shares which have already been issued.

BONUS ISSUE = ДОПОЛНИТЕЛЬНЫЙ ВЫПУСК (или ДОПОЛНИТЕЛЬНАЯ ЭМИССИЯ, или БОНУСНЫЙ ВЫПУСК) – Bonus Issue is an issue of shares made by a company wishing to reduce the average price of its shares. Shareholders receive a number of extra shares in proportion to the number already held. Also known as Capitalization Issue. See also Bonus Share. / Смотрите также Бонус Акция (Bonus Share).

BONUS SHARE = АКЦИЯ ДОПОЛНИТЕЛЬНОГО ВЫПУСКА (или АКЦИЯ ДОПОЛНИТЕЛЬНОЙ ЭМИССИИ, или БОНУС АКЦИЯ) – Bonus Share:- additional shares issued by the company to existing shareholders for free, usually in a pre-determined ratio to the number of shares already held. Also known as Bonus Issue. See also Scrip Share. Shares newly issued by a corporation to its shareholders created through the conversion of reserves into share capital. Also known as Stock Dividend in the United States. This is another way of distributing dividend. When a company decides, not to give cash to the share holders as dividend, it issued shares called Bonus Shares, to the share holders for which it receives no cash. These are fully paid shares.

BONUS SHARE PLAN = БОНУСНЫЙ ПЛАН НА АКЦИИ – Bonus Share Plan allows shareholders the option of receiving their cash dividend in the form of additional shares. Discounts toward the purchase of additional shares are usually offered. Similar to a dividend reinvestment plan. Bonus Share Plan is usually a plan whereby shareholders may elect to receive all or a portion of the dividend in shares instead of cash. You should refer to announcements by the company or contact the company to obtain further information regarding the rules and operation of the plan. / закупить дополнительные акции .

BOOK–BUILDING = ПОСТРОЕНИЕ ПО КНИГЕ – Book-Building is a placement procedure (placement) in which investors are directly involved in the pricing process. The investors' entire subscription wishes (subscription), including their price proposals, are electronically recorded, both quantitatively and qualitatively, by the lead manager in a central 'book'. The information obtained in this book-building process is then incorporated in real time into the pricing and allocation of the shares. Book-building is a widely-accepted procedure specifically designed to establish a fair balance of interests between issuer and investor with regard to the size of the issue price. Since the mid-1990's, book-building has predominated as the preferred syndication and placement procedure for securities. A special form of this method is 'accelerated book-building'.

BOOK CLOTH = КНИЖНАЯ ТКАНЬ (или ПЕРЕПЛЁТНАЯ ТКАНЬ) – Book Cloth is a print cloth treated with pyroxylin or starch and clay and used in bookbinding.

BOOK–ENTRY BONDS = БЕЗДОКУМЕНТАРНЫЕ ОБЛИГАЦИИ – Book-Entry Bonds:- embody a book-entry money claim on the Swiss federal government or the Canton of Berne. Depending on the market situation, book-entry bonds offer a higher return than other forms of fixed-interest investment.

BOOK–ENTRY SECURITIES = БЕЗДОКУМЕНТАРНЫЕ ЦЕННЫЕ БУМАГИ – Book-Entry Securities are the securities that are recorded in electronic records, called Book Entries, rather than as paper certificates. Ownership of US Government book-entry securities is transferred over Fedwire. Securities that are transferred electronically. No physical certificates change hands. See also Dematerialization, and Immobilization. Electronically recorded securities that include each creditor's name, address, Social Security or

tax identification number, and Dollar amount loaned, i.e. no certificates are issued to bond holders, instead, the transfer agent electronically credits interest payments to each creditor's bank account on a designated date. / , то есть .

BOOK ENTRY SECURITY TRANSACTION = ТРАНЗАКЦИЯ С БЕЗДОКУМЕНТАРНОЙ ЦЕННОЙ БУМАГОЙ (или ОПЕРАЦИЯ С БЕЗДОКУМЕНТАРНОЙ ЦЕННОЙ БУМАГОЙ) – Book Entry Security Transaction (BEST) is a fee charged to a COMEX® Division clearing member firm when it makes a deposit or a withdrawal from its margin account. / КОМЭКС® (COMEX®).

BOOK–ENTRY SYSTEM = БЕЗДОКУМЕНТАРНАЯ СИСТЕМА – Book-Entry System is an accounting system that permits the electronic transfer of securities and does not require certificates to change hands. See also Dematerialization, and Immobilization.

BOOK FOLD = СЛОЖЕНИЕ КНИЖКОЙ – Book Fold is a method of folding finished fabric in which the fabric is first folded in half widthwise, then folded back and forth in equal lengths. Finally, the fold edge on each side is folded to the inside, forming a compact bundle equal in length to one-half the width of the goods. / Сложение Книжкой – складка куска ткани в раскидку 'книжкой'.

BOOKING = БРОНИРОВАНИЕ (или ПРЕДВАРИТЕЛЬНЫЙ ЗАКАЗ) – Booking is an act of recording arrangements for the movement/transportation of goods by vessel or other conveyance. To express in advance a desire for something in order to reserve it, e.g., transportation of goods. Also known as Booking Request. Cargo commitment made to carrier by shipper. Arrangements with a carrier for the acceptance and carriage of freight; i.e. a space reservation. / , то есть . Бронирование агентом всей или части грузовместимости судна. Бронирование осуществляется заблаговременно, причём грузоотправитель вправе дать ориентировочные данные о массе и габаритах груза, однако оговариваются предельные сроки, в которые он обязан предоставить уточнённые данные. Букировка производится путём выдачи букинг ноты, подтверждающей сдачу или приём груза к перевозке.

BOOKING CARGO = БРОНИРОВАНИЕ ПРОСТРАНСТВА ПОД ПЕРЕВОЗКУ ГРУЗА – Booking Cargo:- reserving space on a vessel. / Резервирование пространства на судне.

BOOKING NOTE = БРОНИРУЮЩИЙ БИЛЕТ (или ПОДТВЕРЖДЕНИЕ БРОНИРОВАНИЯ, или БУКИНГ НОТА) – Booking Note is a numbered document, which confirms acceptance of a specific shipment while detailing specific information, i.e. weight, id, port, ship name, voyage number, discharge point. / Номерной документ, который подтверждает принятие конкретной партии груза xxxxx детальной конкретизирующей информацией, как-то, вес, ид, порт, название судна, номер рейса, пункт разгрузки. Букинг Нота (Booking Note):- контракт на морскую перевозку грузов, в котором оговорены условия размещения груза на судне и оплаты провоза. Разновидность контракта на морскую перевозку грузов в линейном сообщении. В отличие от фрахтового контракта, в основе которого лежат условия рейсового чартера, в основе букинг ноты лежат условия линейного коносамента, которым как договором морской перевозки и оформляется каждая конкретная перевозка на букинг нот. По рекомендации Балтийской Международной Морской Конференции (БММК) букинг нота должна содержать наименование перевозчика, грузовладельца, судна, род и количество груза, место его размещения, пункты отправления и назначения, предполагаемое время погрузки, ставку фрахта, форму коносамента.

BOOKING NUMBER = НОМЕР БРОНИ – (1) Booking Number is a reservation number used to secure equipment and act as a control number prior to completion of a B/L.

(2) Booking Number is an offer by shipper for transport and acceptance by carrier or agent.

(3) Booking Number is the Booking Reference Number. / Номер для Ссылки по Брони.

(4) Booking Number is a number assigned to booking by agent or carrier. / Номер, установленный агентом или перевозчиком для брони.

BOOKING REFERENCE NUMBER = НОМЕР ССЫЛКИ ПО БРОНИ – Booking Reference Number is:- (1) a shipping reservation number used by a cargo carrier or its agent. See also Booking Number. (2) Booking Reference is the 6 character alpha numeric expression (e.g., YIJHDZ) noted as 'Booking Reference' on your air e-Ticket. Also sometimes called the PNR (short for the Passenger Name Record; a 5-characther reference number generated by the Canada Border Services Agency's reservation system that contains all the information required for the entire itinerary). / Смотрите также Номер Брони (Booking Number).

BOOKING THE BASIS = ПРЕДВАРИТЕЛЬНАЯ ДОГОВОРЁННОСТЬ О БАЗИСЕ – Booking The Basis:- a forward pricing sales arrangement in which the cash price is determined either by the buyer or seller within a specified time. At that time, the previously-agreed basis is applied to the then-current futures quotation. / Предварительное ценообразование для срочной сделки, к котором цена фактического товара определяется продавцом или покупателем в течение определённого времени. В этот момент, предварительно оговорённый базис привязывается к текущей котировке фьючерса.

BOOK INVENTORY = ИНВЕНТАРЬ ПО КНИГАМ (или КНИЖНЫЙ УЧЁТ) – Book Inventory is the value of inventory as shown on the balance sheet. This figure often includes inbound freight costs if freight is considered as asset instead of an expense. Depending upon the system being used, this figure is derived from the posting of received goods or the posting of payables invoices. Typically, book inventory will differ from physical inventory due to shrinkage.

BOOK–KEEPING = ВЕДЕНИЕ КНИГИ (или ХХ) – Book-Keeping, the art of keeping the accounts and books of a merchant. Book-keeping by double entry means that mode or system in which every entry is double, that is, has both a debtor and a creditor. It is called also the Italian Method, because it was first practised in Venice, Genoa, and other towns in Italy, where trade was conducted on an extensive scale at a much earlier date than in England, France, or other parts of Europe. This method, however familiar to merchants and book-keepers, seems intricate to almost all who have not practised it; nor is the dryness and difficulty of the task much lessened by the printed works on the subject, which, having been conpiled more by teachers than by practical merchants, contain a number of obsolete rules and unnecessary details. The most effectual mode of giving clearness and interest to our remarks will be, first, to state a few marcantile transactions, and then to explain the nature of the accounts and entries which result from them..

BOOK LOSS = БАЛАНСОВЫЙ УБЫТОК – Bool Loss is a loss resulting from the lower valuation of assets or the higher valuation of liabilities (such as provisions). Equal to the difference between the old and the new (lower) book value. The opposite of Book Profit.

BOOK MONEY = КНИЖНЫЕ ДЕНЬГИ (или БЕЗНАЛИЧНЫЕ ДЕНЬГИ) – Book Money:- this term refers to balances in customers' favor on giro or current accounts (demand deposits) with a bank. These funds can be withdrawn at any time without any restriction. Book money enables banks to create money by granting credit. The opposite of book money is 'cash'.

BOOK PROFIT = БАЛАНСОВАЯ ПРИБЫЛЬ – Book Profit is a profit which derives from assigning a higher value to assets or a lower value to liabilities (e.g., provisions or reserves) and is equal to the difference between the old and the new (higher) book value. The opposite of Book Loss. / , например, .

BOOKS CLOSING DATE = ДАТА ЗАКРЫТИЯ БУХГАЛТЕРСКИХ КНИГ – Books Closing Date is the date at which a company's share register is closed off to identify the shareholders and to calculate any entitlement to new issues and dividends.

BOOK TRANSFER = ПРОВОДКА ПО КНИГЕ – (1) Book Transfer:- a series of accounting or bookkeeping entries used to settle a series of cash market transactions.

(2) Book Transfer is a transfer of title without actually delivering the product. / Передача права собственности без фактической поставки товара.

BOOK VALUE = БАЛАНСОВАЯ СТОИМОСТЬ (или ЗНАЧЕНИЕ ПО КНИГЕ) – Book Value is an accounting term which usually refers to a business' historical cost of assets less liabilities. The book value of a stock is determined from a company's records by adding all assets (generally excluding such intangibles as goodwill), then deducting all debts and other liabilities, plus the liquidation price of any preferred stock issued. The sum arrived at is divided by the number of common shares outstanding and the result is the book value per common share. Book value of the assets of a company may have little or no significant relationship to market value. Tangible Book Value is different than Book Value in that it deducts from asset value intangible assets, which are assets that are not hard, e.g., goodwill, patents, capitalized start-up expenses and deferred financing costs. Economic Book Value allows for a Book Value analysis that adjusts the assets to their market value. This valuation allows valuation of goodwill, real estate, inventories and other assets at their market value. Book Value is a value computed from historical costs and expenses using accounting rules rather than current market value. Book Value is the net value, in an accounting sense, of a company based on actual costs and asset values. For example, if you start an internet company by raising CAD100K which you then spend on equipment and legal fees such that you have CAD50K left in cash, CAD30K in equipment, and an expense of CAD20K in legal bills, then the book value is CAD80K. However, if investors like what you are doing, the market value of this company will likely be much higher than the book value. Think of book value as the amount of cash you might be able to realize if you simply shut down a company, sold all the assets and paid all the bills. Book Value is often used to refer to this cost valuation of a firm's assets on its financial statements. In the United States, Book Value is the value at which assets are carried on the books of account. Generally, fixed assets are shown at cost less normal depreciation while inventories may be carried at cost or market value, whichever is lower. The book value of a share is the company's net worth dividend by the number of shares outstanding. In accounting, Book Value of a stock is determined from a company's records, by adding all assets then deducting all debts and other liabilities, plus the liquidation price of any preferred issues. The sum arrived at is divided by the number of common shares outstanding and the result is book value per common share. Book value of the assets of a company or a security may have relationship to market value. Book Value:- the net amount shown in the books or in the accounts for any asset, liability or owners' equity item. In the case of a fixed asset, it is equal to the cost or revalued amount of the asset less accumulated depreciation. Also called Carrying Value. The book value of a firm is its total net assets, i.e. the excess of total assets over total liabilities. Also known as Net Asset Value in the United Kingdom. Book Value:- the cost of the security at the time of purchase. Book Value or Adjusted Book Value (of assets):- the book value of a life insurance company's assets is the value at which it purchased them. In practice, companies may modify the value so as to take into account part – but usually not all – of subsequent changes in capital values. In this case, it is better called Adjusted Book Value. / строка баланса (item). , то есть . Под Балансовой Стоимостью понимается оценка основных фондов и оборотных средств (в денежном выражении) в бухгалтерском балансе.

BOOK VALUE PER SHARE RATIO = СООТНОШЕНИЕ БАЛАНСОВОЙ СТОИМОСТИ СО СТОИМОСТЬЮ АКЦИИ – Fiscal year common equity (book value) divided by the fiscal year common shares outstanding. This data is taken from the 10K report.

BOOLEAN = БУЛИЭН (или БУЛЕВО, или БУЛЕВСКОЕ) – Boolean Logic (named for the British-born Irish mathematician George Boole) is way to express relationships in logic arguments using the following three operators:- 'and', 'or', 'not'. The patent search systems use 'AND', 'OR', and 'ANDNOT' as Boolean operators, in combination with parentheses to build nested logical subsets – example:- needle ANDNOT ((record AND player) OR sewing), which would return anything with the word 'needle' in a document as long as it does not also contain the word 'record' and 'player' in the same document or the word 'sewing' in the same document. It also uses some symbols such as '->' to indicate a range, where you enter the field code and start date, ->, and then the end date – example:- ISD/1/1/1995->2/14/1995. / Булева Логика (названная так в честь родившегося в Британии Ирландского математика Дьюдьжа Була) это способ выражения взаимоотношений в логических аргументах, использующий три приводимые операторы:- 'и', 'или', 'не'. Дьюдьж Бул (George Boole; 1815–64) – Английский математик и логик, один из основоположников математической логики. Разработал алгебру логики (Исследование Законов Мышления; 1854).

BOOM = БУМ (или ОЖИВЛЕНИЕ) – Boom is a rapid expansion in the volume of business activity, frequently accompanied by price inflation and increased speculation in securities, commodities, etc. Different from prosperity in that boom refers to a stormy rise in the pace and volume of activity rather than an actual increase in production and consumption. / Кратковременный рост . Резкий подъём .

BOOM = (ГРУЗОВАЯ) СТРЕЛА – Boom is an elongated member protruding from a mast, crane body, trolley, or other supporting structure and from which the load is suspended.

BOONDOGGLE = БУНДАГЛ (или БЕЗДЕЛУШКА) – Boondoggle is a braided cord some times worn by Boy Scouts as a neckerchief slide, hatband, or ornament.

BOOT = БОТИНОК – Boot:- a fitted covering, as of leather or rubber, for the foot and usually reaching the ankle. Often times use for work (work boots) such as building. Boots are also used for hiking (hiking boots) and simply for fashion. Boots come in many various shapes, sizes and colors.

BOOT = ОБЁРТКА – Boot is a rapidly growing panicle enveloped by the flagleaf sheath. In tissue culture, this refers to the panicle collected when the distance between the collar of the flagleaf and subtending leaf is about 7 to 8 cm. / Обёртка початка; влагалище листа; сошник; выходить в трубку (о злаках).

BOOTEE = ЧУНИ (или ПИНЕТКА) – Bootee:- a usually ankle-length boot, slipper, or sock, especially an infant's knitted or crocheted sock. / обувь с коротким голенищем (с застёжкой спереди или боковыми резинками); детский вязаный башмачок.

BOOTHS = КАБИНКИ – Booths:- about 1 400 workspaces, each equipped with a computer system, around the perimeter of the Trading Floor of the New York Stock Exchange where member firms and independent brokers receive orders.

BOOTING = ТРУБКОВАНИЕ (или ВЫХОД В ТРУБКУ) – Booting is a bulging of the flag leaf sheath due to the growing panicle inside.

BOOTING STAGE = СТАДИЯ ТРУБКОВАНИЯ (или СТАДИЯ ВЫХОДА В ТРУБКУ) – Booting Stage is the reproductive phase of Rice growth and development when the developing panicle causes a swelling of the culm. The swollen area is referred to as the Boot.

BOOTKIT = XX – Bootkit is a type of rootkit that infects the Master Boot Record or Volume Boot Record (VBR) on a hard disk drive in order to ensure that its code will be run each time the computer boots. Modern bootkits (such as Mebroot, TDL4 – Olmarik, or Rovnix) also use this technique to bypass certain Operating System security mechanisms by loading the malicious bootkit code even before the OS is fully initialized.

BOOT SECTOR = XX – The Boot Sector is the first sector of any logical disk or partition. It contains information about the disk volume such as its capacity, as well as the bootstrapping program that loads and runs the operating system. A boot sector contains this program even if the disk volume does not have an operating system installed on it. The term Boot Sector is often used synonymously with Volume Boot Record (VBR), although strictly, the VBR is only one type of boot sector, the other one being the Master Boot Record (MBR).

BOOT SECTOR VIRUS = ВИРУС XX – Boot Sector Viruses attack the boot sector of floppy diskettes or the boot sector of a hard disk to ensure that their code is run each time the computer is started. Boot sector infection is an older vector for spreading viruses, but it has recently become more popular as a means of installing bootkits. See also Master Boot Record.

BOOTSTRAPPING = РАСКРУЧИВАНИЕ (или САМОРАСКРУТКА) – Bootstrapping:- in business, this term refers to the process of financing a business by internally generated cash flow as opposed to 'kickstarting' the company with external investment capital. It means keeping salaries and expenses down while generating customer sales to fuel the growth of the venture.

BOOT TOPPING = ПОЯС ПЕРЕМЕННЫХ ВАТЕРЛИНИЙ (или ПОЛОСА НАРУЖНОГО БОРТА СУДНА) – Boot Topping is a protective composition painted round the hull of a ship to prevent corrosion between the load and light waterlines. / между грузовой и лёгкой (при водоизмещении порожнем) ватерлиниями. Под Ватерлинией понимается линия пересечения корпусом плавающего судна поверхности воды. Грузовая ватерлиния совпадает с поверхностью воды при полной загрузке судна и соответствует наибольшей допустимой в эксплуатации осадке. Положение ватерлинии отмечается грузовой маркой.

BOP = BALANCE OF PAYMENTS

bopd = BARRELS OF OIL PER DAY

BORDEREAU = БОРДЭРО (или ОПИСЬ, или ВЕДОМОСТЬ) – (1) In reinsurance, a Bordereau (plural Bordereaux) is a form providing premium or loss data with respect to identified specific risks which is furnished the reinsurer by the reinsured.

(2) Bordereau is a document used in road transport, listing the cargo carried on a road vehicle, often referring to appended copies of the road consignment note. / Документ, используемый в автоперевозках, перечисляющий перевозимый в транспортном средстве груз, часто относящийся к прилагаемым экземплярам автомобильной товарно-транспортной накладной.

BORDEREAUX = ВЕДОМОСТИ – Bordereaux is a list of premiums payable and claims paid or due which is prepared by a coverholder for a managing agent or by a reassured for its reinsurer. Bordereaux are commonly produced on a monthly or quarterly basis. They breakdown block premium payments that are made to underwriters and detail claim payments made on behalf of or due from underwriters. Bordereau (plural Bordereaux) is a form providing premium or loss data with respect to identified specific risks which is furnished the reinsurer by the reinsured.

BORDER EFFECT = КРАЕВОЙ ЭФФЕКТ – Border Effect:- in experiments, the difference in performance of plants planted at the edges of a plot and of those planted at the center of the plot. / Под Краевым Эффектом понимается изменение характера роста по краям поля, опытных делянок, на грядках, у бокового ограждения теплицы.

BORDER ROW = ГРАНИЧНЫЙ РЯД (или КРАЕВОЙ РЯД) – Border Row is a row of plants around test plots which protect test entries from a border row effect, such as a greater than normal growth due to lack of competition for nutrients and light, lower insect populations than on plants surrounded by other plants, etc.

BORER = ТОЧИЛЬЩИК – Borer is an insect larva making tunnels or burrows inside the plant stem. / Под Точильщиками понимается семейство жуков. Длиной 2–8 миллиметра. Около 1 500 видов. Распространены широко. В бывшем СССР насчитывалось свыше 100 видов. Обитают главным образом в мёртвой сухой древесине. Домовый точильщик повреждает деревянные постройки, мебель; хлебный точильщик – муку, хлебные изделия, книги.

BORIF = BOGOR RESEARCH INSTITUTE FOR FOOD CROPS

BORON FIBER = БОРНОЕ ВОЛОКНО – Produced in single-filament reactors by Chemical Vapor Deposition (CVD), Boron Fiber exhibits a unique combination of High Strength, High Modulus and Large Diameter. Elemental boron is deposited on a fine tungsten wire substrate and produced in diameters of 4.0-mil (102-micron) and 5.6-mil (142-micron). The resulting fiber is essentially amorphous boron with a fully borided-tungsten core. The textured surface provides an excellent interface in resin-matrix composites, eliminating any need for sizing treatments. Primarily used in resin-matrix composites it is available as a unidirectional prepreg tape with 250 °F and 350 °F cure epoxies. Boron Fiber is a vapor-deposited filament made by depositing boron on a heated tungsten wire. These fibers are being developed for use in aircraft and space applications. They can be woven into fabrics. Boron Fiber:- this fiber was first introduced by Talley in 1959. In commercial production of boron fibers, the method of Chemical Vapour Deposition (CVD) is used. The CVD is a process in which one material is deposited onto a substrate to produce near theoretical density and small grain size for the deposited material. In CVD the material is deposited on a thin filament. The material grows on this substrate and produces a thicker filament. The size of the final filament is such that it could not be produced by drawing or other conventional methods of producing fibers. It is the fine and dense structure of the deposited material which determines the strength and modulus of the fiber. In the fabrication of boron fiber by CVD, the boron trichloride is mixed with hydrogen and boron is deposited according to the reaction:- $2BCl_3(g) + 3H_2(g) \rightarrow 2B(s) + 6HCl(g)$. In the process, the passage takes place for couple of minutes. During this process, the atoms diffuse into tungsten core to produce the complete boridization and the production of WB_4 and W_2B_5. In the beginning the tungsten fiber of 12 μm diameter is used, which increases to 12 μm. This step induces significant residual stresses in the fiber. The core is subjected to compression and the neighbouring boron mantle is subjected to tension. The key features of this fiber are listed below:- (i) these are ceramic monofilament fiber; (ii) fiber itself is a composite; (iii) circular cross section; (iv) fiber diameter ranges between 33–400 μm and typical diameter is 140 μm; (v) Boron is brittle hence large diameter results in lower flexibility; (vi) thermal coefficient mismatch between boron and tungsten results in thermal residual stresses during fabrication cool down to room temperature; (vii) Boron fibers are usually coated with SiC or B_4C so that it protects the surface during contact with molten metal when it is used to reinforce light alloys. Further, it avoids the chemical reaction between the molten metal and fiber; (viii) strong in both tension and compression; (ix) exhibits linear axial stress-strain relationship up to 650 °C; and (x) since this fiber requires a specialized procedure for fabrication, the cost of production is relatively high. There are those who think carbon fiber is the strongest reinforcing fiber available, but they are mistaken. Boron fiber, a far superior fiber to carbon, is underutilized due to being 6 times more expensive. Here is an interesting article discussing the manufacturing of Boron Fibers in the USA. The article states:- 'Aerospace applications built this business. Boron fiber is used for

structural reinforcement or repair of the F-15 fighter, B-1 bomber, Black Hawk helicopter, space shuttle and Predator. The material also found its way into high-end golf clubs, skis, hockey sticks, fishing rods and Tour de France bike frames. Formula One, for competitive reasons, largely banned its use, says Treasure. Only the wealthiest teams could afford it'. / мононить (monofilament). Размер Зерна или Величина Зерна (Grain Size).

BORO RICE = РИС БОРО – Boro Rice is an irrigated, high-yielding, cold-tolerant, relatively pest-free and photoperiod-insensitive Rice cultivated during the winter months in India and Bangladesh.

BORROWER = ЗАЁМЩИК (или ССУДОПОЛУЧАТЕЛЬ) – Borrower is the person who receives a loan. Any legal entity – a person or group – that obtains funds from a lender for a particular period of time. A borrower signs a promissory note as evidence of indebtedness. Borrower is an individual who makes an application for and receives funds in the form of a loan and is obligated to repay the loan in full under the conditions of the loan. Also known as Issuer. / Заёмщик, заимодавец, договор займа.

BORROWER'S NOTE = НОТА ЗАЁМЩИКА – Borrower's Note is a written, unconditional promise to pay a sum of money at some future date to a named party, to order or on demand. / Безусловное обещание в письменной форме выплатить указанной стороне денежную сумму на какую-то дату в будущем по распоряжению или по требованию.

BORROWING = ЗАИМСТВОВАНИЕ (или ЗАЁМ, или ЗАЙМ) – Borrowing is a way of acquiring necessary capital. One form of borrowing is when an individual or a company asks a bank to loan them a certain amount of money, over a certain period of time, and agrees to pay a certain amount of interest. Most widely used in the sense of accepting money that is not one's own on the understanding that it will be repaid, usually with interest, at a later date. The amount that an entity, usually a country or its government, has borrowed. Thus often the (negative of) the net foreign asset position or the national debt. In the United Kingdom, borrowing – expenses means the costs of taking out a loan to buy a property, and include loan application or establishment fees, bank valuation fees, document preparation fees, stamp duty on the mortgage, title search fees, titles office registration fees and mortgage insurance. Things that have been borrowed. Receiving something of value in exchange for an obligation to pay back something of usually greater value at a particular time in the future. Also known as Debt in the United States. Borrowing is one form of carry. In this case the simultaneous buying of metal for a near dated prompt and the selling of that metal for a later dated prompt. In effect the party is borrowing the metal for the period. / Заёмщик, заимодавец, договор займа. В гражданском праве под Заёмом понимается договор, в силу которого одна сторона (заимодавец) передаёт другой стороне (заёмщику) в собственность деньги или вещи, определённые родовыми признаками – числом, весом, мерой, например, зерно, а заёмщик обязуется возвратить такую же сумму денег или равное количество вещей того же рода и качества.

BORROWING COSTS = ЗАТРАТЫ ПО ЗАИМСТВОВАНИЮ – Borrowing Costs are interest incurred by an enterprise in connection with the borrowing of funds, amortization of discounts or premiums relating to borrowings, ancillary costs incurred in connection with the arrangement of borrowings, and exchange differences arising from foreign currency borrowings. See also Specific Borrowing. Interest and other costs incurred by an entity in connection with the borrowing of funds. / Проценты и другие расходы, понесённые юридическим лицом в связи с заимствованием денежных средств.

BOSPHORUS SURCHARGE = БОСФОРОВСКАЯ НАДБАВКА (или ДОПЛАТА ЗА ПРОХОЖДЕНИЕ ПРОЛИВОМ БОСФОР) – Bosphorus Surcharge is the surcharge applied to cargo transiting through the Bosphorus. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge).

BOSS = УТОЛЩЕНИЕ (или ВТУЛКА, или СТУПИЦА (КОЛЕСА)) – Boss:- that part of a drafting roll of largest diameter where the fibers are gripped. It may be an integral part of the roll, as in steel rolls, or it may have a covering of leather, cork, etc. In the former case, the boss is fluted.

BOSTID = BOARD ON SCIENCE AND TECHNOLOGY FOR INTERNATIONAL DEVELOPMENT

BOSUN = ДРАКОН – Bosun:- shortening of the old term 'Boatswain', an unlicensed member of the crew who supervises the work of the deck men under direction of the first mate. The highest unlicensed rating in the deck department who has immediate charge of all deck hands and who in turn comes under the direct orders of the master or chief mate or mate. Also known as Boatswain. Boatswain or Bosun receives working orders for deck gang from chief mate and passes them onto able-bodied seamen (AB's) and ordinaries. Tantamount to foreman, he is on deck directly supervising maintenance operations. / В Русскоязычном жаргоне моряков термин Дракон используется для обозначения термина Боцман. всей палубной команды и хозяина (или капитана) или старшего помощника (на жаргоне моряков – чиф) или помощника. Известен также как Боцман (Boatswain). Под Боцманом, от Голландского слова Bootsman, от Boot, означающее Лодка или Судно, и Man, означающее Человек, понимается специалист младшего командного состава экипажа судна (в ВМФ России – старшинского состава); непосредственный начальник палубной команды. В обязанности боцмана входит поддержание исправного состояния корпуса, такелажа и палубных устройств судна, руководство общесудовыми работами и обучение рядовых членов палубной команды (матросов) морскому делу, наблюдение за порядком и чистотой на судне. На крупных военных кораблях имеется один Главный Боцман и несколько обычных боцманов.

BOT = BALANCE OF TRADE

BOT = BOARD OF TRUSTEES

BOT = BOUGHT

BOT = БОТ (или ХХ) – Bot is a short for 'Software Robot', as the term is normally used in computer security, a bot is a program that performs a set of malicious actions as instructed by its operator(s). The commands may be scripted or programmed into the bot so that it performs actions when certain criteria are met, or the bot may dynamically receive instructions by connecting to one or more Command and Control servers. Bots that communicate in such a fashion frequently use IRC and HTTP for their communications, although existing or even customized peer-to-peer protocols are sometimes used as well. Peer-to-Peer (P2P) botnets use a more distributed command and control model, so that compromised machines communicate between each other rather than via a C&C server, in order to make the botnet harder to disrupt. The term 'Bot' may also be used interchangeably with zombie to describe a computer that is infected and controlled by a bot program.

BOTANY WOOL = БОТАНИЧЕСКАЯ ШЕРСТЬ – Botany Wools:- originally referred to merino wool shipped from Australia's Botany Bay. It has become a generic term used to describe superlative wools and fine worsted sweaters. / Австралийская мериносовая шерсть по названию Ботанического Залива (Botany Bay).

BOTH–TO–BLAME COLLISION CLAUSE = ОГОВОРКА О КОЛЛИЗИИ ПО СМЕШАННОЙ (или ОБОЮДНОЙ) ВИНЕ (или ОГОВОРКА О СТОЛКНОВЕНИИ ПО СМЕШАННОЙ ВИНЕ) – Both-To-Blame Collision Clause:- if the vessel comes into collision

with another ship as a result of the negligence of the other ship and any act, neglect or default of the master, mariner, pilot or the servants of the carrier in the navigation or in the management of the vessel, the owners of the cargo carried hereunder will indemnify the carrier against all loss or liability to the other or non-carrying ship or her owners in so far as such loss or liability represents loss of, or damage to, or any claim whatsoever of the owners of said cargo, paid or payable by the other or non-carrying ship or her owners to the owners of said cargo and set-off, recouped or recovered by the other or non-carrying ship or her owners as part of their claim against the carrying vessel or carrier. The foregoing provisions shall also apply where the owners, operators or those in charge of any ship or ships or objects other than, or in addition to, the colliding ships or objects are at fault in respect of a collision or contact. Both-To-Blame Collision Clause provides coverage for any amount which the cargo owner may be legally bound to pay the shipowner under the 'both to blame' clause in the ocean bill of lading. / хозяина (или капитана).

BOTNET = БОТНЭТ (или ХХ) – Botnet is a combination of the words Robot and Network. A botnet is a group of computers (the 'bots') communicating with each other and/or with their command-and-control (C&C) server(s). In information security, bots are computers whose security defenses have been breached and are running malicious software that enables a third party to control them without the consent of the computer's owner or legitimate operator. Most often computers compromised in this way are home computers, but bots have been found in school, business and government owned computers. However, in some cases, the bots are compromised servers. For example, ESET researchers discovered large and sophisticated operation, named 'Windigo', in which an organized group of criminals compromised over 25 000 unique Linux and UNIX servers. Botnets are typically used to generate spam, spread other malware (including copies of themselves) or flood a network or Web server with excessive requests to cause it to fail (denial of service attack, DDoS). Botnets have also used for phishing, to transfer stolen data and other financial crimes. The largest botnets consist of millions of computers and pose a serious threat. According to industry estimates quoted by Joseph Demarest, Assistant Director of FBI's Cyber Division during his statement before the Senate Judiciary Committee, Subcommittee on Crime and Terrorism on July 15, 2014, botnets have caused over USD9 billion in losses to US victims and over USD110 billion in losses globally. Approximately 500 million computers are infected globally each year. For this reason, national and international law enforcement agencies work with leading security companies to disrupt botnets by seizing their C&C servers and domains. An example of one such disruption was the joint action of numerous security agencies including the FBI, Interpol, Europol, Microsoft and ESET against the Dorkbot botnets in December 2015. ESET uses Botnet Protection technology that searches outgoing network communications for known malicious patterns and matches the remote site against a blacklist of malicious ones. Any malicious communication detected is blocked reported to the user and optionally to ESET.

BOTTLED GENERATION = ХХ ГЕНЕРАЦИЯ – Bottled Generation (in electricity) is an economic generation that cannot be dispatched because of local operating constraints.

BOTTLE GREEN = БУТЫЛОЧНО–ЗЕЛЁНЫЙ – Bottle Green:- a dark green.

BOTTLENECK = УЗКОЕ МЕСТО – (1) Bottleneck is the traffic or congestion in an area of the warehouse due to poor planning or insufficient resources.

(2) Bottleneck is a stage in a process that limits performance. / Стадия процесса, ограничивающая его исполнение.

BOTTOM = ВПАДИНА – Bottom is the lowest price on a chart for a significant amount of time looking back and forward of the low date. This normally represents the end to a bear market phase and the beginning of a better price advance.

BOTTOM = НИЖНЕЕ (БЕЛЬЁ) – Bottom is a garment worn on the lower body.

BOTTOM–AIR DELIVERY = С НИЖНЕЙ ПОДАЧЕЙ ВОЗДУХА – Bottom-Air Delivery is a type of air circulation in a temperature control container. Air is pulled by a fan from the top of the container, passed through the evaporator coil for cooling, and then forced through the space under the load and up through the cargo. This type of airflow provides even temperatures.

BOTTOM CHORD = НИЖНИЙ ПОЯС – Bottom Chord is a horizontal or inclined member that establishes the lower edge of a truss, usually carrying combined tension and bending stresses. / Горизонтальный или наклонённый элемент или деталь, которая формирует нижнюю грань фермы, обычно несущая комбинированное растяжение и напряжение при изгибе (продольное усилие и момент).

BOTTOM DECK = НИЖНИЙ НАСТИЛ – Bottom Deck:- assembly of deckboards comprising the lower, load bearing surface of the pallet. See also Pallet. Bottom Deck is a flat, horizontal, mass-distributing, bottom surface of a pallet. / Нижний Настил – горизонтальная поверхность поддона (сплошная или решетчатая), служащая его опорой для распределения груза.

BOTTOM FITTINGS = ФИТИНГИ В ОСНОВАНИИ – Bottom Fittings are the special conical shaped devices inserted between a container and the permanent floor on the deck of a vessel in order to avoid shifting of the container during the voyage of this vessel.

BOTTOMLAND = ХХ – Bottomland:- lowlands (usually forested) along streams and rivers that are periodically flooded.

BOTTOM LIFT = ПОДЪЁМ С НИЖНИМ ЗАХВАТОМ – Bottom Lift:- handling of containers with equipment attached to the four bottom corner fittings (castings). / Перевалка контейнеров с помощью оборудования, прикрепляемого к четырём угловым нижним фитингам (отливкам).

BOTTOM LINE = НИЖНЯЯ ЛИНИЯ (или ПОСЛЕДНЯЯ ЧЕРТА) – Bottom Line is jargon for the very bottom line on the income statement. The bottom line tells you how much money the business is making after tax, i.e. it is Net Profit after Tax.

BOTTOM–PICKER = ПРИДОННЫЙ ПОДБОРЩИК – Picker, a trader in raw cotton who makes a quick transaction on small capital or on 'a shoestring'. Bottom-Picker is a person that calls for a bottom to a market before enough time has gone by to confirm the observation. Normally done against a strong trend and a very risky trading idea. Also known as Bottom Fisher. / Лицо, запрашивающее низкую цену на каком-то рынке, в тот момент, пока ещё никто не задумывался об этом. Обычно осуществляется против сильной тенденции на данном рынке, и сама идея такой торговли весьма рискованная. Известен также как Придонный Рыбак (Bottom Fisher).

BOTTOMRY AND RESPONDENTIA = БОДМЕРЕЯ И РЕСПОНДЕНЦИЯ – Bottomry and Respondentia:- Bottomry, in commercial navigation, is a mortgage of the ship. The owner or captain of a ship is, under certain circumstances, authorised to borrow money, either to fit her out so as to enable her to proceed on her voyage, or to purchase a cargo for the voyage, pledging the keel, or bottom of the ship (a part for the whole), in security for payment. In bottomry contracts it is stipulated, that if the ship be lost in the course of the voyage, the lender shall lose his whole money; but if the ship arrive in safety at her destination, the lender is then entitled to get back his principal, and the interest agreed upon, however much that interest may exceed the legal rate. – (Black. Com. book II. c. 30.) The extraordinary hazard run by the lenders of money on bottomry, who, in fact, become adventurers in the voyage, has been held, in all countries, as justifying them in stipulating for the highest rate of interest. When the loan is not on the ship, but on the goods laden on

board, which, from their nature, must he sold or exchanged in the course of the voyage, the borrower's personal responsibility is then the principal security for the performance of the contract, which is therefore called Respondentia. In this consists the principal difference between bottomry and respondentia. The one is a loan upon the ship, the other upon the goods. The money is to be repaid to the lender, with the marine interest, upon the safe arrival of the ship, in the one case, and of the goods in the other. In all other respects, these contracts are nearly the same, and are governed by the same principles. In the former, the ship and tackle, being hypothecated, are liable, as well as the person of the borrower; in the latter, the lender has, in general, only the personal security of the borrower. This contract, which must always be in writing, is sometimes made in the form of a deed poll, called a Bill Of Bottomry, executed by the borrower; sometimes in the form of a bond or obligation, with a penalty. But whatever may be its form, it must contain the names of the lender and the borrower, those of the ship and the master; the sum lent, with the stipulated marine interest; the voyage proposed, with the commencement and duration of the risk which the lender is to run. It must show whether the money is lent upon the ship, or upon goods on board, or on both; and every other stipulation and agreement which the parties may think proper to introduce into the contract. 'It is obvious', says Lord Tenterden, 'that a loan of money upon bottomry, while it relieves the owner from many of the perils of a maritime adventure, deprives him also of a great part of the profits of a successful voyage; and, therefore, in the place of the owners' residence, where they may exercise their own judgment upon the propriety of borrowing money in this manner, the master of the ship is, by the maritime law of all states, precluded from doing it, so as to bind the interest of his owners, without their consent. With regards to a foreign country, the rul appears to be, that if the master of a vessel has occasion for money to repair or victual his ship, or for any other purpose necessary to enable him tp complete the enterprise in which she is engaged; whether the occasion arises from any extraordinary peril or misfortune, or from the ordinary course of the adventure; he may, if he cannot otherwise obtain it, borrow money on bottomry at marine interest, and pledge the ship, and the freight to be earned in the voyage, for repayment at the termination of the voyage. When this is done, the owners are never personally responsible. The remedy of the lender is against the master of the ship'. – (Law of Shipping, Part II. c. 3.) In bottomry and respondentia bonds, the lender receives the whole of his principal and interest, or nothing; he is not answerable for general or particular average; nor will any loss by capture, if subsequently recaptured, affect his claim. In this respect out law differs from that of France (Code de Commerce, Art. 330.) and most other countries:- the lenders on bottomry bonds being there subject to average, as our underwriters upon policies of insurance. No less can void a bottomry contract, unless a total loss, proceeding from a peril of the sea, during the voyage, and within the time specified by the contract. If the loss happen through any default or act of the owners or master, to which the lender was not privy, he may still recover. There is no restriction by the law of England as to the persons to whom money may be lent on bottomry or at respondentia, except in the single case of loans on the ships of foreigners trading to the East Indies, which are forbidden by the 7 Geo. 1. Stat. 1. c. 21. § 2. It does not, however, appear to be necessary, in order to enable the master of a ship in a foreign port to obtain money for her repair, outfit, etc, that the contract pledging the vessel in security of the debt should be in the nature of a bottomry bond. Provided the person who advances the money do not choose to take upon himself the risk of the ship's return, and do not stipulate for maritime interest, 'there seems', says Lord Tenterden, ' to be no reason why the master should not pledge both the ship and the personal credit of the owner'. And in the case of money advanced in this way to refit a ship in distress at Jamaica, which was captured on the voyage home, the lender recovered. – (Law of Shipping, Part. II. c. 3.) Bottomry contracts were well known to the ancients. At Athens, the rate of interest was not fixed by law; but the customary rate seems to have been about 12 per cent. But when money was lent for a voyage, upon the security of the ship and cargo, the interest, on account of the superior risk encountered by the lender, was in most cases much higher. In voyages to the Taurica Chersonesus and Sicily, it was sometimes as high as 30 per cent. – (Anacharsis's Travels, Vol. IV. p. 369. Eng. Trans.) The term Bottomry has sometimes been incorrectly applied to designate a contract, by the terms of which the ship is not pledged as a security, but the repayment of money, with a high premium for the risk, is made to depend upon the success of the voyage. This, however, is plainly a loan upon a particular adventure, to be made by a particular ship, and not a loan upon the ship, and, of course, the lender has only the personal security of the borrower for the due performance of the contract. And it seems that loans have sometimes been made in this manner, and probably also with a pledge of the ship itself, to an amount exceeding the value of the borrower's interest in the ship; and such a contract is still legal in this country in all cases, except the case of ships belonging to British subjects bound to or from the East Indies; as to which it is enacted (19 Geo. 2. c. 37. § 5.). / Чалз Эбэт (Charles Abbott; 1762–1832), первый Лорд Тчэнтчэдэн (Lord Tenterden). Под Бодмереей, от Голландского слова Bodemerij, означающее Денежный Заём Кораблю Под Залог Корабля, в гражданском праве буржуазных государств понимается договор займа под залог судна и груза. Заём по бодмерее получает капитан судна за счёт судовладельца. В случае гибели судна займодатель теряет право на возмещение предоставленных им сумм, поэтому по займу этого типа устанавливается более высокий процент, чем по обычному займу. В современной практике бодмерея используется редко.

BOTTOMRY BILL = БОДМЕРЕЙНЫЙ ВЕКСЕЛЬ (или БОДМЕРЕЙНАЯ ГАРАНТИЯ) – Bottomry Bill:- the pledge of a ship, or of her cargo, as security for repayment of money advanced to the master in an emergency, and of no avail if the ship be lost. Also known as Bottomry Bond. / выплата (repayment) денежных средств, авансированных хозяину (или капитану) в случае опасности, и . Известно также как Обязательство Бодмереи (Bottomry Bond). Бодмерея, от Голландского слова Bodemerij, означающее Денежный Заём Кораблю Под Залог, в гражданском праве буржуазных государств договор займа под залог судна и груза. Заём по Бодмерее получает капитан судна за счёт судовладельца. В случае гибели судна заимодатель теряет право на возмещение предоставленных им сумм, поэтому по займу этого типа устанавливается более высокий процент, чем по обычному займу. В современной практике Бодмерея используется редко.

BOTTOMS = МАНЖЕТЫ (или ПОДОЛЫ) – Bottoms:- yarn left over on the surface of the cop or cheese after winding. Spinning defect. Bottom:- remnant/left over yarns of different shades, counts, twist lappets onto bobbins gives bottoms:- (i) remnant of ring frame cops; (ii) yarn used for lappets, during start of materials has to be of same shade/same count; (iii) remnant double yarn on TFO Bobbins should be cleaned; (iv) red separator on ring frame to segregate different shades; (v) lot change at auto-winding if cop is not changed; and (vi) remnants yarn to be cleared from the ring bobbins and cheeses. / Порок или Дефект прядения.

BOTTOM SEDIMENT AND WATER = ДОННЫЕ ОТЛОЖЕНИЯ И ВОДА (или ВОДНО–ГРЯЗЕВЫЕ ОТЛОЖЕНИЯ) – Bottom Sediment And Water, often found in crude oil and residual fuel. Bottom sediment and water, usually expressed as a percentage by weight. Tanker expression, acceptable on second reference. / Донные отложения и вода часто встречаются в сырой нефти и остатках топлива. Водно-грязевые отложения, как правило, выражаются в процентах по весу. Выражение используется на танкерном рынке при повторном упоминании.

BOTTOM SIDE RAILS = НИЖНИЕ БОКОВЫЕ БАЛКИ (или НИЖНИЕ ПРОДОЛЬНЫЕ БАЛКИ) – Bottom Side Rails are the structural members on the longitudinal sides of the base of the container. / основания контейнера.

BOTTOMS TOTAL = ИТОГО СУДОВ – Bottoms Total is the combined total number of vessels and barges which have passed through a lock chamber (a bottom is the hull of a vessel or barge transiting the lock). / через камеру шлюза (шлюз).

BOTTOM TREATMENT CLAUSE = ОГОВОРКА ОБ ОБРАБОТКЕ ДНИЩА – Bottom Treatment Clause is a clause in the Institute hull clauses, whereby underwriters specify the extent to which they shall be liable for surface preparation and primer painting of plates in repairing the bottom of a ship damaged by an insured peril.

BOTULISM = БОТУЛИЗМ – Botulism is a dangerous food poisoning caused by the bacterium clostridium botulinum occurring for instance in insufficiently sterilized preserved meat or vegetables. / Под Ботулизмом, от Латинского слова Botulus, означающее Колбаса, понимается пищевая токсикоинфекция в результате отравления продуктами, заражёнными палочками ботулизма и их токсинами. Возбудитель – Clostridium Botulinum – строгий анаэроб; обычно размножается и выделяет токсин в таких продуктах, как консервы, солёная рыба, колбаса, ветчина, грибы, приготовленные с нарушением технологии (особенно в домашних условиях). При ботулизме поражается нервная система (нарушение зрения, голоса, глотания). Лечение человека:- срочное введение противоботулиничных сывороток. Животные (лошади, норки, птицы и другие) заболевают при поедании недоброкачественных кормов. Под Ботулизмом, от Латинского слова Botulus, означающее Колбаса, понимается острое инфекционно-токсическое заболевание из группы пищевых токсикоинфекций, вызываемое анаэробными бактериями и их токсинами и характеризующееся преимущественным тяжёлым поражением ядер черепномозговых нервов. Ботулизм встречается во всех частях земного шара, но чаще в странах, где население употребляет много консервированных продуктов домашнего приготовления. Смертность от ботулизма (в 1965) составляла:- в Англии 76.5 на 100 заболевших, в Соединённых Штатах Америки (США) 65, в Дании 40.6, в Японии 31.9 и в бывшем Союзе Советских Социалистических Республик (СССР) 24.5. Возбудителем ботулизма является спороносная палочка – клостридий ботулизма, относящаяся к анаэробным микроорганизмам. Существует 6 типов возбудителя ботулизма:- A, B, C, D, E и F, каждый из которых вырабатывает специфический экзотоксин, поражающий нервную систему. Споры возбудителя ботулизма находятся в почве, откуда они попадают в воду, в пищевые продукты (корма), а с ними в кишечник человека и животных, где размножаются, а затем с фекалиями рассеиваются по земной поверхности. (1) Ботулизм Человека:- человек заражается ботулизмом при попадании палочек ботулизма и их токсинов с пищей в пищеварительный тракт. Заражение происходит через мясные, рыбные (при несанитарных условиях забоя животных и обработки туш), овощные и фруктовые консервы, консервированные грибы, не подвергавшиеся правильной обработке и стерилизации. Всосавшийся в кишечнике экзотоксин циркулирует в крови и вызывает поражение ядер черепномозговых нервов, внутрисердечных нервных узлов. Продолжительность периода от момента заражения до первых признаков болезни (инкубационный период) колеблется от 2 часов (ч) до 10 сутмок (сут); обычно 18–24 ч. Ботулизм начинается внезапно появлением слабости, частой повторной рвотой, запором; живот нередко вздут. Температура тела может повышаться незначительно или остаётся нормальной. Спустя 3–4 ч появляется головокружение, нарушается зрение:- все предметы больной видит как бы в тумане; часто наблюдается двоение в глазах, развивается косоглазие. Больные ощущают сухость во рту, жажду; у них затрудняется глотание пищи и даже воды; возможны расстройства дыхания. Речь становится невнятной, голос очень слабым. Иногда наблюдаются судороги. Смерть может наступить от паралича сердца или дыхательного центра. Достоверный диагноз ботулизма ставят при обнаружении токсинов или микробов ботулизма в крови больного, рвотных массах и прочем. Заболевший возможно скорее должен быть помещён в больницу. Лечение:- специфическая антитоксическая сыворотка, при дыхательных расстройствах – искусственная вентиляция лёгких. Профилактика:- соблюдение санитарно-гигиенических правил при приготовлении пищевых консервов, при обработке, транспортировке и хранении пищевого сырья. (2) Ботулизм Животных:- кормовое отравление, характеризуется параличом мускулатуры глотки, языка и нижней челюсти. К ботулизму восприимчивы Лошади, птицы, реже рогатый скот, из пушных зверей – Норки. Споры возбудителя, попав из почвы в корма, при благоприятных условиях прорастают. Токсин ботулизма, поступая с кормом в кишечник, всасывается в организм. Лечение:- в начальной стадии слабительные – ареколин, пилокарпин, эзерин; в более поздней – сердечные средства. Профилактика:- соблюдение гигиены кормления животных. При возникновении болезни в звероводческих хозяйствах вакцинируют здоровое поголовье.

BOUBOU = БУБУ – Boubou:- a long flowing garment worn in parts of Africa. / Бубу – вид Африканской национальной одежды из белой ткани с широкими рукавами.

BOUCLÉ = БУКЛЕ – Bouclé is a fabric of bouclé yarn, namely an uneven yarn of three piles one of which forms loops at intervals. Wool, also in rayon, silk, cotton, linen, blends, hair fibers. Any weave, knit. From the French for ‘buckled’ or ‘ringed’. A drawn out or ringed, looped yarn is used to give it a kinky appearance at intervals. Made in a variety of weights. Bouclé yarns are usually in both the filling and the warp. Fabrics are usually springy to handle on account of the highly twisted yarns used to achieve the boucle effect. Often ravels easily. Bouclé is a knit or woven fabric made from a rough, curly, knotted bouclè yarn. The fabric has a looped, knotted surface and is often used in sportswear and coats. Bouclé is a fabric woven with boucle yarns with looped appearance on the surface. The fabric has a abrasive surface. Bouclé fabrics are woven or knitted by both, hand and machine. Bouclé is a fabric woven or knit with bouclè yarns. Bouclè fabric has a looped or knotted surface and is used for sportswear and coats. Bouclé is a fabric made of yarn with a length of loops of similar size which can range from tiny circlets to large curls. These loops produce a cross-grained, knobby appearance on woven or knitted fabrics. Bouclé (pronounced ‘boo-clay’) is a French word meaning ‘to curl’. Bouclé is a single cloth, dress goods fabric, weighing from 7 to 8 ounces per yard, 44 inches wide finished, and composed of plain and fancy twist (cotton) yarn in warp and filling, also having a worsted loop yarn in Uhe filling. Boucle is used principally as a novelty dress fabric for ladies’ spring and fall suitings, the distinguishing feature of the cloth being the small loop in the filling yarn, which curls over the face of the goods. Bouclé (woolen):- warp, all brown; filling, 3 brown, 1 worsted, 1 loop. / уточина. , 1 петля. Под Букле, от Французского слова Bouclé, означающее Вьющийся или Завитой, понимаются ткани с волнистой поверхностью, похожей на мелкий каракуль. Они вырабатываются из фасонной пряжи или пряжи креповой крутки. Из букле шьют верхнюю одежду. Букле – преимущественно шерстяная, тканая из буклированной нити пальтовая или костюмная ткань. Буклированная нить с узелками и петлями разной величины придаёт ткани характерную рельефность. Встречаются буклированные ткани из хлопчатобумажных и синтетических волокон.

BOUCLÉ YARN = ПРЯЖА БУКЛЕ – Bouclé Yarn is a novelty yarn with loops which give fabrics a rough appearance. Some boucle yarns have cotton cores with other fibers wound around them. Bouclè yarns may be made from wool, cotton, silk, linen, manufactured fibers, or combinations of fibers. Bouclé Yarn is a rough, quite thick and slubby linen yarn that is characterized by tight loops projecting from the body of the yarn with regular intervals. It is a novelty yarn often mixed with yarns of other fibers for textural interest. Bouclé yarn is very popular because there are many varieties and weights. Bouclé Yarn is a compound yarn comprising a twisted core with an effect-yarn wrapped around so as to produce loops on the surface. Drops Design A/S headquartered in Oslo, Norway. DROPS Alpaca Bouclé is a lovely soft effect yarn spun in alpaca. The yarn fibers are untreated, which means that they are only washed and not exposed to any chemical treatment prior to the dyeing. This highlights the fiber’s natural properties, while it also provides a better shape and texture quality. ‘Bouclé’ is the French word for a loop and it refers to the number of small loops of pure alpaca that give the ball its characteristic look. Spun from 2 strands, the core is a blend of wool and nylon, which helps give the yarn strength, and the combination of alpaca and bouclé provides a super soft yarn with excellent performance and a fantastic effect. Garments made in

DROPS Alpaca Bouclé are light and fluffy. DROPS Alpaca Bouclé contains some mixed colors, this means the wool is manufactured by carding the colors together before spinning, which gives it a mix effect. / Найлан (Nylon). Пряжа фасонной крутки букле (курчавая).

BOUNCE = ОТСКОК – In visual analysis, a small counter-trend rally that is expected to fail but serves the purpose of relieving the market of an oversold condition. Usually brought on by shorts taking profits. Sometimes referred to as Dead-Cat-Bounce. / В техническом анализе биржевых рынков .

BOUNDARY LUBRICATION = ГРАНИЧНОЕ СМАЗЫВАНИЕ – Boundary Lubrication is a form of lubrication between two rubbing surfaces without development of a full-fluid lubricating film. Boundary lubrication can be made more effective by including additives in the lubricating oil that provide a stronger oil film, thus preventing excessive friction and possible scoring. There are varying degrees of boundary lubrication, depending on the severity of service. For mild conditions, oiliness agents may be used; by plating out on metal surfaces in a thin but durable film, oiliness agents prevent scoring under some conditions that are too severe for a straight mineral oil. Compounded oils, which are formulated with polar fatty oils, are sometimes used for this purpose. Anti-wear additives are commonly used in more severe boundary lubrication applications. The more severe cases of boundary lubrication are defined as extreme pressure conditions; they are met with lubricants containing extreme pressure (EP) additives that prevent sliding surfaces from fusing together at high local temperatures and pressures. See also Lubrication, and Thin Film Lubrication. / противоизносные присадки . условия сверхвысокого давления. Смотрите также Тонкоплёночное Смазывание или Смазывание Тонкой Плёнкой (Thin Film Lubrication). Граничное Смазывание – смазывание, при котором трение и износ между поверхностями, находящимися в относительном движении, определяются свойствами поверхностей и свойствами смазочного материала, отличными от объёмной вязкости.

BOUND RATE = ОБЯЗАННАЯ СТАВКА – Bound Rate is the most-favored-nation tariff rate resulting from GATT (short for the General Agreement on Tariffs and Trade) negotiations. / Тарифная ставка для стран наибольшего благоприятствования, вытекающая из переговоров Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

BOUNTY = ПООЩРИТЕЛЬНАЯ ПРЕМИЯ (или ПОБЛАЖКА) – Bounty (in the UK, 1840's), a term used in commerce and the arts, to signify a premium paid by government to the producers, exporters, or importers of certain articles, or to those who employ ships in certain trades. (1) Bounties On Production are most commonly given in the view of encouraging the establishment of some new branch of industry; or they are intended to foster and extend a branch that is believed to be of paramount importance. In neither case, however, is their utility very obvious. In all old settled and wealthy countries, numbers of individuals are always ready to embark in every new undertaking, if it promise to be really advantageous, without any stimulus from government:- and if a branch of industry, already established, be really important and suitable for the country, it will assuredly be prosecuted to the necessary extent, without any encouragement other than the natural demand for its produce. (2) Bounties On Exportation And Importation:- it is enacted by the 3 & 4 Will. 4. c. 52., that a merchant or exporter claiming a bounty or drawback on goods exported must make oath that they have been actually exported, and have not been re-landed, and are not intended to be re-landed, in any part of the United Kingdom, or in the Isle of Man (unless entered for the Isle of Man), or in the islands of Faro or Ferro; and it is further enacted, that if any goods cleared to be exported for a bounty or drawback shall not be duly exported to parts beyond the seas, or shall be re-landed in any part of the United Kingdom, or in the islands of Faro or Ferro, or shall be carried to the islands of Guernsey, Jersey, Alderney, Sark, or Man (not having been duly entered, cleared, and shipped for exportation to such islands), such goods shall be forfeited, together with the ship or ships employed in re-landing or carrying them; and any person by whom or by whose orders or means such goods shall have been cleared, re-landed, or carried, shall forfeit a sum equal to treble the value of such goods. – §§ 87–95. (3) Policy Of Bounties:- it was formerly customary to grant bounties on the exportation of various articles; but the impolicy of such practice is now very generally admitted. It is universally allowed that bounties, if they be given at all, should be given only to the exporters of such commodities as could not be exported without them. But it is plain that, by granting a bounty in such cases, we really tax the public, in order to supply the foreigner with commodities at less than they cost. A. has a parcel of goods which he cannot dispose of abroad for less than 110l.; but they will fetch only 100l. in the foreign market; and he claims and gets a bounty of 10l. to enable him to export them. Such is the mode in which bounties on exportation uniformly operate; and to suppose that they can be a means of enriching the public, is equivalent to supposing that a shop-keeper may be enriched by selling his goods for less than they cost! But however injurious to the state, it has been pretty generally supposed that bounties on exportation are advantageous to those who produce and export the articles on which they are paid. But the fact is not so. A trade that cannot be carried on without the aid of a bounty, must be a naturally disadvantageous one. Hence, by granting it, individuals are tempted to engage or continue in businesses which are necessarily very insecure, and are rarely capable of being rendered lucrative; at the same time that they are prevented, by trusting to the bounty, from making those exertions they naturally would have made, had they been obliged to depend entirely on superior skill and industry for the sale of their produce. The history of all businesses carried on in this country by the aid of bounties, proves that they are hardly less disadvantageous to those engaged in them than to the public. The truth of these remarks has been acknowledged by government. The bounty on the exportation of Corn was repealed in 1815; and the bounties on the exportation of linen and several other articles ceased in 1830. (4) Bounties On Shipping have principally been paid to the owners of vessels engaged in the fishery, and their influence will be treated of under the articles Herring Fishery and Whale Fishery. Bounty is a compensation paid to persons to induce certain actions. In this class are government payments to producers or exporters to strengthen their competitive position. Bounty is an amount paid by a government for the achievement of certain economic or other goals. It often takes the form of a premium paid for the increased production or export of certain goods. The bounty was an important technique of mercantilist economic policy (see also mercantilism). Whereas a subsidy is a lump sum given for the purpose of promoting an enterprise considered beneficial to the public welfare, a bounty is given as a gratuity per unit of production. Bounties are usually in the form of direct cash payments. However, bounties can be in a concealed form such as exports relieved from payment of a tax or excise duty, special railway rates, rebates on taxes and import duties, credit facilities, and export credits guaranteed by the government. Effects of an export bounty can be destroyed by a countervailing duty imposed by an importing country. The compensatory export bounty is aimed at compensating producers for duties paid on imported raw materials used in making the particular commodity. Bounties also have been granted by states for the construction of roads, canals, railroads, and other public works, and they have been used by nations as an inducement to army enlistment. State governments in the United States have given bounties for the killing of animals regarded as destructive to livestock. / вывозной (или экспортный) кредит (export credit).

BOURRELET = БУРЭЛЕ (или СЛАЧЁК, или ШНУРОК, или ЗАКРАИНА, или БОРТИК, или ВЫПУКЛОСТЬ, или УТОЛЩЕНИЕ, или ШИШКА, или ДИВАННЫЙ ВАЛИК, или СКЛАДКА, или ГРЕБЕНЬ) – Bourrelet (plural bourrelets) is a double-knit fabric with raised loops running horizontally across the surface of the cloth giving a rippled or corded effect. / Под Бурэле, от Французского слова Bourrelet, означающее Валик или Кромка или Реборда или Закраина или Фланец, понимается .

BOURETTE = БУРЭТ – Bourrette is a light weight, single cloth fabric, weighing from 4% to 6 ounces, composed of two-ply cotton warp, and either wool, merino or a combination of cotton and wool shoddy Ailing. Both the warp and the filling have an occasional end or pick of fancy bourrette or nub yarn added for effect; hence the name. In appearance bourrette cloth is a semi-rough-faced woolen fabric, having small fancy colored lumps on the yarn, scattered throughout, the goods in accordance with the effect desired. The cloth when finished is used principally in the manufacture of ladies' fall suitings. To Finish This Fabric:- the goods are taken from the loom and measured after which they are brushed then scoured iu a solution of soap and cold water, then tentered and dried and pressed. The bourrette yarn is made by twisting two cotton threads and a worsted thread together, the worsted being allowed to deliver more quickly than the cotton threads, at regular intervals. The excess which is delivered is twisted around the cotton threads in the one place, thereby forming a lump on the twisted yarn, as the worsted yarn is run at a varied speed, and is not regularly distributed around the cotton threads. / уточина.

BOVINE SPONGIFORM ENCEPHALOPATHY = БЫЧЬЯ ГУБЧАТОВИДНАЯ ЭНЦЕФАЛОПАТИЯ – Bovine Spongiform Encephalopathy (BSE) is a fatal disease of the central nervous system of cattle, first identified in the United Kingdom in 1986. On 20 March 1996 the UK Spongiform Encephalopathy Advisory Committee (SEAC) announced the discovery of a new variant of Creutzfeldt-Jacob Disease (vCJD), a fatal disease of the central nervous system in humans, which might be linked to consumption of beef affected by exposure to BSE.

BOW = НОС – Bow is the forward part of a vessel's sides (front). The front of a vessel. / Под Носом понимается передняя оконечность судна, заканчивающаяся форштевнем. Очертания носа определяют форму носовых обводов судна и такие важные эксплуатационные особенности, как всхожесть на волну, ледопроходимость и другие. Распространённые очертания носа:- (i) обыкновенный нос с прямым наклонным форштевнем; (ii) нос судна с U-образными шпангоутами; (iii) бульбообразный нос; (iv) ледокольный нос; (v) ложкообразный нос; и (vi) клиперский нос.

BOW = ПЕРЕКОС – (1) Bow or Bowed:- filling yarn in woven goods which does not keep to the right angle with the warp yarn; and off-angle, distortion, bow or bowed effect is observed in the crosswise filling in the fabric between selvage edges. Bow is a fabric defect when the weft is stretched and forms a curve rather than a right angle to the warp. Bow; bowing:- excessive curvature of the courses in a fabric that may or may not extend over the full width. Note:- this defect is often caused by incorrect take-down tension during knitting or incorrect feeding during finishing. Bow:- when the filling yarns lye in an arc across the width of the fabric. Bow is the greatest distance, measured parallel to the selvages, between a filling yarn and a straight line drawn between the points at which this yarn meets the selvages. Bow may be expressed directly in inches or as a percentage of the width of the fabric at that point. Bow is the deviation of filling yarn as it lies in a fabric from exact straight-line or right-angle relationship to the warp yarns, producing a distorted or bowed effect from selvage to selvage. Defect Name:- Bow. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Bow:- A condition in wovens where the filling yarns lie in an arc across the width of the fabric. In knits, the courses lie in an arc across the width of the fabric. Severity:- Major. / уточная пряжа. Перекос Утка или Набивного Рисунка – результат перекоса ткани при печатании или плохого выполнения операции ширения. Перекос Ткани – неправильное расположение уточных нитей, искажающее клетку или рисунок ткани; возникает в результате небрежного ширения ткани. Выражается в виде арки или дуги по утку. Под Перекосом понимается распространённый порок в виде неперпендикулярного расположения нитей двух систем или рядов и столбиков. Перекос Полотна (bow, warp):- порок основы в виде неперпендикулярного расположения нитей основы и утка. Примечание:- этот порок вызывается неравномерным натяжением основы. Перекос Полотна, Уток (bow, weft):- порок заключительной отделки ткани в виде чрезмерного искривления утка ткани, может распространяться на всю ширину полотна. Примечание:- этот порок вызван недостатком контроля при изготовлении ткани или обработке.

(2) Bow (arcs):- on the woven fabric, this situation means that the weft to form the arc in the width direction of the fabric; on knitted fabric, this situation means that the coil rows to form the arc in the width direction of the fabric. Fabric Printing Defect. Bow is a fabric condition resulting when filling yarns or knitting courses are displaced from a line perpendicular to the selvages and form one or more arcs across the width of fabric. See also Double Bow. / уточные пряжи. Порок или Дефект набивки тканей.

BOW = ПРОДОЛЬНОЕ КОРОБЛЕНИЕ (или ПРОДОЛЬНАЯ ПОКОРОБЛЕННОСТЬ ПО ПЛАСТИ, или ПОГНУТОСТЬ) – Bow is a deviation from a straight line (a curve along the face of the piece of lumber) from end to end of a piece, measured at the point of greatest deviation. / Девиация (величина отклонения) в отношении прямой линии (кривой вдоль пласти изделия из пиломатериалов) от конца к концу иделия, измеряемая в пункте наибольшей девиации. Под Короблением Древесины понимается изменение формы пиломатериалов, заготовок и деталей при их высыхании (разбухании). Различают:- винтовое коробление, поперечное коробление и продольное коробление. Винтовое коробление древесины образуется при наличии тангенциального наклона волокон. Основная причина поперечного коробления древесины – различие в усушке (разбухании) в радиальном и тангенциальном направлениях. Продольное коробление древесины вызывается разницей усушки вдоль волокон отдельных зон доски, например, при наличии такого порока древесины, как крень. Временное коробление древесины может наблюдаться при неравномерных увлажнении или сушке пиломатериалов. Коробление древесины происходит также при механической обработке пиломатериалов или заготовок, имеющих значительные остаточные напряжения, сохранившиеся после камерной сушки. Крень – порок древесины хвойных пород, который образуется в сжатой зоне изогнутых стволов, когда годичные слои уширяются за счёт развития реактивной древесины, тёмным цветом напоминающий позднюю древесину. Различают сплошную и местную крень. Порок увеличивает усушку древесины вдоль волокон, способствует короблению, ухудшает и ряд других её свойств.

BOWING = ПЕРЕКОС (или ПЕРЕКАШИВАНИЕ) – Bowing:- weft becomes bow type or monogram of both the selvedge not in same line. Finishing defect. Bowing:- a line or a design may curve across the fabric. This bowing is the distortion caused by faulty take-up mechanism on the knitting machine. Knitted fabric defect. Bowing:- usually caused by finishing. Woven filling yarns lien in an arc across fabric width:- in knits the course lines lie in an arc across width of goods. Critical on stripes or patterns and not as critical on solid color fabrics. / Порок или Дефект заключительной отделки. Уточные пряжи. Под Перекосом понимается распространённый порок в виде неперпендикулярного расположения нитей двух систем или рядов и столбиков.

BOWLER = КОТЕЛОК – Bowler is a derby hat. / Котелок – шляпа для скачек.

BOW THRUSTERS = НОСОВЫЕ ПОДРУЛИВАЮЩИЕ УСТРОЙСТВА – A propeller used to provide a transverse thrust to the bow of the ship and to assist movement in confined spaces. Bow Thrusters:- a propeller at the lower sea-covered part of the bow of the ship which turns at right angles to the fore-and-aft line and thus provides transverse thrust as a maneuvering aid. / Подруливающее Устройство – средство активного управления судном при малых скоростях хода и без хода. В качестве подруливающего устройства используются крыльчатые движители, поворотные винтовые колонки, а также гребные винты или насосы, устанавливаемые в поперечных гидроканалах, проходящих через корпус судна, как правило, в носу (носовом канале), способные создавать тягу в двух противоположных направлениях, перпендикулярных диаметральной плоскости судна.

BOW TIE = ГАЛСТУК БАНТ (или ГАЛСТУК БАБОЧКА) – Bow Tie is a short necktie tied in a bowknot.

BOX = БОКС – Box:- (1) a rigid container having closed faces; (2) a complete set-up paper box, including base and lid; (3) the physical partionable unit inside a partition (which is a section of a system). Inside the box, you have the modules. / Под Боксом, от Английского слова Box, означающее Коробка, Маленькое Отделение С Перегородкой, понимается:- (1) в биологии, изолированная, застеклённая камера с входом через тамбур, предназначенная в микробиологических и других биологических лабораториях для работ, требующих особой чистоты и стерильности (пересевы культур микроорганизмов, посевы тканей и так далее). (2) Герметическая камера для работы с радиоактивными веществами. (3) Переносная герметическая стеклянная камера (переносной бокс) с 2 или 4 отверстиями (диаметром 12–14 см), к которым плотно пригнаны нарукавники, позволяющие работать внутри самой камеры, не нарушая её герметичности. (4) В медицине, отгороженная часть больничной палаты или специальное помещение в больнице или клинике для изоляции больного. Бокс устраивается в инфекционных и детских лечебных учреждениях для предупреждения внутрибольничных заражений.

BOX = XX – When to use:- occasionally, a market will get out of line enough to justify an initial entry into one of these positions. However, they are most commonly used to 'lock' all or part of a portfolio by buying or selling to create the missing 'legs' of the position. These are alternatives to closing out positions at possibly unfavorable prices. Long box:- long a bull spread, long a bear spread – that is, long call A, short call B, long put B, short put A. Value = B – A – Net Debit. Short box:- Long call B, short call A, long put A, short put B. Value = Net Credit + (A – B). Long-instrument conversion:- long instrument, long put A, short call A. Value = 0. 'Price' = instrument + put – A – call. Short-instrument conversion:- short instrument, long call A, short put A. Value = 0. 'Price' = A + call – instrument – put. Category:- locked or arbitrage trade. These spreads are referred to as 'Locked Trades' because their value at expiration is totally independent of the price of the underlying instrument. If you can buy them for less than that value or sell them for more, you will make a profit (ignoring commission costs). Also known as Conversion. To buy/sell mispriced options and hedge the market risk using only options, unlike the conversion or the reversal, which use futures contracts. If a certain strike put is underpriced, the trader buys the put and sells a call at the same strike, creating a synthetic short futures position. To get rid of the market risk, he sells another put and buys another call, but at different strike prices. / Одна из стратегий биржевой торговли опционами .

BOX = СУНДУК – A slang term Box refers to an ocean-freight container. Common terminology describing a container. Slang Term for Container. / Жаргонный термин для обозначения Контейнера.

BOX = ЯЩИК – Each syndicate has a Box in the underwriting room at Lloyd's from which business may be transacted with Lloyd's brokers. Each box comprises a couple of opposite facing benches and desks at which the underwriters employed by the managing agent of the syndicate sit, plus some loose stools for the visiting Lloyd's brokers to sit on. Most boxes have computer terminals as well as access to other information technology. / Каждый синдикат имеет свой ящик в комнате расписывания у Лойда, из которого дело может вестись с брокерами Лойда. Каждый такой ящик состоит из .

BOX BEAM = БАЛКА КОРОБЧАТОГО СЕЧЕНИЯ – Box Beam is a built-up beam with solid wood flanges and plywood or woodbase panel product webs. / Укреплённая балка с твёрдыми кромками древесины и фанеры или древесной плиты (woodbase panel) product раскосы/решётки (webs). Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов.

BOXCAR = КРЫТЫЙ ВАГОН – Boxcar is a closed rail freight car. / Крытый железнодорожный грузовой вагон.

BOX COAT = КУЧЕРСКОЕ ПАЛЬТО (или XX) – Box Coat is a heavy overcoat formerly worn for driving; a loose coat usually fitted at the shoulders.

BOX CONTAINER = ЯЩИЧНЫЙ КОНТЕЙНЕР – Box Container is alternative colloquial term for the standard ISO container.

BOXER = БОКСЁРКИ – Boxer:- (plural) short pant.

BOXER SHORTS = БОКСЁРСКИЕ ШОРТЫ – Boxer Shorts are the short pants. Underwear.

BOXING = XX – Boxing is a term describing the straight strip of fabric that covers the sides of a three-dimensional round or square pillow. The boxing is joined to the rest of the cover with seams and occasionally includes a decorative trimming such as welting.

BOXING GLOVE = БОКСЁРСКАЯ ПЕРЧАТКА – Boxing Glove is one of a pair of leather mittens heavily padded on the back and worn in boxing.

BOX LOOM = МНОГОЧЕЛНОЧНЫЙ ТКАЦКИЙ СТАНОК – Box Loom is a loom using two or more shuttles for weaving fabrics with filling yarns that differ in fiber type, color, twist, level, or yarn size. The box motion is automatic, changing from one shuttle to another. Examples of fabrics made on box looms are crêpes and ginghams. Box Loom is a loom equipped with mechanism to permit the use of two or more shuttles, making possible the production of bars, checks, or other repeating-pattern effects in the filling direction of woven fabric. / уточные пряжи.

BOX MARK = ОТМЕТИНА ОТ ЧЕЛНОЧНОЙ КОРОБКИ (или КОРПУСА) – Box Mark is a fine line parallel to the filling caused by shuttle damage to a group of filling yarns. See also Shuttle Mark. Box Mark:- a widthwise line showing stained or injured weft due to the rubbing of shuttle when rebound. Woven fabric defect. Box Marks are due to something bruising or staining the weft while it is in or near the box. Main causes are dirty boxes, shuttle riding over the weft, oil from shuttle tongue, dirty shuttles, weft flying about too freely, oil splashes from loose cranks, oily spindles and buffers and dirty picking stick for under pick. / уточина. протирание или притирка (rubbing). Порок или Дефект ткачества.

BOX PALLET = ЯЩИЧНЫЙ ПОДДОН – Box Pallet is a pallet with at least three fixed, removable or collapsible vertical sides.

BOX RATE = СТАВКА ЗА СУНДУК – Box Rate:- a lump sum charge to move cargo in containers from origin to destination.

BOX SIZE = РАЗМЕР КОРОБОЧКИ (или РАЗМЕР СТОЛБЦА) – In point and figure charts, it is the price value of one X or O. An X is shown when prices rise by the box size, and an O is shown when prices fall by the box size. Increasing the box size filters smaller price movements.

BOX SPREAD = КУРСОВАЯ РАЗНИЦА БОКС (или БОКС СПРЭД) – Box Spread:- an option market arbitrage in which both a bull spread and a bear spread are established for a riskless profit. One spread includes put options and the other includes calls. An option

position in which the owner establishes a long call and a short put at one strike price and a short call and a long put at another strike price, all of which are in the same contract month in the same commodity.

BOY = BEGINNING OF YEAR

BOYCOTT = БОЙКОТ – Boycott is an unfair trade practice which occurs when someone in the insurance business refuses to have business dealings with another until he or she complies with certain conditions or concessions. Charles Cunningham Boycott, retired British army captain who was an estate manager in Ireland during the agitation over the Irish land question. He is the eponym for the verb and common noun Boycott. After retiring from the army, Boycott in 1873 became agent for the 3rd Earl of Erne's estates in County Mayo. The Land League, formed in Ireland in 1879 when bad harvests made a famine likely, told Boycott in 1880 that he must reduce rents by 25 percent. In September 1880, after Boycott had attempted to serve writs of eviction, the president of the Land League, Irish nationalist statesman Charles Stewart Parnell, urged that, without resort to violence, the tenants should avoid any communication with those who refused their demand for lower rents. Parnell's policy was first used against Boycott, who, consequently, was forced to employ workers from Ulster, guarded by soldiers, to harvest his crops. He left Ireland the same year and eventually became an agent for estates in Suffolk. Conditions in Ireland quickly eased after William Ewart Gladstone's Land Act of 1881 instituted fair-rent tribunals. / Вильэм (William). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Слово Бойкот, в современном его понимании, появилось в Английском языке от фамилии уволенного из Британской армии капитана Чалза Каниньгэма Бойкота (Charles Cunningham Boycott), ставшего в Ирландии управляющим имением (estate manager) во время агитации по вопросу об Ирландской земле, в отношении которого впервые в 1800 арендаторами была применена эта мера воздействия. В зависимости от контекста может использоваться для обозначения:- (i) средства политической и экономической борьбы, заключающегося в полном или частичном прекращении отношений с отдельным лицом, организацией или государством, например, в межгосударственных отношениях – установление эмбарго на вывоз или ввоз товаров, дискриминационных таможенных пошлин, тарифов или иного; рабочие используют бойкот против предпринимателей в качестве организованного отказа от найма на работу или покупки продукции данного предприятия; или (ii) прекращения отношений с кем-либо в знак протеста против чего-либо. Бойкот, от имени управляющего имением Чалза Каниньгэма Бойкота (Charles Cunningham Boycott), в отношении которого впервые в 1880 была применена Ирландскими арендаторами эта мера за его жестокое обращение с ними. (1) В международном праве отказ государства устанавливать или поддерживать торговые, финансовые или другие отношения с каким-либо государством или с группой государств. В Статуте Лиги Наций бойкот фигурировал как вид санкции. Устав Организации Объединённых Наций (ООН) предусматривает возможность бойкота как одну из принудительных мер для поддержания мира, не связанных с использованием вооружённых сил, применяемых по решению Совета Безопасности ООН. Статья 41 Устава гласит, что эти меры могут включать полный или частичный перерыв экономических отношений, железнодорожных, морских, воздушных, почтовых, телеграфных средств сообщения, радиосвязи, а также разрыв дипломатических отношений. Бойкот может быть формой репрессалий (то есть ответных мер, применяемых против неправомерных действий какого-либо государства). В практике бывшего Союза Советских Социалистических Республик (СССР) бойкот использовался в ответ на действия реакционных правительств капиталистических стран и выражался в разрыве всяких сношений, прекращении закупок товаров в соответствующих странах, в отказе участвовать в конференциях, созываемых на территории бойкотируемого государства. Так, в 1923 СССР объявил бойкот Швейцарии после убийства Советского дипломата Вацлава Вацлавовича Воровского (1871–1923) и оправдания убийцы Швейцарским судом (бойкот был снят в 1927, после того как Швейцарское правительство выразило сожаление по поводу происшедшего и готовность предоставить материальное возмещение семье убитого). Наиболее распространённой формой бойкота является Экономический Бойкот. (2) Экономический Бойкот:- одним из первых примеров экономического бойкота являлся бойкот Английскими колониями в Северной Америке товаров, ввозимых из Англии в середине XVIII века. В Индии в 1905 в знак протеста против акта Вице Короля Керзона о разделе Бенгалии начался стихийный бойкот Английских товаров, который был одной из форм национально-освободительной борьбы против Английского владычества. Бойкот может охватывать все формы или распространяться на отдельные стороны межгосударственных экономических связей. Характер и содержание его зависят от того, какое государство и в каких целях его применяет. В практике международных экономических отношений империалистических государств бойкот является формой экономической борьбы, средством экономического давления на другие страны, а также орудием вмешательства во внутренние дела стран, что нарушает нормы международного права. Империалистические государства пытались применить бойкот против бывшего СССР после провала экономической блокады Советской республики. Бойкот в 1920-е и 1930-е выражался в кампаниях против закупок Советского леса, нефти, спичек и некоторых других товаров, во введении специальных запретов и ограничений на привоз (или импорт) Советских товаров (например, эмбарго на ввоз традиционных товаров Советского вывоза (или экспорта) в Великобританию в 1932–33). Ведя борьбу против политики экономической агрессии, Советское правительство внесло на Лондонскую Экономическую Конференцию (1933) проект протокола об экономическом ненападении. Статья 33 проекта предлагала, чтобы государства, подписавшие протокол, отказались от применения дискриминационных таможенных пошлин, специальных условий ввоза и вывоза, установленных только для одной какой-либо страны, специальных железнодорожных тарифов, особых сборов, взимаемых с торговых судов, экономического бойкота торговли какой-либо страны всякого рода правительственными или административными мерами. После Второй Мировой Войны 1939–45 США, Канада, ряд стран Западной Европы и Япония пытались организовать бойкот социалистических стран путём запрета вывоза из своих стран в СССР и другие социалистические государства товаров и установления дискриминационного режима на ввоз в свои страны товаров из социалистических государств. Дискриминационные меры охватывали не только сферу торговли, но распространились также на судоходство, международные, финансовые, кредитные и расчётные отношения. После заключения Северо-Атлантического Договора (1949) ограничения и запреты в торговле с социалистическими странами были ещё более усилены. В 1951 правительство США приняло так называемый 'Закон Бэттла', установивший целую систему запретов на торговлю с социалистическими странами. Правительство США опубликовало список товаров, содержавший 217 товарных групп, вывоз (или экспорт) которых в социалистические страны был запрещён или ограничен. Под нажимом США такие же списки ввели ряд стран Западной Европы, Канада и Япония. В отношении Китайской Народной Республики (КНР), Корейской Народно-Демократической Республики (КНДР), и Демократической Республики Вьетнам (ДРВ) действовали особые списки товаров, практически запрещавшие всякую торговлю. Несостоятельность этой политики, экономические и политические разногласия между капиталистическими странами, растущие противоречия на мировом капиталистическом рынке заставили империалистические государства стать на путь нормализации экономических отношений с социалистическими странами. Империалистические государства используют бойкот как одно из средств давления на развивающиеся страны. В 1951–53 правительство Англии пыталось установить бойкот в отношении закупок нефти у Ирана после национализации правительством этой страны Англо-Иранской Нефтяной Компании (Anglo Iranian Oil Company; ныне BP), а правительства Англии и Франции предприняли попытку организовать бойкот против Объединённой Арабской Республика (ОАР; объединённое государство Сирии и Египта, существовавшее с Февраля 1958 по Сентябрь 1971) после национализации её

правительством Всеобщей Компании Суэцкого Канала (ныне Египетская Администрация Суэцкого Канала (Suez Canal Authority (SCA))). В свою очередь, развивающиеся страны использовали бойкот как ответную меру на экономическую экспансию, например прекращение Арабскими государствами поставок нефти империалистическим странам в период Израильской агрессии (с 1967). Внутри капиталистических стран бойкот – важное орудие конкурентной борьбы монополий, одна из форм '... удушения монополистами тех, кто не подчиняется монополии, её гнёту, её произволу' (Владимир Ильич Ленин, Полное собрание сочинений, 5 издание, тот 27, страница 321). (3) В трудовых отношениях в капиталистических странах одно из средств экономической борьбы рабочего класса против предпринимателей, заключающееся в организованном отказе наниматься на работу к владельцу бойкотируемого предприятия или покупать продукцию данного предприятия. Виды бойкота разнообразны. Одним из них является система лебелей (наклеивание на товары специальных ярлыков – лебелей, означающих, что между профсоюзом и предпринимателем нет конфликта, отсутствие ярлыка на товаре призывает потребителя к его бойкоту). В ряде капиталистических государств бойкоты, организуемые трудящимися, запрещены или существенно ограничены. Например, в Италии Уголовный Кодекс (Статья 507) устанавливает за призыв к бойкоту наказание в виде лишения свободы на срок до 3 лет (этот срок может быть увеличен в случае, если бойкот принимает массовые формы, а также при чрезвычайных обстоятельствах). Законодательством Англии и Федеративной Республики Германия (ФРГ) бойкот запрещается в том случае, если его цель или средства организации признаются незаконными (неопределённость этой формулировки позволяет ставить вне закона различные виды бойкота). В США бойкоты особенно распространены. Согласно Законам Тафта-Хартли и Лэндрама-Гриффина, запрещаются так называемые 'вторичные' бойкоты, когда рабочие принуждают третьих лиц прекратить покупку товаров или снабжение сырьём предпринимателя, с которым у рабочих возник трудовой конфликт. Аналогичные законы действуют в большинстве штатов, в некоторых штатах запрещены и обычные бойкоты. Признание бойкота незаконным ведёт, как правило, к наложению штрафа на профсоюз или к возмещению предпринимателю убытков, понесённых в результате бойкота.; предприниматель получает также право уволить рабочих за участие в бойкоте.

BOYCOTT CERTIFICATE = СВИДЕТЕЛЬСТВО О БОЙКОТЕ – Boycott Certificate:- required by certain countries restricting carriage to certain flag vessels. / Требуется в отдельных странах, ограничивающих перевозку грузов судами под определёнными флагами.

BOYLE'S LAW = ЗАКОН БОЙЛА (или ЗАКОН БОЙЛЯ) – Boyle's Law:- the absolute pressure of a fixed mass of gas varies inversely as the volume, provided the temperature remains constant. / Под Законом Бойля-Мариотта (по имени Англо-Ирландского учёного Робэта Бойла (или Роберта Бойля; Robert Boyle; 1627-Январь-25–1691-Декабрь-31) и Французского физика и священника Эдмэ Маръёта (или Эдме Мариотта; Edme Mariotte; 1620–84), независимо друг от друга открывших закон) понимается один из основных законов идеальных газов, согласно которому при постоянной температуре удельный объём v данного идеального газа обратно пропорционален давлению p, или при постоянной температуре произведение давления на удельный объём данного идеального газа постоянно:- pv = const. Закон Бойля-Мариотта, один из основных газовых законов, согласно которому при постоянной температуре объём V данной массы идеального газа обратно пропорционален его давлению p, то есть pV = C = const. Постоянная C пропорциональна массе газа (числу молей) и его абсолютной температуре. Закон установлен по опытным данным Английским учёным Робётом Бойлом (1662) и независимо от него Французским учёным Эдмэ Маръётом (1676). Закон Бойля-Мариотта следует из кинетической теории газов, если принять, что размеры молекул пренебрежимо малы по сравнению с расстоянием между ними и отсутствует межмолекулярное взаимодействие. Иными словами, Закон Бойля-Мариотта выполняется строго для идеального газа. Для реальных газов, у которых влиянием размеров молекул и их взаимодействием пренебрегать нельзя, Закон Бойля-Мариотта выполняется приближённо, тем лучше, чем дальше от критического состояния находится газ.

BP = BALANCE OF PAYMENTS

BP = BOILING POINT

BPAI = BOARD OF PATENT APPEALS AND INTERFERENCES

BPAIIS = BOARD OF PATENT APPEALS AND INTERFERENCES INFORMATION SYSTEM

BPH = BROWN PLANTHOPPER

BPI = BANK OF THE PHILILLINE ISLANDS

BPI = BULLISH PERCENT INDEX

BPI = BUREAU OF PLANT INDUSTRY

BPO = BANK PAYMENT ORDER

BPO = BLANKET PURCHASE ORDER

BPO = BROKER PRICE OPINIONS

BPO = BUSINESS PROCESS OBJECT

BPO = BUSINESS PROCESS OPTIMIZATION

BPO = BUSINESS PROCESS OUTSOURCING

BPS = BASIS POINT

BPW = BUSINESS AND PROFESSIONAL WOMEN'S FOUNDATION

BR = BACKWARD REPORTING

BR = BAD REGISTER

BR = BILLS RECEIVABLE

BR = BRAZIL

BR = BYPASS RATIO

BRA = БРА (или ЛИФЧИК, или БЮСТГАЛЬТЕР) – Bra (brassiere):- a woman's close-fitting undergarment with cups for bust support. / Под Бра или Бюстгальтером или Лифчиком понимается .

BRACE = СКОБА – Brace is a diagonal component used to increase rigidity of a post pallet or box pallet. See also Pallet. / Скоба (Brace):- диагональная деталь, применяемая для увеличения жёсткости в ящичном или стоечном поддоне. Смотрите также Поддон (Pallet).

BRACELET = БРАСЛЕТ – Bracelet is an ornamental band or chain worn around the wrist.

BRACHYCERA = БРАХИСЭРА (или КОРОТКОУСИКОВОЕ) – Brachycera is a suborder of Diptera or flies where adults have very short antennae and 1–2 segmented maxillary palps. / , от Греческого слова Brachýs, означающее Короткий, .

BRACHYPTEROUS = БРАХИПТЕРОЗНОЕ (или КОРОТКОКРЫЛОЕ) – Brachypterous:- with short or abbreviated wings. / , от Греческого слова Brachýs, означающее Короткий, .

BRACING = РАСПОРКА (или РАСЧАЛКА) – In Bracing a cargo, you are stopping damage from up and down movements and from vibration; this would be essential for sea and truck movements. To secure a shipment inside a carrier's vehicle to prevent damage. Items used to secure general cargo loads. Bracing is usually made from squared lumber beams that are fitted between the load and the load-bearing sections of the container in order to take up the horizontal and vertical forces acting on the load. The bracing is subject to compressive stress. Also known as Blocking. / Обычно распорка делается из брусков острокантного (отёсанного на четыре канта) пиломатериала, которые укладываются между .

BRACING BEAMS = РАСПОРНЫЕ БРУСКИ (или УПОРНЫЕ БРУСКИ) – Bracing/Bracing Beams are the items used to secure general cargo loads. Bracing is usually made from squared lumber beams that are fitted between the load and the load-bearing sections of the container in order to take up the horizontal and vertical forces acting on the load. The bracing is subject to compressive stress. / из брусков острокантного (отёсанного на четыре канта) пиломатериала, .

BRACT = ПРИЦВЕТНИК (или ПРИЦВЕТНИЧЕК, или КРОЮЩИЙ ЛИСТ, или ОБЁРТКА) – Bract is the three modified leaves at the base of the cotton fruit. Bracts typically surround developing squares, affording some protection to bollworms and other pests from beneficial insects and insecticides; must be opened to reveal developing square when monitoring fruit for damage. A modified leaf at the base of a square, flower or boll. Bract is a reduced or modified leaf subtending an axis. Often found at the base of a flower or flower cluster and may form a cup around the flower in, e.g., Compositae or may be brightly colored and resemble petals in, e.g., Poinsettia. Bract is a reduced or modified leaf at the based of a flower or flower head. A leaf from the axis of which a flower arises. / Видоизменённый лист, в пазухе которого развивается подцветник, цветок или коробочка. Прицветник, лист в пазухе которого развиваются цветок или соцветие. Прицветниками называют также маленькие листья (один или два) на цветоножке. Прицветник, лист в пазухе которого развиваются цветок; кроющий лист цветочного побега. Прицветники мельче обычных листьев, редуцированы, лишь у некоторых растений (например, у Шалфея) они крупные и окрашенные; иногда (например, у Крестоцветных, Укропа) они рано опадают. В одном из Англоязычных текстильных изданий на фотографии частей коробочки и листа Хлопчатника под термином Bract подразумевался Прилистник, растущуй у Хлопчатника не в месте пазушной почки, из которой произрастает Черешок (Stick) с Листом (Leaf), а на самом черешке в основании листа.

BRACTEOLE = ПРИЦВЕТНИЧЕК (или ПРИЦВЕТНИК НА ВТОРИЧНОЙ ОСИ) – Bracteole is a bract borne on a secondary axis, as on a petiole; a reduced leaf.

BRADFORD = БРЭДФОРДСКИЙ (или БРЭДФОДСКИЙ) – Bradford:- spinning English method of spinning wool into worsted yarn. The wool is thoroughly oiled before it is combed, producing a smooth, lustrous yarn used for worsted suitings. This is distinct from the French system which is dry spun.

BRADFORD COUNT = БРЭДФОРДСКАЯ НУМЕРАЦИЯ – Bradford Count or Bradford System is the British standard is based on the Bradford Spinning Count System. This originated in the XIX century and is based on the number of 560-yard worsted skeins that can be produced from one pound of clean wool. The clean wool is then thoroughly oiled which aids in producing a smooth, lustrous yarn for suiting. With this system the larger number will be a finer wool. See also Wool Grades. Bradford Count is one of three grading systems to describe the fineness of wool. The Bradford system uses the number of 560 yard worsted spun skeins from a pound of top from that particular type of fleece. The larger the number, the finer the fleece. The Bradford Count has generally replaced the Blood Count as a grading system.

BRADY BONDS = БРЭДИНСКИЕ ОБЛИГАЦИИ (или БРЭДИНКИ) – The term 'Brady Bonds' refers to bonds issued by public debtors for the restructuring of bank loans. The idea goes back to former US Treasury Secretary Nicholas F. Brady, who in 1989 proposed a catalogue of measures to solve developing countries' debt problems. The creditor banks were to forgive part of the debtor countries' liabilities. The debt service was reduced by exchanging loans for longer-term fixed-income securities which had a discount from face value and/or bore interest at lower-than-market rates. The quality of the bonds was enhanced by guarantees. / (Nicholas F. Brady).

BRAGUETTE = БРАГЭТ (или ГУЛЬФИК, или ШИРИНКА) – Bragette:- a codpiece, a piece of leather or stuffed material worn to accent the male groin. / .

BRAID = ШНУР (или ШНУРОК, или ПЛЕТЁНАЯ ТЕСЬМА, или БЕЙКА, или БОРДЮР, или СУТАЖ, или БАСОННОЕ ИЗДЕЛИЕ, или ОПЛЁТКА) – Braid is:- (1) a narrow textile band, often used as trimming or binding, formed by plaiting several strands of yarn. The fabric is formed by interfacing the yarns diagonally to the production axis of the material. See also Biaxial Braid, and Triaxial Braid. Biaxial Braid:- a braided structure with two yarn systems running in one direction and the other in the opposite direction. Triaxial Braid:- a braided structure with axial yarns running in the longitudinal direction. (2) In aerospace textiles, a system of three or more yarns which are interlaced in such a way that no two yarns are twisted around each other. Braid is a term used to describe narrow trimmings with multicolored designs woven into them. Various types of braid, such as peasant braid, are popular during certain fashion periods.

BRAID ANGLE = УГОЛ ПЛЕТЕНИЯ – Braid Angle is the acute angle measured from the axis of a fabric or rope to a braiding yarn.

BRAIDED FABRIC = ПЛЕТЁНАЯ ТКАНЬ – Braided Fabric is a narrow fabric made by crossing a number of strands diagonally so that each strand passed alternatively over or under one or more of the other strands. They are frequently used in shoelaces and suspenders.

BRAIDED STREAM = СПЛЕТЁННЫЙ ПОТОК – Braided Stream is a shallow, wide stream of interconnected channels with intervening bars and islands exposed at low stream levels.

BRAIDING = СПЛЕТЕНИЕ – Braiding is the intertwining of three or more strands to make a cord. The strand form a regular diagonal pattern down the length of the cord or narrow fabric.

BRAID WOOL = ЗАПЛЕТЁННАЯ (или СВАЛЯВШАЯСЯ) ШЕРСТЬ (или ОЧЕНЬ ГРУБАЯ ШЕРСТЬ) – Braid Wool is the coarsest of the US grades of wool, according to the blood system of classification. It is a very coarse and lustrous wool. See also Wool Grades.

BRAIN DRAIN = УТЕЧКА МОЗГОВ – A term Brain Drain refers to the flight of professionals out of Canada due to our high taxes and lower salaries. But, is it a true statement? Sure, there is always some mobility in a work force – but is there a net outflow?

BRAKE END = ТОРМОЗНОЙ ТОРЕЦ (или КОМЕЛЬ) – The Brake End is the end of a railway car where the hand brake wheel is located. Compartments or partitions in a railcar are numbered sequentially beginning at the brake end.

BRAN = ОКОЛОПЛОДНИК – Bran, the thin skins or husks of Corn, particularly wheat, ground, and separated from the Corn by a sieve or boulter. The Bran is the multi-layered outer skin of the kernel, and is tough enough to protect the other two parts of the kernel from assaults by sunlight, pests, water, and disease. It contains important antioxidants, B vitamins and fiber. Bran is the hard outer layer of grain and consists of combined aleurone and pericarp. Along with germ, it is an integral part of whole grains, and is often produced as a by-product of milling in the production of refined grains. When bran is removed from grains, they lose a portion of their nutritional value. Bran is present in and may be milled from any cereal grain, including Rice, Wheat, Maize, Oats, Barley, and Millet. Bran should not be confused with chaff, which is coarser scaly material surrounding the grain, but not forming part of the grain itself. Bran is particularly rich in dietary fiber and omegas and contains significant quantities of starch, protein, vitamins, and dietary minerals. Bran is a pericarp of grain. The outer layers of a cereal grain such as Wheat, approximately 20 percent of which is indigestible cellulose, used as a source of dietary fiber. The broken outer coat, or husk, of grains of Wheat, Rye, Oats, etc separated from the flour after grinding, as by sifting. Bran is a coarse outer covering or coat (seed husk) of cereal grain, such as Wheat or Rye. Bran provides a source of dietary fiber, B vitamins, iron, magnesium, and zinc. When separated from the meal or flour portion of a grain, it is less nutritious. Bran is the meal derived from the outer covering of a cereal grain; a source of dietary fiber. The outer layer of grains (such as Wheat or Oats) that is removed during milling. Bran is a good source of carbohydrates, calcium, phosphorus and fiber. It's found in cereals and baked goods and can be purchased at health-food stores and most supermarkets. Bran is the outer layers of a cereal grain, including the pericarp, tegmen, embryo, aleurone layer, and a small portion of the starch endosperm, which are removed in milling. / шлифование (grinding). и может быть закуплен в . Известен также как Перикарпий (Pericarp). Околоплодник – это наружные слои зерна Злаковых (таких как, Маис (Кукуруза), Овёс, Просо, Пшеница, Рис, Рожь и Ячмень), состоящий из перикарпия (pericarp), покрова (tegmen), эмбриона (embryo), алейронового слоя (aleurone layer) и маленькой порции крахмального эндосперма (starch endosperm), которые удаляются во время помола. Под Околоплодником понимается стенка плода растений, защищающая семена. Формируется обычно из стенок завязи. Состоит из трёх (иногда двух) слоёв:- наружного (экзокарпия, например, кожица ягоды Винограда), внутреннего (эндокарпия, например косточка в костянке Вишни), среднего (мезокарпия, например, сочная мякоть плода Арбуза). Околоплодник является систематическим признаком растений.

BRANCH = ВЕТВЬ – Branch is a natural division of a stem or trunk, especially a secondary stem growing off the main stem or trunk. Branch is a division of the stem or axis of growth. / основного стебля или ствола.

BRANCH = ФИЛИАЛ – (1) Branch is a division of a business or other organization. Branch is a smaller, remotely located office that is separate from a company's corporate headquarters. When you find yourself and your employees traveling frequently to a specific locale, it may be time to consider opening a branch office there. That will reduce the need to travel and greatly improve your coverage of the remote office. For many locations, such as international markets many time zones away, a branch office may be the only feasible way to serve a particular market. Be careful about opening a large number of branch offices simply to reduce travel time and costs, though. It can cost far more to staff, lease, equip and maintain an office than to conduct numerous business trips. Cost out the alternatives carefully, and only commit when you can find the right location, the right personnel and the right price. A secondary place of business apart from the principal or main office from which real estate business is conducted. A branch office usually must be run by a licensed real estate broker working on behalf of the broker. A Branch Office is part of the legal entity under which it operates and has its own organization and administration. It underwrites business for its assigned territory, has its own balance sheet and is subject to local regulations. Also known as Branch Office. A local unit of a business or an auxiliary controlled by such a business. Branch or Branch Office is a smaller, remotely located office that is separate from a company's corporate headquarters. When you find yourself and your employees traveling frequently to a specific locale, it may be time to consider opening a branch office there. That will reduce the need to travel and greatly improve your coverage of the remote office. For many locations, such as international markets many time zones away, a branch office may be the only feasible way to serve a particular market. Be careful about opening a large number of branch offices simply to reduce travel time and costs, though. It can cost far more to staff, lease, equip and maintain an office than to conduct numerous business trips. Cost out the alternatives carefully, and only commit when you can find the right location, the right personnel and the right price. See also Parent Company, Representation, and Subsidiary. A direct investment branch is an unincorporated enterprise in the host country that:- (i) is a permanent establishment or office of a foreign direct investor; or (ii) is an unincorporated partnership or joint venture between a foreign direct investor and third parties; or (iii) is land, structures (except those structures owned by foreign government entities), and immovable equipment and objects, in the host country, that are directly owned by a foreign resident. Holiday and second homes owned by non-residents are therefore regarded as part of direct investment, though few, if any, countries actually include such investment in their direct investment statistics; or (iv) is mobile equipment (such as ships, aircraft, gas and oil drilling rigs) that operates within an economy for at least one year if accounted for separately by the operator and is so recognised by the tax authorities. This is considered to be direct investment in a notional enterprise in the host country. / Под Филиалом, от позднелатинского слова Filialis, означающее Сыновний, понимается отделение или часть предприятия, учреждения или организации. Филиал это обособленное подразделение компании, расположенное вне места её нахождения и не являющееся юридическим лицом. Филиал осуществляет все или часть функций головного предприятия (материнской компании) от его имени на основании положения, утверждаемого головным предприятием. Филиал не имеет собственного баланса, а головное предприятие обеспечивает ежедневное составление сводного бухгалтерского баланса. Смотрите также Материнская Компания (Parent Company), Представительский Офис или Представительство (Representative Office) и Дочернее Предприятие (Subsidiary).

(2) For SWIFT purposes, a domestic or foreign location of an office of a financial institution, assigned to provide financial services on behalf of that financial institution. If this office has an ISO Bank Identifier Code, it will have the same bank code as the related financial institution. In the case of banks, representative offices are not considered branches. An administrative division of some larger or more complex organization. A Branch, banking center or financial center is a retail location where a bank or financial institution offers a wide array of face to face service to its customers. Like a store, a branch may either be a standalone building, or an office within a larger complex, such as a shopping mall. Services provided by a branch include cash withdrawals and deposits from a demand account with a bank teller, financial advice through a specialist, safe deposit box rentals, bureau de change, insurance sales (where it is allowed by law), etc. Traditionally, the branch was the only channel of access to a financial institution's services. Today, with such features as

automated teller machines, telephone and online banking, customers can bank virtually anywhere, anytime, which brings financial institutions to reduce their branch business hours or to merge smaller branches into larger ones. Some financial institutions reduce their costs by having no branches and are sometimes known as Virtual Banks. / Для целей Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) филиал предполагает под собой местное или зарубежное местоположение офиса финансового института (финансового учреждения), предназначенное для оказания финансовых услуг от имени данного финансового института. Если этот офис имеет . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

BRANCH CIRCUIT = ОТВЕТВЛЁННАЯ ЦЕПЬ – Branch Circuit:- the conductors between the last overcurrent protective device and the outlets or loads.

BRANCH STEM = БОКОВАЯ ВЕТКА (или ВЕТВИСТЫЙ СТЕБЕЛЬ) – Branch Stem:- xxxxx. The Stem that branches is called a Branch. A Branch Attachment is where a branch is attached to the trunk of a tree. Three types of branch attachment are recognized due to differences in the anatomical position of buds that form them. Two key components contribute to the mechanical strength and toughness of the attachment:- interlocking wood grain at the top of the attachment and an embedded knot that often lies within the attachment. A common malformation of a branch attachment is the inclusion of bark within the join, which can weaken the attachment.

BRAND = ФИРМЕННЫЙ ЗНАК (или ОБЩЕИЗВЕСТНЫЙ ТОВАРНЫЙ ЗНАК, или БРЭНД, или ЭМБЛЕМА) – Logos (such as the Nestle design) can be amongst the world's most-recognised symbols. But brands are not limited to design logos – small combinations are capable of registration. Anything which reminds customers and potential customers of a particular company or name can be treated as a brand or trademark. A well known trademark can be a psychological barrier to competition. Putting a valuation on a recognized brand name or logo is not easy. Recognised brands may last 20 years, and the brand may suffer vicissitudes of recognition over that period. Brand valuation by independent external advisors can be useful in determining how marketing budget allocation can or should be best used in international groups. Insignia identifying the producer of a specific commodity. / Знак, определяющий производителя определённого товара. Под Фирменным Знаком понимается эмблема предприятия, объединения, учреждения, помещаемая на его продукции, товаросопроводительной документации, упаковке (таре), бланках, средствах рекламы, производственной одежде, средствах транспорта и так далее. Фирменный знак служит одним из элементов так называемого фирменного стиля.

BRANDED SEED = БРЭНДОВАННОЕ СЕМЯ – Branded Seed:- plant material derived from a cross that is sold without a variety name. The variety is owned by a seed genetics supplier which licenses the production and marketing rights to one or more other companies to be marketed under many different brand names. Branded seed must be labeled under variety-not-stated provisions of applicable state seed labeling laws.

BRASH = ХВОРОСТ (или ВАЛЕЖНИК, или ПОРУБОЧНЫЕ ОСТАТКИ) – Brash is the low density forestry material consisting of tops of trees and small branches. Also referred to as 'Lop And Top'.

BRASKISH = СОЛОНОВАТОЕ – Brackish is a mixture of salt and fresh water with intermediate salinity. / солёность; или осолонённость (почвы).

BRASS = ЛАТУНЬ – Brass is an alloy of copper and zinc; the proportions of zinc and copper can be varied to create a range of brasses with varying properties. By comparison, bronze is principally an alloy of copper and tin. Bronze does not necessarily contain tin, and a variety of alloys of copper, including alloys with arsenic, phosphorus, aluminium, manganese, and silicon, are commonly termed 'bronze'. The term is applied to a variety of brasses and the distinction is largely historical, both terms having a common antecedent in the term latten. Brass is a substitutional alloy. It is used for decoration for its bright gold-like appearance; for applications where low friction is required such as locks, gears, bearings, doorknobs, ammunition casings and valves; for plumbing and electrical applications; and extensively in musical instruments such as horns and bells for its acoustic properties. It is also used in zippers. Brass is often used in situations where it is important that sparks not be struck, as in fittings and tools around explosive gases. Properties:- the malleability and acoustic properties of brass have made it the metal of choice for musical instruments such as the trombone, tuba, trumpet, cornet, baritone horn, euphonium, tenor horn, and French horn which are collectively known as the Brass within an orchestra. Even though the saxophone is classified as a woodwind instrument and the harmonica is a free reed aerophone, both are also often made from brass. In organ pipes of the reed family, brass strips (called tongues) are used as the reeds, which beat against the shallot (or beat 'through' the shallot in the case of a 'free' reed). Although not part of the brass section, snare drums are also sometimes made of brass. Brass has higher malleability than bronze or zinc. The relatively low melting point of brass (900 to 940 °C, 1 652 to 1 724 °F, depending on composition) and its flow characteristics make it a relatively easy material to cast. By varying the proportions of copper and zinc, the properties of the brass can be changed, allowing hard and soft brasses. The density of brass is approximately 0.303 lb/cubic inch, 8.4 to 8.73 grams per cubic centimeter. Today almost 90% of all brass alloys are recycled. Because brass is not ferromagnetic, it can be separated from ferrous scrap by passing the scrap near a powerful magnet. Brass scrap is collected and transported to the foundry where it is melted and recast into billets. Billets are heated and extruded into the desired form and size. Aluminium makes brass stronger and more corrosion resistant. Aluminium also causes a highly beneficial hard layer of aluminium oxide (Al_2O_3) to be formed on the surface that is thin, transparent and self-healing. Tin has a similar effect and finds its use especially in sea water applications (naval brasses). Combinations of iron, aluminium, silicon and manganese make brass wear and tear resistant.

BRASSARD = БРАССАР (или НАРУЧИ, или НАРУКАВНИК, или НАРУКАВНАЯ ПОВЯЗКА) – Brassard is a cloth band worn around the upper arm usually bearing an identifying mark. / Наручи (о латах).

BRASSIERE = БРАСЬЕР (или БЮСТГАЛЬТЕР, или ЛИФЧИК, или ПОМОЧИ, или ЛЯМКИ, или КОРСЕТ) – Brassiere is a woman's close-fitting undergarment with cups for bust support. / Узкая короткая женская рубаха (устаревшее название).

BRAVO = БРАВО – (2) Bravo (pronunciation:- BRAH-voh) or B is international nautical signal flag meaning:- I am taking in, discharging, or carrying dangerous cargo. NATO:- during gunnery practice, flies on engaged side. Meaning:- I am taking on or discharging explosives.

BREACH = НАРУШЕНИЕ – Breach is a breaking of a promise or a failure to perform an obligation under an agreement. / Срыв обещания или неисполнение взятого по соглашению обязательства.

BREACH OF WARRANTY = НАРУШЕНИЕ РУЧАТЕЛЬСТВА – The Marine Insurance Act (1906) demands that the assured comply literally with any warranty in the policy, whether it be a express warranty or a implied warranty. Non compliance where not excused, is term 'Breach of Warranty', and discharges the underwriter from all liability under the policy, whether or not it relates to the breach, as from the date of the breach; but without prejudice to any valid claims arising from accidents occurring prior to the date of the breach. Breach of warranty is excused where circumstances have changed so that the warranty has become unnecessary; or where it would be illegal to comply with the warranty; or where the policy conditions waive breach of warranty.

BREACH OF WARRANTY CLAUSE = ОГОВОРКА О НАРУШЕНИИ РУЧАТЕЛЬСТВА – Breach Of Warranty Clause is a clause in a policy whereby underwriters waive breach of certain specified warranties. In hull policies, the clause relates only to warranties as to cargo, trade, locality, towage, salvage services or date of sailing, and requires prompt notice, and amended conditions and an additional premium if underwriters so desire. There is no similar clause in cargo policies as a standard, but cargo underwriters usually waive breach of the implied warranties of seaworthiness and cargoworthiness of the overseas carrying vessel, provided the assured are not privy thereto.

BREADTH = РАЗБРОС (или ШИРИНА) – Breadth:- a comparison of the number of issues traded with the number of issues listed for trading. A measurement of the number of issues advancing versus the number of issues declining on a given day or as a moving average. Many measurements are used:- advances divided by declines, as a percentage, advances minus declines as a net positive or negative number. The measurement consistently followed is an insight into investor sentiment and is used extensively by market analysts.

BREADTH THRUST = ШИРОКОЕ НАСТУПЛЕНИЕ – Breadth Thrust Indicator is a technical indicator used to ascertain market momentum. The breadth thrust indicator is computed by calculating the number of advancing issues on an exchange such as the NYSE® divided by the total number of issues (advancing + declining) on it, and generating a 10-day moving average of this percentage. The indicator signals the start of a potential new bull market when it moves from a level of below 40% (indicating an oversold market) to above 61.5% within any 10-day period, a sentiment shift that occurs only rarely. The breadth thrust indicator was developed by investor and analyst Martin Zweig. Since it provides a timing signal with a gap of many years or even decades, its utility lies more in signaling long-term trends than as a short-term trading indicator. Breadth Thrust:- Martin Zweig developed this momentum indicator that illustrates a thrust when, during a 10 day period, the average number of issues that are advancing goes from below 40% to above 61.5%. This means the market went from being oversold to one of strength, but is not yet considered overbought. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Мартин Цвайг разработал этот индикатор момента .

BREAK = ОБВАЛ (или ПАДЕНИЕ) – Break is a rapid and sharp decline in price. Break is a sudden sharp price decline. / В техническом анализе биржевых рынков под Обвалом или Падением понимается быстрое и резкое снижение цены.

BREAK = ОБРЫВ (или РАЗРЫВ, или НАЖИМ) – Break:- weak at a certain point, but strong above and below the weak spot, as opposed to 'Tender', which signifies a generally weak fiber. This can be caused by a sudden change in pasture, feed, illness, or lambing. Break is a point on the front edge of the garment at which the roll of the lapel begins. Usually at the same point as the lower end of the bridle. Break:- a temporary interference with the growth of the wool, causing a marked thinning of all or a proportion of the fiber population, and producing distinct weaknesses in one part of the staple. It is caused by a sudden change of pasture, want of feed or water, sickness, bad lambing, or faulty dipping.

BREAKAWAY GAP = ОТРЫВ С ПРОБОЕМ УРОВНЯ (или РАСХОЖДЕНИЕ С ПРОБОЕМ УРОВНЯ, или РАЗРЫВ С ПРОБОЕМ УРОВНЯ, или ПРОМЕЖУТОК С ПРОБОЕМ УРОВНЯ, или ЗАЗОР С ПРОБОЕМ УРОВНЯ) – Breakway Gap occurs when prices break away from an area of congestion. When the price is breaking away from a triangle (Ascending or Descending) with a gap then it can be implied that change in sentiment is strong and coming move will be powerful. One must keep an eye on the volume. If it is heavy after the gap is formed then there is a good chance that market does not return to fill the gap. When the price is breaking away on a low volume, there is a possibility that the gap will be filled before prices resume their trend. Breakaway Gap is a price gap that forms on the completion of an important price pattern. A breakaway gap usually signals the beginning of an important price move. Breakaway Gaps signal a potential change in trend and are especially significant when accompanied by an increase in volume. A bullish breakaway gap forms when a security gaps up after an extended decline. Bullish breakaway gaps can also occur after an extended base or consolidation period. A bearish breakaway gap forms when a security gaps down after an extended advance. Bearish breakaway gaps can also form after an extended top or consolidation period. See also Common Gap, Continuation Gap, Down Gap, Exhaustion Gap, Gap, Runaway Gap, and Up Gap. The initial gap out of a trading range congestion area, or a reversal pattern, that signifies the beginning of a strong trend. Many times the gap will be through a highly visible support or resistance level such as a trendline, channel boundary, or a moving average. Breakaway Gaps or Breakout Gaps occur in the beginning of the trend. These give trader an indication that a new trend is emerging. This is the most potentially profitable gap for trading purposes. Breakaway gaps may not get filled on subsequent trading days, and even if they do it takes a long time for price to return to the area of the gap. After identifying the breakaway gaps, a trader should go long or short in the stock with a stop loss at the low of the day of the gap. Maintain a trailing stop loss once price moves in the position's favor. Consider an example found in India's Sensex, a value-weighted index based on 30 of India's largest stocks. As seen in 'Break and run' (right – a breakaway gap has the best potential for big profits because, if correct, it gets the trader in near the beginning of a big move), Sensex formed a breakaway gap on May 18, 2009, when the market opened at 13 479. The previous trading day, May 15, closed at 12 173. This massive gap occurred after an election that the market considered economically favorable and, with the foundation of those fundamental underpinnings, it was a clear indication that a new trend was starting. In such a scenario, traders were well-advised to go long Sensex with a stop loss of 13 479 and a target of 8% to 10%. Breakway Gap:- when a tradable exits a trading range by trading at price levels that leave a price area where no trading occurs on a bar chart. / В техническом анализе биржевых рынков, . Разрыв С Пробоем Уровня наблюдается, когда цены вылетают за пределы торгового диапазона, уходя из области, где велась активная торговля. Разрыв с пробоем уровня, остающийся незаполненным в течение нескольких дней, является одним из самых важных и надёжных графических сигналов длительной тенденции во взятом направлении движения цены.

BREAK BULK = НАВАЛОЧНЫЙ – Break Bulk:- the process of assimilating many small shipments into one large shipment at a central point so that economies of scale may be achieved; to commence discharge of cargo. Applies to goods that have been stripped from container or other form of bulk carriage for forwarding to final destination. / разгрузка груза. Относится к товарам, отобранным из контейнера или иного транспортного средства для перевозки навалом с целью доставки к конечному месту назначения.

BREAK BULK CARGO = НАВАЛОЧНЫЙ ГРУЗ (или МАССОВЫЙ ГРУЗ) – Break Bulk Cargo:- a cargo which is not containerised due to its weight and/or size, e.g., steel pipes, boats, etc. Loose cargo, such as cartons, stowed directly in the ship's hold as opposed to containerized or bulk cargo. See also Containeization. Loose, non-containerized products. Examples include forest products such as cut lumber, granite, imported steel or imported coiled steel Loose, kaolin clay, non-containerized products. General cargo stowed conventionally as opposed to unitised (palletised), containerised and Roll On/Roll Off cargo. General cargo on a ship, as opposed to cargo in containers. Also referred to as Conventional Cargo. Can include cargo in packages, pallets or bulk form (dry or liquid). Also known as Conventional Cargo. / Общий груз на судне, в противоположность грузу в контейнере. Также встречается под термином конвенциональный груз. Такой груз может находиться в упаковках, на поддонах, навалом в сухой форме или наливным в жидком виде. Известен также как Массовый Груз (Conventional Cargo).

BREAKBULK VESSEL = НАВАЛОЧНИК (или СУДНО–НАВАЛОЧНИК, или НАВАЛОЧНОЕ СУДНО) – (1) Conventional Carriers designed to carry containers and non-containerised cargo; vessel with hatches built to accommodate various commodities. Breakbulk

Vessel is a general, multipurpose, cargo ship that carries cargoes of nonuniform sizes, often on pallets, resulting in labor-intensive loading and unloading; calls at various ports to pick up different kinds of cargoes. / Под Навалочником понимается судно для перевозки грузов без тары – навалом или насыпью. Навалочники иногда оборудуют продольными конвейерами под трюмами, ковшовыми элеваторами, пневматическими разгрузчиками (для порошкообразных грузов) и другим, обычно же грузовое устройство у навалочника отсутствует. Навалочники рассчитаны на перевозку грузов широкой номенклатуры в трюмах, чередующихся с порожними, что способствует целесообразному распределению груза; иногда предусматривается приём в трюмы водяного балласта. Грузоподъёмность навалочников до 150 000 тонн. Известен также как Балкер (Bulk Carrier).

(2) Breakbulk Vessel is a vessel designed to handle palletized, pre-slung, boxed, and unitized cargo. Holds can be at the open bay or between deck type. Between deck means, the hold can be converted from multi levels to open bay. This type of vessel is usually self-sustaining.

BREAK BULK WAREHOUSES = НАВАЛОЧНЫЕ СКЛАДЫ – Break Bulk Warehouses are the warehouses that receive product in bulk, often by railcar, and then repackage the product based on customer requirements. In the case of containers with imported products, this generally requires the inspection and relabeling of product. Generally, special billing rules apply.

BREAKDOWN MAINTENANCE = РЕМОНТ ПОЛОМКИ – Breakdown Maintenance is a maintenance performed after a machine has failed to return it to an operating state. / Под Ремонтом, от Французского слова Remonte, от слова Remonter, означающее Пополнить или Поправить или Снова Собрать, понимается совокупность технико-экономических и организационных мероприятий, связанных с поддержанием и частичным или полным восстановлением потребительной стоимости основных фондов (средств производства) или предметов личного пользования. Ремонтом называют также замену неисправных элементов, устранение изъянов, починку и тому подобное. Ремонт технических устройств осуществляется с целью восстановления их исправности или работоспособности. В зависимости от конструктивных особенностей, характера повреждений и степени износа отдельных составных частей устройств, а также по трудоёмкости восстановительных работ различают текущий (малый), средний и капитальный ремонт. Во время текущего ремонта заменой или восстановлением узлов и деталей устраняются мелкие повреждения, а также выполняются регулировочные работы. Текущий ремонт производится персоналом, обслуживающим устройство, или ремонтными бригадами на месте эксплуатации, часто в ходе профилактического осмотра. При среднем ремонте устройство частично разбирают, проверяют техническое состояние узлов, устраняют обнаруженные дефекты, а иногда производят капитальный ремонт отдельных его частей. Средний ремонт осуществляется подвижными или стационарными ремонтными службами. Капитальный ремонт – наиболее полный и трудоёмкий вид ремонта, выполняемый в стационарных условиях ремонтными предприятиями. При капитальном ремонте осуществляют полную разборку устройства, проверку и устранение повреждений составных частей или замену их, сборку устройства и его комплексную проверку, регулировку и испытания. Расходы по среднему и текущему ремонтам включаются в себестоимость продукции предприятия. Затраты по капитальному ремонту основных фондов не увеличивают их первоначальной стоимости и производятся за счёт амортизации фонда (смотрите Амортизация). В интересах повышения эффективности общественного производства часто экономически более выгодно вместо дорогостоящего капитального ремонта внедрять новое, более совершенное оборудование. Все виды ремонта основных фондов производят в планово-предупредительном порядке. Запланированные организационные и технические меры для профилактического ухода и надзора призваны предотвращать преждевременный износ и аварии, поддерживать основные фонды в состоянии эксплуатационной готовности. Ремонт предметов личного потребления выполняется преимущественно предприятиями бытового обслуживания за счёт населения.

BREAKDOWN OF RESISTANCE = НАРУШЕНИЕ РЕЗИСТЕНТНОСТИ (или НАРУШЕНИЕ СОПРОТИВЛЯЕМОСТИ) – Breakdown Of Resistance is the inability to maintain resistance when attacked by a newly selected insect biotype that has a gene for virulence at every locus corresponding to a gene for resistance in the host.

BREAKDOWNS = ПОЛОМКИ – Breakdowns:- it is one type of the casualty. Machinery breakdowns serious enough to disable a vessel for any length of time are now relatively infrequent. However, every year salvage tugs go to the assistance of vessels left helpless after a major failure of propulsion or steering systems. / Это один из типов несчастных случаев. Серьёзные поломки оборудования, которые могут надолго задержать судно, в наши дни достаточно редки. Однако, каждый год спасательные буксиры идут на помощь судам, потерявшим ход из-за отказа двигательной или рулевой систем.

BREAK EVEN = ОКУПАЕМАЯ (или САМООКУПАЕМАЯ) – (1) Break Even:- to cover one's costs, making neither a profit or loss. / Покрыть затраты на что-либо, ничего при этом не заработав, но и не потеряв.

(2) Break Even:- price at which an underlying covers the cost of an option purchase. / Цена, при которой соответствующий биржевой инструмент покрывает затраты на закупку опциона.

BREAKEVEN POINT = ТОЧКА ОКУПАЕМОСТИ (или ТОЧКА САМООКУПАЕМОСТИ) – The underlying futures price at which a given options strategy is neither profitable nor unprofitable. For calls options, it is the strike price plus the premium. For put options, it is the strike price minus the premium. / Цена соответствующего фьючерса, при которой определённая стратегия по опционам не приносит ни дохода, ни убытка. Для опционов на покупку, это соответствует значению суммы сходной цены и премия. Для опционов на продажу, это соответствует значению разницы между сходной ценой и премией.

BREAK–EVEN PRICE = ЦЕНА ОКУПАЕМОСТИ (или ЦЕНА САМООКУПАЕМОСТИ) – For options or warrants, the Break-Even Price is that price of the underlying asset as from which the option can be exercised at no loss, even after taking the paid option premium into account. In the case of a call option, the break-even price is above the strike price, and below it in the case of a put option.

BREAK–EVEN RATE = СТАВКА ОКУПАЕМОСТИ (или СТАВКА САМООКУПАЕМОСТИ) – The weight at which it is cheaper to charge the lower rate for the next higher weight-break multiplied by the minimum weight indicated, than to charge the higher rate for the actual weight of the shipment (aircargo). / В перевозках авиационных грузов .

BREAK EVEN SALES = ОКУПАЕМЫЕ ПРОДАЖИ (или САМООКУПАЕМЫЕ ПРОДАЖИ) – Break Even Sales is the amount of delivered sales or revenue required to cover expenses or to 'break even'. The accuracy of this calculation is dependent upon the ability to isolate fixed and variable expenses from each other.

BREAKEVEN SELLING PRICE = ОКУПАЕМАЯ ПРОДАЖНАЯ ЦЕНА (или ОКУПАЕМАЯ ЦЕНА ПРОДАЖИ) – Breakeven Selling Price is the price a producer must receive for a commodity in order to recover all of the costs associated with producing and/or storing the commodity. See also Accounting Cost Breakeven Selling Price; Cash Flow Breakeven Selling Price; and Economic Cost Breakeven Selling Price.

BREAK FACTOR = ФАКТОР РАЗРЫВА (или ФАКТОР ОБРЫВА) – Break Factor is a measure of yarn strength calculated as:- (i) the product of breaking strength times indirect yarn number, or (ii) the product of breaking strength times the reciprocal of the direct yarn number.

BREAKING = МЯТЬЁ (или ОБРЫВАНИЕ, или РАЗРЫВ) – Breaking, also known as Scrutching. In breaking, the flax plants that have been through the 'retting' process pass through rollers or are beaten with a wooden blade to help 'break' the stronger parts without damaging the longer fibers.

BREAKING A LEG = НЕИСПОЛНЕНИЕ ОДНОГО ИЗ СОСТАВЛЯЮЩИХ – Leg Into – rather than establishing the strategy as a single trade, some investors decide to trade one part, or leg, of the strategy and then trade the other part at a later time. This is called 'Legging Into The Strategy'. A straddle has two legs, one put and one call. The Leg of a spread or straddle is one part of the position. A straddle is buying a put and a call at the same strike price. Just the put position or just the call position is one leg. Straddle – an options strategy with which the investor holds a position in both a call and put with the same strike price and expiration date. Short Straddle – a straddle in which a short position is taken in both a put and a call option. Also known as Bear Straddle. The opposite of long straddle. Short Leg – the part of an option spread indicating a commitment to sell the underlying security. Straddle – an option position consisting of the purchase of put and call options having the same expiration date and strike price. Leg Up – Used in the context of general equities. (1) Have a portion of the offsetting side of a Trade in your pocket (spoken for) so your Capital risk in the Transaction is reduced. Purchase of 10 000 of a 50 000 Buy order Leaves the trader a 'leg up'. (2) Complete one side of a two-sided transaction, as in a Swap or contingency order. / Стрэдл это позиция по опциону, заключающаяся в закупке опционов на продажу и на покупку, имеющих одни и теже даты прекращения признания и одинаковую сходную цену. Неисполнение одной из составляющих стрэдла.

BREAKING BULK = ВСКРЫТИЕ (или РАСПАКОВЫВАНИЕ, или ПОДГОТОВКА К ВЫГРУЗКЕ) – Breaking Bulk:- the initial opening of hatches on entering port and the commencement of discharge of cargo. / разгрузки груза.

BREAKING ELONGATION = РАЗРЫВНОЕ УДЛИНЕНИЕ – Breaking Elongation is a deprecated term. See also Elongation At Break. / Разрывное Удлинение, например, волокон. Смотрите также Удлинение При Разрыве (Elongation At Break).

BREAKING EXTENSION = РАЗРЫВНОЕ РАСШИРЕНИЕ – Breaking Extension is the extension of the specimen at the breaking point.

BREAKING FORCE = РАЗРЫВНАЯ СИЛА – Breaking Force (synonym:- Force At Break) is the maximum force applied to a test specimen carried to rupture during a tensile test.

BREAKING LENGTH = РАЗРЫВНАЯ ДЛИНА – Breaking Length is a measure of the breaking strength of a yarn; the calculated length of a specimen whose weight is equal to its breaking load. The breaking length expressed in kilometers is numerically equal to the breaking tenacity expressed in grams-force per tex. Breaking Length is a measure of the breaking strength of a yarn. It is the calculated length of yarn which equals its breaking load and is equal to the tensile stress at rupture of the yarn. Breaking Length is the length of the specimen which will just break under its own weight when hung vertically. For example:- a 100 denier viscose rayon yarn broke at a load of 185 g, the breaking length would be:- (185 x 9 000) / (100 x 1 000) = 16.65. / Разрывная Длина тела – нити, ткани – в которой напряжение от собственного веса становится равным пределу прочности.

BREAKING LOAD = РАЗРЫВНАЯ НАГРУЗКА (или РАЗРЫВНОЕ УСИЛИЕ) – Breaking Load is the maximum load (or force) applied to a specimen in a tensile test carried to rupture. It is commonly expressed in grams-force (kilograms-force), pounds, or Newton's. See also Breaking Strength. Breaking Load is the maximum stress needed to rupture a fiber, yarn or fabric in a tension test. Breaking Load is the load at which the specimen break usually, expressed in grams weight or pounds weight. The maximum load (or force) applied to a specimen in a tensile test carried to rupture. / Максимальная нагрузка (или сила) воздействия на испытываемый образец для его разрыва.

BREAKING RATIO = СООТНОШЕНИЕ С РАЗРЫВОМ – Breaking Ratio:- xxxxx. See also Break Factor.

BREAKING STRENGTH = ПРОЧНОСТЬ НА РАЗРЫВ – Breaking Strength (synonym:- Strength At Break) is term still commonly used, but improperly, for the average of the results of breaking force measurements. Breaking Strength is:- (1) the maximum resultant internal force that resists rupture in a tension test. The expression 'breaking strength' is not used for compression tests, bursting tests, or tear resistance tests in textiles. (2) The load (or force) required to break or rupture a specimen in a tensile test made according to a specified standard procedure. See also Breaking Load. It is the optimum resultant internal force that resists rupture in a tension test. / Нагрузка (или усилие) испытываемого на растяжение образца .

BREAKING TENACITY = ОТНОСИТЕЛЬНАЯ РАЗРЫВНАЯ НАГРУЗКА (или ОТНОСИТЕЛЬНАЯ ПРОЧНОСТЬ НА РАЗРЫВ, или УДЕЛЬНАЯ ПРОЧНОСТЬ НА РАЗРЫВ, или РАЗРЫВНАЯ НАГРУЗКА) – Breaking Tenacity is the tensile stress at rupture of a specimen (fiber, filament, yarn, cord, or similar structure) expressed as Newtons per tex (N/tex), grams-force per tex (gf/tex), or gram-force per denier. The breaking tenacity is calculated from the breaking load and linear density of the unstrained specimen, or obtained directly from tensile testing machines which can be suitably adjusted to indicate tenacity instead of breaking load for specimens of known linear density. Breaking tenacity expressed in grams-force per tex is numerically equal to breaking length expressed in kilometers. The tenacity corresponding to the breaking load, cN/tex. ISO 3060:1974 – Textiles – Cotton Fibres – Determination of Breaking Tenacity of Flat Bundles (A standard is reviewed every 5 years; this standard was last reviewed and confirmed in 2019; therefore this version remains current):- Foreword:- ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO Member Bodies). The work of developing International Standards is carried out through ISO Technical Committees. Every Member Body interested in a subject for which a Technical Committee has been set up has the right to be represented on that Committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. Draft International Standards adopted by the Technical Committees are circulated to the Member Bodies for approval before their acceptance as International Standards by the ISO Council. International Standard ISO 3060 was drawn up by Technical Committee ISO/TC 38, Textiles, and circulated to the Member Bodies in March 1973. It has been approved by the Member Bodies of the following countries:- Australia; Belgium; Brazil; Bulgaria; Canada; Czechoslovakia; Egypt, Arab Republic of; Finland; France; Hungary; India; Ireland; Israel; Japan; The Netherlands; New Zealand; Norway; Poland; Romania; South Africa, Republic of; Spain; Sweden; Switzerland; Thailand; Turkey; The United Kingdom; and The United States of America. The Member Body of the following country expressed disapproval of the document on technical grounds:- Germany. The method is applicable to fibres being tested either at a nominal gauge length of zero or at a finite gauge length. It is especially intended to be used with tensile strength test instruments which have been designed for specific use on flat bundles of cotton fibres. It may be used with other tensile strength test instruments if equipped to accomodate the fibre clamps. It is difficult and time consuming to estimate the average breaking tenacity of samples of cotton from tests on individual fibres. For both commercial and technical purposes, quicker estimates may be obtained from

determinations made on flat bundles of parallel fibres. In this procedure, short fibres are combed out and the measured fibre strength corresponds with the breaking strength of the longer fibres in the sample. The bundles of fibres may be secured by clamps which are either in close contact (zero gauge length) or separated to give a specified nominal gauge length. Fibre strength testing at zero gauge length is current commercial practice, although some investigations suggest that tests at a gauge length of 3.2 mm are more closely related to the tenacity of many classes of cotton yarn. International Calibration Cotton Standards for zero gauge and national Calibration Cotton Standards for 3.2 mm gauge have been established to enable different operators to adjust their personal levels of testing to an agreed common level. These standards may also be used by operators to adjust the level of test results obtained from measurements made on instruments with different rates of loading to the agreed level for the standard. Scope And Field of Application:- (i) This International Standard specifies a method of test for the determination of the breaking tenacity of cotton fibres arranged in a parallel manner in a flat bundle. The method applies to fibres from raw cotton, or to fibres from various stages in the manufacturing process, or to fibres separated or extracted from manufactured cotton products. The method is applicable to fibres being tested either at a nominal gauge length of zero, or at a finite gauge length. (ii) The method is especially intended to be used with tensile strength test instruments which have been designed for specific use on flat bundles of cotton fibres (see the annexes). It may be used with other tensile strength test instruments if equipped to accommodate the fibre clamps. Definitions:- (1) Gauge Length is the length of a specimen under specified pre-tension measured from nip-to-nip of the jaws of holding clamps in their starting position at the beginning of the test. (2) Breaking Load is the maximum load (or force) applied to a specimen in a tensile test carried to rupture. (3) Tensile Strength is the strength shown by a specimen subjected to tension, as distinct from torsion, compression or shear, and expressed as force per unit cross-sectional area of the unstrained specimen. (4) Tenacity is the tensile force per unit of linear density of the unstrained specimen, expressed in centinewtons per tex. (5) Breaking Tenacity is the tenacity corresponding to the breaking load. Notes:- International Calibration Cotton Standards for zero gauge tests and United States Calibration Cotton Standards for 3.2 mm gauge tests are available from the US Dept of Agriculture, Agricultural Marketing Service. Cotton Division, Box 17723, Memphis, Tennessee 38117, USA. Correction factors do not usually exceed the range of 0.90–1.10 for one of these instruments and the range of 1.10 to 1.30 for the other. The ‘pound-force’ and the ‘kilogram-force’ are also used on certain instruments. The values of these units are, in SI units, approximately as follows:- (a) 1 pound-force (lbf) = 4.448 N; and (b) 1 kilogram·force (kgf) = 9.80 N. Mention of the name of a proprietary instrument is not intended to promote, or give preference to, the use of that instrument over others not mentioned. Breaking Tenacity (synonym:- Tenacity At Break) is the breaking force divided by the linear density of the unstrained material. / Разрывная Нагрузка, выраженная в граммах на одно денье. Способность волокна воспринимать растягивающее усилие, соответствующее разрывной нагрузке, и измеряемая в санти-Ньютонах на текс (cH/текс).

BREAKING TOUGHNESS = РАЗРЫВНАЯ УПРУГОСТЬ (или СЖИМАЕМОСТЬ, или ВЯЗКОСТЬ, или ЖЁСТКОСТЬ, или ПРОЧНОСТЬ, или КРЕПОСТЬ) – Breaking Toughness is the work required to achieve the breaking force of the test specimen expressed per unit length and linear density of the unstrained material. Breaking Toughness:- the units used are J/g.

BREAKOUT = ПРОБОЙ – Breakout:- price of a security emerging from a previous trading pattern. The new price ‘breaks out’ above the high (or below the low) trading pattern lines that enclose all other prices for that security in the preceding period. Breakouts are used by technical analysts to predict substantial upside or downside movement. The point at which the price of the underlying asset moves out of a pattern or channel. Breakout is a period where a stock’s value increases. Typically immediately follows a consolidation. The point at which prices penetrate a support or resistance level to begin a strong move. Breakout is a price movement through an identified level of support or resistance, which is usually followed by heavy volume and increased volatility. Traders will buy the underlying asset when the price breaks above a level of resistance and sell when it breaks below support. In practice, a breakout is most commonly used to refer to a situation where the price breaks above a level of resistance and heads higher, rather than breaking below a level of support and heading lower. Once a resistance level is broken, it is regarded as the next level of support when the asset experiences a pullback. Most traders use chart patterns and other technical tools such as trendlines to identify possible candidates that are likely to break through a support/resistance level. A breakout is the bullish counterpart to a breakdown. Breakout (in technical analysis), when prices pass through, and stay through an area of support or resistance. Breakout is the point when the market price moves out of the trend channel. / В техническом анализе биржевых рынков, .

BREAK–OUT = ПРОРЫВ (или ВЫХОД) – (1) Break-Out:- xxxxx. See also Smash. / Смотрите также Срыв или Отрыв (Smash).

(2) Breakout (military), a military operation to end a situation of encirclement or siege.

BREAKOUT/BREAKAWAY GAP = ПРОБОЙ/РАЗРЫВ С ПРОБОЕМ УРОВНЯ – In technical analysis, this occurs when prices break out of their trading range, leaving a gap in the chart. It is associated with an increase in volume and is regarded as a strong trend signal.

BREAKOUT MODE = РЕЖИМ ПРОБОЯ – We use a ‘Breakout’ Mode strategy when the market has had some form of range contraction. A trend day, or large range expansion day, often follows periods of range contraction, or small average daily ranges. When we are in breakout mode, we use strategies to enter in the direction the market is moving, instead of waiting for a reaction in the price. Buying into strength or selling into weakness when market contraction/consolidation has been identified. These are usually one or two day trades. / В техническом анализе биржевых рынков, .

BREAKS IN SELVAGE = ОБРЫВЫ В КРОМКЕ (или РАЗРЫВЫ В КРОМКЕ, или НАЖИМЫ В КРОМКЕ) – Breaks In Selvage:- Fabric:- dress goods; Construction:- (i) Count:- 100 x 68; (ii) Warp:- 36/1 1%-in. 1%-den. bright viscose rayon; (iii) Filling:- same as warp; Finish:- gray goods. Defect:- finisher claimed selvage breaks and rips during processing. Analysis:- examination of a sample gray-goods cutting showed distortion of the selvage opposite the shuttle-box side of the fabric, along with a number of broken or partially cut filling yarns. This defect was apparently produced in the weaving and was undoubtedly responsible for the difficulty encountered by the finisher. / Уточина:- .

BREAK SPINNING = РАЗРЫВНОЕ ПРЯДЕНИЕ – Break Spinning is a direct spinning process for converting manufactured fiber tows to spun yarn that incorporates prestretching and tow breaking with subsequent drafting and spinning in one operation. An alternative name for open-end spinning. / Разрывное Прядение – альтернативное название для прядения со свободным концом волокон (или пневмомеханического способа прядения, или безверетённого прядения).

BREAK–UP VOYAGE = РЕЙС В МЕСТО РАЗБОРКИ СУДНА – Break-Up Voyage is a voyage where the ship’s final destination is a break-up yard, for the purpose of breaking up the ship. The 1983 Institute Time Clauses (ITC) provide that where the insured ship undertakes such a voyage during the currency of the policy, any claim occurring subsequent to sailing on the break up voyage shall be limited to the scrap value of the ship. This does not apply if prior arrangements have been made with the underwriters regarding the break-up voyage. The break-up voyage clause does not affect claims recoverable under the three fourths collision clause, nor under the general average (GA) and salvage charge clause.

BREAST BEAM = ГРУДНИЦА – Breast Beam:- the bar, wooden or otherwise, at the front of the loom over which the cloth passes on its way to the cloth roller. This beam runs parallel with the reed, lease rods, and whip roll; these four parts of the loom must be parallel to produce cloth because of the fact that the warp must interlace at right angles with the filling to make woven fabric. / Грудница ткацкого станка. Уточина.

BREASTHOOK = БРЕШТУК (или ГОРИЗОНТАЛЬНАЯ КНИЦА, или БРЭСТХУК) – Breasthook:- a place bracket joining the starboard and port stringers at the bow of a ship. / Под Кницей понимается деталь, соединяющая профильные элементы набора корпуса судна, сходящиеся под углом. Кница обычно имеет треугольную форму и изготавливается из стального листа или дерева.

BREASTPLATE = НАГРУДНАЯ ТАБЛИЧКА (или НАГРУДНЫЙ ЩИТ, или НАПЕРСНИК) – Breastplate:- a vestment worn in ancient times by a Jewish high priest set with 12 gems bearing names of the tribes of Israel.

BREASTWORK = СИСТЕМА КРАНЦЕВ (или БРУСТВЕР) – Breastwork is a timber barrier that separates a vessel from a wharf. / Барьер из древесины, который разделяет судно от верфи.

BREATHABILITY = ВОЗМОЖНОСТЬ ДЫШАТЬ – Breathability:- the movement of water or water vapor from one side of the fabric to the other, caused by capillary action, wicking, chemical, or electrostatic action. Also known as Moisture Transport.

BREECH = БРИДЖИ (или РЕЙТУЗЫ, или ШТАНЫ, или КАЛЬСОНЫ, или ПАНТАЛОНЫ) – Breech:- short pants covering the hips and thighs and fitting snugly at the lower edges at or just below the knee; pants.

BREECH = ОБНОЖКА (или С ЛЯЖЕК ОВЦЫ) – Breech or Britch Wool is a wool from the thigh and rear region of the sheep. It is the coarsest and poorest wool on the entire fleece. It is usually manure-encrusted and urine-stained fiber. It should be 'skirted' and removed from a fleece for a hand spinner.

BREECHCLOTH = НАБЕДРЕННАЯ ПОВЯЗКА – Breechcloth is a loincloth.

BREED = ПОРОДА – Breed is a particular type or variety. An artificial mating group derived from a common ancestor for genetic study and domestication. / Под Породой понимается:- (1) древесная порода – роды и виды деревьев (Берёза, Ель, Осина, Сосна, Тополь, Яблоня и другие). Термин применяется в лесном хозяйстве и плодоводстве. (2) Порода животных – целостная консолидированная (устойчивая) группа сельскохозяйственных животных одного вида, имеющих общее происхождение и отличающихся специфическими экстерьерно-конституциональными и полезными хозяйственными свойствами, передающимися по наследству.

BREED CHARACTERISTICS or BREED TYPE = ХАРАКТЕРИСТИКИ ПОРОДЫ или ТИП ПОРОДЫ – Breed Characteristics or Breed Type:- individual breeds have distinct characteristics. A Merino is very fine, shows a lot of crimp, and the fibers are very close. A Lincoln, is much coarser with low crimp.

BREEDER SEED = ПОРОДИСТОЕ СЕМЯ – Breeder Seed is a seed of the highest genetic purity produced for maintaining purity of a variety. It is used to produce foundation seed. Breeder Seed:- seed or vegetative propagating material, increased by the originating, sponsoring plant breeder or institution, used as the source for the increase of foundation seed.

BREEDER STOCK = ПОРОДИСТЫЙ ЗАПАС – Breeder Stock refers to the reserve of seed of a given variety available in an institution and the varieties maintained by a breeder for distribution or use in the breeding program.

BREEDING = РАЗВЕДЕНИЕ (или БРИДИНГ, или БРИДИНЬ) – Breeding is the art and science of improving plants and animals genetically for the benefit of mankind. See also Selection. / Под Разведением сельскохозяйственных животных понимается наука о размножении сельскохозяйственных животных и улучшении их наследственных качеств, совершенствовании существующих и выведении новых пород; раздел зоотехнии; производственная деятельность по осуществлению этих задач. Разрабатывает теорию и практические приёмы племенной работы применительно ко всем видам сельскохозяйственных животных. Важнейшие методы разведения сельскохозяйственных животных – чистопородное разведение, скрещивание и гибридизация при тщательном отборе и подборе животных. Тесно связано с генетикой.

BREEDING LINE = ЛИНИЯ РАЗВЕДЕНИЯ (или ПЛЕМЕННАЯ ЛИНИЯ) – Breeding Line is a genetic line bred in a crossing program, before it is named and officially released for commercial cultivation. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

BRENT = БРЭНТ – Brent is a light, sweet crude oil produced in the North Sea within the territorial waters of the United Kingdom (UK). Brent crude oil is a mixture of the oil produced in 19 separate oil fields in the North Sea. The oil is collected through two distinct pipeline systems (the Brent and Ninian systems) to a loading terminal at Sullom Voe in the Shetland Islands. The Sullom Voe terminal is operated by the Royal Dutch/Shell Petroleum oil company. Because Brent is slightly heavier and has slightly more sulfur than WTI, which is also a light, sweet crude oil, it normally costs less than WTI. More crude oil is priced in relation to Brent than to any other type of crude oil. Brent serves as the benchmark for approximately 40–50 million barrels of crude oil produced daily. Most of the crude oil priced off Brent is purchased in Europe. About one- fifth of the 10 million barrels of crude oil imported daily into the United States are priced off Brent. The UK oil fields, including the Brent fields, are among the most mature of the oil fields in the North Sea, and the production of Brent is in decline. In the early 1990s, the Brent fields produced approximately 700 000 barrels per day, which is the equivalent of about 60 cargoes per month. By 2002, production had fallen to around 350 000 barrels per day, or about 20–25 cargoes per month. Production is expected to decline by approximately 15 percent per year for the next several years. As is explained in more detail in Section III.C, the drop in the number of Brent cargoes leaving the Sullom Voe terminal to less than one per day made the Brent market much more prone to distortions and squeezes. To alleviate this problem, in July 2002, Platts added two other grades of North Sea crude oil, Forties and Oseberg, to the pool of oil from which it computes the price of Brent. In September, the London IPE approved the inclusion of Forties and Oseberg within the Brent benchmark. The new benchmark is still often referred to as Brent, but also is called BFO. The inclusion of the Forties and Oseberg grades within the Brent benchmark has increased the number of cargoes to about 60 cargoes per month and reduced the vulnerability of the Brent benchmark price to manipulation. The market for Brent is actually a complicated interrelation of four sub-markets:- (1) an over-the-counter (OTC) market for '15-day Brent' which, in 2002, changed to an OTC market for '21-day Brent' (The 21-day BFO contract replaced the 15-day Brent contract when the Forties and Oseberg grades were added to the benchmark. The additional 6 days were provide to allow buyers more time to make arrangements for delivery if Forties or Oseberg were delivered rather than Brent); (2) the spot market for 'dated Brent'; (3) the Brent futures market; and (4) an OTC market for Brent-based derivatives. Oil companies and traders use the 21-day Brent market to purchase standardized contracts for the delivery of 600 000 barrel Brent cargoes up to 21 days prior to the loading of those cargoes at the North Sea terminal.

The dated Brent market is the spot market used to buy or sell Brent cargoes once they are about to be or after they already have been loaded on ship. The futures market and OTC swaps are used for hedging and speculation, but rarely to obtain actual delivery of oil. / Щел (Shell). нефти марки Брэнт, закупленной в Европе. Всего на мировых рынках торгуется свыше десяти общепризнанных сортов нефти, но более всего известен котируемый на Лондонской бирже Brent (Brent Crude, BFO) – сорт нефти, добываемый в Северном Море, название которого происходит от одноименного месторождения, открытого в 1970. Слово Brent образовано от первых букв названий нефтеносных пластов Broom, Rannoch, Etieve, Ness и Tarbat. Цена нефти Brent с 1971 является базой для ценообразования около 40% всех мировых сортов нефти, именно поэтому данную марку называют эталонной (маркерной). Brent классифицируется как лёгкая малосернистая нефть, её плотность при 20 °C составляет ≈ 825–828 кг/м^3, содержание серы ≈ 0.37%.

BRENT BLEND = СМЕСЬ БРЭНТ (или СМЕСЬ НЕФТЕЙ ИЗ БЛИЗЛЕЖАЩИХ К БРЭНТУ МЕСТОРОЖДЕНИЙ) – Brent Blend is a type of sweet crude oil that is used as a benchmark for the prices of other crude oils. Brent blend is most often found in parts of the North Sea off the coast of the UK and Norway. Brent blend makes up more than half of the world's globally traded supply of crude oil, which is why it makes an obvious choice for the benchmark of crude oil. As previously mentioned, the brent blend is a mix of crude oil from several facilities in the Ninian and Brent fields on the North Sea. Much like the other internationally recognized benchmark for crude oil, West Texas Intermediate, the Brent blend is a light and sweet crude oil, though not as light or sweet as WTI. Brent futures are traded on both the ICE® and NYMEX® exchanges, with delivery dates for all 12 months of the year. Brent Blend is the most commonly traded North Sea crude oil. Brent has an API of about 37.5. The blend is technically a mix of crude from the Shell UK – operated Brent field and the BP operated Ninian field. The blend is, however, commonly referred to simply as Brent. About Brent Blend:- Production and Handling:- production is divided among several international oil companies, with Shell and Exxon Mobil holding the largest stakes in the Brent fields, while Chevron and British Petroleum retain large shares in Ninian and Magnus. Other companies with sizeable interests include Total and CNR with many other smaller partners. Output of ≈220 kbd comes from the co-mingling of the Brent and Ninian systems. The main fields of the Brent system are Brent, Cormorant, Hutton, Thistle, Murchison (22% Norwegian), and Dunlin. The main fields of the Ninian system are Ninian, Alwyn North, and Magnus. The crude oil is primarily refined in North-west Europe, but depending on arbitrage opportunities, significant volumes often move to the US Gulf and East Coast, as well as to the Mediterranean. Typical cargo size is 600 kb. Load Port Data:- Sullom Voe (60 Deg 27' N. 01 Deg 17' W), a major deep-water harbor, is the loading terminal for oil flowing through the Brent and Ninian pipelines from a group of oil fields in the east Shetland Basin. Four crude oil-loading berths are available for tankers ranging in size from 18 000–350 000 deadweight tons. The maximum allowed draft ranges from 15.9 meters at Jetty No. 1 to 22.6 m at Jetties 3 and 4. Typical Characteristics:- Brent Blend is a high quality, light, low-sulfur North Sea crude oil. Characteristics:- (i) Gravity:- 38.5; (ii) Sulfur:- 0.41%; and (iii) Loading Port:- Sullom Voe. North Sea Brent Crude is a type of oil that is sourced from the North Sea. This type of oil is used as a benchmark to price European, African and Middle Eastern oil that is exported to the West. North Sea brent crude was discovered in the early 1960s. It is now sourced primarily by the United Kingdom, Norway, Denmark, the Netherlands and Germany. Brent crude oil is not as light or as sweet as its counterpart, West Texas Intermediate oil. Types of Crude Oil:- crude oil quality is measured in terms of density (light to heavy) and sulfur content (sweet to sour). Density is classified by the American Petroleum Institute ('API'). API gravity is defined based on density at a temperature of 15.6 °C. The higher the API gravity, the lighter the crude. Light crude generally has an API gravity of 38 degrees or more, and heavy crude an API gravity of 22 degrees or less. Crude with an API gravity between 22 and 38 degrees is generally referred as medium crude. Sweet crude is commonly defined as oil with a sulfur content of less than 0.5%, while sour crude has a sulfur content of greater than 0.5%. Brent Blend is a light, sweet North Sea crude with an API gravity of approximately 38 and a sulfur content of approximately 0.4%. Most Brent Blend is refined in Northwestern Europe, but significant volumes are also shipped to the US and Mediterranean countries. Brent Blend is used for pricing around two-thirds of the crude traded internationally. Rolling price assessments are based on physical Brent-Forties-Oseberg crude oil cargoes loading not less than 10 days ahead and loaded free on board at the named port of shipment ('Brent Dated). Impact On Refining:- the quality of crude oil and other feedstocks dictates the level of processing and conversion necessary to achieve what a refiner sees as an optimal mix of products. Light, sweet crude is more expensive than heavier, sourer crude because it requires less processing and produces a slate of products with a greater percentage of value-added products, such as gasoline, diesel, and aviation fuel. Heavier, sourer crude typically sells at a discount to lighter, sweeter grades because it produces a greater percentage of lower value-added products with simple distillation and requires additional processing to produce lighter products. / Шеврон Корпорэйшэн (Chevron Corporation). Бритиш Пэтчролиэм (British Petroleum). ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)). Наиболее распространённая в торговле марка нефти из соседствующих месторождений, расположенных в Северном Море. По классификации Американского Института Нефти (АИН) Брэнт имеет плотность примерно 37.5. Данный сорт с технической точки зрения представляет собой смесь нефтей, добываемых компанией Щел Ю.Кей. (Shell UK) на месторождении Брэнт, и нефтей, добываемых компанией Би.Пи. (BP) на месторождении Ниньян (Ninian). Данную смесь, тем не менее, общепризнанно ассоциируют просто с Брэнтом.

BRENT CRUDE OIL = НЕФТЬ МАРКИ БРЭНТ – Brent Crude is a crude oil sourced from the North Sea (between Great Britain and Scandinavia). Brent crude is a light sweet crude oil, though not as light or sweet as the West Texas Intermediate (WTI). It contains approximately 0.37% of sulphur. Brent crude is suitable for production of gasoline and middle distillates. It is usually refined in Northwest Europe. It is used to price two thirds of the world's internationally traded crude oil supplies. Brent crude is traded at the NYMEX® under ticker symbol BZ and at the ICE Europe under symbol B. Contract size in both exchanges is 1 000 barrels with a contract price quoted in US Dollars and Cents per barrel. Delivery dates take place the twelve months of the year. Brent Crude Oil is a light sweet crude oil from North Sea. Brent crude oil is a global benchmark for other grades and is widely used to determine crude oil prices in Europe and in other parts of the world. It is more expensive than the Organization of Petroleum Exporting Countries (OPEC) basket, but lesser than West Texas Intermediate (WTI) because of higher sulphur content than the WTI crude. Brent is typically refined in Northwest Europe, but a major portion is been exported to the US Gulf and East Coasts, and also to parts of Mediterranean. It has API (American Petroleum Institute) gravity between 38–39 and has higher sulphur content than the other well-known benchmark, WTI crude oil. See also West Texas Intermediate Crude Oil. The ICE (IntercontinentalExchange, Inc) Brent Crude futures contract provides a highly flexible hedging instrument and trading mechanism. This contract is tailored specifically to meet the oil industry's need for an international crude oil futures contract and is an integral part of the Brent pricing complex, which also includes spot and forward markets and is used to price over 65% of the world's traded crude oil. ICE's Brent Crude futures contract is key for establishing the most important international oil price benchmark in the world. The Brent Blend complex consists of three related markets – dated or physical Brent, forward Brent and ICE® futures, and is used as a basis for pricing two thirds of the world's internationally traded crude oil. It is a deliverable contract based on Exchange of Futures for Physical mechanism (EFP) delivery with an option to cash settle. The flexible nature of ICE Brent Crude futures enables companies to take delivery of physical crude supplies if they wish, through EFP or alternatively and more commonly, open positions can be cash settled after expiry against a physical price index. Brent Crude is a major trading classification of sweet light crude oil comprising Brent Blend, Forties Blend, Oseberg and Ekofisk crudes (also known as the BFOE Quotation). Brent Crude is sourced from the North Sea. The Brent Crude oil marker is also known as Brent Blend, London Brent

and Brent petroleum. The other well-known classifications (also called References or Benchmarks) are the OPEC Reference Basket, Dubai Crude, Oman Crude, and West Texas Intermediate. Brent is the leading global price benchmark for Atlantic basin crude oils. It is used to price two thirds of the world's internationally traded crude oil supplies. Background:- originally Brent Crude was produced from the Brent oilfield. The name 'Brent' comes from the naming policy of Shell UK Exploration and Production, operating on behalf of Exxon Mobil and Royal Dutch Shell, which originally named all of its fields after birds (in this case the Brent Goose). But it is also an acronym for the formation layers of the oil field:- Broom, Rannoch, Etieve, Ness and Tarbat. Petroleum production from Europe, Africa and the Middle East flowing West tends to be priced relative to this oil, i.e. it forms a benchmark. However, large parts of Europe now receive their oil from Russia. Characteristics:- Brent blend is a light crude oil (LCO), though not as light as West Texas Intermediate (WTI). It contains approximately 0.37% of sulphur, classifying it as sweet crude, yet not as sweet as WTI. Brent is suitable for production of petrol and middle distillates. It is typically refined in Northwest Europe. Brent Crude has an API gravity of around 38.06 and a specific gravity of around 0.835. Trading:- the ICE Futures Europe symbol for Brent crude futures is B. It was originally traded on the open outcry International Petroleum Exchange in London, but since 2005 has been traded on the electronic IntercontinentalExchange, known as ICE. One contract equals 1 000 barrels (159 m^3). Contracts are quoted in US Dollars. Each tick lost or gained equals USD10. Pricing:- prior to September 2010, there existed a typical price difference per barrel of between ±3 USD/bbl compared to WTI and OPEC Basket, however since the autumn of 2010 there has been a significant divergence in price compared to WTI, reaching over USD11 a barrel by the end of February 2011 (WTI:- 104 USD/bbl, LCO:- 116 USD/bbl). Many reasons have been given for this widening divergence ranging from a speculative change away from WTI trading (although not supported by trading volumes), Dollar currency movements, regional demand variations, and even politics. The depletion of the North Sea oil fields is one explanation for the divergence in forward prices. In February 2011 the divergence reached USD16 during a supply glut, record stockpiles, at Cushing, Oklahoma before peaking at above USD23 in August 2012. It has since (September 2012) decreased significantly to around USD18 after refinery maintenance settled down and supply issues eased slightly. Historically the different price spreads are based on physical variations in supply and demand (short term). However, as of July 18, 2013, the prices of Brent Crude and WTI Crude converged and were less than one dollar apart in the front month futures contracts. As of this date, WTI crude was trading above USD108 per barrel, and Brent was lower than USD109. Delivery Dates:- in addition to the IntercontinentalExchange, Brent crude financial futures are also traded on the NYMEX®, with the symbol BZ, and have expiry dates in all 12 months of the year. / Щел (Shell), ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)). ОСЭН или ОПЭК (OPEC), в Англоязычном произношении.

BRETON LACE = БРЭТОНСКОЕ КРУЖЕВО – Breton Lace is a lace made on open net, usually embroidered with very heavy, often brightly colored, yarns, Breton is the area in France where the lace is said to have originated. / Брэтон (Breton).

BRETTON WOOD CONFERENCE = БРЭТЧЭН ВУДЗСКАЯ КОНФЕРЕНЦИЯ – Bretton Woods Conference is the name commonly given to the United Nations Monetary and Financial Conference, held (1944-July-01-22) at Bretton Woods, NH, the United States. The conference resulted in the creation of the International Monetary Fund, to promote international monetary cooperation, and of the International Bank for Reconstruction and Development. By December 1945, the required number of governments had ratified the treaties creating the two organizations, and by the summer of 1946 they had begun operation. The Bretton Woods Conference, officially known as the United Nations Monetary and Financial Conference, was a gathering of delegates from 44 nations that met from July 01 to 22, 1944 in Bretton Woods, New Hampshire, to agree upon a series of new rules for the post-WWII international monetary system. The two major accomplishments of the conference were the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (IBRD). The lessons taken by US policymakers from the interwar period informed the institutions created at the conference. Officials such as President Franklin D. Roosevelt and Secretary of State Cordell Hull were adherents of the Wilsonian belief that free trade not only promoted international prosperity, but also international peace. The experience of the 1930s certainly suggested as much. The policies adopted by governments to combat the Great Depression – high tariff barriers, competitive currency devaluations, discriminatory trading blocs – had contributed to creating an unstable international environment without improving the economic situation. This experience led international leaders to conclude that economic cooperation was the only way to achieve both peace and prosperity, at home and abroad. The first articulation of this vision was included in the Atlantic Charter issued by Roosevelt and British Prime Minister Winston Churchill at the Atlantic Conference of August 1941. The Charter's fourth point committed the United States and Great Britain 'to further the enjoyment by all States of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity'. The fifth point expressed a commitment to 'the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labor standards, economic advancement and social security'. Great Britain and the United States elaborated on these principles the following year during the negotiations concerning the terms under which the United Kingdom would receive lend-lease assistance from the United States. Britain agreed to join in promoting international cooperation that would expand 'production, employment, and the exchange and consumption of goods' and would reduce tariffs and other trade barriers. Washington and London also agreed to begin talks aimed at achieving these international economic goals. By February 1942, officials in both countries had already begun laying more concrete plans for international economic stability in the postwar world. Harry Dexter White, Special Assistant to the US Secretary of the Treasury, and John Maynard Keynes, an advisor to the British Treasury, independently drafted plans for organizations that would provide financial assistance to countries experiencing short-term deficits in their balance of payments. This assistance would help ensure that such countries would not adopt protectionist or predatory trade and monetary policies to improve their balance of payments position. Both plans envisioned a world of fixed exchange rates, believed to be more conducive to the expansion of world trade than floating exchange rates. Although similar in purpose, the organizations proposed by Keynes and White differed in size, philosophy, and function. From 1942 until the spring of 1944, numerous bilateral and multilateral meetings of allied financial experts were held in an effort to agree upon a common approach. Finally, on April 21, 1944, allied leaders released a 'Joint Statement by Experts on the Establishment of an International Monetary Fund'. This statement provided the basis for the negotiations at Bretton Woods. After a preliminary conference in Atlantic City in mid-June 1944, the Bretton Woods Conference convened on July 01. Three weeks of discussion later, the delegates signed the Final Act of the United Nations Monetary and Financial Conference, which included charters outlining the aims and mechanisms of both the IMF and IBRD. The IMF was charged with the maintenance of a system of fixed exchange rates centered on the US Dollar and gold. A forum for consultation and cooperation, the organization would contribute to orderly international monetary relations and the expansion of world trade by providing short-term financial assistance to countries experiencing temporary deficits in their balance of payments; balance of payments deficits attributable to more long-term structural factors could be addressed through modification of a country's exchange rate. The IBRD, meanwhile, was responsible for providing financial assistance for the reconstruction of war-ravaged nations and the economic development of less developed countries. In July 1945, Congress passed the Bretton Woods Agreements Act, authorizing US entry into the IMF and IBRD. The two organizations officially came into existence on December 27, 1945. The fixed exchange rate regime established at Bretton Woods endured for the better part of three decades; only after the Dollar exchange crises of August 1971 (when President Richard Nixon suspended the Dollar's convertibility into gold) and February/March 1973 did floating exchange rates become the norm for the currencies of the major industrialized nations. Bretton Woods Conference, formally United Nations Monetary and Financial Conference, meeting at Bretton

Woods, State of New Hampshire, the United States (July 01–22, 1944), during World War II to make financial arrangements for the postwar world after the expected defeat of Germany and Japan. The conference was attended by experts noncommittally representing 44 states or governments, including the Soviet Union. It drew up a project for the International Bank for Reconstruction and Development (IBRD) to make long-term capital available to states urgently needing such foreign aid, and a project for the International Monetary Fund (IMF) to finance short-term imbalances in international payments in order to stabilize exchange rates. The 'Bretton Woods Conference', as it has come to be known, was officially called the United Nations Monetary and Financial Conference. Bretton Woods, New Hampshire refers to the Mount Washington Hotel where the Conference was held on July 01–22, 1944. Preliminary drafting for the Conference had been undertaken at a meeting in Atlantic City in June of the same year. The Conference operated through plenary sessions, commissions and committees. Commission I on the International Monetary Fund was headed by Harry D. White of the United States. Commission II on the Bank for Reconstruction and Development was led by Lord Keynes of the United Kingdom. Commission III on Other Means of International Financial Cooperation was the responsibility of Eduard Suárez of Mexico. The first two Commissions were further divided into Committees where most of the substantive work of the Conference was accomplished. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Xxxxx (Secretary of State Cordell Hull). Xxxxx (British Prime Minister Winston Churchill). Xxxxx (President Richard Nixon). Xxxxx (Harry Dexter White). Xxxxx (Lord John Maynard Keynes). Xxxxx (Eduard Suárez).

BREWERS DRIED GRAINS = СУШЁНАЯ ПИВНАЯ ДРОБИНА (или СУШЁНОЕ ПЕРЕРАБОТАННОЕ ПИВОВАРАМИ ЗЕРНО) – Brewers Dried Grains is the dried extracted residue of barley malt alone or in a mixture with other cereal grain or grain products resulting from the manufacture of wort or beer and may contain pulverized spent hops. / Пивное Зерно – продукт, получаемый после выхода солода из ячменя.

BREWERS MILLED RICE = ПИВОВАРЕННЫЙ ОБРУШЕННЫЙ РИС (или ОБРУШЕННЫЙ РИС ДЛЯ ПИВОВАРЕНИЯ) – In the rice industry of the United States, 'Brewers Milled Rice' shall consist of milled Rice which, when determined in accordance with §868.303, contains not more than 25.0 percent of whole kernels and which does not meet the kernel-size requirements for the class Second Head Milled Rice or Screenings Milled Rice. / содержит не более 25.0 процентов целиковой зерновки (целых ядер) и . высевка (screening).

BREWERS' RICE = ПИВОВАРЕННЫЙ РИС (или РИС ДЛЯ ПИВОВАРЕНИЯ) – Brewers' Rice is the portion of total milled Rice consisting of broken pieces which can pass through a 5 1/2 /64-inch sieve, used in the process of brewing beer and other fermented products. Brewers Rice applications:- (i) beer brewing; (ii) production of rice flour; and (iii) pet foods. / Рис Для Пивоварения является побочным продуктом производства пищевого Риса. В ходе помола Риса полностью удаляют наружные слои оболочки, алейроновый слой и .

BREXIT = BRITISH EXIT

BRIARC = BICOL REGION INTEGRATED AGRICULTURAL RESEARCH

BRIC = BRAZIL, RUSSIA, INDIA AND CHINA

BRICK RED = КИРПИЧНО–КРАСНЫЙ – Brick Red:- a moderate reddish brown.

BRICS = BRAZIL, RUSSIAN FEDERATION, INDIA, PEOPLE'S REPUBLIC OF CHINA, AND SOUTH AFRICA

BRIDGE = МОСТ – (1) Bridge is the term commonly used for the link between Euroclear and Clearstream that permits cross-system settlements of trades between participants. / Юроклыэ (Euroclear).

(2) Bridge is an elongated member supported horizontally at two spaced points and which either serves as or bears a track or guide between the supporting points on which a load-supporting trolley or a traveling bridge is adapted to move.

BRIDGE = МОСТИК (или РУБКА) – Bridge is the raised platform extending athwartships, the part of the ship from which the ship is steered and navigated. Used loosely to refer to the navigating section of the vessel where the wheel house and chart room are located; erected structure amidships or aft or very rarely fore over the main deck of a ship to accommodate the wheelhouse. / Под Судовым Мостиком может пониматься:- (i) ограждённая часть палубы верхней рубки, где расположены приборы управления судном (компас, машинный телеграф, пеленгатор и так далее) или корабельным оружием, посты связи и наблюдения; или (ii) переход над верхней палубой вдоль судна (обычно танкера) для сообщения между надстройками. По назначению различают:- дальномерный мостик, навигационный мостик, сигнальный мостик, ходовой мостик и прочие. На танкерах для сообщения между надстройками устраивают над верхней палубой продольный переходный мостик. Под Рубкой, от Голландского слова Roef, означающее Каюта, понимается закрытое сооружение (жилое, служебное, хозяйственное) на главной палубе или надстройке судна, не доходящее до бортов. В рубках, часто располагаемых в несколько ярусов, размещают жилые и служебные помещения. Различают боевую, рулевую, штурманскую и другие рубки.

BRIDGE CRANE = МОСТОВОЙ КРАН – A Bridge Crane runs on an elevated runway system along the length of a factory and provides three axis of hook motion (X, Y, and Z). The hoist moves the load up and down, the trolley moves the load right and left, and the bridge of the crane moves the load forward and backward. Both single and double girder overhead traveling bridge crane designs allow very precise hook positioning and gentle load placement. Double girder cranes typically provide better hook height, but single girder cranes offer other advantages depending on your application. Advantages of a bridge crane:- (i) greatest flexibility for hook coverage and control over the load; and (ii) fewest number of physical obstructions on your factory floor. / Мостовой кран – грузоподъёмный кран, предназначенный для подъёма, опускания и горизонтального перемещения различных грузов. Он состоит из мостового пролётного строения или балки, снабжённых концевыми балками с ходовыми тележками, передвигающимися по рельсам, уложенным на подкрановые балки, и грузовой тележки (тали), перемещающейся вдоль пролётного строения. Мост перемещается по подкрановым рельсам, например, вдоль пролёта цеха, а грузовая тележка (таль) – по мосту поперёк пролёта. Мостовые краны широко используют как основное подъёмно-транспортное средство в литейных, механических, сборочных и других цехах крупных промышленных предприятий. Грузоподъёмность мостового крана 5–600 тонн.

BRIDGE FINANCING = МОСТИЧНОЕ ФИНАНСИРОВАНИЕ – Bridge Financing is venture capital financing instrument. Bridge financing involves the provision of funds to companies for the preparation of an IPO (short for the Initial Public Offering), in particular to improve the company's equity capital ratio. In other words, bridge capital 'bridges' the time until the company obtains new equity capital from the IPO.

BRIDGE LOAN = ПРОМЕЖУТОЧНАЯ (или ВРЕМЕННАЯ, или КРАТКОСРОЧНАЯ) ССУДА – Bridge Loan is a short-term loan made to enable a borrower to complete a purchase before he receives funds from another source, e.g., seasonal loan. Short-term bank loan, usually for one to three months, to temporarily cover a borrower's needs until permanent financing can be secured. /

Краткосрочный Заём, взятый заёмщиком с тем, чтобы завершить закупку до того, как он получит денежные средства из другого источника, например, сезонного заёма.

BRIDGE MAGNET = МЕТАЛЛООТДЕЛИТЕЛЬ (или МЕТАЛЛОУЛОВИТЕЛЬ) – Extra powerful Bridge Magnet or Magnetic Separator usually fitted at an early stage of the opening line to remove significant metal objects from the material flow. Magnetic separators offer basic yet reliable protection against ferrous debris in the material flow, usually fitted at the end of the opening line so as to protect venerable down strem processing machines (chute feed lines). Double deflection of airflow deposits ferrous debris on two pairs of powerful magnets. Magnets mounted on hinged panels for easy removal of debris. In spinning process. / В прядильном производстве .

BRIDGE POINT = ПРОМЕЖУТОЧНЫЙ ПУНКТ – Bridge Point is an inland location where cargo is received by the ocean carrier and then moved to a coastal port for loading. / наземный участок, на котором груз .

BRIDGE PORT = ПРОМЕЖУТОЧНЫЙ ПОРТ (или СВЯЗУЮЩИЙ ПОРТ) – Bridge Port is a port where cargo is received by the ocean carrier and stuffed into containers but then moved to another coastal port to be waded on a vessel.

BRIDGING = ЗАМЫКАНИЕ (или ШУНТИРОВАНИЕ) – Bridging is a condition of filter element loading in which contaminant spans the space between adjacent sections of a filter element, thus blocking a portion of the useful filtration. / Под Шунтом, от Английского слова Shunt, означающее Ответвление, понимается электрический проводник или магнитопровод, присоединяемый параллельно электрической или магнитной цепи для ответвления части электрического тока или магнитного потока, когда нежелательно либо невозможно весь ток (поток) пропустить через данную цепь. Шунты изготовляют в виде пластины, ленты или проволоки, преимущественно из манганина, константана (электрические шунты) и магнитно-мягких материалов (магнитные шунты).

BRIEF = ХХ (или БРЕВЕ) – Brief:- short snug pants or underpants. / .

BRIGHT = ЯРКОЕ (или СВЕТЛОЕ, или БЛЕСТЯЩЕЕ) – (1) Bright is the term applied to fibers whose luster has not been reduced by physical or chemical means; the opposite of dull or matte. / Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

(2) Bright:- very white, almost reflective, wool relatively free of dirt and sand. Some breeds, like Cormo, are known for producing particularly bright fleeces.

BRIGHTNESS = ЯРКОСТЬ – Brightness is:- (1) aspect of visual perception whereby an area appears to emit more or less light; (2) of an object color, combination of lightness and saturation; (3) in the textile industry, perceived as saturated, vivid, deep, or clean; (4) (color) of paper, reflectance of an infinitely thick specimen (reflectivity) measured for blue light with a centroid wavelength of 457 nm under specified spectral and geometric conditions of measurement; and (5) dyer's, the color quality, combining lightness and saturation that would be decreased by adding black, gray, or a complementary color to a chromatic dye. / Яркость (L) – световая величина, равная отношению светового потока $d^2\varphi$ к геометрическому фактору:- $d\Omega dA\cos\theta$: $L = d^2\varphi / d\Omega dA\cos\theta$. Здесь $d\Omega$ – заполненный излучением телесный угол, dA – площадь участка, испускающего или принимающего излучение, θ – угол между перпендикуляром к этому участку и направлением излучения. Из общего определения яркости следуют два практически наиболее интересных частных определения:- (i) яркость – отношение силы света (I) элемента поверхности к площади его проекции, перпендикулярной рассматриваемому направлению:- $L = dI / dA \cos\theta$. (ii) Яркость – отношение освещённости (E) в точке плоскости, перпендикулярной направлению на источник, к элементарному телесному углу, в котором заключён поток, создающий эту освещённость:- $L = dE / d\Omega\cos\theta$. Яркость измеряется в кд·м$^{-2}$. Из всех световых величин яркость наиболее непосредственно связана со зрительными ощущениями, так как освещённости изображений предметов на сетчатке пропорциональны яркостям этих предметов. В системе энергетических фотометрических величин аналогичная яркости величина называется энергетической яркостью и измеряется в вт·ср$^{-1}$·м$^{-2}$.

BRIGHT SPECKS = ЯРКИЕ КРАПИНКИ (или ЯРКИЕ МУШКИ) – Bright Specks:- Fabric:- spun-rayon and wool-blend dress goods; Construction:- (i) Count:- 38 x 36; (ii) Warp:- 14/1 60% 1%-in. 1% -den. bright viscose rayon 25% 1%-in. 5/4-den. bright viscose rayon 15% 58's wool cut iy 2 in.; (iii) Filling:- same as warp; Finish:- plain dyed navy. Defect:- bright specks throughout, giving a tinsel like sparkle effect. Analysis:- microscopic examination showed that this defect was due to several of the 5%-denier fibers having abnormal, flat-filament formation. The sparkle effect was caused by these comparatively large flat surfaces reflecting more light than the normal portions of the fibers. In cross section, the normal, rounded filaments had normal contours, while the flat portions were elongated. This defect was apparently produced by some faulty coagulation process during the spinning of the staple. / Уточина:- .

BRIGHT STOCK = БРАЙТСТОК (или ЯРКОЕ СЫРЬЁ, или ОСТАТОЧНЫЙ КОМПОНЕНТ) – Bright Stock:- a heavy residual lubricant stock with low pour point, used in finished blends to provide good bearing film strength, prevent scuffing, and reduce oil consumption. Usually identified by its viscosity, Saybolt Universal Seconds (SUS) at 210 degrees F or cSt at 100 degrees C.

BRIGHT WARP ENDS = ЯРКИЕ ПРОДОЛЬНЫЕ НИТИ ОСНОВЫ – Bright Warp Ends:- Fabric:- lining twill; Construction:- (i) Count:- 112 x 72; (ii) Warp:- 150/40 bright acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed brown. Defect:- two single bright-appearing ends in warp. Analysis:- denier, filament count, twist, and rayon identification of the bright-appearing ends showed no abnormal condition. Single-strand elongation tests, however, showed the two ends in question to have abnormally low breaking strength and elongation and, in removing them from the fabric, it was found that they had much less crimp than adjacent normal warp ends. This defect was due to stretched warp ends probably caused by excessive tension during weaving. Theoretically, the denier of these ends should be slightly lower than normal, owing to the overstretching, but it has been found that changes in the stress-strain characteristics of the yarn are a much more reliable measure of overtensioning. / Уточина:- .

BRIGHT WORK = НЕКРАШЕНАЯ ДЕТАЛЬ (или РАБОТА ПО НАВЕДЕНИЮ БЛЕСКА) – Bright Work (maritime term):- brass work, polished (also varnished wood work in yachts). / Медные и деревянные некрашеные детали, требующие чистки.

BRIGHT YARN = БЛЕСТЯЩАЯ ПРЯЖА (или ЯРКАЯ ПРЯЖА) – Bright Yarns are high luster yarns made of rayon or acetate fibers. Bright Yarn is a yarn, in a course or wale, of higher lustre than the adjacent yarns. Note:- this defect is caused by irregularity in processing of the yarn, e.g., uneven distribution of delustrant, or by mixing yarns of different delustrant content, e.g., dull, semi-dull, etc. Note:- this defect is caused by a lack of control during texturing processes. / Глянцевая Пряжа (bright yarn):- порок пряжи в тканых полотнах в виде места с нежелательным блеском на поверхности тканого полотна. Примечание:- данный порок вызван неправильной обработкой пряжи, например, неравномерным распределением матирующего вещества или смешиванием пряжи с различным содержанием матирующего вещества, например, матового, полуматового и так далее.

BRILLIANTINE = БРИЙАНТИН (или БРИЛЬЯНТИН) – Brilliantine:- a light lustrous fabric that is similar to alpaca and is woven usually with a cotton warp and mohair or worsted filling. / уточина. Брильянтин или Брийантин – торговое название плательной

ткани с хлопчатобумажной основой и утком из гребенной блестящей шерсти; по полотняному фону выработаны узоры длинными уточными перекрытиями.

BRINE CIRCUIT = РАССОЛЬНАЯ ЦЕПЬ (или РАССОЛЬНАЯ СХЕМА) – Brine Circuit is the intermediate circuit of a cooling system that uses a saline solution (brine) as a coolant to reduce the freezing point. This method is often used to reduce the amount of chemical-based coolant used in the cooling system.

BRINELLING = БРИНЕЛЛИРОВАНИЕ (или БРИНЭЛИНЬ) – Brinelling:- permanent deformation of the bearing surfaces where the rollers (or balls) contact the races. Brinelling results from excessive load or impact on stationary bearings. It is a form of mechanical damage in which metal is displaced or upset without attrition. / ролики (или шарики) . на стационарных подшипниках. Яляется формой механического повреждения, при котором металл . По имени Шведского инженера-металлурга Юана Аугуста Бринэла (или Бринелля) (Johan August Brinell; 1849-Ноябрь-21–1925-Ноябрь-17). Образование вмятин от тел качения на поверхностях качения подшипников.

BRISTLE = ЩЕТИНКА – (1) Bristle is a short, stiff, coarse fiber.

(2) Bristle is a short and blunt seta. A stiff hair. Bristle is the hair of the dog. / Короткая и щетинка.

BRITANNIA = БРИТАНИЯ – Britannia coins are British bullion coins issued by the Royal Mint in gold since 1987 and in silver since 1997. Britannia gold coins contain one troy ounce of gold and have a face value of £100. Gold Britannias also are issued in fractional sizes of one-half, one-quarter, and one-tenth of a troy ounce and with face values of £50, £25, and £10 respectively. Britannia silver coins contain one troy ounce of silver and have a face value of £2. Silver Britannias also are issued in fractional sizes of one-half, one-quarter, and one-tenth of a troy ounce and with face values of £1, 50p, and 20p respectively. (1) Gold Britannia:- from 2013 the gold coins have a millesimal fineness of .9999 (or 24 carat gold). Until 2012 the gold coins have a millesimal fineness of .917 (91.7% or 22 carat gold) with the non-gold component being copper until 1989 and silver from 1990. 2013 Gold Britannia specifications (gold content, not total weight):- (a) one ounce:- diameter 38.61 mm, (31.104 g). 1987–2012 Gold Britannia specifications (gold content, not total weight):- (a) one ounce:- diameter 32.69 mm, (31.104 g); (b) half ounce:- diameter 27.00 mm, (15.552 g); (c) quarter ounce:- diameter 22.00 mm,(7.776 g); and (d) tenth ounce:- diameter 16.50 mm, (3.110 g). (2) Silver Britannia:- from 2013 the silver coins have a millesimal fineness of .999 (99.9% silver). From 1997-2012 the silver coins have a millesimal fineness of 958 (95.8% or Britannia silver). Silver Britannias have been released each year beginning in 1997, when a silver proof set was offered. In 1997 and in all subsequent even-numbered years the reverse design has depicted a standing Britannia figure. Beginning in 1999 and continuing in odd-numbered years, a series of alternate, non-repeating depictions of Britannia have replaced the standing figure on the reverse. Regardless of what this says above, you will find that if you research websites that sell them, the Silver Britannias do NOT necessarily follow this design pattern. The 2010 design, for instance, is a non-repeating depiction in an even year, while the 2012 & 2013 issues both bear the regular standing Britannia figure. Britannia is the British gold coin first issued in 1987 with a fineness of 916.6. The Britannia is a British bullion gold coin which was first issued in 1987. It weighs one troy ounce and has a face value of 100 pounds. Fractional Britannia coins, which weigh a half, quarter, and one-tenth of an ounce, and which have face values of 50, 25, and 10 pounds respectively, have also been launched. All Britannia coins have a millesimal fineness of 916 (91.6%, 22 carat) gold. Between 1987 and 1989, the non-gold component of Britannia coins was copper; from 1990 copper was replaced by silver. Originally only gold Britannia coins were manufactured, however since 1997 onwards, after a silver proof set was offered, the Royal Mint has also started manufacturing silver coins under the Britannia name, which are since then released every year. The metal used in the making of these coins is 'Britannia silver' with millesimal fineness 958 (95.8%), an alloy of silver containing 95.8% silver, with the balance being copper. Silver Britannia coins are available in weights of 1 ounce, 1/2 ounce, 1/4 ounce and 1/10 ounce. Silver Britannia coins belonging to 1997 and following even-numbered years have a reverse design which depicts a standing Britannia figure. Ever since 1999, all Britannia coins belonging to odd-numbered years feature a series of alternate, non-repeating depictions of Britannia, instead of the standing figure on the reverse.

BRITCH = (СУКОННАЯ ШЕРСТЬ) С ЛЯЖЕК ОВЦЫ (или ОБНОЖКА) – Britch is the short, curly fibers found in the groin and belly area of sheep. It has a very different character from the rest of the fleece and should be skirted out. In a perfect world, spinners would never see this.

BRITCHES = БРИДЖИ (или ШТАНЫ) – Britches:- breeches, trousers.

BRITISH EXIT = ВЫХОД БРИТАНИИ – British Exit or Brexit (stands for British Exit) is a referendum for the United Kingdom to no longer be a member of the European Union. The vote passed on 23 June 2016.

BRITISH GOVERNMENT STOCKS/SECURITIES = АКЦИИ/ЦЕННЫЕ БУМАГИ БРИТАНСКОГО ПРАВИТЕЛЬСТВА – British Government Stocks/Securities:- stocks/securities issued to investors by the British Government. The monies which are paid to the Government by the investors as the purchase price of these stocks/securities are borrowings by the Government which have to be paid back at the redemption date of the stock/security.

BRITISH GUM = БРИТАНСКАЯ ГУММИ (или БРИТАНСКОЕ КЛЕЯЩЕЕ ВЕЩЕСТВО, или БРИТАНСКАЯ КАМЕДЬ, или БРИТАНСКАЯ СМОЛА, или БРИТАНСКАЯ РЕЗИНА) – British Gum or Dextrin is prepared by heating starch. It varies considerably in composition sometimes being only slightly roasted and consequently only partly converted into dextrine, and at other times being highly torrefied, and almost completely soluble in cold water and very dark in color. Its thickening power decreases and its gummy nature increases as the temperature at which it is roasted is raised. The lighter colored gums or dextrines will make a good thickening with from 2 to 3 lb of gum to one gallon of water, but the darkest and most highly calcined require from 6 to lb per gallon to give a substantial paste. Between these limits all qualities are obtainable. The darkest qualities are very useful for strongly acid colors, and with the exception of gum Senegal, are the best for strongly alkaline colors and discharges. Like the natural gums, neither light nor dark British gums penetrate as well into the fiber of the cloth so deeply as pure starch or flour, and are therefore unsuitable for very dark strong colors. See also Dextrin. British Gum is a brownish substance, very soluble in cold water, formed by heating dry starch at a temperature of about 600 °Fahrenheit. It corresponds, in its properties, to dextrin, and is used, in solution, as a substitute for gum in stiffering goods. Dextrin is a translucent, gummy, amorphous substance, nearly tasteless and odorless, used as a substitute for gum, for sizing, etc, and obtained from starch by the action of heat, acids, or diastase. It is of somewhat variable composition, containing several carbohydrates which change easily to their respective varieties of sugar. It is so named from its rotating the plane of polarization to the right. / Дэкстрин (Dextrin). Щелочное (Alkaline). Британская Камедь, получаемая нагреванием кукурузного крахмала; применяется в ситцепечатании как загуститель печатных красок.

BRITISH HIGH COMMISSION = БРИТАНСКАЯ ВЫСОКАЯ КОМИССИЯ – A British High Commission is the name of the British representative office in Commonwealth countries. Embassies and consulates are in non-Commonwealth countries. The Embassy is in the capitol city, consulates are in secondary cities. So Australia has a British High Commission as they are a Commonwealth country.

The US has a British Embassy in Washington, DC (the capitol) and British Consulates in New York City, Los Angeles, Chicago and several other cities. Bermuda and Cayman Islands are considered British Overseas Territories so there are no High Commissions or Embassies there. You cannot be a diplomat within your own country. The definition of a diplomat is someone who represents their country's interests in a foreign country. The term British High Commission (BHC, or High Commission, HC, or Her Majesty's High Commission, HMHC) is used in lieu of Embassy in Commonwealth countries. A High Commission is the same as an Embassy except it's the embassy of a Commonwealth country in another Commonwealth country. All Commonwealth countries have High Commissions rather than Embassies in each other's countries. A Consulate is a sub-office of an Embassy or High Commission, mostly there to provide what help they can to their own citizens abroad and sometimes to issue visas. Embassies and High Commissions often have jobs available to local people of the administrative kind, but otherwise they will be staffed by their own citizens posted abroad. It would be a bit difficult to be a diplomat without travelling abroad as the whole point of the job, by definition, is interaction with other countries, promoting and protecting your own country's interests, and maintaining diplomatic relations. No country has an embassy in Bermuda as it is just too small to be worth having one. The same goes for the Cayman Islands. What often happens in this case is that a country's embassy or High Commission in another nearby country will cover them as well – for instance the US Embassy in Jamaica also covers the Caymans. Both countries are British Overseas Territories and have a Governor sent from the UK, so obviously there is no British High Commission there. British High Commission is a name for British missions in commonwealth (the ones they colonized); and British Embassies are in lands that they did not colonize. / Термин Британская Высокая Комиссия (БВК, или Высокая Комиссия, ВК, или Высокая Комиссия Её Величества, ВКЕВ) используется вместо термина Посольство в странах Содружества.

BRITISH IMPERIAL SYSTEM = БРИТАНСКАЯ ИМПЕРИАЛЬНАЯ СИСТЕМА – The British Imperial System is a traditional system of weights and measures used officially in Great Britain from 1824 until the adoption of the metric system beginning in 1965. The United States Customary System of weights and measures is derived from it. British Imperial units are now legally defined in metric terms. The British Imperial System evolved from the thousands of Roman, Celtic, Anglo-Saxon, and customary local units employed in the Middle Ages. Traditional names such as pound, foot, and gallon were widely used, but the values so designated varied with time, place, trade, product specifications, and dozens of other requirements. Early royal standards established to enforce uniformity took the name Winchester, after the ancient capital of Britain, where the X century Saxon king Edgar the Peaceable kept a royal bushel measure and quite possibly others. XIV century statutes recorded a yard (perhaps based originally on a rod or stick) of 3 feet, each foot containing 12 inches, each inch equaling the length of three barleycorns (employed merely as a learning device since the actual standard was the space between two marks on a yard bar). Units of capacity and weight were also specified. In the late XV century, King Henry VII reaffirmed the customary Winchester standards for capacity and length and distributed royal standards (physical embodiments of the approved units) throughout the realm. This process was repeated about a century later in the reign of Queen Elizabeth I. In the XVI century the rod (5.5 yards, or 16.5 feet) was defined (once again as a learning device and not as a standard) as the length of the left feet of 16 men lined up heel to toe as they emerged from church. By the XVII century usage and statute had established the acre, rod, and furlong at their present values (4 840 square yards, 16.5 feet, and 660 feet, respectively), together with other historic units. The several trade pounds in common use were reduced to just two:- the Troy pound, primarily for precious metals, and the pound avoirdupois, for other goods sold by weight. The Weights and Measures Act of 1824 and the Act of 1878 established the British Imperial System on the basis of precise definitions of selected existing units. The 1824 act sanctioned a single imperial gallon to replace the wine, ale, and Corn (Wheat) gallons then in general use. The new gallon was defined as equal in volume to 10 pounds avoirdupois of distilled water weighed at 62 °F with the barometer at 30 inches, or 277.274 cubic inches (later corrected to 277.421 cubic inches). The two new basic standard units were the imperial standard yard and the Troy pound, which was later restricted to weighing drugs, precious metals, and jewels. A 1963 act abolished such archaic measures as the rod and chaldron (a measure of coal equal to 36 bushels) and redefined the standard yard and pound as 0.914 4 meters and 0.453 592 37 kg respectively. The gallon now equals the space occupied by 10 pounds of distilled water of density 0.998 859 gram per milliliter weighed in air of density 0.001 217 gram per milliliter against weights of density 8.136 grams per milliliter. While the British were reforming their weights and measures in the XIX century, the Americans were just adopting units based on those discarded by the act of 1824. The standard US gallon is based on the Queen Anne wine gallon of 231 cubic inches and is about 17 percent smaller than the British imperial gallon. The US bushel of 2 150.42 cubic inches, derived from the Winchester bushel abandoned in Britain, is approximately 3 percent smaller than the British imperial bushel. In the British system, units of dry and liquid capacity are the same, while in the United States they differ; the liquid and dry pint in Britain both equal 0.568 cubic decimeter, while the US liquid pint is 0.473 cubic decimeter, and the US dry pint is 0.551 cubic decimeter. British and American units of linear measure and weight are essentially the same. Notable exceptions are the British stone of 14 pounds, which is not used in the United States, and a divergence in definition of the hundredweight (100 pounds in the United States, 112 in Britain) that yields two different tons, the short US ton of 2 000 pounds and the long British ton of 2 240 pounds. In 1959 major English-speaking nations adopted common metric definitions of the inch (2.54 cm), the yard (0.914 4 meters), and the pound (0.453 6 kg). / , от Латинского слова Affirmo, означающее Утверждаю, . Обычной Системе Мер США.

BRITISH THERMAL UNIT = БРИТАНСКАЯ ЕДИНИЦА ТЕПЛОТЫ – British Thermal Unit (Btu) is the amount of heat required to raise the temperature of 1 pound of water 1 degree Fahrenheit. The British Thermal Unit (BTU or Btu) is a traditional unit of energy equal to about 1 055.055 85 Joules. It is approximately the amount of energy needed to heat 1 pound (0.454 kg) of water 1 °F (0.556 °C). The term BTU is also used to describe the heat value (energy content) of different fuels. Prices of different fuels and their units of measure (Dollars per ton of coal, Dollars per barrel of crude, Cents per gallon of gasoline, Cents per thousand cubic feet of natural gas) can be easily compared when expressed as Dollars and Cents per million BTUs. The standard measure of heat energy. It takes one Btu to raise the temperature of one pound of water by one degree Fahrenheit at sea level. For example, it takes about 2 000 Btu to make a pot of Coffee. One Btu is equivalent to 251.996 calories, 778.169 foot-pounds, 1 055.056 Joules, and 0.293 071 Watt-hours. Note:- in the abbreviation, only the B is capitalized. The British Thermal Unit (BTU or Btu) is the unit of heat energy defined as the amount of heat required to raise the temperature of one pound of water by one degree Fahrenheit. In America the British thermal unit is sometimes called the Heat Unit. In defining the Btu, it is necessary to specify the temperature of the water; thus there have been several definitions over the years. However, one Btu is equal to about 251.996 (small) calories, or 0.251 996 of the (kilo-)calories counted by dieters. Using the current definition of the calorie (the IT calorie), one Btu equals approximately 778.169 foot pounds, 1.055 056 kiloJoules or 0.293 071 Watt hour. The symbol BThU has also been used, especially in Britain. The quantity of heat required to raise the temperature of 1 pound of liquid water by 1 degree Fahrenheit at the temperature at which water has its greatest density (approximately 39 degrees Fahrenheit). See also Heat Content. The amount of heat required to increase the temperature of a pound of water 1° Fahrenheit. A British thermal unit (Btu) is used as a common measure of heating value for different fuels. Prices of different fuels and their units of measure (Dollars per barrel of crude, Dollars per ton of coal, Cents per gallon of gasoline, Cents per thousand cubic feet of natural gas) can be easily compared when expressed as Dollars and Cents per million Btus. British Thermal Unit (Btu) is a standard unit for measuring the quantity of heat energy equal to the quantity of heat required to raise the temperature of 1 pound of water by 1 degree Fahrenheit. British Thermal Unit (BTU) is the measure of heat output for a fuel, and one of the key indicators of

wood pellet quality. The higher the BTU rating, the more heat you will feel. You should expect to find a BTU rating of 8 400–9 000+ in premium wood pellets. / Под Британской Единицей Теплоты (Б.е.т.) понимается единица количества теплоты, термодинамического потенциала, теплоты фазового превращения в Британской системе единиц. Обозначение:- Б.е.т. (Btu). 1 Б.е.т. = 1 055.056 Джоулей (Дж).

BRITTLE = ЛОМКОЕ (или ХРУПКОЕ) – Brittle refers to harsh, dry, 'wire-like' fiber; much like the split ends in hair.

BRITTLE CULM = ЛОМКАЯ СОЛОМИНА – Brittle Culm is a culm that break easily, particularly at maturity, due to low content of a-cellulose in cell walls. / Под Соломиной понимается цилиндрический, обычно полый в междоузлиях стебель злаков; у современных сортов Овса, Пшеницы, Ржи и других сельскохозяйственных культур; устойчив к полеганию.

BRITTLE FRACTURE = КРОШАЩИЙСЯ ИЗЛОМ (или РАЗРЫВ, или ТРЕЩИНА) – Brittle Fracture:- caused by mechanical stress placed on plastic films at freezing temperatures. / Под Изломом понимается поверхность, образующаяся после разрушения образца или изделия. Различают:- (i) Вязкий Излом – со следами местной пластической деформации на поверхности (у металлов); (ii) Излом Замедленного Разрушения – после длительного статического нагружения; (iii) Усталостный Излом – после разрушения в результате многократного нагружения; и (iv) Хрупкий Излом, например, у закалённых сталей, керамики, стекла. Излом можно рассматривать как своеобразную моментальную фотографию всего процесса разрушения. Поэтому анализ и правильное 'чтение' излома играют важную роль при установлении причин аварий и поломок. Микроскопический анализ структуры излома называется Фрактографией.

BRITTLE POINT = ТОЧКА ХРУПКОСТИ – Brittle Point is the temperature at which a polymer no longer exhibits viscoelastic properties.

BRL = BARREL

BRL = BRAZILIAN REAL

BRM = BUSINESS REFERENCE MODEL

BROADACRE APPLICATION = ОБШИРНОЕ ПРИМЕНЕНИЕ – Broadacre Application is an application of fertilizer, herbicide or insecticide applied to the whole field. / Применение или внесение удобрений, гербицидов или инсектицидов, вносимых по всей площади поля.

BROAD–BASED SECURITY INDEX = РАСШИРЕННЫЙ ИНДЕКС ПО ЦЕННЫМ БУМАГАМ – Broad-Based Security Index:- any index of securities that does not meet the legal definition of Narrow-Based Security Index. See also Narrow-Based Security Index. / Любой индекс по ценным бумагам, который не подходит под юридическое определение Усечённого Индекса По Ценным Бумагам. Смотрите также Усечённый Индекс По Ценным Бумагам (Narrow-Based Security Index).

BROADCAST = РАЗБРОС – Broadcast:- to apply seeds or granules by hand or machine over a surface area. To spread randomly.

BROADCAST AMAN RICE = РАЗБРОСНЫЙ РИС АМАН – Broadcast Aman Rice is a deepwater Rice sown in March and April alone or mixed with Aus and transplanted in May after Boro Rice is harvested. It grows in the monsoon floodwater with depths from 0.5 up to 4.0 m from June to September and generally harvested during November and December. Some of these Rices are photoperiod-sensitive.

BROADCASTING = РАЗБРАСЫВАНИЕ – Broadcasting is the action of spreading seeds, fertilizer, or pesticides on the surface of the field at random, by hand or by machine.
